THOM. IOHNSON.

TO THE RIGHT HONORABLE
HIS SINGVLAR GOOD LORD AND
MASTER, SIR WILLIAM CECIL KNIGHT, BARON OF
Burghley, Maſter of the Court of Wards and Liueries, Chancellor of the
Vniuerſitie of Cambridge, Knight of the moſt noble Order of the Garter,
one of the Lords of her Maieſties moſt honorable Priuy Councell, and Lord high Treaſurer of *England*.

Among the manifold creatures of God (right Honorable, and my ſingular good Lord) that haue all in all ages diuerſly entertained many excellent wits, and drawn them to the contemplation of the diuine wiſdome, none haue prouoked mens ſtudies more, or ſatisfied their deſires ſo much as plants haue done, and that vpon juſt and worthy cauſes: for if delight may prouoke mens labor, what greater delight is there than to behold the earth apparelled with plants, as with a robe of embroidered worke, ſet with Orient pearles and garniſhed with great diuerſitie of rare and coſtly jewels? If this varietie and perfection of colours may affect the eie, it is ſuch in herbs and floures, that no *Apelles*, no *Zeuxis* euer could by any art expreſſe the like: if odours or if taſte may worke ſatisfaction, they are both ſo ſoueraigne in plants, and ſo comfortable that no confection of the Apothecaries can equall their excellent vertue. But theſe delights are in the outward ſenſes: the principal delight is in the mind, ſingularly enriched with the knowledge of theſe viſible things, ſetting forth to vs the inuiſible wiſdome and admirable workmanſhip of Almighty God. The delight is great, but the vſe greater, and ioyned often with neceſſitie. In the firſt ages of the world they were the ordinary meate of men, and haue continued euer ſince of neceſſary vſe both for meates to maintaine life, and for medicine to recouer health. The hidden vertue of them is ſuch, that (as *Pliny* noteth) the very bruit beaſts haue found it out: and (which is another vſe that he obſerues) from thence the Dyars tooke the beginning of their Art.

Plin.l.8.ca.27.
Ibid.l.22.ca.2.

Furthermore, the neceſſary vſe of thoſe fruits of the earth doth plainly appeare by the great charge and care of almoſt all men in planting & maintaining of gardens, not as ornaments onely, but as a neceſſarie prouiſion alſo to their houſes. And here beſide the fruit, to ſpeake againe in a word of delight, gardens, eſpecially ſuch as your Honor hath, furniſhed with many rare Simples, do ſingularly delight, when in them a man doth behold a flouriſhing ſhew of Summer beauties in the midſt of Winters force, and a goodly ſpring of flours, when abroad a leafe is not to be ſeene. Beſides theſe and other cauſes, there are many examples of thoſe that haue honoured this ſcience: for to paſſe by a multitude of the Philoſophers, it may pleaſe your Honor to call to remembrance that which you know of ſome noble Princes, that haue ioyned this ſtudy with their moſt important matters

Plut. de Diſcr. adul. & amic.
Plin. lib.25, cap.2.

ters of ſtate: *Mithridates* the great was famous for his knowledge herein, as *Plutarch* noteth. *Euax* alſo King of Arabia, the happy garden of the world for principall Simples, wrot of this argument, as *Pliny* ſheweth. *Diocleſian* likewiſe, might haue had his praiſe, had he not drowned all his honour in the bloud of his perſecution. To conclude this point, the example of *Solomon* is before the reſt, and greater, whoſe wiſdome and knowledge was ſuch, that hee was able to ſet out the nature of all plants from the higheſt Cedar to the loweſt Moſſe. But my very good Lord, that which ſometime was the ſtudy of great Phyloſophers and mightie Princes, is now neglected, except it be of ſome few, whoſe ſpirit and wiſdome hath carried them among other parts of wiſdome and counſell, to a care and ſtudie of ſpeciall herbes, both for the furniſhing of their gardens, and furtherance of their knowledge: among whom I may iuſtly affirme and publiſh your Honor to be one, being my ſelfe one of your ſeruants, and a long time witneſſe thereof: for vnder your Lordſhip I haue ſerued, and that way emploied my principall ſtudy and almoſt all my time, now by the ſpace of twenty yeares. To the large and ſingular furniture of this noble Iſland I haue added from forreine places all the varietie of herbes and floures that I might any way obtaine, I haue laboured with the ſoile to make it fit for plants, and with the plants, that they might delight in the ſoile, that ſo they might liue and proſper vnder our clymat, as in their natiue and proper countrey: what my ſucceſſe hath beene, and what my furniture is, I leaue to the report of they that haue ſeene your Lordſhips gardens, and the little plot of myne owne eſpeciall care and husbandry. But becauſe gardens are priuat, and many times finding an ignorant or a negligent ſucceſſor, come ſoone to ruine, there be that haue ſollicited me, firſt by my pen, and after by the Preſſe to make my labors common, and to free them from the danger wherunto a garden is ſubject: wherein when I was ouercome, and had brought this Hiſtory or report of the nature of Plants to a iuſt volume, and had made it (as the Reader may by compariſon ſee) richer than former Herbals, I found it no queſtion vnto whom I might dedicate my labors; for conſidering your good Lordſhip, I found none of whoſe fauour and goodnes I might ſooner preſume, ſeeing I haue found you euer my very good Lord and Maſter. Againe, conſidering my duty and your Honors merits, to whom may I better recommend my Labors, than to him vnto whom I owe my ſelfe, and all that I am able in your ſeruice or deuotion to performe? Therefore vnder hope of your Honorable and accuſtomed fauor I preſent this Herball to your Lordſhips protection; and not as an exquiſite Worke (for I know my meanneſſe) but as the greateſt gift and chiefeſt argument of duty that my labour and ſeruice can affoord: wherof if there be no other fruit, yet this is of ſome vſe, that I haue miniſtred Matter for Men of riper wits and deeper iudgements to poliſh, and to adde to my large additions where any thing is defectiue, that in time the Worke may be perfect. Thus I humbly take my leaue, beſeeching God to grant you yet many daies to liue to his glory, to the ſupport of this State vnder her Majeſtie our dread Soueraigne, and that with great increaſe of honor in this world, and all fulneſſe of glory in the world to come.

Your Lordſhips moſt humble

and obedient Seruant,

IOHN GERARD.

LANCELOTVS BRVNIVS MEDICVS REGINEVS
IOHANNI GERARDO *Chirurgo peritiſſimo*
& rei Herbariæ callentiſſimo S.P.D.

CVM ſingularum medicinæ partium cognitio atque intelligentia libero homine digna cenſenda eſt; tum earum nulla vel antiquitate, vel dignitate, vel vtilitate, vel denique iucunditate cum ſtirpium cognitione iure comparari debet. Antiquiſſimam eam eſſe ex eo liquet, quòd quum ceteræ medicinæ partes (ſicut reliquæ etiam artes) ab ipſis hominibus (prout eos dura preſſit neceſſitas) primum excogitatæ & inuentæ fuerunt: ſola herbarum arborumque cognitio ante hominem formatum condita, eidemque mox creato ab ipſo mundi architecto donata videri poteſt. Cuius tanta apud antiqua ſecula exiſtimatio ac dignitas erat, vt & ipſius inuentionem ſapientiſſimo Deorum Apollini veteres tribuerint, & reges celeberrimi in ſtirpium viribus indagandis ſtudium laboremque ſuum conſumere, ſummæ ſibi apud poſteros laudi honorique futurum cenſuerint. Iam verò plantarum vtilitas, atq; etiam neceſſitas, adeò latè patet, vt eius immenſitatem nullius vel acutiſſimi hominis animus capere, nedum meus calamus exprimere queat. Stirpium enim complurimæ nobis in cibos, alimentumque cedunt: innumeræ aduerſus morbus remedia ſuppeditant: ex alijs domos, naues, inſtrumenta tam bellica quam ruſtica fabricamus: aliquot etiam earum veſtes noſtris corporibus ſubminiſtrant. In quibus ſingulis recenſendis diutiùs perſiſtere, hominis eſſet intemperantèr abutentis & otio & literis. Quantas autem & quam varias voluptates ex ſtirpium ſiue amœnitate oculis capiamus, ſiue fragrantia naribus hauriamus, ſine ſumma in earum conditorem impietate inficiari non poſſumus. Adèo vt abſque ſtirpium ope & ſubſidio vita nobis ne vitalis quidem haberi, debeat.

Quum igitur res plantaria reliquis omnibus medicinæ partibus antiquitate antecedat; dignitate, nulli cedat; vtilitate inſuper oblectationeque cæteras longè ſuperet, quis futurus eſt, adeo, aut inſenſatus vt non exploratum habeat, aut ingratus, vt non ingenuè agnoſcat, quanta vniuerſis Anglis commoda, quantaſque voluptates tuus mi *Gerarde* in ſtirpium inueſtigatione & cultu labor indeſeſſus, ſtudium inexhauſtum, immenſique ſumptus hoc de ſtirpibus edito libro allaturi ſunt. Macte itaque iſta tua virtute, iſtoque de republica benè merendi ſtudio, & quod inſigni tua cum laude ingreſſus es vertutis gloriæque curriculum, eidem inſiſte animosè & gnauitèr, neq; à re plantaria promouenda prius deſiſte, quam eam à te ad vmbilicum jam fermè productam ipſe plenè abſoluas atque perficias. Sic enim & tibi adhùc ſuperſtiti gloriam paries immortalem, & poſt obitum tantam tui nominis celebritatem relinques, vt tuarum laudum opus poſteros noſtros nulla vnquam captura ſit oblivio. Bene vale. Ex Aula Reginea Weſtm. ipſis Cal. Decemb. 1597.

MATTHIAS DE LOBEL
IOHANNI GERARDO
felicitatem.

Authoris neceſſaria diligentia in ſtirpium ſiue Materiæ Medicæ cognitione commendatur.

QVum Londinum appuli,in ſinu gauiſus ſum Gerarde *amiciſsime,dum typographo formis excudenda Plantarum collectanea tua commiſſa vidi, de quibus ſummas,nulla die perituras laudes Anglia tibi Rei-herbariæ familiam vniuerſam, medicatricis artis partem, antiquiſsimum, iucundiſsimum & vtiliſsimum ſtudium,retegere cupido,debet. Priſcorum enim* Theophraſti,Dioſcoridis, Plinij, *&* Galeni *ſcripta, paſsim toto orbe pervulgata, tanquam fontes; Neotericorum autem,ſeu rivulos,* Brunfelſij, Fuchſij, Tragi, Ruellij,Matthioli,Dodonæi,Turneri,Cluſij, Daleſchampij, Camerarij,Tabernæmontani, Penæ,*noſtramque novam methodam & ordinem, à Gramine & notioribus ad Triticea, generatim & ſpeciatim,materno idiomate, Anglicæ genti tuæ Cultiſsimæ,Reipublicæ voluptabili commodo, recludis; quò ipſa ſtimulata, herbarum delitias & hortorum ſuauiſsimum & amœniſsimum cultum amplectetur, maximorum Imperatorum, Regum & Heroum tam priſcorum quam nuperorum exemplo. Nec ſatis hoc tibi fuit; ſed multò magis inſuper præſtitiſti, quòd copiam multarum elegantiſsimarum plantarum in Anglia ſponte naſcentium ab alijs hactenus prætermiſſarum, hiſtoriam deſcripſiſti,magna hoc ſtudio captorum vtilitate & oblectamento: Singulas enim regiones peculiares quaſdam plantas, quas in alias non facilè reperias, gignere certum. Neque magni tibi fuit hac inſpectione & è viuis Naturæ typis noſſe; quippe qui diu herbas indigenas,inquilinas & peregrinas cum nuperrimè ſolo erumpentes & pululantes, tum adultas, ſemineque prægnantes, hortulo tuo ſuburbano aluiſti & fouiſti: Exactum enim cognoſcendarum ex figura aut facie ſuperficiaria herbarum ſtudium generatim conſiſtit* (Dioſcoride *teſte) in frequenti & aſsidua, temporis omnis,inſpectione. Sed alia eſt interioris & ſubſtantialis formæ plantarum, quæ oculis cerni non poteſt, ſolers cognitio; quam etiam, quantum potes percunctando,ſeniorum Græcorum medicorum more, aperire conaris. Solebant autem antiqui ſuorum Medicaminum experimenta,in Reipublicæ vtilitatem,ſcriptis tabellis dare,quibus apud Epheſeos templi ſyluaticæ Dianæ parietes veſtiebantur. Compertum etiam eſt Hippocratem diſcendi cupidum, permultis regionibus peragratis, idem præſtitiſſe, & in methodum commemorabiliorem reſtituiſſe & illuſtraſſe. Melius enim eſt Reipublicæ quam noſtris commodis proſpicere. Non eſt igitur quod huius inuidioſæ procacis ætatis conviciatores maledici Zoili ſcripta tua obtrectent: dediſti enim gratis quod potuiſti, cætera doctioribus iudicijs relinquens; exortivis & exoticis incompartarum penè adhuc virium mangonizatis & lenocinijs allectis Floriſtarum floribus à Flora Dea meretrice nobili dictis, valetudini & vtilitati potius conſulens, quam voluptati,valere juſsis. Nonnulli ſiquidem ex alijs libris herbarum tranſcriptores rapſodi, ignotis ſibi vivis plantis ad medendum maximè neceſſarijs, aſsignant incertis, dubijs & ſuppoſitijs ſtirpibus aut ſimplicibus facultates legitimi ſimplicis medicamenti, maximo errore & ſumma periclitatione (vnum enim ſæpe ſimplex compoſitionem ineptam reddit,peruertit aut deprauat) quibus nec tutò nec temerè credendum; multoque etiam minus multis herbarum experimentis fallacibus,quibus etiam neque niſi notiſsimis morbis ſimplicibus, compoſitis & implicatis, eorundemque ſæuiſsimis ſymptomatibus,vtendum,ne inoportunus earum vſus ſæpius uenenum quam remedium ſit. Summo enim ægrotantium diſpendio & exercitatiſsimorum Medicorum tædio periclitatores procaces, contemptis & neglectis artis inſtitutionibus,* Hippocratis *&* Galeni *præceptis,per ſalutis diſcrimina & hominum ſtrages medentum tentamenta agunt. Omitto, breuitatis ergò, vulgi opifices,textores ſellularios, ſordidiſsimos fabros, interpolatores, circulatores forenſes & veteratores ſcutica dignos, qui profeſsionibus & mechanicis artibus ſuis faſtiditis,ſcelerato inſaniæ lucro, ſe Medicos* Theophraſteos, *quem vix vnquam ſummis labris deguſtarunt, profitentur. Non inueniſtè* Syluius *in huiuſmodi homines inuehit,dum ait,* Quam quiſque nouit artem,hanc exerceat vnam,atque excolat,& totus in ea verſetur;&c. *Et ſub finem præfationis rurſus ait,* Faxit Deus vt quiſque quam exercet Artem,pernoſcat,& Medicus nihil eorum quæ ad morbos citè & tutò curandos vtilia vel neceſſaria eſſe conſueuerunt, ignoret. Præualet Medicus vbi Pharmacopœi fides ſuſpecta eſt,qui ipſe ſimplicia & compoſita pernoſcit; imò quam infamiæ notam imprudens inurit, dum ignarus horum ſimplicium medicamentorum, tanquam aſinus quidam ad omnia Pharmacopœi rogata, auribus motis,velut annuit: quid quod illi ſæpe etiam volens Pharmacopæus illudit. Abſurdiſſimus eſt ac ſæpè ridiculus qui medicinam facit,harum rerum ignarus; & Pharmacopœo ignorantiæ ſuſpectum meritò ſe reddit. *Plura ſi vis require apud* Syluium, *ibidem loci.*

Præſtigioſas popularium medicaſtrorũ fallacias detegimus & inueteratos depulimus errores.

Initio prologi Pharmac. Præparand.

Medico quam plurima perſcrutanda, vt ſatis ſuperque ad artem medicatricem perdiſcendam, annos paucos haudquaquam ſufficere, teſtantur ipſius experientiſsimi & diuini ſenis verba vbi inquit; Ego enim ad finem medicinæ non perveni, etiamſi jam ſenex ſim. *Et ſtatim per initia Aphoriſmorum vitam brevem & artem longam pronunciavit. Quomodo ergo tuto medebuntur multi larvati Medici aut Medicaſtri tam repente creati, nulla Medicinæ parte, Medicamentorumve facultatibus perſpectis? Hujuſmodi adulatores, aſſentatores, dubitatores, rixatores, periclitatores, & Gnathonicos paraſiſtratos hiſtrionibus qui in tragœdijs introducuntur ſimilimos fecit Hippocrates.* Quemadmodum enim illi (inquit) figuram quidem & habitum ac perſonam eorum quos referunt habent, illi ipſi autem vere non ſunt: Sic & medici fama quidem & nomine multi, * re autem & opere valde pauci. *Itaque cum paulo ante Medicinam omnium artium præclariſsimam eſſe dixerit:* Verum propter ignorantiam eorum qui eam exercent, & ob vulgi ruditatem, qui tales pro Medicis judicat & habet, jam eo res deveniſſe, vt omnium artium longe viliſſima cenſeatur. At vero hoc peccatum ob hanc potiſſimum cauſam committi videtur; ſoli namque Medicinæ nulla pœna in rebus-publicis ſtatuta eſt, præterquam ignominiæ. *Ne animam & famam læderit, aut illi inſignis ignominia inureretur ob huiuſmodi ardua & noxia diſcrimina, bonus ille & ſyncerus Dodonæus (quamvis multas herbas ex alijs & Fuchſio tranſcripſerit, cujus methodo vſus eſt, quemq; inchoaverat, vt ipſemet mihi retulit, vernacula Germanica inferiori lingua vertere) vulgatiſsimis, notiſsimis ijſque paucis ex tot herbarum millibus, quinquagenis aut ſeptuagenis herbis quibus vtebatur potius contentus fuit, quam innumeris ſibi ignotis periclitari: melius enim omnino medicamento carere, abſtinere, & naturæ committere, quam abuti. Vtinam hujus noſtræ ætatis quamplures auſo potiti, medicinam factitantes, eo ſtudio, candore & voto mederentur: Illis id forſitan nequaquam evenerit, quod Philoſophis (Hippocrate defuncto) diſcipulis ſuis inexpertis & parum adhuc exercitatis medendo, id eſt necando (vt memoriæ traditum eſt) contingit: quamobrem ars medica Athænis, Roma & per vniverſam Græciam centum & ſeptuaginta annis, interdicta & exul fuit. Merito igitur caute & tute agendum: Opiatis & Diagrediatis, Colocynthide, Tithymalis, Eſula, Lathyride, Mercurio, Stibio, & ſimilibus moleſtiſsimis ſimplicibus cum cautione vtendum: optimis ducibus & experientiſsimis ſenioribus præceptoribus adhærendum, quorum ſub vexillis fidiſsime & tutiſsime rara & præclara, ob barbariē fere extincta, patrum & auorum remedia, maximo & priſtino artis ornamento & proximi vtilitate renovantur, & in vſum revocantur; neglectis, ſpretis, & excluſis Empiricis verboſis, invidioſis, ſuſpenſis, ambagioſis & exitioſis opinionibus, quibus mundus immundus regitur & labitur; qui cum decepi velit, decipiatur: in cujus fallacias per appoſite finxit & cecinit olim hos verſiculos eruditiſsimus collega D. Iacobus Paradiſius nobilis Gandavenſis alludens ad nomen tanti verſutiſsimi herois Noſtradami Salonenſis Galloprovinciæ,*

Epiſt. ad Democritum.

* Multi malunt videri quam eſſe.

Noſtra-damus, cum verba damus, quia fallere noſtrum;
Et cum verba damus, nil niſi noſtra damus.

Vale. Londini ipſis Calendis Decemb. 1597.

i Soh

In GERARDI Botanologian

περίνυμοι,

VLtimus ecce Gerardus: *at edit an optimus herbas?*
Quidni? non notas ſed dedit ille novas.
Ergo ne invideas, videas cum nomen & omen
φυτολόγε, *mirum eſt ardua quanta gerit.*
Οὗτοι ἅπαντα, κάτωθεν, πάρεστι πολύχυμα τ' ὕλη :
Sic liber eſt promus, condus ut hortus erat.
Et γαῖαν αἰθέρα *Cœlúmque ſolúmque ſubegit.*
τοῦ γ' ἄρα ἀθανάτοις αἰ μόνον ὅδε γέρας.

ANTON. HVNTONVS
Medicinæ candidatus.

Ad Iohannem Gerardum *Chirurgum Herbariumque peritiſſimum.*

NVlla oculos hominum ſpecies magis allicit illa,
Quam præſtante manu duxit generoſus Apelles.
Nulla aures animoſque magis facundia, quam quæ
Se fuſam loquitur Ciceronis ab ore deſerti:
Hæc eadem hunc librum commendat cauſa, *Gerarde,*
Cui pro laude ſatis tali natum eſſe parente,
Artifices cui inter dextras pro numine, nomen
Nobilius reliquis herbæ, plantæque magiſtris.
Illi etenim Europæ ſuccos, Aſiæque liquores
Quæque arente ſolo ſitiens parit Africa, tractant:
Tu veterum inventis nova conſuis omnia, ſi qua
Indus vterque dedit noſtram futura ſalutem,
Sive aliunde vehit noſtras mercator ad oras,
Hoc ipſo vtilius. Quia quæ ſunt credita ſcriptis,
Illa manu expertus medico, & bene dives ab horto
Explorato diu multumque emittis in auras,
Quæ curent hominum languentia corpora, multi
Præſtanteſque viri docuere fideliter artem.
Sed ſi ſuſtuleris plantas quem verba iuvabunt
Sic animo, ſic fronte minax. In prælia miles
Proſilit, at ſtricto cedit victoria ferro
Quæ tibi pro tanto cedit victoria ferro
Præmia perſolvet, Myrti laurique coronas?
Iſtam novit edax mercedem abolere vetuſtas,
At tibi pro ſtudio impenſiſque laboribus iſtis,
Queis hominum curas ſertam tectamque ſalutem,
Ille opifex rerum, cuſtoſque authorque ſalutis
Æternâ ſtatuit frontem redimire coronâ.

G.Launeus Medicus.

In hiſtoriam plantarum, Io. Gerardi *civis & Chirurgi Lond.* M. Iacobi Ihonſtonij *Scoti Ballinerifæ Regij pagi portionarij Epigramma.*

DEſine quæ vaſtis pomaria montibus Atlas
Clauſerat (Heſperij munera rara ſoli)
Auratis folijs auratos deſine ramos
Mirari & ramis pendula poma ſuis.
Singula cum Domino periere, & Gorgone viſo
In montis riguit veſcera verſus Atlas.
Alcinoi perijt qui, cedat penſilis hortus,
Quem celebrat priſci temporis aura fugax:
Vna Gerardini ſpecies durabilis horti
Æterno famæ marmore ſculpta manet.
Hic quicquid Zephyrus produxit, quicquid & Eurus,
Antiquus quicquid & novus orbis habet,

Intulit in patriam naturamque exprimit arte.
Sic nullo cedit terra Britanna ſolo.
Quod magis eſt Graium & Latium concludit in vno
Margine, & Anglorum jam facit ore loqui:
Sic erit æternum hinc vt vivas, horte *Gerardi*,
Cultoris ſtudio nobilitate tui.

In Plantarum hiſtoriam, à ſolertiſſimo viro, Reiq; Herbariæ peritiſſimo, D. Iohanne Gerardo, *Anglice editam Epigramma.*

EGregiam certè laudem, decus immortale refertis
Tu, ſocijq; tui, magnum & memorabile nomen
(Illuſtris DEVORAX) raptoribus orbis IBERIS
Devictis claſſe Anglorum; Tuque (Dicaſta
Maxime EGERTONE) veterem ſuperans Rhadamanthum,
HEROVM merito ἡμιθεῶν cenſendus in albo.
Nec laus veſtra minor (ſacræ pietatis alumni)
Qui mentes hominum divina paſcitis eſca.
Ornatis Patriam cuncti, nomenq; Britannum
Augetis, vobiſq; viam munitis ad aſtra.
Quin agite, in partem ſaltem permittite honoris
Phœbei veniant Vates, qui pellere gnari
Agmina morborum, humanæ inſidiantia vitæ.
Hujus & ingentes, ſerena fronte labores
ANGLO-DIOSCORIDIS, Patriæ, veſtræq; ſaluti
Excipite exhauſtos: paulum huc divortite in HORTOS
Quos CHORTEIA colit, quos Flora exornat, & omnes
Naiades, & Dryades, Charites, Nymphæq; Britannæ.
Corporibus hic grata ſalus, animiſq; voluptas.
Hic laxate animos: HABITAVIT NVMEN IN HORTIS.

Fran. Hering, Med. D.

POſt tot ab ingenuis conſcripta volumina myſtis,
Herbarum vires qui reſerare docent,
Tu tandem prodis Spartamq; hanc gnaviter ornas,
Dum reliquis palmam præripuiſſe ſtudes.
Nec facis hoc, rutilo vt poſſis ditarier auro,
Nec tibi vt accreſcat grandis acervus opum;
Sed prodeſſe volens, veſtitos gramine colles
Perluſtras, & agros, frondiferumq; nemus.
Indeq; Pæonias (apis inſtar) colligis herbas,
Inq; tuum ſtirpes congeris alueolum.
Mille tibi ſpecies plantarum, milleq; notæ;
Hortulus indicio eſt, quem colis ipſe domi.
Pampineæ vites, redolens cedrus, innuba laurus,
Nota tibi, nota eſt pinguis oliva tibi.
Balſama, narciſſus, rhododaphne, nardus, amomum,
Salvia, dictamnus, galbana nota tibi.
Quid multis? radix, ſtirps, flos, cum cortice ramus,
Spicaq; cum ſiliquis eſt bene nota tibi.
Gratulor ergo tibi, cunctiſq; (*Gerarde*) Britannis,
Namptwicoq; tuo gratulor atq; meo.
Nam Ceſtreſhyrij te ac me genuere parentes,
Tu meliore tamen ſydere natus eras:
Macte animo, pergaſq; precor, cœptumq; laborem
Vrge etiam vlterius. Vivitur ingenio.
Aurum habeant alij, gemmas, nitidoſq; pyropos,
Plantas tu & flores ſcribe *Gerarde*. Vale.

Vere & ex animo tuus, Tho. Newton, *Ilfordenſis*
ἱεροφάντης.

To the well affected Reader and Peruſer of this Booke, *St. Bredwell* Phyſitian, greeting.

Plin.Iun. in Pan. O*Pen is the Campe of glory and honour for all men, ſaith the younger* Pliny, *not*
onely men of great birth and dignitie, or men of office endued with publique
charge and titles, are ſeene therein, and haue the garland of praiſe and preferment
waiting to crowne their merits, but euen the common Souldier likewiſe:
ſo as he whoſe Name and note was erſt obſcure, may by egregious acts of valour
obtaine a place amongſt the Noble. The ſchoole of Science keepeth ſemblable
proportion: whoſe amplitude, as not alwaies, nor onely, men of great titles
and degrees labor to illuſtrate; ſo whoſoeuer doth, may confidently account of,
at the leaſt, his name to be immortall. What is he then that will deny his voice of gratious commendation
to the Authors of this Booke: To euery one, no doubt, there is due a condigne meaſure. The
Turnerus. *firſt Gatherers out of the Antients, and Augmenters by their owne paines, haue already ſpred the*
Dodonæus. Pena. *odour of their good names thorow all the lands of learned habitations. Doctor* Prieſt, *for his tranſlation*
Lobelius. *of ſo much as* Dodonæus, *hath thereby left a Tombe for his honourable ſepulture. Maſter*
Tabernam. Gerard *comming laſt, but not the leaſt, hath many waies accommodated the whole Worke vnto our*
Engliſh Nation: For this Hiſtory of Plants, as it is richly repleniſhed by thoſe fiue mens Labors laid
together, ſo yet could it full ill haue wanted that new acceſſion he hath made vnto it. Many things
hath he nouriſhed in his Garden, and obſerued in our Engliſh fields, that neuer came into their pens
to write of. Againe, the greateſt number of theſe plants, hauing neuer been written of in our Engliſh
tongue, would haue wanted names for the vulgar ſort to call them by: in which defect hee hath
been curiouſly carefull, touching old and new names to make ſupply. And leſt the Reader ſhould too
often languiſh with fruſtrate deſire to finde ſome plant he readeth, of rare vertue, he ſpareth not to tell
(if himſelfe haue ſeen it in England) in what wood, paſture, or ditch the ſame may be ſeene and gathered.
Which when I thinke of, and therewithall remember with what chearefull alacritie and reſolute
attendance he hath many yeares tilled this ground, and now brought forth the fruit of it, whether
I ſhould more commend his diligence to attaine this skill, or his large beneuolence in beſtowing
it on his Countrey, I cannot eaſily determine. This Booke-birth thus brought forth by Gerard, *as it*
is in forme and diſpoſition faire and comely, (euery Species *being referred to his likelieſt* Genus,
of whoſe ſtocke it came) ſo is it accompliſhed with ſurpaſſing varietie, vnto ſuch ſpreading growth
and ſtrength of euery limme, as that it may ſeeme ſome heroicall Impe of illuſtrious Race, able to
draw the eyes and expectation of euery man vnto it. Somewhat rare it will be heere for a Man to
moue a queſtion of this nature, and depart againe without ſome good ſatisfaction. Manifold will bee
the vſe both to the Phyſitian and others: for euery man delighteth in knowledge naturally, which
Laert.l.5.ca.1 *(as* Ariſtotle *ſaid) is in proſperitie an ornament, in aduerſitie a refuge. But this booke aboue many*
others will ſute with the moſt, becauſe it both plentifully adminiſtreth knowledge (which is the food
of the minde) and doth it alſo with a familiar and pleaſing taſte to euery capacitie. Now as this commoditie
is communicated to all, and many ſhall receiue much fruit thereof; ſo I wiſh ſome may haue
Iuven.7 Sat. *the minde to returne a benefit againe: that it might not be true in all, that* Iuvenal *ſaith,* Scire volunt
omnes, mercedem ſolvere nemo, *(id eſt)* All deſire to know, none to yeeld reward.
Let men thinke, That the perfection of this knowledge is the high aduancement of the health of
man: That perfection is not to be attained but by ſtrong endeauour: neither can ſtrong endeauour be
accompliſhed without free maintenance. This hath not hee, who is forced to labour for his dayly
bread: but if he, who from the ſhort houres of his daily and neceſſarie trauell, ſtealing as it were
ſome for the publique behoofe, and ſetting at length theſe pieces together, can bring forth ſo comely a
garment as this, meet to couer or put away the ignorance of many; what may be thought he would do,
if publique maintenance did free him from that priuate care, and vnite his thoughts to be wholly intent
to the generall good. O Reader, if ſuch men as this ſticke to rob themſelues of ſuch wealth as
thou haſt, to enrich thee with that ſuſtenance thou wanteſt, detract not to ſhare out of thine abundance
to merit and encourage their paines; that ſo fluxable riches and permanent ſciences may the one become
Cic.Offic. 1. *a prop to the other. Although praiſe and reward, ioyned as companions to fruitfull endeauors, are*
in part deſired of all men that vndertake loſſes, labours, or dangers for the publique behoofe, becauſe
Simpl.Comm. in Epict. *they adde ſinues (as it were) vnto Reaſon, and able her more and more to refine her ſelfe: yet do they*
not embrace that honour in reſpect of it ſelfe, nor in reſpect of thoſe that conferred it vpon them, but

as hauing thereby an argument in themſelues, that there is ſomething in them worthy eſtimation among men: which then doubleth their dilligence to deſerue it more abundantly. Admirable and for the imitation of Princes, was that act of Alexander, who ſetting Ariſtotle to compile commentaries of the bruit creatures, allowed him for the better performance thereof, certaine thouſands of men, in all Aſia and Greece, moſt skilfull obſeruers of ſuch things; to giue him information touching all beaſts, fiſhes, foules, ſerpents, and flies. What came of it? A booke written, wherein all learned men in all ages ſince do exerciſe themſelues principally, for the knowledge of the creatures. Great is the number of thoſe that of their owne priuate haue laboured in the ſame matter, from his age downe to our preſent time, which all do not in compariſon ſatisfie vs. Whereas if in thoſe enſuing ages there had riſen ſtill new Alexanders, there (certainely) would not haue wanted Ariſtotles to haue made the euidence of thoſe things an hundred fold more cleered vnto vs; than now they be. Whereby you may perceiue the vnequall effects that follow thoſe vnſutable cauſes of publicke and priuate maintenances vnto labours and ſtudies. Now that I might not diſpaire in this my exhortation, I ſee examples of this munificence in our age to giue me comfort: Ferdinand the Emperor and Coſmus Medices Prince of Tuſcane are herein regiſtred for furthering this ſcience of Plants, in following of it themſelues and becomming skilfull therein: which courſe of theirs could not be holden without the ſupporting and aduancing of ſuch as were ſtudious to excell in this kinde. Bellonius likewiſe (whom for honours cauſe I name) a man of high attempts in naturall ſcience, greatly extolleth his Kings liberalitie, which endued him with free leaſure to follow the ſtudie of Plants, ſeconded alſo herein by Montmorencie the Conſtable, the Cardinals Caſtilion and Lorraine, with Oliuerius the Chancellor; by whoſe meanes he was enabled to performe thoſe his notable peregrinations in Italy, Africa, and Aſia: the ſweet fruit whereof, as we haue receiued ſome taſte by his obſeruations, ſo we ſhould plenteouſly haue been filled with them, if violent death by moſt accurſed robbers had not cut him off. And as I finde theſe examples of comfort in forraine nations, ſo we are (I confeſſe) much to be thankefull to God, for the experience we haue of the like things at home. If (neuertheleſſe) vnto that Phyſicke lecture lately ſo well erected, men who haue this Worlds goods ſhall haue hearts alſo of that ſpirit, to adde ſome ingenious labourer in the skill of ſimples, they ſhall mightily augment and adorne the whole ſcience of Phyſicke. But if to that likewiſe they ioyne a third, namely the art of Chymicall preparation; that out of thoſe good creatures which God hath giuen man for his health, pure ſubſtances may be procured for thoſe that be ſicke, (I feare not to ſay it, though I ſee how Momus ſcorneth) this preſent generation would purchaſe more to the perfection of Phyſicke, than all the generations paſt ſince Galens time haue done: that, I ſay, nothing of this one fruit that would grow thereof, to wit, the diſcouering and aboliſhing of theſe pernitious impoſtures and ſophiſtications, which mount promiſing Paracelſians euery where obtrude, through want of a true and conſtant light among vs to diſcerne them by. In which behalfe, remembring the mournefull ſpeech of graue Hippocrates; The art of Phyſicke truly excelleth all arts, howbeit, through the ignorance partly of thoſe that exerciſe it, and partly of thoſe that iudge raſhly of Phyſitions, it is accounted of all Arts the moſt inferiour: I ſay in like manner, the Art of Chymiſtrie is in it ſelfe the moſt noble inſtrument of naturall knowledges; but through the ignorance and impiety, partly of thoſe that moſt audaciouſly profeſſe it without skill, and partly of them that impudently condemne that they know not, it is of all others moſt baſely deſpiſed and ſcornfully rejected. A principall remedy to remoue ſuch contumelious diſgrace from theſe two pure virgins of one ſtocke and linage, is this that I haue now inſinuated, euen by erecting the laboratory of an induſtrious Chymiſt, by the ſweet garden of flouriſhing ſimples. The Phyſicke Reader by their meanes ſhall not onely come furniſhed with authorities of the Antients, and ſenſibles probabilities for that he teacheth, but with reall demonſtrations alſo in many things, which the reaſon of man without the light of the furnace would neuer haue reached vnto. I haue vttered my hearts deſire,
for promoting firſt the perfection of my profeſſion, and next by neceſſary conſequence, the
healthie liues of men. If God open mens hearts to prouide for the former, it cannot be
but the happy fruits ſhall be ſeene in the later. Let the ingenious
learned iudge whether I haue reaſon on my ſide: the
partiall addicted ſect I ſhun, as men
that neuer meane good to
poſterity.

Hipp.de Lege.

George Baker, *one of her Maieſties chiefe Chirurgions in ordinarie, and M. of the Chirurgions of the Citie of London, to the Reader.*

ARiſtotle, a Prince amongſt the Philoſophers, writing in his Metaphyſicks of the nature of mankind, ſaith, that man is naturally inclined and deſirous of ſcience. The which ſentence doth teach vs, that all creatures (being vertuouſly giuen) doe ſtriue to attain to perfection, and draw neere in what they can to the Creator; and this knowledge is one of the principall parts which doth concerne the perfection of vnderſtanding: for of the ſame doth follow, that all ſuch are generally inclined to know the meanes by the which they may conſerue their life, health, and reputation. And although it be neceſſary for man to learn and know all ſciences, yet neuertheleſſe the knowledge of naturall philoſophie ought to be preferred, as being the moſt neceſſary; and moreouer, it doth bring with it a ſingular pleaſure and contentment. The firſt inuentor of this knowledge was *Chiron* the Centaure, of great renowne, ſonne to *Saturne* and *Phillyre*: and others ſay that it was inuented of *Apollo*; & others of *Eſculape* his ſon; eſteeming that ſo excellent a ſcience could neuer proceed but from the gods immortall, and that it was impoſſible for man to finde out the nature of Plants, if the great worker, which is God, had not firſt inſtructed and taught him. For, as *Pliny* ſaith, if any think that theſe things haue bin inuented by man, he is vngratefull for the workes of God. The firſt that we can learne of among the Greeks that haue diligently written of herbes, haue bin *Orpheus*, *Muſæus*, and *Heſiode*, hauing bin taught by the Ægyptians: then *Pythagoras* of great renown for his wiſdome, which did write bookes of the nature of Plants, and did acknowledge to learne the ſame from *Apollo* and *Eſculape*. *Democrite* alſo did compoſe bookes of Plants, hauing firſt trauelled ouer all Perſia, Arabia, Ethiopia, and Egypt. Many other excellent ſpirits haue taken great pleaſure in this ſcience, which to accompliſh haue hazarded their liues in paſſing many vnknowne regions, to learne the true knowledge of *Elleborus*, and other Medicaments: of which number were *Hippocrates*, *Crateua*, *Ariſtotle*, *Theophraſt*, *Diocles Cariſtius*, *Pamphylus*, *Montius*, *Hierophile*, *Dioſcorides*, *Galen*, *Pliny*, and many others, which I leaue to name, fearing to be too long. And if I may ſpeake without partiality of the Author of this book, his great paines, his no leſſe expenſes in trauelling far and neere for the attaining of his skill haue bin extraordinary. For he was neuer content with the knowledge of thoſe ſimples which grow in thoſe parts, but vpon his proper coſt and charges hath had out of all parts of the world all the rare ſimples which by any means he could attaine vnto, not only to haue them brought, but hath procured by his excellent knowledge to haue them growing in his garden, which as the time of the yeare doth ſerue may be ſeene: for there ſhall you ſee all manner of ſtrange trees, herbes, roots, plants, floures, and other ſuch rare things, that it would make a man wonder, how one of his degree, not hauing the purſe of a number, could euer accompliſh the ſame. I proteſt vpon my conſcience, I do not thinke for the knowledge of Plants, that he is inferiour to any: for I did once ſee him tried with one of the beſt ſtrangers that euer came into England, and was accounted in Paris the onely man, being recommended vnto me by that famous man Maſter *Amb.*

Pareus; and he being here was deſirous to goe abroad with ſome of our Herbariſts,for the which I was the meane to bring them together, and one whole day we ſpent herein, ſearching the rareſt Simples: but when it came to the triall,my French man did not know one to his foure. What doth this man deſerue that hath taken ſo much paines for his countrey, in ſetting out a Booke, that to this day, neuer any in what language ſoeuer did the like? Firſt, for correcting their faults in ſo many hundred places, being falſly named, miſtaken the one for the other; and then the pictures of a great number of plants now newly cut. If this man had taken this paines in Italy and Germany where *Matthiolus* did write, he ſhould haue ſped as well as he did: For(ſaith he)I had ſo great a deſire euer to finiſh my Book, that I neuer regarded any thing in reſpect of the publique good, not ſo much as to think how I ſhould finiſh ſo great a charge, which I had neuer carried out,but that by Gods ſtirring vp of the renowned Emperour *Ferdinando* of famous memorie, and the excellent Princes had not helped mee with great ſums of money,ſo that the common wealth may ſay, That this bleſſing doth rather proceed of them than from me. There haue beene alſo other Princes of Almain,which haue been liberal in the preferring of this Book,and the moſt excellent Elector of the Empire the Duke of *Saxony*,which ſent me by his Poſt much mony toward my charges: the liberalitie of the which, & their magnificence toward me I cannot commend ſufficiently. They which followed in their liberalitie were the excellent *Fredericke* Count Palatine of the Rhine, and the excellent *Ioachim* Marques of Brandeburg, which much ſupplied my wants: and the like did the reuerend Cardinall and Prince of Trent, and the Excellent Archbiſhop of Saltzperg,the Excellent Dukes of Bauare and Cleues,the duke of Megapolencis, Prince of Vandalis, the State Republique of Noremberg, the liberalitie of whom ought to be celebrated for euer: and it doth much reioyce me that I had the help and reward of Emperors,Kings,Electors of the Roman Empire, Archdukes, Cardinalls,Biſhops, Dukes and Princes, for it giveth more credit to our Labors that any thing that can be ſaid. Thus far *Matthiolus* his owne writing of the liberalitie of Princes towards him. What age do we liue in here that wil ſuffer all vertue to go vnrewarded? Maſter *Gerrard* hath taken more pains than euer *Matthiolus* did in his Commentaries, and hath corrected a number of faults that he paſſed ouer; and I dare affirme (in reuerence be it ſpoken to that Excellent man) that Maſter *Gerrard* doth know a great number of Simples that were not knowne in his time: and yet I doubt whether he ſhall taſte of the liberalitie of either Prince, Duke, Earle, Biſhop, or publique Eſtate Let a man excell neuer ſo much in any excellent knowledge, neuertheles many times he is not ſo much regarded as a Ieſter,a Boaſter,a Quackſaluer or Mountebanke: for ſuch kinde of men can flatter, diſſemble, make of trifles great matters, in praiſing of this rare ſecret,or that excellent ſpirit,or this Elixer or Quinteſſence; which when it ſhall come to the triall, nothing ſhall be found but boaſting words.

VALE.

To the courteous and well willing Readers.

ALthough my paines hau not beene ſpent (courteous Reader) in the gracious diſcouerie of golden Mines, nor in the tracing after ſiluer veines, whereby my natiue country might be inriched with ſuch merchandiſe as it hath moſt in requeſt and admiration; yet hath my labour (I truſt) been otherwiſe profitably imploied, in deſcrying of ſuch a harmeleſſe treaſure of herbes, trees, and plants, as the earth frankely without violence offereth vnto our moſt neceſſary vſes. Harmeleſſe I call them, becauſe they were ſuch delights as man in the perfecteſt ſtate of his innocencie did erſt inioy: and treaſure I may well terme them ſeeing both Kings and Princes haue eſteemed them as Iewels; ſith wiſe men haue made their whole life as a pilgrimage to attaine to the knowledge of them: by the which they haue gained the hearts of all, and opened the mouthes of many, in commendation of thoſe rare vertues which are contained in theſe terreſtriall creatures. I confeſſe blind Pluto *is now adaies more ſought after than quicke ſighted* Phœbus: *aud yet this duſty mettall, or excrement of the earth (which was firſt deepely buried leaſt it ſhould be an eie-ſore to grieue the corrupt heart of man) by forcible entry made into the bowels of the earth, is rather ſnatched at of man to his owne deſtruction, than directly ſent of God to the comfort of this life. And yet behold in the compaſsing of this wordly droſſe, what care, what coſt, what aduentures, what myſticall proofes, and chymicall trials are ſet abroach; when as notwithſtanding the chiefeſt end is but vncertaine wealth. Contrariwiſe, in the expert knowledge of herbes, what pleaſure ſtill renewed with variety? what ſmall expence? what ſecurity? and yet what an apt and ordinary meanes to conduct man to that moſt deſired benefit of health? which as I deuoutly wiſh vnto my natiue countrey, and to the carfull nurſing mother of the ſame; ſo hauing bent my labours to the benefit of ſuch as are ſtudiouſly practiſed in the conſeruation thereof, I thought it a chiefe point of my dutie, thus out of my poore ſtore to offer vp theſe my far fetched experiments, together with mine owne countries vnknowne treaſure, combined in this compendious Herball (not vnprofitable though vnpoliſhed) vnto your wiſe conſtructions and courteous conſiderations. The drift whereof is a ready introductton to that excellent art of Simpling, which is neither ſo baſe nor contemptible as perhaps the Engliſh name may ſeeme to intimate: but ſuch it is, as altogether hath beene a ſtudy for the wiſeſt, an exerciſe for the nobleſt, a paſtime for the beſt. From whence there ſpring floures not onely to adorne the garlands of the Muſes, to decke the boſomes of the beautifull, to paint the gardens of the curious, to garniſh the glorious crownes of Kings; but alſo ſuch fruit as learned* Dioſcorides *long trauelled for; and princely* Mithridates *reſerued as precious in his owne cloſet:* Mithridates *I meane, better knowne by his ſoueraigne Mithridate, than by his ſometime ſpeaking two and twenty languages. But what this famous Prince did by tradition,* Euax *king of the Arabians did deliuer in a diſcourſe written of the vertues of herbes, and dedicated it vuto the Emperor* Nero. *Euery greene Herbariſt can make mention of the herbe* Lyſimachia, *whoſe vertues were found out by King* Lyſimachus, *and his vertues no leſſe eterniſed in the ſelfe ſame plant, than the name of* Phydias, *queintly beaten into the ſhields of* Pallas, *or the firſt letters of* Ajax *or* Hyacinthus *(whether you pleaſe) regiſtred in that beloued floure of* Apollo. *As for* Artemiſia, *firſt called* Παρθένις, *whether the title thereof ſprang firm* Ἄρτεμις, Diana *her ſelfe, or from the renowned Queene of Caria, which diſcloſed the vſe thereof vnto poſterity, it ſuruiueth as a monnment to reuiue the memories of them both for euer. What ſhould we ſpeake of* Gentiana, *bearing ſtill the cogniſance of* Gentius? *or of diuers other herbes taking their denominations of their princely innertors? What ſhould I ſay of thoſe royall perſonages,* Iuba, Attalus, Climenus, Achilles, Cyrus, Maſyniſſa, Semyramis, Diocleſian? *but onely thus, to ſpeake their Princely loues to Herbariſme, and their euerlaſting honors (which neither old* Plinius *dead, nor yong* Lipſius *liuing will permit to diei?)* Creſcent herbæ, creſcetis amores: creſcent herbæ, creſcetis honores. *But had this wonted faculty wanted the authoriſement of ſuch a royall company, King* Solomon, *excelling all the reſt for wiſdome, of greater royalty than they all (though the Lillies of the field out-braued him) he onely (I ſay) mighi yeeld hereunto ſufficient countenance and commendation, in that his lofty wiſedome thought no ſcorne to ſtoupe vnto the lowly plants. I liſt not ſeek the* common colours of antiquitie, when notwithſtanding the world can brag of no more antient Monument than Paradiſe and the garden of Eden; and the Fruits of the earth may contend for ſeniority, ſeeing their Mother was the firſt Creature that conceiued, and they themſelues the firſt fruit ſhe brought forth. Talke of perfect happineſſe or pleaſure, and what place was ſo fit for that as the garden place wherein Adam was ſet to be the Herbariſt? Whither did the Poets hunt for their ſincere delights, but into the gardens of Alcinous, of Adonis, and the Orchards of the Heſperides? Where did they dreame that heauen ſhould be, but in the pleaſant garden of Elyſium? Whither doe all men walke for their honeſt recreation, but thither where the earth hath moſt beneficially painted her face with flouriſhing colours? And what ſeaſon of the yeare more longed for than the Spring, whoſe gentle breath inticeth forth the kindly ſweets, and makes them yeeld their fragrant ſmells? Who would therefore looke dangerouſly up at Planets, that might ſafely looke downe at Plants? And if true bee the prouerb, Quæ ſupra nos, nihil ad nos; I ſuppoſe this new ſaying cannot be falſe, Quæ infra nos, ea maximè ad nos. Eaſie therefore is this treaſure to be gained, and yet pretious. The ſcience is nobly ſupported by wiſe and kingly Fauorits: the ſubiect thereof ſo neceſſarie and delectable, that nothing can be confected, either delicate for the taſte, dainty for ſmell, pleaſant for ſight, wholſome for body, conſeruatiue or reſtoratiue for health, but it borroweth the rellish of an herb, the ſauor of a flour, the colour of a leafe, the juice of a plant, or the decoction of a root. And ſuch is the treaſure that this my Treatiſe is furniſhed withall; wherein though myne art be not able to counteruaile Nature in her liuely portraitures, yet haue I counterfeited likeneſſe for life, ſhapes and ſhadowes for ſubſtance, being ready with the bad Painter to explaine the imperfections of my penſill with my pen, chuſing rather to ſcore vpon my pictures ſuch rude marks as may deſcribe my meaning, than to let the beholder to gueſſe at random and miſſe. I haue here therefore ſet downe not only the names of ſundry Plants, but alſo their natures, their proportions and properties, their affects and effects, their increaſe and decreaſe, their flouriſhing and fading, their diſtinct varieties and ſeuerall qualities, as well of thoſe which our owne country yeeldeth, as of others which I haue fetched further, or drawn out by peruſing diuers Herbals ſet forth in other languages: wherein none of my countrymen haue to my knowledge taken any paines, ſince that excellent Worke of Maſter Doctor Turner. After which time Maſter Lyte a worſhipfull Gentleman tranſlated Dodonæus out of French into Engliſh; and ſince that, Doctor Prieſt one of our London Colledge hath (as I heard) tranſlated the laſt edition of Dodonæus, and meant to publiſh the ſame; but being preuented by death, his tranſlation likewiſe periſhed. Laſtly my ſelfe, one of the leaſt among many, haue preſumed to ſet forth vnto the view of the World, the firſt fruits of theſe myne owne Labours, which if they be ſuch as may content the Reader, I ſhall thinke my ſelfe well rewarded; otherwiſe there is no man to be blamed but my ſelfe, being a Worke I confeſſe for greater Clerks to vndertake: yet may my blunt attempt ſerue as a whetſtone to ſet an edge vpon ſharper wits, by whom I wiſh this my courſe: Diſcourſe might be both fined and refined. Faults I confeſſe haue eſcaped, ſome by the Printers overſight, ſome through defects in my ſelfe to perform ſo great a work, and ſome by means of the greatneſſe of the Labour, and that I was conſtrained to ſeeke after my liuing, being void of friends to beare ſome part of the burthen. The rather therefore accept this at my hands (louing Country-men) as a token of my goodwill, and I truſt that the beſt and well minded will not raſhly condemne me, although ſomething haue paſſed worthy reprehenſion. But as for the ſlanderer or Envious I paſſe not for them, but return vpon themſelues any thing they ſhall without cauſe either murmure in corners, or iangle in ſecret. Farewell.

From my Houſe in Holborn, within the Suburbs
of London, this firſt of December, 1597.

Thy ſincere and vnfeigned Friend,

IOHN GERARD.

TO THE READER.

Courteous READER,

THere are many things which I thinke needfull to impart vnto thee, both concerning the knowledge of Plants in generall, as alſo for the better explaining of ſome things pertinent to this preſent Hiſtorie, which I haue here ſet forth much amended and inlarged. For the general differences, affections, &c. of Plants, I hold it not now ſo fitting nor neceſſary for me to inſiſt vpon them; neither do I intend in any large diſcourſe to ſet forth their many and great vſes and vertues: giue me leaue onely to tell you, That God of his infinite goodneſſe and bounty hath by the *medium* of Plants, beſtowed almoſt all food, clothing, and medicine vpon man. And to this off-ſpring we alſo owe (for the moſt part) our houſes, ſhipping, and infinite other things, though ſome of them *Proteus*-like haue run through diuers ſhapes, as this paper whereon I write, that firſt from ſeed became Flaxe; then after much vexation thread, then cloath, where it was cut and mangled to ſerue the faſhions of the time, but afterward reiected and caſt aſide; yet vnwilling ſo to forſake the ſeruice of man for which God had created it, again it comes (as I may terme it) to the hammer, from whence it takes a more noble form and aptitude to be imployed to ſacred, ciuill, forrein, and domeſticke vſes. I will not ſpeake of the many and various obiects of delight that theſe preſent to the ſences, nor of ſundry other things which I could plentifully in this kinde deliuer; but rather acquaint you from what Fountaines this Knowledge may be drawne, by ſhewing what Authours haue deliuered to vs the Hiſtorie of Plants, and after what manner they haue done it. And this will be a meanes that many controuerſies may be the more eaſily vnderſtood by the leſſe learned and juditious Reader.

Solomon. He whoſe name we firſt find vpon record (though doubtleſſe ſome had treated thereof before) that largely writ of Plants, was the wiſeſt of men, euen King *Solomon*, who certainly would not haue medled with this ſubiect, if he in his wiſedome had not known it worthy himſelfe, and exceeding fitting: Firſt, for the honour of his Creator, whoſe gifts and bleſſings theſe are: Secondly, for the good of his Subiects, whereof without doubt he in this Work had a ſpeciall regard, for the curing of their diſeaſes and infirmities. But this kingly Worke being loſt, I will not inſiſt vpon it, but come to ſuch as are yet extant, of which (following the courſe of antiquity) that of *Theophraſtus* firſt takes place.

Theophraſtus. Now *Theophraſtus* ſucceeded *Ariſtotle* in the gouernment of the Schoole at Athens, about the 114 Olymp. which was ſome 322 yeares before Chriſt. He among many other things writ a Hiſtorie of Plants in ten bookes, and of the cauſes of them, eight bookes; of the former ten there are nine come to our hands reaſonable perfect; but there now remain but ſix of the eight of the cauſes of Plants. Some looking vpon the Catalogue of the bookes of *Theophraſtus* his writing, ſet forth in his life, written by *Diogenes Laertius*, may wonder that they finde no mention of theſe bookes of Plants, amongſt theſe he reckons vp, and indeed I thought it ſomewhat ſtrange, and ſo much the more, becauſe this his life
Lugd. Batau. 1613. is ſet forth by *Daniel Heinſius*, before his edition * of *Theophraſtus*, and there alſo no mention neither in the Greeke nor Latine of thoſe Workes. Conſidering this, I thinking to haue ſaid ſomething thereof, I found the doubt was long ſince cleared by the learned
Excuſ. ab Henr. Steph. 1593. *Cauſabone* in his notes vpon " *Laertius*, where *pag*. 331, for Περὶ φυτικῶν ἱστορίας and φυτικῶν αἰτιῶν, hee wiſhes you to reade Περὶ φυτικῶν ἱστοριῶν and αἰτιῶν. Thus being certaine of the Authour, let mee ſay ſomwhat of the Worke, which though by the iniury of time it hath ſuffered much, yet is it one of the chiefe pieces of Antiquitie, from whence the knowledge of plants is

to be drawn. *Theophraſtus* as he followed *Ariſtotle* in the Schoole, ſo alſo in his manner of writing; for according as *Ariſtotle* hath deliuered his *Hiſtoria Animalium*, ſo hath he ſet forth this of Plants, not by writing of each *ſpecies* in particular, but of *their differences and nature, by their parts, affections, generations, and life.* Which how hard a thing it was he tells you in his ſecond chapter, and renders you this reaſon, *Becauſe there is nothing common to all Plants, as the mouth and belly is to other liuing creatures, &c.* Now by this manner of writing you may learne the generall differences and affections of Plants, but cannot come to the particular knowledge of any, without much labor; for you muſt go to many places to gather vp the deſcription of one plant: neither doth he (nor is it neceſſarie for any writing in this manner) make mention of any great number, and of many it may be but once. His Works being in Greeke were tranſlated into Latine by *Theodore Gaza*, who did them but *Græca fide*, for he omitted ſome things, otherwhiles rendred them contrarie to the minde of the Author; but aboue all, he took to himſelfe too much libertie in giuing of names, in imitation of the Greeke, or of his own inuention, when it had been better by much for his Reader to haue had them in the Greeke; as when hee renders Ἐλατήριον, *Agitatorium*; Ἡλιοτρόπιον, *Solaris, &c.* The learned *Iulius Scaliger* hath ſet forth *Animadverſiones* vpon theſe Books, wherein he hath both much explained the minde of *Theophraſtus*, and ſhewed the errors of *Gaza*. Some ſince his time haue promiſed to do ſomething to this Authour, as *Daniel Heïnſius* and *Spigelius*; but twenty yeares are paſt ſince, and I haue not yet heard of any thing done in this kinde by either of them. Thus much for *Theophraſtus*.

Theoph. Hiſt. pl. l. 1. cap. 1.

Σημεῖον δὲ τὸ μηδὲν ἔχειν κοινὸν λαβεῖν ὃ πᾶσιν ὑπάρχει, &c.

Let me not paſſe ouer *Ariſtotle* in ſilence, though his bookes writ of this ſubiect were but two, and theſe according to the conjecture of *Iulius Scaliger* (who hath made a large and curious examination of them, haue either periſhed, or come to vs not as they were originally written by *Ariſtotle*, but as they haue been by ſome later man put into Greeke. Amongſt other things *Scaliger* hath theſe concerning thoſe two bookes; *Reor è textrina Theophraſti detracta fila quædam, iiſq; clavos additos, tametſi neque aureos, neque purpureos. Quod ſi protinus autorem tibi dari vis ad Arabum diligentiam propius accedit.* And afterwards thus; *Attribuere viri docti, alius alij, at quidem qui aliorum viderem nihil Planudem autorem facienti malim aſſentiri; extant enim illius alijs in libris ſimilis veſtigia ſemilatinietatis, &c.* Thus much for *Ariſt.* whom as you ſee I haue placed after his Scholler, becauſe there is ſuch doubt of theſe bookes caried about in his name, and for that *Scaliger*, as you ſee, thinks them rather taken out of *Theophraſtus*, than written by his Maſter.

Ariſtotle.

The next that orderly followes is *Pedacius Dioſcorides Anazarbeus*, who liued (according to *Suidas*) in the time of *Cleopatra*, which was ſome few yeares before the birth of our Sauior. Now *Suidas* hath confounded * *Dioſcorides Anazarbeus* with *Dioſcorides Phacas*; but by ſome places in *Galen* you may ſee they were different men: for our Anazarbean *Dioſcorides* was of the Emperick Sect, but the other was a follower of *Herophylus* and of the Rational Sect. He writ not only of Plants, but *de tota materia medica*; to which ſtudy he was addicted euen from his childehood, which made him trauell much ground, and leade a military life, the better to accompliſh his ends: and in this hee attained to that perfection, that few or none ſince his time hane attained to. Of the exellencie of his work, which is as it were the foundation and ground-worke of all that hath bin ſince deliuered in this kinde, heare what *Galen*, one of the excellenteſt of Phyſitians, and one who ſpent no ſmal time in this ſtudy, affirmes: *But* (ſaith he) *the Anazarbean* Dioſcorides *in fiue bookes hath written of the neceſſary matter of Medicine, not onely making mention of Herbes, but alſo of Trees, Fruits,* * *Liquors and Iuyces, as alſo of all Minerals, and of the parts of liuing Creatures: and in myne opinion he hath with the greateſt perfection performed this worke of the matter of Medicine; for although many before him haue written well vpon this Subiect, yet none haue writ ſo well of all.* Now *Dioſcorides* follows not the method of *Theoph.* but treats of each herb in particular, firſt giuing the Names, then the deſcription, and then the place where they vſually grow, and laſtly their vertues. Yet of ſome, which as then were as frequently known with them as Sage, Roſemary, an Aſh or oke tree are with vs, he hath omitted the deſcriptions as vnneceſſarie, as indeed at that time when they were ſo vulgarly known they might ſeeme ſo to bee, but now wee know the leaſt of theſe, and haue no certaintie, but ſome probable coniectures to direct vs to the knowledge of them. He was not curious about his words nor method, but plainly and truly deliuered that whereof he had certaine and experimentall knowledge, concerning the deſcripion and nature of Plants. But the generall method he obſerued you may finde ſet forth by *Bauhine*, in his edition of *Matthiolus*, immediatly after the Preface of the firſt booke; whereto I refer the Curious, being too long for me in this place to inſiſt vpon. His Works that are come to vs are fiue Books *de materia Medica*. One *De letalibus venenis, eorumq; præcautione & curatione*. Another, *De Cane*

Dioſcorides.

Διοσκορίδης Ἀναζαρβεὺς ἰατρὸς ὁ ἐπικληθεὶς φακᾶς &c. *Suid.*

De ſimpl. med. facult. lib. 6. proem.

χυμῶν ϗ ὀπῶν

rabido, deq; notis quæ morſus ictuſve animalium venenum relinquentium ſequuntur. A third, *De eorum curatione.* Theſe eight books within theſe two laſt centuries of years haue bin tranſlated out of Greeke into Latine, and commented vpon by diuers, as *Hermolaus Barbarus, Iohannes Ruellius, Marcellus Virgilius,&c.* But of theſe and the reſt, as they offer themſelues, I ſhall ſay ſomewhat hereafter. There is alſo another Worke which goes vnder his name, and may well be his. It is *περὶ εὐπορίστων, ſive de facile parabilibus,* diuided into two books, tranſlated and confirmed with the conſent of other Greeke Phyſitions, by the great labor of *Iohn Moibane* a Phyſition of Auſpurge, who liued not to finiſh it, but left it to be perfected and ſet forth by *Conrade Geſner.*

Pliny. The next that takes place is the laborious *Caius Plinius ſecundus,* who liued in the time of *Veſpaſian,* and was ſuffocated by the ſulphurious vapours that came from mount Veſuvius, falling at that time on fire; he through ouermuch curioſitie to ſee and finde out the cauſe thereof, approching too nigh, and this was *Anno Dom. 79.* He read and writ exceeding much, though by the injury of time we haue no more of his than 37 books, *De hiſtoria Mundi,* which alſo haue receiued ſuch wounds, as haue tried the beſt skill of our Criticks, and yet in my opinion in ſome places require *Medicas manus.* From the twelfth to the end of the twenty ſeuenth of theſe books he treats of plants, more from what he found written in other Authors, than from any certain knowledge of his owne, in many places following the method and giuing the words of *Theophraſtus,* and in other places thoſe of *Dioſcorides,* though he neuer make mention of the later of them: he alſo mentions and no queſtion followed many other Authors, whoſe writings are long ſince periſhed. Sometimes he is pretty large, and otherwhiles ſo briefe, that ſcarce any thing can from thence be gathered. From the ſeuenteenth vnto the twenty ſeuenth he variouſly handles them; what method you may quickly ſee by his *Elenchus* contained in his firſt booke, but in the twenty ſeuenth he handles thoſe whereof he had made no, or not ſufficient mention, after an alphabeticall order, beginning with *Æthiopis, Ageratum, Aloe,&c.* ſo going on to the reſt.

Galen. Paulus. Aetius. I muſt not paſſe ouer in ſilence, neither need I long inſiſt vpon *Galen, Paulus Ægineta,* and *Aetius,* for they haue only alphabetically named Plants and other ſimple medicines, briefly mentioning their temperature and faculties, without deſcriptions (ſome very few, and thoſe briefe ones excepted) and other things pertinent to their hiſtorie.

Macer. The next that preſent themſelues are two counterfeits, who abuſe the world vnder feined titles, and their names haue much more antiquitie than the works themſelues. The firſt goes vnder the title of *Æmilius Macer* a famous Poet, of whom *Ovid* makes mention in theſe verſes:

Sæpe ſuas volucres legit mihi grandior ævo,
Quæq; nocet Serpens, quæ juvat herba Macer.

Pliny alſo makes mention of this *Macer.* He in his Poems imitated *Nicander*; but this Worke that now is caried about vnder his name, is written in a rude and ſomwhat barbarous verſe, far different from the ſtile of thoſe times wherein *Macer* liued, and no way in the ſubiect imitating *Nicander.* It ſeemes to haue been written about 400 or 500 yeares agoe.

Apuleius. The other alſo is an vnknowne Author, to whom the Printers haue giuen the title of *Apuleius Madaurenſis,* and ſome haue beene ſo abſurdly bold of late, as to put it vnto the Works of *Apuleius*: yet the vncurious ſtile and method of the whole Worke will conuince them of error, if there were no other argument. I haue ſeen ſome foure Manuſcripts of this Author, and heard of a fifth, and all of them ſeem to be of good antiquitie: the Figures of them all for the moſt part haue ſome reſemblance each of other. The firſt of theſe I ſaw ſome nine yeares agoe, with that worthy louer and ſtorer of Antiquitie, Sr *Robert Cotton*; it was in a faire Saxon hand, and as I remember in the Saxon tongue, but what title it carried I at that time was not curious to obſerue. I ſaw alſo another after that, which ſeemed to be of no ſmall ſtanding, but careleſly obſerued not the title. But ſince I being informed by my friend Mr *Goodyer* (as you may finde in the chapter of Saxifrage of the Antients) that his Manuſcript, which was very antient, acknowledged no ſuch Author as *Apuleius,* I begun a little to examine ſome other Manuſcripts; ſo I procured a very faire one of my much honored friend Sr *Theod. Mayern*: In the very beginning of this is writ, *In hoc continentur libri quatuor medicinæ Ypocratis, Platonis Apolienſis vrbis de diverſis Herbis; Sexti Papiri placiti ex Animalibus,&c.* A little after in the ſame page at the beginning of a table which is of the Vertues, are theſe words; *In primo libro ſunt herbæ deſcriptæ,* *quas Apolienſis Plato deſcripſit,&c.* and thus alſo he is named in the title of the Epiſtle or Proem; but the end of the work is *Explicit liber Platonis de herbis maſculinis,&c.* With this in all things agrees that of Mr *Goodyer*, as he hath affirmed to me. Beſides theſe, I found one with Mr *Iohn Tradeſcant*, which was written in a more ignorant and barbarous time, as one may cojecture by the title, which is thus at the very beginning; *In nomine domini incipit herboralium Apulei Platonis quod accepit à Scolapio,& Chirone Centauro magiſtro.* Then followes (as alſo in the former and in the printed bookes) the tractat aſcribed to *Antonius Muſa, de herba Betonica.* After that are theſe words, *Liber medicinæ Platonis herbaticus explicit.* By this it ſeems the Author of this Worke either was named, or elſe called himſelf *Plato*, a thing not without example in theſe times. This worke was firſt printed at Baſil, 1528; amongſt ſome other works of phyſicke, and one *Albanus Torinus* ſet it forth by the helpe of many Manuſcripts, of whoſe imperfections he much complains, and I think not without cauſe. After this, *Gabriel Humelbergius* of Rauenſpurge in Germany ſet it forth with a Comment vpon it, who alſo complaines of the imperfections of his copies, and thinkes the Worke not perfect. Indeed both the editions are faulty in many places; and by the help of theſe Manuſcripts I haue ſeene they might be mended (if any thought it worth their labour) in ſome things, as I obſerued in curſorily looking ouer them. One thing I much maruell at, which is, That I finde not this Author mentioned in any Writer of the middle times, as *Platearius, Bartholomæus Anglus,&c.* Now I conjecture this Worke was originally written in Greeke, for theſe reaſons; firſt, becauſe it hath the Greeke names in ſuch plenty, and many of them proper, ſignificant, and in the firſt place. Secondly, ſome are only named in Greek, as *Hierobulbon, Artemiſia Leptophyllos*, and *Artemiſia tagantes, Batrachion, Gryas*, (which I iudge rather Greeke than Latine) &c. Beſides, in both the written books in very many places amongſt the names I finde this word *Omòes*, but diuerſly written; for I conjecture the Greeke names were written in the Greeke character, and ὁμοίως amongſt them: and then alſo when the reſt of the Worke was tranſlated, which afterwards made the tranſcribers who vnderſtood it not to write it variouſly, for in the one book it is alwaies written *Amoeos*, and in the other, *Omoeos*, and ſometimes *Omeos*, as in the chapter of *Brittanica*, the one hath it thus, *Nomen herbæ iſtius Britanica, Amoeos dicunt eum Damaſinium, &c.* The other thus, *Nomen herbæ Brittanica, Omeos Damaſinius,&c.* And in the chapter of *Althæa* the one hath it thus, *Nomen hujus herbæ Altea Amoeos vocant hanc herbam Moloche,&c.* The other, *Nomen herbæ Ibiſcus Omoeos Moloche,&c.* If it be certain which *Philip Ferrarius* affirmes in his *Lexicon Geographicum*, That the City Apoley is Conſtantinople, then haue I found *Apolienſis vrbs*, of which I can find no mention in any antient or modern Geographer beſides; and then it is more than probable that this was written in Greeke, and it may bee thought differently tranſlated, which occaſions ſuch diuerſitie in the Copies, as you ſhall finde in ſome places. Now I conjecture this Worke was written about ſome 600 yeares ago.

From the Antients haue ſprung all or the greateſt part of the knowledge that the middle or later times haue had of Plants; and all the controuerſies that of late time haue ſo ſtuffed the books of ſuch as haue writ of this ſubiect, had their beginning by reaſon that the careleſnes of the middle times was ſuch, that they knew little but what they tranſcribed out of theſe Antients, neuer endeauoring to acquire any perfect knowledge of the things themſelues: ſo that when as learning (after a long winter) began to ſpring vp again, men began to be ſomwhat more curious, and by the notes and deſcriptions in theſe antient Authors they haue labored to reſtore this loſt knowledge, making inquirie, firſt, Whether it were knowne by *Theophraſtus, Dioſcorides*, or any of the Antients, then by what name. But to return to my Authors.

The Arabians.

About *An. Dom.* 1100, or a little after liued the Arabians *Avicen, Averrhoes, Meſve, Rhaſis* and *Serapio*; moſt of theſe writ but briefly of this ſubiect, neither haue we their Works in the Arabicke wherein they were written, but barbarouſly tranſlated into Latine, and moſt of theſe works were by them taken out of the Greeks, eſpecially *Dioſcorides* and *Galen*; yet ſo, as they added ſomwhat of their own, and otherwhiles confounded other things with thoſe mentioned by the Greeks, becauſe they did not well know the things whereof they writ. *Avicen, Averrhoes*, and *Rhaſis* alphabetically and briefly (following the method of *Galen*) giue the names, temperature, and vertues of the chiefeſt ſimple medicines. But *Serapio* after a particular Tract of the Temperature and Qualities of ſimple medicines in generall, comes to treat of them in particular, and therein followes chiefly *Dioſcorides, Galen*, and *Paulus*, and diuers Arabians that went before him. This is the chiefe work in this kinde of the Arabians which hath come to vs: he himſelfe tells vs his method in his preface,

Auicen.
Auerrhoes.
Rhaſis.
Serapio.

face,which is (when he comes to particulars) firſt of medicines temperat,then of thoſe that are hot and dry in the firſt degree,then thoſe cold and dry in the ſame degree; after that,thoſe hot and dry in the ſecond degree,&c. and in each of theſe tracts he followeth the order of the Arabick Alphabet.

Iſodore. *Platearius.* *Barthol. Angl.* *Hortus ſanitat.*

In or after the times of the Arabians,vntill about the yere 1400,there were diuers obſcure and barbarous writers,who by ſight knew little whereof they writ,but tooke out of the Greeks,Arabians,and one another, all that they writ, giuing commonly rude figures, ſeldome ſetting down any deſcriptions. I will only name the chiefe of them that I haue ſeen,and as neere as I can gueſſe,in that order that one of them ſucceeded another:for the particular times of their liuing is ſomewhat difficult to be found out. One of the antienteſt of them ſeems to be *Iſidore:* then *Platearius*,whoſe work is alphabetical, and intituled *Circa inſtans*. The next *Matthæus Sylvaticus*,who flouriſhed about the yeare 1319.his work is called *Pandectæ*. A little after him was *Bartholomæus Anglus*, whoſe Works (as that of *Iſodore*,and moſt of the reſt of thoſe times) treat of diuers other things beſides Plants,as Beaſts,Birds,Fiſhes,&c. His worke is called *De proprietatibus rerum:* the Authors name was *Bartholmew Glanvill*,who was deſcended of the noble family of the Earles of Suffolk, and he writ this Work in *Edw*. the thirds time,about *An.Dom.*1397. After all theſe,and much like them,is the *Hortus ſanitatis*,whoſe Author I know not. But to leaue theſe obſcure men and their writings,let me reck'on ſome of later time,who with much more learning and iudgement haue endeauored to illuſtrate this part of Phyſicke.

Hermol. Barb.

About ſome 200 years ago learning again beginning to flouriſh,diuers began to leaue and loath the confuſed and barbarous writings of the middle times,and to haue recourſe to the Antients, from whence together with puritie of Language they might acquire a more certain knowledge of the things treated of,which was wanting in the other. One of the firſt that tooke pains in this kinde was *Hermolaus Barbarus* Patriarch of Aquileia,who not onely tranſlated *Dioſcorides*,but writ a Commentary vpon him in fiue bookes, which he calls his *Corollarium*. In this Work he hath ſhewed himſelfe both iuditious and learned.

Merc.Virg.

After him *Marcellus Virgilius* Secretary to the State of Florence,a man of no leſſe learning and iudgement than the former, ſet forth *Dioſcorides* in Greeke and Latine, with a Comment vpon him.

Iohn Ruellius.

Much about their time alſo *Iohn Ruellius* a French phyſitian,who flouriſhed in the yere 1480,tranſlated *Dioſcorides* into Latine,whoſe tranſlation hath bin the moſt followed of all the reſt. Moreouer,he ſet forth a large Worke,*De natura Stirpium*,diuided into three bookes,wherein he hath accuratly gathered all things out of ſundry Writers, eſpecially the Greeks and Latines: for firſt hauing (after the maner of *Theophraſtus*) deliuered ſome common precepts and aduertiſements pertaining to the forme, life,generation,ordering, and other ſuch accidents of Plants, hee then comes to the particular handling of each *Species*.

Otho Brunfel.

Much about this time the Germanes began to beautifie this ſo neceſſarie part of Phyſicke; and amongſt them *Otho Brunfelſius* a phyſitian of good account, writ of Plants,and was the firſt that gaue the liuely figures of them; but he treated not in all of aboue 288 plants. He commonly obſerues this method in his particular chapters;firſt the figure (yet he giues not the figures of all he writes of) then the Greeke,Latine,and German names; after that,the deſcription and hiſtorie out of moſt former Authors;then the temperature and vertues; and laſtly the Authors names that had treated of them. His Worke is in three parts or Tomes, the firſt was printed in *An.*1530. the ſecond in 1531, and the third in 1536.

Hieron.Tragus.

Next after him was *Hieronymus Tragus*, a learned ingenious and honeſt writer,who ſet forth his works in the German tongue, which were afterwards tranſlated into Latine by *Dauid Kiber*. He treats of moſt of the Plants commonly growing in Germany, and I can obſerue no generall method he keeps,but his particular one is commonly this;he firſt giueth the figure with the Latine &high Dutch name;then commonly a good deſcription; after that,the names,then the temperature,and laſtly the vertues, firſt inwardly,then outwardly vſed. He hath figured ſome 567,and deſcribed ſome 800. his figures are good,and ſo are moſt of the reſt that follow. His works were ſet forth in Latine,*An.*1552.

Leonhar. Fuch.

In his time liued *Leonhartus Fuchſius* a German Phyſitian,being alſo a learned and diligent writer,but he hath taken many of his deſcriptions as alſo vertues word for word out of the Antients,and to them hath put figures:his generall method is after the Greek Alphabet,and his particular one thus: Firſt,the names in Greeke and Latine, together ofttimes with their etymologies, as alſo the German and French names, then the kinds, after that the form, the place, time, temperature, then the vertues; firſt out of the Antients, as *Dioſcorides, Galen, Pliny, &c.* and ſometimes from the late writers, whom he doth not particulariſe, but expreſſes in generall, *ex recentioribus*. His Worke was ſet forth at Baſil, 1542 in *Fol.* containing 516 figures; alſo they were ſet forth in *Octavo*, the hiſtorie firſt, with, al the figures by themſelues together at the end, with the Latine and high Dutch names.

Conrade Geſner.

About this time and a little after flouriſhed *Conrade Geſner*, a Germane phyſitian alſo, who ſet forth diuers things of this nature, but yet liued not to finiſh the great and general Work of plants, which he for many yeres intended, and about which he had taken a great deale of pains, as may be gathered by his Epiſtles. He was a very learned, painfull, honeſt, and iuditious writer, as may appeare by his many & great works, whereof thoſe of Plants was firſt a briefe alphabeticall hiſtory of plants without figures, gathered out of *Dioſcorides, Theophraſtus, Pliny, &c.* with the vertues briefly, and for the moſt part taken out of *Paulus Ægineta*, with their names in Greek and French put in the margent. This was printed at Venice, 1541, in a ſmall form. He ſet forth a catalogue of plants in Latine, Greek, high Dutch and French printed at Zurich, 1542. Alſo another tract *De Lunarijs & noctu lucentibus cum montis fracti, ſive Pilati Lucernatum deſcriptione, Ann.* 1552. in *quarto*. He alſo ſet forth the foure books of *Valerius Cordus* (who died in his time) and his *Sylva obſervationum* in Strausburgh, 1561, in *fol.* and to theſe he added a Catalogue of the Germane gardens, with an appendix and *Corollarium* to *Cordus* his hiſtory. Alſo another treatiſe of his, *de ſtirpium collectione*, was ſet forth at Zurich by *Wolphius, An.* 1587, in *Octavo*.

Leonicerus.

At the ſame time liued *Adam Lonicerus* a phyſitian of Frankford, whoſe natural hiſtory was there printed, *An.* 1551. and the firſt part thereof is of plants, and foure years after he added anothe rpart thereto, treating alſo of plants. I find no general method obſerued by him: but his particular method vſually is this; firſt he giues the figure, then the names in Latine and Dutch, then the temperature, &c. as in *Tragus*, from whom and *Cordus* he borrowes the moſt part of his firſt tome, as he doth the ſecond from *Matth.* & *Amat Luſitanus*.

P. And. Matthiolus.

In his time the Italian phyſitian *Petrus Andreas Matthiolus* ſet forth his Commentaries vpon *Dioſcorides*, firſt in Latine, with 957 large and very faire figures, and then afterwards in Latine at Venice, with the ſame figures, *An.* 1568. After this he ſet forth his epitome in *quarto*, with 921 ſmaller figures. Now theſe his Commentaries are very large, and hee hath in them deliuered the hiſtory of many plants not mentioned by *Dioſcorides*: but he is iuſtly reprehended by ſome, for that he euery where taxes & notes other writers, when he himſelfe runs into many errors, & ſome of them wilfull ones; as when he giues figures framed by his own fancie, as that of *Dracontium majus, Rhabarbarum, &c.* and falſified other ſome in part, the better to make them agree with *Dioſcor.* his deſcription, as when hee pictures *Arbor Iudæ* with prickles, and giues it for the true *Acatia*: and hee oft times giues bare figures without deſcription of his owne, but ſaith it is that deſcribed by *Dioſcorides, Nullis reclamantibus notis*, for which the Authors of the *Adverſaria* much declaim againſt him. It had bin fit for him, or any one that takes ſuch a worke in hand, to haue ſhewed by deſcribing the plant he giues, and conferring it with the deſcription of his Authour, that there is not any one note wanting in the deſcription, vertues, or other particulars which his Author ſets down; and if he can ſhew that his is ſuch, then will the contrary opinions of all others fall of themſelues, and need no confutation.

Amatus Luſitanus.

Amatus Luſitanus alſo about the ſame time ſet forth Commentaries vpon *Dioſcorides*, adding the names in diuers languages, but without figures, at Strausburgh, *Ann.* 1554, in *Quarto*. He diſſented from *Matthiolus* in many things, whereupon *Matthiolus* writ an Apologie againſt him. He hath performed no great matter in his enarrations vpon *Dioſcorides*, but was an author of the honeſty of *Matthiolus*; for as the one deceiued the World with counterfeit figures, ſo the other by feined cures to ſtrengthen his opinion, as *Crato* iudged of his *Curationes Medicinales* (another Worke of his) which he thinkes *potius ficta quam facta*.

Remb. Dodonæ

Rembertus Dodonæus, a Phyſitian born at Mechlin in Brabant, about this time began to write of Plants. Hee firſt ſet forth an hiſtory in Dutch, which by *Cluſius* was turned into French, with ſome additions, *An.* 1560. And this was tranſlated out of French into Engliſh by Mr *Henry Lyte*, and ſet forth with figures, *Ann. Dom.* 1578. and diuers times ſince printed, but without figures. In the yeare 1552, *Dodonæus* ſet forth in Latine his *Frugum hiſtoria*, and within a while after, his *Florum, purgantium, & deleteriorum hiſtoria*. And afterwards he put them all together, his former and thoſe his later Works, and diuided them into 30 books, and ſet them forth with 1305 figures, in *fol. Ann.* 1583. This edition was alſo tranſlated into Engliſh, which became the foundation of this preſent Worke, as I ſhall ſhew hereafter. It hath ſince been printed in Latine, with the addition of ſome few new figures; and of late in Dutch, *Ann.* 1618, with the addition of the ſame figures, and moſt of theſe in the *Exoticks* of *Cluſius*, and great ſtore of orher additions. His generall method is this; firſt he diuides his works into ſix Pemptades or fiues: the firſt Pemptas or fiue books of theſe contain plants in an alphabetical order, yet ſo, as that other plants that haue affinitie with them are comprehended with them, though they fal not into the order of the alphabet. The ſecond Pempt. contains *Flores Coronariæ, Plantæ odoratæ & vmbelliferæ*. The third is *De Radicibus, Purgantibus herbis, convolvulis, deleterijs ac perniciosis plantis, Filicibus, Muſcis, & Fungis.* The fourth is *De Frumentis, Leguminibus, paluſtribus, & aquatilibus*. The fifth, *De Oleribus & Carduis*. The ſixt, *De Fruticibus & Arboribus*. The particular method is the ſame vſed by our Author.

Peter Pena.
Matth. Lobel.

In the yeare 1570, *Peter Pena* and *Matthias Lobel* did here at London ſet forth a Worke intituled *Stirpium Adverſaria nova*; the chief end and intention wherof being to find out the *Materia medica* of the Antients. The generall method is the ſame with that of our Author, which is, putting things together as they haue moſt reſemblance one with another in external forme, beginning with Graſſes, Cornes, &c. They giue few figures, but ſomtimes refer you to *Fuchſius, Dodon.* & *Matthiolus*; but where the figures war not giuen by former Authors, then they commonly giue it; yet moſt of theſe figures are very ſmall and vnperfect, by reaſon (as I conjecture) they were taken from dried plants. In this work they inſiſt little vpon the vertues of plants, but ſuccinctly handle Controuerſies, and giue their opinions of plants, together with their deſcriptions and names, which ſomtimes are in all theſe languages, Greek, Latine, French, high & low Dutch, and Engliſh; otherwhile in but one or two of them. Some writers for this Work call them *Doctiſſimi Angli*; yet neither of them were born here, for *Pena* (as I take it) was a French man, and *Lobel* was born at Ryſſele in Flanders, yet liued moſt part of his later time in this kingdom, and here alſo ended his daies. In the yeare 1576 he ſet forth his Obſeruations, and ioyned them with the *Adverſaria*, by them two to make one entire work: for in his Obſeruations he giues moſt part of the figures and vertues belonging to thoſe herbs formerly deſcribed only in the *Adverſ.* and to theſe alſo addes ſome new ones not mentioned in the former worke. After which he ſet forth an Herbal in Dutch, wherein he comprehended all thoſe plants that were in the two former Works, and added diuers other to them, the Worke containing ſome 2116 figures, which were printed afterward in a longiſh form, with the Latine names, and references to the Latine & Dutch books. After all theſe, at London, *An.* 1605, he again ſet forth the *Adverſaria*, together with the ſecond part thereof, wherein is contained ſome forty figures, being moſt of them of Graſſes and floures, but the deſcriptions were of ſome 100 plants, varieties and all. To this he added a Treatiſe of Balſam, which alſo was ſet forth alone in *quarto, An.* 1598; and the *Pharmacopæa* of *Rondeletius*, with Annotations vpon it. He intended another great Worke, whoſe title ſhould haue bin *Stirpium illuſtrationes*, but was preuented by death.

Carol. Cluſius.

Some ſix yeares after the edition of the *Adverſaria, Anno* 1576, that learned diligent and laborious Herbariſt *Carol. Cluſius* ſet forth his Spaniſh Obſeruations, hauing to this purpoſe trauelled ouer a great part of Spaine; and being afterwards called to the Imperiall Court by *Maximilian* the ſecond, he viewed Auſtria and the adiacent prouinces, and ſet forth his there Obſeruations, *An.* 1583. He alſo tranſlated out of Spaniſh the Works of *Garcias ab Orta* and *Chriſtopher Acoſta*, treating of the ſimple medicines of the Eaſt Indies, and *Nicolas Monardus*, who writ of thoſe of the Weſt Indies. After this he put into one body both his Spaniſh and Pannonick Obſeruations, with ſome other, and thoſe hee comprehends in ſix books, intituled *Rariorum Plantarum Hiſtoria*: whereto he alſo adds an Appendix, a treatiſe of Muſhromes, ſix Epiſtles treating of plants, from *Honorius Bellus* an Italian phyſitian liuing at Cydonia in Candy; as alſo the deſcription of mount Baldus, being a catalogue with the deſcription and figures of ſome rare and not before written of plants there growing, written by *Iohn Pona* an Apothecarie of Verona. (This Deſcription of *Pona's* was afterwards with ſome new deſcriptions and thirty ſix figures ſet forth alone in *quarto, Anno* 1608.) This firſt Volume of *Cluſius* was printed in Antwerpe, *Anno* 1601, in Folio: and in the yeare 1605 he alſo in Folio ſet forth in another volume ſix bookes of *Exotickes* containing various matter, as plants, or ſome particles of them, as Fruits, Woods, Barks, &c. as alſo the forenamed tranſlations of *Garcias, Acoſta*, and *Monardus*: Three Tracts beſides of the ſame *Monardus*; the firſt, *De lapide Bezaar, & Herba Scorſonera*. The ſecond, *De Ferro & eius facultatibus*: The third, *De Niue & eius commodis*.

Honor. Bellus.

Iohn Pona.

To theſe he alſo added *Bellonius* his Obſeruations or Singularities, and a tract of the ſame Author. *De neglecta Stirpium cultura*, both formerly tranſlated out of French into Latine by him. He way borne at Atrebas or Arras, the chiefe city of Artois, *Anno* 1526. and died at Leyden, *Anno* 1609. After his death, by *Euerard Vorſtius*, *Peter Paw*, or ſome others, were ſet forth ſome additions and emendations of his former Works, together with his funerall oration made by *Vorſtius*, his Epitaph, &c. in Quarto, *Anno* 1611. by the name of his *Curæ poſteriores*.

Andr·Cæſalp:

In the yeare 1583 *Andreas Cæſalpinus* an Italian Phyſitian, and Profeſſor at Piſa, ſet forth an hiſtory of Plants, comprehended in ſixteene bookes: his Worke is without figures, and he oft times giues the Tuſcane names for Latine; wherefore his Worke is the more difficult to be vnderſtood, vnleſſe it be by ſuch as haue beene in Tuſcanie, or elſe are already well exerciſed in this ſtudy. He commonly in his owne words diligently for the moſt part deſcribes each Plant, and then makes enquirie whether they were knowne by the Antients. Hee ſeldome ſets downe the faculties, vnleſſe of ſome, to which former Writers haue put downe none. In the firſt booke he treats of Plants in generall, according as *Theophraſtus* doth: but in the following bookes hee handles them in particular: he maketh the chiefe affinity of Plants to conſiſt in the ſimilitude of their ſeeds and ſeed veſſels.

Ioach Camer:

Fr.Calceolarius

Ioh.Thalius:

Ioachimus Camerarius a Phyſition of Noremberg flouriſhed about this time: Hee ſet forth the Epitome of *Matthiolus*, with ſome additions and accurate figures, in Quarto, at Frankfort, 1586. in the end of which Worke (as alſo in that ſet forth by *Matthiolus* himſelfe) is *Iter baldi*, or a journey from Verona to mount Baldus, written by *Francis Calceolarius* an Apothecary of Verona. Another Worke of *Camerarius* was his *Hortus Medicus*, being an Alphabeticall enumeration of Plants, wherein is ſet forth many things concerning the names, ordering, vertues, &c. of Plants. To this he annexed *Hyrcinia Saxonothuringica Iohannis Thalij*, or an alphabeticall Catalogue written by *Iohn Thalius*, of ſuch Plants as grew in Harkwald a part of Germany betweene Saxony and Durengen. This was printed alſo at Frankfort in quarto, *Anno* 1588.

Hiſt.Lugd:

Leon.Rawolf

In the yeare 1587. came forth the great Hiſtory of Plants printed at Lyons, which is therefore vulgarly termed *Hiſtoria Lugdunenſis*: it was begun by *Dalechampius*: but hee dying before the finiſhing thereof, one *Iohn Molinæus* ſet it forth, but put not his name thereto. It was intended to comprehend all that had written before, and ſo it doth, but with a great deale of confuſion, which occaſioned *Bauhine* to write a treatiſe of the errors committed therein, in which hee ſhewes there are about foure hundred figures twice or thrice ouer. The whole number of the figures in this worke are 2686. This Hiſtory is diuided into eighteene bookes, and the Plants in each booke are put together either by the places of their growings, as in Woods, Copſes, mountains, Watery places, &c. or by their externall ſhape, as vmbelliferous, bulbous, &c. or by their qualities, as purging, poyſonous, &c. Herein are many places of *Theophraſtus* and other antient Writers explained. He commonly in each chapter giues the names, place, forme, vertue, as moſt other do. And at the end thereof there is an Appendix containing ſome Indian plants, for the moſt part out of *Acoſta*; as alſo diuers Syrian and Ægiptian plants deſcribed by *Reinold Rawolfe* a Phyſition of Ausburgh.

Tabernamont.

At this time, to wit, *Anno* 1588. *Iacobus Theodorus Tabernamontanus* ſet forth an Hiſtory of Plants in the Germane tongue, and ſome twelue yeares after his Figures being in all 2087. were ſet forth in a long forme, with the Latine and high-Dutch names put vnto them; and with theſe ſame Figures was this Worke of our Author formerly Printed.

Proſp.Alpinus.

Proſper Alpinus a Phyſition of Padua in Italy, in the yeare 1592 ſet forth a Treatiſe of ſome Ægyptian Plants, with large yet not very accurate figures: hee there treats of ſome 46. plants, and at the end thereof is a Dialogue or Treatiſe of Balſam. Some ſix yeares agone, *Anno* 1627. his Son ſet forth two bookes of his Fathers, *De Plantis Exoticis*, with the figures cut in Braſſe: this worke containes ſome 136 Plants.

Fab.Columna.

Fabius Columna a gentleman of Naples, of the houſe of *Columna* at Rome, *Anno* 1592. ſet forth a Treatiſe called *Phytobaſanos*, or an Examination of Plants; for therein he examines and aſſerts ſome plants to be ſuch and ſuch of the Antients: and in the end of this worke he giues alſo the Hiſtory of ſome not formerly deſcribed Plants. Hee alſo ſet forth two other bookes, *De minus cognitis*, or of leſſe knowne Plants: the firſt of which was Printed at Rome, *Anno* 1606; and the other 1616. He in theſe works, which in all containe little aboue two hundred thirty ſix plants, ſhewes himſelfe a man of an exquiſit iudgment, and very learned and diligent, duely examining and weighing each circumſtance in the writings of the Antients.

Caſp. Bauhine.

Caſpar Bauhine, a Phyſition and Profeſſor of Baſil, beſides his Anatomicall Works, ſet forth diuers of Plants. *Anno* 1596 he ſet forth his *Phytopinax*, or Index of Plants, wherein he followes the beſt method that any yet found: for according to *Lobels* method (which our Author followed) he begins with Graſſes, Ruſhes, &c. but then he briefely giues the Etymologie of the name in Greeke and Latine, if any ſuch be, and tells you who of the Antients writ thereof, and in what part of their Works: and laſtly (which I chiefly commend him for) he giues the *Synonima's* or ſeuerall names of each Plant giuen by each late Writer, and quoteth the pages. Now there is nothing more troubles ſuch as newly enter into this ſtudy, than the diuerſitie of names, which ſometimes for the ſame plant are different in each Author; ſome of them not knowing that the plant they mention was formerly written of, name it as a new thing; others knowing it writ of, yet not approuing of the name. In this Worke he went but through ſome halfe of the hiſtory of Plants. After this, *Anno* 1598, he ſet forth *Matthiolus* his Commentaries vpon *Dioſcorides*, adding to them 330 Figures, and the deſcriptions of fifty new ones not formerly deſcribed by any; together with the *Synonima's* of all ſuch as were deſcribed in the Worke. He alſo *Anno* 1613 ſet forth *Tabernamontanus* in Dutch, with ſome addition of hiſtory and figures. In *Anno* 1620 he ſet forth the *Prodromus*, or fore-runner of his *Theatrum Botanicum*, wherein he giues a hundred and forty new figures, and deſcribes ſome ſix hundred plants, the moſt not deſcribed by others. After this, *Anno* 1623, he ſets forth his *Pinax Theatri Botanici*, whoſe method is the ſame with his *Phytopinax*, but the quotatians of the pages in the ſeuerall Authors are omitted. This is indeed the Index and ſumme of his great and generall Worke, which ſhould containe about ſix thouſand plants, and was a Worke of forty yeares: but he is dead ſome nine yeares agone, and yet this his great Worke is not in the Preſſe, that I can heare of.

Baſil Beſler.

Baſil Beſler an Apothecary of Noremberg, *Anno* 1613 ſet forth the garden of the Biſhop of Eyſtet in Bauaria, the figures being very large, and all curiouſly cut in braſſe, and printed vpon the largeſt paper: he onely giues the *Synonima's* and deſcriptions, and diuideth the worke firſt into foure parts, according to the foure ſeaſons of the yeare; and then againe he ſubdiuides them, each into three, ſo that they agree with the moneths, putting in each Claſſis the Plants that flouriſh at that time.

Theſe are the chiefe and greateſt part of thoſe that either in Greeke or Latine (whoſe Works haue come to our hands) haue deliuered to vs the hiſtory of Plants; yet there are ſome who haue vſed great diligence to helpe forward this knowledge, whoſe names I wil not paſſe ouer in ſilence.

Aloyſ. Anguill.

The firſt and antienteſt of theſe was *Aloyſius Anguillara* a Phyſition of Padua, and Preſident of the publique Garden there: his opinions of ſome plants were ſet forth in Italian at Venice, 1561.

Melchior Guillandinus.

Melchior Guillandinus, who ſucceeded *Anguillara* in the garden at Padua, writ an Apologie againſt *Matthiolus*, ſome Epiſtles of Plants, and a Commentary vpon three chapters of *Pliny*, *De Papyro*.

Fer. Imperato.

Ferantes Imperatus an Apothecary of Naples alſo ſet forth a Naturall Hiſtory diuided into twenty eight bookes, printed at Naples *Anno* 1599. In this there is ſomething of Plants: but I haue not yet ſeene the opinions of *Anguillara*, nor this Naturall Hiſtory: yet you ſhall find frequent mention of both theſe in moſt of the forementioned Authors that writ in their time, or ſince, wherefore I could not omit them.

Will. Turner.

Let me now at laſt looke home, and ſee who we haue had that haue taken pains in this kinde. The firſt that I finde worthy of mention is Dr *William Turner*, the firſt of whoſe works that I haue ſeene, was a little booke of the names of herbes, in Greeke, Latine, Engliſh, Dutch, and French, &c. Printed at London *Anno* 1548. In the yeare 1551 he ſet forth his Herbal or Hiſtory of Plants, where he giues the figures of *Fuchſius*, for the moſt part: he giues the Names in Latine, Greeke, Dutch, and French: he did not treat of many Plants; his method was according to the Latine alphabet. He was a man of good iudgment and learning, and well performed wat he tooke in hand.

Hen. Lyte.

After this, *Dodonæus* was tranſlated into Engliſh by Mr *Lyte*, as I formerly mentioned. And ſome yeares after, our Author ſet forth this Worke, whereof I will preſently treat, hauing firſt made mention of a Worke ſet forth betweene that former Edition and this I now preſent you withall.

Ioh. Parkinſon.

Mr *Iohn Parkinſon* an Apothecary of this City (yet liuing and labouring for the common good) in the yeare 1629 ſet for a Worke by the name of *Paradiſus terreſtris*, wherein he giues the figures of all ſuch plants as are preſerued in gardens, for the beautie of their floures, for vſe in meats or ſauces; and alſo an orchard of all trees bearing fruit, and ſuch ſhrubs as for their raritie or beauty are kept in Orchards and gardens, with the ordering, planting and preſeruing of all theſe. In this Worke hee hath not ſuperficially handled theſe things, but accurately deſcended to the very varieties in each ſpecies: wherefore I haue now and then referred my Reader addicted to theſe delights, to this worke eſpecially in floures and fruits, wherein I was loth to ſpend too much time, eſpecially ſeeing I could adde nothing to what he had done vpon that ſubiect before. He alſo there promiſed another Worke, the which I thinke by this time is fit for the Preſſe.

Now am I at length come to this preſent Worke, whereof I know you will expect I ſhould ſay ſomewhat; and I will not fruſtrate your expectation, but labour to ſatisfie you in all I may, beginning with the Author, then his Worke, what it was, and laſtly, what it now is.

For the Author M^r *Iohn Gerard* I can ſay little, but what you alſo may gather out of this Worke; which is, he was borne in the yeare 1545. in Cheſhire, at Namptwich, from whence he came to this City, and betooke himſelfe to Surgery, wherein his endeauours were ſuch, as he therein attained to be a Maſter of that worthy Profeſſion: he liued ſome ten yeares after the publiſhing of this worke, and died about the yeare 1607. His chiefe commendations is, that he out of a propenſe good will to the publique aduancement of this knowledge, endeauoured to performe therein more then he could well accompliſh; which was partly through want of ſufficient learning, as (beſides that which he himſelfe ſaith of himſelfe in the chapter of Water Docke) may be gathered by the tranſlating of diuers places out of the *Aduerſaria*; as this for one in the deſcription of * *Aſter Atticus*, *Caules pedales terni aut quaterni*: which is rendred, A ſtalke foure or fiue foot long. He alſo by the ſame defect called burnt Barley, * *Hordeum diſtichon*; and diuided the titles of honour from the name of the perſon whereto they did belong, making two names therof, beginning one clauſe with * *Iulius Alexandrinus* ſaith, &c. and the next with, *Cæſarius Archiater* ſaith. He alſo was very little conuerſant in the writings of the Antients, neither, as it may ſeeme by diuers paſſages, could hee well diſtinguiſh betweene the antient and moderne writers: for he in one place ſaith, [* Neither by *Dioſcorides*, *Fuchſius*, or any other antient writer once remembred.] Diuers ſuch there are, which I had rather paſſe ouer in ſilence, than here ſet downe: neither ſhould I willingly haue touched hereon, but that I haue met with ſome that haue too much admired him, as the only learned and iudicious writer. But let none blame him for theſe defects, ſeeing he was neither wanting in pains nor good will, to performe what hee intended; and there are none ſo ſimple but know, that heauie burthens are with moſt paines vndergone by the weakeſt men: and although there were many faults in the worke, yet iudge well of the Author; for as a late Writer well ſaith, *Falli & hallucinari humanum eſt; ſolitudinem quærat oportet, qui vult cum perfectis viuere. Penſanda vitijs bona cuiuſque ſunt, & qua maior pars ingenij ſtetit, ea iudicandum de homine eſt.*

Iohn Gerard.

See the former Edition in the places here mentioned.

p. 518.

Cun. li. 3 *ca.* 3. *de Rep Heb.*

Now let me acquaint you how this Worke was made vp. *Dodonæus* his Pemptades comming forth *Anno* 1583, were ſhortly after tranſlated into Engliſh by D^r *Prieſt* a Phyſition of London, who died either immediately before or after the finiſhing of this tranſlation. This I had firſt by the relation of one who knew D^r *Prieſt* and M^r *Gerard*: and it is apparant by the worke it ſelfe, which you ſhall finde to containe the Pemptades of *Dodonæus* tranſlated, ſo that diuers chapters haue ſcarce a word more or leſſe than what is in him. But I cannot commend my Author for endeauouring to hide this thing from vs, cauilling (though commonly vniuſtly) with *Dodonæus*, whereſoeuer he names him, making it a thing of heare-ſay, * that D^r *Prieſt* tranſlated *Dodonæus*: when in the Epiſtle of his friend M^r *Bredwell*, prefixed before this Worke, are theſe words: [The firſt gatherers out of the Antients, and augmenters by their owne paines, haue already ſpread the odour of their good names through all the lands of learned habitations: D^r *Prieſt* for tranſlating ſo much as *Dodonæus*, hath hereby left a tombe for his honourable ſepulture. M^r *Gerard* comming laſt, but not the leaſt, hath many waies accomodated the whole Worke vnto our Engliſh Nation, &c.] But that which may ſerue to cleare all doubts, if any can be in a thing ſo manifeſt, is a place in *Lobels* Annotations vpon *Rondeletius* his *Pharmacopeia*, where *pag.* 59. he findes fault with *Dodonæus*, for vſing barbarouſly the word *Seta* for *Sericum*: and with D^r *Prieſt*, who (ſaith he) at the charges of M^r *Norton* tranſlated *Dodonæus*, and deceiued by this word *Seta*, committed an abſurd errour in tranſlating it a briſtle, when as it ſhould haue beene, ſilke. This place ſo tranſlated is to be ſeen in the chapter of the Skarlet Oke, at the letter F. And *Lobel* well knew that it was D^r *Prieſt* that committed this error, and therefore blames not M^r *Gerard*, to whom hee made ſhew of friendſhip, and who was yet liuing: but yet hee couertly gaue vs to vnderſtand, that the worke wherein that error was committed, was a tranſlation of *Dodonæus* and that made by

See his Epiſtle to the Reader.

Dr *Prieſt*; and ſet forth by Mr *Norton*. Now this tranſlation became the ground-worke whereupon Mr *Gerard* built vp this Worke: but that it might not appeare a tranſlation, he changes the generall method of *Dodonæus*, into that of *Lobel*, and therein almoſt all ouer followes his *Icones* both in method and names, as you may plainly ſee in the Graſſes and *Orchides*. To this tranſlation he alſo added ſome plants out of *Cluſius*, and otherſome out of the *Aduerſaria*, and ſome fourteene of his owne not before mentioned. Now to this hiſtory figures were wanting, which alſo Mr *Norton* procured from Frankfort, being the ſame wherewith the Works of *Tabernamontanus* were printed in Dutch: but this fell croſſe for my Author, who (as it ſeemes) hauing no great iudgment in them, frequently put one for another: and beſides there were many plants in thoſe Authors which hee followed, which were not in *Tabornamontanus*, and diuers in him which they wanted, yet he put them altogether, and one for another; and oft times by this meanes ſo confounded all, that none could poſſibly haue ſet them right, vnleſſe they knew this occaſion of theſe errors. By this meanes, and after this manner was the Worke of my Author made vp, which was printed at the charges of Mr *Norton Anno* 1597.

Now it remaines I acquaint you with what I haue performed in this Edition which is either by mending what was amiſſe, or by adding ſuch as formerly were wanting: ſome places I helped by putting out, as the Kindes in the Chapter of Stonecrop, wheare there was but one mentioned. I haue alſo put out the Kindes in diuers places elſe where, they were not very neceſſary, by this meanes to get more roome for things more neceſſarie: as alſo diuers figures and deſcriptions which were put in two or three places, I haue put them out in all but one, yet ſo, as that I alwaies giue you notice where they were, and of what. Some words or paſſages are alſo put out here and there, which I thinke needleſſe to mention. Sometimes I mended what was amiſſe or defectiue, by altering or adding one or more words, as you may frequently obſerue, if you compare the former Edition with this, in ſome few chapters almoſt in any place. But I thinke I ſhall beſt ſatisfie you if I briefely ſpecifie what is done in each particular, hauing firſt acquainted you with what my generall intention was: I determined, as well as the ſhortneſſe of my time would giue me leaue, to retaine and ſet forth whatſoeuer was formerly in the booke deſcribed, or figured without deſcriptions (ſome varieties that were not neceſſary excepted) and to theſe I intended to adde whatſoeuer was figured by *Lobel*, *Dodonæus*, or *Cluſius*, whoſe figures we made vſe of; and alſo ſuch plants as grow either wilde, or vſually in the gardens of this Kingdome, which were not mentioned by any of the forenamed Authors; for I neither thought it fit nor requiſite for me, ambitiouſly to aime at all that *Bauhine* in his *Pinax* reckons vp, or the Exotickes of *Proſper Alpinus* containe, not mentioned in the former. This was my generall intention. Now come I to perticulars, and firſt of figures: I haue, as I ſaid, made vſe of thoſe wherewith the Workes of *Dodonæus*, *Lobel*, and *Cluſius* were formerly printed, which though ſome of them be not ſo ſightly, yet are they generally as truly expreſt, and ſometimes more. When figures not agreeable to the deſcriptions were formerly in any place, I giue you notice thereof with a marke of alteration before the title, as alſo in the end of the Chapter; and if they were not formerly in the booke, then I giue you them with a marke of addition. Such as were formerly figured in the booke, though put for other things; and ſo hauing no deſcription therein, I haue cauſed to be new cut and put into their fit places, with deſcriptions to them, and only a marke of alteration. The next are the deſcriptions, which I haue in ſome places lightly amended, without giuing any notice thereof; but when it is much altered, then giue I you this marke † at the beginning thereof; but if it were ſuch as that I could not helpe it but by writing a new one, then ſhall you finde it with this marke ‡ at the beginning and end thereof, as alſo whatſoeuer is added in the whole booke, either in deſcription or otherwiſe. The next is the Place, which I haue ſeldome altered, yet in ſome places ſupplied, and in others I haue put doubts, & do ſuſpect otherſome to be falſe, which becauſe I had not yet viewed I left as I found. The Time was a thing of no ſuch moment, for any matter worth mentioning to be performed vpon, wherefore I will not inſiſt vpon it. Names are of great importance, and in them I ſhould haue bin a little more curious if I had had more time, as you may ſee I at the firſt haue beene; but finding it a troubleſome worke, I haue only afterwards where I iudged it moſt needfull inſiſted vpon it: *Bauhinus* his *Pinax* may ſupply what you in this kinde finde wanting. In many places of this worke you ſhall finde large diſcourſes and ſometimes controuerſies handled by our Author in the names; theſe are for the moſt part out of *Dodonæus*, & ſome of them were ſo abbreuiated, and by that meanes confounded, that I thought it not worth my paines to mend them, ſo I haue put them out in ſome few places, and referred you to the places in *Dodonæus* out of which they were taken,as in the chapter of Alehooſe:it may be they are not ſo perfect as they ſhould be in ſome very few other places, (for I could not compare all) but if you ſuſpect any ſuch thing,haue recourſe to that Author,and you ſhall find full ſatisfaction.

Now come I to the Temper and Vertues. Theſe commonly were taken forth of the fore-mentioned Author, and here and there out of *Lobels* Obſeruations, ond *Camerarius* his *Hortus medicus*. To theſe he alſo added ſome few receipts of his owne: theſe I haue not altered, but here and there ſhewed to which they did moſt properly belong; as alſo if I found them otherwiſe than they ought, I noted it; or if in vnfit places, I haue transferred them to the right place,and in diuers things whereof our Author hath been ſilent, I haue ſupplied that defect.

For my additions I will here ſay nothing,but refer you to the immediate inſuing Catalogue,which will informe you only what is added in figure, or deſcription,or in both, by which, and theſe two formerly mentioned markes, you may ſee what is much altered or added in the Worke;for this marke † put either to figure,or before any clauſe,ſhews it to haue bin otherwiſe put before;or that clauſe whether it be in deſcription,Place,Time, Names,or Vertues to be much altered. This other marke ‡ put to a figure ſhewes it not to haue been formerly in the worke,but now added; and put in any other place it ſhewes all is added vntill you come to another of the ſame marks.But becauſe it is ſometimes omitted, I will therefore giue notice in the *Errata* where it ſhould be put, in thoſe places where I obſerue either the former or later of them to be wanting.

Further,I muſt acquaint you how there were the deſcriptions of a few plants here and there put in vnfitting places,which made me deſcribe them as new added,as *Saxifraga maior Matthioli*, *Perſicaria ſiliquoſa*, of which in the chapter of *Perſicaria* there was an ill deſcription,but a reaſonable good one in the chapter of *Aſtrantia nigra*. *Papauer ſpinoſum*,was figured and deſcribed amongſt the Cardui; now all theſe(as I ſaid) I added as new in the moſt fitting places: yet found them afterwards deſcribed, but put them out all, except the laſt, whoſe hiſtory I ſtill retained, with a reference to the preceding figure and Hiſtorie. Note alſo,whereſoeuer my Author formerly mentioned *Cluſius*, according to his Spaniſh or Pannonicke Obſeruations,I haue made it,according to this Hiſtorie, which containes them both with additions.

Alſo I muſt certifie you, becauſe I know it is a thing that ſome will thinke ſtrange, that the number of the pages in this booke do no more exceed that of the former(conſidering there is ſuch a large acceſſion of matter and figures)the cauſe hereof is, each page containes diuers lines more than the former, the lines themſelues alſo being longer; and by the omiſſion of deſcriptions and figures put twice or thrice ouer,and the Kinds,vnneceſſarily put in ſome places, I gained as much as conueniently I could, being deſirous that it might be bound together in one volume.

Thus haue I ſhewed what I haue performed in this Worke,entreating you to take this my Labor in good part; and if there be any defect therein(as needs there muſt in all humane works) aſcribe it in part to my haſte and many buſineſſes, and in ſome places to the want of ſufficient information, eſpecially in Exoticke things; and in otherſome, to the little conuerſation I formerly had with this Author, before ſuch time as (ouercome by the importunitie of ſome friends, and the generall want of ſuch a Worke) I tooke this taske vpon me. Furthermore I deſire,that none would raſhly cenſure me for that which I haue here done;but they that know in what time I did it,and who themſelues are able to do as much as I haue here performed; for to ſuch alone I ſhall giue free liberty, and will be as ready to yeeld further ſatisfaction if they deſire it, concerning any thing I haue here aſſerted, as I ſhall be apt to neglect and ſcorne the cenſure of the Ignorant and Vnlearned, who I know are ſtill forward to verifie our Engliſh prouerbe *

**A fooles bolt is ſoone ſhot.*

I muſt not in ſilence paſſe ouer thoſe from whom I haue receiued any fauour or incouragement, whereby I might be the better enabled to performe this Taſke. In the firſt place let me remember the only Aſſiſtant I had in this Worke,which was Mr *Iohn Goodyer* of Maple-Durham in Hampſhire, from whom I receiued many accurate deſcriptions, and ſome other obſeruations concerning plants; the which (deſirous to giue euery man his due) I haue cauſed to be ſo printed,as they may be diſtinguiſhed from the reſt: and thus you ſhall know them; in the beginning is the name of the plant in Latine in a line by it ſelfe,and at the end his name is inſerted; ſo that the Reader may eaſily finde thoſe things that I had from him,and I hope together with me will be thankfull to him,that he would ſo readily impart them for the further increaſe of this knowledge.

Mr *George Bowles* of Chiſſelhurſt in Kent muſt not here be forgot, for by his trauells and induſtry I haue had knowledg of diuers plants,which were not thought nor formerly knowne to grow wilde in this kingdome, as you ſhall finde by diuers places in this book.

Thomas Hickes
Iohn Buggs.
William Broad.
Job Weale.
Leon. Buckner.
Iames Clarke.
Robert Lorkin.

My louing friends and fellow Trauellers in this ſtudy, and of the ſame profeſſion, whoſe companie I haue formerly enjoyed in ſearching ouer a great part of Kent, and who are ſtill ready to doe the like in other places, are here alſo to be remembred, and that the rather, becauſe this knowledge amongſt vs in this city was almoſt loſt, or at leaſt too much neglected, eſpecially by thoſe to whom it did chiefely belong, and who ought to be aſhamed of ignorance, eſpecially in a thing ſo abſolutely neceſſary to their profeſſion. They ſhould indeed know them as workemen do their tooles, that is readily to call them by their names, know where to fetch, and whence to procure the beſt of each kinde; and laſtly, how to handle them.

I haue already much exceeded the bounds of an Epiſtle, yet haue omitted many things of which I could further haue informed thee Reader, but I will leaue them vntill ſuch time as I finde a gratefull exceptance; or ſome other occaſion that may againe inuite me to ſet Pen to Paper; which, That it may be for my Countreyes good and Gods glory, ſhall euer be the prayers and
Endeauours of thy Well-
Wiſher.

From my houſe on Snow-hill;
Octob.22.1633.

THOMAS IOHNSON.

A Catalogue of Additions.

BEcauſe the markes were not ſo carefully and right put to theſe Figures, which were not formerly in the booke, I haue thought good to giue you the names of all ſuch as are added, either in figure or deſcription, or both: together with the booke, Chapter, and number or place they hold in each chapter. *F* ſtands for Figure, *D* for Deſcription, and where both are added, you ſhall find both theſe letters; and where the letter *C* is put, the hiſtorie of the whole chapter is added.

THE

THE FIRST BOOKE OF THE HISTORY OF PLANTS.

Containing Graſſes, Ruſhes, Reeds, Corne, Flags, and Bulbous or Onion-rooted Plants.

IN this Hiſtorie of Plants it would be tedious, to vſe by way of introduction any curious diſcourſe vpon the generall diuiſion of Plants, contained in Latine vnder *Arbor, Frutex, Suffrutex, Herba*: or to ſpeake of the differing names of their ſeuerall parts, more in Latine than our vulgar tongue can well expreſſe. Or to go about to teach thee, or rather to beguile thee by the ſmell or taſte, to gheſſe at the temperature of Plants: when as all and euery of theſe in their place ſhall haue their true face and note, whereby thou mayſt both know and vſe them.

In three bookes therefore, as in three gardens, all our Plants are beſtowed; ſorted as neere as might be in kindred and neighbourhood.

The firſt booke hath Graſſes, Ruſhes, Corne, Reeds, Flags, Bulbous or Onion-rooted Plants.

The ſecond, moſt ſorts of Herbs vſed for meat, medicine, or ſweet ſmell.

The third hath Trees, Shrubs, Buſhes, Fruit-bearing Plants, Roſins, Gummes, Roſes, Heaths, Moſſes, Muſhroms, Corall, and ther ſeuerall kindes.

Each booke hath Chapters, as for each Herb a bed: and euery Plant preſents thee with the Latine and Engliſh name in the title, placed ouer the picture of the Plant.

Then followeth the Kinds, Deſcription, Place, Time, Names, Natures, and Vertues, agreeing with the beſt receiued Opinions.

Laſt of all thou haſt a generall Index, as well in Latine as Engliſh, with a carefull ſupply likewiſe of an *Index Bilinguis*, of Barbarous Names.

And thus hauing giuen thee a generall view of this Garden, now with our friendly Labors wee will accompanie thee and leade thee through a Graſſe-plot, little or nothing of many Herbariſts heretofore touched; and begin with the moſt common or beſt knowne Graſſe, which is called in Latine *Gramen Pratenſe*; and then by little and little conduct thee through moſt pleaſant gardens and other delightfull places, where any Herbe or Plant may be found fit for Meat or Medicine.

CHAP. 1. *Of Medow-Graſſe.*

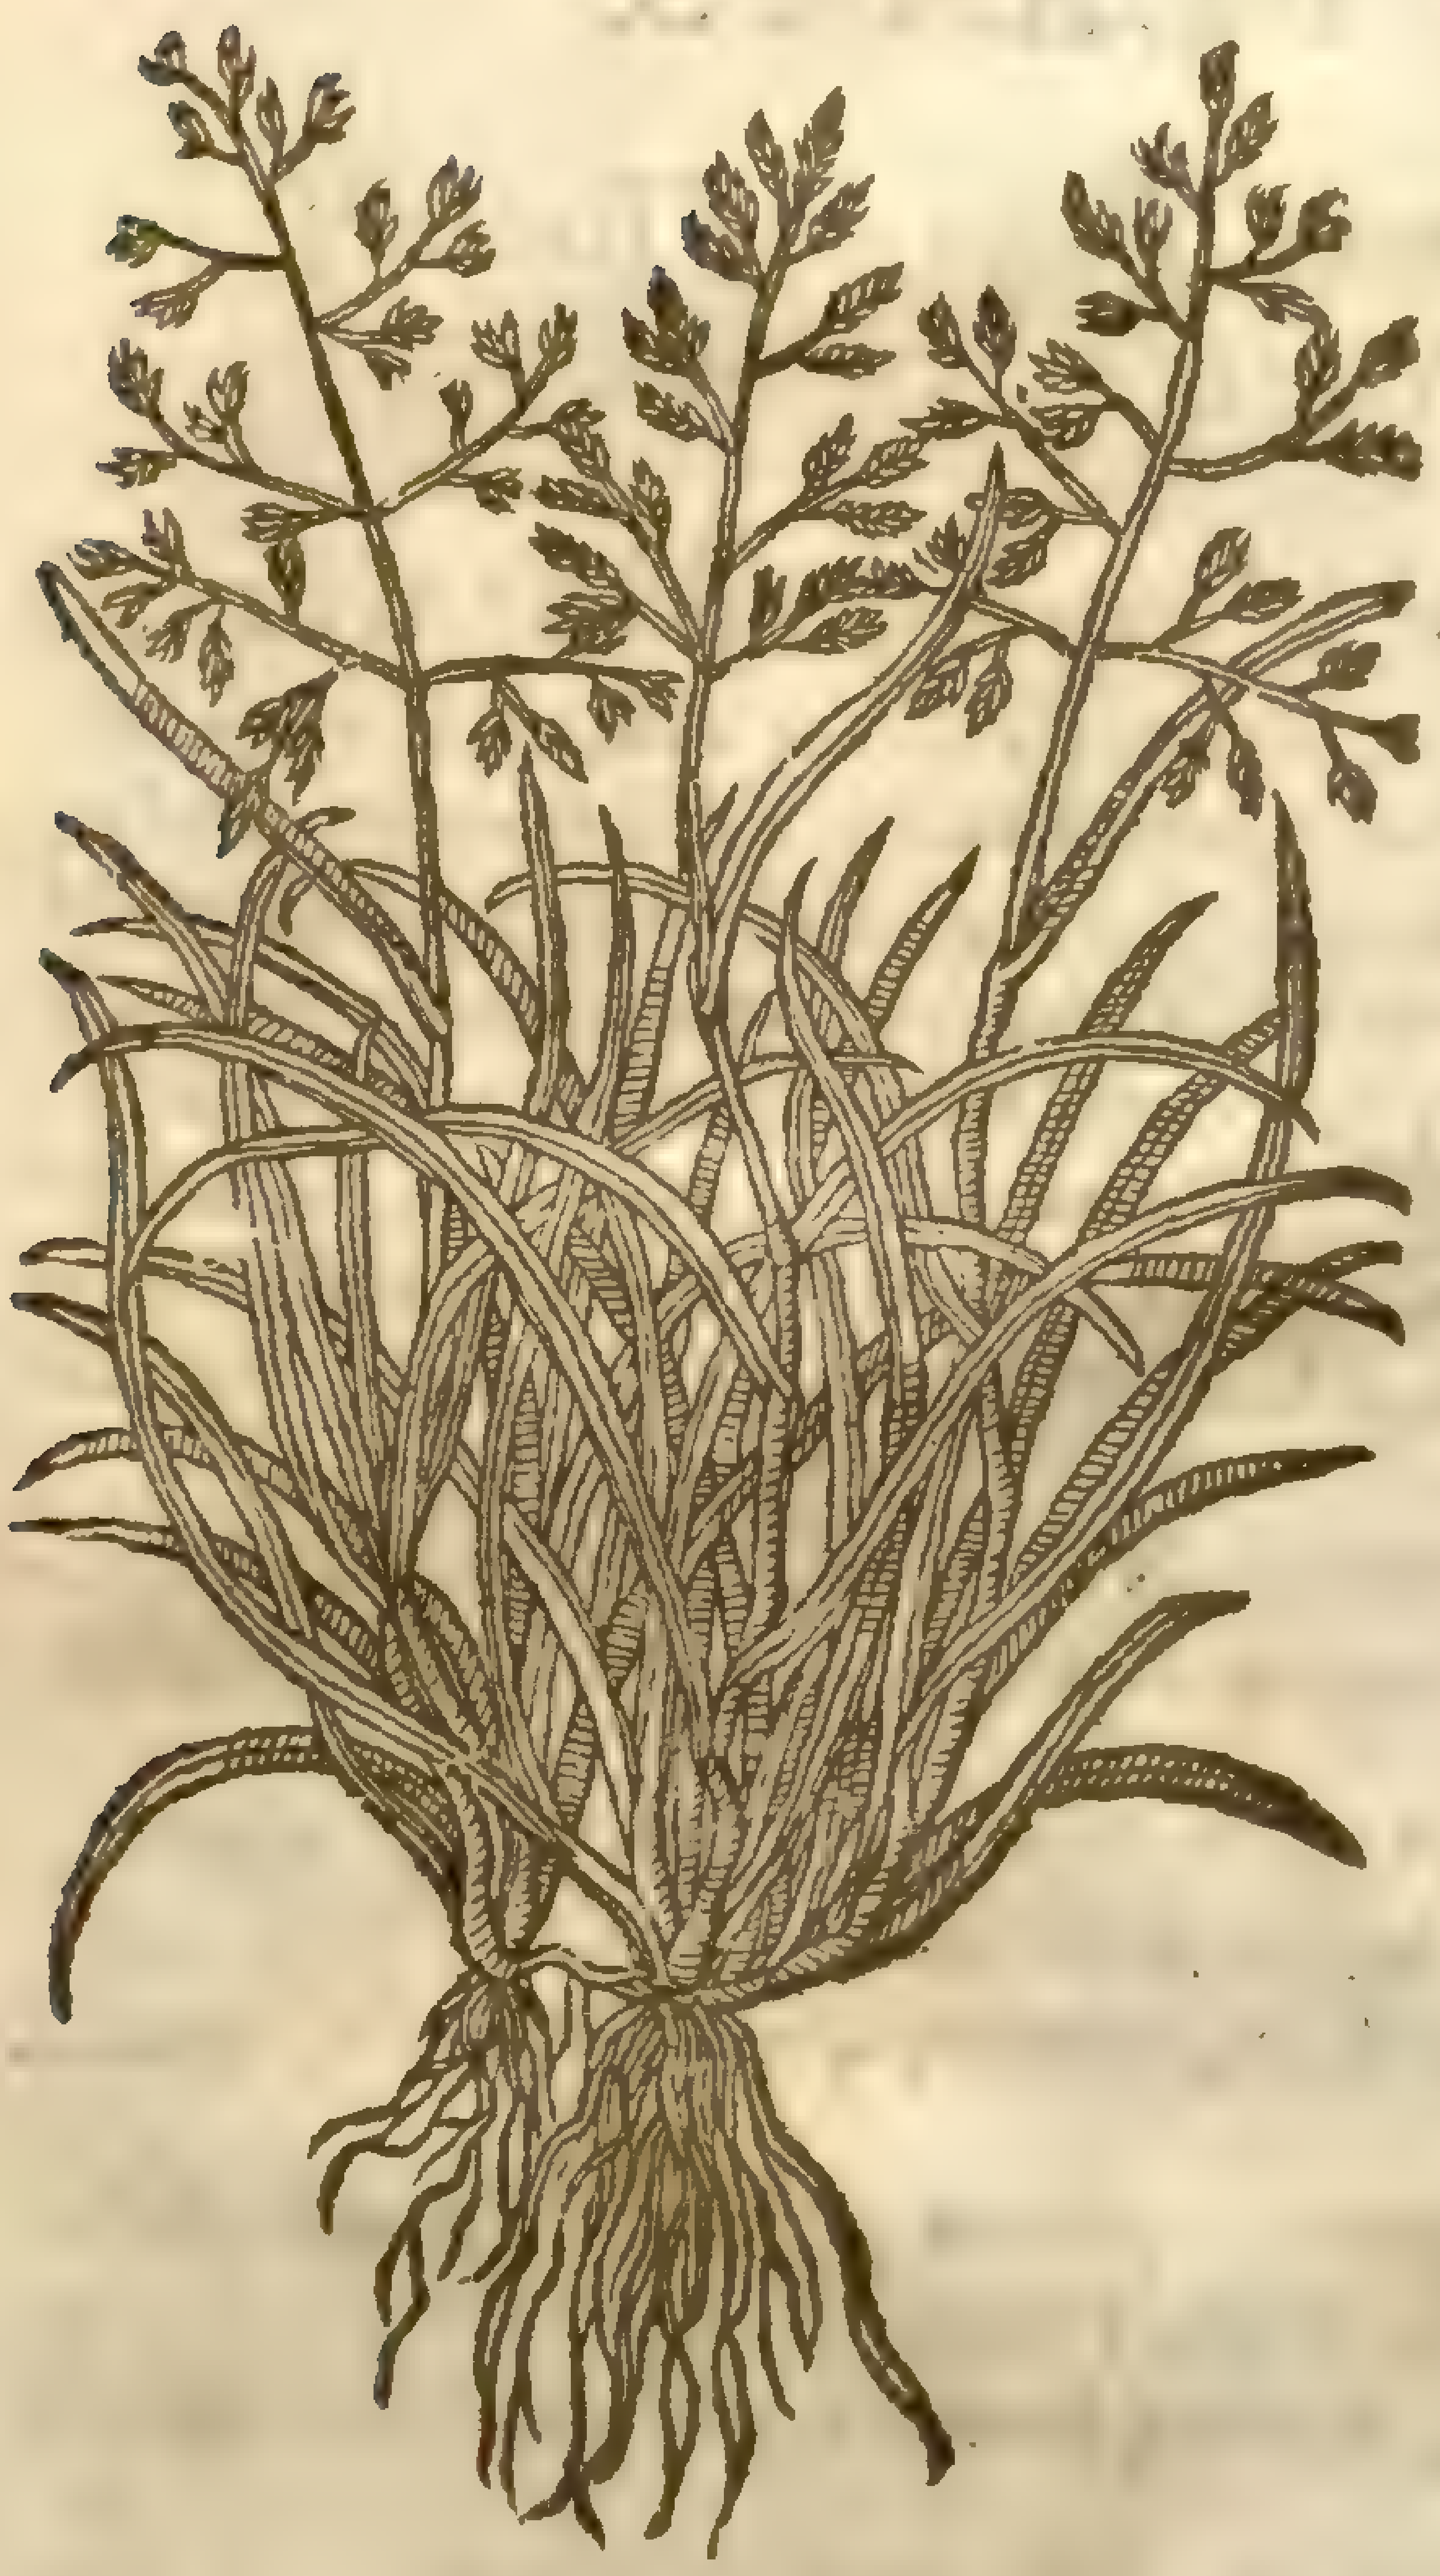
THere be ſundry and infinite kindes of Graſſes not mentioned by the Antients, either as vnneceſſarie to be ſet downe, or vnknowne to them: only they make mention of ſome few, whoſe wants we meane to ſupply, in ſuch as haue come to our knowledge, referring the reſt to the curious ſearcher of Simples.

¶ *The Deſcription.*

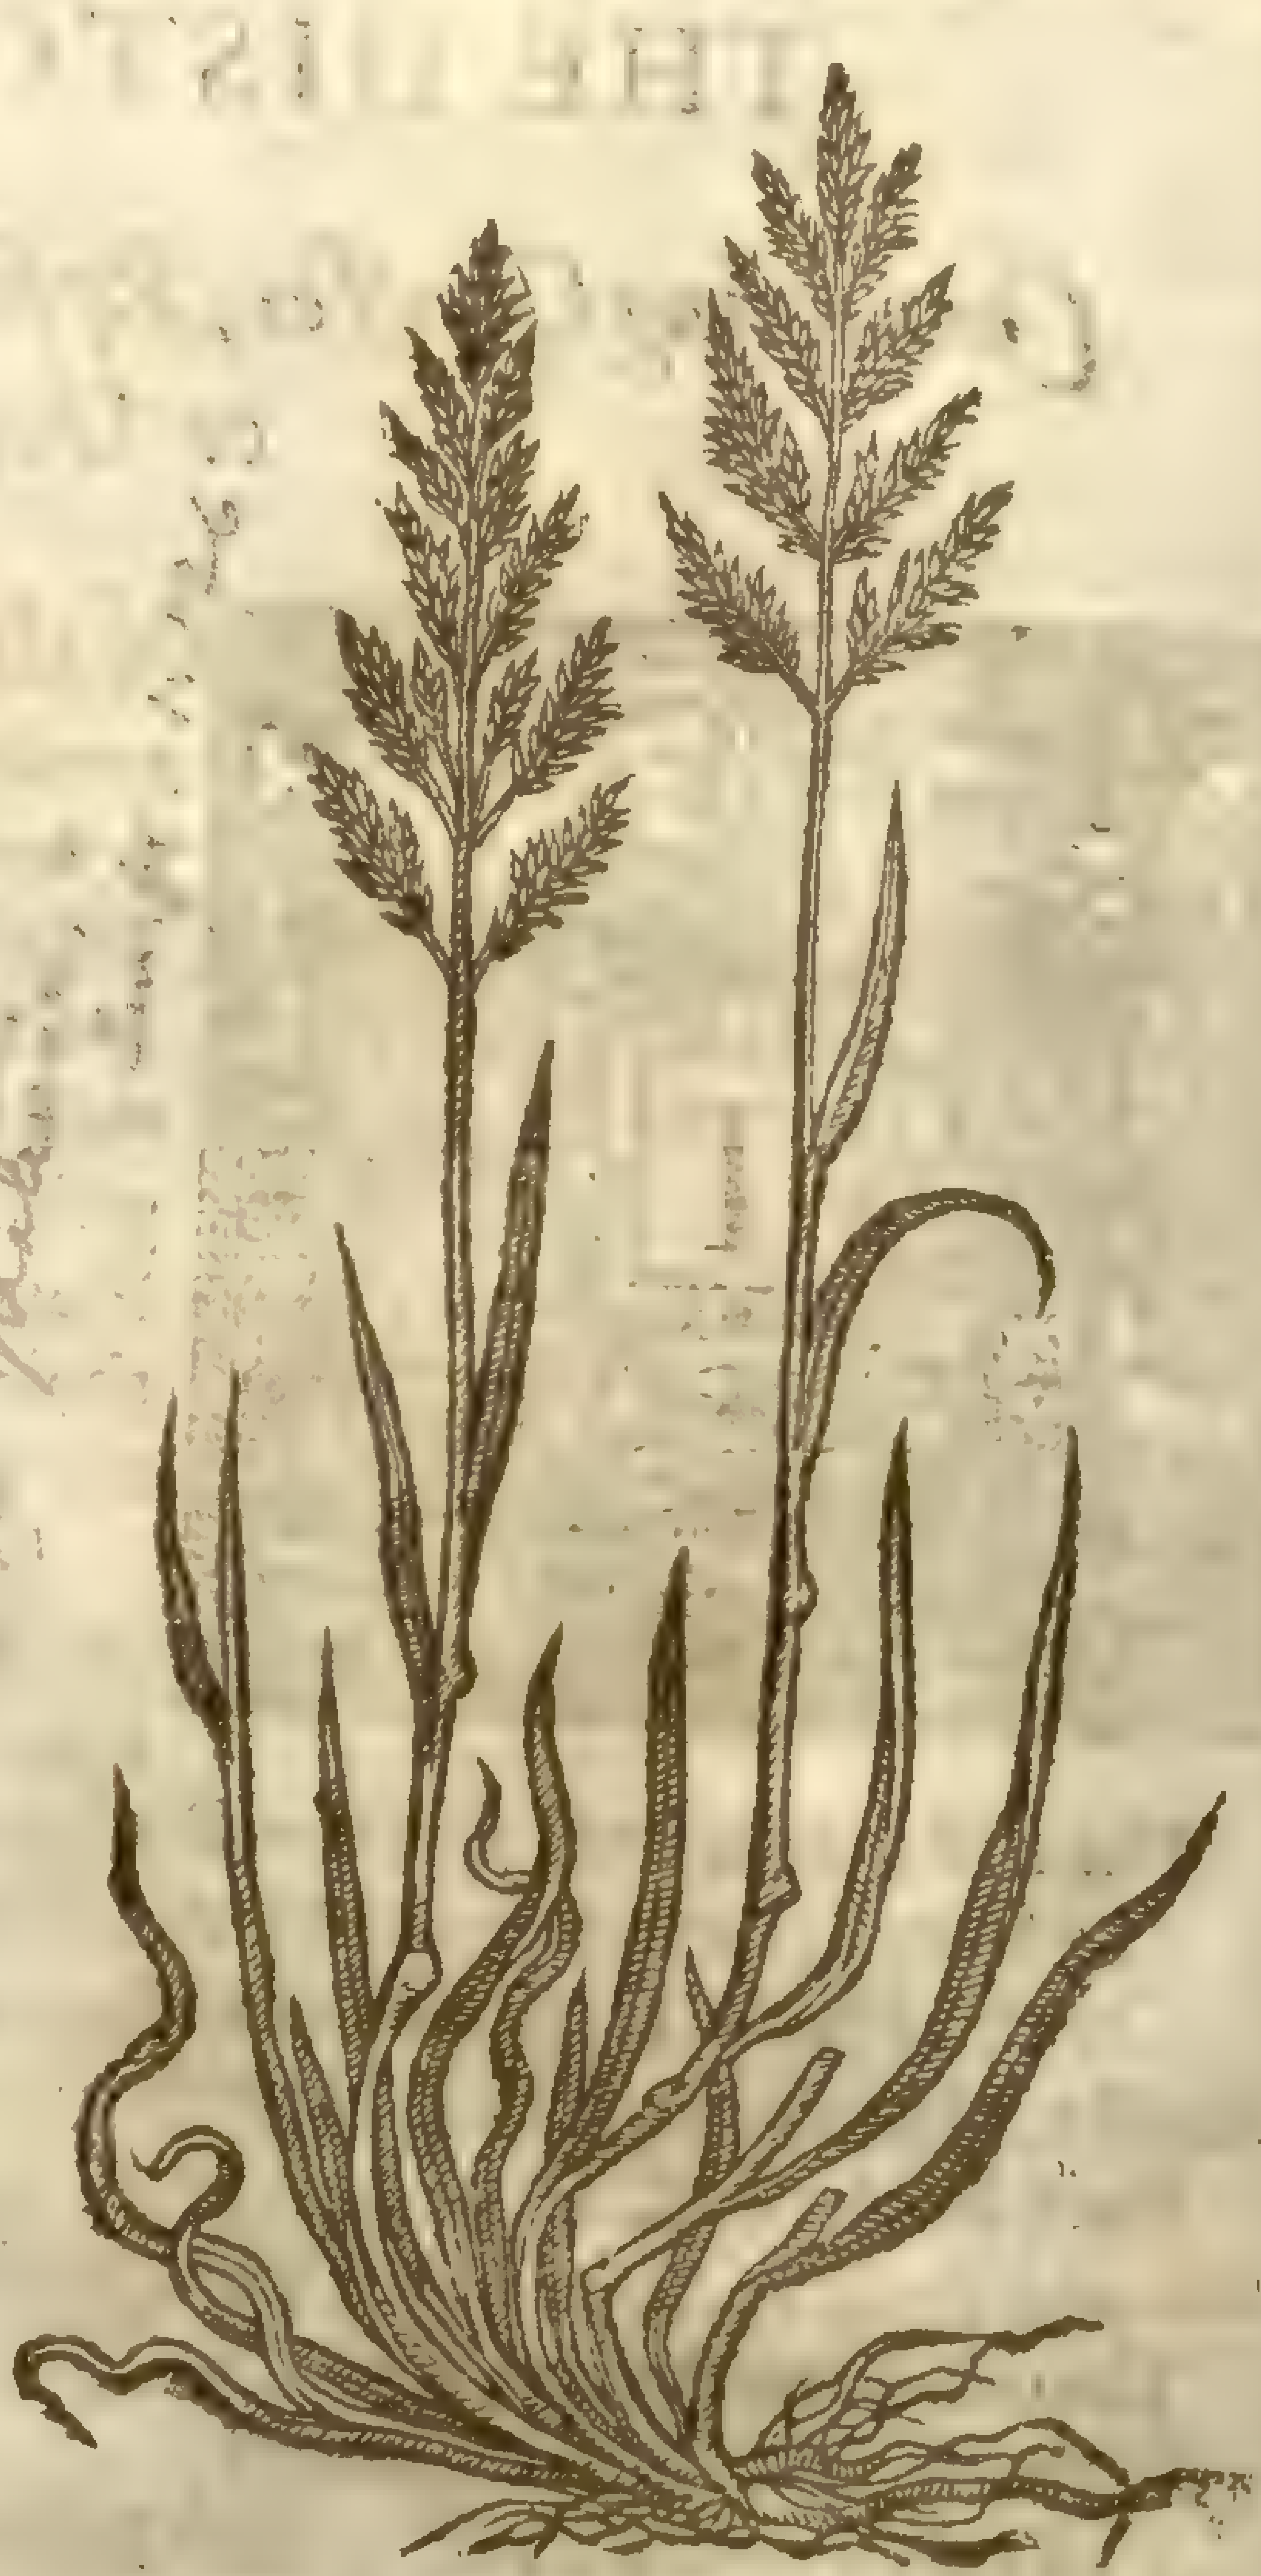
1 COmmon Medow Graſſe hath very ſmall tufts or roots, with thicke hairy threds depending vpon the higheſt turfe, matting and creeping on the ground with a moſt thicke and apparant ſhew of wheaten leaues, lifting vp long thinne jointed and light ſtalks, a foot or a cubit high, growing ſmall and ſharpe at the top, with a looſe eare hanging downward, like the tuſt or top of the common Reed.

2 Small Medow Graſſe differeth from the former in the varietie of the ſoile; for as the firſt kinde groweth in medowes, ſo doth this ſmall Graſſe clothe the hilly and more dry grounds vntilled, and barren by nature; a Graſſe more fit for ſheepe than for greater cattell. And becauſe the kindes of Graſſe do differ apparantly in root, tuft, ſtalke, leafe, ſheath, eare, or creſt, we may aſſure our ſelues that they are endowed with ſeuerall Vertues, formed by the Creator for the vſe of man, although they haue been by a common negligence hidden and vnknowne. And therefore in this our Labor we haue placed each of them in their ſeuerall bed, where the diligent ſearcher of Nature may, if ſo he pleaſe, place his learned obſeruations.

1 *Gramen pratenſe.*
Medow-Graſſe.



2 *Gramen pratenſe minus.*
Small Medow-Graſſe.



¶ *The Place.*

Common Medow-Graſſe groweth of it ſelfe vnſet or vnſowne, euery where; but the ſmall Medow-Graſſe for the moſt part groweth vpon dry and barren grounds, as partly we haue touched in the Deſcription.

¶ *The Time.*

Concerning the time when Graſſe ſpringeth and ſeedeth, I ſuppoſe there is none ſo ſimple but knoweth it, and that it continueth all the whole yeare, ſeeding in Iune and Iuly. Neither needeth it any propagation or replanting by ſeed or otherwiſe; no not ſo much as the watery Graſſes, but that they recouer themſelues againe, although they haue beene drowned in water all the Winter long, as may appeare in the wilde fennes in Lincolnſhire, and ſuch like places.

¶ *The Names.*

Graſſe is called in Greeke, Ἄγρωστις: in Latine, *Gramen*; as it is thought, *à gradiendo, quod geniculatis internodijs ſerpat, crebroque novas ſpargat radices.* For it groweth, goeth, or ſpreadeth it ſelfe vnſet or vnſowne naturally ouer all fields or grounds, cloathing them with a faire and perfect green. It is yearely mowed, in ſome places twice, and in ſome rare places thrice. Then is it dried and withered by the heate of the Sun, with often turning it; and then is it called *Fænum, neſcio an à fænore aut fætu.* In Engliſh, Hay: in French, *Le herbe du praiz.*

¶ *The Nature.*

The roots and ſeeds of Graſſe are of more vſe in Phyſicke than the herbe, and are accounted of all Writers moderatly to open obſtructions, and prouoke vrine.

¶ *The Vertues.*

The decoction of Graſſe with the roots of Parſley drunke, helpeth the Diſſurie, and prouoketh vrine. A

The roots of Graſſe, according to *Galen,* doe glew and conſolidate together new and bleeding wounds. B

The juice of Graſſe mixed with hony and the pouder of Sothernwood taken in drinke, killeth wormes in children; but if the childe be yong, or tender of nature, it ſhall ſuffice to mix the juice of Graſſe and the gall of an Oxe or Bull together, and therewith anoint the childes belly, and lay a clout wet therein vpon the nauell. C

Fernelius ſaith, That Graſſe doth helpe the obſtruction of the liuer, reines, and kidnies, and the inflammation of the reins called *Nephritis.* D

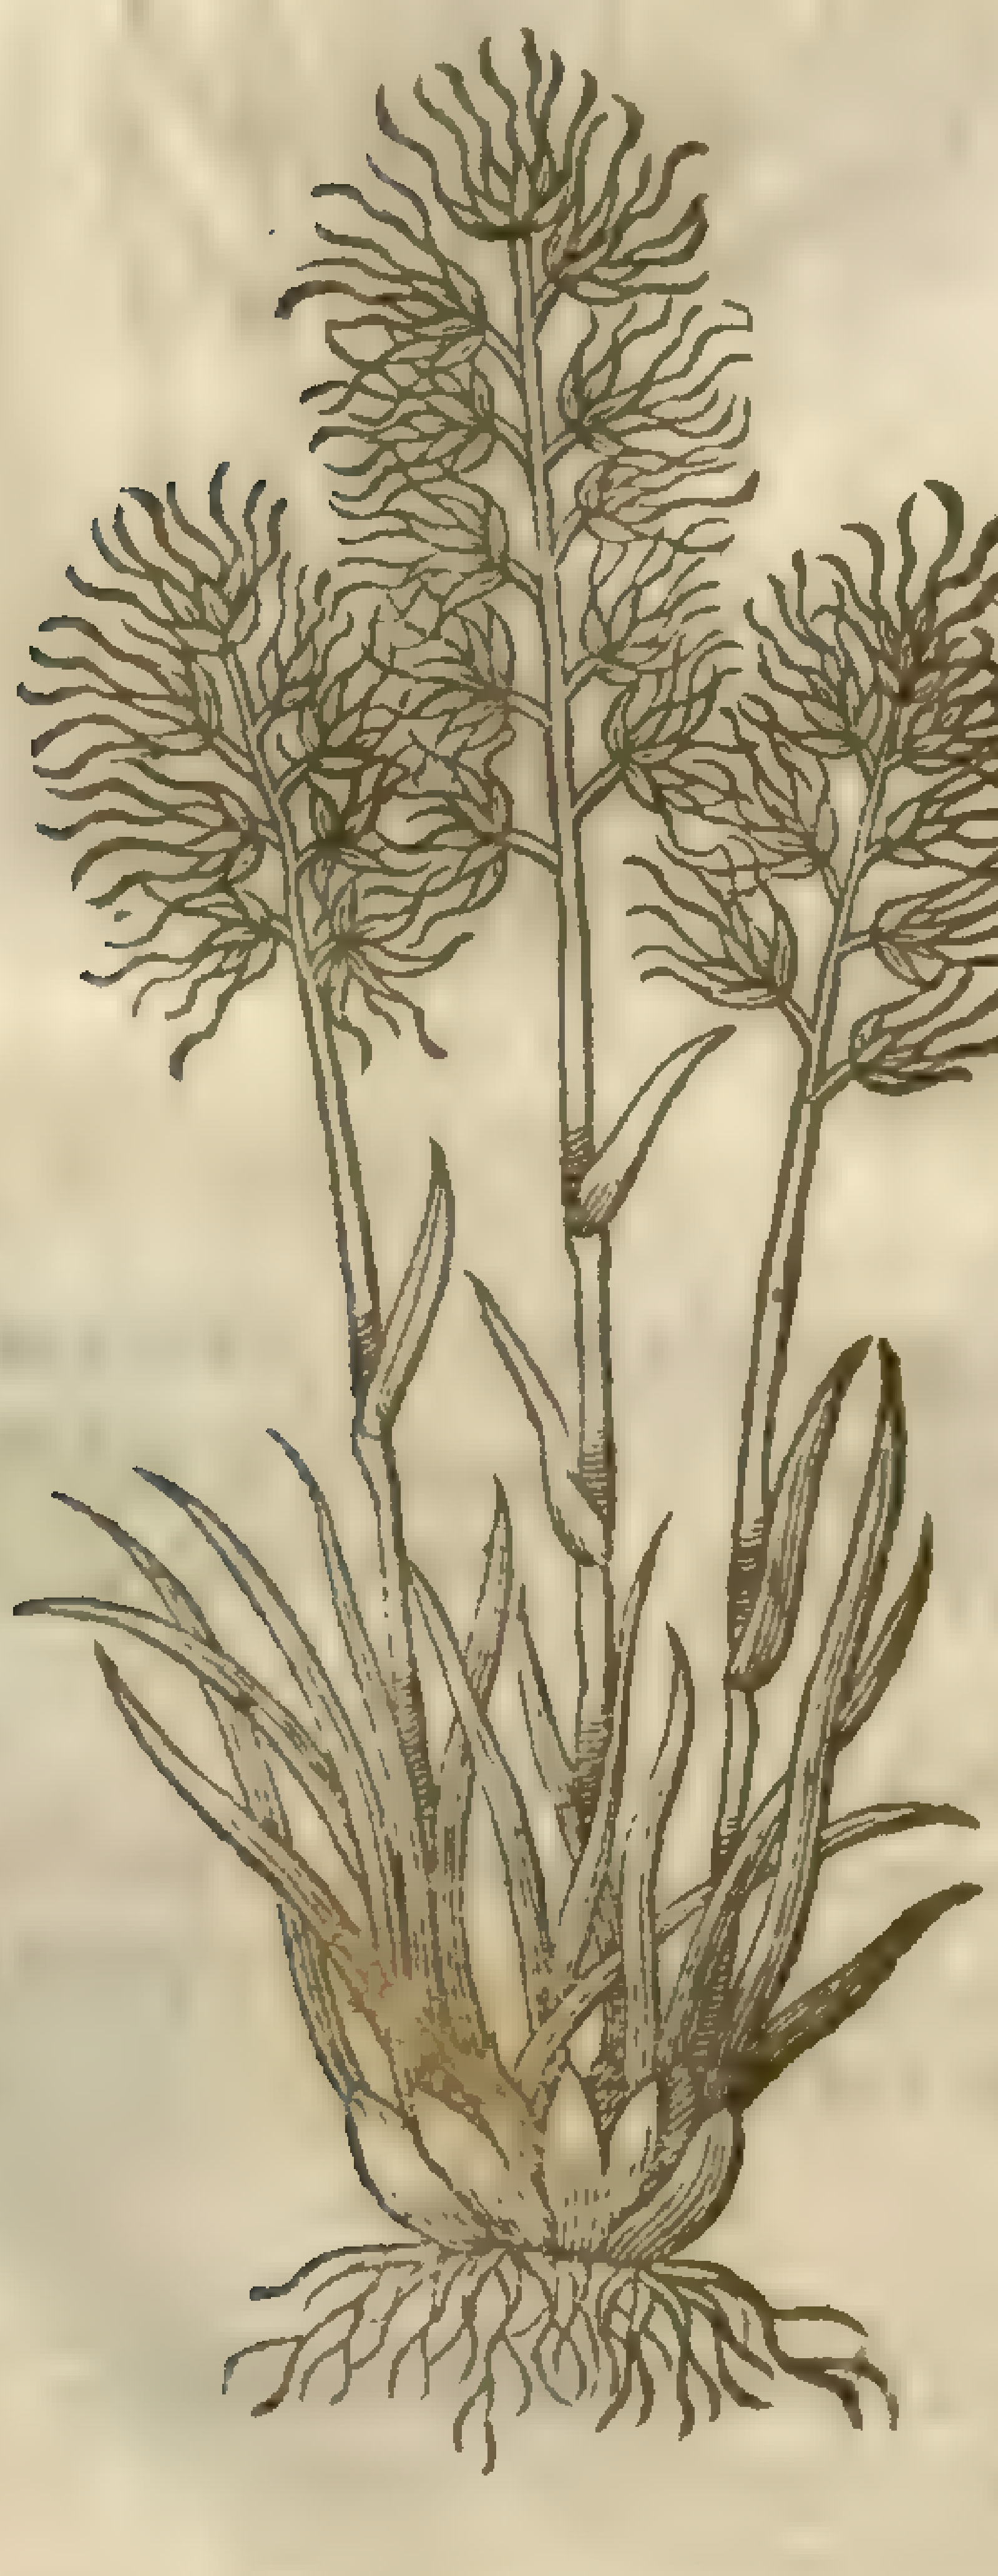
Hay ſodden in water till it be tender, and applied hot to the chaps of beaſts that be chap-fallen through long ſtanding in pound or ſtable without meat, is a preſent remedie. E

Chap. 2. *Of Red Dwarfe-Graſſe.*

¶ *The Deſcription.*

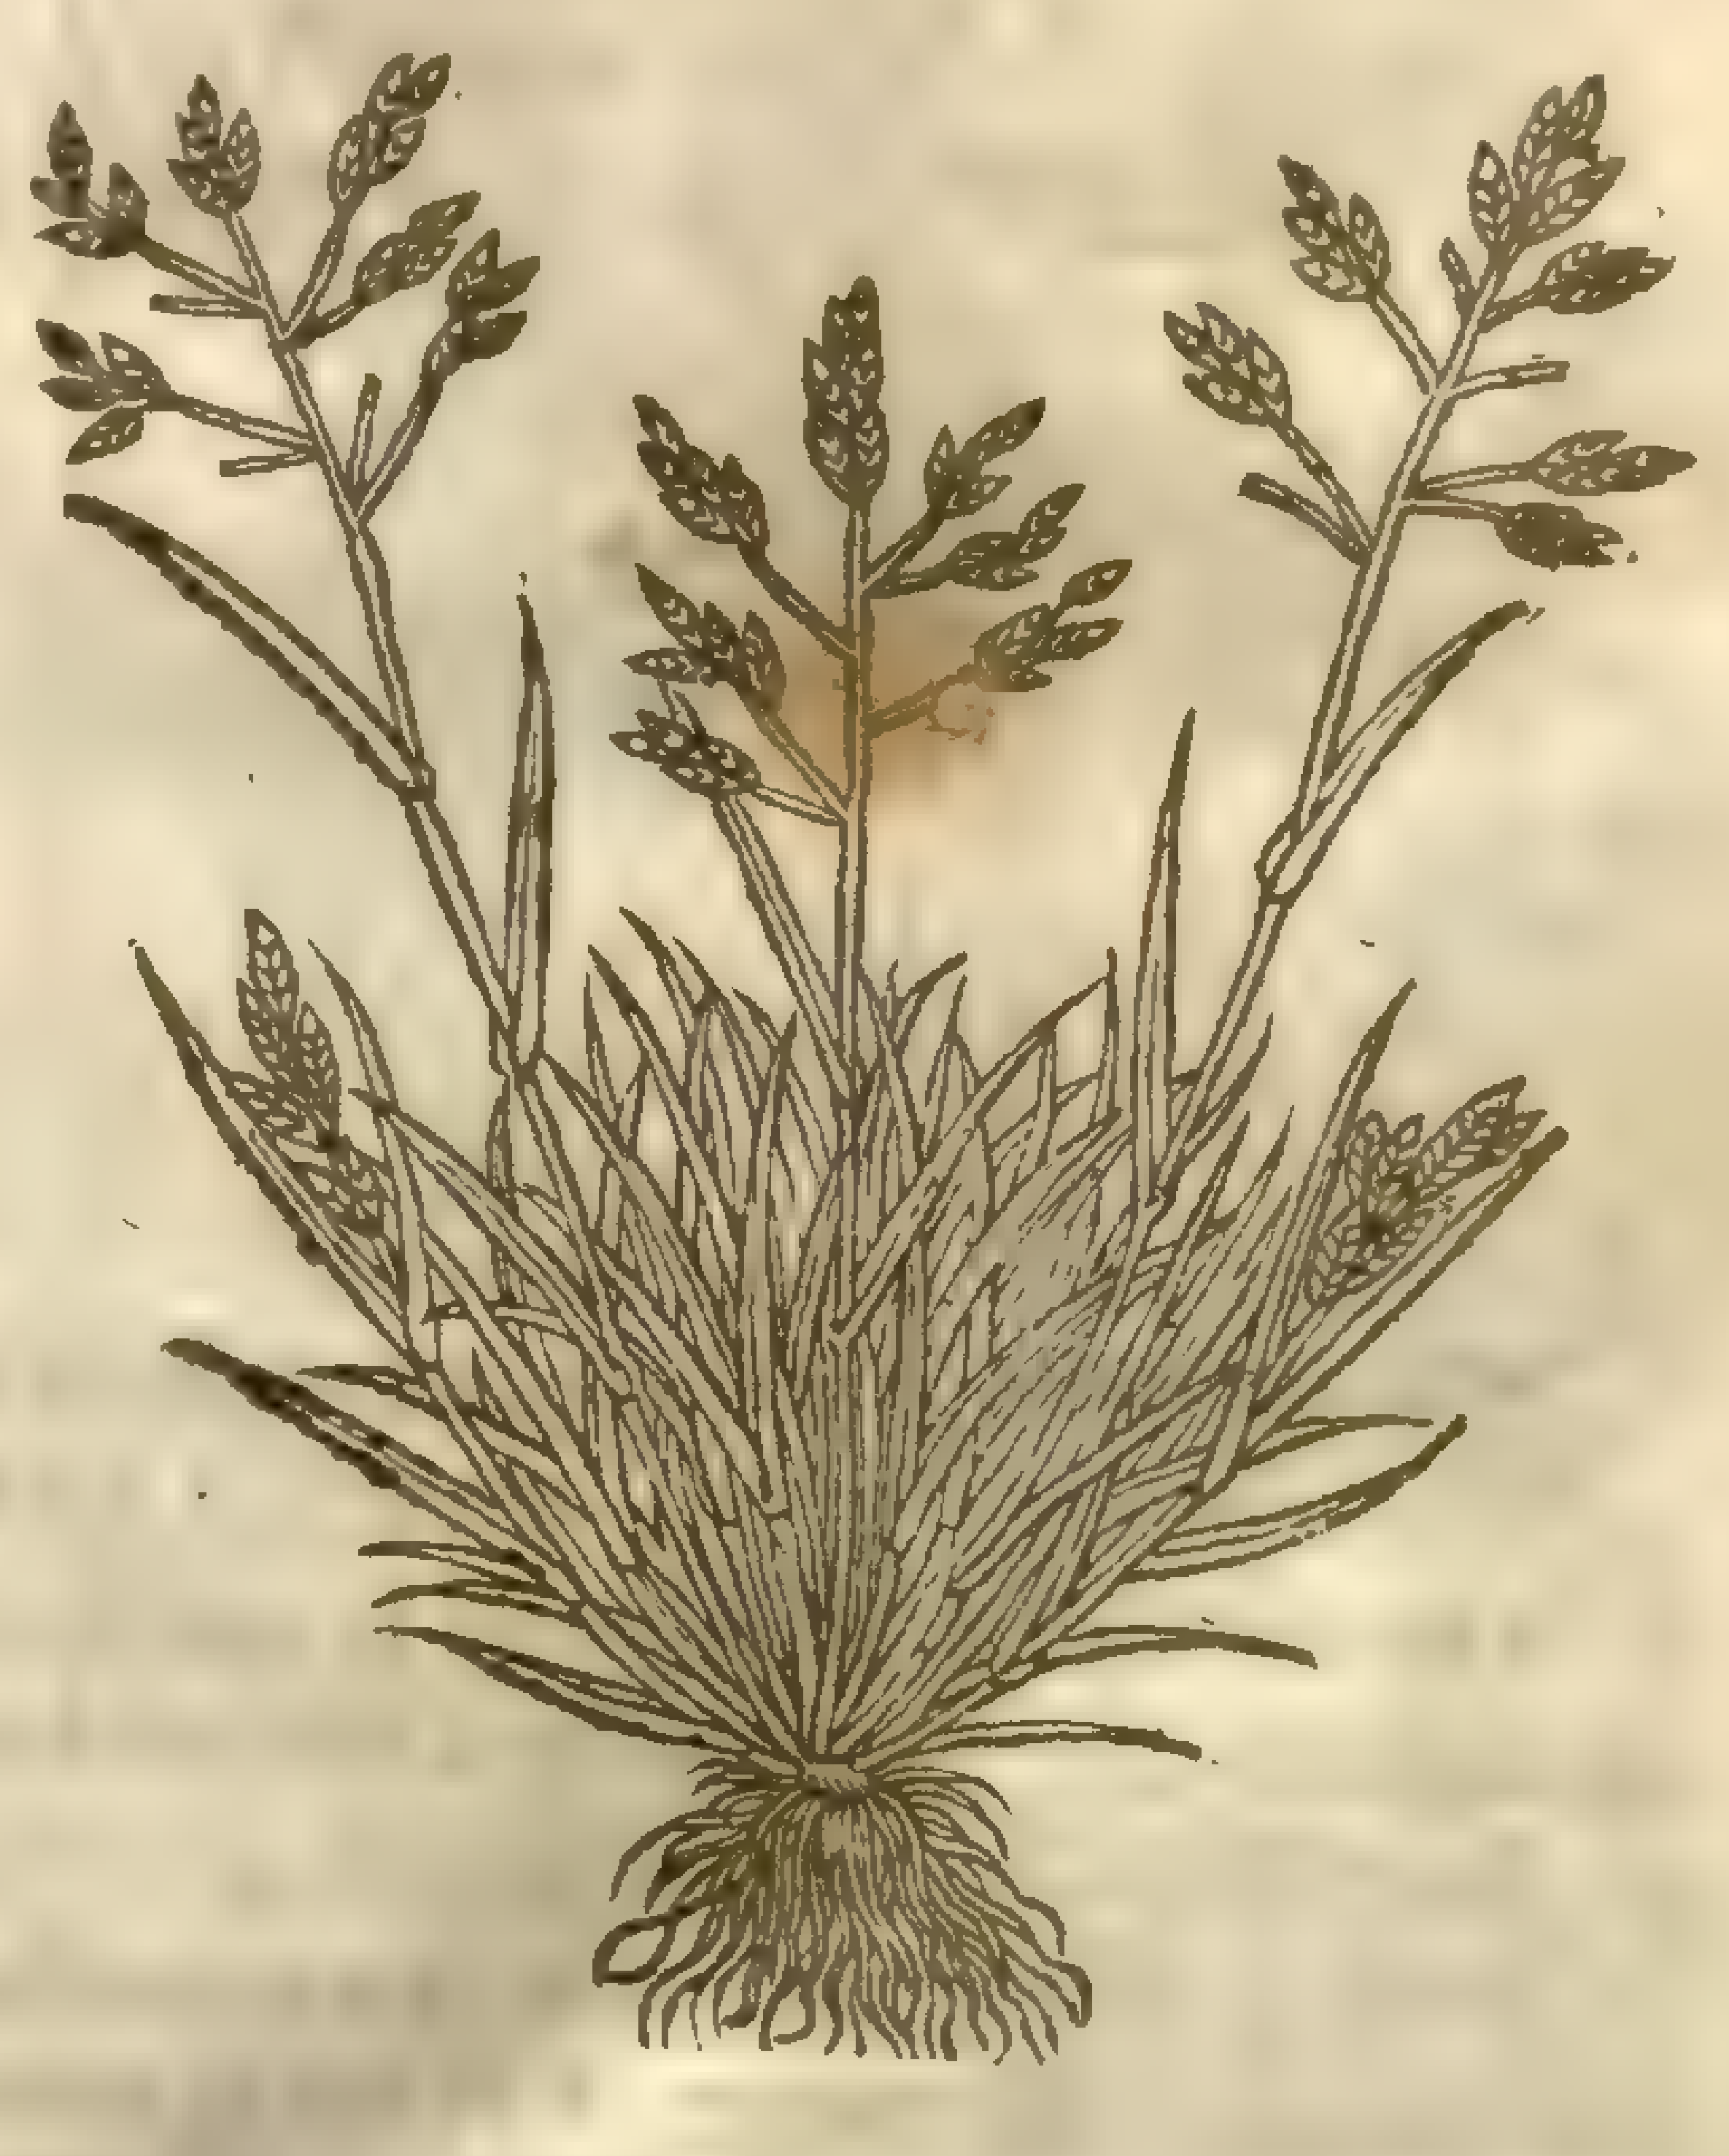
1 Dwarfe-Graſſe is one of the leaſt of Graſſes. The root conſiſts of many little bulbs, couered with a reddiſh filme or skin, with very many ſmall hairy and white ſtrings: the tuft or eare is of a reddiſh colour, and not much differing from the graſſe called *Iſchæmon,* though the eare be ſofter, broader, and more beautifull.

† 1 *Gramen minimum rubrum, ſiue Xerampelinum.*
Red Dwarfe-Graſſe.



2 *Gramen minimum album.*
White Dwarfe-Graſſe.

Poa annua et [illegible]
Sm. fl. 1. 127

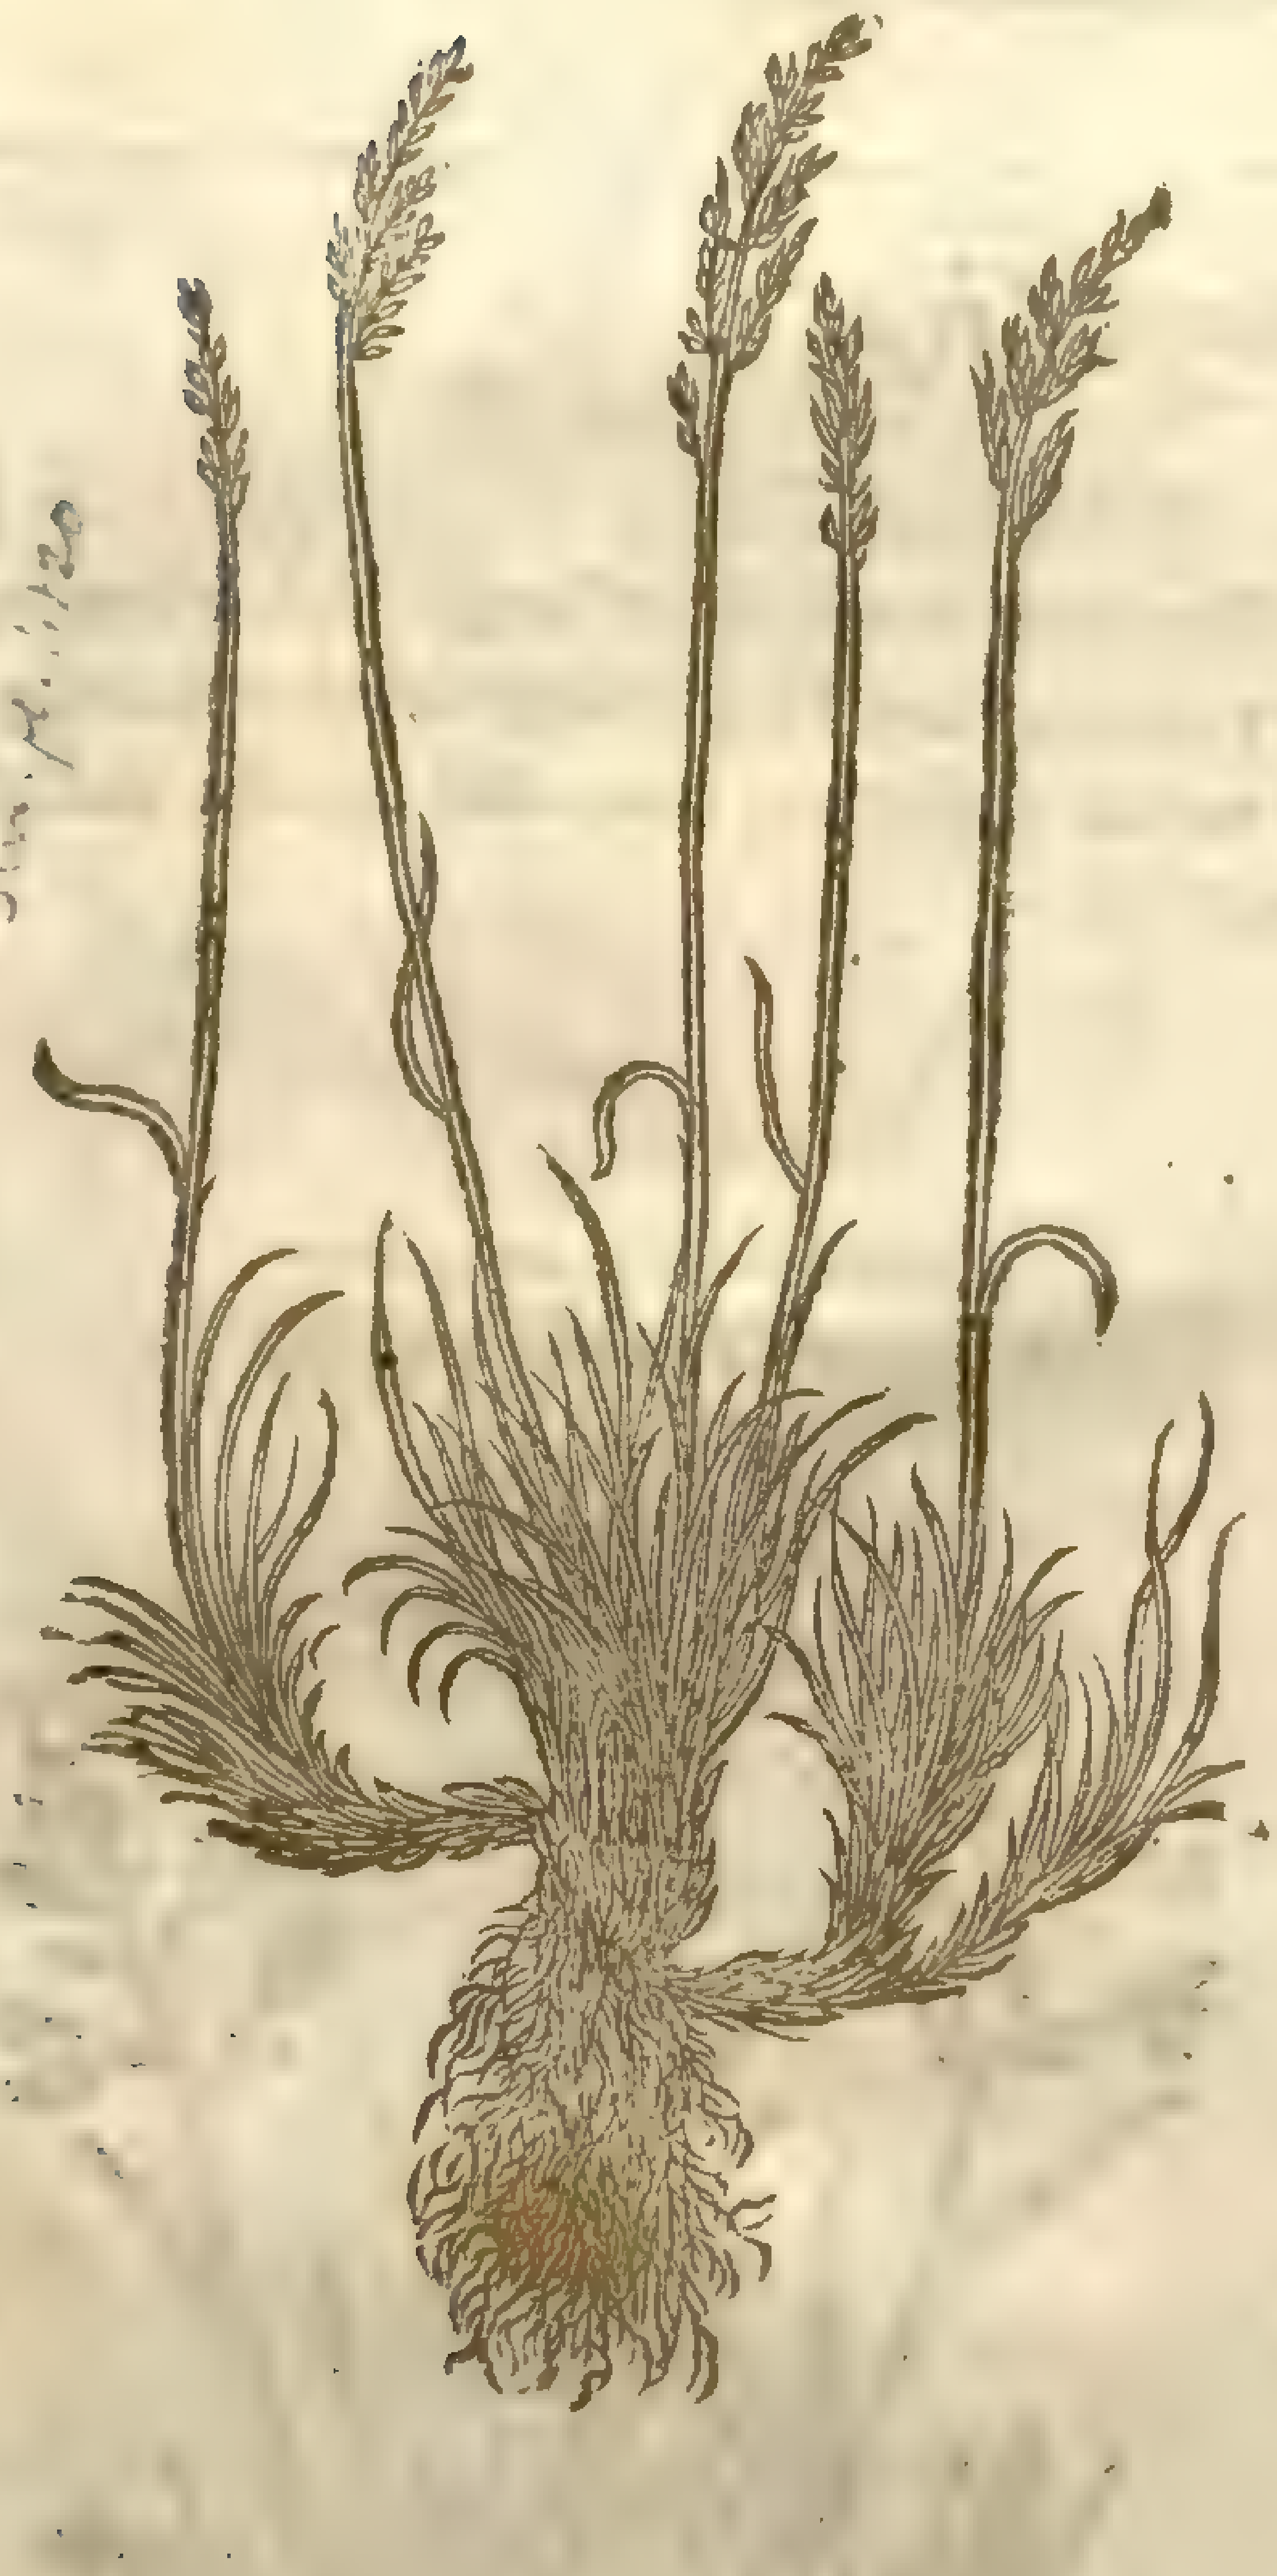


† 2 This kinde of Graſſe hath ſmall hairy roots; the leaues are ſmall and ſhort, as alſo the ſtalke, which on the top thereof beares a pannicle not much vnlike the ſmall medow Graſſe, but leſſe: the colour thereof is ſometimes white, and otherwhiles reddiſh; whence ſome haue giuen two figures, which I thinking needleſſe, haue only retained the later, and for the former giuen the figure of another Graſſe, intended by our Author to be comprehended in this Chapter.

3 Small hard Graſſe hath ſmall roots compact of little ſtrings or threds, from which come forth many ſoure ruſhy leaues of the length of an inch and a halfe: the tuft or eare is compact of many pannicles or very little eares, which to your feeling are very hard or harſh. This Graſſe is vnpleaſant, and no wholeſome food for cattell.

4 Ruſh-Graſſe is a ſmall plant ſome hand-full high, hauing many ſmall ruſhy leaues, tough and pliant, as are the common Ruſhes: wheron grow ſmall ſcaly or chaffie husks, in ſtead of flours: the ſeeds are like thoſe of Ruſhes, but ſmaller: the root is threddy like the former. ‡ There is a varietie of this to be found in bogs, with the ſeeds bigger, and the leaues & whole plant leſſer. ‡

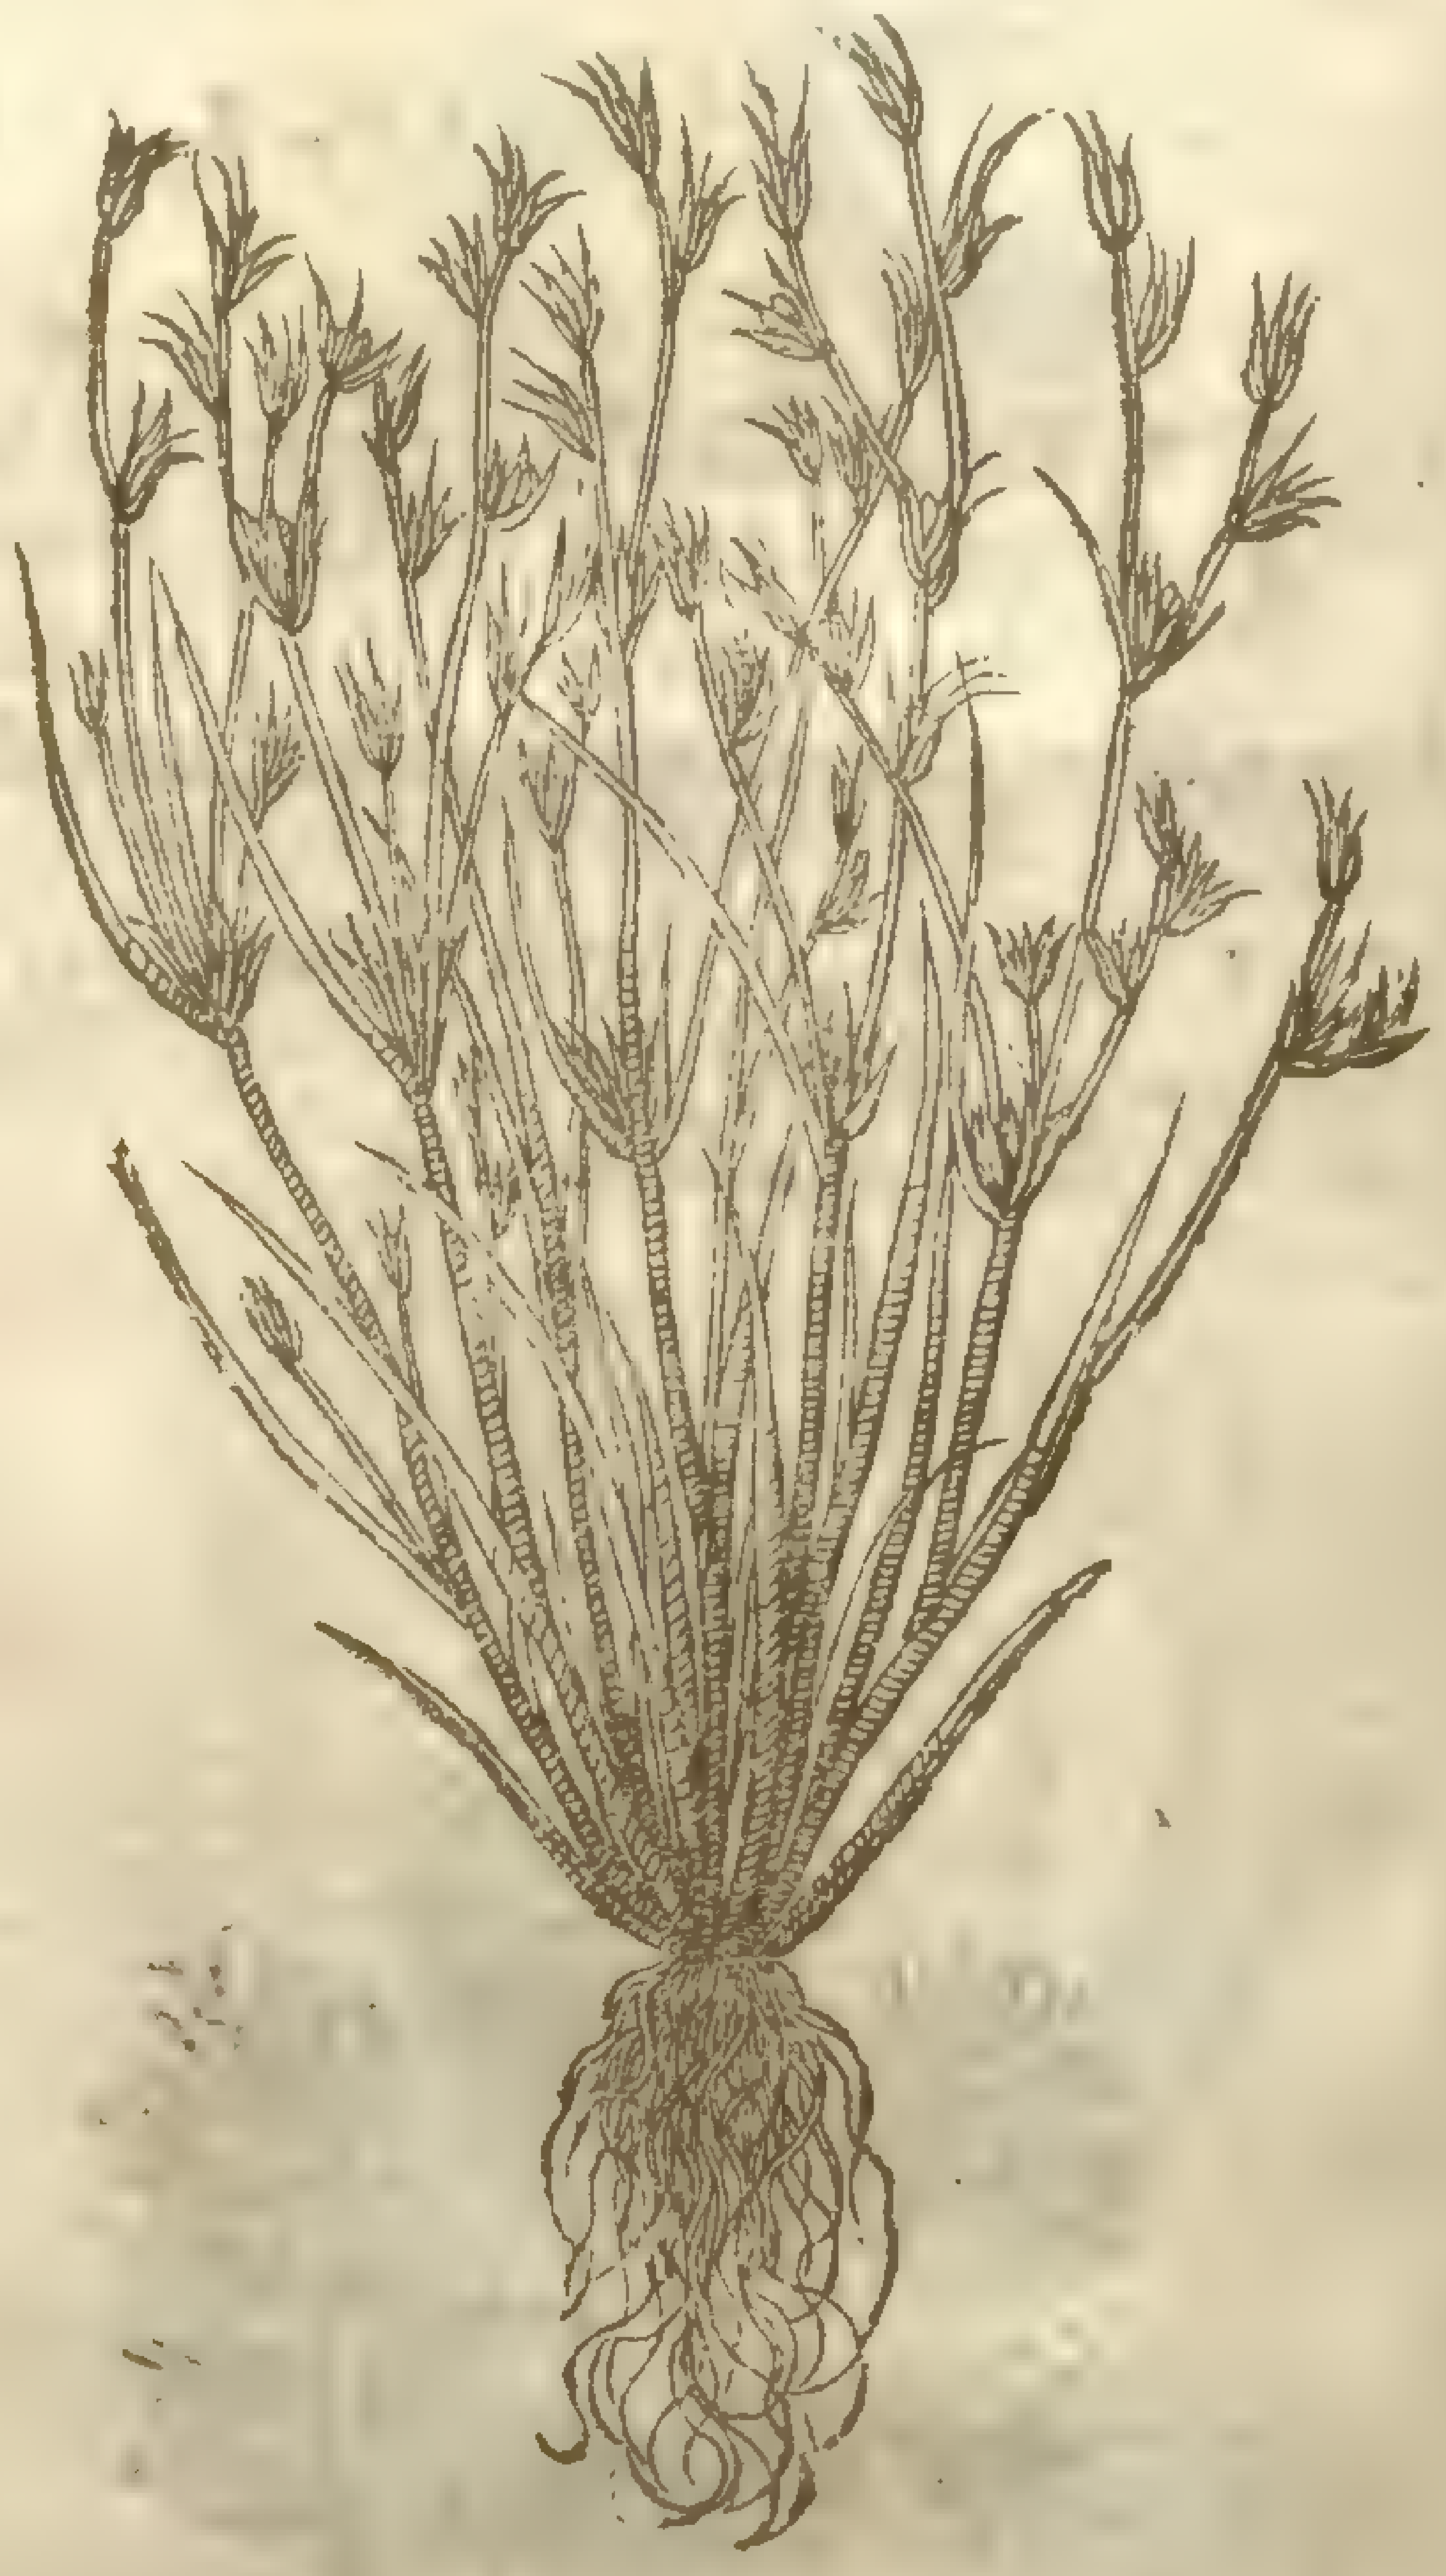
3 *Gramen minus duriuſculum.*
Small hard Graſſe.



Poa rigida [illegible] Sm. [illegible]

4 *Gramen junceum.*
Ruſh-graſſe, or Toad-graſſe.

Juncus bufonius [illegible]



¶ *The Place.*

The Dwarfe-graſſe growes on heathy rough and dry barren grounds, in moſt places of England. ‡ That which I haue giuen you I haue not yet obſerued growing in any part of England. ‡

The white Dwarfe-graſſe is not ſo common as the former, yet doth it grow very plentifully among the Hop gardens in Eſſex, and many other places.

Small Hard-graſſe groweth in moiſt freſh mariſhes and ſuch like places.

Ruſh-graſſe groweth in ſalt mariſhes neere vnto the ſea, where the mariſhes haue beene ouerflowne with ſalt water. ‡ It alſo groweth in many wet woods, lanes, and ſuch like places; as in the lane going by Totenam Court toward Hampſted. The leſſer varietie hereof growes on the bogs vpon Hampſted heath. ‡

¶ *The Time.*

Theſe kindes of Graſſes do grow, floure, and flouriſh, when the common Medow-graſſe doth.

¶ *The Names.*

It ſufficeth what hath been ſaid of the Names in the Deſcription, as well in Engliſh as Latine; only that ſome haue deemed white Dwarfe-graſſe to be called *Xerampelinum.*

Ruſh-graſſe hath been taken for *Holoſteum Matthioli.*

‡ ¶ *The Names in particular.*

1 This I here giue you in the firſt place is *Gramen minimum Xerampelinum* of *Lobel:* it is the

Gramen of *Matthiolus*, and *Gramen Bulboſum* of *Daleſchampius*. Our Author did not vnderſtand what *Xerampelinus* ſignified, when as he ſaid the white Dwarfe-graſſe was ſo termed; for the word imports red or murrey, ſuch a colour as the withered leaues of Vines are of. 2. *Tabern.* calls this, *Gramen panniculatum minus*. 3. *Lobel* calls this, *Exile Gramen durius*. 4. This by *Matthiolus* was called *Holoſteum*: by *Thalius*, *Gramen epigonatocaulon*: by *Tabern. Gra. Bufonium*, that is, Toad-graſſe.

¶ *The Nature and Vertues.*

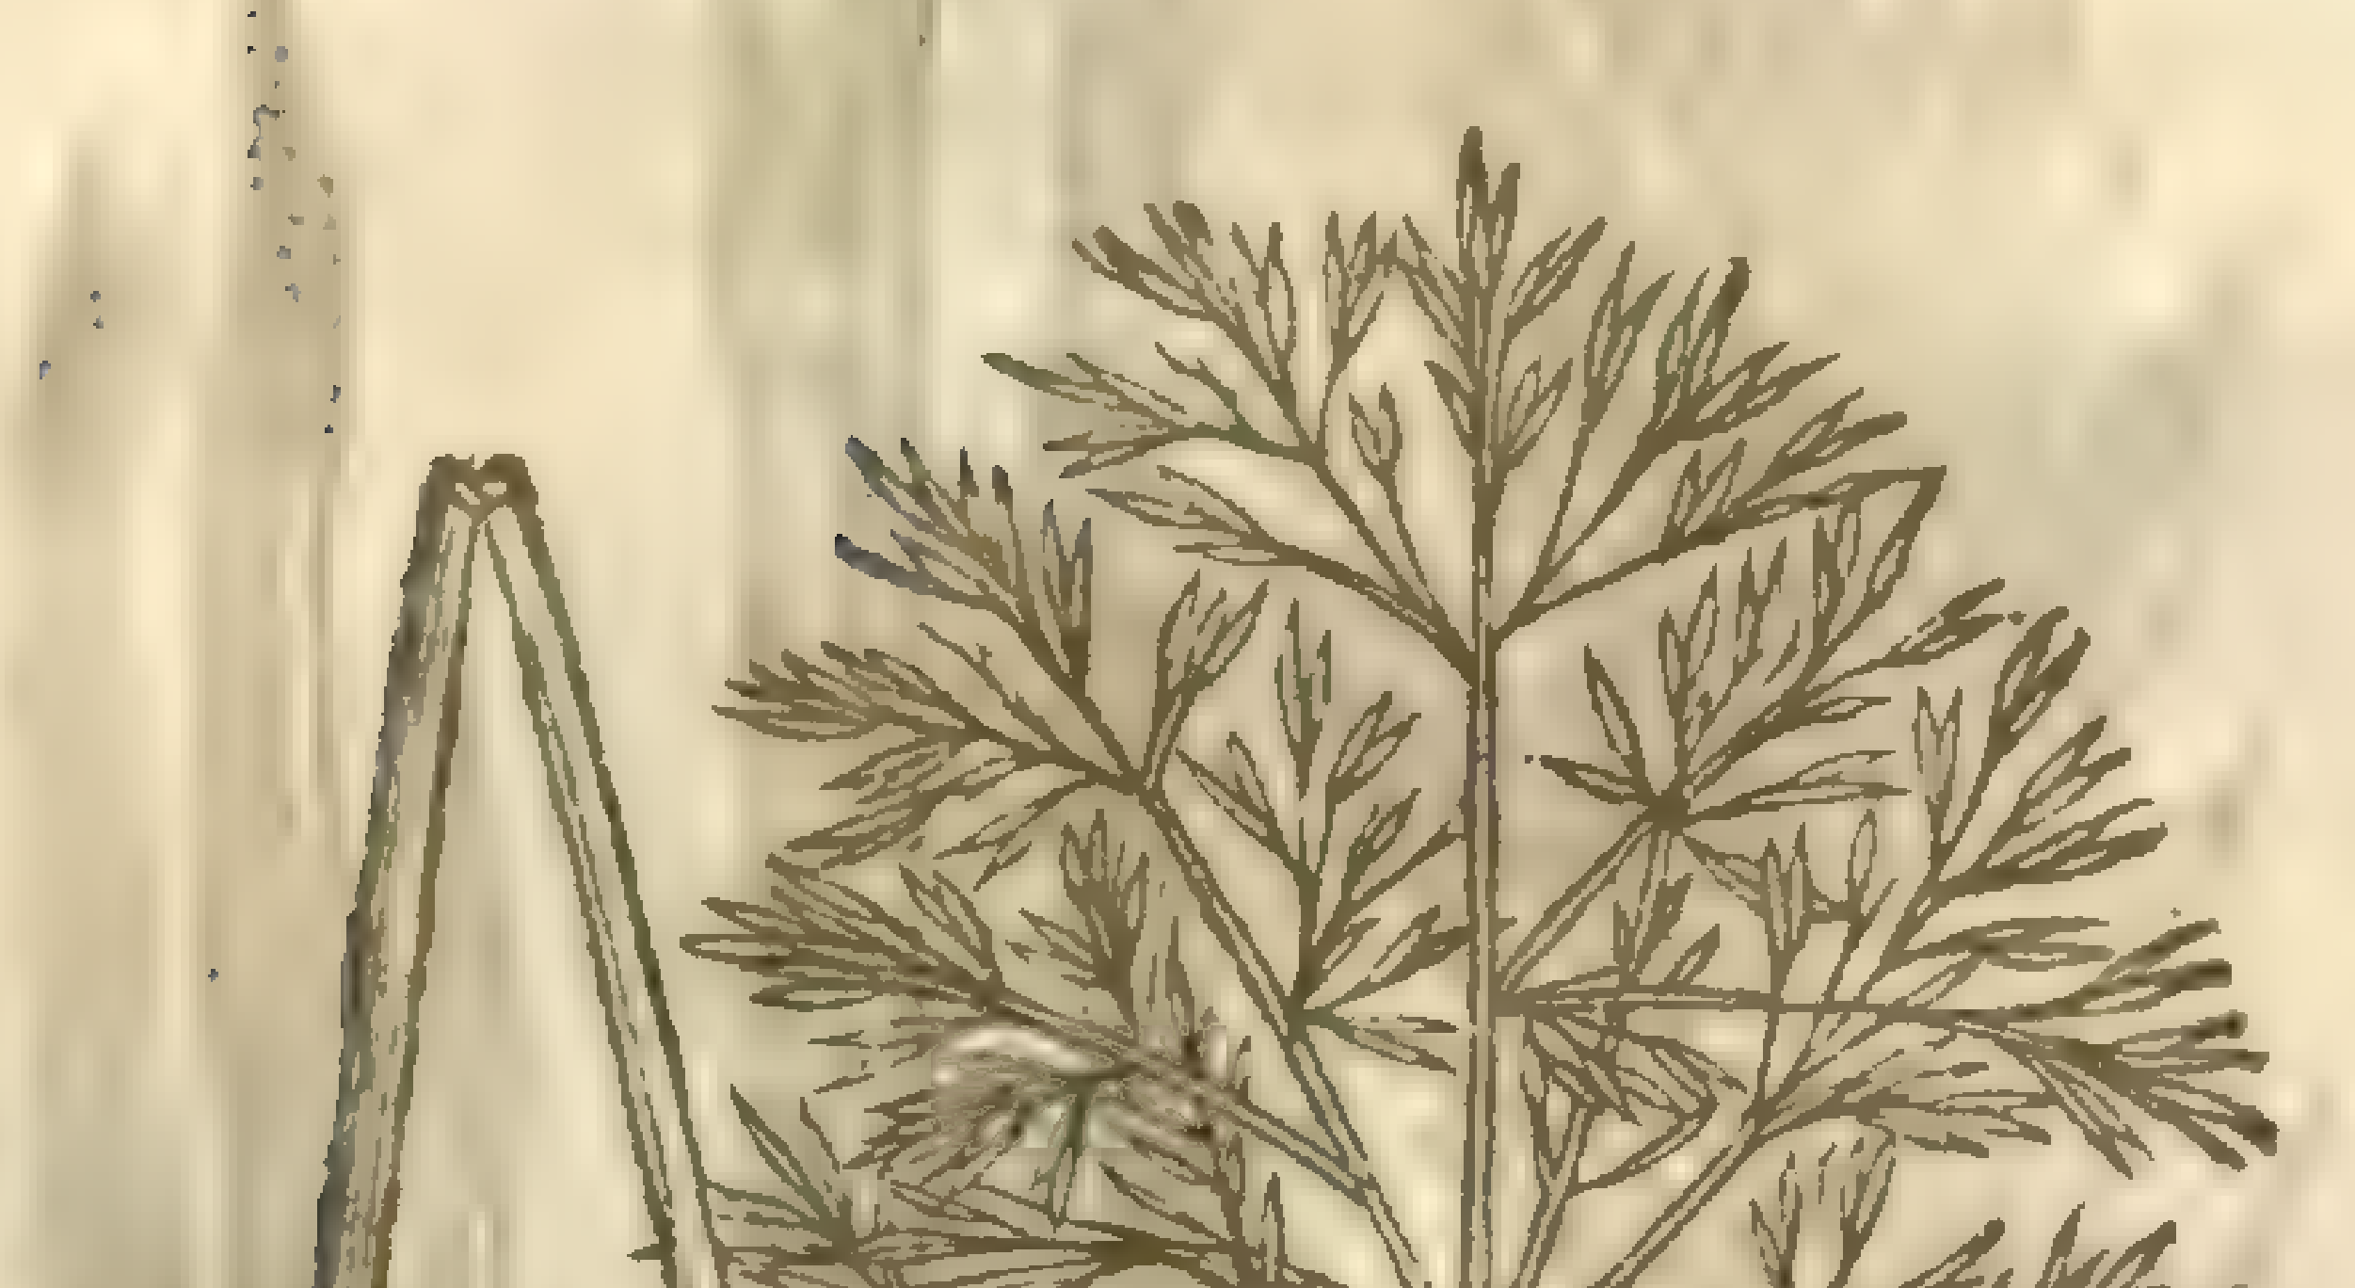
Theſe kindes of Graſſe do agree as it is thought with the common Medow-graſſe in nature and vertues, notwithſtanding they haue not been vſed in phyſicke as yet, that I can reade of.

† The firſt figure was onely a varietie of the ſecond, according to *Bauhinus*; yet in my iudgement it was the ſame with the third, which is *Gramen minus duriuſculum*.

Chap. 3. *Of Corne-Graſſe.*

¶ *The Deſcription.*

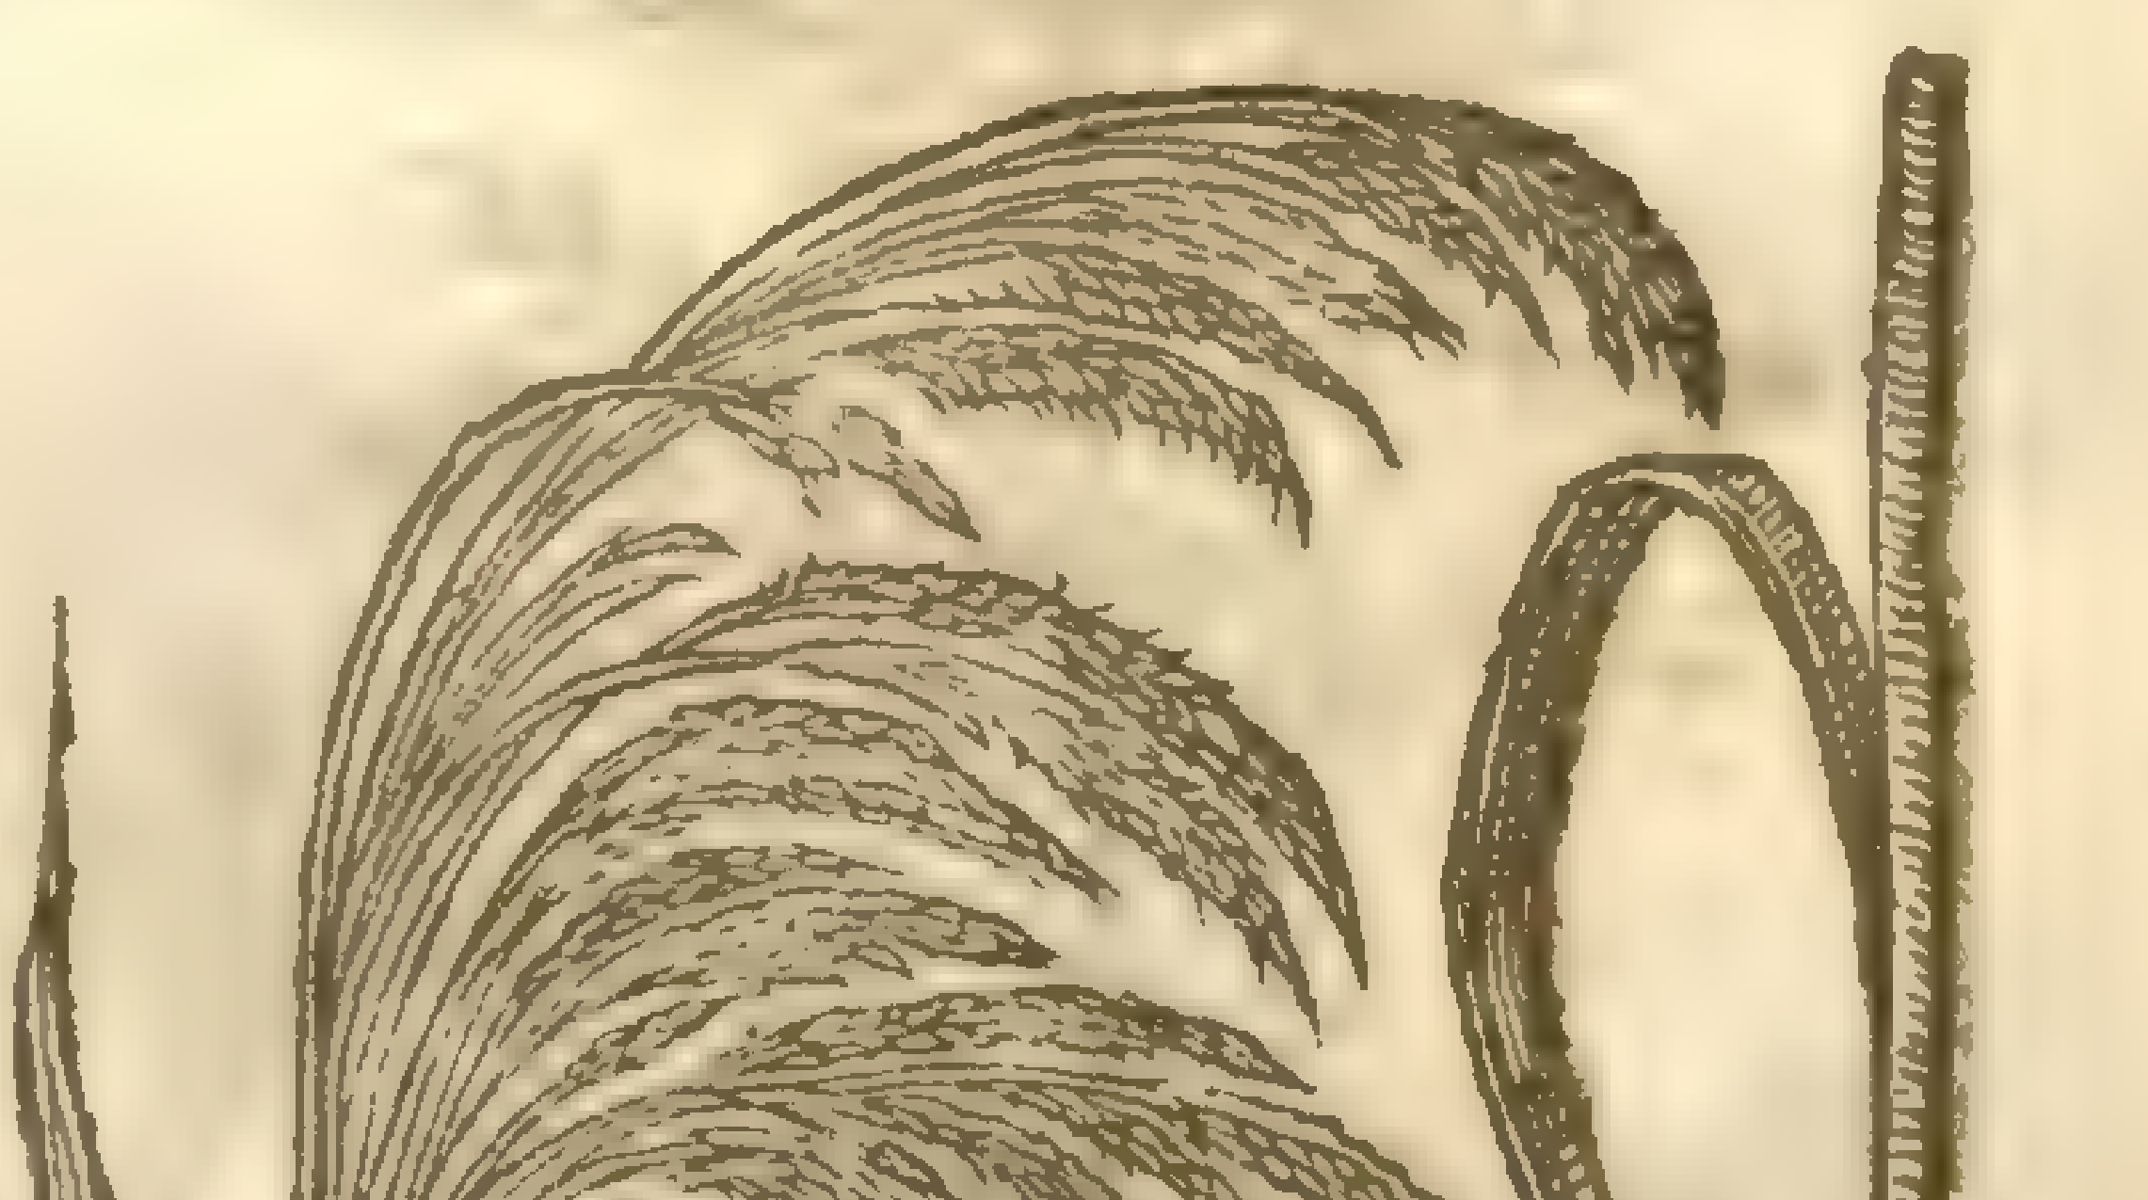
1 Corne-graſſe hath many graſſie leaues reſembling thoſe of Rie, or rather Oats, amongſt the which come vp ſlender benty ſtalkes, kneed or jointed like thoſe of Corne; whereupon groweth a faire tuft or pannicle not much vnlike to the feather-like tuft of common Reed, but rounder compact together like vnto Millet. The root is threddy like thoſe of Oats.



1 *Gramen ſegetale.*
Corne-graſſe.

Aira caryophyllea Sp. pl.

Lob. ic. 2



2 *Gramen harundinaceum.*
Reed-graſſe, or Bent.

Agrostis spica venti Sp. pl.

2 Reed-graſſe hath many thin graſſie leaues like the former: the buſhy top with his long feather-like pannicles do reſemble the common Reed, which is lightly ſhaken with the winde, branched vpon a long ſlender Reeden ſtalke, kneed or jointed like corne. The root is ſmall and fibrous.

¶ *The Place and Time.*

Theſe kindes of Graſſes grow for the moſt part neere hedges, & in fallow fields in moſt places. Their time of ſpringing, flouring, and fading, may be referred to the common Medow-graſſe.

¶ *The Names.*

† The firſt is called in Engliſh, Corne-graſſe. *Lobel* calls this, *Segetum gramen pannicula ſpecioſa latiore:* others terme it *Gramen ſegetale*, for that it vſually groweth among corne; the which I haue not as yet ſeene.

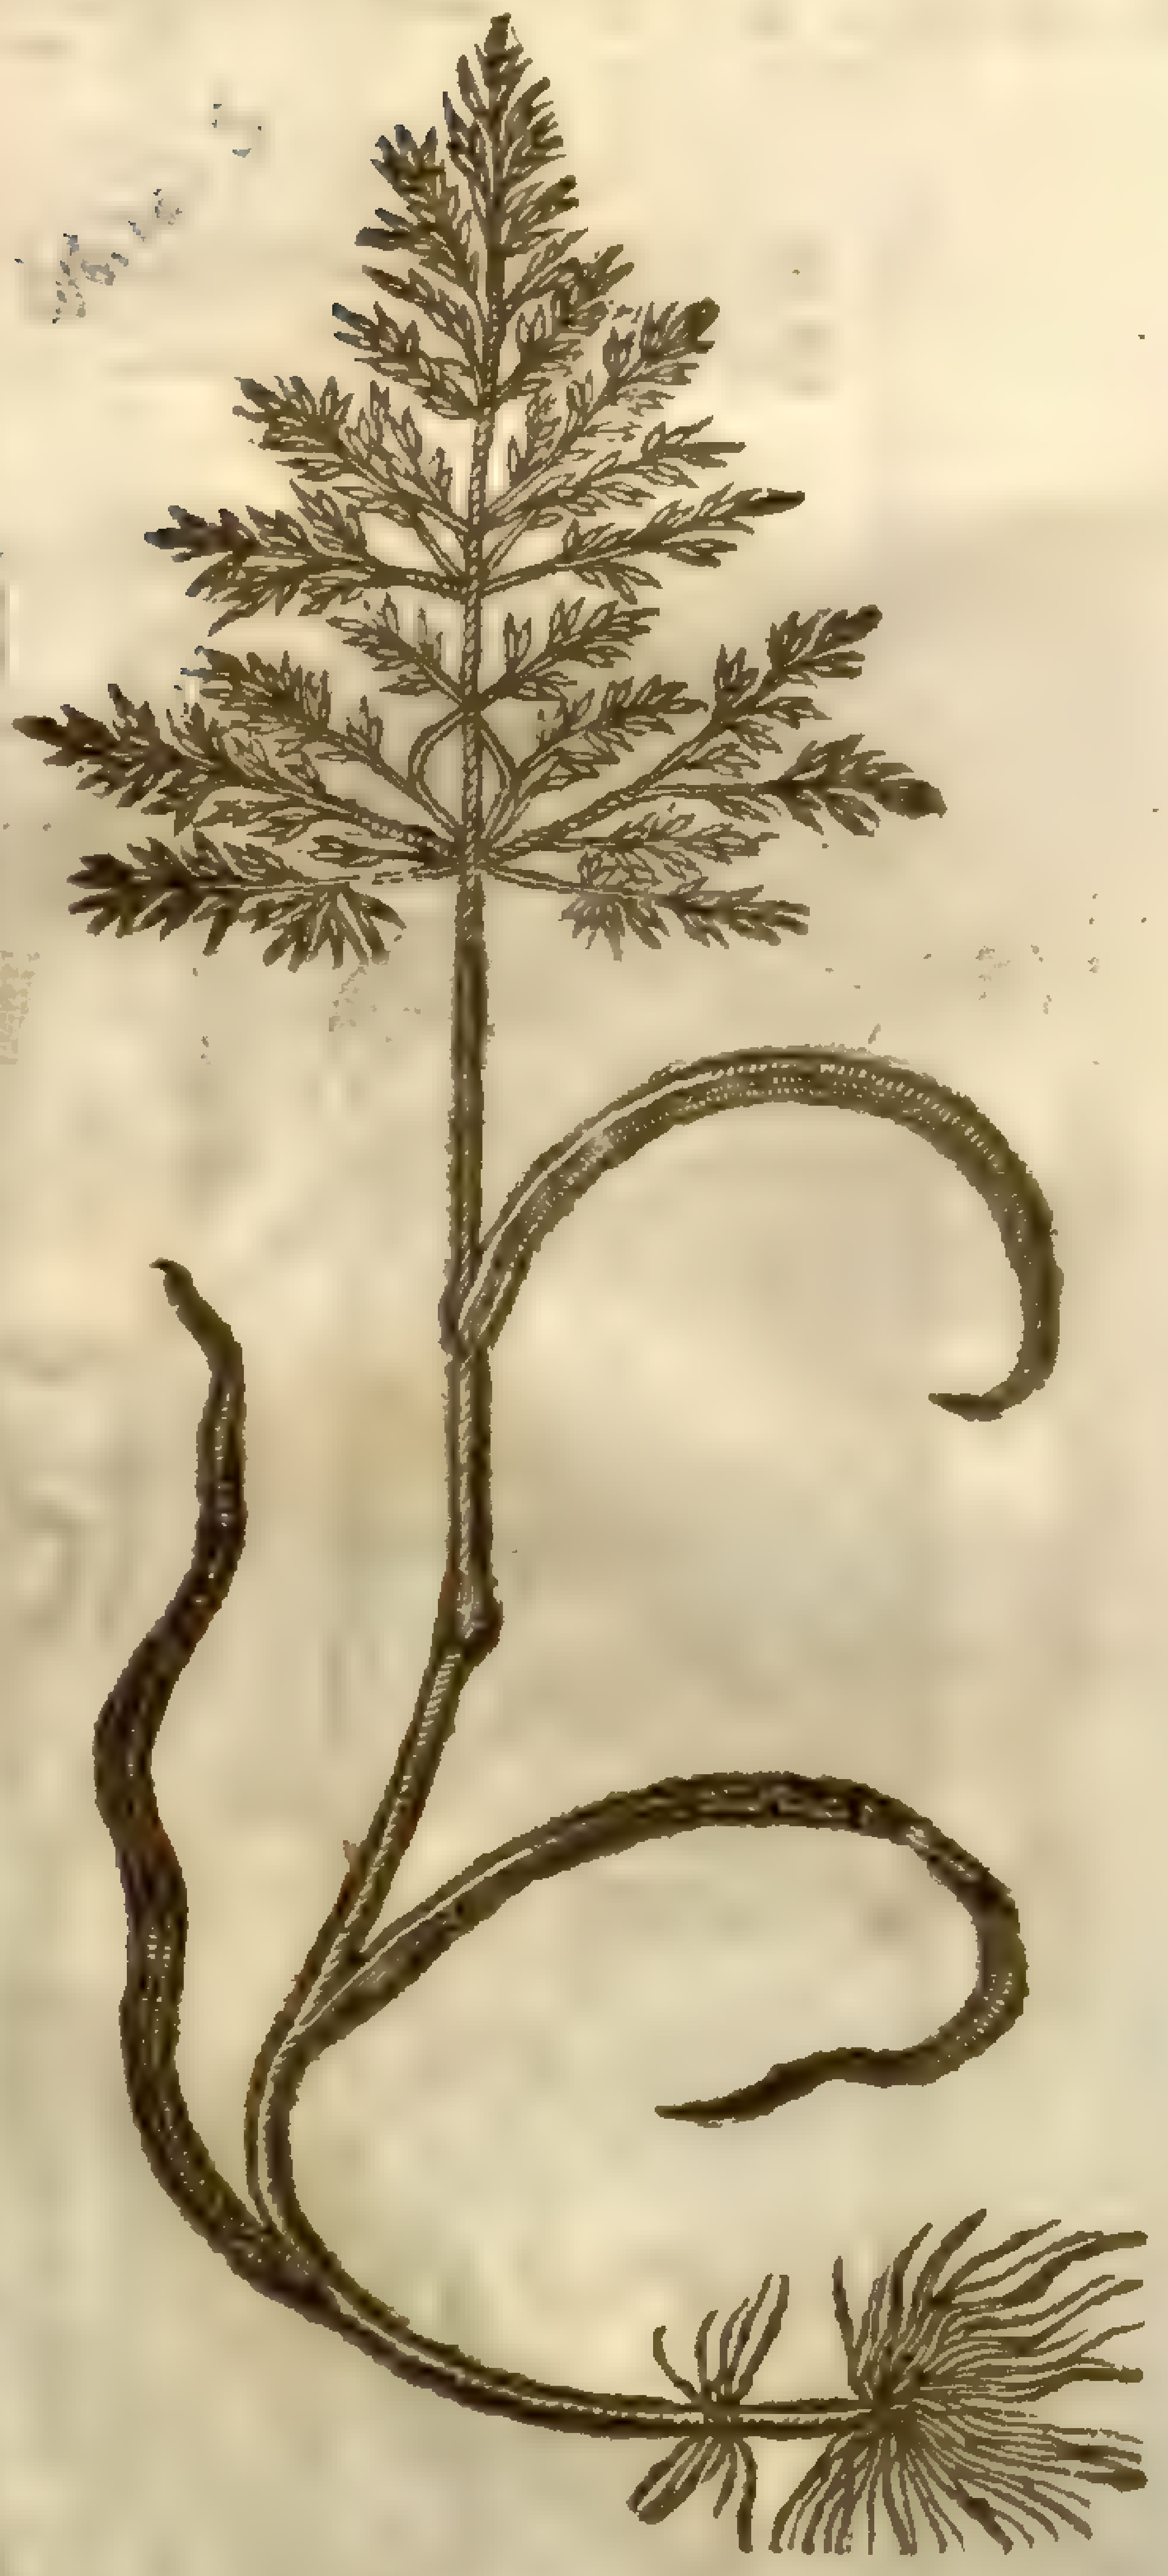
The ſecond is called in Engliſh, Reed-graſſe: of *Lobel* in Latine, *Gramen agrorum latiore, arundinacea, & comoſa pannicula*, for that his tuft or pannicles do reſemble the Reed: and *Spica venti agrorum*, by reaſon of his feather top, which is eaſily ſhaken with the wind. ‡ Some in Engliſh, much agreeing to the Latine name, call theſe Windle-ſtrawes. Now I take this laſt to be the Graſſe with which we in London do vſually adorne our chimneys in Sommer time: and wee commonly call the bundle of it handſomely made vp for our vſe, by the name of Bents. ‡

¶ *The Temperature and Vertues.*

Theſe Graſſes are thought to agree with common Graſſe, as well in Temperature as Vertues, although not vſed in phyſicke.

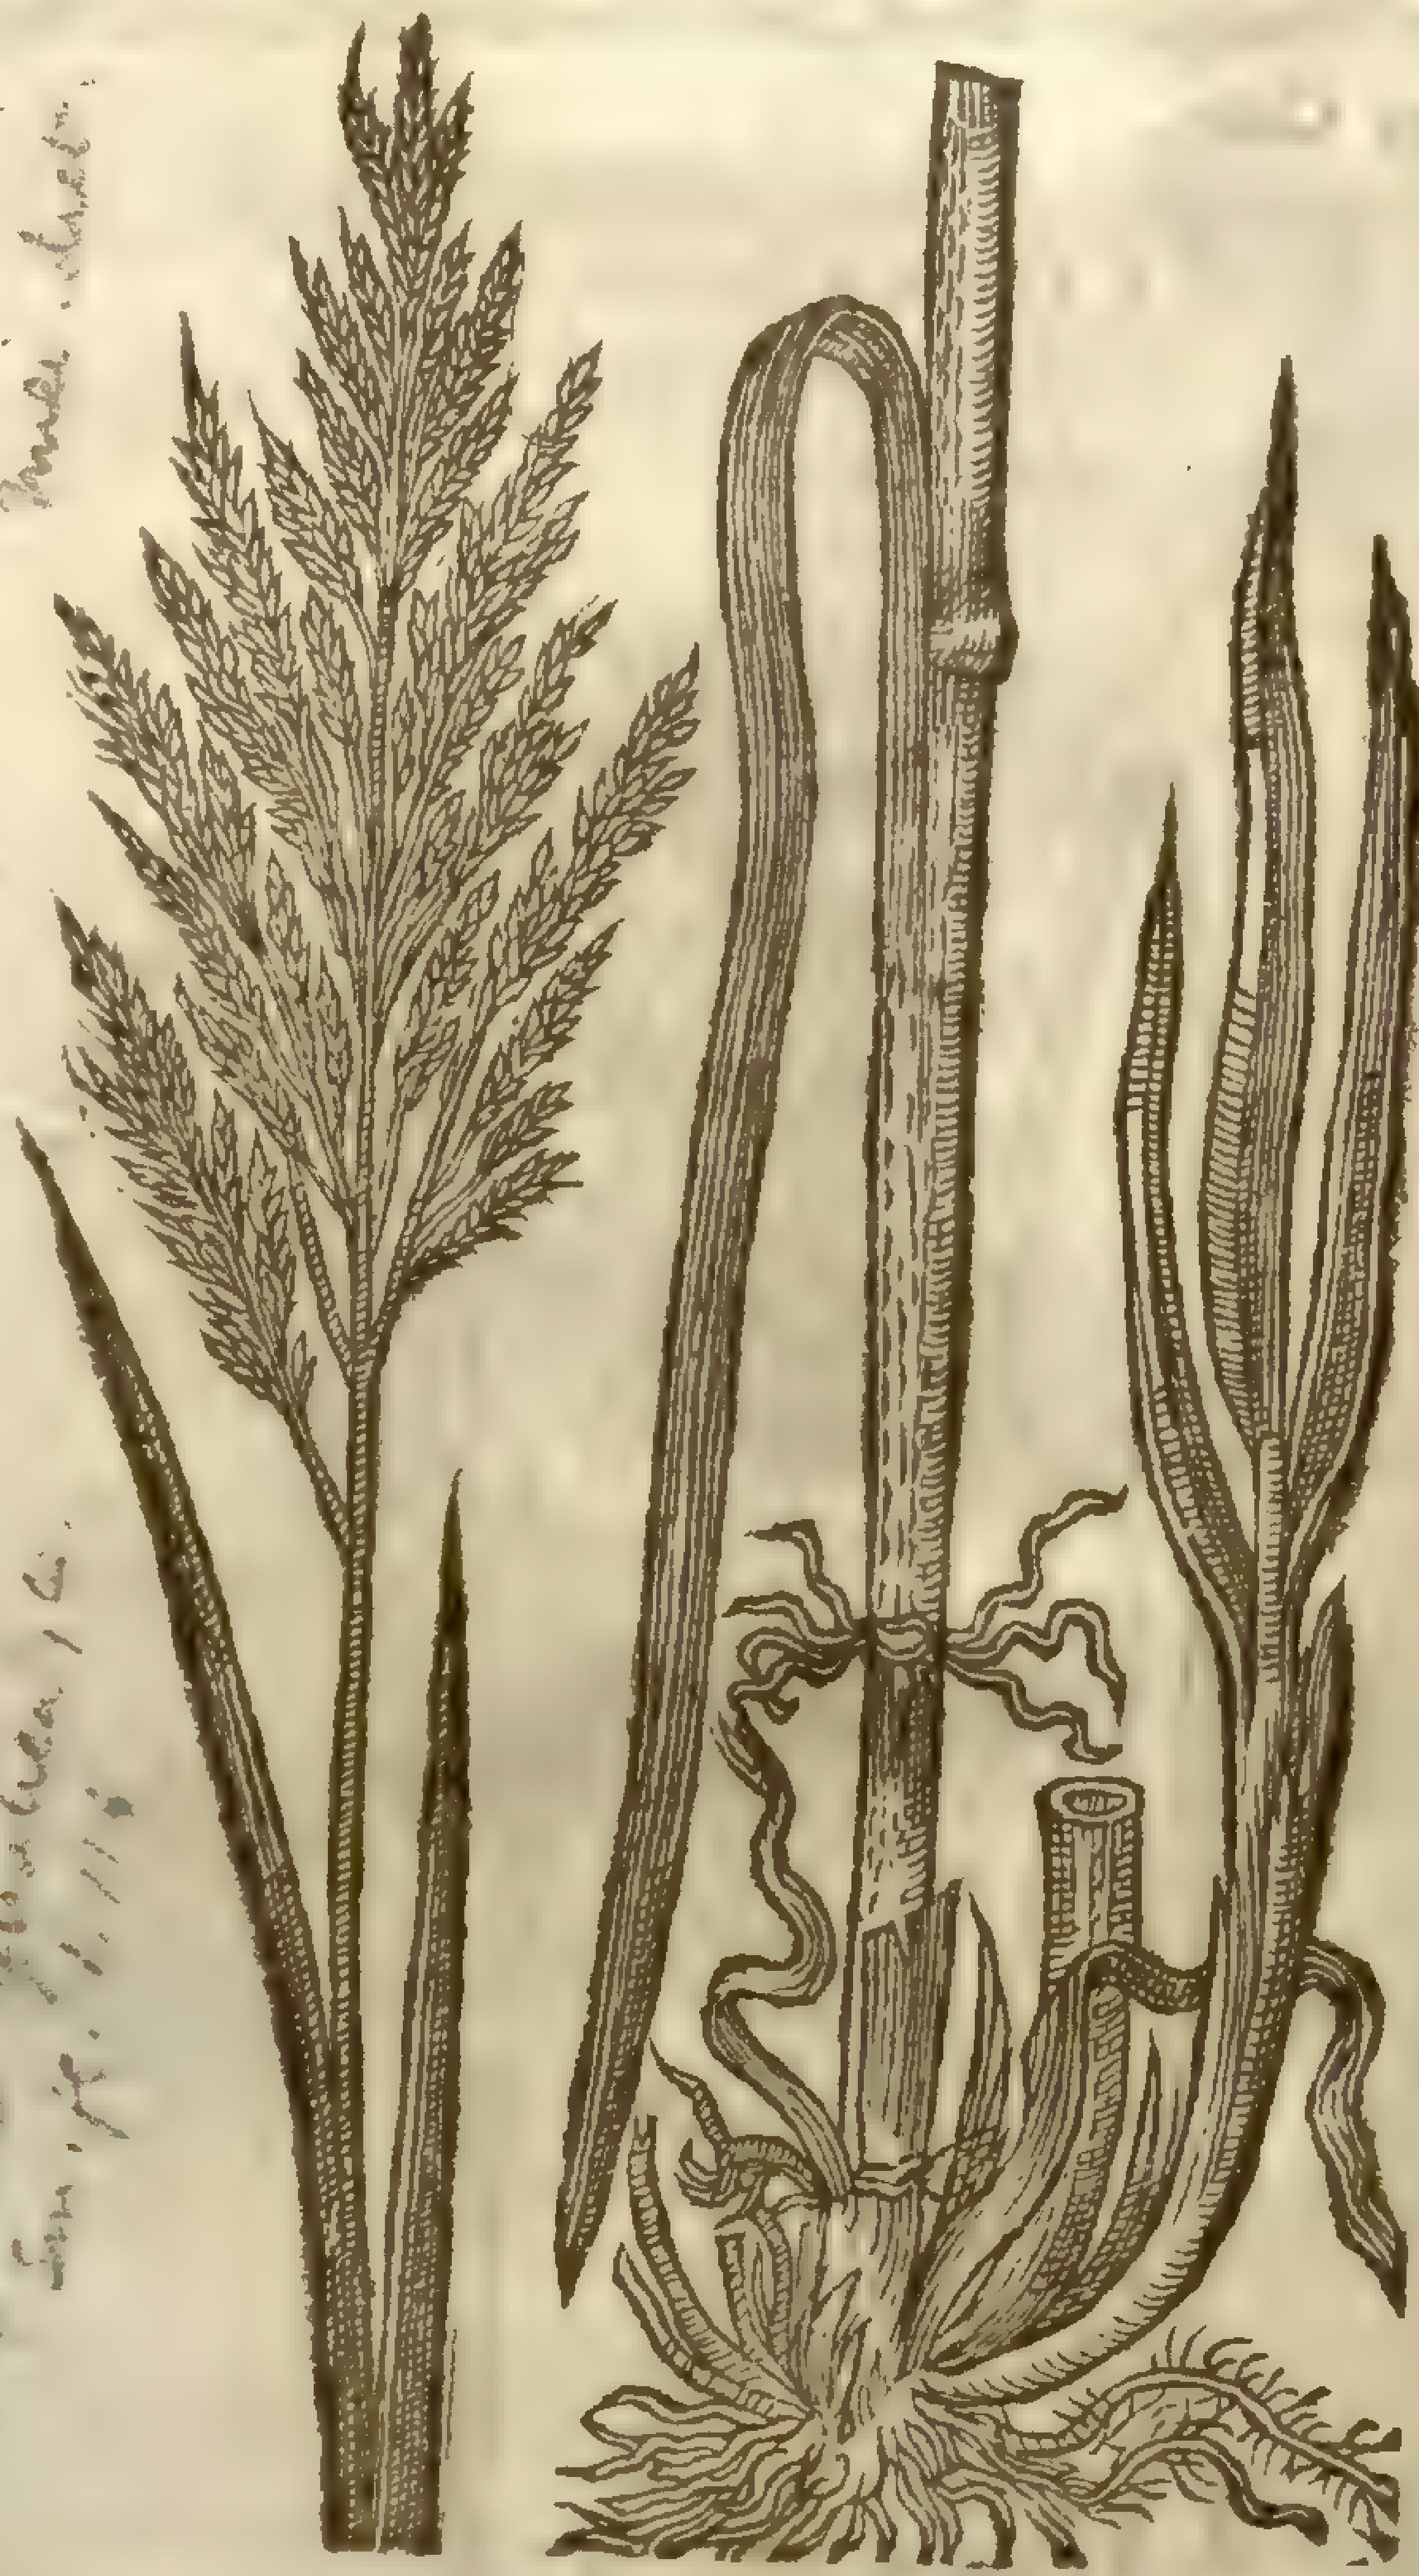
CHAP. 4. *Of Millet Graſſe.*

1 *Gramen Miliaceum.*
Millet Graſſe.



Milium effusum, L.

† 1 *Gramen majus aquaticum.*
Great Water-Graſſe.



Poa aquatica,

¶ *The Deſcription.*

1 Millet Graſſe is but a ſlender Graſſe, bearing a tuft or eare like vnto the common Medow-graſſe, but conſiſting of ſmall ſeeds or chaffie heads like to Milium or Millet, whereof it tooke the name. The ſtalke or leaues do reſemble the Bent, wherewith countrey people do trim their houſes.

2 The great Water-Graſſe, in root, leafe, tuft, and reeden ſtalke, doth very well reſemble the Graſſe called in Latine, *Gramen ſulcatum*, or *Pictum*; and by our Engliſh women, Lady-laces, becauſe it is ſtript or furrowed with white and greene ſtreakes like ſilke laces, but yet differs from that, that this Water-Graſſe doth get vnto it ſelfe ſome new roots from the middle of the ſtalkes and joints, which the other doth not. ‡ This is a large Graſſe, hauing ſtalkes almoſt as thicke as ones little finger, with the leaues anſwerable vnto them, and a little roughiſh. The tuft is ſomewhat like a Reed, but leſſe, and whitiſh coloured. ‡

¶ *The Place, Time, Names, Nature, and Vertues.*

The former growes in medowes, and about hedges; and the later is to be found in moſt fennie and waterie places; and haue their Vertues and Natures common with the other Graſſes, for any thing that wee can finde in writing. The reaſon of their names may be gathered out of the deſcription.

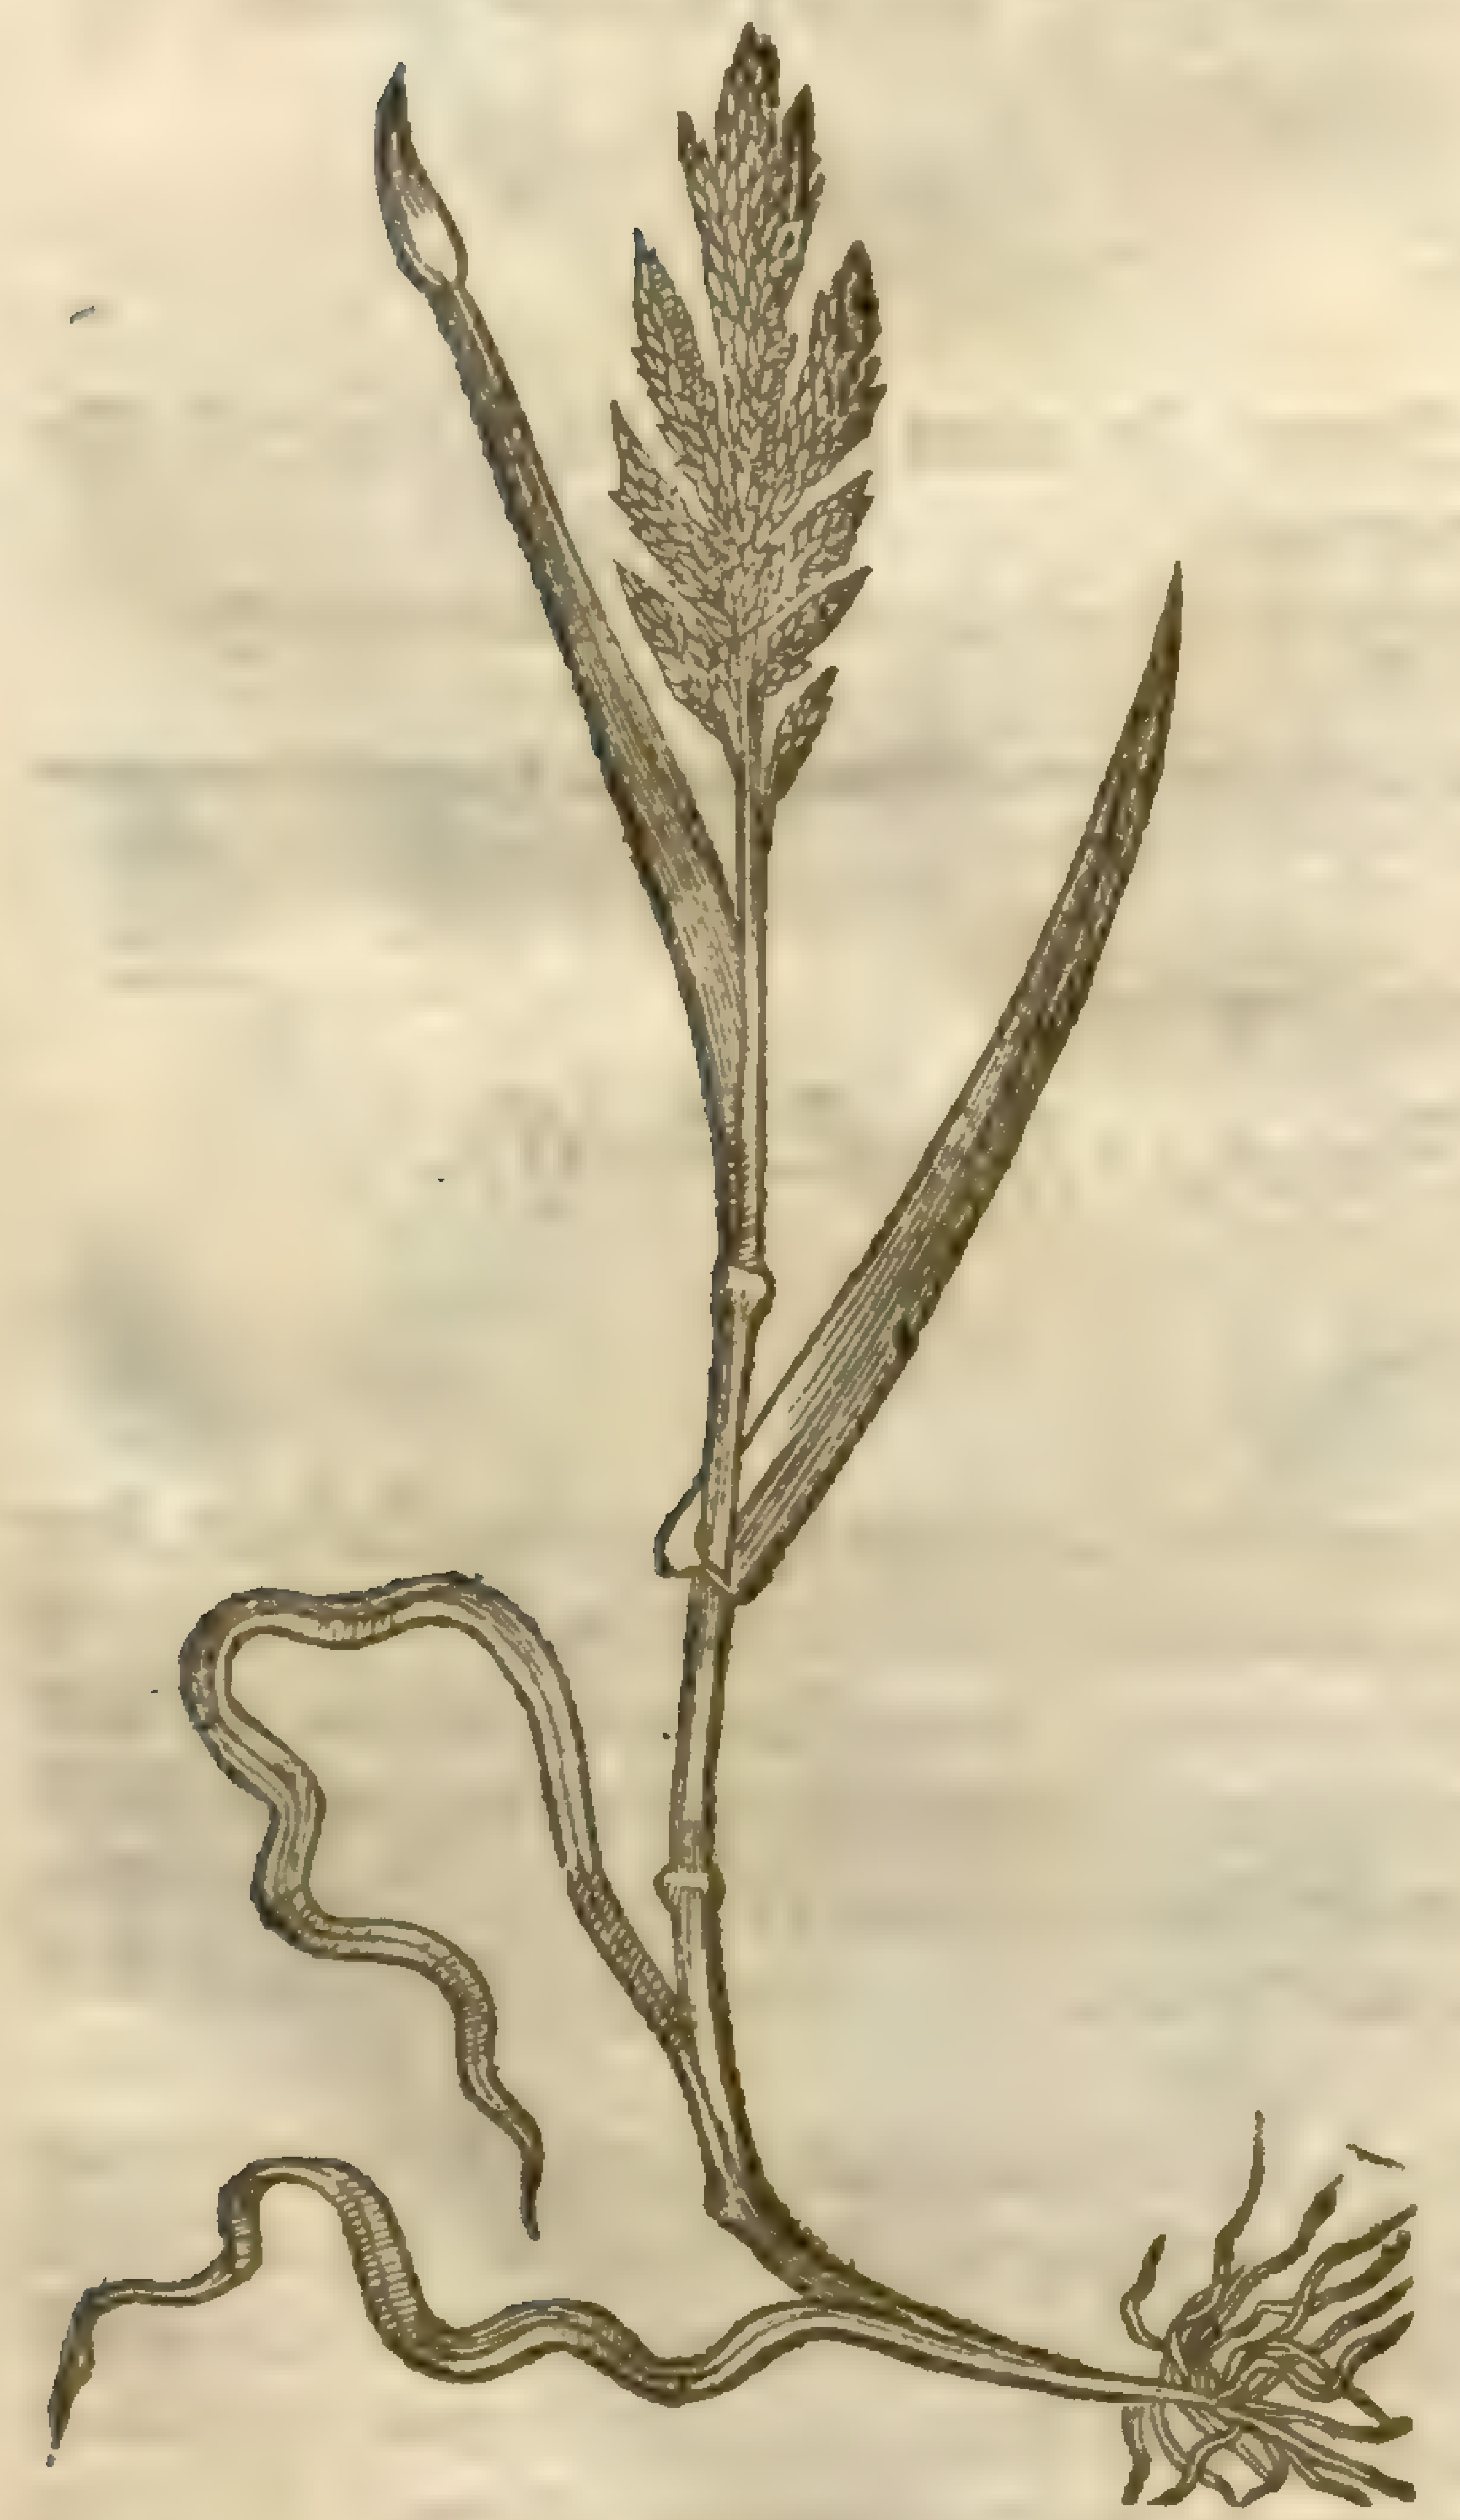
‡ This which I giue you in the ſecond place is not of the ſame plant that was figured in the former edition; for that picture was of *Gramen aquaticum harundinaceum paniculatum* of *Tabern.* which hath a running root and large ſpecious pannicle like to a Reed, of a browne colour; but it is moſt apparant that our Author meant this, and framed his deſcription by looking vpon this figure, eſpecially the later part thereof. The true figure of this was in the ſecond place in the next Chapter.

Chap. 5.

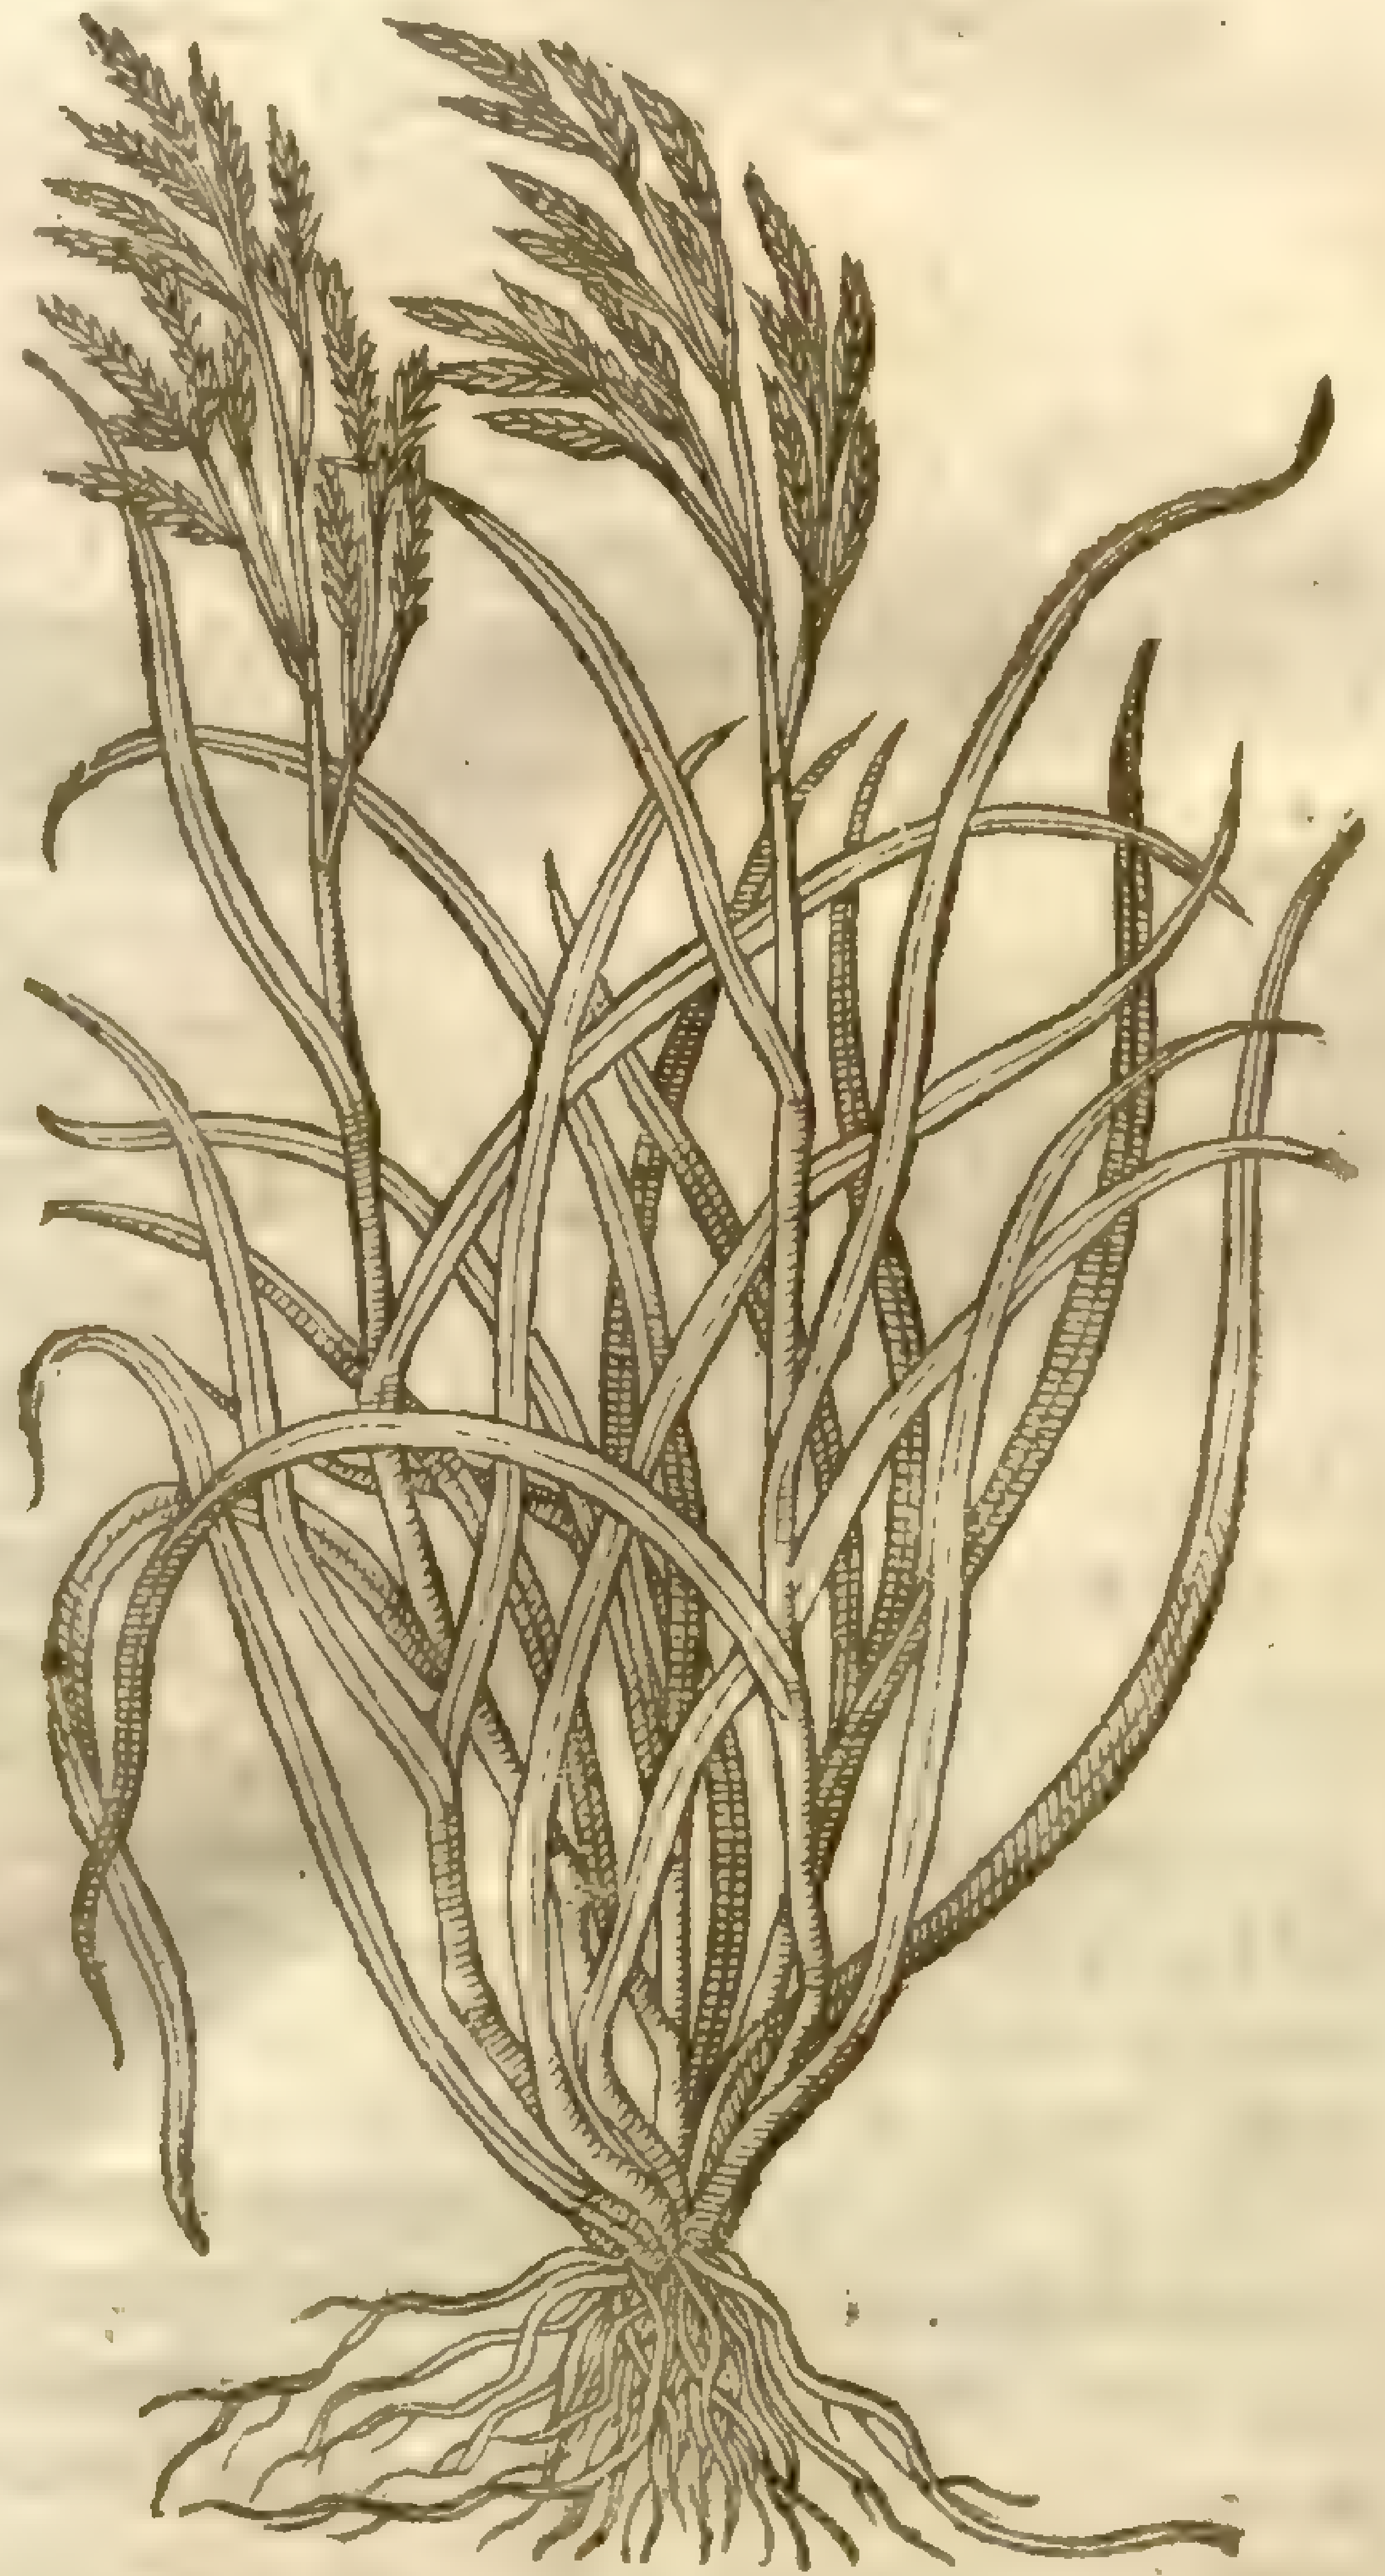
Of Darnell Graſſe.

¶ *The Deſcription.*

1 Darnell graſſe, or *Gramen Sorghinum*, as *Lobel* very properly termed it, hath a browniſh ſtalke thicke and knotty, ſet with long ſharpe leaues like vnto the common Dogs-graſſe; at the top whereof groweth a tuſt or eare of a grayiſh colour, ſomewhat like *Sorghum*, whereof it tooke his name.



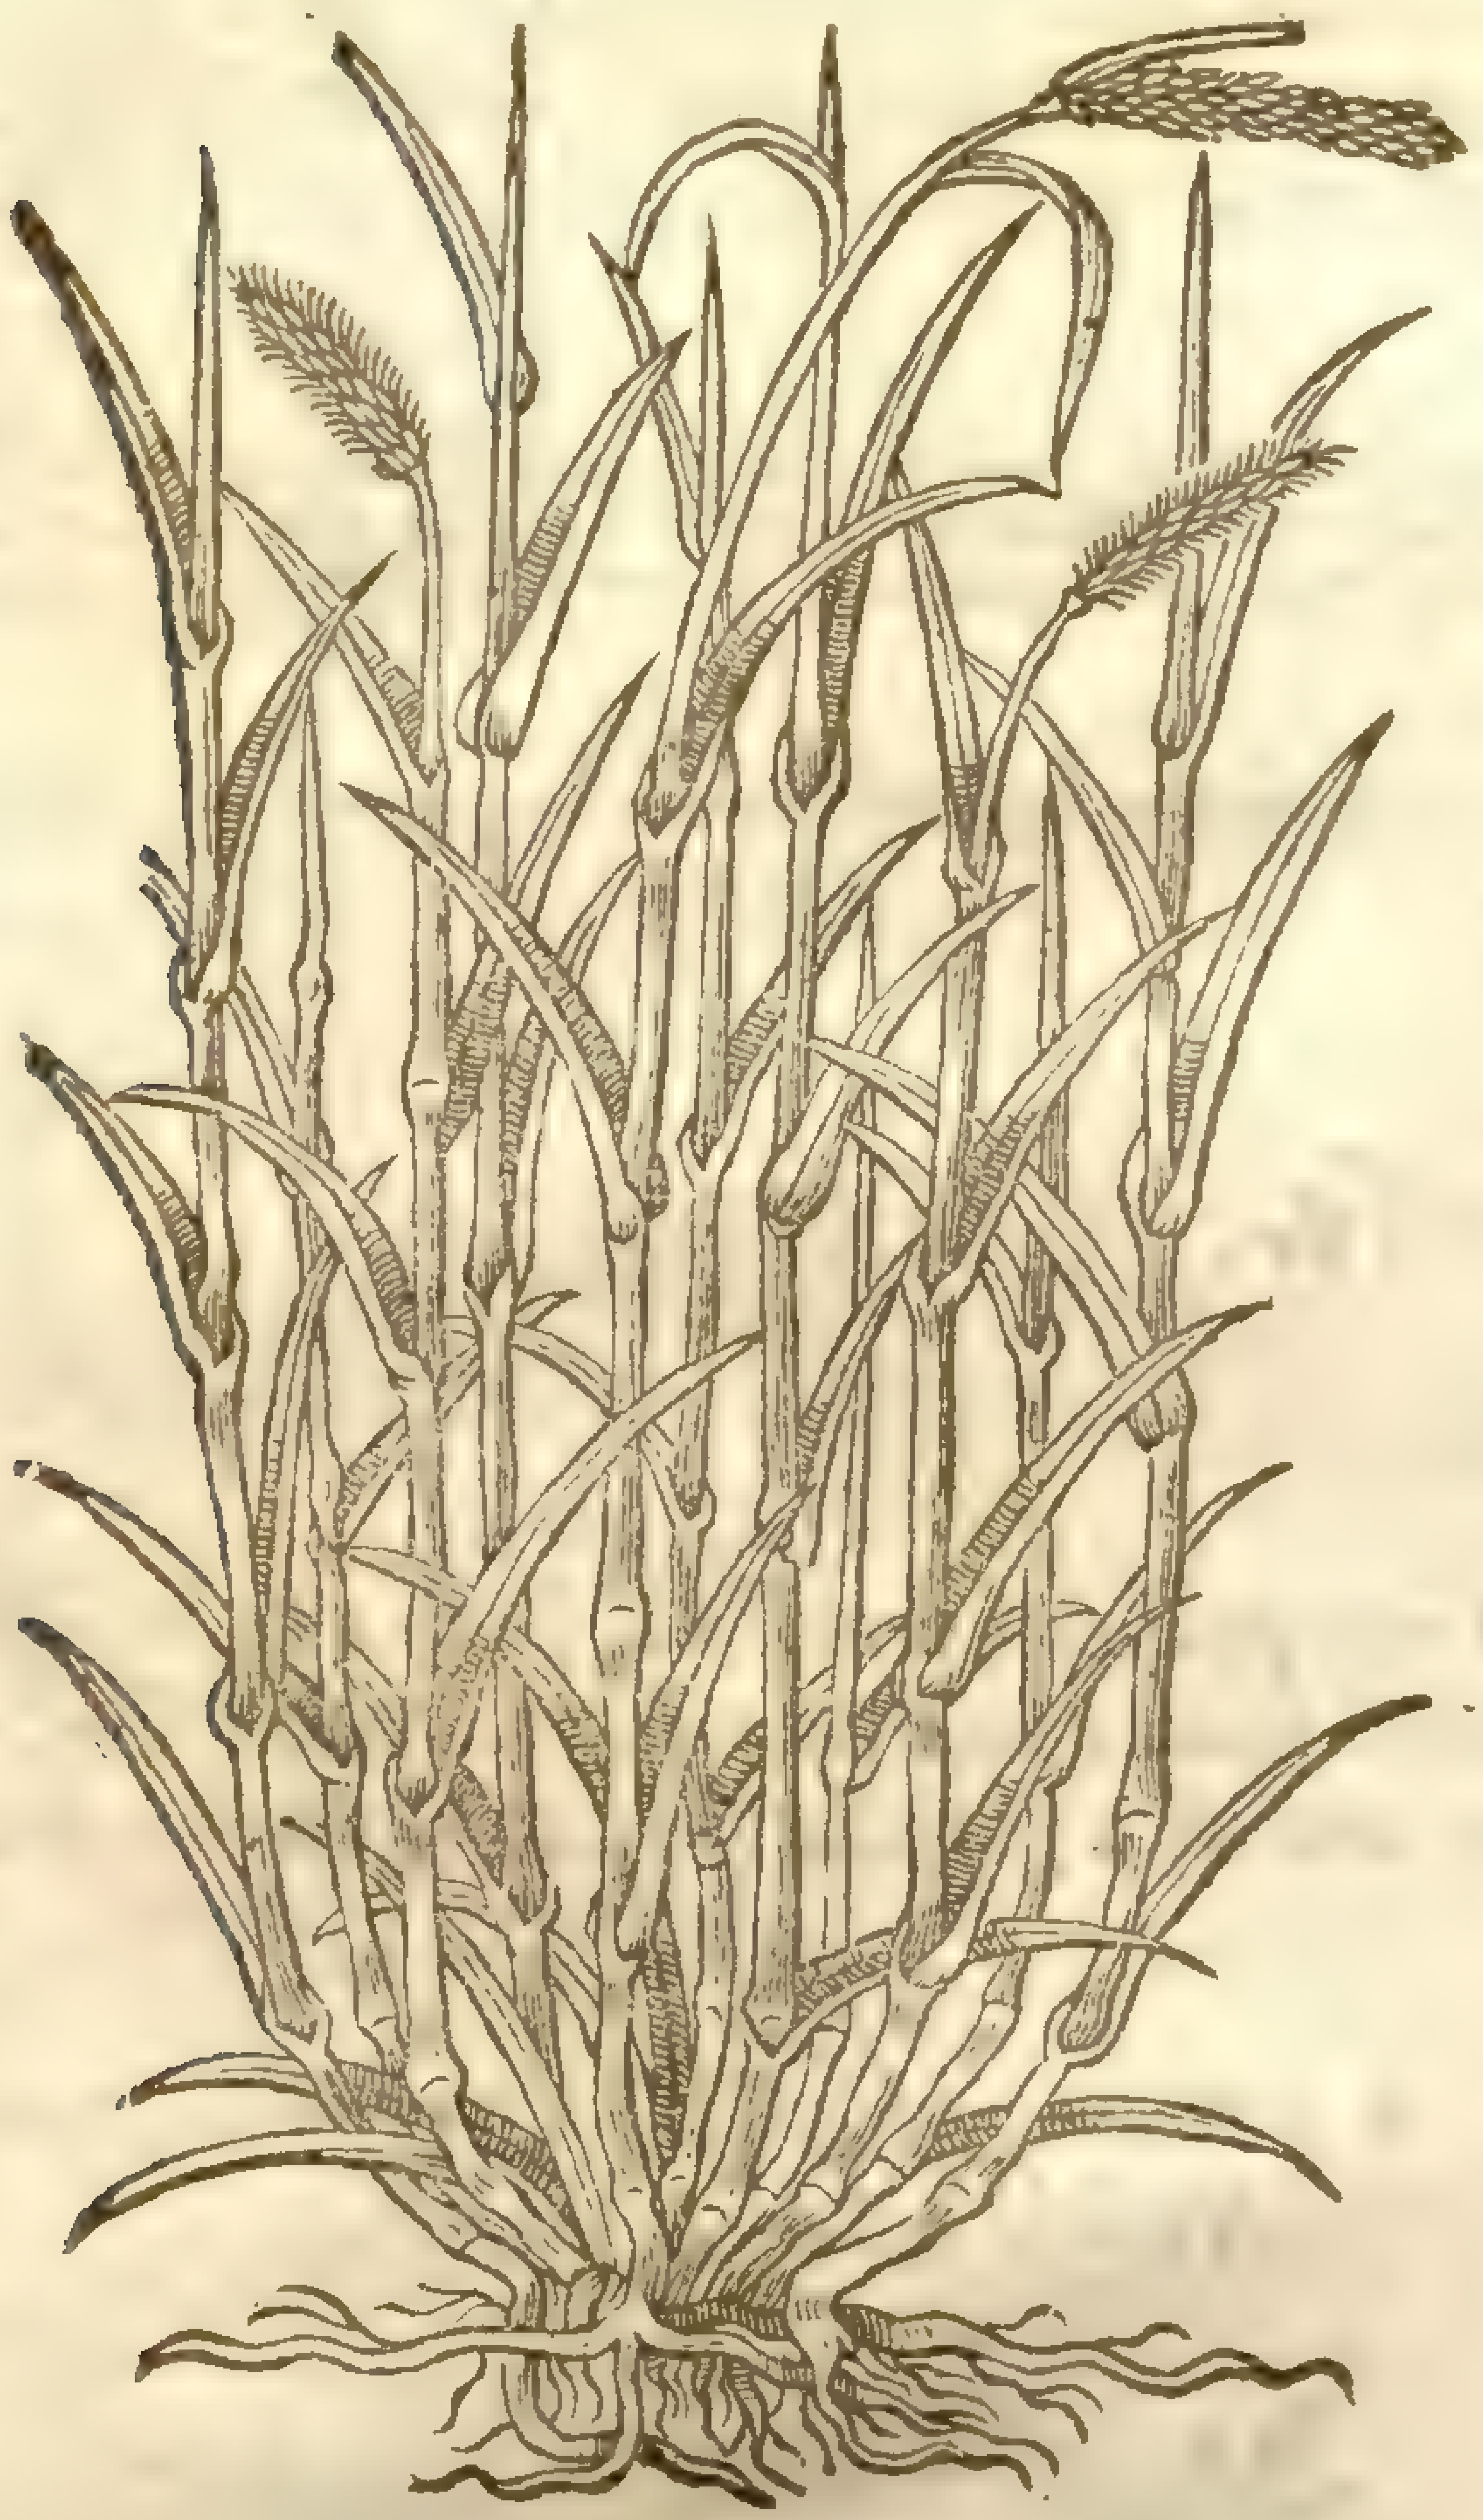
1 *Gramen Sorghinum.*
Darnell Graſſe.



‡ 2 *Gramen harundinaceum panniculatum:*
Wilde Reed.

2 Wilde Reed, or *Gramen harundinaceum panniculatum*, called alſo *Calamogroſtis*, is farre bigger than Couch-graſſe or Dogs graſſe, and in ſtalkes and leaues more rough, rugged, and cutting. It is bad food for cattell, though they want, or be very hungry; and deadly to Sheepe, becauſe that, as the Husbandman ſaith, it is a cauſe of leanneſſe in them, thirſt, and conſumption; it cutteth their

‡ 3 *Gramen harundinaceum minus.*
The leſſer Reed-graſſe.



tongue, ſtraitneth the gullet or throat, and draweth downe bloud into the ſtomacke or maw; whereof enſueth inflammation, and death for the moſt part. And not onely this *Calamogroſtis* is hurtfull, but alſo all other kindes of ſhearing leaued Reeds, Flagges, Sedge, and the like, which haue as it were edges, and cut on both ſides like kniues, as well mens fingers, as cattels mouthes. This herb is in a meane between reed and graſſe. The root is white, creeping downewards very deepe. The ſpike or eare is like vnto the Reed, being ſoft and cottony, ſomewhat reſembling Panicke.

‡ 3 This in root, ſtalks, and leaues, is like to the laſt deſcribed, but that they are leſſer. The top or head is a long ſingle ſpike or eare, not ſeuered or parted into many eares, like the top of the precedent, and by this and the magnitude it may chiefely be diſtinguiſhed from it. This was in the twelfth place in the ſixteenth chapter, vnder the title of *Gramen harundinaceum minus:* and the *Calamogroſtis* but now deſcribed, was likewiſe there againe in the eleuenth place. ‡

¶ *The Place.*

The firſt growes in fields and Orchards almoſt euerie where.

The other grow in fenny waterie places.

¶ *The Names.*

2 This in Lincolnſhire is called Sheere-graſſe or Henne; in other parts of England, Wilde Reed: in Latine, *Calamogroſtis*, out of the Greeke *Kalamogroſtis*.

As for their natures and vertues, we do not finde any great vſe of them worth the relating.

† The figure that was in the ſecond place was of *Gramen maius aquaticum*, being the ſecond of the precedent Chapter. The true figure of this was pag.21 vnder the title of *Gramen harundinaceum maius*. The third being there alſo, as I haue touched in the Deſcription.

Chap. 6. *Of Feather-top, Ferne, or Wood-Graſſe.*

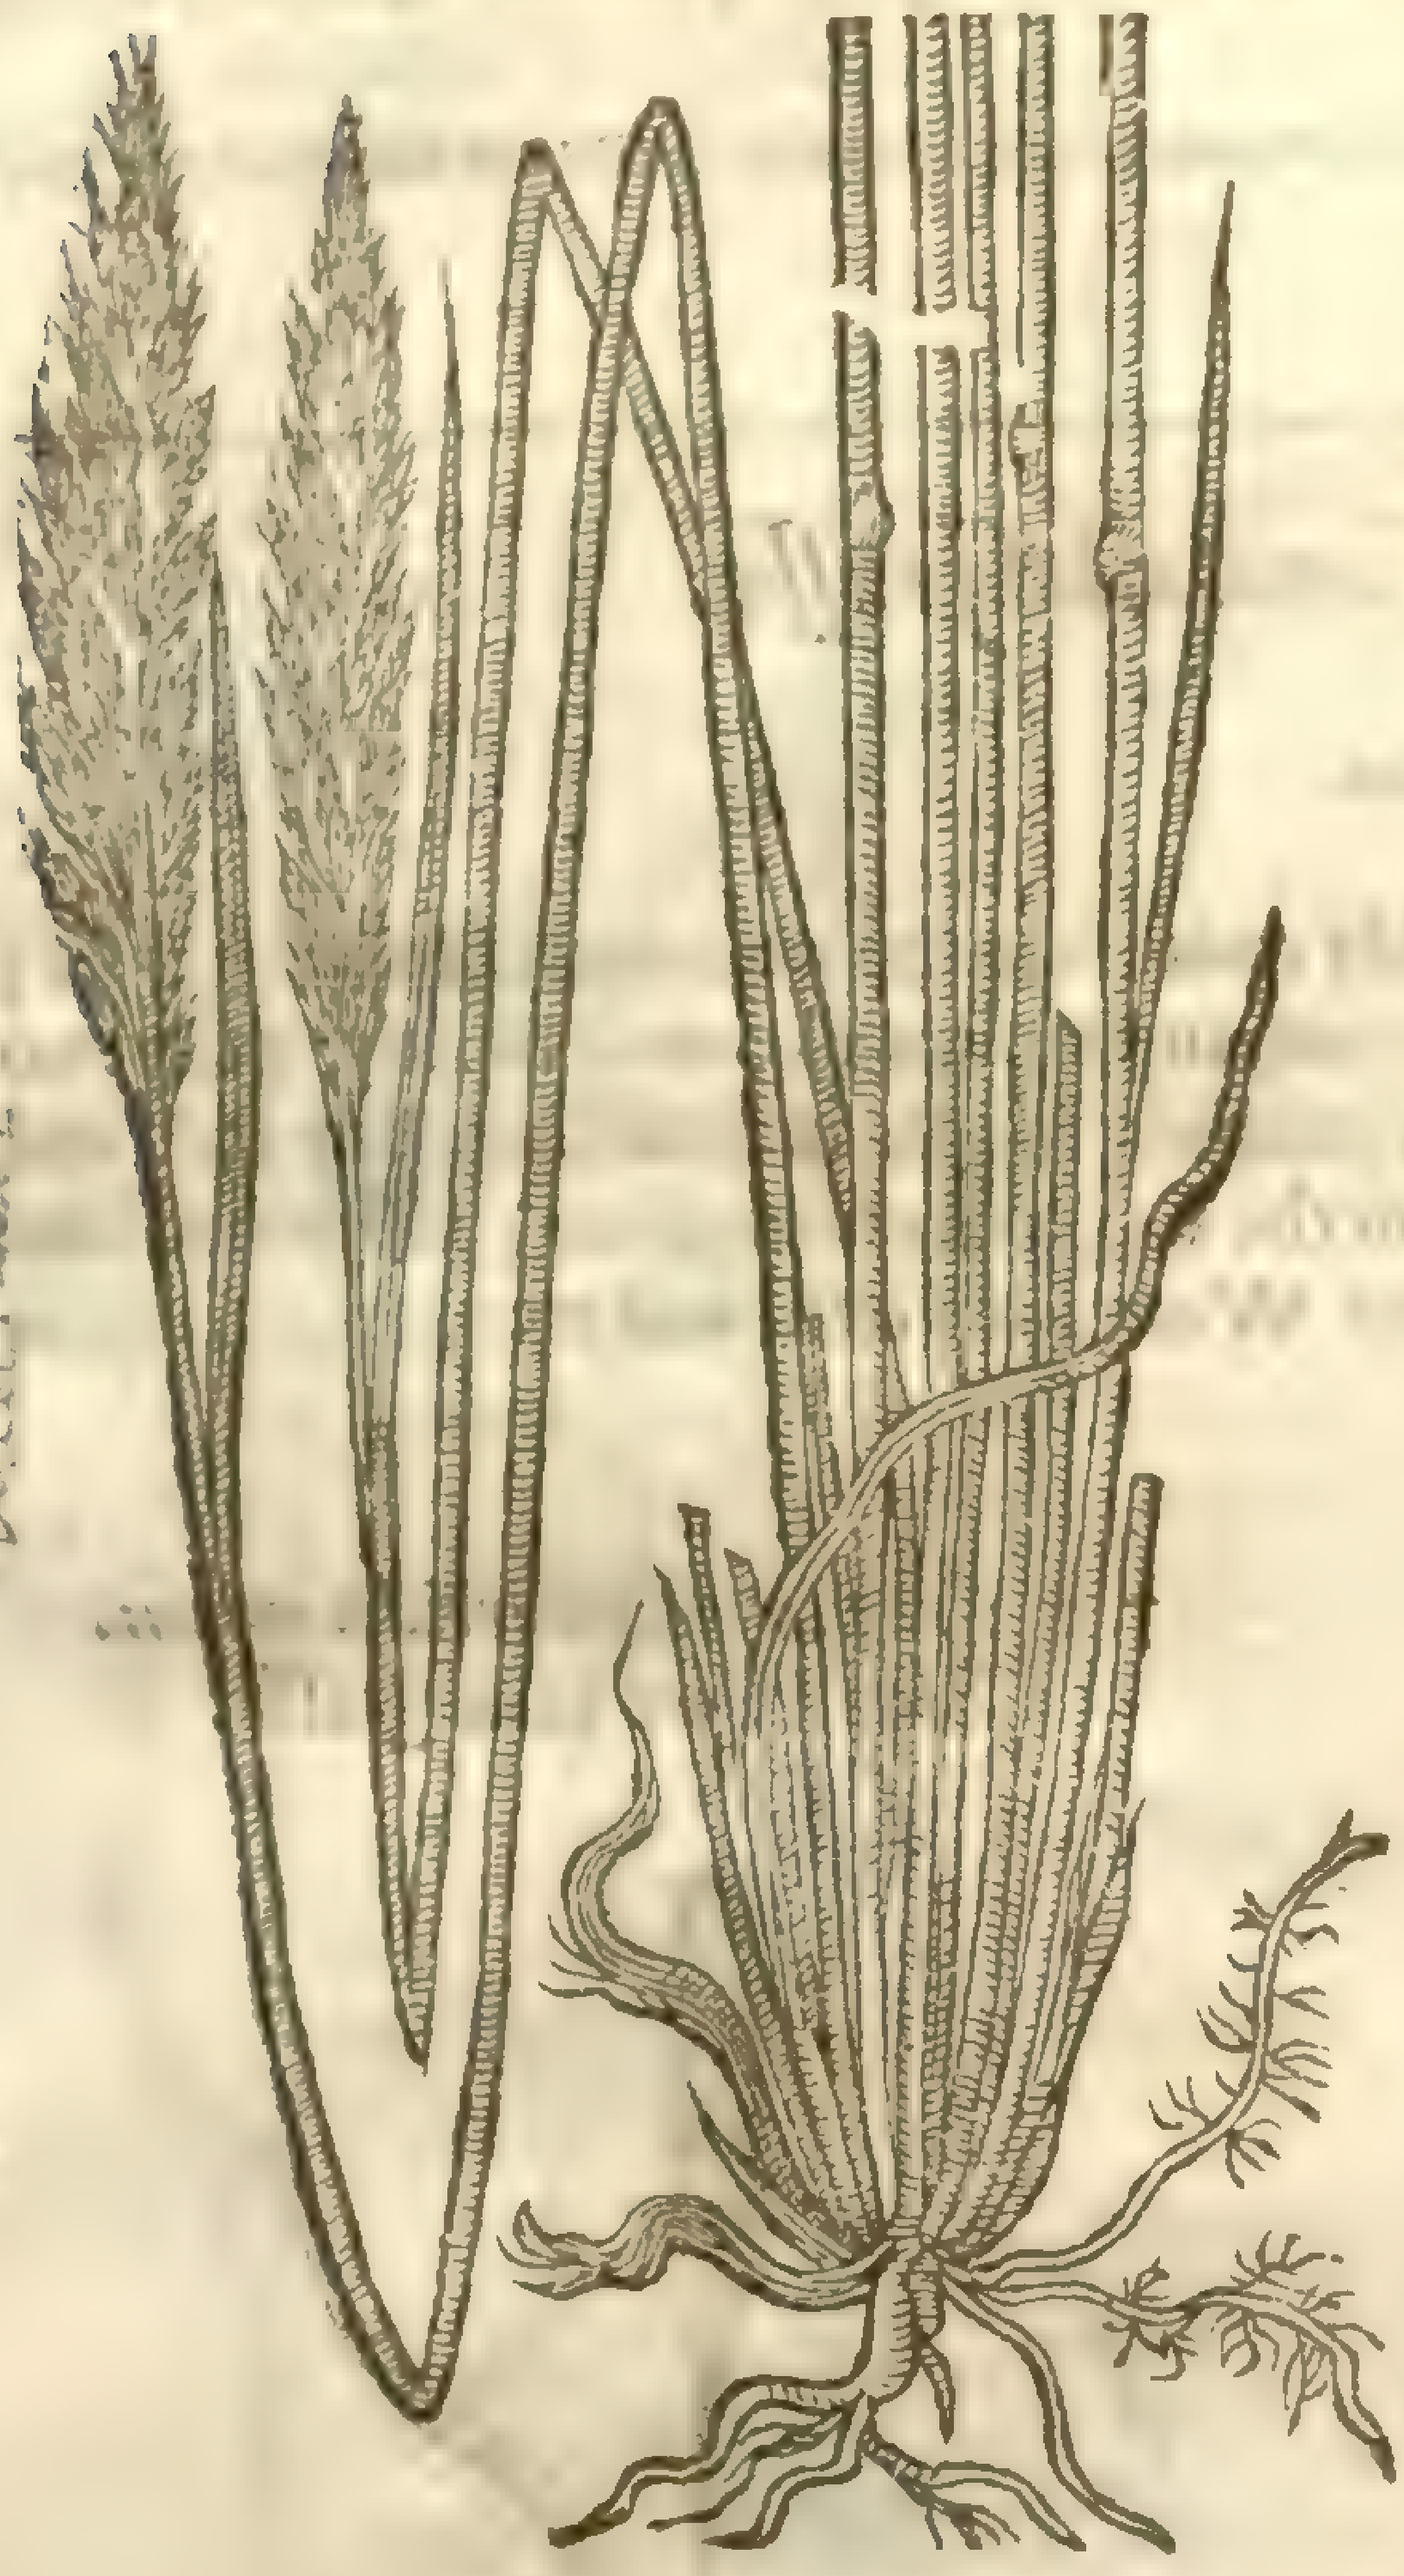
¶ *The Deſcription.*

‡ 1 This might fitly haue been put to thoſe mentioned in the fore-going chapter, but that our Author determined it for this, as may appeare by the mention made of it in the Names, as alſo by the deſcription hereof, framed from the figure we here giue you. ‡ This Graſſe is garniſhed with chaffie and downie tufts, ſet vpon a long benty ſtalk of two cubits high, or ſomewhat more, naked without any blades or leaues for the moſt part. His root is tough and hard. ‡ The top is commonly of a red or murrey colour, and the leaues ſoft and downy. ‡

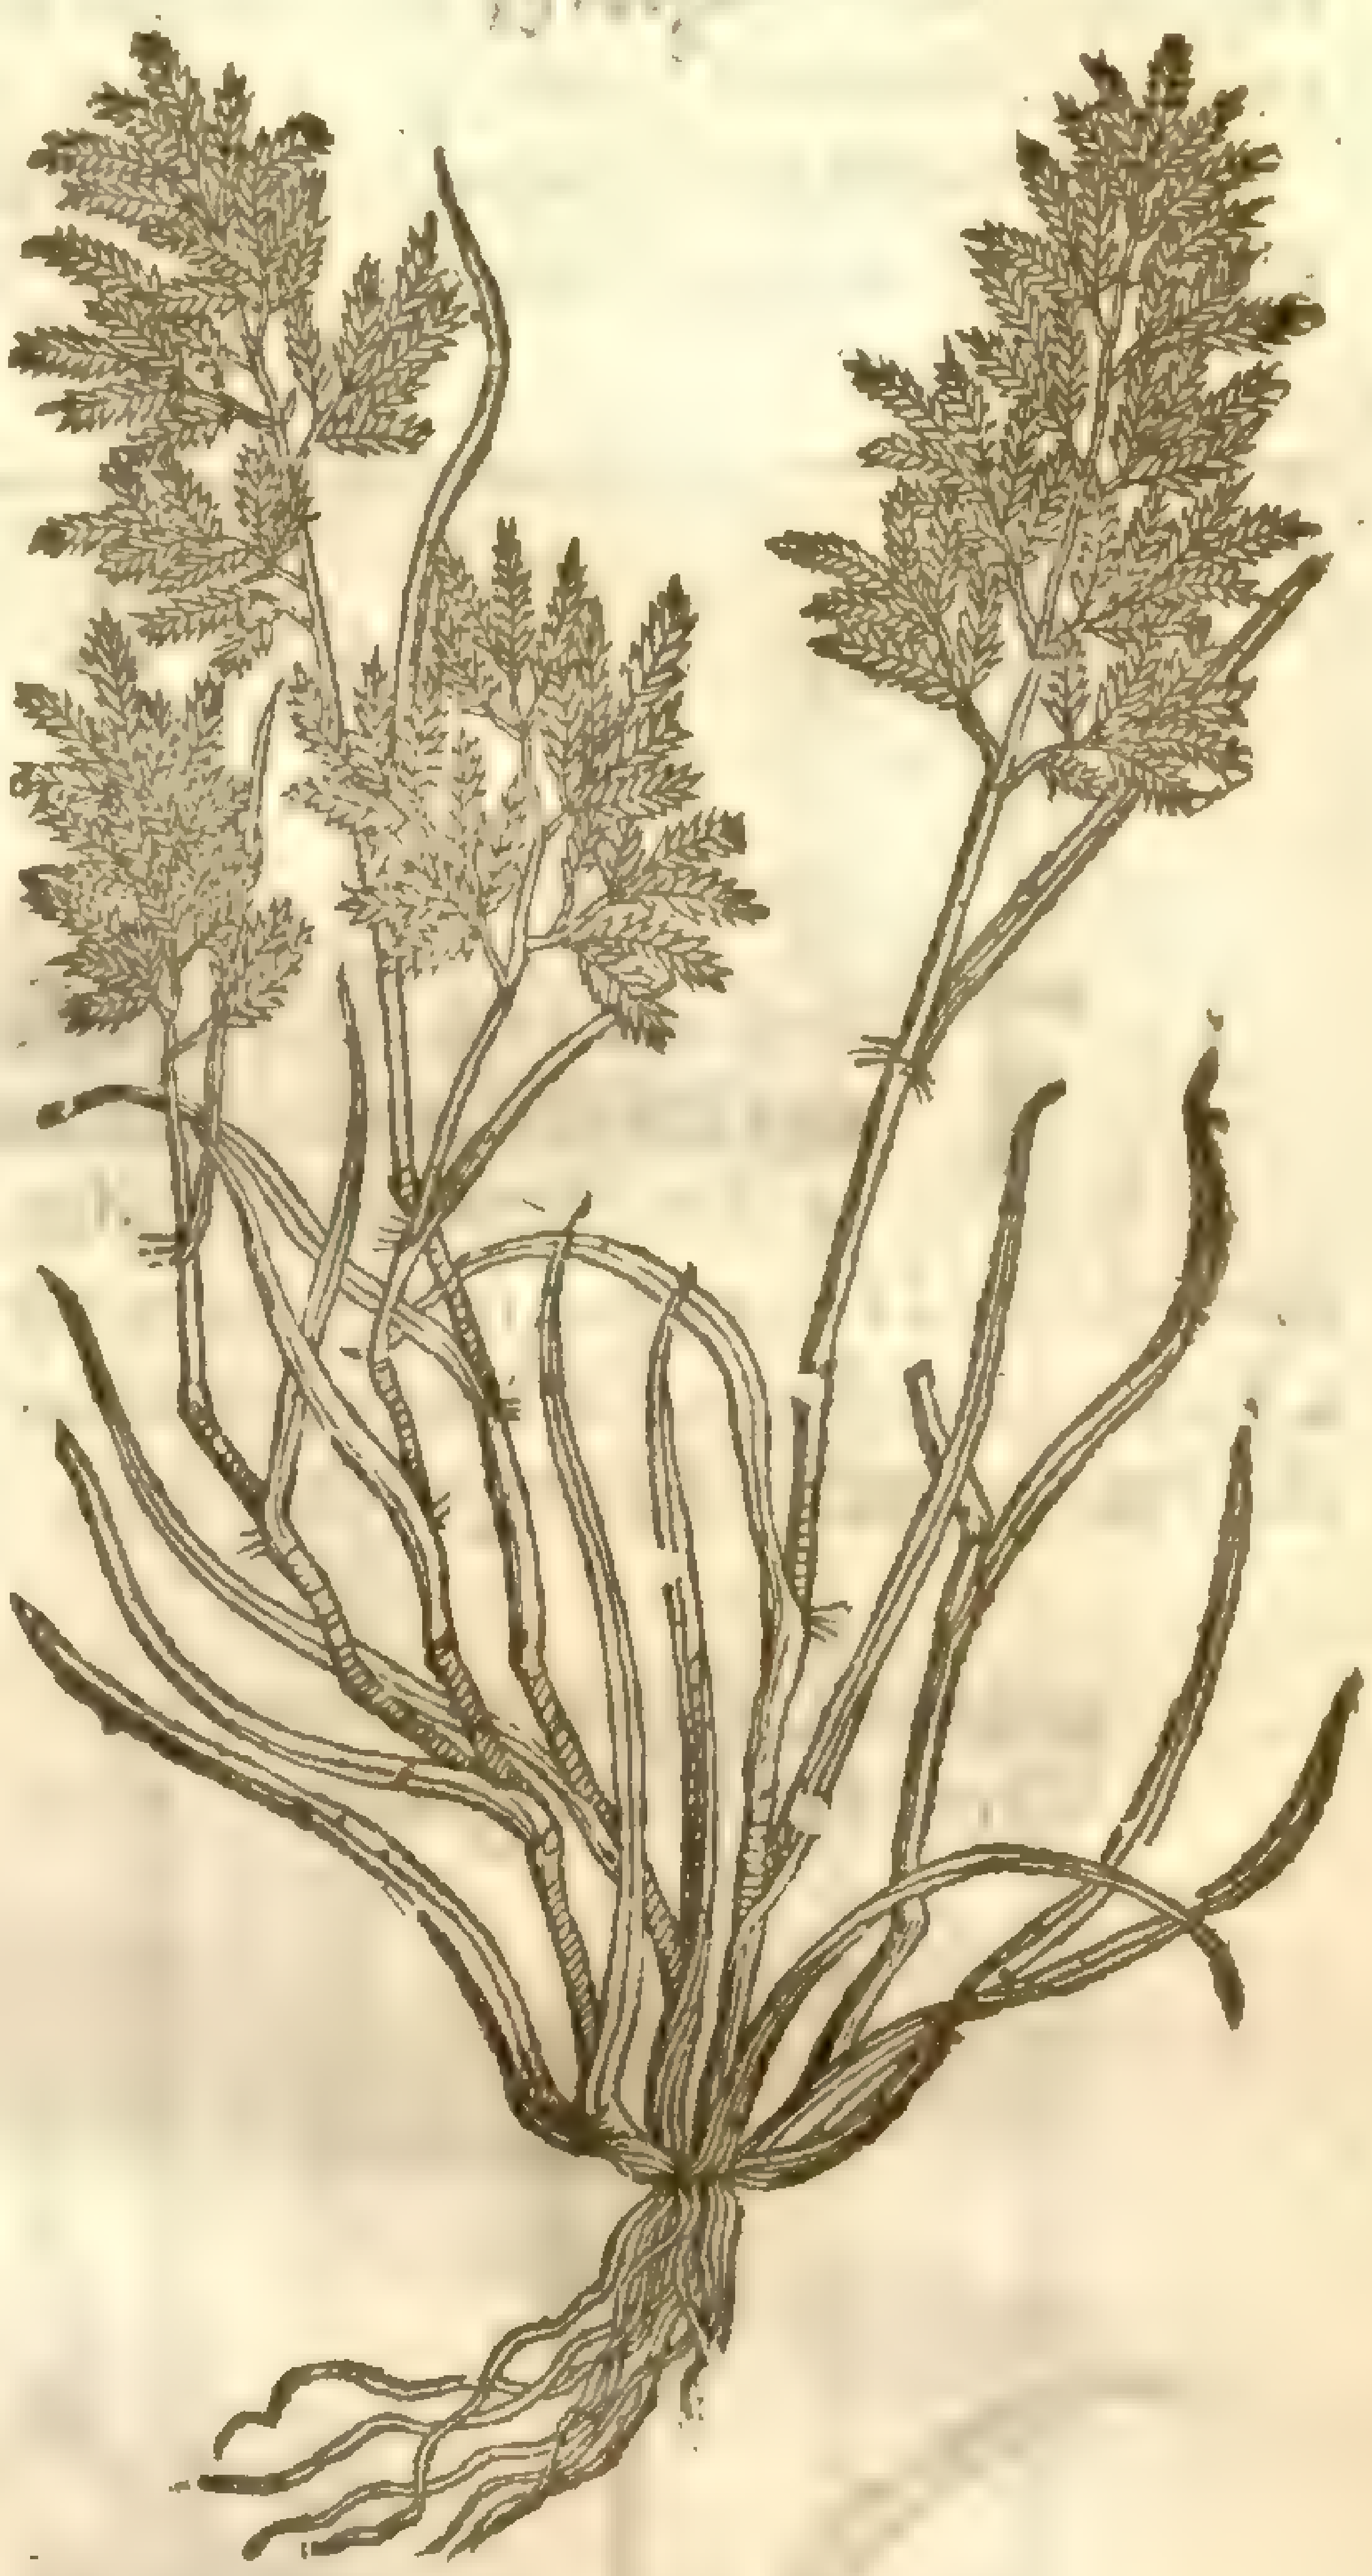
‡ 2 This, whoſe figure was formerly by our Author giuen for the laſt deſcribed, though very much different from it, is a very pretty and elegant graſſe: it in roots and leaues is not vnlike to the vſuall medow Graſſe: the ſtalke riſeth to the height of a foot, and at the top thereof it beareth a beautifull pannicle, whence the French and Spaniſh Nations call it *Amourettes*, that is, Louely Graſſe. This head conſiſts of many little eares, ſhaped much like thoſe of the ordinarie Quaking Graſſe, longer and flatter, being compoſed of more skales, ſo that each of them ſomewhat reſembles the leafe of a ſmall Fern; whence I haue called it Fern-graſſe. Theſe tops when they are ripe are white, and are gathered where they grow naturally, to beautifie garlands. ‡

3 Wood-graſſe hath many ſmall and threddy roots compact together in manner of a tuft; from which ſpring immediatly out of the earth many graſſie leaues, among the which are ſundrie benty

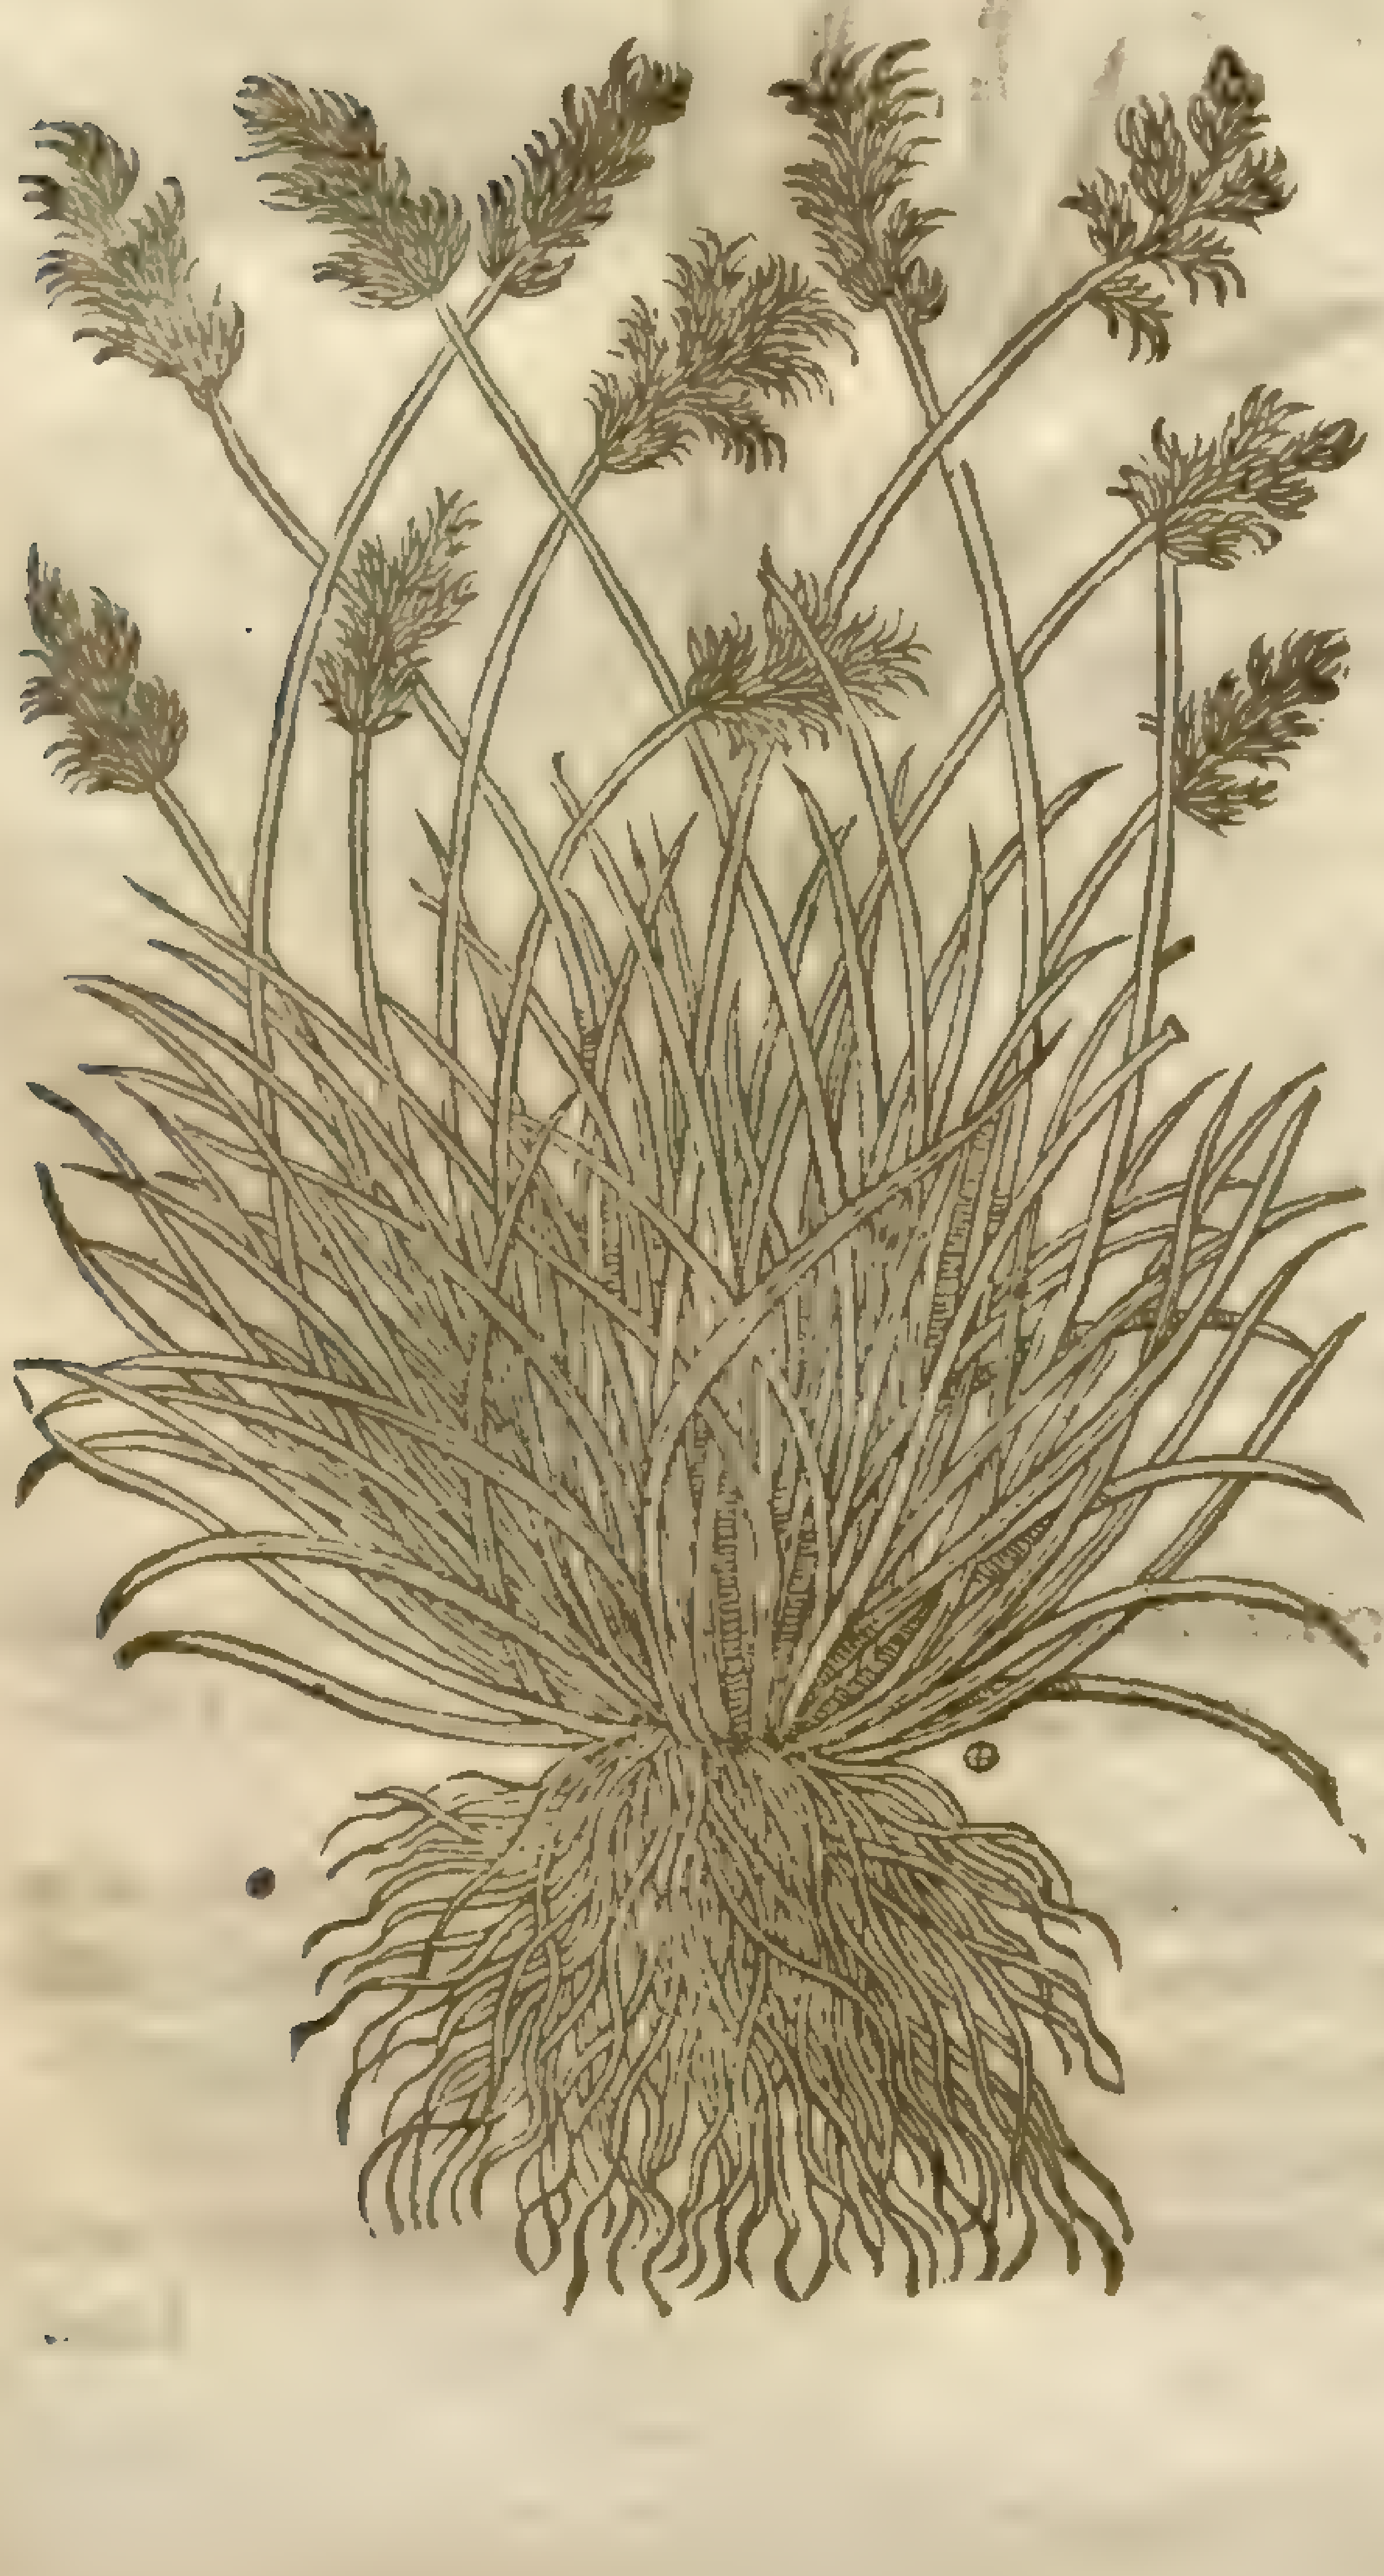
‡ 1 *Gramen tomentoſum arundinaceum.*
Feather-top,or Woolly Reed-graſſe.



2 *Gramen panniculatum elegans.*
Ferne-graſſe.



3 *Gramen ſylvaticum majus.*
The greater Wood-graſſe.



benty ſtalkes,naked and without leaues or blades like the former, bearing at the top a ſoft ſpikie tuft or eare much like vnto a Fox-taile,of a browniſh colour.

‡ 4 This in leaues,ſtalks,roots,manner and place of growing is like the laſt deſcribed : The only difference betweene them is, That this hath much leſſe,yet ſharper or rougher eares or tufts. The figure and deſcription of this was formerly giuen by our Author in the ſixteenth chapter and ninth place, vnder the title of *Gramen ſylvaticum minus*. But becauſe the difference between the laſt deſcribed and this is ſo ſmall, we haue ſpared the figure, to make roome for others more different and note-worthy.

¶ *The Time and Place.*

1 This kind of Graſſe growes in fertil fields and paſtures.

2 The ſecond growes in diuers places of Spain and France.

The other two grow in woods.

¶ *The Names.*

1 *Lobel* in Latine calleth this, *Gramen tomentoſum & aceroſum*. Some haue taken it for the ſecond kinde of *Calamogroſtis* ; but moſt commonly

it is called *Gramen plumoſum* : and in Engliſh, a Bent or Feather-top graſſe.

2 *Gramen panniculatum* is called by ſome, *Heragroſtis* in Greeke. *Lobel* calls this, *Gramen panniculoſum phalaroides*. And it is named in the *Hiſt. Lugd. Gramen filiceum, ſeu polyanthos* : that is, Ferne, or many-floured Graſſe. ‡

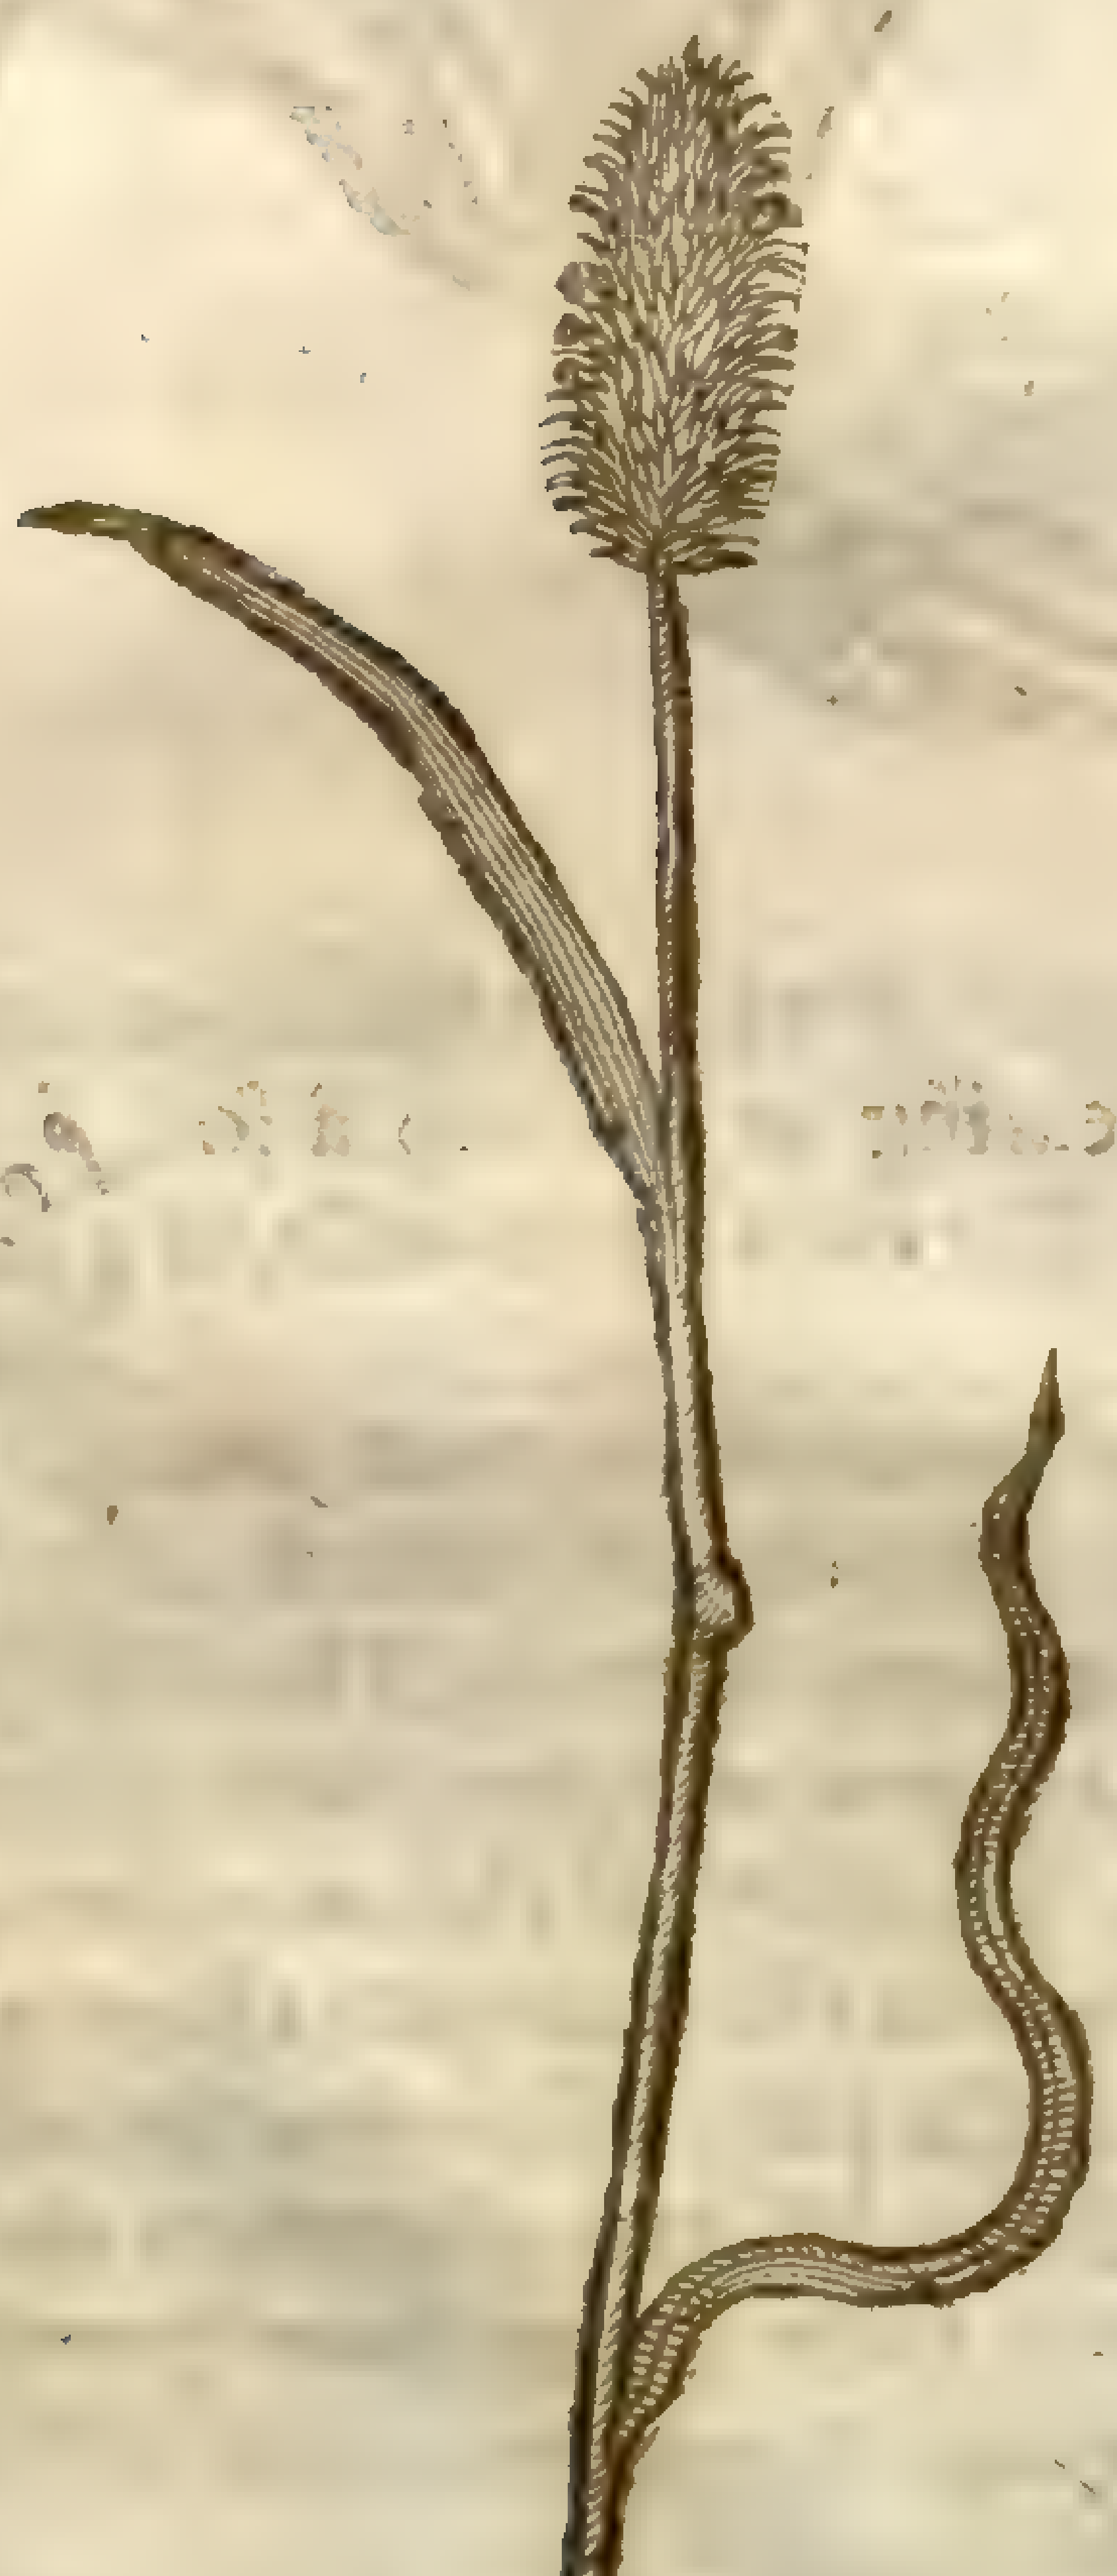
3 *Gramen ſylvaticum*, or as it pleaſeth others, *Gramen nemoroſum*, is called in our tongue, wood Graſſe, or ſhadowie Graſſe.

Chap. 8. *Of great Fox-taile Graſſe.*

¶ *The Deſcription.*

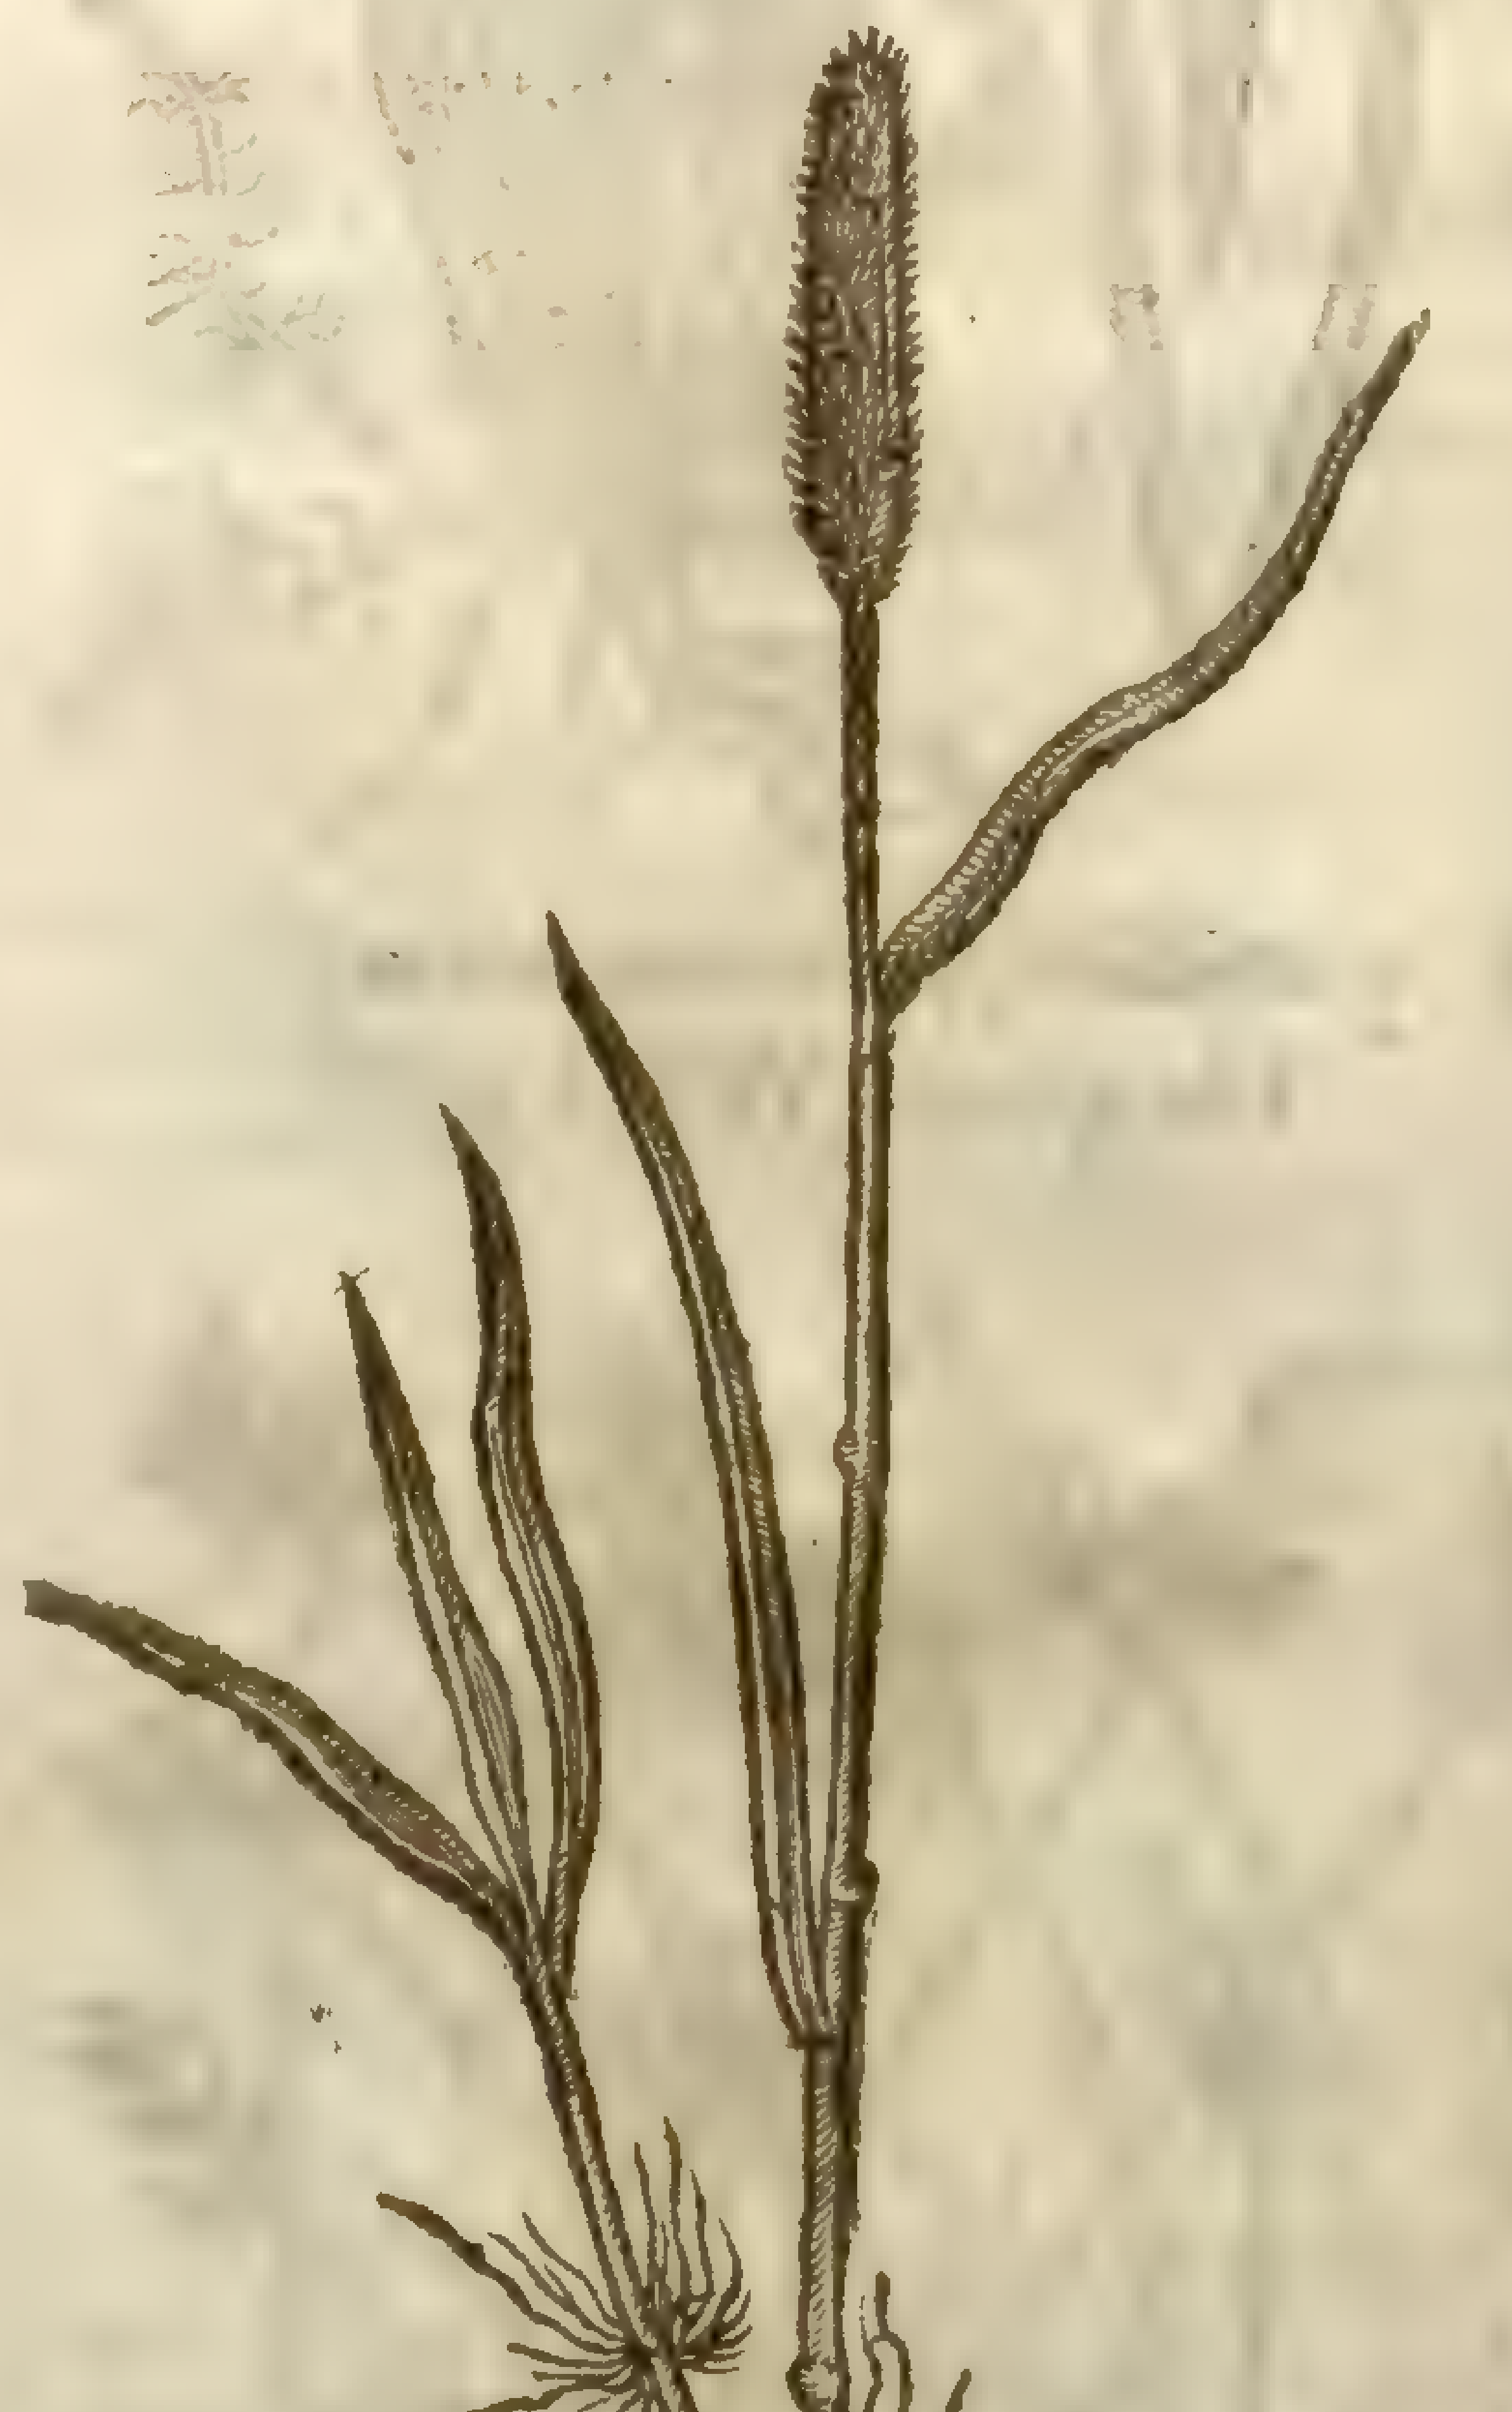
1 The great Fox-taile Graſſe hath many threddy roots like the common Medow-graſſe; and the ſtalke riſeth immediatly from the root, in faſhion like vnto Barley, with two or three leaues or blades like Otes; but is nothing rough in handling, but ſoft and downie, and ſomewhat hoary, bearing one eare or tuft on the top, and neuer more; faſhioned like a Fox-taile, whereof it tooke his name. At the approch of Winter it dieth, and recouereth it ſelfe the next yeare by falling of his ſeed.

1 *Gramen Alopecuroides majus.*
Great Fox-taile graſſe.



[illegible]

† 2 *Gramen Alopecuroides minus.*
Small Fox-taile graſſe.

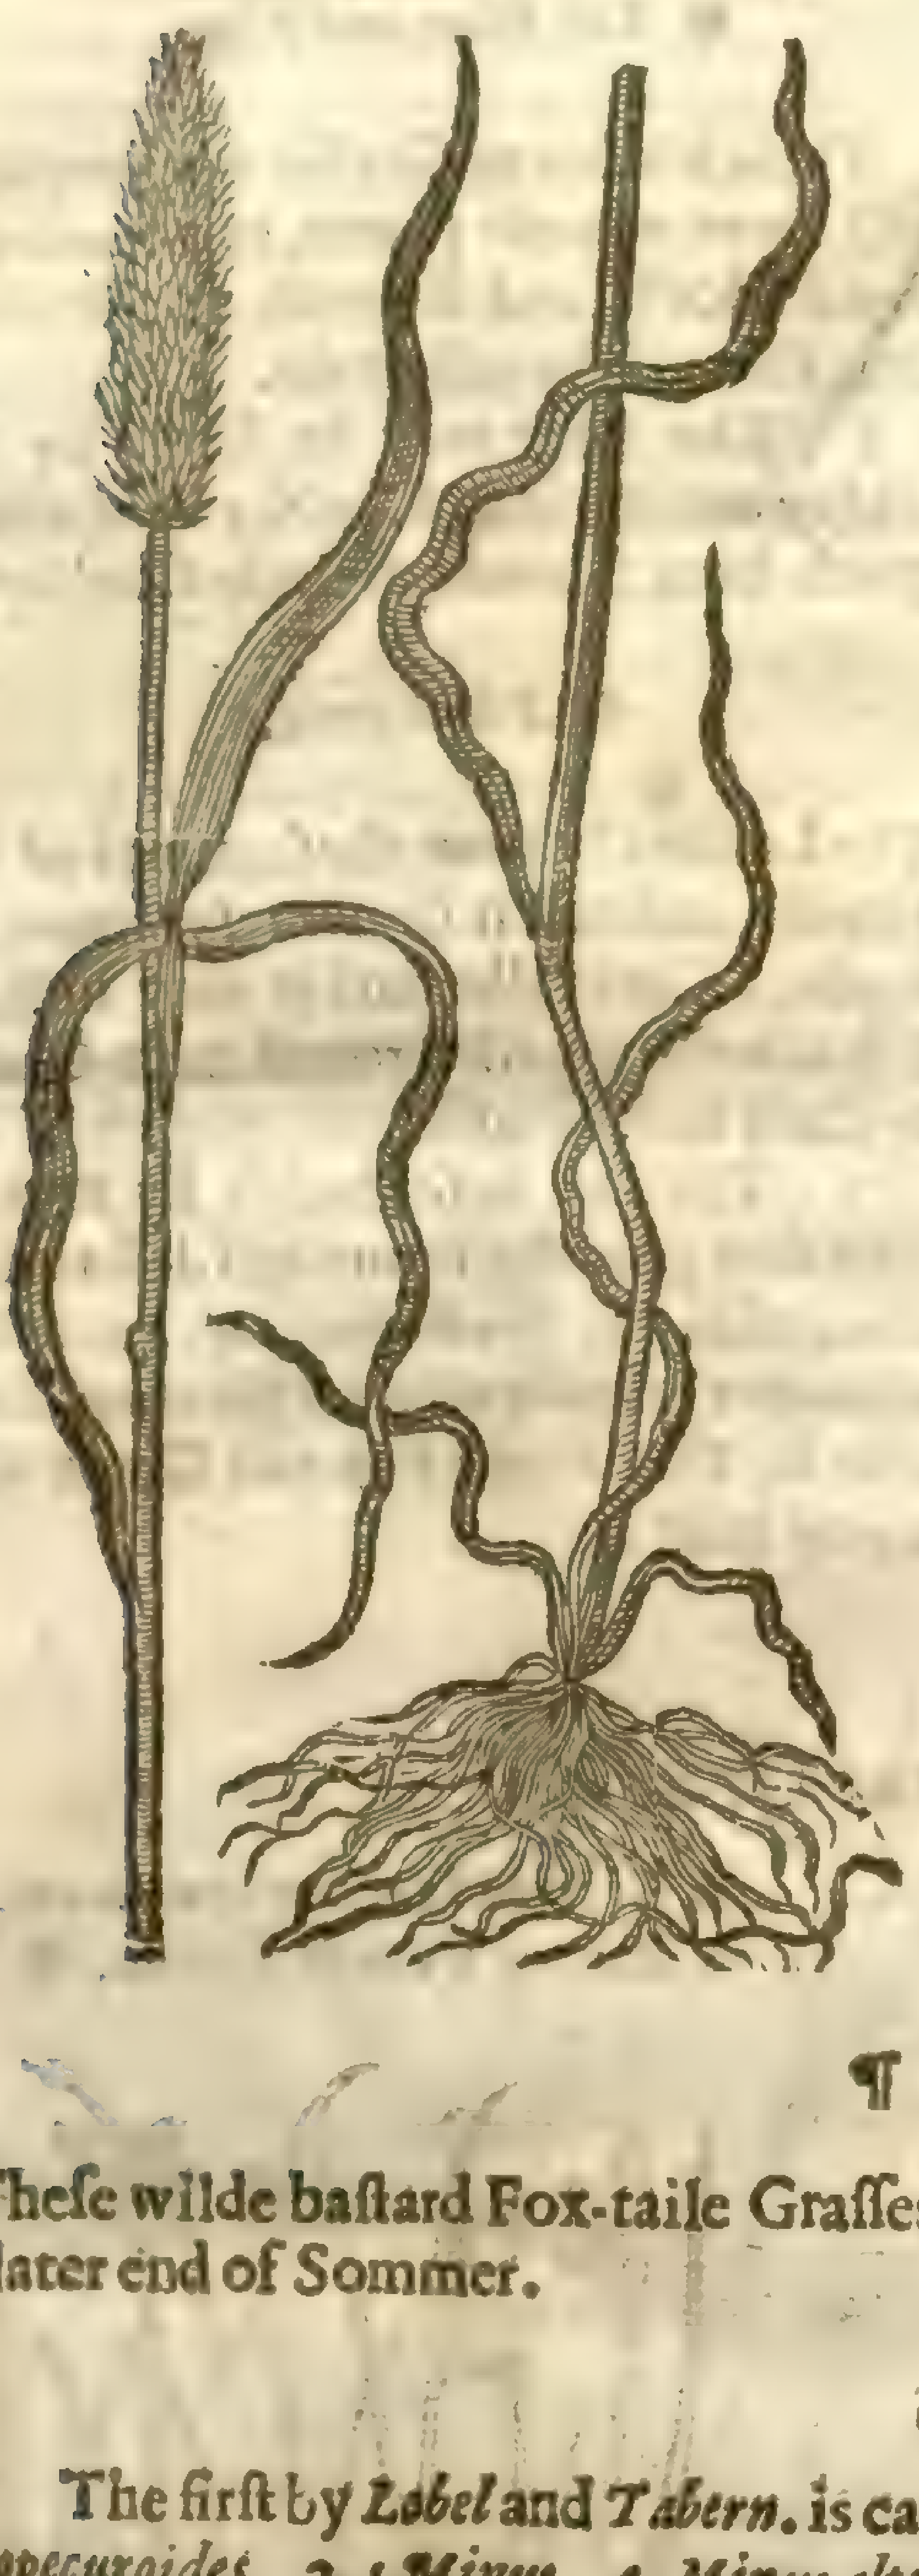


2 The leſſer Fox-taile Graſſe hath a tough or hard root compact of many ſmall ſtrings, yeelding a ſtrawie ſtalke like the former, though ſomwhat leſſer, with the like top or creſt, but of a whitiſh colour.

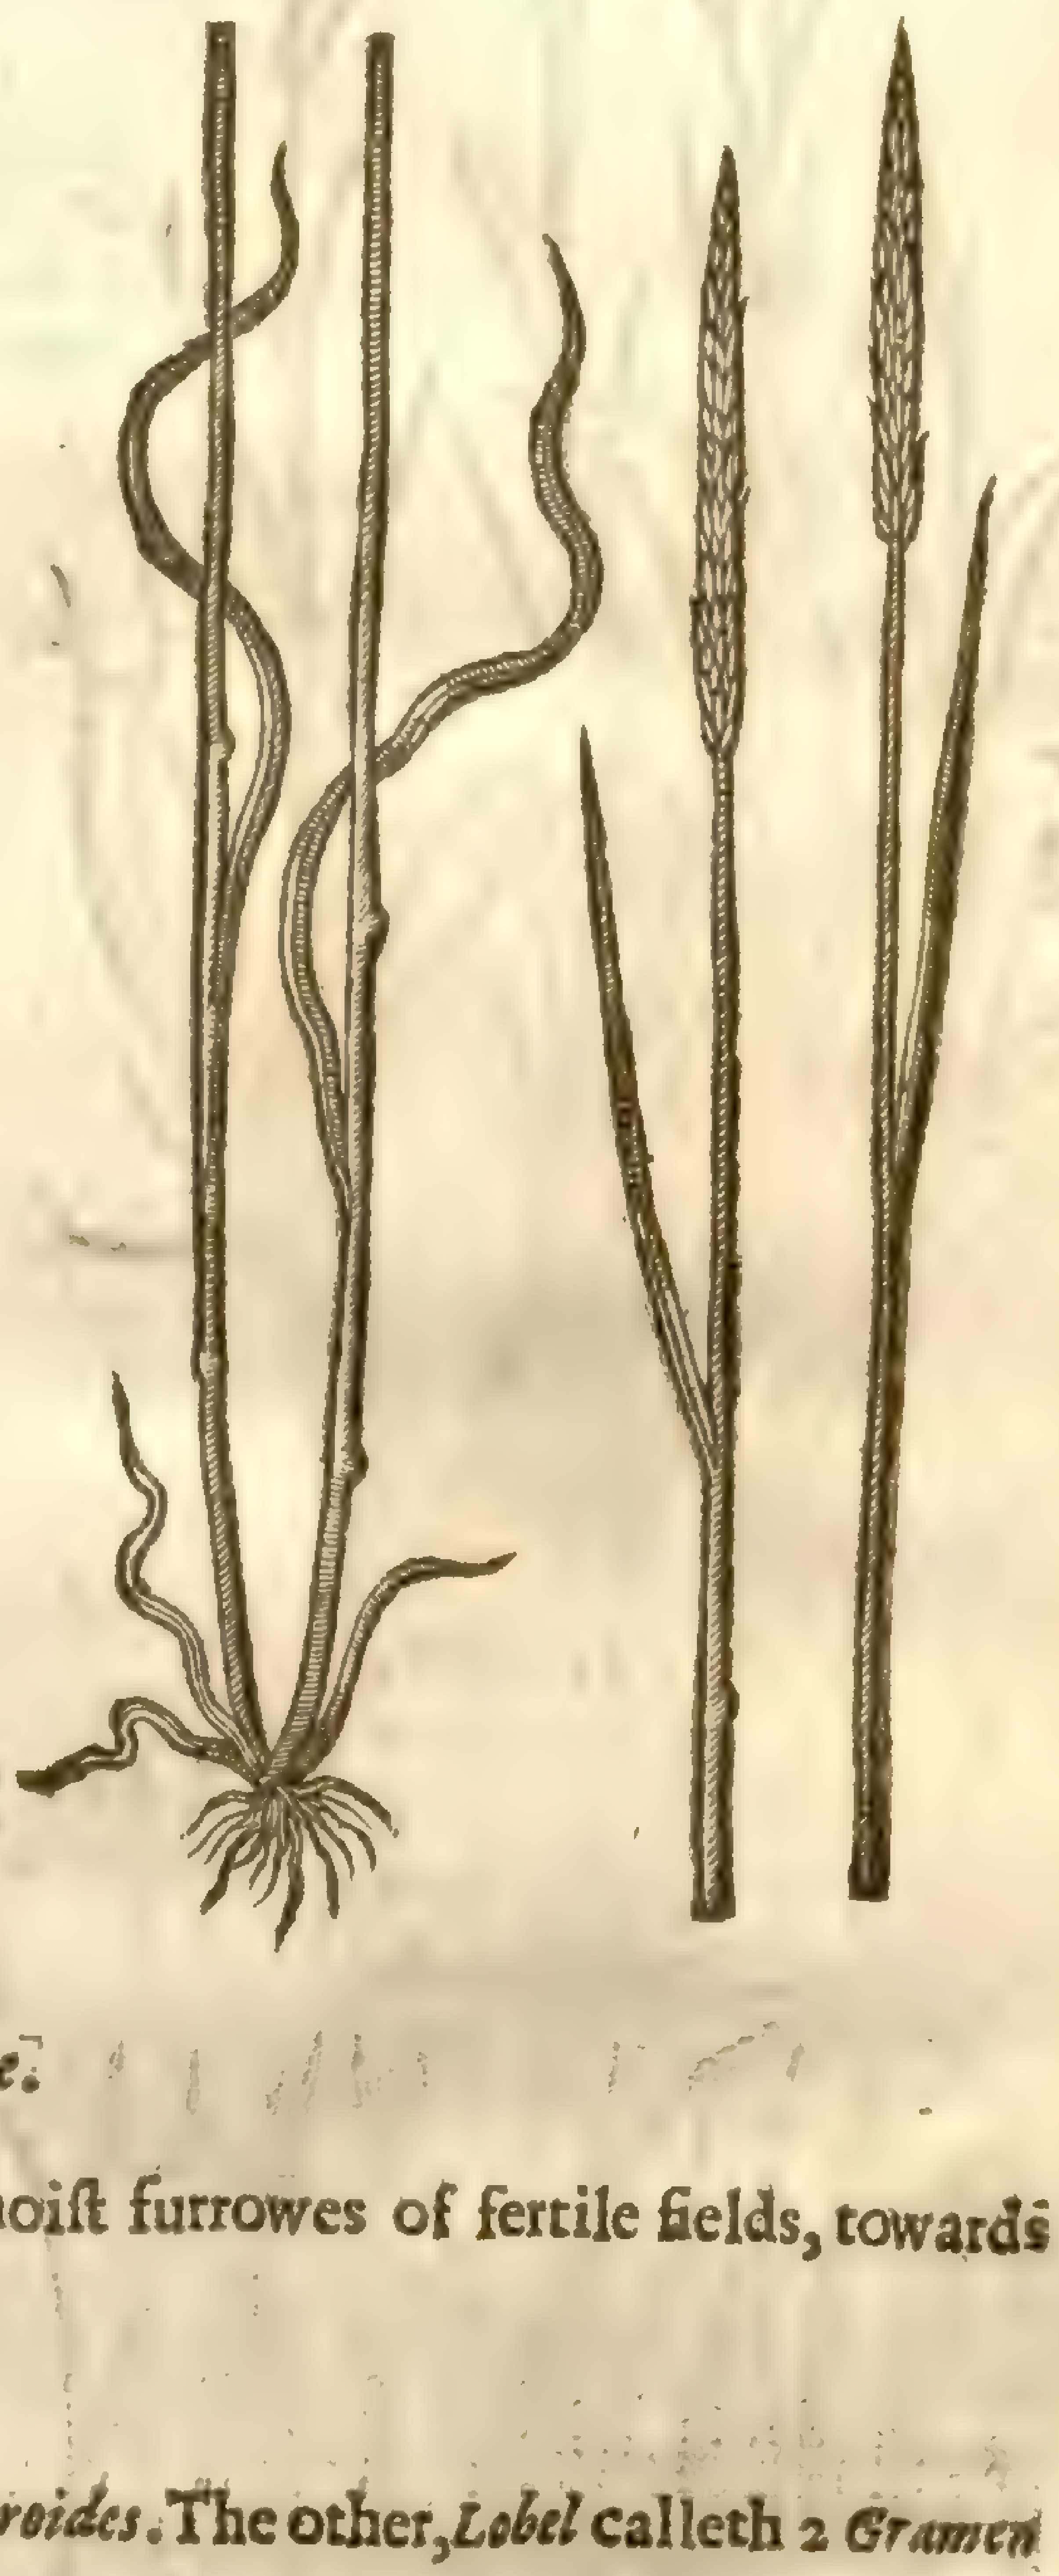
3 Great baſtard Fox-taile Graſſe hath a ſtrawie ſtalke or ſtem, which riſeth to the height of a cubit and a halfe, hauing a ſmall root conſiſting of many fibres. His leafe is ſmall and graſſie, and hath on his top one tuft or ſpike, or eare of a hard chaffie ſubſtance, ſome three inches long, compoſed of longiſh ſeeds, each hauing a little beard or awne.

4 Small baſtard Fox-taile Graſſe doth reſemble the former, ſauing that this kinde doth not

ſend forth ſuch large ſtalkes and eares as the other, but ſmaller, and not ſo cloſe packed together, neither hauing ſo long beards or awnes.



1 *Gramen Alopecurinum majus.*
Great baſtard Fox-taile graſſe.



2 *Gramen Alopecurinum minus.*
Small baſtard Fox-taile graſſe.

¶ *The Place and Time.*

Theſe wilde baſtard Fox-taile Graſſes do grow in the moiſt furrowes of fertile fields, towards the later end of Sommer.

¶ *The Names.*

‡ The firſt by ***Lobel*** and ***Tabern.*** is called ***Gramen Phalaroides.*** The other, ***Lobel*** calleth 2 ***Gramen Alopecuroides.*** 3, ***Minus.*** 4, ***Minus alterum.***

CHAP. 8. *Of great Cats taile Graſſe.*

¶ *The Deſcription.*

1 GReat Cats-taile Graſſe hath very ſmall roots compact of very ſmall ſkinnes or threds, which may eaſily be taken from the whole root. The ſtalke riſeth vp in the middeſt, and is ſomewhat like vnto wilde Barley, kneed and ioynted like corne, of a foot high or thereabout; bearing at the top a handſome round cloſe compact eare reſembling the Cats-taile.

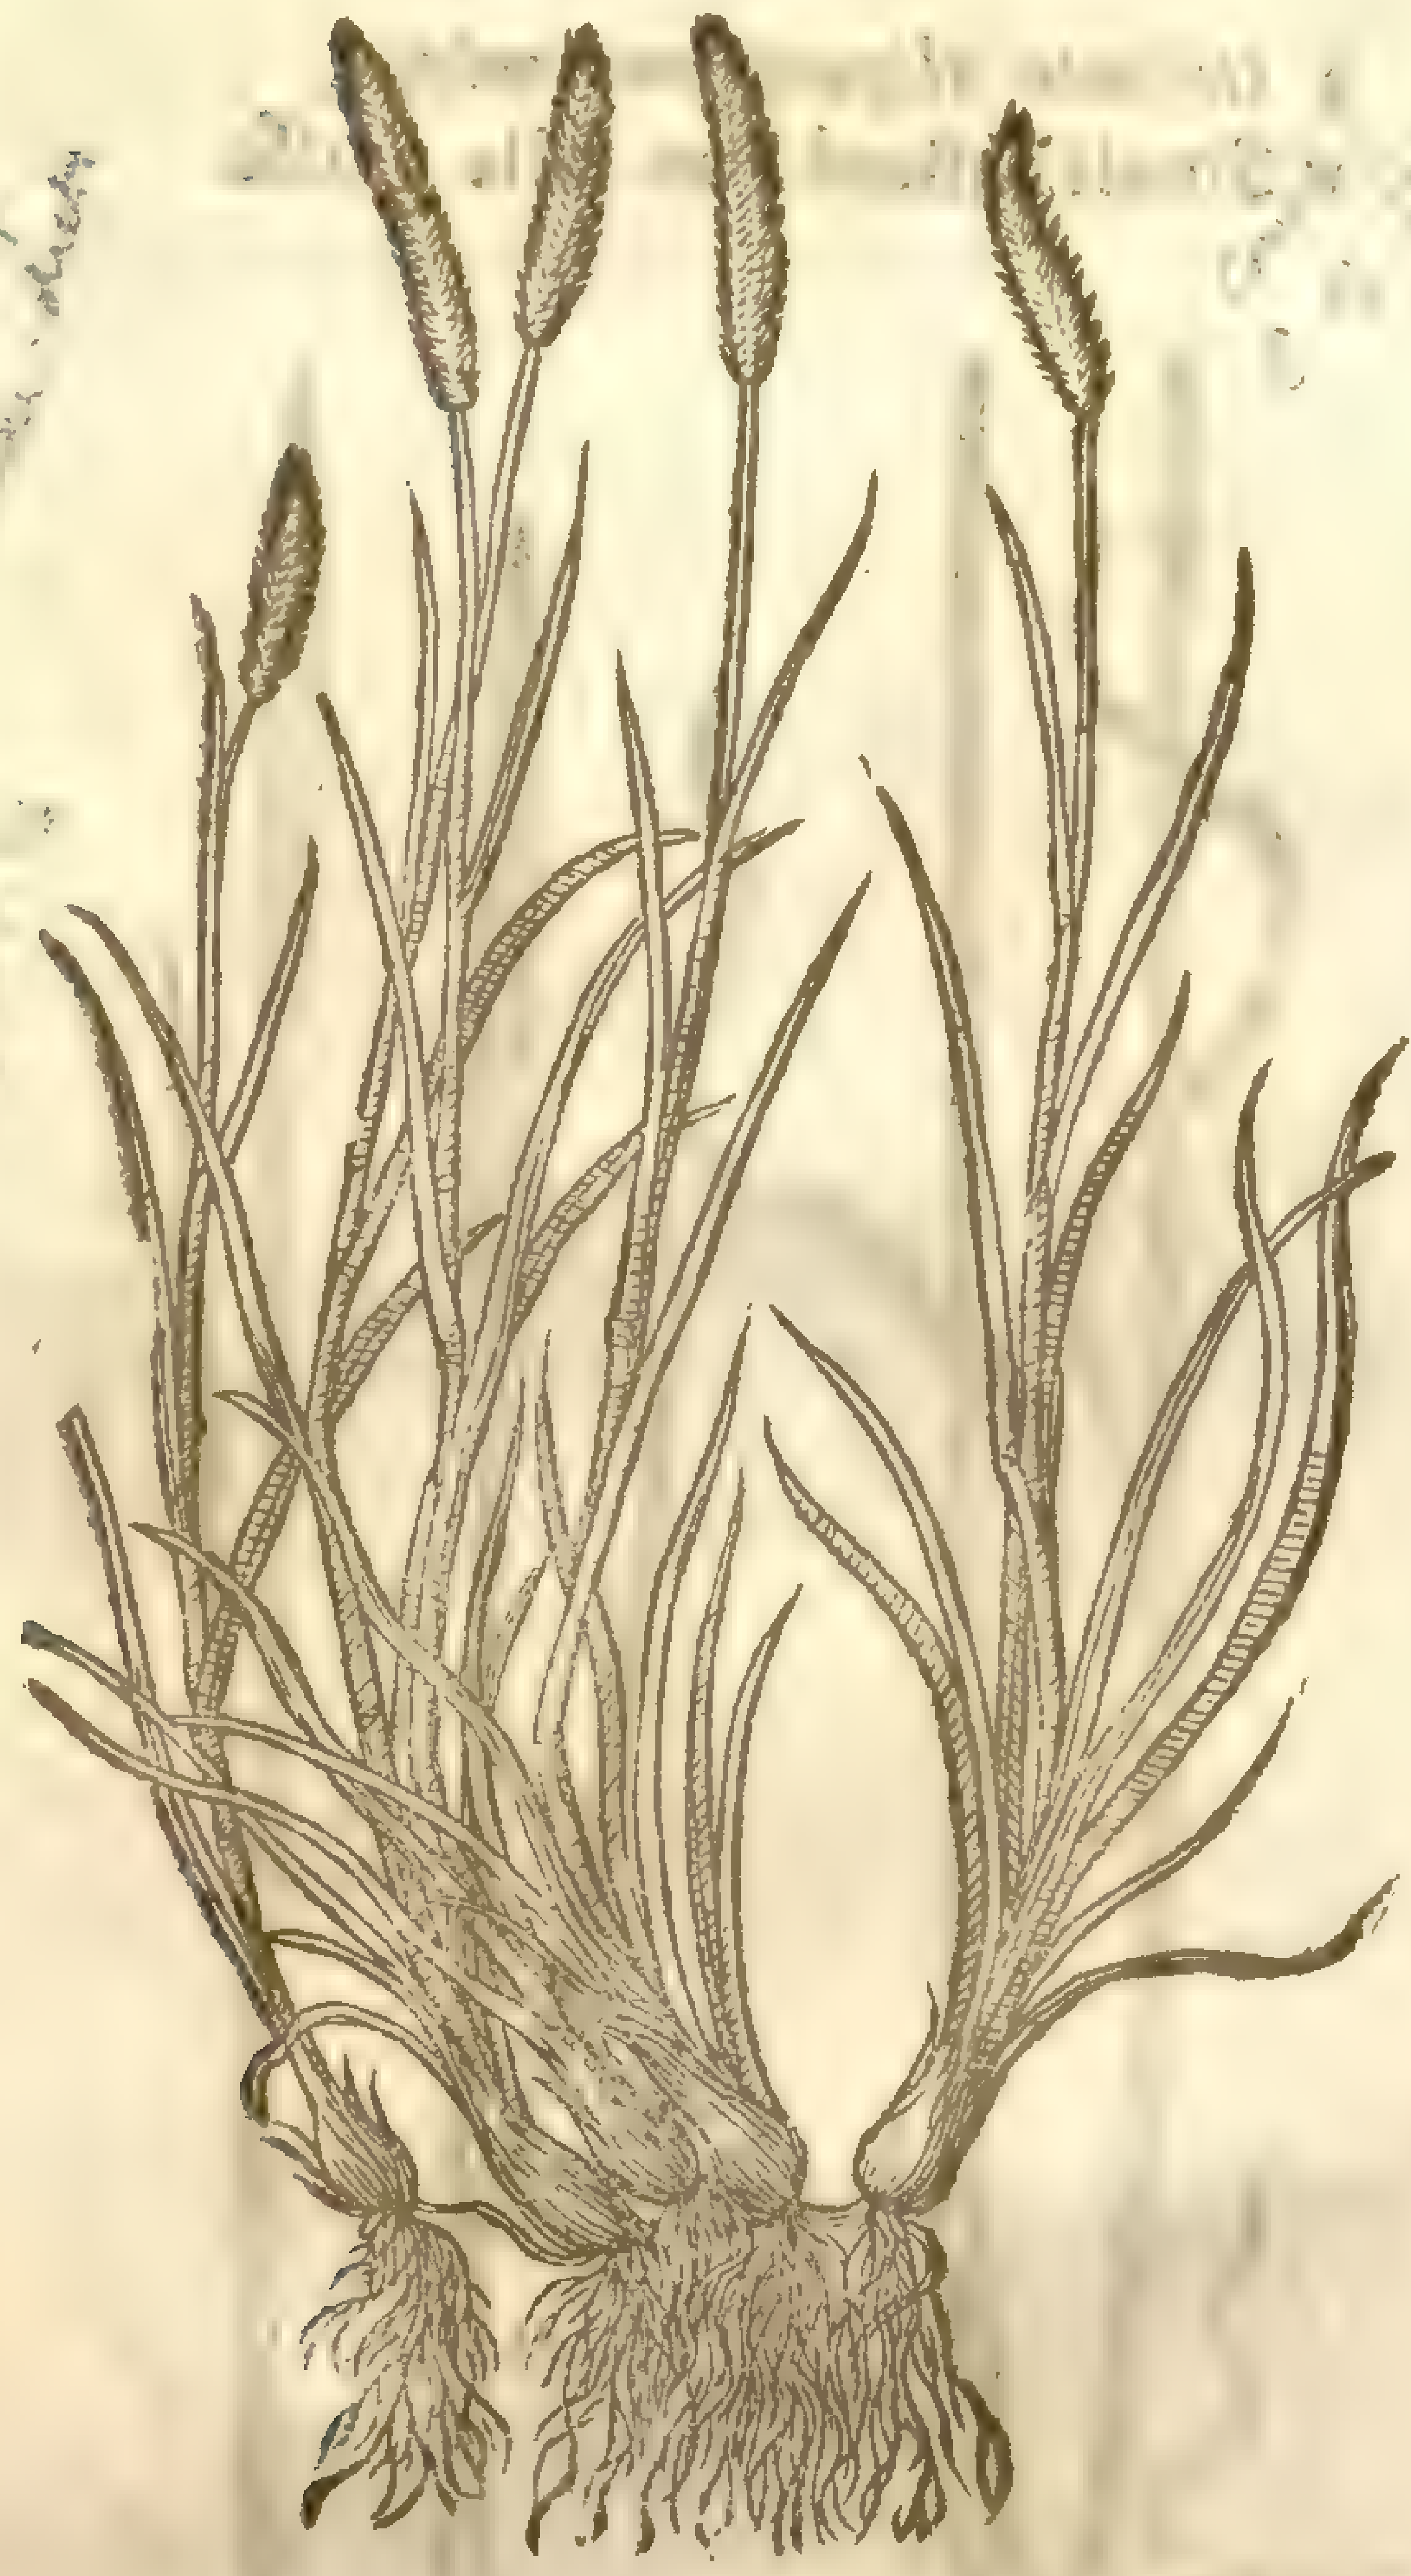
Phleum pratense
[illegible]

2 The ſmall Cats-taile Graſſe is like vnto the other, differing chiefely in that it is leſſer than it. The root is thicke or cloued like thoſe of Ruſh Onions or Ciues, with many ſmall ſtrings or hairy threds annexed vnto it.

‡ 3 There is another that growes plentifully in many places about London, the which may fitly be referred to this Claſſis. The root thereof is a little bulbe, from whence ariſeth a ſtalke ſome two foot or better high, ſet at each joint with long graſſie leaues, the ſpike or eare is commonly

P. pratense, b.
[illegible]

Gramen Typhinum minus.
Small Cats taile graſſe.



Phleum pratense, L. [illegible]
[illegible]

monly foure or fiue inches long, cloſely and handſomly made in the faſhion of the precedent, which in the ſhape it doth very much reſemble. ‡

¶ *The Place and Time.*

Theſe kindes of Graſſes do grow very well neere waterie places, as *Gramen Cyperoides* doth, and flouriſh at the ſame time that all the others do.

‡ The later may be found by the bridge entring into Chelſey field, as one goeth from S. *Iames* to little Chelſey. ‡

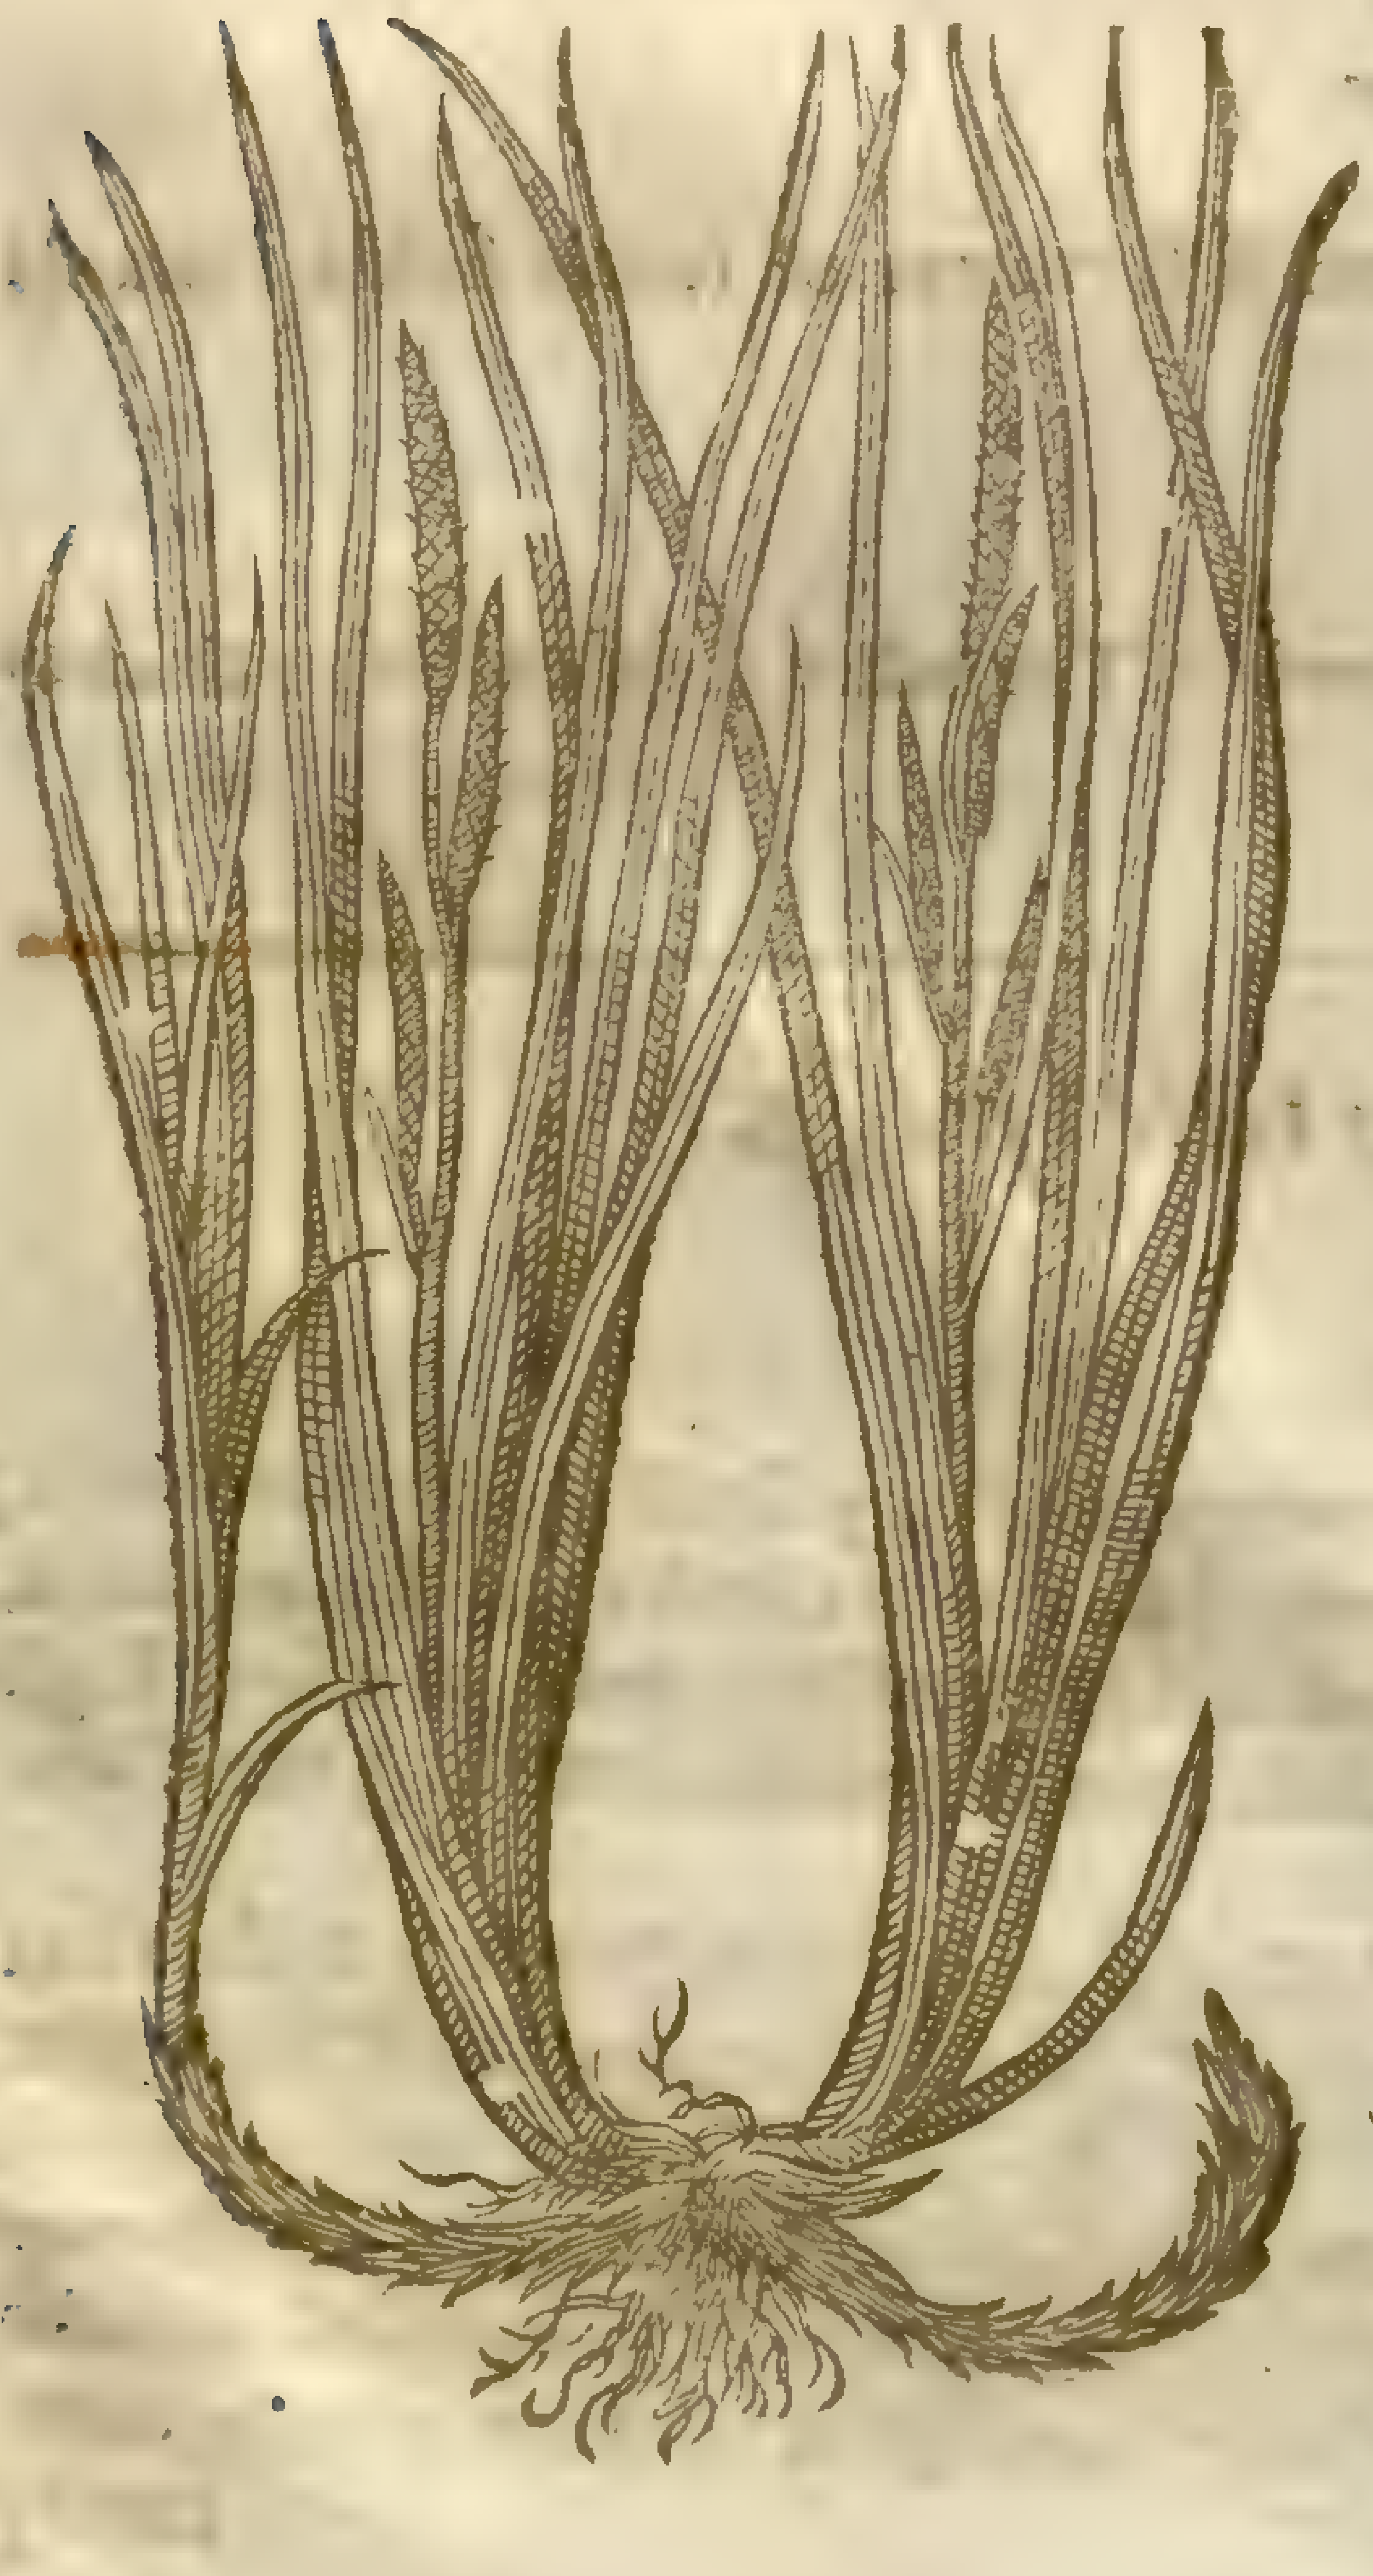
¶ *The Names.*

The Latines borrow theſe names of the Greeks, and call it *Gramen Typhinum*, of *Typha*, a Cats taile: and it may in Engliſh as well be called round Bent-Graſſe, or Cats taile Graſſe.

‡ The laſt deſcribed is by *Bauhine*, who firſt gaue the figure and deſcription thereof in his *Prodromus, pag.* 10. called *Gramen Typhoides maximū ſpica longiſſima*; that is, The largeſt Fox-tail Graſſe with a very long eare.

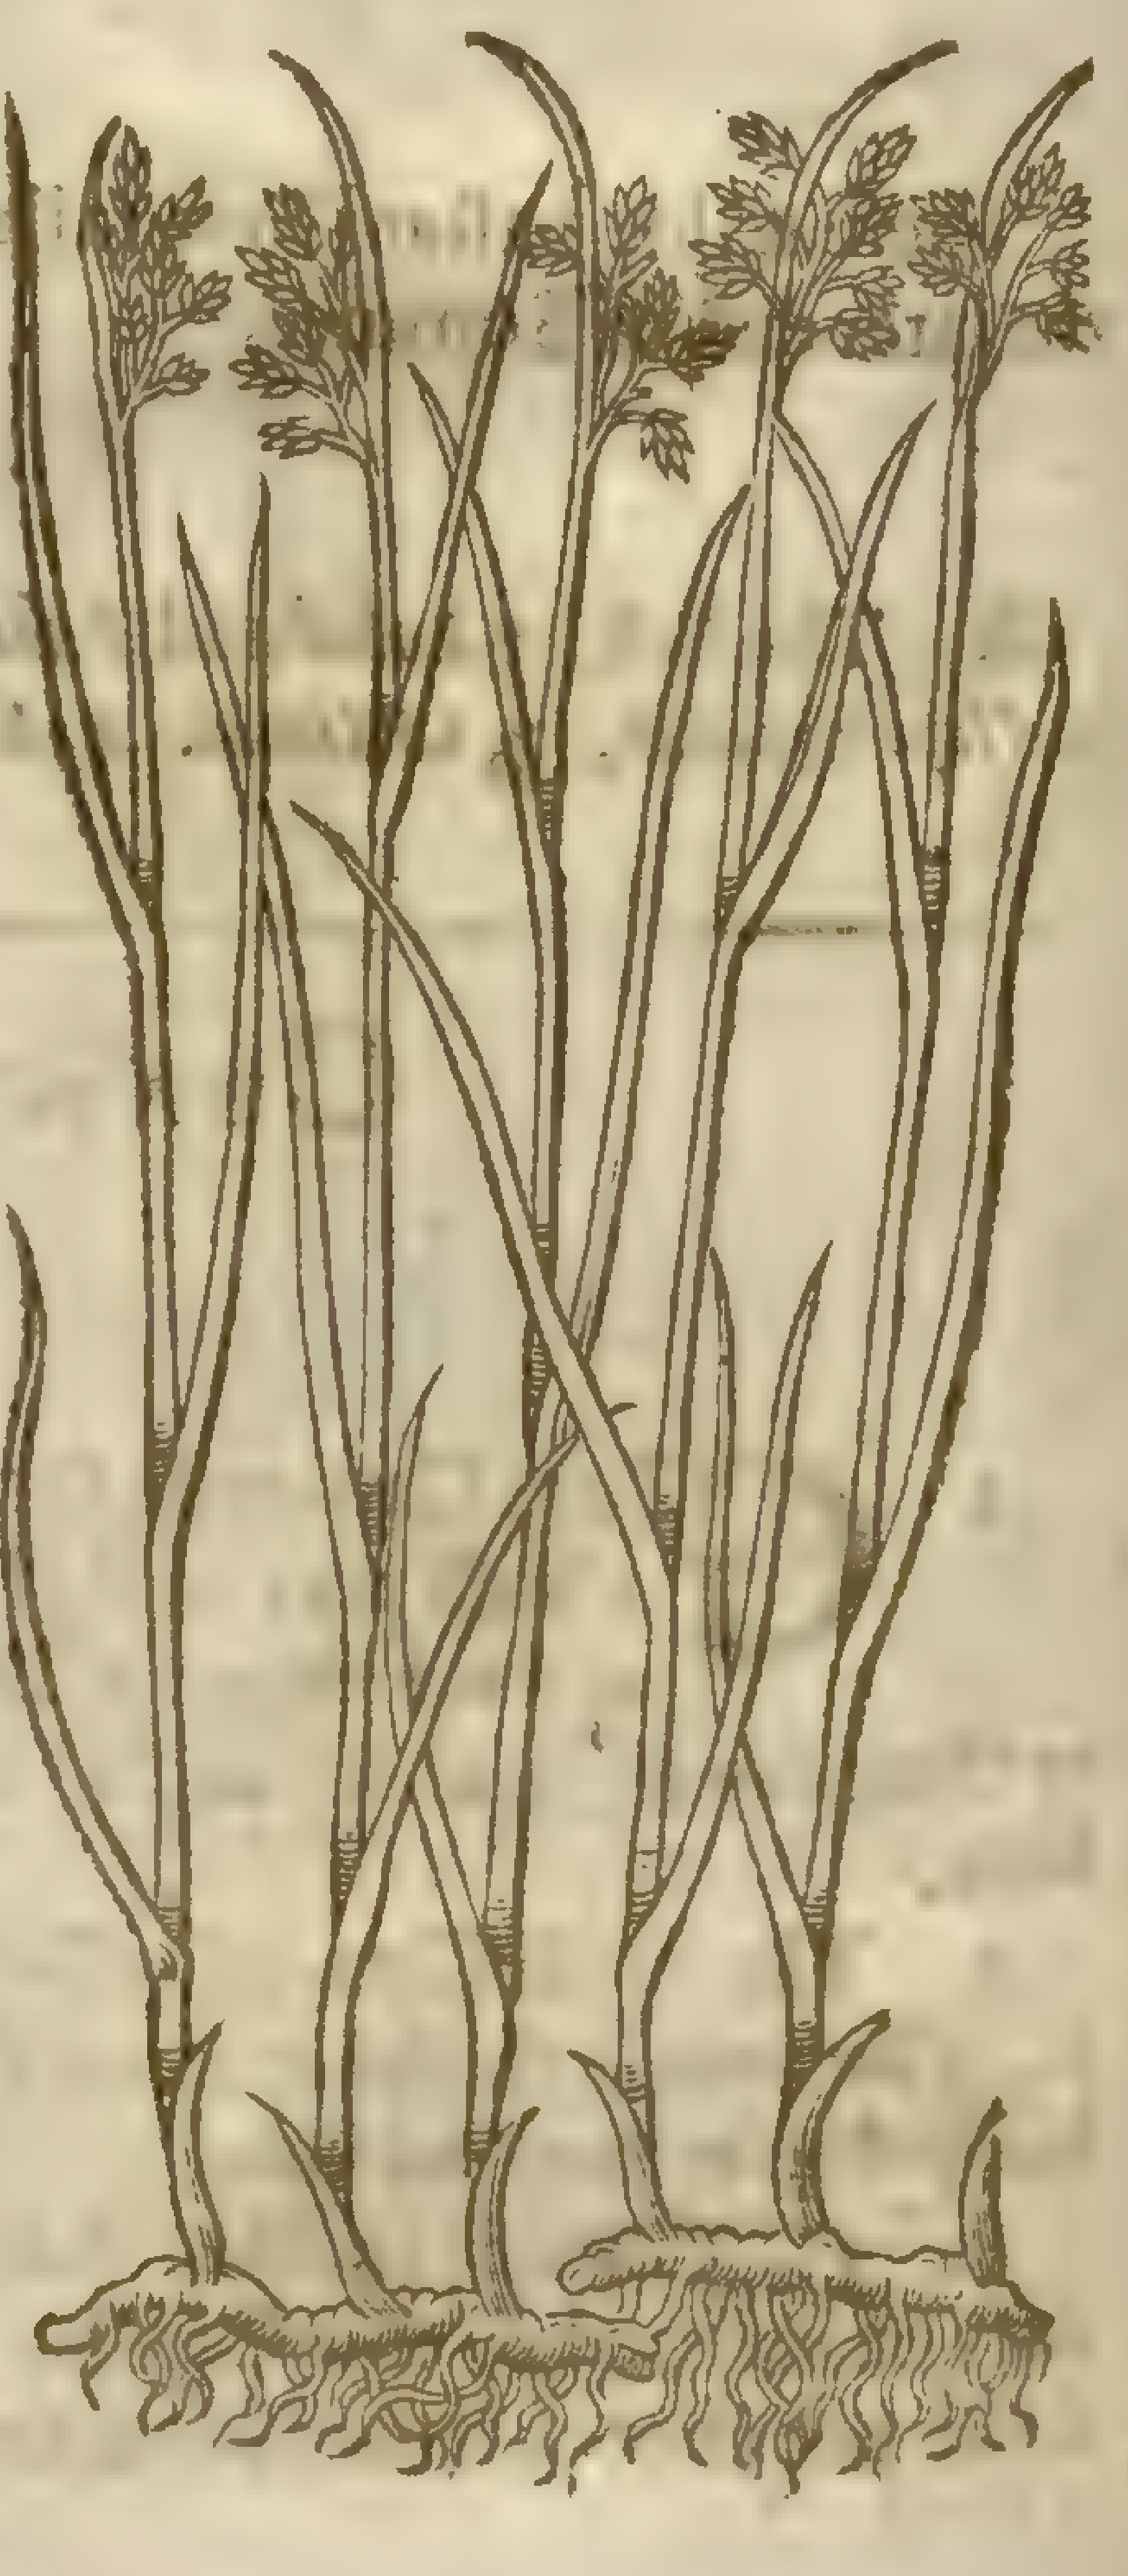
Chap. 9. *Of Cyperus Graſſe.*

1 *Gramen Cyperoides.*
Cyperus Graſſe.



Carex riparia, Curt.
marsh, ditch

2 *Gramen Iunceum aquaticum.*
Ruſhy Water-Graſſe.



Carex paludosa, Good.
river, ditch

¶ *The Deſcription.*

1 Cyperus Graſſe hath roots ſomewhat like Cyperus, whereof it tooke his name. His leaues are long and large like vnto the common Reed: the ſtalke growes to the height of a cubit in ſome places, vpon which growe little ſcaly knobs or eares, ſpike-faſhion, ſomewhat like vnto Cats taile or Reed-Mace, very chaffie, rough, and rugged.

2 Ruſhy Water-Graſſe hath his roots like the former, with many fibrous ſtrings hanging at them, and it creepes along vpon the vppermoſt face of the earth, or rather mud, wherein it growes, bearing at each joint one ſlender benty ſtalke, ſet with a few ſmall graſſy blades or leaues; bringing forth at the top in little hoods ſmall feather-like tufts or eares.

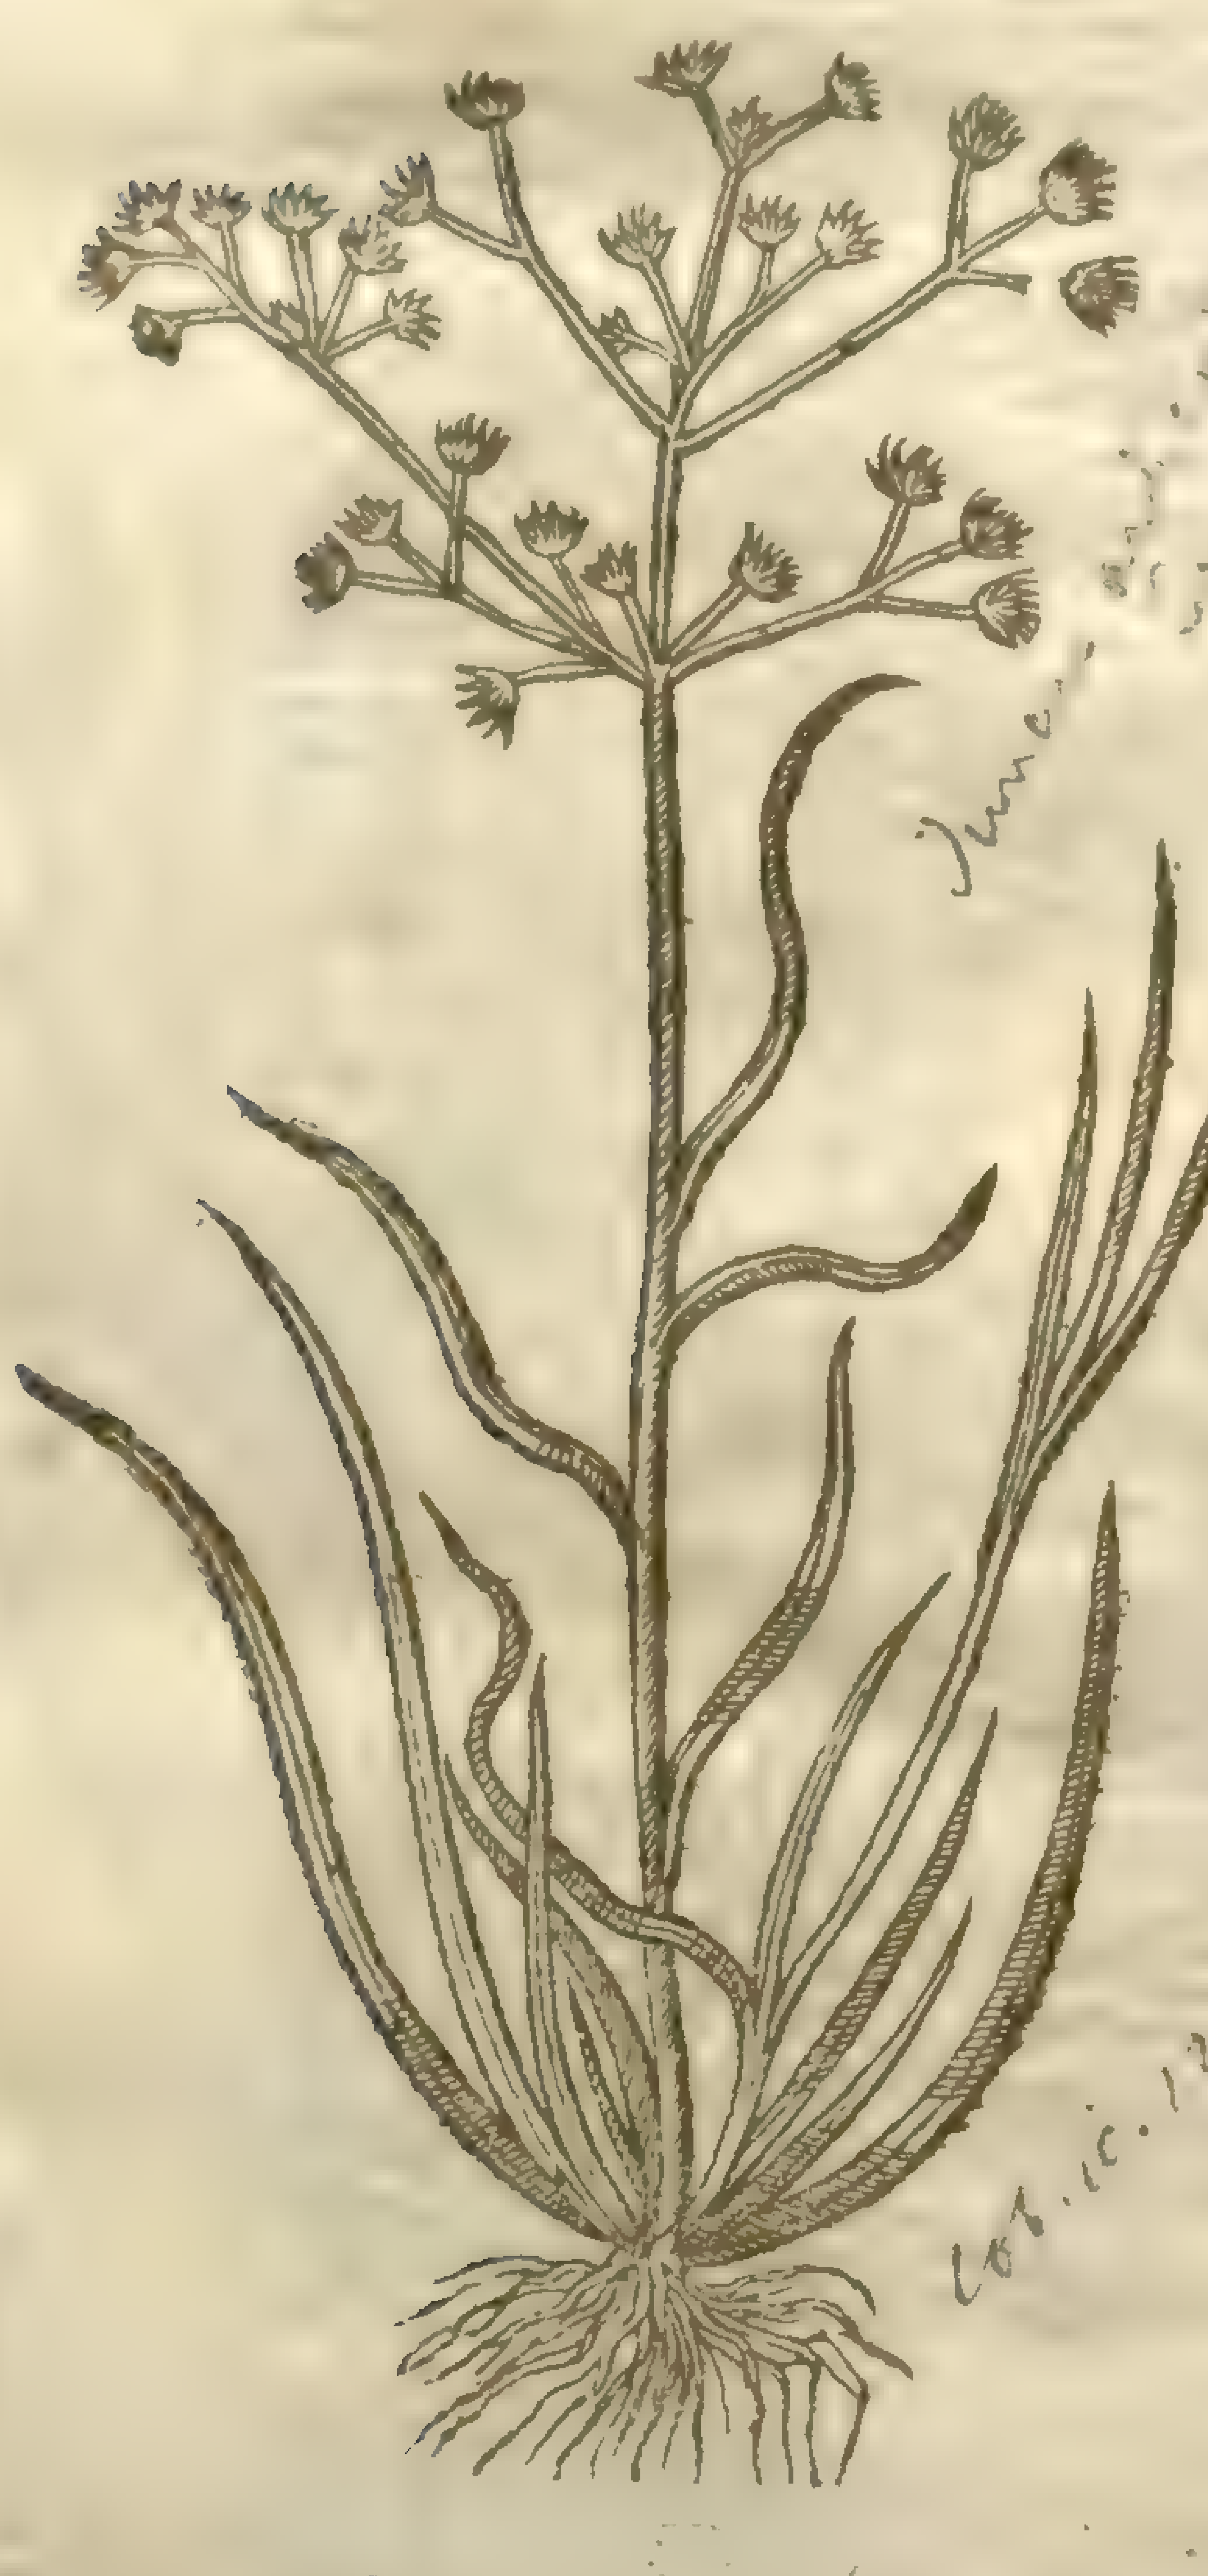
¶ *The Place, Time, and Names.*

They grow (as I ſaid) in myrie and muddy grounds, in the ſame ſeaſon that others doe. And concerning their names there hath been ſaid enough in their titles.

Chap. 10. *Of Water-Graſſe.*

[illegible] palustri [illegible] [illegible]

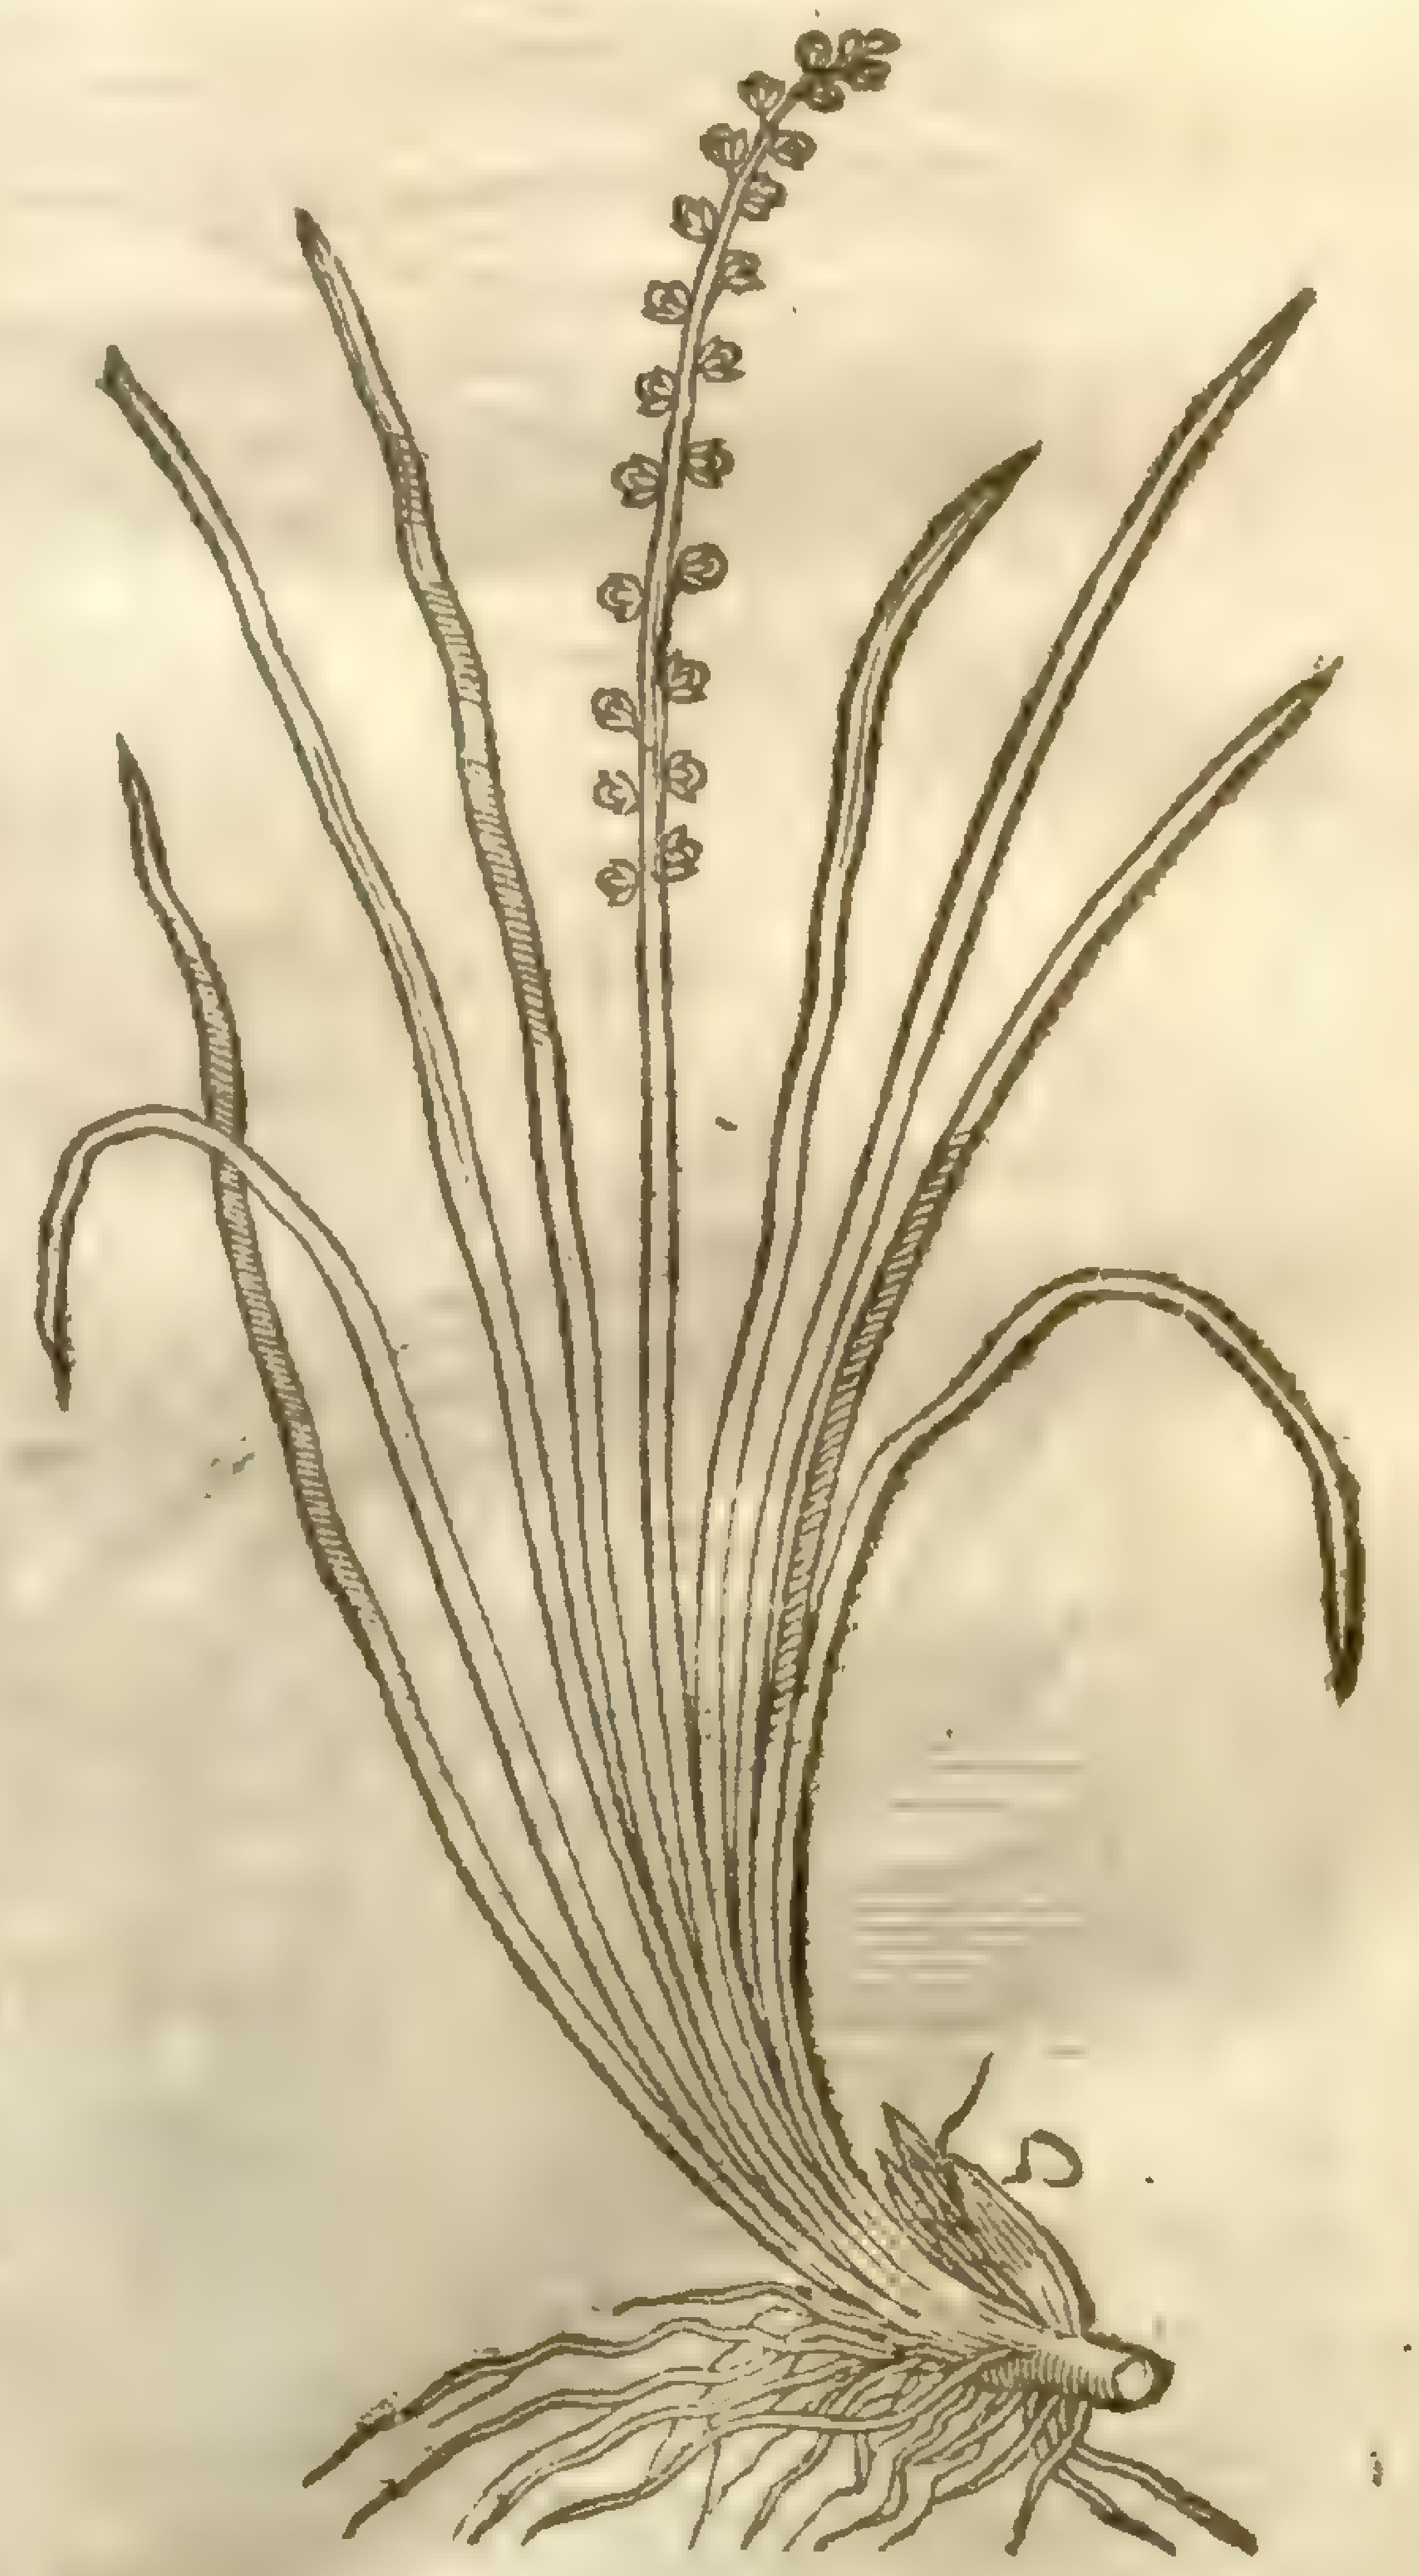
1 *Gramen aquaticum.*
Water-Graſſe.



Junc [illegible]

lob. ic. 12

2 *Gramen aquaticum ſpicatum.*
Spiked Water-Graſſe.



¶ *The Deſcription.*

† 1 Water-graſſe, or as we terme it, Water-Burre-graſſe, hath a few long narrow ſlender and jointed leaues: among which riſeth vp a ſtalke of two foot high, bearing vpon his ſmal and tender branches many little rough knobs, or browniſh ſharpe pointed ſeeds, made vp into cornered heads: his root is ſmall and threddy.

‡ The figure of this plant is not well expreſt, for it ſhould haue had the leaues made narrower, and joints expreſt in them, like as you may ſee in the *Gramen junceum ſylvaticum*, which is the ninth in the ſixteenth chapter; for that and this are ſo like, that I know no other difference betweene them, but that this hath leaues longer and narrower than that, and the heads ſmaller and whiter. There is a reaſonable good figure of this in the *Hiſt. Lugd. p.* 1001. vnder the name of *Arundo minima.*

2 Spiked Water-Graſſe hath long narrow leaues; the ſtalke is ſmall, ſingle, and naked, without leaues or blades, bearing alongſt the ſame toward the top an eare or ſpike made of certain ſmal buttons, reſembling the buttony floures of ſea Wormewood. His root is thicke and tough, full of fibres or threds.

¶ *The Place and Time.*

They differ not from the former kinds of Graſſes in Place and Time: and their Names are manifeſt.

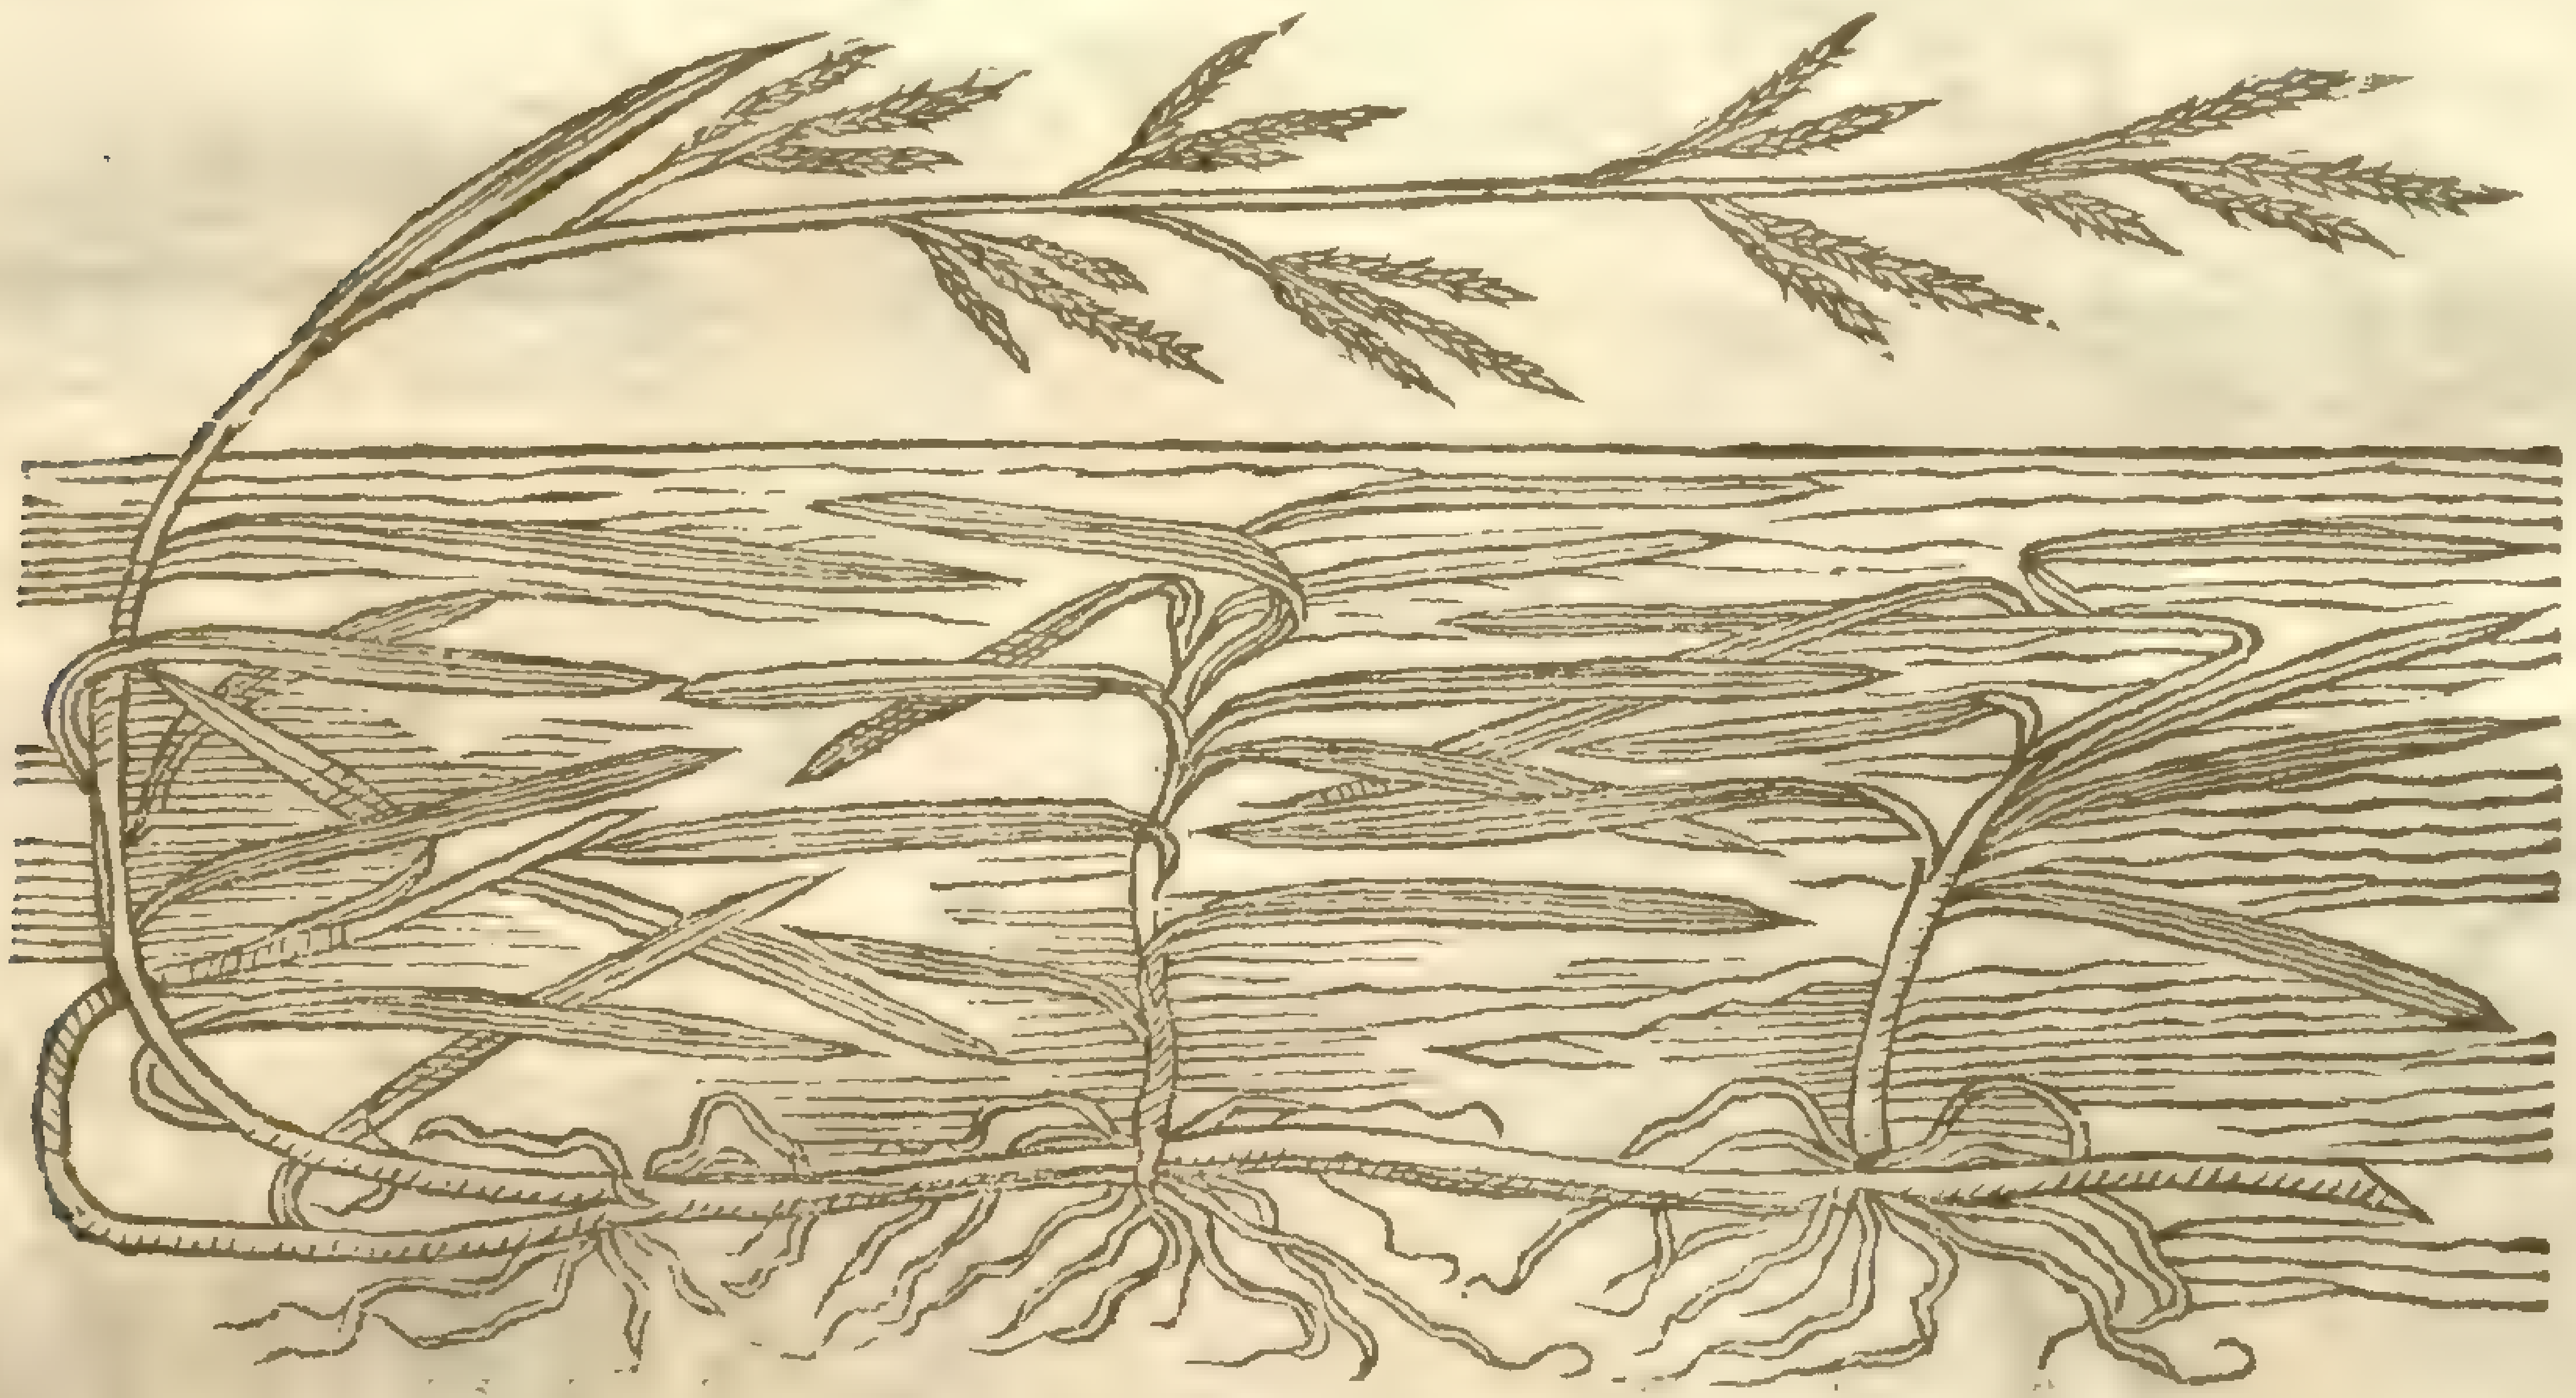
¶ *The Nature and Vertues.*

Their Nature and Vertues are referred vnto Dogs graſſe, whereof we will ſpeake hereafter.

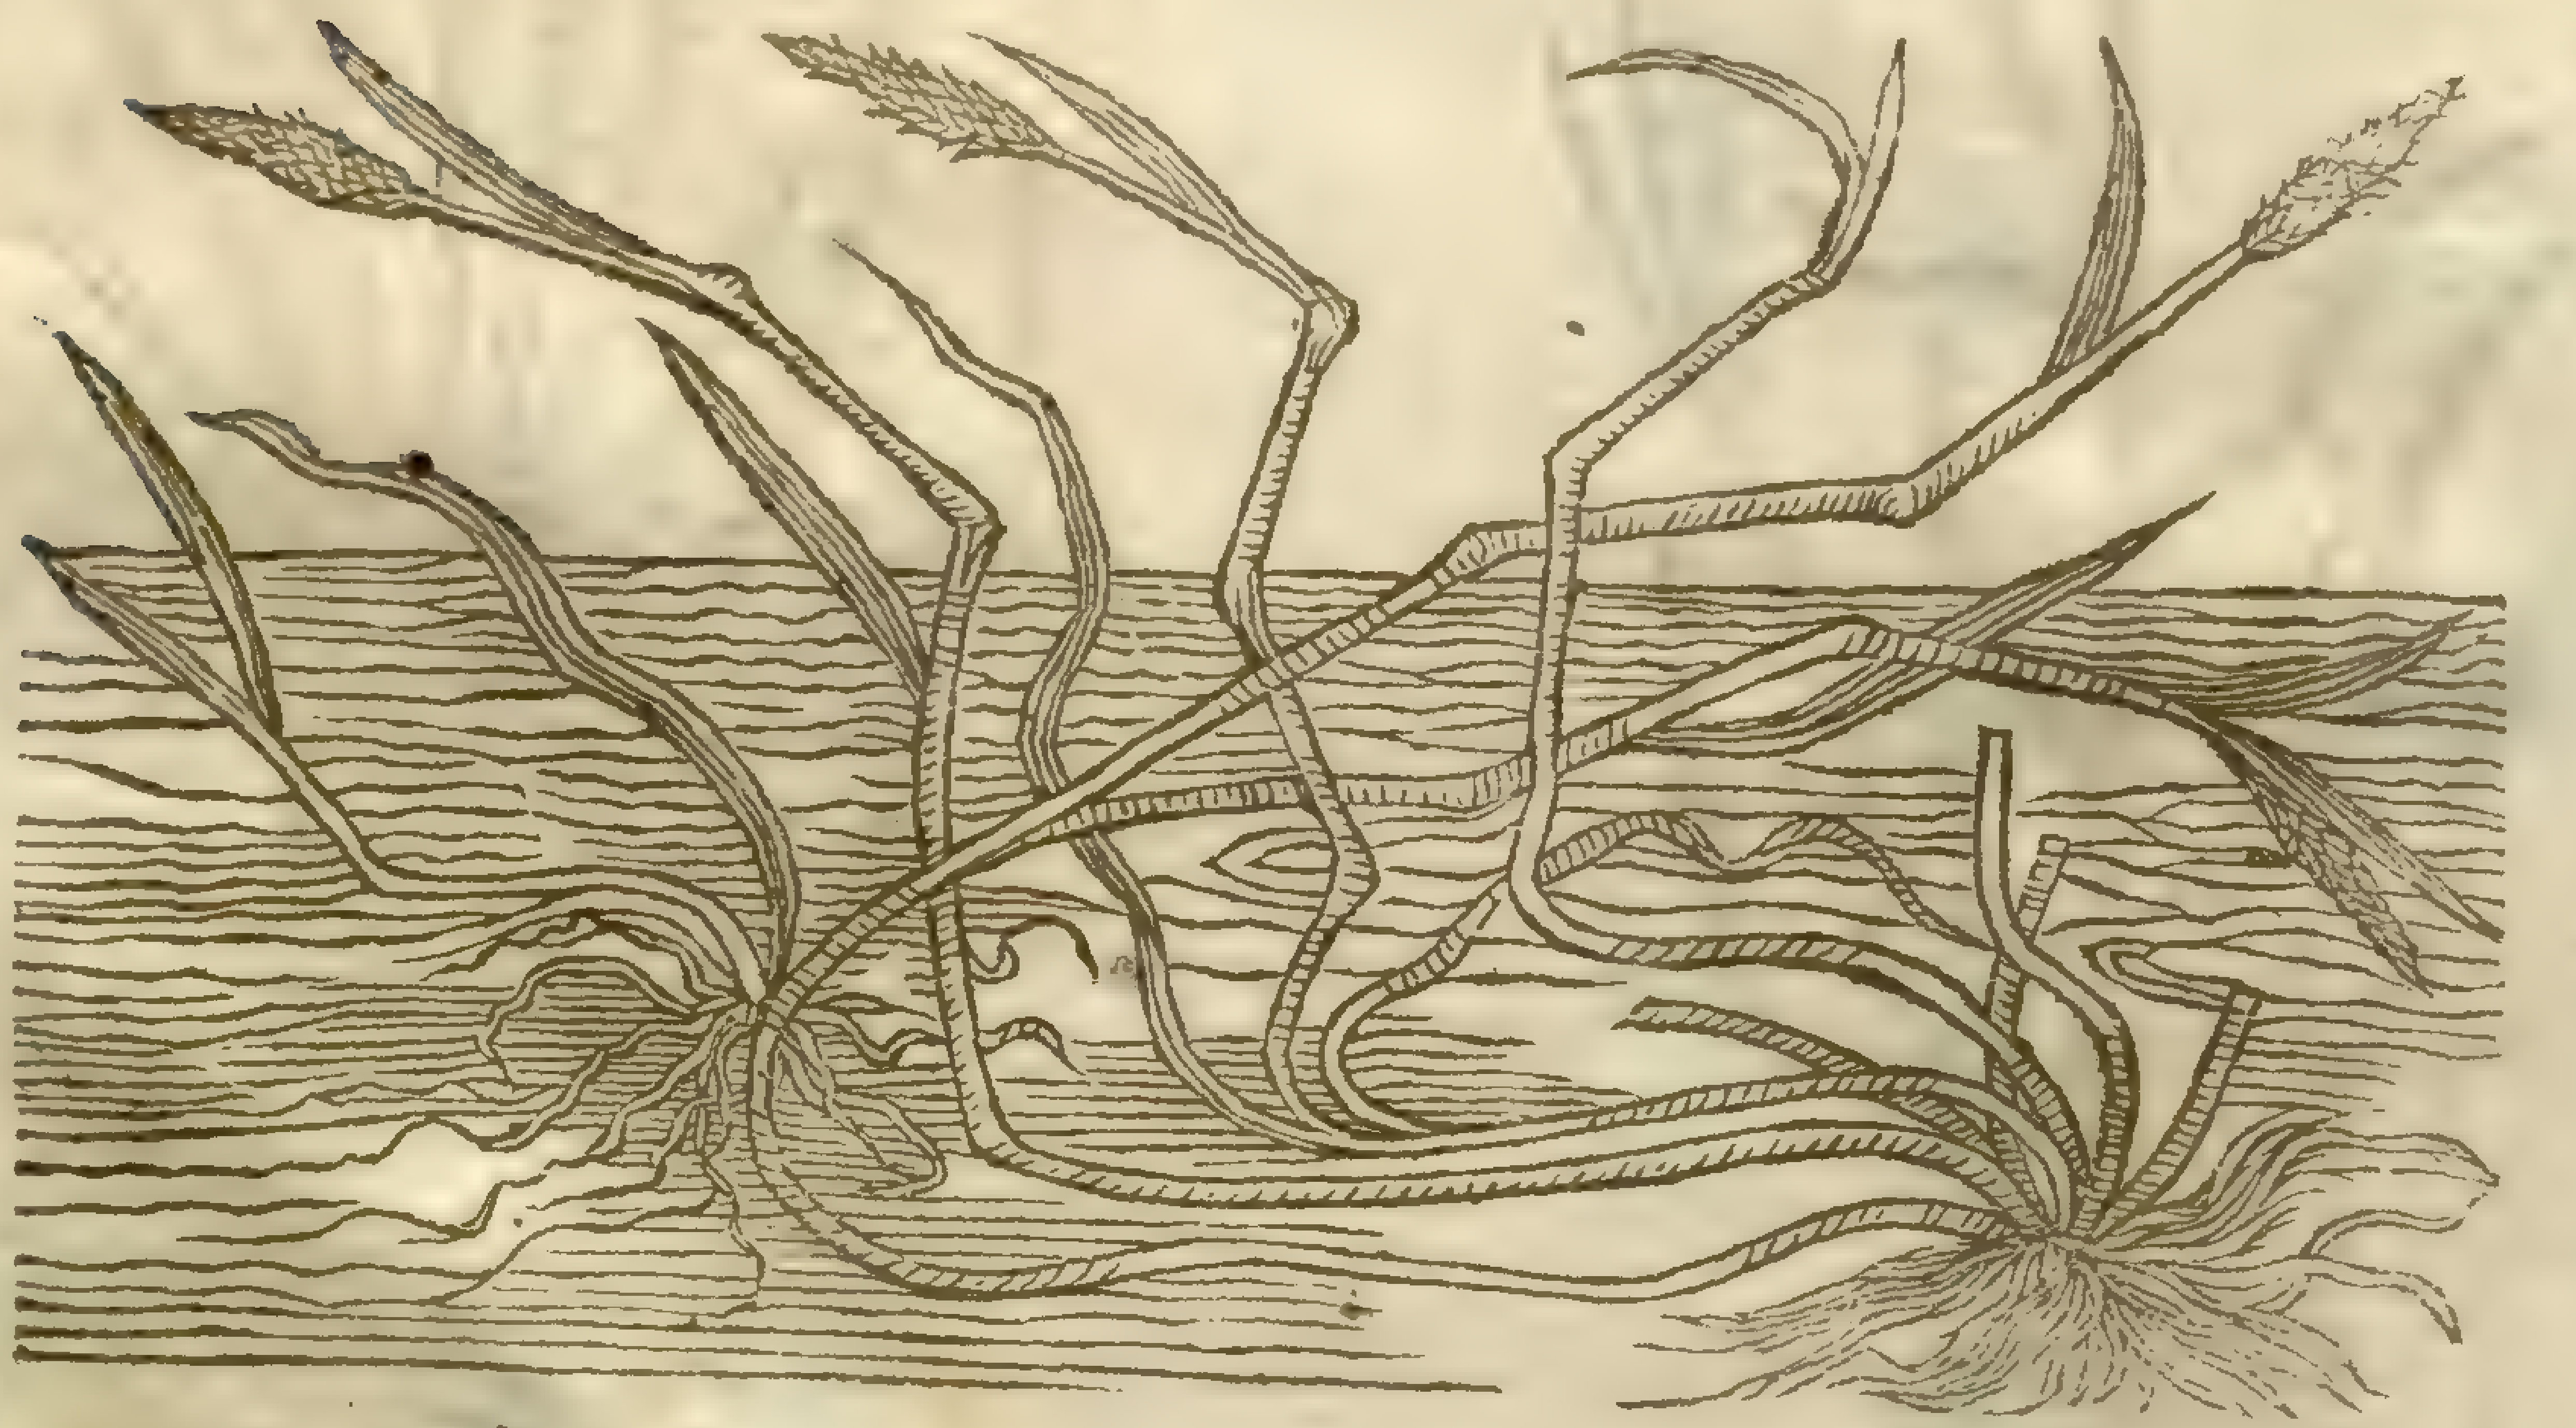
Chap. II. *Of Flote-Graſſe.*

[illegible] Syn p. [illegible]

1 *Gramen Fluviatile.* Flote-Graſſe.



2 *Gramen fluviatile ſpicatum.* Spiked Flote-graſſe.



[illegible] Syn. p. [illegible] 82

¶ *The Deſcription.*

† 1 Flote-Graſſe hath a long and round root ſomewhat thicke, like vnto Dogs-Graſſe, ſet on euen ioynts with ſmall ſtrings or threds; from the which riſe vp long and crooked ſtalks, croſſing, winding, and folding one within another, with many flaggie leaues, which horſes eat greedily of. At the top of theſe ſtalks, and ſomwhat lower, there come forth very many little eares of a whitiſh colour, compoſed of two rankes of little chaffie ſeeds ſet alternatly, each of theſe ſmall eares being almoſt an inch in length.

2 Spike Flote-Graſſe, or Spiked Flote-Graſſe beareth at the top of each ſlender creeping ſtalke one ſpiked eare and no more, and the other many, which maketh a difference betwixt them; otherwiſe they are one like the other. His root is compact, tufted, and made of many thrummie threds.

¶ *The Place.*

The firſt of theſe growes euery where in waters. The ſecond is harder to be found.

¶ The

¶ *The Names.*

The firſt is called *Gramen fluviatile*, and alſo *Gramen aquis innatans*: in Engliſh, Flote-graſſe. *Tragus* calls it *Gramen Anatum*, Ducks Graſſe.

The ſecond is called *Gramen fluviatile ſpicatum*, and *fluviatile album*, by *Tabernamontanus*. Likewiſe in Engliſh it is called Flote-Graſſe, and Floter-Graſſe, becauſe they ſwimme and flote in the water.

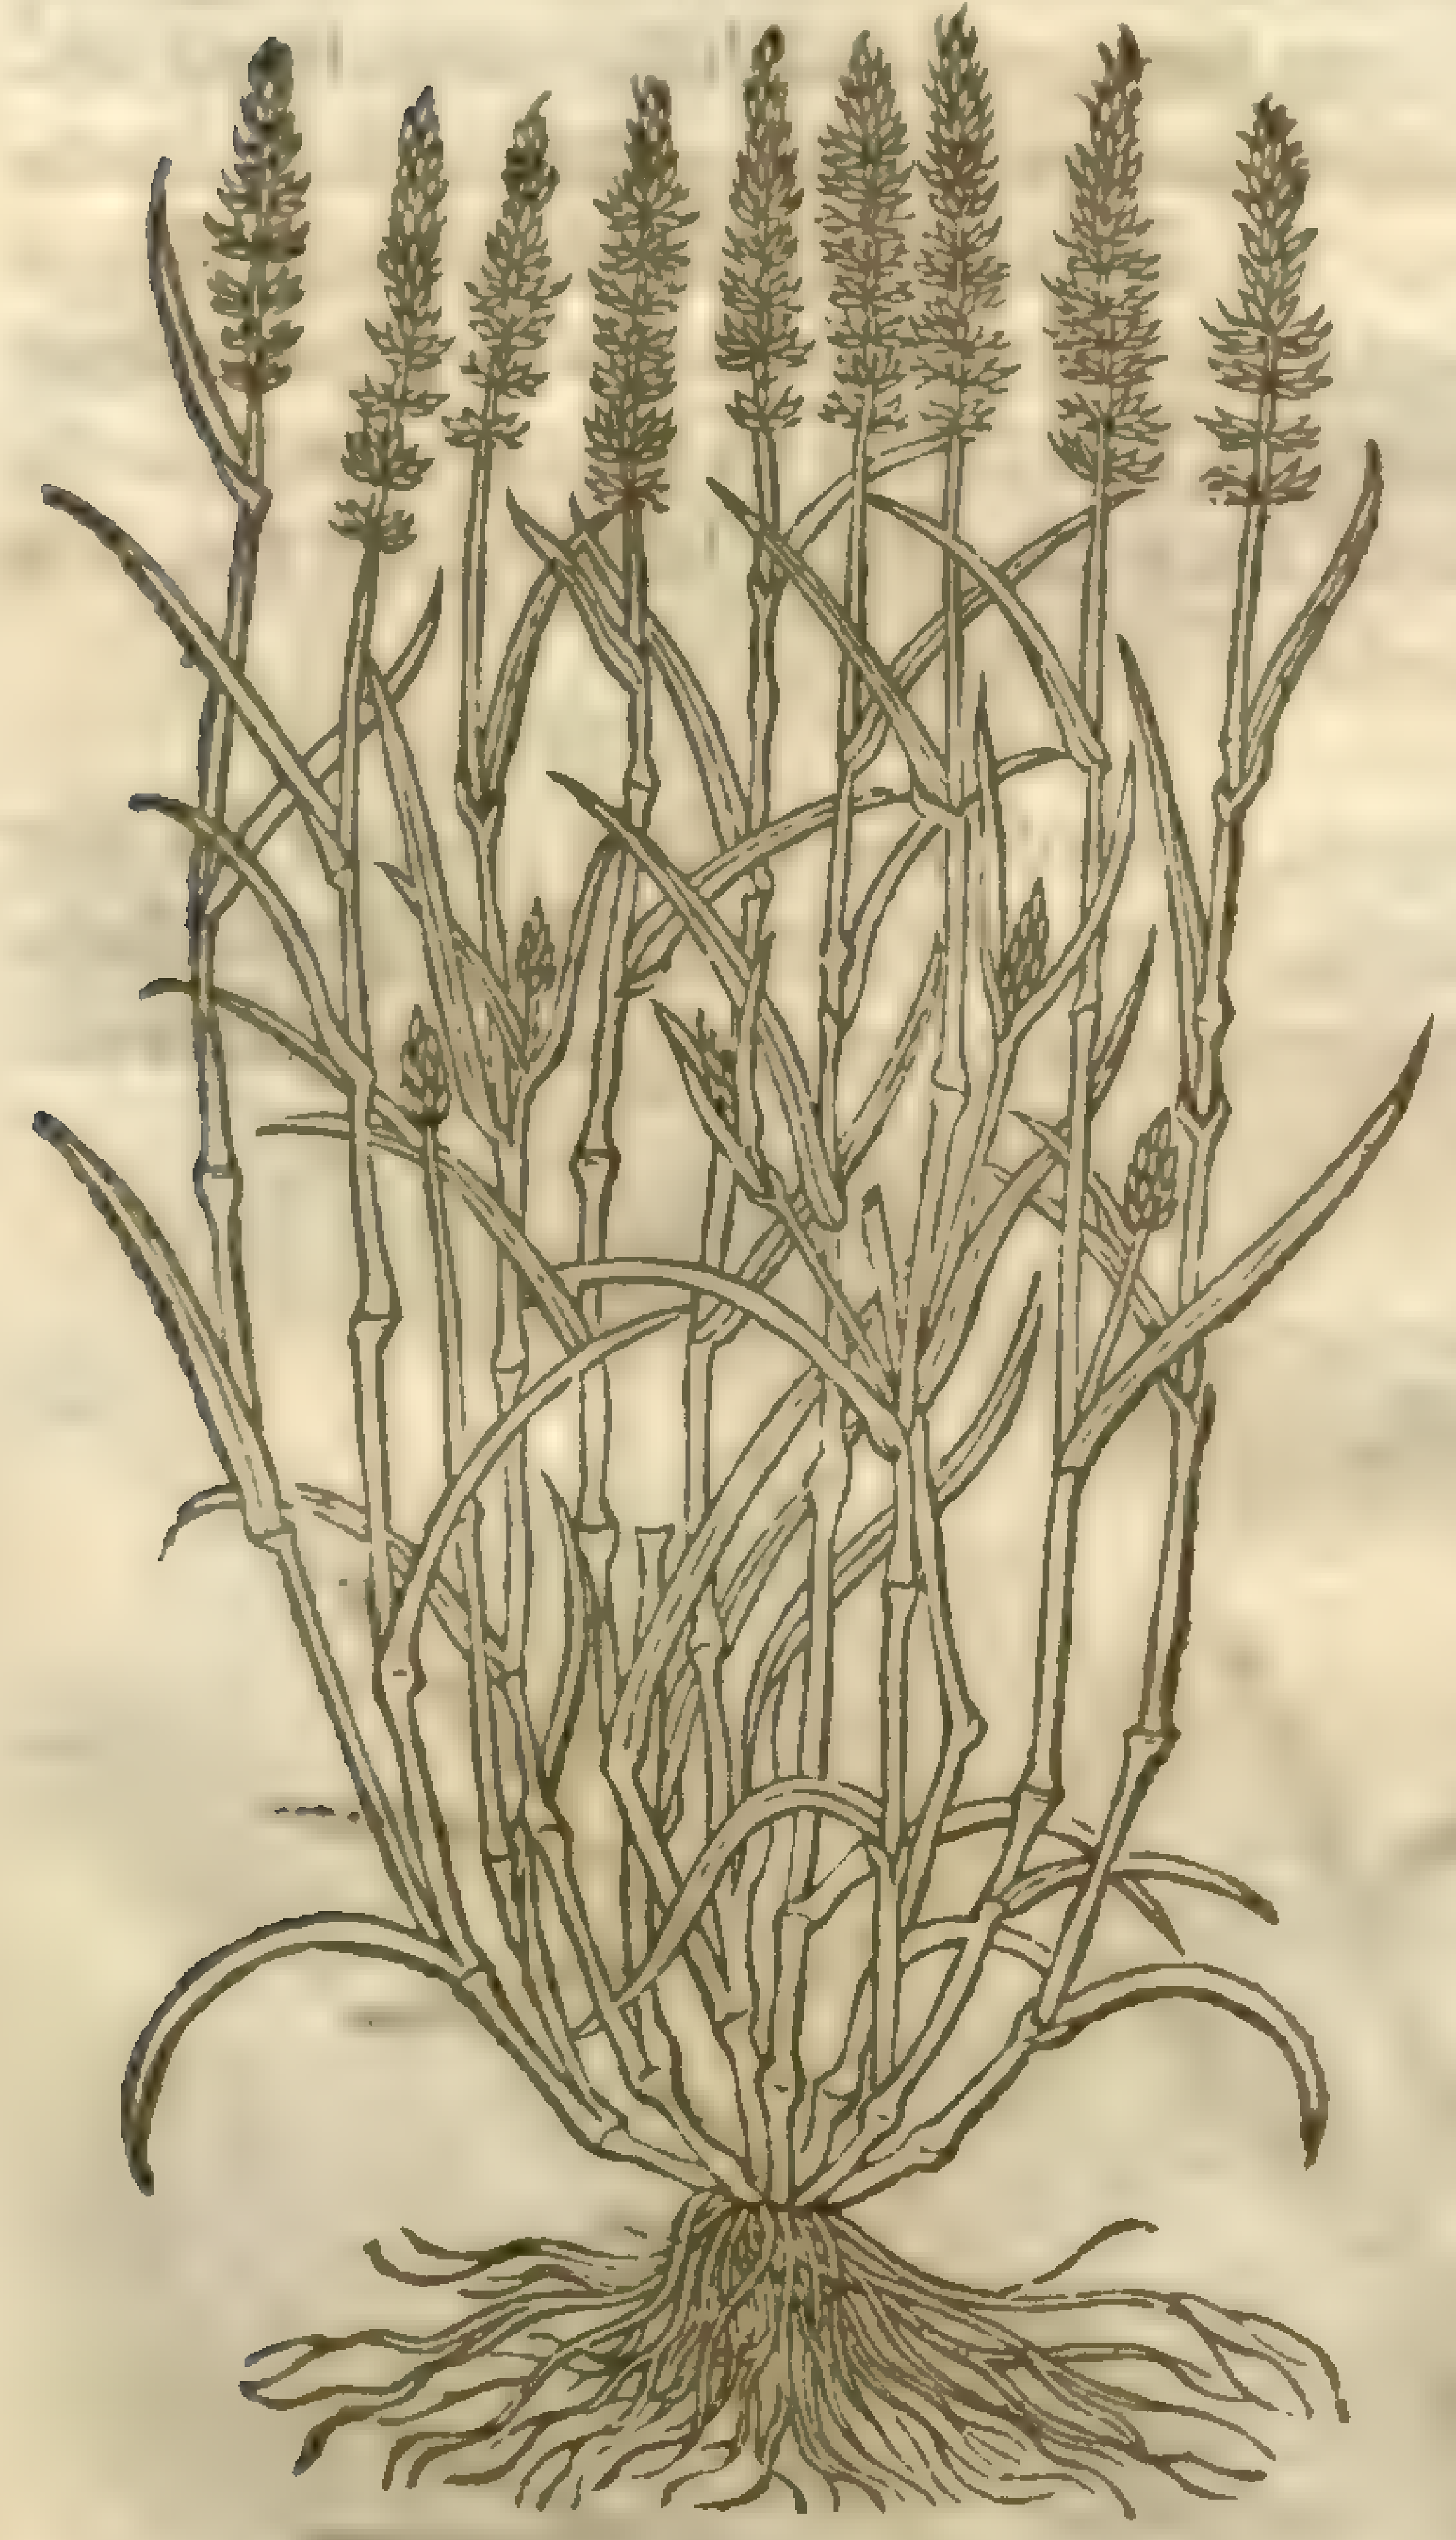
CHAP. 12. *Of Kneed-Graſſe.*

¶ *The Deſcription.*

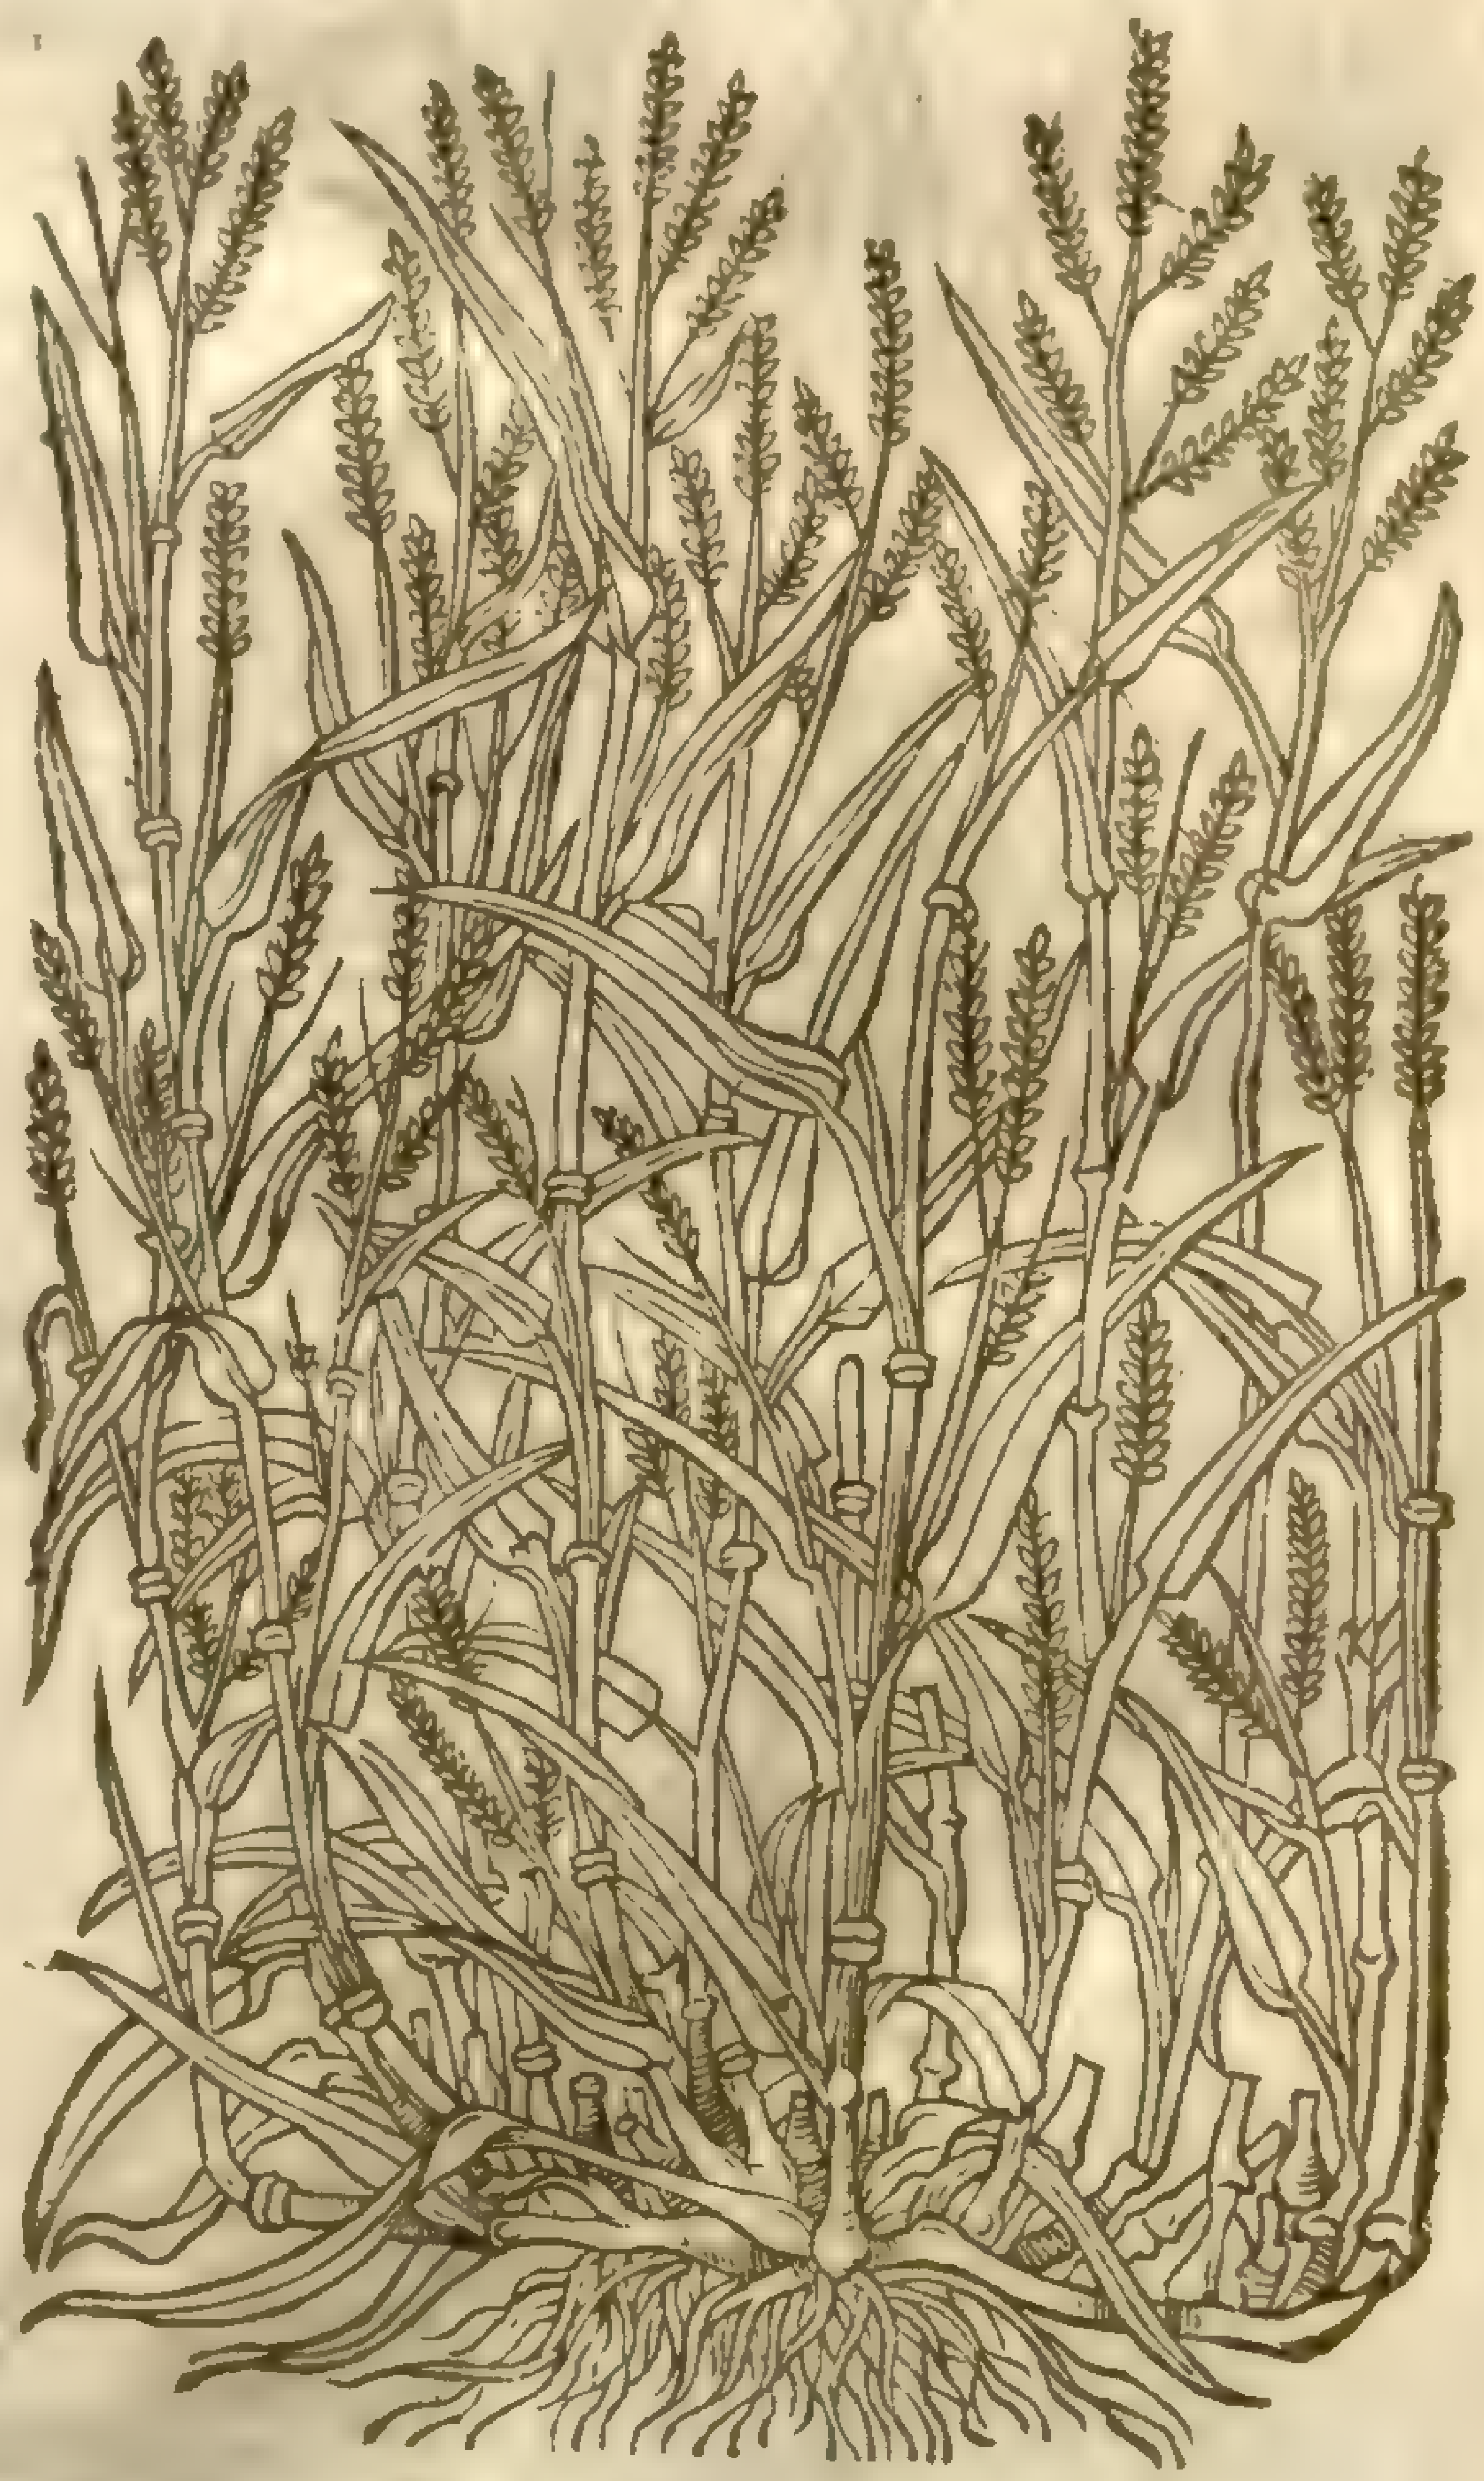
1 KNeed-Graſſe hath ſtreight and vpright ſtrawy ſtalkes, with joints like to the ſtraw of corne, and beareth ſmall graſſy leaues or blades ſpiked at the top like vnto Panicke, with a rough eare of a darke browne colour. His roots are hairy and thready, and the joints of the ſtraw are very large and conſpicuous.

1 *Gramen geniculatum.*
Kneed-Graſſe,

Panicum verticillatum Sm. fl. 1.98
Spik bent



2 *Gramen geniculatum aquaticum.*
Water Kneed-Graſſe.



2 Water Kneed-Graſſe hath many long and ſlender ſtemmes, jointed with many knobby and gouty knees like vnto Reed, ſet with broad flaggy leaues ſomwhat ſharpe pointed, bearing at the top a tuft or pannicle, diuided into ſundry ſmall branches of a duskiſh colour. His root is threddie like the other.

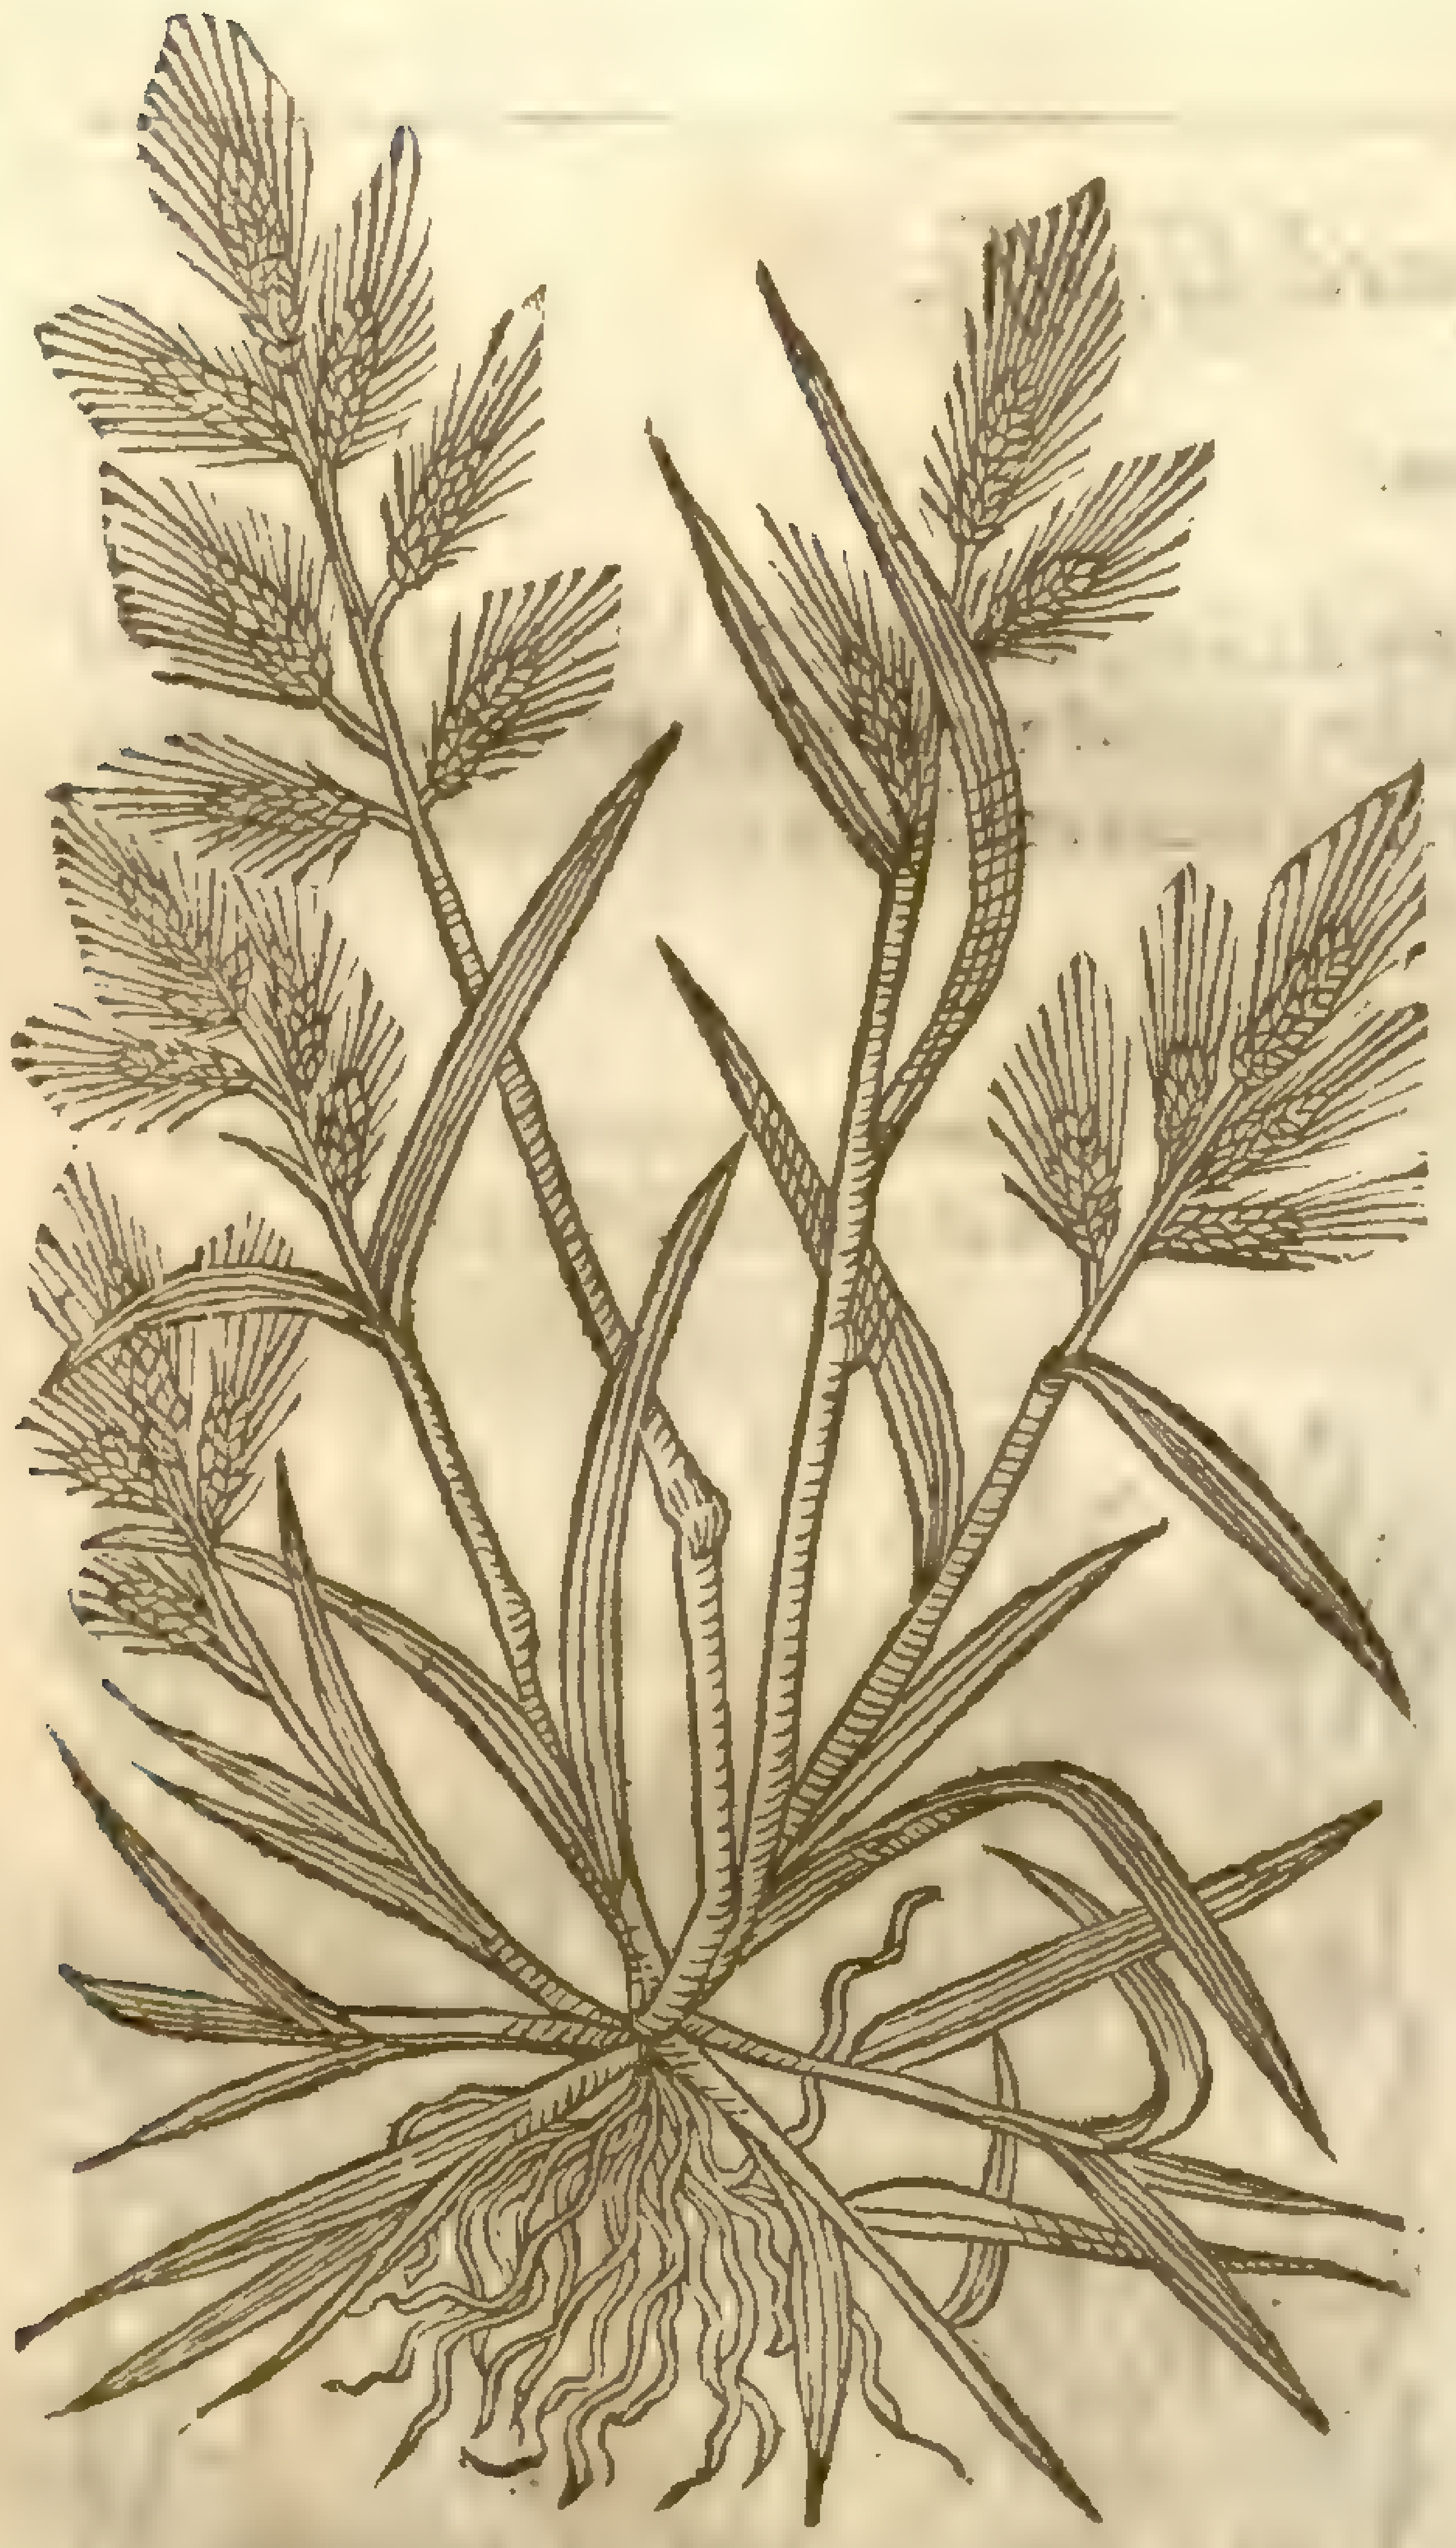
¶ *The Place, Time, and Names.*

Theſe Graſſes do grow in fertile moiſt medowes, not differing in time from others. And they are called *Geniculata*, becauſe they haue large joints like as it were knees.

We haue nothing deliuered vs of their Nature and Properties.

Chap. 13. Of Bearded Panicke-Graſſe.

1 *Gramen Paniceum.*
Bearded Panick-Graſſe.



[illegible]

Lob. ic. 14

¶ *The Deſcription.*

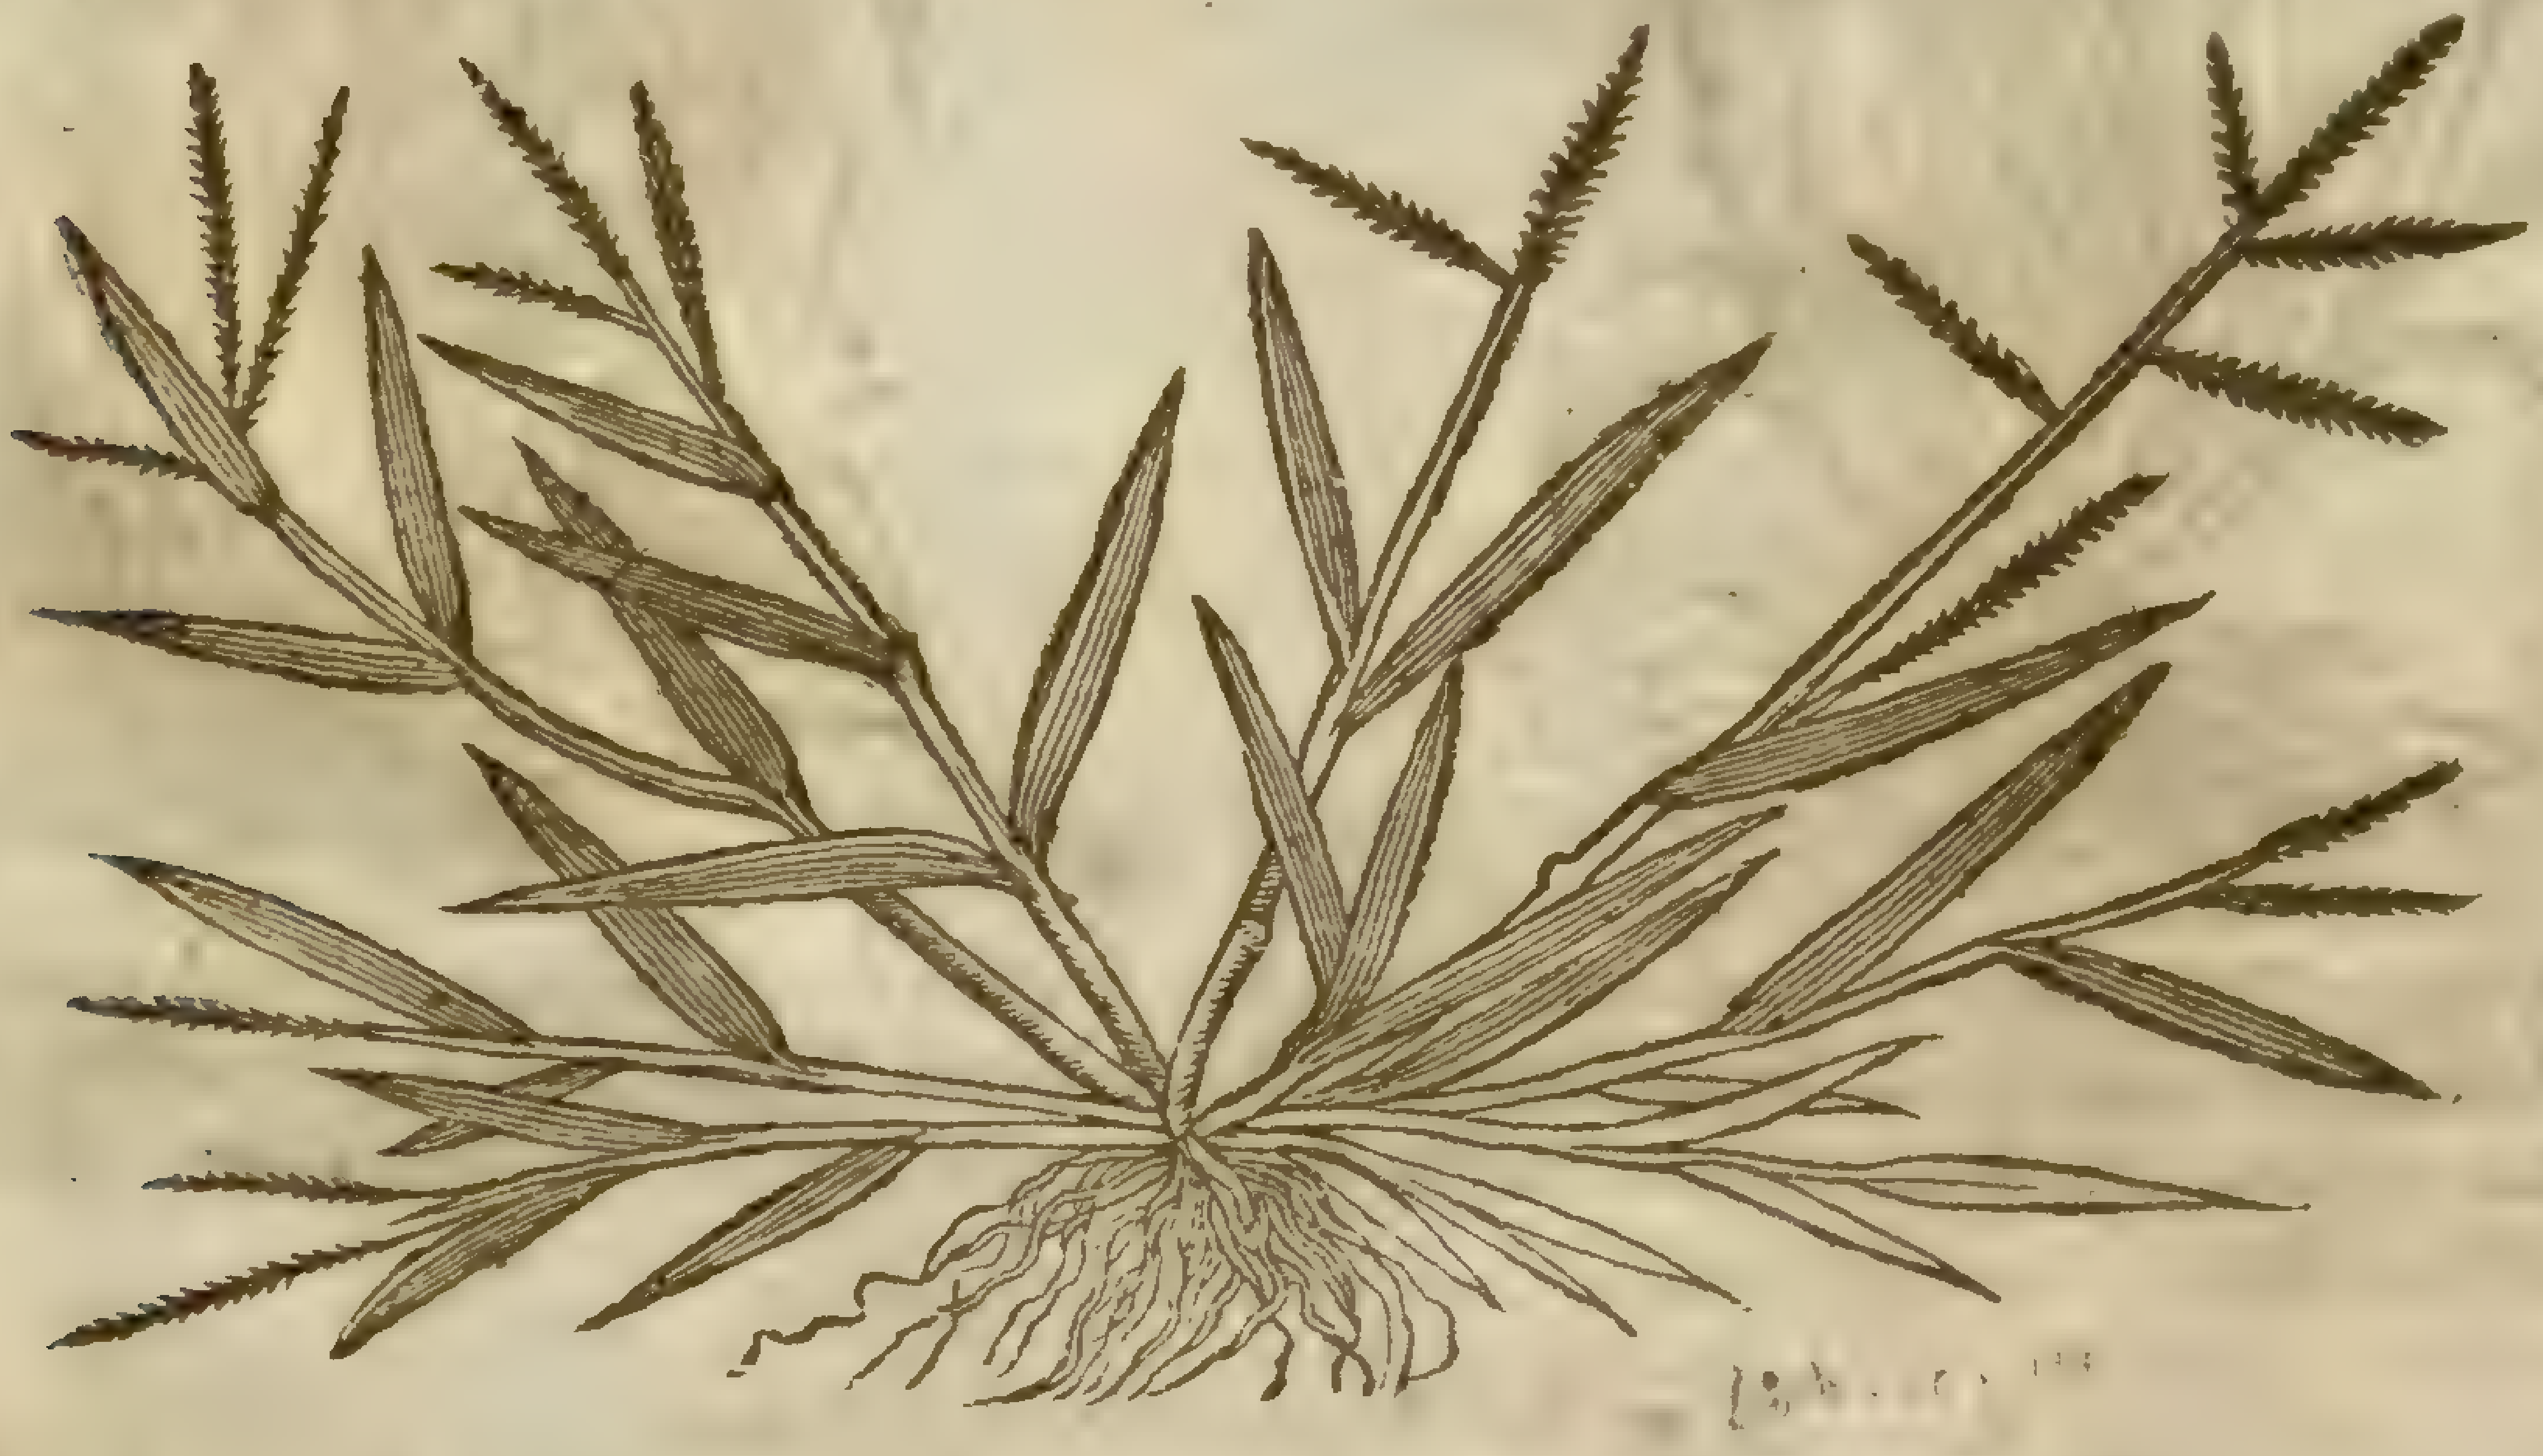
1 Bearded Panicke graſſe hath broad and large leaues like Barly, ſomwhat hoarie, or of an ouer-worne Ruſſet colour. The ſtalkes haue two or three joints at the moſt, and many eares on the top without order; vpon ſome ſtalkes more eares, on others fewer, much like vnto the eare of wilde Panicke, but that this hath many beards or awnes, which the other wants.

2 Small Panicke Graſſe, as *Lobel* writeth, in roots, leaues, joints, and ſtalks, is like the former, ſauing that the eare is much leſſe, conſiſting of fewer rowes of ſeed, contained in ſmall chaffie blackiſh huskes. This, as the former, hath many eares vpon one ſtalke.

‡ 3 This ſmall Pannicke Graſſe from a threddy root ſendeth forth many little ſtalks, whereof ſome are one hand-full, other-ſome little more than an inch high; and each of theſe ſtalks on the top ſuſtains one ſingle eare, in ſhape very like vnto the eare of wilde Panick, but about halfe the length. The ſtalks of this are commonly crooked, and ſet with graſſie leaues like the reſt of this kinde.

The figure hereof was vnfitly placed by our Author in the ſixteenth place in the eighth chapter, vnder the title of *Gramen Cyperoides ſpicatum.*

2 *Gramen Paniceum parvum.*
Small Panicke-Graſſe.

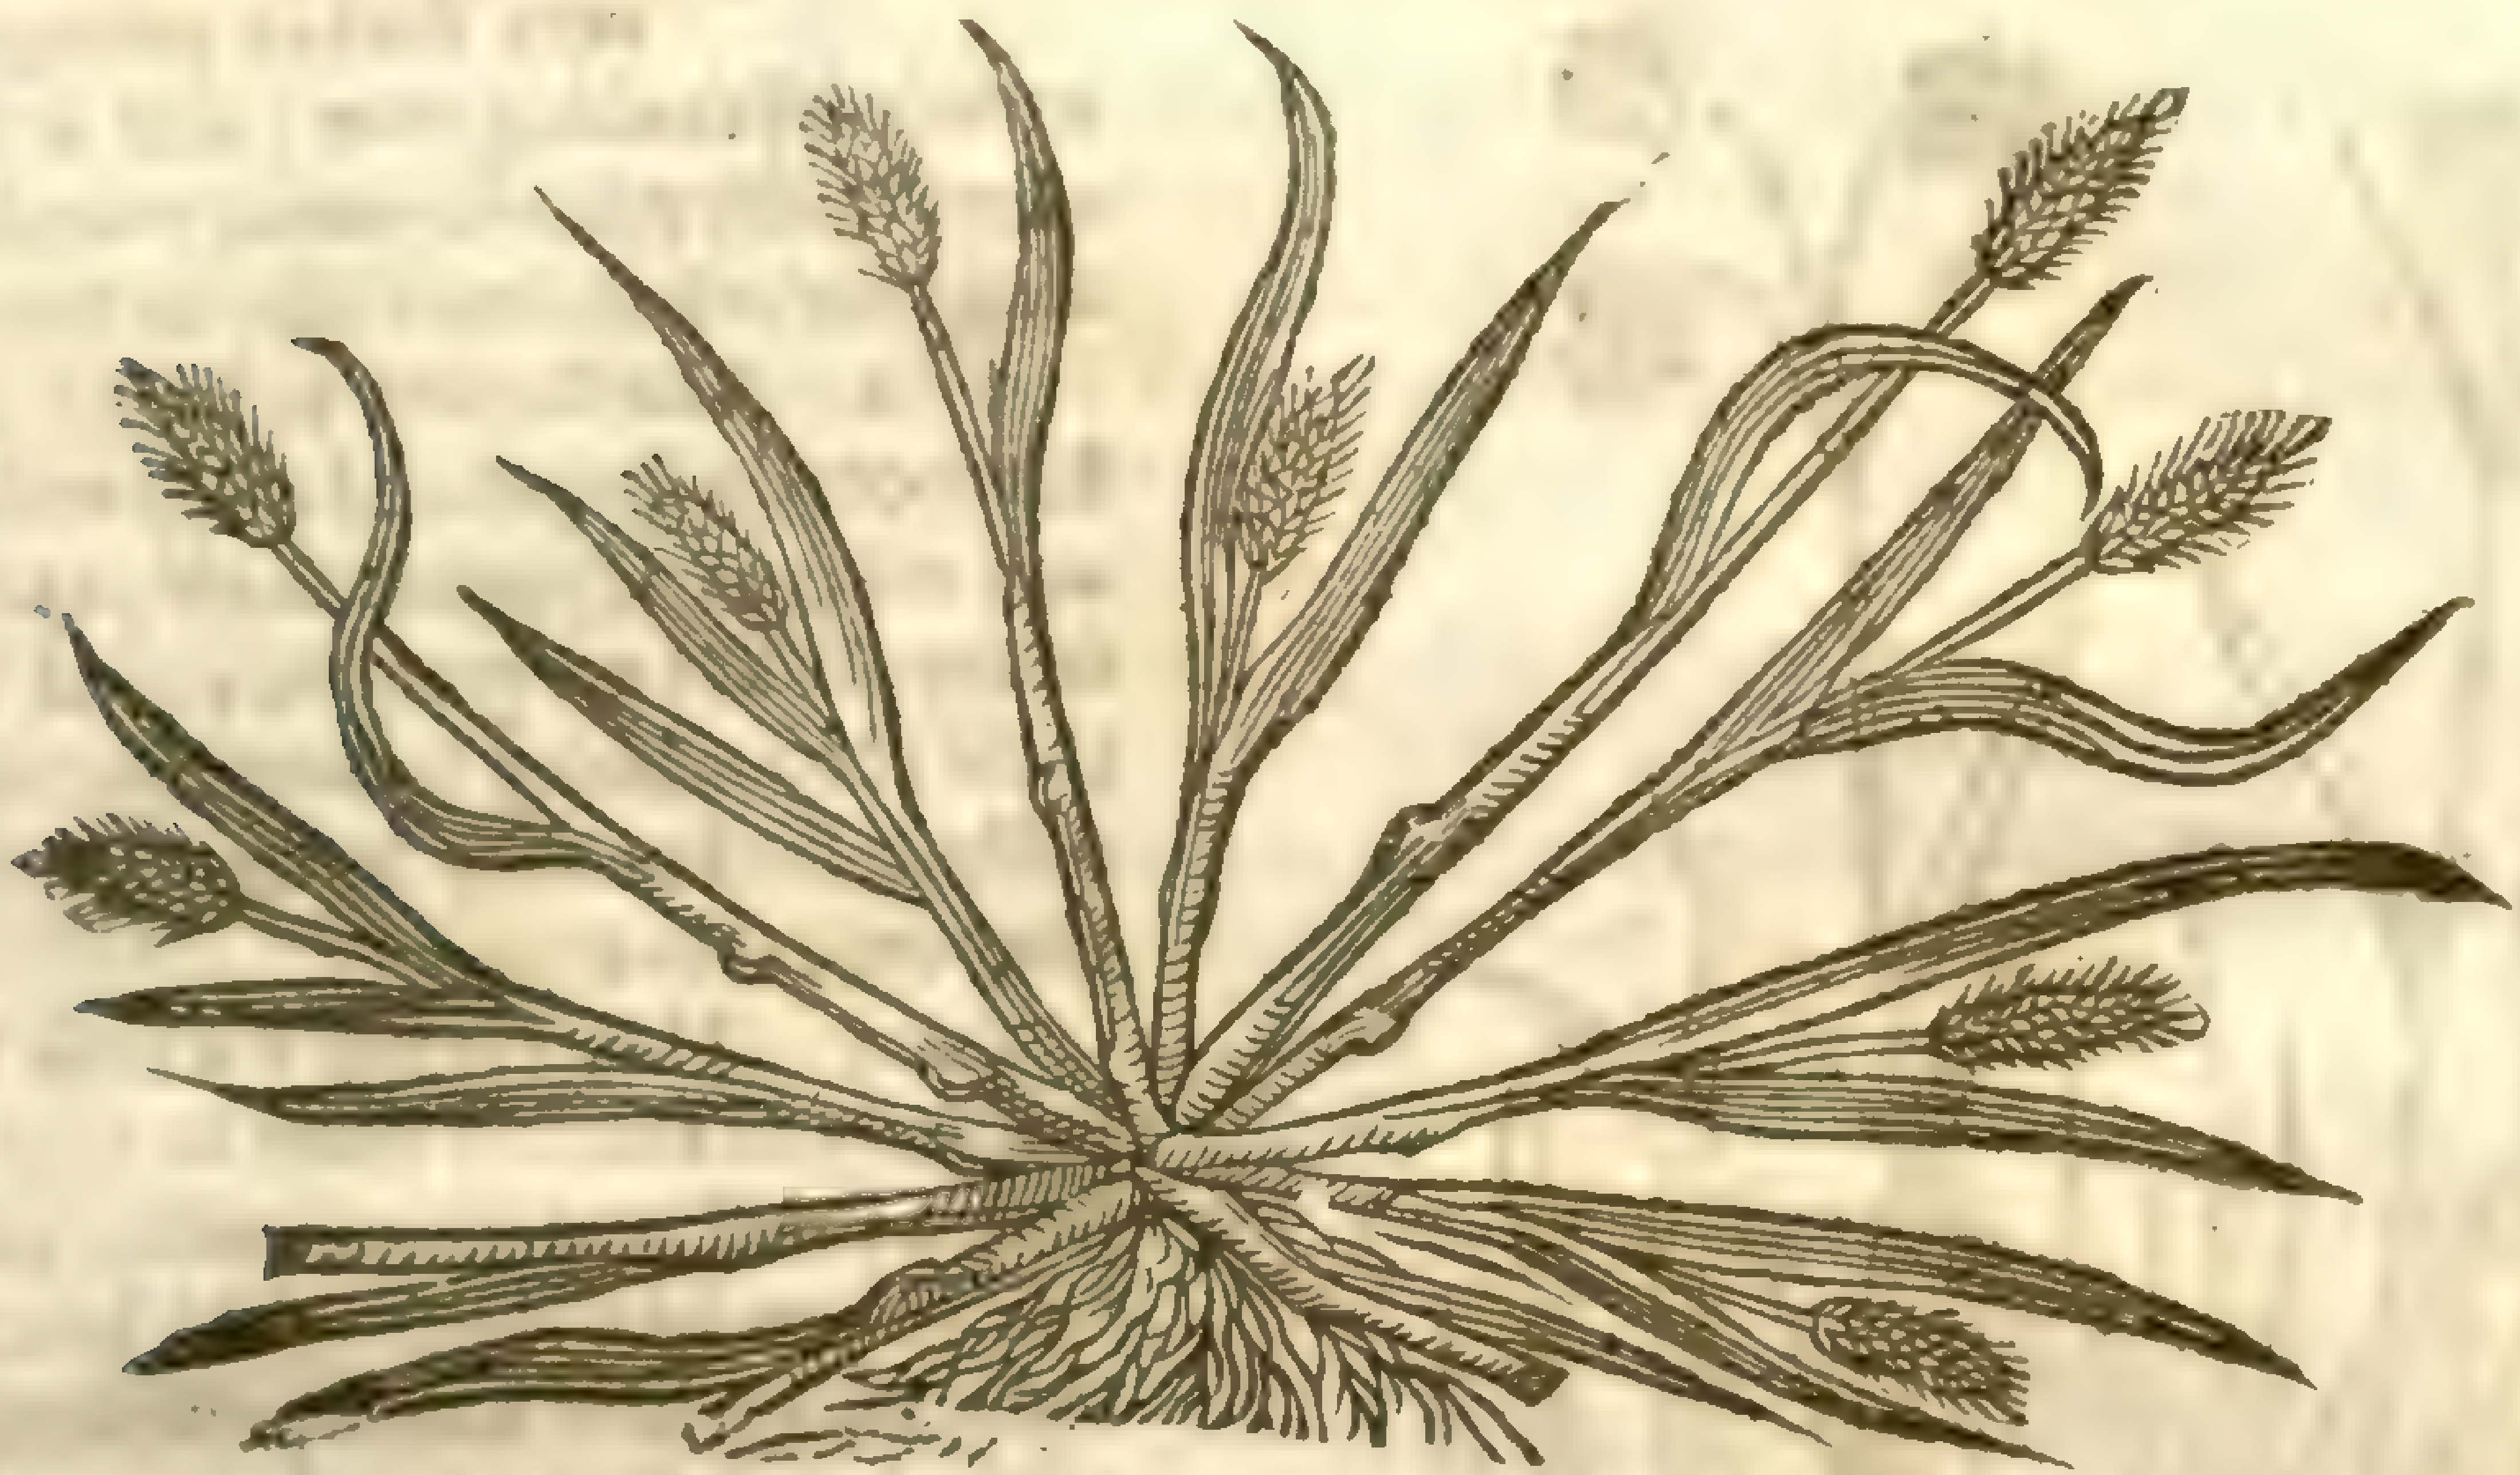


¶ *The Place and Time.*

The firſt of theſe two doth grow neere vnto mud walls, or ſuch like places not manured, yet fertile or fruitfull.

The ſecond groweth in ſhallow waterie plaſhes of paſtures, and at the ſame time with others. ‡ I haue not as yet obſerued any of theſe growing wilde. ‡

† 3 *Gramen Panici effigie ſpica ſimplici.*
Single eared Panicke Graſſe.

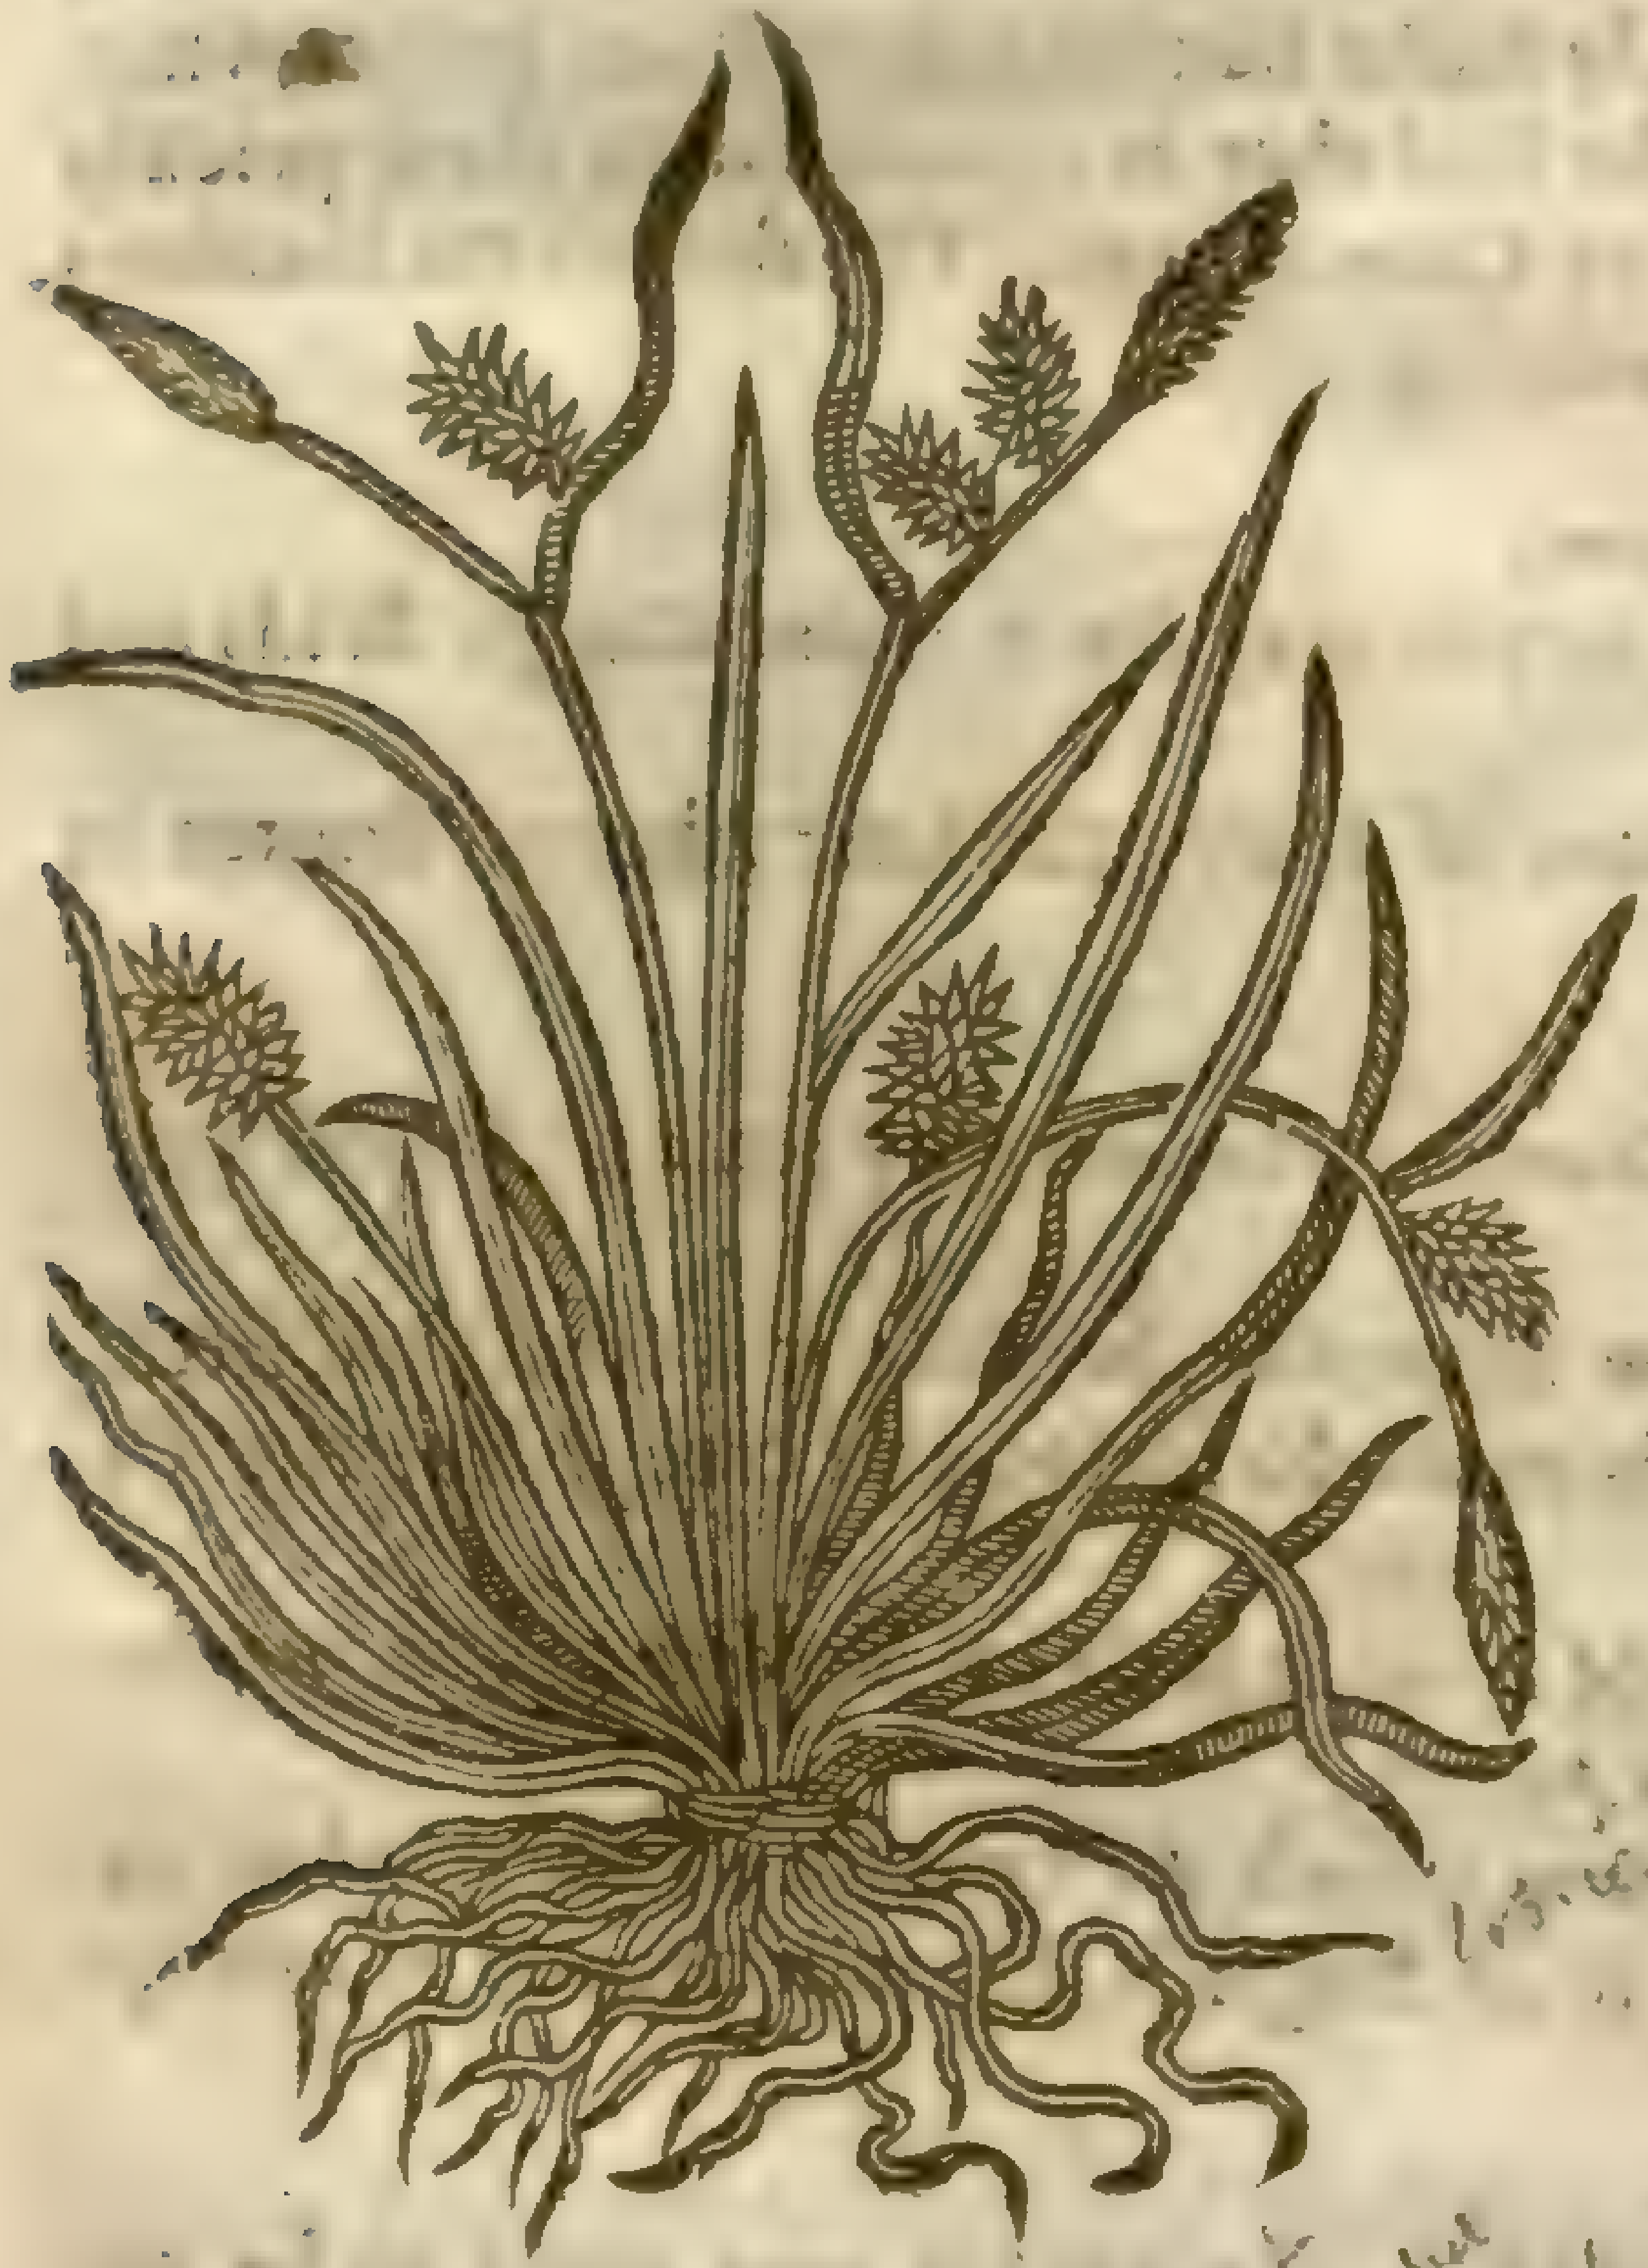


¶ *The Names and Vertues.*

They are called Panicke Graſſes, becauſe they are like the Italian corne called Panicke. Their nature and vertues are not knowne.

CHAP. 14. *Of Hedge-hog Graſſe.*

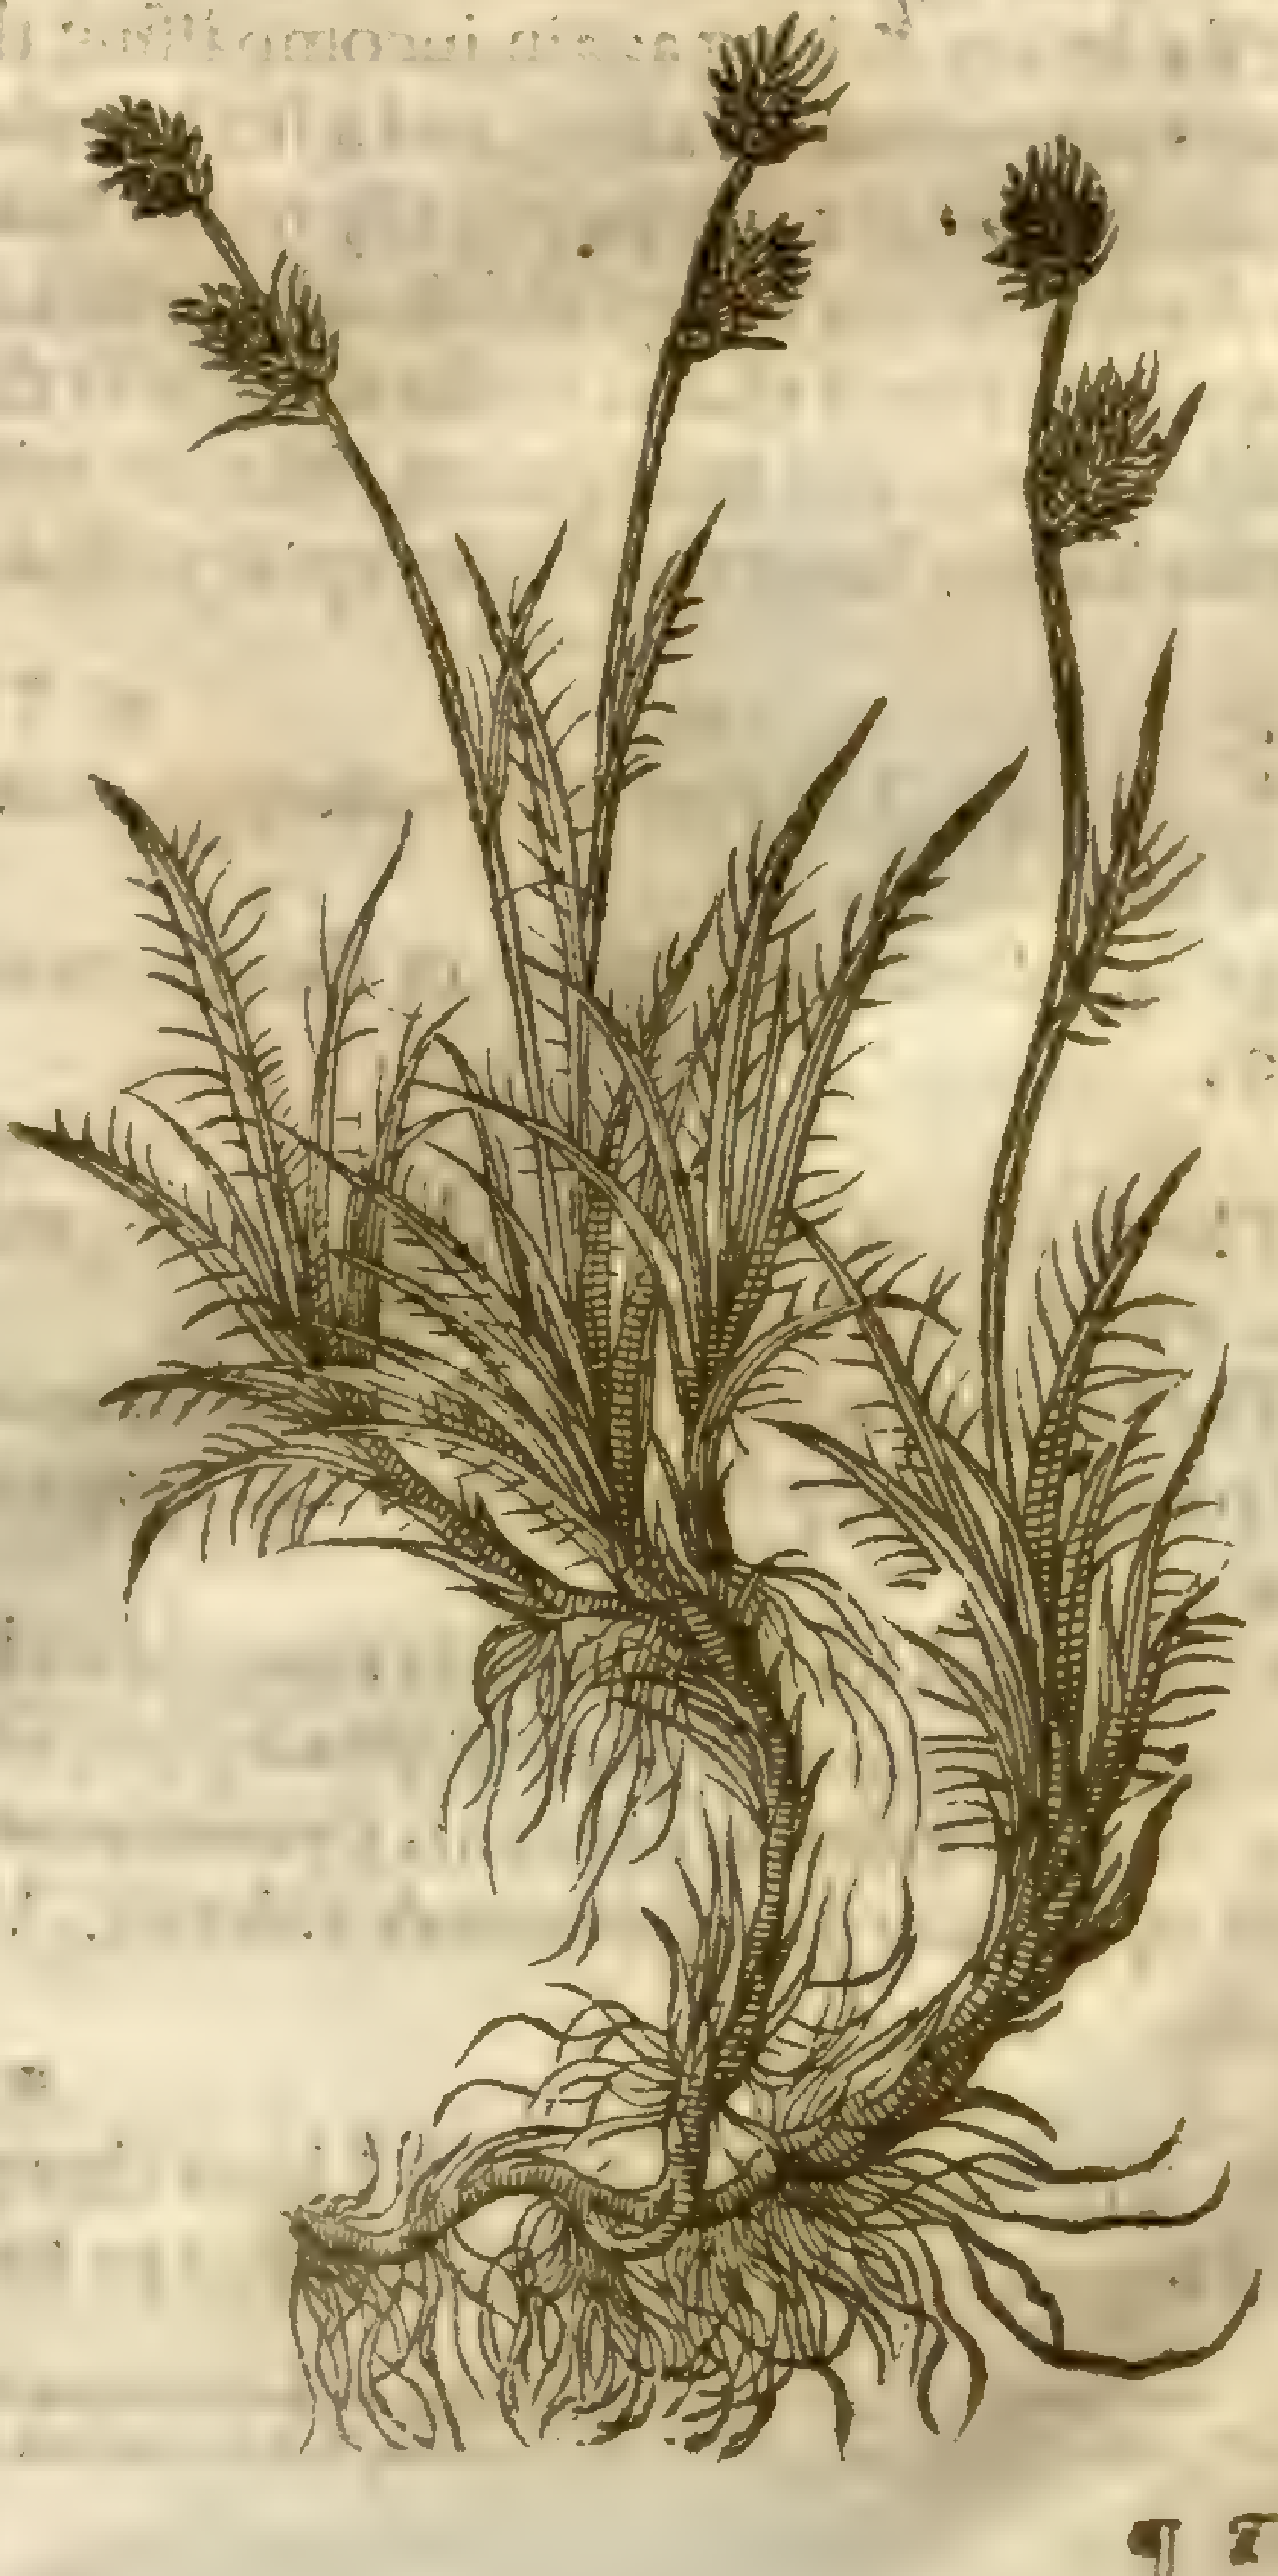
† 1 *Gramen paluſtre Echinatum.*
Hedge-hog Graſſe.



lob. ic. 15

[illegible] plants made Sept. 4 106

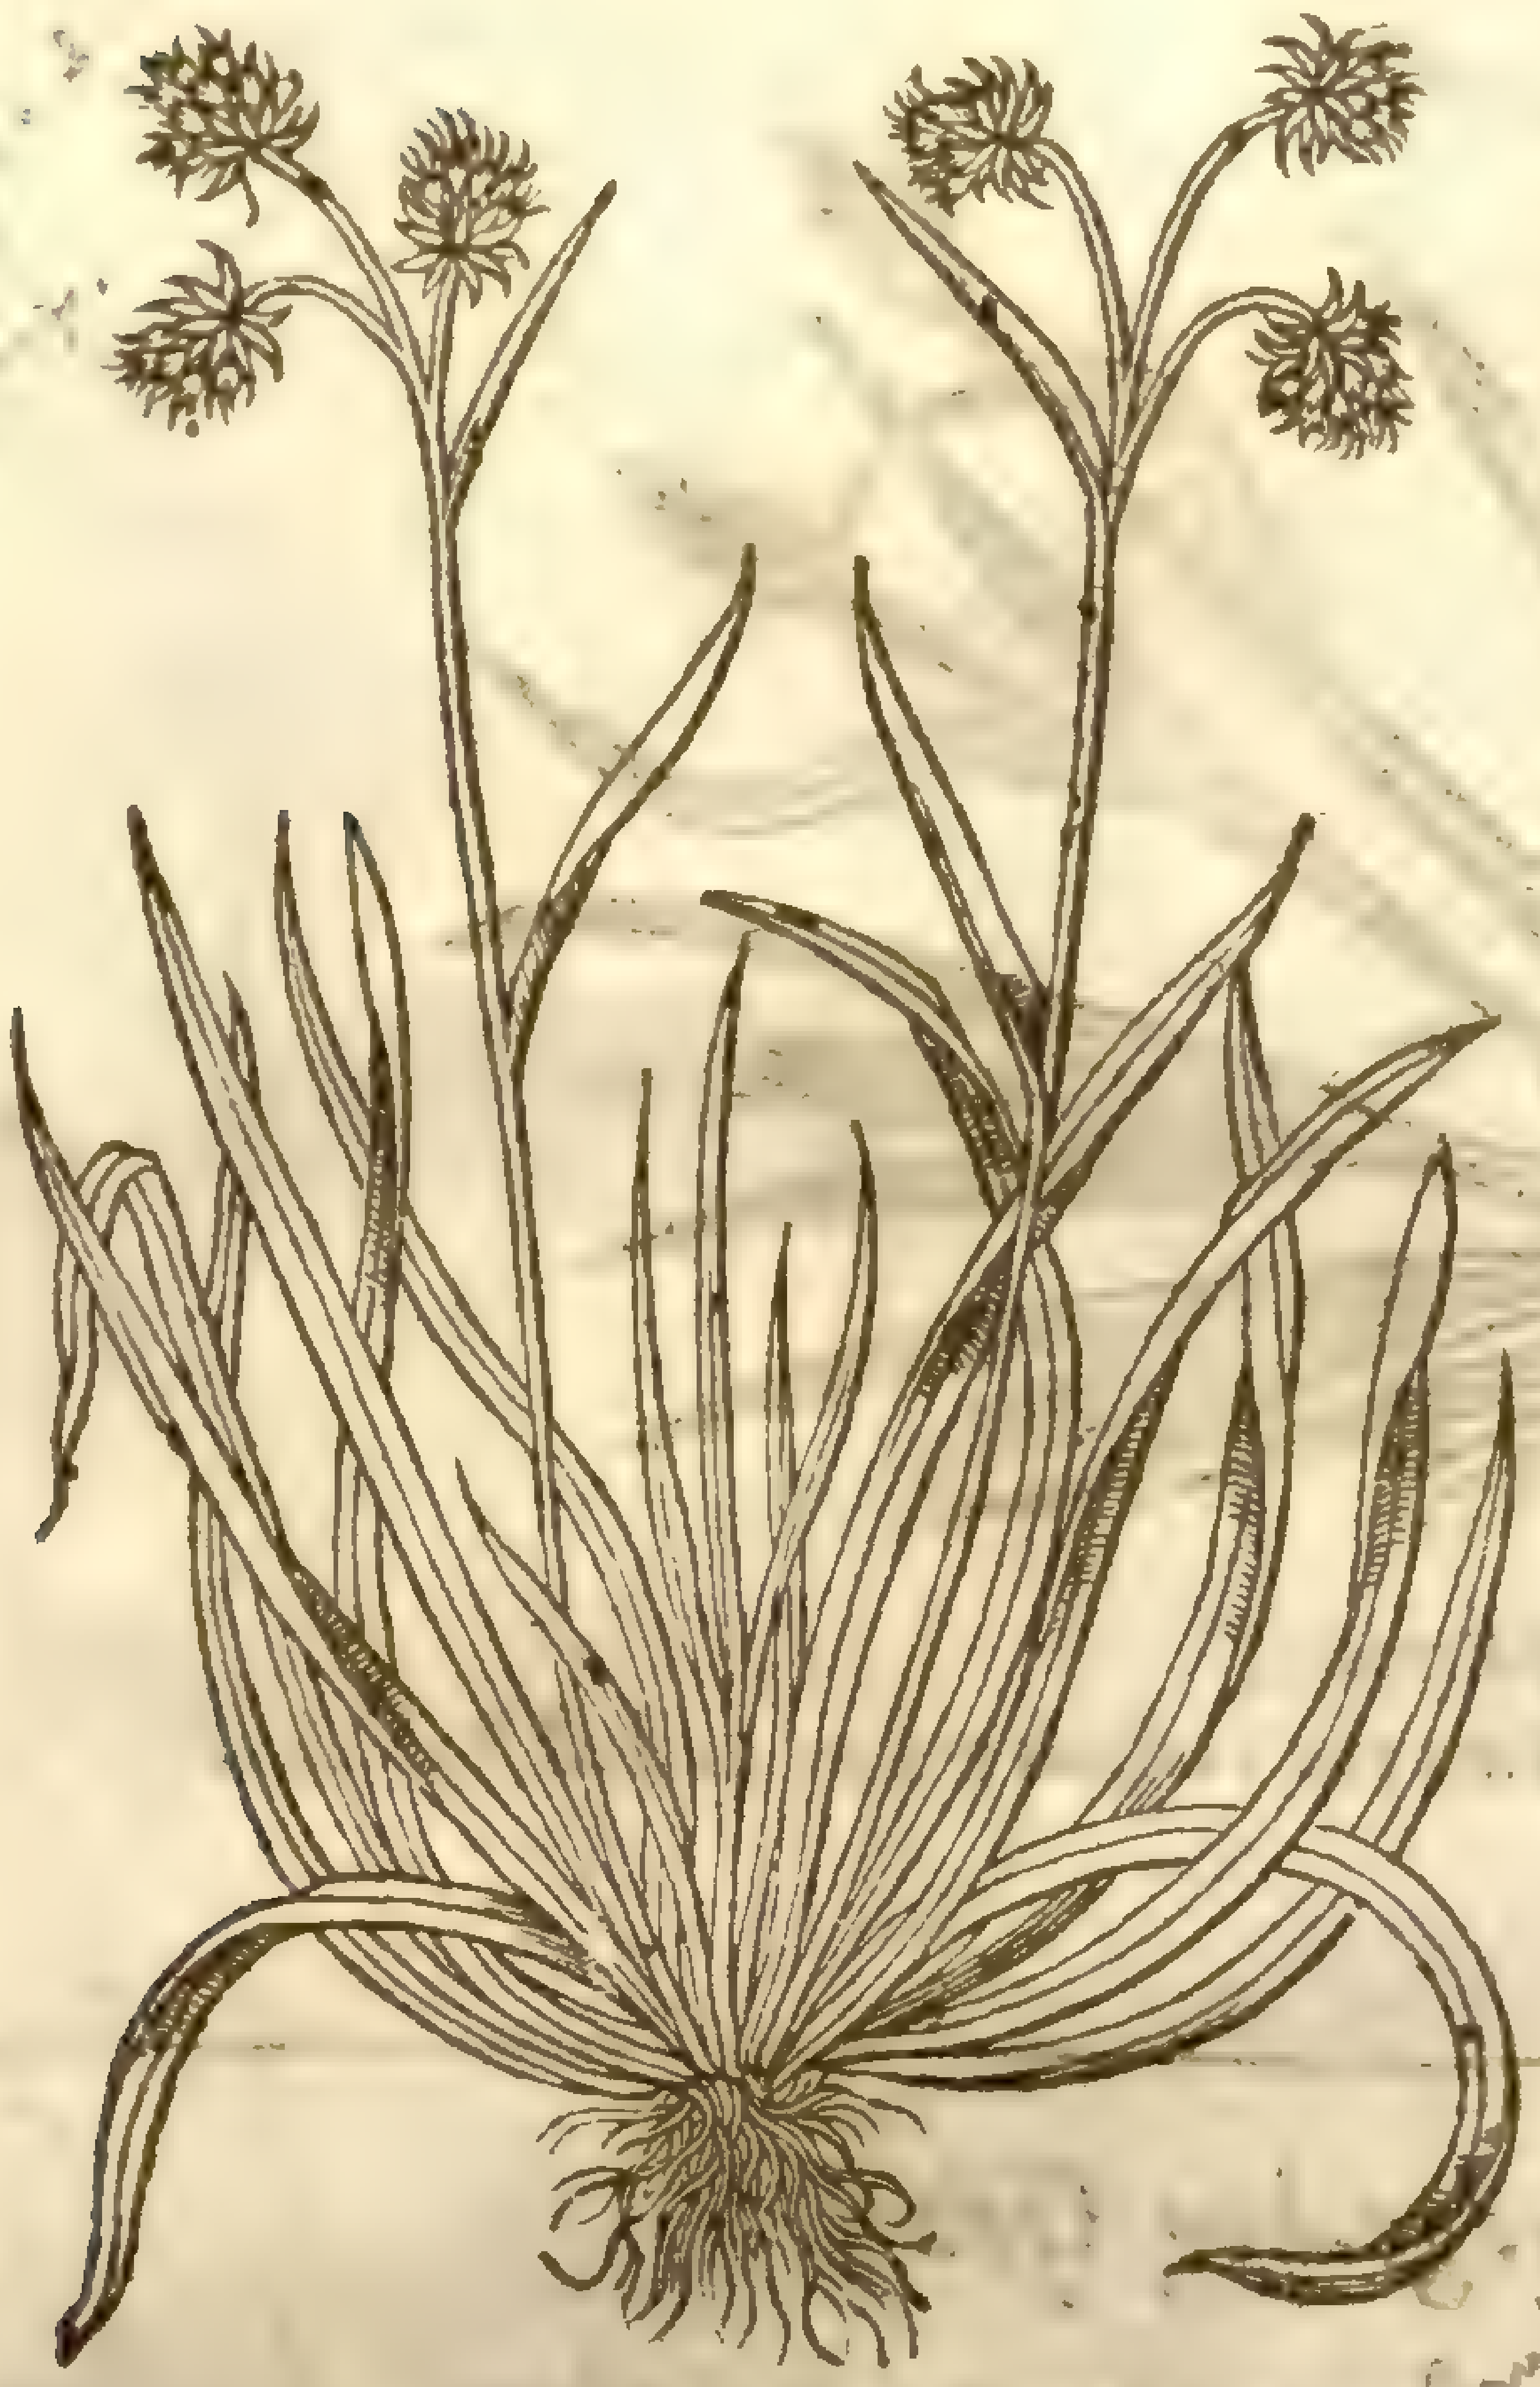
2 *Gramen exile Hirſutum.*
Hairy-graſſe.



[illegible] made Sept. 2. 181

lob. ic. 15

‡ 3 *Gramen Capitulis globoſis.*
Round headed Siluer-graſſe.



[illegible]

¶ *The Deſcription.*

1 Hedge-hog Graſſe hath long ſtiffe flaggy leaues with diuers ſtalkes proceeding from a thicke ſpreading root; and at the top of euery ſtalke grow certaine round and pricking knobs faſhioned like an hedge-hog.

† 2 The ſecond is rough and hairie: his roots do ſpread and creep vnder the mud and mire as Cyperus doth; and at the top of the ſtalkes are certaine round ſoft heads, their colour being browne, intermixed with yellow, ſo that they looke prettily when as they are in their prime.

‡ 3 This Graſſe (whoſe figure was formerly in the firſt place in this Chapter) hath a ſmall and fibrous root, from which riſe leaues like thoſe of Wheat, but with ſome long white hairs vpon them like thoſe of the laſt deſcribed: at the tops of the ſtalks (which are ſome foot or better high) there grow two or three round heads conſiſting of ſoft and white downie threds. Theſe heads are ſaid to ſhine in the night, and therefore they in Italy call it (according to *Cæſalpinus*) *Luciola, quia noctu lucet.*

4 To this I may adde another growing alſo in Italy, and firſt deſcribed by *Fabius Columna.* It hath ſmall creeping joynted roots, out of which come ſmall fibres, and leaues little and very narrow at the firſt, but thoſe that are vpon the ſtalks are as long again, incompaſſing the ſtalkes, as in Wheat, Dogs-graſſe, and the like. Theſe leaues are creſted all along, and a little forked at the end: the ſtraw or ſtalk is very ſlender, at the top whereof growes a ſharpe prickly round head, much after the manner of the laſt deſcribed: each of the ſeed-veſſels, whereof this head conſiſts, ends in a prickly ſtalke hauing fiue or ſeuen points, wherof the vppermoſt that is in the middle is the longeſt. The ſeed that is contained in theſe prickly veſſels is little and tranſparent, like in colour to that of Cow-wheat. The floures (as in others of this kinde) hang trembling vpon yellowiſh ſmall threds. ‡

¶ *The Place and Time.*

† 1 2 They grow in watery medowes and fields, as you may ſee in Saint *Georges* fields and ſuch like places.

3 4 Both theſe grow in diuers mountainous places of Italy; the later whereof floures in May.

¶ *The Names.*

The firſt is called Hedge-hog Graſſe, and in Latine, *Gramen Echinatum,* by reaſon of thoſe prickles which are like vnto a hedge-hog.

The ſecond hairy Graſſe is called *Gramen exile hirſutum Cyperoides,* becauſe it is ſmall and little, and rough or hairy like a Goat: and *Cyperoides,* becauſe his roots do ſpring and creepe like the *Cyperus.*

‡ 3 This by *Anguillara* is thought to be *Combretum* of *Pliny;* it is *Gram. lucidum* of *Tabernamontanus;* and *Gramen hirſutum Capitulo globoſo,* of *Bauhine, Pin. pag.* 7.

4 *Fabius Columna* calls this *Gramen montanum Echinatum tribuloides capitatum:* and *Bauhine* nameth it, *Gramen ſpica ſubrotunda echinata.* We may call it in Engliſh, Round headed Caltrope Graſſe.

¶ *The Vertues.*

3 The head of this (which I haue thought good to call Siluer-graſſe) is very good to be applied to greene wounds, and effectuall to ſtay bleeding, *Cæſalp.* ‡

---

† It is euident by the name and deſcription, that our Author meant this which we here giue you in the firſt place; yet his figure was of another Graſſe ſomewhat like the ſecond, which figure and deſcription you may find here expreſt in the third place.

Chap.

CHAP. 15. *Of Hairy Wood-Graſſe.*

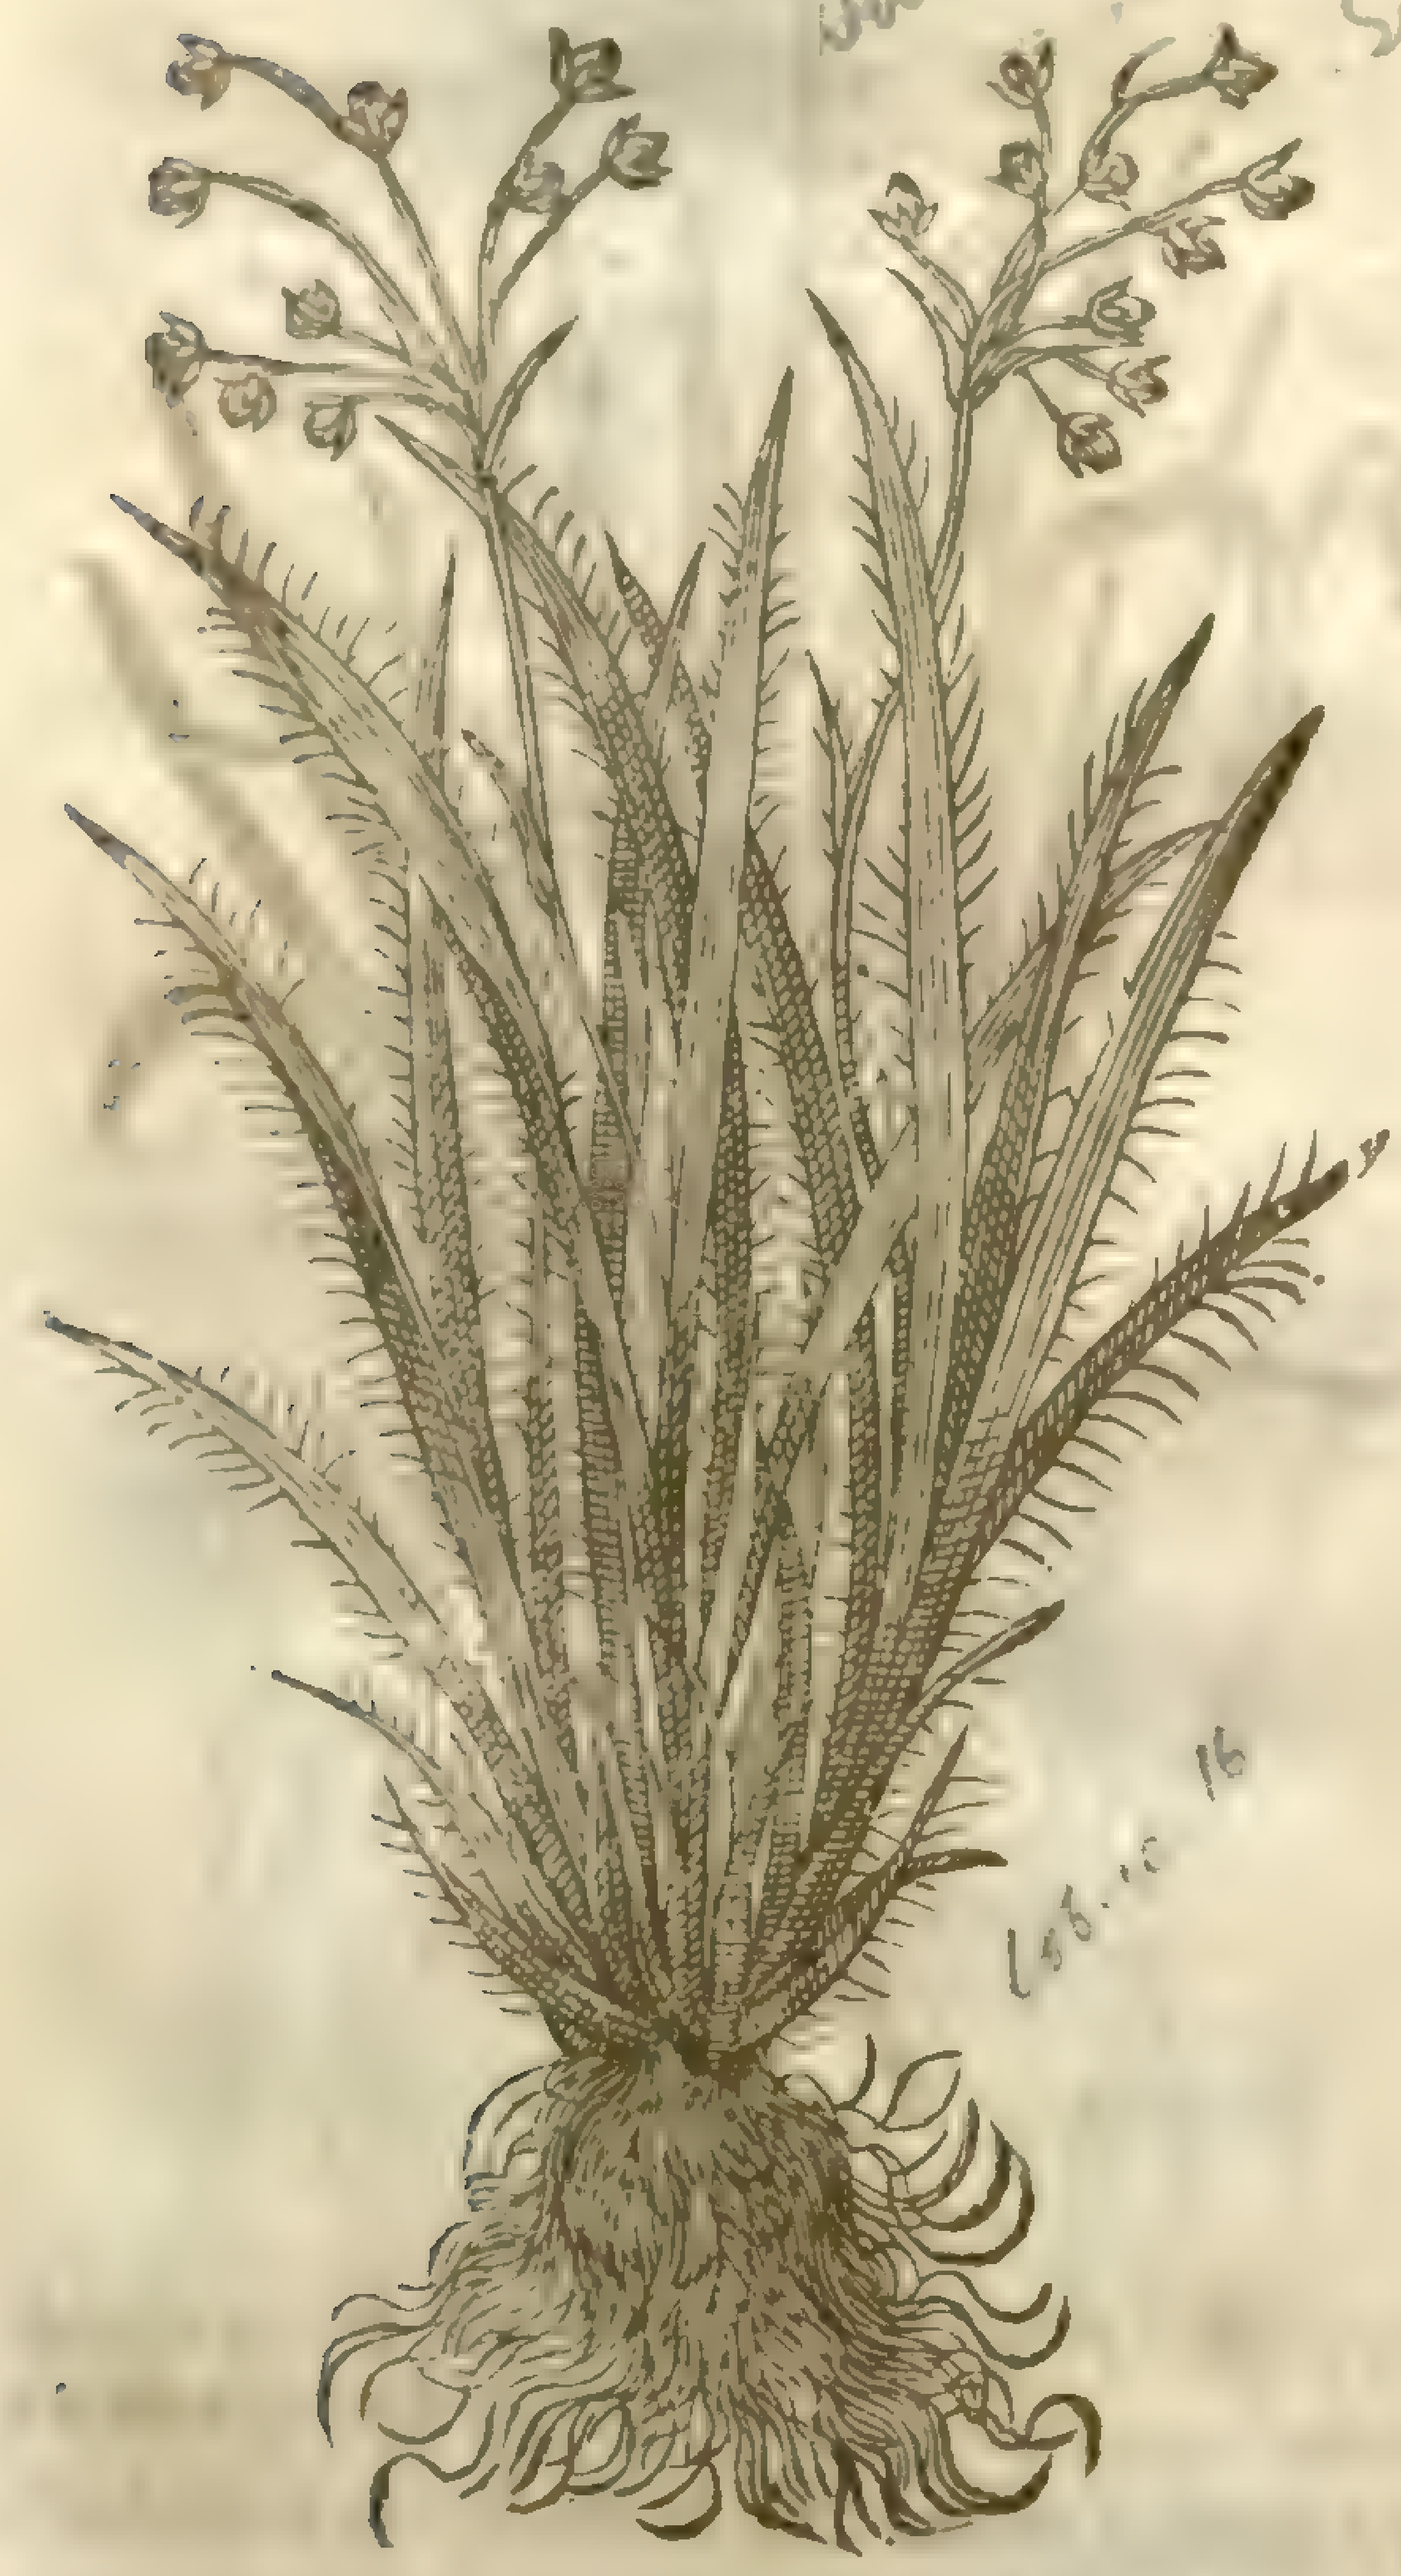
¶ *The Deſcription.*

1 HAiry Woodgraſſe hath broad rough leaues ſomewhat like the precedent, but much longer, and they proceed from a threddy root, which is very thicke, and full of ſtrings, as the common Graſſe, with ſmall ſtalkes riſing vp from the ſame roots; but the top of theſe ſtalkes is diuided into a number of little branches, and on the end of euery one of them ſtandeth a little floure or huske like to the top of *Allium Vrſinum*, or common Ramſons, wherein the ſeed is contained when the floure is fallen.

2 Cyperus Wood-graſſe hath many ſhearie graſſie leaues, proceeding from a root made of many hairy ſtrings or threds: among which there riſeth vp ſundry ſtraight and vpright ſtalkes, on whoſe tops are certaine ſcaly and chaffie huskes, or rather ſpikie blackiſh eares, not much vnlike the catkins or tags which grow on Nut-trees, or Aller trees.

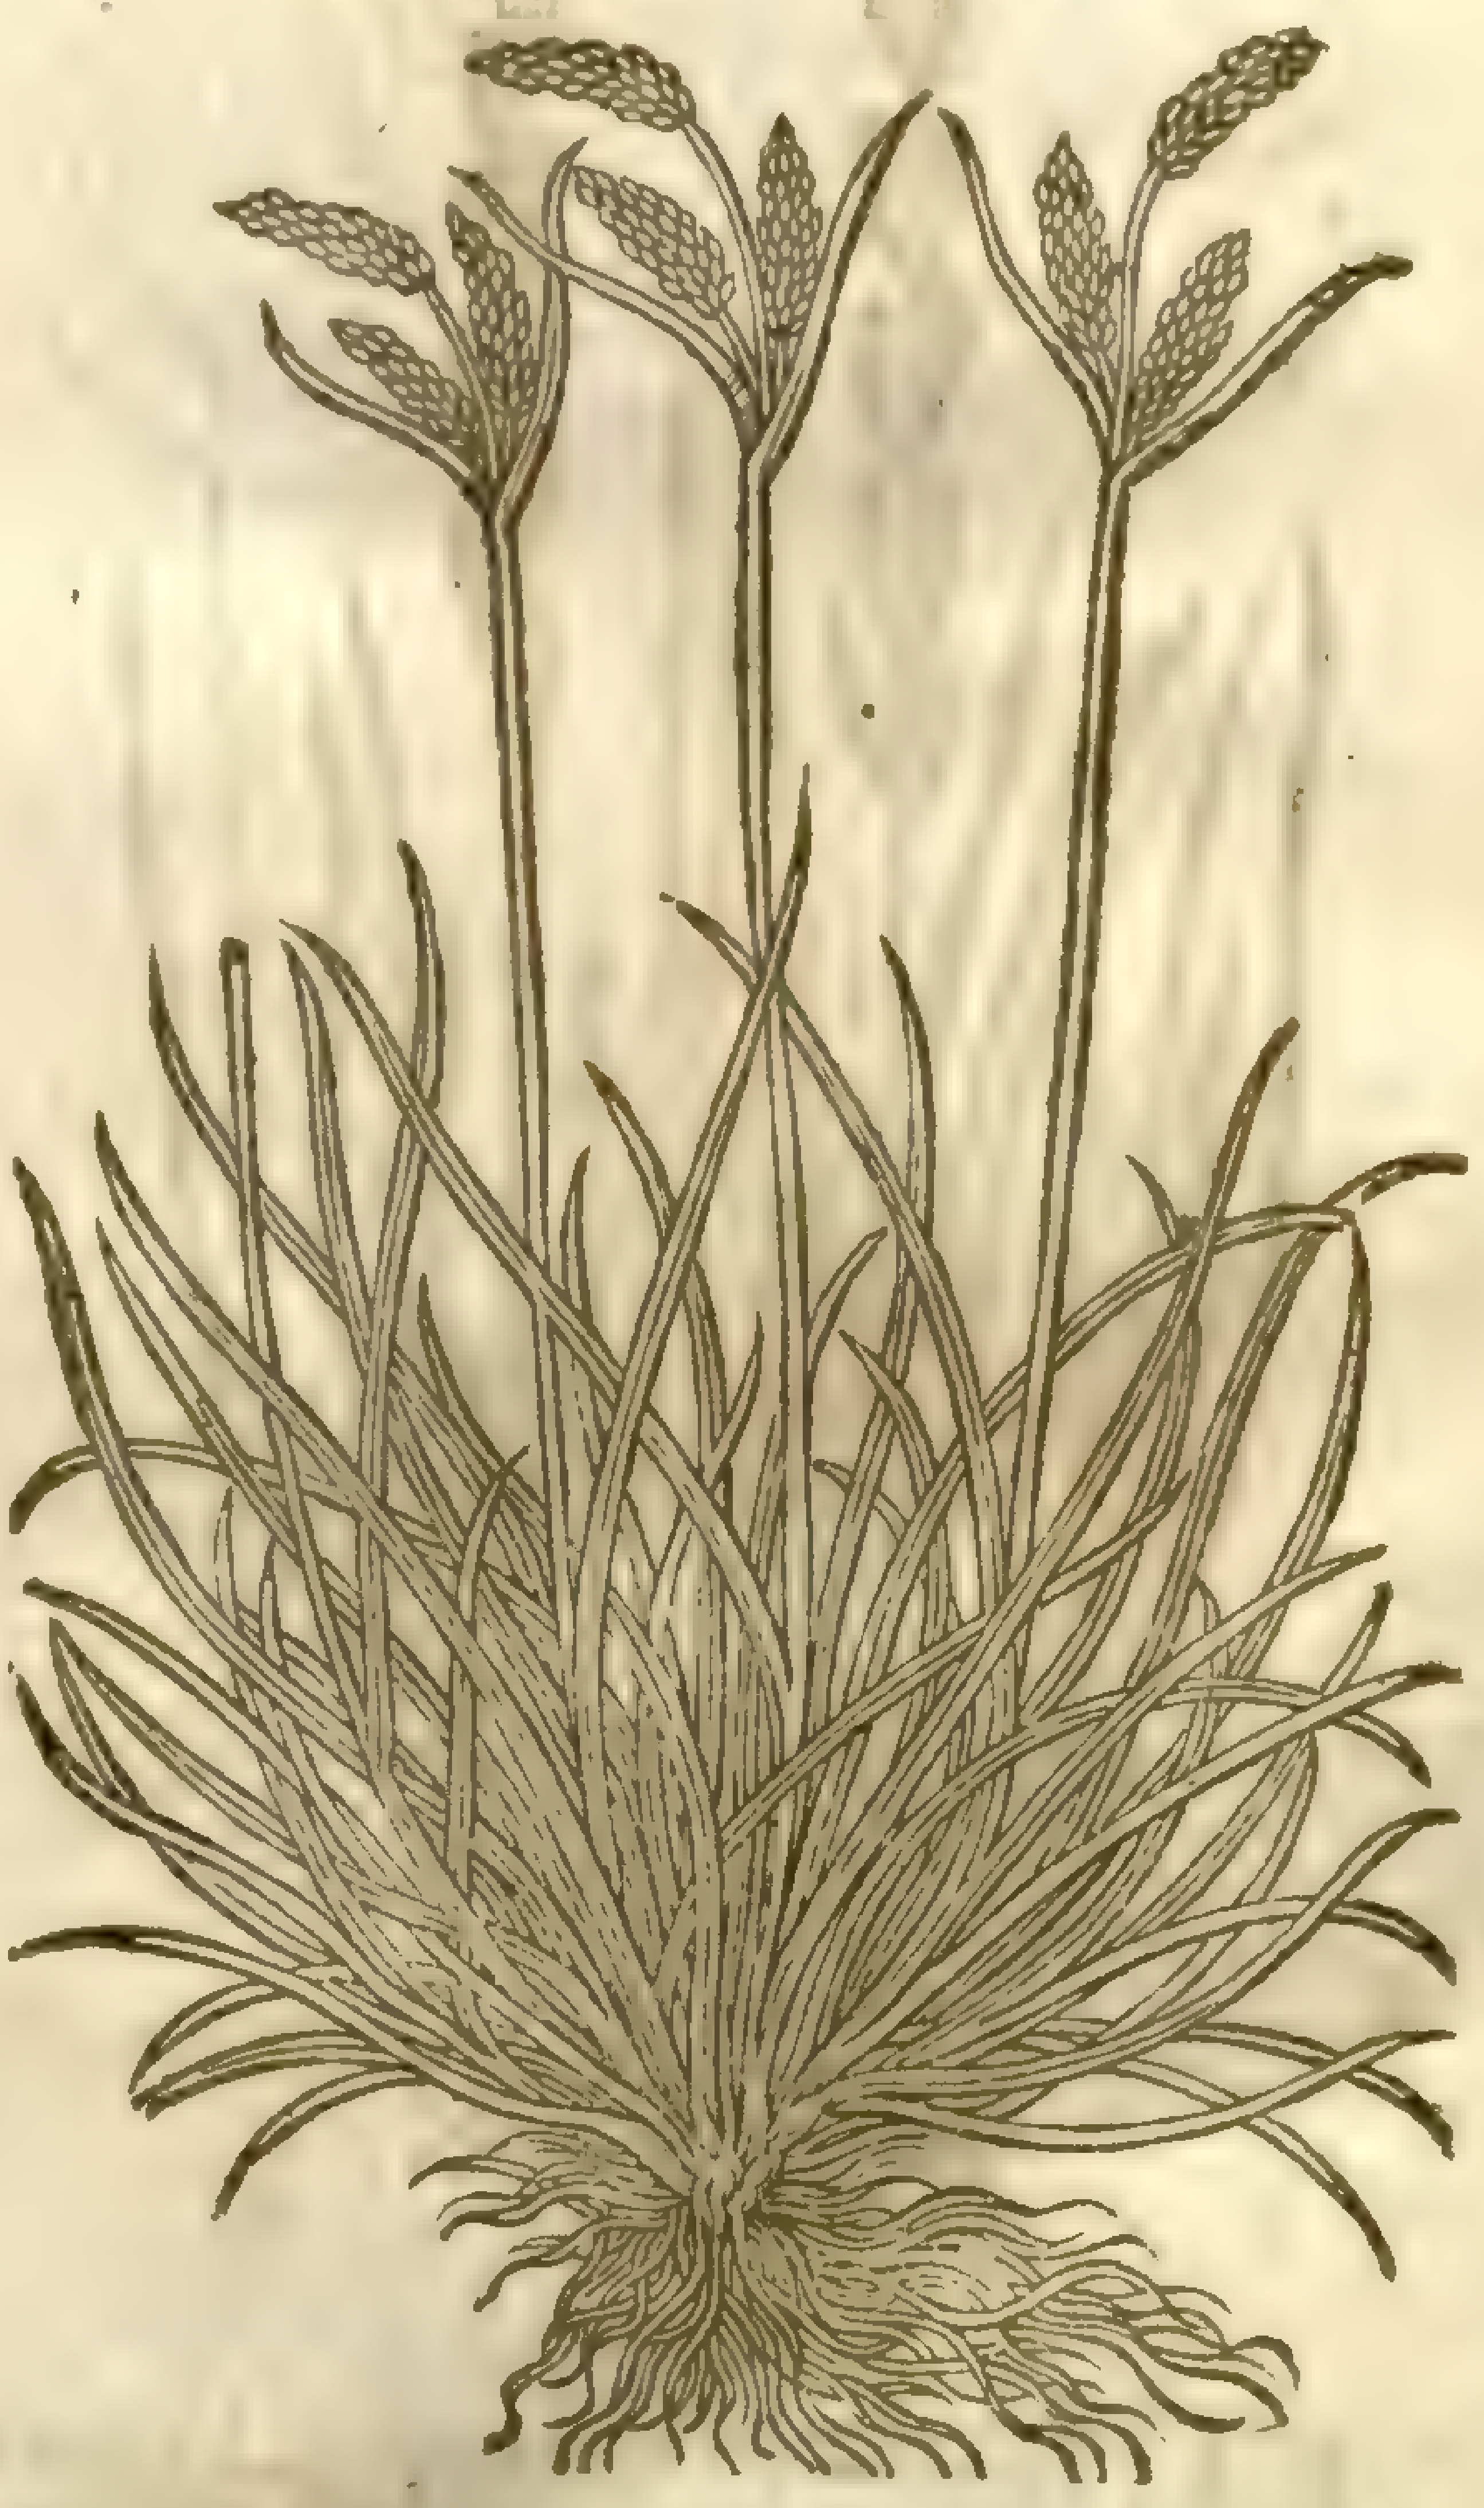
1 *Gramen hirſutum nemoroſum.*
Hairy Wood-graſſe.

Juncus pilosus [illegible]



Lob. ic. 16

2 *Gramen Cyperinum nemoroſum.*
Cyprus Wood-graſſe.



¶ *The Place, Time, and Names.*

Theſe two grow in woods or ſhadowie places, and may in Engliſh be called Wood-graſſe. Their time is common with the reſt.

¶ *Their Nature and Vertues.*

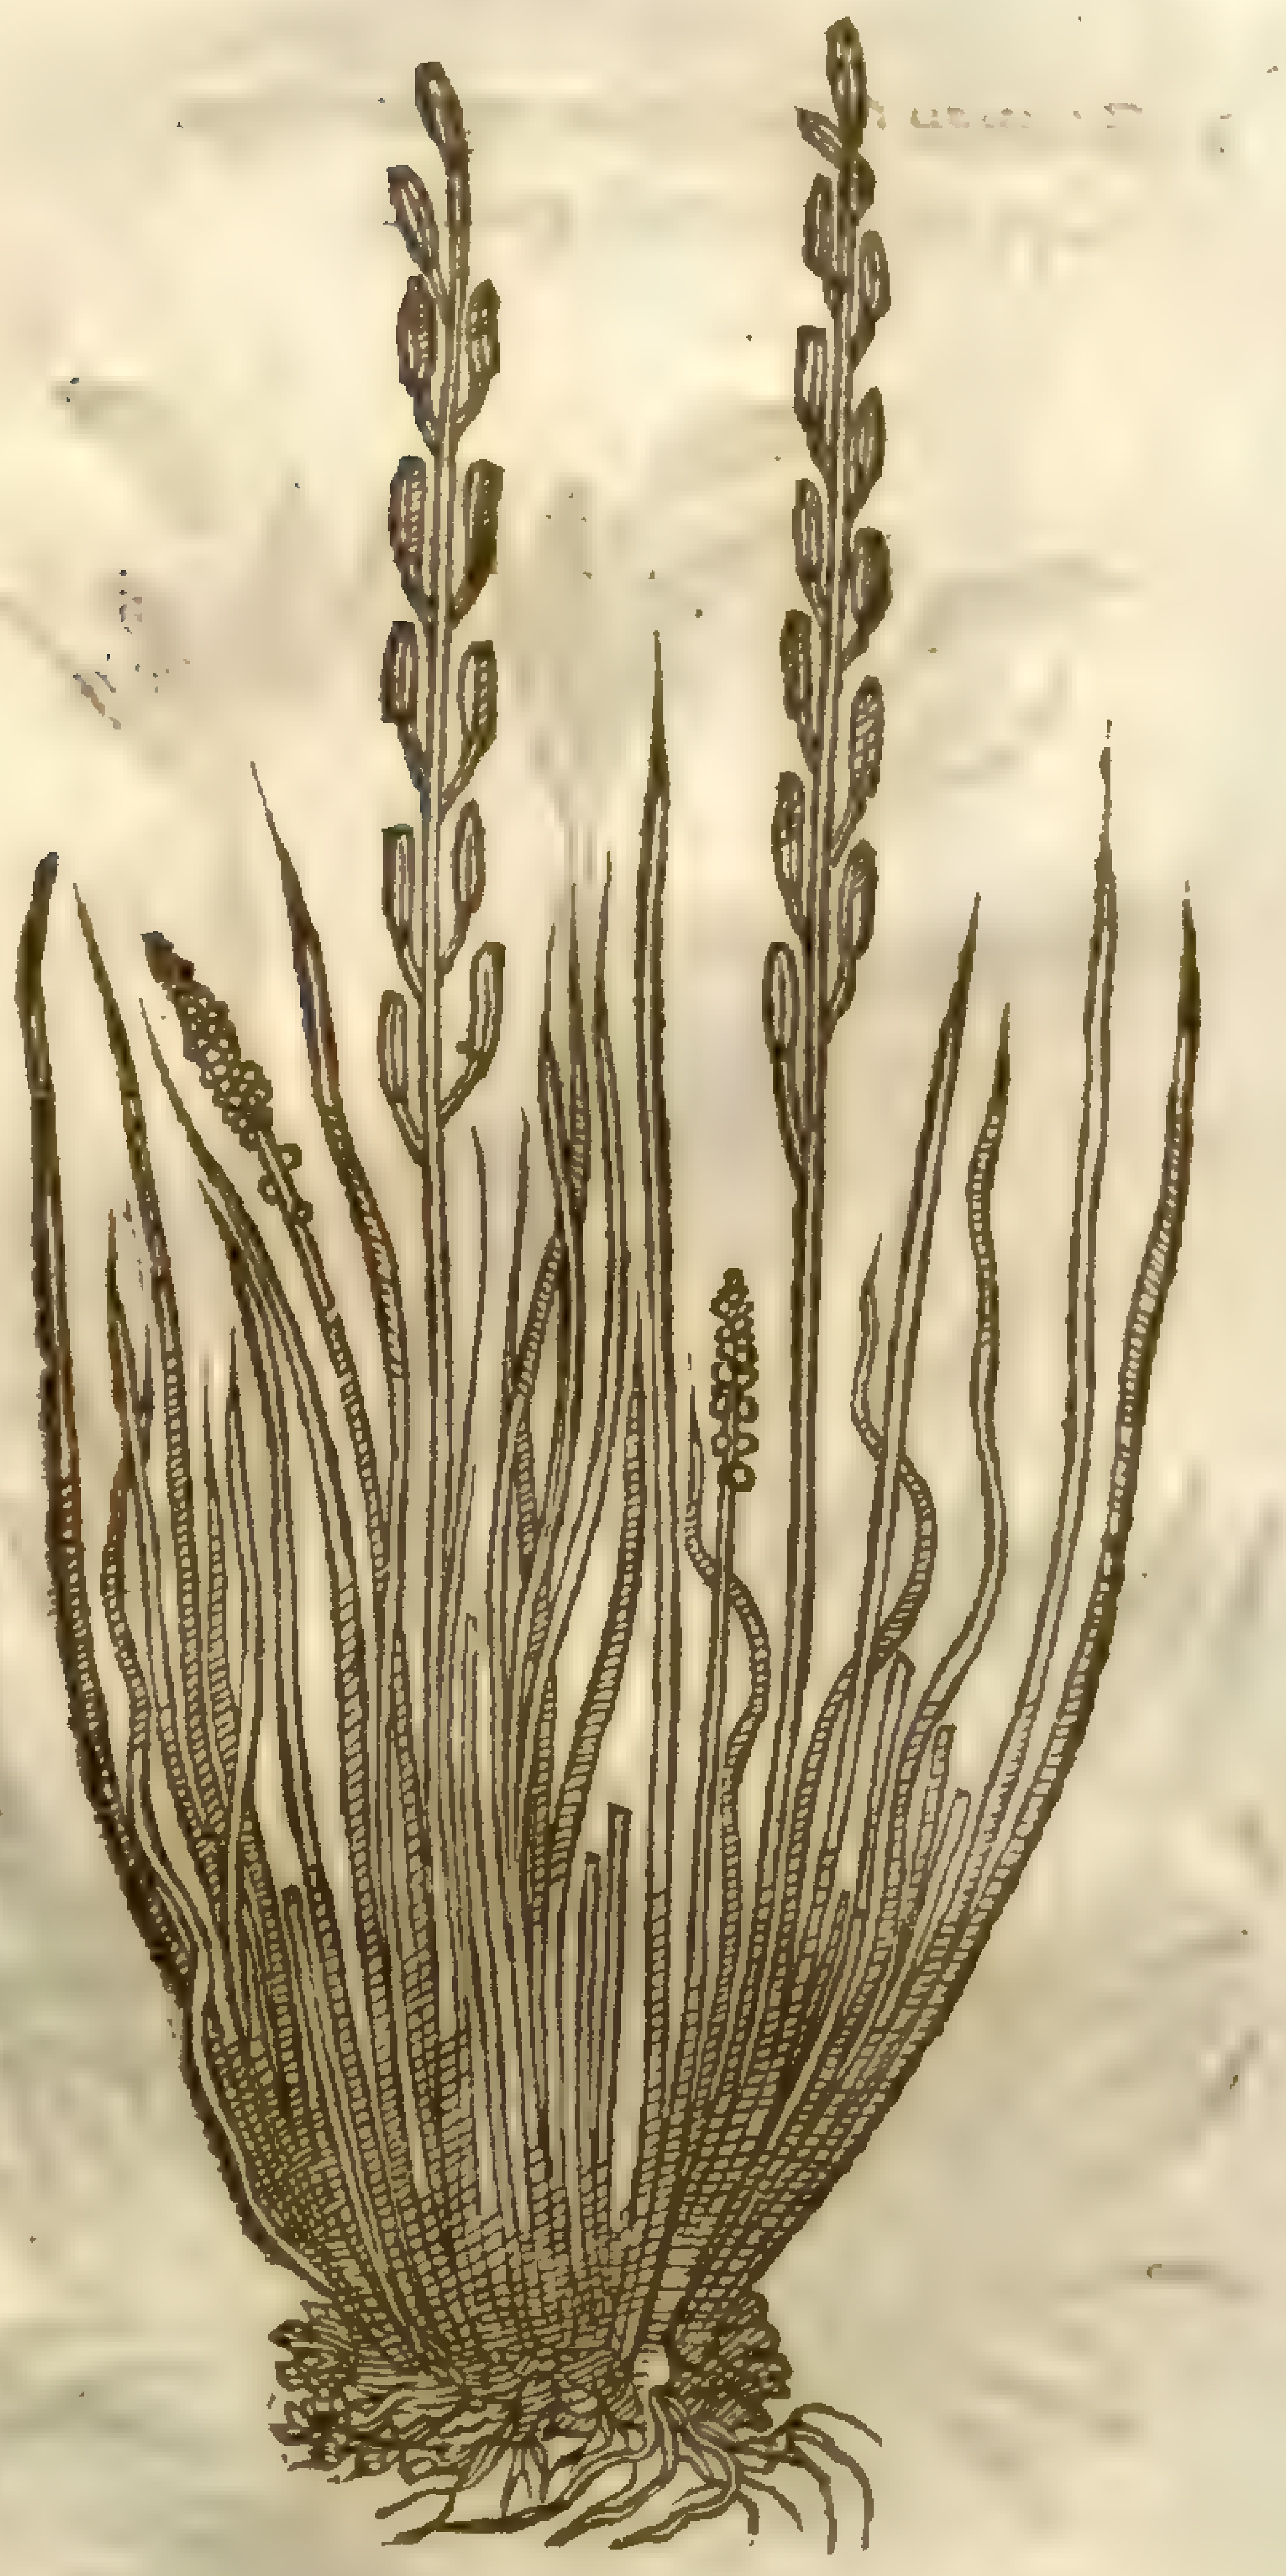
There is nothing to be ſaid of their nature and vertues, being as vnknowne as moſt of the former.

Chap. 16. *Of Sea Spike-Graſſe.*

¶ *The Deſcription.*

† 1 Sea Spike-graſſe hath many ſmall hollow round leaues about ſix inches long, riſing from a buſhie threddy white fibrous root, which are very ſoft and ſmooth in handling. Among theſe leaues there doe ſpring vp many ſmall ruſhie ſtalkes; alongſt which are at the firſt diuers ſmall flouring round buttons; the ſides whereof falling away, the middle part growes into a longiſh ſeed-veſſell ſtanding vpright.

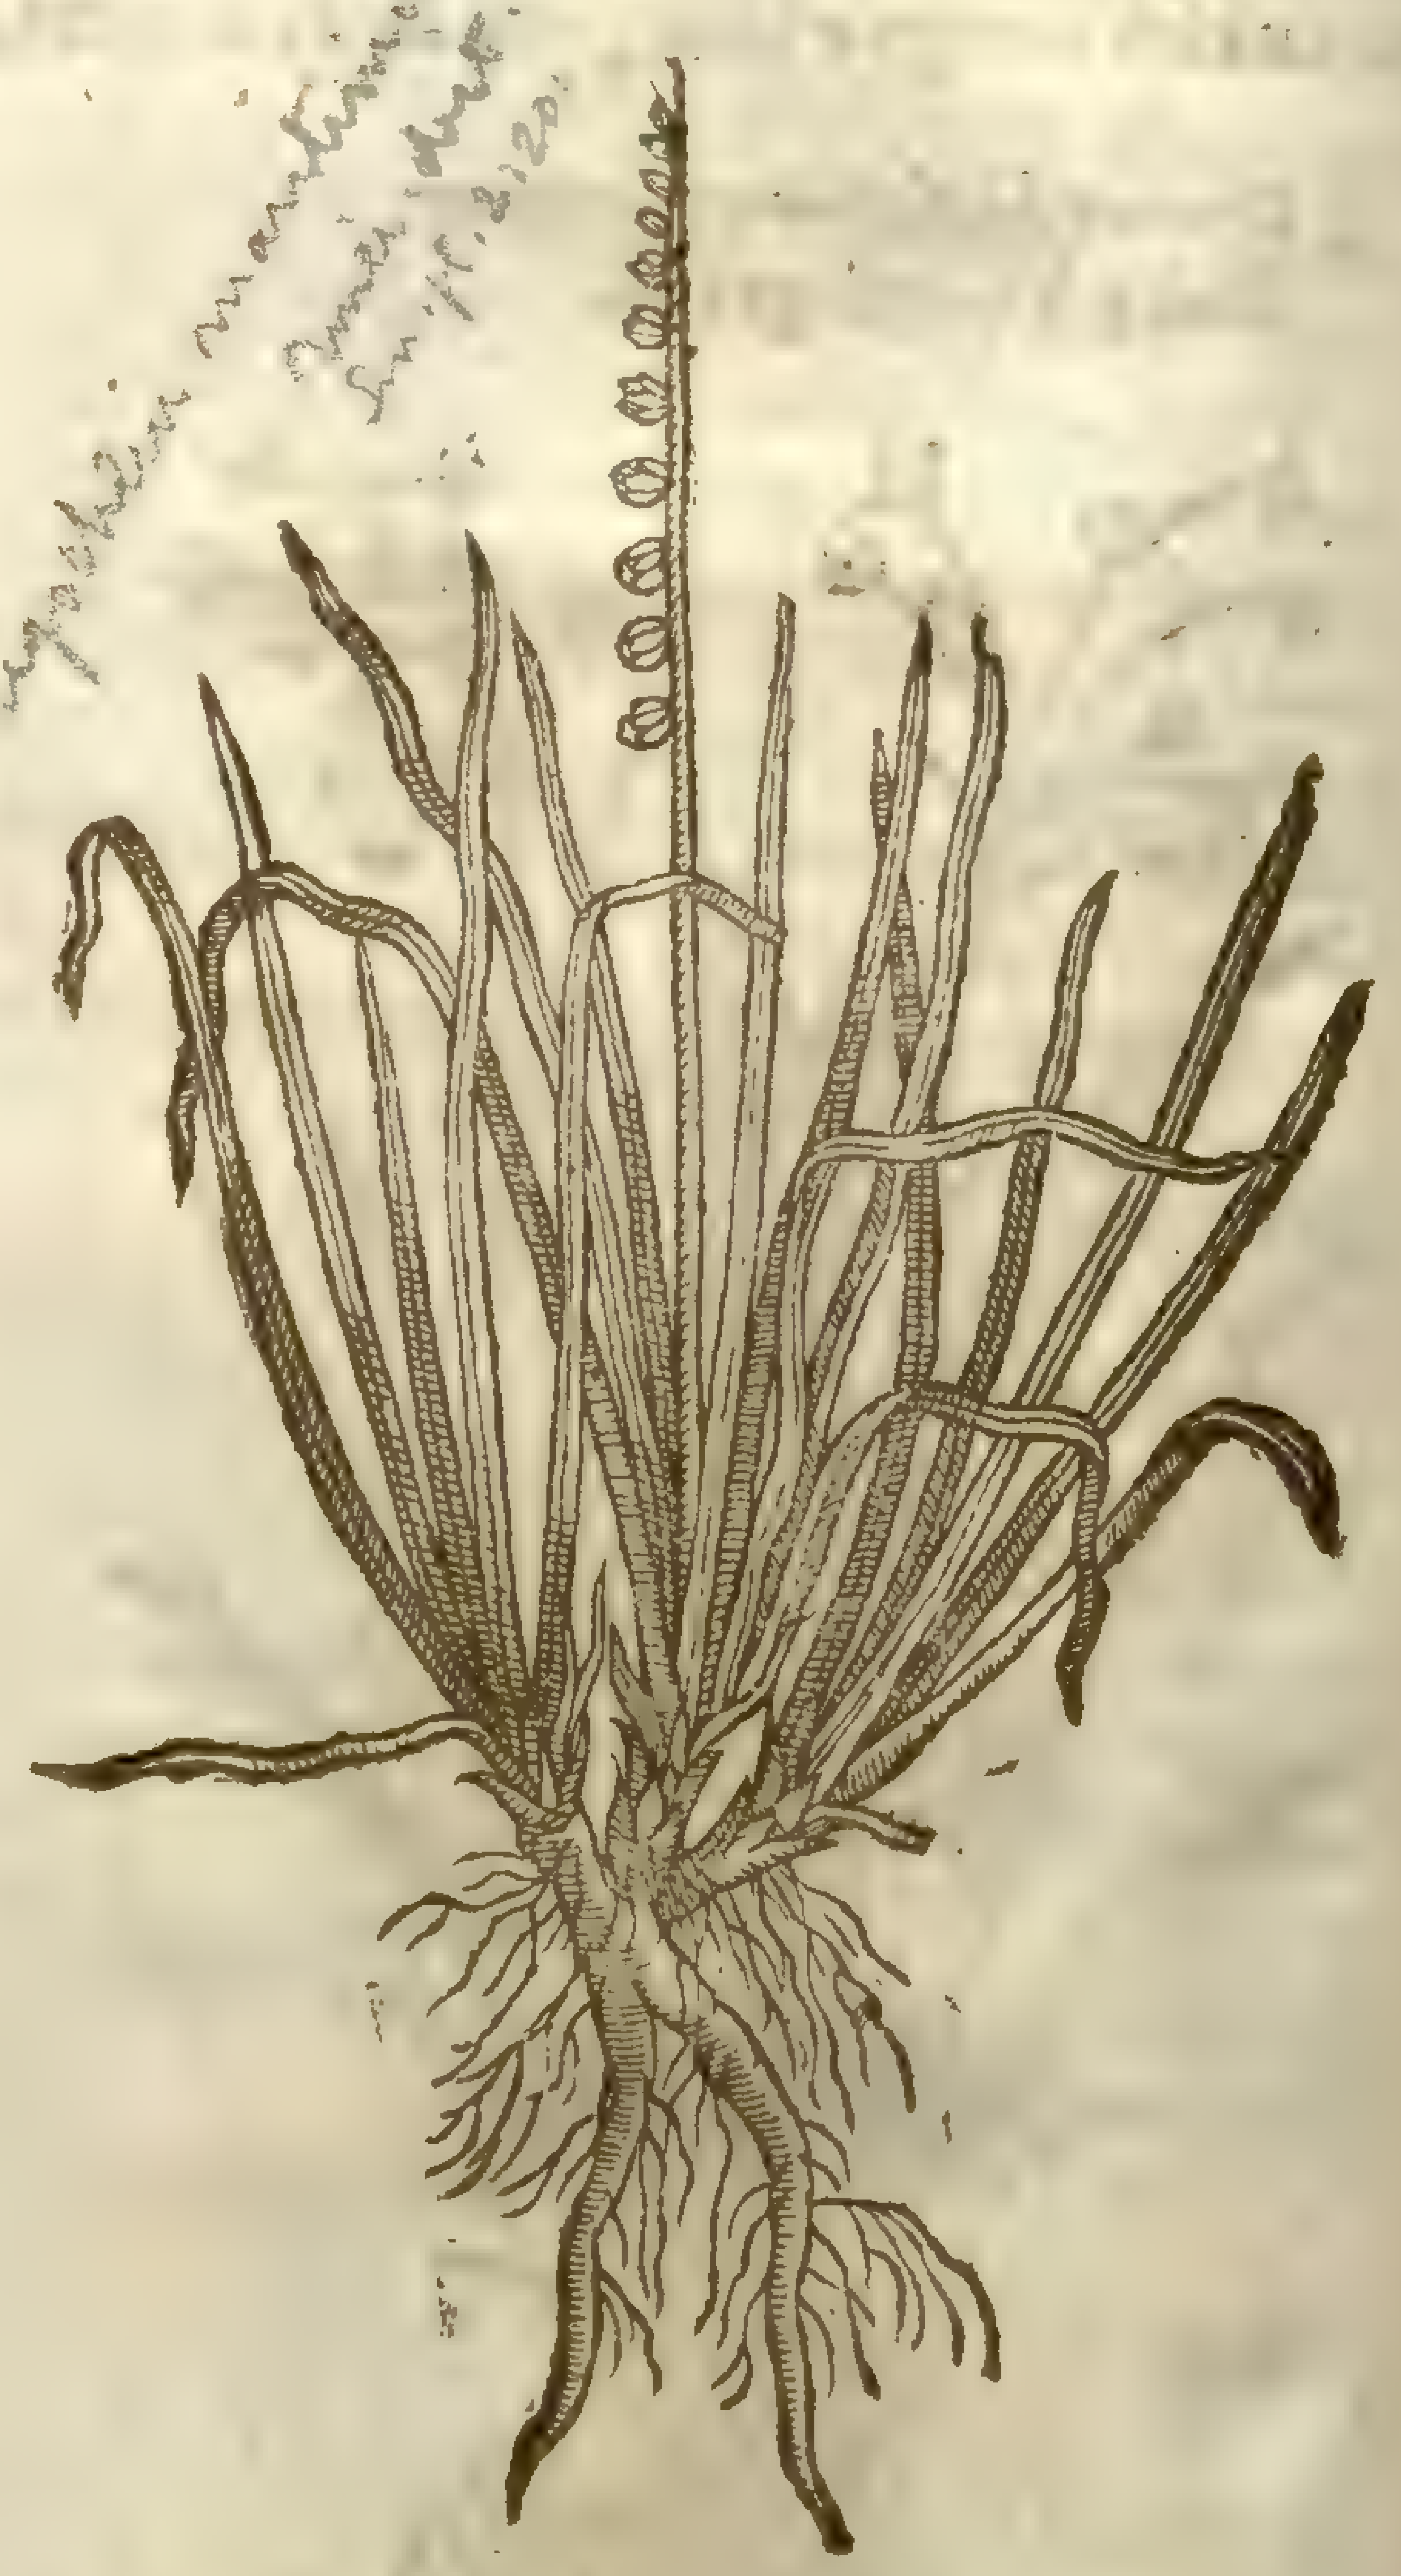
1 *Gramen marinum ſpicatum.*
Sea Spike-graſſe.



Triglochin palustre, Linn. sp. [illegible]

(ubi ?)

2 *Gramen ſpicatum alterum.*
Salt marſh Spike-graſſe.



Triglochin maritimum, Linn. sp. [illegible]

† 2 Salt marſh Spike-graſſe hath a wooddie tough thicke root with ſome ſmall hairy threds faſtned thereunto; out of which ariſe long and thicke leaues very like thoſe of the Sea-graſſe we vulgarly call Thriſt. And amongſt theſe leaues grow vp ſlender naked ruſhie ſtalkes which haue on one ſide ſome ſmall knobs or buttons of a greeniſh colour hanging on them.

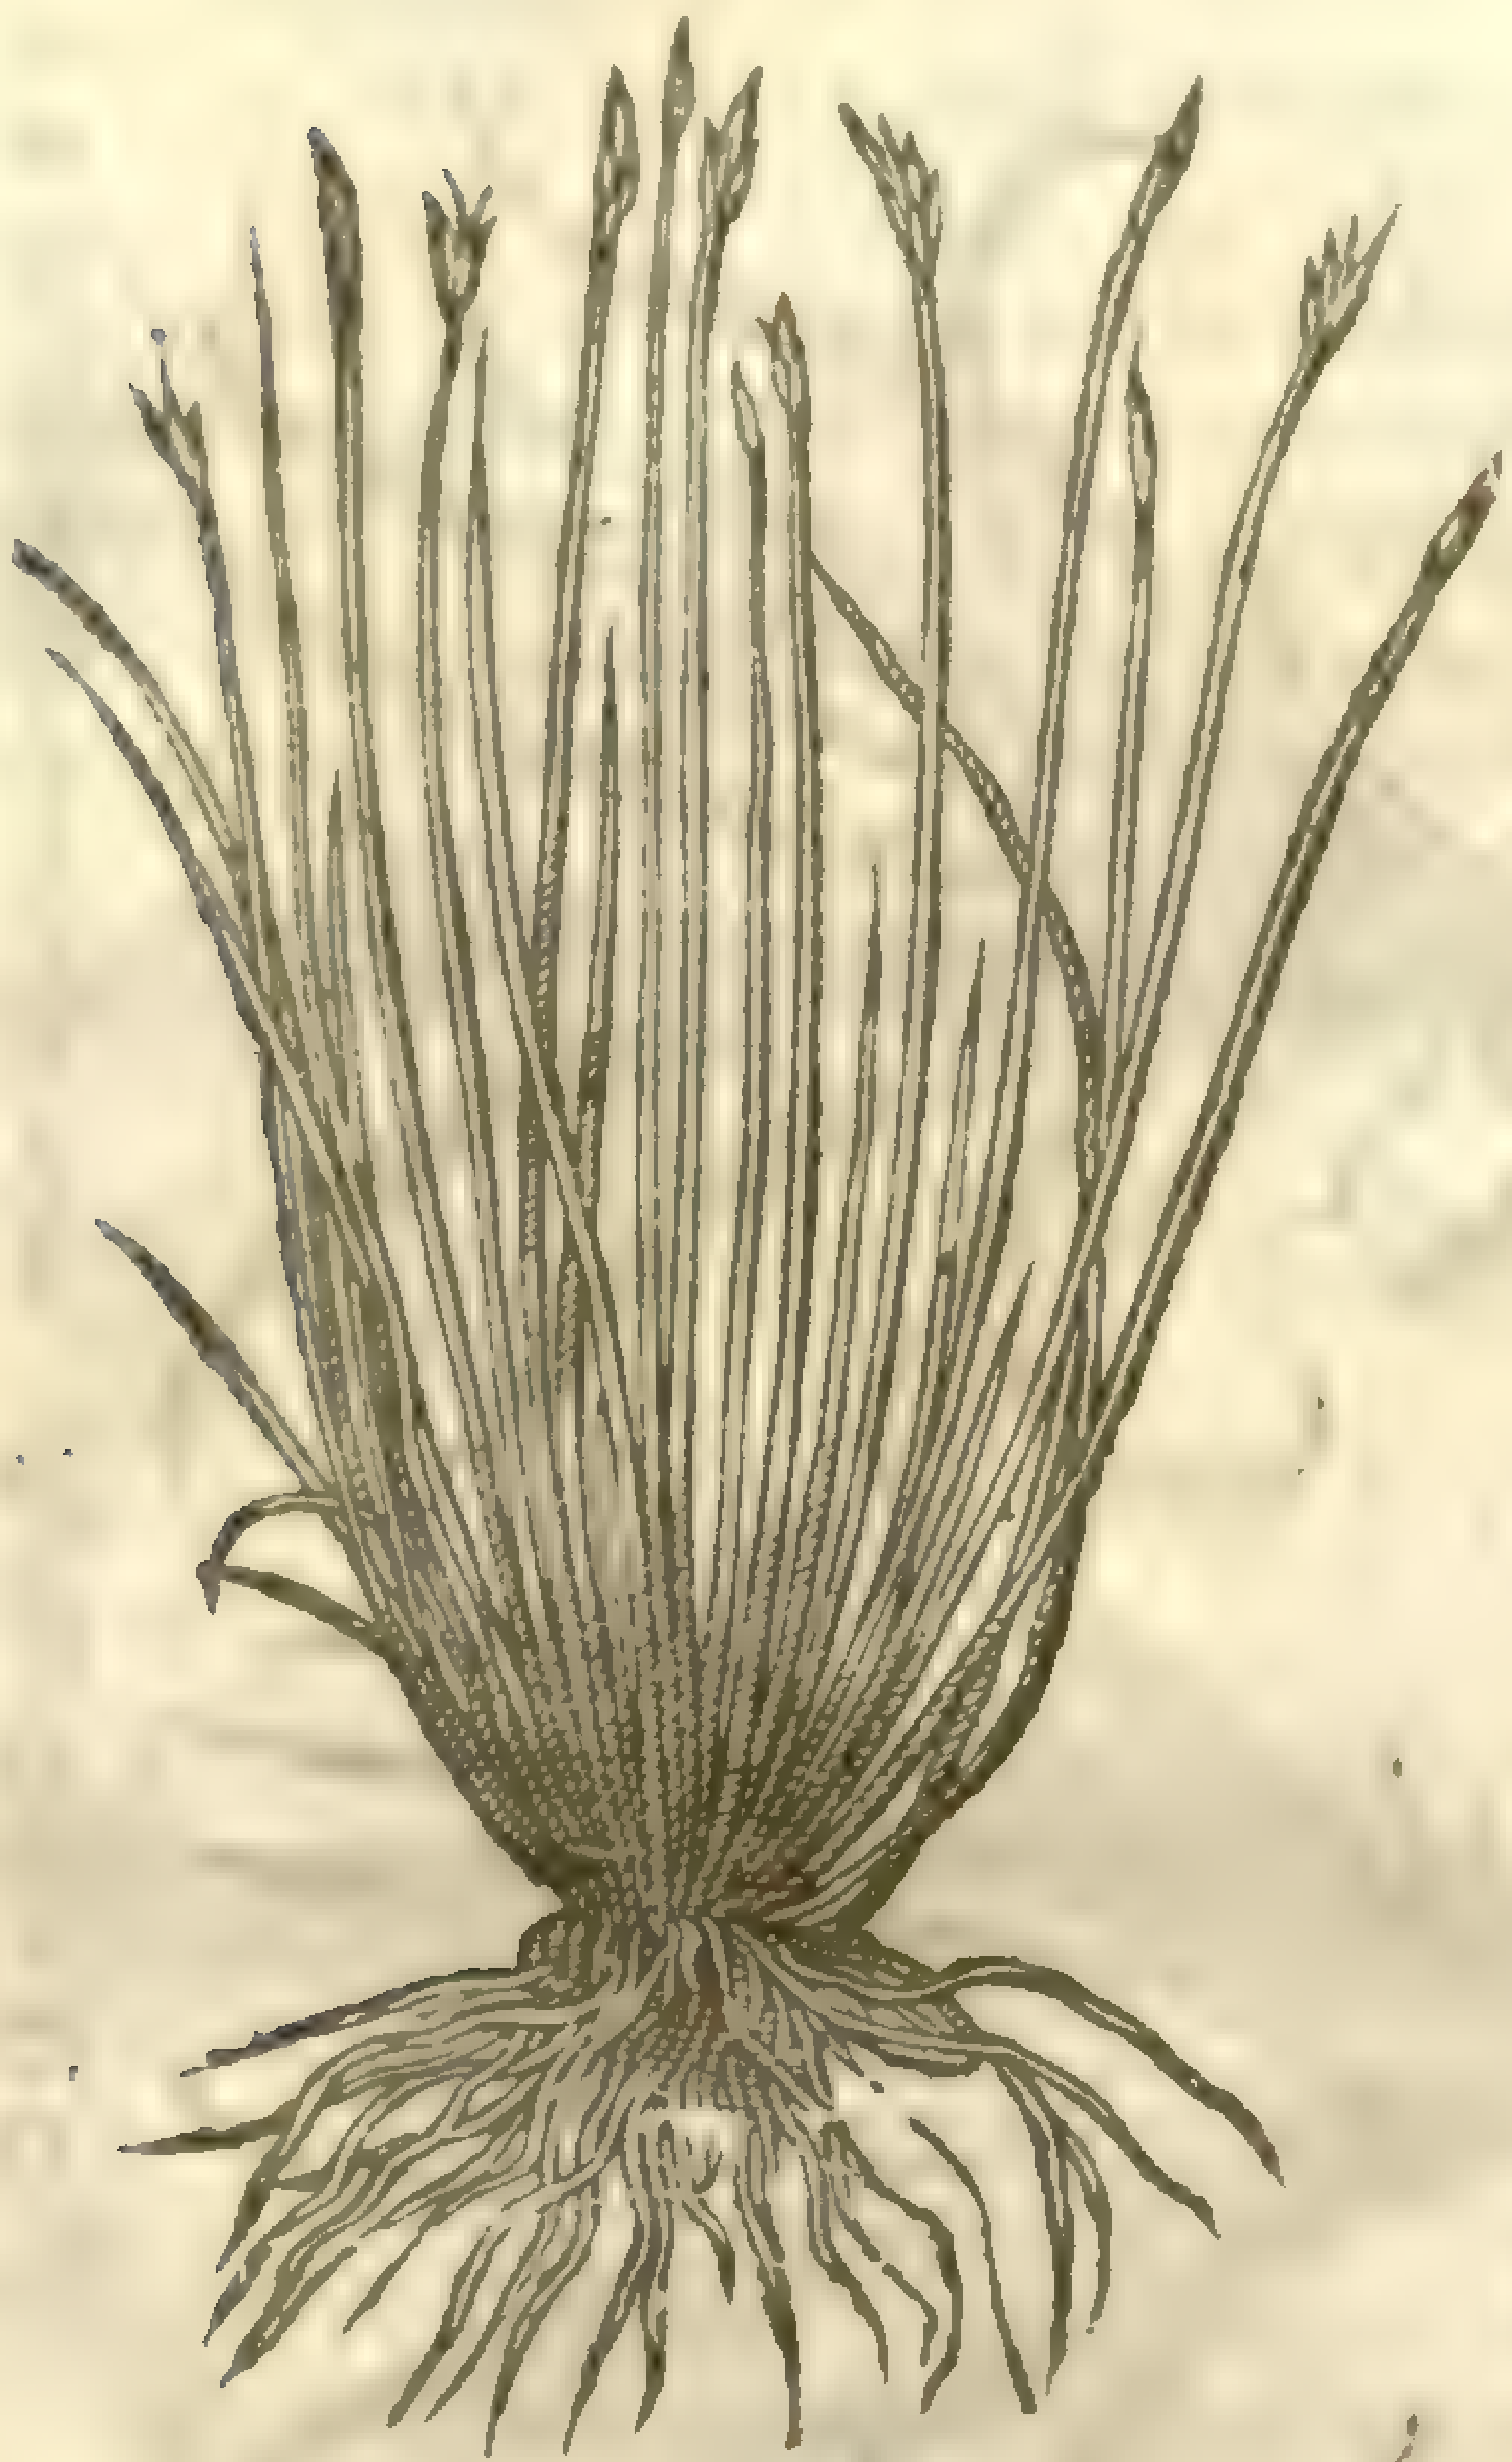
3 The third hath many ruſhy leaues tough and hard, of a browne colour, well reſembling Ruſhes: his root is compact of many ſmall tough and long ſtrings. His ſtalke is bare and naked of leaues vnto the top, on which it hath many ſmall pretty chaffie buttons or heads.

4 The fourth is like the third, ſauing that it is larger; the ſtalke alſo is thicker and taller than that of the former, bearing at the top ſuch husks as are in Ruſhes.

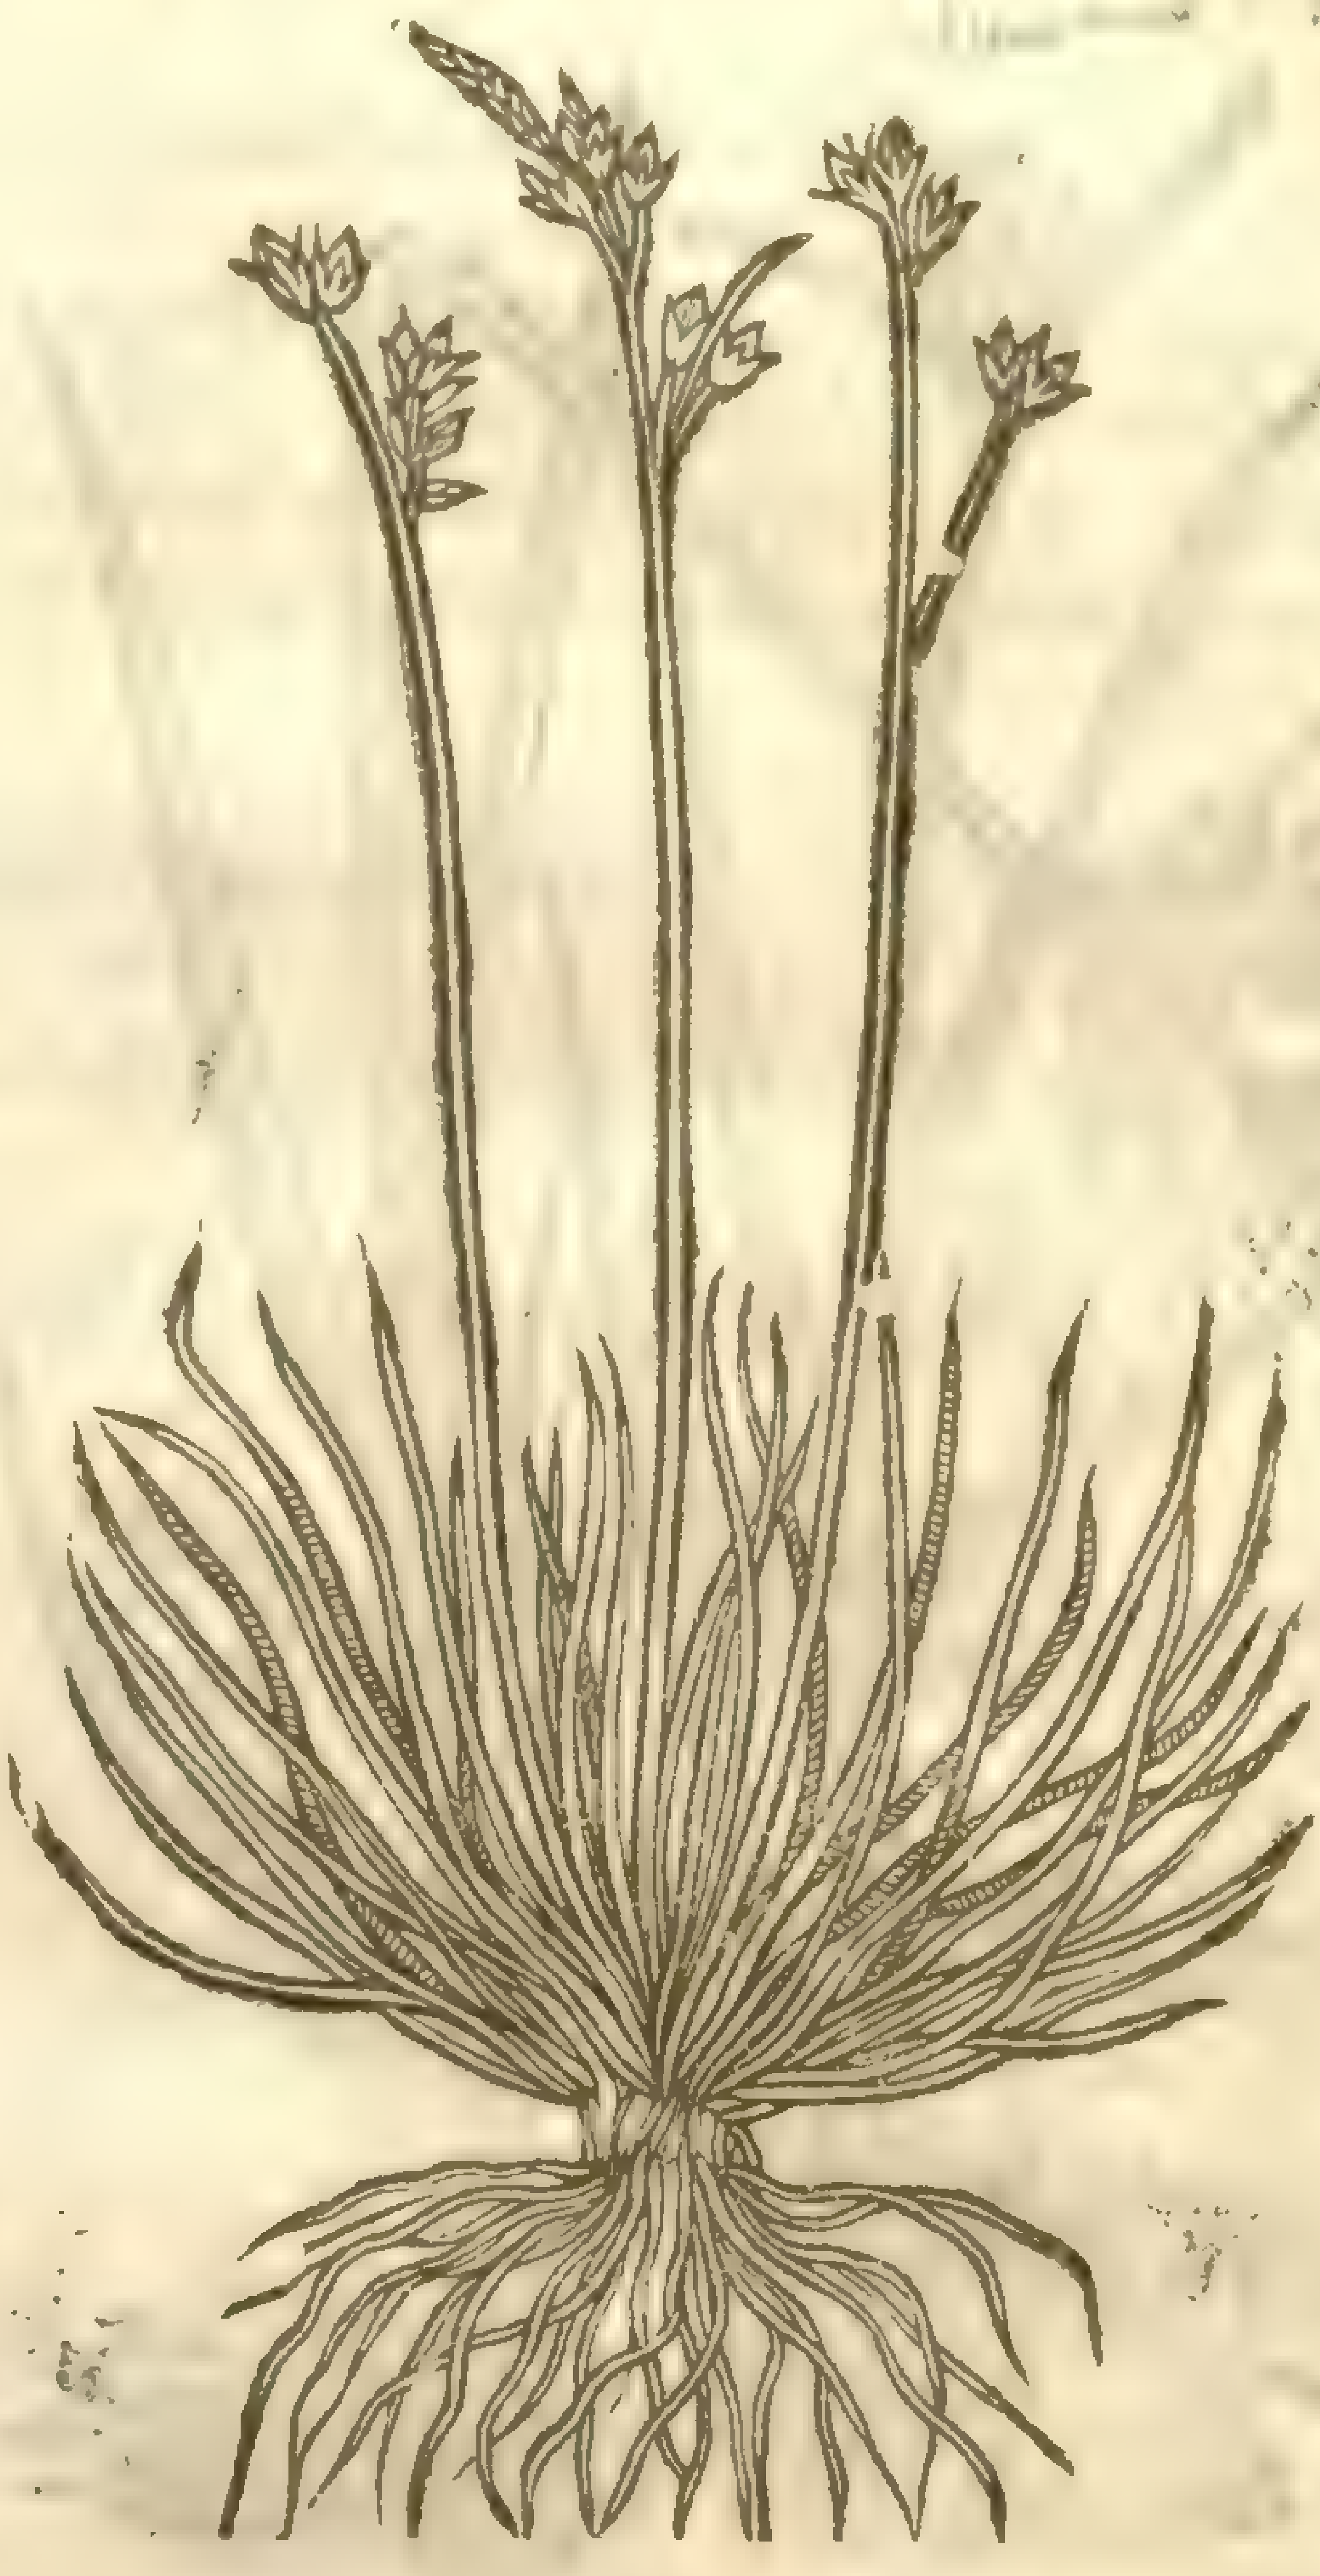
5 Great Cypreſſe Graſſe hath diuers long three-ſquare ſtalkes proceeding from a root compact of many long and tough ſtrings or threds. The leaues are long and broad, like vnto the ſedge called *Carex*. The ſpike or eare of it is like the head of Plantaine, and very prickly, and commonly of a yellowiſh greene colour.

6 Small Cypreſſe graſſe is like vnto the other in root and leaues, ſauing that it is ſmaller. His ſtalke is ſmooth and plaine, bearing at the top certaine tufts or pannicles, like to the laſt deſcribed in roughneſſe and colour.

3 *Gramen junceum marinum.*
Sea Ruſh-graſſe.



4 *Gramen junceum maritimum.*
Mariſh Ruſh-graſſe.



Juncus [illegible]

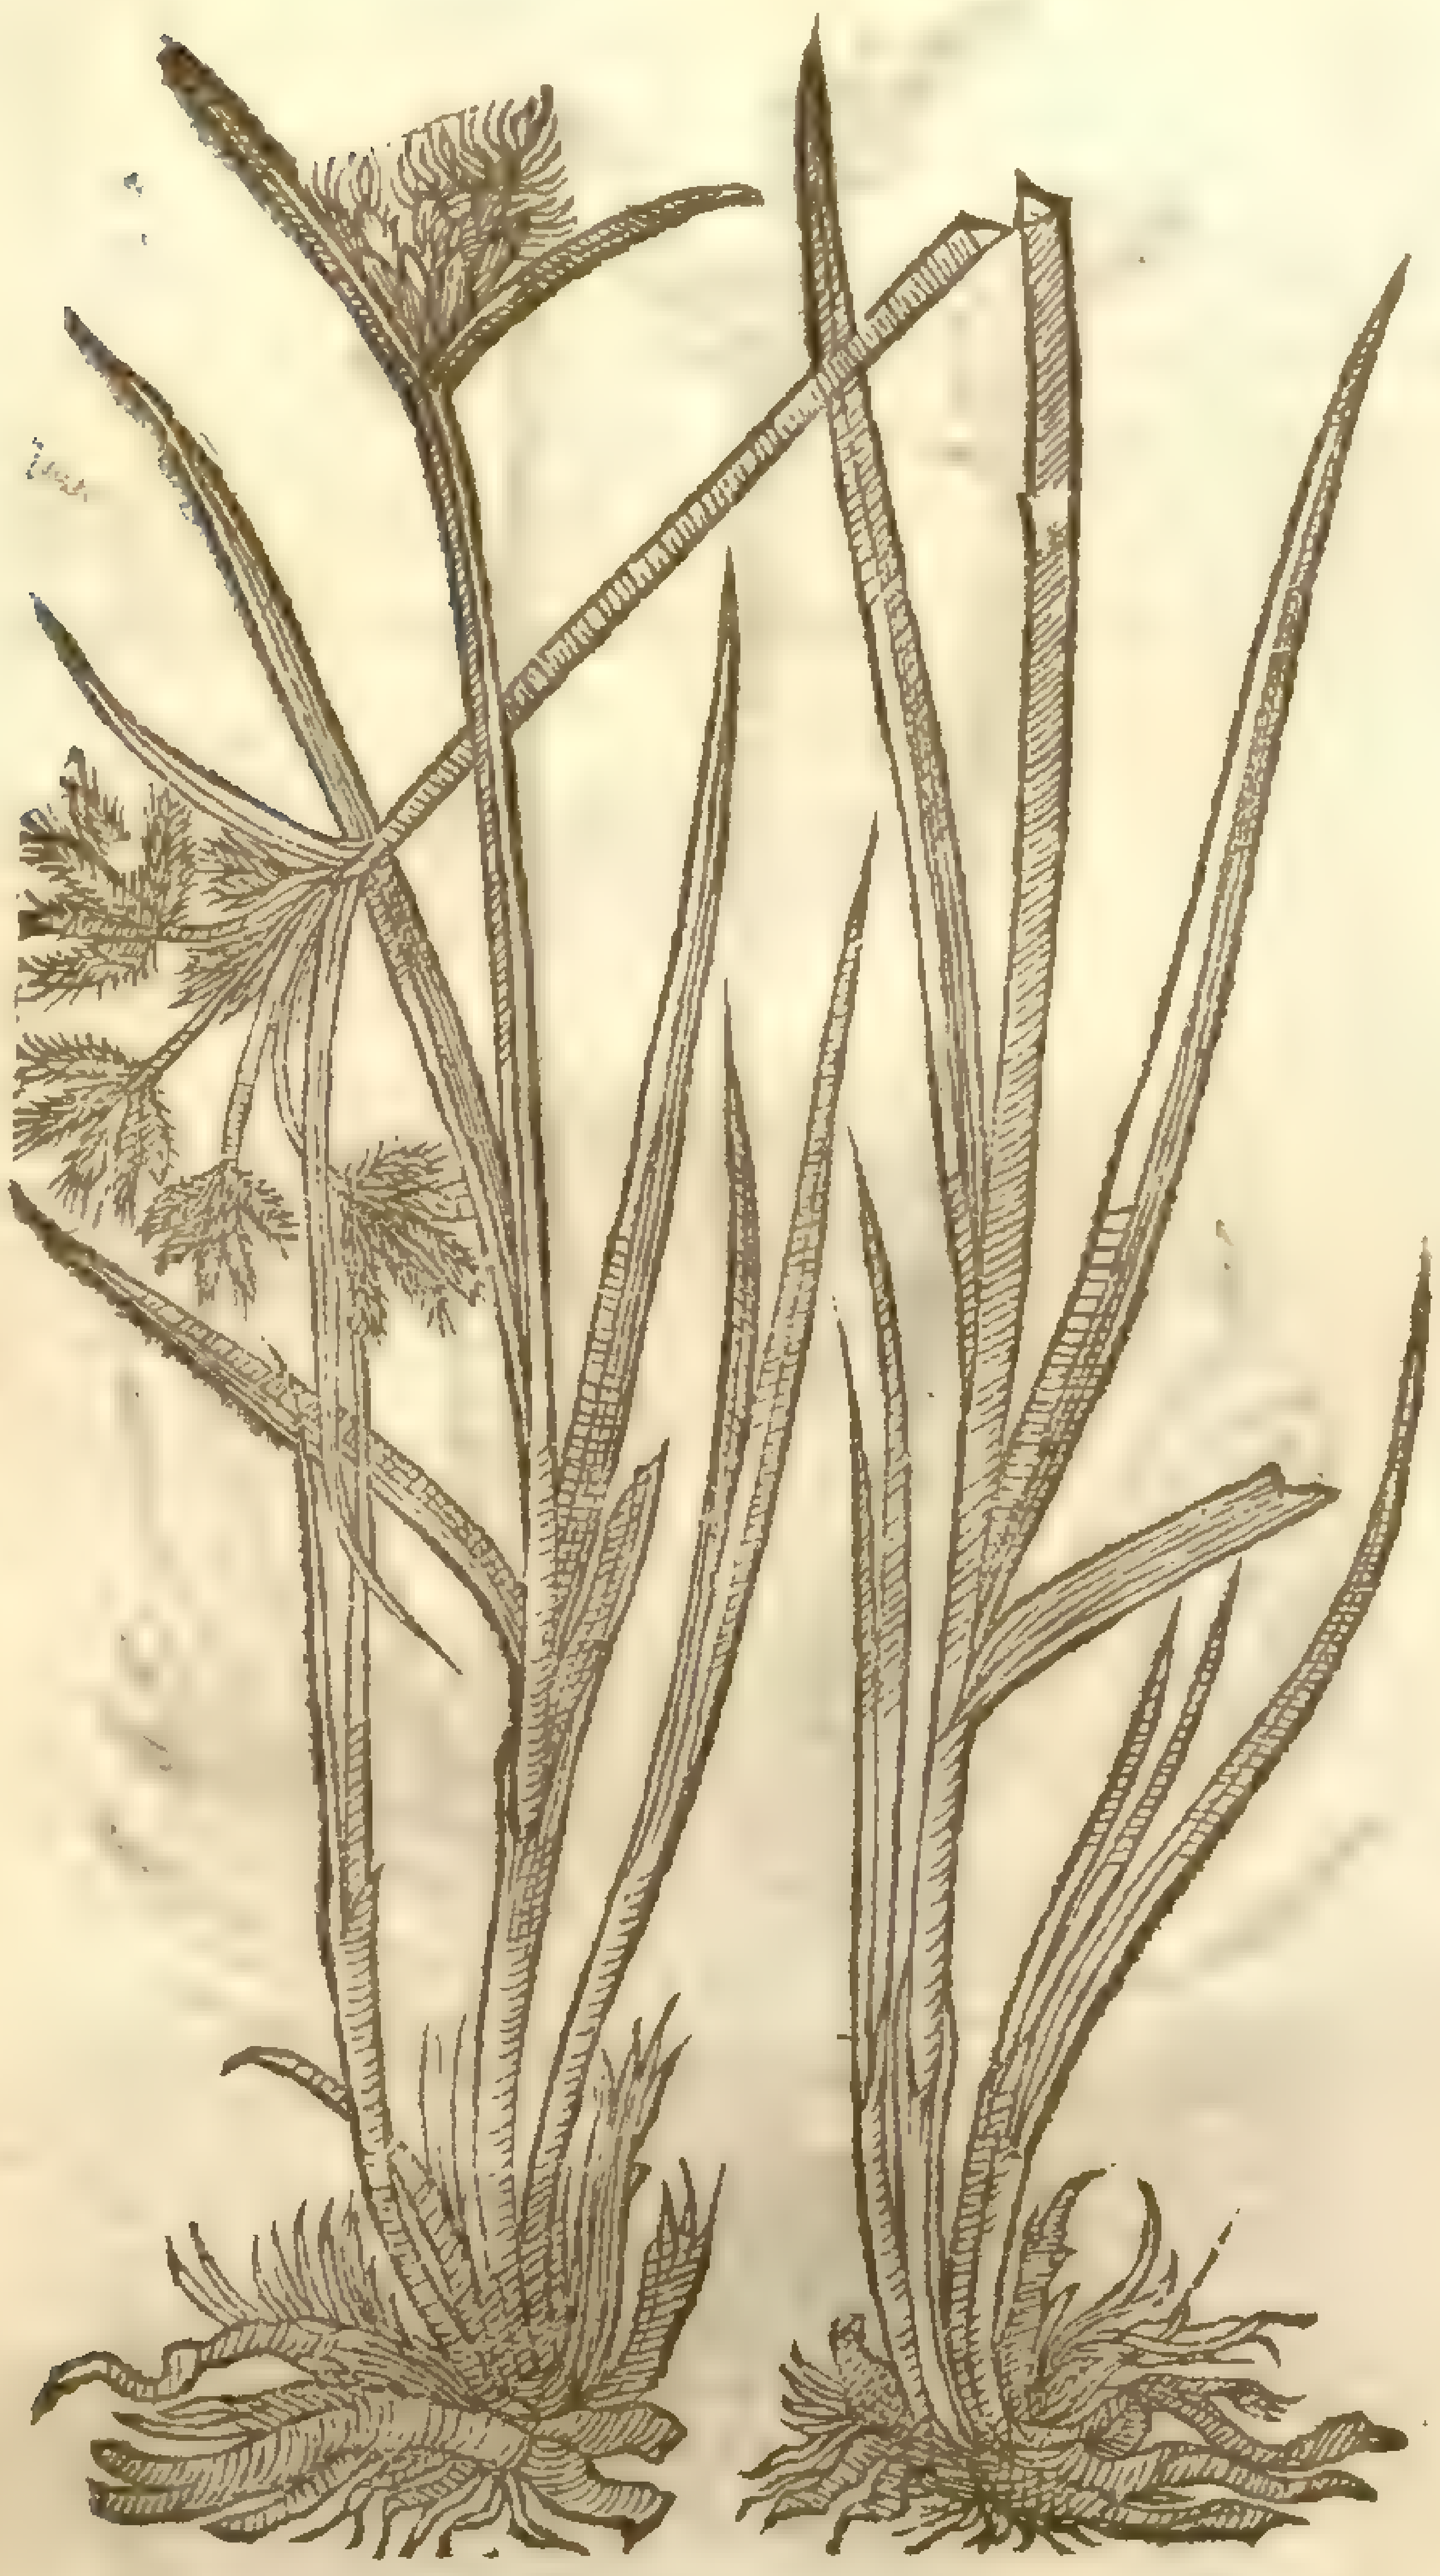
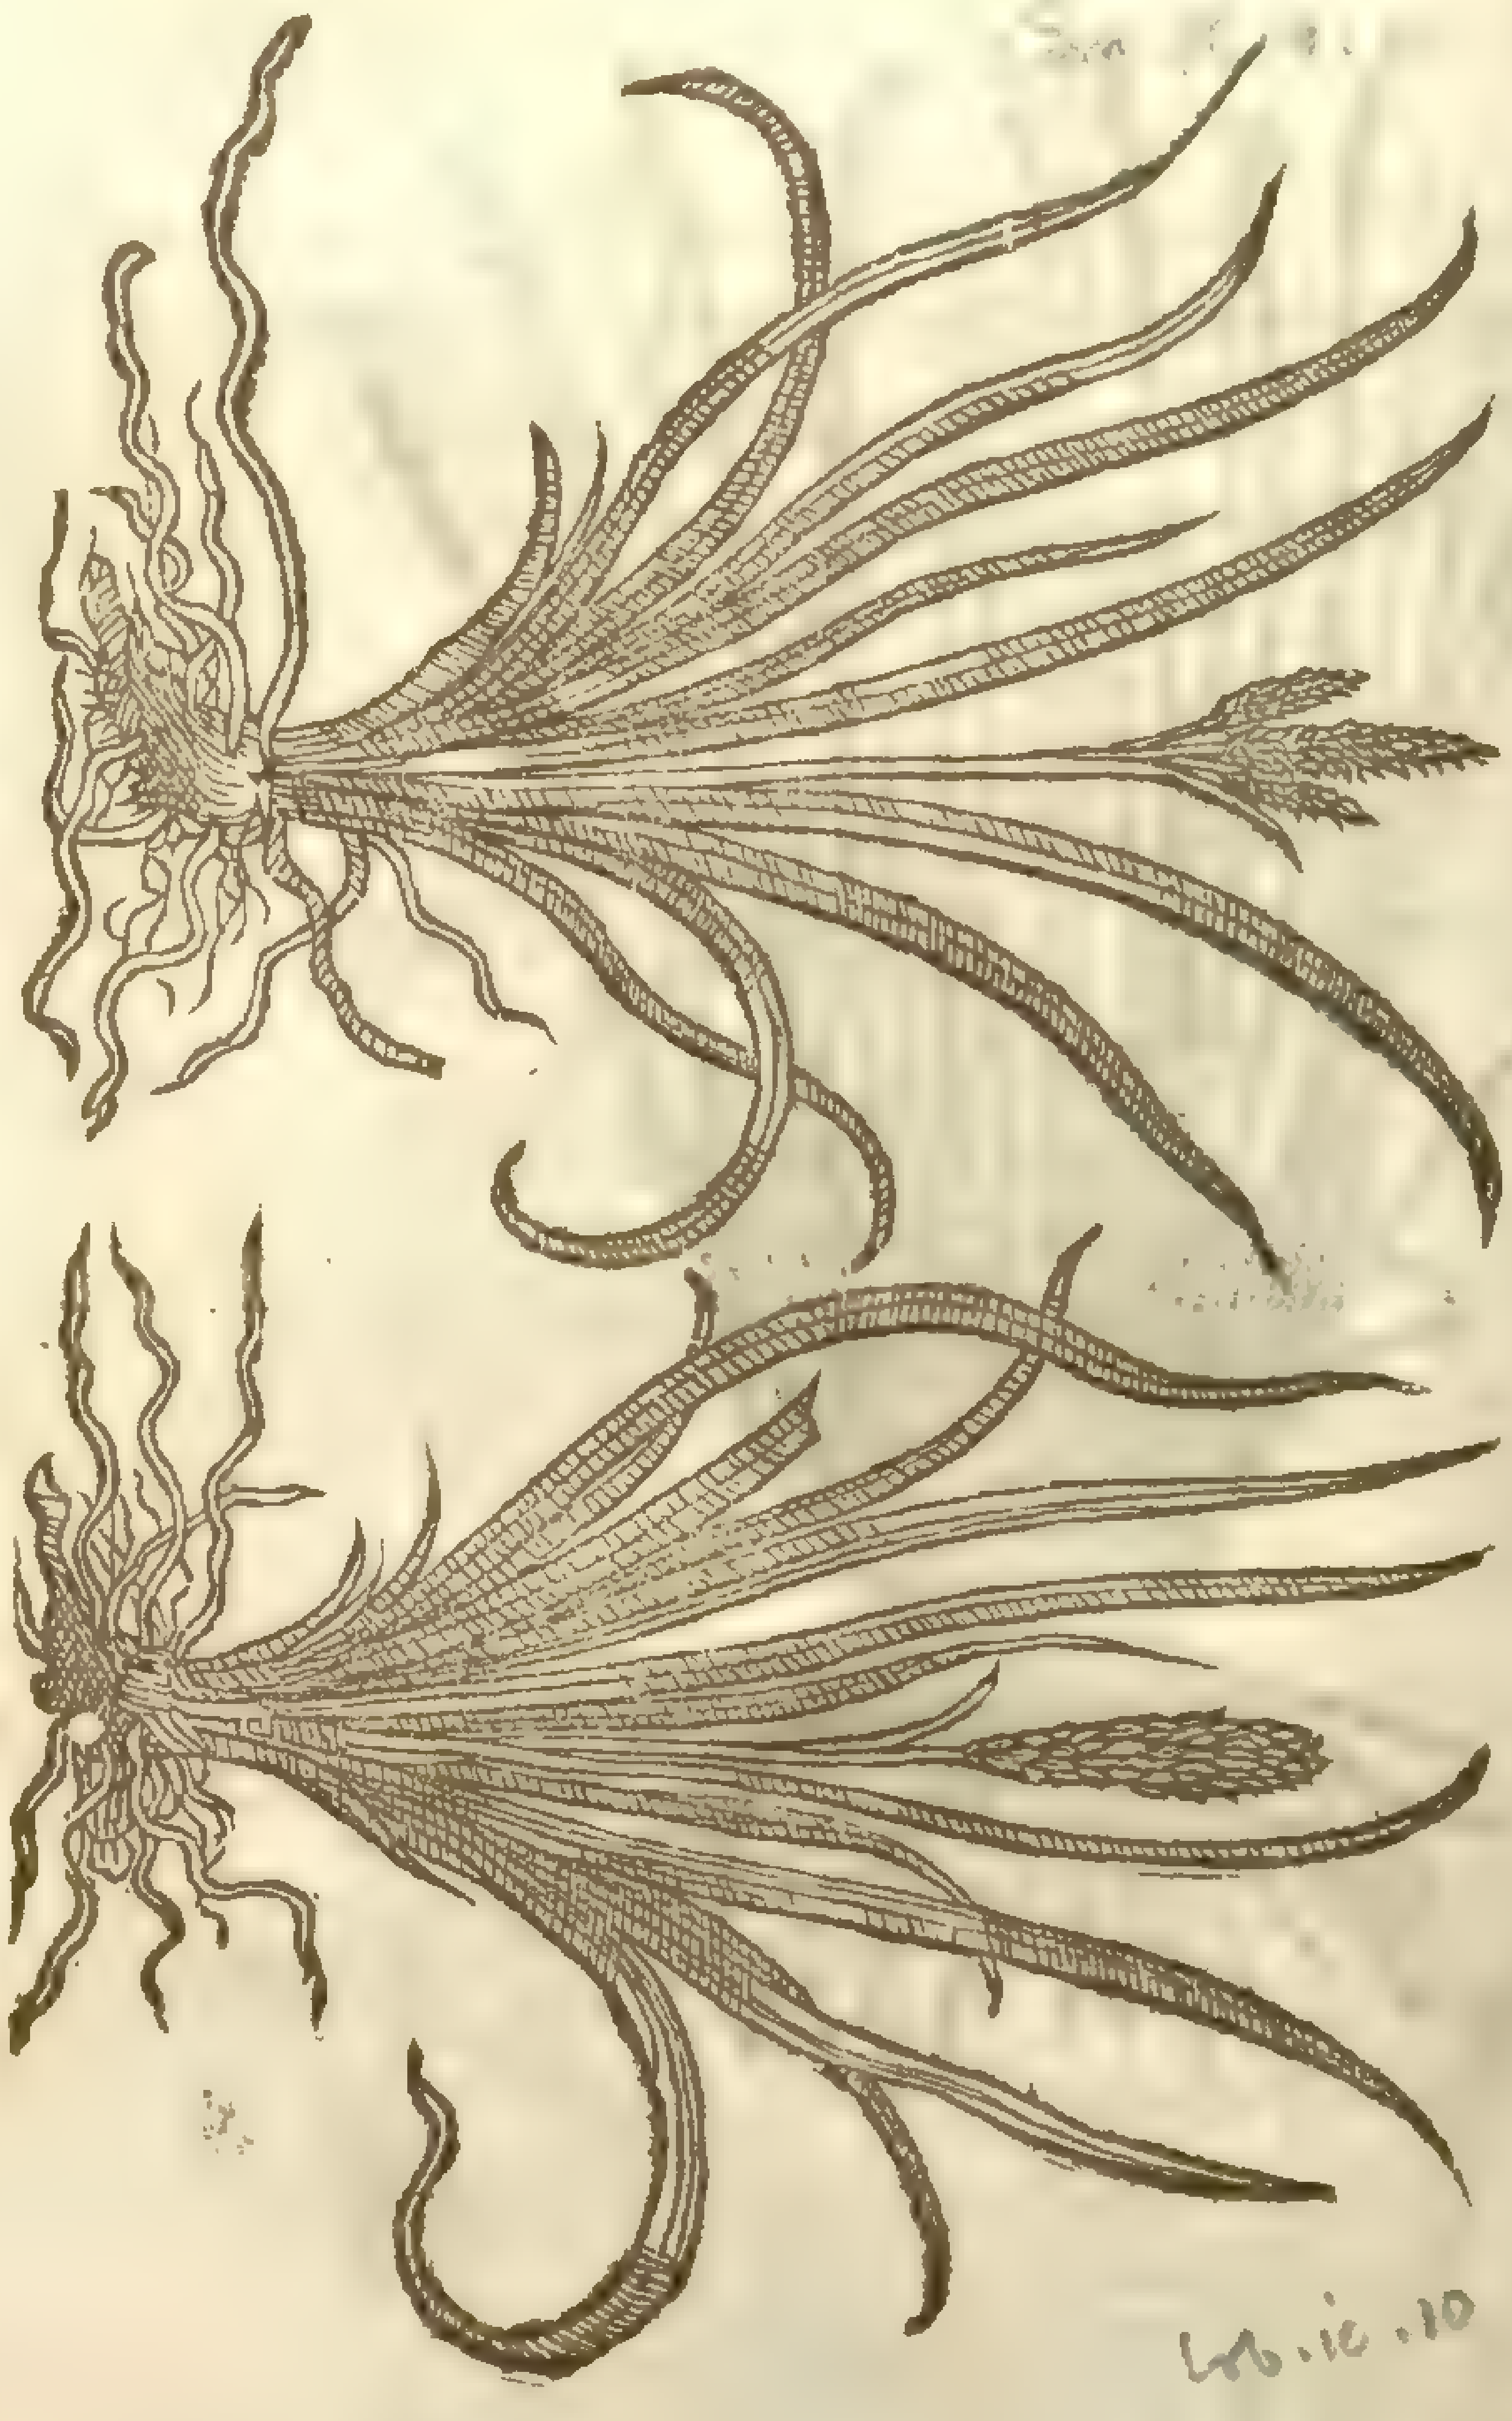
S. compactus [illegible] 181



Carex praecox, Jacq.
Mudo. dest.

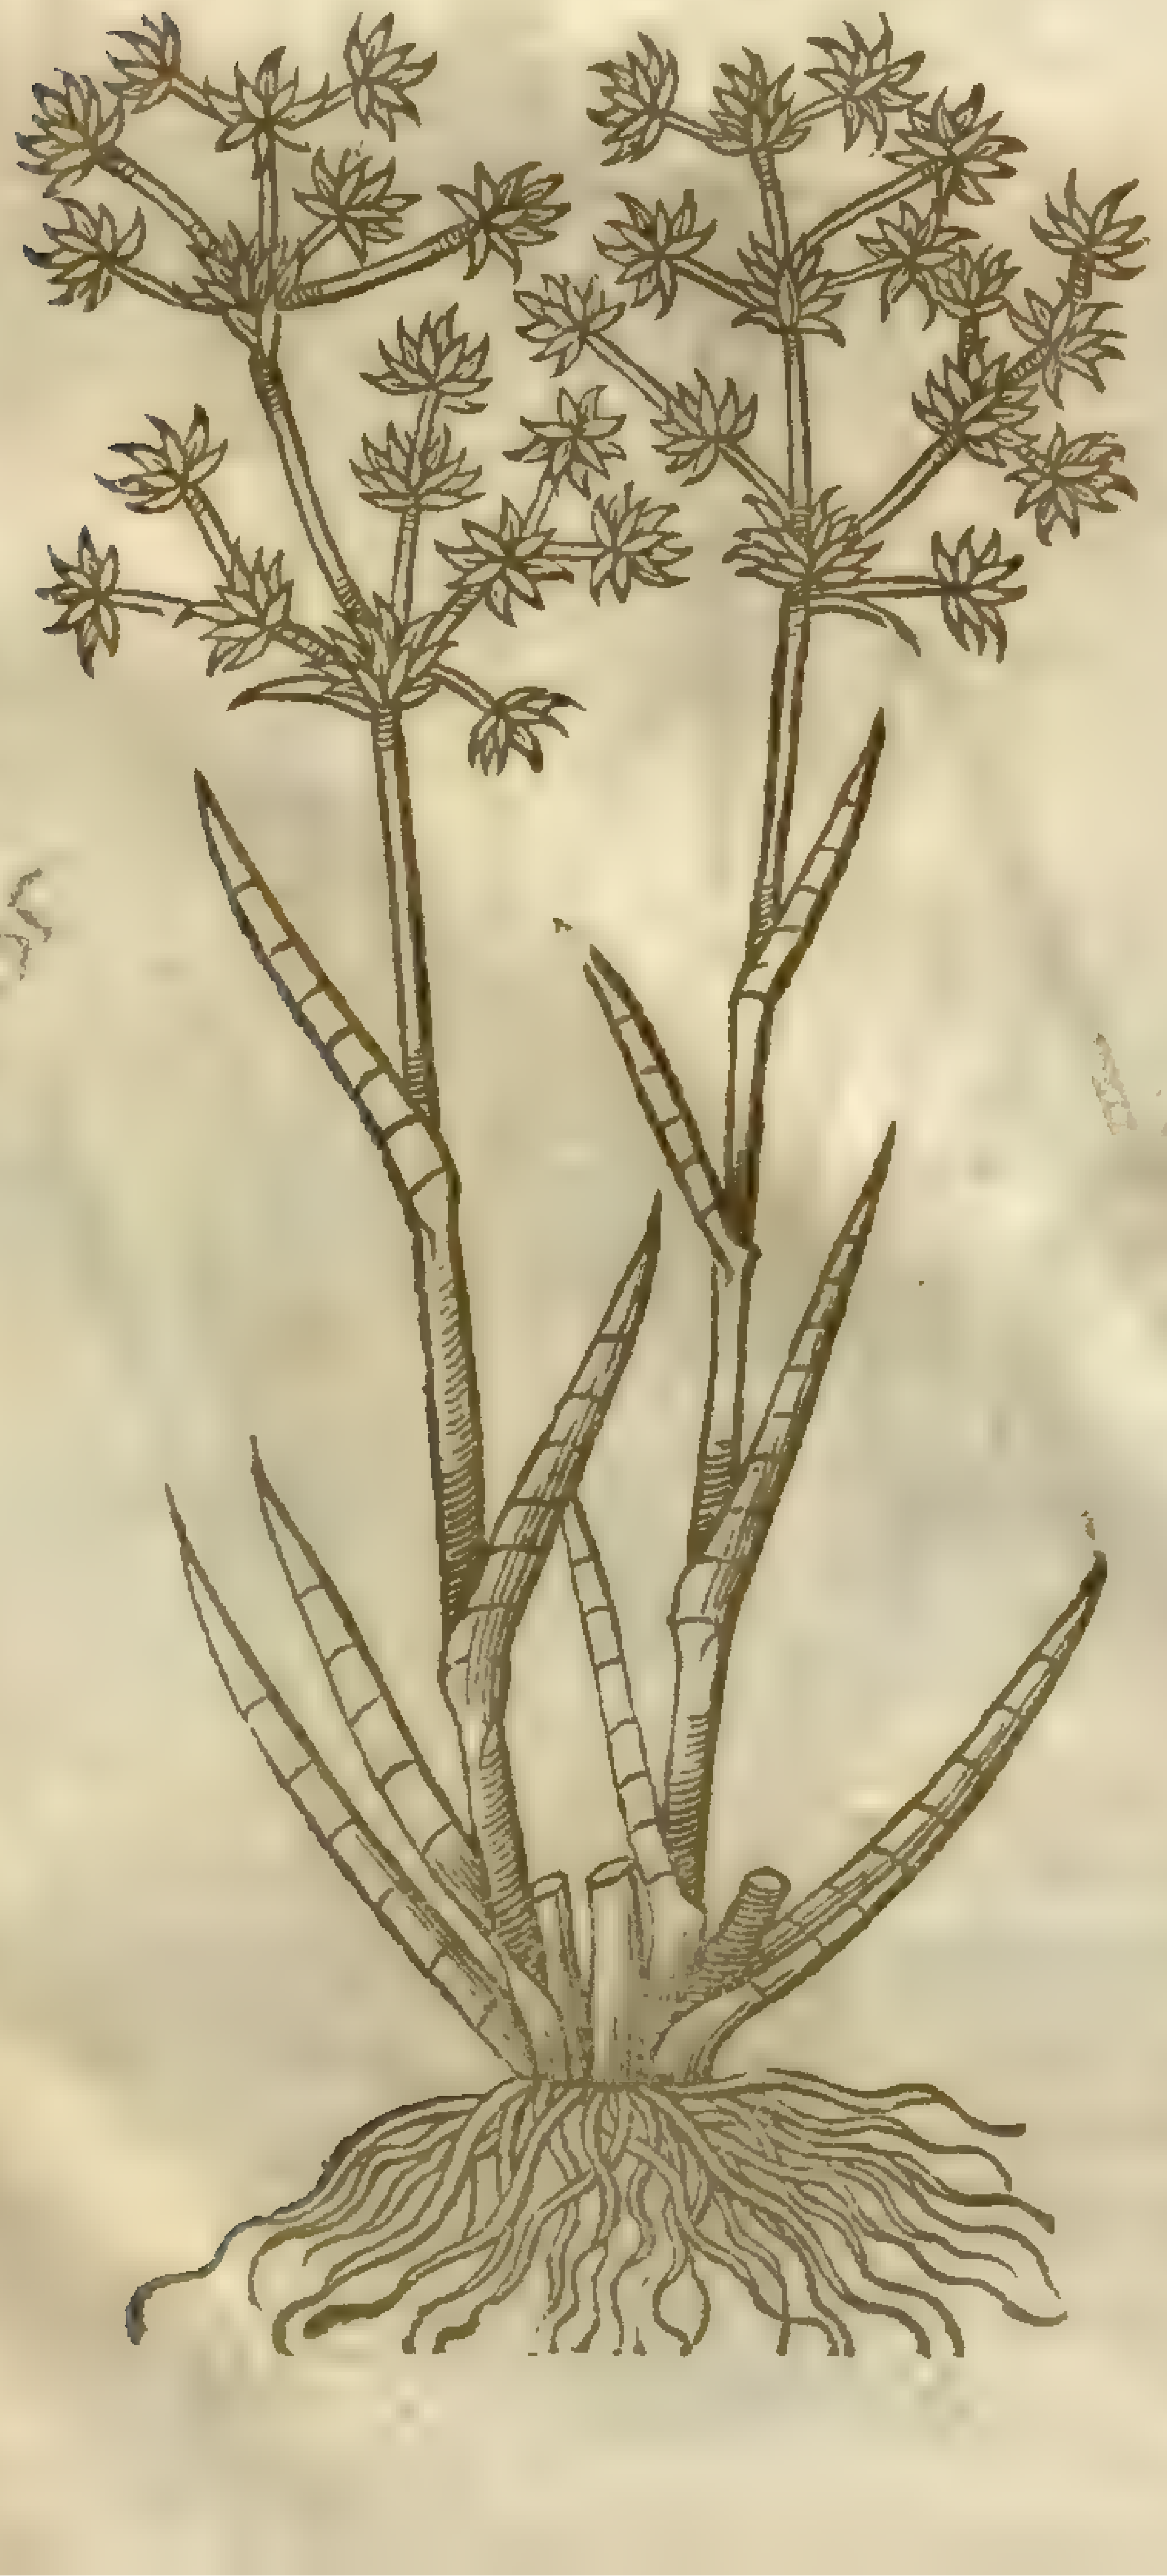


‡ 8 *Gramen Cyperoides ſpicatum.* Spike Cypreſſe Graſſe.

Lob. ic. 10

9 *Gramen junceum ſylvaticum.*
Wood Ruſhy graſſe.

J. sylvaticus, Willd.
Sm. fl. b. 135



7 The firſt of theſe two kindes hath many crooked and crambling roots of a wooddy ſubſtance, very like vnto the right Cyperus, differing from it onely in ſmell, becauſe the right Cyperus roots haue a fragrant ſmell, and theſe none at all. His leaues are long and broad, rough, ſharpe or cutting at the edges like Sedge. His ſtalke is long, big, and three-ſquare like to Cyperus, and on his top hath a chaffie vmbel or tuft like vnto the true Cyperus,

‡ 8 The ſecond kind hath many broad leaues like vnto thoſe of Gillouers, but of a freſher greene; amongſt the which riſeth vp a ſhort ſtalk ſome handfull or two high, bearing at the top three or foure ſhort eares of a reddiſh murrey colour, and theſe ears grow commonly together at the top of the ſtalk, and not one vnder another. There is alſo another leſſer ſort hereof, with leaues and roots like the former, but the ſtalke is commonly ſhorter, and it hath but one ſingle eare at the top thereof. You haue the figures of both theſe expreſt in the ſame table or piece.

This kinde of Graſſe is the *Gramen ſpicatum folijs Vetonicæ* of *Lobel.* ‡

9 This hath long tough and hairy ſtrings, growing deepe in the earth like a turfe, which make the root; from which riſe many crooked tough & ruſhy ſtalkes, hauing toward the top ſkaly and chaffie knobs or buttons.

‡ This growes ſome halfe yard high, with round browniſh heads, and the leaues are ioynted as you ſee them expreſſed in the figure we heare giue you. ‡

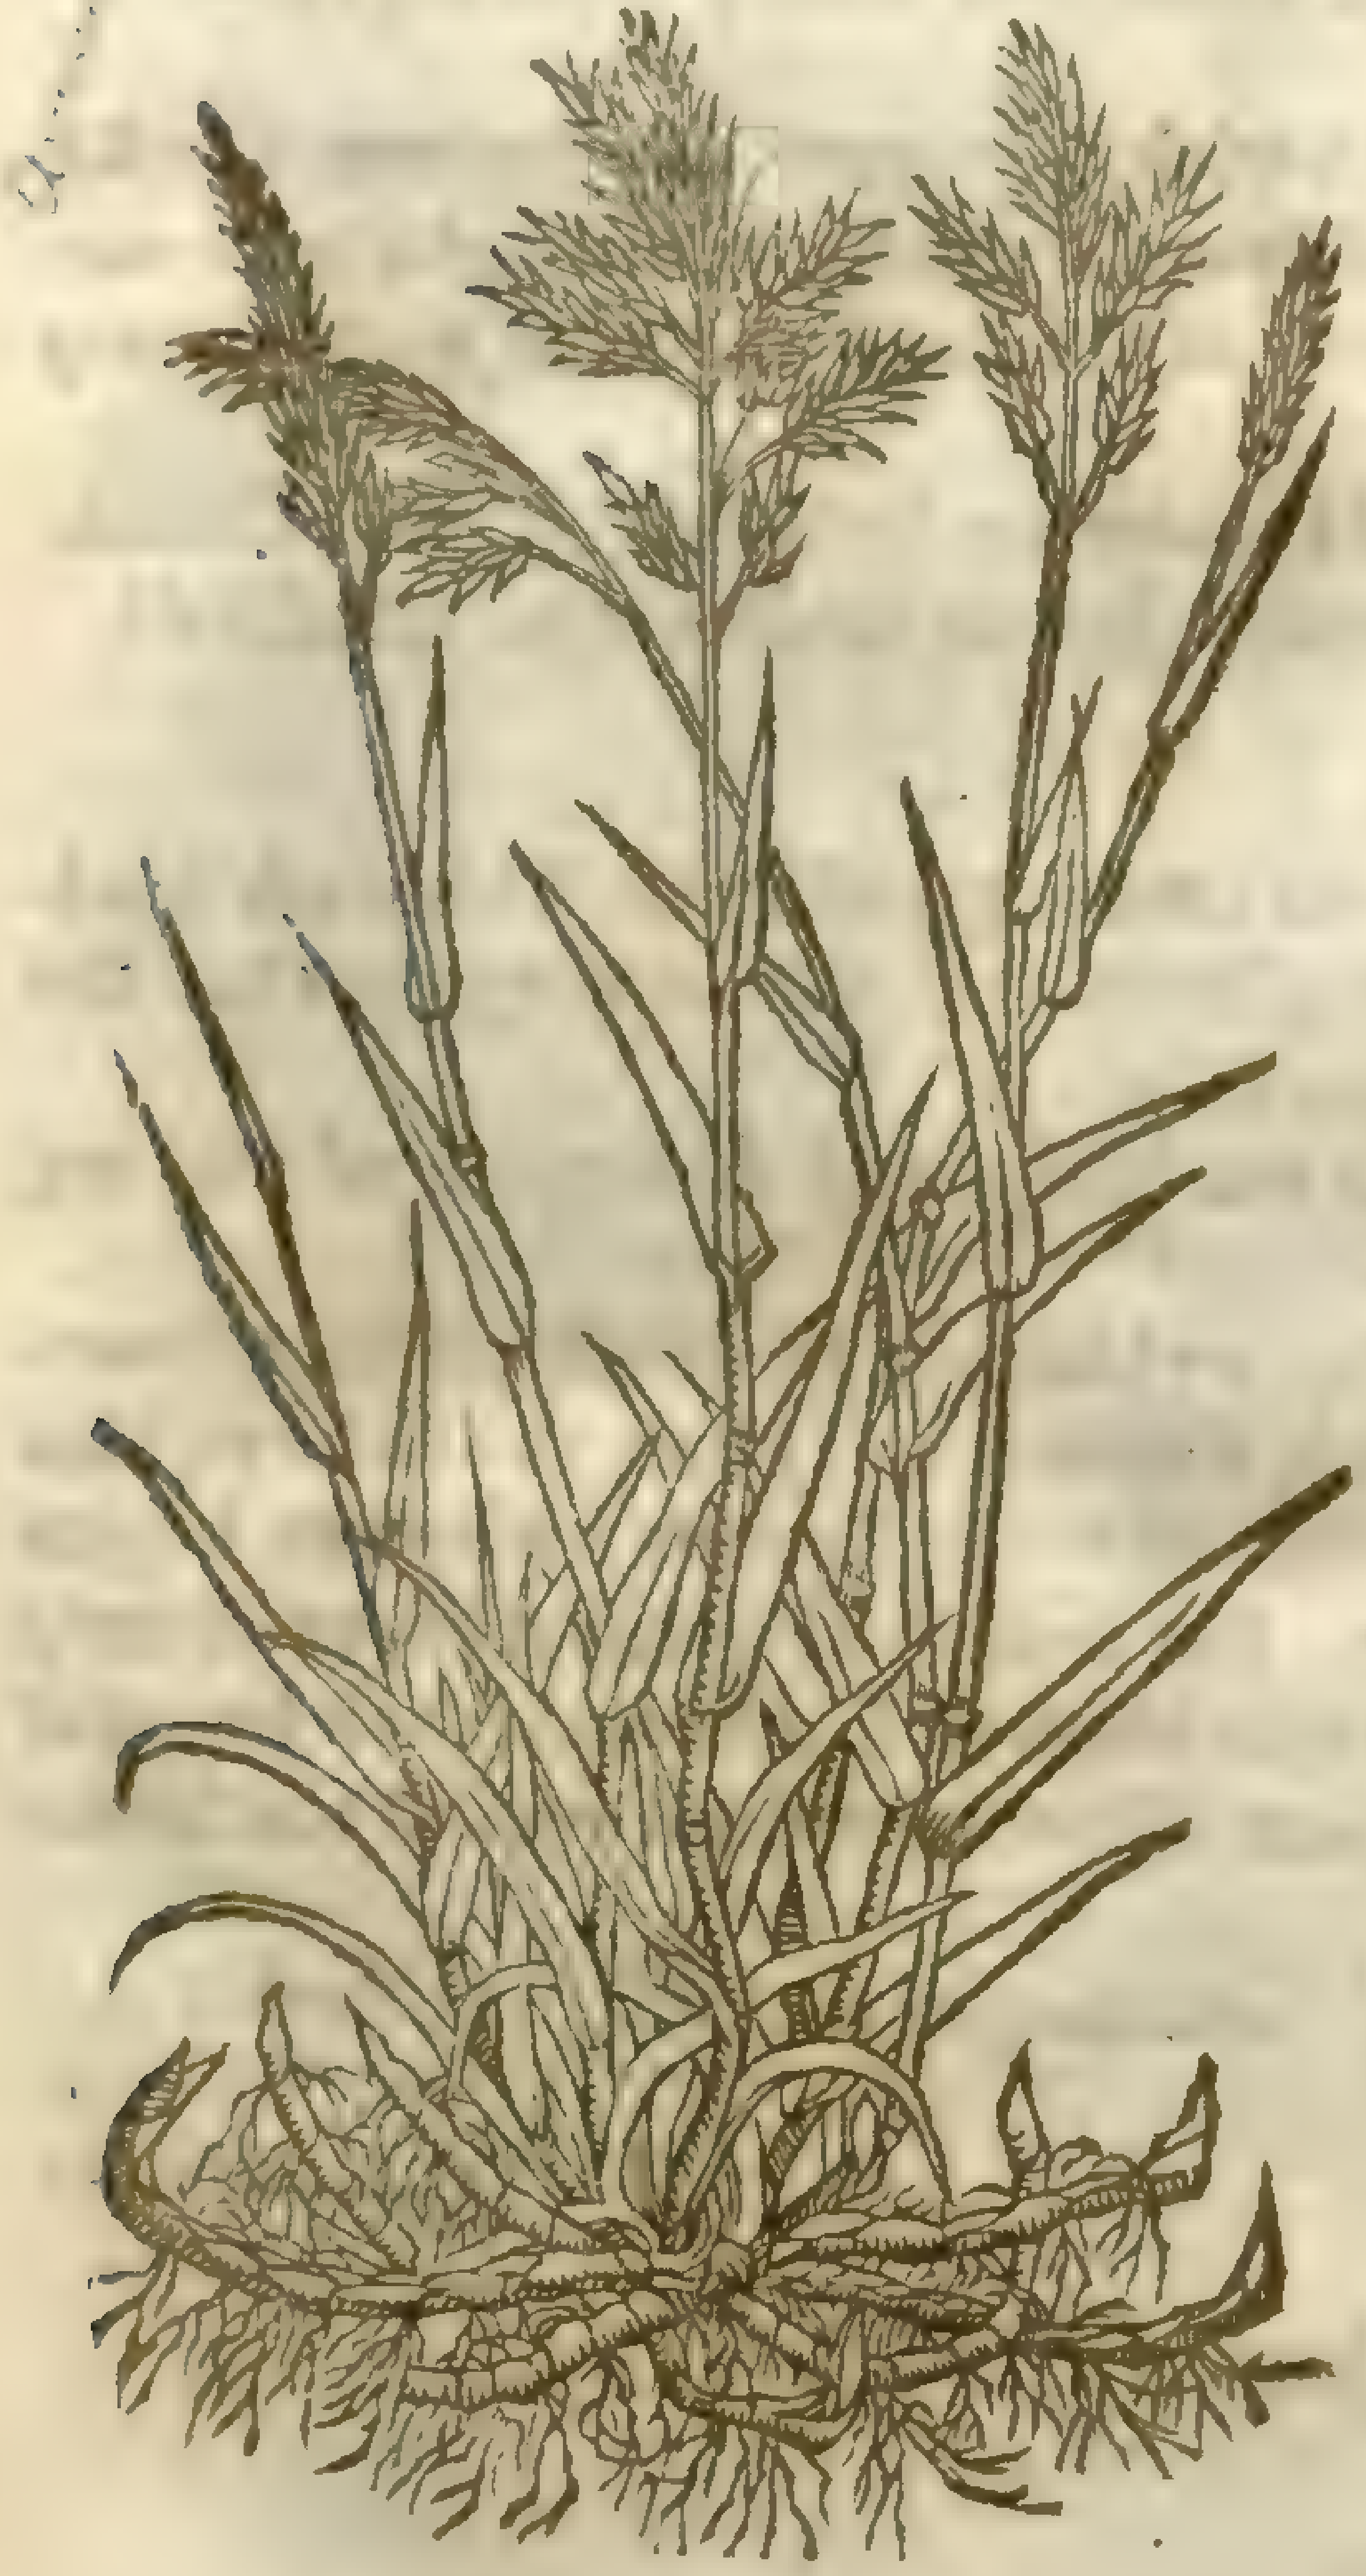
¶ *The Place, Time, Names, Nature, and Vertues.*

All the Graſſes which we haue deſcribed in this Chapter do grow in mariſh and watery places neere to the ſea or other fenny grounds, or by muddy and myrie ditches, at the ſame time that the others do grow and flouriſh. Their names are eaſily gathered of the places they grow in, or by their Deſcriptions, and are of no vertue or propertie in medicine, or any other neceſſarie vſe as yet knowne.

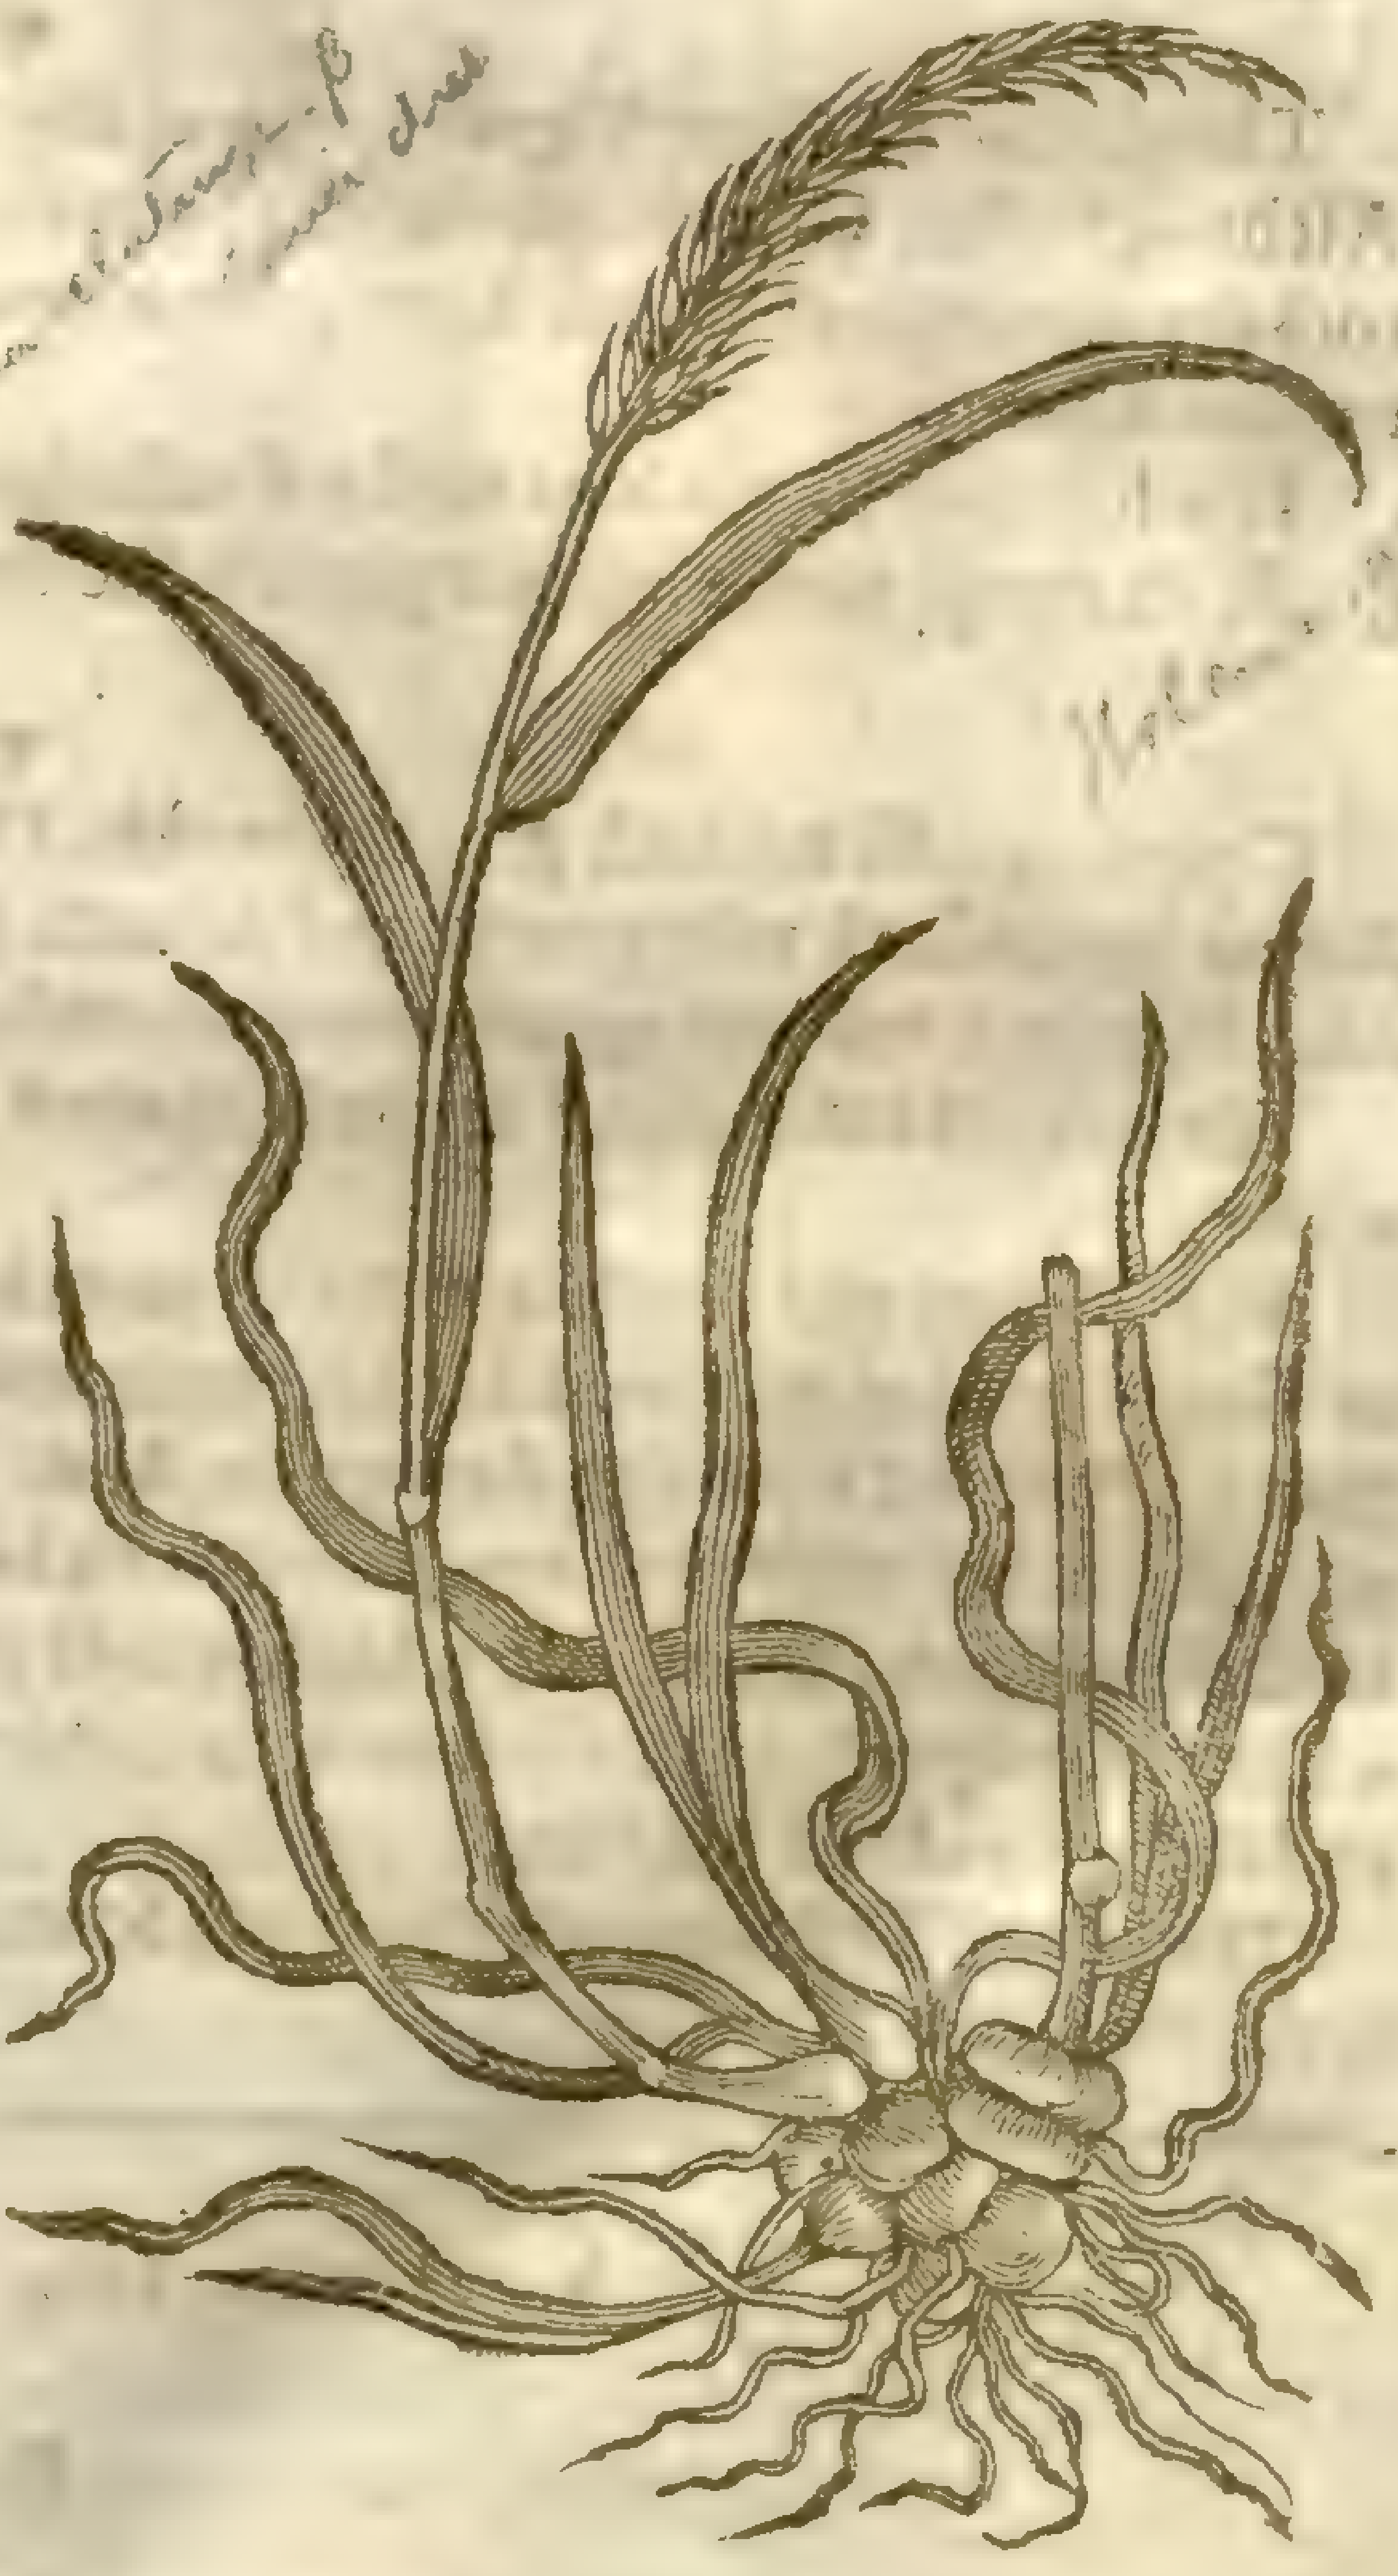
† Formerly in the eighth place (but very vnfitly) was the figure of *Gramen pannici effigie ſpica ſimp.* being the third in the thirteenth Chapter. The ninth alſo is reſtored to his due place, being the fourth in the ſixt chap. The two Reed-graſſes that were in the 11 and 12 places are alſo before in the fift Chap.

Chap. 17. *Of Couch-Graſſe or Dogs-Graſſe.*

1 *Gramen Caninum.*
Couch-graſſe or Dogs-graſſe.



2 *Gramen Caninum nodoſum.*
Knotty Dogs-graſſe.



¶ *The Deſcription.*

† 1 The common or beſt known dogs graſſe or Couch-graſſe hath long leaues of a whitiſh greene colour: the ſtalke is a cubit and a halfe high, with joints or knees like wheaten ſtrawes, but theſe joints are couered with a little ſhort downe or woollineſſe. The plume or tuft is like the reed, but ſmaller and more chaffie, and of a grayiſh colour: it creepeth in the ground hither and thither with long white roots, ioynted at certaine diſtances, hauing a pleaſant ſweet taſt: they are platted or wrapped one within another very intricately, inſomuch as where it hapneth in gardens amongſt pot-herbes, great labour muſt be taken before it can be deſtroyed, each piece being apt to grow, and euery way to dilate it ſelfe.

† 2 Knotty Dogs-graſſe is like vnto the former in ſtalke and leafe, but that they are of a deeper colour, alſo the ſpike or eare is greener, and about ſome two handfuls long, it much in ſhape reſembles an Ote, yet far ſmaller, and is much more diſperſed than the figure preſents to you. The roots of this are ſomewhat knotty and tuberous, but that is chiefely about the Spring of the yere; for afterwards they become leſſe and leſſe vntill the end of Sommer. And theſe Bulbes doe grow confuſedly together, not retaining any certaine ſhape or number.

¶ *The Place.*

1 The firſt grows in gardens and arable lands, as an infirmitie or plague of the fields, nothing pleaſing to husbandmen; for after the field is plowed, they are conſtrained to gather the roots together with harrowes and rakes, and being ſo gathered and laid vpon heaps, they ſet them on fire leſt they ſhould grow againe.

2 The ſecond growes in plowed fields and ſuch like places, but not euery where as the other. I haue found of theſe in great plenty, both growing, and plucked vp with harrowes, as before is rehearſed, in the fields next to Saint *Iames* wall, as ye go to Chelſey, and in the fields as yee goe from the Tower hill in London, to Radcliffe.

¶ *The Time.*

Theſe Graſſes ſeldome come to ſhew their eare before Iuly.

¶ *The Names.*

It is called *Gramen Caninum*, or *Sanguinale*, and *Vniola*. The countreymen of Brabant name it **Peen**: others, **Ledt graſſe**: of the Greeks, ἄγρωστις: of the Latines by the common name, *Gramen*. It is of ſome named ἀγρικὸν: in Engliſh, Couch-graſſe, Quitch-graſſe, and Dogs-graſſe.

Gramen Caninum bulboſum or *nodoſum*, is called in Engliſh, Knobby or knotty Couch-graſſe.

¶ *The Nature.*

The nature of Couch-graſſe, eſpecially the roots, agreeth with the nature of common Graſſe. Although that Couch-graſſe be an vnwelcome gueſt to fields and gardens, yet his phyſicke vertues do recompenſe thoſe hurts; for it openeth the ſtoppings of the liuer and reins, without any manifeſt heate.

The learned Phyſitions of the Colledge and Societie of London do hold this bulbous Couch-graſſe in temperature agreeing with the common Couch-graſſe, but in vertues more effectuall.

¶ *The Vertues.*

A Couch-graſſe healeth green wounds. The decoction of the root is good for the kidnies & bladder: it prouoketh vrin gently, and driueth forth grauell. *Dioſcorides* and *Galen* doe agree, that the root ſtamped and laid vpon greene wounds, healeth them ſpeedily.

B The decoction thereof ſerueth againſt griping paines of the belly, and difficultie of making water.

C *Marcellus* an old Author maketh mention, Chap. 26. That 27 knots of the herbe called *Gramen* or Graſſe, boiled in wine till halfe be conſumed, preſſed forth, ſtrained, and giuen to drinke to him that is troubled with the ſtrangurie, hath ſo great vertue, that after the Patient hath once begun to make water without paine, it may not be giuen any more. But it muſt be giuen with water only to ſuch as haue a feuer. By which words it appeareth, that this knotted Graſſe was taken for that which is properly called *Gramen*, or *Agroſtis*; and hath been alſo commended againſt the Stone and diſeaſes of the bladder.

The later Phyſitions vſe the roots ſomtimes of this, and ſomtimes of the other indifferently.

Chap. 18. *Of Sea Dogs-Graſſe.*

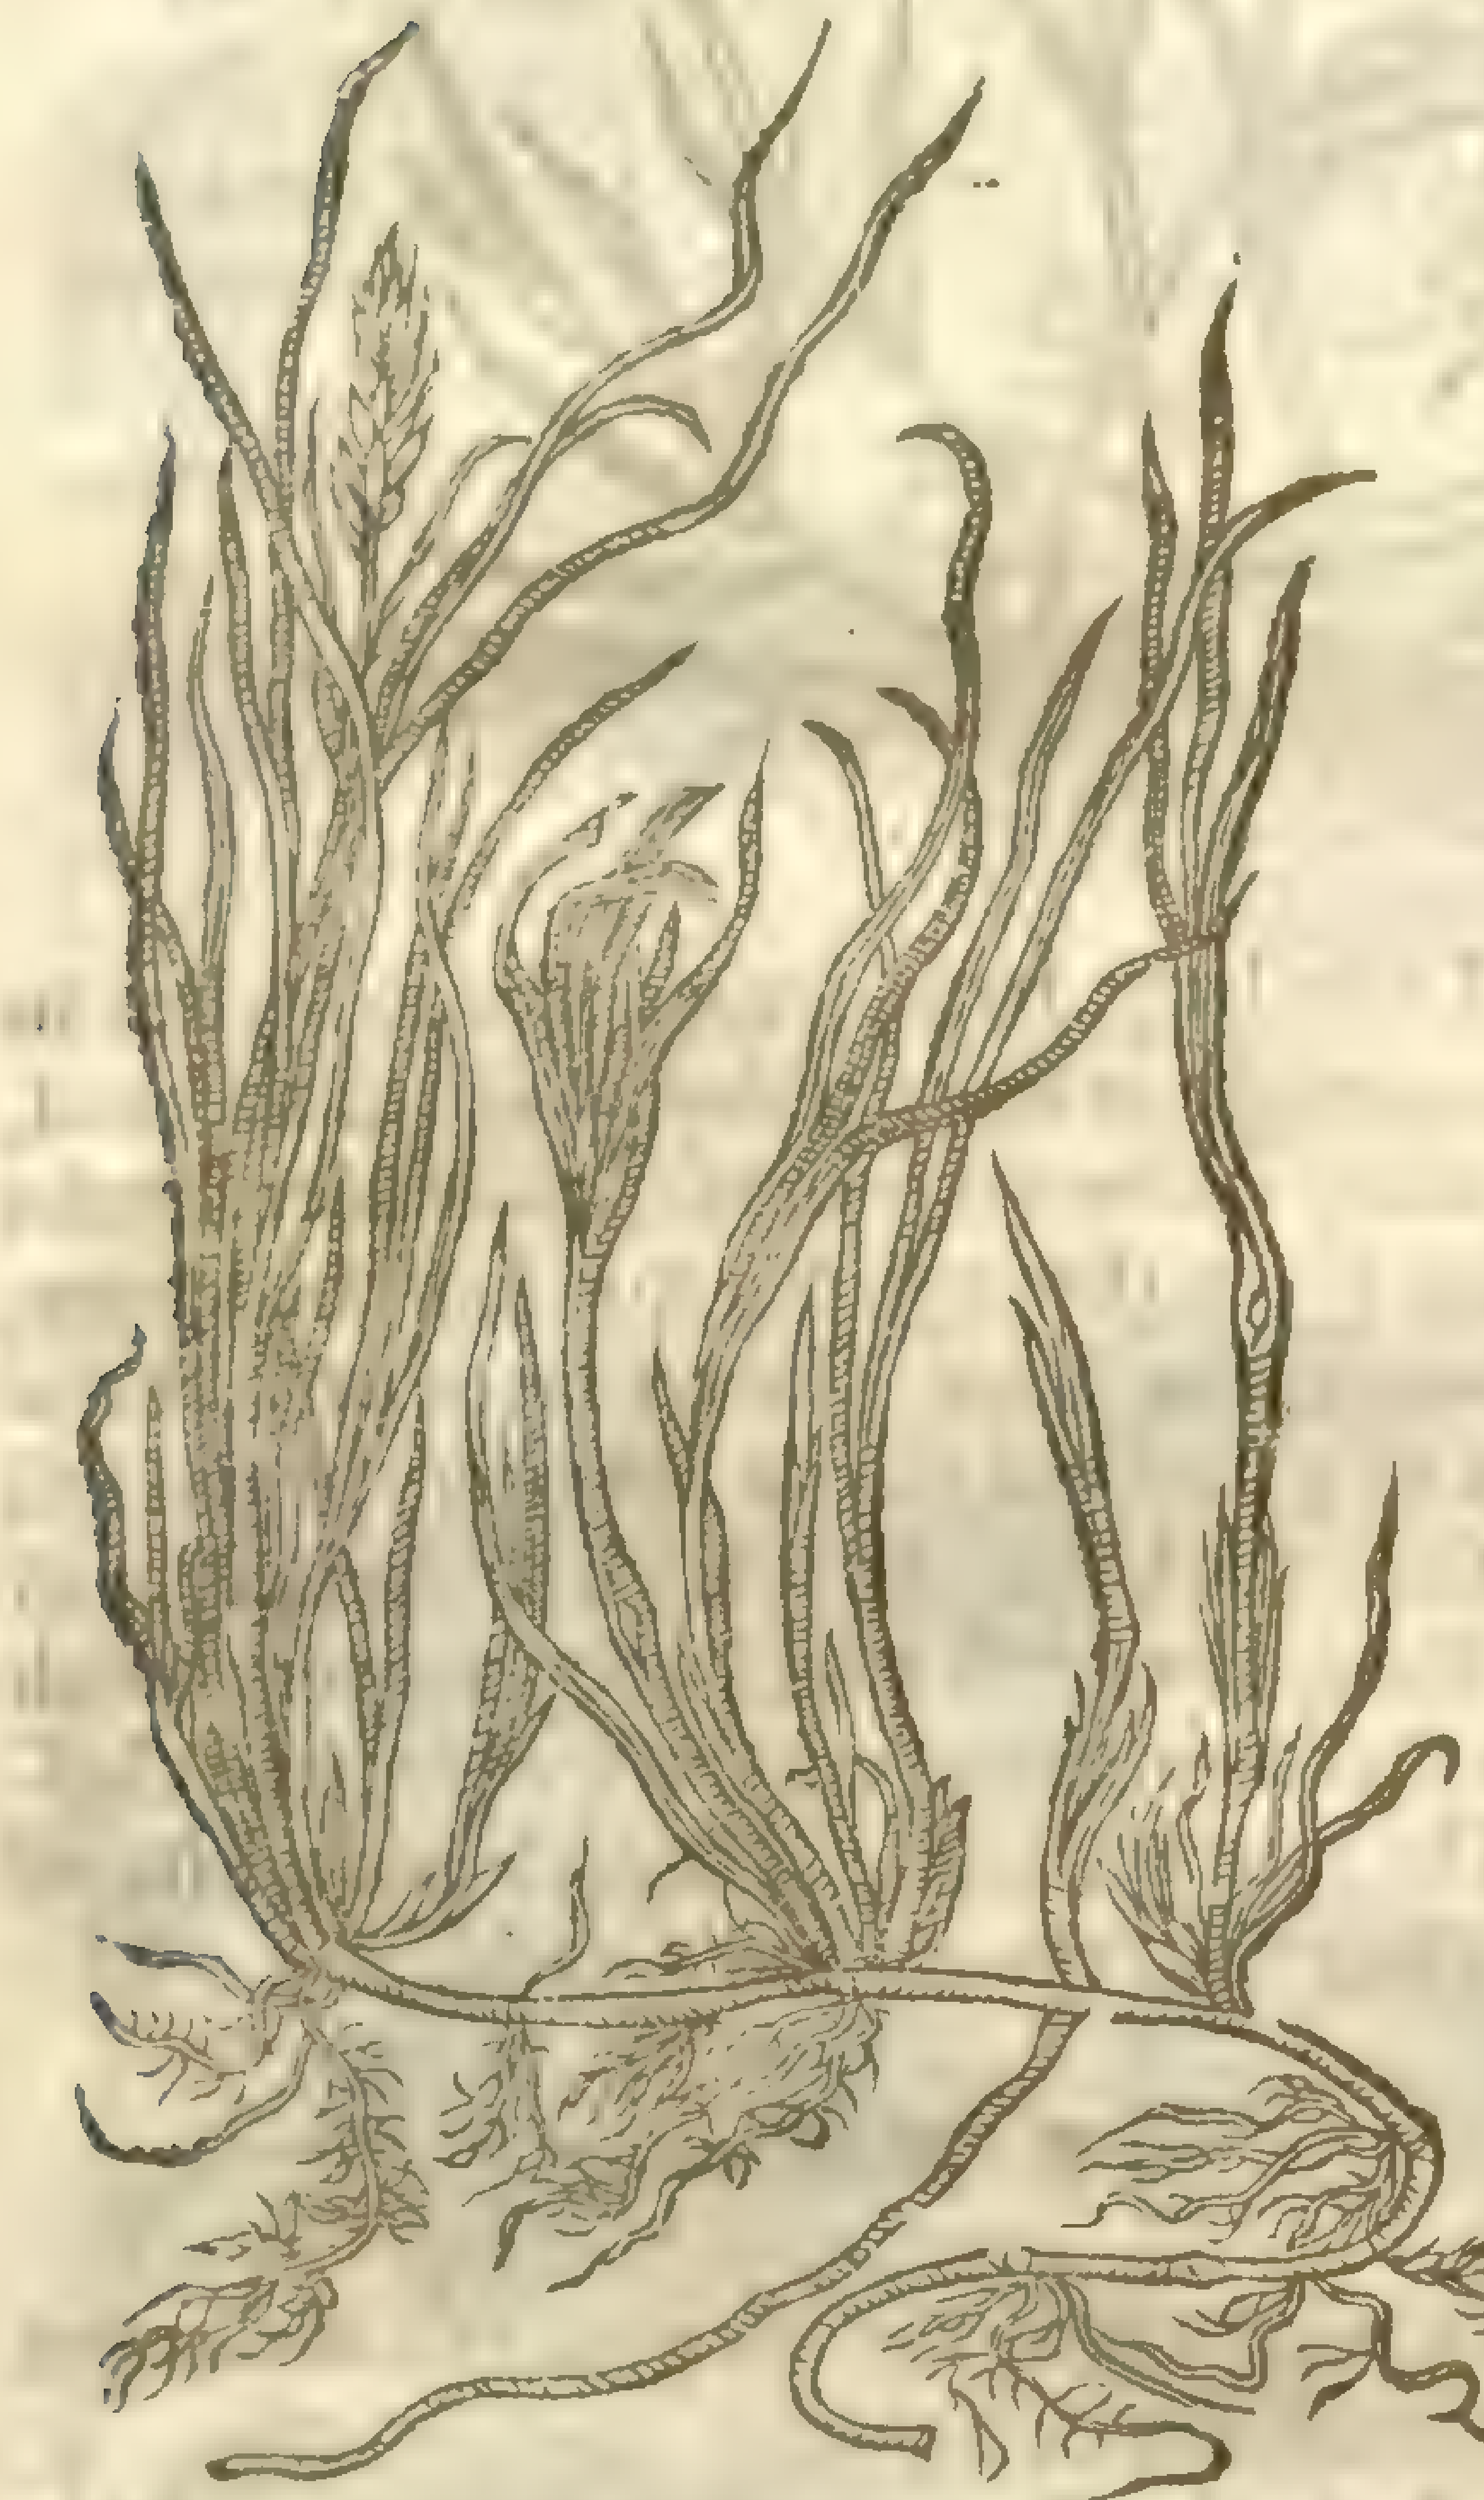
¶ *The Deſcription.*

1 The Sea Dogs-graſſe is very like vnto the other before named: his leaues are long and ſlender, and very thicke compact together, ſet vpon a knotty ſtalke ſpiked at the top like the former. Alſo the root crambleth and creepeth hither and thither vnder the earth, occupying much ground by reaſon of his great encreaſe of roots.

‡ This Graſſe (whereof *Lobel* gaue the firſt figure and deſcription, vnder the name of *Gramen geniculatum Caninum marinum*) I conjecture to be that which growes plentifully vpon the banks in the ſalt mariſhes by Dartford in Kent, and moſt other ſalt places by the ſea; as alſo in many banks and orchards about London, and moſt other places farre from the ſea. Now *Lobels* figure beeing not good, and the deſcription not extant in any of his Latine Workes, I cannot certainly affirme any thing. Yet I thinke it fit to giue you an exact deſcription of that I do probably iudge to be it;

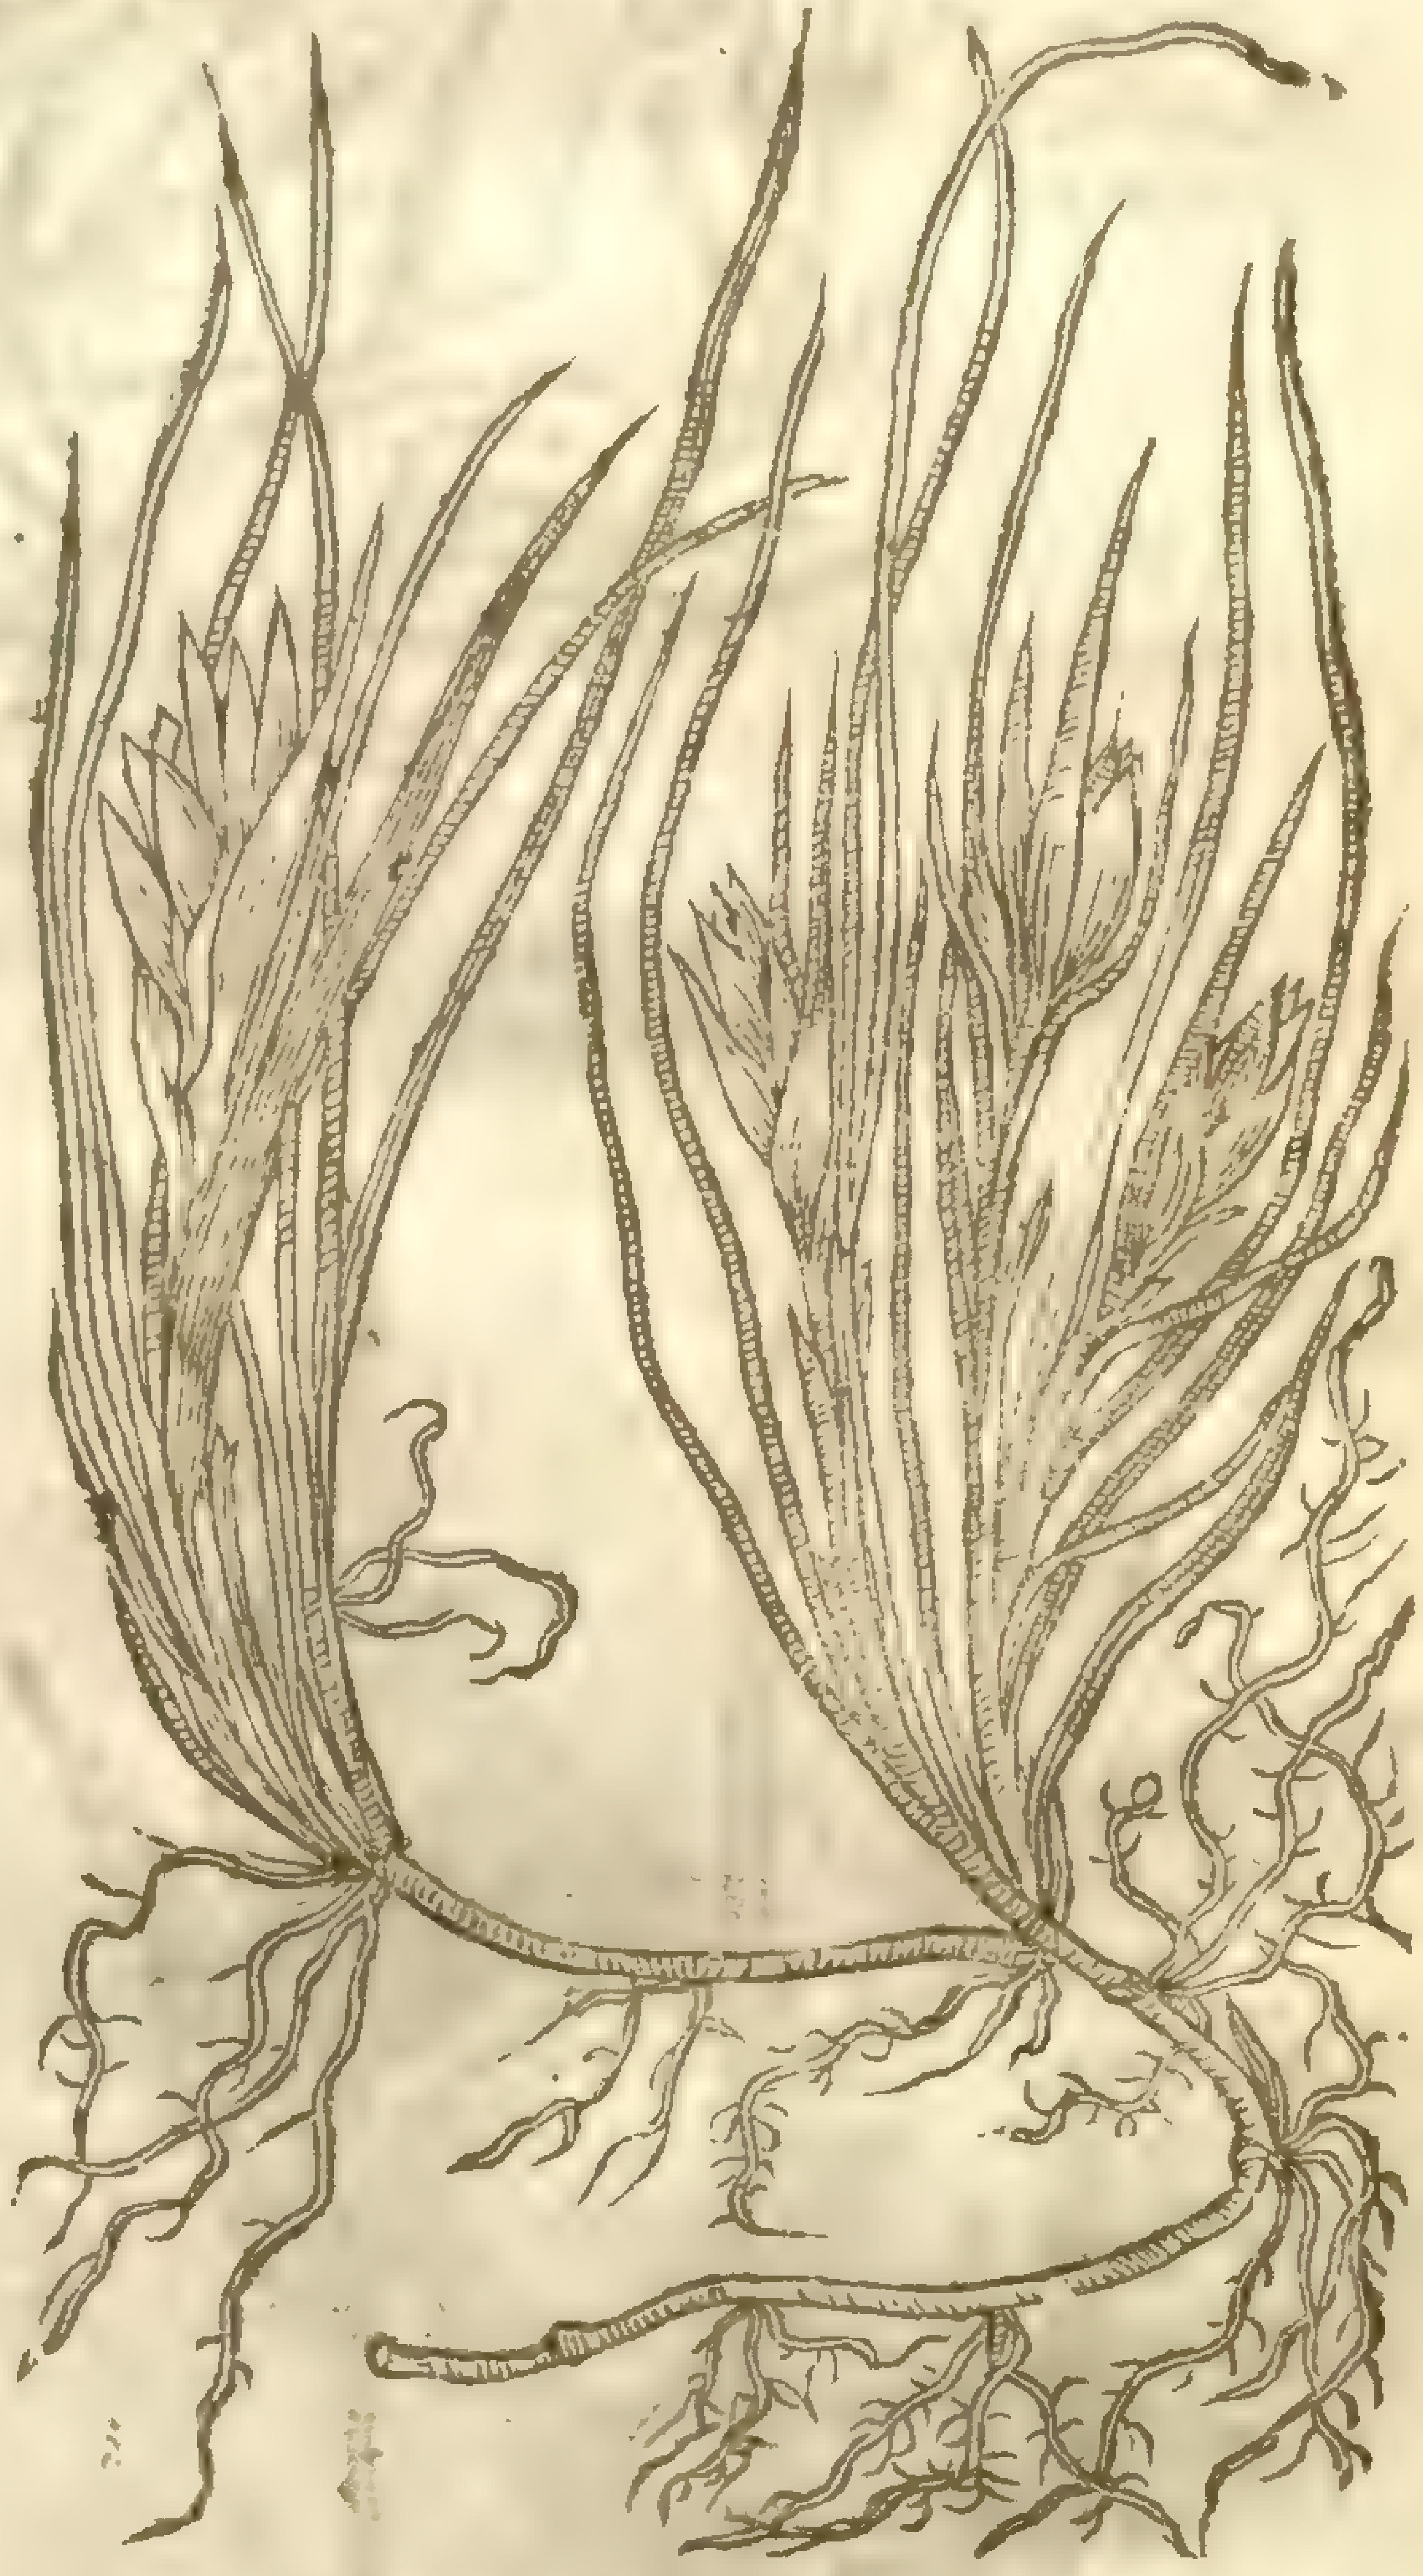
and not onely ſo, but I iudge it to be the ſame Graſſe that *Bauhinus* in his *Prodromus* hath ſet forth, *pag.* 17. vnder the name of *Gramen latifolium ſpica triticea compacta*. This is a very tall Graſſe; for it ſends forth a ſtalke commonly in good ground to the height of a yard and a halfe: the leaues are large, thicke, and greene, almoſt as big as thoſe of white Wheat; the which it alſo very much reſembles in the eare, which is vſually ſome handfull and an halfe long, little ſpokes ſtanding by courſe with their flat ſides toward the ſtraw. About the beginning of Iuly it is hung with little whitiſh yellow floures ſuch as Wheat hath. The roots of this are like thoſe of the firſt deſcribed. This ſometimes varies in the largeneſſe of the whole plant, as alſo in the greatneſſe, ſparſedneſſe, and compactedneſſe of the eare. ‡

1 *Gramen Caninum marinum.*
Sea Dogs-graſſe.



2 *Gramen Caninum marinum alterum.*
Sea Couch-graſſe.

Triticum junceum L. [illegible]
Sp. pl. [illegible]



2 The ſecond Sea Dogs-graſſe is according vnto *Lobel* ſomewhat like the former: his rootes are more ſpreading and longer, diſperſing themſelues farther vnder the ground than any of the reſt. The leaues are like the former, thicke buſhed at the top, with a cluſter or buſh of ſhort thick leaues one folded within another. The ſtalke and tuft is of a middle kinde betweene *Iſchæmon* and the common Couch-graſſe.

¶ *The Place, Time, Names, Nature, and Vertues.*

They grow on the ſea ſhore at the ſame time that others do, and are ſo called becauſe they grow neere the ſea ſide. Their nature and vertues are to be referred vnto Dogs graſſe.

Chap. 19. *Of vpright Dogs-Graſſe.*

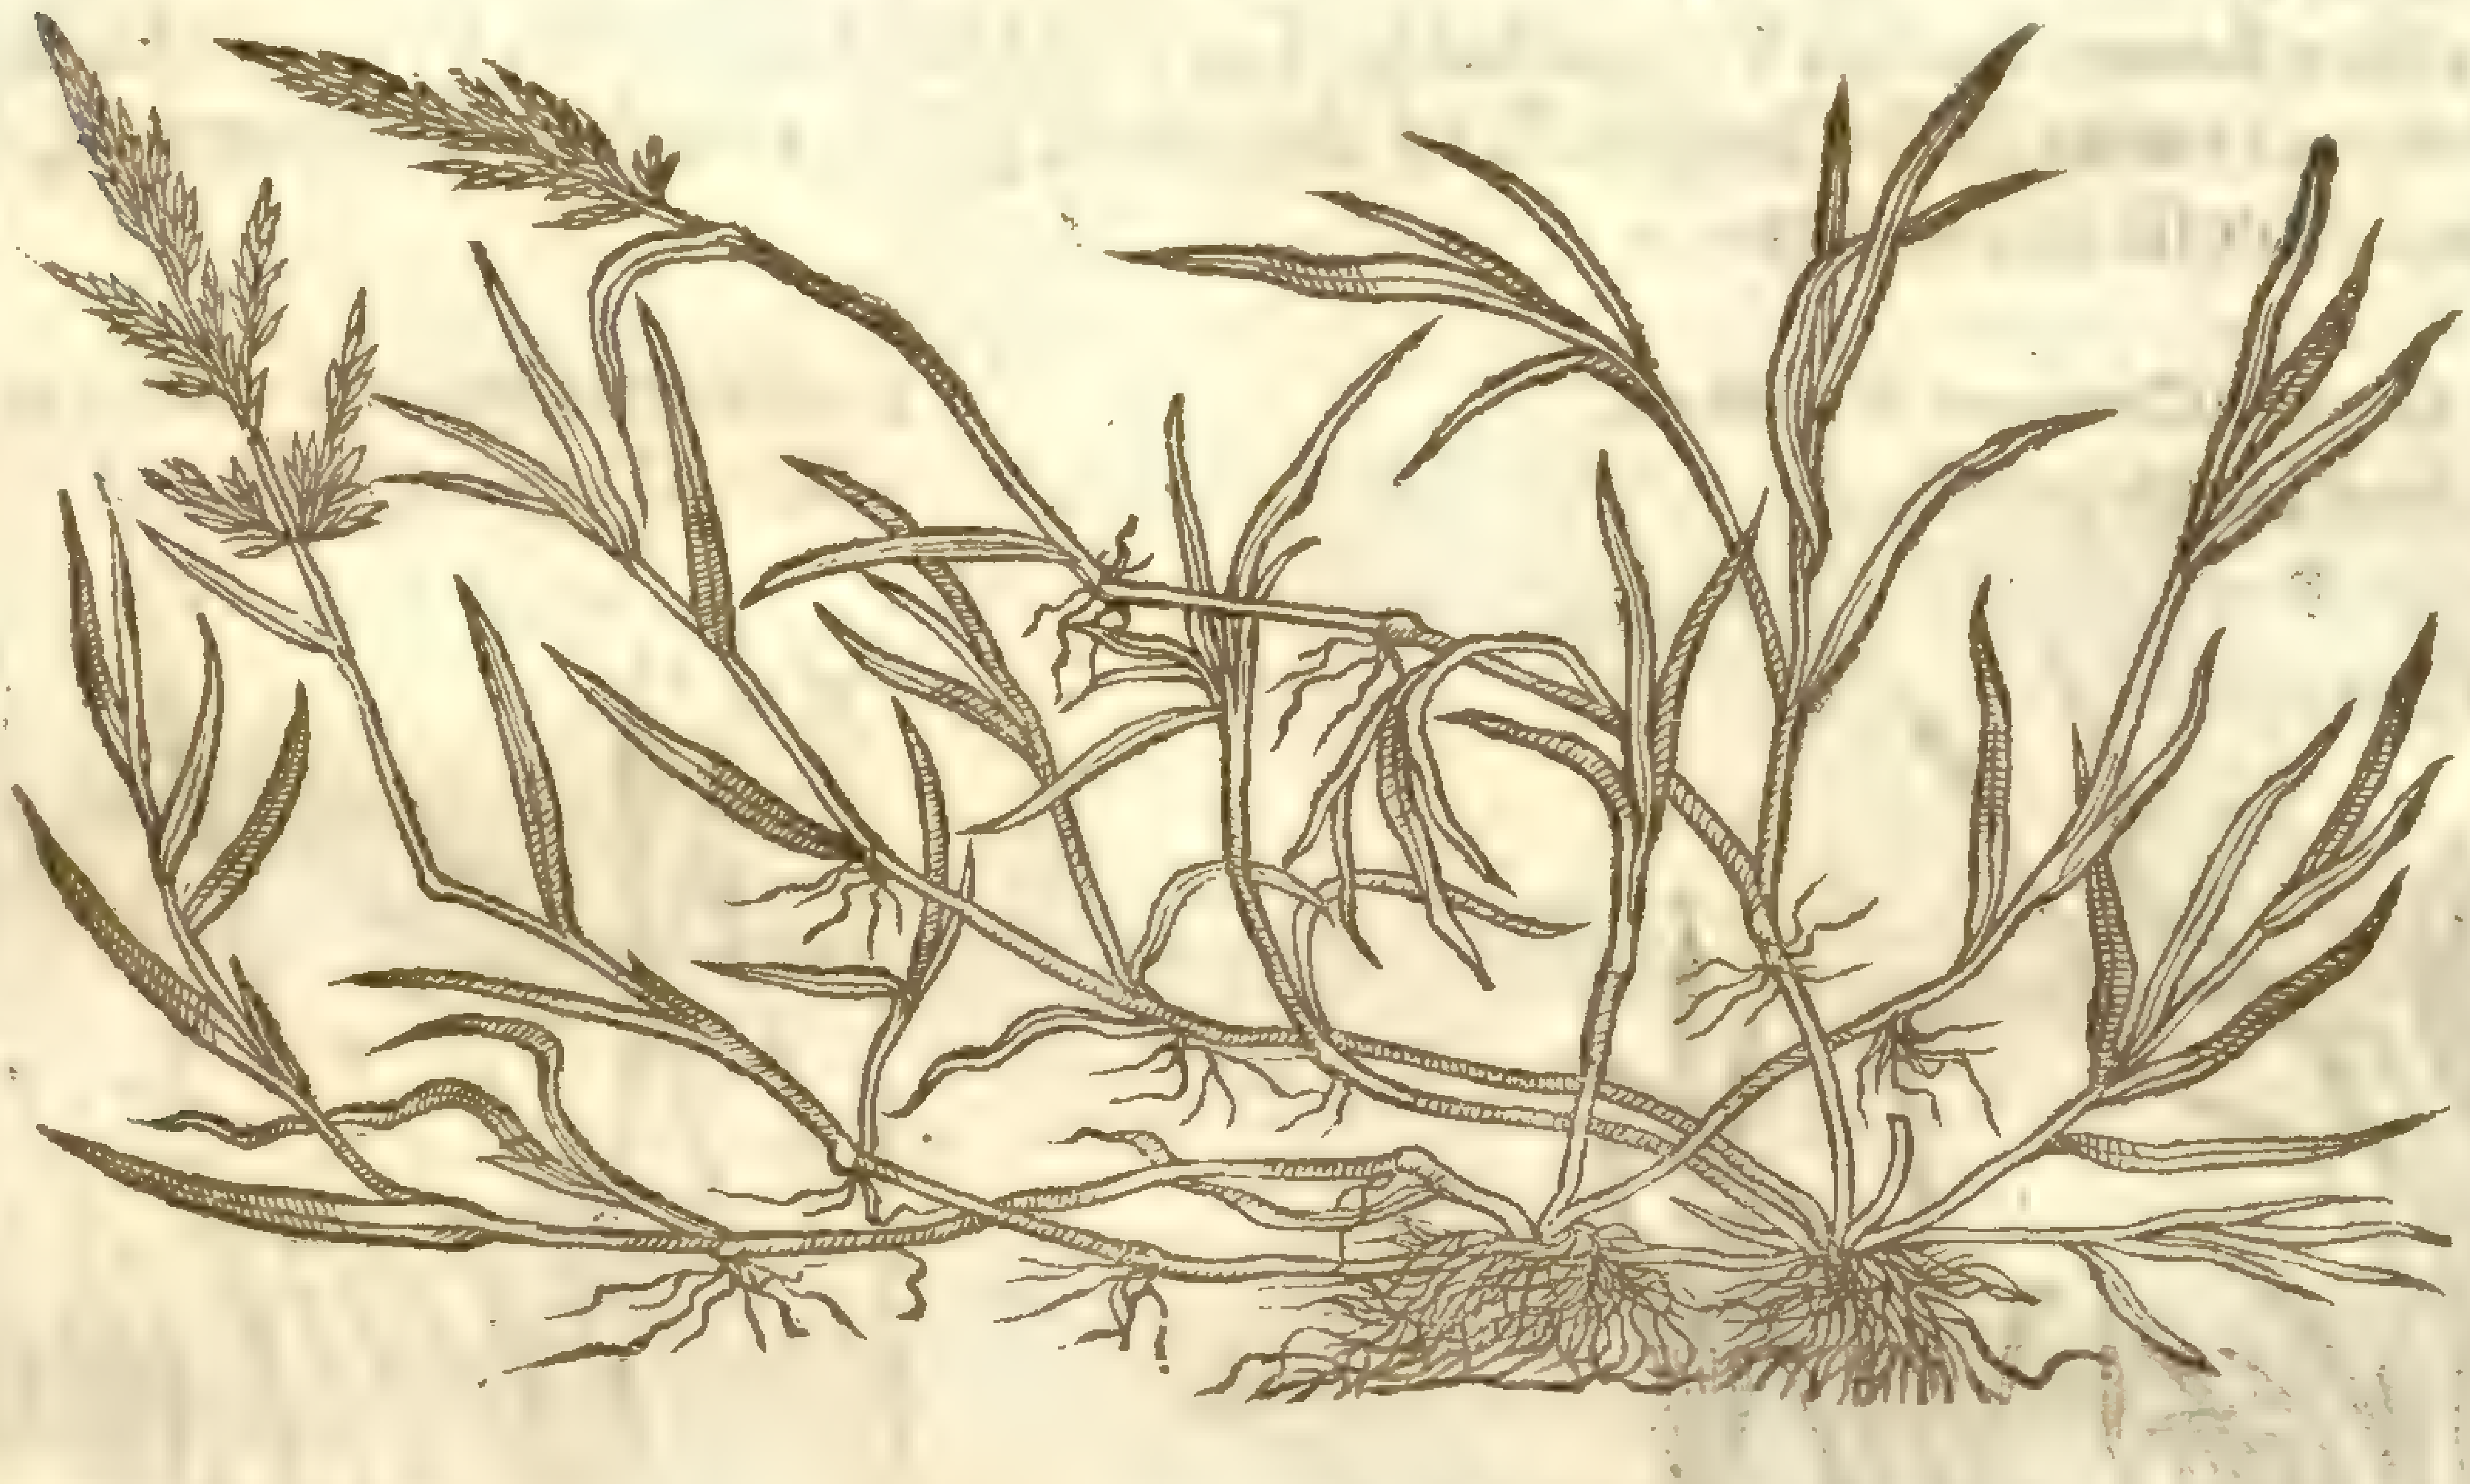
¶ *The Deſcription.*

1 Vpright Dogges-Graſſe, or Quitch-Graſſe, by reaſon of his long ſpreading ioynted roots is like vnto the former, and hath at euery knot in the root ſundry ſtrings of hairie ſubſtance, ſhooting into the ground at euery ioynt as it ſpreadeth: the ſtalkes lye creeping, or riſe but a little from the ground, and at their tops haue ſpoky pannicles farre ſmaller than the

common Couch-graſſe. By which notes of difference it may eaſily be diſcerned from the other kindes of Dogs-graſſe.

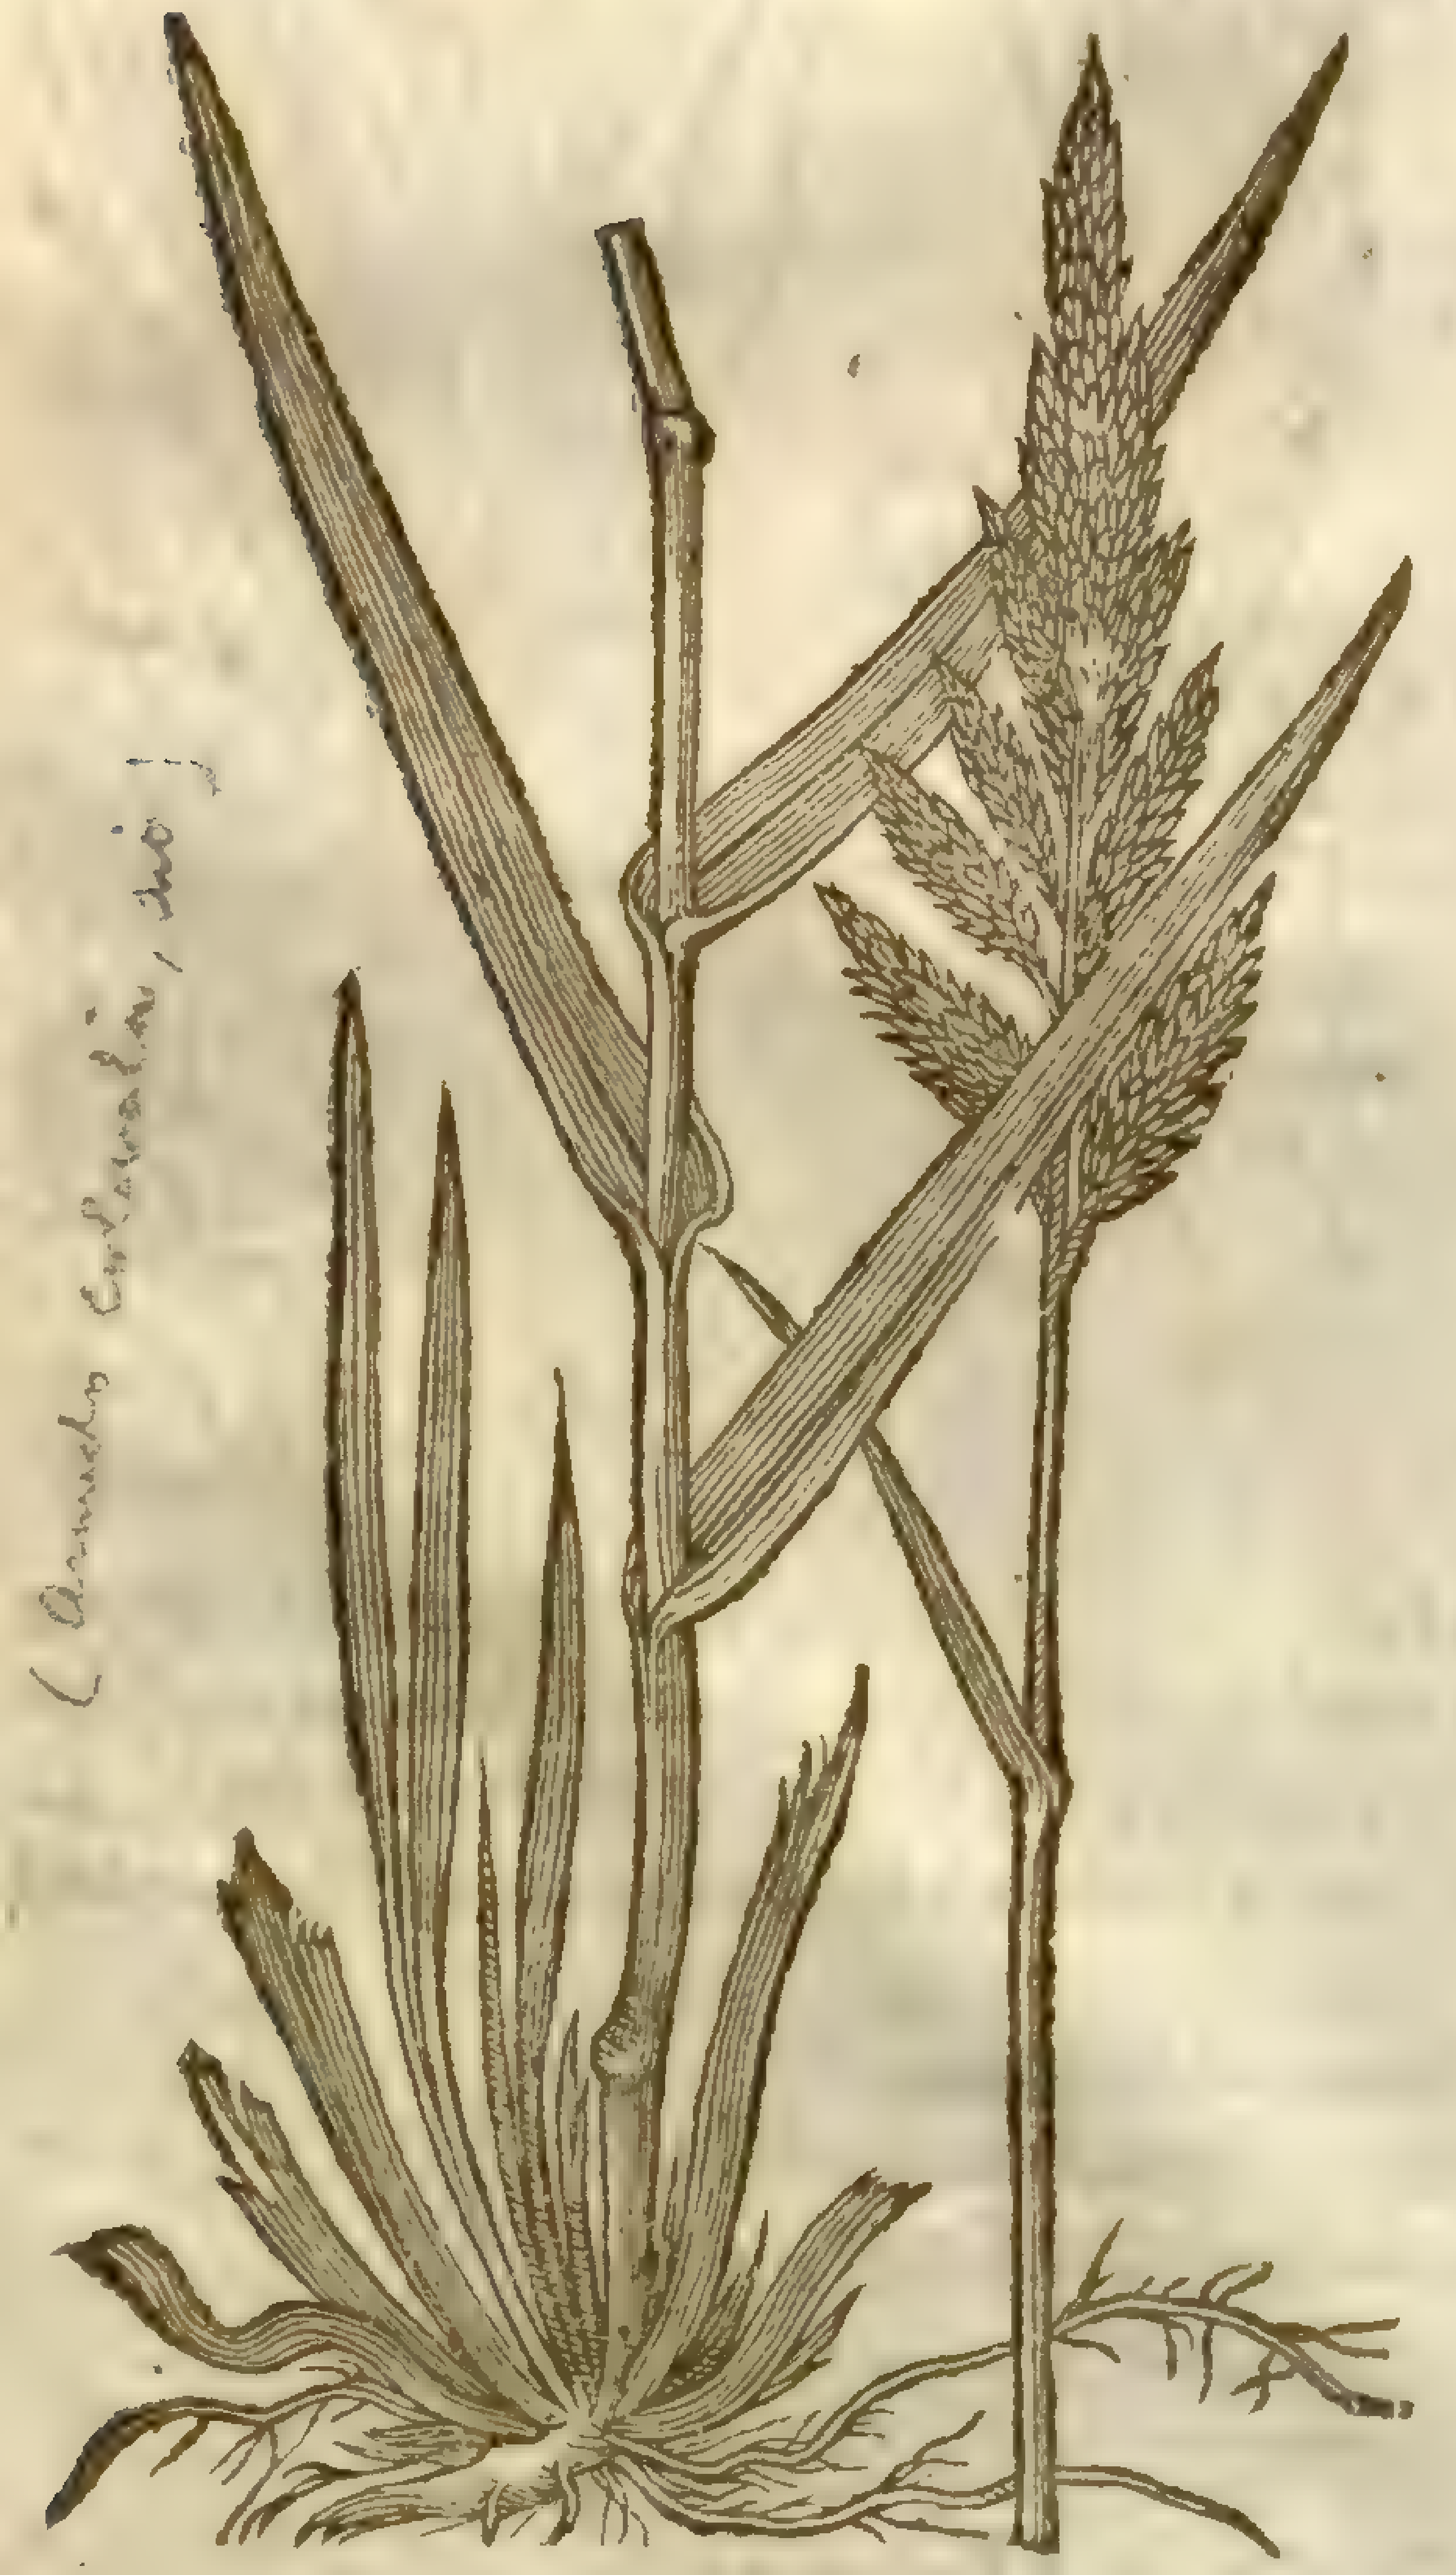
1 *Gramen Caninum ſupinum.*
Vpright Dogs-graſſe.

Agrostis alba [illegible]



Agrostis stolonifera, L. [illegible]

2 *Gramen ſtriatum.*
Lady-lace Graſſe.



Phalaris arundinacea, L. [illegible]
(Arundo colorata, Ait.)

2 Lady-laces hath leaues like to Millet in faſhion, rough or ſharp pointed like to the reed, with many white veins or ribs, and ſiluer ſtreaks running along through the midſt of the leaues, faſhioning the ſame like to laces or ribbons wouen of white and greene ſilke, very beautifull and faire to behold. It groweth to the height of wilde Pannicke, with a ſpoky top not very much vnlike, but more compact, ſoft, white, and chaffie. The root is ſmall and hairy, and white of colour like vnto the medow Graſſe.

¶ *The Place.*

1 Vpright Dogs-graſſe groweth in dunged grounds and fertile fields.

2 Lady-Laces grow naturally in wooddy and hilly places of Sauoy, and anſwers common Graſſe in his time of feeding.

It is kept and maintained in our Engliſh gardens rather for pleaſure, than vertue which is yet knowne.

¶ *The Names.*

Lobel calleth the later, *Gramen ſulcatum* and *ſtriatum*, or *Gramen pictum*: in Engliſh, the furrowed Graſſe, the white Chameleon Graſſe, or ſtreaked graſſe; and vſually of our Engliſh women it is called Lady-laces, or painted Graſſe: in French, *Aiguillettes d'armes*.

¶ *The Nature and Vertues.*

The Vertues are referred vnto the Dogs-graſſes.

Chap.

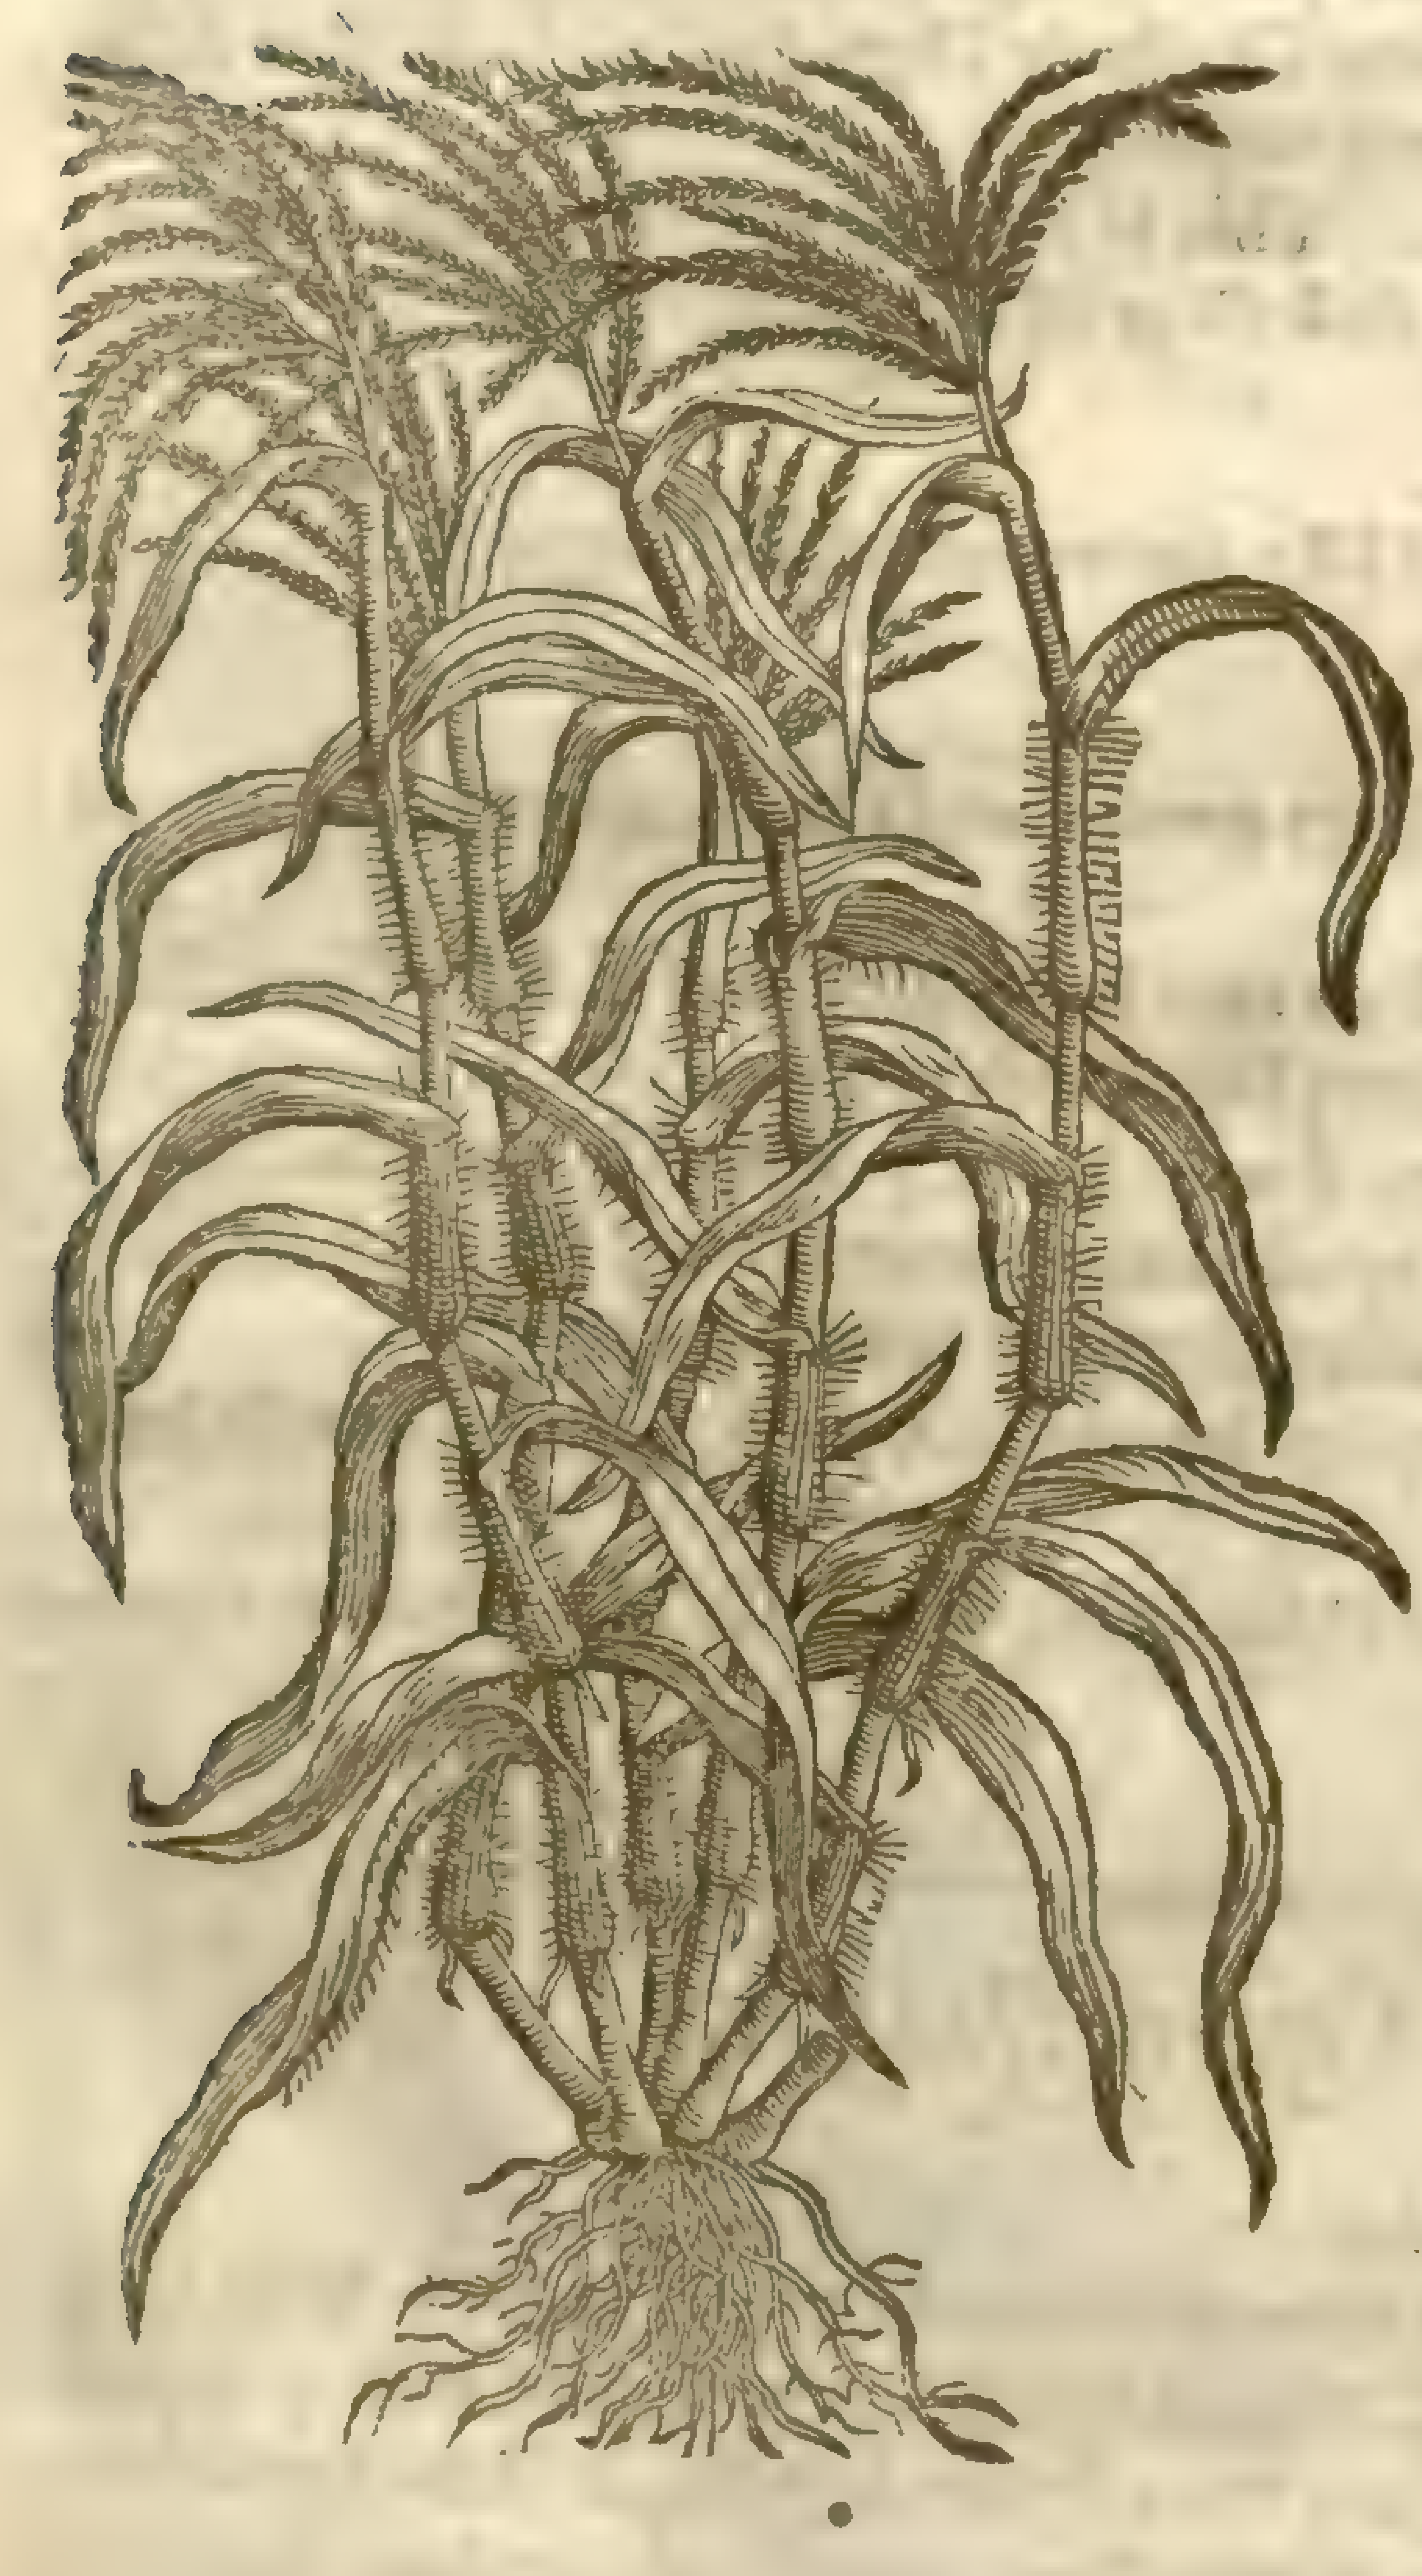
CHAP. 20. *Of Dew-Graſſe.*

¶ *The Deſcription.*

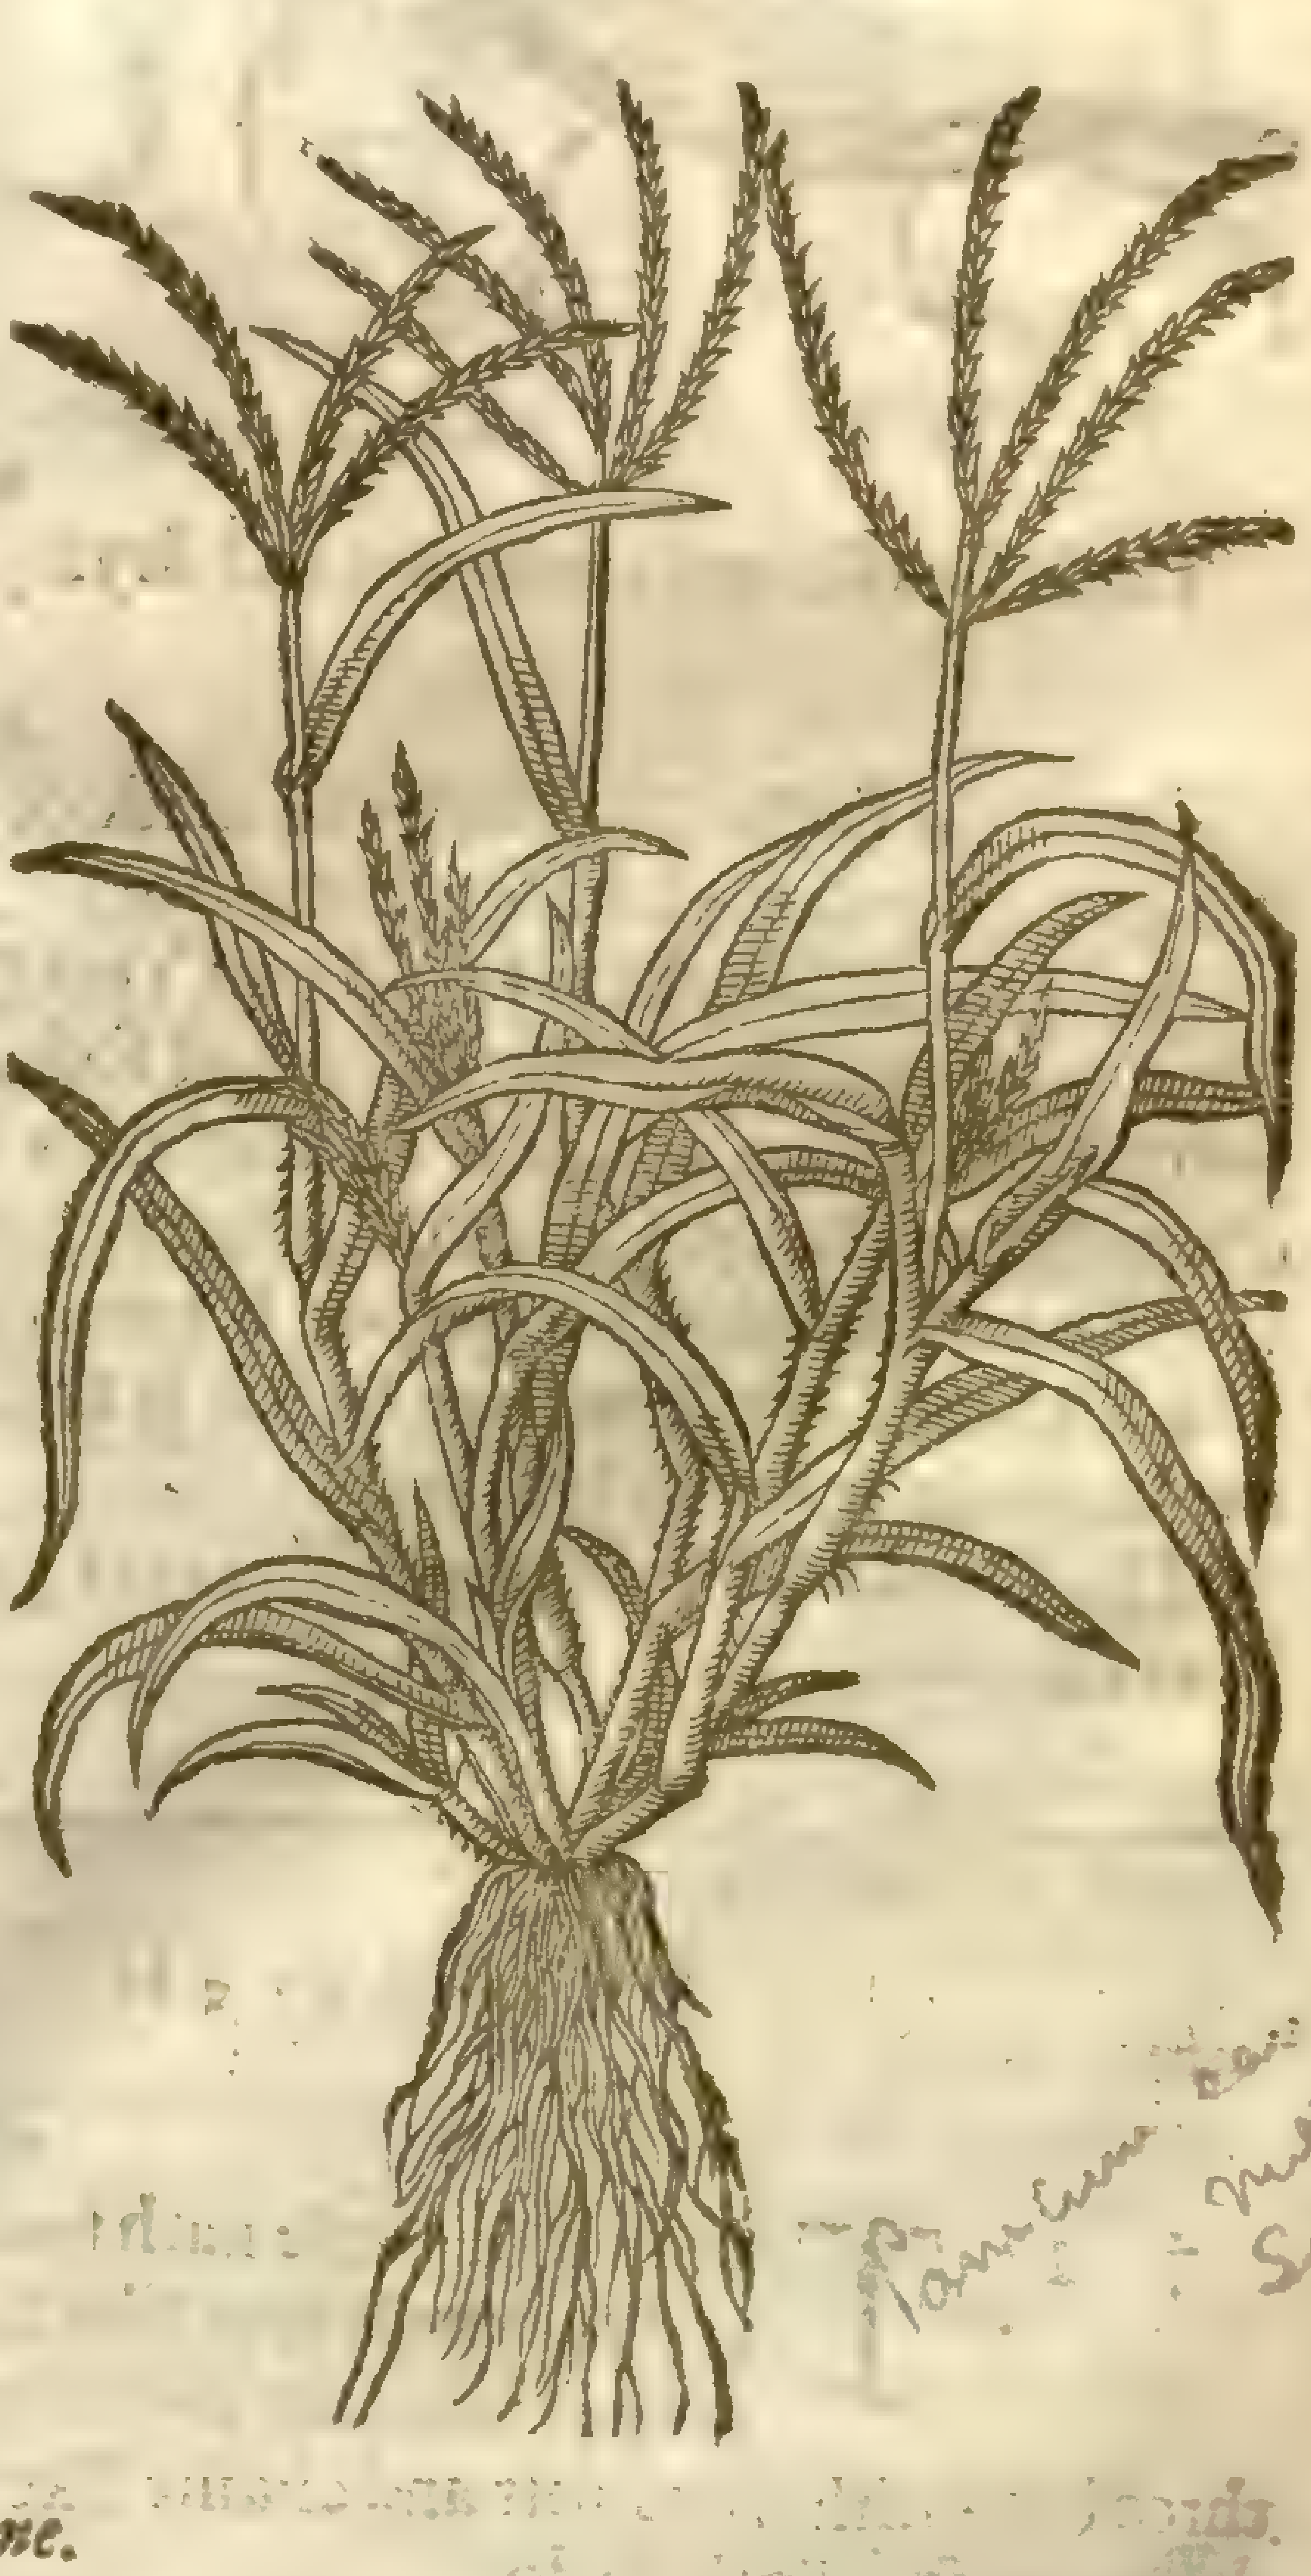
1 Dew Graſſe hath very hard and tough roots long and fibrous; the ſtalkes are great, of three or foure cubits high, very rough and hairy, jointed and kneed like the common Reed: the leaues are large and broad like vnto corne. The tuft or eare is diuided into ſundry branches, chaffie, and of a purple colour; wherein is contained a ſeed like *Milium*, wherwith the Germans make pottage and ſuch like meat, as we in England do with Ote-meale; and it is ſent into Middleborow and other townes of the Low-countries, in great quantitie for the ſame purpoſe, as *Lobel* hath told me.

2 The ſecond kinde of Dew-graſſe or *Iſchæmon* is ſomewhat like the firſt kinde of Medow-graſſe, reſembling one the other in leaues and ſtalks, ſauing that the creſt or tuft is ſpread or ſtretched out abroad like a Cocks foot ſet downe vpon the ground, whereupon it was called *Galli crus*, by *Apuleius*. Theſe tops are cleere and vpright, of a gliſtering Purple colour, or rather Violet, and it is diuided into foure or fiue branches, like the former Dew-graſſe. The root conſiſts of a great many ſmall fibres.

‡ 3 To theſe may fitly be added another Graſſe, which *Cluſius* hath iudged to be the medicinall Graſſe of the Antients: and *Lobel* refers it to the Dogs graſſes, becauſe it hath a root jointed thicke, and creeping like as the Dogs graſſes. The ſtalks are ſome foot high, round, and of a purpliſh colour: but the top is very like to that of the laſt deſcribed, of a darke purple colour.



1 *Gramen Mannæ eſculentum*
Dew-graſſe.



2 *Iſchæmon vulgare.*
Cocks foot Graſſe.

Panicum [illegible] = mihi dat. Sep. 1. 96.

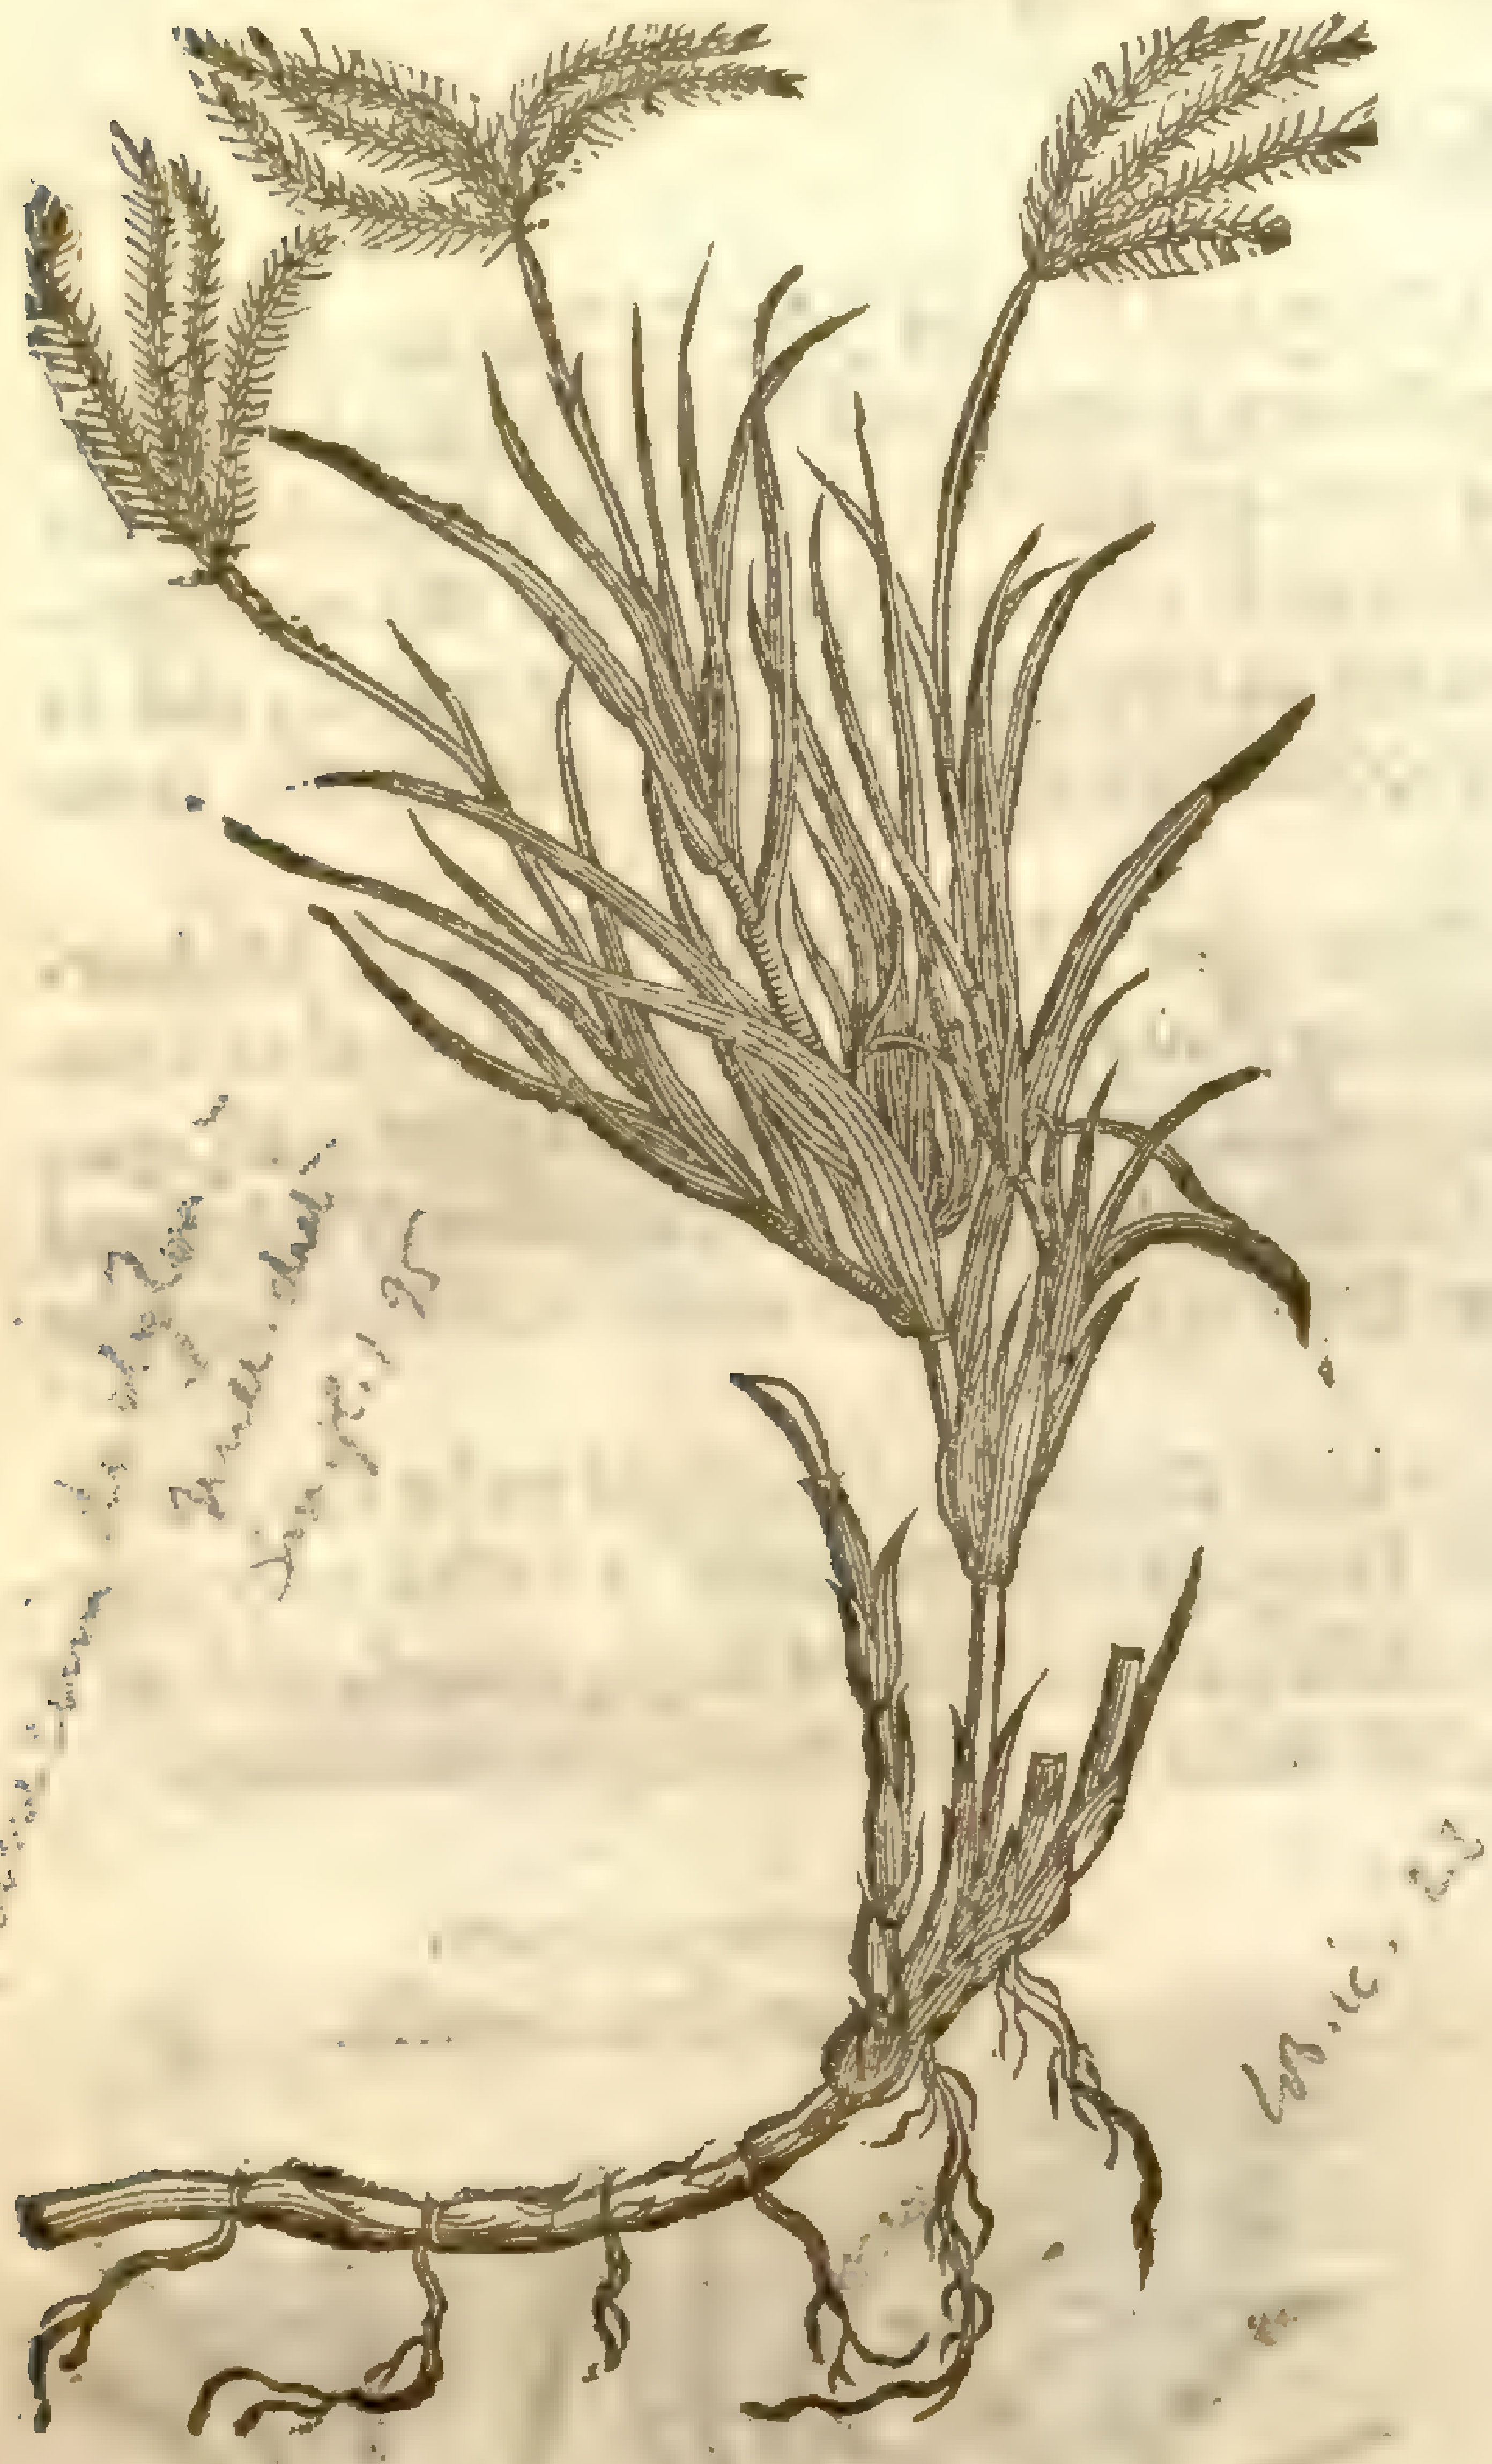
¶ *The Place and Time.*

1 The firſt groweth naturally in Germanie, Bohemia, and Italy, and in the territories of Goritia and Carinthia, as *Matthiolus* reporteth.

2 The ſecond groweth neere vnto rough bankes of fields, as I haue ſeene in the hilly bankes neere Greenhithe in Kent. It differeth not in time from thoſe we haue ſpoken of.

‡ 3 This

‡ 3 *Gramen dactiloides radice repente.*
Cocks-foot Graſſe with creeping roots.



[illegible]

Lob. ic. 23

‡ 3 This groweth plentifully in moſt parts of Spaine and France: and it is probable, that this was the graſſe our Author found neere Greenhithe in Kent.

¶ *The Names.*

1 The Germans call it **Himeldau**: That is to ſay, *Cæli ros*; whereupon it was called *Gramen Mannæ*: it ſeemes to be *Milij ſylveſtris ſpurium quoddam genus*, a certaine wilde or baſtard kinde of Millet. *Leonicerus* and *Ruellius* name it *Capriola* and *Sanguinaria*: ſome would haue it to be *Gramen aculeatum Plinij*; but becauſe the deſcription thereof is very ſhort, nothing can be certainly affirmed. But they are far deceiued who thinke it to be *Coronopus*, as ſome very learned haue ſet downe: but euerie one in theſe dayes is able to controll that error. *Lobel* calleth it *Gramen Mannæ eſculentum*, for that in Germany and other parts, as Bohemia and Italy, they vſe to eat the ſame as a kinde of bread-corne, and alſo make pottage therewith, as we do with Ote-meale; for the which purpoſe it is there ſowne as corne, and ſent into the Low-Countries, and there ſold by the pound. In Engliſh it may be called Manna Graſſe or Dew-graſſe, but more fitly, Rice-graſſe.

2 This is iudged to be *Iſchæmon* of *Pliny*; and *Galli Crus* of *Apuleius*.

¶ *The Nature.*

A These Graſſes are aſtringent and drying, in taſte ſweet like the common Dogs graſſe.

¶ *The Vertues.*

B *Apuleius* ſaith, if a plaiſter be made of this Graſſe, Hogs greaſe, and the Leauen of houſhold bread, it cureth the biting of mad dogs.

As in the deſcription I told you, this Plant in his tuft or eare is diuided into ſundry branches, ſome tuft into three, ſome foure, and ſome fiue clouen parts like Cocks toes. *Apuleius* reporteth, if you take that eare which is diuided only into three parts, it wonderfully helpeth the running or dropping of the eyes, and thoſe that begin to be bleare eyed, being bound about the necke, and ſo vſed for certaine dayes together, it turneth the humors away from the weake part.

C ‡ Manna-graſſe or Rice-graſſe is ſaid to be very good to be put into pulteſſes, to diſcuſſe hard ſwellings in womens breaſts.

D The Cocks-foot Dogs graſſe is very good in all caſes as the other Dogs-Graſſes are, and equally as effectuall. ‡

‡ Chap. 21. *Of diuers Cyperus Graſſes.*

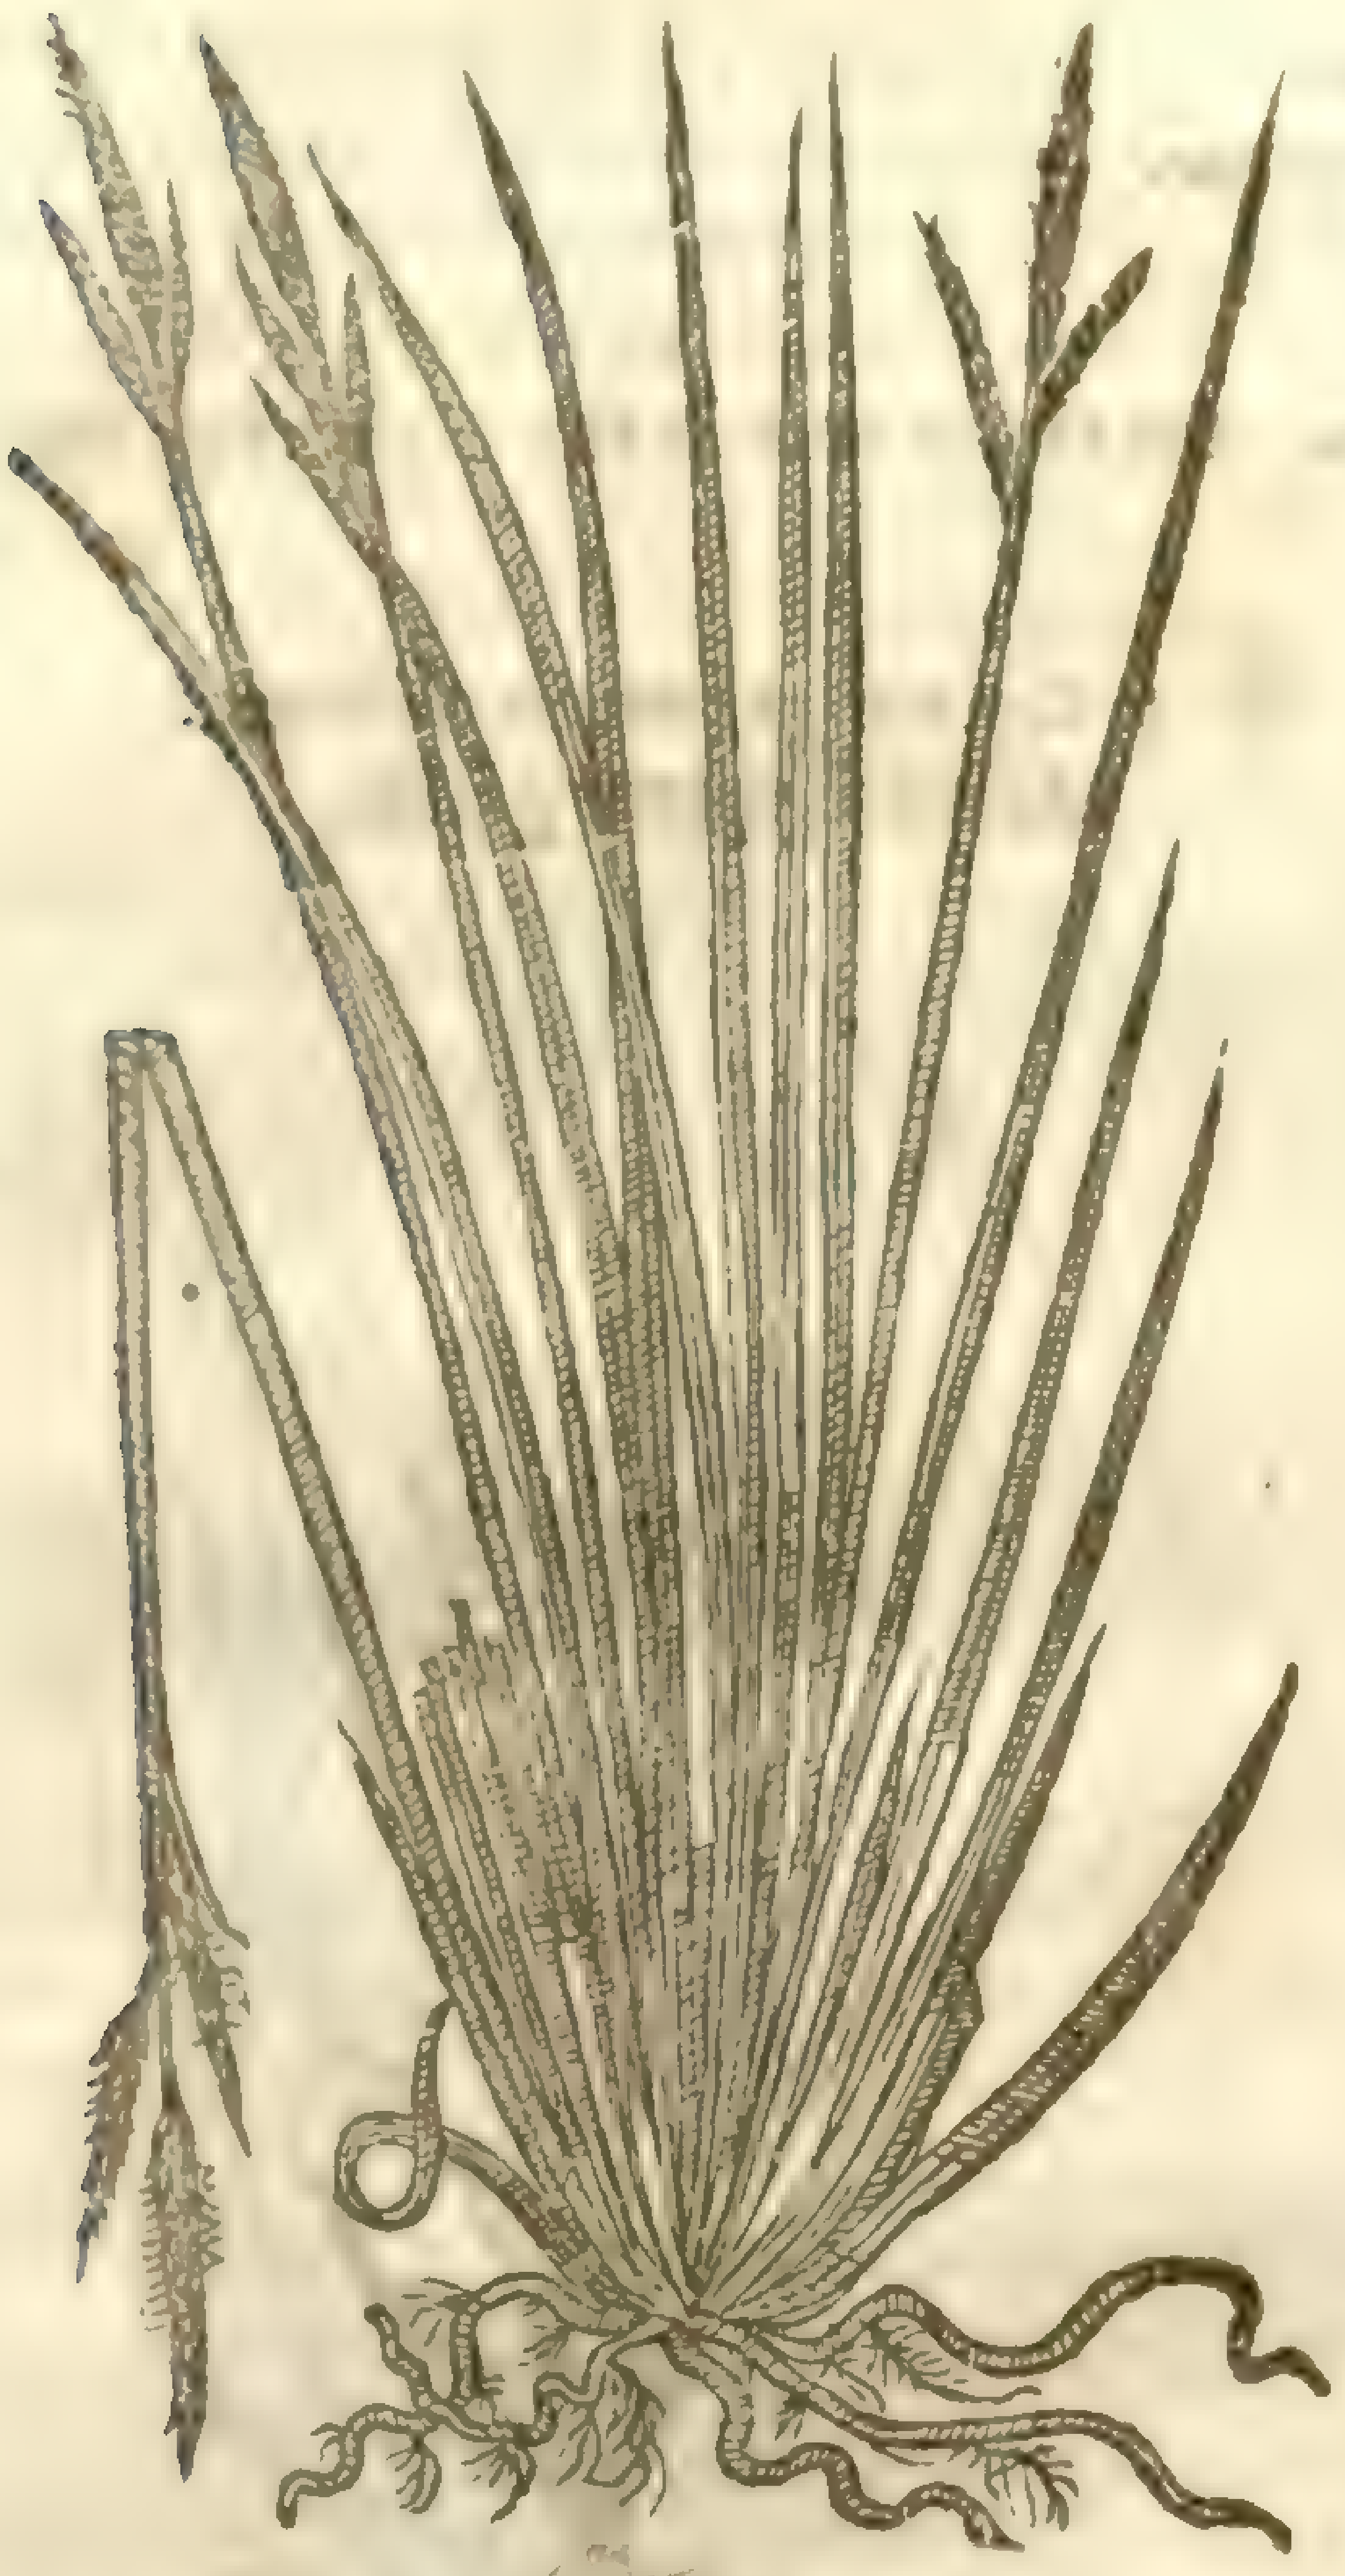
¶ *The Deſcription.*

‡ 1 The firſt of theſe hath reaſonable ſtrong fibrous roots, from whence riſe ſtiffe long and narrow leaues like thoſe of other Cyperus Graſſes: the ſtalkes alſo (as it is proper to all the plants of this kindred) are three ſquare, bearing at their tops ſome three browniſh eares ſoft and chaffie like the reſt of this kinde, ſtanding vpright, and not hanging downe as ſome others do.

2 This hath pretty thicke creeping blacke roots, from whence ariſe three ſtalks, ſet with ſhorter leaues, yet broader than thoſe of the laſt deſcribed; and from the top of the ſtalke come forth three or foure foot-ſtalks, whereupon hang longiſh rough skaly and yellowiſh heads.

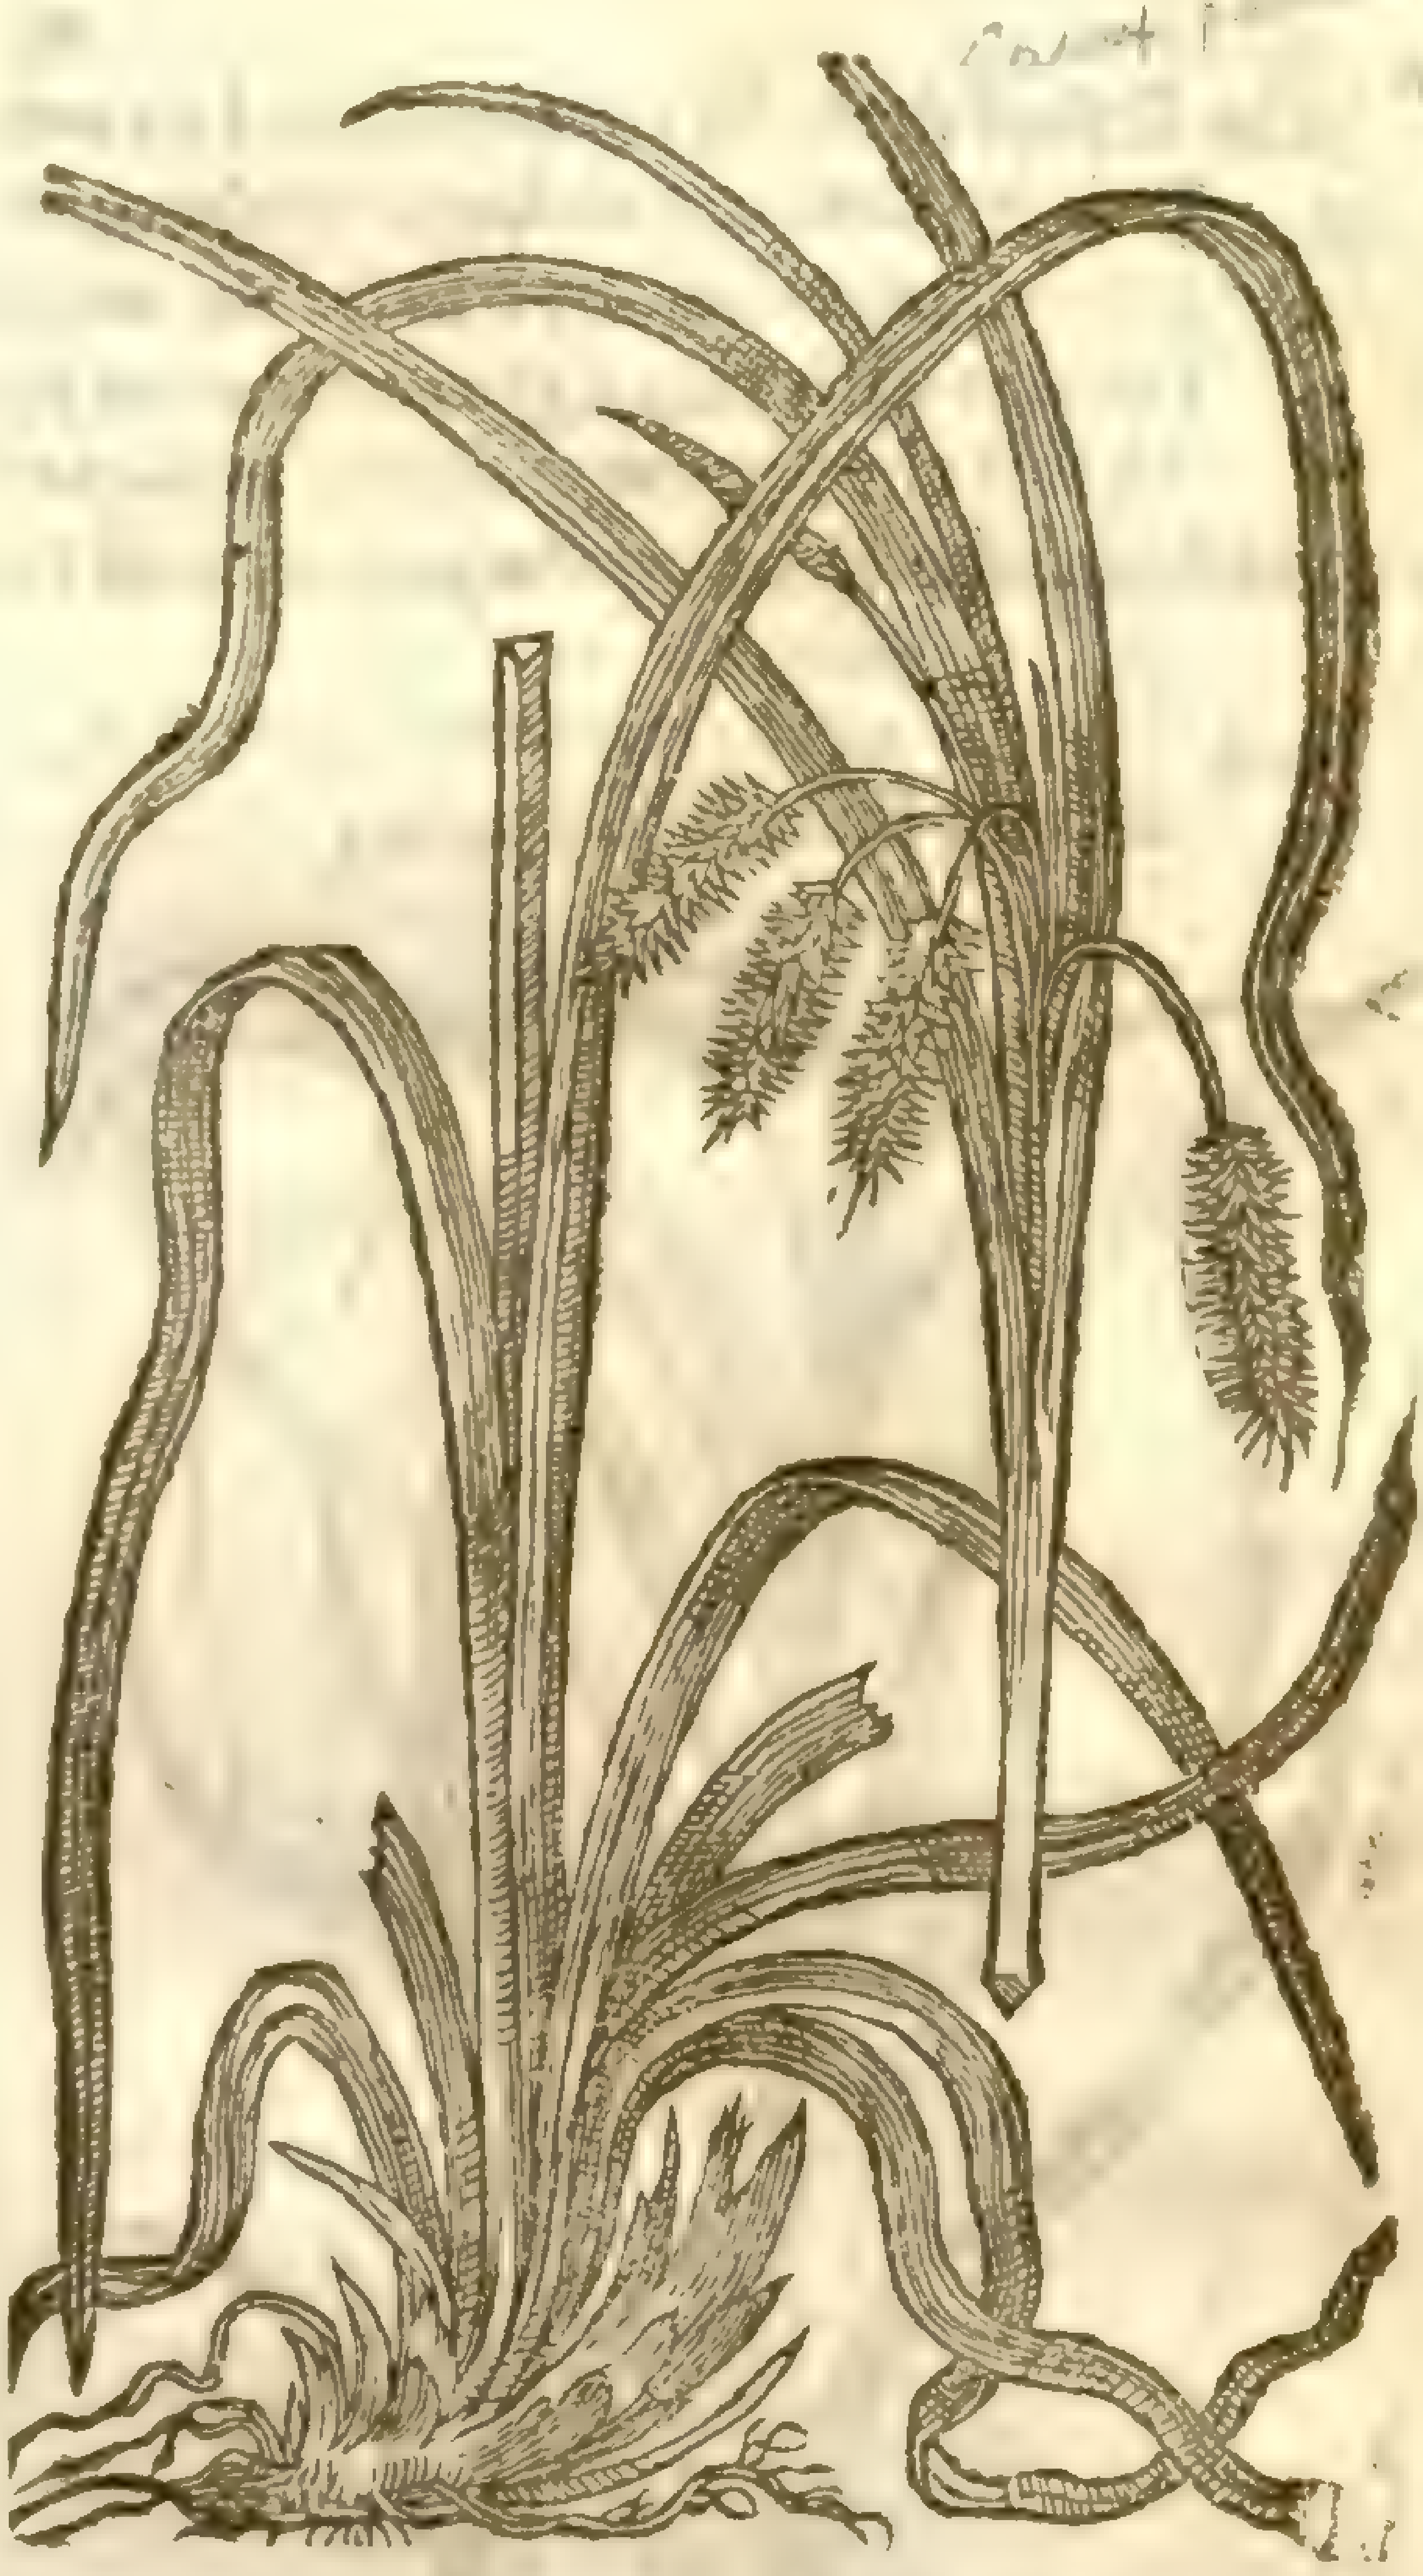
3 The roots of this are blacke, without ſmell, and ſomewhat larger than thoſe of the laſt deſcribed:

‡ 1 *Gramen Cyperoides anguſtifolium majus.*
Great narrow leaued Cyperus Graſſe.

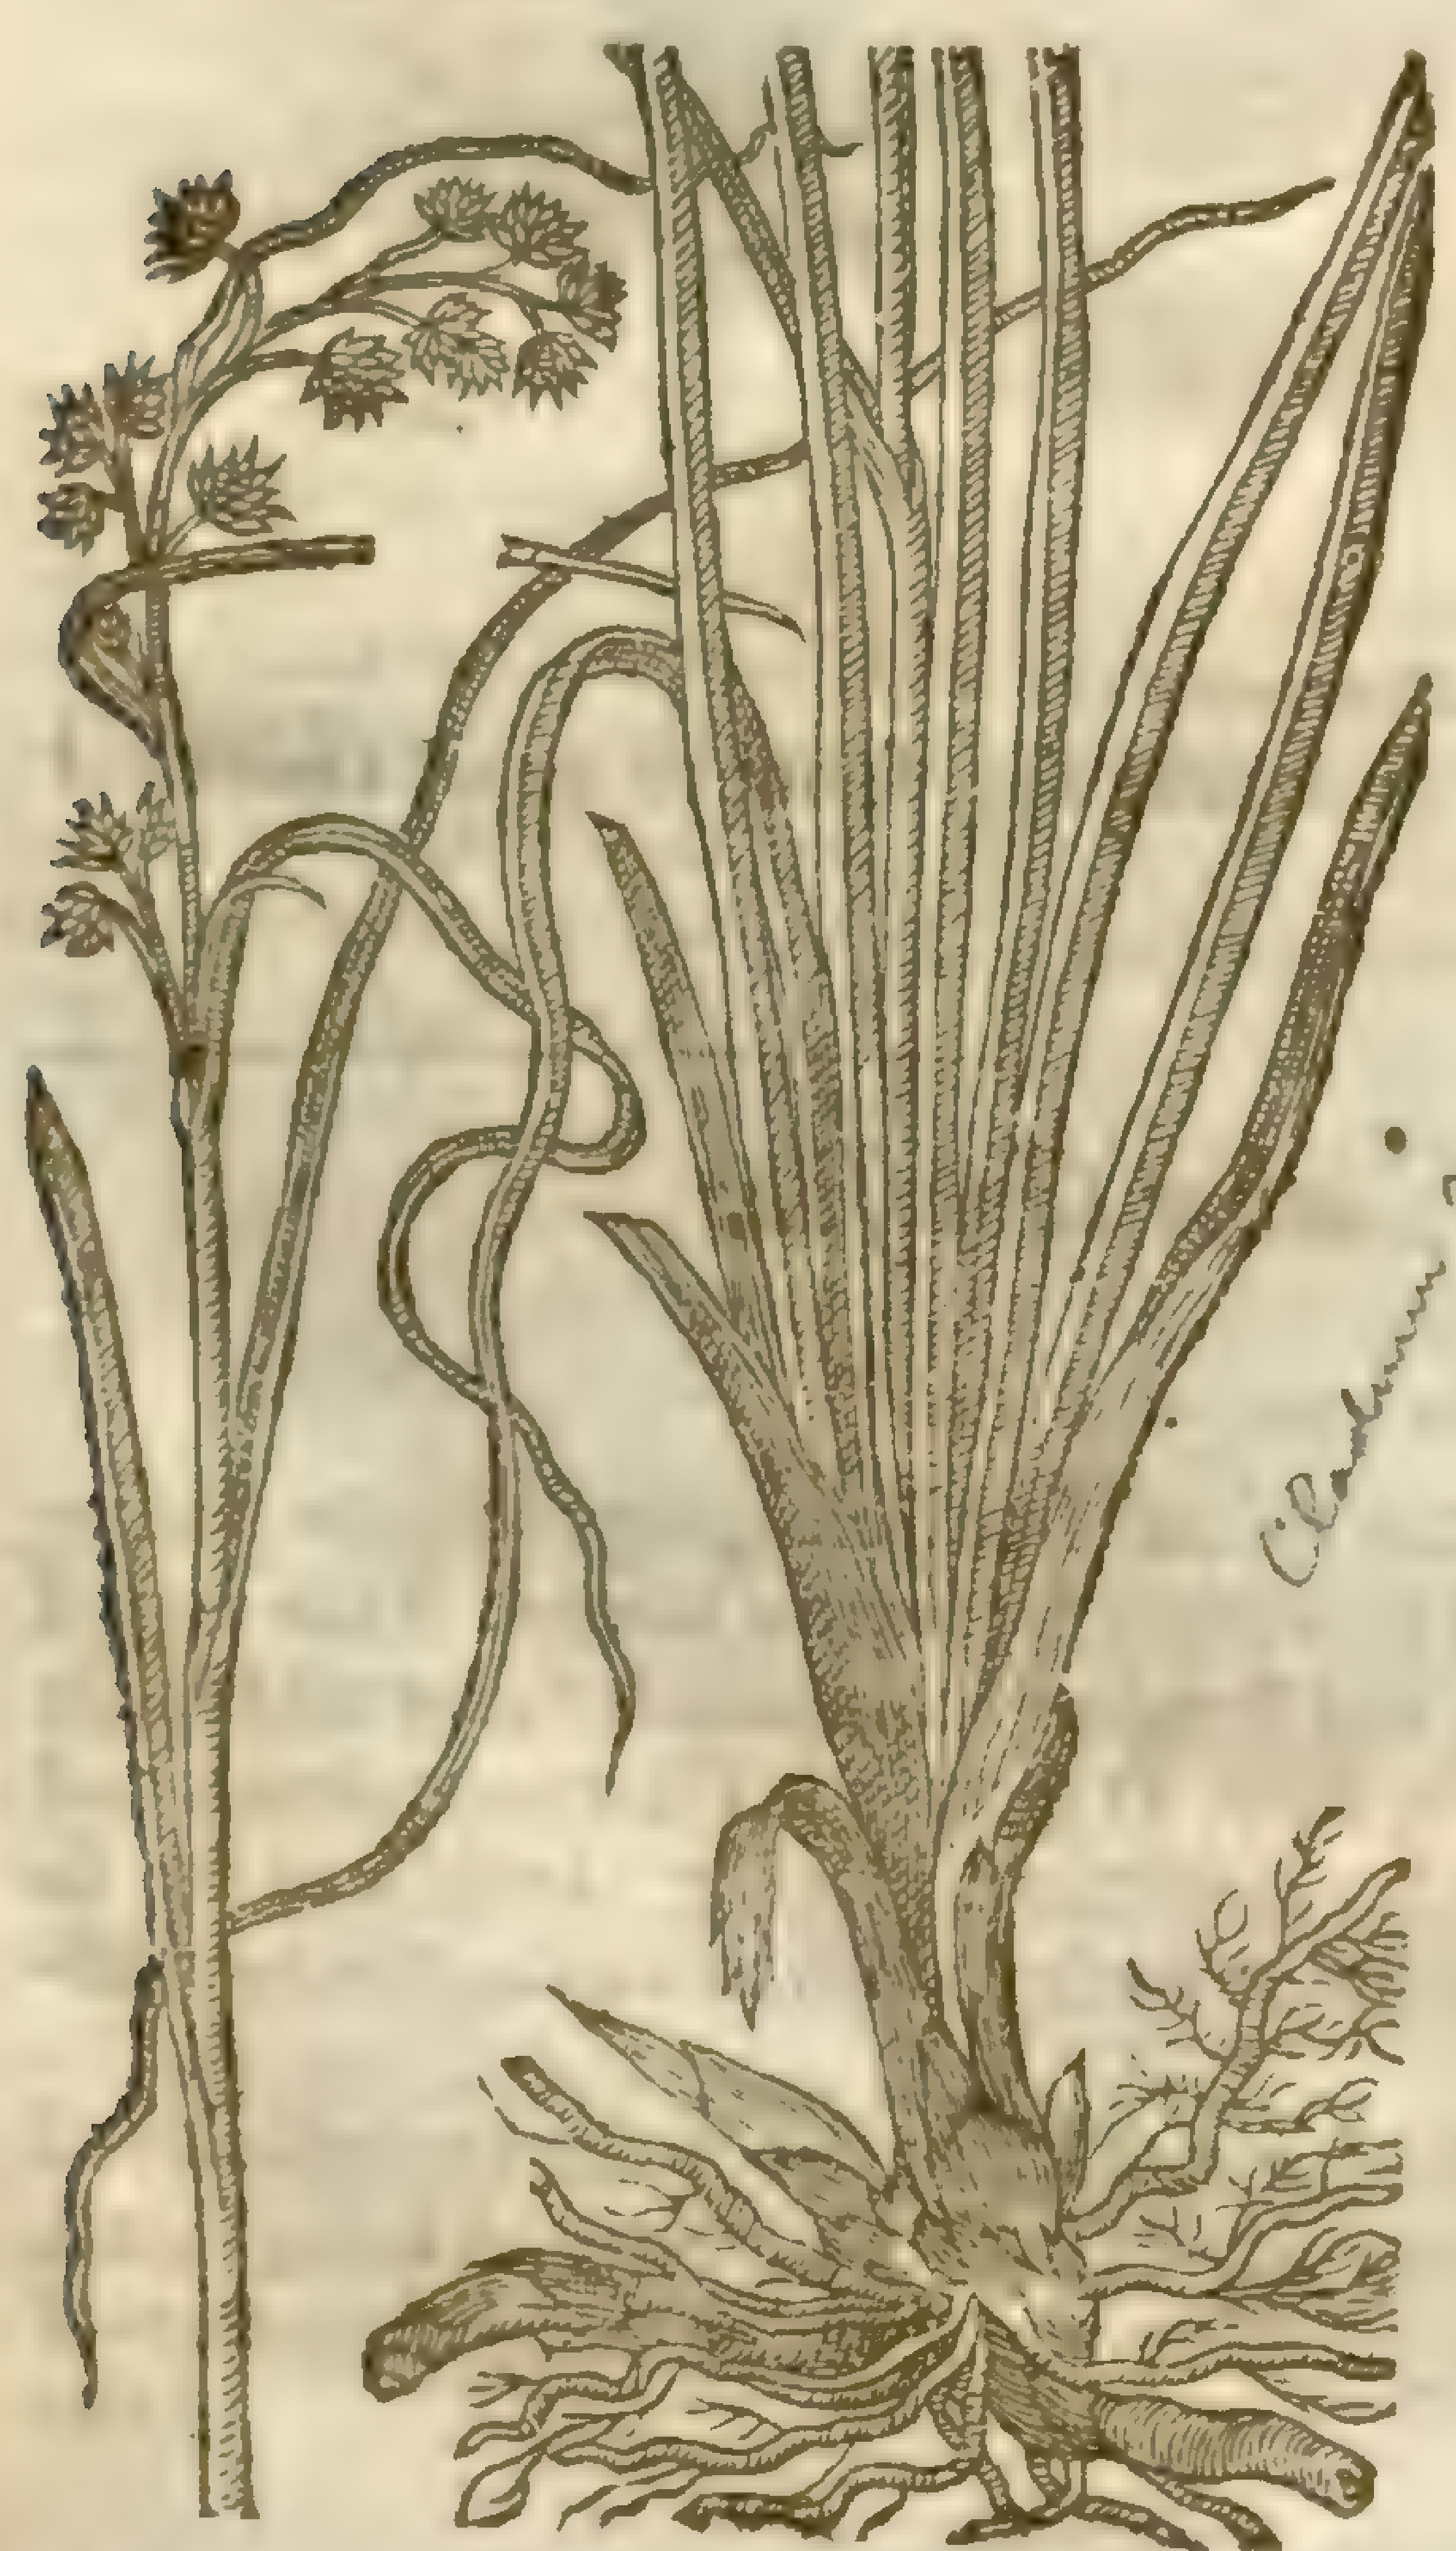


‡ 2 *Pſeudocyperus.*
Baſtard Cyperus.

Carex pſeudocyperus L. [illegible] Sm. pl. 6. 10!



‡ 3 *Cyperus longus inodorus ſylueſtris.*
Long Baſtard Cyperus.



Cladium mariscus Sm. pl. i. 36

Schoenus mariscus L. [illegible]

[illegible]

deſcribed: the 3 ſquare ſtalke alſo is ſome two cubits high, bearing at the top diſperſedly round ſcaly heads ſomewhat like thoſe of the wood Ruſh-graſſe: the leaues are ſomewhat ſharpe and triangular like thoſe of the other Cyperus.

4 This Cyperus hath creeping blacke roots, hauing here and there knotty tuberous heads for the moſt part, putting vp leaues like thoſe of the laſt deſcribed, as alſo a ſtalke bearing at the top long chaffie eares like to ſome others of this kinde.

5 This Cyperus-Graſſe hath pretty thicke fibrous and blacke roots, from whence ariſeth a ſtalke ſome cubit high, pretty ſtiffe, triangular, jointed, ſet at each joynt with a large greene leafe which at the bottome incompaſſes the ſtalke, which is omitted in the figure. At the top of the ſtalke, as in the true Cyperus, come forth two or three pretty large leaues, betweene which riſe vp many ſmall foot-ſtalkes very much branched, and bearing many blacke ſeeds ſomewhat like Millet or Ruſhes.

¶ *The Place and Time.*

All theſe grow in ditches and waterie places;

places, and are to bee found with their heads about the middle of Summer, and ſome of them ſooner.

¶ *The Names.*

The firſt of theſe by *Lobel* is called *Gramen paluſtre majus*.

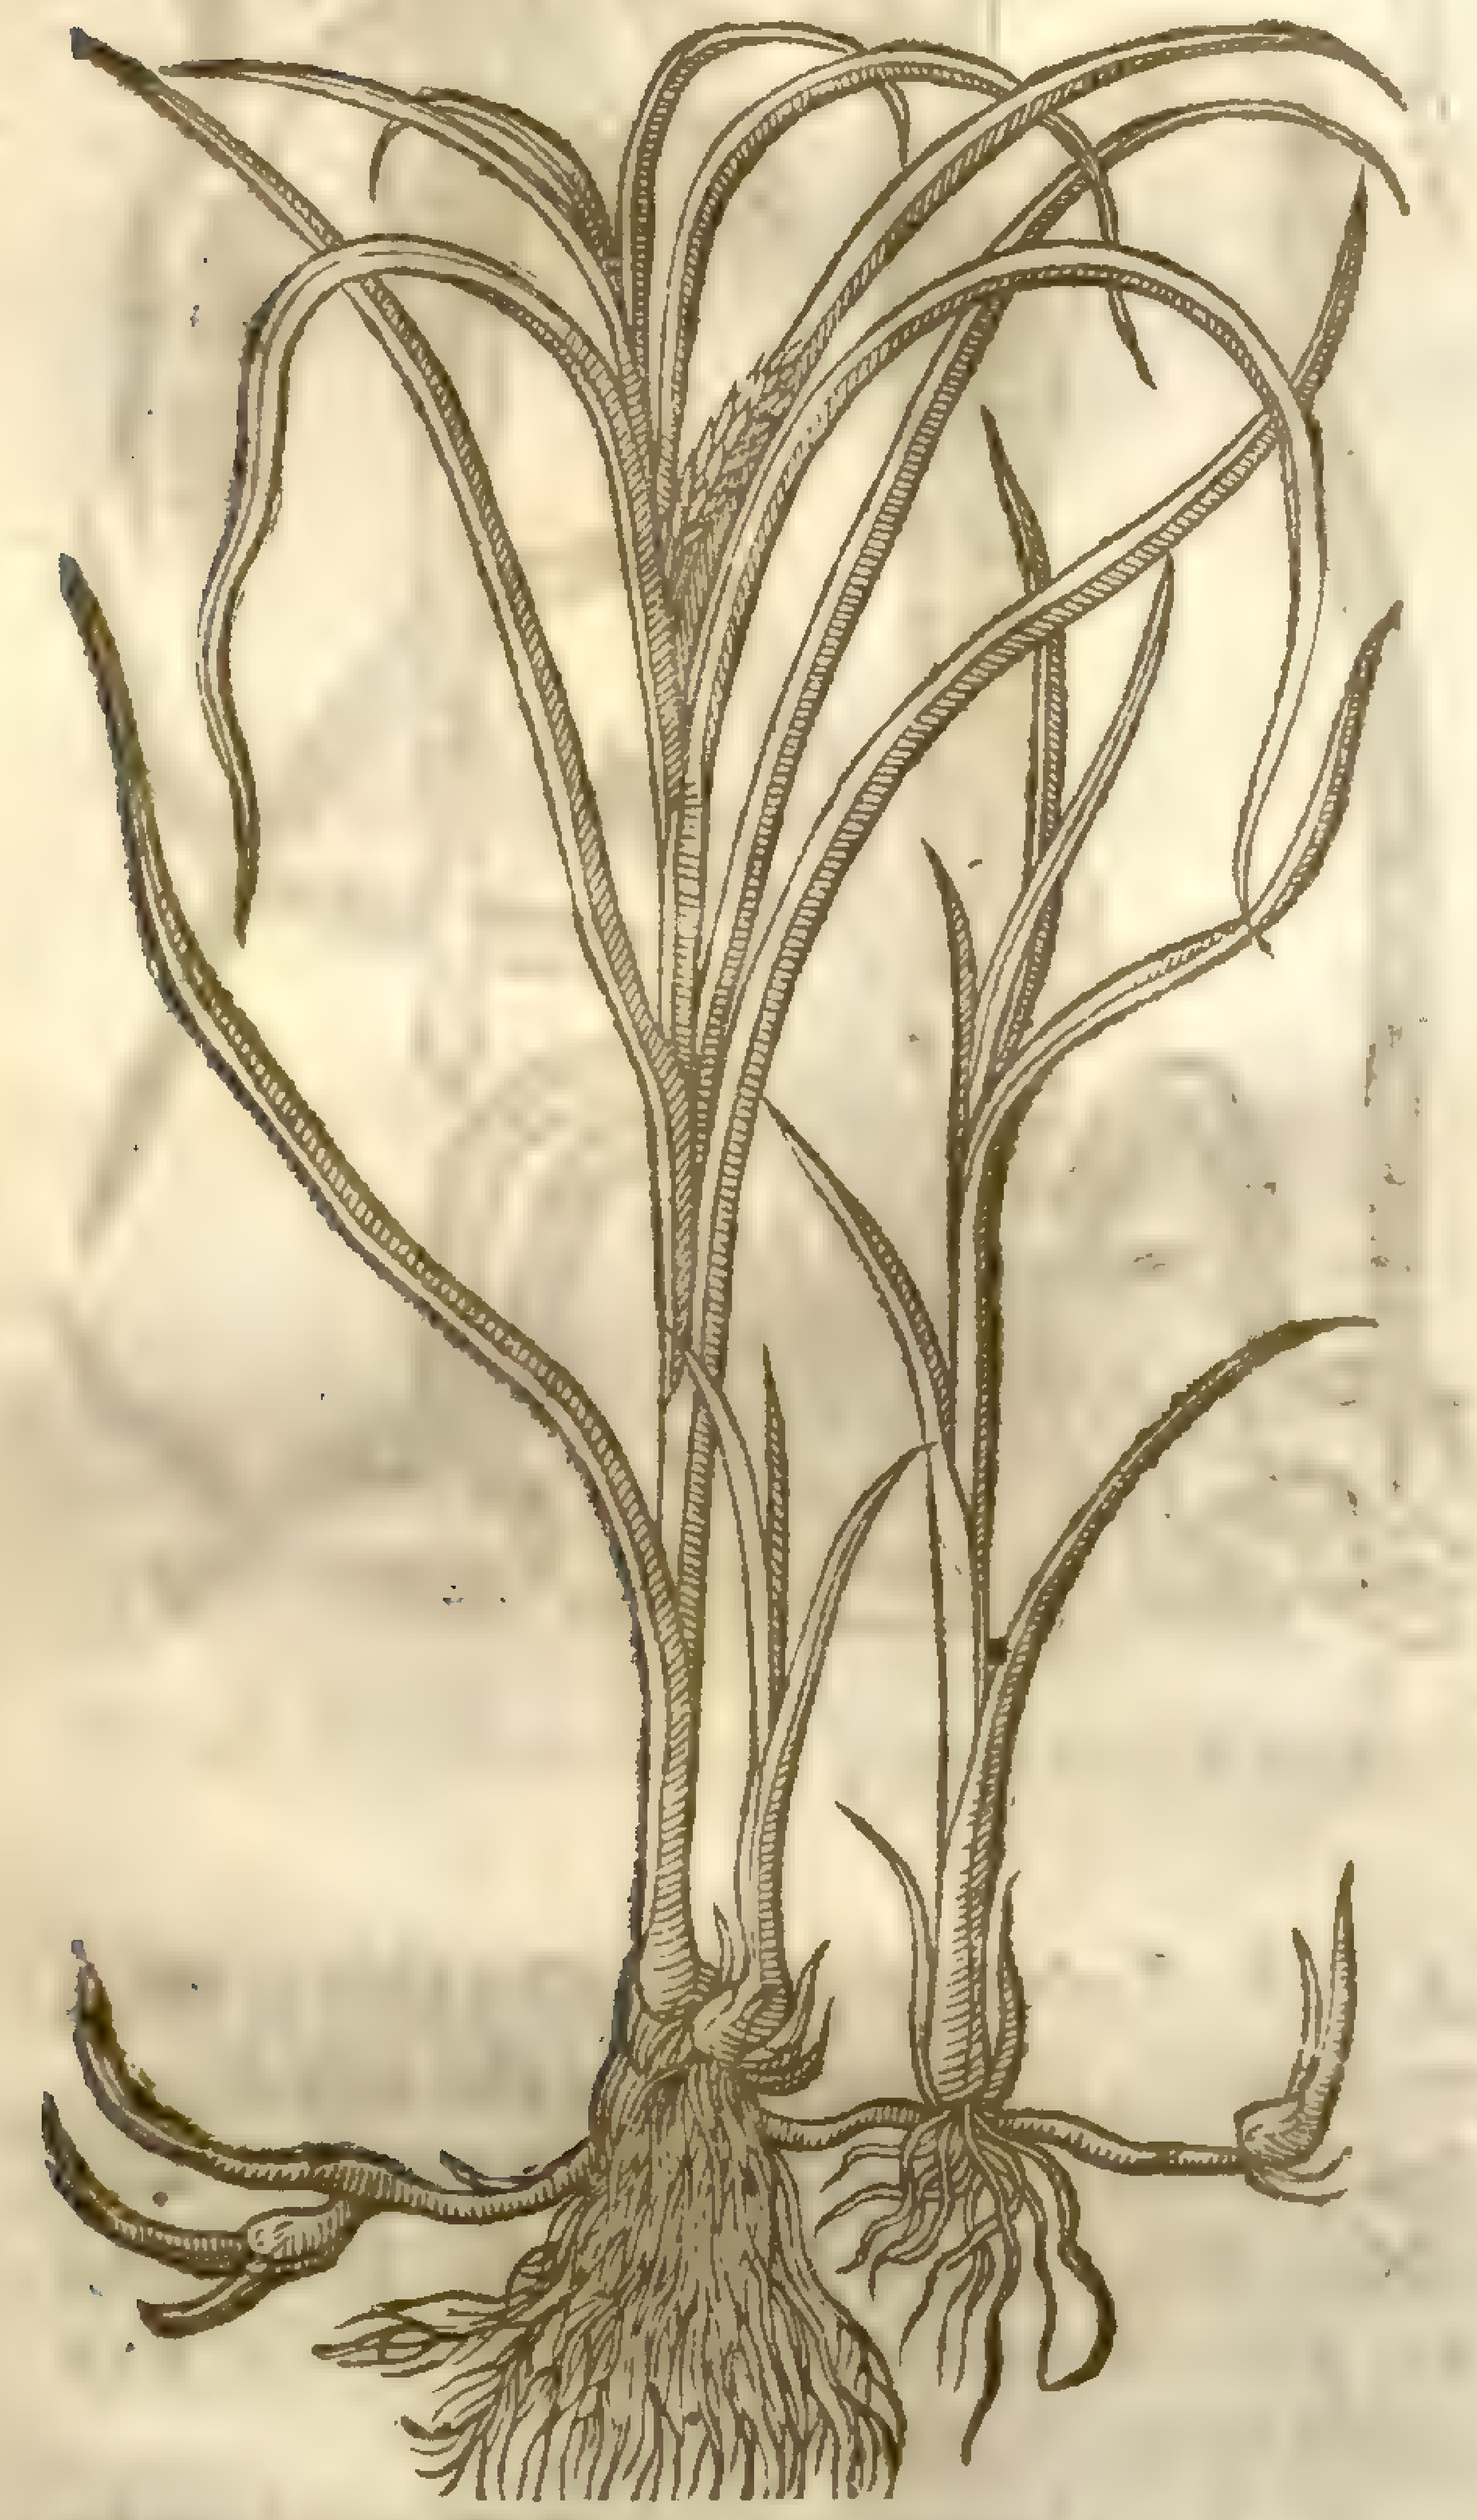
2 This by *Geſner*, *Lobel*, and *Dodonæus* is called *Pſeudocyperus*.

3 *Lobel* names this, *Cyperus longus inodorus ſylueſtris*.

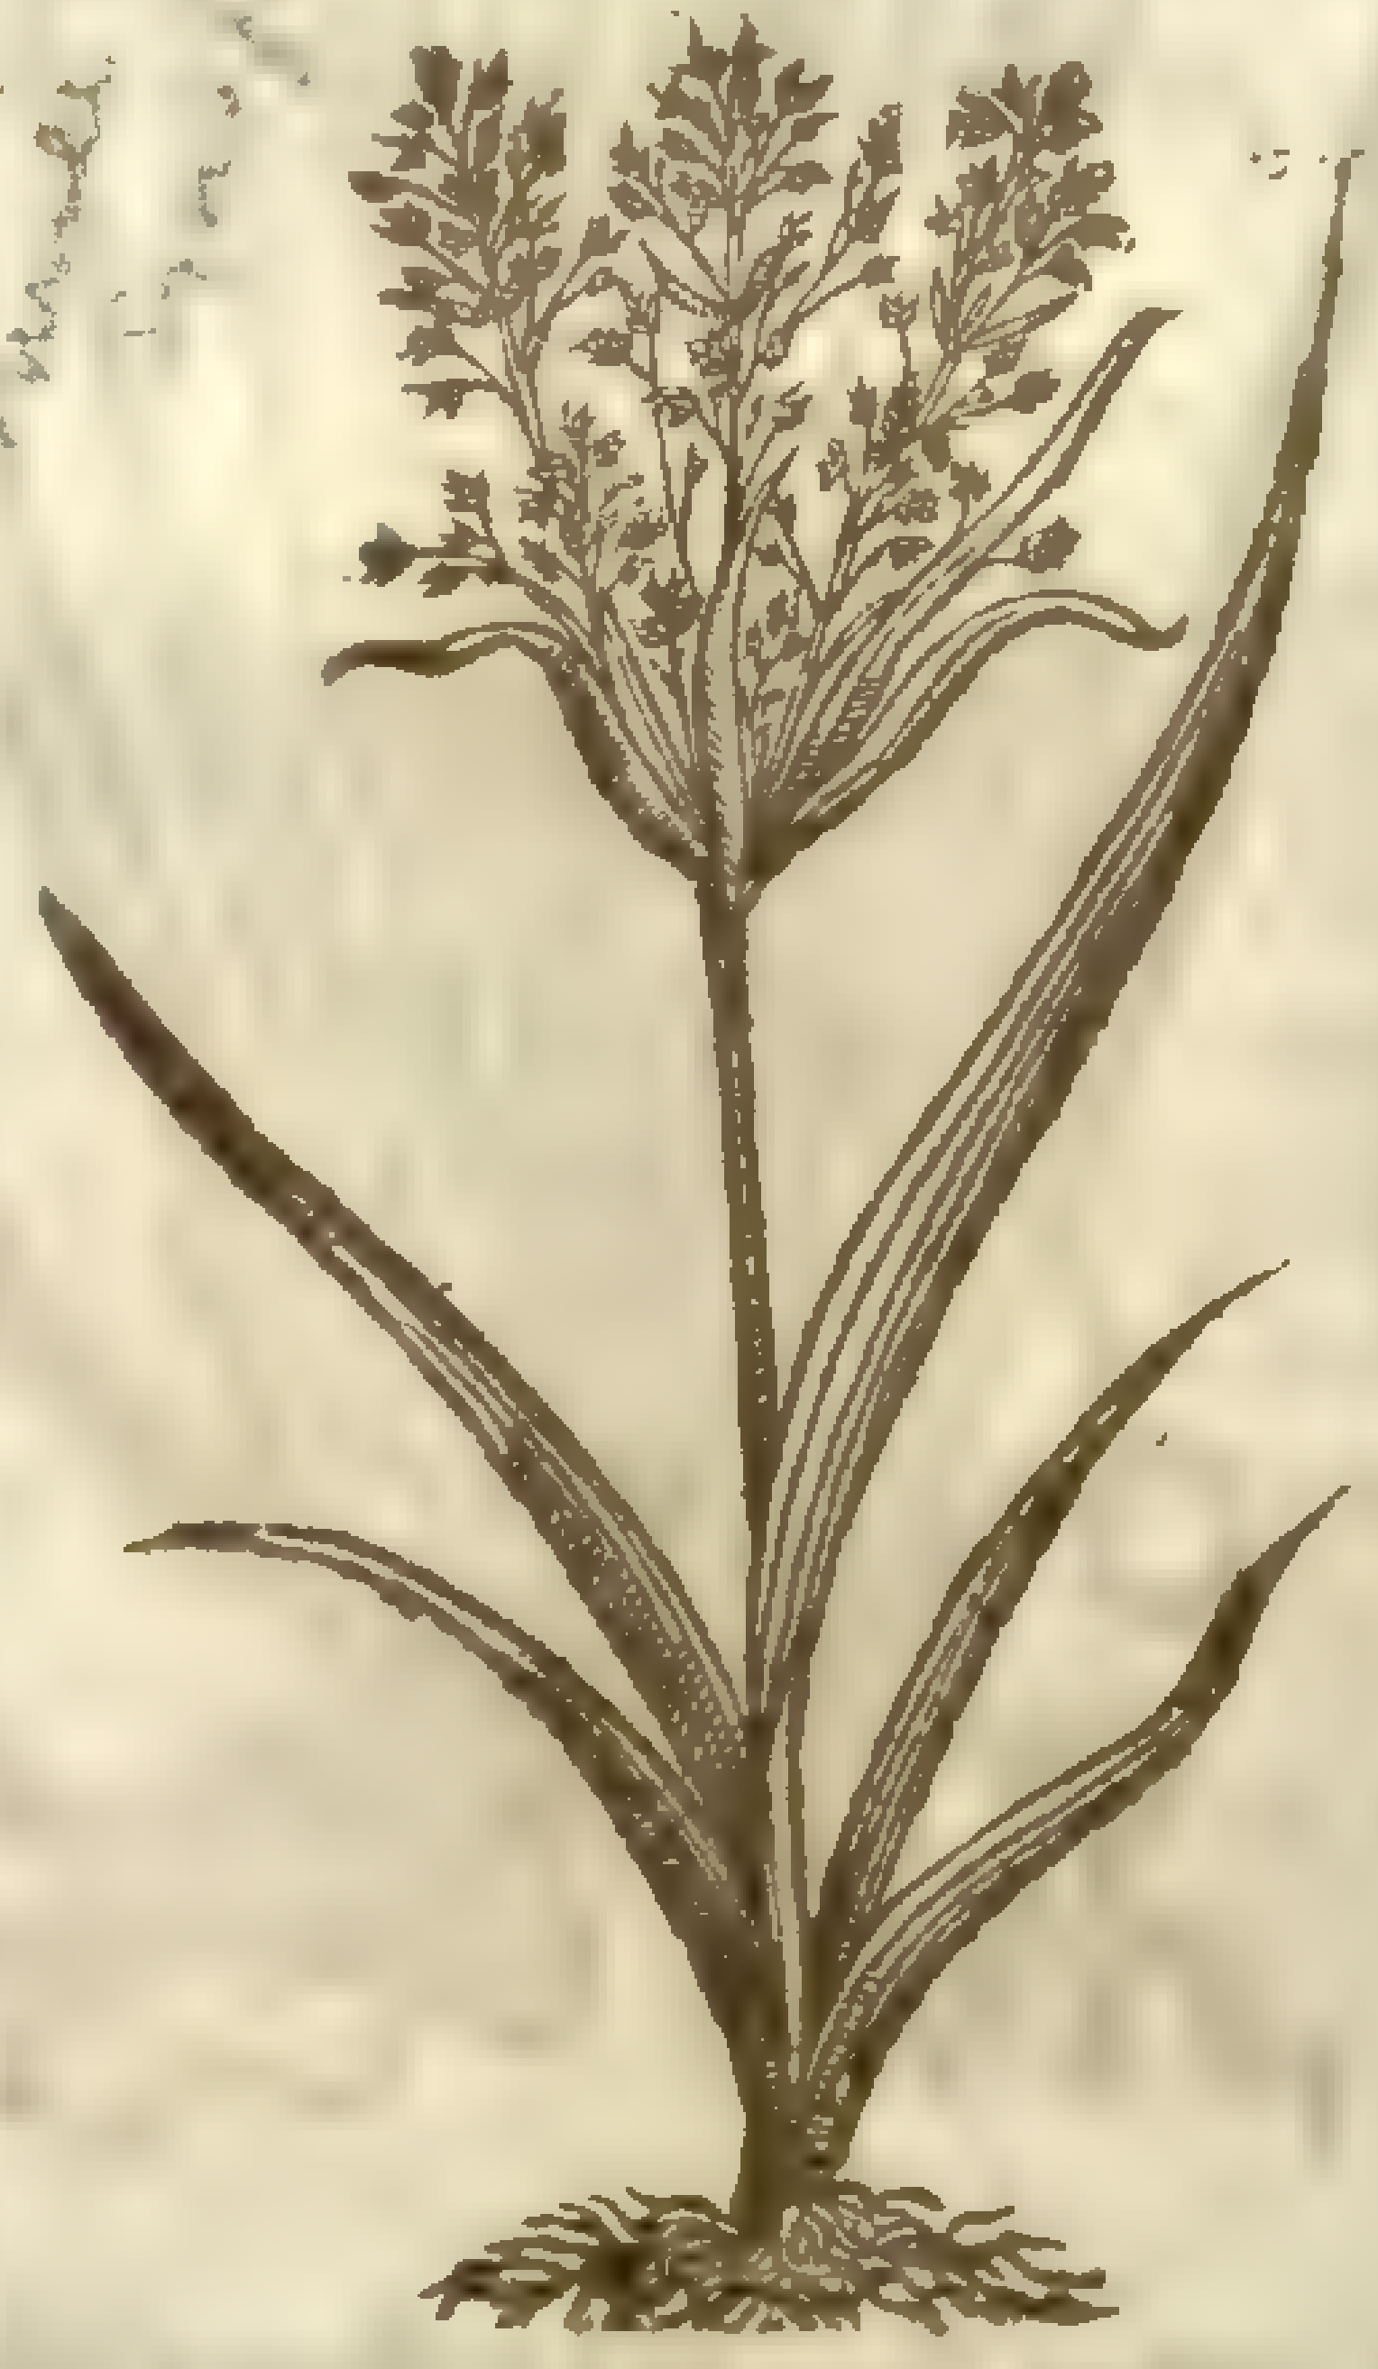
4 He alſo calls this, *Cyperus aquaticus ſeptentrionalis*.

5 This is the *Cyperus graminea miliacea* of *Lobel* and *Pena*: the *Iuncus latus* in the *Hiſtor. Lugdun. pag.* 988. and the *Pſeudocyperus polycarpos* of *Thalius*.

‡ 4 *Cyperus rotundus inodorus ſylueſtris.*
Round Baſtard Cyperus.



‡ 5 *Cyperus gramineus miliaceus.*
Millet Cyperus graſſe.



Scirpus sylvaticus [illegible]

¶ *The Temperature and vertue.*

None of theſe are made vſe of in Phyſicke; but by their taſte they ſeeme to be of a cold and aſtringent qualitie. ‡

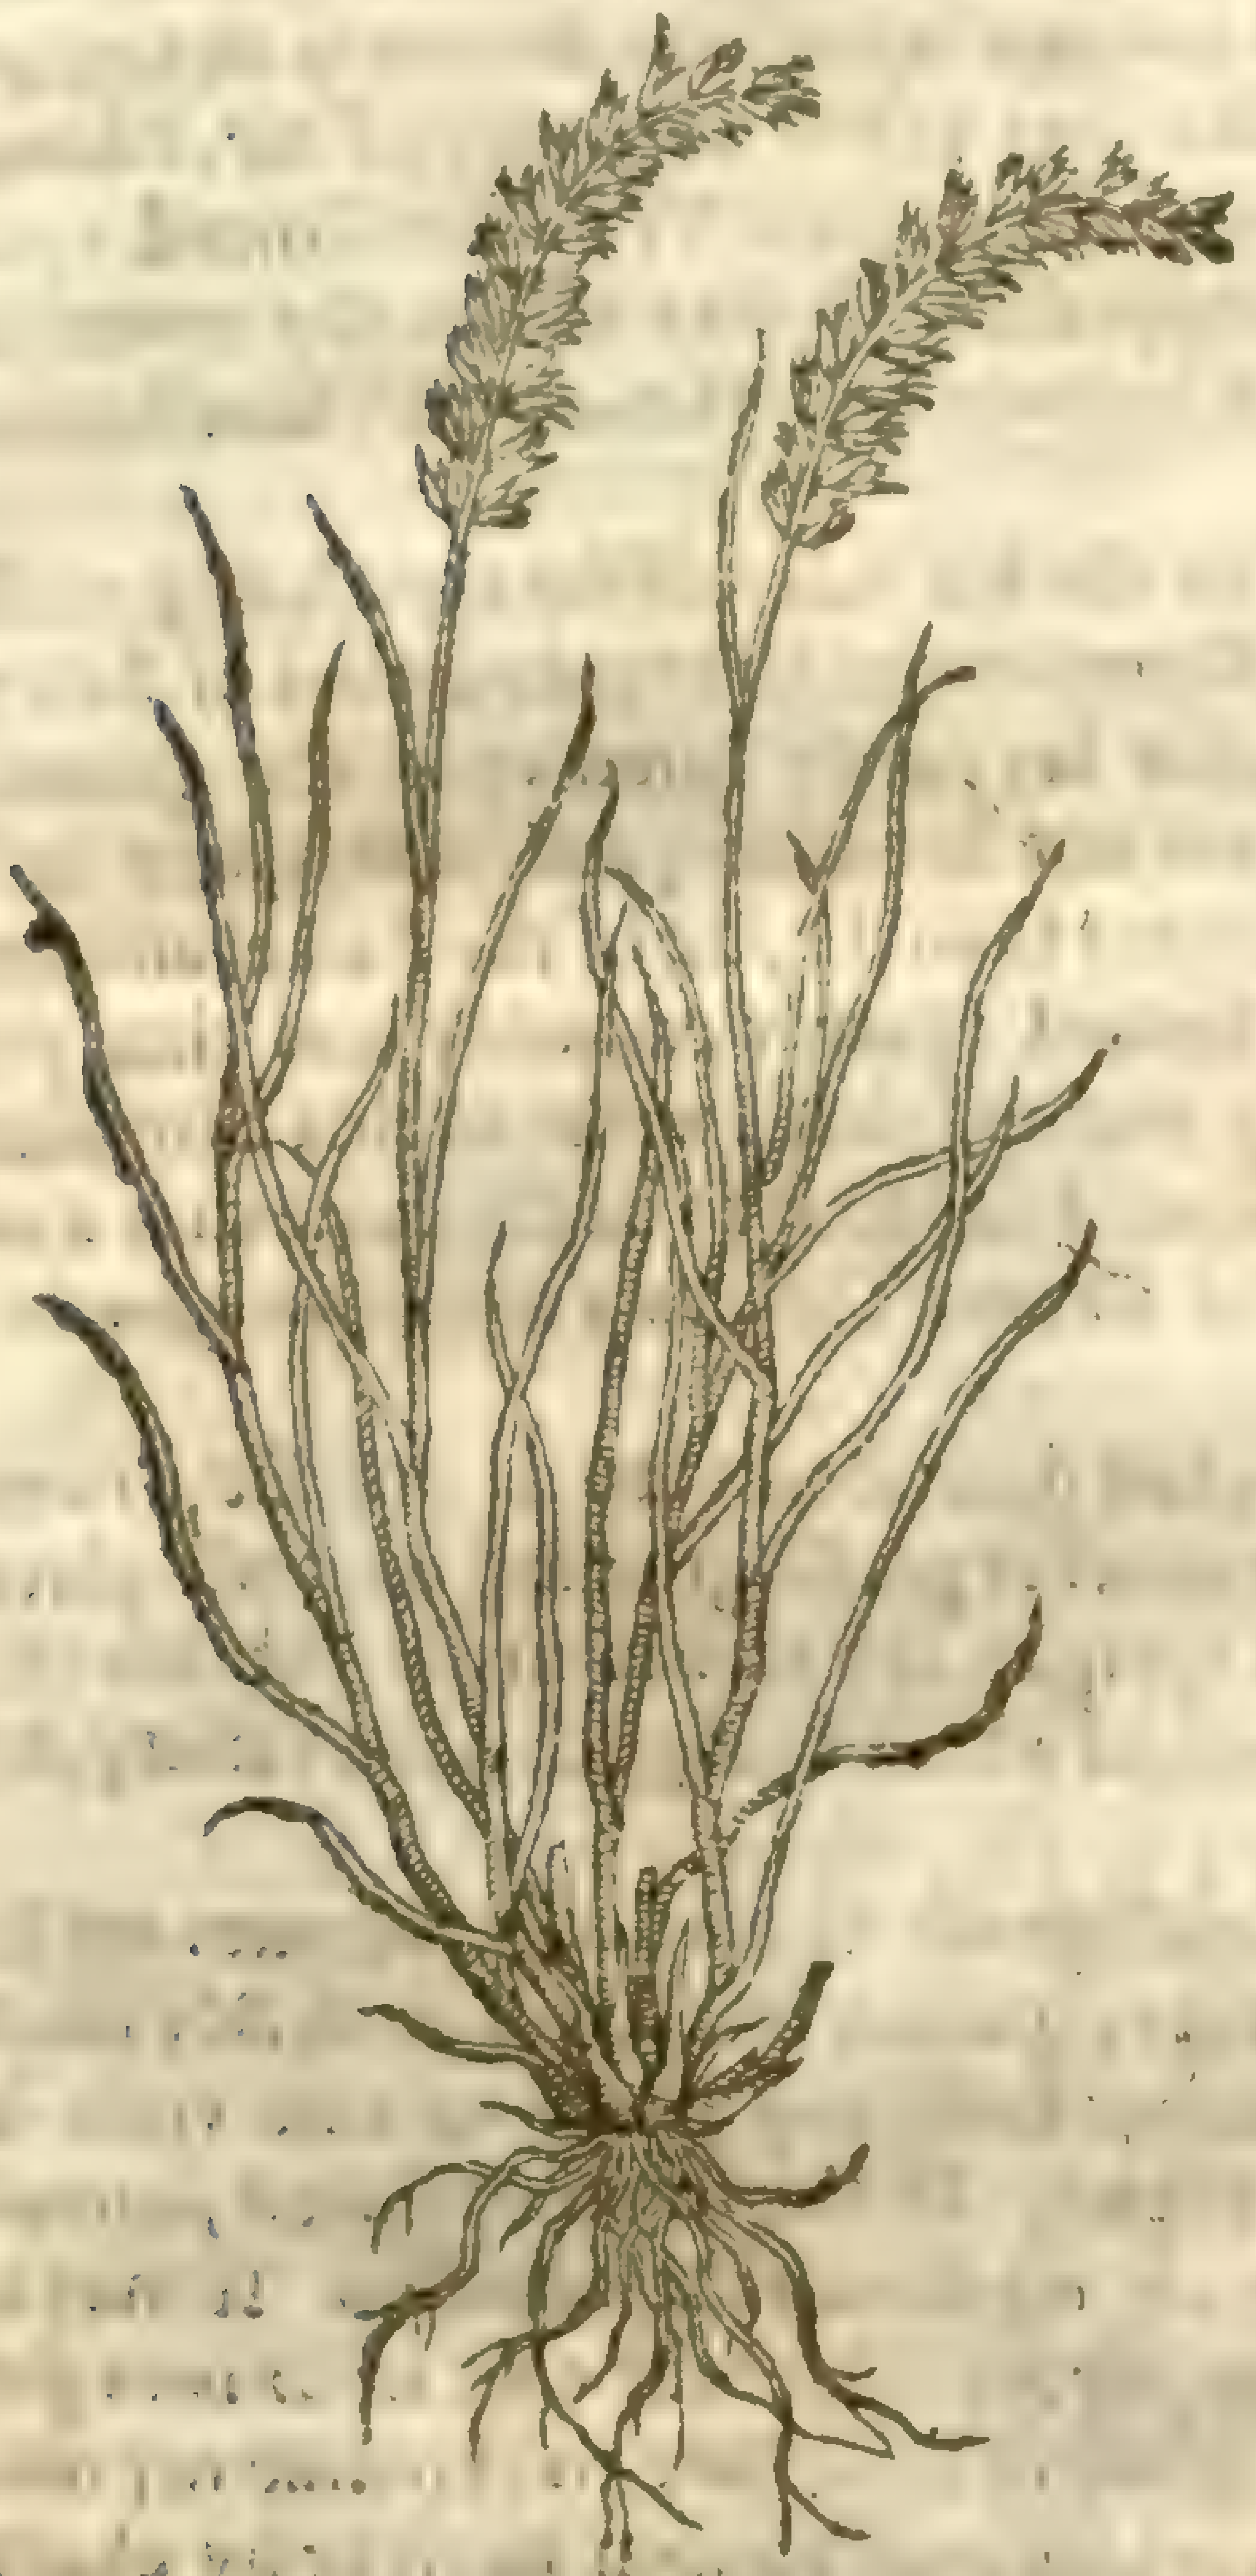
‡ Chap. 22. *Of diuers other Graſſes.*

¶ *The Deſcription.*

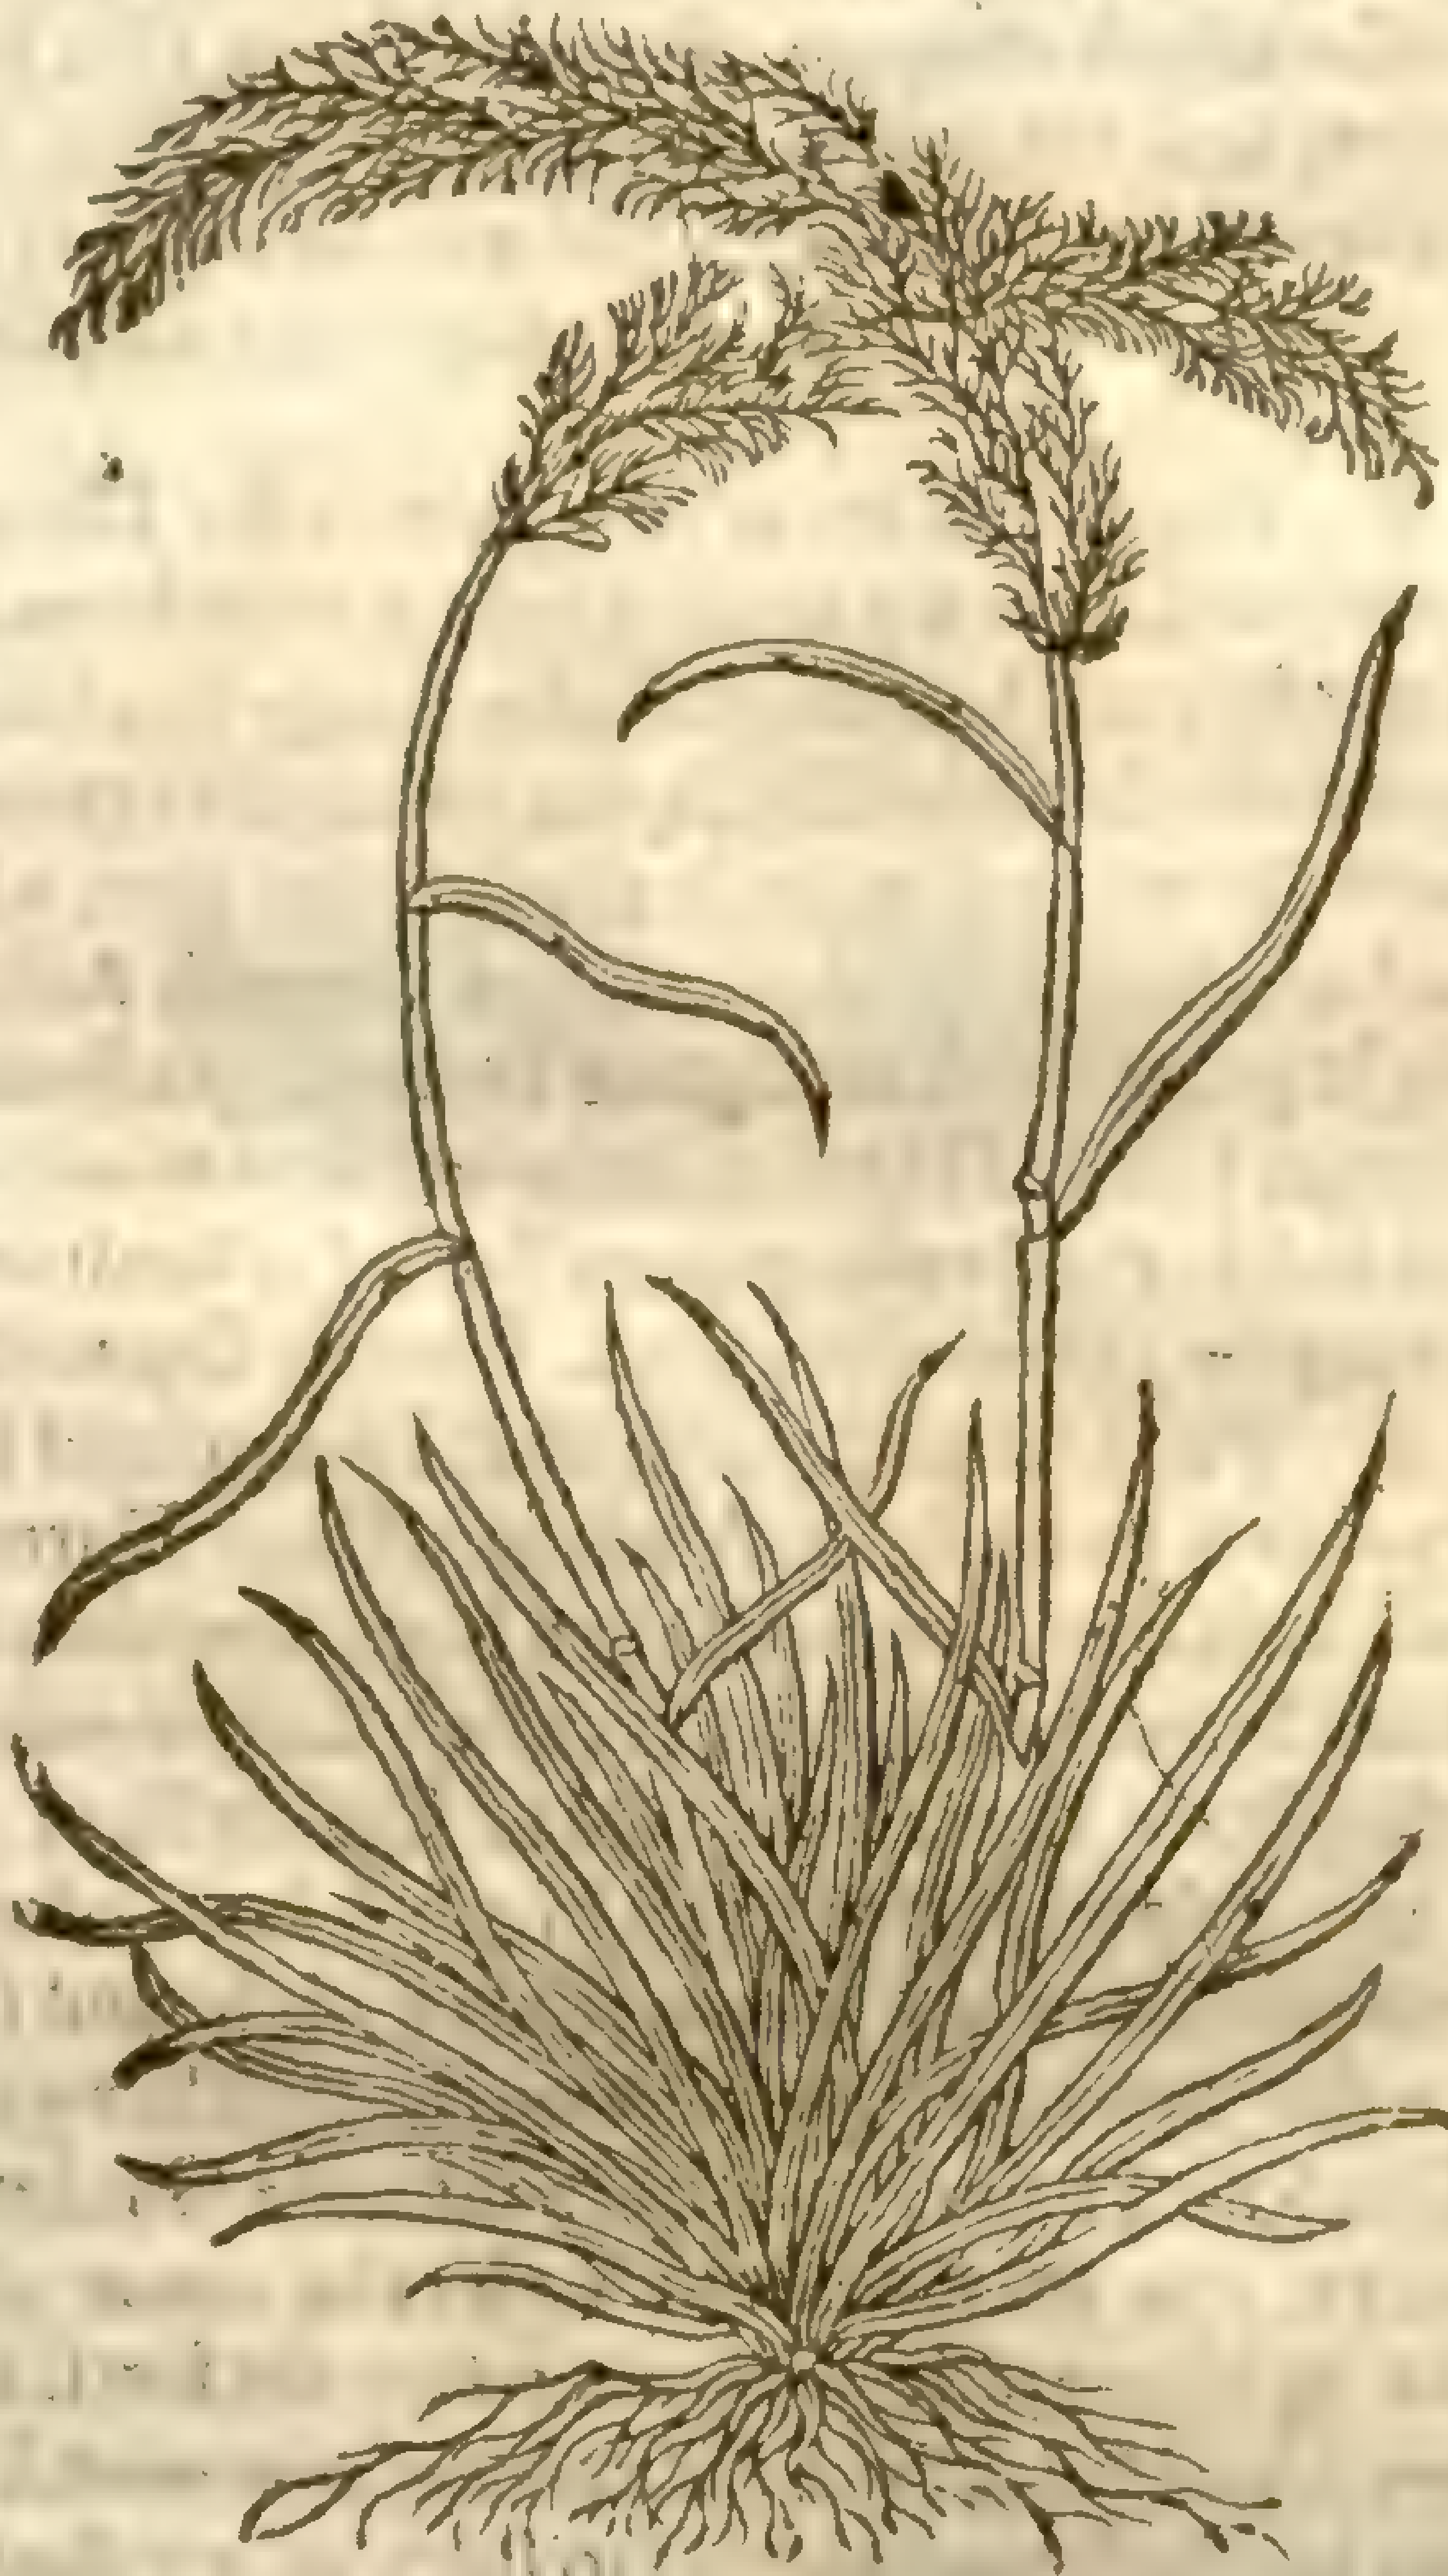
‡ 1 This Ote or Hauer-graſſe, deſcribed by *Cluſius*, hath ſmall creeping roots: the ſtalkes are ſome cubit high, ſlender, jointed, and ſet with ſhort narrow leaues: at the top of the ſtalke growes the eare, long, ſlender, and bending, compoſed of downie huskes containing a ſeed like to a naked Ote. The ſeed is ripe In Iuly. It growes in the mountainous and ſhadowie woods of Hungarie, Auſtria, and Bohemia. Our Authour miſtaking himſelfe in the figure, and as much in the title, gaue the figure of this for Burnt Barley, with this title, *Hordeum Diſtichon*. See the former edition, *pag*. 66.

2 I cannot omit this elegant Graſſe, found by Mr. *Goodyer* vpon the walls of the ancient city of Wincheſter, and not deſcribed as yet by any that I know of. It hath a fibrous and ſtringy root, from which ariſe leaues long and narrow, which growing old become round as thoſe of *Spartum* or

Mat-weed: among theſe graſſie leaues there growes vp a ſlender ſtalke ſome two foot long, ſcarſe ſtanding vpright, but oft times hanging down the head or top of the eare: it hath ſome two joints, and at each of theſe a pretty graſſie leafe. The eare is almoſt a foot in length, compoſed of many ſmall and ſlender hairy tufts, which when they come to maturitie looke of a grayiſh or whitiſh colour, and doe very well reſemble a Capons taile; whence my friend the firſt obſerued thereof, gaue it the title of *Gramen* Αλεκτρυονουρος, or Capons-taile graſſe; by which name I receiued the ſeed thereof, which ſowne, tooke root, and flouriſhes.



‡ 1 *Gra. montanum avenaceum.*
Mountaine Hauer-Graſſe.



‡ 2 *Gramen murorum ſpica longiſſimâ.*
Capon-taile Graſſe.

[illegible]

3 Next to this I thinke fit to place the *Gramen Criſtatum*, or Cocks-combe graſſe of *Bauhinus*. This Graſſe hath for the root many white fibrous threds thicke packt together: the leaues are but ſhort, about the bigneſſe of the ordinarie medow-graſſe; the ſtalks are ſome cubit and halfe high, with ſome two or three knots a piece: the leaues of the ſtalke are ſome foure or fiue inches long: the eare is ſmall, longiſh, of a pale greene colour, ſomewhat bending, ſo that in ſome ſort it reſembles the combe of a Cocke, or the ſeed-veſſell of that plant which is called *Caput Gallinaceum*. This is ordinarily to be found in moſt medowes about Mid-ſummer.

4 There is alſo commonly about the ſame time in our medowes to be found a Graſſe growing to ſome cubit high, hauing a ſmall ſtalke, at the the top whereof there grows an eare ſome inch and an halfe, or two inches long, conſiſting as it were of two rankes of corne: it very much reſembles Rie both in ſhape and colour, and in his ſhort bearded awnes, wherefore it may very fitly be termed *Gramen ſecalinum*, or Rie-graſſe. Yet it is not *Gramen ſpica ſecalina* which *Bauhine* deſcribes in the fifty ſeuenth place, in his *Prodromus*, *pag*. 18. for that is much taller, and the eare much larger than this of my deſcription.

5 In diuers places about hedges, in Iuly and Auguſt is to be found a fine large tall Graſſe, which *Bauhine* (who alſo firſt deſcribed it) hath vnder the name of *Gramen ſpica Brizæ majus*. This hath ſtalkes as tall as Rie, but not ſo thicke, neither are the leaues ſo broad: at the top of the ſtalke grow diuers prettie little flattiſh eares conſiſting of two rankes of chaffie huskes or ſeed-veſſels, which haue yellowiſh little floures like to thoſe of Wheat.

6 There is alſo commonly to be found about May or the beginning of Iune, in medowes and

ſuch places, that graſſe which in the *Hiſtoria Lugdun.* is ſet forh vnder the name of *Gramen Lanatum Daleſchampij*: the ſtalkes and leaues are much like the common medow graſſe, but that they are more whitiſh and hairie; the head or panicle is alſo ſoft and woolly, and it is commonly of a gray, or elſe a murrie colour.

7 There is to be found in ſome bogs in Summer time about the end of Iuly a prettie ruſhie graſſe, ſome foote or better in height, the ſtalke is hard and ruſhie, hauing ſome three joints, at each whereof there comes forth a leafe as in other graſſes, and out of the boſome of the two vppermoſt of theſe leaues comes forth a ſlender ſtalke being ſome 2 or 3 inches high, and at the top thereof growes as in a little vmble a pretty white chaffie floure; and at, or nigh to the top of the maine ſtalke there grow three or foure ſuch floures cluſtering together vpon little ſhort and ſlender foot-ſtalkes: the leaues are but ſmall, and ſome handfull or better long, the root I did not obſerue. This ſeemes to haue ſome affinitie with the *Gramen junceum aquaticum*, formerly deſcribed in the ninth chapter. I neuer found this but once, and that was in the company of Mr. *Thomas Smith*, and Mr. *Iames Clarke*, Apothecaries of London; wee riding into Windſor Forreſt vpon the ſearch of rare plants, and wee found this vpon a bogge neere the high way ſide at the corner of the great parke. I thinke it may very fitly be called *Gramen junceum leucanthemum*: White floured Ruſh-graſſe.

[illegible]

8 The laſt yeare at Margate in the Iſle of Tenet, neere to the ſea ſide and by the chalky cliffe I obſerued a pretty little graſſe which from a ſmall white fibrous roote ſent vp a number of ſtalkes of an vnequall height; for the longeſt, which were thoſe that lay partly ſpred vpon the ground, were ſome handfull high, the other that grew ſtreight vp were not ſo much; and of this, one inch and halfe was taken vp in the ſpike or eare, which was no thicker than the reſt of the ſtalke, and ſeemed nothing elſe but a plaine ſmooth ſtalke, vnleſſe you looked vpon it earneſtly, and then you might perceiue it to be like Darnell graſſe: wherefore in the journall that I wrote of this Simpling voyage, I called it *pag.* 3. *Gramen paruum marinum ſpica Loliacea*. I iudge it to be the ſame that *Bauhine* in his *Prodromus, pag.* 19. hath ſet forth vnder the name of *Gramen Loliaceum minus ſpica ſimplici*. It may be called in Engliſh, Dwarſe Darnell-graſſe.

9 The Darnell-graſſe that I compared the eare of this laſt deſcribed vnto, is not the *Gramen ſorghinum* (which our Authour called Darnell-graſſe) but another graſſe growing in moſt places with ſtalkes about ſome ſpan high, but they ſeldome ſtand vpright, the eare is made juſt like that which hereafter *chap.* 58 is called *Lolium rubrum*, Red Darnell, of which I judge this is a variety, differing little there from but in ſmalneſſe of growth.

10 Vpon Hampſtead heath I haue often obſerued a ſmall graſſe whoſe longeſt leaues are ſeldome about two or three inches high, and theſe leaues are very greene, ſmall, and perfectly round like the *Spartum Auſtriacum*, or Feather-graſſe: I could neuer finde any ſtalke or eare vpon it: wherefore I haue brought it into the Garden to obſerue it better. In the forementioned journall, *pag.* 33. you may finde it vnder the name of *Gramen Spartium capillaceo folio minimum*. It may be this is that graſſe which *Bauhine* ſet forth in his *Prodromus, pag.* 11. vnder the title of *Gramen ſparteum Monſpeliacum capillaceo folio minimum*. I haue thought good in this place to explaine my meaning by theſe two names, to ſuch as are ſtudious in plants, which may happen to light by chance (for they were not intended for publicke) vpon our Iournall, that they need not doubt of my meaning.

11 I muſt not paſſe ouer in ſilence two or three Graſſes, which for any thing that I know are ſtrangers with vs, the one I haue ſeene with Mr. *Parkinſon*, and it is ſet forth by *Bauhine, pag.* 30. of his *Prodromus*. The other by *Lobell* in the ſecond part of his *Aduerſaria, pag.* 468. The firſt (which *Bauhine* fitly cals *Gramen alopecuroides ſpica aſpera*, and thinks it to be *Gram. Echinatum Daleſchampij*, deſcribed *Hiſt. Lugd. pag.* 432.) hath a fibrous and white root, from which ariſeth a ſtiffe ſtalke diuided by many knots, or knees: the leaues are like to the other fox-taile-graſſes, but greener: the eare is rough, of ſome inch in length, and growes as it were vpon one ſide of the ſtalke: the eare at firſt is greene, and ſhewes yellowiſh little floures in Auguſt.

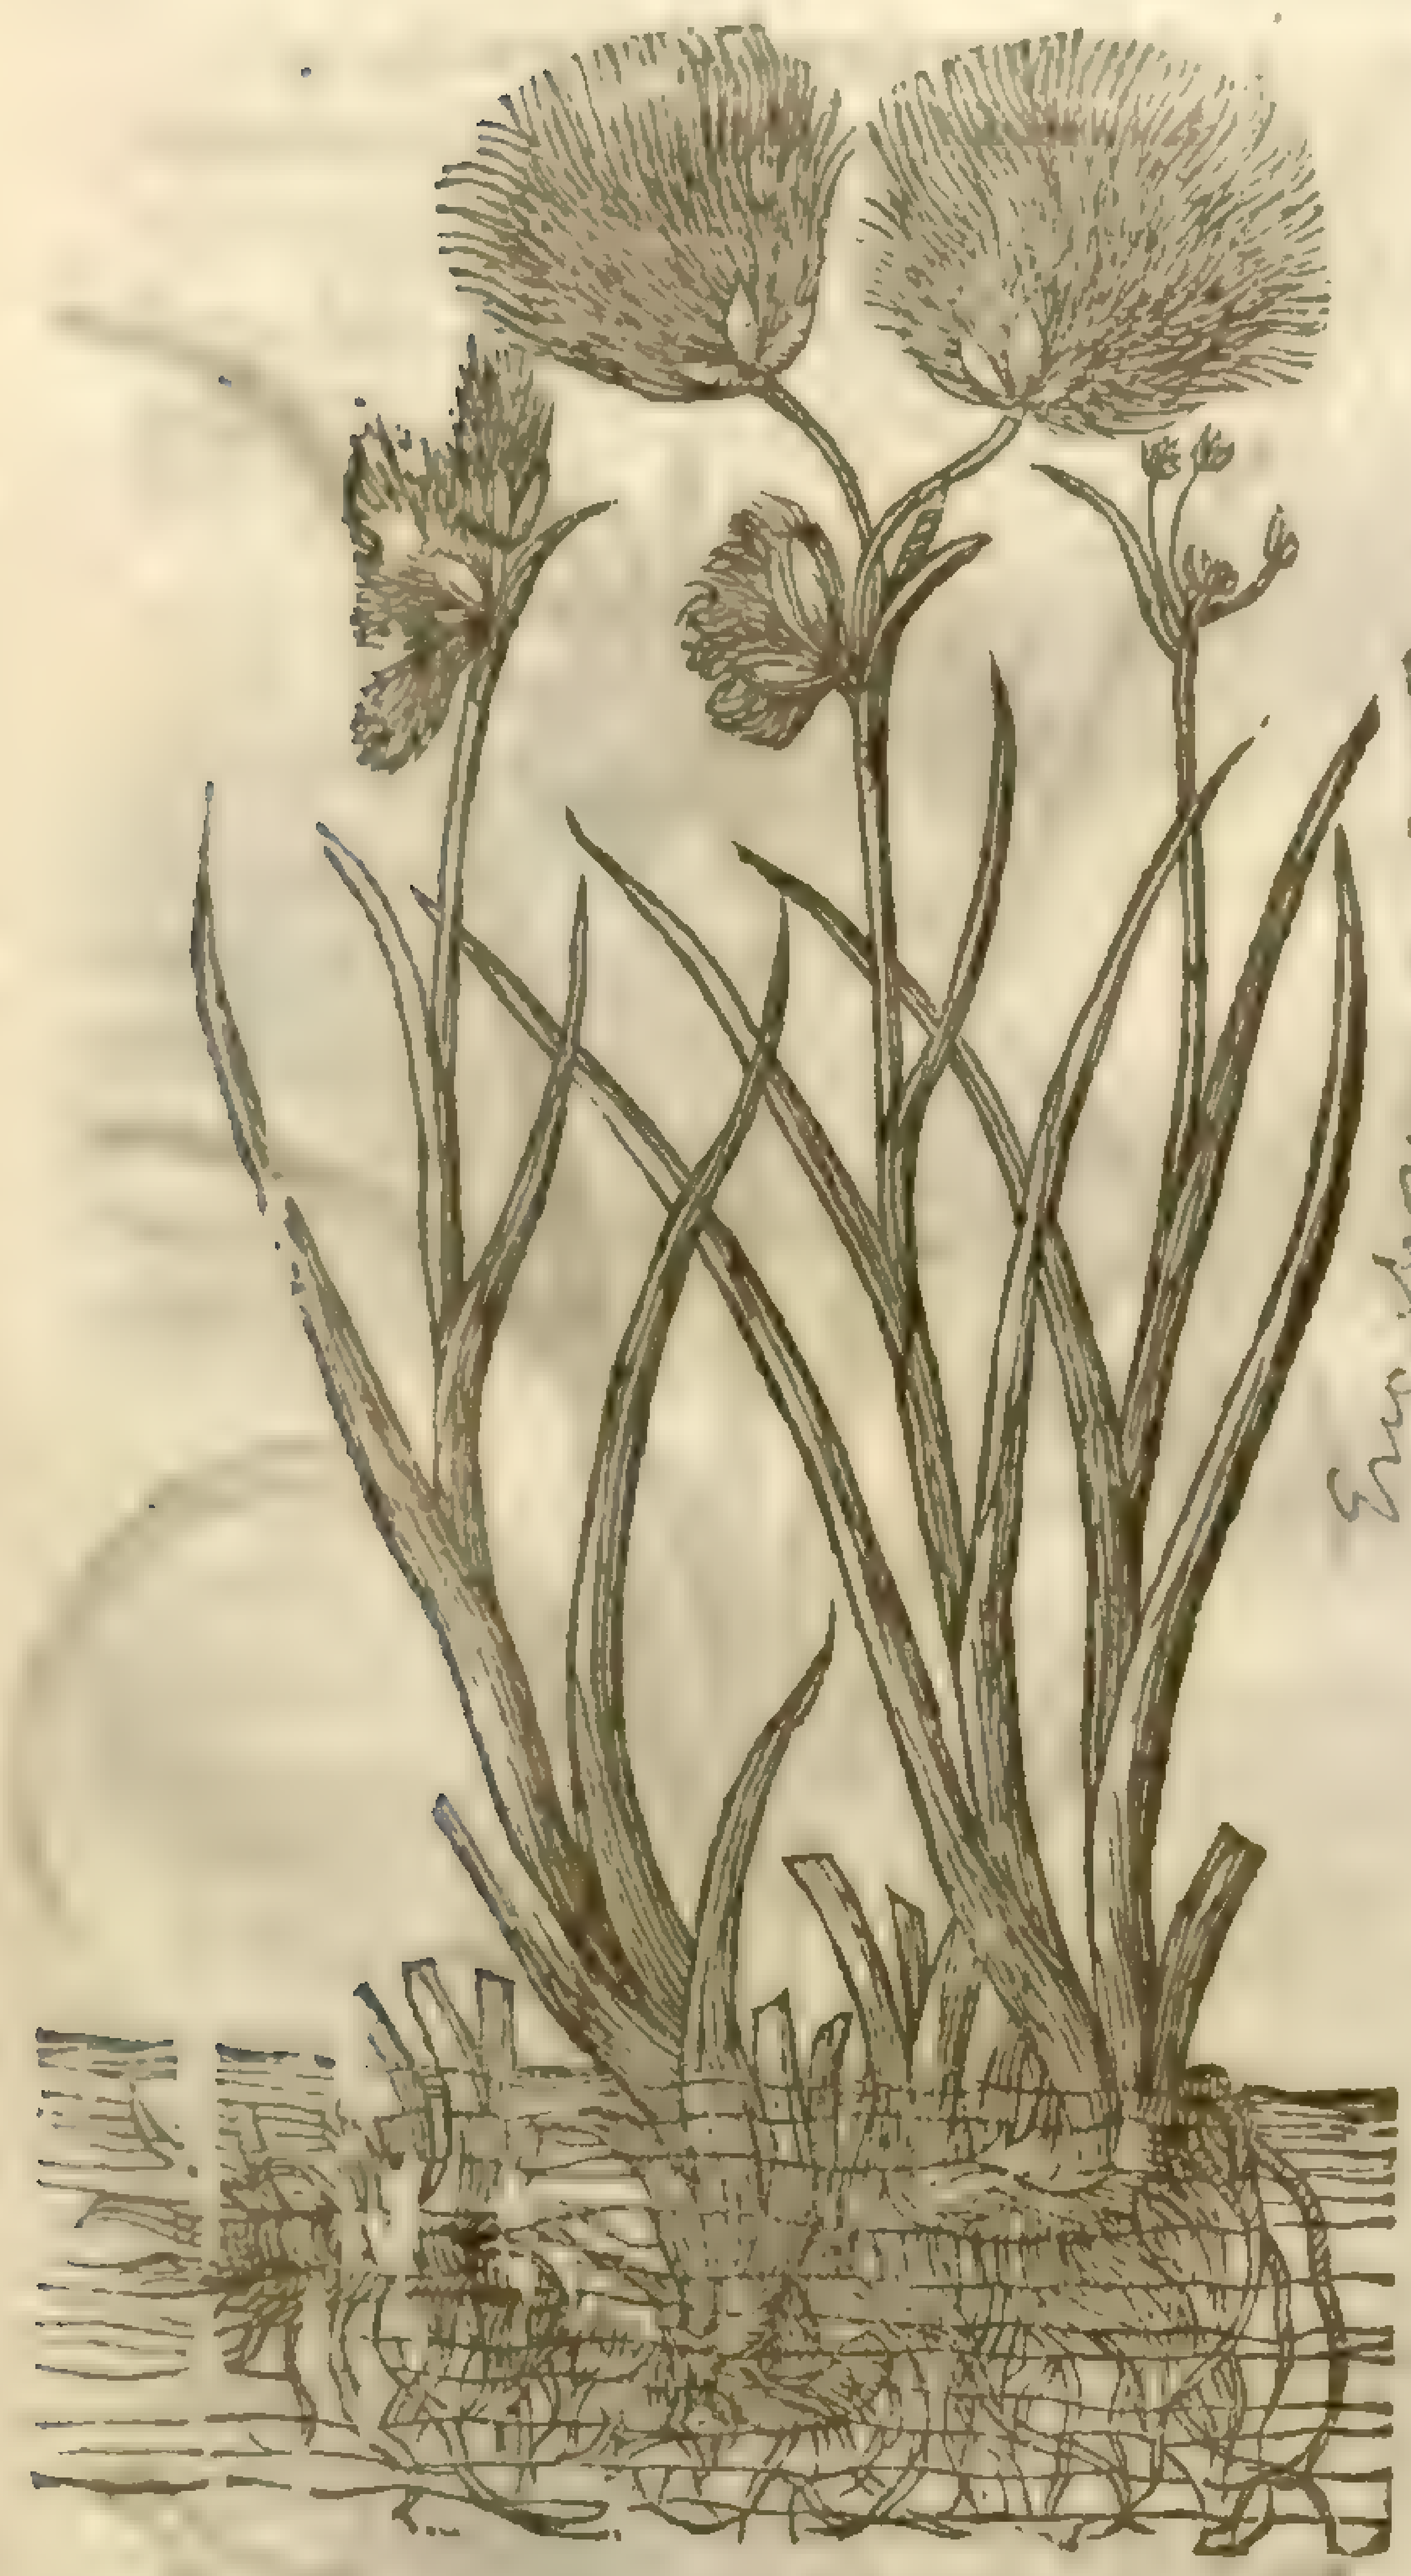
12 This other Graſſe which *Lobell* in the quoted place figures and deſcribes by the name of *Gramen Scoparium Iſchami panniculis Gallicum*, hath roots ſome cubit long, ſlender and very ſtiffe, (for of theſe are made the head bruſhes which are vulgarly vſed) the ſtraw is ſlender, and ſome cubit high, being here and there joynted like to other Graſſes: the top hath foure or fiue eares ſtanding after the manner of Cocks foot Graſſe, whereof it is a kinde. It growes naturally about Orleance, and may be called in Engliſh, Bruſh-graſſe. ‡

CHAP. 23. *Of Cotton-Graſſe.*

¶ *The Deſcription.*

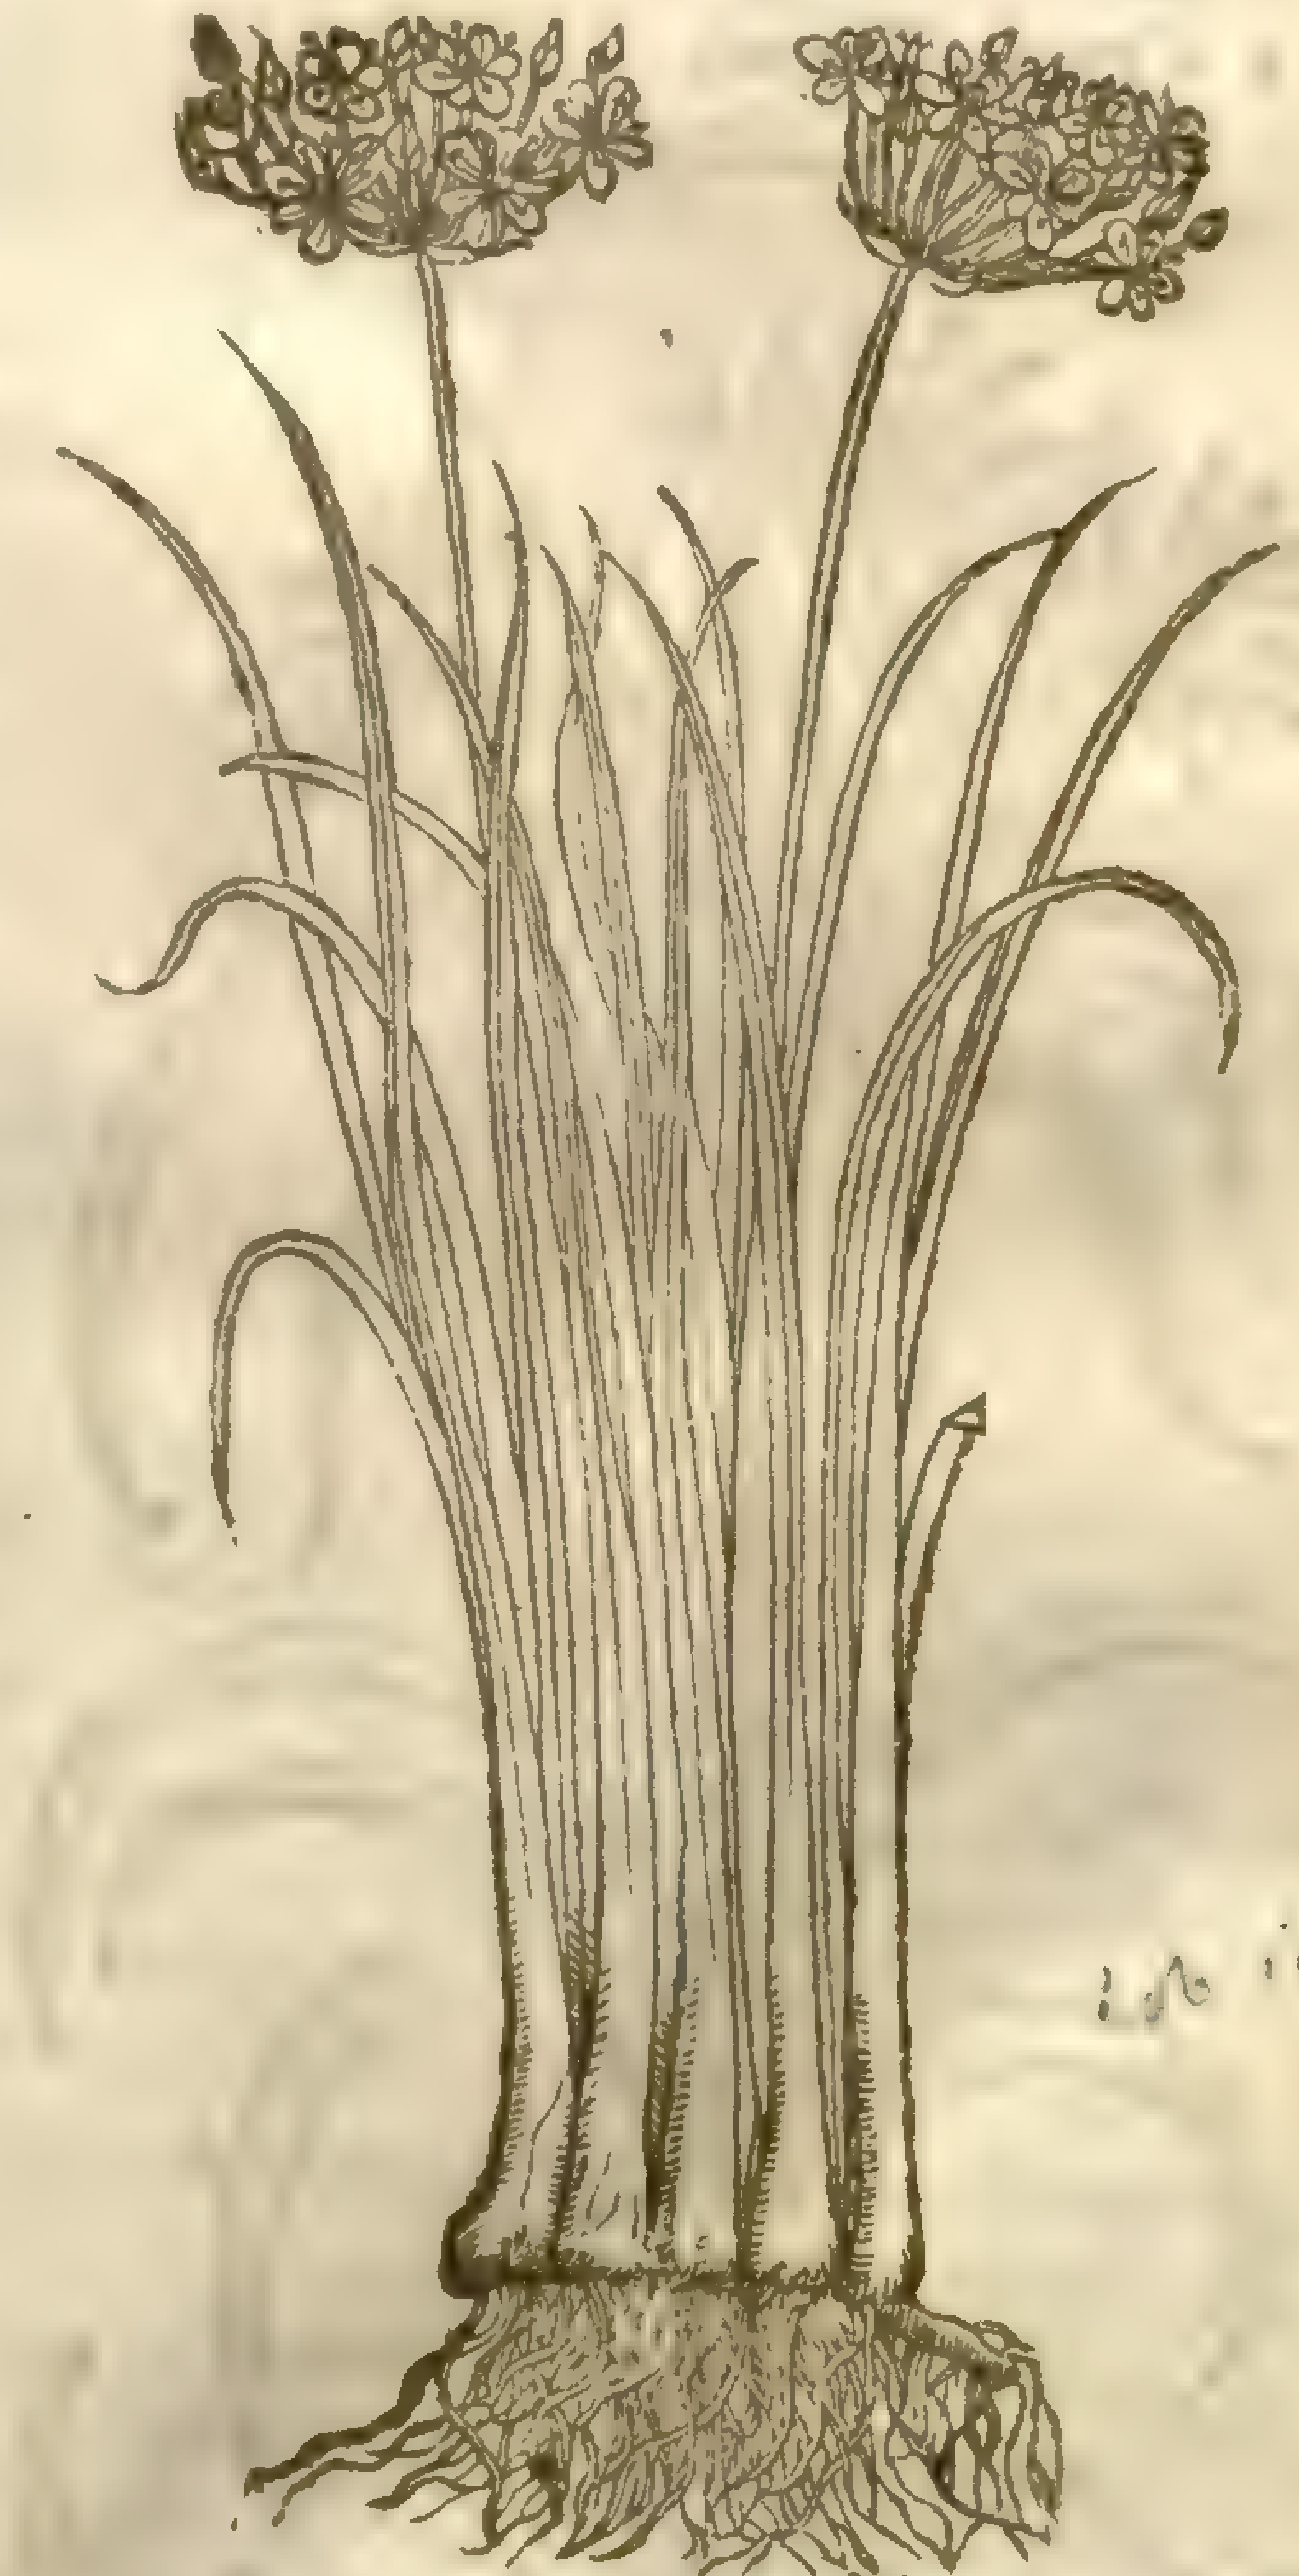
1 THis ſtrange Cotton-Graſſe, which *L'Obelius* hath comprehended vnder the kindes of Ruſhes; notwithſtanding that it may paſſe with the Ruſhes, yet I finde in mine owne experience, that it doth rather reſemble graſſe than ruſhes, and may indifferently be taken for either, for that it doth participate of both. The ſtalke is ſmall and ruſhy, garniſhed with many graſſie leaues alongſt the ſame, bearing at the top a buſh or tuft of moſt pleaſant downe or cotton like vnto the moſt fine and ſoft white ſilke. The root is very tough, ſmall and threddy.

2 This Water Gladiole, or graſſy ruſh, of all others is the faireſt and moſt pleaſant to behold, and ſerueth very well for the decking and trimming vp of houſes, becauſe of the beautie and brauerie thereof: conſiſting of ſundry ſmall leaues, of a white colour mixed with carnation, growing at the top of a bare and naked ſtalke, fiue or ſix foot long, and ſometime more. The leaues are long and flaggie, not much vnlike the common reed. The root is threddy, and not long.



1 *Gramen Tomentarium.*
Cotton Graſſe.

Eriophorum angustifolium, L. [illegible]



2 *Gladiolus paluſtris Cordi.*
Water Gladiole.

Butomus umbellatus, L. [illegible]

Lob. ic. 86.

¶ *The Place and Time.*

1 Cotton graſſe groweth vpon bogy and ſuch like mooriſh places, and it is to be ſeene vpon the bogs in Hampſted heath. It groweth likewiſe in Highgate parke neere London.

2 Water Gladiole groweth in ſtanding pooles, motes, and water ditches. I found it in great plenty being in company with a worſhipfull Gentleman Mr. *Robert Wilbraham*, at a Village fifteene miles from London called Buſhey. It groweth likewiſe neere Redriffe by London, and many other places: the ſeaſon anſwereth all others.

¶ *The Names.*

1 *Gramen Tomentoſum* is called likewiſe *Iuncus bombicinus*: of *Cordus*, *Linum pratenſe*, and *Gnaphalium, Hieronymi Bockij*. In Engliſh, Cotton-Graſſe.

2 Water Gladiole is called of *L'Obelius*, *Iuncus Cyperoides floridus paludoſus*, Flouring Cypreſſe Ruſh : *Iuncus*, for that his ſtalke is like the ruſh : *Cyperoides*, becauſe his leaues reſemble *Cyperus* : *Floridus*, becauſe it hath on the top of euery ſtalke a fine vmble or tuft of ſmall floures in faſhion of the Lilly of Alexandria, the which it is very like, and therefore I had rather call it Lilly graſſe.

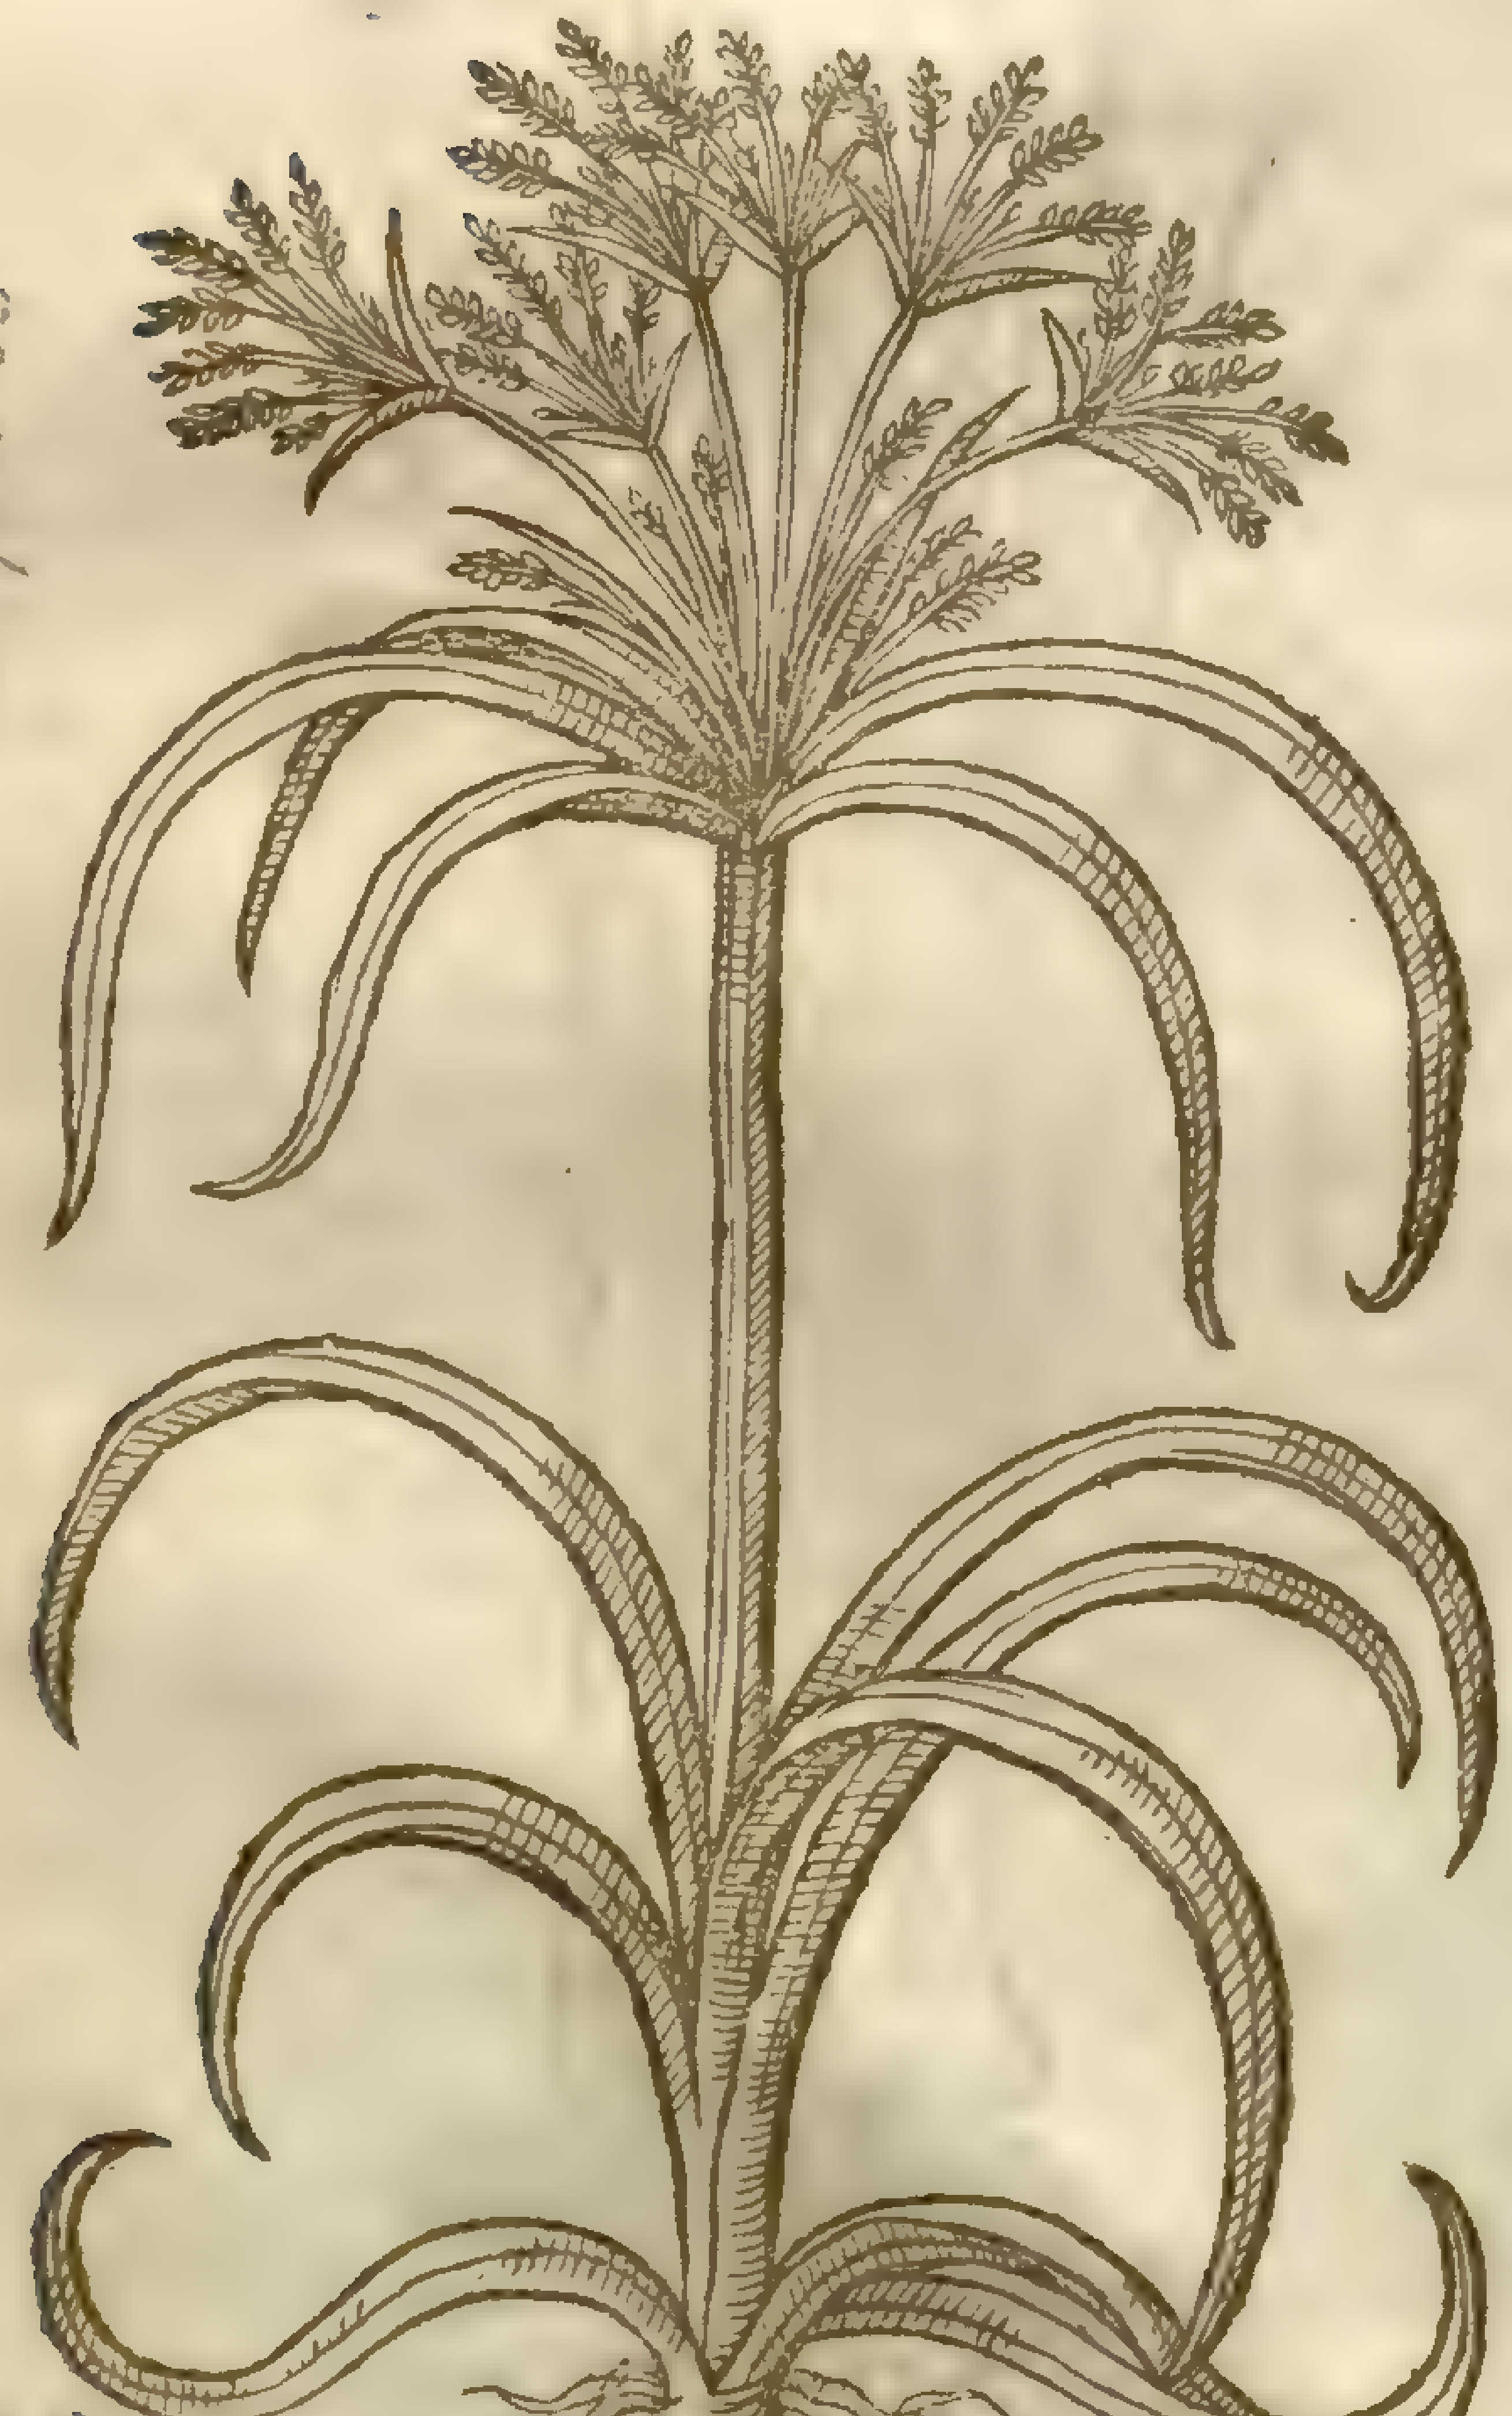
¶ *The Nature and Vertues.*

A *Cordus* ſaith, That *Iuncus bombicinus* ſodden in wine, and ſo taken, helpeth the throwes and gripings of the belly, that women haue in their childing.

There be alſo ſundry kinds of Graſſes wholly vnknowne, or at leaſt not remembred of the old Writers, whereof ſome few are touched in name onely by the late and new Writers : now for as much as they haue onely named them, I will referre the better conſideration of them to the induſtrie and diligence of painefull ſearchers of nature, and proſecute my purpoſed labour, to vnfold the diuers ſorts and manifold kindes of *Cyperus*, Flags, and Ruſhes : and becauſe that there is added vnto many of the Graſſes before mentioned, this difference, *Cyperoides*, that is to ſay, reſembling *Cyperus*, I thought it therefore expedient to joyne next vnto the hiſtory of Graſſes the diſcourſe of *Cyperus*, and his kinds, which are as follow.

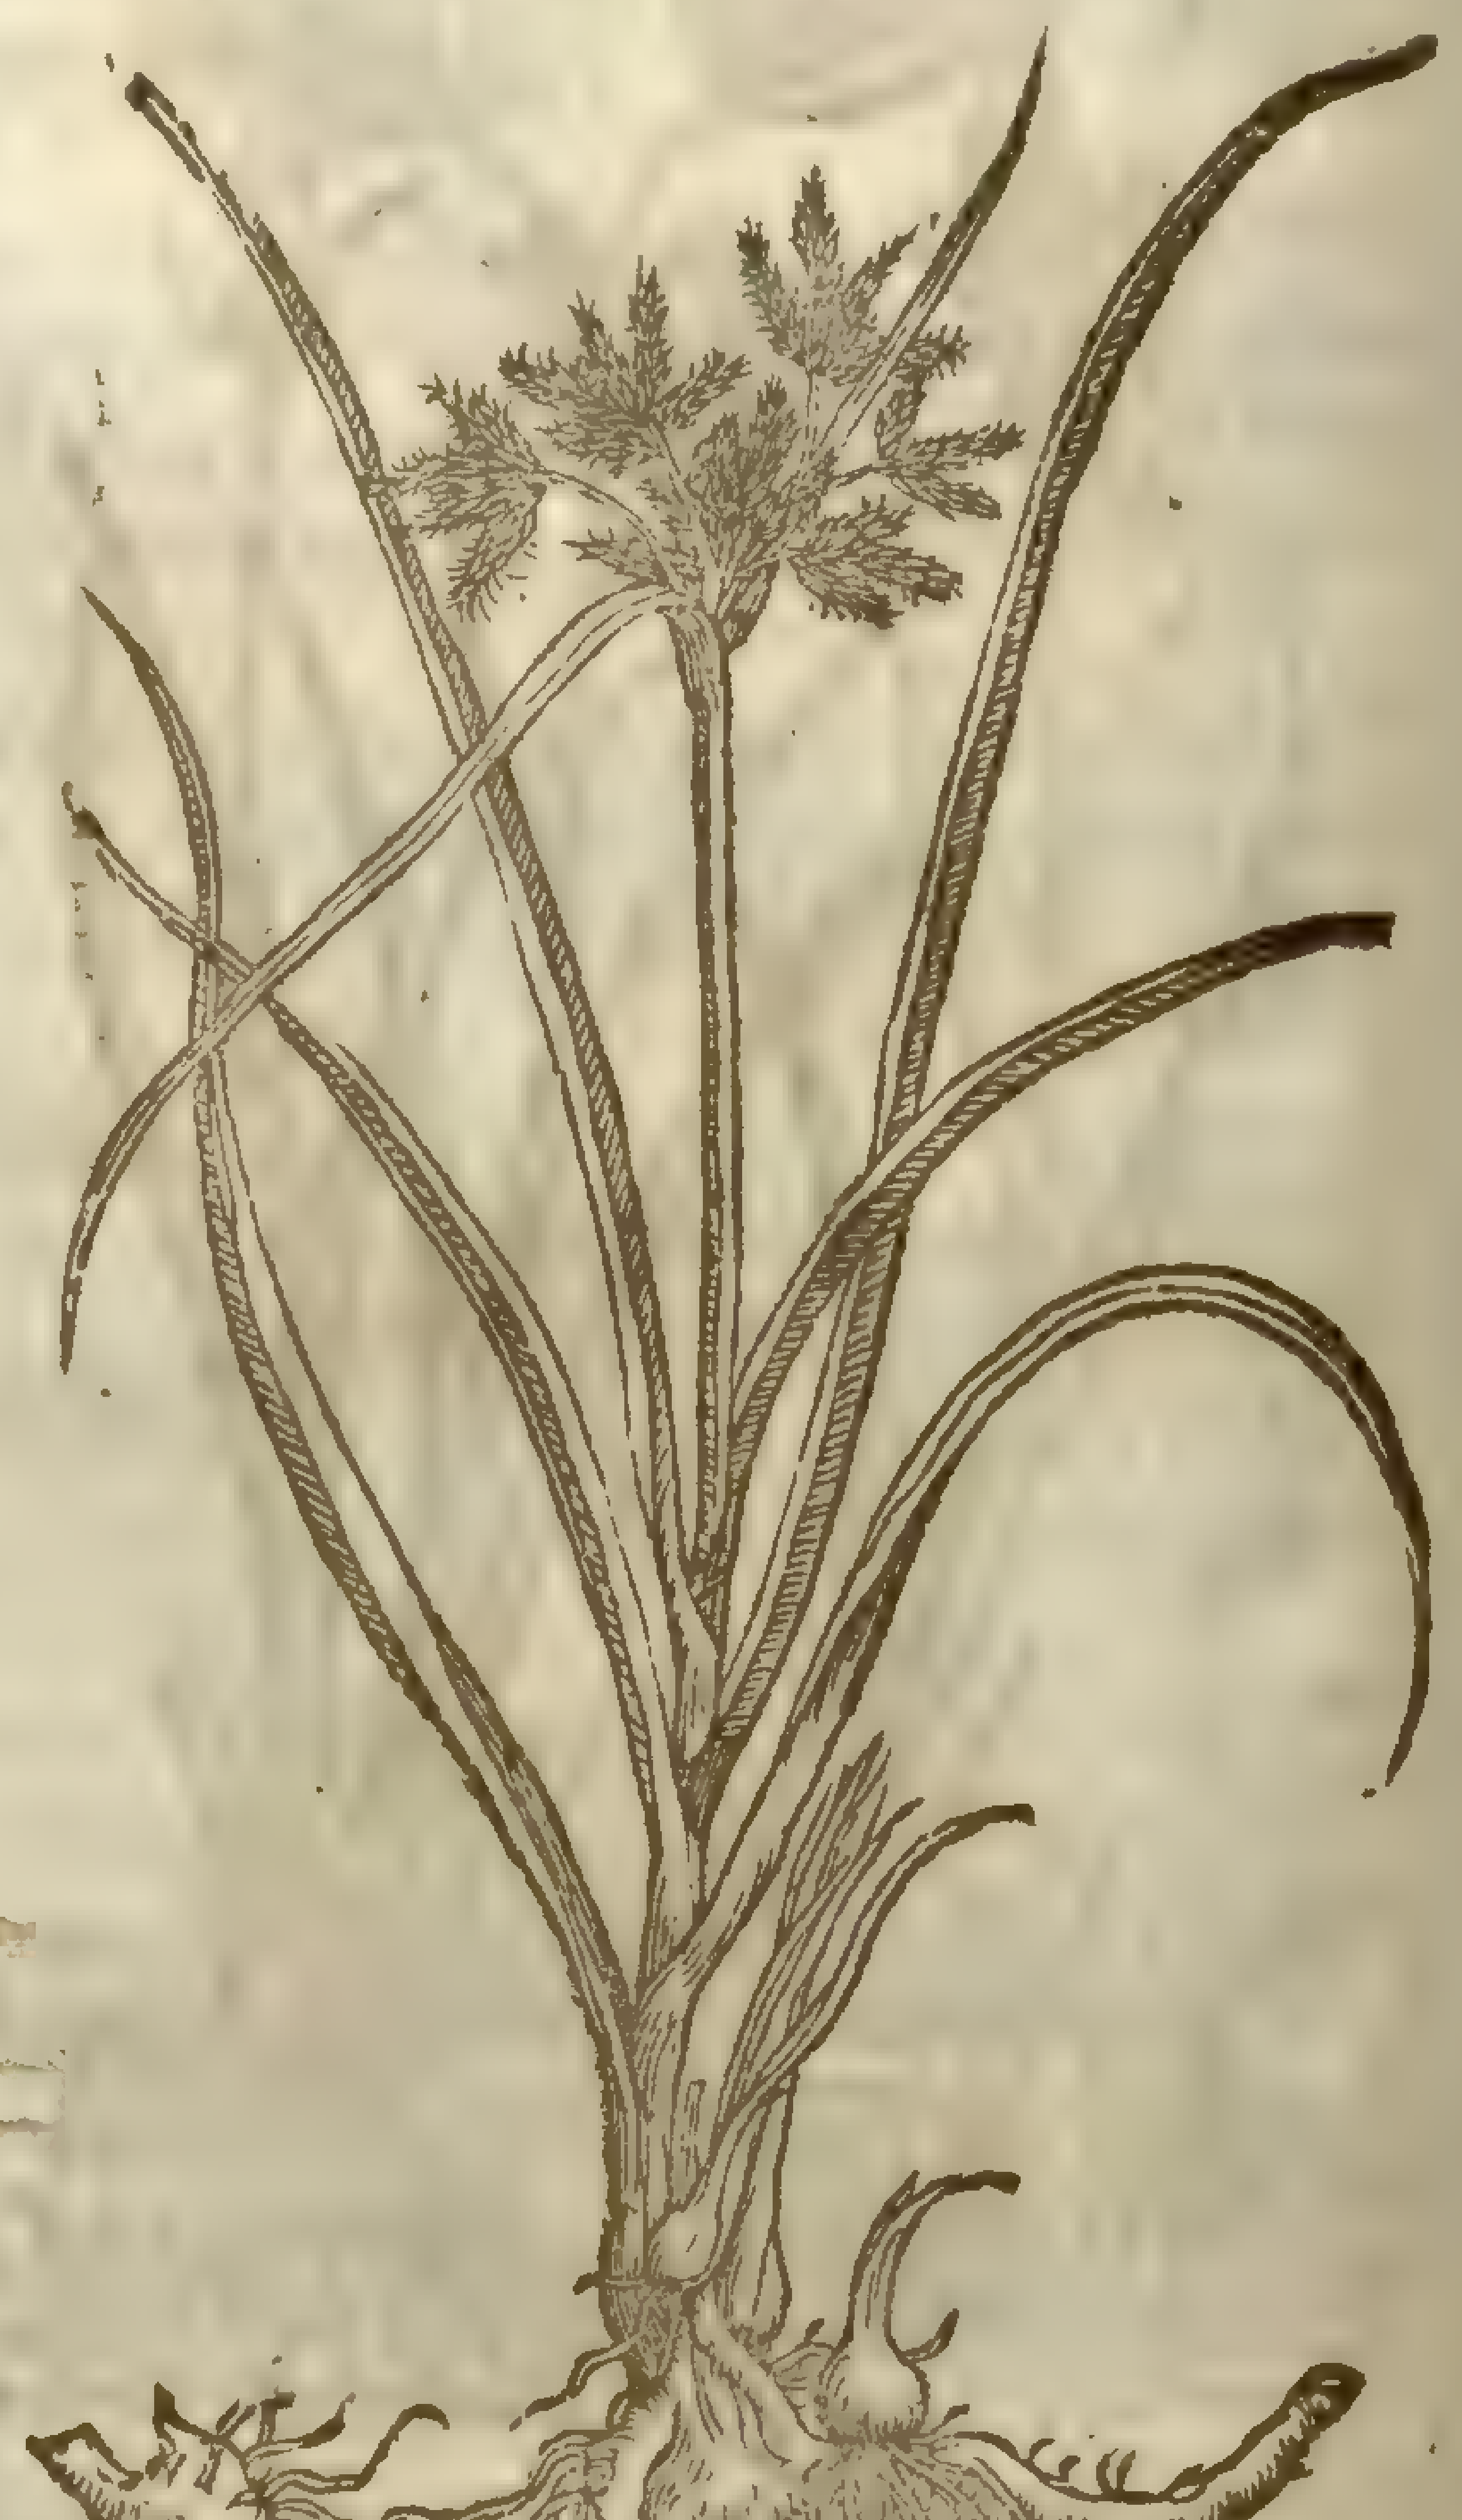
Chap. 24. *Of Engliſh Galingale.*

1 *Cyperus longus.*
Engliſh Galingale.



C. longus [illegible] Sim. pl. 1. 53

2 *Cyperus rotundus vulgaris.*
Round Galingale.



¶ *The Deſcription.*

1 English Galingale hath leaues like vnto the common Reed, but leſſer and ſhorter. His ſtalke is three ſquare, two cubits high : vpon whoſe top ſtand ſundry branches, euery little branch bearing many ſmall chaffie ſpikes. The root is blacke and very long, creeping hither and thither, occupying much ground by reaſon of his ſpreading : it is of a moſt ſweet and pleaſant ſmell when it is broken.

2 The common round *Cyperus* is like the former in leaues and tops, but the roots are here and there knotty and round, and not altogether ſo well ſmelling as the former.

‡ 3 There is alſo another *Cyperus* which growes in Syria and Ægypt, whoſe roots are round, blackiſh, and large, many hanging vpon one ſtring, and hauing a quicke and aromaticke ſmell: the leaues and ſpoky tufts reſemble the former.

4 There is ſaid to be another kinde of this laſt deſcribed, which is leſſer, and the roots are blacker, and it growes in Creet, now called Candy.

5 There is alſo another round *Cyperus* which growes about ditches and the bankes of Riuers whereas the ſalt water ſometimes comes: the roots of this are hard and blacke, without ſmell, many hanging ſometimes vpon one ſtring: the ſtalke and leaues are much like the former, but the heads vnlike, for they are rough and blackiſh about the bigneſſe of a filbert, and hang ſome ſix or ſeuen at the top of the ſtalke. It floures in Iuly and Auguſt. ‡

¶ *The Place and Time.*

1 2 The firſt and ſecond of theſe grow naturally in fenny grounds, yet will they proſper exceedingly in gardens, as expreience hath taught vs.

3 4 The former of theſe growes naturally in Syria and Ægypt, the later in Candy.

5 This growes plentifully in the Mariſhes below Graueſend, in Shipey, Tenet, and other places.

¶ *The Names in generall.*

Cyperus is called in Greeke, Κύπειρος, or Κύπειρις: of the Latines as well *Cypirus* as *Cyperus*: of ſome, *Iuncus quadratus*: of *Pliny*, *Iuncus Angulosus*, and *Triangularis*: of others, *Aſpalathum* and *Eryſiſceptron*: in French, *Souchet*: in Dutch, **Galgan**: in Spaniſh, *Iunco odoroſa*: by vs, *Cyperus* and Engliſh Galingale.

† ¶ *The Names in particular.*

1 This is called, *Cyperus longus*, and *Cyperus longus Odoratior*: in Engliſh, common *Cyperus*, and Engliſh Galingale. 2 This is called, *Cyperus rotundus vulgaris*, Round Engliſh Galingale. 3 *Cyperus rotundus Syriacus*, or *Ægyptiacus*, Syrian, or Ægyptian round *Cyperus*. 4 *Cyperus minor Creticus*, Candy round *Cyperus*. 5 *Cyperus rotundus inodorus Littoreus*, Round ſalt marſh *Cyperus*, or Galingale. †

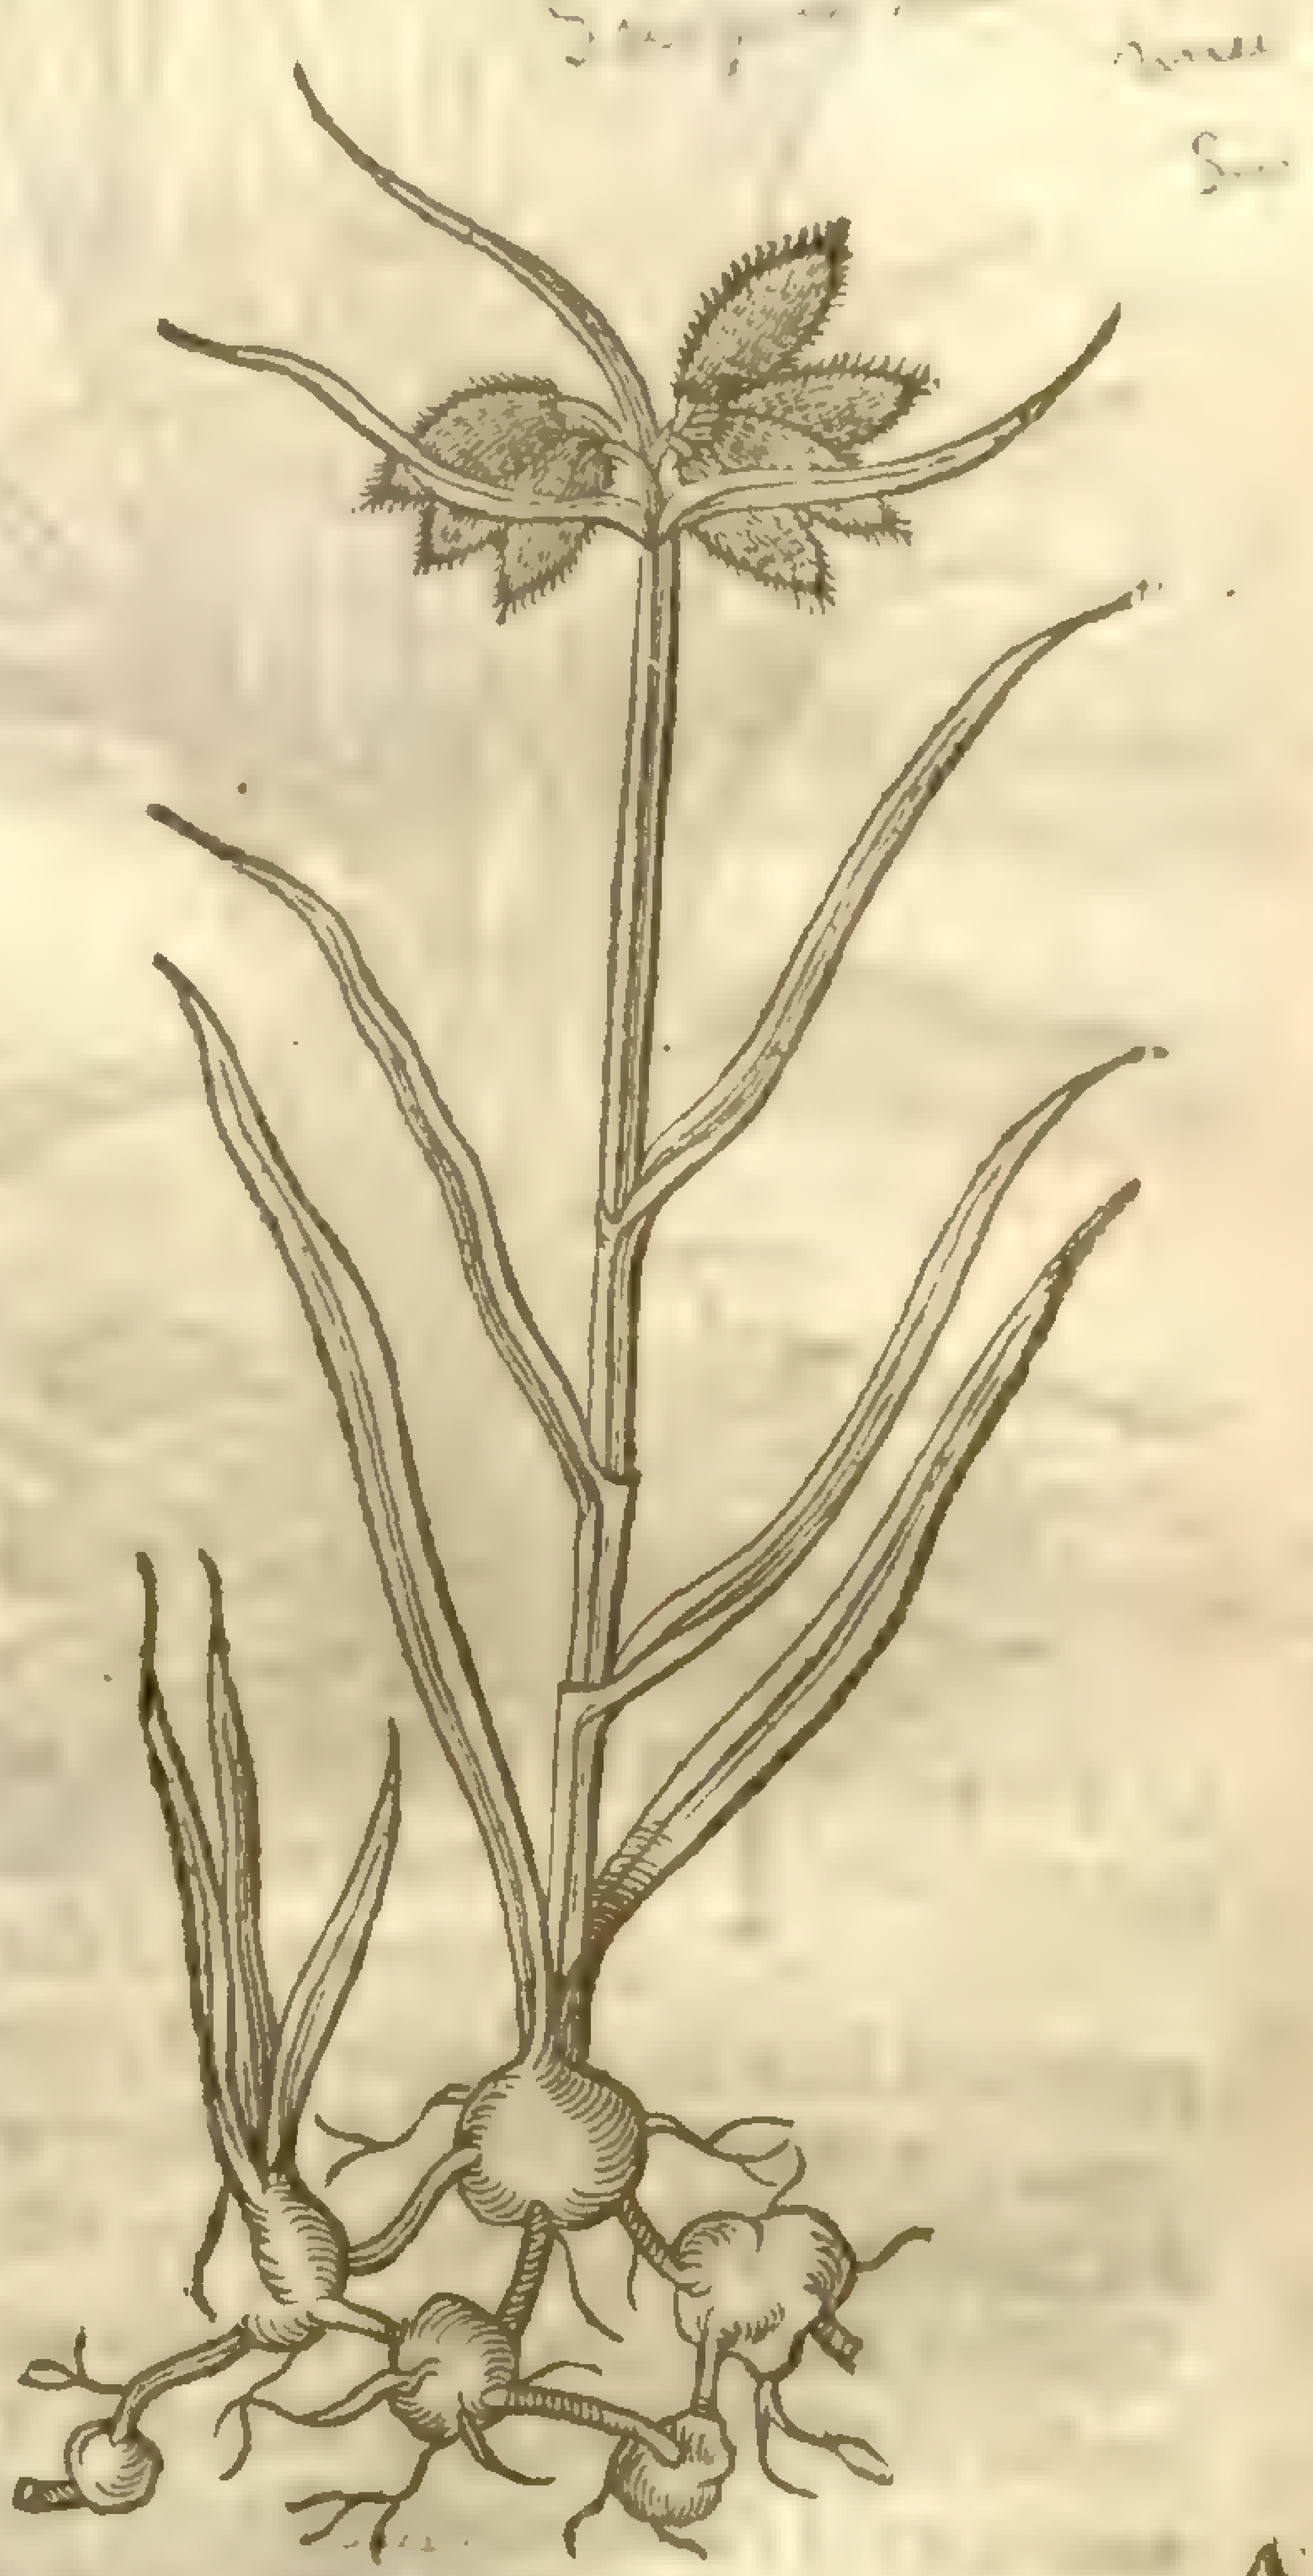
¶ *The Nature.*

Dioſcorides ſaith, That *Cyperus* hath an heating qualitie. *Galen* ſaith, the roots are moſt effectuall in medicine, and are of an heating and drying qualitie: and ſome doe reckon it to be hot and dry in the ſecond degree.

¶ *The Vertues.*

It maketh a moſt profitable drinke to breake and expell grauell, and helpe the dropſie. A

5 *Cyperus rotundus littoreus.*
Round Salt-marſh *Cyperus.*



If it be boiled in wine, and drunke, it prouoketh vrine, driueth forth the ſtone, and bringeth down the naturall ſickneſſe of women. B

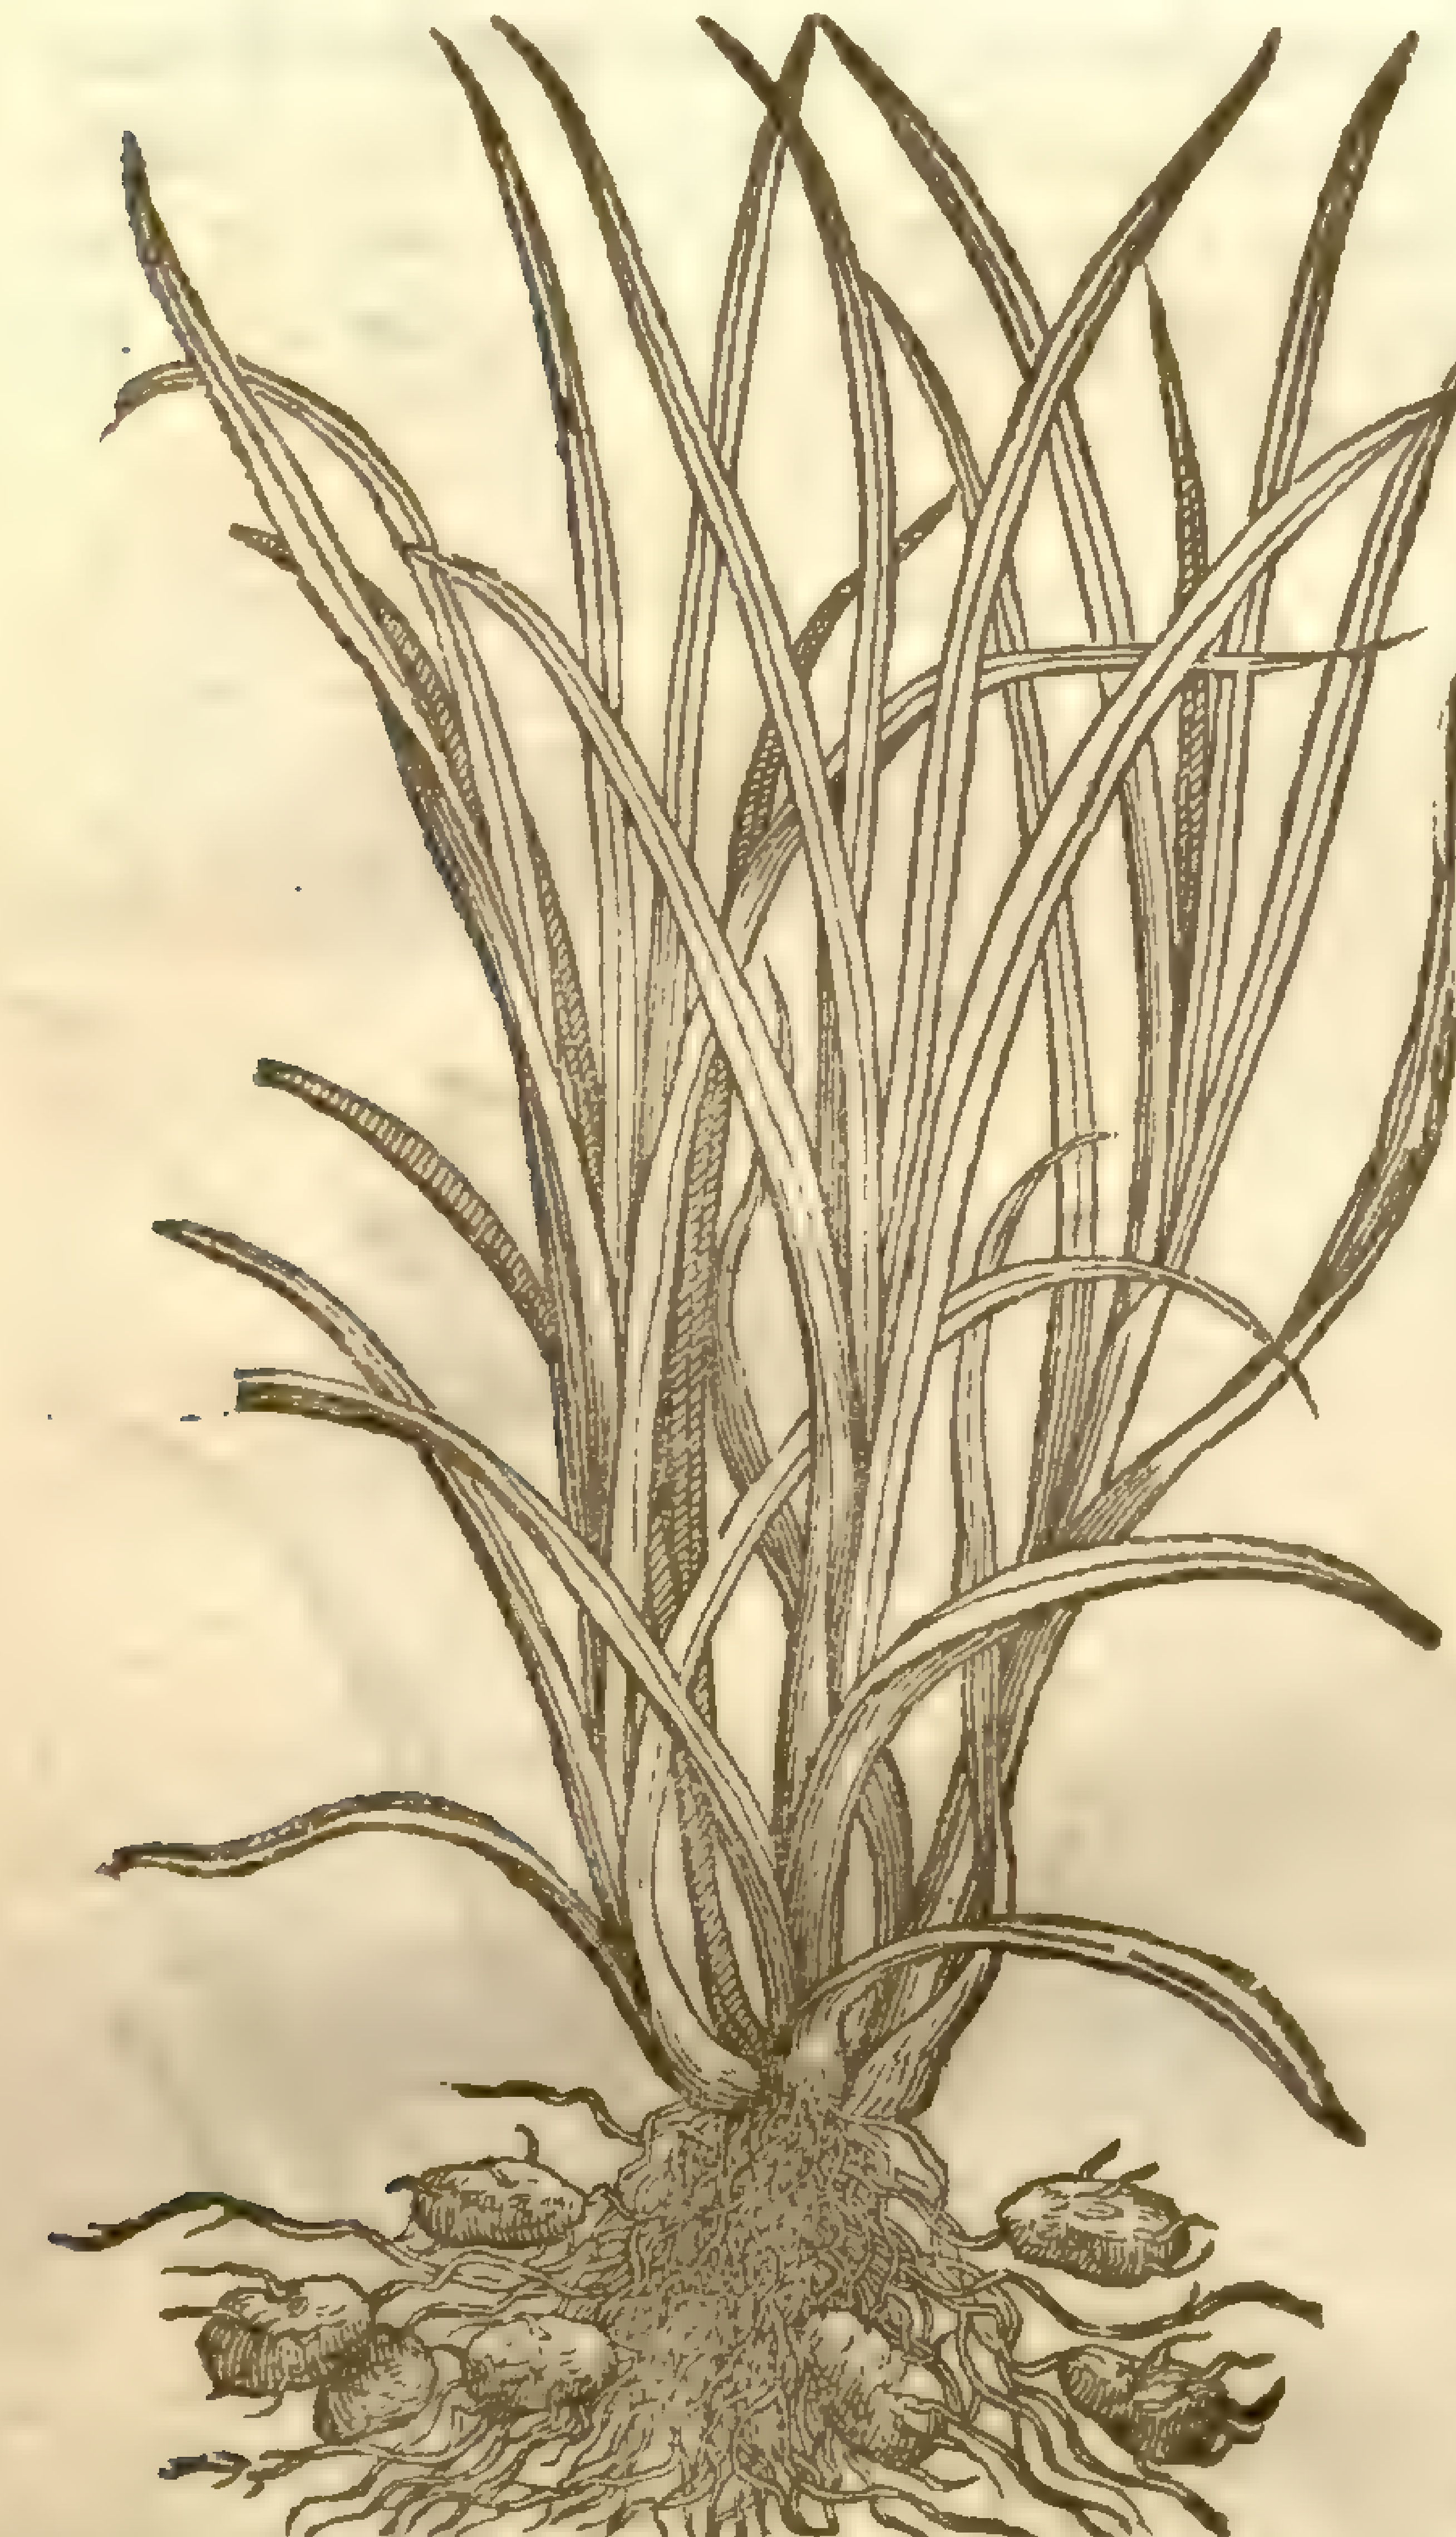
The ſame taken as aforeſaid, is a remedie againſt the ſtinging and poyſon of Serpents. C

Fernelius ſaith, The root of *Cyperus* vſed in Baths helpeth the coldneſſe and ſtopping of the matrix, and prouoketh the tearmes. D

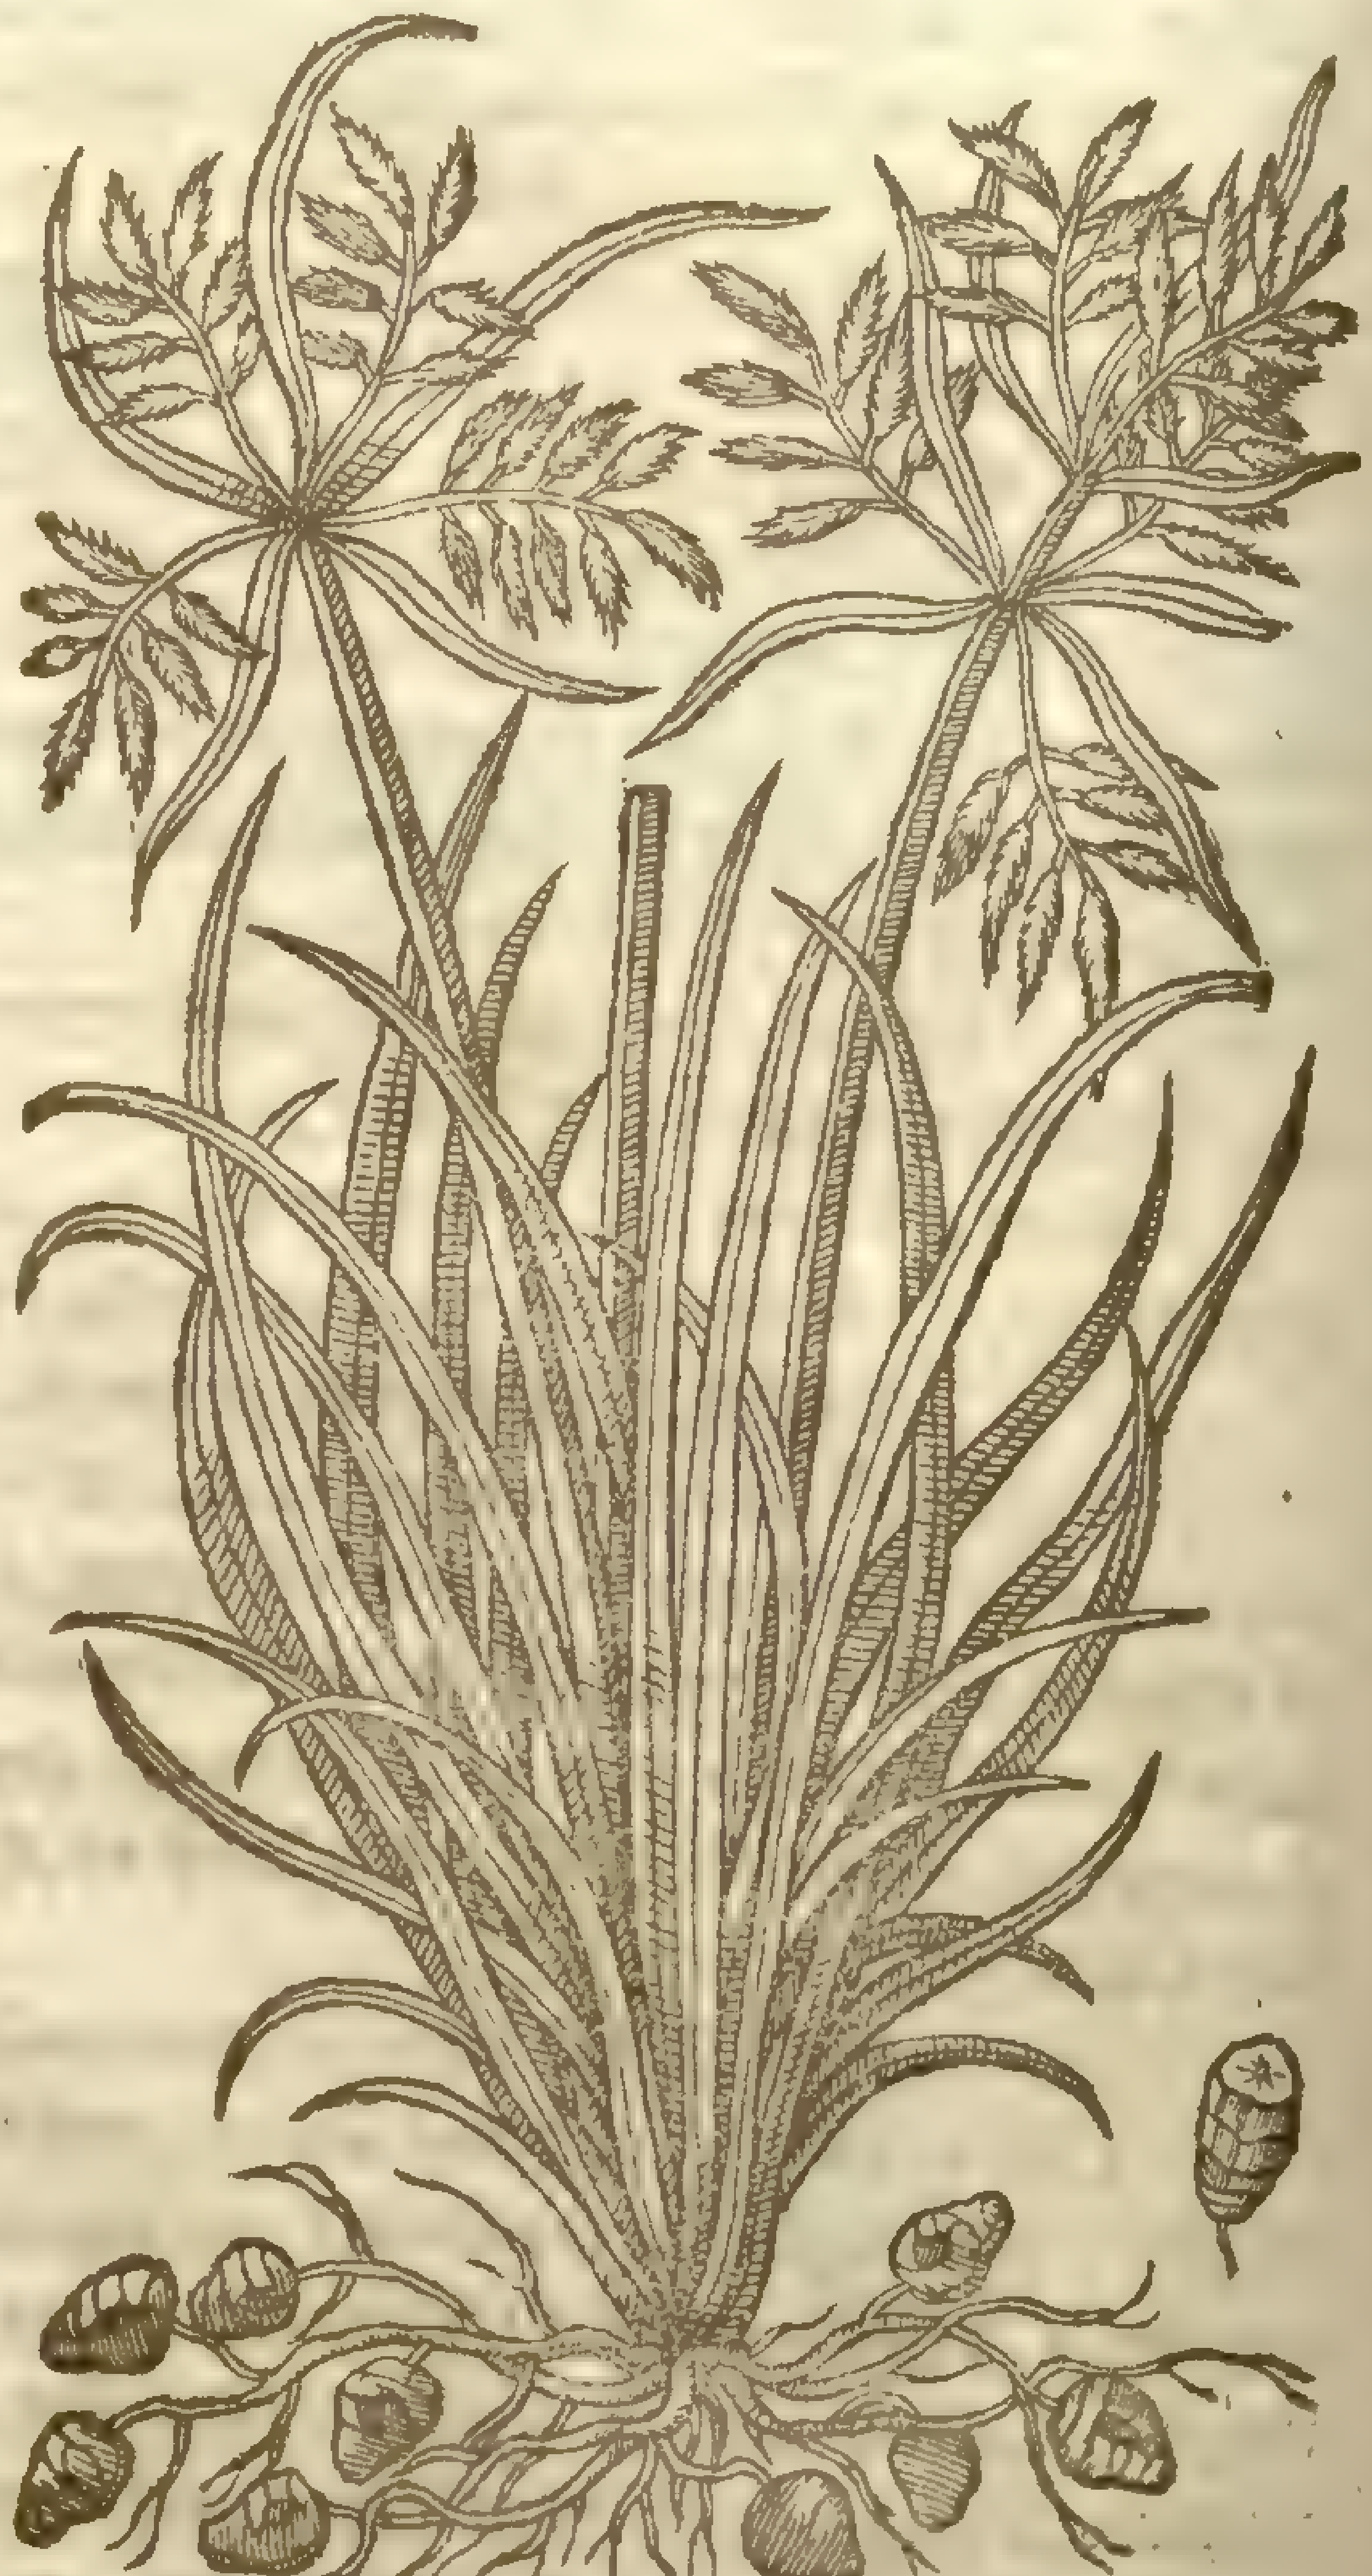
He writeth alſo, that it increaſeth bloud by warming the body, and maketh good digeſtion; wonderfully refreſhing the ſpirits, and exhilerating the minde, comforting the ſenſes, and increaſing their liuelineſſe, reſtoring the colour decayed, and making a ſweet breath. E

The powder of *Cyperus* doth not onely dry vp all moiſt vlcers, either of the mouth, priuy members and fundament, but ſtaieth the humor and healeth them, though they be maligne and virulent, according to the iudgement of *Fernelius*. F

‡ Chap. 24. *Of Italian Traſi, or Spaniſh Galingale.*



1 *Cyperus Eſculentus ſiue Caule & flore.*
Italian Traſi, or Spaniſh Galingall, without ſtalke and floure.



2 *Cyperus Eſculentus, ſiue Traſi Italorum.*
Italian Traſi, or Spaniſh Galingall.

C. esculentus, L. [illegible]

‡ 1 The Italian Traſi, which is here termed Spaniſh Galingale, is a plant that hath many ſmall roots, hanging at ſtringy fibres like as our ordinary Dropwort roots doe, but they are of the bigneſſe of a little Medlar, and haue one end flat and as it were crowned like as a Medlar, and it hath alſo ſundry ſtreakes of lines, ſeeming to diuide it into ſeuerall parts; it is of a browniſh colour without, and white within; the taſt thereof is ſweet almoſt like a Cheſnut. The leaues are very like thoſe of the garden *Cyperus*, and neuer exceed a cubit in length. Stalkes, floures, or ſeed it hath none, as *Iohn Pona* an Apothecary of Verona, who diligently obſerued it nigh to that city whereas it naturally growes, affirmes; but hee ſaith there grows with it much wild *Cyperus*, which as he judges hath giuen occaſion of their error who gaue it the ſtalkes and floures of *Cyperus*, or Engliſh Galingale, as *Matthiolus* and others haue done. It is encreaſed by ſetting the roots, firſt ſteeped in water, at the beginning of Nouember. I haue here giuen you the figure of it without the ſtalke, according to *Pona*, and with the ſtalke, according to *Matthiolus* and others.

¶ *The Names.*

The Italian Traſi is called in Greeke by *Theophraſtus* Μαλιναθάλλη, *Hiſt. plant*. 4. *cap*. 10. as *Fabius Columna* hath proued at large: *Pliny* tearmes it, *Anthalium*: the later writers, *Cyperus Eſculentus*, and *Dulcichinum*: The Italians, *Traſi*, and *Dolzolini*, by which names in Italy they are cryed vp and downe the ſtreets, as Oranges and Lemmons are here.

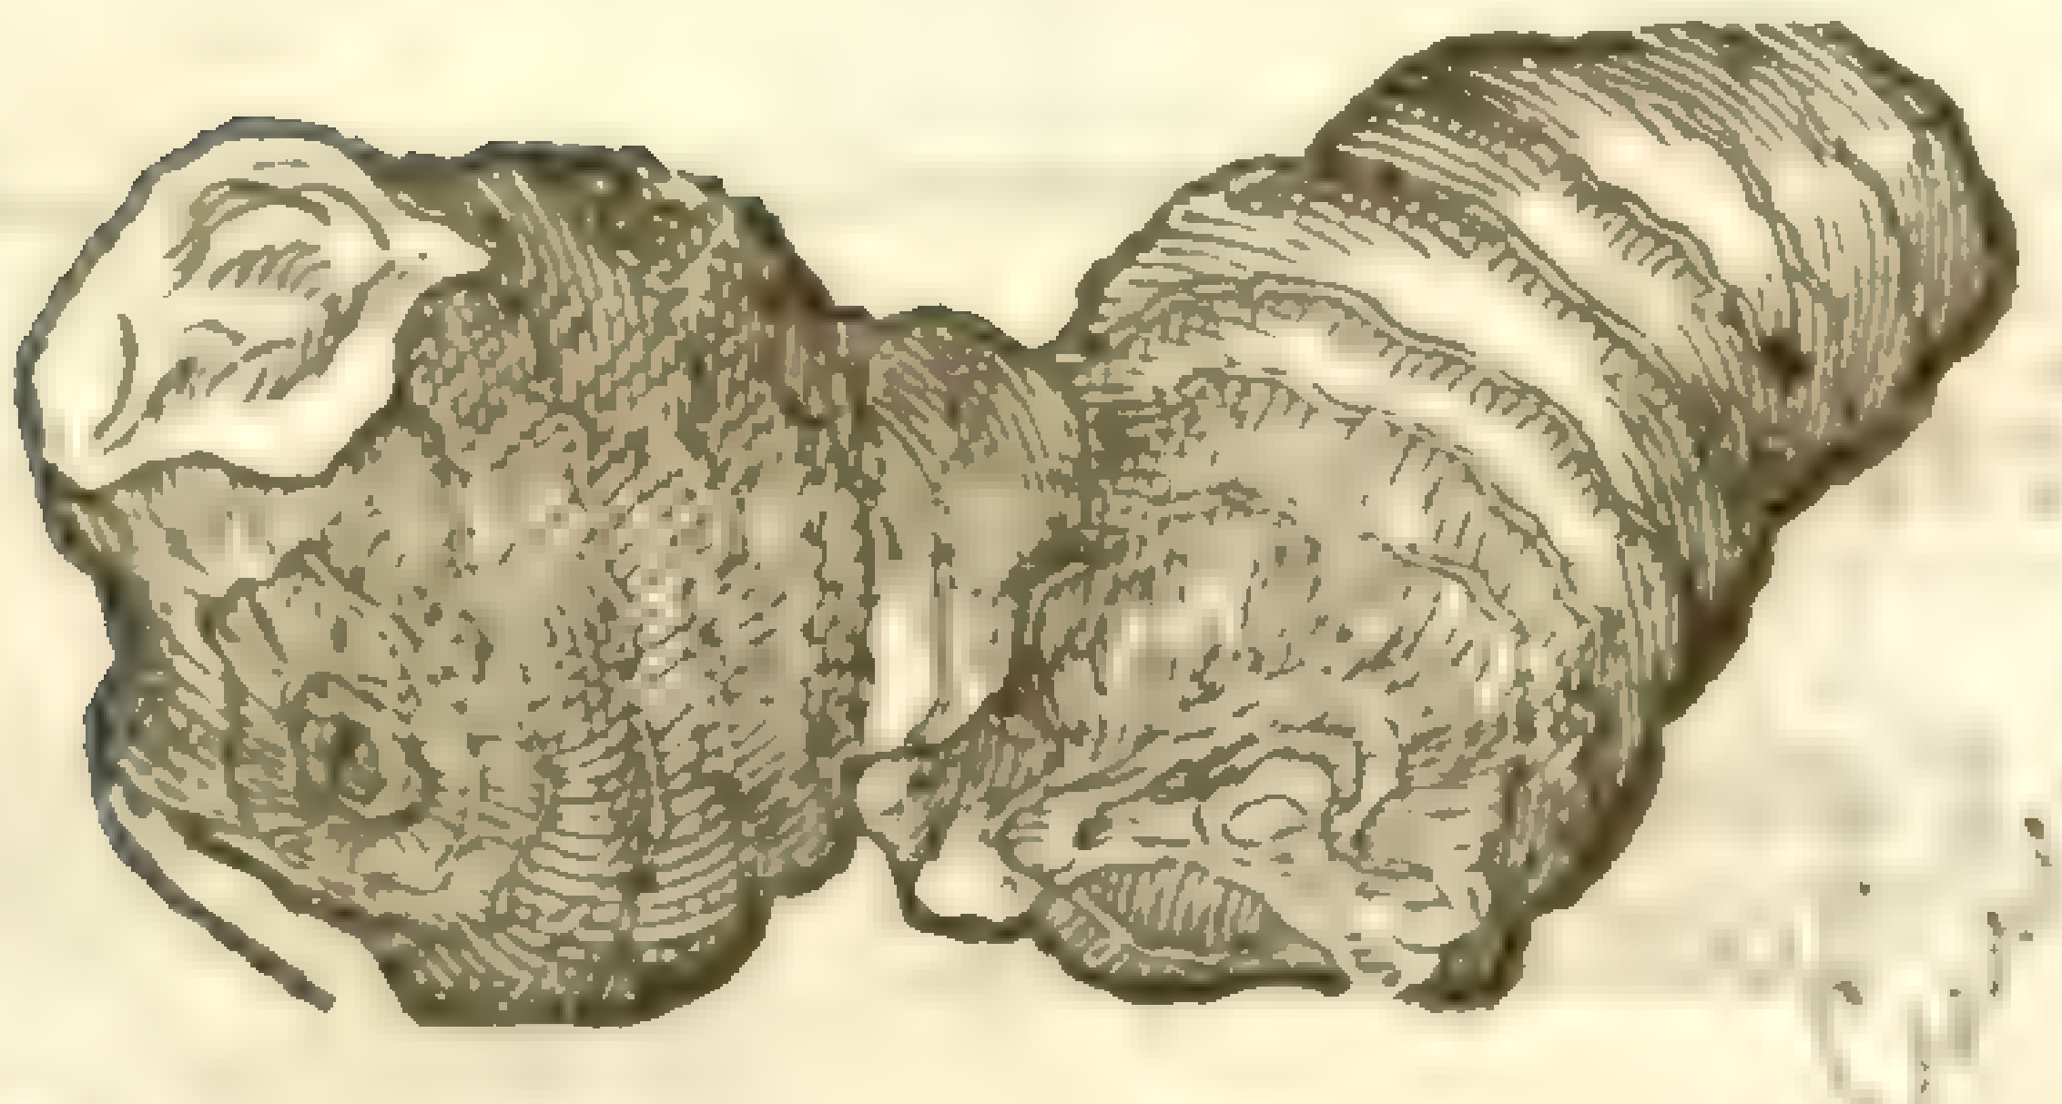
¶ *The Temperature and Vertues.*

A The milke or creame of theſe Bulbous roots being drunke, mundifies the breſt and lungs, wherefore it is very good for ſuch as are troubled with coughs. Now you muſt beat theſe roots, and macerate them in broth, and then preſſe out the creame through a linnen cloath, which by ſome late Writers is commended alſo to be vſed in venereous potions.

B The ſame creame is alſo good to be drunke againſt the heate and ſharpeneſſe of the vrine, eſpecially if you in making it do adde thereto the ſeeds of Pompions, Gourds, and Cucumbers. The Citiſens of Verona eate them for dainties, but they are ſomewhat windy. ‡

‡ CHAP. 26. *Of the true Galingale, the greater and the leſſer.*

‡ 1 *Galanga major.*
The greater Galingale.



Curcuma longa [illegible]

‡ 2 *Galanga minor.*
The leſſer Galingale.

THe affinitie of name and nature hath induced me in this place to inſert theſe two, the bigger and the leſſer Galingale; firſt therefore of the greater.

¶ *The Deſcription.*

1 THe great Galingale, whoſe root onely is in vſe, and brought to vs from Iava in the Eaſt Indies, hath flaggie leaues ſome two cubits high, like thoſe of Cats-taile or Reed-mace: the root is thicke and knotty, reſembling thoſe of our ordinary flagges, but that they are of a more whitiſh colour on the inſide, and not ſo large. Their taſte is very hot and biting, and they are ſomewhat reddiſh on the outſide.

2 The leſſer growing in China, and commonly in ſhops called Galingale, without any addition, is a ſmall root of a browniſh red colour both within and without; the taſte is hot and biting, the ſmell aromaticall, the leaues (if we may beleeue *Garcias ab Horto*) are like thoſe of Myrtles.

¶ *The Names.*

1 The firſt is called by *Matthiolus*, *Lobel*, and others, *Galanga major.* Some thinke it to be the *Acorus* of the Ancients: and *Pena* and *Lobel* in their *Stirp. Aduerſ.* queſtion whether it be not the *Acorus Galaticus* of *Dioſcorides.* But howſoeuer, it is the *Acorus* of the ſhops, and by many vſed in Mithridate in ſtead of the true. The Indians call it *Lancuaz.*

2 The leſſer is called *Galanga*, and *Galanga minor*, to diſtinguiſh it from the precedent. The Chinois call it, *Lauandon*: the Indians, *Lancuaz*: we in Engliſh tearme it, Galingale, without any addition.

¶ *The Temperature and Vertues.*

Theſe roots are hot and dry in the third degree, but the leſſer are ſomewhat the hotter.

A They ſtrengthen the ſtomacke, and mitigate the paines thereof ariſing from cold and flatulencies.

B The ſmell, eſpecially of the leſſer, comforts the too cold braine; the ſubſtance thereof being chewed ſweetens the breath. It is good alſo againſt the beating of the heart.

C They are vſefull againſt the Collicke proceeding of flatulencies, and the flatulent affects of the wombe; they conduce to venery, and heate the too cold reines. To conclude, they are good againſt all cold diſeaſes. ‡

‡ CHAP. 27. *Of Turmericke.*

THis alſo challengeth the next place, as belonging to this Tribe, according to *Dioſcorides*; yet the root, which onely is brought vs, and in vſe, doth more on the outſide reſemble Ginger, but that it is yellower, and not ſo flat, but rounder. The inſide thereof is of a Saffron colour, the taſte hot and bitteriſh: it is ſaid to haue leaues larger than thoſe of Millet, and a leafie ſtalke. There is ſome varietie of theſe roots, for ſome are longer and ſome rounder, and the later are the hotter, and they are brought ouer oft times together with Ginger.

¶ *The Place.*

It growes naturally in the Eaſt-Indies about Calecut, as alſo at Goa.

¶ *The Names.*

This without doubt is the *Cyperus Indicus* of *Dioſcorides, Lib. 1. Cap. 4.* It is now vulgarly by moſt Writers, and in ſhops called by the name of *Terra merita*, and *Curcuma:* yet ſome terme it *Crocus Indicus*, and we in Engliſh call it, Turmericke.

¶ *The Temperature and Vertues.*

A This root is certainely hot in the third degree, and hath a qualitie to open obſtructions, and it is vſed with good ſucceſſe in medicines againſt the yellow Iaundiſe, and againſt the cold diſtempers of the liuer and ſpleene.

‡ Chap. 28. *Of Zedoarie.*

Zedoarie is alſo a root growing naturally in the woods of Malaver about Calecut and Cananor in the Indies; the leaues thereof are larger than Ginger, and much like them; the root is alſo as large, but conſiſting of parts of different figures, ſome long and ſmall, others round; their colour is white, and oft times browniſh on the inſide, and they haue many fibres comming out of them, but they are taken away together with the outward rinde before they come to vs. Theſe roots haue a ſtrong medicine-like ſmell, and ſomewhat an vngratefull taſte.

‡ *Zerumbeth, ſiue Zedoaria rotunda.*
Round Zedoarie.

¶ *The Names.*

Some call the long parts of theſe roots *Zedoaria*, and the round (whoſe figure we here giue you) *Zerumbeth*, and make them different, whenas indeed they are but parts of the ſame root, as *Lobel* and others haue well obſerued. Some make *Zedoaria* and *Zerumbeth* different, as *Auicen*: others confound them and make them one, as *Rhaſes* and *Serapio*. Some thinke it to be Ἀρνάβω of *Ægineta*: but that is not ſo; for he ſaith, τῶν ἀρωματιζόντων ἐστὶν, ὅθεν τοῖς μύροις μάλιστα μίγνυται; It is an Aromaticke, and therefore chiefely mixed in ointments: which is as much as if he ſhould haue ſaid, That it was put into ointments for the ſmells ſake, which in this is no waies gratefull, but rather the contrary.

¶ *The Temperature and Vertues.*

A It is hot and dry in the ſecond degree; it diſcuſſes flatulencies, and fattens by a certaine hidden qualitie. It alſo diſſipates and amends the vngratefull ſmell which Garlicke, Onions, or too much wine infect the breath withall, if it be eaten after them. It cures the bites and ſtings of venomous creatures, ſtops laskes, reſolues the Abſceſſes of the wombe, ſtaies vomiting, helpes the Collicke, as alſo the paine of the ſtomacke.

B It kils all ſorts of wormes, and is much vſed in Antidotes againſt the plague, and ſuch like contagious diſeaſes. ‡

Chap. 29. *Of Ruſhes.*

‡ I Do not here intend to trouble you with an accurate diſtinction and enumeration of Ruſhes; for if I ſhould, it would be tedious to you, laborious to me, and beneficial to neither. Therefore I will onely deſcribe and reckon vp the chiefe and more note-worthy of them, beginning with the moſt vſuall and common. ‡

¶ *The Deſcription.*

1 The roots of our common Ruſhes are long and hairy, ſpreading largely in the ground, from which, as from one entire tuft, proceed a great company of ſmall ruſhes; ſo exceedingly well knowne, that I ſhall not need to ſpend much time about the deſcription thereof.

2 There be ſundry ſorts of Ruſhes beſides the former, whoſe pictures are not here expreſt, and the rather for that the generall deſcription of Ruſhes, as alſo their common vſe and ſeruice are ſufficient to leade vs to the knowledge of them. This great Water-Ruſh or Bul-Ruſh, in ſtead of leaues bringeth forth many ſtrait twiggie ſhoots or ſprings, which be round, ſmooth, ſharpe pointed, and without knots. Their tuft or floure breaketh forth a little beneath the top, vpon the one ſide of the Ruſh, growing vpon little ſhort ſtems like Grape cluſters, wherein is contained the ſeed after the faſhion of a ſpeares point. The roots be ſlender and full of ſtrings. *Pliny* and *Theophraſtus* before him, affirme that the roots of the Ruſh doe die euery yeare, and that it groweth

it groweth againe of the ſeed. And they affirme likewiſe that the male is barren, and groweth againe of the young ſhoots; yet I could neuer obſerue any ſuch thing.

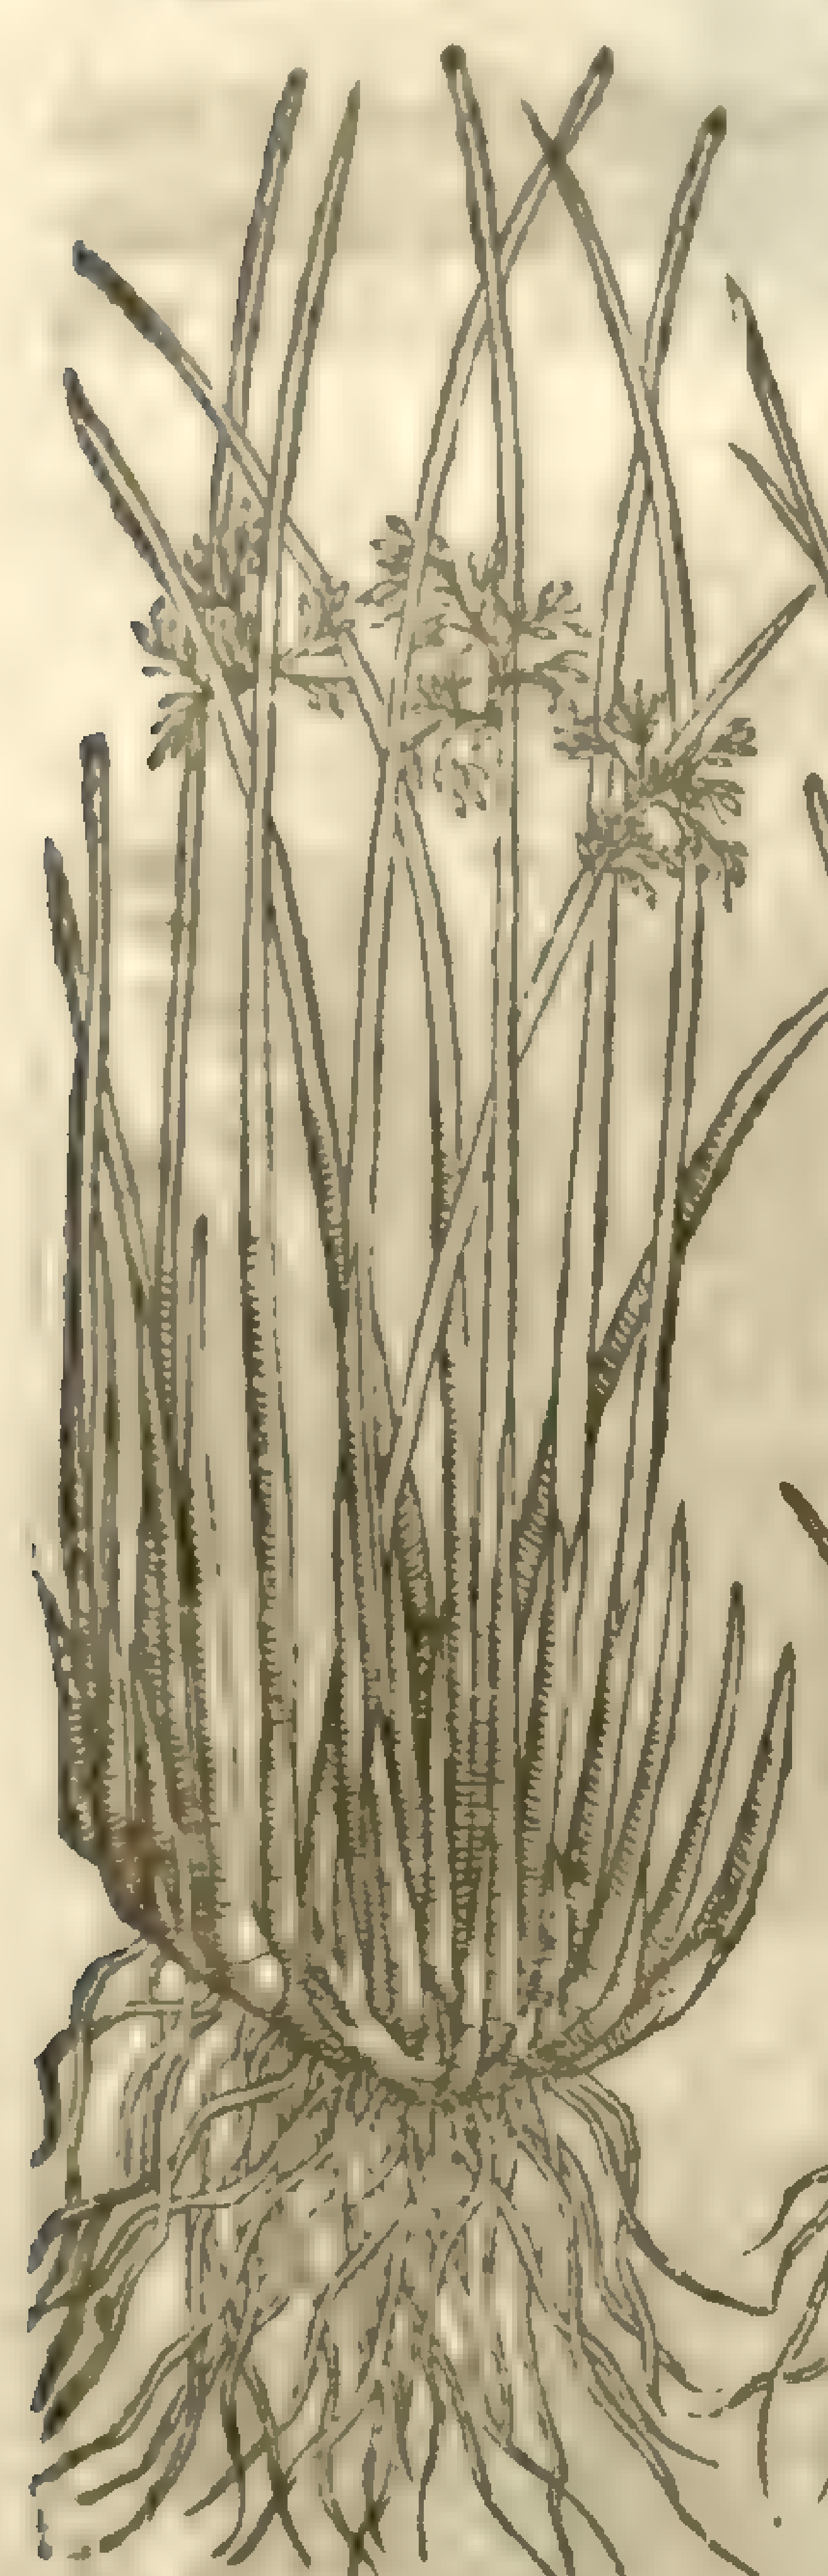
‡ 3 There growes a Ruſh to the thickneſſe of a Reed, and to ſome two yards and an halfe, or three yards high, in diuers fenny grounds of this kingdome; it is very porous and light, and they vſually make mats, and bottom chaires therewith. The ſeeds are contained in reddiſh tufts, breaking out at the top thereof. The roots are large and joynted, and it grows not, vnleſſe in waters. ‡

4 *Iuncus acutus*, or the ſharpe Ruſh, is likewiſe common and well knowne; not much differing from *Iuncus læuis*, but harder, rougher, and ſharper pointed, fitter to ſtraw houſes and chambers than any of the reſt; for the others are ſo ſoft and pithy, that they turne to duſt and filth with much treading; where contrariwiſe this ruſh is ſo hard that it laſts ſound much longer.

‡ 5 There is alſo another pretty ſmall kinde of Ruſh growing to ſome foot in height, hauing ſmooth ſtalkes which end in a head like to that of the ordinary Horſe-taile. This ruſh hath alſo one little joynt toward the bottome thereof. It growes in watery places, but not ſo frequently as the former. ‡

1 *Iuncus læuis.*
Common Ruſhes

J. effusus, L. [illegible] dict.

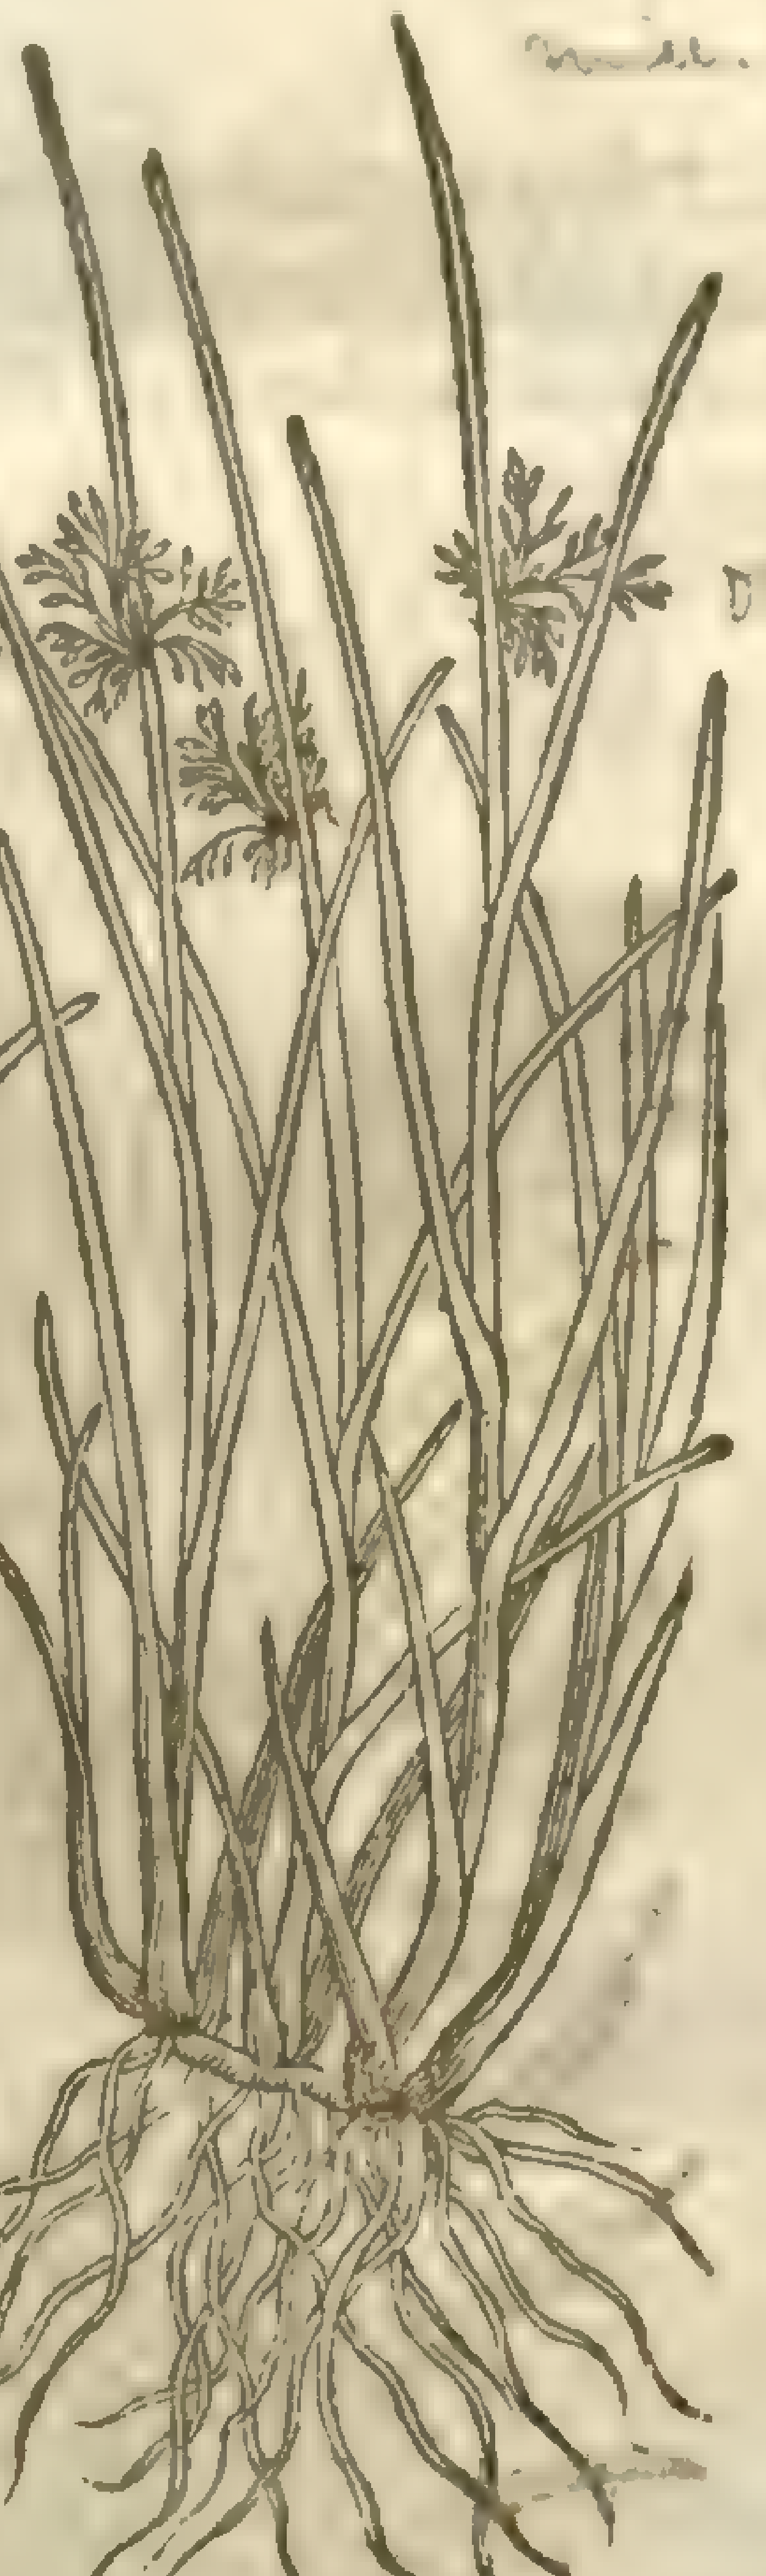


J. effusus, L

Sw. fl. 2. 162

4 *Iuncus acutus.*
Sharpe Ruſh, or hard Ruſh.

J. tenuis, Sol. [illegible] dict.



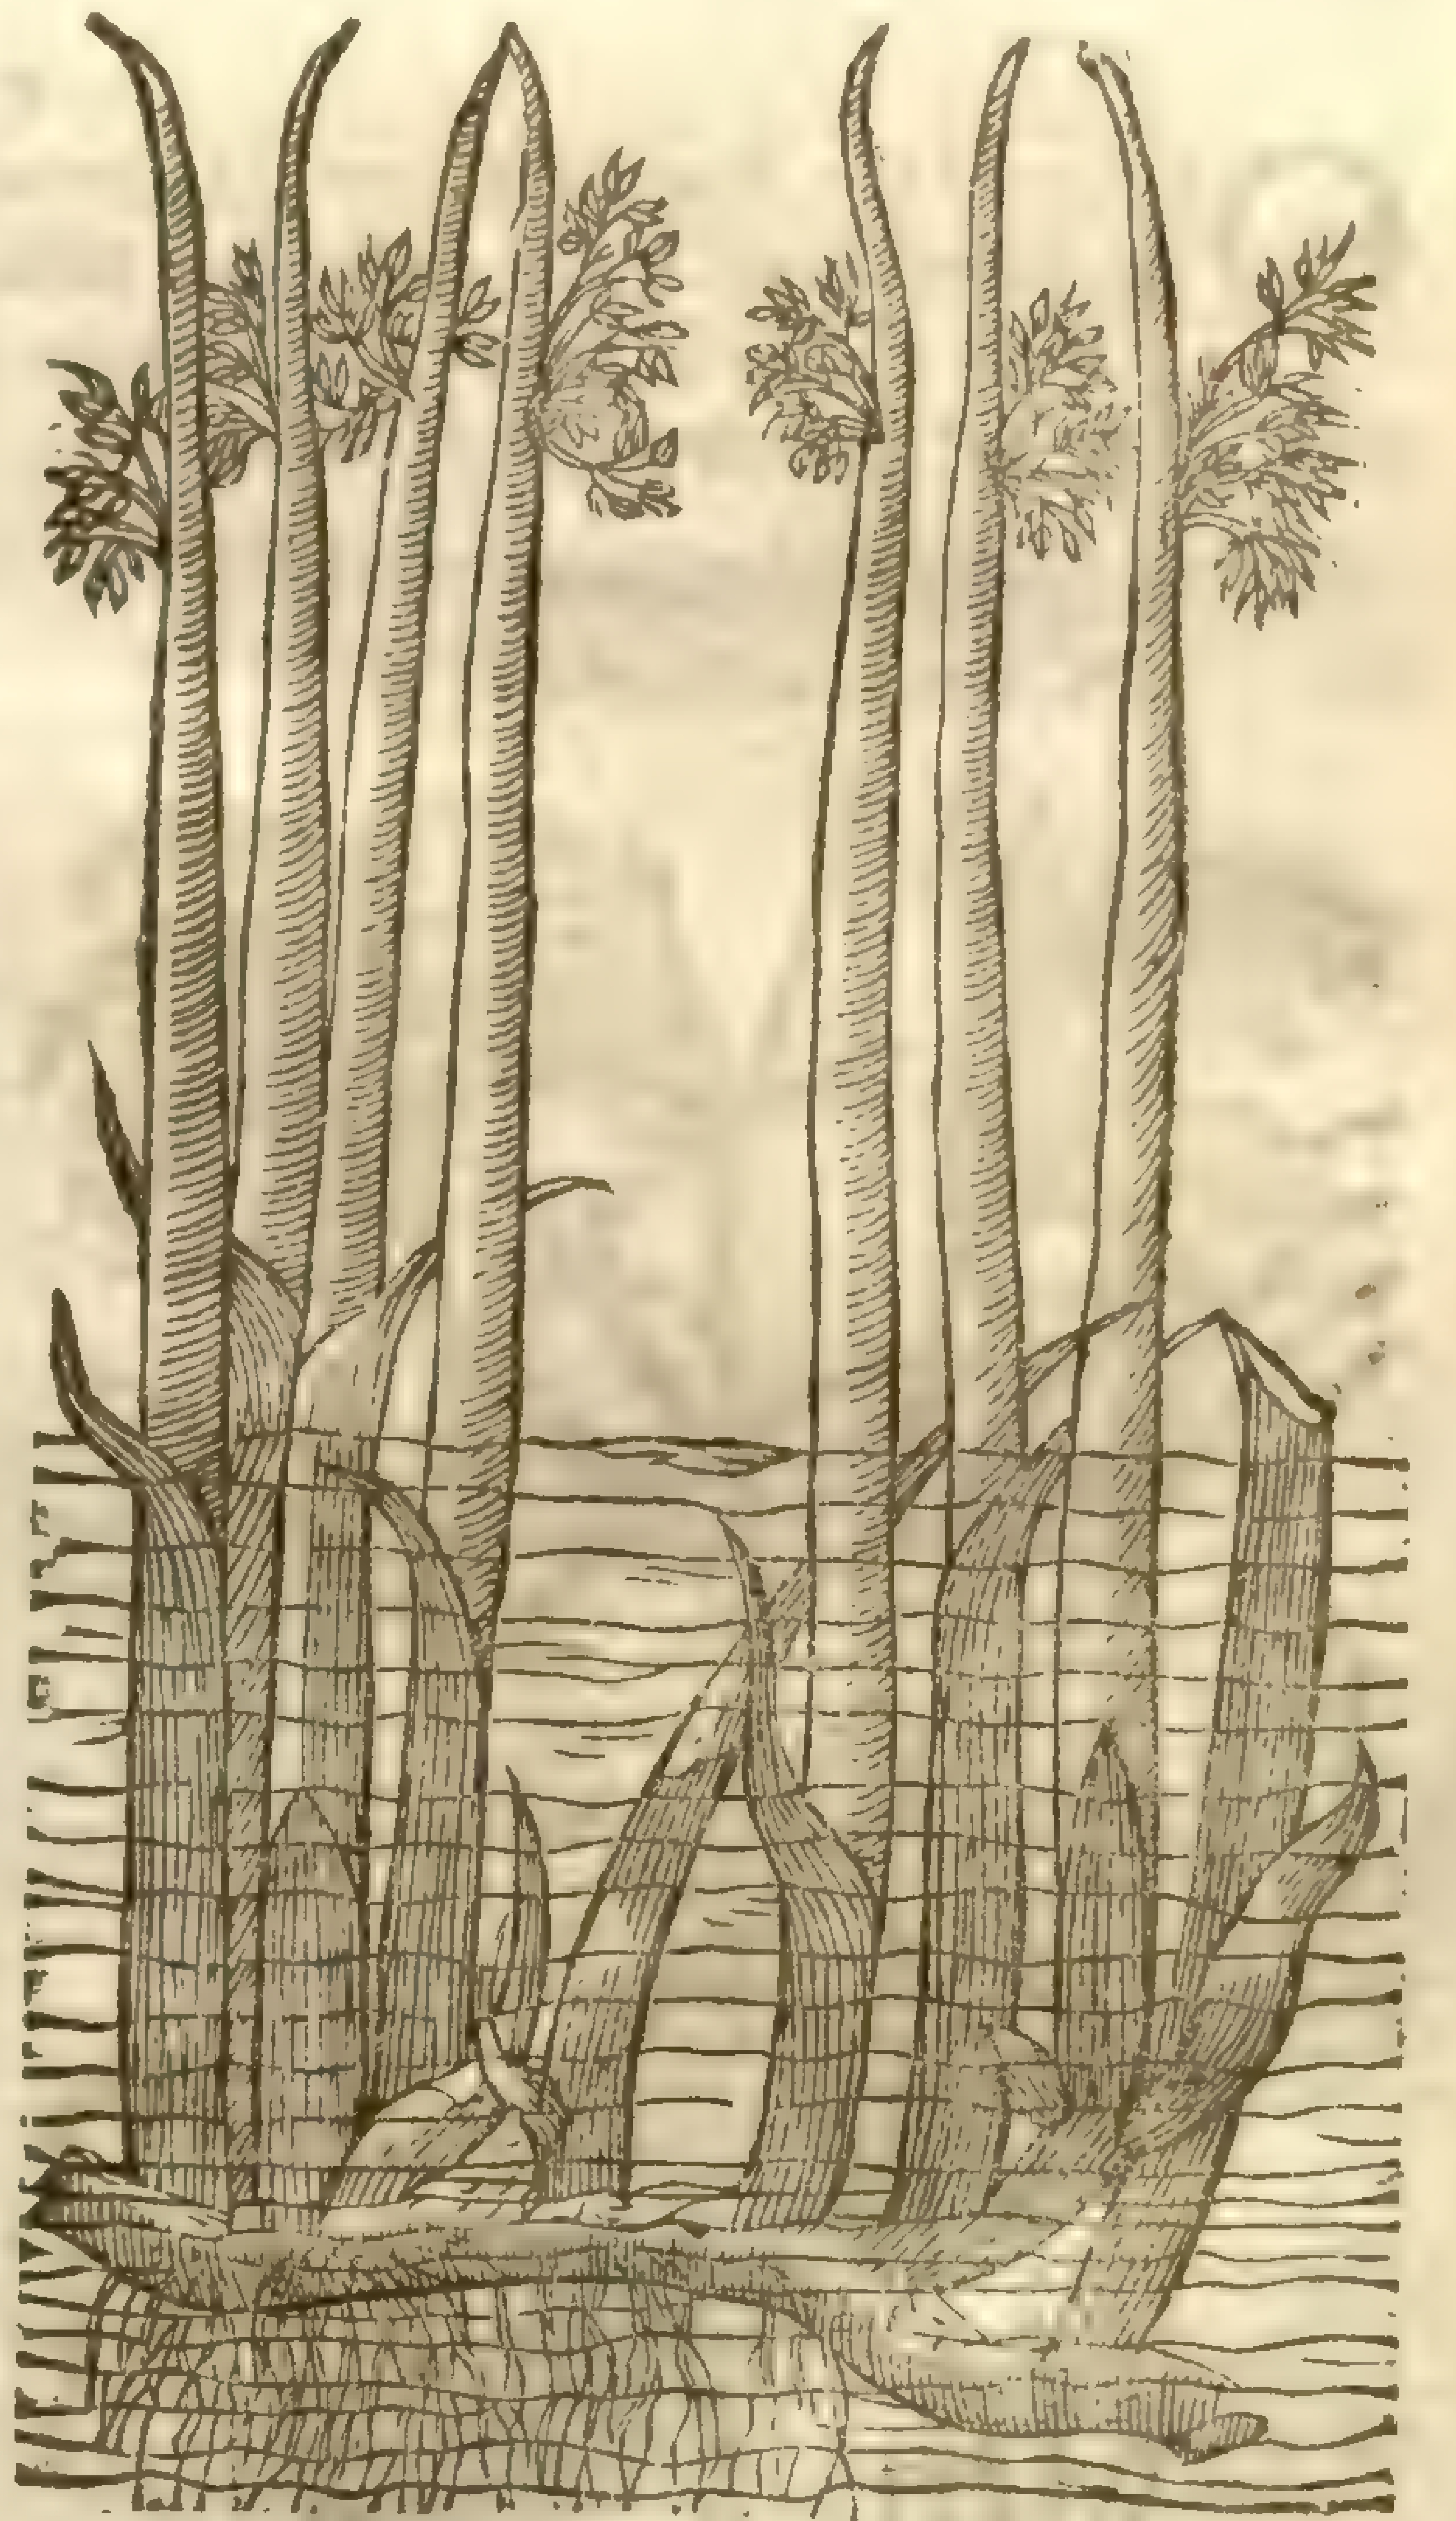
Dod. 605

J. glaucus, Sibth.

Sm. fl. 2. 160

3 *Iuncus aquaticus maximus.*
Great Water-Ruſh, or Bul-Ruſh:

Scirpus lacustris, L. [illegible] dict.



¶ *The Place.*

1 *Iuncus læuis* groweth in fertile fields, and medowes that are ſomewhat moiſt.

2 3 5 Grow in ſtanding pooles, and by riuers ſides in ſundry places.

4 *Iuncus acutus* groweth vpon dry and barren grounds, eſpecially neere the furrows of plowed land. I need not ſpeake of their time of growing, they being ſo common as they are.

¶ *The Time.*

The Ruſh is called in Greeke, σχοῖνος: in Latine, *Iuncus*: in high Dutch, **Binken**: in low Dutch, **Bieſen**: in Italian, *Giunco*: in Spaniſh, *Iunco*: in French, *Ionc*: in Engliſh, Ruſhes.

2 3 The Grecians haue called the Bul-Ruſh, ὁλόσχοινος. The greater are commonly in many places termed Bumbles.

1 *Iuncus læuis* is that Ruſh which *Dioſcorides* called σχοῖνος λεία.

4 *Iuncus acutus* is called in Greeke ὀξύσχοινος: In Dutch, **Pſeren Bieſen.**

5 This is called by *Lobel*, *Iuncus aquaticus minor Capitulis Equiſeti*: By *Daleſchampius*, *Iuncus clauatus*, or Club ruſh.

¶ *The*

¶ *The Nature and Vertues.*

A These Ruſhes are of a dry nature.

B The ſeed of Ruſhes dried at the firſt, and drunke with wine allaied with water, ſtayeth the laske and the ouermuch flowing of womens tearmes.

C *Galen* yeeldeth this reaſon thereof, becauſe that their temperature conſiſteth of an earthly eſſence, moderately cold and waterie, and meanely hot, and therefore doth the more eaſily drie vp the lower parts, and by little and little ſend vp the cold humors to the head, whereby it prouoketh drowſineſſe and deſire to ſleepe, but cauſeth the head-ache; whereof *Galen* yeeldeth the reaſon as before.

D The tender leaues that be next the root make a conuenient ointment againſt the biting of the Spider called *Phalangium*.

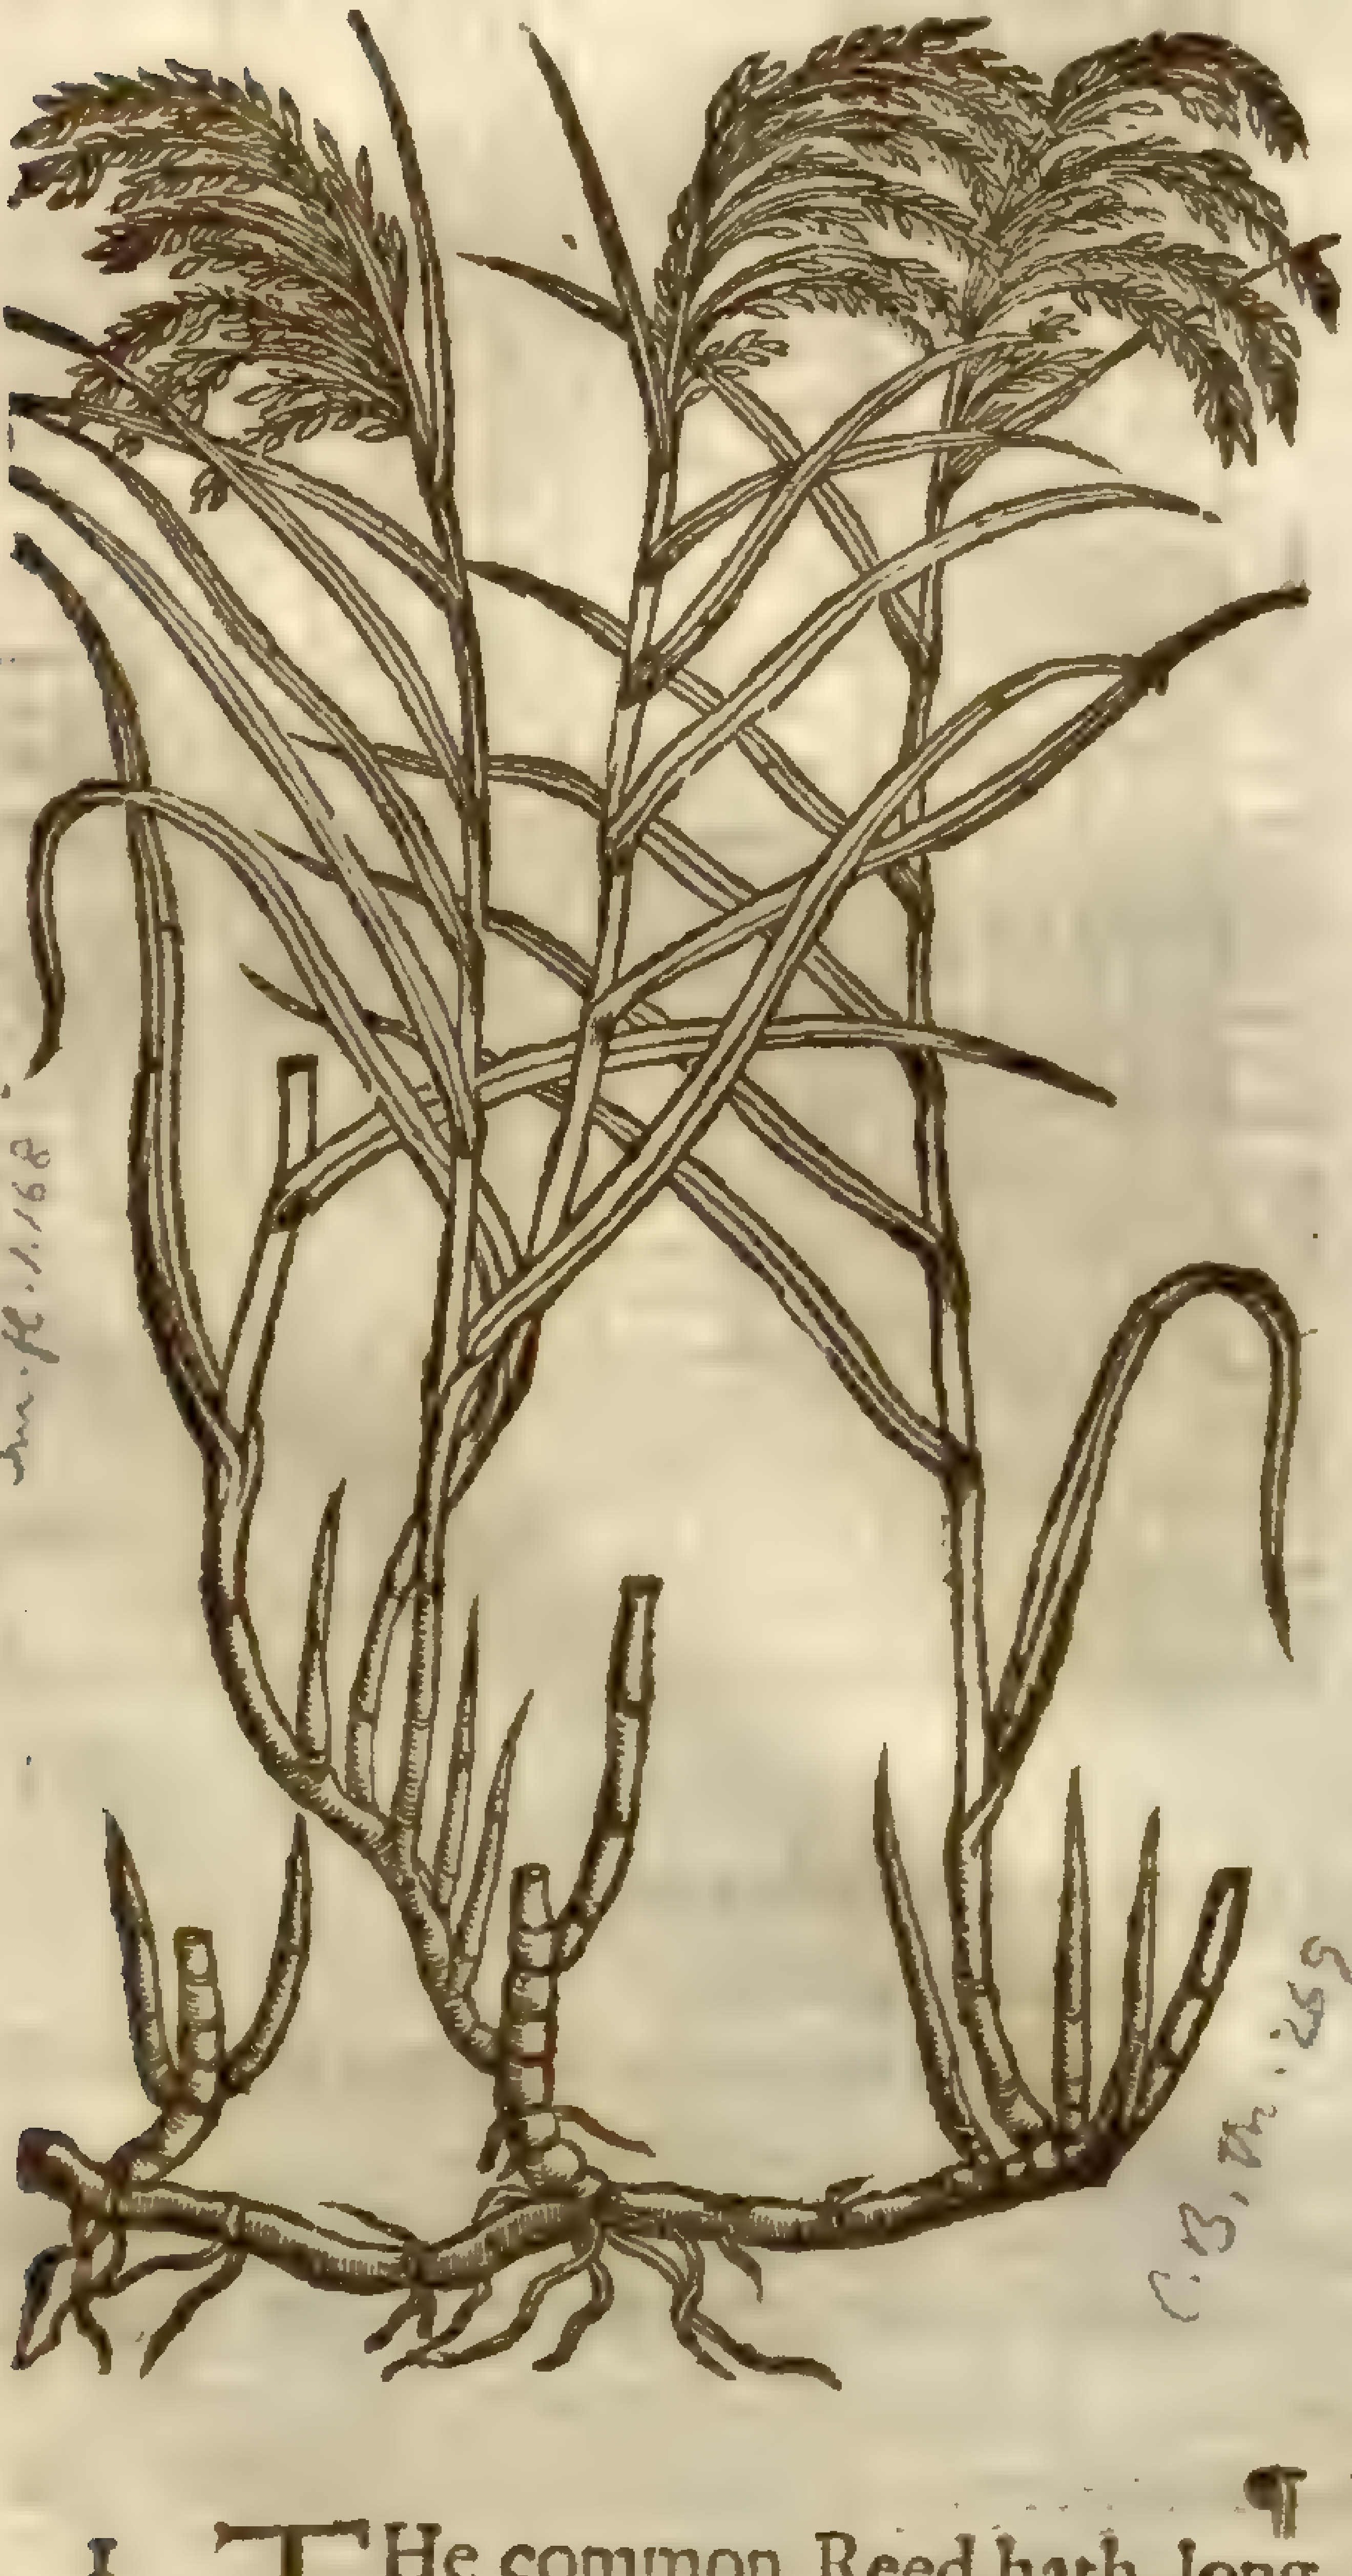
E The ſeed of the Bull-Ruſh is moſt ſoporiferous, and therefore the greater care muſt be had in the adminiſtration thereof, leaſt in prouoking ſleepe you induce a drowſineſſe or dead ſleep.

Chap. 30. *Of Reeds.*

¶ *The Kindes.*

Of Reeds the Ancients haue ſet downe many ſorts. *Theophraſtus* hath brought them all firſt into two principall kindes, and thoſe hath he diuided againe into moe ſorts. The two principall are theſe, *Auletica*, or *Tibiales Arundines*, and *Arundo vallatoria*. Of theſe and the reſt we will ſpeake in their proper places.

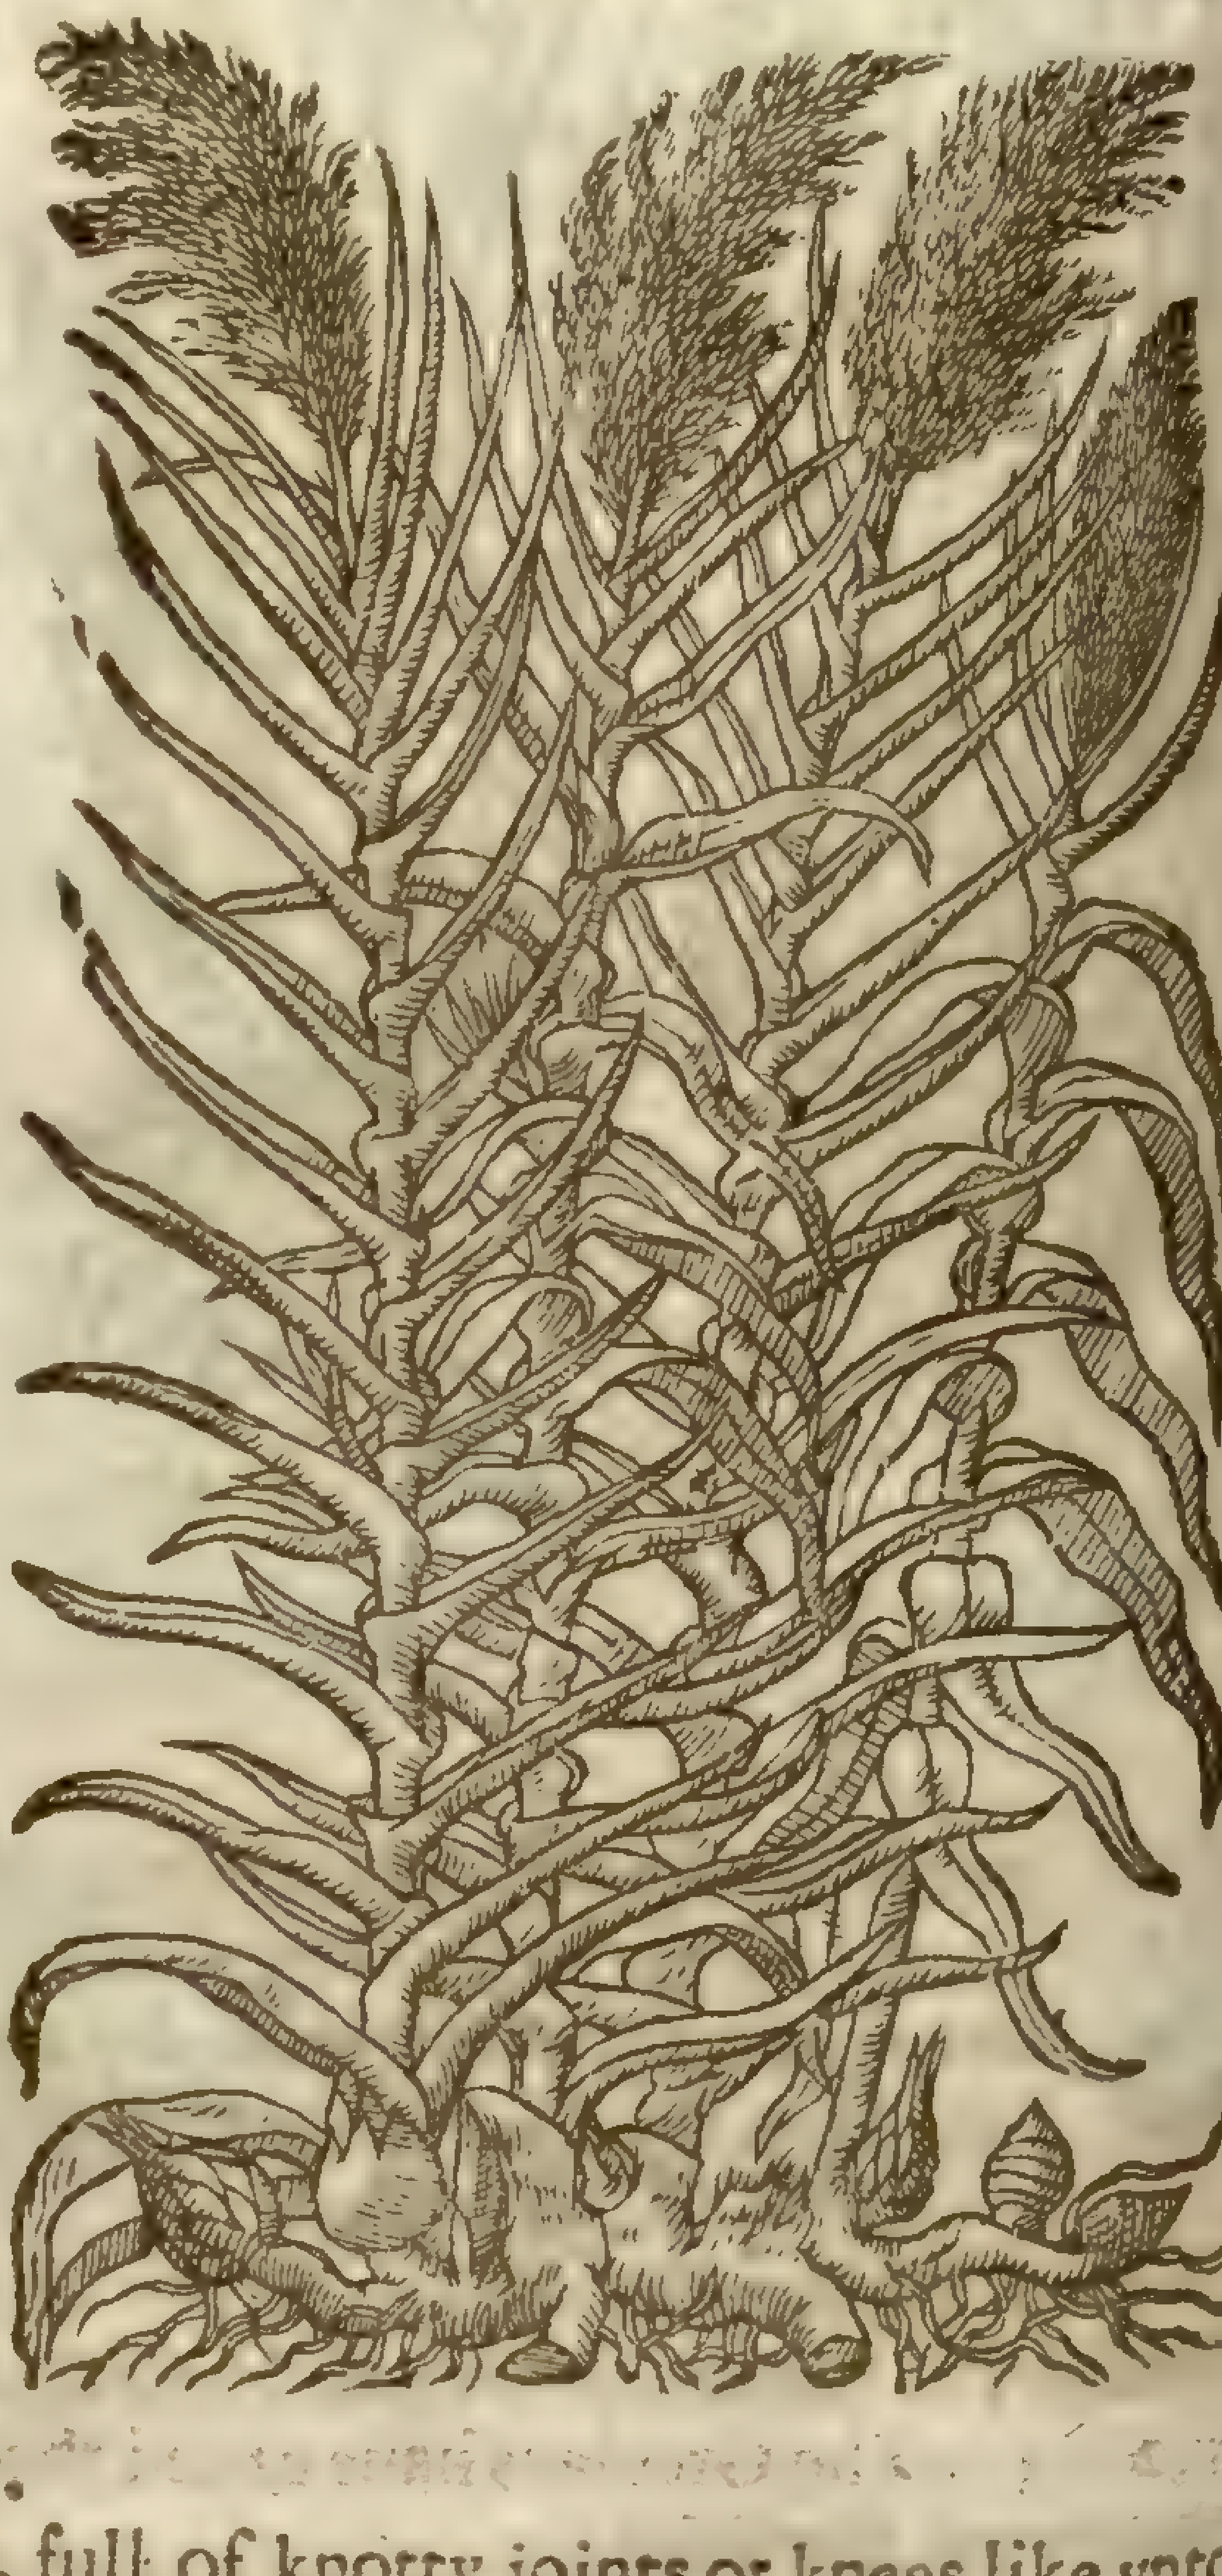
1 *Arundo vallatoria.*
Common Reed.



A. Phragmites, L.
Sp. plant. 632
mill. dict.
Sm. fl. 1.168

C.B.th.259

2 *Arundo Cypria.*
Cypreſſe Canes.



Arundo Donax, L.
mill. dict.

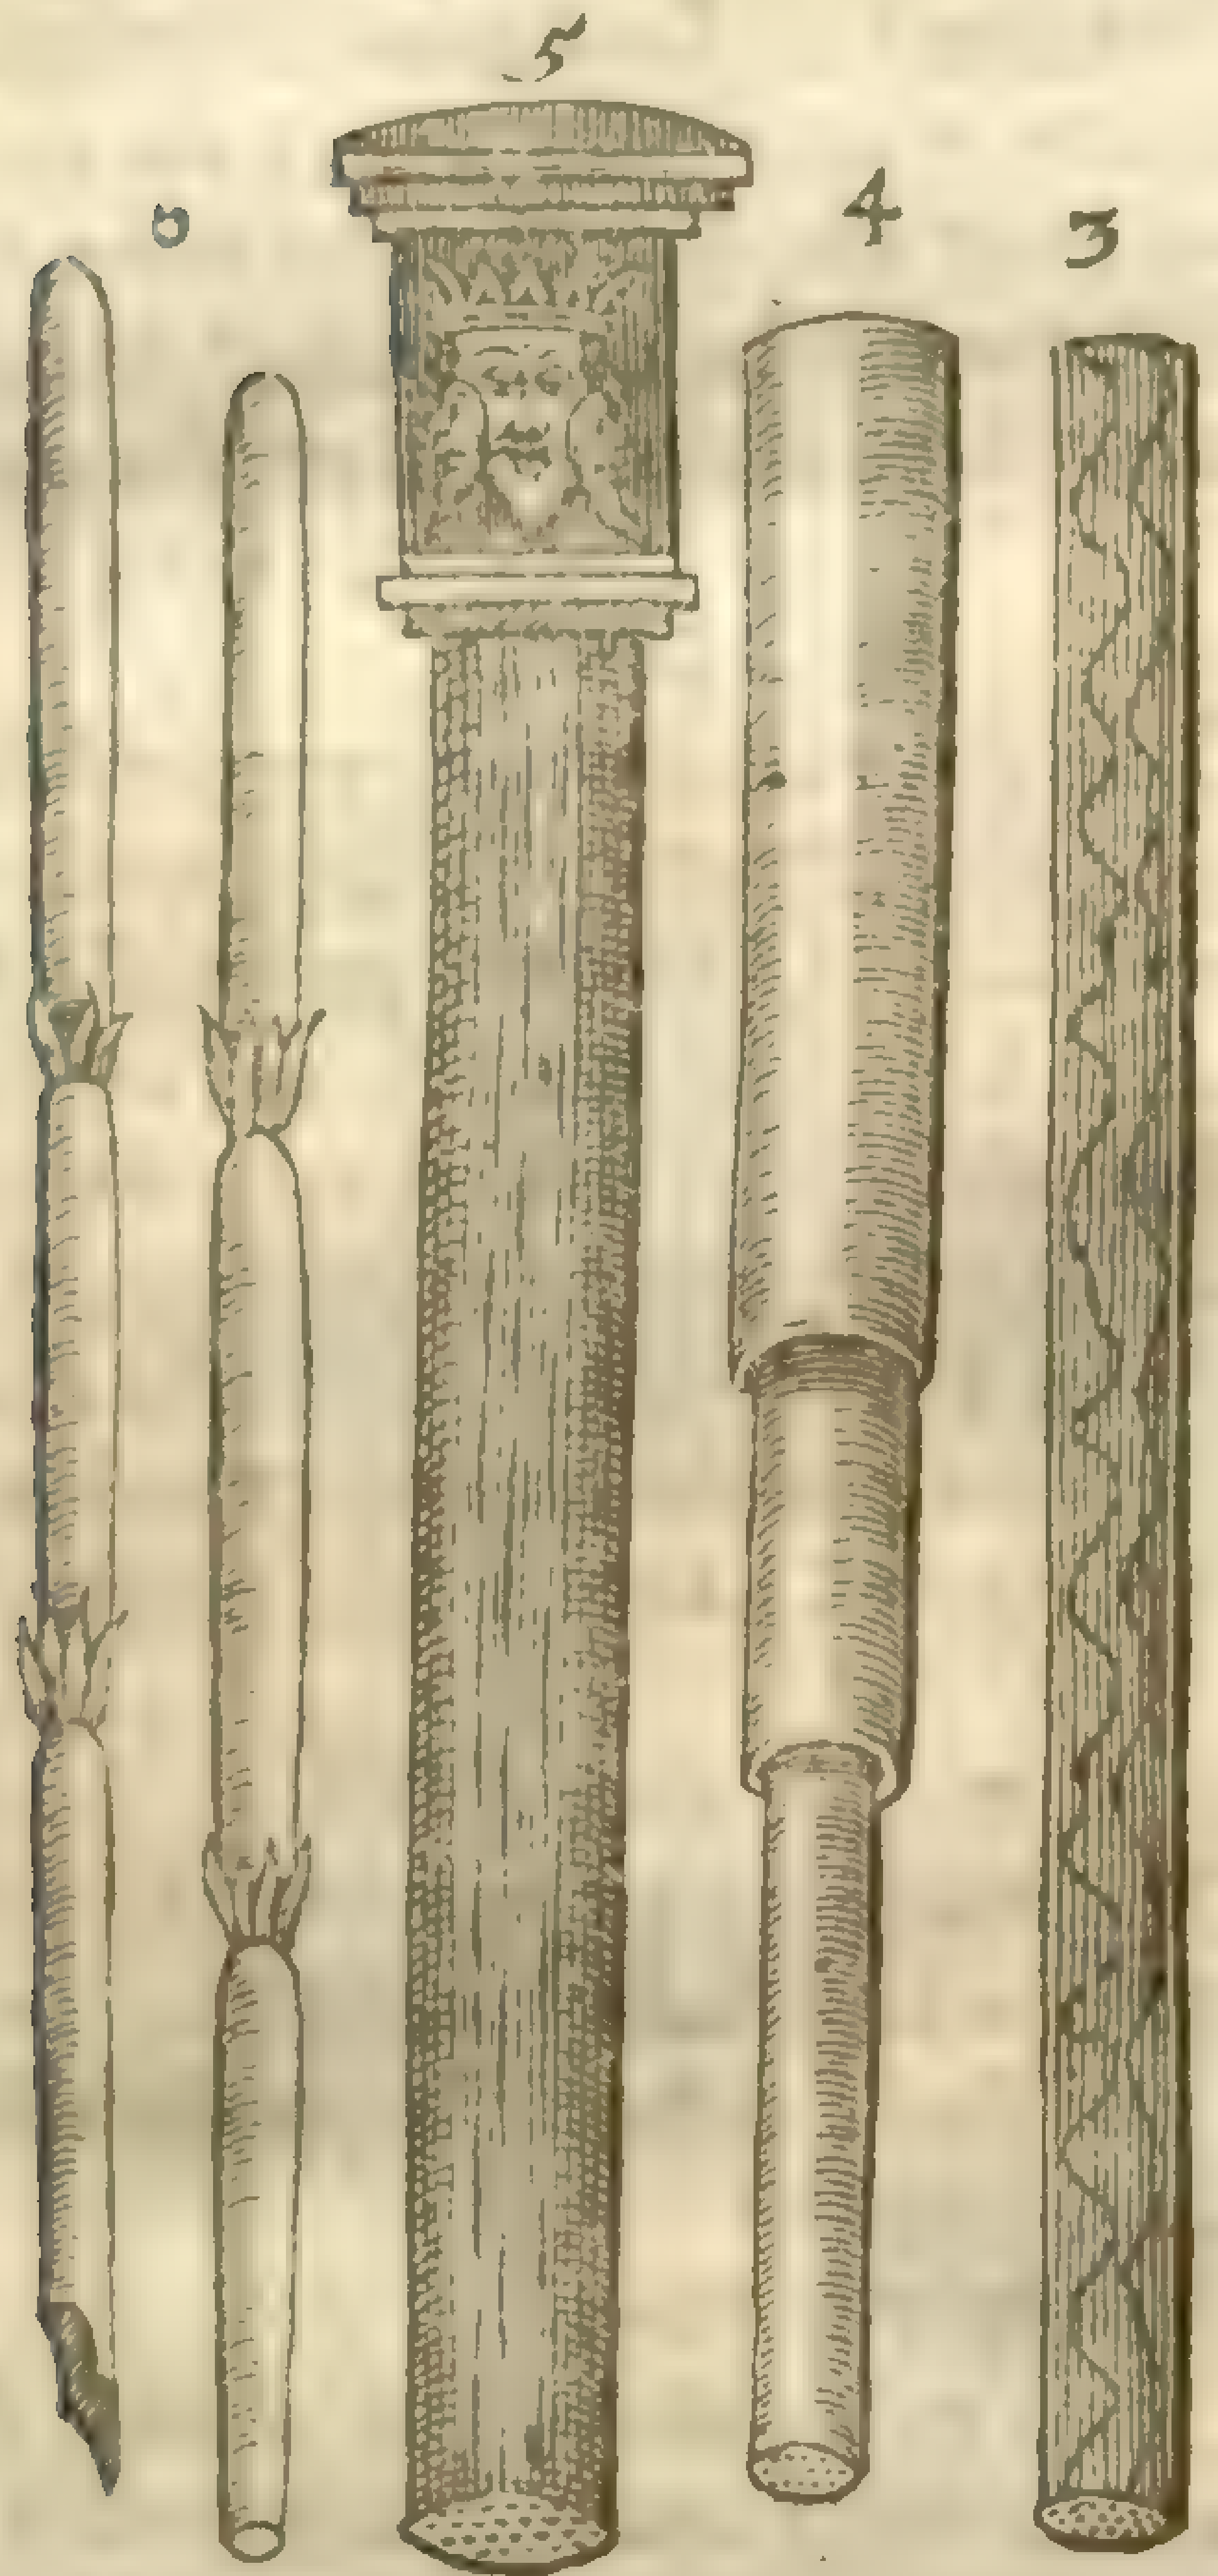
¶ *The Deſcription.*

1 The common Reed hath long ſtrawie ſtalkes, full of knotty joints or knees like vnto corne, whereupon doe grow very long rough flaggy leaues. The tuft or ſpokie eare doth grow at the top of the ſtalkes, browne of colour, barren and without ſeed, and doth reſemble a buſh of feathers, which turneth into fine downe or cotton which is caried away with the winde. The root is thicke, long, and full of ſtrings, diſperſing themſelues farre abroad,

whereby it doth greatly iucreaſe. ‡ *Bauhine* reports, That he receiued from D.*Cargill* a Scottiſh man a Reed whoſe leaues were a cubit long, and two or three inches broad, with ſome nerues apparantly running alongſt the leafe; theſe leaues at the top were diuided into two, three, or foure points or parts; as yet I haue not obſerued it. *Bauhine* termes it *Arundo Anglica folijs in ſummitate diſſectis.* ‡

1 The Cypreſſe Reed is a great Reed hauing ſtalkes exceeding long, ſometimes twenty or thirtie foot high, of a woody ſuſtance, ſet with very great leaues like that of Turky Wheate. It carrieth at the top the like downie tuft that the former doth.

3 *Arundo farcta.*
Stuffed Canes.
4 *Calamus ſagittalis Lobelij.*
Small ſtuffed Reed.
5 *Naſtos Cluſij,*
Turky walking ſtaues.
6 *Arundo ſcriptoria.*
Turkie writing Reed.



3 Theſe Reeds *Lobelius* hath ſeene in the Low countries brought from Conſtantinople, where, as it is ſaid, the people of that countrey haue procured them from the parts of the Adriaticke ſea ſide where they doe grow. They are full ſtuft with a ſpongeous ſubſtance, ſo that there is no hollowneſſe in the ſame, as in Canes and other Reeds, except here and there certaine ſmall pores or paſſages of the bigneſſe of a pinnes point; in manner ſuch a pith as is to be found in the Bull-Ruſh, but more firme and ſolid.

4 The ſecond differeth in ſmalneſſe, and that it will winde open in fleakes, otherwiſe they are very like, and are vſed for darts, arrowes, and ſuch like.

5 This great ſort of Reeds or Canes hath no particular deſcription to anſwer your expectation, for that as yet there is not any man which hath written thereof, eſpecially of the manner of growing of them, either of his owne knowledge or report from others, ſo that it ſhall ſuffice that ye know that that great cane is vſed eſpecially in Conſtantinople and thereabout, of aged and wealthy Citiſens, and alſo Noblemen and ſuch great perſonages, to make them walking ſtaues of, caruing them at the top with ſundry Scutchions, and pretty toyes of imagerie for the beautifying of them; and ſo they of the better ſort doe garniſh them both with ſiluer and gold, as the figure doth moſt liuely ſet forth vnto you.

6 In like manner the ſmaller ſort hath not as yet beene ſeene growing of any that haue beene curious in herbariſme, whereby they might ſet downe any certainty thereof; onely it hath beene vſed in Conſtantinople and thereabout, euen to this day to make writing pens withall, for the which it doth very fitly ſerue, as alſo to make pipes, and ſuch like things of pleaſure.

¶ *The Place.*

The common Reed groweth in ſtanding waters and in the edges and borders of riuers almoſt euery where; and the other being the angling Cane for fiſhers groweth in Spaine and thoſe hot Regions.

¶ *The Time.*

They flouriſh and floure from Aprill to the end of September, at what time they are cut downe for the vſe of man, as all do know.

¶ *The Names.*

The common Reed is called *Arundo*, and *Harundo vallatoria*: in French, *Roſeau*: in Dutch, **Riet**: in Italian, *Canne a far ſiepo*: of *Dioſc. Phragmitis*: in Engliſh, Reed.

Arundo Cypria; or after *Lobelius*, *Arundo Donax*: in French, *Canne*: in Spaniſh, *Cana*, in Italian, *Calami a far Connochia*: in Engliſh, Pole reed, and Cane, or Canes.

¶ *The Nature.*

Reeds are hot and dry in the ſecond degree, as *Galen* ſaith.

¶ *The Vertues.*

The roots of reed ſtamped ſmall draw forth thorns and ſplinters fixed in any part of mans body. A

The ſame ſtamped with vinegre eaſe all luxations and members out of joynt. B

And likewiſe ſtamped they heale hot and ſharpe inflammations. The aſhes of them mixed with vinegre helpe the ſcales and ſcurfe of the head, and the falling of the haire. C

D The great Reed or Cane is not vſed in phyſicke, but is eſteemed to make ſlears for Weauers, ſundry ſorts of pipes, as alſo to light candles that ſtand before Images, and to make hedges and pales, as we do of lats and ſuch like; and alſo to make certaine diuiſions in ſhips to diuide the ſweet oranges from the ſowre, the Pomecitron and lemmons likewiſe in ſunder, and many other purpoſes.

Chap. 31. *Of Sugar-Cane.*

¶ *The Deſcription.*

1 Sugar Cane is a pleaſant and profitable Reed, hauing long ſtalkes ſeuen or eight foot high, joynted or kneed like vnto the great Cane; the leaues come forth of euery joynt on euery ſide of the ſtalke one, like vnto wings, long, narrow, and ſharpe pointed. The Cane it ſelfe, or ſtalke is not hollow as the other Canes or Reeds are, but full, and ſtuffed with a ſpongeous ſubſtance in taſte exceeding ſweet. The root is great and long, creeping along within the vpper cruſt of the earth, which is likewiſe ſweet and pleaſant, but leſſe hard or woody than other Canes or Reeds; from the which there doth ſhoot forth many young ſiens, which are cut away from the maine or mother plant, becauſe they ſhould not draw away the nouriſhment from the old ſtocke, and ſo get vnto themſelues a little moiſture, or elſe ſome ſubſtance not much worth, and cauſe the ſtocke to be barren, and themſelues little the better; which ſhoots do ſerue for plants to ſet abroad for encreaſe.

Arundo Saccharina.
Sugar Cane.

Saccharum officinarum, L.
Indie, dul.

A

¶ *The Place.*

The Sugar Cane groweth in many parts of Europe at this day, as in Spaine, Portugal, Olbia, and in Prouence. It groweth alſo in Barbarie, generally almoſt euery where in the Canarie Iſlands, and in thoſe of Madera, in the Eaſt and Weſt Indies, and many other places. My ſelfe did plant ſome ſhoots thereof in my garden, and ſome in Flanders did the like: but the coldneſſe of our clymat made an end of mine, and I think the Flemmings will haue the like profit of their labour.

¶ *The Time.*

This Cane is planted at any time of the yeare in thoſe hot countries where it doth naturally grow, by reaſon they feare no froſts to hurt the young ſhoots at their firſt planting.

¶ *The Names.*

The Latines haue called this plant *Arundo Saccharina*, with this additament, *Indica*, becauſe it was firſt knowne or brought from India. Of ſome it is called, *Calamus Saccharatus*: in Engliſh, Sugar Cane: in Dutch, **Suyckerriedt.**

¶ *The Nature and Vertue.*

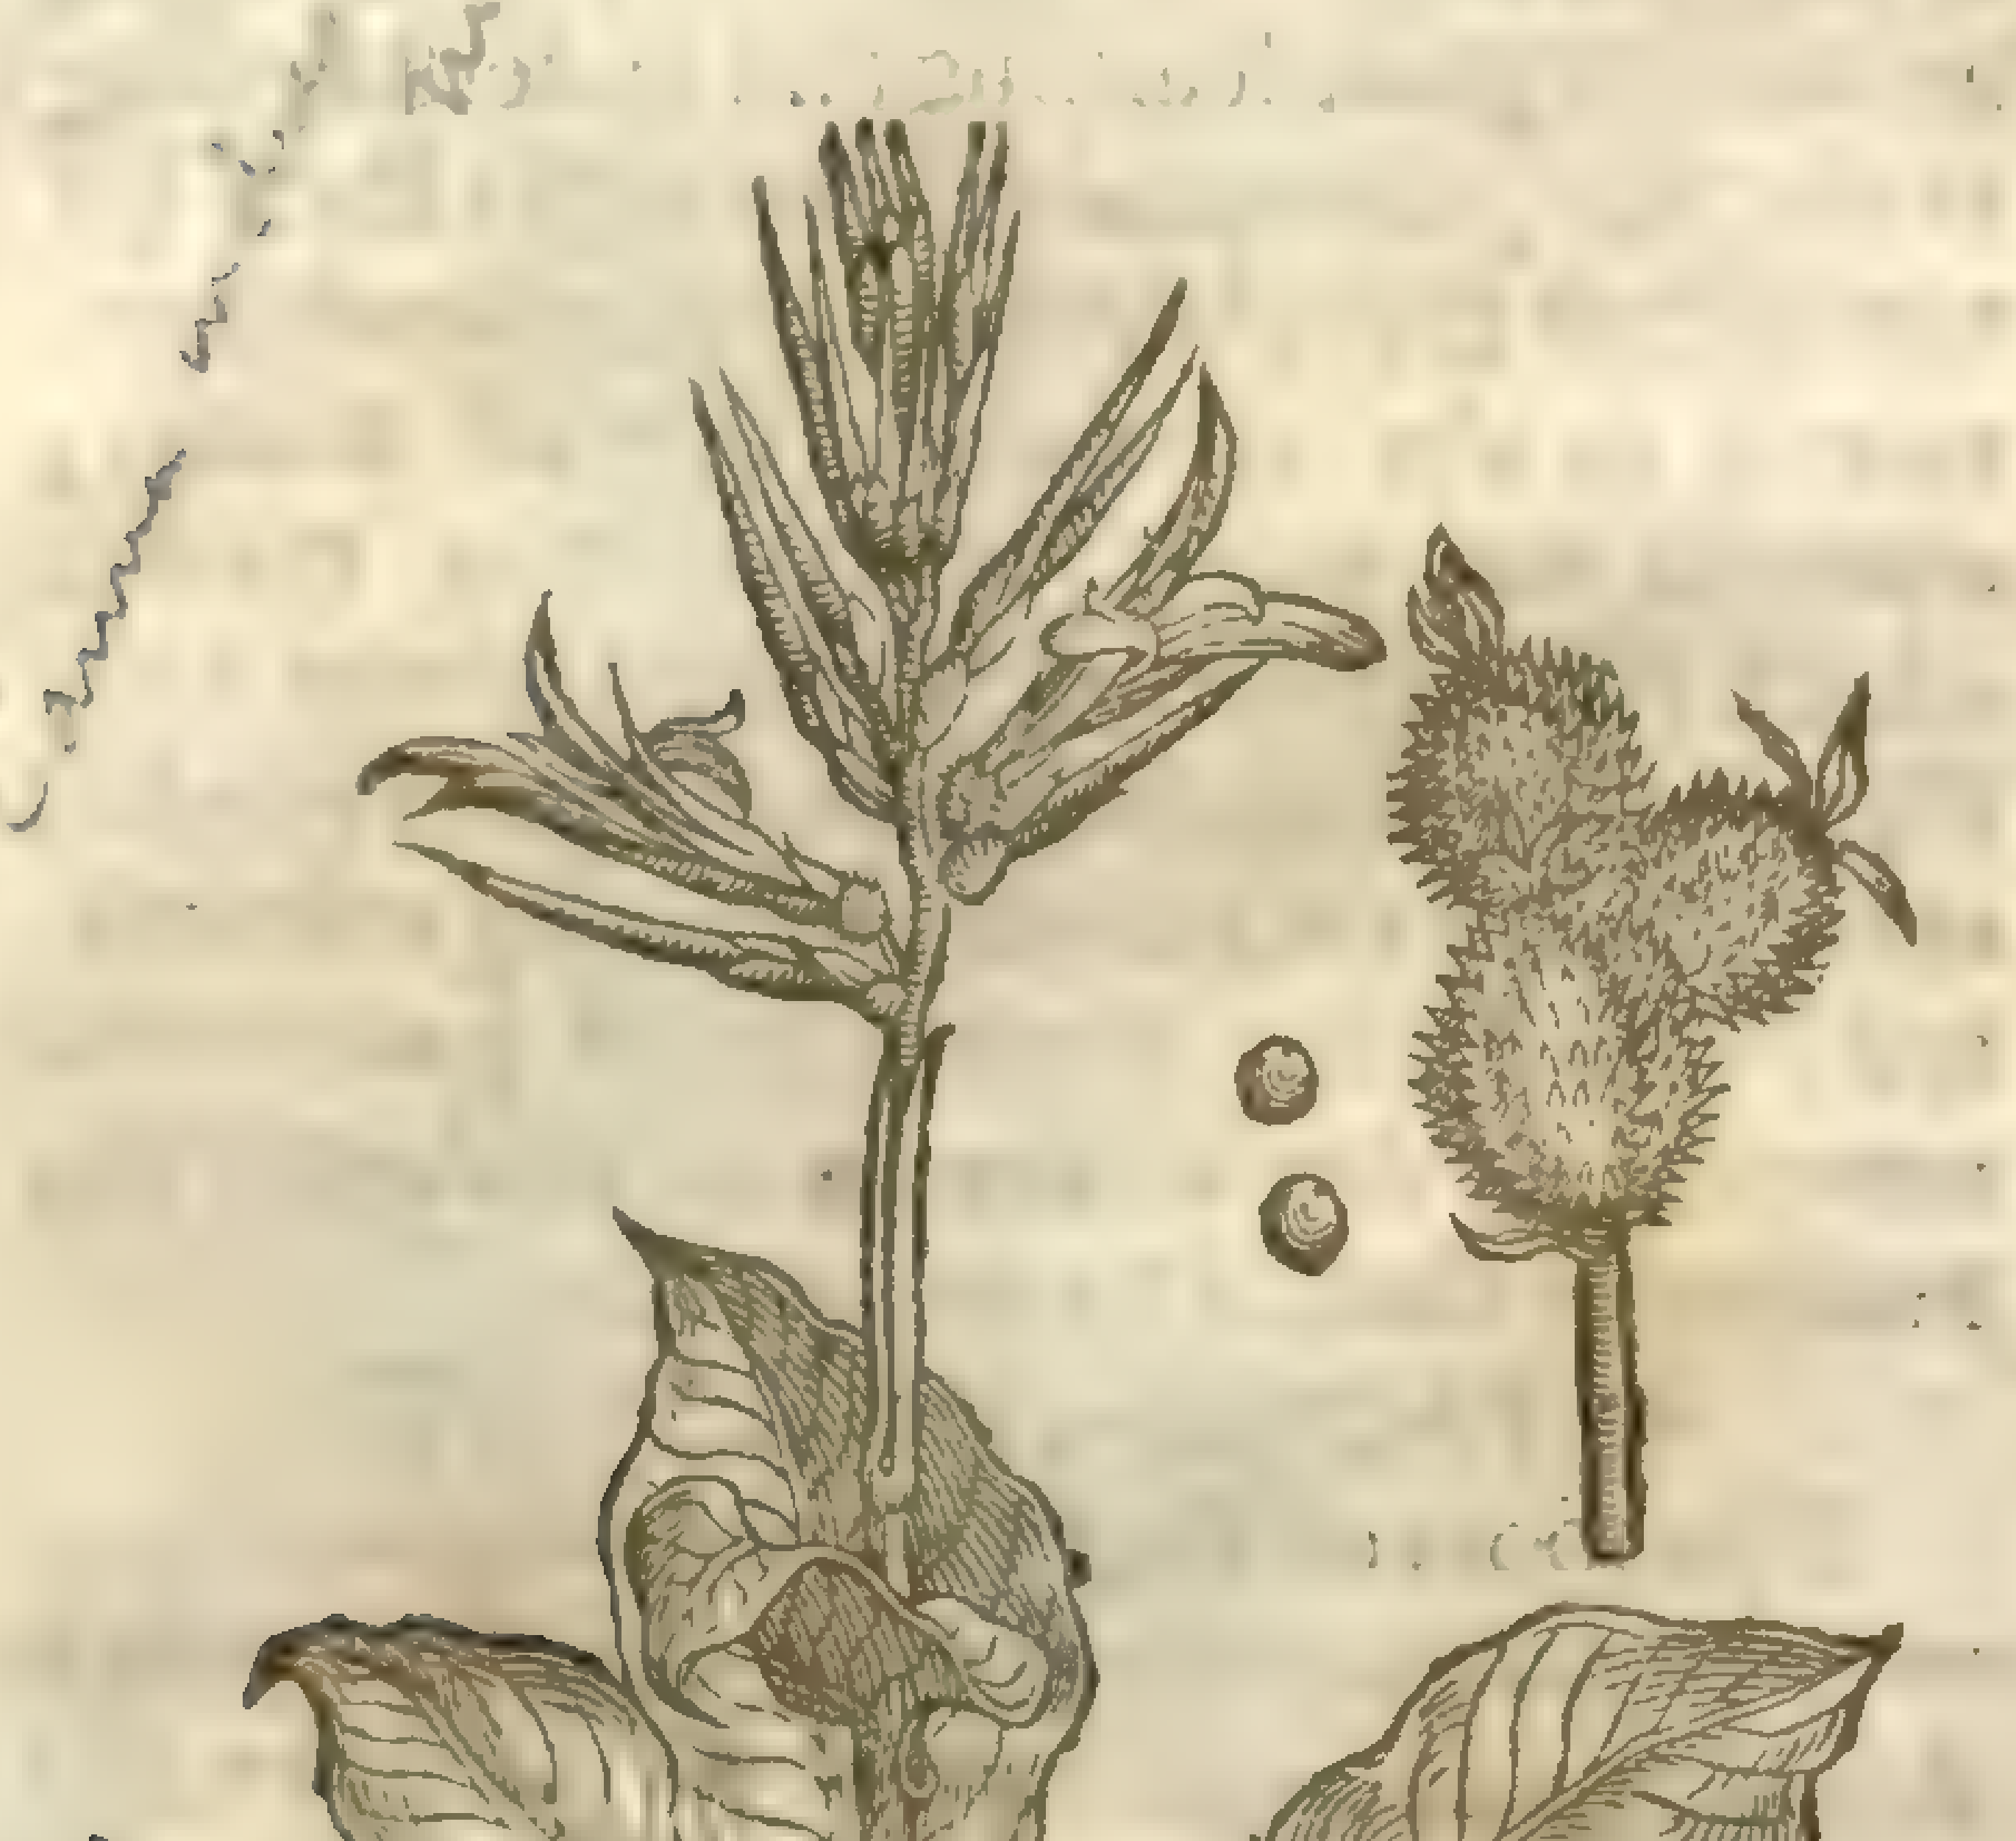
The Sugar or juice of this Reed is of a temperate qualitie; it drieth and cleanſeth the ſtomacke, maketh ſmooth the roughneſſe of the breſt and lungs, cleareth the voice, and putteth away hoarſeneſſe, the cough, and all ſoureneſſe and bitterneſſe, as *Iſaac* ſaith in *Dictis*.

¶ *The Vſe.*

Of the juyce of this Reed is made the moſt pleaſant and profitable ſweet, called Sugar, whereof is made infinite confections, confectures, Syrups and ſuch like, as alſo preſeruing and conſeruing of ſundry fruits, herbes, and floures, as Roſes, Violets, Roſemary floures, and ſuch like, which ſtill retaine with them the name of Sugar, as Sugar Roſet, Sugar Violet, &c. The which to write of would require a peculiar volume, and not pertinent vnto this hiſtorie, for that it is not my purpoſe to make of my booke a Confectionary, a Sugar Bakers furnace, a Gentlewomans preſeruing pan, nor yet an Apothecaries ſhop or Diſpenſatorie; but onely to touch the chiefeſt matter that I purpoſed to handle in the beginning, that is, the nature, properties, and deſcriptions of plants. Notwithſtanding I thinke it not amiſſe to ſhew vnto you the ordering of theſe reeds when they be new gathered, as I receiued it from the mouth of an Indian my ſeruant: he ſaith, They cut them in ſmall pieces, and put them into a trough made of one whole tree, wherein they put a great ſtone in manner of a mill-ſtone, whereunto they tie a gorſe, buffle, or ſome other beaſt which draweth it round: in which trough they put thoſe pieces of Canes, and ſo cruſh and grind them as we doe the barkes of trees for Tanners, or apples for Cyder. But in ſome places they vſe a great wheele wherein ſlaues doe tread and walke as dogs do in turning the ſpit: and ſome others doe feed as it were the bottome of the ſaid wheele, wherein are ſome ſharpe or hard things which doe cut and cruſh the Canes into powder. And ſome likewiſe haue found the inuention to turne the wheele with water works, as we doe our Iron mills. The Canes being thus brought into duſt or powder, they put them into great cauldrons with a little water, where they boile vntill there be no more ſweetneſſe left in the cruſhed reeds. Then doe they ſtraine them through mats or ſuch like things, and put the liquor to boile againe vnto the conſiſtence of hony, which being cold is like vnto ſand both in ſhew and handling, but ſomewhat ſofter; and ſo afterwards it is carried into all parts of Europe, where it is by the Sugar Bakers artificially purged and refined to that whiteneſſe as we ſee.

Chap. 31. *Of Flouring Reed.*

Arundo florida.
Flouring Reed.



¶ *The Deſcription.*

Flouriſhing Reed hath a thicke and fat ſtalke of foure or fiue foot high, great below neere the ground, and ſmaller toward the top, taper-wiſe; whereupon do grow very faire broad leaues full of ribs or ſinewes like vnto Plantaine, in ſhape repreſenting the leaues of white Hellebor, or the great Gentian, but much broader and larger euery way; at the top of which ſtalkes do grow phantaſticke floures of a red or vermilion colour; which being faded, there follow round, rough, and prickly knobs, like thoſe of *Sparganium*, or water-Burre, of a browne colour, and from the middle of thoſe knobs three ſmall leaues. The ſeed contained in thoſe knobs is exceeding black, of a perfect roundneſſe, of the bigneſſe of the ſmalleſt peaſe. The root is thicke, knobby, and tuberous, with certain ſmall threds fixed thereto. ‡ There is a variety of this, hauing floures of a yellow or Saffron colour, with red joints.

¶ *The Place.*

It groweth in Italy in the garden of Padua, and many other places of thoſe hot regions. My ſelfe hau planted it in my garden diuers times, but it neuer came to flouring or ſeeding, for that it is very impatient to endure the injurie of our cold clymat. It is a natiue of the West Indies.

¶ *The Time.*

It muſt be ſet or ſowen in the beginning of Aprill, in a pot with fine earth, or in a bed made with horſe-dung, and ſome earth ſtrawed thereon, in ſuch manner as Cucumbers and Muſke-Melons are.

¶ *The Names.*

The name *Arundo Indica* is diuerſly attributed to ſundry of the Reeds, but principally vnto this, called of *Lobelius*, *Cannacorus*: of others, *Arundo florida*, and *Harundo florida*: in English, the Flouring Reed.

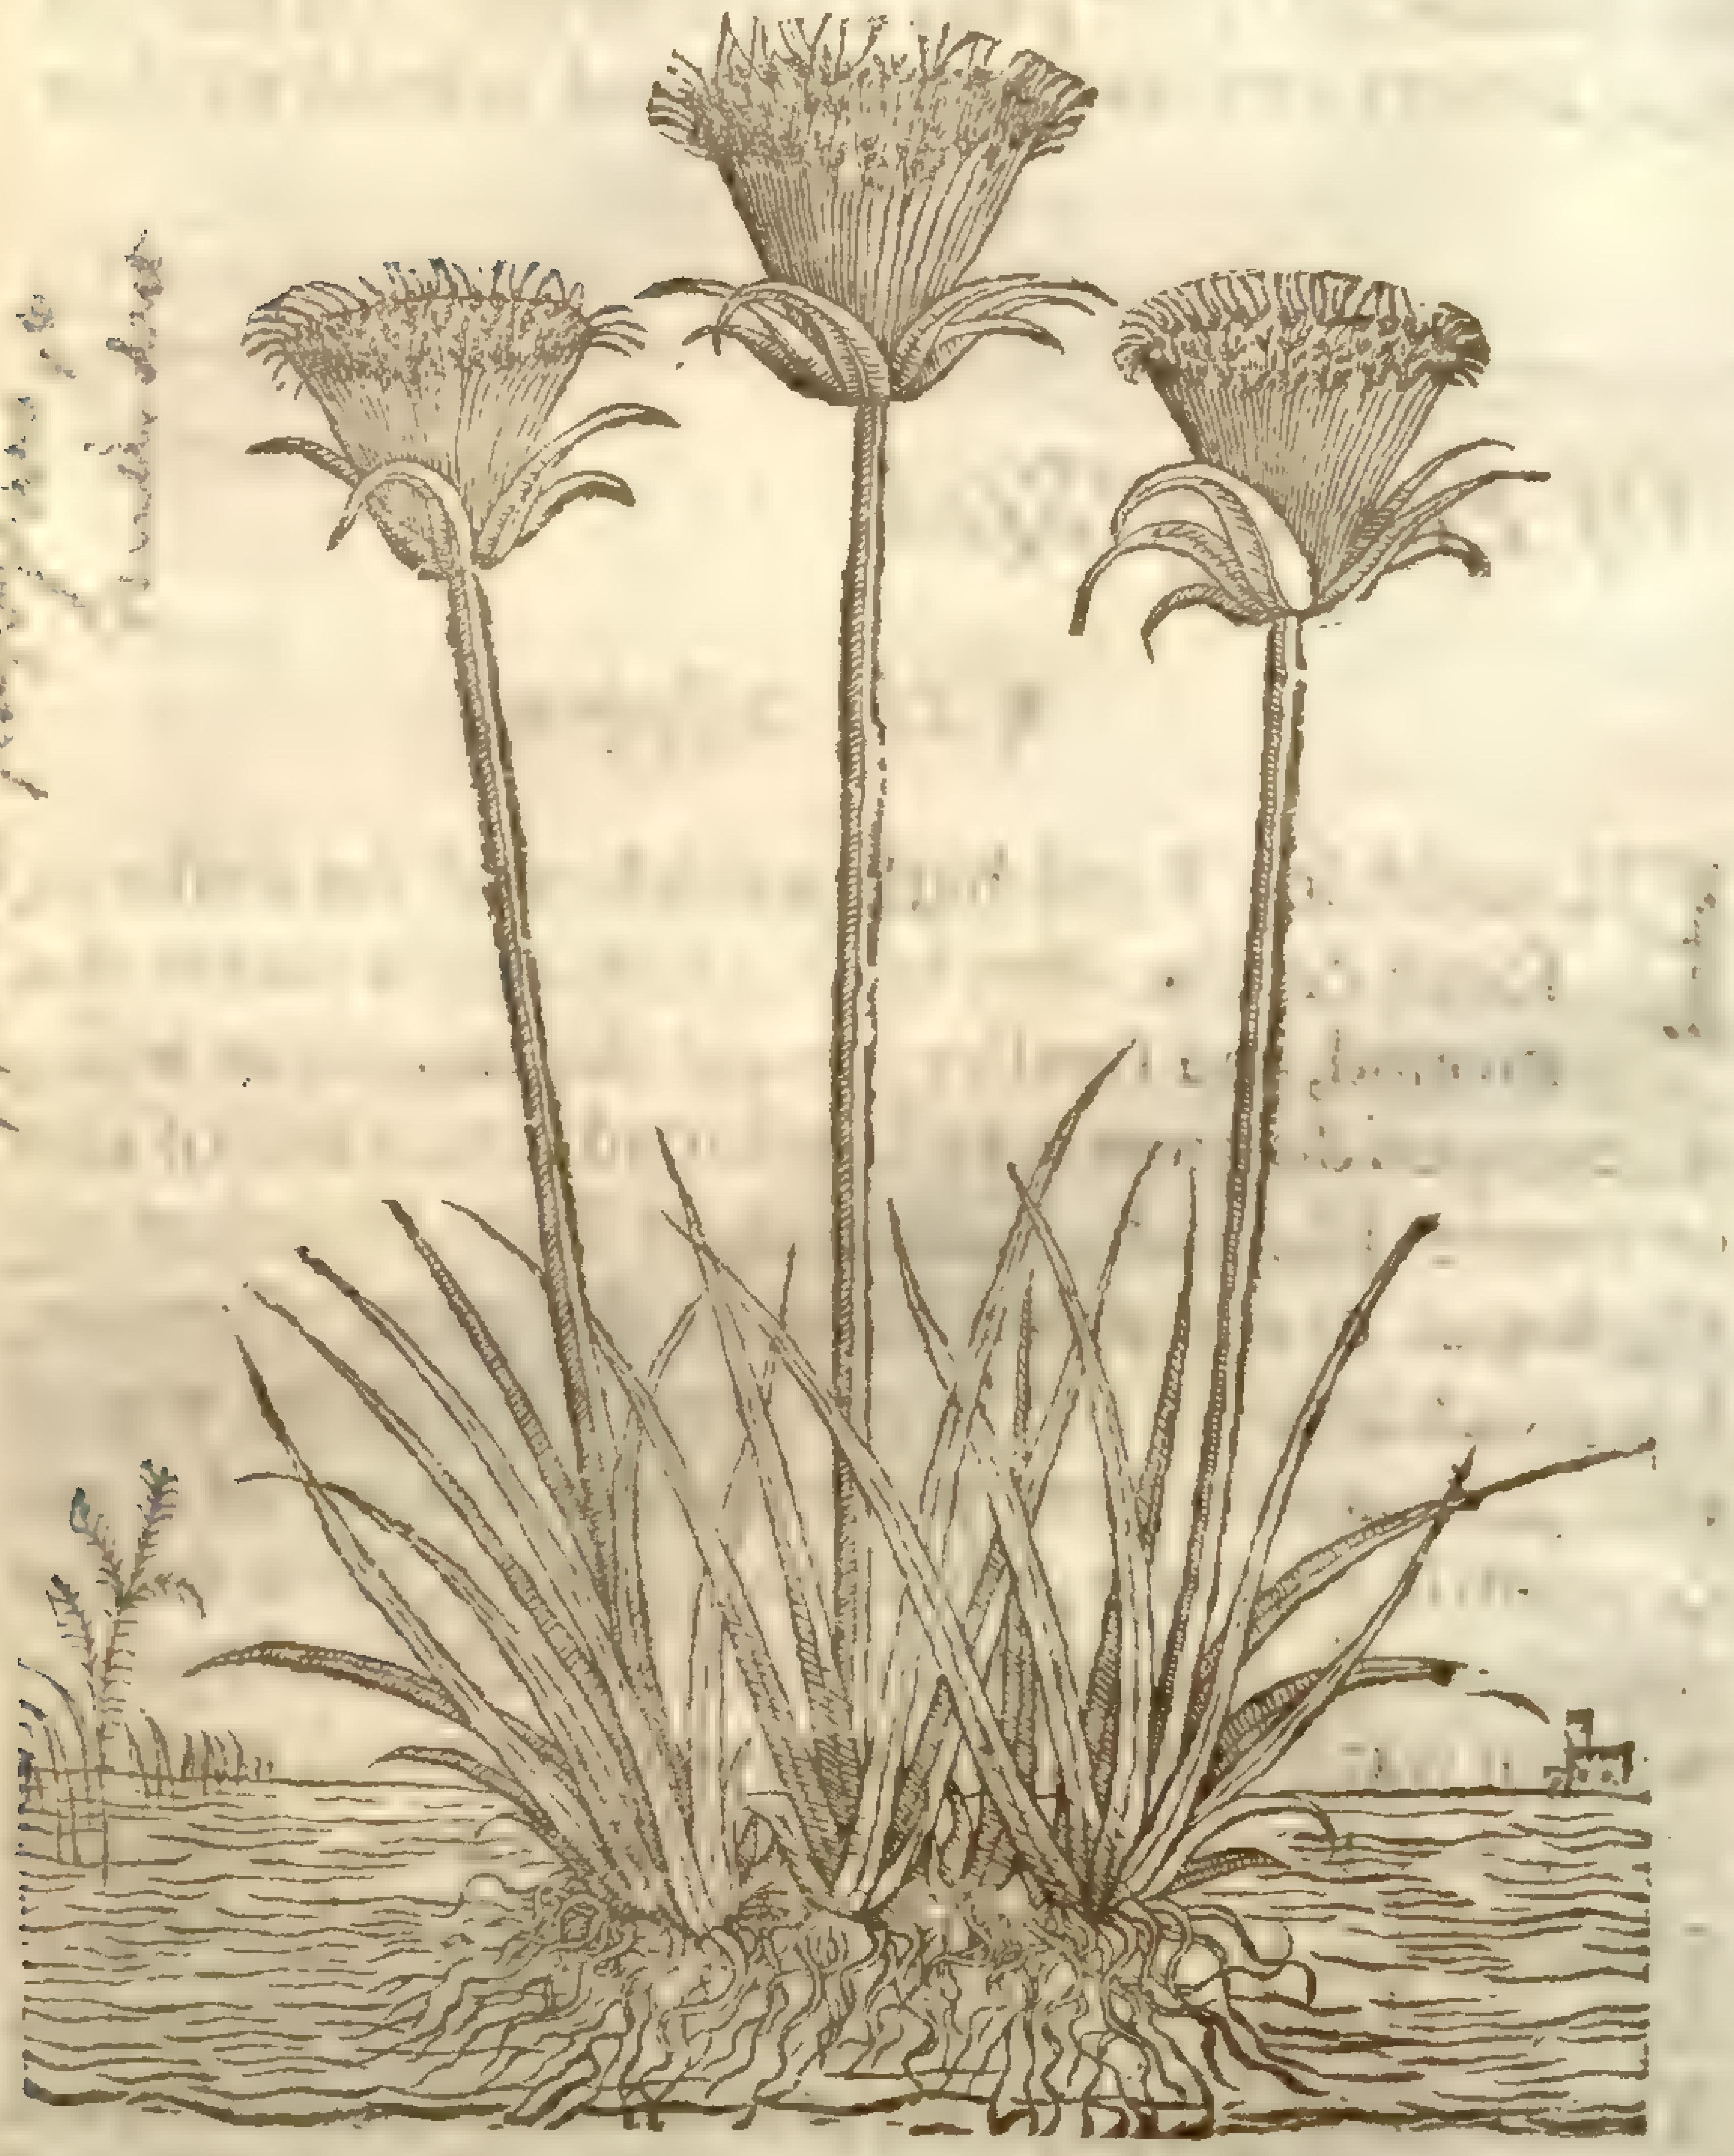
¶ *The Nature and Vertues.*

There is not any thing ſet downe as touching the temperature and vertues of this Flouriſhing Reed, either of the Ancients, or of the new or later Writers.

Chap. 33. *Of Paper Reed.*

PAper Reed hath many large flaggie leaues ſomewhat triangular and ſmooth, not much vnlike thoſe of Cats-taile, riſing immediately from a tuft of roots compact of many ſtrings, amongſt the which it ſhooteth vp two or three naked ſtalkes, ſquare, and riſing ſome ſix or ſeuen cubits high aboue the water: at the top whereof there ſtands a tuft or bundle of chaffie threds ſet in comely order, reſembling a tuft of floures, but barren and void of ſeed.

Papyrus Niloitca.
Paper Reed.



Cyperus papyrus [illegible]

¶ *The Place.*

This kinde of Reed growes in the Riuers about Babylon, and neere the city Alcaire, in the riuer Nilus, and ſuch other places of thoſe countries.

¶ *The Time.*

The time of ſpringing and flouriſhing anſwereth that of the common Reed.

¶ *The Names.*

This kinde of Reed, which I haue Engliſhed Paper Reed, or Paper plant, is the ſame (as I doe reade) that Paper was made of in Ægypt, before the inuention of paper made of linnen clouts was found out. It is thought by men of great learning and vnderſtanding in the Scriptures, and ſet downe by them for truth, that this plant is the ſame Reed mentioned in the ſecond chapter of *Exodus*; whereof was made that basket or cradle, which was dawbed within and without with ſlime of that countrey, called *Bitumen Iudaicum*, wherein *Moſes* was put being committed to the water, when *Pharaoh* gaue commandement that all the male children of the Hebrewes ſhould be drowned.

¶ *The Nature, Vertues, and Vſe.*

A The roots of Paper Reed doe nouriſh, as may appeare by the people of Ægypt, which doe vſe to chew them in their mouthes, and ſwallow downe the juice, finding therein great delight and comfort.

B The aſhes burned aſſwage and conſume hard apoſtumes, tumors, and coraſiue vlcers in any part of the body, but chiefely in the mouth.

C The burnt Paper made hereof doth performe thoſe effects more forcibly.

D The ſtalkes hereof haue a ſingular vſe and priuiledge in opening the channels and hollow paſſages of a Fiſtula, being put therein; for they doe ſwell as doth the pith of Elder, or a tent made of a ſponge.

E The people about Nilus do vſe to burne the leaues and ſtalkes, but eſpecially the roots.

F The fraſles wherein they put Raiſins and figs are ſometimes made hereof; but generally with the herbe *Spartum*, deſcribed in the next Chapter.

Chap. 34. *Of Mat-Weed.*

¶ *The Kindes.*

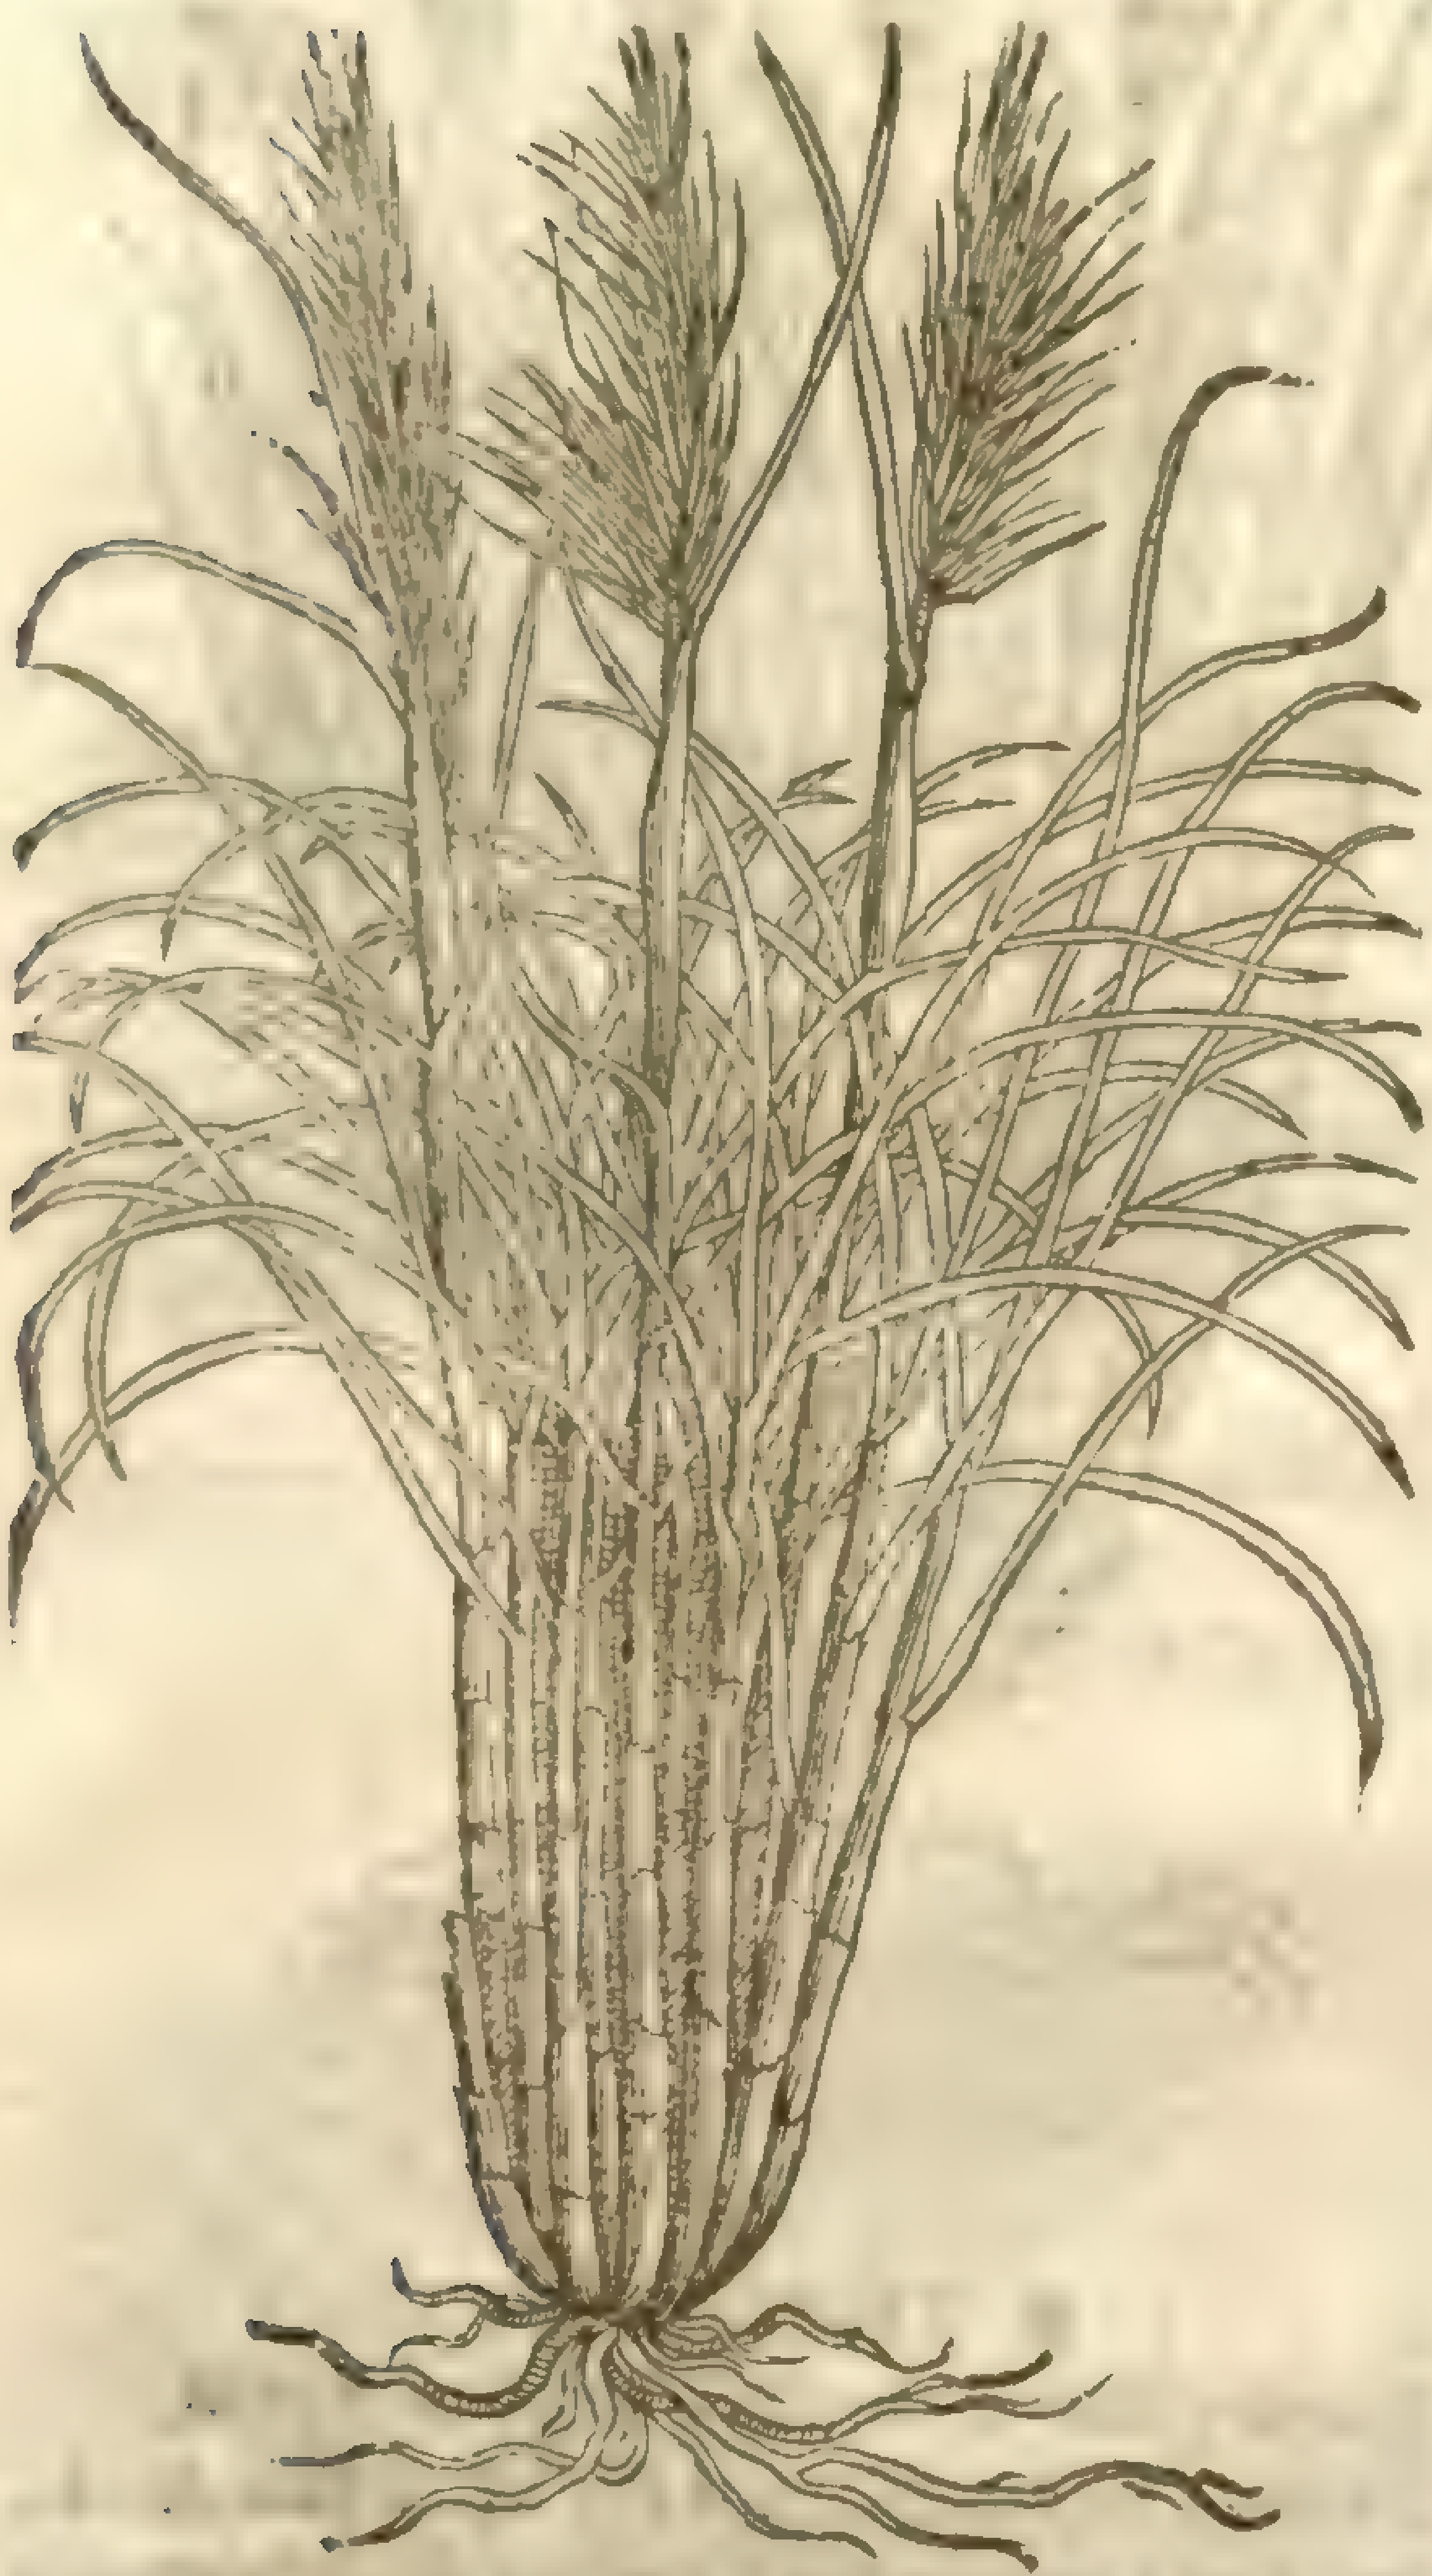
There be diuers kindes of Mat-weeds, as ſhall be declared in their ſeuerall deſcriptions.

¶ *The Deſcription.*

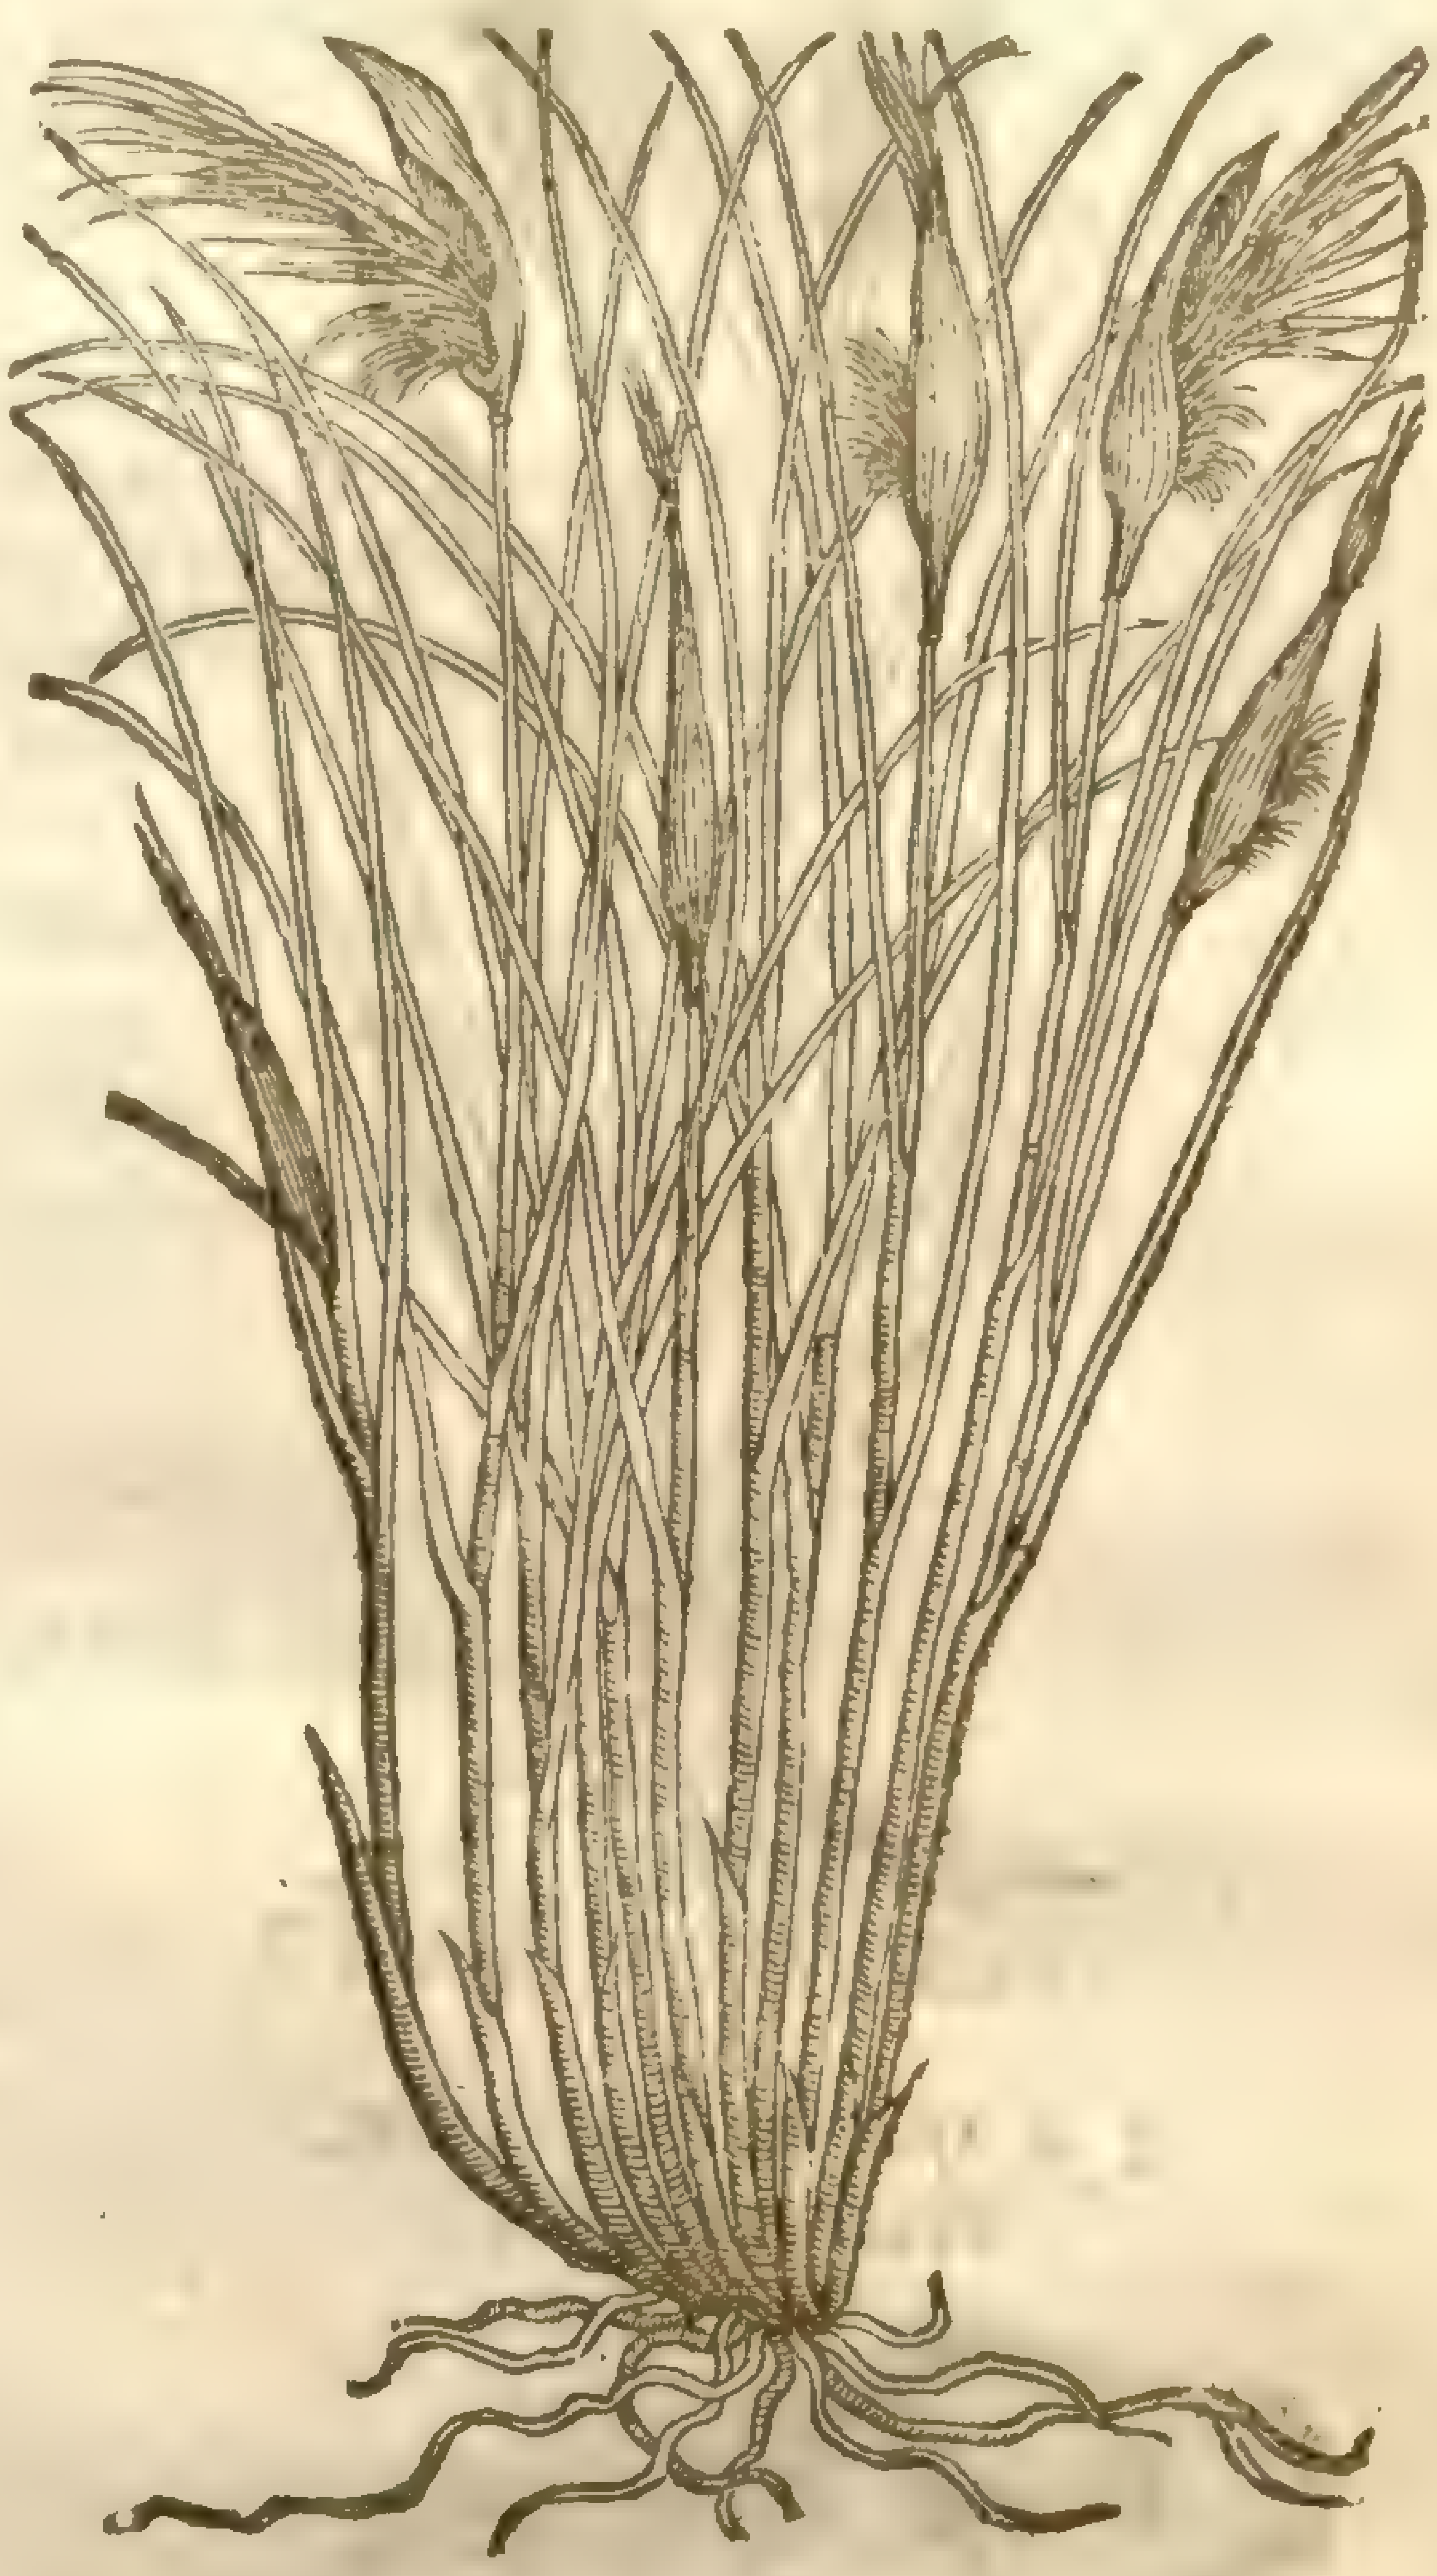
THe herbe *Spartum*, as *Pliny* ſaith, groweth of it ſelfe, and ſendeth forth from the root a multitude of ſlender ruſhie leaues of a cubit high, or higher, tough and pliable, of a whitiſh colour, which in time drawe narrow together, making the flat leafe to become round, as is the Ruſh. The ſtub or ſtalke thereof beareth at the top certaine feather-like tufts comming forth of a ſheath or huske, among the which chaffie huskes is contained the ſeed, long and chaffie. The root conſiſteth of many ſtrings folding one within another, by meanes whereof it commeth to the forme of a tuſt or haſſocke.

Lygeum Spartum, L.
[illegible]

1 *Spartum Plinij Cluſio.*
Plinies Mat-Weed.



2 *Spartum alterum Plinij.*
Hooded Mat-Weed.



2 The ſecond likewiſe *Pliny* deſcribeth to haue a long ſtalke not much vnlike to Reed, but leſſer, whereupon doe grow many graſſie leaues, tough and pliant, hard in handling as are the Ruſhes. A ſpokie chaffie tuſt groweth at the top of the ſtalke, comming forth of a hood or ſinewie ſheath, ſuch as encloſeth the floures of Onions, Leekes, Narciſſus, and ſuch like, before they come to flouring, with ſeed and roots like the precedent.

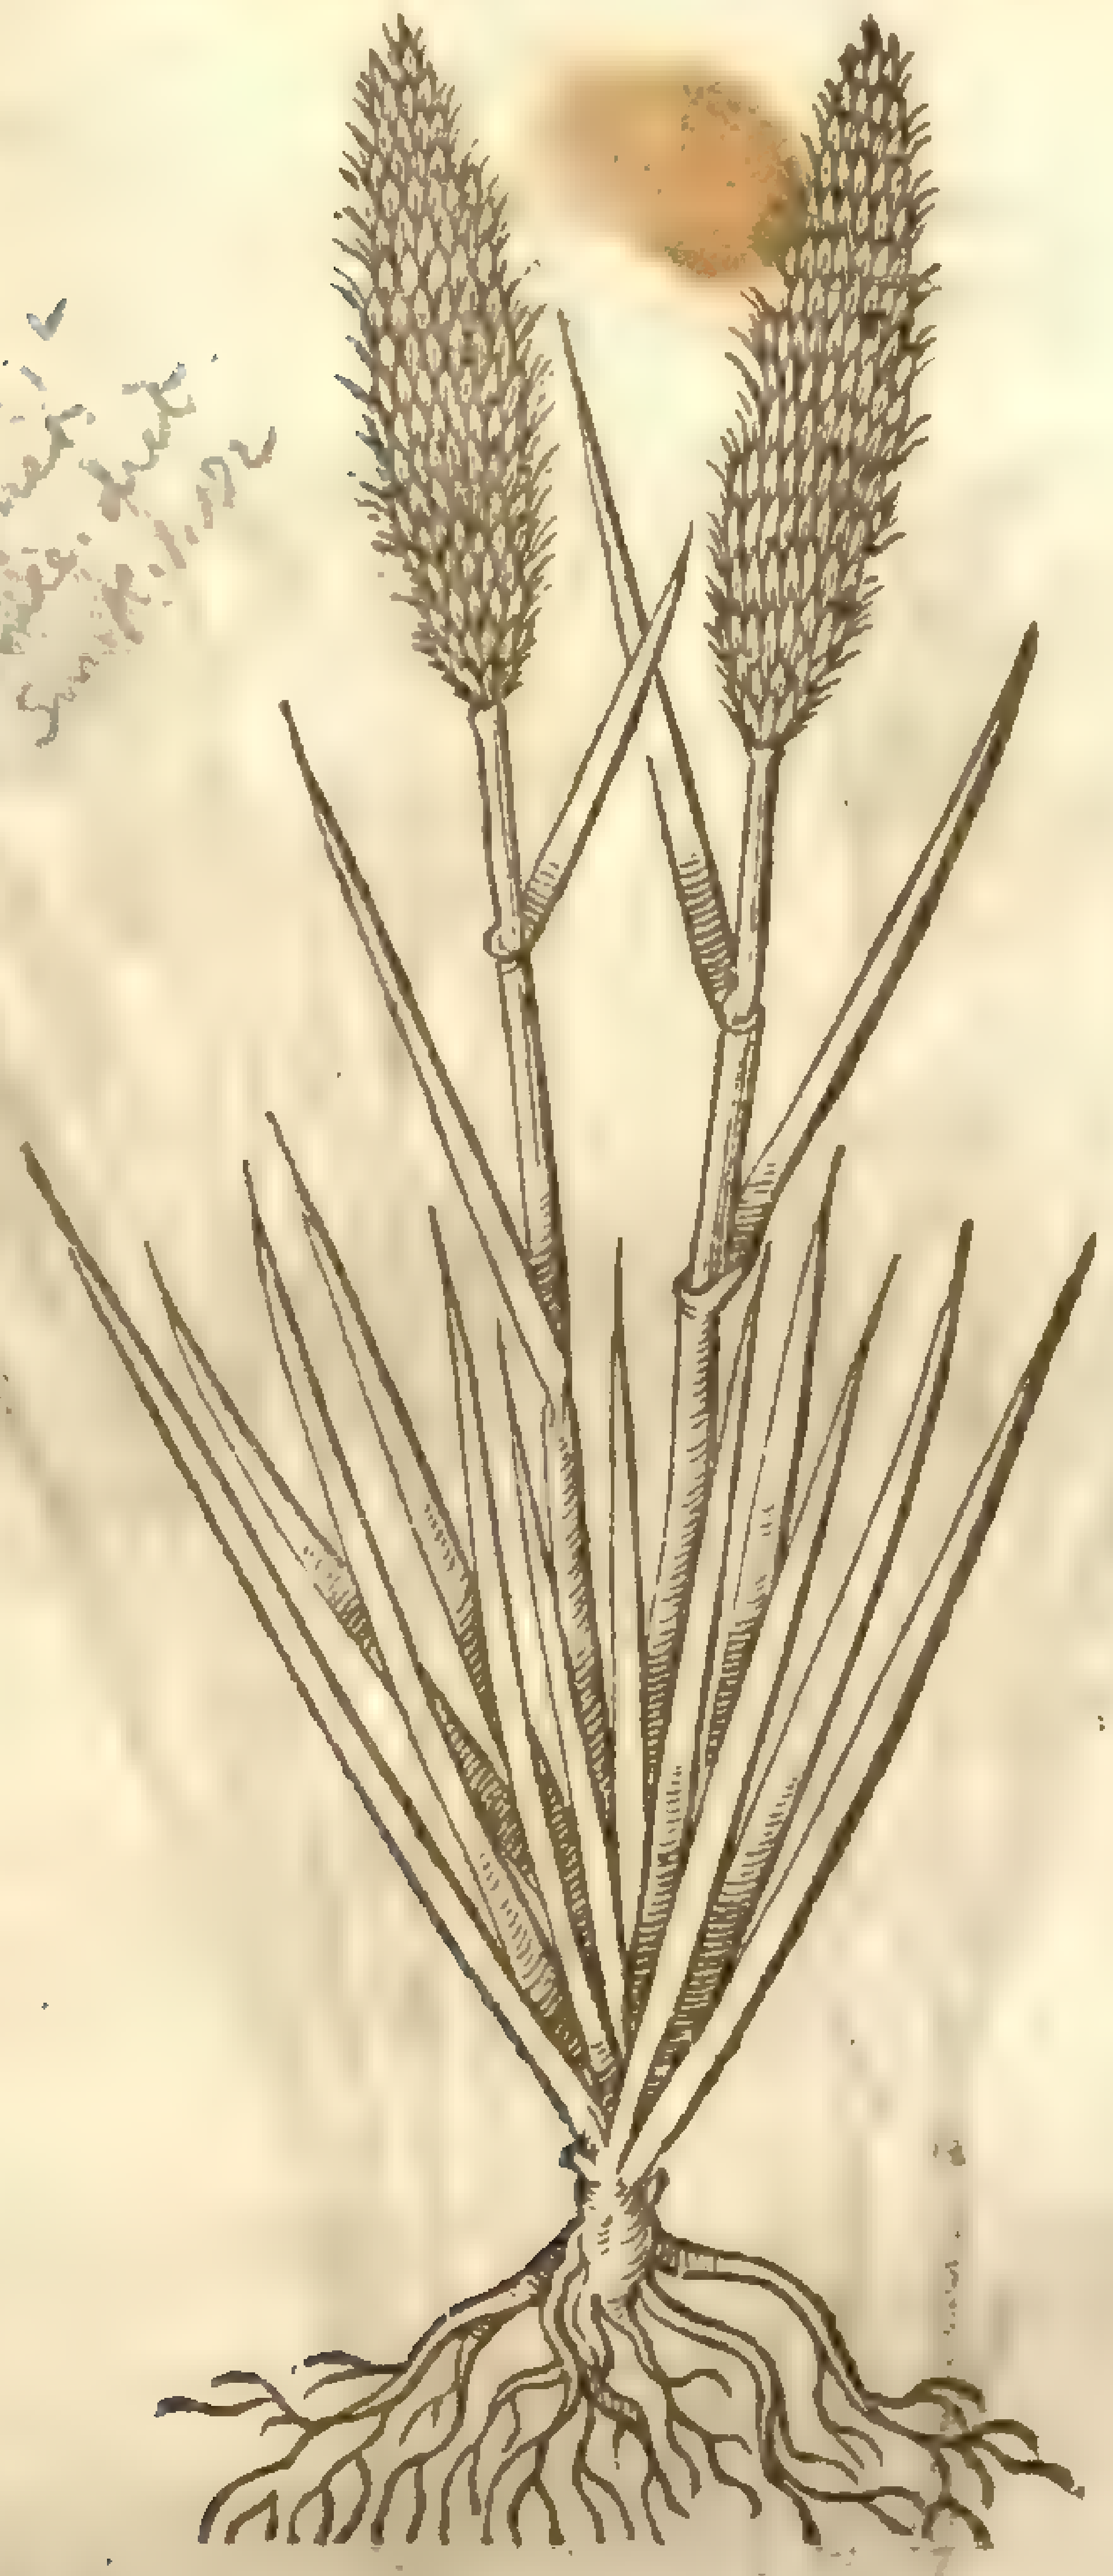
3 Engliſh Mat-weed hath a ruſhie root, deepely creeping and growing in heapes of ſand and grauell, from the which ariſe ſtiffe and ſharpe pointed leaues a foot and a halfe long, of a whitiſh colour, very much reſembling thoſe of Camels hay. The ſtalke groweth to the height of a cubit or more, whereupon doth grow a ſpike ‡ or eare of ſome fiue or ſix inches long, ſomewhat reſembling Rie; it is the thickeneſſe of a finger in the midſt, and ſmaller towards both the ends. The ſeed is browne as ſmall as Canarie ſeed, but round and ſomewhat ſharpe at the one end ‡. Of this plant neither Sheepe nor any other Cattel will taſte or eate.

4 This other Engliſh Mat-Weed is like vnto the former, ſauing that the roots of this are long, not vnlike to Dogs Graſſe, but do not thruſt deepe into the ground, but creepe onely vnder the vpper cruſt of the earth. The tuft or eare is ſhorter, and more reſembling the head of Canary ſeed than that of Rie.

‡ 5 *Lobel* giues a figure of another ſmaller Ruſh-leaued *Spartum* with ſmall heads, but hee hath not deſcribed it in his Latine Workes, ſo that I can ſay nothing certainely of it.

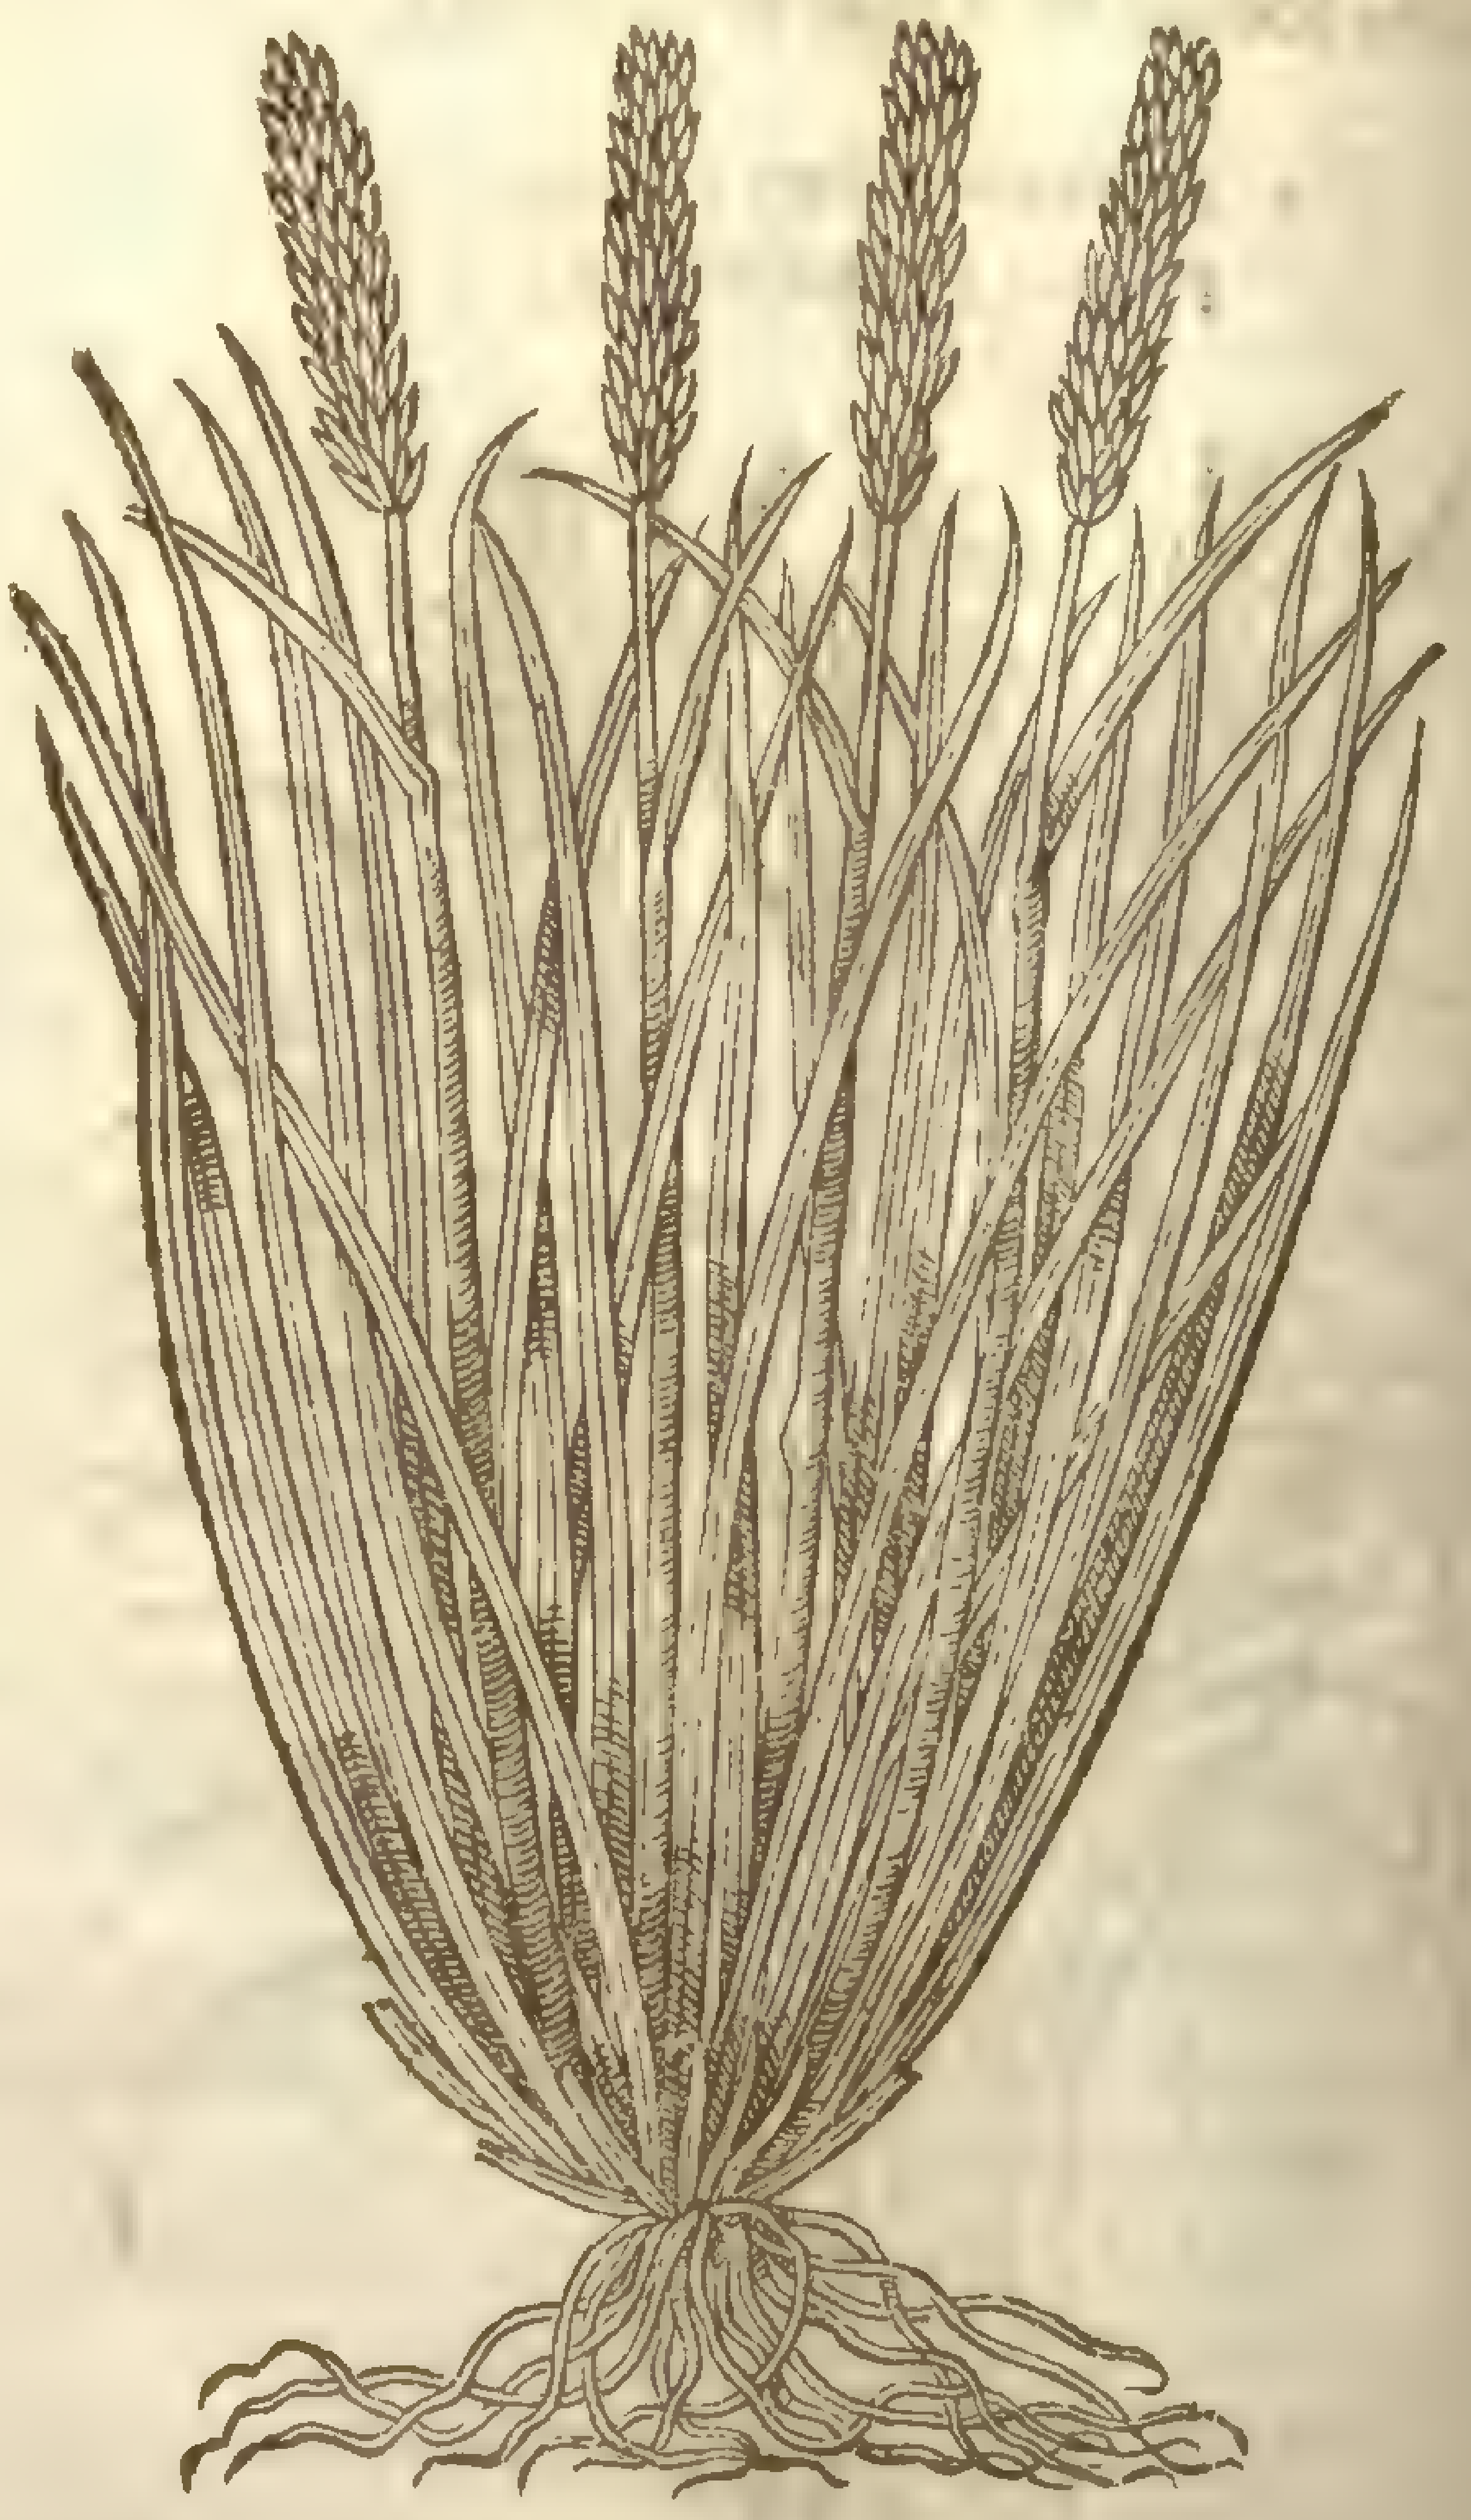
6 To this kindred muſt be added the Feathered Graſſe, though not pertaking with the former in place of growth. It hath many ſmall leaues of a foots length, round, greene and ſharpe pointed, not much in forme vnlike the firſt deſcribed Mat-weed, but much leſſe: amongſt theſe leaues riſe vp many ſmall ſtalkes not exceeding the height of the leaues, which beare a ſpike vnlike the forementioned Mat-weeds, hauing three or foure ſeeds ending in, or ſending vp very fine white Feathers, reſembling the ſmaller ſort of feathers of the wings of the Bird of Paradiſe. The root conſiſts of many ſmall graſſie fibres.

3 *Spartum Anglicanum.*
Engliſh Mat-weed or Helme.

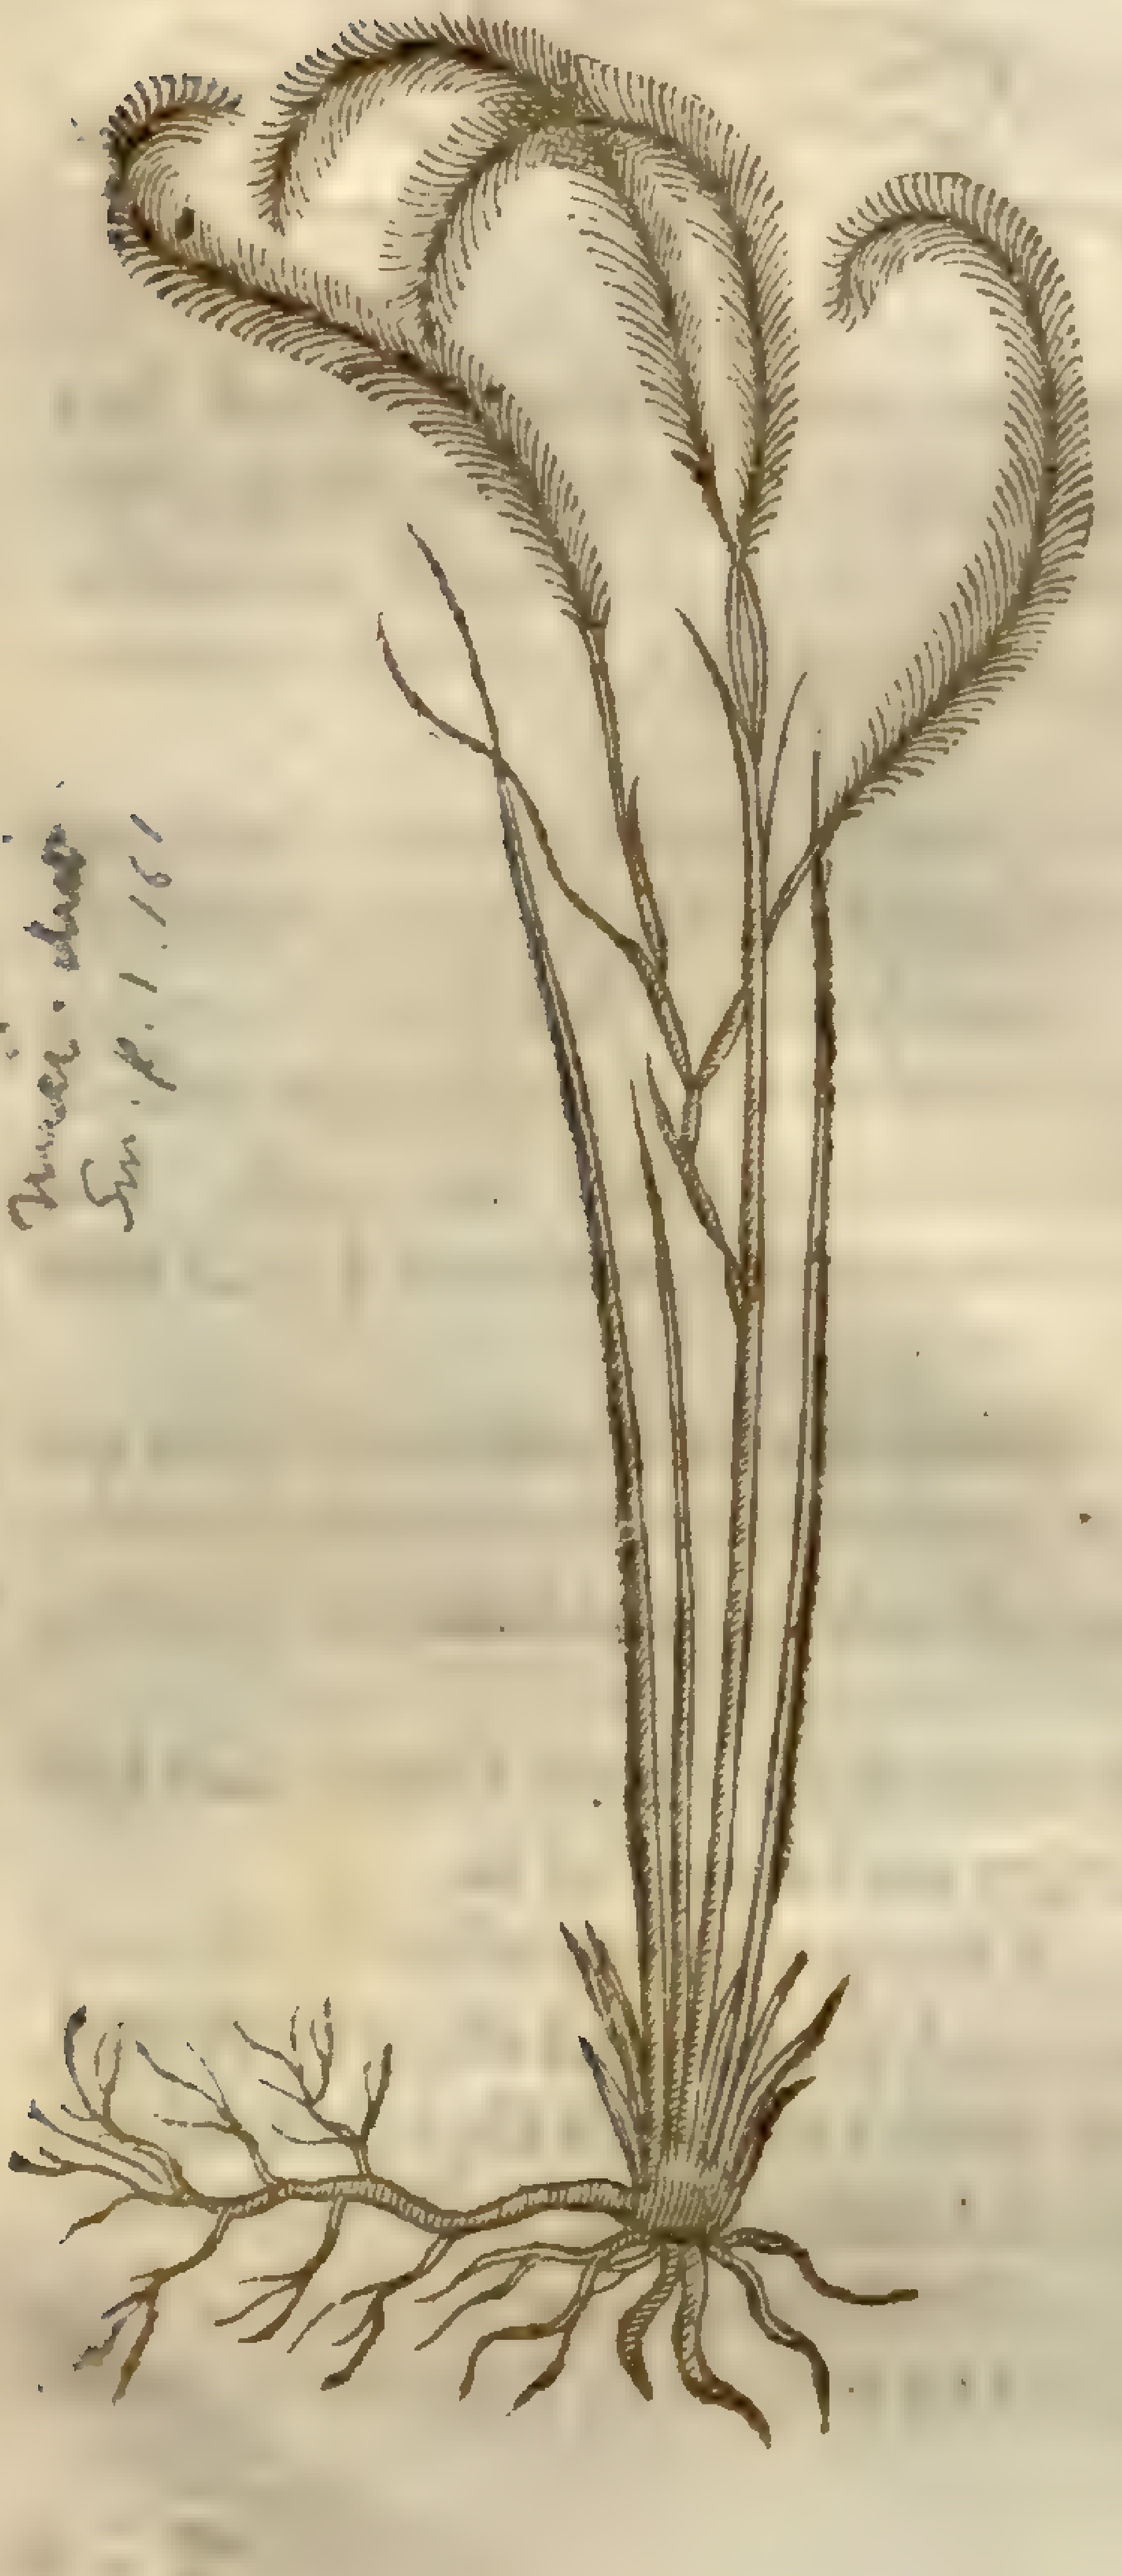


Arundo arenaria; Spartinet. [illegible] Syn. p. 392

4 *Spartum Anglicanum alterum.*
Small Engliſh Mat-weed or Helme.



† 6 *Spartum Auſtriacum.*
Feather-graſſe.



Stipa pennata; & [illegible] Syn. p. 161

¶ *The Place.*

1 2 Theſe grow in diuers places of Spain.

‡ 3 I being in company with M. *Thom. Hicks*, *W. Broad*, and three other London Apothecaries beſides, in Auguſt 1632, to find out rare plants in the Iſle of Tenet, found this bigger Engliſh one in great plenty, as ſoone as wee came to the ſea ſide, going betweene Margate and Sandwich.

4, 5. Theſe it may be grow alſo vpon our coaſts; howeuer, they grow neere the ſea ſide in diuers parts of the Low countries.

6 This elegant plant *Cluſius* firſt obſerued to grow naturally in the mountaines nigh to the Baths of Baden in Germany, and in diuers places of Auſtria and Hungary. It is nouriſhed for the beauty in ſundry of our Engliſh gardens. ‡

¶ *The Time.*

Theſe beare their heads in the middle, & ſome in the later end of Sommer.

¶ *The Names.*

‡ 1 This is called *Spartum primum Plinij*, that is, the firſt Mat-weed deſcribed by *Pliny*: in Spain they call it *Sparto*: the French in Prouince terme it *Olpho*.

2 This is *Spartum alterum Plinij*, *Plinies* ſecond Mat-weed, or Hooded Matweed: it is called *Albardin* in Spain.

3 This is *Spartum* 3. *Cluſij*, and *Gramen Sparteum ſecund. Schœnanthinum* of *Taber*. Our Author

gaue *Cluſius* his figure for the firſt, and *Tabernamontanus* figure for the ſecond *Spartum Anglicanum*: but I will thinke them both of one plant (though *Bauhine* diſtinguiſh them) vntil ſome ſhal make the contrary manifeſt. This the Dutch call **Halme**; and our Engliſh in Tenet, Helme. *Turner* cals it Sea-Bent.

4 This is *Spartum herba 4 Batavicum* of *Cluſius*; *Gramen Sparteum*, or *Iunci Spartium* of *Tabern.* and our Author gaue *Tabern.* figure, Chap. 23. of this Booke, vnder the title of *Iuncus marinus gramineus*: *Lobel* calls it *Spartum noſtras alterum*. 5 *Lobel* calls this, *Spartum noſtras parvum*: of which ſee the figure and deſcription at the end of the booke.

6 *Cluſius* calls this, *Spartum Auſtriacum*: *Daleſchampius*, *Gramen pinnatum*: we in England call it *Gramen plumoſum*, or Feathered-graſſe. ‡

¶ *The Temperature, Vertues, and Vſe.*

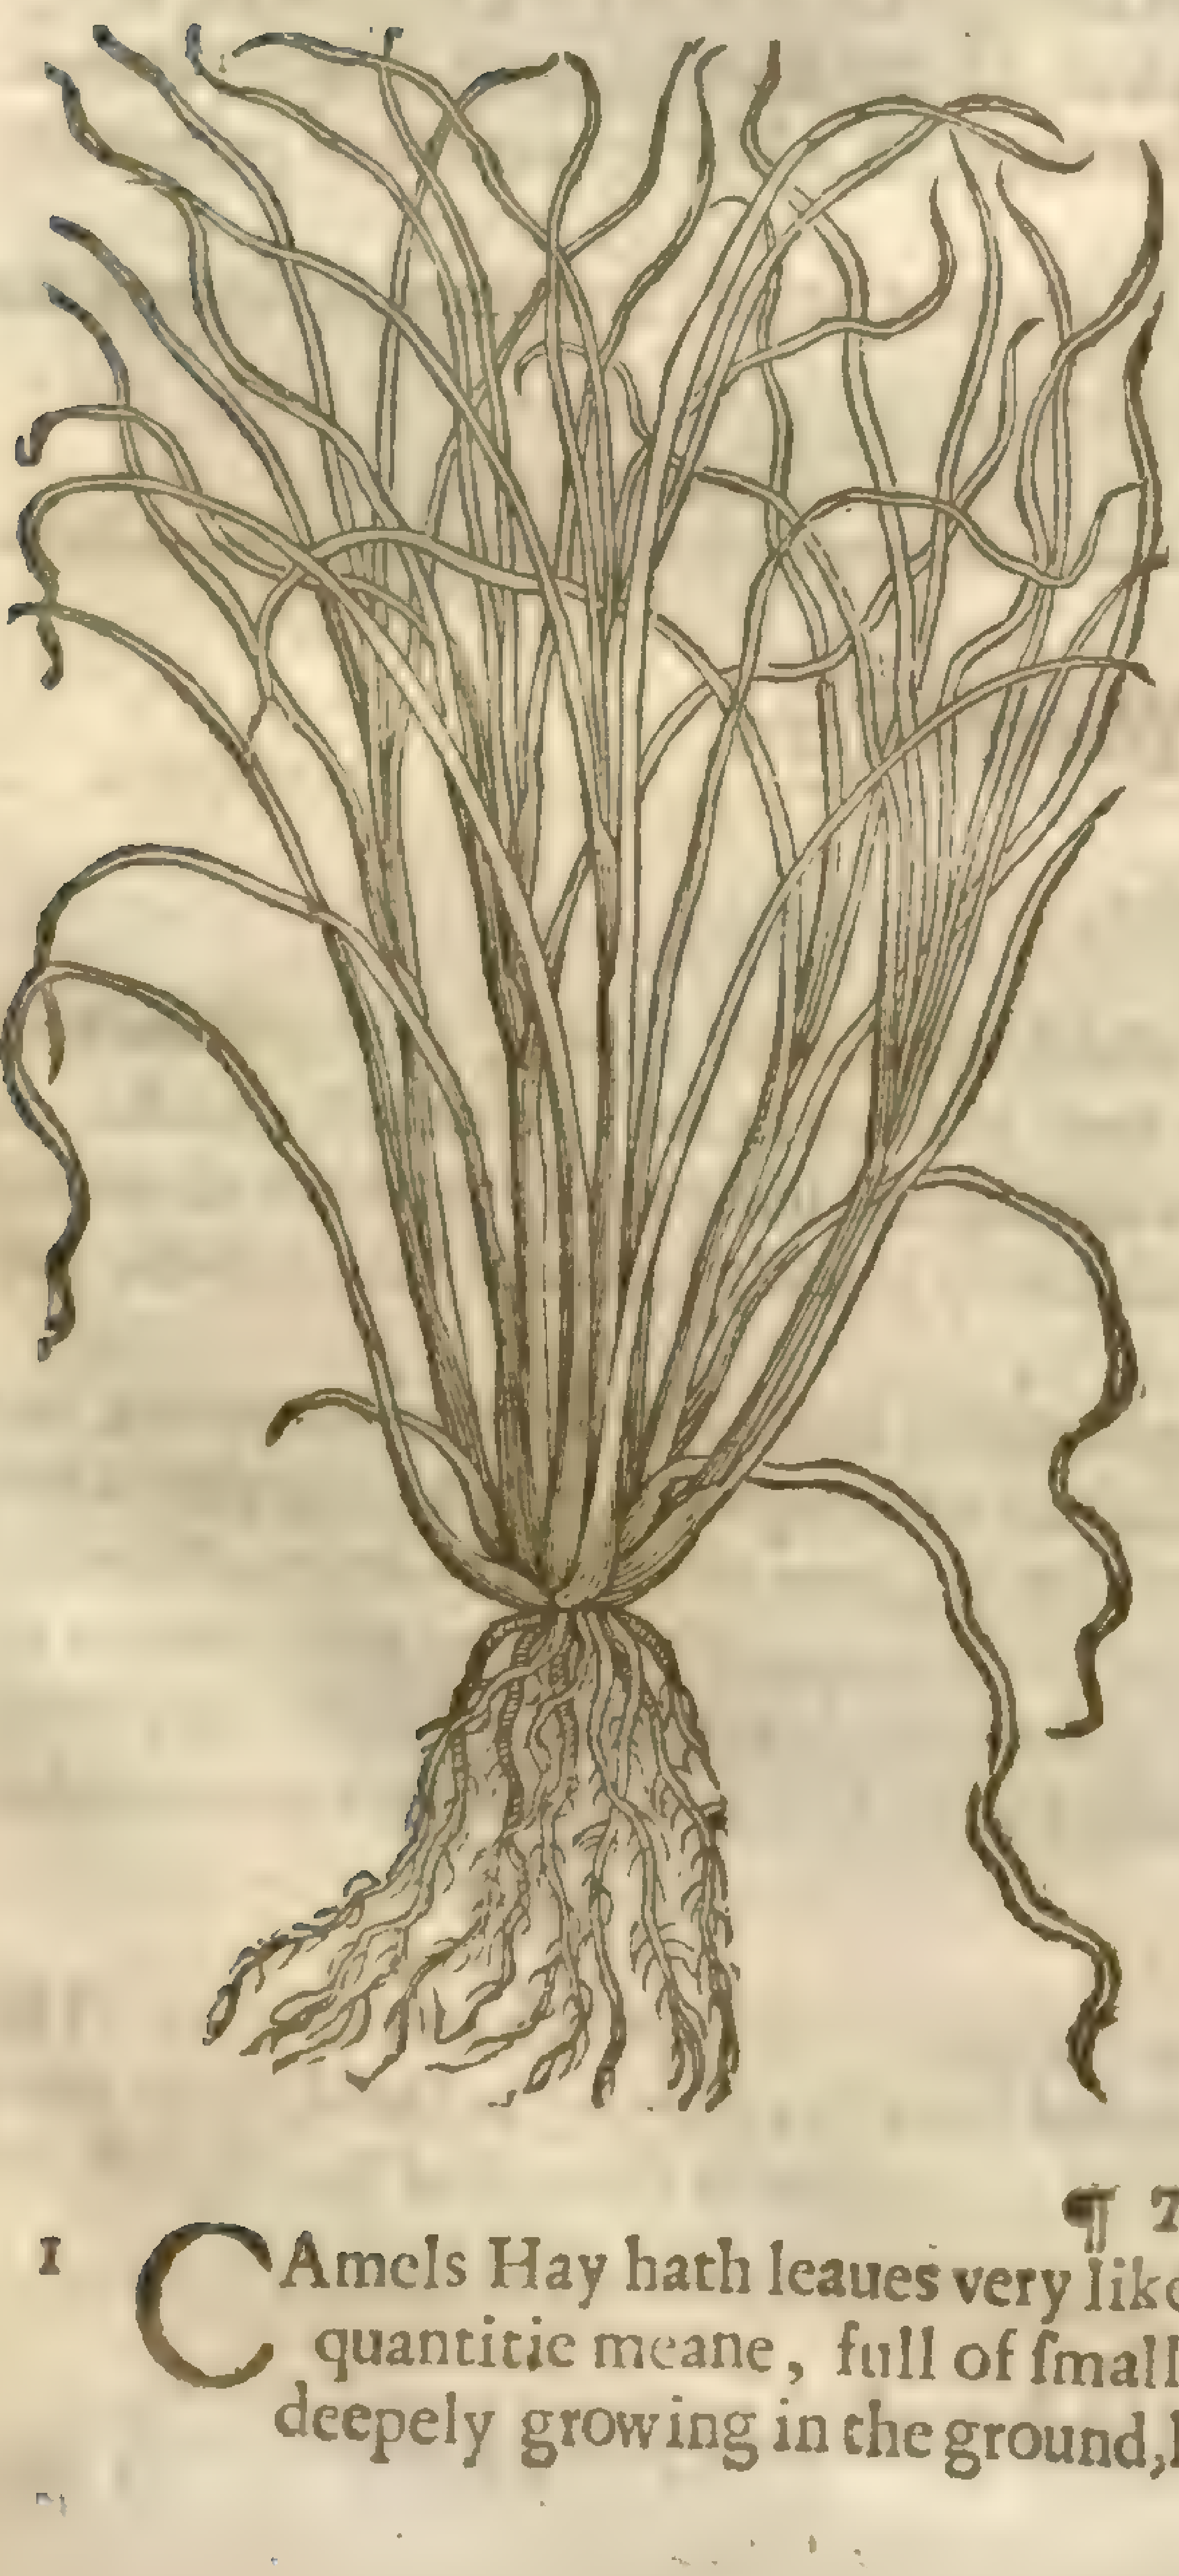
A These kinds of graſſie or rather ruſhy Reeds haue no vſe in phyſicke, but ſerue to make Mats and hangings for chambers, frailes, baskets, and ſuch like. The people of the countries where they grow do make beds of them, ſtraw their houſes and chambers in ſtead of Ruſhes, for which they do excell, as my ſelfe haue ſeen. *Turner* affirmes, That they made hats of the Engliſh one in Northumberland in his time.

B They do likewiſe in ſundry places of the Iſlands of Madera, Canaria, S. *Thomas*, & other of the Iſlands in the tract vnto the Weſt Indies, make of them their boots, ſhooes, herdmens coats, fires, and lights. It is very hurtfull for Cattell, as Sheere-graſſe is.

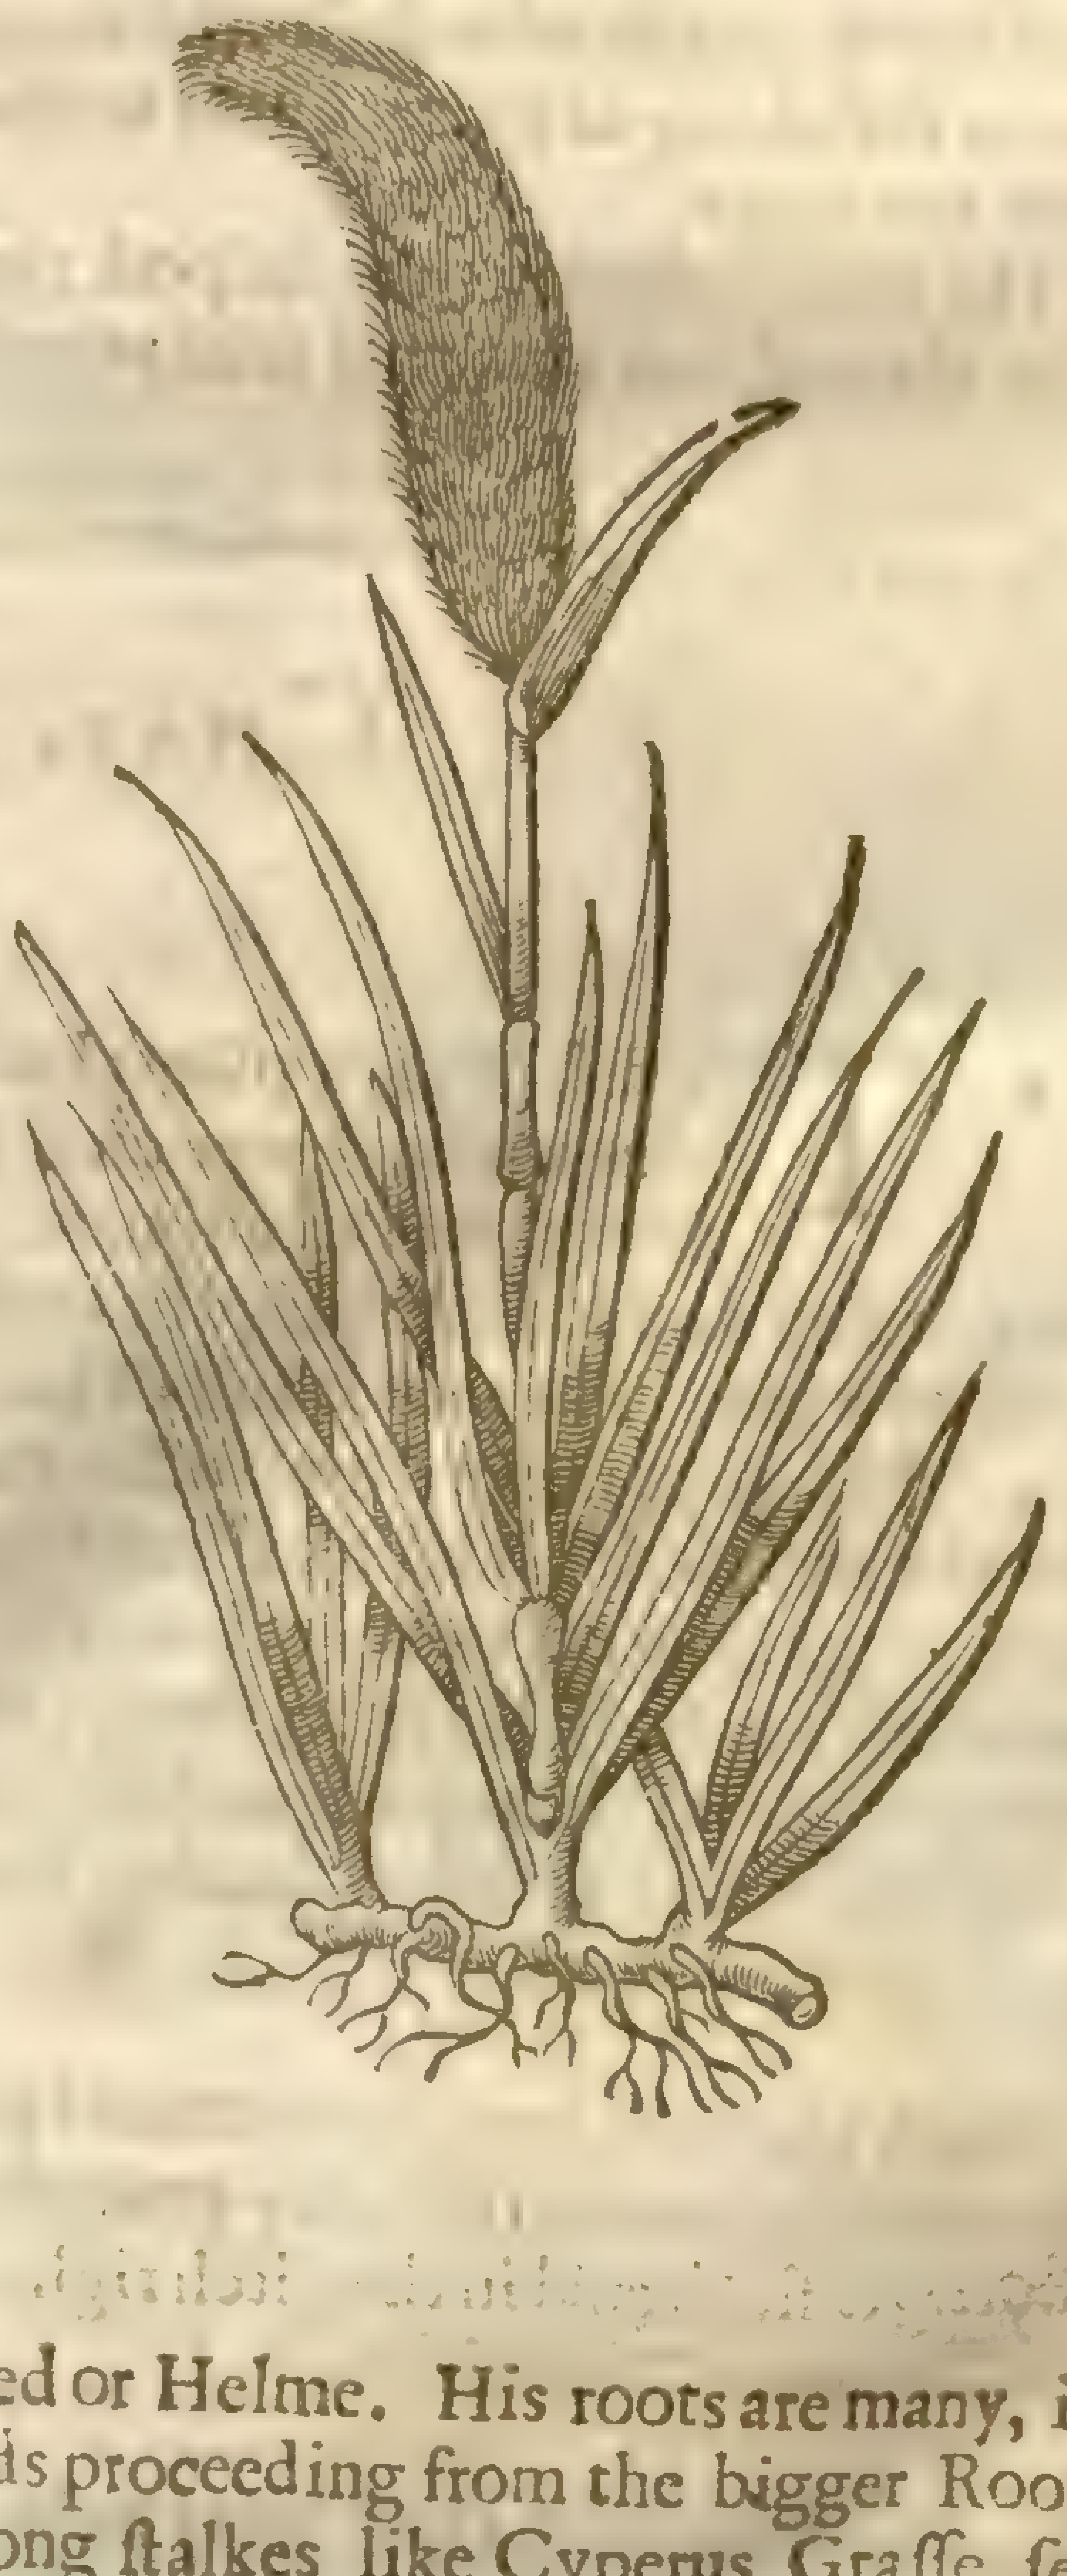
C The Feather-graſſe is worne by ſundry Ladies and Gentlewomen in ſtead of a Feather, which it exquiſitly reſembles.

Chap. 53. *Of Camels-Hay.*

1 *Scœnanthum.*
Camels Hay.



2 *Scœnanthum adulterinum.*
Baſtard Camels Hay.



¶ *The Deſcription.*

1 Camels Hay hath leaues very like vnto Mat-Weed or Helme. His roots are many, in quantitie meane, full of ſmall haires or threads proceeding from the bigger Root, deepely growing in the ground, hauing diuers long ſtalkes like Cyperus Graſſe, ſet

with ſome ſmaller leaues euen vnto the top, where do grow many ſmall chaffie tufts or pannicles, like thoſe of wilde Oats, of a reaſonable good ſmell and ſauour when they are broken, like vnto a Roſe, with a certaine biting and nipping of the tongue.

† 2 *Francis Penny* (of famous memorie) a good Phyſition and skilfull Herbariſt, gathered on the coaſt of the Mediterranean ſea, betweene Aigues Mortes and Peſcaire, this beautifull Plant, whoſe roots are creeping, and ſtalks and leaues reſemble Squinanth. The floures are ſoft, pappous, and thicke compact, and ſome fiue or ſix inches in length, like to Fox-taile: they in colour reſemble white ſilke or ſiluer. Thus much *Lobel*. Our Author deſcribed this in the firſt place, Chap. 23. vnder *Iuncus marinus gramineus*; for ſo *Lobel* calls it.

¶ *The Place.*

1 This growes in Africa, Nabathæa, and Arabia, and is a ſtranger in theſe Northern regions.

2 The place of the ſecond is mentioned in the deſcription.

¶ *The Time.*

Their time anſwereth the other Reeds and Flags.

¶ *The Names.*

Camels Hay is called in Greeke, σχοῖνος ἀρωματικὸς: in Latine, *Iuncus odoratus*, and *Scœnanthum*: in ſhops, *Squinanthum*, that is, *Flos Iunci*: in French, *Paſteur de Chammeau*: in Engliſh, Camels Hay, and Squinanth.

2 This *Lobel* calls *Iuncus marinus gramineus*, and *Pſeudoſchœnanthum*: We call it baſtard Squinanth, and Fox-taile Squinanth.

¶ *The Temperature.*

This plant is indifferently hot, and a little aſtrictiue.

¶ *The Vertues.*

A Camels Hay prouoketh vrine, moueth the termes, and breaketh winde about the ſtomacke.

B It cauſeth aking and heauineſſe of the head: *Galen* yeeldeth this reaſon thereof, becauſe it heateth moderatly, and bindeth with tenuitie of parts.

C According to *Dioſcorides*, it diſſolues, digeſts, and opens the paſſages of the veins.

D The floures or chaffie husks are profitable in drinke for them that piſſe bloud any wayes. It is giuen in medicines that are miniſtred to cure the paines and griefes of the guts, ſtomacke, lungs, liuer, and reins, the fulneſſe, loathſomneſſe, and other defects of the ſtomacke, the dropſie, conuulſion or ſhrinking of ſinues, giuen in the quantitie of a drame, with a like quantitie of pepper for ſome few dayes.

E The ſame boiled in wine helpeth the inflammation of the matrice, if the woman do ſit ouer the fume thereof, and bathe her ſelfe often with it alſo.

Chap. 36. *Of Burre-Reed.*

¶ *The Deſcription.*

1 THe firſt of theſe plants hath long leaues, which are double edged, or ſharpe on both ſides, with a ſharpe creſt in the middle, in ſuch manner raiſed vp that it ſeemeth to be triangle or three-ſquare. The ſtalks grow among the leaues, and are two or three foot long, being diuided into many branches, garniſhed with many prickly husks or knops of the bigneſſe of a nut. The root is full of hairy ſtrings.

2 The great water Burre differeth not in any thing from the firſt kinde in roots or leaues, ſaue that the firſt hath his leaues riſing immediatly from the tuft or knop of the root; but this kinde hath a long ſtalke comming from the root, whereupon a little aboue the root the leaues ſhoot out round about the ſtalke ſucceſſiuely, ſome leaues ſtill growing aboue others, euen to the top of the ſtalke, and from the top thereof downward by certaine diſtances. It is garniſhed with many round wharles or rough coronets, hauing here and there among the ſaid wharles one ſingle ſhort leafe of a pale greene colour.

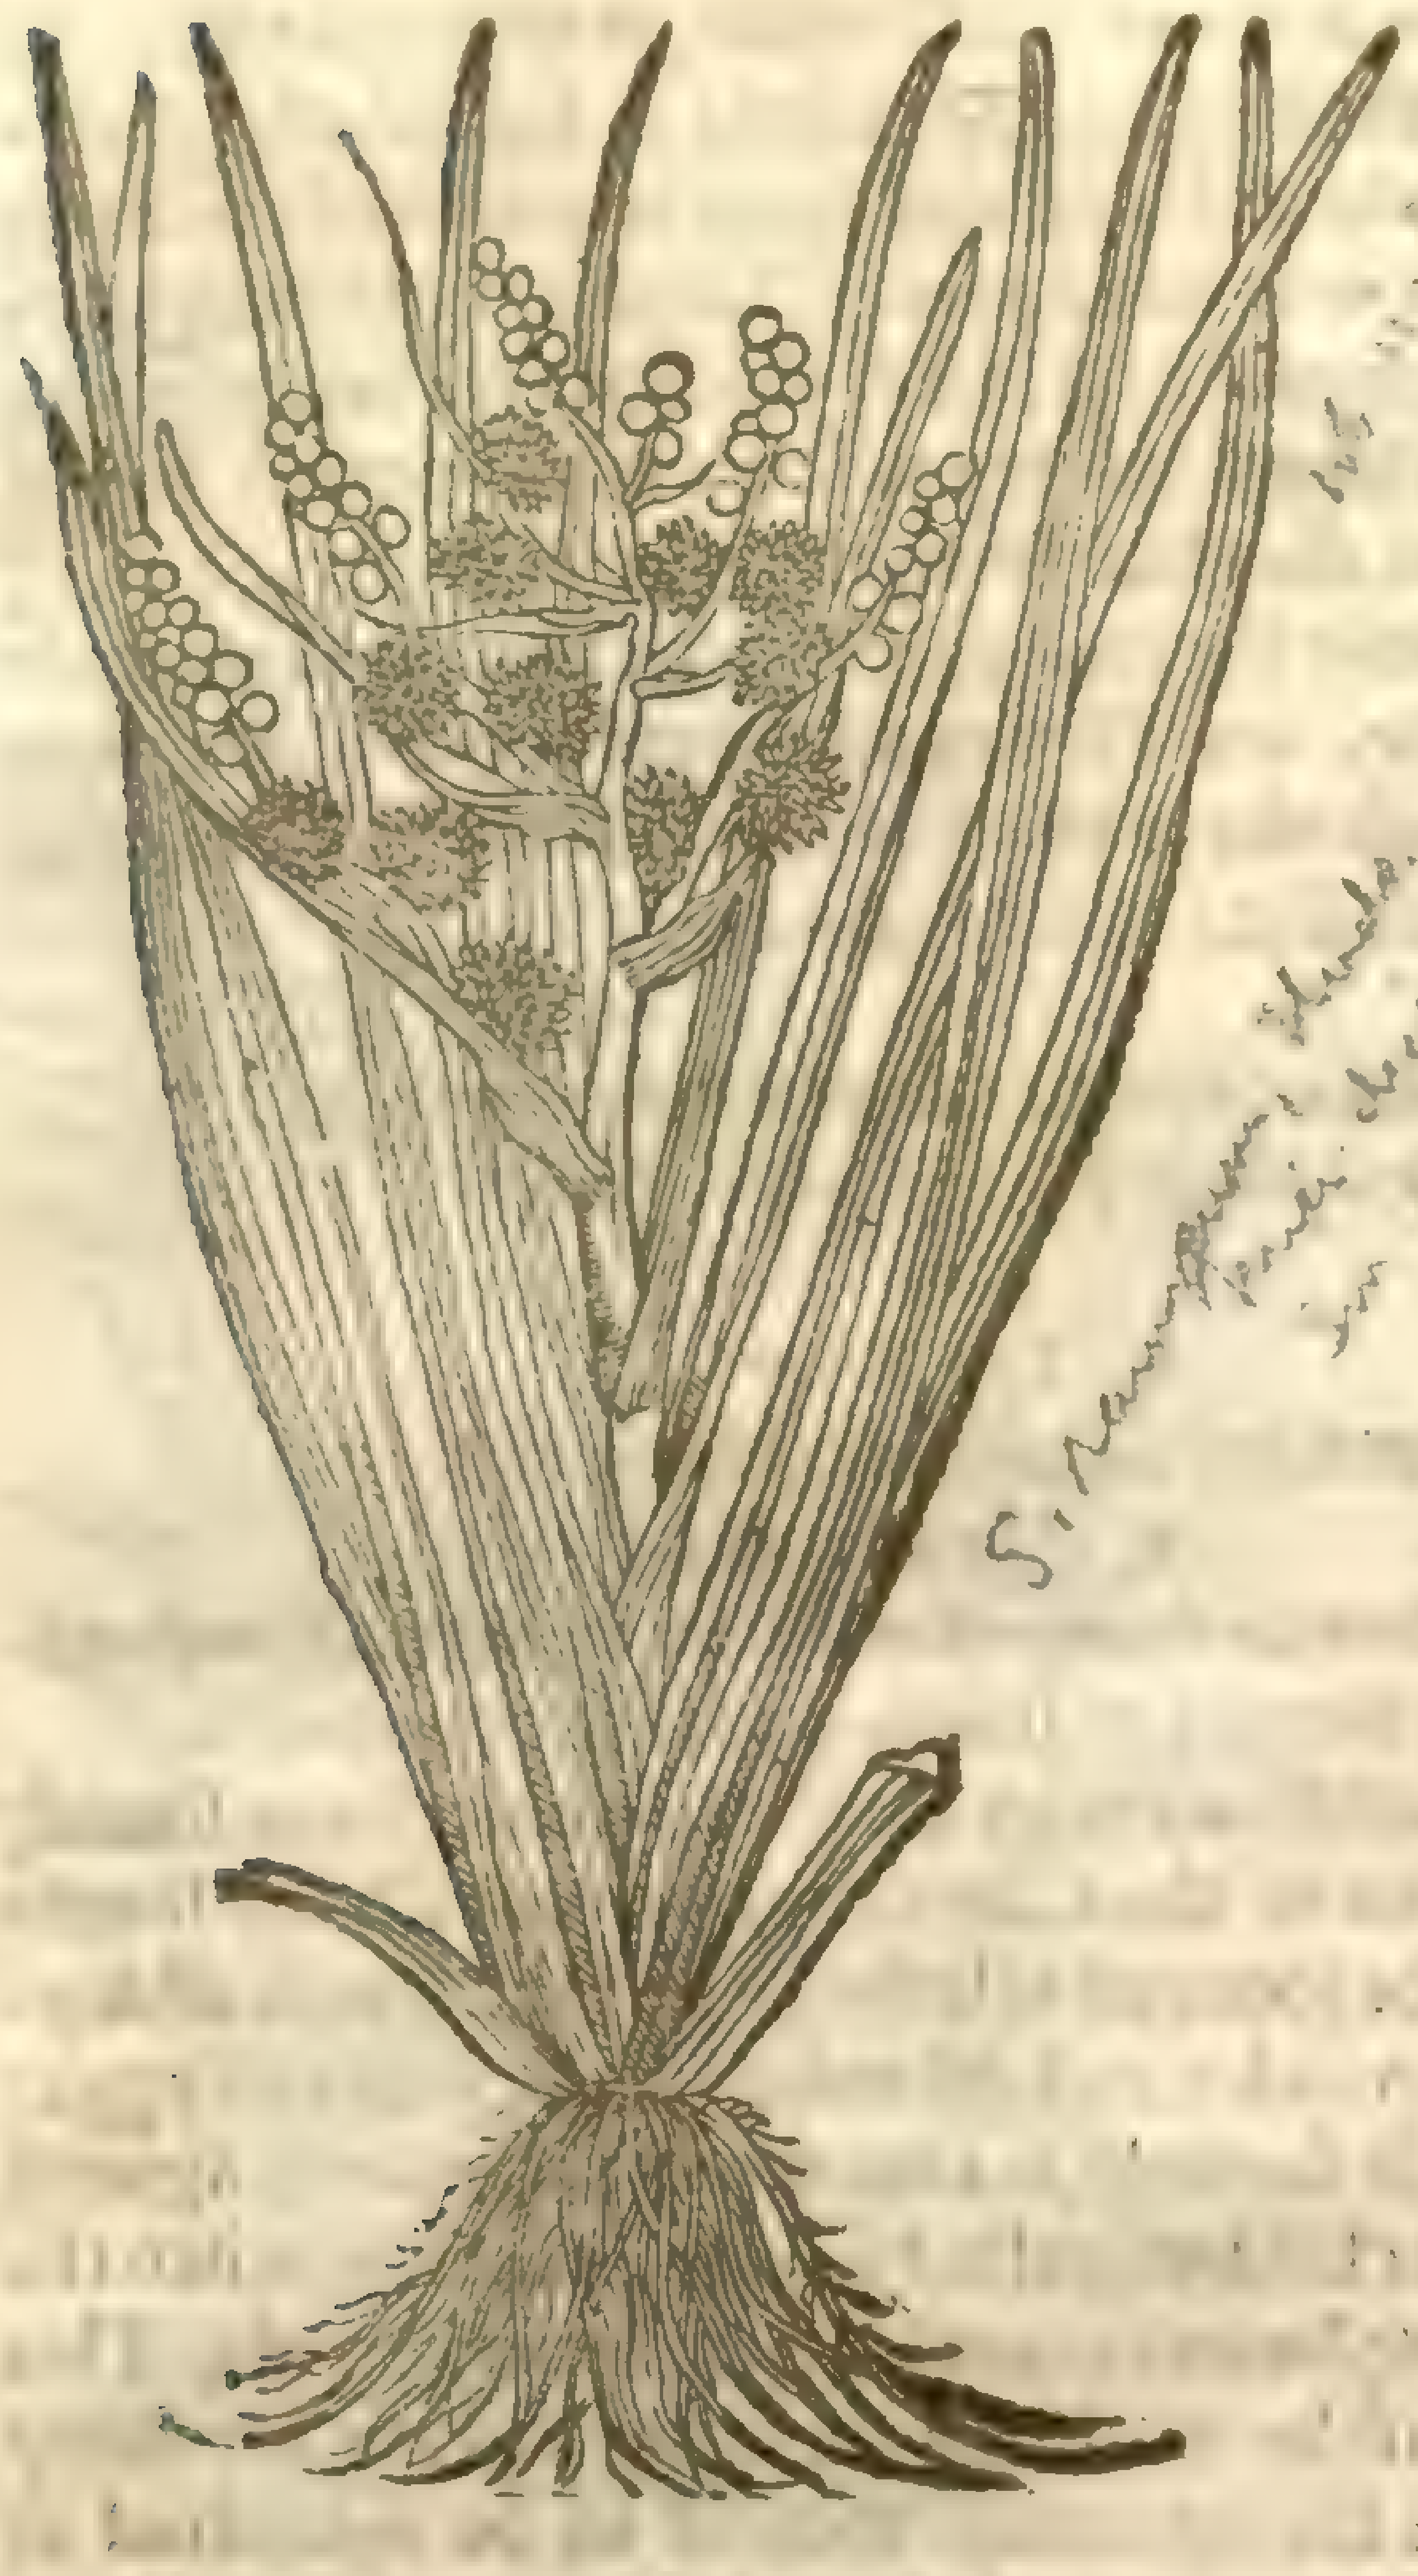
¶ *The Place.*

Both theſe are very common, and grow in moiſt medowes and neere vnto water courſes. They plentifully grow in the fenny grounds of Lincolnſhire and ſuch like places; in the ditches about S. *Georges* fields, and in the ditch right againſt the place of execution at the end of Southwark, called S. *Thomas* Waterings.

¶ *The Time.*

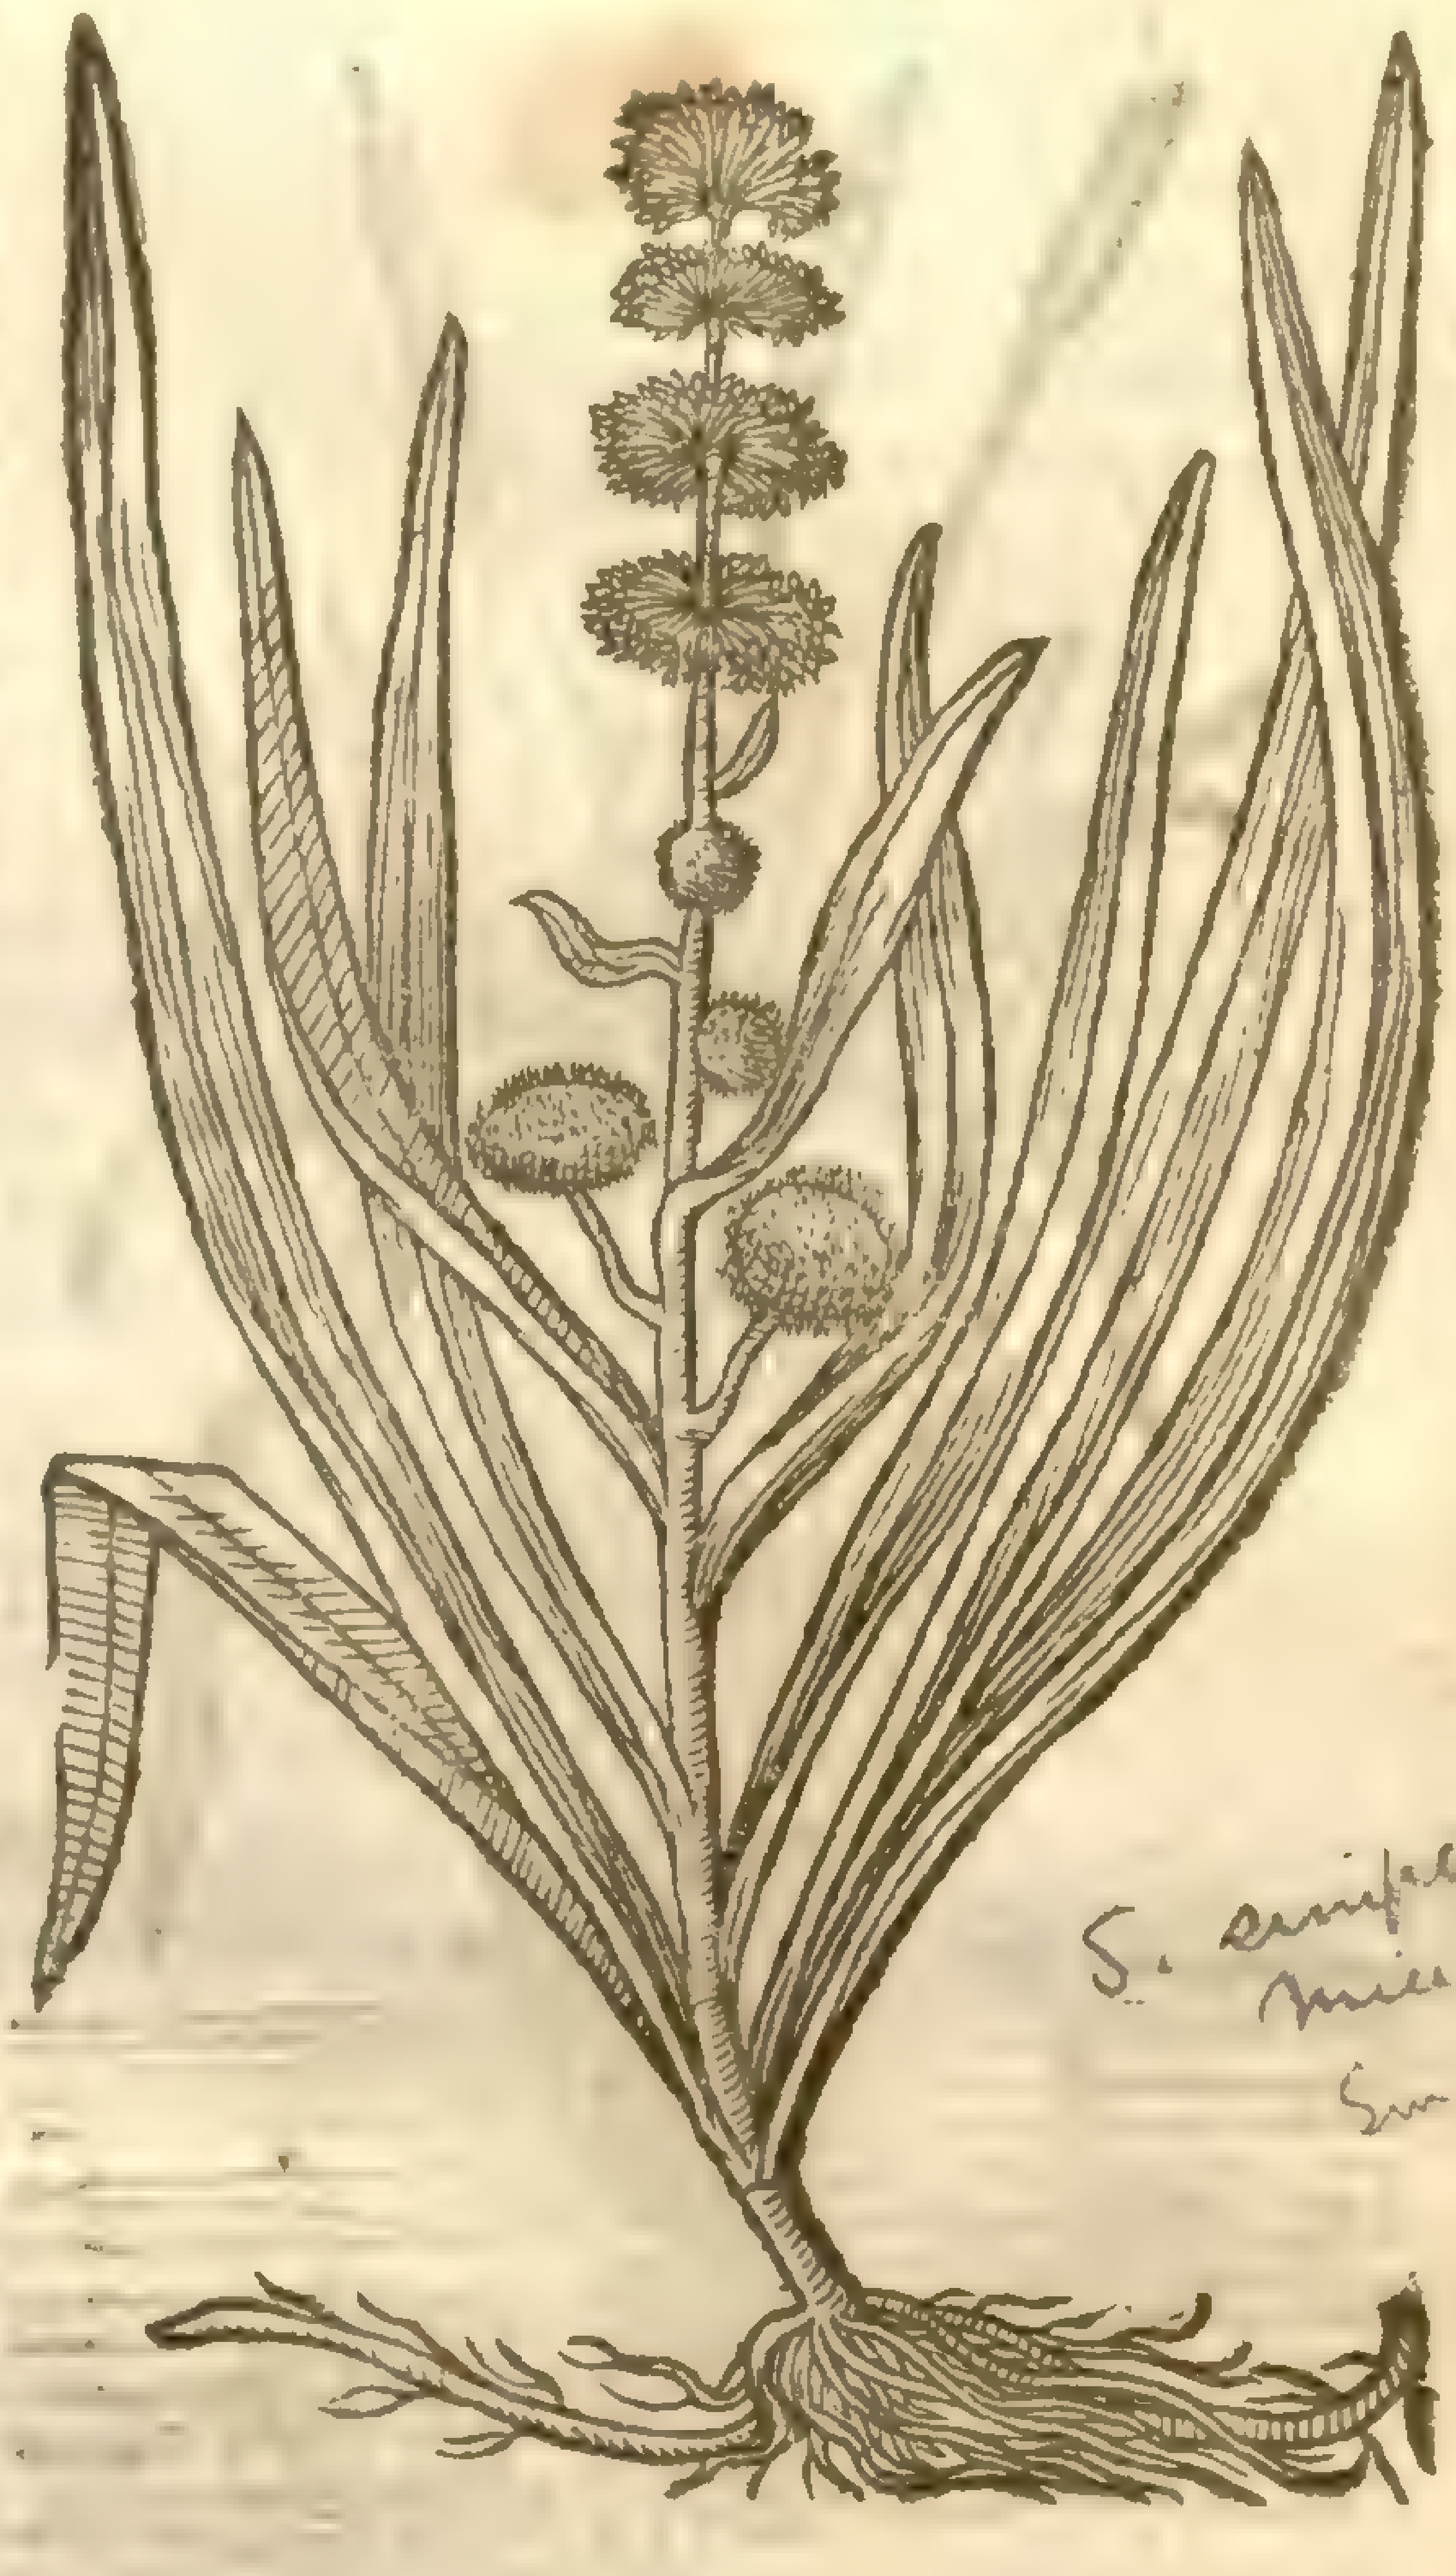
They bring forth their burry bullets or ſeedy knots in Auguſt.

1 *Sparganium ramoſum.*
Branched Burre Reed.



S. ramosum, Huds. [illegible] Eng. fl. iv. [illegible]

2 *Sparganium latifolium.*
Great water Burre.



S. simplex, Huds. [illegible] Eng. fl. iv. [illegible]

¶ *The Names.*

Theſe plants of ſome are called *Sparganium* : *Theophraſtus* in his fourth booke and eighteenth chap. calleth them *Butomus* : of ſome, *Platanaria* : I call them Burre-Reed : in the Arabian tongue they are called *Safarhe Bamon* : in Italian, *Sparganio* : of *Dodonaus*, *Carex*. Some call the firſt *Sparganium ramoſum*, or branched Burre Reed. The ſecond, *Sparganium non ramoſum*, Not-branched Bur Reed.

¶ *The Temperature.*

They are cold and dry of complexion.

¶ *The Vertues.*

Some write, that the knops or rough burres of theſe plants boiled in wine, are good againſt the bitings of venomous beaſts, if they be either drunke, or the wound waſhed therewith.

CHAP. 37. *Of Cats-taile.*

¶ *The Deſcription.*

CAts-taile hath long and flaggy leaues full of a ſpongeous matter or pith, amongſt which leaues groweth vp a long ſmooth naked ſtalke without knot, faſhioned like a ſpeare, of a firm or ſollid ſubſtance, hauing at the top a browne knop or eare, ſoft, thick, and ſmooth, ſeeming to be nothing elſe but a deale of flocks thicke ſet and thruſt together, which being ripe turns into a downe and is carried away with the winde. The roots be hard, thicke, and white, full of ſtrings, and good to burne, where there is plenty thereof to be had.

¶ *The Place.*

It groweth in pooles and ſuch like ſtanding waters, and ſometimes in running ſtreames.

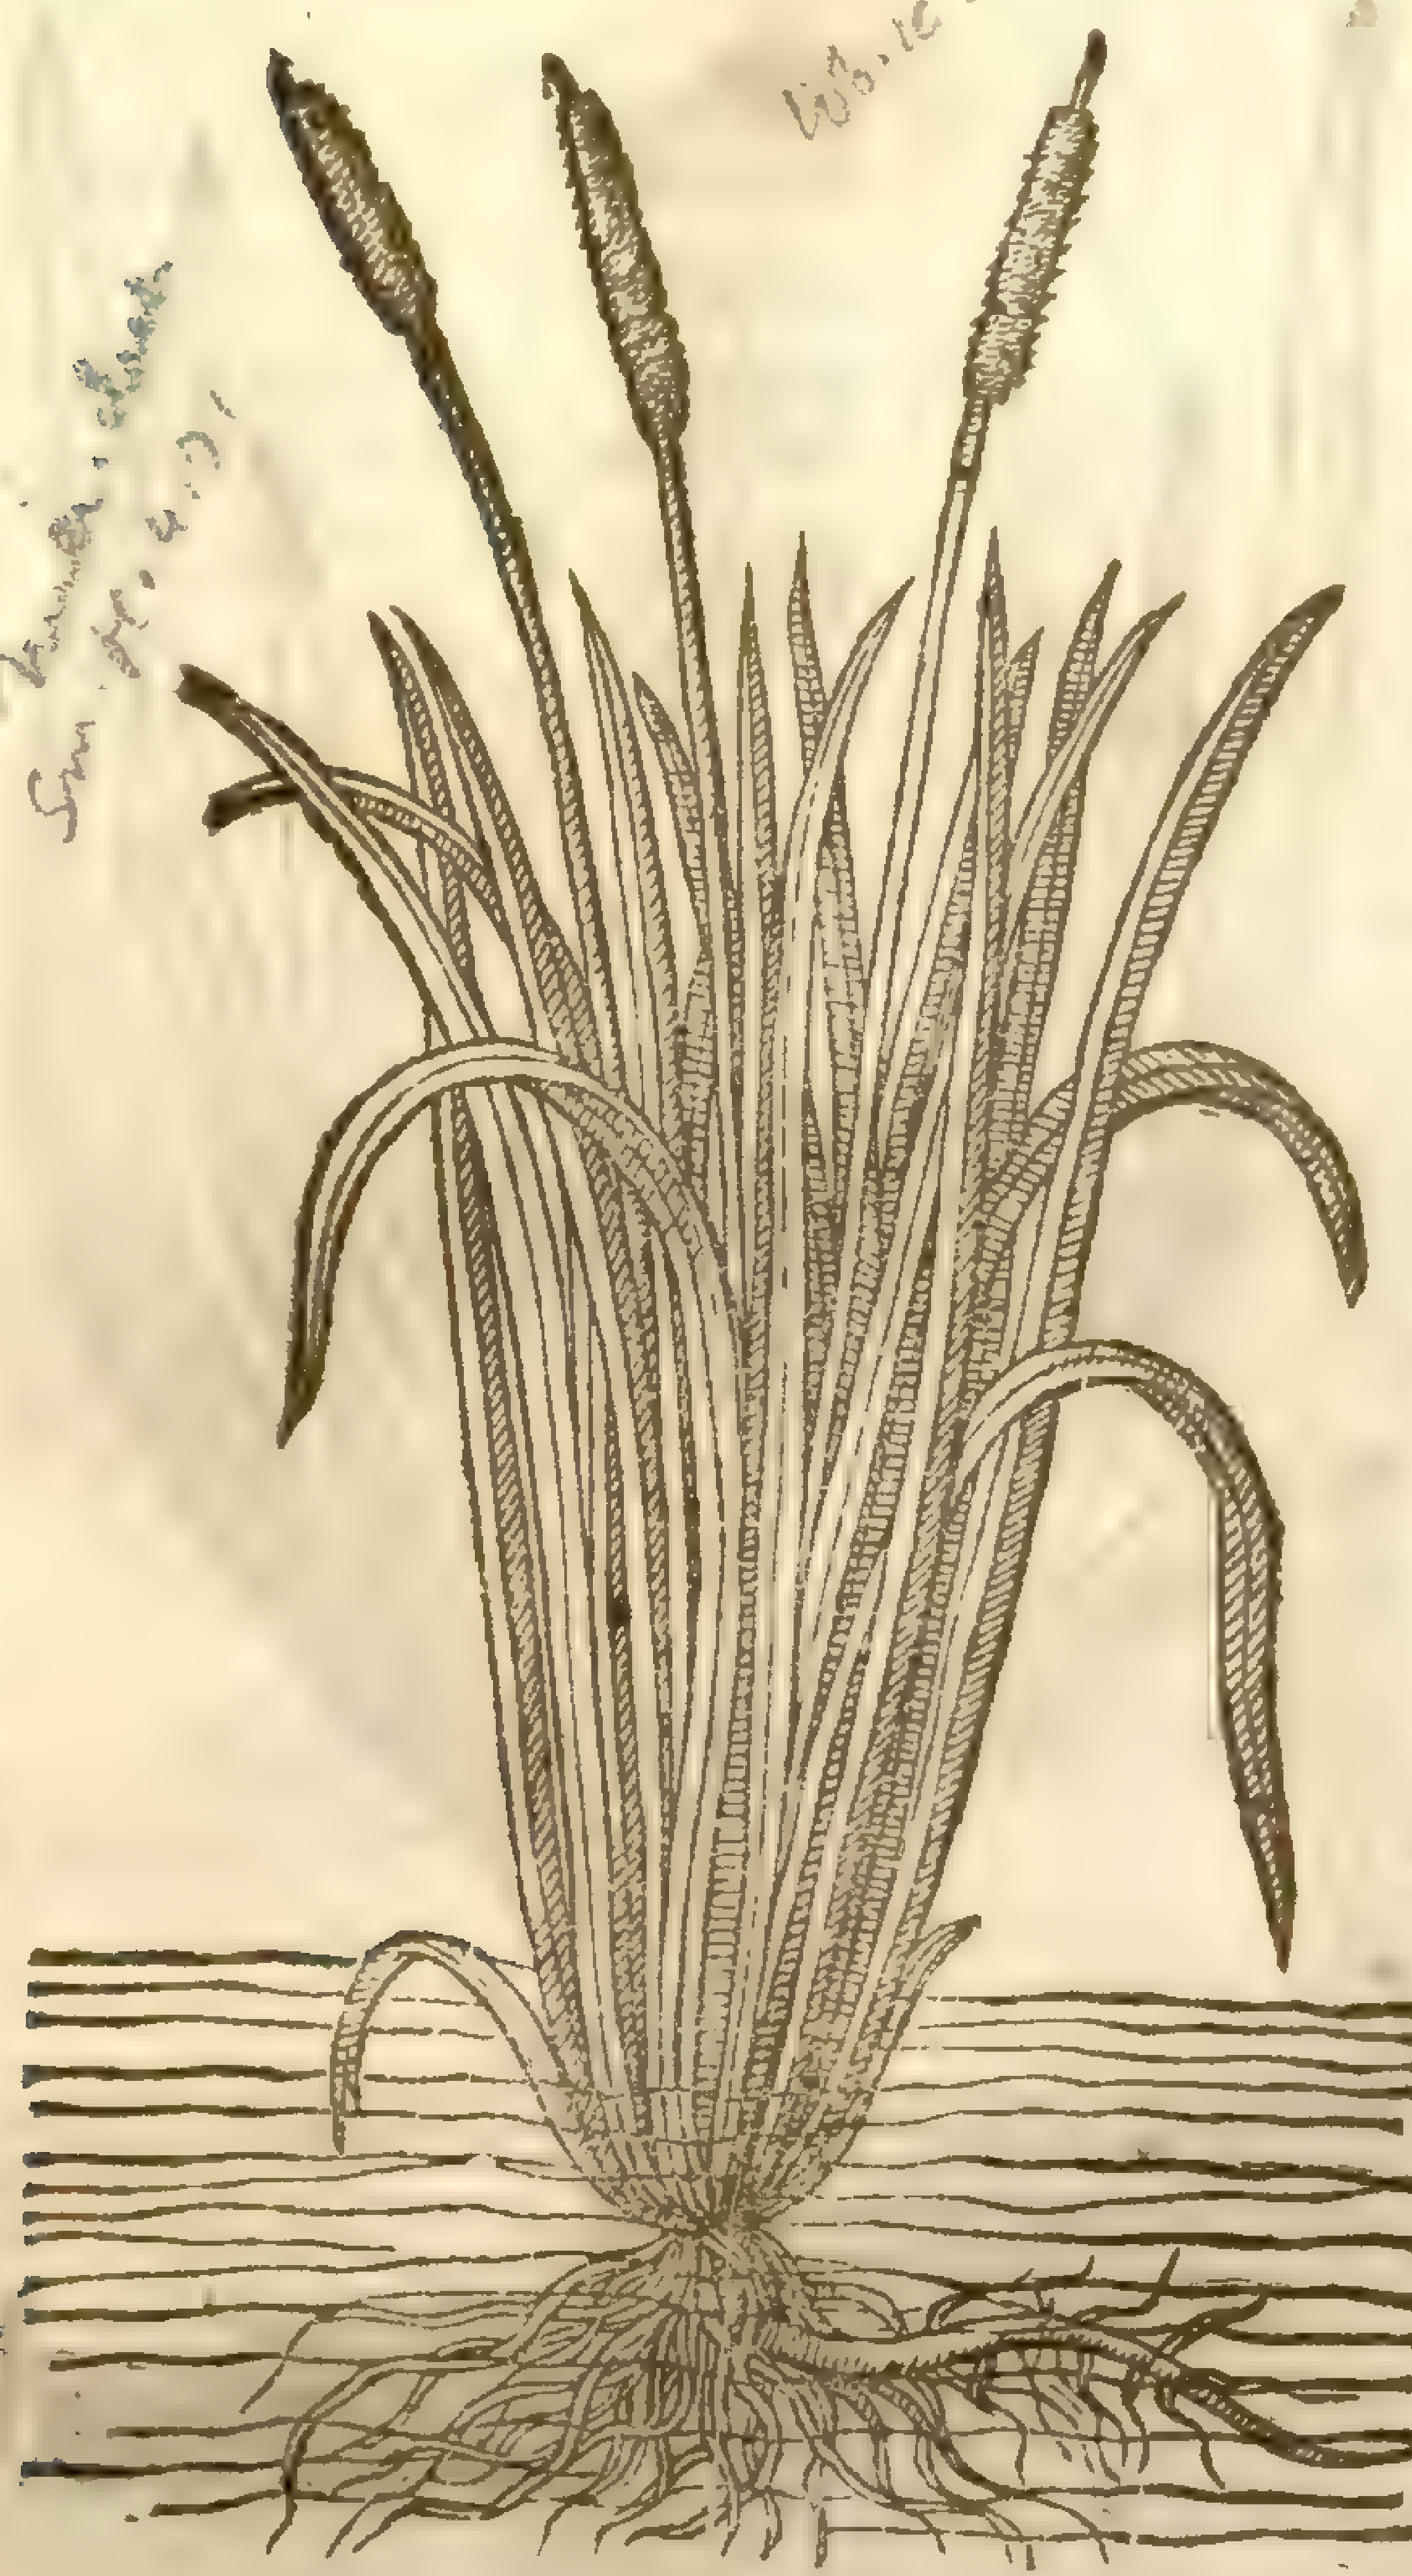
I haue found a ſmaller kinde hereof growing in the ditches and mariſhie grounds in the Iſle of Shepey, going from Sherland houſe to Feuerſham.

¶ *The Time.*

They floure and beare their mace or torch in Iuly and Auguſt.

¶ *The*

Typha.
Cats-taile.



T. latifolia L. [illegible]

¶ *The Names.*

It is called in Greeke, *Typhe* : in Latine, *Typha* : of ſome, *Ceſtrum Morionis* : in French, *Marteau Maſſes* : in Dutch, **Liſchdodem** and **Donſen** : in Italian, *Mazzaſorda* : in Spaniſh, *Behordo*, and *Iunco amacorodato* : in Engliſh, Cats-taile or Reed-mace. Of this Cats-taile *Ariſtophanes* makes mention in his Comedy of Frogs, where he bringeth them forth one talking with another, being very glad that they had ſpent the whole day in ſkipping and leaping *inter Cyperum & Phleum*; among Galingale and Cats-taile. *Ovid* ſeemes to name this plant *Scirpus*; for hee termeth the mats made of the leaues, Cats-taile mats: as in his ſixt booke *Faſtorum*,

> *At Dominus, diſcedite, ait, plauſtroque morantes*
> *Suſtulit, in plauſtro ſcirpea matta fuit.*

¶ *The Nature.*

It is cold and dry of complexion.

¶ *The Vertues.*

A The ſoft downe ſtamped with Swines greaſe wel waſhed, healeth burnes or ſcalds with fire or water.

B Some Practitioners by their experience haue found, that the downe of the Cats taile beaten with the leaues of Betony, the roots of Gladiole, and the leaues of *Hyppogloſſon* into pouder, and mixed with the yelks of egges hard ſodden, & ſo eaten, is a moſt perfect remedy againſt the diſeaſe in children called Ἐντεροκήλη, which is, when the gut called *Inteſtinum cæcum* is fallen into the cods. This medicine muſt be miniſtred euery day faſting for thirty dayes ſpace: the quantitie thereof to be miniſtred at once is 1. ʒ. This being vſed as before is ſpecified, doth not onely helpe children and ſtriplings, but growne men alſo, if in time of their cure they vſe conuenient ligature or truſſings, and fit conſounding plaiſters vpon the grieued place, according to art appointed for that purpoſe in Chirurgerie.

C This downe in ſome places of the Iſle of Ely and the Low-countries adioyning thereto, is gathered and well ſold to make mattreſſes thereof for plow-men and poore people.

It hath been alſo often proued to heale kibed or humbled heeles, (as they are termed) being applied to them either before or after the ſkin is broken.

CHAP. 38. *Of Stitch-wort.*

¶ *The Deſcription.*

1 Stitch-wort, or as *Ruellius* termeth it, *Holoſteum*, is of two kindes, and hath round tender ſtalks full of joints leaning toward the ground: at euery ioynt grow two leaues one againſt another. The floures be white, conſiſting of many ſmall leaues ſet in the manner of a ſtar. The roots are ſmall, ioynted, and threddy. The ſeed is contained in ſmall heads ſomewhat long, and ſharp at the vpper end; and when it is ripe, it is very ſmall, and browne.

2 The ſecond is like the former in ſhape of leaues and floures, which are ſet in form of a ſtar; but the leaues are orderly placed, and in good proportion, by couples two together, being of a whitiſh colour. When the floures be vaded, then follow the ſeeds, which are incloſed in bullets like the ſeed of flax, but not ſo round. The chiues or threds in the middle of the floure are ſometimes of a reddiſh or blackiſh colour. ‡ There are more differences of this plant, or rather varieties, as differing little but in the largeneſſe of the leaues, floures, and ſtalks. ‡

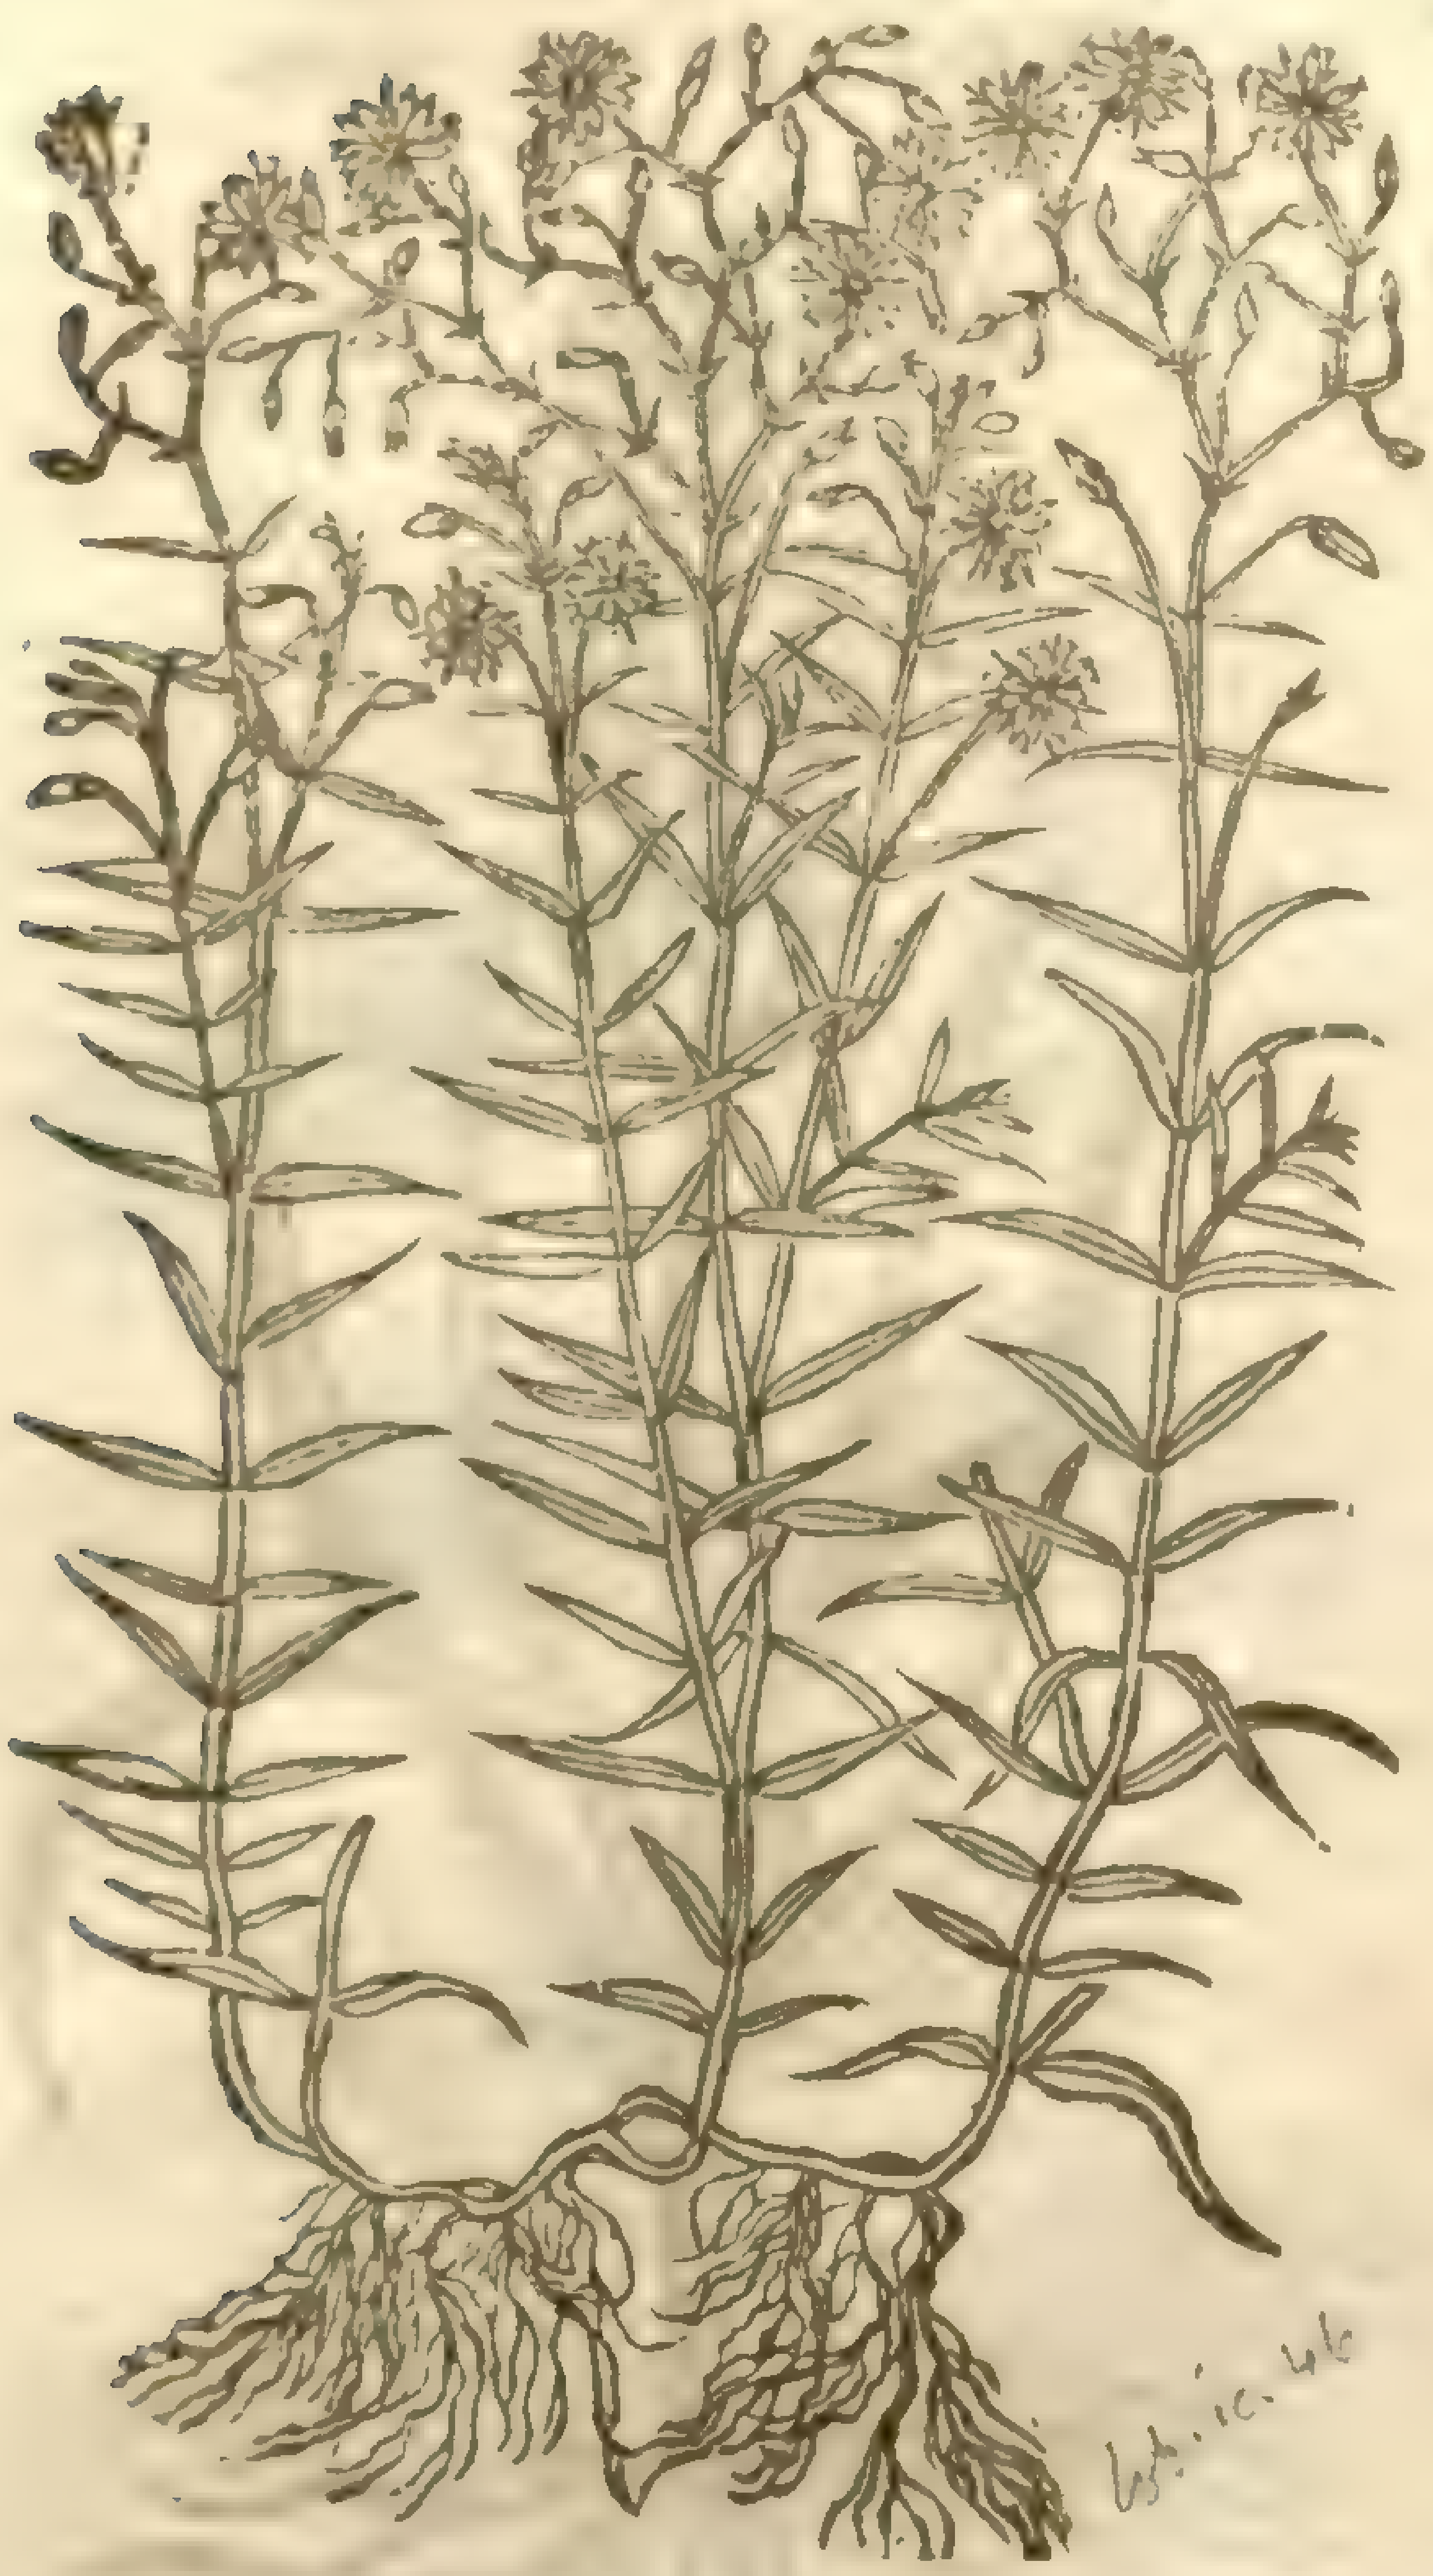
¶ *The Place.*

They grow in the borders of fields vpon banke ſides and hedges almoſt euery where.

¶ *The Time.*

They flouriſh all the Summer, eſpecially in May and Iune.

Gramen Leucanthemum. Stellaria holostea [illegible]
Stitch-wort.



¶ *The Names.*

Some (as *Ruellius* for one) haue thought this to be the plant which the Grecians call Ὁλόστεον: in Latine, *Tota oſſea*: in Engliſh, All-bone. Wherof I ſee no reaſon, vnleſſe it be by the figure *Antonomia*; as when we ſay in Engliſh, he is an honeſt man, our meaning is, he is a knaue: for this is a tender herbe, hauing no ſuch bony ſubſtance. ‡ *Dodonæus* queſtions whether this plant be not *Crataogonon*; and he calls it *Gramen Leucanthemum*, or White floured Graſſe. The qualitie here noted with B, is by *Dioſcorides* giuen to *Cratæogonon*, but it is with his ἱστορεῖται ὑπό τινων, that is, ſome ſay or report ſo much. Which phraſe of ſpeech hee often vſeth when as hee writes faculties by heare-ſay, and doubts himſelfe of the truth of them.

¶ *The Nature.*

The ſeed of Stitch-wort, as *Galen* writeth, is ſharpe and biting to him that taſtes it; and to him that vſeth it very like to Mill.

¶ *The Vertues.*

They are wont to drinke it in wine with the pouder of Acornes, againſt the paine in the ſide, ſtitches, and ſuch like. A

Diuers report, ſaith *Dioſcorides*, That the Seed of Stitchwort being drunke, cauſeth a woman to bring forth a man childe, if after the purgation of her ſickneſſe, before ſhe conceiue, ſhee doe drinke it faſting thrice in a day, halfe a dram at a time, in three ounces of water many dayes together. B

CHAP. 39. *Of Spider-wort.*

¶ *The Deſcription.*

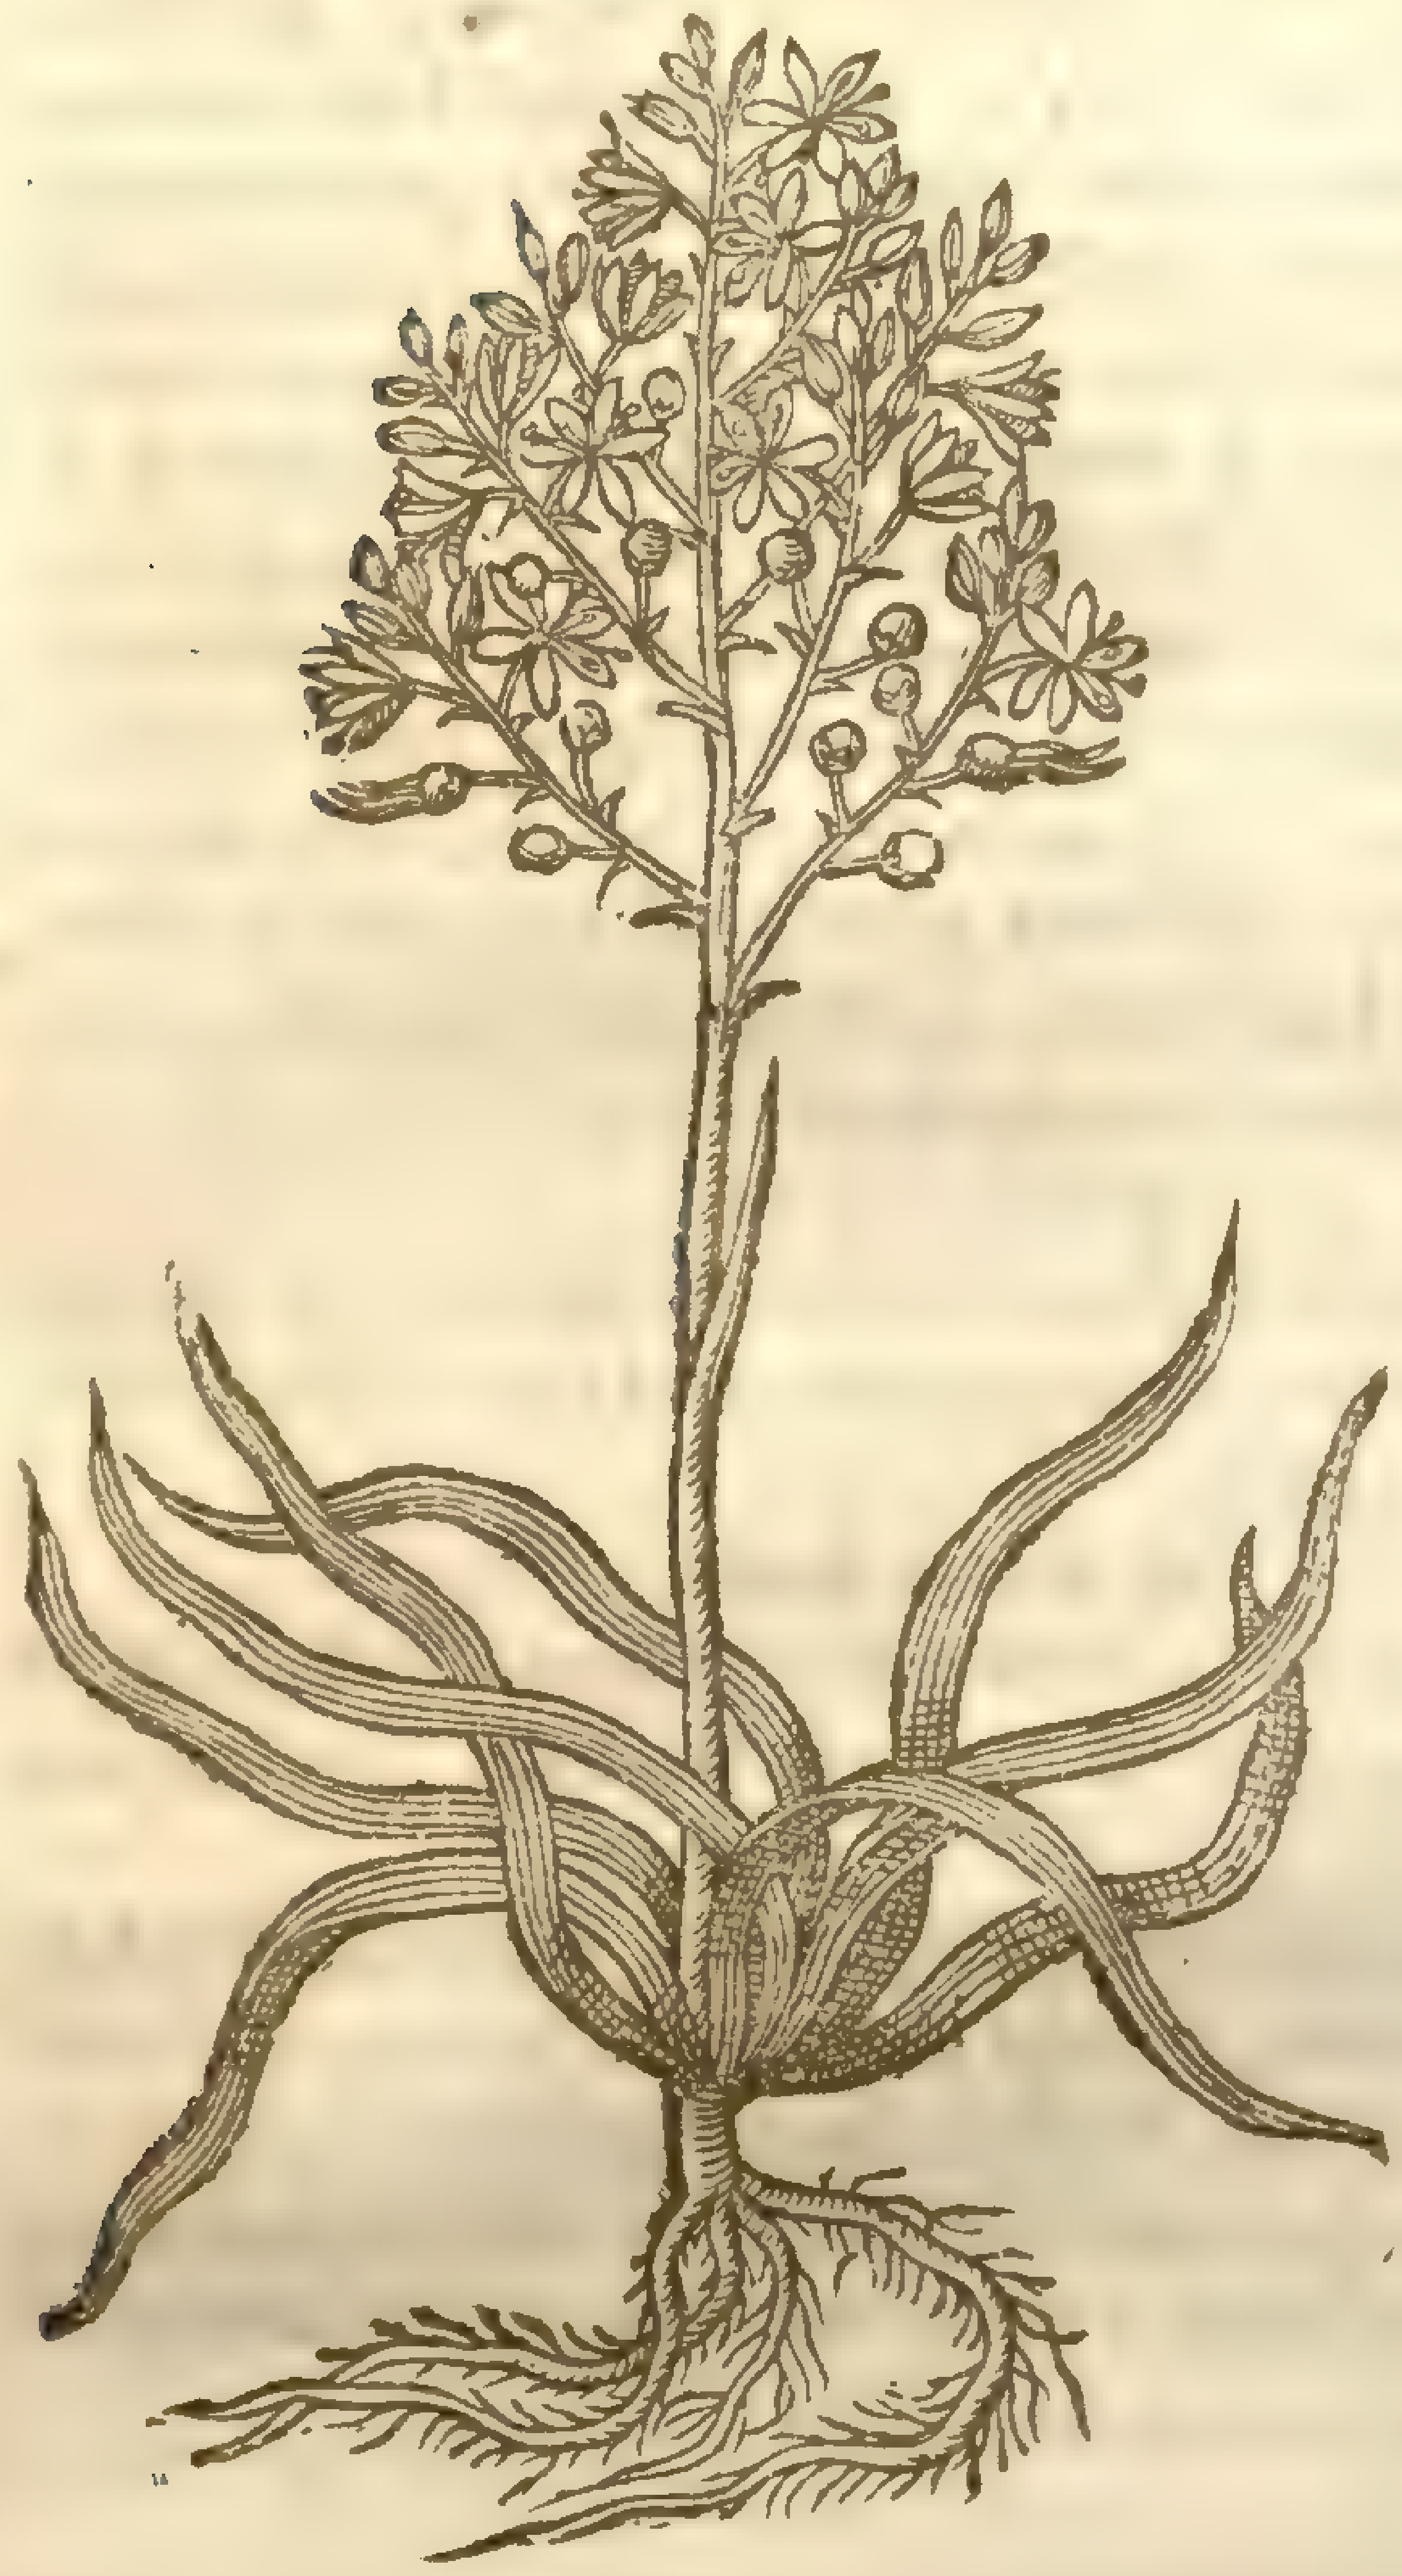
1 THe obſcure deſcription which *Dioſcorides* and *Pliny* haue ſet down for *Phalangium*, hath bred much contention among late writers. This plant hath leaues much like Couch graſſe, but they are ſomewhat thicker and fatter, and of a more whitiſh green colour. The ſtalks grow to the height of a cubit. The top of the ſtalke is beſet with ſmall branches, garniſhed with many little white floures, compact of ſix leaues. The threds or thrums in the middle are whitiſh, mixed with a faire yellow: which being fallen, there follow blacke ſeeds incloſed in ſmal round knobs which be three cornered. The roots be many, tough, and white of colour.

2 The ſecond is like the firſt, but that his ſtalke is not branched as the firſt, and floureth a moneth before the other.

3 The third kinde of Spiderwort, which *Cluſius* nameth *Aſphodelus minor*, hath a root of many threddy ſtrings, from the which immediatly riſe vp graſſie leaues narrow and ſharp pointed: among which come forth diuers naked ſtraight ſtalks diuided toward the top into ſundry branches, garniſhed on euery ſide with faire ſtarre-like floures of colour white, with a purple vein diuiding each leafe in the midſt: they haue alſo certaine chiues or threds in them. The ſeed followeth incloſed in three ſquare heads like vnto the kindes of Aſphodils.

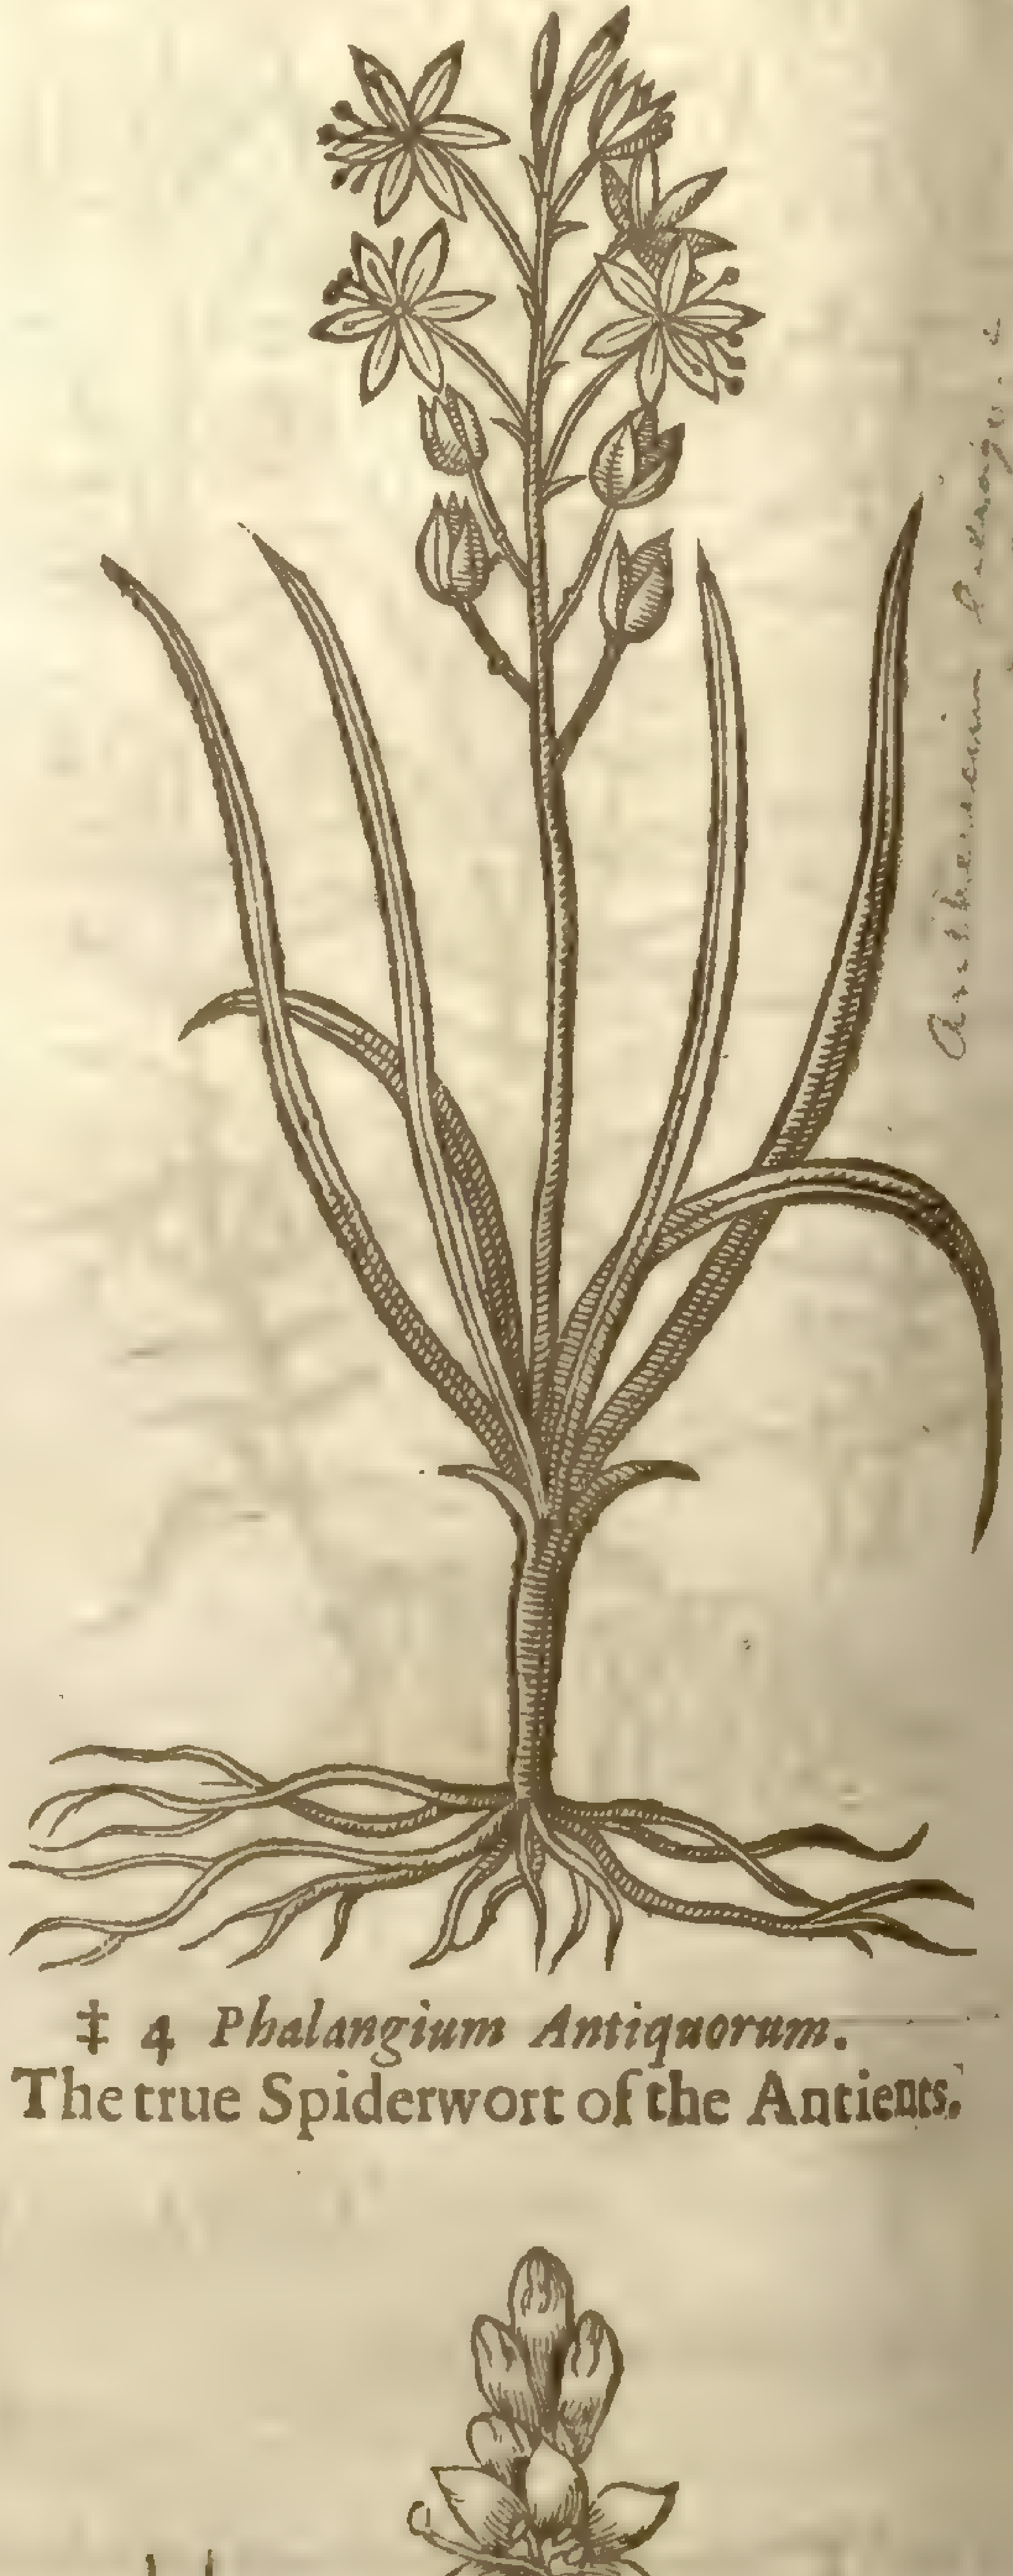
‡ 4 This Spiderwort hath a root conſiſting of many thick long and white fibres, not much vnlike the precedent, out of which it ſends forth ſome fiue or ſix greene and firme leaues, ſomewhat hollow in the middle, and mutually involuing each other at the root. Amongſt theſe there riſeth vp a round greene ſtalke, bearing at the top thereof ſome nine or ten floures, more or leſſe; Theſe conſiſt of ſix leaues a piece, of colour white, (the three innermoſt leaues are the broader, and more curled, and the three outmoſt are tipt with greene at the tops.) The whole floure much

reſembles a white Lilly, but much ſmaller. Three ſquare heads containing a duſky and vnequall feed, follow after the floure.



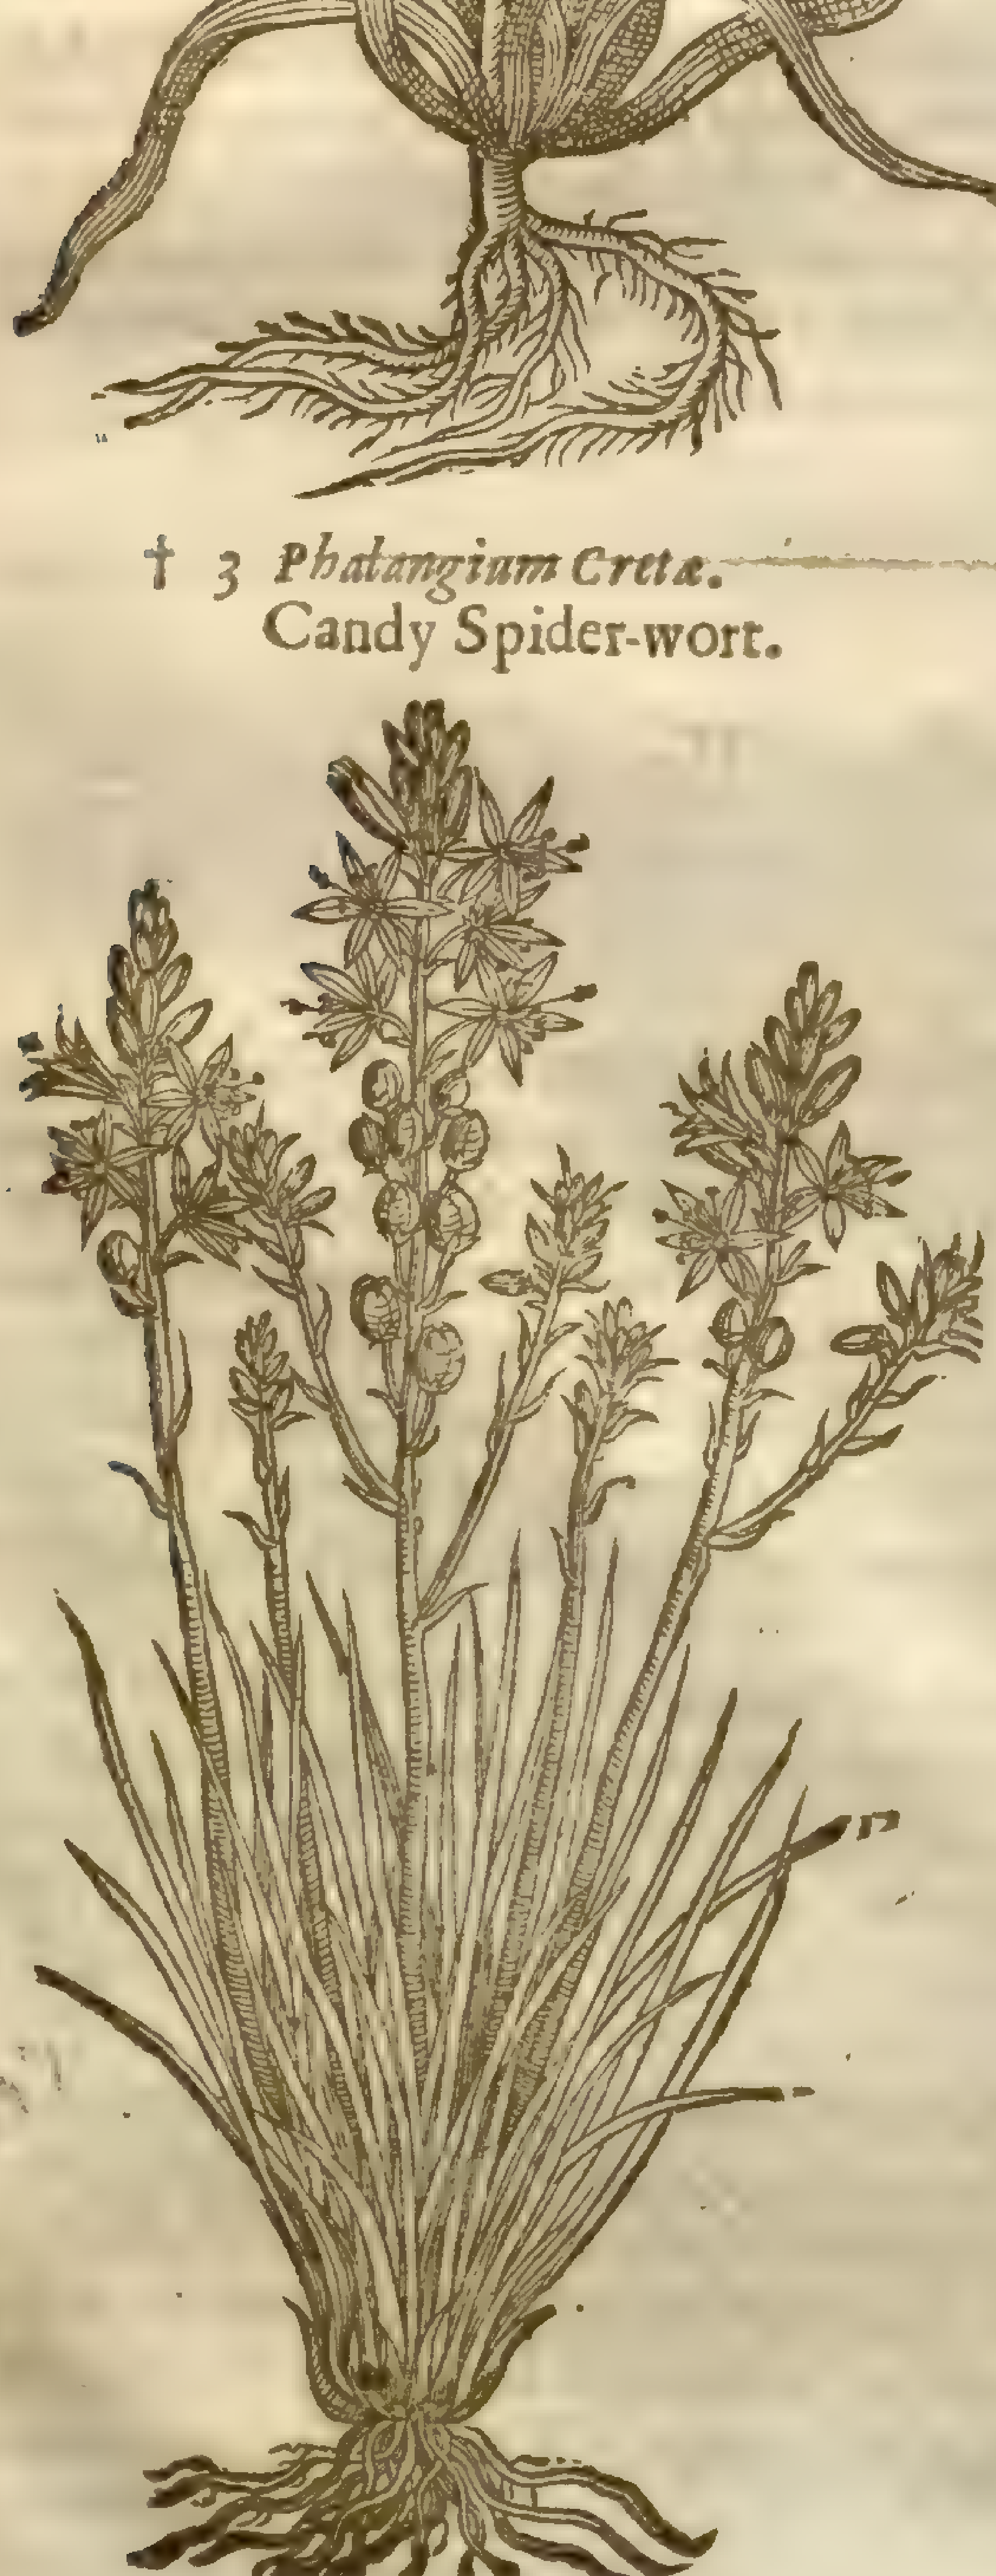
1 *Phalangium ramoſum.*
Branched Spiderwort.

Anthericum ramosum;



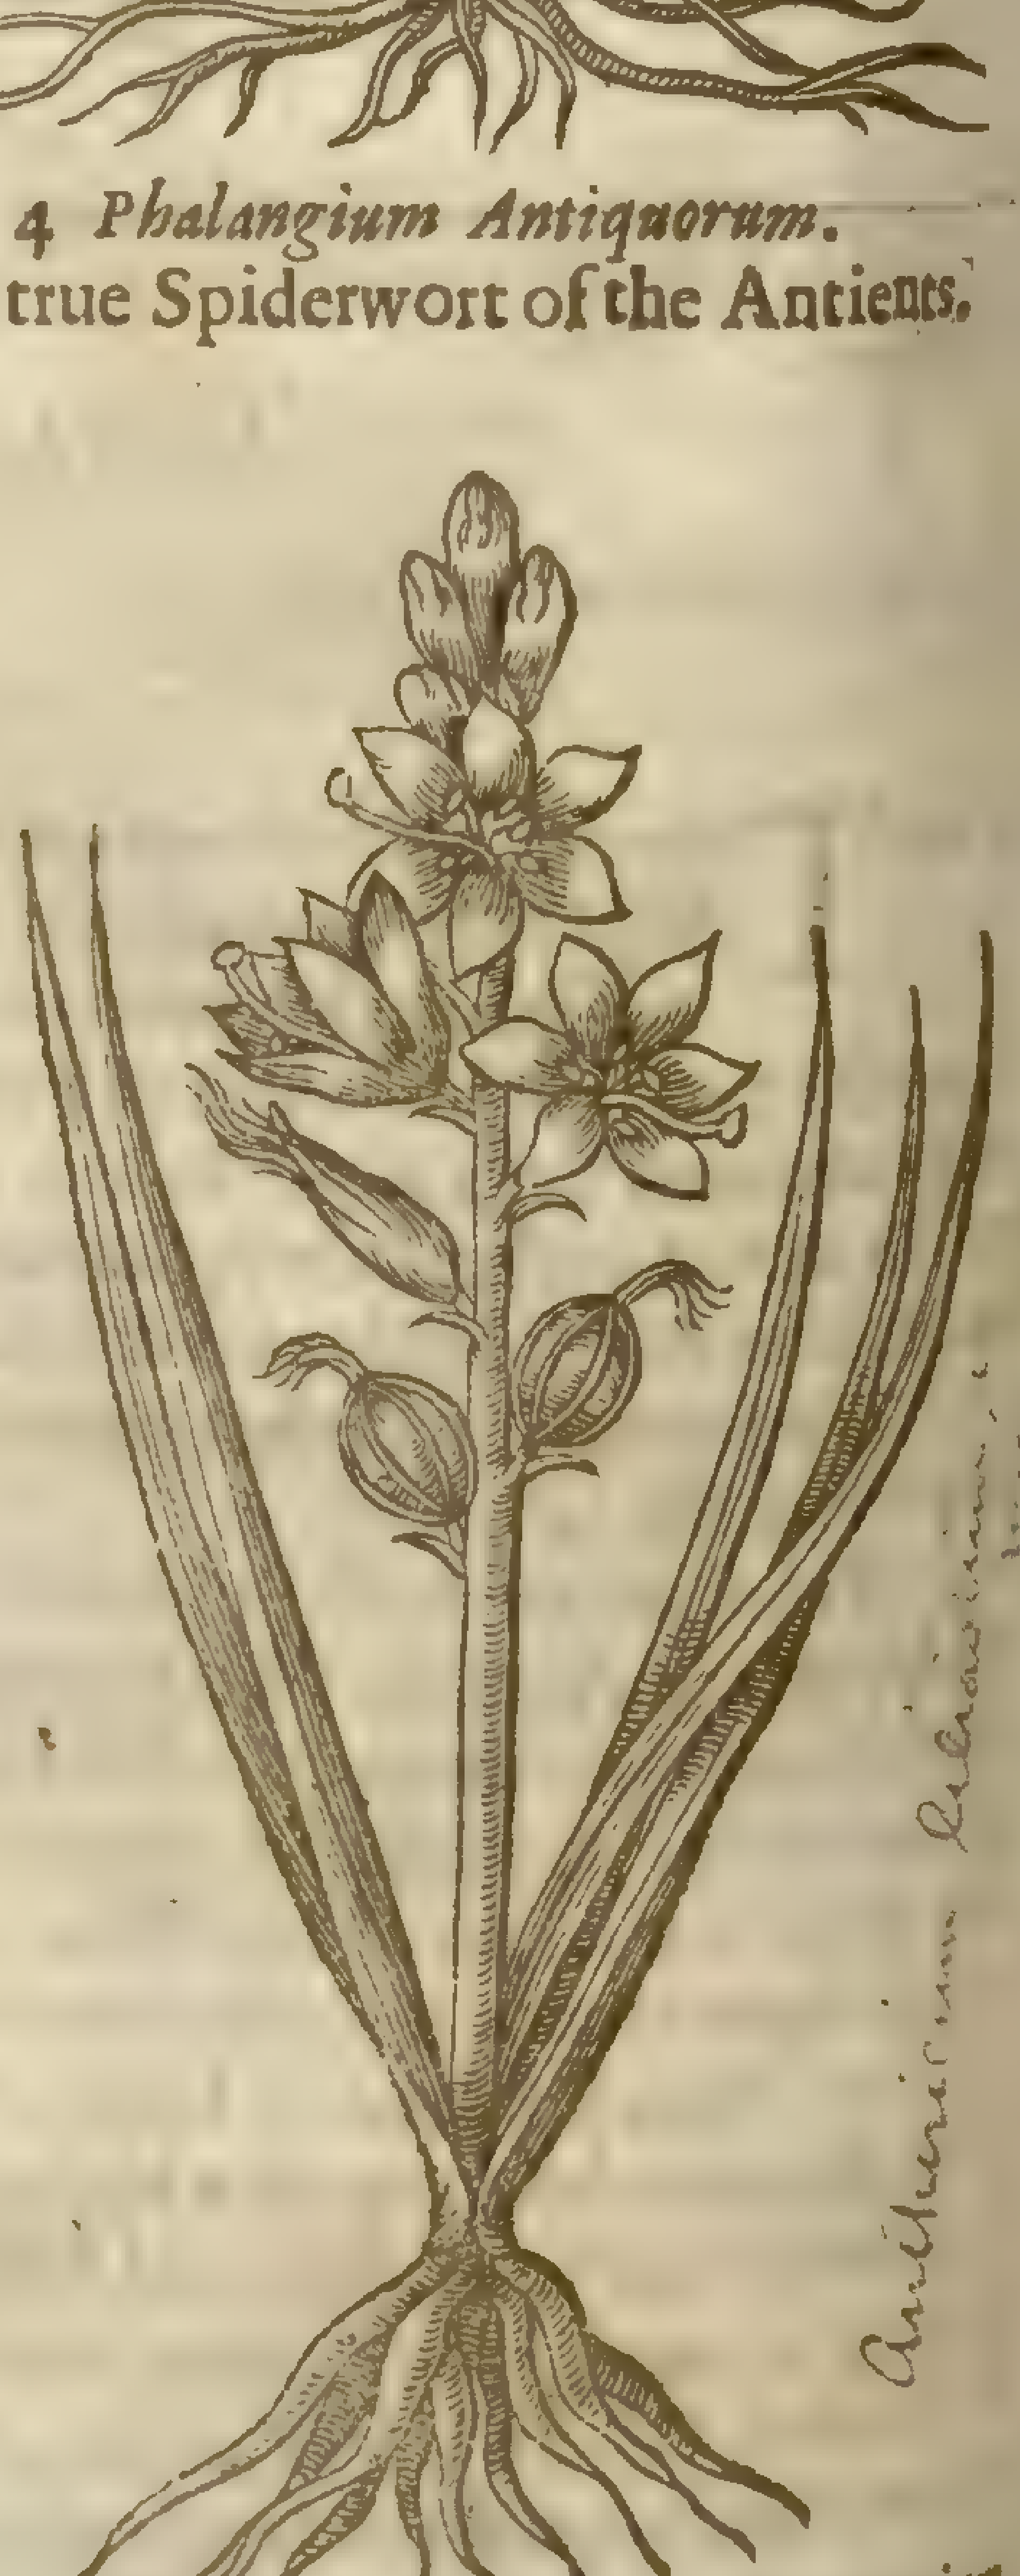
2 *Phalangium non ramoſum.*
Vnbranched Spiderwort.

Anthericum Liliago



† 3 *Phalangium Cretæ.*
Candy Spider-wort.

Asphodelus fistulosus,

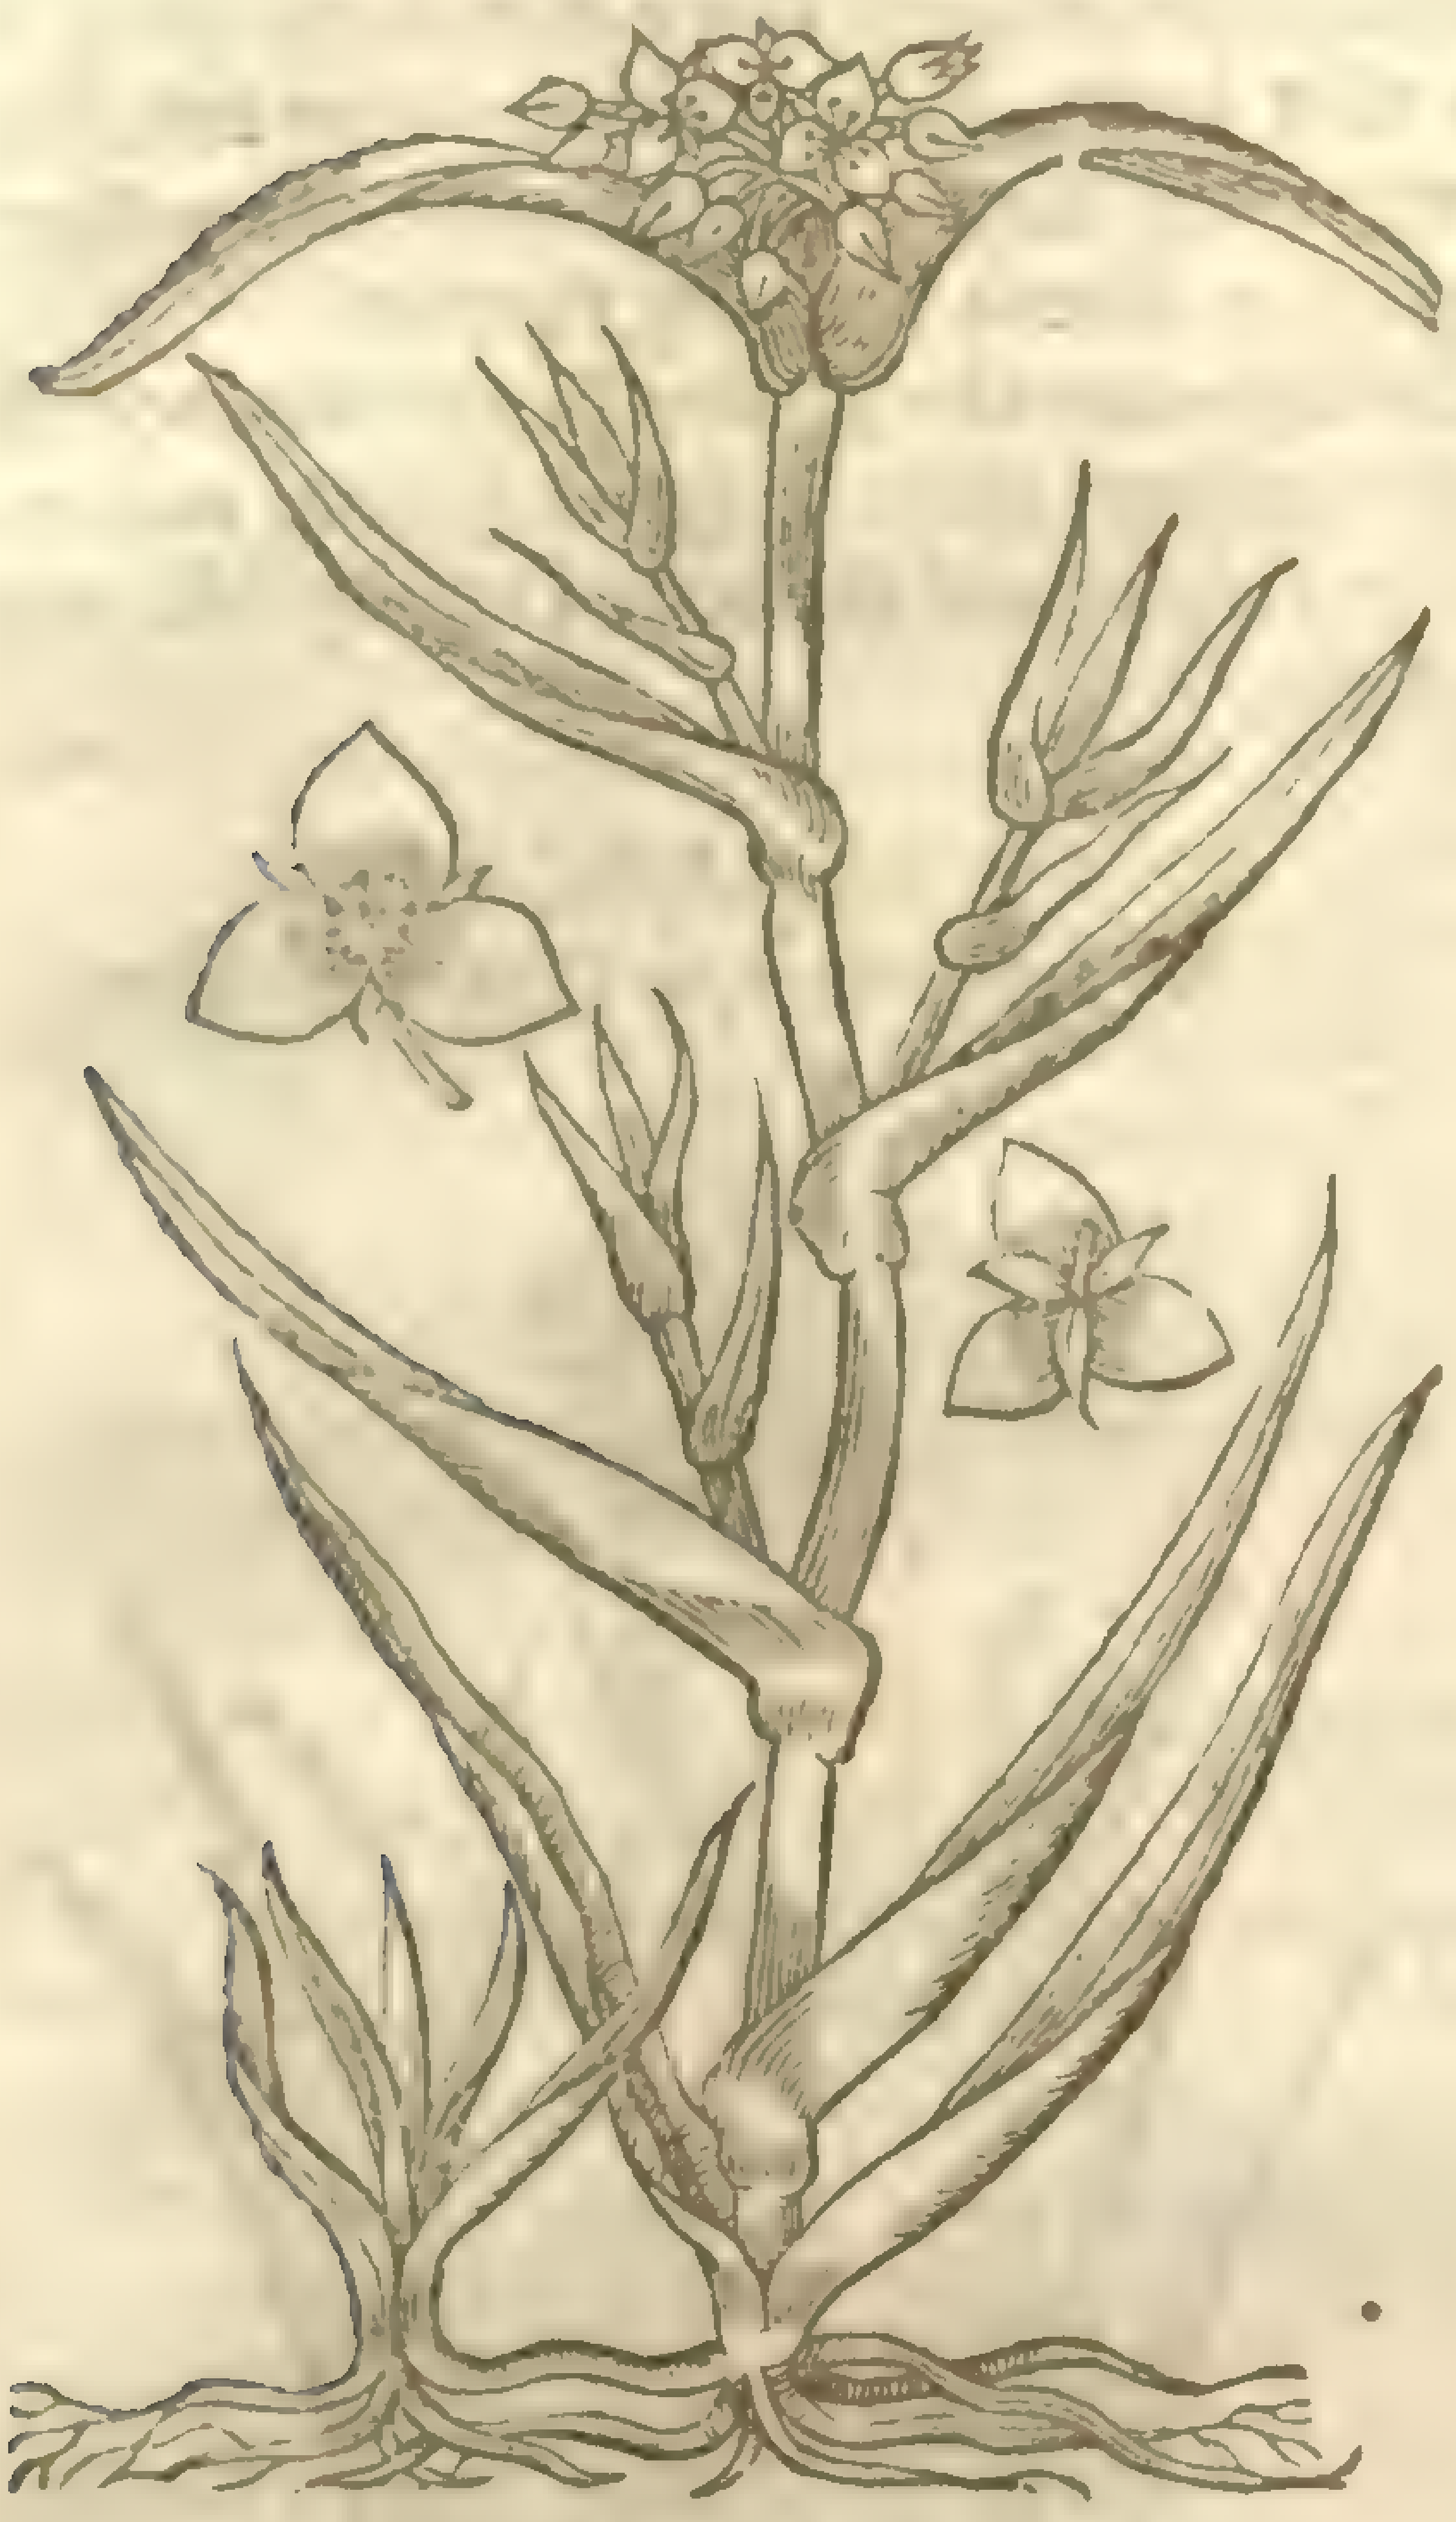


‡ 4 *Phalangium Antiquorum.*
The true Spiderwort of the Antients.

Anthericum liliastrum

‡ 5 *Phalangium Virginianum Tradeſc.*
Tradeſcants Virginian Spider-wort.

[illegible] virginica. L [illegible]



5 This plant in my iudgment cannot be fitlier ranked with any than theſe laſt deſcribed; therefore I haue here giuen him the fift place,as the laſt commer. It hath many creeping ſtringy roots,which here and there put vp green leaues in ſhape reſembling thoſe of the laſt deſcribed: amongſt theſe there riſeth vp a pretty ſtiffe ſtalke jointed, & hauing at each joint one leafe incompaſſing the ſtalke, and out of whoſe boſome ofttimes little branches ariſe: now the ſtalke at the top vſually diuides it ſelfe into two leaues,much after the manner of *Cyperus*;between which come forth many flours,conſiſting of three prety large leaues apiece,of colour deepe blew,with reddiſh chiues tipt with yellow ſtanding in their middle. Theſe fading, (as vſually they do the ſame day they ſhew themſelues) there ſucceed little heads couered with the three little leaues that ſuſtained the floure. In theſe heads there is contained a long blackiſh ſeed.

¶ *The Place.*

1.2.3. Theſe grow only in gardens with vs, and that very rarely. 4 This growes naturally in ſome places of Sauoy. 5 This Virginian is in many of our Engliſh gardens, as with Mr.*Parkinſon*, Mr *Tradeſcant*, and others.

¶ *The Time.*

1.4.5. Theſe floure in Iune; the ſecond about the beginning of Iune, and the third about Auguſt.

¶ *The Names.*

The firſt is called *Phalangium ramoſum*, branched Spider-wort. 2, *Phalangium non ramoſum*, Vnbranched Spider-wort. *Cordus* calls it *Liliago*. 3, This *Cluſius* calls *Aſphodelus minor*: *Lobel*, *Phalangium Cretæ*, Candy Spider-wort. 4 This is thought to be the *Phalangium* of the Antients,and that of *Matthiolus*. It is *Phalangium Allobrogicum* of *Cluſius*, Sauoy Spider-wort. This by Mr *Parkinſon* (who firſt hath in writing giuen the figure and deſcription thereof) is aptly termed *Phalangium Ephemerum Virginianum*, Soon-fading Spiderwort of Virginia: or *Tradeſcants* Spiderwort,for that Mr.*Iohn Tradeſcant* firſt procured it from Virginia. *Bauhine* hath deſcribed it at the end of his *Pinax*, and very vnfitly termed it *Allium, ſiue Moly Virginianum*. ‡

¶ *The Nature.*

Galen ſaith, *Phalangium* is of a drying qualitie, by reaſon of the tenuitie of parts.

¶ *The Vertues.*

A *Dioſcorides* ſaith, That the leaues,ſeed,and floures,or any of them drunk in wine,preuaile againſt the bitings of Scorpions,and againſt the ſtinging and biting of the Spider called *Phalangium*,and all other venomous beaſts.

B The roots tunned vp in new ale and drunke for a moneth together, expell poyſon;yea although it haue vniuerſally ſpread it ſelfe through the body.

Chap. 40. *Of the Floure de-luce.*

¶ *The Kindes.*

There be many kindes of Iris or Floure de-luce, whereof ſome are tall and great, ſome little, ſmall,and low; ſome ſmell exceeding ſweet in the root, ſome haue no ſmell at all. Some floures are ſweet in ſmell,and ſome without: ſome of one colour,ſome of many colours mixed: vertues attributed to ſome,others not remembred; ſome haue tuberous or knobby roots,others bulbous or Onion roots; ſome haue leaues like flags,others like graſſe or ruſhes.

Mo. Bot. Garden. 1893

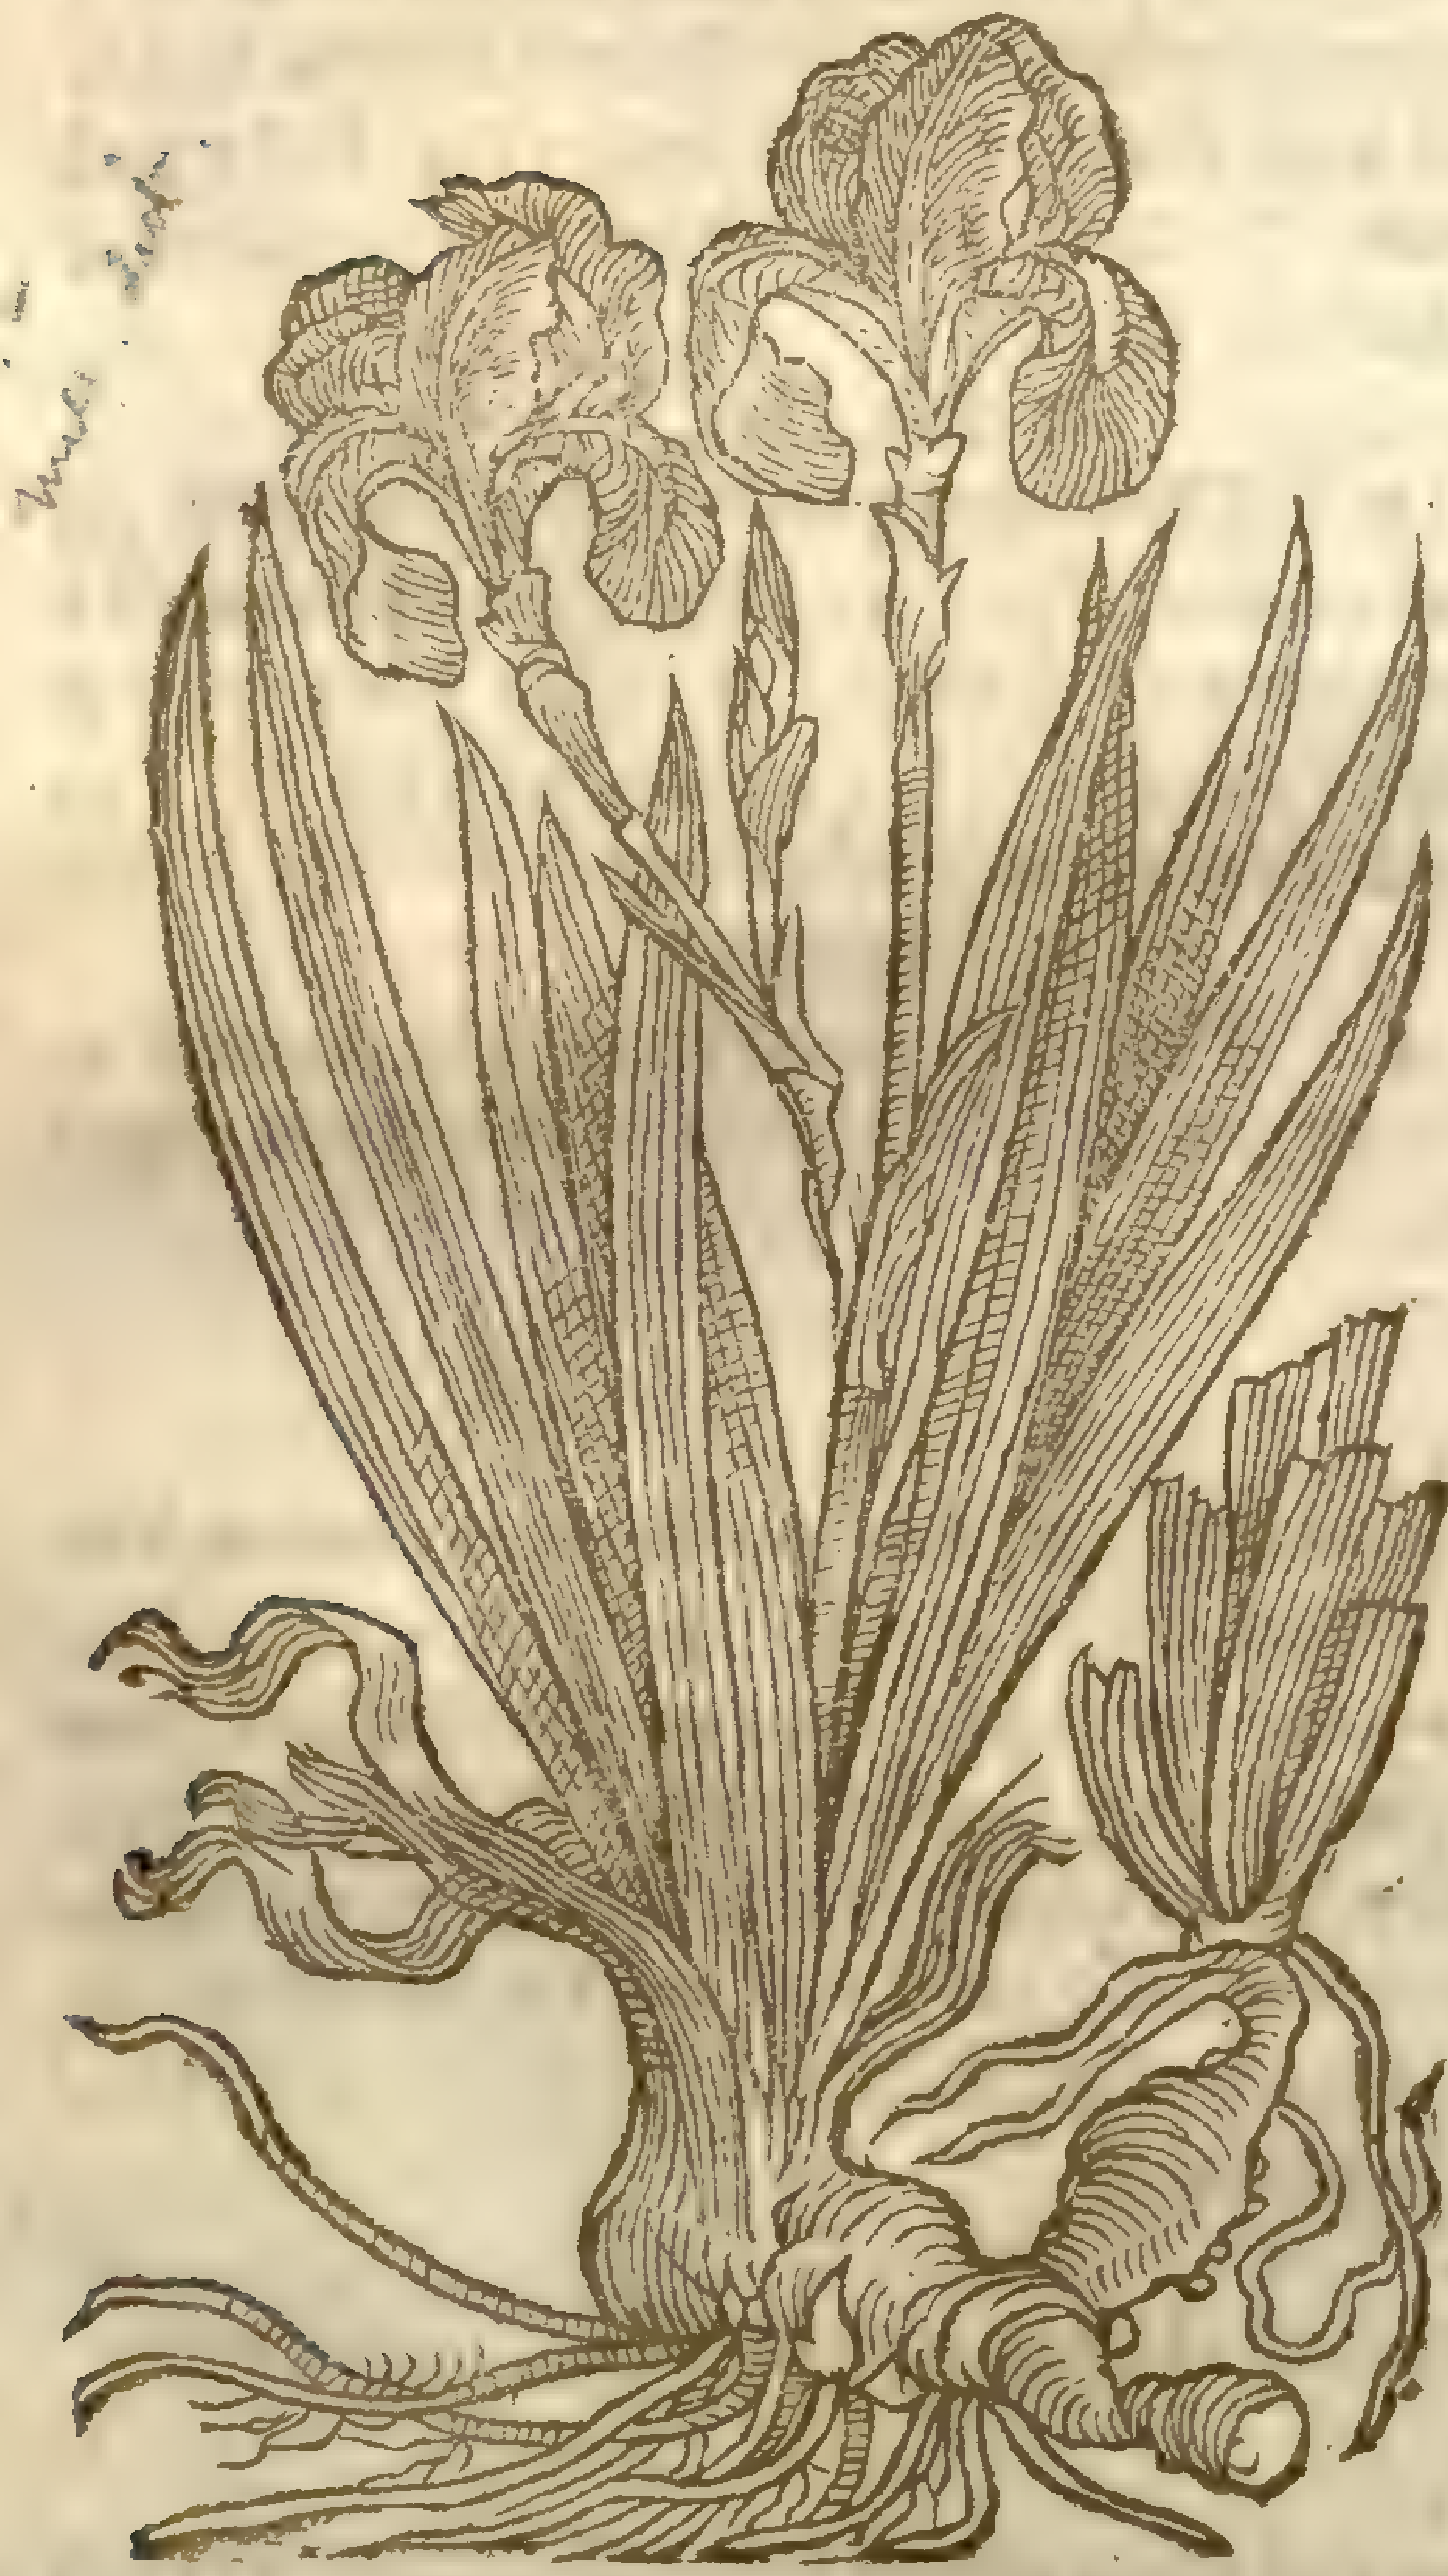
¶ The

¶ *The Deſcription.*

1 THe common Floure de-luce hath long and large flaggy leaues like the blade of a ſword with two edges, amongſt which ſpring vp ſmooth and plaine ſtalks two foot long, bearing floures toward the top compact of ſix leaues ioyned together, wherof three that ſtand vpright are bent inward one toward another; and in thoſe leaues that hang downeward there are certaine rough or hairy welts, growing or riſing from the nether part of the leafe vpward, almoſt of a yellow colour. The roots be thicke, long, and knobby, with many hairy threds hanging thereat.

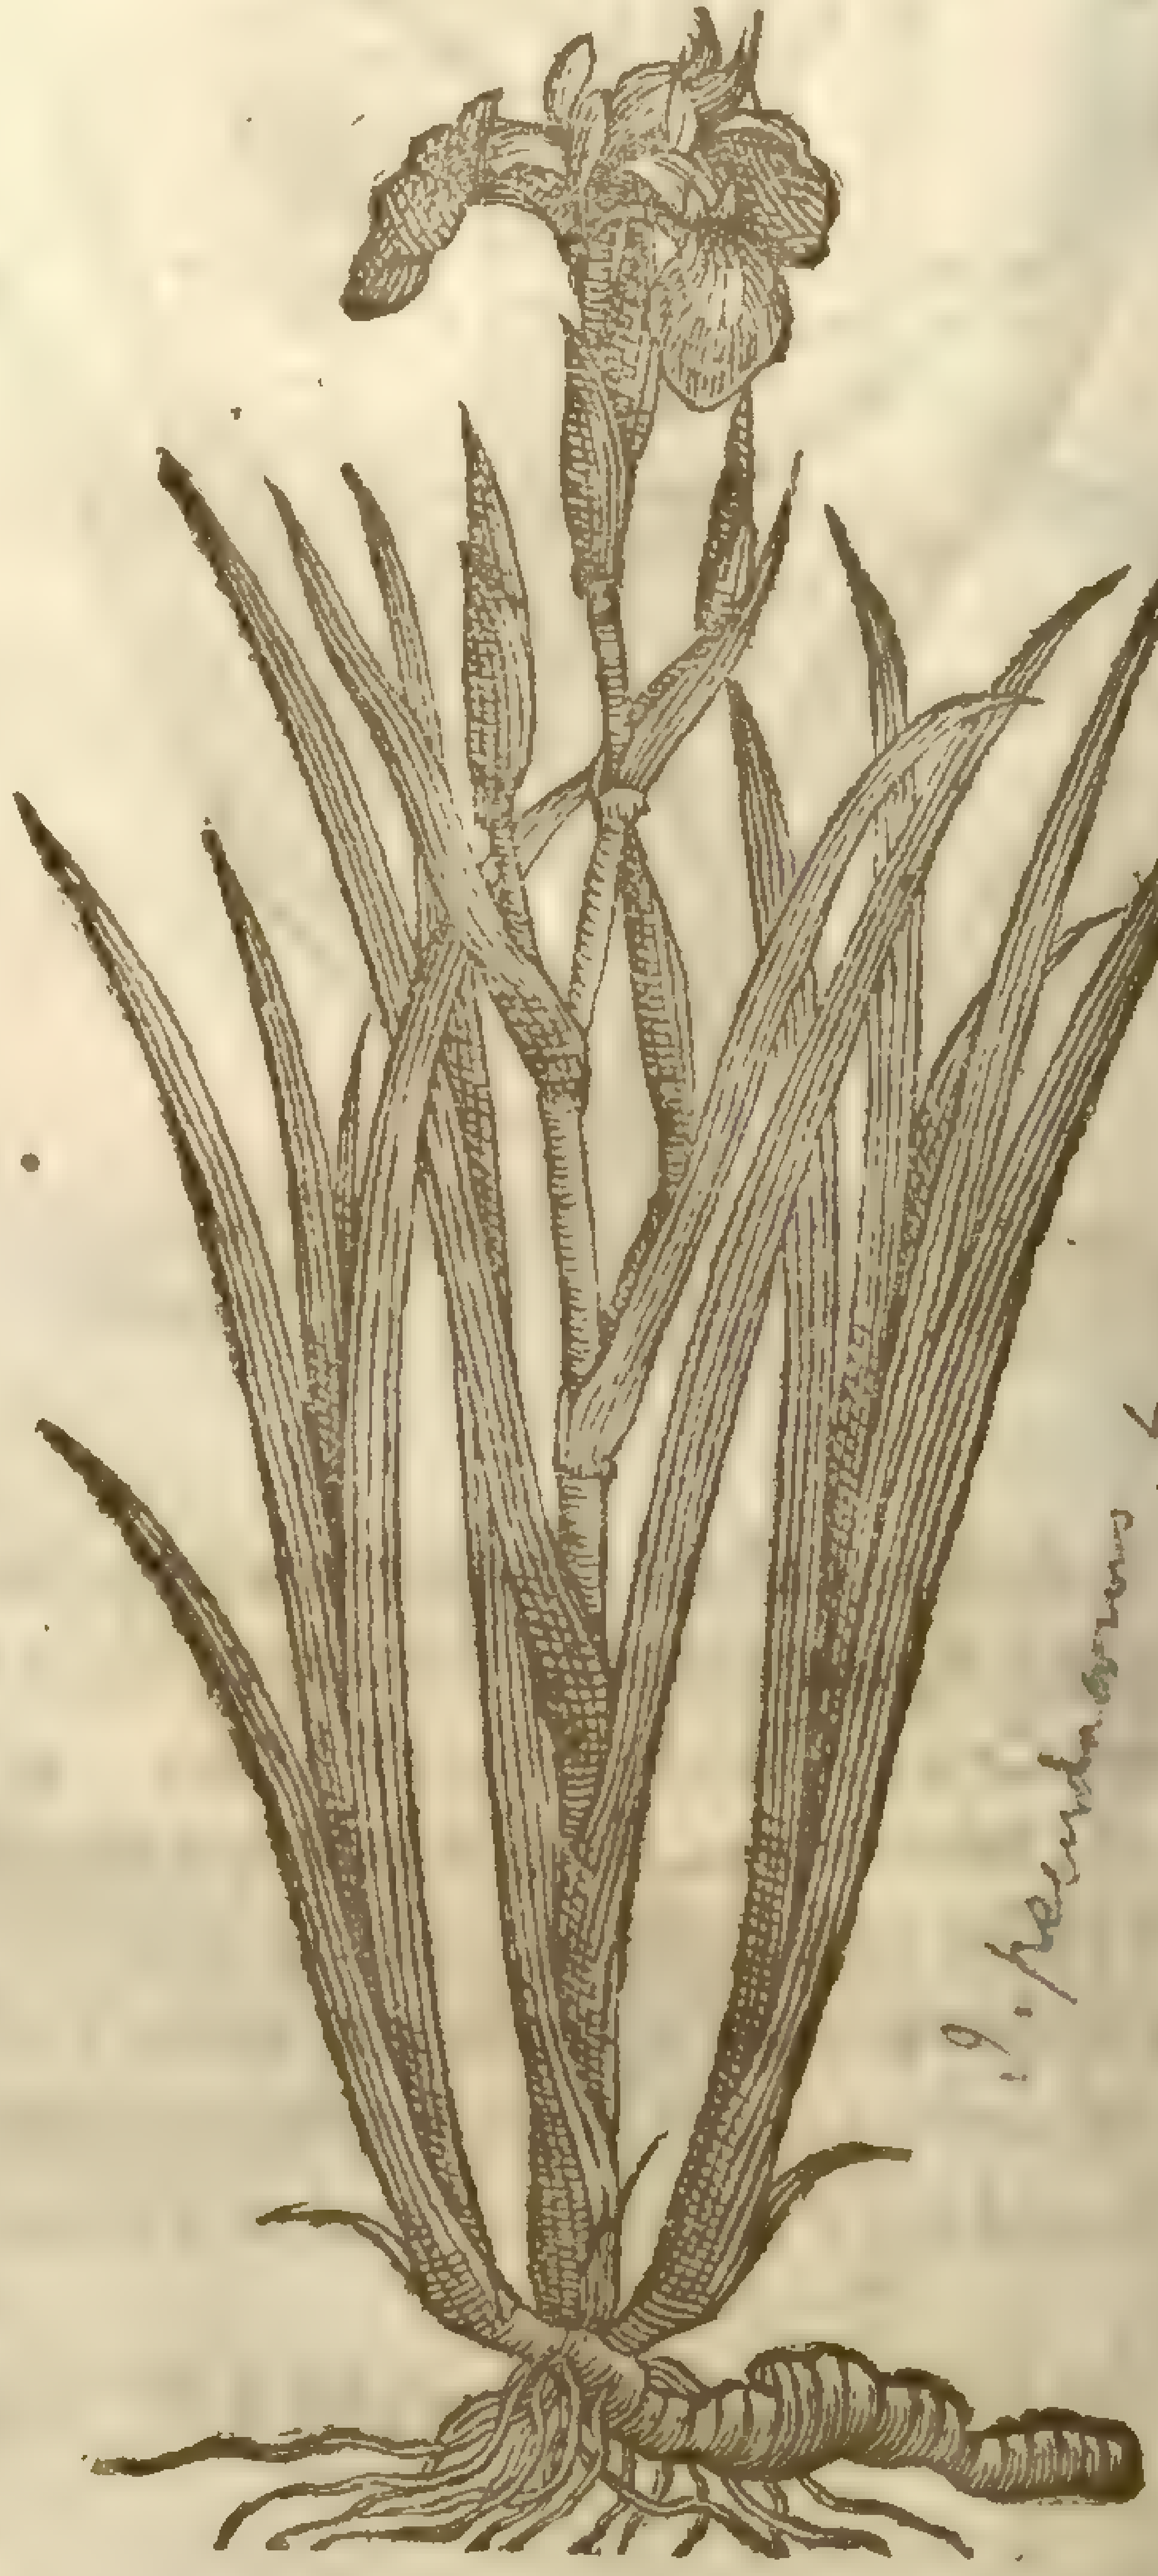
2 The water Floure de-luce, or water Flag, or *Acorus*, is like vnto the garden Floure de-luce in roots, leaues, and ſtalkes, but the leaues are much longer, ſometimes of the height of foure cubits, and altogether narrower. The floure is of a perfect yellow colour, and the root knobby like the other; but being cut, it ſeemes to be of the colour of raw fleſh.

1 *Iris vulgaris.*
Floure de-luce.



I. germanica, L. [illegible]

2 *Iris paluſtris lutea.*
Water Flags, or Floure de-luce.



I. pseudacorus, L. [illegible]

¶ *The Place.*

The water Floure de-luce or yellow Flag proſpereth well in moiſt medowes, and in the borders and brinks of Riuers, ponds, and ſtanding lakes. Although it be a watery plant of nature, yet being planted in gardens it proſpereth well.

¶ *The Names.*

Floure de-luce is called in Greeke, Ἶρις: *Athenæus* and *Theophraſtus* reade Ἱερὶς: as though they ſhould ſay *Conſecratrix*: by which name it is called of the Latines, *Radix Marica*, or rather *Radix Naronica*, of the riuer Naron, by which the beſt and greateſt ſtore do grow. Whereupon *Nicander* in his Treacles commendeth it thus:

Iridem quam aluit Drilon, & Naronis ripa.

Which may thus be Engliſhed;

Iris, which Drilon water feeds,
And Narons banks, with other weeds.

The Italians, *Giglio azurro*: in Spaniſh, *Lilio Cardeno*: in French, *Flambe*: the Germans, **Gilgen, Schwertel**; in Dutch, **Liſch.**

The ſecond is called in Latine, *Iris paluſtris lutea, Pſeudoacorus*, and *Acorus paluſtris*: in Engliſh, Water flags, baſtard Floure de-luce, or Water Floure de-luce: and in the North they call them Seggs.

¶ The Nature.

1 The roots of the Floure de luce being as yet freſh and greene, and full of juyce, are hot almoſt in the fourth degree. The dried roots are hot and dry in the third degree, burning the throat and mouth of ſuch as taſte them.

2 The baſtard Floure de-luce his root is cold and dry in the third degree, and of an aſtringent or binding facultie.

¶ The Vertues.

A The root of the common Floure de-luce cleane waſhed, and ſtamped with a few drops of Roſewater, and laid plaiſterwiſe vpon the face of man or woman, doth in two daies at the moſt take away the blackneſſe or blewneſſe of any ſtroke or bruſe: ſo that if the skinne of the ſame woman or any other perſon be very tender and delicate, it ſhall be needfull that ye lay a piece of ſilke, ſindall, or a piece of fine laune betweene the plaiſter and the skinne; for otherwiſe in ſuch tender bodies it often cauſeth heat and inflammation.

B The juyce of the ſame doth not onely mightily and vehemently draw forth choler, but moſt eſpecially watery humors, and is a ſpeciall and ſingular purgation for them that haue the Dropſie, if it be drunke in whay or ſome other liquor that may ſomewhat temper and alay the heate.

C The dry roots attenuate or make thinne thicke and tough humours, which are hardly and with difficultie purged away.

D They are good in a loch or licking medicine for ſhortneſſe of breath, an old cough and all infirmities of the cheſt which riſe hereupon.

E They remedie thoſe that haue euill ſpleenes, and thoſe that are troubled with convulſions or cramps, biting of ſerpents, and the running of the reines, being drunke with vinegre, as ſaith *Dioſcorides*; and drunke with wine it bringeth downe the monethly courſes of women.

F The decoction is good in womens baths, for it mollifieth and openeth the matrix.

G Being boyled very ſoft, and laid to plaiſter-wiſe it mollifieth or ſoftneth the kings euill, and old hard ſwellings.

H ‡ The roots of our ordinarie flags are not (as before is deliuered) cold and dry in the third degree, nor yet in the ſecond, as *Dodonæus* affirmes; but hot and dry, and that at the leaſt in the ſecond degree, as any that throughly taſts them will confeſſe. Neither are the faculties and vſe (as ſome would perſuade vs) to be neglected; for as *Pena* and *Lobel* affirme, though it hath no ſmell, nor great heat, yet by reaſon of other faculties it is much to be preferred before the *Galanga major*, or forreine *Acorus* of ſhops, in many diſeaſes; for it imparts more heat and ſtrength to the ſtomacke and neighbouring parts than the other, which rather preyes vpon and diſſipates the innate heate and implanted ſtrength of thoſe parts. It bindes, ſtrengthens, and condenſes: it is good in bloudy flixes, and ſtaies the courſes. ‡

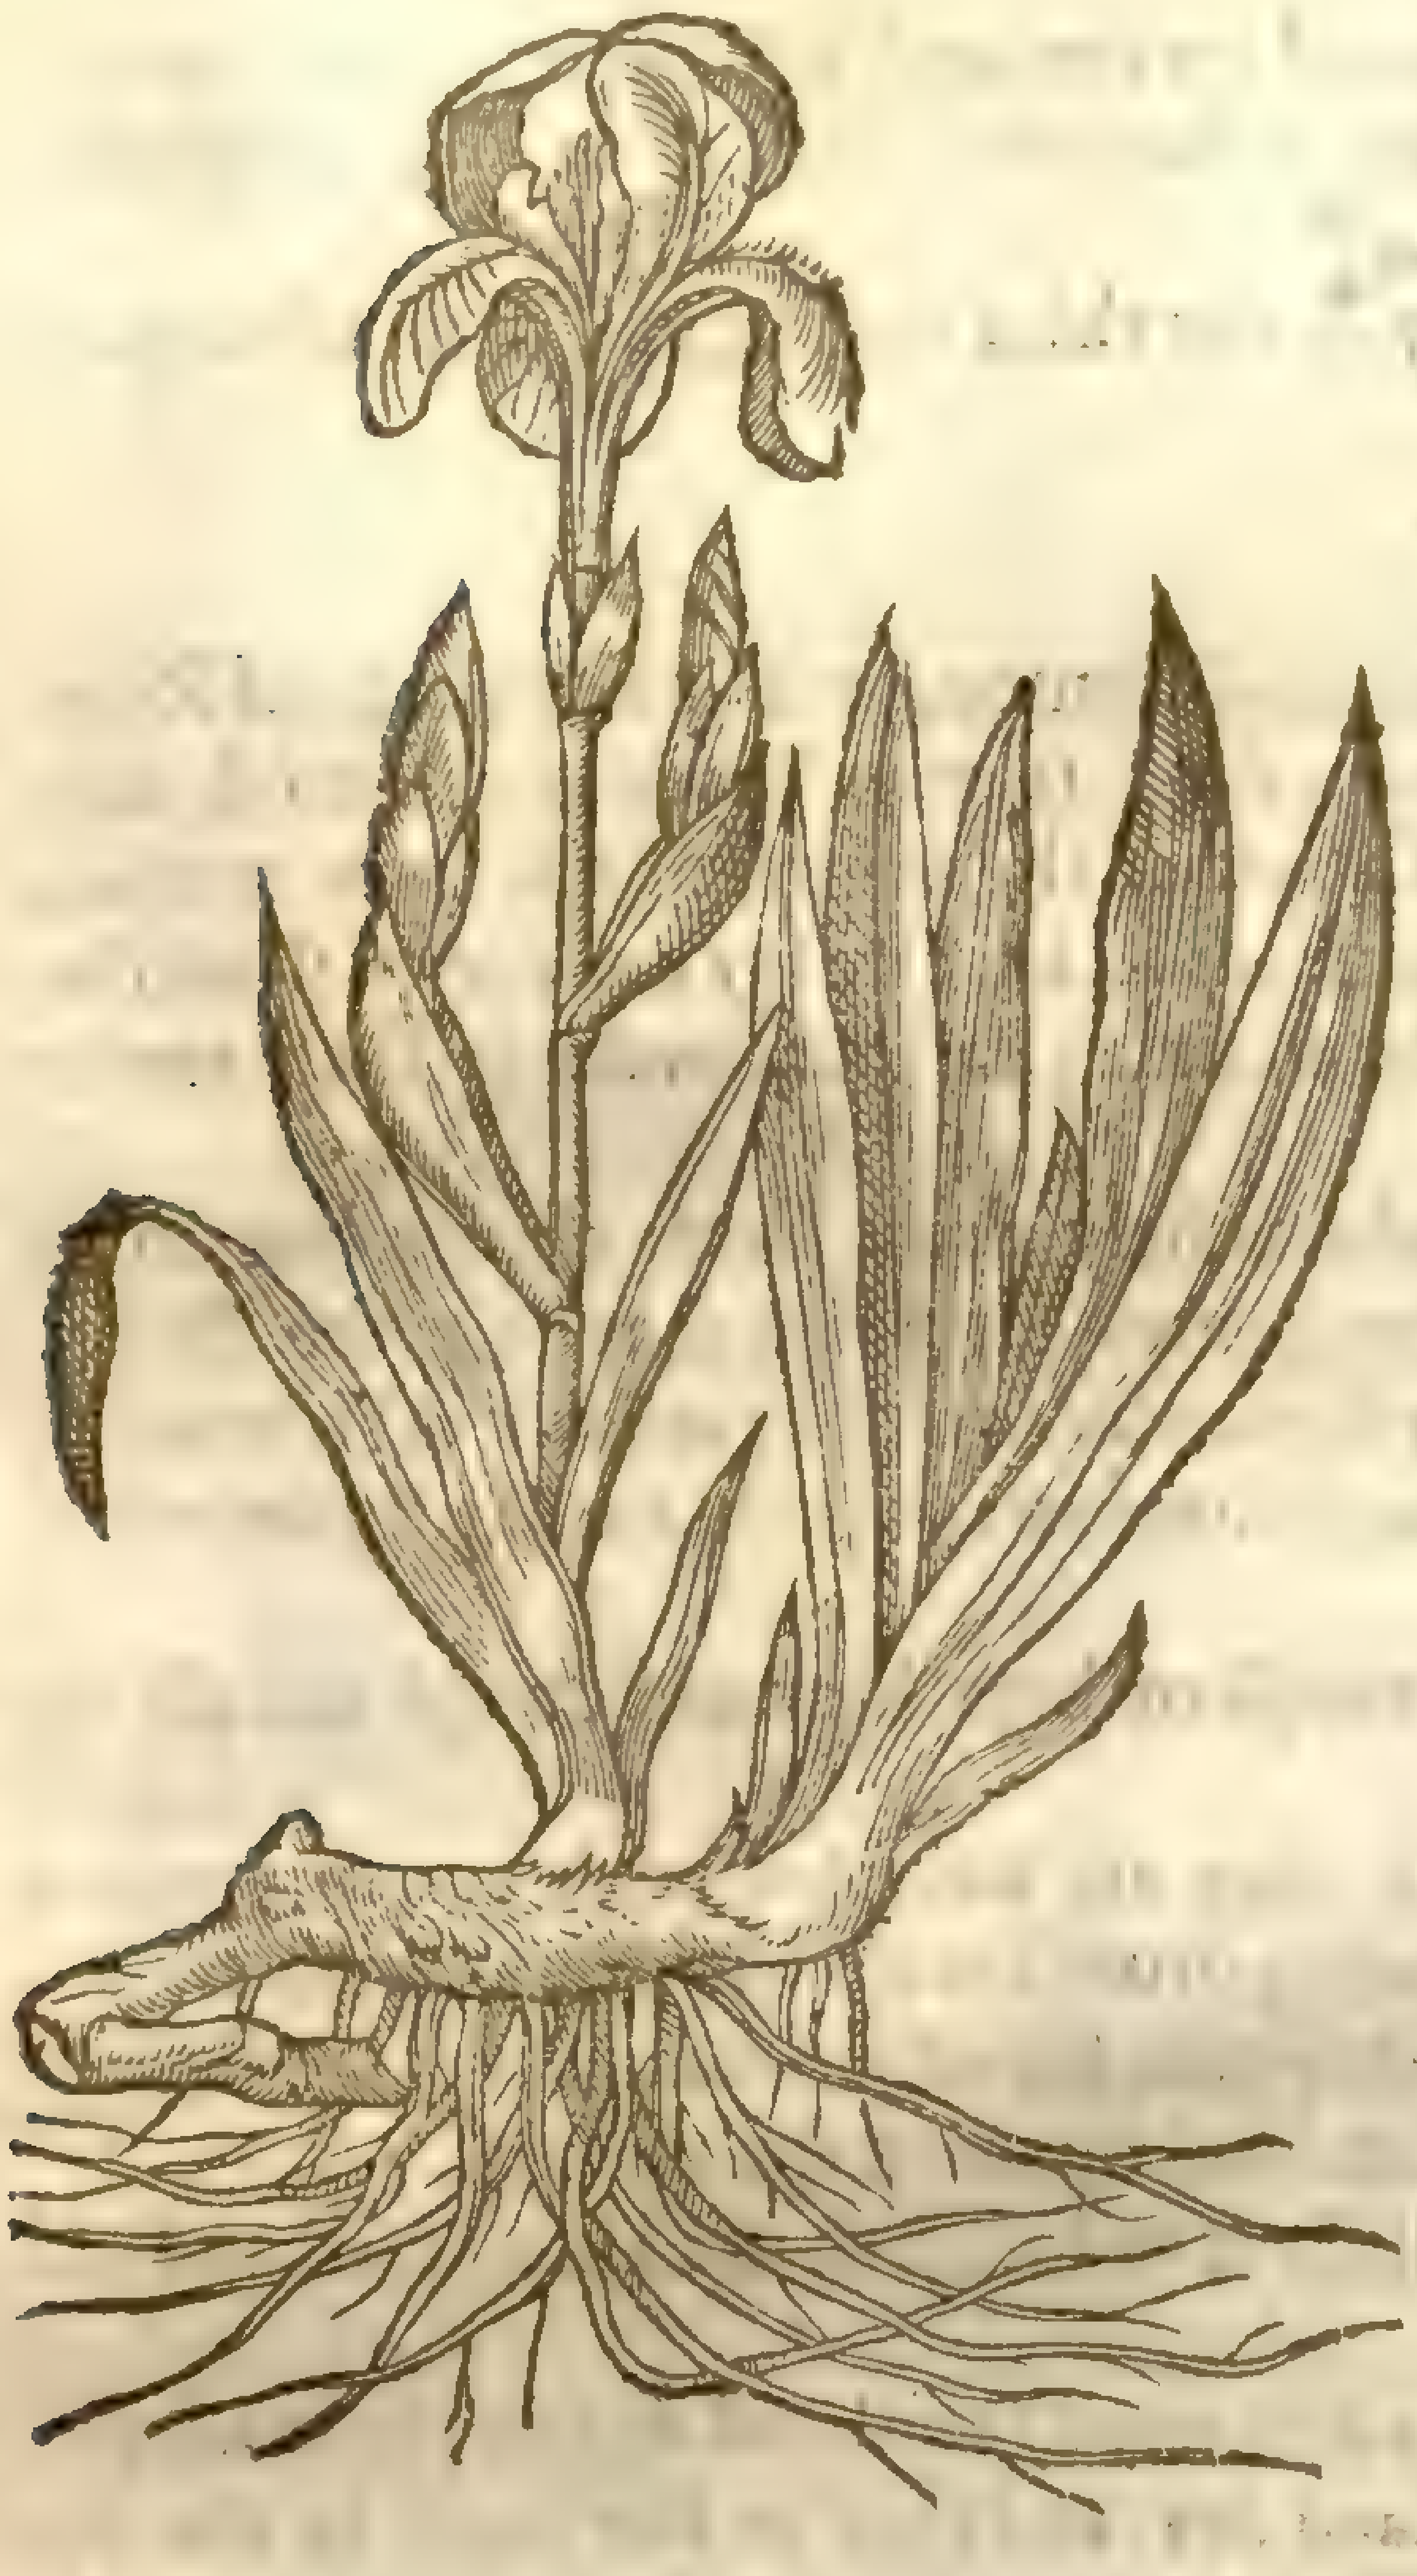
Chap. 41. *Of Floure de-luce of Florence.*

¶ The Deſcription.

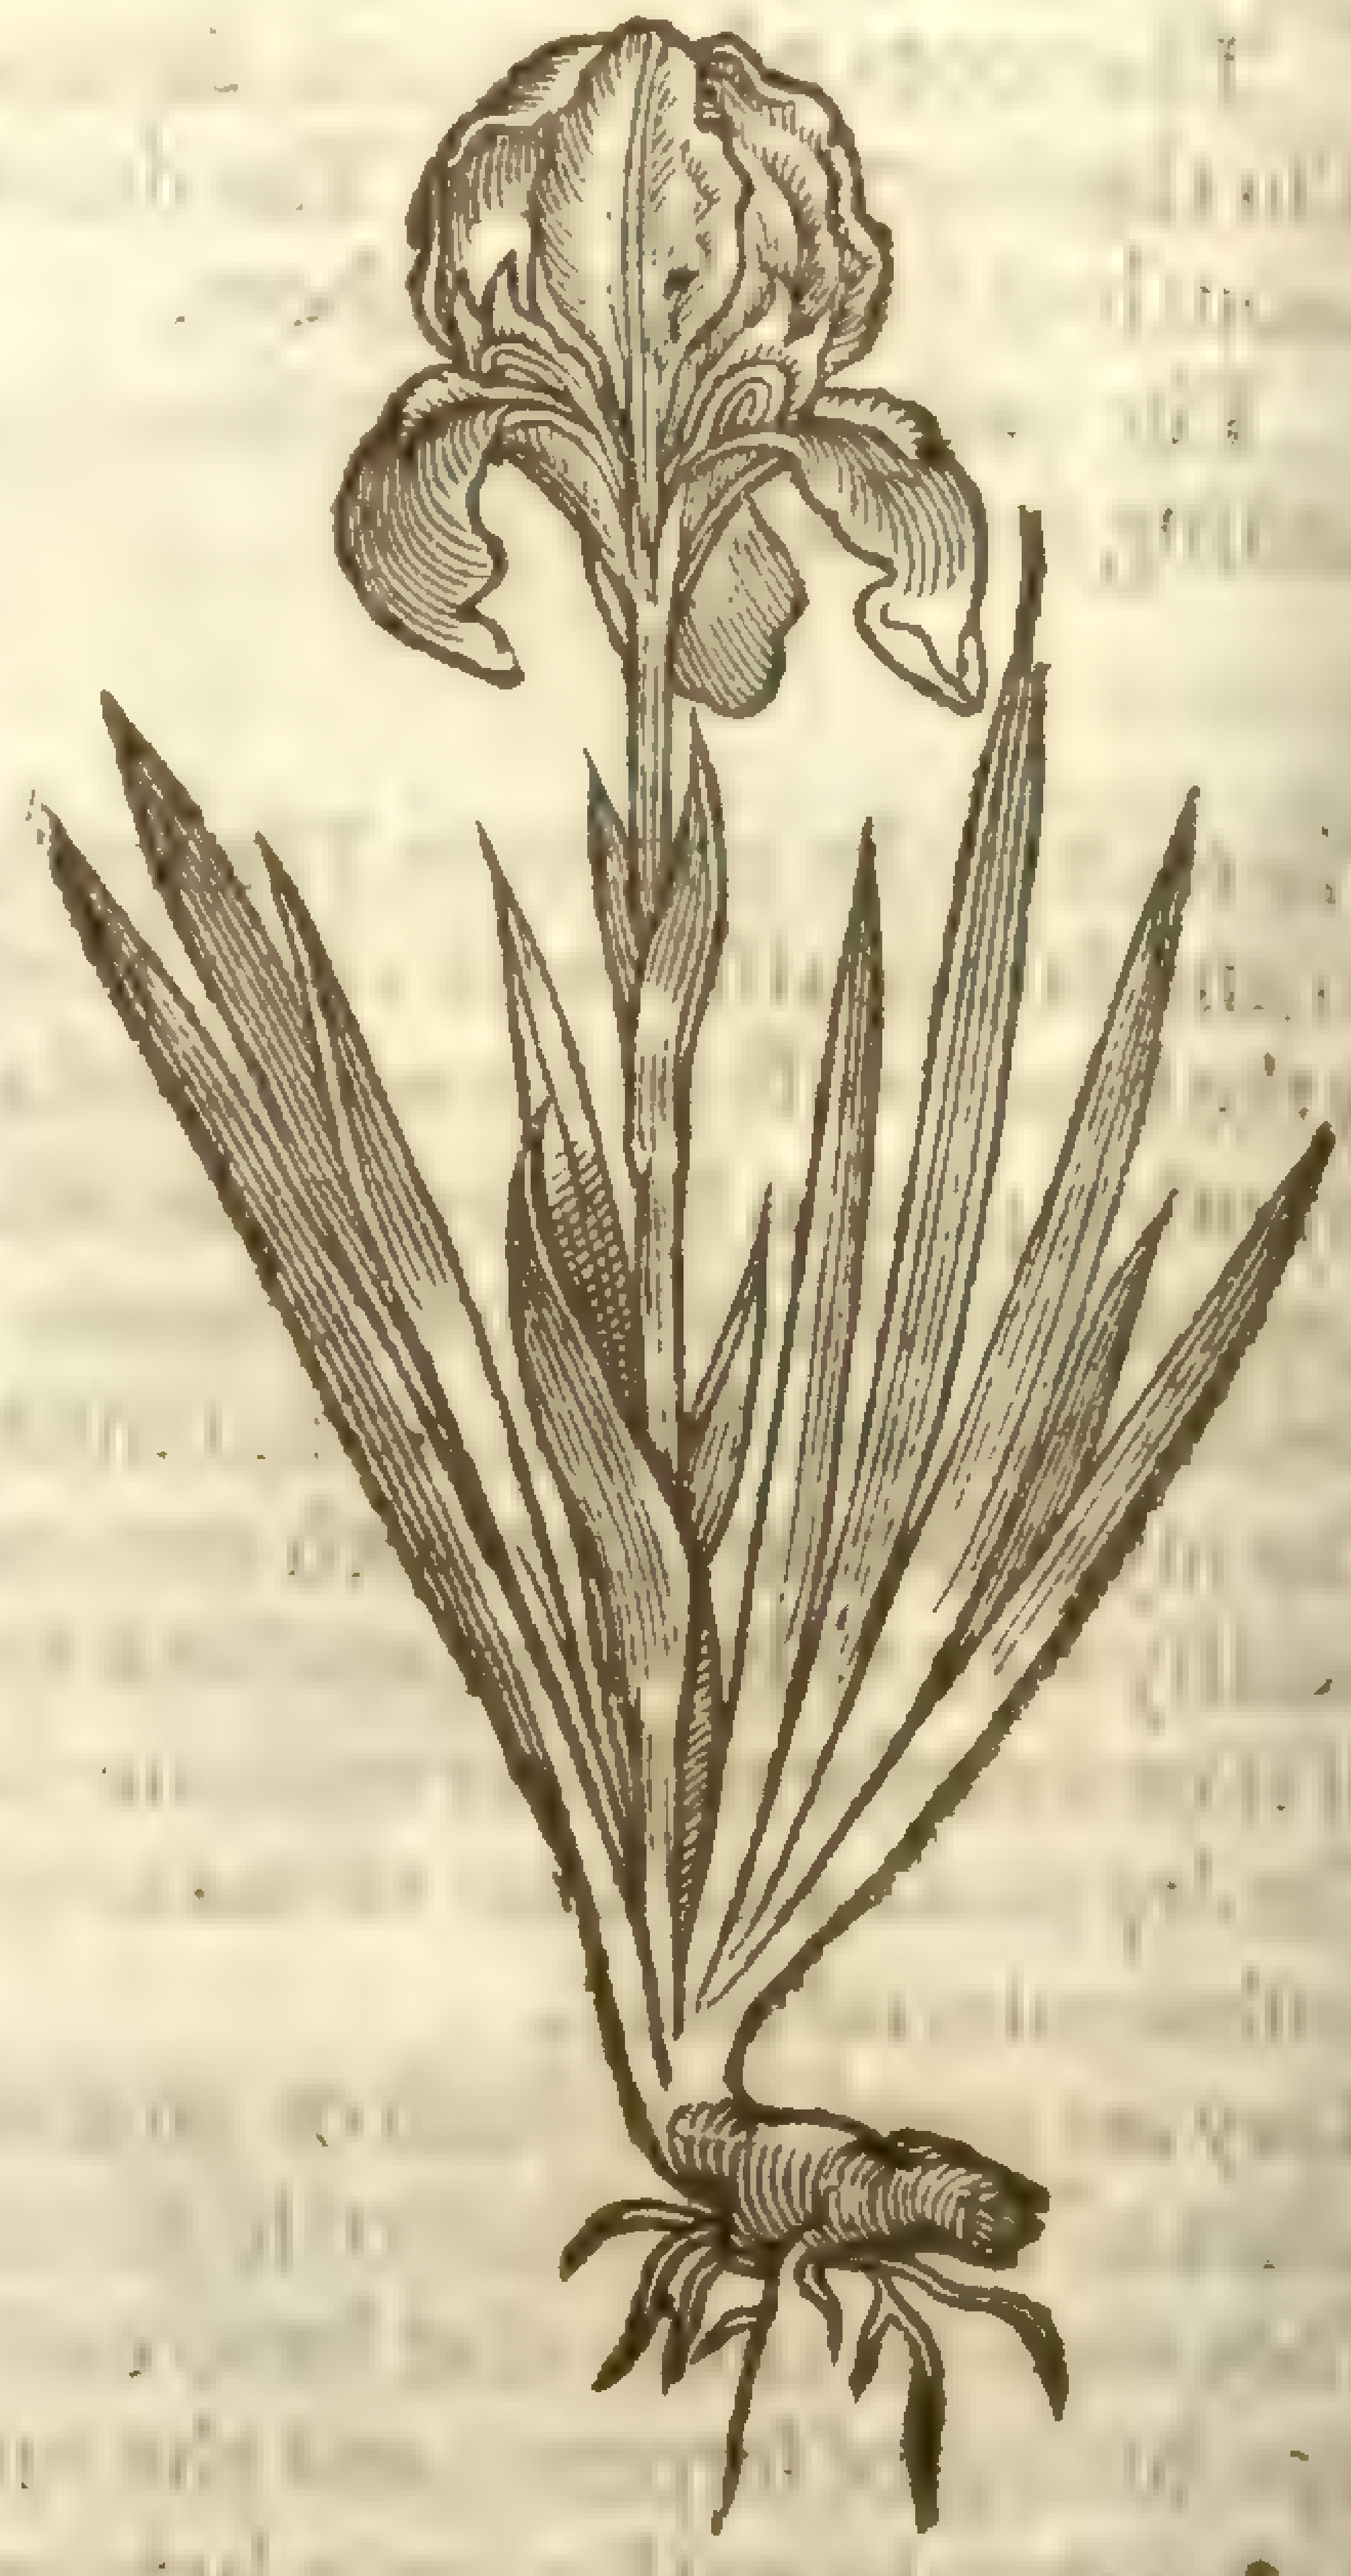
1 The Floure de-luce of Florence, whoſe root in ſhops and generally euery where are called *Ireos*, or *Orice* (whereof ſweet waters, ſweet pouders, and ſuch like are made) is altogether like vnto the common Floure de-luce, ſauing that the floures of the *Ireos* is of a white colour, and the roots exceeding ſweet of ſmell, and the other of no ſmell at all.

2 The white Floure de-luce is like vnto the Florentine Floure de-luce in roots, flaggy leaues, and ſtalkes; but they differ in that, that this *Iris* hath his floure of a bleake white colour declining to yellowneſſe; and the roots haue not any ſmell at all; but the other is very ſweet, as we haue ſaid.

3 The great Floure de-luce of Dalmatia hath leaues much broader, thicker, and more cloſely compact together than any of the other, and ſet in order like wings or the fins of a Whale fiſh, greene toward the top, and of a ſhining purple colour toward the bottome, euen to the ground: amongſt which riſeth vp a ſtalke of foure foot high, as my ſelfe did meaſure oft times in my garden: whereupon doth grow faire large floures of a light blew, or as we terme it a watchet colour. The floures do ſmell exceeding ſweet, much like the Orenge floure. The ſeeds are contained in ſquare cods, wherein are packed together many flat ſeeds like the former. The root hath no ſmell at all.

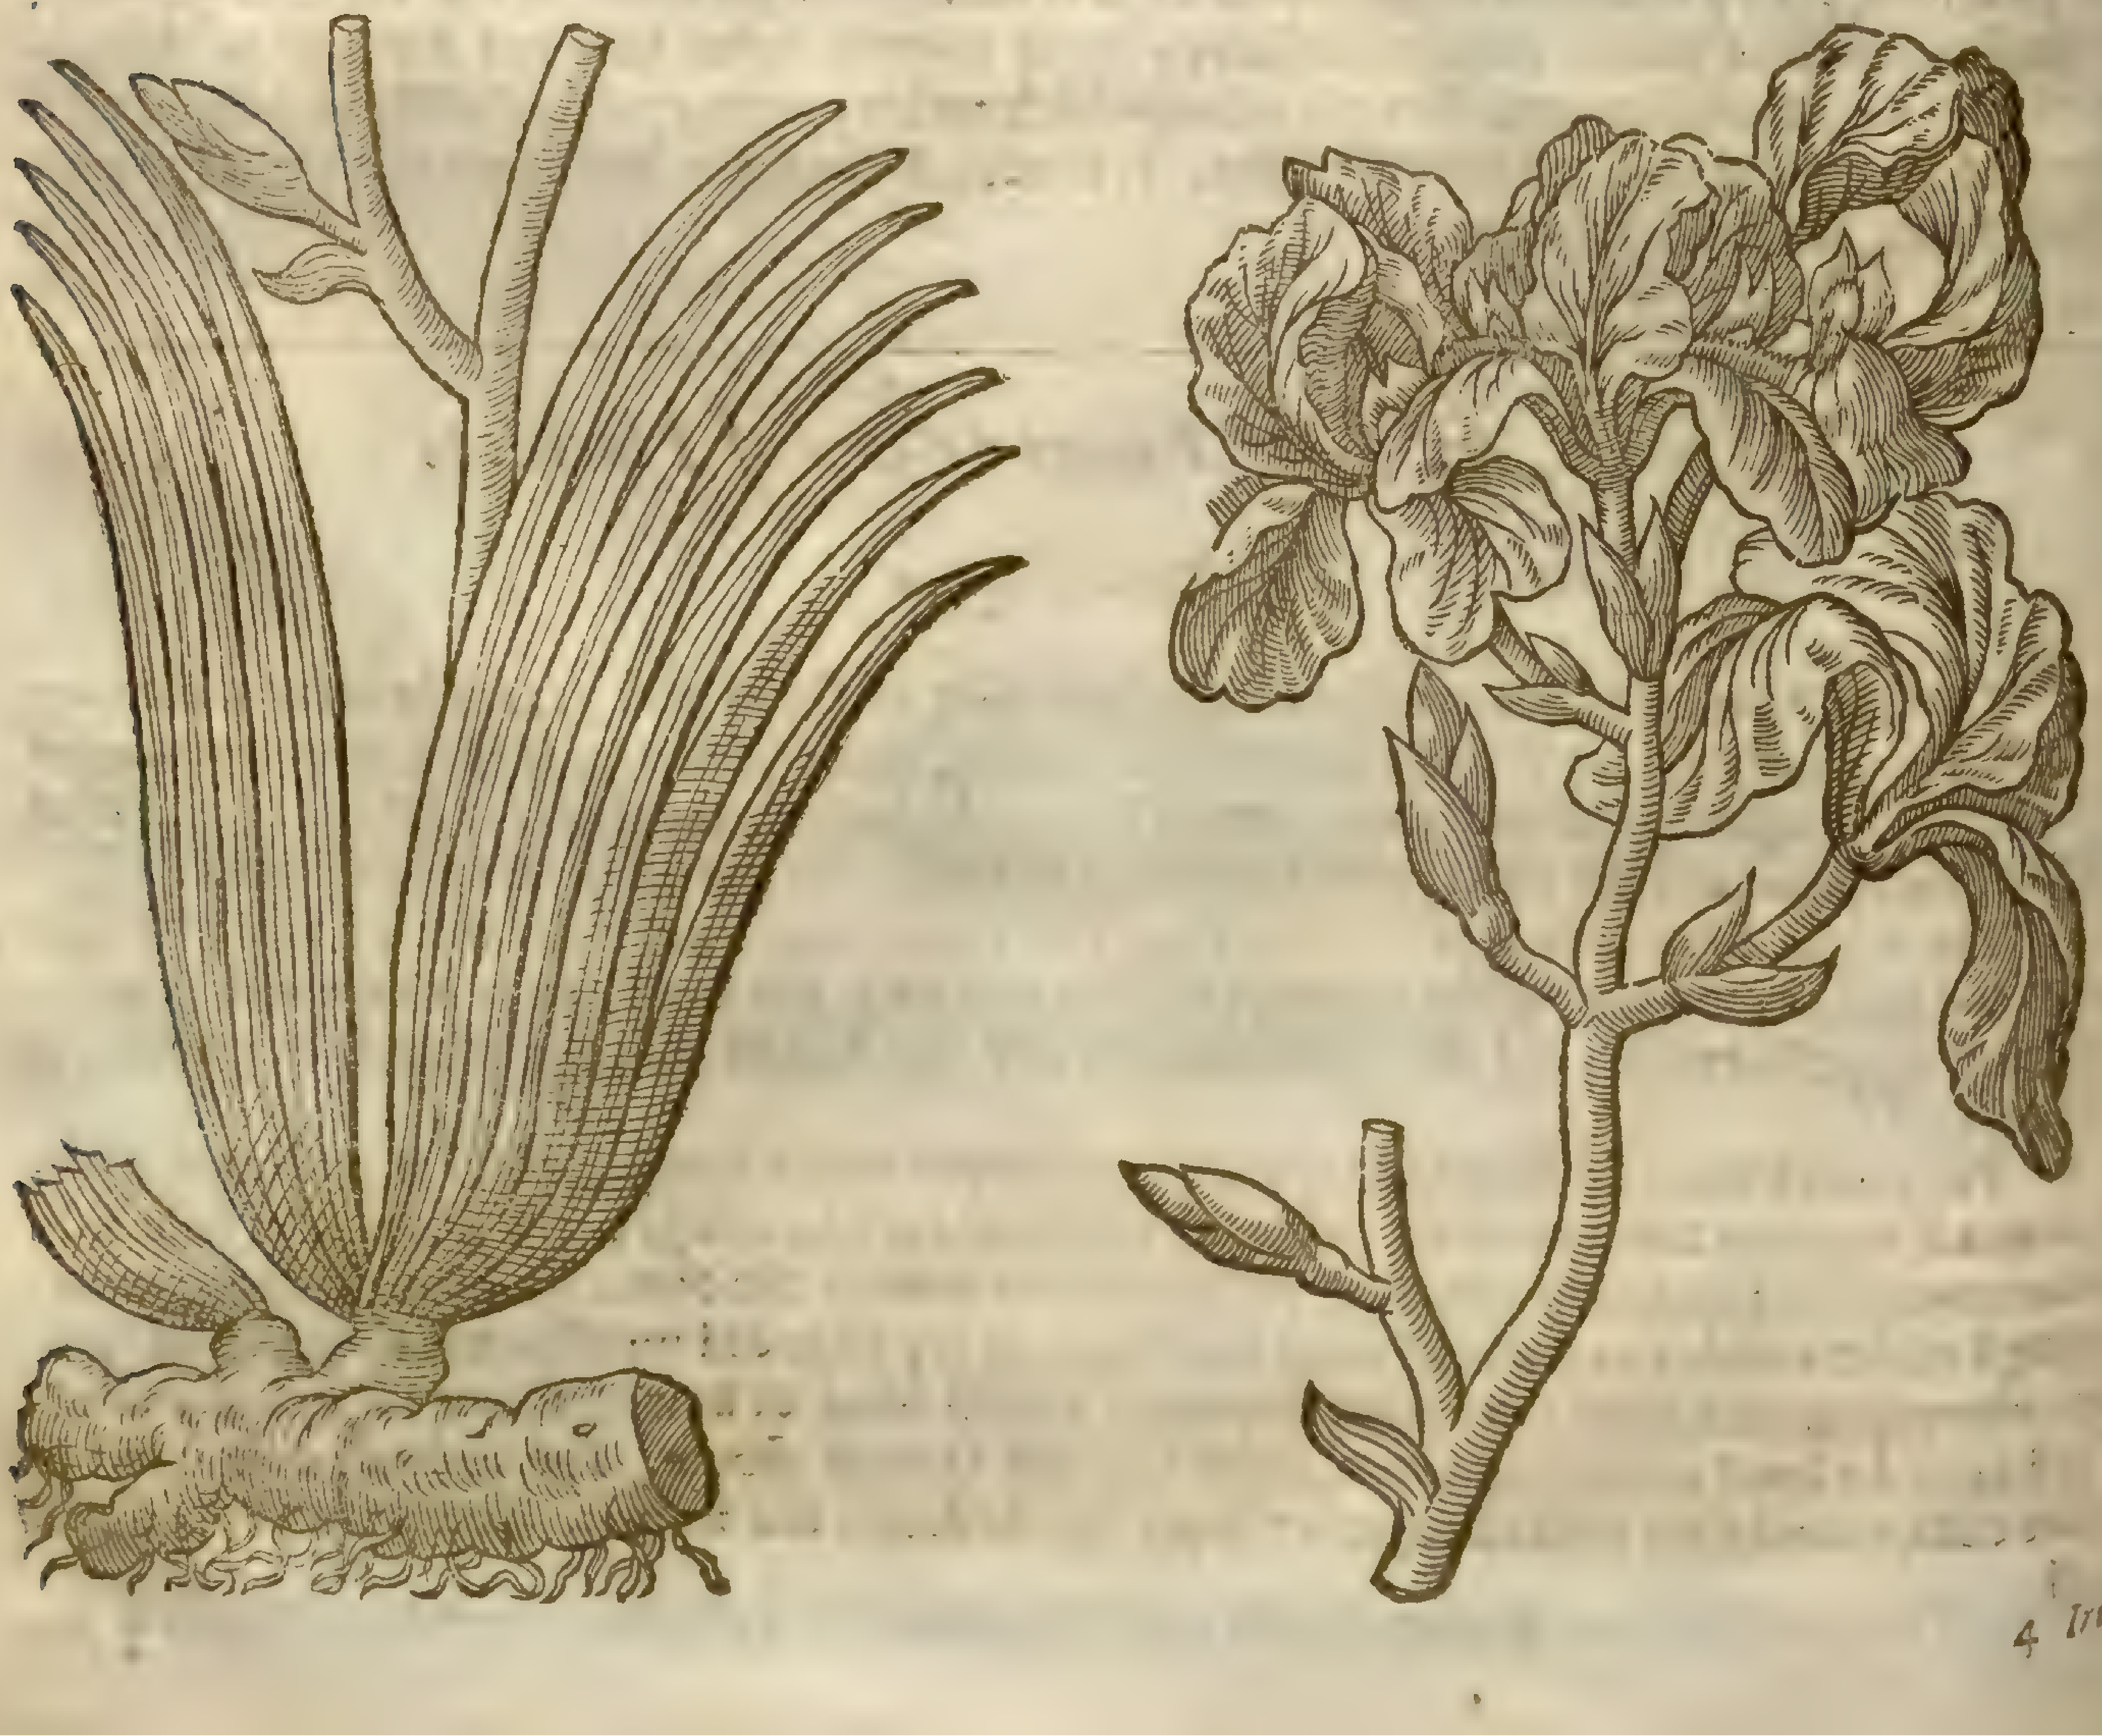


1 *Iris Florentina.*
Floure de-luce of Florence.

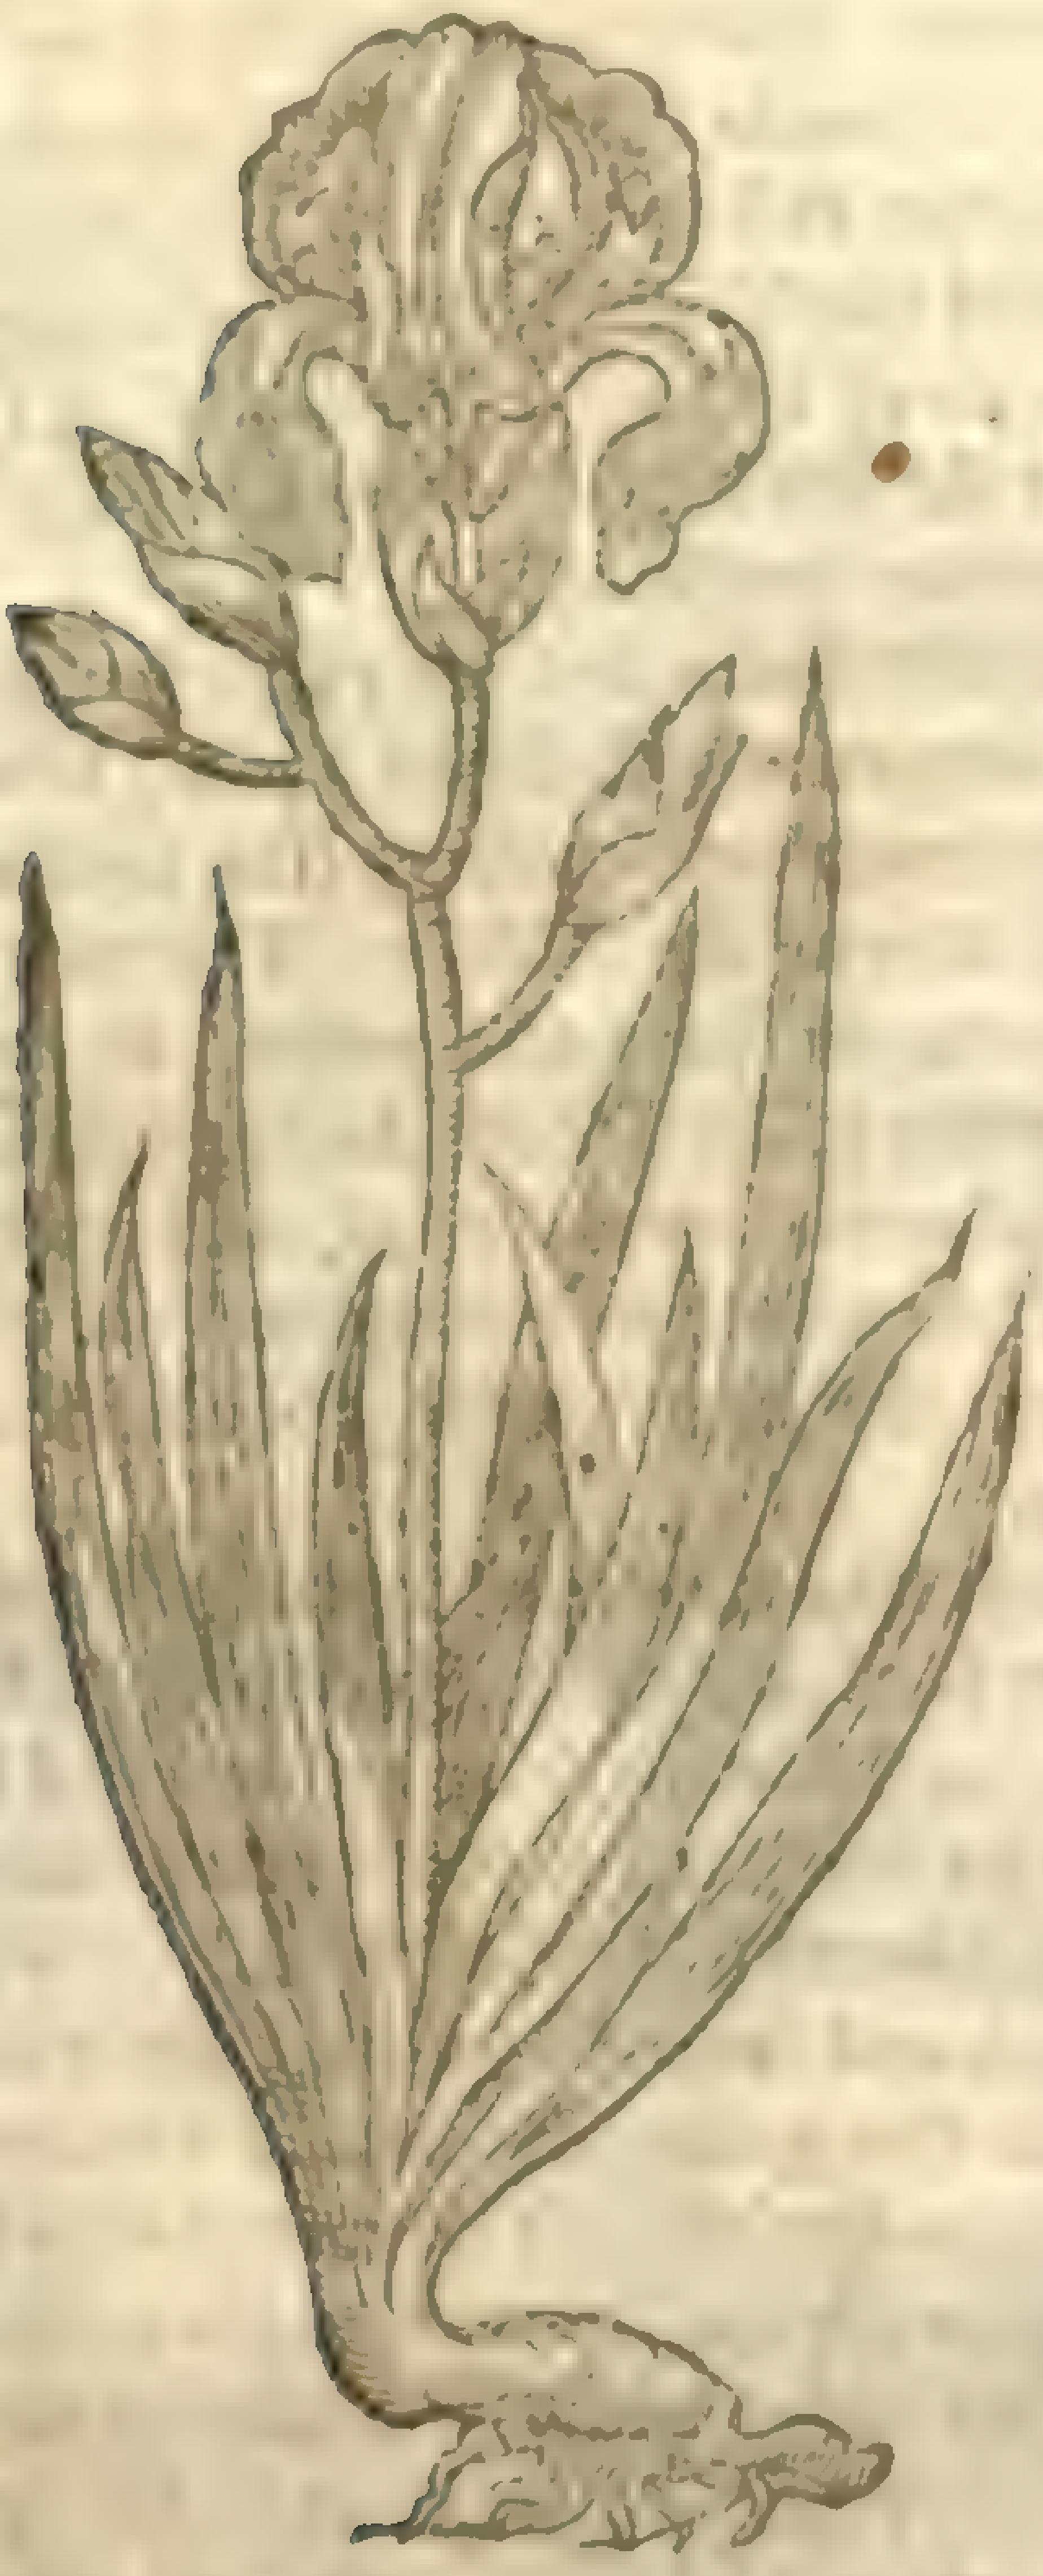


2 *Iris alba.*
White floure de-luce.

3 *Iris Dalmatica major.*
Great Floure de-luce of Dalmatia.

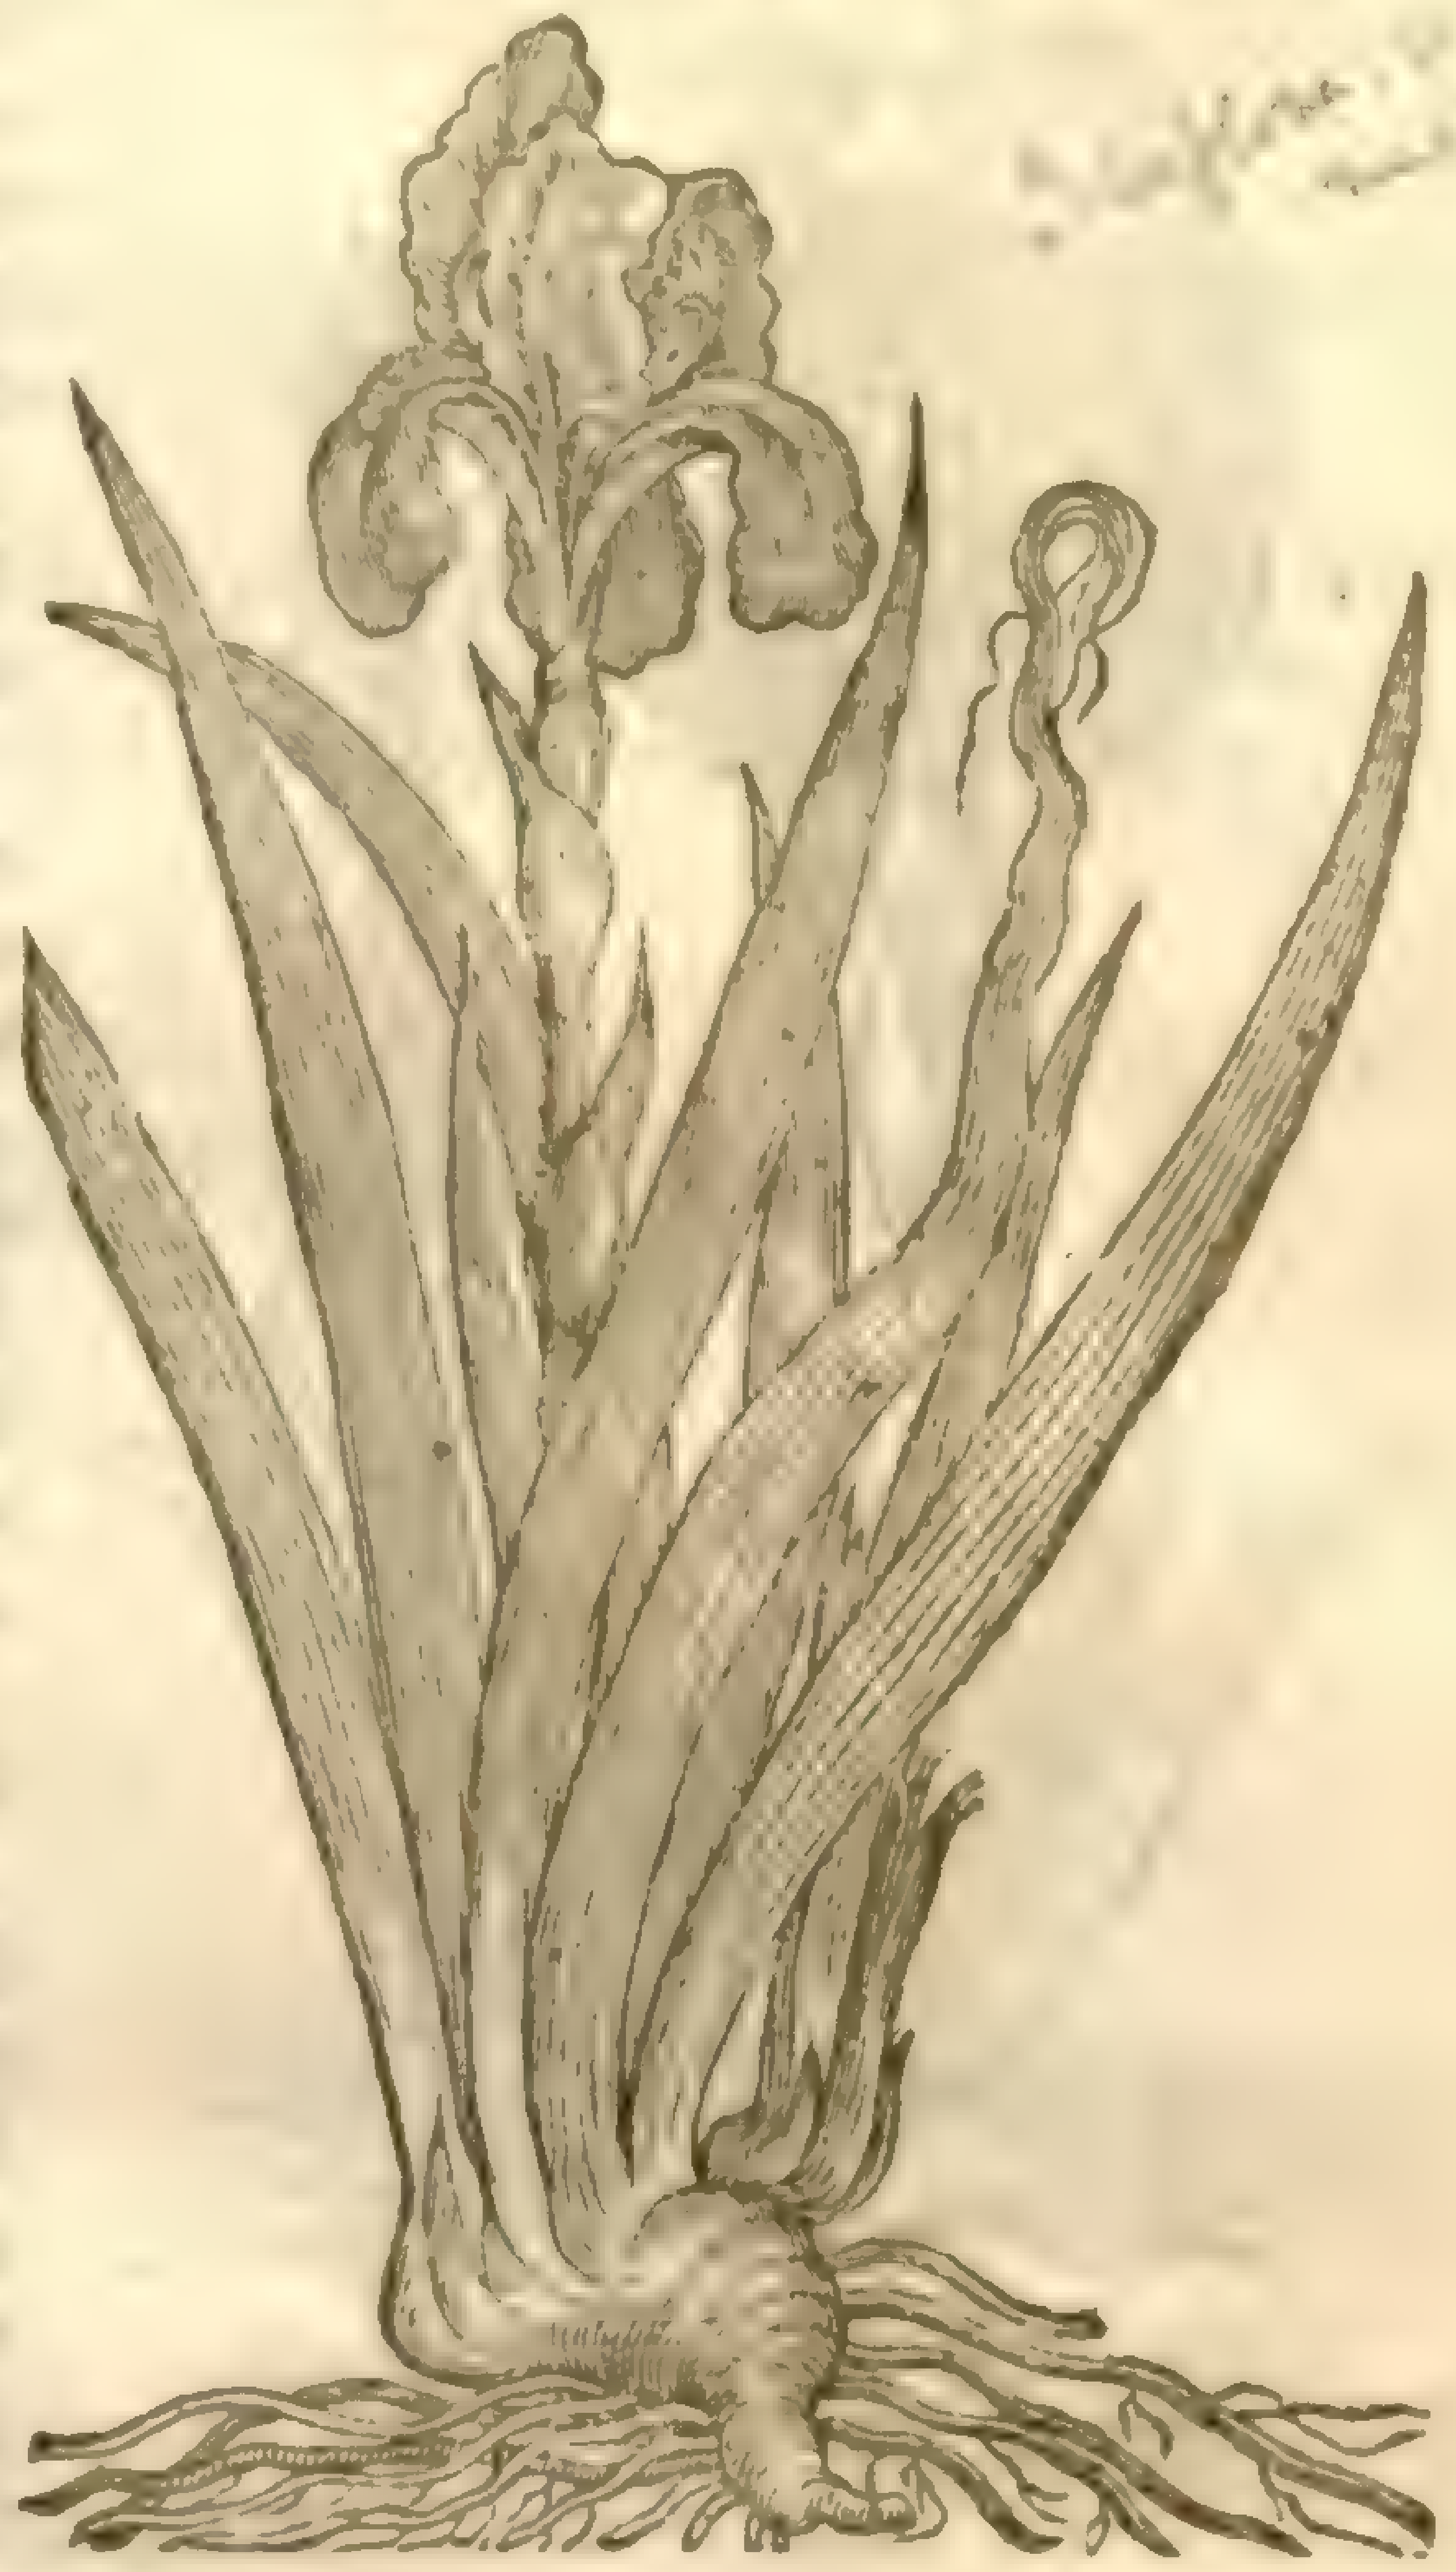


4 *Iris Dalmatica minor.*
Small Dalmatian *Iris.*

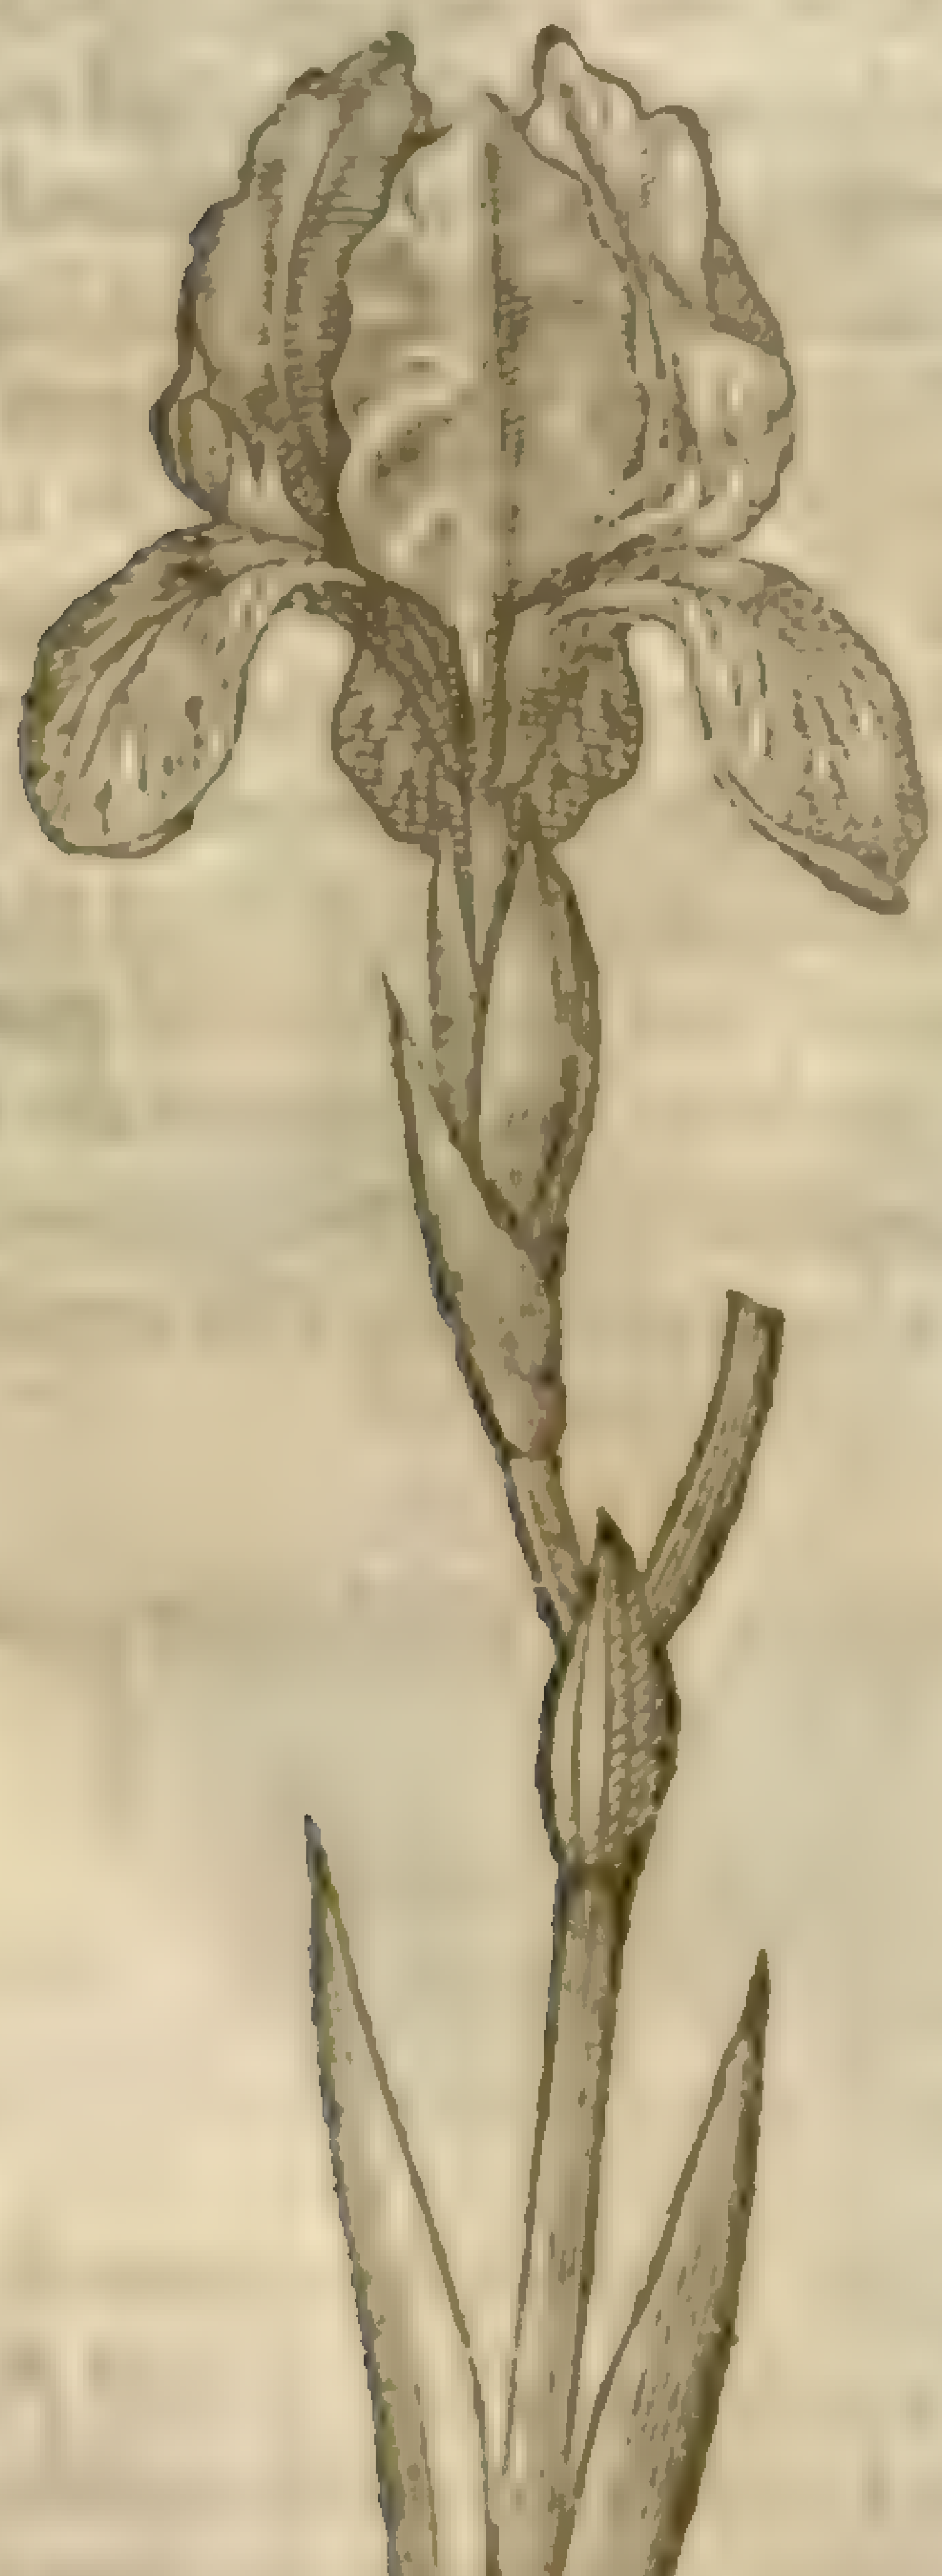


5 *Iris Biflora.*
Twice-flouring Floure de-luce.

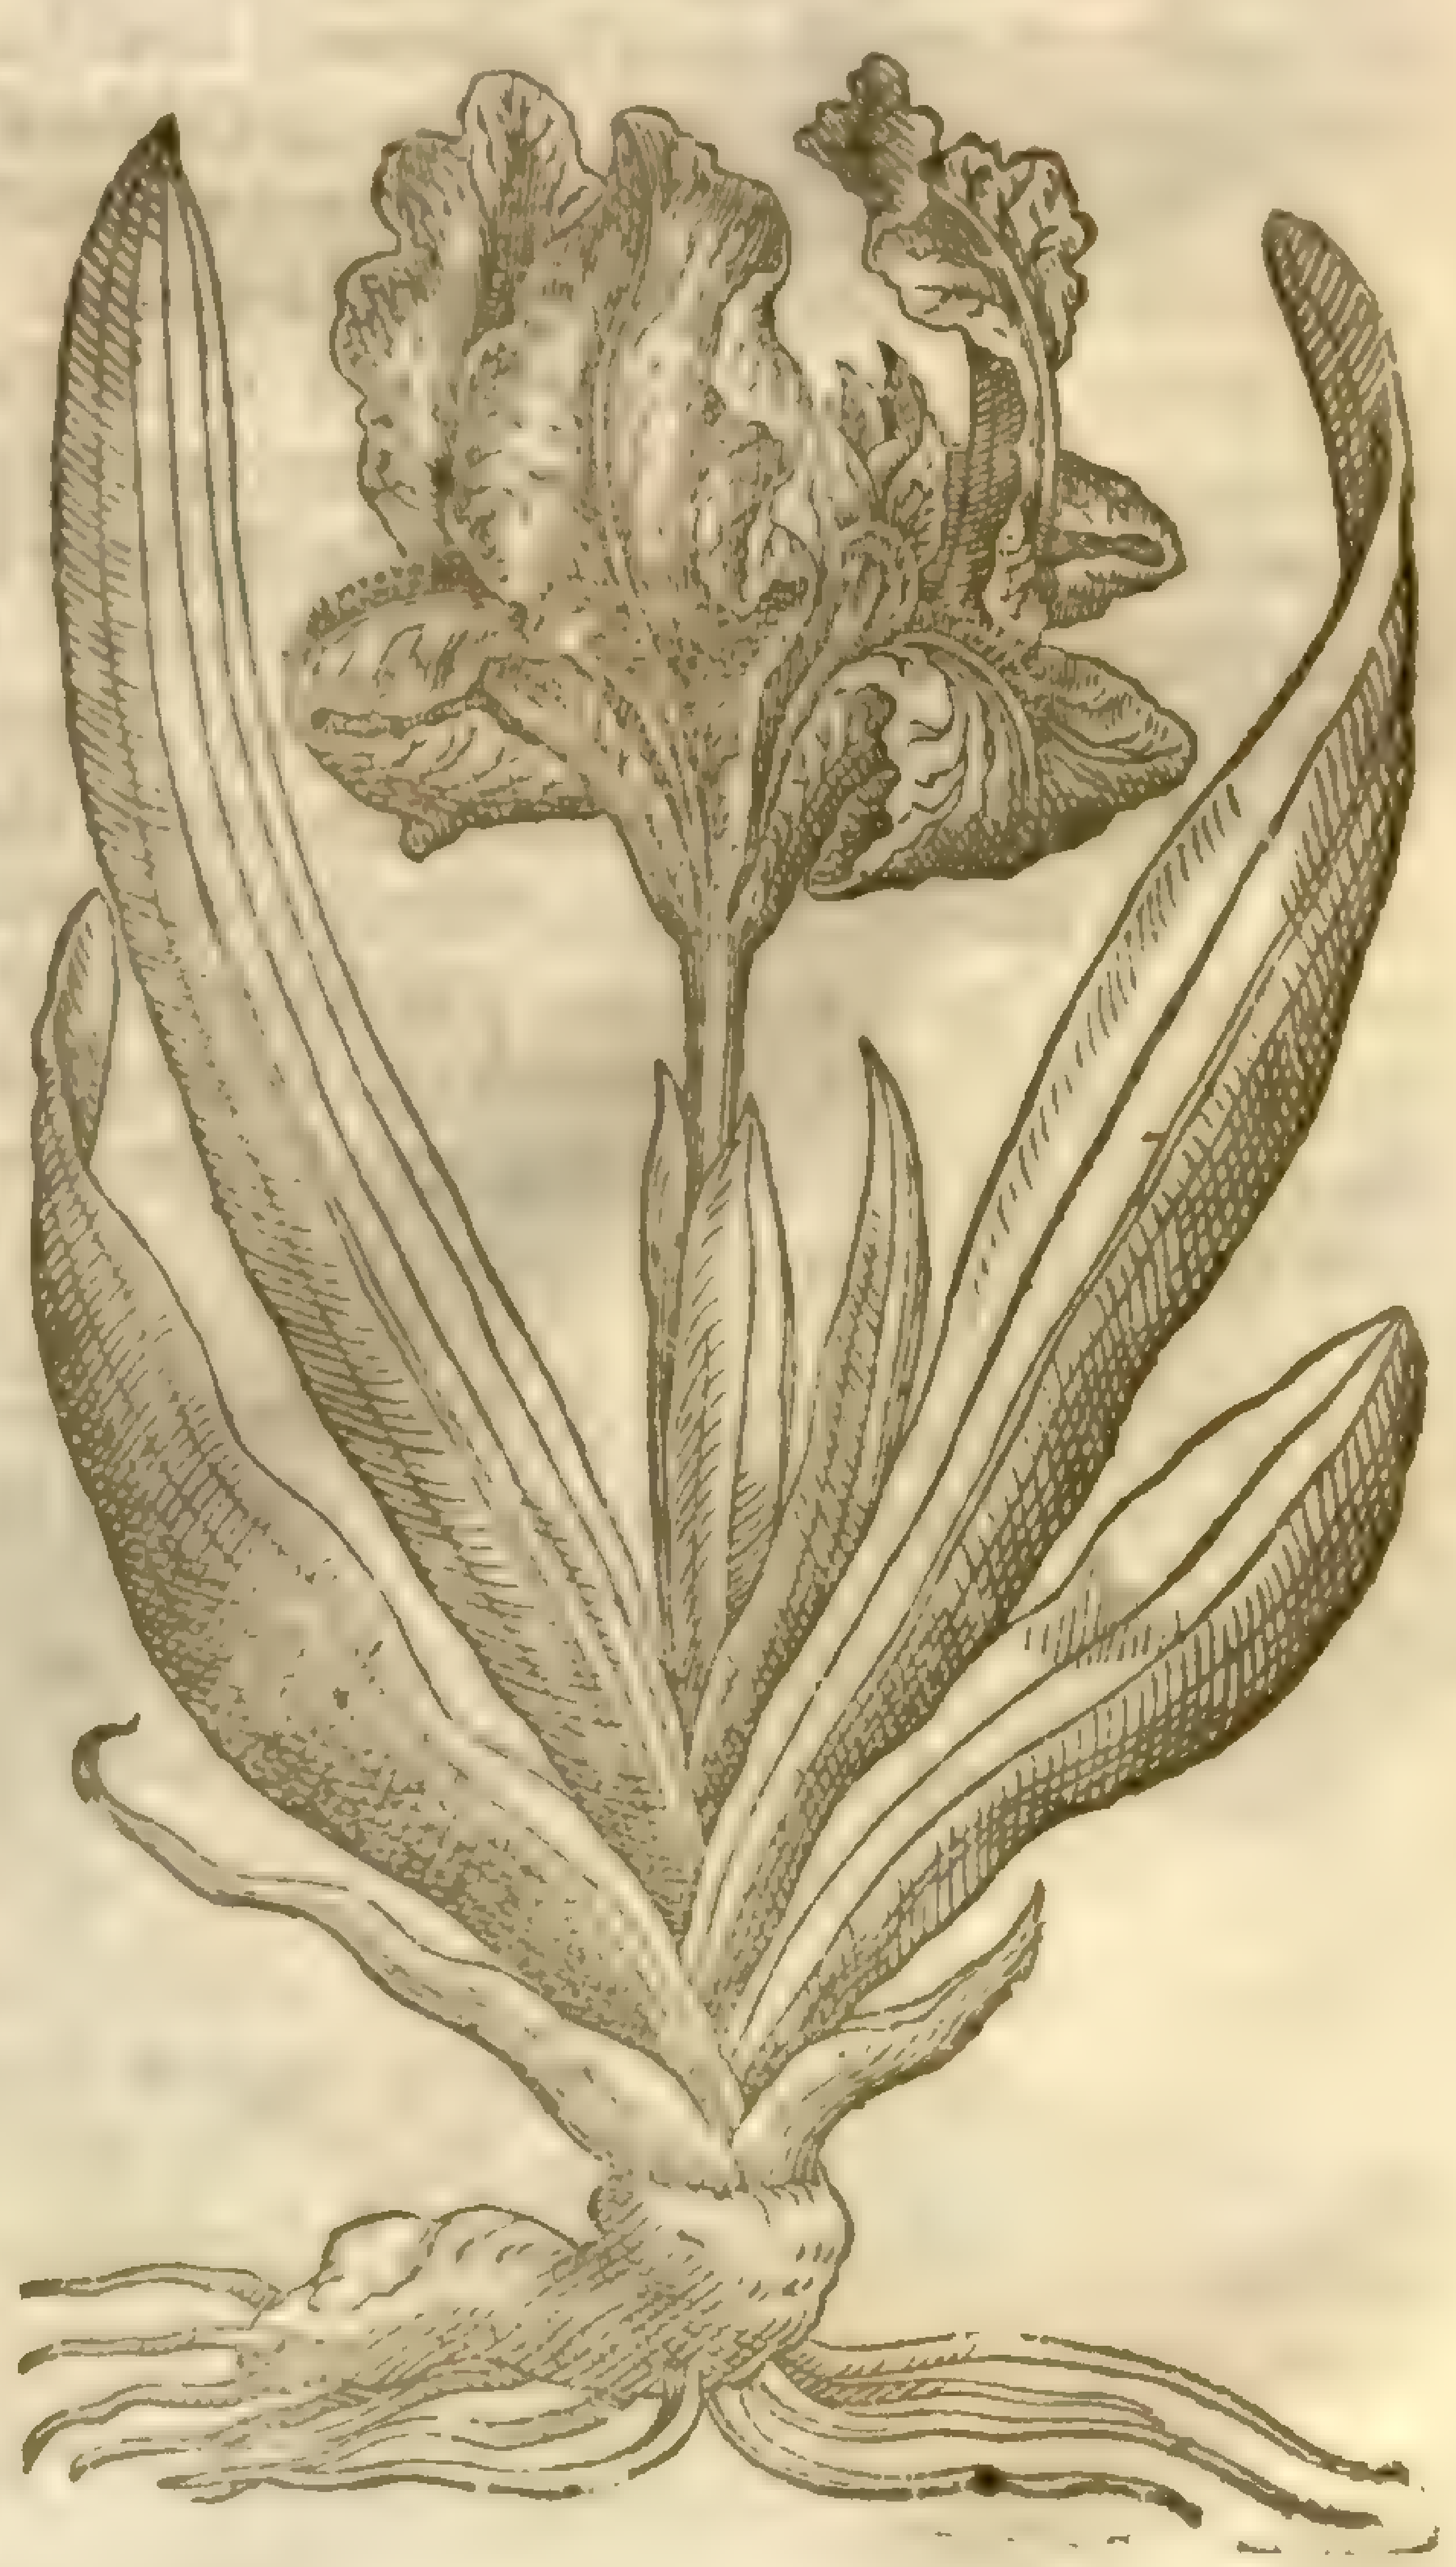
[illegible]



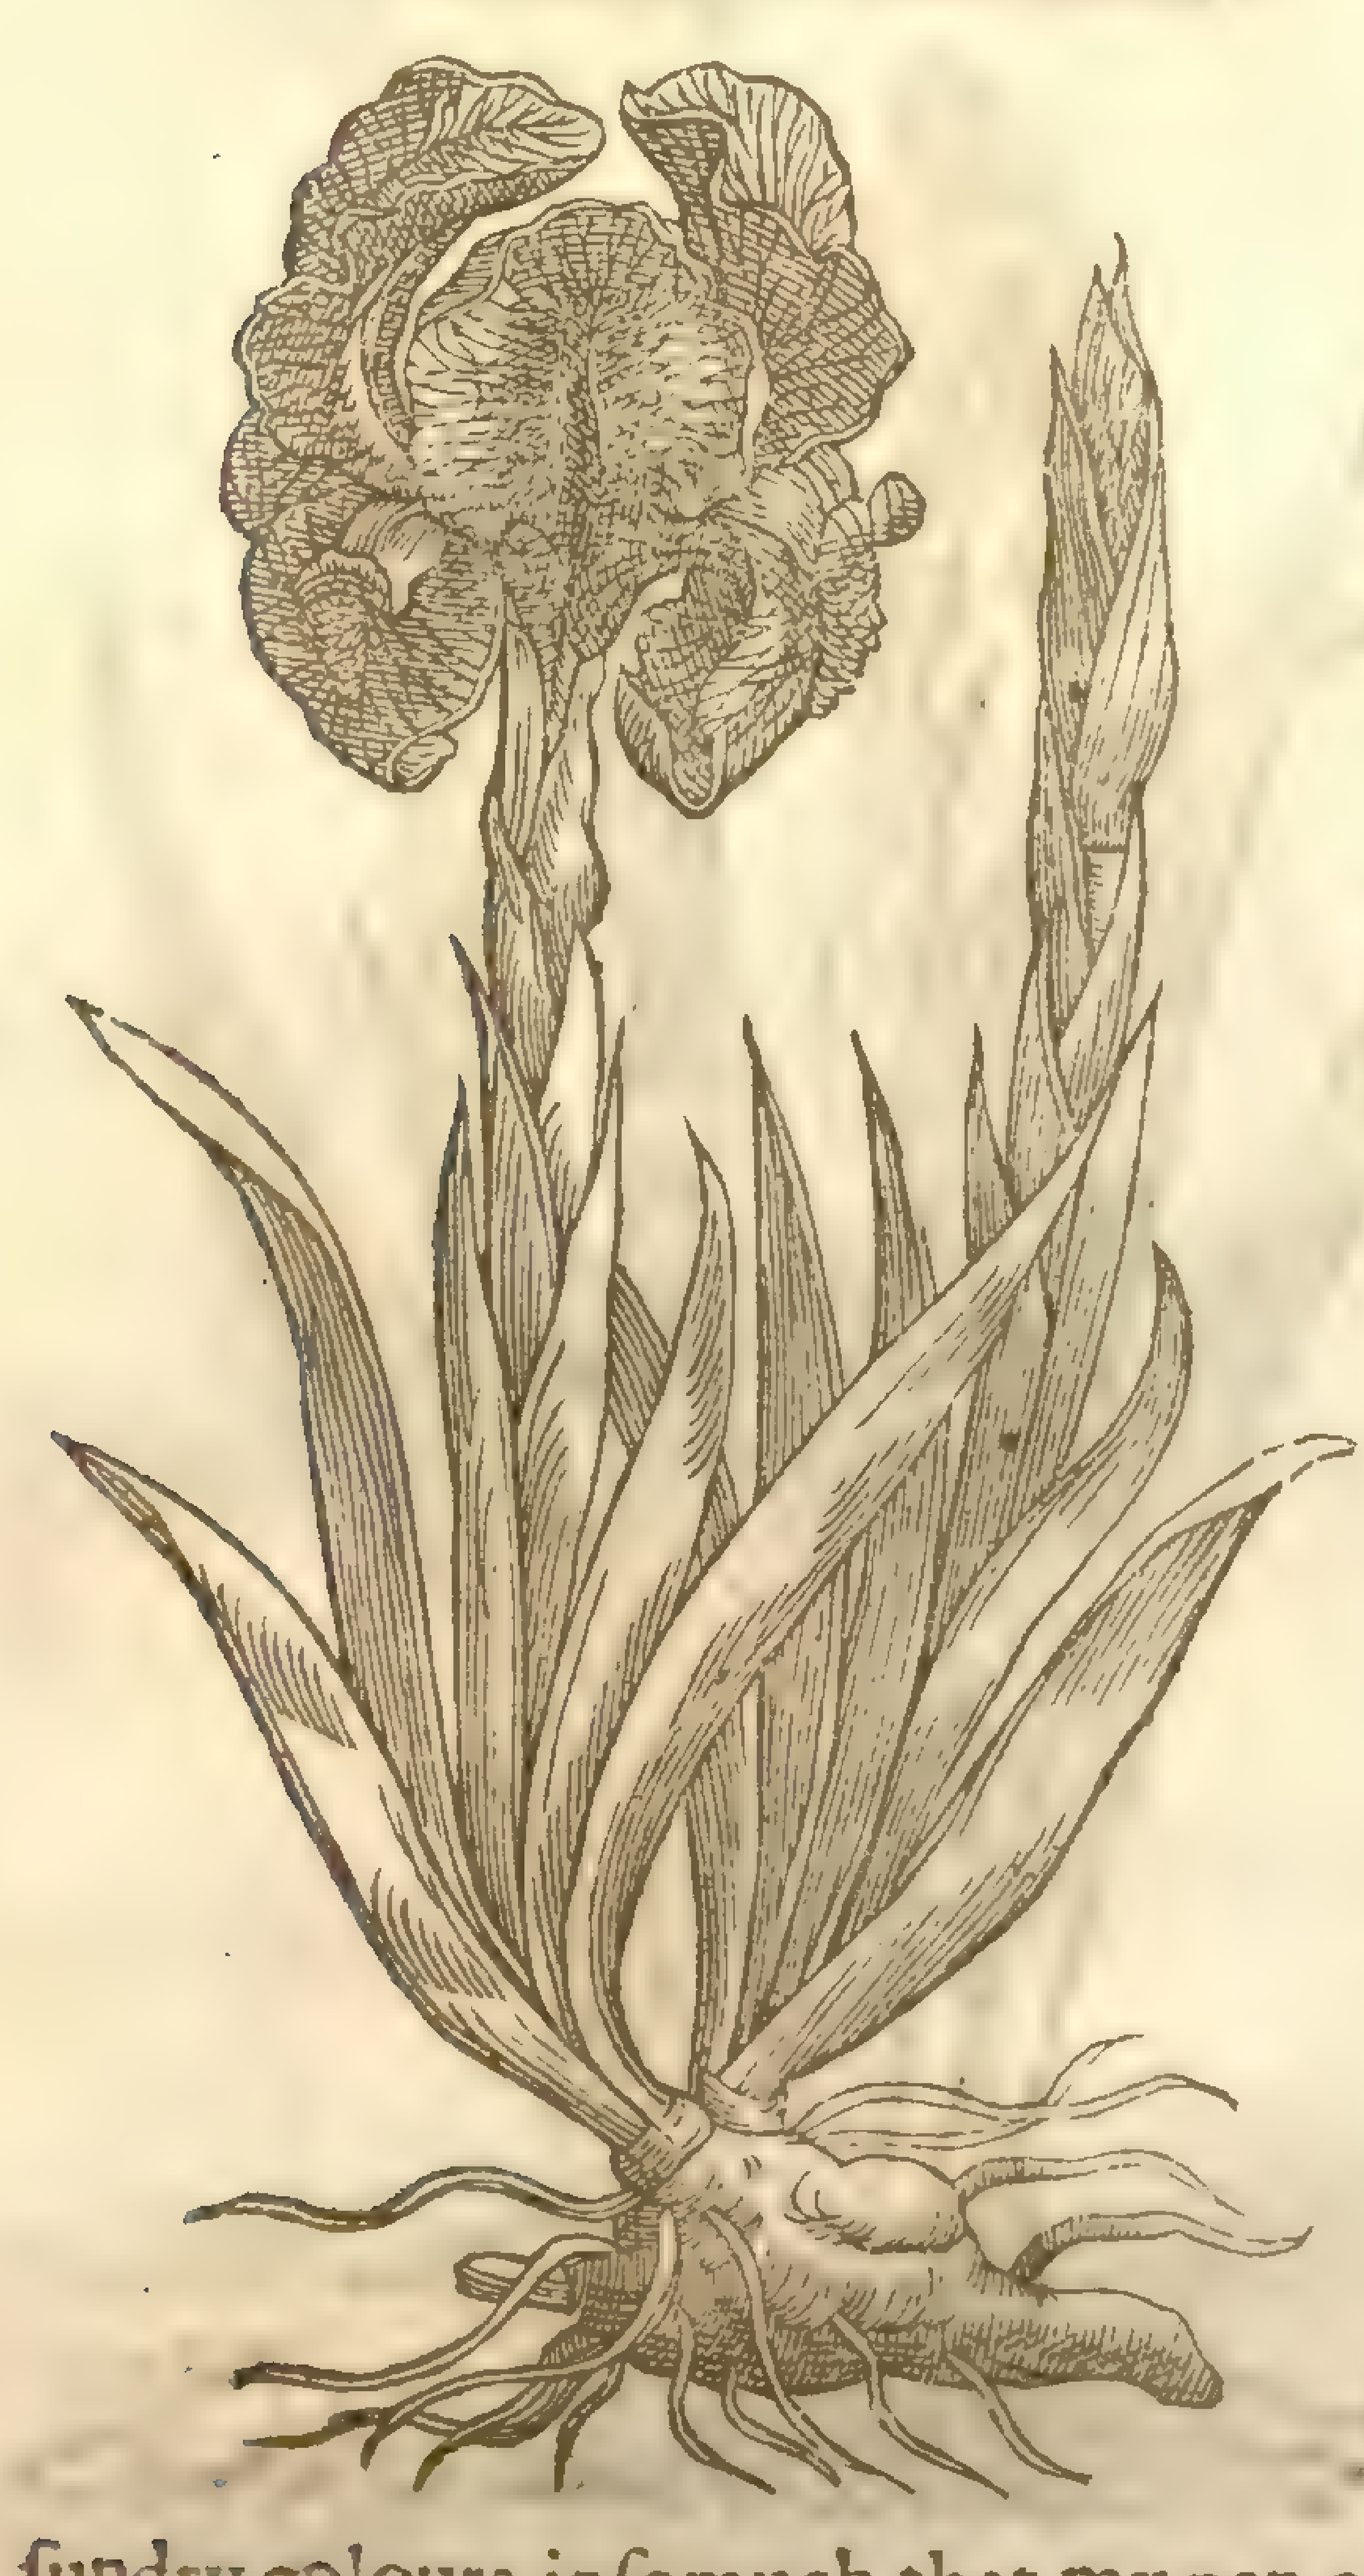
6 *Iris Violacea.*
Violet Floure de-luce



7 *Iris Pannonica.*
Auſtrian Floure de-luce.



† 8 *Iris Camerarij.*
Germane Floure de-luce.



4 This ſmal Floure de-luce of Dalmatia is in ſhew like to the precedent, but rather reſembling *Iris biflora*, being both of one ſtature, ſmall and dwarfe plants in reſpect of the greater. The floures be of a more blew colour: they floure likewiſe in May, as the others doe; but beware that ye neuer caſt any cold water vpon them preſently taken out of the Well; for their tendernes is ſuch that they wither away and rot immediatly, as I my ſelfe haue proued: but thoſe which I left vnwatred at the ſame time liue and proſper to this day.

5 This kind of Floure de-luce came firſt from Portugall to vs. It bringeth forth in the Spring time floures of a purple or violet colour, ſmelling like a violet, with a white hairy welt downe the middle. The root is thicke and ſhort, ſtubborne or hard to breake. In leaues and ſhew it is like to the leſſer Floure de-luce of Dalmatia, but the leaues are more ſpred abroad, and it commonly hath but one ſtalke, which in Autumne floureth againe, and bringeth forth the like floures; for which cauſe it is called *Iris biflora*.

6 *Iris violacea* is like vnto the former, but much ſmaller, and the floure is of a more deepe violet colour.

7 *Carolus Cluſius* that excellent and learned Father of Herbariſts, hath ſet forth in his Panonick Obſeruations, the picture of this beautifull Floure de-luce with great broad leaues thick and fat, of a purple colour neere vnto the ground, like the great Dalmatian Floure de-luce, which it very well reſembles. The root is very ſweet being dry, ſtriuing with the Florentine *Iris* in ſweetneſſe. The floure is of all other moſt confuſedly mixed with ſundry colours, inſomuch that my pen cannot ſet downe euery line or ſtreake as it deſerueth. The three leaues that ſtand vpright do claſpe or embrace one another, and are of a yellow colour. The leaues that looke downward about the edges are of a pale colour, the middle part of white mixed with a line of purple, & it hath many ſmal lines ſtriped ouer the ſaid white floure, euen to the brim of the pale coloured edge. It ſmelleth like the Hauthorne floures, being lightly ſmelled vnto.

8 The Germane Floure de-luce, which *Camerarius* hath ſet forth in his booke named *Hortus Medicus*, hath great thicke and knobby roots. The ſtalke is thicke and full of juice: the leaues be very broad, in reſpect of all the reſt of the Floure de-luces. The floure groweth at the top of the ſtalke, conſiſting of ſix great leaues blew of colour, welted downe the middle with white tending to yellow; at the bottome next the ſtalke it is white of colour, with ſome yellowneſſe fringed about the ſaid white, as alſo about the brims or edges, which greatly ſetteth forth his beauty; the which *Ioachimus Camerarius* the ſon of old *Camerarius* of Noremberg, had ſent him out of Hungary, and did communicate one of the plants thereof to *Cluſius*; whoſe figure he hath moſt liuely ſet forth with this deſcription, differing ſomewhat from that which *Ioachimus* himſelfe did giue vnto me at his being in London. The leaues, ſaith he, are very large, twice ſo broad as any of the others. The ſtalk is ſingle and ſmooth, the floure groweth at the top, of a moſt bright-ſhining blew colour, the middle rib tending to whiteneſſe, the three vpper leaues ſomewhat yellowiſh. The root is likewiſe ſweet like *Ireos*.

¶ *The Place.*

Theſe kinds of Floure de-luces do grow wilde in Dalmatia, Goritia, and Piedmont; notwithſtanding our London gardens are very well ſtored with euery one of them.

¶ *The Time.*

Their time of flouring anſwereth the other Floure de-luces.

¶ *The Names.*

The Dalmatian Floure de-luce is called in Greeke of *Athenæus* and *Theophraſtus*, *Ieris*: it is named alſo *Ourania*, of the heauenly Bow or Rainbow: vpon the like occaſion, *Thaumaſtos*, or Admirable: for the Poets ſometime do call the Rainbow, *Thaumantias*: in Latine, *Iris*: in Engliſh, Floure de-luce. Their ſeuerall titles do ſufficiently diſtinguiſh them, whereby they may be knowne one from another.

¶ *The*

¶ *The Nature.*

The nature of theſe floure de-luces are anſwerable to thoſe of the common kinde, that is to ſay, the roots are hot and dry in the later end of the ſecond degree.

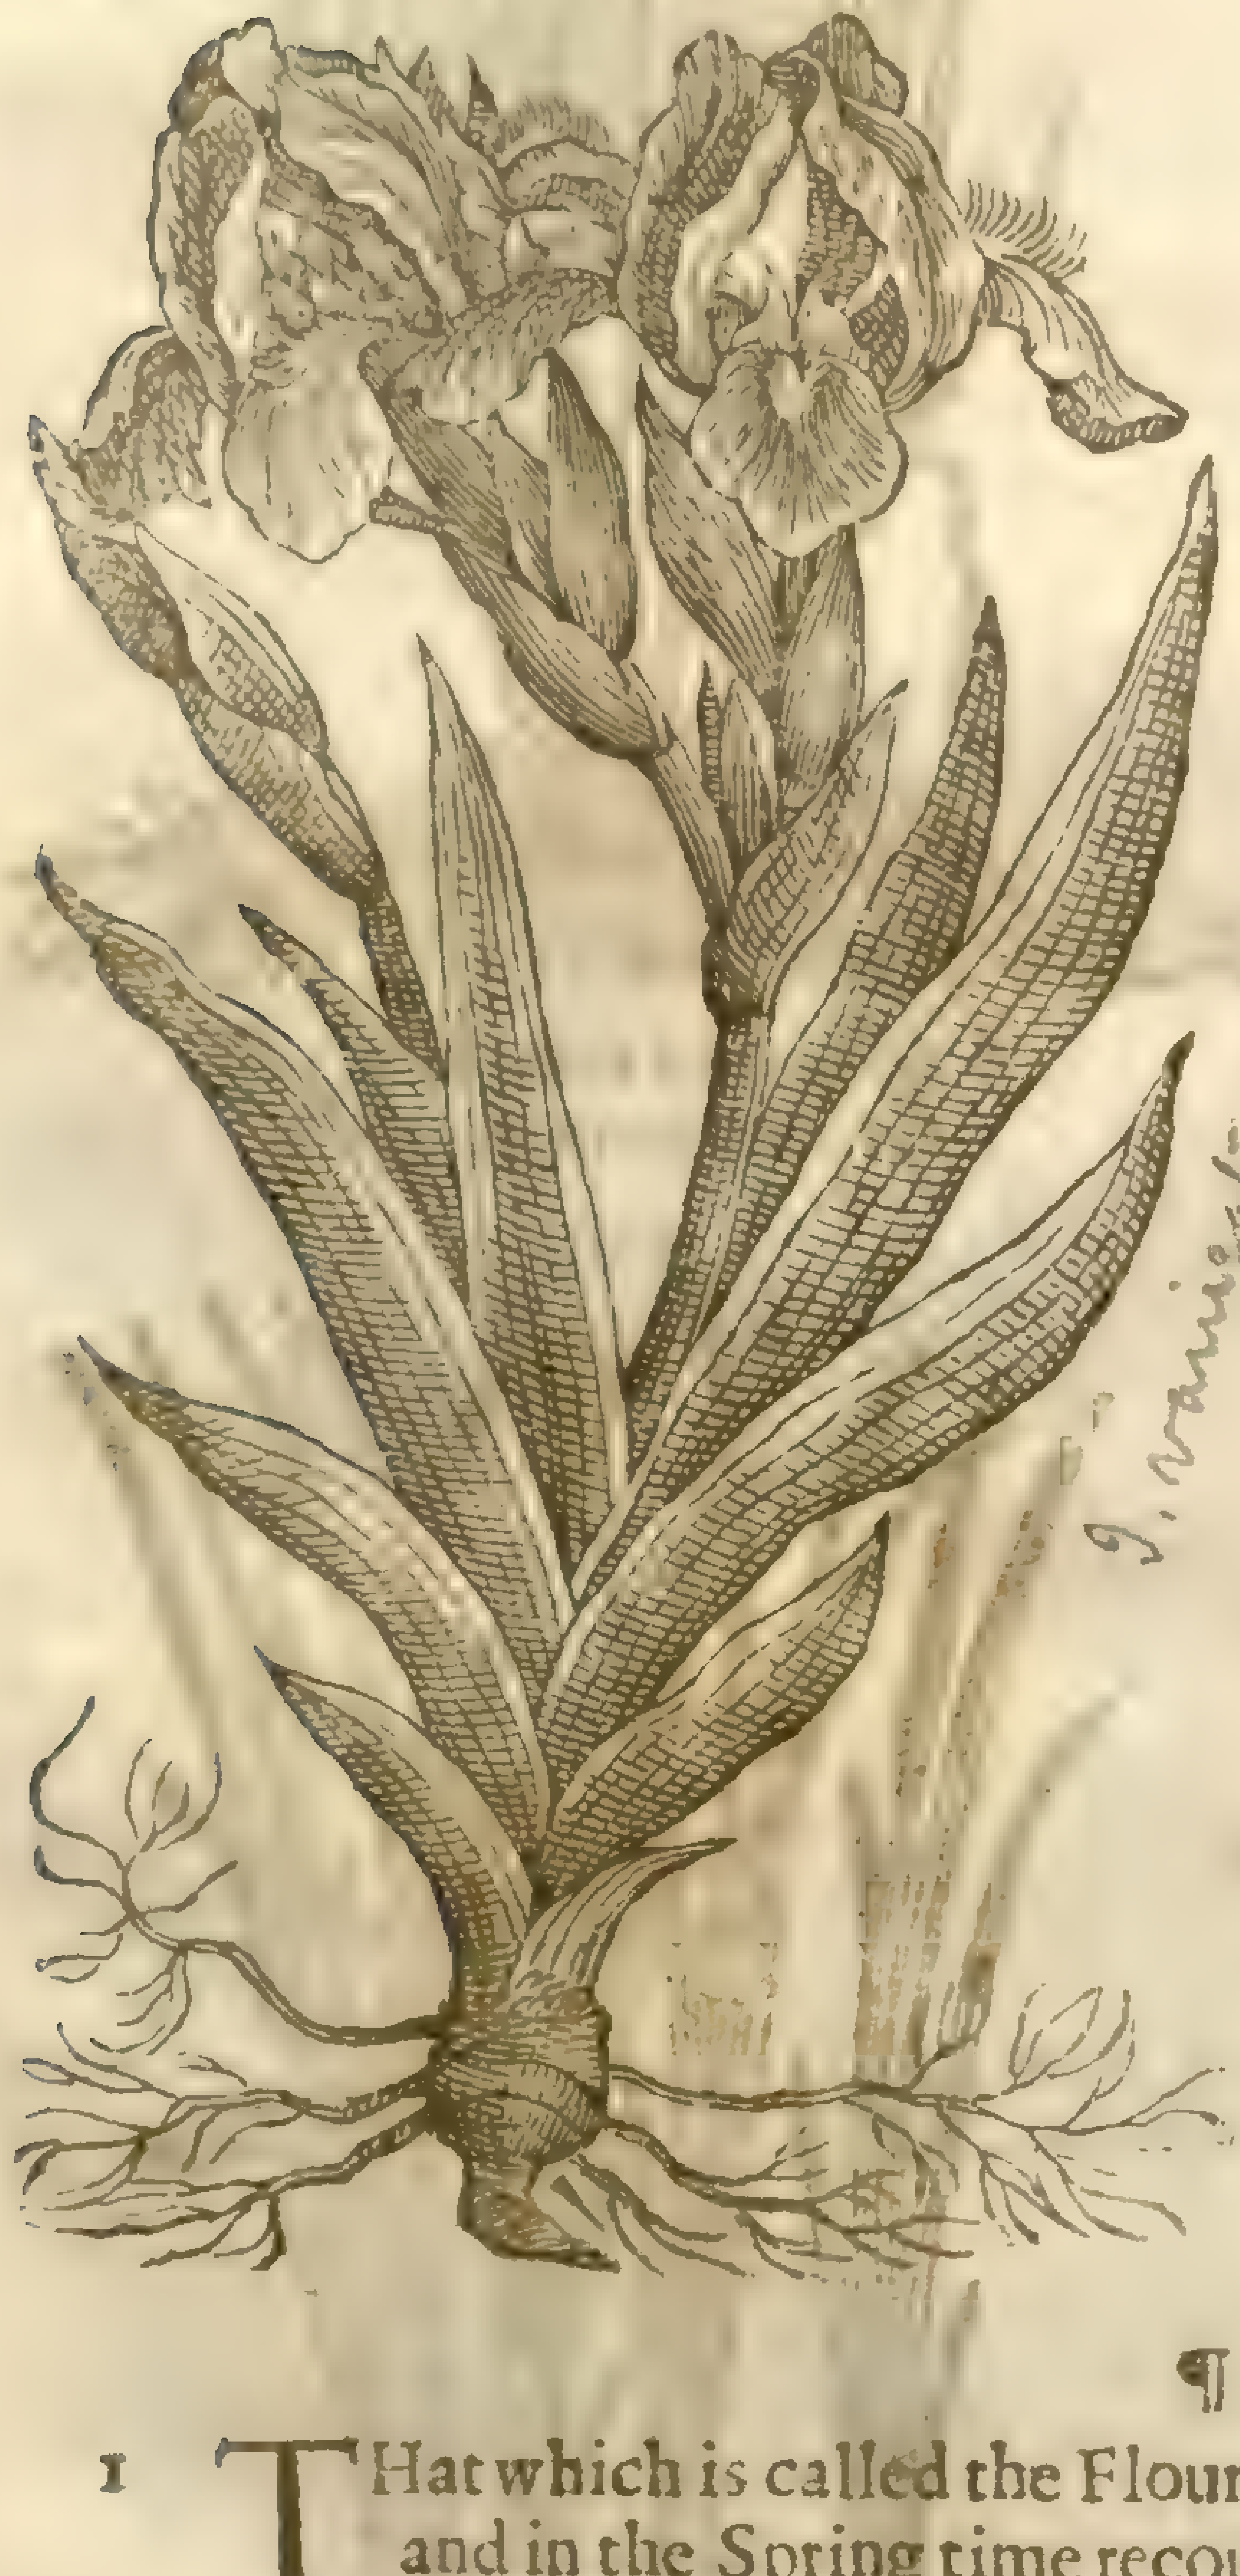
¶ *The Vertues.*

A The juice of theſe Floure de-luces doth not only mightily and vehemently draw forth choler, but eſpecially waterie humors, & is a ſingular good purgation for them that haue the dropſie, if it be drunke in ſweet wort or whay.

B The ſame are good for them that haue euill ſpleens, or that are troubled with cramps or convulſions, and for ſuch as are bit with ſerpents. It profiteth alſo much thoſe that haue the Gonorrhea, or running of the reins, being drunke with vineger, as *Dioſc.* ſaith; and drunke with wine they bring downe the monethly termes.

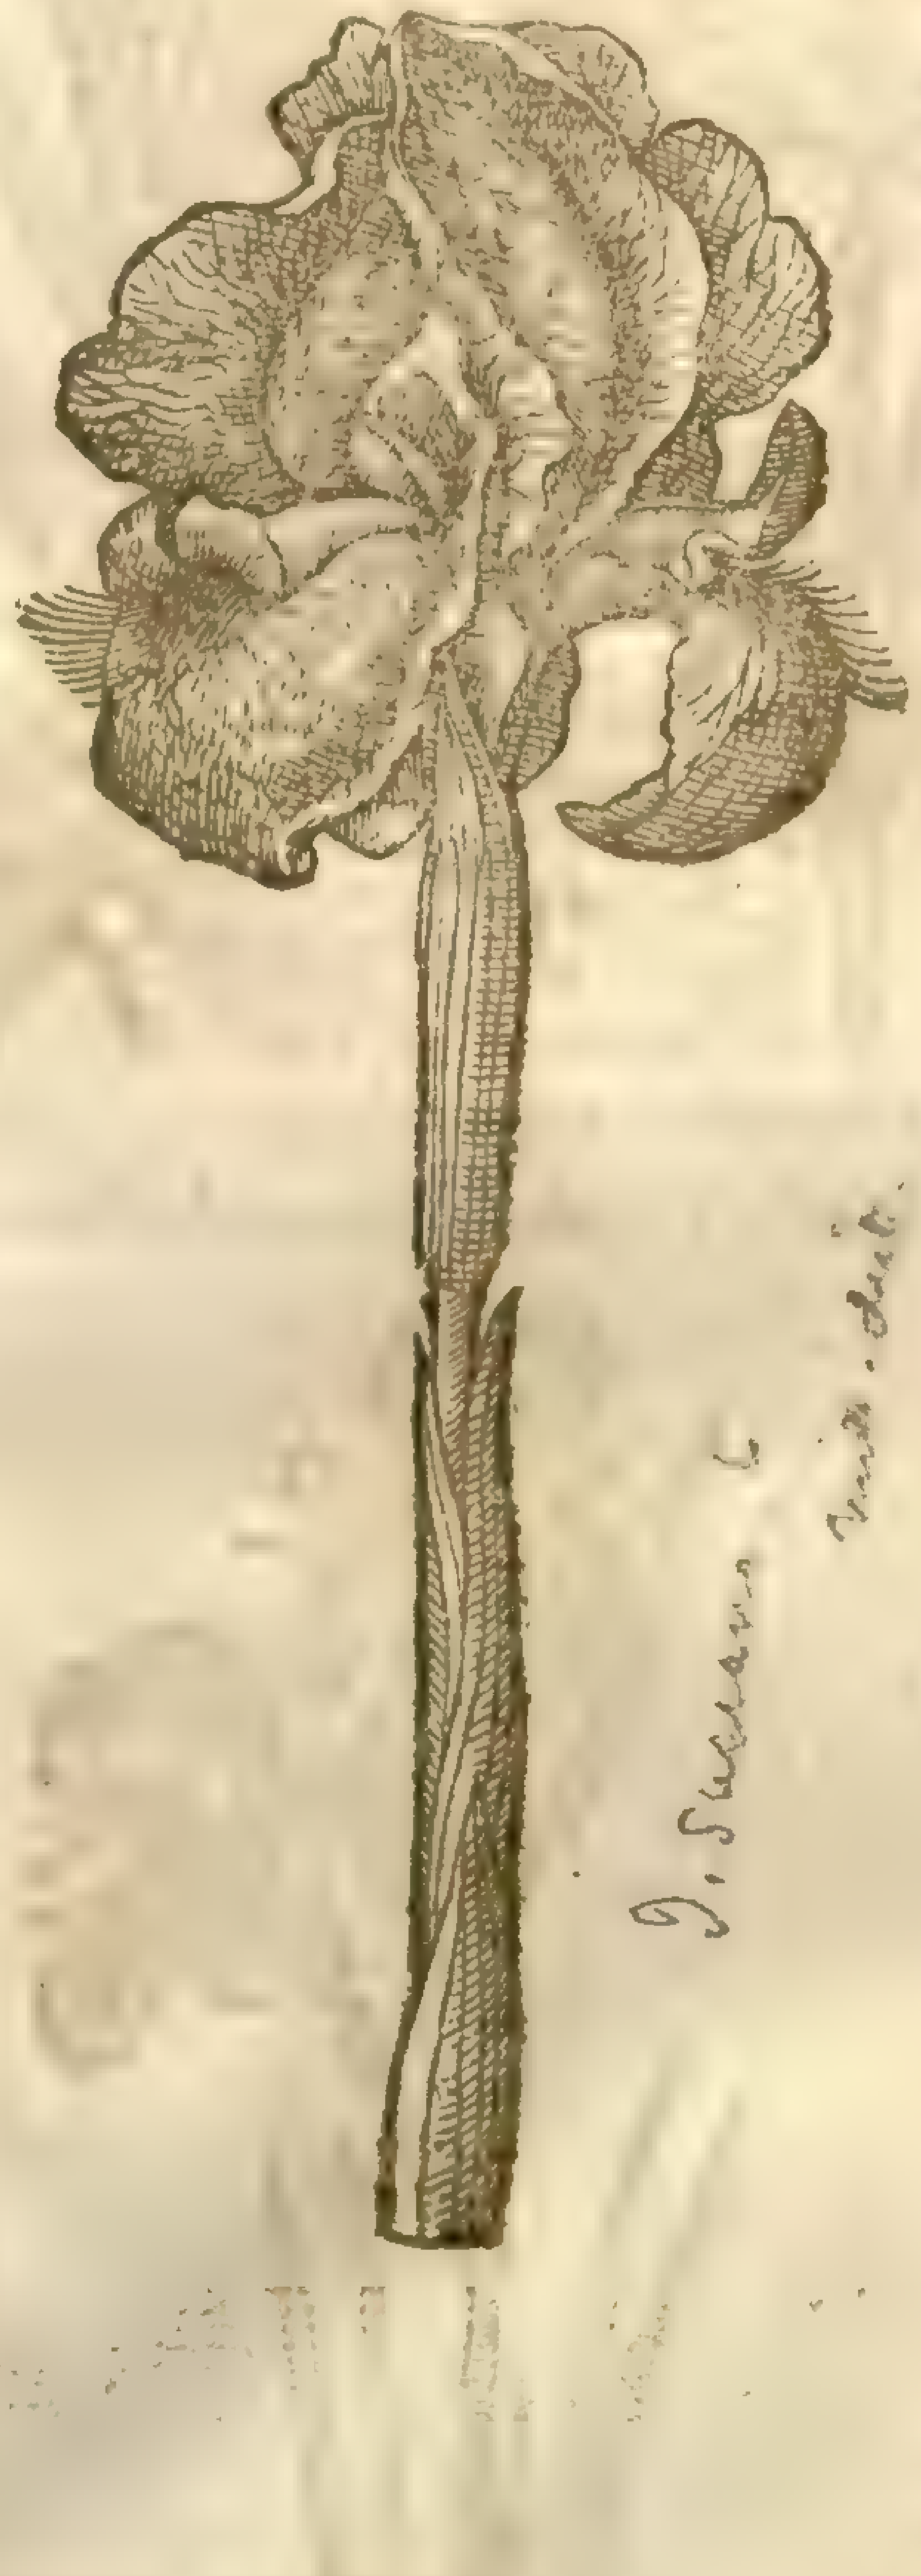
Chap. 42. *Of variable Floure de-luces.*

1 *Iris lutea variegata.*
Variable Floure de-luce.



I. variegata, L. mihi dict.

† 2 *Iris Chalcedonica.*
Turky Floure de-luce.



I. Suſiana L. mihi dict.

¶ *The Deſcription.*

1 That which is called the Floure de-luce of many colours, loſeth his leaues in Winter, and in the Spring time recouereth them anew. I am not able to expreſſe the ſundrie colours and mixtures contained in this floure: it is mixed with purple, yellow, black, white, and a fringe or blacke thrum downe the middle of the lower leaues, of a whitiſh yellow, tipped or frized, and as it were a little raiſed vp, of a deep purple colour neere the ground.

2 The ſecond kinde hath long and narrow leaues of a blackiſh green like ſtinking Gladdon; among which riſe vp ſtalks two foot long, bearing at the top of each ſtalke one floure compact of ſix great leaues: the three that ſtand vpright are confuſedly and very ſtrangely ſtriped, mixed with white and a duskiſh blacke colour. The three leaues that hang downward are like a gaping hood, and are mixed in like manner, (but the white is nothing ſo bright as of the other) and are as it were ſhadowed ouer with a darke purple colour ſomwhat ſhining; ſo that according to my iudgment, the whole floure is of the colour of a Ginny hen, a rare and beautifull floure to behold.

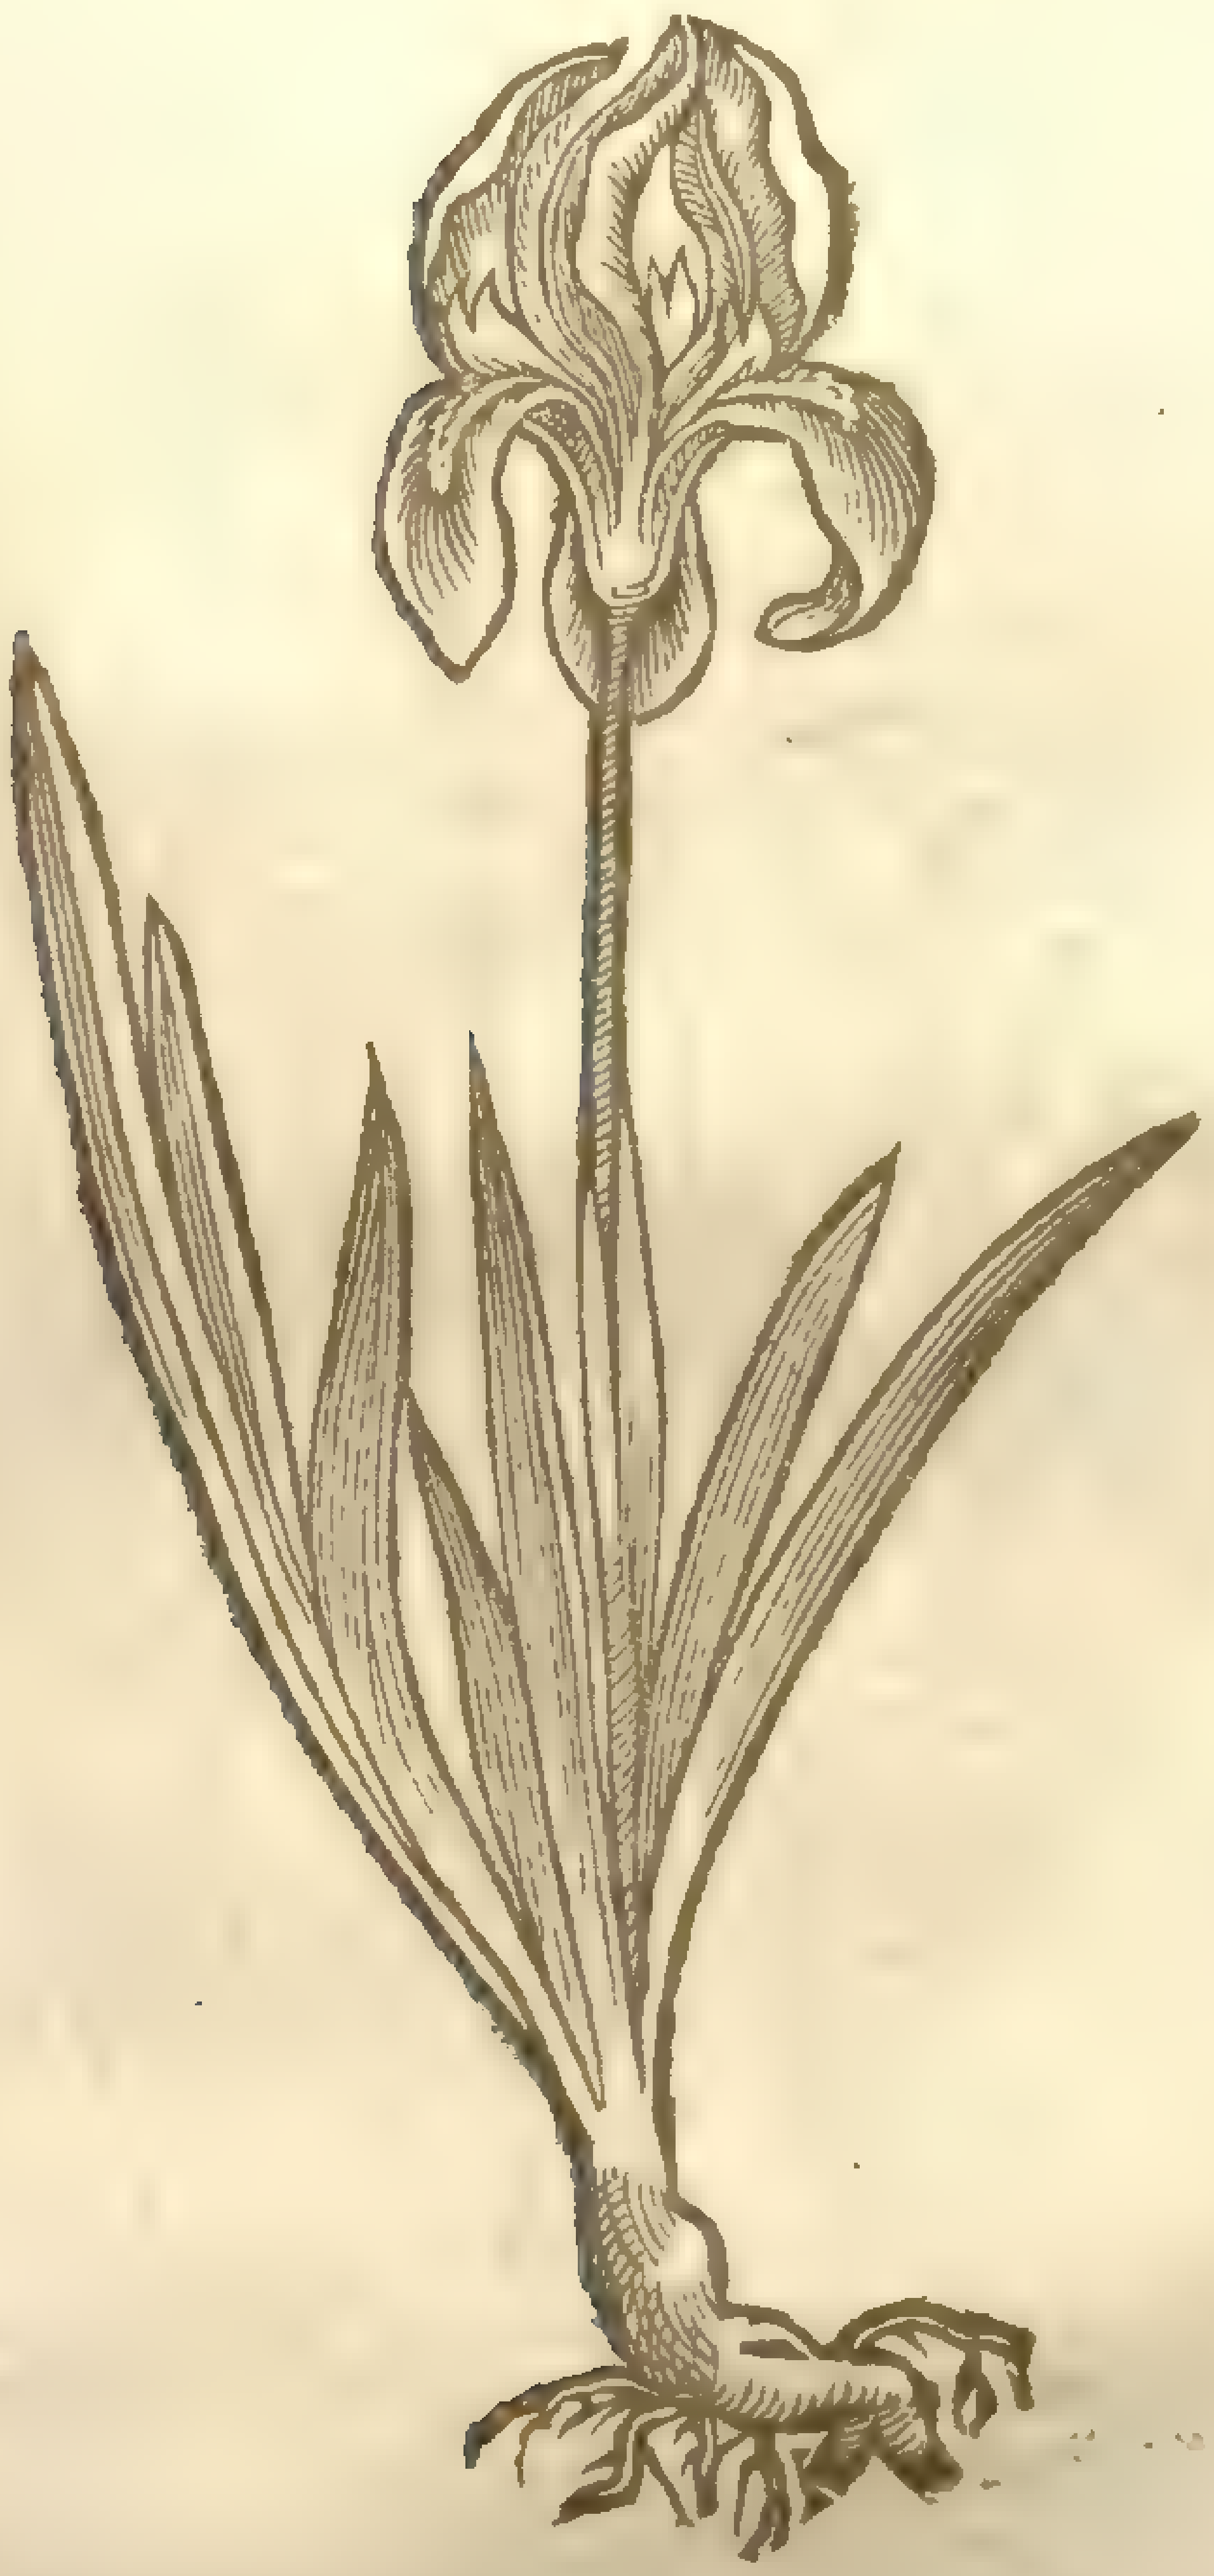
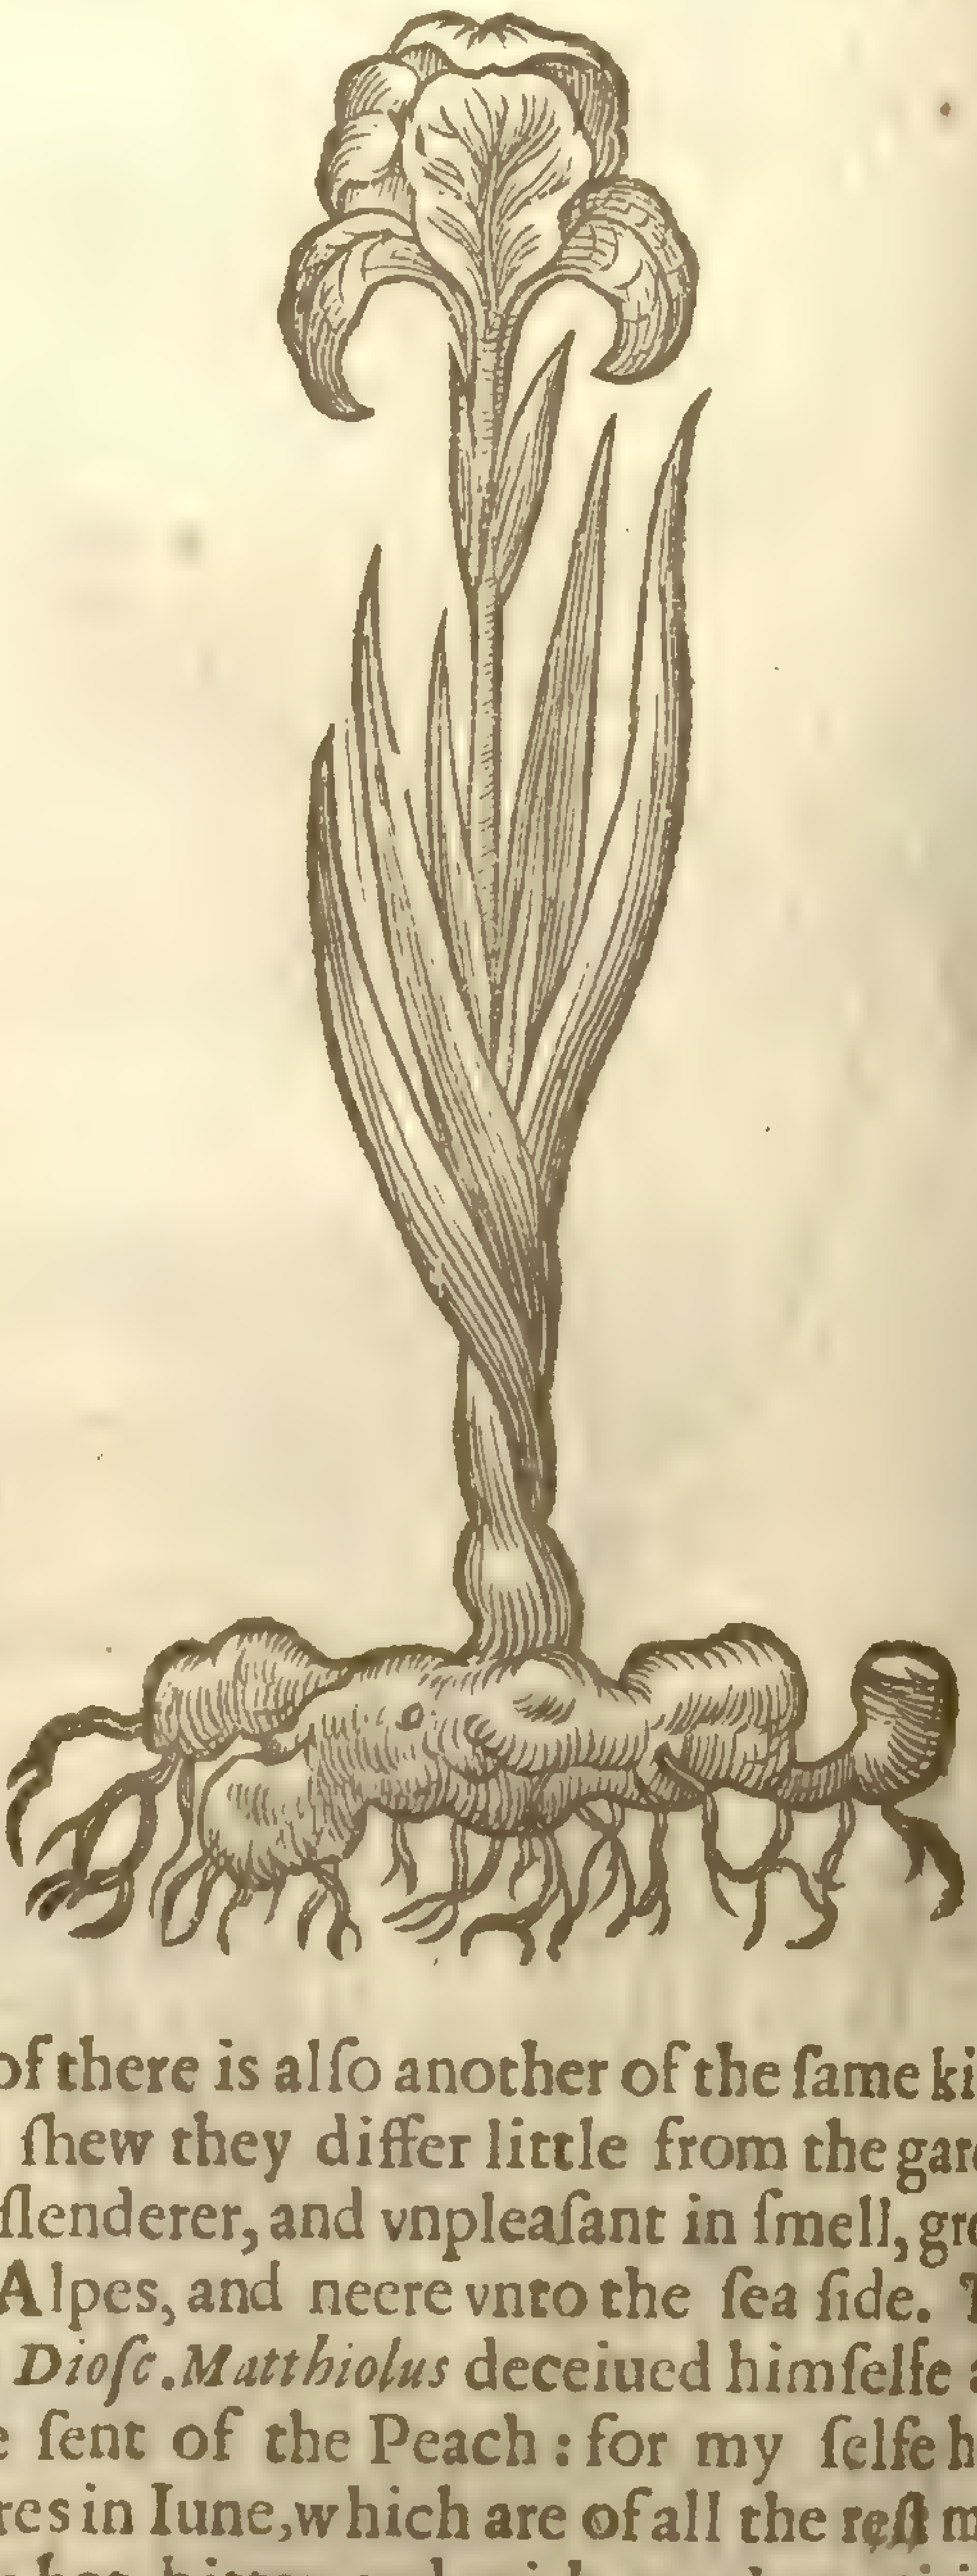
‡ 10 *Chamairis Lutea.*
Yellow Dwarfe *Iris.*



‡ 11 *Chamairis variegata.*
Variegated Dwarfe *Iris.*



3 The French or rather Sea Floure de-luces (whereof there is alſo another of the ſame kinde altogether leſſer) haue their root without any ſauour. In ſhew they differ little from the garden Floure de-luce, but that the leaues of theſe are altogether ſlenderer, and vnpleaſant in ſmell, growing plentifully in the rough crags of the rockes vnder the Alpes, and neere vnto the ſea ſide. The learned Dr. *Aſſatius* a long time ſuppoſed it to be *Medium Dioſc. Matthiolus* deceiued himſelfe and others, in that he ſaid, That the root of this plant hath the ſent of the Peach: for my ſelfe haue proued it to be without ſauour at all. It yeeldeth his floures in Iune, which are of all the reſt moſt like vnto the graſſe Floure de-luce. The taſte of his root is hot, bitter, and with much tenuitie of parts, as hath been found by Phyſicall proofe.

‡ 4 This *Iris Bizantina* hath long narrow leaues like thoſe of the laſt deſcribed; very narrow, ſharpe pointed, hauiug no vngratefull ſmell; the ſtalkes are ſome cubit and an halfe in length, and ſometime more; at the top they are diuided into 2 or 3 branches that haue 2 or 3 floures a piece, like in ſhape to the floures of the broad leafed variegated bulbous *Iris*; they haue alſo a good ſmell: the ends of the hanging-downe leaues are of a darke colour, the other parts of them are variegated with white, purple or violet colour. The three other leaues that ſtand vp are of a deepe violet or purple colour. The root is blackiſh, ſlender, hard, knotty. ‡

5 Narrow leafed Floure de-luce hath an infinite number of graſſie leaues much like vnto Reed, among which riſe vp many ſtalkes: on the ends of the ſame ſpring forth two, ſometimes three right ſweet and pleaſant floures, compact of nine leaues. Thoſe three that hang downeward are greater than the reſt, of a purple colour, ſtripped with white and yellow; but thoſe three ſmall leaues that appeare next, are of a purple colour without mixture: thoſe three that ſtand vpright are of an horſe-fleſh colour, tipped with purple, and vnder each of theſe leaues appeare three ſmall browne aglets like the tongue of a ſmall bird.

6 The ſmall graſſie Floure de-luce differeth from the other in ſmalneſſe and in thinneſſe of leaues, and in that the ſtalkes are lower than the leaues, and the floures in ſhape and colour are like thoſe of the ſtinking Gladdon, but much leſſe.

‡ There are many other varieties of the broad leafed Floure de-luces beſides theſe mentioned by our Authour; as alſo of the narrow leafed, which here wee doe not intend to inſiſt vpon, but referre ſuch as are deſirous to trouble themſelues with theſe nicities, to *Cluſius* and others.

Notwithſtanding I judge it not amiſſe to giue the figures and briefe deſcriptions, of ſome more of the Dwarfe Floure de-luces, as alſo of one of the narrower leaued.

7 This therefore which we giue you in the ſeuenth place is *Iris flore cæruleo obſoleto,&c. Lobelij*. The leaues of this are ſmall and long like thoſe of the wild *Bizantine* Floure de-luce; the root (which is not very big) hath many ſtrong threds or fibres comming out of it: the ſtalke (which is ſomewhat tall) diuides it ſelfe into two or three branches, whereon grow floures in ſhape like thoſe of the other Floure de-luces, but their colour is of an ouerworne blew, or aſh colour.

8 Many are the differences of the *Chamæirides latifoliæ*, or broad leafed Dwarfe Floure de-luces, but their principall diſtinction is in their floures; for ſome haue floures of violet or purple colour, ſome of white, otherſome are variegated with yellow and purple, &c. Therefore I will onely name the colour, and giue you their figures, becauſe their ſhapes differ little. This eighth therfore is *Chamæiris nivea, aut candida*, White Dwarfe *Iris*: The ninth, *Chamæiris latifolia flore rubello*, Red floured Dwarfe *Iris*: The tenth, *Chamæiris lutea*, Yellow Dwarfe *Iris*: The eleuenth, *Chamæiris variegata*, Variegated *Iris*. The leaues and ſtalkes of theſe plants are vſually about a foot high; the floures, for the bigneſſe of the plants, large, and they floure betimes, as in Aprill. And thus much I thinke may ſuffice for the names and deſcriptions of theſe Dwarfe varieties of Floure de-luces.

¶ *The Place.*

Theſe plants doe grow in the gardens of London, amongſt Herbariſts and other Louers of Plants.

¶ *The Time.*

They floure from the end of March to the beginning of May.

¶ *The Names.*

The Turky Floure de-luce is called in the Turkiſh tongue, *Alaiſa Suſiani*, with this additament from the Italians, *Fiore Belle pintate*: in Engliſh, Floure de-luce. The reſt of the names haue beene touched in their titles and hiſtories.

¶ *Their Nature and Vertues.*

The faculties and temperature of theſe rare and beautifull floures are referred to the other ſorts of Floure de-luces, whereunto they do very well accord.

A There is an excellent oyle made of floures and roots of Floure de-luce, of each a like quantitie, called *Oleum Irinum*, made after the ſame manner that oyle of Roſes, Lillies and ſuch like be made: which oyle profiteth much to ſtrengthen the ſinewes and joynts, helpeth the crampe proceeding of repletion, and the diſeaſe called in Greeke *Peripneumonia*.

B The floures of French floure de-luce diſtilled with *Diatrion Santalon*. and Cinnamon, and the water drunke, preuaileth greatly againſt the Dropſie, as *Hollerius* and *Geſner* teſtifie.

Chap. 43. *Of ſtinking Gladdon.*

¶ *The Deſcription.*

Stinking Gladdon hath long narrow leaues like *Iris*, but ſmaller, of a darke greene colour, and being rubbed, of a ſtinking ſmell very lothſome. The ſtalkes are many in number, and round toward the top, out of which doe grow floures like the Floure de-luce, of an ouerworne blew colour, or rather purple, with ſome yellow and red ſtreakes in the midſt. After the floures be vaded there come great huskes or cods, wherein is contained a red berry or ſeed as big as a peaſe. The root is long, and threddy vnderneath.

¶ *The Place.*

Gladdon groweth in many gardens: I haue ſeene it wild in many places, as in woods and ſhadowie places neere the ſea.

¶ *The Time.*

The ſtinking Gladdon floureth in Auguſt, the ſeed thereof is ripe in September.

¶ *The Names.*

Stinking Gladdon is called in Greeke ξυρις, by *Dioſcorides*; and ιρις αγρια by *Theophraſtus*, according to *Pena*: in Latine, *Spatula fœtida* among the Apothecaries: it is called alſo *Xyris*: in Engliſh, ſtinking Gladdon, and Spurgewort.

¶ *The Nature.*

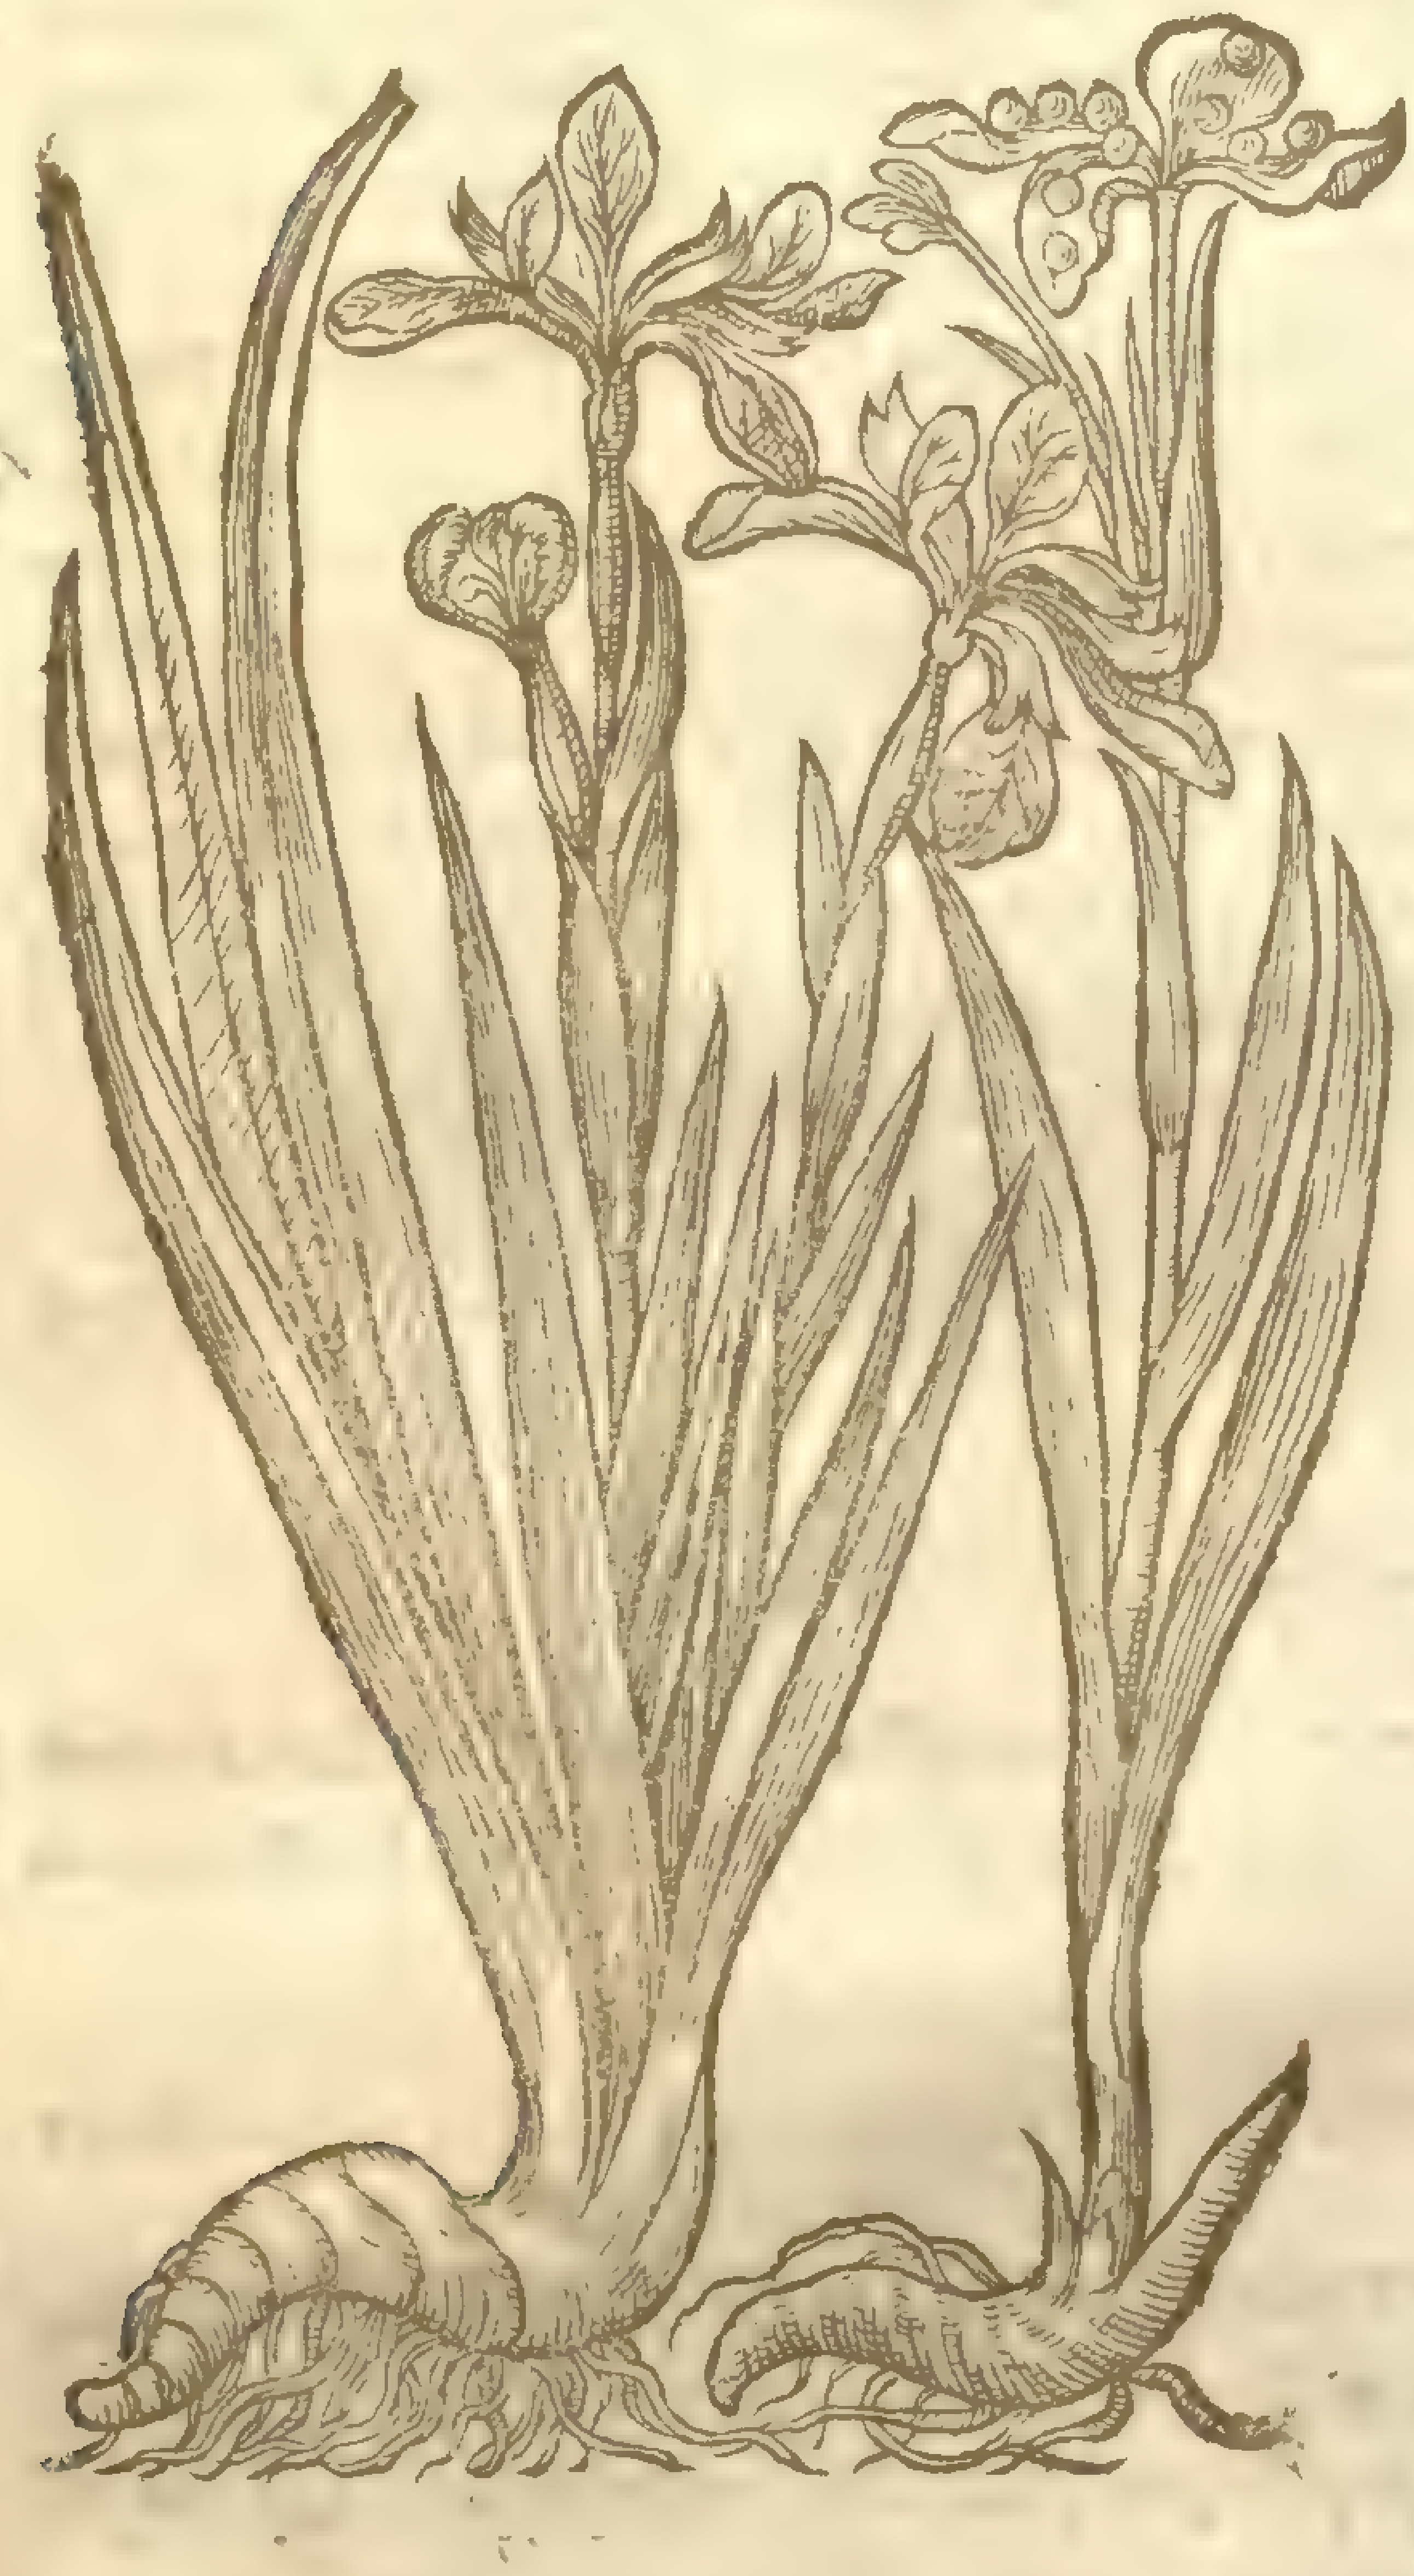
Gladdon is hot and dry in the third degree.

¶ *The Vertues.*

A Such is the facultie of the roots of all the Irides before named, that being pounding they prouoke ſneeſing, and purge the head: generally all the kinds haue a heating and extenuating quality.

They

Xyris.
Stinking Gladdon.



[illegible]

B They are effectuall againſt the cough; they eaſily digeſt and conſume the groſſe humors which are hardly concocted: they purge colour and tough flegme: they procure ſleepe, and helpe the gripings within the belly.

C It helpeth the Kings Euill, and Buboes in the groine, as *Pliny* ſaith. If it be drunke in Wine it prouoketh the termes, and being put in Baths for women to ſit ouer, it prouoketh the like effects moſt exquiſitely. The root put in manner of a peſſarie haſtneth the birth. They couer with fleſh, bones that be bare, being vſed in plaiſters. The roots boiled ſoft, and vſed plaiſterwiſe, ſoften all old hard tumours, and the ſwellings of the throat called *Struma*, that is, the Kings Euill; and emplaiſtered with honey it breaketh out broken bones.

D The meale thereof healeth all the rifts of the fundament, and the infirmities thereof called *Condylomita*; and openeth Hemorrhoides. The juice ſnuffed or drawne vp into the noſe, prouoketh ſneeſing, and draweth down by the noſe great ſtore of filthy excrements, which would fall into other parts by ſecret and hidden waies, and conueiances of the channels.

E It profiteth being vſed in a peſſarie, to prouoke the termes, and will cauſe abortion.

F It preuaileth much againſt all euil affections of the breſt and lungs, being taken in a little ſweet wine, with ſome Spikenard; or in Whay with a little Maſticke.

G The root of *Xyris* or Gladdon is of great force againſt wounds and fractures of the head: for it draweth out all thornes, ſtubs, prickles, and arrow-heads, without griefe; which qualitie it effecteth (as *Galen* ſaith) by reaſon of his tenuitie of parts, and of his attracting, drying, and digeſting facultie, which chiefely conſiſteth in the ſeed or fruit, which mightily prouoketh vrine.

H The root giuen in Wine, called in Phyſicke *Paſſum*, profiteth much againſt Convulſions, Ruptures, the paine of the huckle bones, the ſtrangurie, and flux of the bellie. Where note, That whereas it is ſaid that the potion aboue named ſtayeth the flux of the belly, hauing a purging qualitie; it muſt be vnderſtood that it worketh in that manner as *Rhabarbarum* and *Aſarum* do, in that they concoct and take away the cauſe of the laske; otherwiſe no doubt it moueth vnto the ſtoole, as *Rheubarb*, *Aſarum*, and the other Irides do. Hereof the country people of Somerſet-ſhire haue good experience, who vſe to drinke the decoction of this Root. Others doe take the infuſion thereof in ale or ſuch like, wherewith they purge themſelues, and that vnto very good purpoſe and effect.

I The ſeed thereof mightily purgeth by vrine, as *Galen* ſaith, and the country people haue found it true.

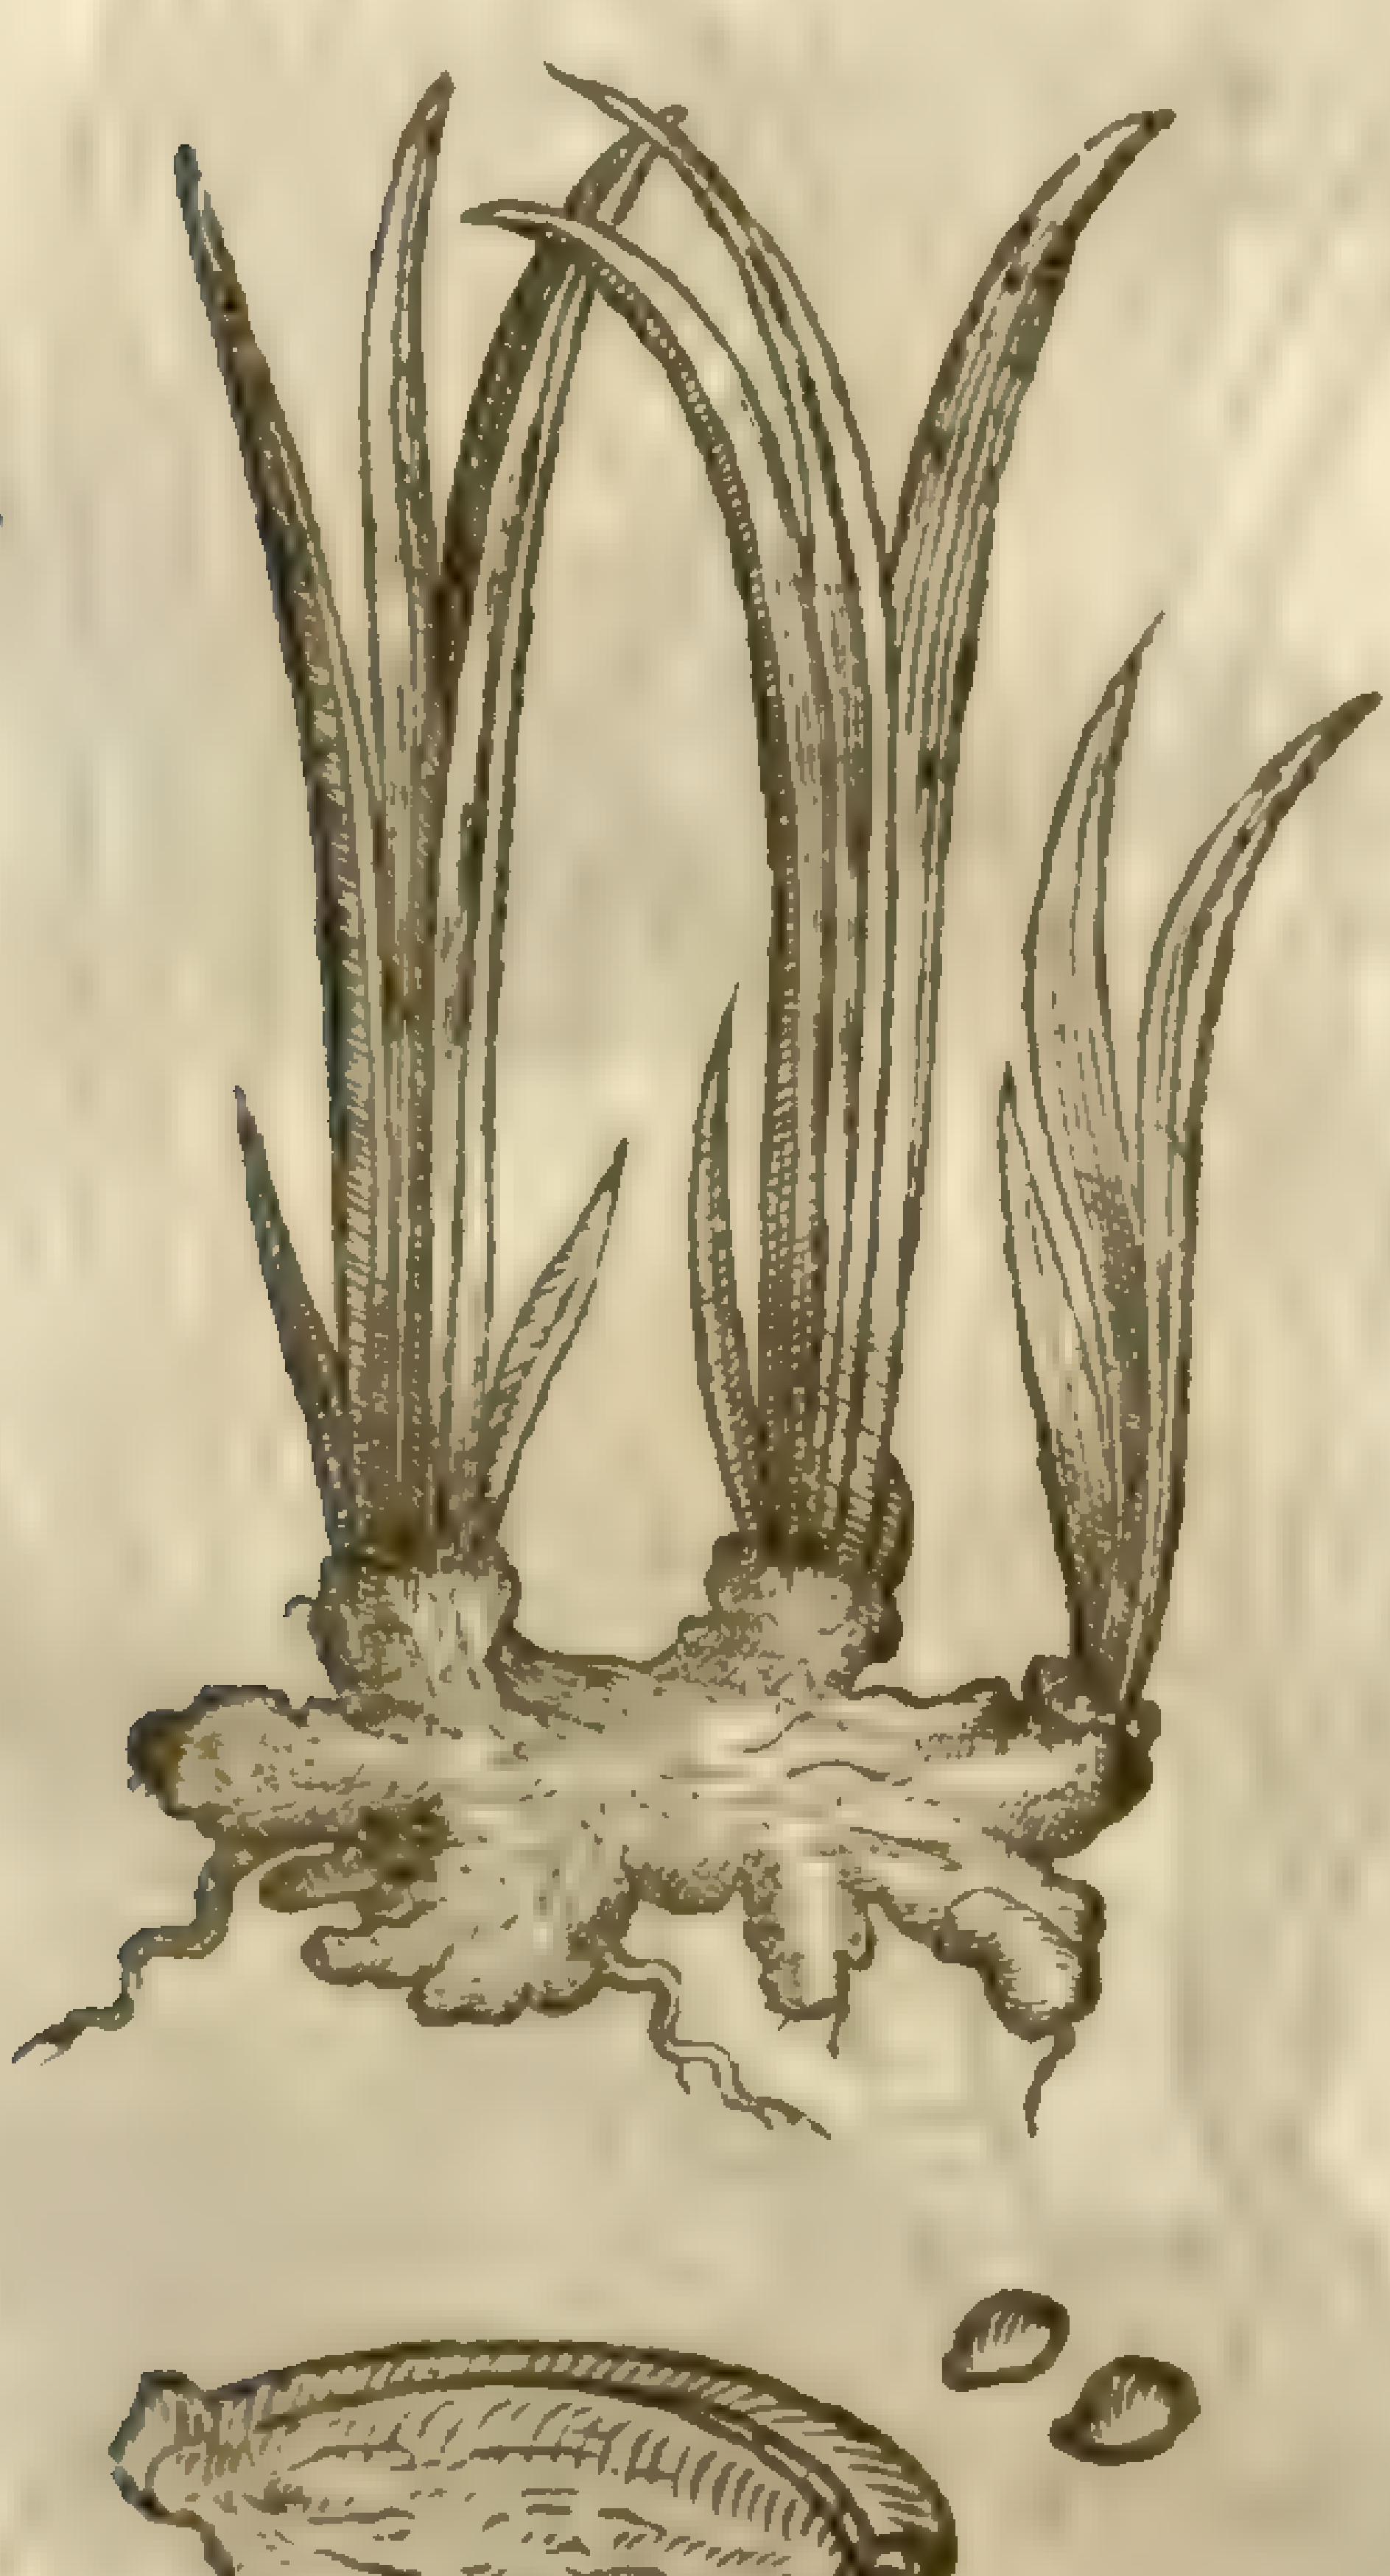
Chap. 44. *Of Ginger.*

¶ *The Deſcription.*

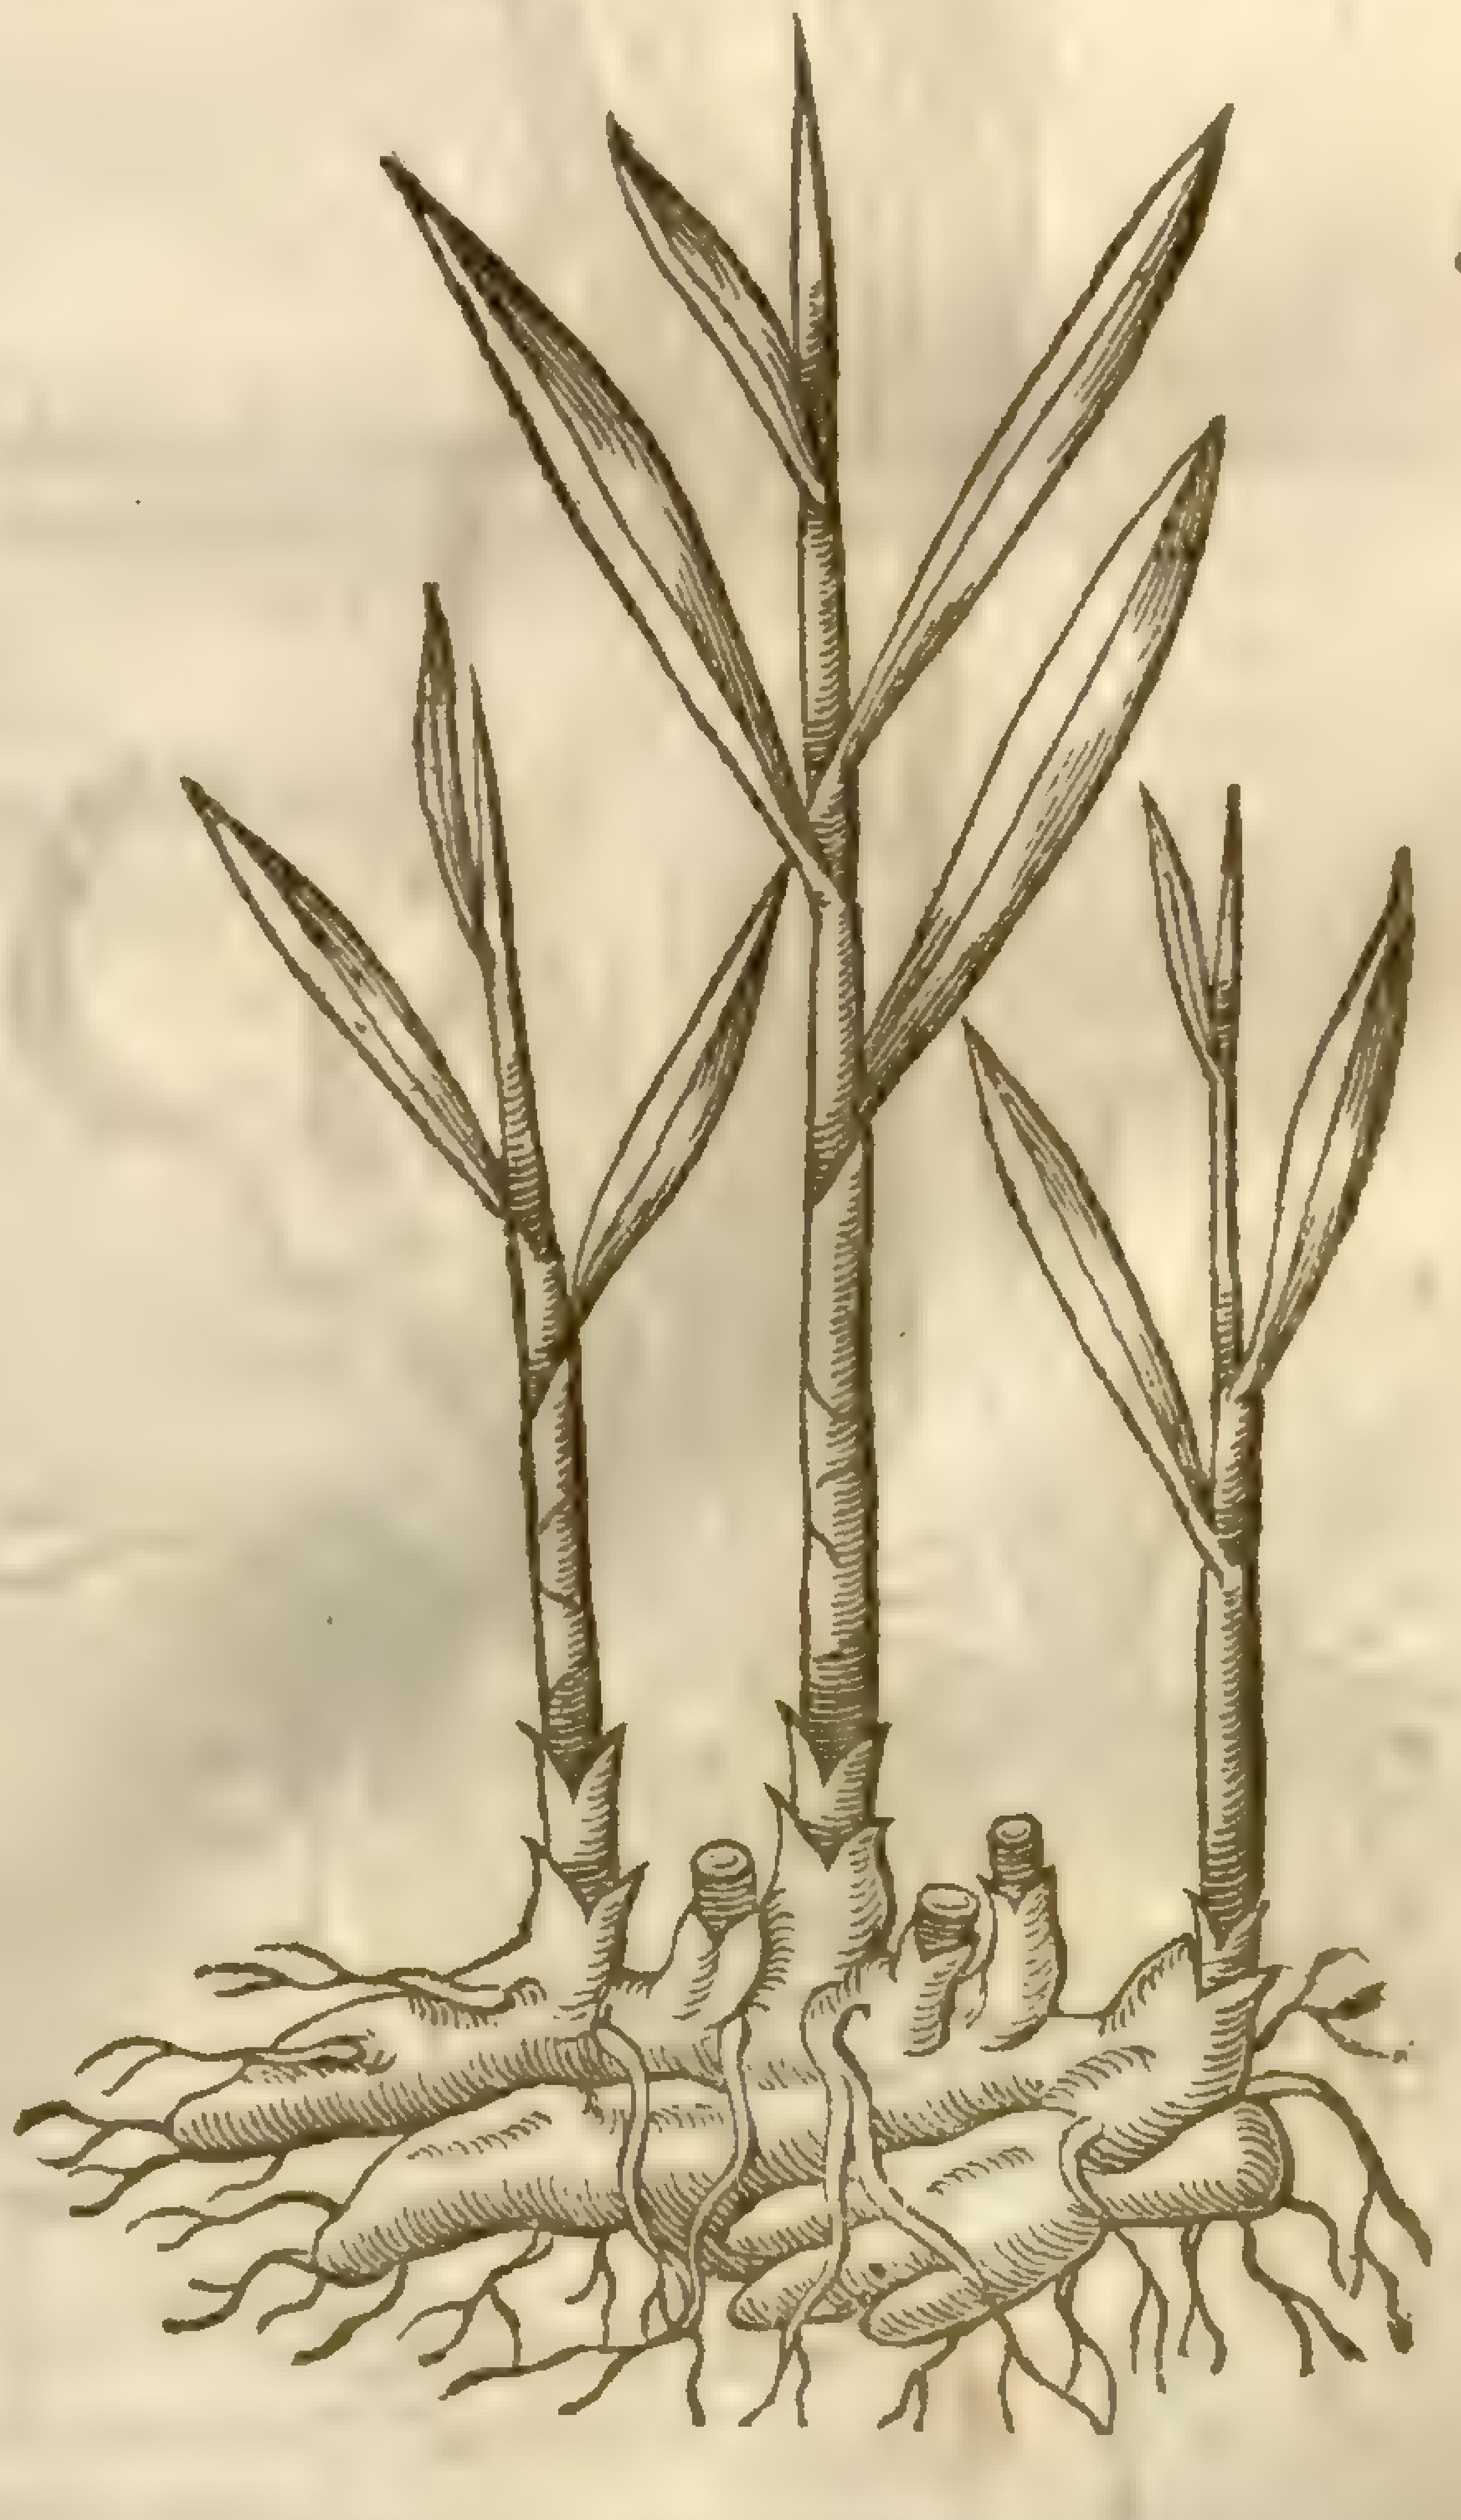
Ginger is moſt impatient of the coldneſſe of theſe our Northerne regions, as my ſelfe haue found by proofe, for that there haue beene brought vnto me at ſeuerall times ſundry plants thereof, freſh, greene, and full of juice, as well from the Weſt Indies, as from Barbary and other places; which haue ſprouted and budded forth greene leaues in my garden in the heate of Summer, but as ſoone as it hath beene but touched with the firſt ſharpe blaſt of Winter, it hath preſently periſhed both blade and root. The true forme or picture hath not before this time been ſet forth by any that hath written; but the world hath beene deceiued by a counterfeit figure, which the reuerend and learned Herbariſt *Matthias Lobel* did ſet forth in his Obſeruations. The forme whereof notwithſtanding I haue here expreſſed, with the true and vndoubted picture alſo, which I receiued from *Lobels* owne hands at the impreſſion hereof. The cauſe of whoſe former error, as alſo the meanes whereby he got the knowledge of the true Ginger, may appeare by his own words ſent vnto me in Latine, which I haue here thus Engliſhed :

How hard and vncertaine it is to deſcribe in words the true proportion of Plants (hauing none other guide than skilfull, but yet deceitfull formes of them, ſent from friends or other means) they beſt do know who haue deeplieſt waded in this ſea of Simples. About thirty yeares paſt or more, an honeſt and expert Apothecarie *William Dries*, to ſatisfie my deſire, ſent me from Antwerpe to London the picture of Ginger, which he held to be truly and liuely drawne. I my ſelfe gaue him credit eaſily, becauſe I was not ignorant, that there had beene often Ginger roots brought greene, new, and full of juice, from the Indies to Antwerp: and further, that the ſame had budded & grown in the ſaid *Dries* garden. But not many yeares after I perceiued, that the picture which was ſent me by my friend was a counterfeit, and before that time had been drawne and ſet forth by an old Dutch Herbariſt. Therefore not ſuffering this error any further to ſpread abroad (which I diſcouered not many yeares paſt at Fluſhing in Zeeland, in the garden of *William* of Naſſau Prince of Orange, of famous memorie, through the means of a worthy perſon (if my memorie faile mee not) *Vander Mill*; at what time he opened and looſed his firſt yong buds and ſhoots about the end of Sommer, reſembling in leaues, and ſtalks of a foot high, the young and tender ſhoots of the common Reed called *Harundo vallatoria)* I thought it conuenient to impart thus much vnto Mr. *Iohn Gerrard* an expert Herbariſt, and maſter of happy ſucceſſe in Surgerie, to the end he might let poſteritie know thus much, in the painfull and long laboured trauels which now he hath in hand, to the great good and benefit of his countrey. The plant it ſelfe brought me to Middleborow and ſet in my garden, periſhed through the hardneſſe of Winter.

Thus much haue I ſet downe, truly tranſlated out of his owne words in Latine; though too fauourably by him done to the commendation of my mean skill.



Zinziberis ficta icon.
The feigned figure of Ginger.



Zinziberis verior icon.
The true figure of Ginger.

¶ *The Place.*

Ginger groweth in Spaine, Barbary, in the Canarie Iſlands, and the Azores. Our men who ſacked Domingo in the Indies, digged it vp there in ſundry places wilde.

¶ *The Time.*

Ginger flouriſheth in the hot time of Sommer, and loſeth his leaues in Winter.

¶ *The Names.*

Ginger is called in Latine *Zinziber*, and *Gingiber*: in Greeke, ζιγγίβερις and γιγγίβερι: in French, *Gigembre*.

¶ *The Nature.*

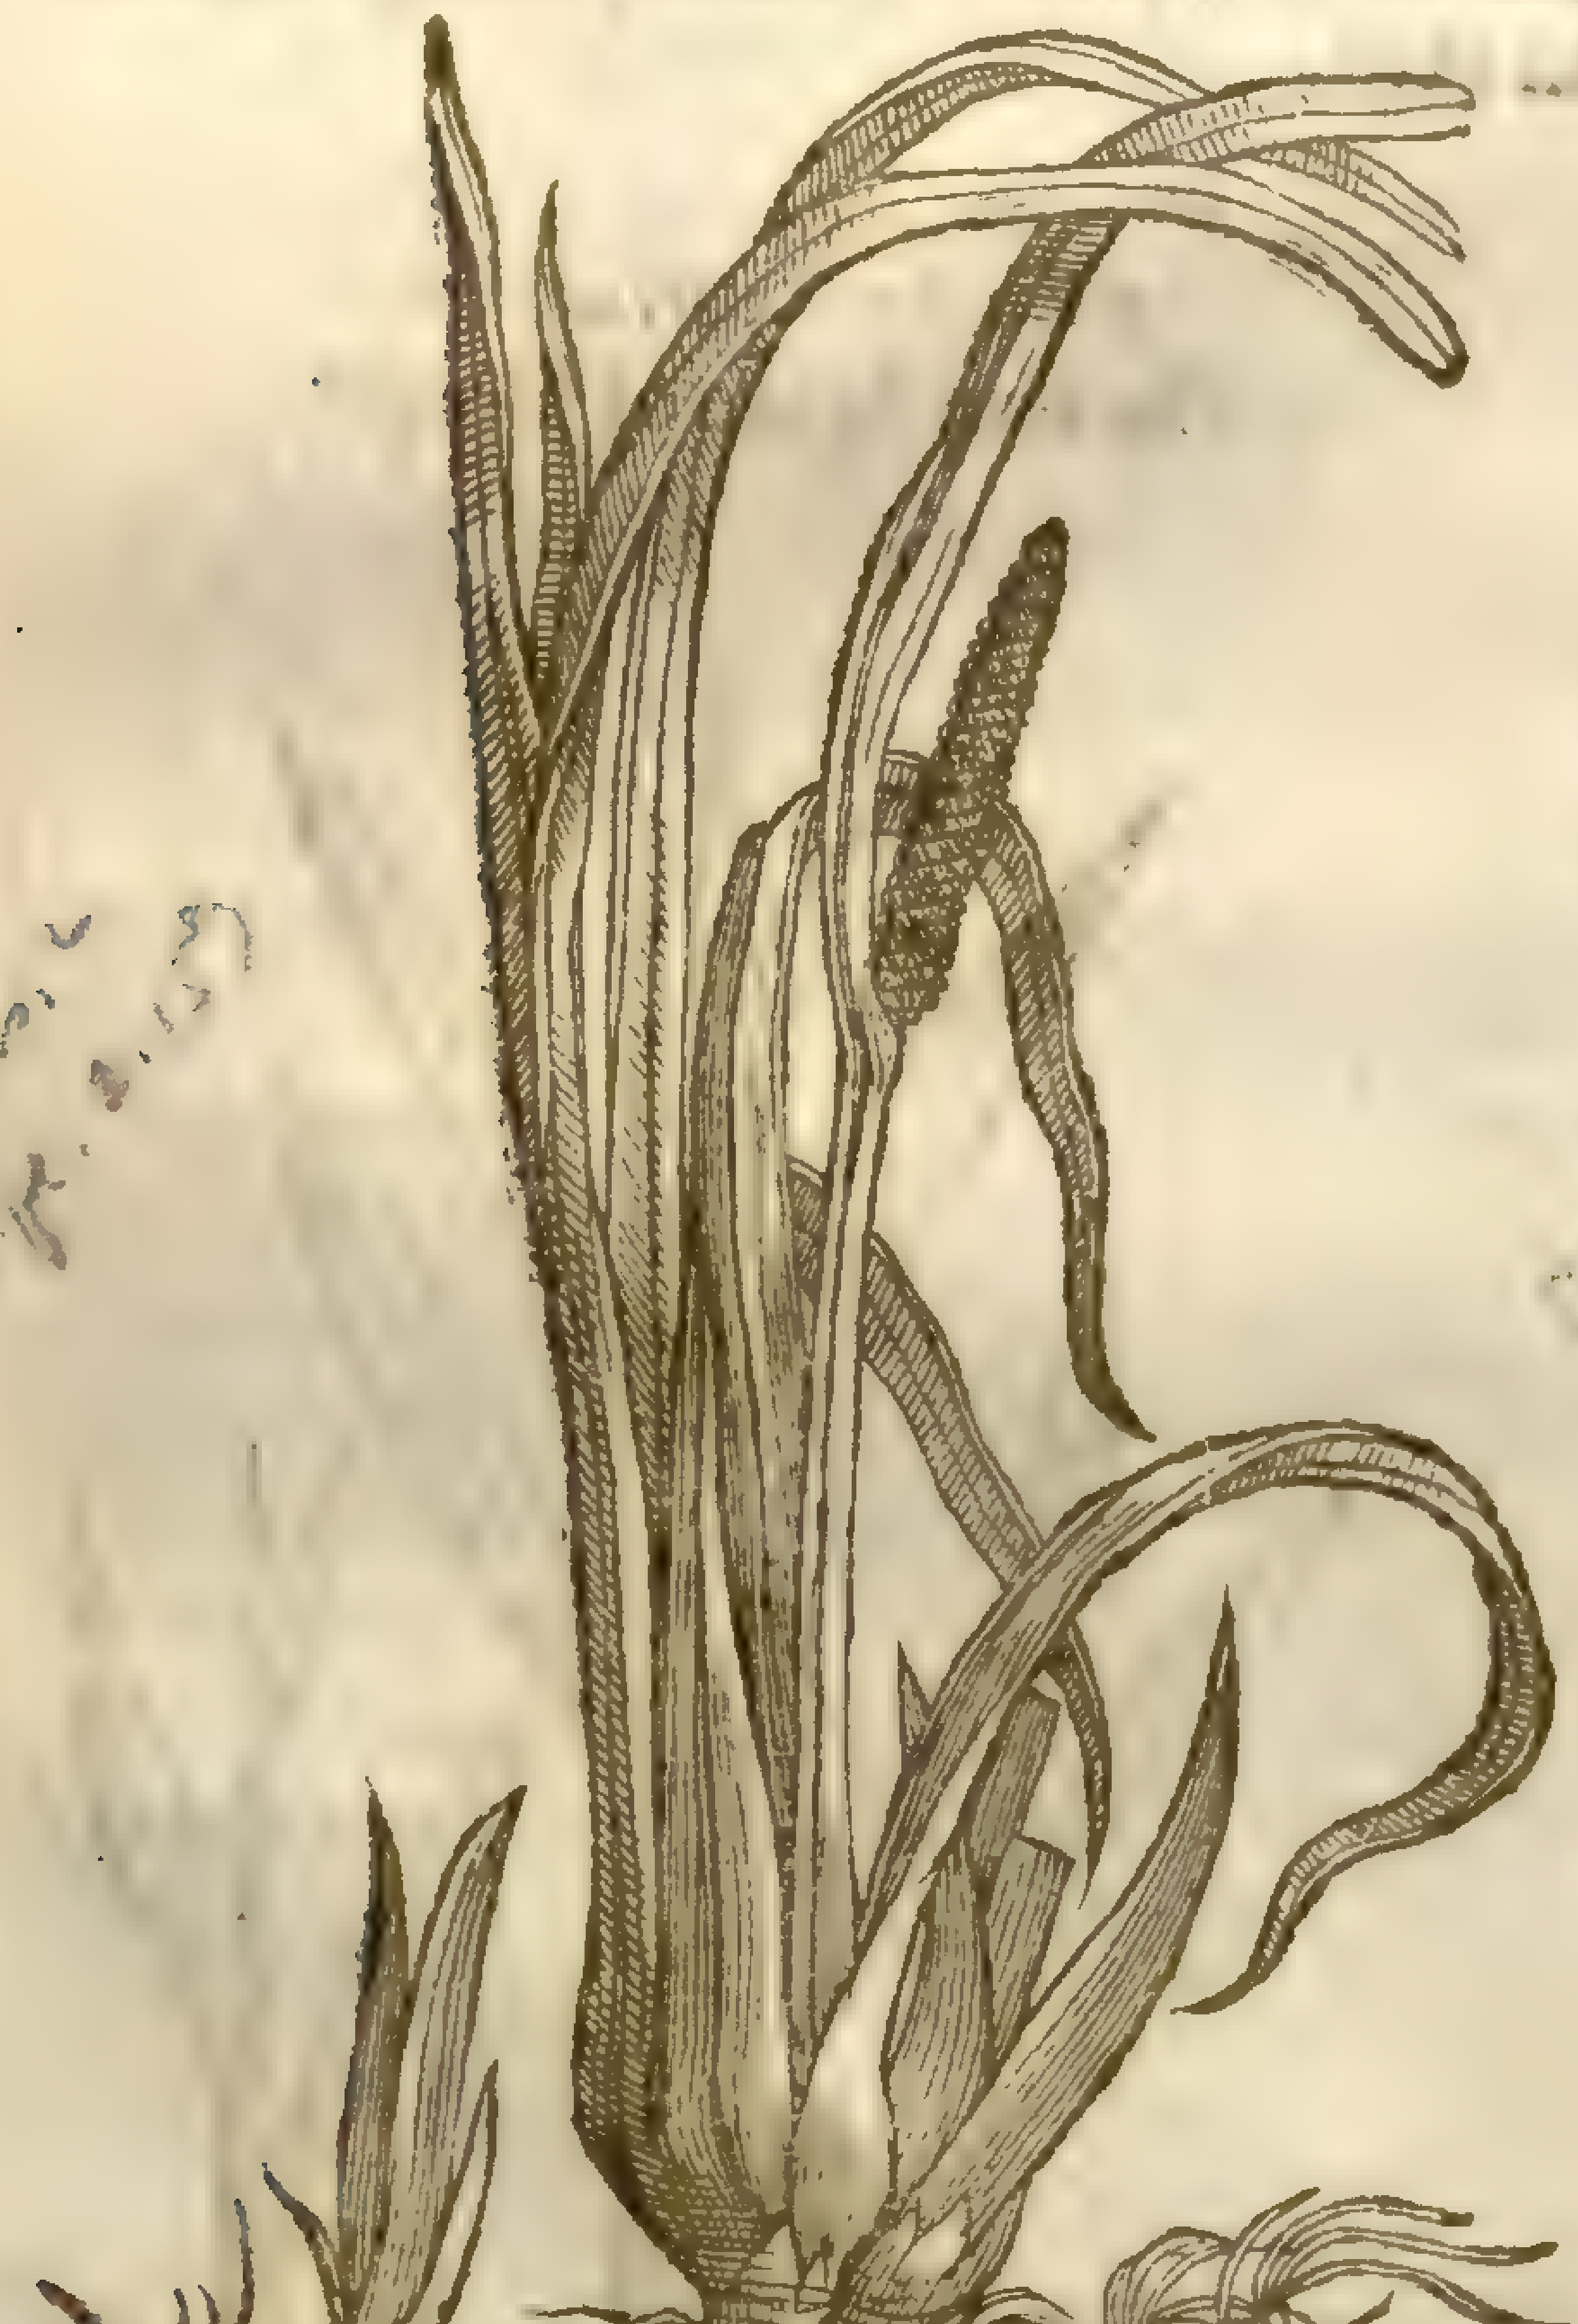
Ginger heateth and drieth in the third degree.

¶ *The Vertues.*

A Ginger, as *Dioſcorides* reporteth, is right good with meat in ſauces, or otherwiſe in conditures; for it is of an heating and digeſting qualitie, gently looſeth the belly, and is profitable for the ſtomacke, and effectually oppoſeth it ſelfe againſt all darkneſſe of the ſight; anſwering the qualities and effects of Pepper. It is to be conſidered, That canded, greene, or condited Ginger is hot and moiſt in qualitie, prouoking Venerie: and being dried, it heateth and drieth in the third degree.

Chap. 45. *Of Aromaticall Reeds.*

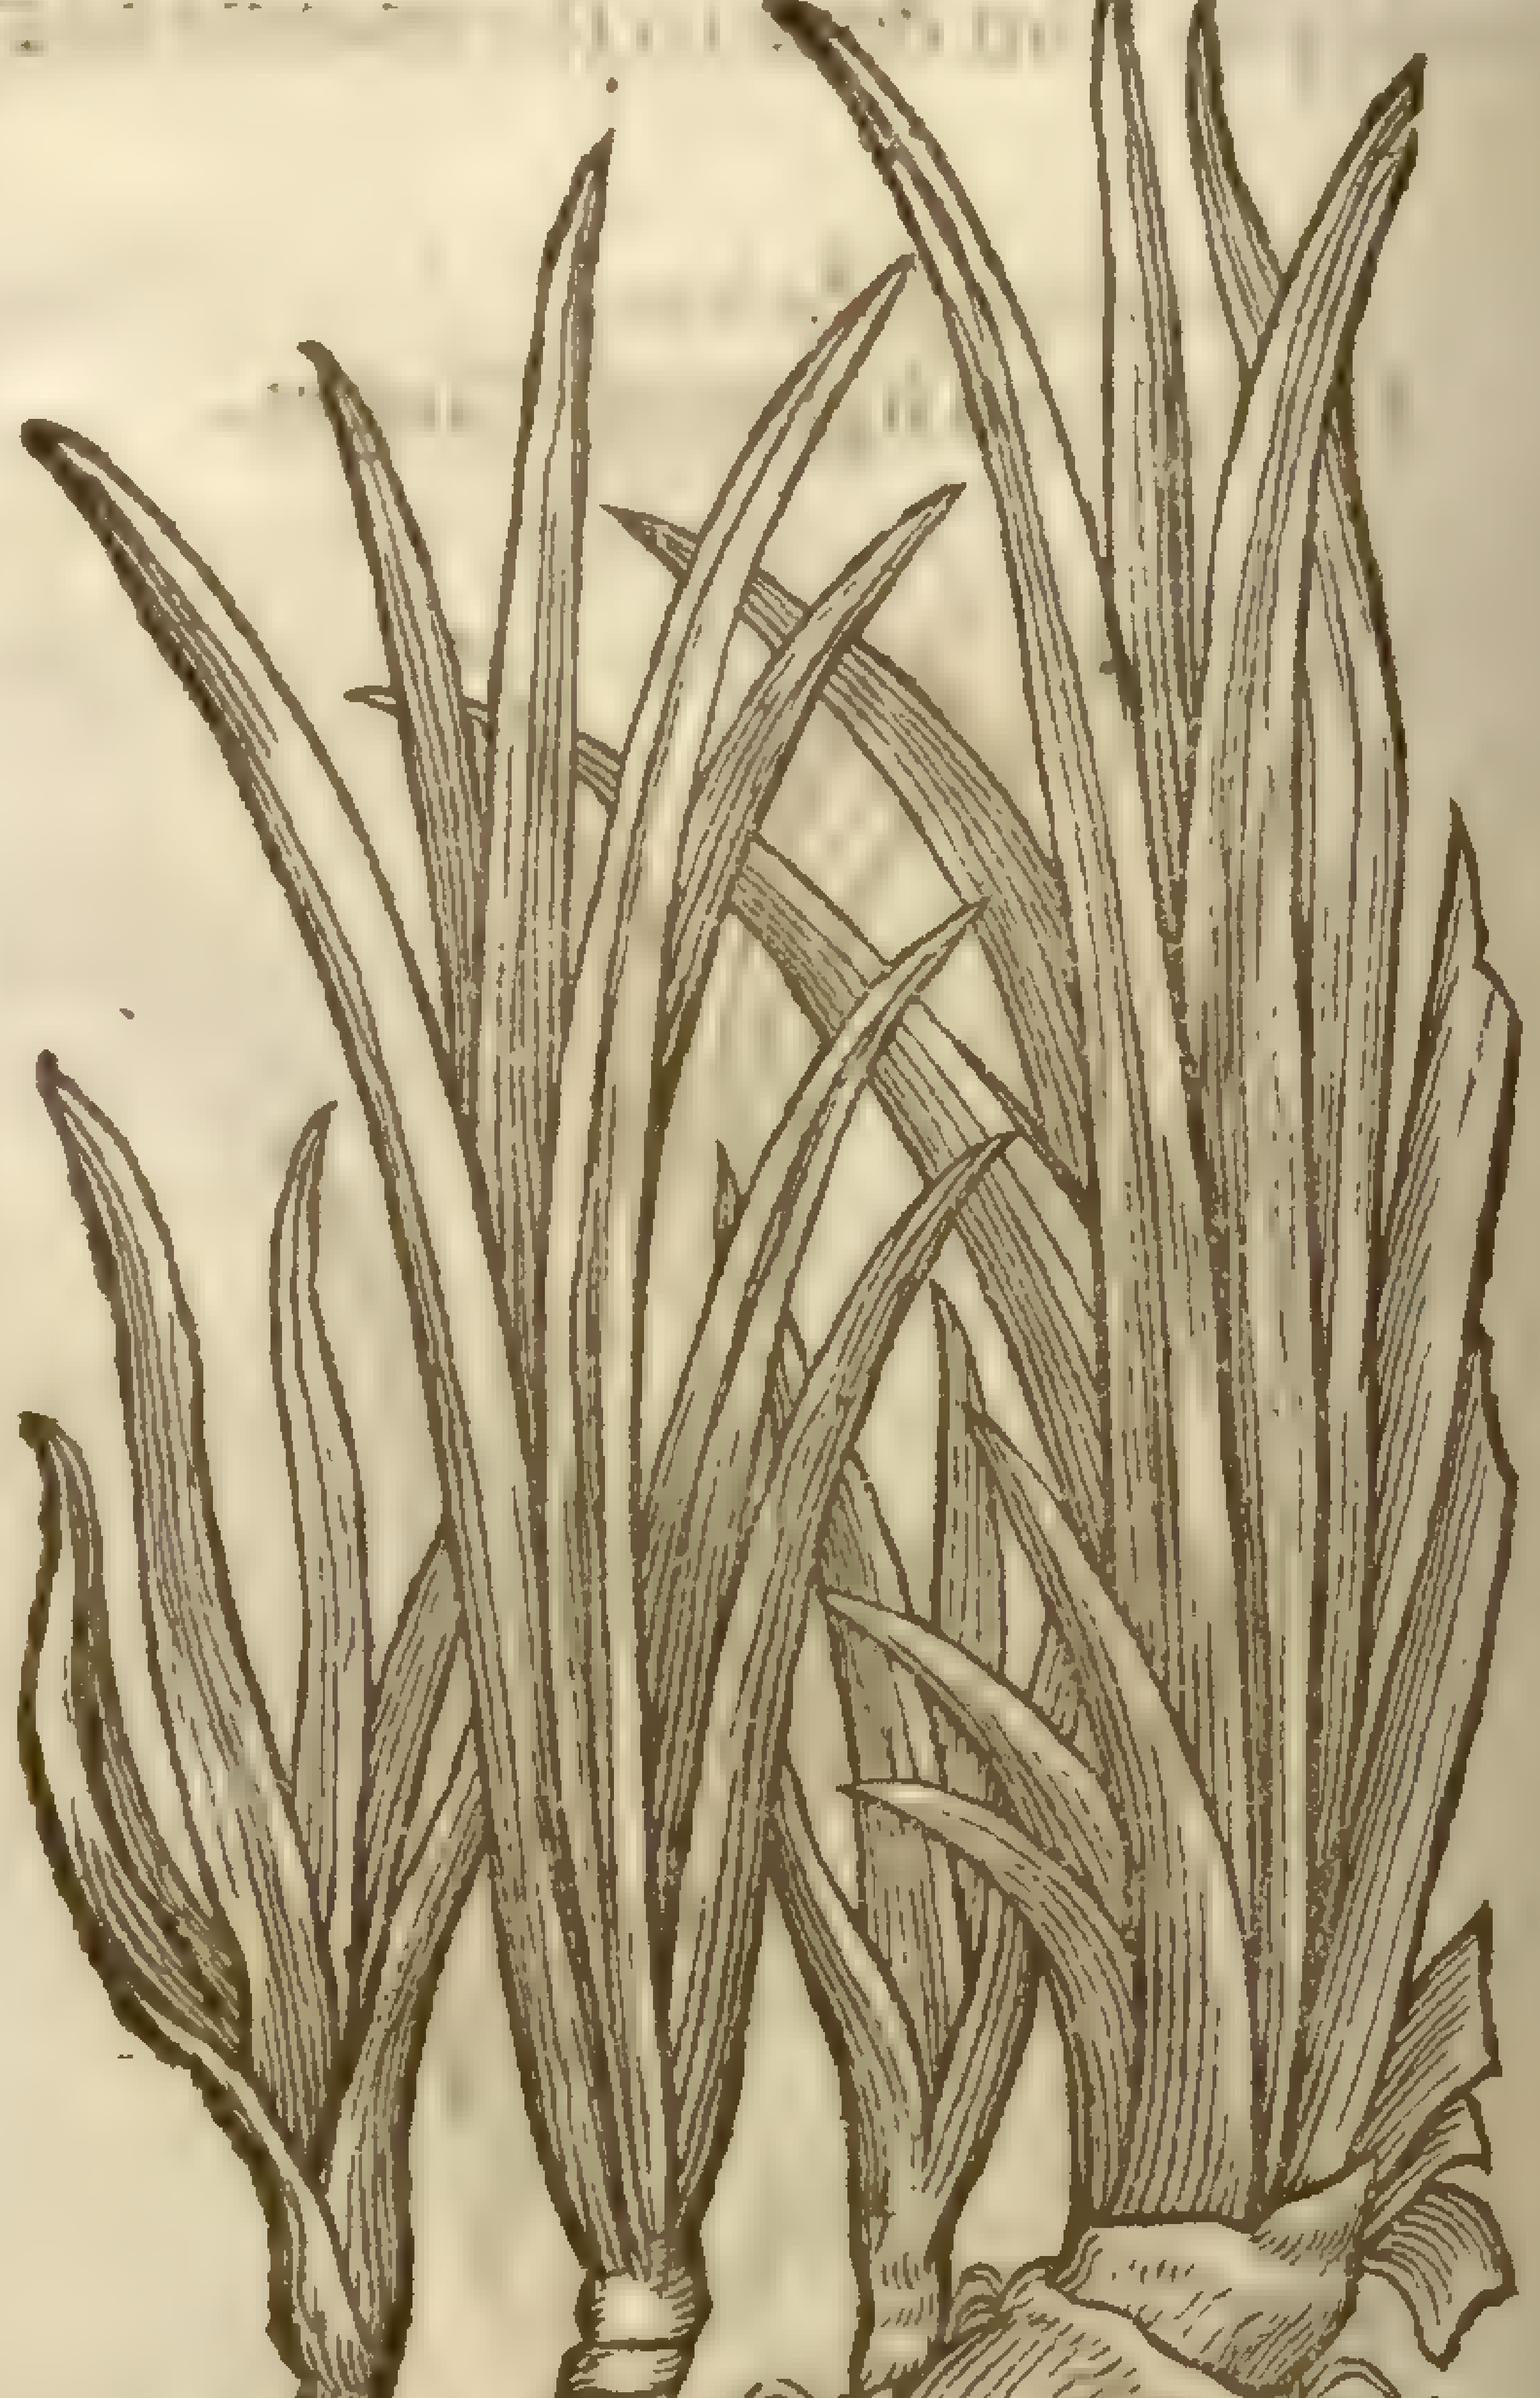
1 *Acorus verus, officinis falſo Calamus, cum julo.*
The true *Acorus* with his floure.



A. Calamus [illegible]

[illegible] Calamus [illegible]

Acorus verus ſine julo.
The true *Acorus* without his floure.



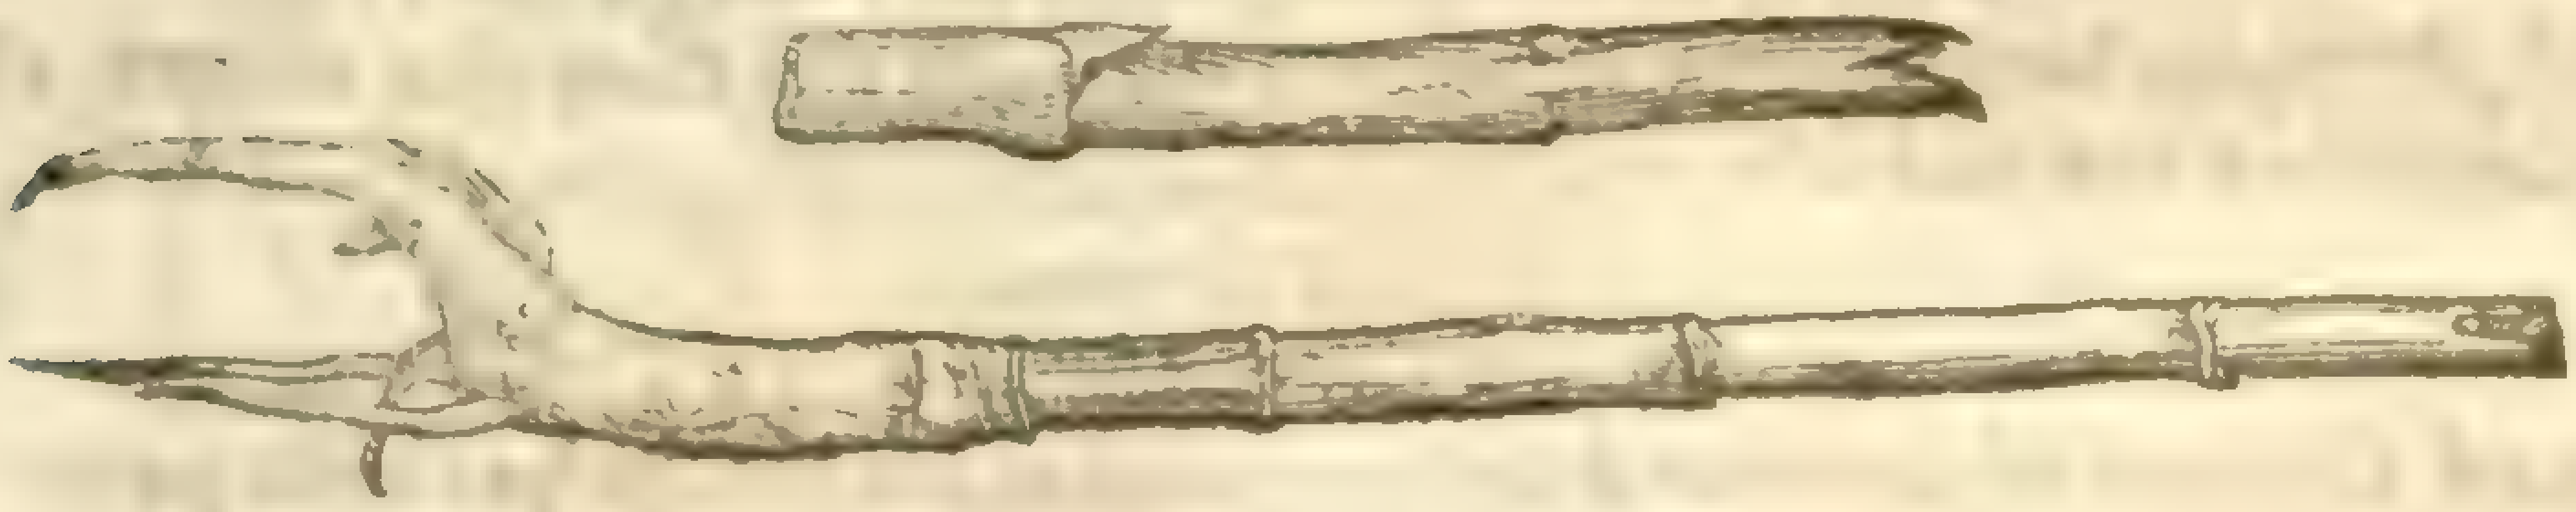
¶ *The Deſcription.*

1 This ſweet ſmelling Reed is of a darke dun colour, full of joints and knees, eaſie to be broken into ſmall ſplinters, hollow, and full of a certaine pith cobweb-wiſe, ſomwhat gummy in eating, and hanging in the teeth, and of a ſharpe bitter taſte. It is of the thickeneſſe of a little finger, as *Lobel* affirmeth of ſome which he had ſeene in Venice.

2 Baſtard Calamus hath flaggy leaues like vnto the water Floure de-luce or Flagge, but narrower, three foot long; of a freſh greene colour, and aromaticke ſmell, which they keepe a long time, although they be dried. Now the ſtalke which beares the floure or fruit is much like ano-

ther leafe,but only from the fruit downwards,whereas it is ſomwhat thicker,and not ſo broad, but almoſt triangular. The floure is a long thing reſembling the Cats-tailes which grow on Haſels. It is about the thickneſſe of an ordinary Reed,ſome inch and halfe long,of a greeniſh yellow colour, curiouſly checquered as if it were wrought with a needle with green and yellow ſilk intermixt. † I haue not as yet ſeene it beare his tuft in my garden, hauing read that it is barren, and by proofe haue ſeen it ſo: yet for all that I beleeue *Cluſius*, who ſaith he hath ſeene it beare his floure in that place where it doth grow naturally, although in England it is altogether barren. The root is ſweet in ſmell,bitter in taſte,and like vnto the common Flag,but ſmaller,and not ſo red.

3 *Calamus Aromaticus Antiquorum.*
The true Aromaticall Reed of the Antients.



‡ 3 I think it very fitting in this place to acquaint you with a Plant,which by the conjecture of the moſt learned,and that not without good reaſon, is iudged to be the true *Calamus* of the Antients. *Cluſius* giues vs the hiſtorie thereof in his notes vpon *Garcias ab Horto,lib.* 1. *ca.* 32. in theſe words: Whenas (ſaith he) this hiſtorie was to be the third time printed,I very opportunely came to the knowledge of the true *Calamus Aromaticus*; the which the learned *Bernard Paludanus* the Friſian, returning from Syria and Egypt, freely beſtowed vpon me,together with the fruit Habhel, and many other rare ſeeds,about the beginning of the yeare 1579. Now we haue cauſed a figure to be exactly drawne by the fragments thereof,for that it ſeemes ſo exquiſitly to accord with *Dioſcorides* his deſcription. In mine opinion it is rather to be iudged an vmbelliferous plant than a reedie; for it hath a ſtraight ſtalke parted with many knots or ioynts,otherwiſe ſmooth,hollow within,and inueſted on the in-ſide with a ſlender filme like as a Reed, and it breaketh into ſhiuers or ſplinters,as *Dioſcorides* hath written. It hath a ſmell ſufficiently ſtrong, and the taſte not vngratefull,but bitter,and pertaking of ſome aſtriction: the leaues,as by remains of them might appeare, ſeeme by couples at euery ioynt to ingirt the ſtalke: the root at the top is ſomewhat tuberous,and then ends in fibres. Twenty fiue yeares after *Paludanus* gaue me this *Calamus*, the learned *Anthonie Coline* the Apothecarie (who lately tranſlated into French theſe Commentaries, the fourth time ſet forth, *Anno* 1593.) ſent me from Lyons pieces of the like Reed; certifying me withall, That he had made vſe thereof in his compoſition of Treacle. Now theſe pieces, though they in forme reſembled thoſe I had from *Paludanus*,yet had they a more bitter taſte than his,neither did they pertake of any aſtriction; which peraduenture was to be attributed to the age of one of the two. Thus much *Cluſius*.

¶ *The Place.*

The true *Calamus Aromaticus* groweth in Arabia,and likewiſe in Syria,eſpecially in the mooriſh grounds betwixt the foot of Libanus † and another little hill, not the mountaine Antilibanus, as ſome haue thought, in a ſmall vally neere to a lake whoſe plaſhes are dry in Summer. *Plin.* 12.22.

Baſtard or falſe *Calamus* growes naturally at the foot of a hill neere Pruſa a city of Bithynia,not far from a great lake. It proſpers exceeding well in my garden,but as yet it beareth neither floure nor ſtalke. It groweth alſo in Candy as *Pliny* reporteth; in Galatia likewiſe, and in many other places.

¶ *The Time.*

They loſe their leaues in the beginning of Winter,and do recouer them again in the Spring of the yeare. ‡ In May this yeare 1632, I receiued from the worſhipfull gentleman M^r *Tho. Glynn* of Glynnlhivon in Carnaruanſhire,my very good friend,the pretty *Iulus*,or floure of this plant,which I could neuer ſee here about London,though it groweth with vs in many gardens,and that in great plenty. ‡

¶ *The Names.*

‡ The want of the true *Calamus* being ſupplied by *Acorus* as a *ſuccedaneum*, was the cauſe (as *Pena* and *Lobel* probably conjecture) that of a ſubſtitute it tooke the prime place vpon it; and being as it were made a Vice-Roy, would needs be a King. But the falſeneſſe of the title was diſco-

uered by *Matthiolus* and others,and ſo it is ſent backe to its due place again; though notwithſtanding it yet in ſhops retaines the title of *Calamus*.

1 The figure that by our Author was giuen for this,is ſuppoſed (and that as I thinke truly) to be but a counterfeit of *Matthiolus* his inuention; who therein hath bin followed (according to the cuſtome of the world) by diuers others. The deſcription is of a ſmall Reed called *Calamus odoratus Libani*, by *Lobel* in his Obſeruations, and figured in his *Icones, p.54*.

2 This is called Ἄκορος and Ἄκορον by the Greeks: by ſome,according to *Apulcius*, Ἀφροδισίας: and in Latine it is called *Acorus* and *Acorum*; and in ſhops, as I haue formerly ſaid, *Calamus Aromaticus*: for they vſually take *Galanga maior* (deſcribed by me *Cap.26.*) for *Acorus*. It may beſides the former names be fitly called in Engliſh, the ſweet Garden Flag.

3 This is iudged to be the Κάλαμος ἀρωματικὸς of *Dioſcorides*, the Κάλαμος εὐώδης of *Theophraſtus*, that is, the true *Calamus Aromaticus* that ſhould be vſed in Compoſitions. ‡

¶ *The Nature of the true Acorus or our ſweet garden Flag.*

Dioſcorides ſaith,the roots haue an heating facultie. *Galen* and *Pliny* doe affirme, that they haue thin and ſubtill parts both hot and dry.

¶ *The Vertues of the ſame.*

A The decoction of the root of *Calamus* drunke prouoketh vrine, helpeth the paine in the ſide, liuer,ſpleen,and breſt; conuulſions,gripings,and burſtings: it eaſeth and helpeth piſſing by drops.

B It is in great effect being put in broth,or taken in fumes through a cloſe ſtoole, to prouoke womens naturall accidents.

C The juice ſtrained with a little hony taketh away the dimneſſe of the eyes, and helpeth much againſt poiſon, the hardneſſe of the ſpleen, and all infirmities of the bloud.

D The root boiled in wine,ſtamped and applied plaiſterwiſe vnto the cods, wonderfully abateth the ſwelling of the ſame,and helpeth all hardneſſe and collections of humors.

E The quantitie of two ſcruples and a halfe of the root drunke in foure ounces of Muskadel, helpeth them that be bruiſed with grieuous beating or falls.

F The root is with good ſucceſſe mixed in counterpoyſons. In our age it is put into Eclegma's, that is,medicines for the lungs, and eſpecially when the lungs or cheſt are oppreſt with raw and cold humors.

G ‡ The root of this preſerued is very pleaſant to the taſte, and comfortable to the ſtomacke and heart; ſo that the Turks at Conſtantinople take it faſting in the morning againſt the contagion of the corrupt aire: and the Tartars haue it in ſuch eſteeme,that they will not drinke water (which is their vſuall drinke) vnleſſe they haue firſt ſteeped ſome of this root therein.

¶ *The Choice.*

The beſt *Acorus*,as *Dioſcorides* ſaith,is that which is ſubſtantiall and well compact,white within,not rotten,full,and well ſmelling.

Pliny writeth,That thoſe which grow in Candia are better than thoſe of Pontus, and yet thoſe of Candia worſe than thoſe of the Eaſterne countries,or thoſe of England,although we haue no great quantitie thereof.

¶ *The Faculties of the true Calamus out of Dioſcorides.*

H ‡ It being taken in drink moueth vrine; wherefore boiled with the roots of graſſe or Smallage ſeeds,it helpeth ſuch as be hydropick,nephritick,troubled with the ſtrangury,or bruiſed.

I It moues the Courſes either drunke or otherwiſe applied. Alſo the fume thereof taken by the mouth in a pipe,either alone or with dried turpentine, helps coughs.

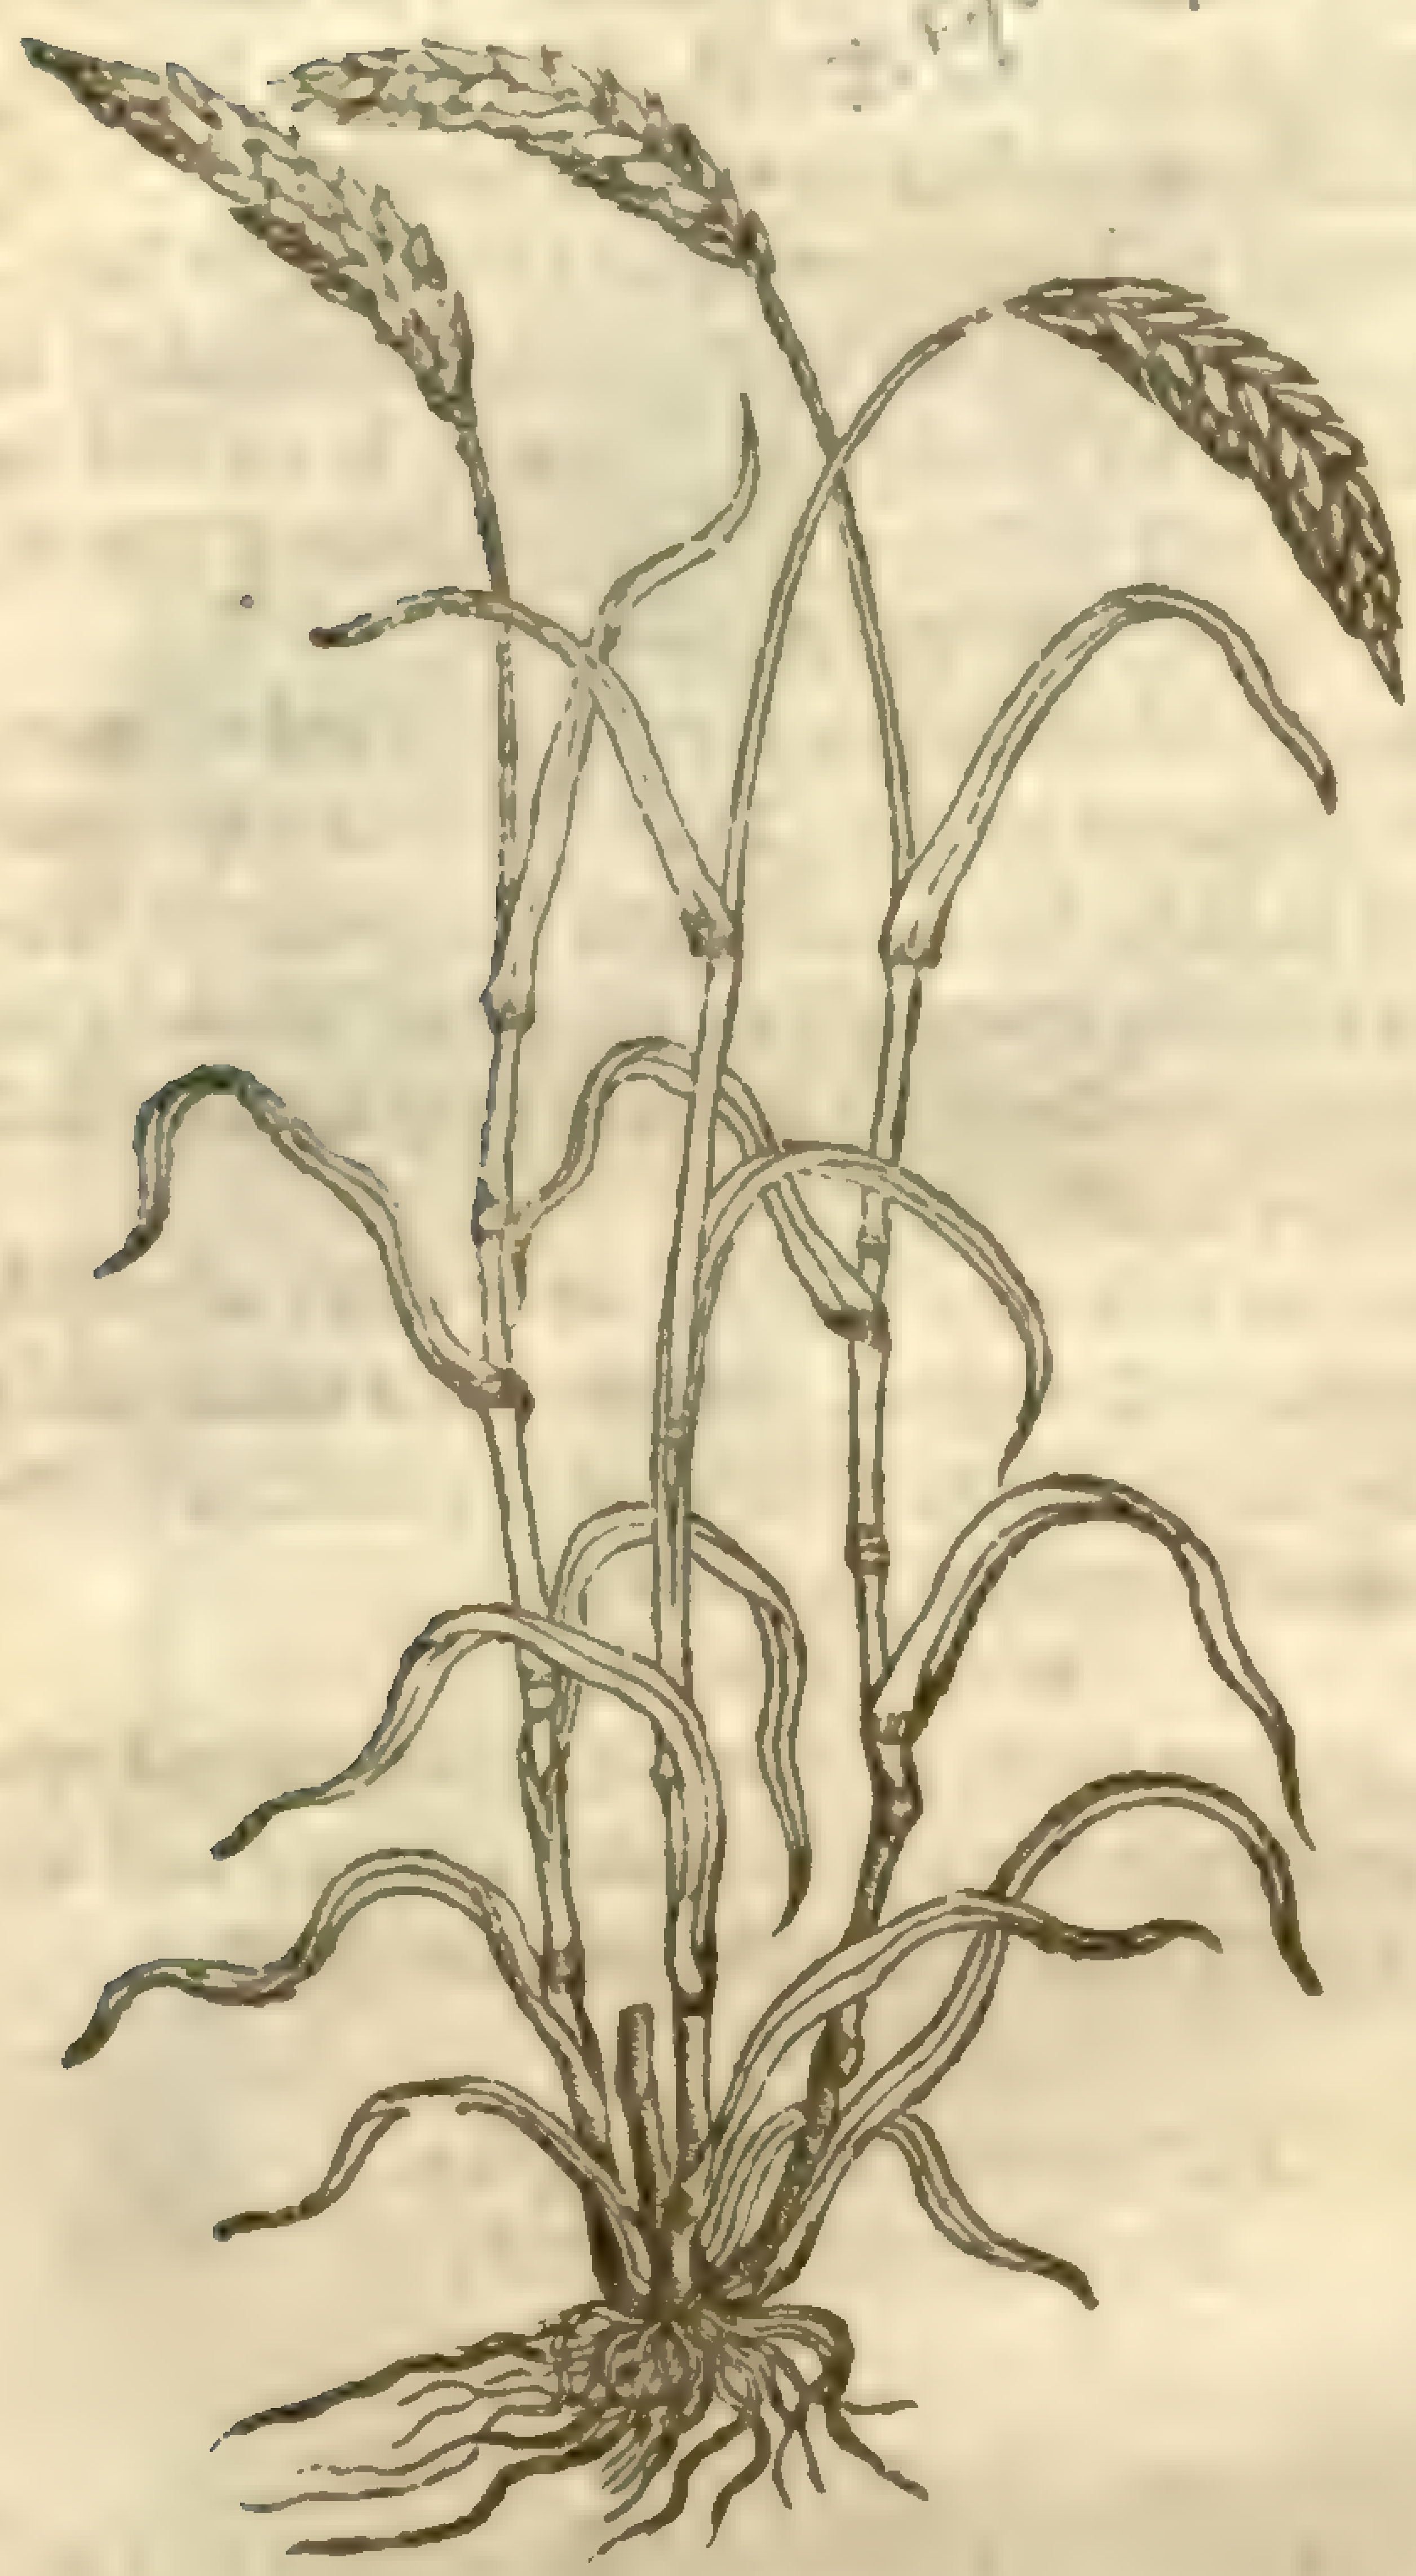
K It is boiled alſo in baths for women,and decoctions for Cliſters,and it enters into plaiſters and perfumes for the ſmells ſake. ‡

Chap. 46. *Of Corne.*

THus far haue I diſcourſed vpon Graſſes,Ruſhes,Spartum,Flags,and Floure de-luces: my next labor is to ſet downe for your better instruction the hiſtorie of Corne, and the kinds therof, vnder the name of Graine,which the Latines call *Cerealea ſemina*, or Bread-corne: the Grecians, σιτηρὰ, and δημήτρια σπέρματα: of which we purpoſe to diſcourſe. There belong to the hiſtory of grain all ſuch things as be made of Corne, as *Far, Condrus, Alica, Tragus, Amylum, Ptiſana, Polenta, Ma*, *Byne*, or Malt, *Zythum*, and whatſoeuer are of that ſort. There be alſo ioyned vnto them many ſeeds, which *Theophraſtus* in his eighth booke placeth among the Graines, as Millet, Sorgum, Panicke, Indian wheat, and ſuch like. *Galen* in his firſt booke of the Faculties of nouriſhments, reckoneth vp the diſeaſes of Graine, as well thoſe that come of the graine it ſelfe degenerating, or that are changed into ſome other kinde, and made worſe through the fault of the weather, or of the ſoile; as alſo ſuch as be cumberſome by growing among them, which doe likewiſe fitly ſucceed the graines. And beginning with corne, we will firſt ſpeake of wheat, and deſcribe it in the firſt place, becauſe it is preferred before all other corne.

1 *Triticum ſpica mutica.*
White Wheate.

T. ſp. hybernum b. α
[illegible]



¶ *The Deſcription.*

1 THis kinde of Wheate which *Lobelius*, diſtinguiſhing it by the eare, calleth *Spica Mutica*, is the moſt principall of all other, whoſe eares are altogether bare or naked, without awnes or chaffie beards. The ſtalke riſeth from a thready root, compact of many ſtrings, joynted or kneed at ſundry diſtances; from whence ſhoot forth graſſie blades and leaues like vnto Rie, but broader. The plant is ſo well knowne to many, and ſo profitable to all, that the meaneſt and moſt ignorant need no larger deſcription to know the ſame by.

2 The ſecond kinde of Wheat, in root, ſtalkes, joints and blades, is like the precedent, differing onely in eare, and number of graines, whereof this kind doth abound, hauing an eare conſiſting of many ranks, which ſeemeth to make the eare double or ſquare. The root and graine is like the other, but not bare and naked, but briſtled or bearded, with many ſmall and ſharpe eiles or awnes not vnlike to thoſe of Barley.

3 Flat Wheate is like vnto the other kindes of Wheat in leaues, ſtalks, and roots, but is bearded and bordered with rough and ſharpe ailes, wherein conſiſts the difference. ‡ I know not what our author means by this flat Wheat, but I conjecture it to be the long rough eared Wheat, which hath blewiſh eares when as it is ripe, in other things reſembling the ordinary red Wheat. ‡

4 The fourth kinde is like the laſt deſcribed, and thus differeth from it, in that, this kind hath many ſhort ſmall ears comming forth of one great eare, & the beards hereof be ſhorter than of the former kind.

5 Bright Wheat is like the ſecond before deſcribed, and differeth from it in that, that this kind is foure ſquare, ſomewhat bright and ſhining; the other not.

‡ I thinke it a very fit thing to adde in this place a rare obſeruation, of the tranſmutation of one ſpecies into another, in plants; which though it haue beene obſerued in ancient times, as by *Theophraſtus*, *de cauſ. plant. lib.* 3. *cap.* 16. whereas among others hee mentioned the change of ζειᾶς εἰς βρόμον. Spelt into oates: and by *Virgil* in theſe words;

Grandia ſæpe quibus mandavimus Hordea ſulcis,
Infælix Lolium, & ſteriles dominantur avenæ.

That is;

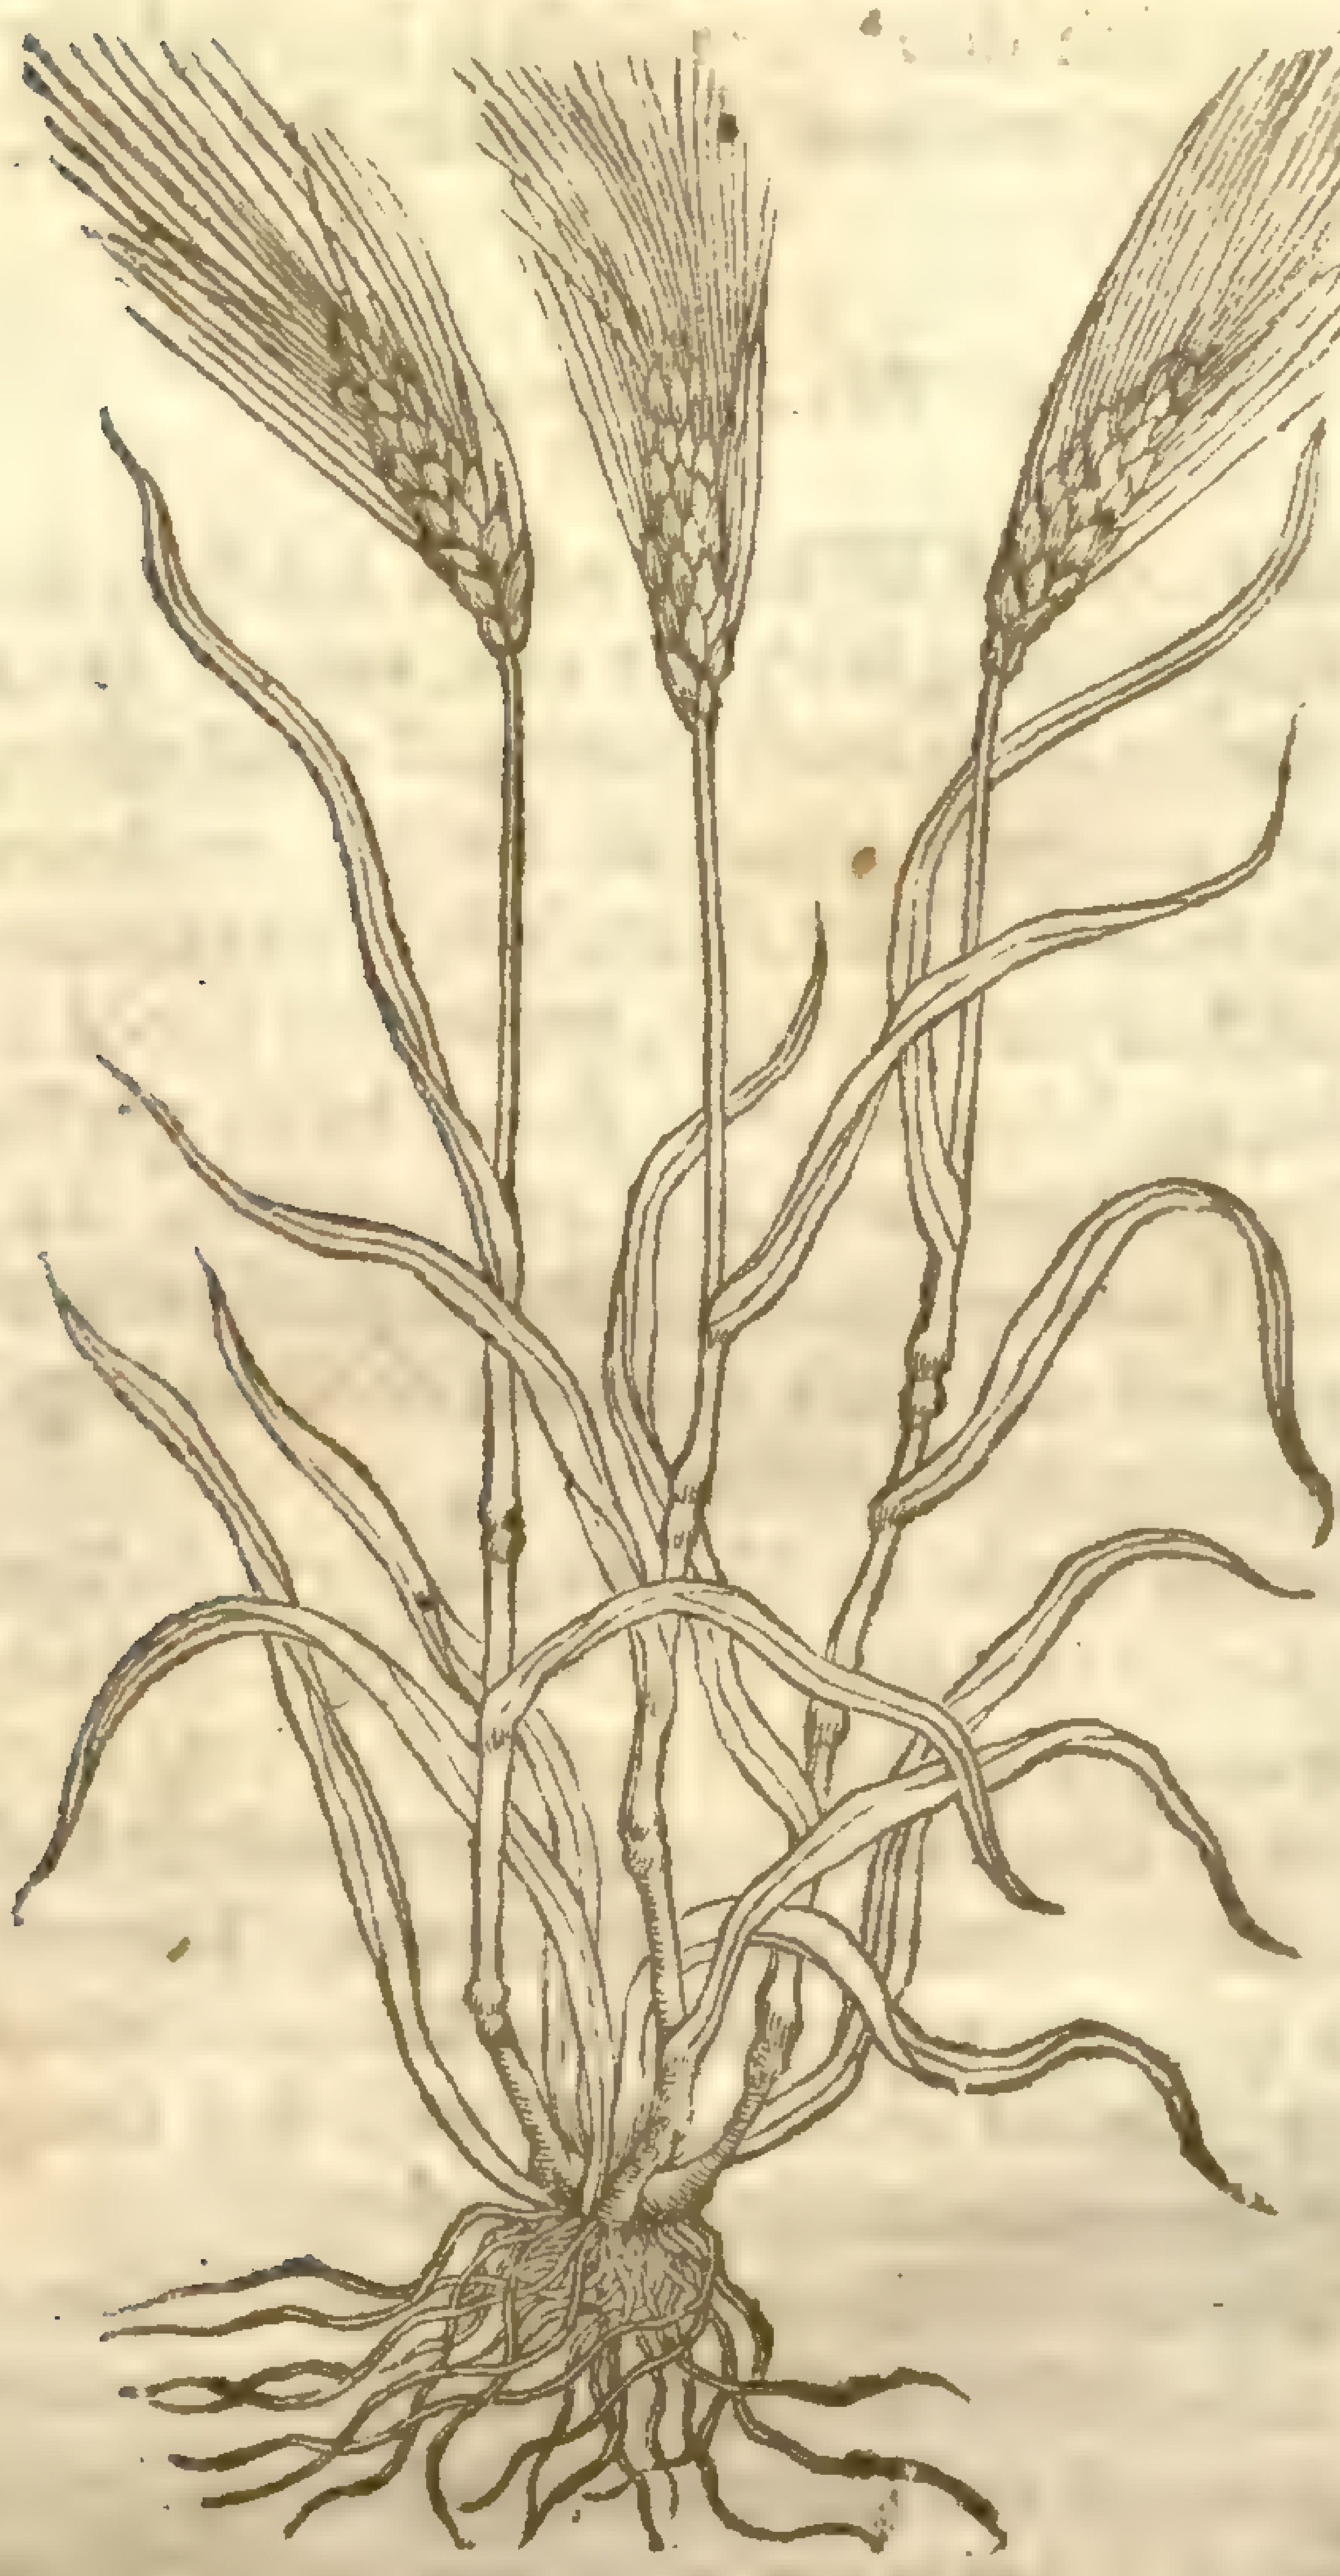
In furrowes where great Barly we did ſow,
Nothing but Darnell and poore Oats do grow.

yet none that I haue read haue obſerued, that two ſeuerall graines, perfect in each reſpect, did grow at any time in one eare: the which I ſaw this yeare 1632, in an eare of white Wheat which was found by my very good friend Mr. *Iohn Goodyer*, a man ſecond to none in his induſtrie and ſearching of plants, nor in his judgement or knowledge of them. This eare of wheat was as large and faire as moſt are, and about the middle thereof grew three or foure perfect Oats in all reſpects: which being hard to be found, I held very worthy of ſetting downe, for ſome reaſons not to be inſiſted vpon in this place. ‡

¶ *The Place.*

Wheat groweth almoſt in all the countries of the world that are inhabited and manured, and requireth a fruitfull and fat ſoile, and rather Sunny and dry, than watery grounds and ſhadowie: for in dry ground (as *Columella* reporteth) it groweth harder and better compact: in a moiſt and darke ſoile it degenerateth ſometime to be of another kinde.

2 *Triticum ariſtis circumvallatum.*
Bearded Wheat, or Red Wheat.



¶ *The Time.*

They are moſt commonly ſowen in the fall o the leafe, or Autumne: ſometime in the Spring

¶ *The Names.*

Wheat is called of the Græcians, πυρὸς: of the La-tines, *Triticum*, and the white Wheat *Siligo. Tr-ticum* doth generally ſignifie any kinde of Co which is threſhed out of the eares and made clea by fanning or ſuch ordinary means. The Germa call it **Weuſen**: in low Dutch, **Terwe**: in Italia *Grano*: the Spaniards, *Trigo*: the Frenchmen, *Bled au Fourment*: in Engliſh we call the firſt, White Wheat, and Flaxen Wheat. *Triticum lucidum* is called Bright Wheat: Red Wheat is called in Kent, Duck-bill Wheat, and Normandy Whea.

¶ *The Nature.*

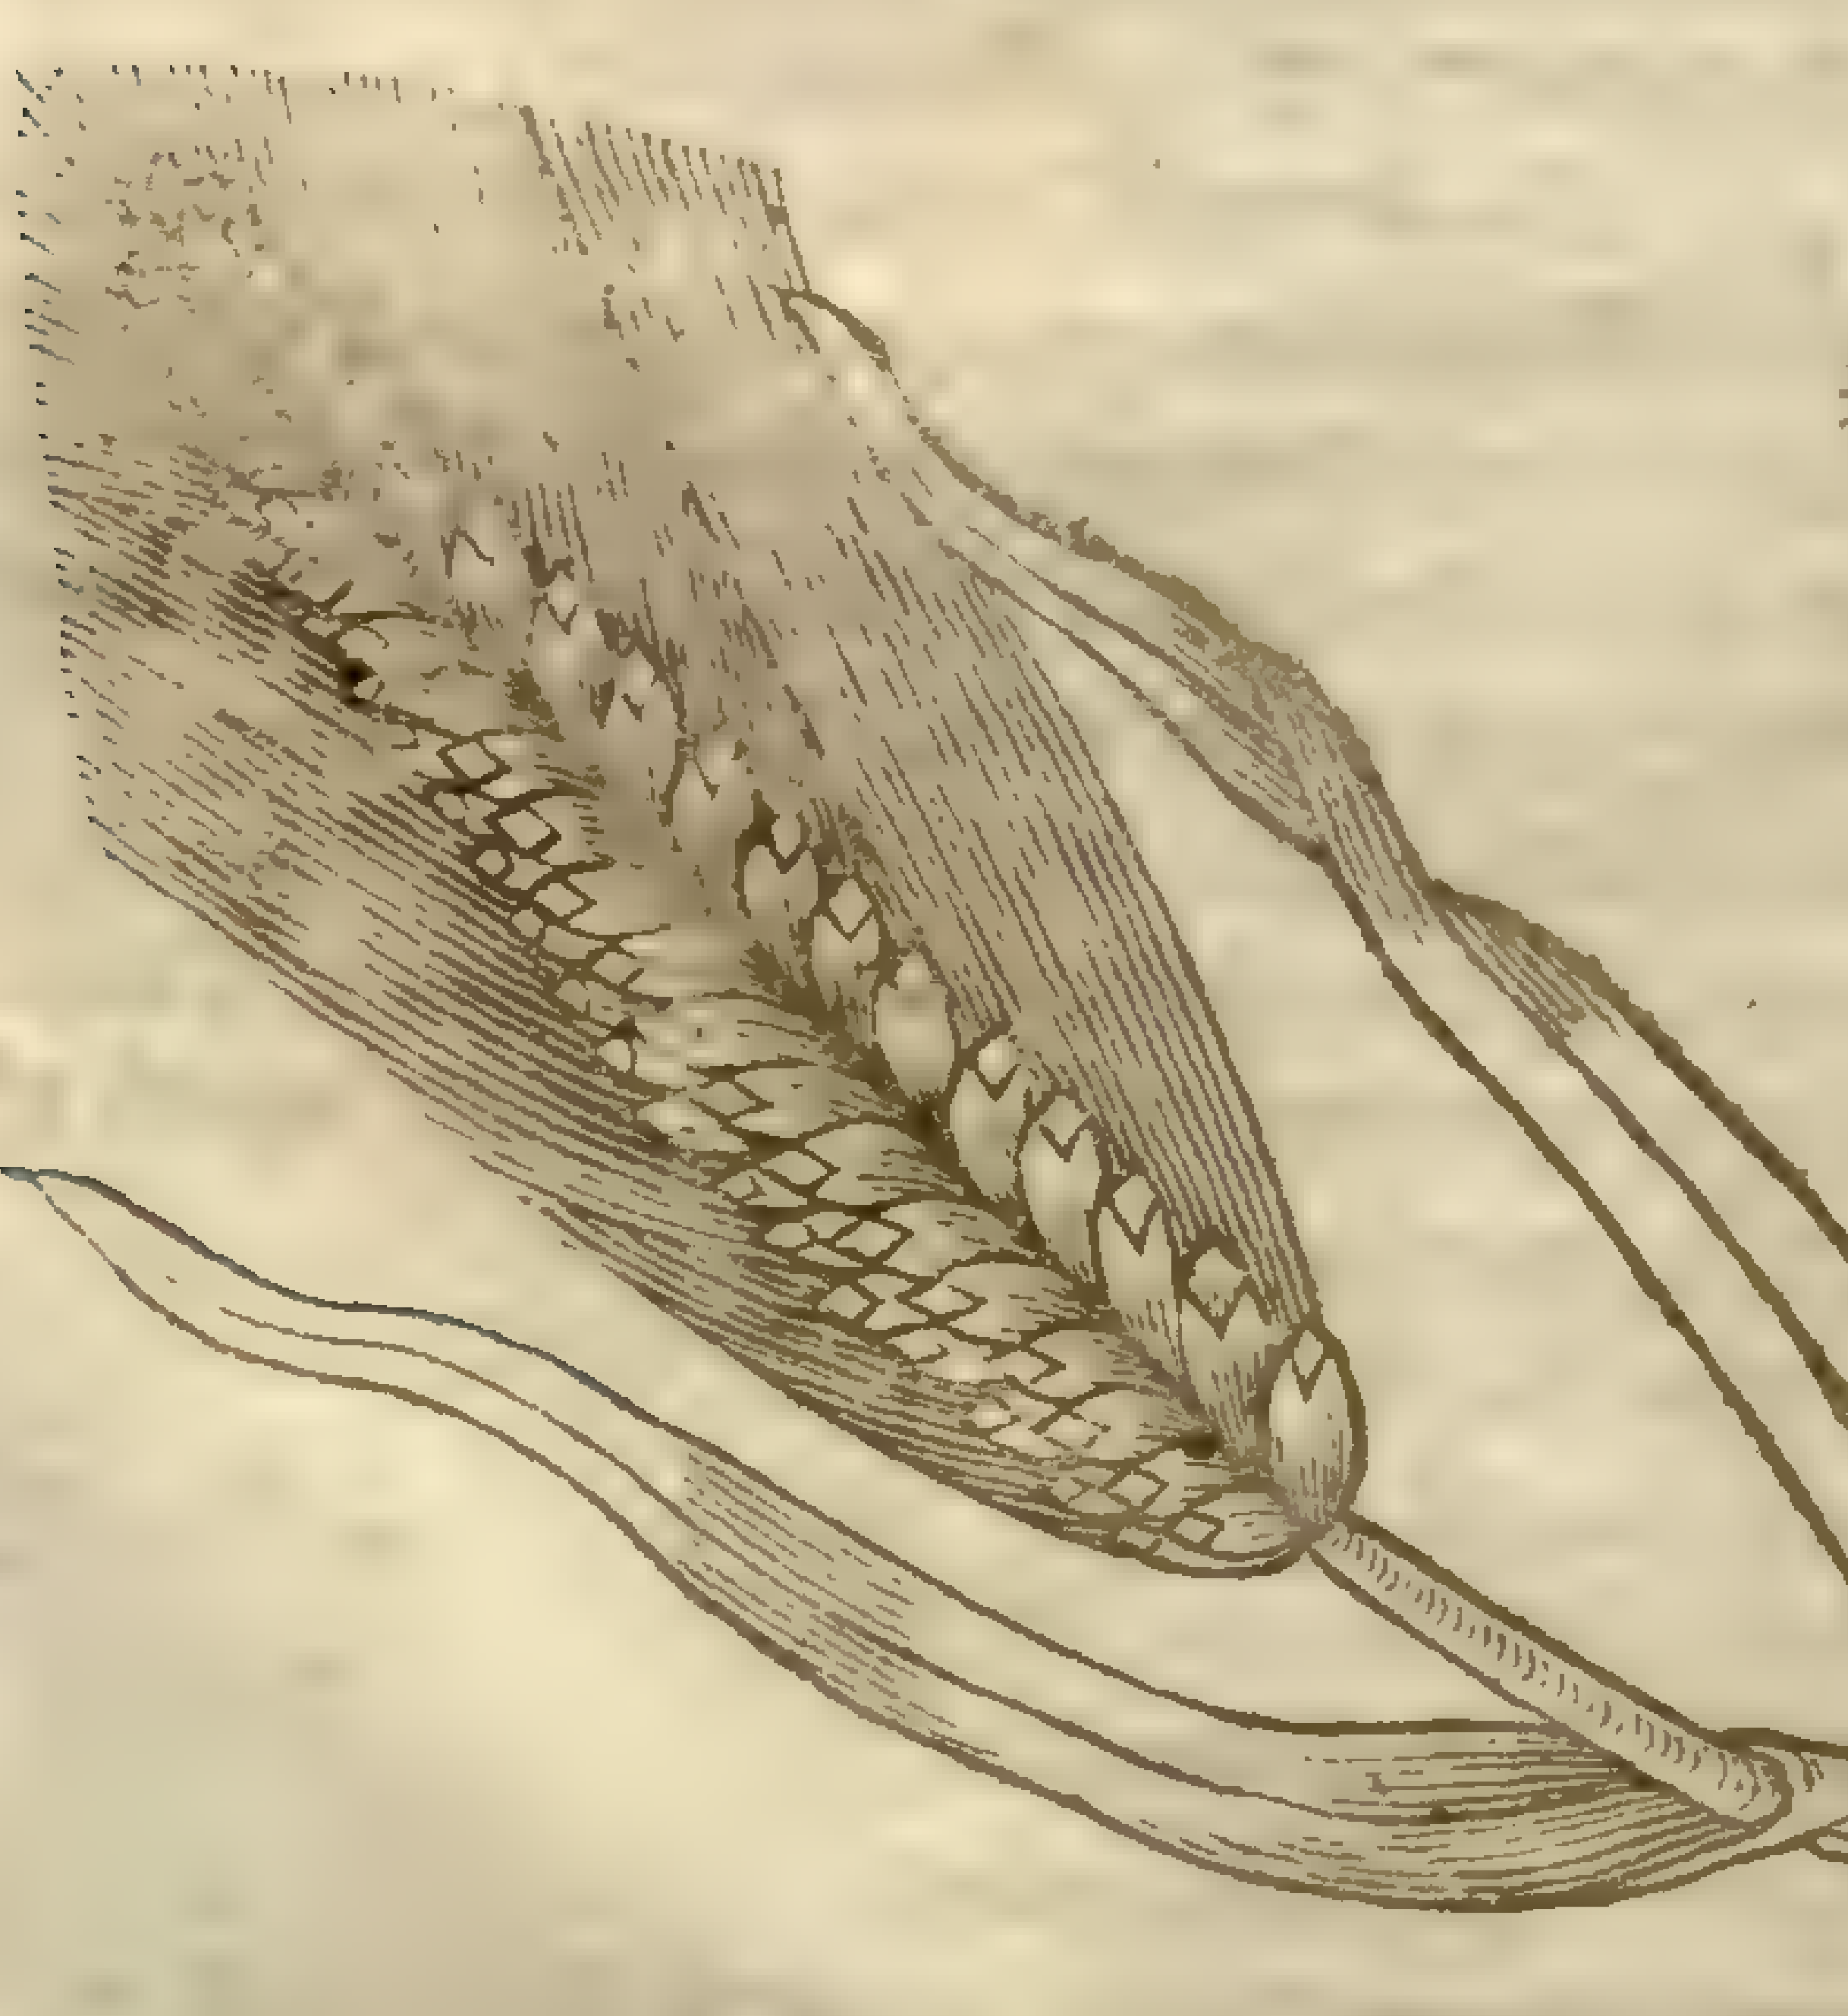
Wheat (ſaith *Galen*) is very much vſed of men, and with greateſt profit. Thoſe Wheats do nou-riſh moſt that be hard, and haue their whole ſub-ſtance ſo cloſely compact as they can ſcarſely be bit aſunder; for ſuch do nouriſh very much; and the contrary but little.

Wheat as it is a medicine outwardly applied, is hot in the firſt degree, yet can it not manifeſtly either dry or moiſten. It hath alſo a certain clam-mineſſe and ſtopping qualitie.

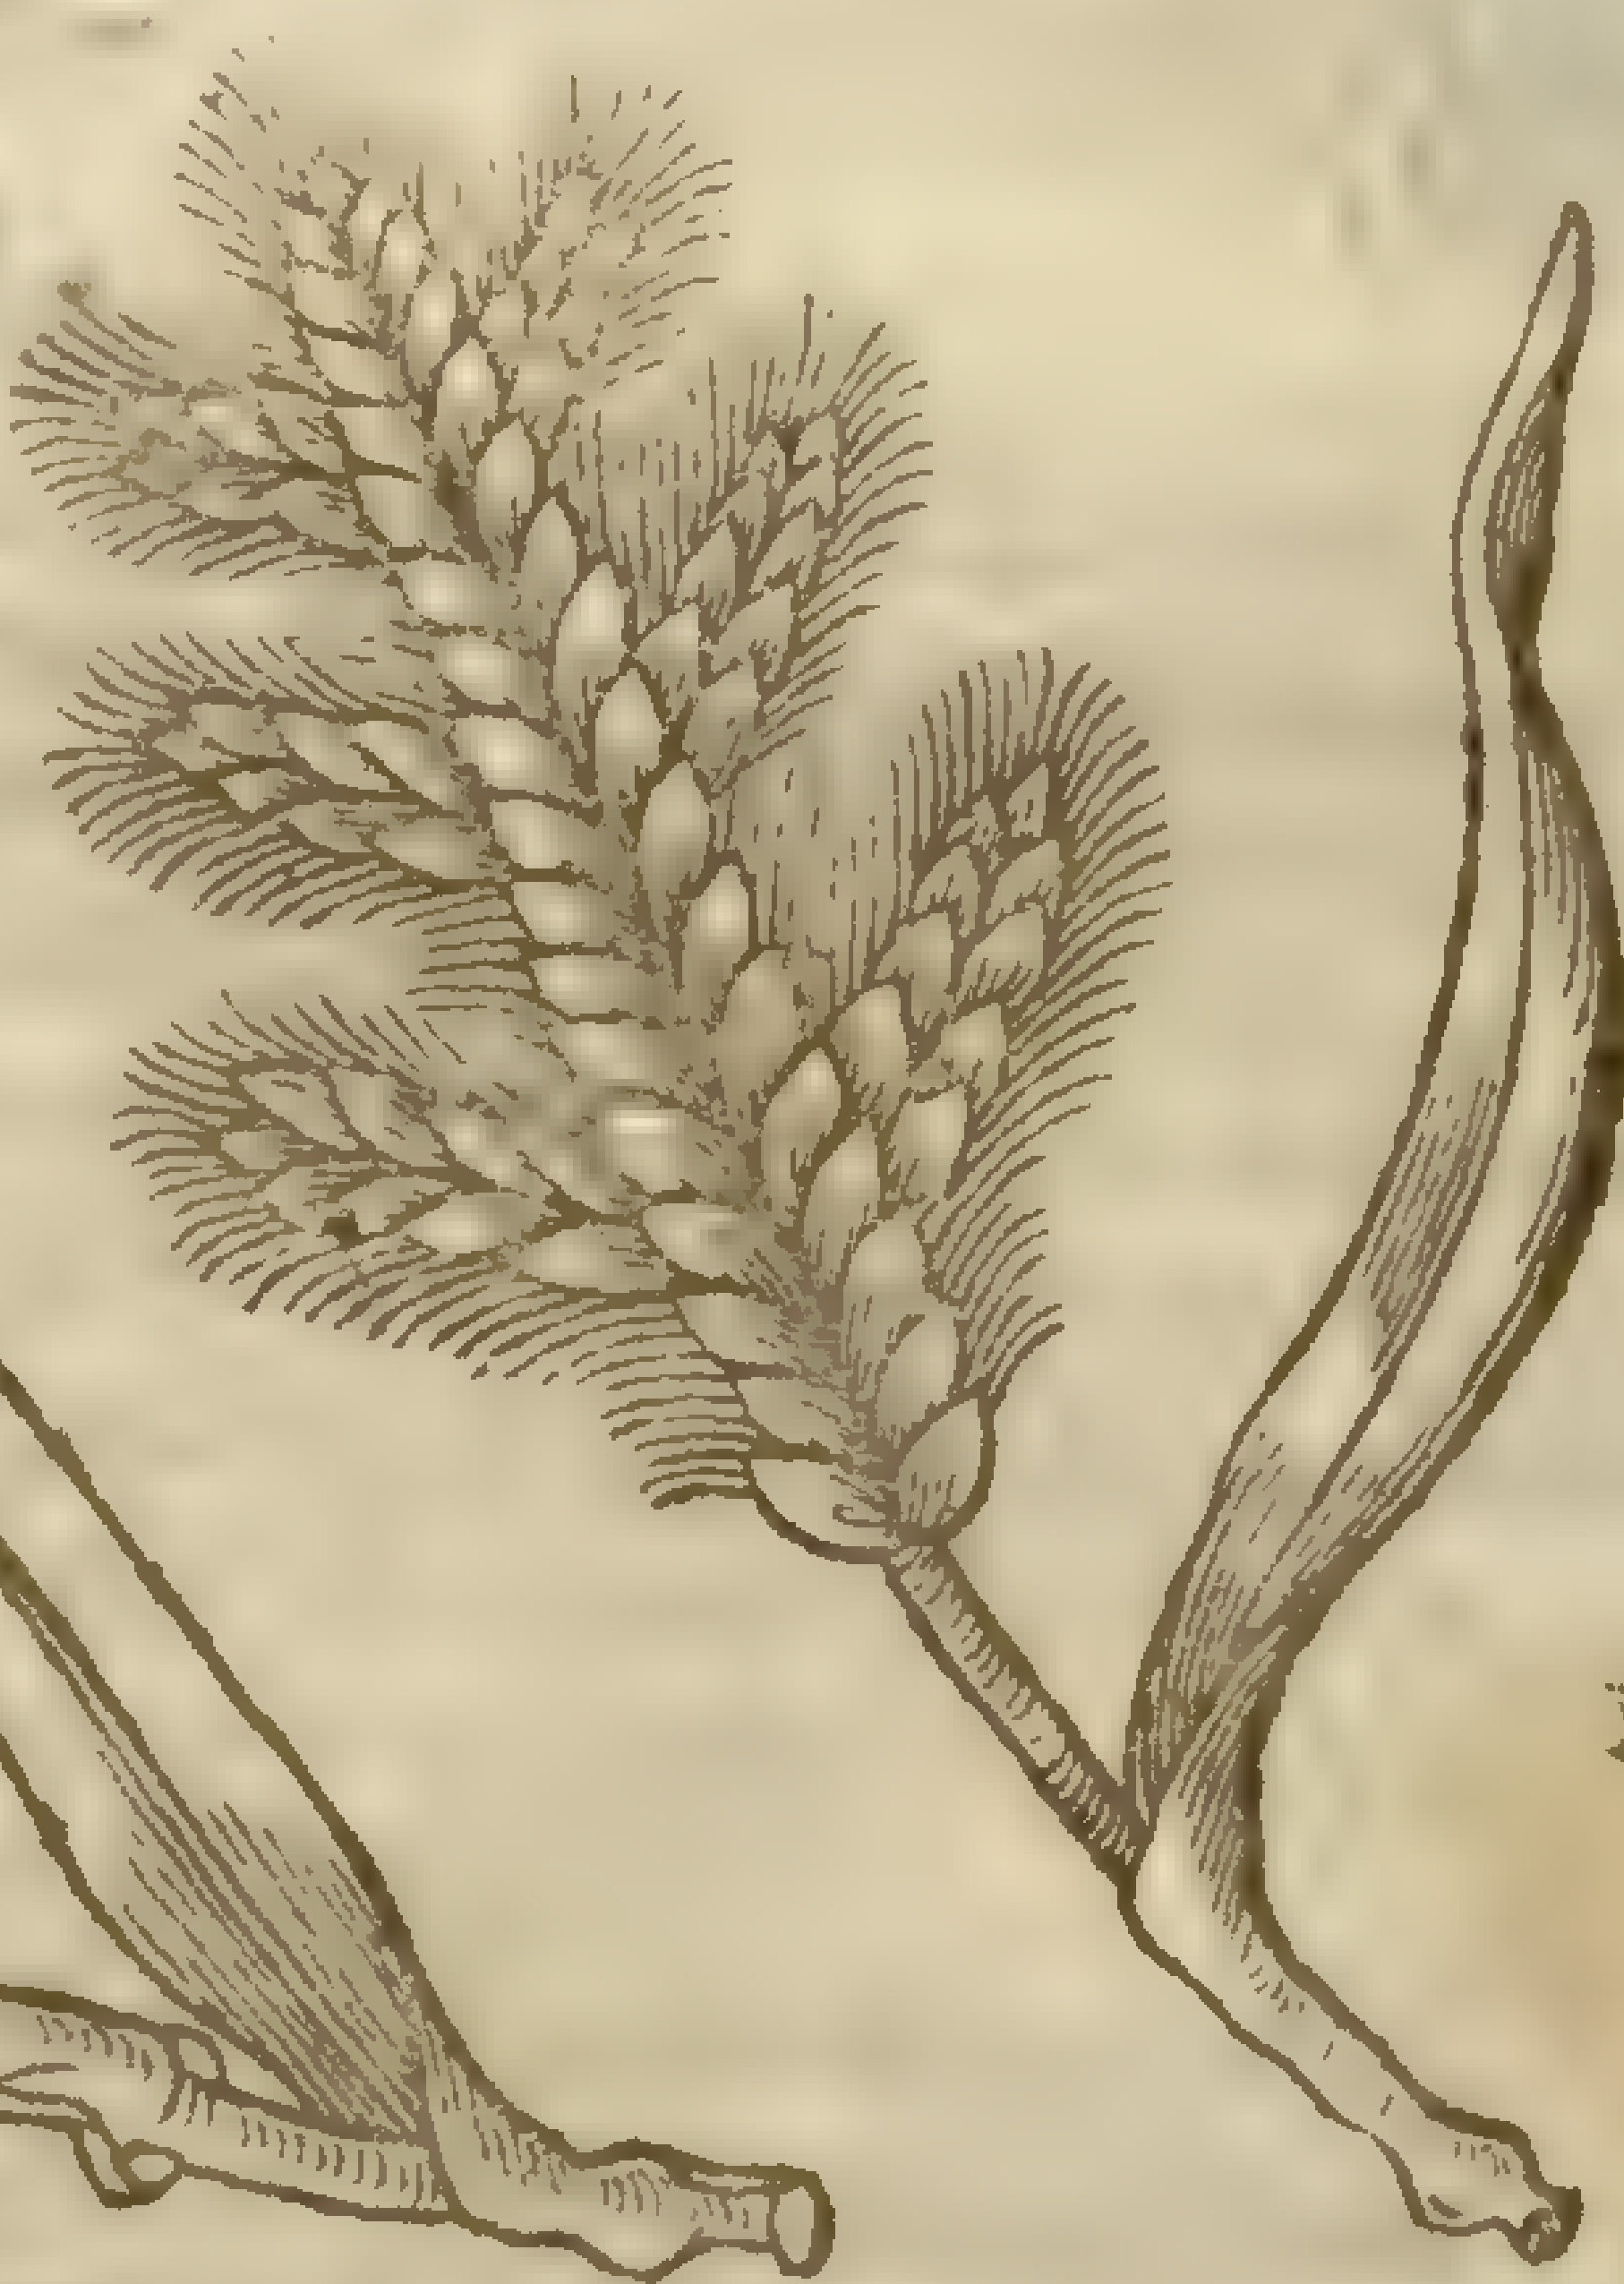
¶ *The Vertues.*

A Raw Wheat, ſaith *Dioſcorides*, being eaten, bree-deth wormes in the belly: being chewed and ap-plied, it doth cure the biting of mad dogs.

3 *Triticum Typhinum.*
Flat Wheat.



4 *Triticum multiplici ſpica.*
Double eared Wheat.



Tr. compositum, i.e. Mirac. wheat.

B The floure of wheat being boiled with hony and water, or with oyle and water, taketh away all inflammations, or hot ſwellings.

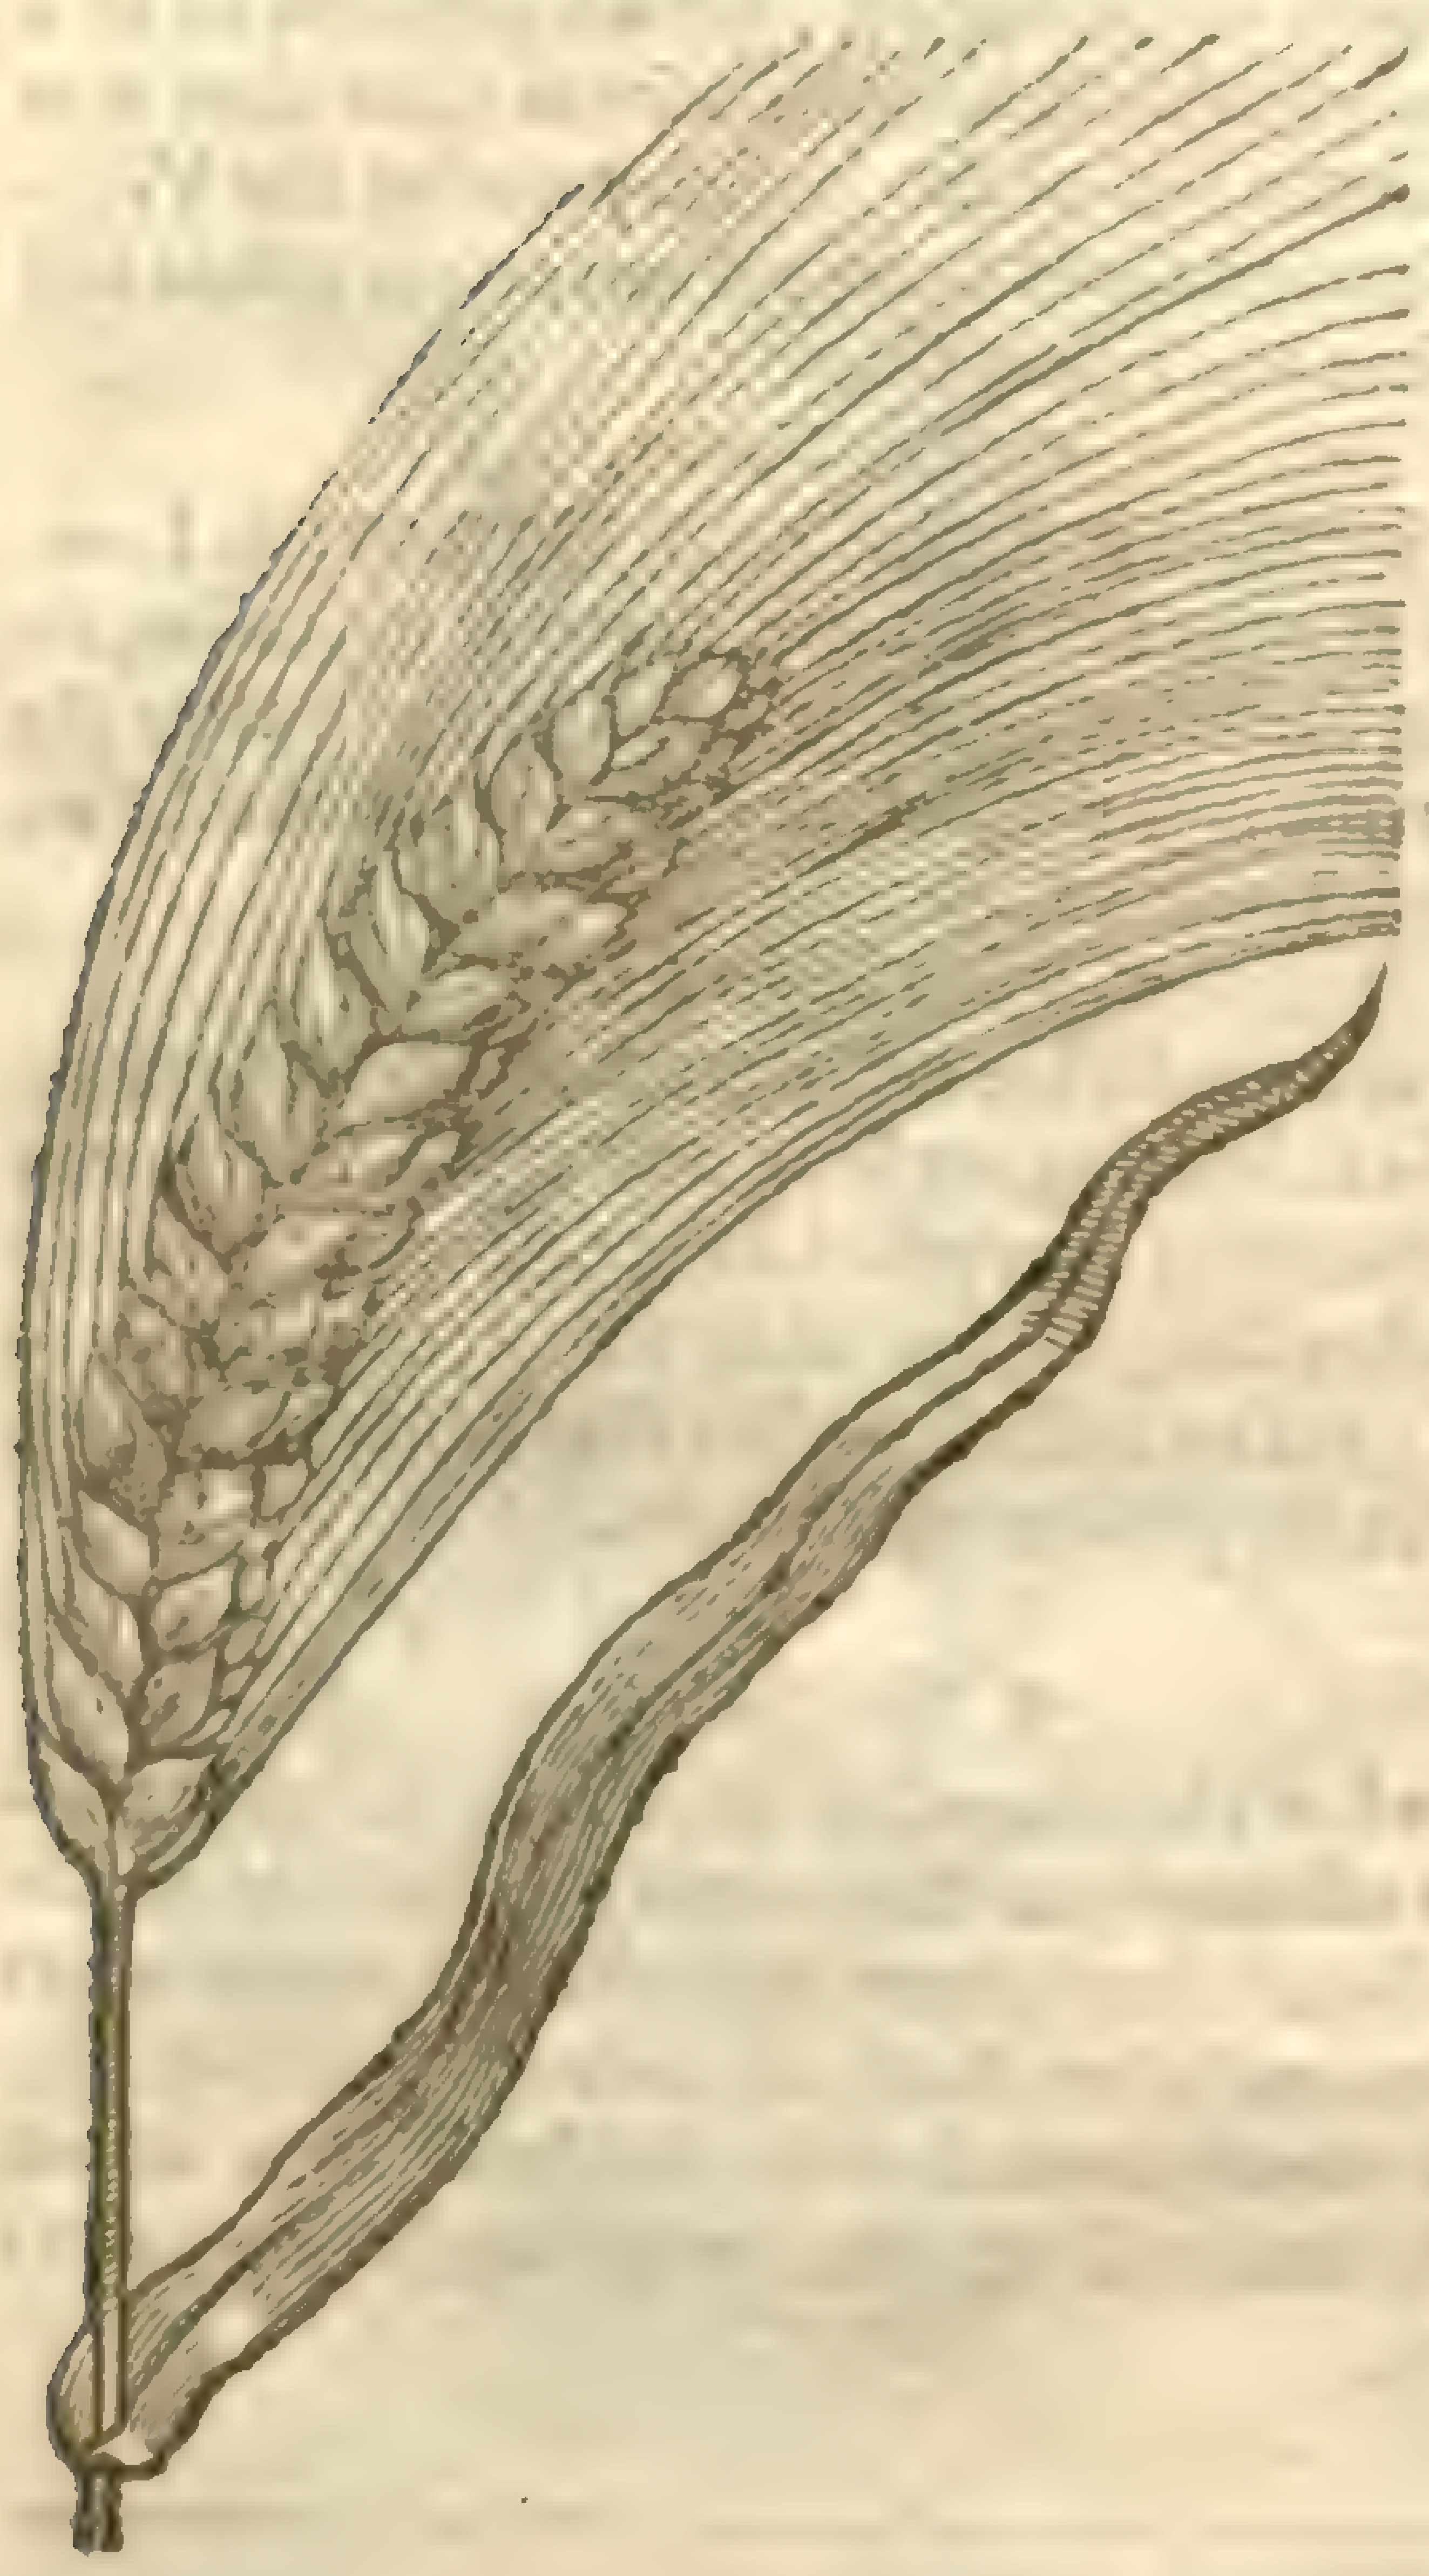
C The bran of Wheat boyled in ſtrong Vinegre, clenſeth away ſcurfe and dry ſcales, and diſſolueth the beginning of all hot ſwellings, if it be laid vnto them. And boyled with the decoction of Rue, it ſlacketh the ſwellings in womens breaſts.

D The graines of white Wheat, as *Pliny* writeth in his two and twentieth booke, and ſeuenth chapter, being dried browne, but not burnt, and the pouder thereof mixed with white wine is good for watering eies, if it be laid thereto.

E The dried pouder of red Wheat boyled with vinegre, helpeth the ſhrinking of ſinewes.

F The meale of Wheat mingled with the juice of Henbane, and plaiſterwiſe applied, appeaſeth inflam-

3 *Triticum lucidum.*
Bright Wheat.



inflammations, as *Ignis ſacer*, or Saint *Anthonies* Fire, and ſuch like, ſtaying the flux of humors to the joynts, which the Græcians call *Rheumatiſmata*. Paſte made of fine meale, ſuch as Booke-binders vſe, helpeth ſuch as doe ſpit bloud, taken warme one ſpoonefull at once. The bran of wheat boiled in ſharpe vinegre, and rubbed vpon them that be ſcuruie and mangie, eaſeth the party very much.

G The leauen made of Wheat hath vertue to heate and draw outward, it reſolueth, concocteth, and openeth all ſwellings, bunches, tumors, and felons, being mixed with ſalt.

H The fine floure mixed with the yolke of an egge, honey, and a little ſaffron, doth draw and heale byles and ſuch like ſores, in children and in old people, very well and quickly. Take crums of wheaten bread one pound and an halfe, barley meale ℥ ij. Fennigreeke and Lineſeed of each an ounce, the leaues of Mallowes, Violets, Dwale, Sengreene, and Cotyledon, *ana* one handfull: boyle them in water and oyle vntill they be tender: then ſtampe them very ſmall in a ſtone morter, and adde thereto to the yolke of three egges, oyle of Roſes, and oyle of Violets, *ana* ℥ ij. Incorporate them altogether; but if the inflammation grow to an Eryſipelas, then adde thereto the juice of Nightſhade, Plantaine, and Henbane, *ana* ℥ ij. it eaſeth an Eryſipelas, or Saint *Anthonies* fire, and all inflammations very ſpeedily.

I Slices of fine white bread laid to infuſe or ſteepe in Roſe water, and ſo applied vnto ſore eyes which haue many hot humours falling into them, doe eaſily defend the humour, and ceaſe the paine.

K The oyle of wheat preſſed forth betweene two plates of hot iron, healeth the chaps and chinks of the hands, feet, and fundament, which come of cold, making ſmooth the hands, face or any other part of the body.

L The ſame vſed as a Balſame doth excellently heale wounds, and being put among ſalues or vnguents, it cauſeth them to worke more effectually, eſpecially in old vlcers.

Chap. 47. *Of Rie.*

¶ *The Deſcription.*

THe leafe of Rie when it firſt commeth vp, is ſomewhat reddiſh, afterward greene, as be the other graines. It groweth vp with many ſtalkes, ſlenderer than thoſe of wheat, and longer, with knees or joynts by certaine diſtances like vnto Wheat: the eares are orderly framed vp in rankes, and compaſſed about with ſhort beards, not ſharpe but blunt, which when it floureth ſtand vpright, and when it is filled vp with ſeed it leaneth and hangeth downeward. The ſeed is long, blackiſh, ſlender, and naked, which eaſily falleth out of the huskes of it ſelfe. The roots be many, ſlender, and full of ſtrings.

¶ *The Place.*

Rie groweth very plentifully in the moſt places of Germany and Polonia, as appeareth by the great quantitie brought into England in time of dearth, and ſcarcitie of corne, as hapned in the yeare 1596. and at other times, when there was a generall want of corne, by reaſon of the abboundance of raine that fell the yeare before; whereby great penurie enſued, as well of cattell and all other victuals, as of all manner of graine. It groweth likewiſe very well in moſt places of England, eſpecially towards the North.

Secale.
Rie.

Secale cereale
Hort. dict.

¶ *The Time.*

It is for the moſt part ſowne in Autumne, and ſometimes in the Spring, which proueth to be a grain more ſubiect to putrifaction than that was ſowne in the fall of the leafe, by reaſon the Winter doth ouertake it before it can attain to his full maturitie and ripeneſſe.

¶ *The Names.*

Rie is called in high-Dutch, **Rocken**: in Low-Dutch, **Rogge**: in Spaniſh, *Centeno*: in Italian, *Segala*: in French, *Seigle*, which ſoundeth after the old Latine name which in *Pliny* is *Secale* and *Farrago, lib.* 18. *cap.* 16.

¶ *The Temperature.*

Rie as a medicine is hotter than wheat, & more forcible in heating, waſting, and conſuming away that whereto it is applied. It is of a more clammy and obſtructing nature than wheat, and harder to digeſt; yet to ruſtick bodies that can well digeſt it, it yeelds good nouriſhment.

¶ *The Vertues.*

A Bread, or the leauen of Rie, as the Belgian phyſitians affirme vpon their practiſe, doth more forcibly digeſt, draw, ripen, and breake all apoſtumes botches, and biles, than the leauen of wheat.

B Rie meale bound vnto the head in a linnen cloath, doth aſſwage the long continuing paines thereof.

Chap. 48. *Of Spelt Corne.*

¶ *The Deſcription.*

Spelt is like to Wheat in ſtalks and eare: it groweth vp with a multitude of ſtalkes, which are kneed and iointed higher than thoſe of Barly: it bringeth forth a diſordered eare for the moſt part without beards. The cornes be wrapped in certain dry husks, from which they cannot eaſily be purged, and are ioyned together by couples in two chaffie husks, out of which when they be taken they are like vnto wheat cornes: it hath alſo many roots as Wheat hath, whereof it is a kinde.

¶ *The Place*

It groweth in fat and fertile moiſt ground.

¶ *The Time.*

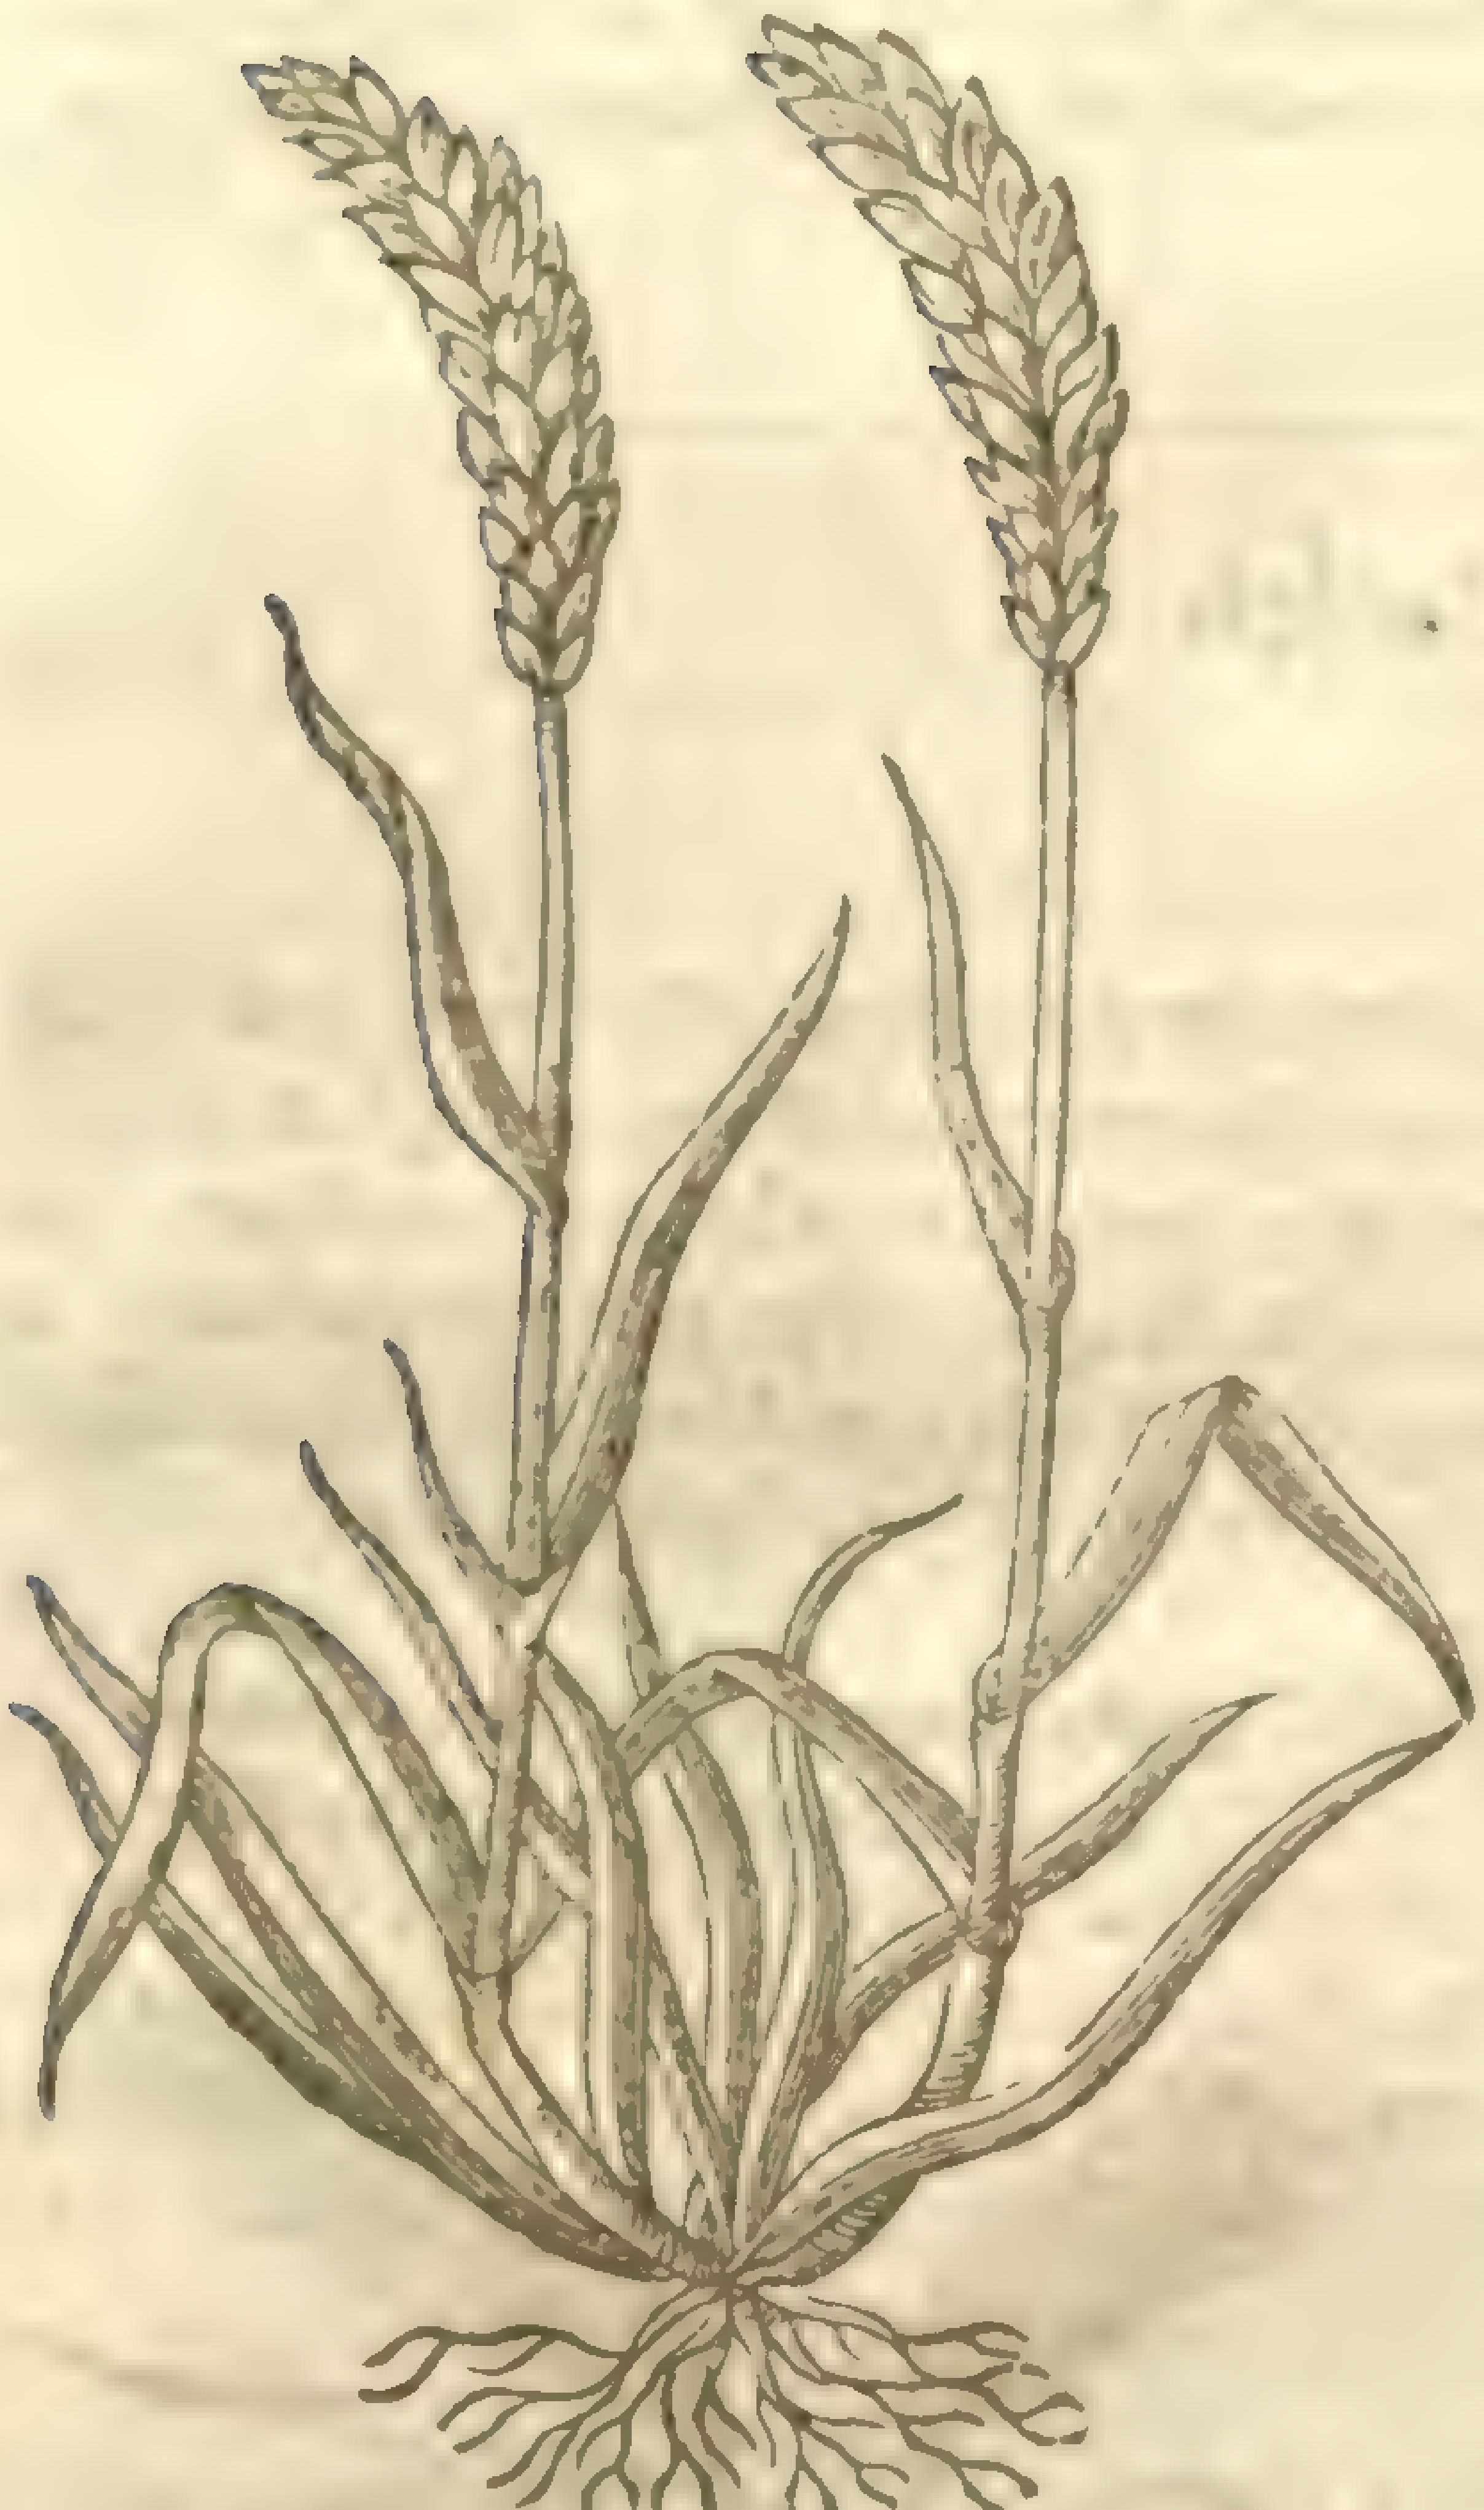
It is altered and changed into wheat it ſelfe, as degenerating from bad to better, contrary to all other that do alter or change; eſpecially (as *Theophraſtus* ſaith) if it be clenſed, and ſo ſowne, yet not forthwith, but in the third yeare.

¶ *The Names.*

The Grecians haue called it *Zeia* and *Zea*: the Latines, *Spelta*: in the German tongue, **Spelt** and **Dinkel**: in low-Dutch, **Spelte**: in French, *Eſpeautre*: of moſt Italians, *Pirra*, *Farra*: of the Tuſcans, *Biada*: of the Millanois, *Alga*: in Engliſh, Spelt Corne. *Dioſcorides* maketh mention of two kinds of Spelt; one which he names *Aple*, or ſingle: another, *Dicoccos*, which brings forth two Cornes ioyned together in a couple of huskes, as before in the deſcription is mentioned. That Spelt which *Dioſcorides* calls *Dicoccos*, is the ſame which *Theoph.* and *Galen* do name *Zea*. The moſt antient Latines haue called *Zea* or *Spelta* by the name of *Far*, as *Dionyſius Halicarnaſſæus* doth ſufficiently teſtifie: The old Romans (ſaith he) did call ſacred mariages by the word *Farracia*, becauſe the Bride and Bride-groome did eate of that *Far* which the Grecians call *Zea*. The ſame thing *Aſclepiades* affirmeth in *Galen*, in his ninth book according to the places affected, writing thus; *Farris, quod Zea appellant*: that is to ſay, *Far*, which is called *Zea*, &c. And this *Far* is alſo named of the Latines, *Ador*, *Ador eum* and *Semen adoreum*.

Zea, ſiue Spelta.
Spelt Corne.

[illegible]



¶ *The Temper.*

Spelt, as *Dioſcorides* reporteth, nouriſheth more than Barley. *Galen* writeth in his books of the Faculties of ſimple Medicines, Spelt is in all his temperature in a meane betweene wheat and barley, and may in vertue be referred to the kindes of Barly and Wheat, being indifferent to them both.

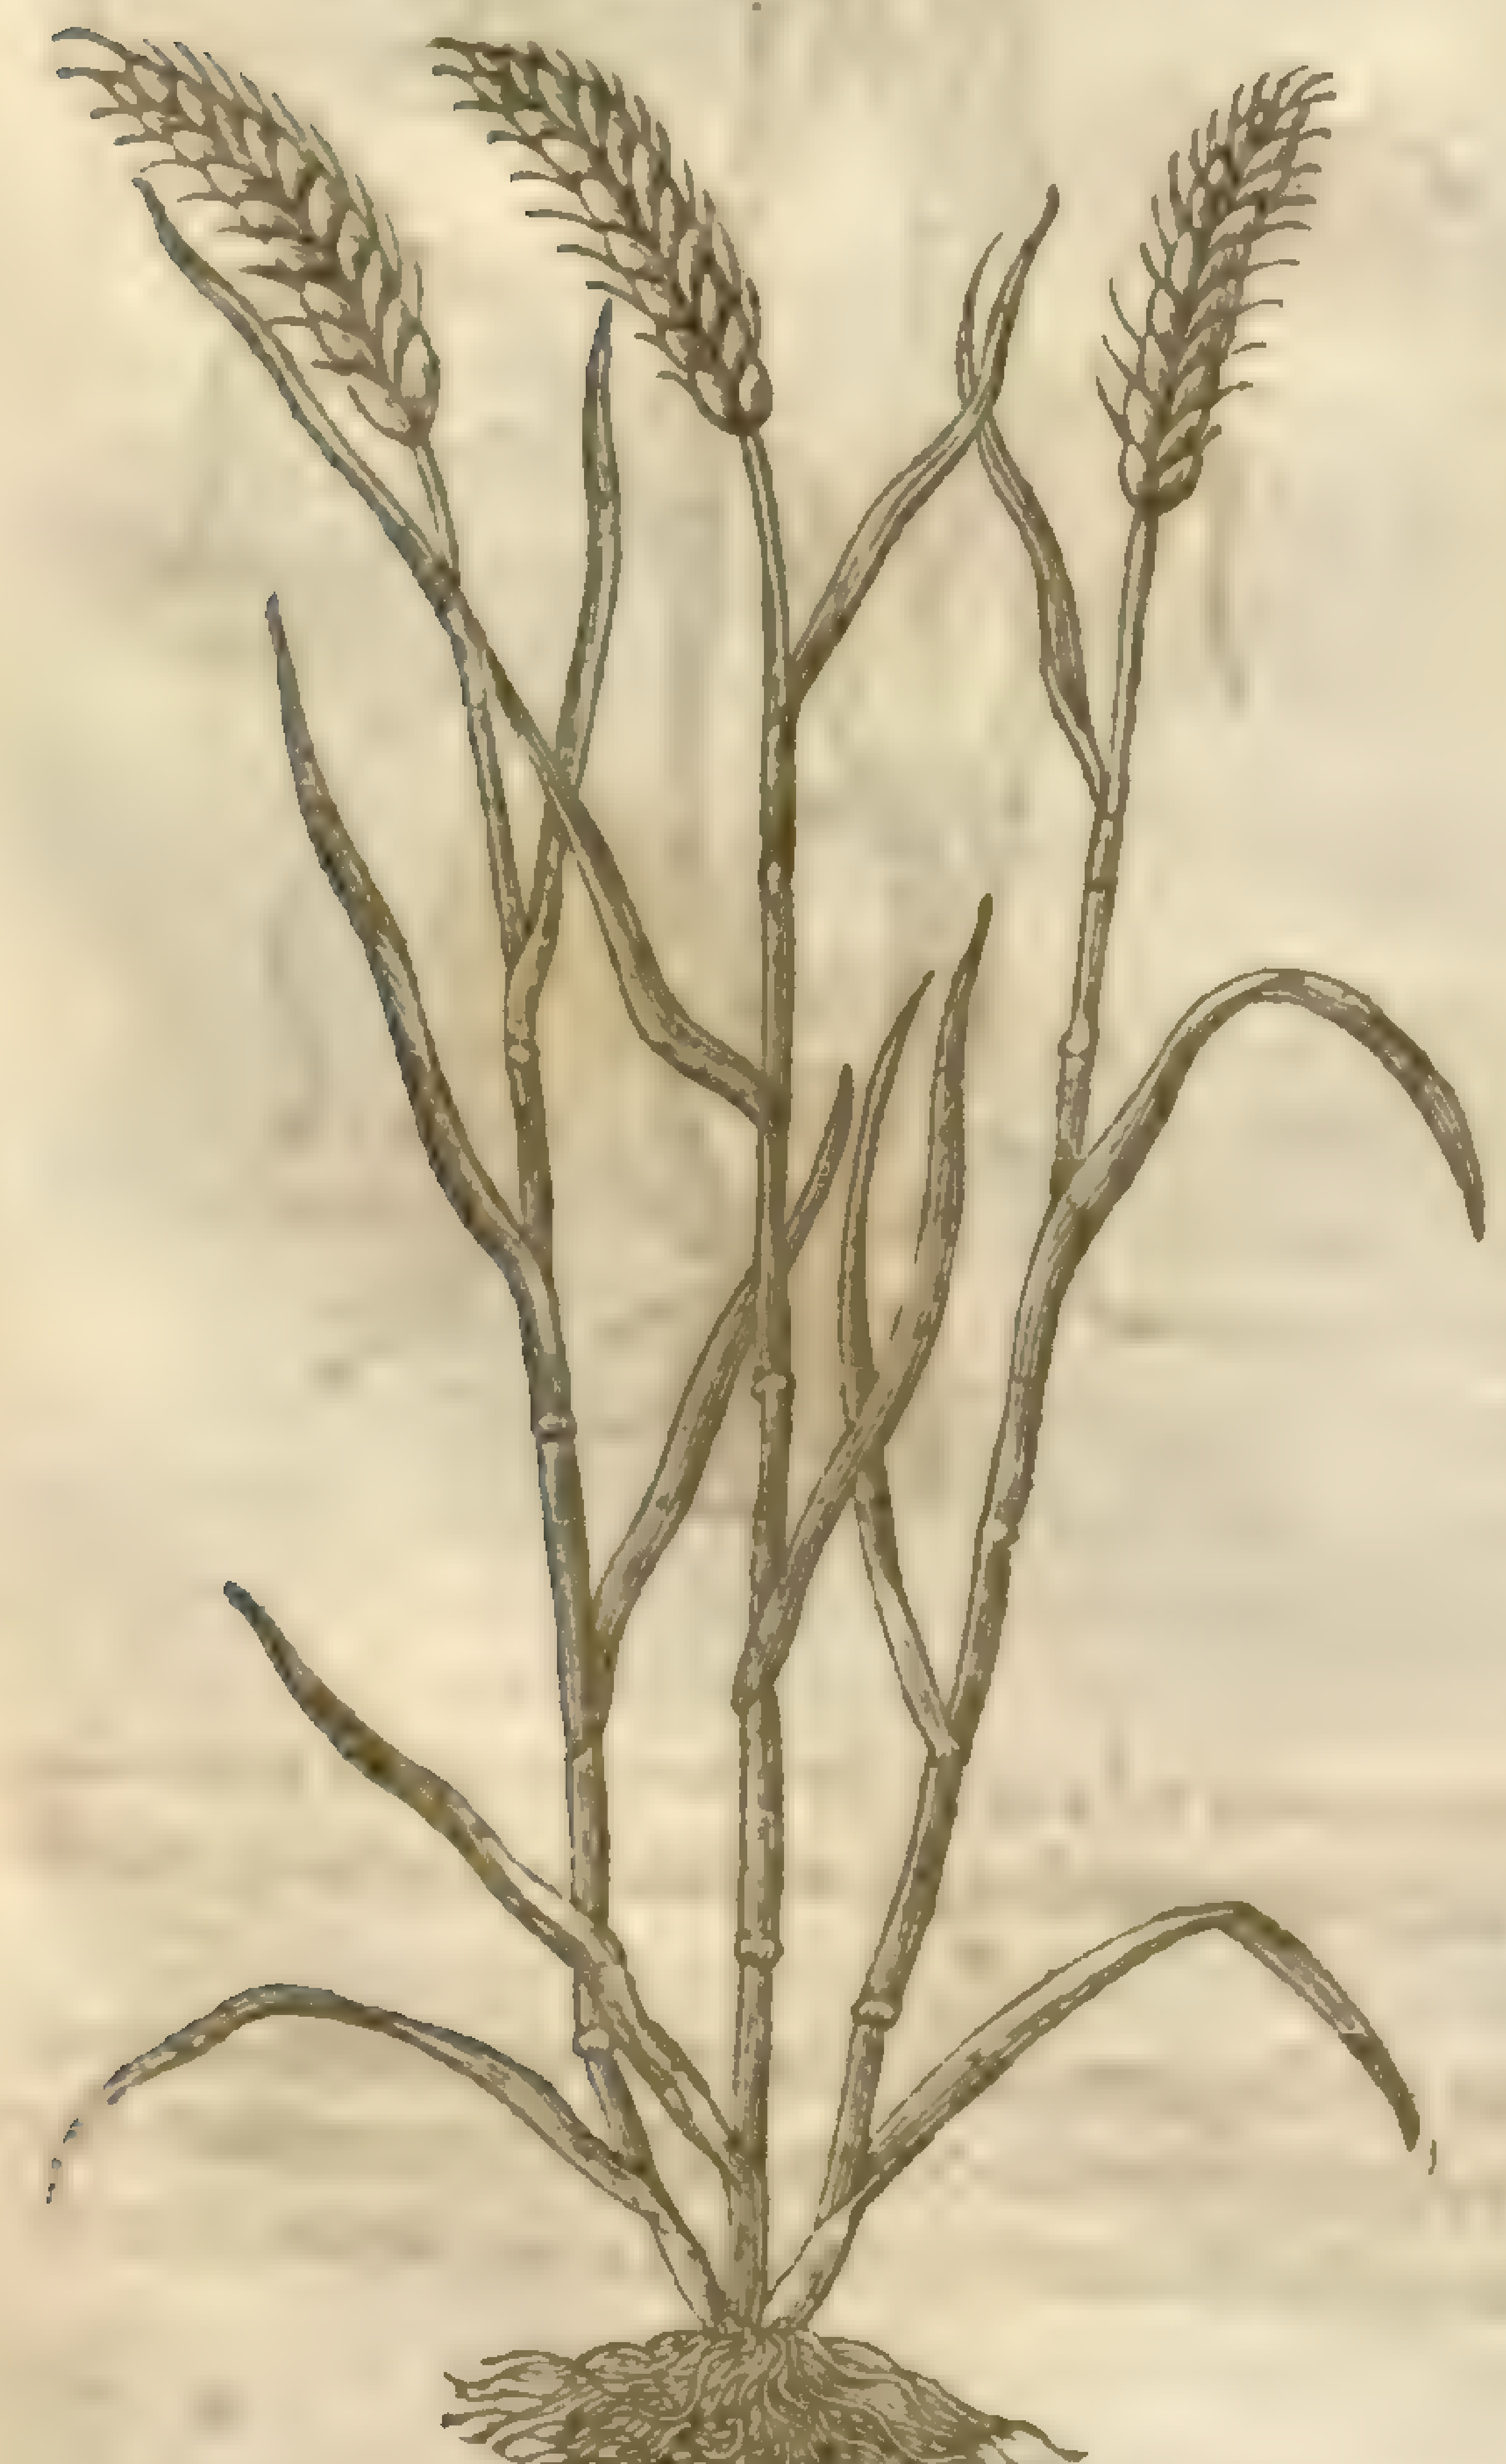
¶ *The Vertues.*

A The floure or meale of Spelt corne boiled in water with the pouder of Saunders, and a little Oile of Roſes and Lillies, vnto the forme of a pulteſſe, and applied hot, takes away the ſwelling of the legs gotten by cold and long ſtanding.

B ‡ Spelt (ſaith *Turner*) is common about Weiſenburgh in high Almaine, eight Dutch miles on this ſide Strausburgh, and there all men vſe it for wheat, for there groweth no wheat at all: yet I neuer ſaw fairer & pleaſanter bread in any place in all my life, than I haue eaten there, made only of this Spelt. The corn is much leſſe than Wheat, and ſomewhat ſhorter than Rie, but nothing ſo blacke. ‡

CHAP. 49. *Of Starch-Corne.*

Triticum Amyleum.
Starch Corne.



¶ *The Deſcription.*

THis other kinde of *Spelta* or *Zea* is called of the German Herbariſts, *Amyleum frumentum*, or Starch-corne; and it is a kinde of Graine ſowne to that end, or a three-moneths graine, and is very like vnto wheat in ſtalke and ſeed; but the eare thereof is ſet round about and made vp with two rankes, with certaine beards almoſt after the maner of Barly, and the ſeed is cloſed vp in chaffie husks, and is ſowne in the Spring.

¶ *The Place.*

Amil corne or Starch corne is ſowne in Germanie, Polonia, Denmarke, and other thoſe Eaſterne regions, as well to feed their cattel and pullen with, as alſo to make ſtarch; for the which purpoſe it very fitly ſerueth.

¶ *The Time.*

It is ſowne in Autumne or the fall of the leafe, and oftentimes in the Spring; and for that cauſe hath been called *Trimeſtre*, or three months grain: it bringeth his ſeed to ripeneſſe in the beginning of Auguſt, and is ſown in the Low-Countries in the Spring of the yeare.

¶ *The Names.*

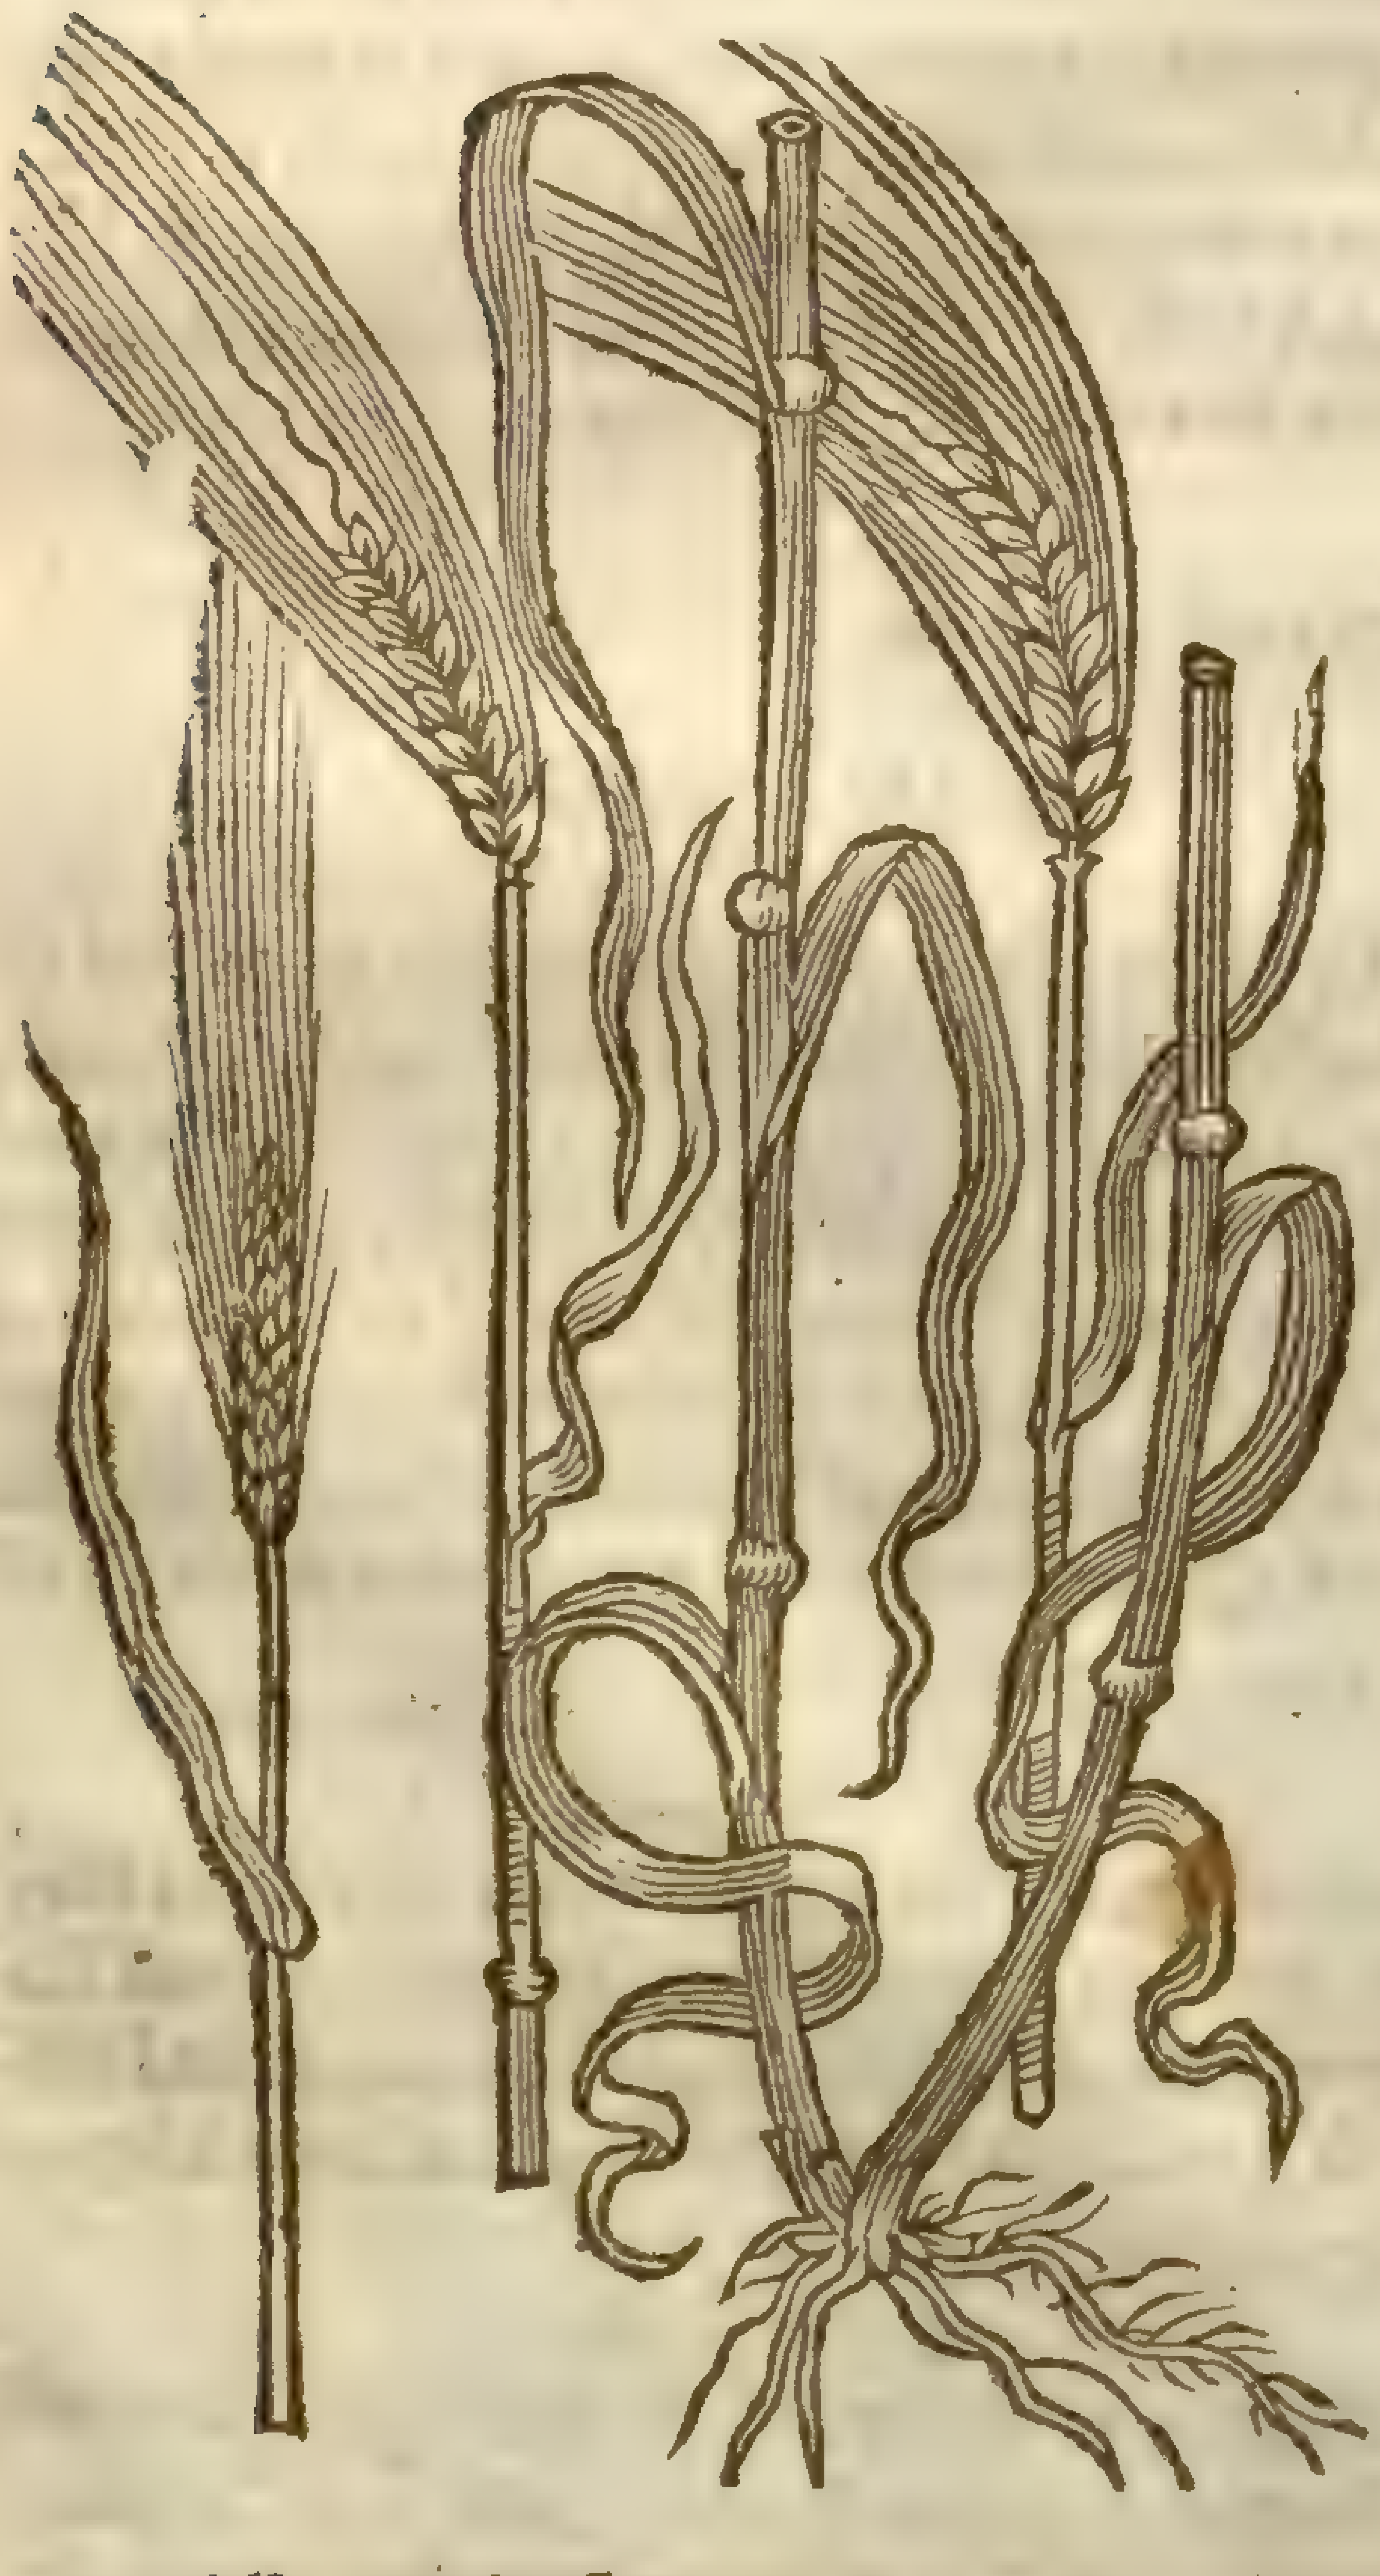
Becauſe the Germanes haue great vſe of it to make ſtarch with, they do call it **Amelcorne:** We thinke good to name it in Latine, *Amyleum frumentum*: in Engliſh it may be called Amelcorne, after the German word; and may likewiſe be called Starch corne. *Tragus* and *Fuchſius* took it to be *Triticum trimeſtre*, or three moneths wheat: but it may rather be referred to the *Farra*; for *Columella* ſpeaketh of a graine called *Far Halicaſtrum*, which is ſowne in the Spring, and for that cauſe it is named *Trimeſtre*, or three moneths Far. If any be deſirous to learne the making of ſtarch, let them read *Dodonæus* laſt edition, where they ſhall be fully taught; my ſelfe not willing to ſpend time about ſo vain a thing, and not pertinent to the ſtory. It is vſed alſo to feed cattell and pullen, and is in nature ſomewhat like to Wheat or Barley.

Chap. 50. *Of Barley.*

¶ *The Deſcription.*

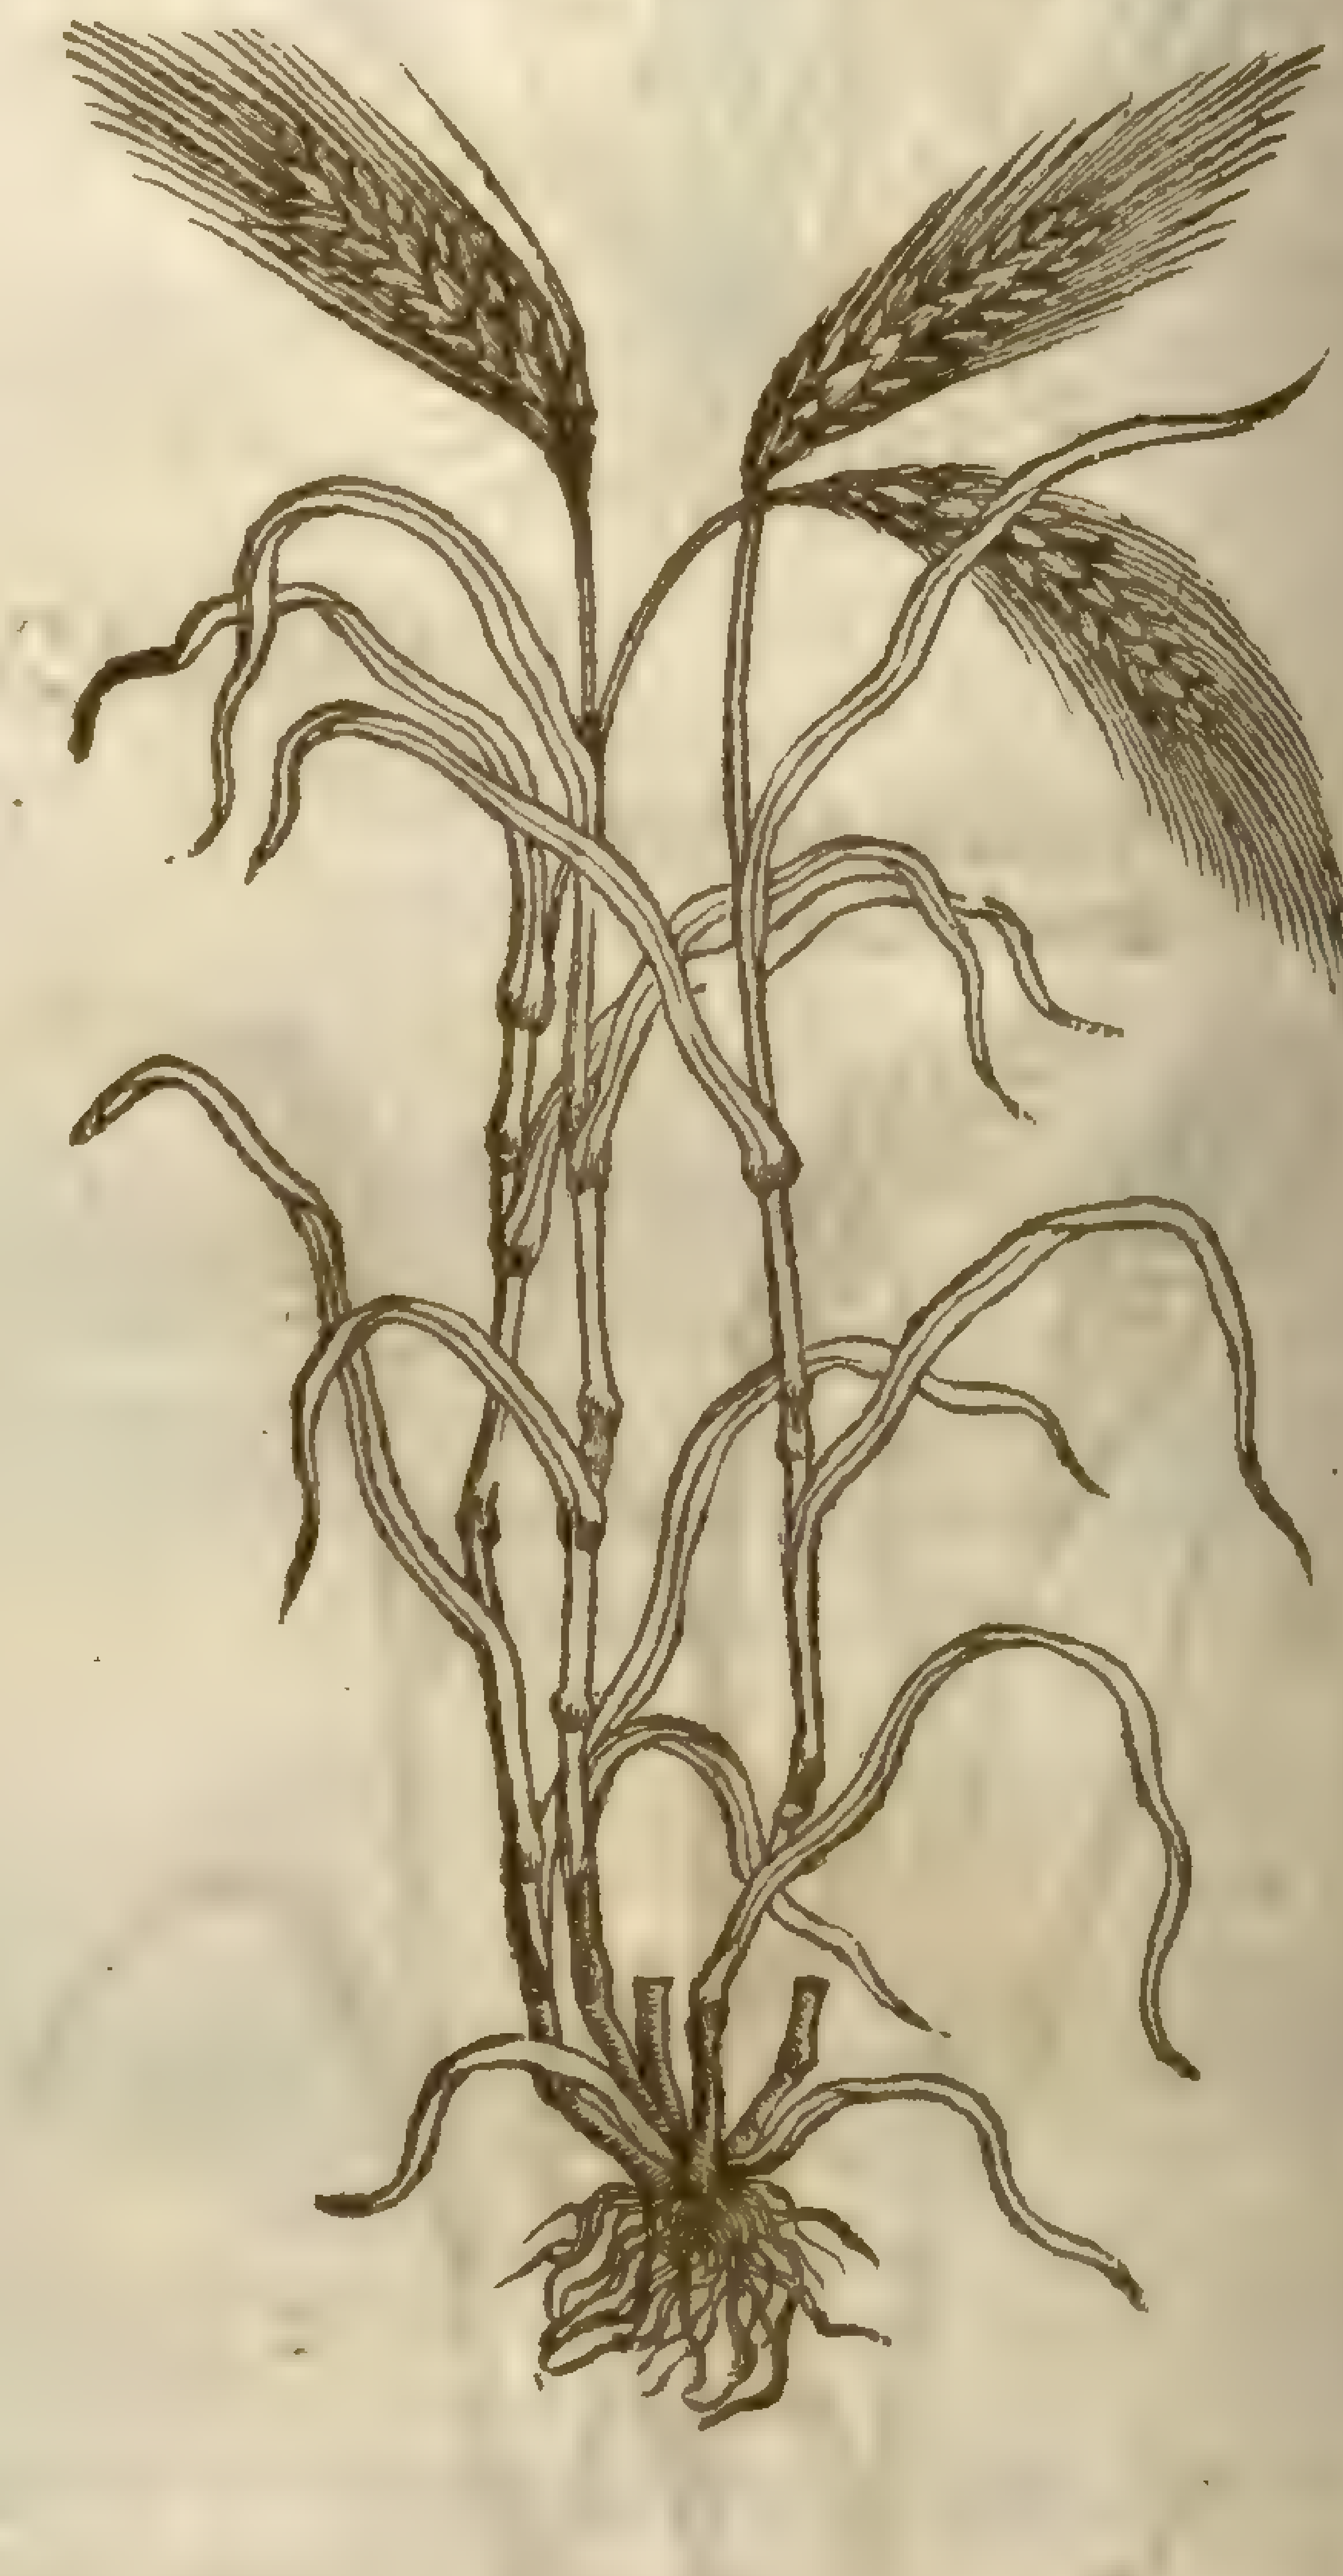
Barley hath an helme or ſtraw which is ſhorter and more brittle than that of Wheat, and hath more joints: the leaues are broader and rougher; the eare is armed with long rough & prickly beards or ailes, and ſet about with ſundry ranks, ſomtimes two, otherwhiles three, foure, or ſix at the moſt according to *Theophraſtus*, but eight according to *Tragus*. The grain is included in a long chaffie huske, the roots be ſlender, and grow thick together. Barley, as *Pliny* writeth, is of all grain the ſofteſt, and leaſt ſubiect to caſualtie, yeelding fruit very quickly and profitably.

1 *Hordeum diſtichon.*
Common Barley.



H. vulgare, L. [illegible]

2 *Hordeum Polyſtichum vernum.*
Beare Barley, or Barley Big.



1 The moſt vſuall Barley is that which hath but two rowes of corne in the eare, each grain ſet iuſt oppoſit to other, and hauing his long awne at his end, is couered with an huske ſticking cloſe thereto.

2 This which commonly hath foure rowes of corne in the eare, and ſometimes more, as wee haue formerly deliuered, is not ſo vſually ſowne with vs: the eare is commonly ſhorter than the former, but the graine very like; ſo that none who knowes the former but may eaſily know the later at the firſt ſight.

¶ *The Place.*

They are ſowne, as *Columella* teacheth, in looſe and dry ground, and are well knowne all Europe through.

2 The ſecond is ſowne commonly in ſome parts of Yorke ſhire and the Biſhopricke of Durham.

¶ *The Names.*

1 The firſt is called of the Grecians, κριθή: in high Dutch, **Gerſten**: in Low-Dutch, **Gerſt**: in Italian, *Orzo*: in Spaniſh, *Ceuada*: in French, *Orge*: in Engliſh, Barley.

2 The ſecond is called of the Grecians, πολύστιχος, and alſo ἑξάστιχος: *Columella* calleth it *Galaticum*: and *Hippocrates*, ἀχίλλειος κριθή: of our Engliſh Northerne people, Big, and Barley Big. *Crimnon* (ſaith *Galen* in his Commentaries vpon the ſecond booke of *Hippocrates* his Prognoſtickes) is the groſſer part of Barley meale being groſſely ground. Malt is well knowne in England, inſomuch that the word needeth no interpretation: notwithſtanding becauſe theſe Workes may chance into ſtrangers hands that neuer heard of ſuch a word, or ſuch a thing, by reaſon it is not euery where made, I thought good to lay downe a word of the making thereof. Firſt, it is ſteeped in water vntil it ſwel, then is it taken from the water, and laid (as they terme it) in a Couch, that is, ſpred vpon an euen floore the thickneſſe of ſome foot and a halfe; and thus it is kept vntill it Come, that is, til it ſend forth two or three little ſtrings or fangs at the end of each Corne. Then it is ſpred vſually twice a day, each day thinner than other, for ſome eight or ten dayes ſpace, vntill it be pretty dry, and then it is dried vp with the heate of the fire, and ſo vſed. It is called in high-Dutch, **Maltz**: in Low-Dutch, **Mout**: in Latine of later time, *Maltum*; which name is borrowed of the Germans. *Aetius* a Greeke Phyſitian nameth Barley thus prepared, *Byne*, or *Bine*: and he alſo affirmeth, That a plaiſter of the meale of Malt is profitably laid vpon the ſwellings of the Dropſie. *Zythum*, as *Diodorus Siculus* affirmeth) is not only made in Egypt, but alſo in Galatia: The aire is ſo cold (ſaith he writing of Galatia) that the country bringeth forth neither wine nor oile, and therefore men are compelled to make a compound drinke of Barly, which they call *Zythum*. *Dioſcorides* nameth one kind of Barly drinke *Zythum*: another, *Curmi*. *Simeon Zethi* a later Grecian calls this kind of drink by an Arabicke name, φοῦκας: in Engliſh we call it Beere and Ale which is made of Barley Malt.

¶ *The Temperature.*

Barley, as *Galen* writeth in his booke of the Faculties of Nouriſhments, is not of the ſame temperature that wheat is, for wheat doth manifeſtly heate; but contrariwiſe, what medicine or bread ſoeuer is made of Barly, is found to haue a certain force to coole and dry in the firſt degree, according to *Galen* in his booke of the Faculties of Simples. It hath alſo a little abſterſiue or clenſing qualitie, and drieth ſomewhat more than Bean meale.

¶ *The Vertues.*

Barly, ſaith *Dioſcorides*, doth clenſe, prouoke vrine, breedeth windineſſe, and is an enemie to the ſtomacke. A

Barly meale boiled in an honied water with figs, taketh away inflammations: with pitch, roſin, and Pigeons dung, it ſoftneth and ripeneth hard ſwellings. B

With Melilot and Poppy ſeeds it taketh away the pain in the ſides: it is a remedie againſt windineſſe in the guts, being applied with Lineſeed, Fœnugreek, and Rue: with tar, wax, oile, and the vrine of a yong boy, it doth digeſt, ſoften, and ripe hard ſwellings in the throat, called the Kings-Euill. C

Boiled with wine, Myrtles, the barke of the Pomegranate, wilde peares, and the leaues of brambles, it ſtoppeth the laske. D

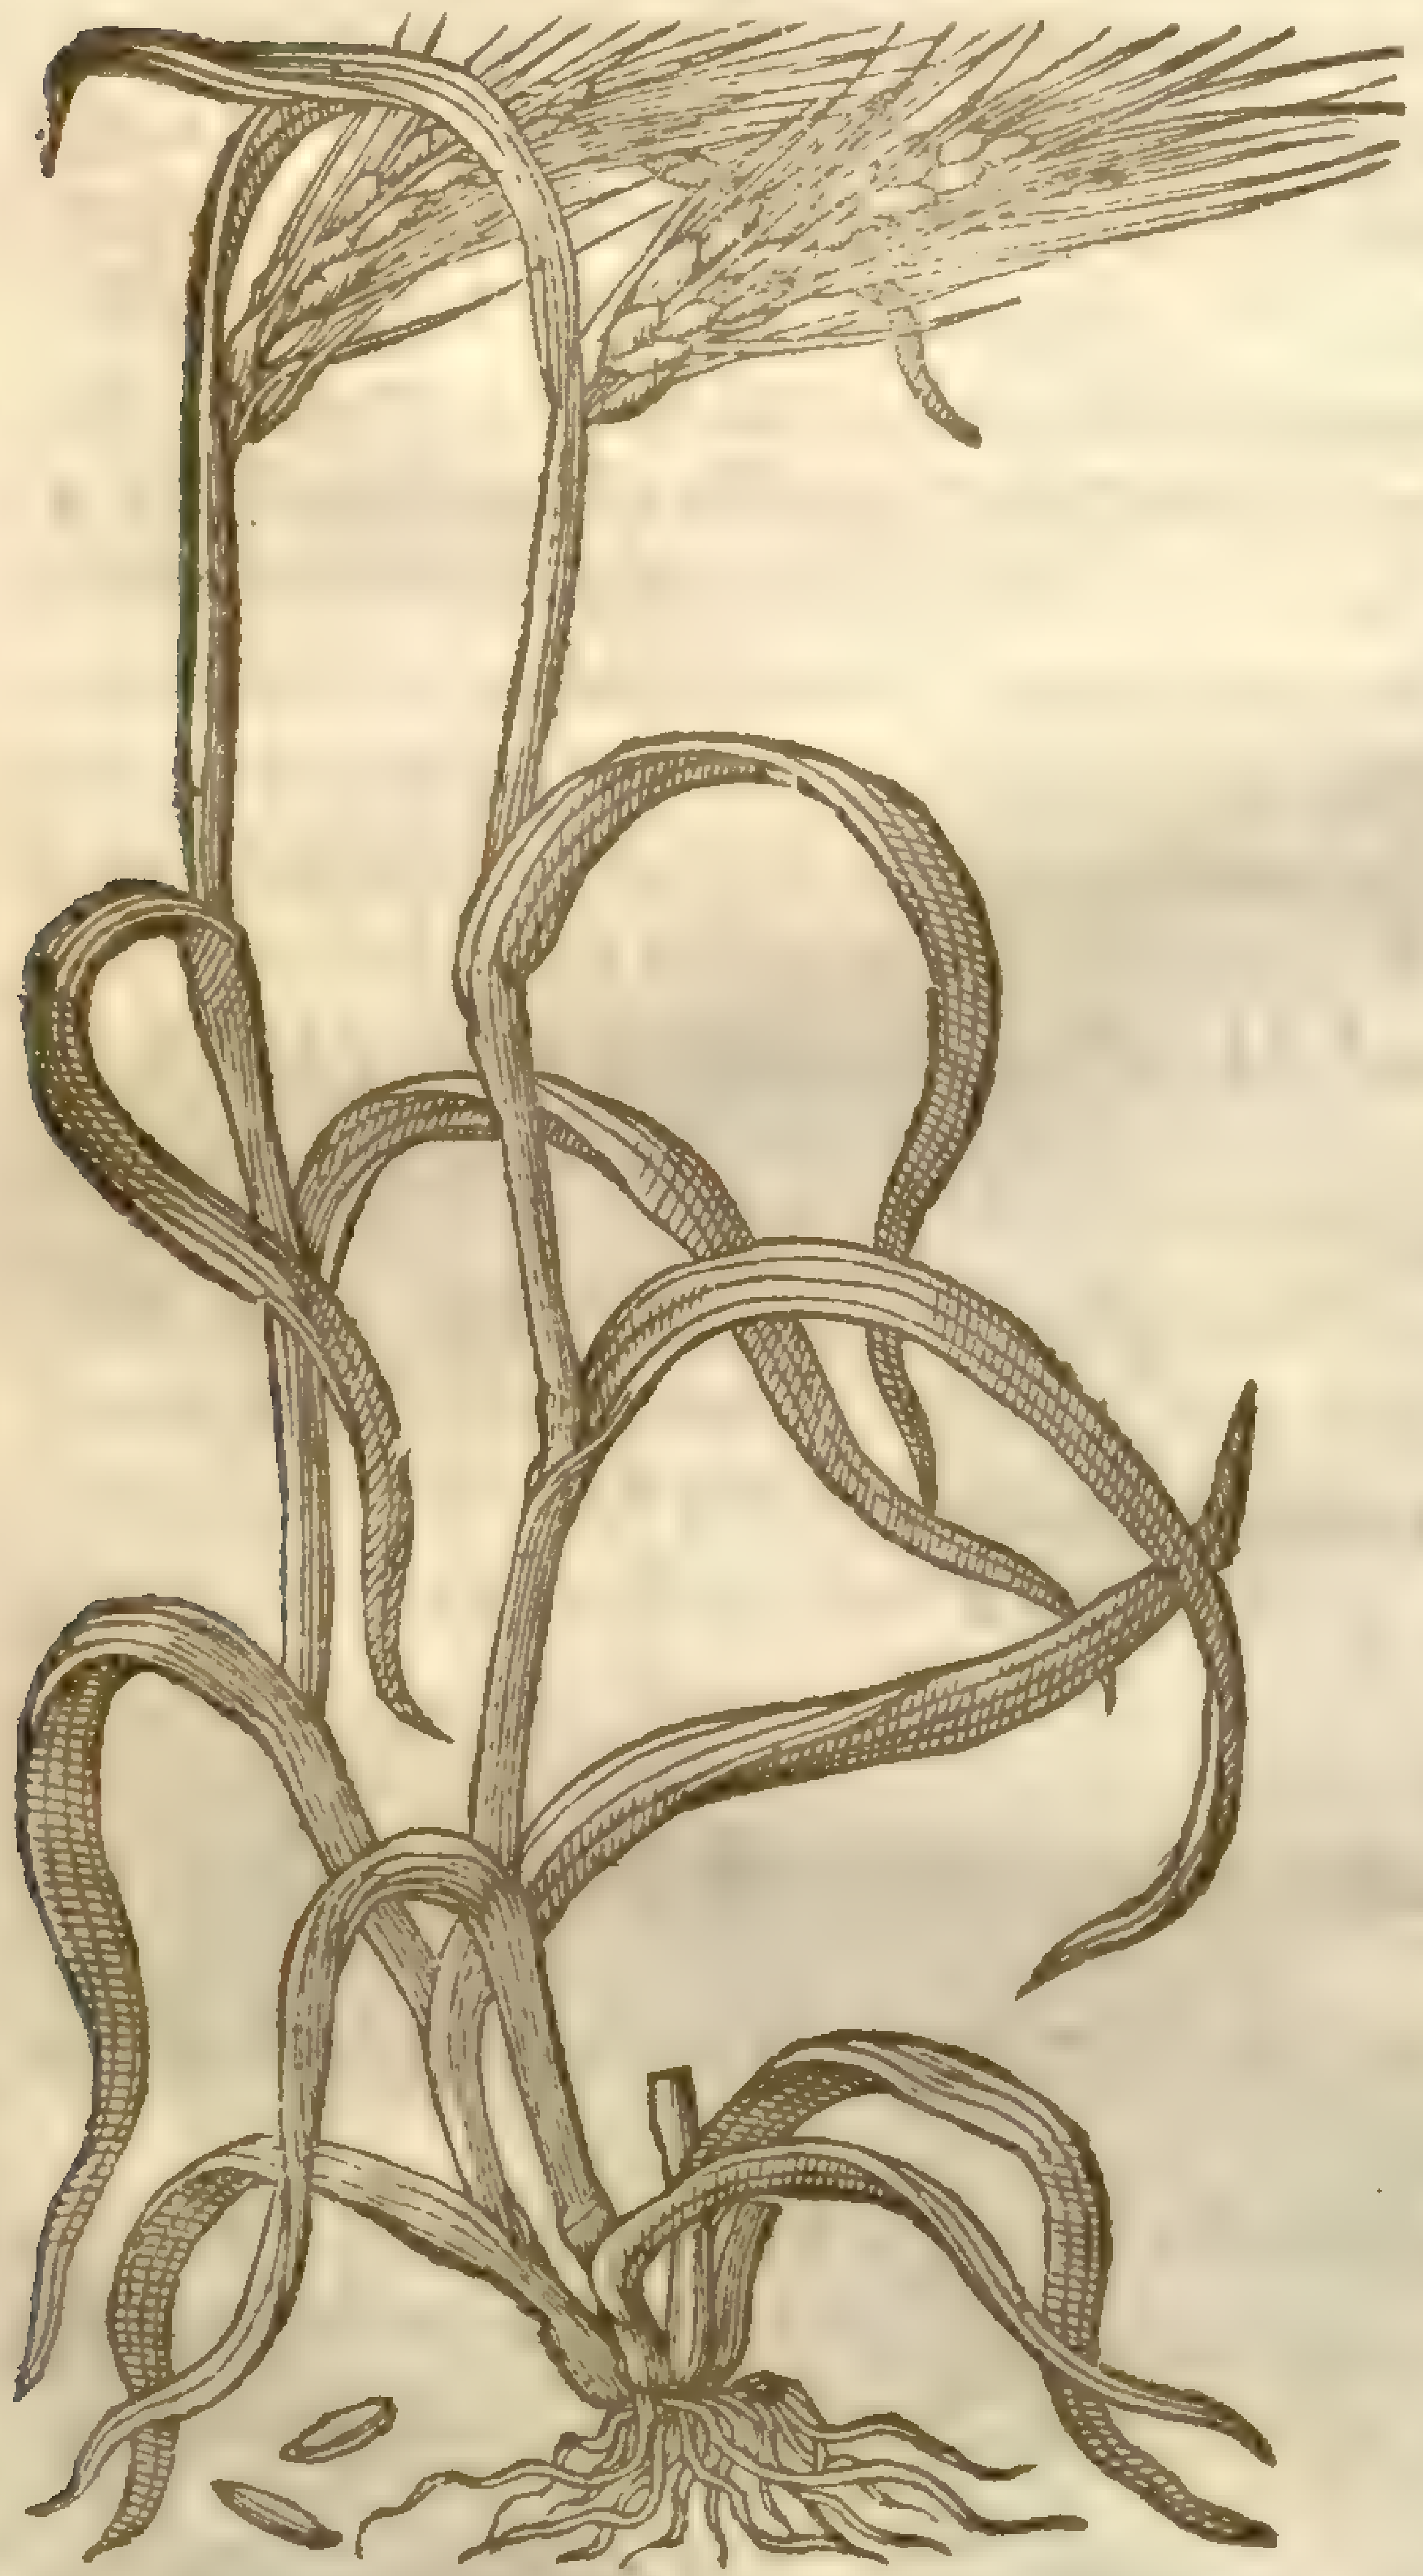
Further, it ſerueth for *Ptiſana*, *Polenta*, *Maza*, Malt, Ale, and Beere: the making whereof if any be deſirous to learne, let them reade *Lobels Adverſaria*, in the chapter of Barly. But I think our London Beere Brewers are not to learne to make Beere of either French or Dutch, much leſſe of me that can ſay nothing therein of mine owne experience, more than by the writings of others. But I may deliuer vnto you a Confection made thereof, (as *Columella* did concerning ſweet Wine ſodden to the halfe) which is this; Boile ſtrong Ale till it come to the thickneſſe of hony, or the form of an vnguent or ſalue, which applied to the paines of the ſinues and joints (as hauing the propertie to abate Aches and pains) may for want of better remedies be vſed for old and new ſores, if made after this manner: E

Take ſtrong Ale two pound, one Oxe gall, and boile them to one pound with a ſoft fire, continually ſtirring it; adding thereto of Vineger one pound, of *Olibanum* one ounce, floures of Camomil and melilot of each ℥ 1. Rue in fine pouder ℥s. a little hony, and a ſmall quantity of the pouder of Comin ſeed; boile them all together to the forme of an vnguent, and ſo apply it. There be ſundry ſorts of Confections made of Barley, as *Polenta*, *Ptiſana*, made of Water and husked or hulled Barley and ſuch like. *Polenta* is the meat made of parched Barley, which the Grecians doe pro- F perly call *Alphiton*. Maza is made of parched Barley tempered with water, after *Hippocrates* and *Xenophon*. *Cyrus* hauing called his ſouldiers together,exhorted them to drinke water wherein parched Barley meale had been ſteeped,calling it by the ſame name *Maza*.*Heſychius* doth interpret *Maza* to be Barley meale mixed with water and oile.

Barley meale boiled in water,with garden Nightſhade, the leaues of garden Poppy, the pouder of Fœnigreeke and Lineſeed,and a little Hogs greaſe,is good againſt all hot & burning ſwellings, and preuaileth againſt the dropſie,being applied vpon the belly.

Chap. 51. *Of naked Barley.*

Hordeum nudum.
Naked Barley.



¶ *The Deſcription.*

Hordeum nudum is called *Zeopyrum*,and *Tritico Speltum*, becauſe it is like to *Zea*, otherwiſe called *Spelta*, and is like to that which is called French Barley, whereof is made that noble drinke for ſicke folks,called *Ptiſana*. The plant is altogether like vnto Spelt,ſauing that the eares are rounder, the eiles or beards rougher or longer, and the ſeed or graine naked without huskes, like to wheat, the which in its yellowiſh color it ſomwhat reſembles.

¶ *The Place.*

‡ It is ſown In ſundry places of Germany,for the ſame vſes as Barley is.

¶ *The Names.*

It is called *Hordeum nudum*, for that the corne is without huske,and reſembleth Barly. In Greek it is called *Zeopyron*, becauſe it participateth in ſimilitude and nature with *Zea*,that is,*Spelt* and *Puros*,(that is)wheat. ‡

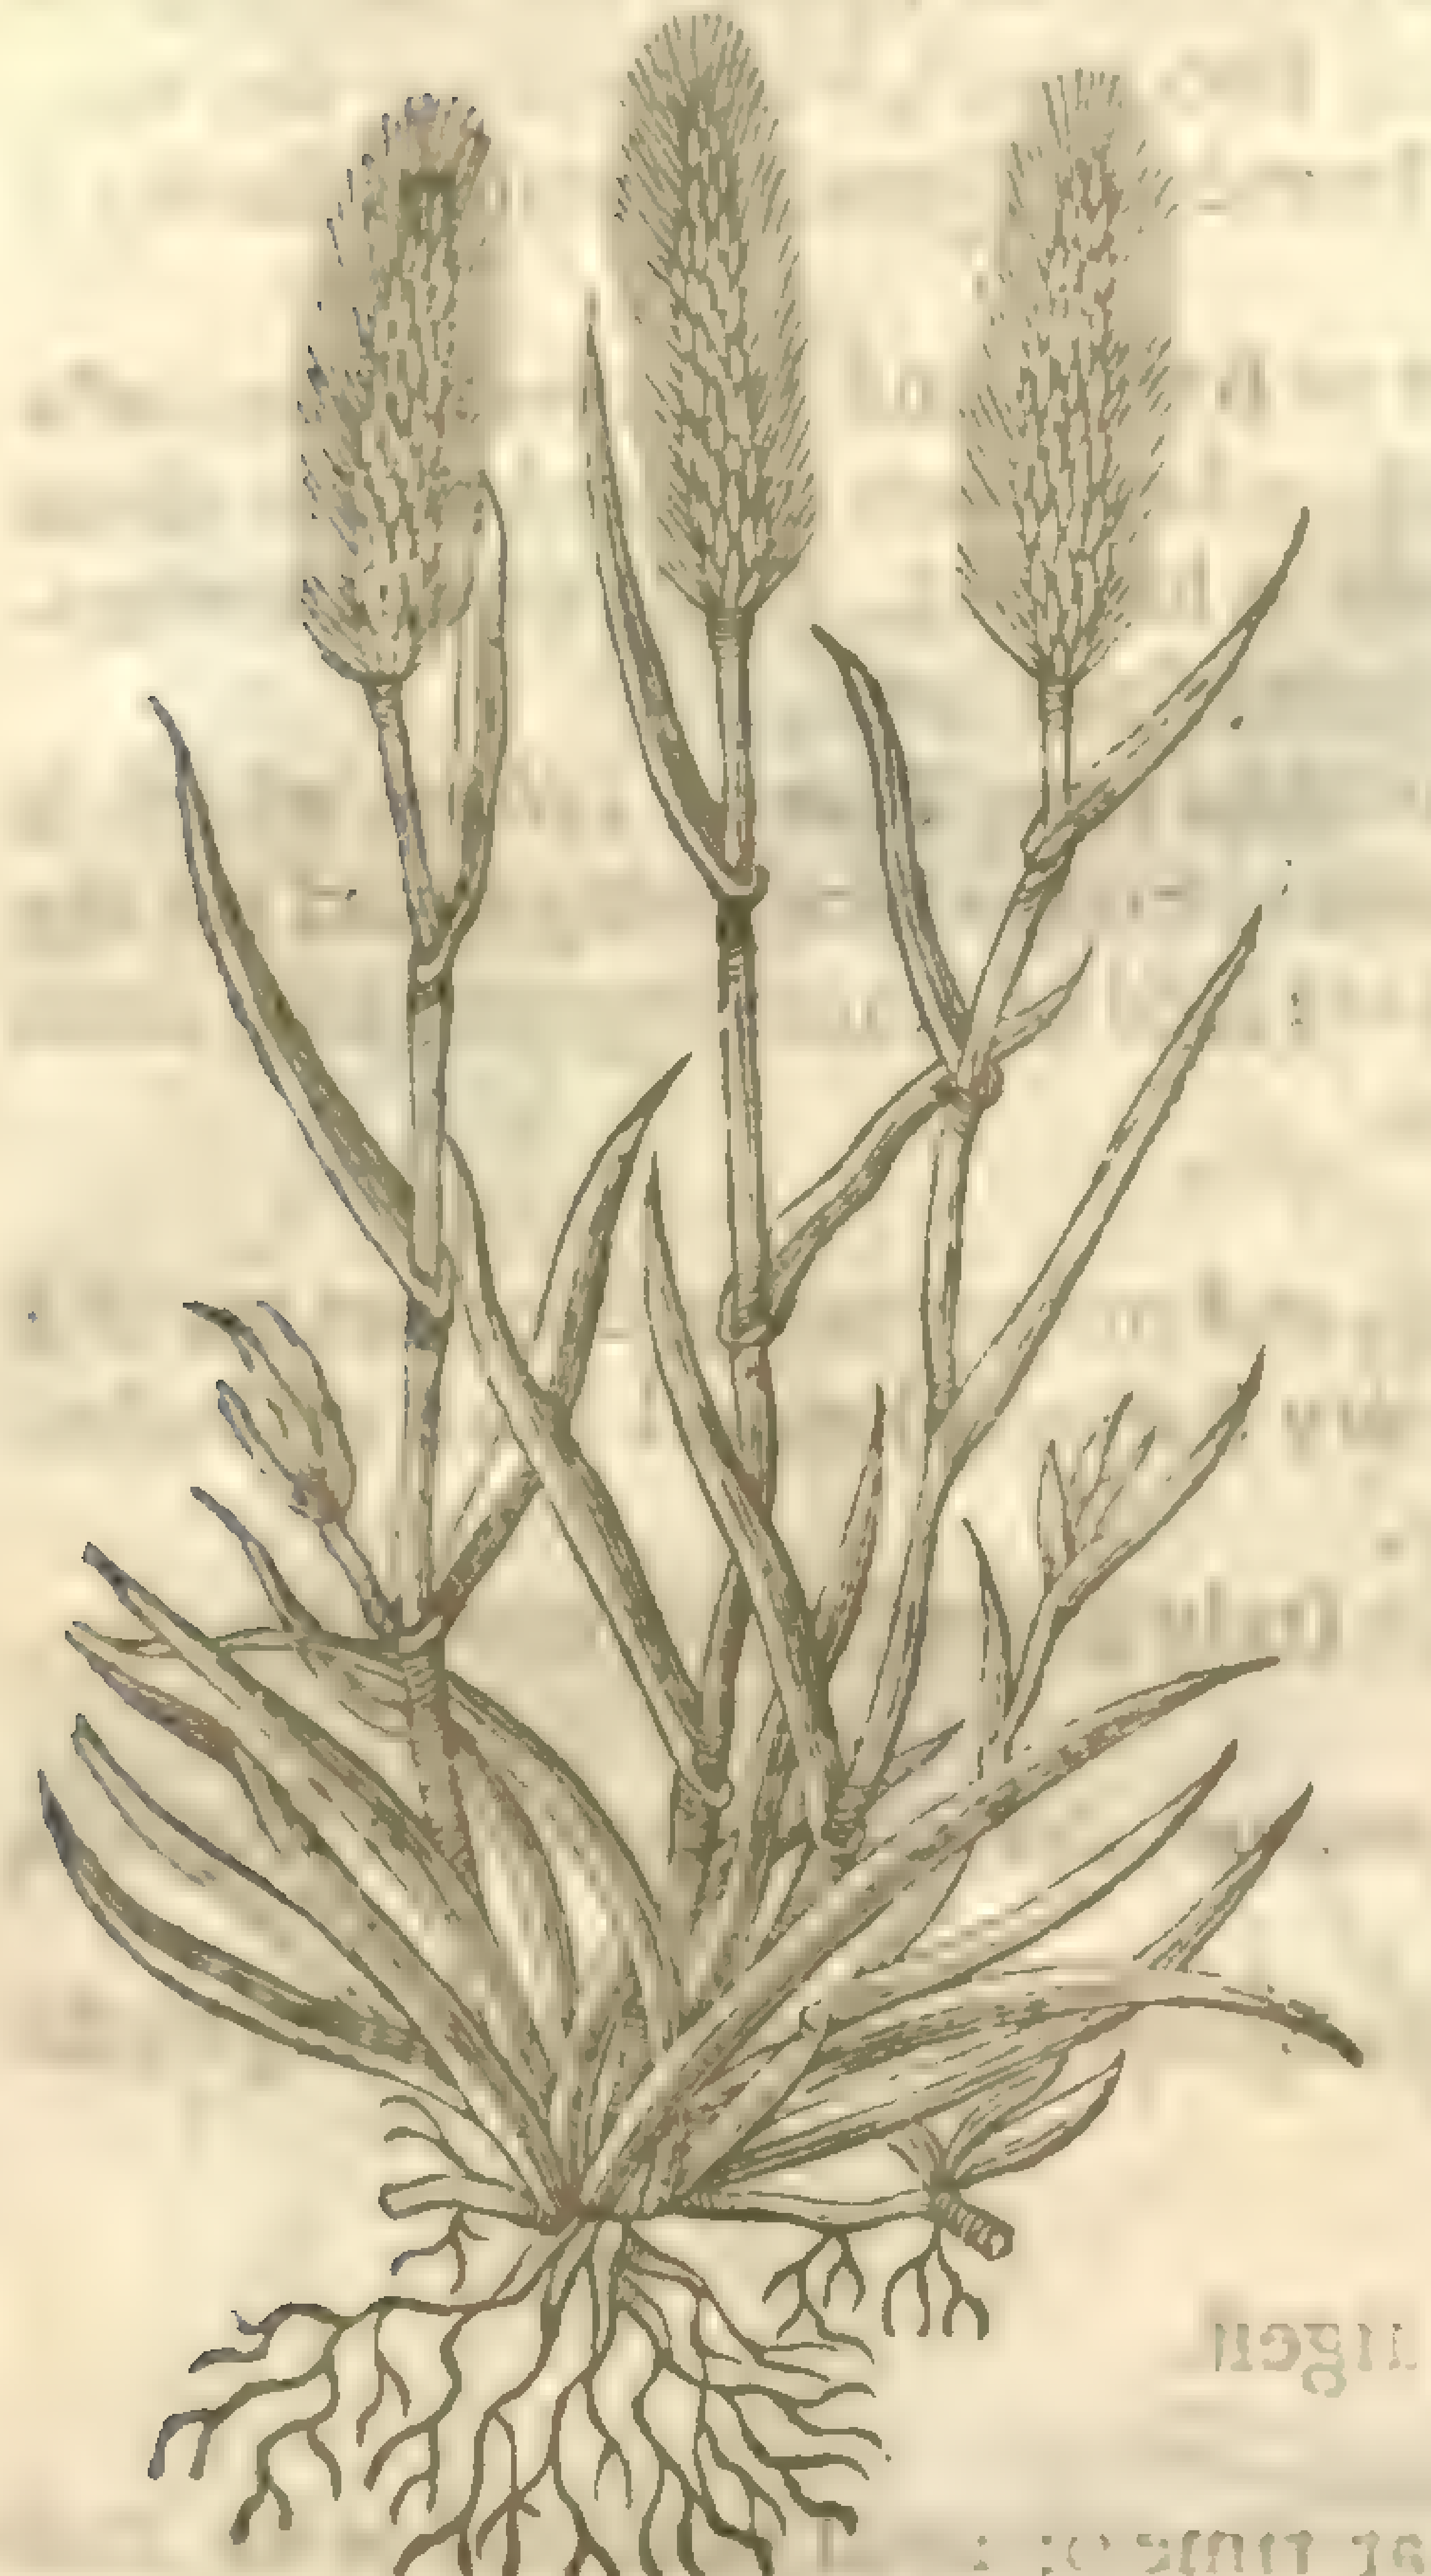
¶ *The Vertues.*

A This Barley boiled in water cooleth vnnatural and hot burning choler. In vehement feuers you may adde thereto the ſeeds of white Poppy and Lettuce, not onely to coole, but alſo to prouoke ſleepe.

B Againſt the ſhortneſſe of the breath, and paines of the breſt, may be added to all the foreſaid, figs,raiſins of the Sun,liquorice,and Anniſe ſeed.

C Being boiled in the whay of milke,with the leaues of Sorrel,Marigolds,and Scabious,it quencheth thirſt,and cooleth the heate of the inflamed liuer,being drunke firſt in the morning,and laſt to bedward.

Hordeum Spurium.
Wall Barley.



H. murinum [illegible]

CHAP. 52.

Of Wall-Barley.

¶ *The Deſcription.*

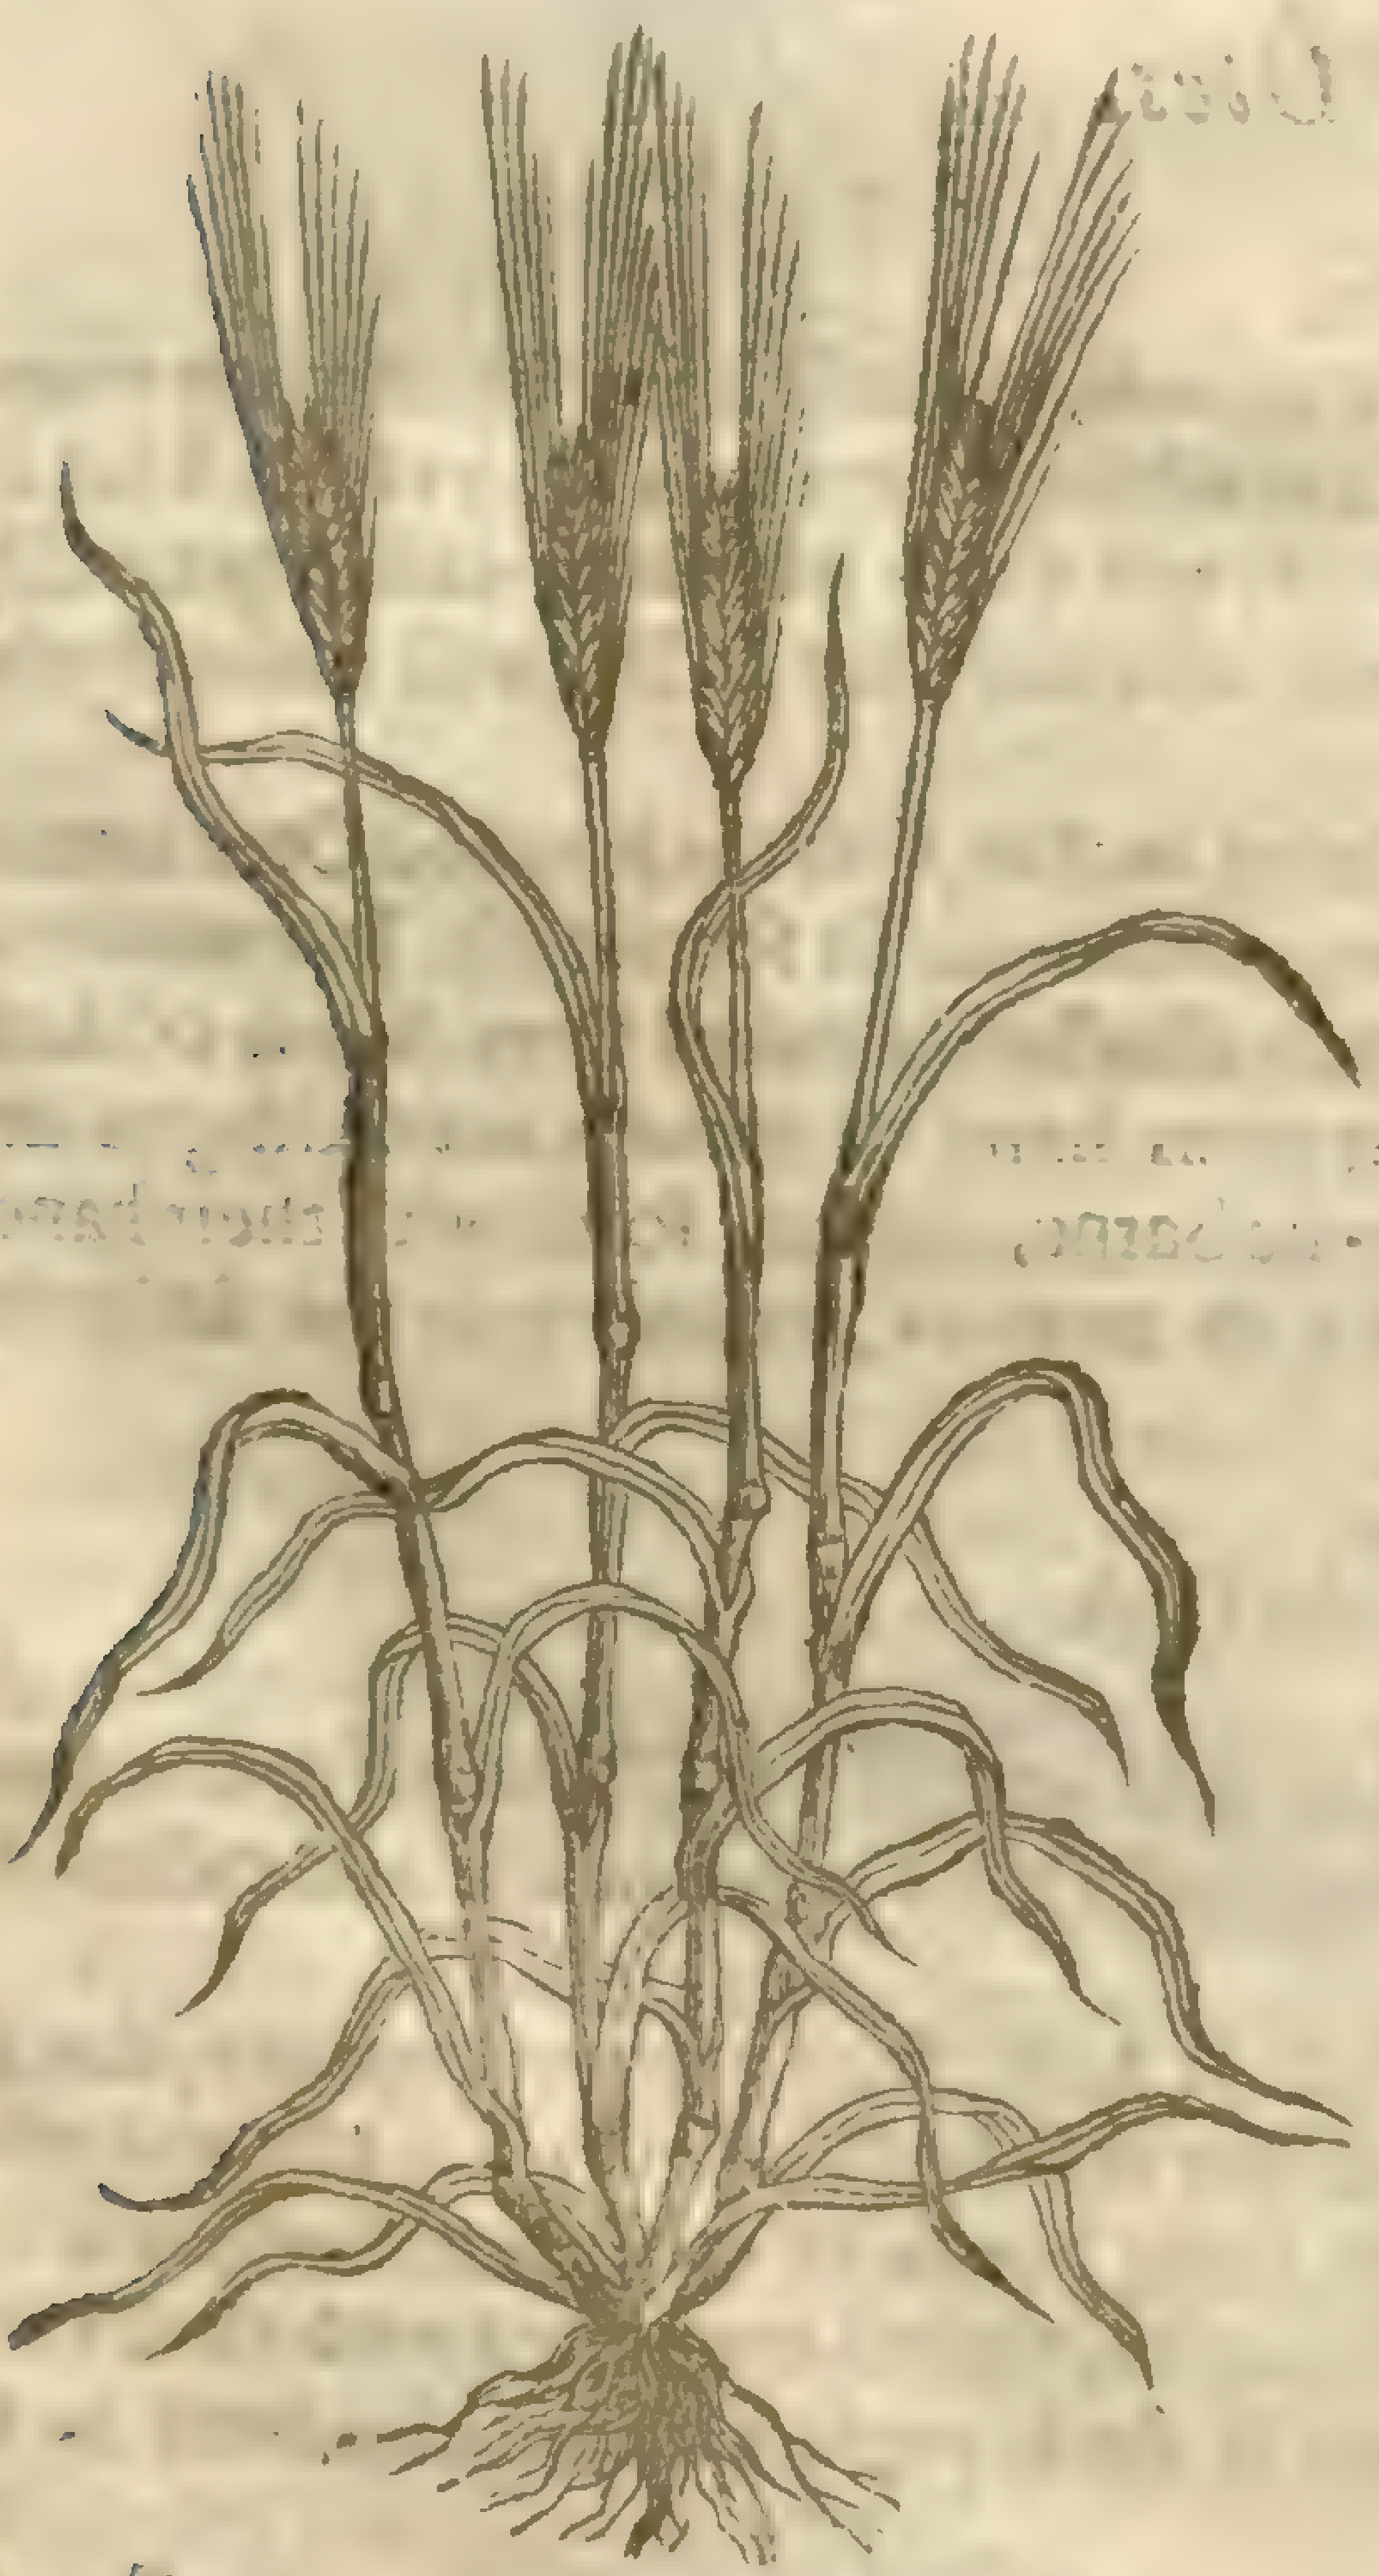
THis kinde of wilde Barley, is called of the Latines, *Hordeum Spurium*; of *Pliny*, *Holcus*: in Engliſh, Wall Barley, Way Barley, or after old Engliſh writers, Way Bennet. It groweth vpon mud walls and ſtony places by the wayes ſide; very wel reſembling ſelf-ſowed Barly, yet the blades are rather like graſſe than Barly. ‡ This groweth ſome foot or better in height, with graſſie leaues; the eare is very like that of Rie, and the corne both in colour and ſhape abſolutely reſembles it; ſo that it cannot be fitlier named, than by calling it wilde Rie, or Rie-graſſe. ‡

¶ *The Vertues.*

A This baſtard wilde Barley ſtamped and applied vnto places wanting haire, cauſeth it to grow and come forth; whereupon in old time it was called *Riſtida*.

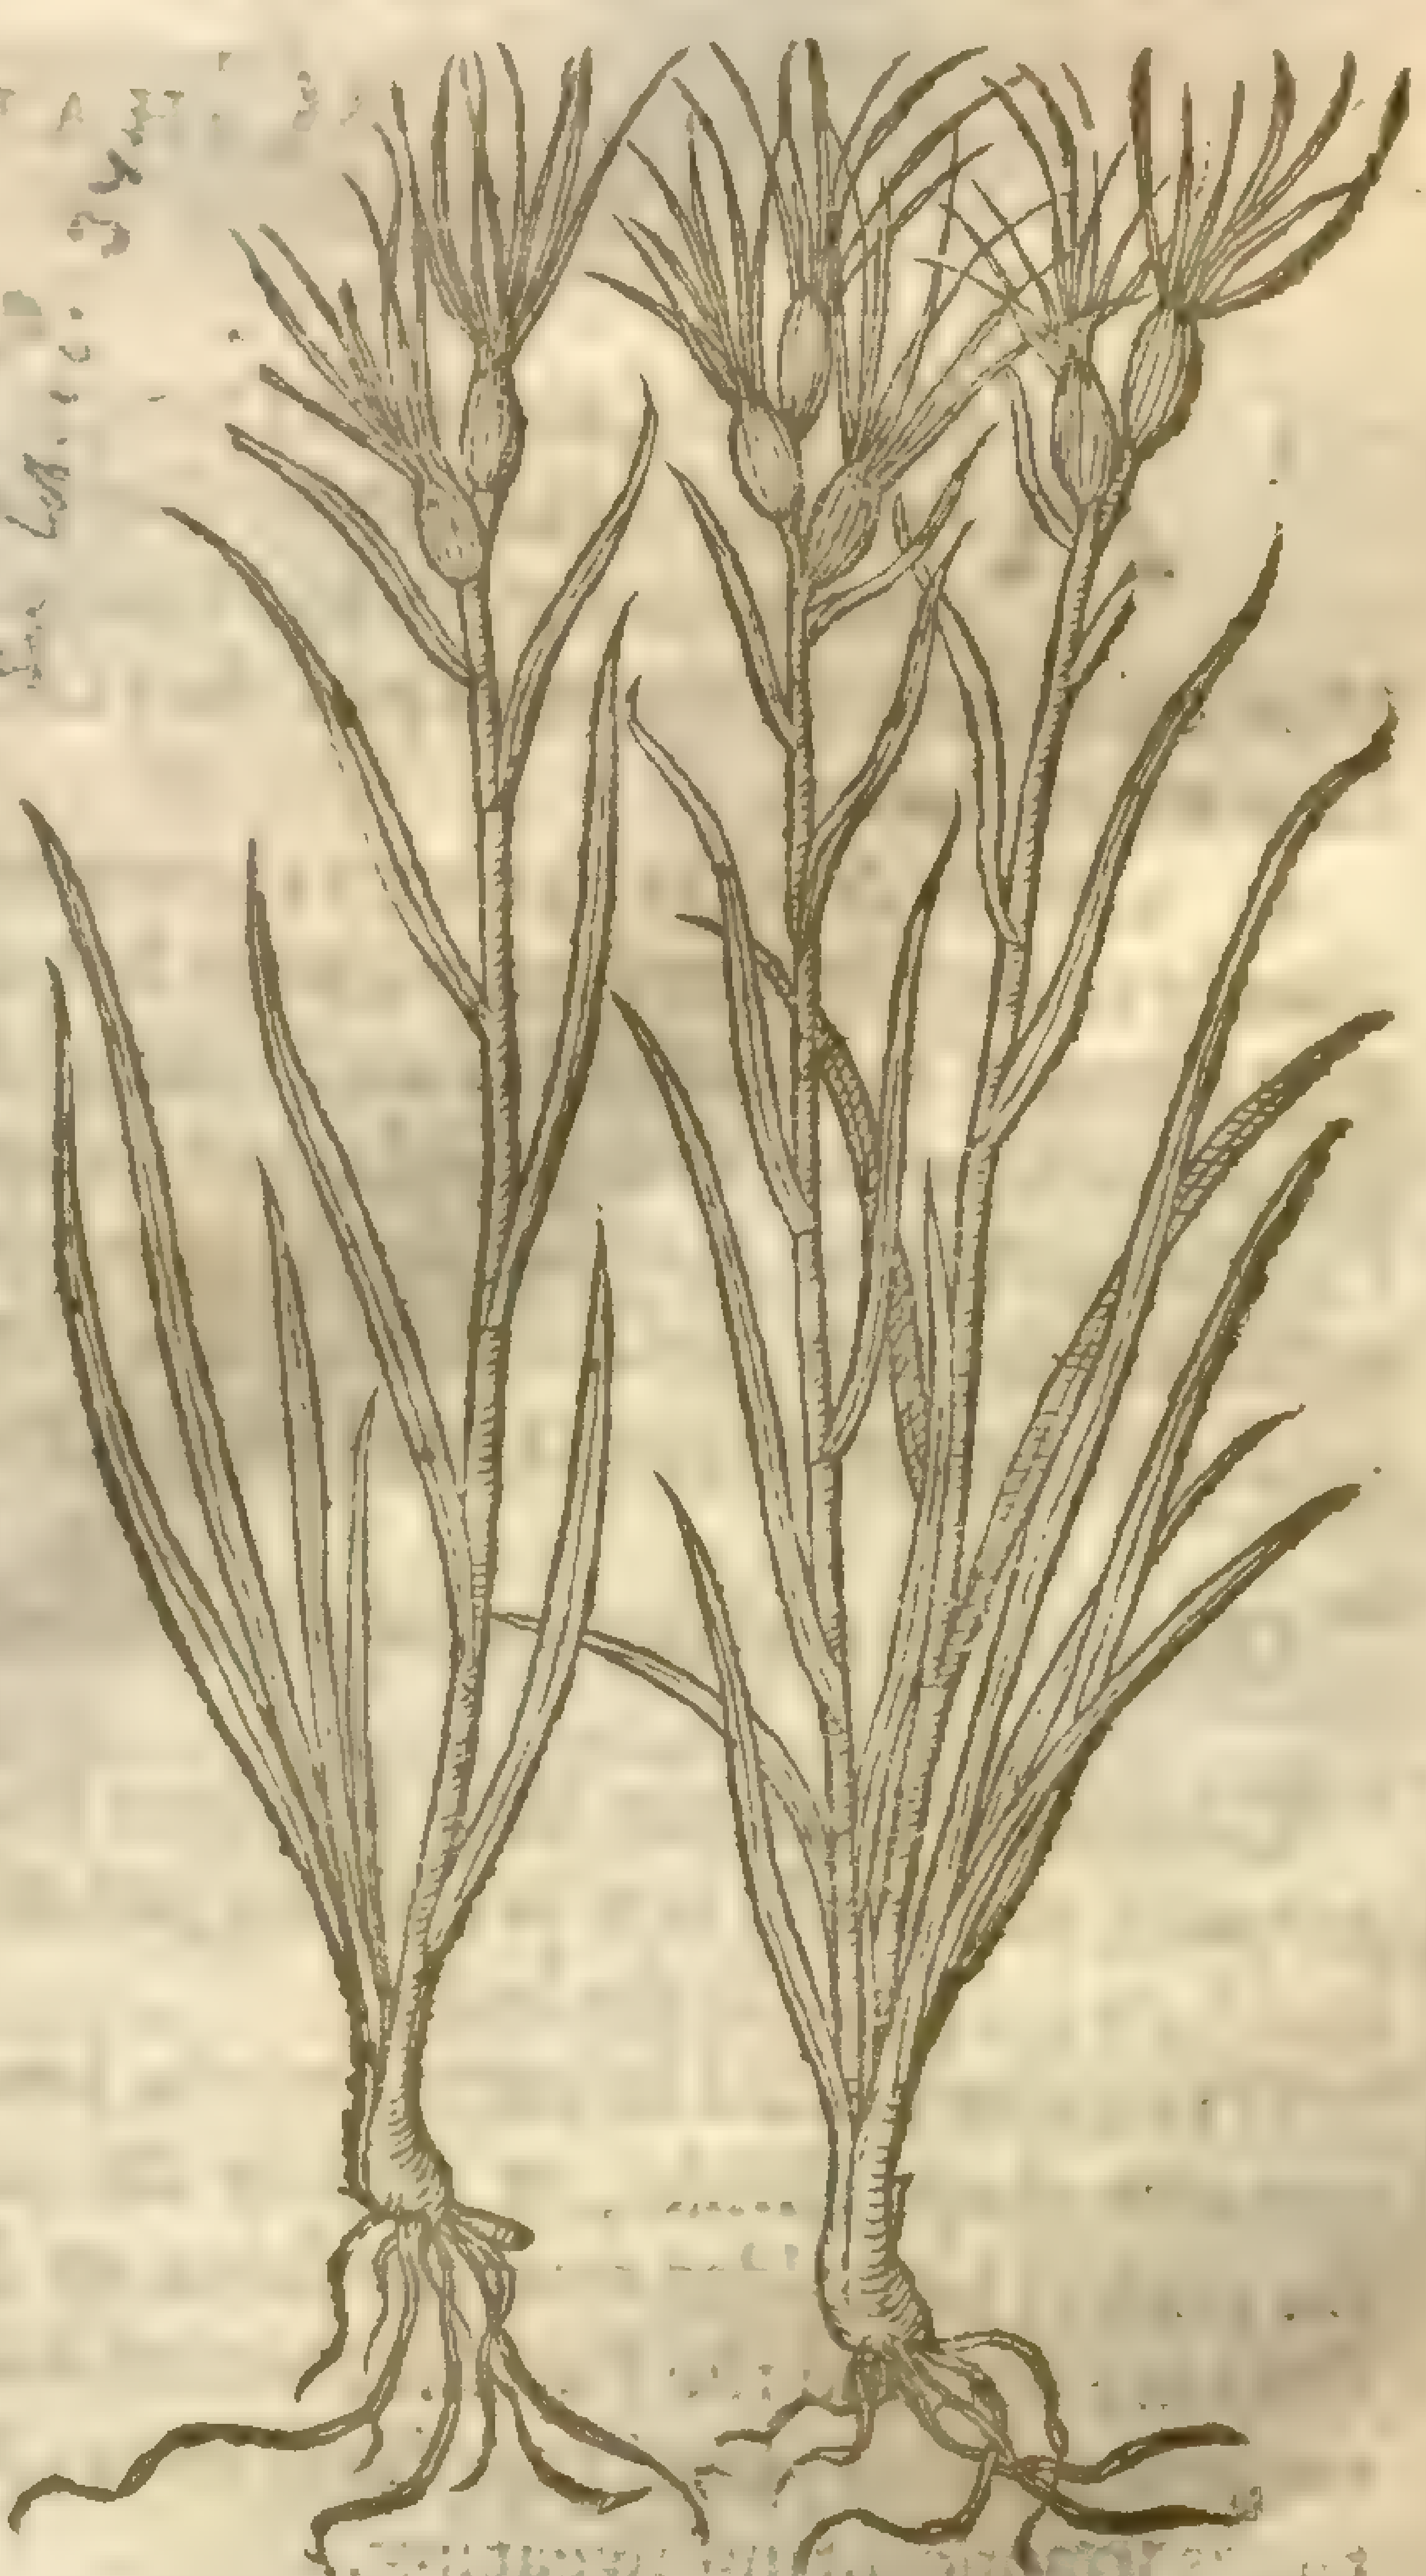
CHAP. 53. *Of S. Peters Corne.*

1 *Briza Monococcos.* S. *Peters* Corne.



Triticum monococcum [illegible]

2 *Feſtuca Italica.* Hauer-Graſſe.



Aegilops triuncialis [illegible]

¶ *The Deſcription.*

† 1 Briſa is a Corne whoſe leaues, ſtalkes, and eares are leſſe than Spelt; the eare reſembles our ordinary Barley, the Corne growing in two rowes, with awnes at the top, and huskes vpon it not eaſily to be gotten off. In colour it much reſembles Barley; yet *Tragus* ſaith it is of a blackiſh red colour.

2 This *Ægilops* in leaues and ſtalkes reſembles Wheat or Barley, and it growes ſome two handfuls high, hauing a little eare or two at the top of the ſtalke, wherein are incloſed two or three ſeeds a little ſmaller than Barley, hauing each of them his awne at his end. Theſe ſeeds are wrapped in a creſted filme or skinne, out of which the awnes put themſelues forth.

Matthiolus ſaith, That he by his owne triall hath found this to be true, That as *Lolium*, which is our common Darnel, is certainely knowne to be a ſeed degenerate from wheat, being found for the moſt part among wheat, or where wheat hath been: ſo is *Feſtuca* a ſeed or graine degenerating from Barley, and is found among Barley or where Barley hath been.

¶ *The Place.*

‡ 1 Briza is ſowen in ſome parts of Germany and France; and my memorie deceiues me if I haue not oftentimes found many eares thereof amongſt ordinary Barley, when as I liued in the further ſide of Lincolneſhire, and they there call it Brant Barley.

2 This *Ægilops* growes commonly among their Barley in Italy and other hot countries. ‡

¶ *The Names.*

1 *Briza Monococcos*, after *Lobelius*, is called by *Tabernamontanus*, *Zea Monococcos*: in Engliſh, Saint *Peters* Corne, or Brant Barley.

2 *Feſtuca* of Narbone in France is called, Αἰγίλωψ: in Latine, *Ægilops Narbonenſis*, according to the Greeke: in Engliſh, Hauer-graſſe.

¶ *The Nature.*

They are of qualitie ſomewhat ſharpe, hauing facultie to digeſt.

¶ *The Vertues.*

A The juice of *Feſtuca* mixed with Barley meale dried, and at time of need moiſtned with Roſe water, applied plaiſterwiſe, healeth the diſeaſe called *Ægilops*, or fiſtula in the corner of the eye: it mollifieth and diſperſeth hard lumps, and aſſwageth the ſwellings of the joynts.

Chap. 54. *Of Otes.*

¶ *The Deſcription.*

1 *Avena Veſca*, common Otes, is called *Veſca, à Veſcendo*, becauſe it is vſed in many countries to make ſundry ſorts of bread, as in Lancaſhire, where it is their chiefeſt bread corne for Iannocks, Hauer cakes, Tharffe cakes, and thoſe which are called generally Oten cakes; and for the moſt part they call the graine Hauer, whereof they do likewiſe make drinke for want of Barley.

2 *Auena Nuda* is like vnto the common Otes; differing in that, that theſe naked Otes immediately as they be threſhed, without helpe of a Mill become Otemeale fit for our vſe. In conſideration whereof in Northfolke and Southfolke they are called vnhulled or naked Otes. Some of thoſe good houſe-wiues that delight not to haue any thing but from hand to mouth, according to our Engliſh prouerbe, may (while their pot doth ſeeth) go to the barne, and rub forth with their hands ſufficient for that preſent time, not willing to prouide for to morrow, according as the ſcripture ſpeaketh, but let the next day bring it forth.

¶ *The Nature.*

Otes are dry and ſomewhat cold of temperature, as *Galen* ſaith.

¶ *The Vertues.*

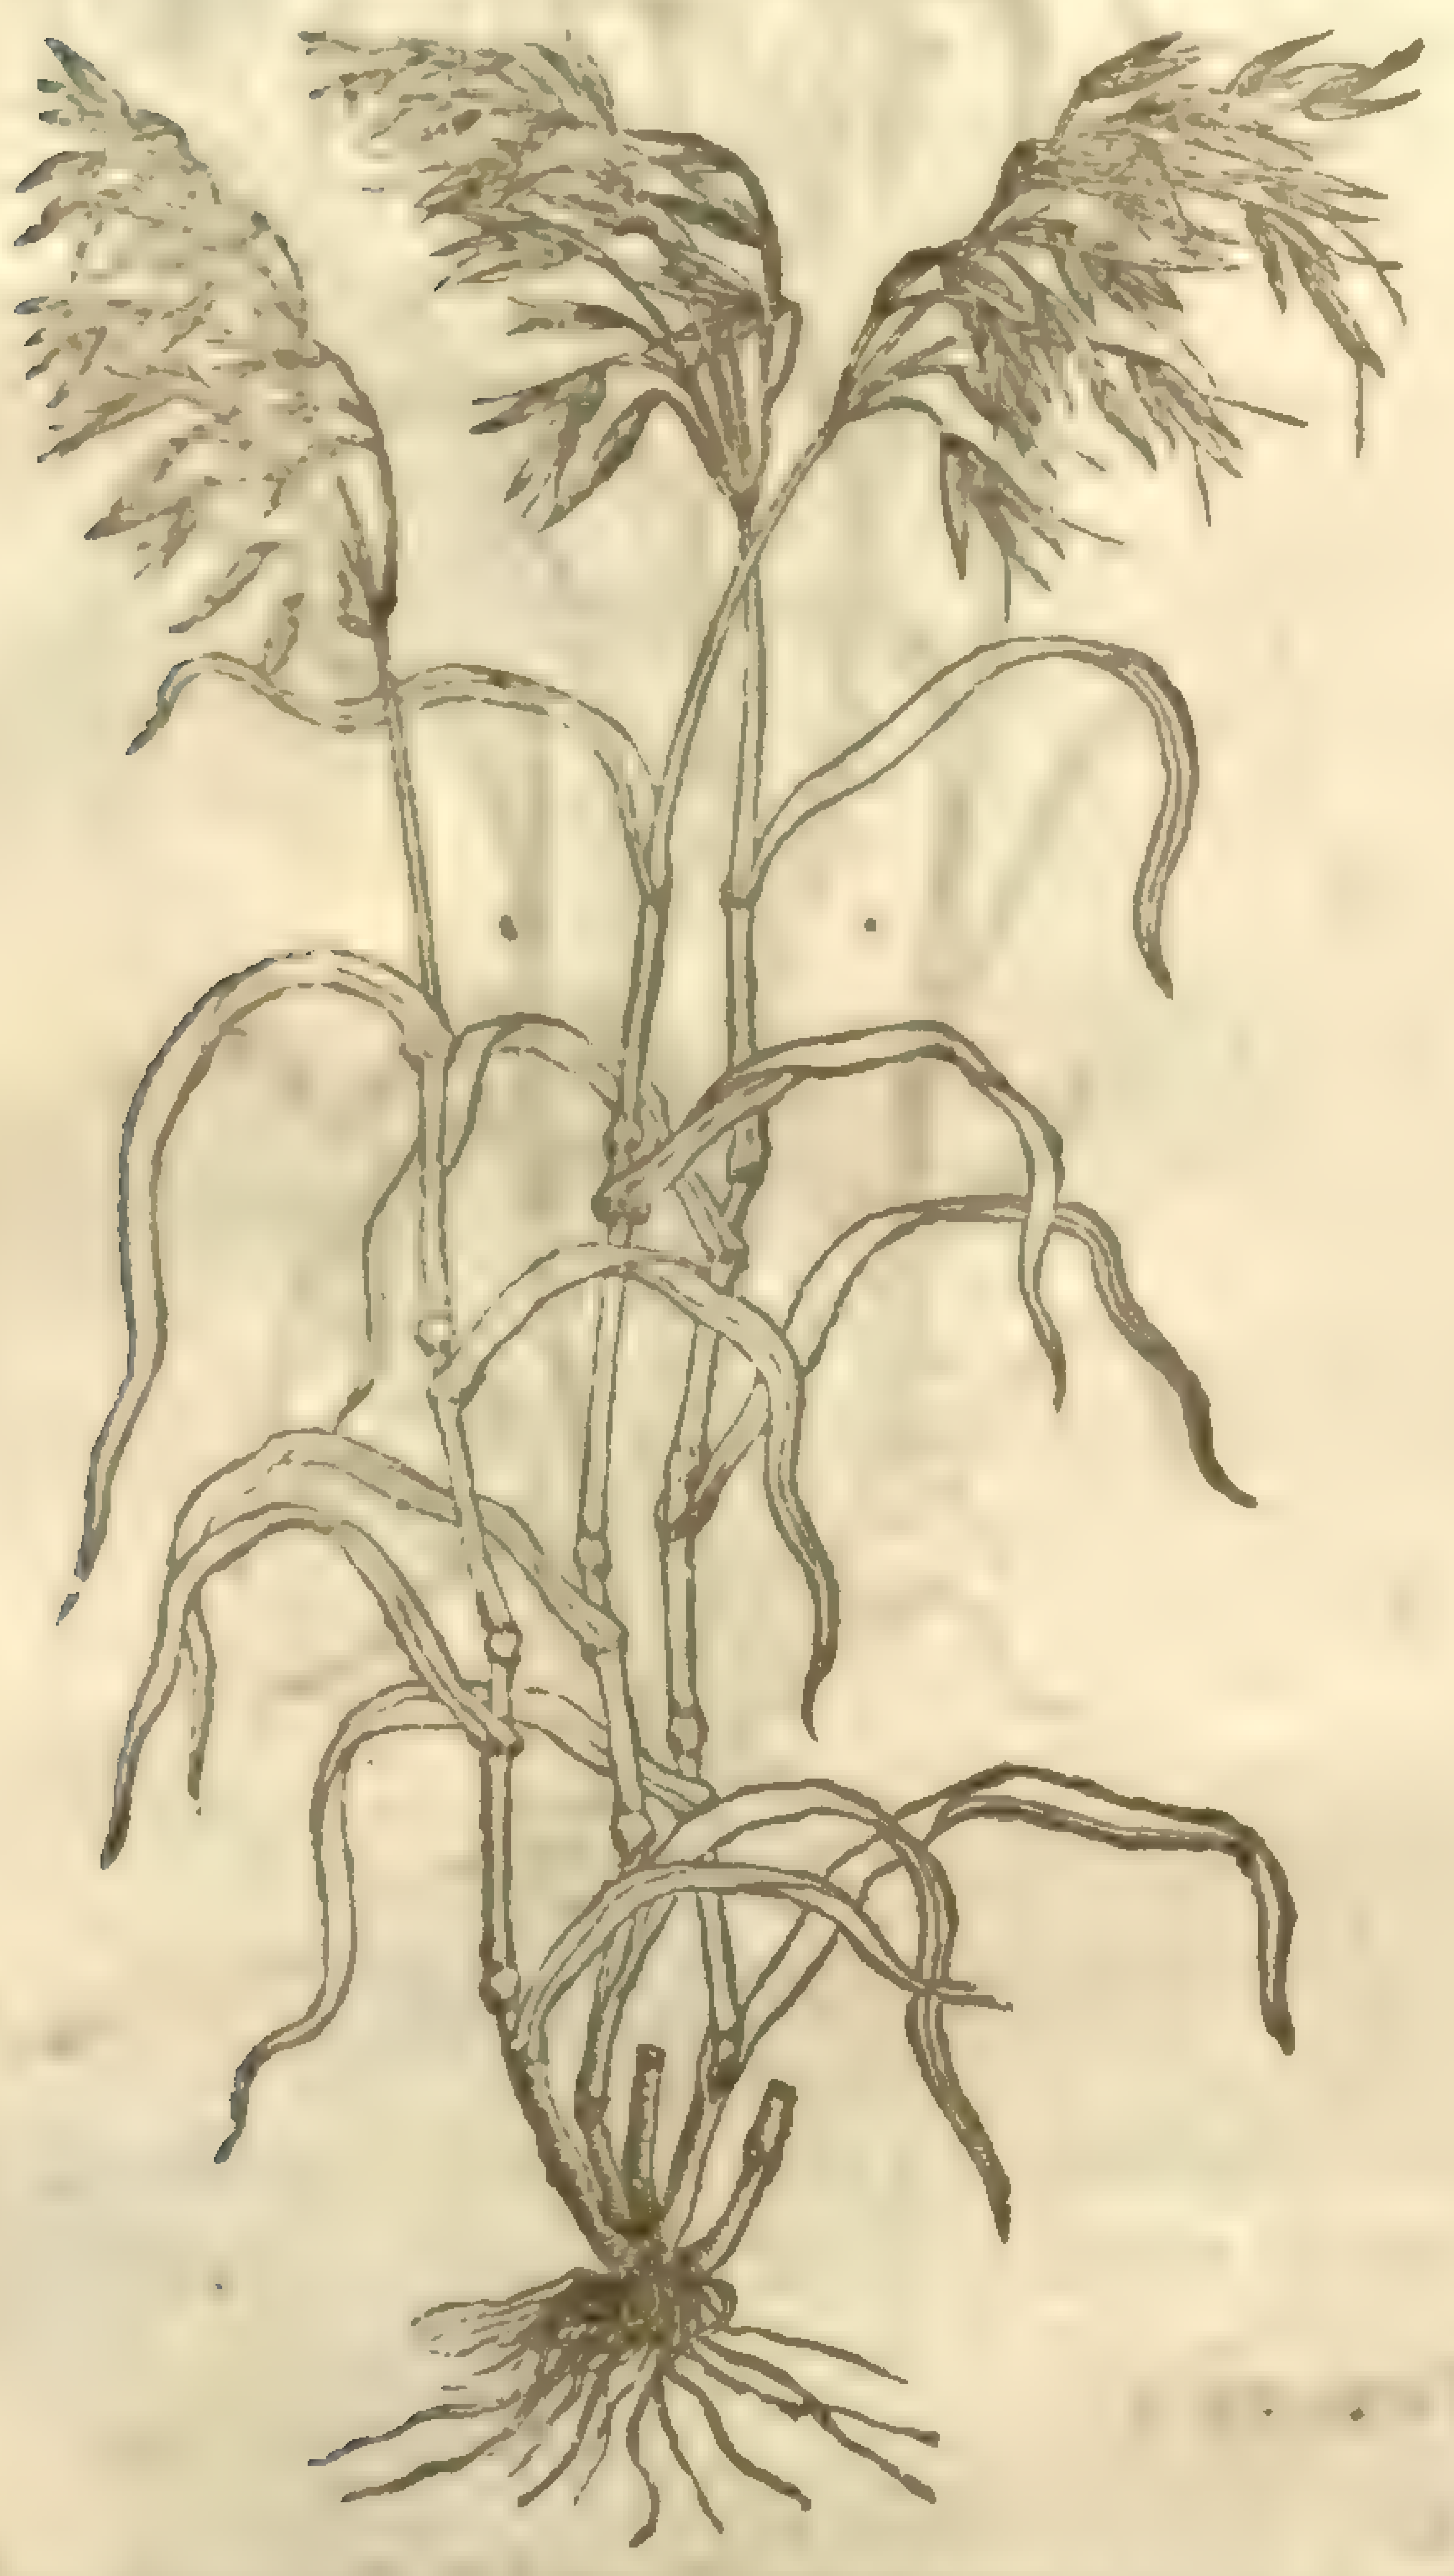
A Common Otes put into a linnen bag, with a little bay ſalt quilted handſomely for the ſame purpoſe, and made hot in a frying pan, and applied very hot, eaſeth the paine in the ſide called the ſtitch, or collicke in the belly.

B If Otes be boiled in water, and the hands and feet of ſuch as haue the *Serpigo* or *Impetigo*, that is, certaine chaps, chinks, or rifts in the palmes of the hands or feet (a diſeaſe of great affinitie with the pocks) be holden ouer the fume or ſmoke thereof in ſome bowle or other veſſell wherein the Otes are put, and the Patient couered with blankets to ſweat, being firſt annointed with that ointment or vnction vſually applied *contra Morbum Gallicum*: it doth perfectly cure the ſame in ſix times ſo annointing ſweating.

Otemeale is good for to make a faire and wel coloured maid to looke like a cake of tallow, eſpecially if ſhe take next her ſtomacke a good draught of ſtrong vinegre after it. C

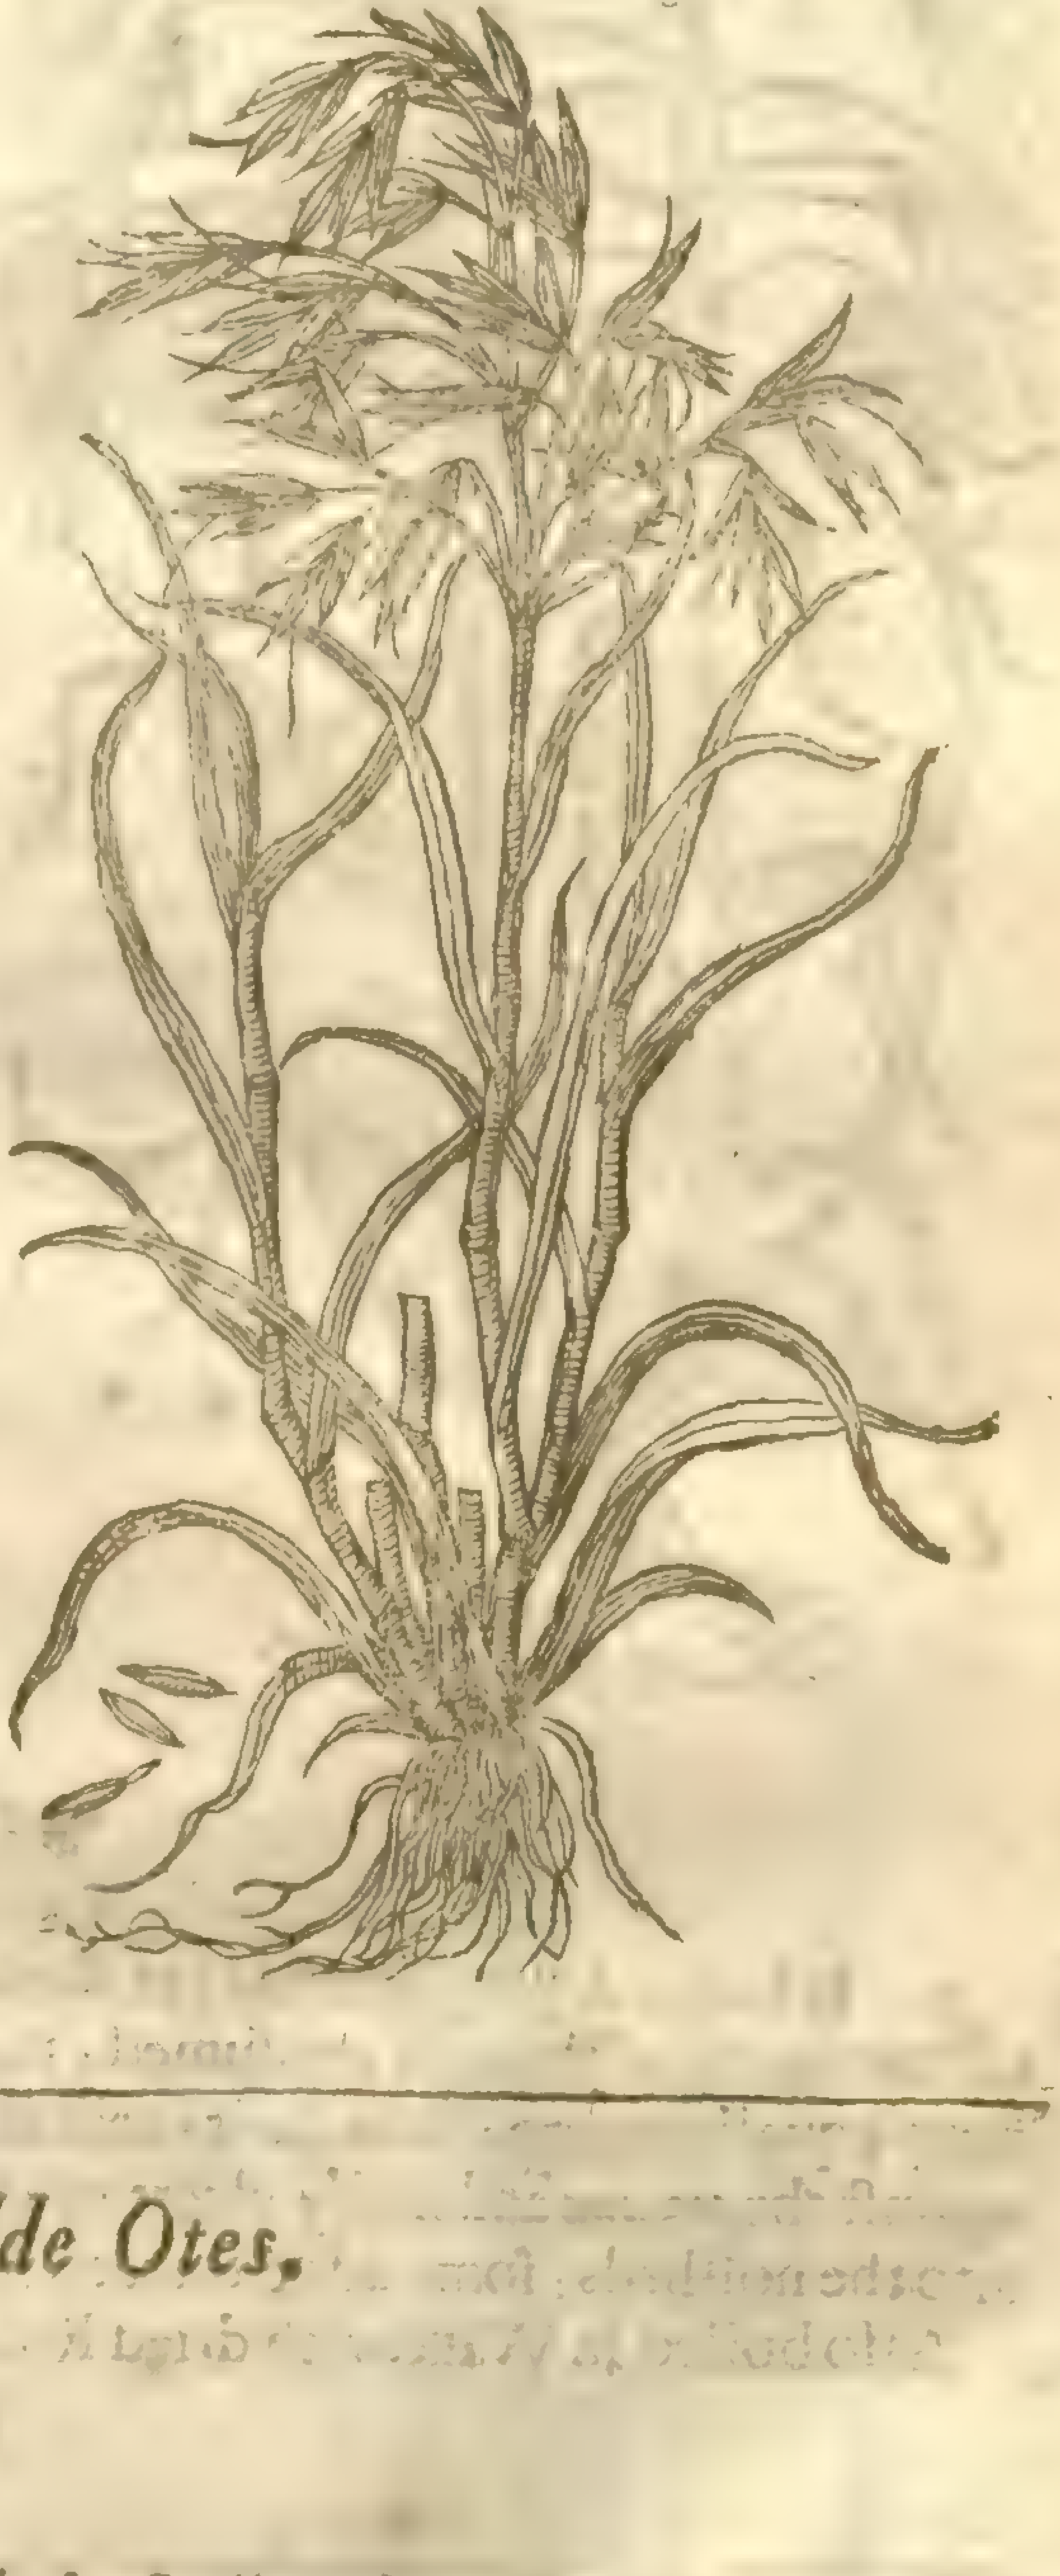
Otemeale vſed as a Cataplaſme dries and moderately diſcuſſes, and that without biting; for it hath ſomewhat a coole temper, with ſome aſtriction, ſo that it is good againſt ſcowrings. D

1 *Auena Veſca.*
Common Otes.



2 *Auena Nuda.*
Naked Otes.

2 [illegible]



Chap. 55. *Of Wilde Otes.*

¶ *The Deſcription.*

1 B*Romos ſterilis*, called likewiſe *Auena fatua*, which the Italians do call by a very apt name *Vena vana*, and *Auena Caſſa*, (in Engliſh, Barren Otes or wilde Otes) hath like leaues and ſtalkes as our common Otes; but the heads are rougher, ſharpe, many little ſharpe huskes making each eare.

† 2 There is alſo another kinde of *Bromos* or wilde Otes, which *Dodonæus* calleth *Feſtuca altera*, not differing from the former wilde Otes in ſtalkes and leaues, but the heads are thicker, and more compact, each particular eare (as I may tearme it) conſiſting of two rowes of ſeed handſomely compact and joyned together; being broader next the ſtraw, and narrower as it comes to an end.

¶ *The Place and Time.*

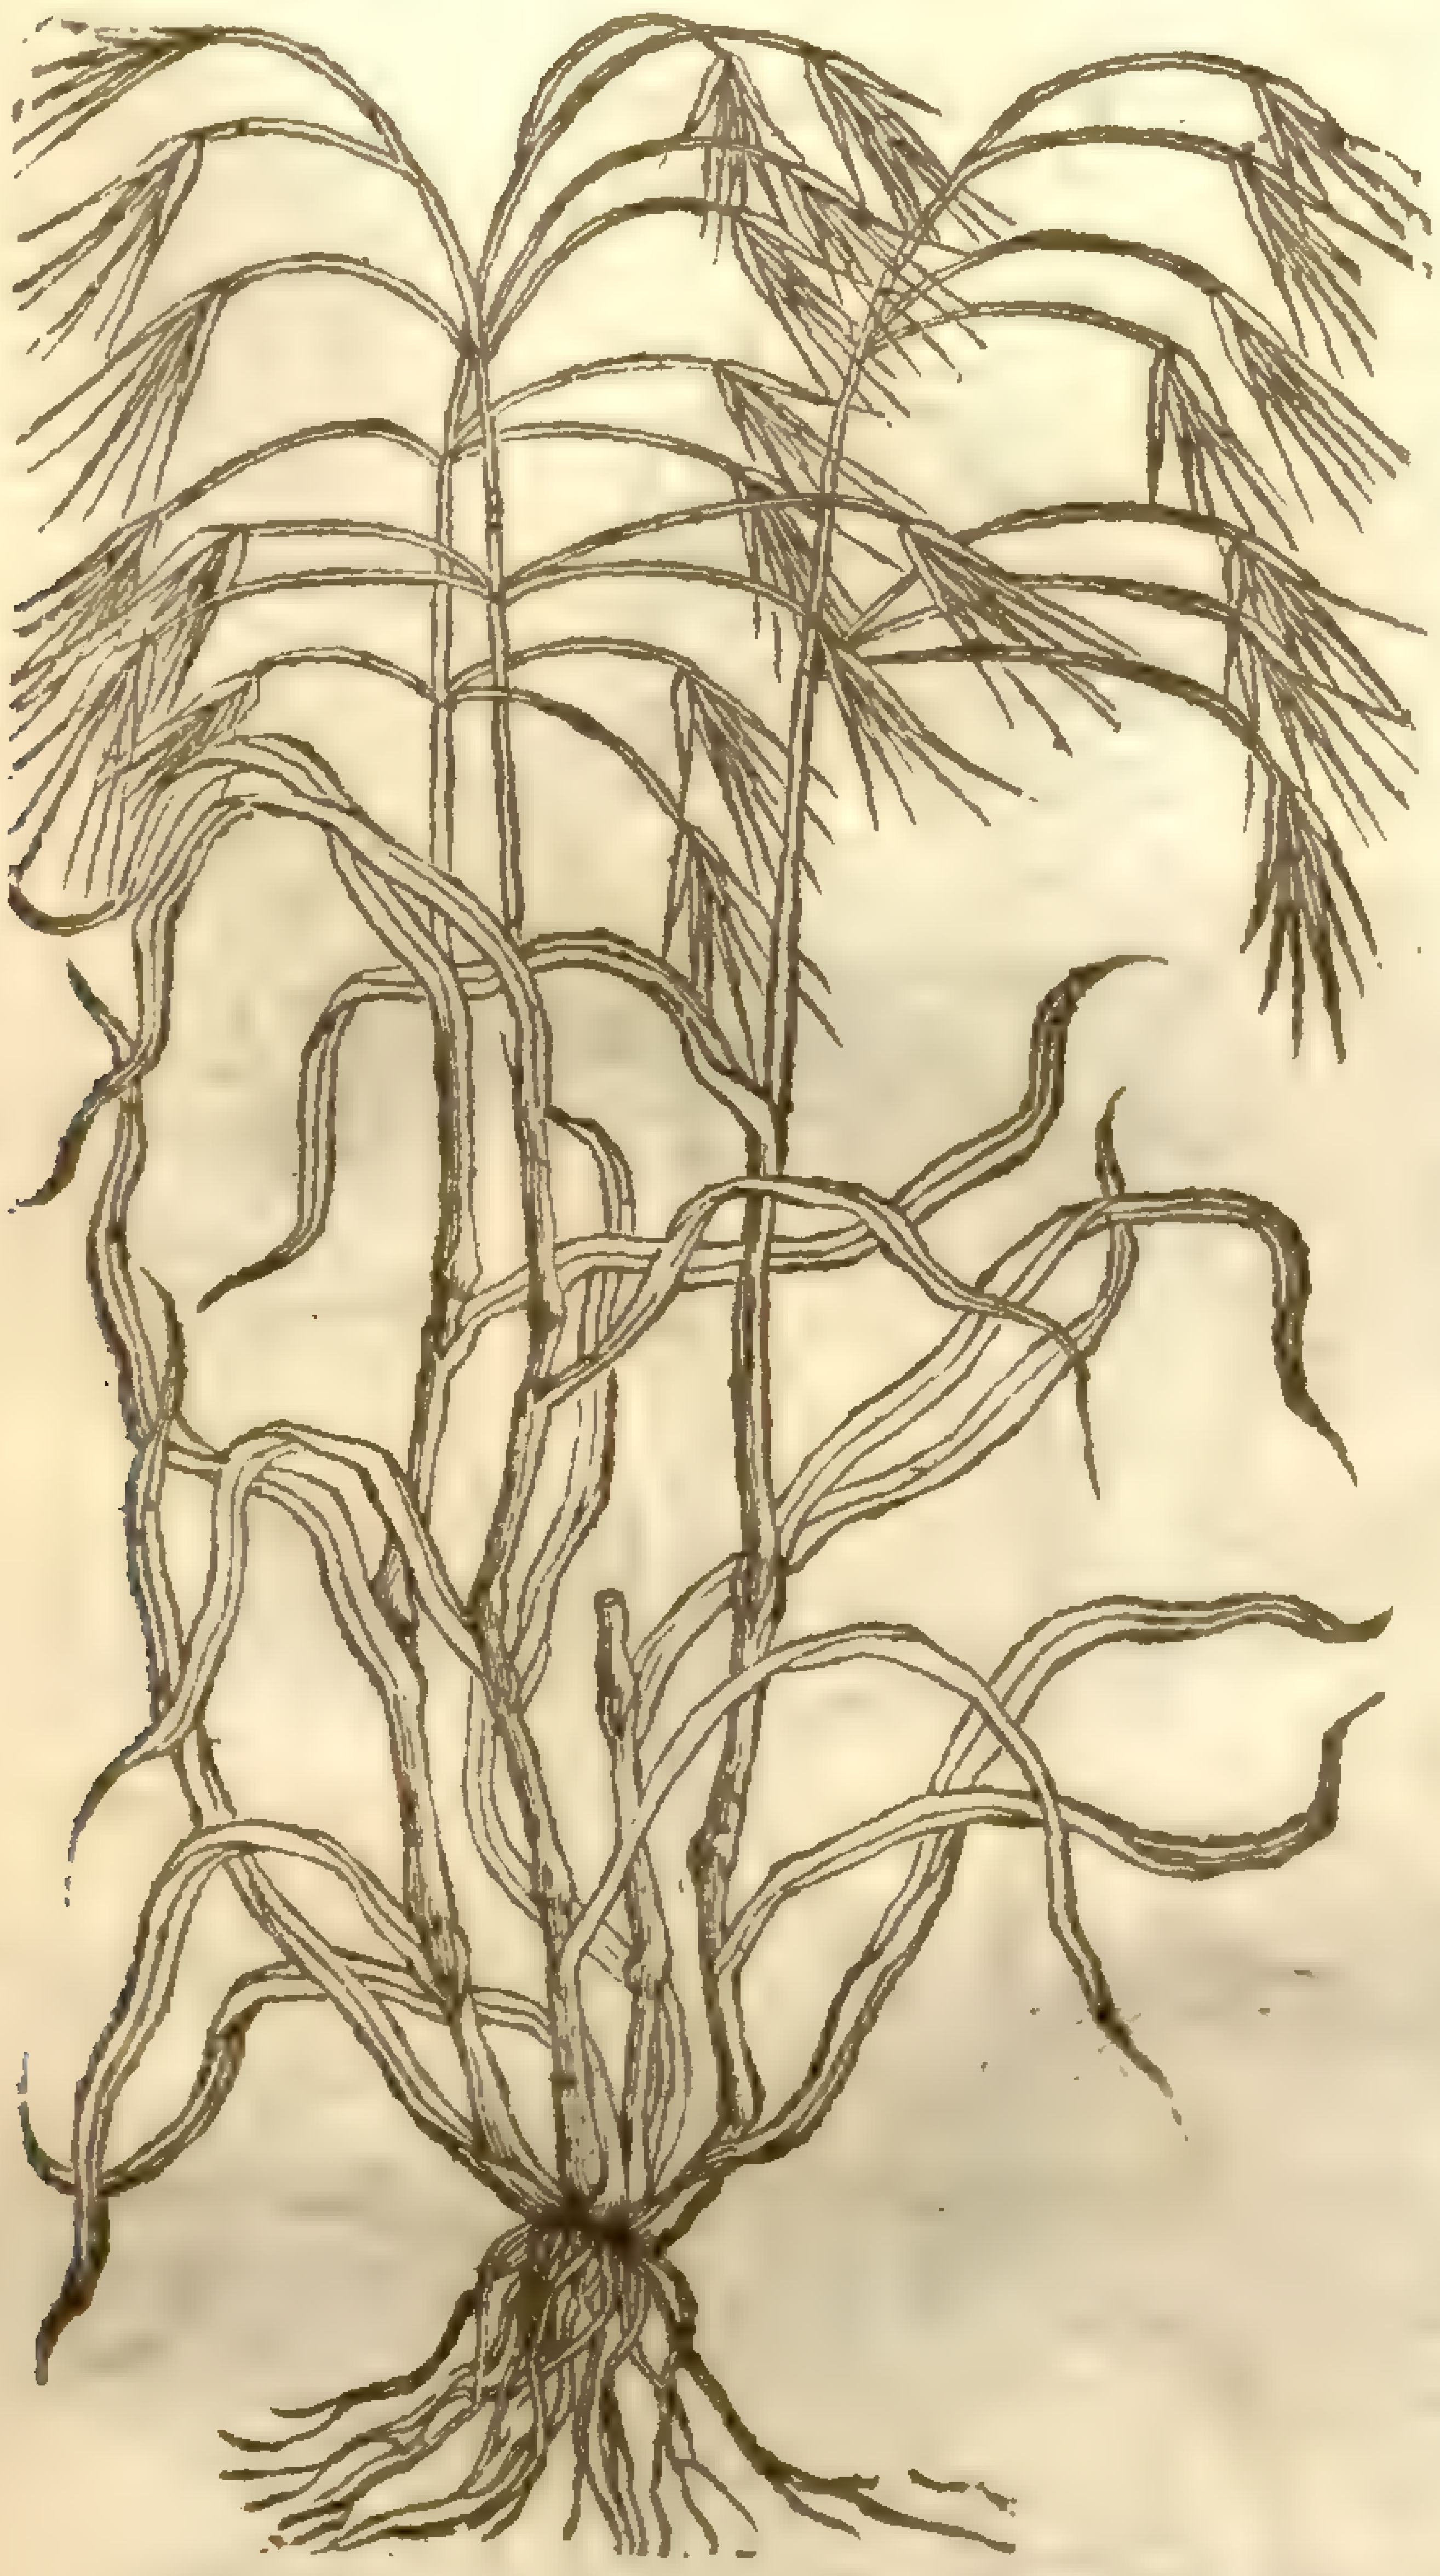
‡ The firſt in Iuly and Auguſt may be found almoſt in euery hedge; the later is to be found in great plentie, in moſt Rie.

¶ *The Names.*

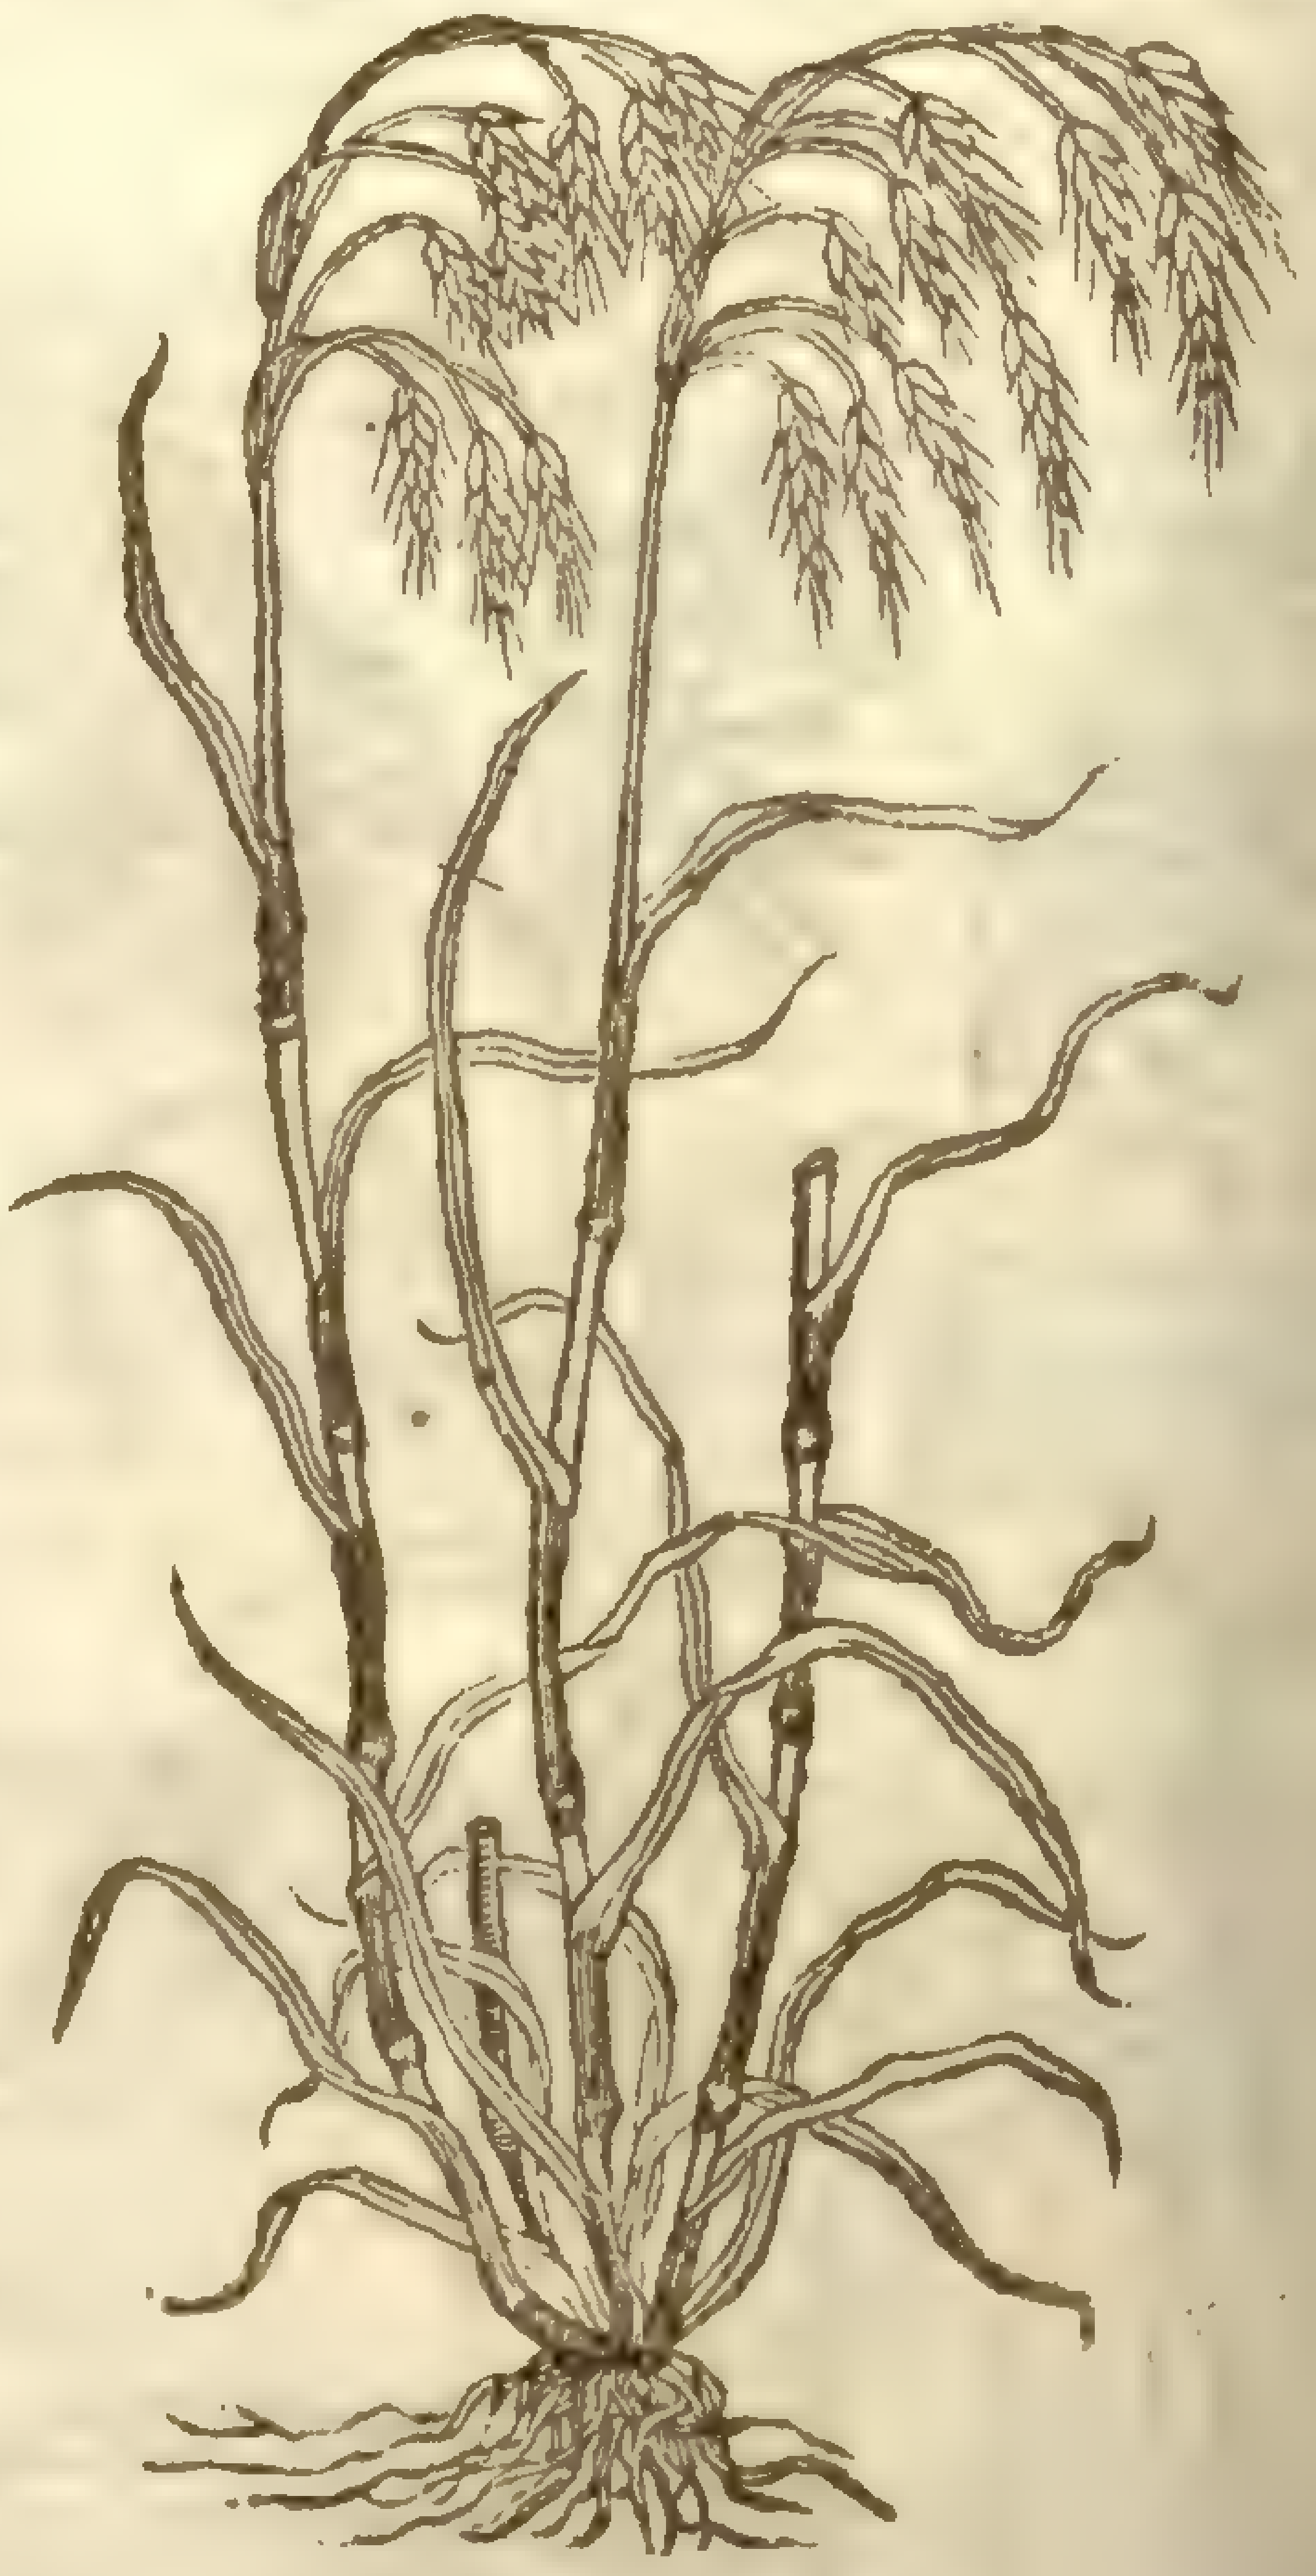
1 This is called in Greeke, *βρῶμος πόα*: in Latine, *Bromos ſterilis* by *Lobel*: *Ægylops prima* by *Matthiolus*: in Engliſh, wilde-Otes, or Hedge-Otes.

2 *Lobel* calls this *Bromos ſterilis altera*: *Dodonæus* termes it, *Feſtuca altera*: in Brabant they call it, **Drauich**: in Engliſh, Drauke.

1 *Bromos ſterilis.*
Wilde Otes.



2 *Bromos altera.*
Drauke, or ſmall wilde Otes.



¶ *The Nature and Vertues.*

A 1 It hath a drying facultie (as *Dioſcorides* ſaith.) Boile it in water together with the roots vntill two parts of three be conſumed; then ſtraine it out, and adde to the decoction a quantitie of hony equall thereto: ſo boile it vntill it acquire the thickneſſe of thin hony. This medicine is good againſt the *Ozæna* and filthy vlcers of the noſe, dipping a linnen cloath therein, and putting it vp into the noſthrils; ſome adde thereto Aloes finely poudred, and ſo vſe it.

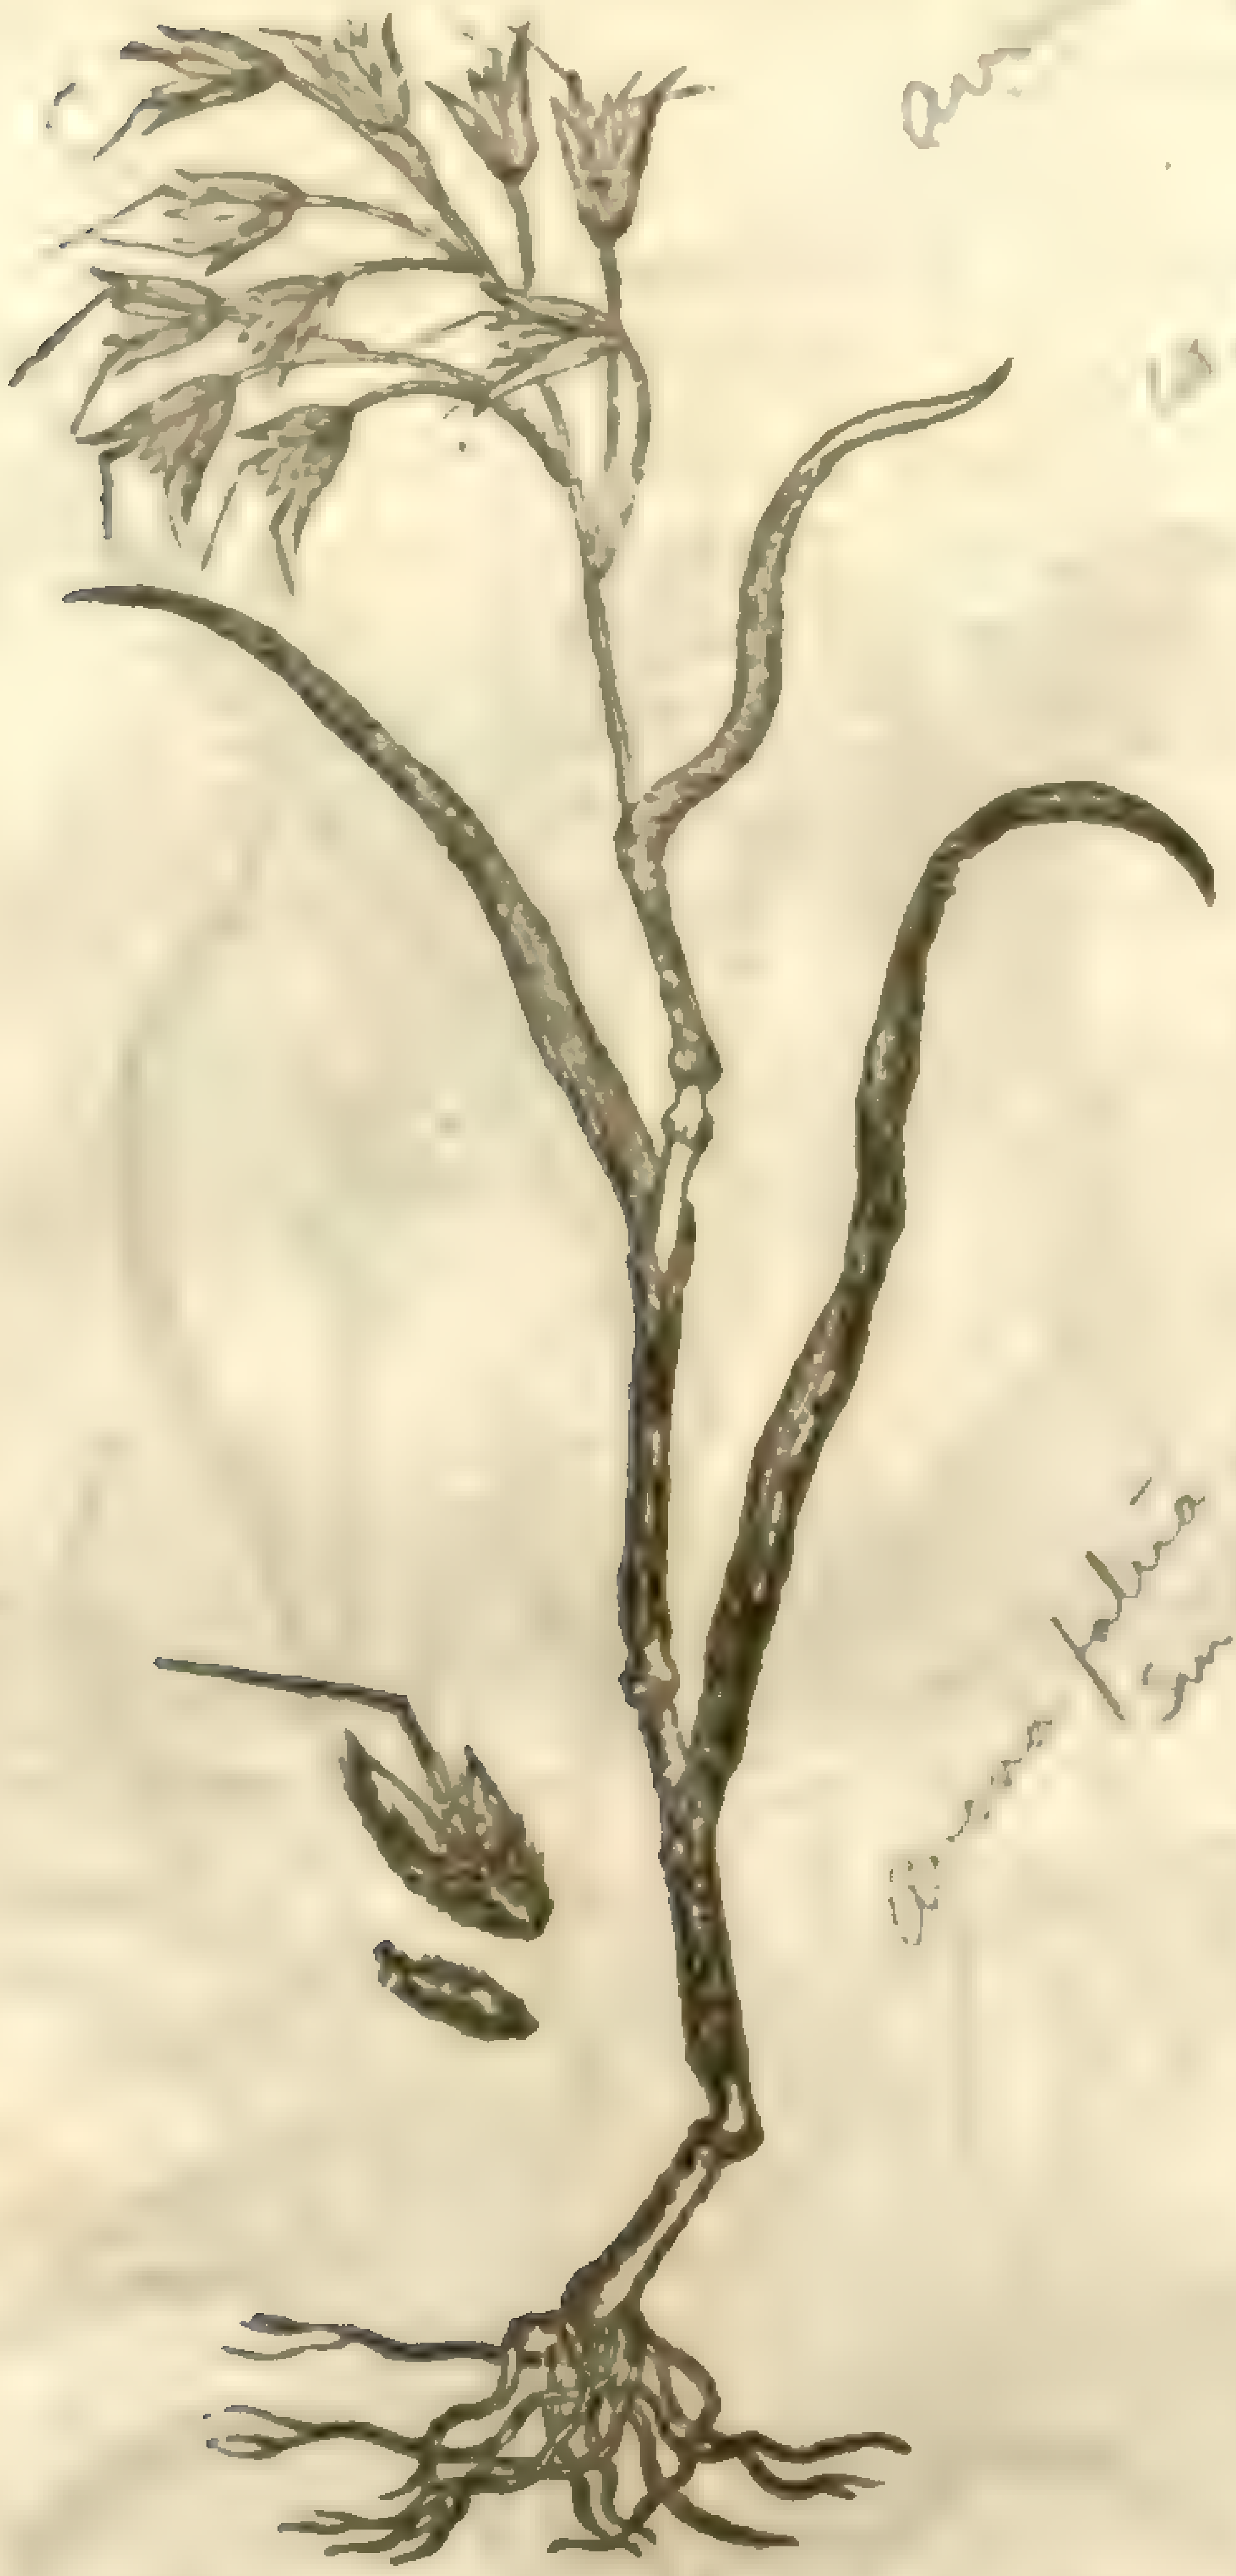
B Alſo boiled in Wine with dried Roſe leaues, it is good againſt a ſtinking breath. ‡

Chap. 56. *Of Bearded Wilde Otes.*

¶ *The Deſcription.*

ÆGylops *Bromoides Belgarum* is a Plant indifferently partaking of the nature of *Ægilops* and *Bromos*. It is in ſhew like to the naked Otes. The ſeed is ſharpe, hairy, and ſomewhat long, and of a reddiſh colour, encloſed in yellowiſh chaffie huskes like as Otes, and may be Engliſhed, Creſted or bearded Otes. I haue found it often among Barley and Rie in ſundry grounds. This is likewiſe vnprofitable and hurtfull to Corne; whereof is no mention made by the Antients worthy the noting.

1 *Ægilops*



† *Ægilops Bromoides.*
Bearded wilde Otes.

Avena [illegible]

Avena fatua, Sm. p. 1. 163

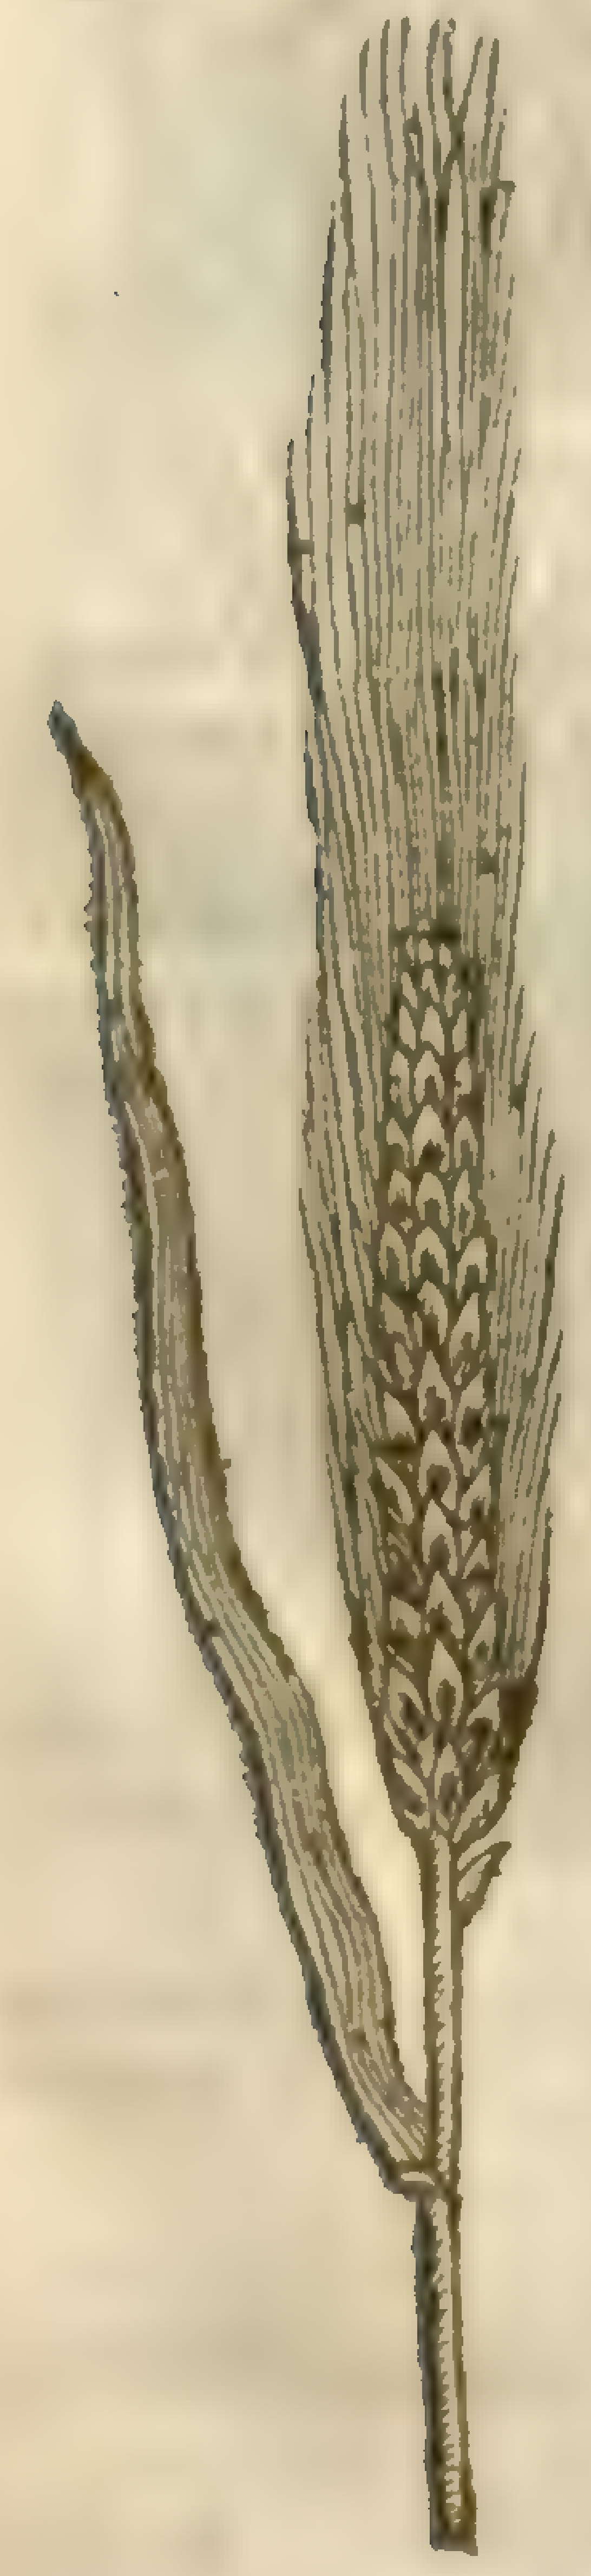
CHAP. 57. *Of Burnt Corne.*

¶ *The Deſcription.*

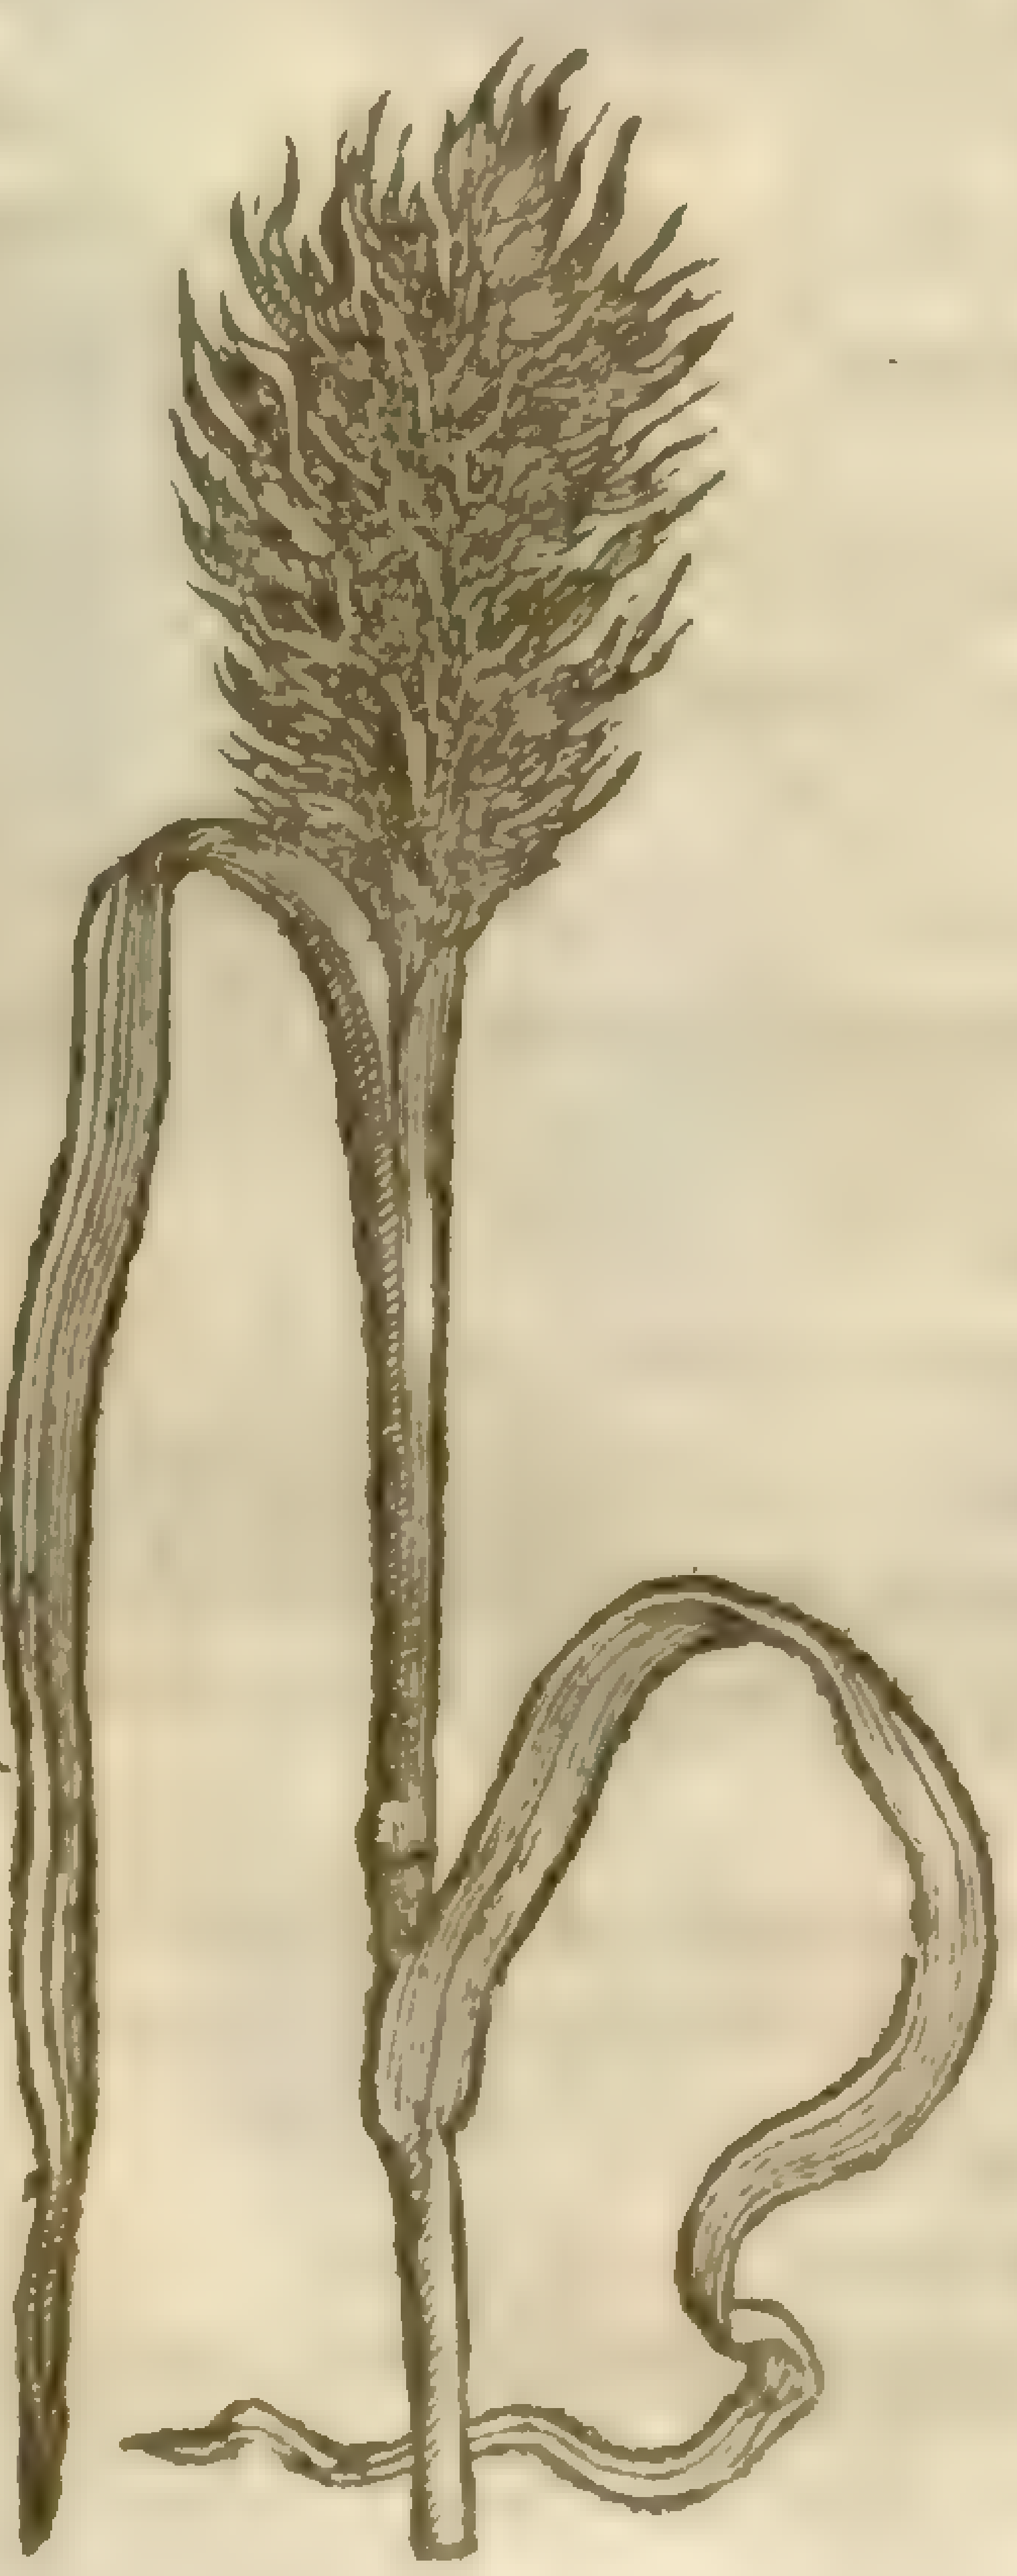
1 Hordeum *vſtum*, or *Vſtilago Hordei*, is that burnt or blaſted Barly which is altogether vnprofitable & good for nothing, an enemy vnto corne; for that in ſtead of an eare with corne, there is nothing els but blacke duſt, which ſpoileth bread, or whatſoeuer is made thereof.

2 Burnt Otes, or *Vſtilago Avena* or *Avenacea*, is likewiſe an vnprofitable plant, degenerating from Otes, as the other from barly, rie and wheat. It were in vaine to make a long harueſt of ſuch euil corne, conſidering it is not poſſeſſed with one good qualitie. And therefore thus much ſhall ſuffice for the deſcription.

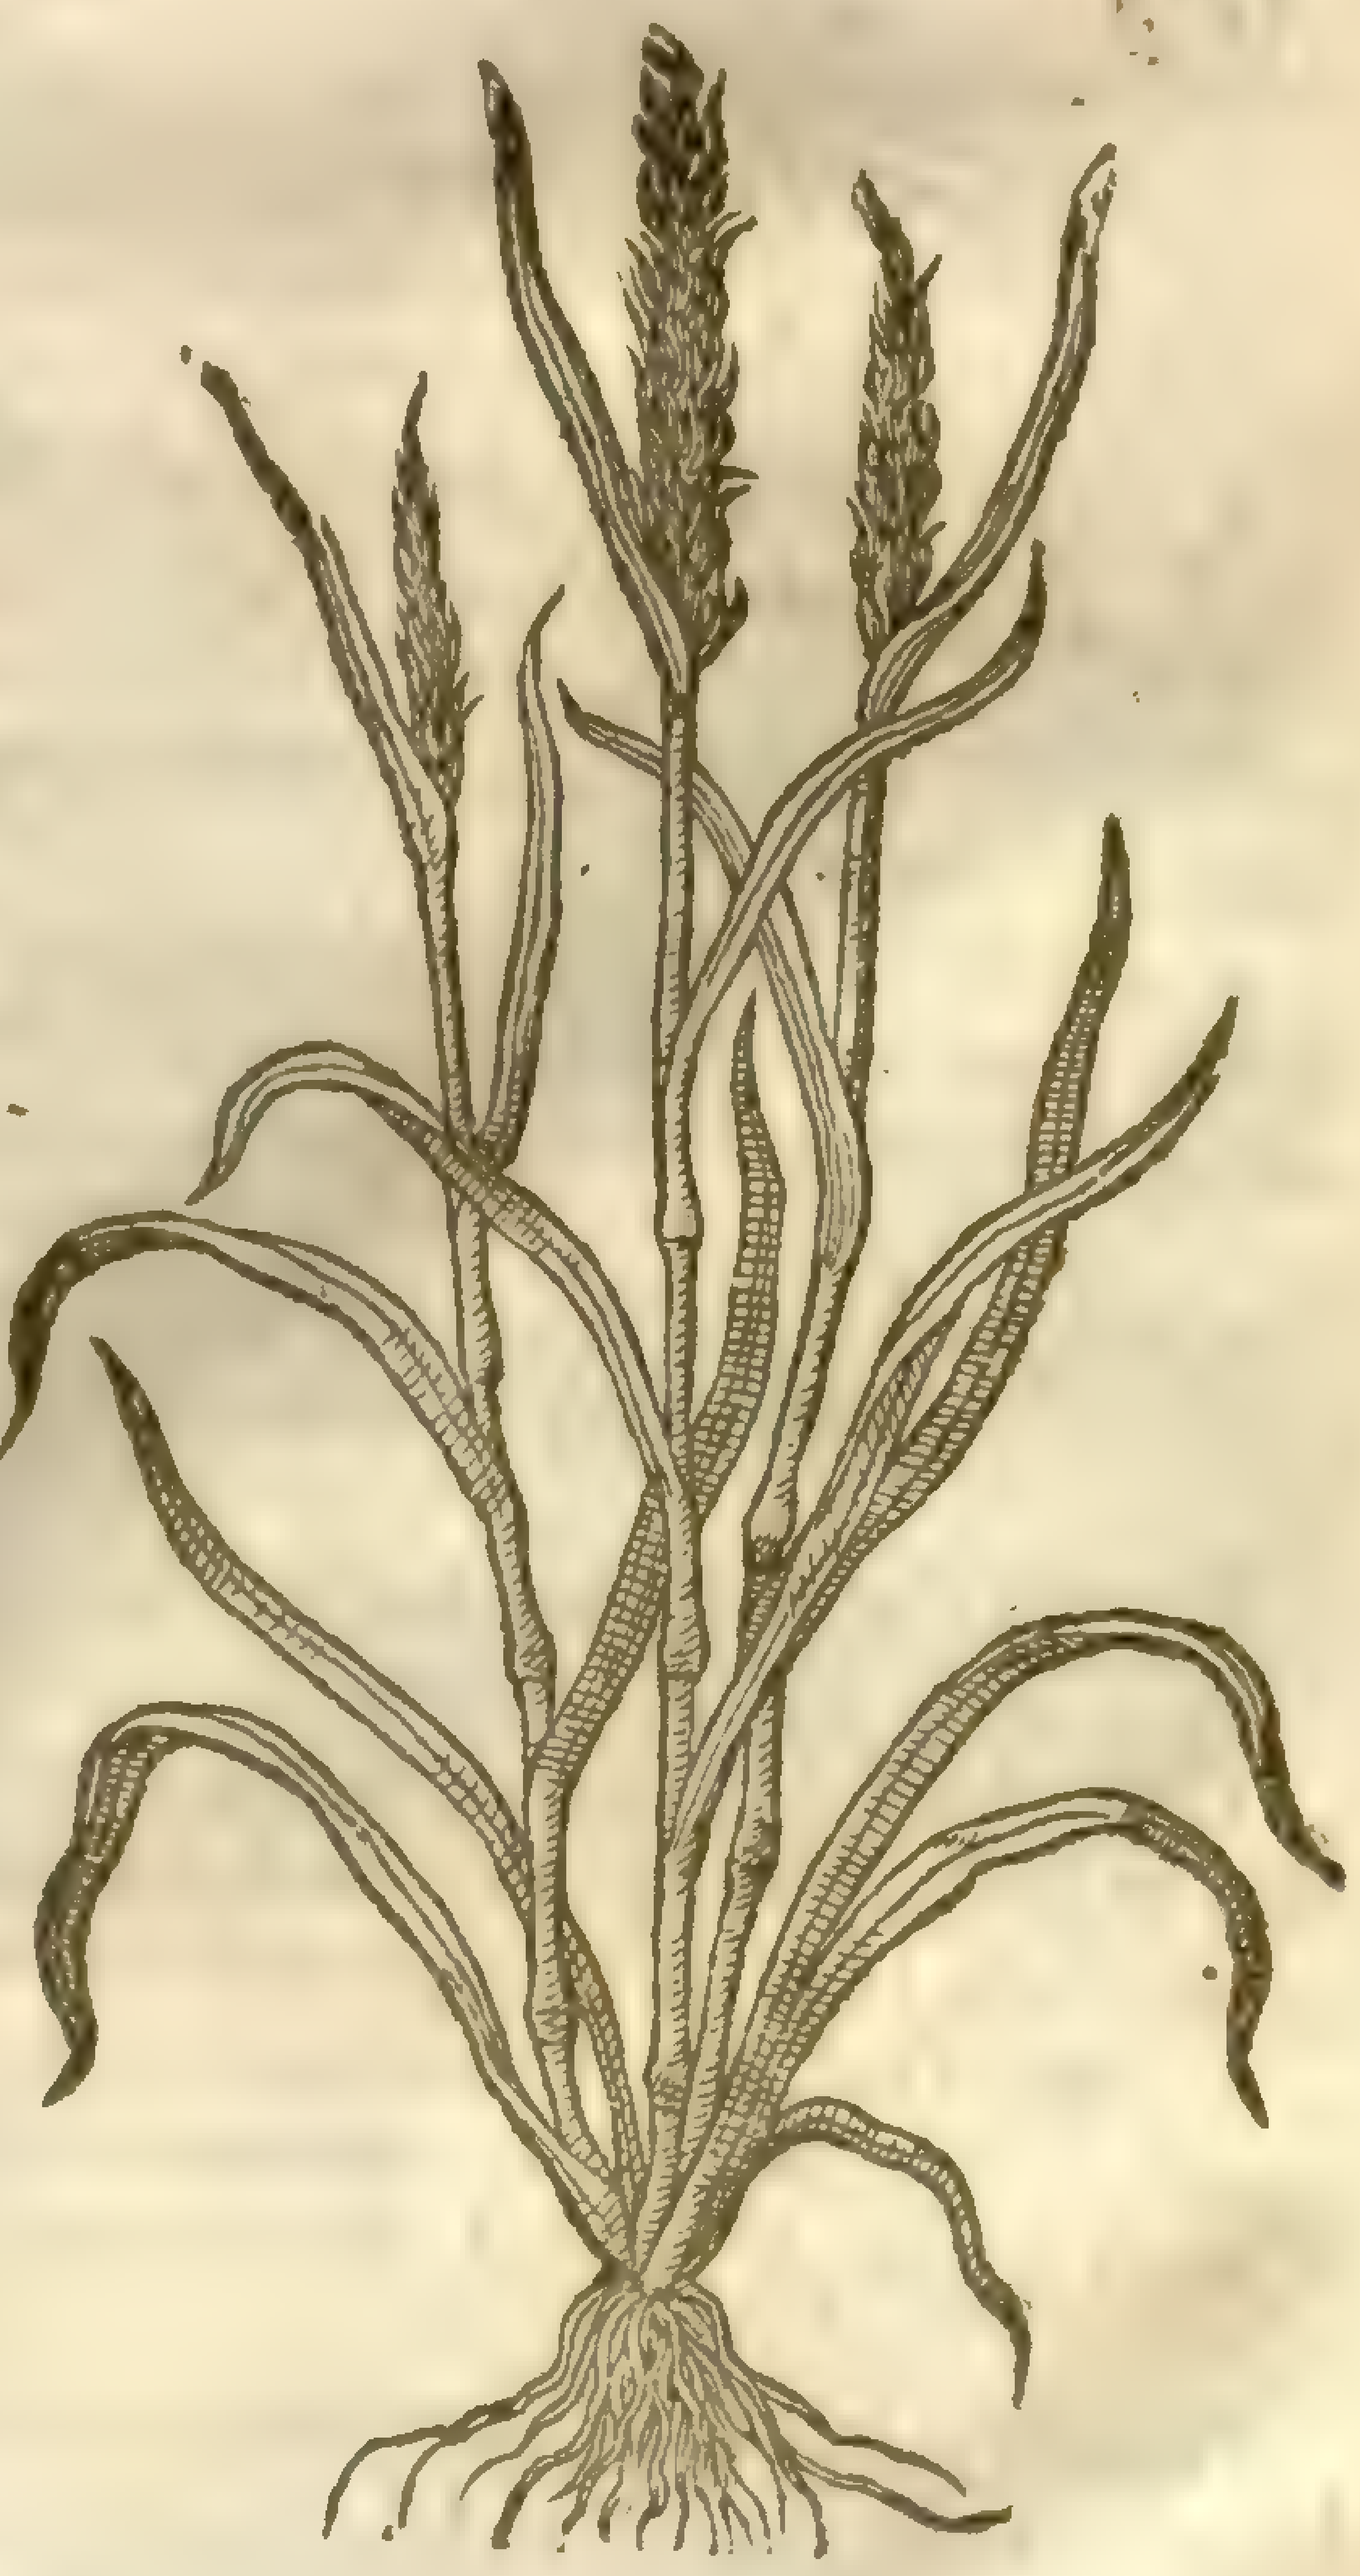
3 Burnt Rie hath no one good property in phyſicke, appropriate either to Man, Birds, or Beaſt, and is an hurtfull maladie vnto all Corn where it groweth, hauing an eare in ſhape like to Corne, but in ſtead of graine it doth yeeld a blacke pouder or duſt, which cauſeth bread to looke black, and to haue an euill taſt: and that Corne where it is, is called ſmootie Corn, and the thing it ſelfe, Burnt Corn, or blaſted Corn:



1 *Hordeum vſtum, ſiue vſtilago hordei.* Burnt Barly.



2 *Vſtilago Avenacea.* Burnt Otes.



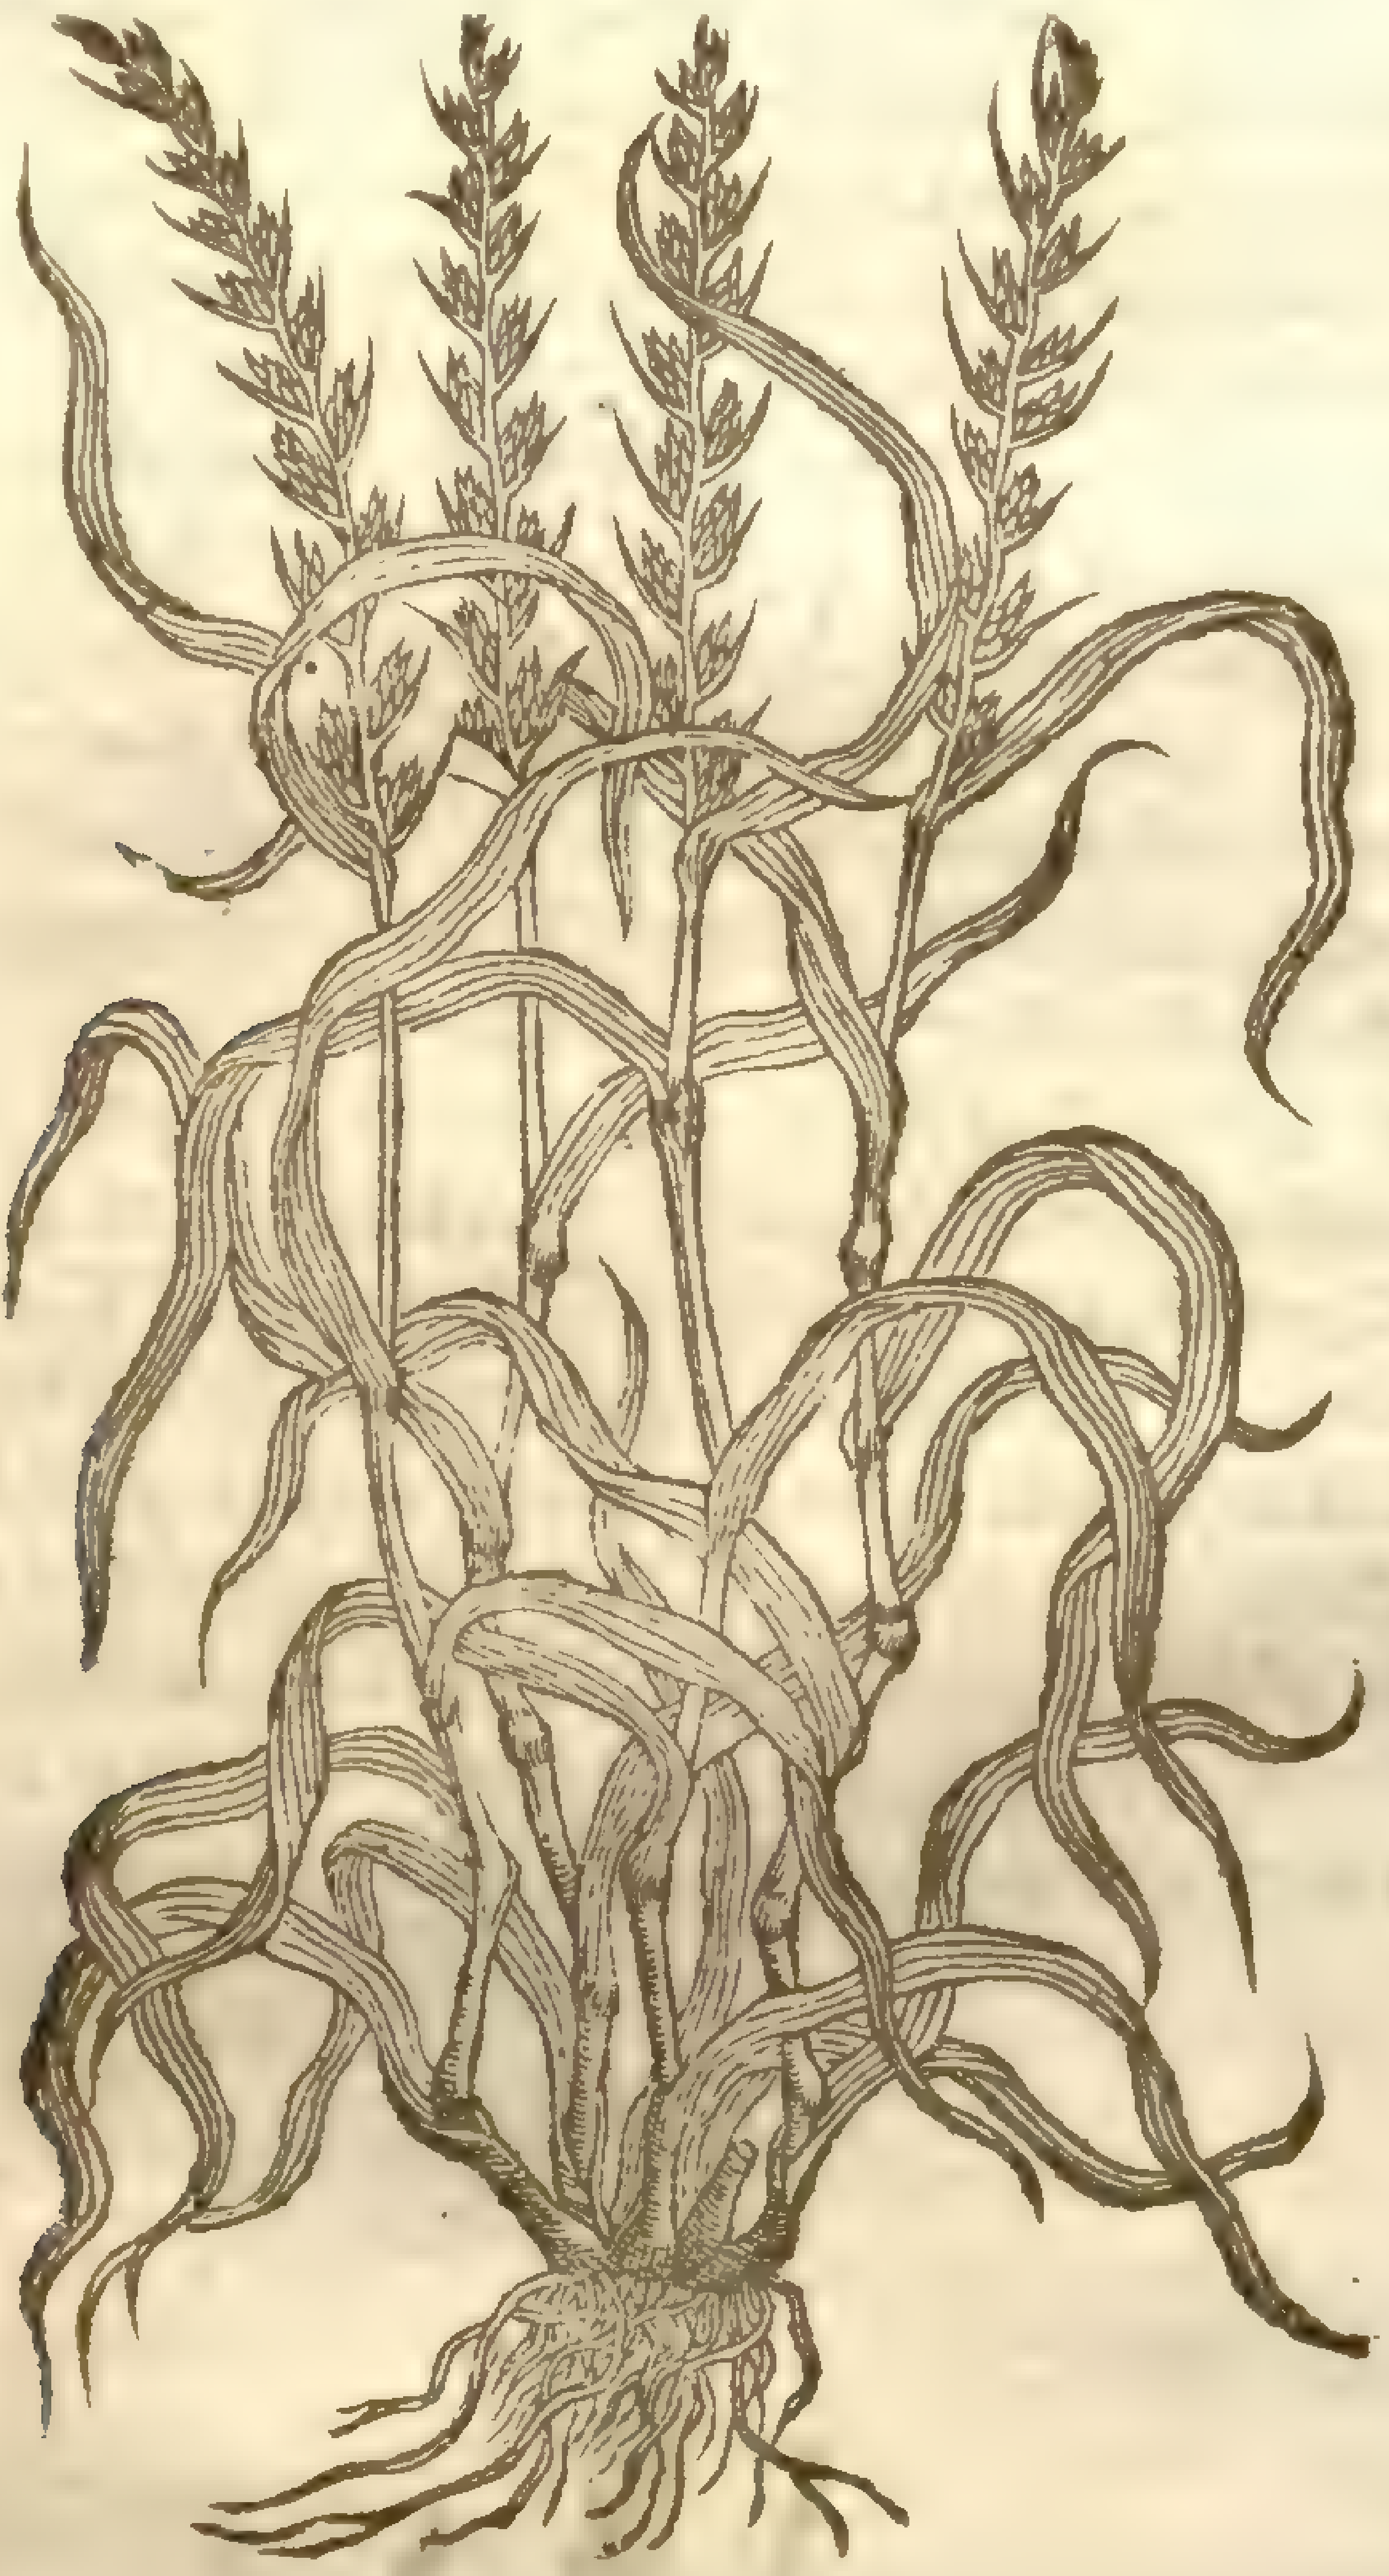
3 *Vſtilago Secalina.* Burnt Rie.

CHAP. 58. *Of Darnell.*

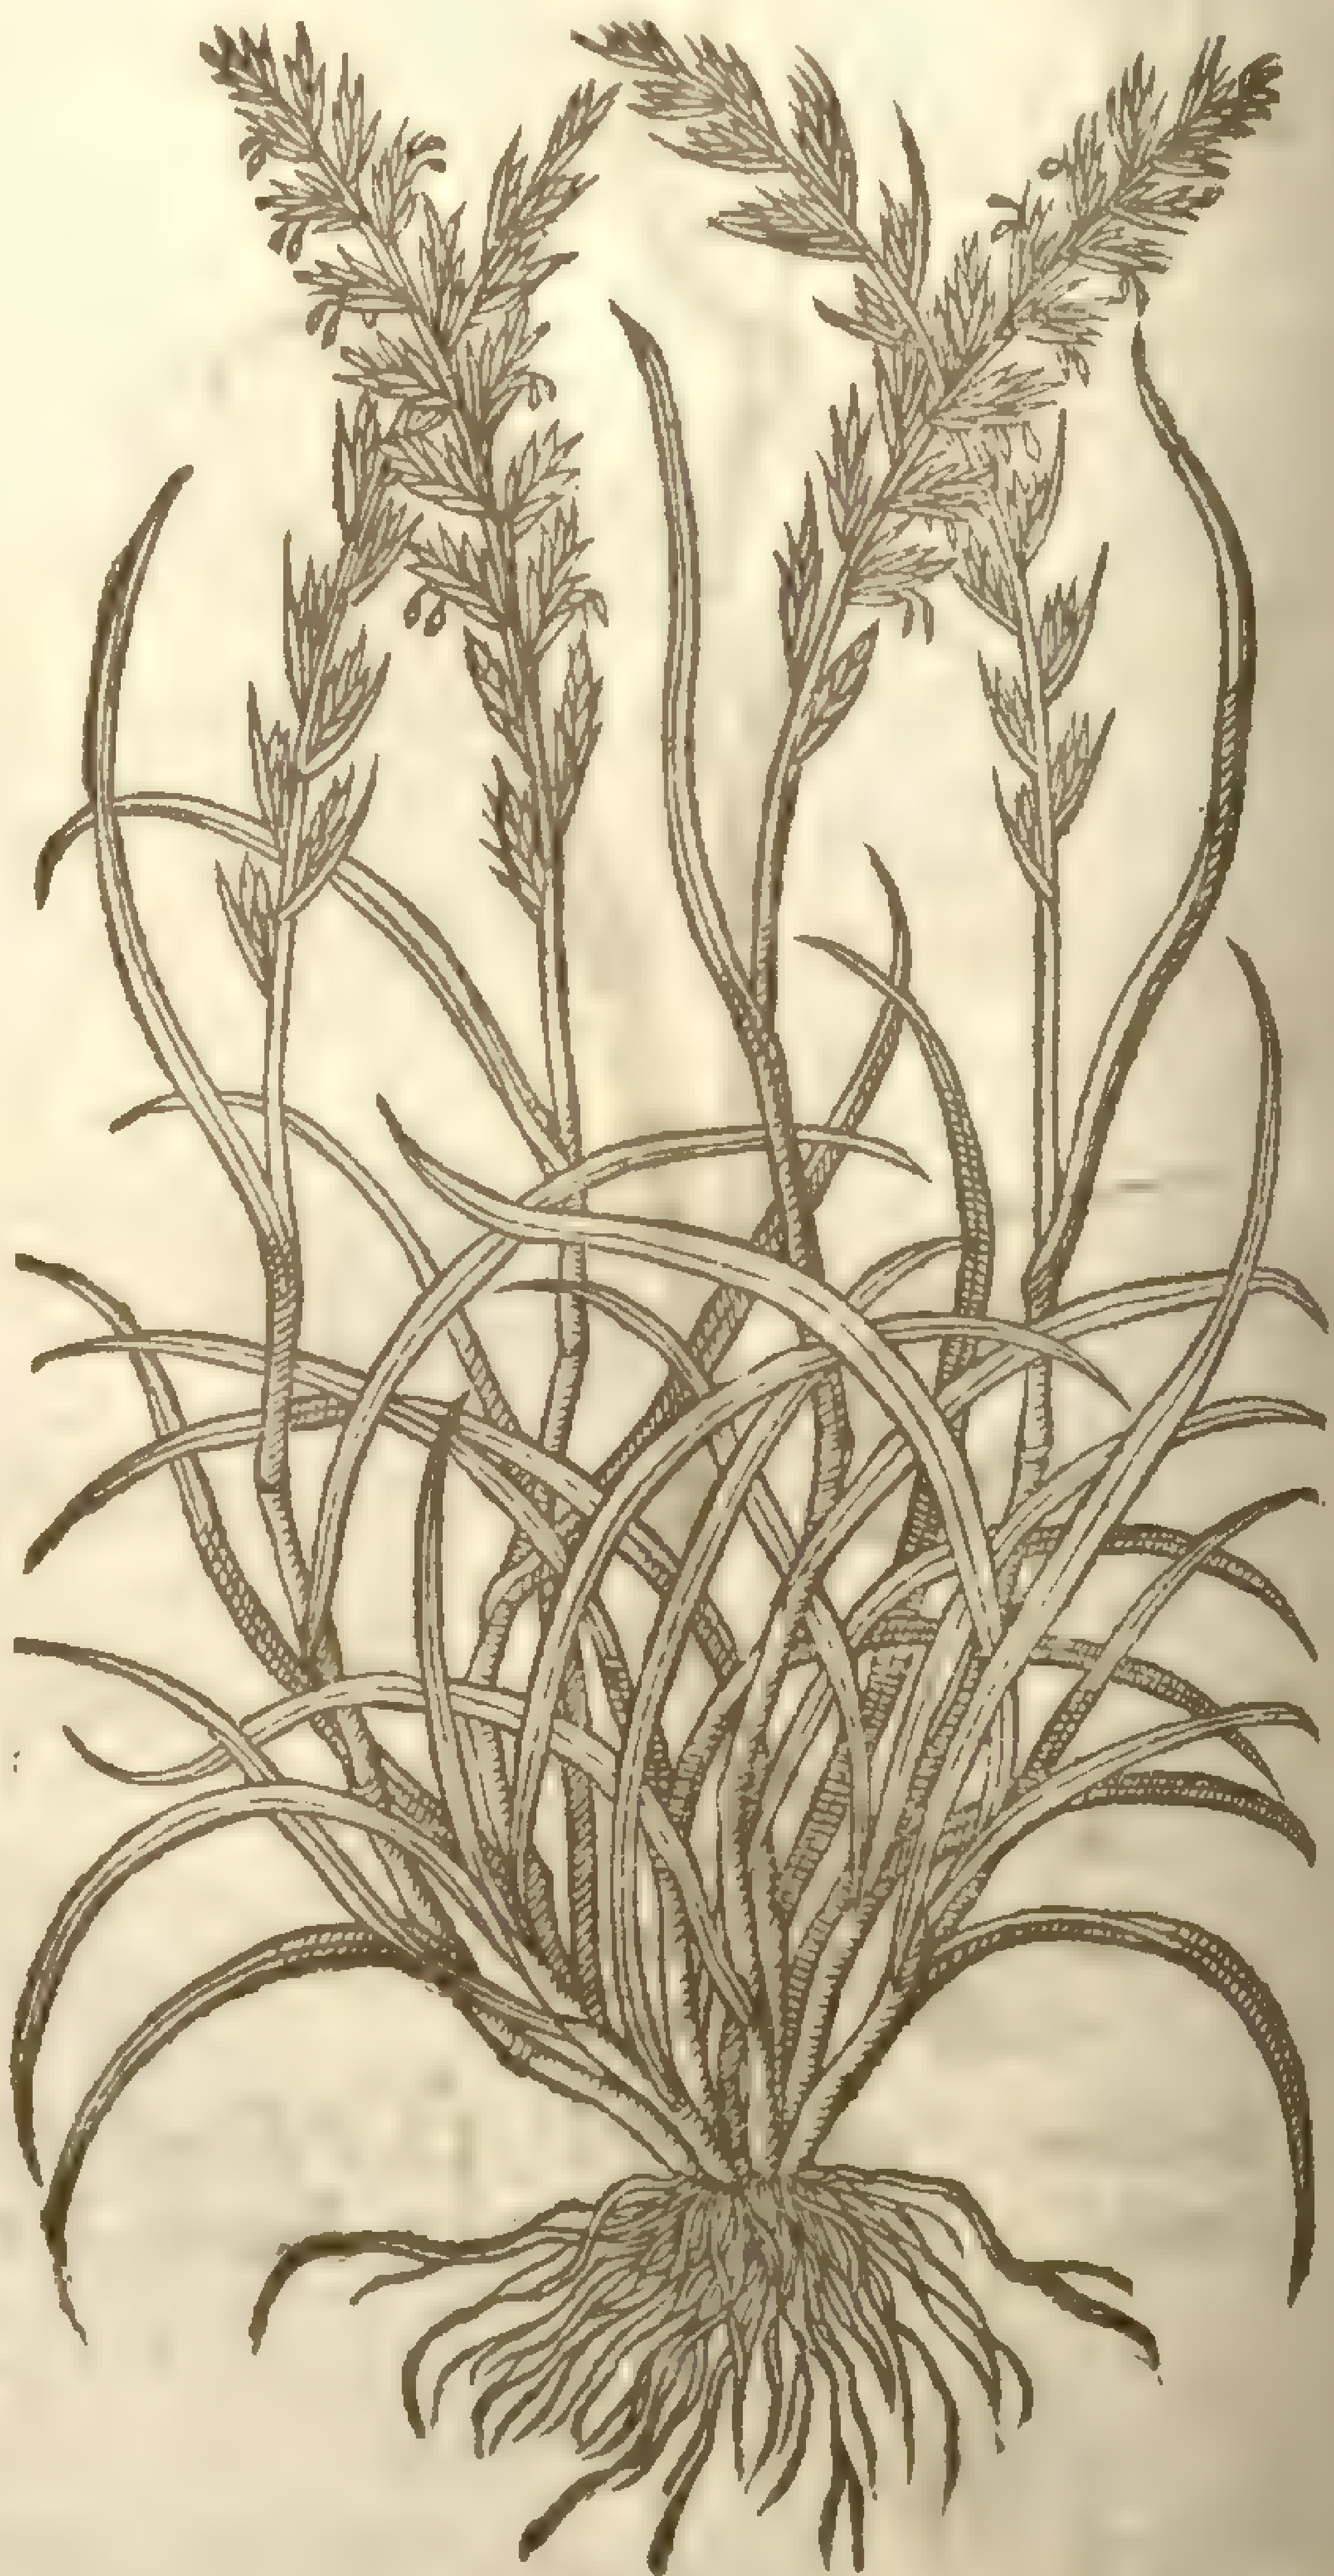
L. temulentum, [illegible] Sm. [illegible]

L. perenne, [illegible] Sm. [illegible]

1 *Lolium album.*
White Darnell.



2 *Lolium rubrum.*
Red Darnell.



¶ *The Deſcription.*

1 AMong the hurtfull weeds Darnell is the firſt. It bringeth forth leaues or ſtalkes like thoſe of wheat or barly, yet rougher, with a long eare made vp of many little ones, euerie particular one whereof containeth two or three grains leſſer than thoſe of Wheat, ſcarcely any chaffie huske to couer them with; by reaſon whereof they are eaſily ſhaken out and ſcattered abroad.

2 Red Darnell is likewiſe an vnprofitable corne or graſſe, hauing leaues like barly. The joints of the ſtraw or ſtalke are ſometimes of a reddiſh colour, bearing at the top a ſmall and tender eare, flat, and much in forme reſembling the former.

¶ *The Place.*

They grow in fields among wheat and barley, of the corrupt and bad ſeed, as *Galen* ſaith, eſpecially in a moiſt and dankiſh ſoile.

¶ *The Time.*

They ſpring and flouriſh with the corne, and in Auguſt the ſeed is ripe.

¶ *The Names.*

1 Darnell is called in Greeke, αἶρα: in the Arabian tongue, *Zizania*, and *Sceylen*: in French, *Iuray*: in Italian, *Loglio*: in Dutch, **Dolick**: in Engliſh, Darnell: of ſome, Iuray and Raye: and of ſome of the Latines, *Triticum temulentum*.

2 Red Darnell is called in Greeke, φοῖνιξ, or *Phœnix*, becauſe of the crimſon colour: in Latine, *Lolium rubrum*, and *Lolium murinum*: of ſome, *Hordeum murinum*, and *Triticum murinum*: in Dutch **Muyſe coren**: in Engliſh, Red Darnell, or great Darnell graſſe.

¶ *The Temperature.*

Darnell is hot in the third degree, and dry in the ſecond. Red Darnell drieth without ſharpnes, as *Galen* ſaith.

¶ The

¶ *The Vertues.*

A The ſeed of Darnell, Pigeons dung, oile Oliue, and pouder of Line-ſeed, boiled to the forme of a plaiſter, conſume wens, hard lumps, and ſuch like excreſcenſes in any part of the body.

B The new bread wherein Darnell is, eaten hot cauſeth drunkenneſſe; in like manner doth beere or ale wherein the ſeed is fallen, or put into the malt.

C Darnel taken with red wine ſtayeth the flux of the belly, and the ouermuch flowing of womens termes.

D *Dioſcorides* ſaith, That Darnel meale doth ſtay and keep backe eating ſores, gangrens, and putrified vlcers: and being boiled with Radiſh roots, ſalt, brimſtone, and vineger, it cureth ſpreading ſcabs and dangerous tettars called in Greeke λειχῆνας, and leprous or naughty ſcurfe.

E The ſeed of Darnell giuen in white or Rheniſh wine, prouoketh the fleures and menſes.

F A fume made thereof with parched barly meale, myrrh, ſaffron, and frankincenſe, made in forme of a pulteſſe and applied vpon the belly, helps conception, and cauſeth eaſie deliuerance of childebearing.

G Red Darnel (as *Dioſcorides* writeth) being drunke in ſowre or harſh Red wine, ſtoppeth the lask, and the ouermuch flowing of the fleures or menſes, and is a remedie for thoſe that piſſe in bed.

¶ *The Danger.*

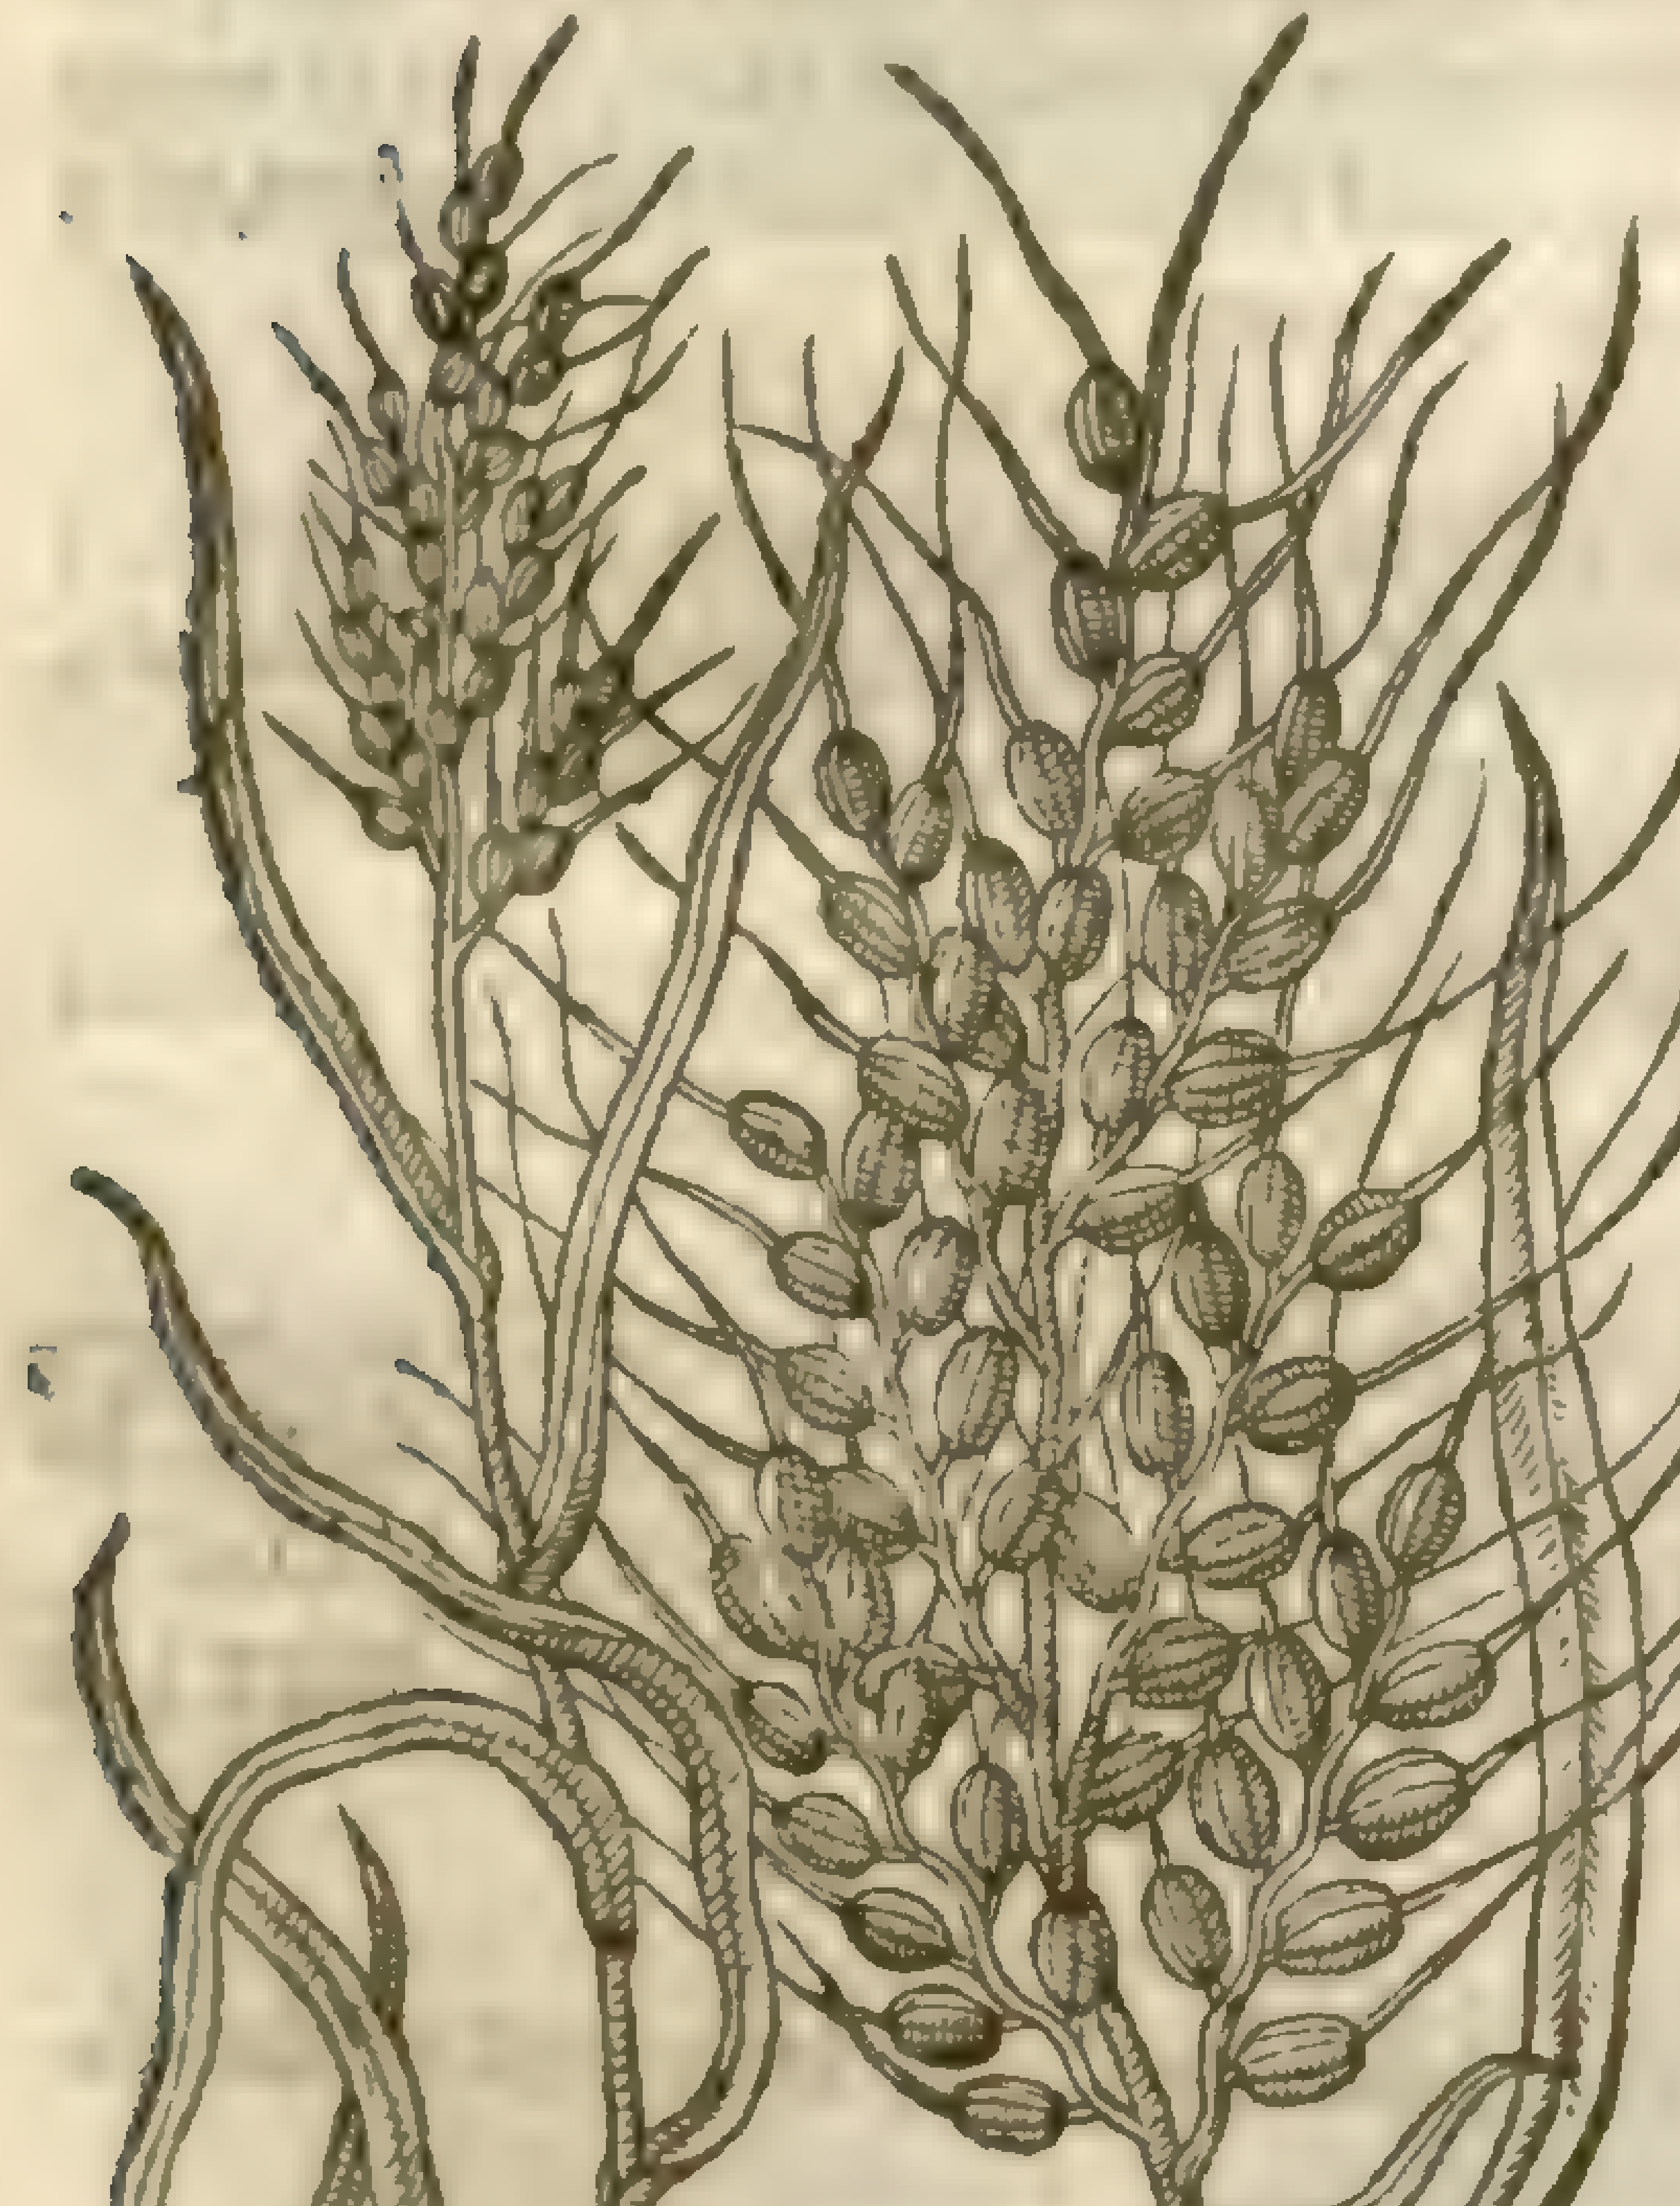
Darnell hurteth the eyes and maketh them dim, if it happen in corne either for bread or drink: which thing *Ovid, lib.* 1. *Faſtorum* hath mentioned in this verſe:

Et careant loliis oculos vitiantibus agri.

And hereupon it ſeemeth that the old prouerb came, That ſuch as are dim ſighted ſhould be ſaid, *Lolio victitare.*

CHAP. 59. *Of Rice.*

Oryza.
Rice.



¶ *The Deſcription.*

Rice is like vnto Darnel in ſhew, as *Theophraſtus* ſaith: it bringeth not forth an eare like corn, but a certain mane or plume as Mill or Millet or rather like Panick. The leaues, as *Pliny* writes, are fat and full of ſubſtance like to the blades of leeks, but broader; but (if neither the ſoile nor climat did alter the ſame) the plants of Rice that did grow in my garden had leaues ſoft and graſſie like barley. the floure did not ſhew it ſelf with me, by reaſon of the injurie of our vnſeaſonable yeare 1596. *Theophraſtus* concludeth, that it hath a floure of a purple colour: but, ſaith my Author, Rice hath leaues like vnto Dogs-graſſe or barly, a ſmall ſtraw or ſtem full of ioynts like corn; at the top whereof groweth a buſh or tuft far vnlike to barly or Darnel, garniſhed with round knobs like ſmall gooſe-berries, wherein the ſeed or graine is contained: euery ſuch round knob hath one ſmall rough aile, taile, or beard like vnto Barly hanging thereat. *Ariſtobulus*, as *Strabo* reporteth, ſheweth, that Rice growes in water in Bactria, and neere Babylon, and is two yards high, and hath many eares, and bringeth forth plenty of ſeed. It is reaped at the ſetting of the ſeuen ſtars, & purged as Spelt and Ote-meale, or hulled as French Barley.

¶ *The Place.*

It groweth in the territorie of the Bactrians, in Babylon, in Suſium, and in the lower part of Syria. It groweth in theſe daies not only in thoſe countries before named, but alſo in the fortunat Iſlands and in Spain, from whence it is brought to vs purged and prepared as wee ſee, after the manner of French Barly. It proſpereth beſt in fenny and wateriſh places.

¶ *The Time.*

It is ſowne in the Spring in India, as *Eratoſthenes* witneſſeth, when it is moiſtned with Sommer ſhowers.

¶ *The Names.*

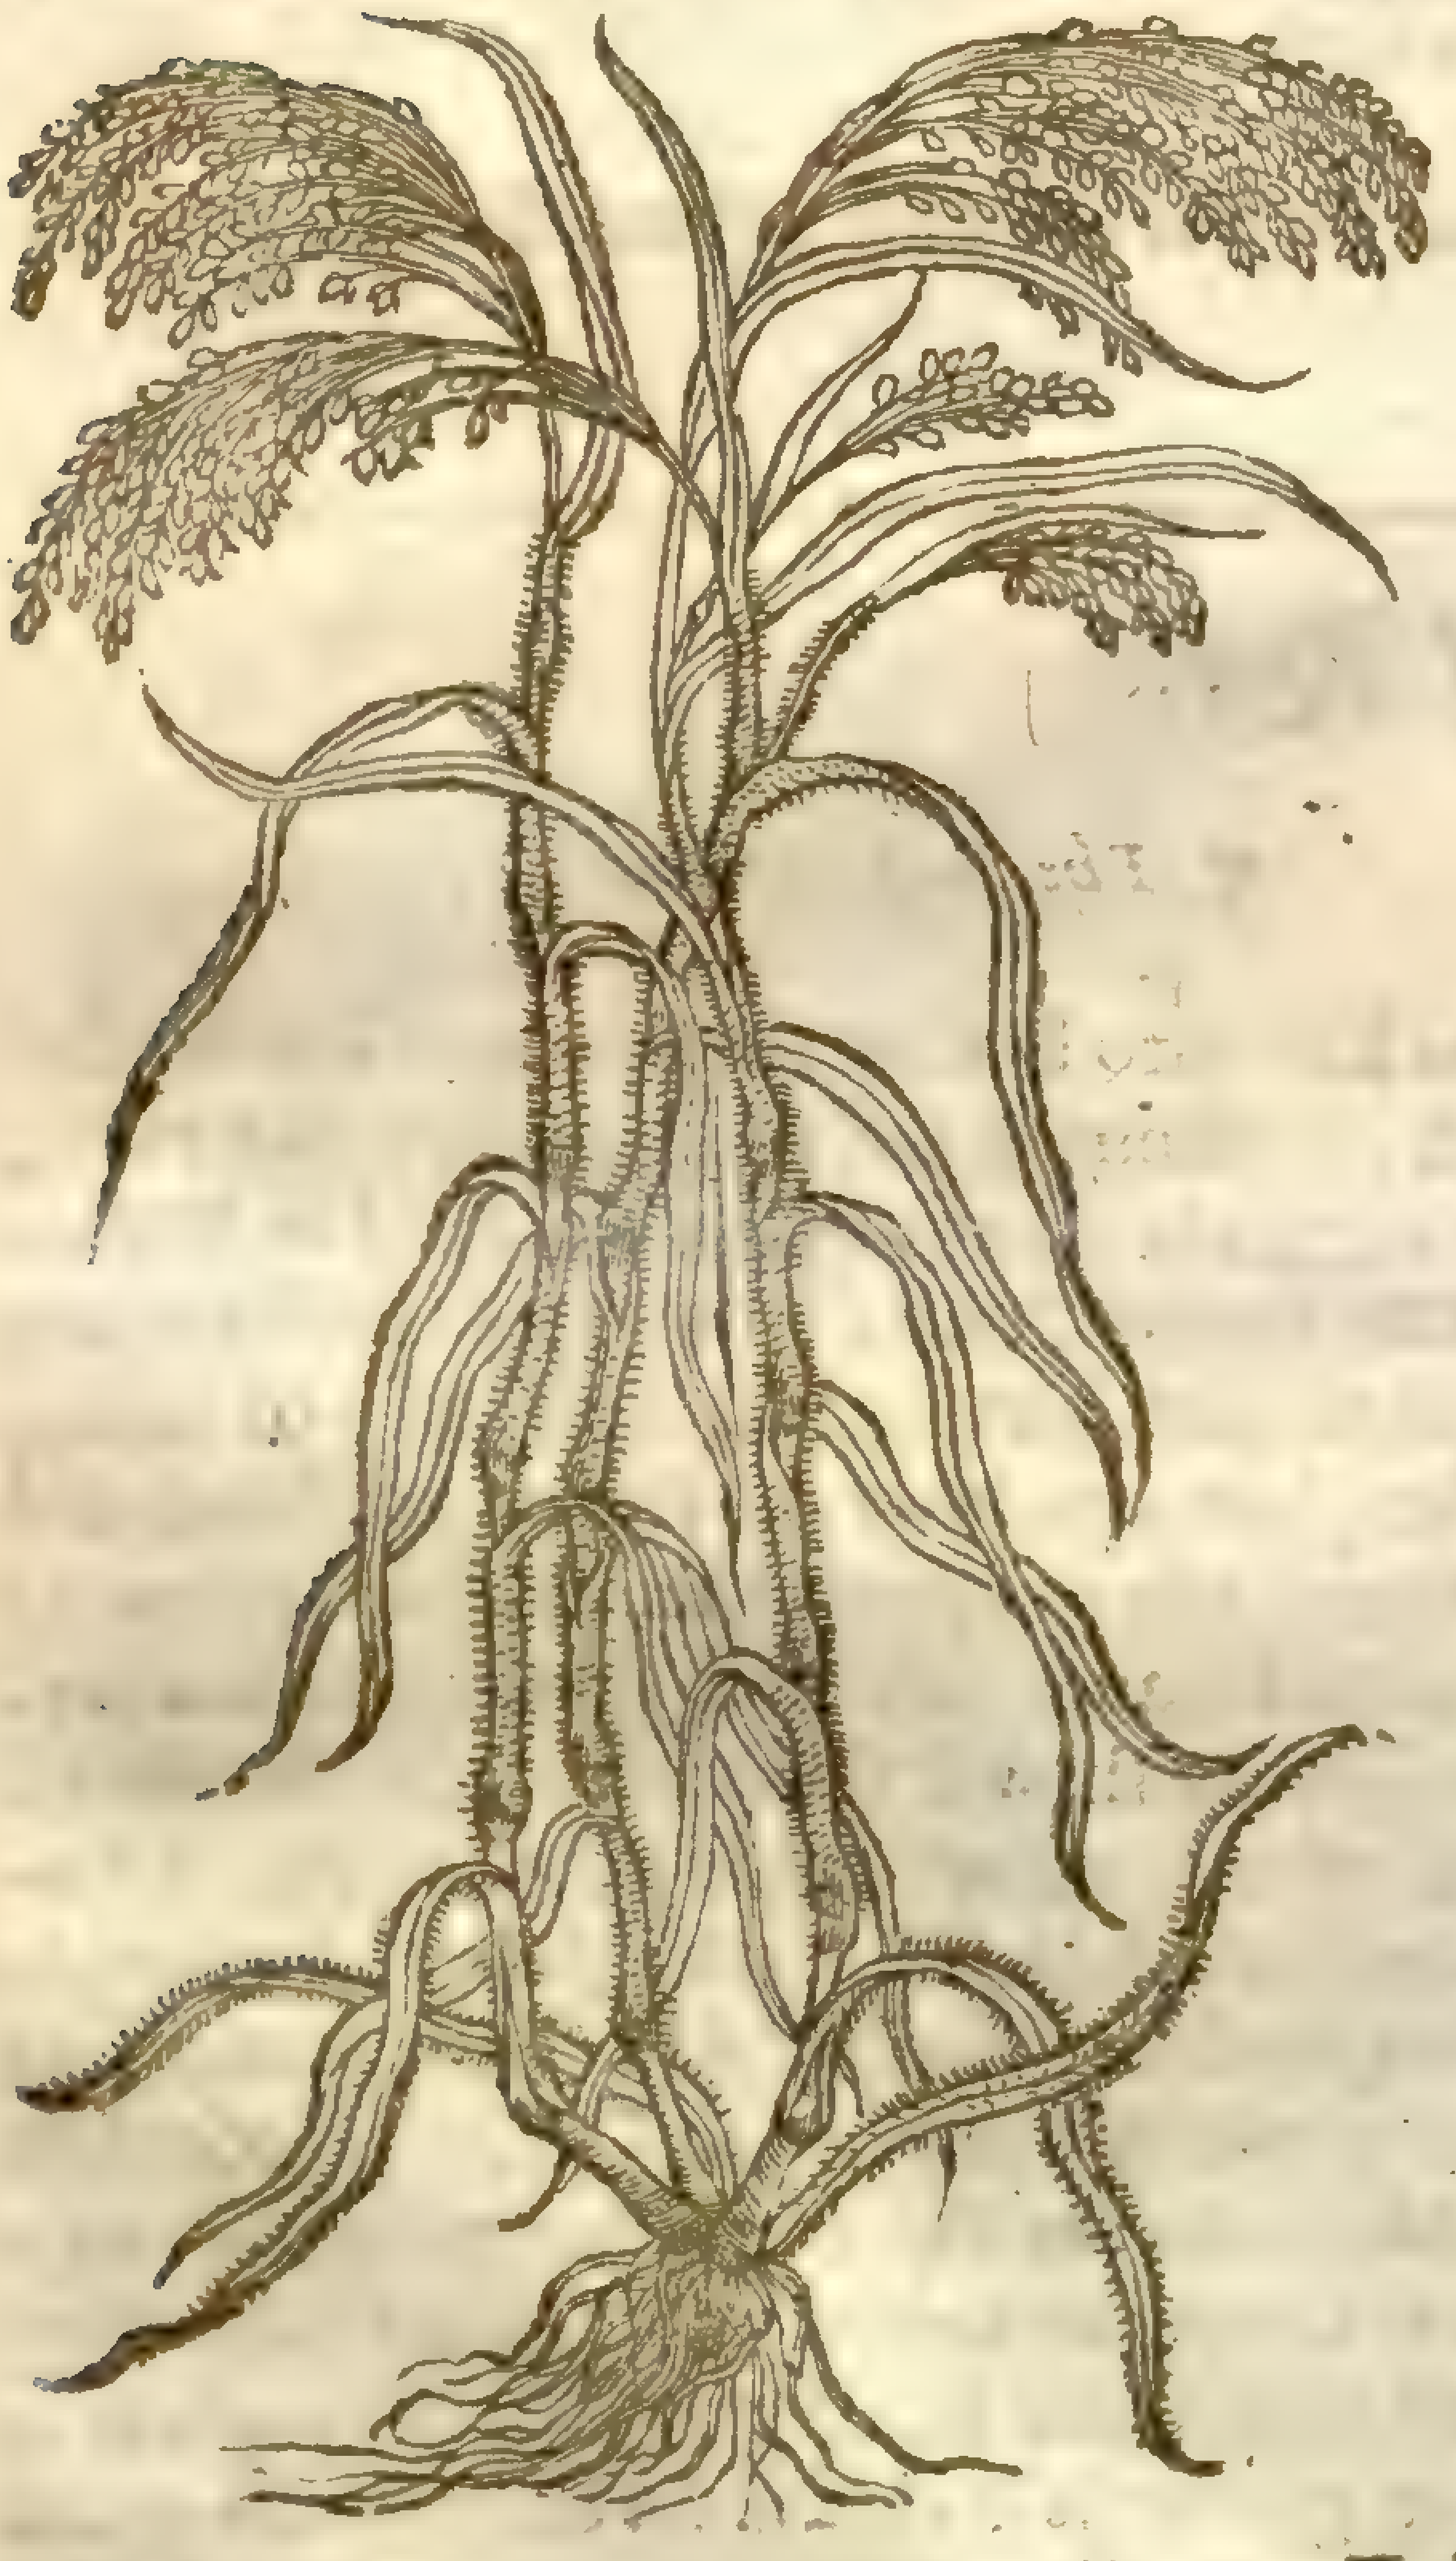
The Grecians call it ὄρυζα, or as *Theophraſtus* ſaith, ὄρυζον: the Latines keepe the Greeke word *Oryza*: in French it is called *Riz*: in the German tongue, **Riſz**, and **Rys**: in Engliſh, Rice.

¶ *The Temperature and Vertues.*

Galen ſaith, that all men vſe to ſtay the belly with this grain, being boiled after the ſame maner that *Chondrus* is. In England we vſe to make with milke and Rice a certain food or pottage, which doth both meanly binde the belly, and alſo nouriſh. Many other good kinds of food is made with this kind of grain, as thoſe that are ſkilfull in cookerie can tell.

Chap. 60. *Of Millet.*

Milium.
Mill, or Millet.



¶ *The Deſcription.*

Milium riſeth vp with many hairy ſtalks knotted or jointed like wheat. The leaues are long, and like the leaues of the common Reed. It bringeth forth on the top of the ſtalke a ſpoky buſh or mane called in Greek φόβη, like the plume or feather of the pole-reed, hanging downward, of colour for the moſt part yellow or white; in which groweth the ſeed, ſmall, hard, and gliſtering, couered with a few thin huskes, out of which it eaſily falleth. The roots be many, and grow deepe in the ground.

2 *Milium nigrum* is like vnto the former, ſauing that the eare or plume of this plant is more looſe and large, and the ſeed ſomwhat bigger, of a ſhining blacke colour.

¶ *The Place.*

It loueth a light and looſe mold, and proſpers beſt in a moiſt and rainy time. And after *Columella*, it groweth in great aboundance in Campania.

¶ *The Time.*

It is to be ſowne in Aprill and May, and not before, for it ioyeth in warme weather.

¶ *The Names.*

It is called of the Grecians, κέγχρος, of ſome, κεγχρίον: and of *Hippocrates*, *Paſpale*, as *Hermolaus* ſaith. In Spaniſh, *Mijo*: in Italian, *Miglio*: in high-Dutch, **Hirz**: in French, *Millet*: in low-Dutch, **Hirs**: in Engliſh, Mill, or Millet.

¶ *The Temperature.*

It is cold in the firſt degree, as *Galen* writeth, and dry in the third, or in the later end of the ſecond, and is of a thin ſubſtance.

¶ *The Vertues.*

A The meale of Mill mixed with tar is layd to the bitings of Serpents and all venomous beaſts.

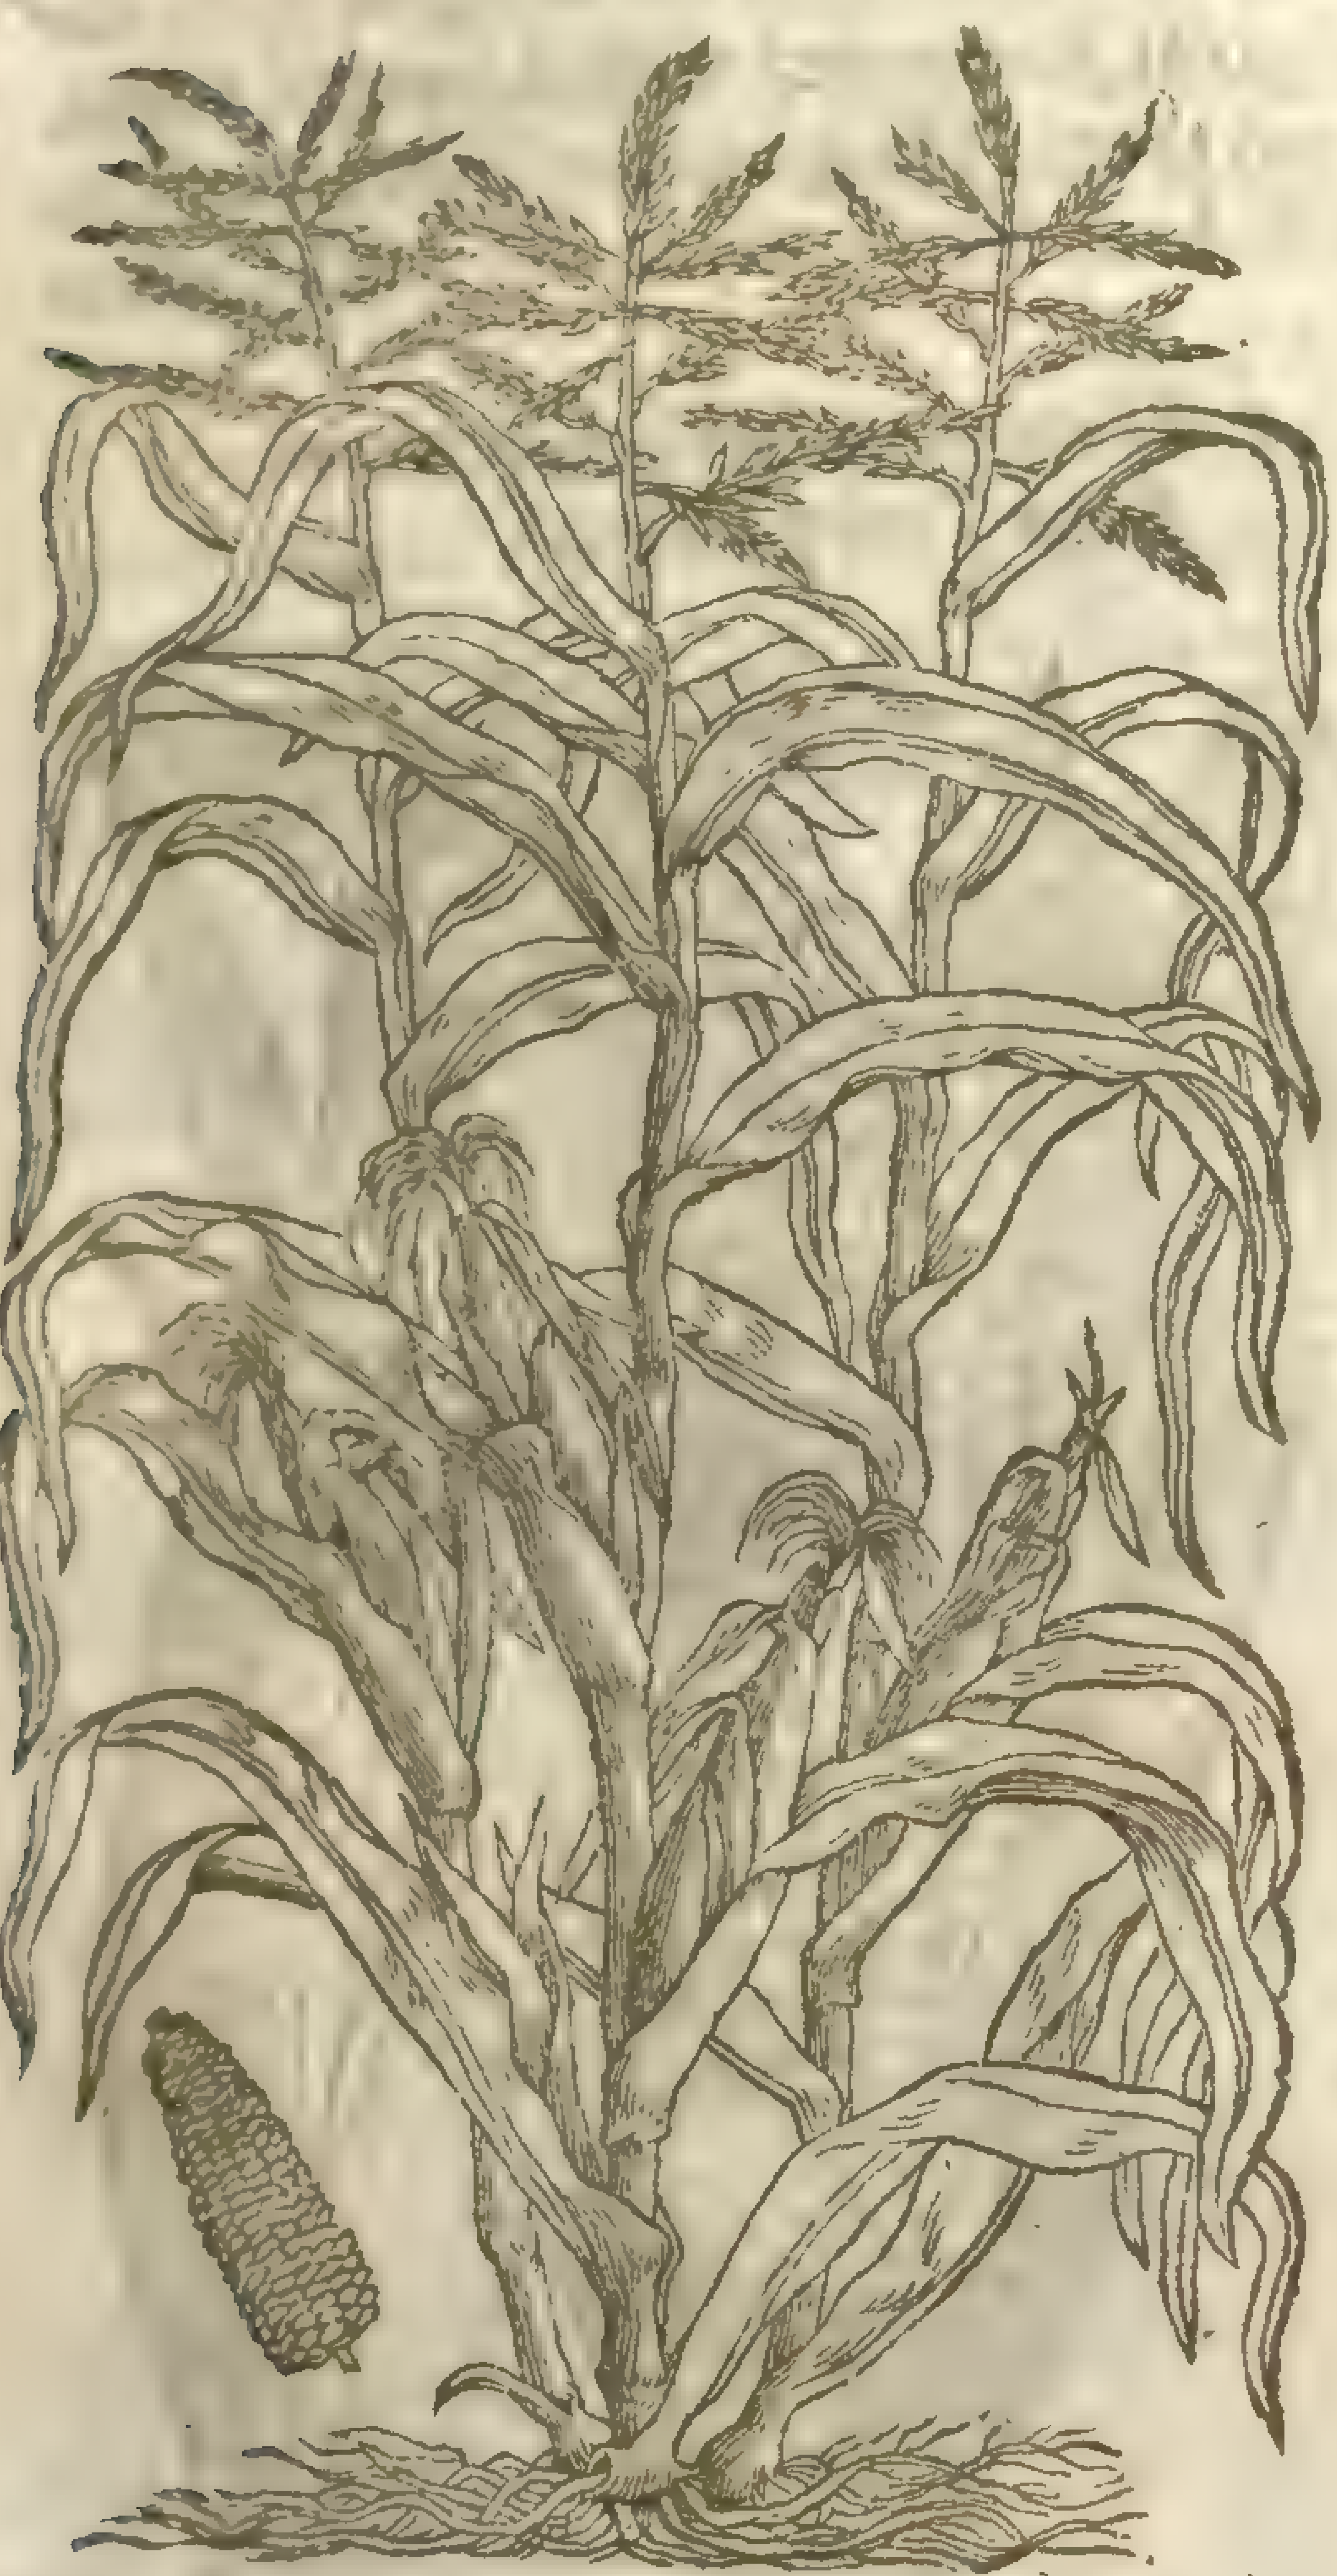
B There is a drink made hereof bearing the name of *Syrupus Ambroſij*, or *Ambroſe* his Syrup, which procureth ſweat and quencheth thirſt, vſed in the city of Millan in rertian Agues. The receipt whereof *Henricus Rantſzouius* in his booke of the Gouernment of health ſetteth down in this manner: Take (ſaith he) of vnhusked Mill a ſufficient quantitie, boile it vntill it be broken; then take fiue ounces of the hot decoction, and adde thereto two ounces of the beſt White wine, and ſo giue it hot vnto the Patient being well couered with clothes, and then he will ſweat throughly. This is likewiſe commended by *Iohannes Heurneus*, in his booke of Practiſe.

C Millet parched, and ſo put hot into a linnen bag, and applied, helps the griping pains of the belly, or any other pain occaſioned by cold.

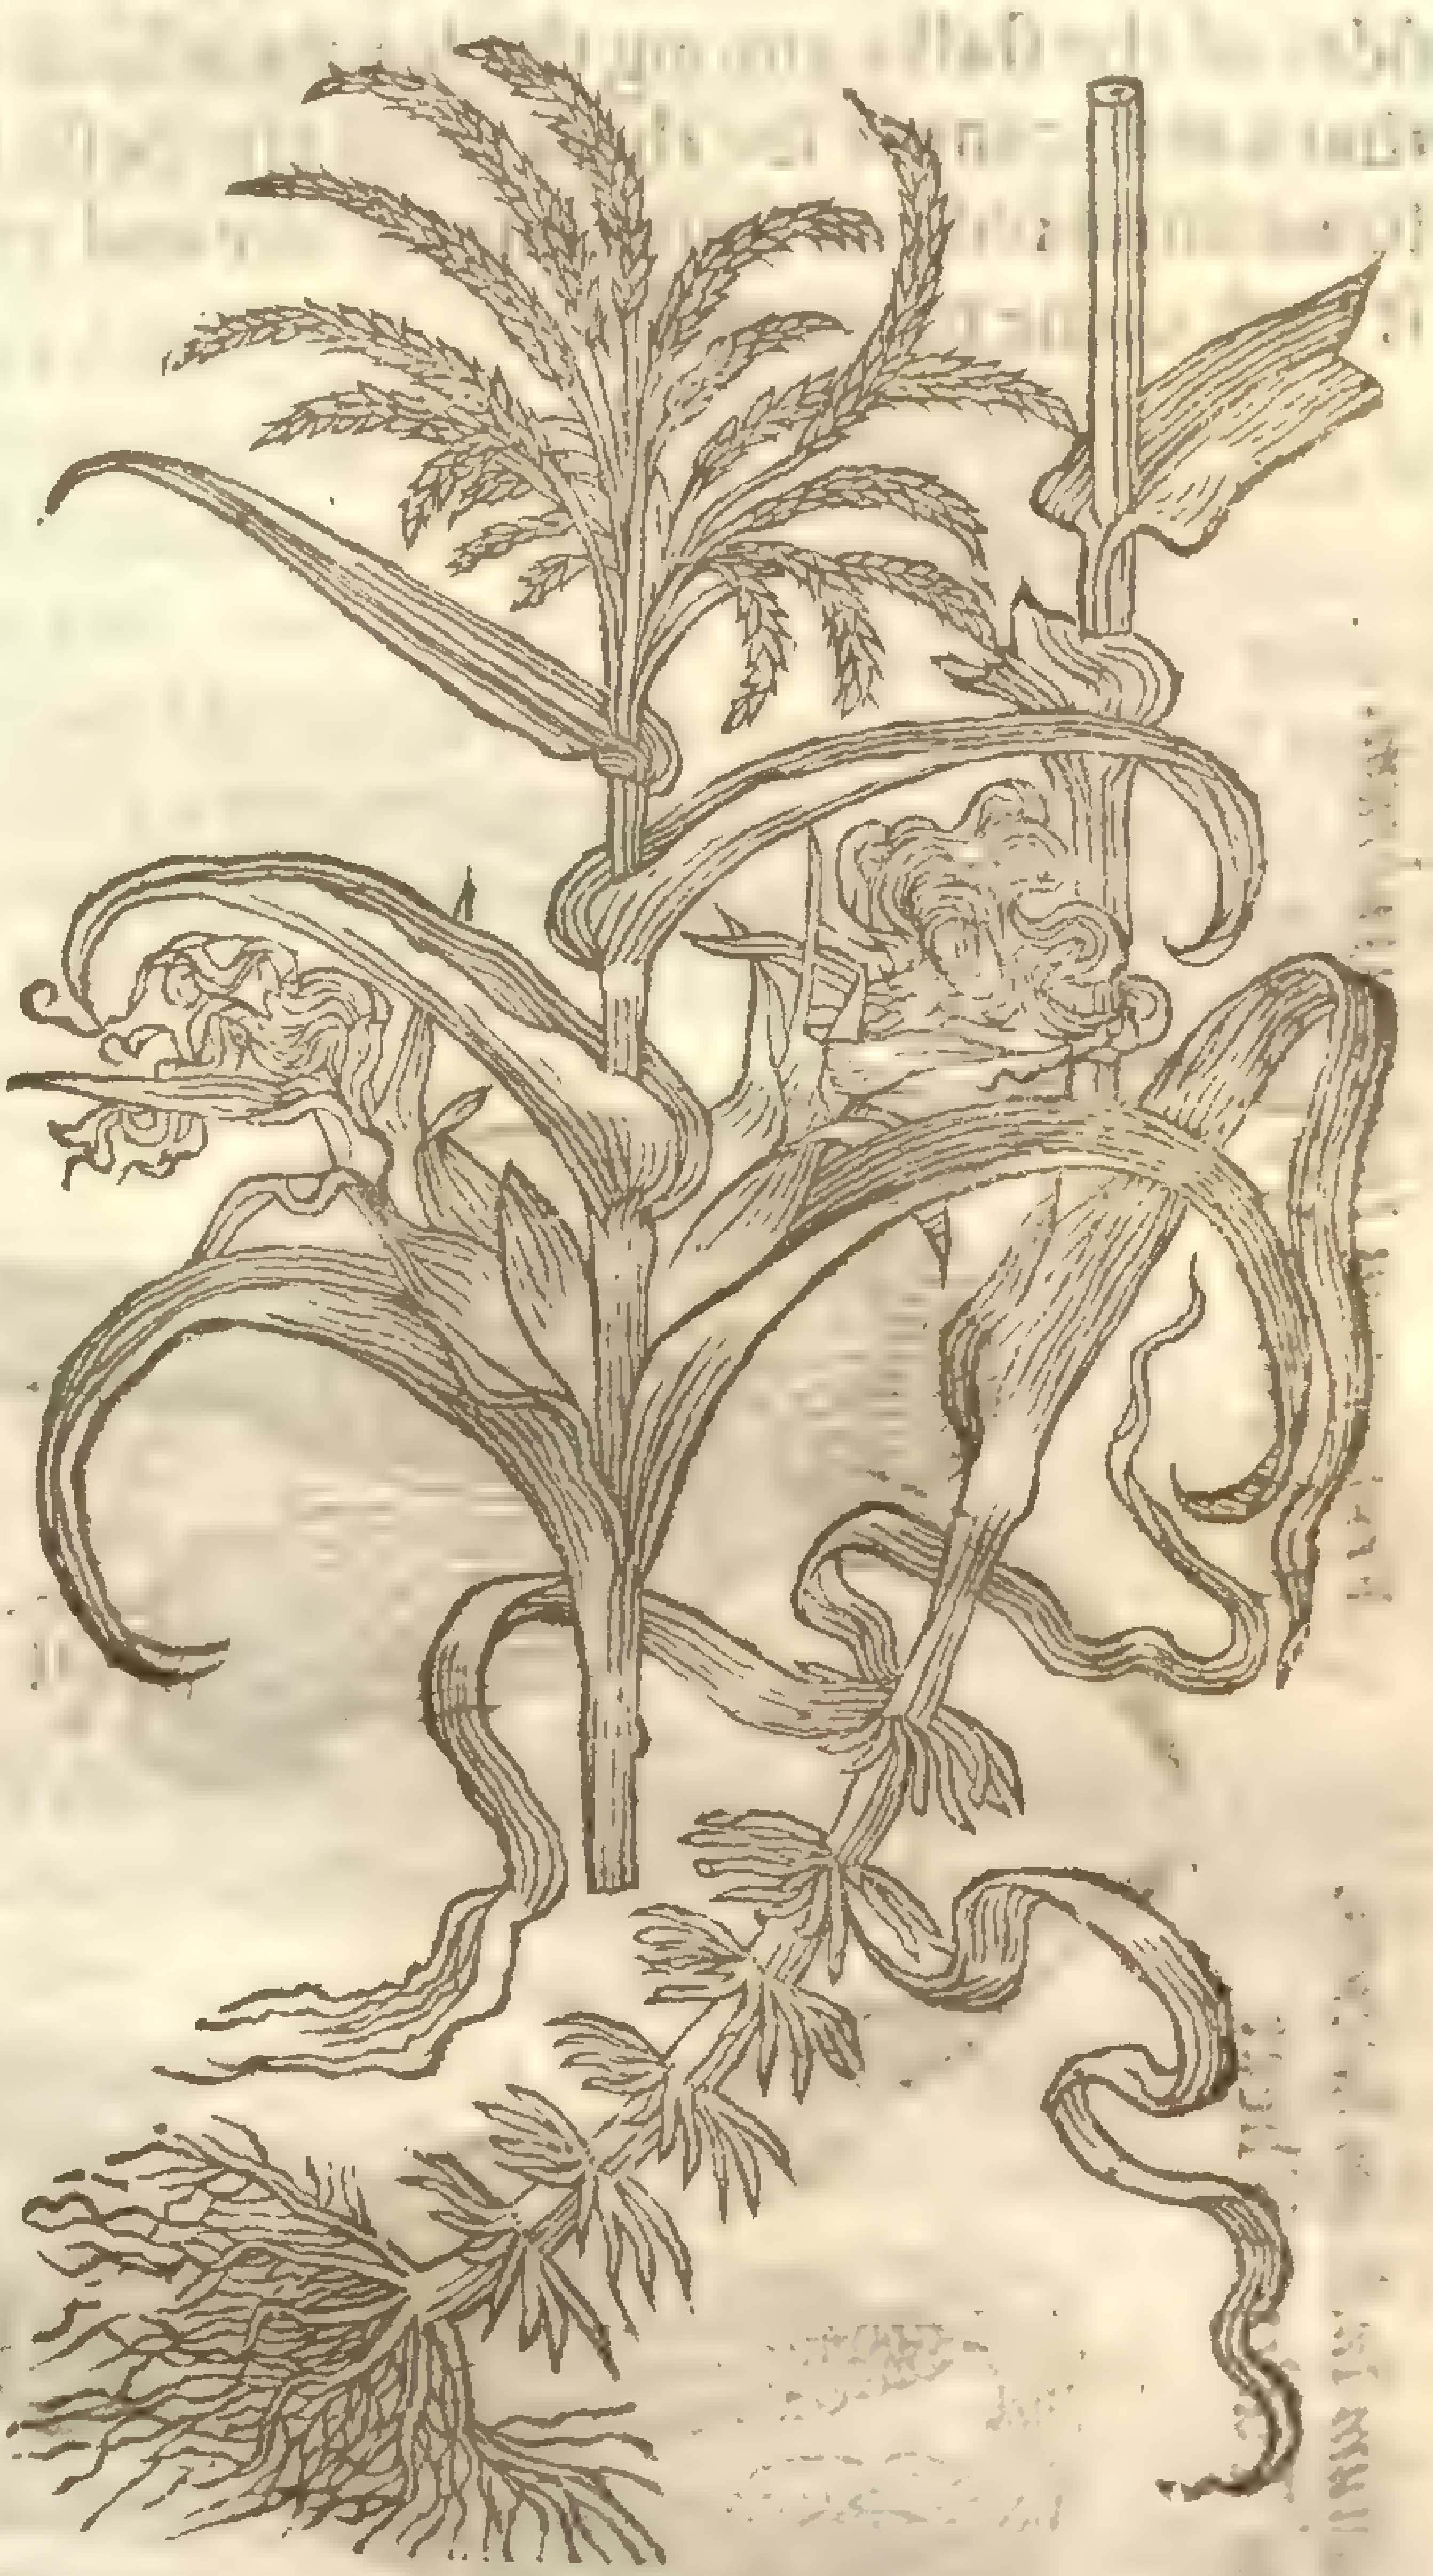
Chap.

CHAP. 61. *Of Turkie Corne.*

1 *Frumentum Aſiaticum.*
Corne of Aſia.



2 *Frumentum Turcicum.*
Turky corne.



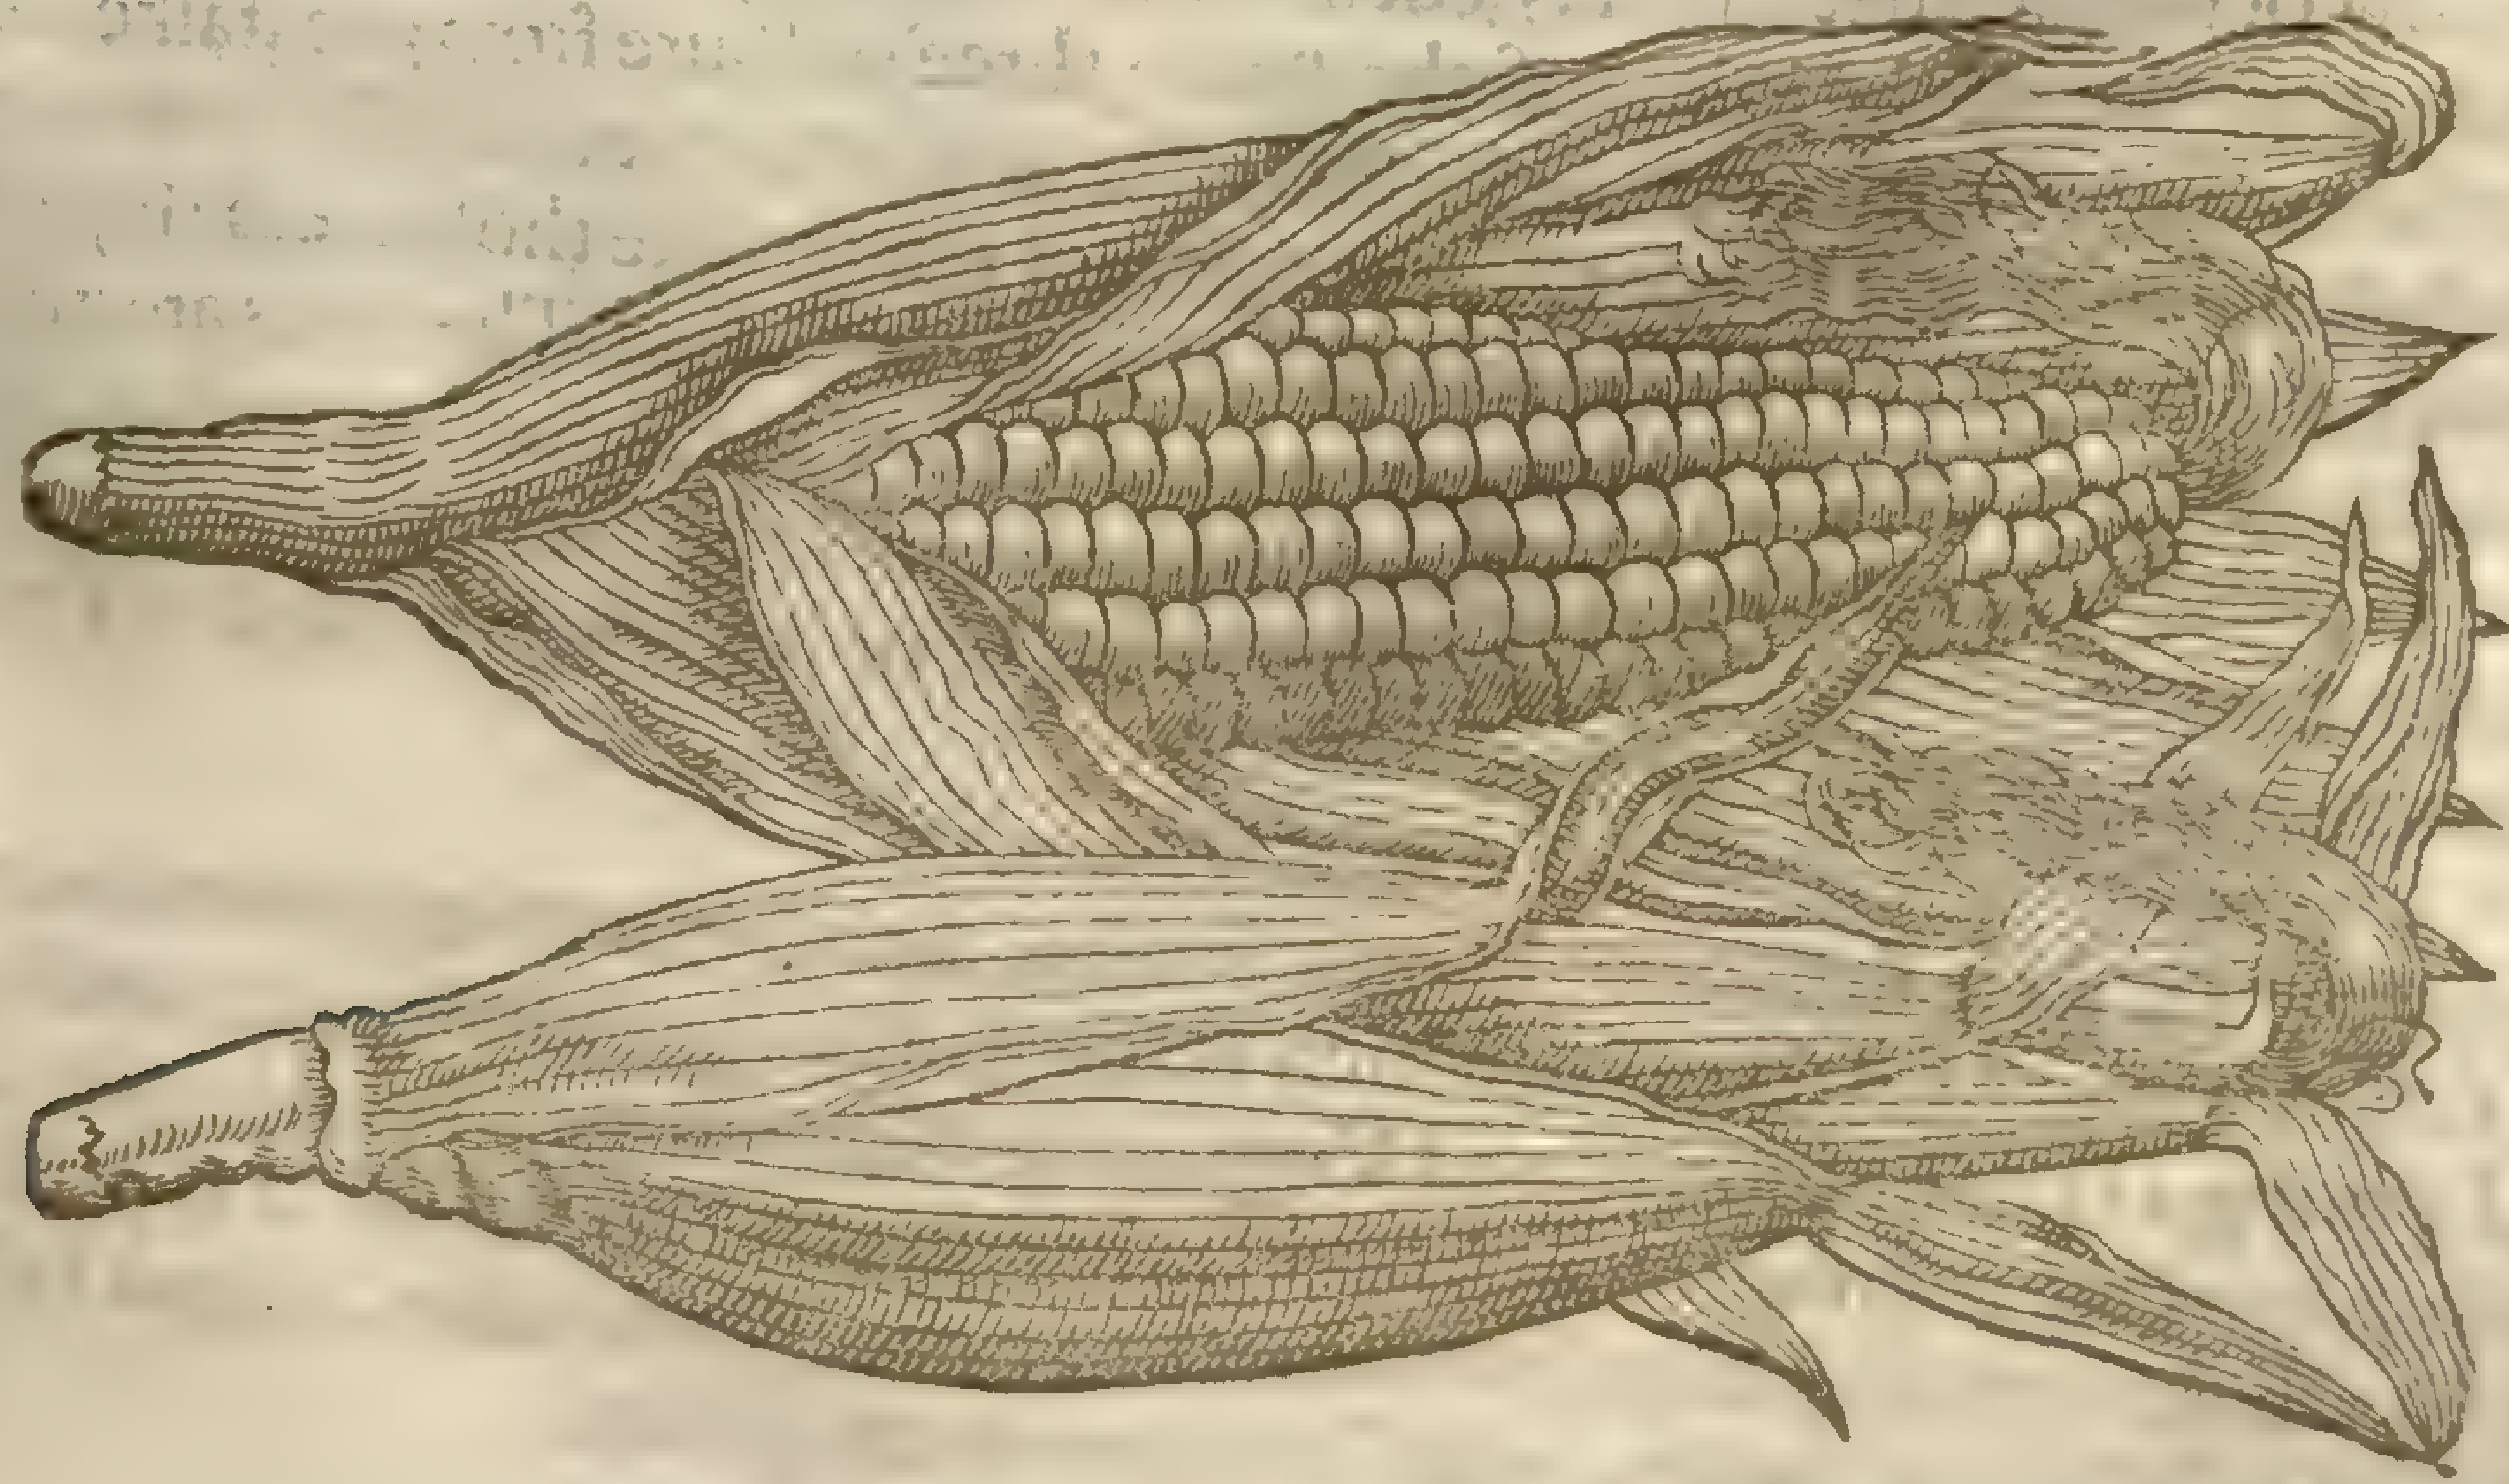
¶ *The Kindes.*

OF Turky Corns there be diuers ſorts, notwithſtanding of one ſtocke or kindred, conſiſting of ſundry coloured Graines, wherein the difference is eaſie to be diſcerned; and for the better explanation of the ſame, I haue ſet forth to your view certain eares of different colours in their ful and perfect ripeneſſe, and ſuch as they ſhew themſelues to be when their skin or filme doth open it ſelfe in the time of gathering.

The forme of the eares of Turky Wheat.

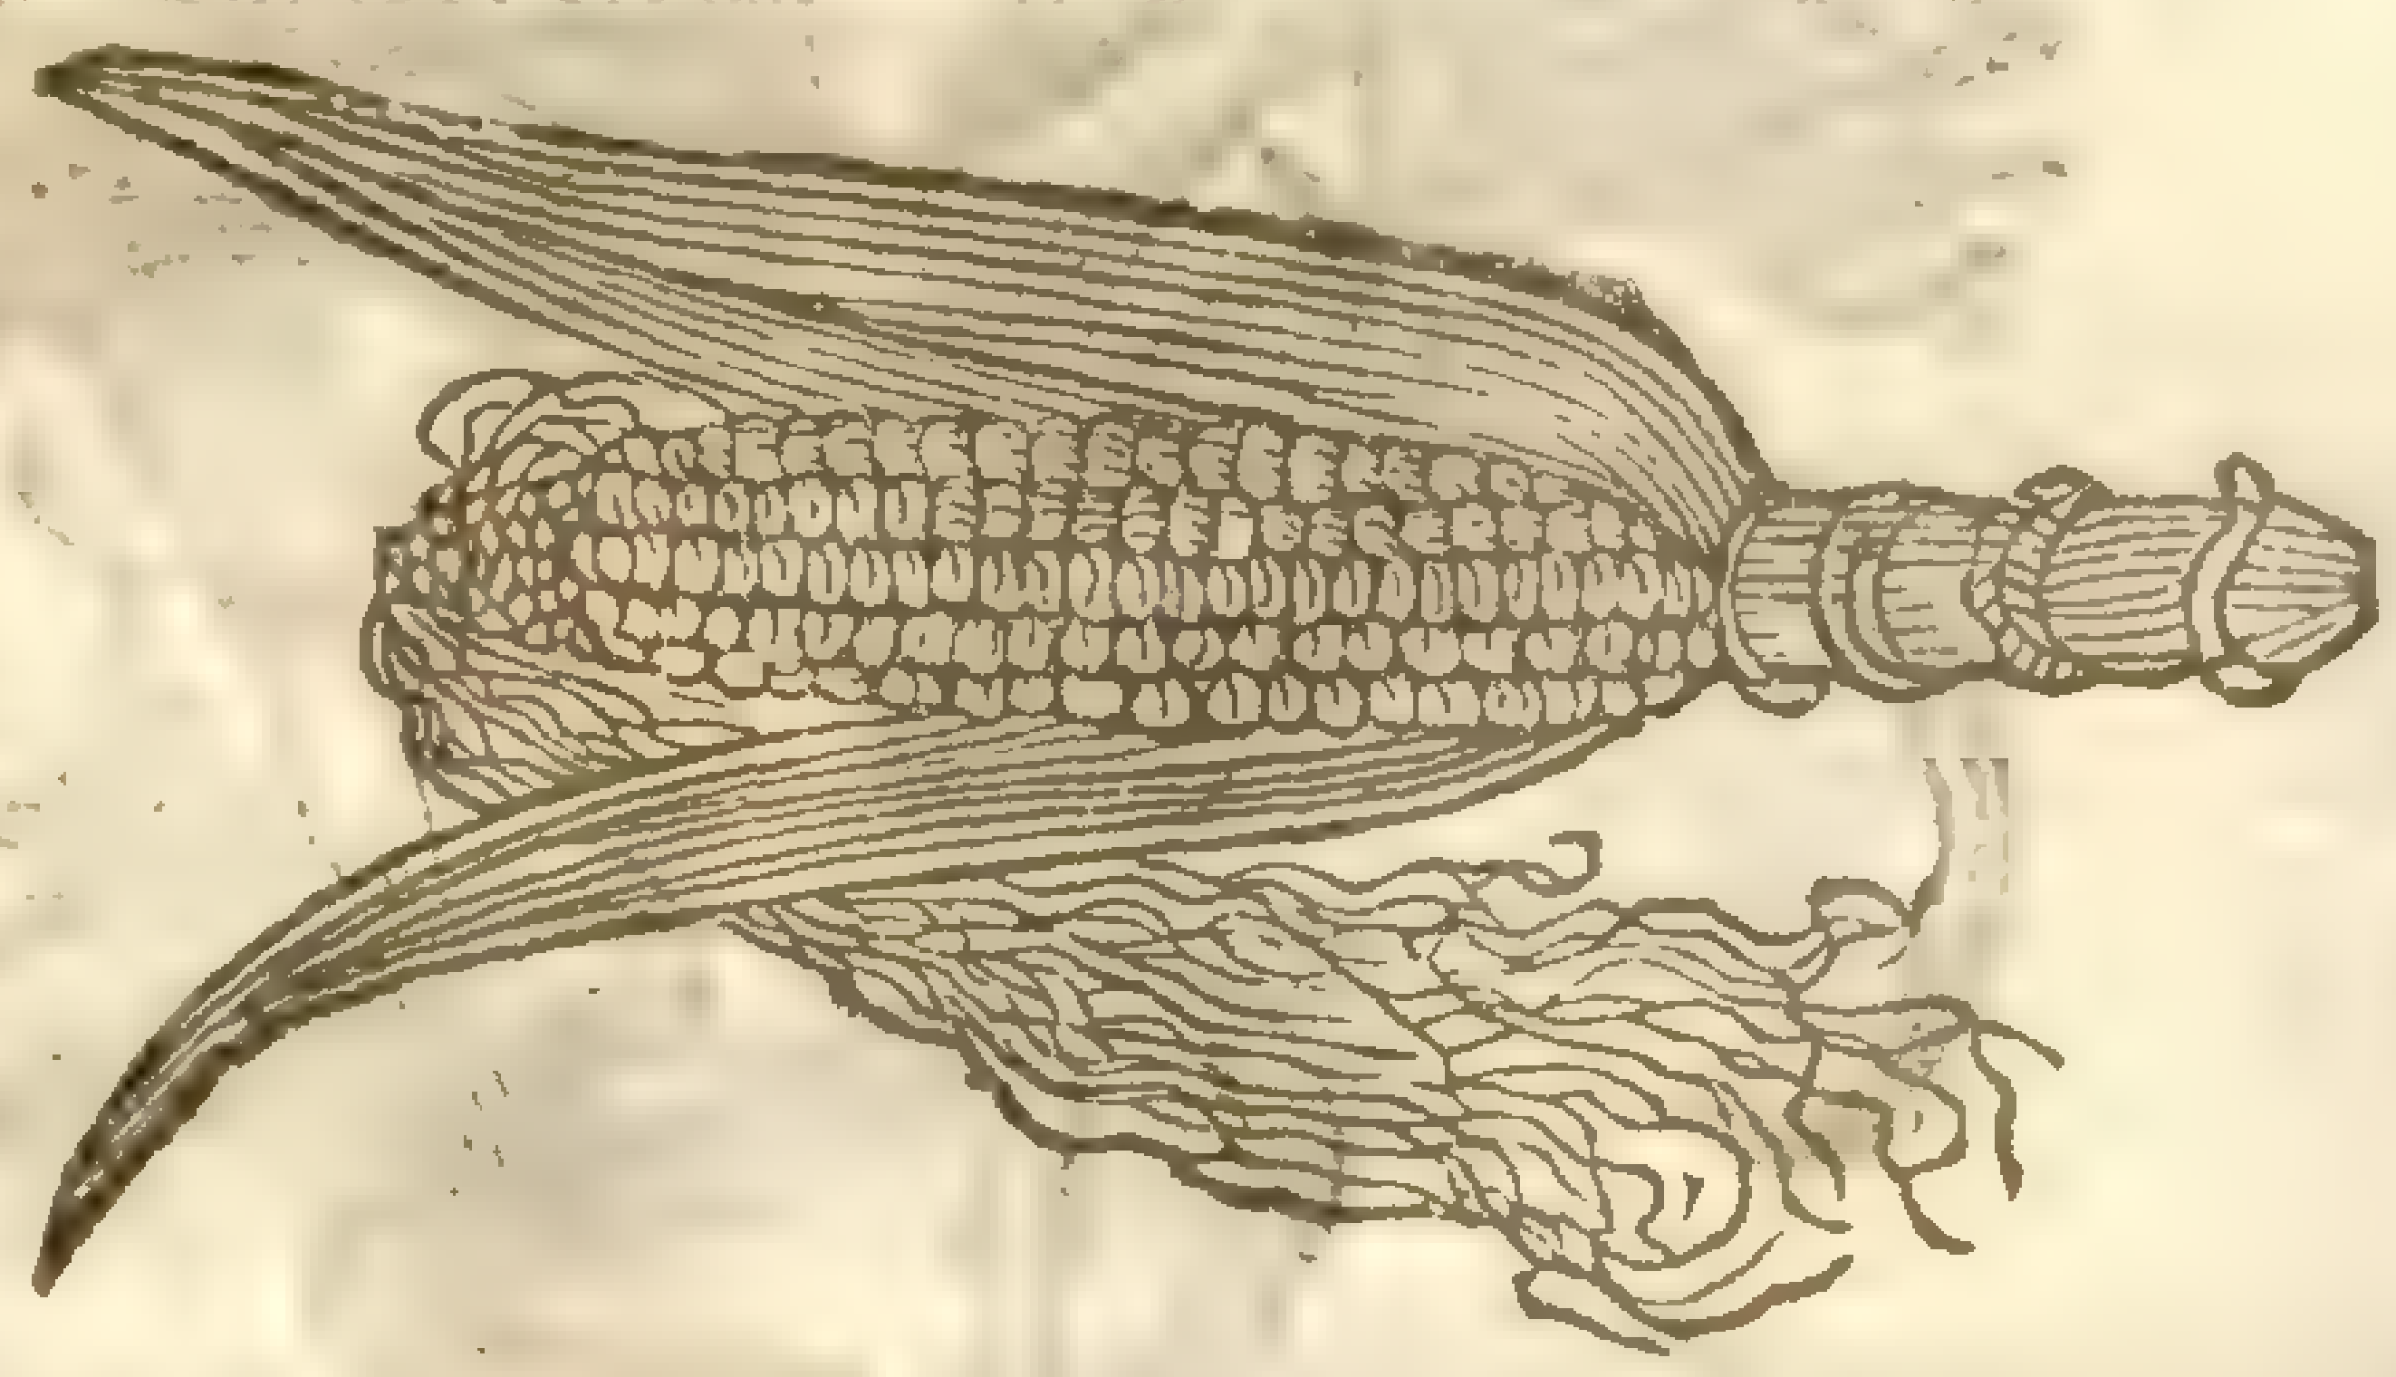
3 *Frumenti Indici ſpica.*
Turky Wheat in the huſke, as alſo naked or bare.

577.75

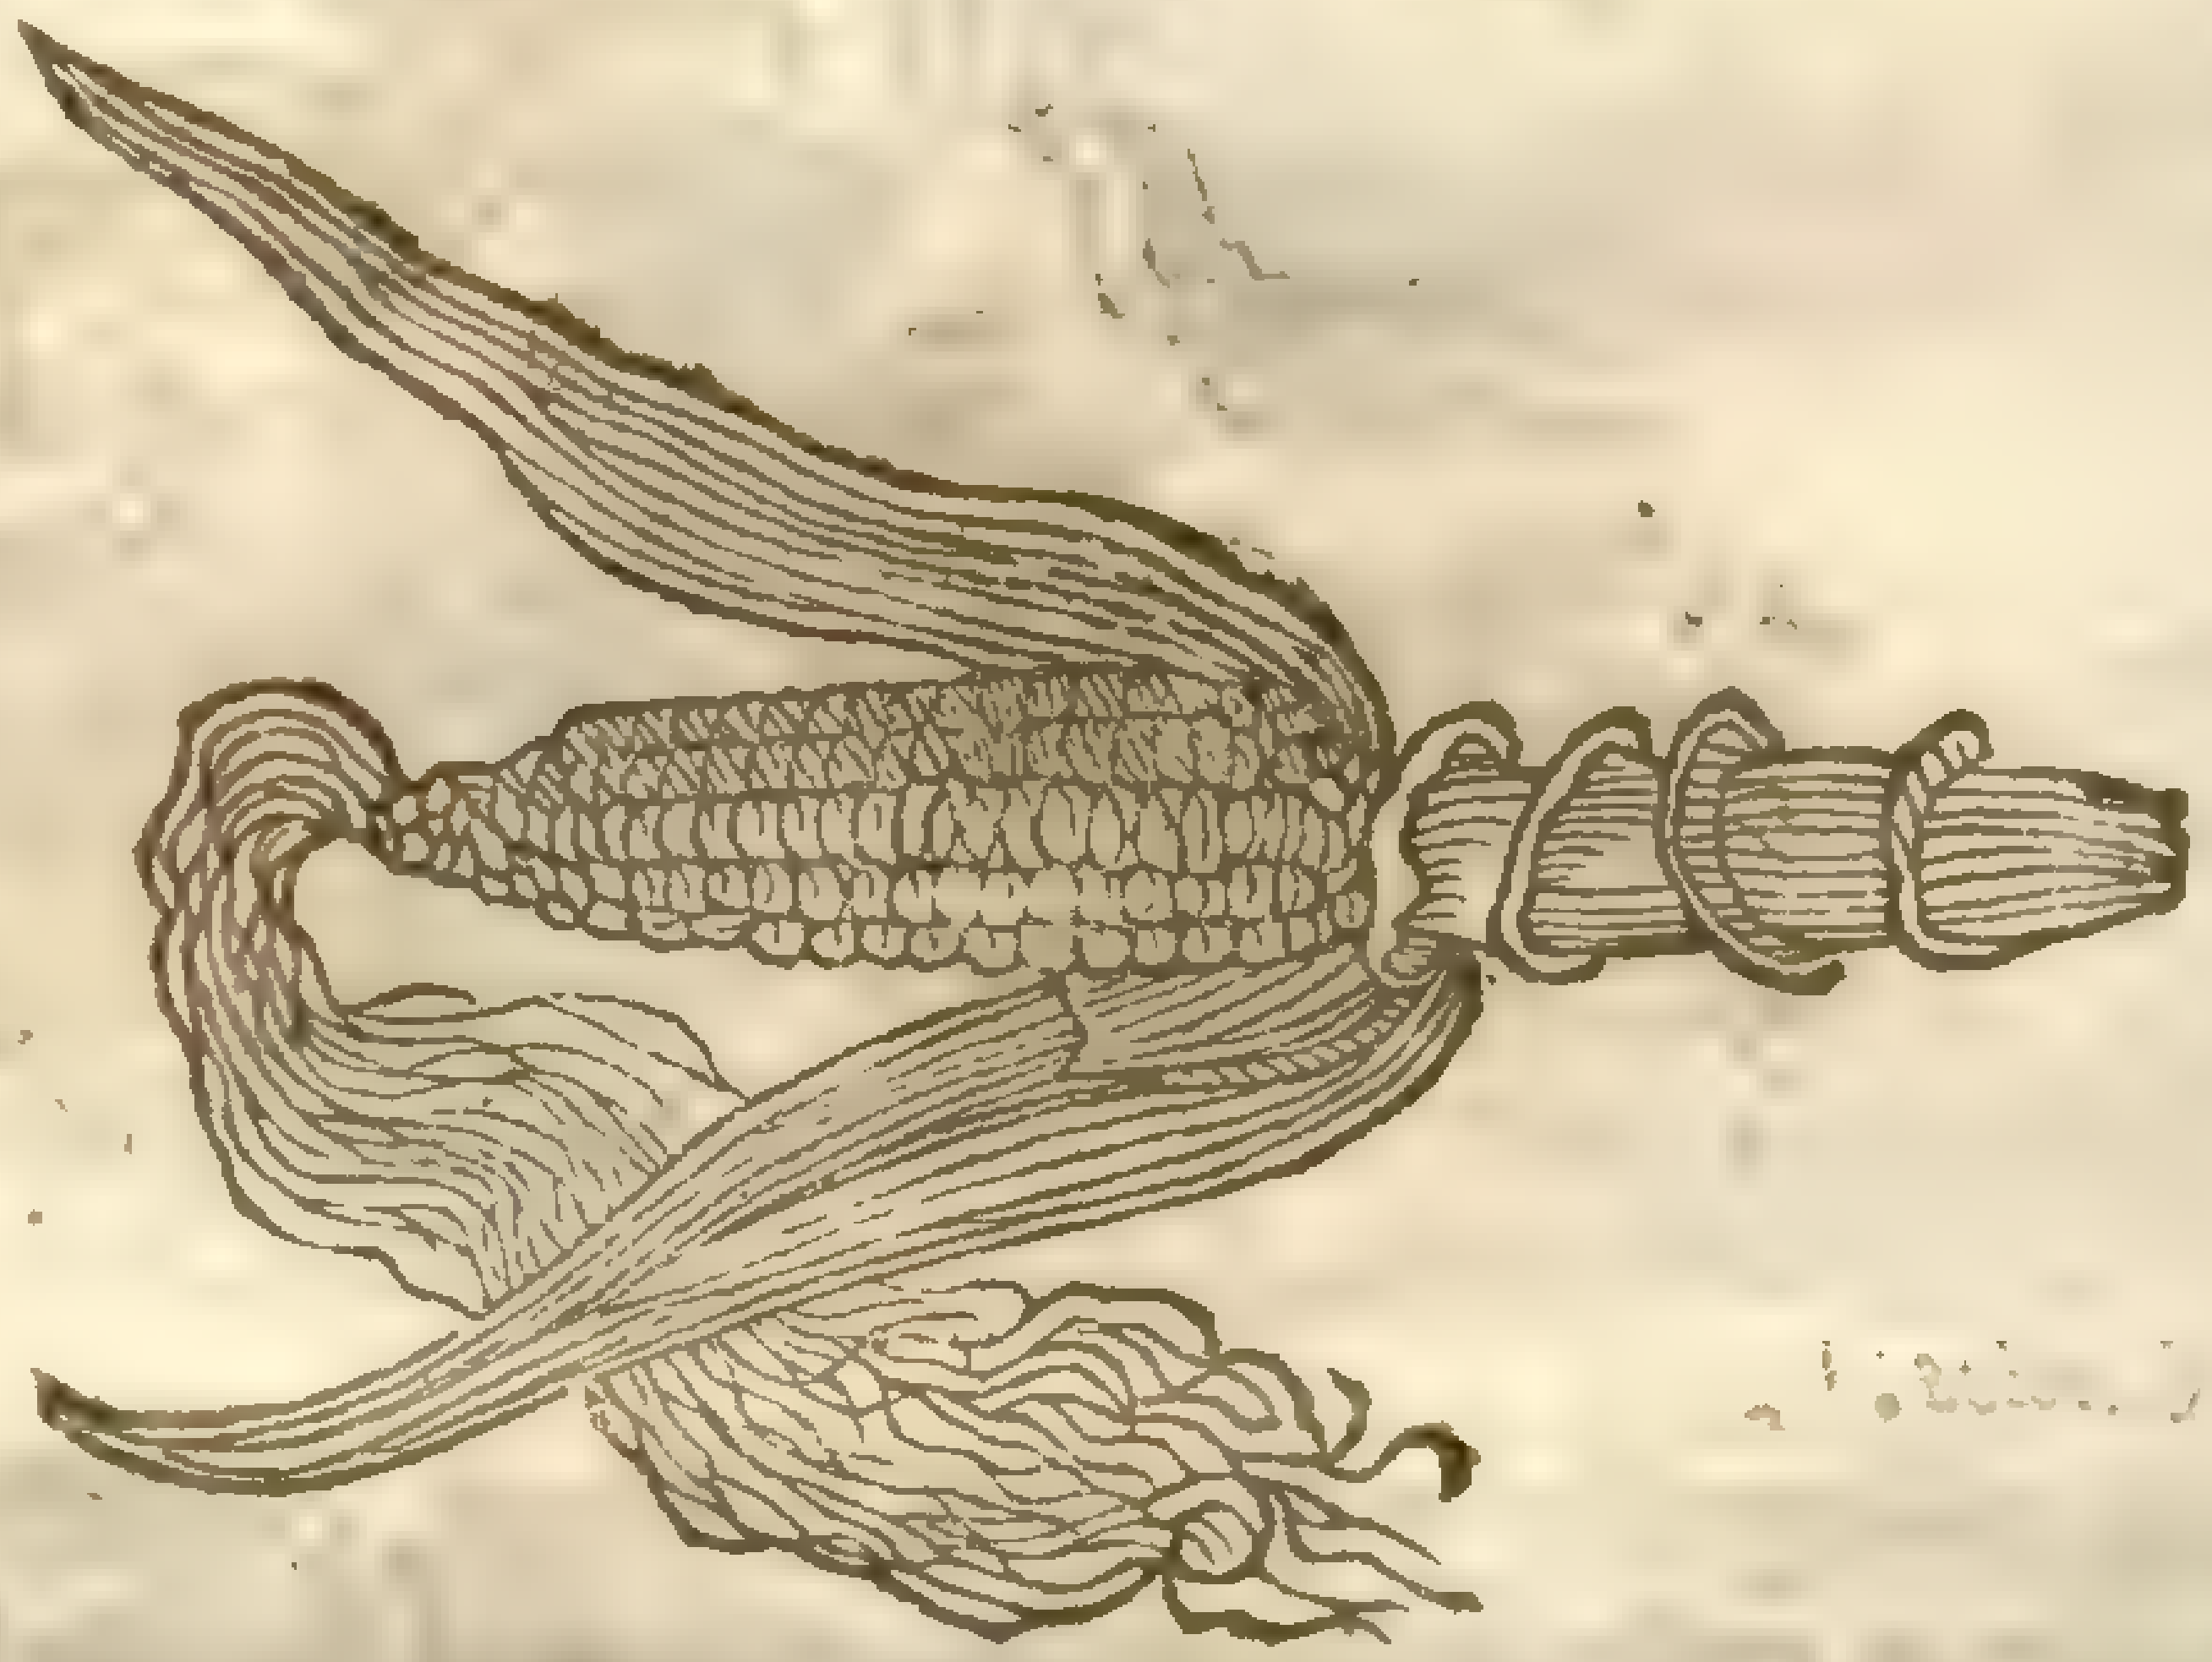


¶ *The Deſcription.*

1 COrne of Aſia beareth a long great ſtem or ſtalke, couered with great leaues like the great Cane reed, but much broader, and of a darke browniſh colour towards the bottome: at the top of the ſtalks grow idle or barren tufts like the common Reed, ſometimes of one colour,and ſometimes of another. Thoſe eares which are fruitfull do grow vpon the ſides of the ſtalks,among the leaues,which are thicke and great,ſo couered with skinnes or filmes, that a man cannot ſee them vntill ripeneſſe haue diſcouered them. The grain is of ſundry colours, ſometimes red,and ſometimes white and yellow,as my ſelfe hath ſeen in myne own garden,where it hath come to ripeneſſe.

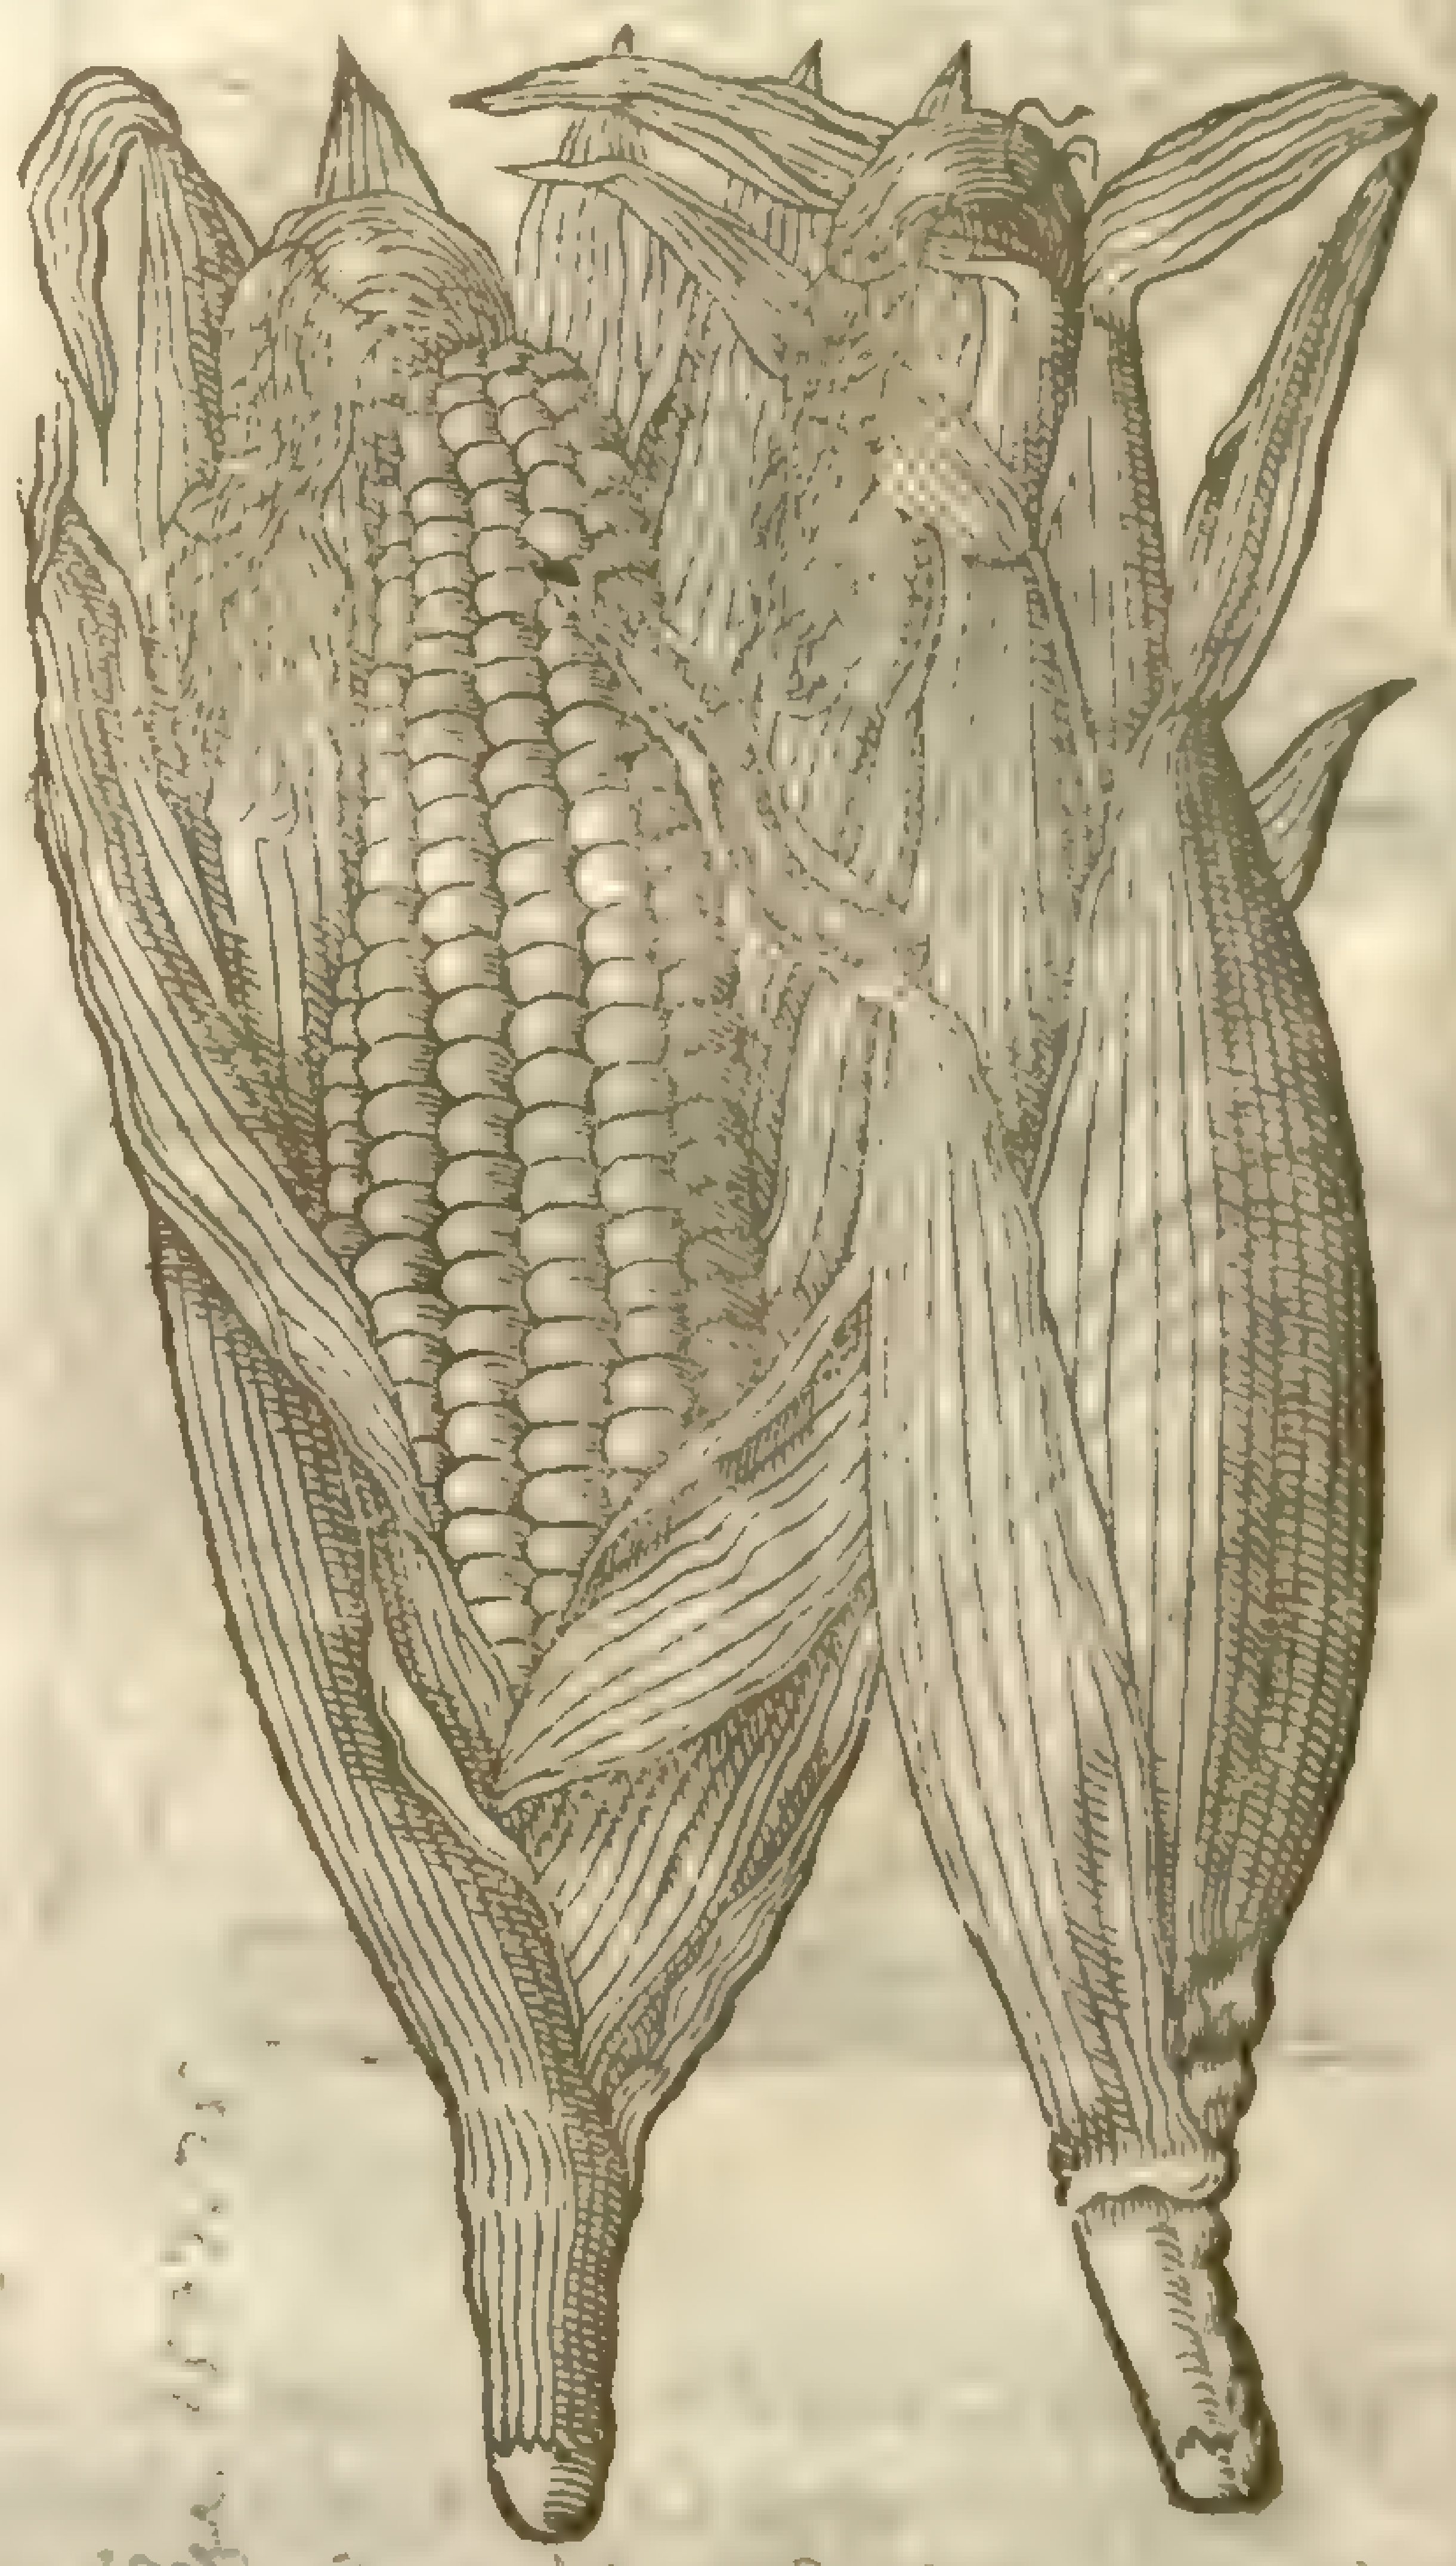


5 *Frumentum Indicum rubrum.* Red Turky Wheat.



4 *Frumentum Indicum luteum.* Yellow Turky Wheat.

6 *Frumentum Indicum cæruleum.* Blew Turky Wheat.



2 The ſtalk of Turky wheat is like that of the Reed,full of ſpongie pith,ſet with many joints fiue or ſix foot high,big beneath,and now and then of a purple colour,and by little and little ſmall aboue: the leaues are broad,long,ſet with veins like thoſe of the Reed. The eares on the top of the ſtalke be a ſpanne long,like vnto the feather-top of the common Reed,diuided into many plumes hanging downward,empty and barren without ſeed, yet blooming as Rie doth. The floure is either white,yellow,or purple,that is to ſay,euen as the fruit will be. The fruit is contained in verie big eares which grow out of the joints of the ſtalke,three or foure from one ſtalke, orderly placed one aboue another,couered with coats and filmes like husks & leaues,as if it were a certain ſheath: out of which do ſtand long and ſlender beards,ſoft and tender,like thoſe laces that grow vpon Sauorie,but greater and longer,euerie one faſtned vpon his owne ſeed. The ſeeds are great,of the bigneſſe of common peaſon,cornered in that part whereby they are faſtned to the eare, and in the outward part round: being of colour ſometimes white, now and then yellow, purple, or red; of taſte ſweet and pleaſant,very cloſely ioyned together in eight or ten orders or ranks. This graine hath many roots ſtrong and full of ſtrings.

¶ *The Place.*

Theſe kinds of grain were firſt brought into Spaine, and then into other prouinces of Europe: not (as ſome ſuppoſe) out of Aſia *minor*, which is the Turks dominions; but out of America and the Iſlands adioining,as out of Florida,and Virginia or Norembega,where they vſe to ſow or ſet it to make bread of it,where it growes much higher than in other countries. It is planted in the gardens of theſe Northern regions,where it commeth to ripeneſſe when the ſummer falleth out to be faire and hot; as my ſelfe haue ſeen by proof in myne owne garden.

¶ *The Time.*

It is ſowen in theſe countries in March and Aprill, and the fruit is ripe in September.

¶ *The Names.*

† Turky wheat is called of ſome *Frumentum Turcicum*,and *Milium Indicum*,as alſo *MaiZum*,and *Maiz*,or *Mays*. It in all probabilitie was vnknowne to the antient both Greeke and Latine Authors. In Engliſh it is called,Turky corne, and Turky wheat. The Inhabitants of America and the Iſlands adjoyning, as alſo of the Eaſt and Weſt Indies,do call it *Mais*: the Virginians,*Pagatowr*.

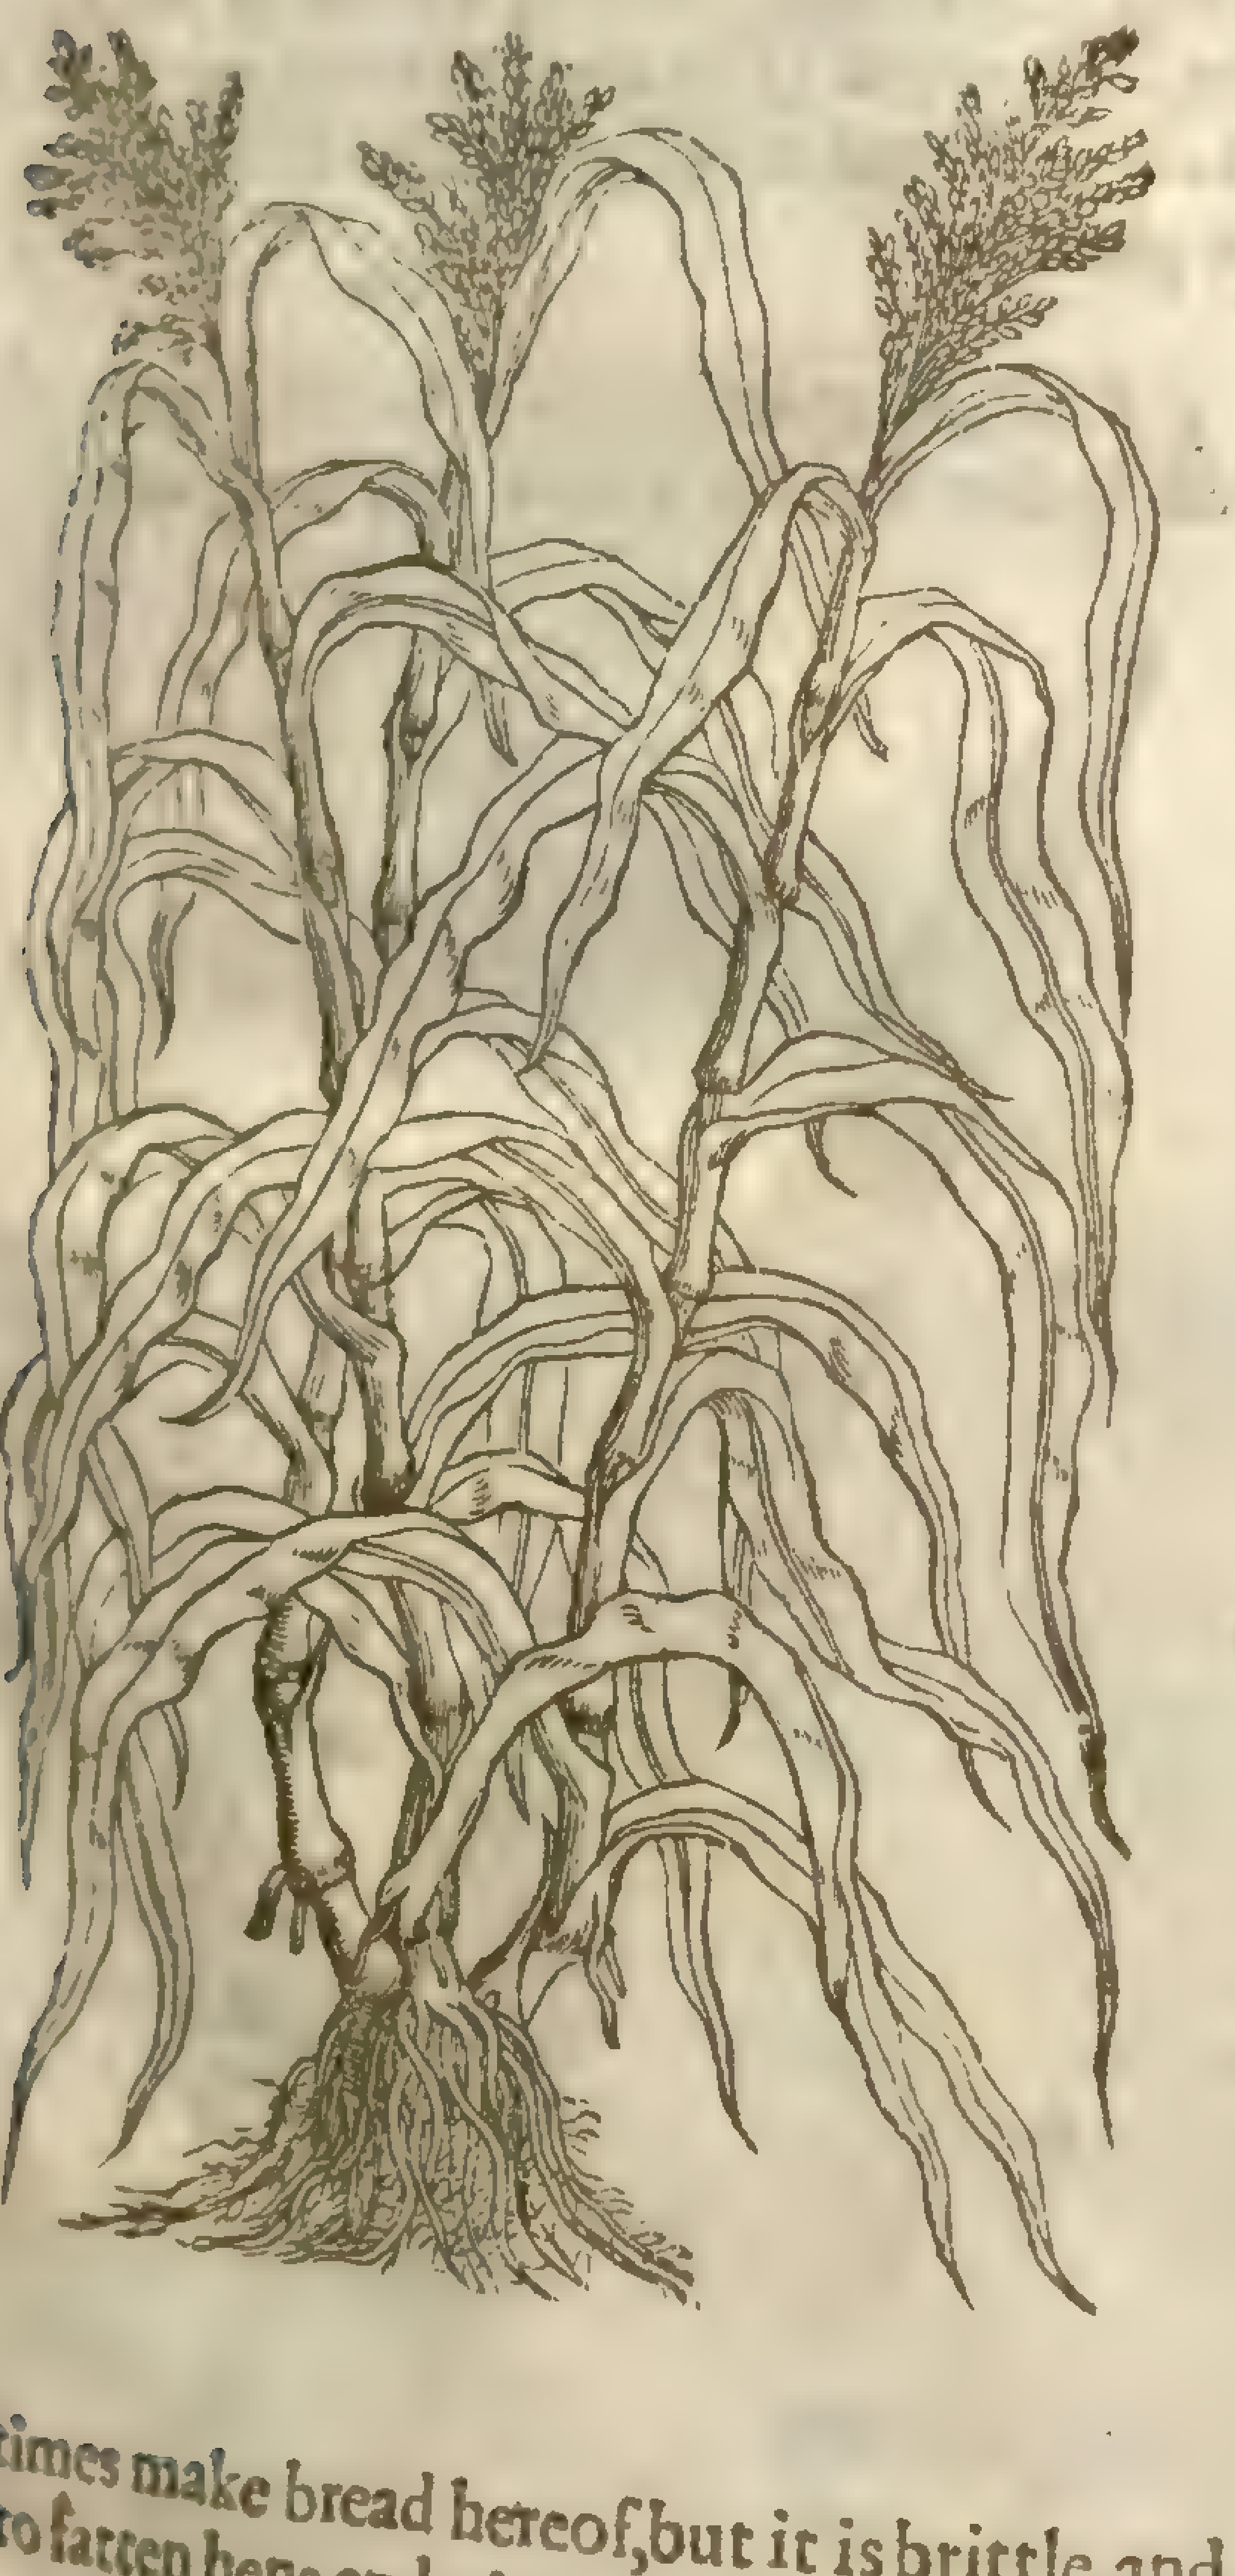
¶ *The Temperature and Vertues.*

Turky wheat doth nouriſh far leſſe than either wheat, rie, barly, or otes. The bread which is made thereof is meanely white,without bran: it is hard and dry as Bisket is,and hath in it no clammineſſe at all; for which cauſe it is of hard digeſtion, and yeeldeth to the body little or no nouriſhment; it ſlowly deſcendeth, and bindeth the belly, as that doth which is made of Mill or Panick. Wee haue as yet no certaine proofe or experience concerning the vertues of this kinde of Corne; although the barbarous Indians,which know no better,are conſtrained to make a vertue of neceſſitie,and thinke it a good food: whereas we may eaſily iudge,that it nouriſheth but little,and is of hard and euill digeſtion, a more conuenient food for ſwine than for man.

Sorghum vulgare Pers.

CHAP. 62. *Of Turkie Millet*

Sorghum
Turky Millet.



¶ *The Deſcription.*

TVrky Millet is a ſtranger in England. It hath many high ſtalkes,thicke,and joynted commonly with ſome nine joynts, beſet with many long and broad leaues like Turky wheat: at the top whereof groweth a great and large tuft or eare like the great Reed. The ſeed is round and ſharpe pointed,of the bigneſſe of a Lentill, ſometimes red,and now and then of a ſullen blacke colour. It is faſtned with a multitude of ſtrong ſlender roots like vnto threds: the whole plant hath the forme of a Reed: the ſtalkes and eares when the ſeed is ripe are red.

¶ *The Place.*

It ioyeth in a fat and moiſt ground: it groweth in Italy,Spaine and other hot regions.

¶ *The Time.*

This is one of the Summer graines, and is ripe in Autumne.

¶ *The Names.*

The Millanois and other people of Lombardy call it *Melegua*,and *Meliga*: in Latine, *Melica*: in Hetruria,*Saggina*: in other places of Italy,*Sorgho*: in Portugal,*Milium Saburrum*: in Engliſh, Turky Mill, or Turky Hirſſe.

‡ This ſeems to be the *Milium* which was brought into Italy out of India in the reigne of the Emperour *Nero*: the which is deſcribed by *Pliny*,*lib*.18.*cap*.7. ‡

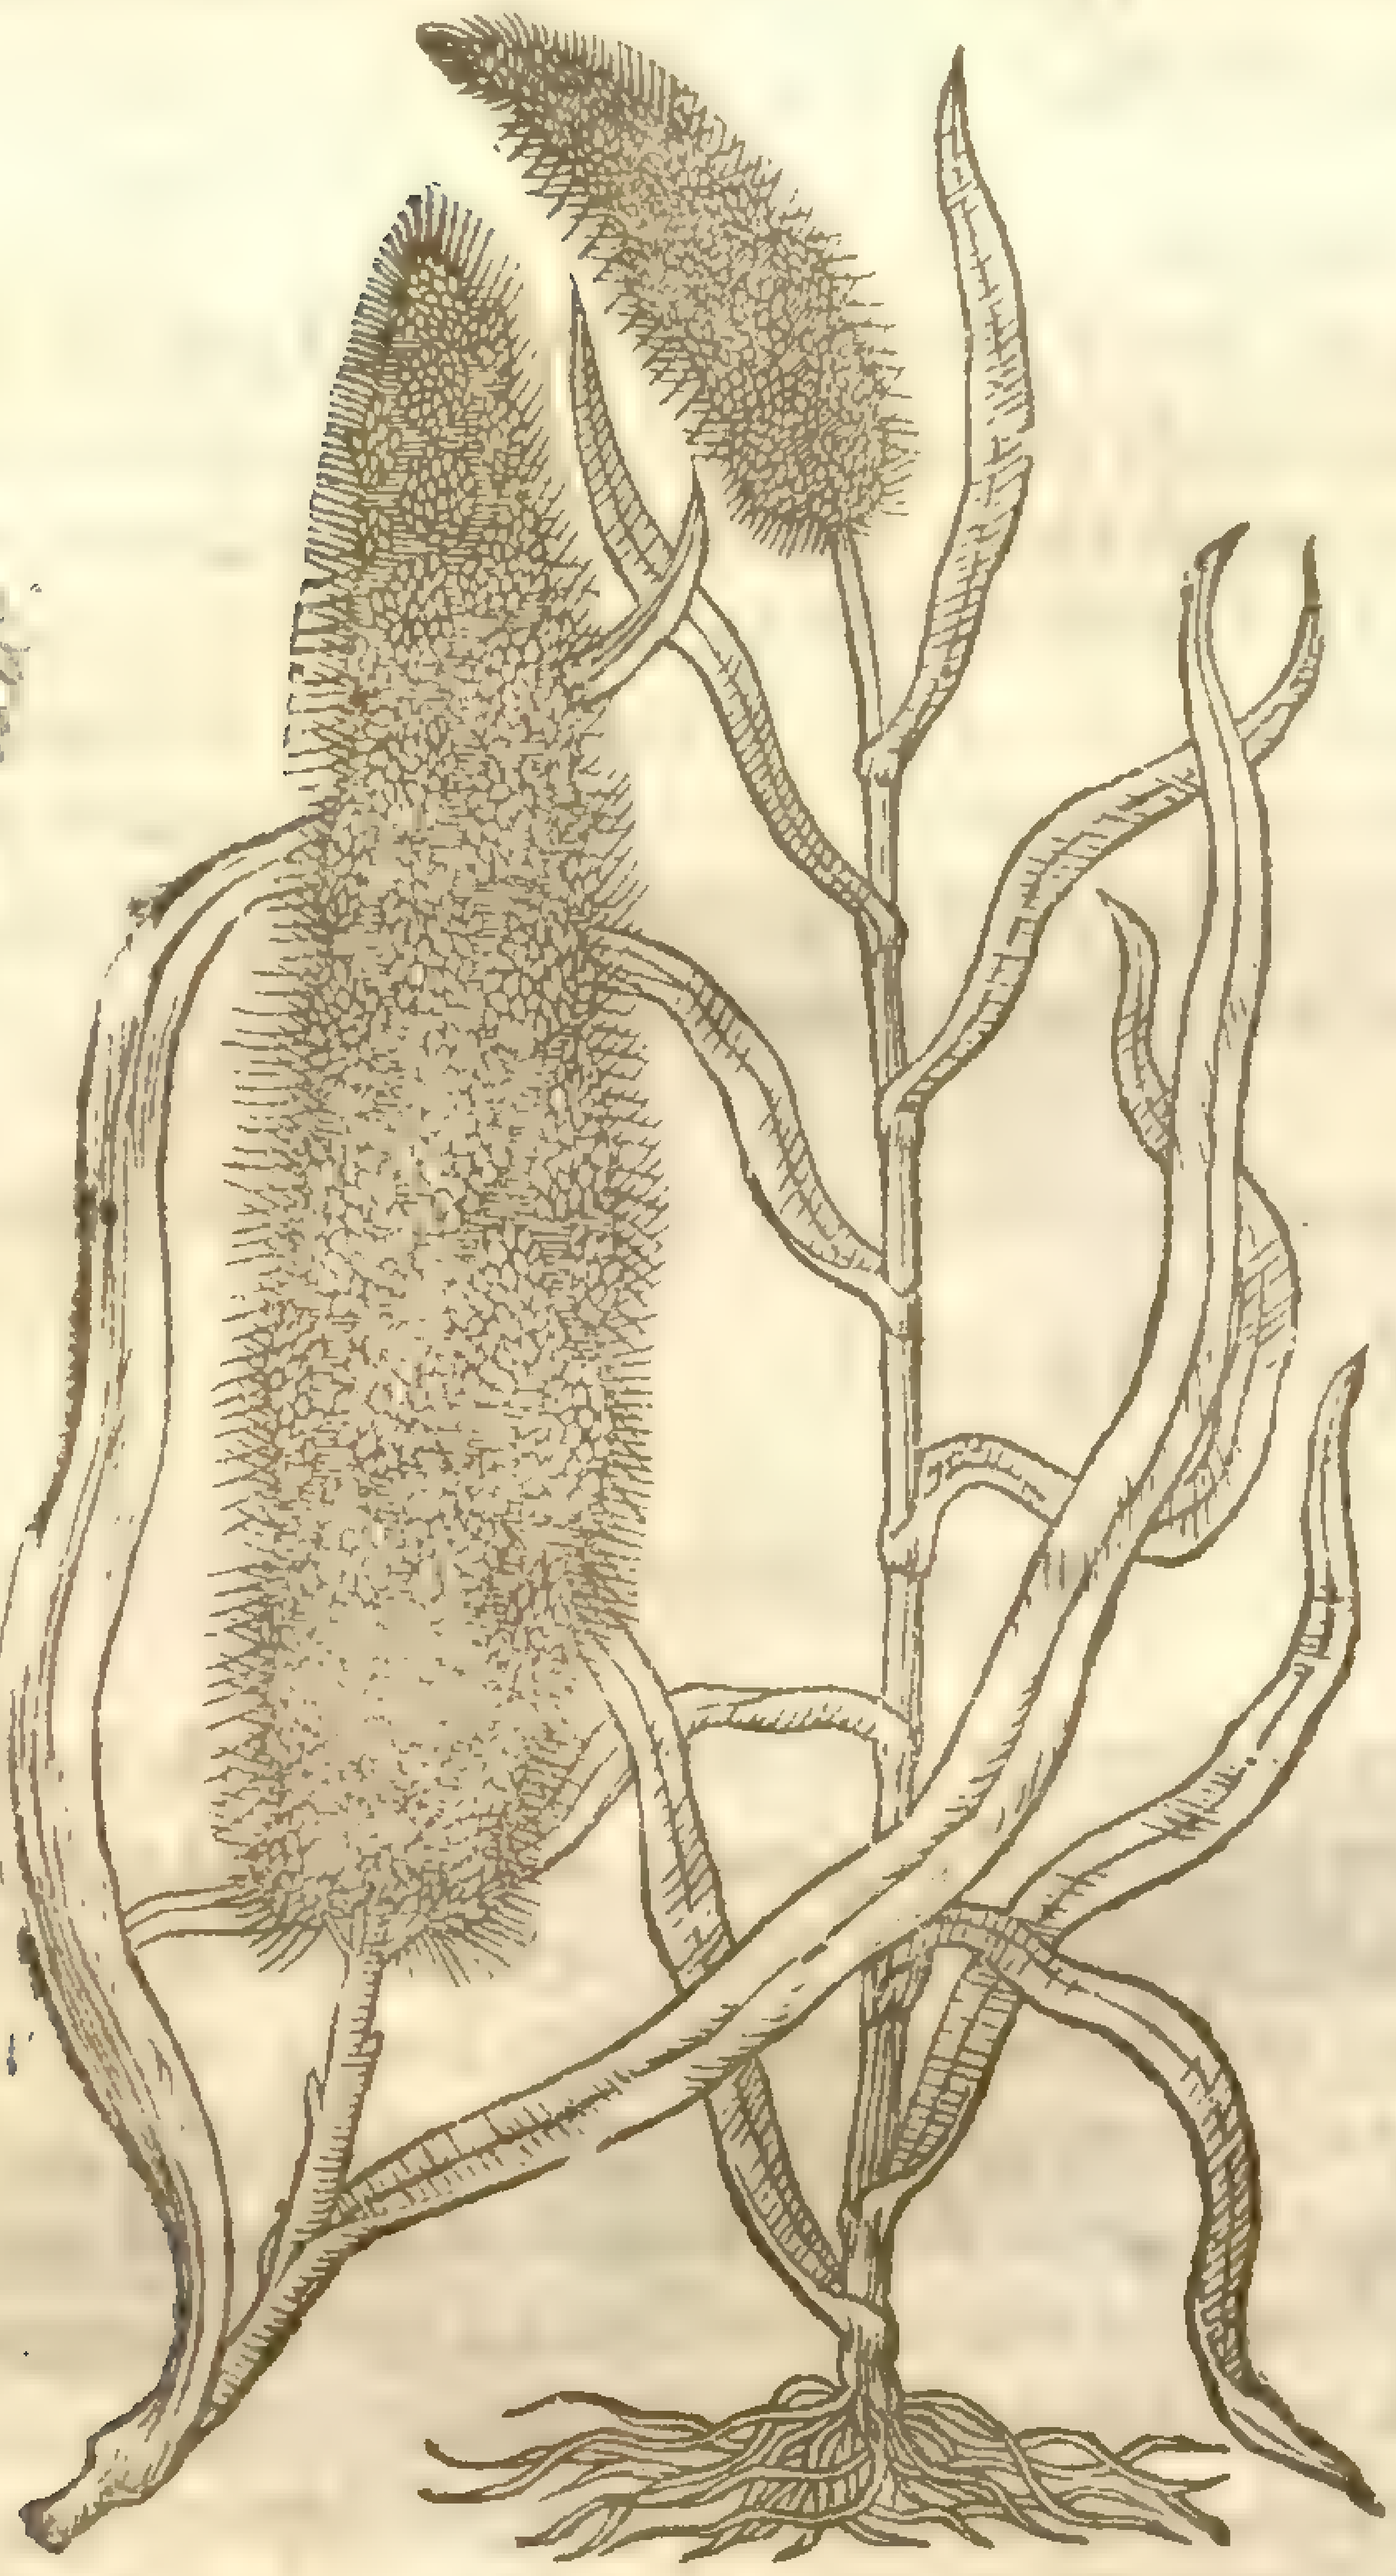
¶ *The Temperature and Vertues.*

The ſeed of Turky Mill is like vnto Panicke in taſte and temperature. The country People ſometimes make bread hereof,but it is brittle,and of little nouriſhment,and for the moſt part it ſerueth to fatten hens and pigeons with.

CHAP.

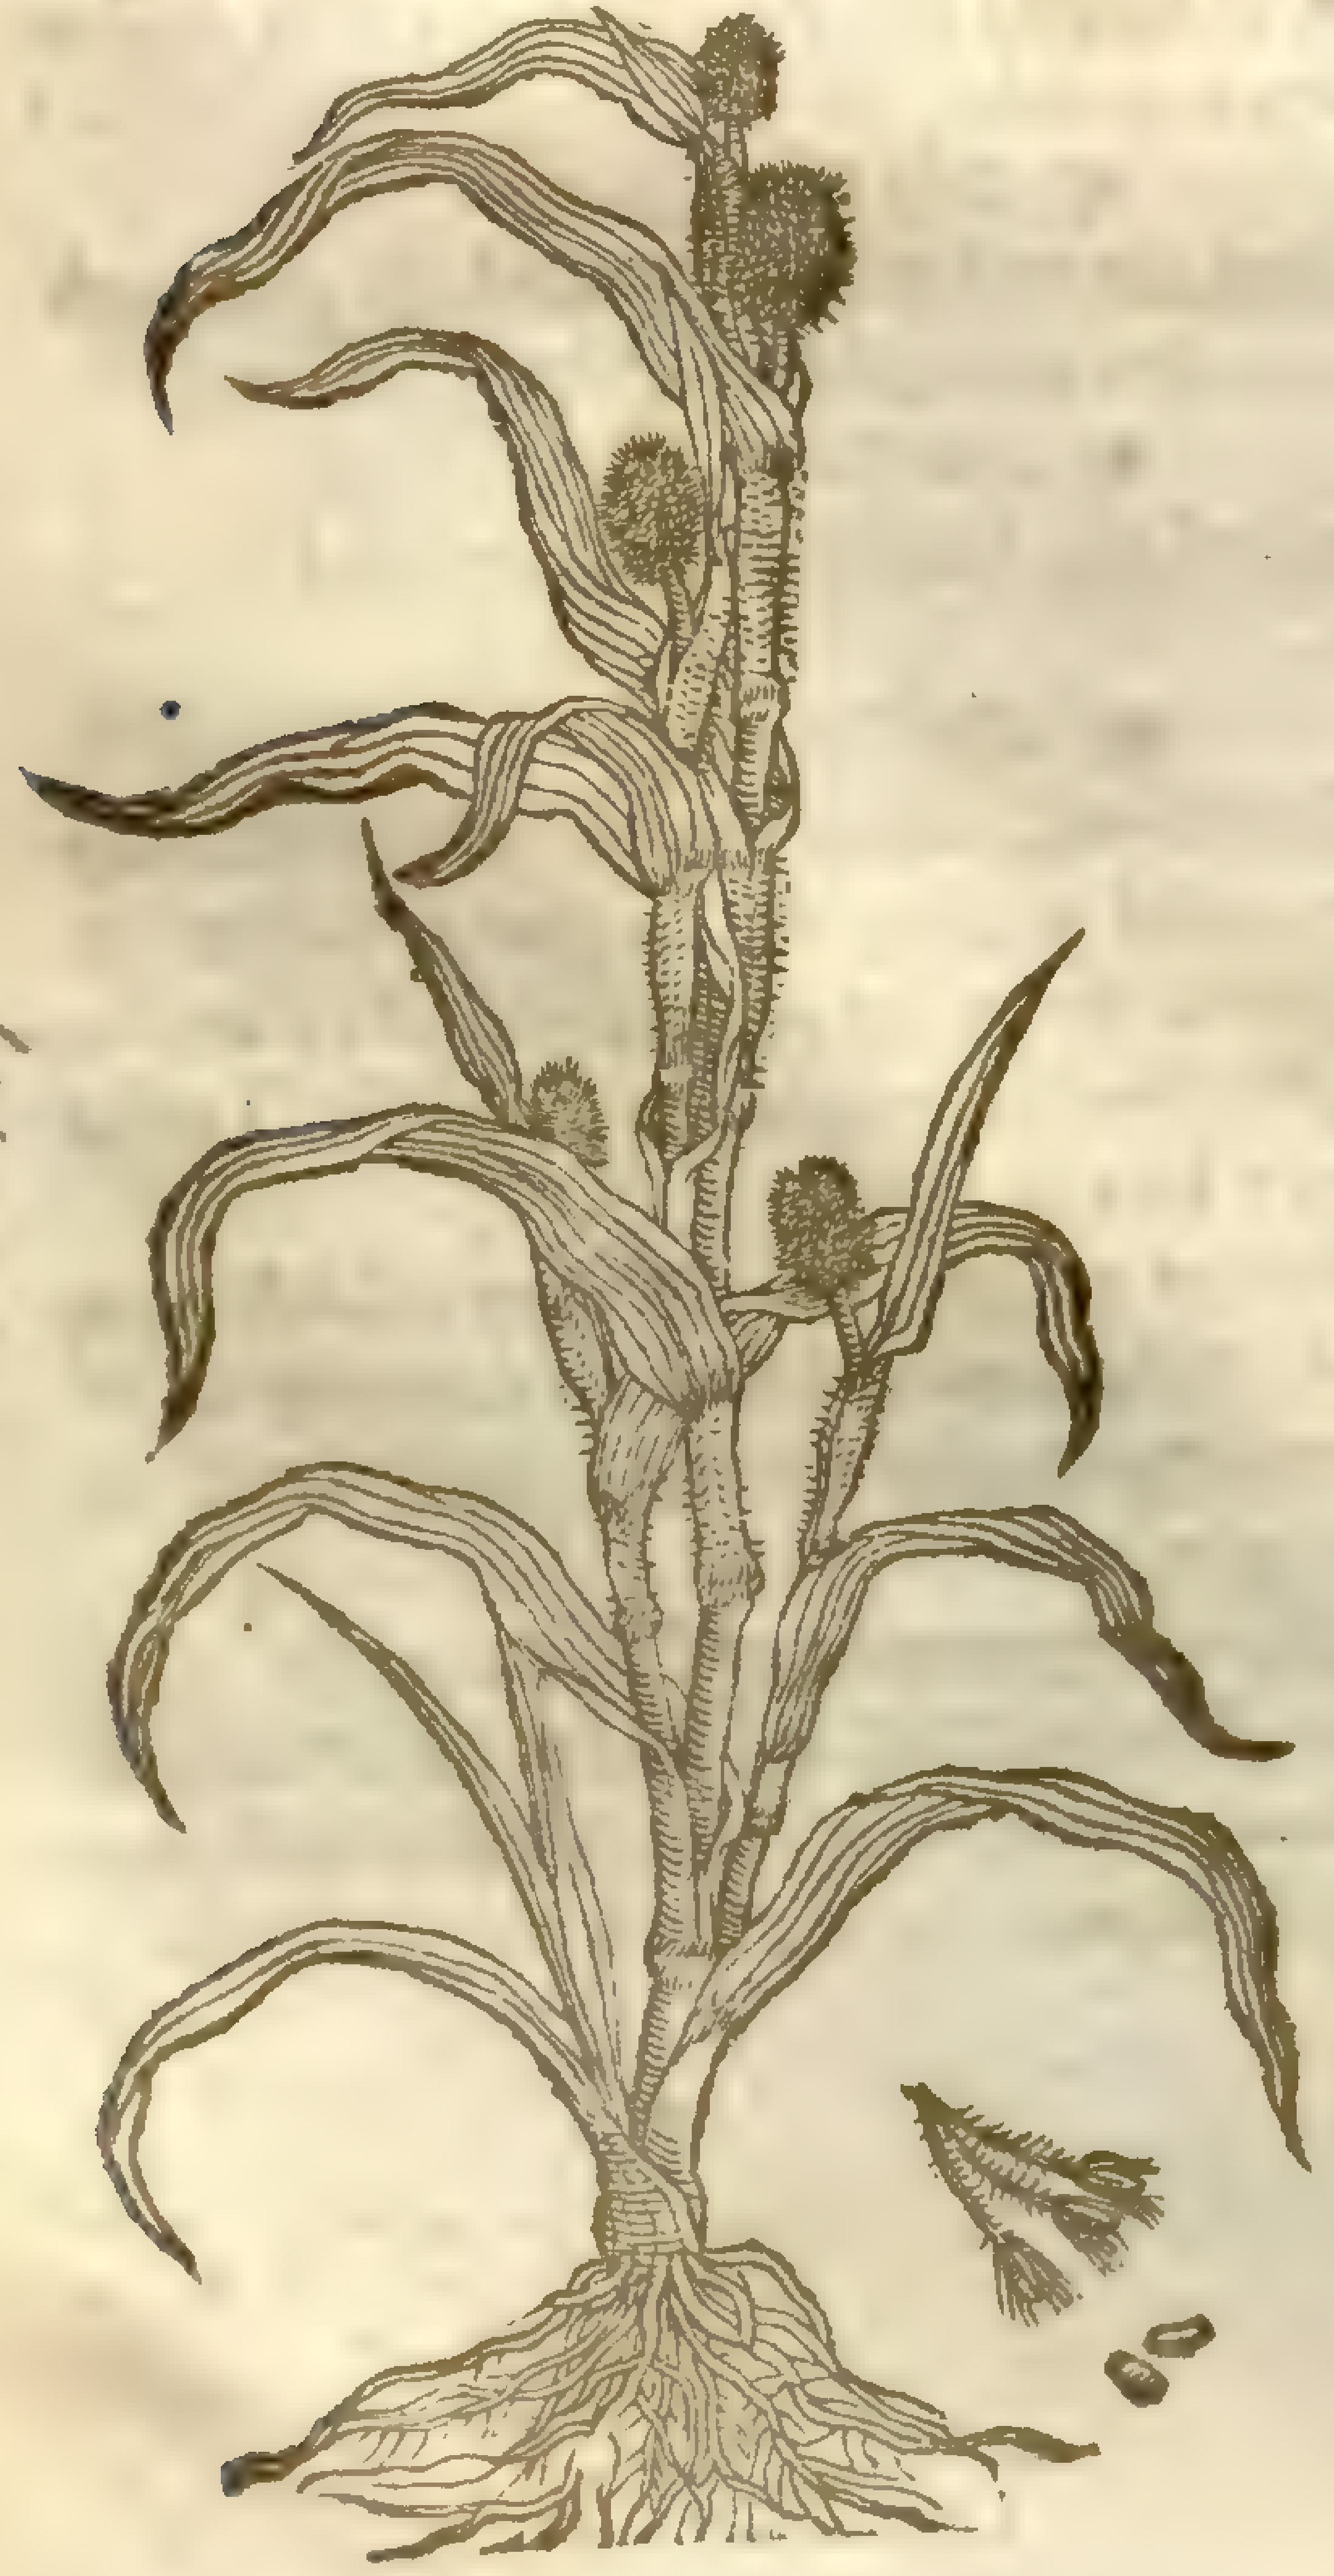
Chap. 63. Of Panicke.

1 *Panicum Indicum.*
Indian Panick.



Panicum italicum [illegible]

2 *Panicum cæruleum.* Blew Panick.



[illegible]

¶ *The Kindes.*

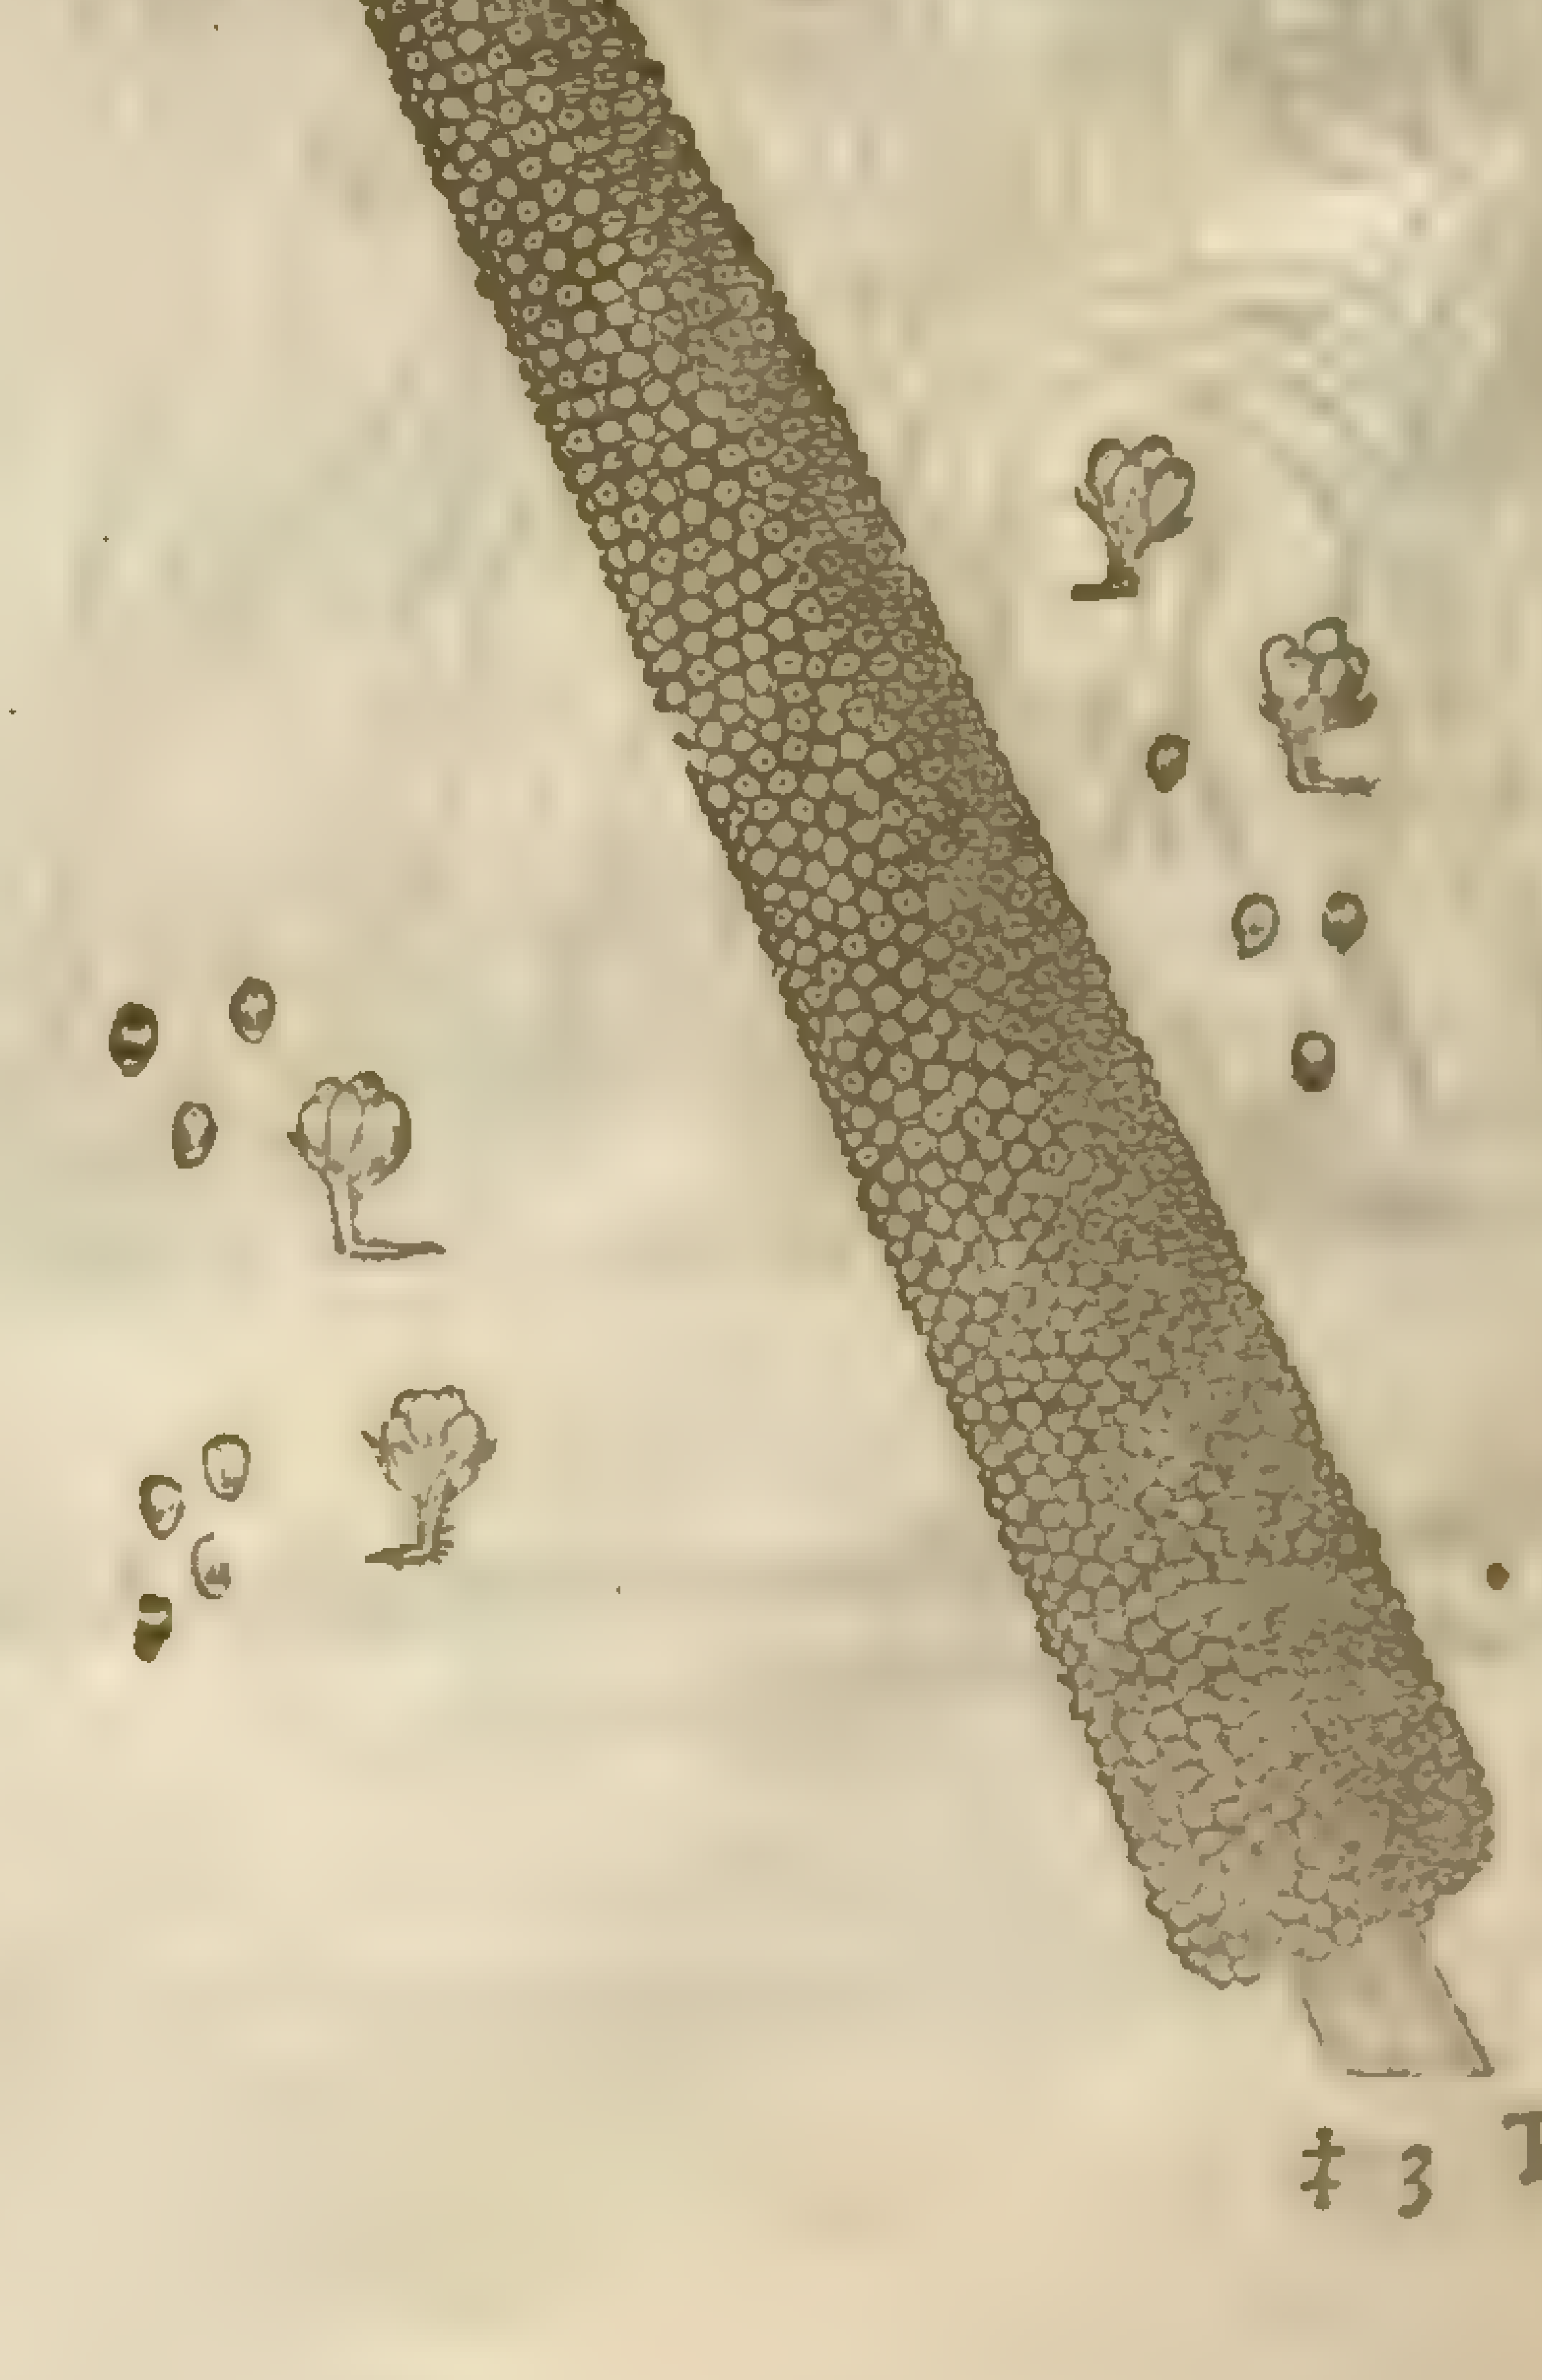
There be ſundry ſorts of Panicke, although of the Antients there haue been ſet downe but two, that is to ſay, the wild or field Panick, and the garden or manured Panicke.

¶ *The Deſcription.*

1 The Panick of India growes vp like Millet, whoſe ſtraw is knotty or ful of joints; the eares be round and hanging downeward; in which is contained a white or yellowiſh ſeed like Canarie ſeed, or *Alpiſti*.

2 Blew Panick hath a reddiſh ſtalk like to Sugar cane, as tall as a man, thicker than a finger, full of a fungous pith, of a pale colour: the ſtalks be vpright and knotty: thoſe that grow neere the root are of a purple colour. On the top or ſtalke commeth forth a ſpike or eare like the water Cats-taile, but of a blew or purple colour. The ſeed is like to naked Otes. The roots are very ſmal, in reſpect of the other parts of the plant.

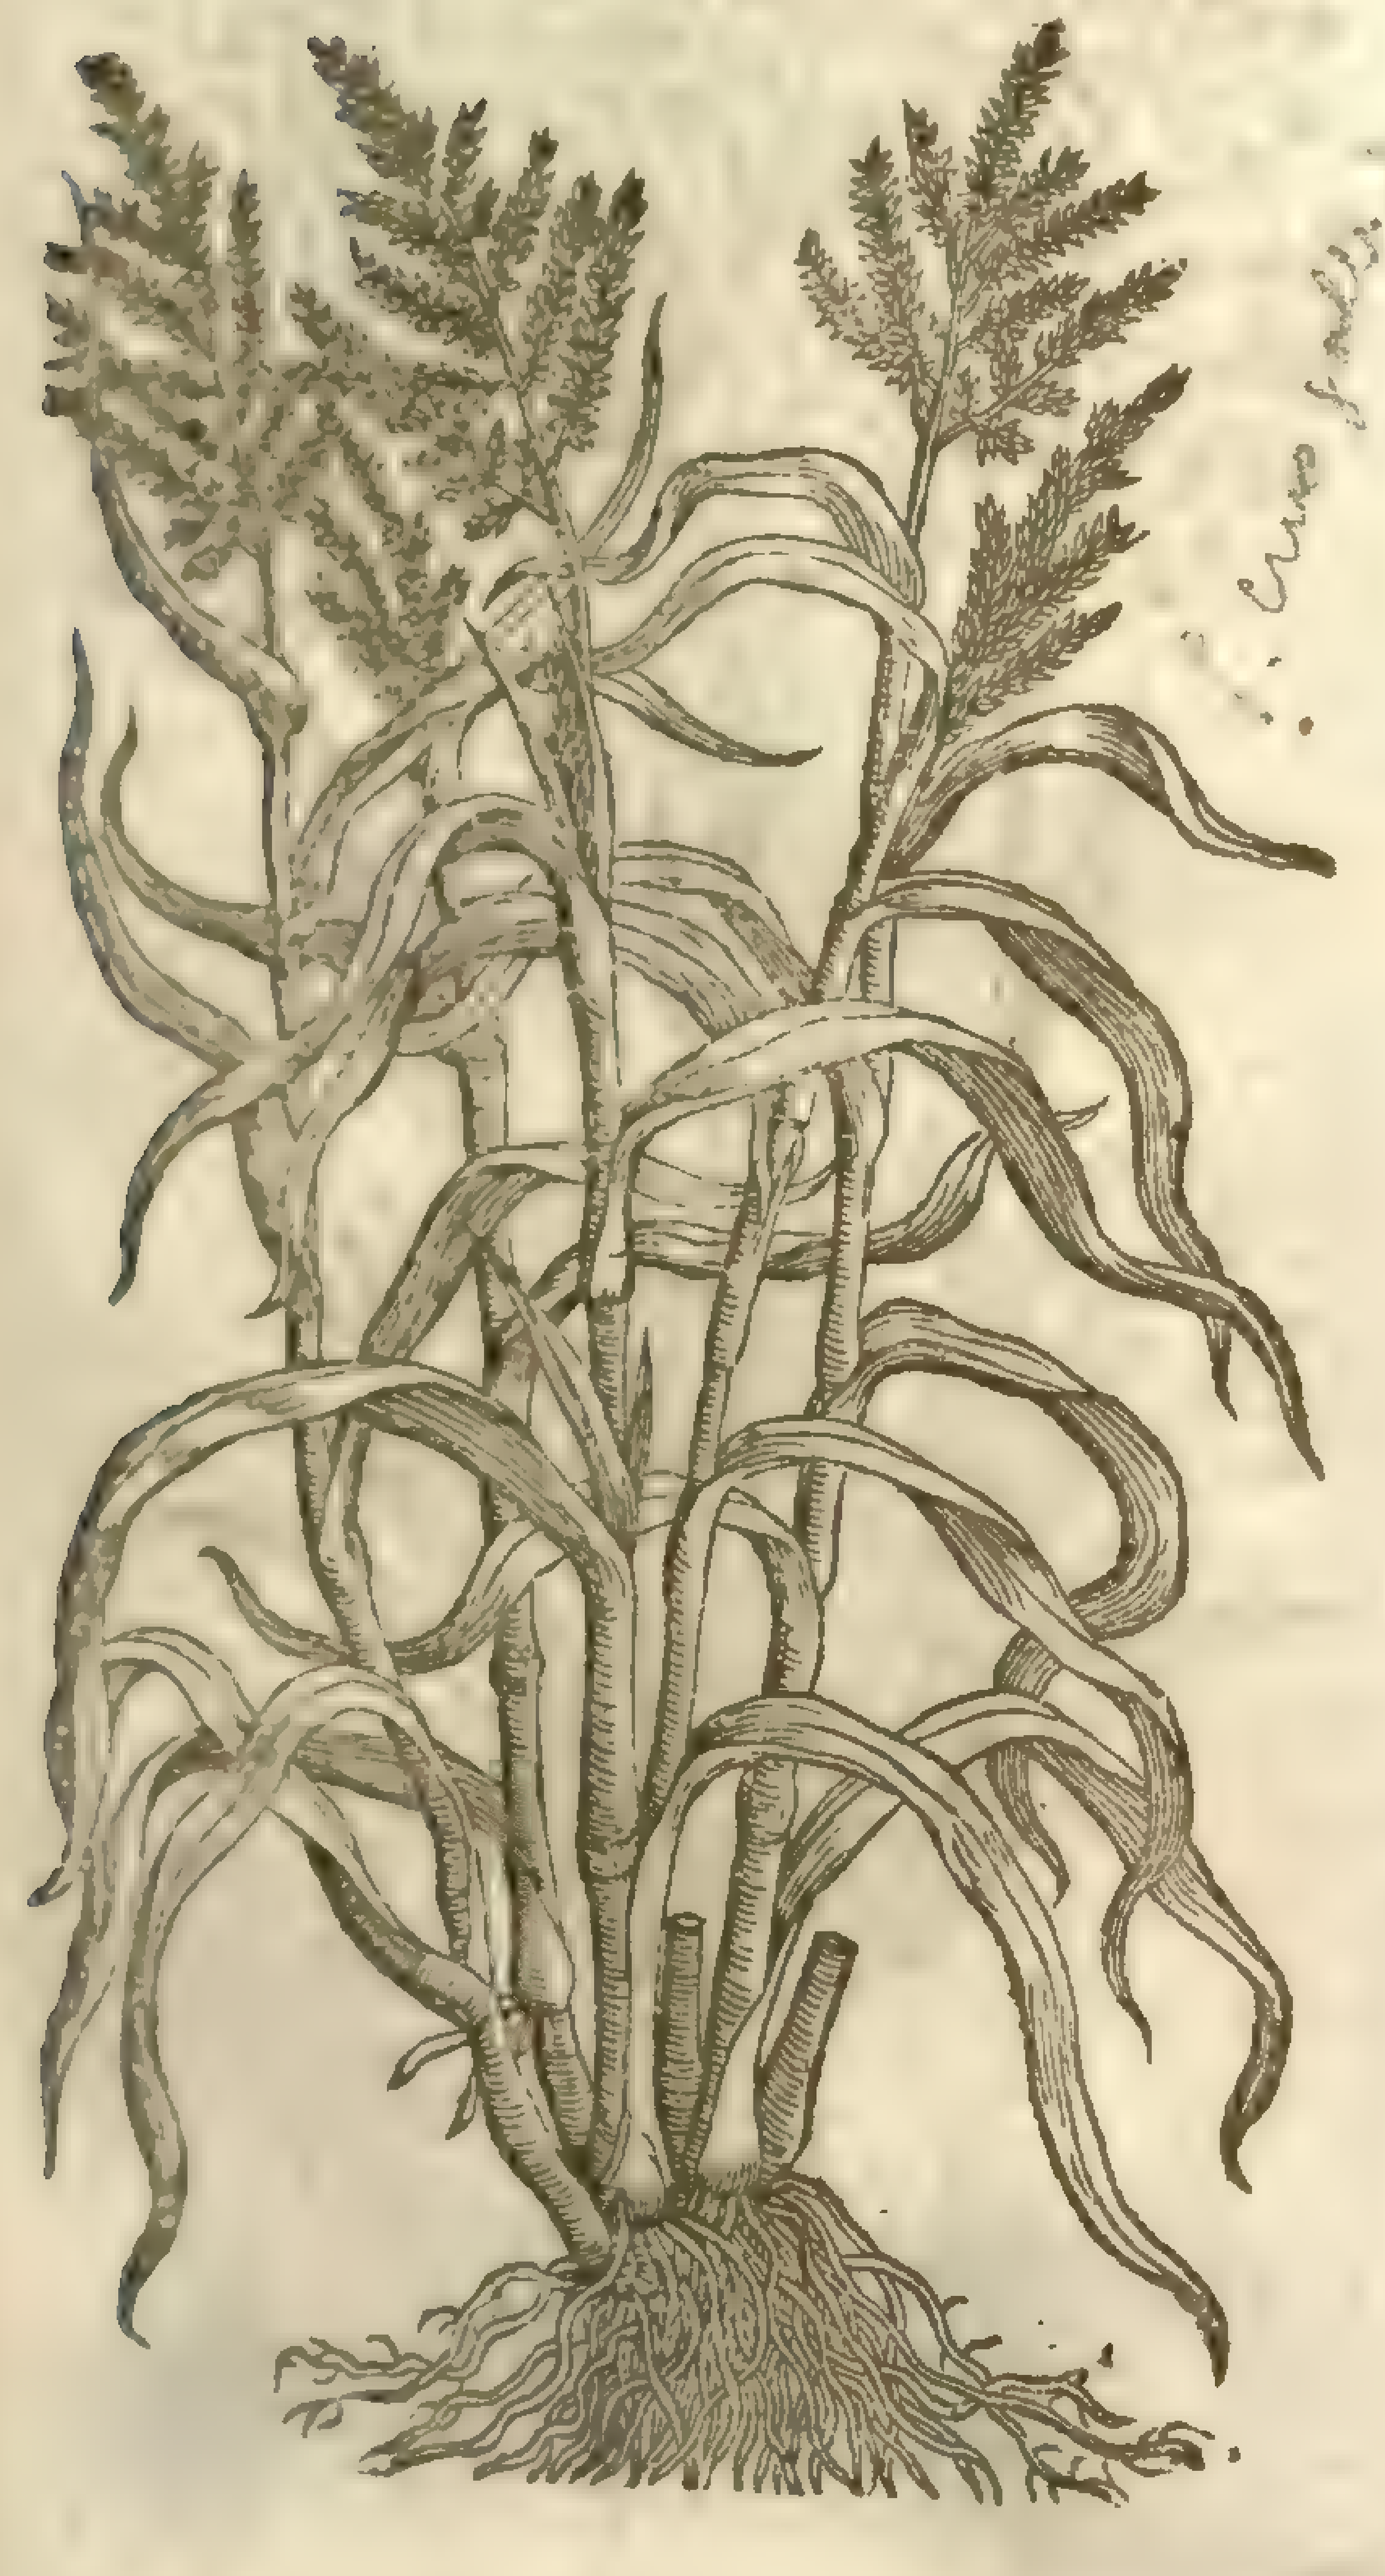
‡ 3 *Panicum Americanum ſpica longiſſima.*
Weſt-Indian Panick with a very long eare.



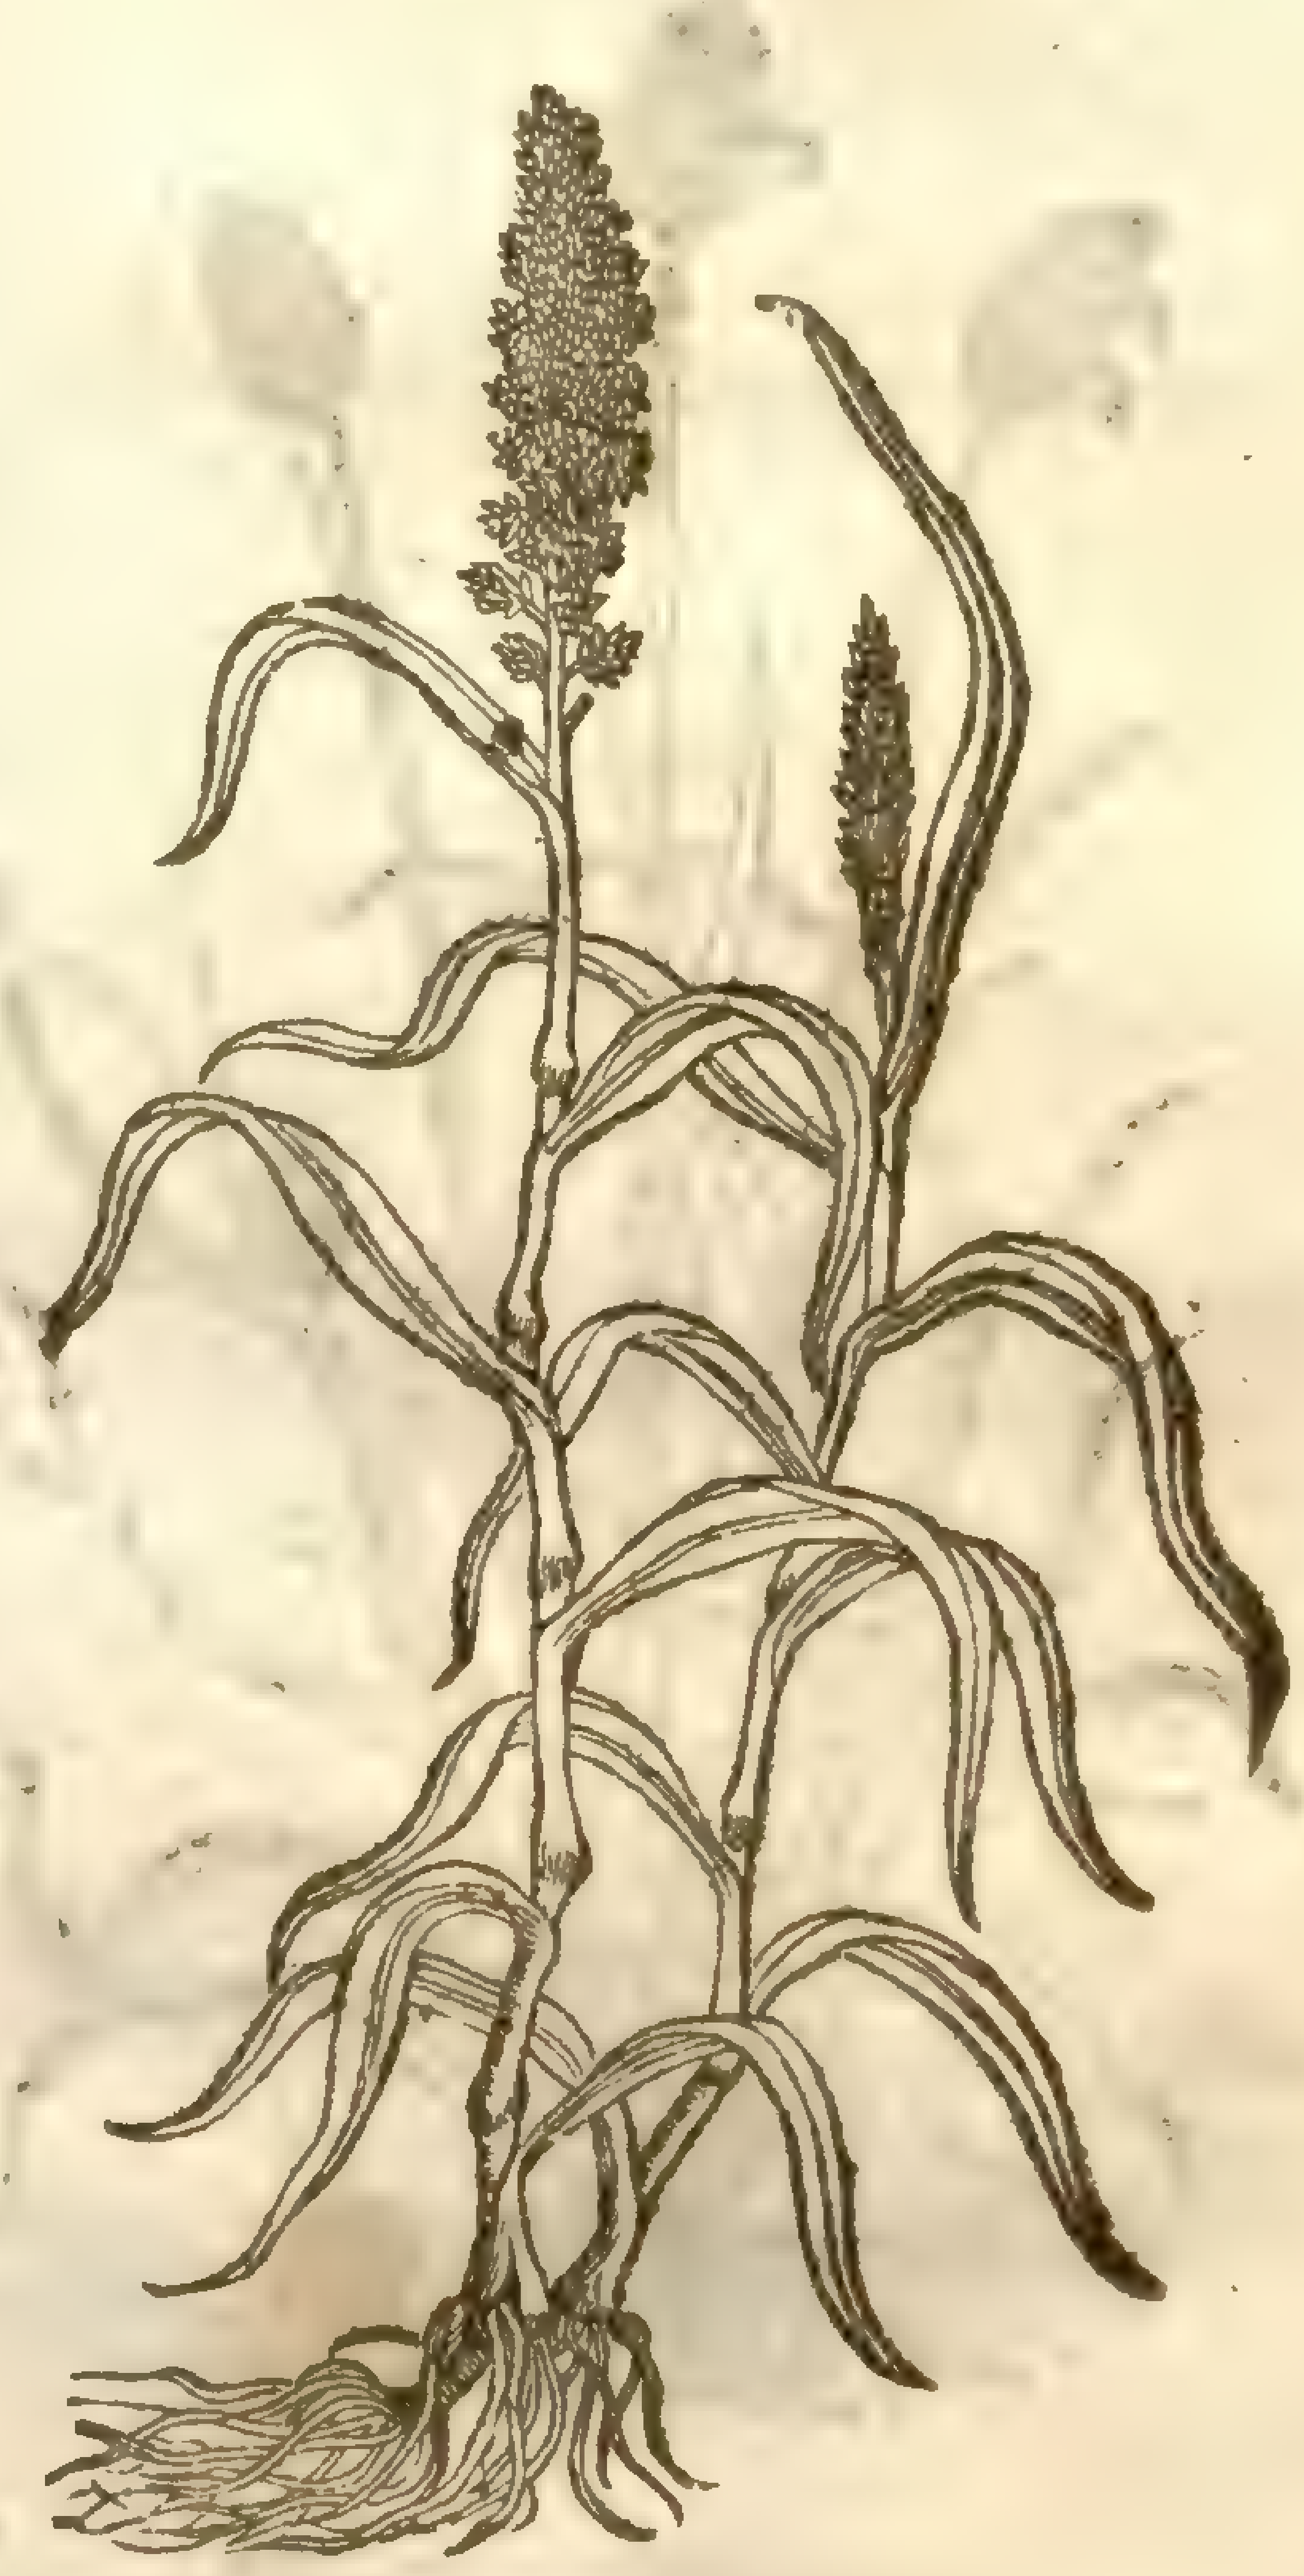
‡ 3

‡ 3 To theſe may be added another Weſt-Indian Panick, ſent to *Cluſius* from Mr *Iames Garret* of London. The eare hereof was thicke, cloſe compact, and made taper-faſhion, ſmaller at the one end than at the other; the length thereof was more than a foot and a halfe. The ſhape of the ſeed is much like the laſt deſcribed, but that many of them together are contained in one hairy huske, which is faſtned to a very ſhort ſtalke, as you may ſee repreſented apart by the ſide of the figure. ‡

4 *Panicum vulgare.*
Common or Germane Panick.



5 *Panicum ſylveſtre.*
Wilde Panick.



4 Germane Panick hath many hairy roots growing thick together like vnto wheat, as is all the reſt of the plant, as well leaues or blades, as ſtraw or ſtalke. The eare groweth at the top ſingle, not vnlike to Indian Panick, but much leſſer. The graines are contained in chaffie skales, red declining to tawny.

5 The wild Panick groweth vp with long reeden ſtalks full of joints, ſet with long leaues like thoſe of *Sorghum* or Indian Panick: the tuft or feather-like top is like to the common reed, or eare of the graſſe called *Iſchæmon*, or Manna graſſe. The root is ſmall and threddy.

¶ *The Place and Time.*

The kindes of Panick are ſowen in the Spring, and are ripe in the beginning of Auguſt. They proſper beſt in hot and dry regions, and wither for the moſt part with much watering, as doth Mill and Turky wheat. They quickly come to ripeneſſe, and may be kept good a long time.

¶ *The Names.*

Panick is called in Greeke ἔλυμος, and μελίνη: *Diocles* the Phyſitian nameth it *Mel Frugum*: the Spaniards, *Panizo*: the Latines, *Panicum*, of *Pannicula*: in Engliſh, Indian Panick, or Otemeale.

¶ *The Temperature.*

Panicks nouriſh little, and are driers, as *Galen* ſaith.

¶ *The Vertues.*

Panick ſtoppeth the lask, as Millet doth, being boiled (as *Pliny* reporteth) in Goats milke, and drunke twice in a day. Outwardly in pulteſſes or otherwiſe, it dries and cooles. A

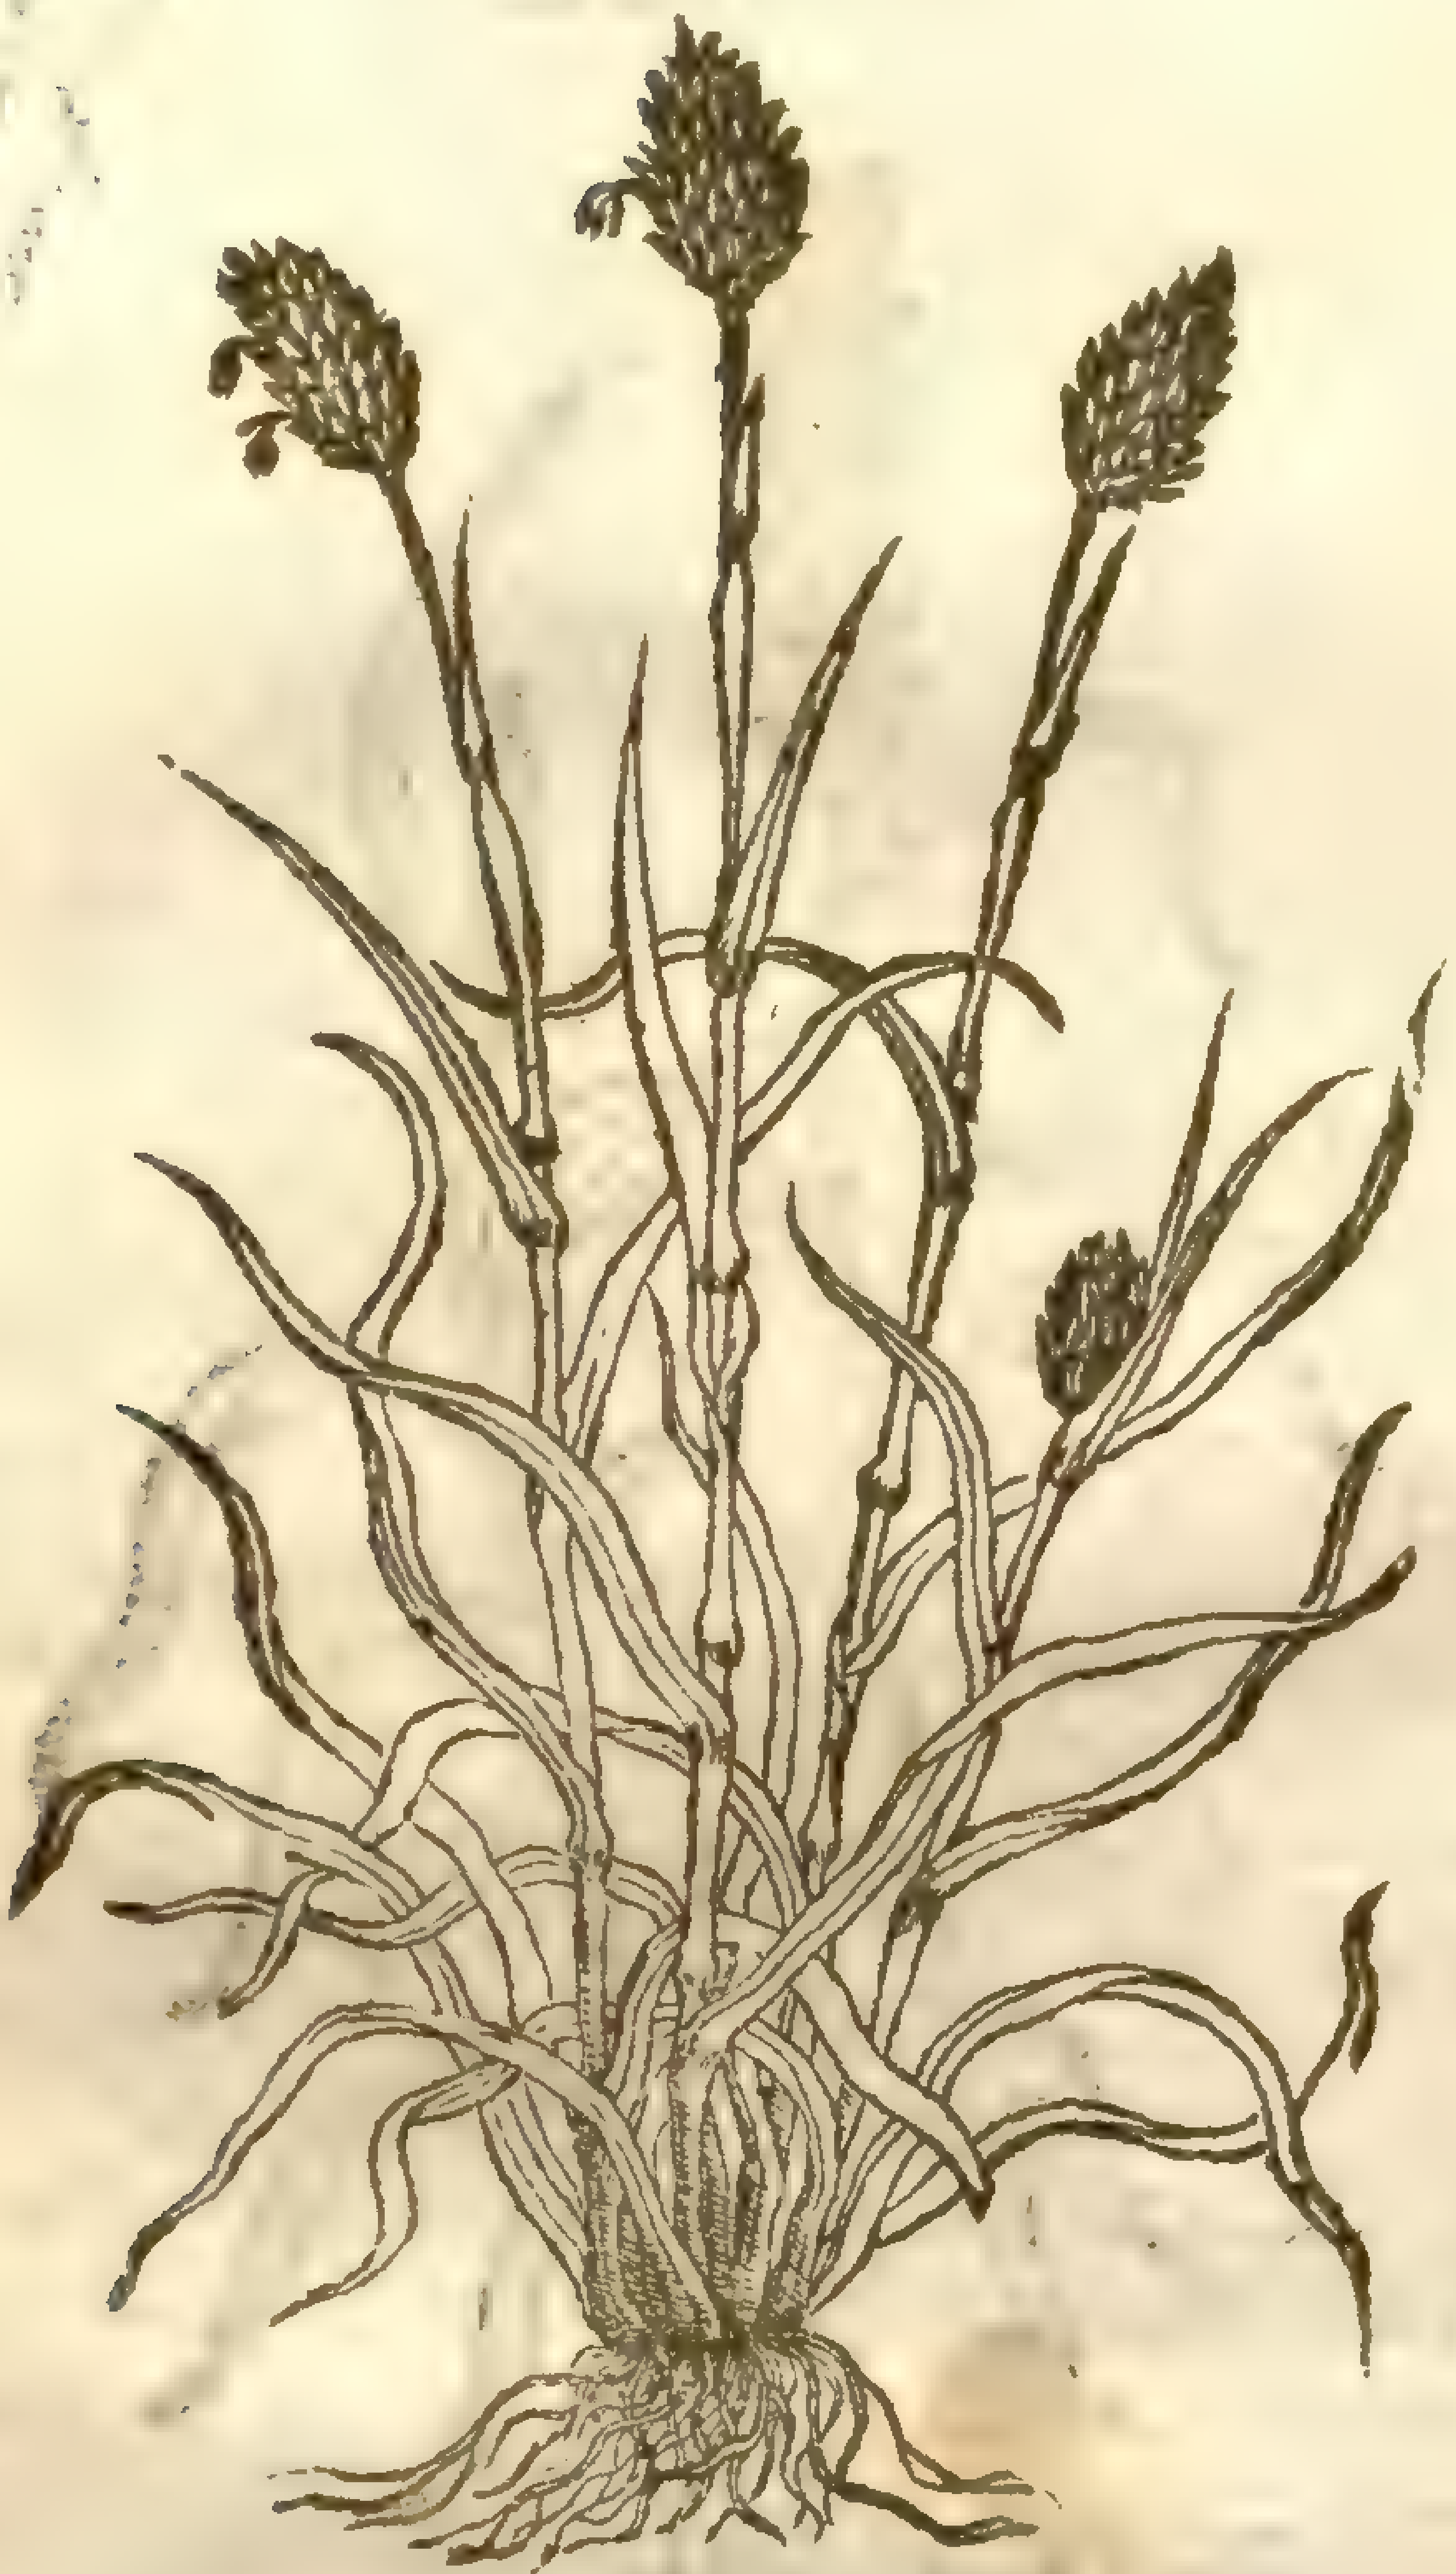
Bread made of Panicke nouriſheth little, and is cold and dry, very brittle, hauing in it neither clammineſſe nor fatneſſe, and therefore it drieth a moiſt belly. B

Chap.

CHAP. 64. *Of Canarie ſeed, or pety Panick.*

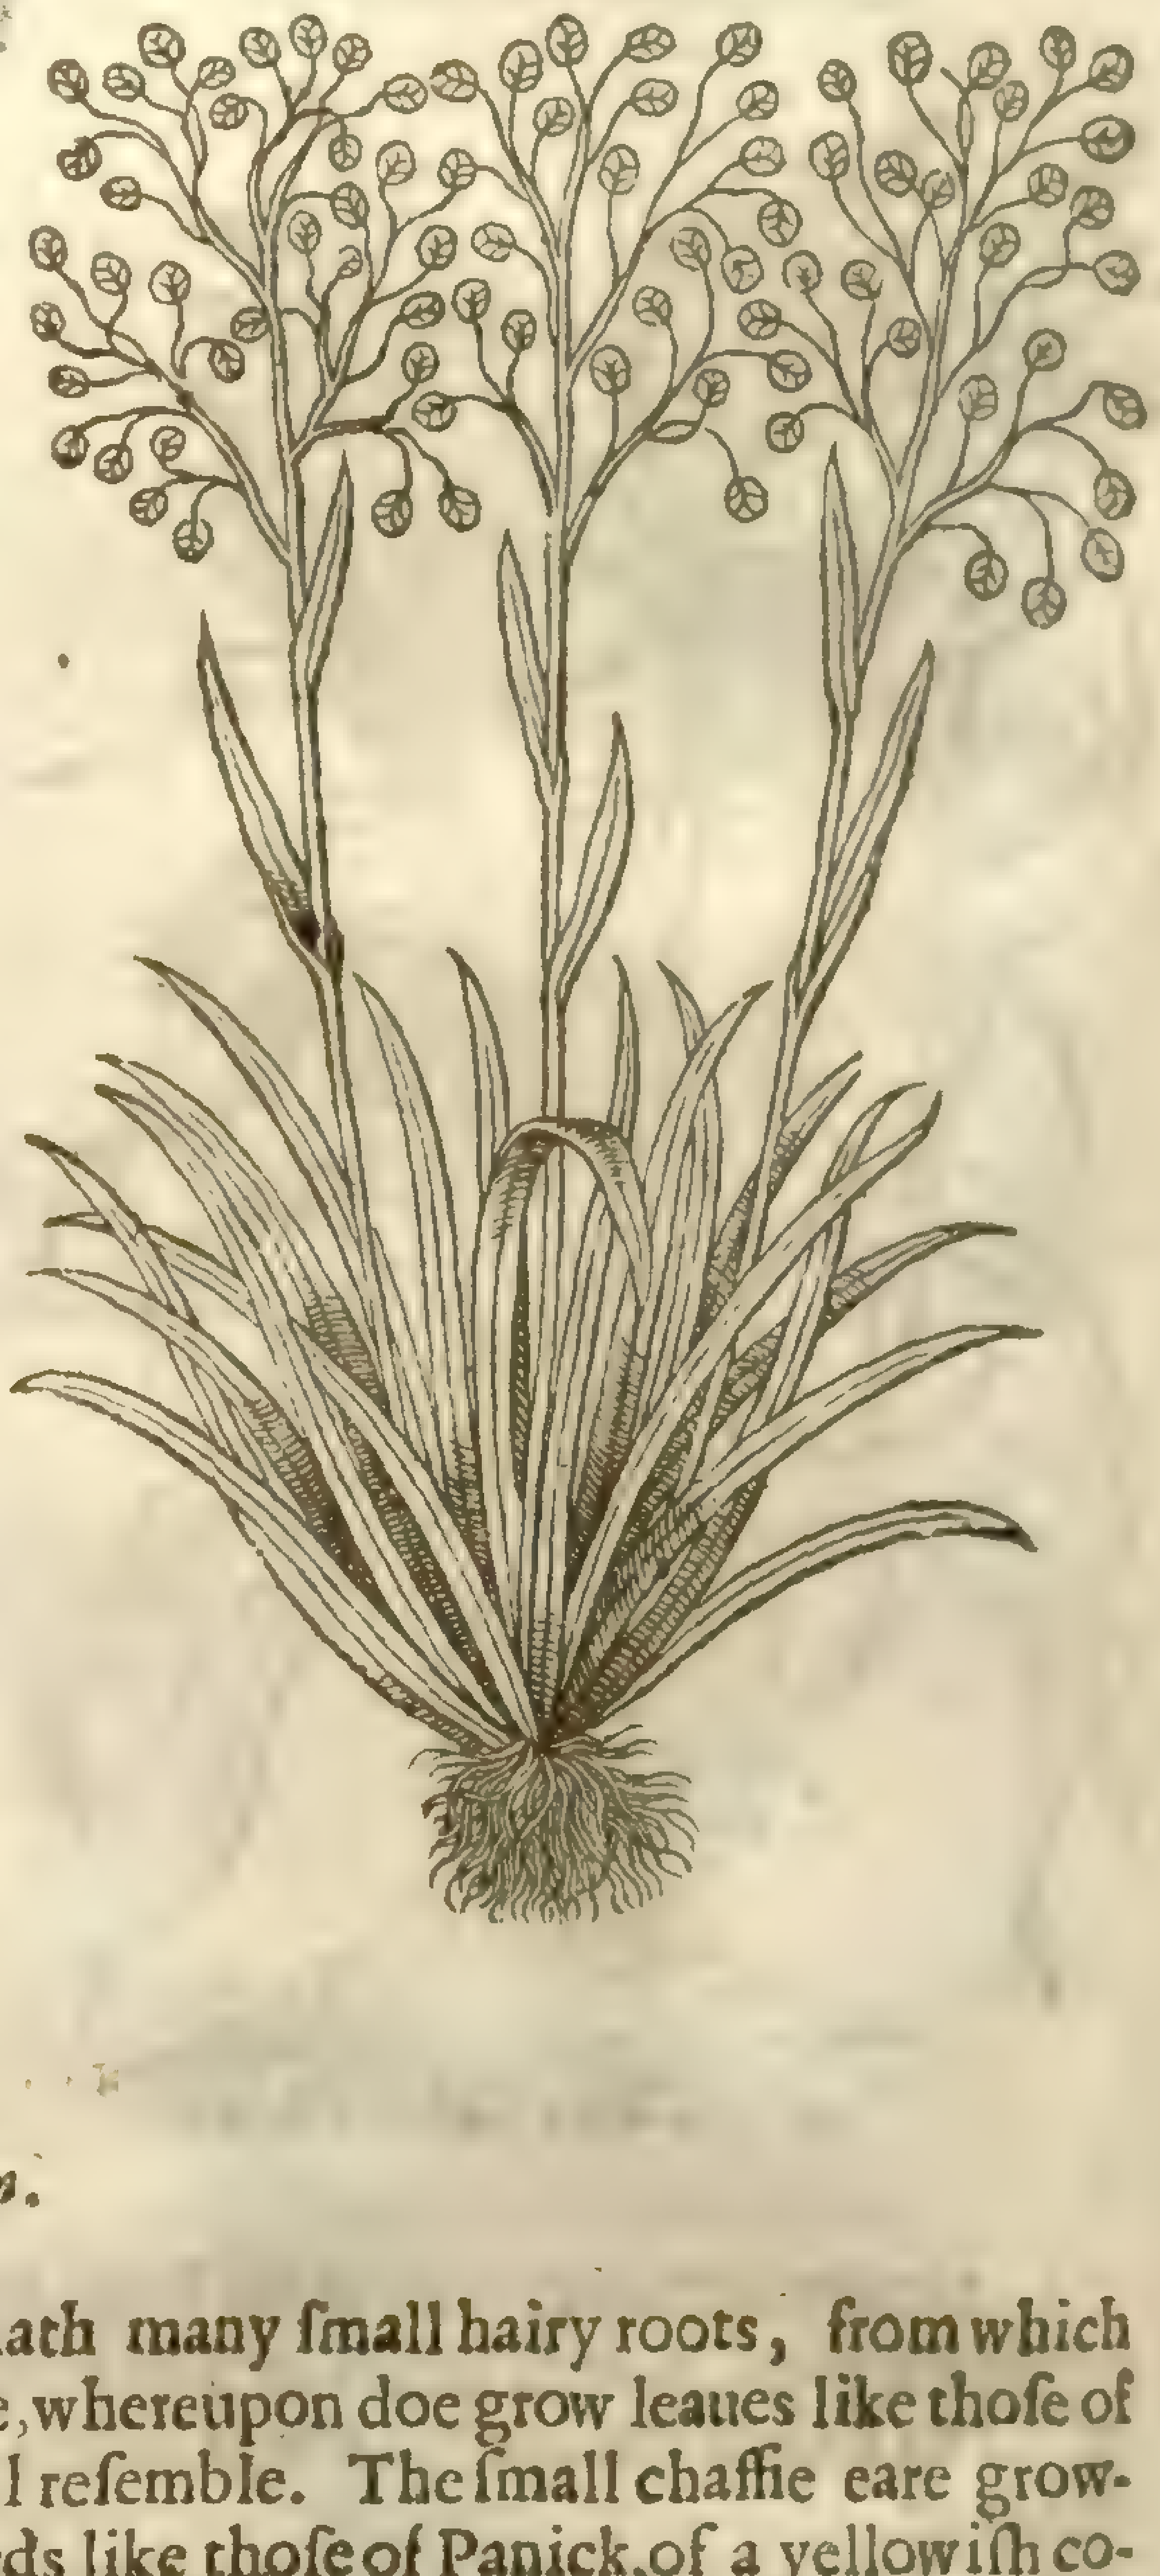
1 ***Phalaris.***
Canarie ſeed.

P. canariensis [illegible]



2 ***Phalaris pratenſis.***
Quaking graſſe.

Briza media [illegible]



¶ *The Deſcription.*

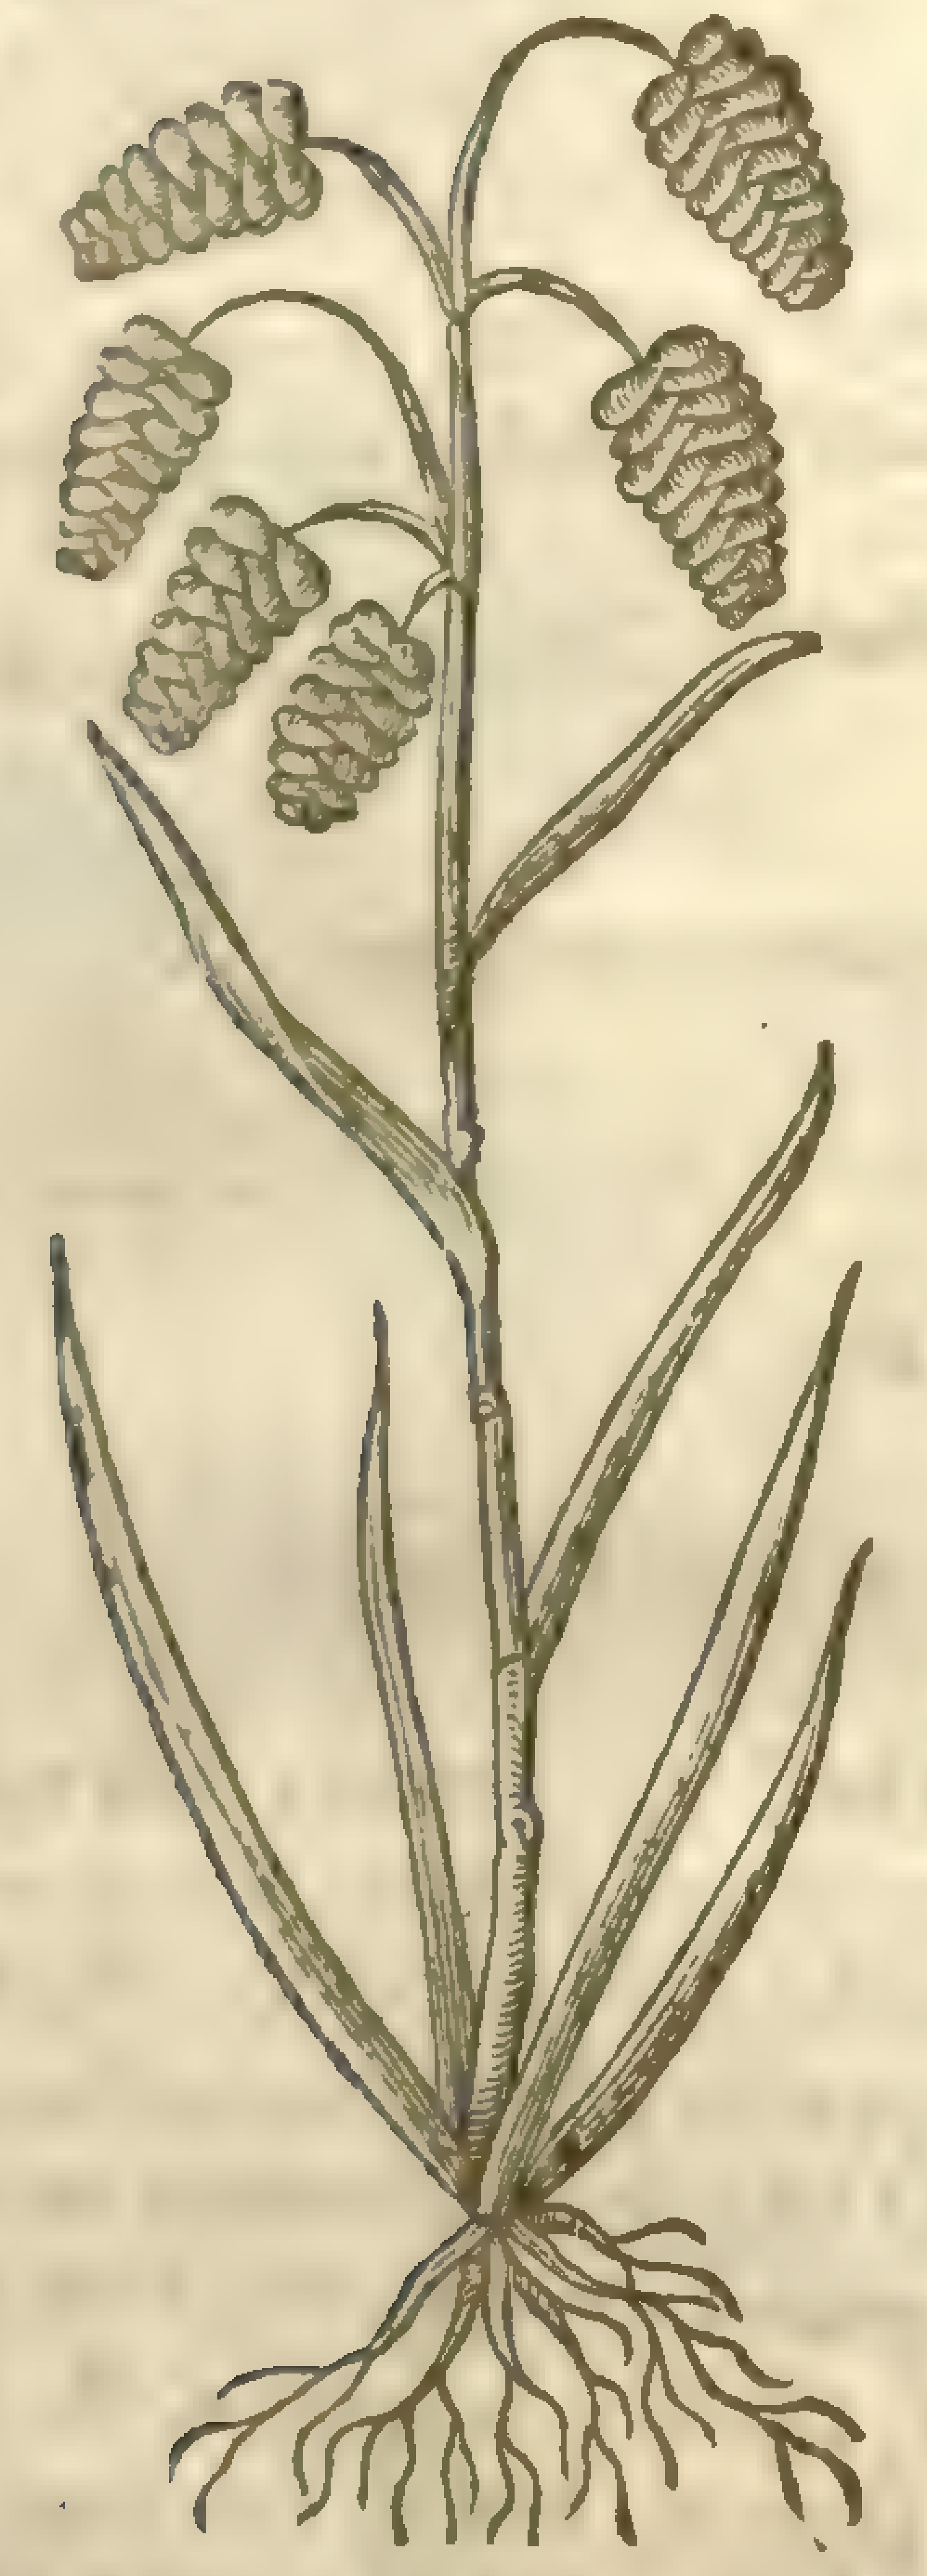
1 CAnarie ſeed, or Canarie graſſe after ſome, hath many ſmall hairy roots, from which ariſe ſmall ſtrawy ſtalkes ioynted like corne, whereupon doe grow leaues like thoſe of Barley, which the whole plant doth very well reſemble. The ſmall chaffie eare groweth at the top of the ſtalk, wherein is contained ſmall ſeeds like thoſe of Panick, of a yellowiſh colour and ſhining.

2 Shakers or Quaking Graſſe groweth to the height of halfe a foot, and ſometimes higher, when it groweth in fertile medowes. The ſtalke is very ſmall and benty, ſet with many graſſie leaues like the common medow-graſſe, bearing at the top a buſh or tuft of flat ſcaly pouches, like thoſe of Shepheards purſe, but thicker, of a browne colour, ſet vpon the moſt ſmall and weak hairy foot-ſtalks that may be found, whereupon thoſe ſmall pouches do hang; by means of which ſmall hairy ſtrings, the knaps which are the floures do continually tremble and ſhake, in ſuch ſort that it is not poſſible with the moſt ſtedfaſt hand to hold it from ſhaking.

‡ 3 There is alſo another graſſie plant which may fitly be referred to theſe: the leaues and ſtalks reſemble the laſt deſcribed, but the heads are about the length and bredth of a ſmall Hop, and handſomely compact of light ſcaly filmes much like thereto; whence ſome haue termed it, *Gramen Lupuli glumis.* The colour of this pretty head when it commeth to ripeneſſe is white. ‡

¶ *The Place.*

1 Canarie ſeed groweth naturally in Spain, and alſo in the Fortunat or Canary Iſlands, and alſo in England or any other of theſe cold regions, if it be ſowne therein.



3 *Phalaris pratenſis altera.*
Pearle-graſſe.

2 Quaking *Phalaris* groweth in fertile paſtures, and in dry medowes.

3 This growes naturally in ſome parts of Spain, and is ſowne yearely in many of our Lōndon gardens.

¶ *The Time.*

1 3 Theſe Canarie ſeeds are ſowne in May, and are ripe in Auguſt.

¶ *The Names.*

1 Canarie ſeed or Canarie Corne, is called of the Grecians, φαλαρις: the Latines retaining the ſame Name, *Phalaris*: in the Iſlands of Canary, *Alpiſti*: in Engliſh, Canary ſeed, and Canarie Graſſe.

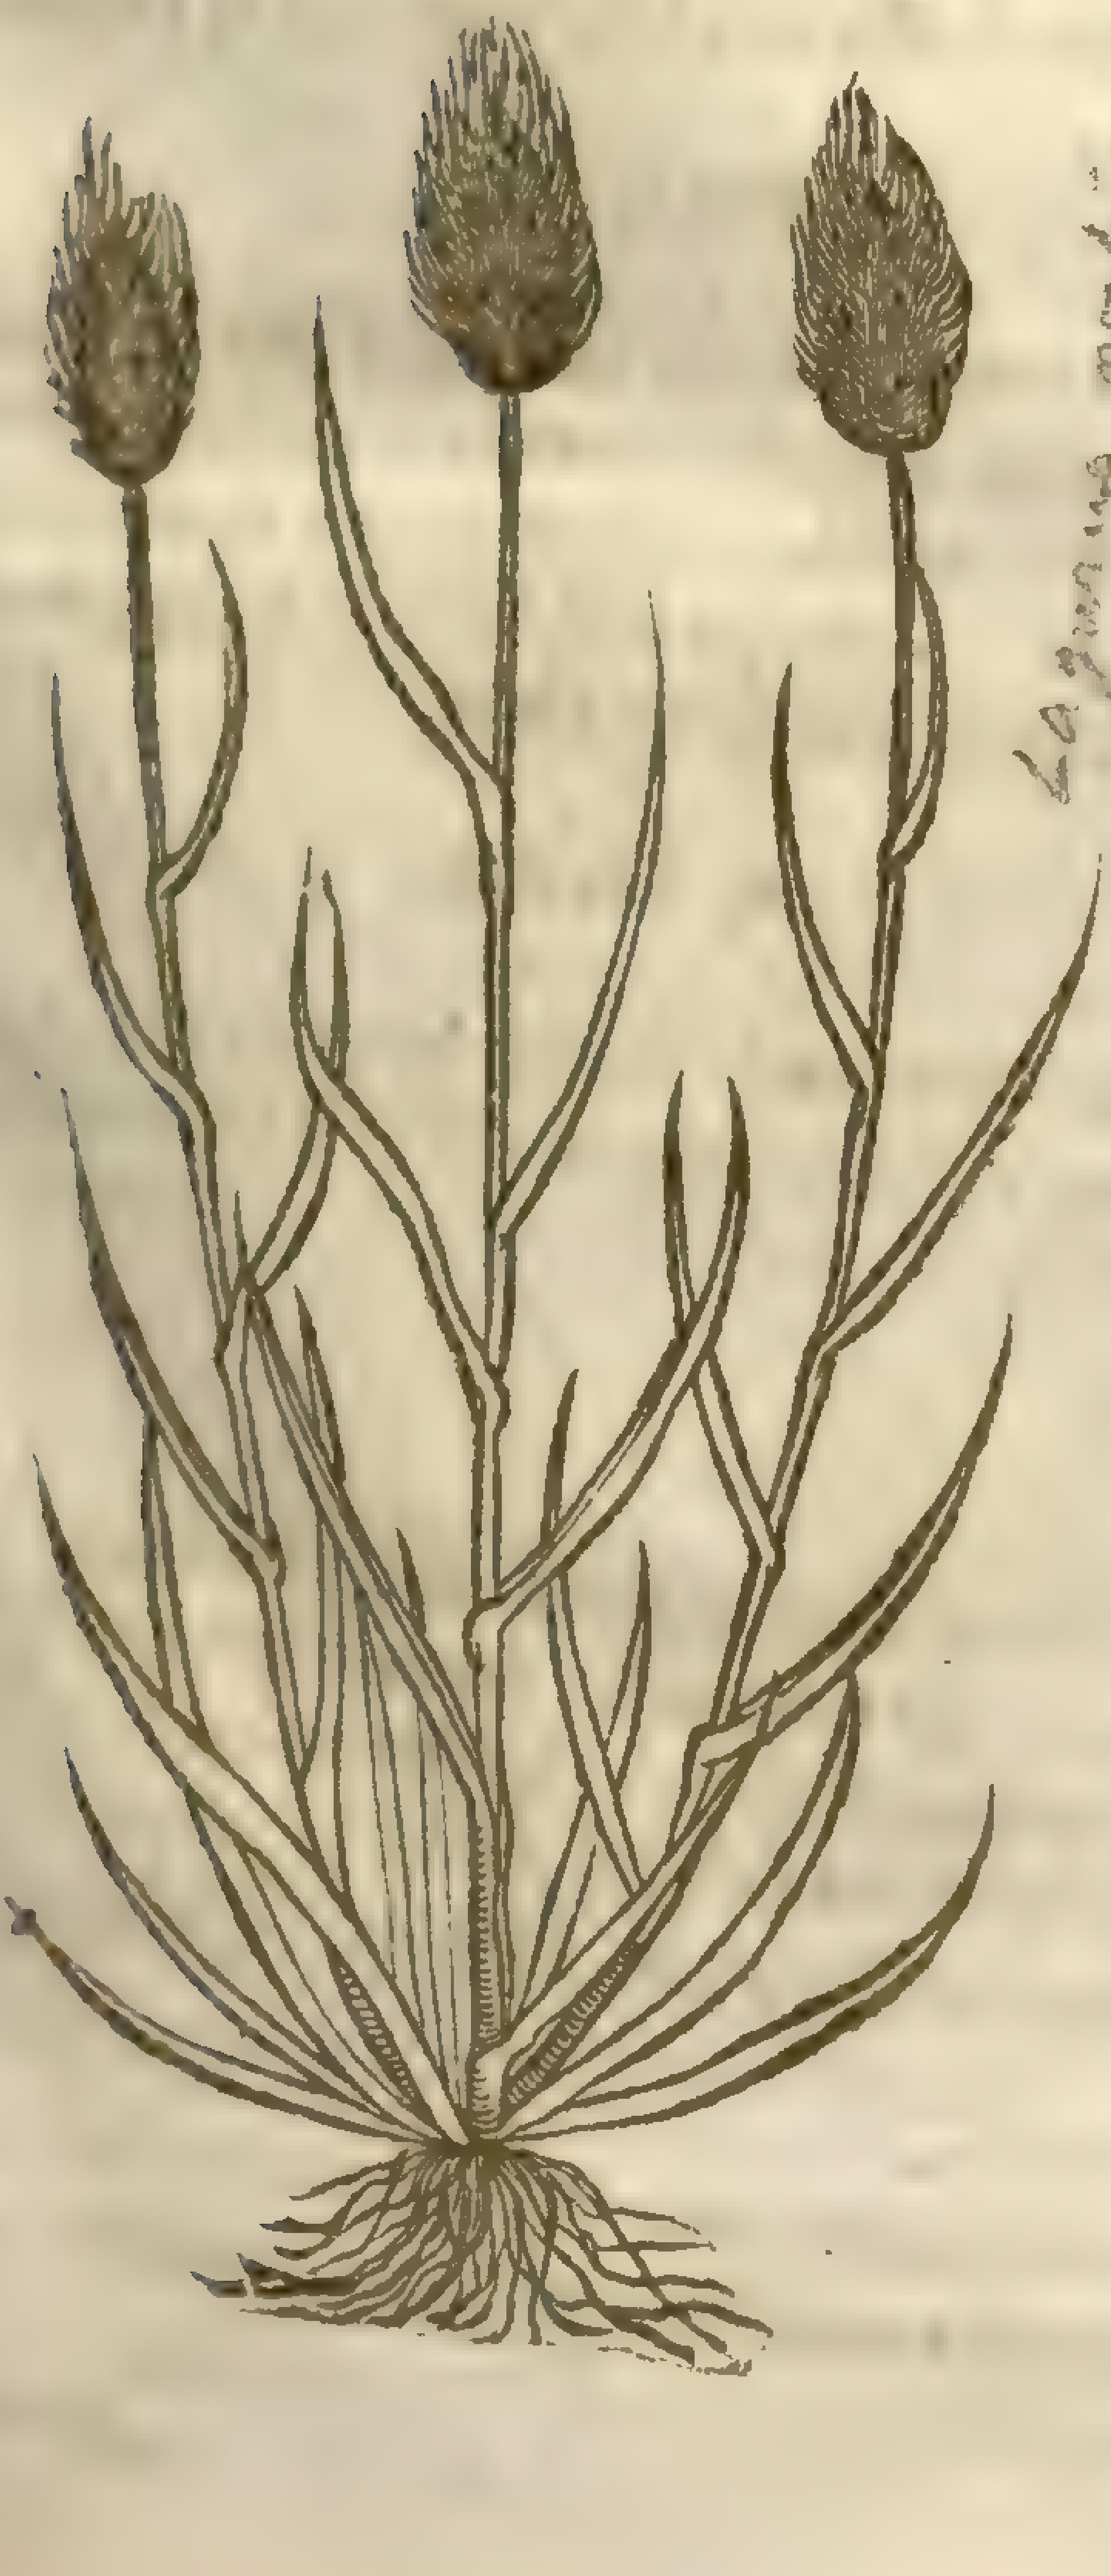
2 *Phalaris pratenſis* is called alſo *Gramen tremulum*: in Cheſhire about Nantwich, Quakers, and Shakers: in ſome places, Cow-Quakes.

3 This by ſome is termed *Phalaris altera*: *Cluſius* cals it *Gramen amourettes majus*: *Bauhine*, *Gramen tremulum maximum*: in Engliſh they call it Pearle graſſe, and Garden Quakers.

¶ *The Nature and Vertues.*

A I find nothing ſet downe as touching the temperature of *Phalaris*, notwithſtanding it is thought to be of the nature of Millet.

B The juice and ſeed (as *Galen* ſaith) are thought to be profitably drunke againſt the paines of the bladder. Apothecaries, for want of Millet, do vſe the ſame with good ſucceſſe in fomentations; for in dry fomentations it ſerueth in ſtead thereof, and is his *ſuccedaneum*, or *quid pro quo*. We vſe it in England alſo to feed Canary Birds.



Alopecuros.
Fox-taile.

Lagurus ovatus, [illegible]

CHAP. 65.

Of Fox-Taile.

¶ *The Deſcription.*

1 FOx-taile hath many graſſy leaues or blades rough and hairy like thoſe of barly, but leſſe and ſhorter. The ſtalk is likewiſe ſoft and hairy; whereupon growes a ſmall ſpike or eare, ſoft and very downy, briſtled with very ſmall haires in ſhape like vnto a Fox-taile, whereof it took his name, which dieth at the approch of winter, and recouereth it ſelfe the next yeare by falling of his ſeed.

‡ There is one or two varieties of this plant in the largeneſſe and ſmalneſſe of the eare.

2 Beſides theſe forementioned ſtrangers, there is alſo another which grows naturally in many watry ſalt places of this kingdome, as in Kent by Dartford, in Eſſex, &c. The ſtalkes of this plant are graſſy, and ſome two foot high, with leaues like Wheat or Dogs-graſſe. The eare is very large, being commonly four or fiue inches long, downy, ſoft like ſilk, & of a browniſh colour.

¶ *The Place.*

1 This kinde of Fox-taile graſſe groweth in England only in gardens.

¶ *The Time.*

1 This ſpringeth vp in May, of the ſeed that was ſcattered the yere before, and beares his taile with his ſeed in Iune.

3 This beares his head in Iuly.

¶ *The Names.*

1 There hath not been more ſaid of the antient or later writers, as touching the name, than is ſet downe, by which they call it in Greeke, *Alopecuros*: that is in Latine, *Cauda vulpis*: in Engliſh, Fox-taile.

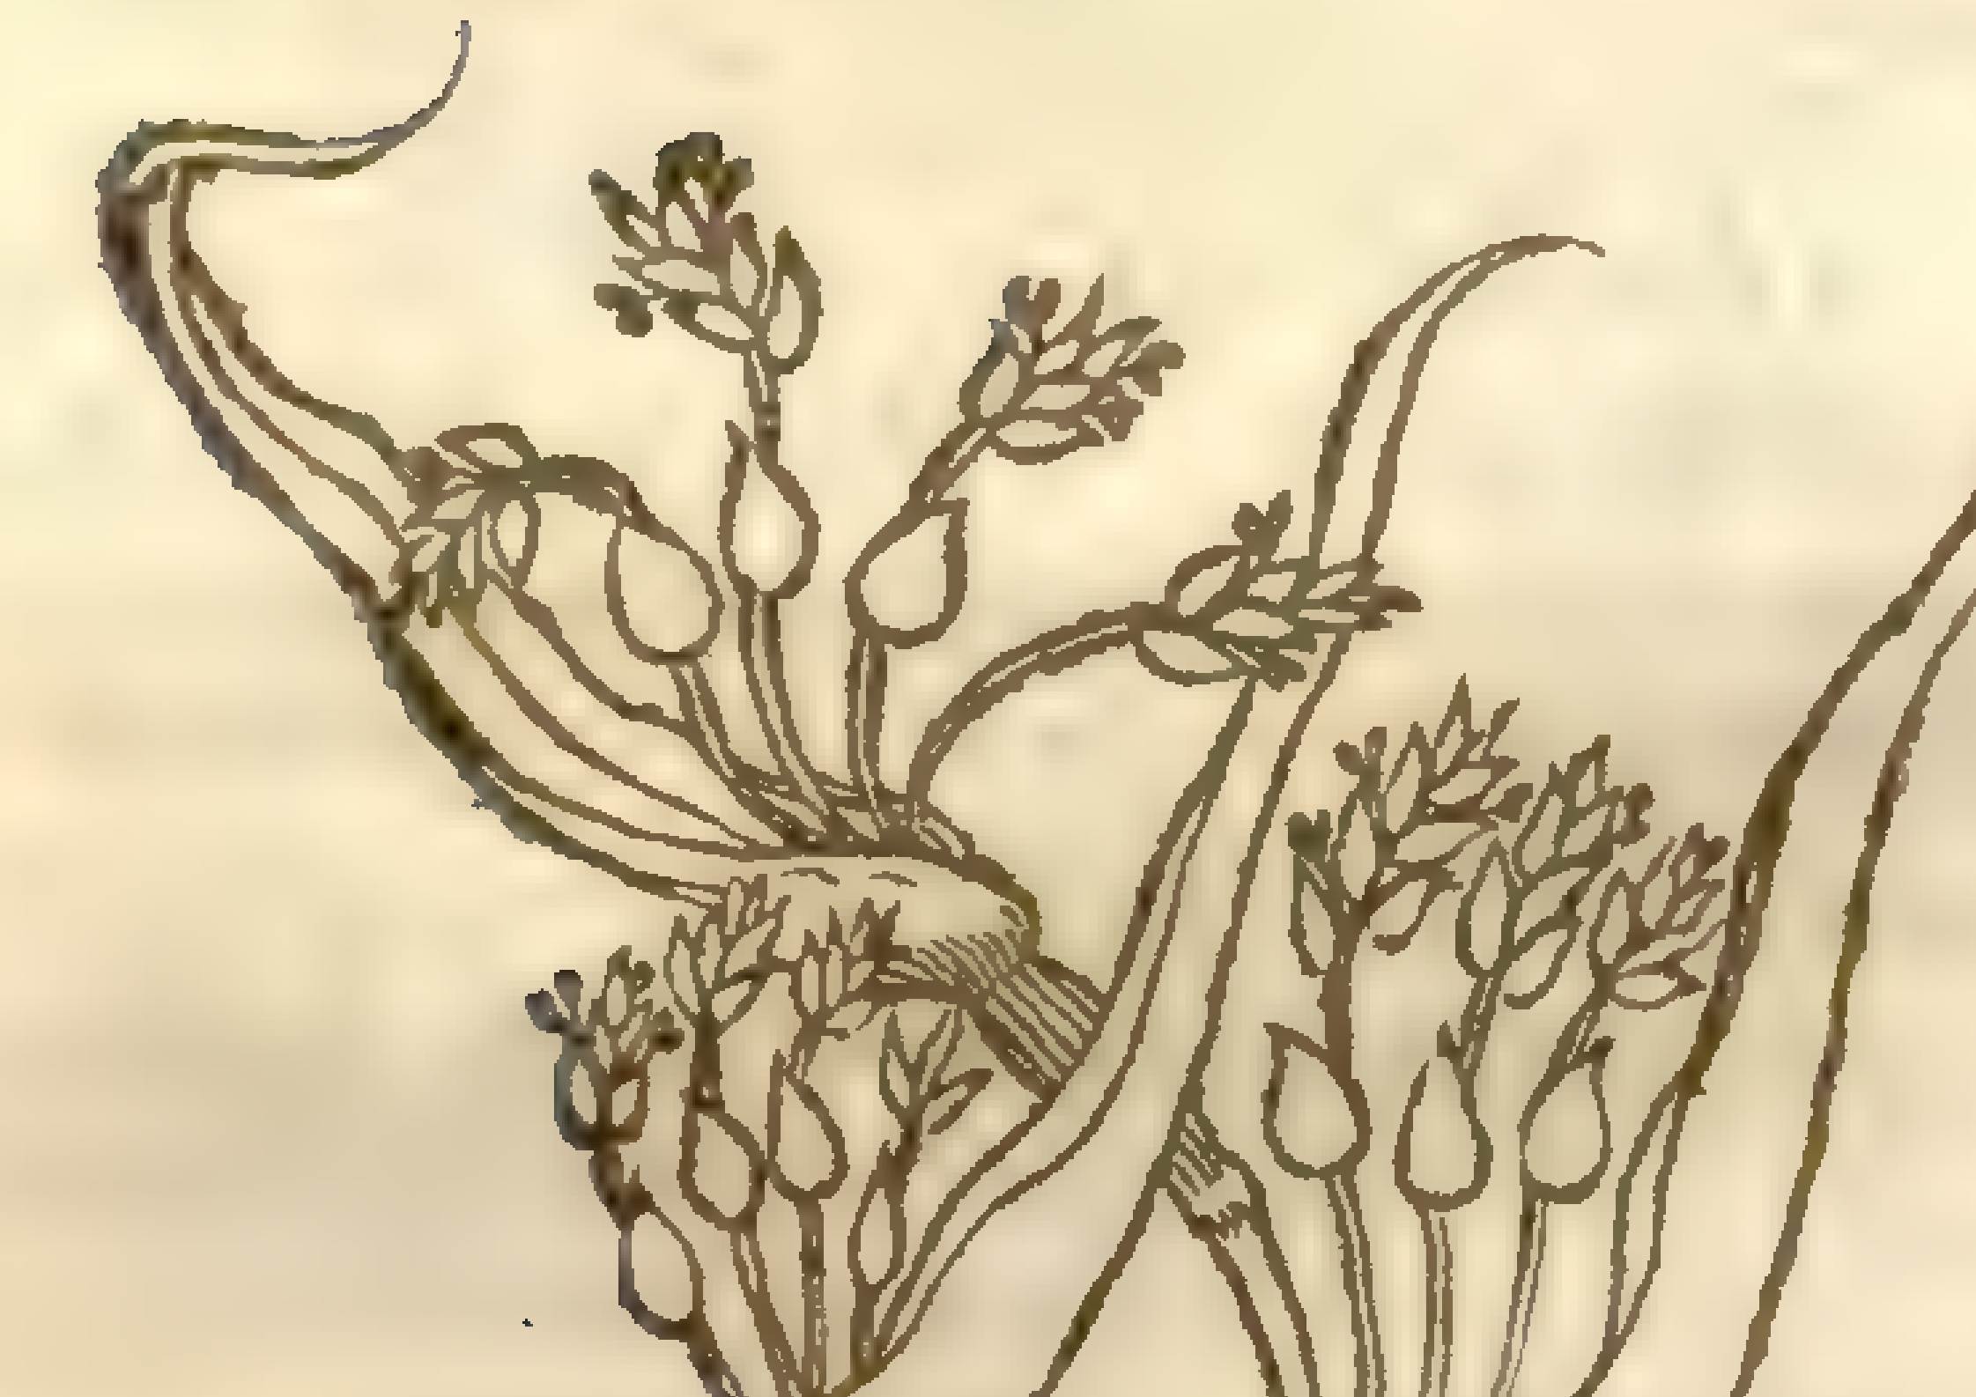
2 This by *Lobel* is called *Alopecuros altera maxima Anglica paludoſa*: That is, the large Engliſh Mariſh Fox-taile.

¶ *The Temperature and Vertues.*

I finde not any thing extant worthy the memorie, either of his nature or vertues.

Chap. 45. *Of Iobs Teares.*

Lachrima Iobi.
Iobs Teares.



¶ *The Deſcription.*

Iobs Teares hath many knotty ſtalks, proceeding from a tuft of threddy roots two foot high, ſet with broad leaues like to thoſe of Reed; amongſt which leaues come forth many ſmall branches like ſtraw of corne: on the end wherof doth grow a gray ſhining ſeed or grain hard to break, and like in ſhape to the ſeeds of Gromel, but greater, and of the ſame colour, whereof I hold it a kinde: euery of which graines are bored through the middeſt like a bead, and out of the hole commeth a ſmal idle or barren chaffie eare like vnto that of Darnell.

¶ *The Place.*

It is brought from Italy and the countries adioyning, into theſe countries, where it doth grow very well, but ſeldom comes to ripeneſſe; yet my ſelf had ripe ſeed thereof in my garden, the Summer being very hot.

¶ *The Time.*

It is ſowne early in the Spring, or elſe the Winter will ouertake it before it come to ripeneſſe.

¶ *The Names.*

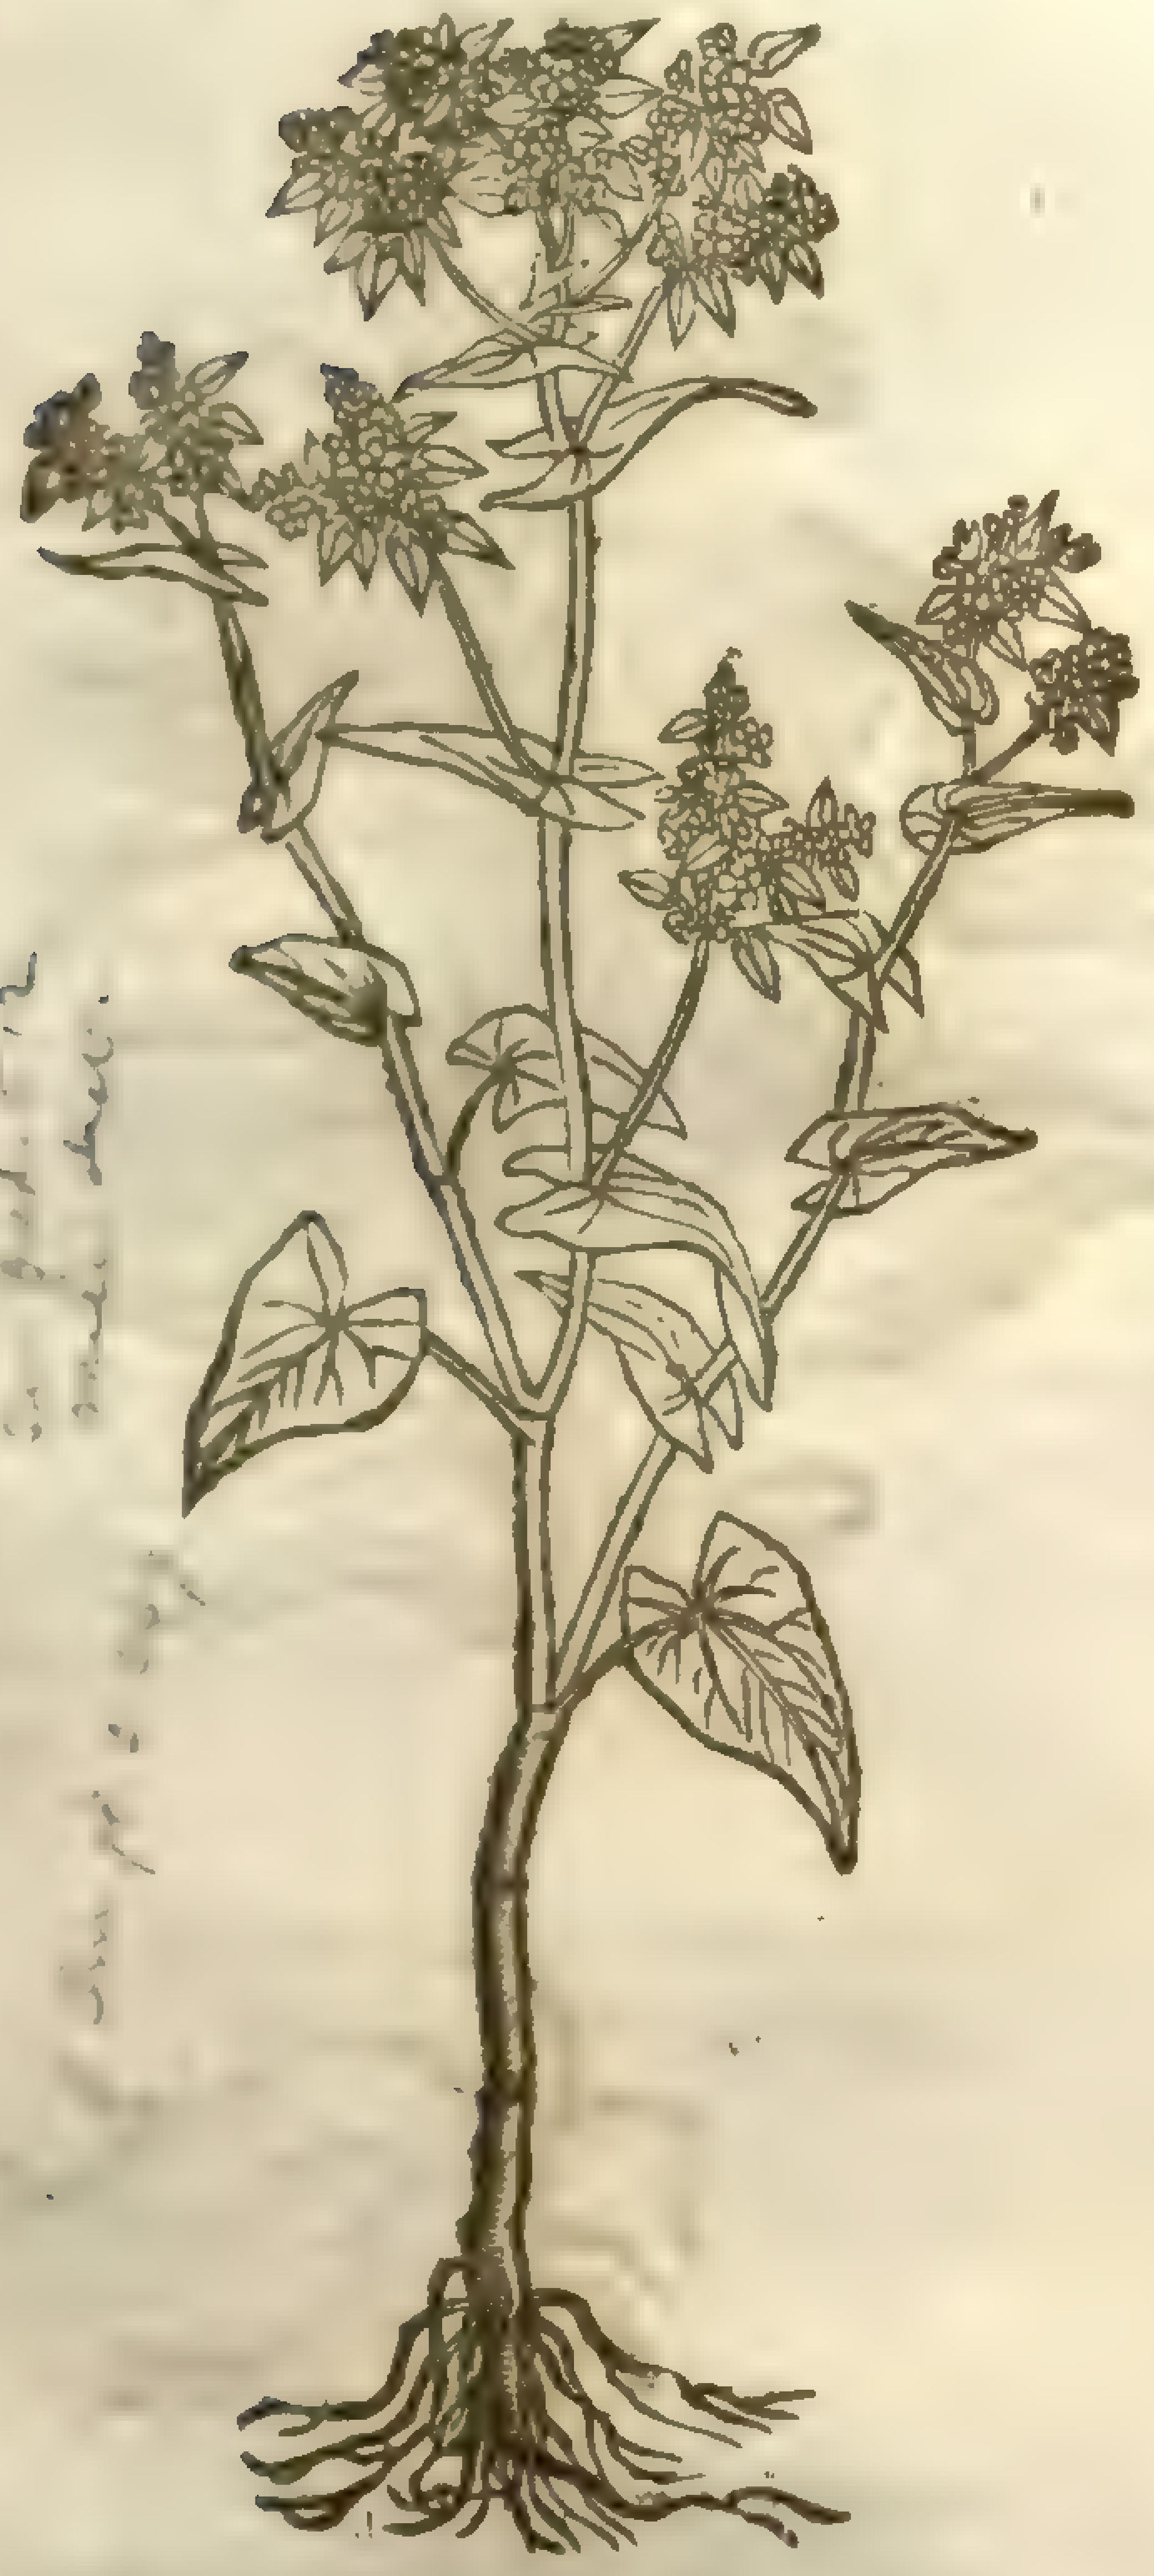
Diuers haue thought it to be *Lithoſpermi ſpecies*, or a kinde of Gromell, which the ſeed doth very notably reſemble, and doth not much differ from *Dioſcorides* his Gromell. Some thinke it *Plinies Lithoſpermum*, and therefore it may very fitly be called in Latine, *Arundo Lithoſpermos*, that is in Engliſh, Gromell Reed, as *Geſner* ſaith. It is generally called *Lachrima Iob*, and *Lachrima Iobi*: of ſome it is called *Dioſpyros*: in Engliſh it is called *Iobs* Teares, or *Iobs* Drops, for that euery graine reſembleth the drop or teare that falleth from the eye.

¶ *The Nature and Vertues.*

There is no mention made of this herbe for the vſe of Phyſicke; only in France and thoſe places where it is plentifully growing, they make beads, bracelets, and chaines thereof, as we do with Pomander and ſuch like.

CHAP. 67. *Of Buck-wheat.*

Tragopyron.
Buckwheat, or Bucke.



Polygonum fagopyrum.

¶ *The Deſcription.*

BVck-wheat may very well be placed among the kinds of graine or corne, for that oftentimes in time of neceſſitie bread is made thereof, mixed among other graine. It hath a round fat ſtalke ſomewhat creſted, ſmooth and reddiſh, which is diuided in many armes or branches, whereupon do grow ſmooth and ſoft leaues in ſhape like thoſe of Iuie or one of the Bindeweeds, not much vnlike Baſil, whereof *Tabernamontanus* called it *Ocymum Cereale:* The floures be ſmall, white, and cluſtred together in one or moe tufts or vmbels, ſlightly daſht ouer here & there with a flouriſh of light Carnation colour. The ſeeds are of a darke blackiſh colour, triangle, or three ſquare like the ſeed of blacke Bindeweed. The root is ſmall and threddy.

¶ *The Place.*

It proſpereth very wel in any ground, be it neuer ſo dry or barren, where it is commonly ſowen to ſerue as it were in ſtead of a dunging. It quickly commeth vp, and is very ſoone ripe: it is very common in and about the Namptwich in Cheſhire, where they ſow it as well for food for their cattell, pullen, and ſuch like, as to the vſe aforeſaid. It groweth likewiſe in Lancaſhire, and in ſome parts of our South country, about London in Middleſex, as alſo in Kent and Eſſex.

¶ *The Time.*

This baſe kinde of graine is ſowen in Aprill and the beginning of May, and is ripe in the beginning of Auguſt.

¶ *The Names.*

Buck-wheat is called of the high Almaines, **Heydencorn**: of the baſe Almanes, **Buckenweidt**; that is to ſay, *Hirci triticum*, or Goats wheat: of ſome, *Fagi triticum*, Beech Wheat: In Greeke, ὤκιμον, by *Theophraſtus*; and by late writers, τραγοπύρον: in Latine, *Fago triticum*, taken from the faſhion of the ſeed or fruit of the Beech tree. It is called alſo *Fegopyrum*, and *Tragopyrum*: In Engliſh, French wheat, Bullimong, and Buck-wheat: in French, *Dragee aux cheneaux.*

¶ *The Temperature.*

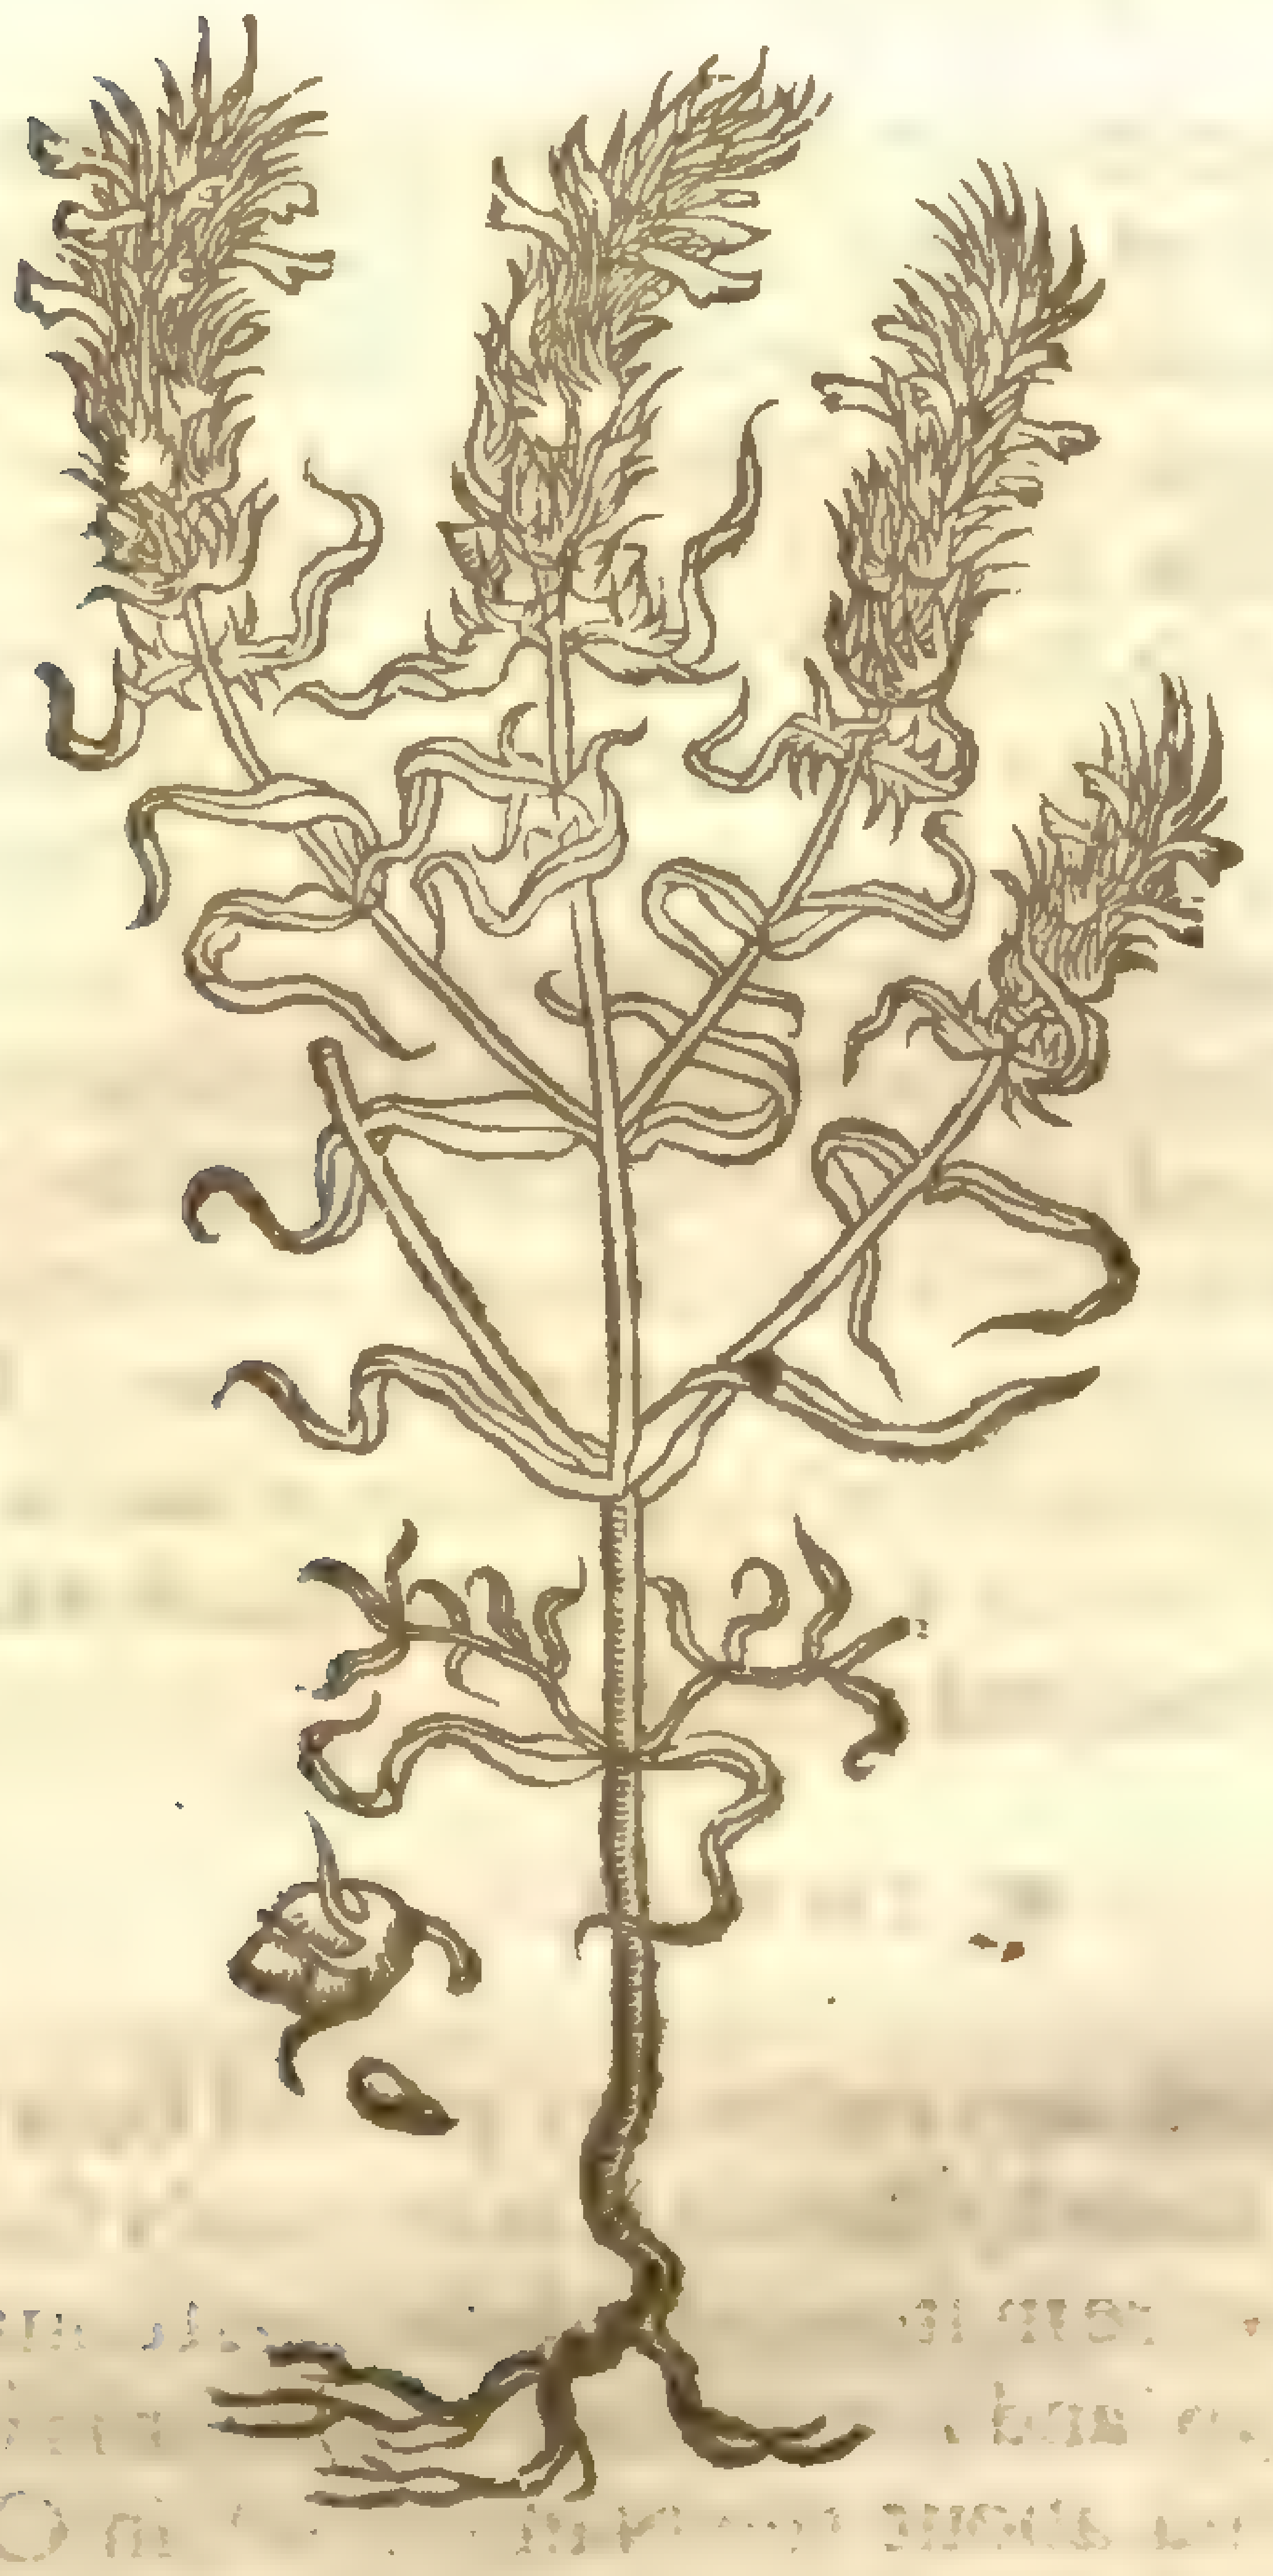
Buck-wheat nouriſheth leſſe than Wheat, Rie, Barley, or Otes; yet more than either Mill or Panicke.

¶ *The Vertues.*

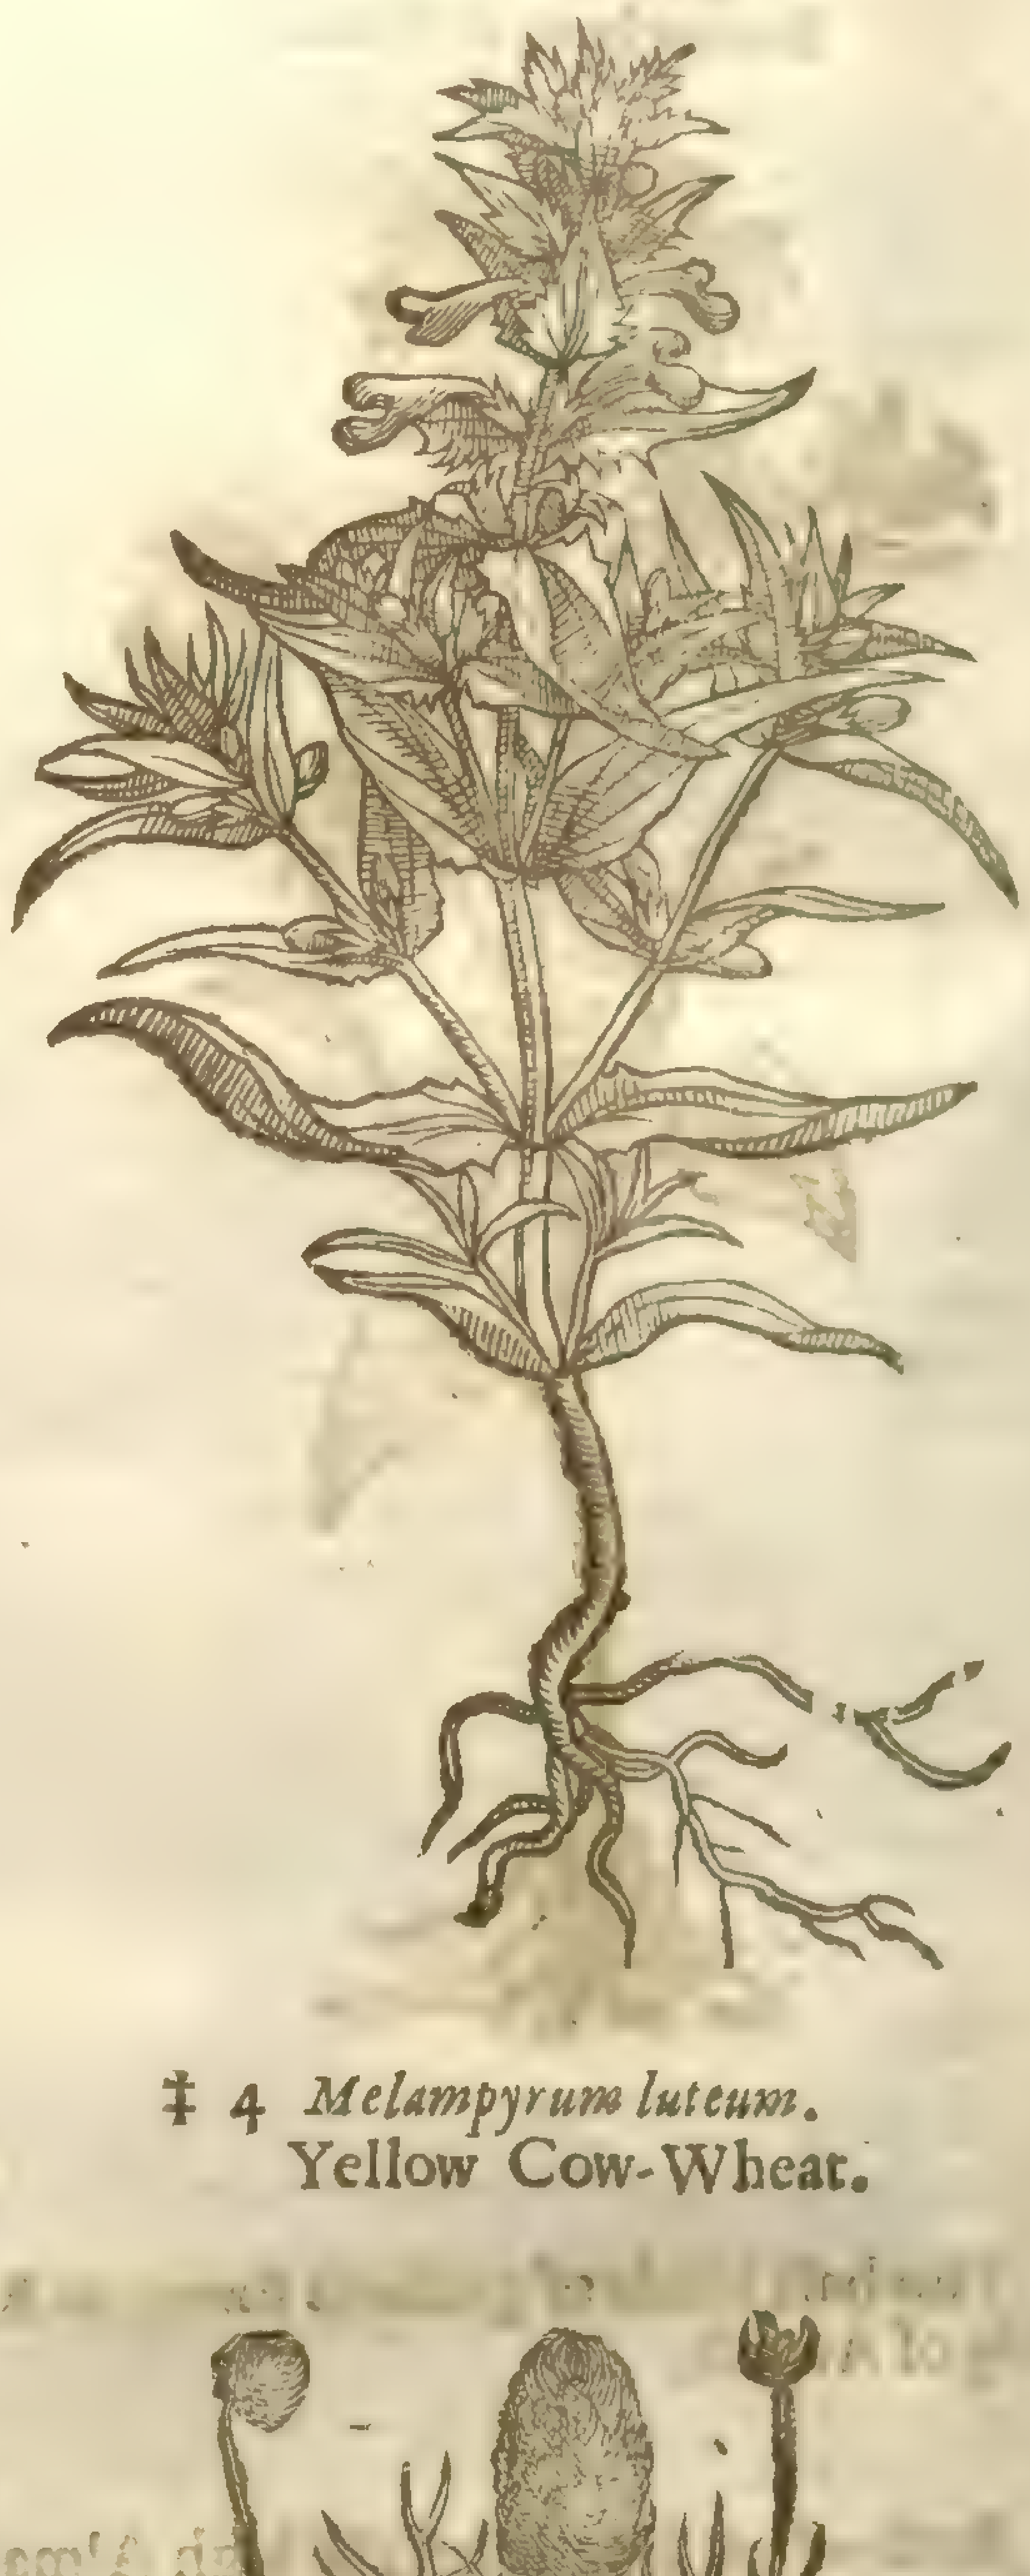
Bread made of the meale of Buck-wheat is of eaſie digeſtion, and ſpeedily paſſeth through the belly, but yeeldeth little nouriſhment.

CHAP. 68. *Of Cow-Wheat.*

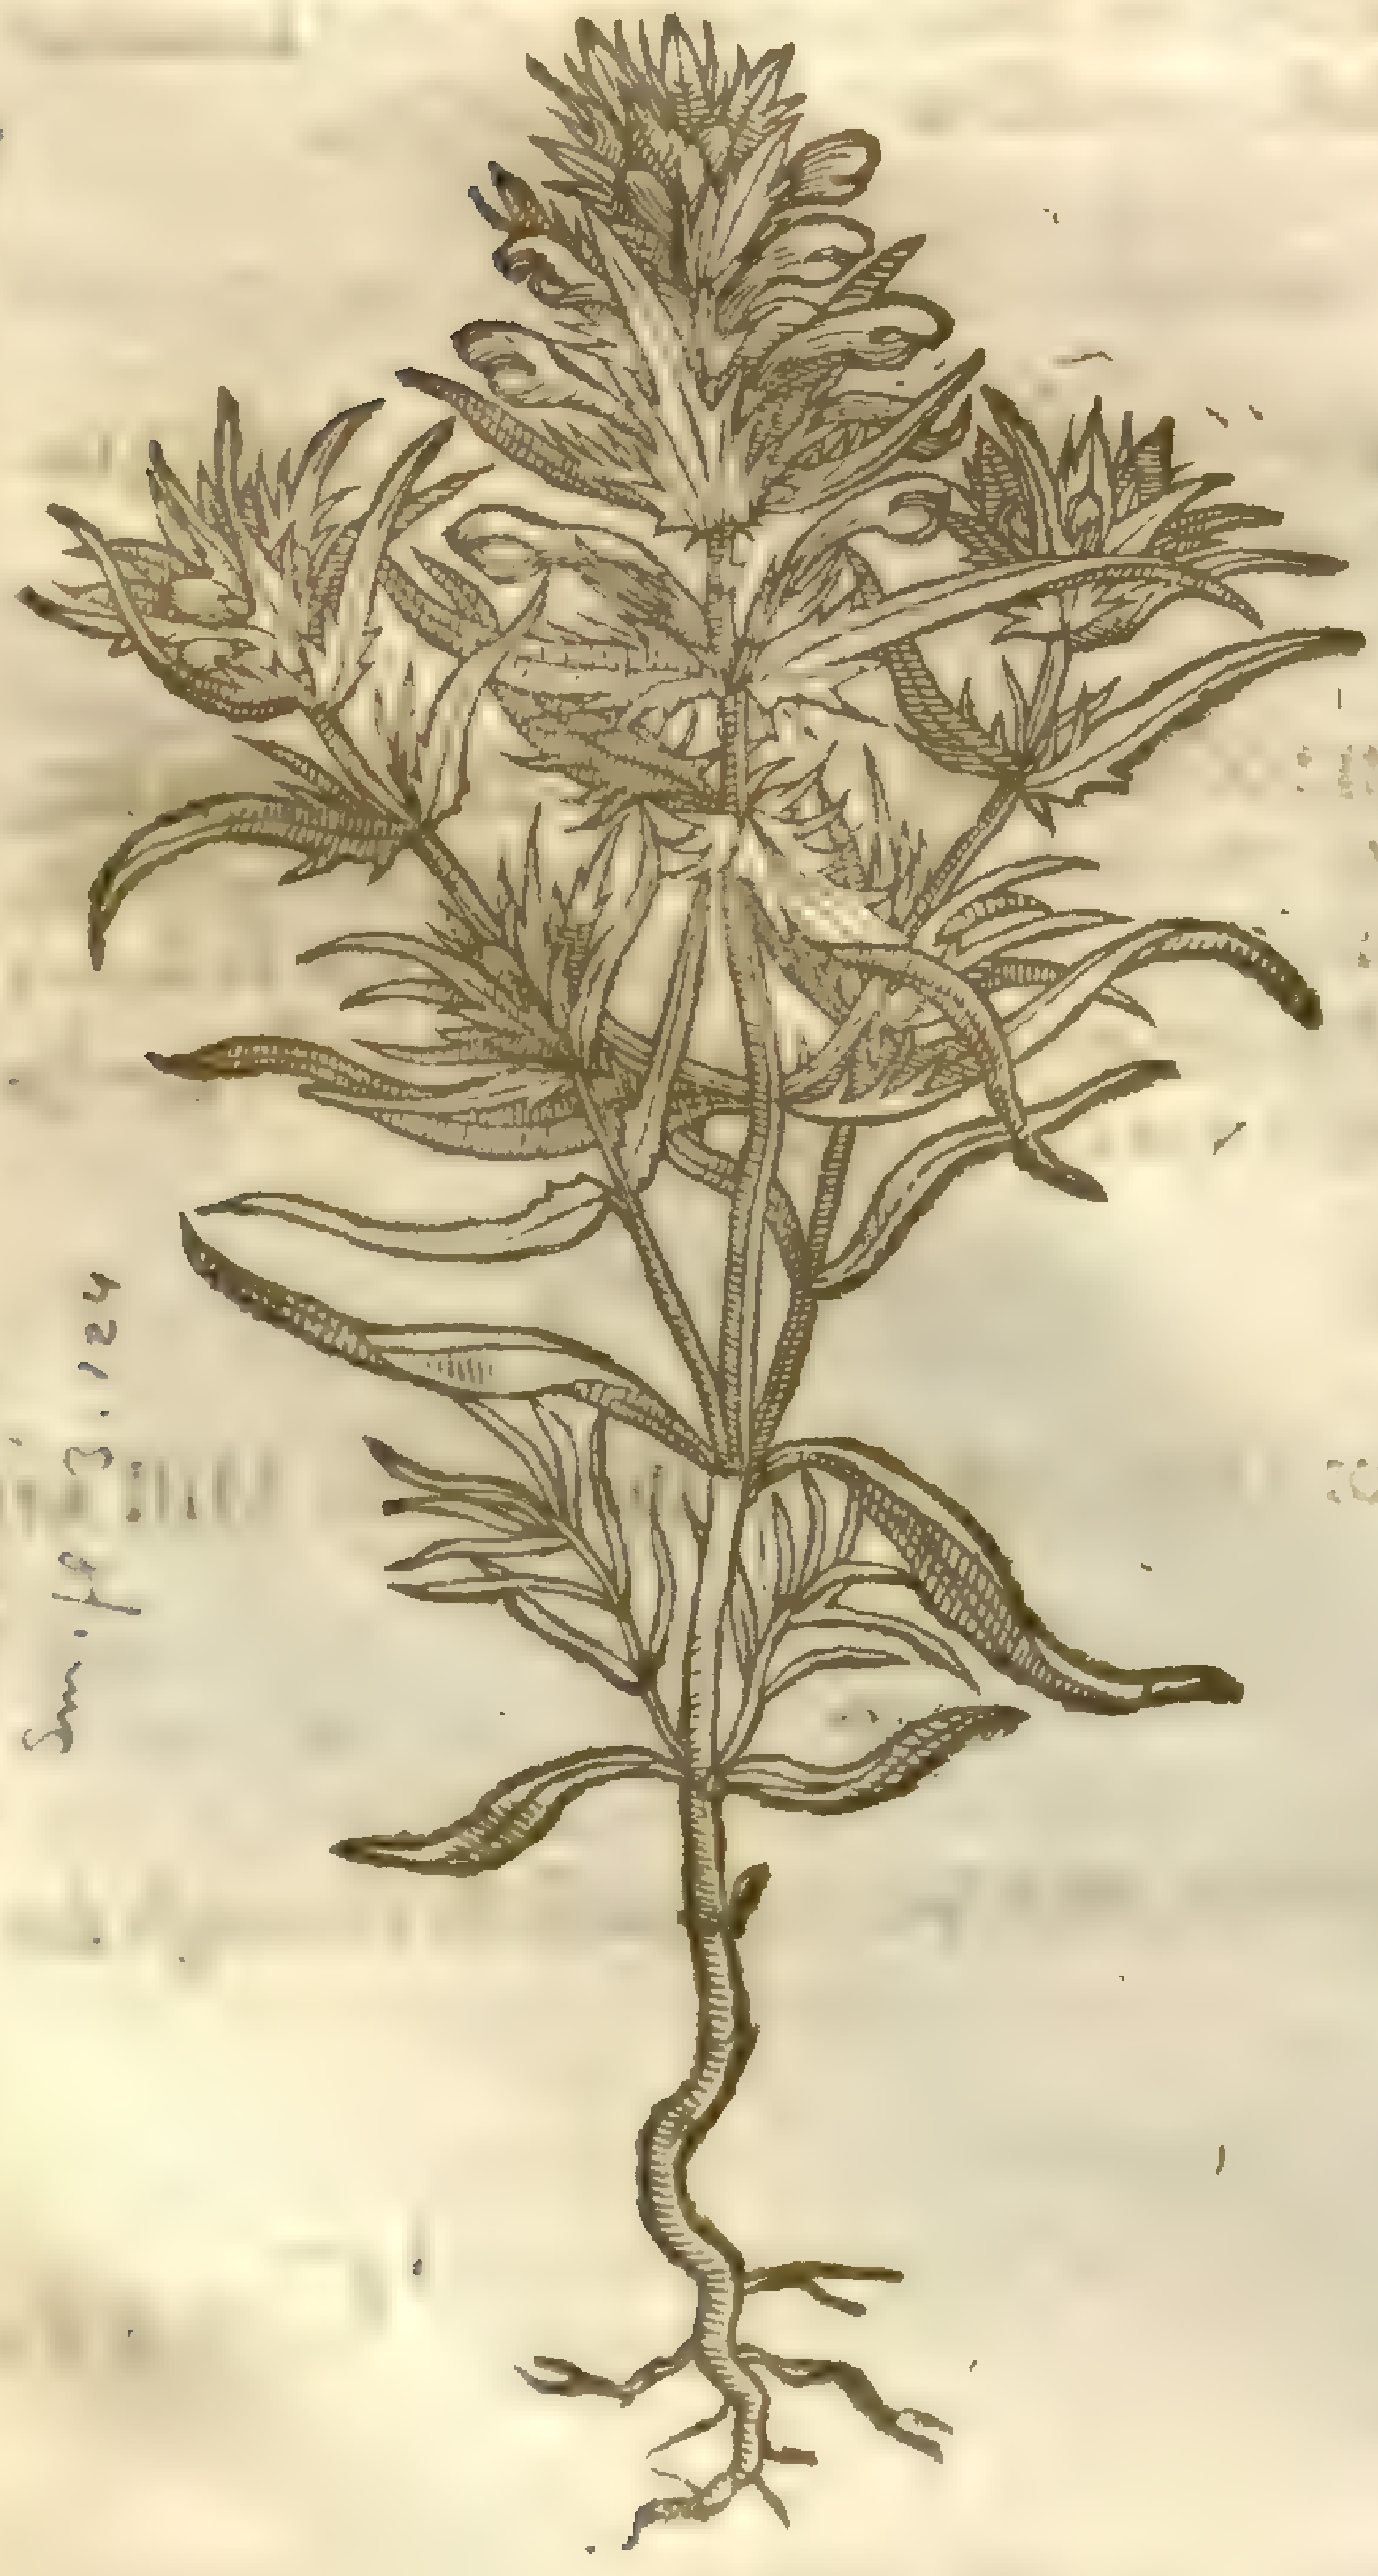
[illegible]



1 *Melampyrum album.*
White Cow-Wheat.

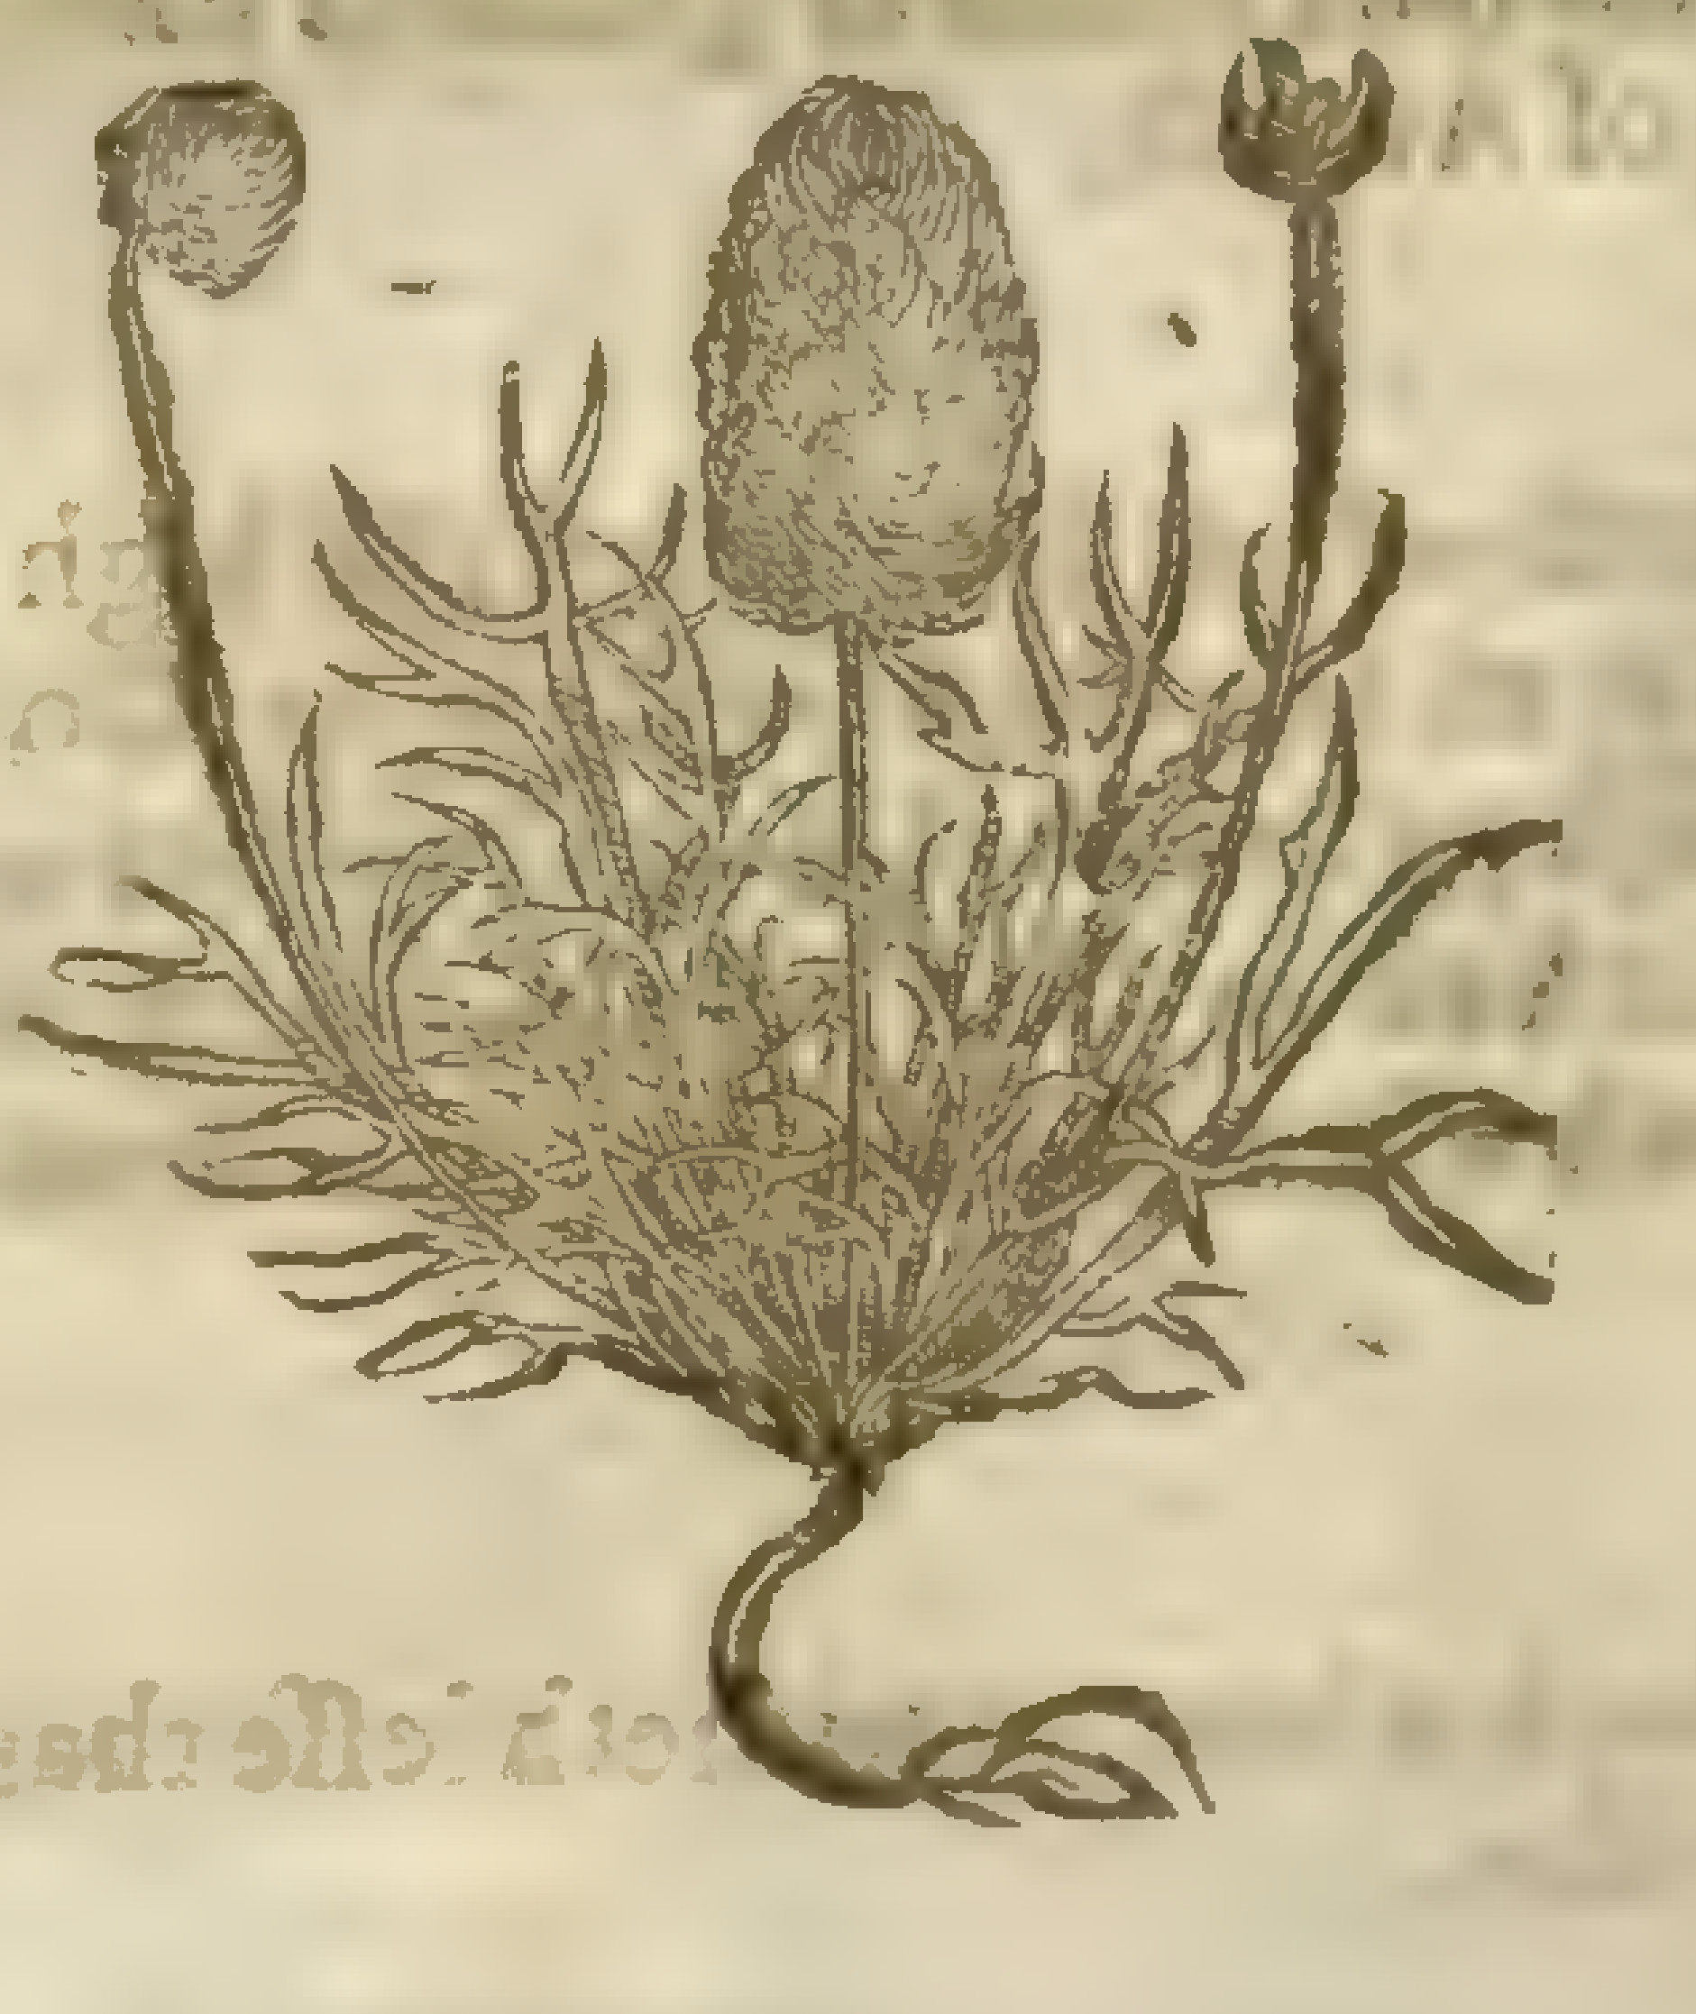


‡ 2 *Melampyrum purpureum.*
Purple Cow Wheat.



‡ 3 *Melampyrum cæruleum.*
Blew Cow-Wheat.

[illegible]



‡ 4 *Melampyrum luteum.*
Yellow Cow-Wheat.

¶ *The Deſcription.*

1 MElampyrum growes vpright with a ſtraight ſtalke, hauing other ſmall ſtalkes comming from the ſame, of a foot long. The leaues are long and narrow, and of a darke colour. On the tops of the branches grow buſhie or ſpikie ears full of floures and ſmall leaues mixed together, and much jagged, the whole eare reſembling a Foxe-taile. This

eare beginning to floure below, and ſo vpward by little and little vnto the top: the ſmall leaues before the opening of the floures, and likewiſe the buds of the floures, are white of colour. Then come vp broad husks, wherein are encloſed two ſeeds ſomewhat like wheat, but ſmaller and browner. The root is of a woody ſubſtance.

‡ 2 3 Theſe two are like the former in ſtalkes and leaues, but different in the colour of their floures, the which in the one are purple, and in the other blew. *Cluſius* calls theſe, as alſo the *Cratæogonon* treated of in the next chapter, by the name of *Parietariæ ſylueſtres.* ‡

4 Of this kinde there is another called *Melampyrum luteum*, which groweth neere vnto the ground, with leaues not much vnlike Harts horne, among which riſeth vp a ſmall ſtraw with an eare at the top like *Alopecuros*, the common Fox-taile, but of a yellow colour.

¶ *The Place.*

1 The firſt groweth among corne, and in paſture grounds that be fruitfull: it groweth plentifully in the paſtures about London.

The reſt are ſtrangers in England.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Melampyrum is called of ſome *Triticum vaccinium*: in Engliſh, Cow-wheat, and Horſe-floure: in Greeke, μελάμπυρον: The fourth is called *Melampyrum luteum*: in Engliſh, Yellow Cow-wheat.

¶ *The Danger.*

The ſeed of Cow-Wheat raiſeth vp fumes, and is hot and dry of nature, which being taken in meats and drinks in the manner of Darnell, troubleth the braine, cauſeth drunkenneſſe and headache.

Chap. 69. *Of Wilde Cow-Wheat.*

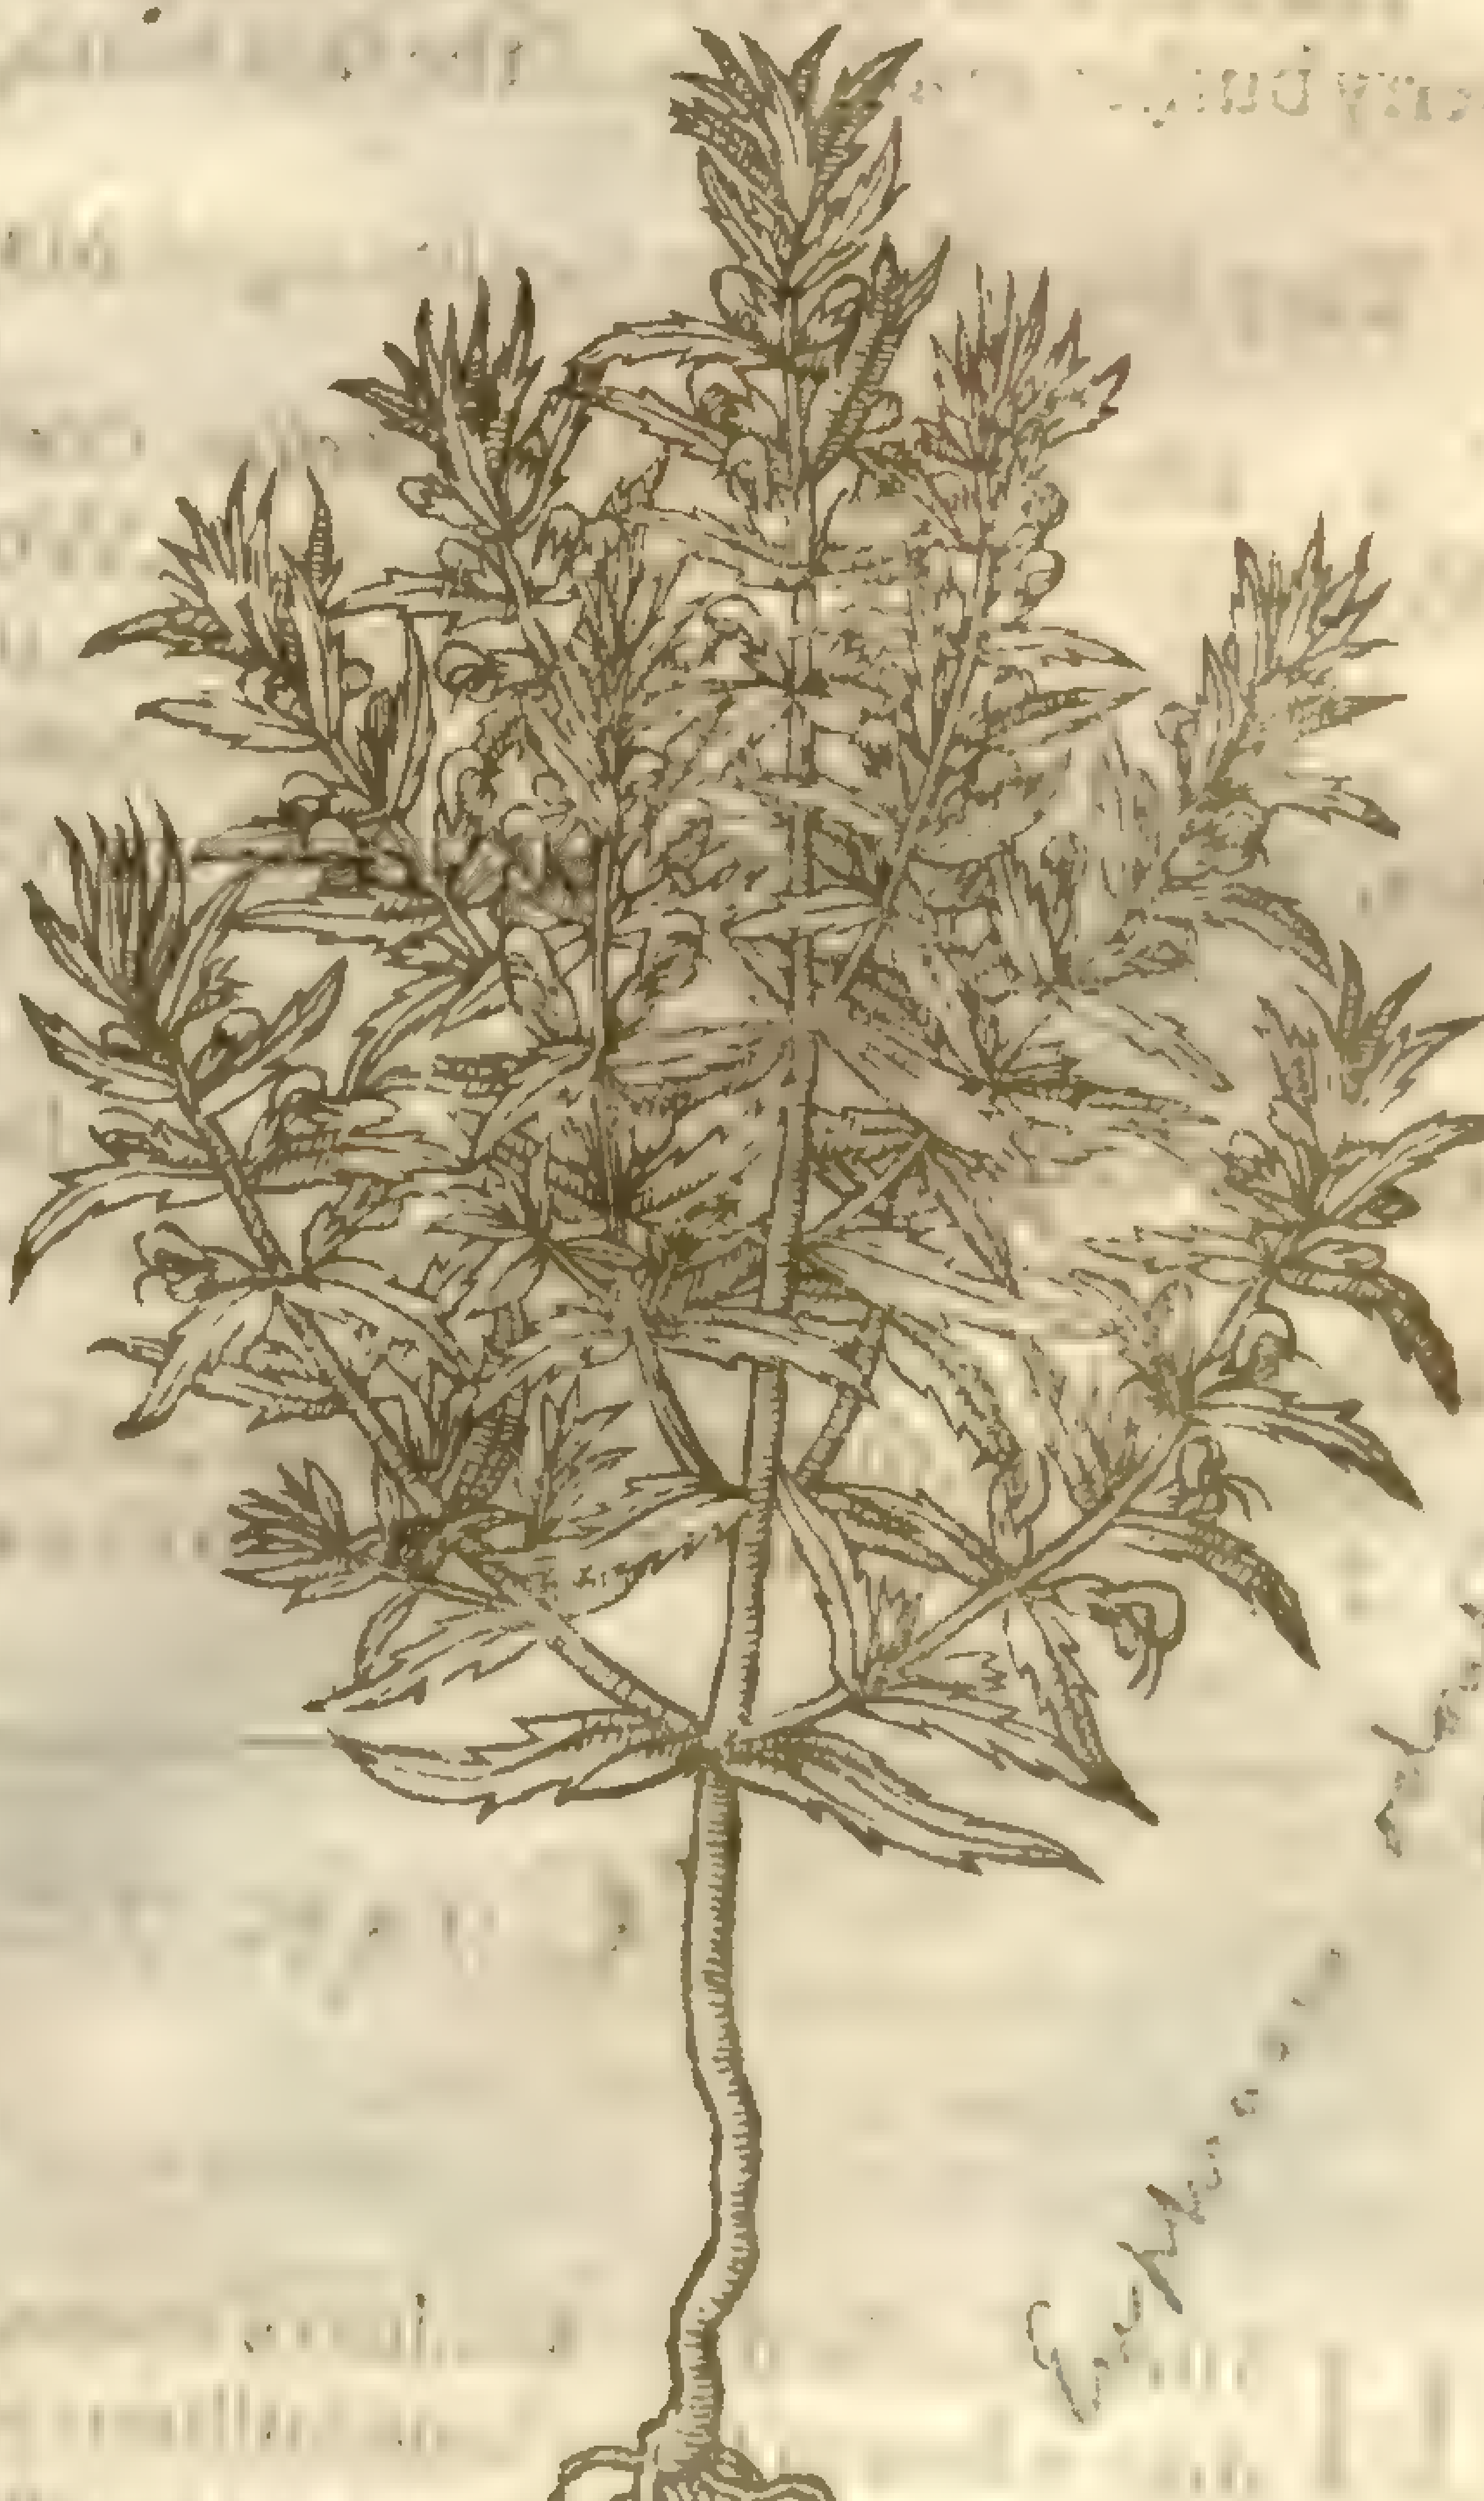
3 *Cratæogonon Euphroſine.*
Eyebright Cow-Wheat.

Park 57
Lob. ic. 496



Euphrasia [illegible]

¶ The Deſcription.

1 The firſt kind of wilke Cow-Wheat *Cluſius* in his Pannonick hiſtory calls *Parietaria ſylveſtris*, or wilde Pellitory: which name, according to his owne words, if it do not fitly anſwer the Plant, he knoweth not what to call it, for that the Latines haue not giuen any name thereunto: yet becauſe ſome haue ſo called it, hee retaineth the ſame name. Notwithſtanding he referred it vnto the kindes of *Melampyrum*, or Cow-wheat, or vnto *Crataeogonon*, the wilde Cow-wheat, which it doth very well anſwer in diuers points. It hath an hairy foure ſquare ſtalke, very tender, weake and eaſie to breake, not able to ſtand vpright without the helpe of his neighbours that dwell about him, a foot high or more; whereupon do grow long thin leaues, ſharpe pointed, and oftentimes lightly ſnipt about the edges, of a darke purpliſh colour, ſometimes greeniſh, ſet by couples one oppoſite againſt the other; among the which come forth two floures at one joynt, long and hollow ſomewhat gaping like the floures of a dead nettle, at the firſt of a pale yellow, and after of a bright golden colour; which do floure by degrees, firſt a few, and then more, by meanes whereof it is long in flouring. Which being paſt, there ſucceed ſmall cups or ſeed veſſels, wherein is contained browne ſeed not vnlike to wheat.

2 Red leafed wilde Cow-wheat is like vnto the former, ſauing that the leaues be narrower, and the tuft of leaues more jagged. The ſtalkes and leaues are of a reddiſh horſe-fleſh colour. The floures in forme are like the other, but in colour differing; for that the hollow part of the floure with the heele or ſpurre is of a purple colour, the reſt of the floure yellow. The ſeed and veſſels are like the precedent.

3 This kinde of wilde Cow-wheat *Tabernamontanus* hath ſet forth vnder the title of *Odontites*: others haue taken it to be a kinde of *Euphraſia* or Eyebright, becauſe it doth in ſome ſort reſemble it, eſpecially in his floures. The ſtalkes of this plant are ſmall, woody, rough, and ſquare. The leaues are indented about the edges, ſharpe pointed, and in moſt points reſembling the former Cow-wheat; ſo that of neceſſity it muſt be of the ſame kinde, and not a kinde of Eyebright as hath beene ſet downe by ſome.

¶ The Place.

Theſe wilde kindes of Cow-wheat doe grow commonly in fertile paſtures, and buſhie Copſes, or low woods, and among buſhes vpon barren heaths and ſuch like places.

The two firſt doe grow vpon Hampſted heath neere London, among the Iuniper buſhes and bilberry buſhes in all parts of the ſaid heath, and in euery part of England where I haue trauelled.

¶ The Time.

They floure from the beginning of May, to the end of Auguſt.

¶ The Names.

1 The firſt is called of *Lobelius*, *Crataeogonon*: and of *Tabernamontanus*, *Milium Syluaticum*, or Wood Millet, and *Alſine ſyluatica*, or Wood-Chickweed.

2 The ſecond hath the ſame titles: in Engliſh, Wilde Cow-wheat.

3 The laſt is called by *Tabernamontanus*, *Odontites*: of *Dodonaeus*, *Euphraſia altera*, and *Euphroſine*. *Hippocrates* called the wilde Cow-wheat, *Polycarpum*, and *Polycritum*.

¶ The Nature and Vertues.

There is not much ſet downe either of the nature or vertues of theſe plants: onely it is reported that the ſeeds do cauſe giddineſſe and drunkenneſſe, as Darnell doth.

The ſeed of *Crataeogonon* made in fine pouder, and giuen in broth or otherwiſe, mightily prouoketh Venerie.

Some write, that it will likewiſe cauſe women to bring forth male children.

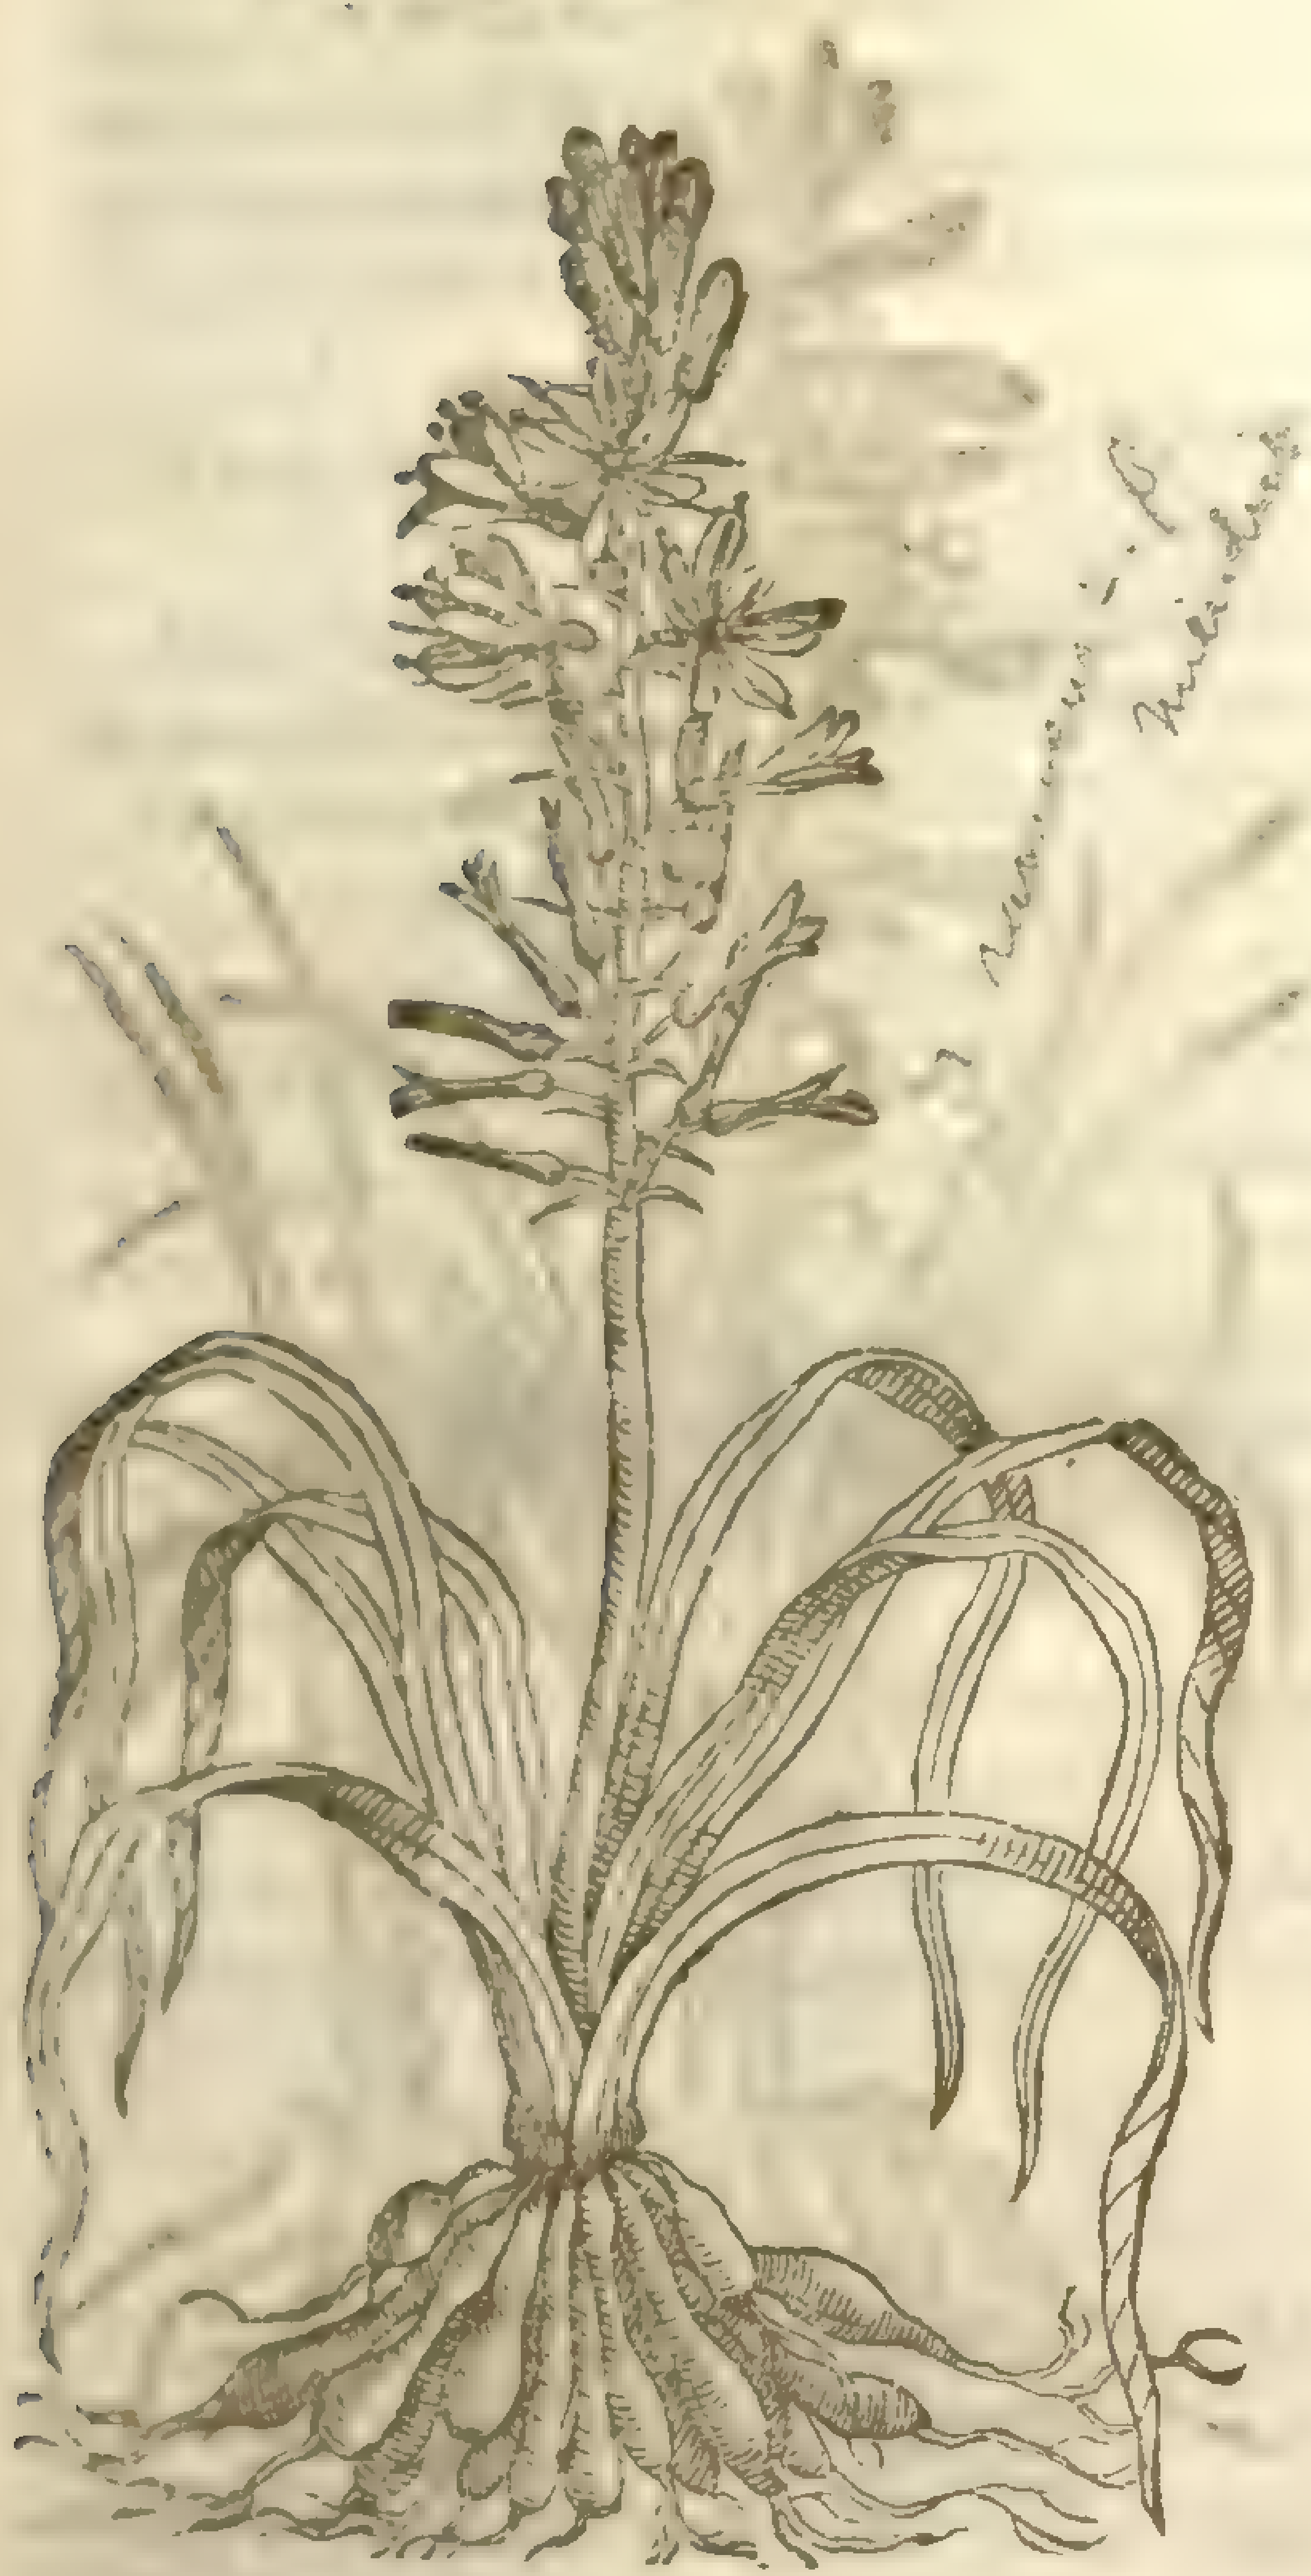
† See the vertues attributed to *Crataeogonon* by *Dioſcorides* before, Chap. 38. B.

Chap. 70. *Of White Aſphodill.*

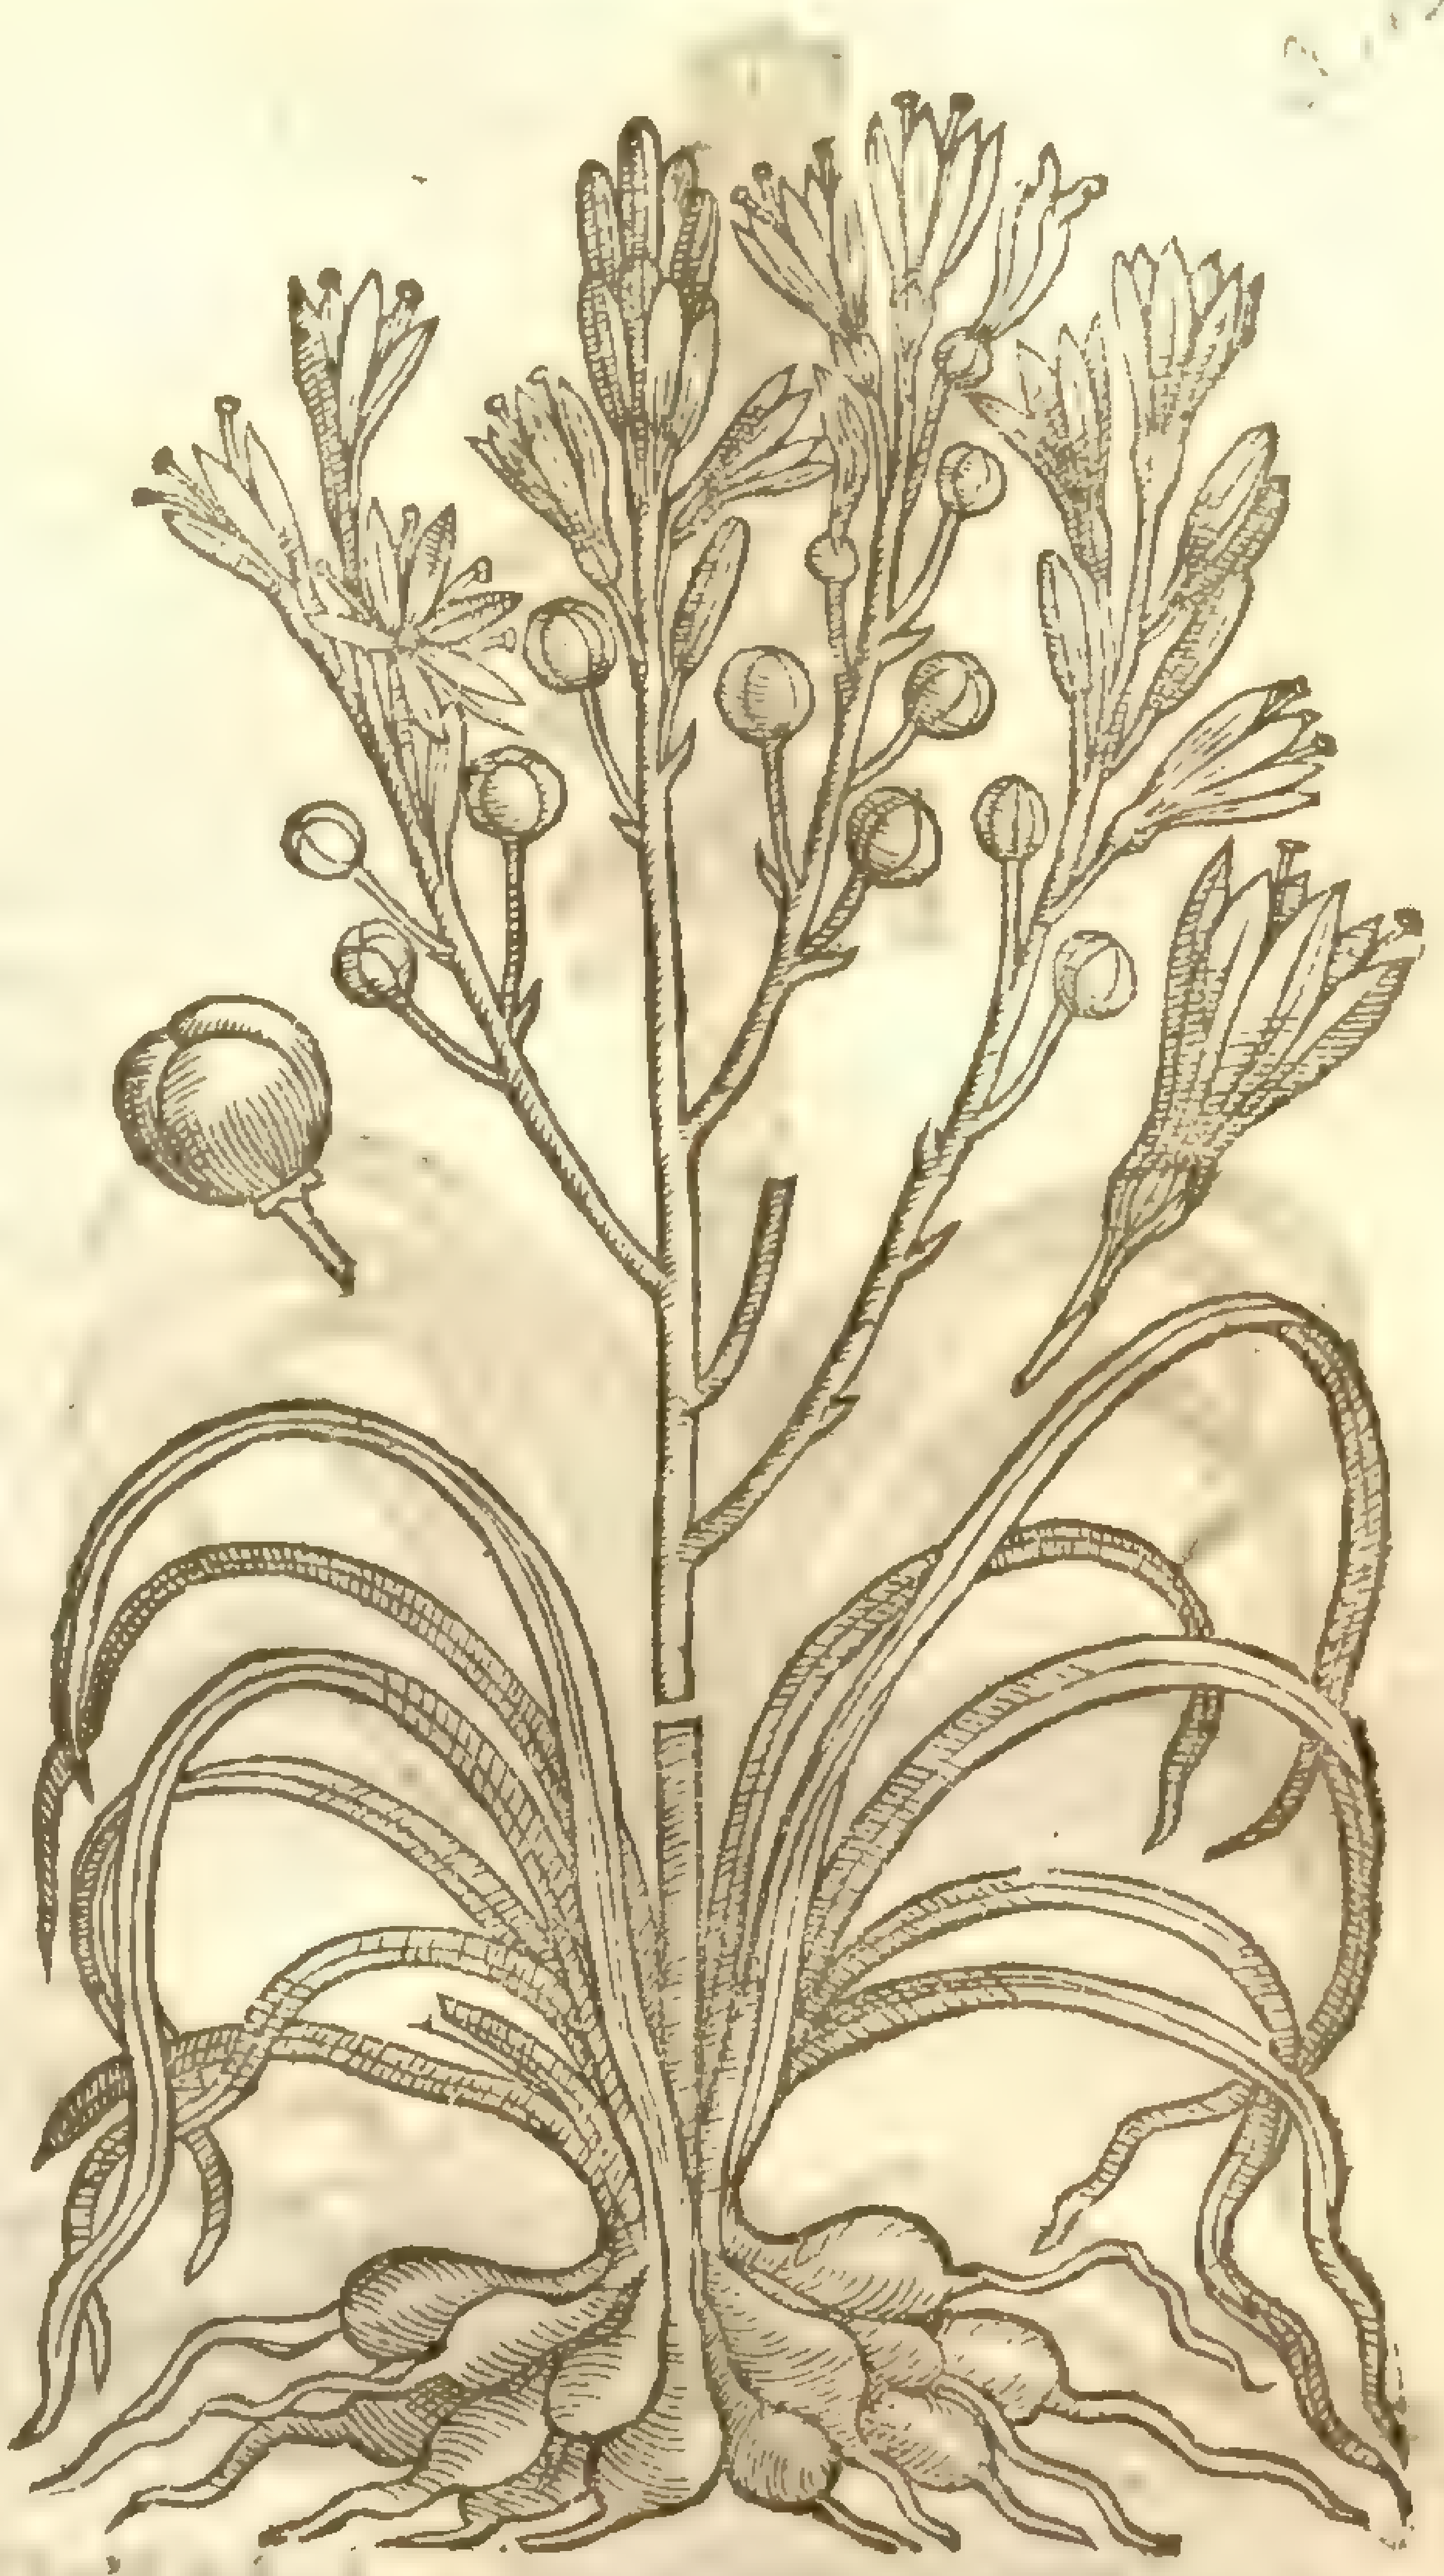
¶ The Kindes.

Hauing finiſhed the kindes of corne, it followeth to ſhew vnto you the ſundry ſorts of Aſphodils, whereof ſome haue bulbous roots, other tuberous or knobby roots, ſome of yellow colour, and ſome of mixt colours: notwithſtanding *Dioſcorides* maketh mention but of one Aſphodill, but *Pliny* ſetteth downe two; which *Dionyſius* confirmeth, ſaying, That there is the male and female Aſphodill. The later age hath obſerued many moe beſides the bulbed one, of which *Galen* maketh mention.

1 *Aſphodelus nonramoſus.*
White Aſphodill.



2 *Aſphodelus ramoſus.*
Branched Aſphodill.



¶ *The Deſcription.*

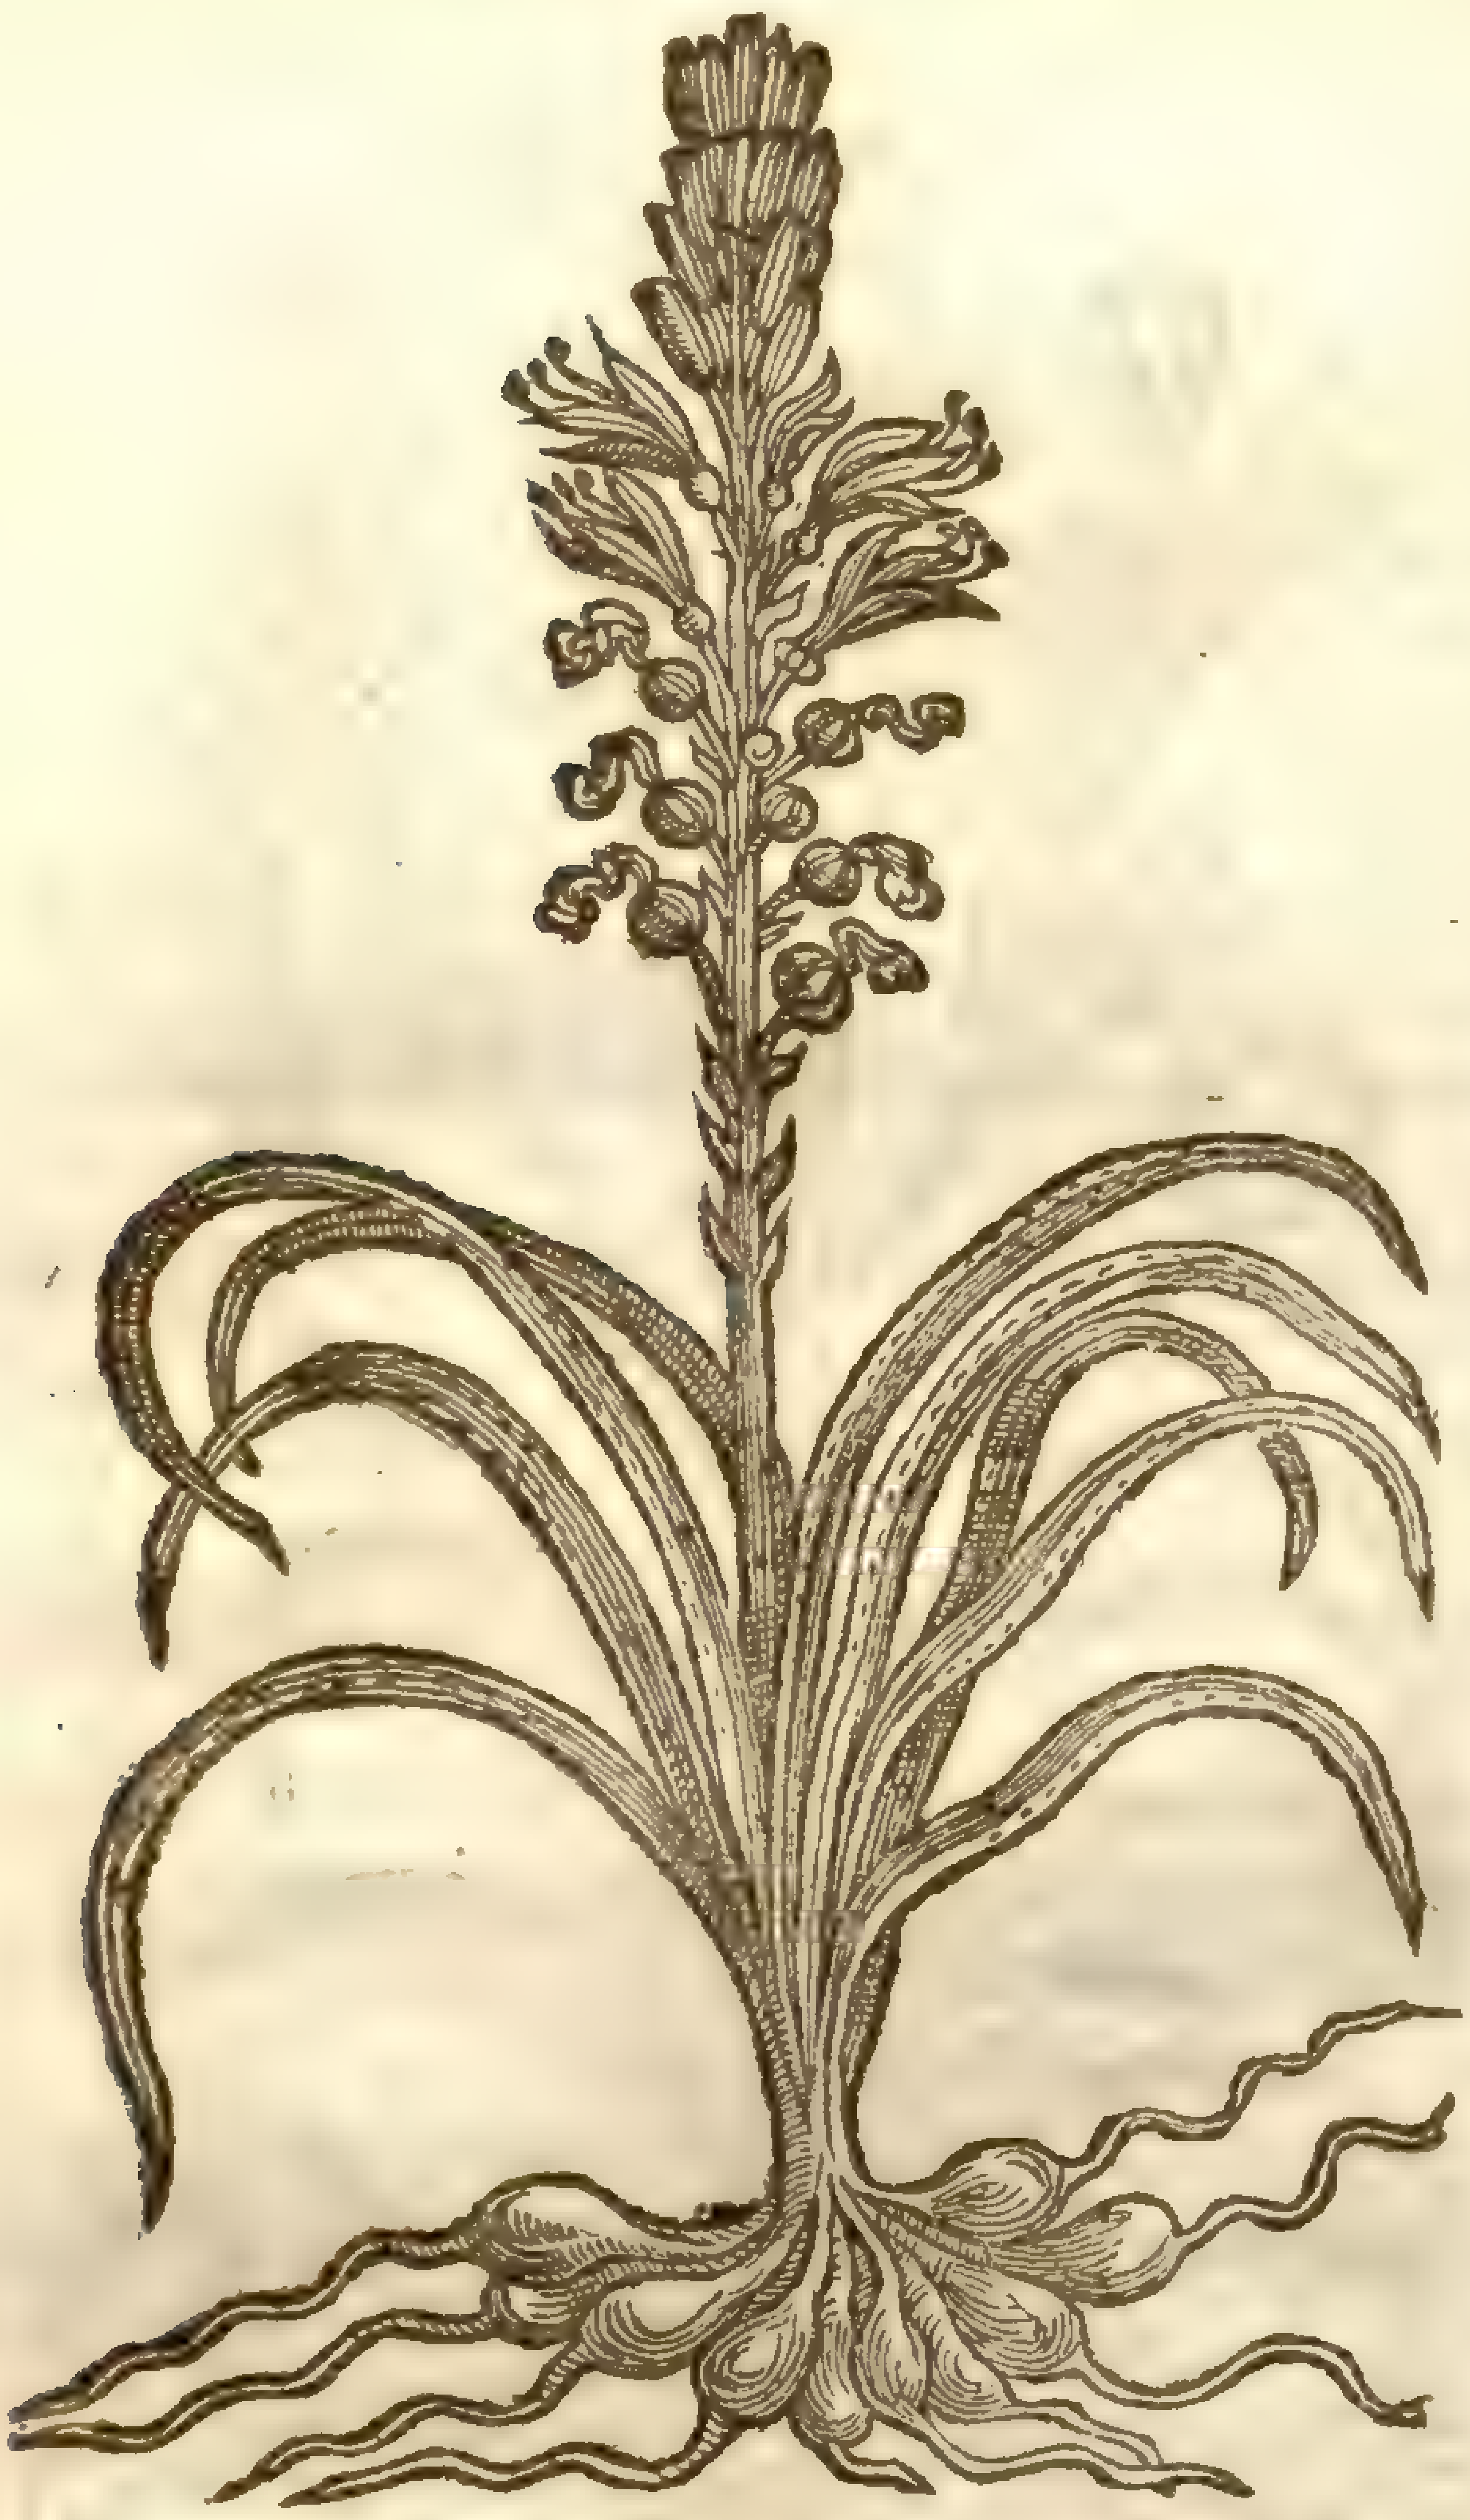
1 THe white Aſphodill hath many long and narrow leaues like thoſe of leeks, ſharpe pointed. The ſtalke is round, ſmooth, naked, and without leaues, two cubits high, garniſhed from the middle vpward with a number of floures ſtarre-faſhion, made of fiue leaues apiece; the colour white, with ſome darke purple ſtreakes drawne downe the backe-ſide. Within the floures be certaine ſmall chiues. The floures being paſt, there ſpring vp little round heads, wherein are contained hard, blacke, and 3 ſquare ſeeds like thoſe of Buck-wheat or Staueſacre. The root is compact of many knobby roots growing out of one head, like thoſe of the Peonie, full of iuice, with a ſmall bitterneſſe and binding taſte.

2 Branched Aſphodill agreeth well with the former deſcription, ſauing that this hath many branches or armes growing out of the ſtalke, whereon the floures doe grow, and the other hath not any branch at all, wherein conſiſteth the difference.

3 Aſphodill with the reddiſh floure groweth vp in roots, ſtalke, leafe, and manner of growing like the precedent, ſauing that the floures of this be of a dark red colour, and the other white, which ſetteth forth the difference, if there be any ſuch difference, or any ſuch plant at all: for I haue conferred with many moſt excellent men in the knowledge of plants, but none of them can giue mee certaine knowledge of any ſuch, but tell mee they haue heard it reported that ſuch a one there is, and ſo haue I alſo; but certainely I cannot ſet downe any thing of this plant vntill I heare more certaintie; for as yet I cannot credit my Authour, which for reuerence of his perſon I forbeare to name.

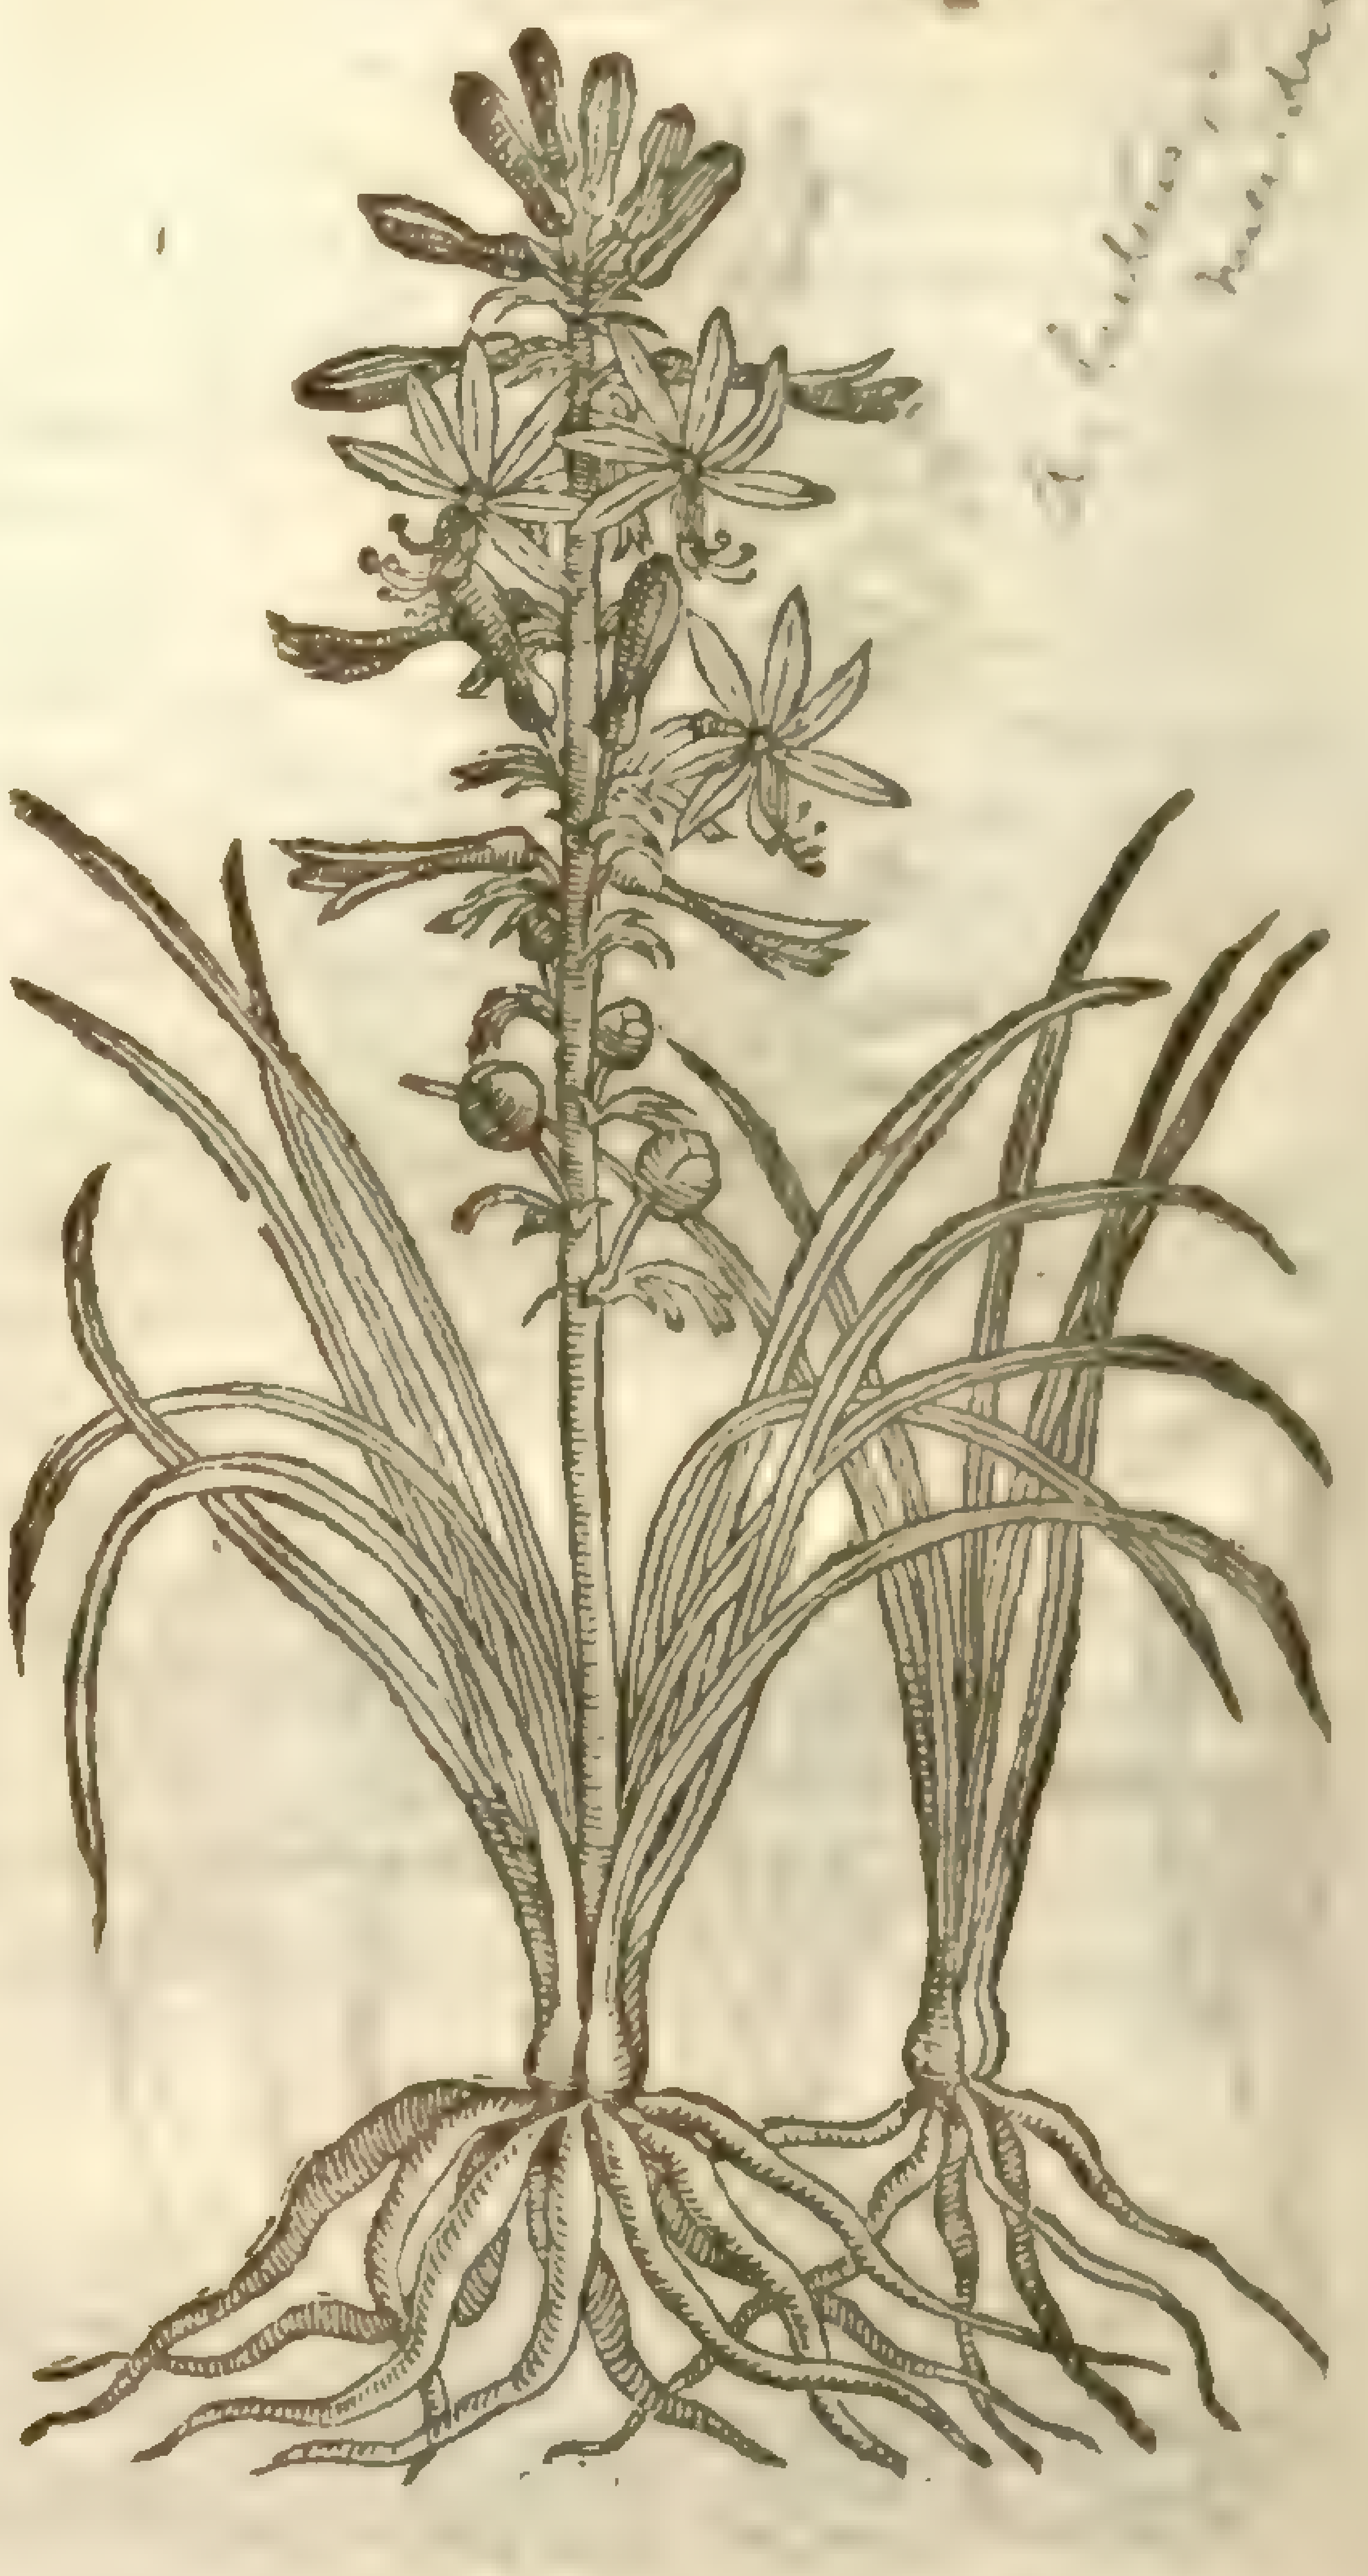
4 The yellow Aſphodill hath many roots growing out of one head, made of ſundry tough, fat and oleous yellow ſprigs, or groſſe ſtrings, from the which riſe vp many graſſie leaues, thick and groſſe, tending to ſquareneſſe: among the which commeth vp a ſtrong thicke ſtalke ſet with the like leaues euen to the floures, but leſſe: vpon the which do grow ſtarre-like yellow floures, otherwiſe like the white Aſphodill.

3 *Aſphodelus flore rubente.*
Red Aſphodill.

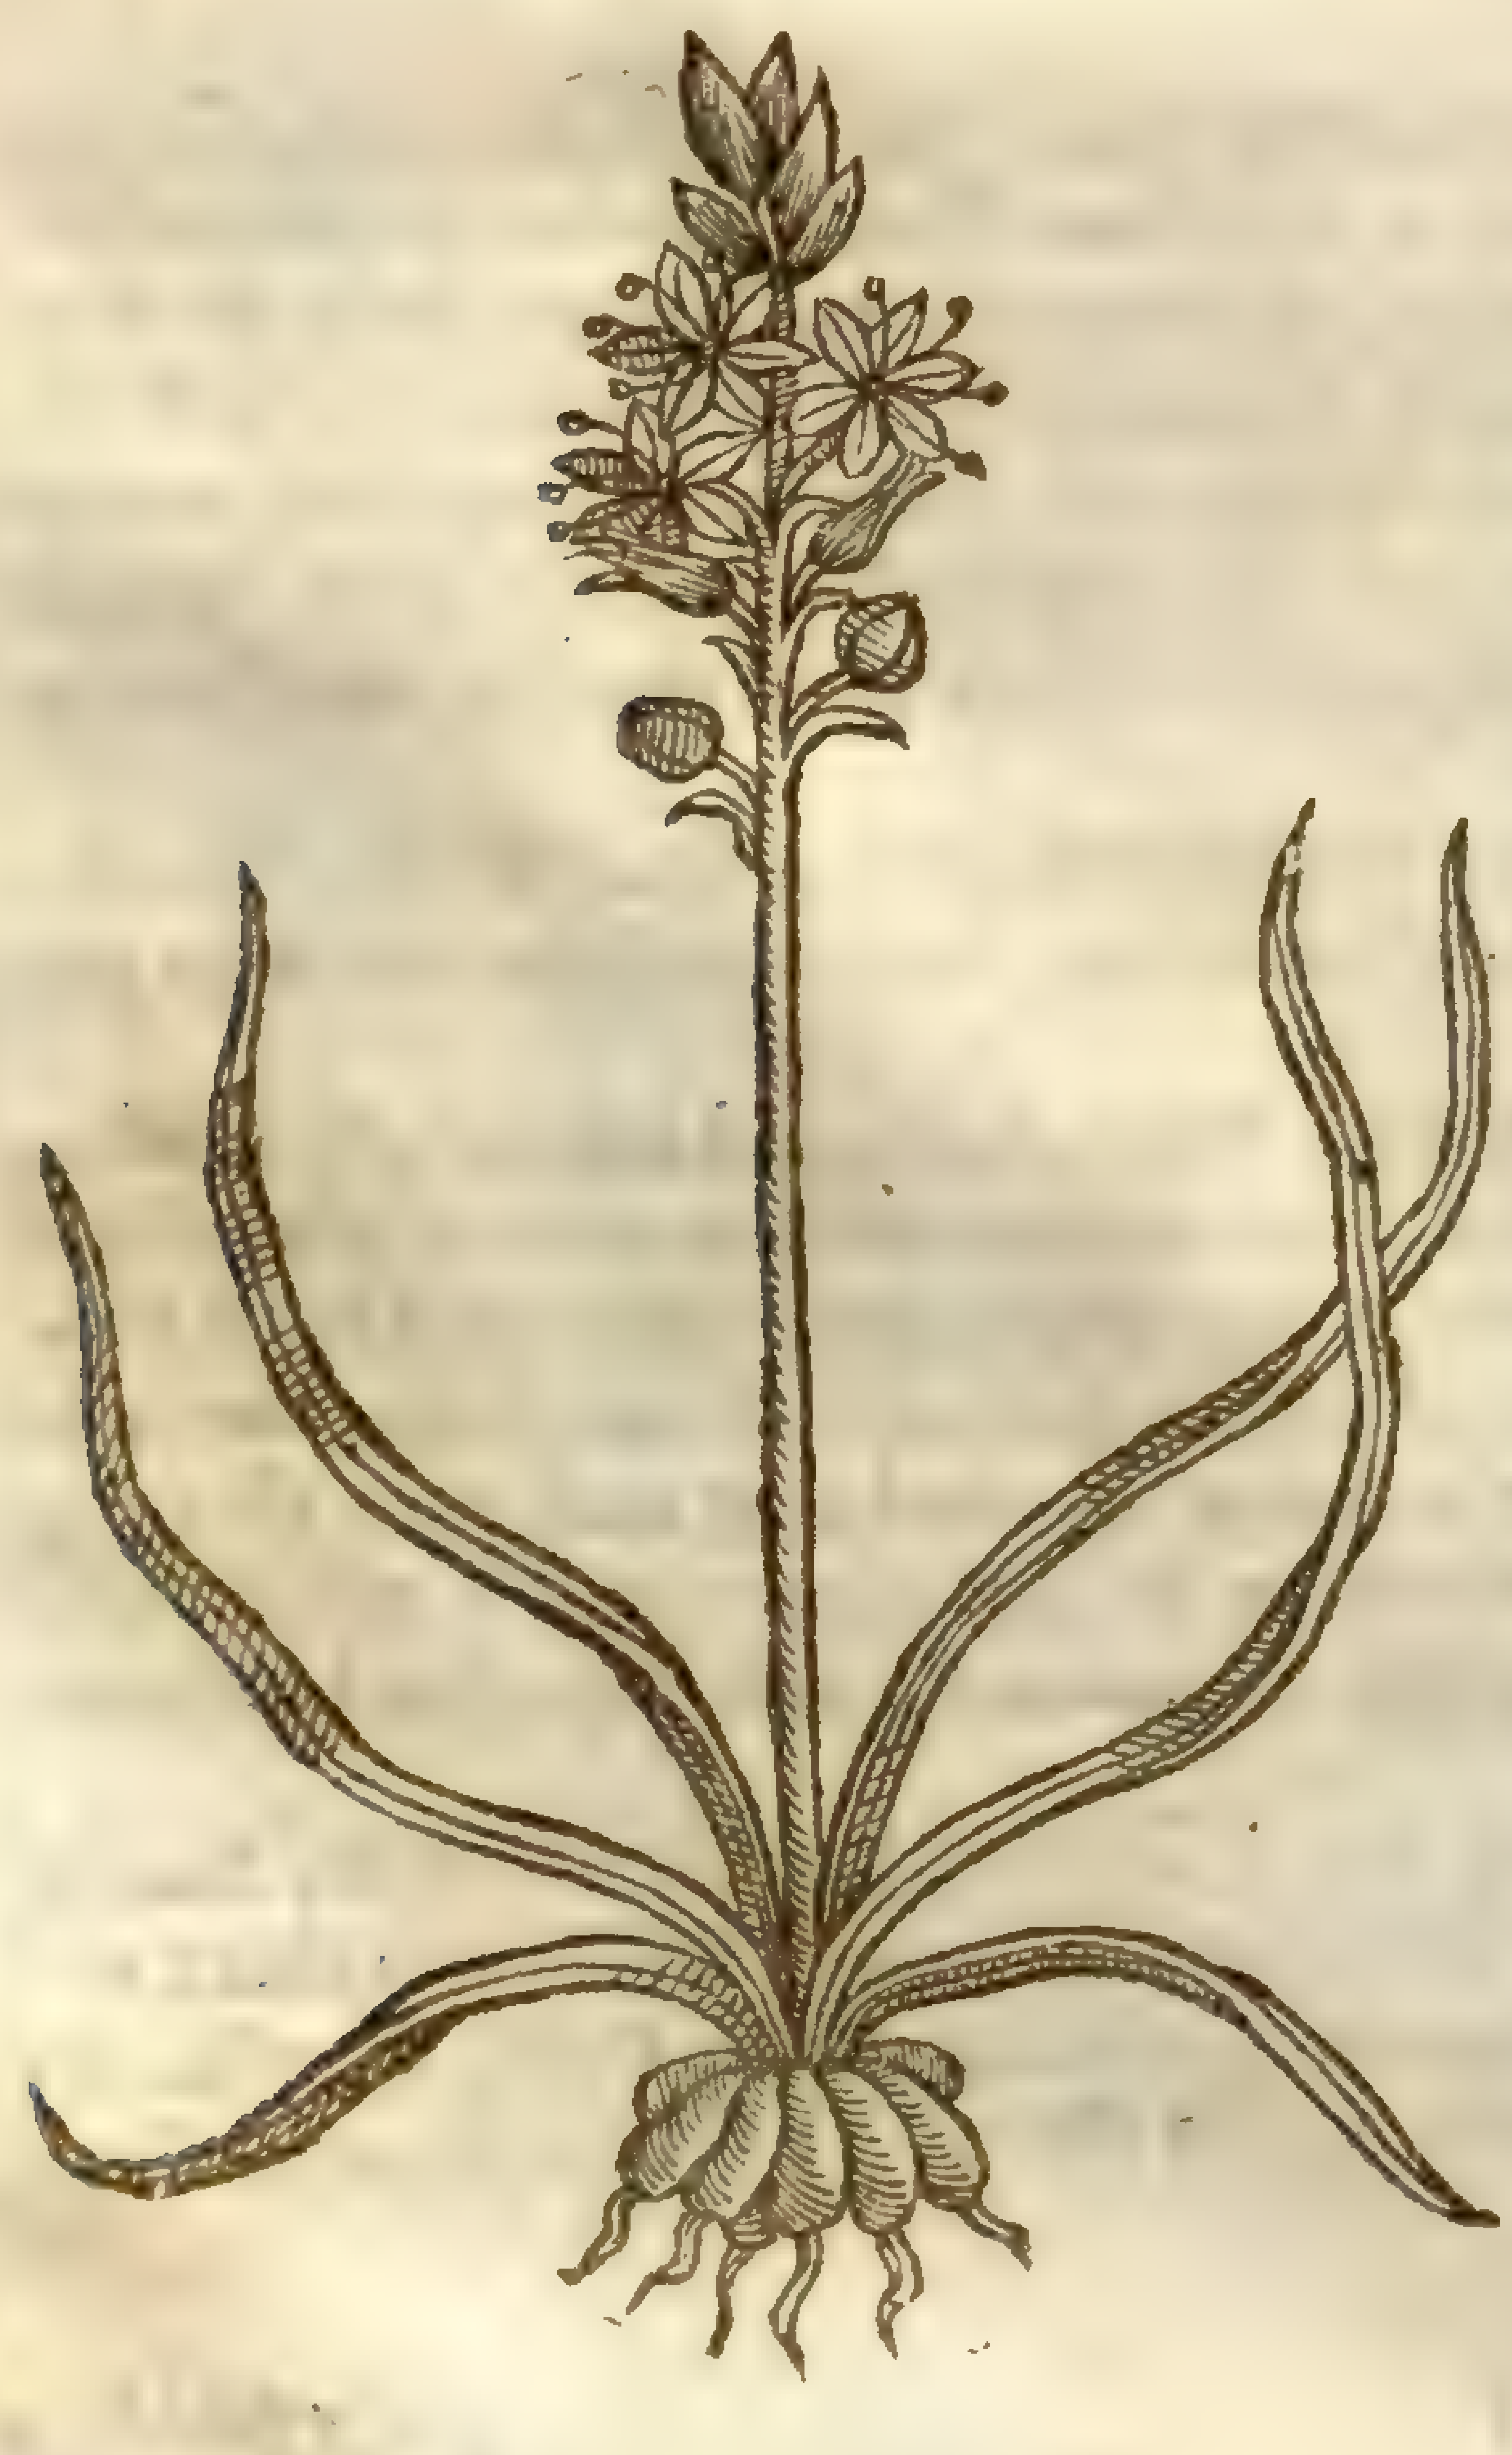


4 *Aſphodelus luteus.*
Yellow Aſphodill.

[illegible]



‡ 5 *Aſphodelus minimus.* Dwarfe Aſphodill.



‡ 5 Beſides theſe, there is an Aſphodill which *Cluſius* for the ſmalneſſe cals *Aſphodelus minimus*. The roots thereof are knotty & tuberous, reſembling thoſe of the laſt deſcribed, but leſſe: from theſe ariſe fiue or ſix very narrow and long leaues; in the middeſt of which grows vp a ſtalk of the height of a foot, round and without branches, bearing at the top therof a ſpoke of floures, conſiſting of ſix white leaues apiece, each of which hath a ſtreak running alongſt it, both on the inſide and outſide like as the firſt deſcribed. It floures in the beginning of Iuly, when as the reſt are paſt their floures. It loſeth the leaues in winter, and gets new ones again in the beginning of Aprill. ‡

¶ *The Time and Place.*

They floure in May and Iune, beginning below and ſo flouring vpward: and they grow naturally in France, Italy, Spaine, and moſt of them in our London gardens.

¶ *The Names.*

Aſphodill is called in Latine, *Aſphodelus*, *Albucum*, *Albucus*, and *Haſtulus regia*: in Greek, ἀσφόδελος: in Engliſh, Aſphodil, not daffodil, for Daffodill is *Narciſſus*, another plant differing from Aſphodill. *Pliny* writeth, That the ſtalk with the floures is called *Anthericos*: and the root, that is to ſay the bulbe, *Aſphodelus*.

Of this Aſphodill *Heſiod* maketh mention in his Works, where he ſaith, That fooles know not how much good there is in the Mallow and in the Aſphodill; becauſe the roots of Aſphodill are good to be eaten. Yet *Galen* doth not beleeue that he meant of this Aſphodill, but of that bulbed one, whereof we will make mention hereafter. And he himſelfe teſtifieth, That the bulbes thereof are not to be eaten without very long ſeething: and therefore it is not likely that *Heſiod* hath commended any ſuch; for he ſeemeth to vnderſtand by the Mallow and the Aſphodill, ſuch kinde of food as is eaſily prepared, and ſoone made readie.

¶ *The Nature.*

Theſe kindes of Aſphodils be hot and dry almoſt in the third degree.

¶ *The Vertues.*

After the opinion of *Dioſcorides* and *Aetius*, the roots of Aſphodill eaten prouoke vrine and the termes effectually, eſpecially being ſtamped and ſtrained with wine, and drunke. A

One dram thereof taken in wine in manner before rehearſed, helpeth the pain in the ſides, ruptures, convulſions, and the old cough. B

The roots boiled in dregs of Wine cure foule eating vlcers, all inflammations of the dugges or ſtones, and eaſe the fellon being put thereto as a pulteſſe. C

The juice of the root boiled in old ſweet Wine, together with a little myrrh and ſaffron, makes an excellent Collyrie profitable for the eyes. D

Galen ſaith, the roots burnt to aſhes, and mixed with the greaſe of a Ducke, help the *Alopecia*, and bring haire againe that was fallen by that diſeaſe. E

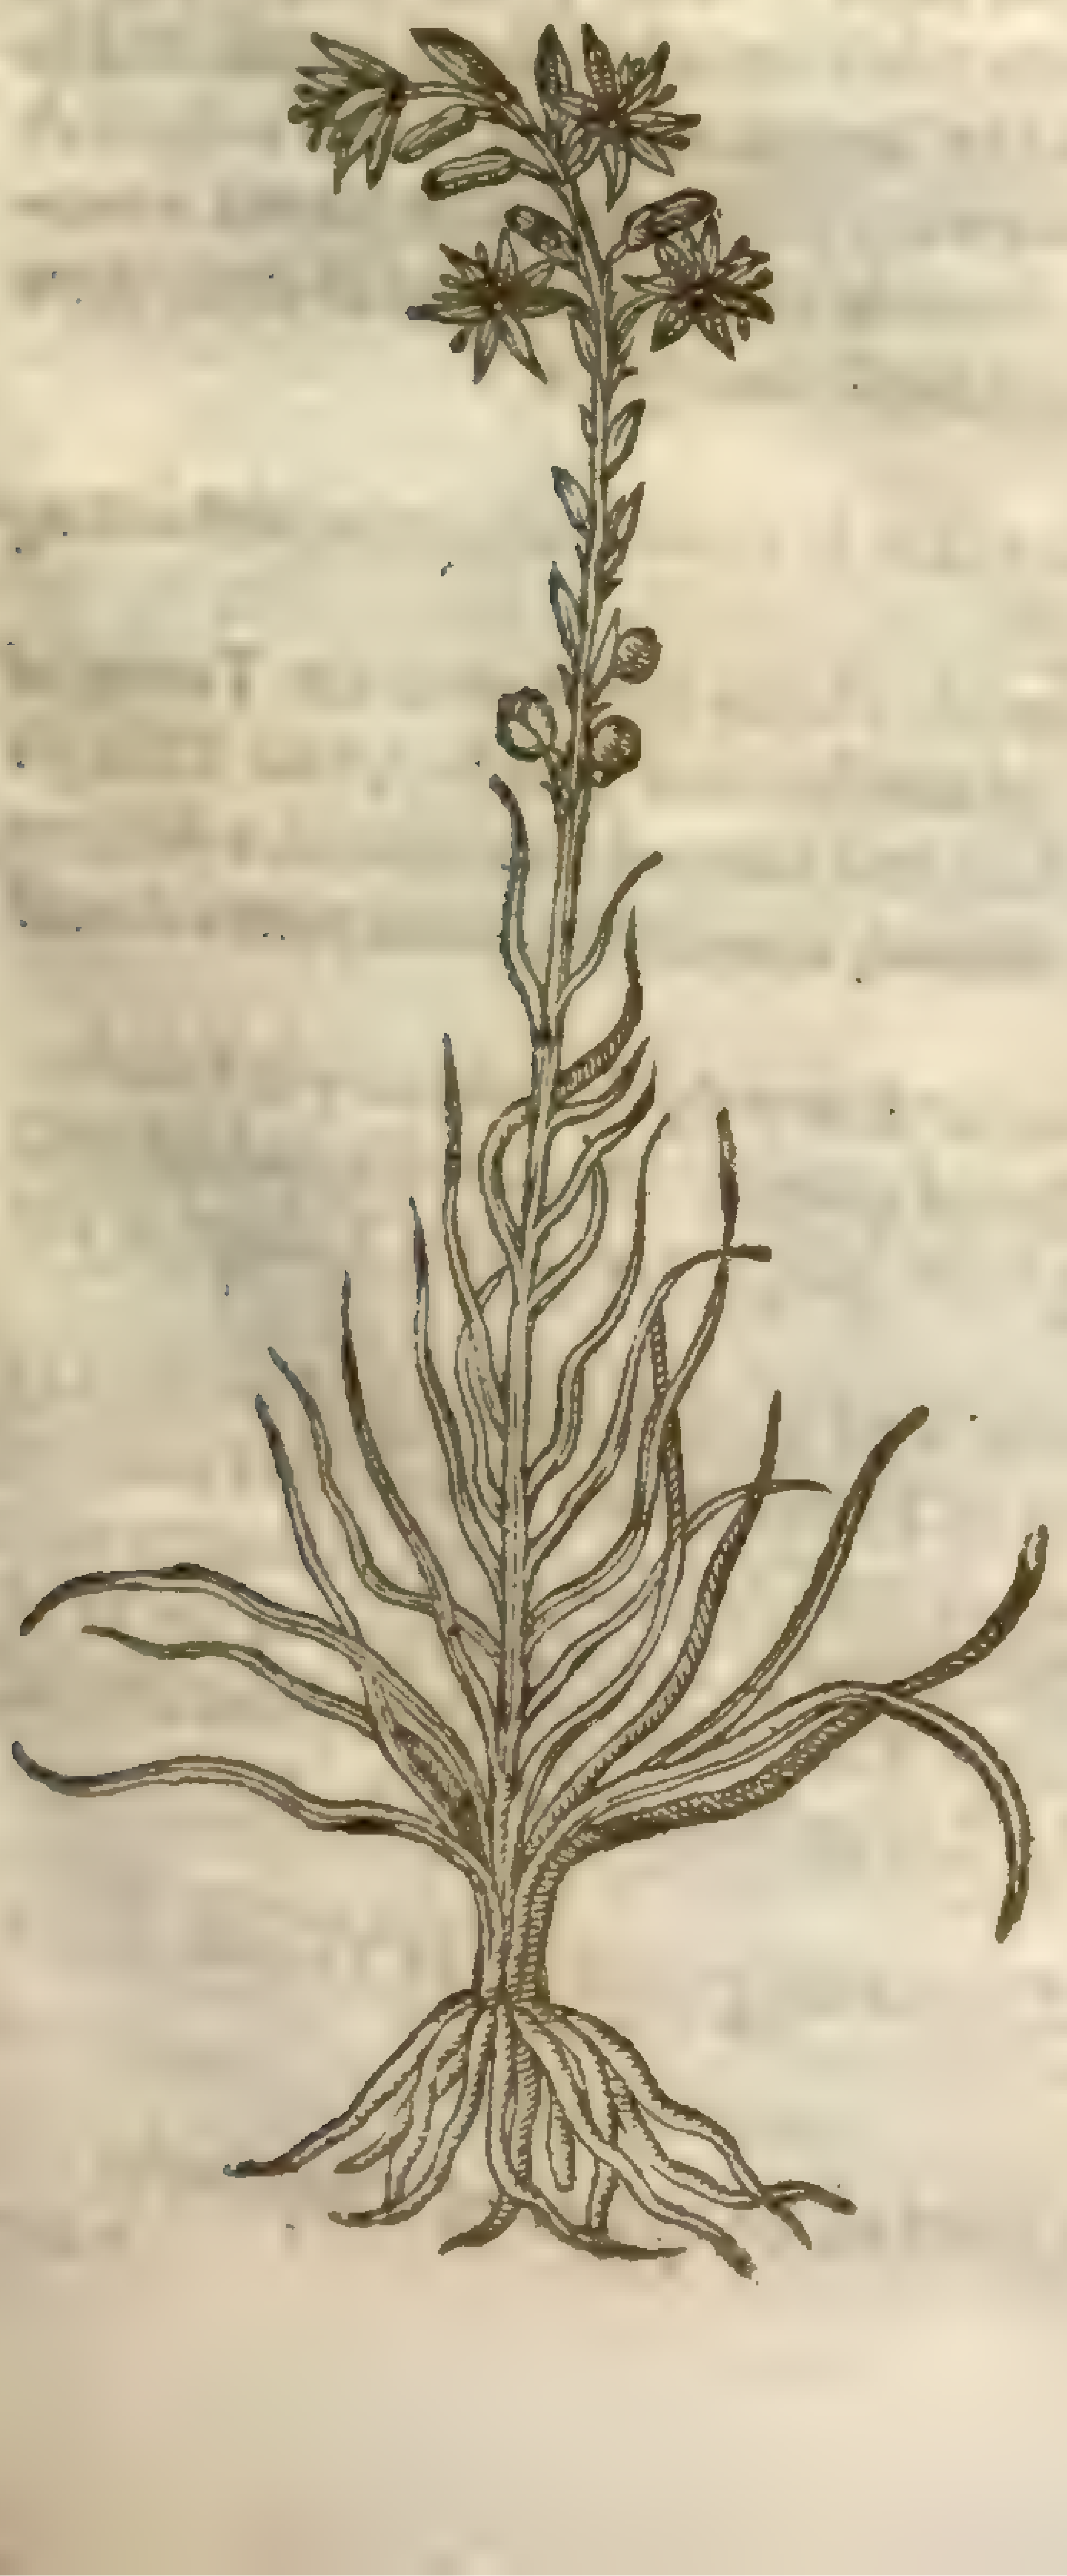
The weight of a dram thereof taken with wine, helpeth the drawing together of ſinues, cramps, and burſtings. F

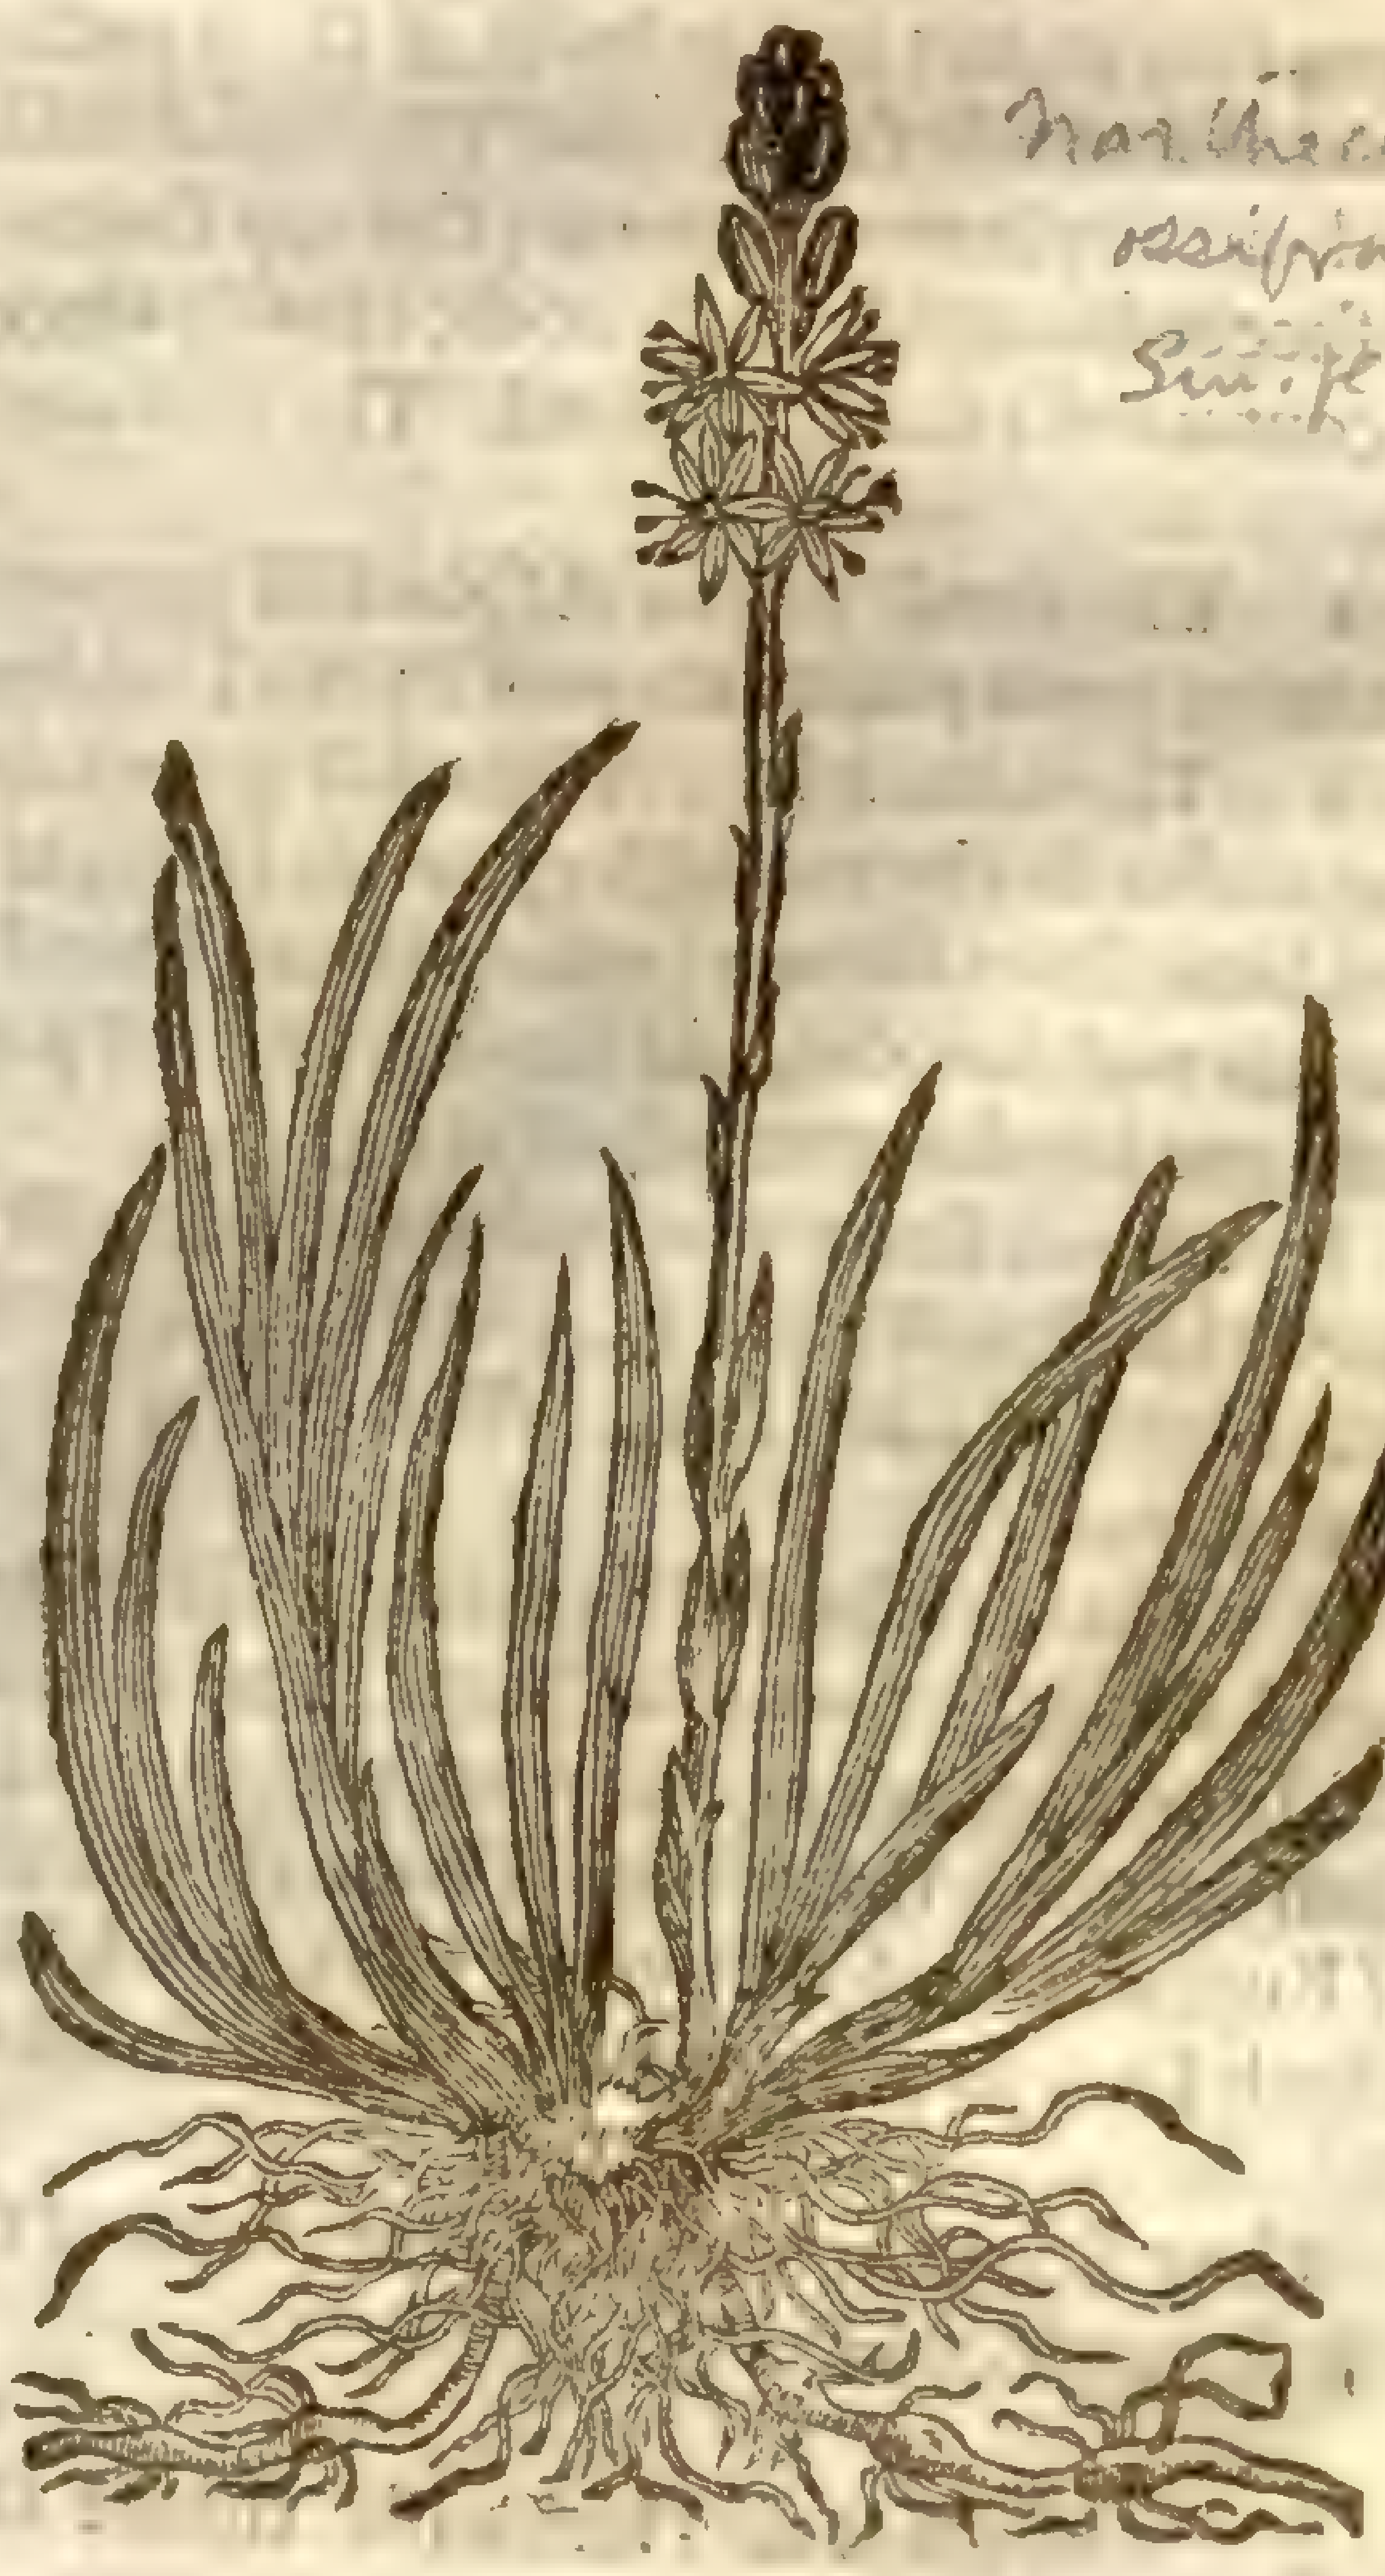
The like quantitie taken in broth prouoketh vomit, and helpeth thoſe that are bitten with any venomous beaſts. G

The iuice of the root cleanſeth and taketh away the white morphew, if the face be annointed therewith; but firſt the place muſt be chafed and well rubbed with a courſe linnen cloth.

Chap. 71. *Of the Kings Speare.*

1 *Aſphodelus luteus minor.* The Kings Speare. 2 *Aſphodelus Lancaſtriæ.* Lancaſhire Aſphodil. H

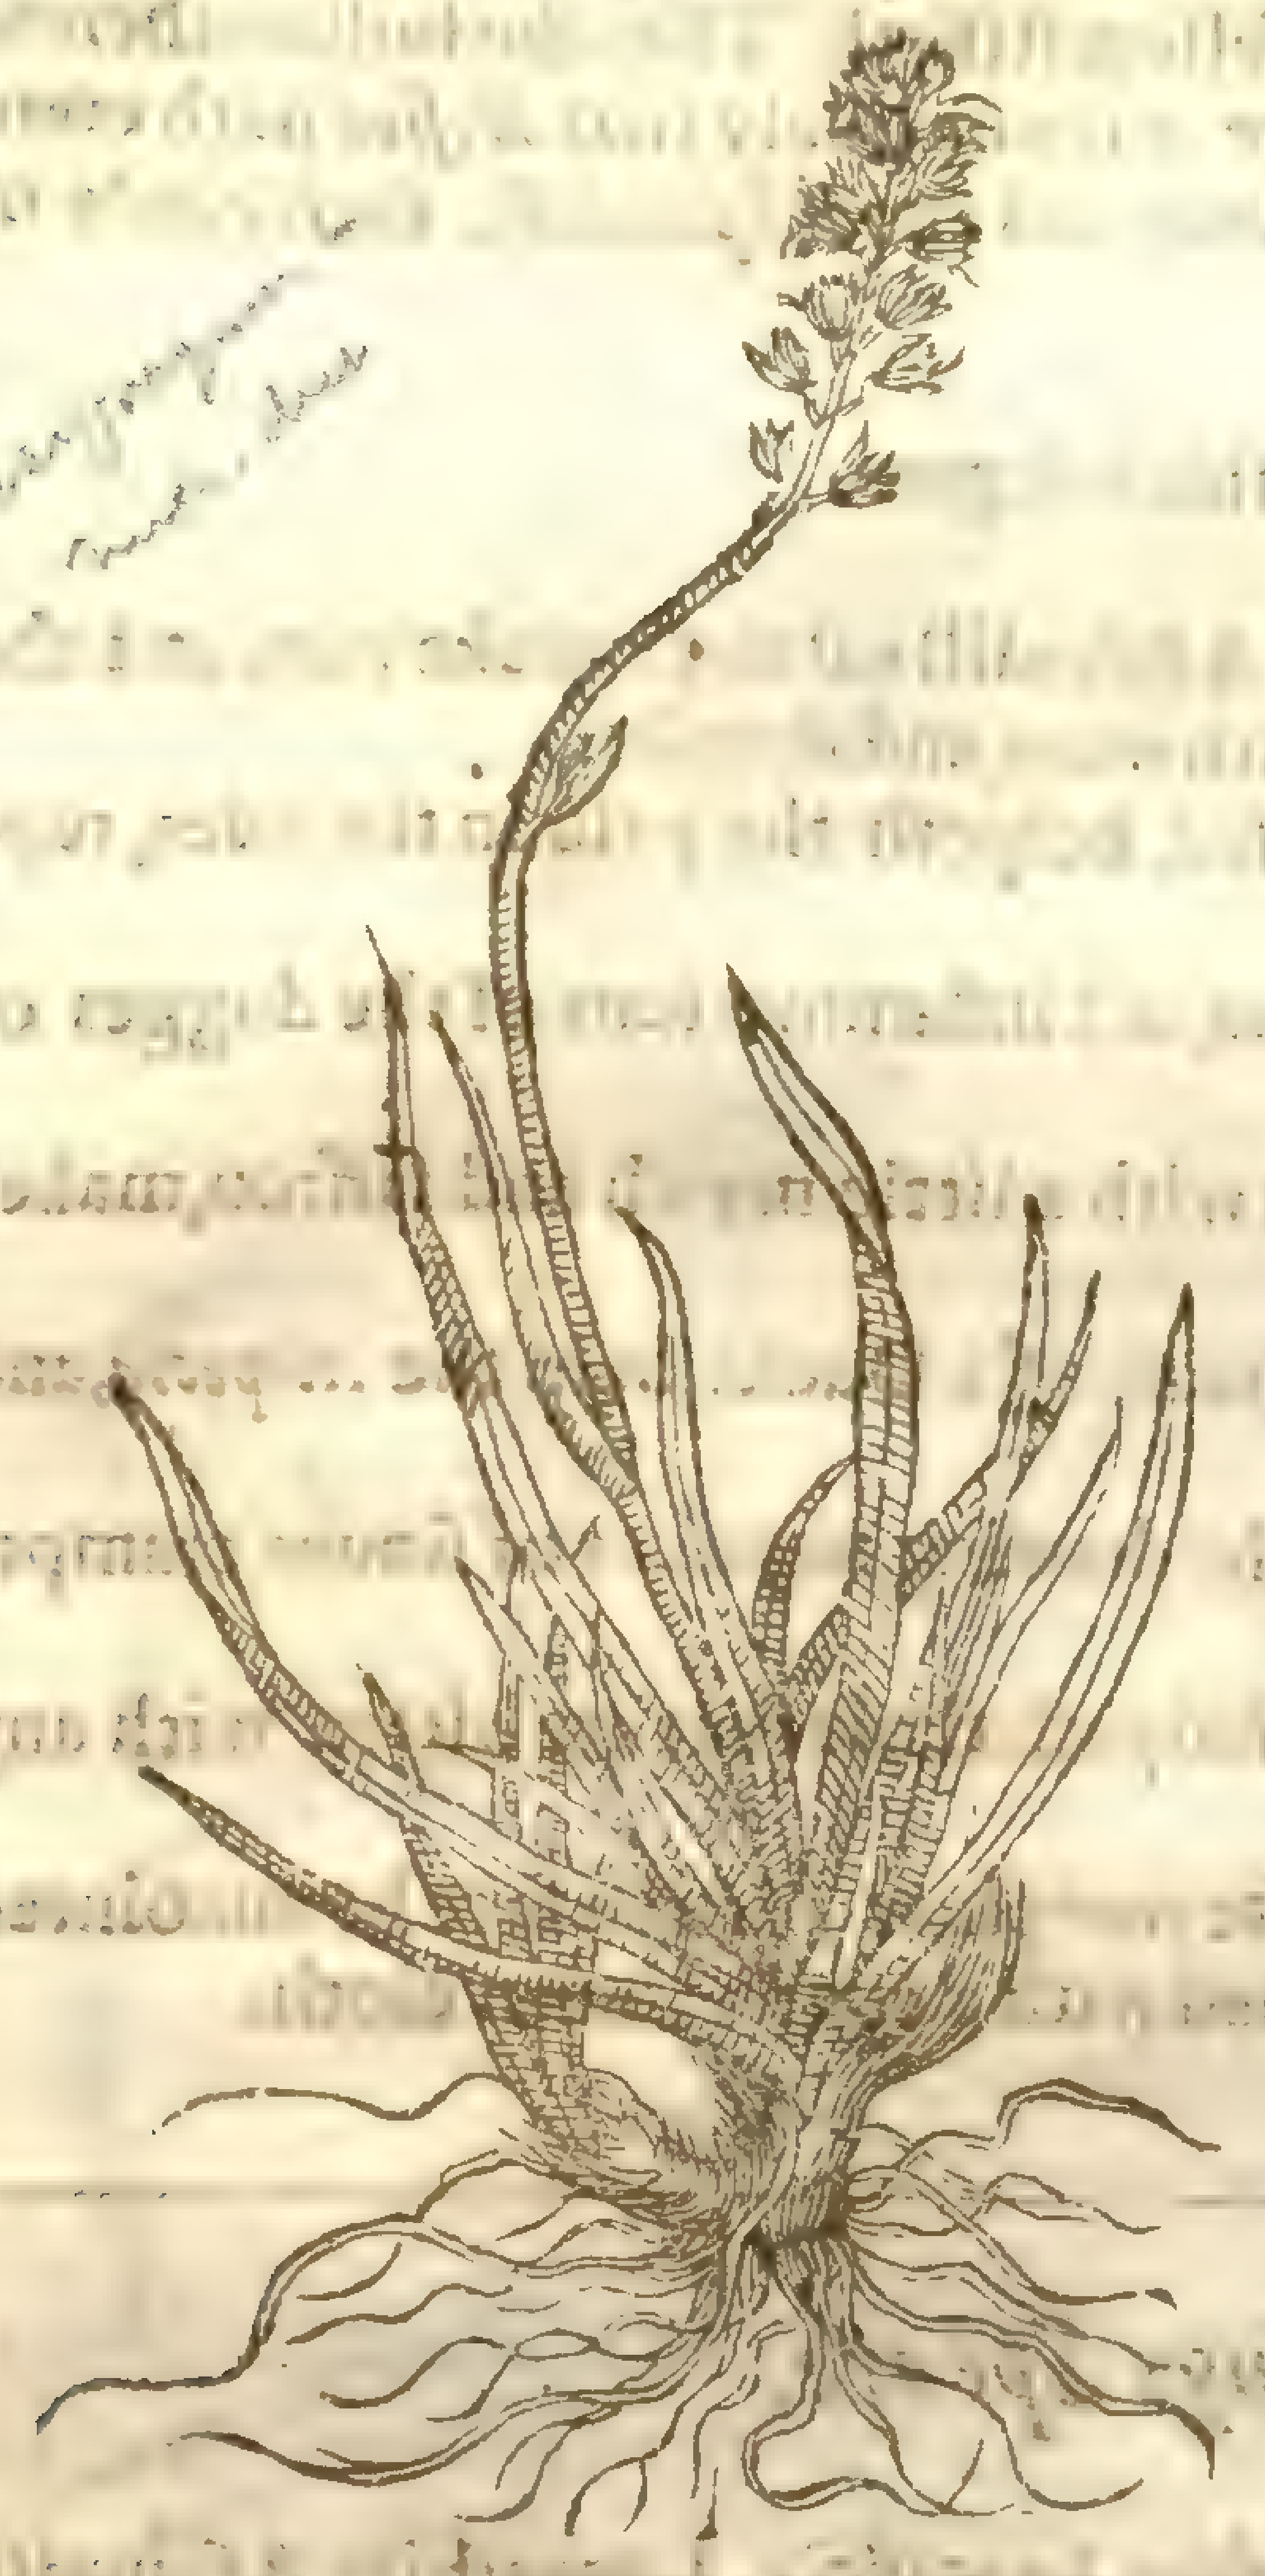




Narthecium ossifragum, Huds. Sm. Fl. 2. 151

Eng. Bot. tab. 535

1 3 *Aſphodelus Lancaſtriæ verus.*
The true Lancaſhire Aſphodill.



Anthericum ossifragum [illegible]

¶ *The Deſcription.*

1 The leaues of the Kings Speare are long, narrow, and chamfered or furrowed, of a blewiſh greene colour. The ſtalke is round, of a cubit high. The floures which grow thereon from the middle to the top are very many, in ſhape like to the floures of the other; which being paſt, there come in place therof little round heads or ſeed-veſſels, wherein the ſeed is contained. The roots in like manner are very many, long, and ſlender, ſmaller than thoſe of the other yellow ſort. Vpon the ſides whereof grow forth certaine ſtrings, by which the plant it ſelfe is eaſily encreaſed and multiplied.

2 There is found in theſe daies a certaine waterie or mariſh Aſphodill like vnto this laſt deſcribed, in ſtalkes and floures, without any difference at all. It bringeth forth leaues of a beautifull greene ſomwhat chamfered, like to thoſe of the floure de-luces, or corne-flag, but narrower, not full a ſpan long. The ſtalke is ſtraight, a foot high, whereupon grow the floures, conſiſting of ſix ſmall leaues: in the middle whereof come forth ſmall yellow chiues or threds. The ſeed is very ſmall, contained in long ſharpe pointed cods. The root is long, joynted, and creepeth as graſſe doth, with many ſmall ſtrings.

‡ 2 Beſides the laſt deſcribed (which our Author I feare miſtaking, termed *Aſphodelus Lancaſtriæ*) there is another water Aſphodill, which growes in many rotten mooriſh grounds in this kingdome, and in Lancaſhire is vſed by women to die their haire of a yellowiſh colour, and therefore by them it is tearmed Maiden-haire, (if we may beleeue *Lobel.*) This plant hath leaues of ſome two inches and an halfe, or three inches long, being ſomewhat broad at the bottome, and ſo ſharper towards their ends. The ſtalke ſeldome attaines to the height of a foot, and it is ſmooth without any leaues thereon; the top thereof is adorned with pretty yellow ſtar-like floures, whereto ſucceed longiſh little cods, vſually three, yet ſometimes foure or fiue ſquare, and in theſe there is contained a ſmall red ſeed. The root conſiſts onely of a few ſmall ſtrings. ‡

¶ *The Place.*

1 The ſmall yellow Aſphodill groweth not of it ſelfe wilde in theſe parts, notwithſtanding we haue great plenty thereof in our London gardens.

2 The Lancaſhire Aſphodill groweth in moiſt and mariſh places neere vnto the Towne of Lancaſter, in the mooriſh grounds there, as alſo neere vnto Maudſley and Mattom, two Villages not farre from thence; where it was found by a Worſhipfull and learned Gentleman, a diligent ſearcher of ſimples, and feruent louer of plants, Mr. *Thomas Hesket*, who brought the plants thereof vnto me for the encreaſe of my garden.

I receiued ſome plants thereof likewiſe from Maſter *Thomas Edwards*, Apothecary in Exceſter, learned and ſkilfull in his profeſſion, as alſo in the knowledge of plants. He found this Aſphodill at the foot of a hill in the Weſt part of England, called Bagſhot hill, neere vnto a Village of the ſame name.

‡ This Aſphodill figured and deſcribed out of *Dodonæus*, and called *Aſphodelus Lancaſtriæ* by our Author, growes in an heath ſome two miles from Bruges in Flanders, and diuers other places of the Low-countries; but whether it grow in Lancaſhire or no, I can ſay nothing of certaintie: but I am certaine, that which I haue deſcribed in the third place growes in many places of the Weſt of England; and this yeare 1632, my kinde friend Mr. *George Bowles* ſent me ſome plant thereof, which I keepe yet growing. *Lobel* alſo affirmes this to be the Lancaſhire Aſphodill. ‡

¶ *The Time.*

They floure in May and Iune: moſt of the leaues thereof remaine greene in the Winter, if it be not extreme cold.

¶ *The Names.*

Some of the later Herbariſts thinke this yellow Aſphodill to be *Iphyon* of *Theophraſtus*, and others iudge it to be *Erizambac* of the Arabians. In Latine it is called *Aſphodelus luteus*: of ſome it is called *Haſtula Regia*. We haue Engliſhed it, the Speare for a King, or ſmall yellow Aſphodill.

2 The Lancaſhire Aſphodill is called in Latine, *Aſphodelus Lancaſtriæ*: and may likewiſe be called *Aſphodelus paluſtris*, or *Pſeudoaſphodelus luteus*, or Baſtard yellow Aſphodill.

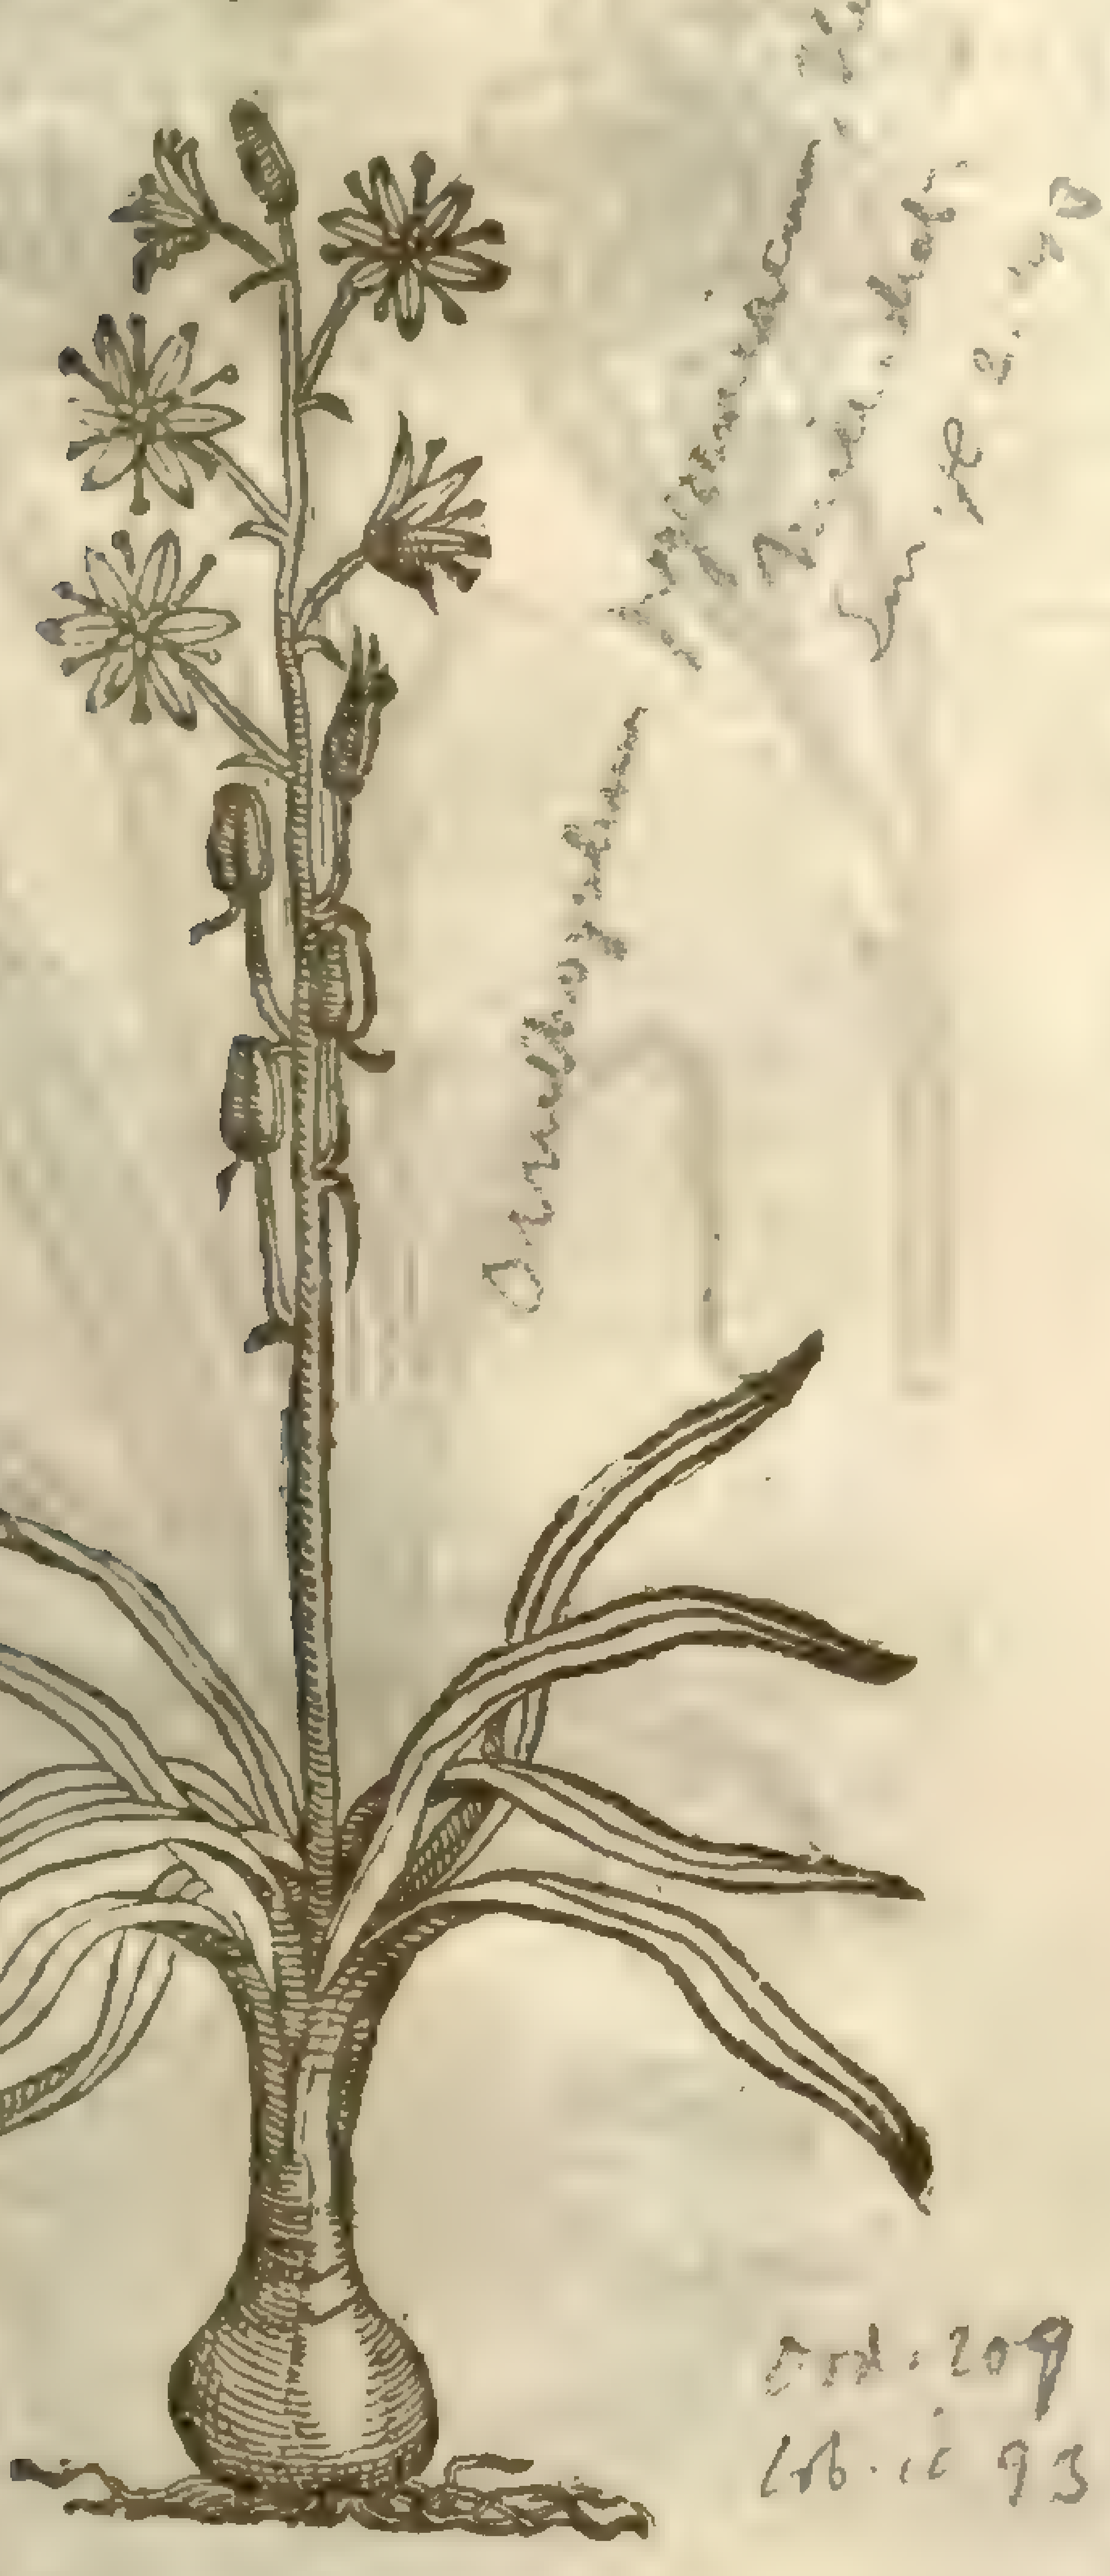
‡ 3 This is *Aſphodelus minimus luteus paluſtris Scoticus & Lancaſtrienſis*, of *Lobel*, and the *Pſeudoaſphodelus pumilio folijs Iridis*, of *Cluſius*, as farre as I can iudge; althouh *Bauhine* diſtinguiſheth them. ‡

¶ *The Temperature and Vertues.*

It is not yet found out what vſe there is of any of them in nouriſhment or medicines.

Chap. 72. *Of Onion Aſphodill.*

Aſphodelus Bulboſus.
Onion Aſphodill.



Ornithogalum [illegible]

Ord: 209
Lib. ic 93

¶ *The Deſcription.*

THe bulbed Aſphodil hath a round bulbous or Onion root, with ſome fibres hanging thereat; from the which come vp many graſſie leaues, very well reſembling the Leeke, among the which leaues there riſeth vp a naked or ſmooth ſtem, garniſhed toward the top with many ſtar-like floures, of a whitiſh greene on the inſide, and wholly greene without, conſiſting of ſix little leaues ſharpe pointed, with certaine chiues or threads in the middle. After the floure is paſt there ſucceedeth a ſmall knop or head three ſquare, wherein lieth the ſeed.

¶ *The Place.*

It groweth in the gardens of Herbariſts in London, and not elſe where that I know of, for it is not very common.

¶ *The Time.*

It floureth in Iune and Iuly, and ſomewhat after.

¶ *The Names.*

The ſtalke and floures being like to thoſe of the Aſphodill before mentioned, do ſhew it to be *Aſphodeli ſpecies*, or a kinde of Aſphodill; for which cauſe alſo it ſeemeth to be that Aſphodil of which *Galen* hath made mention in the ſecond book of the Faculties of nouriſhments, in theſe words; The root of Aſphodill is in a manner like to the root of Squill, or Sea Onion, as well in ſhape as bitternes. Notwithſtanding, ſaith *Galen*, my ſelfe haue known certeine countrymen, who in time of famine could not with many boilings and ſteepings make it fit to be eaten. It is called of *Dodonæus*, *Aſphodelus fæmina*, and *Aſphodelus Bulboſus*, *Hyacintho-Aſphodelus*, and *Aſphodelus Hyacinthinus* by *Lobel*, and that rightly; for that the root is like the Hyacinth, and the floures like the Aſphodill: and therefore as it doth participate of both kindes, ſo likewiſe doth the name: in Engliſh we may call it, Bulbed Aſphodill. *Cluſius* calls it *Ornithogalum majus*, and that fitly.

¶ *The Nature.*

The round rooted Aſphodill, according to *Galen*, hath the ſame temperature and vertue that *Aron*, *Ariſarum*, and *Dracontium* haue, namely an abſterſiue and cleanſing quality.

¶ *The Vertues.*

The yong ſprouts or ſprings thereof are a ſingular medicine againſt the yellow Iaundiſe, for that the root is of power to make thin and open. A

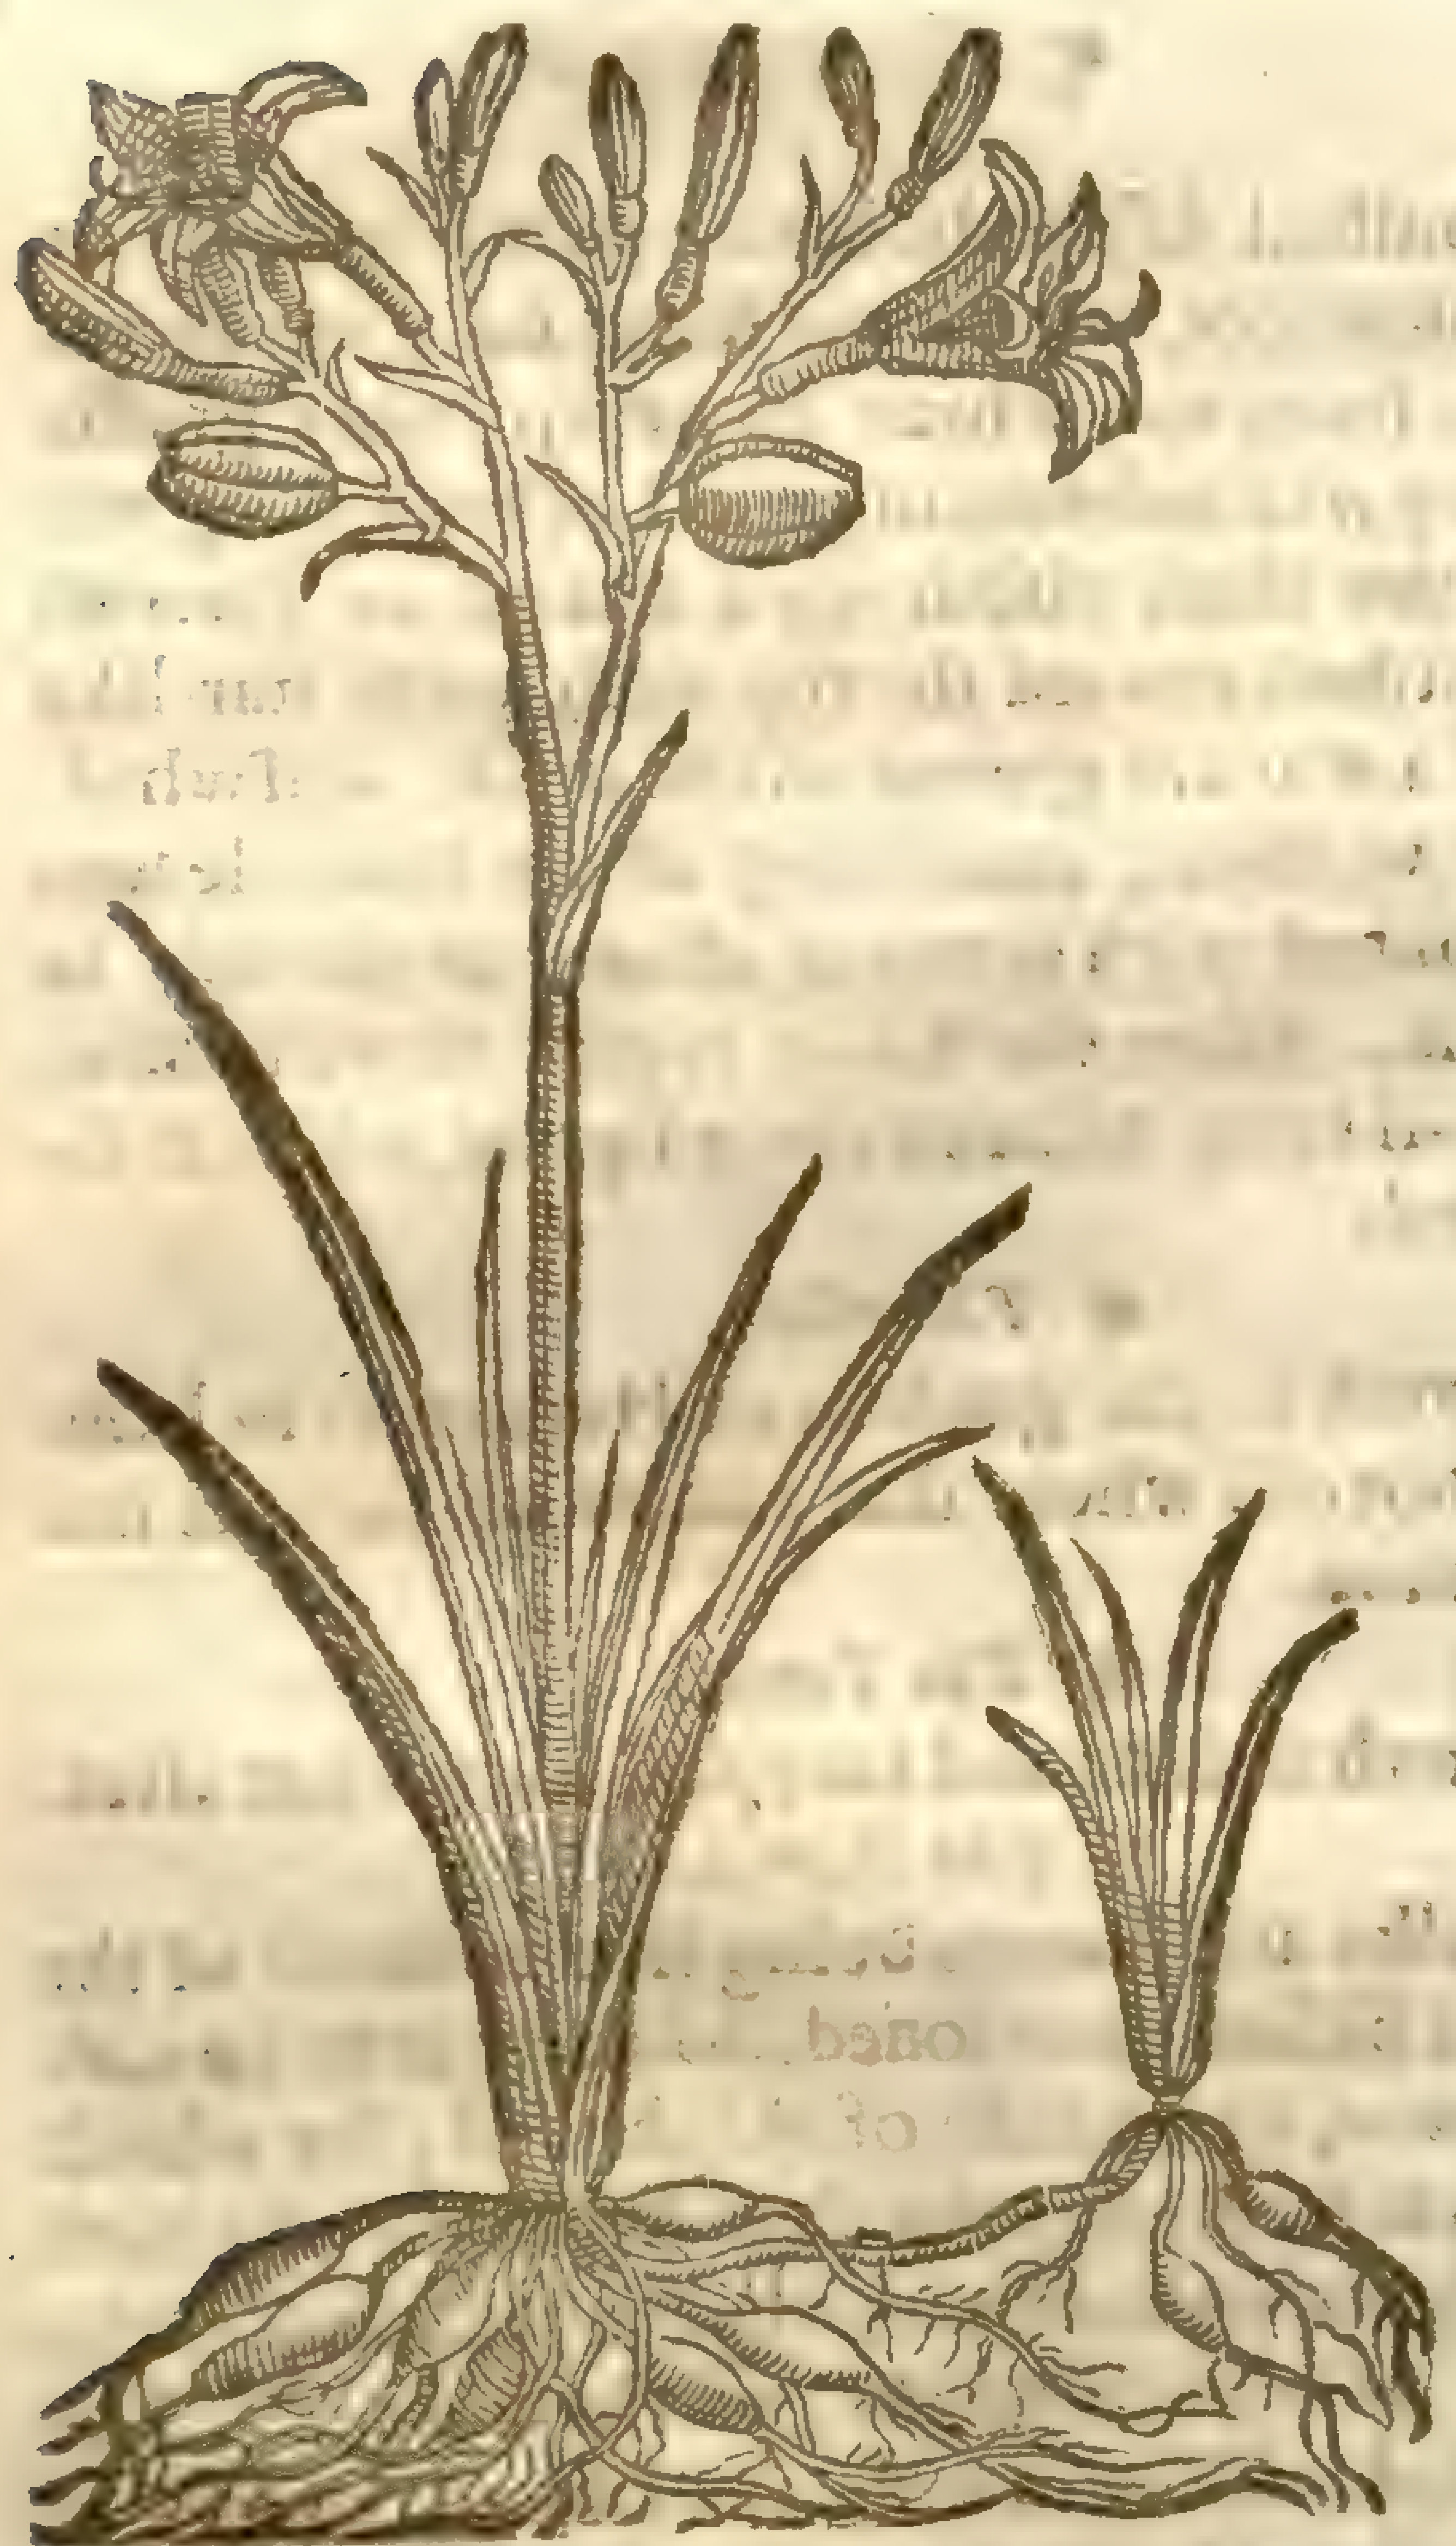
Galen ſaith, that the aſhes of this Bulbe mixed with oile or hens greaſe cure the falling of the haire in an *Alopecia* or ſcalld head. B

CHAP. 73. *Of Yellow Lillie.*

¶ *The Kindes.*

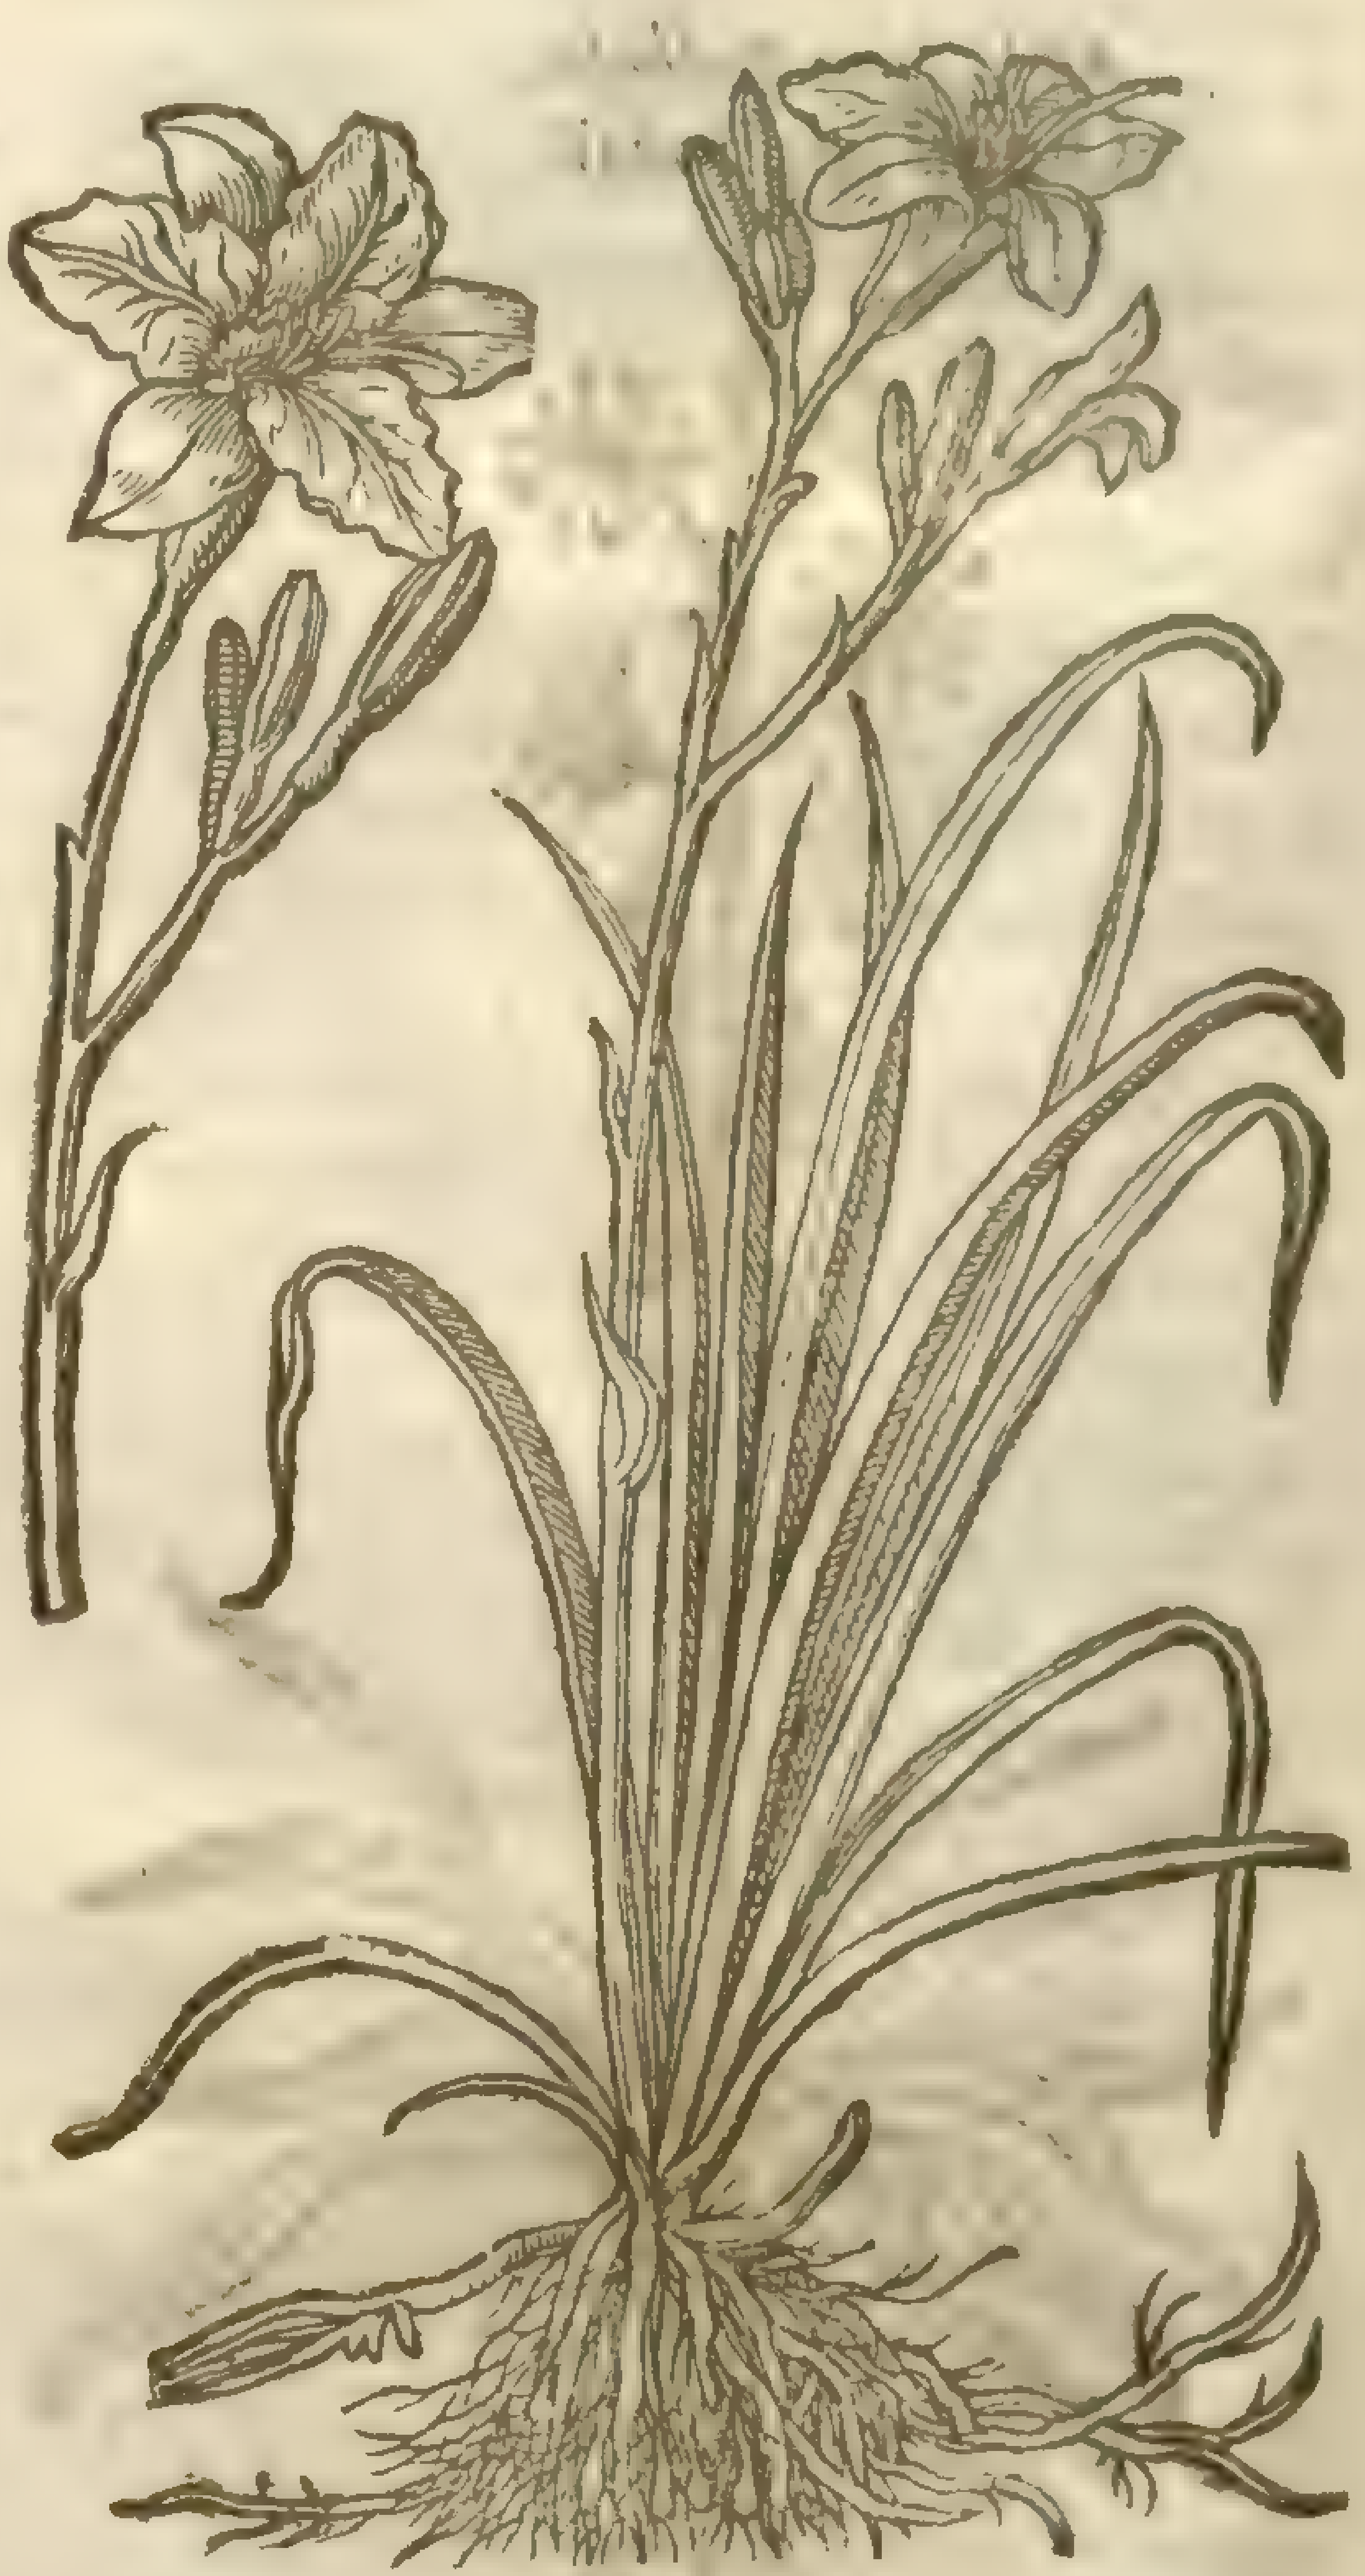
BEcauſe we ſhall haue occaſion hereafter to ſpeake of certaine Cloued or Bulbed Lillies, wee will in this chapter entreat onely of another kinde not bulbed, which likewiſe is of two ſorts, differing principally in their roots: for in floures they are Lillies, but in roots Aſphodils, participating as it were of both, though neerer approching vnto Aſphodils than Lillies.

1 *Lilium non bulboſum.*
The yellow Lillie.



Hemerocallis flava [illegible]

2 *Lilium non bulboſum Phœniceum.*
The Day-Lillie.



Hemerocallis fulva [illegible]

¶ *The Deſcription.*

1 THe yellow Lillie hath very long flaggie leaues, chamfered or channelled, hollow in the middeſt like a gutter; among the which riſeth vp a naked or bare ſtalke, two cubits high, branched toward the top, with ſundry brittle armes or branches, whereon do grow many goodly floures like vnto thoſe of the common white Lillie in ſhape and proportion, of a ſhining yellow colour; which being paſt, there ſucceed three cornered huskes or cods, full of blacke ſhining ſeeds like thoſe of the Peonie. The root conſiſteth of many knobs or tuberous clogs, proceeding from one head, like thoſe of the white Aſphodill or Peonie.

2 The Day-Lillie hath ſtalkes and leaues like the former. The floures be like the white Lillie in ſhape, of an Orenge tawny colour: of which floures much might be ſaid which I omit. But in briefe, this plant bringeth forth in the morning his bud, which at noone is full blowne, or ſpred abroad, and the ſame day in the euening it ſhuts it ſelfe, and in a ſhort time after becomes as rotten and ſtinking as if it had beene trodden in a dunghill a moneth together, in foule and rainie weather: which is the cauſe that the ſeed ſeldome followes, as in the other of his kinde, not bringing forth any at all that I could euer obſerue; according to the old prouerbe, Soone ripe, ſoone rotten. His roots are like the former.

¶ *The Place.*

Theſe Lillies do grow in my garden, as alſo in the gardens of Herbariſts, and louers of fine and rare plants; but not wilde in England as in other countries.

¶ *The Time.*

Theſe Lillies do floure ſomewhat before the other Lillies, and the yellow Lillie the ſooneſt.

¶ *The Names.*

Diuers do call this kinde of Lillie, *Liliaſphodelus*, *Liliago*, and alſo *Liliaſtrum*, but moſt commonly *Lilium non bulboſum*: in Engliſh, Liriconſancie and yellow Lillie. The old Herbariſts name it, *Hemerocallis*: for they haue two kinds of *Hemerocallis*; the one a ſhrub or wooddy plant, as witneſſeth *Theophraſtus*, in his ſixth booke of the hiſtory of Plants. *Pliny* ſetteth downe the ſame ſhrub among thoſe plants, the leaues whereof onely do ſerue for garlands.

The other *Hemerocallis* which they ſet downe, is a Floure which periſhes at night, and buddeth at the ſunne riſing, according to *Athenæus*; and therefore it is fitly called ἡμεροκαλλές; that is, Faire or beautifull for a day: and ſo we in Engliſh may rightly tearme it the Day-Lillie, or Lillie for a day.

¶ *The Nature.*

The nature is rather referred to the Aſphodills than to Lillies.

¶ *The Vertues.*

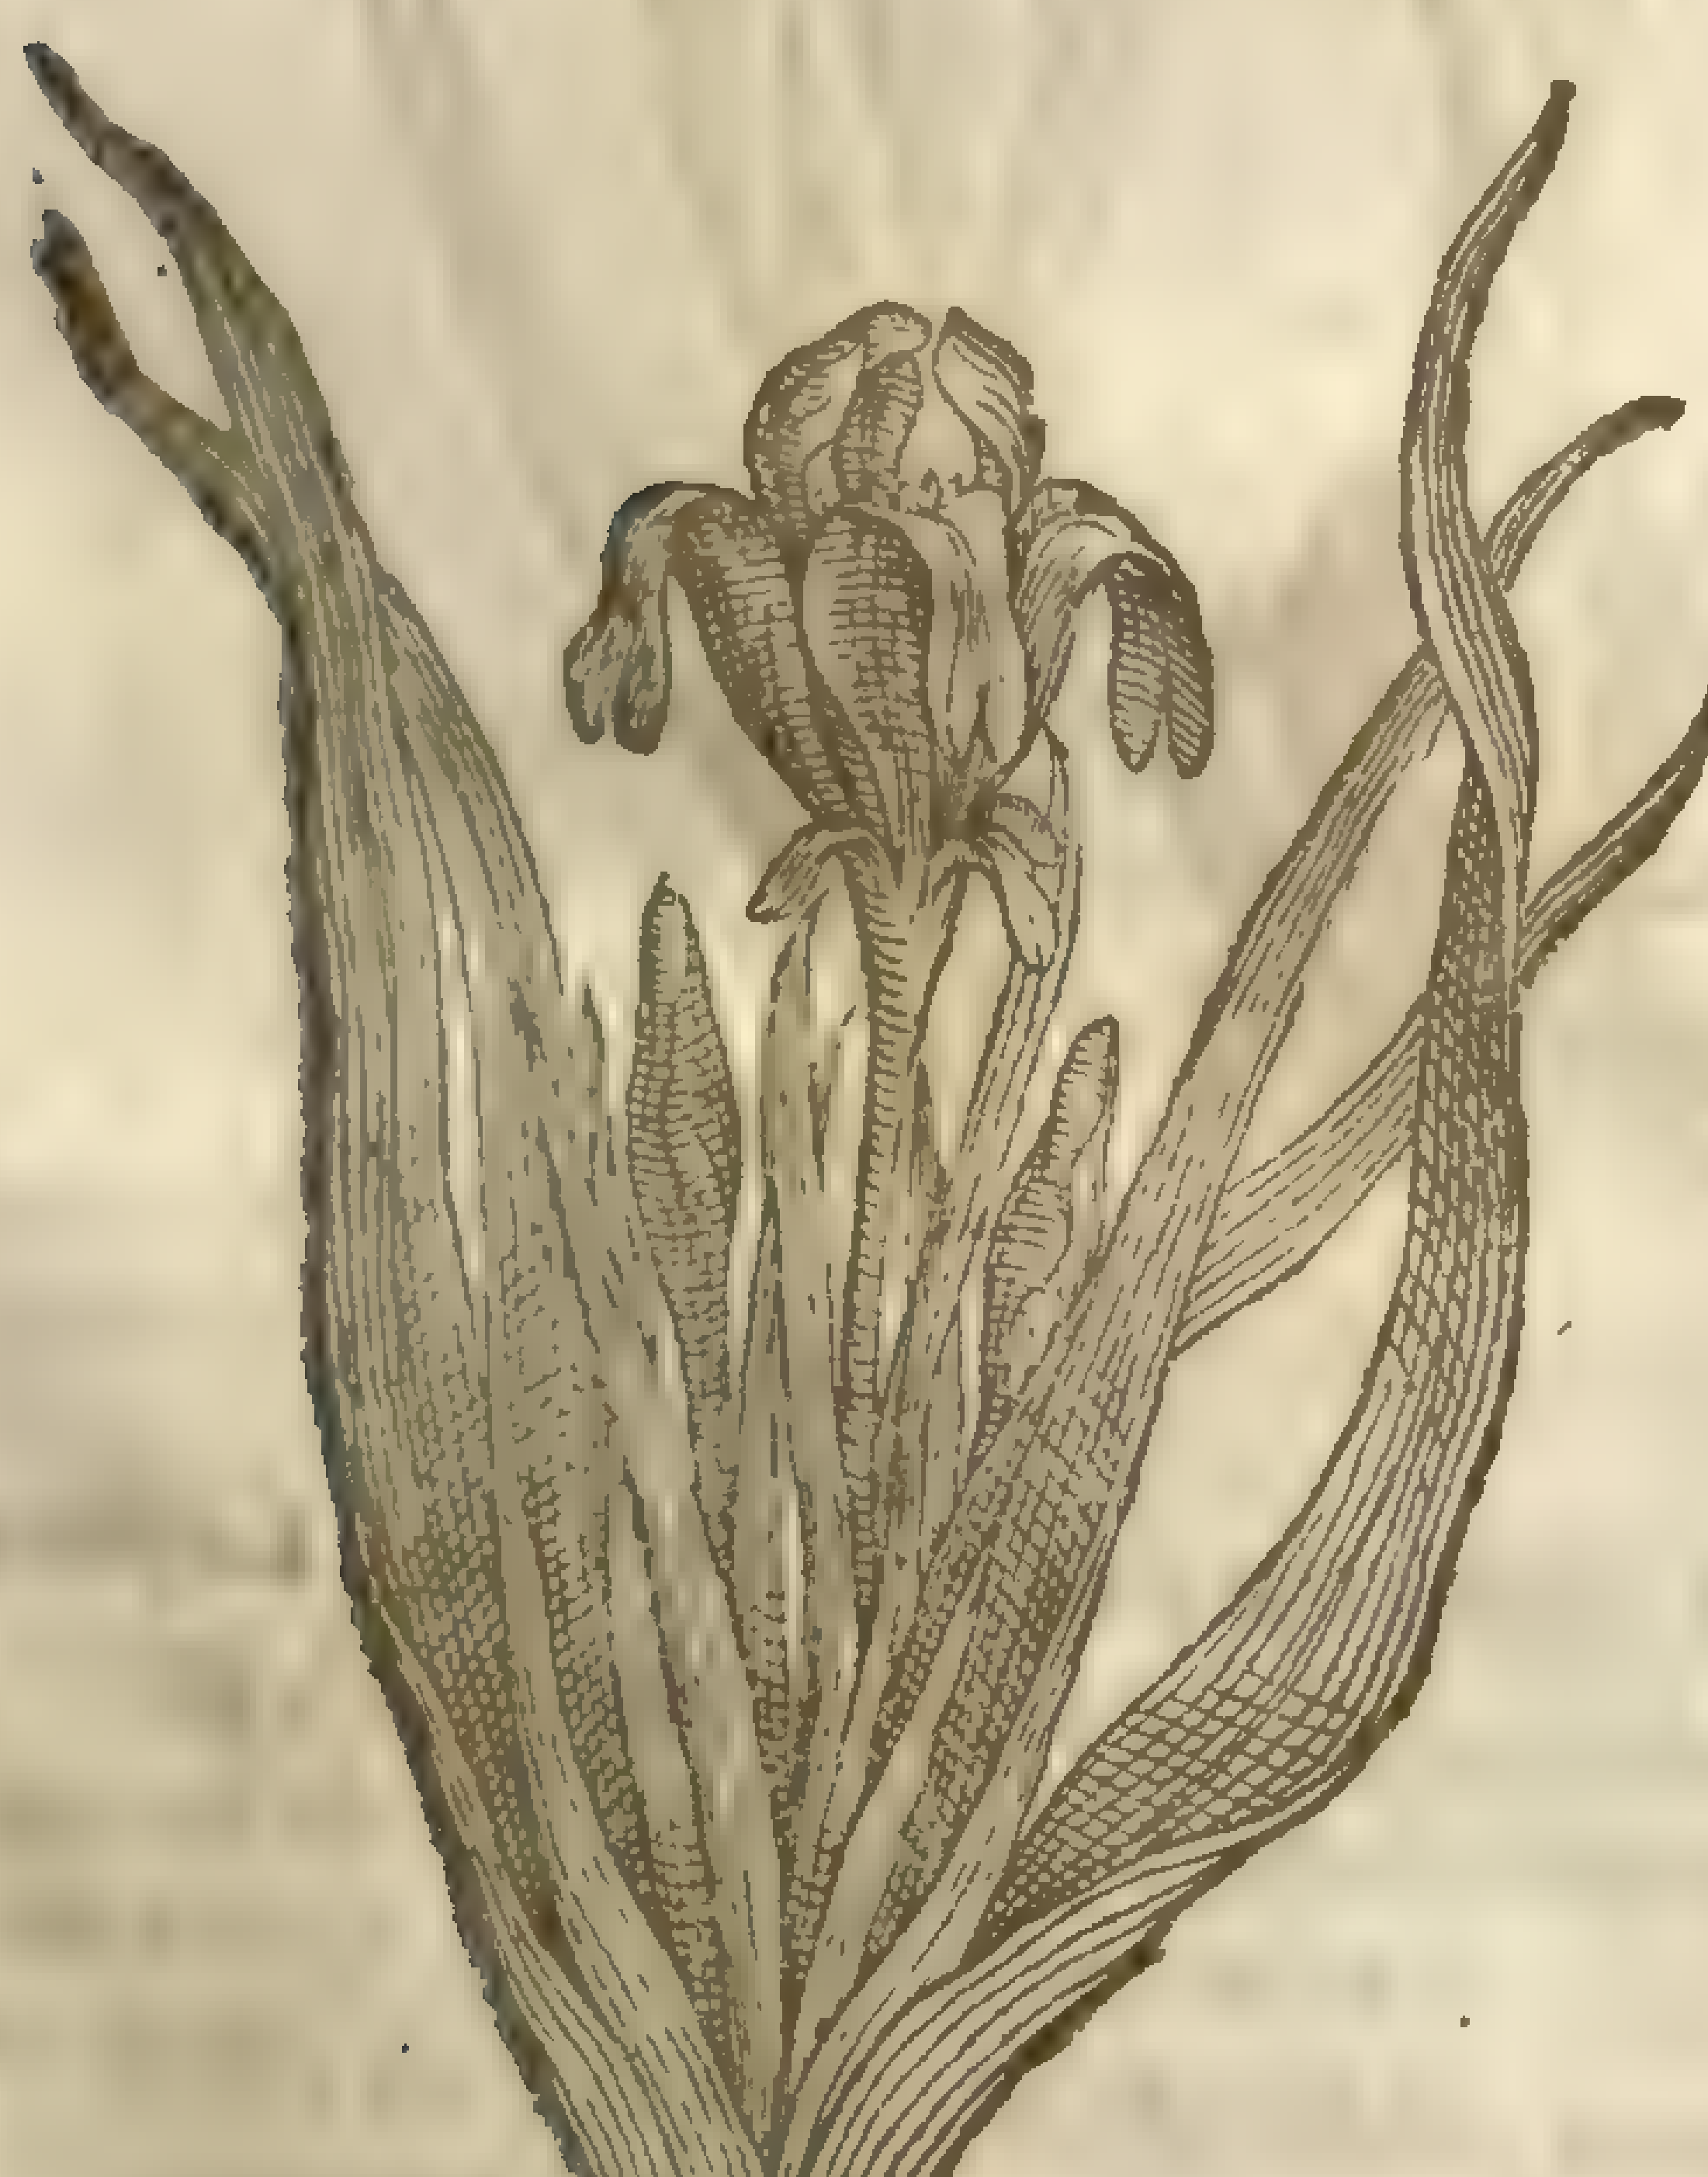
Dioſcorides ſaith, that the root ſtamped with honey, and a mother peſſarie made thereof with wooll, and put vp, bringeth forth water and bloud. A

The leaues ſtamped and applied, allay hot ſwellings in the dugges, after womens trauell in childe-bearing, and likewiſe take away the inflammations of the eies. B

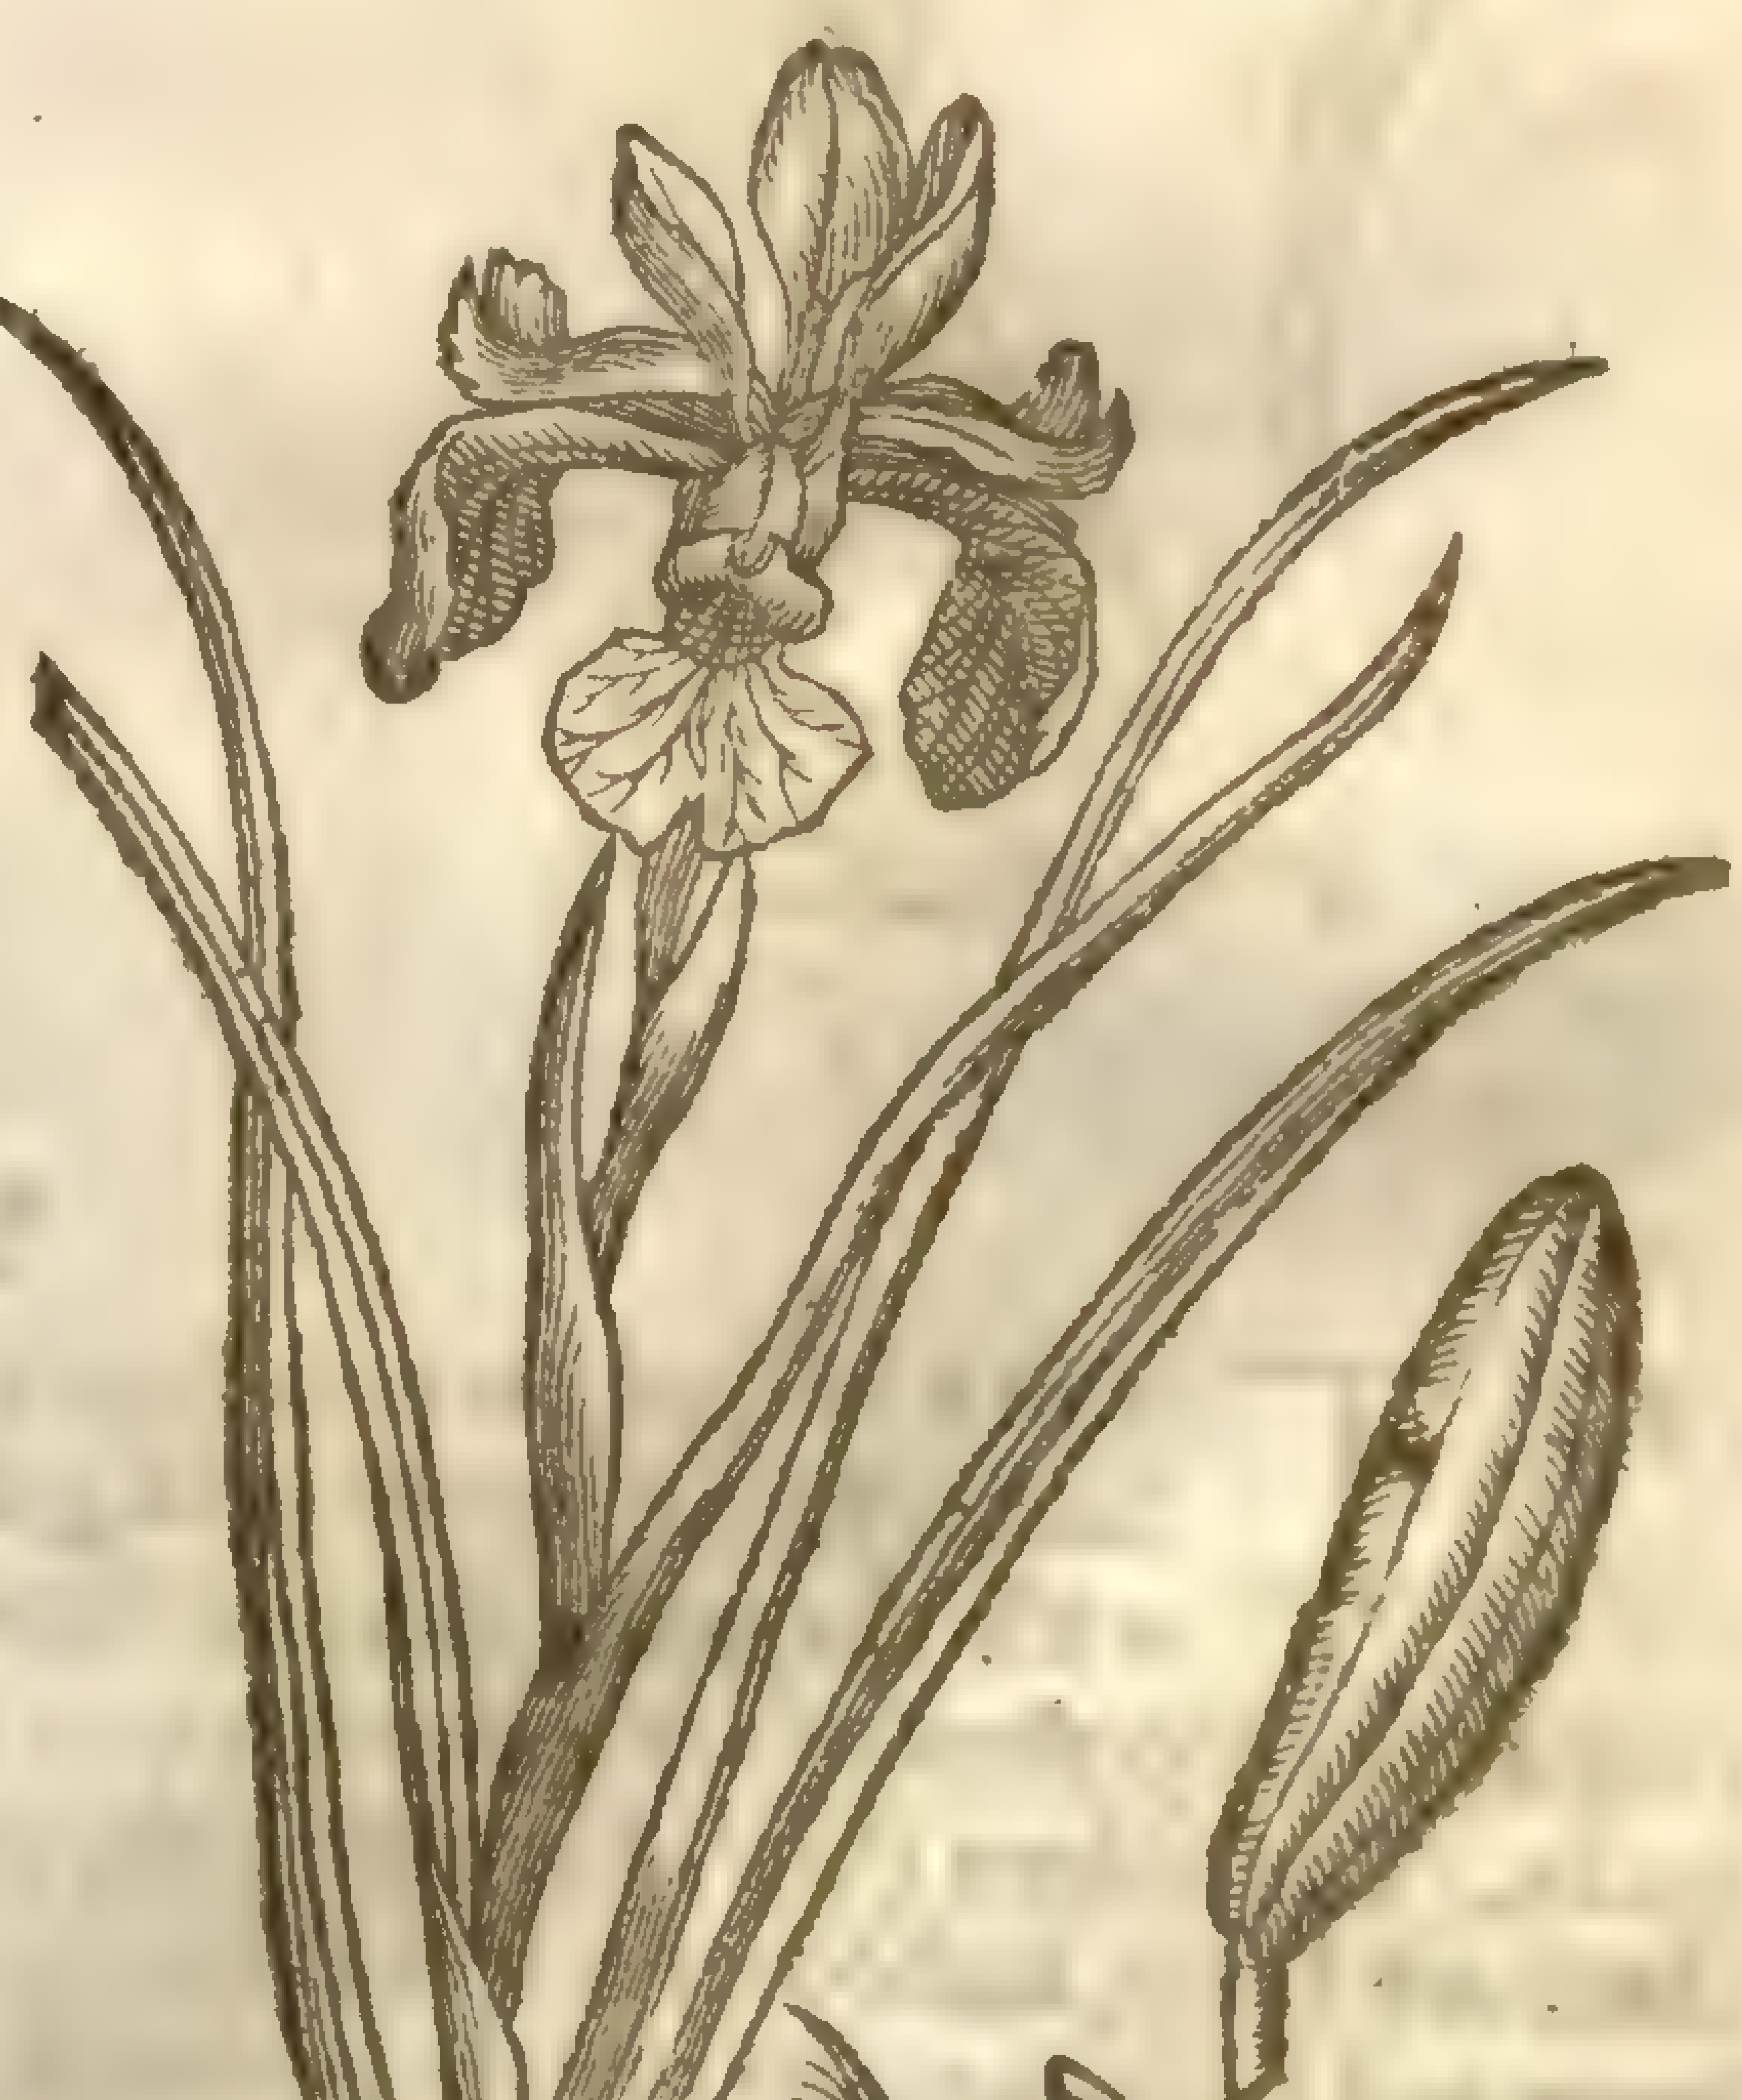
The roots and the leaues be laid with good ſucceſſe vpon burnings and ſcaldings. C

CHAP. 74. *Of Bulbed Floure de-luce.*

‡ 1 *Iris Bulboſa latifolia.*
Broad leaued Bulbous Floure de-luce.



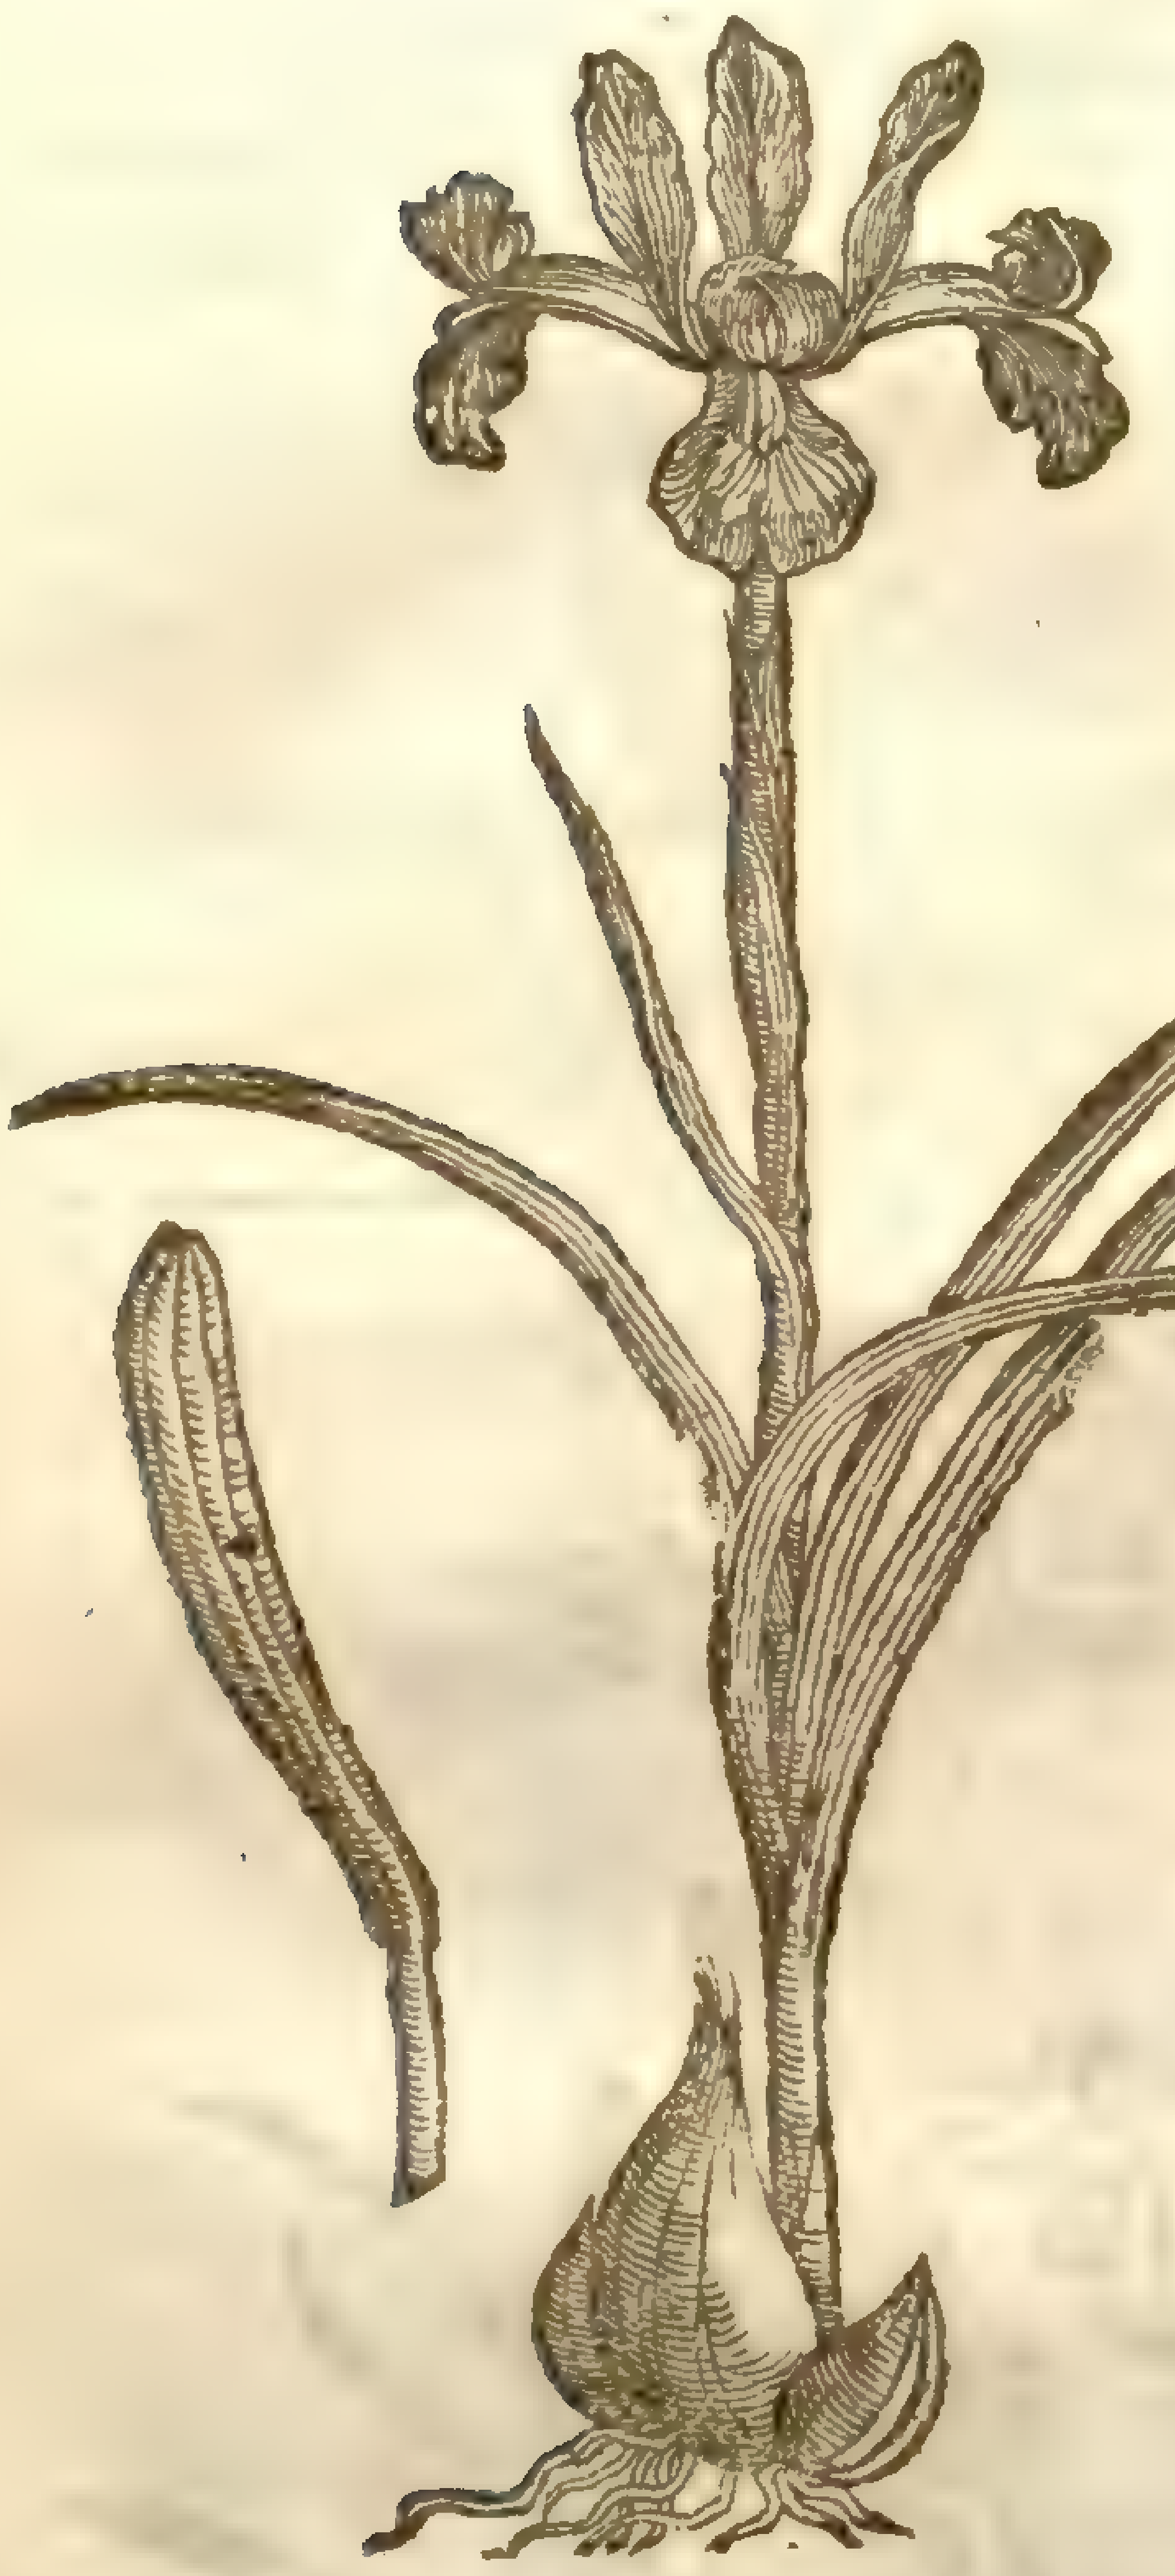
2 *Iris Bulboſa Anglica.*
Onion Floure de-luce.



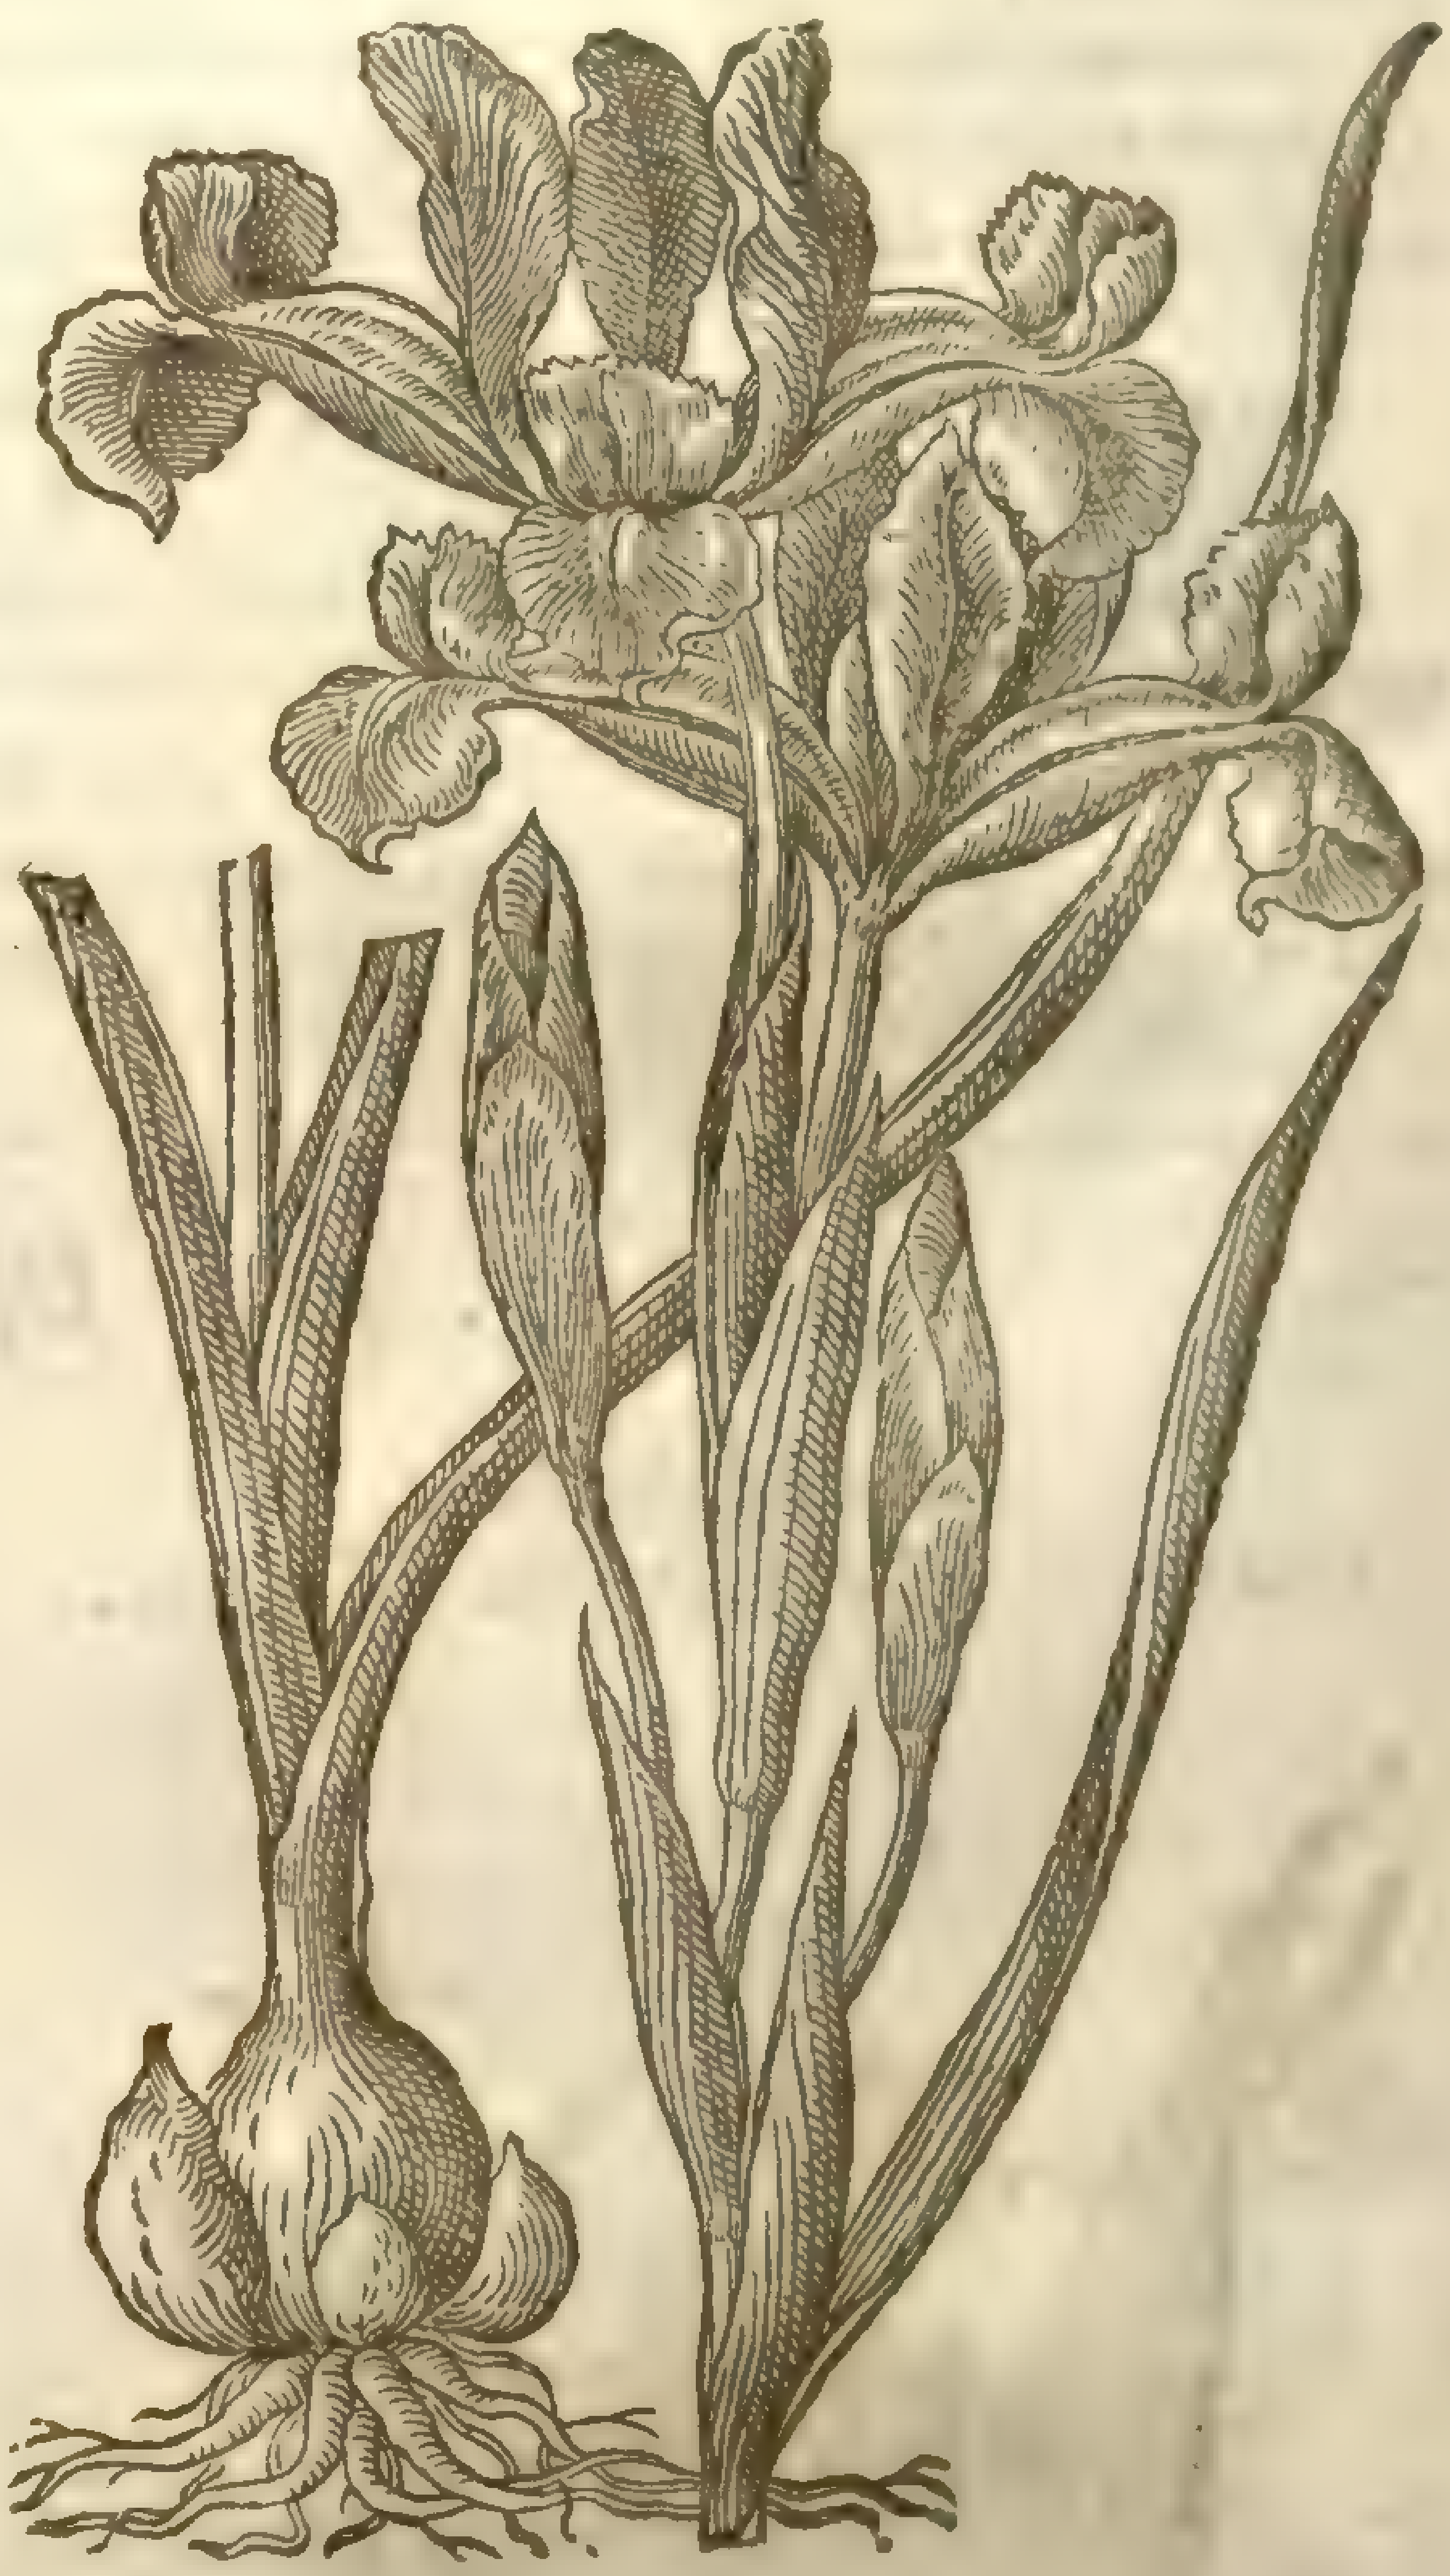
¶ The

¶ *The Kindes.*

Like as we haue ſet downe ſundry ſorts of Floure de-luces, with flaggy leaues, and tuberous or knobby roots, varying very notably in ſundry reſpects, which we haue diſtinguiſhed in their proper Chapters: it reſteth that in like manner we ſet forth vnto your view certaine bulbous or Onion-rooted Floure de-luces, which in this place doe offer themſelues vnto conſideration; whereof there be alſo ſundry ſorts, ſorted into one chapter as followeth.



3 *Iris Bulboſa flore vario.*
Changeable Floure de-luce.



‡ 4 *Iris Bulboſa verſicolor Polyclonos.*
Many branched changeable Floure de-luce.

¶ *The Deſcription.*

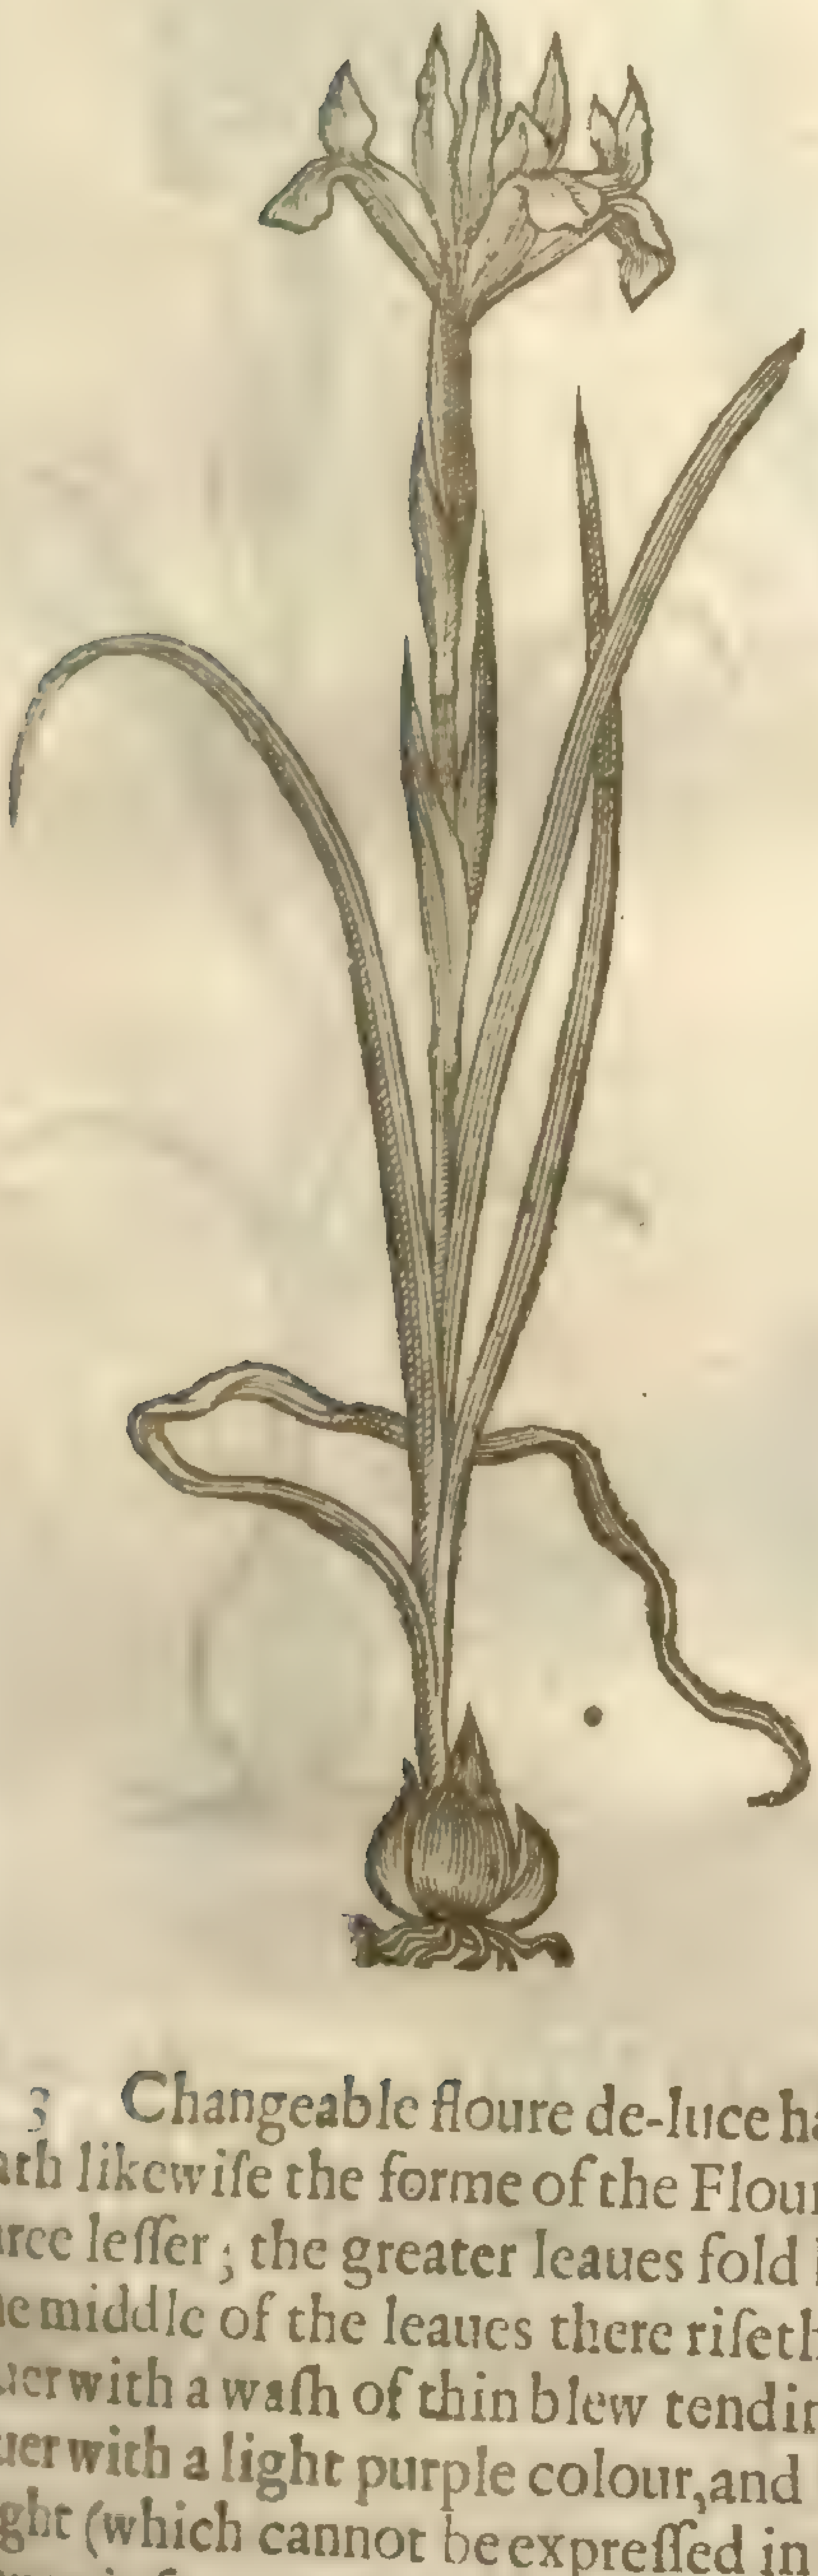
‡ 1 The firſt of theſe, whoſe figure here we giue you vnder the name of *Iris bulboſa Latifolia*, hath leaues ſomewhat like thoſe of the Day-Lillie, ſoft, and ſomewhat paliſh greene, with the vnder ſides ſomewhat whiter; amongſt which there riſeth vp a ſtalke bearing at the top thereof a floure a little in ſhape different from the formerly deſcribed Floure de-luces. The colour thereof is blew; the number of the leaues whereof it conſiſts, nine: three of theſe are little, and come out at the bottome of the Floure as ſoone as it is opened; three more are large, and being narrow at their bottome, become broader by little and little, vntill they come to turne downeward, whereas then they are ſhapen ſomewhat roundiſh or obtuſe. In the middeſt of theſe there runs vp a yellow variegated line to the place whereas they bend backe. The three other leaues are arched like as in other floures of this kinde, and diuided at their vpper end, and containe in them three threads of a whitiſh blew colour.

This is called *Iris bulboſa Latifolia*, by *Cluſius*; and *Hyacinthus Poetarum Latifolius*, by *Lobel*. It floures in Ianuarie and Februarie, whereas it growes naturally, as it doth in diuers places of Portugall and Spaine. It is a tender plant and ſeldome thriues well in our gardens. ‡

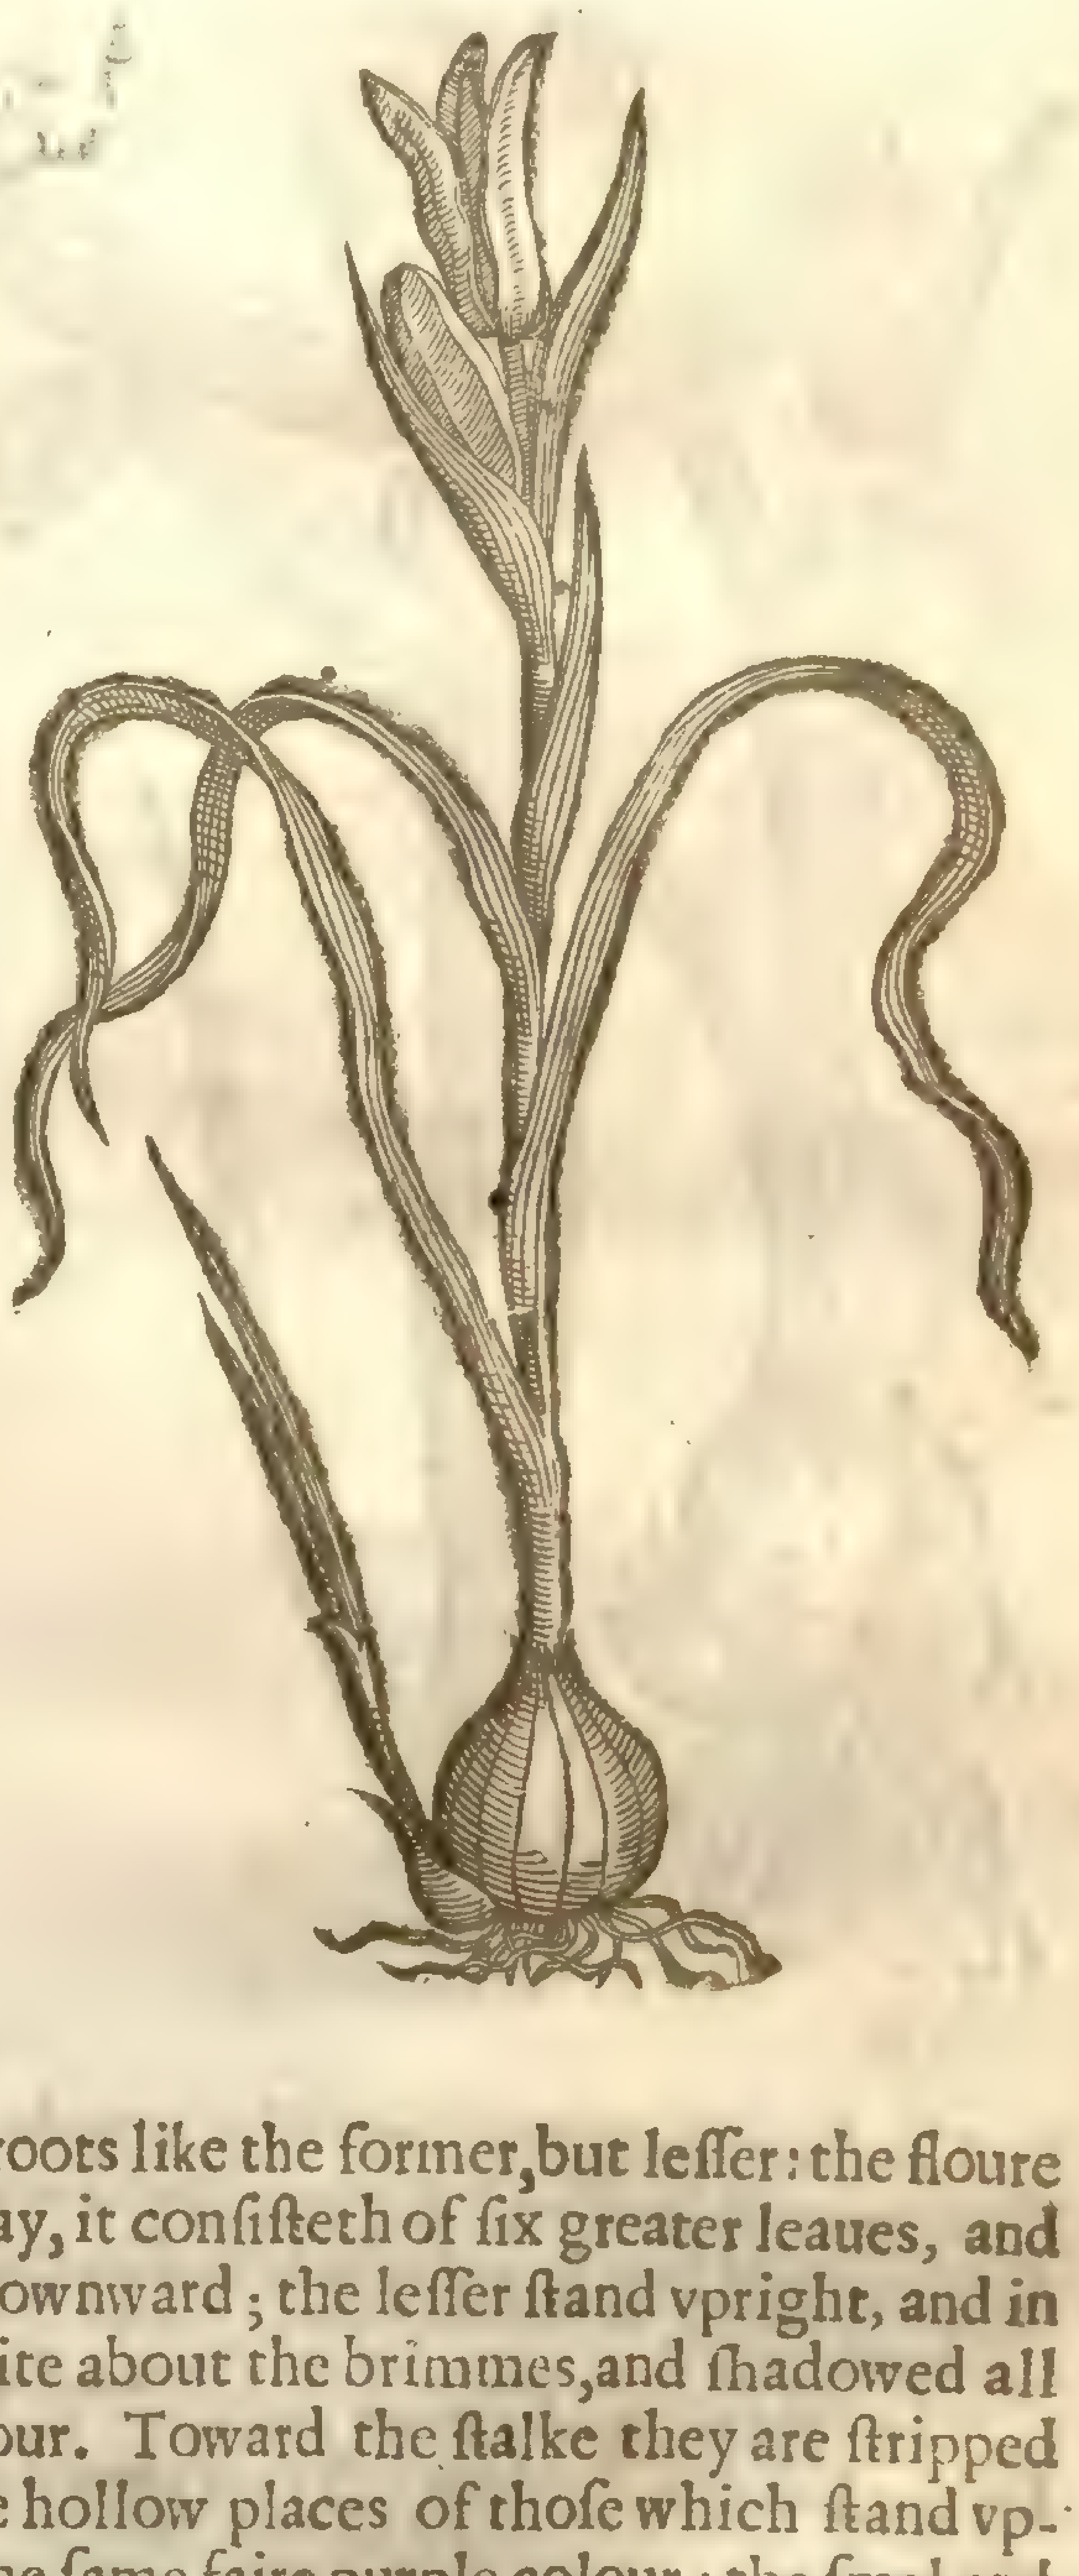
2 Onion Floure de-luce hath long narrow blades or leaues, creſted, chamfered, or ſtreaked on the backe ſide as it were welted; below ſomewhat round, opening it ſelfe toward the top, yet remaining as it were halfe round, whereby it reſembleth an hollow trough or gutter. In the bottome of the hollowneſſe it tendeth to whiteneſſe; and among theſe leaues doe riſe vp a ſtalke of a cubit high; at the top whereof groweth a faire blew Floure, not differing in ſhape from the common

mon Floure de-luce: the which being paſt, there come in the place thereof long thick cods or ſeed veſſels, wherein is contained yellowiſh ſeed of the bigneſſe of a tare or fitch. The root is round like an onion, couered ouer with certain browne skins or filmes. Of this kinde there are ſome fiue or ſix varieties, cauſed by the various colours of the floures.

5 *Iris bulboſa Flore luteo cum flore & ſemine.*
Yellow bulbed Floure de-luce in floure and ſeed.



Iris [illegible]



3 Changeable floure de-luce hath leaues, ſtalks, and roots like the former, but leſſer: the floure hath likewiſe the forme of the Floure de-luce, that is to ſay, it conſiſteth of ſix greater leaues, and three leſſer; the greater leaues fold backward and hang downward; the leſſer ſtand vpright, and in the middle of the leaues there riſeth vp a yellow welt white about the brimmes, and ſhadowed all ouer with a waſh of thin blew tending to a Watchet colour. Toward the ſtalke they are ſtripped ouer with a light purple colour, and likewiſe amongſt the hollow places of thoſe which ſtand vpright (which cannot be expreſſed in the figure) there is the ſame faire purple colour: the ſmel and ſauor is ſweet and pleaſant. The root is Onion-faſhion, or bulbous like the other.

‡ 4 There is alſo another variegated Floure de-luce, much like this laſt deſcribed in the colour of the Floure; but each plant produceth more branches and floures, whence it is termed *Iris bulboſa verſicolor polyclonos*, Many-branched changeable Floure de-luce. ‡

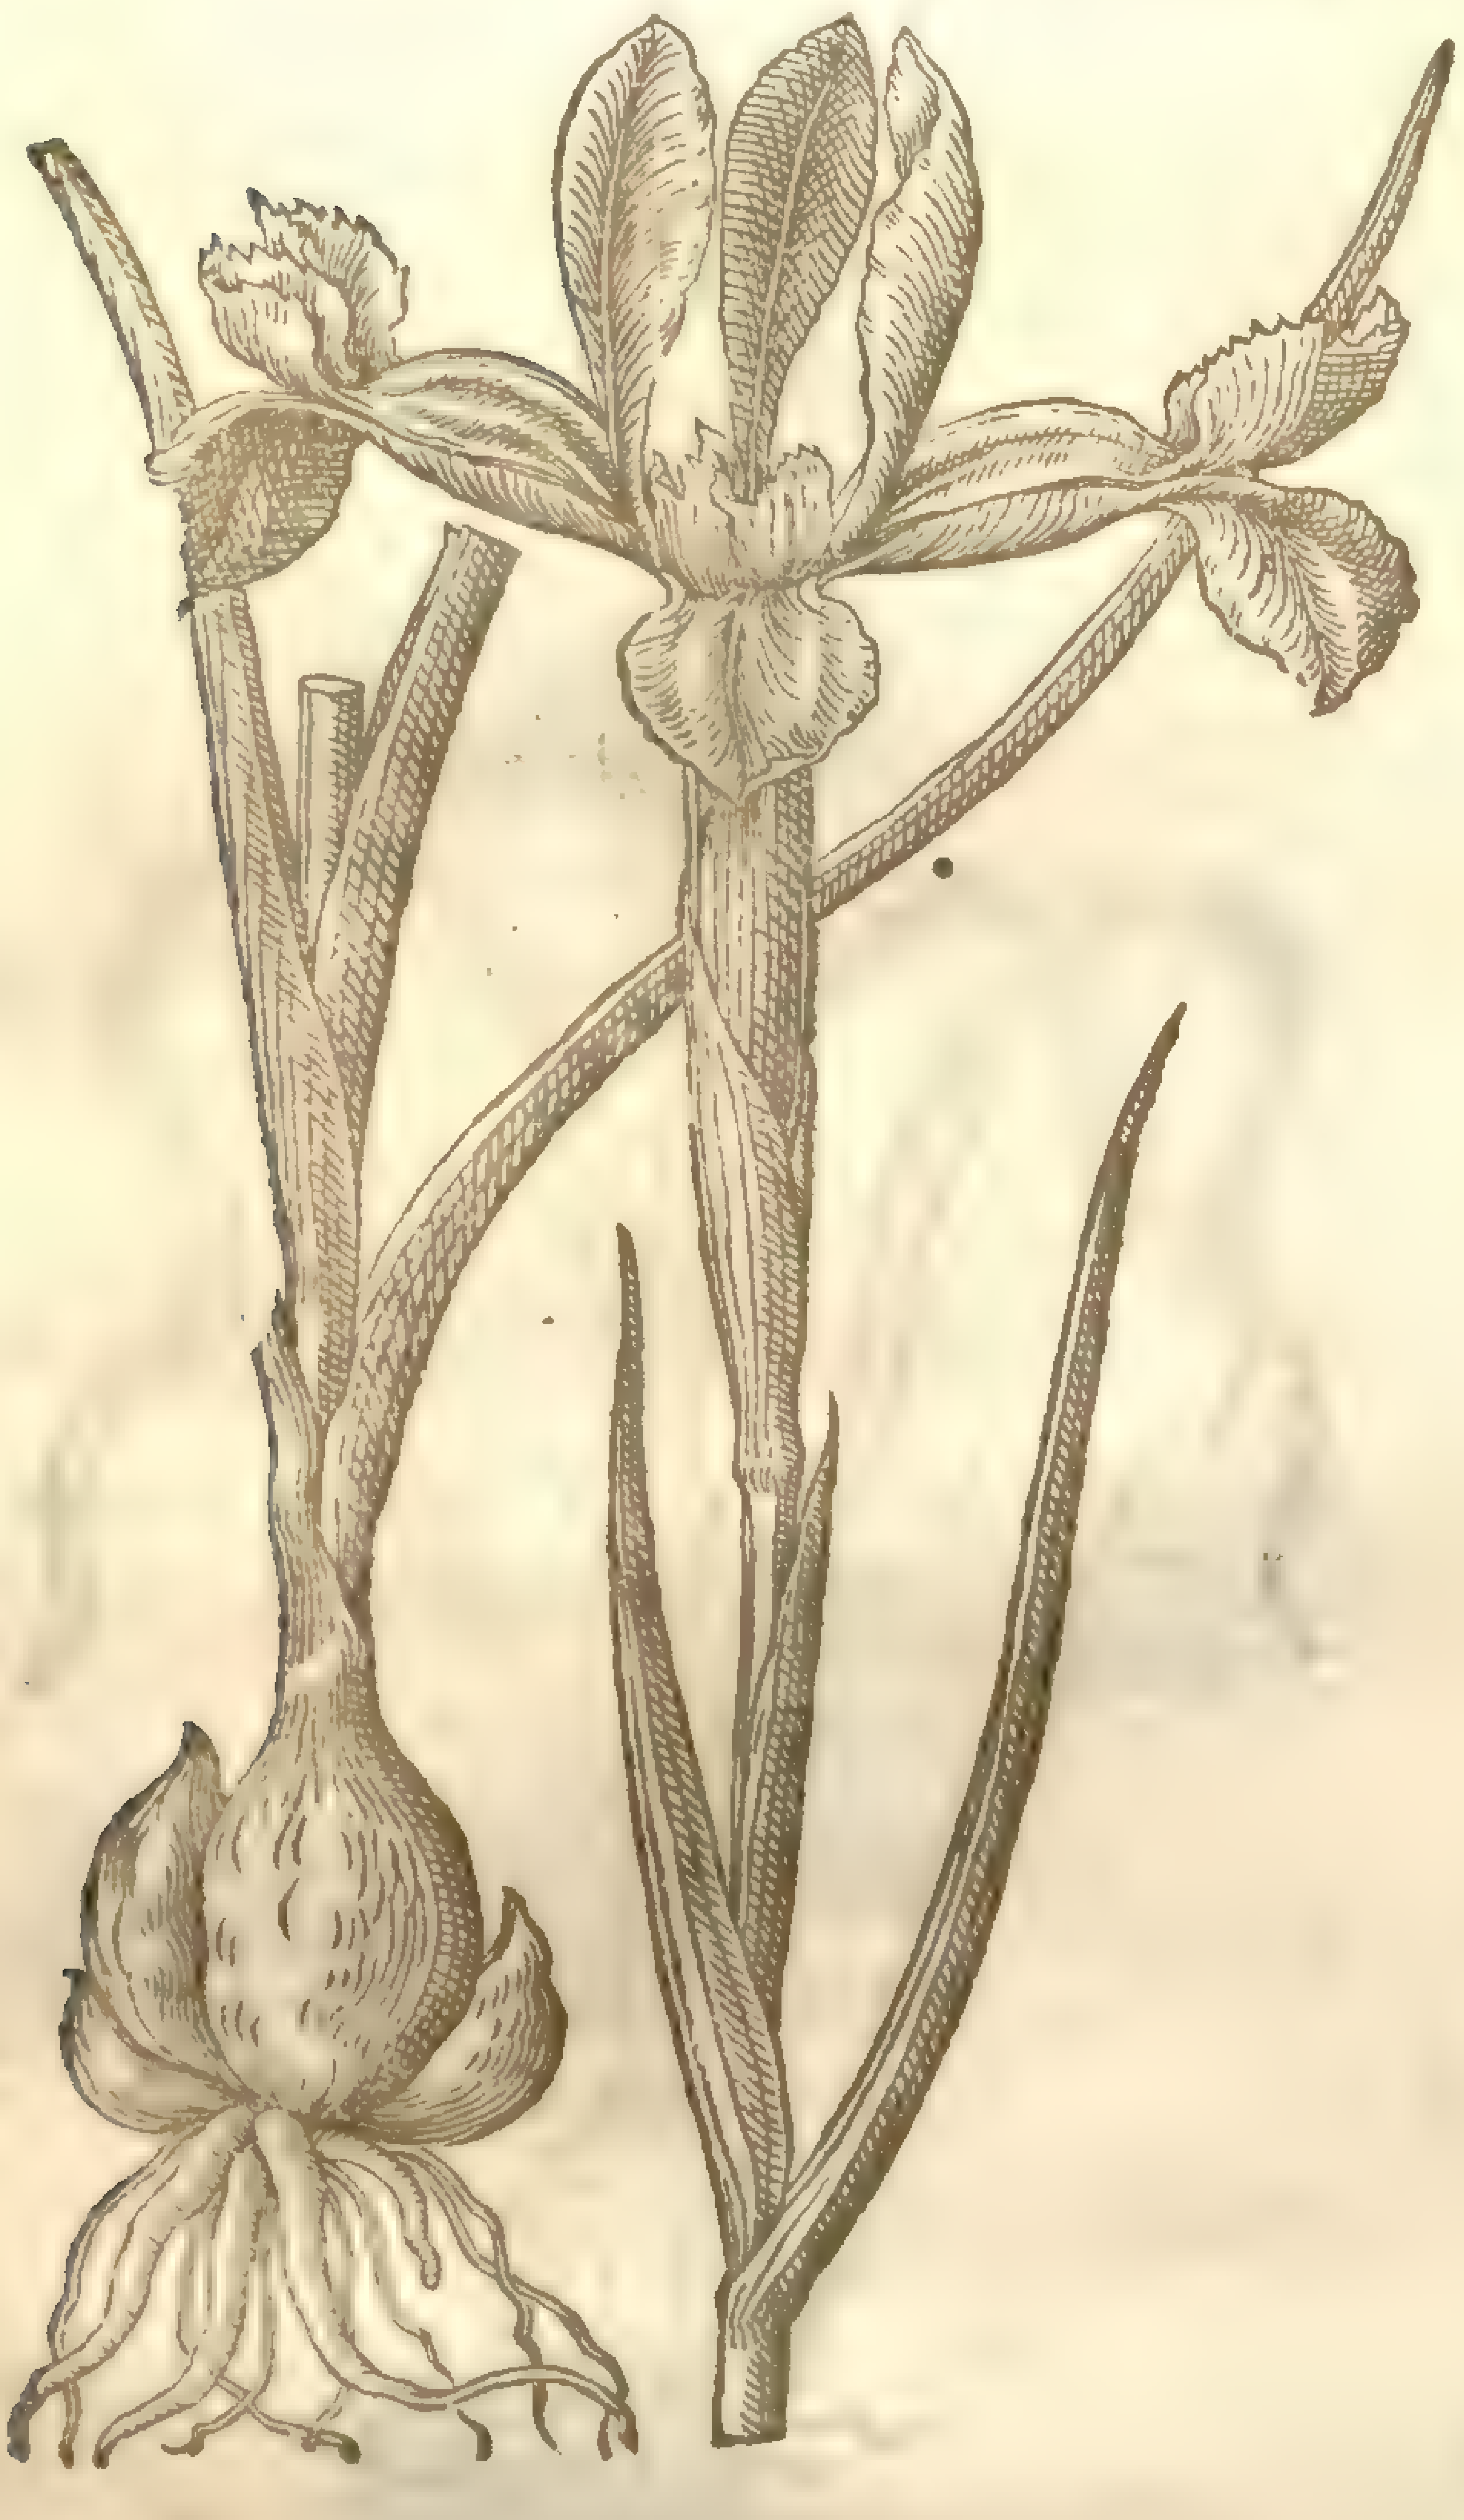
5 Of which kinde or ſort there is another in my garden, which I receiued from my brother *Iames Garret* Apothecarie, far more beautifull than the laſt deſcribed; the which is daſhed ouer, in ſtead of the blew or watchet colour, with a moſt pleaſant gold yellow colour, of ſmell exceeding ſweet, with bulbed roots like thoſe of the other ſort.

6 It is reported that there is in the garden of the Prince Elector the Lantgraue of Heſſen, one of this kinde with white floures, the which as yet I haue not ſeene.

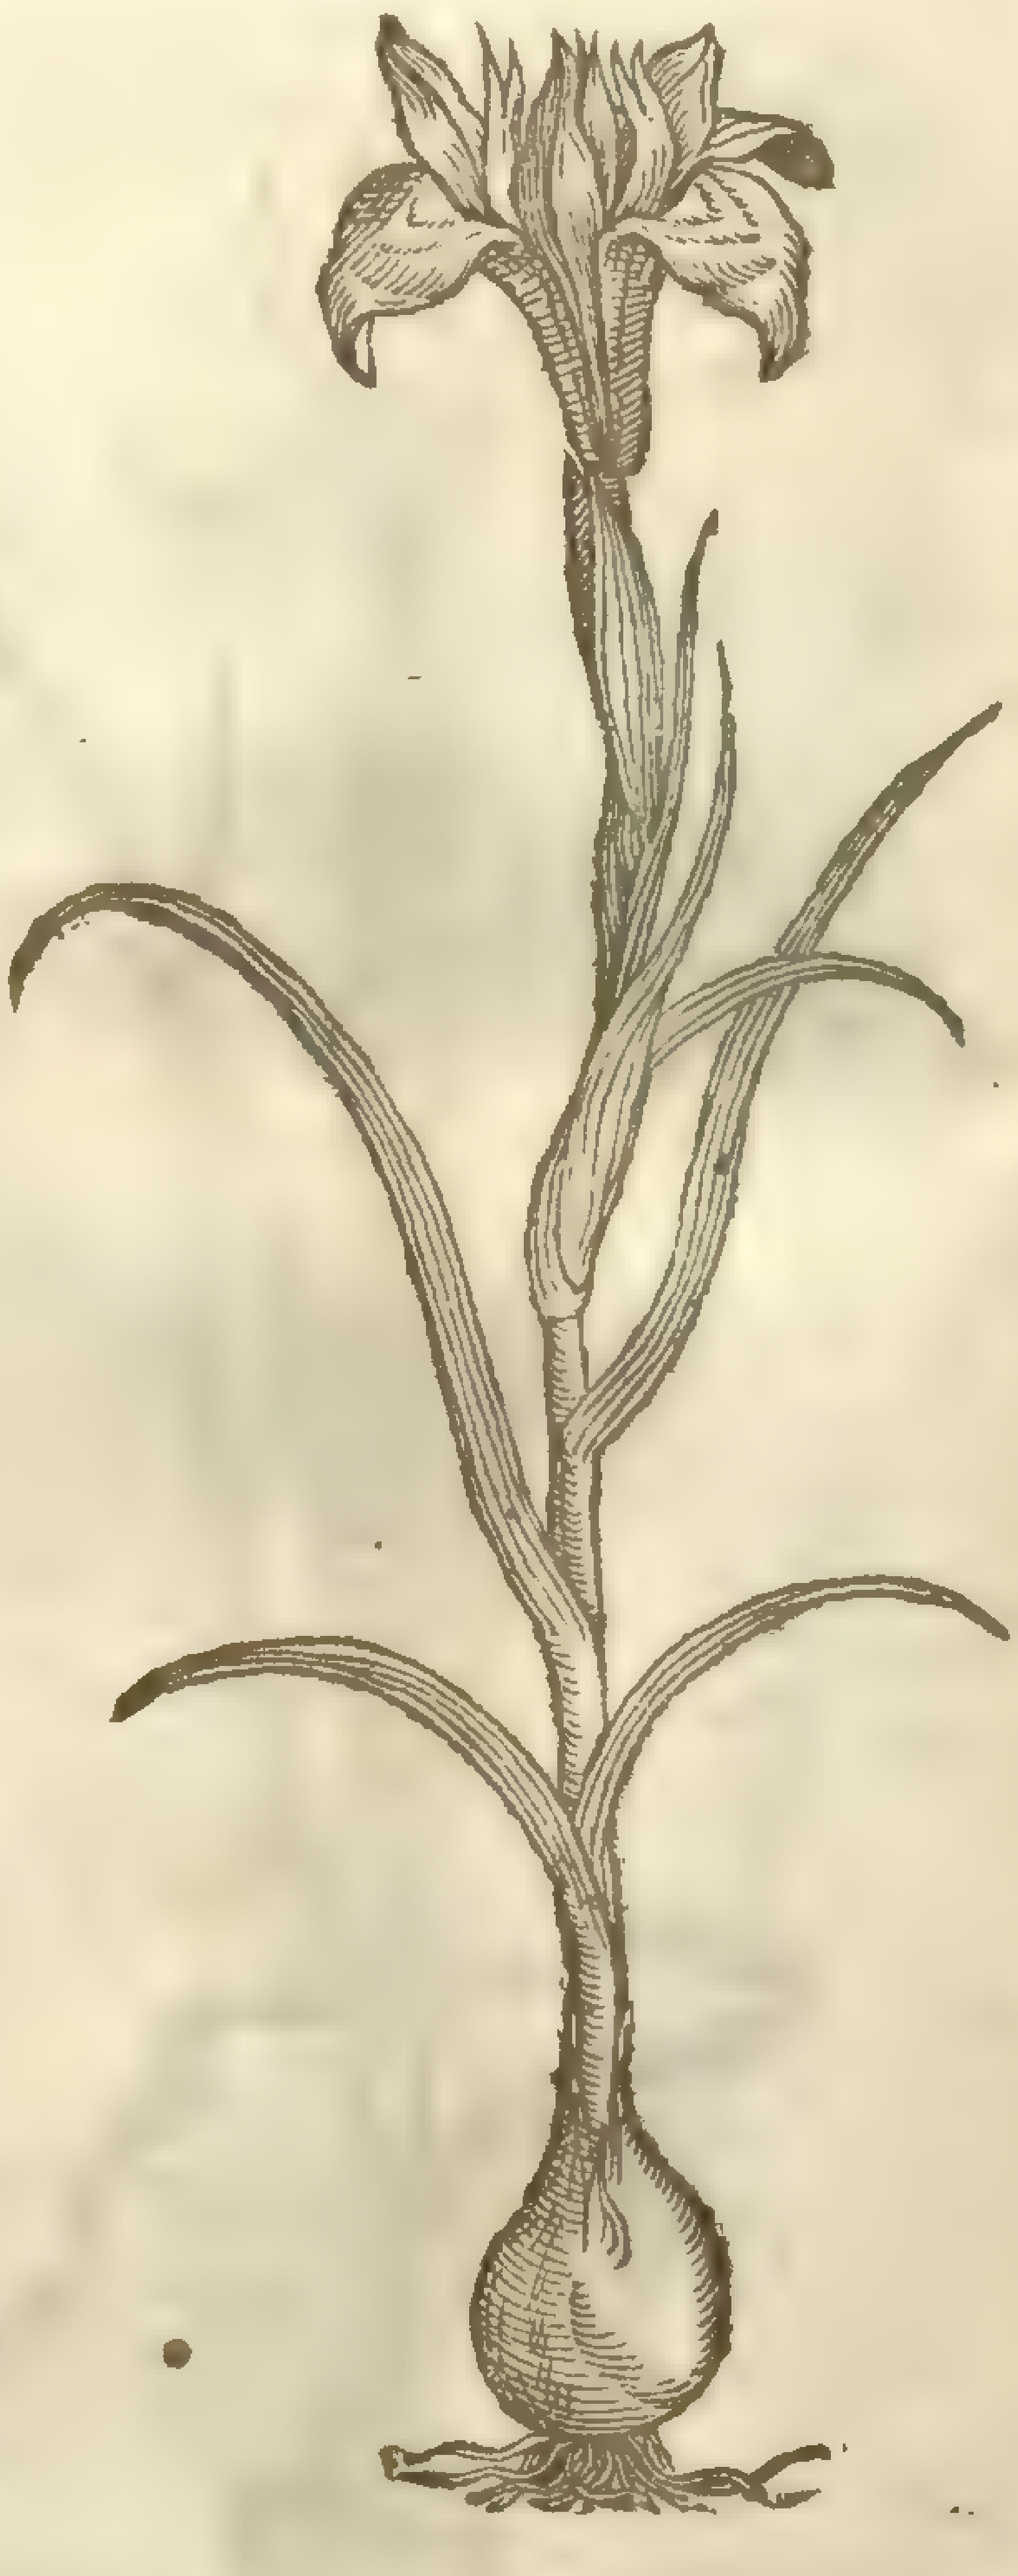
‡ Beſides theſe ſorts mentioned by our Author, there are of the narrow leafed bulbous Floure de-luces, ſome twenty foure or more varieties, which in ſhape of roots, leaues, and floures, differ verie little or almoſt nothing at all; ſo that he which knowes one of theſe, may preſently know the reſt. Wherefore becauſe it is a thing no more pertinent to a generall hiſtorie of plants, to inſiſt vpon theſe accidentall nicities, than for him that writeth an hiſtorie of beaſts, to deſcribe all the colours, and their mixtures, in Horſes, Dogs, and the like; I referre ſuch as are deſirous to informe

themſelues of thoſe varieties, to ſuch as haue only and purpoſely treated of Floures and their diuerſities, as *De-Bry*, *Swerts*; and our countryman Mr *Parkinſon*, who in his *Paradiſus terreſtris* publiſhed in Engliſh, *Anno* 1629. hath iudiciouſly and exactly comprehended all that hath bin deliuered by others in this nature.

‡ 6 *Iris bulboſa flore cinereo.*
Aſh-coloured Floure de-luce.



‡ 7 *Iris bulboſa floro albido.*
Whitiſh Floure de-luce.



¶ *The Place.*

The ſecond of theſe bulbed Floure de-luces growes wilde or of it ſelfe in the corne fields of the Weſt part of England, as about Bathe and Wells & thoſe places adiacent, from whence they were firſt brought into London, where they be naturaliſed, and encreaſe in great plenty in our London gardens.

The other ſorts do grow naturally in Spaine and Italy wilde, from whence wee haue had plants for our London gardens, whereof they do greatly abound.

¶ *The Time.*

They floure in Iune and Iuly, and ſeldome after.

¶ *The Names.*

The bulbed Floure de-luce is called of *Lobel*, *Iris Bulboſa*, and alſo *Hyacinthus flore iridis:* of ſome, *Hyacinthus Poetarum* : and peraduenture it is the ſame that *Apuleius* mentioneth, Chap. 21. ſaying, That *Iris* named among the old Writers *Hieris*, may alſo be called, and not vnproperly, *Hierobulbus* or *Hieribulbus* ; as though you ſhould ſay, *Iris bulboſa* , or bulbed Ireos ; vnleſſe you would haue ἱερόβολβος called a greater or larger Bulbe : for it is certain, that great and huge things were called of the Antients, ἱερὰ, or *Sacra* : in Engliſh, Holy.

¶ *The Nature.*

The nature of theſe bulbed Floure de-luces are referred to the kindes of Aſphodils.

¶ *The Vertues.*

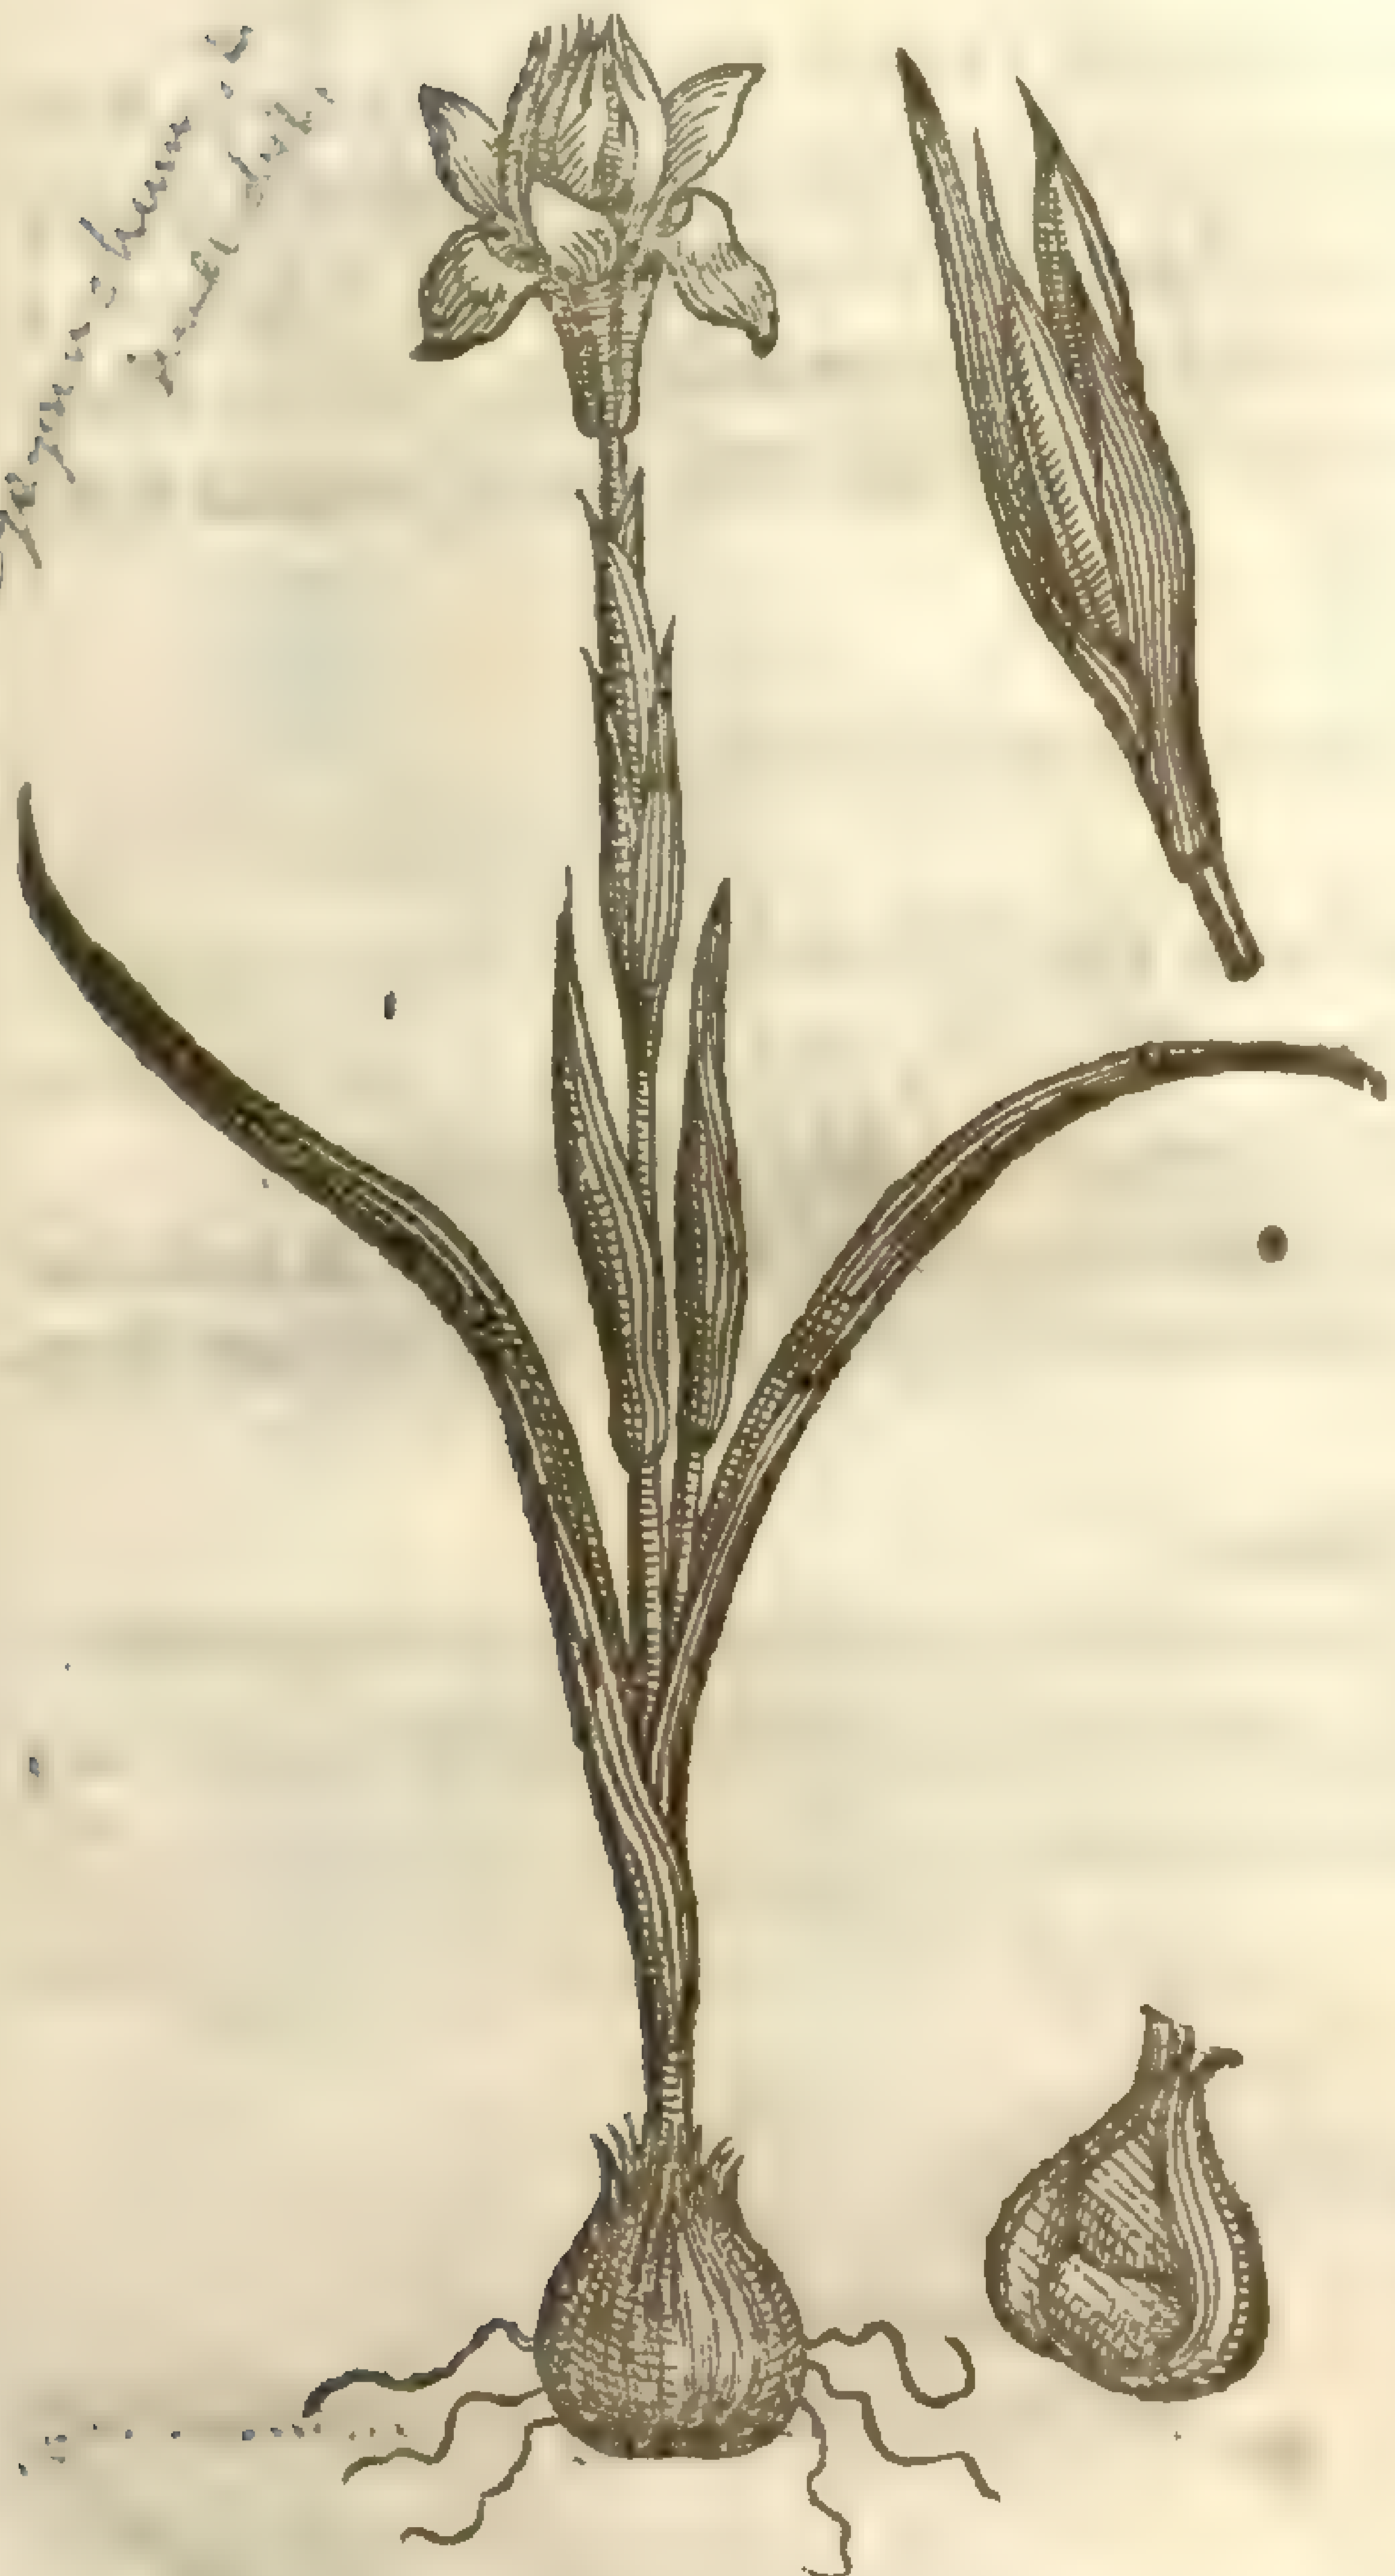
A Take (ſaith *Apuleius*) of the herbe *Hierobulbus* ſix ʒ. Goats ſuet as much, oile of Alcanna one pound, mix them together, being firſt ſtamped in a ſtone mortar, it taketh away the paine of the Gout.

B Moreouer, if a woman do vſe to waſh her face with the decoction of the root, mixed with meale of Lupines, it clenſeth away the freckles and morphew and ſuch like deformities.

Chap.

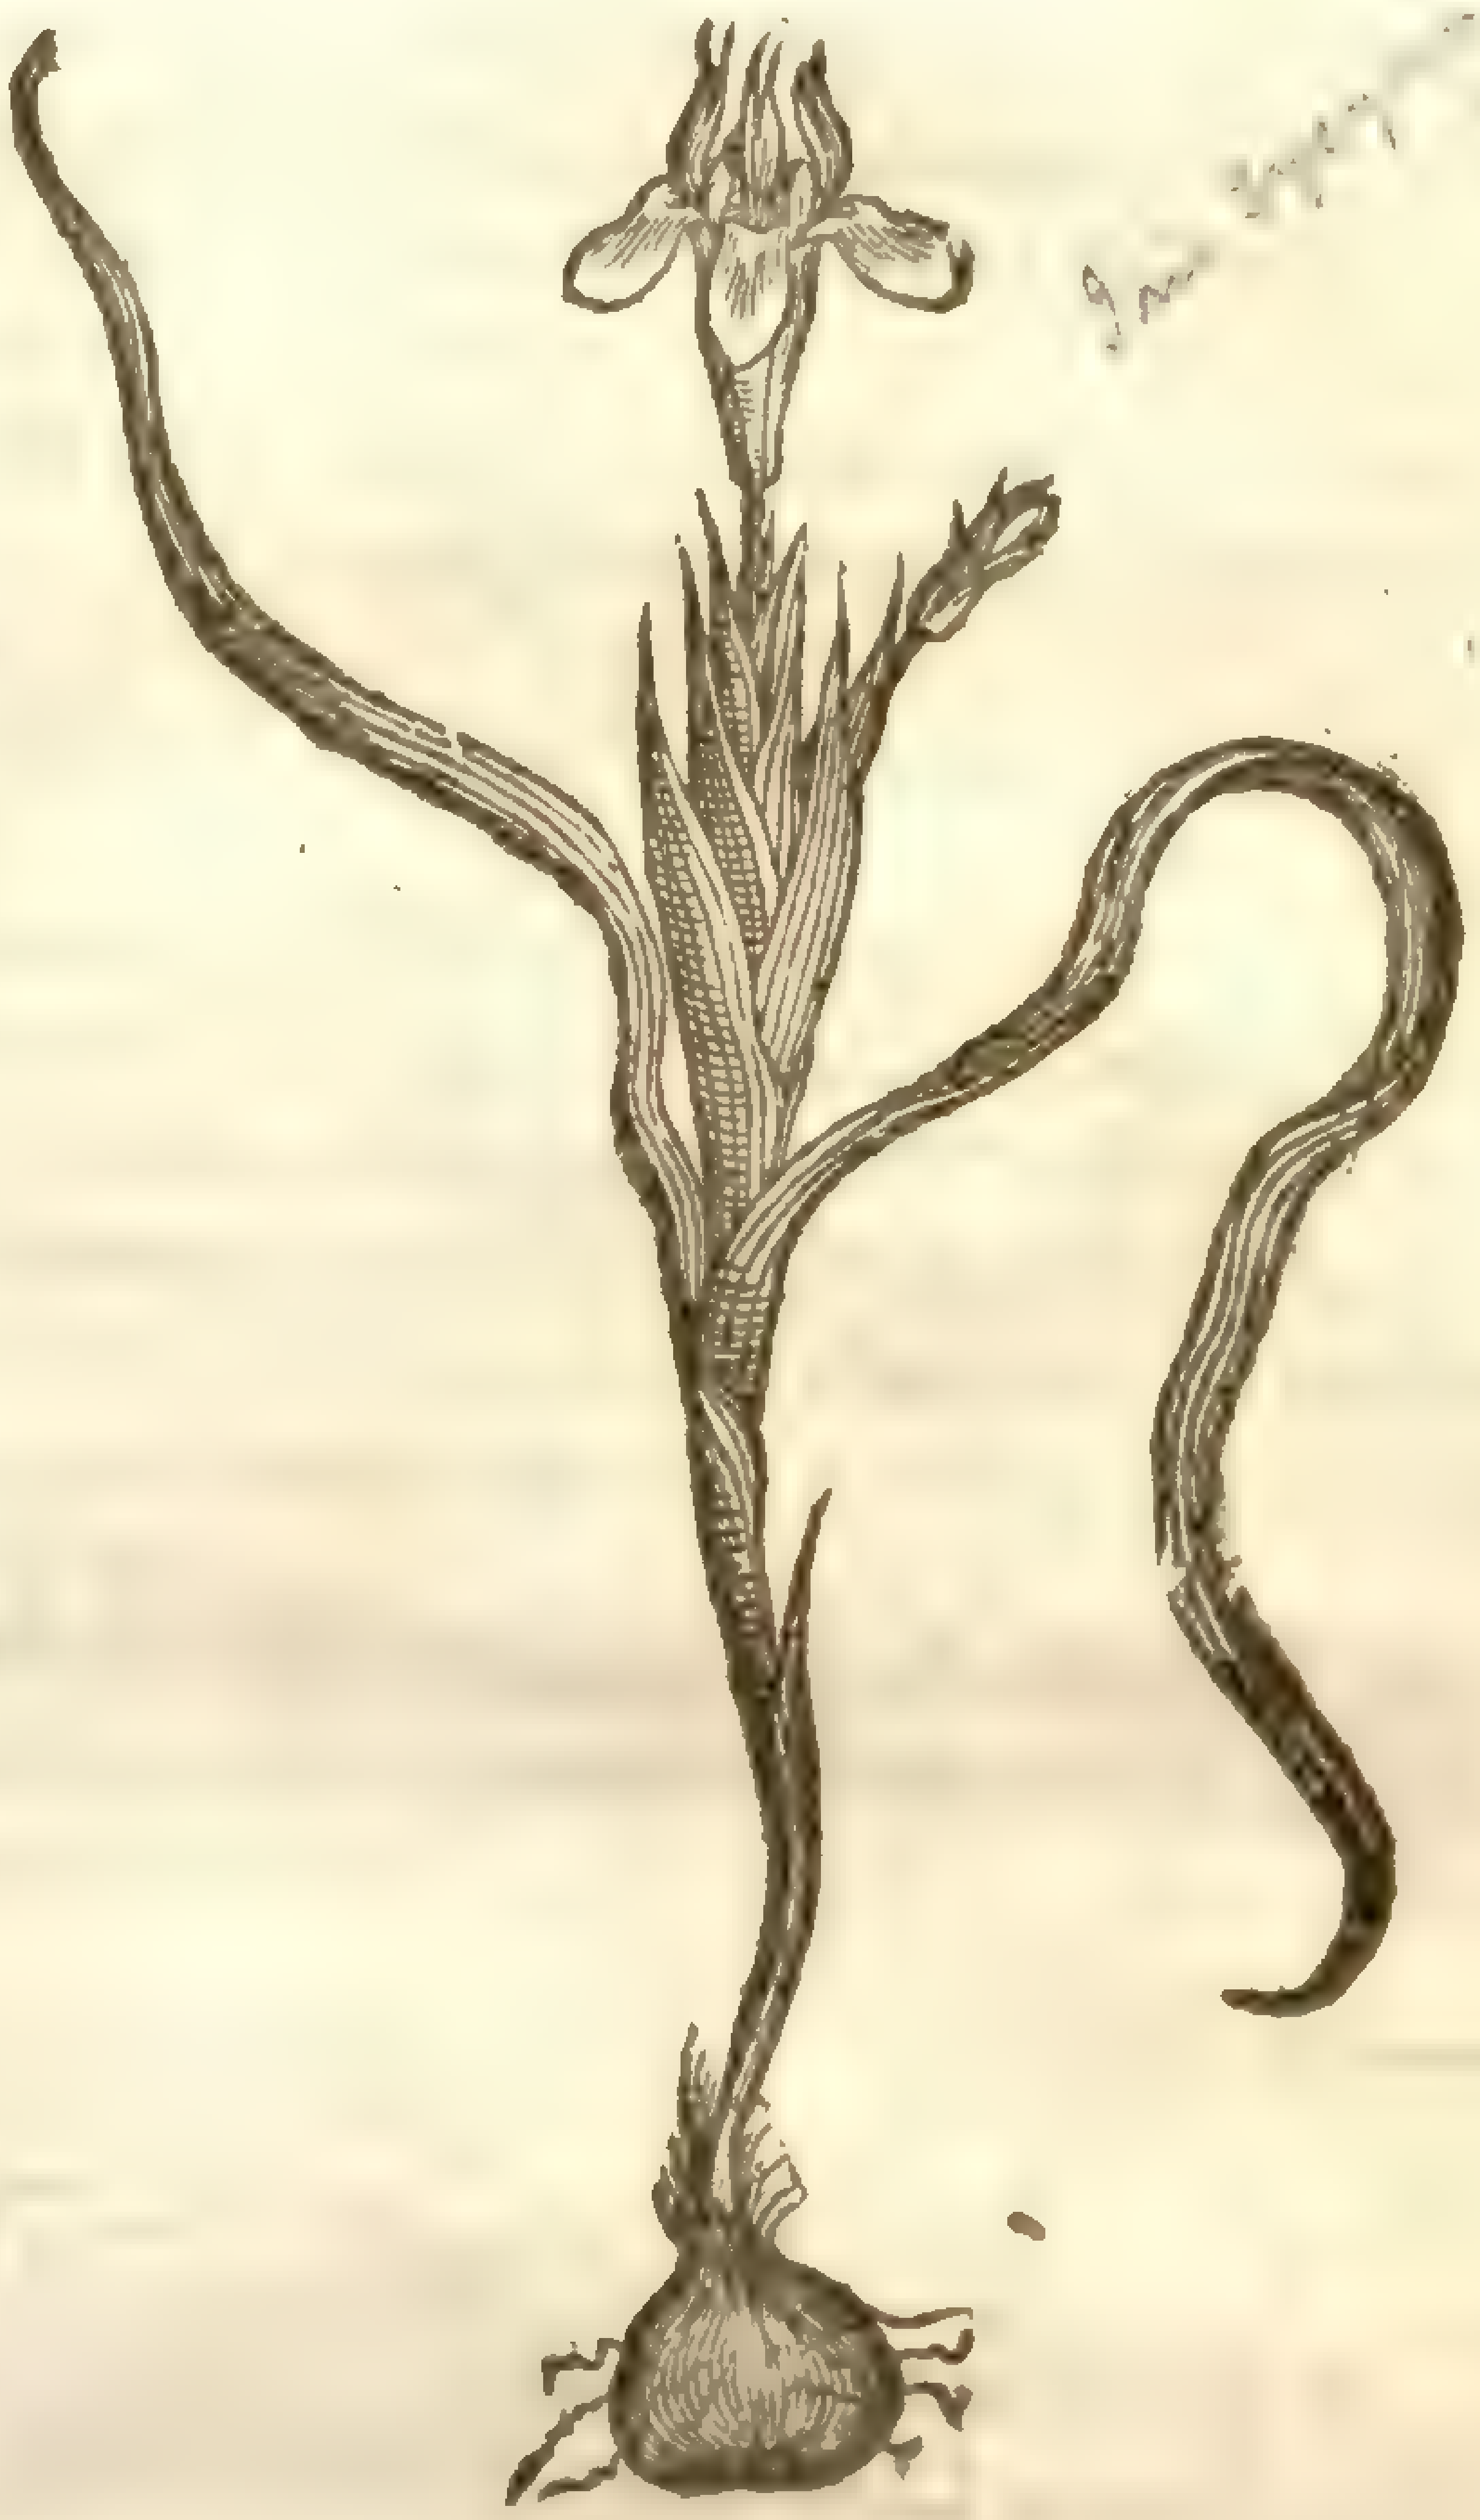
CHAP. 75. *Of Spaniſh Nut.*

1 *Siſynrichium majus.*
Spaniſh Nut.



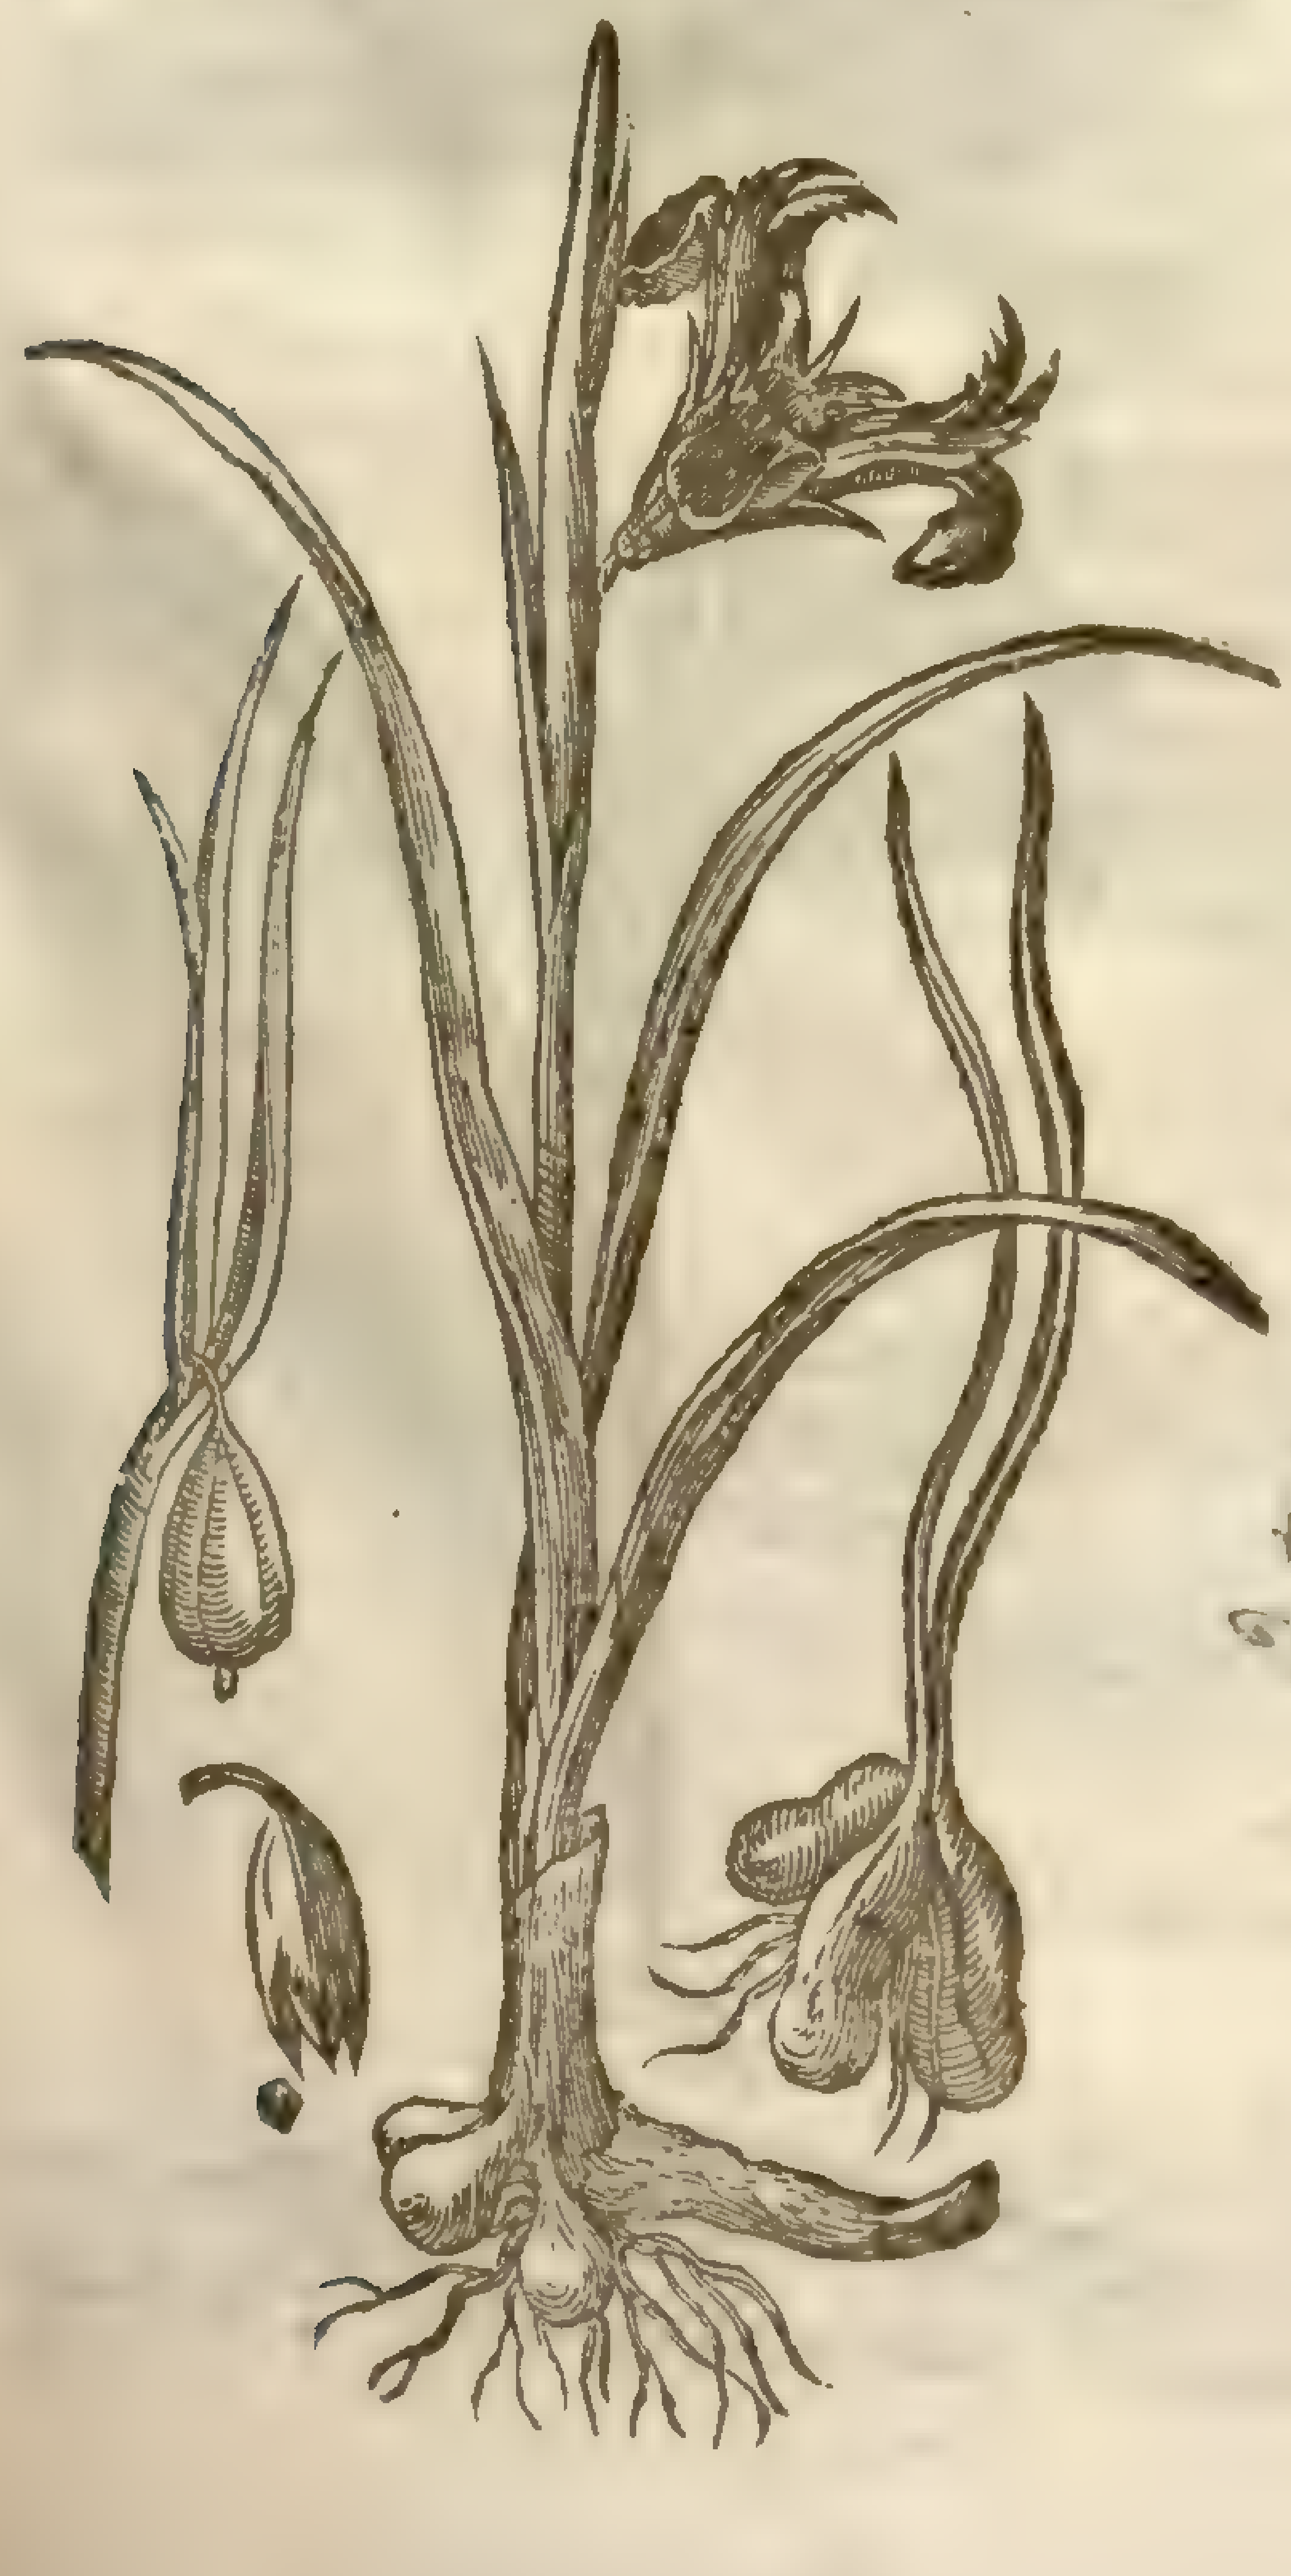
Iris siſyrinchium, i [illegible]

‡ 2 *Siſynrichium minus.*
Small Spaniſh Nut.



Iris [illegible]

3 *Iris tuberoſa.* Veluet Floure de-luce.



I. tuberoſa, i [illegible]

¶ *The Deſcription.*

1 Spaniſh Nut hath ſmal graſſy leaues like thoſe of the Stars of Bethlem, or *Ornithogalum*; amongſt which riſeth vp a ſmall ſtalke of halfe a foot high, garniſhed with the like leaues, but ſhorter. The floures grow at the top, of a sky colour, in ſhape reſembling the Floure de-luce, or common *Iris*; but the leaues that turne downe are each of them marked with a yellowiſh ſpot: they faile quickely, and being paſt, there ſucceed ſmall cods with ſeeds as ſmall as thoſe of Turneps. The root is round, compoſed of two bulbs, the one lying vpon the other as thoſe of the Corn-flag vſually do; and they are couered with a skin or filme in ſhape like a Net. The Bulbe is ſweet in taſt, and may be eaten before any other bulbed root.

2 There is ſet forth another of this kinde ſomwhat leſſer, with floures that ſmell ſweeter than the former.

3 Velvet Floure de-luce hath many long ſquare leaues ſpongeous or ful of pith, trailing vpon the ground, in ſhape like to the leaues of ruſhes: among which riſeth vp a ſtalk of a foot

high, bearing at the top a floure like a Floure de-luce. The lower leaues that turne downward are of a perfect blacke colour, ſoft and ſmooth as is blacke Veluet; the blackeneſſe is welted about with greeniſh yellow, or as we terme it, a Gooſe-turd green; of which colour the vppermoſt leaues do conſiſt: which being paſt, there followeth a great knob or creſted ſeed-veſſell of the bignes of a mans thumbe, wherein is contained round white ſeed as big as the Vetch or tare. The root conſiſts of many knobby bunches like fingers.

¶ *The Place.*

Theſe baſtard kindes of Floure de-luces are ſtrangers in England, except it be among ſome few diligent Herbariſts in London, who haue them in their gardens, where they encreaſe exeeedingly, eſpecially the laſt deſcribed, which is ſaid to grow wild about Conſtantinople, Morea, & Greece: from whence it was tranſported into Italy, where it hath bin taken for *Hermodactylus*, and by ſome expreſſed and ſet forth in writing vnder the title of *Hermodactylus*, whereas in truth it hath no ſemblance at all with *Hermodactylus*.

¶ *The Time.*

The wilde or baſtard Floure de-luces do floure from May to the end of Iuly.

¶ *The Names.*

1 2 Theſe bulbed baſtard Floure de-luces, which we haue Engliſhed Spaniſh Nuts, are called in Spaine *Nozelhas*, that is, little Nuts; the leſſer ſort, *Parva Nozelha*, and *Macuca*: we take it to be that kinde of nouriſhing bulbe which is named in Greeke σισυρίγχιον: of *Pliny*, *Siſynrichium*.

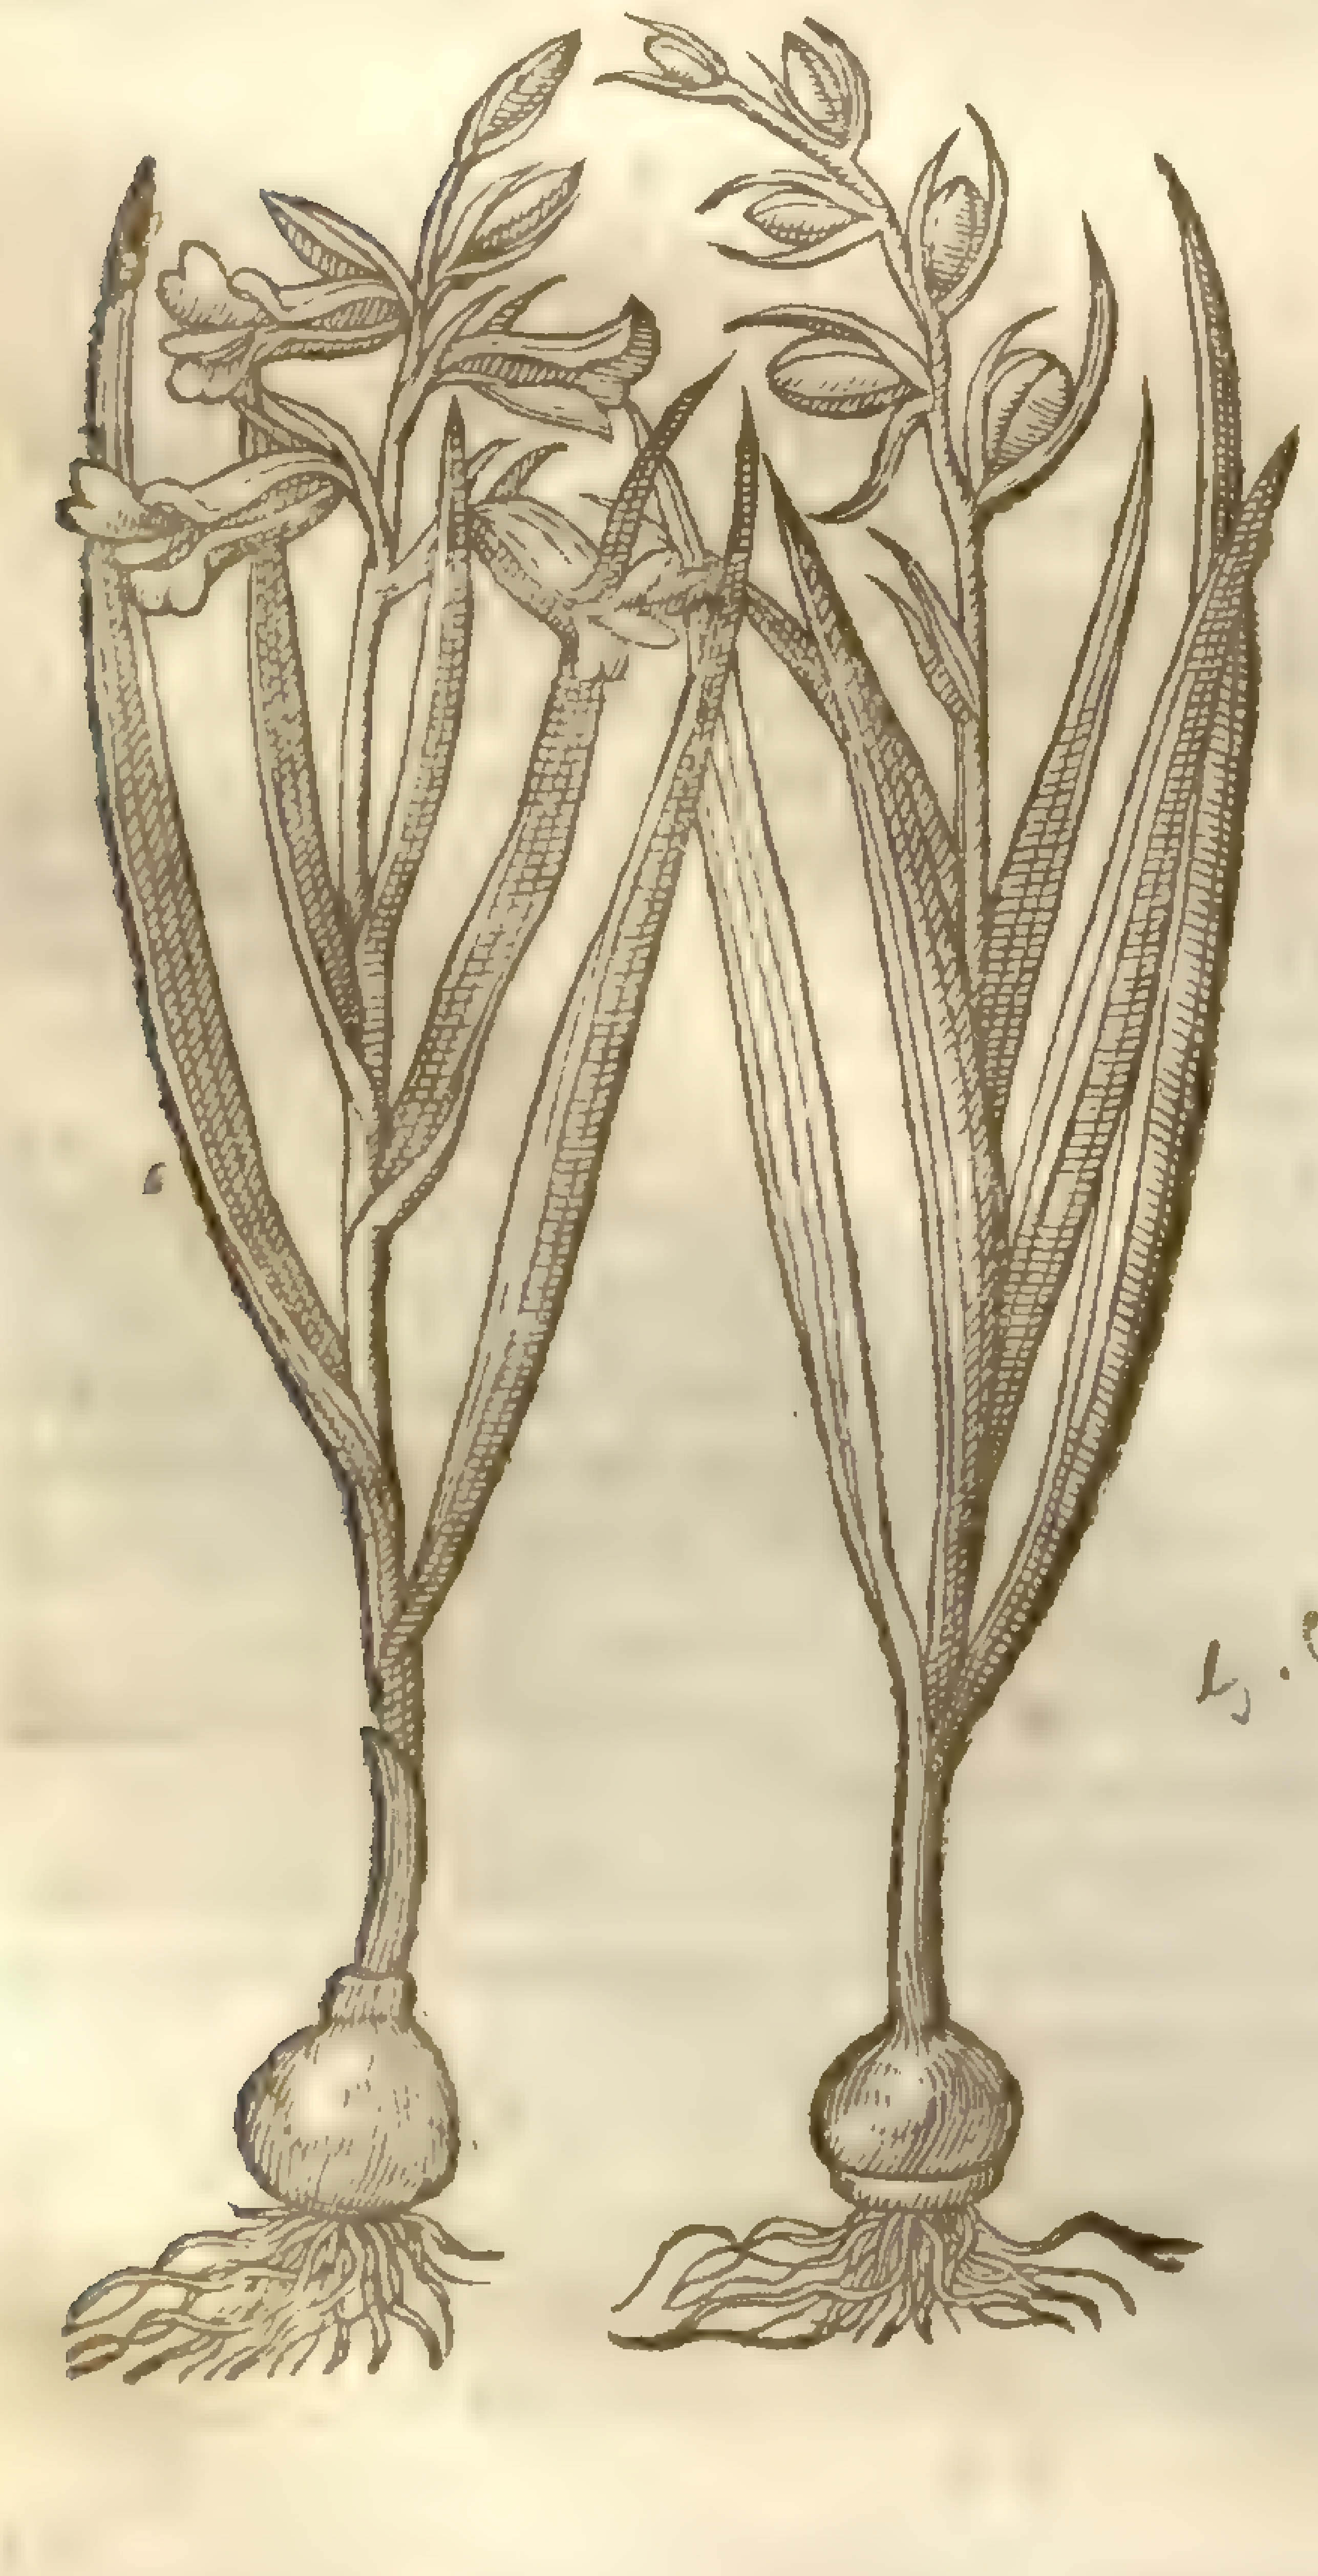
‡ 3 Some, as *Vlyſſes Aldroandus*, would haue this to be *Louchitis prior* of *Dioſcorides*: *Matthiolus* makes it *Hermodactylus verus*, or the true Hermodactill: *Dodonæus* and *Lobel* more fitly referre it to the Floure de-luces, and call it *Iris tuberoſa*. ‡

¶ *The Nature and Vertues.*

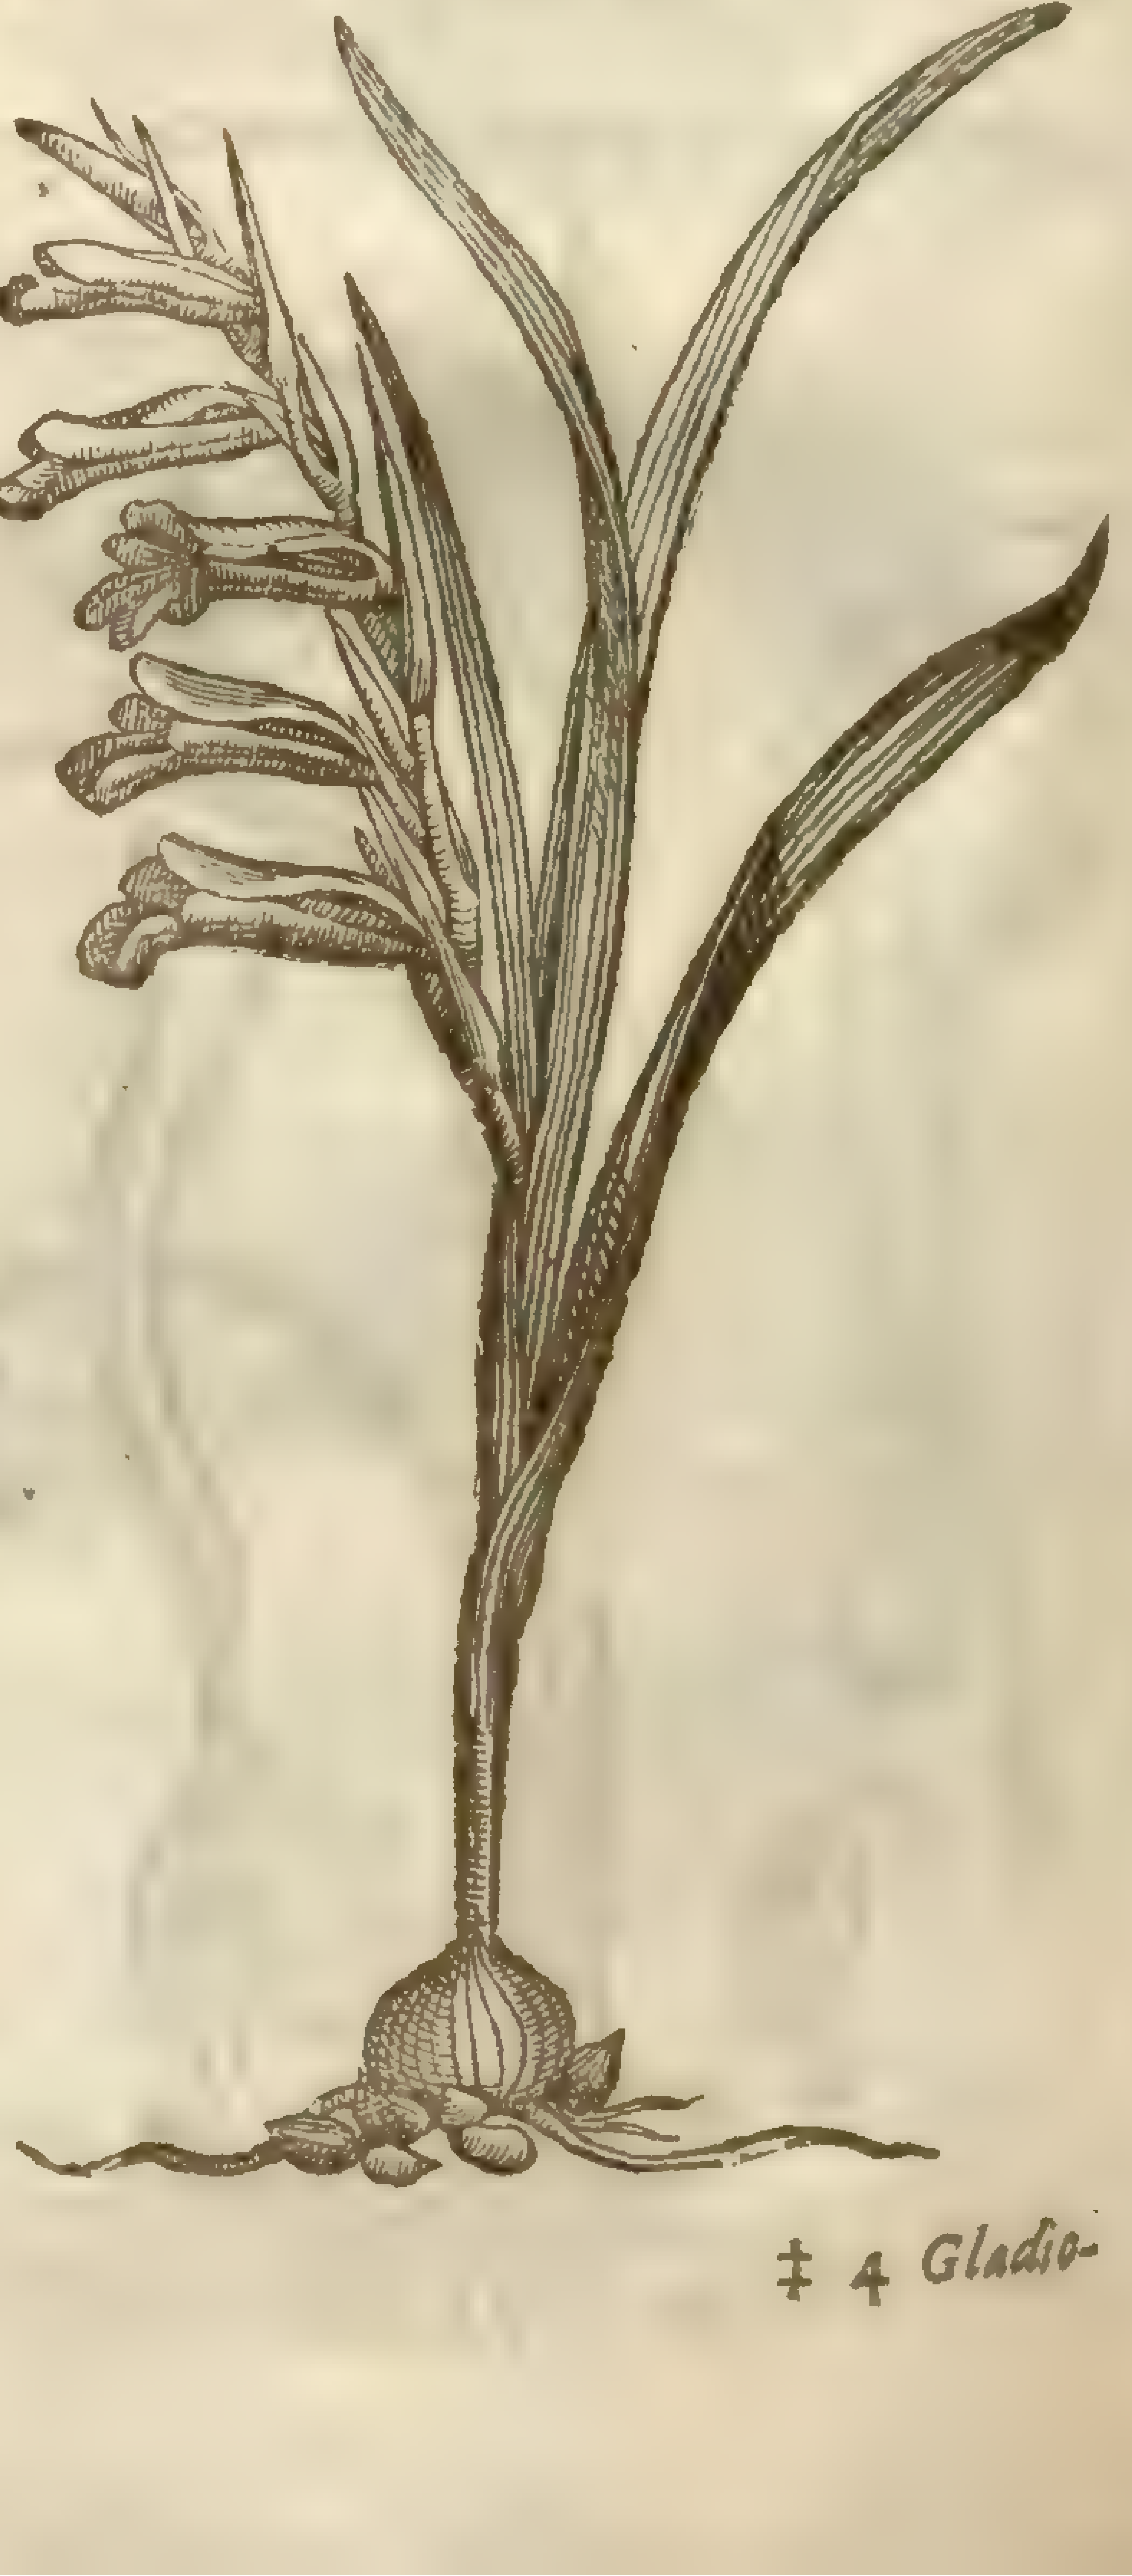
Of theſe kinds of Floure de-luces there hath been little or nothing at all left in writing concerning their natures or vertues; only the Spaniſh nut is eaten at the tables of rich and delicious, nay vitious perſons, in ſallads or otherwiſe, to procure luſt and lecherie.

Chap. 76. *Of Corne-Flag.*

1 *Gladiolus Narbonenſis.*
French Corn-Flag or Sword-Flag.



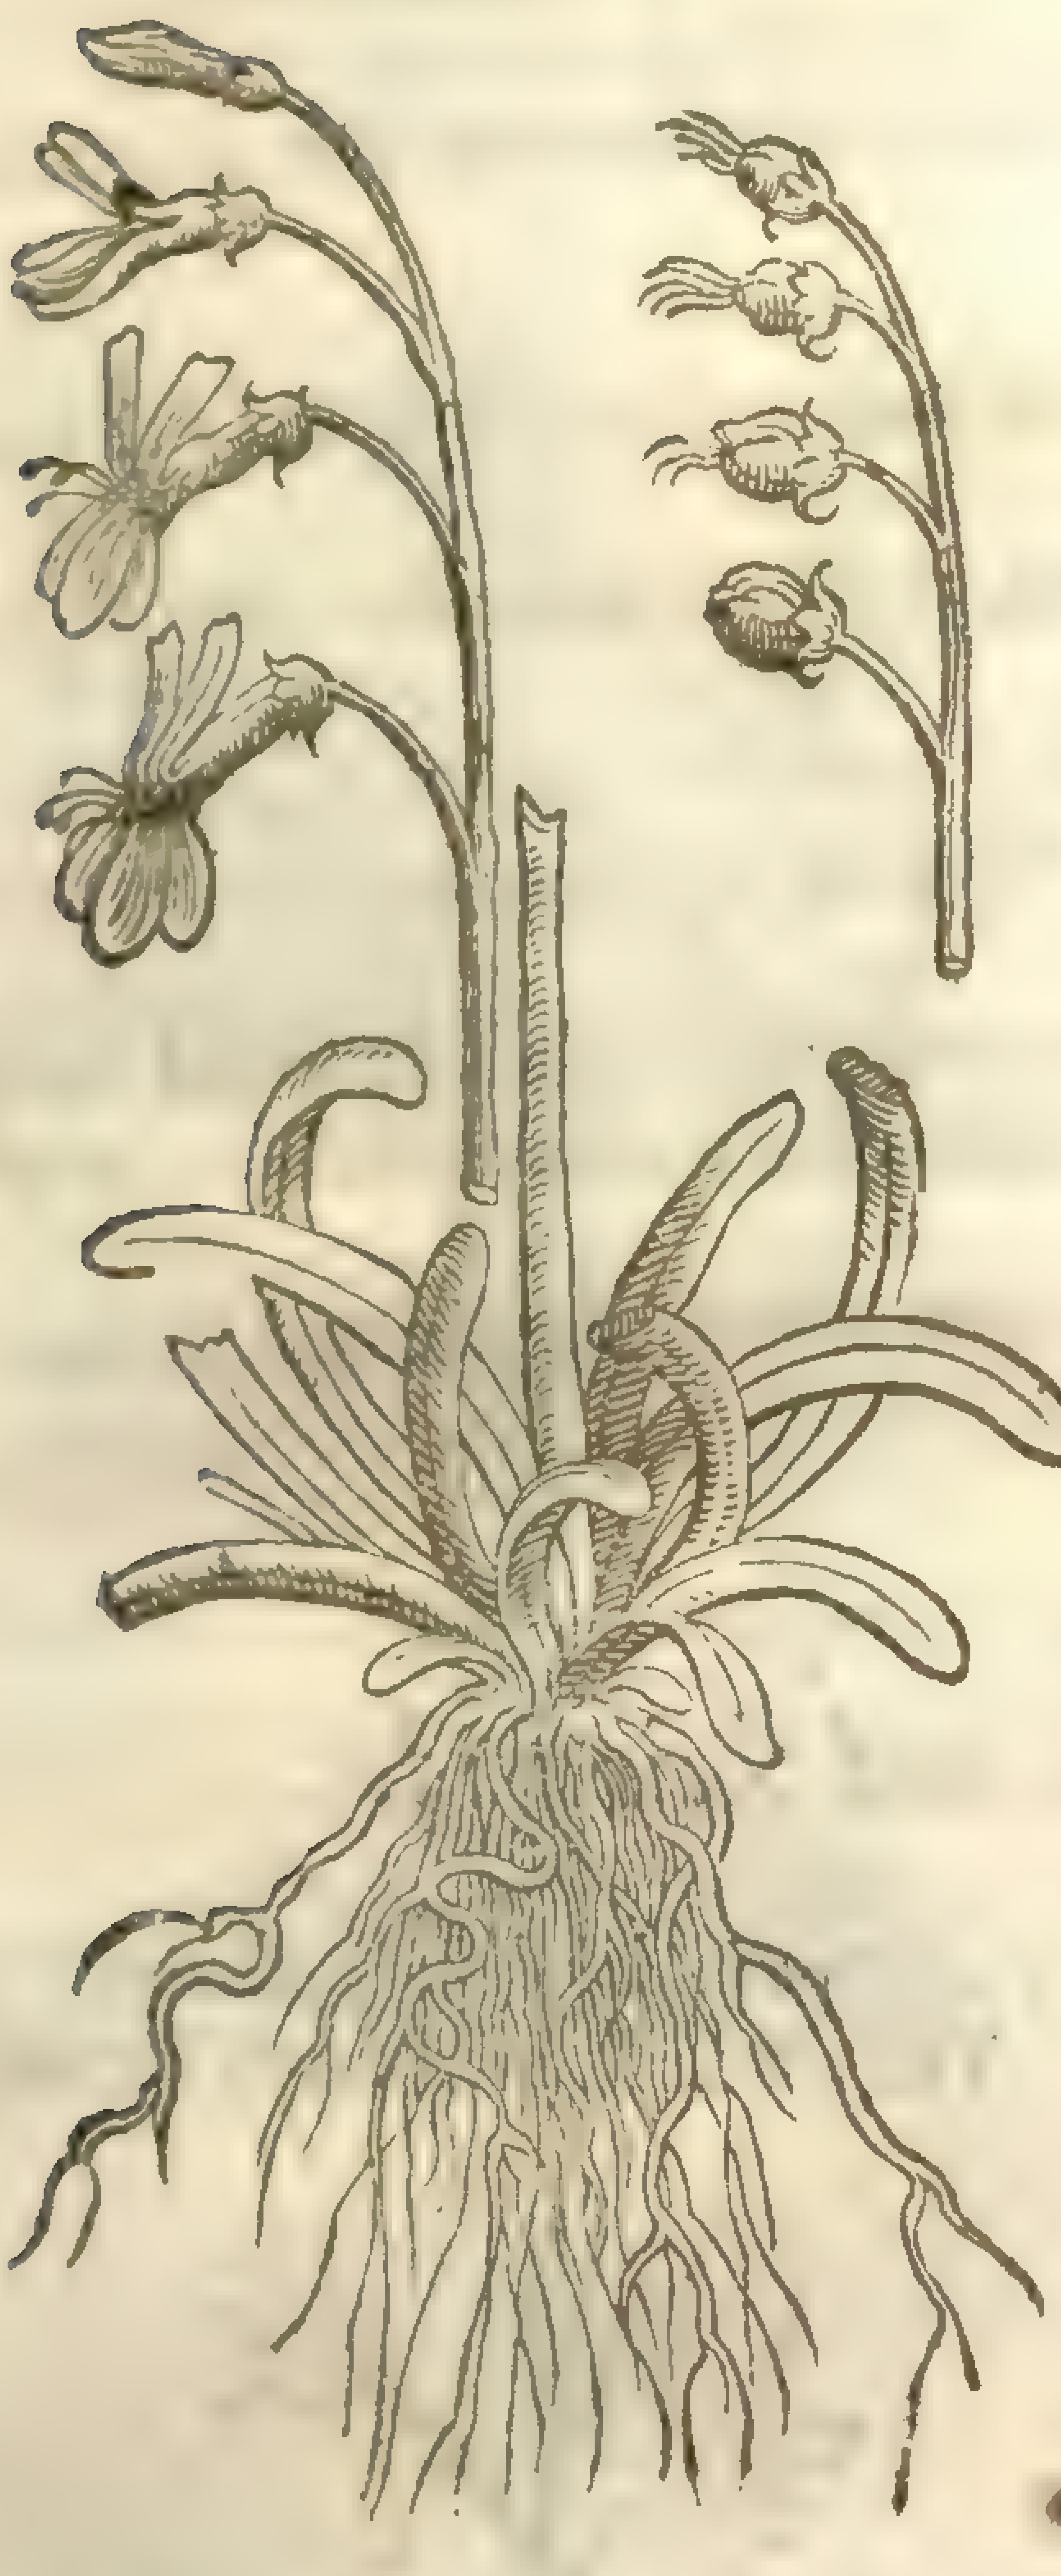
2 *Gladiolus Italicus.*
Italian Corn-Flag or Sword-Flag.



G. communis in mea. dis bta.

‡ 4 *Gladio-*

‡ 4 *Gladiolus Lacuſtris.*
Water Sword-flag.



Lobelia Dortmanna

¶ *The Deſcription.*

1 FRench Corne-flagge hath ſmall ſtiffe leaues ribbed or chamfered with long nerues or ſinues running through the ſame, in ſhape like thoſe of the ſmall Floure de-luce, or the blade of a ſword, ſharpe pointed, of an ouerworne green colour, among which riſeth vp a ſtif brittle ſtalk two cubits high, wherupon do grow in comly order many faire purple flours gaping like thoſe of Snapdragon, or not much differing from the Fox-gloue called in Latine *Digitalis.* After them come round knobby ſeed-veſſels full of chaffie ſeed, very light, of a brown reddiſh colour. The root conſiſts of two bulbes one ſet vpon the other; the vppermoſt whereof in the beginning of the ſpring is leſſer, and more full of juice; the lower greater, but more looſe and lithie, which ſhortly after periſheth.

2 Italian Corn-flag hath long narrow leaues with many ribs or nerues running through the ſame: the ſtalk is ſtiffe and brittle, wherupon do grow floures orderly placed vpon one ſide of the ſtalk, whereas the precedent hath his floures placed on both ſides of the ſtalk, in ſhape & colour like the former, as are alſo the roots, but ſeldom ſeen one aboue another, as in the former.

3 There is a third ſort of Corne-flag, agreeing with the laſt deſcribed in euery point, ſaue that the floures of this are of a pale colour, as it were betweene white and that which we call Maidens bluſh.

‡ 4 This water Sword-flag, deſcribed by *Cluſius* in his *Cur. Poſt.* hath leaues about a ſpanne long, thicke and hollow, with a partition in their middles, like as we ſee in the cods of ſtock Gillouers, and the like: their colour is green, and taſte ſweet, ſo that they are an acceptable food to the wilde Ducks ducking to the bottom of the water; for they ſometimes lie ſome ells vnder water: which notwithſtanding is ouer-topt by the ſtalke, which ſprings vp from among theſe leaues, and beares floures of colour white, larger than thoſe of Stock-Gillouers: but in that hollow part which is next the ſtalke they are of a blewiſh colour, almoſt in ſhape reſembling the floures of the Corn flag, yet not abſolutely like them. They conſiſt of fiue leaues, whereof the two vppermoſt are reflected toward the ſtalke: the three other being broader hang downward. After the floures there follow round pointed veſſels filled with red ſeed. It floures at the end of Iuly.

It was found in ſome places of Weſt-Friſeland, by *Iohn Dortman* a learned Apothecarie of Groning. It growes in waters which haue pure grauell at the bottom, and that bring forth no plant beſides.

Cluſius and *Dortman* who ſent it him, call it *Gladiolus Lacuſtris*, or *Stagnalis*.

¶ *The Place.*

Theſe kindes of Corne-flags grow in medowes and in earable grounds among corne, in many places of Italy, as alſo in the parts of France bordering thereunto. Neither are the fields of Auſtria and Morauia without them, as *Cordus* writeth. We haue great plenty of them in our London gardens, eſpecially for the garniſhing and decking them vp with their ſeemly floures.

¶ *The Time.*

They floure from May to the end of Iune.

¶ *The Names.*

Corne-Flag is called in Greeke, ξίφιον: in Latine, *Gladiolus*, and of ſome, *Enſis*: of others, φάσγανον: and *Gladiolus ſegetalis. Theophraſtus* in his diſcourſe of *Phaſganum* maketh it the ſame with *Xiphion. Valerius Cordus* calleth Corne-flag, *Victorialis fœmina*: others, *Victorialis rotunda*: in the Germane

Tongue, **Seigwurtz**; yet we muſt make a difference betweene *Gladiolus* and *Victorialis longa*, for that it is a kinde of Garlicke found vpon the higheſt Alpiſh mountaines, which is likewiſe called of the Germanes, **Seigwurtz**. The floures of the Corne-flag are called of the Italians, *Monacuccio*: in Engliſh, Corne-Flag, Corne-Sedge, Sword-Flag, Corne Gladin: in French, *Glais*.

¶ *The Temperature.*

The root of Corn-flag, as *Galen* ſaith, is of force to draw, waſte, conſume and dry, as alſo of a ſubtill and digeſting qualitie.

¶ *The Vertues.*

A The root ſtamped with the pouder of Frankincenſe and wine, and applied, draweth forth ſplinters and thornes that ſticke faſt in the fleſh.

B Being ſtamped with the meale of Darnell and honied water, it waſtes and makes ſubtill, hard lumps, nodes, and ſwellings, being emplaiſtred.

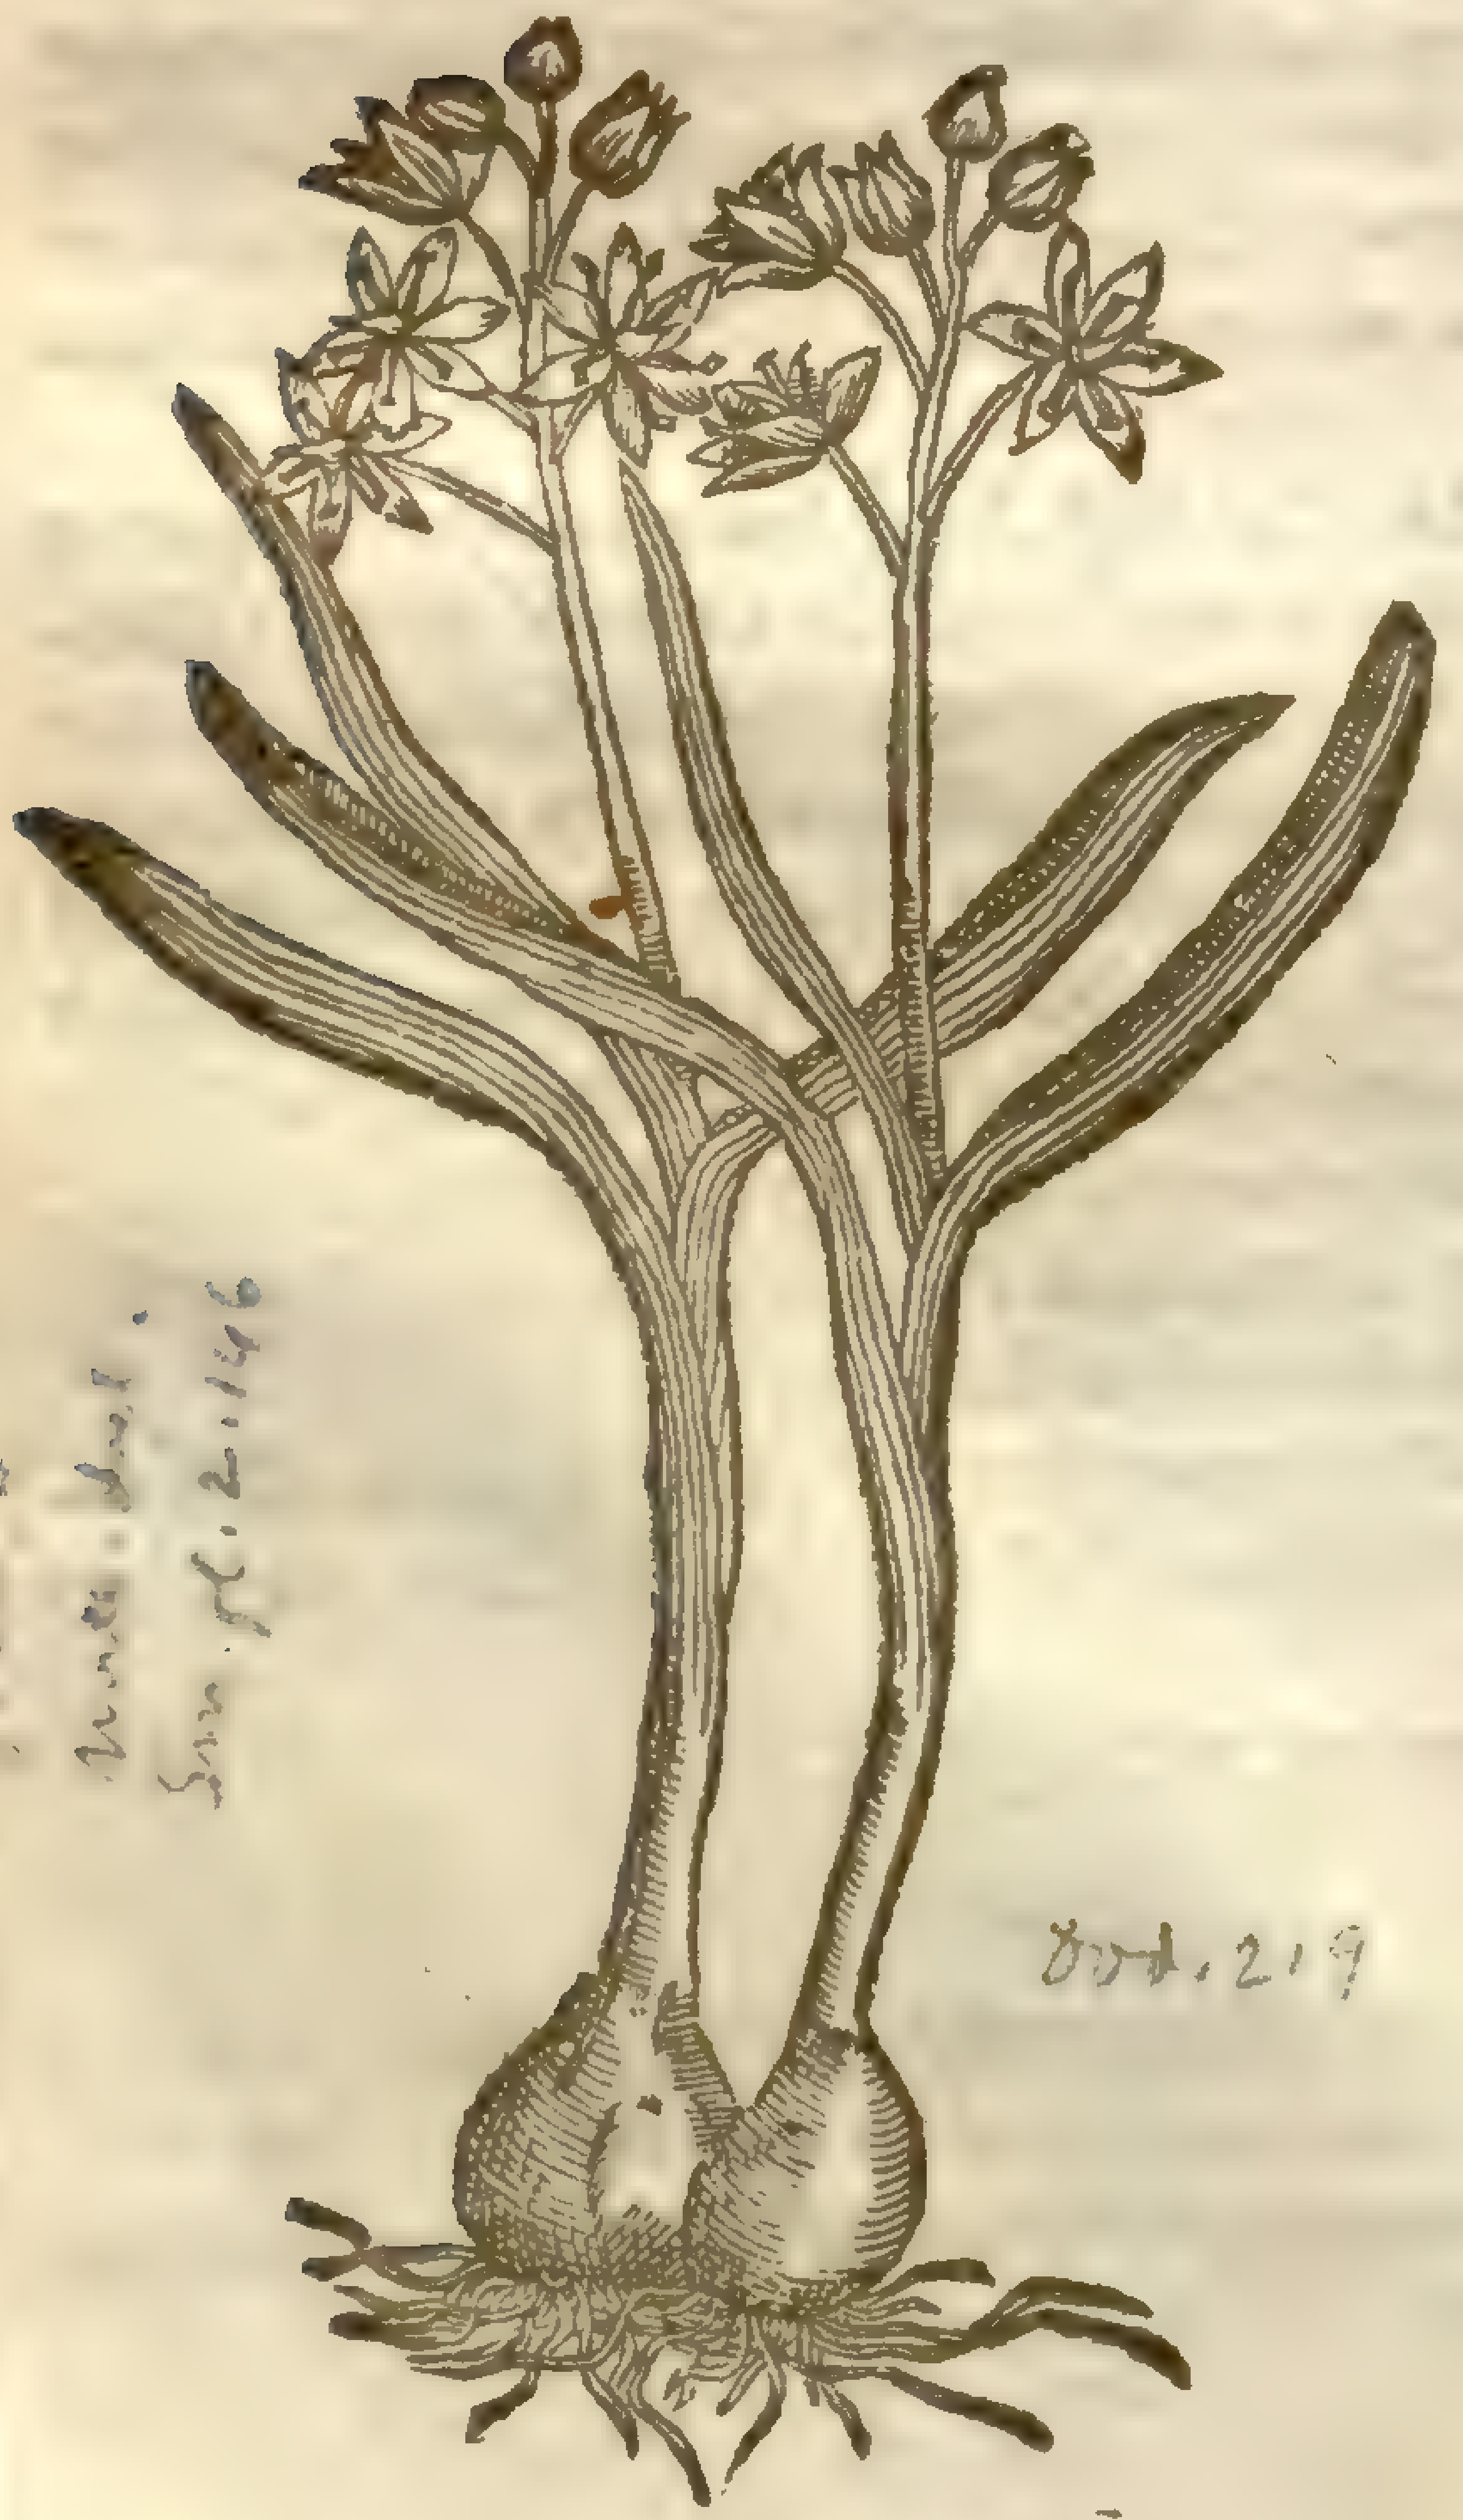
C Some affirme, That the vpper root prouoketh bodily luſt, and the lower cauſeth barrenneſſe.

D The vpper root drunke in water is profitable againſt that kinde of burſting in children called *Enterocele*.

E The root of Corn-flag ſtamped with hogs greaſe and wheaten meale, hath been found by late Practitioners in Phyſicke and Surgerie, to be a certain and approued remedie againſt the *Scrophulæ*, and ſuch like ſwellings in the throat.

F The cods with the ſeed dried and beaten into pouder, and drunk in Goats milke or Aſſes milke, preſently taketh away the paine of the Colique.

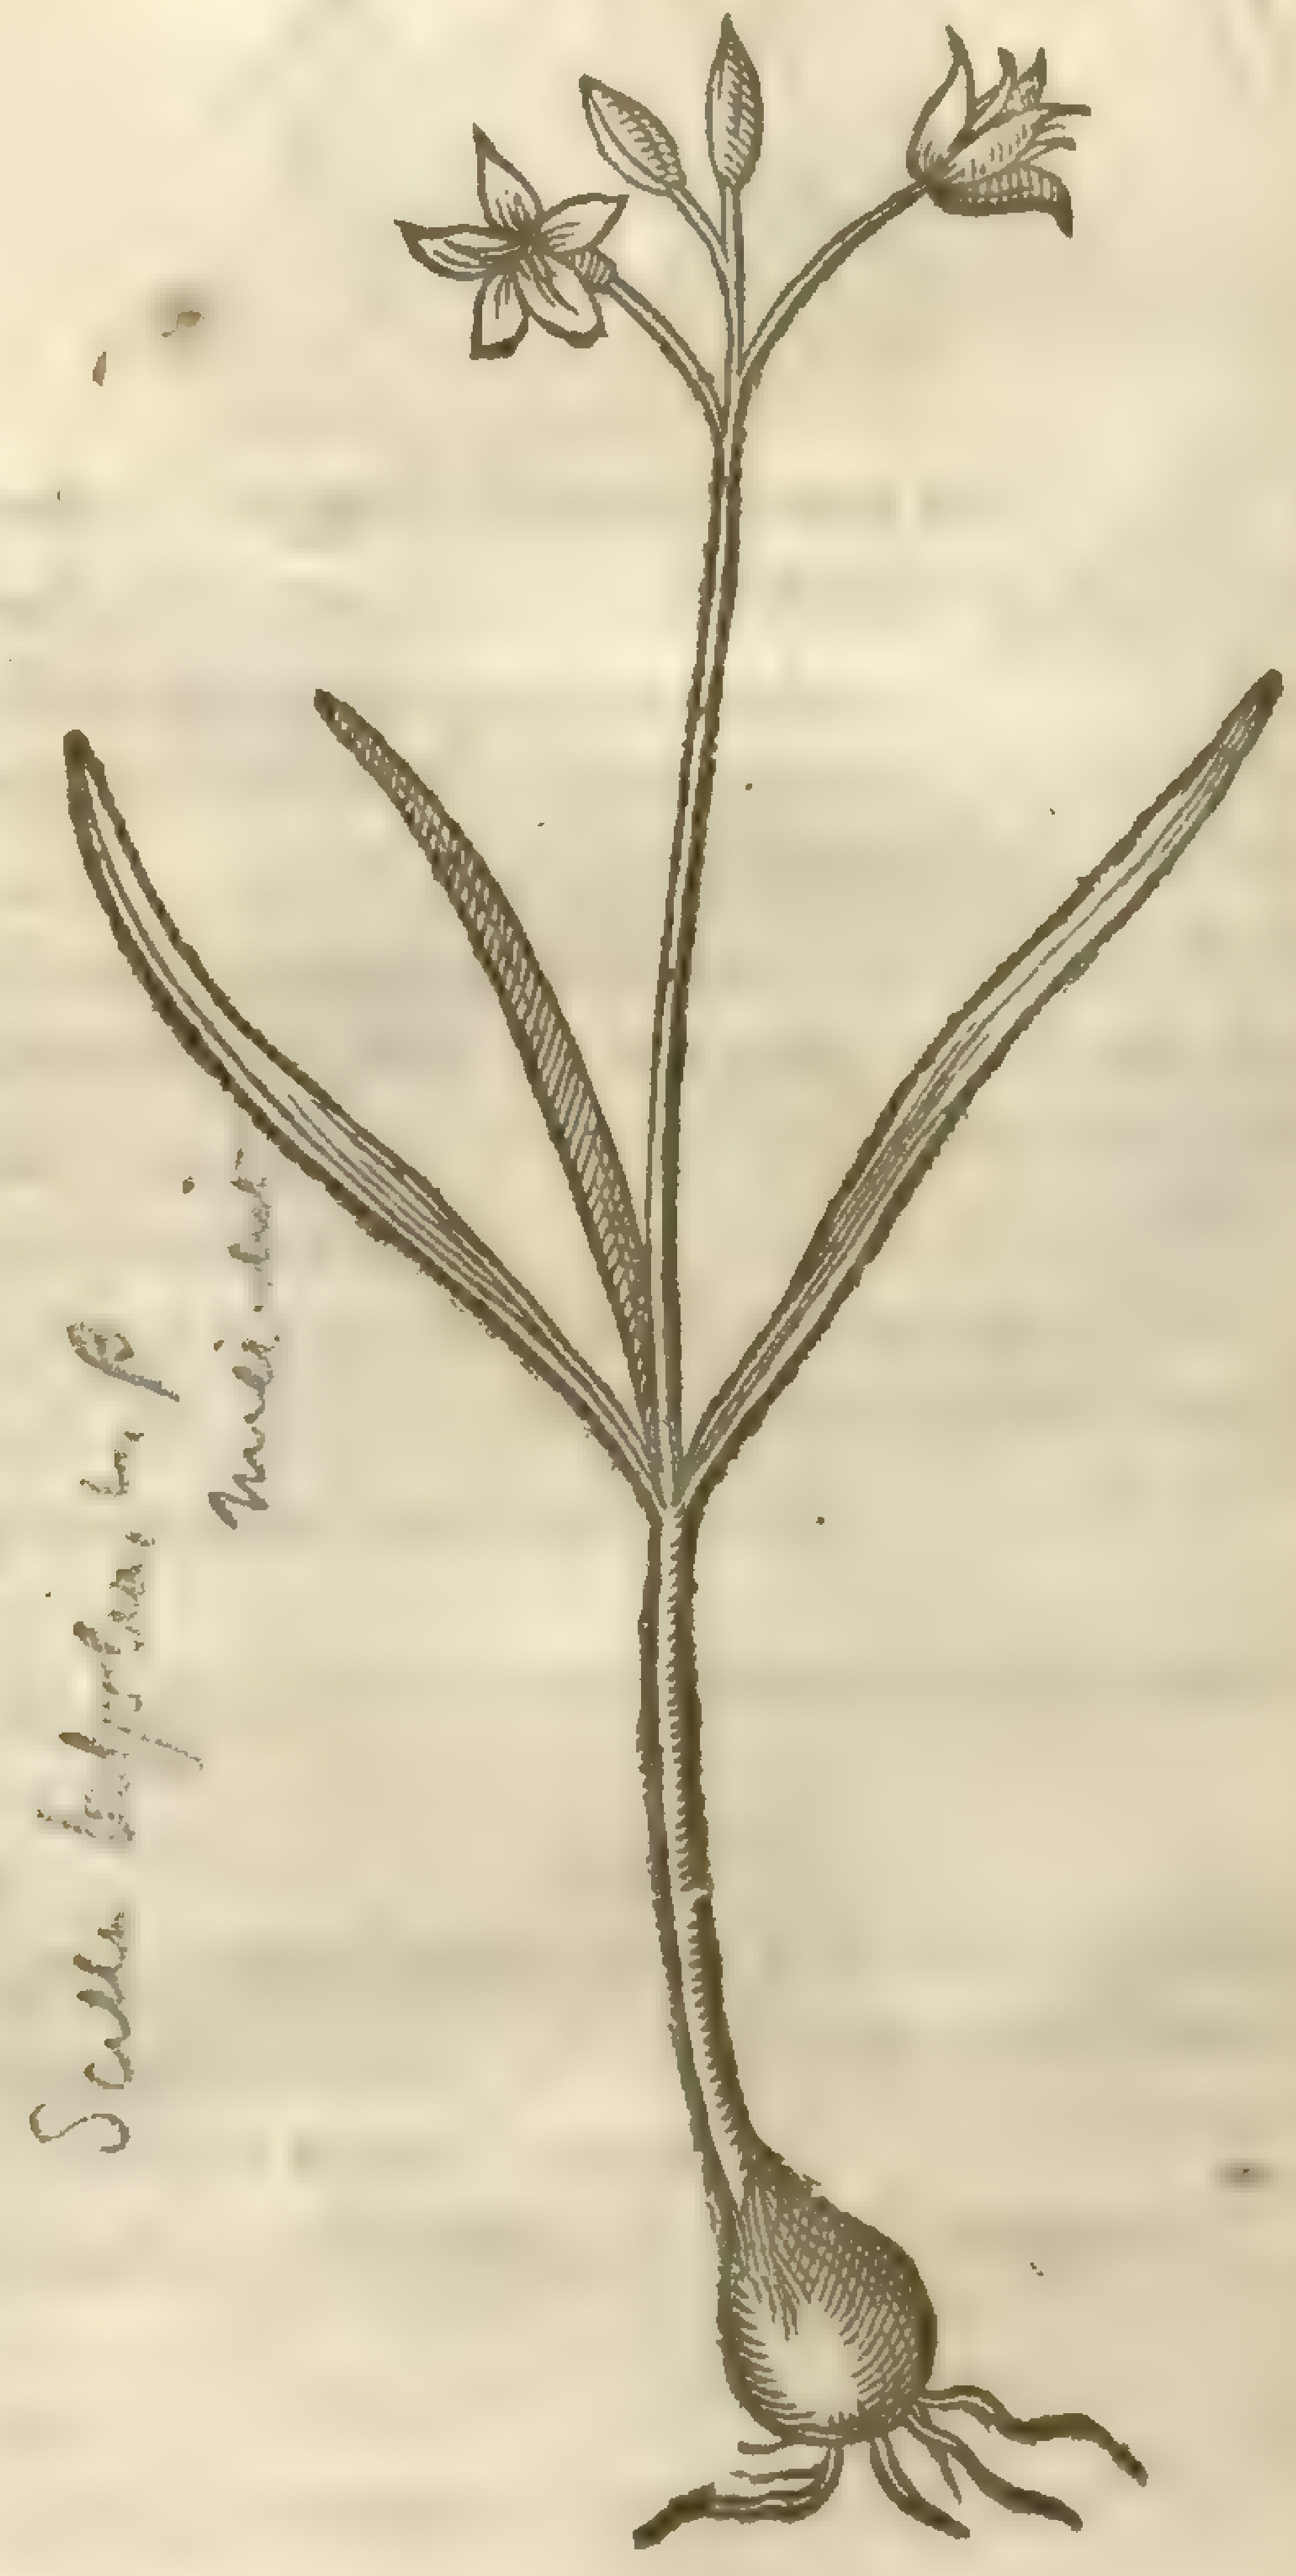
Chap. 77. *Of Starry Hyacinths and their kindes.*



1 *Hyacinthus ſtellatus Fuchſij.*
Starry Iacinth.

Scilla bifolia L.
mihi dub.
Sm. fl. 2.146

Dod. 219



‡ 2 *Hyacinthus ſtellaris albicans.*
The white floured ſtarry Iacinth.

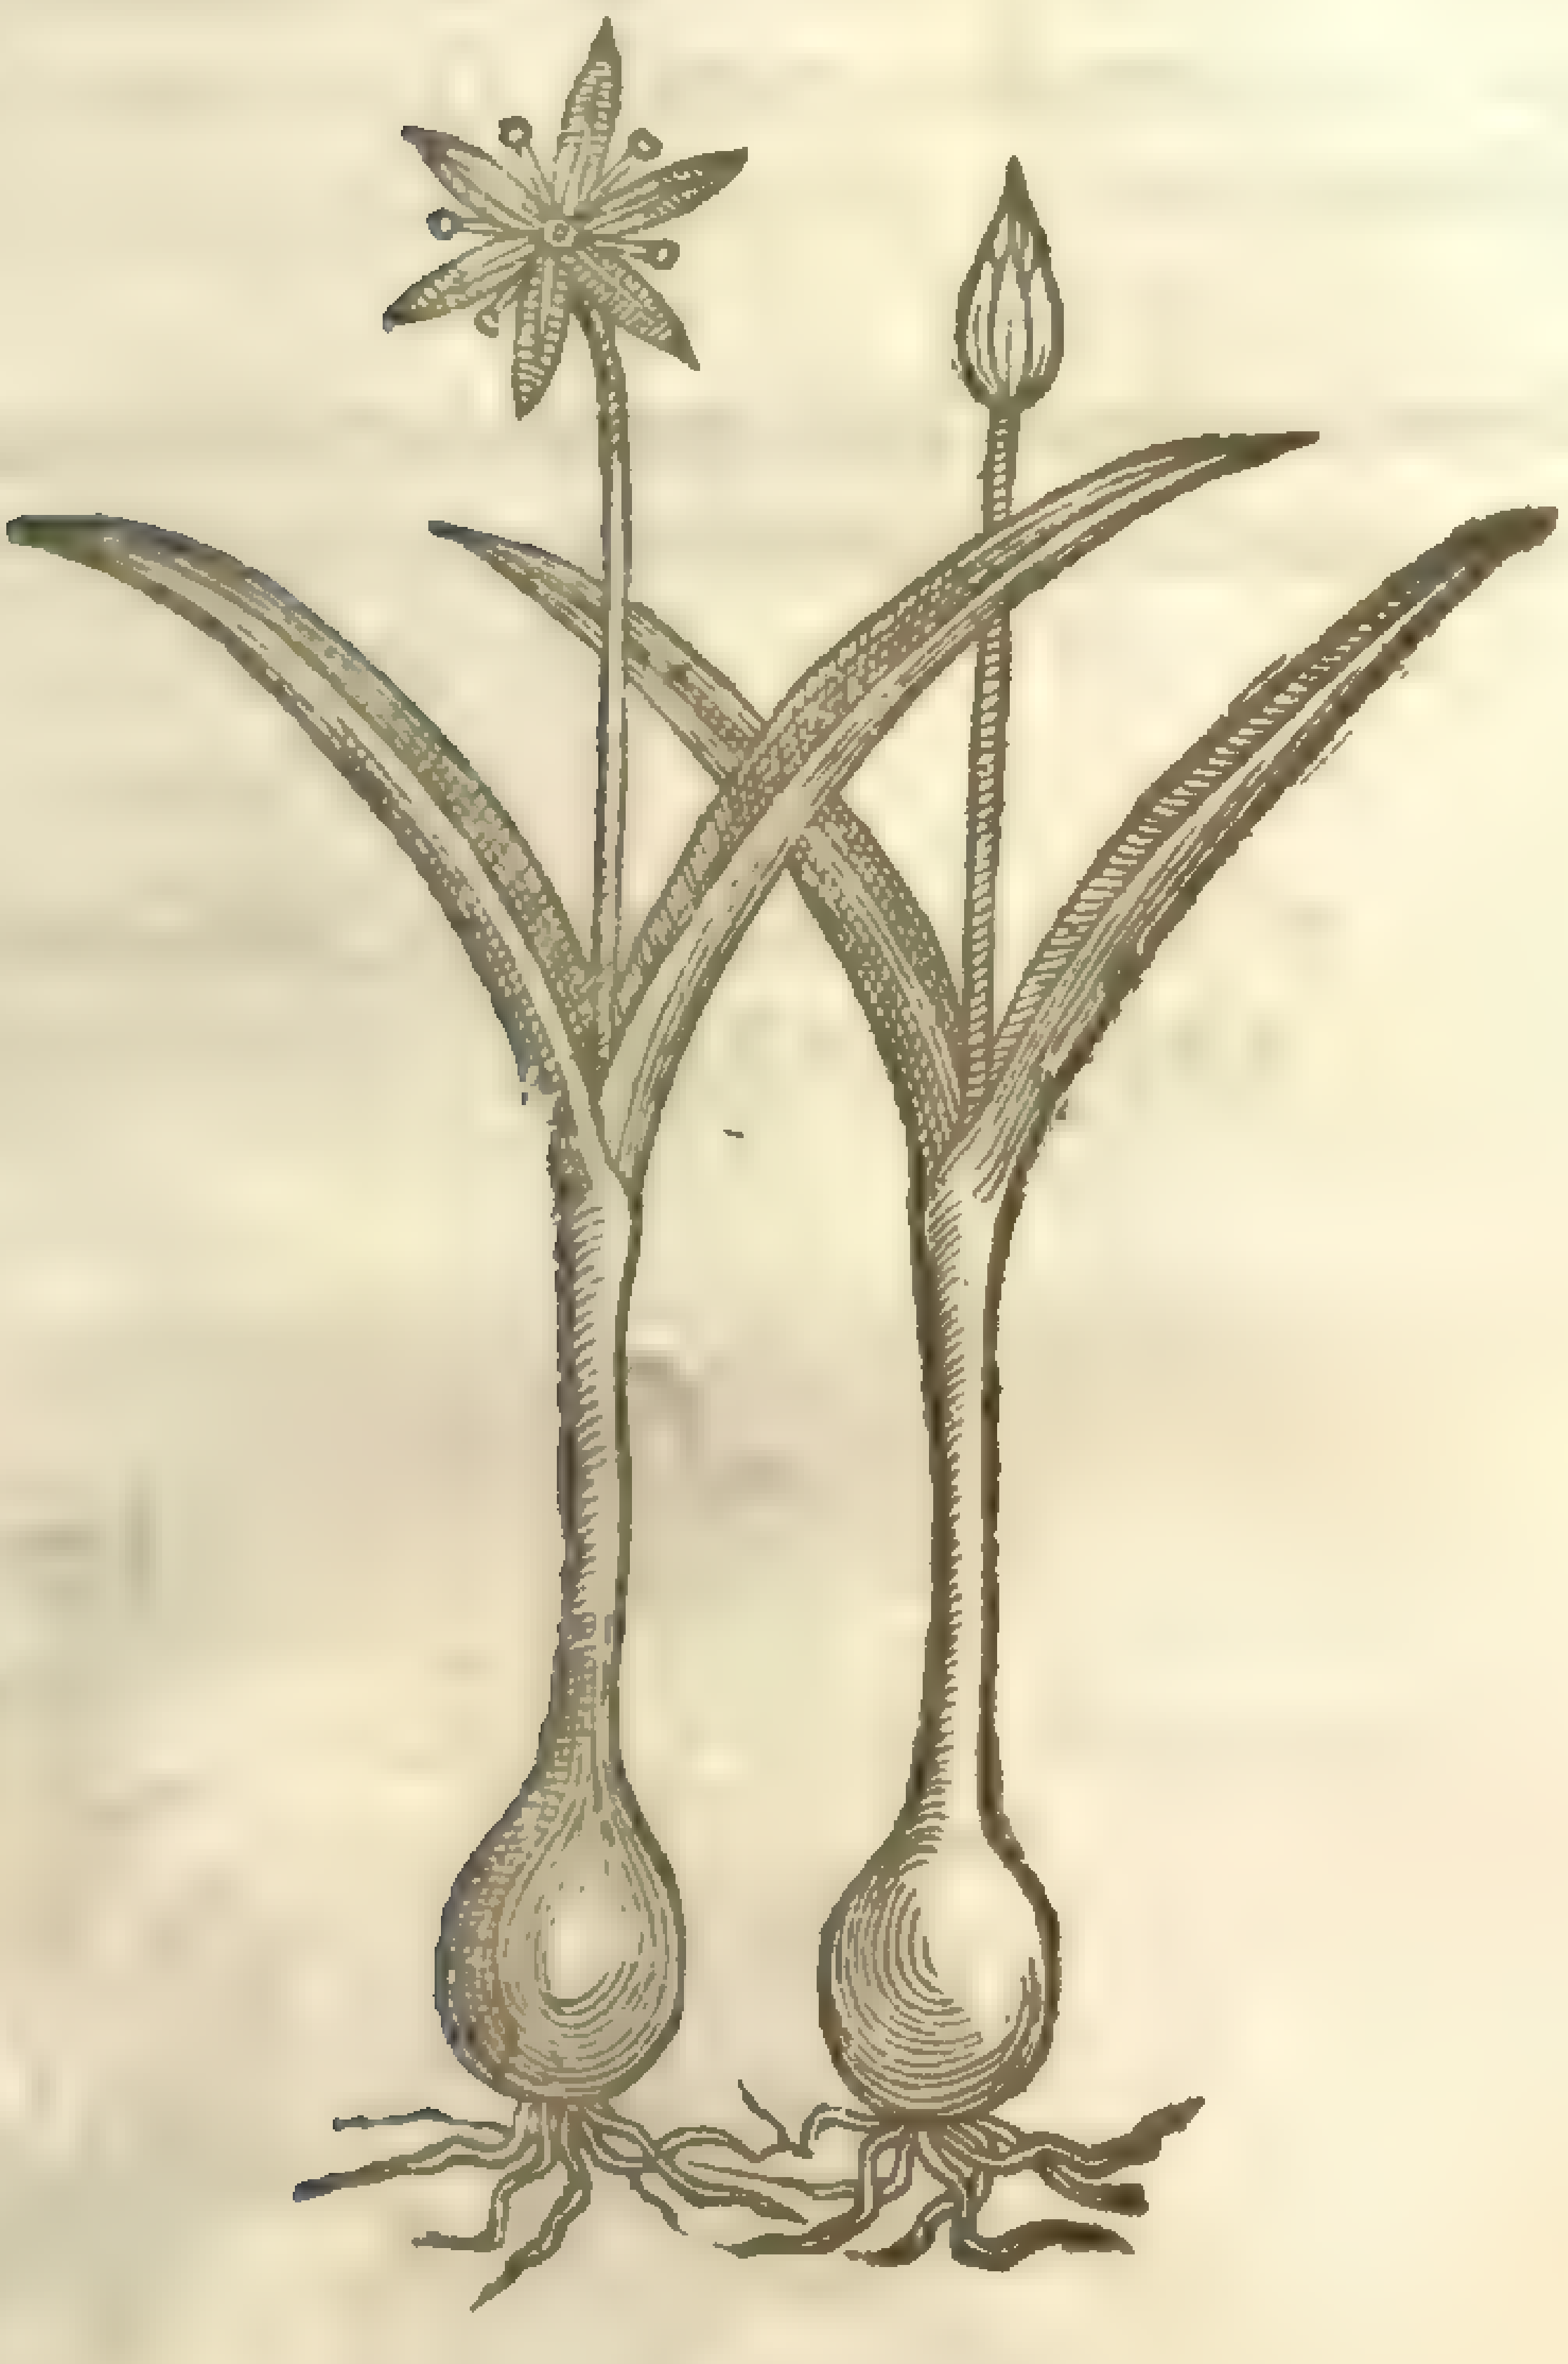
Scilla bifolia, L. β
mihi dub.

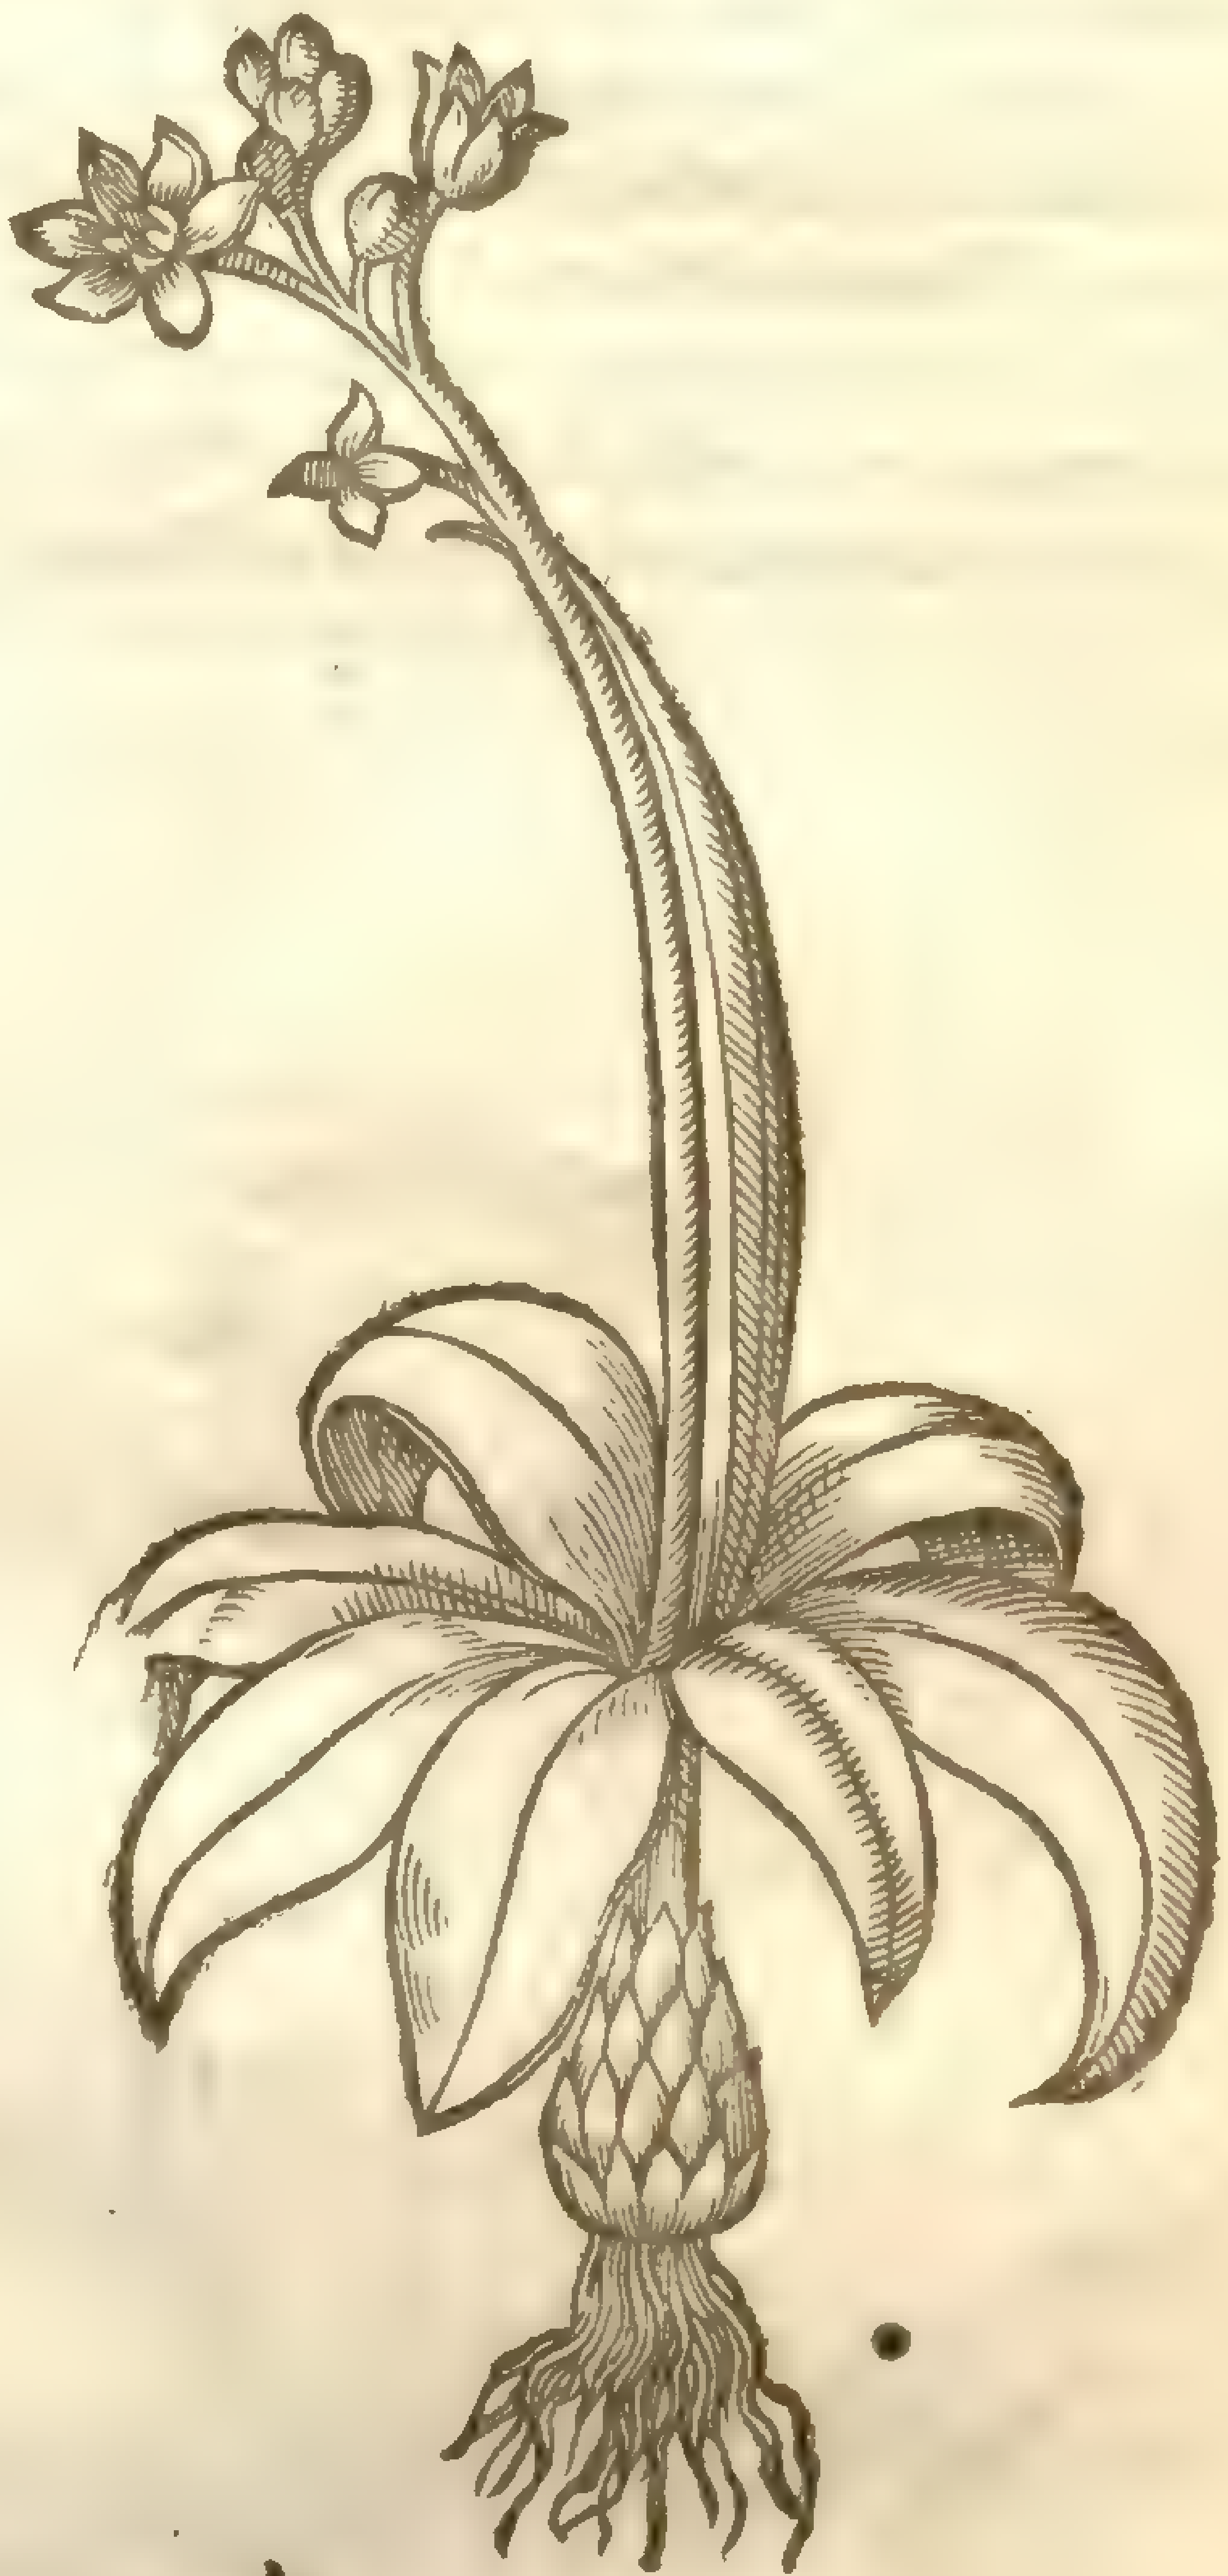
¶ *The Kindes.*

THere be likewiſe bulbous or Onion-rooted plants that do orderly ſucceed, whereof ſome are to be eaten, as Onions, Garlicke, Leekes, and Ciues; notwithſtanding I am firſt to entreat of thoſe bulbed roots, whoſe faire and beautifull floures are receiued for their grace & ornament in gardens and garlands: the firſt is the Hyacinths, whereof there is found at this day diuers ſorts, differing very notably in many points, as ſhall be declared in their ſeuerall deſcriptions.

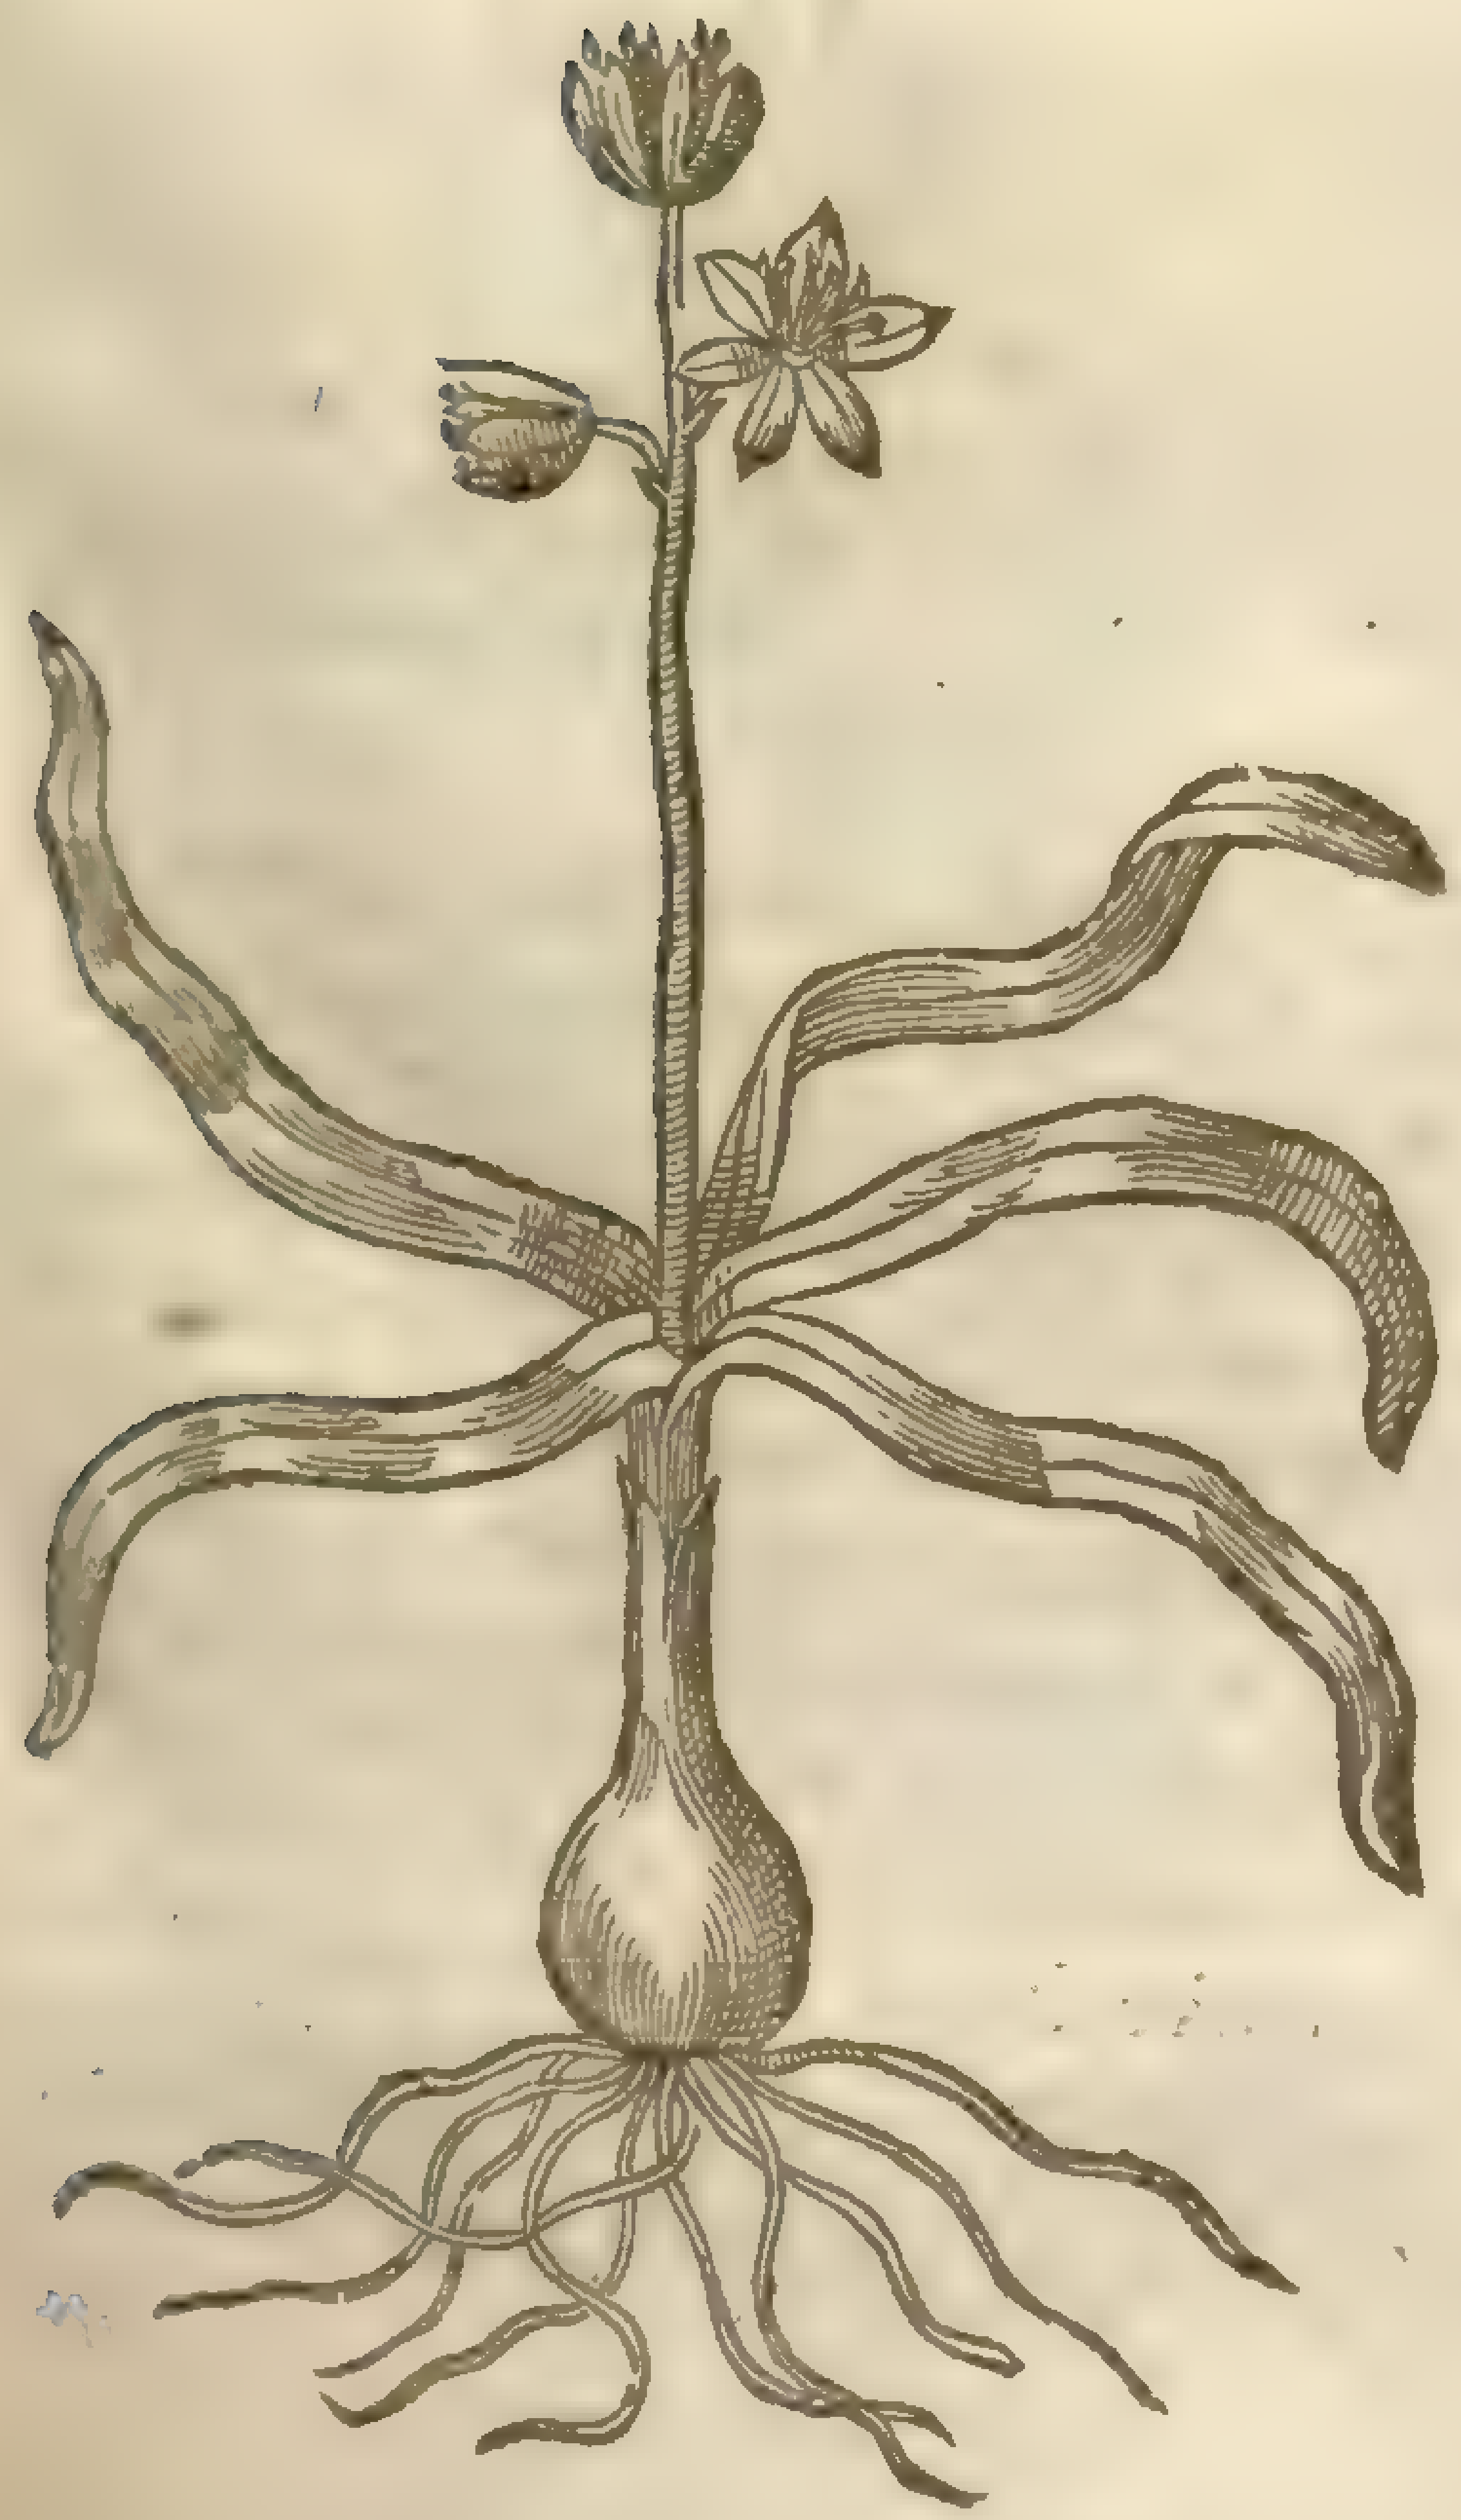
† 3 *Hyacinthus ſtellatus bifolius.*
Two leaued ſtarry Iacinth.

4 *Hyacinthus ſtellatus latifolius cum flore & ſemine.*
The Lilly leaued ſtarry Iacinth in floure and ſeed.





‡ 6 *Hyacinthus ſtellaris Byzantinus.*
The ſtarry Iacinth of Conſtantinople.



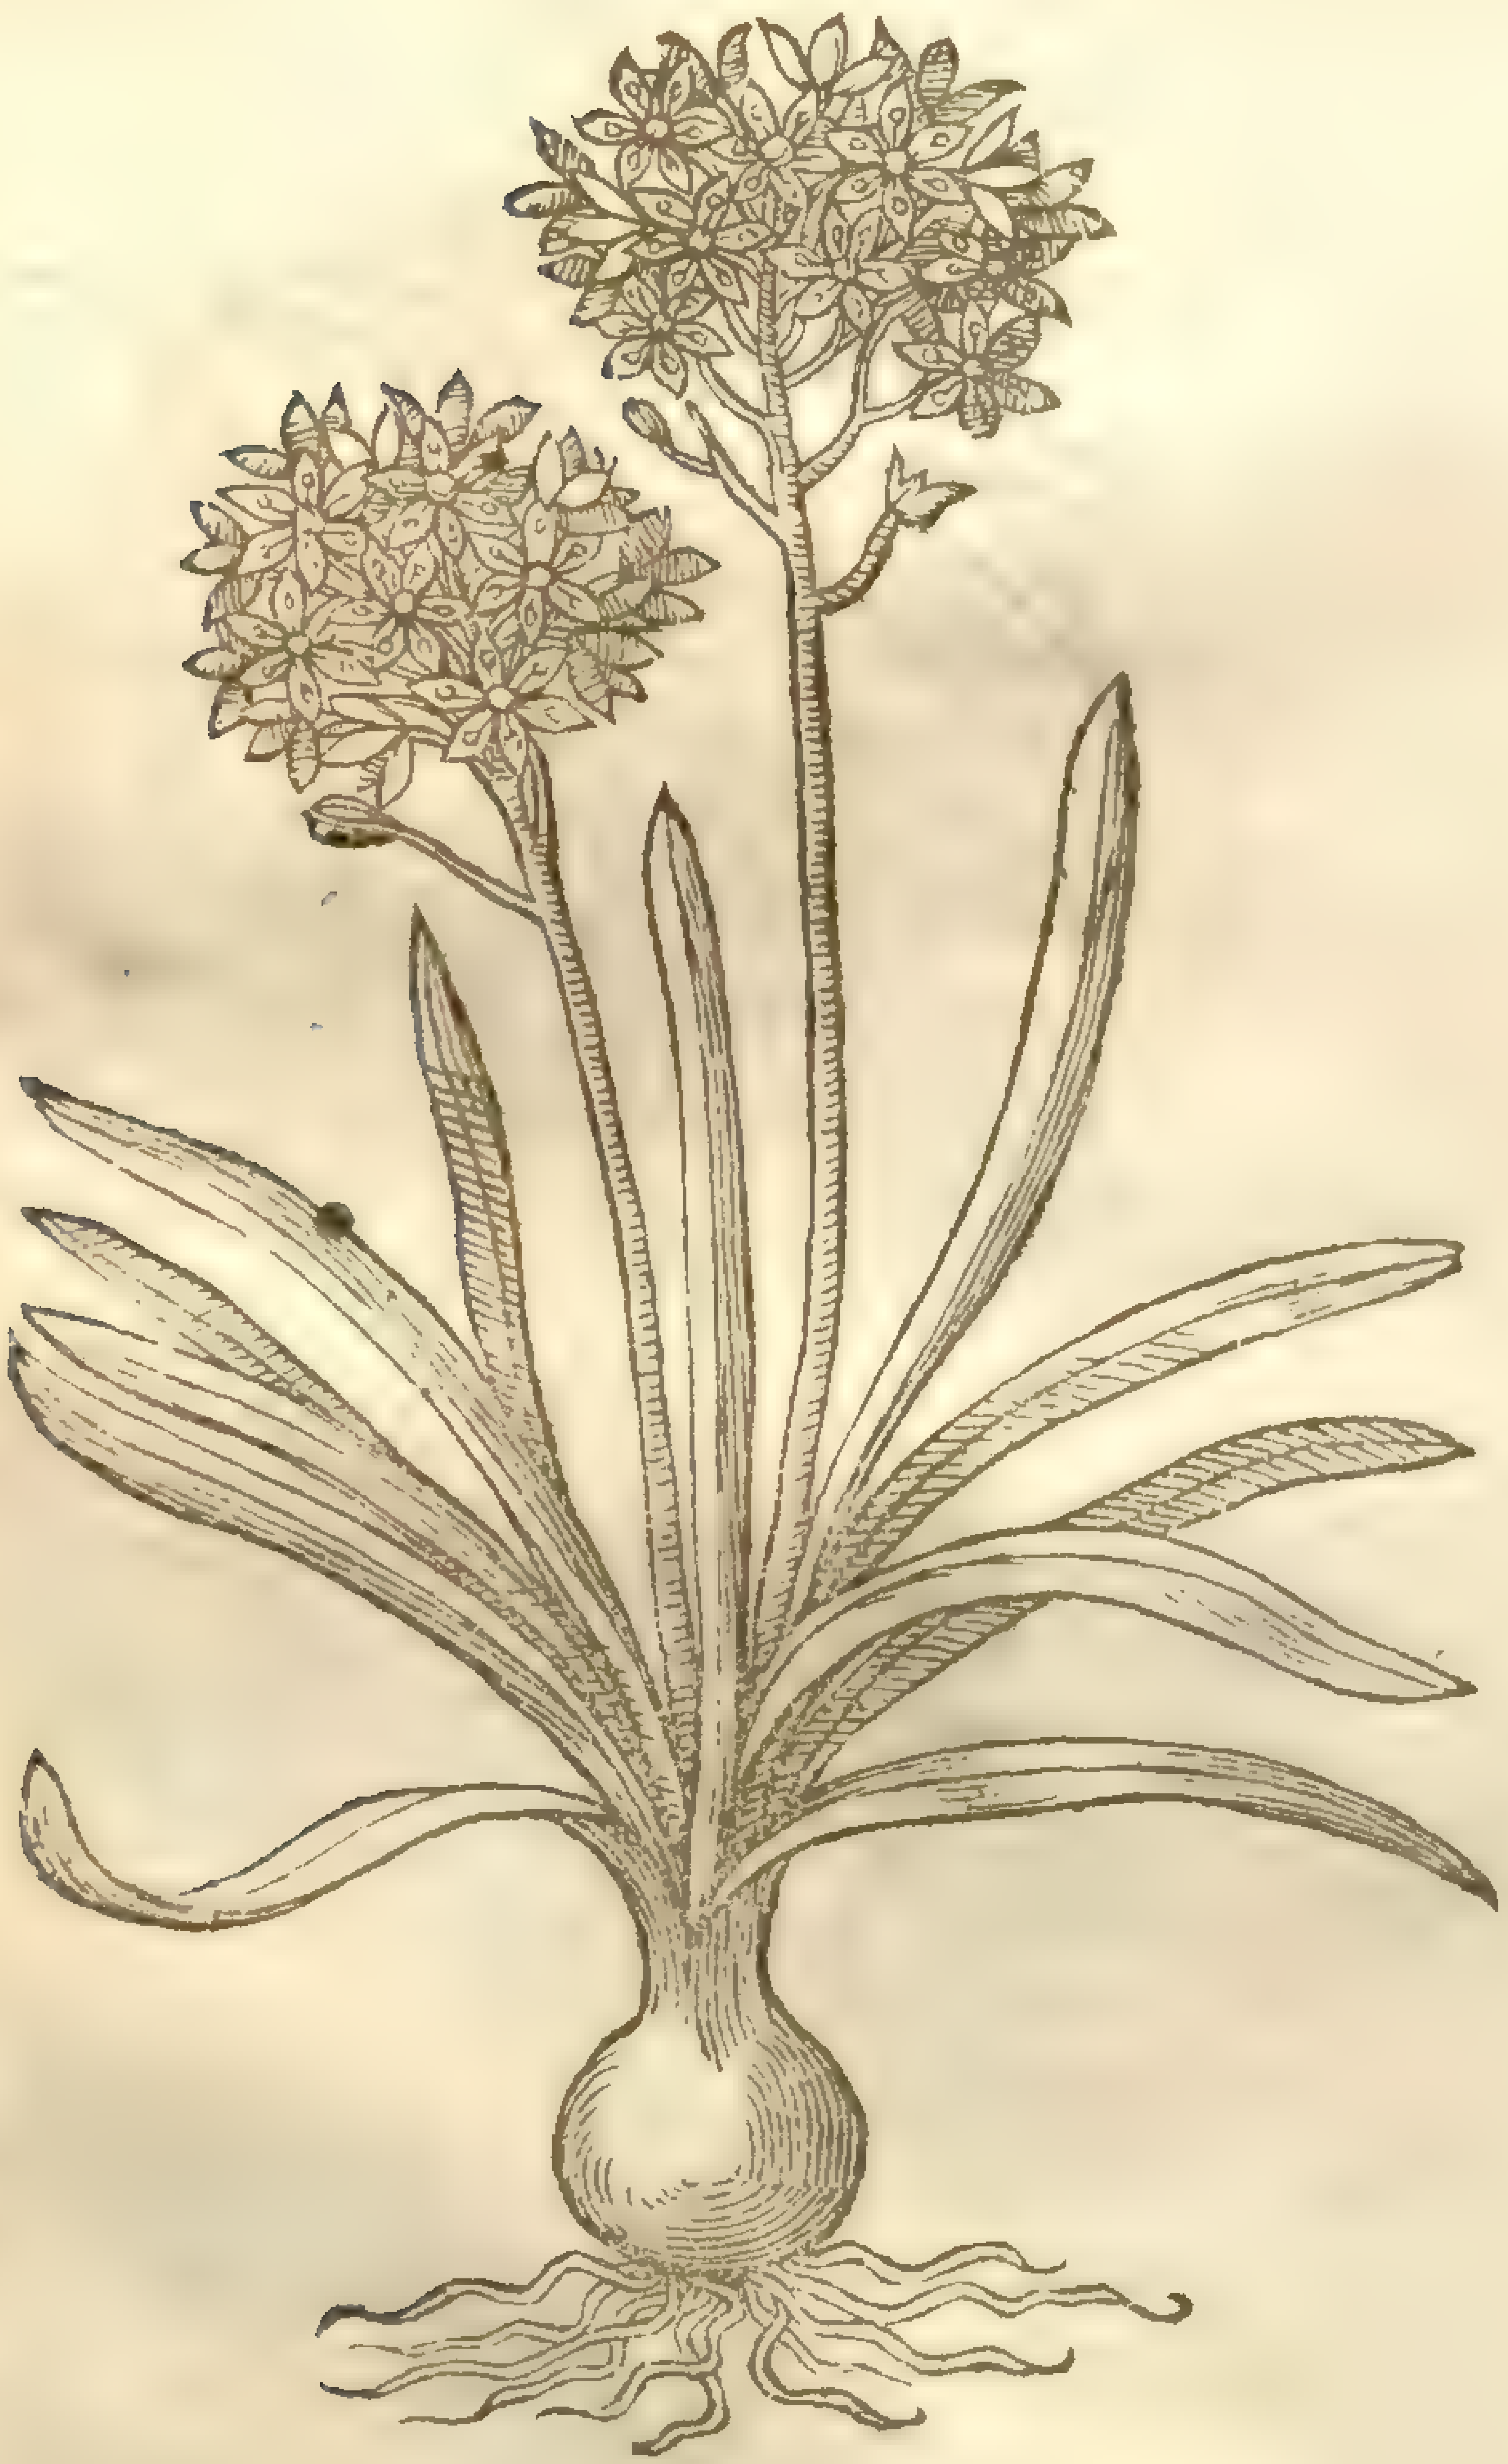
¶ *The Deſcription.*

1 The firſt kinde of Iacinth hath three very fat thicke browne leaues, hollow like a little trough, very brittle, of the length of a finger: among which ſhoot vp fat thick browniſh ſtalks, ſoft and very tender, and ful of juice; whereupon do grow many ſmal blew floures conſiſting of ſix little leaues ſpred abroad like a ſtar. The ſeed is contained in ſmal round bullets, which are ſo ponderous or heauy, that they lie trailing vpon the ground. The root is bulbous or onion-faſhion, couered with browniſh ſcales or filmes.

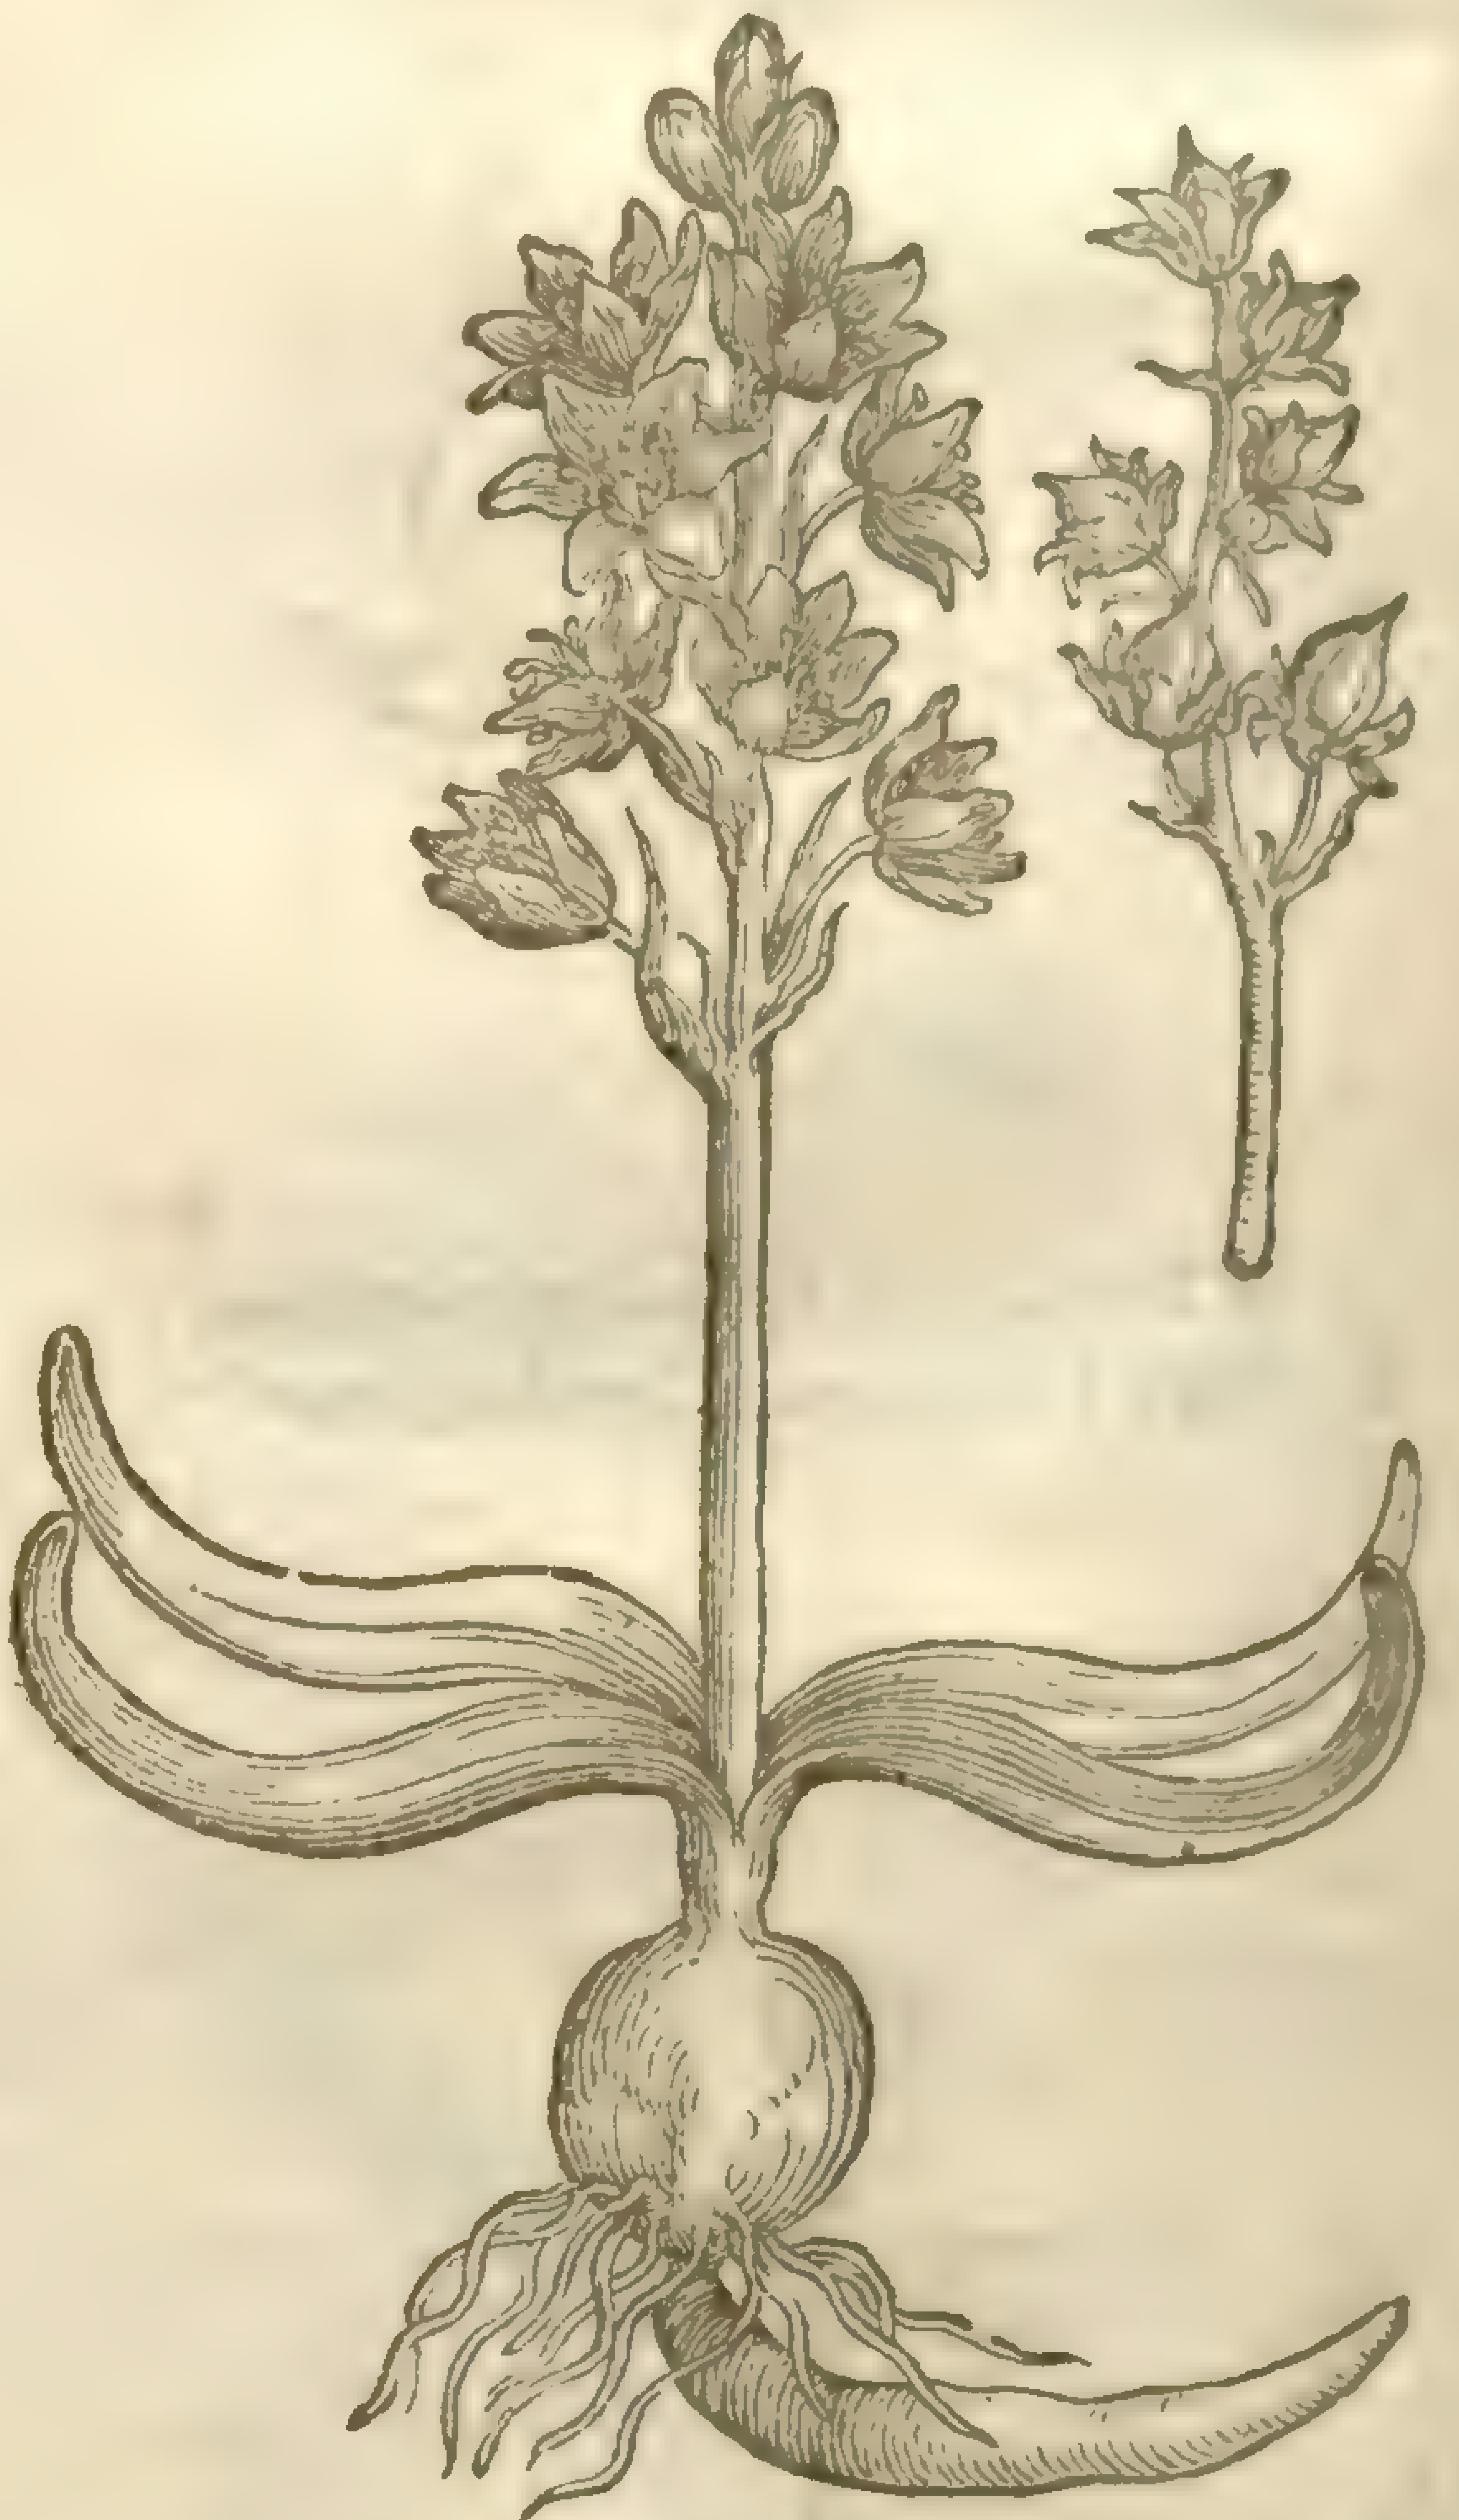
2 There is alſo a white floured one of this kinde.

3 There is found another of this kinde, which ſeldome or neuer hath more than two leaues. The roots are bulbed like the other: the floures be whitiſh, ſtar-faſhion, tending to blewneſſe; the which I receiued of *Robinus* of Paris.

‡ 8 *Hyacinthus ſtellaris* Someri.
Somers ſtarry Iacinth.



‡ 9 *Hyacinthus ſtellatus æſtiuus major.*
The greater ſtarry Summer Iacinth.



4 This kinde of Hyacinth hath many broad leaues ſpred vpon the ground like vnto thoſe of garden Lilly, but ſhorter. The ſtalks do riſe out of the midſt thereof, bare, naked, and very ſmooth, an handfull high; at the top whereof do grow ſmall blew floures ſtarre-faſhion, very like vnto the precedent. The root is thicke and full of juice, compact of many ſcaly cloues of a yellow colour.

‡ There are ſome ten or eleuen varieties of ſtarry Iacinths beſides theſe two mentioned by our Author. They differ each from other either in the time of flouring, (ſome of them flouring in the Spring, other ſome in Summer) in their bigneſſe, or the colours of their floures. The leaues of moſt of them are much like to our ordinarie Iacinth or Hare-bells, and lie ſpred vpon the ground. Their floures in ſhape reſemble the laſt deſcribed, but are vſually more in number, and ſomewhat larger. The colour of moſt of them is blew or purple, one of them excepted, which is of an Aſh colour, and is knowne by the name of *Somers* his Iacinth. I thinke it not amiſſe to giue you their vſuall names, together with ſome of their figures; for ſo you may eaſily impoſe them truly vpon the things themſelues whenſoeuer you ſhall ſee them.

5 *Hyacinthus ſtellaris Byzantinus nigra radice flore cæruleo.*
The blew ſtarry Iacinth of Conſtantinople with the blacke root. [illegible]

6 *Hyacinthus ſtellatus Byzantinus major flore cæruleo.*
The greater blew ſtarry Iacinth of Conſtantinople.

7 *Hyacinthus ſtellatus Byzantinus major flore boraginis.* Scilla amœna L. Mill. dict.
The other blew ſtarry Iacinth of Conſtantinople, with floures ſomwhat reſembling borage

8 *Hyacinthus ſtellaris æſtivus, ſive exoticus* Someri *flore cinereo.*
Aſh-coloured ſtarry Iacinth, or *Somers* Iacinth.

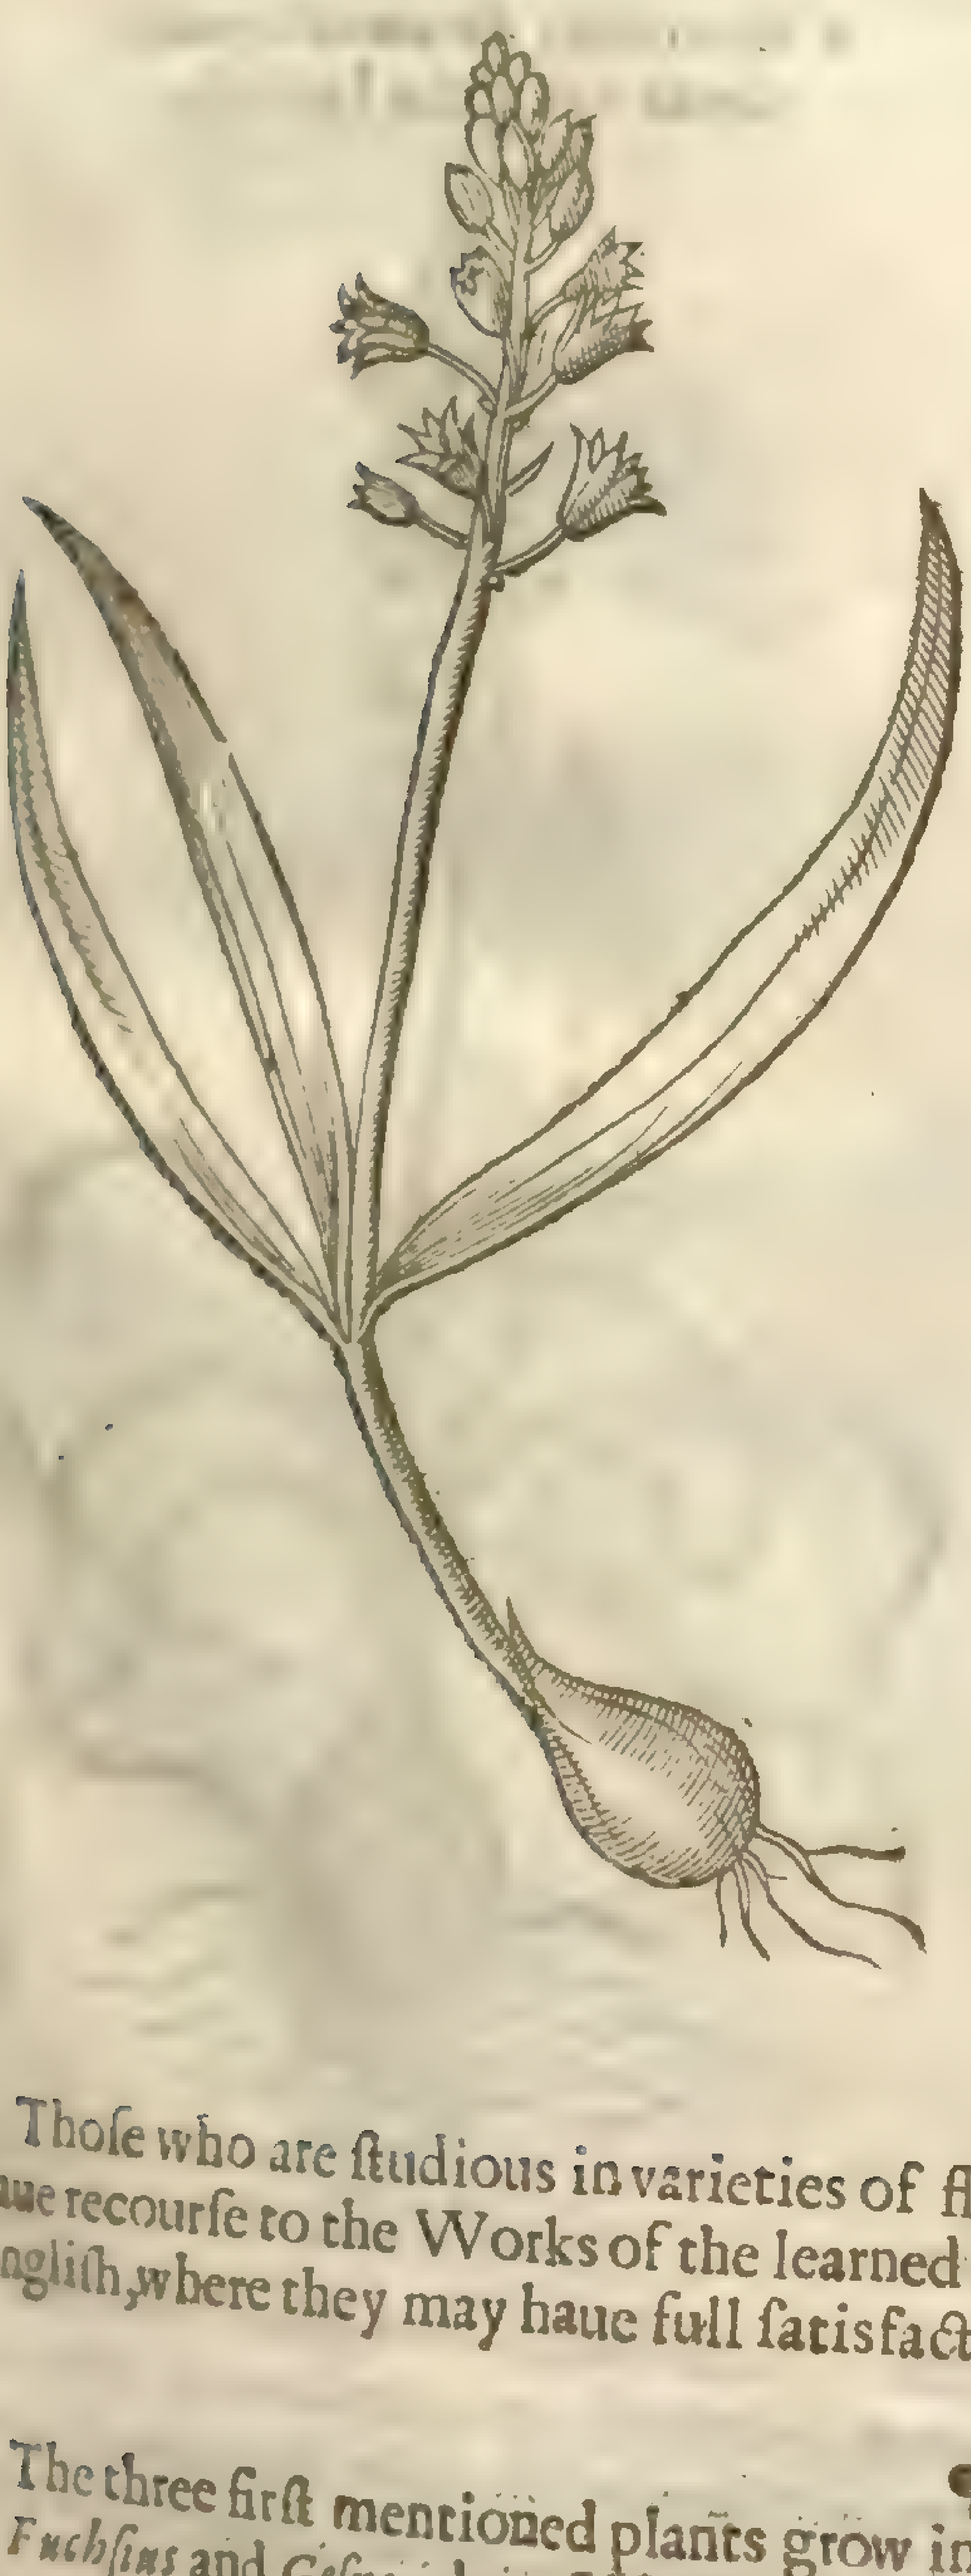
9 *Hyacinthus ſtellatus æſtivus maior.*
The greater ſtarry Summer Iacinth.

11 *Hyacinthus ſtellaris* Poreti *flore cæruleo ſtrijs purpureis.*
Porets ſtarry Iacinth with blew floures, hauing purple ſtreaks alongſt their middles.

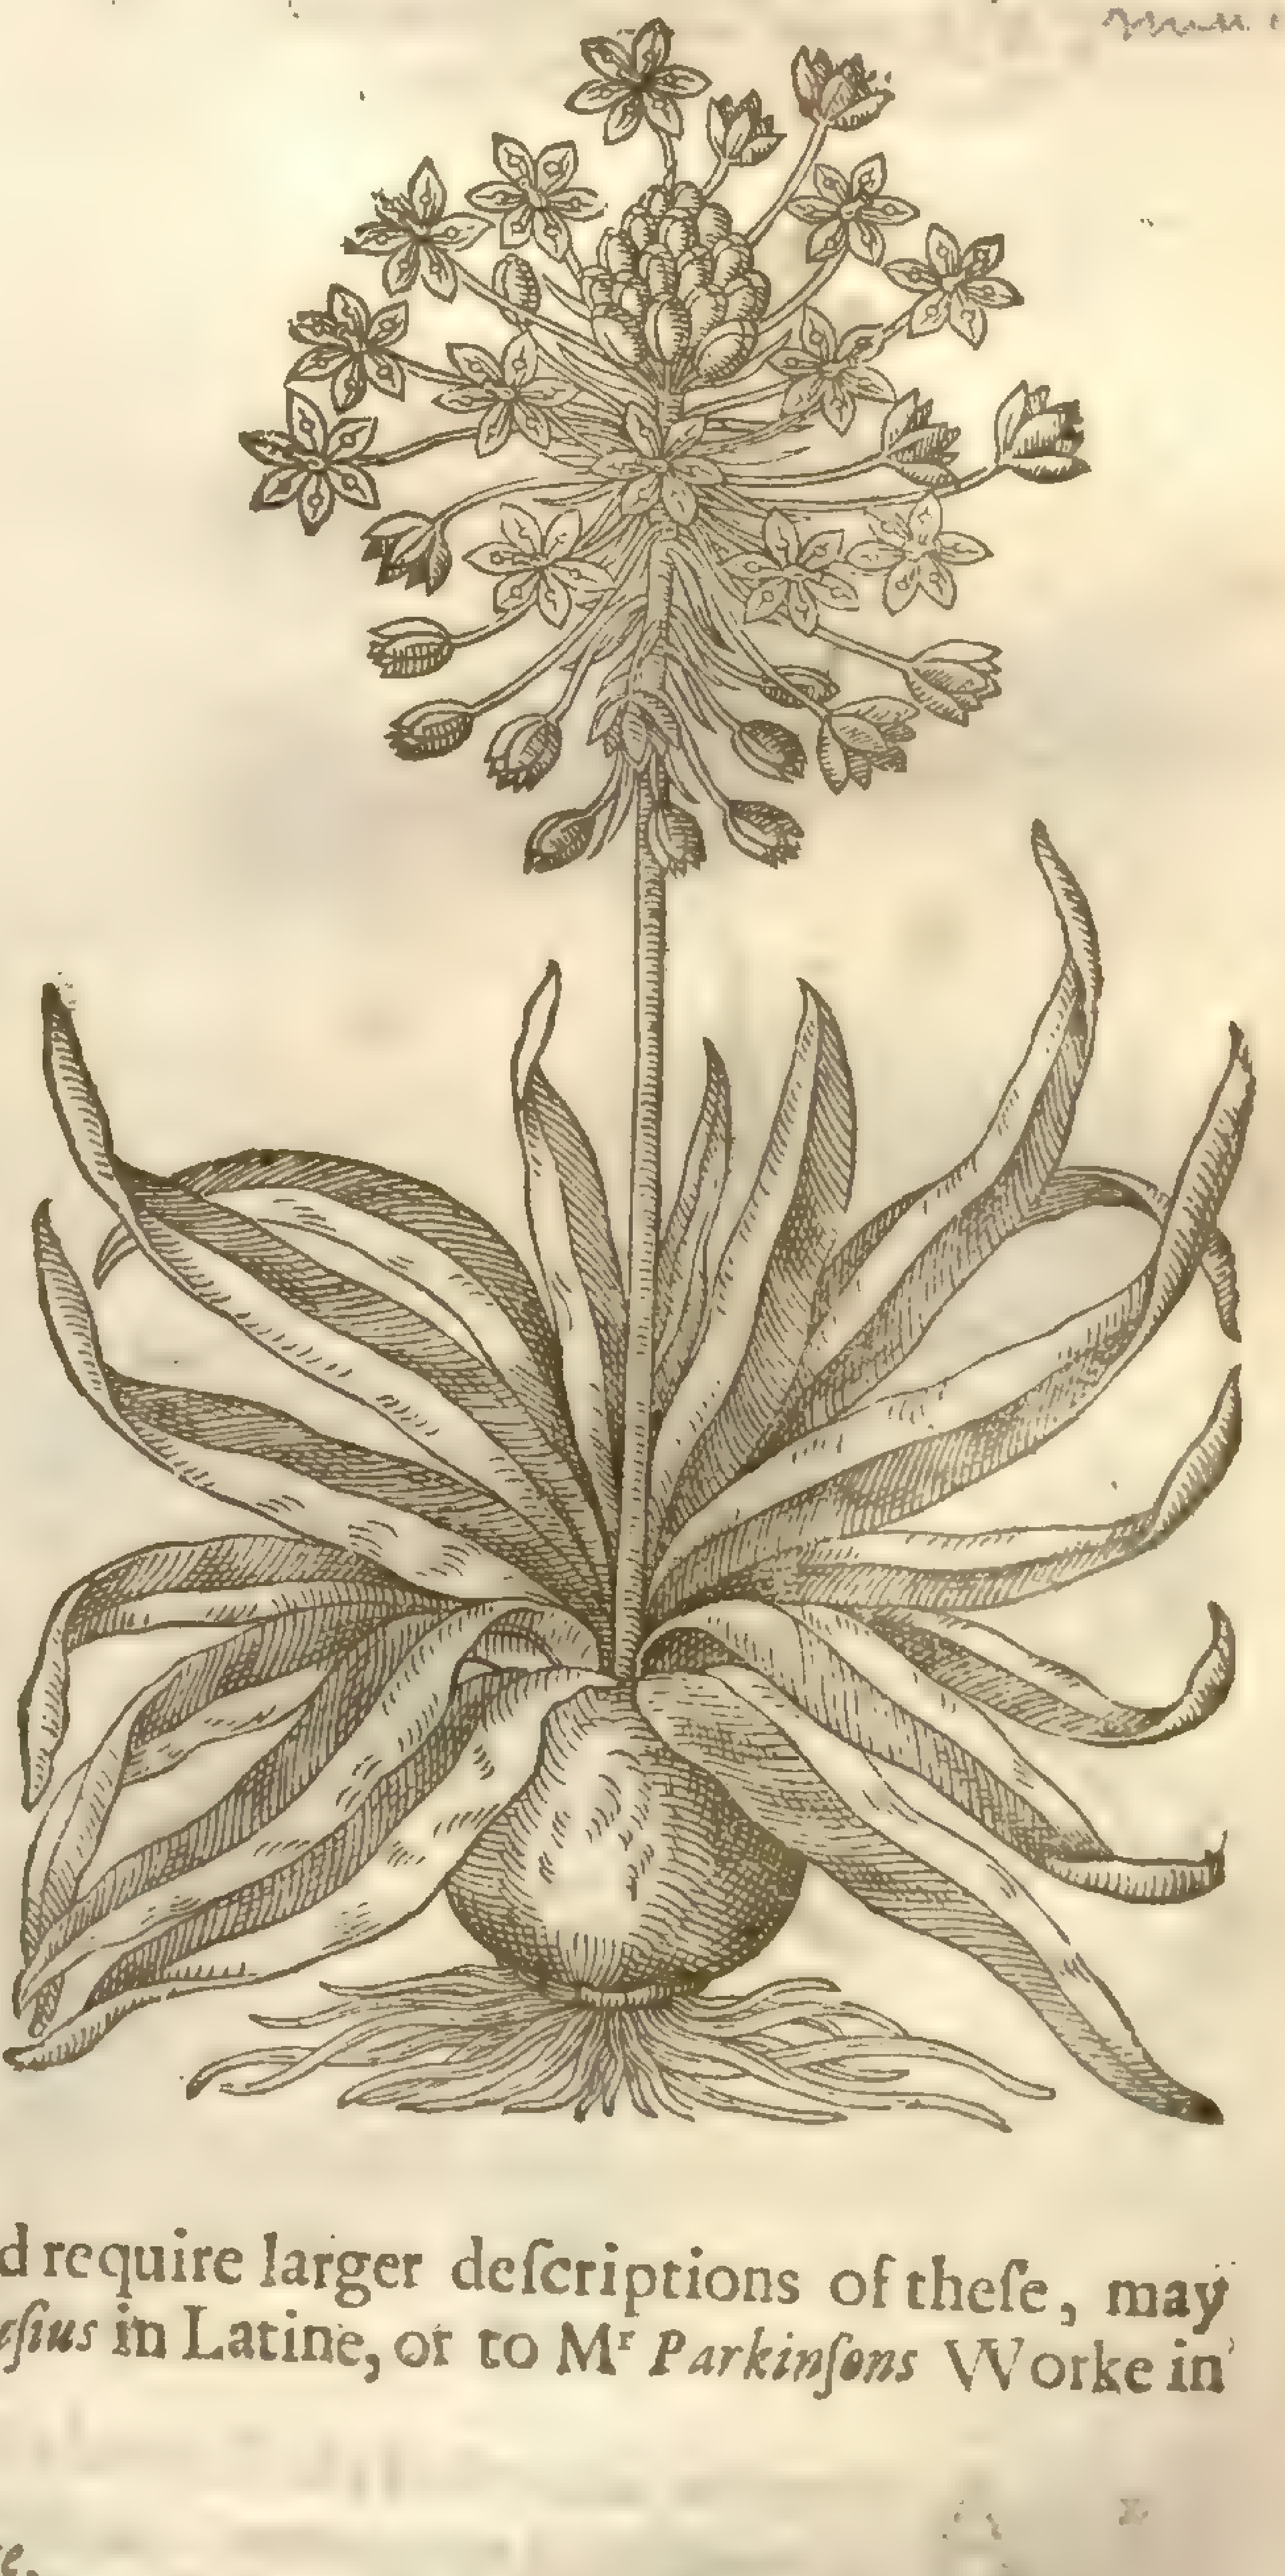
12 *Hyacinthus Hiſpanicus ſtellaris flore ſaturè cæruleo.* Scilla campanulata [illegible]
The Spaniſh ſtarry Iacinth with deepe blew floures.

13 There is another ſtarry Iacinth more large and beautifull than any of theſe before mentioned. The leaues are broad, and not verie long, ſpred vpon the ground, and in the midſt of them there riſeth vp a great ſpoke of faire ſtarry floures, which firſt begin to open themſelues below, and ſo ſhew themſelues by little and little to the top of the ſtalke. The vſuall ſort hereof hath blew or purple floures. There is alſo a ſort hereof which hath fleſh-coloured floures, and another with white floures: This is called *Hyacinthus ſtellatus Peruanus*, The ſtarry Iacinth of Peru.

10 *Hyacinthus ſtellatus æſtivus minor.*
The leſſer ſtarry Summer Iacinth.



13 *Hyacinthus Peruanus.*
Hyacinth of Peru.
Scilla peruviana L. Mill. dict.



Thoſe who are ſtudious in varieties of floures, and require larger deſcriptions of theſe, may haue recourſe to the Works of the learned *Carolus Cluſius* in Latine, or to Mr *Parkinſons* Worke in Engliſh, where they may haue full ſatisfaction. ‡

¶ *The Place.*

The three firſt mentioned plants grow in many places of Germany in Woods and mountaines, as *Fuchſius* and *Geſner* do teſtifie. In Bohemia alſo vpon diuers bankes that are full of Herbes. In

England we cheriſh moſt of theſe mentioned in this place, in our gardens, onely for the beautie of their floures.

¶ *The Time.*

The three firſt begin to floure in the midſt of Ianuarie, and bring forth their ſeed in May. The other floures in the Spring.

¶ *The Names.*

The firſt of theſe Hyacinths is called *Hyacinthus Stellatus*, or *ſtellaris Fuchſij*, of the ſtarre-like floures: *Narciſſus cæruleus, Bockij*: of ſome, *Flos Martius ſtellatus.*

3 This by *Lobel* is thought to be *Hyacinthus bifolius* of *Theophraſtus*: *Tragus* calls it *Narciſſus cæruleus*: and *Fuchſius*, *Hyacinthus cæruleus minor mas*. We may call it in Engliſh, the ſmall two leafed ſtarry Iacinth.

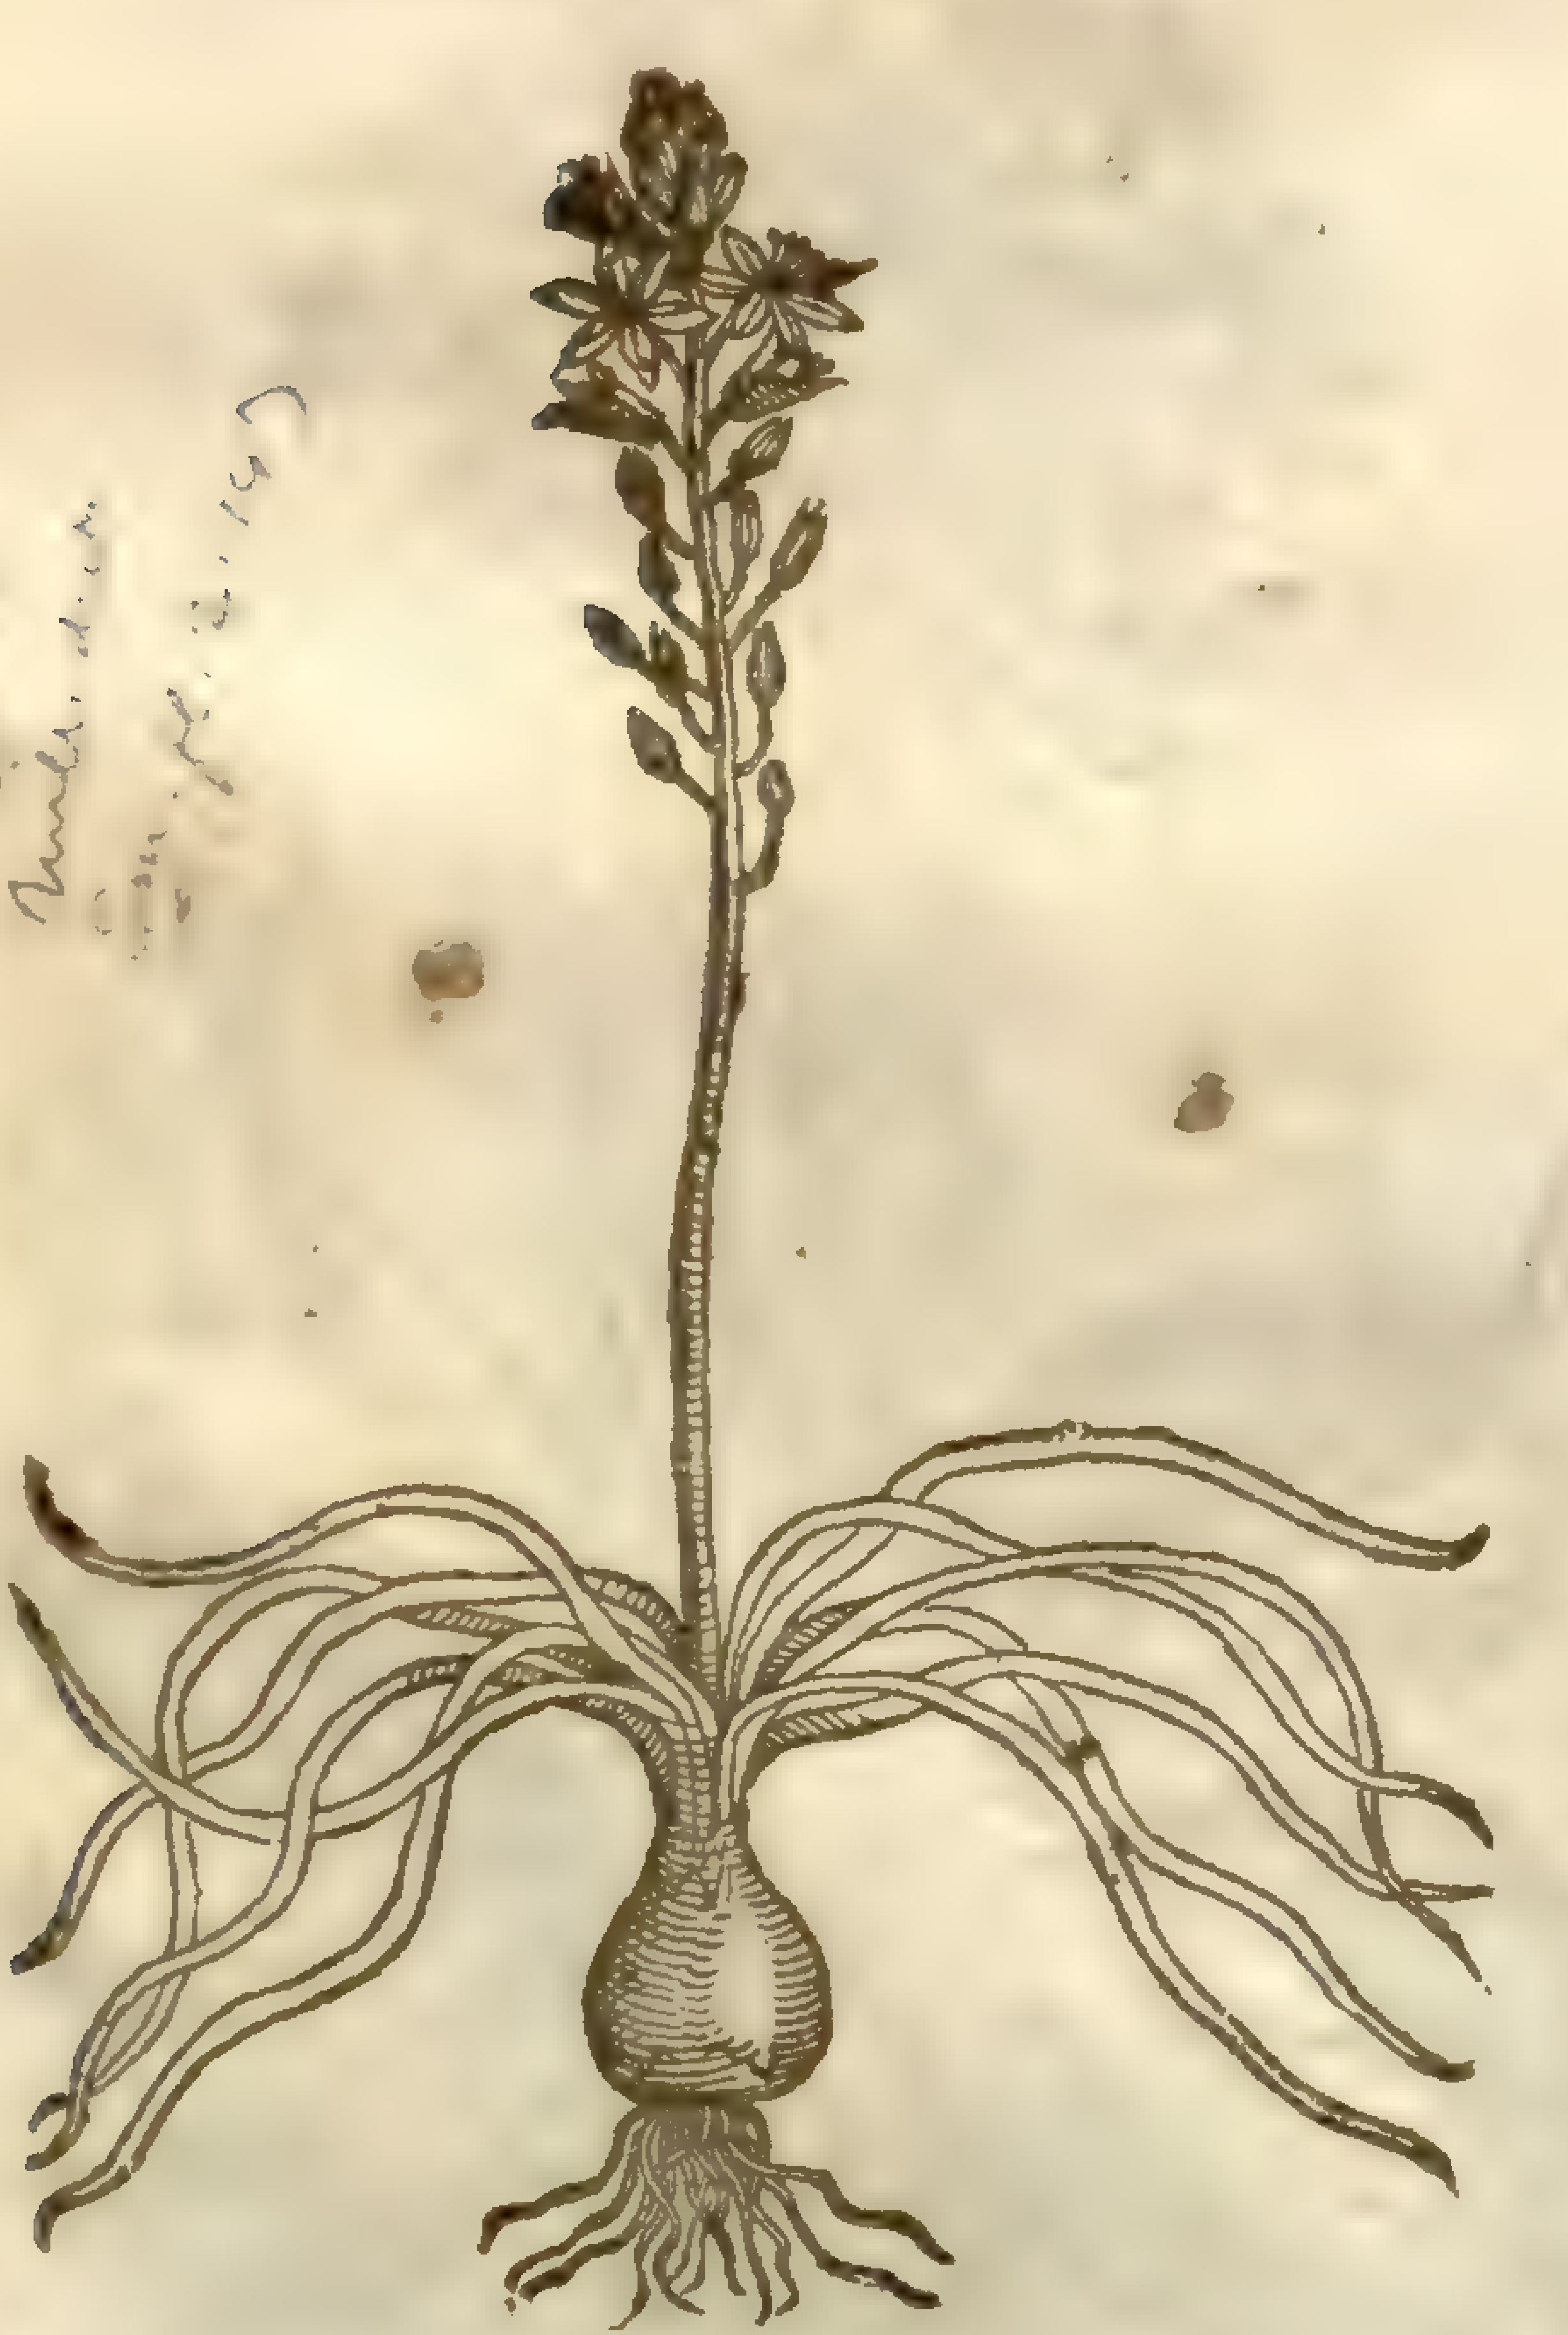
4 The Lilly Hyacinth is called *Hyacinthus Germanicus Liliflorus*, or German Hyacinth, taken from the countrey where it naturally groweth wilde.

¶ *The Vertues.*

A ‡ The faculties of the ſtary Iacinths are not written of by any: but the Lilly-leaued Hyacinth (which growes naturally in a hil in Aquitain called *Hos*, where the Herdmen call it *Sarahug*) is ſaid by them to cauſe the heads of ſuch cattell as feed thereon to ſwell exceedingly, and then killeth them; which ſhewes it hath a maligne and poyſonous qualitie. *Cluſ.* ‡

Chap. 78. *Of Autumne Hyacinths.*

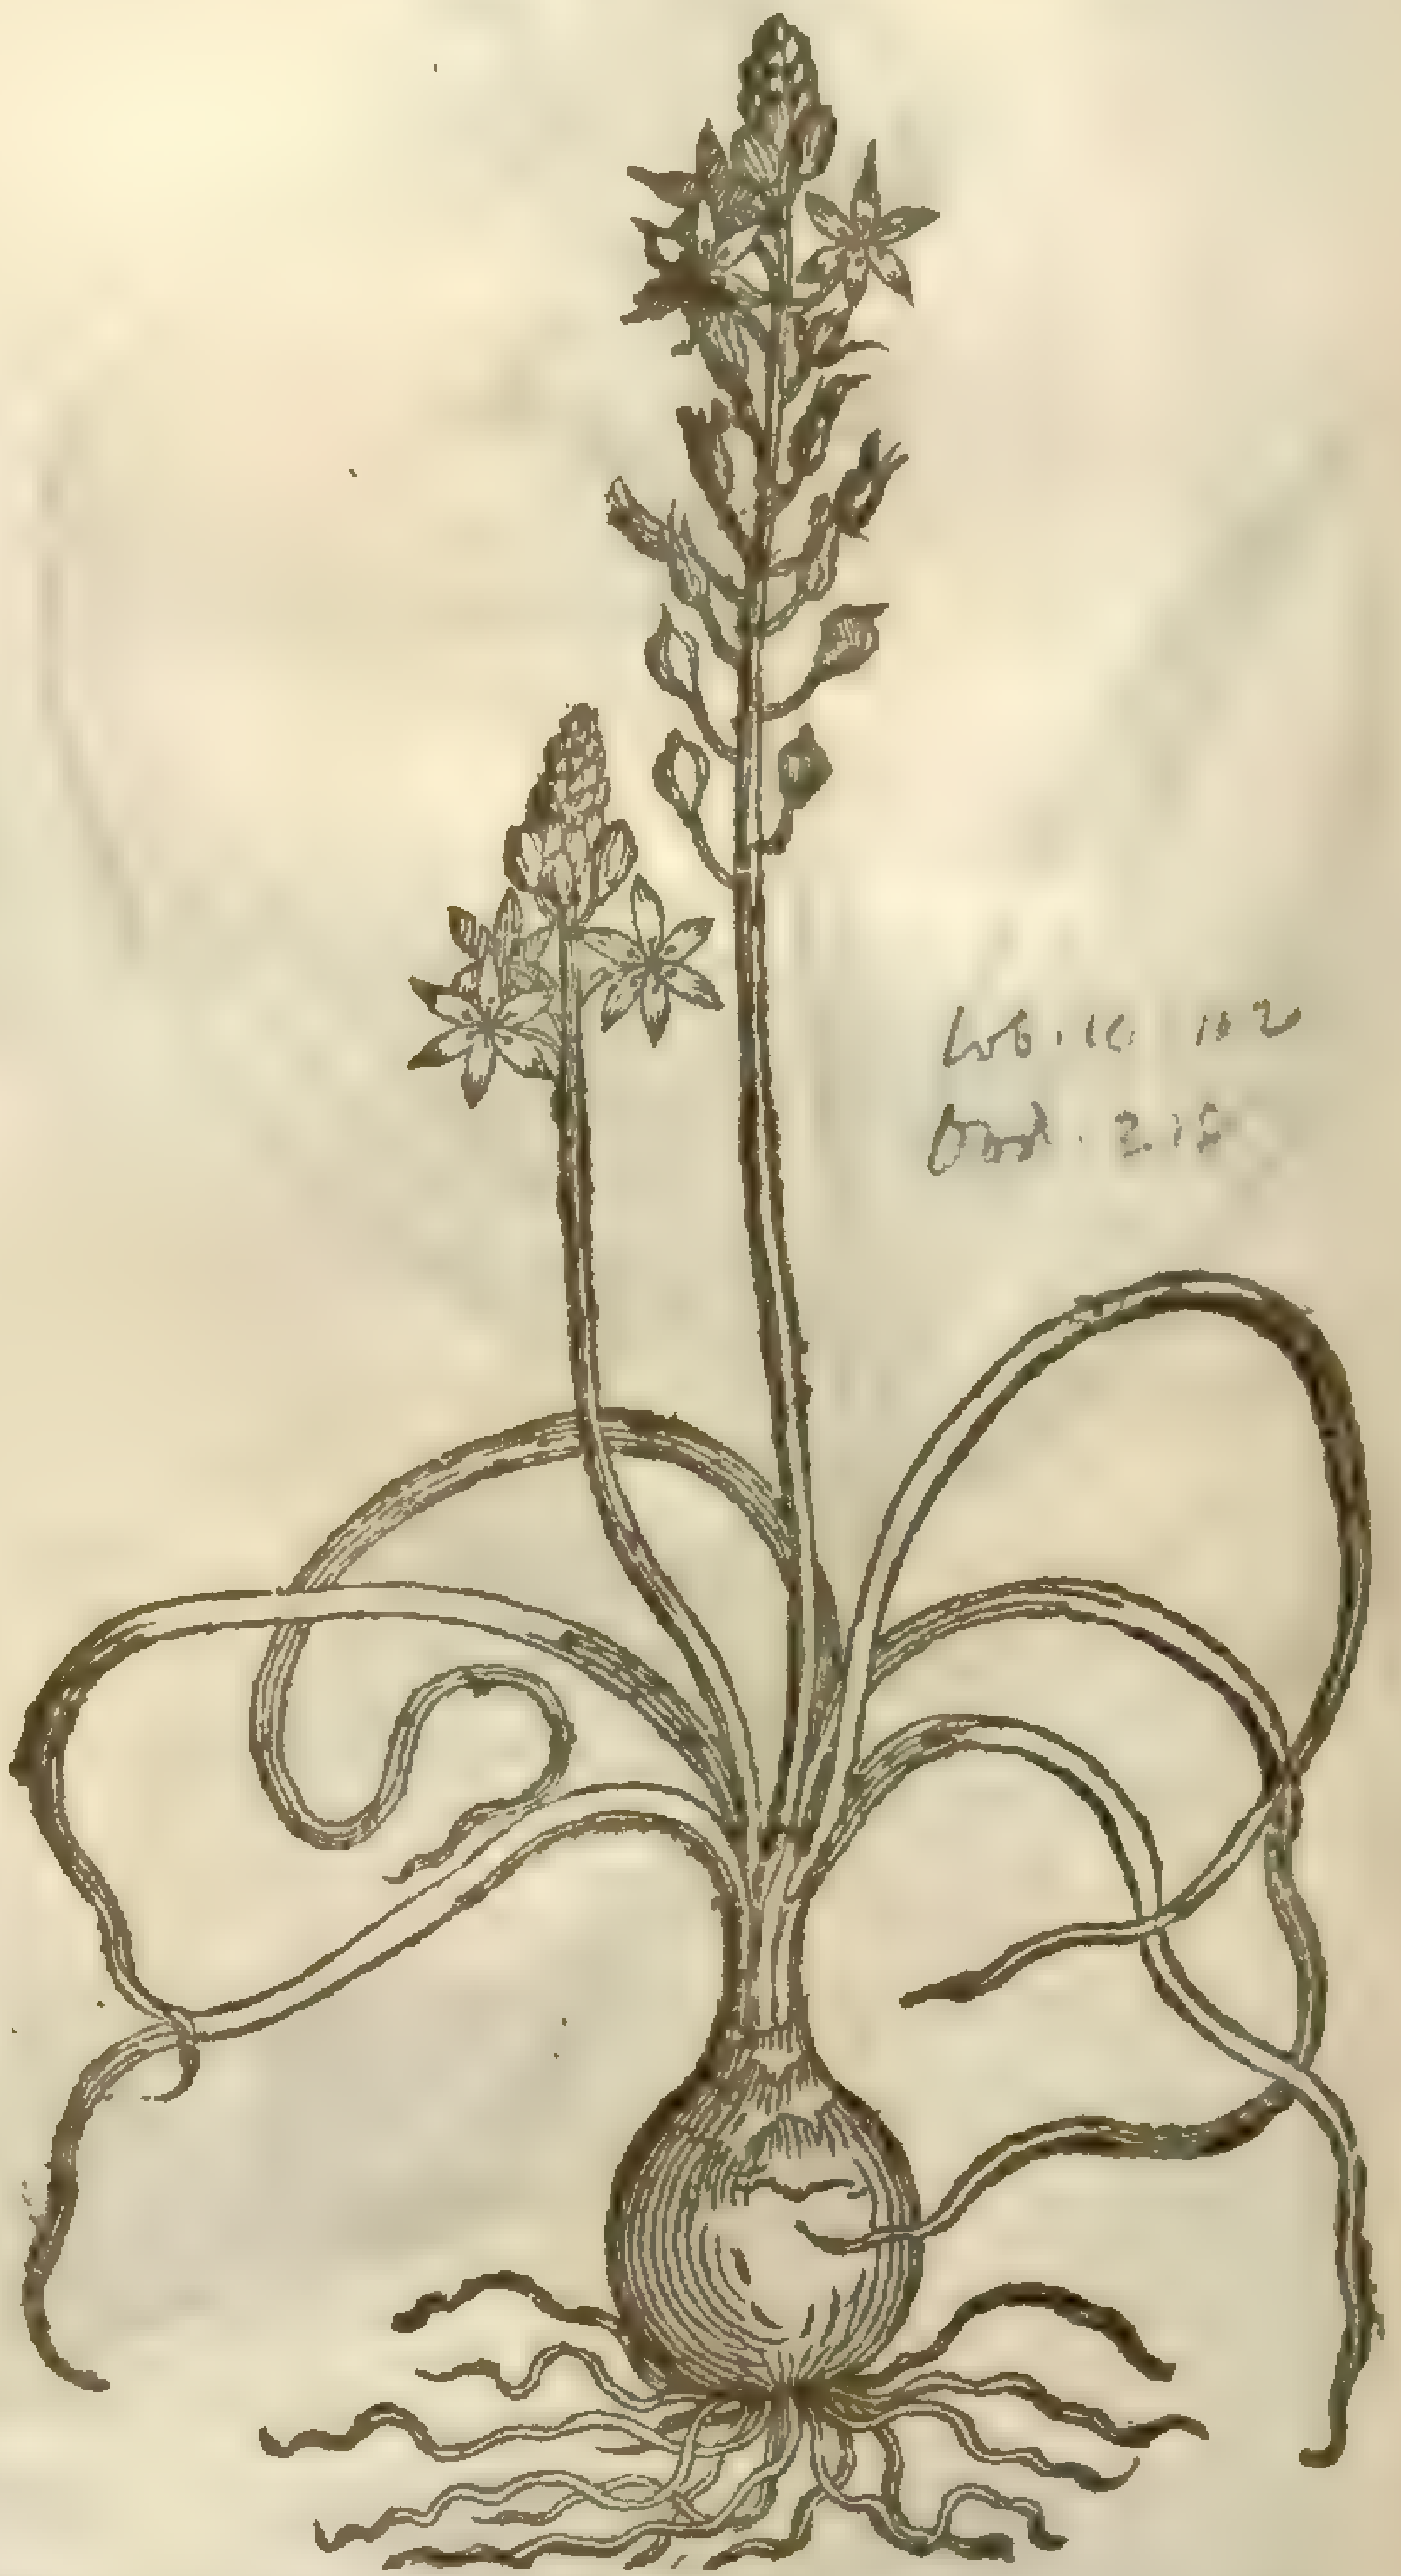
1 *Hyacinthus Autumnalis minor.*
Small Autumne Iacinth.



Scilla autumnalis [illegible]

Dod. 2.19
Lob. 1c. 102

2 *Hyacinthus Autumnalis maior.*
Great Autumne Iacinth.



Lob. 1c. 102
Dod. 2.19

¶ *The Deſcription.*

1 Avtumne Iacinth is the leaſt of all the Iacinths: it hath ſmal narrow graſſy leaues ſpred abroad vpon the ground: in the midſt whereof ſpringeth vp a ſmall naked ſtalke an handfull high, ſet from the middle to the top with many ſmall ſtar-like blew floures, hauing certain ſmall looſe chiues in the middle. The ſeed is black, contained in ſmall husks: the root is bulbous.

2 The great winter Iacinth is like vnto the precedent in leaues, ſtalkes, and floures, not differing in any point but in greatneſſe.

‡ 3 To theſe I thinke it not amiſſe to adde another ſmal Hyacinth, more differing from theſe laſt deſcribed in the time of the flouring, than in the ſhape. The root of it is little, ſmall, white, longiſh, with a few fibres at the bottom; the leaues are ſmall and long like the laſt deſcribed: the ſtalke which is ſcarce an handfull high, is adorned at the top with thtee or foure ſtarry floures of a blewiſh Aſh colour, each floure conſiſting of ſix little leaues with ſix chiues, and their pointals of a darke blew, and a peſtill in the midſt. It floures in Aprill. ‡

¶ *The Place.*

† The greater Autumne Hyacinth groweth not wild in England, but it is to be found in ſome gardens.

The firſt or leſſer growes wilde in diuers places of England, as vpon a bank by the Thames ſide between Chelſey and London.

¶ *The Time.*

They floure in the end of Auguſt, and in September, and ſometimes later.

¶ *The Names.*

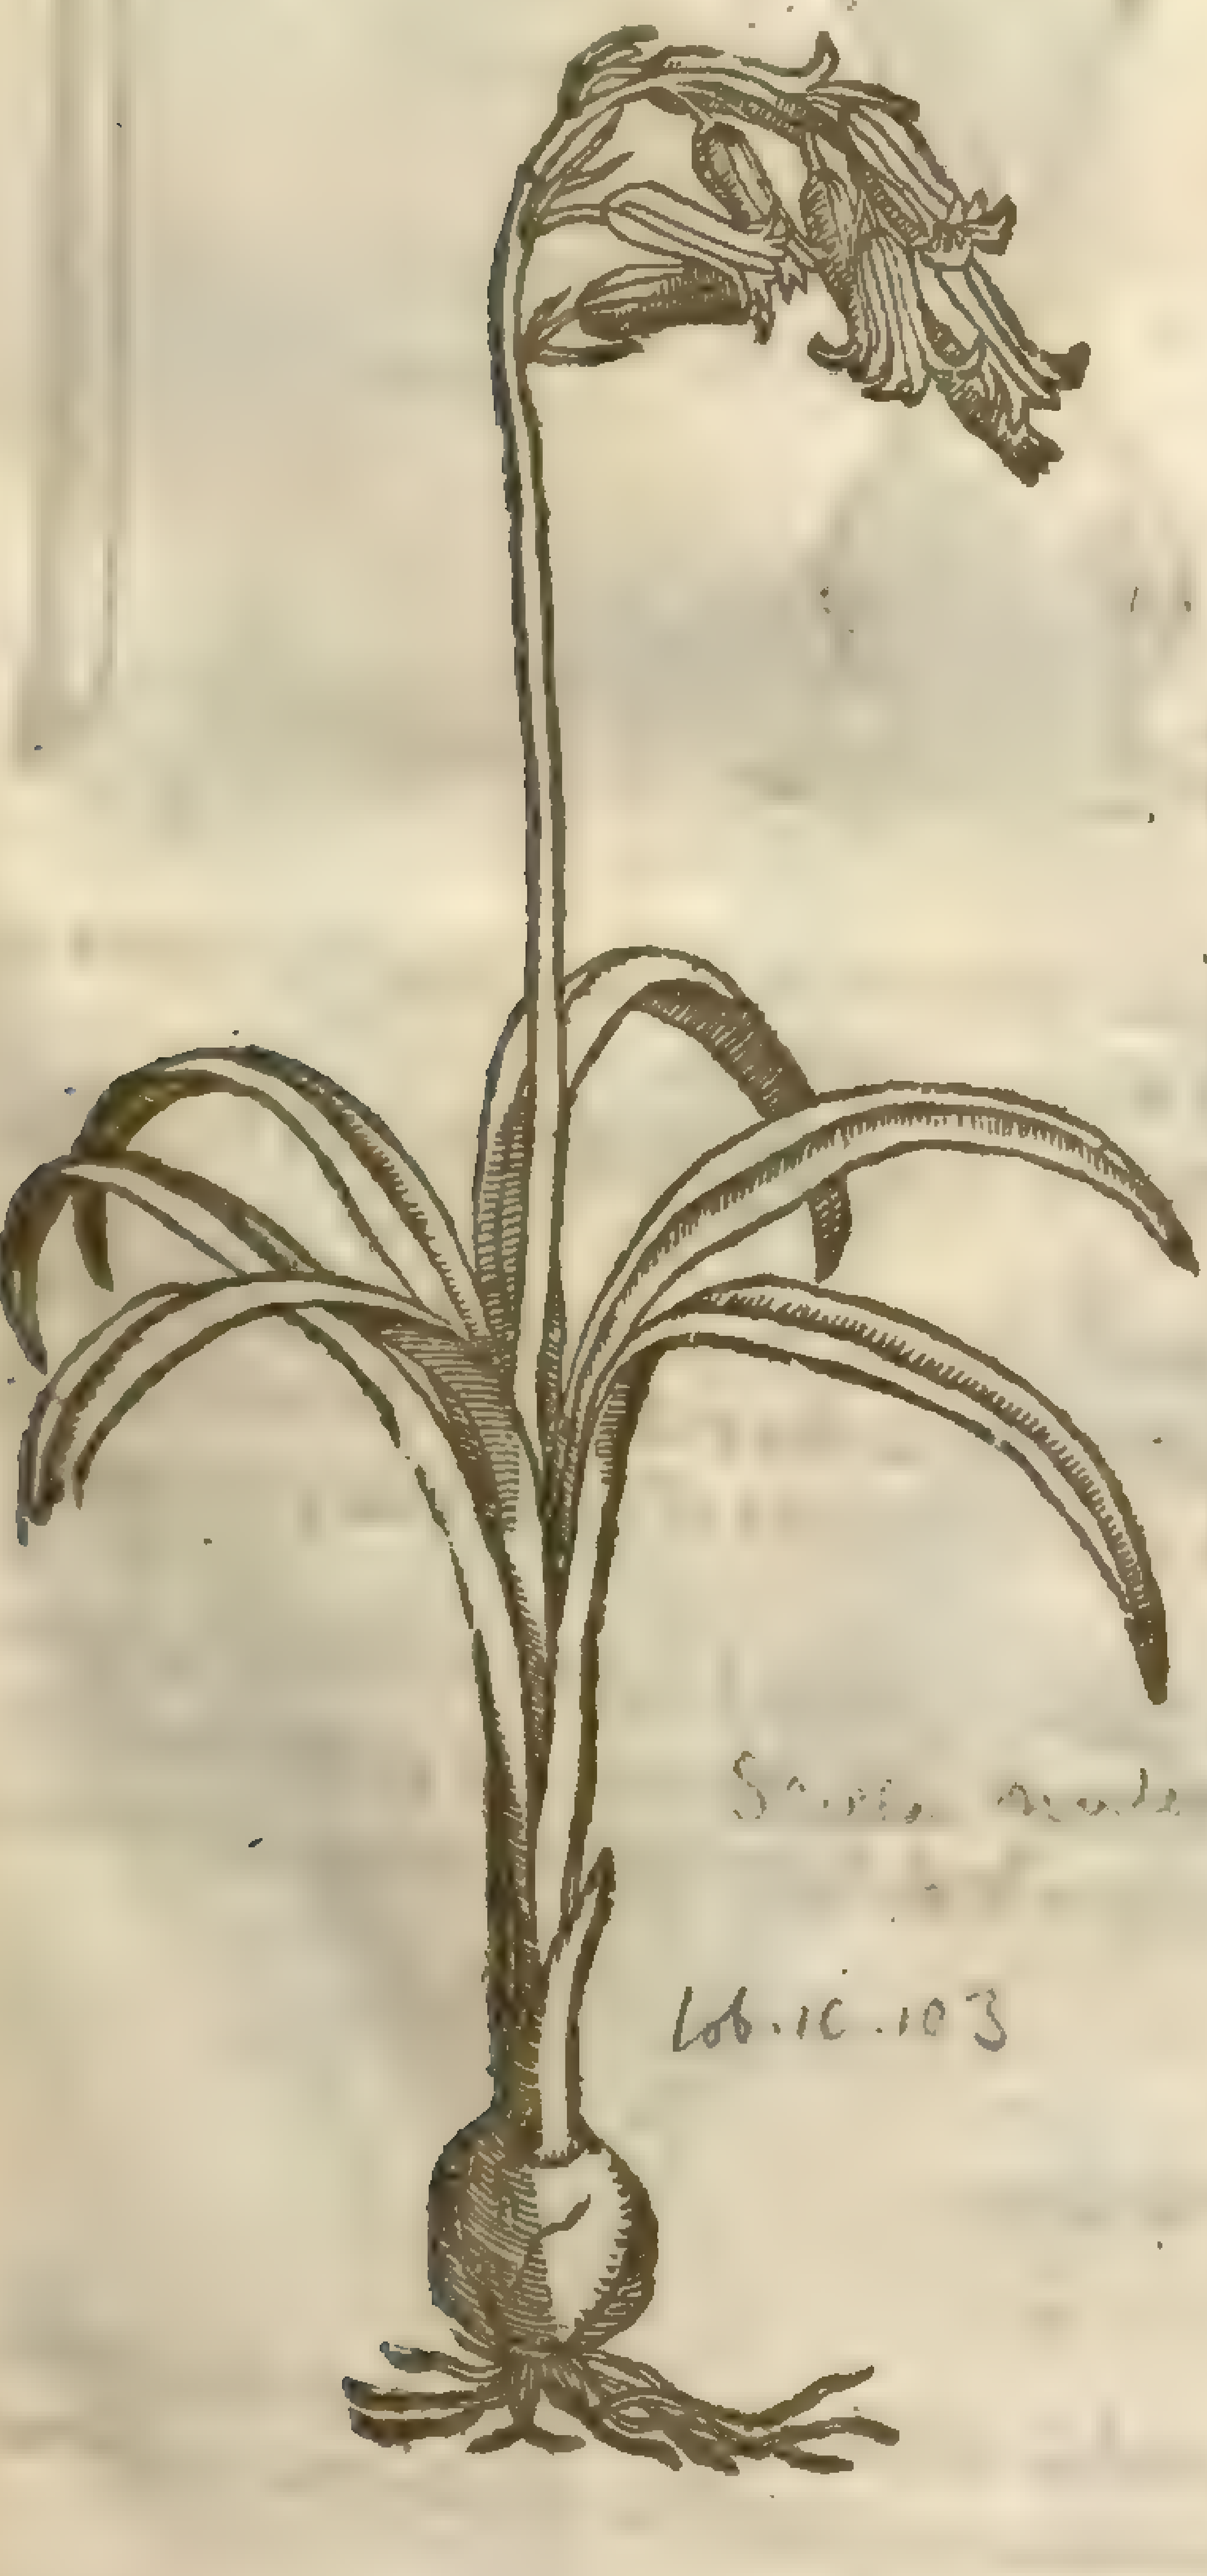
1 The firſt is called *Hyacinthus Autumnalis minor*, or the leſſer Autumne Iacinth, or Winter Iacinth.

2 The ſecond, *Hyacinthus Autumnalis major*, the great Autumne Iacinth, or Winter Iacinth.

3 This is called by *Lobel*, *Hyacinthus parvulus ſtellaris vernus*, The ſmall ſtarry Spring Iacinth.

Chap. 79. *Of the Engliſh Iacinth, or Hare-bells.*

1 *Hyacinthus Anglicus.*
Engliſh Hare-bells.

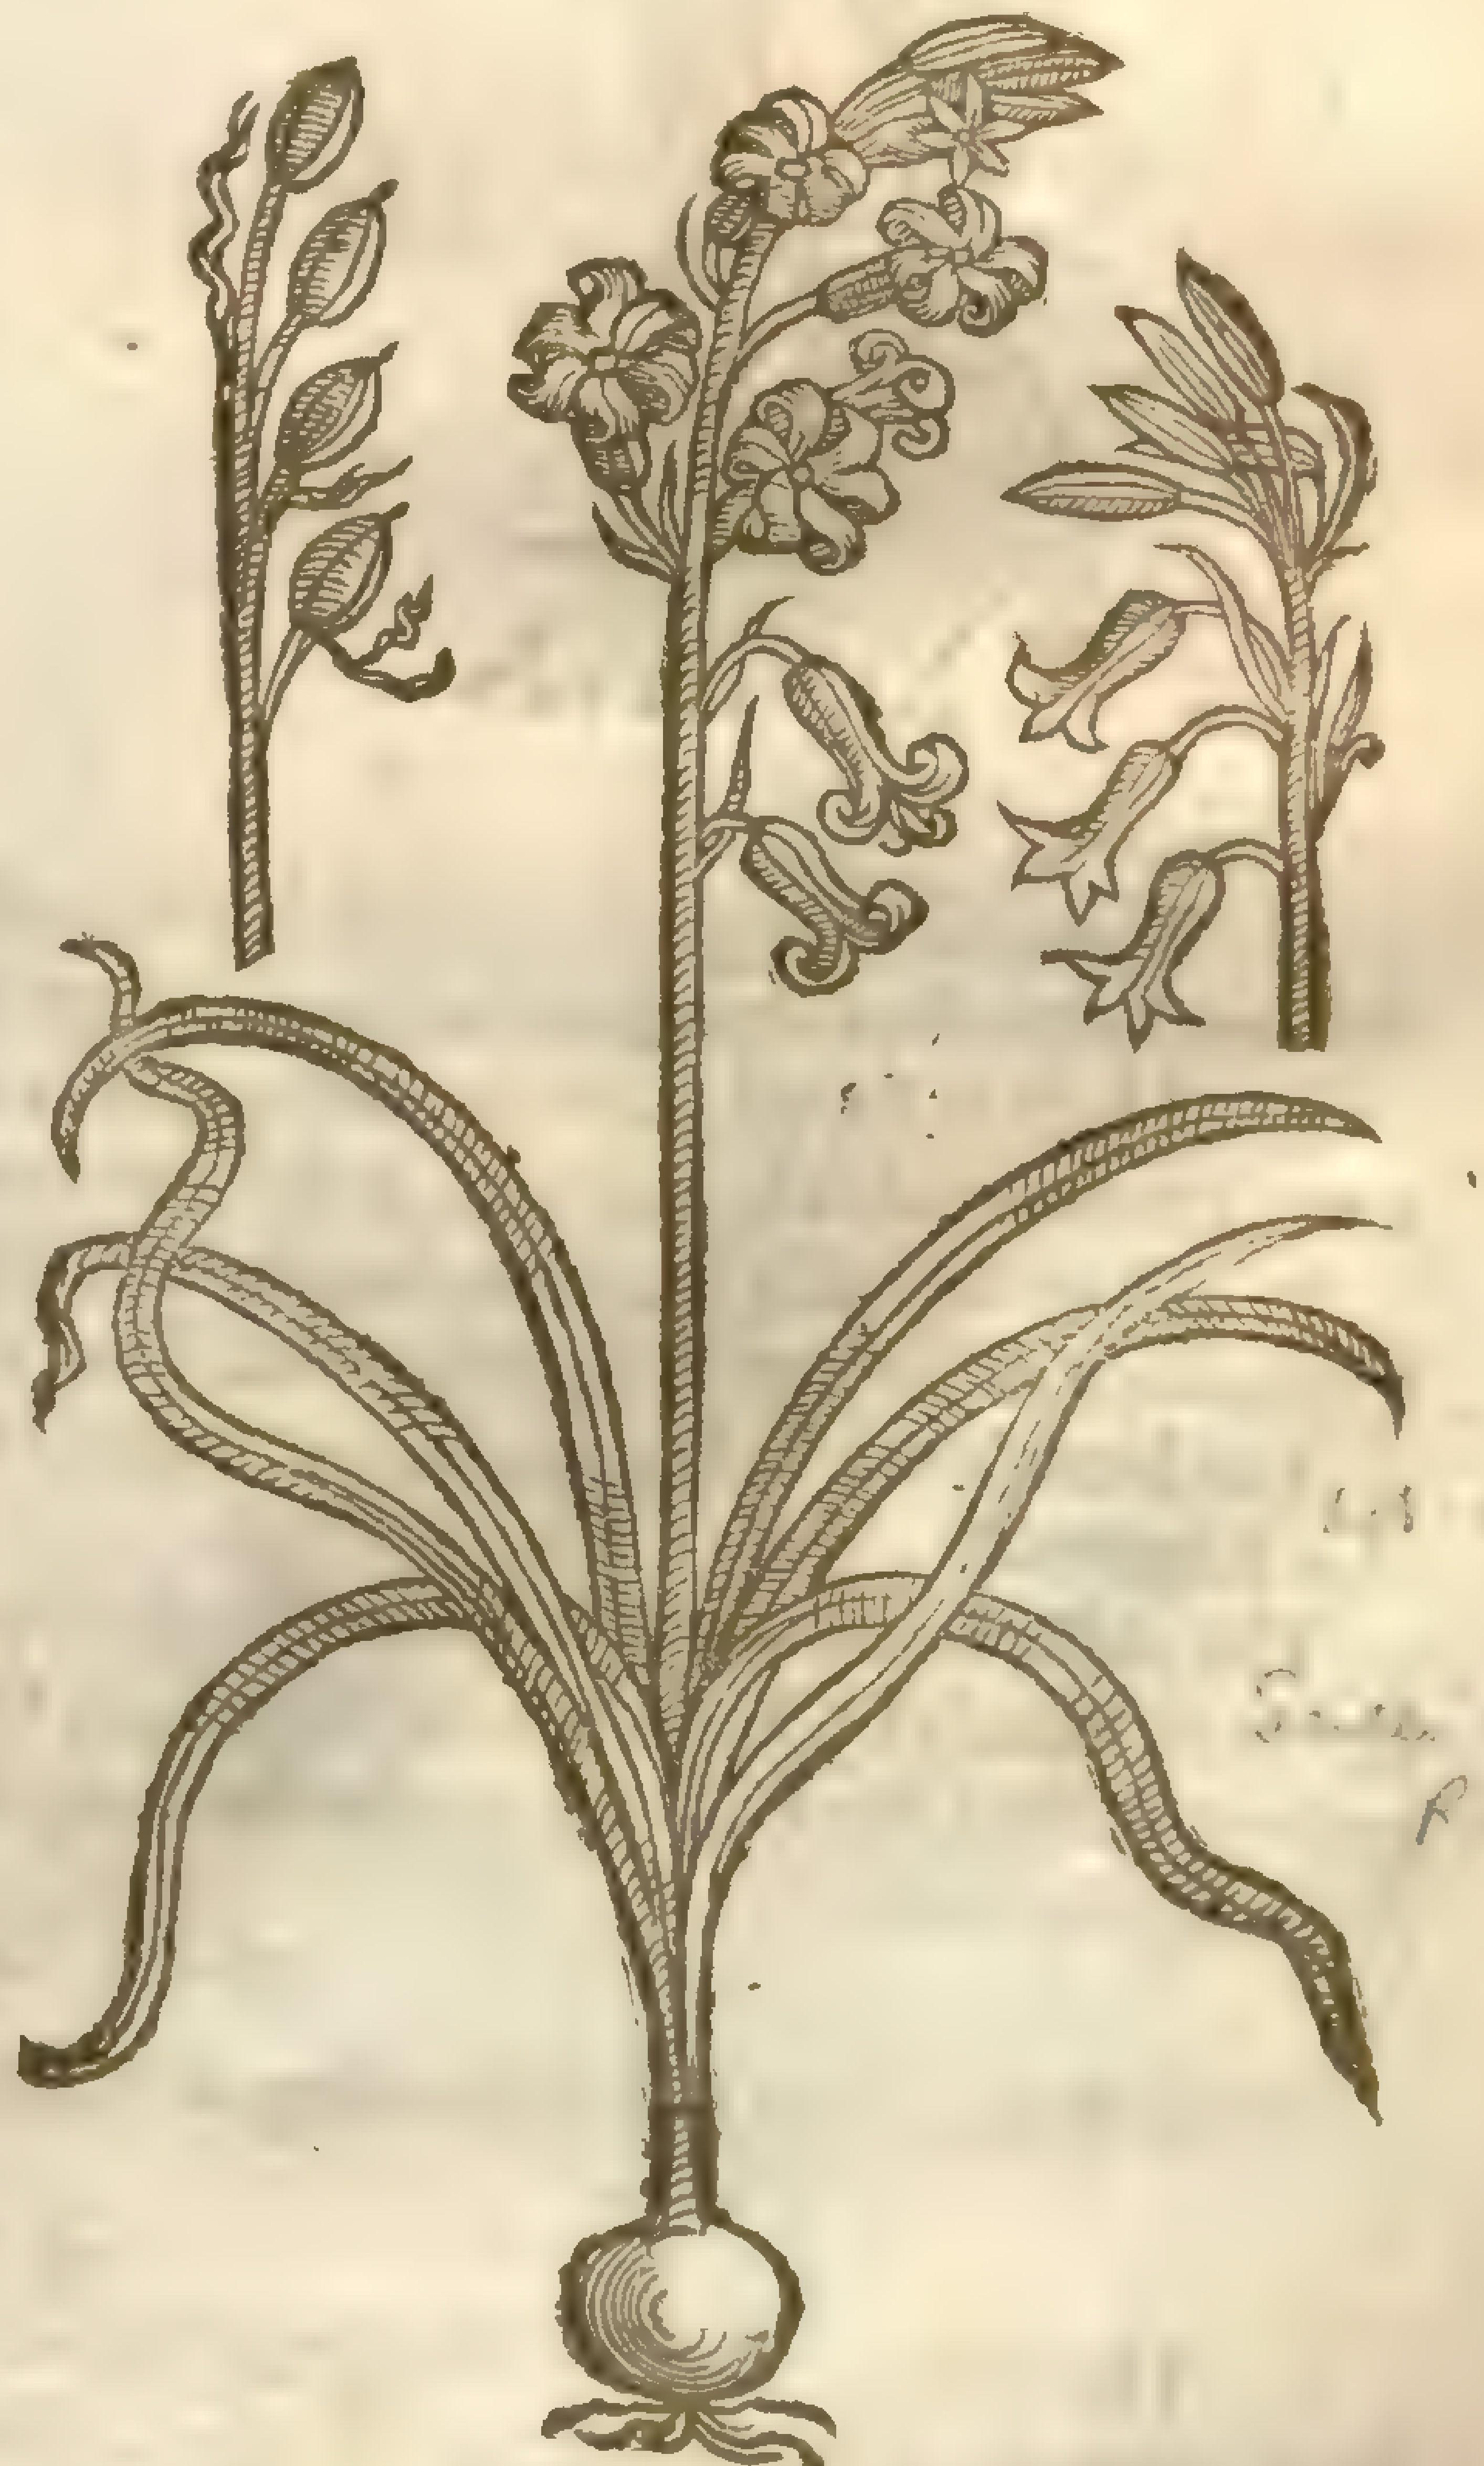


[illegible]

Lob.ic.103

[illegible]

2 *Hyacinthus albus Anglicus.*
White Engliſh Hare-bells.



Lob.ic.103

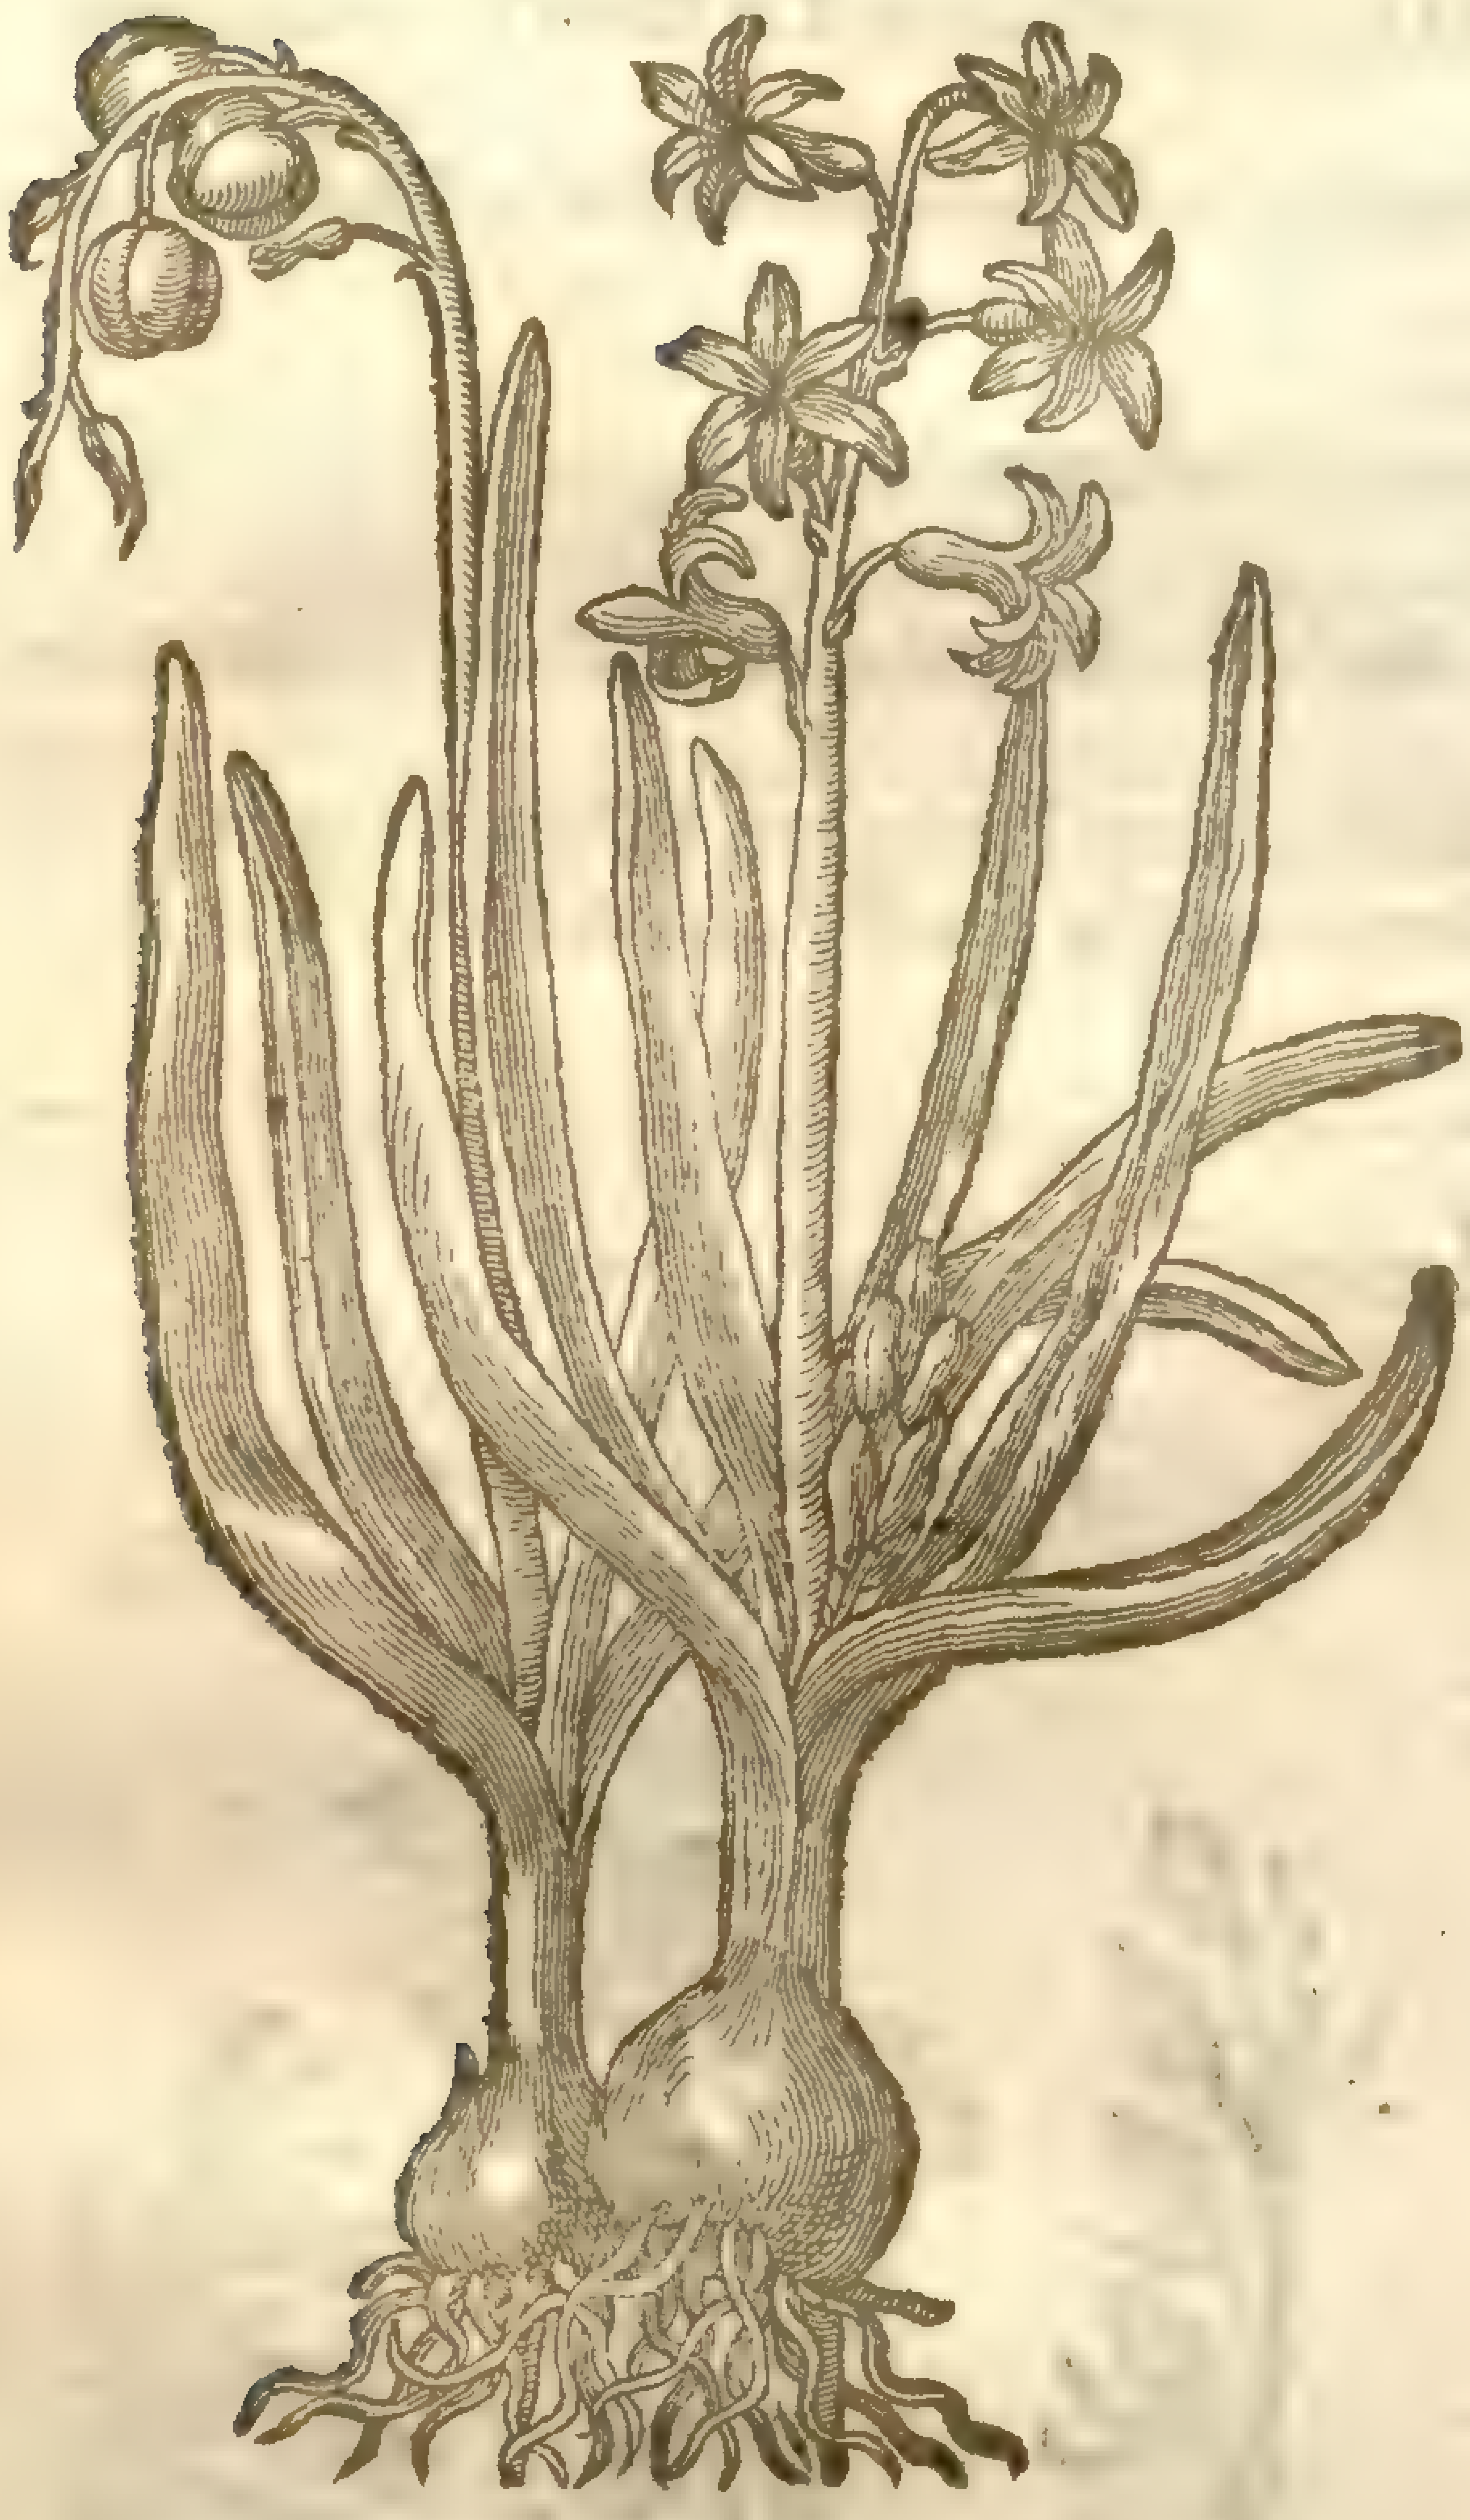
[illegible]

¶ *The Deſcription.*

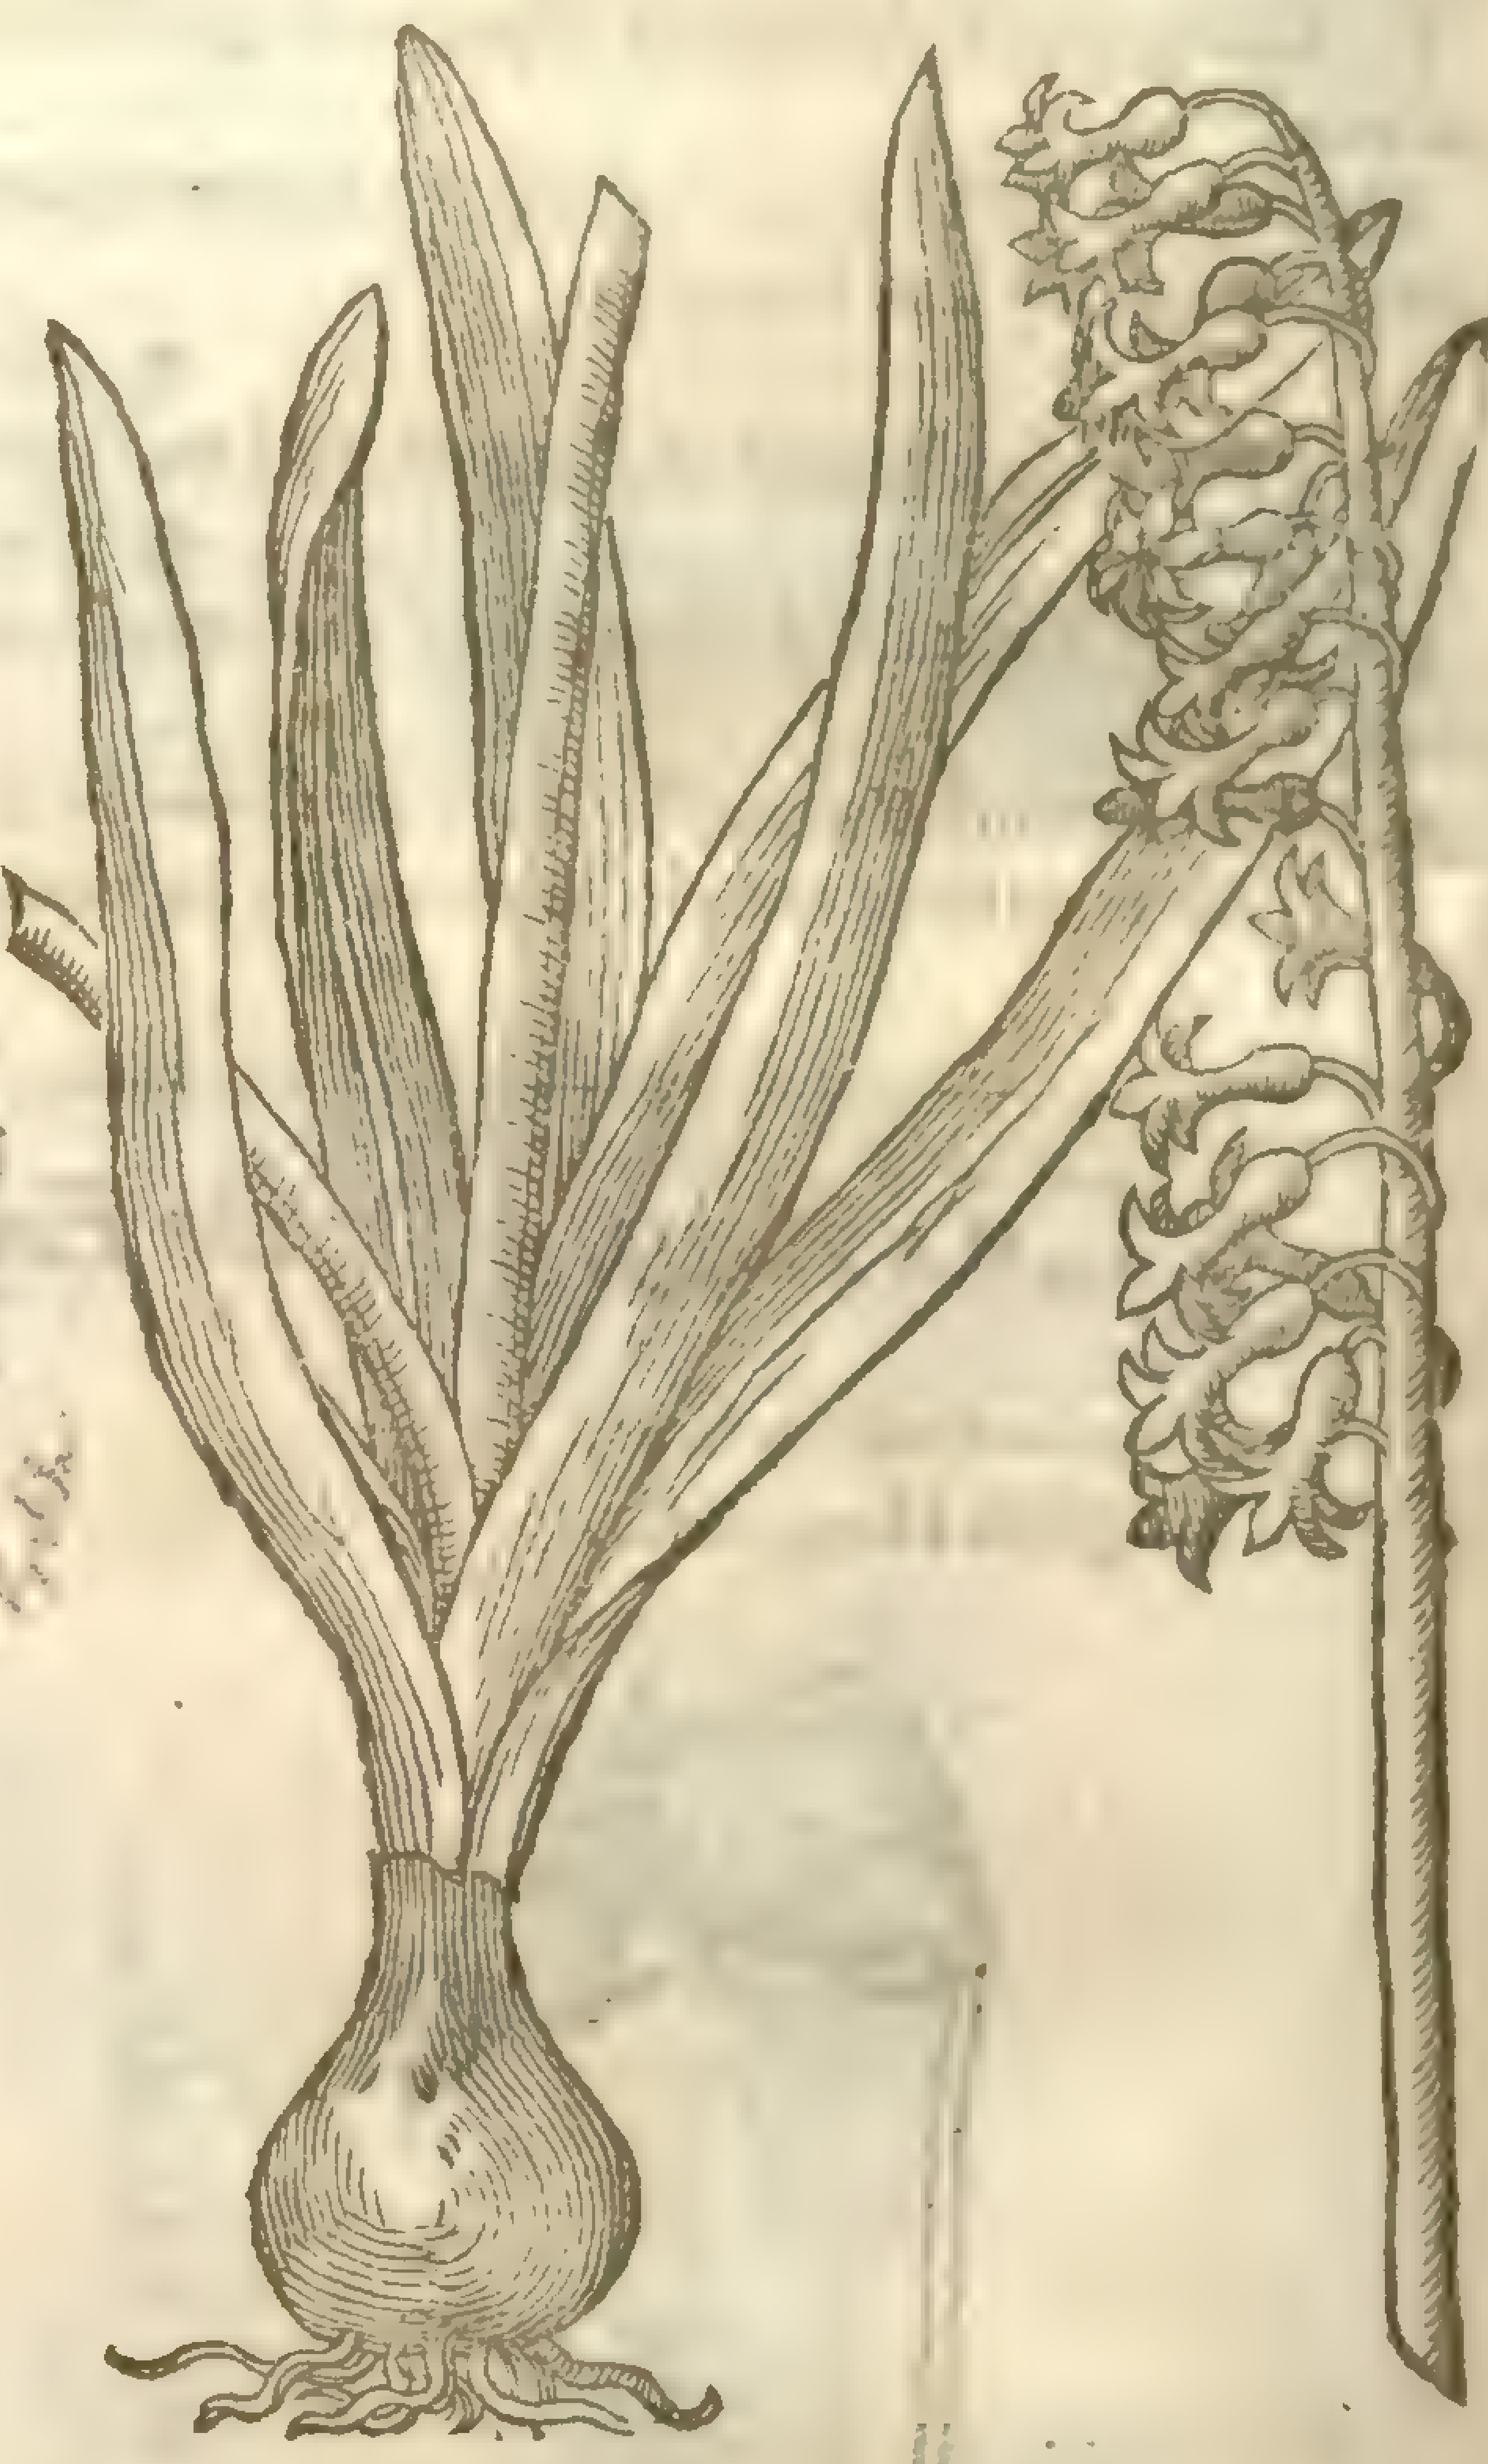
1 The blew Hare-bells or Engliſh Iacinth is very common throughout all England. It hath long narrow leaues leaning towards the ground, among the which ſpring vp naked

or bare ſtalks loden with many hollow blew floures, of a ſtrong ſweet ſmell ſomewhat ſtuffing the head: after which come the cods or round knobs, containing a great quantitie of ſmall blacke ſhining ſeed. The root is bulbous, full of a ſlimie glewiſh juice, which will ſerue to ſet feathers vpon arrowes in ſtead of glew, or to paſte bookes with: hereof is made the beſt ſtarch next vnto that of Wake-robin roots.

4 *Hyacinthus Orientalis cæruleus.*
The blew Orientall Iacinth.



5 *Hyacinthus Orientalis polyanthos.*
Many-floured Oriental Iacinth



H. orientalis L.
[illegible]
[illegible]

2 The white Engliſh Iacinth is altogether like vnto the precedent, ſauing that the leaues of this are ſomewhat broader, the floures more open, and very white of colour.

3 There is found wilde in many places of England another ſort, hauing floures of a faire Carnation colour, which maketh a difference from the other.

‡ There are alſo ſundry other varieties of this ſort, but I thinke it vnneceſſarie to inſiſt vpon them, their difference is ſo little, conſiſting not in their ſhape, but in the colour of their floures. ‡

The blew Hare-bels grow wilde in woods, Copſes, and in the borders of fields euery where thorow England.

The other two are not ſo common, yet do they grow in the woods by Colcheſter in Eſſex, in the fields & woods by South-fleet neere vnto Grauesend in Kent, as alſo in a piece of ground by Canturbury called the Clapper, in the fields by Bathe, about the woods by Warrington in Lancaſhire and other places.

¶ *The Time.*

They floure from the beginning of May vnto the end of Iune.

¶ *The Names.*

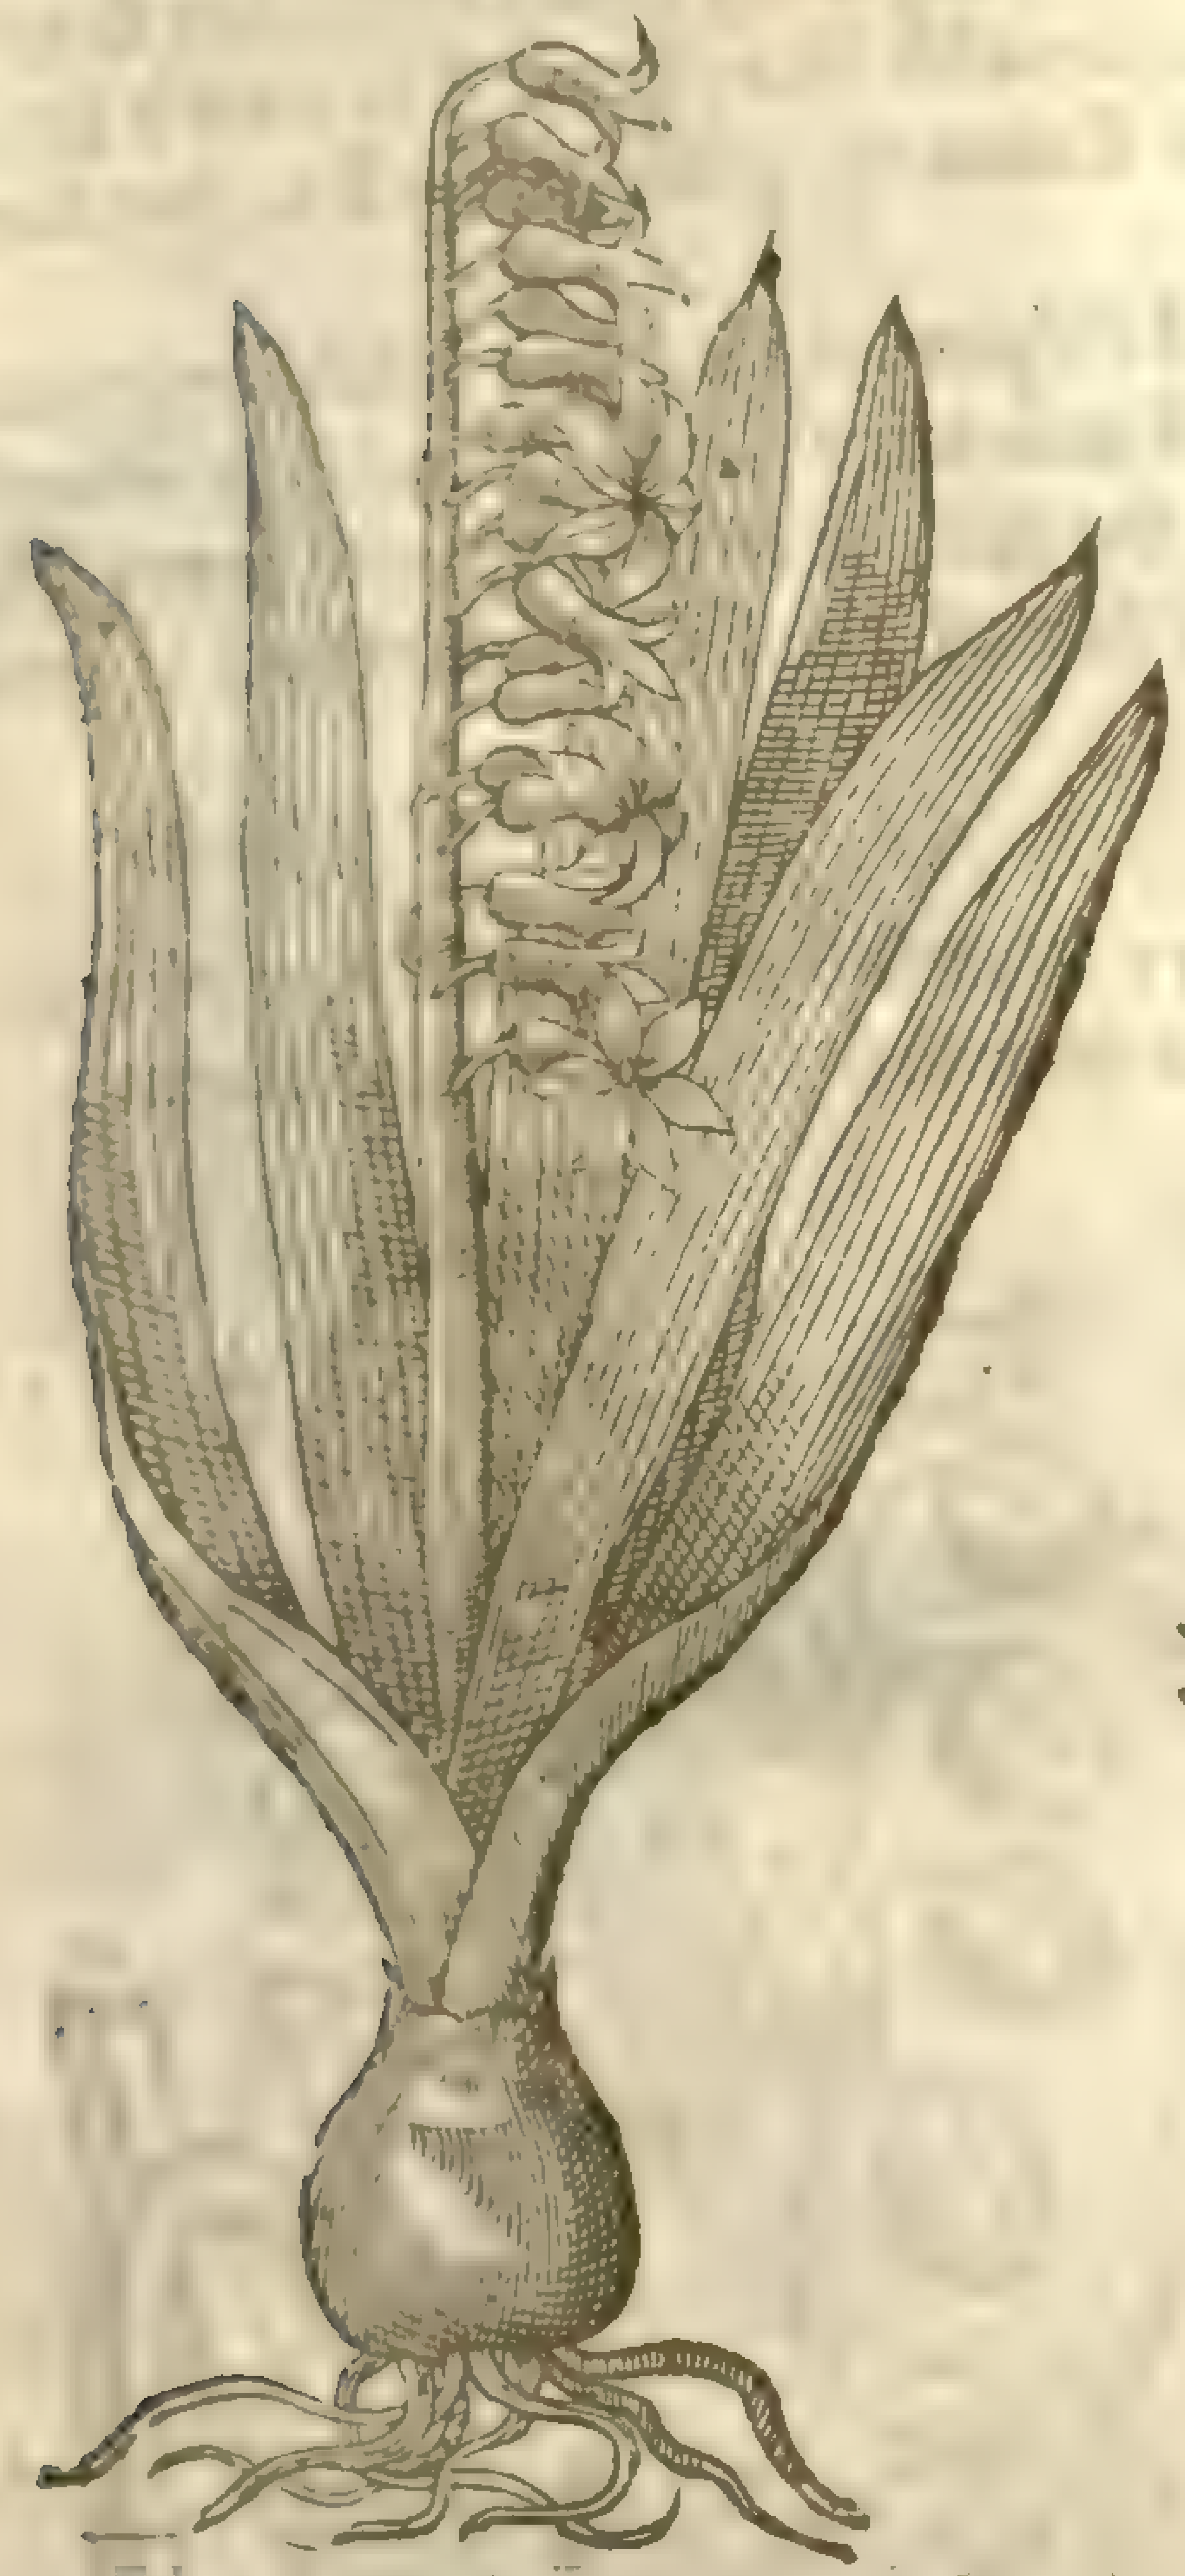
1 The firſt of our Engliſh Hyacinths is called *Hyacinthus Anglicus*, for that it is thought to grow more plentifully in England than elſewhere: of *Dodonæus*, *Hyacinthus non ſcriptus*, or the vnwritten Hyacinth.

2 The ſecond, *Hyacinthus Belgicus candidus*, or Low-Country Hyacinth with white floures.

‡ 3 This third is called *Hyacinthus Anglicus aut Belgicus, flore incarnato*, Carnation Hare-bells.

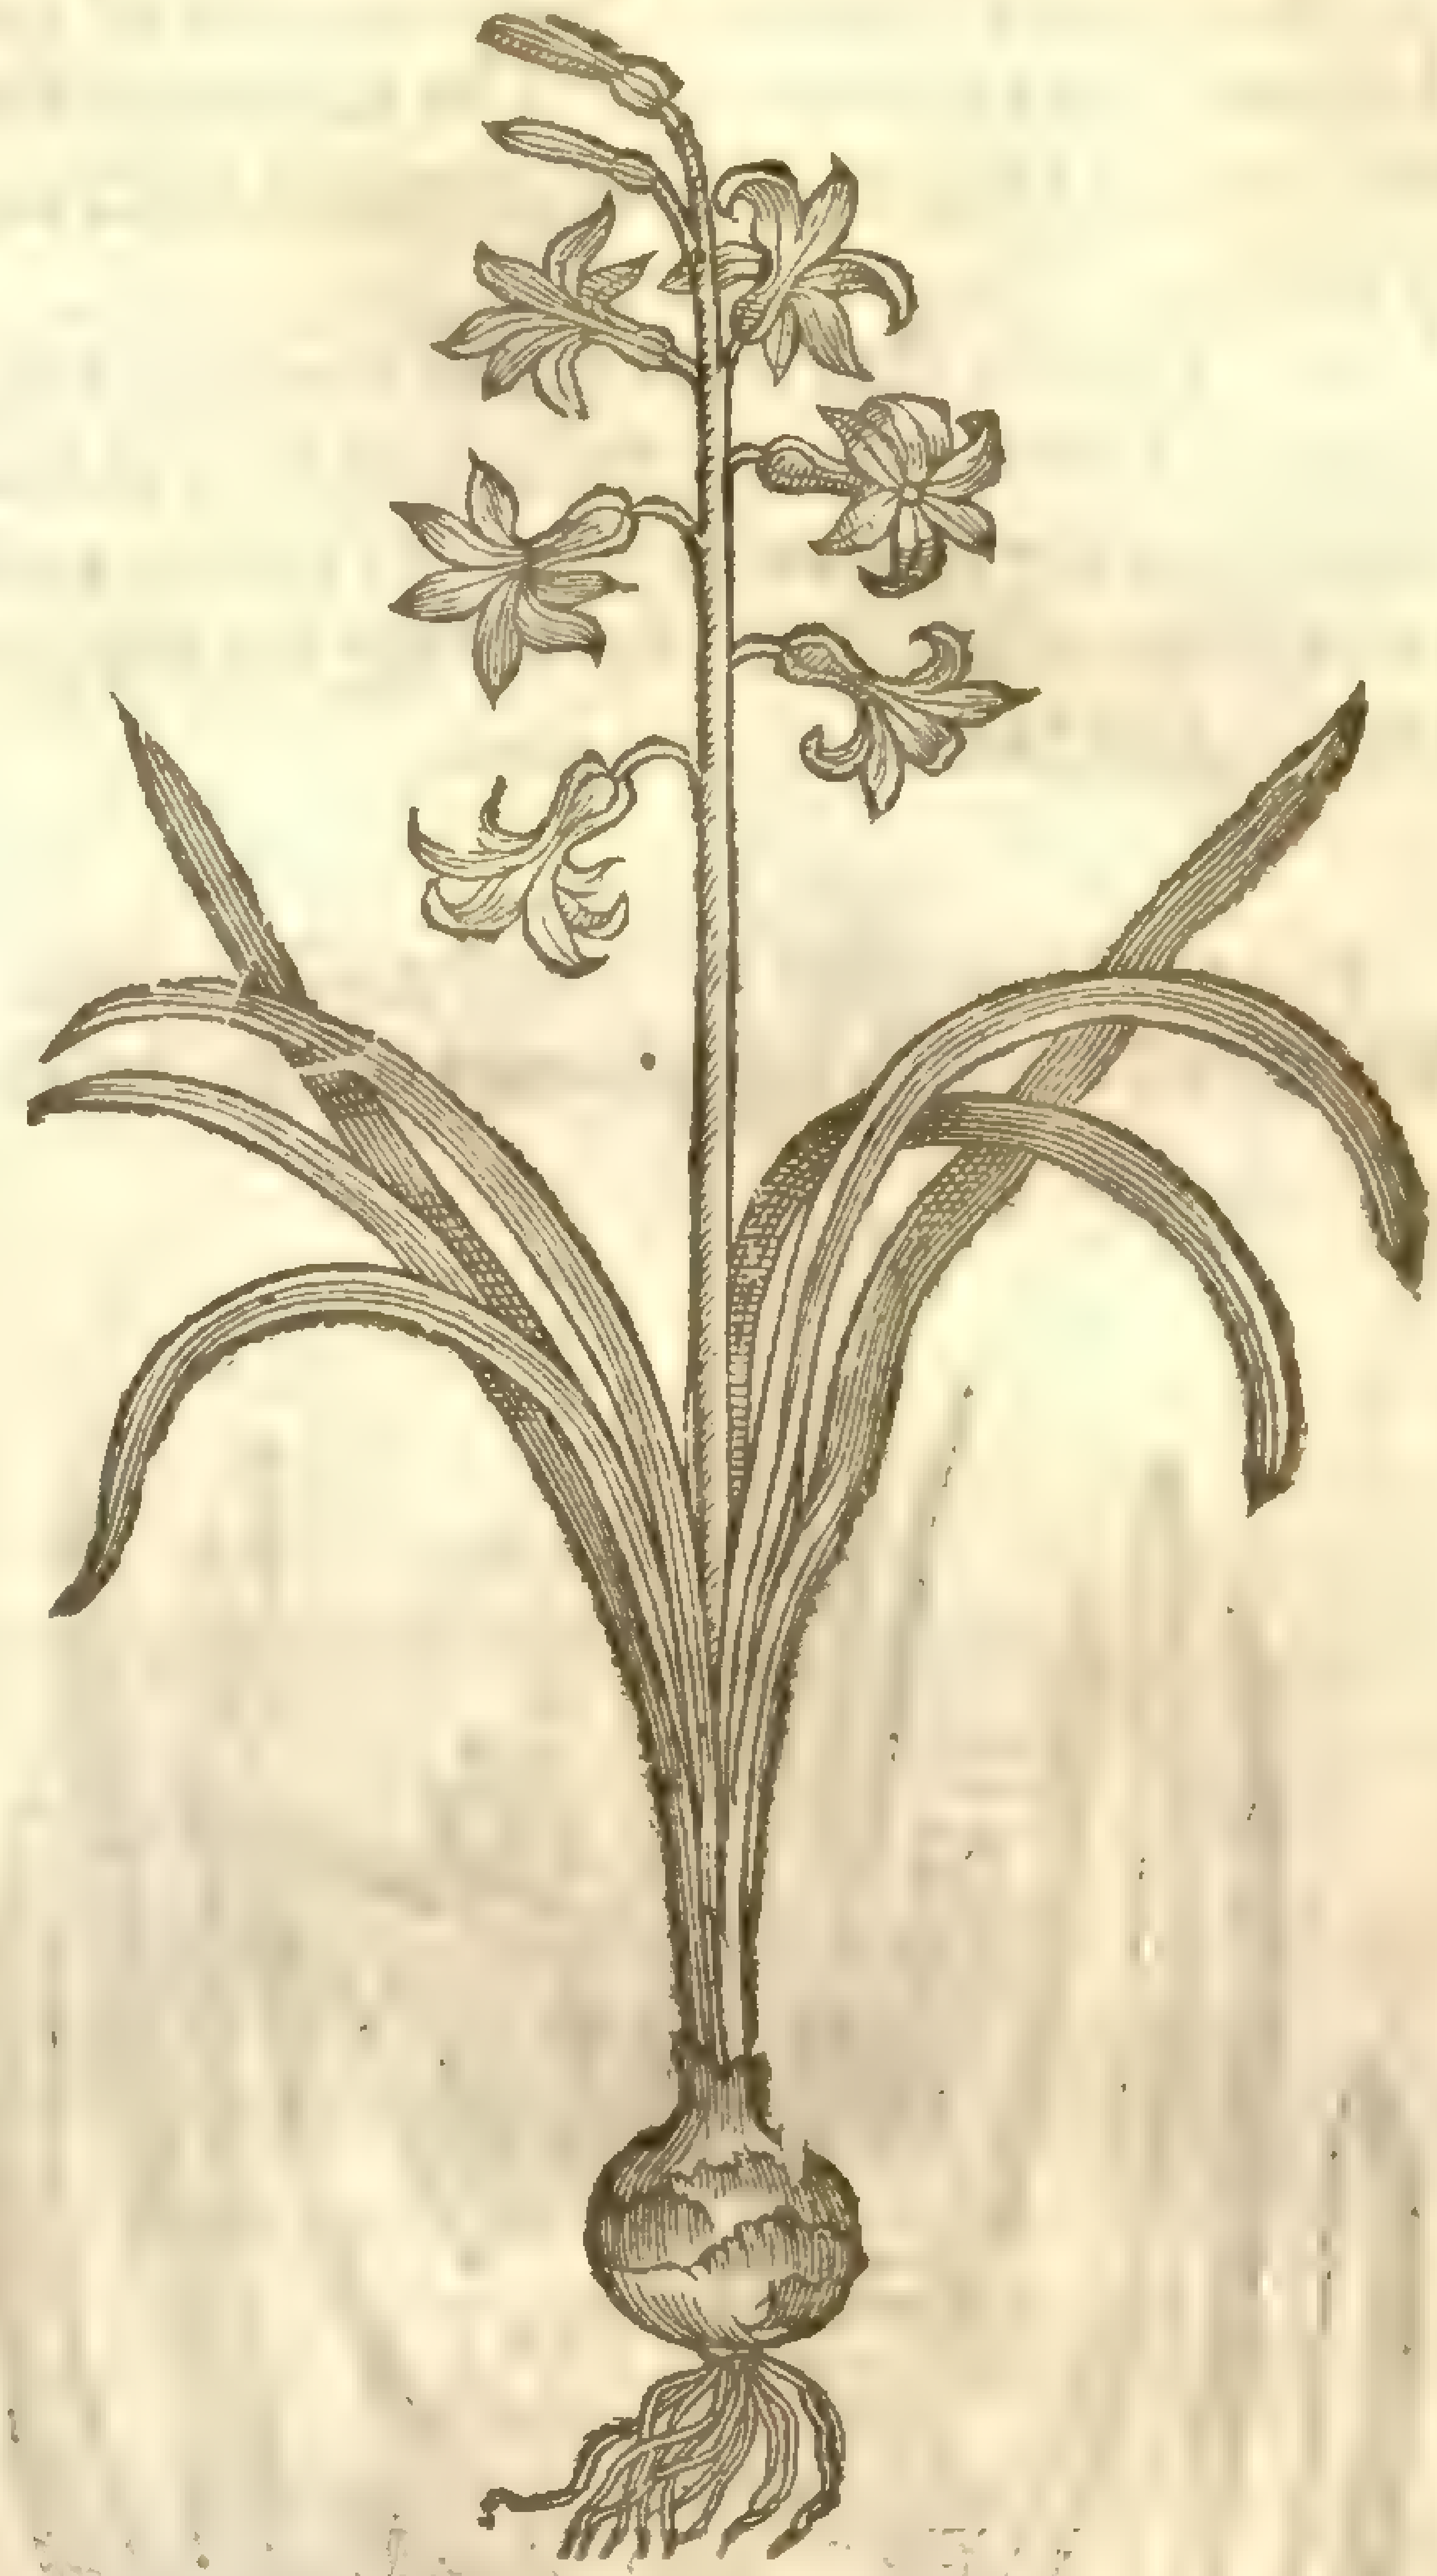
4 ‡ *Hyacinthus*

‡ 6 *Hyacinthus Orientalis polyanthos alter.*
The other many-floured Orientall Iacinth.

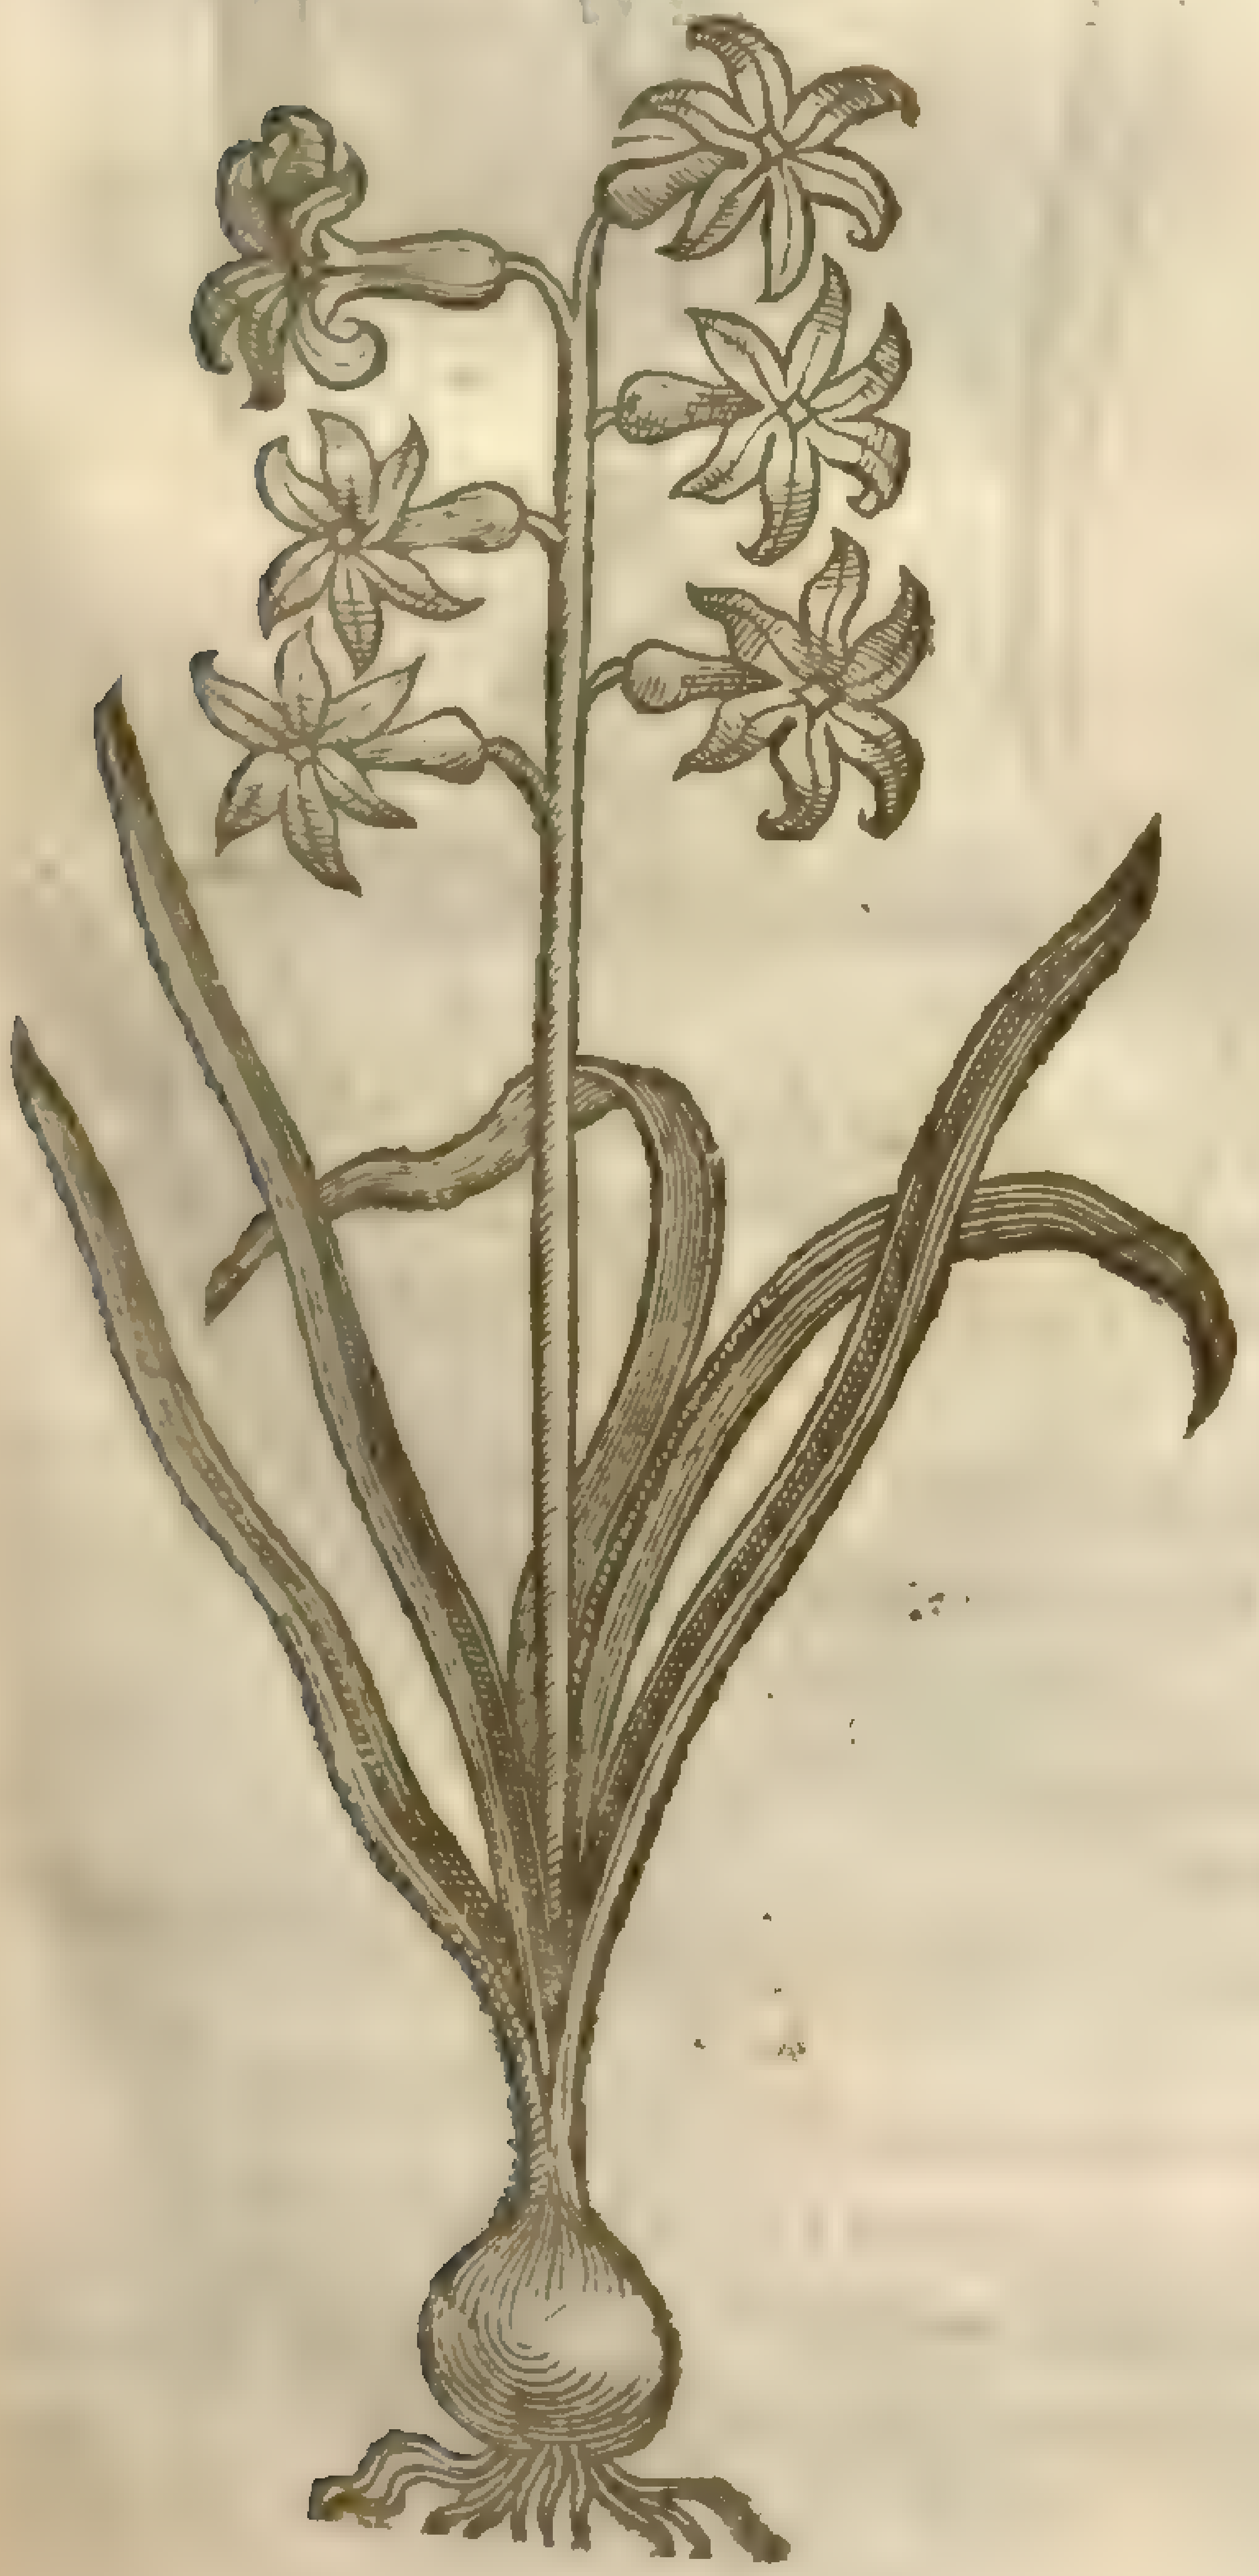


H. orientalis, L.
multi. [illegible]
[illegible]

‡ 7 *Hyacinthus Orientalis purpurorubeus.*
Reddiſh purple Orientall Iacinth.

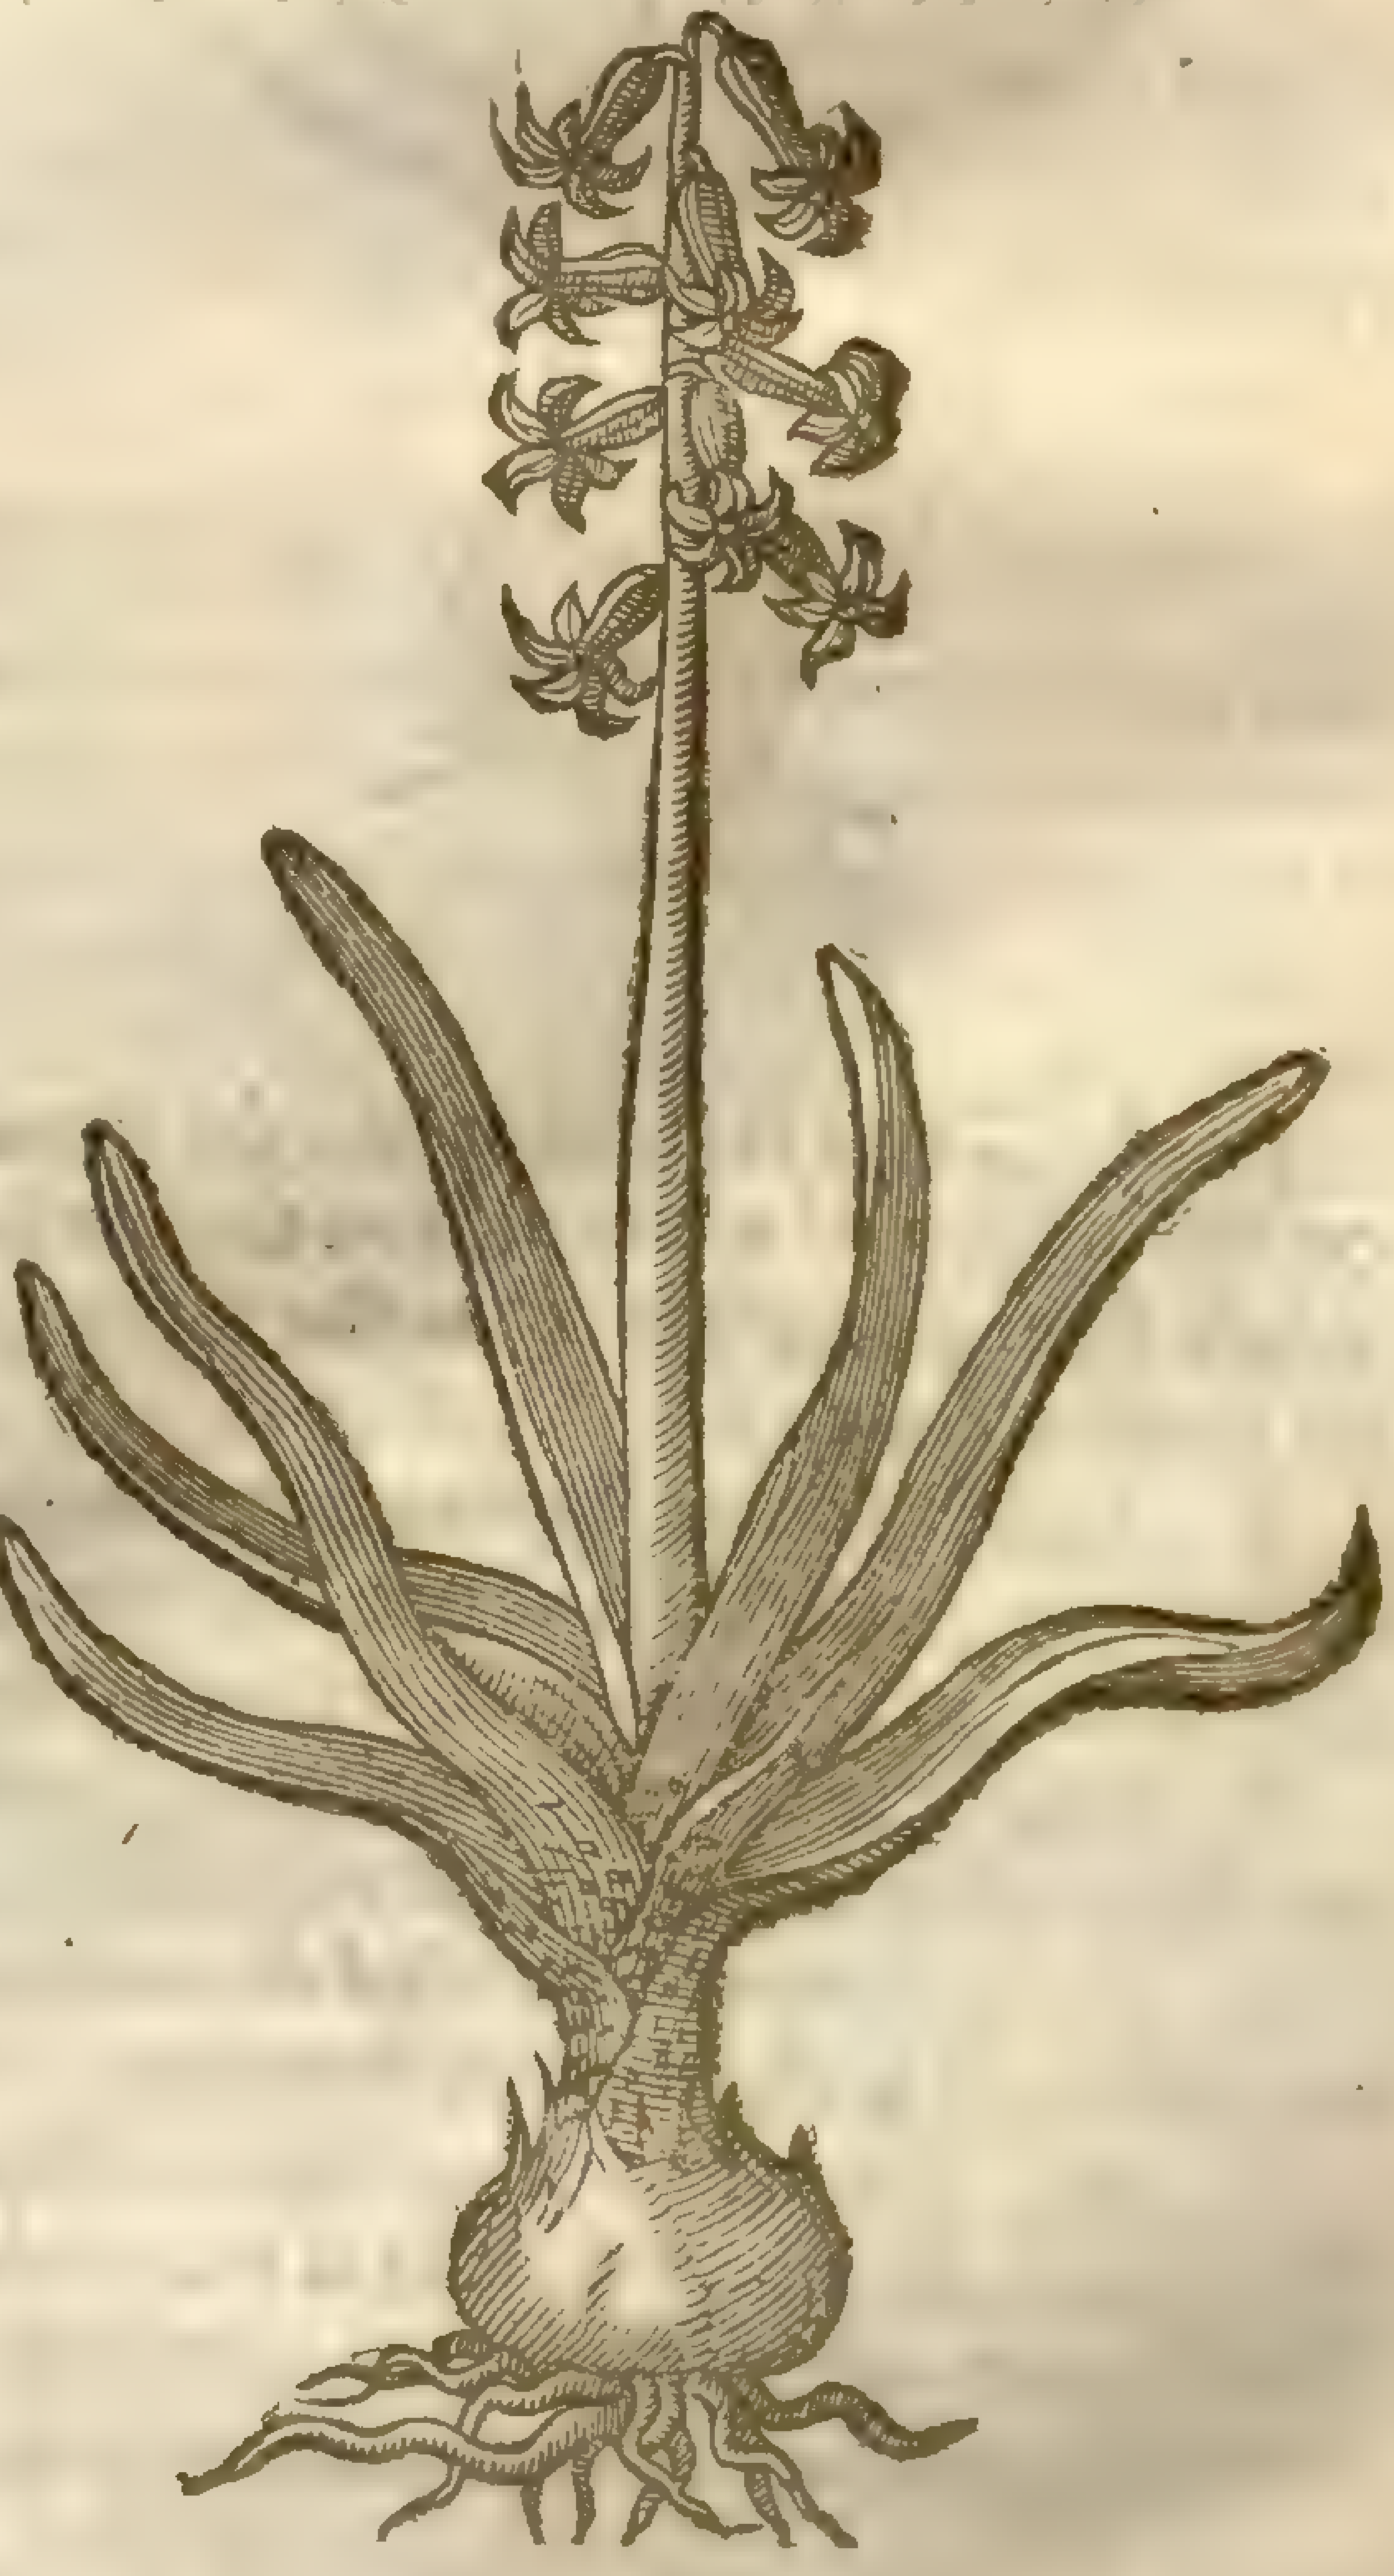


‡ 8 *Hyacinthus Orientalis albus.*
White Orientall Iacinth.



H. orientalis, L.
[illegible]
[illegible]

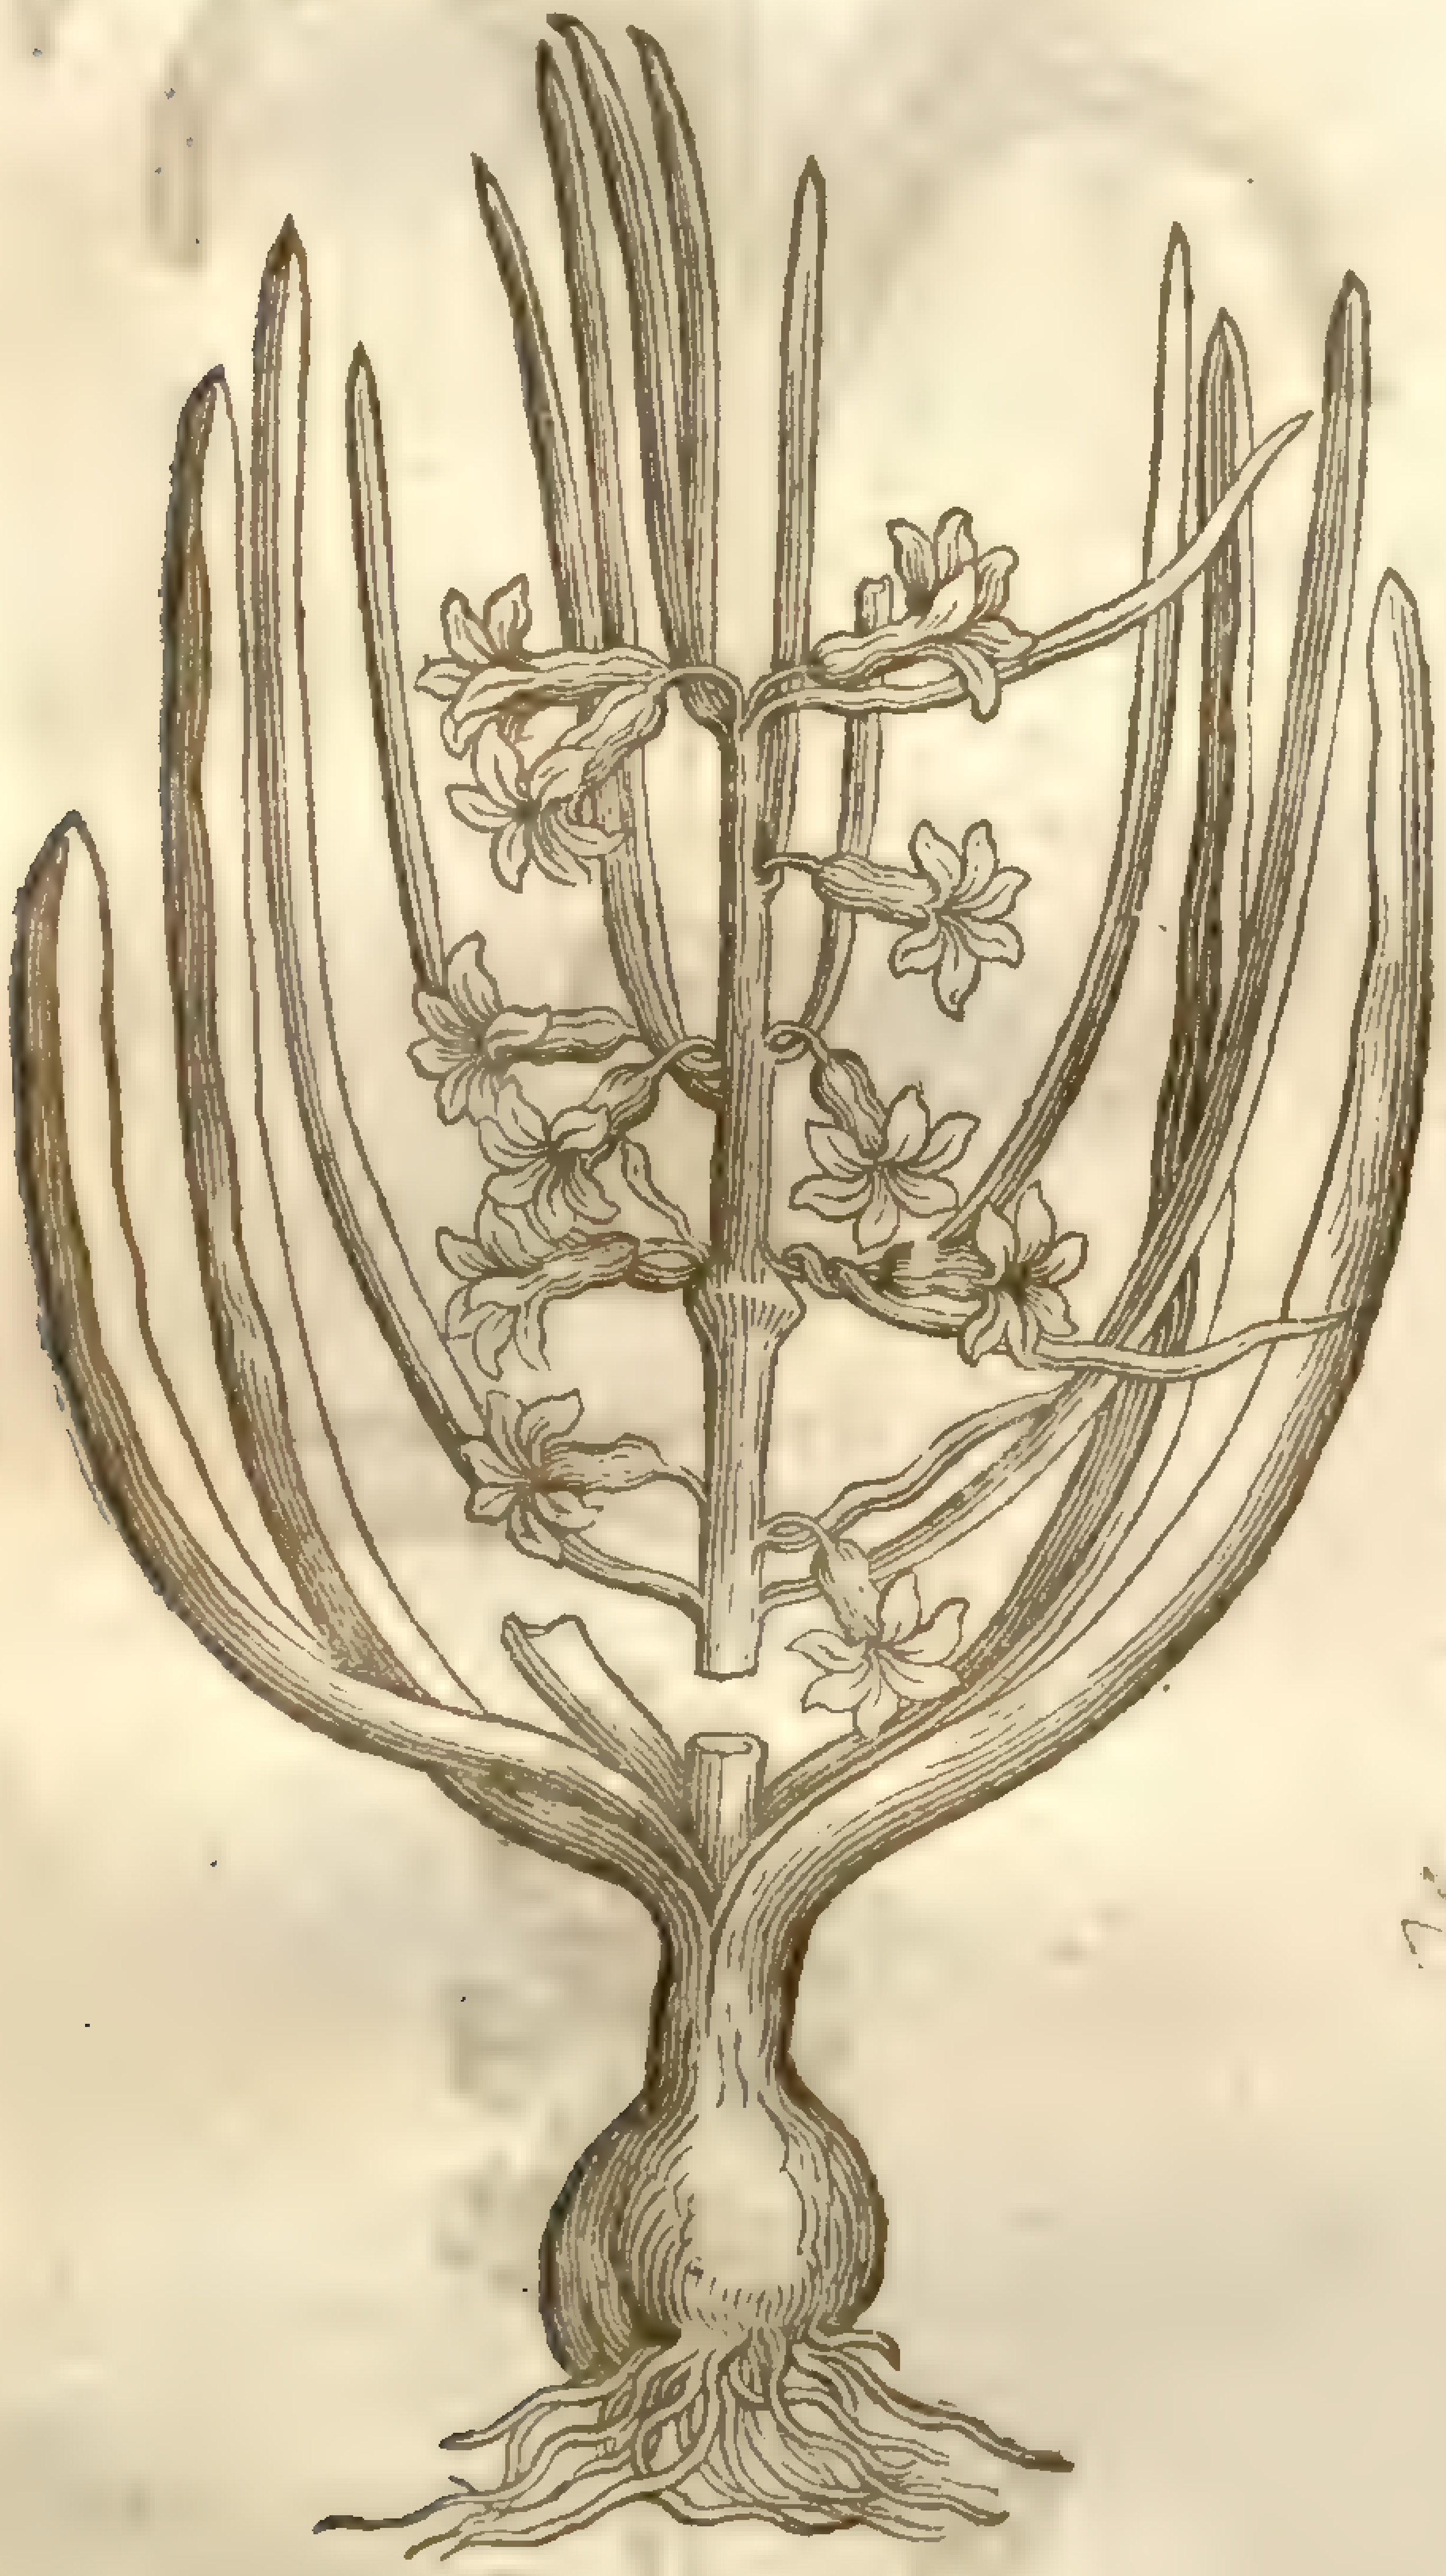
‡ 9 *Hyacinthus Brumalis.*
Winter Iacinth.



4 The Orientall Iacinth hath great leaues,thicke,fat,and full of juice,deeply hollowed in the middle like a trough. From the middle of thoſe leaues riſeth vp a ſtalke two hands high,bare without leaues,very ſmooth, ſoft, and full of juice, loden toward the top with many faire blew floures hollow like a bell,greater than the Engliſh Hyacinth,but otherwiſe like them. The root is great, bulbous or Onion-faſhion,couered with many ſcaly reddiſh filmes or pillings, ſuch as doe couer Onions.

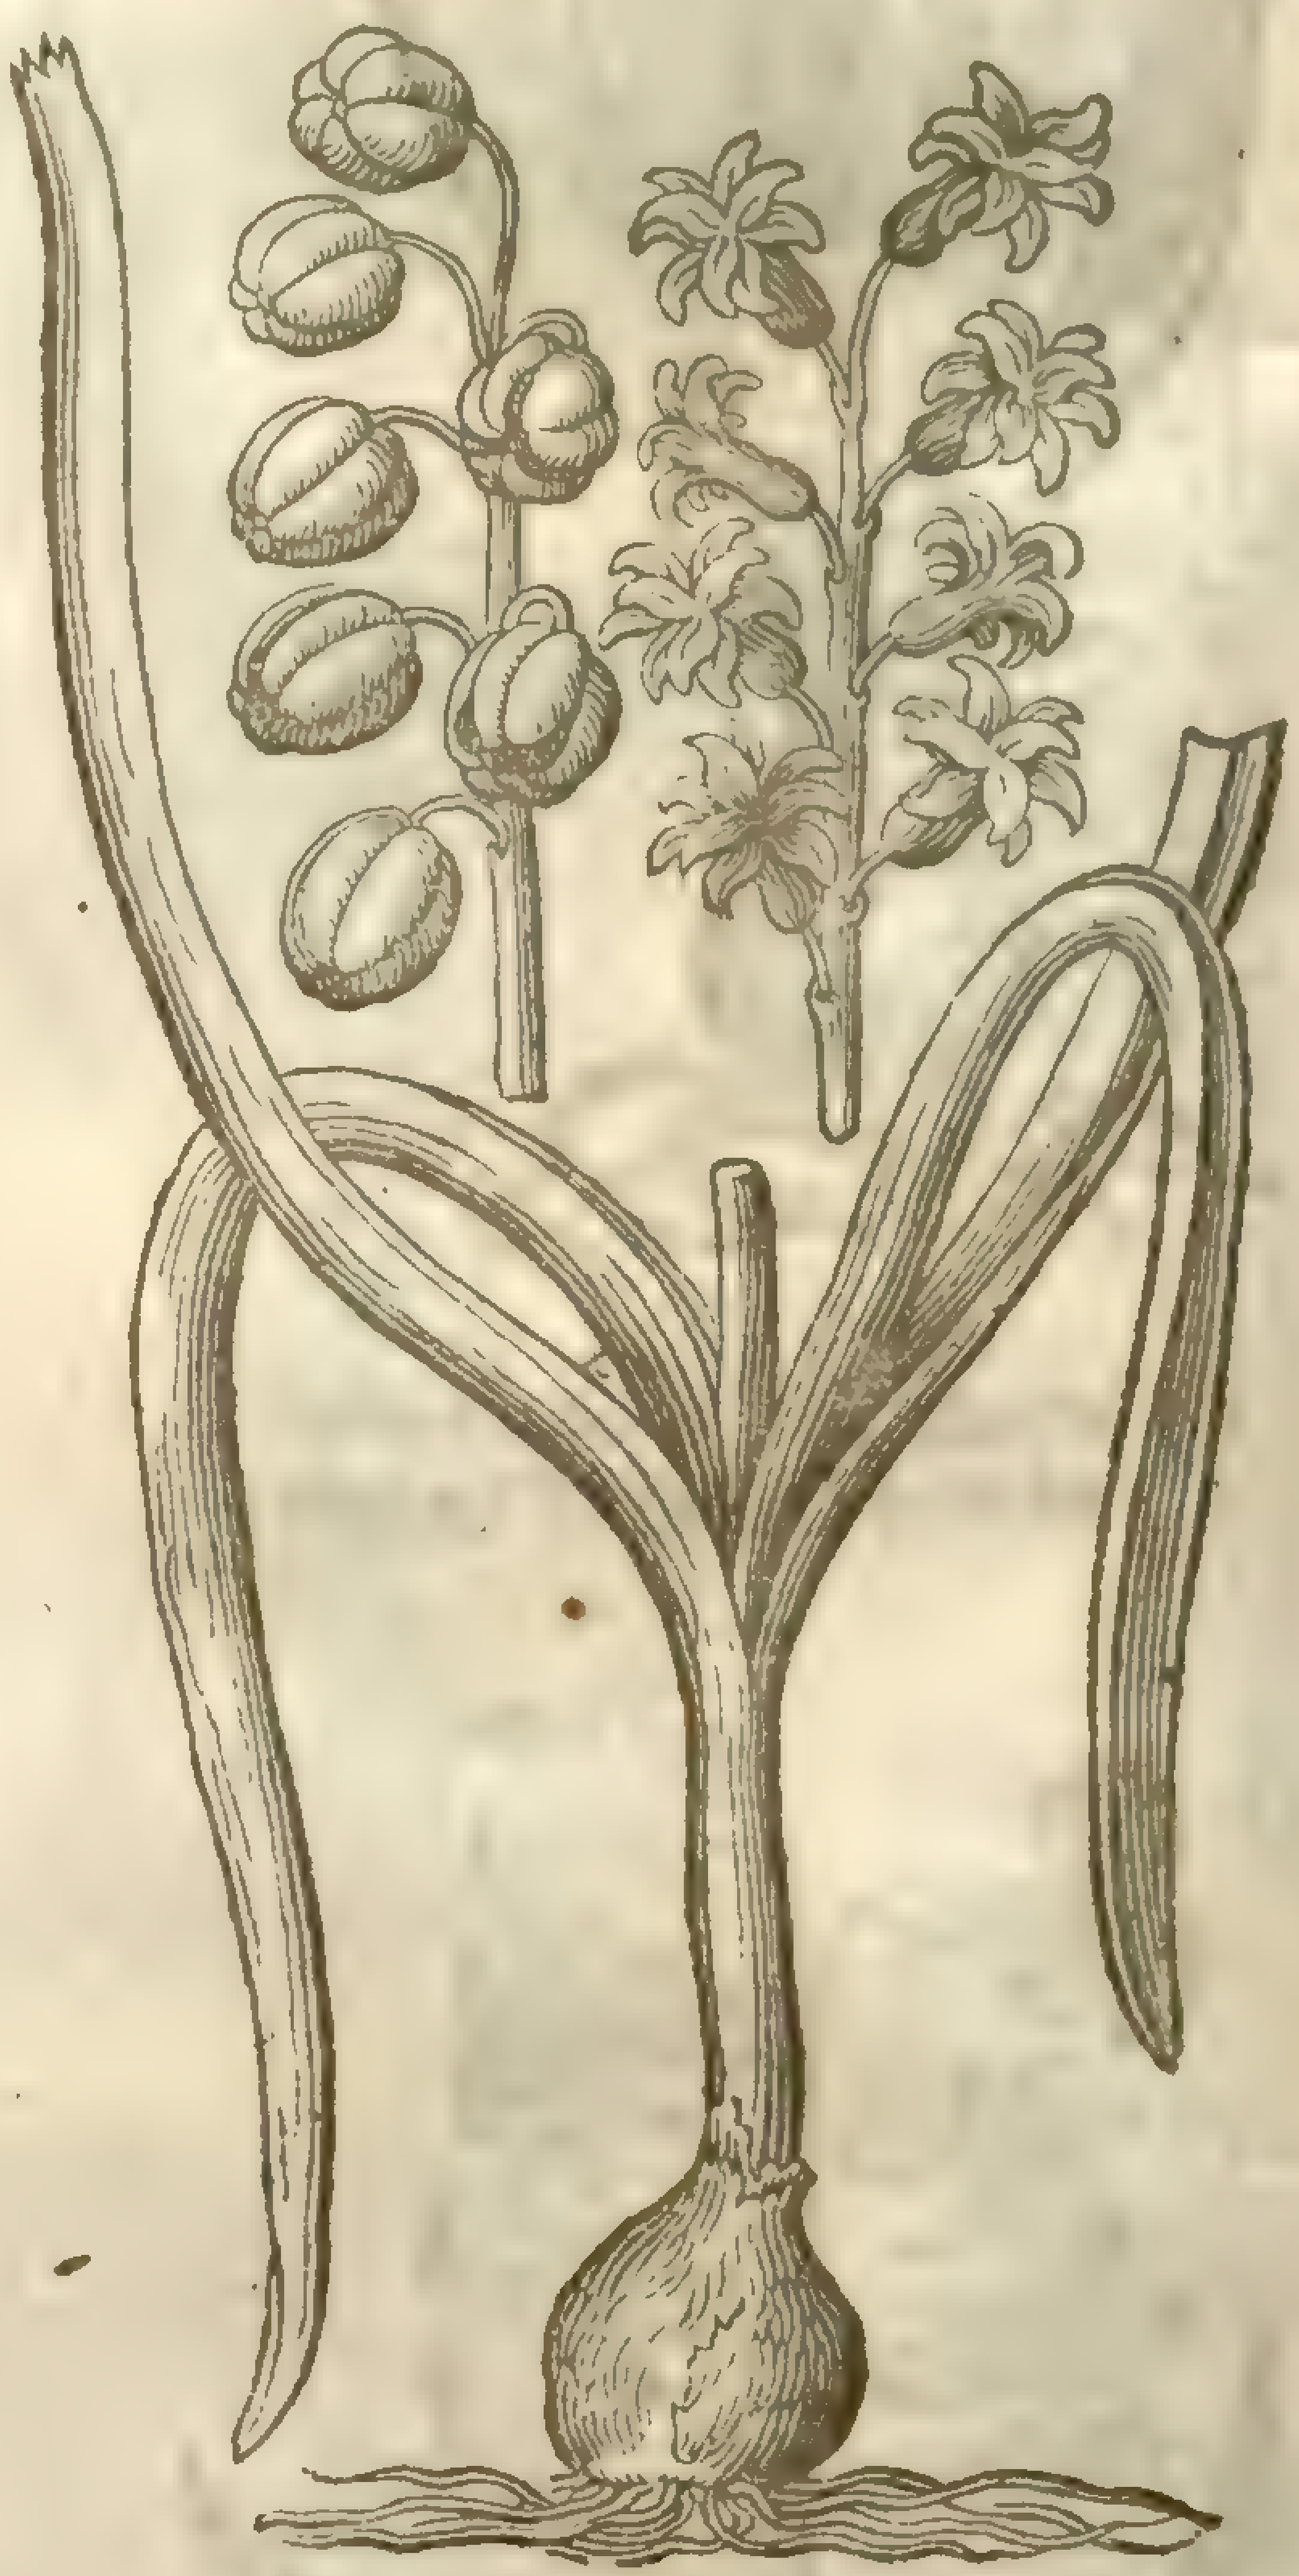
5 The Iacinth with many floures (for ſo doth the word *Polyanthos* import) hath verie many large and broad leaues ſhort and very thicke,fat,or full of ſlimie juice : from the middle whereof riſe vp ſtrong thicke groſſe ſtalks, bare and naked, ſet from the middle to the top with many blew or sky-coloured floures growing for the moſt part vpon one ſide of the ſtalke. The root is great, thicke,and full of ſlimie juice.

‡ 10 *Hyacinthus Orientalis caule folioſo.*
Orientall Iacinth with leaues on the ſtalke.



[illegible]

‡ 11 *Hyacinthus Orientalis flore pleno.*
The double floured Oriental Iacinth.



‡ 6 There is another like the former in each reſpect, ſauing that the flours are wholly white on the inſide,and white alſo on the outſide,but three of the out leaues are of a pale whitiſh yellow. Theſe floures ſmell ſweet as the former,and the heads wherin the ſeeds are contained,are of a lighter green colour. ‡

7 There is come vnto vs from beyond the ſeas diuers other ſorts, whoſe figures are not extant with vs ; of which there is one like vnto the firſt of theſe Oriental Iacinths, ſauing that the floures thereof are purple coloured,whence it is termed *Hyacinthus purpuro rubeus.*

8 Likewiſe there is another called *Orientalis albus,* differing alſo from the others in colour of the floures,for that theſe are very white,and the others blew.

9 There is another called *Hyacinthus Brumalis,*or winter Iacinth : it is like the others in ſhape, but differeth in the time of flouring.

‡ 10 There is another Hyacinth belonging rather to this place than any other , for that in root, leaues,floures,and ſeeds,it reſembles the firſt deſcribed Oriental Iacinth ; but in one reſpect it differs not onely from them , but alſo from all other Iacinths ; which is , it hath a leafie ſtalke, hauing ſometimes one,and otherwhiles two narrow long leaues comming forth at the bottom of the

‡ 14 *Hyacinthus obſoleto flore Hiſpanicus major.*

Polianthes tuberosa, L. β
Mill. dict.
[illegible]

the ſetting of the floure. Whereupon *Cluſius* calls it *Hyacinthus Orientalis caule folioſo*: That is, the Oriental Hyacinth with leaues on the ſtalke.

¶ *Of double floured Oriental Hyacinths.*

Of this kindred there are two or three more varieties, whereof I will giue you the deſcription of the moſt notable, and the names of the other two; which, with that I ſhall deliuer of this, may ſerue for ſufficient deſcription. The firſt of theſe (which *Cluſius* calls *Hyacinthus Orientalis ſubvireſcente flore*, or, the greeniſh floured double Orientall Iacinth) hath leaues, roots, and ſeeds like vnto the formerly deſcribed Orientall Iacinths; but the floures (wherin the difference conſiſts) are at the firſt, before they be open, greene, and then on the out ſide next to the ſtalke of a whitiſh blew: and they conſiſt of ſix leaues whoſe tips are whitiſh, yet retaining ſome manifeſt greenes: then out of the midſt of the floures comes forth another floure conſiſting of three leaues, whitiſh on their inner ſide, yet keeping the great veine or ſtreake vpon the outer ſide, each floure hauing in the middle a few chiues with blackiſh pendants. It floures in Aprill.

12 This varietie of the laſt deſcribed is called *Hyacinthus Orientalis flore cæruleo pleno*, The double blew Orientall Iacinth.

13 This, *Hyacinthus Orientalis candidiſſimus flore pleno*, The milke-white double Orientall Iacinth.

14 This, which *Cluſius* calls *Hyacinthus obſoletior Hiſpanicus*, hath leaues ſomewhat narrower, and more flexible than the *Muſcari*, with a white veine running alongſt the inſide of them: among theſe leaues there riſeth vp a ſtalke of ſome foot high, bearing ſome fifteene or ſixteene floures, more or leſſe, in ſhape much like the ordinary Engliſh, conſiſting of ſix leaues, three ſtanding much out, and the other three little or nothing. Theſe floures are of a very dusky colour, as it were mixt with purple, yellow, and greene: they haue no ſmell. The ſeed, which is contained in triangular heads, is ſmooth, blacke, ſcaly, and round. It floures in Iune.

15 The leſſer Spaniſh Hyacinth hath leaues like the Grape-floure, and ſmall floures ſhaped like the Orientall Iacinth, ſome are of colour blew, and other ſome white. The ſeeds are contained in three cornered ſeed-veſſels. I haue giuen the figure of the white and blew, together with their ſeed-veſſels.

16 This Indian Iacinth with the tuberous root (ſaith *Cluſius*) hath many long narrow ſharpe pointed leaues ſpread vpon the ground, being ſomewhat like to thoſe of Garlicke, and in the middeſt of theſe riſe vp many round firme ſtalkes of ſome two cubits high, and oft times higher, ſometimes exceeding the thickneſſe of ones little finger; which is the reaſon that oftentimes, vnleſſe they be borne vp by ſomething, they lie along vpon the ground. Theſe ſtalkes are at certaine ſpaces ingirt with leaues which end in ſharpe points. The tops of theſe ſtalkes are adorned with many white floures, ſomewhat in ſhape reſembling thoſe of the Orientall Iacinth. The roots are knotty or tuberous, with diuers fibres comming out of them. ‡

¶ *The Place.*

Theſe kindes of Iacinths haue beene brought from beyond the Seas, ſome out of one countrey, and ſome out of others, eſpecially from the Eaſt countries, whereof they tooke the name *Orientalis*.

¶ *The Time.*

They floure from the end of Ianuarie vnto the end of Aprill.

¶ *The Nature.*

The Hyacinths mentioned in this Chapter do lightly cleanſe and binde; the ſeeds are dry in the third degree; but the roots are dry in the firſt, and cold in the ſecond.

¶ *The Vertues.*

A The Root of Hyacinth boyled in Wine and drunke, ſtoppeth the belly, prouoketh vrine, and helpeth againſt the venomous biting of the field Spider.

B The ſeed is of the ſame vertue, and is of greater force in ſtopping the laske and bloudy flix. Being drunke in wine it preuaileth againſt the falling ſickneſſe.

C The roots, after the opinion of *Dioſcorides*, being beaten and applied with white Wine, hinder or keepe backe the growth of haires.

D ‡ The ſeed giuen with Southerne-wood in Wine is good againſt the Iaundiſe. ‡

Chap. 80. *Of Faire haired Iacinth.*

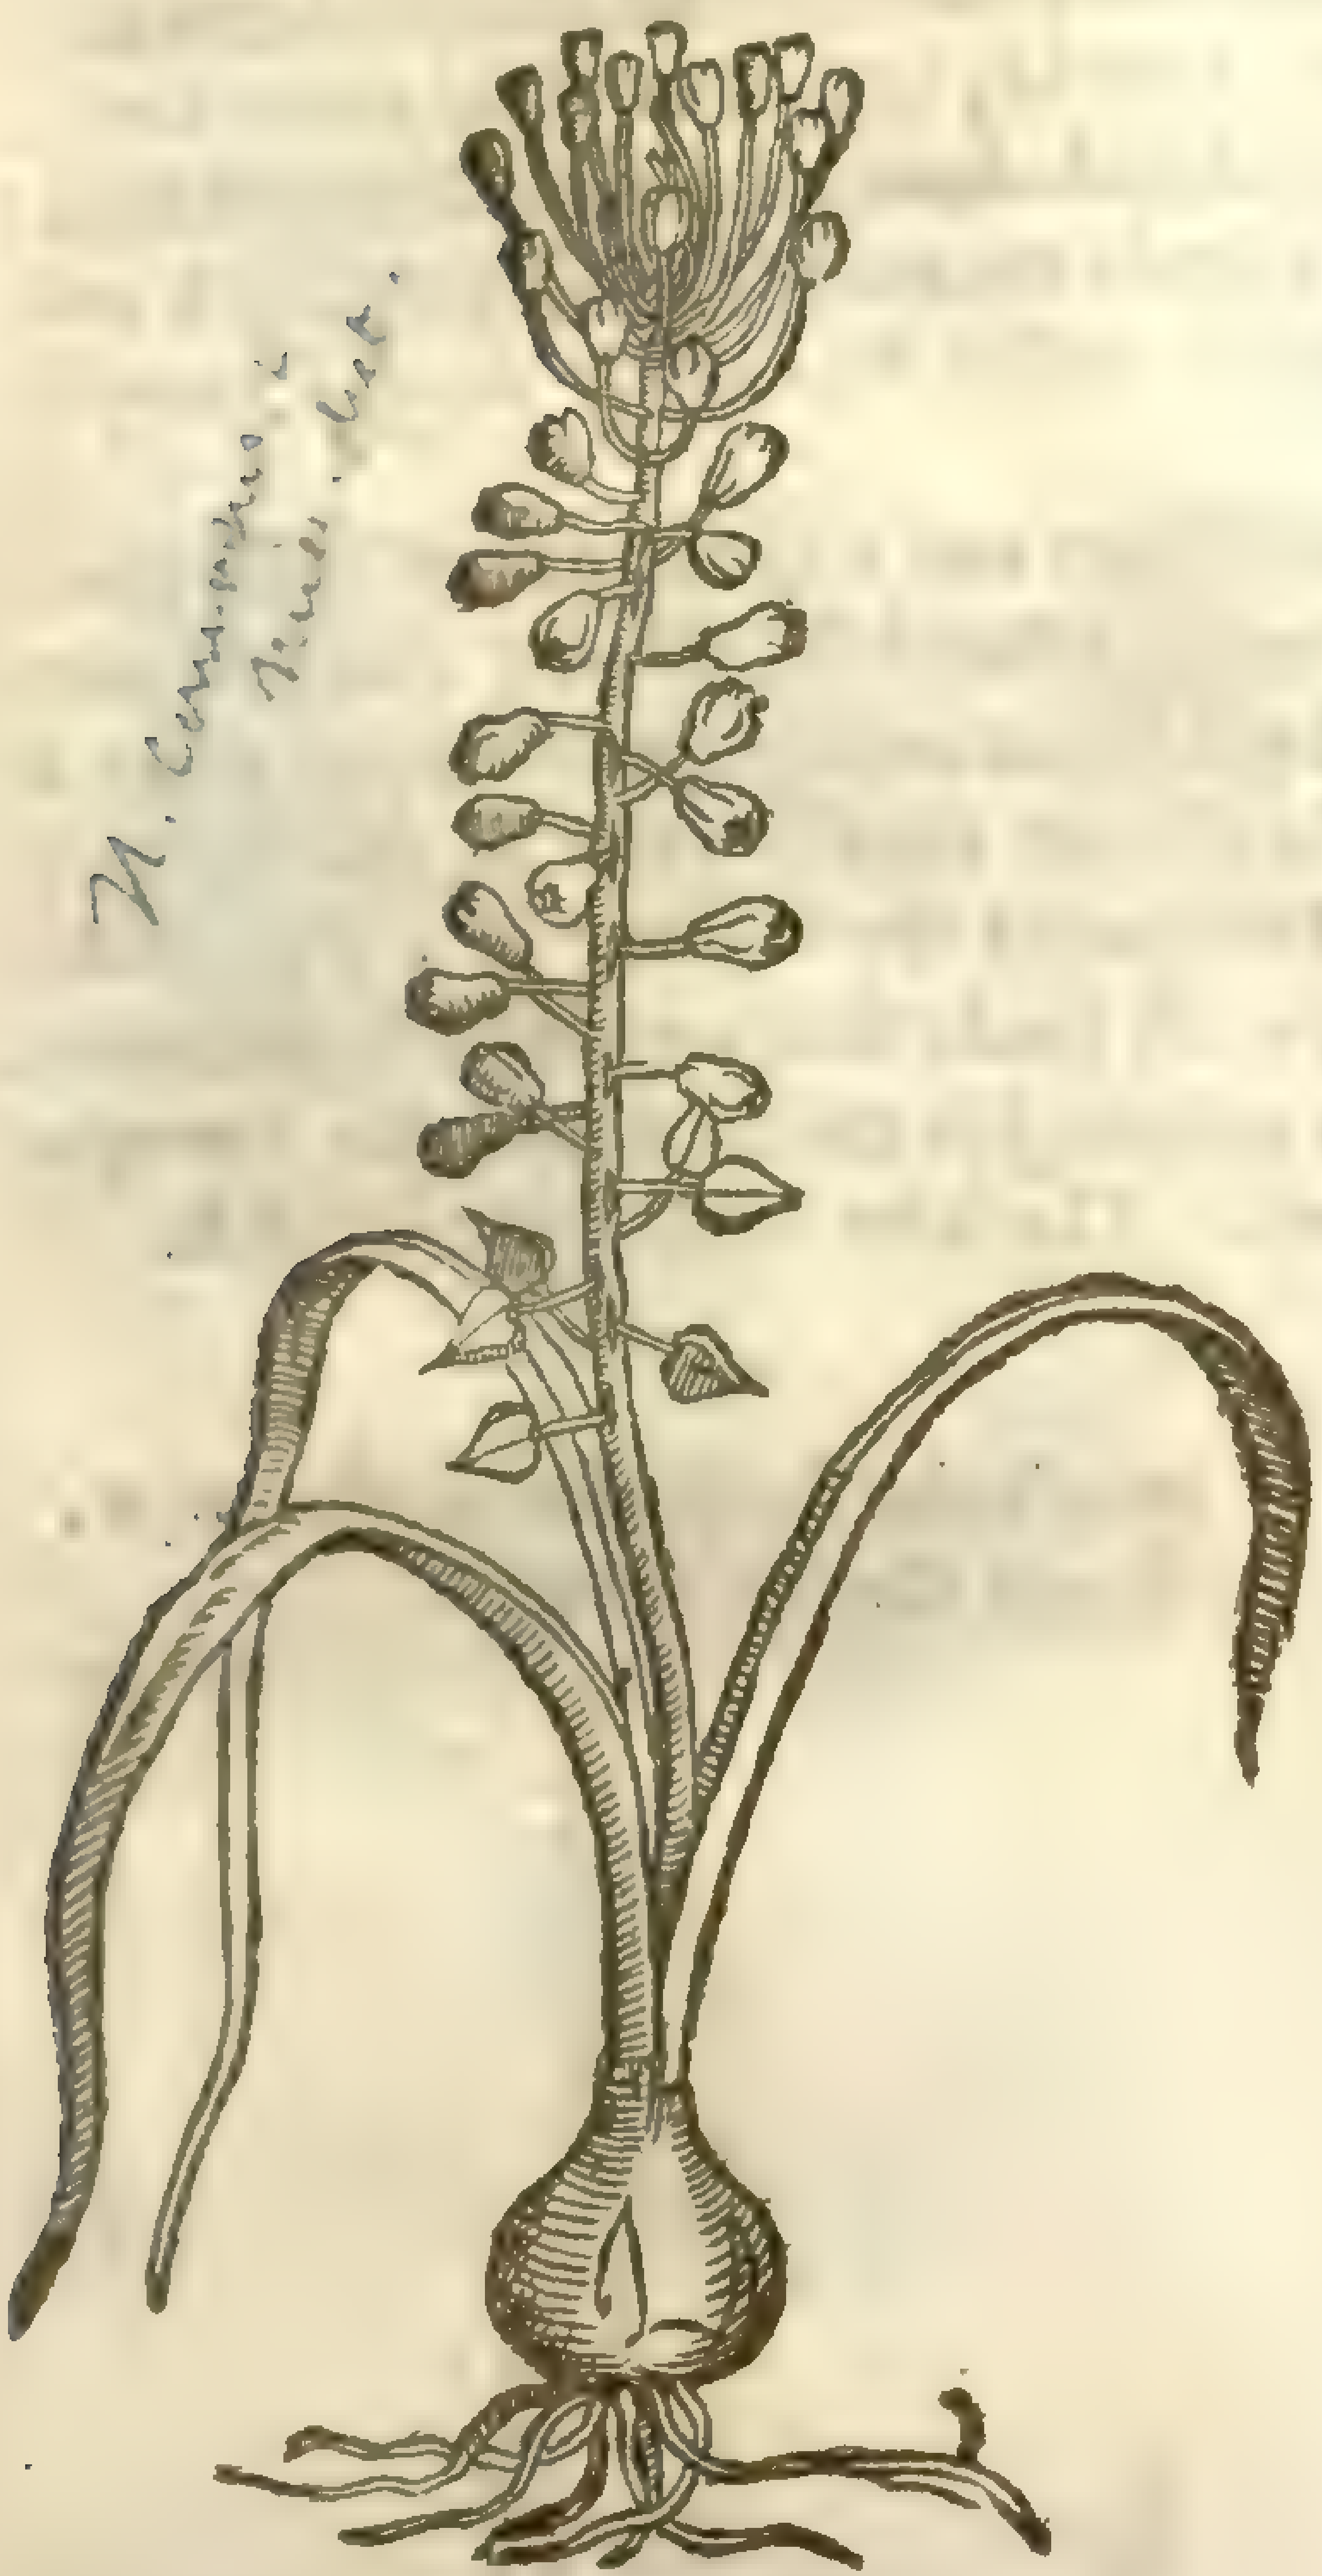
¶ *The Deſcription.*

1 The Faire haired Iacinth hath long fat leaues, hollowed alongſt the inſide, trough faſhion, as are moſt of the Hyacinths, of a darke greene colour tending to redneſſe. The ſtalke riſeth out of the middeſt of the leaues, bare and naked, ſoft and full of ſlimie juyce, which are beſet round about with many ſmall floures of an ouerworne purple colour: The top of the ſpike conſiſteth of a number of faire ſhining purple floures, in manner of a tuft or buſh of haires, whereof it tooke his name *Comoſus*, or faire haired. The ſeed is contained in ſmall bullets, of a ſhining blacke colour, as are moſt of thoſe of the Hyacinths. The roots are bulbous or Onion faſhion, full of ſlimie juice, with ſome hairie threds faſtened vnto their bottome.

2 White haired Iacinth differeth not from the precedent in roots, ſtalkes, leaues, or ſeed. The floures hereof are of a darke white colour, with ſome blackneſſe in the hollow part of them, which ſetteth forth the difference.

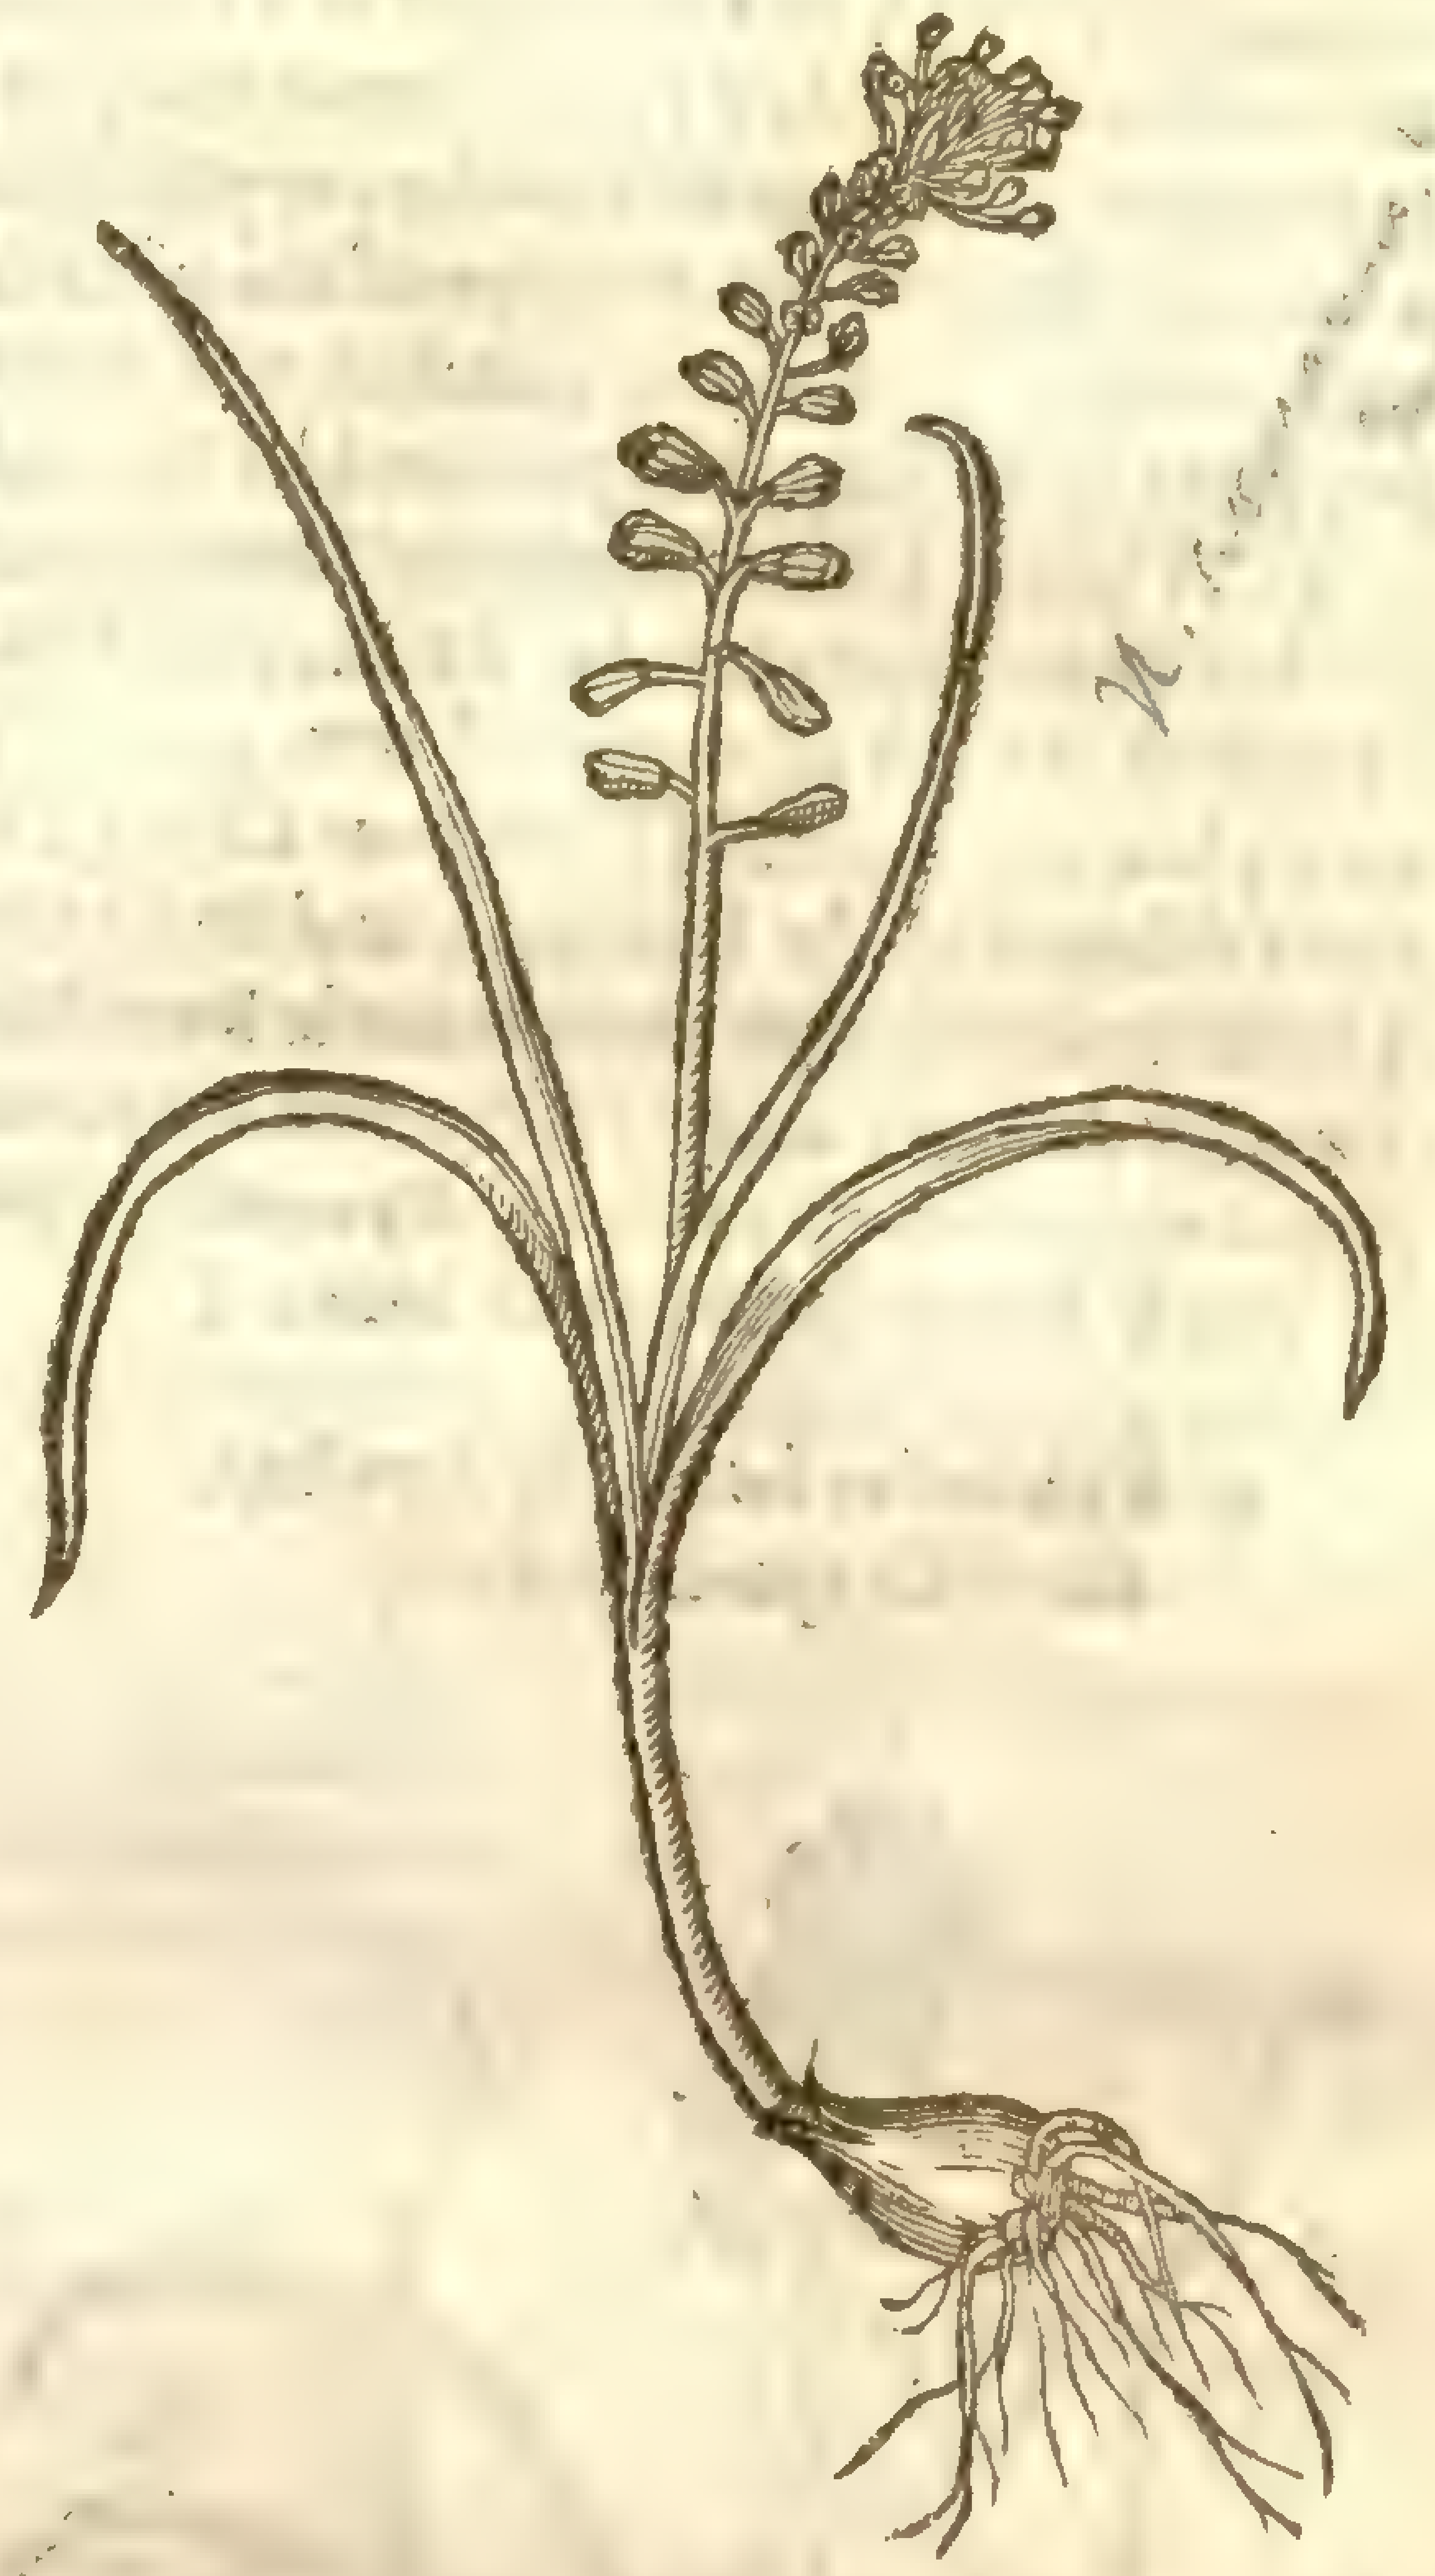
3 Of this kinde I receiued another ſort from Conſtantinople, reſembling the firſt hairy Hyacinth very notably: but differeth in that, that this is altogether greater, as well in leaues, roots, and floures, as alſo it is of greater beautie without all compariſon.

1 *Hyacinthus comoſus.*
Faire haired Iacinth.



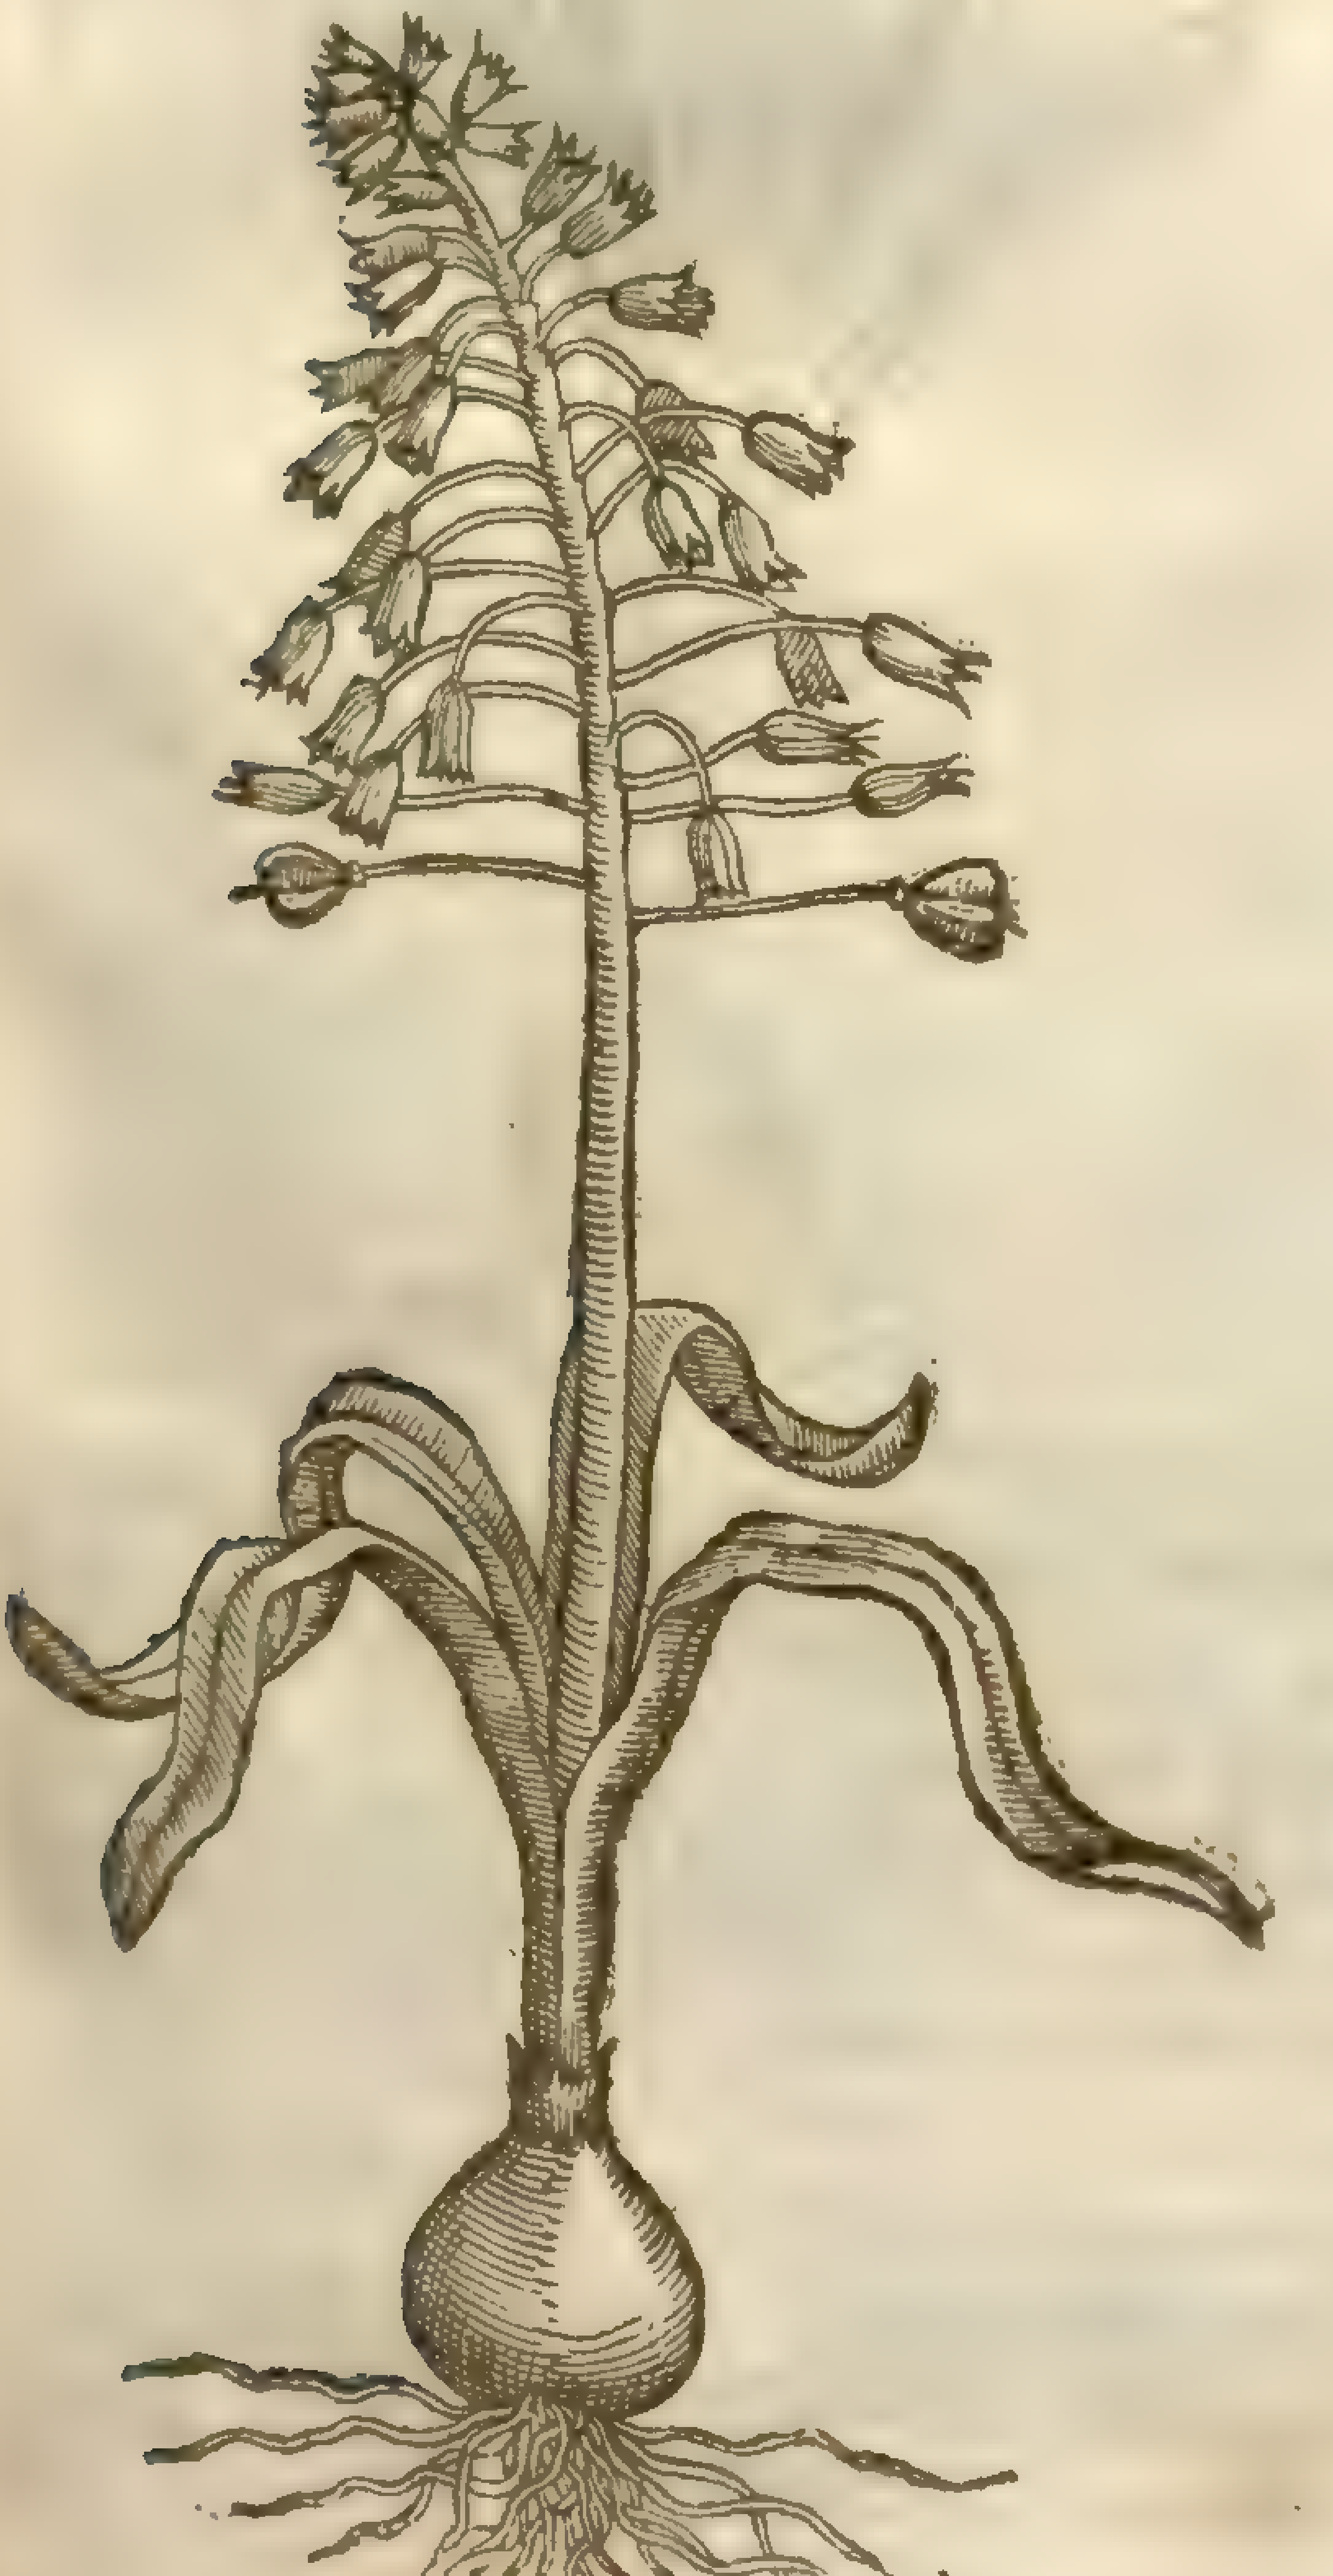
H. Comosus
[illegible]

2 *Hyacinthus comoſus albus.*
White haired Iacinth.

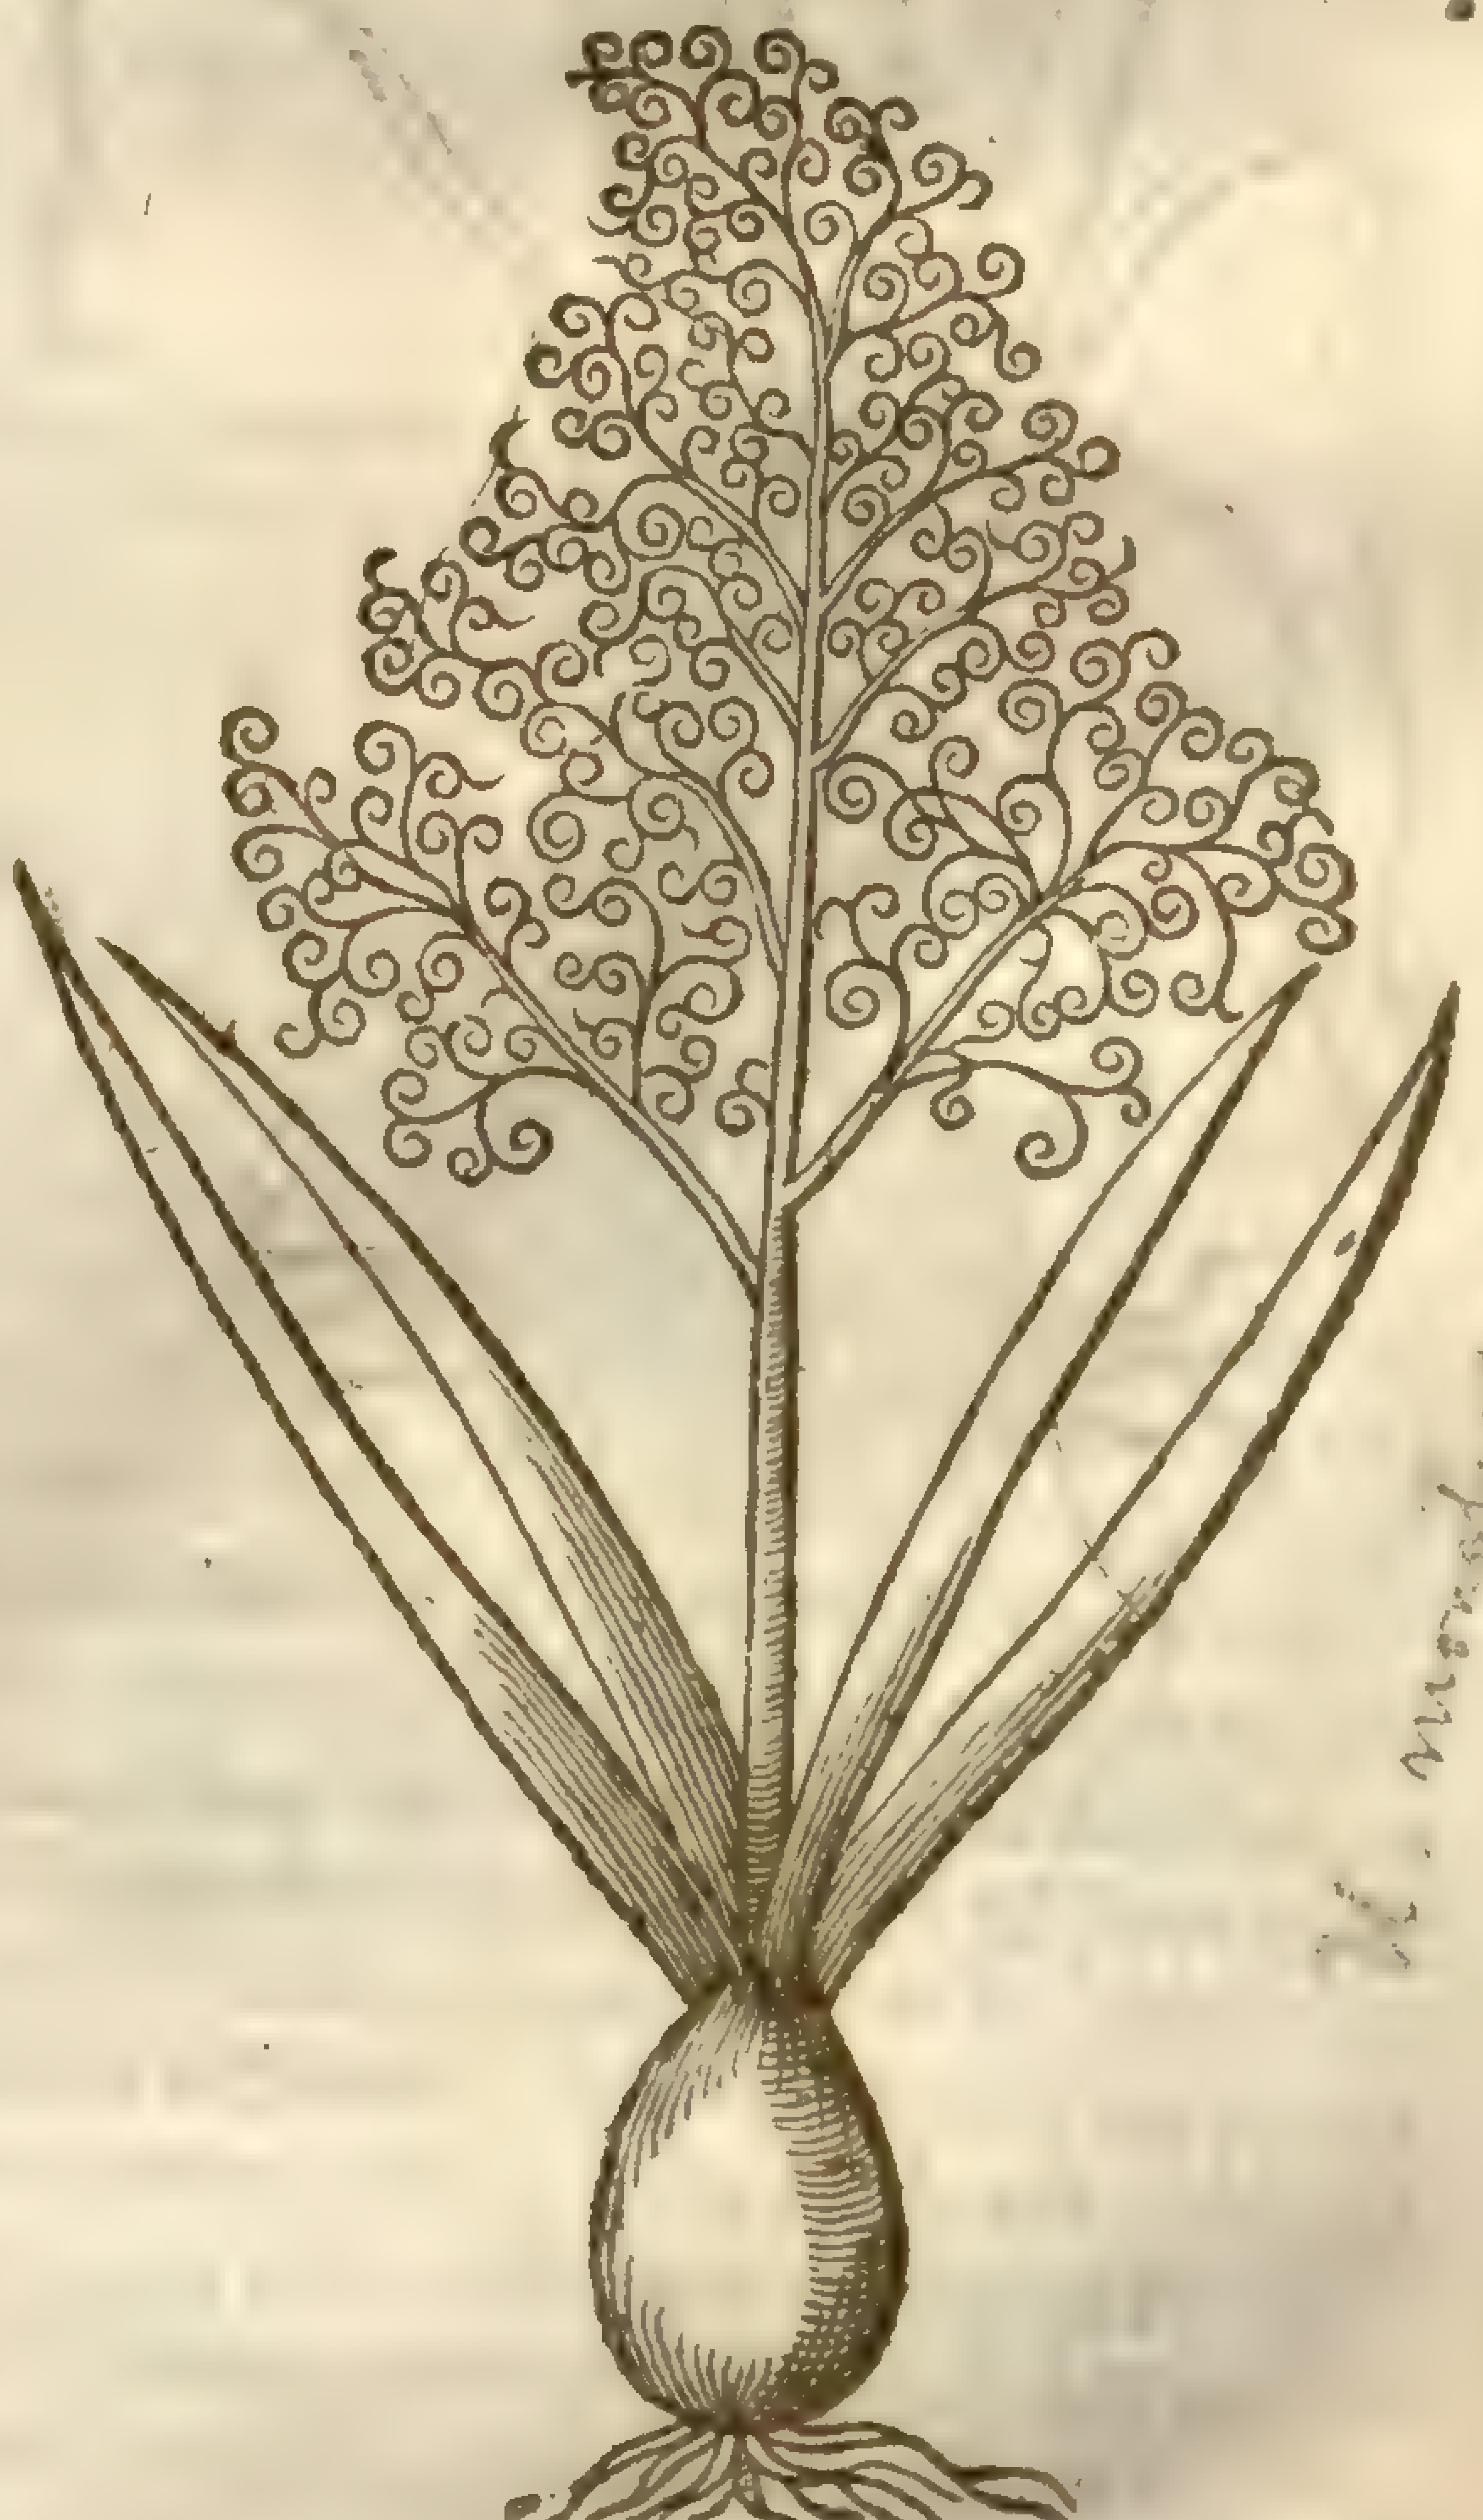


H. [illegible]
[illegible]

3 *Hyacinthus comoſus Bizantinus.*
Faire-haired Iacinth of Conſtantinople.



‡ 5 *Hyacinthus comoſus ramoſus elegantior.*
Faire curld-haired branched Iacinth.



H. Monstrosus
[illegible]

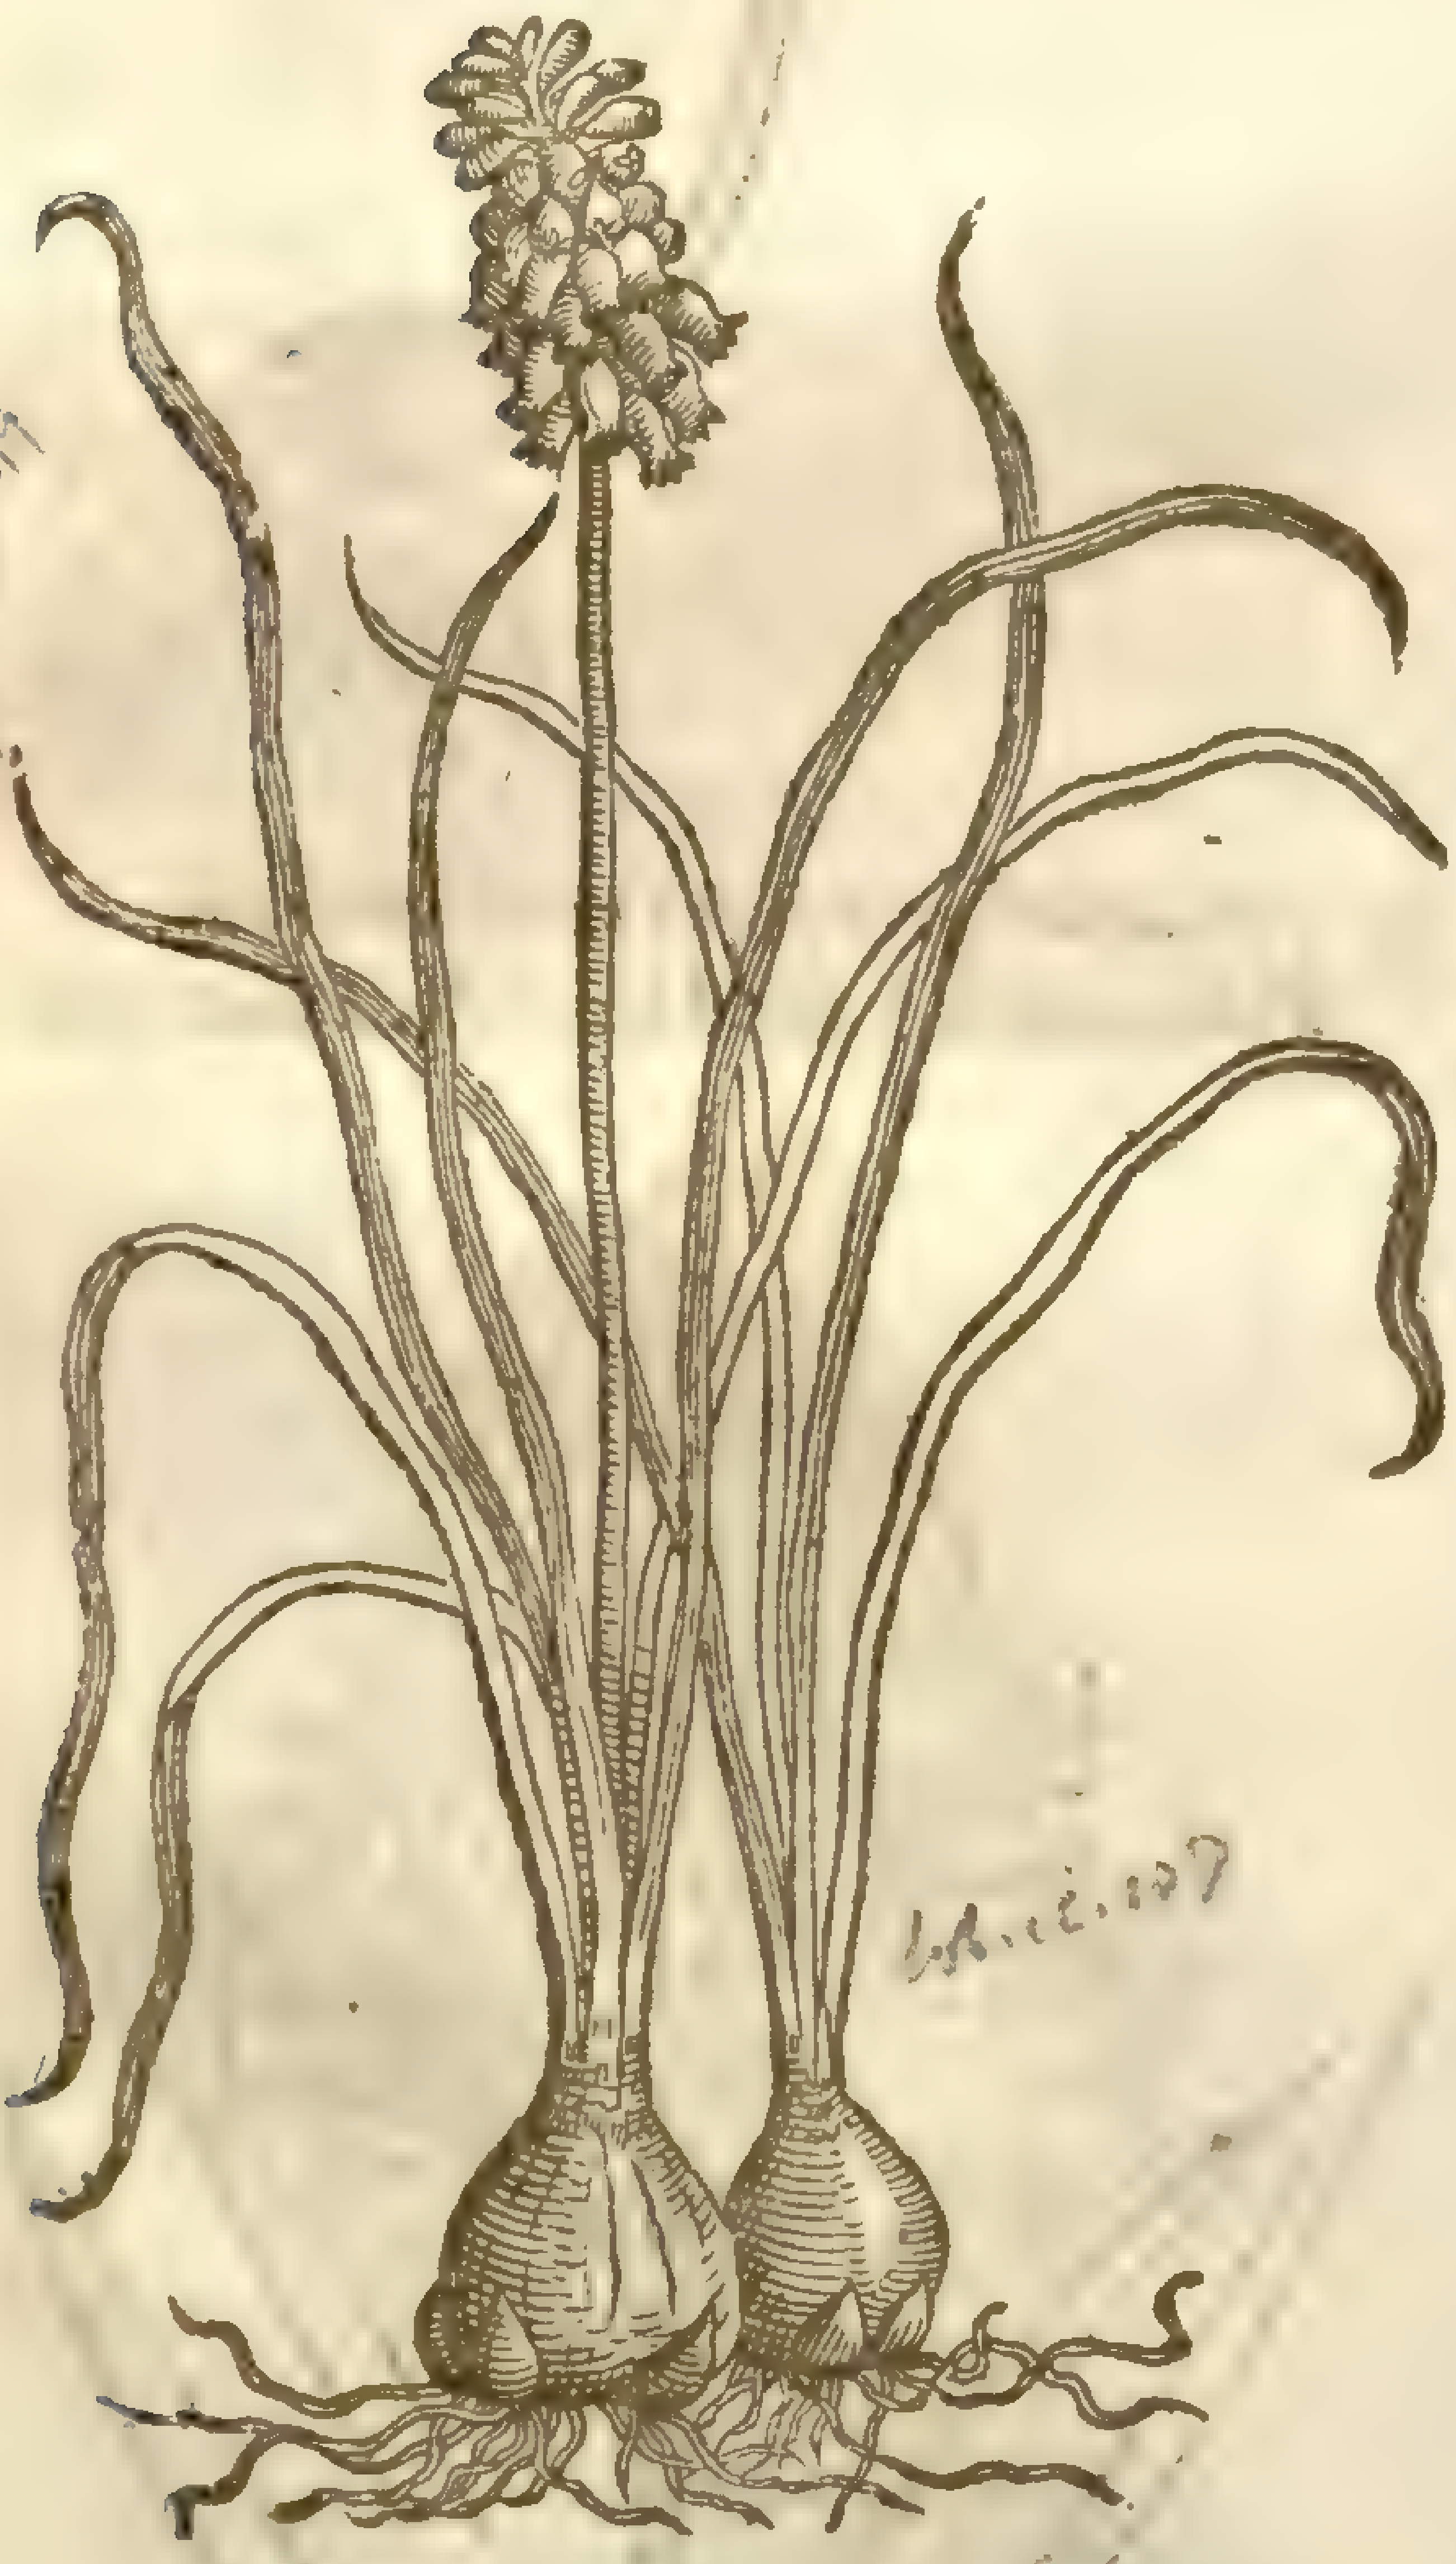
‡ 4 There are two other more beautifull haired Iacinths nouriſhed in the gardens of our prime Floriſts. The firſt of theſe hath roots and leaues reſembling the laſt deſcribed: the ſtalke commonly riſeth to the height of a foot, and it is diuided into many branches on euery ſide, which are ſmall and threddy; and then at the end as it were of theſe threddy branches there come forth many ſmaller threds of a darke purple colour, and theſe ſpread and diuaricate themſelues diuers waies, much after the manner of the next deſcribed; yet the threds are neither of ſo pleaſing a colour, neither ſo many in number, nor ſo finely curled. This is called *Hyacinthus comoſus ramoſus purpureus*, The faire hairy branched Iacinth.

5 This is a moſt beautifull and elegant plant, and in his leaues and roots he differs little from the laſt deſcribed; but his ſtalke, which is as high as the former, is diuided into very many ſlender branches, which ſubdiuided into great plenty of curled threads variouſly ſpread abroad, make a very pleaſant ſhew. The colour alſo is a light blew, and the floures vſually grow ſo, that they are moſt dilated at the bottome, and ſo ſtraiten by little and little after the manner of a Pyramide. Theſe floures keepe their beautie long, but are ſucceeded by no ſeeds that yet could be obſerued. This by *Fabius Columna* (who firſt made mention hereof in writing) is called *Hyacinthus Sanneſius panniculoſa coma*: by others, *Hyacinthus comoſus ramoſus elegantior*, The faire curld-haire Iacinth.

Theſe floure in May and Iune. ‡

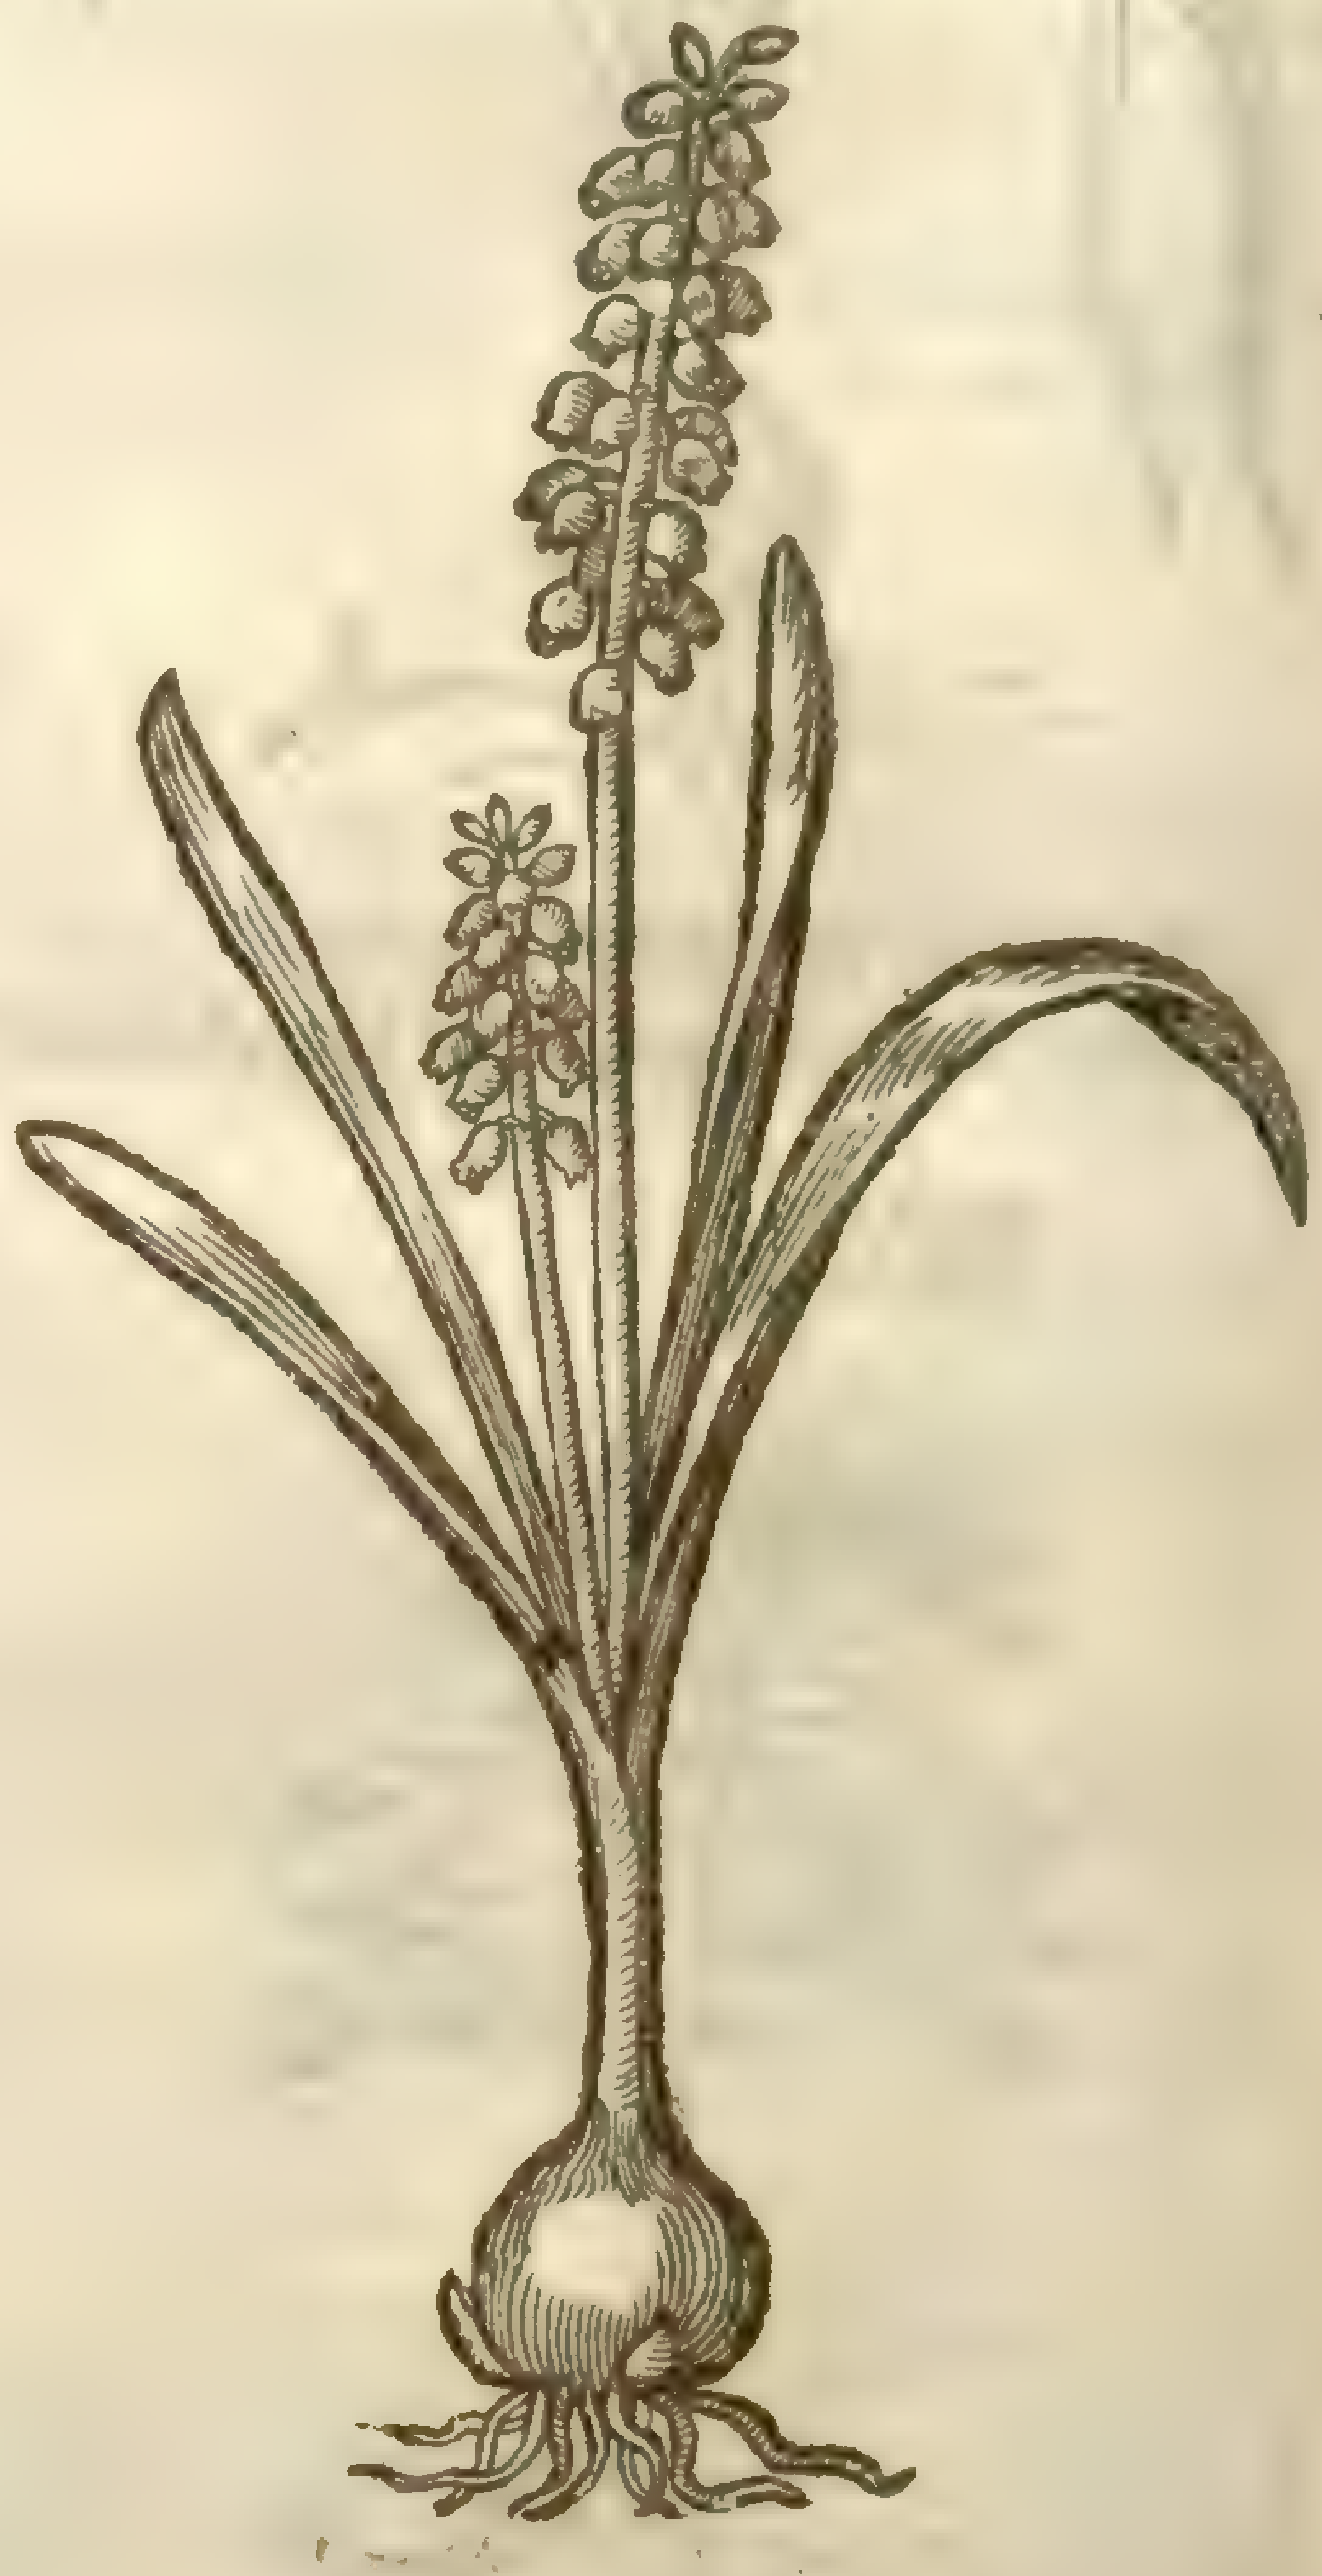
6 *Hyacinthus botryoides cæruleus.*
Blew Grape-floure.

H. racemosum, L.
[illegible]
Sm. Fl. 2. 147



Wh. i. 107

7 *Hyacinthus botryoides cæruleus major.*
Great Grape-floure.



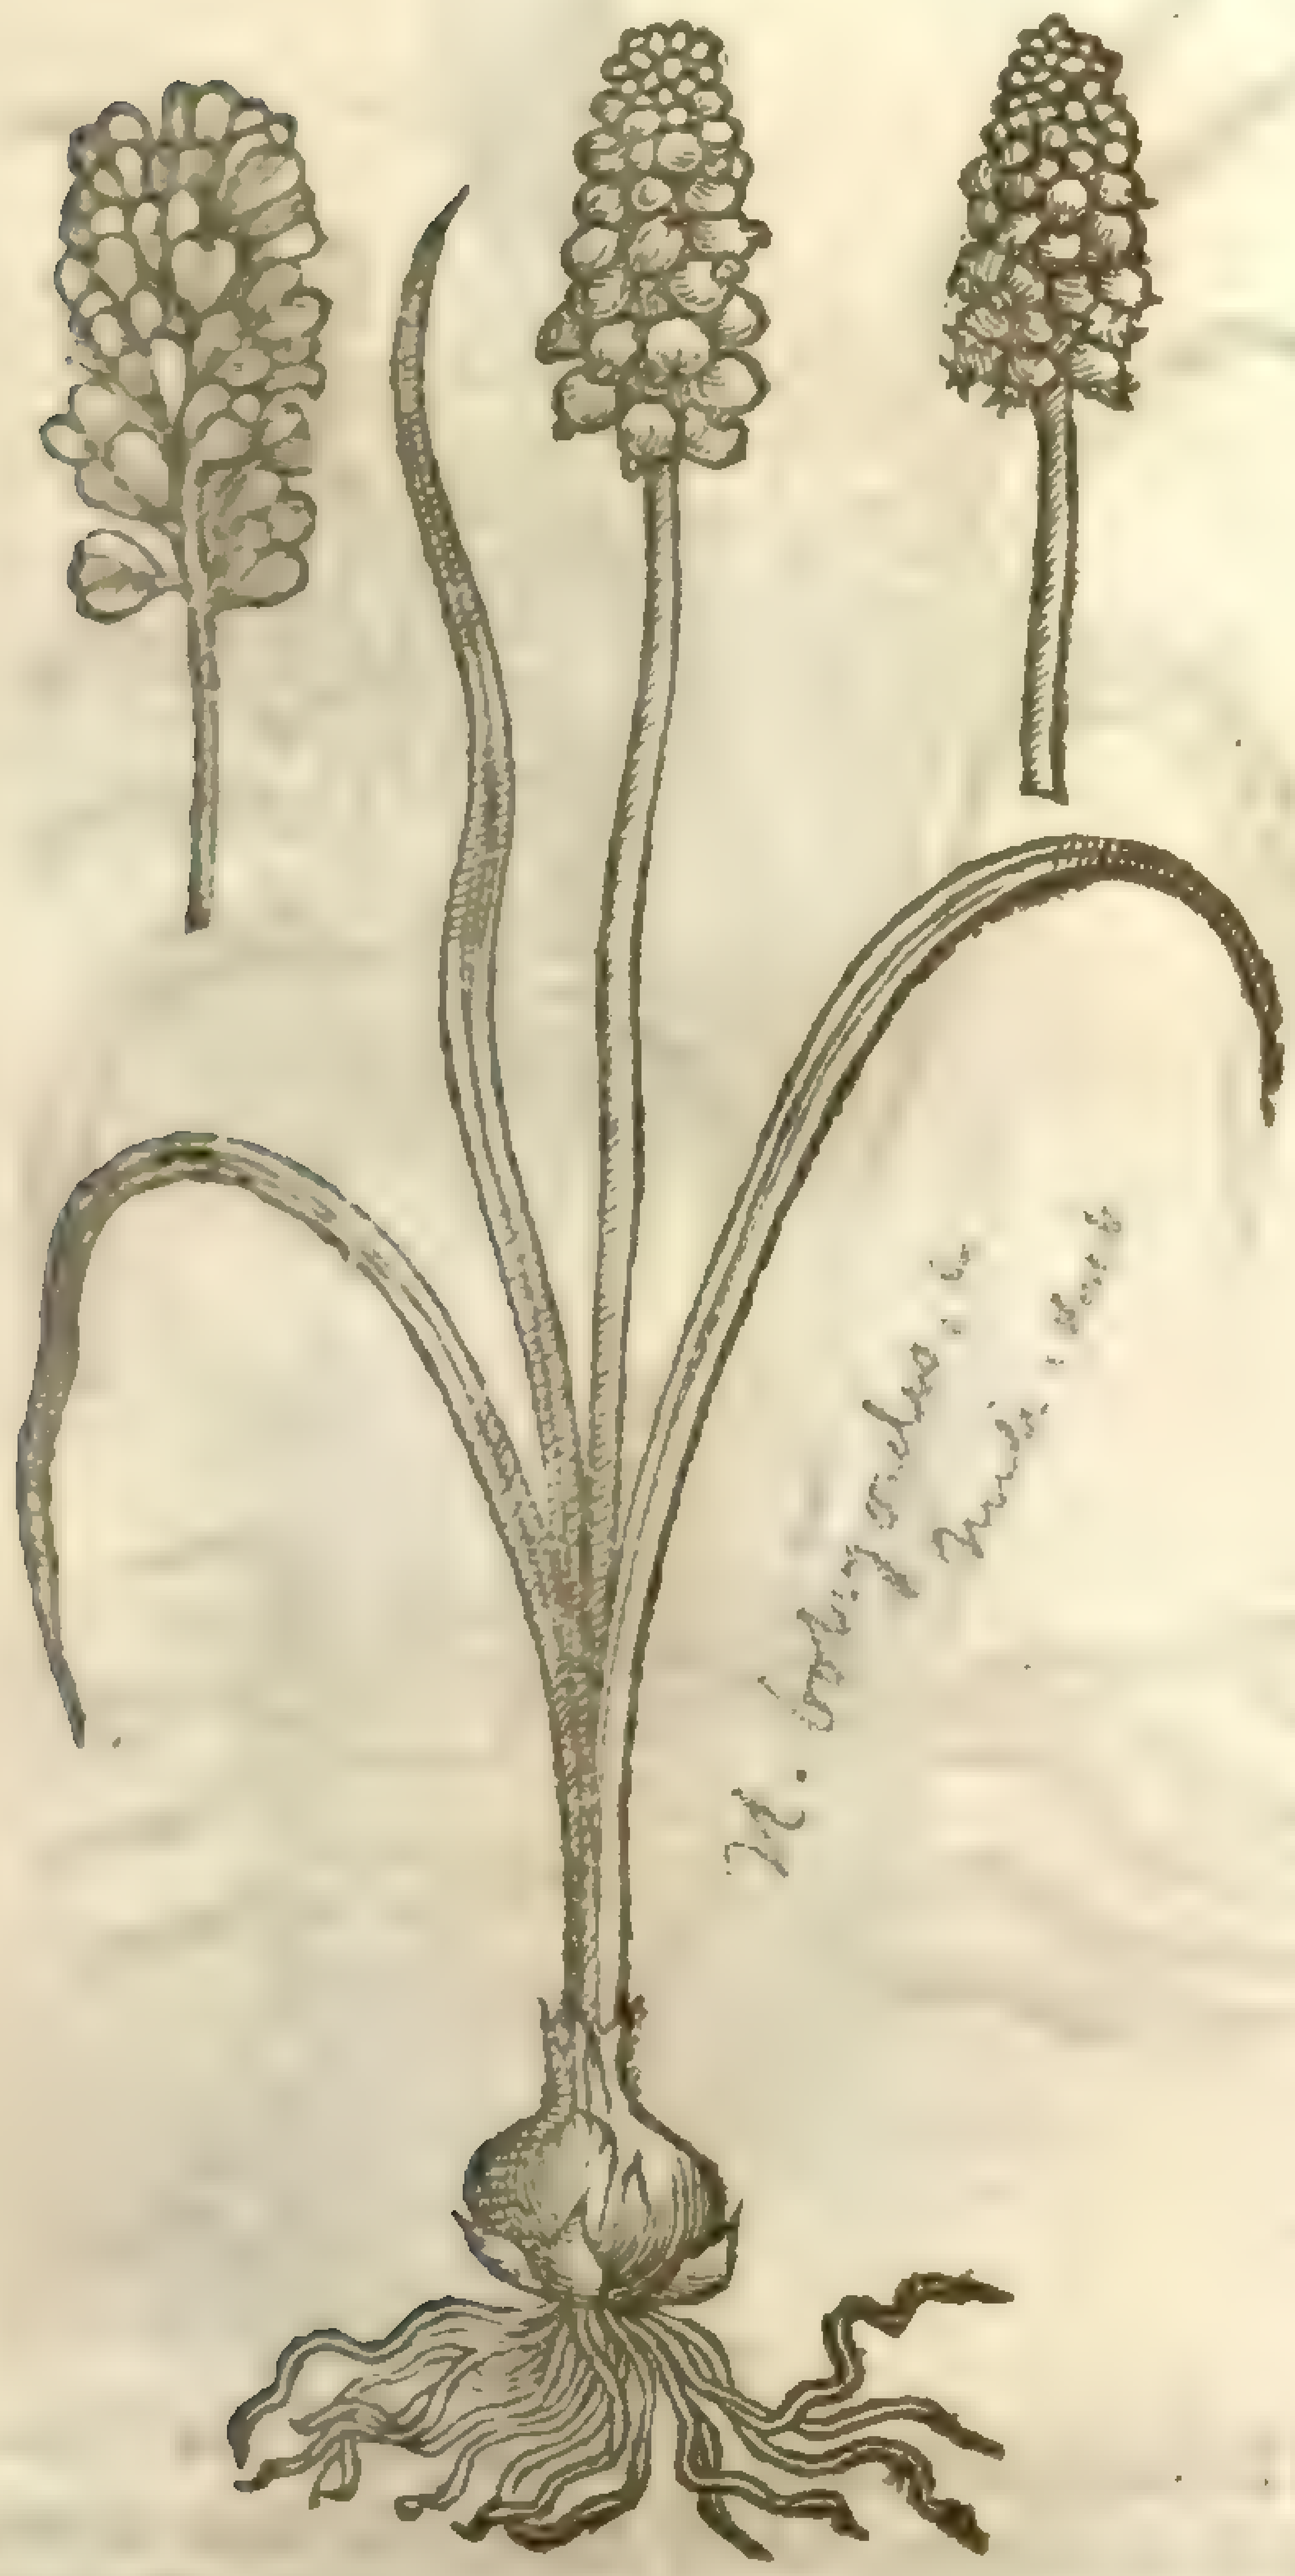
6 The ſmall Grape-floure hath many long fat and weake leaues trailing vpon the ground, hollow in the middle like a little trough, full of ſlimy juice like the other Iacinths; amongſt which come forth thicke ſoft ſmooth and weake ſtalkes, leaning this way and that way as not able to ſtand vpright by reaſon it is ſurcharged with very heauie floures on the top, conſiſting of many little bottle-like blew floures, cloſely thruſt or packed together like a bunch of grapes, of a ſtrong ſmell, yet not vnpleaſant, ſomewhat reſembling the ſauour of the Orenge. The root is round and bulbous, ſet about with infinite young cloues or roots, whereby it greatly increaſeth.

7 The great Grape-floure is very like vnto the ſmaller of his kinde. The difference conſiſteth, in that this plant is altogether greater, but the leaues are not ſo long.

8 The sky-coloured Grape-floure hath a few leaues in reſpect of the other Grape-floures, the which are ſhorter, fuller of juice, ſtiffe and vpright, whereas the others traile vpon the ground.

The floures grow at the top, thruſt or packt together like a bunch of Grapes, of a pleaſant bright sky colour, euery little bottle-like floure ſet about the hollow entrance with ſmall white ſpots not eaſily to be perceiued. The roots are like the former.

8 *Hyacinthus Botryoides cæruleus major.*
Great Grape-floure.



H. botryoides [illegible]

9 The white Grape-floure differeth not from the sky-coloured Iacinth, but in colour of the floure: for this Iacinth is of a pleaſant white colour tending to yellownes, tipped about the hollow part with White, whiter than White it ſelfe; otherwiſe there is no difference.

¶ *The Place.*

Theſe plants are kept in gardens for the beautie of their floures, wherewith our London gardens do abound.

¶ *The Time.*

They floure from Februarie to the end of May.

¶ *The Names.*

The Grape-floure is called *Hyacinthus Botryoides*, and *Hyacinthus Neotericorum, Dodonæi*: of ſome, *Bulbus Eſculentus, Hyacinthus ſylueſtris, Cordi*: *Hyacinthus exiguus, Tragi*. Some iudge them to be *Bulbinæ*, of *Pliny*.

† The faire haired Iacinth deſcribed in the firſt place is, the *Hyacinthus* of *Dioſcorides* and the Antients. †

¶ *The Nature and vertues.*

† The vertues ſet downe in the precedent Chapter properly belong to that kinde of Hyacinth which is deſcribed in the firſt place in this Chapter. †

CHAP. 81. *Of Muſcari, or Musked Grape-floure.*

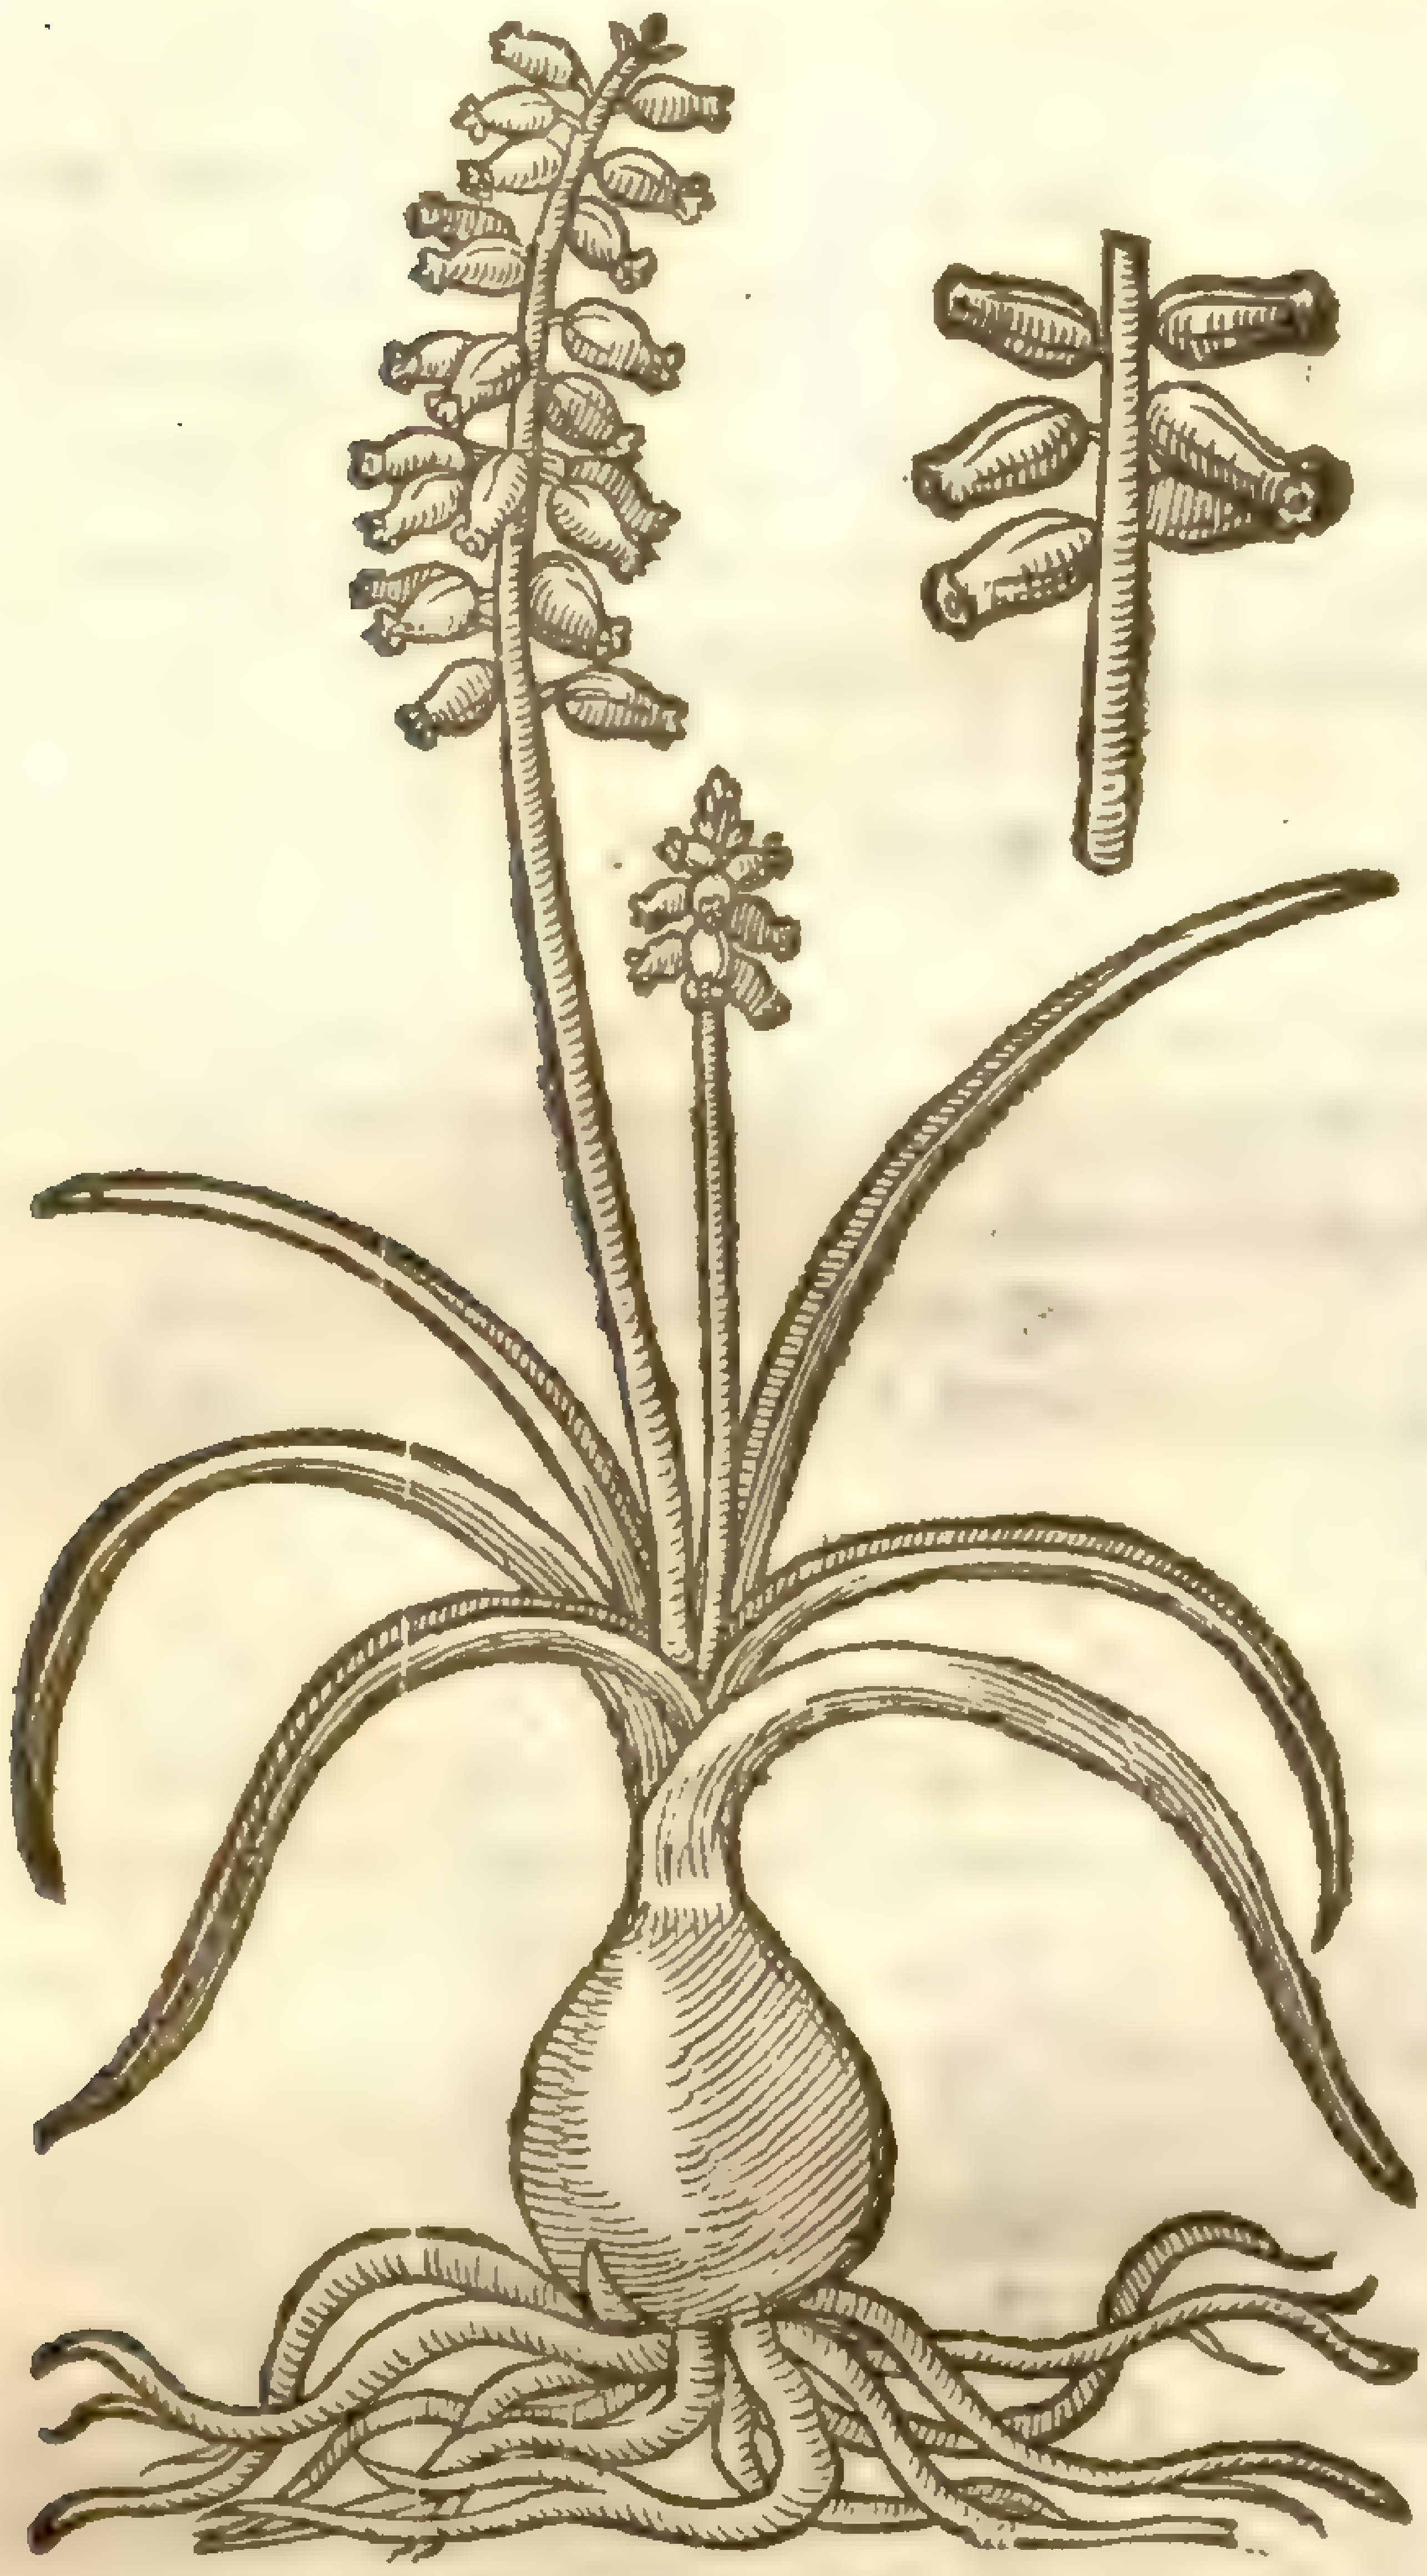
¶ *The Deſcription.*

1 YEllow Muſcarie hath fiue or ſix long leaues ſpread vpon the ground, thicke fat, and full of ſlimie juyce, turning and winding themſelues crookedly this way and that way, hollowed alongſt the middle like a trough, as are thoſe of faire haired Iacinth, which at the firſt budding or ſpringing vp are of a purpliſh colour; but being growne to perfection, become of a darke greene colour: amongſt the which leaues riſe vp naked, thicke, and fat ſtalkes, infirme and weake in reſpect of the thickneſſe and greatneſſe thereof, lying alſo vpon the ground as do the leaues; ſet from the middle to the top on euery ſide with many yellow floures, euery one made like a ſmall pitcher or little box, with a narrow mouth, exceeding ſweet of ſmell like the ſauour of muske, whereof it tooke the name *Muſcari*. The ſeed is cloſed in puffed or blowne vp cods, confuſedly made without order, of a fat and ſpongeous ſubſtance, wherein is contained round blacke ſeed. The root is bulbous or onion faſhion, whereunto are annexed certaine fat and thicke ſtrings like thoſe of Dogs-graſſe.

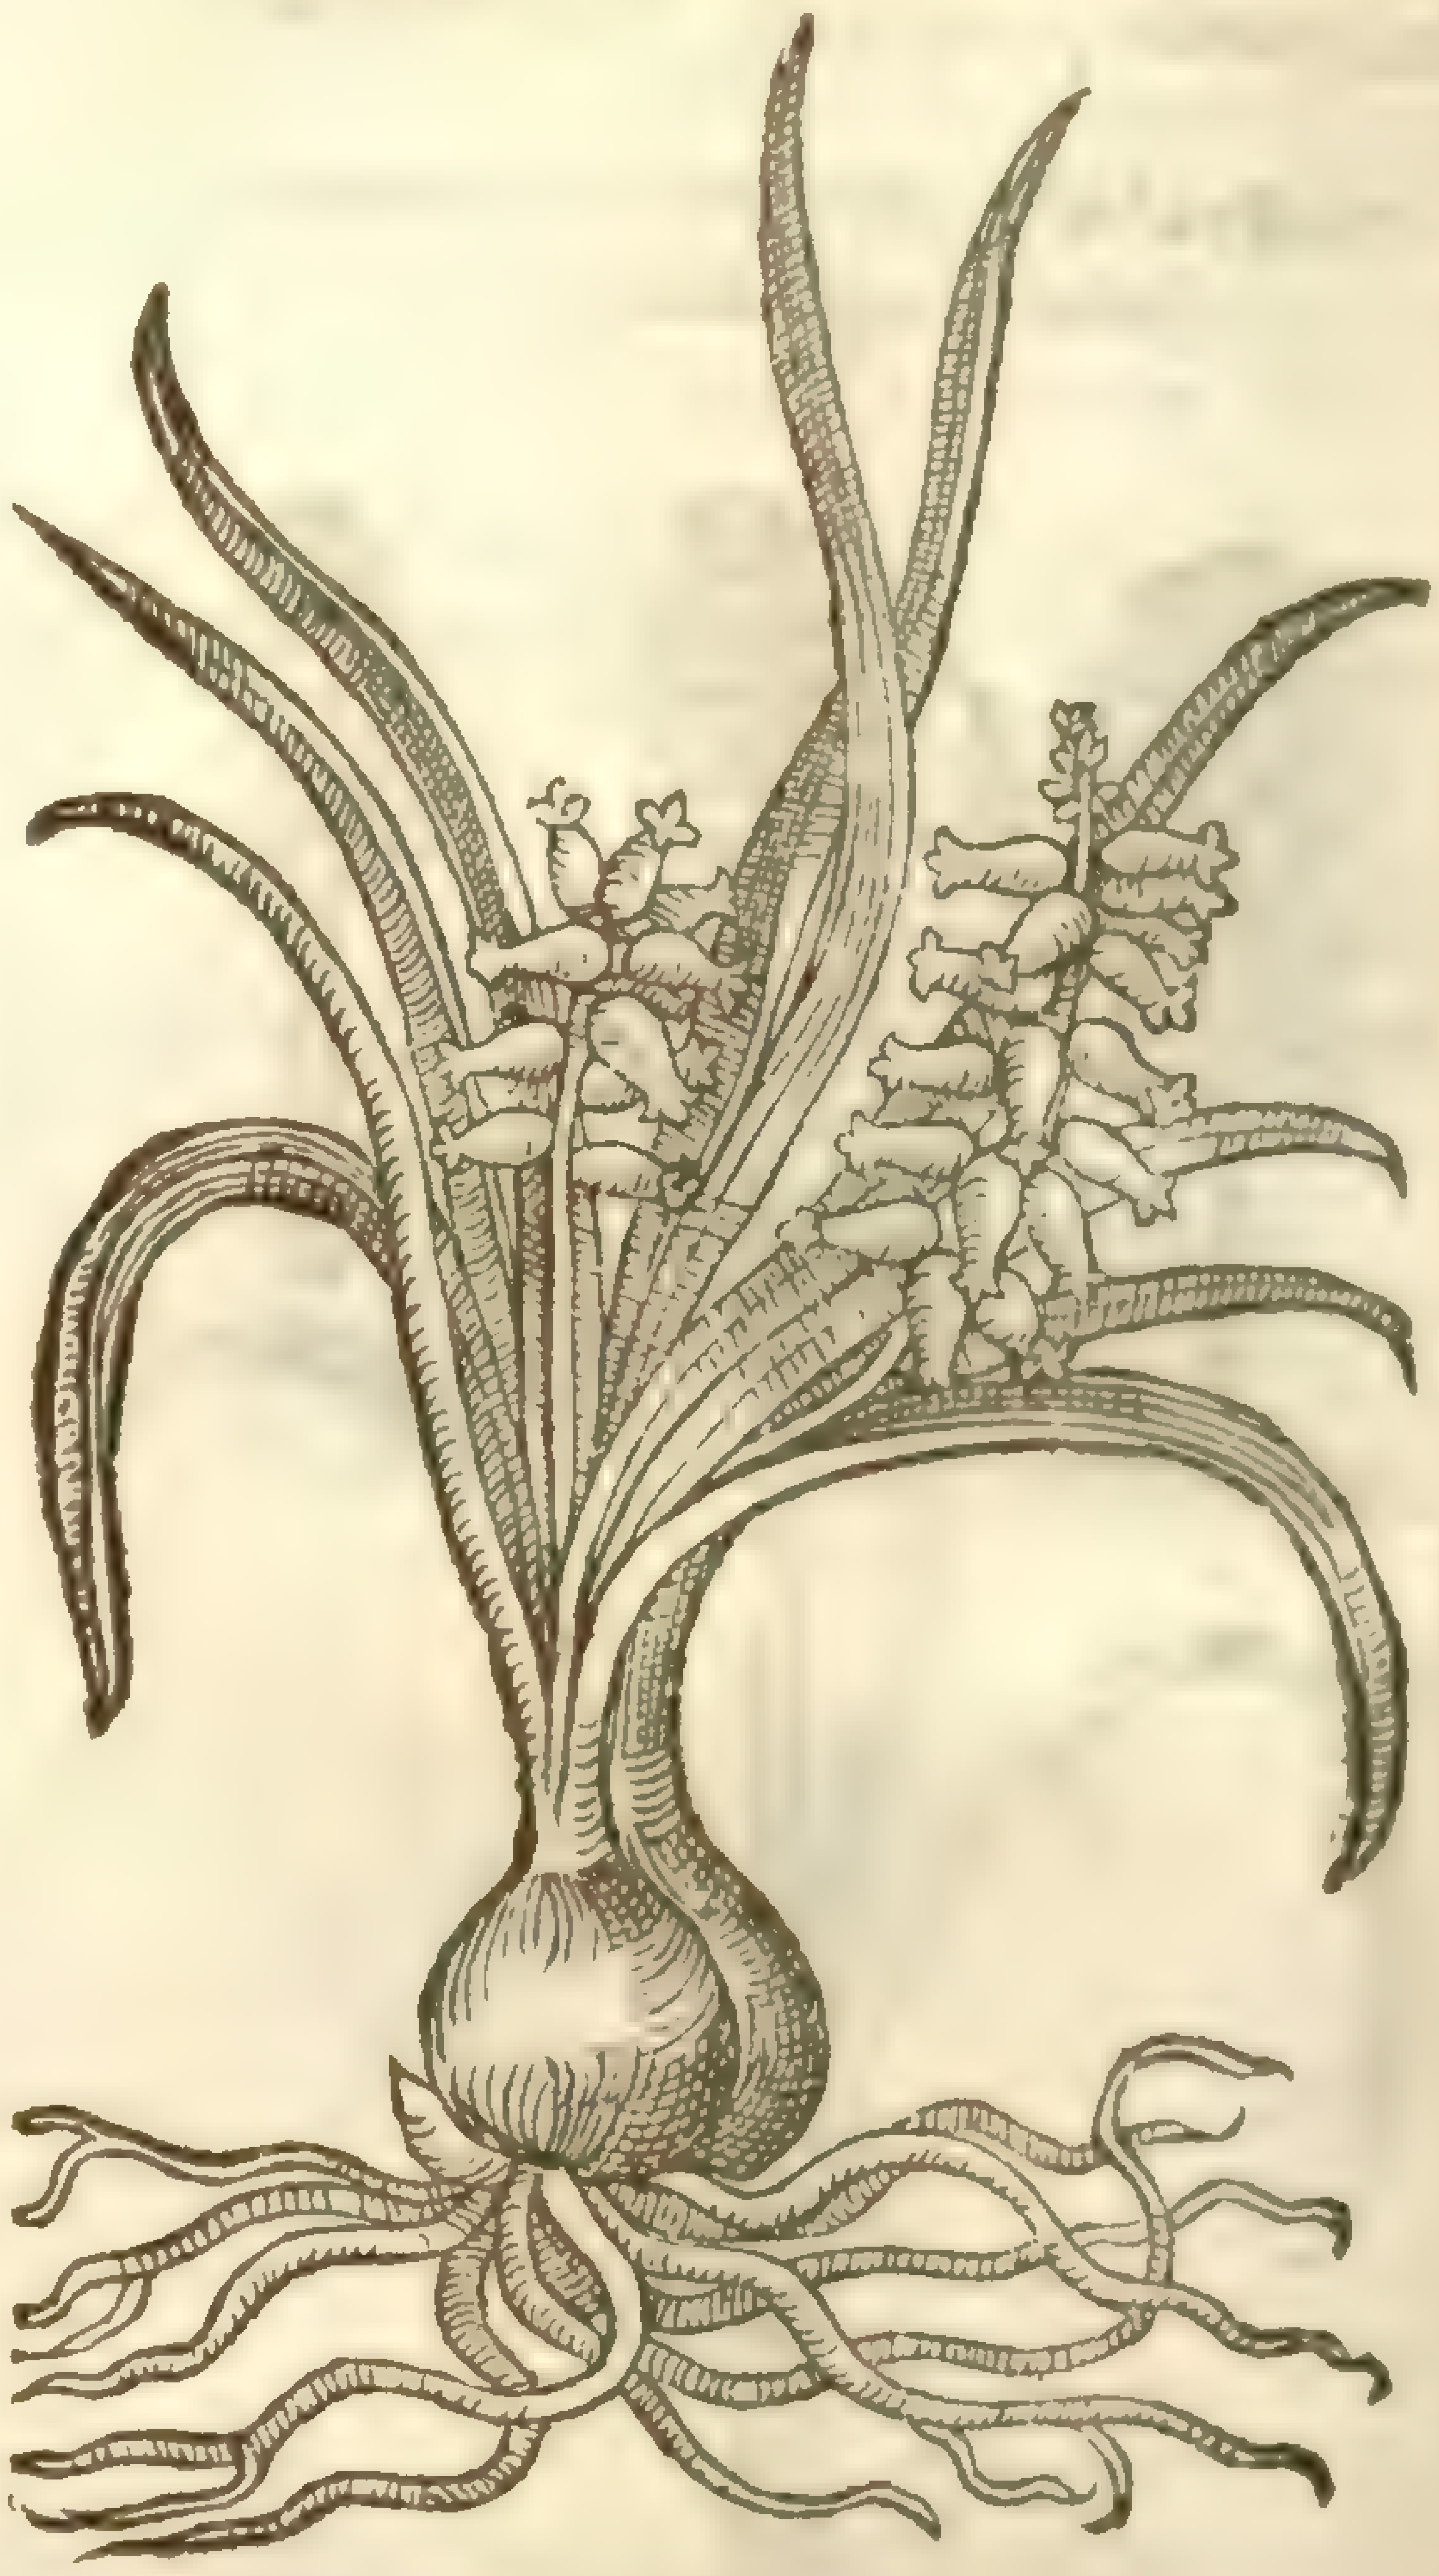
2 Aſh-coloured *Muſcari* or grape-floure, hath large and fat leaues like the precedent, not differing in any point, ſauing that the leaues at their firſt ſpringing vp are of a pale dusky colour like aſhes. The floures are likewiſe ſweet, but of a pale blacke colour, wherein conſiſteth the difference.

¶ The

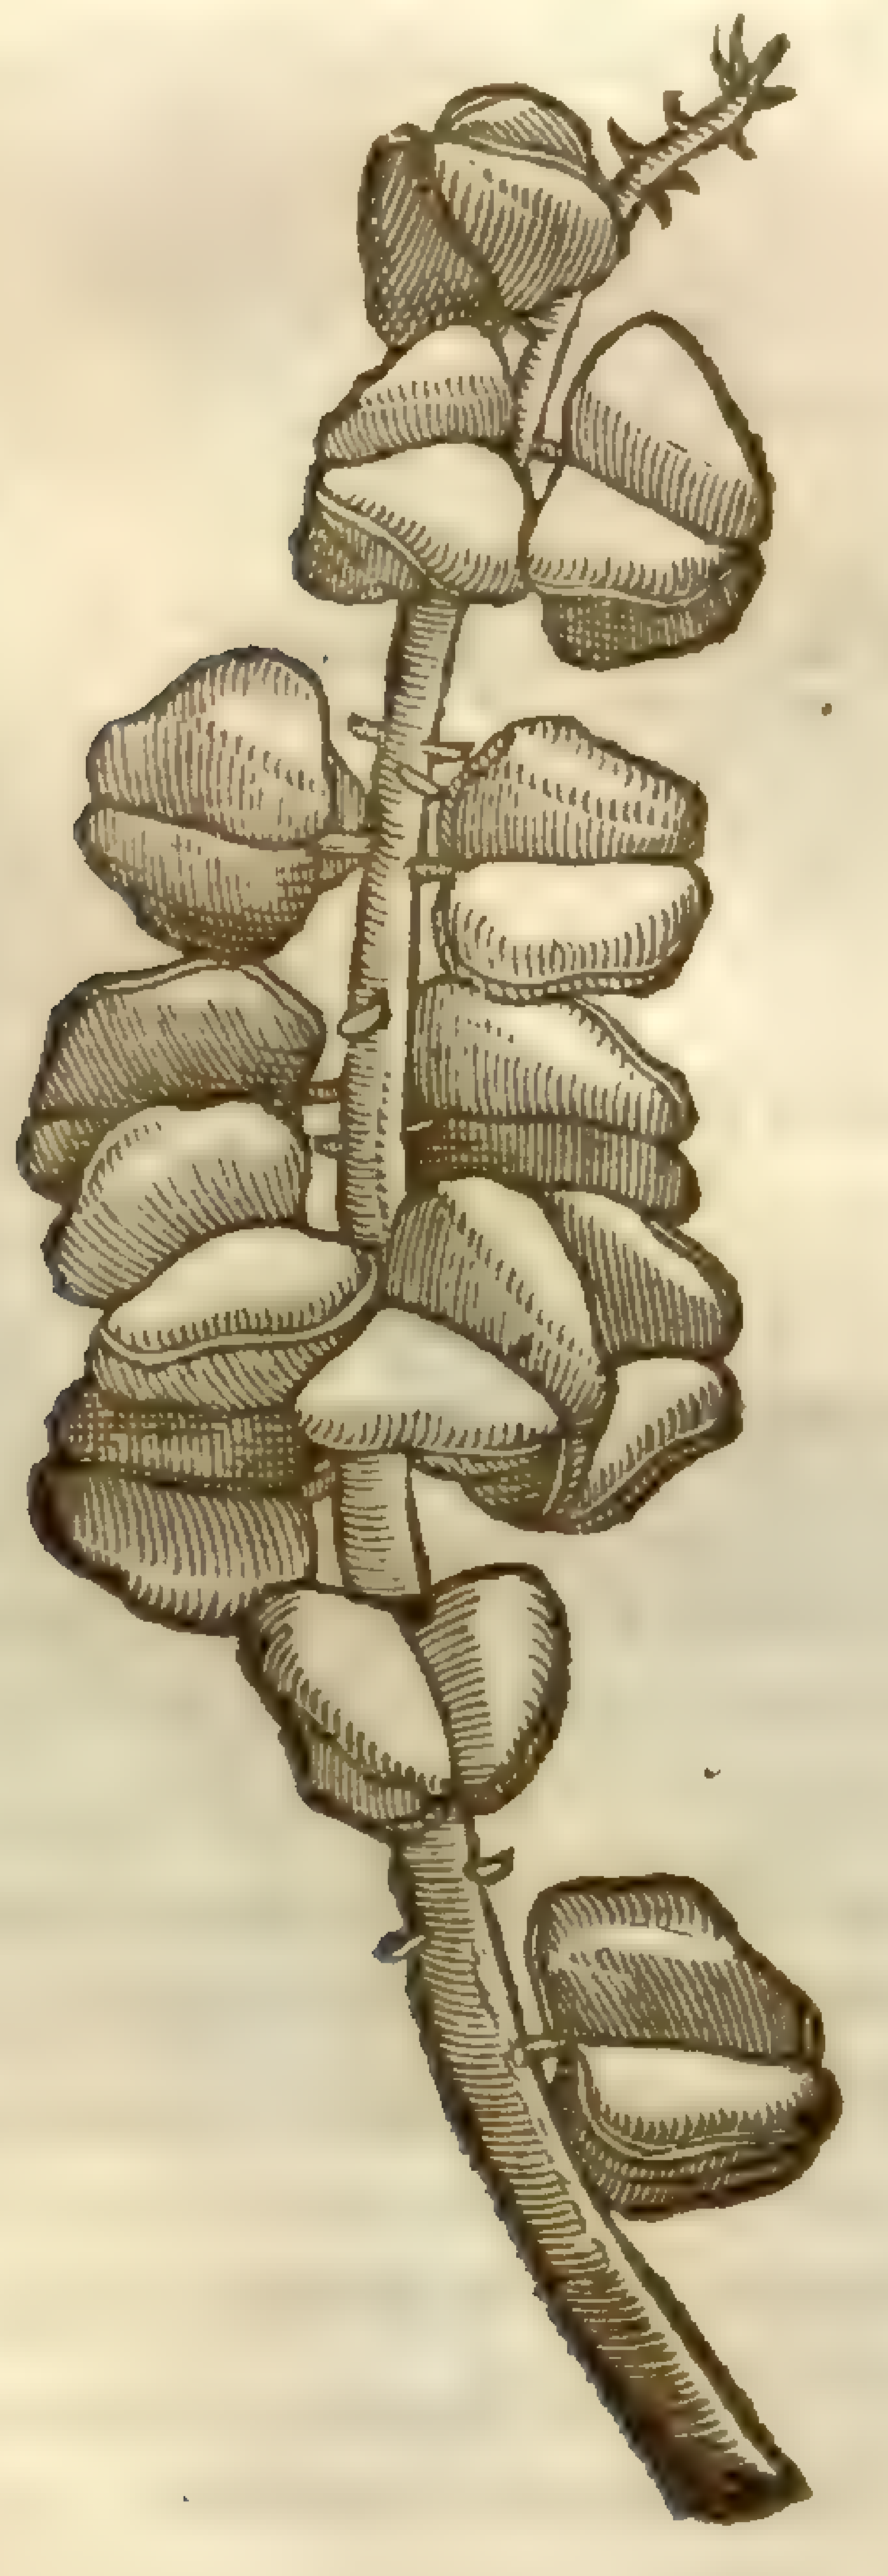
1 *Muſcari flavum.*
Yellow musked Grape-floure.



2 *Muſcari Cluſij.*
Aſh-coloured Grape-floure.



Muſcari caulis ſiliquis onuſtus.
The ſtalke of Muſcari hanged with the ſeed veſſels.



¶ *The Place.*

Theſe plants came from beyond the Thracian Boſphorus, out of Aſia, and from about Conſtantinople, and by the meanes of Friends haue been brought into theſe parts of Europe, whereof our London gardens are poſſeſſed.

¶ *The Time.*

They floure in March and Aprill, and ſometimes after.

¶ *The Names.*

They are called generally *Muſcari:* in the Turky Tongue, *Muſchoromi, Muſcurimi, Tipcadi,* and *Dipcadi,* of their pleaſant ſweet ſmell: of *Matthiolus, Bulbus Vomitorius.* Theſe plants may be referred vnto the Iacinths, whereof vndoubtedly they be kindes.

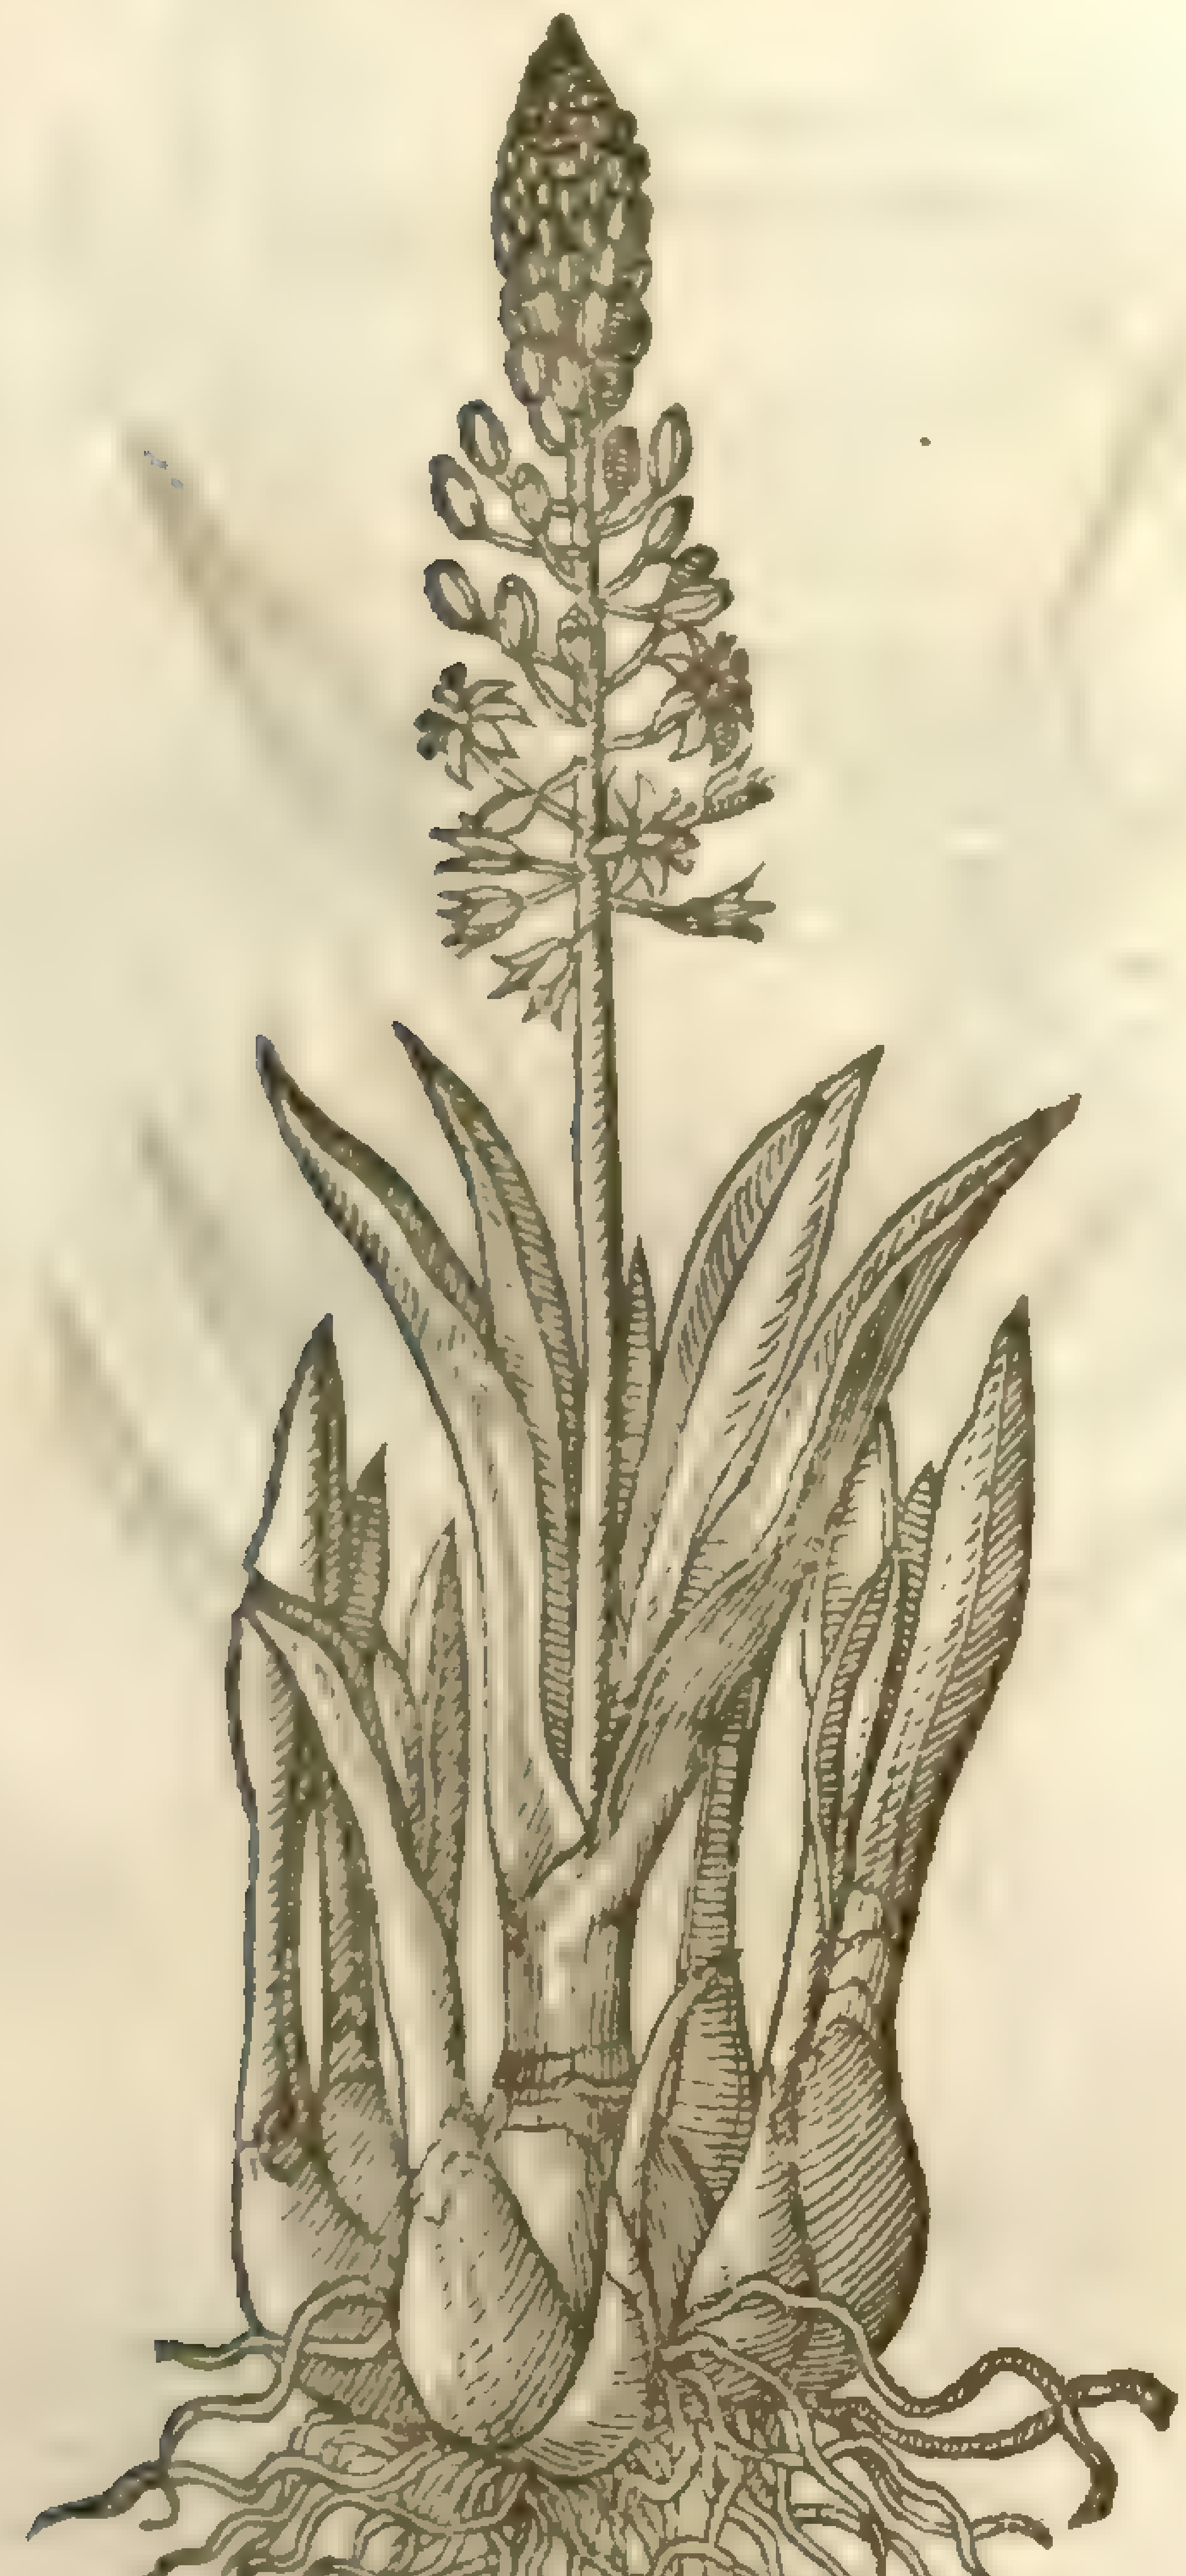
¶ *The Nature and Vertues.*

There hath not as yet any thing beene touched concerning the nature or vertues of theſe Plants, onely they are kept and maintained in gardens for the pleaſant ſmell of their floures, but not for their beauty, for that many ſtinking field floures do in beautie farre ſurpaſſe them. *Vomitorius,* in that he ſuppoſed they procure vomiting; which of other Authors hath not bin remembred.

Chap.

CHAP. 82. *Of Woolly Bulbus.*

Bulbus Eriophorus.
Woolly Iacinth



¶ *The Deſcription.*

THere hath fallen out to be here inſerted a bulbous plant conſiſting of many Bulbes, which hath paſſed currant amongſt all our late Writers. The which I am to ſet forth to the view of our Nation, as others haue done in ſundry languages to theirs, as a kind of the Iacinths, which in roots and leaues it doth very well reſemble; called of the Grecians, Ἐριοφόρος: in Latine, *Laniferus*, becauſe of his aboundance of Wooll-reſembling ſubſtance, wherewith the whole Plant is in euery part full fraught, as well roots, leaues, as ſtalkes. The leaues are broad, thicke, fat, full of juice, and of a ſpider-like web when they be broken. Among theſe leaues riſeth vp a ſtalke two cubits high, much like vnto the ſtalke of Squilla or Sea-Onion; and from the middle to the top it is beſet round about with many ſmall ſtarre-like blew floures without ſmell, very like to the floures of Aſphodill; beginning to floure at the bottome and ſo vpward by degrees, whereby it is long before it haue done flouring: which floures the learned Phyſitian of Vienna, *Iohannes Aicholzius*, deſired long to ſee; who brought it firſt from Conſtantinople, and planted it in his Garden, where he nouriſhed it tenne yeares with great curioſitie; which time being expired, thinking it to be a barren plant, he ſent it to *Carolus Cluſius*, with whom in ſome few yeres it did beare ſuch floures as are before deſcribed, but neuer ſince to this day. This painefull Herbariſt would gladly haue ſeene the ſeed that ſhould ſucceed theſe floures; but they being of a nature quickly ſubject to periſh, decay, and fade, began preſently to pine away, leauing onely a few chaffie and idle ſeed-veſſels without fruit. My ſelfe haue beene poſſeſſed with this plant at the leaſt twelue yeares, whereof I haue yearely great encreaſe of new roots, but I did neuer ſee any token of budding or flouring to this day: notwithſtanding I ſhall be content to ſuffer it in ſome baſe place or other of my garden, to ſtand as the cipher o at the end of the figures, to attend his time and leiſure, as thoſe men of famous memorie haue done. Of whoſe temperature and vertues there hath not any thing been ſaid, but kept in gardens to the end aforeſaid.

CHAP. 83. *Of two feigned Plants.*

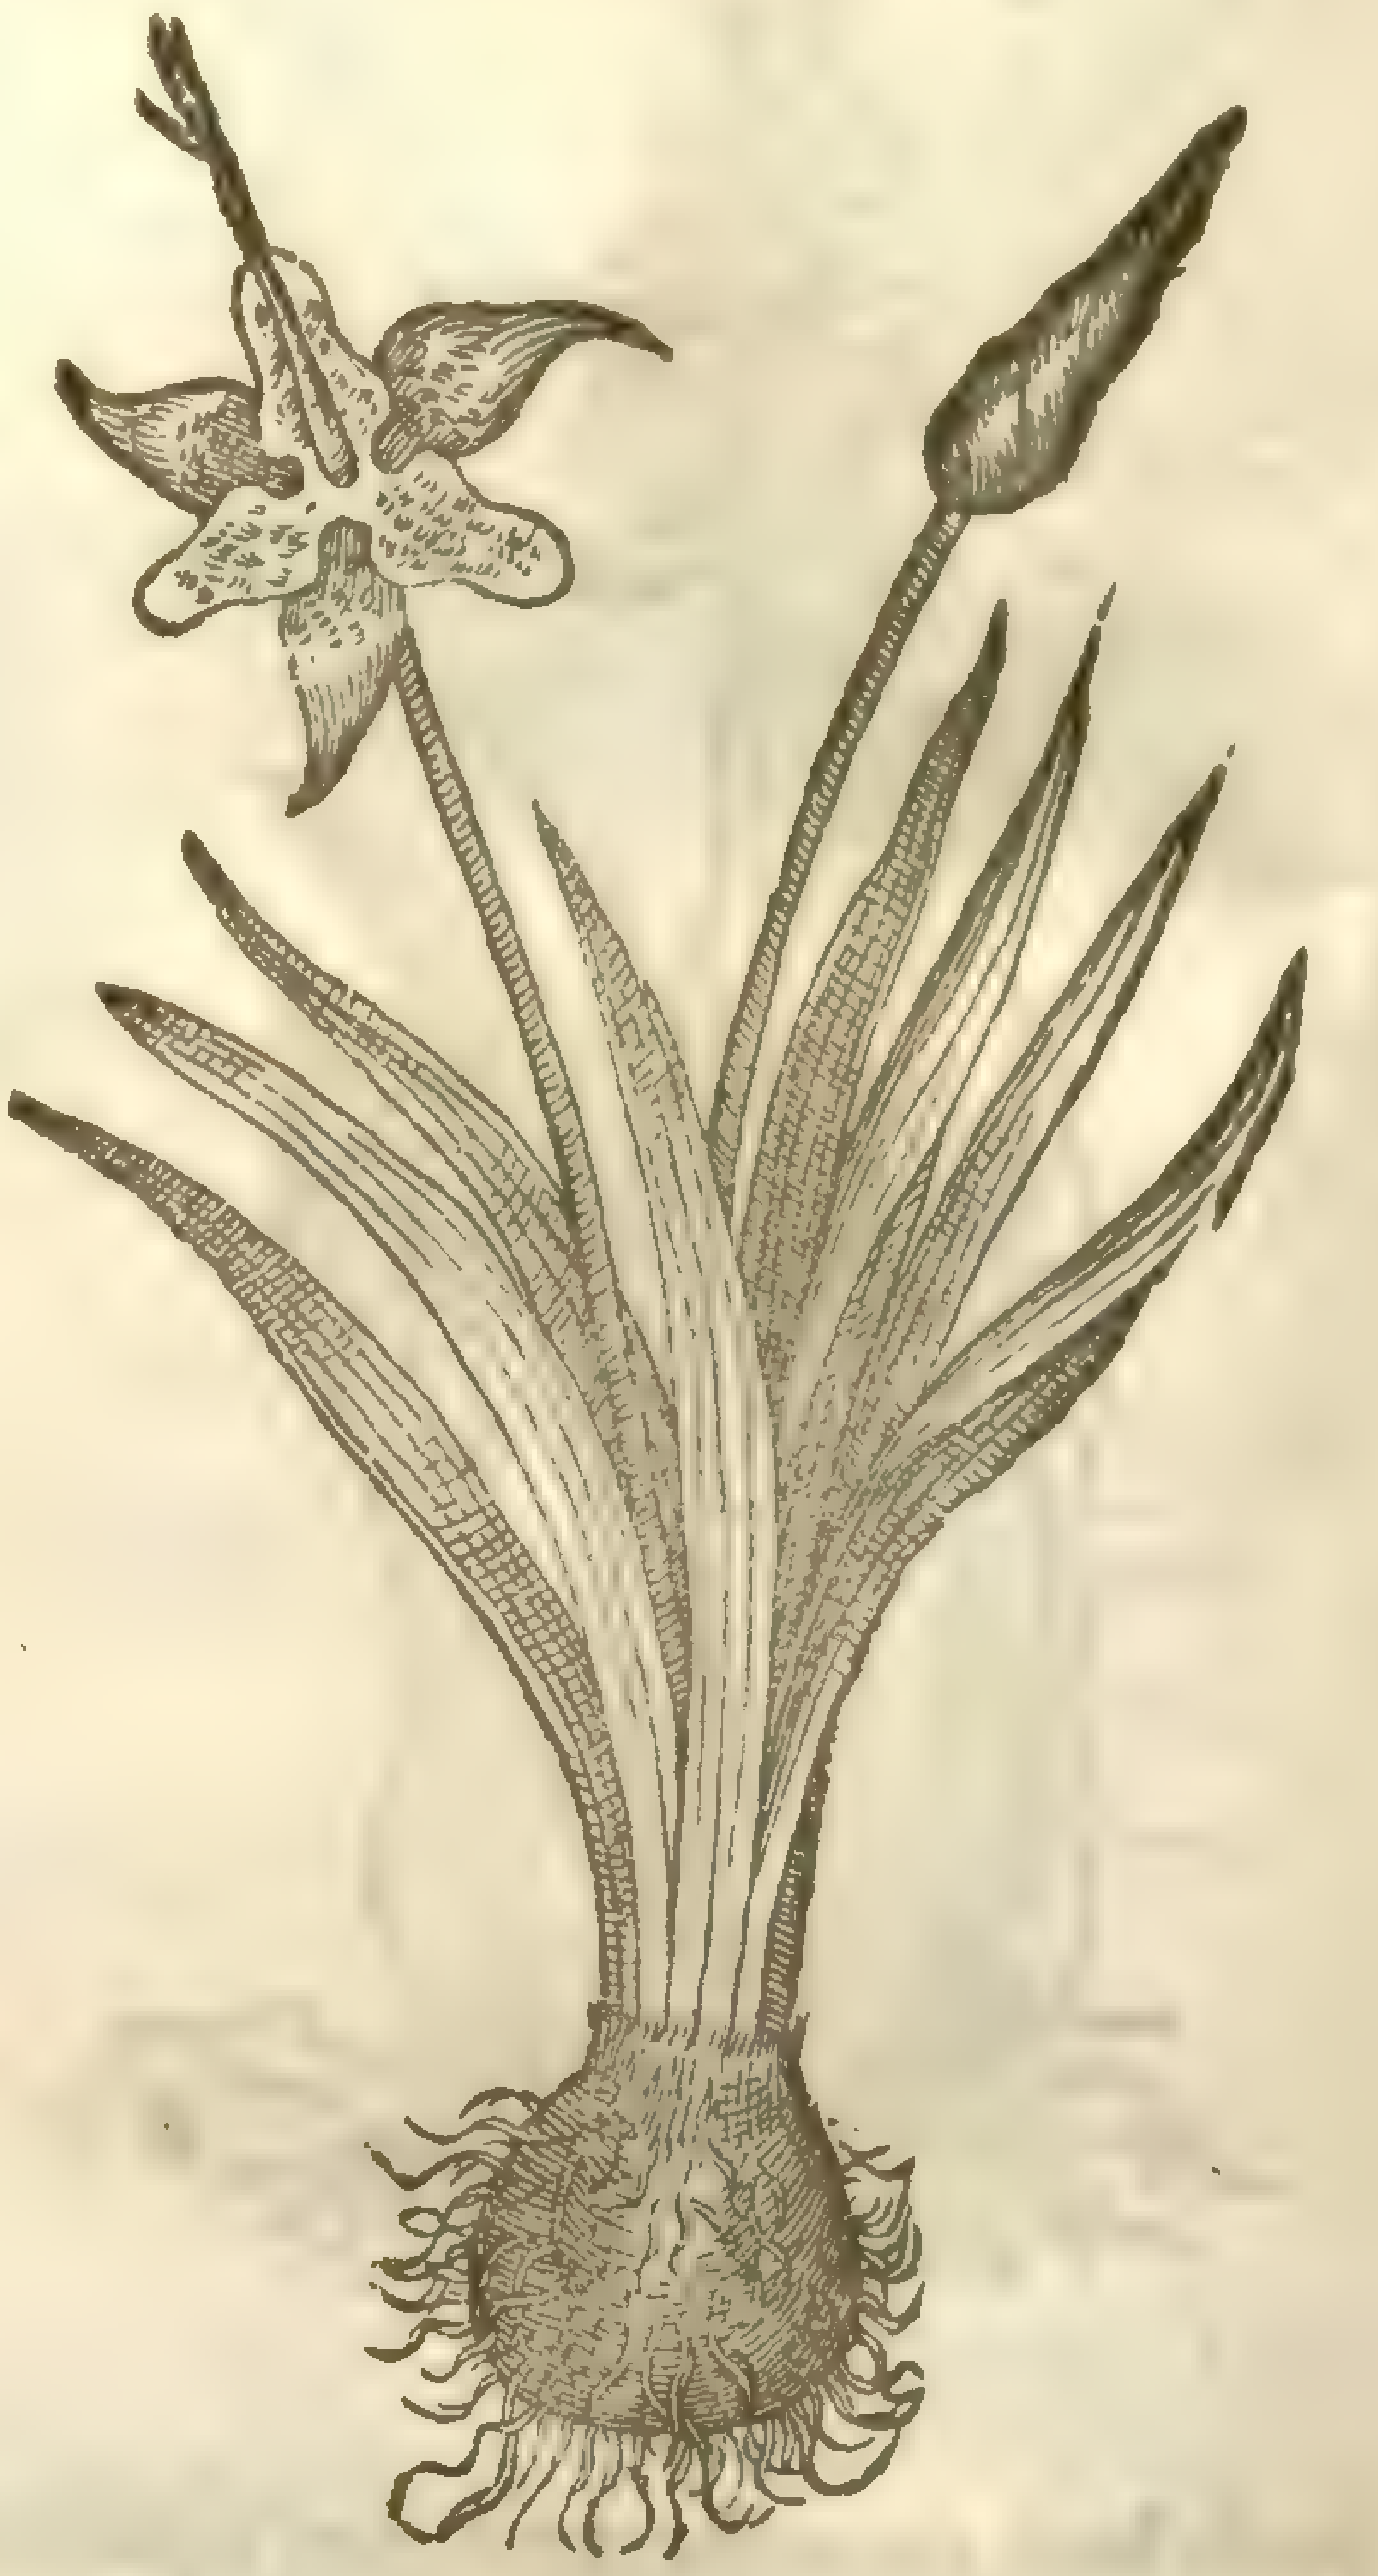
¶ *The Deſcription.*

1 I Haue thought it conuenient to conclude the hiſtorie of the Hyacinths with theſe two bulbous Plants, receiued by tradition from others, though generally holden for feigned and adulterine. Their pictures I could willingly haue omitted in this hiſtorie, if the curious eye could elſewhere haue found them drawne and deſcribed in our Engliſh Tongue: but becauſe I finde them in none, I will lay them downe here, to the end that it may ſerue for excuſe to others who ſhall come after, which liſt not to deſcribe them, being as I ſaid condemned for feigned and adulterine nakedly drawne onely. And the firſt of them is called *Bulbus* ἐριόφορος: by others, *Bulbus Bombicinus Commentitius*. The deſcription conſiſteth of theſe points, *viz.* The floures (ſaith the Author) are no leſſe ſtrange than wonderfull. The leaues and roots are like to thoſe of Hyacinths,

cinths, which hath cauſed it to occupie this place. The floures reſemble the Daffodils or Narciſſus. The whole plant conſiſteth of a woolly or flockie matter: which deſcription with the Picture was ſent vnto *Dodonæus* by *Iohannes Aicholzius*. It may be that *Aicholzius* receiued inſtructions from the Indies, of a plant called in Greeke, τριχώδης, which groweth in India, whereof *Theophraſtus* and *Athenæus* do write in this manner, ſaying, The floure is like the *Narciſſus*, conſiſting of a flockie or woolly ſubſtance, which by him ſeemeth to be the deſcription of our bombaſt Iacinth.

1 *Bulbus Bombicinus Commentitius.*
Falſe bumbaſt Iacinth.

2 *Tigridis flos.*
The floure of Tygris.



2 The ſecond feigned picture hath beene taken of the Diſcouerer and others of late time, to be a kinde of Dragons not ſeene by any that haue written thereof; which hath moued them to thinke it a feigned picture likewiſe; notwithſtanding you ſhall receiue the deſcription thereof as it hath come to my hands. The root (ſaith my Author) is bulbous or Onion faſhion, outwardly blacke; from the which ſpring vp long leaues, ſharpe pointed, narrow, and of a freſh greene colour: in the middeſt of which leaues riſe vp naked or bare ſtalkes, at the top whereof groweth a pleaſant yellow floure, ſtained with many ſmall red ſpots here and there confuſedly caſt abroad: and in the middeſt of the floure thruſteth forth a long red tongue or ſtile, which in time groweth to be the cod or ſeed-veſſell, crooked or wreathed, wherein is the ſeed. The vertues and temperature are not to be ſpoken of, conſidering that we aſſuredly perſuade our ſelues that there are no ſuch plants, but meere fictions and deuices, as we terme them, to giue his friend a gudgeon.

‡ Though theſe two haue beene thought commenticious or feigned, yet *Bauhinus* ſeemeth to vindicate the later, and *Iohn Theodore de Bry* in his *Florilegium* hath ſet it forth. He giues two Figures thereof, this which we here giue you being the one; but the other is farre more elegant, and better reſembles a naturall plant. The leaues (as *Bauhine* ſaith) are like the ſword-flag, the root like a leeke, the floures (according to *De Bryes* Figure) grow ſometimes two or three on a ſtalke: the floure conſiſts of two leaues, and a long ſtile or peſtill: each of theſe leaues is diuided into three parts, the vttermoſt being broad and large, and the innermoſt much narrower and ſharper: the tongue or ſtile that comes forth of the midſt of the floure is long, and at the end diuided into three crooked forked points. All that *De Bry* ſaith thereof is this; *Flos Tigridis rubet egregiè, circa medium tamen pallet, albuſque eſt & maculatus; ex Mexico à Caſparo Bauhino.* That is; *Flos Tigridis* is wondrous red, yet it is pale and whitiſh about the middle, and alſo ſpotted; it came from about Mexico, I had it from *Caſpar Bauhine.* ‡

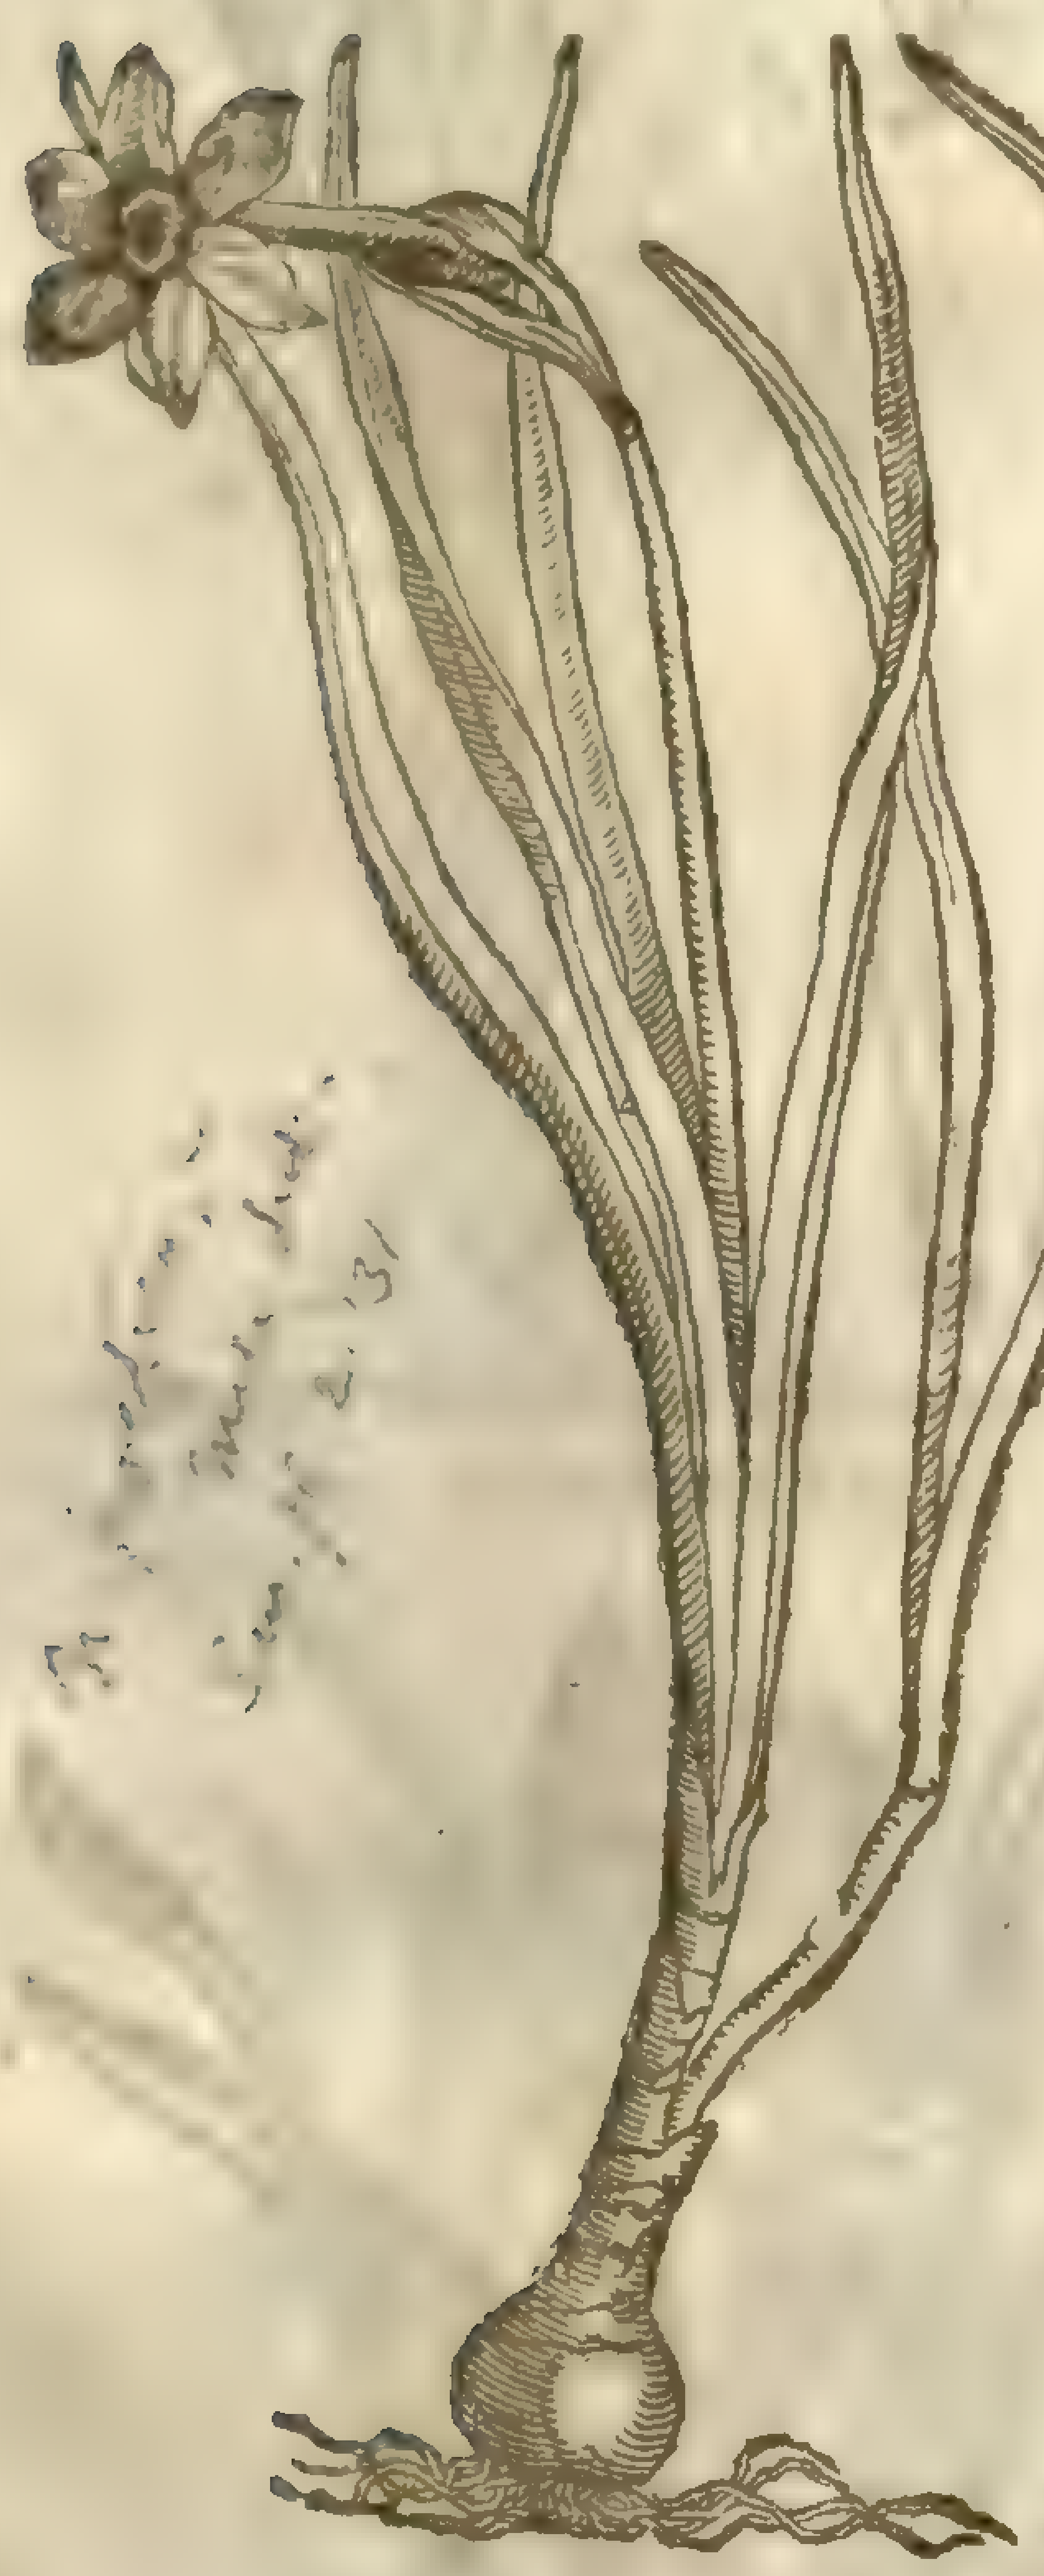
Chap.

Chap. 84. *Of Daffodils.*

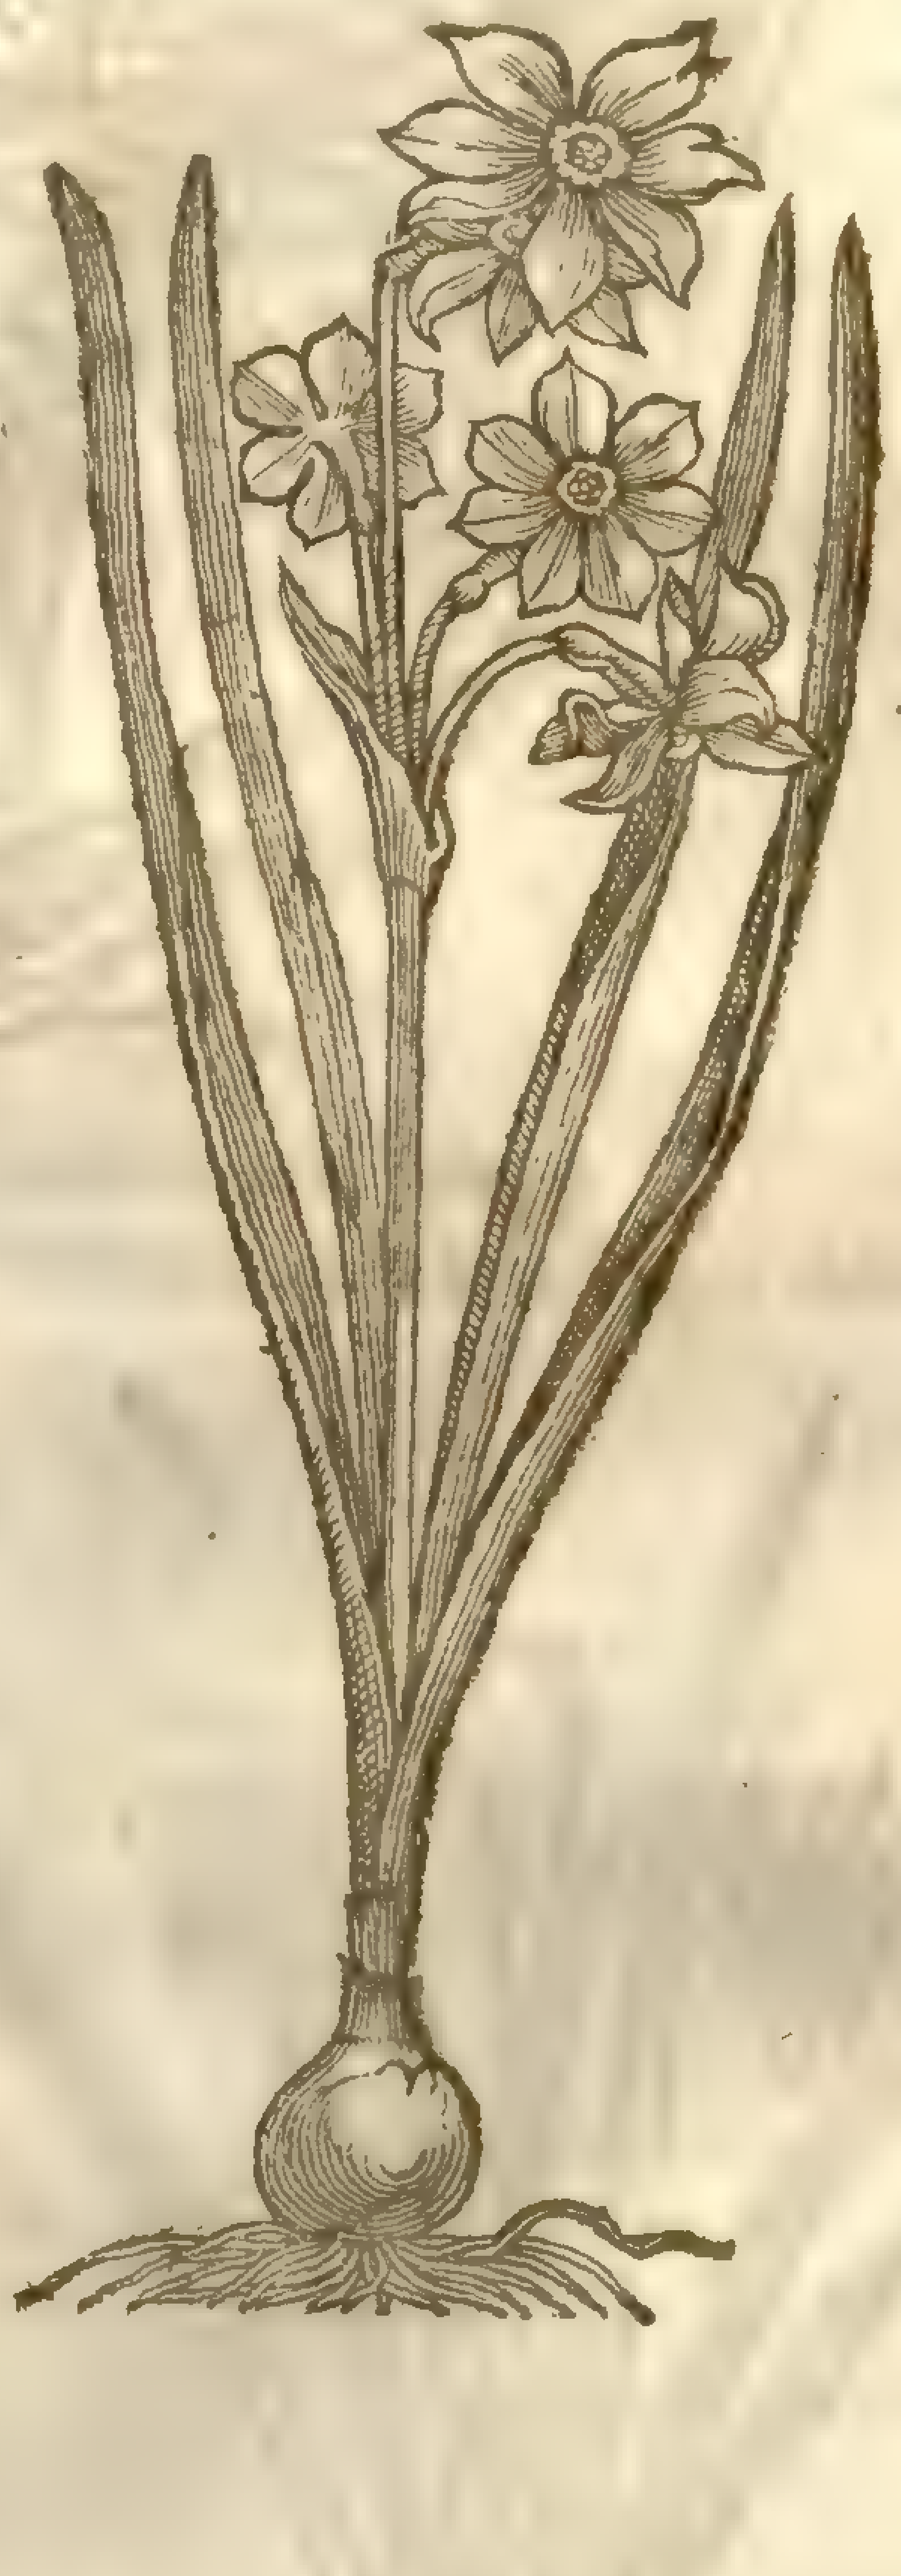
¶ *The Kindes.*

Daffodill, or *Narciſſus* according to *Dioſcorides*, is of two ſorts; the floures of both are white, the one hauing in the middle a purple circle or coronet; the other with a yellow cup, circle or coronet. Since whoſe time there haue been ſundry others deſcribed, as ſhall be ſet forth in their proper places.

1 *Narciſſus medio purpureus.*
Purple circled Daffodill.



‡ 4 *Narciſſus medio croceus ſerotinus polyanthos.*
The late many-floured Daffodill with the Saffron coloured middle.

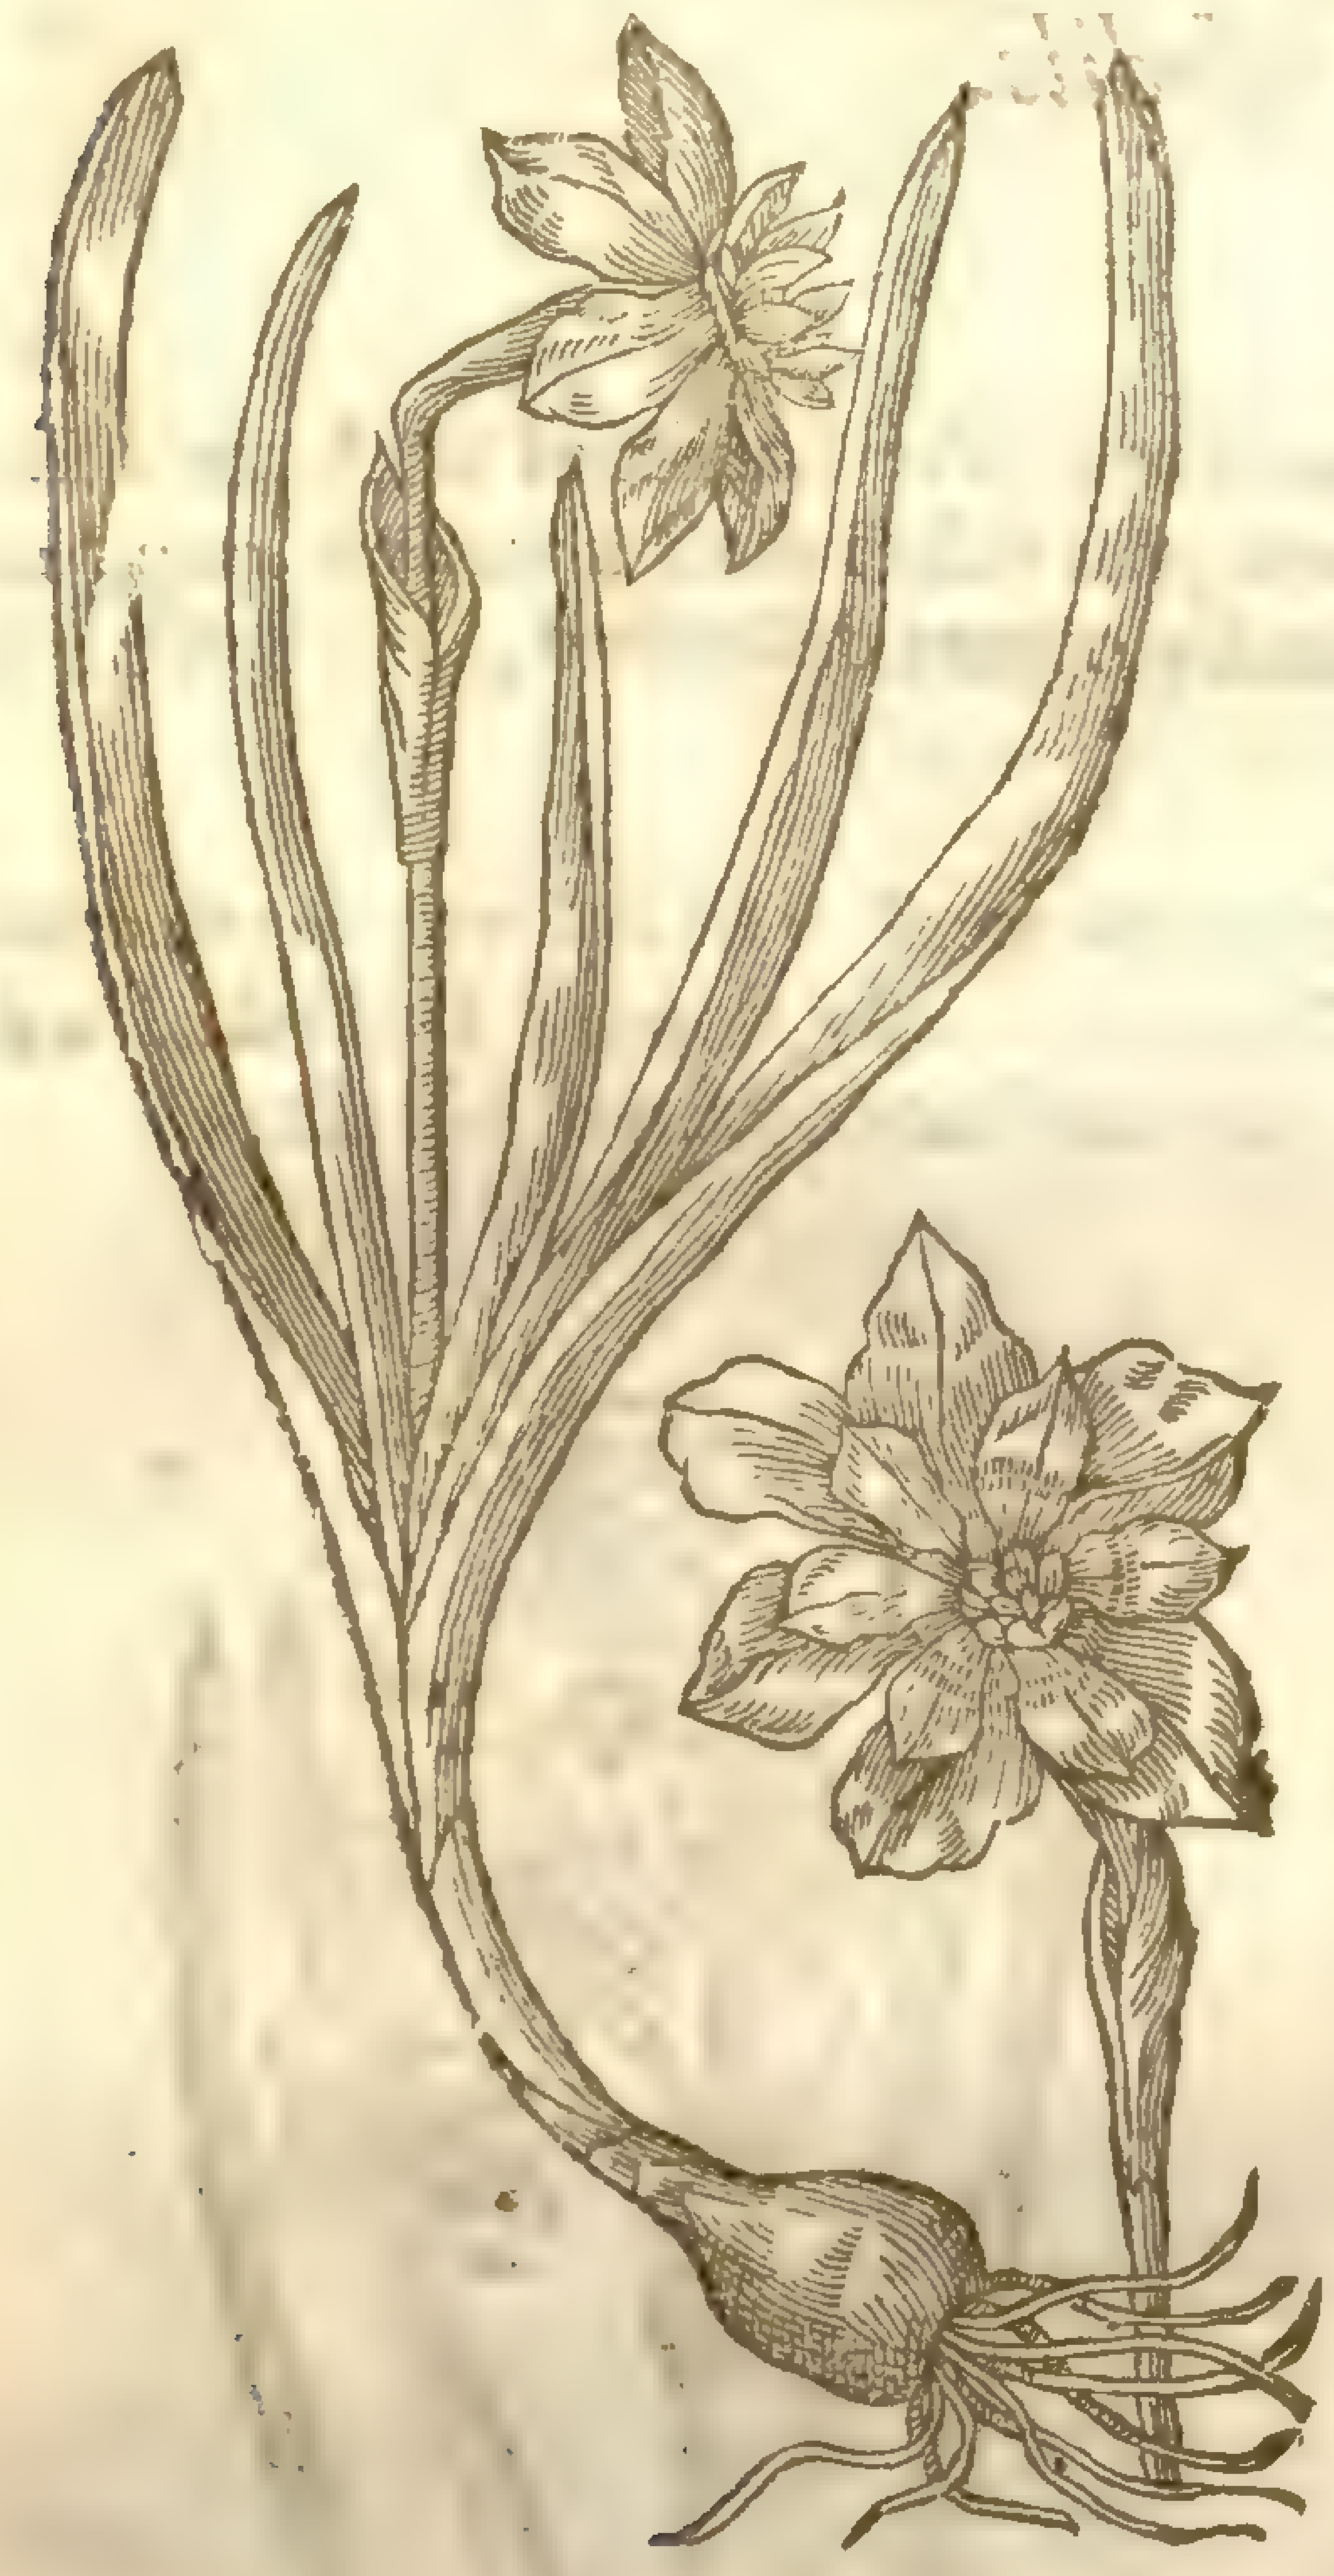


¶ *The Deſcription.*

1 The firſt of the Daffodils is that with the purple crowne or circle, hauing ſmall narrow leaues, thicke, fat, and full of ſlimie juice; among the which riſeth vp a naked ſtalke ſmooth and hollow, of a foot high, bearing at the top a faire milke white floure growing forth of a hood or thin filme ſuch as the flours of onions are wrapped in: in the midſt of which floure is a round circle or ſmall coronet of a yellowiſh colour, purfled or bordered about the edge of the ſaid ring or circle with a pleaſant purple colour; which being paſt, there followeth a thicke knob or button, wherein is contained blacke round ſeed. The root is white, bulbous or Onion-faſhion.

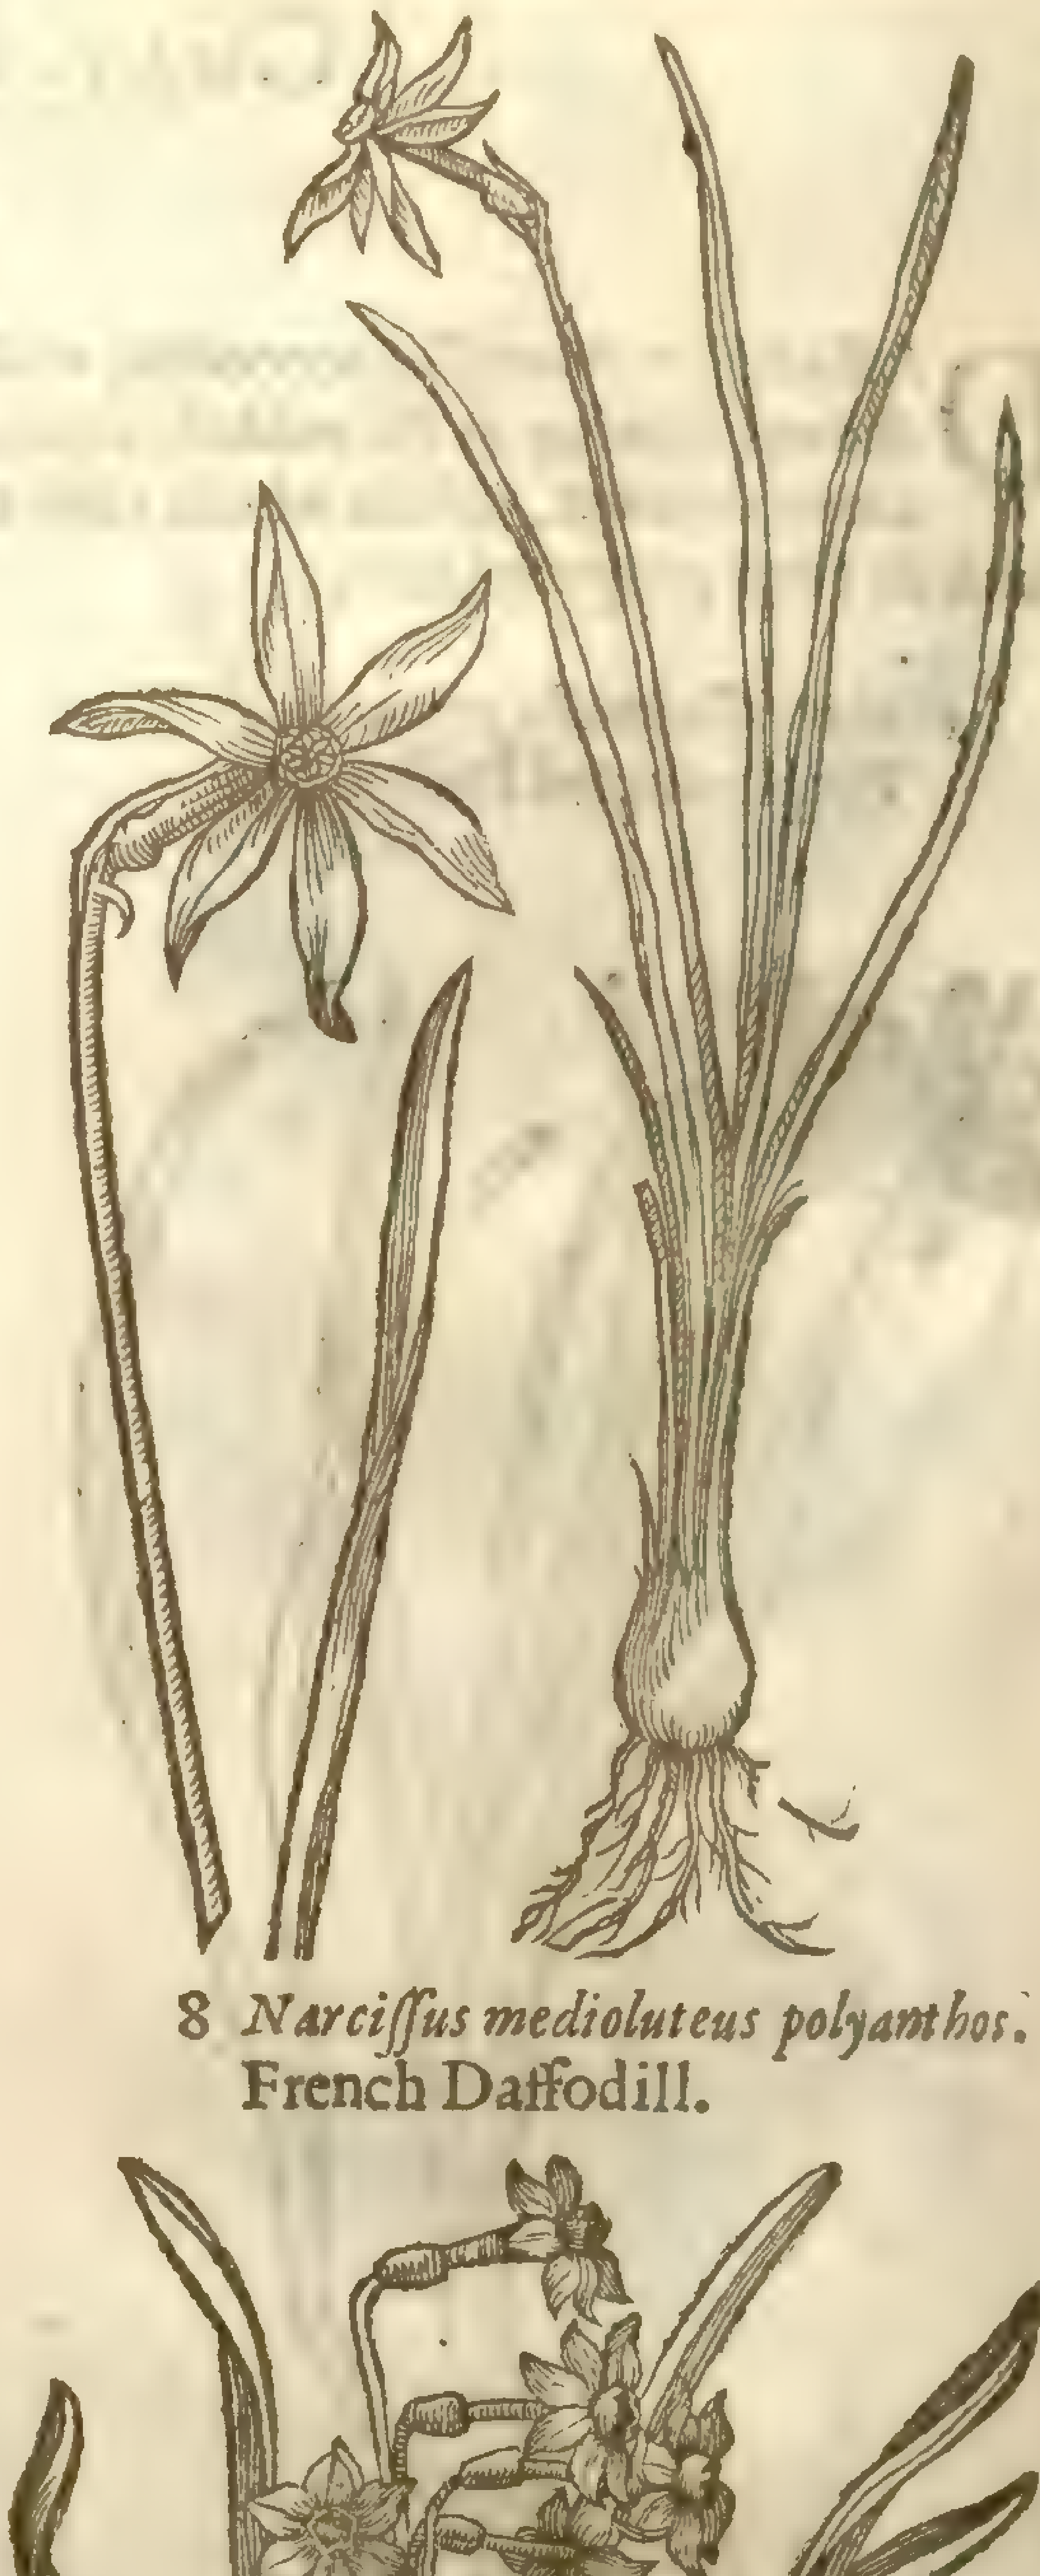
2 The ſecond kinde of Daffodil agreeth with the precedent in euery reſpect, ſauing that this Daffodill floureth in the beginning of Februarie, and the other not vntill Aprill, and is ſomewhat leſſer. It is called *Narciſſus medio purpureus præcox*; That is, Timely purple ringed Daffodill. The next may haue the addition *præcocior*, More timely: and the laſt in place, but firſt in time, *præcociſſimus*, Moſt timely, or very early flouring Daffodill.

‡ 5 *Narciſſus medio purpureus flore pleno.*
Double floured purple circled Daffodill.

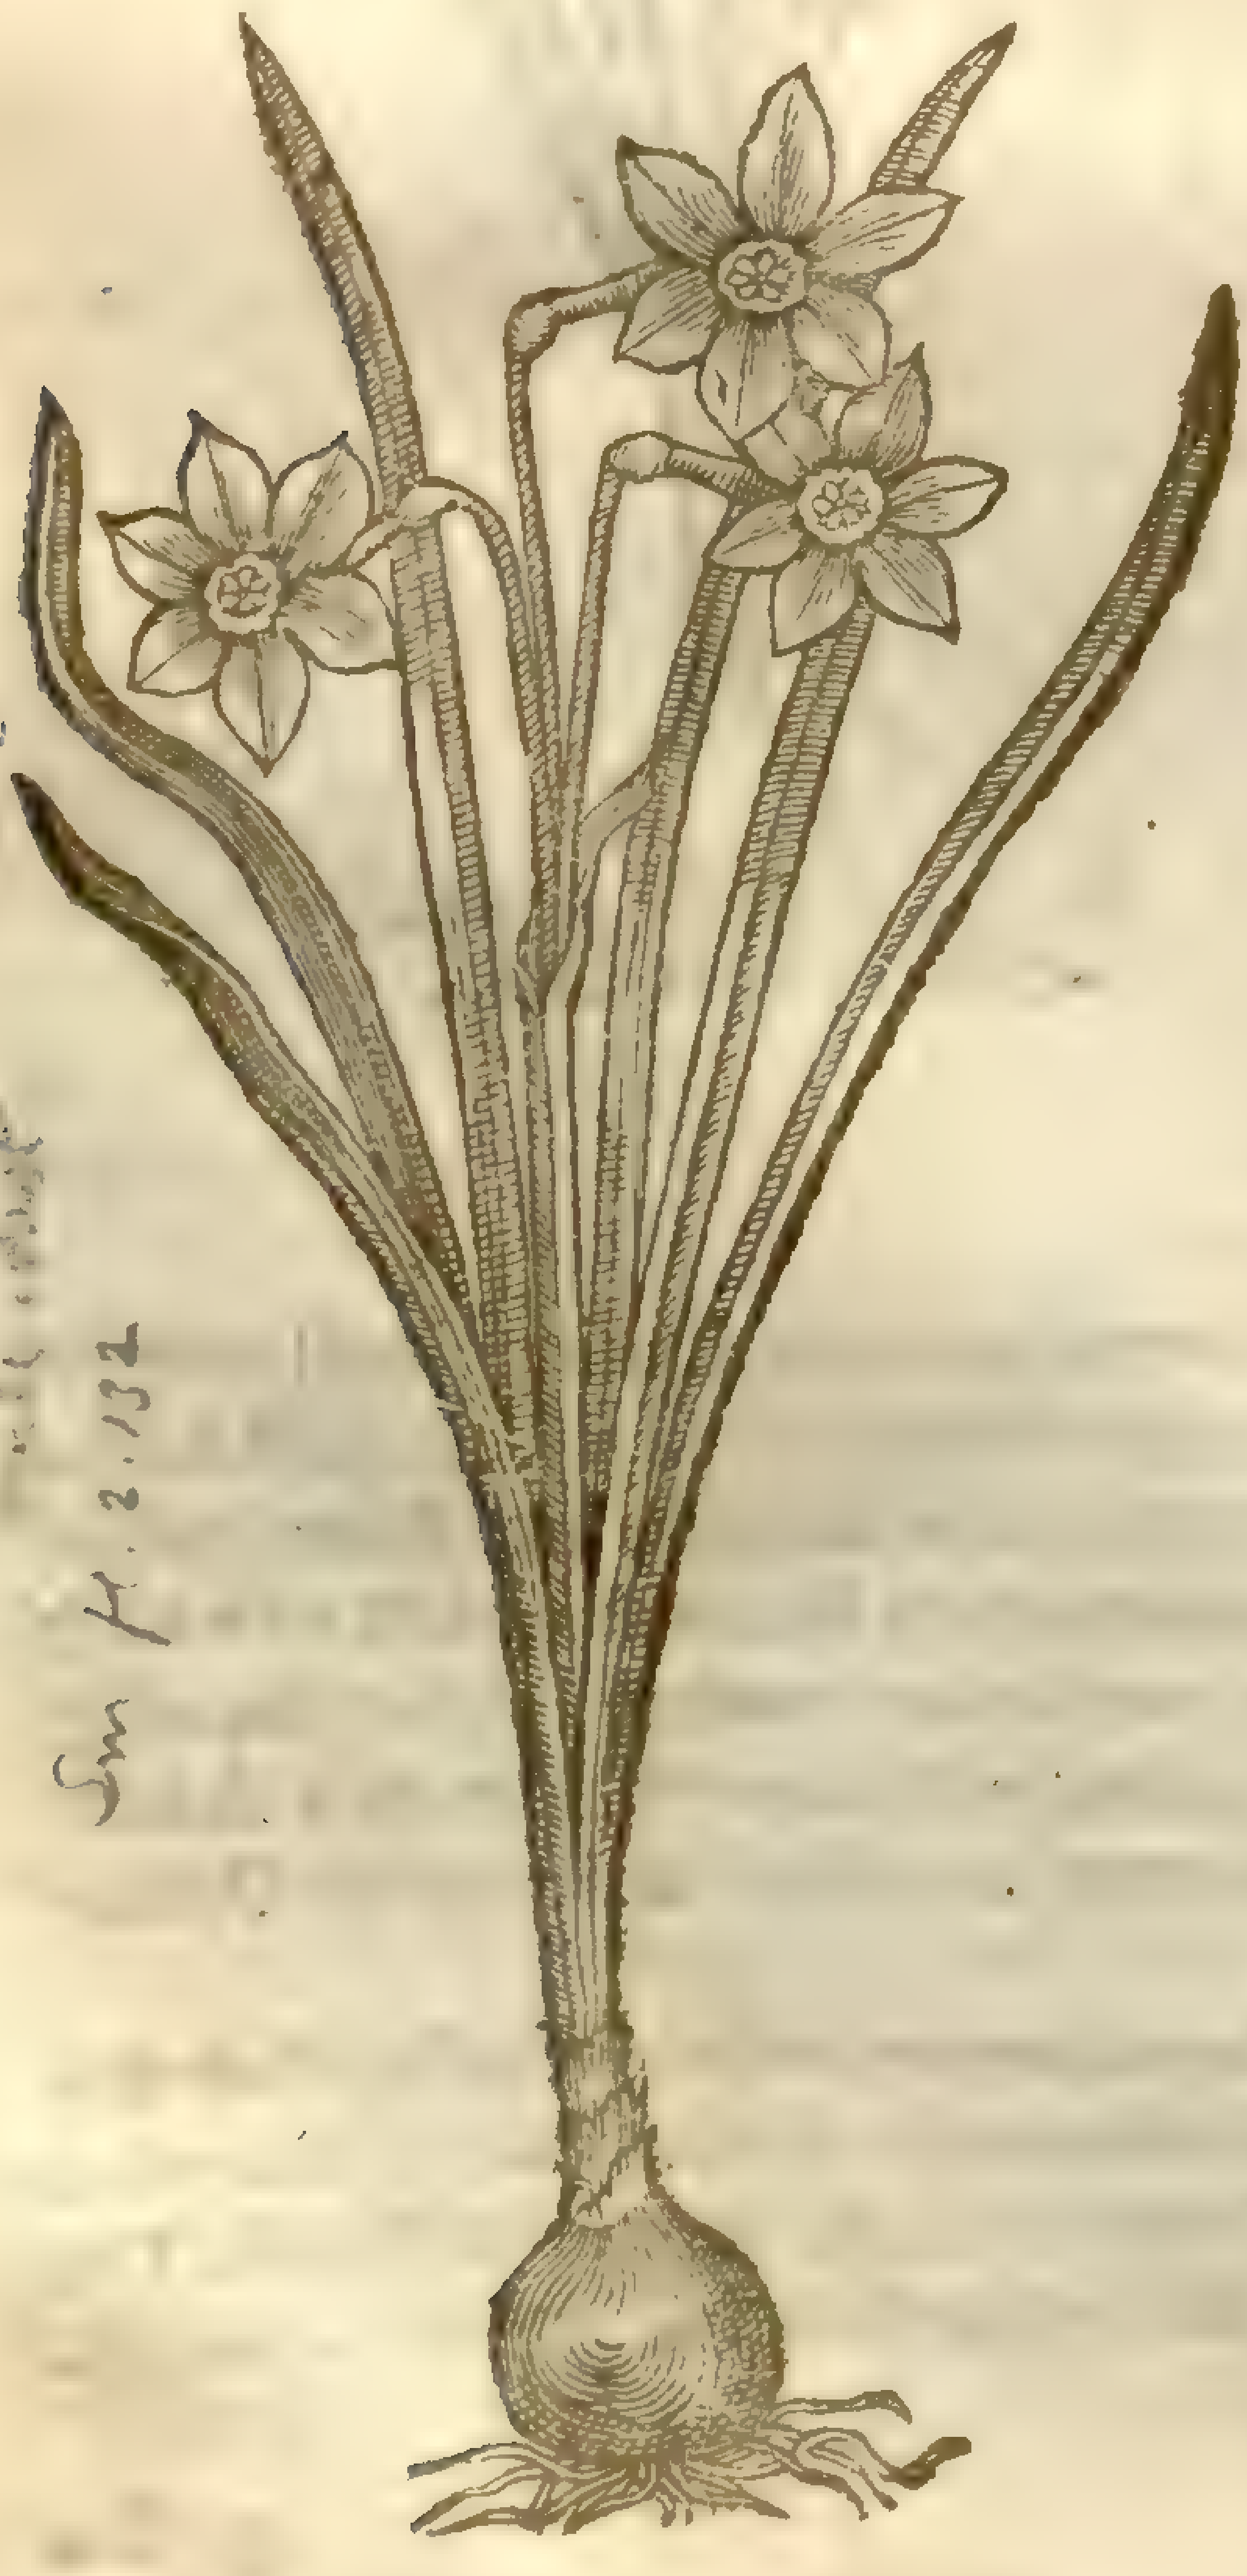


[illegible] Sm p. 2.132

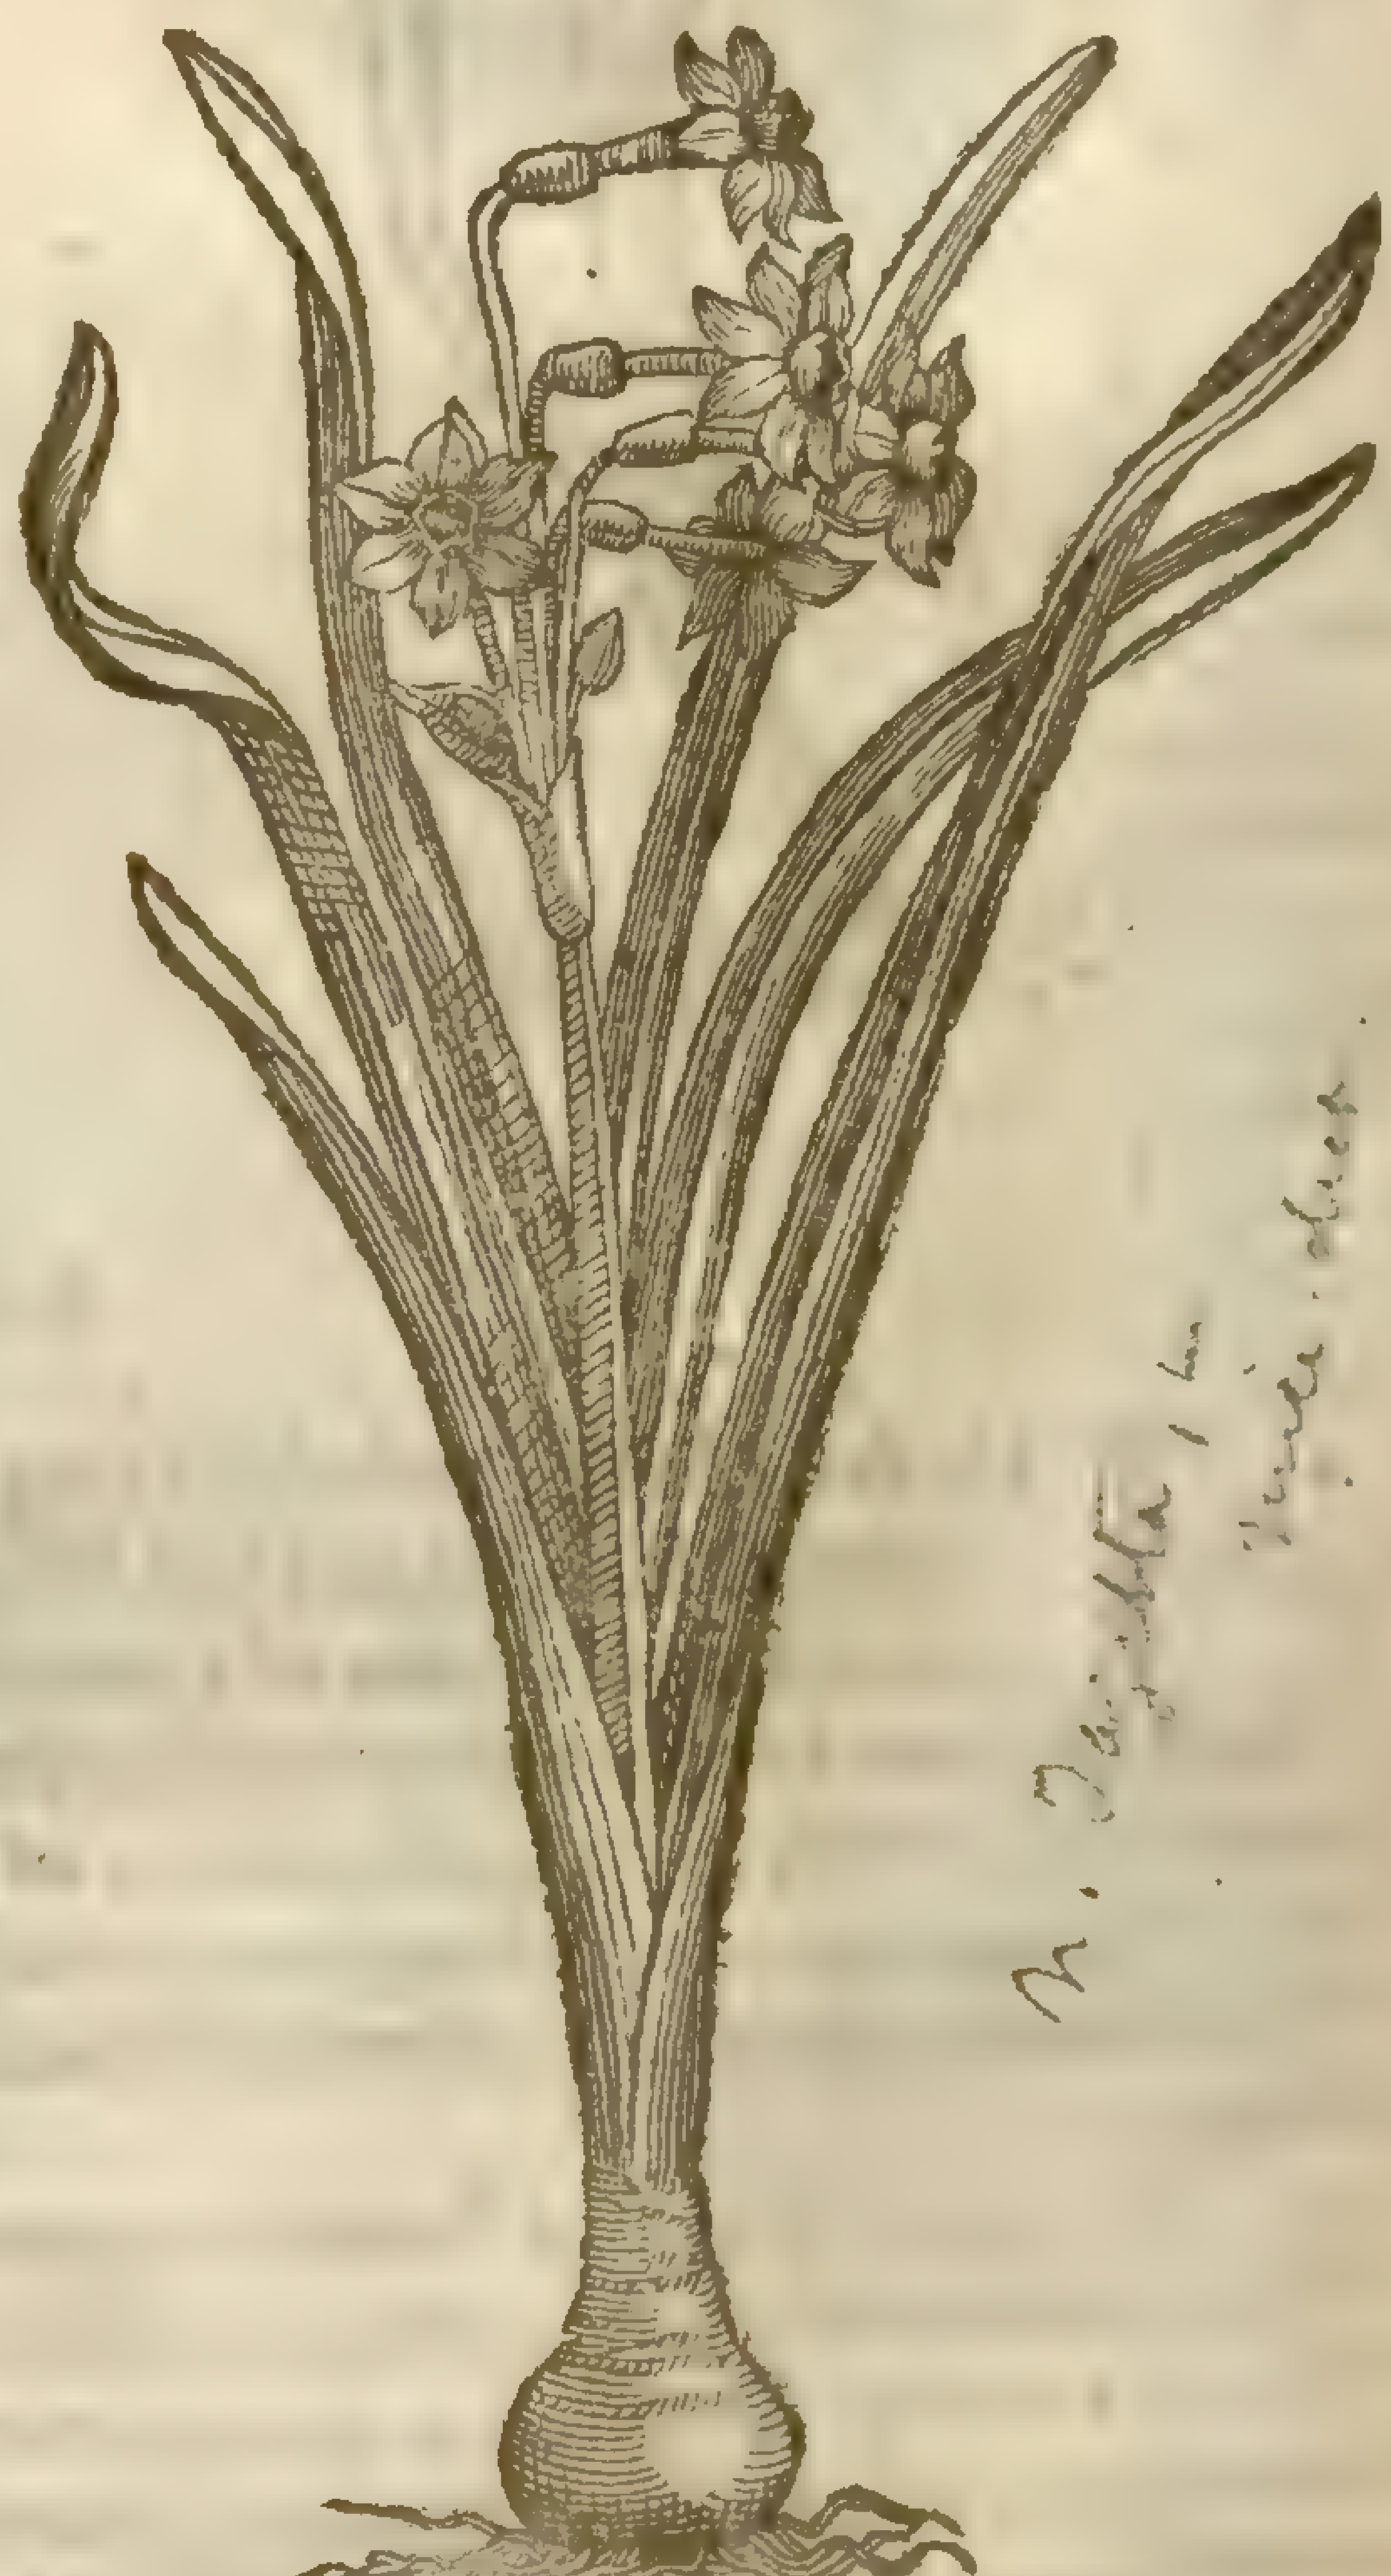
6 *Narciſſus minor ſerotinus.*
The late flouring ſmall Daffodil.



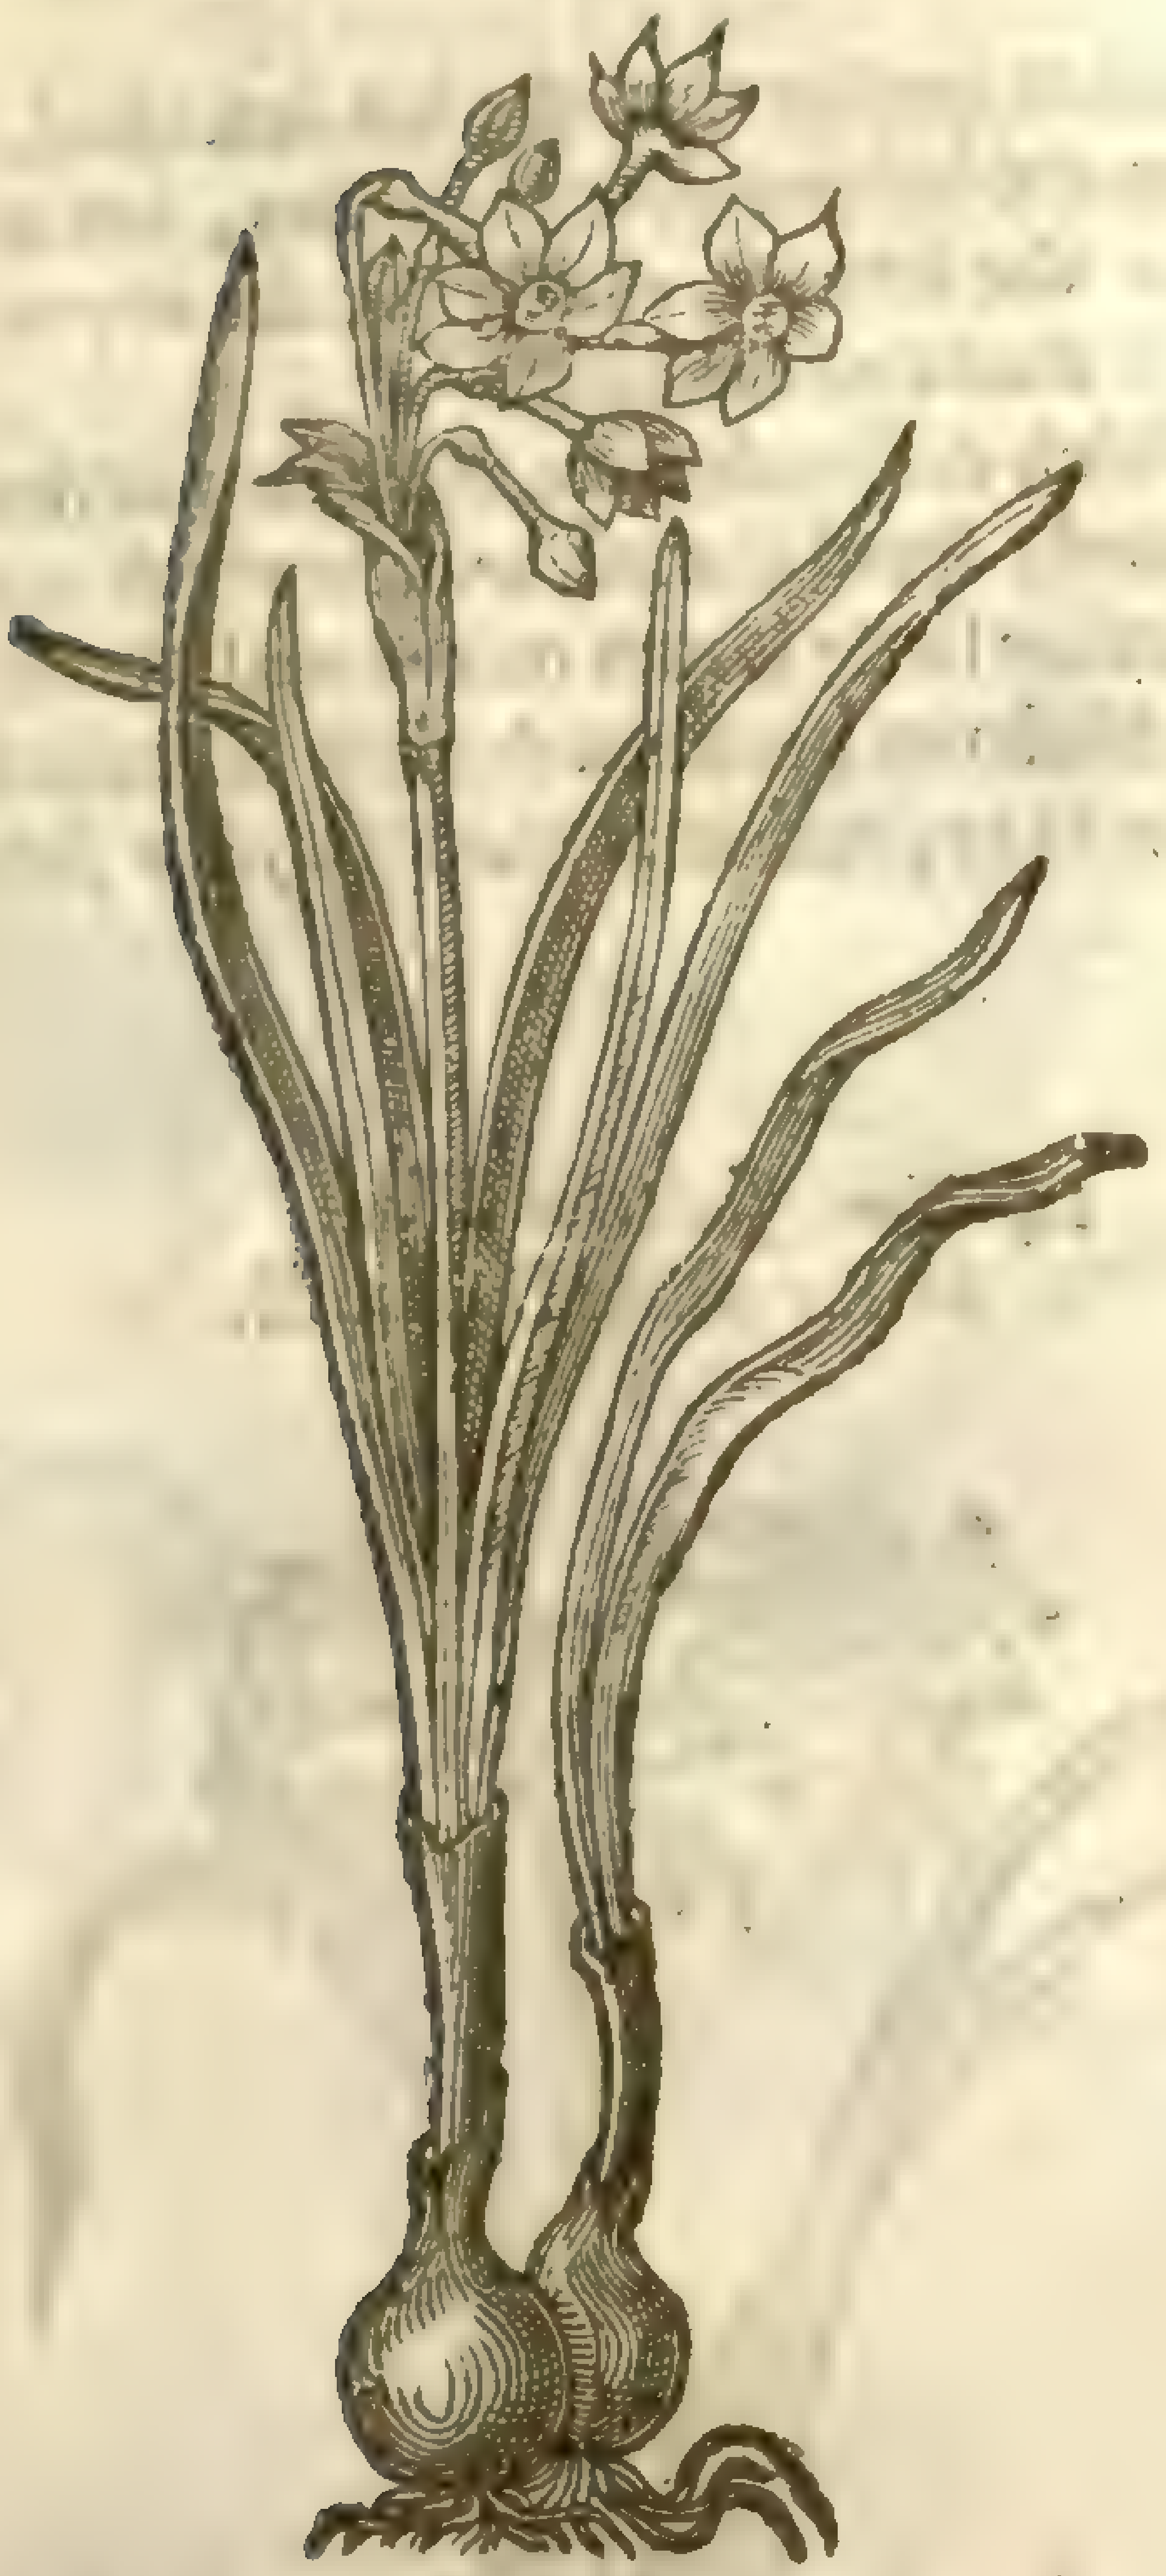
7 *Narciſſus medioluteus.*
Primroſe Pearles, or the common white Daffodill.



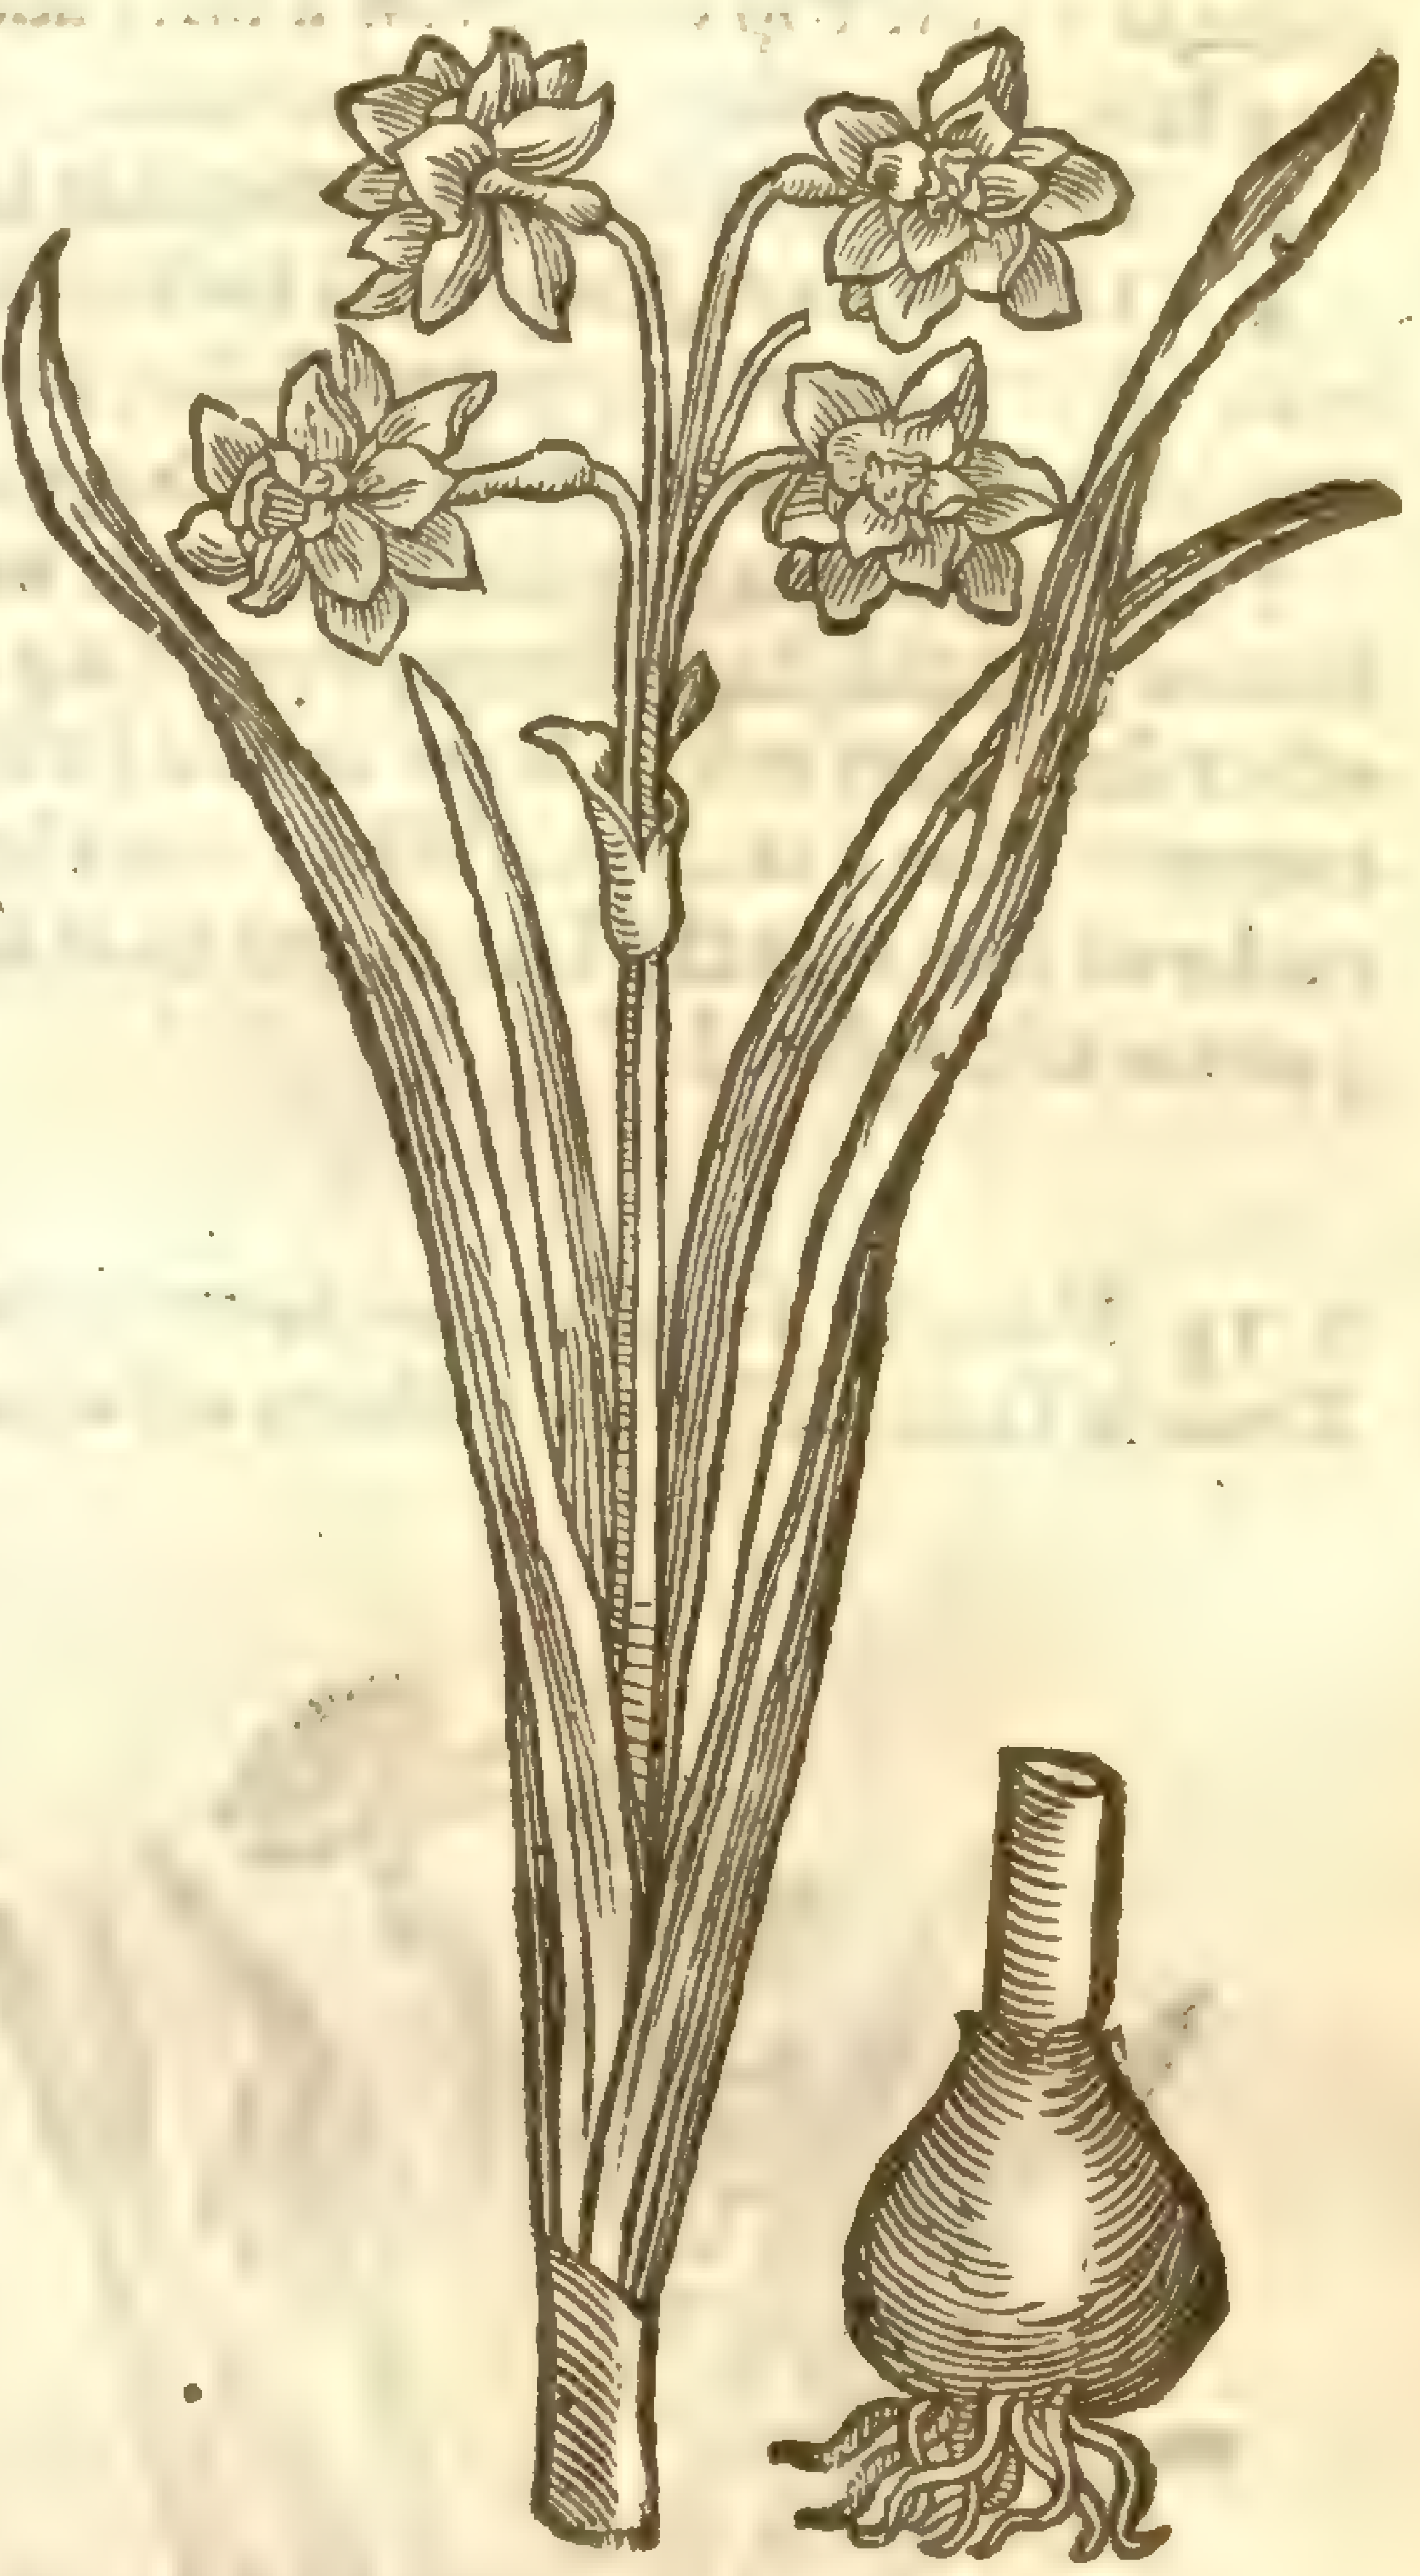
8 *Narciſſus medioluteus polyanthos.*
French Daffodill.



9 *Narciſſus Piſanus.*
Italian Daffodill.

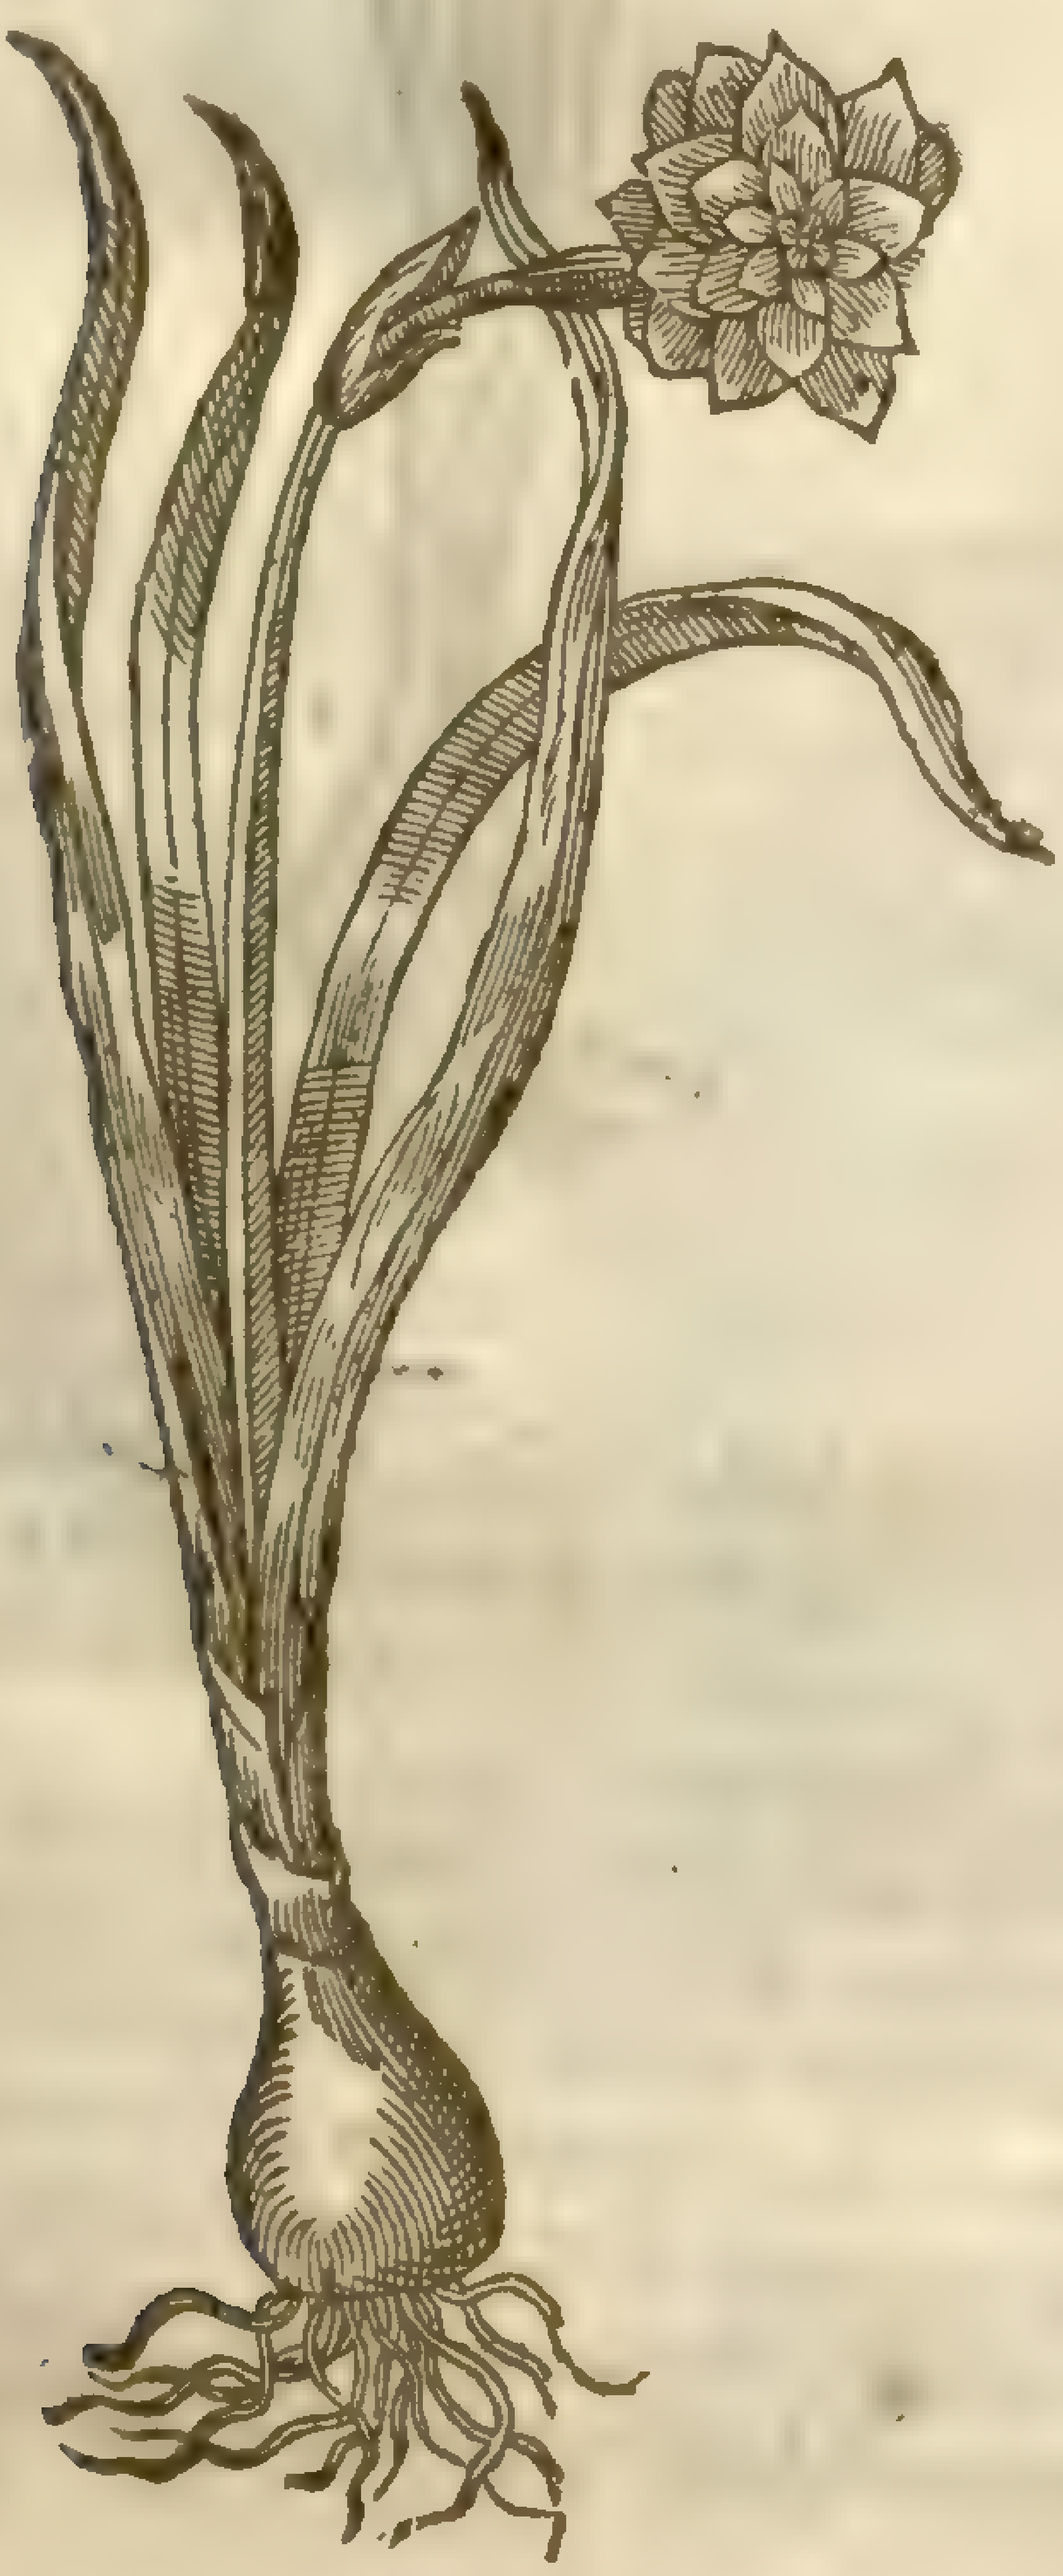


10 *Narciſſus albus multiplex.*
The double white Daffodill of Conſtantinople.

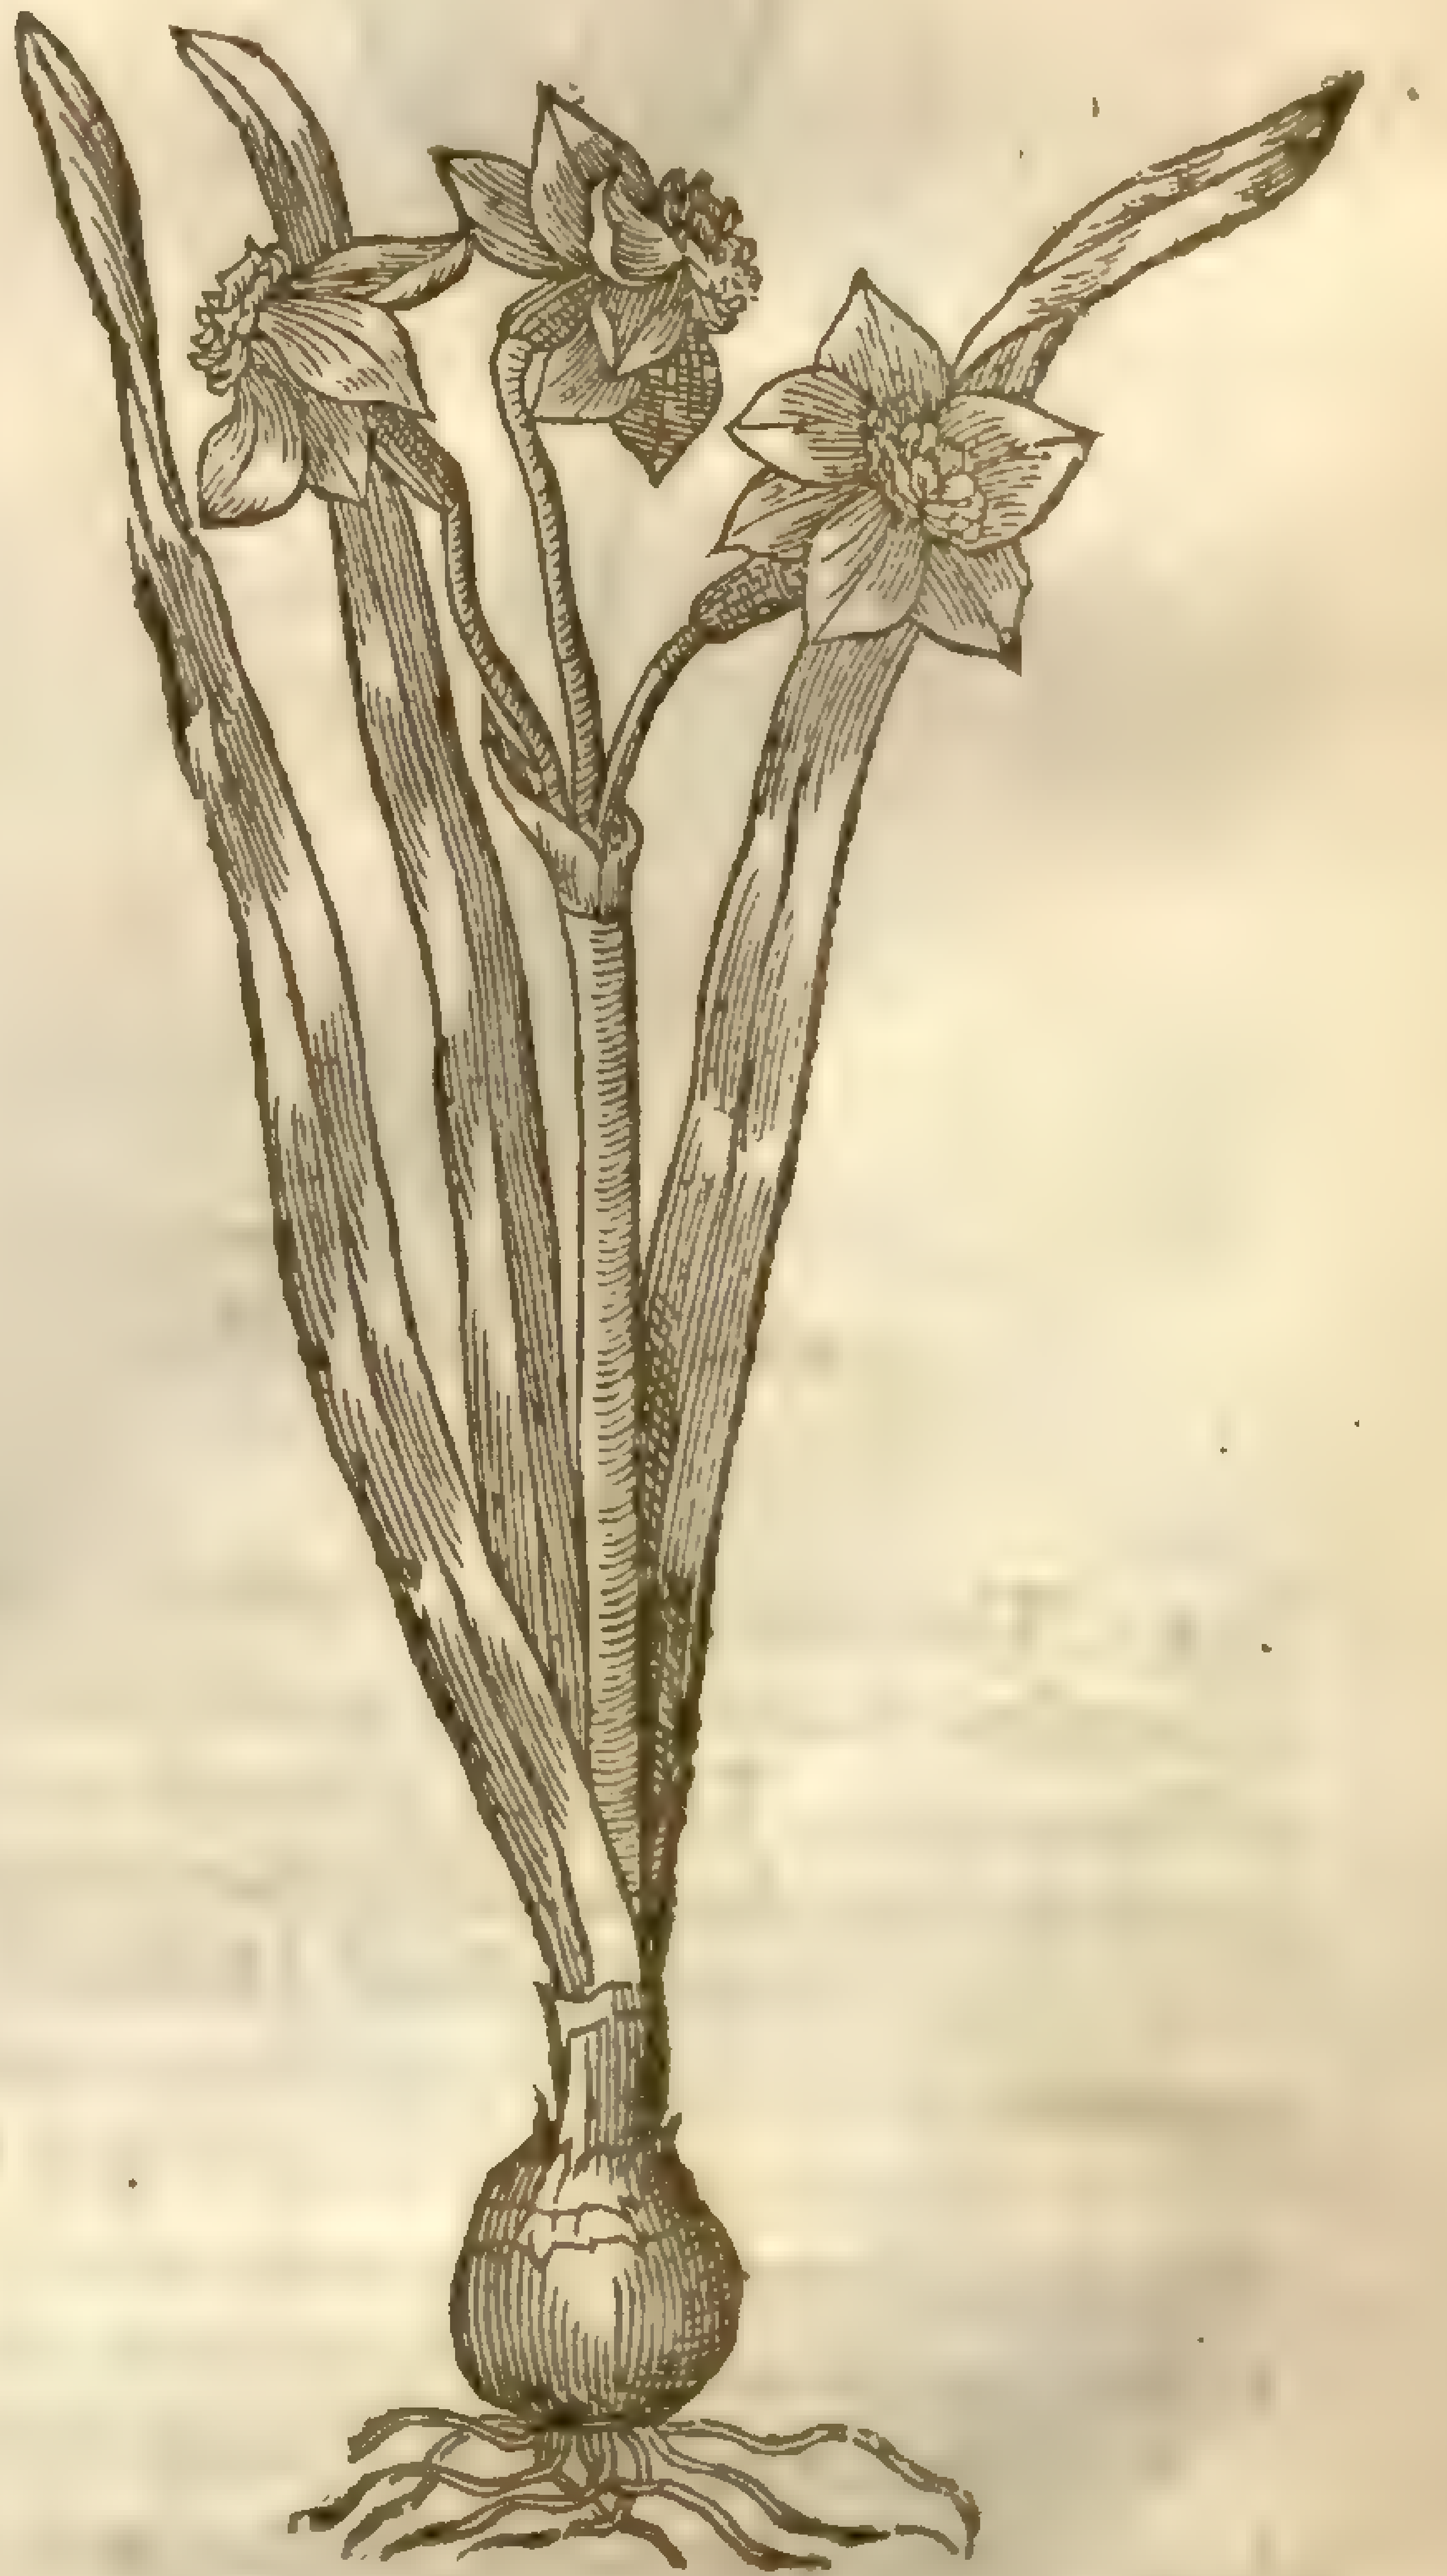


N. Daffodil [illegible] [illegible]

‡ 11 *Narciſſus flore pleno albo.*
The other double white Daffodill.



‡ 12 *Narciſſus flore pleno, medio luteo.*
Double white Daffodil with the middle yellow.



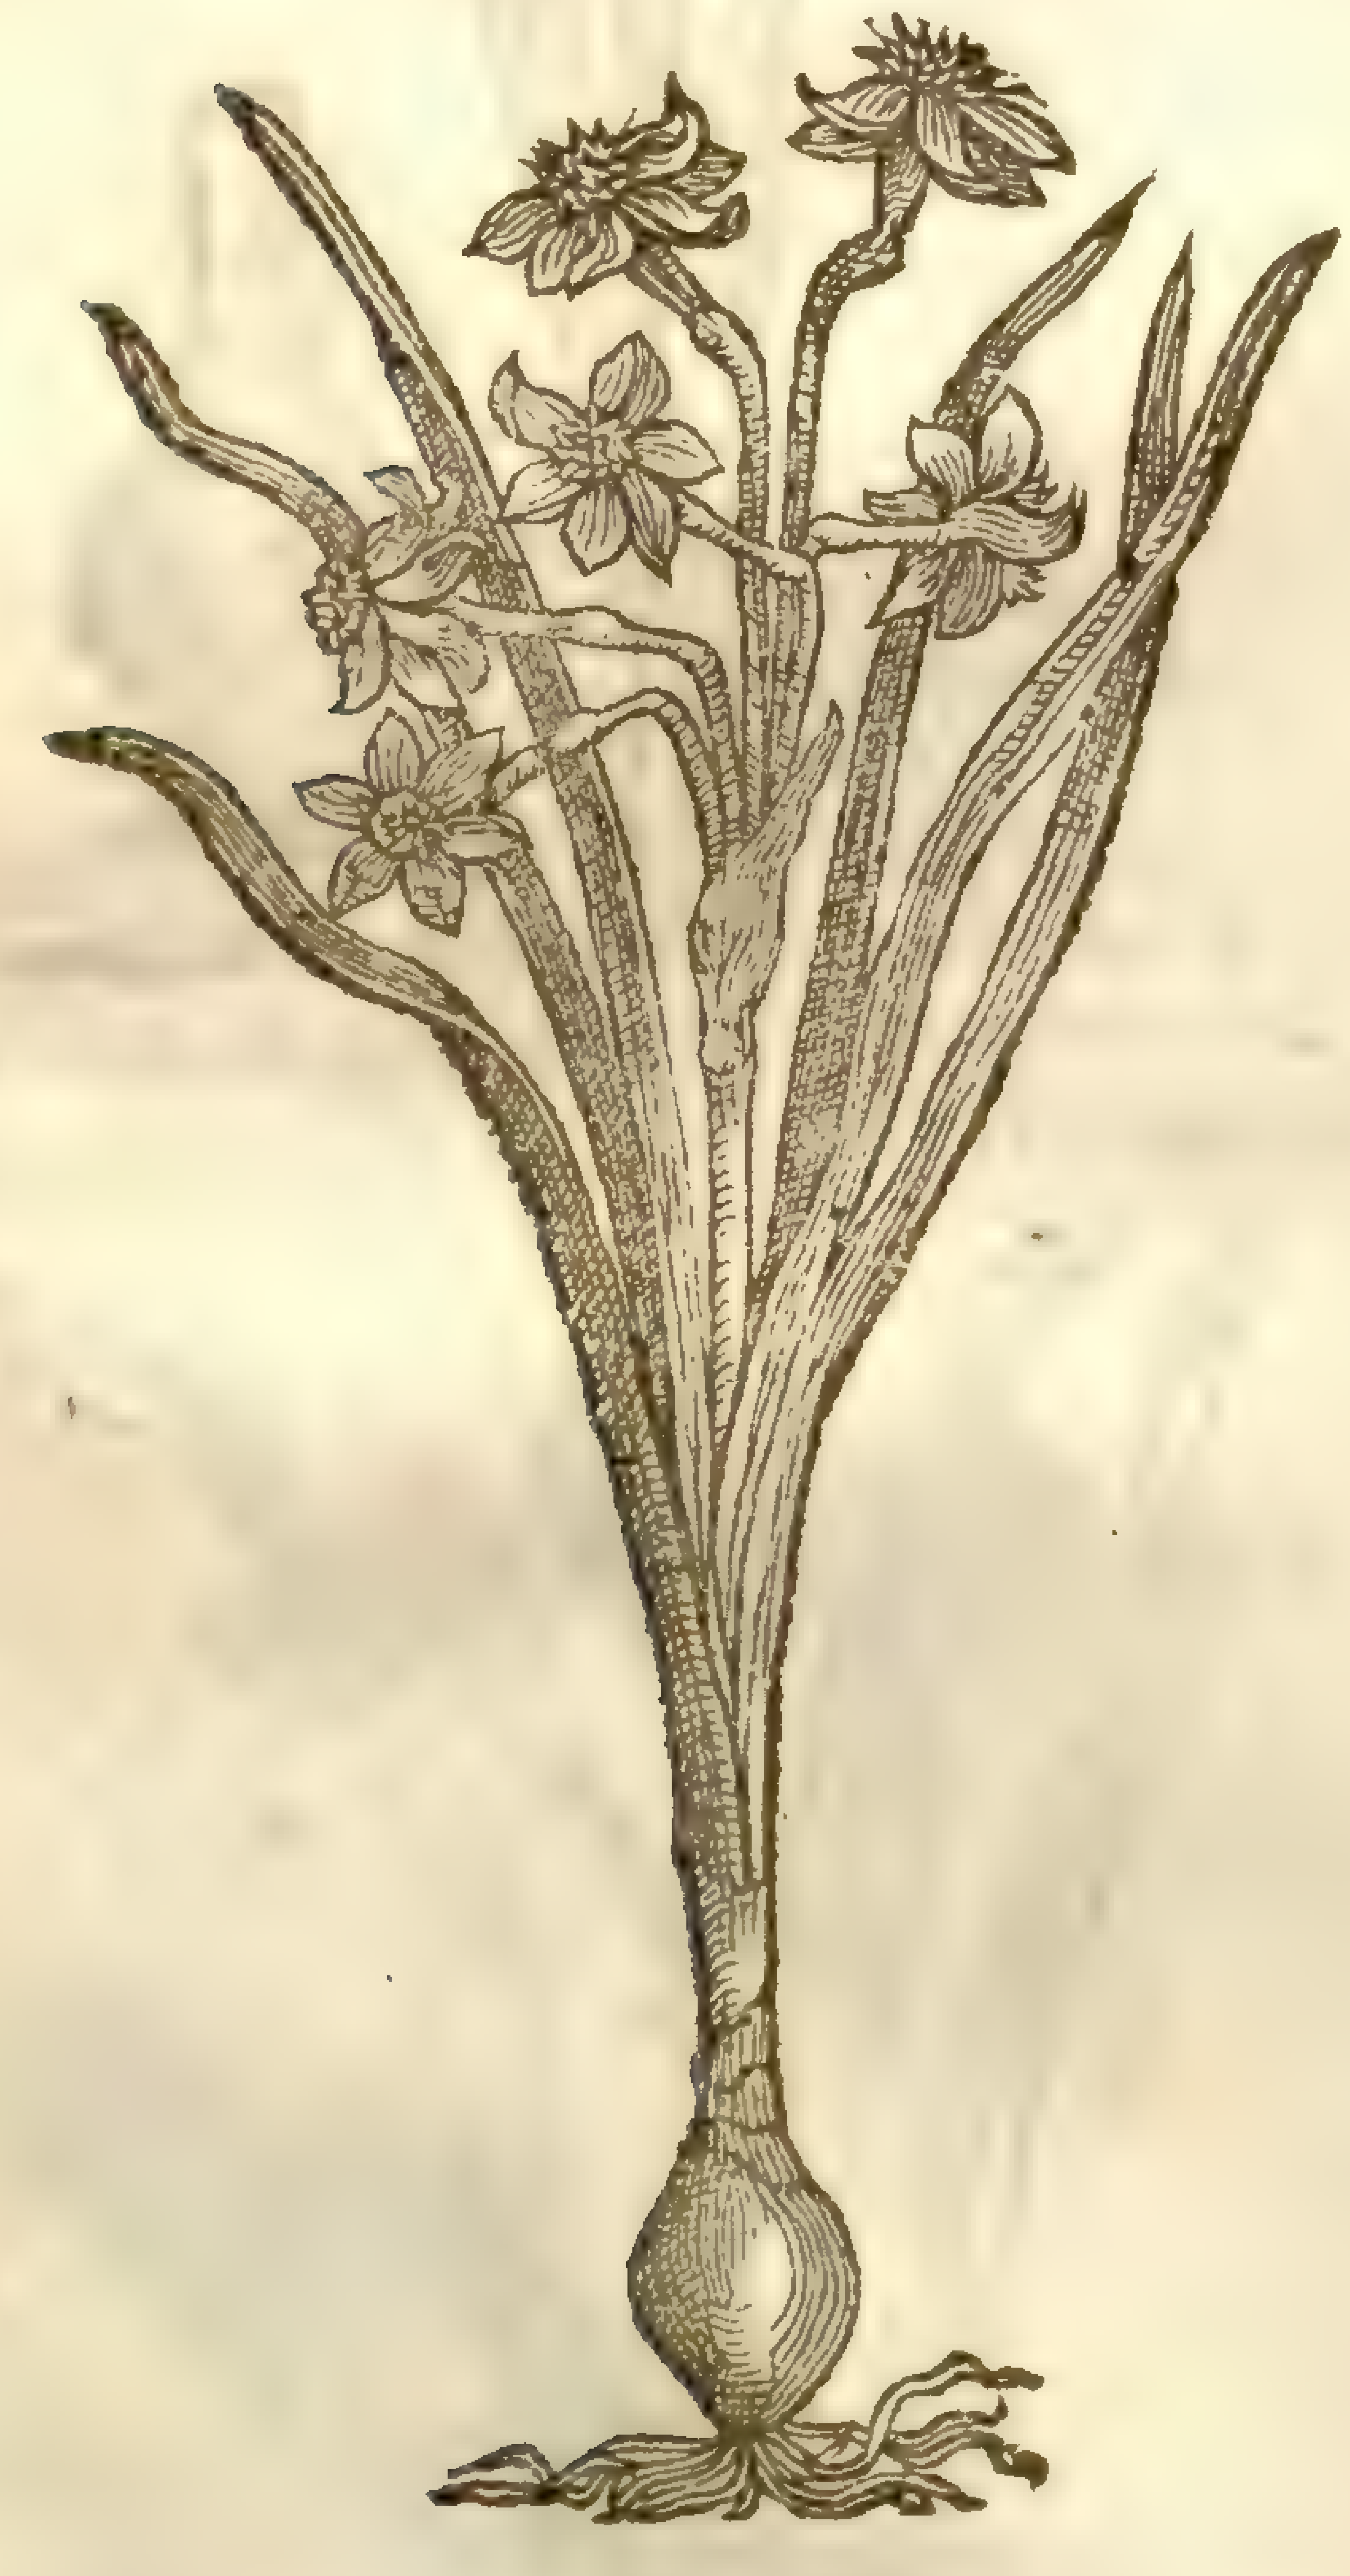
3 The third kinde of Daffodill with the purple ring or circle in the middle, hath many ſmall narrow leaues,very flat,crookedly bending toward the top, among which riſeth vp a ſlender bare ſtalke,at whoſe top doth grow a faire and pleaſant floure like vnto thoſe before deſcribed, but leſſer,wherein conſiſteth the difference.

‡ There is alſo another ſomewhat leſſe,and flouring ſomwhat earlier than the laſt deſcribed.

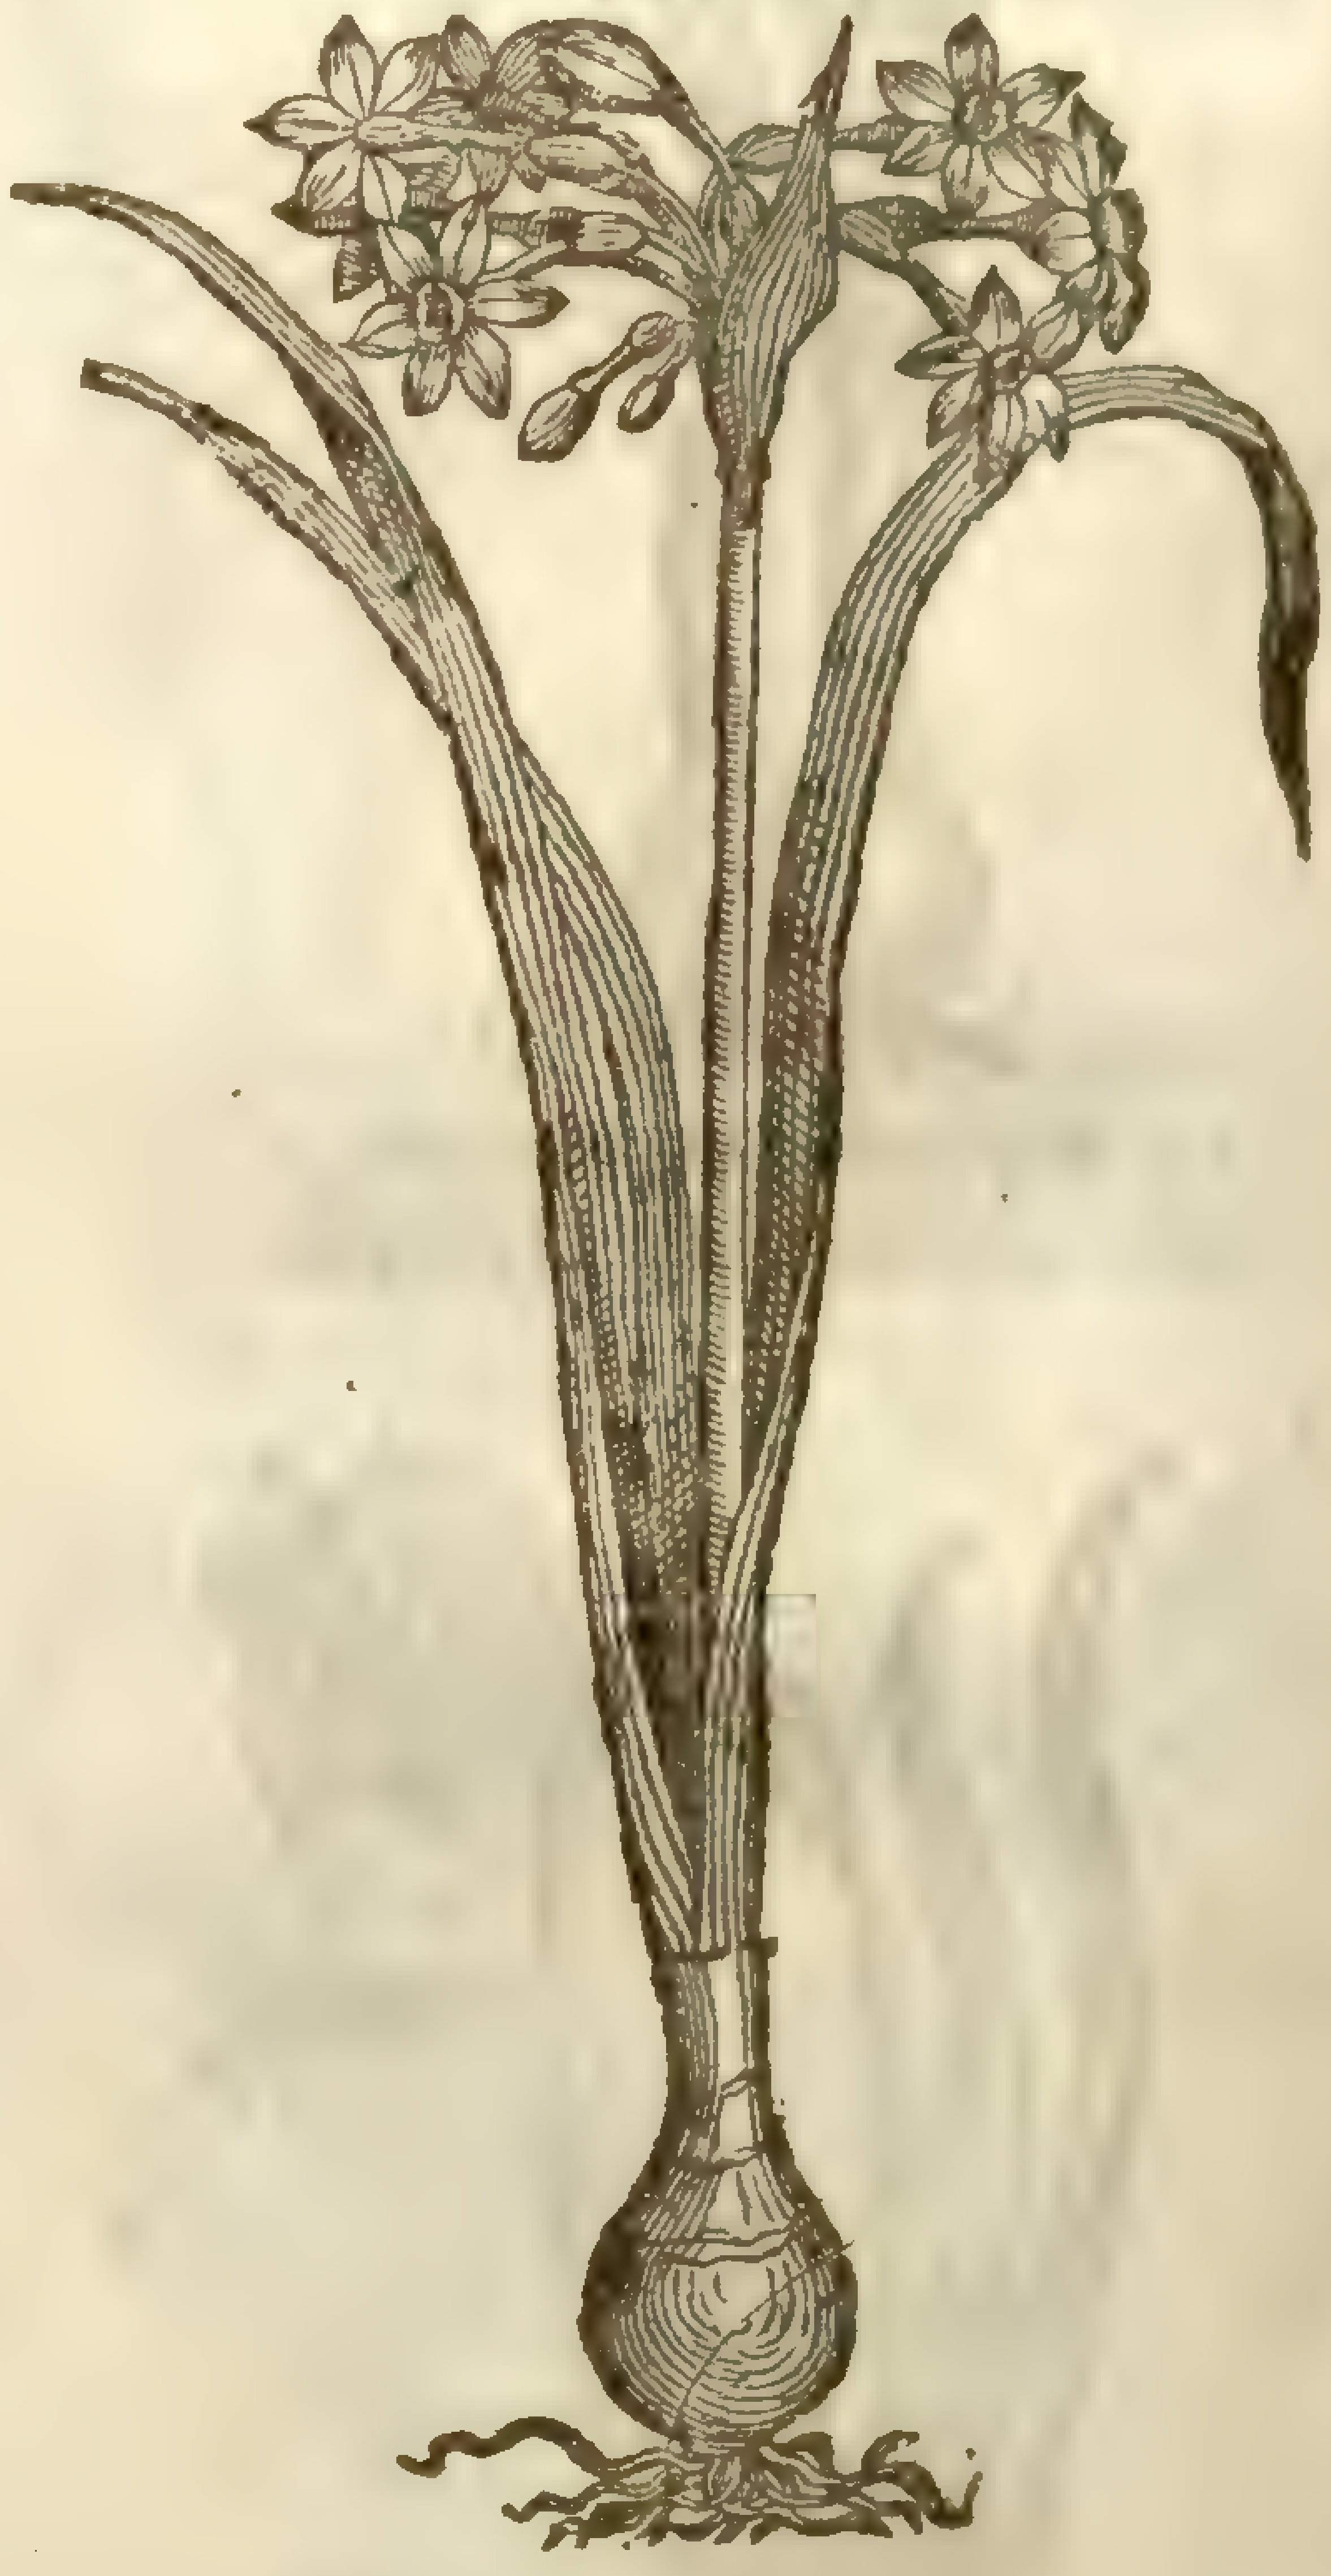
4 This in roots,leaues and ſtalks, differeth very little from the laſt mentioned kindes, but it beares many floures vpon one ſtalke, the out leaues being like the former, white, but the cup or ring in the middle of a ſaffron colour,with diuers yellow threds contained therein.

5 To theſe may be added another mentioned by *Cluſius*,which differeth from theſe only in the floures; for this hath floures conſiſting of ſix large leaues fairely ſpred abroad, within which are other ſix leaues not ſo large as the former, and then many other little leaues mixed with threds comming forth of the middle. Now there are purple threds which run between the firſt & ſecond ranke of leaues,in the leaues,and ſo in the reſt. This floures in May; and it is *Narciſſus pleno flore quintus* of *Cluſius*. ‡

‡ 13 *Narciſſus flore pleno, medio verſicolore.*
Double Daffodill with a diuers coloured middle.



14 *Narciſſus totus albus.*
Milke white Daffodill.



6 This late flouring Daffodill hath many fat thicke leaues,full of juice; among which riſeth vp a naked ſtalke,on the top whereof groweth a faire white floure, hauing in the middle a ring or yellow circle. The ſeed groweth in knobby ſeed-veſſels. The root is bulbous or onion-faſhion. It floureth later than others before deſcribed,that is to ſay,in Aprill and May.

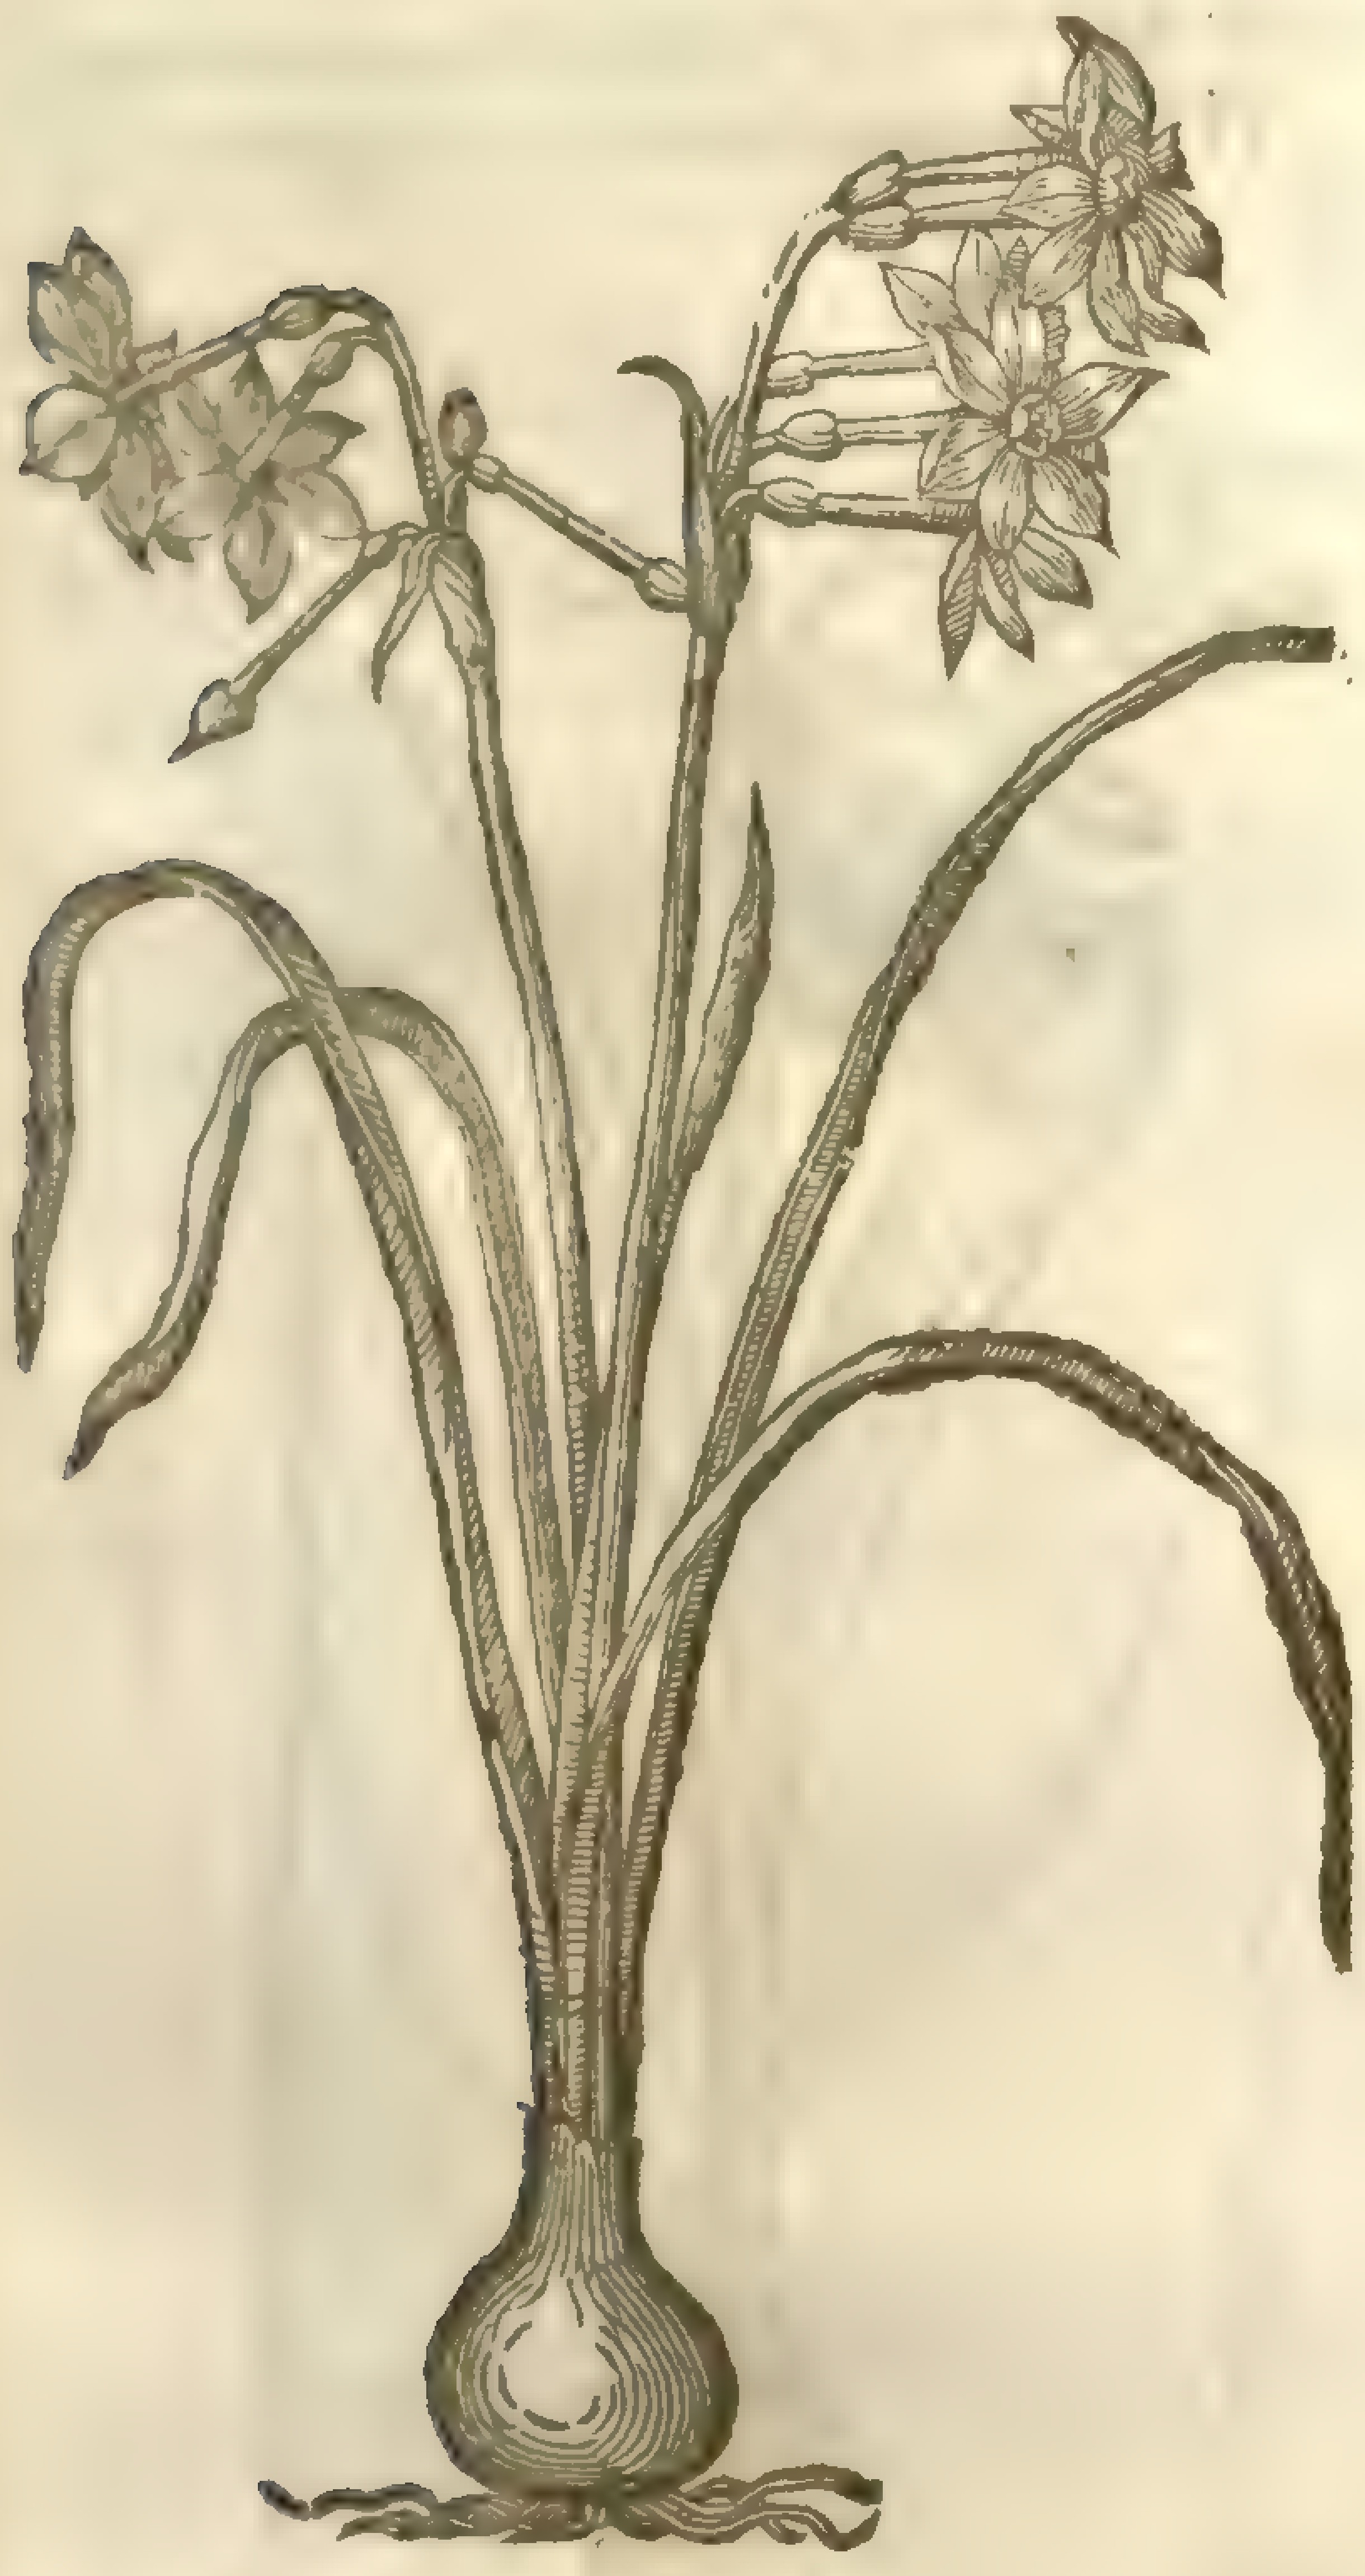
7 The ſecond kinde of Daffodill is that ſort of *Narciſſus* or Primroſe peereleſſe that is moſt common in our country gardens,generally knowne euerie where. It hath long fat and thick leaues, full of a ſlimie juice; among which riſeth vp a bare thicke ſtalke,hollow within and full of juice. The floure groweth at the top, of a yellowiſh white colour, with a yellow crowne or circle in the middle,and floureth in the moneth of Aprill,and ſometimes ſooner. The root is bulbous faſhion.

8 The eighth Daffodill hath many broad and thicke leaues, fat and full of juice, hollow, and ſpongeous. The ſtalks, floures, and roots are like the former,and differeth in that,that this plant

bringeth forth many floures vpon one ſtalk,and the other fewer,and not of ſo perfect a ſweet ſmel, but more offenſiue and ſtuffing the head. It hath this addition,*Polyanthos*,that is,of many floures, wherein eſpecially conſiſteth the difference.

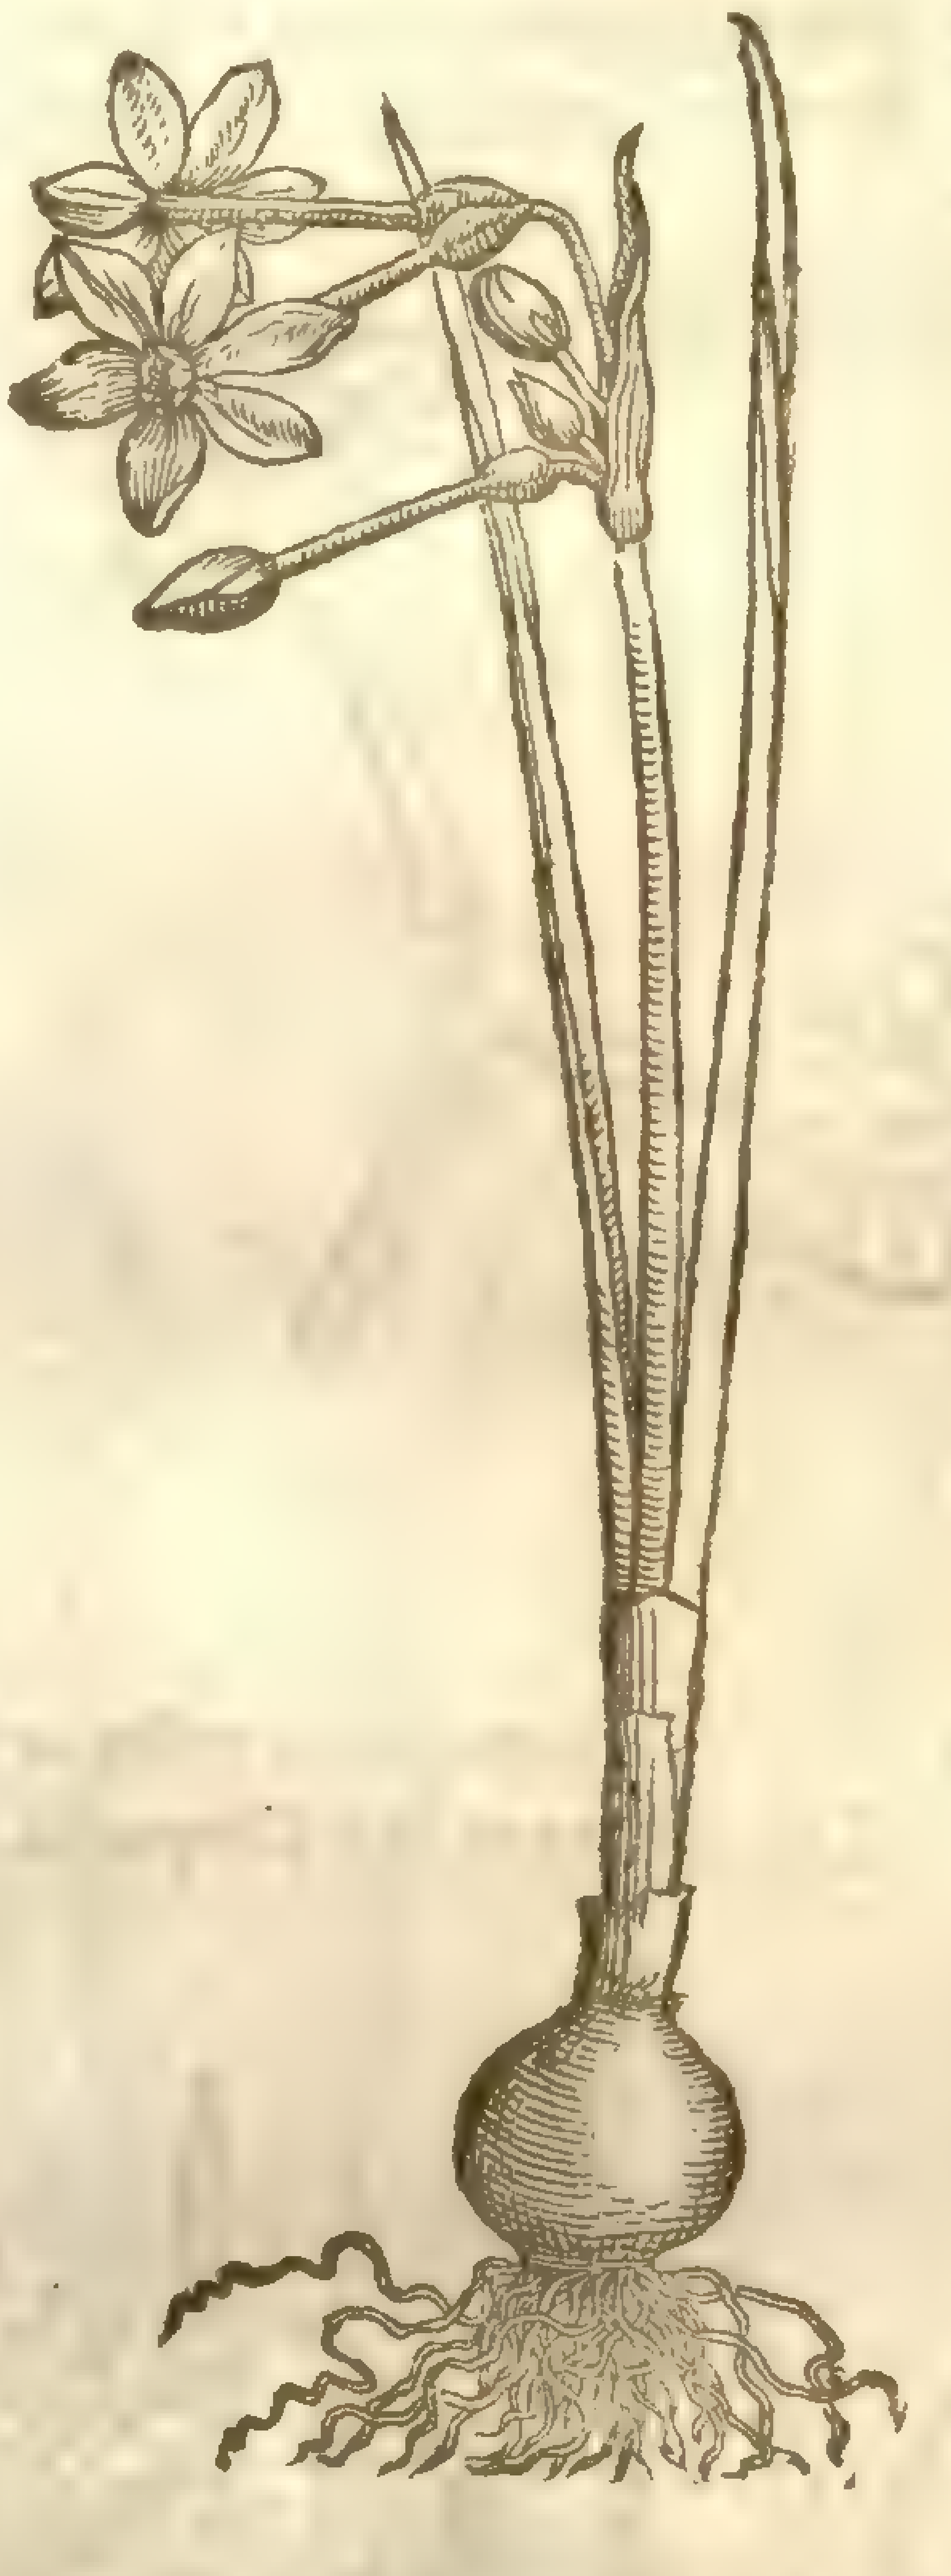
9 The Italian Daffodill is very like the former, the which to diſtinguiſh in words, that they may be knowne one from another, is impoſſible. Their floures,leaues,and roots are like,ſauing that the floures of this are ſweeter,and more in number.

15 *Narciſſus juncifolius præcox.*
Ruſh Daffodill,or *Iunquilia.*



N. Jonquilla [illegible]

16 *Narciſſus juncifolius ſerotinus.*
Late flouring Ruſh Daffodill.



10 The double white Daffodill of Conſtantinople was ſent into England vnto the right honourable the Lord Treaſurer,among other bulbed floures; whoſe roots when they were planted in our London gardens,did bring forth beautifull floures very white and double, with ſome yellowneſſe mixed in the middle leaues,pleaſant and ſweet in ſmell; but ſince that time we neuer could by any induſtrie or manuring bring them vnto flouring againe. So that it ſhould appeare, when they were diſcharged of that birth or burthen which they had begotten in their own country,and not finding that matter,ſoile,or clymat to beget more floures, they remaine euer ſince barren and fruitleſſe. Beſides,we found by experience,that thoſe plants which in Autumne did ſhoot forth leaues,did bring forth no floures at all; and the others that appeared not vntil the Spring,did flouriſh and beare their floures. The ſtalkes, leaues, and roots are like vnto the other kindes of Daffodils. It is called of the Turkes, *Giul Catamer lale*, that is, Narciſſus with double floures. Notwithſtanding we haue receiued from beyond the ſeas,as wel from the Low-Countries,as alſo from France,another ſort of greater beauty,which from yeare to yeare doth yeeld forth moſt pleaſant double floures,and great encreaſe of roots, very like as well in ſtalks as other parts of the plant, vnto the other ſorts of Daffodils. It differeth onely in the floures, which are very double and thicke thruſt together, as are the floures of our double Primroſe; hauing in the middle of the floure ſome few chiues or welts of a bright purple colour,and the other mixed with yellow, as aforeſaid.

‡ 11 This alſo with double white floures,which *Cluſius* ſets forth in the ſixt place, is of the ſame kinde with the laſt deſcribed,but it beares bnt one or two floures vpon a ſtalke, whereas the other hath many.

12 This,which is *Cluſius* his *Narciſſus flore pleno* 2. is in roots, leaues, and ſtalkes very like the

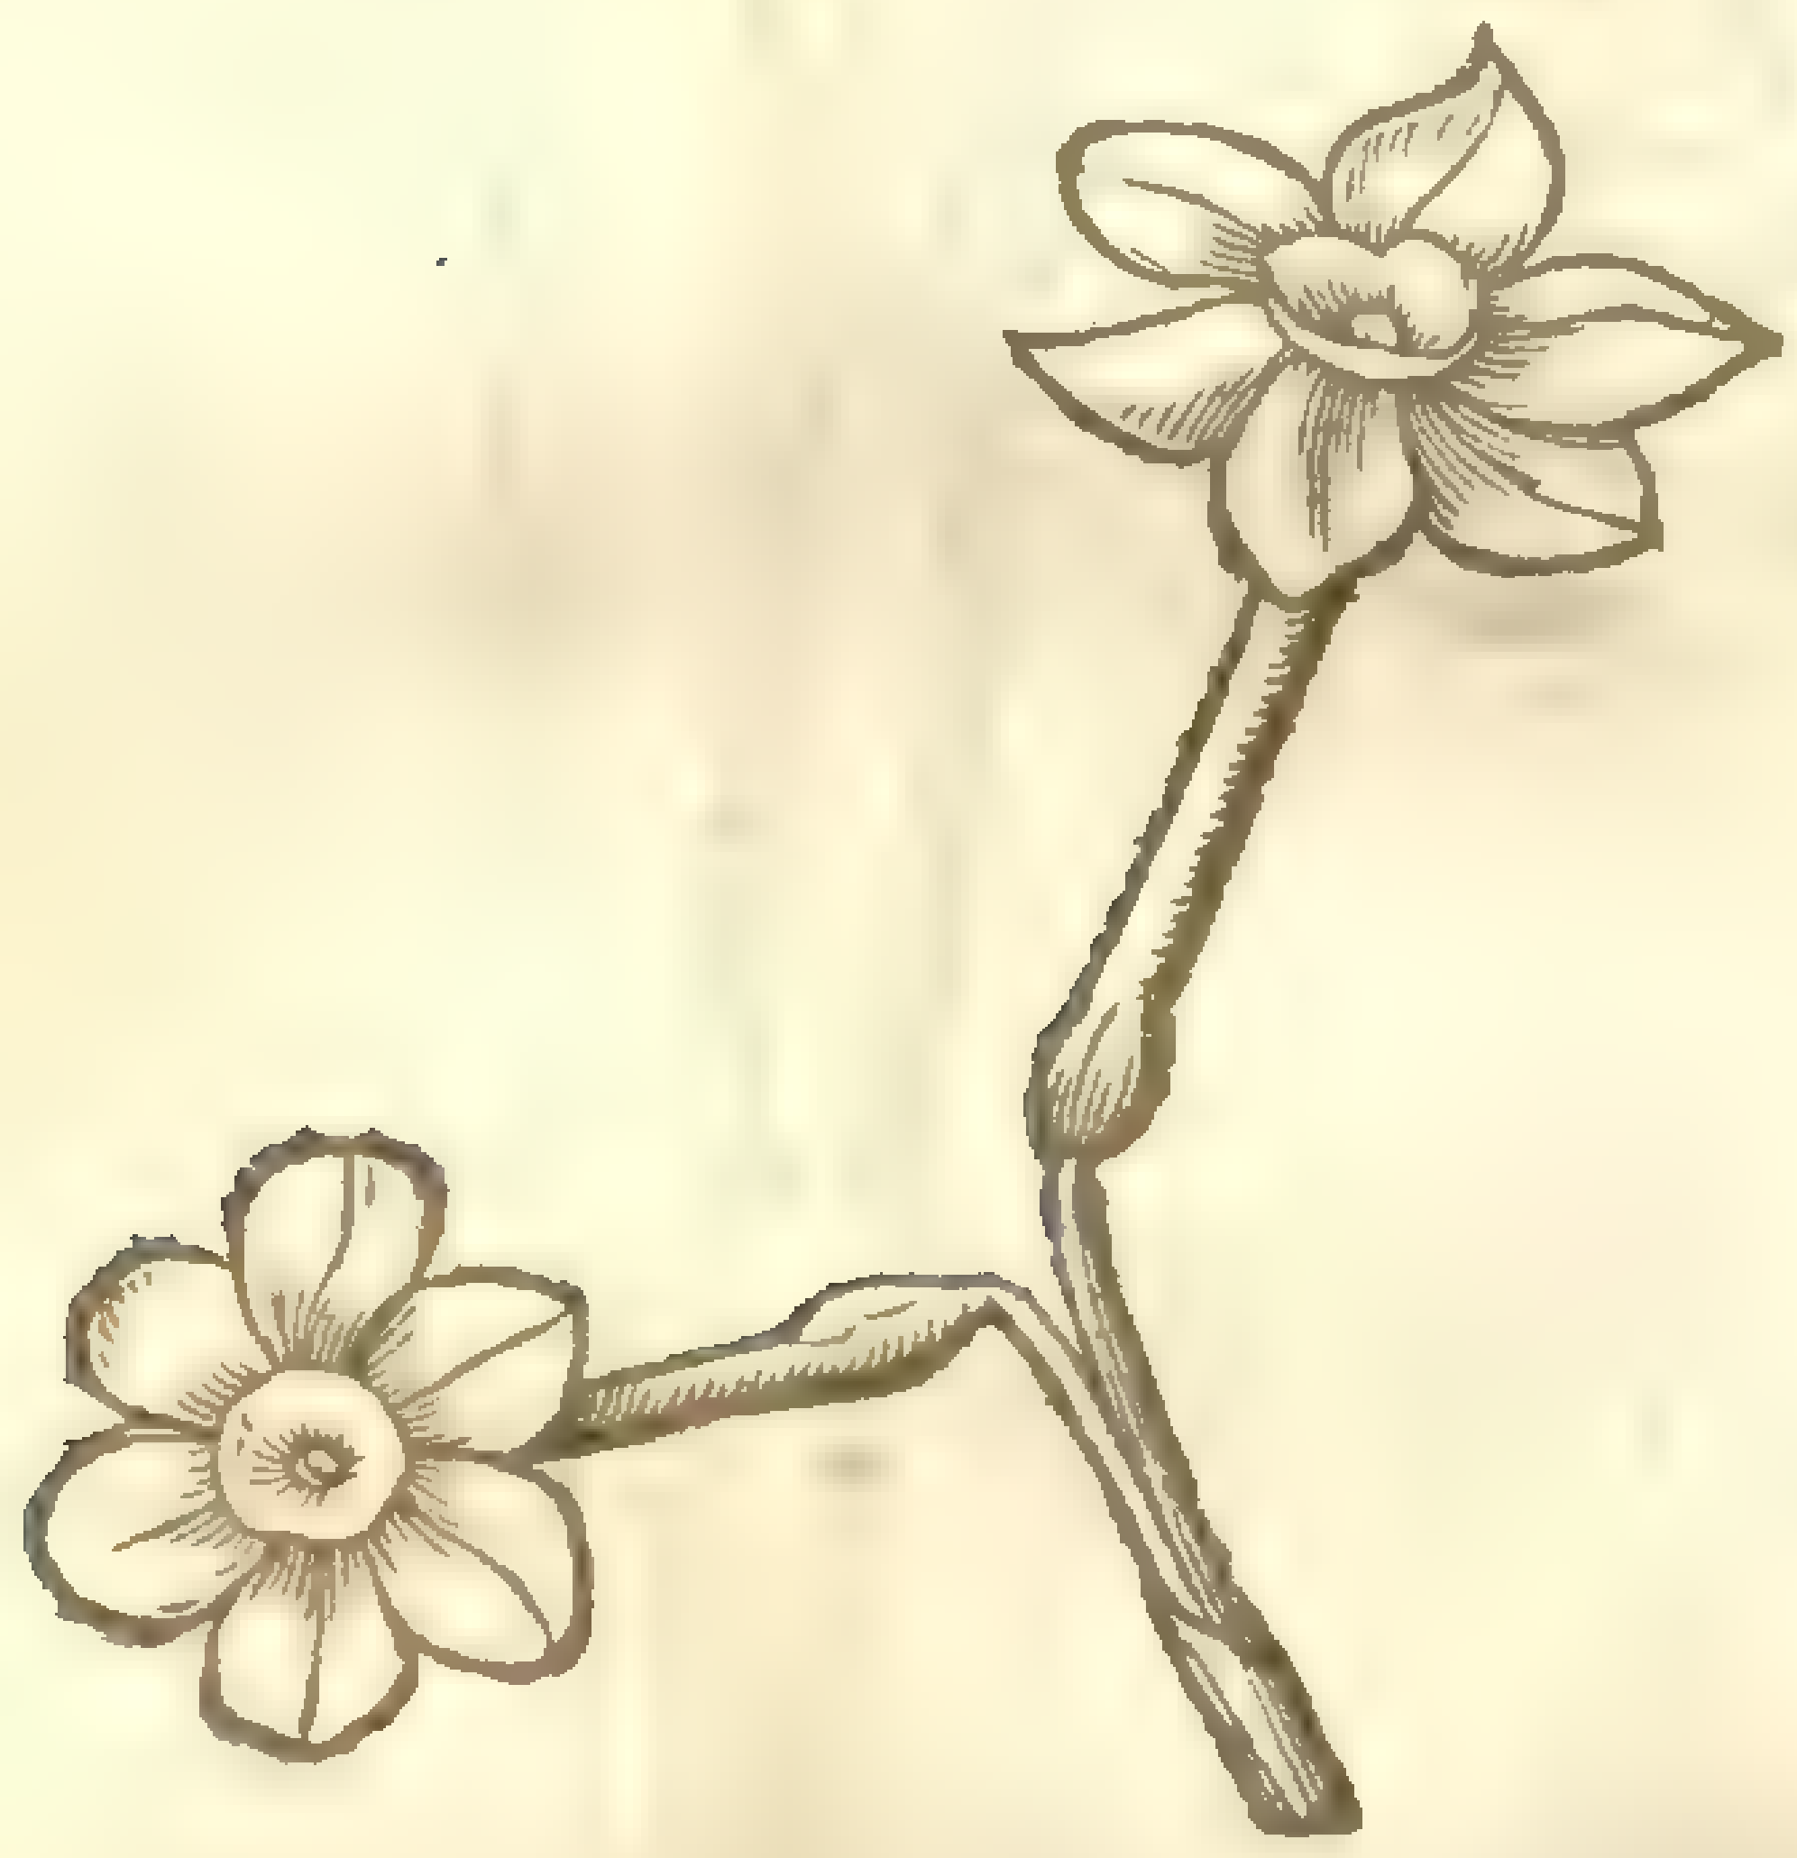
precedent;

precedent ; but the floures are compoſed of ſix large white out-leaues ; but the middle is filled with many faire yellow little leaues,much like to the double yellow wall-floure. They ſmel ſweet like as the laſt mentioned.

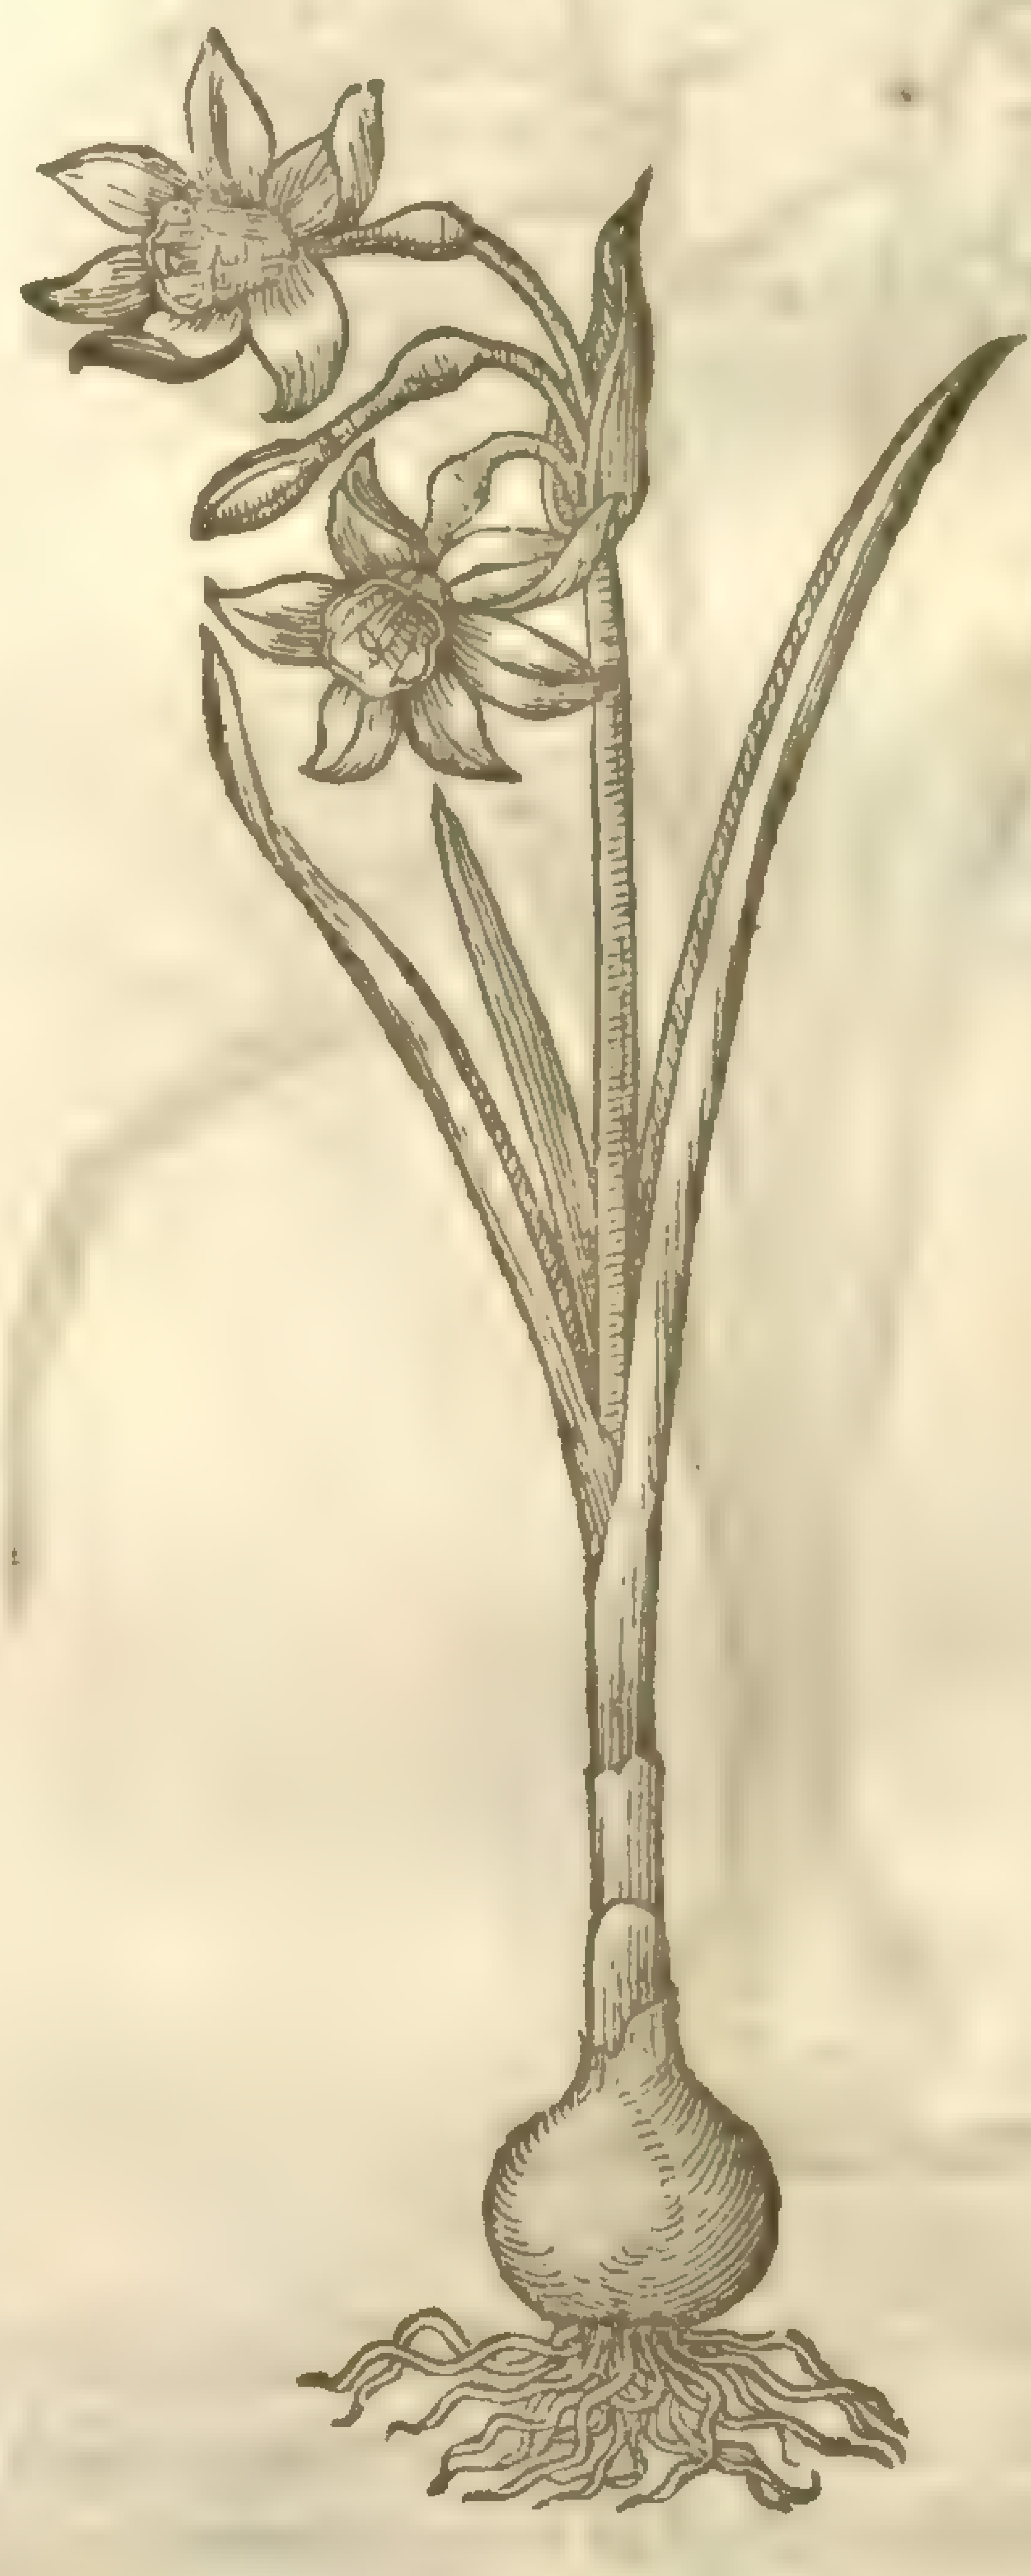
13 This differs from the laſt mentioned only in that it is leſſe,& that the middle of the floure within the yellow cup is filled with longiſh narrow little leaues as it were croſſing each other. Their colour is white,but mixed with ſome greene on the out ſide,and yellow on the in ſide. ‡

14 The milke white Daffodill differeth not from the common white Daffodill, or Primroſe Peerleſſe,in leaues,ſtalks,roots,or floures,ſauing that the floures of this plant haue no other colour but white,whereas all the others are mixed with one colour or other.

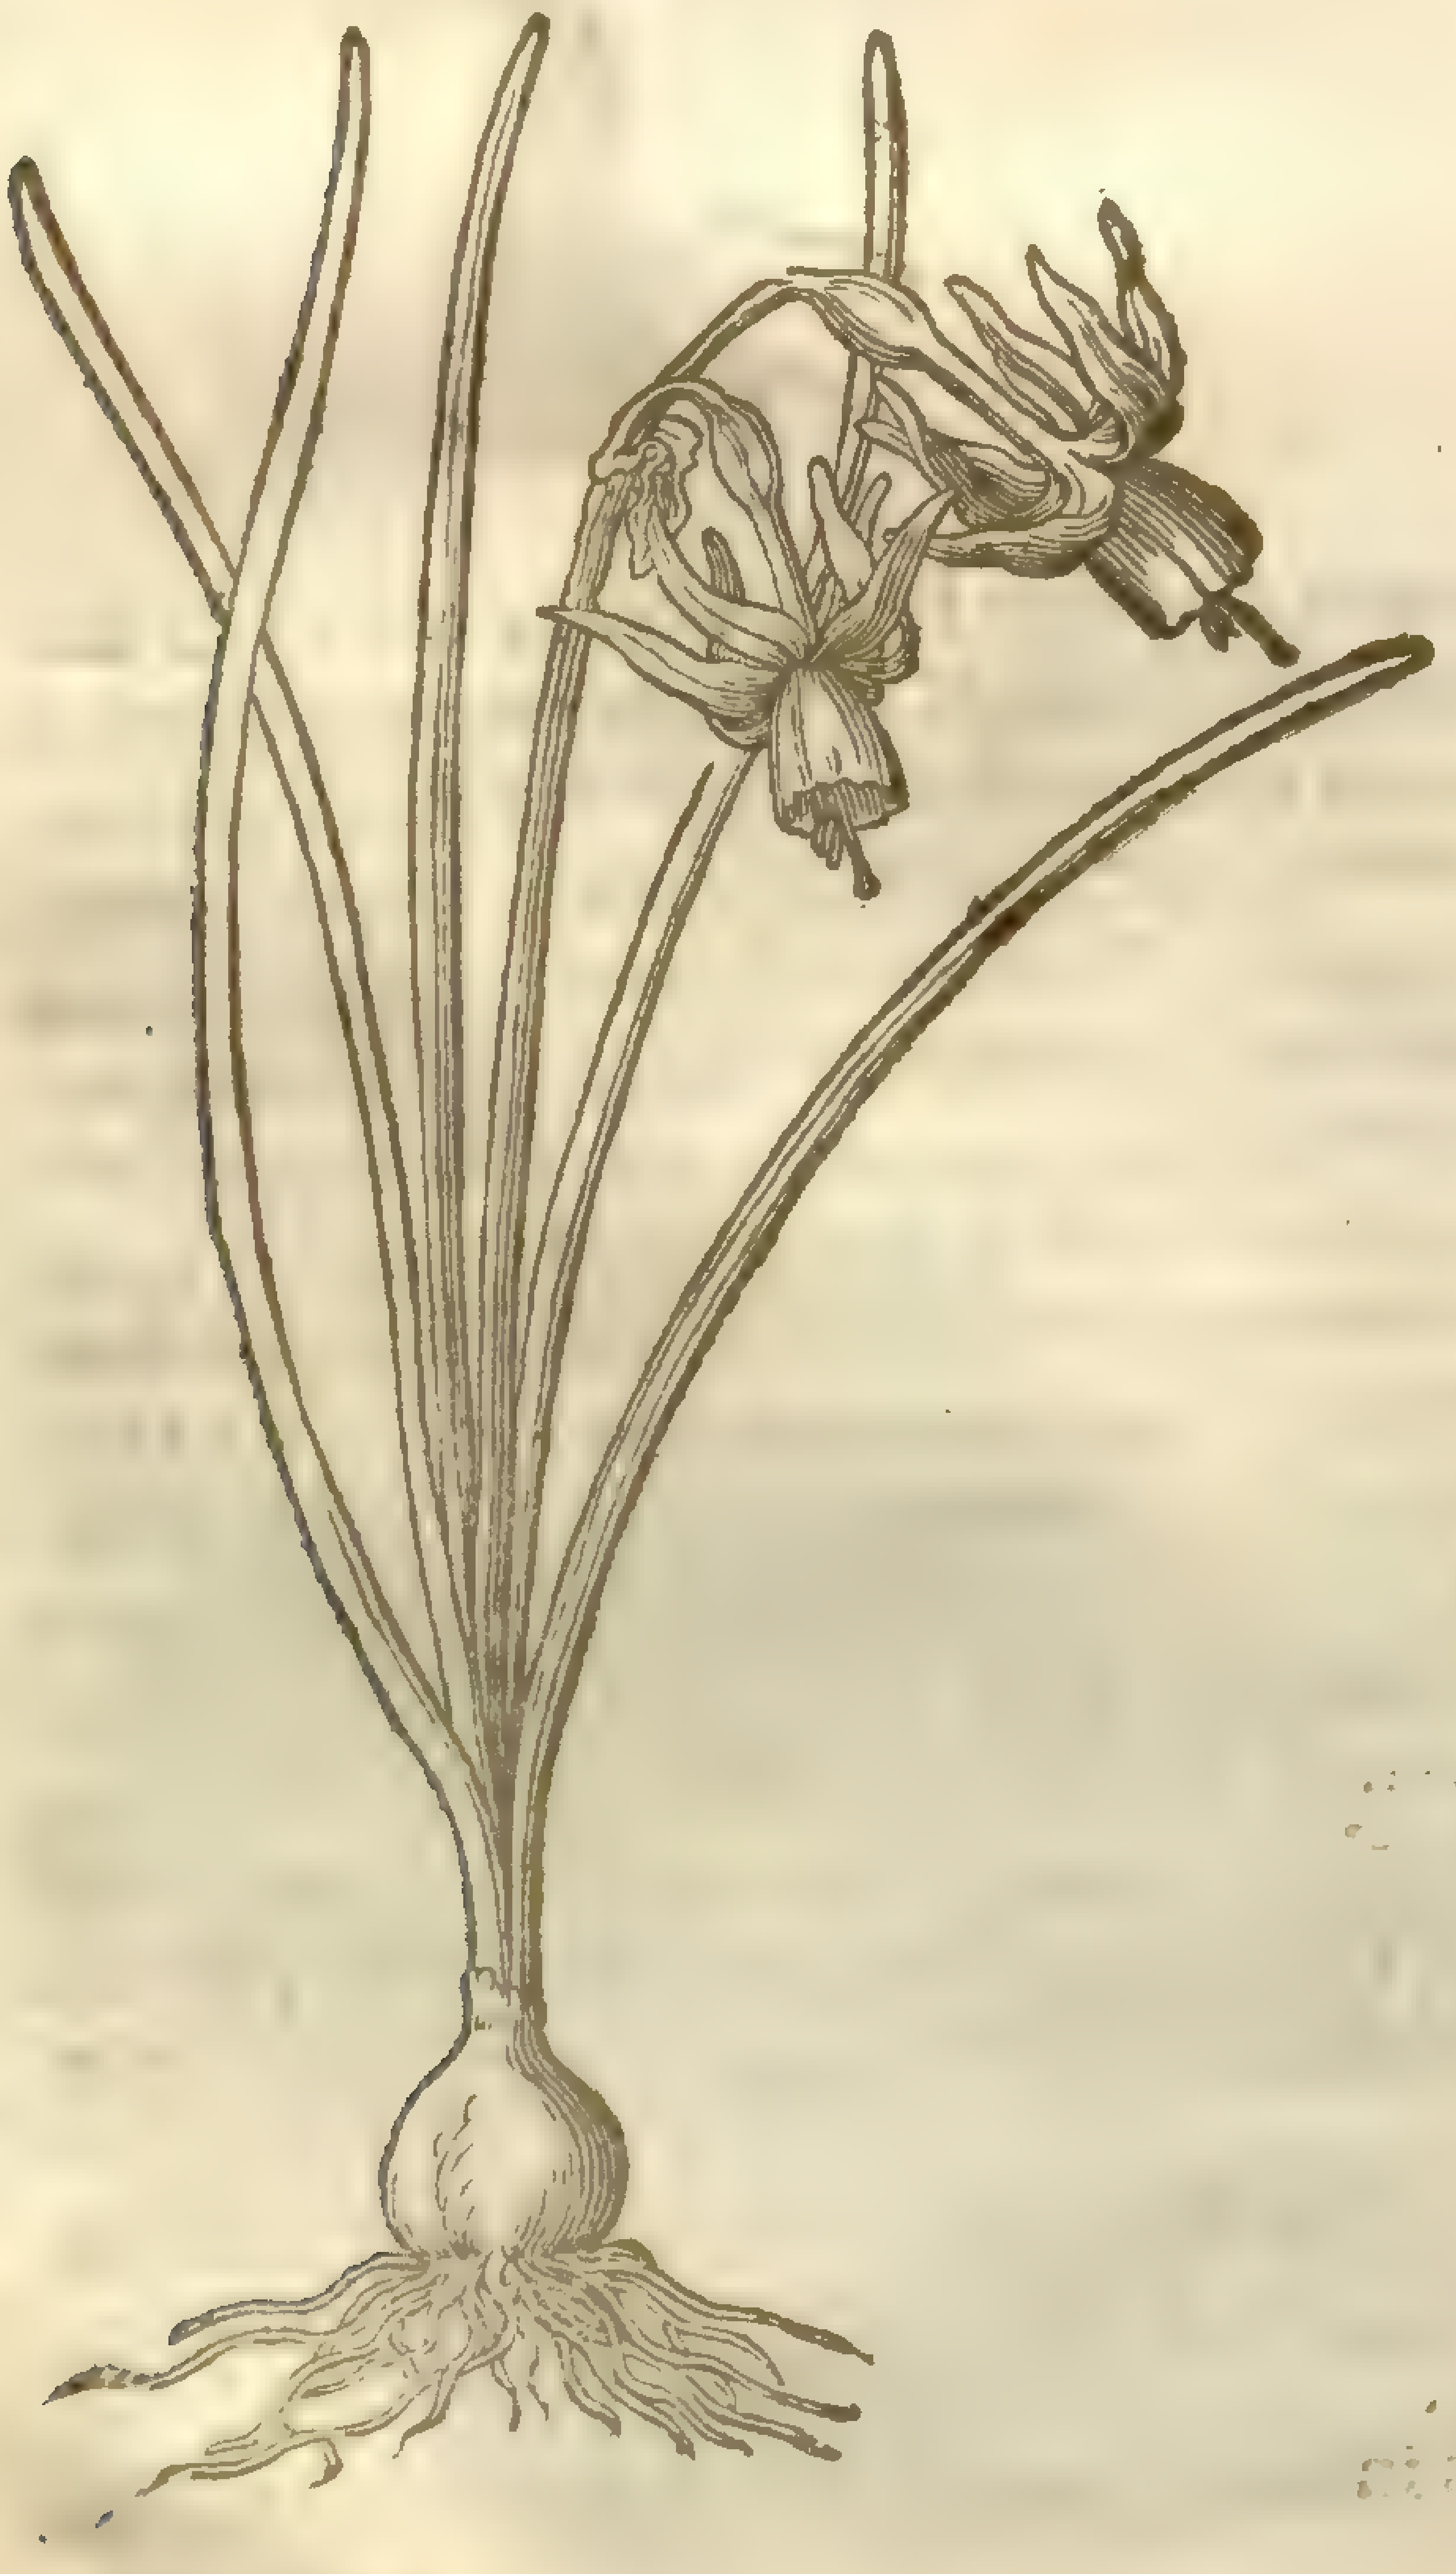
‡ 17 *Narciſſus juncifolius Roſcoluteus.*
Roſe or round floured *Iunquilia.*



‡ 18 *Narciſſus juncifolius amplo calice.*
White *Iunquilia* with the large cup.



‡ 19 *Narciſſus juncifolius reflexus flore albo.*
The white reflex *Iunquilia.*



15 The Ruſh daffodill hath long narrow & thick leaues very ſmooth and flexible , almoſt round like Ruſhes, whereof it tooke his ſyrname *Iuncifolius* , or Ruſhy. It ſpringeth vp in the beginning of Ianuarie, at which time alſo the floures ſhoot forth their buds at the top of ſmall ruſhy ſtalks, ſometimes two, and often more vpon one ſtalke,made of ſix ſmall yellow leaues. The cup or crowne in the middle is likewiſe yellow,in ſhape reſembling the other Daffodils, but ſmaller,and of a ſtrong ſweet ſmell. The root is bulbed,white within,and couered with a blacke skin or filme.

16 This Ruſh Daffodill is like vnto the precedent in each reſpect,ſauing that it is altogether leſſe, and longer before it come to flouring. There is alſo a white floured one of this kinde.

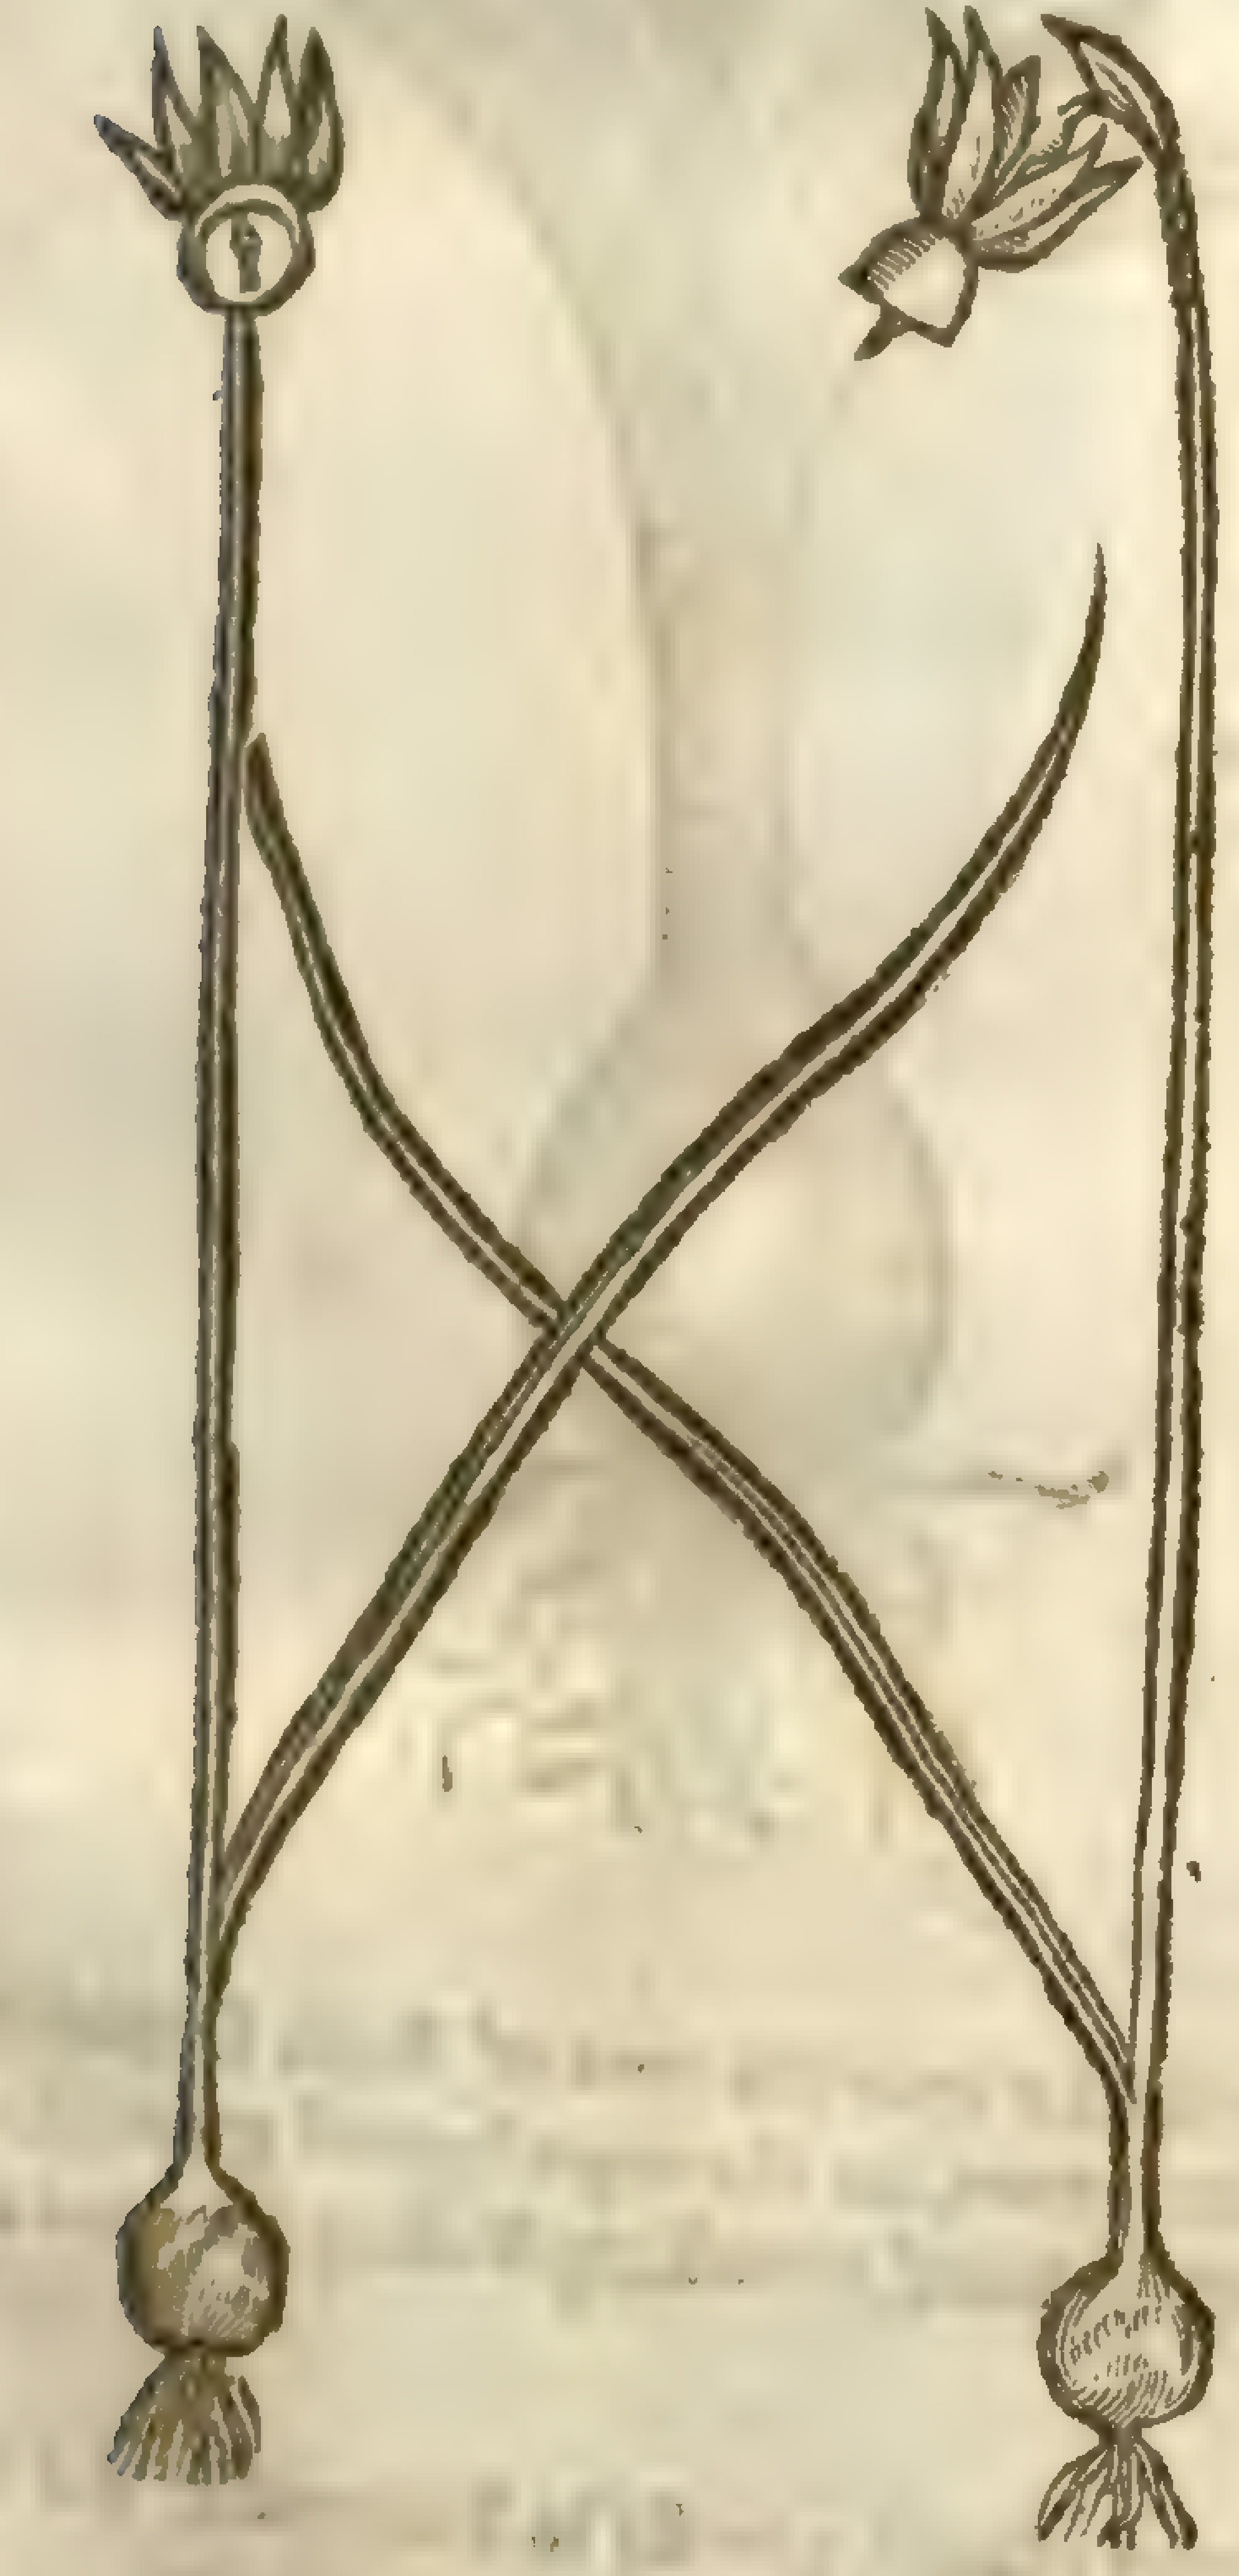
‡ 17 There is alſo another Ruſh Daffodill or *Iunquilia*, with floures not ſharpe pointed, but round, with a little cup in the middle: The colour is yellow, or elſe white. This is *Lobels Narciſſus juncifolius flore rotundæ circinitatis roſeo.*

18 There is alſo another *Iunquilia*, whoſe leaues and ſtalks are like thoſe of the firſt deſcribed Ruſhy Daffodill, but the cup in the midſt of the floure is much larger. The colour of the floure is commonly white. *Cluſius* calls this, *Narciſſus 1 juncifolius amplo calice.*

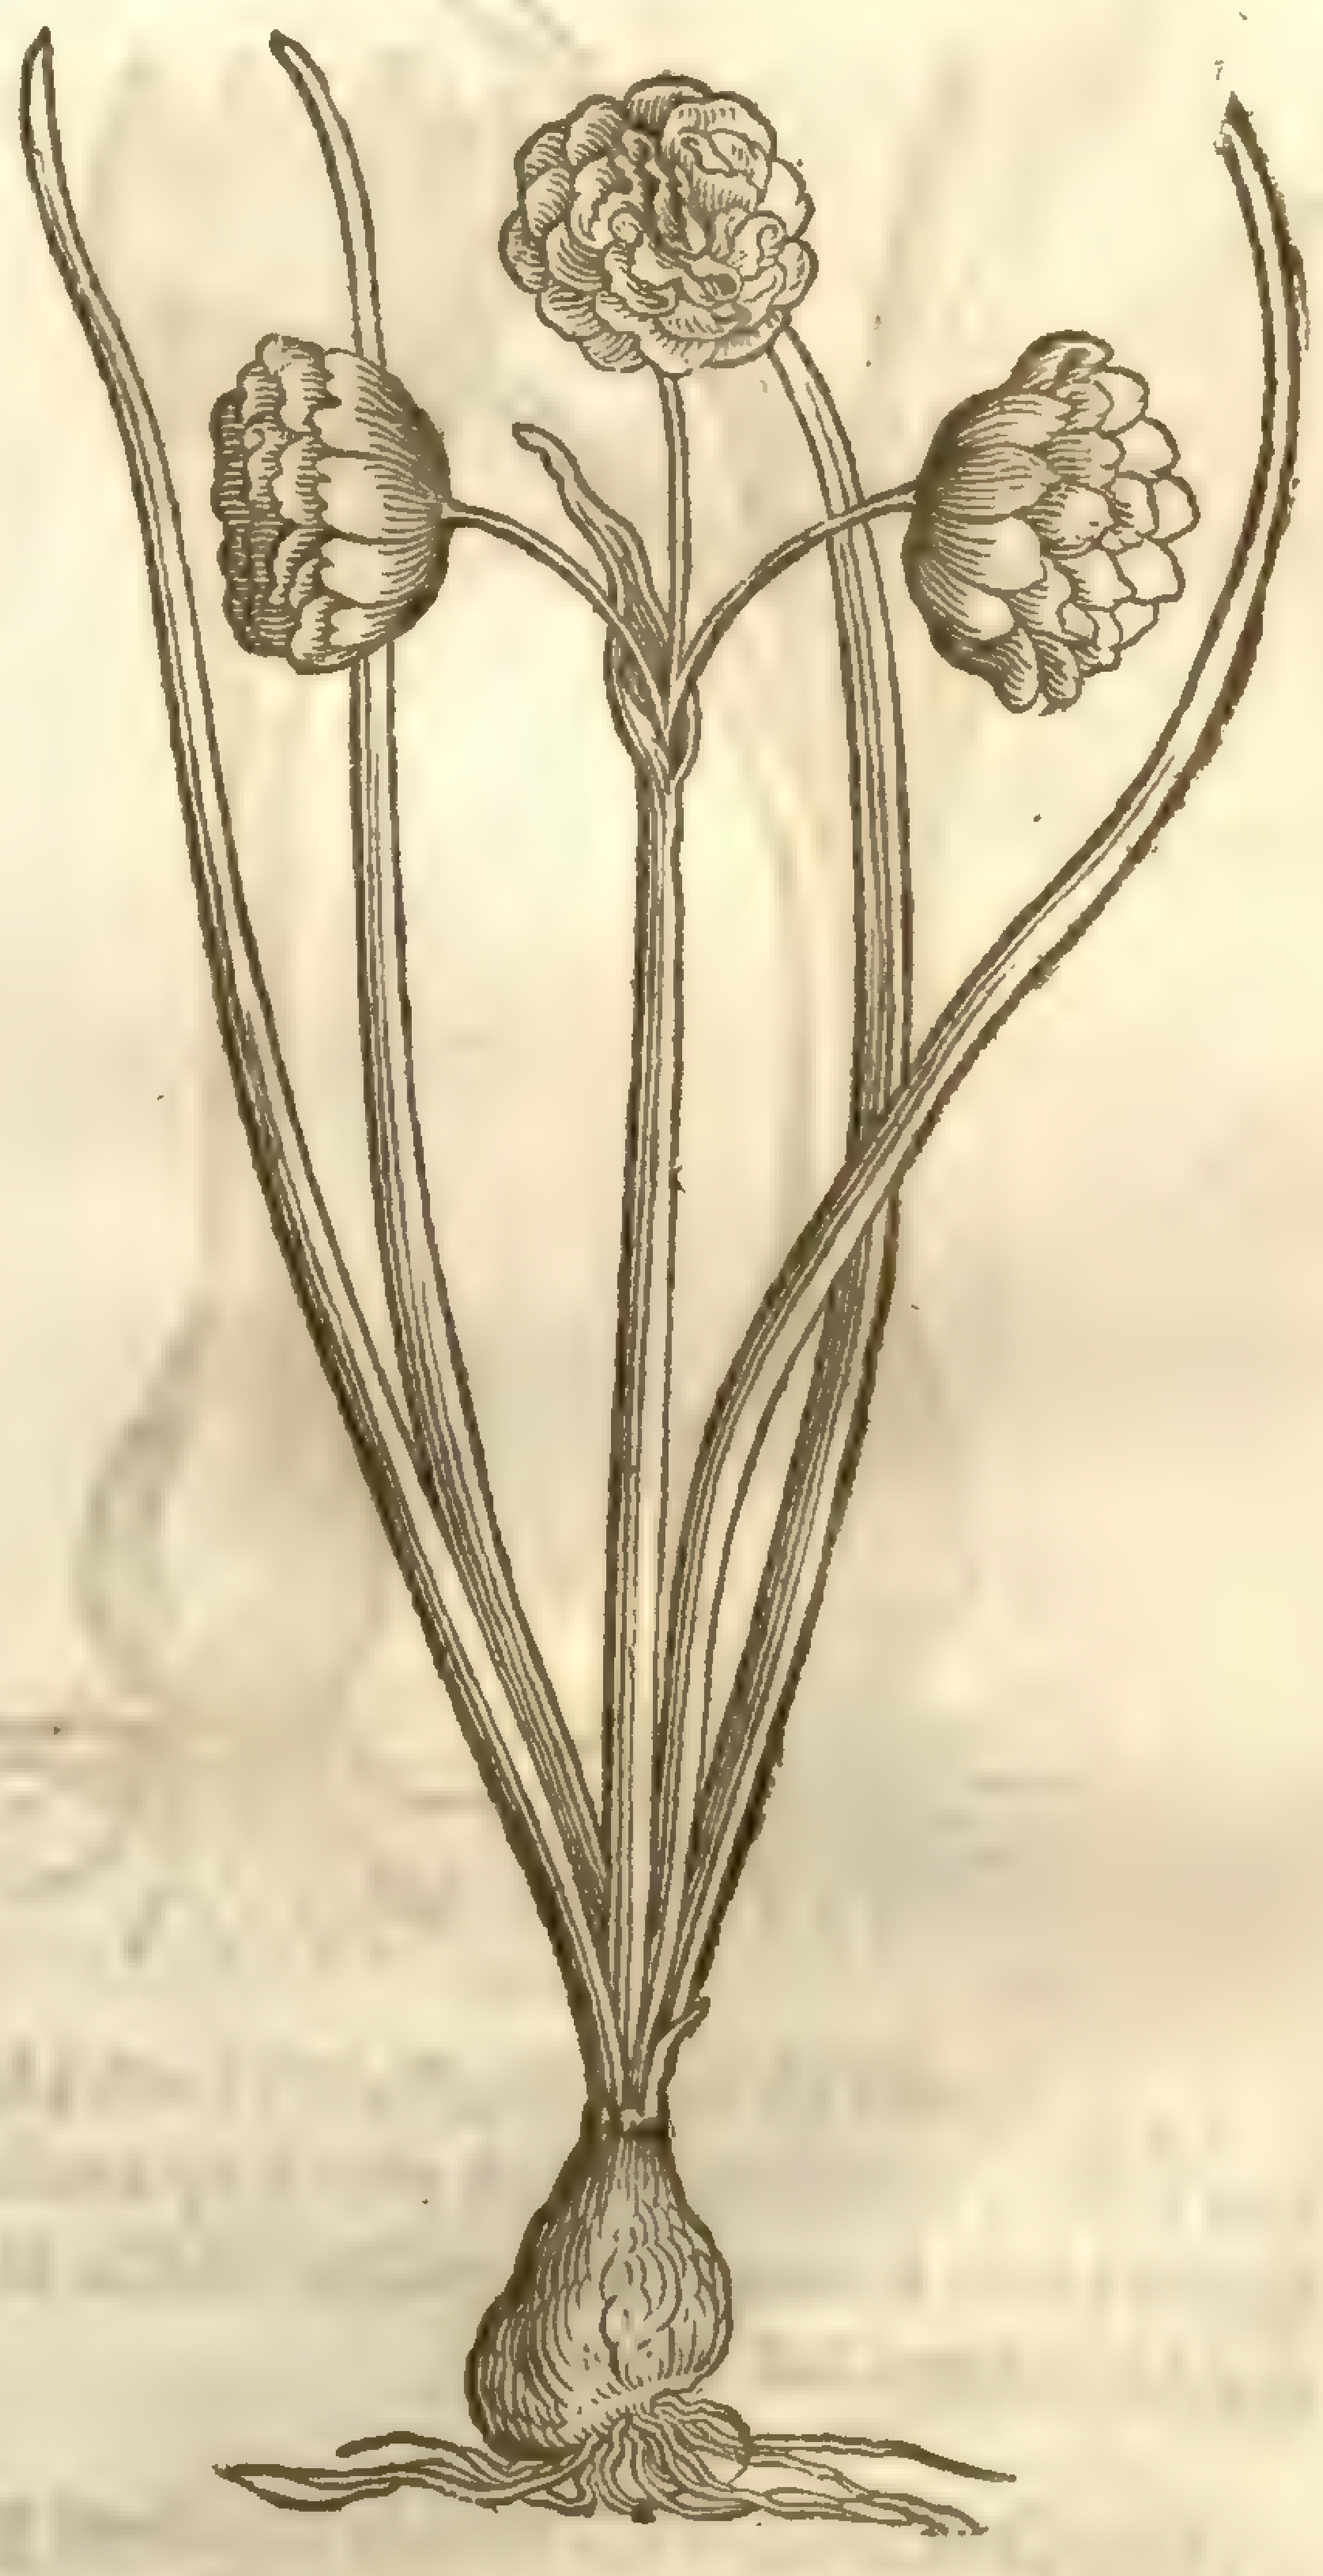
19 There are three or foure reflex *Iunquilia's*, whoſe cups hang downe, and the ſix incompaſſing leaues turne vp or backe, whence they take their names. The floures of the firſt are yellow; thoſe of the ſecond all white, the cup of the third is yellow, and the reflex leaues white. The fourth hath a white cup, and yellow reflex floures. This ſeemes to be *Lobels Narciſſus montanus minimus coronatus.*

20 This is like to the ordinary leſſer *Iunquilia*, but that the floures are very double, conſiſting of many long and large leaues mixed together; the ſhorter leaues are obtuſe, as if they were clipt off. They are wholly yellow.

‡ 19 *Narciſſus juncifolius reflexus minor.*
The leſſer reflex *Iunquilia.*



‡ 20 *Narciſſus juncifolius multiplex.*
The double *Iunquilia.*



21 The Perſian Daffodill hath no ſtalke at all but onely a ſmall and tender foot-ſtalke of an inch high, ſuch as the Saffron floure hath: vpon which ſhort and tender ſtalk doth ſtand a yellowiſh floure conſiſting of ſix ſmall leaues, of which the three innermoſt are ſomwhat narrower than thoſe on the outſide. In the middle of the floure doth grow forth a long ſtile or pointall, ſet about with many ſmall chiues or threds. The whole floure is of an vnpleaſant ſmell much like to Poppy: the leaues riſe vp a little before the floure, long, ſmooth, & ſhining: the root is bulbed, thick and groſſe, blackiſh on the out ſide, and pale within, with ſome threds hanging at the lower part.

22 The Autumne Daffodill bringeth forth long ſmooth glittering leaues of a deep green colour, among which riſeth vp a ſhort ſtalke bearing at the top one floure and no more, reſembling the floure of Mead Saffron or common Saffron, conſiſting of ſix leaues of a bright ſhining yellow colour; in the middle whereof ſtand ſix threds or chiues, and alſo a peſtel or clapper yellow likewiſe. The root is thicke and groſſe like vnto the precedent.

‡ 23 To this laſt may be adioyned another which in ſhape ſomewhat reſembles it. The

leaues are ſmooth, green, growing ſtraight vp, and almoſt a fingers bredth; among which riſeth vp a ſtalke a little more than halfe a foot in height, at the top of which groweth forth a yellow floure not much vnlike that of the laſt deſcribed Autumne Narciſſe: it conſiſts of ſix leaues ſome inch and halfe in length, and ſome halfe inch broad, ſharpe pointed, the three inner leaues being ſomewhat longer than the outer. There grow forth out of the midſt of the floure three whitiſh chiue tipt with yellow, and a peſtell in the midſt of them longer than any of them. The root conſiſts of many coats, with fibres comming forth of the bottome thereof like others of this kinde. It floures in Februarie. ‡

21 *Narciſſus Perſicus.*
The Perſian Daffodill.

22 *Narciſſus Autumnalis major.*
The great Winter Daffodill.

24 Small Winter Daffodill hath a bulbous root much like vnto the root of Ruſh Daffodill, but leſſer; from the which riſeth vp a naked ſtalke without leaues, on the top whereof groweth a ſmall white floure with a yellow circle in the middle, ſweet in ſmell, ſomthing ſtuffing the head as do the other Daffodils.

¶ *The Place.*

The Daffodils with purple coronets grow wilde in ſundry places, chiefly in Burgondie, and in Suitzerland in medowes.

The Ruſh Daffodill groweth wilde in ſundry places of Spaine, among graſſe and other herbes. *Dioſcorides* ſaith that they be eſpecially found vpon mountains. *Theocritus* affirmeth the Daffodils to grow in medowes, in his 19 Eidyl, or 20 according to ſome editions: where he writeth, That the faire Lady *Europa* entring with her Nymphs into the medowes, did gather the ſweet ſmelling daffodils; in theſe verſes:

Αἱδ', ἐπεὶ ὦν, &c.

Which we may Engliſh thus:

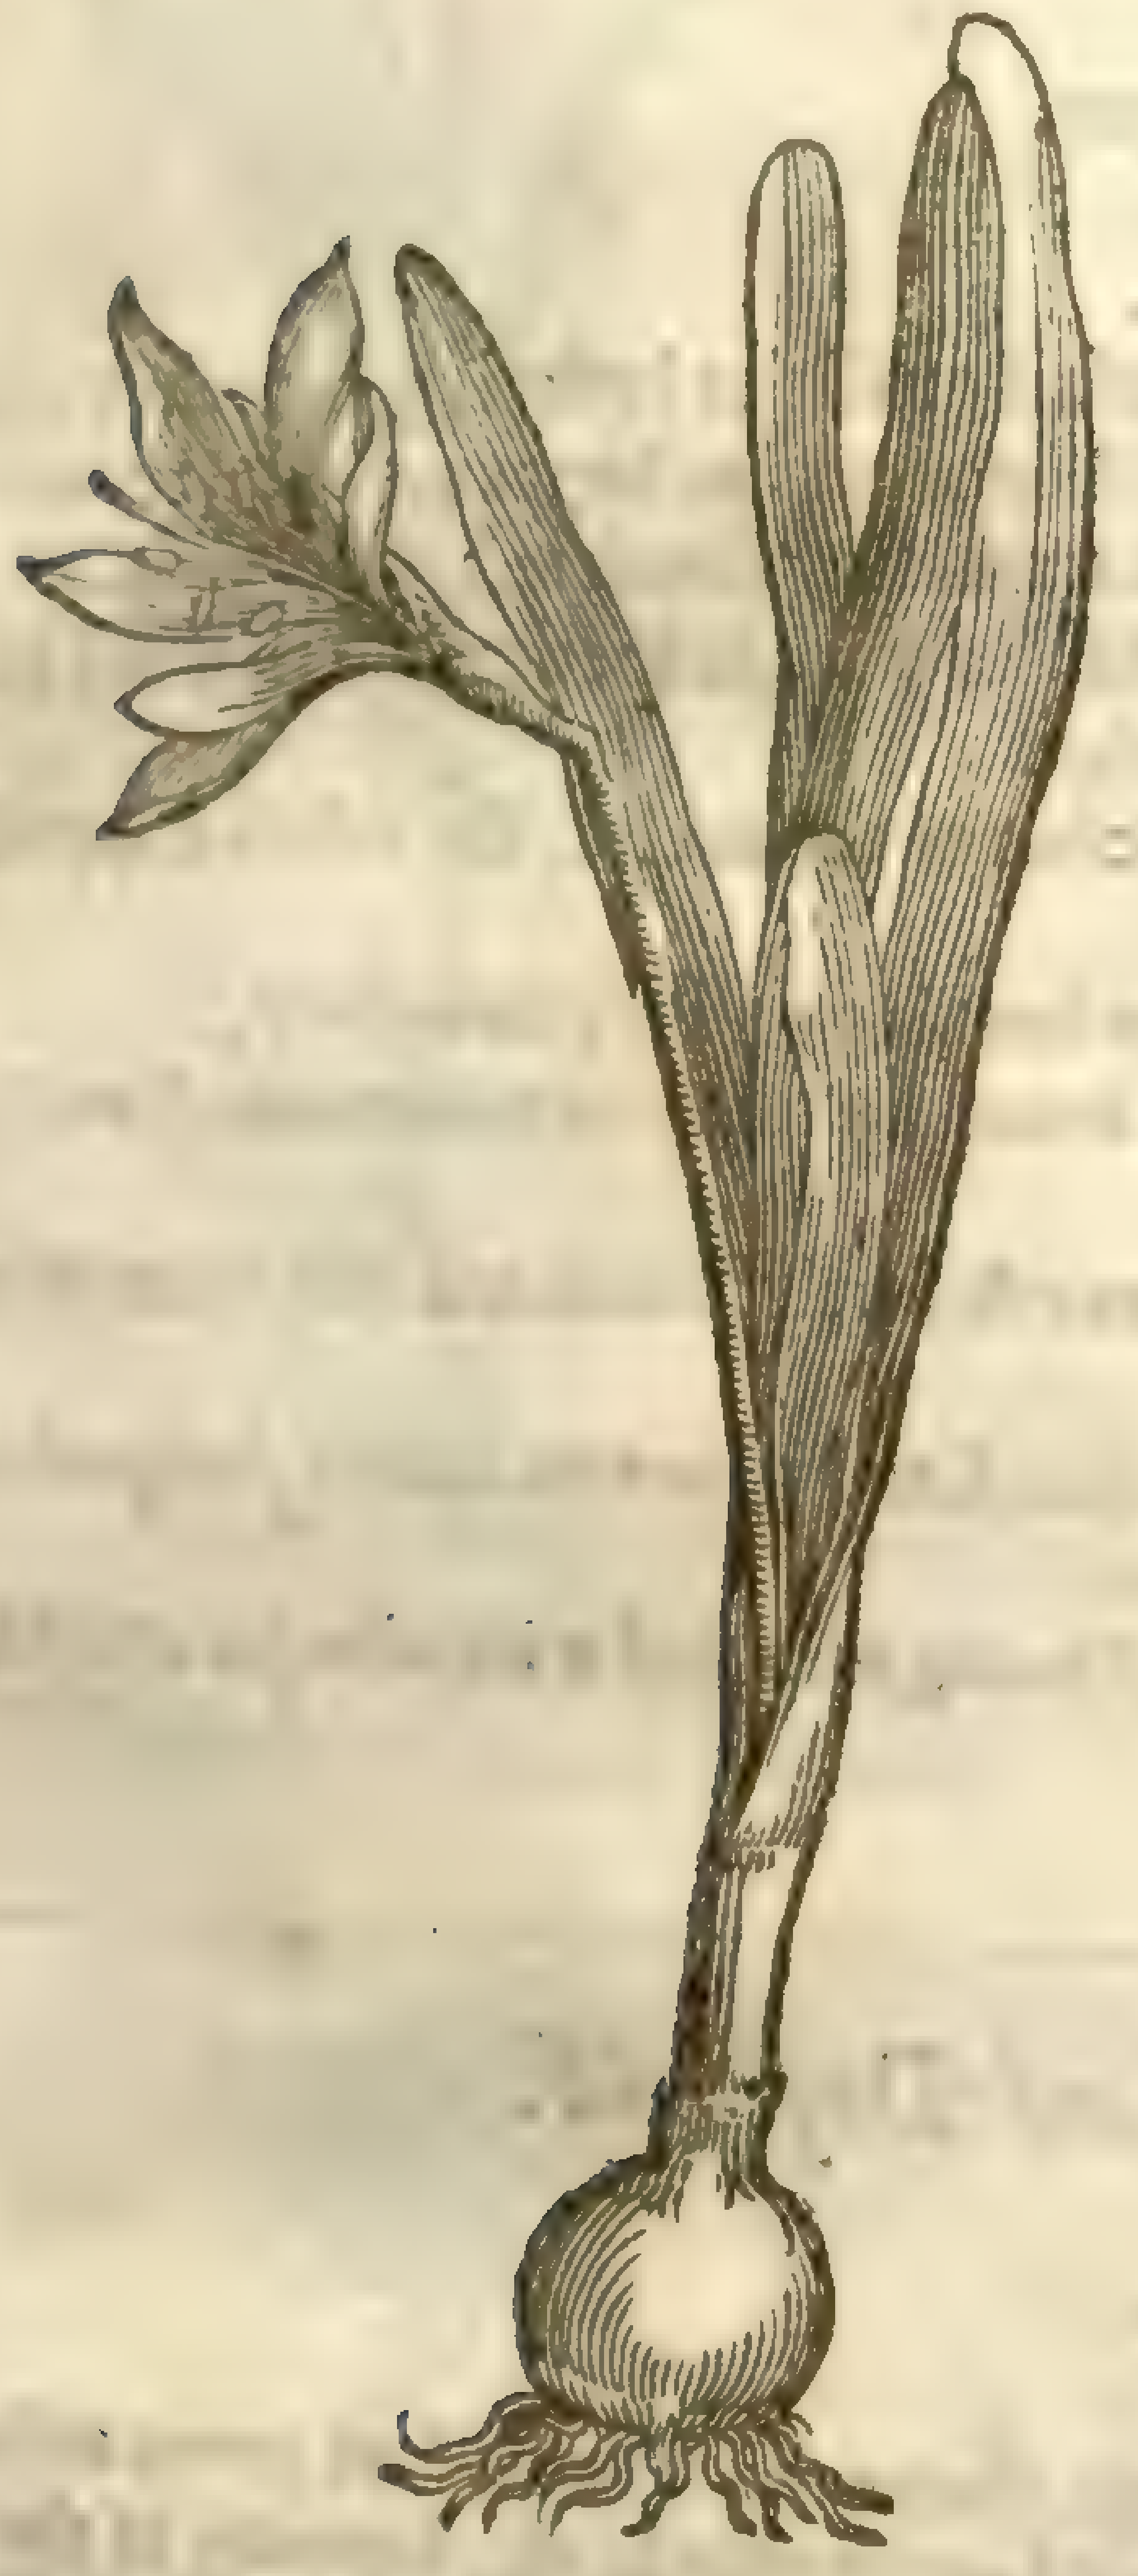
But when the Girles were come into
The medowes flouring all in ſight,
That Wench with theſe, this Wench with thoſe
Trim floures, themſelues did all delight:
She with the Narciſſe good in ſent,
And ſhe with Hyacinths content.

But it is not greatly to our purpoſe, particularly to ſeeke out their places of growing wilde, ſeeing we haue them all & euerie one of them in our London gardens, in great aboundance. The common wilde Daffodill groweth wilde in fields and ſides of woods in the Weſt parts of England.

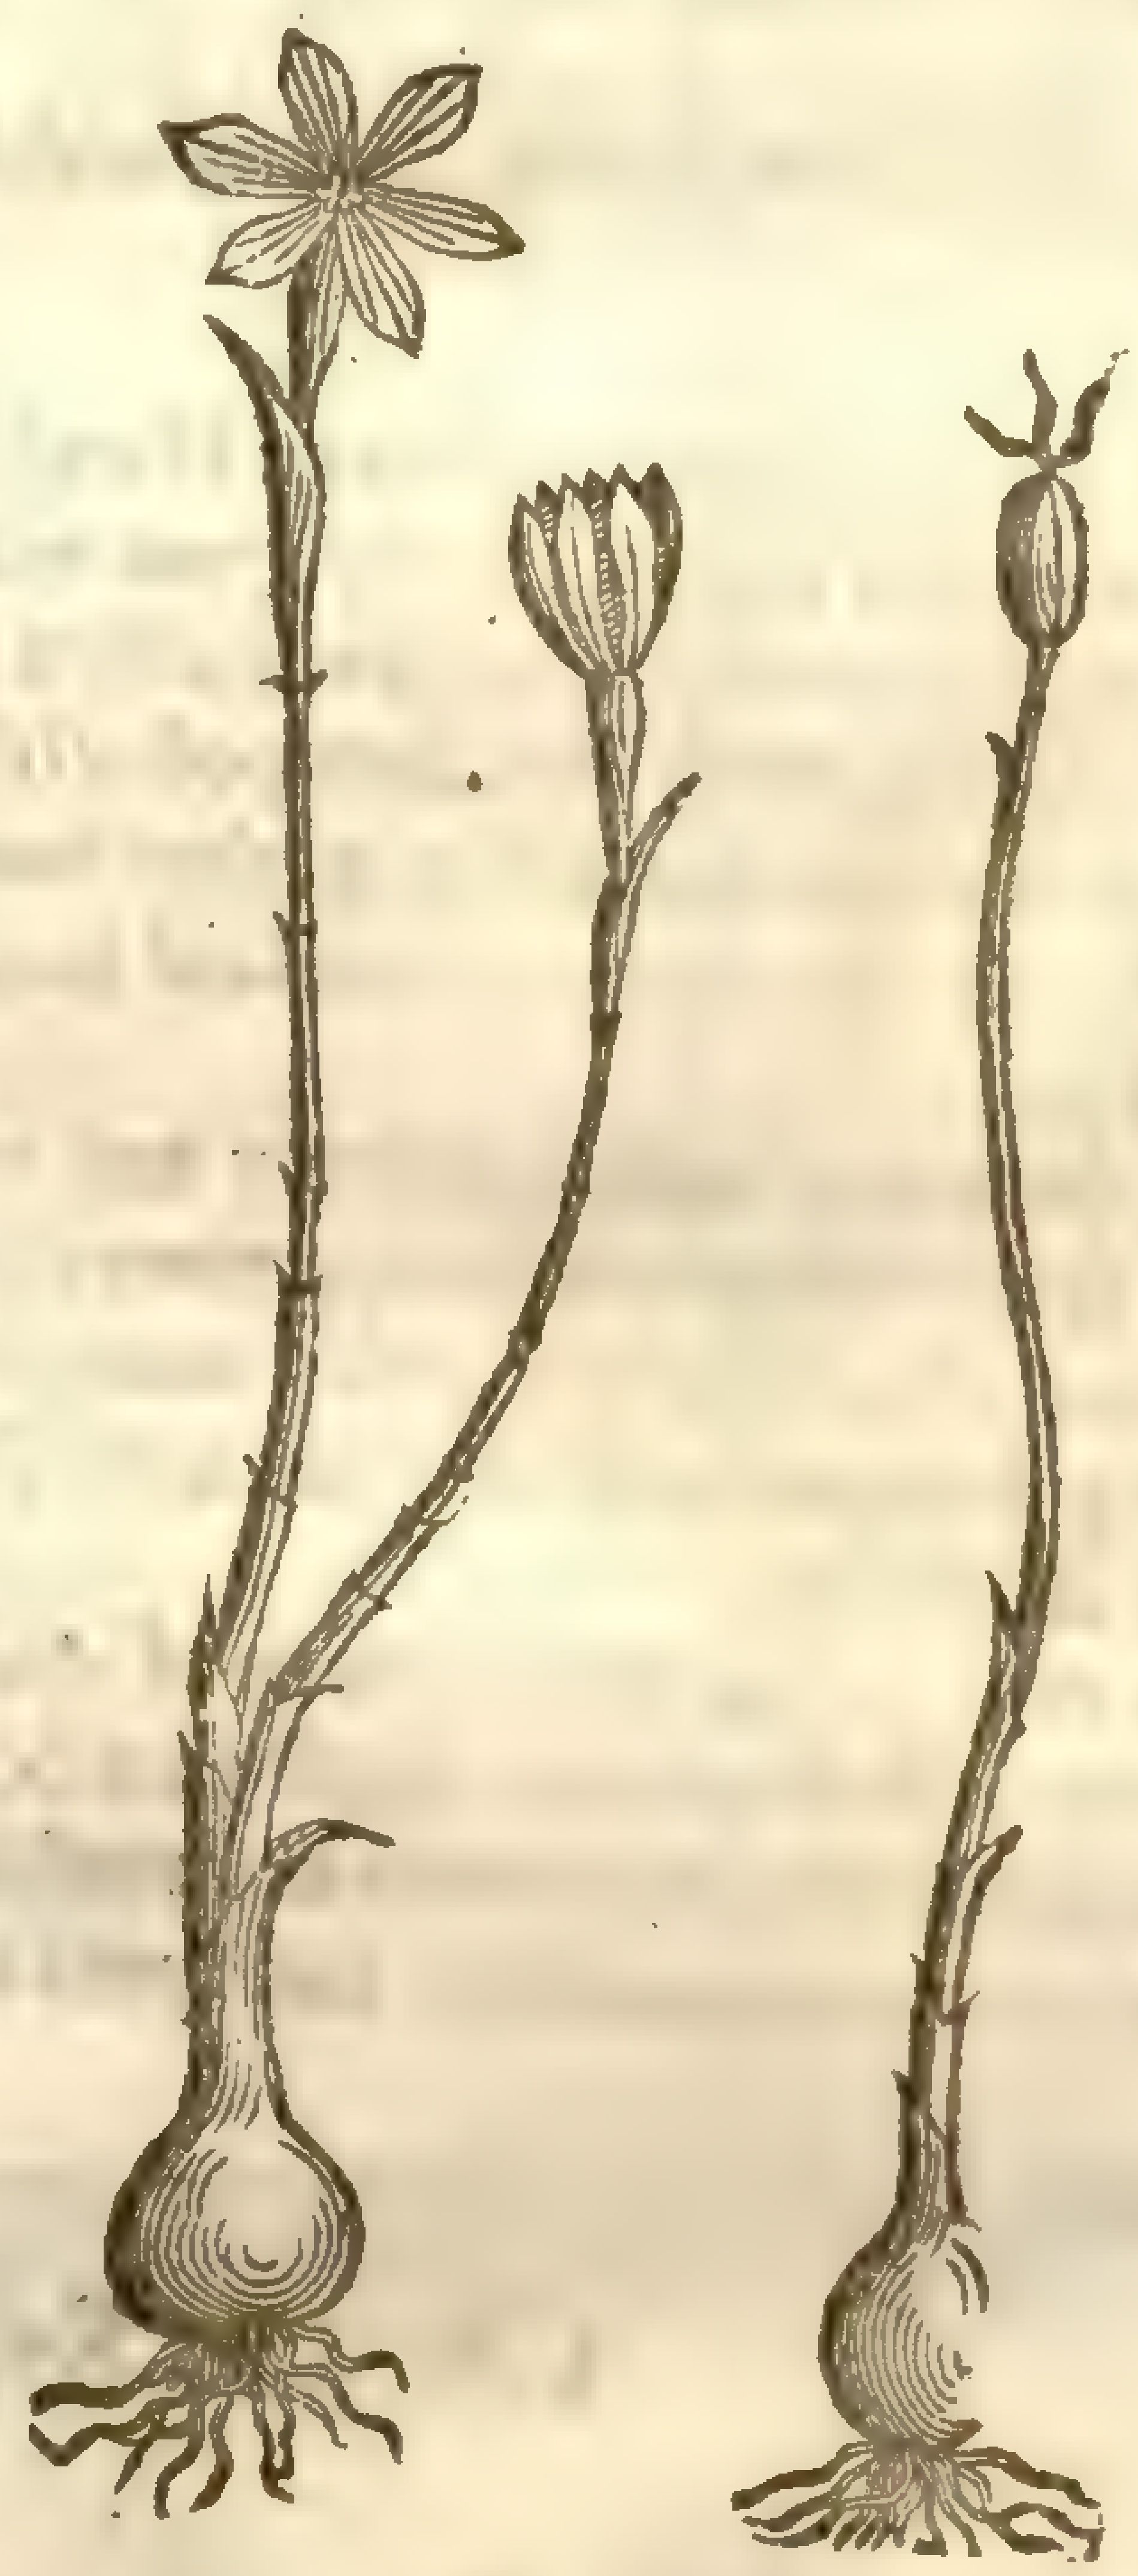
¶ *The Time.*

They floure for the moſt part in the Spring, that is, from the beginning of February vnto the end of Aprill.

The Perſian and Winter Daffodils do floure in September and October.



‡ 23 *Narciſſus vernus præcocior flavo flore.*
The timely Spring yellow Daffodill.



24 *Narciſſus Autumnalis minor.*
Small Winter Daffodill.

¶ *The Names.*

Although their names be ſet forth in their ſeuerall titles, which may ſerue for their appellations and diſtinctions; notwithſtanding it ſhall not be impertinent to adde a ſupply of names, as alſo the cauſe why they are ſo called.

The Perſian Daffodill is called in the Sclauonian or Turkiſh tongue, *Zaremcada Perſiana*, and *Zaremcatta*, as for the moſt part all other ſorts of Daffodils are. Notwithſtanding the double floured Daffodill they name *Giul catamer lale*: which name they generally giue vnto all double floures.

The common white Daffodil with the yellow circle they call *Serin Cade*, that is to ſay, the kings Chalice; and *Deue bohini*, which is to ſay, Camels necke, or as we do ſay of a thing with long ſpindle ſhinnes, Long ſhanks; vrging it from the long necke of the floure.

The Ruſh Daffodill is called of ſome *Iunquilias*, of the ſimilitude the leaues haue with Ruſhes: of *Dioſcoriaes*, *Bulbus Vomitorius*, or Vomiting Bulbe, according to *Dodonæus*.

Generally all the kindes are comprehended vnder this name *Narciſſus*, called of the Grecians Νάρκισσος: in Dutch, **Narciſſen**: in Spaniſh, *Iennetten*: in Engliſh, Daffodilly, Daffodowndilly, and Primroſe peereleſſe.

Sophocles nameth them the Garland of the infernall gods, becauſe they that are departed & dulled with death, ſhould worthily be crowned with a dulling floure.

Of the firſt and ſecond Daffodill *Ovid* hath made mention in the third booke of his *Metamor-*

phoſis, where hee deſcribeth the transformation of the faire boy *Narciſſus* into a floure of his owne name; ſaying,

Nuſquam corpus erat, croceum pro corpore florem
Inueniunt, folijs medium cingentibus albis.

But as for body none remain'd; in ſtead whereof they found
A yellow floure, with milke white leaues ingirting of it round.

Pliny and *Plutarch* affirme, as partly hath been touched before, that their narcoticke quality was the very cauſe of the name *Narciſſus*, that is, a qualitie cauſing ſleepineſſe; which in Greeke is Νάρκωσις: or of the fiſh Torpedo called Νάρκη, which benummes the hands of them that touch him, as being hurtfull to the ſinues, and bringeth dulneſſe to the head, which properly belongeth to the Narciſſes, whoſe ſmell cauſeth drowſineſſe.

¶ *The Nature.*

The roots of Narciſſus are hot and dry in the ſecond degree.

¶ *The Vertues.*

A *Galen* ſaith, That the roots of Narciſſus haue ſuch wonderfull qualities in drying, that they conſound and glew together very great wounds, yea and ſuch gaſhes or cuts as happen about the veins, ſinues, and tendons. They haue alſo a certaine clenſing and attracting facultie.

B The root of Narciſſus ſtamped with hony and applied plaiſter-wiſe, helpeth them that are burned with fire, and joineth together ſinues that are cut in ſunder.

C Being vſed in manner aforeſaid it helpeth the great wrenches of the ancles, the aches and pains of the joints.

D The ſame applied with hony and nettle ſeed helpeth Sun burning and the morphew.

E The ſame ſtamped with barrowes greaſe and leuen of rie bread, haſtneth to maturation hard impoſtumes which are not eaſily brought to ripeneſſe.

F Being ſtamped with the meale of Darnel and hony, it draweth forth thorns and ſtubs out of any part of the body.

G The root, by the experiment of *Apuleius*, ſtamped and ſtrained, and giuen in drinke, helpeth the cough and cholique, and thoſe that be entred into a ptiſicke.

H The roots whether eaten or drunken, do moue vomit, and being mingled with vineger and Nettle ſeed, take away lentiles and ſpots in the face.

CHAP. 85. *Of the baſtard Daffodill.*

¶ *The Deſcription.*

1 THe double yellow Daffodill hath ſmall ſmooth narrow leaues of a dark green colour; among which riſeth vp a naked hollow ſtalke of two hands high, bearing at the top a faire and beautifull yellow floure of a pleaſant ſweet ſmell: it ſheddeth his floure, but there followeth no ſeed at all, as it hapneth in many other double floures. The root is ſmall, bulbous or onion-faſhion like vnto the other Daffodils, but much ſmaller.

2 The common yellow Daffodill or Daffodowndilly is ſo well knowne to all, that it needeth no deſcription.

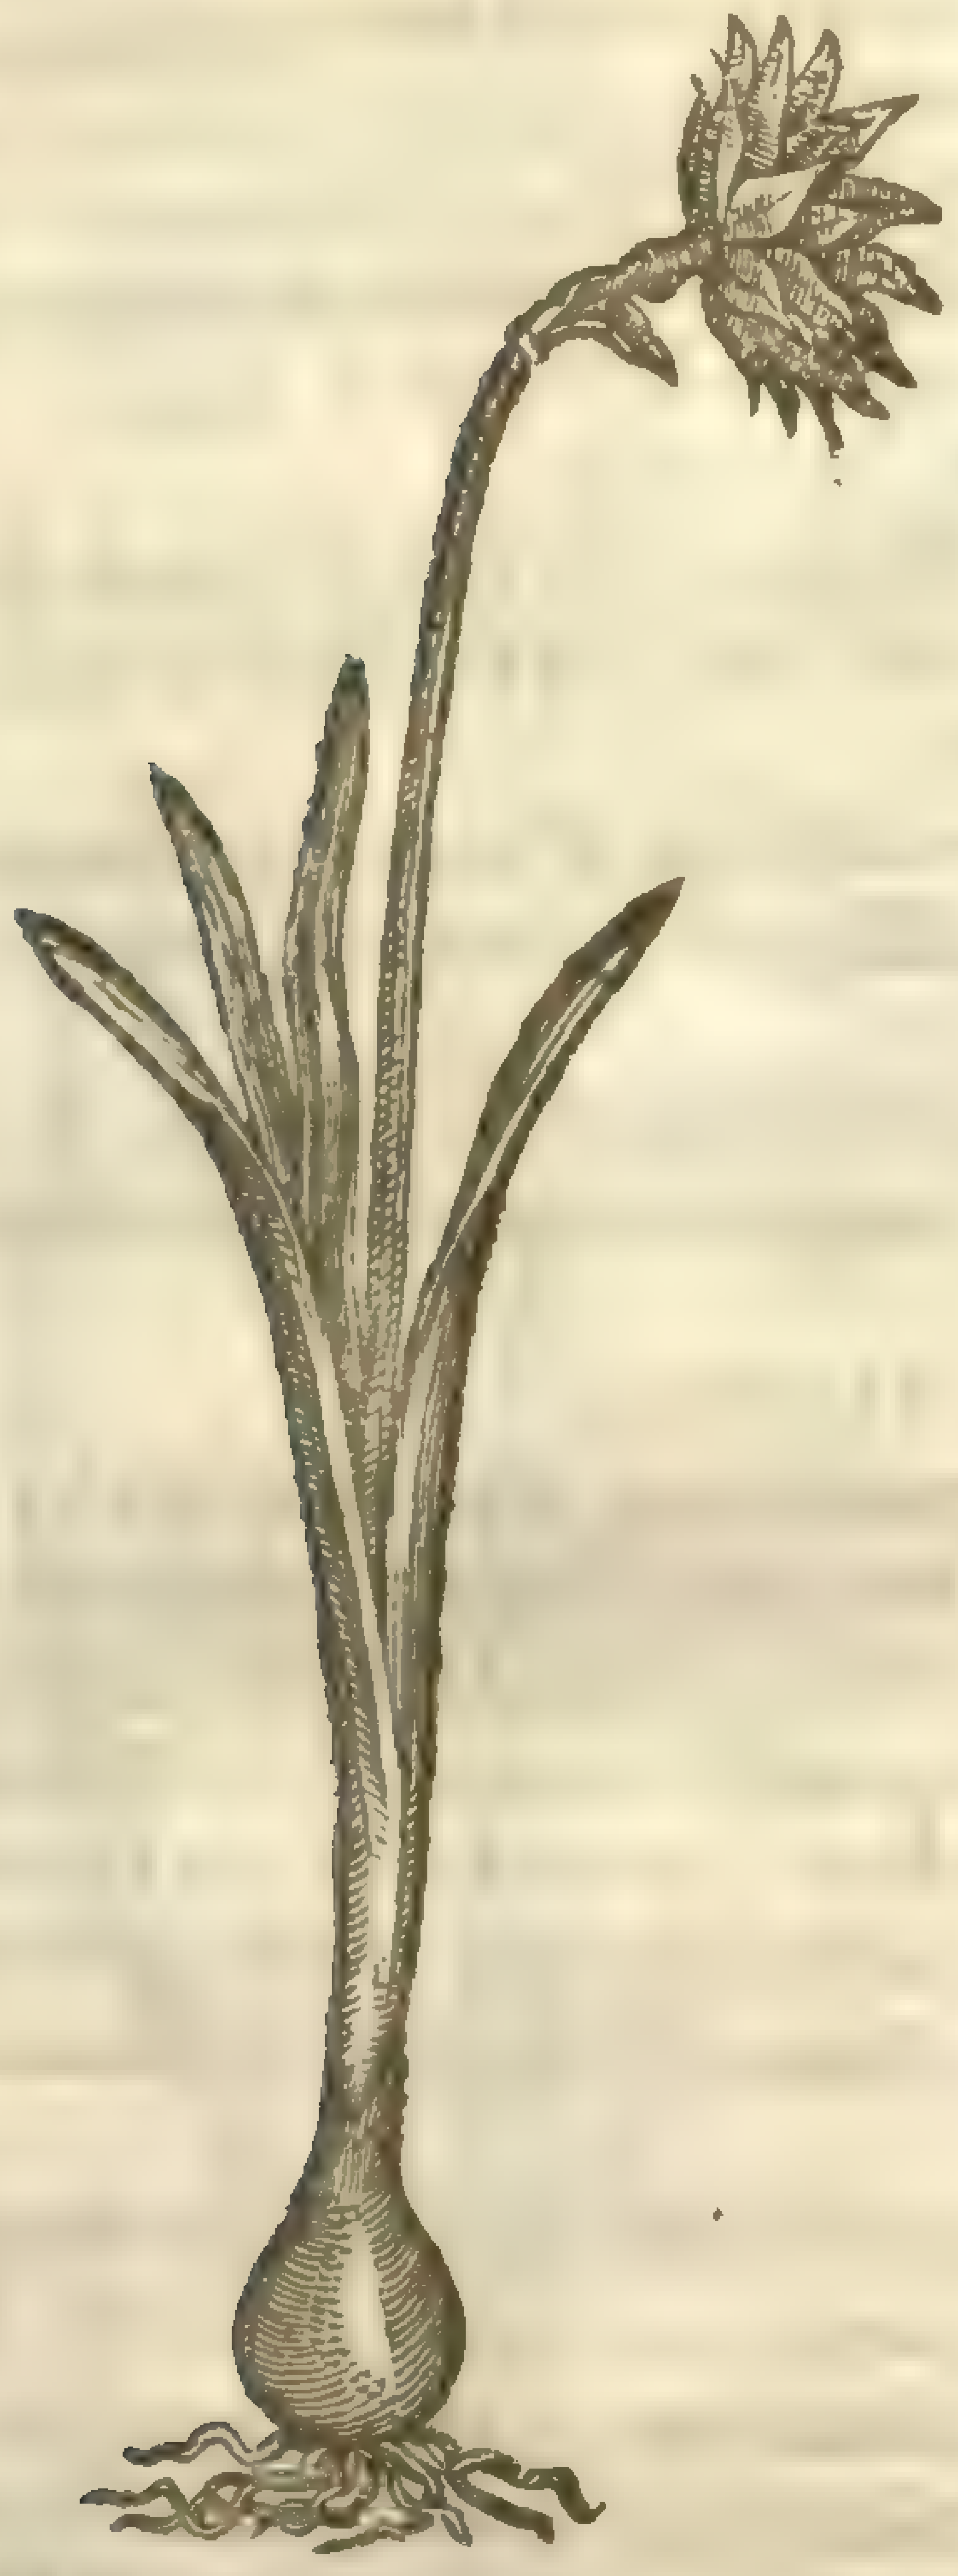
3 We haue in our London gardens another ſort of this common kind, which naturally groweth in Spaine, very like vnto our beſt knowne Daffodil in ſhape and proportion, but altogether fairer, greater, and laſteth longer before the floure doth fall or fade.

‡ 4 This hath leaues and roots like the laſt deſcribed, but ſomewhat leſſe, the floure alſo is in ſhape not vnlike that of the precedent, but leſſe, growing vpon a weake ſlender greene ſtalke, of ſome fingers length: the ſeed is contained in three cornered, yet almoſt round heads. The root is ſmall, bulbous, and blacke on the out ſide.

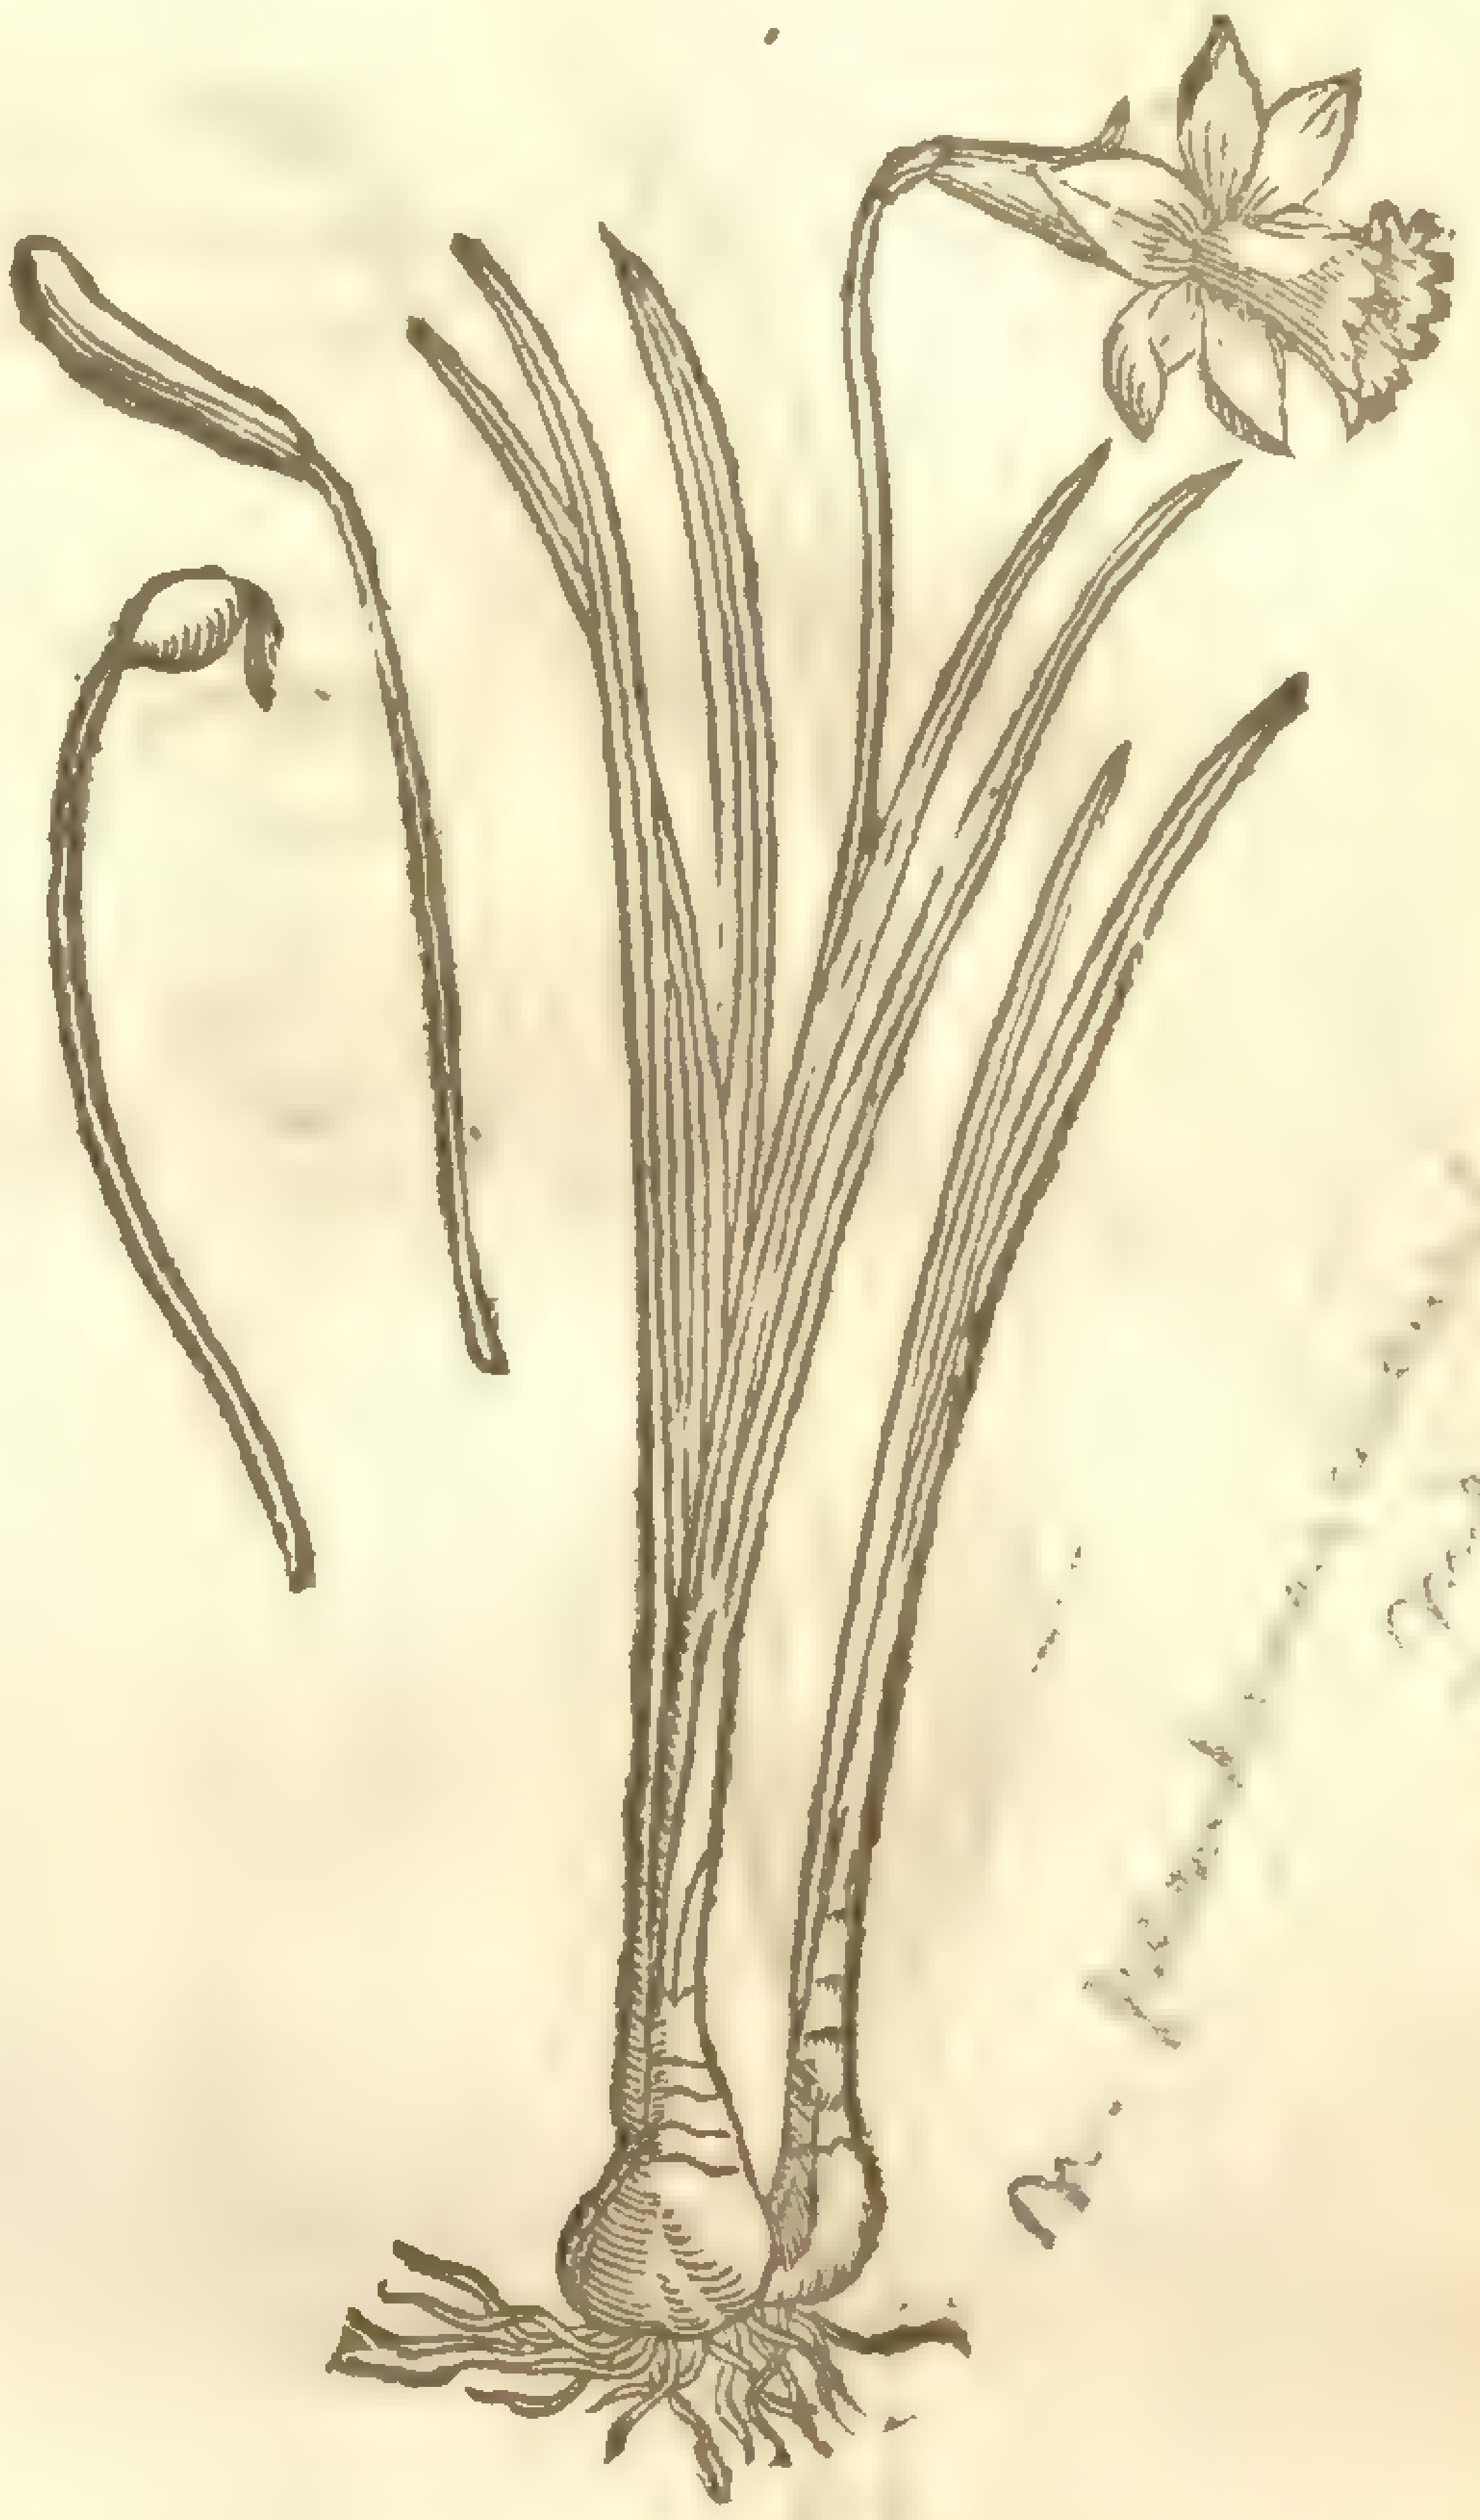
5 This hath a longiſh bulbous root, ſomwhat blacke on the out ſide, from which riſe vp leaues not ſo long nor broad as thoſe of the laſt deſcribed: in the midſt of theſe leaues ſprings vp a ſtalk ſlender, and ſome halfe foot in height; at the top of which, out of a whitiſh filme breakes forth a floure like in ſhape to the common Daffodill, but leſſe, and wholly white, with the brim of the cup welted about. It floures in Aprill, and ripens the ſeed in Iune.

¶ *The Place.*

The double yellow Daffodill I receiued from *Robinus* of Paris, which he procured by means of friends, from Orleance and other parts of France.

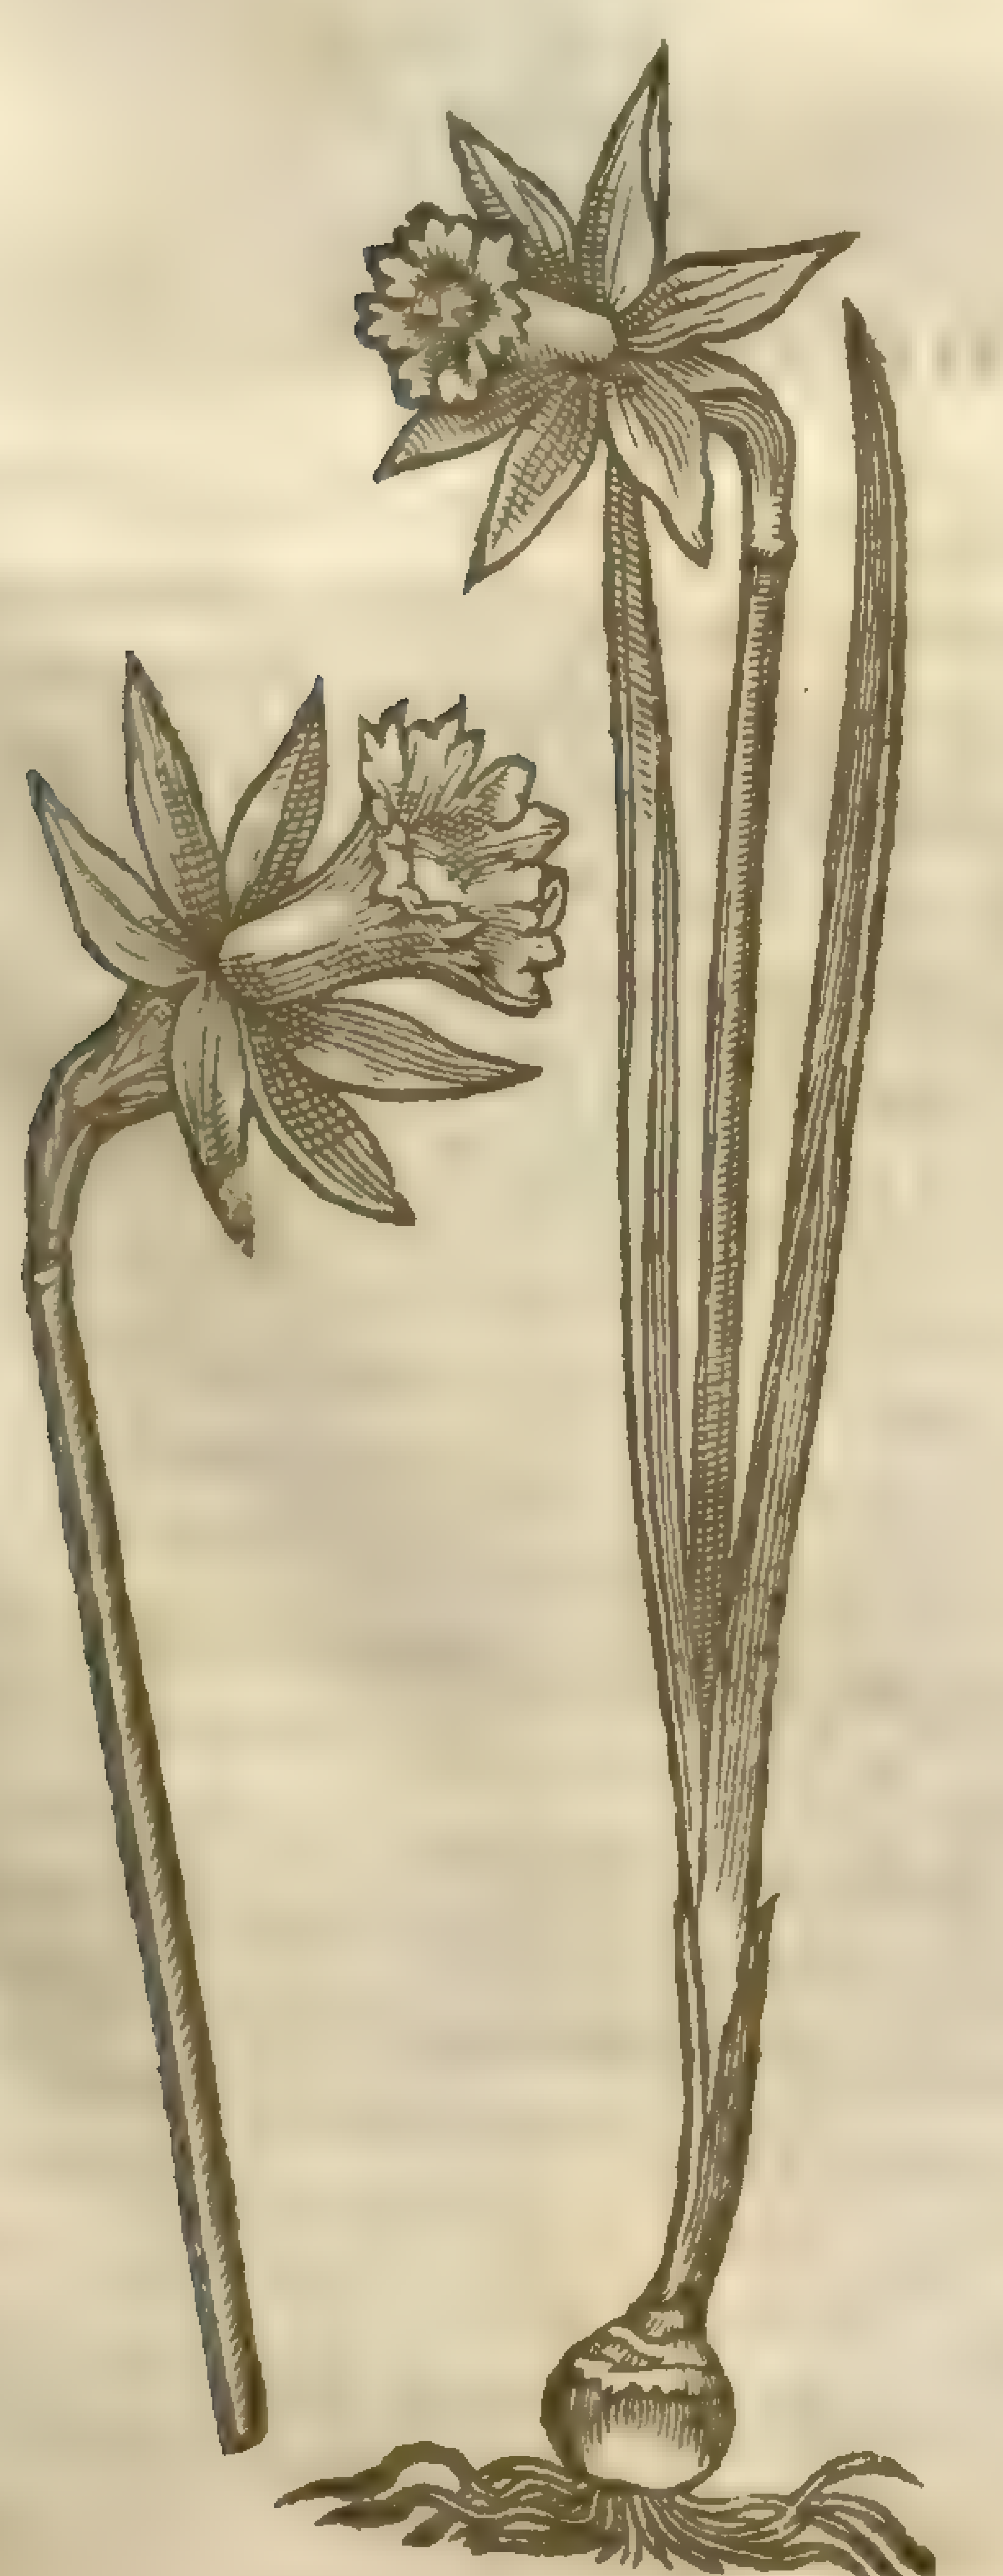


1 *Pſeudonarciſſus luteus multiplex.*
Double yellow Daffodill.

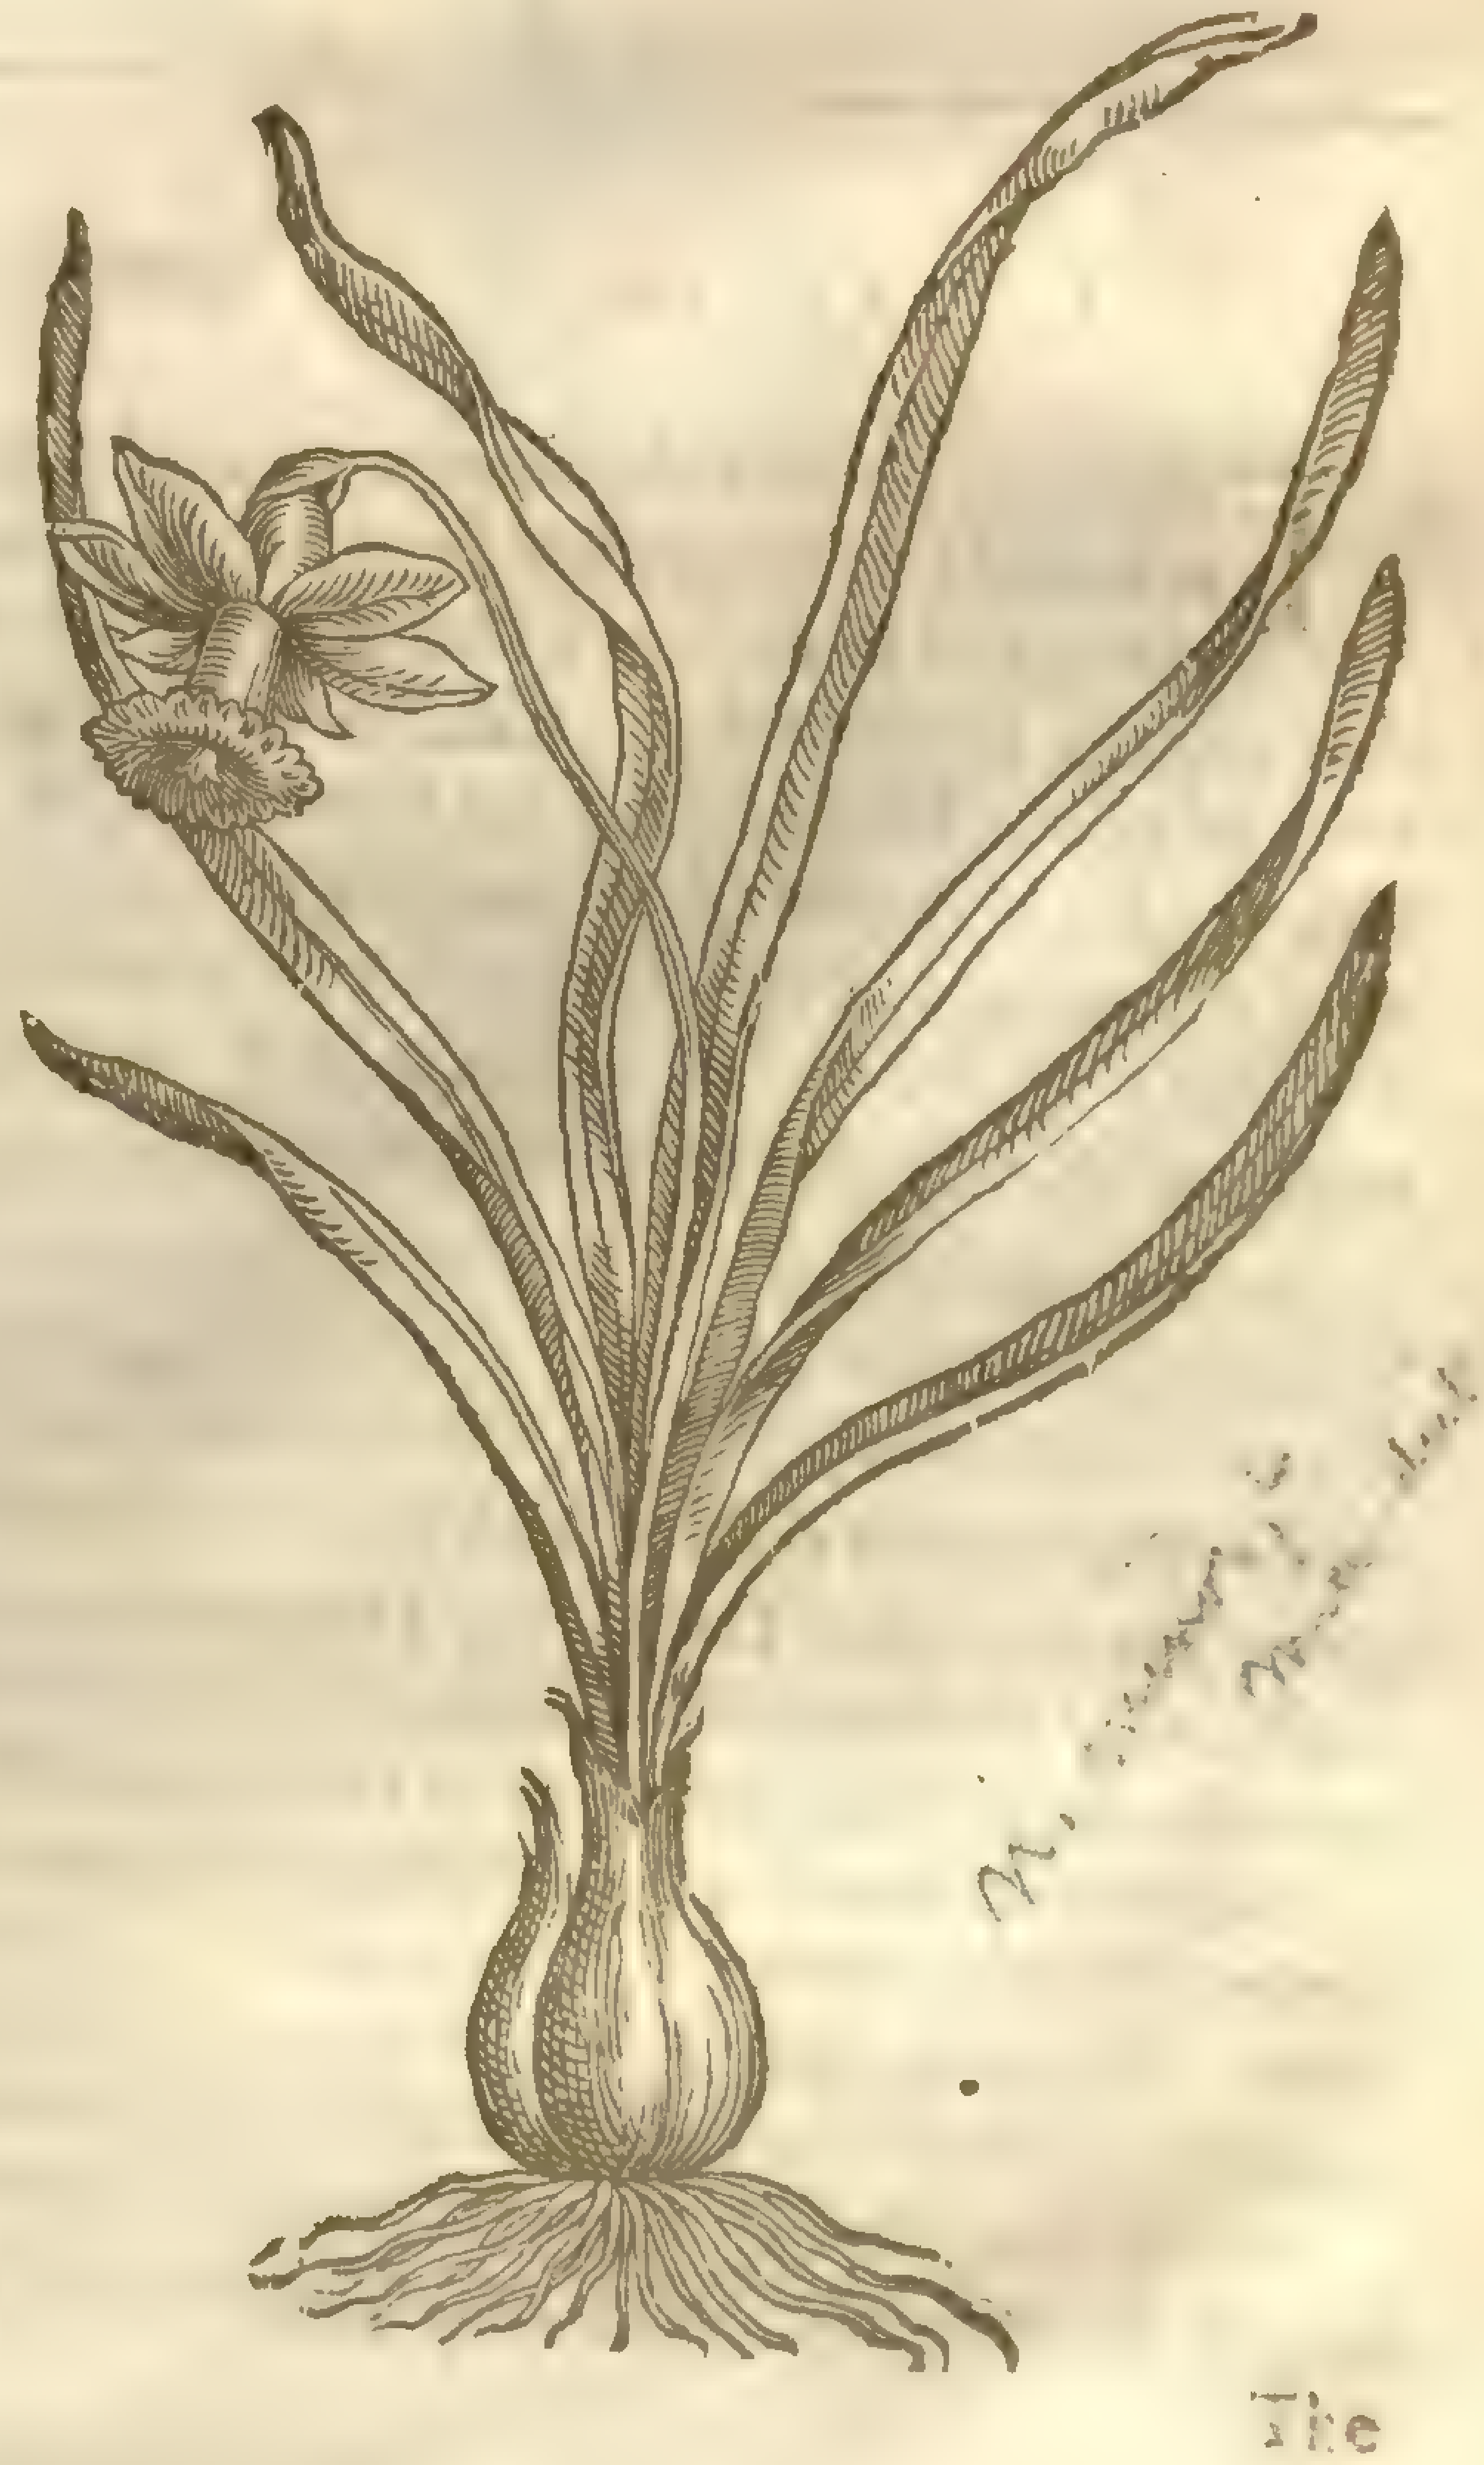


2 *Pſeudonarciſſus Anglicus.*
Common yellow Daffodill.

[illegible]



‡ 3 *Pſeudonarciſſus Hiſpanicus.*
The Spaniſh yellow Daffodill.

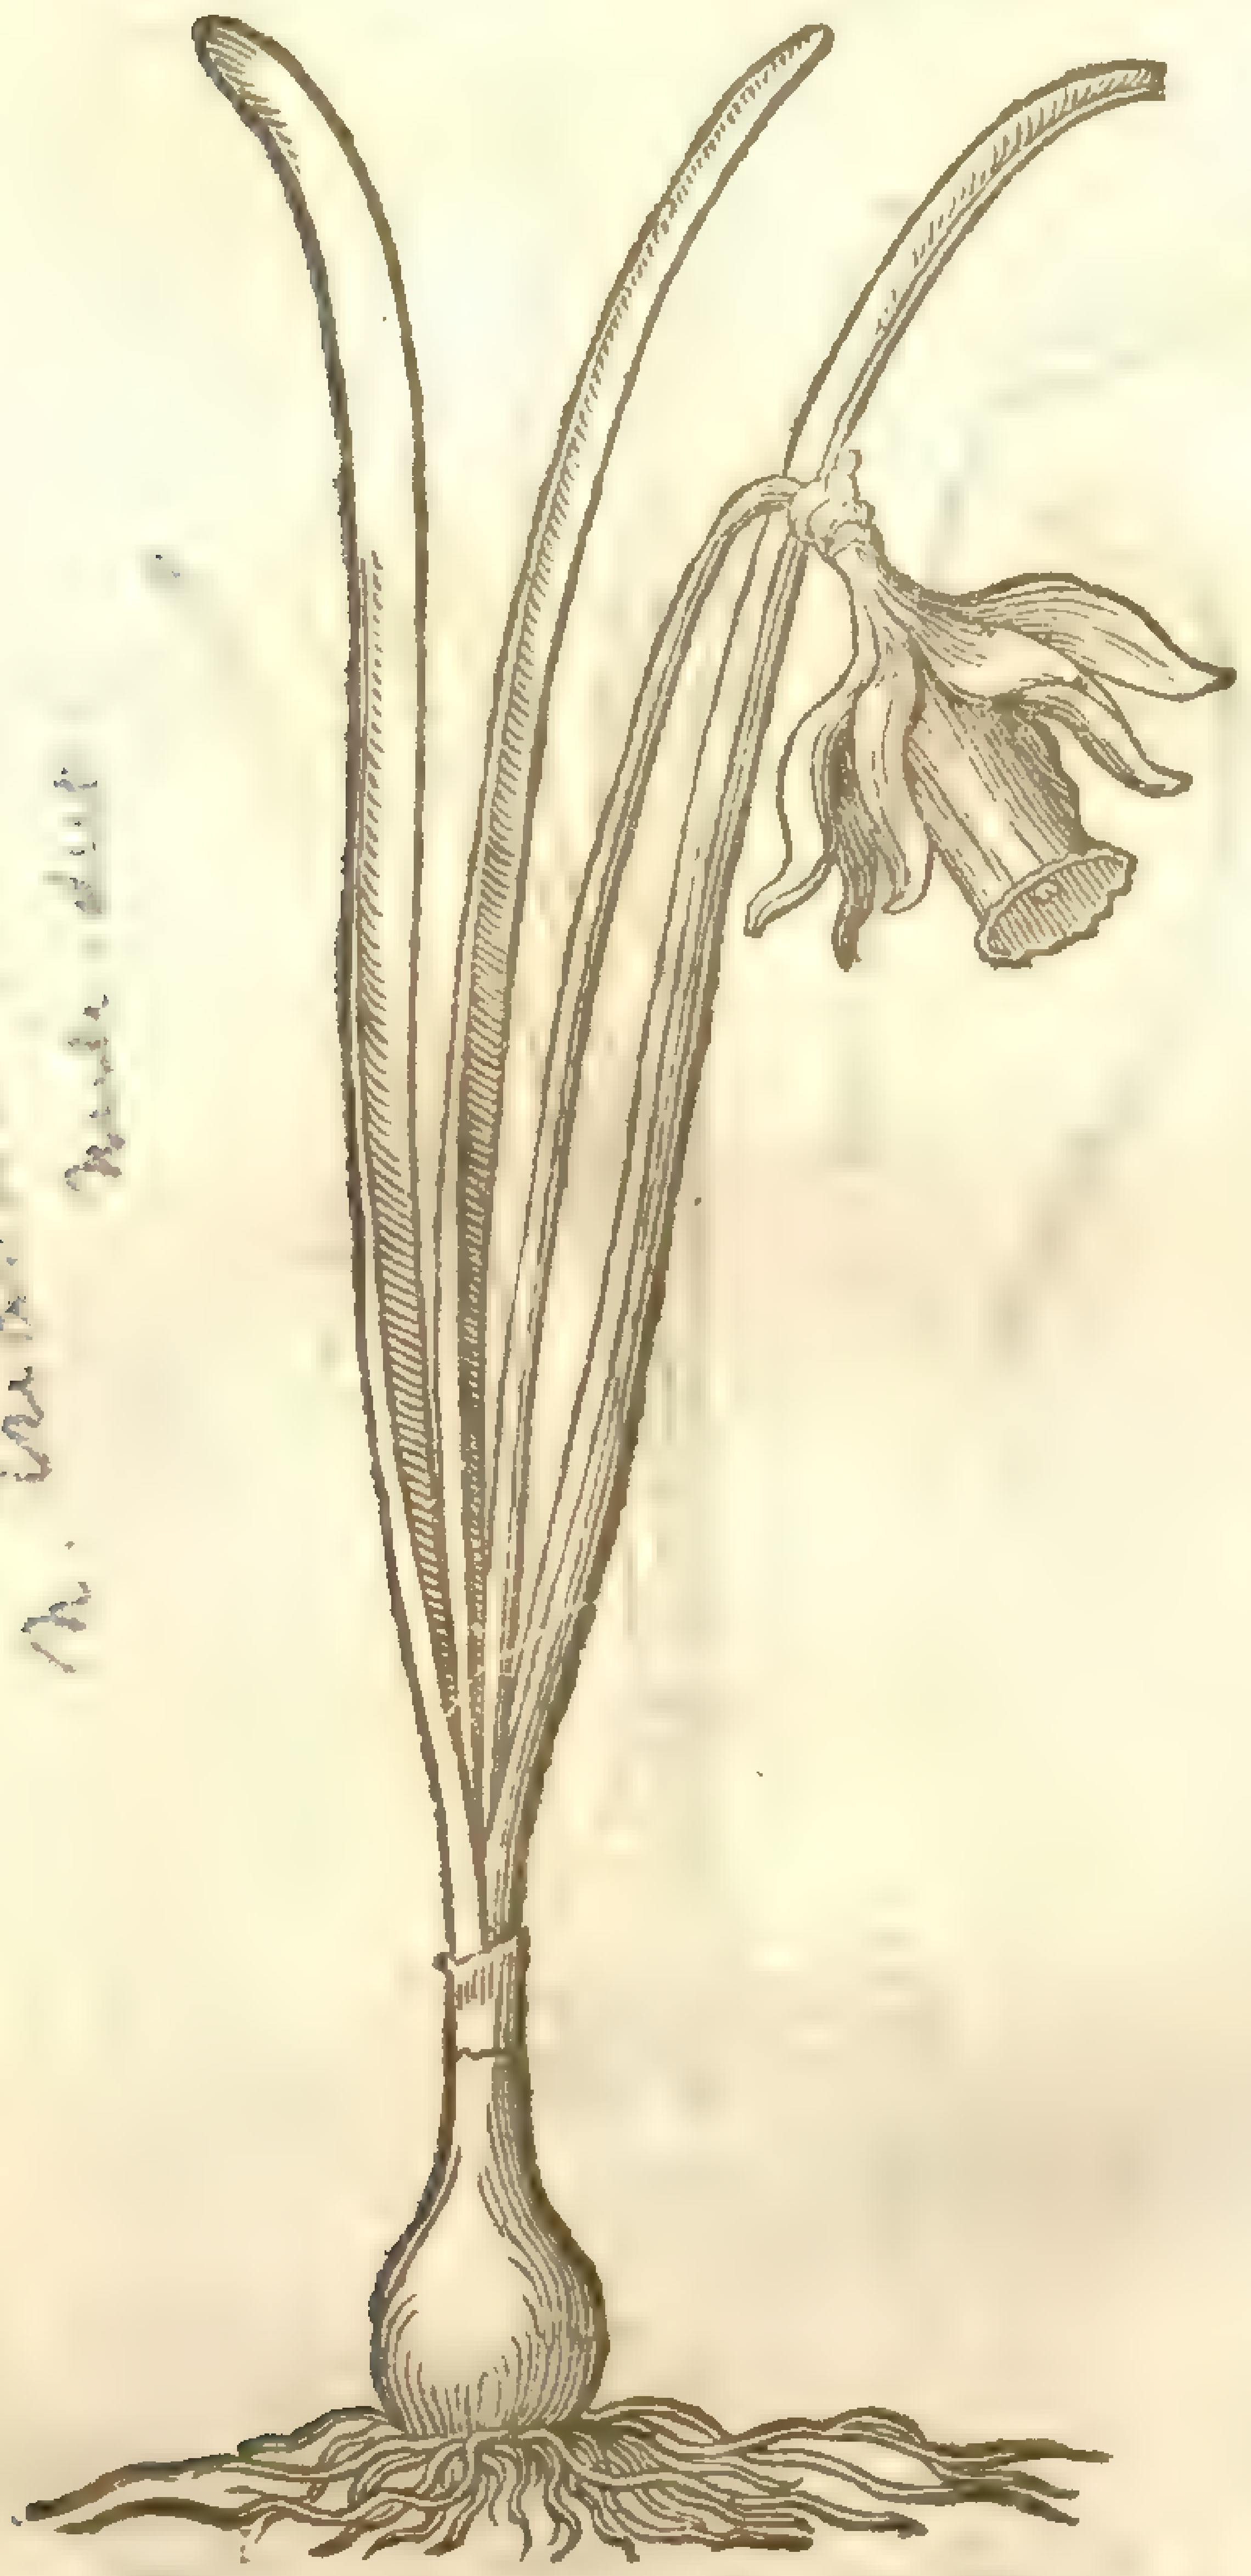


‡ 4 *Pſeudonarciſſus minor Hiſpanicus.*
The leſſer Spaniſh Daffodill.

[illegible]

The

‡ 5 *Pſeudonarciſſus albo flore.*
White baſtard Daffodill.



The yellow Engliſh Daffodill groweth almoſt euerie where through England. The yellow Spaniſh Daffodill doth likewiſe decke vp our London Gardens, where they encreaſe infinitely.

¶ *The Time.*

The double Daffodill ſends forth his leaues in the beginning of Februarie, and his floures in Aprill.

¶ *The Names.*

The firſt is called *Pſeudonarciſſus multiplex*, and *Narciſſus luteus polyanthos*: in Engliſh, the double yellow Daffodill or Narciſſus.

The common ſort are called in Dutch, **Geel Sporckel bloemen**: in Engliſh, yellow Daffodil, Daffodilly, and Daffodowndilly.

¶ *The Temper.*

The temperature is referred vnto the kinds of Narciſſus.

¶ *The Vertues.*

A Touching the vertues hereof, it is found out by experiment of ſome of the later Phyſitians, that the decoction of the roots of this yellow Daffodil do purge by ſiege tough and flegmatick humors, and alſo wateriſh, and is good for them that are full of raw humors, eſpecially if there be added thereto a little aniſe ſeed and Ginger, which will correct the churliſh hardneſſe of the working.

B The diſtilled water of Daffodils doth cure the palſie, if the Patient be bathed and rubbed with the ſayd liquor by the fire. It hath been proued by an eſpeciall and truſty friend of mine, a man learned, and a diligent ſearcher of nature, Mr *Nicolas Belſon*, ſomtime of Kings Colledge in Cambridge.

Chap. 86. *Of diuers other Daffodils or Narciſſes.*

‡ There are beſides the forementioned ſorts of Daffodils, ſundry others, ſome of which may be referred to them, other ſome not. I do not intend an exact enumeration of them, it being a thing not ſo fit for a hiſtorie of plants, as for a Florilegie, or booke of floures. Now thoſe that require all their figures, and more exact deſcriptions, may finnde full ſatisfaction in the late Worke of my kinde friend Mr *Iohn Parkinſon*, which is intituled *Paradiſus terreſtris*: for in other Florilegies, as in that of *De Bry*, *Swertz*, &c. you haue barely the names and figures, but in this are both figures and an exact hiſtorie or declaration of them. Therefore I in this place will but onely briefely deſcribe and name ſome of the rareſt that are preſerued in our choice gardens, and a few others whereof yet they are not poſſeſſed.

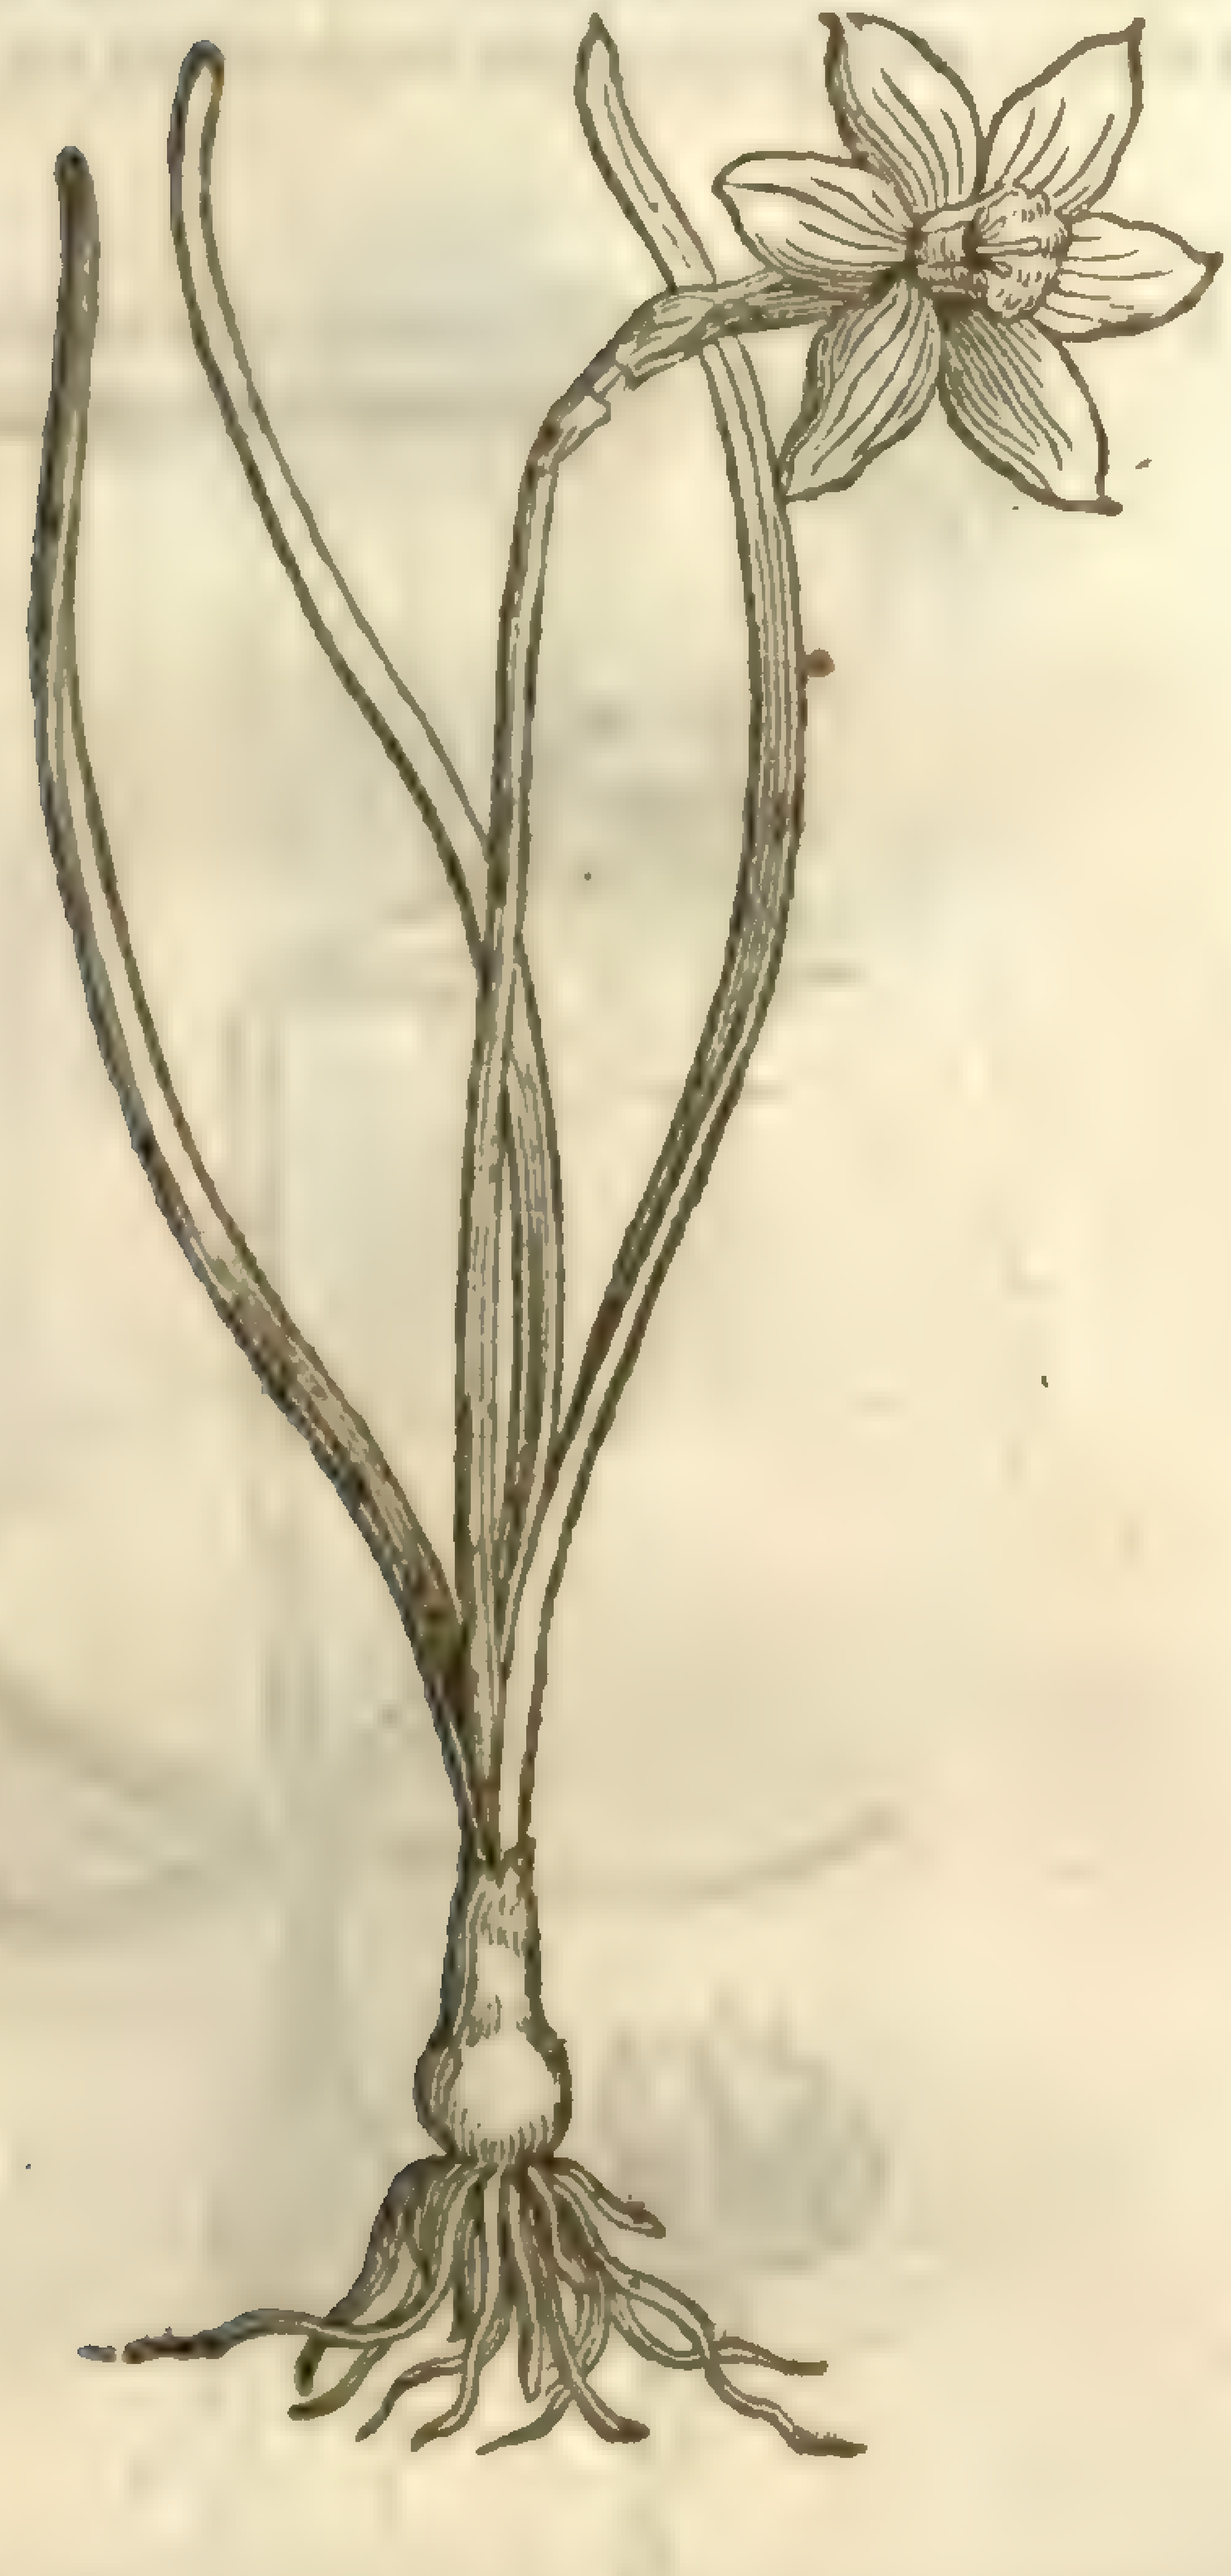
¶ *The Deſcriptions.*

1 The firſt of theſe, which for the largeneſſe is called *Nonpareille*, hath long broad leaues and roots like the other Daffodils. The floure conſiſts of ſix very large leaues of a pale yellow colour, with a very large cup, but not very long: this cup is yellower than the incompaſſing leaues, narrower alſo at the bottome than at the top, and vneuenly cut about the edges. This is called *Narciſſus omnium maximus*, or *Nonpareille*; the figure well expreſſeth the floure, but that it is ſomwhat too little. There is a varietie of this, with the open leaues and cup both yellow, which makes the difference. There is alſo another *Nonpareille*, whoſe floures are all white, and the ſix leaues that ſtand ſpred abroad are vſually a little folded or turned in at their ends.

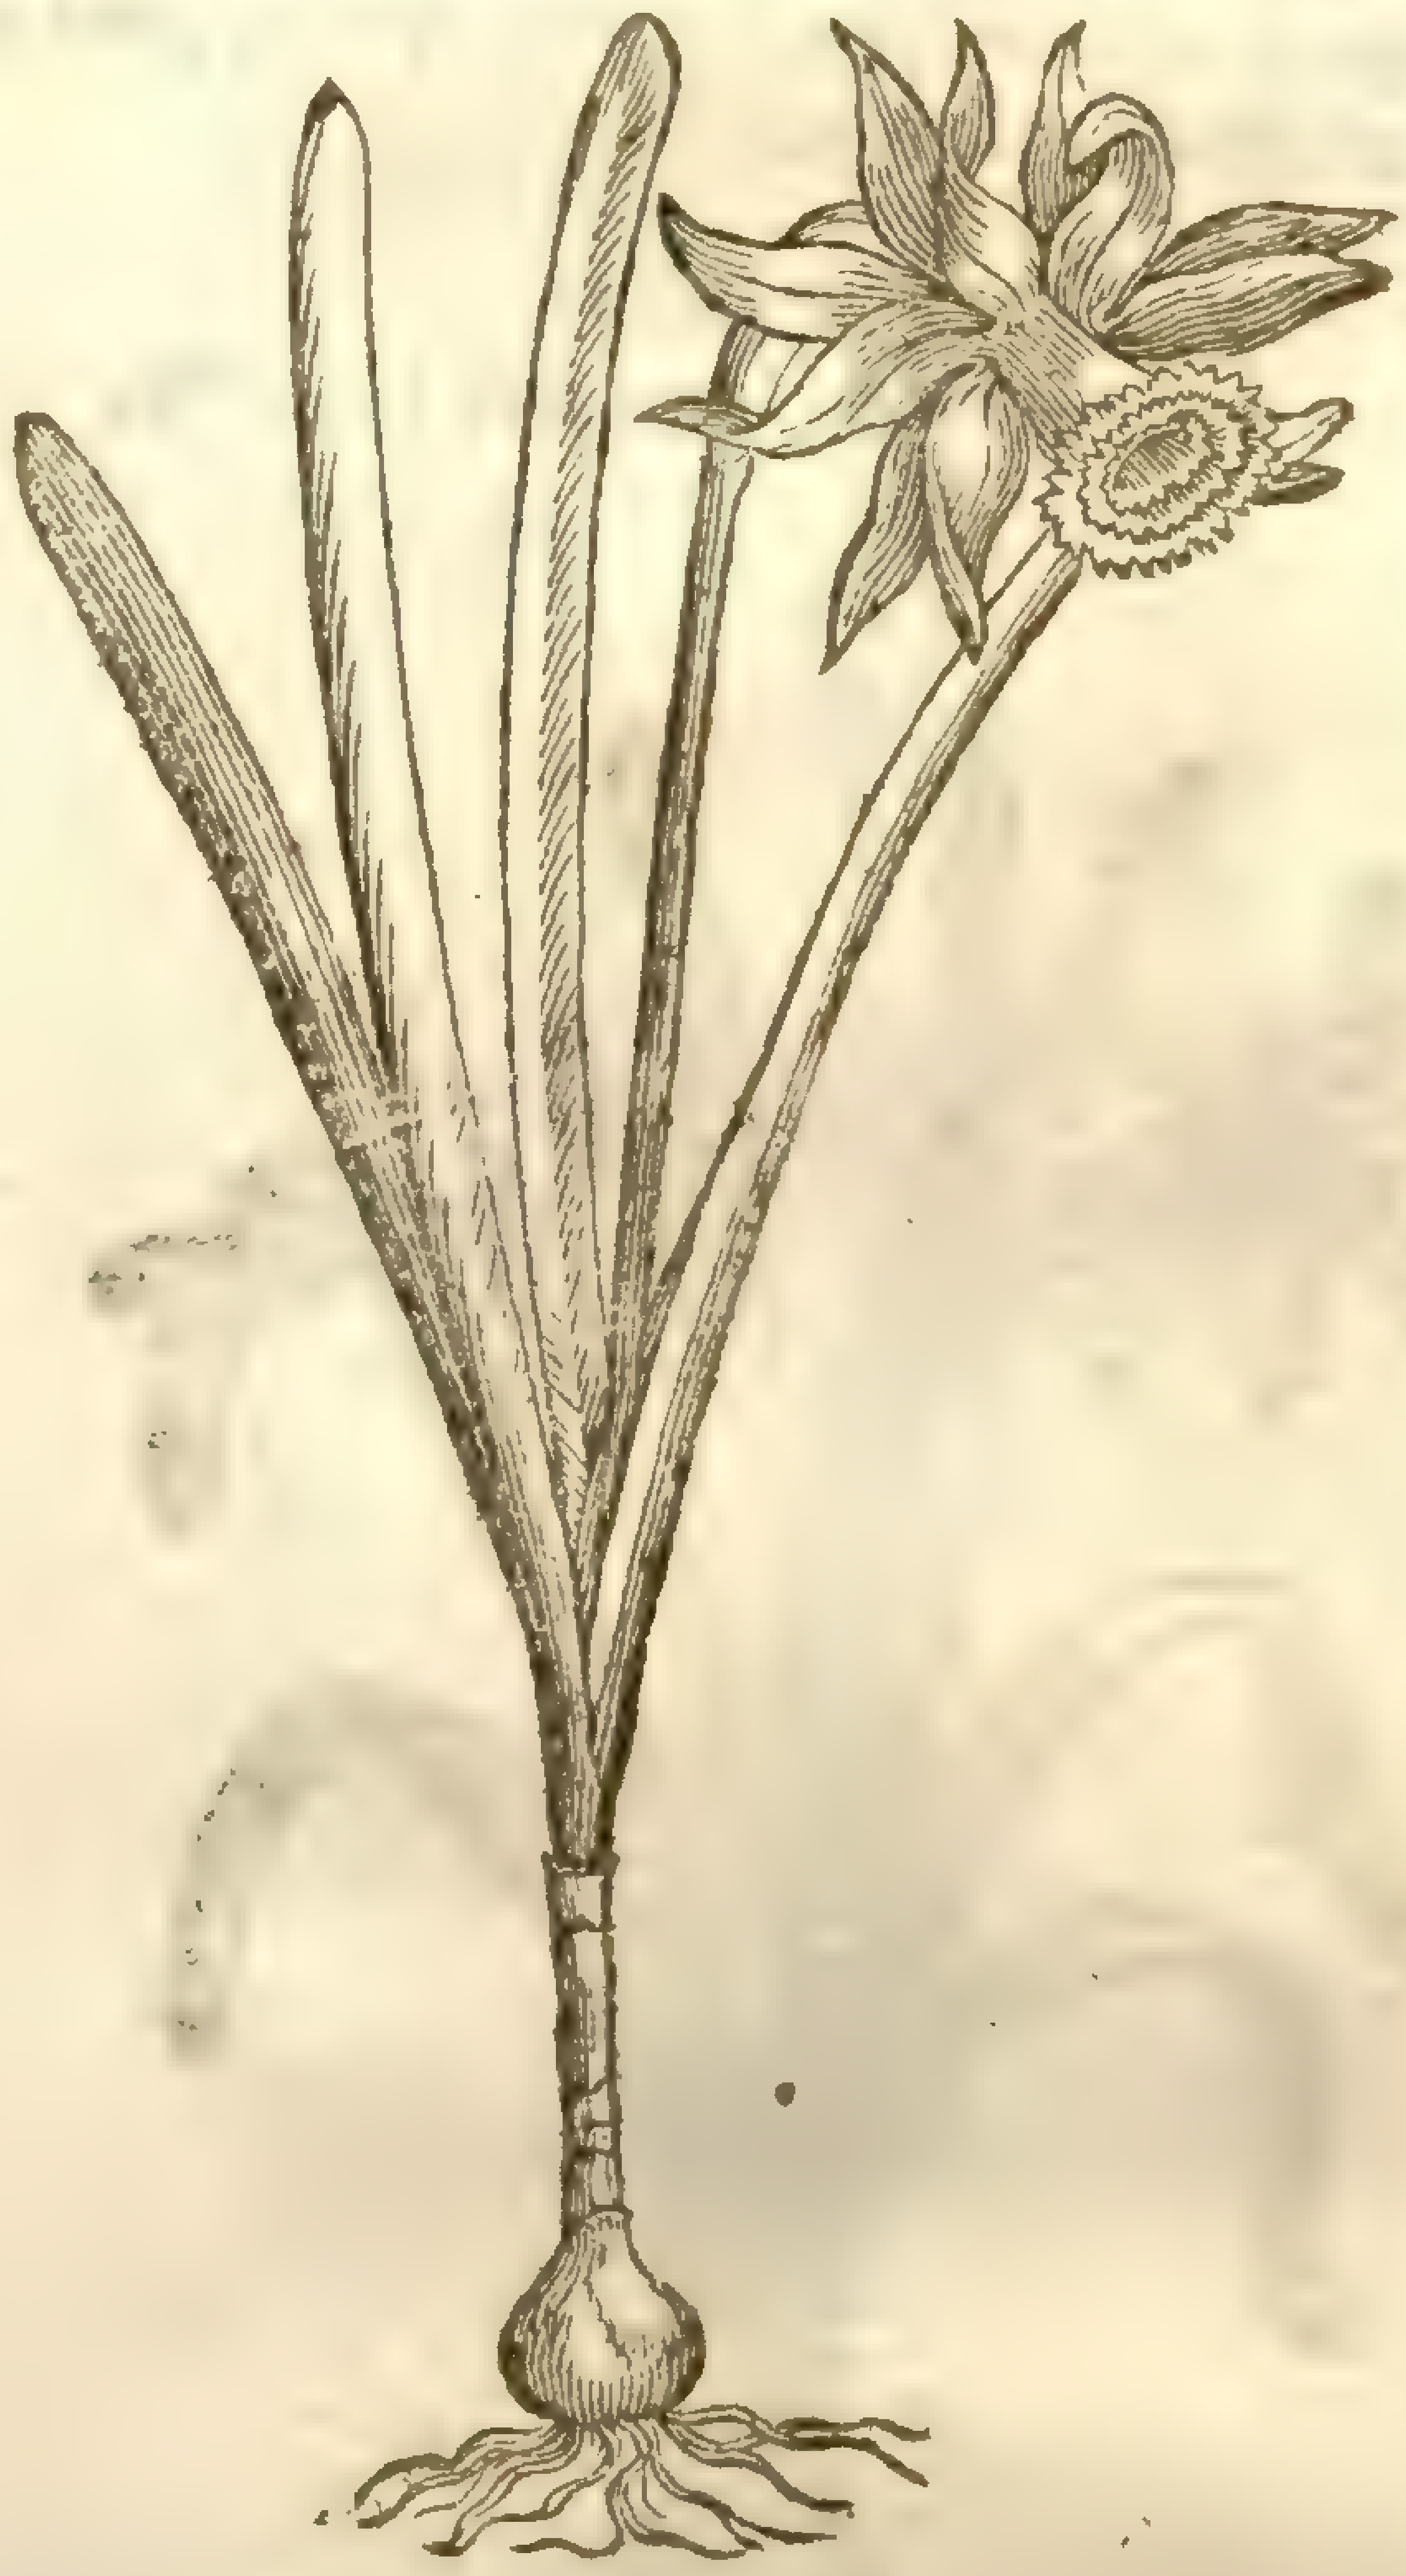
2 Beſides theſe former, there are foure or fiue double yellow Daffodils which I cannot paſſe ouer in ſilence; the firſt is that which is vulgarly amongſt Floriſts knowne by the name of *Robines*

Narciſſus, and it may be was the ſame our Author in the precedent chapter mentions hee receiued from *Robine*; but he giuing the figure of another, and a deſcription not well fitting this, I can affirme nothing of certaintie. This double Narciſſe of *Robine* growes with a ſtalke ſome foot high, and the floure is very double, of a pale yellow colour, and it ſeems commonly to diuide it ſelf into ſome ſix partitions, the leaues of the floure lying one vpon another euen to the midſt of the floure. This may be called *Narciſſus pallidus multiplex Robini, Robines* double pale Narciſſe.

‡ 1 *Narciſſus omnium maximus.*
The *Nonpareille* Daffodill.



‡ 3 *Pſeudonarciſſus flore pleno.*
The double yellow Daffodill.



2 The next to this is that which from our Author, the firſt obſeruer thereof, is vulgarly called *Gerrards* Narciſſe. The leaues and root do not much differ from the ordinarie Daffodil; the ſtalk is ſcarce a foot high, bearing at the top thereof a floure very double; the ſix outmoſt leaues are of the ſame yellow colour as the ordinarie one is; thoſe that are next are commonly as deepe as the tube or trunk of the ſingle one, and amongſt them are mixed alſo other paler coloured leaues, with ſome green ſtripes here & there among thoſe leaues. Theſe floures are ſomtimes all contained in a trunk like that of the ſingle one, the ſix out-leaues excepted: otherwhiles this incloſure is broke, and then the floure ſtands faire open like as that of the laſt deſcribed. *Lobel* in the ſecond part of his *Adverſaria* tels, That our Author M^{r} *Gerrard* found this in Wiltſhire, growing in the garden of a poore old woman, in which place formerly a cunning man (as they terme him) had dwelt.

This may be called in Latine, according to the Engliſh, *Narciſſus multiplex Gerrardi, Gerrards* double Narciſſe.

The figure we here giue you is expreſſed ſomewhat too tall, and the floure is not altogether ſo double as it ought to be.

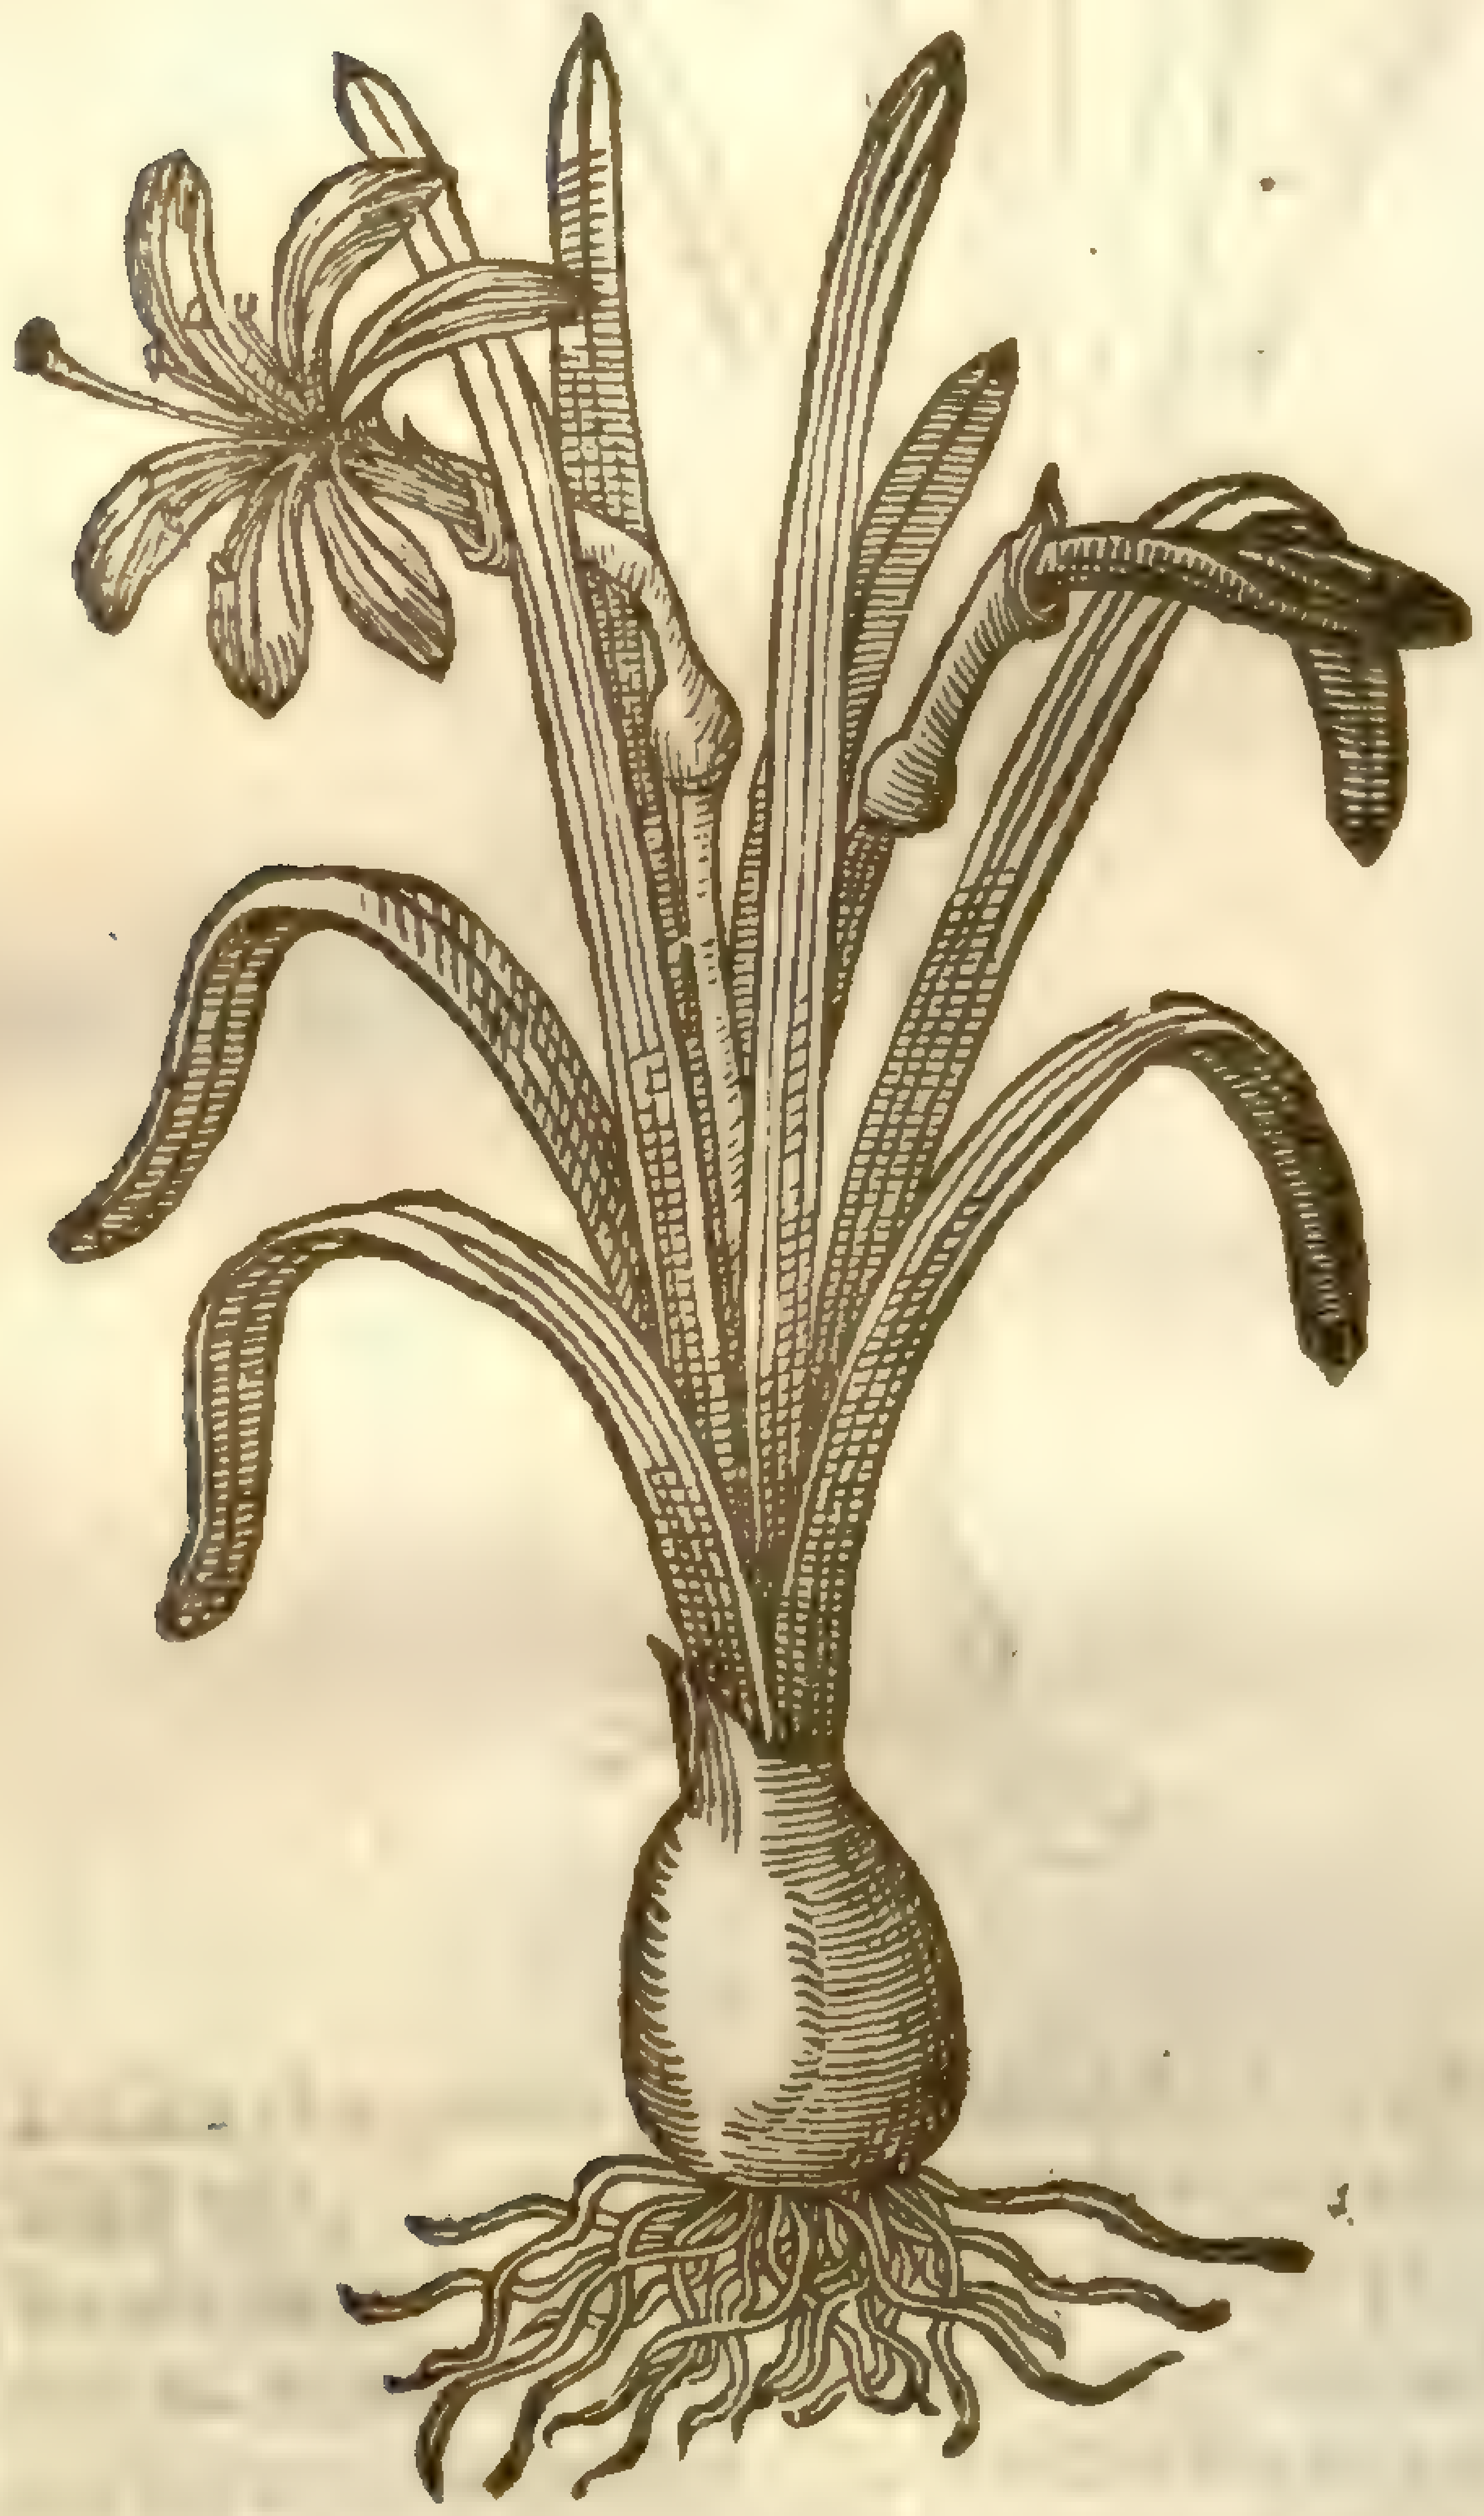
4 There are alſo two or three double yellow Daffodils yet remaining. The firſt of theſe is called *Wilmots* Narciſſe, from M^{r} *Wilmot* late of Bow, and this hath a very faire double & large yellow floure compoſed of deeper and paler yellow leaues orderly mixed.

The ſecond (which is called *Tradeſcants* Narciſſe, from Maſter *Iohn Tradeſcant* of South Lambeth) is the largeſt and ſtatelieſt of all the reſt: in the largeneſſe of the floures it exceeds *Wilmots*, which otherwiſe it much reſembles; ſome of the leaues wherof the floure conſiſts are ſharp pointed, and theſe are of a paler colour; otherſome are much more obtuſe, and theſe are of a deeper and fairer yellow.

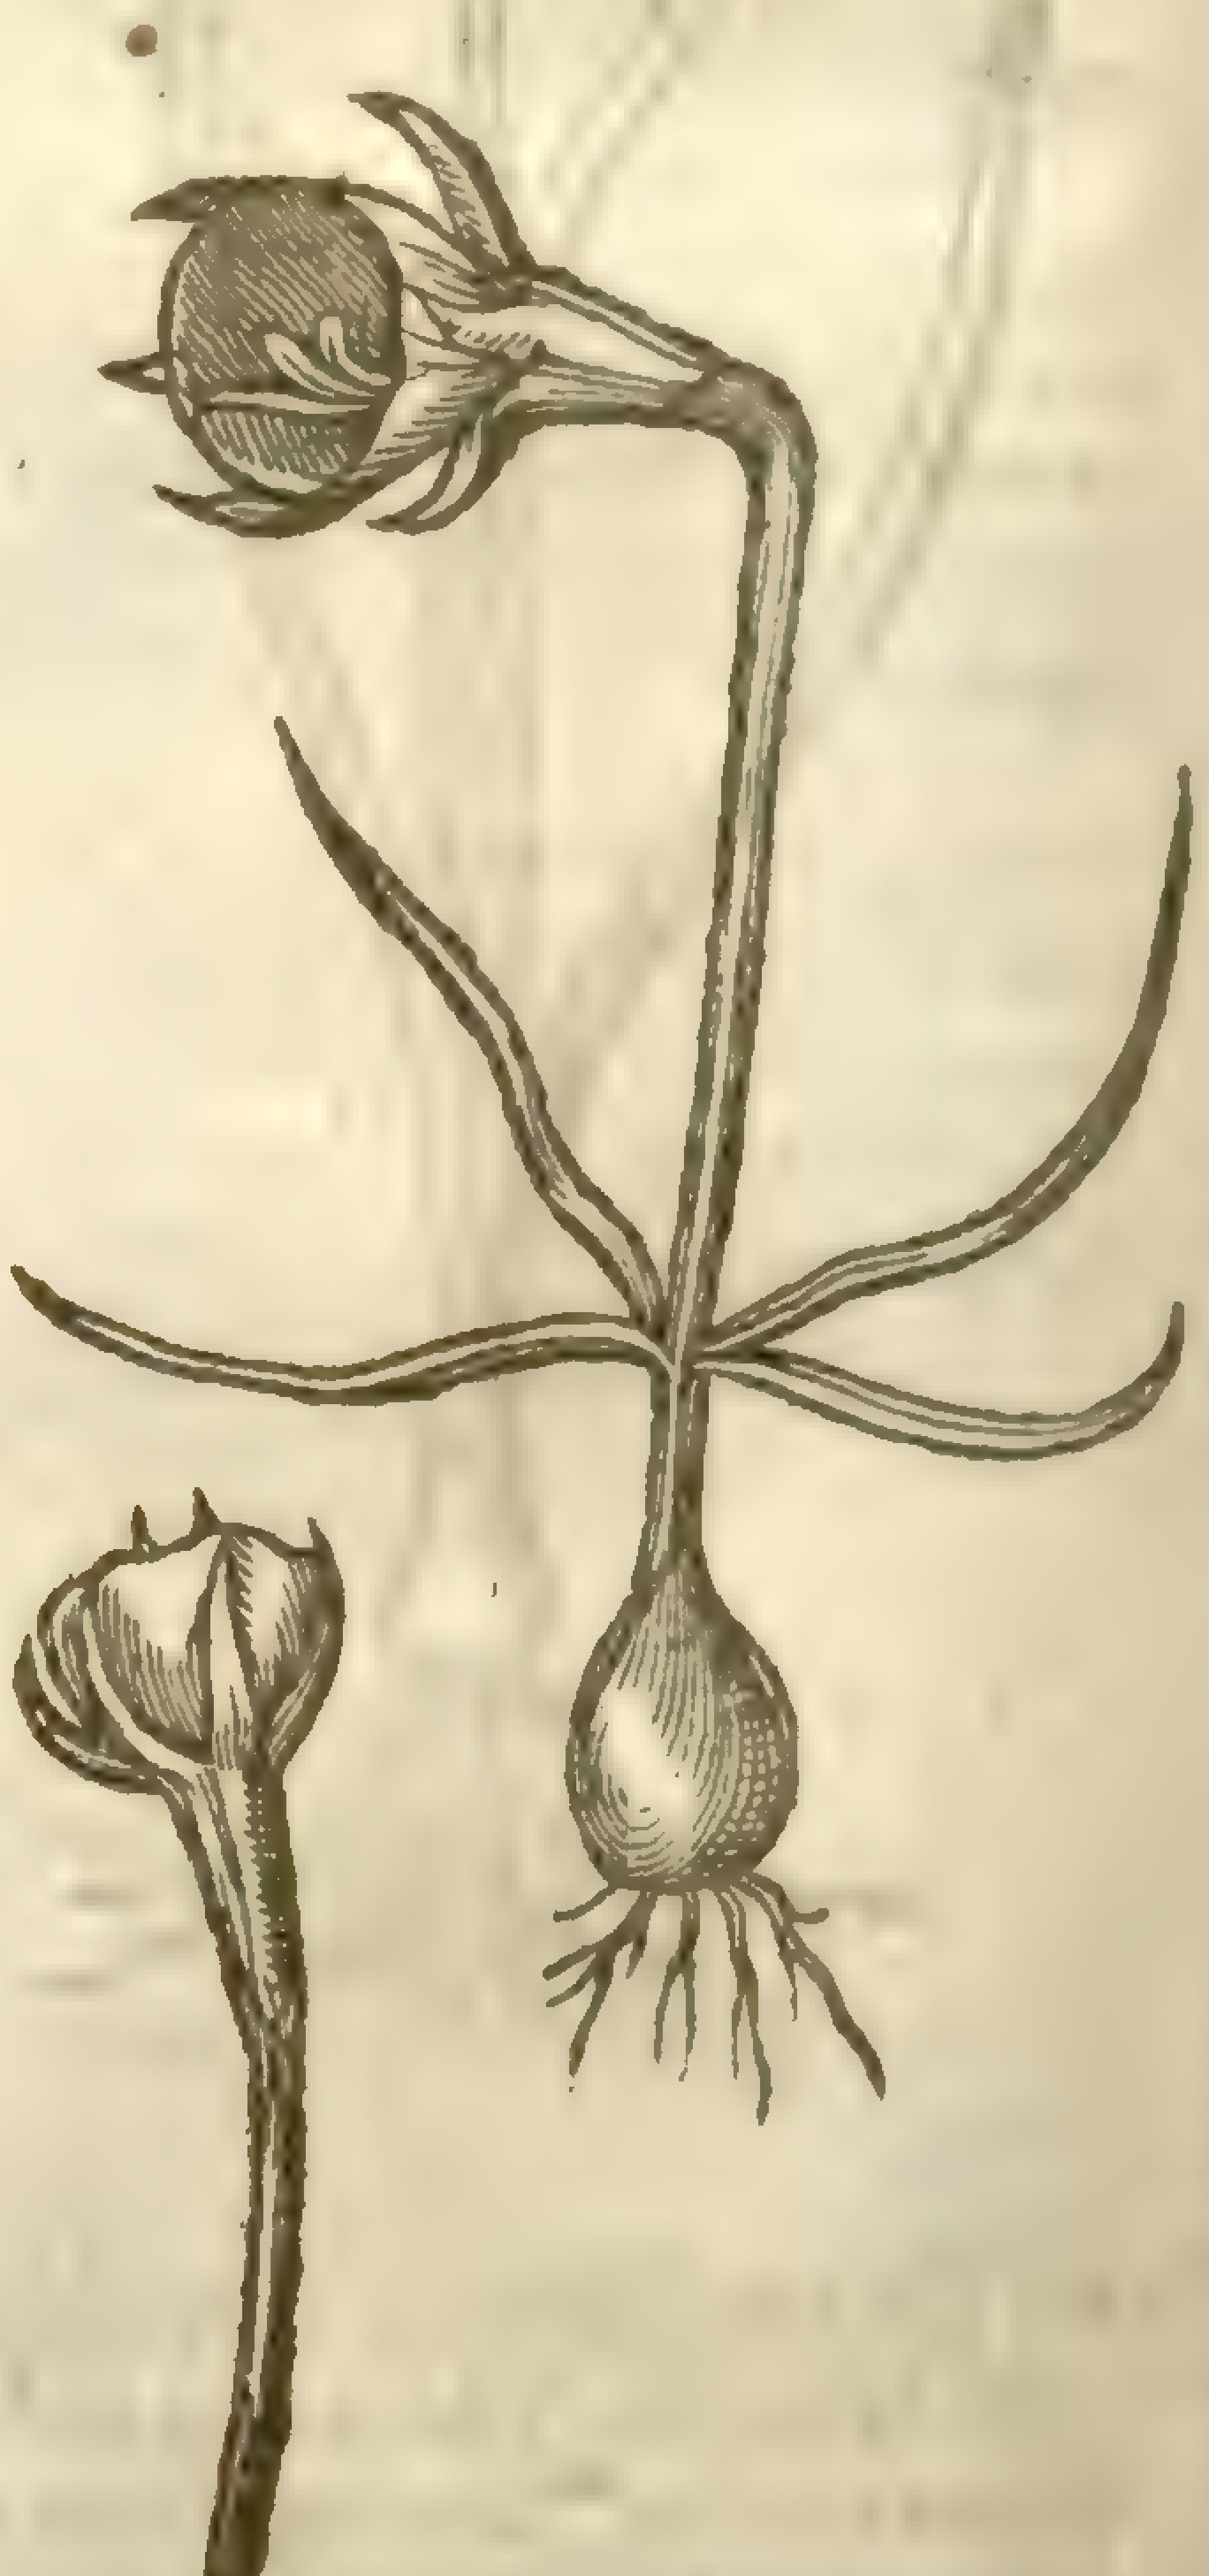
This may be called *Narciſſus Roſeus* Tradeſcanti, *Tradeſcants* Roſe Daffodill.

The third Mr. *Parkinſon* challengeth to himſelfe; which is a floure to be reſpected, not ſo much for the beautie, as for the various compoſure thereof, for ſome of the leaues are long and ſharpe pointed, others obtuſe and curled, a third ſort long and narrow, and vſually ſome few hollow, and in ſhape reſembling a horne; the vtmoſt leaues are commonly ſtreaked, end of a yellowiſh green; the next to them fold themſelues vp round, and are vſually yellow, yet ſometimes they are edged with greene. There is a deepe-yellow peſtle diuided into three parts, in the midſt of this floure. It floures in the end of March. I vſually (before Mr. *Parkinſon* ſet forth his Florilegie, or garden of floures) called this floure *Narciſſus* πολύμορφος, by reaſon of its various ſhape and colour: but ſince I thinke it fitter to giue it to the Author, and terme it *Narciſſus multiplex varius* Parkinſoni, *Parkinſons* various double Narciſſe.

‡ 5 *Narciſſus Iacobæus Indicus.*
The Indian or Iacobæan Narciſſe.



‡ 6 *Narciſſus juncifoltns montanus minimus.*
The leaſt Ruſh-leaued Mountaine Narciſſe.



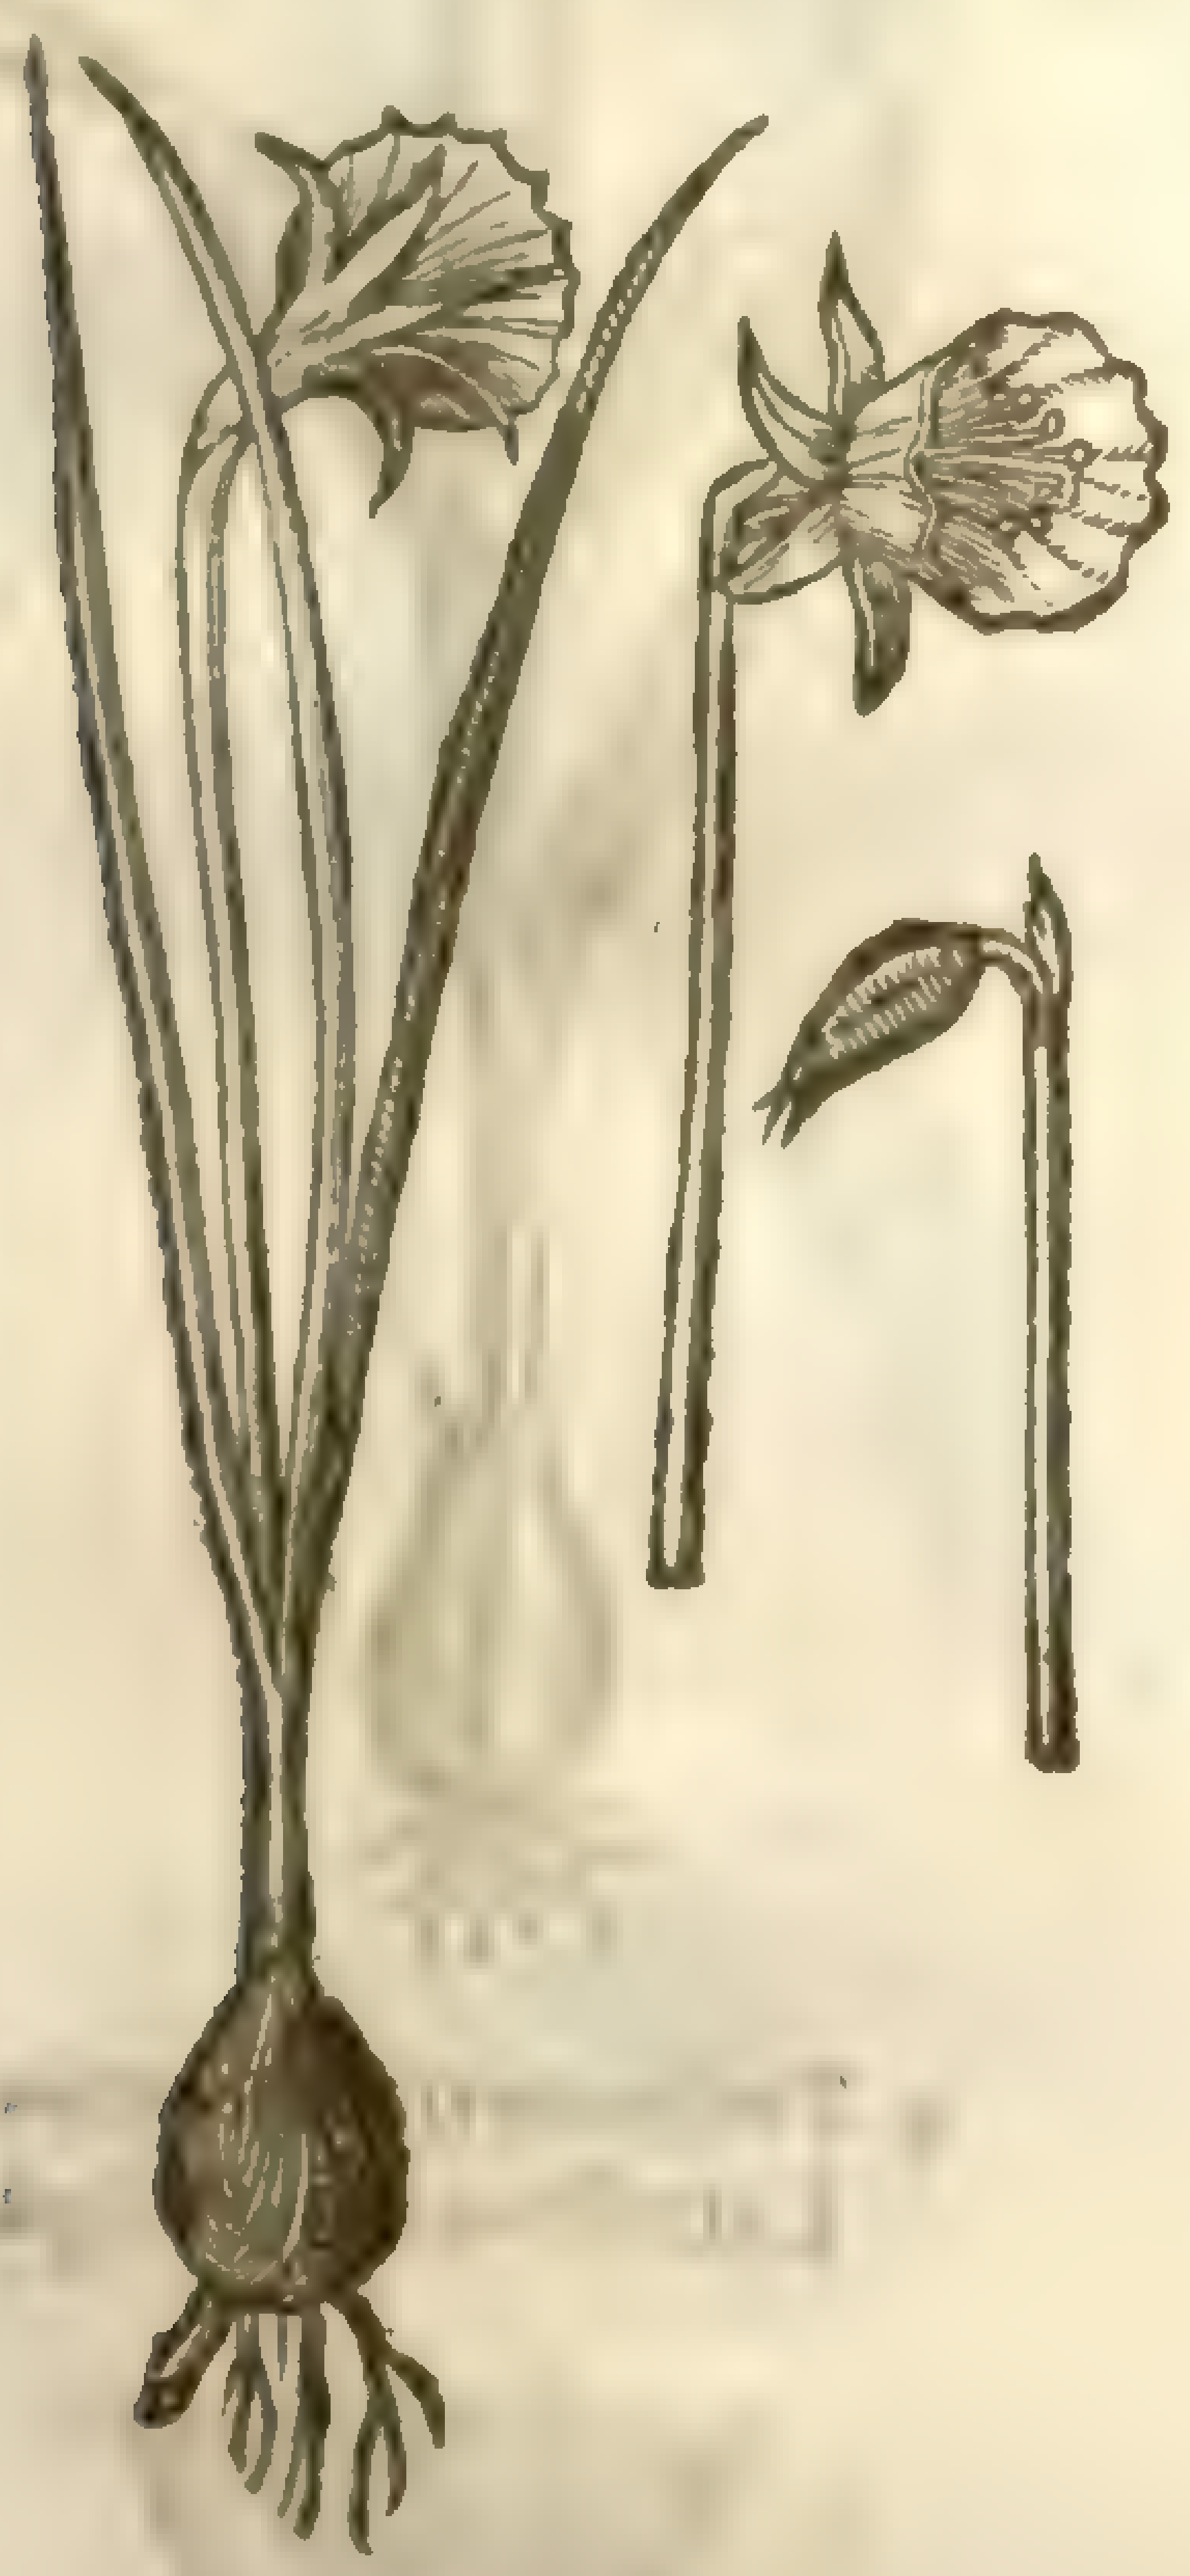
5 Now come I to treat of ſome more rarely to be found in our gardens, if at all. That which takes the firſt place is by *Cluſius* called *Narciſſus Iacobæus Indicus*, the Indian or Iacobæan Narciſſe. The root hereof is much like vnto an ordinary onion, the leaues are broad like the other Narciſſes: the ſtalke is ſmooth, round, hollow, and without knots, at the top whereof, out of a certaine skinny huske comes forth a faire red floure like that of the flouring Indian reed, but that the leaues of this are ſomewhat larger, and it hath ſix chiues or threds in the middle thereof, of the ſame colour as the floure, and they are adorned with browniſh pendants; in the midſt of theſe there ſtands a little farther out than the reſt, a three forked ſtile, vnder which ſucceeds a triangular head, after the falling of the floure.

This giues his floure in Iune or Iuly.

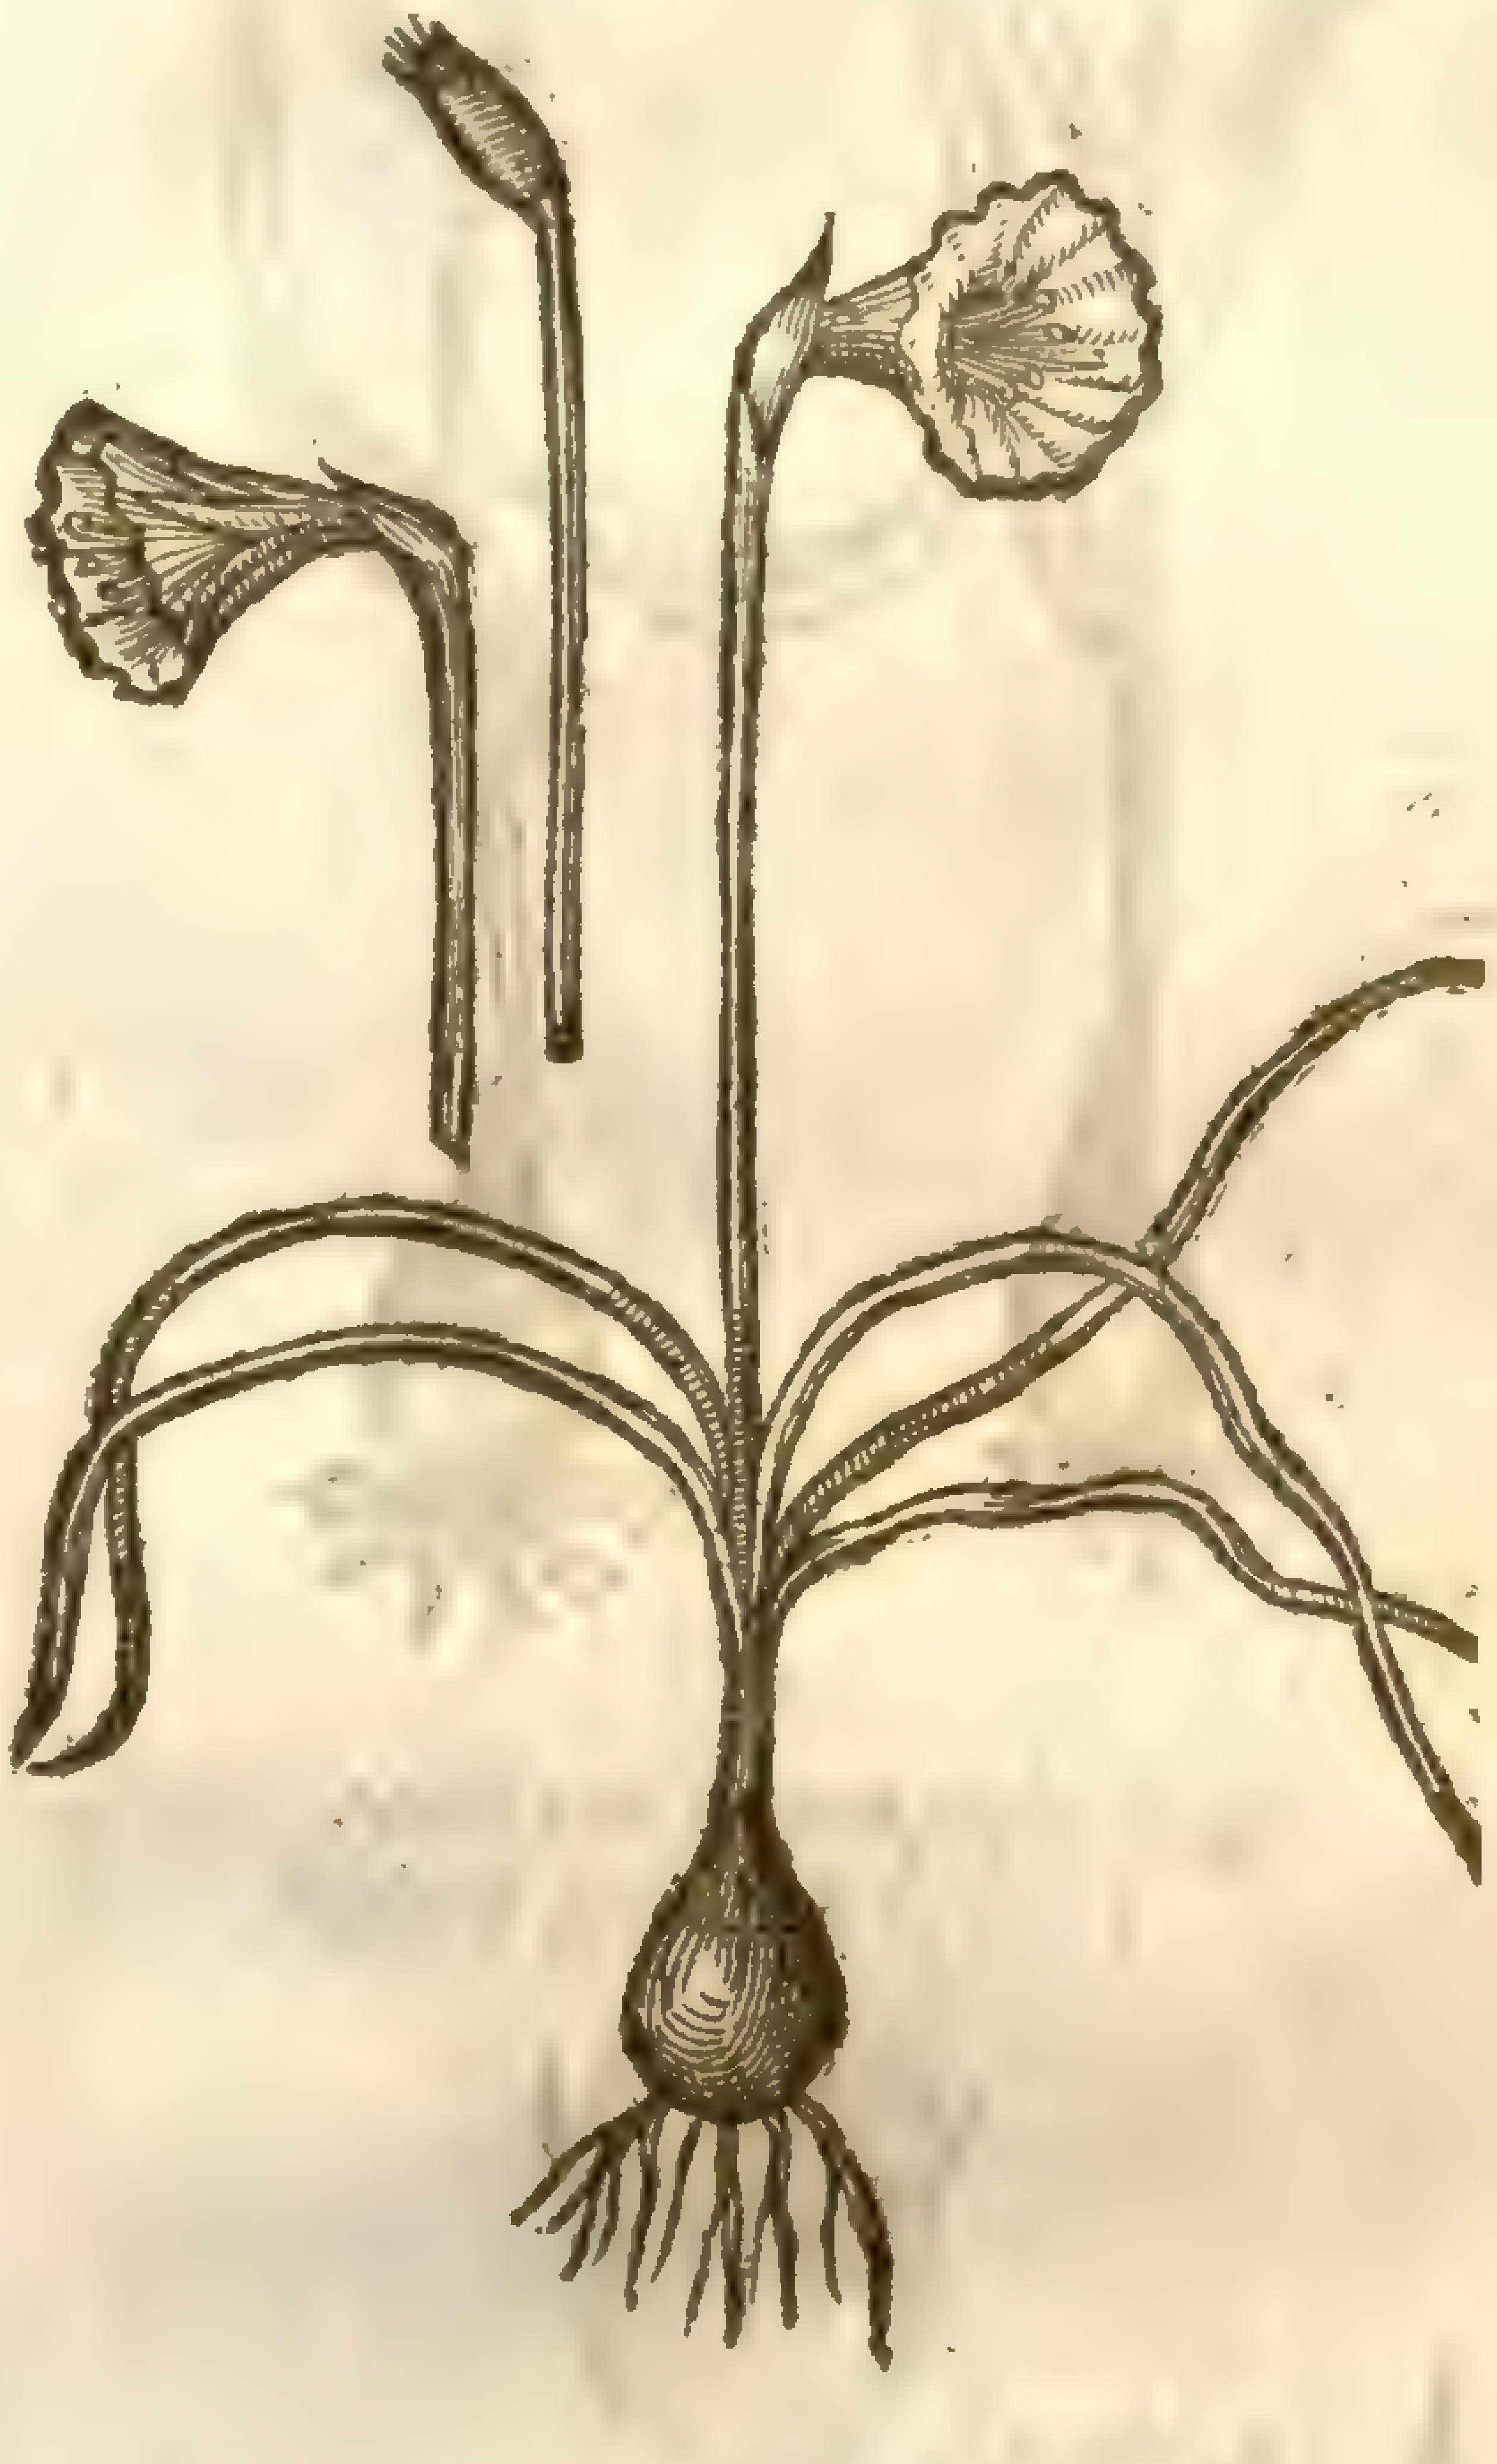
6 This *Lobel* calls *Narciſſus montanus juncifolijs minimus*, The leaſt Ruſh-leaued mountaine Narciſſe. The leaues of this are like the *Iunquilia*; the ſtalke is ſhort, the floure yellow, with the ſix winged leaues ſmall and paler coloured, the cup open and large to the bigneſſe of the floure.

7 This alſo is much like the former, but the ſix incompaſſing leaues are of a greeniſh feint yellow colour; the cup is indented or vnequally curled about the edges, but yellow like the precedent. *Lobel* calls this, *Narciſſus montanus juncifolius flore fimbriato*, The mountain Ruſh leaued Narciſſe with an indented or curled cup.

‡ 7 *Narciſſus montanus juncifolius flore fimbriato.*
The mountaine Ruſh leaued Narciſſe with an indented or curled cup.



‡ 8 *Narciſſus omnium minimus montanus albus.*
The leaſt mountaine white Narciſſe.



8 The leaues of this are ſmall as the Autumne Iacinth, the ſtalke ſome handfull high, and the floure like the laſt deſcribed, but it is of a whitiſh colour. *Lobel* calls this laſt deſcribed, *Narciſſus omnium minimus montanus albus*, The leaſt mountaine white Narciſſe. Theſe three laſt vſually floure in Februarie. ‡

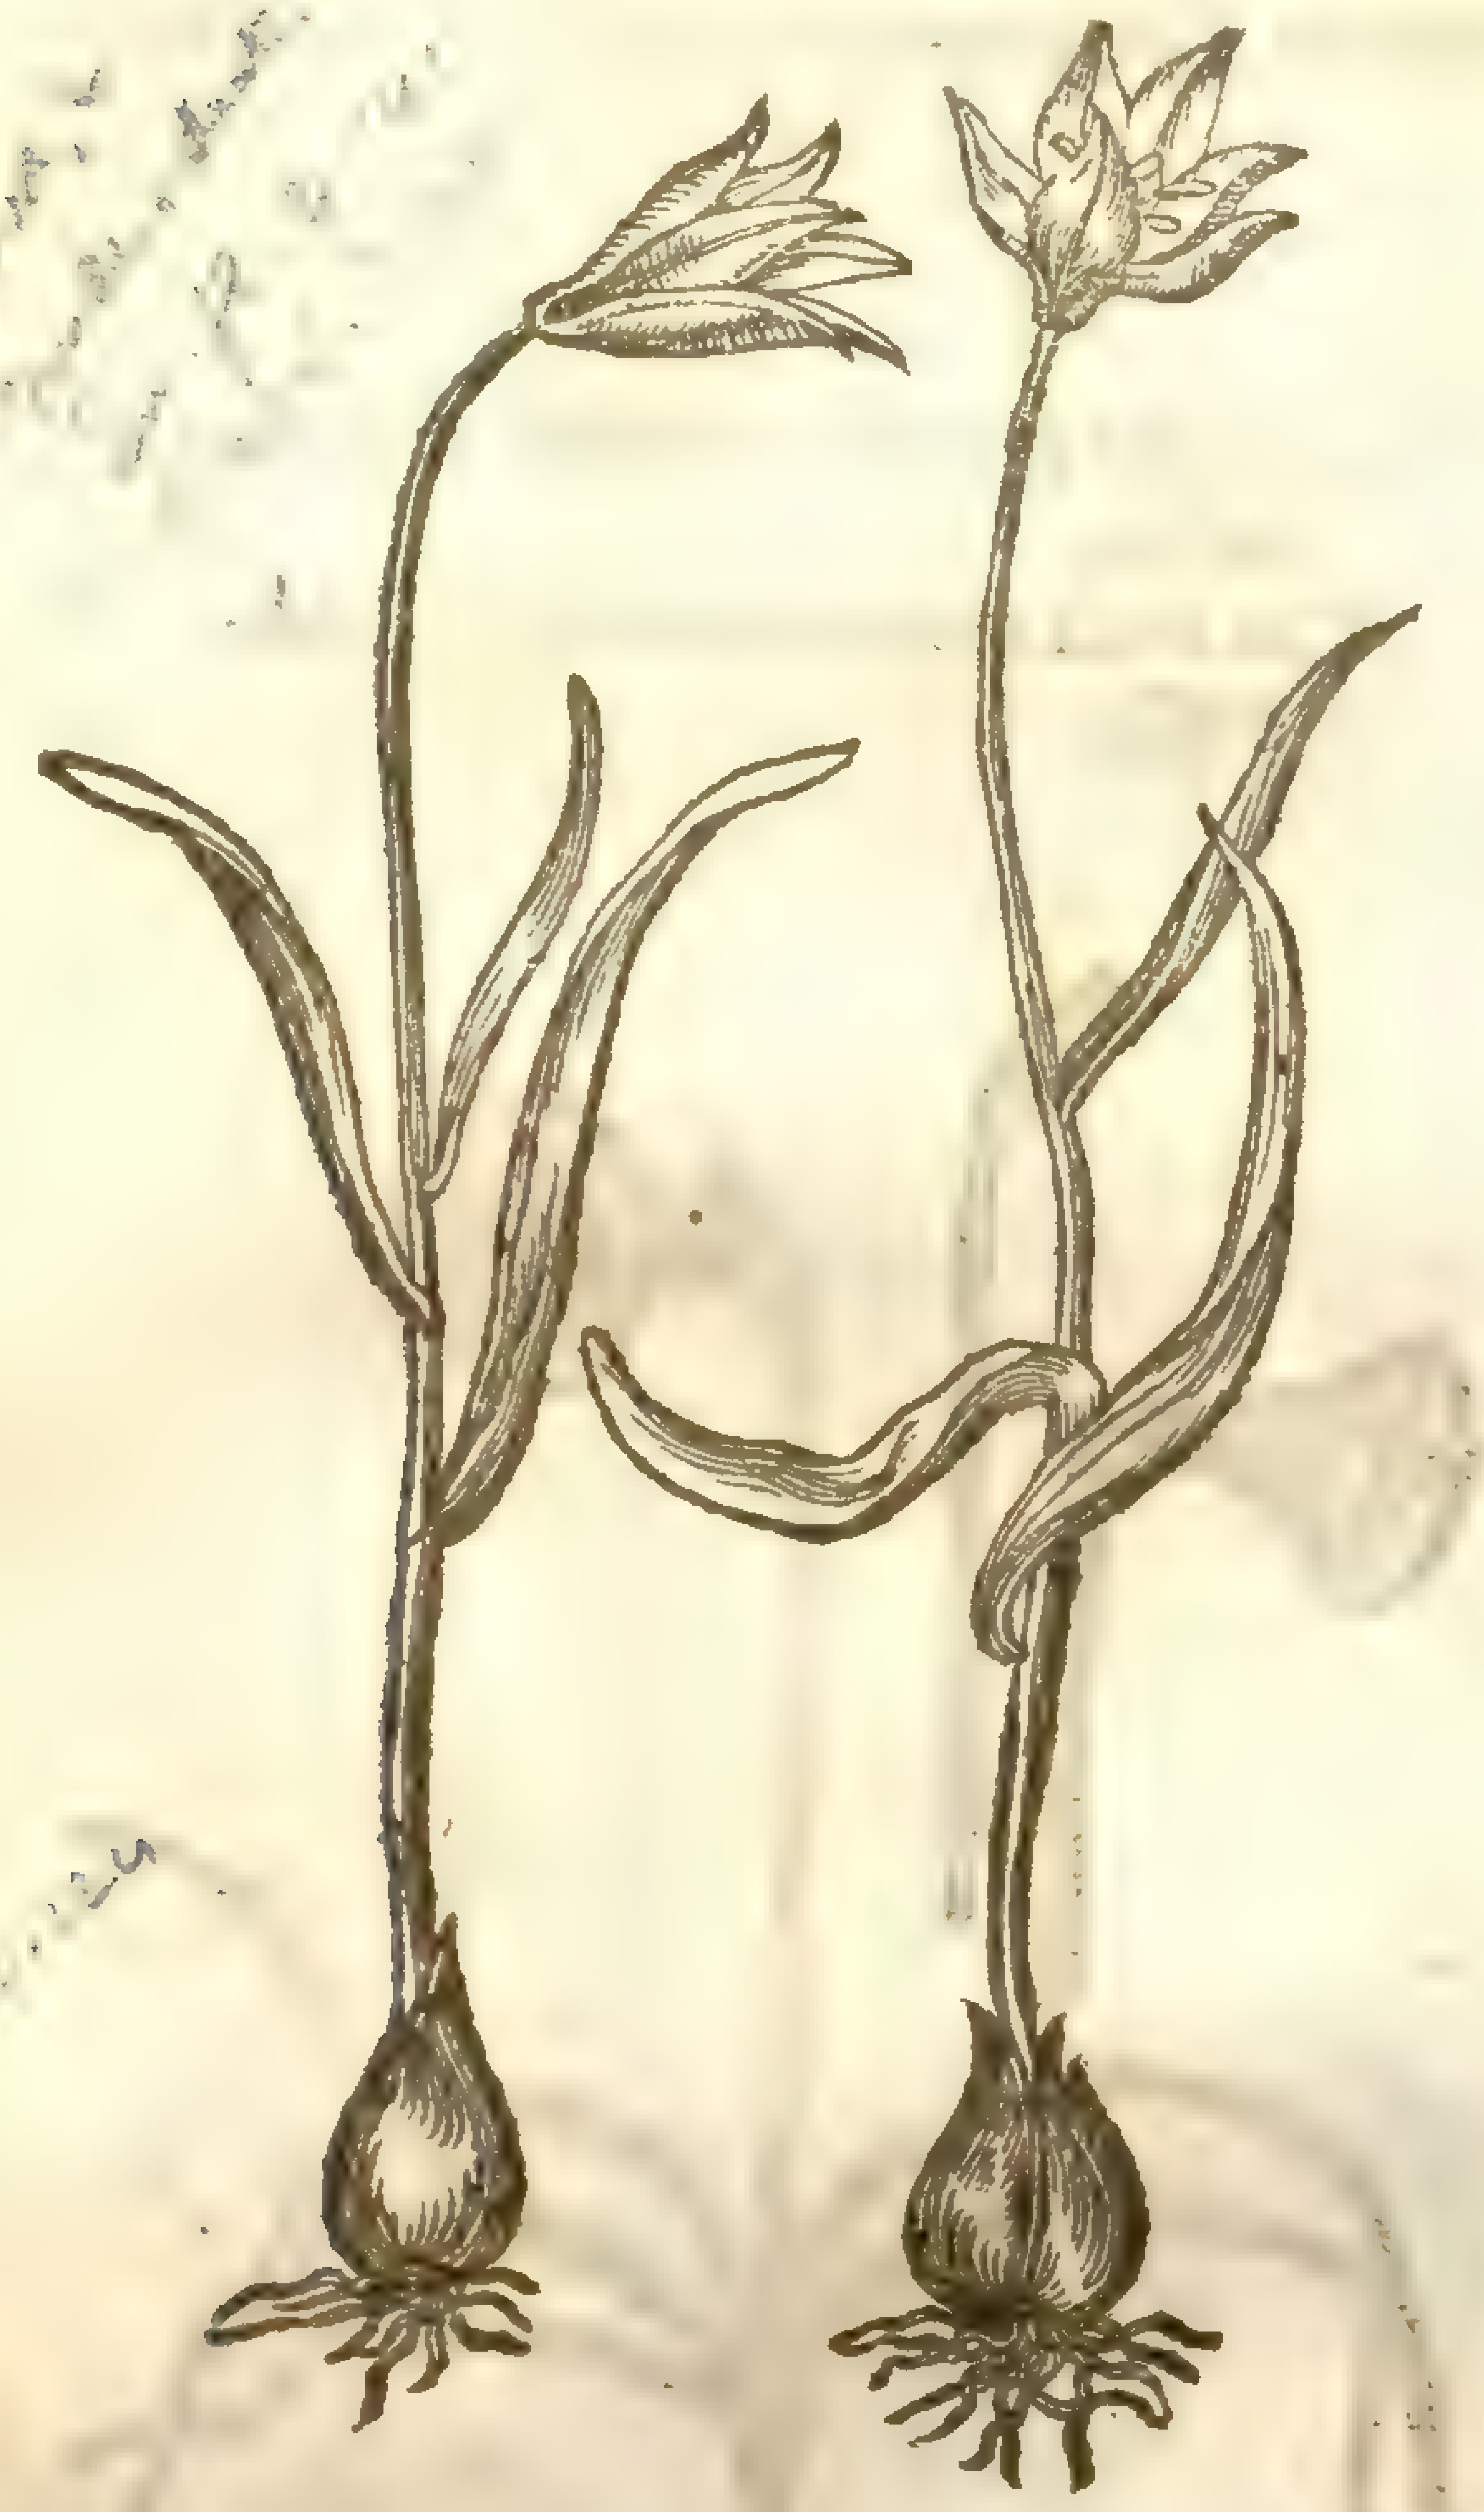
Chap. 87. *Of Tulipa, or the Dalmatian Cap.*

¶ *The Kindes.*

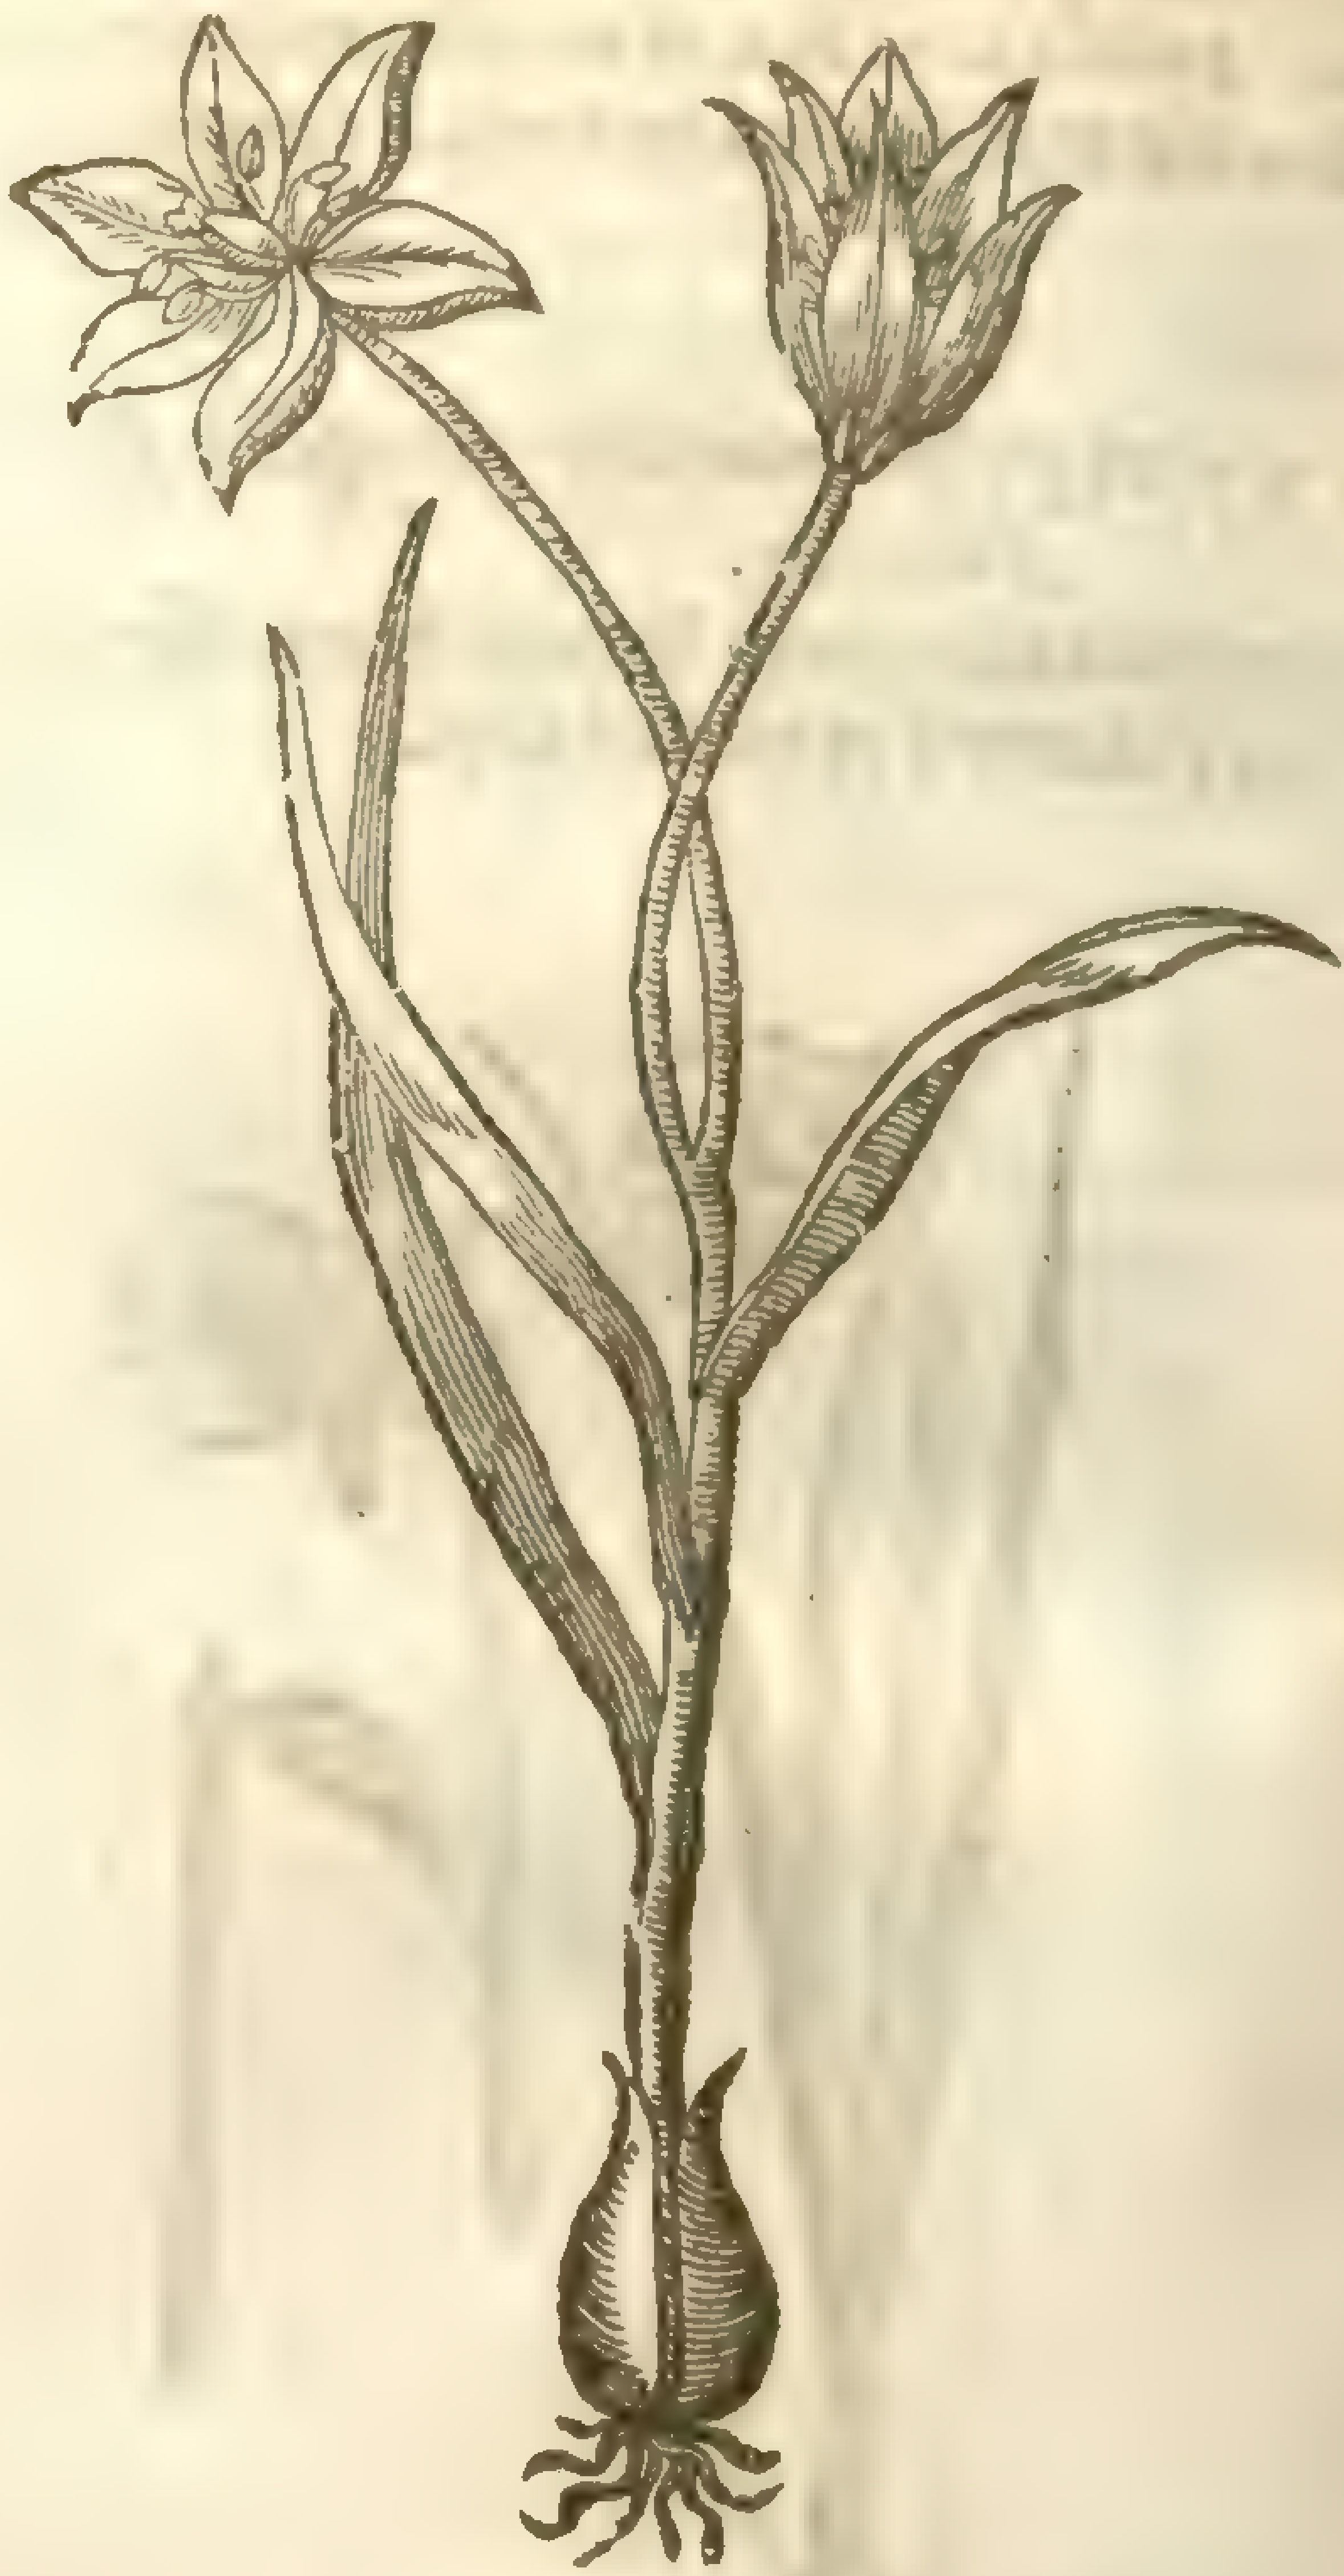
Tulipa or the Dalmatian Cap is a ſtrange and forrein floure, one of the number of the bulbed floures, whereof there be ſundry ſorts, ſome greater, ſome leſſer, with which all ſtudious and painefull Herbariſts deſire to be better acquainted, becauſe of that excellent diuerſitie of moſt braue floures which it beareth. Of this there be two chiefe and generall kindes, *viz. Præcox*, and *Serotina*; the one doth beare his floures timely, the other later. To theſe two we will adde another ſort called *Media*, flouring betweene both the others. And from theſe three ſorts, as from their heads, all other kindes doe proceed, which are almoſt infinite in number. Notwithſtanding, my louing friend Mr *Iames Garret*, a curious ſearcher of Simples, and learned Apothecarie of London, hath vndertaken to finde out, if it were poſſible, their infinite ſorts, by diligent ſowing of their ſeeds, and by planting thoſe of his owne propagation, and by others receiued from his friends

1 *Tulipa Bononienſis.*
Italian Tulipa.

T. sylvestris [illegible]



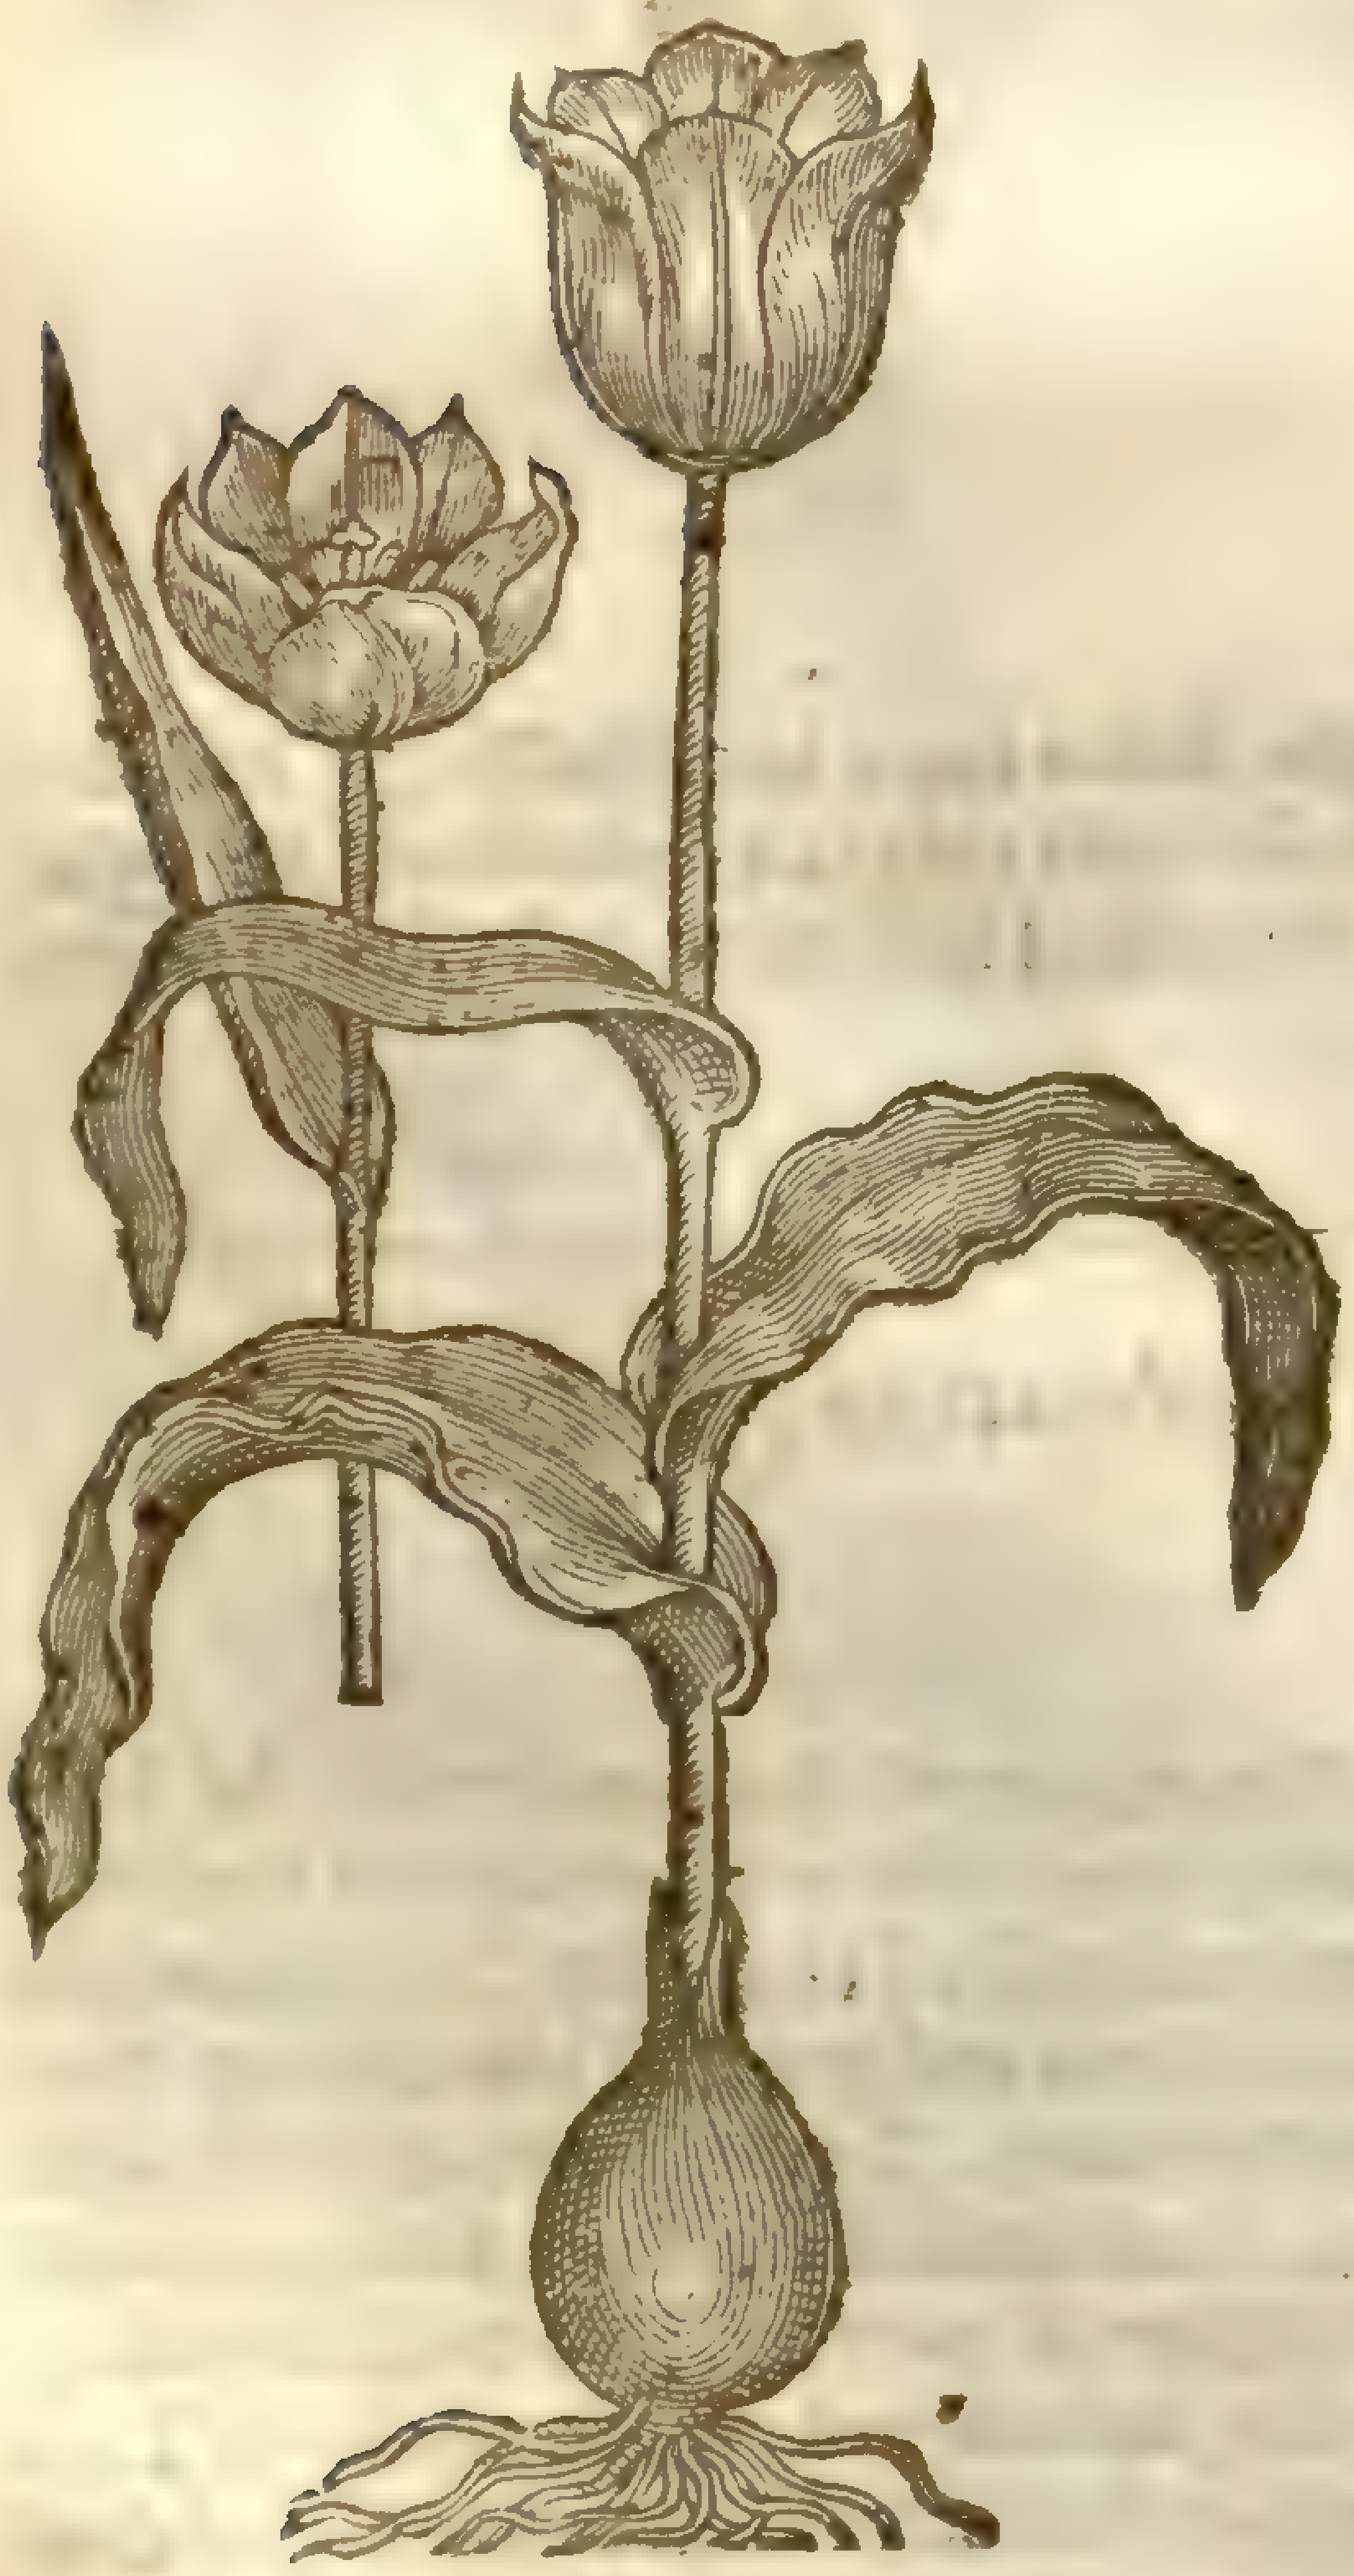
2 *Tulipa Narbonenſis.*
French Tulipa.



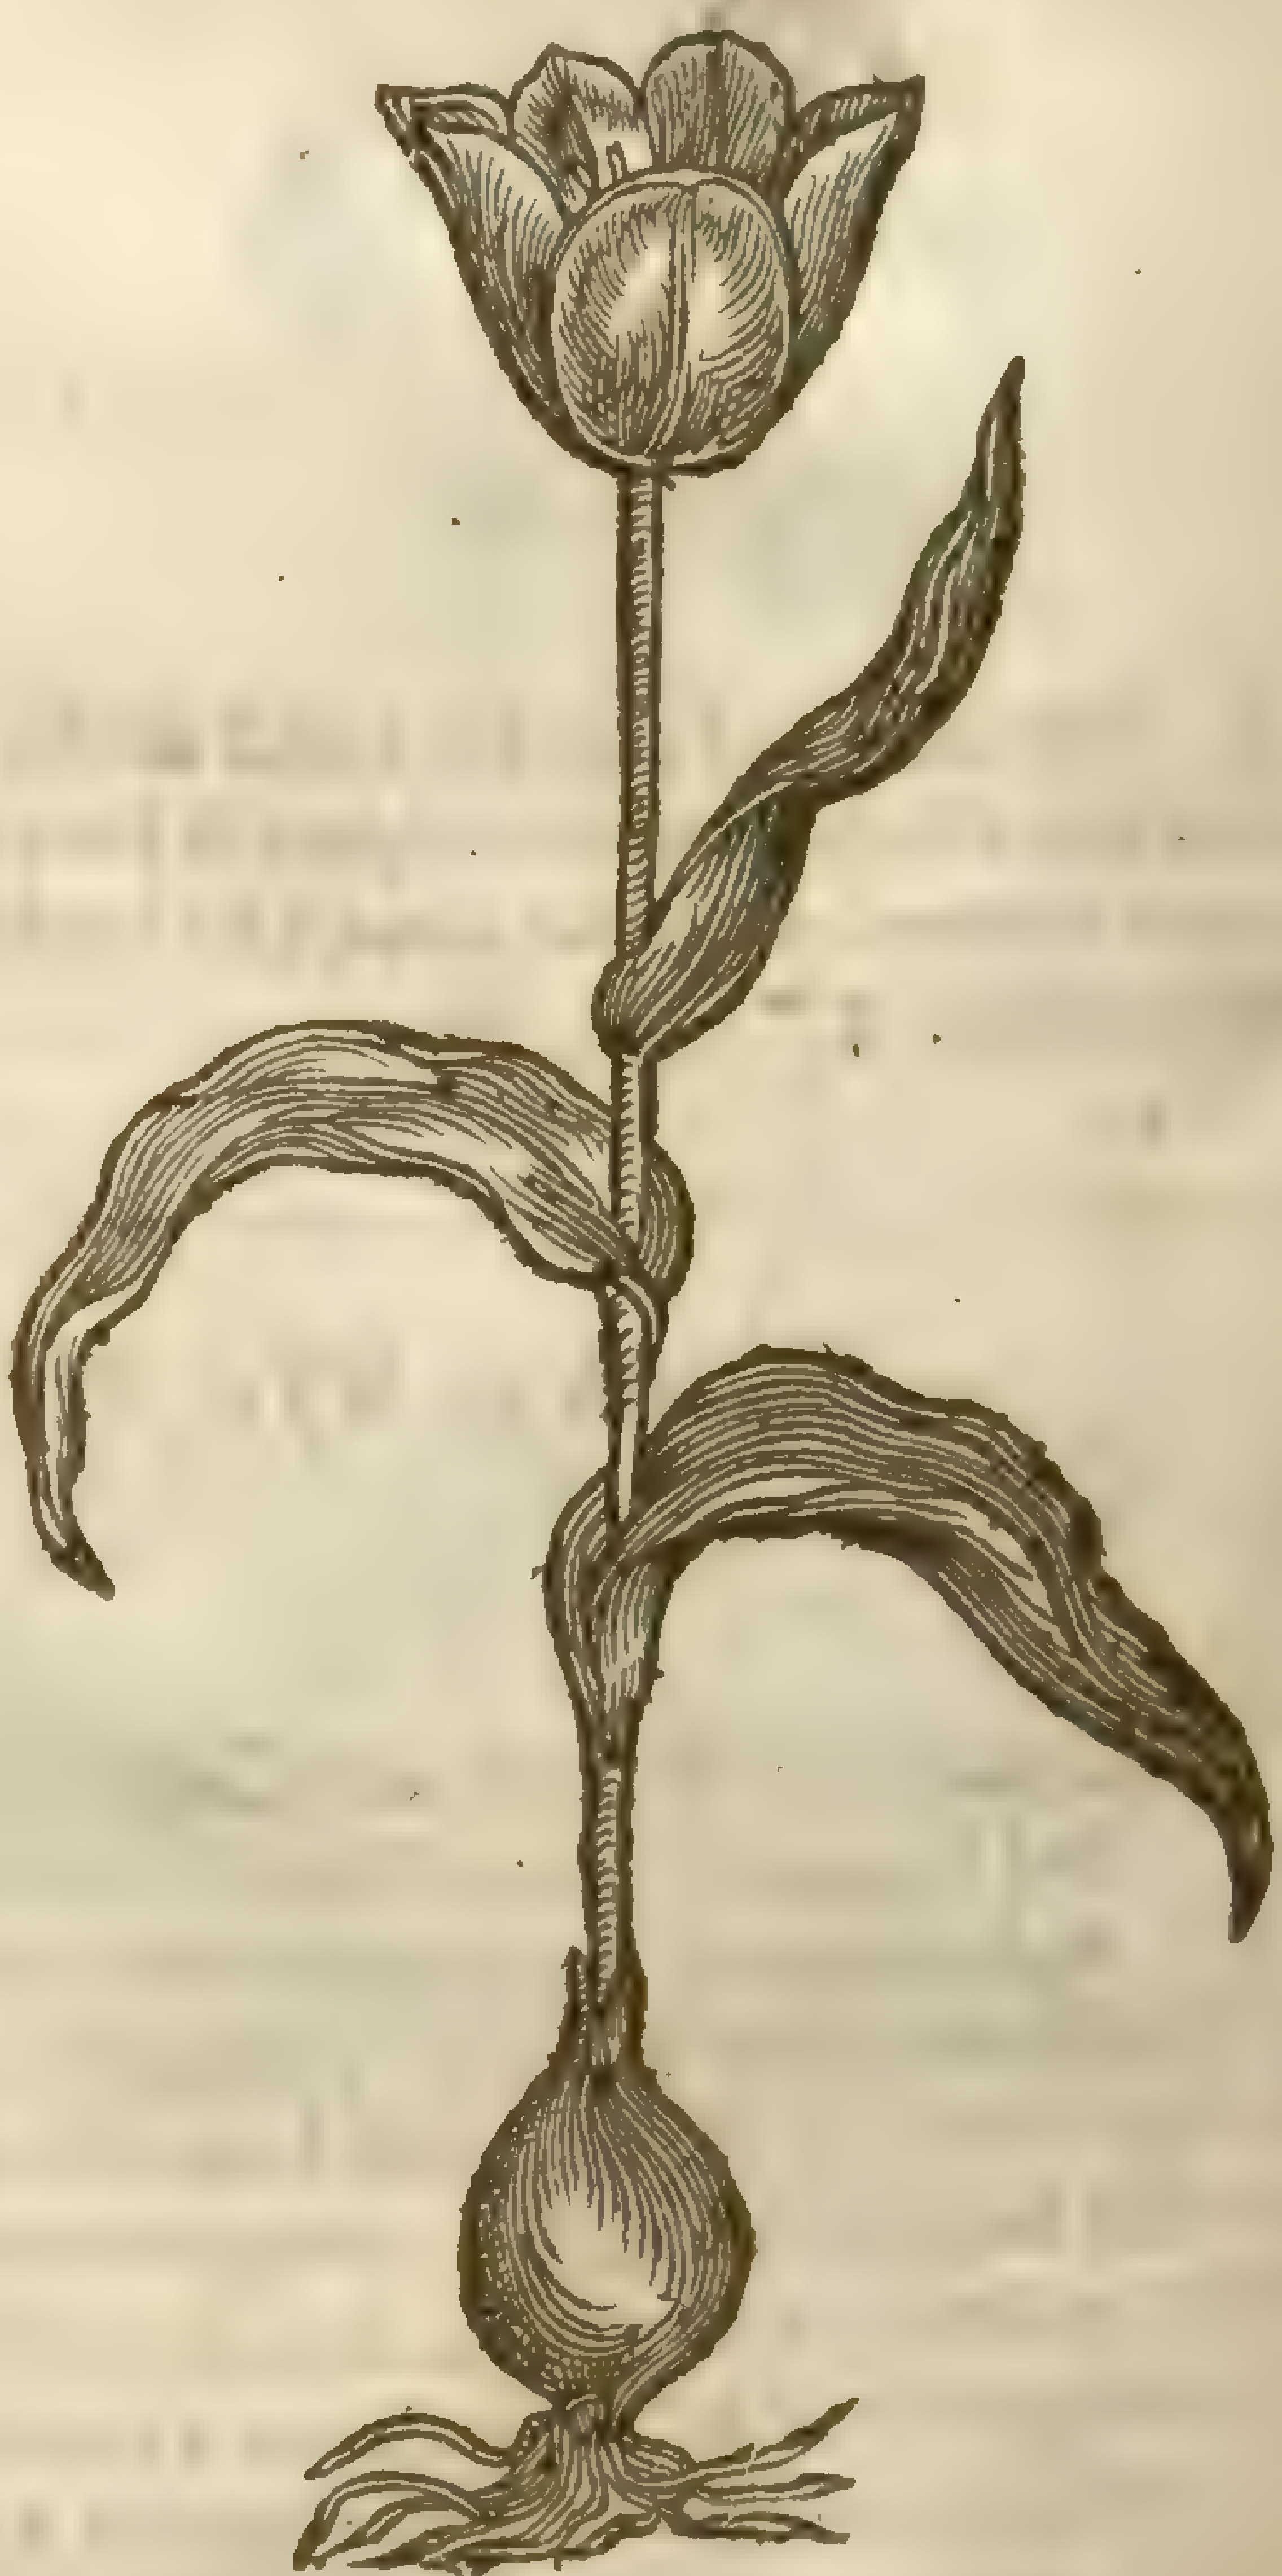
[illegible]

3 *Tulipa præcox tota lutea.*
Timely flouring Tulipa.

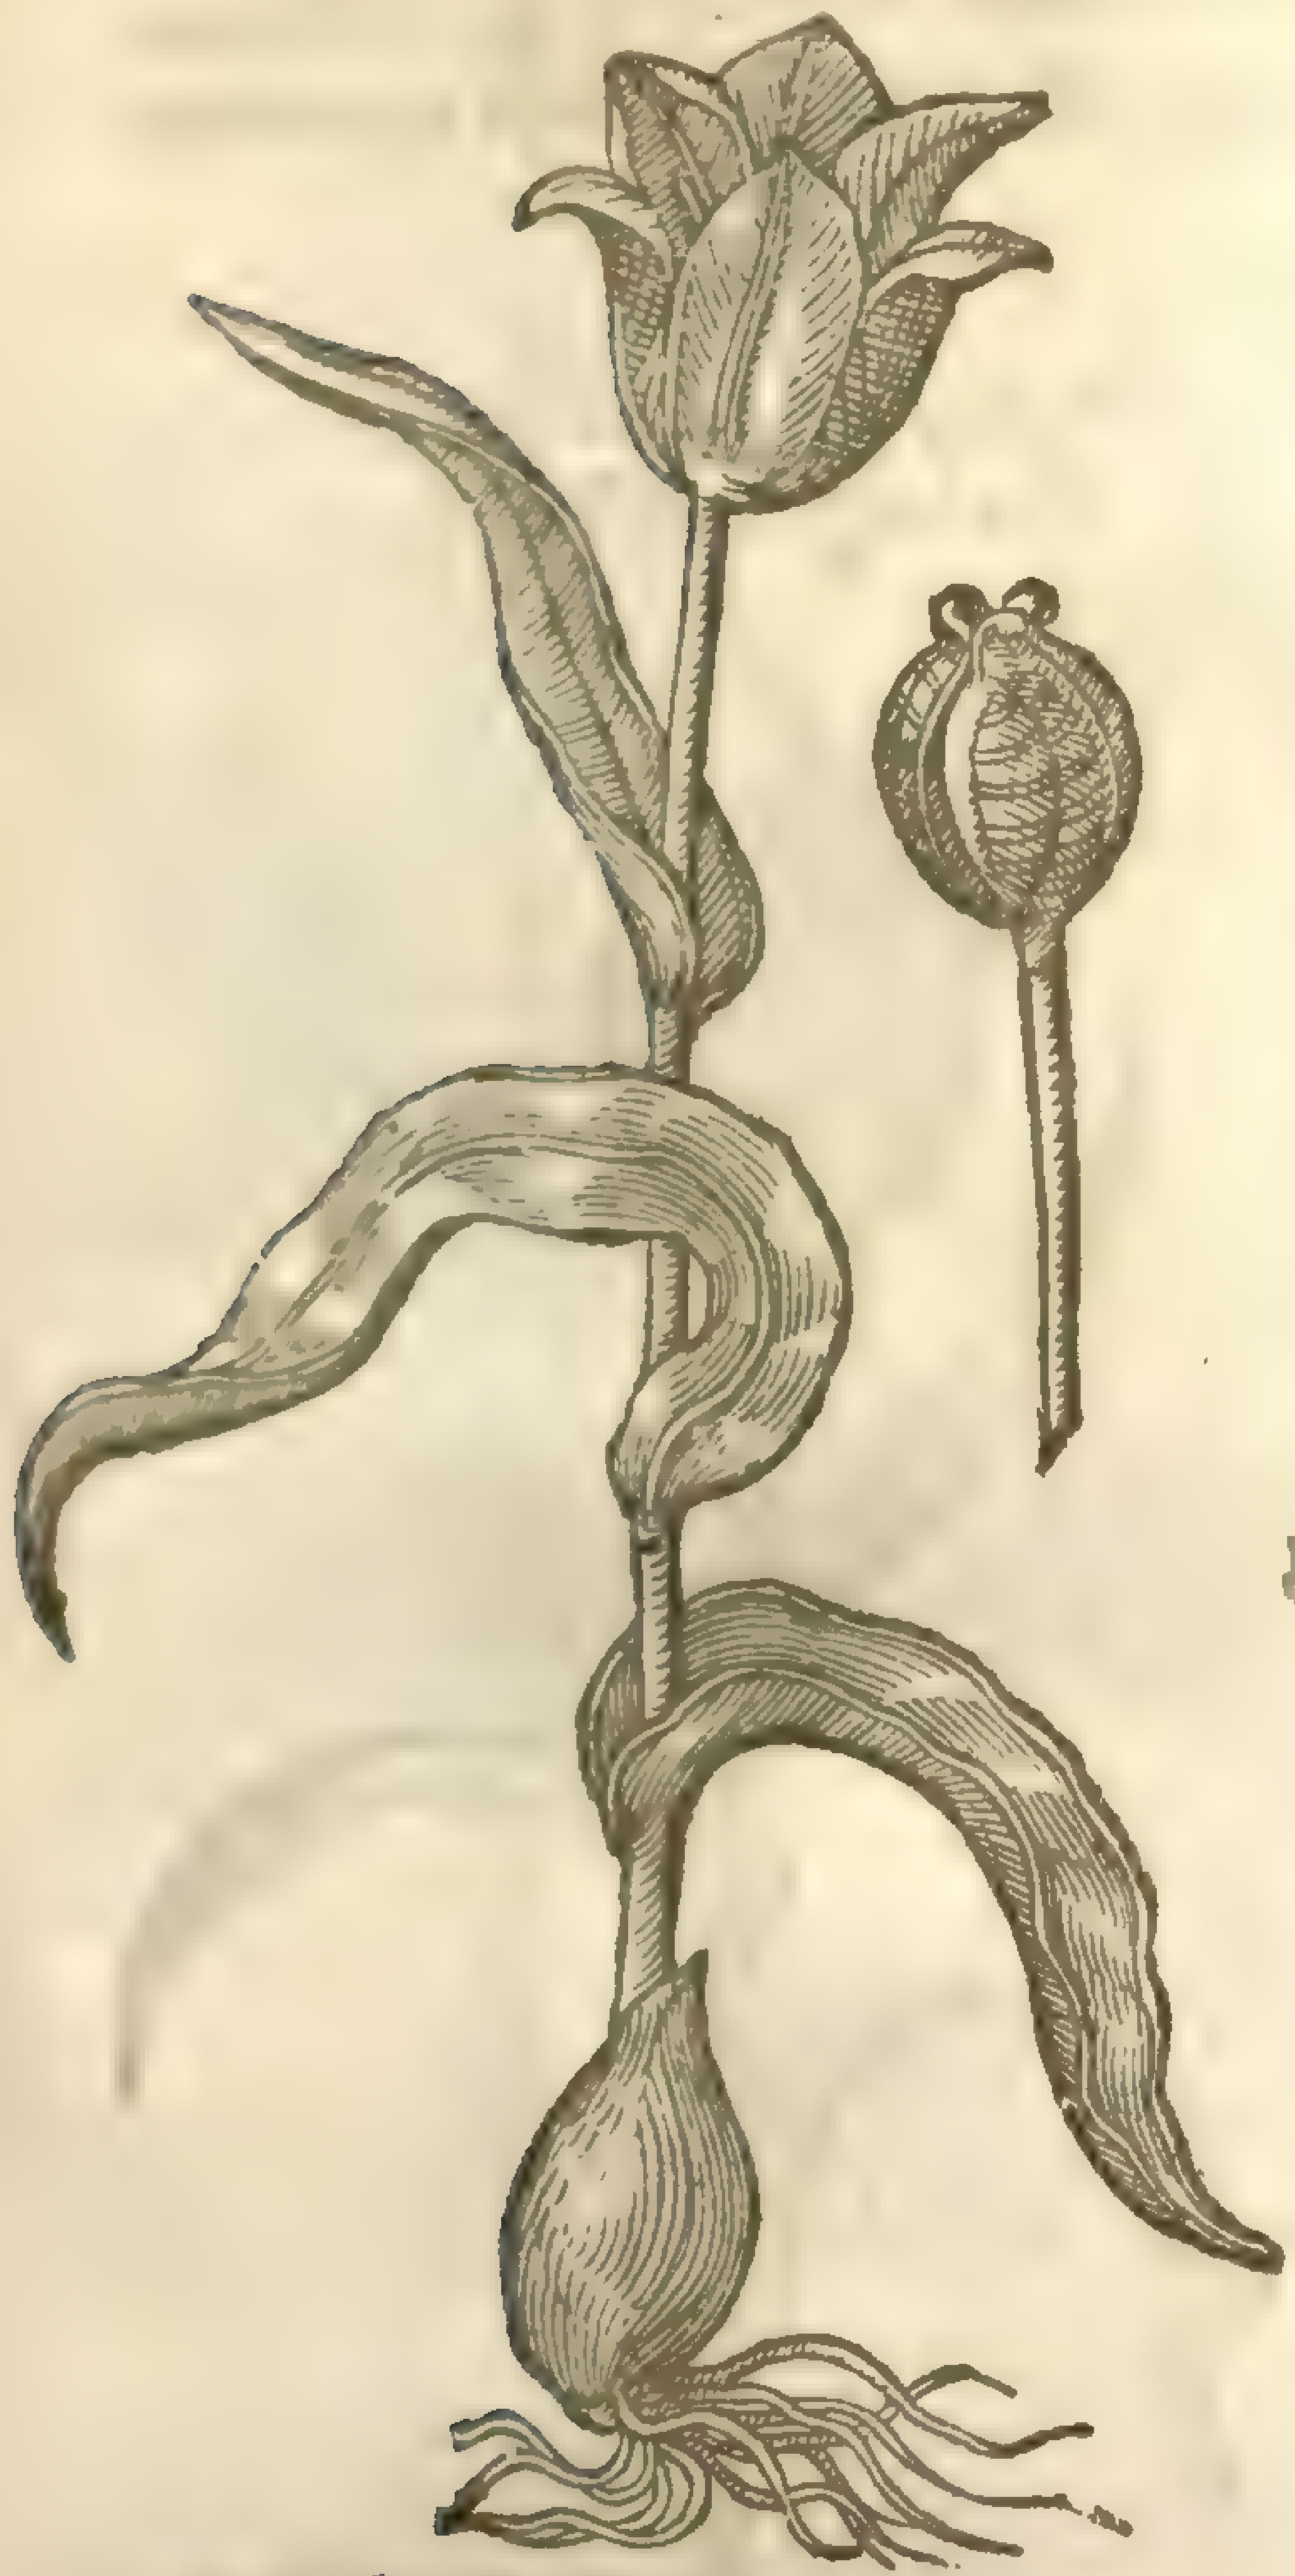
T. Gesneriana, & [illegible]



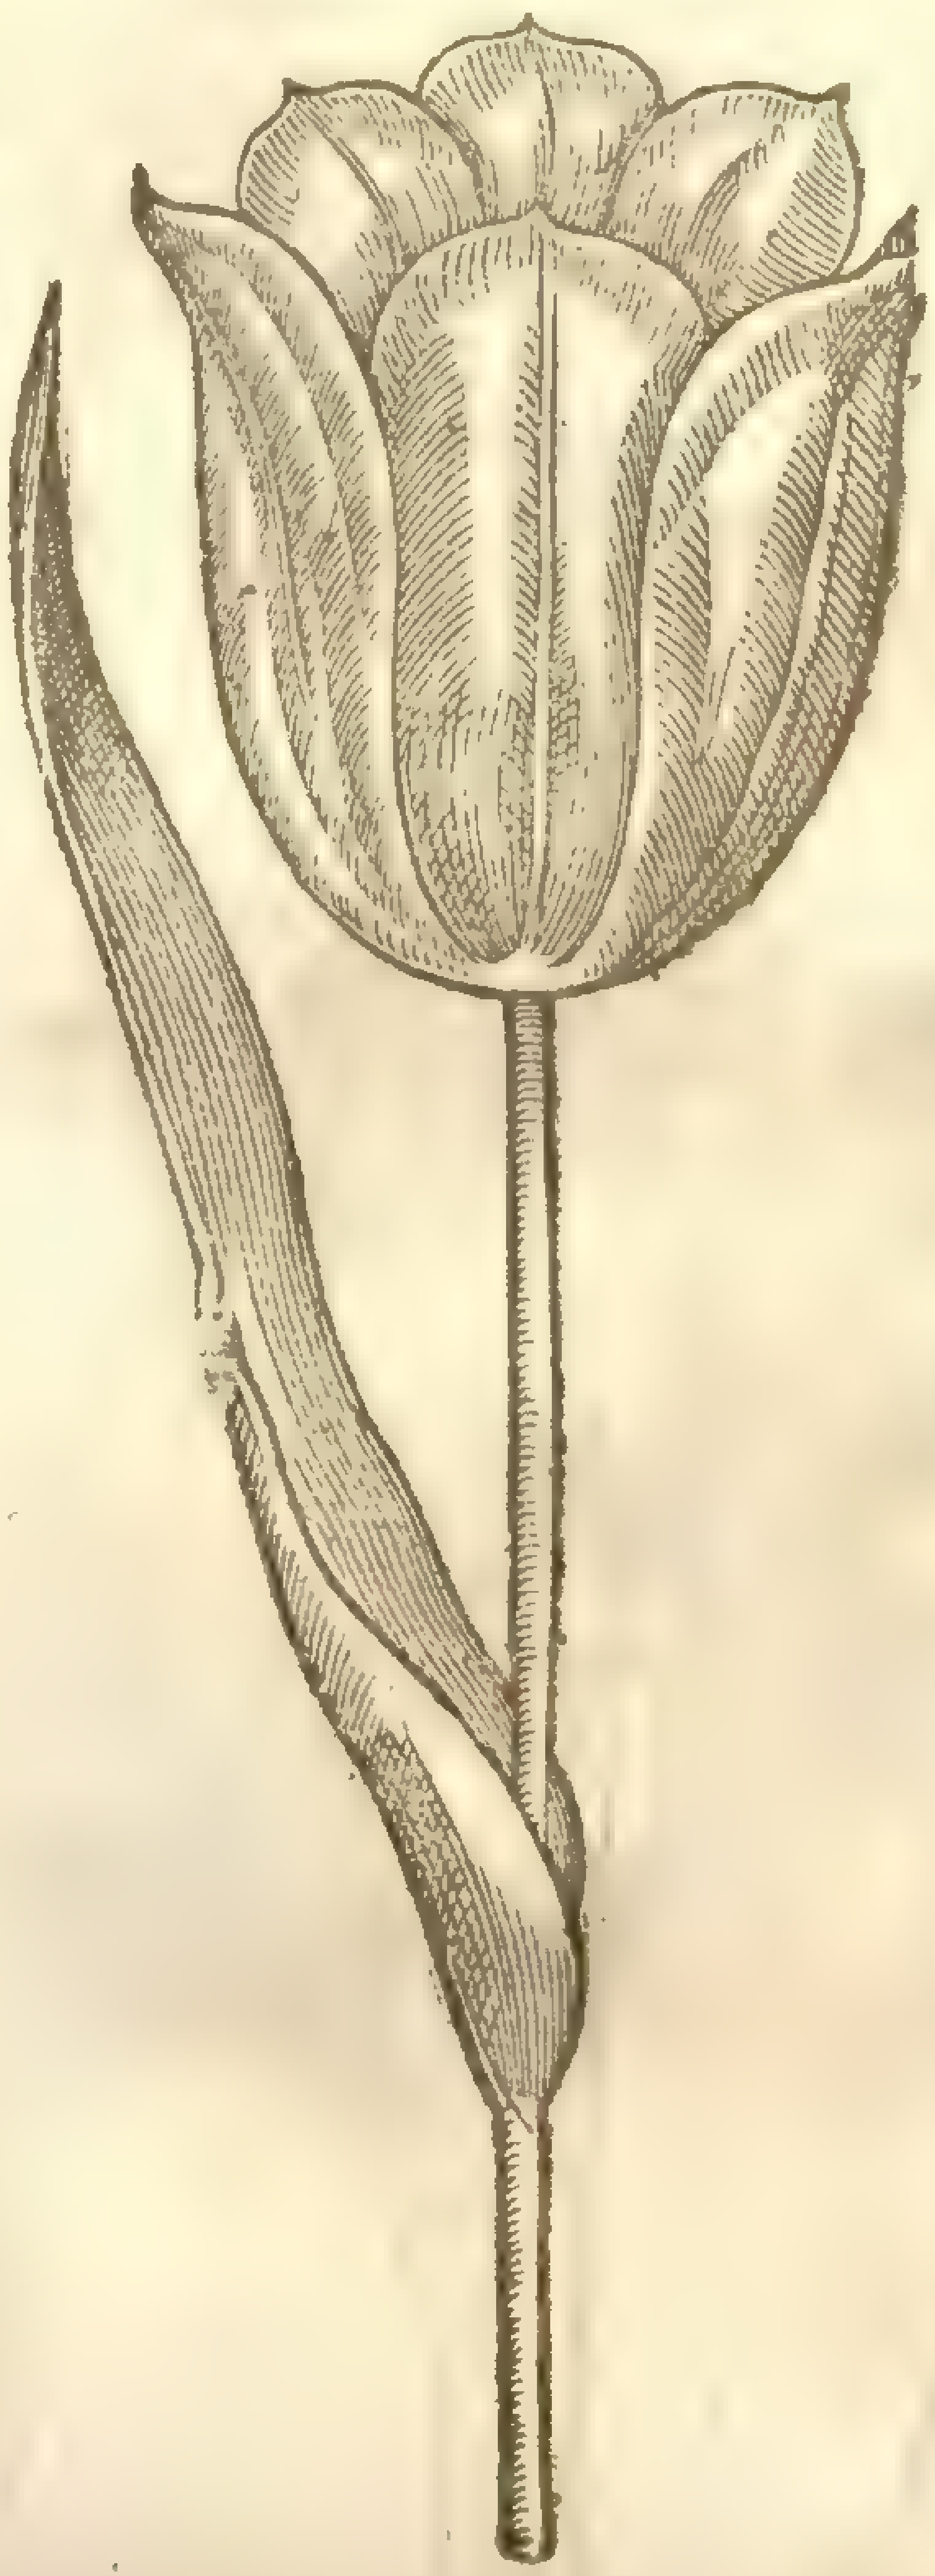
4 *Tulipa coccinea ſerotina.*
Late flouring Tulipa.



5 *Tulipa media ſanguinea albis oris.*
Apple bloome Tulipa.

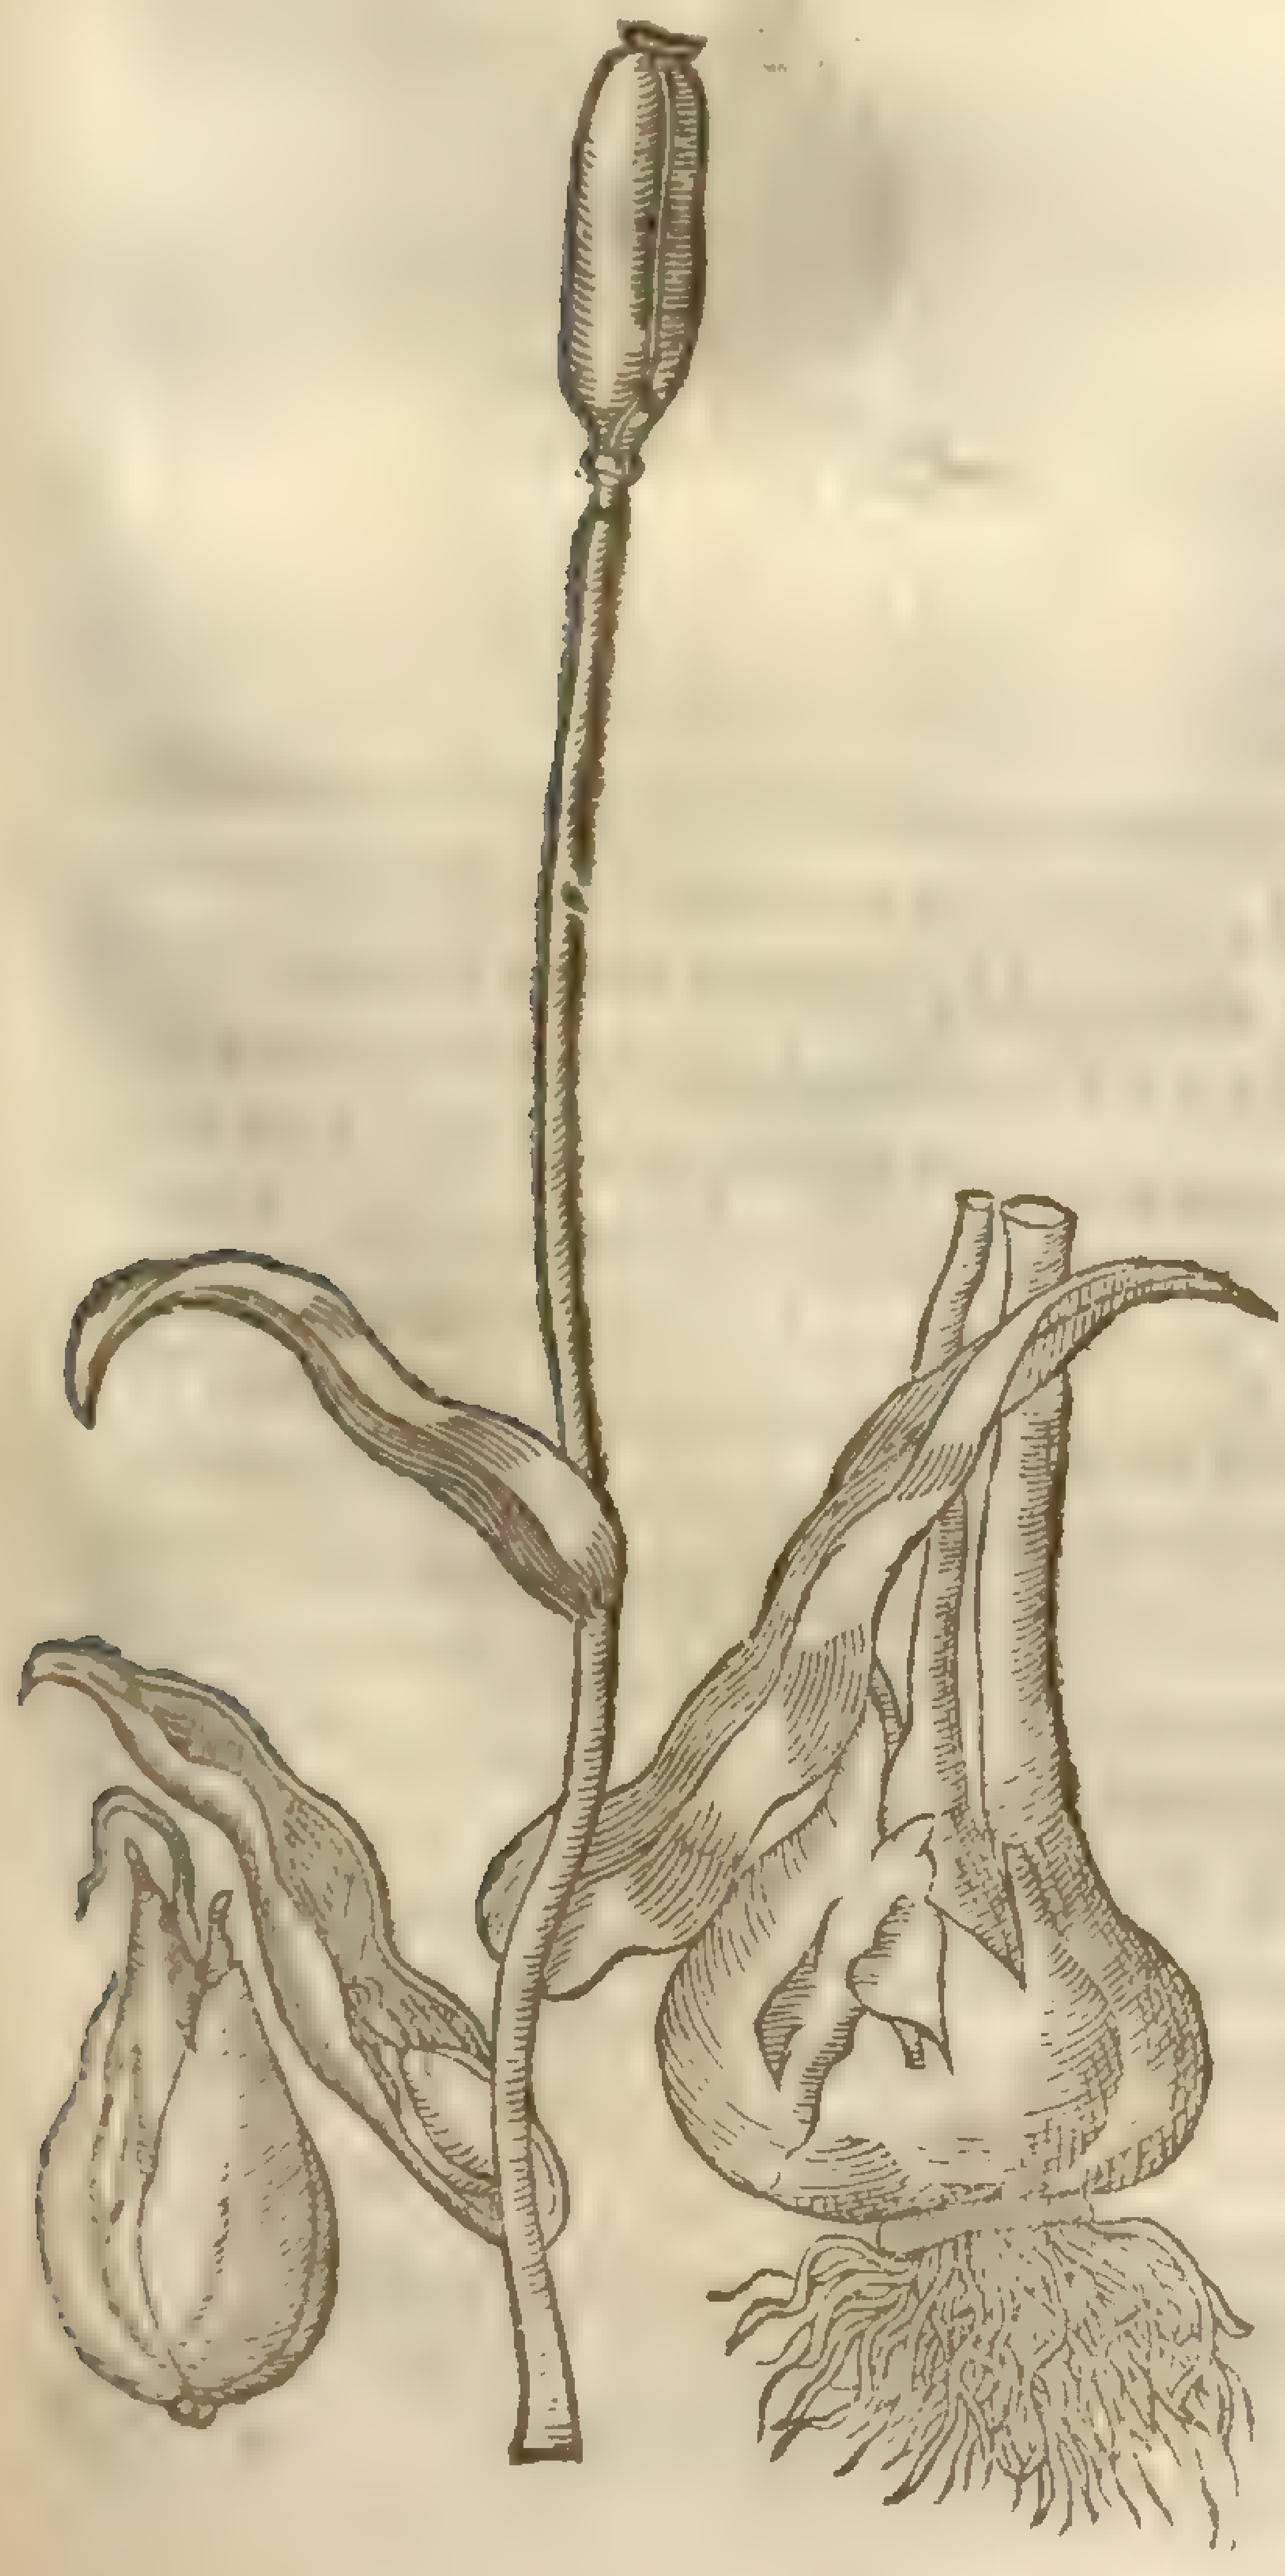


6 *Tulipa candida ſuavis rubentibus oris.*
Bluſh coloured Tulipa.

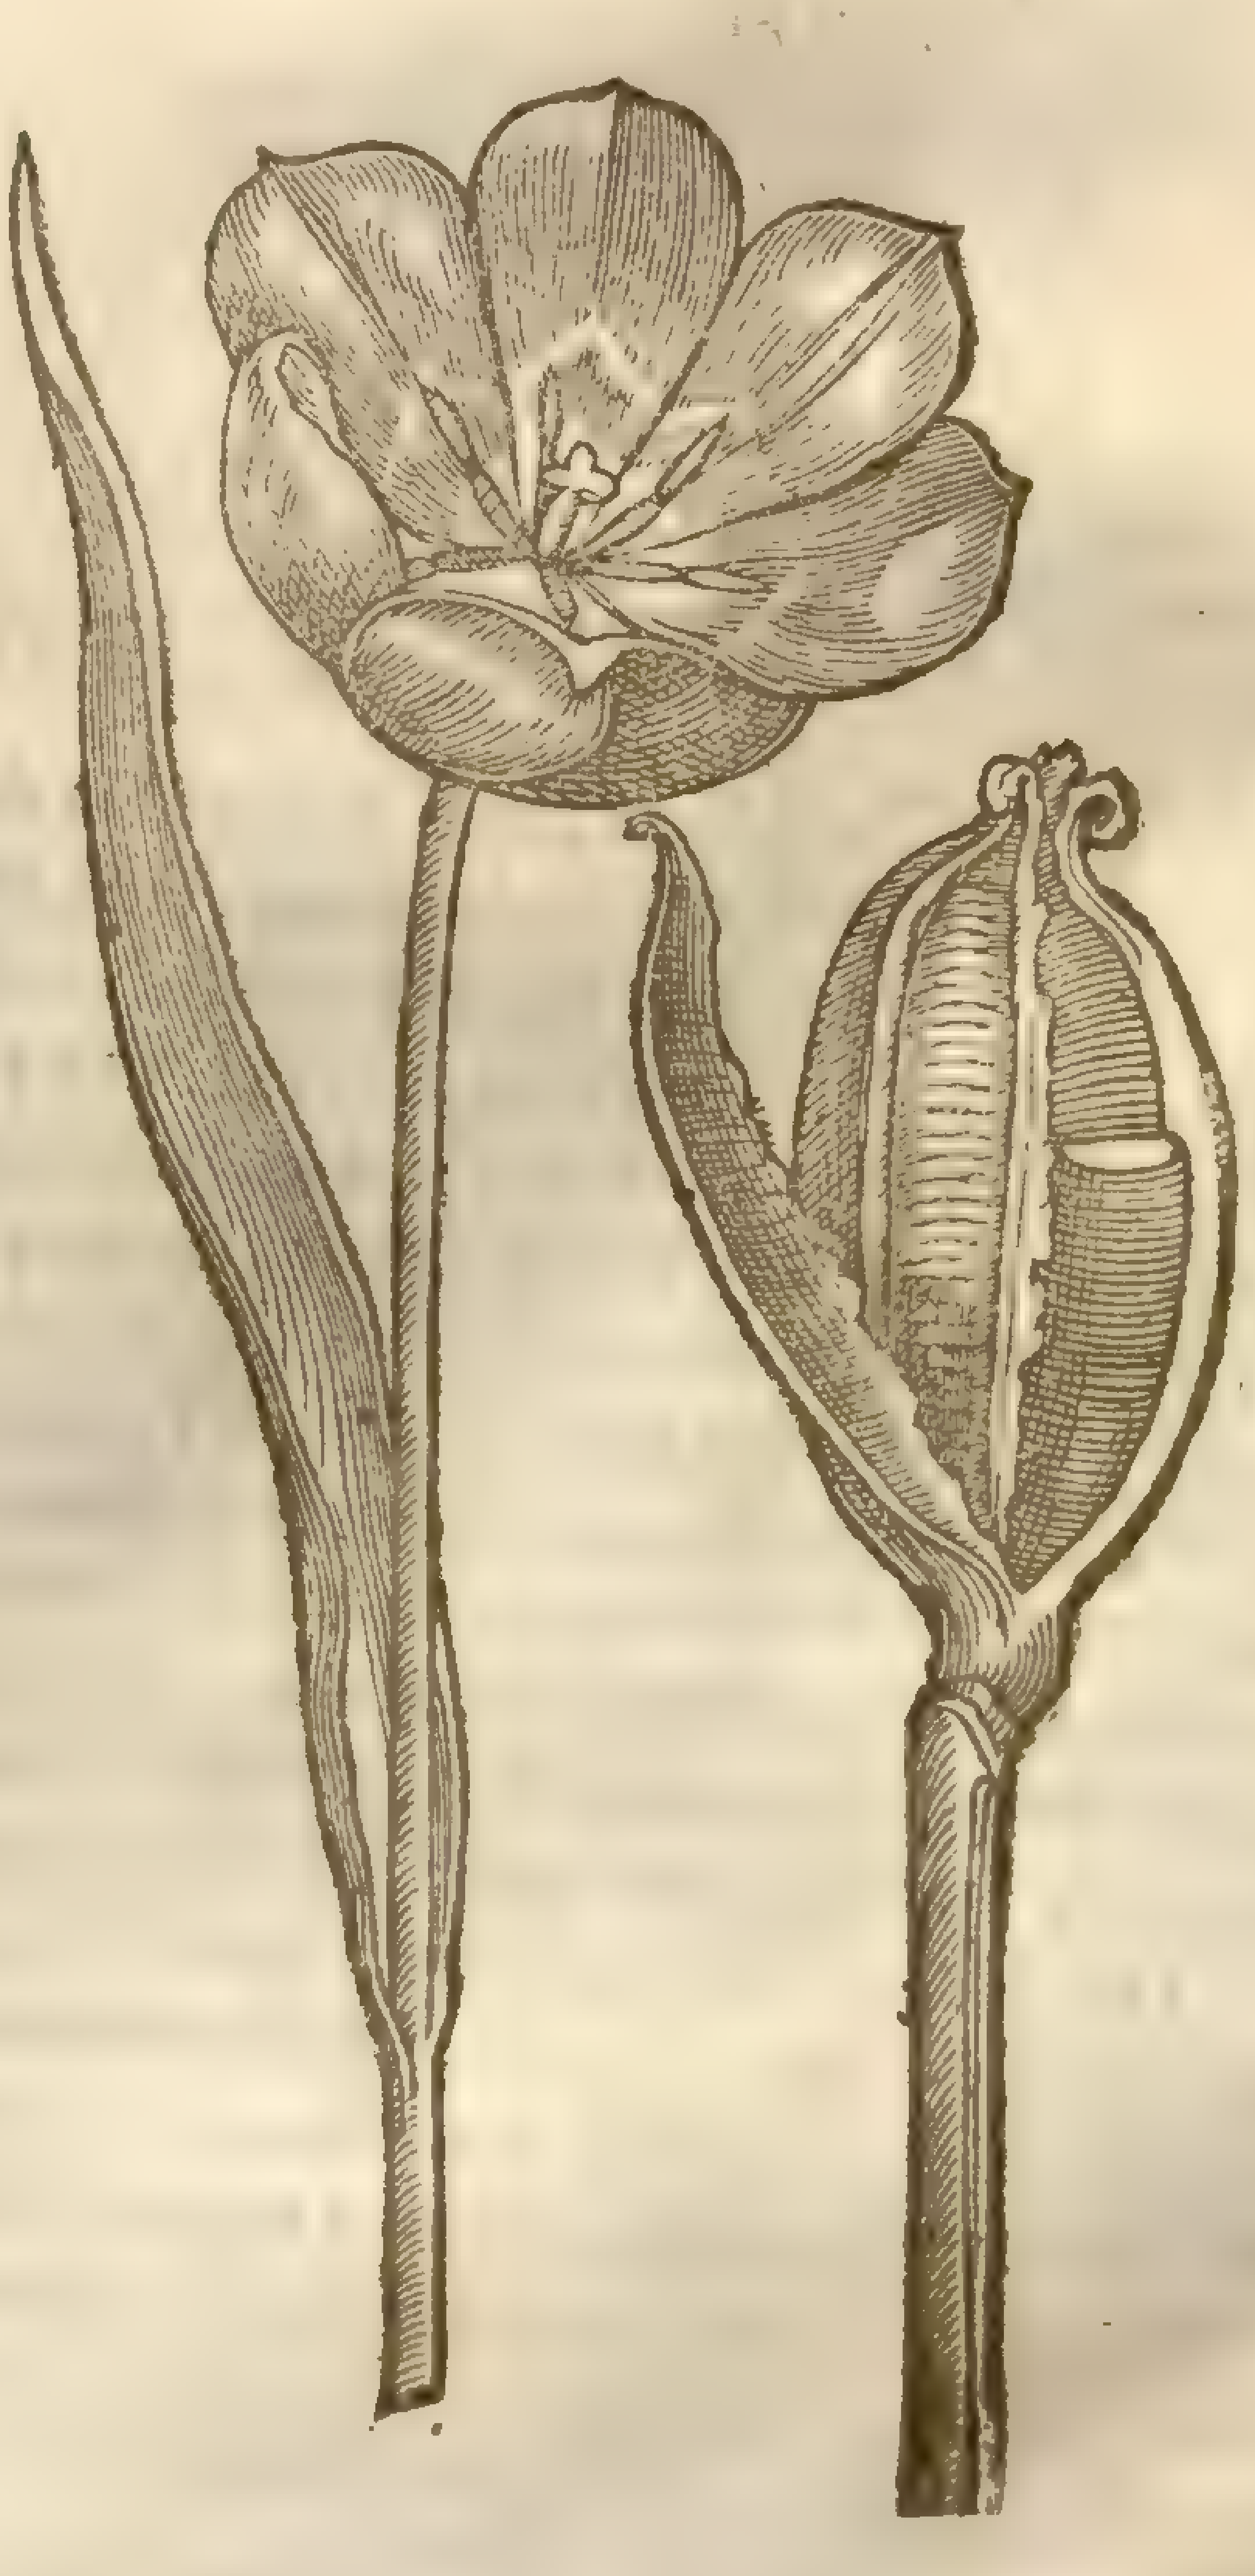


[illegible]

7 *Tulipa bulbifera.*
Bulbous ſtalked Tulipa.

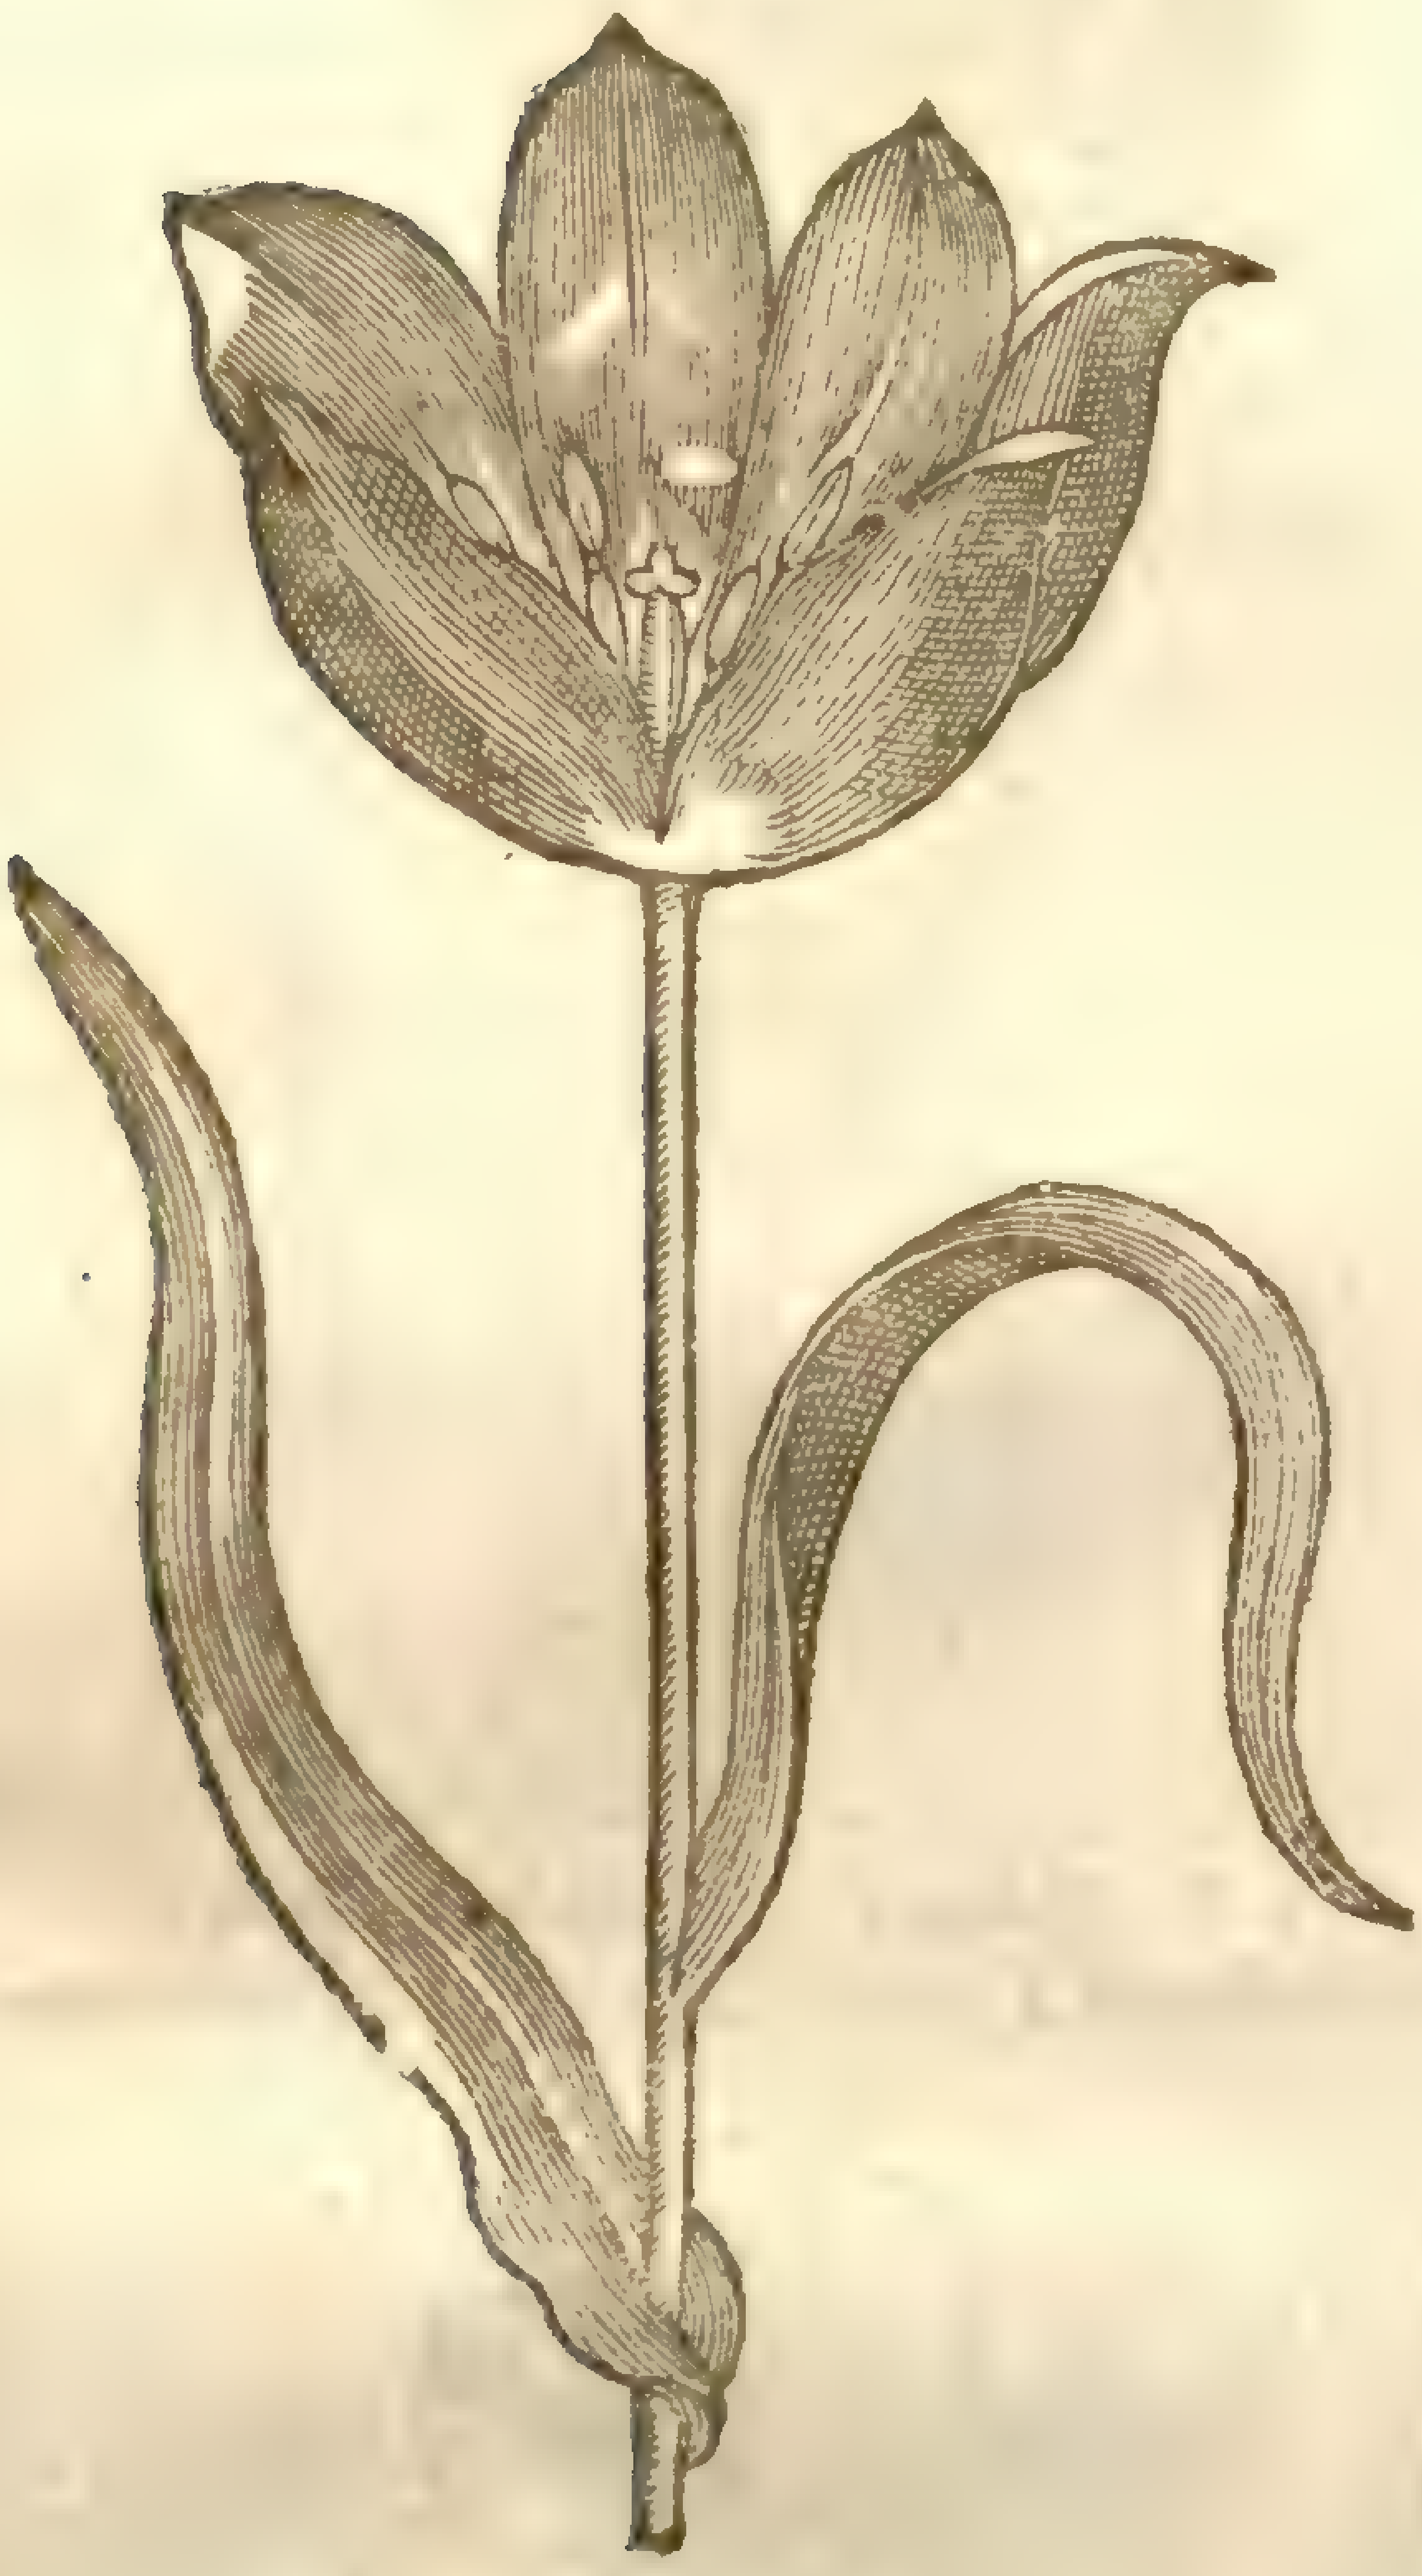


‡ 8 *Tulipa ſanguinea luteo fundo.*
The blond-red Tulip with a yellow bottome.

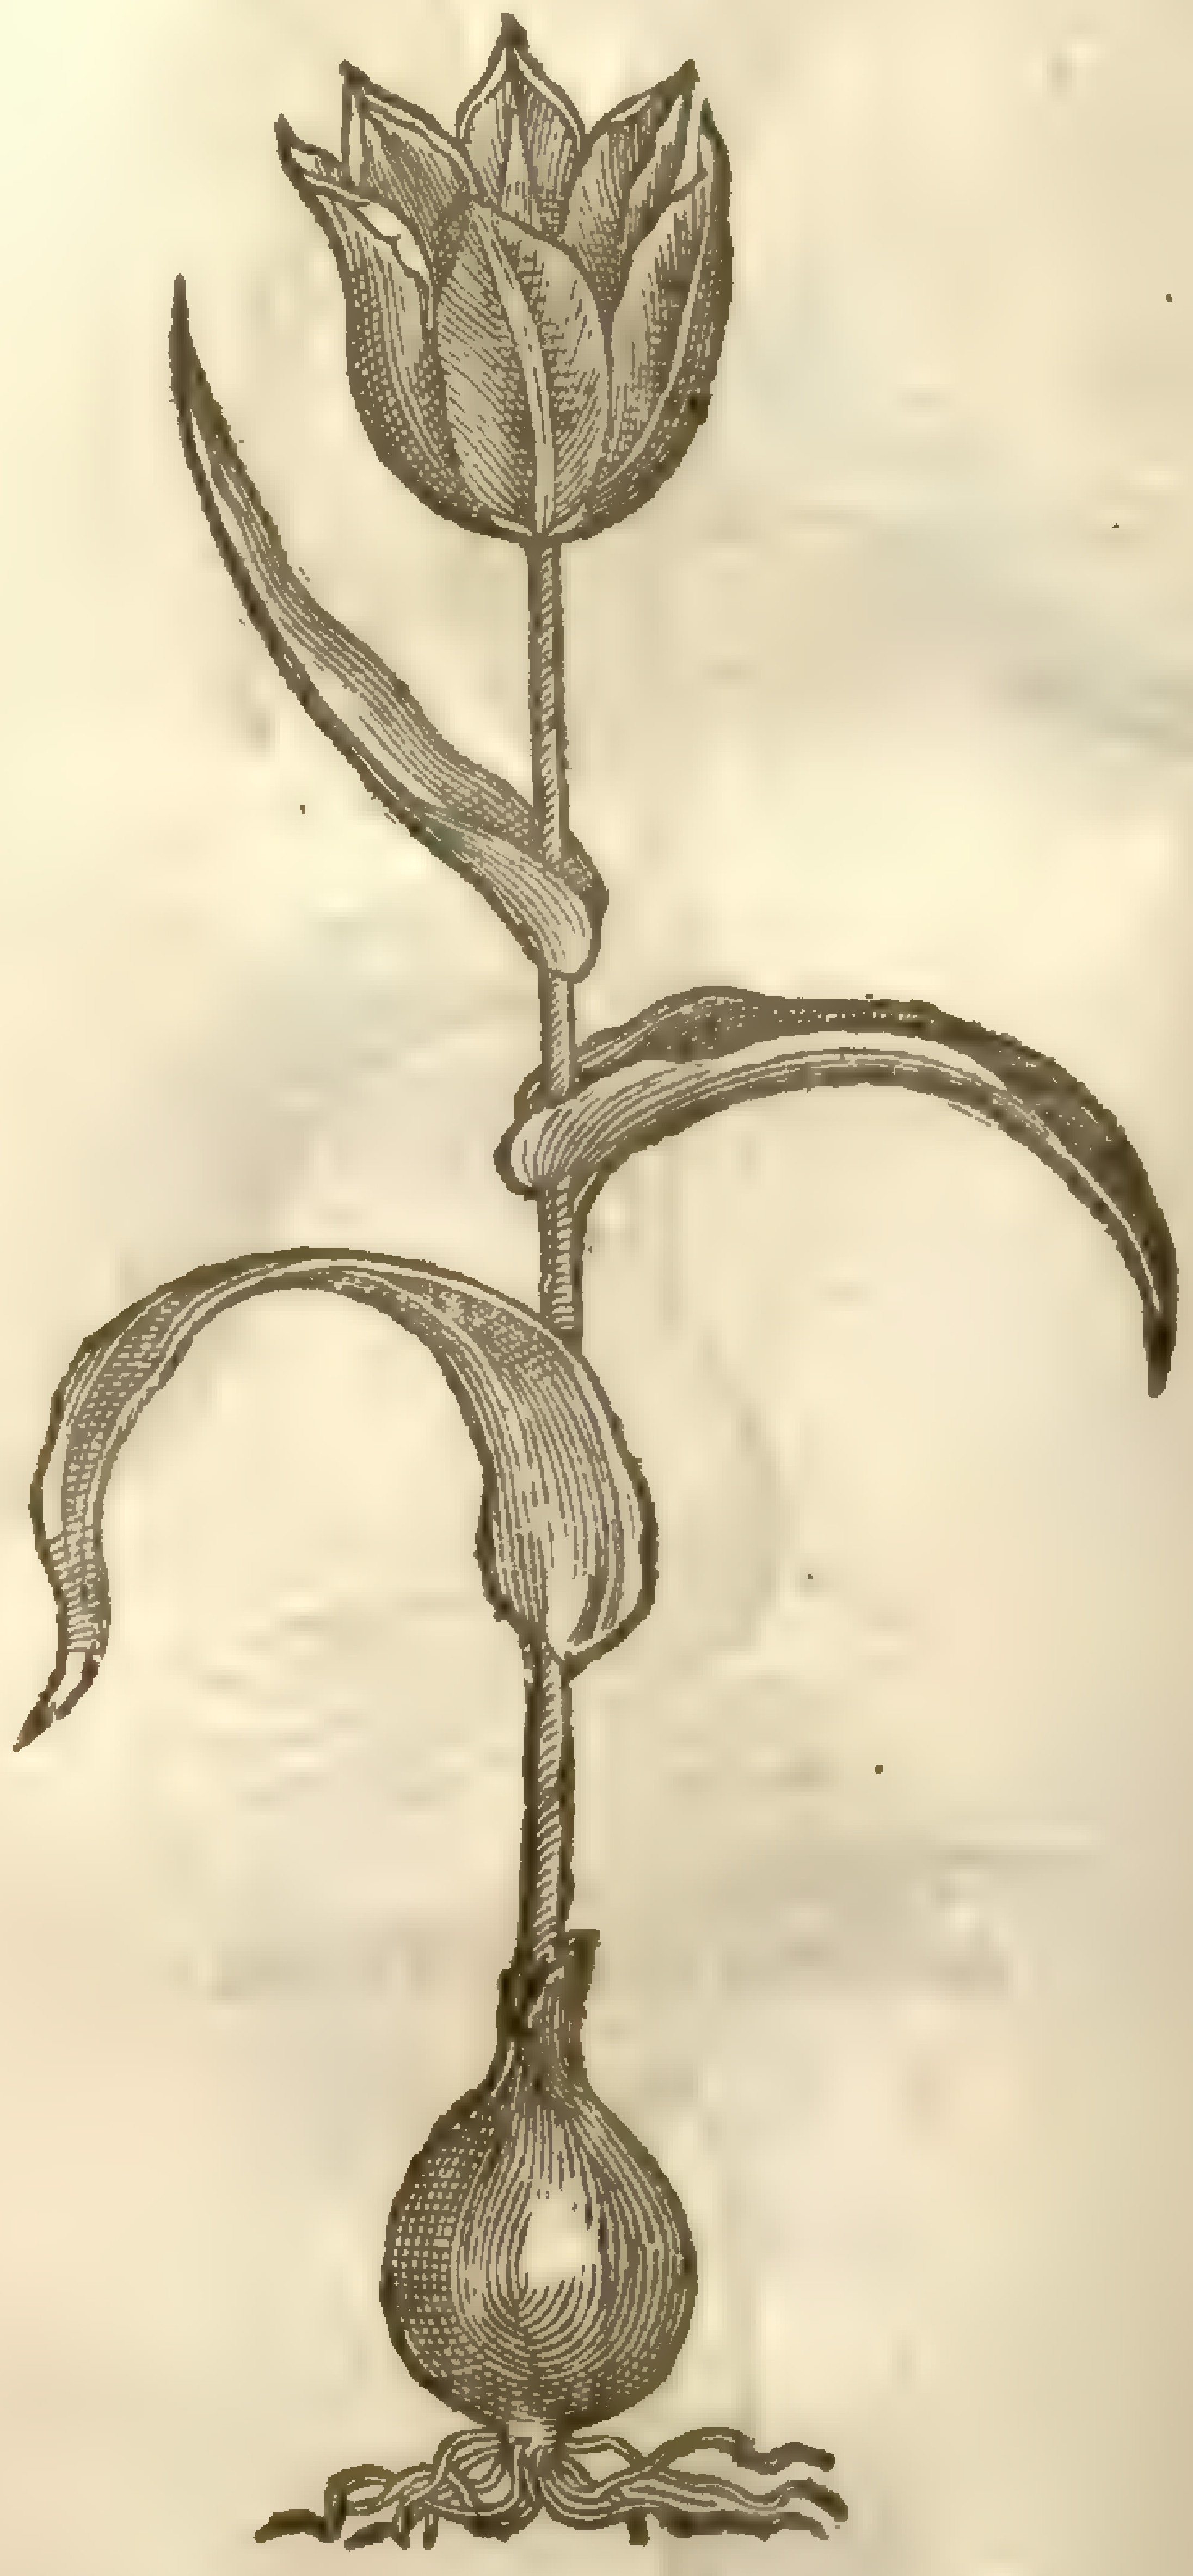


beyond the ſeas for the ſpace of twenty yeares,not being yet able to attaine to the end of his trauel,for that each new yeare bringeth forth new plants of ſundry colours not before ſeen; all which to deſcribe particularly were to rolle *Siſiphus* ſtone,or number the ſands. So that it ſhall ſuffice to ſpeake of and deſcribe a few,referring the reſt to ſome that meane to write of Tulipa a particular volume.

‡ 9 *Tulipa purpurea.*
The purple Tulip.



‡ 10 *Tulipa rubra amethiſtina.*
The bright red Tulip.



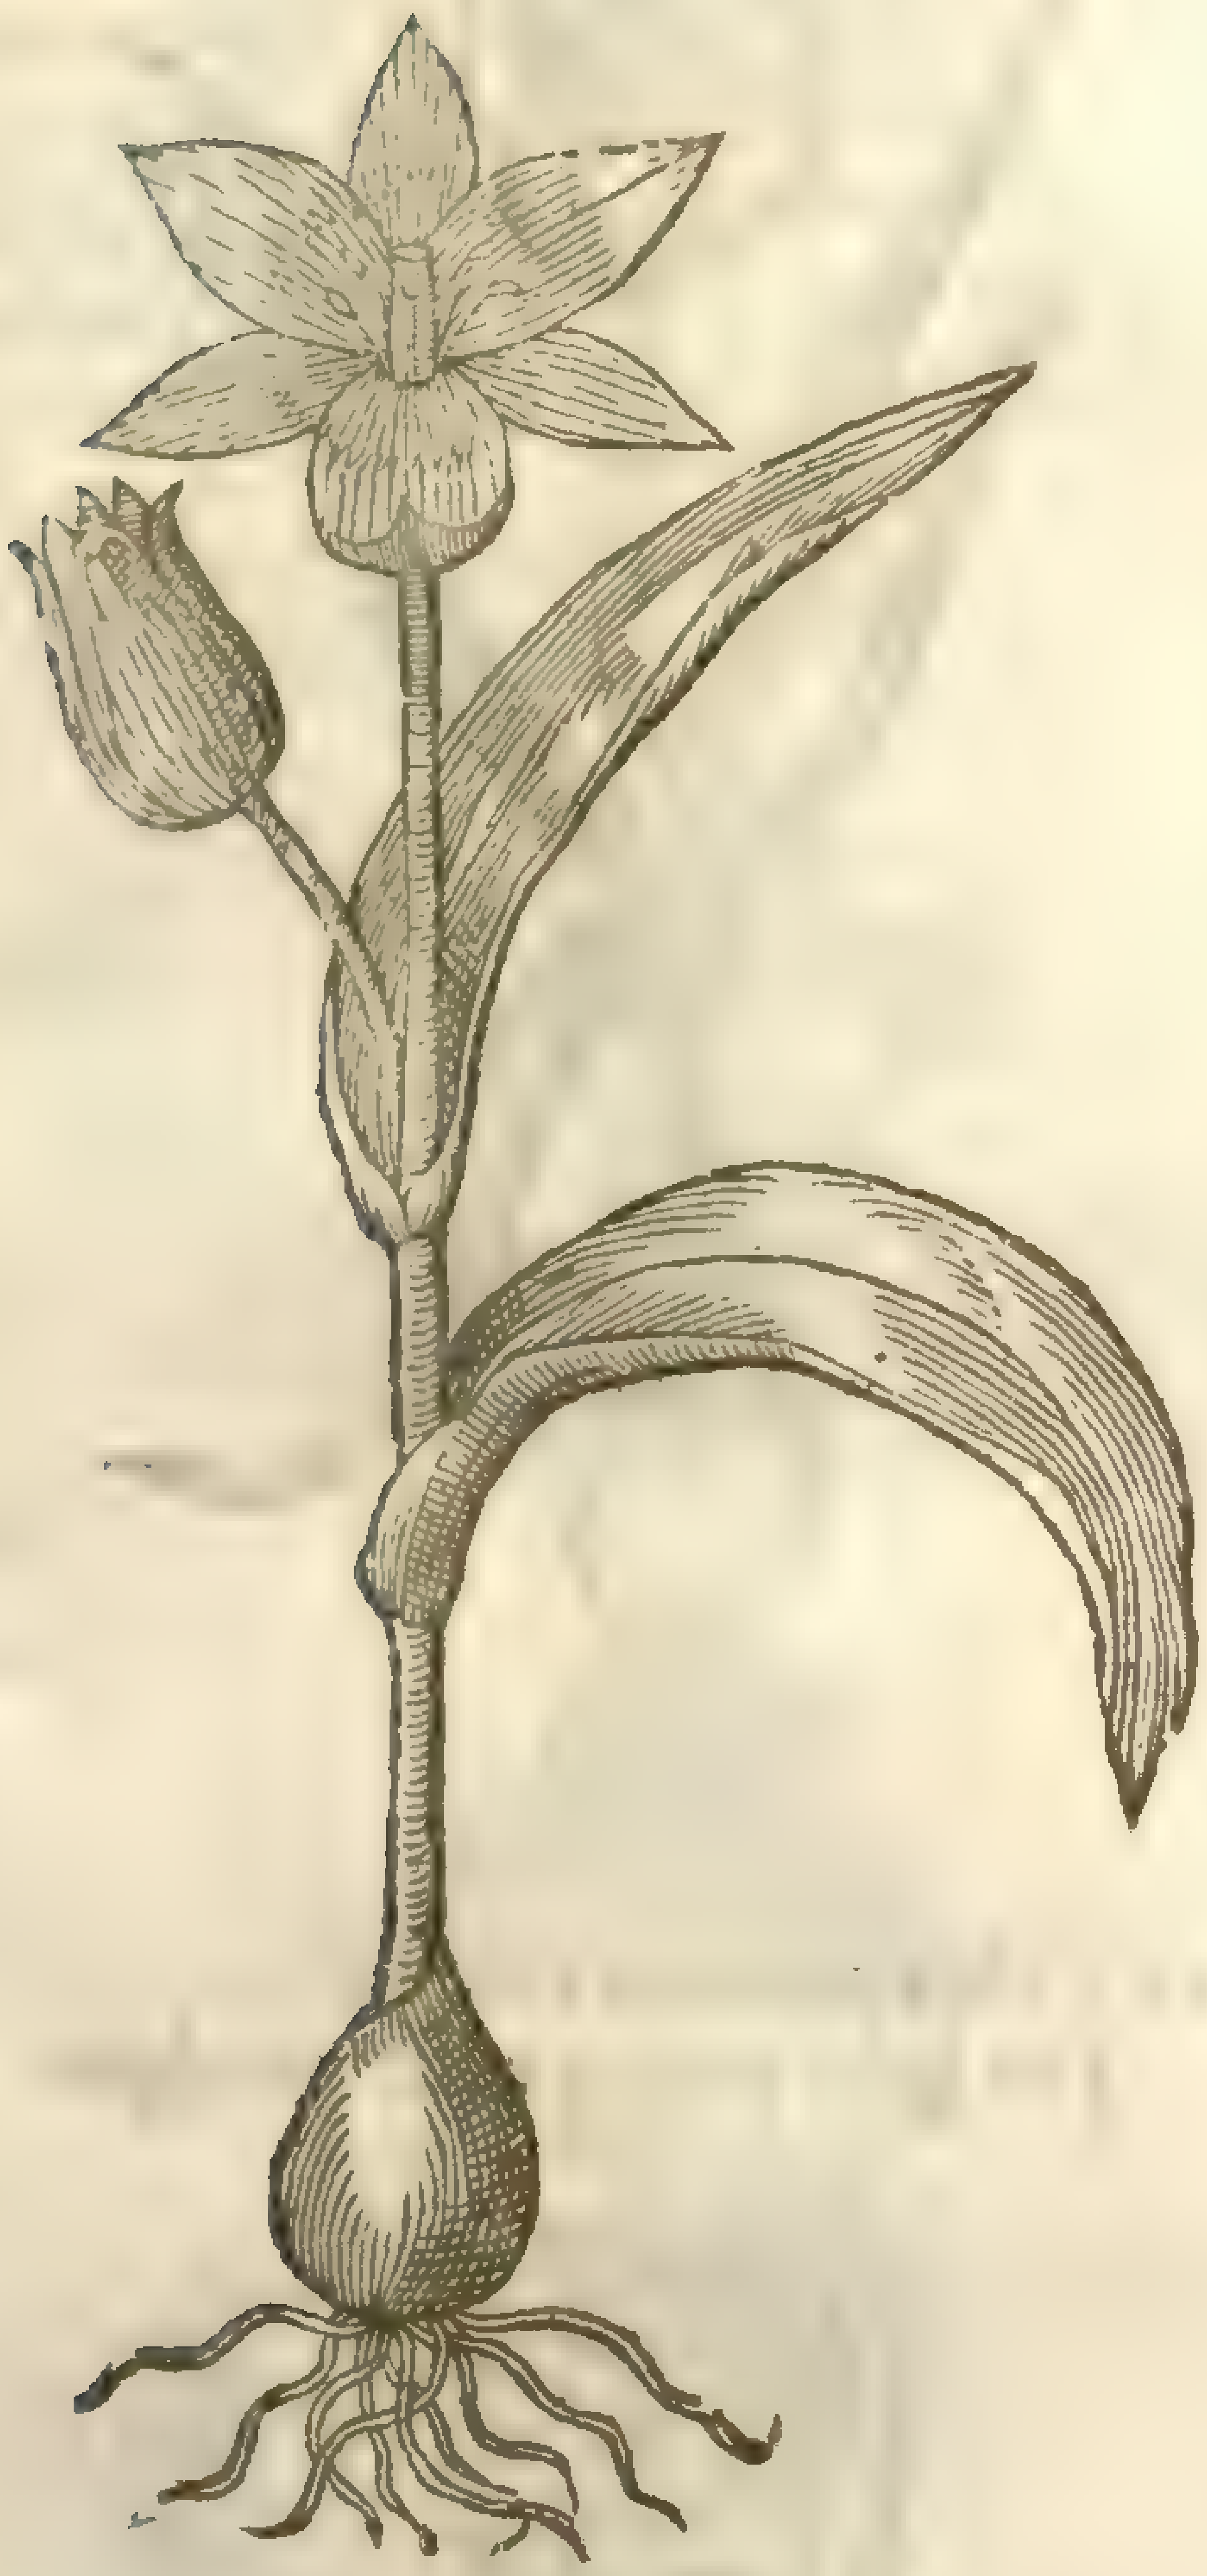
¶ *The Deſcription.*

1 THe Tulipa of Bolonia hath fat thicke and groſſe leaues,hollow,furrowed or chanelled, bended a little backward,and as it were folded together:which at their firſt comming vp ſeeme to be of a reddiſh colour,and being throughly growne turne into a whitiſh greene. In the midſt of thoſe leaues riſeth vp a naked fat ſtalke a foot high,or ſomthing more; on the top whereof ſtandeth one or two yellow floures,ſomtimes three or more,conſiſting of ſix ſmal leaues,after a ſort like to a deepe wide open cup,narrow aboue,and wide in the bottome. After it hath been ſome few dayes floured,the points and brims of the floure turn backward,like a Dalmatian or Turkiſh Cap,called Tulipan,Tolepan,Turban,and Turfan,whereof it tooke his name. The chiues or threds in the middle of the floure be ſomtimes yellow,otherwhiles blackiſh or purpliſh, but commonly of one ouerworne colour or other, Nature ſeeming to play more with this floure than with any other that I do know. This floure is of a reaſonable pleaſant ſmell,and the other of his kinde haue little or no ſmel at all. The ſeed is flat,ſmooth,ſhining,and of a griſtly ſubſtance. The root is bulbous,and very like to a common onion of S. *Omers.*

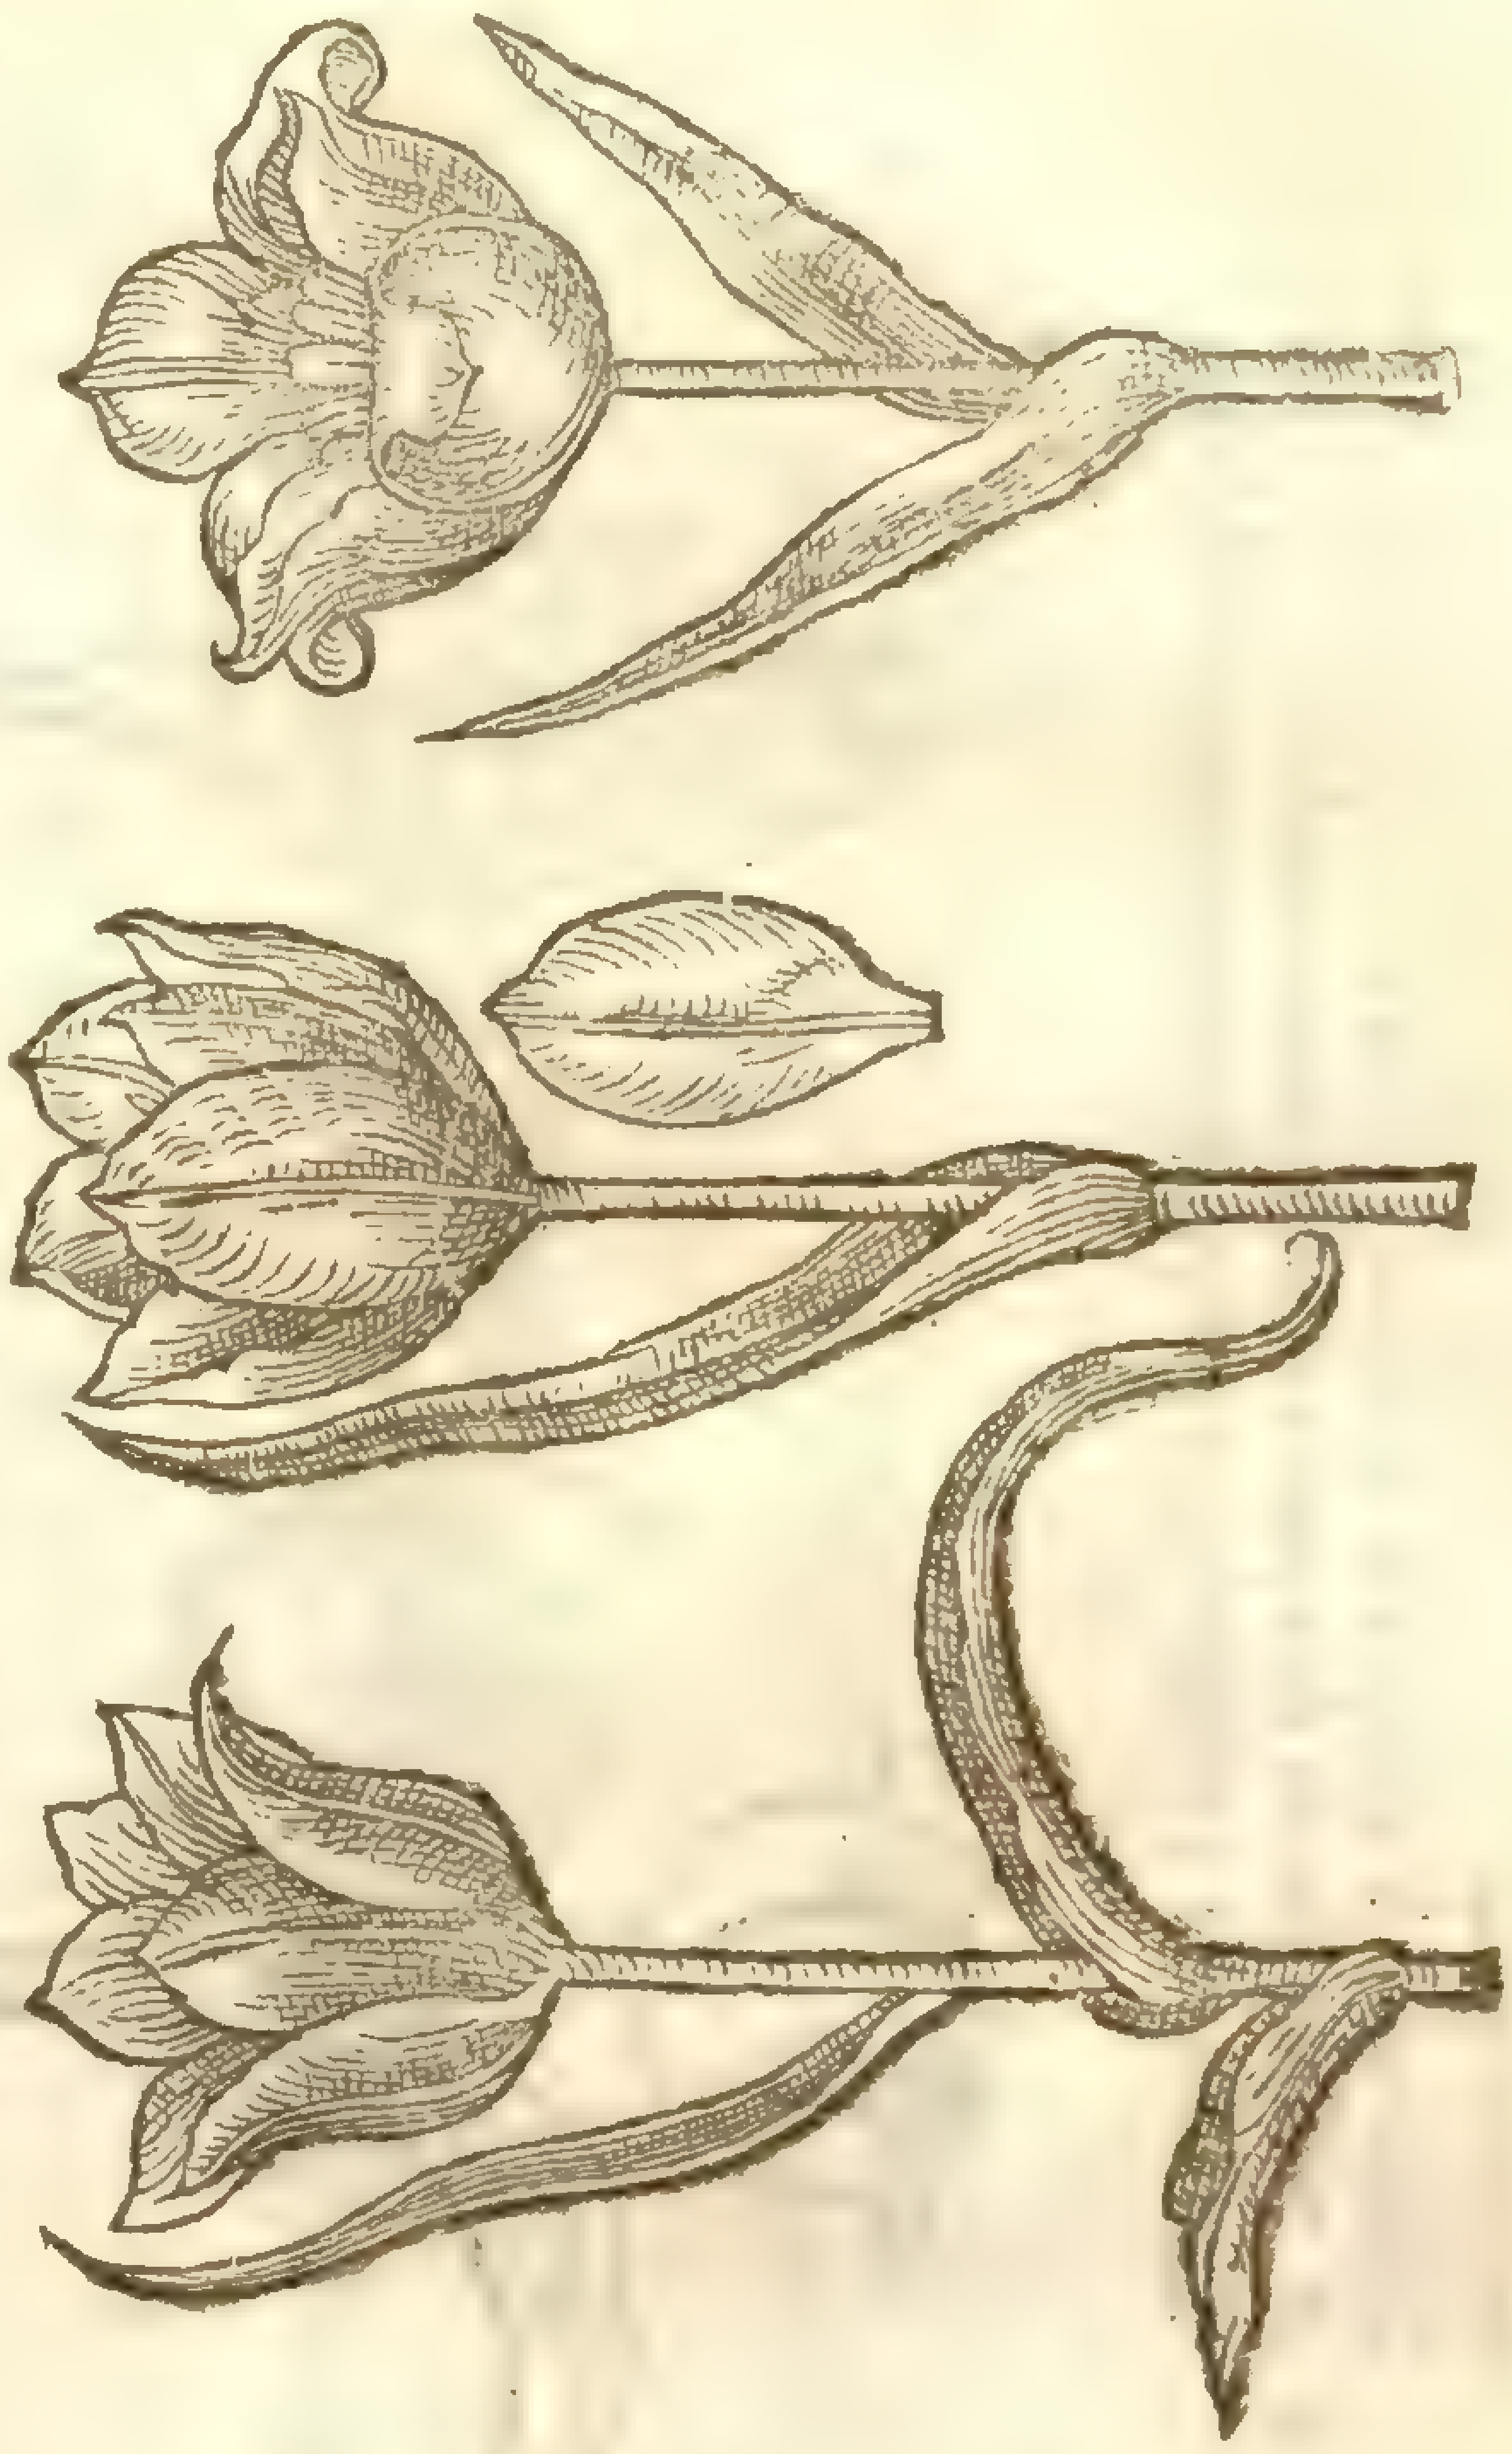
2 The French Tulipa agreeth with the former,except in the blacke bottome which this hath in the middle of the floure,and is not ſo ſweet of ſmell,which ſetteth forth the difference.

3 The yellow Tulipa that floureth timely hath thicke and groſſe leaues full of juice,long,hollow,or gutter faſhion,ſet about a tender ſtalke, at the top whereof doth grow a faire and pleaſant ſhining yellow floure,conſiſting of ſix ſmall leaues without ſmell. The root is bulbous or like an onion.

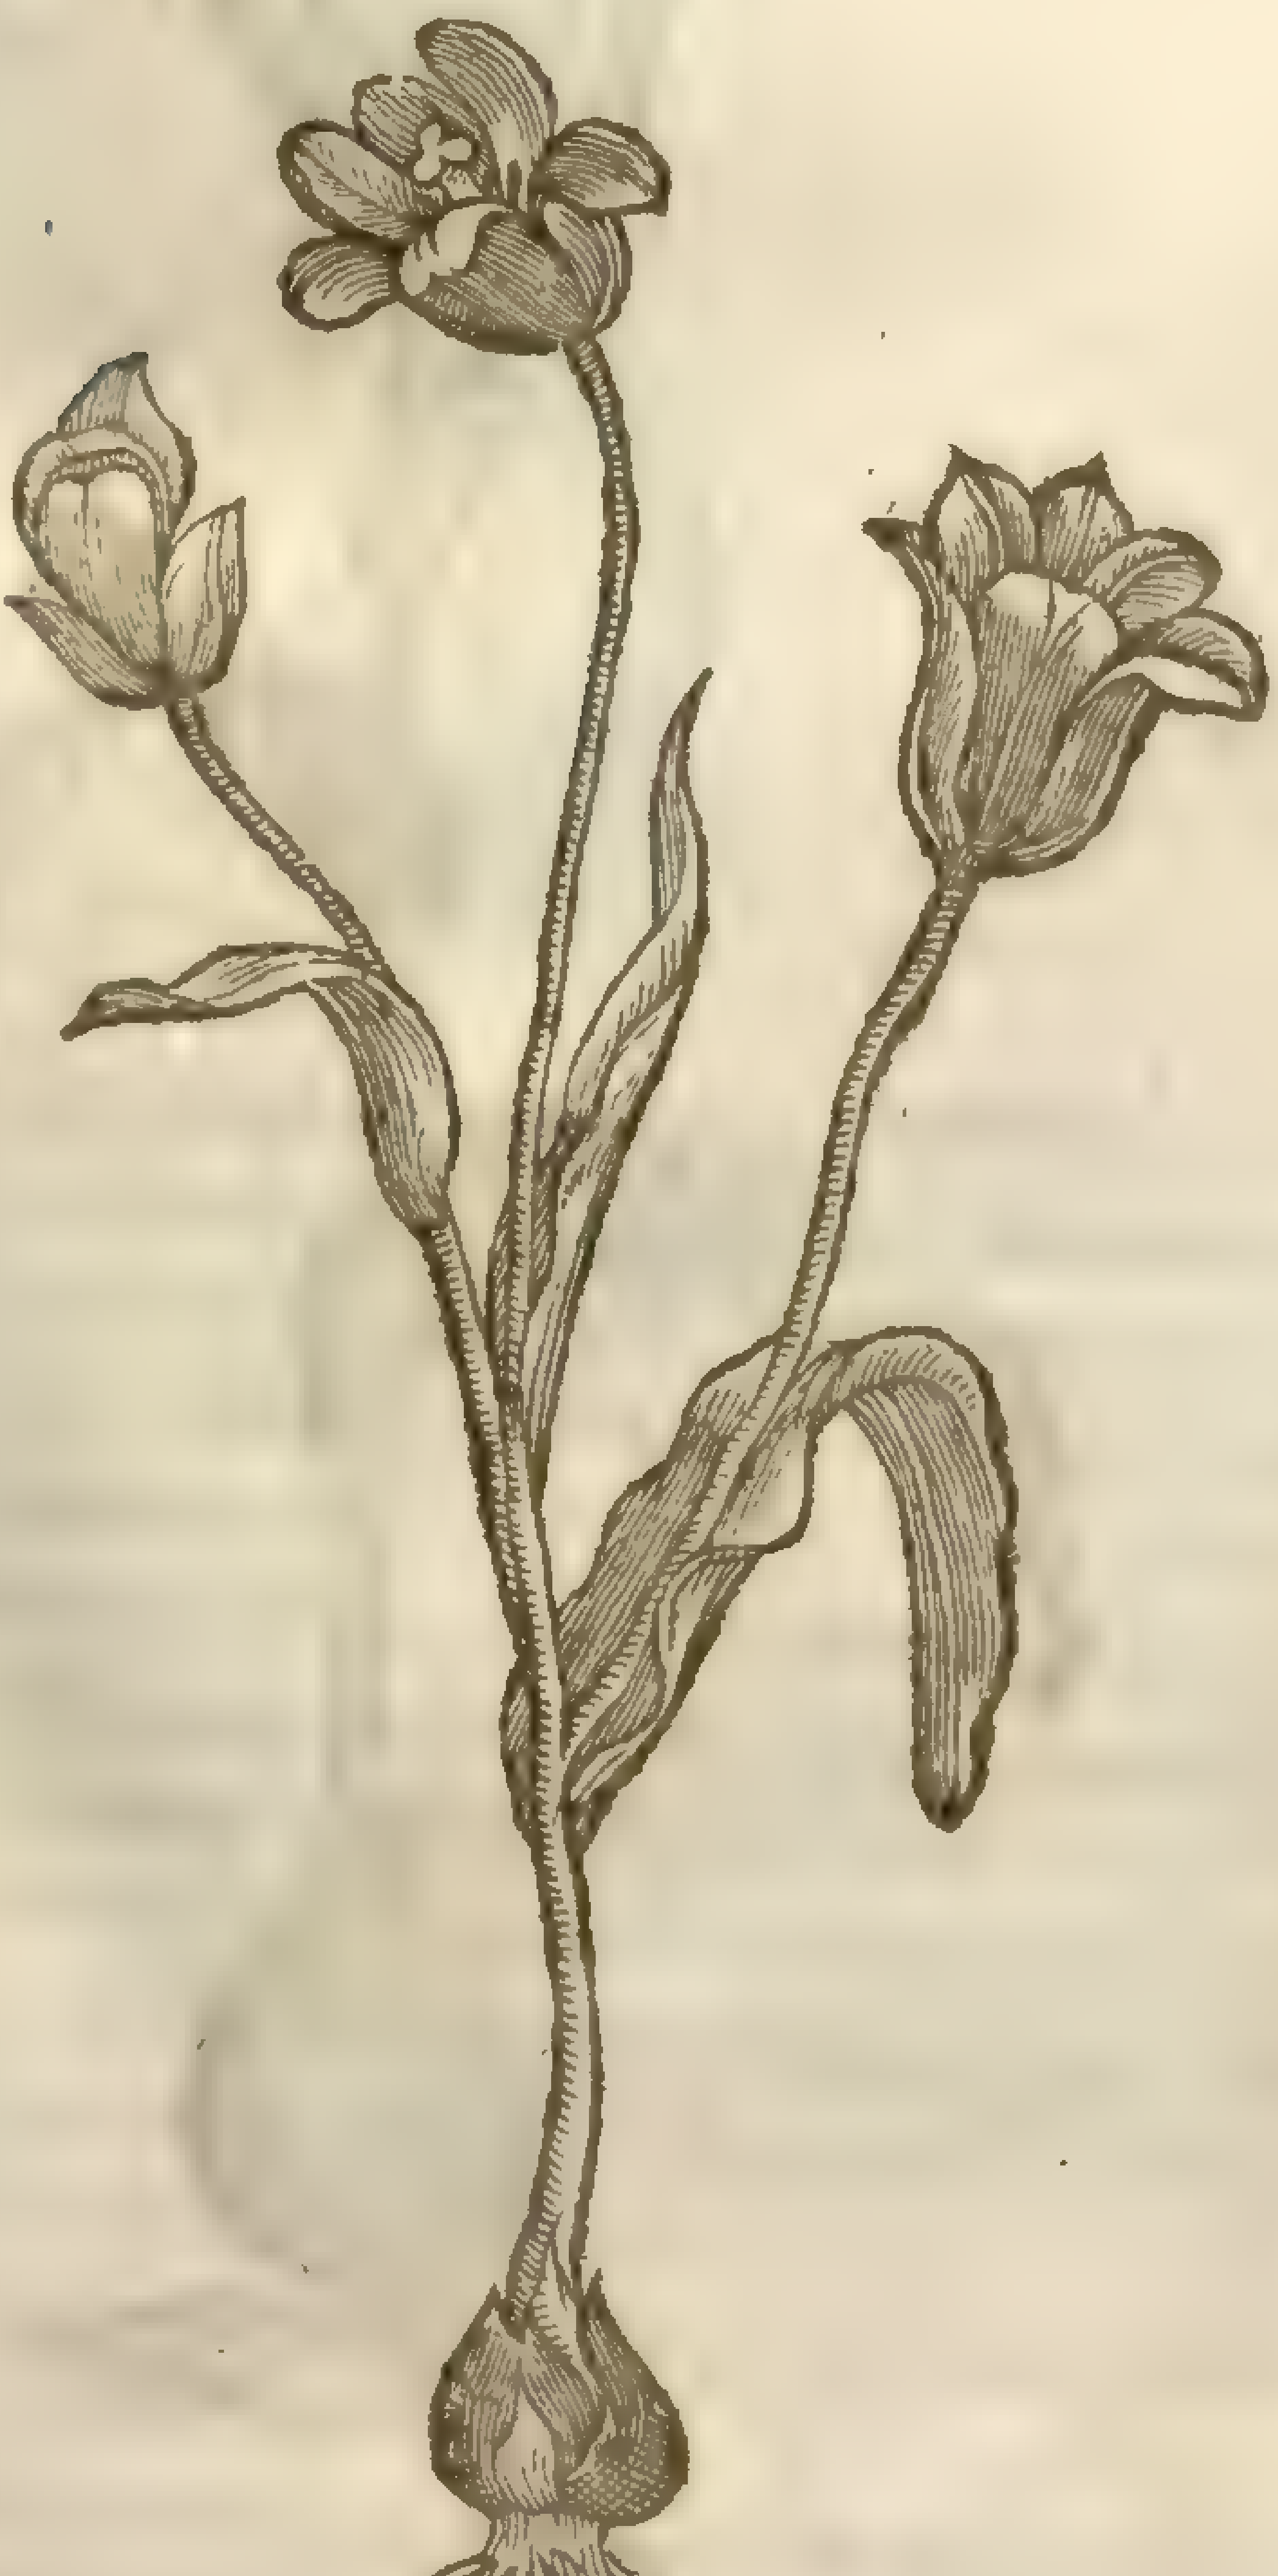
‡ 11 *Tulipa flore albo ſtrijs purpureis.*
The white Tulip with purple ſtreakes.



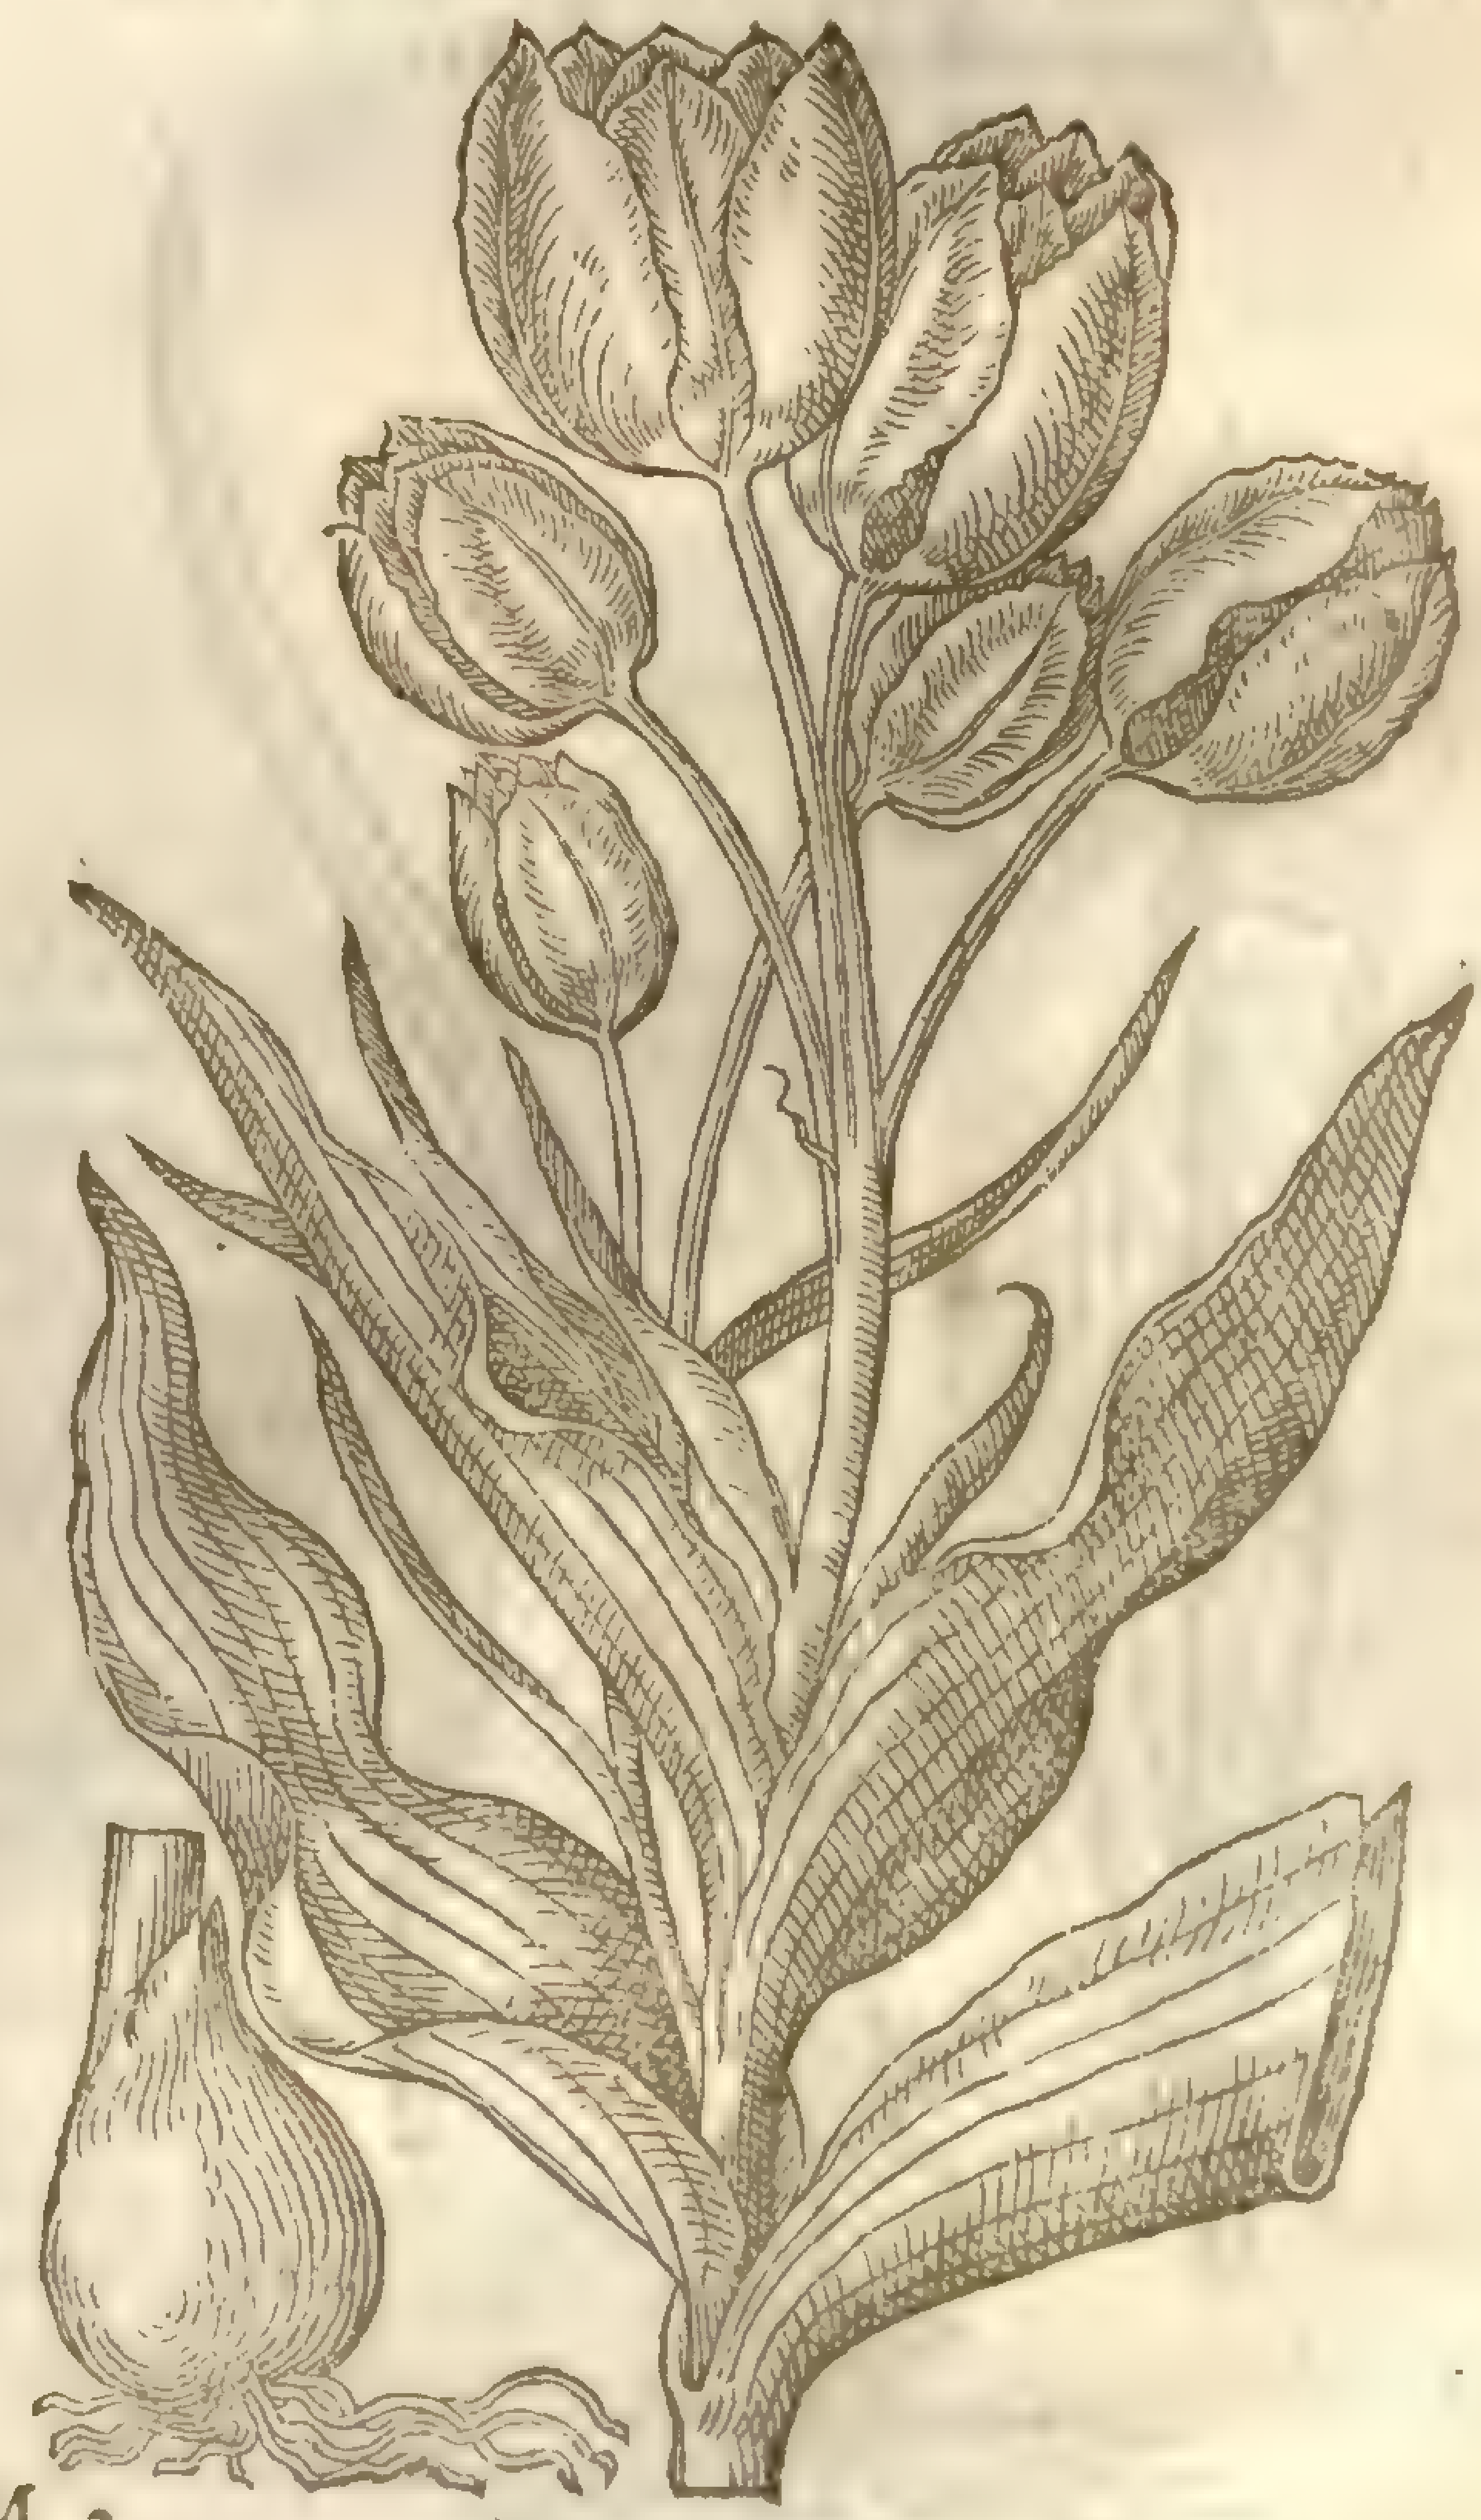
‡ 12 *Tulipa flore albo oris dilute rubentibus.*
The white Tulip with light red edges.
‡ 13 *Tulipa flore pallido.* The ſtraw-coloured Tulip.
‡ 14 *Tulipa flammea ſtrijs flaueſcentibus.*
The flame coloured Tulip with yellowiſh ſtreakes.



‡ 15 *Tulipa polyclonos minor ſerotina flore rubro vel flauo,* Cluſij.
The leſſer many-branched late Tulip of *Cluſius*, with red, or elſe yellow floures.



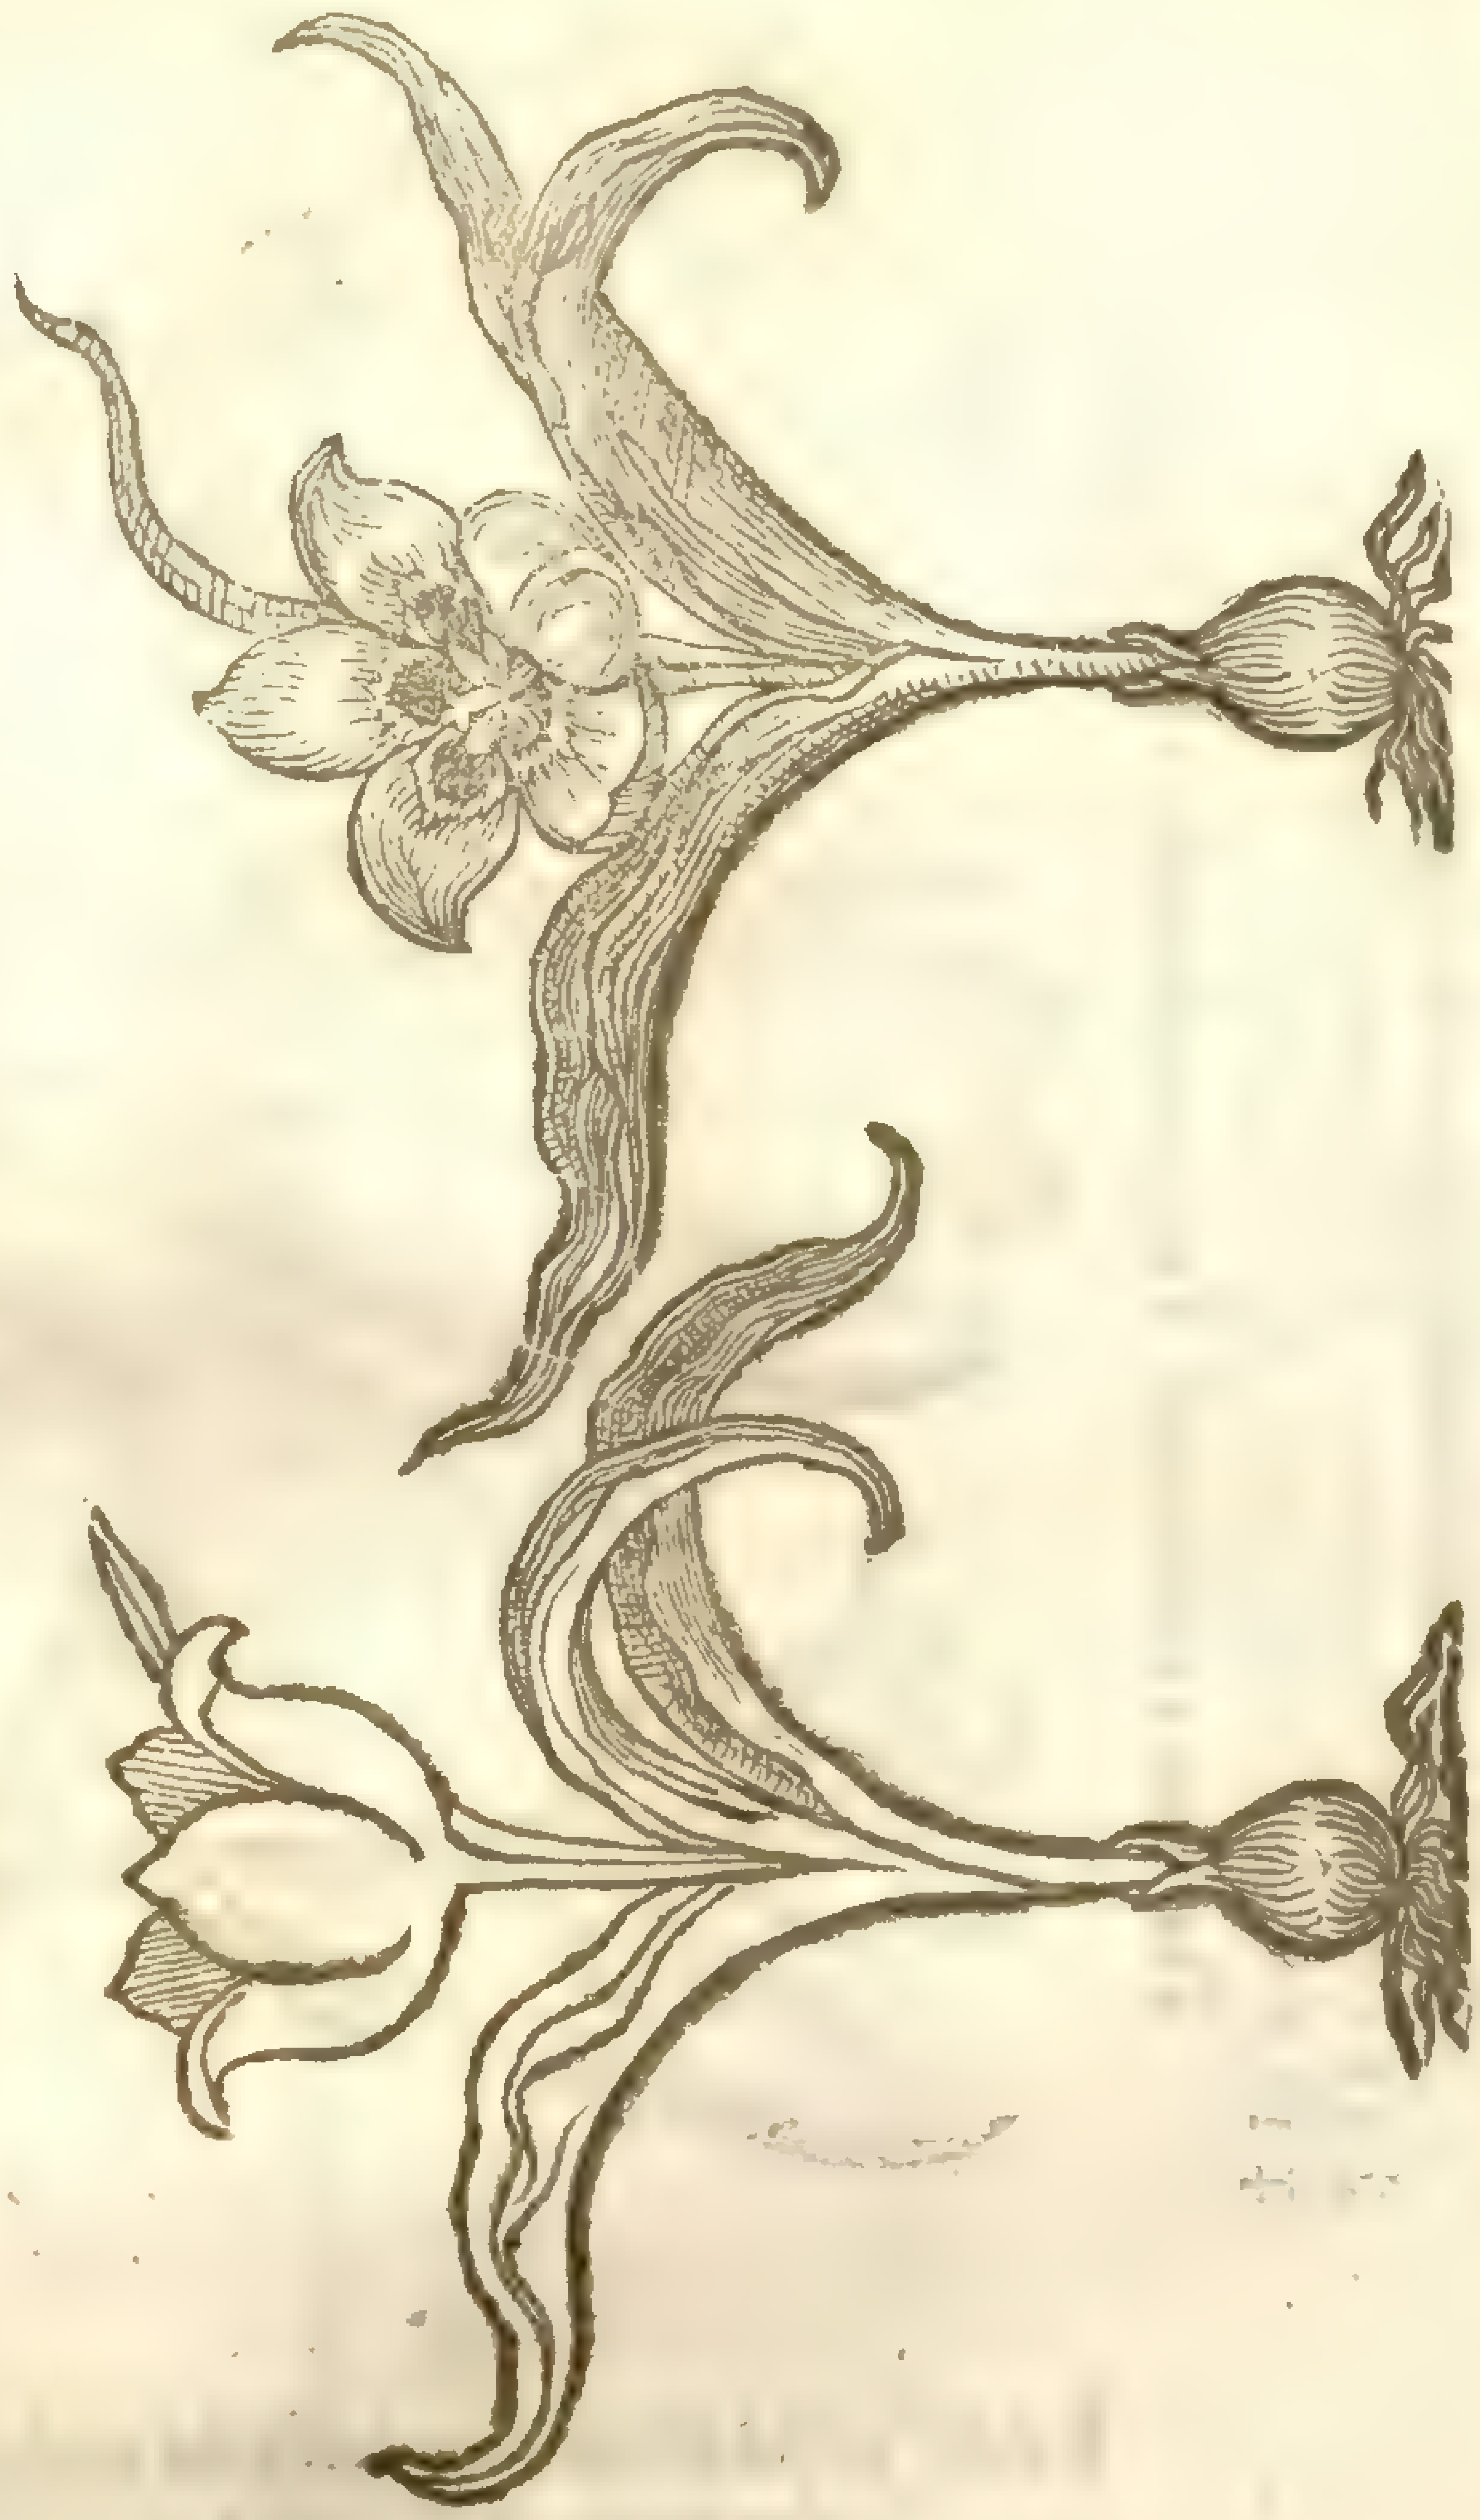
‡ 16 *Tulipa ſerotina polyclados major flo. flauo fundo nigro,* Cluſij.
Cluſius his greater many branched Tulip with a yellow floure, and blacke bottome.



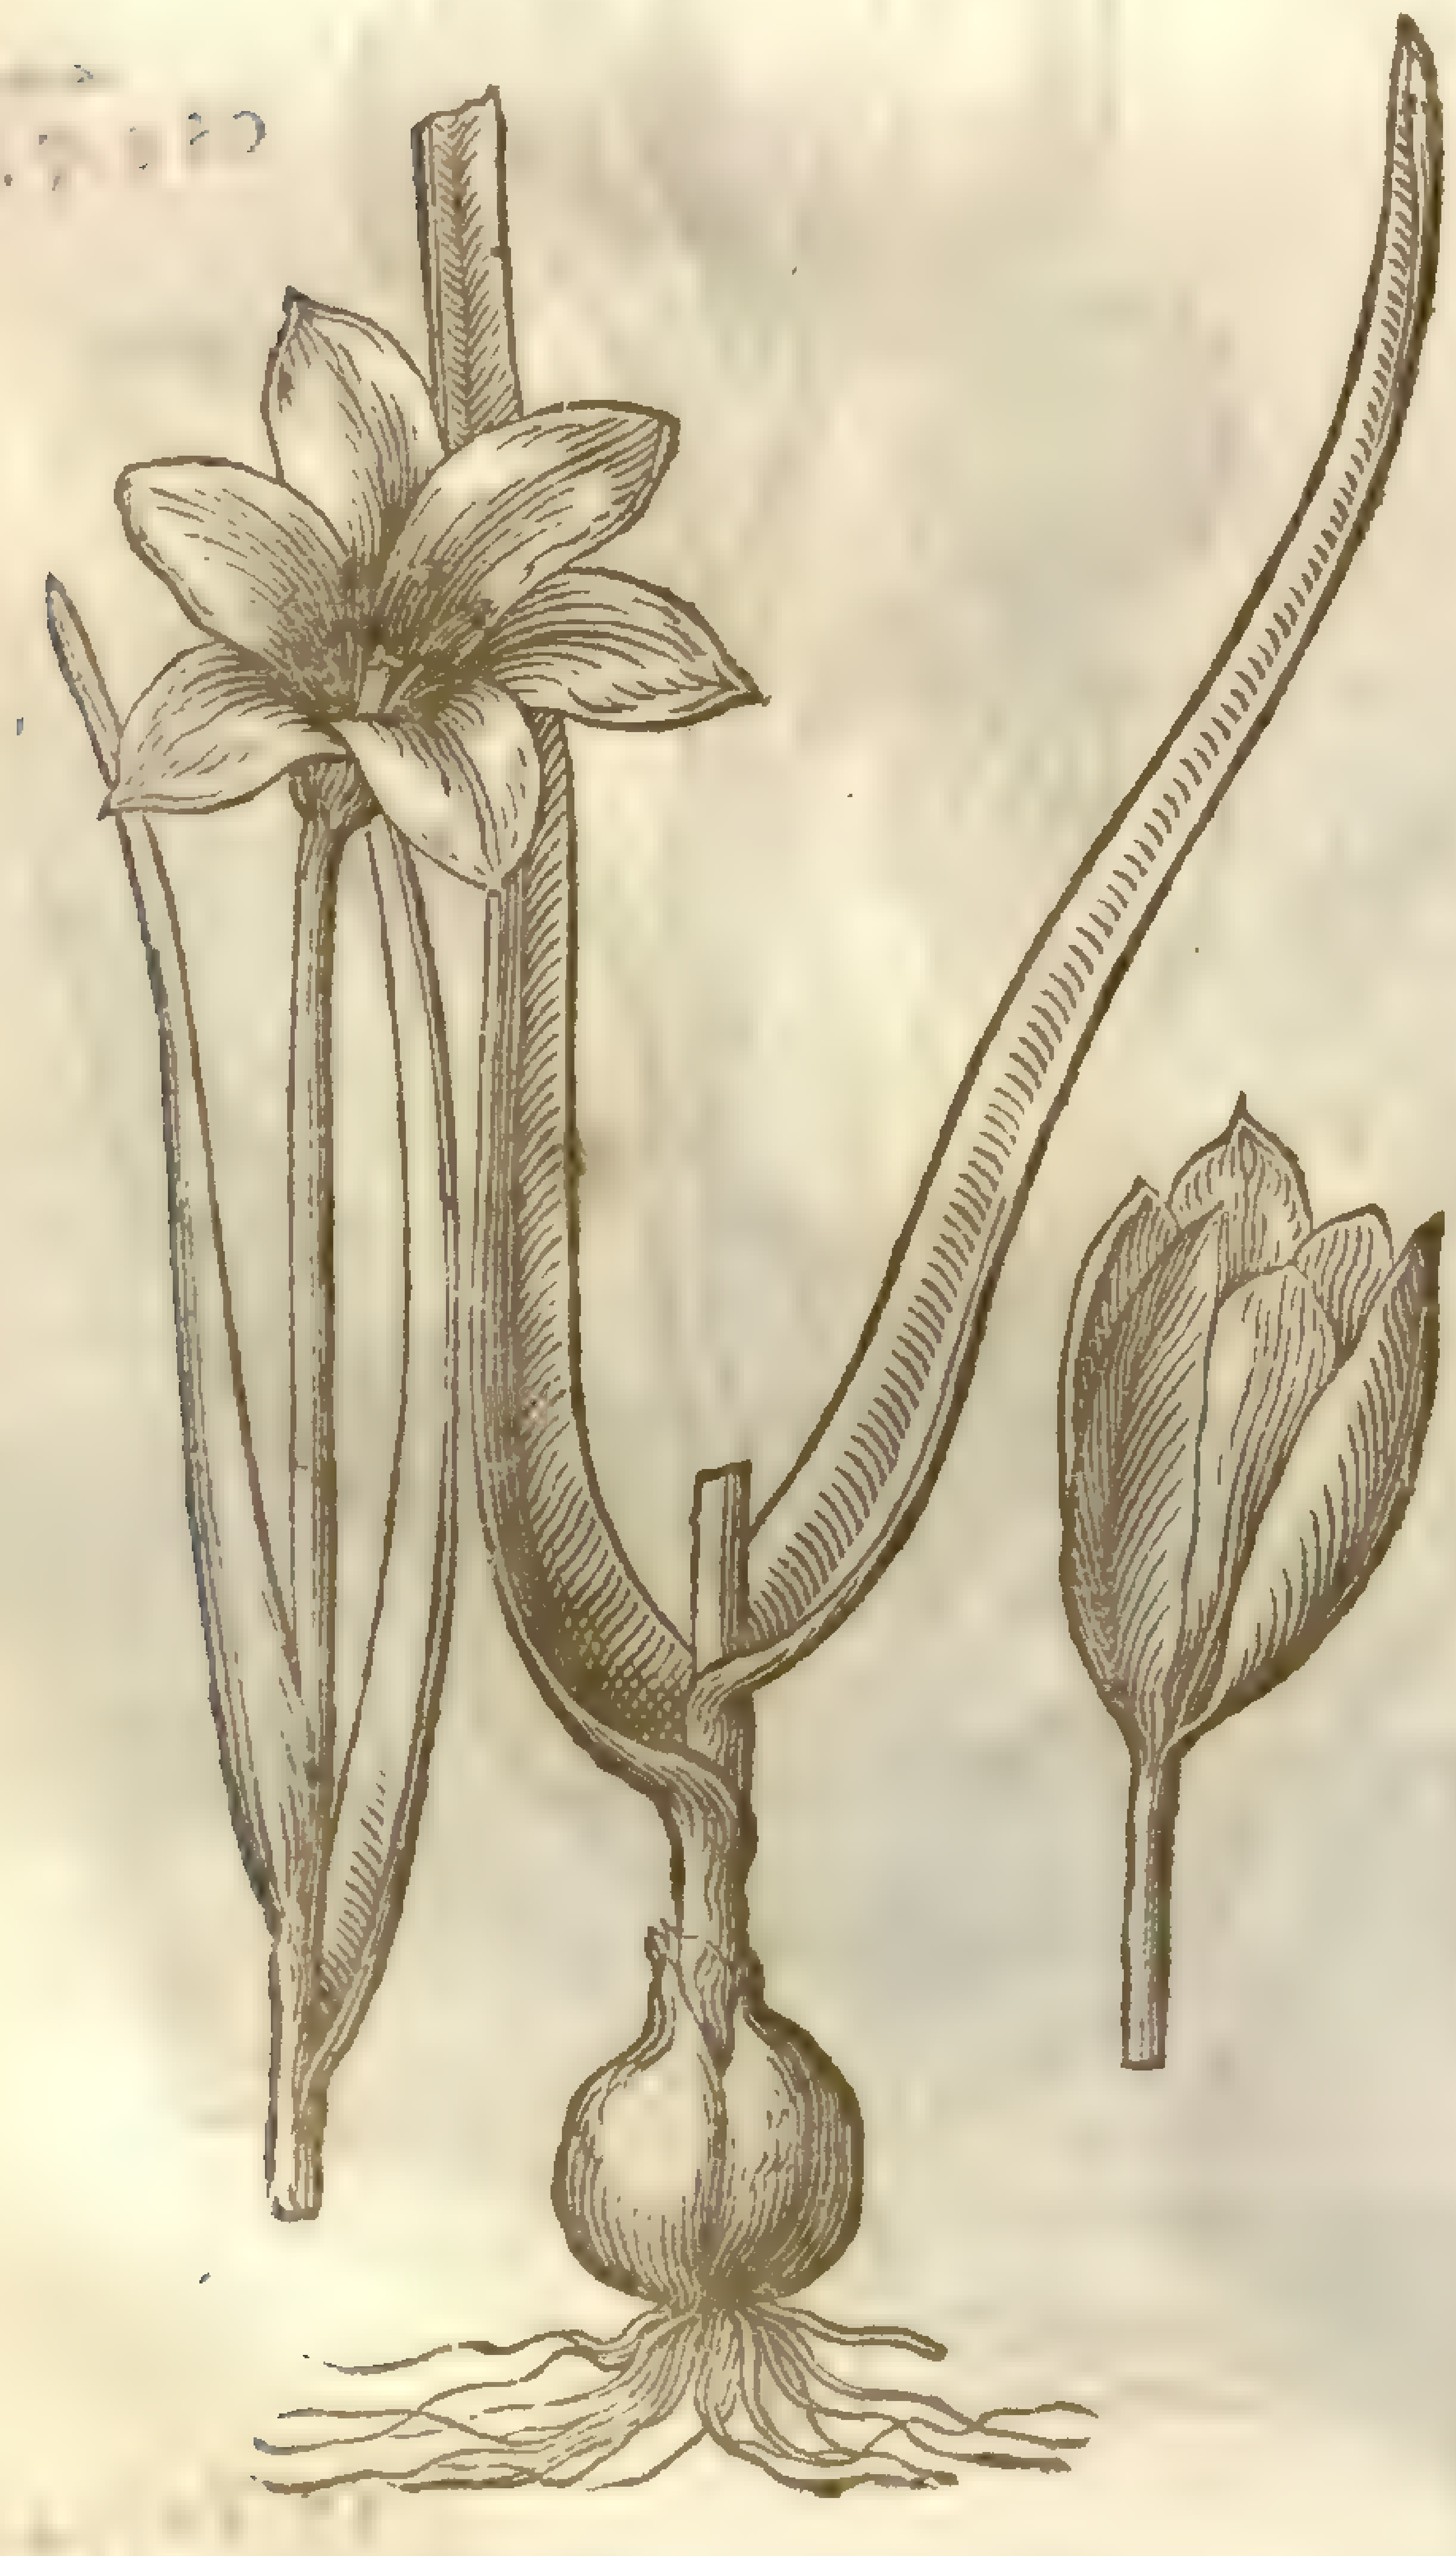
‡ 17

‡ 17 *Tulipa pumilio obſcure rubens oris virentibus.*
The dwarfe Tulip with darke red floures edged with greene.

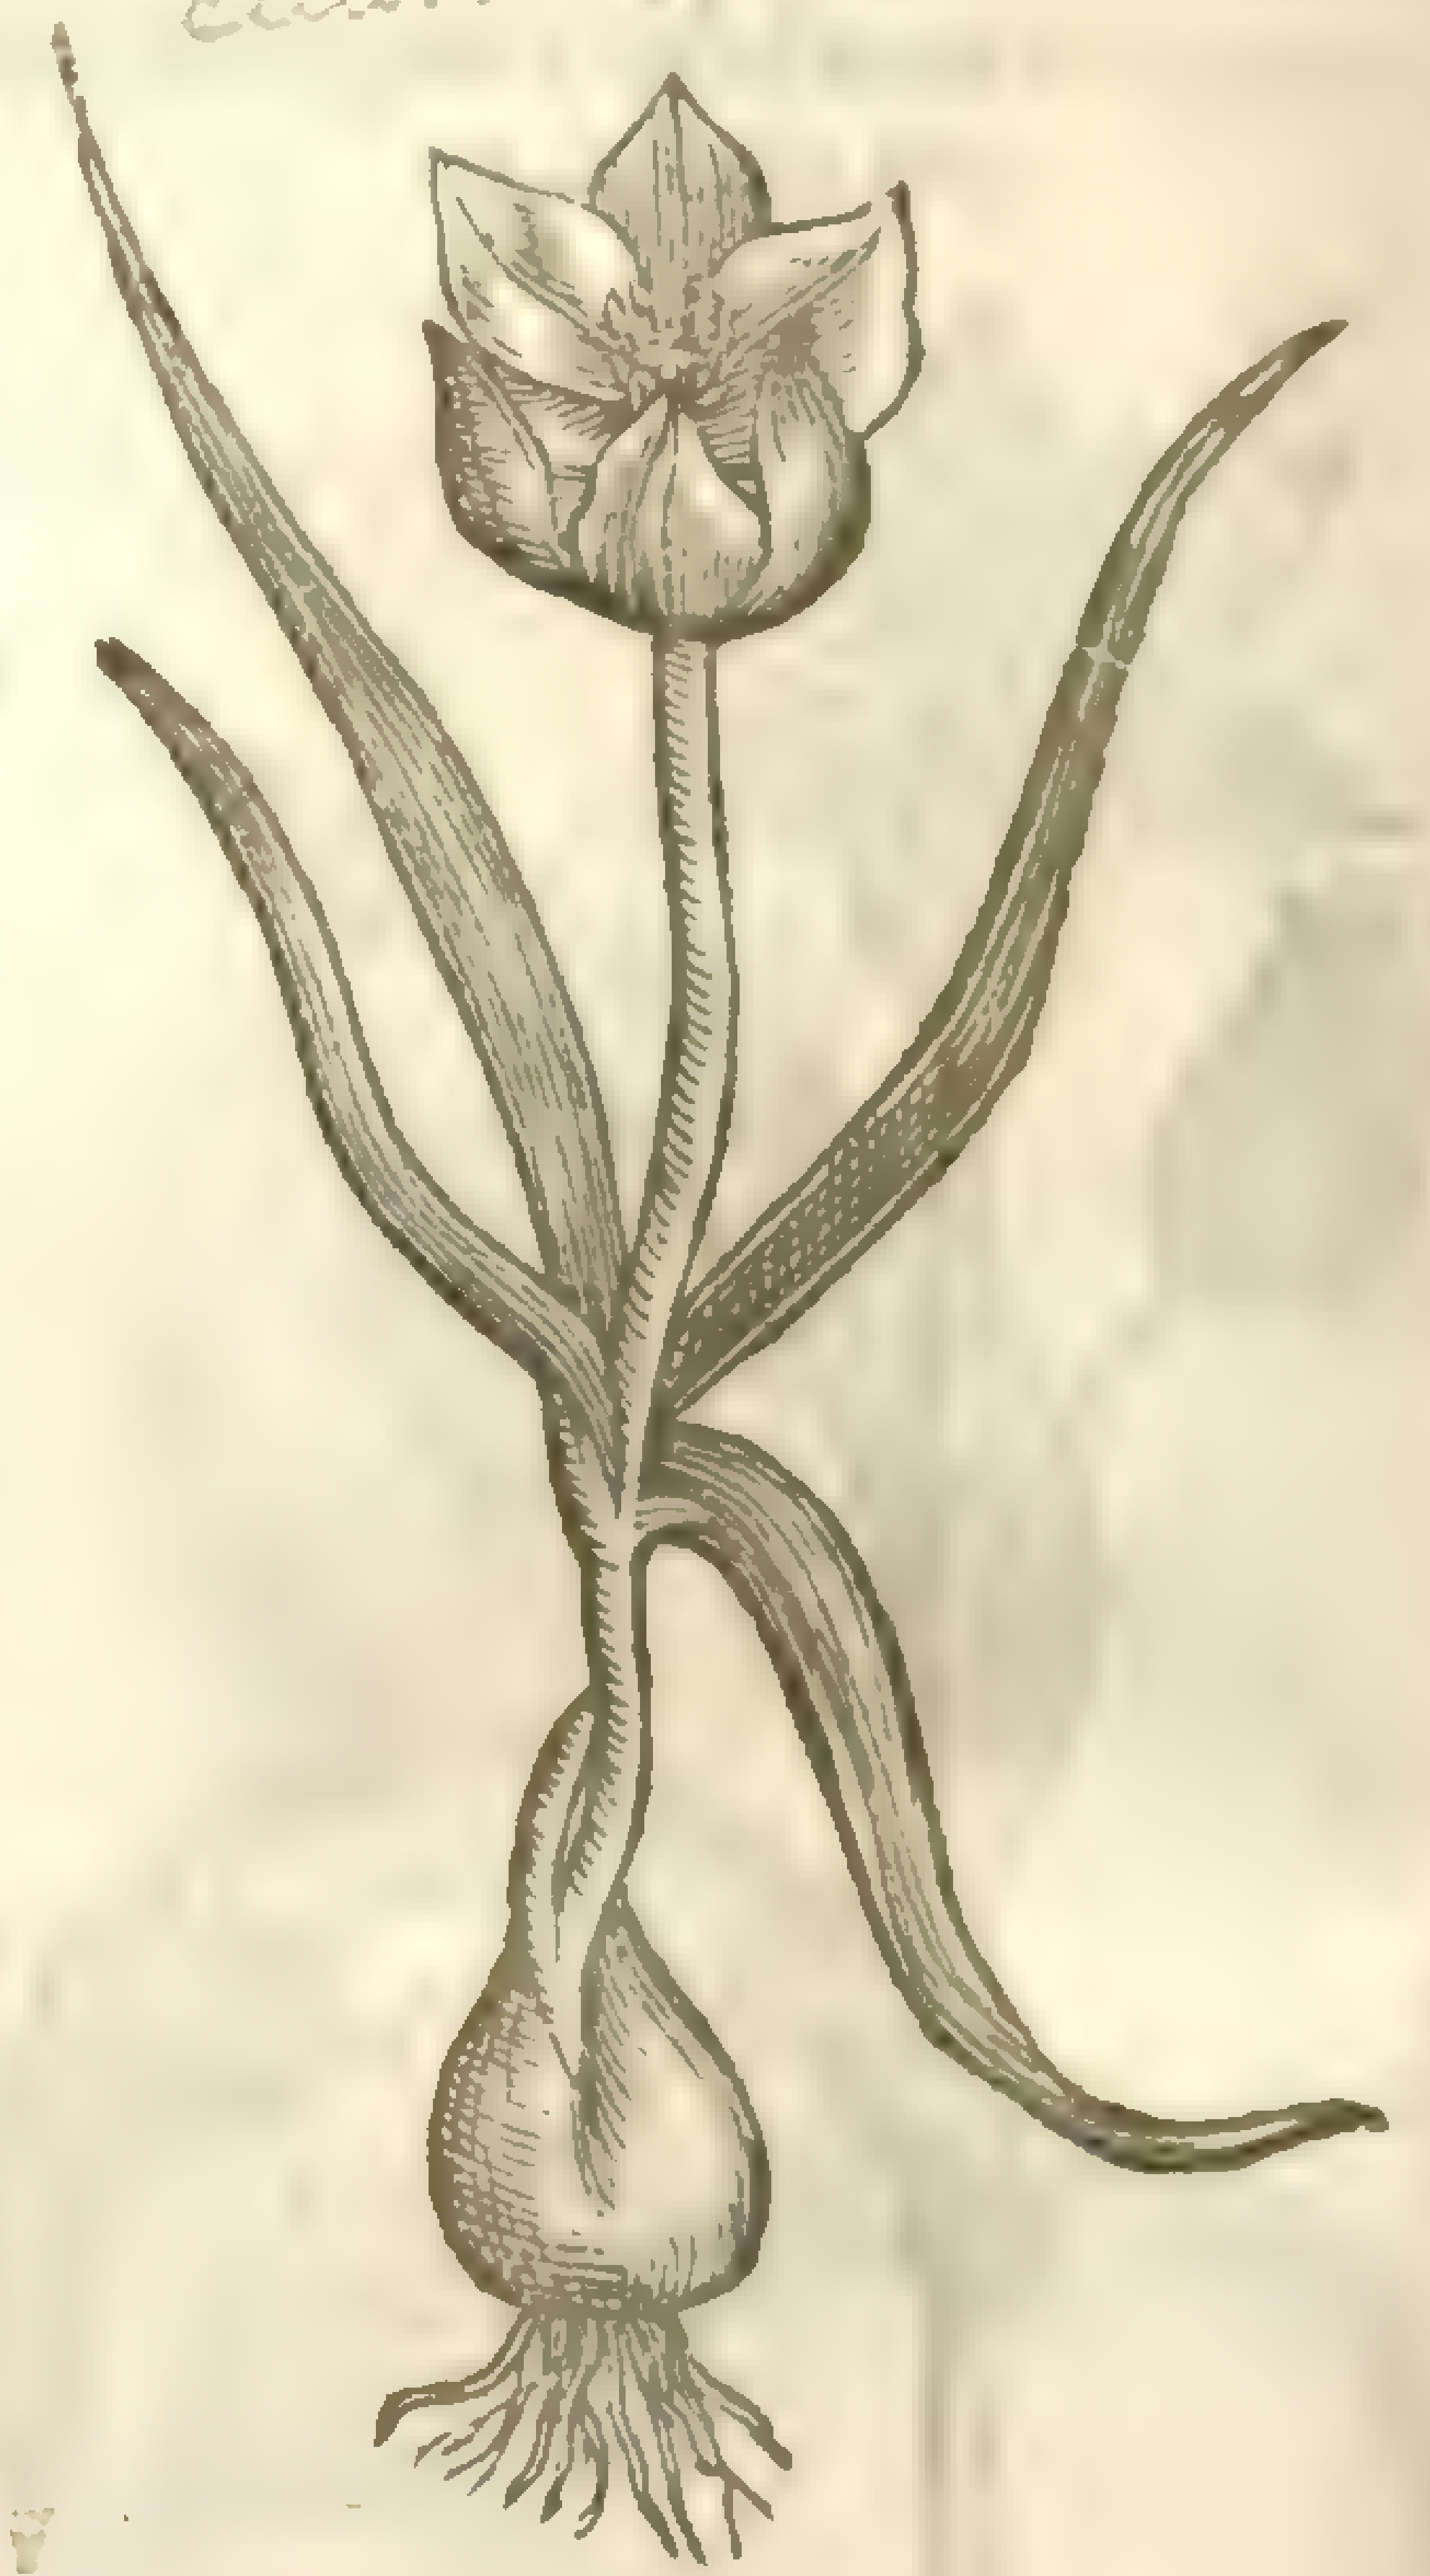
‡ 18 *Tulipa pumilio flore purpuraſcente intus candido.*
The Dwarfe Tulip with a purpliſh floure, white within.



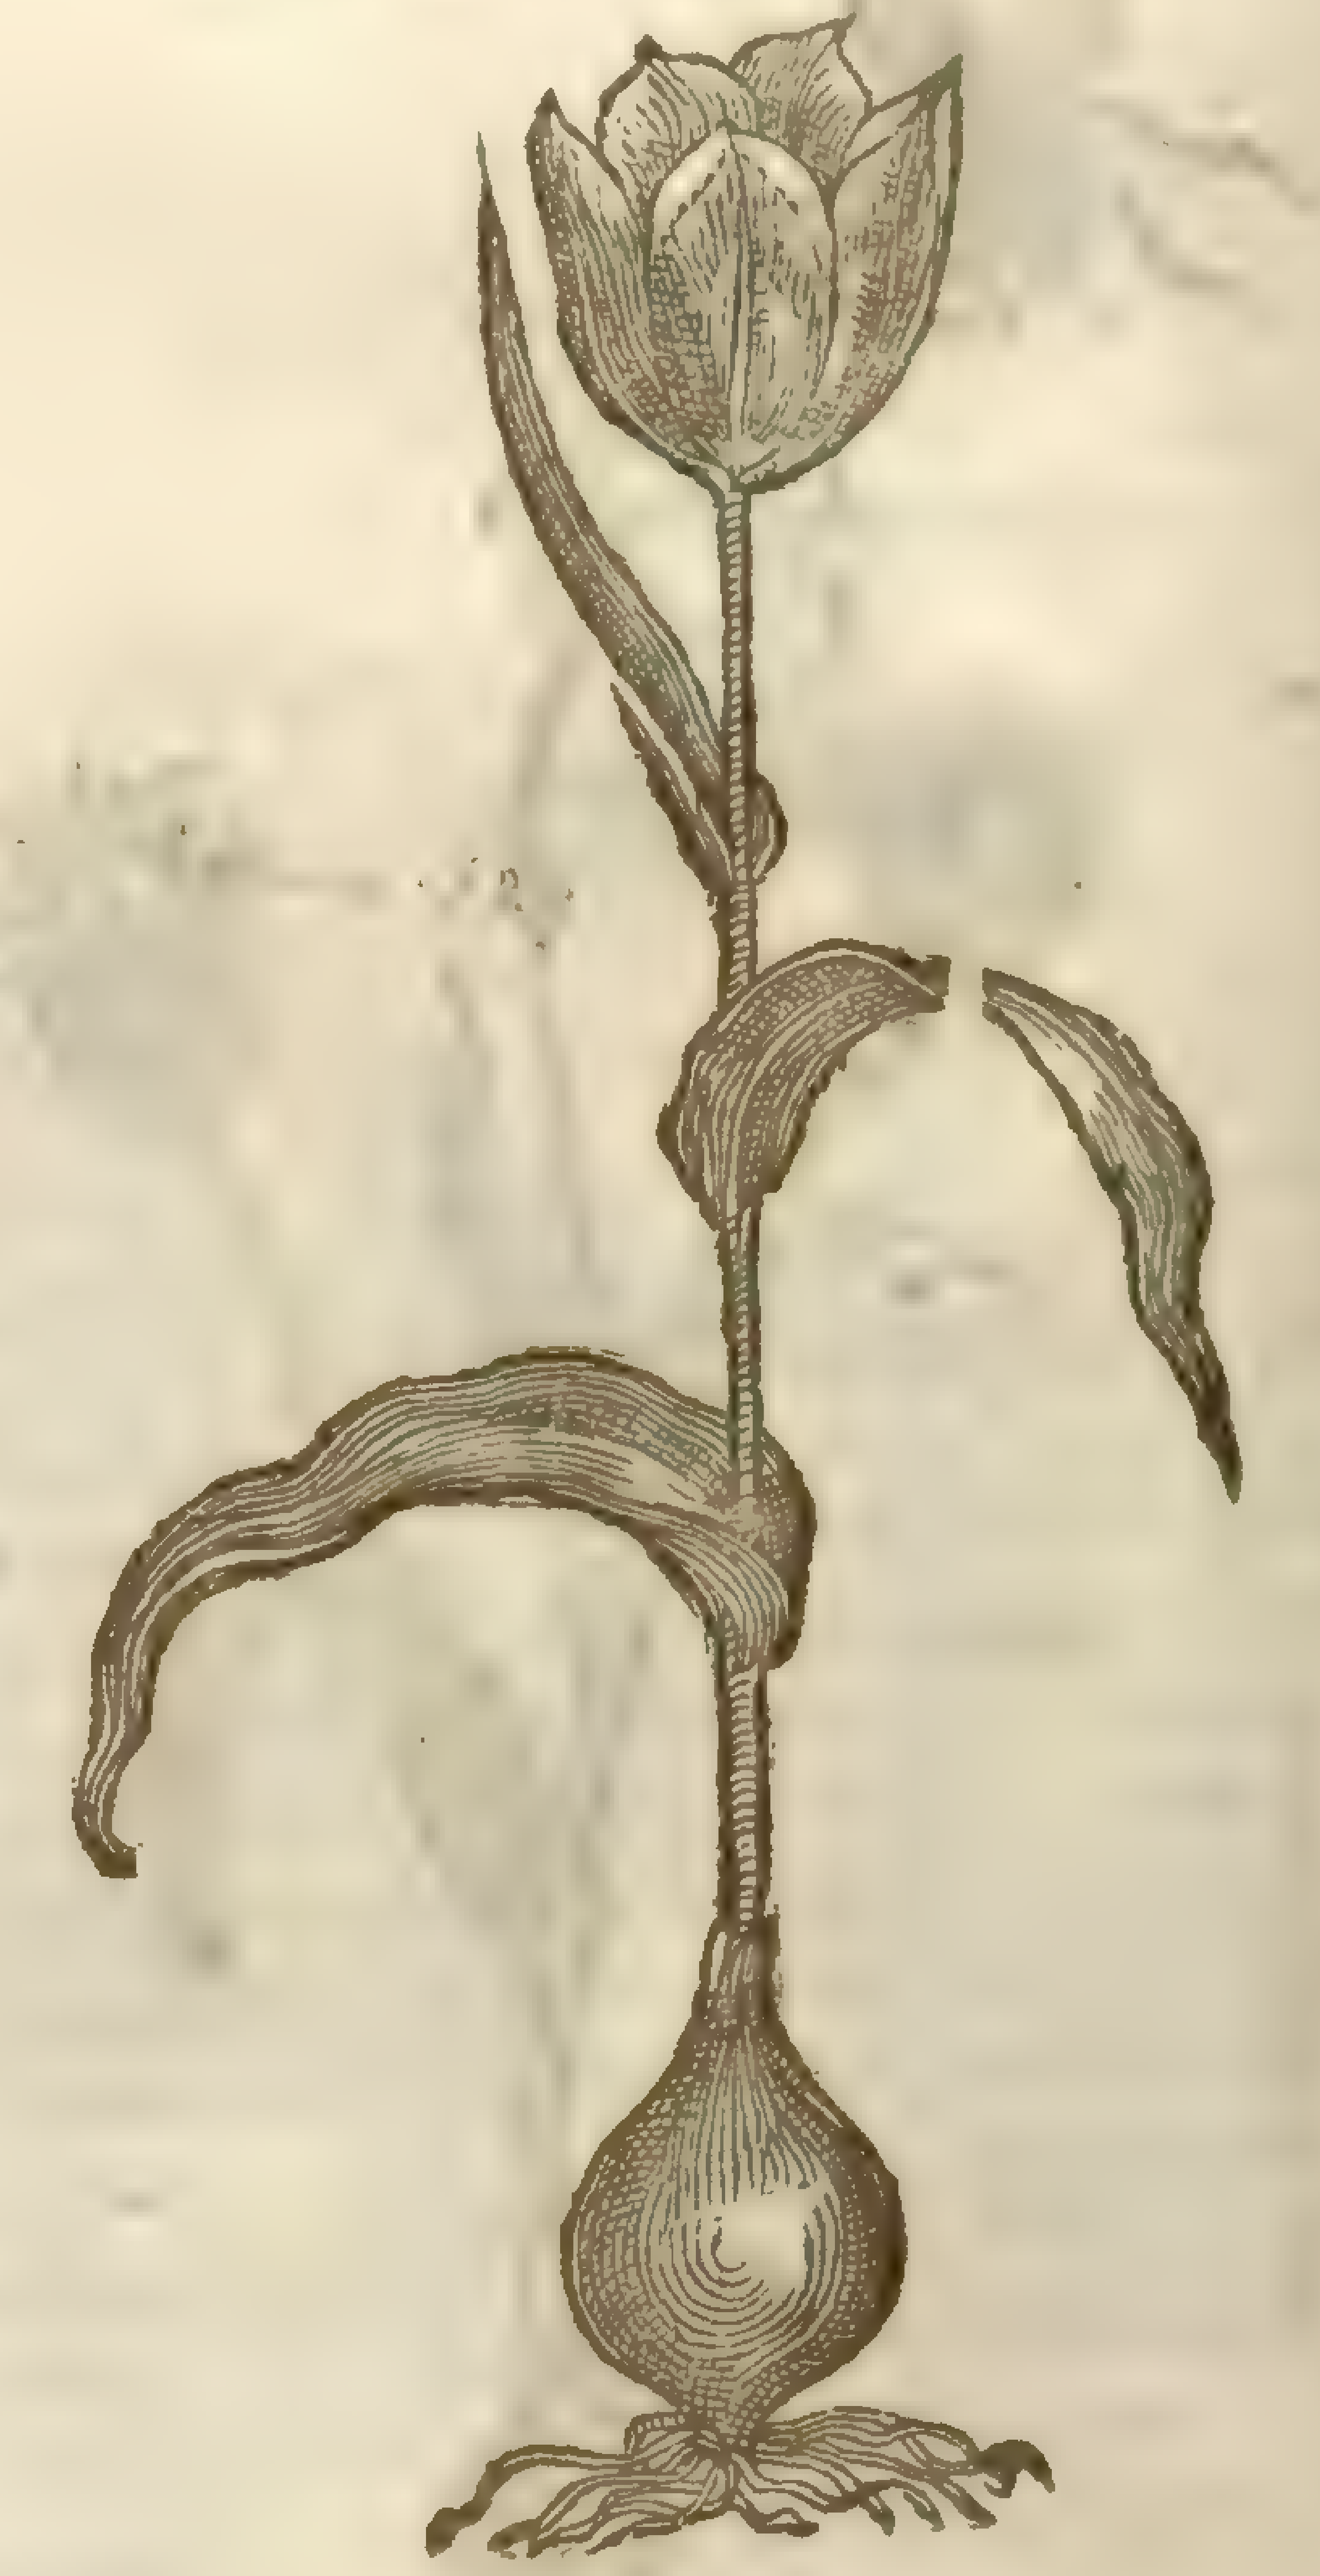
‡ 20 *Tulipa Perſica flore rubro, oris albidis elegans.*
The pretty Perſian Tulip hauing a red floure with whitiſh edges.



‡ 19 *Tulipa pumilio lutea,*
The yellow Dwarfe Tulip.



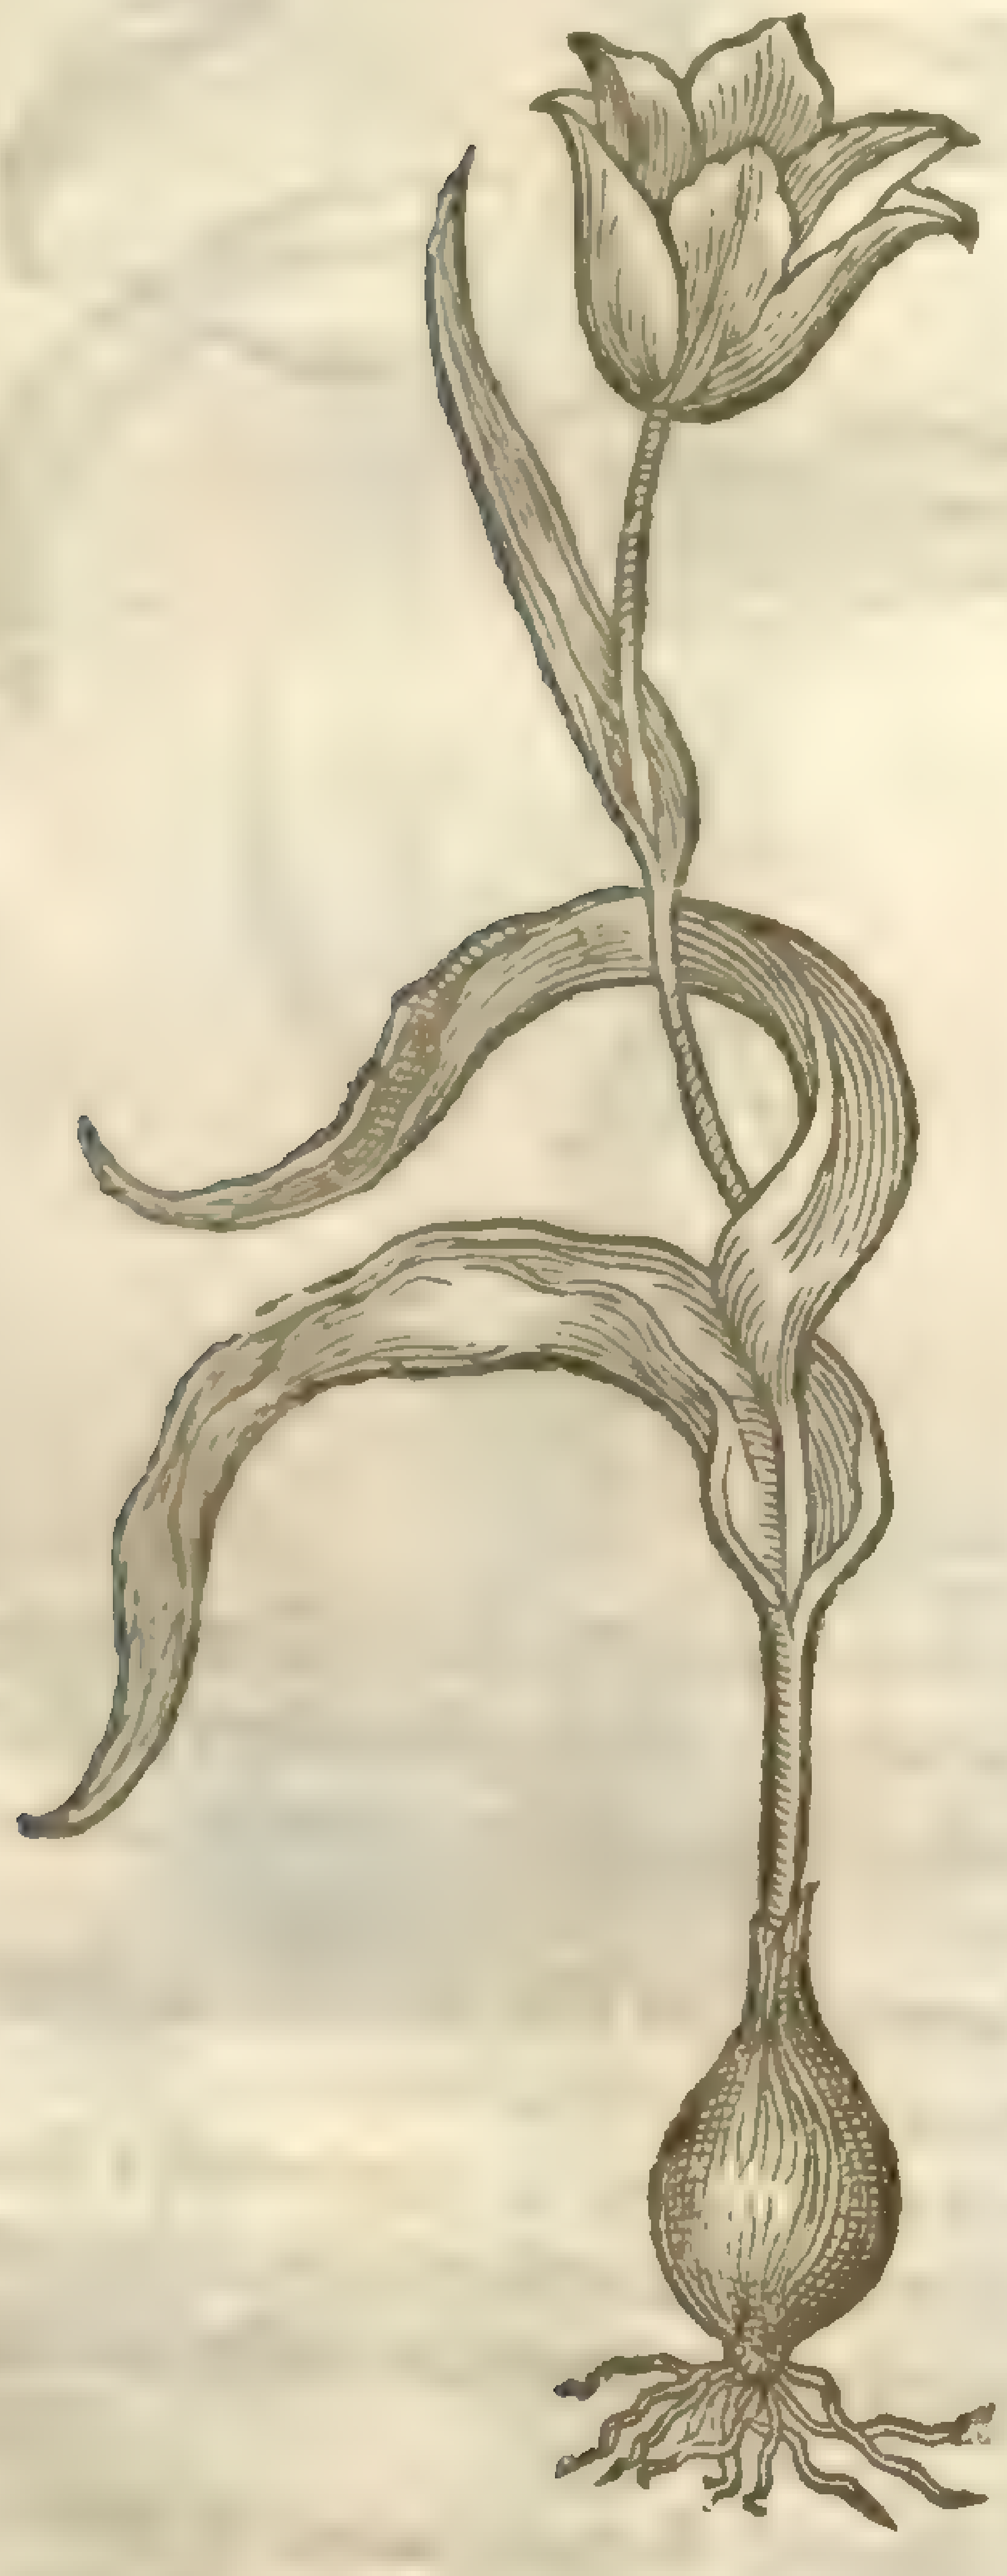
‡ 21 *Tulipa aurea oris rubentibus.*
The gold yellow with red edges.



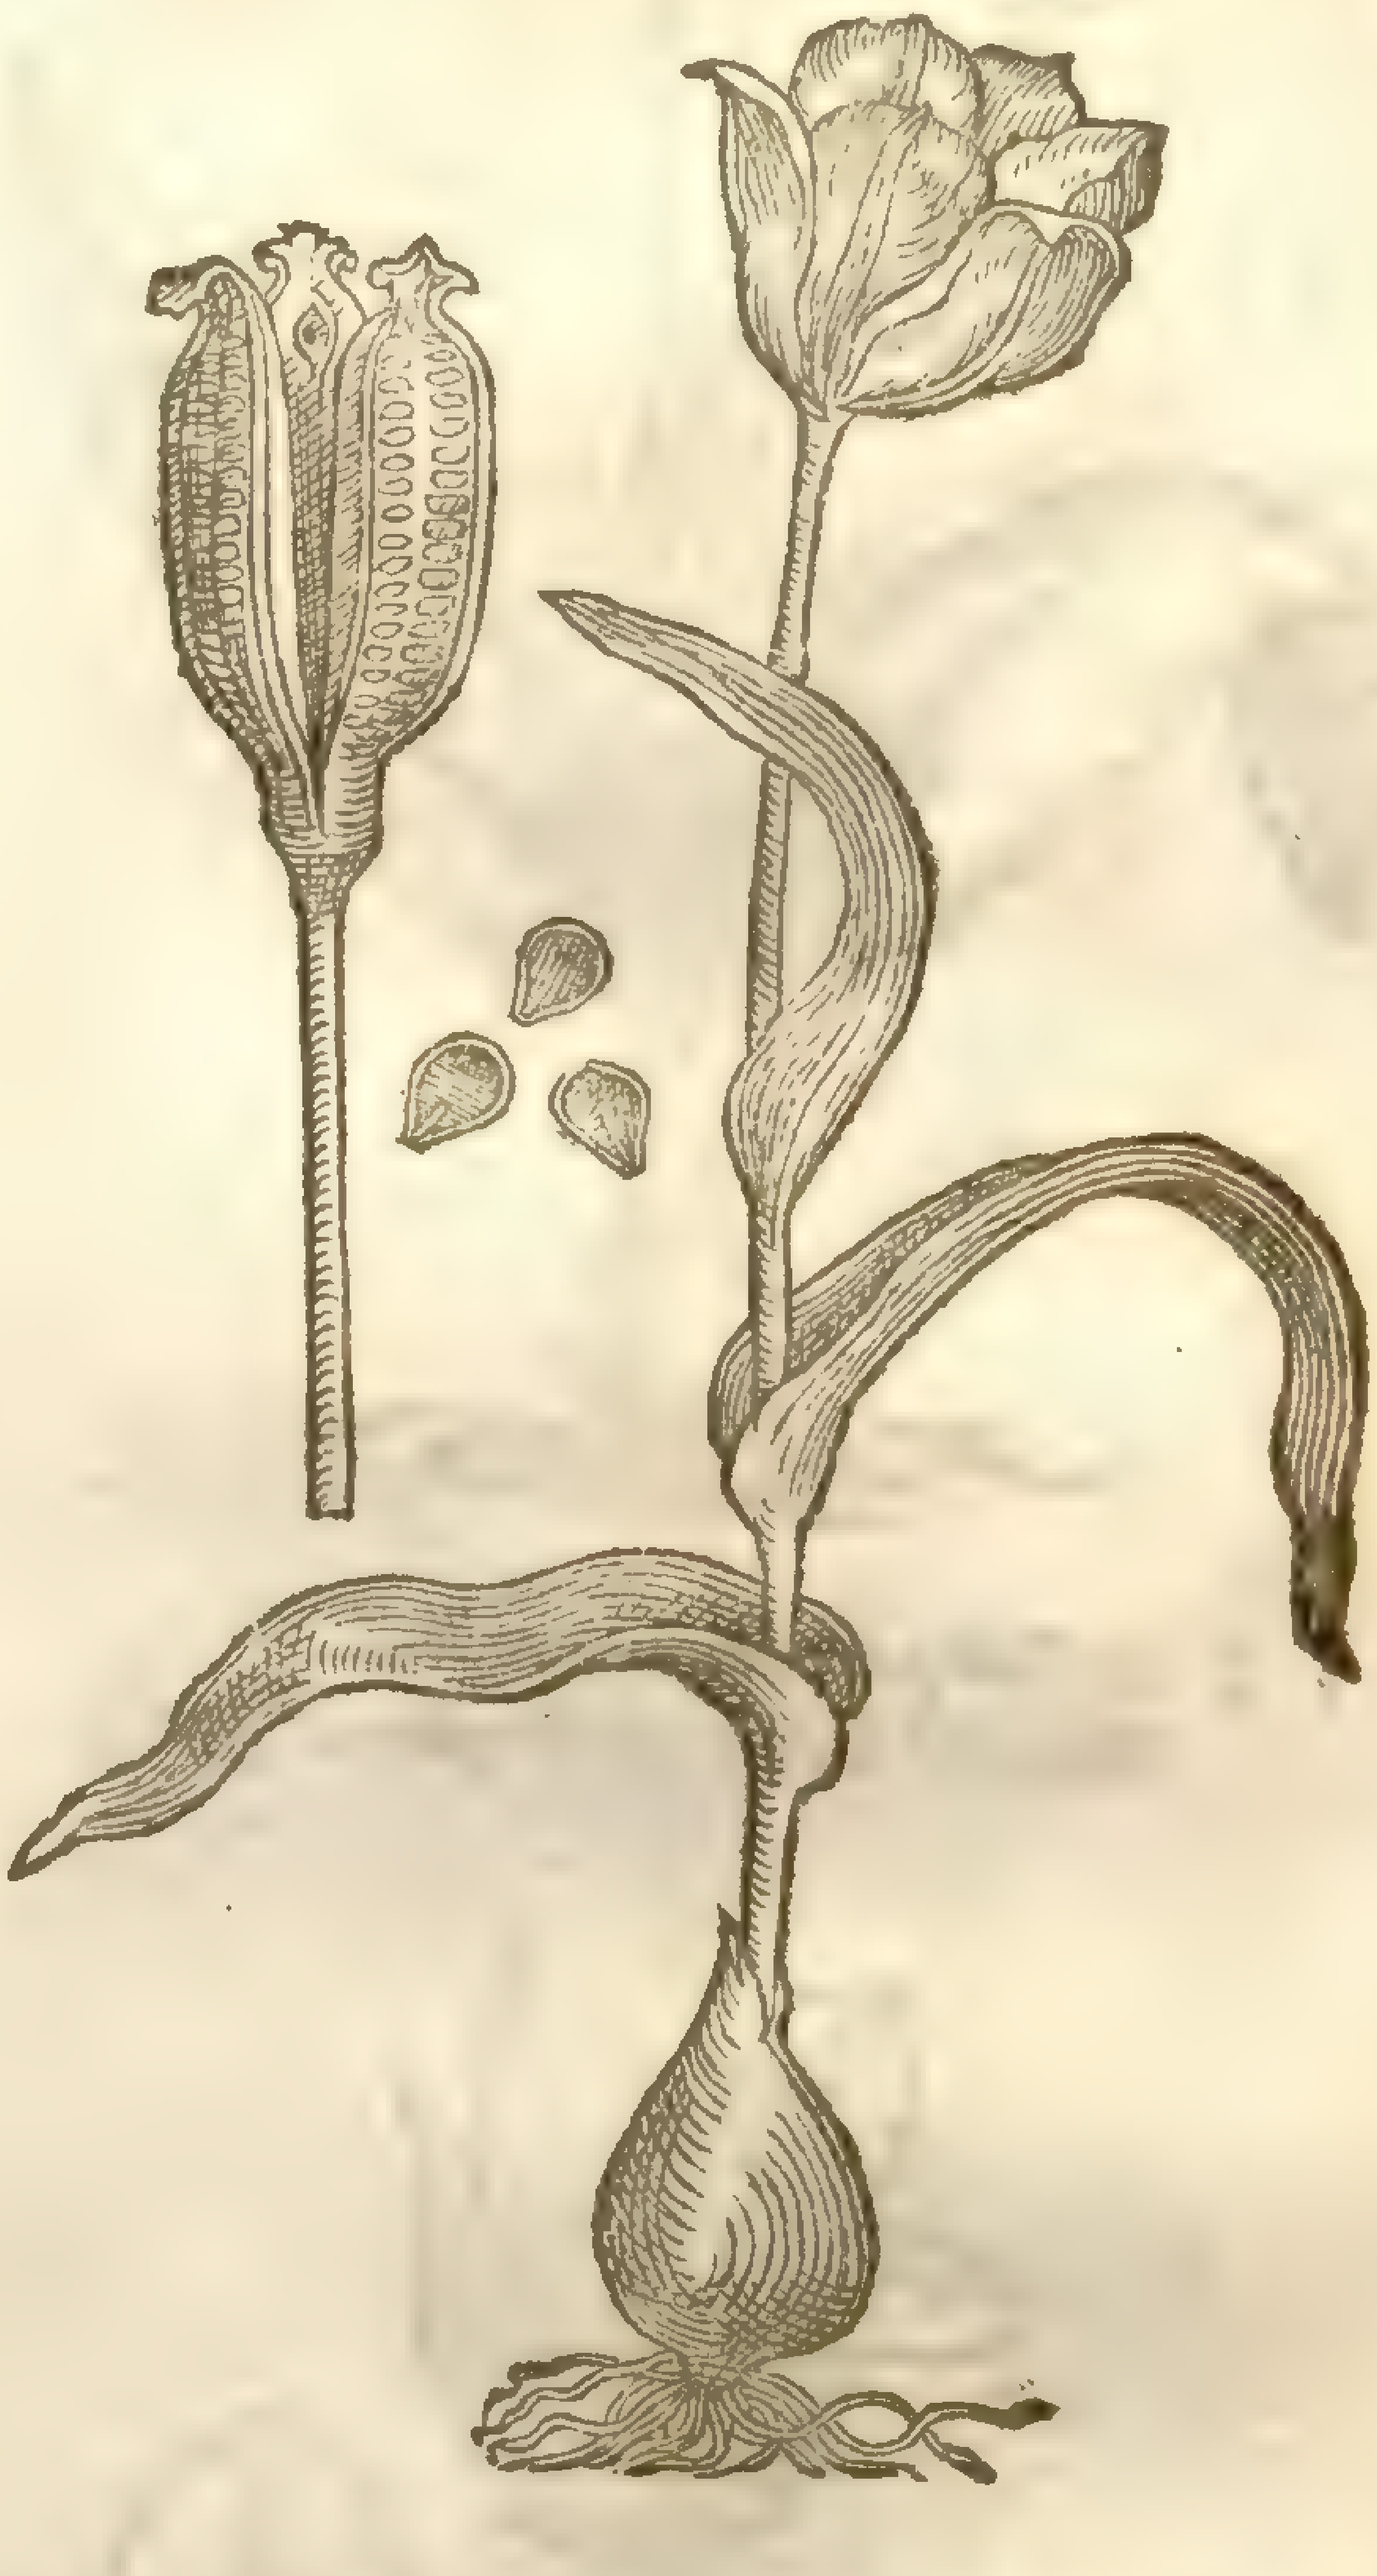
4 The fourth kinde of Tulip, that floureth later, hath leaues, ſtalkes, and roots like vnto the precedent. The floures hereof be of a skarlet colour, welted or bordered about the edges with red. The middle part is like vnto a heart, tending to whiteneſſe, ſpotted in the ſame whiteneſſe with red ſpeckles or ſpots. The ſeed is contained in ſquare cods, flat, tough, and ſinewie.

5 The fift ſort of Tulipa, which is neither of the timely ones, nor of the later flouring ſort, but one that bringeth forth his moſt beautifull floures betweene both. It agreeth with the laſt deſcribed Tulipa, in leaues, ſtalkes, roots, and ſeed, but differeth in the floures. The floure conſiſteth of ſix ſmall leaues joyned together at the bottome: the middle of which leaues are of a pleaſant bloudy colour, the edges be bordered with white, and the bottome next vnto the ſtalke is likewiſe white; the whole floure reſembling in colour the bloſſomes of an Apple tree.

‡ 22 *Tulipa miniata.*
The vermilion Tulip.



‡ 23 *Tulipa albo & rubro ſtriatus.*
The white and red ſtriped Tulip.



6 The ſixth hath leaues, roots, ſtalkes, and ſeed like vnto the former, but much greater in euery point. The floures hereof are white, daſht about the brimmes or edges with a red or bluſh colour. The middle part is ſtripped confuſedly with the ſame mixture, wherein is the difference.

7 *Carolus Cluſius* ſetteth forth in his Pannonicke hiſtory a kinde of Tulipa that beareth faire red floures, blacke in the bottome, with a peſtell in the middle of an ouer-worne greeniſh colour; of which ſort there happeneth ſome to haue yellow floures, agreeing with the other before touched: but this bringeth forth encreaſe of roots in the boſome of his loweſt leafe next to the ſtalke, contrary to the other kindes of Tulipa.

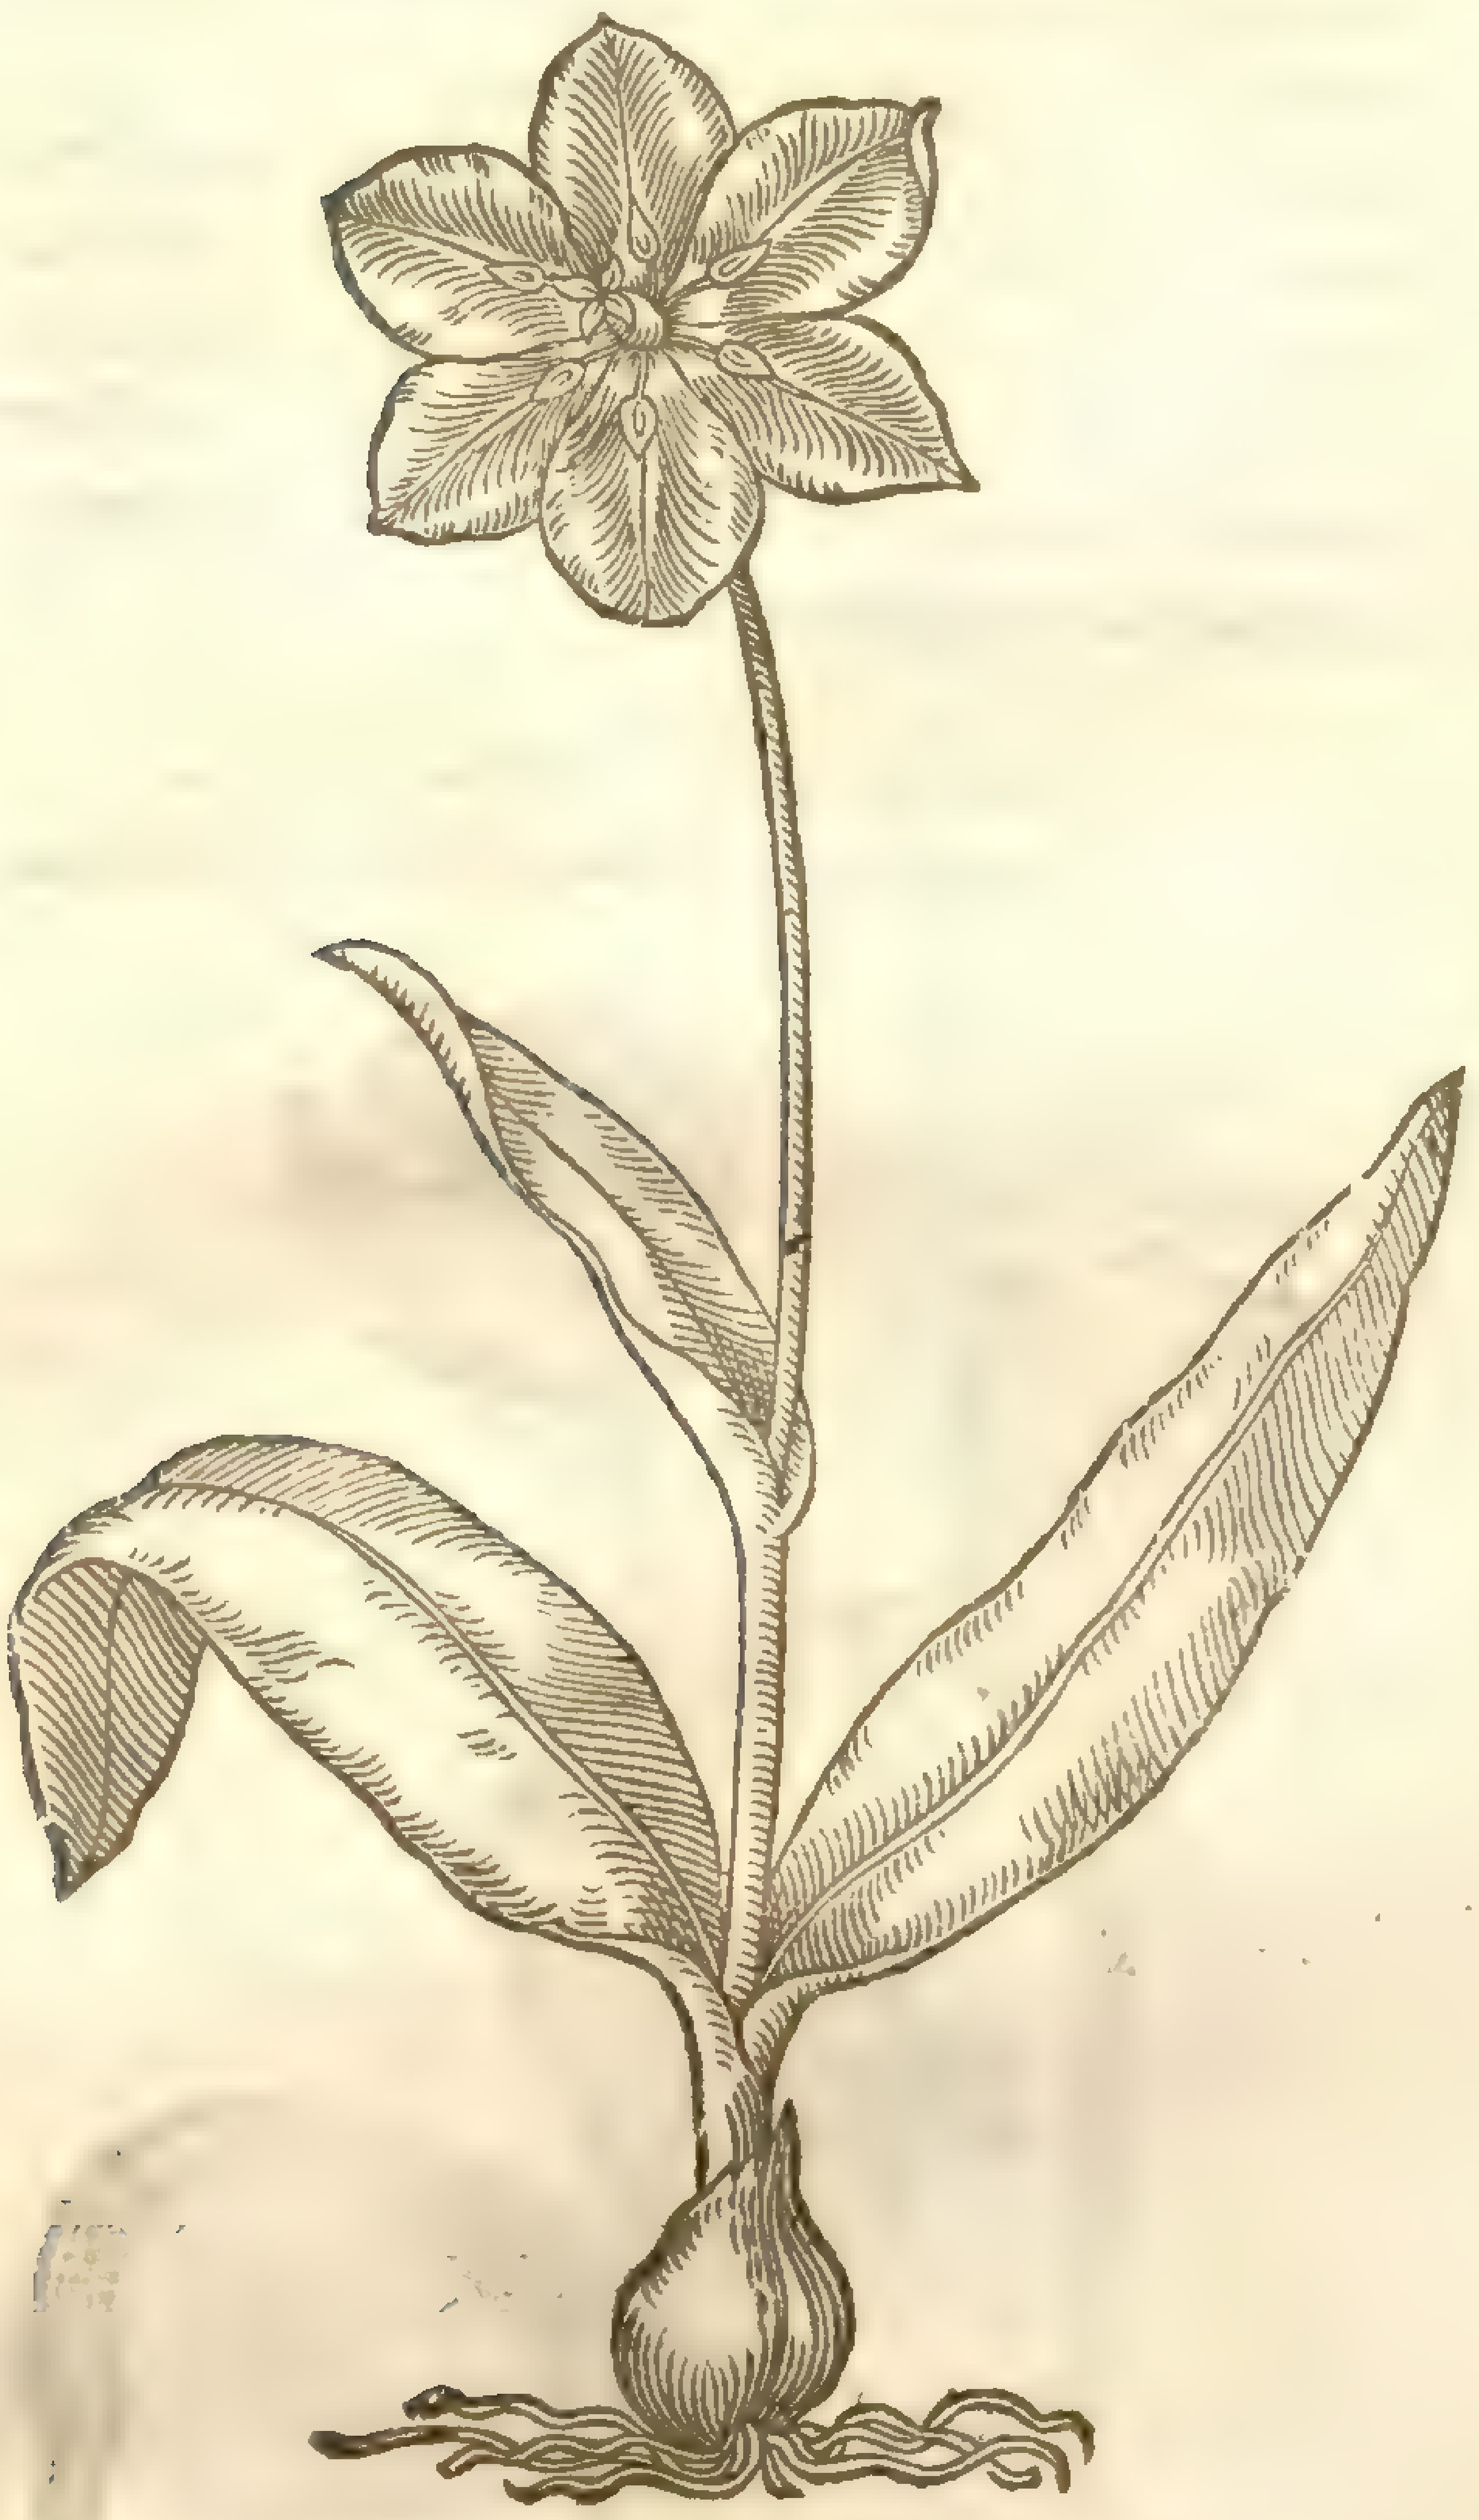
8 *Lobelius* in his learned Obſeruations hath ſet forth many other ſorts; one he calleth *Tulipa Chalceaonica*, or the Turky Tulipa, ſaying it is the leaſt of the ſmall kindes or Dwarfe Tulipa's, whoſe floure is of a ſanguine red colour, vpon a yellow ground, agreeing with the other in root, leafe, and ſtalke.

9 He hath likewiſe ſet forth another; his floure is like the Lilly in proportion, but in colour of a fine purple.

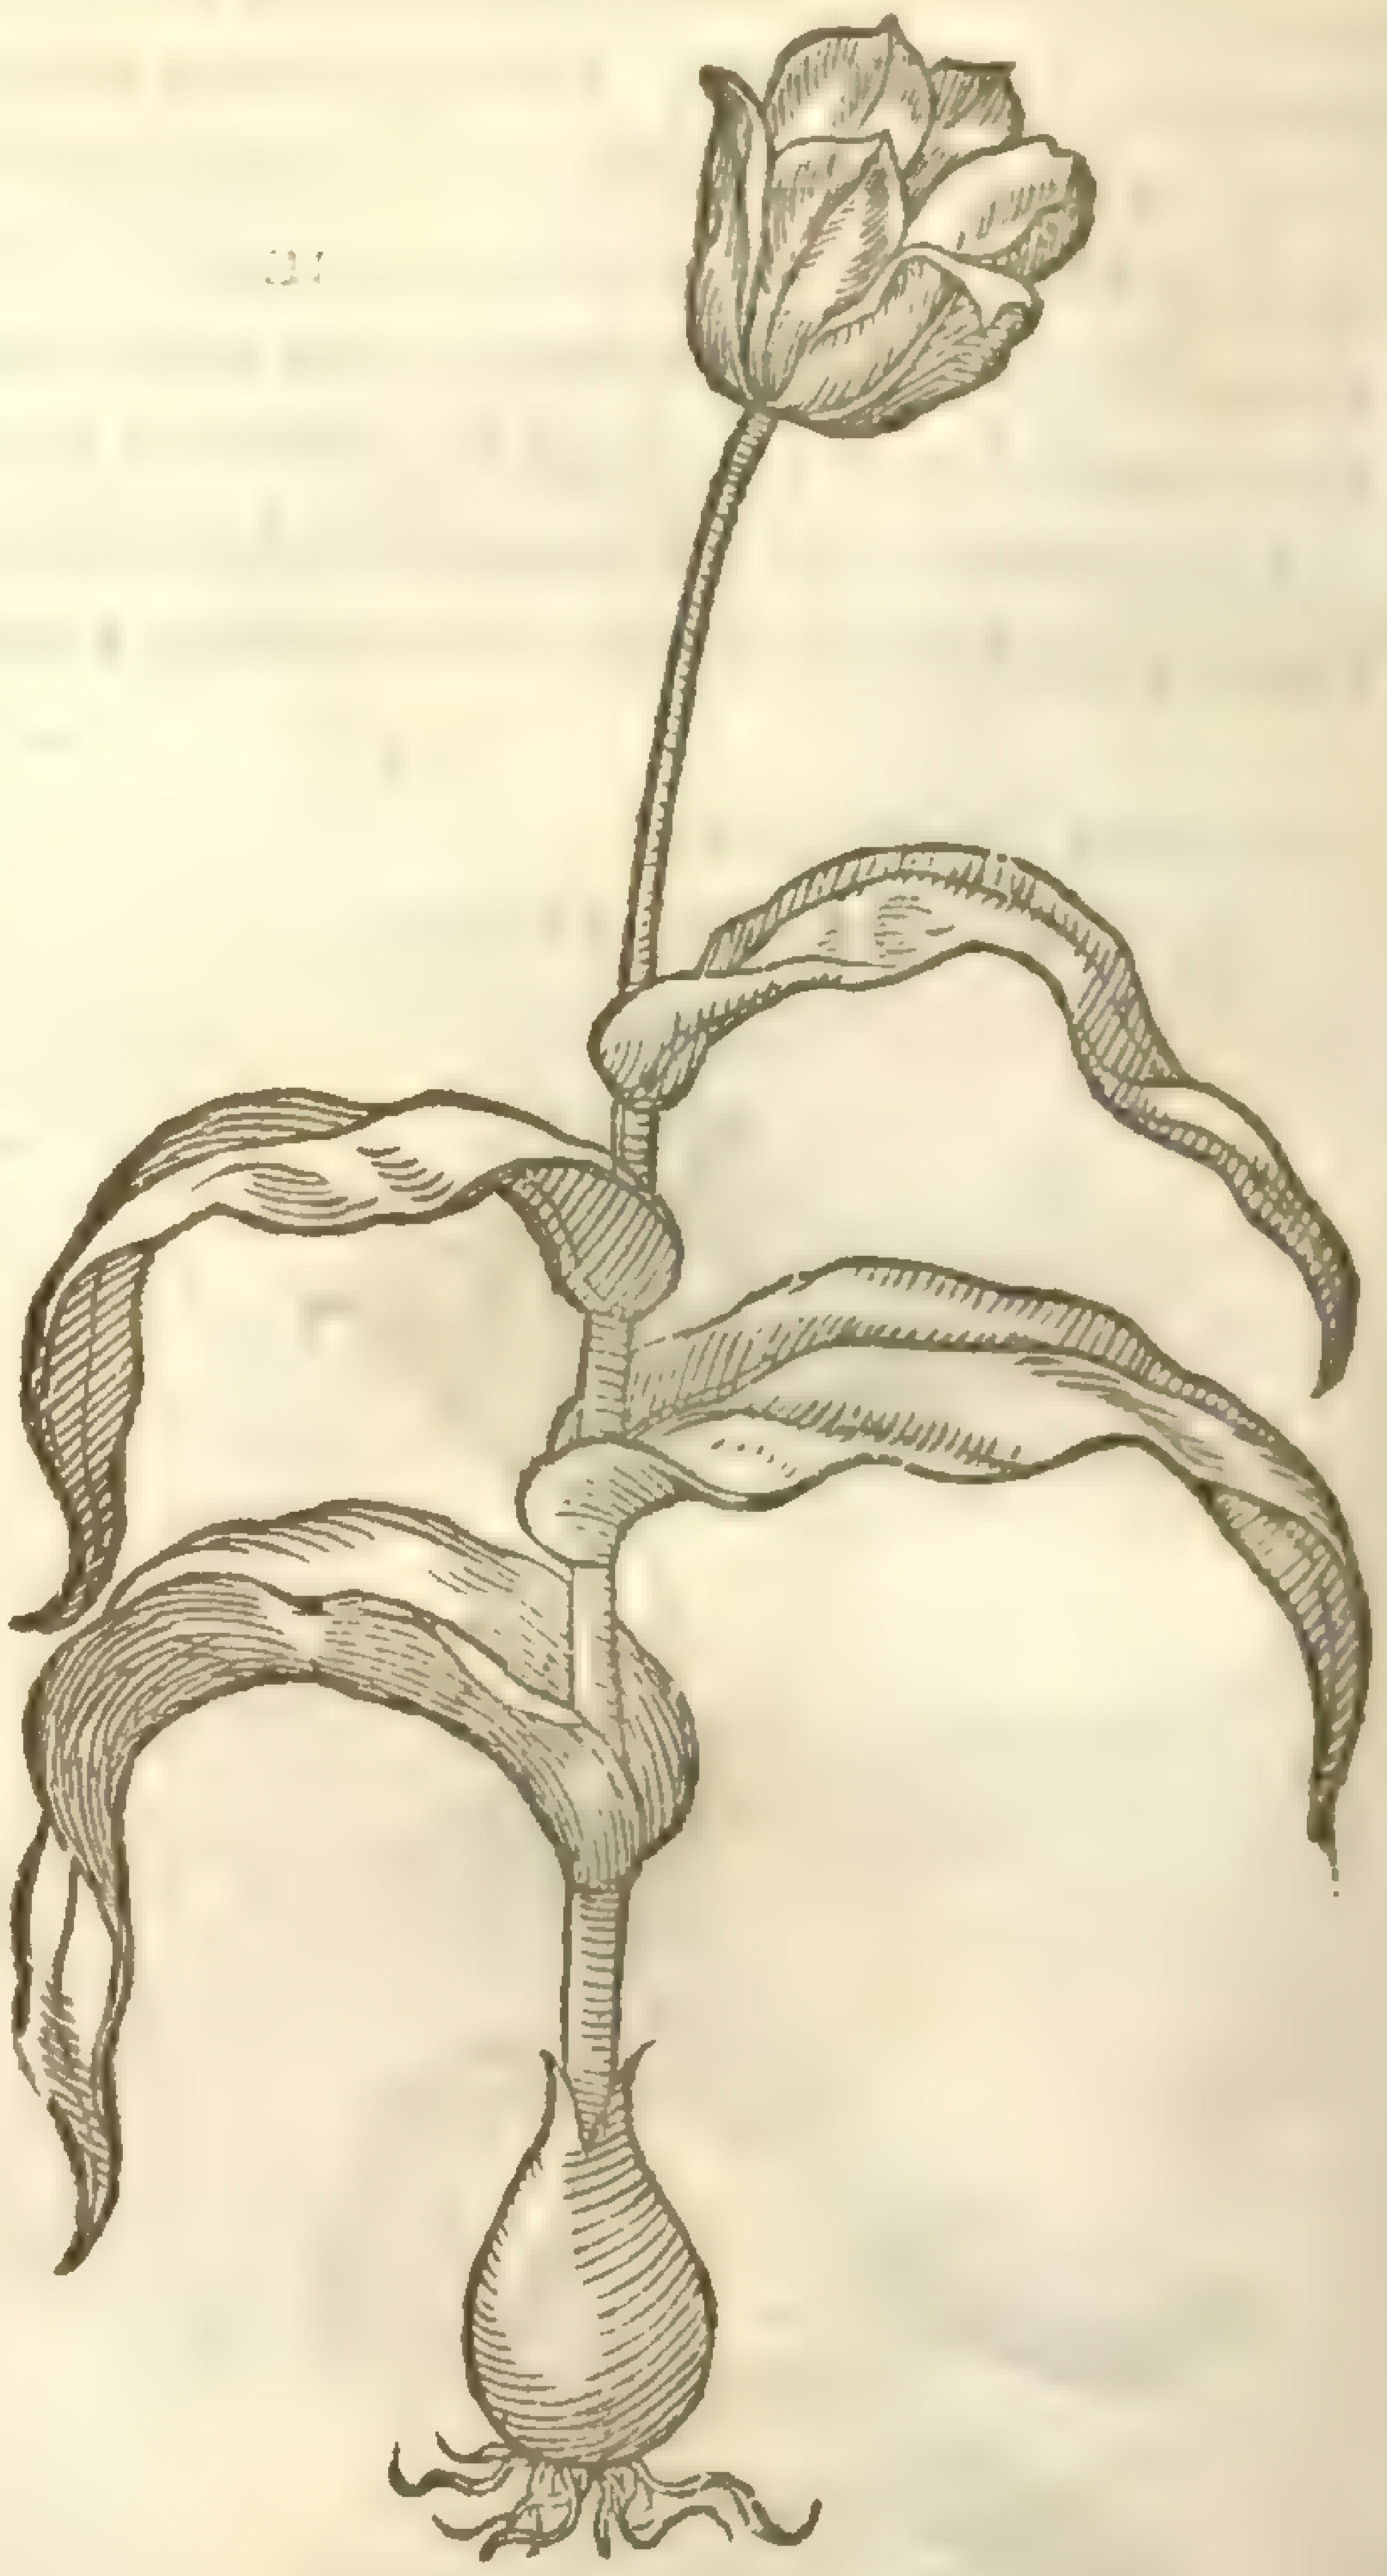
10 We may alſo behold another ſort altogether greater than any of the reſt, whoſe floure is in colour like the ſtone called *Amethiſt*, not vnlike to the floures of Peonies.

11 We haue likewiſe another of greater beautie, and very much deſired of all, with white floures daſht on the back ſide, with a light waſh of watched colour.

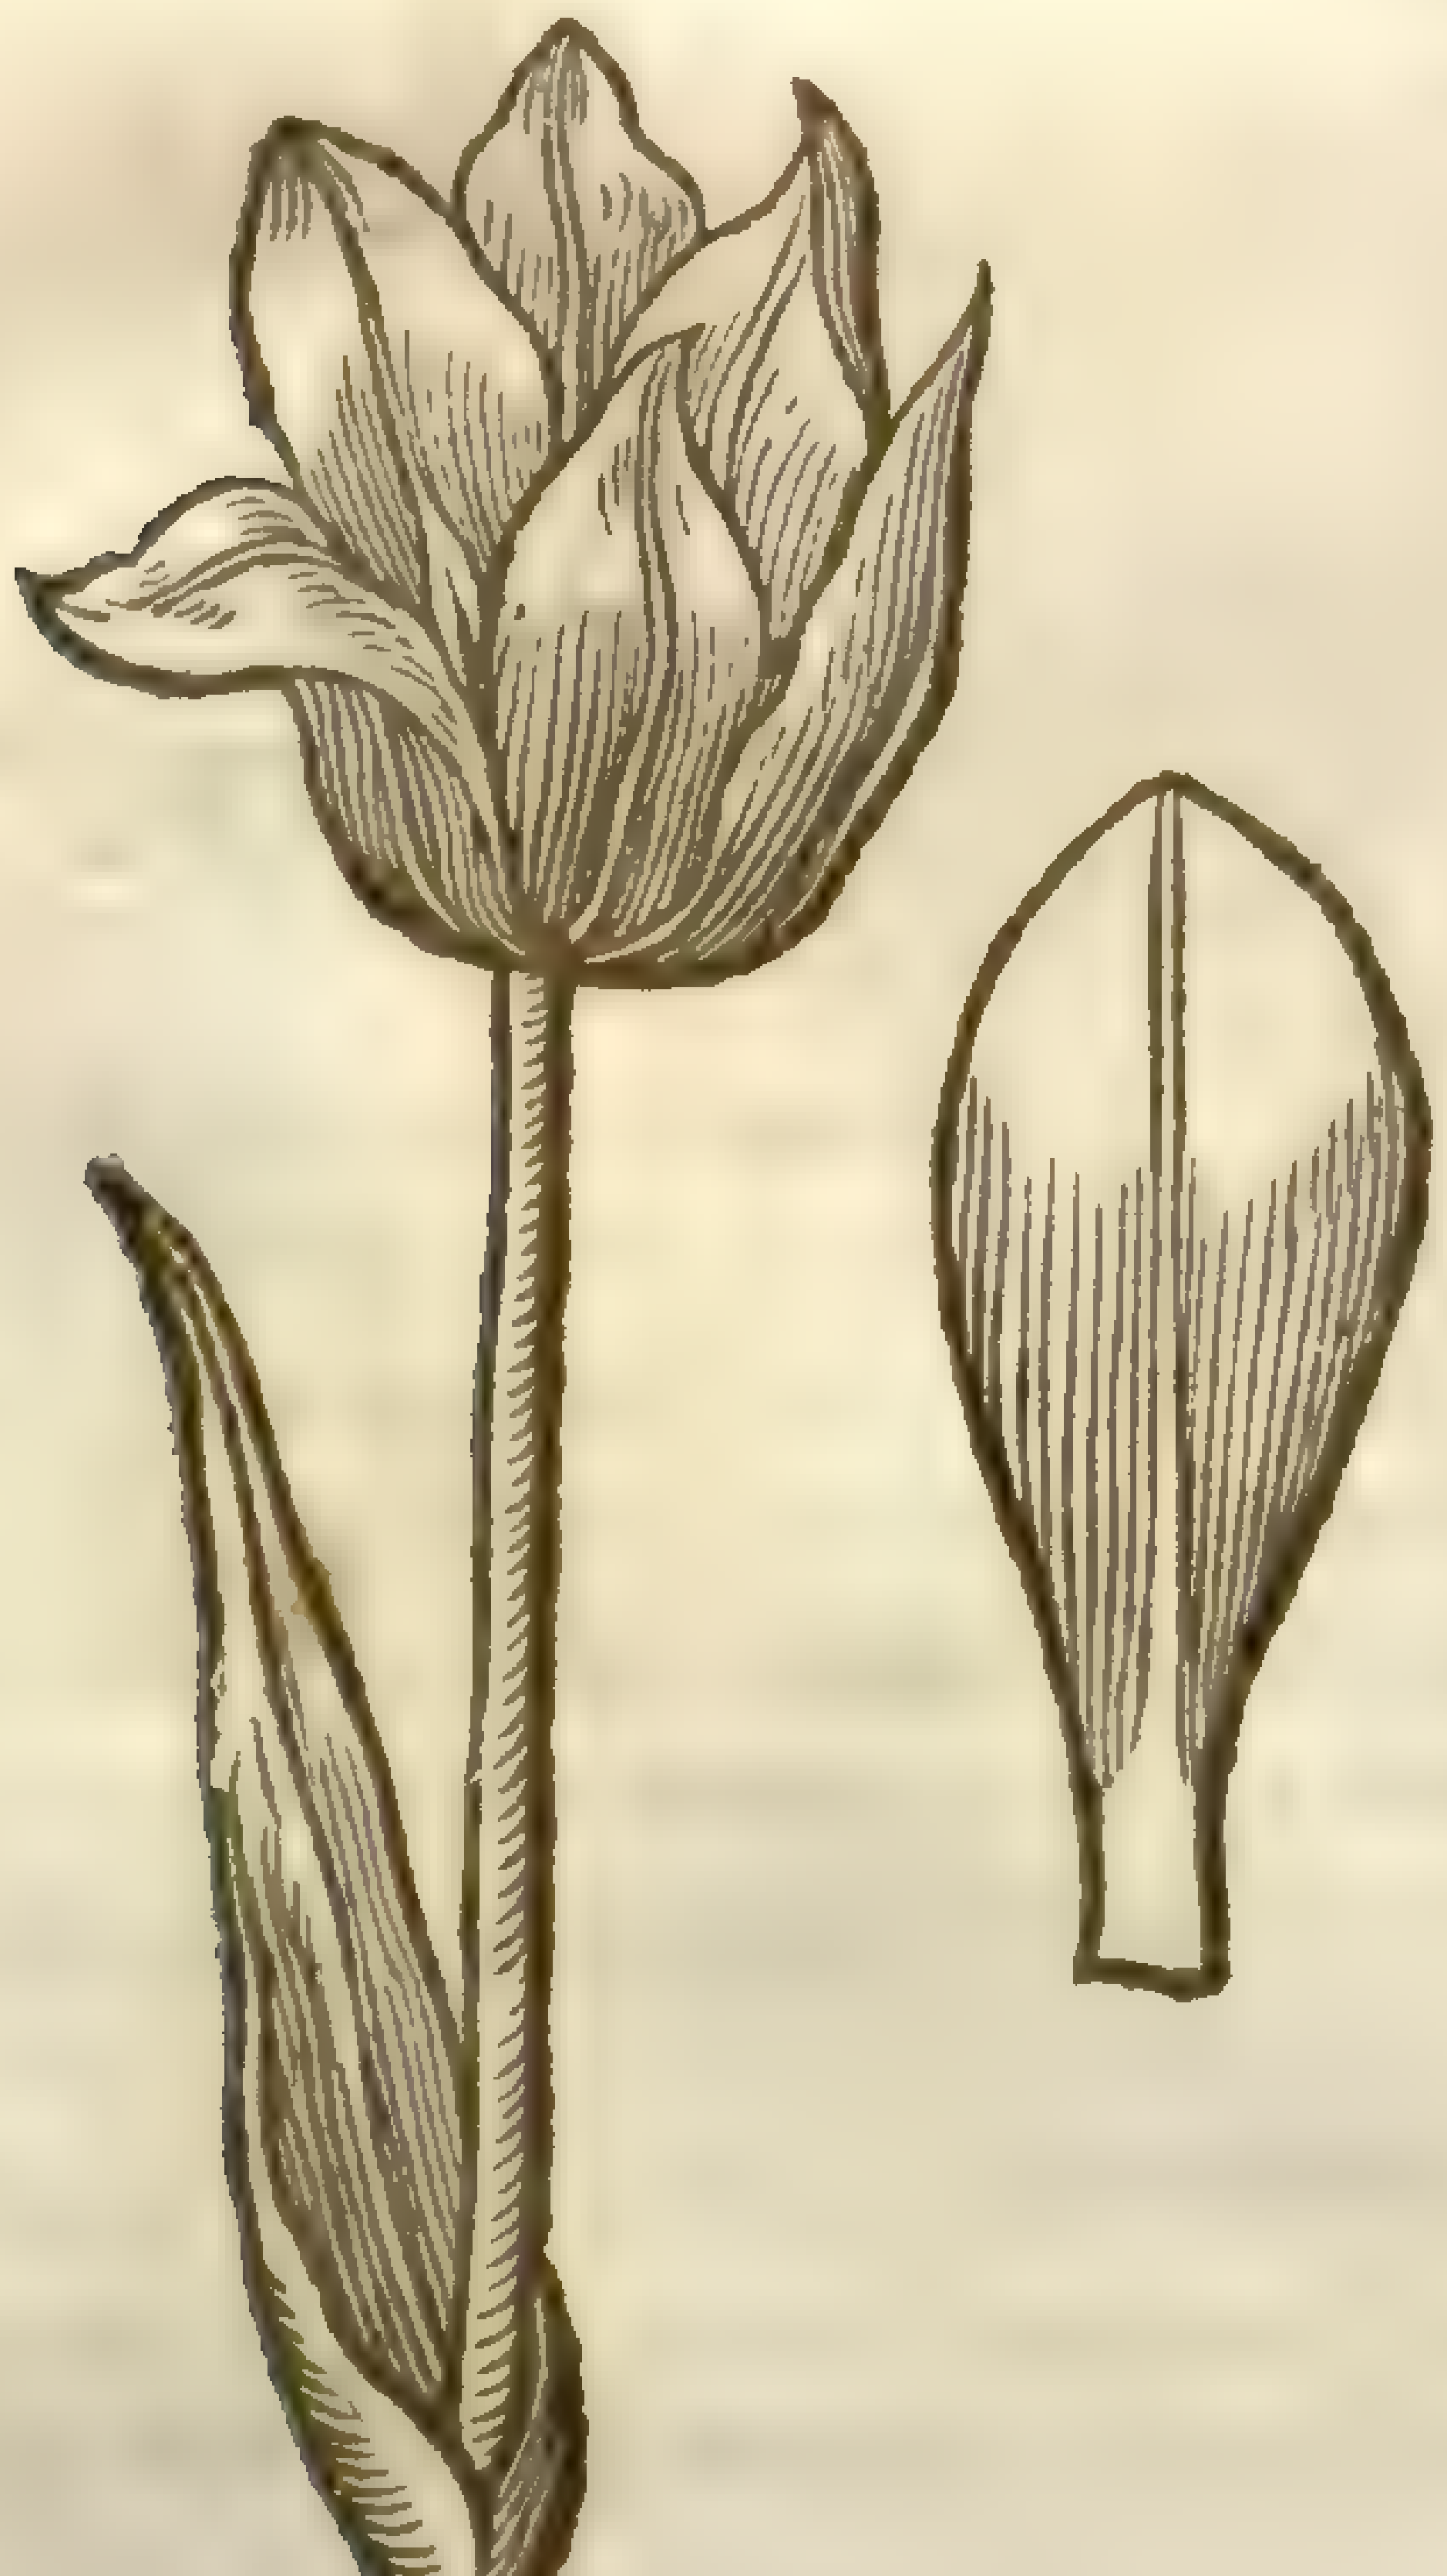
‡ 24 *Tulipa luteo & rubro ſtriatus.*
The red and yellow Fooles coat.



‡ 25 *Tulipa flore coloris ſulphurei.*
The ſulpher coloured Tulip.



‡ 26 *Tulipa rubra oris pallidis.*
The red Tulip with pale edges.



12 There is another alſo in our London gardens, of a ſnow white colour ; the edges ſlightly waſht ouer with a little of that we call bluſh colour.

13 We haue another like the former, ſauing that his floure is of a ſtraw colour.

14 There is another to be ſeene with a floure mixed with ſtreaks of red and yellow, reſembling a flame of fire, wherupon we haue called it Flambant.

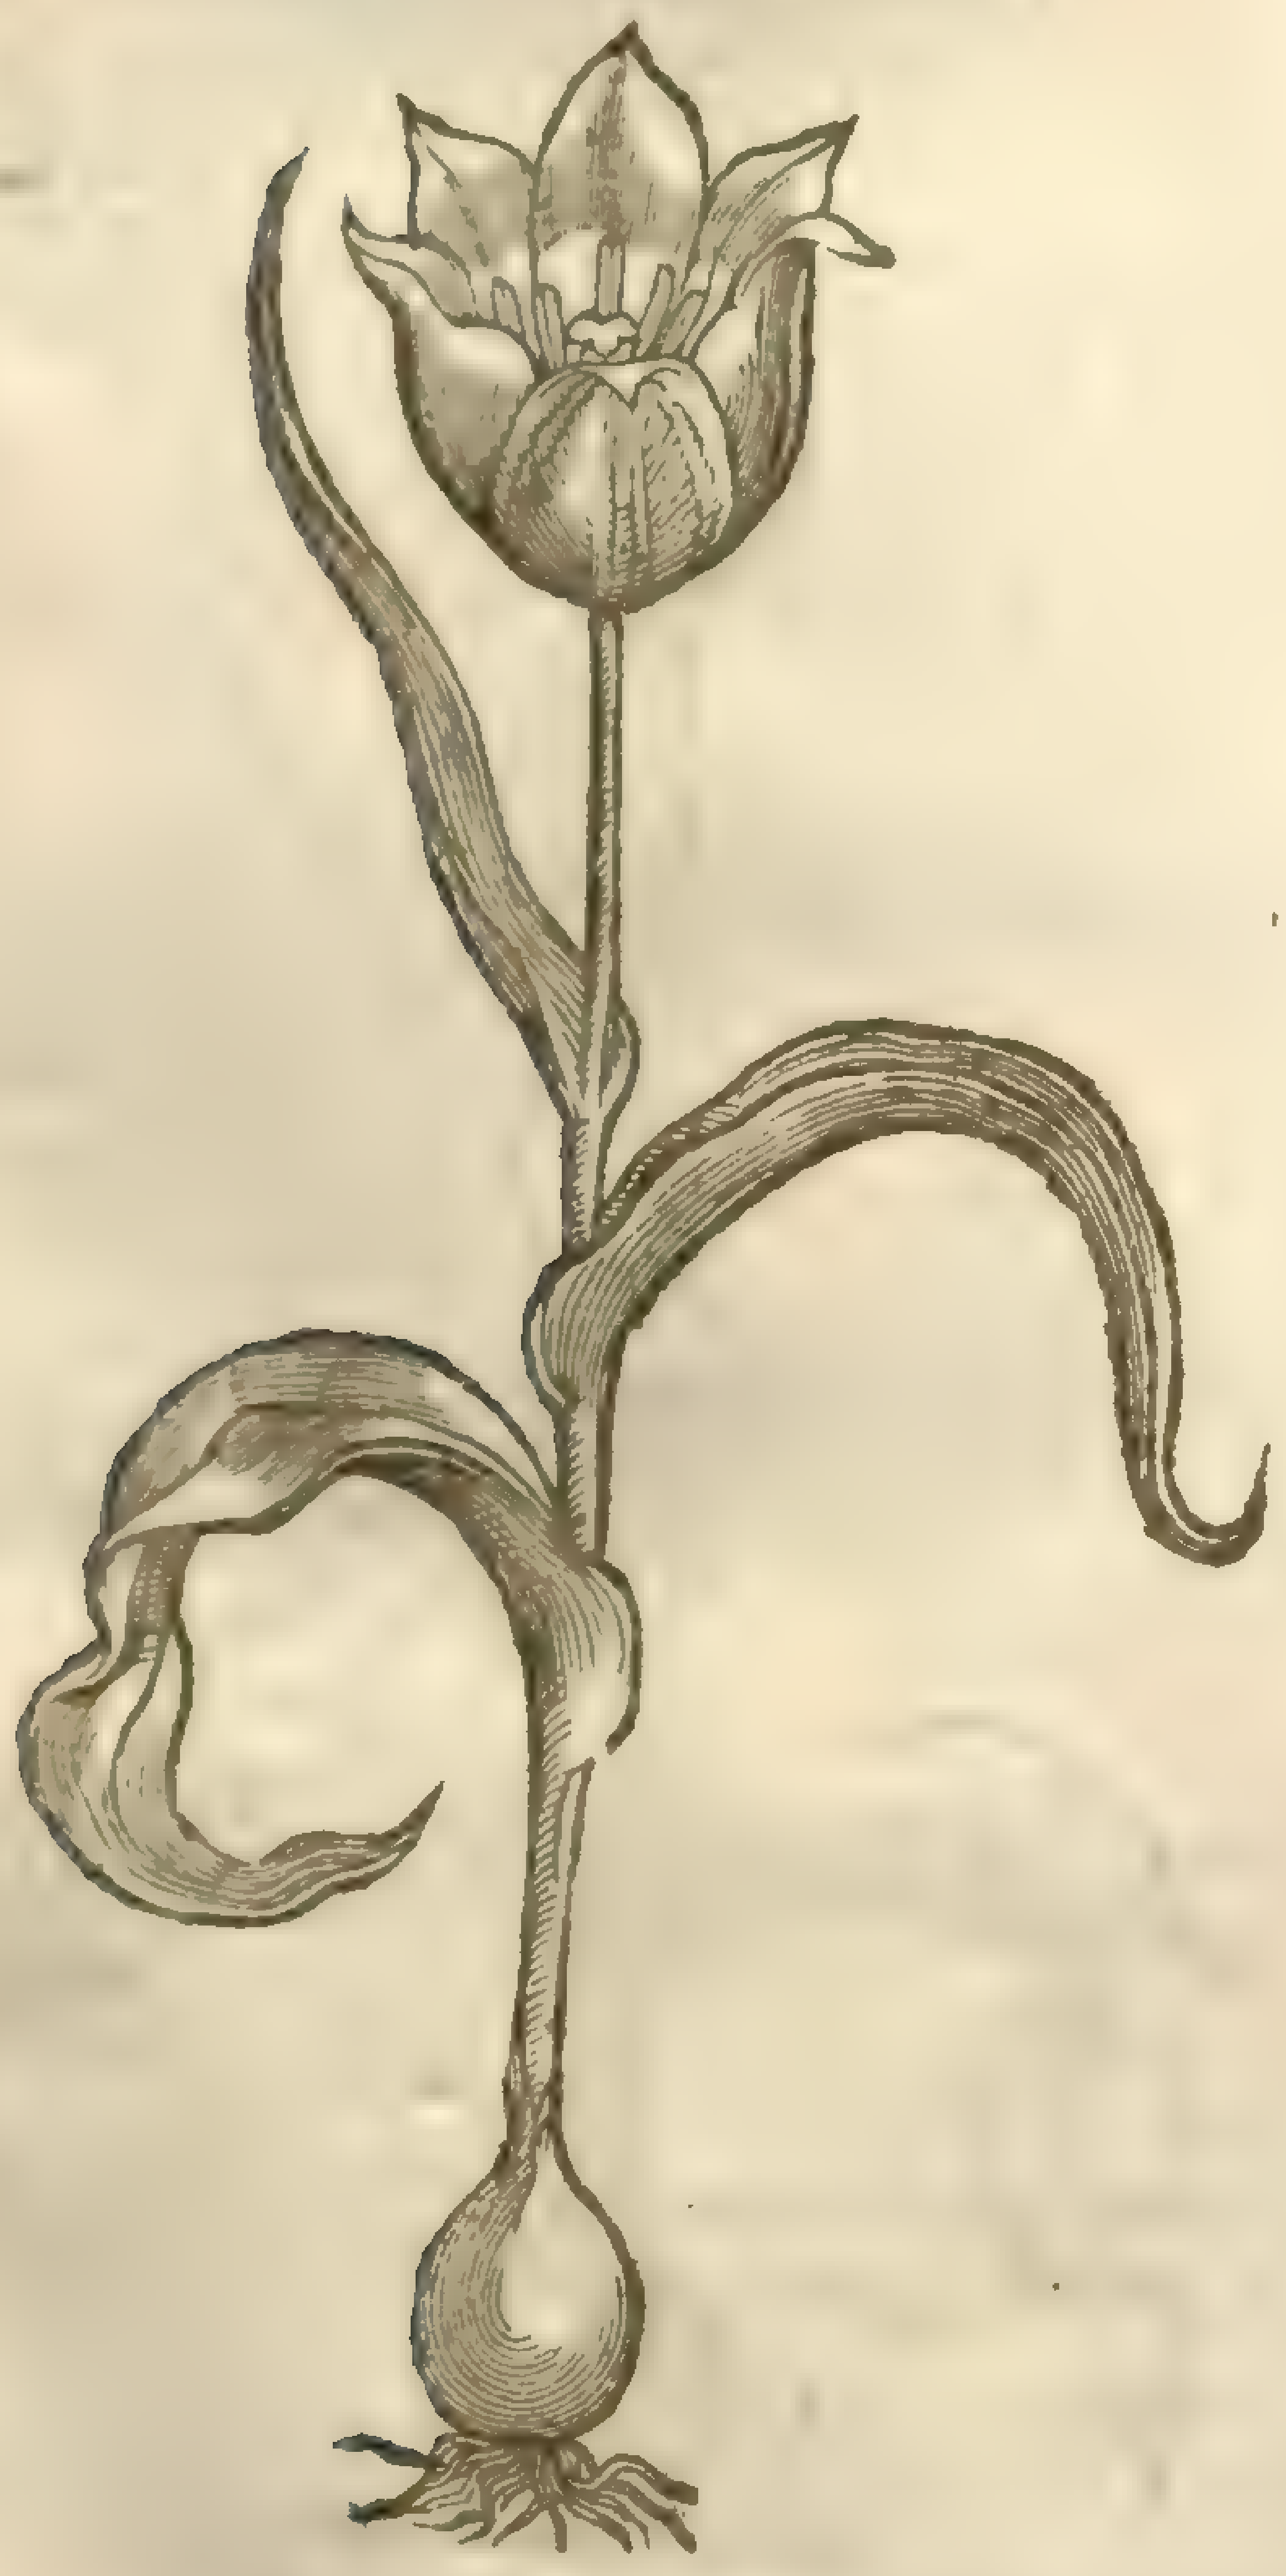
There be likewiſe ſo many more differing ſo notably in colour of their floures, although in leaues, ſtalke, and roots for the moſt part one like another, that (as I ſaid before) to ſpeake of them ſeuerally would require a peculiar volume.

‡ Therefore not to trouble you any further, I haue giuen you onely the figures and names of the notableſt differences which are in ſhape ; as the dwarfe Tulipa's, and the branched ones, together with the colour of their floures, contained in their titles, that you need not far to ſeeke it. ‡

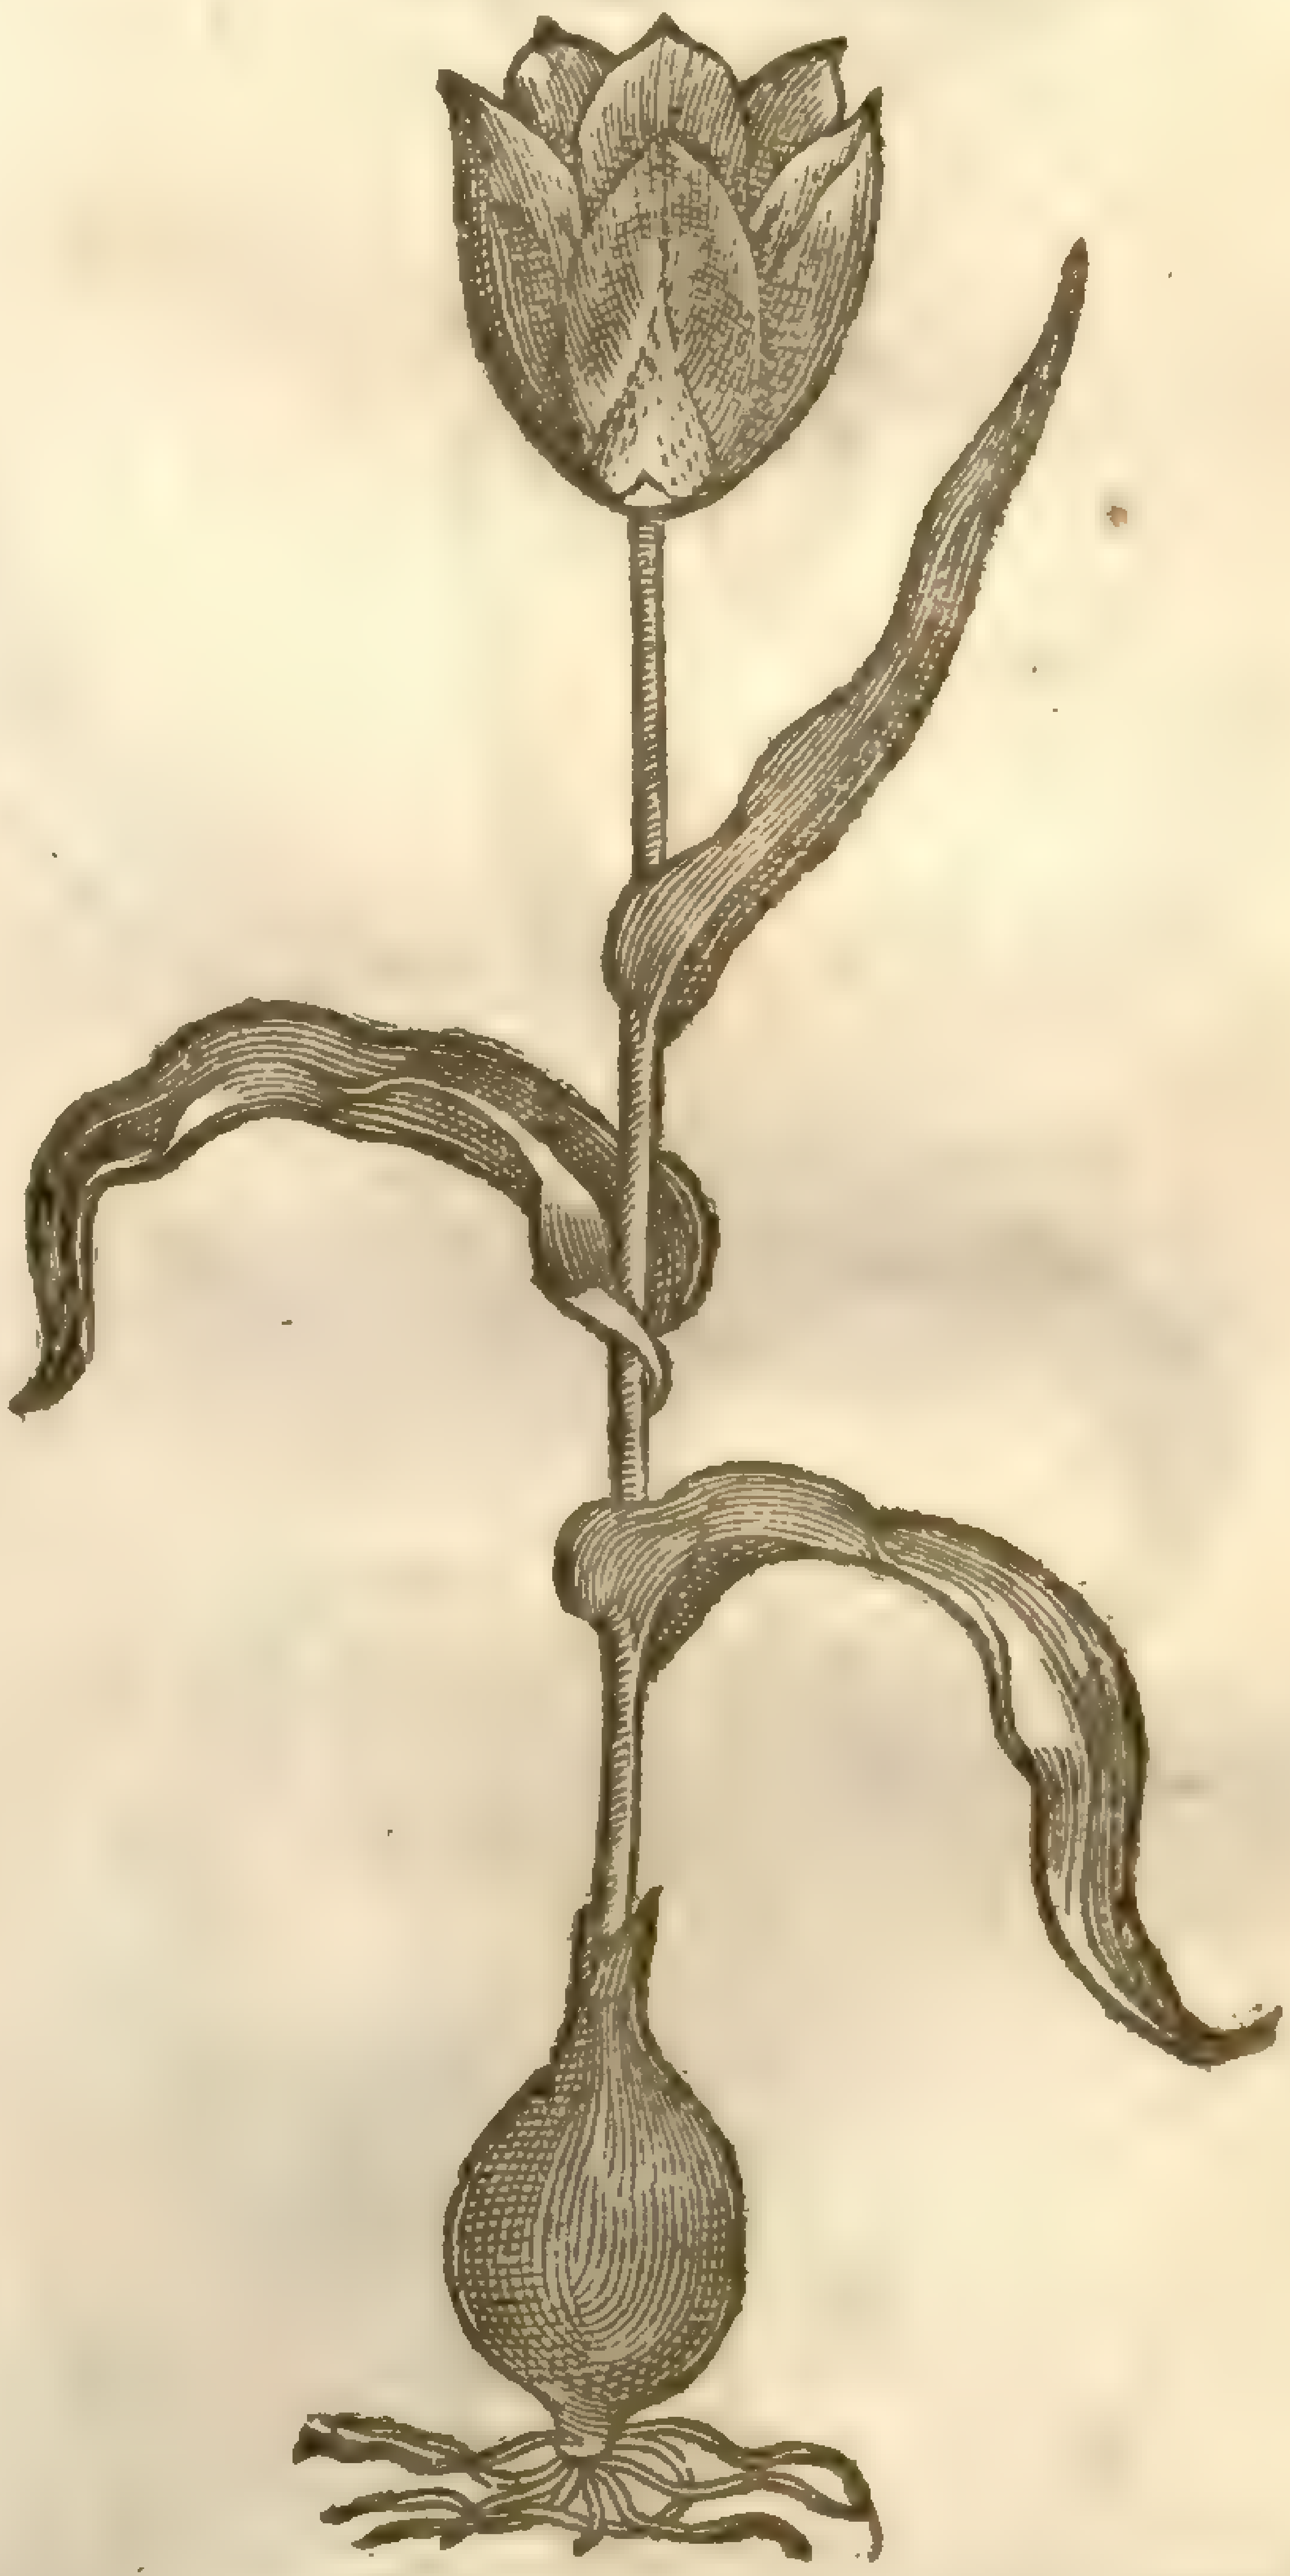
There be a ſort greater than the reſt, which in forme are like ; the leaues whereof are thicke, long, broad, now and then ſomewhat folded in the edges ; in the middeſt whereof doth riſe vp a ſtalk a foot high, or ſomthing higher, vpon which ſtandeth onely one floure bolt vpright, conſiſting of ſix leaues, after a ſort like to a deepe wide cup of this forme, *viz.* the bottome turned vpwards, with threads thredsor chiues in the middle, of the colour of Saffron. The colour of the floure is ſomtimes yellow, ſometimes white, now and then as it were of a light purple, and many times red; and in this there is no ſmall varieties of colours, for the edges of the leaues, and oftentimes the nails or lower part of the leaues are now and then otherwiſe colored than the leaues themſelues, and many times there doth run all along theſe ſtreakes ſome other colours. They haue no ſmell at all that can be perceiued. The roots of theſe are likewiſe bulbed or onion faſhion, euerie of which to ſet forth ſeuerally would trouble the writer, and wearie the reader; ſo that what hath beene ſaid ſhall ſuffice touching the deſcription of Tulipa's.

‡ True it is that our Author here affirmes, that the varietie of theſe floures are ſo infinite, that it would both tire the writer and reader to recount them. Yet for that ſome are more in loue with floures than with plants in generall, I haue thought good to direct them where they may finde ſomewhat more at large of this plant. Let ſuch therefore as deſire further ſatisfaction herein, haue recourſe to the Florilegies of *De Bry, Swertz, Robine*, or to Mr *Parkinſon*, who hath not only treated of the floures in particular, but alſo of the ordering of them. ‡

‡ 27 *Tulipa lutea ſerotina.*
The late flouring yellow Tulip.



‡ 28 *Tulipa ſerotina lutea gutis ſanguineis, fundo nigro.*
The late Yellow, with ſanguine ſpots and a blacke bottome.



¶ *The Place.*

Tulipa groweth wilde in Thracia, Cappadocia, and Italy; in Bizantia about Conſtantinople; at Tripolis and Aleppo in Syria. They are now common in all the Engliſh gardens of ſuch as affect floures.

¶ *The Time.*

They floure from the end of Februarie vnto the beginning of May, and ſomwhat after: although *Augerius Busbequius* in his journey to Conſtantinople, ſaw betweene Hadrianople and Conſtantinople, great aboundance of them in floure euerie where, euen in the midſt of Winter, in the moneth of Ianuarie, which that warme and temperat clymat may ſeeme to performe.

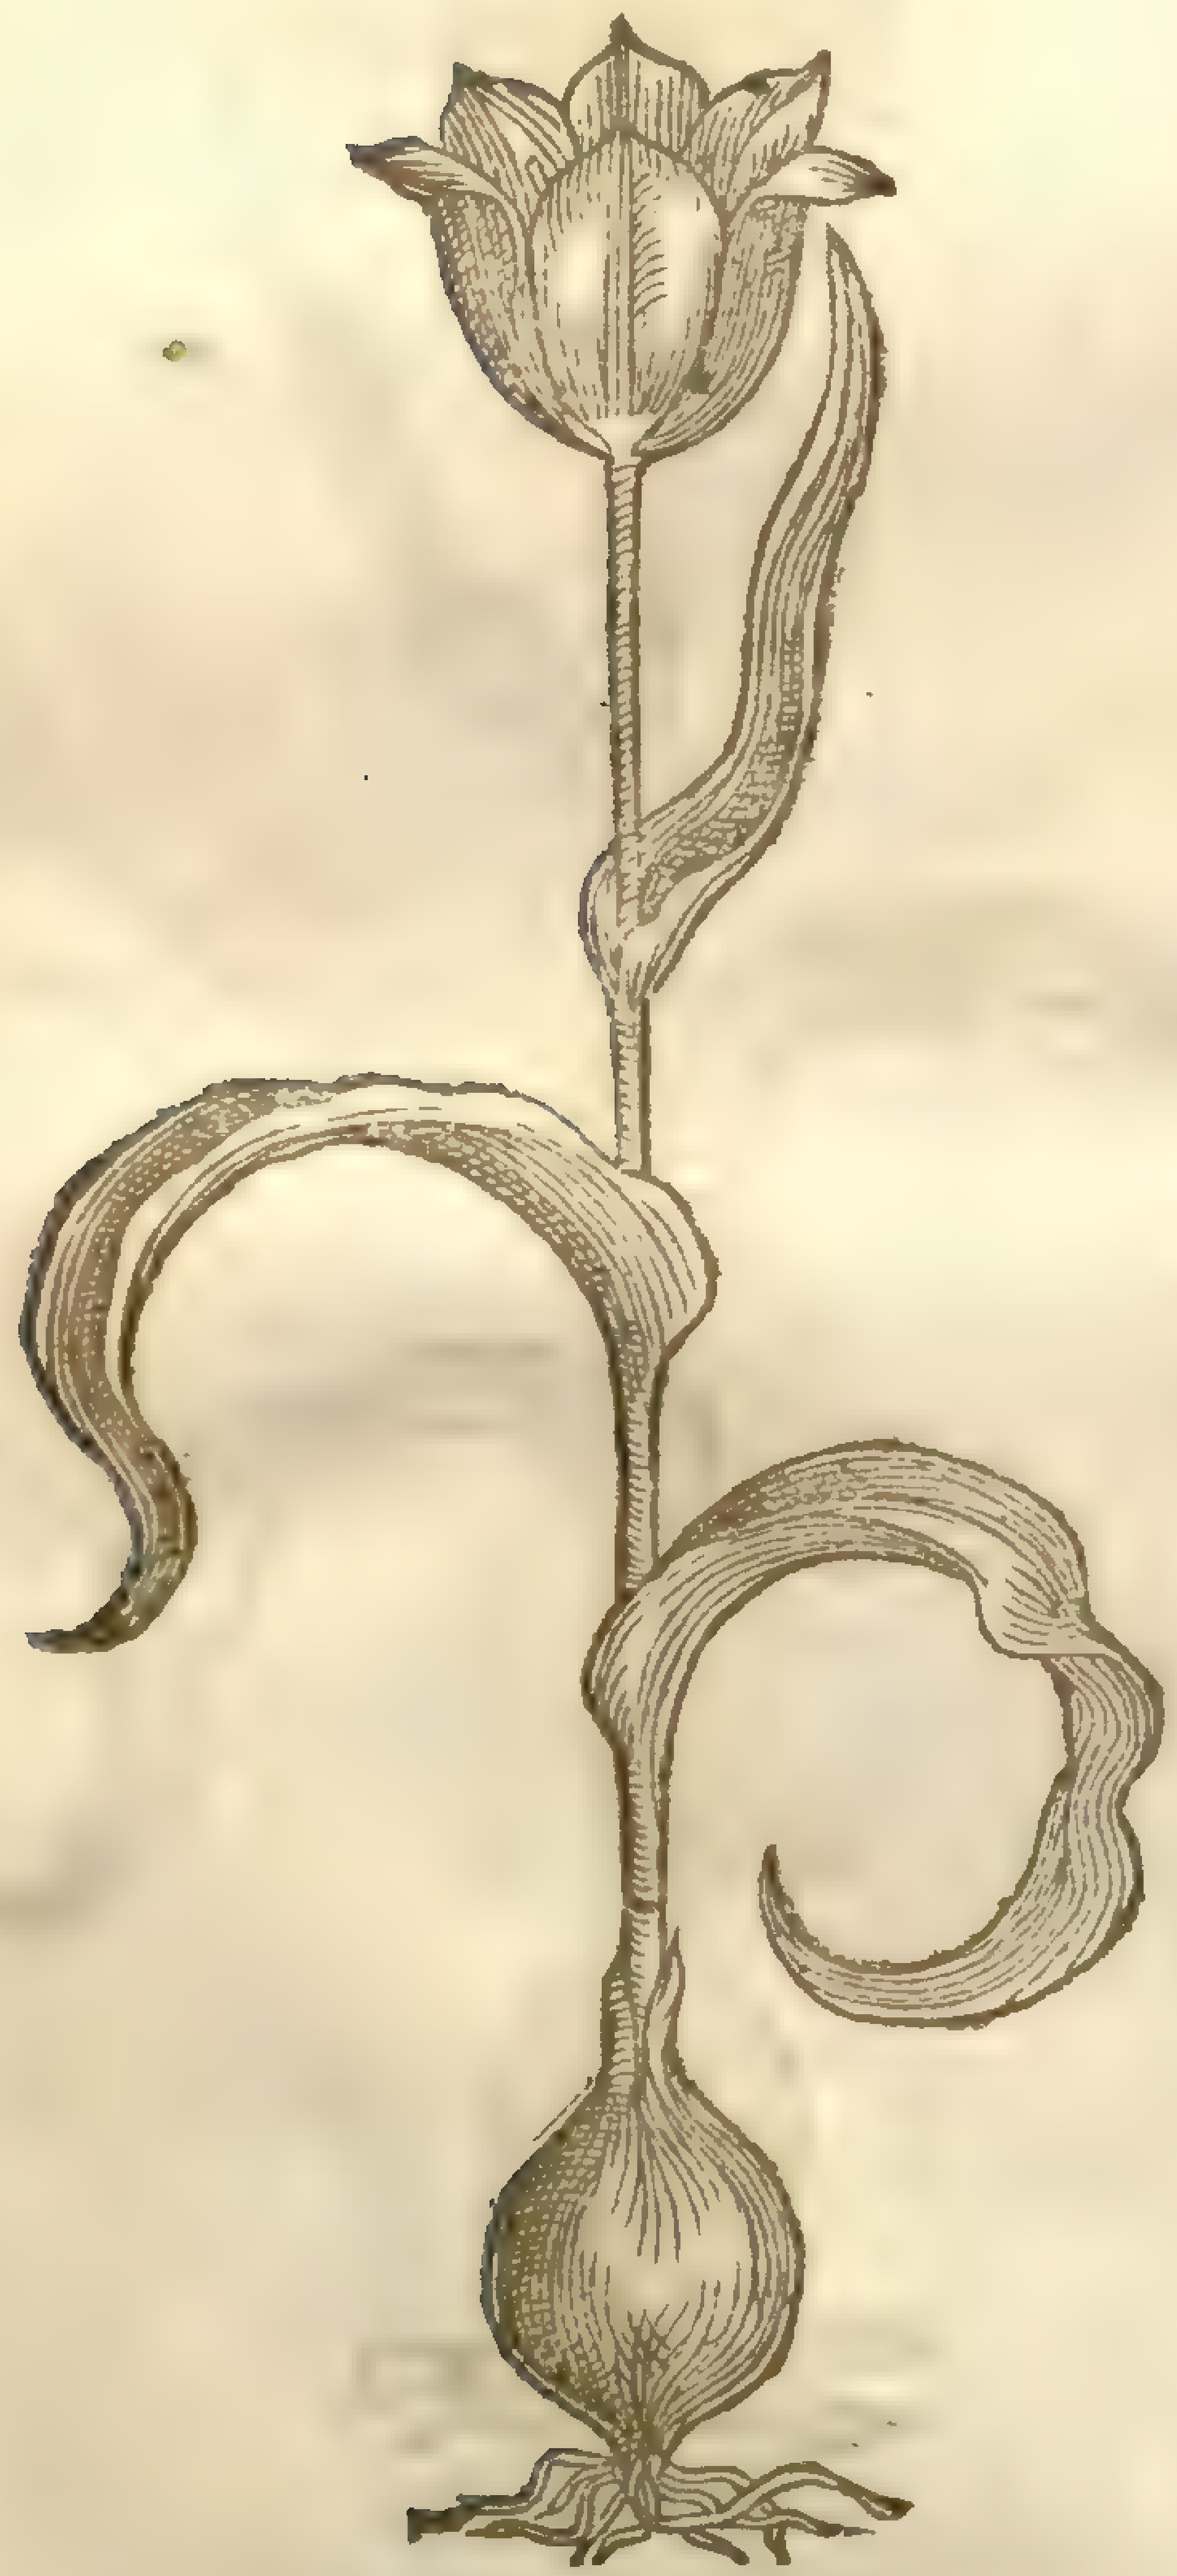
¶ The

¶ *The Names.*

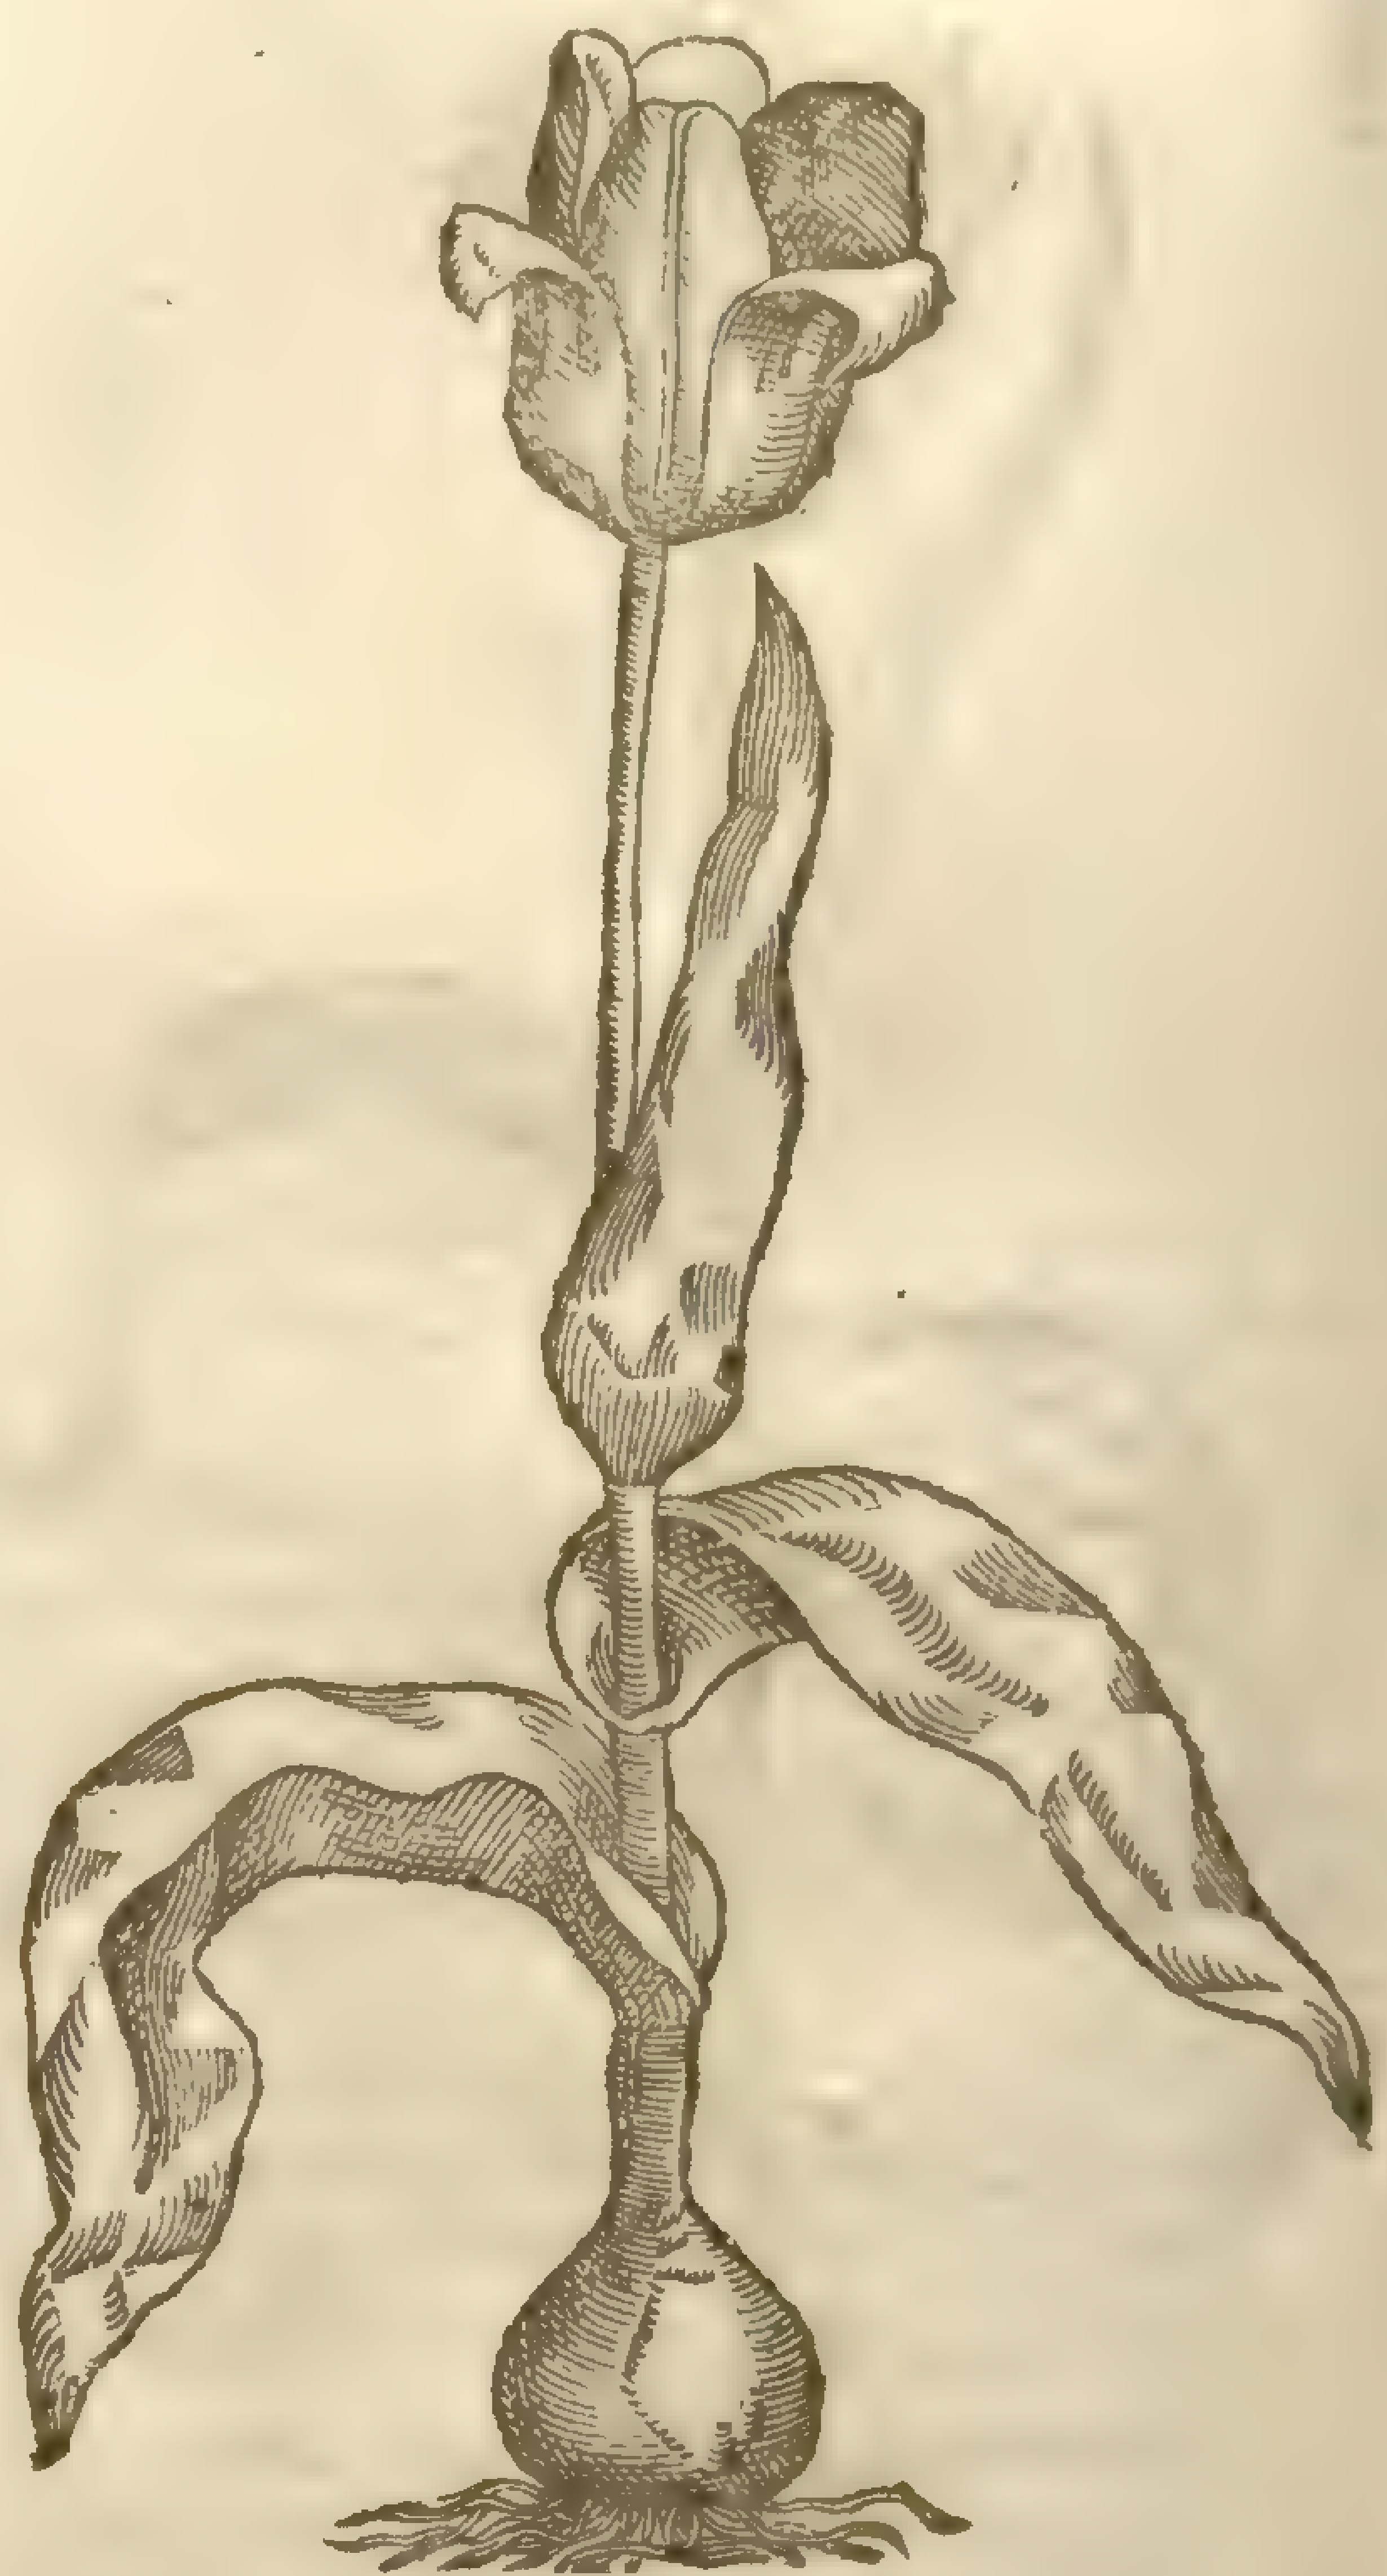
The later Herbariſts by a Turkiſh or ſtrange name call it Tulipa, of the Dalmatian cap called Tulipa, the forme whereof the floure when it is open ſeemeth to repreſent.

It is called in Engliſh after the Turkiſh name Tulipa, or it may be called Dalmatian Cap, or the Turks Cap. What name the antient Writers gaue it is not certainly knowne. A man might ſuſpect it to be ποηφι, if it were a Bulbe that might be eaten, and were of force to make milke cruddie; for *Theophraſtus* reckoneth it among thoſe Bulbes that may be eaten: and it is an herb, as *Heſychius* ſaith, wherewith milke is crudded. *Conradus Geſnerus* and diuers others haue taken Tulipa to be that *Satyrium* which is ſyrnamed *Erythronium*, becauſe one kind hath a red floure; or altogether a certaine kinde of *Satyrium*: with which it doth agree reaſonable well, if in *Dioſcorides* his deſcription we may in ſtead of Λευκοσπέρμω, reade κρινοσπέρμω, or Λειρ·οσπέρμω; for ſuch miſtakes are frequent in antient and moderne Authors, both in writing and printing. In the Turky tongue it is called *Calé lalé, Cauále lalé*, and likewiſe *Turban* and *Turfan*, of the Turkes Cap ſo called, as beforeſaid of *Lobelius*.

‡ 29 *Tulipa Holias alba ſtrijs & punctis ſanguineis.*
The white Holias with ſanguine ſpots and ſtreakes.



‡ 30 *Tulipa media ſature purpurea fundo ſubcæruleo.*
A middle Tulip of a deepe purple colour, with a blewiſh bottom.



‡ I do verily thinke that theſe are the κρίνα τοῦ ἀγροῦ, the Lillies of the field mentioned by our Sauiour, *Mat.6.28,29.* for he ſaith, That *Solomon* in all his royaltie was nor arrayed like one of theſe. The reaſons that induce me to thinke thus, are theſe; Firſt, their ſhape: for their floures reſemble Lillies; and in theſe places whereas our Sauiour was conuerſant they grow wilde in the fields. Secondly, the infinite varietie of colour, which is to be found more in this than any other ſort of floure. And thirdly, the wondrous beautie and mixtures of theſe floures. This is my opinion, and theſe my reaſons, which any may either approue of or gainſay, as he ſhall thinke good. ‡

¶ *The Temperature and Vertues.*

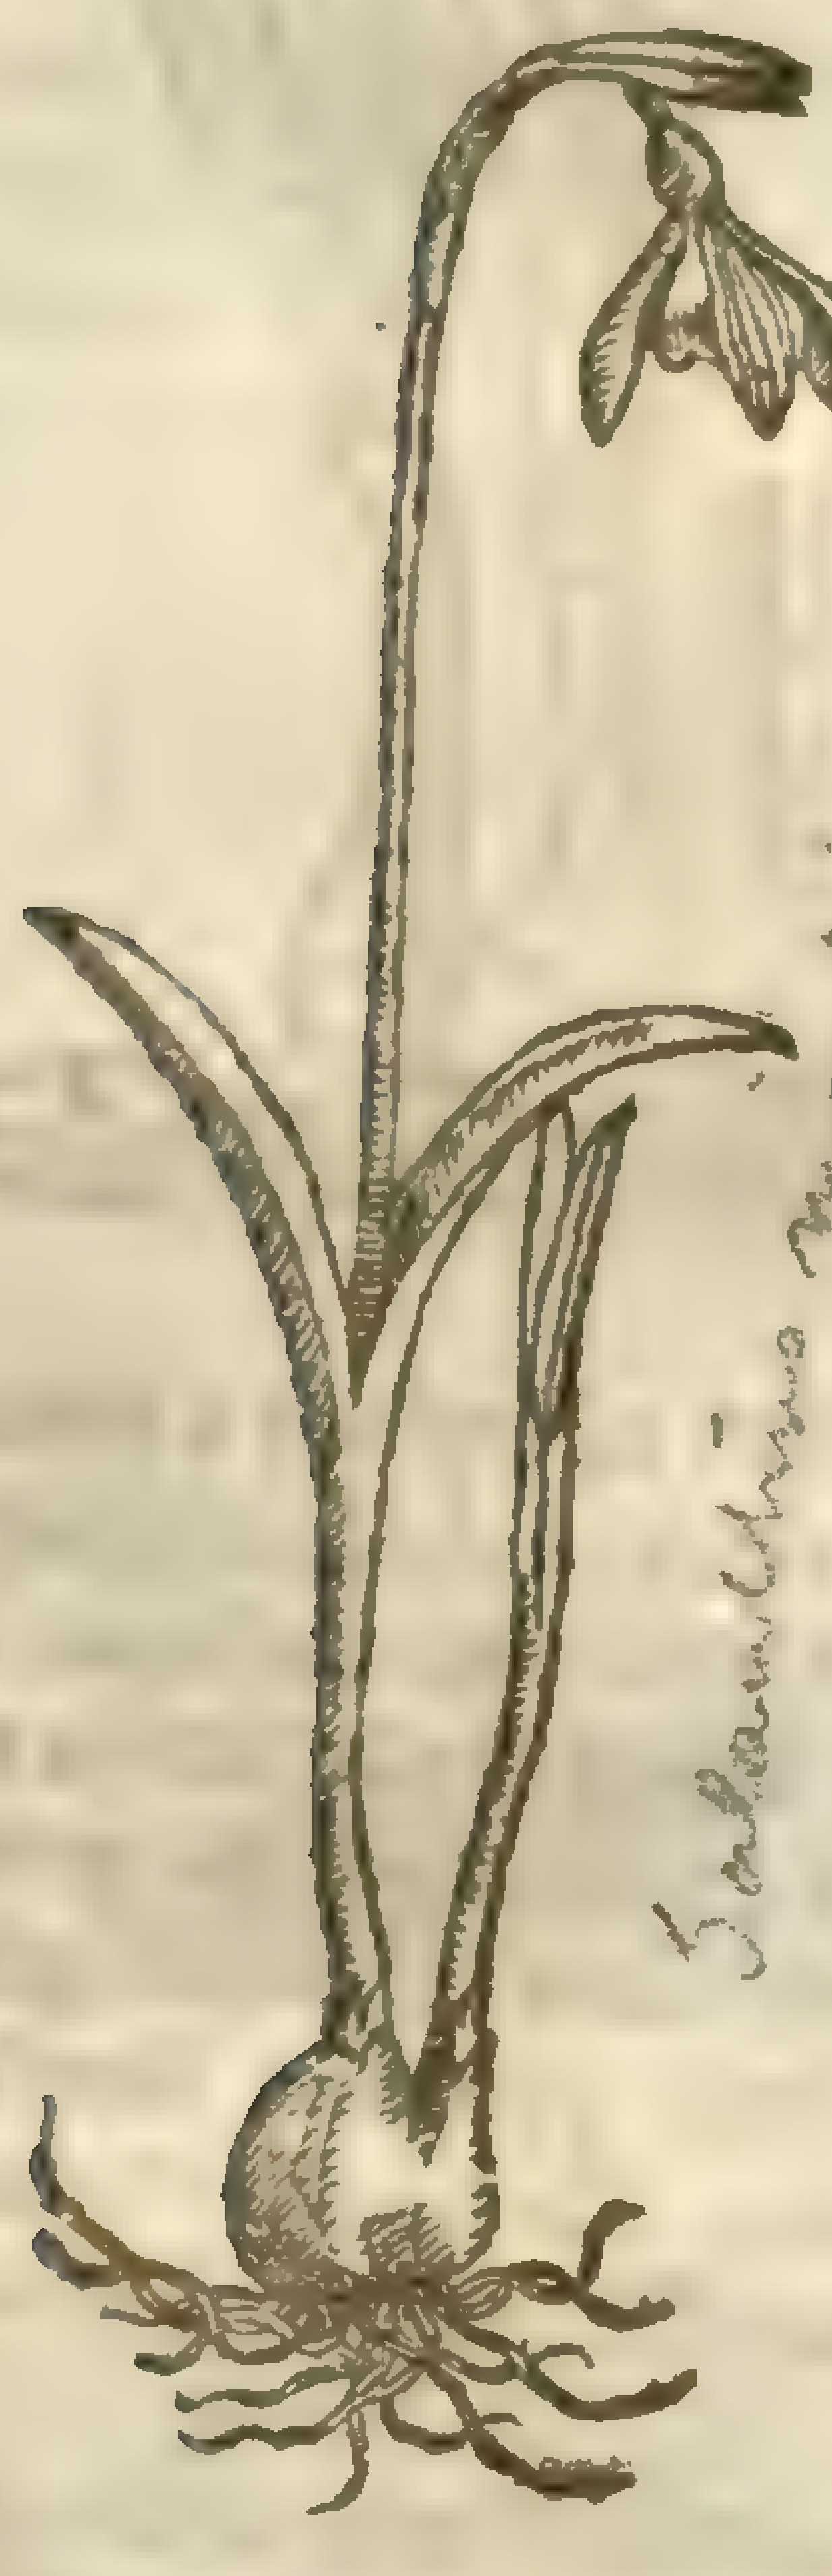
There hath not been any thing ſet downe of the antient or later Writers, as touching the Nature or Vertues of the Tulipa, but they are eſteemed ſpecially for the beauty of their floures.

‡ The roots preſerued with ſugar, or otherwiſe dreſſed, may be eaten, and are no vnpleaſant nor any way offenſiue meat, but rather good and nouriſhing. ‡

Chap. 88. *Of bulbous Violets.*

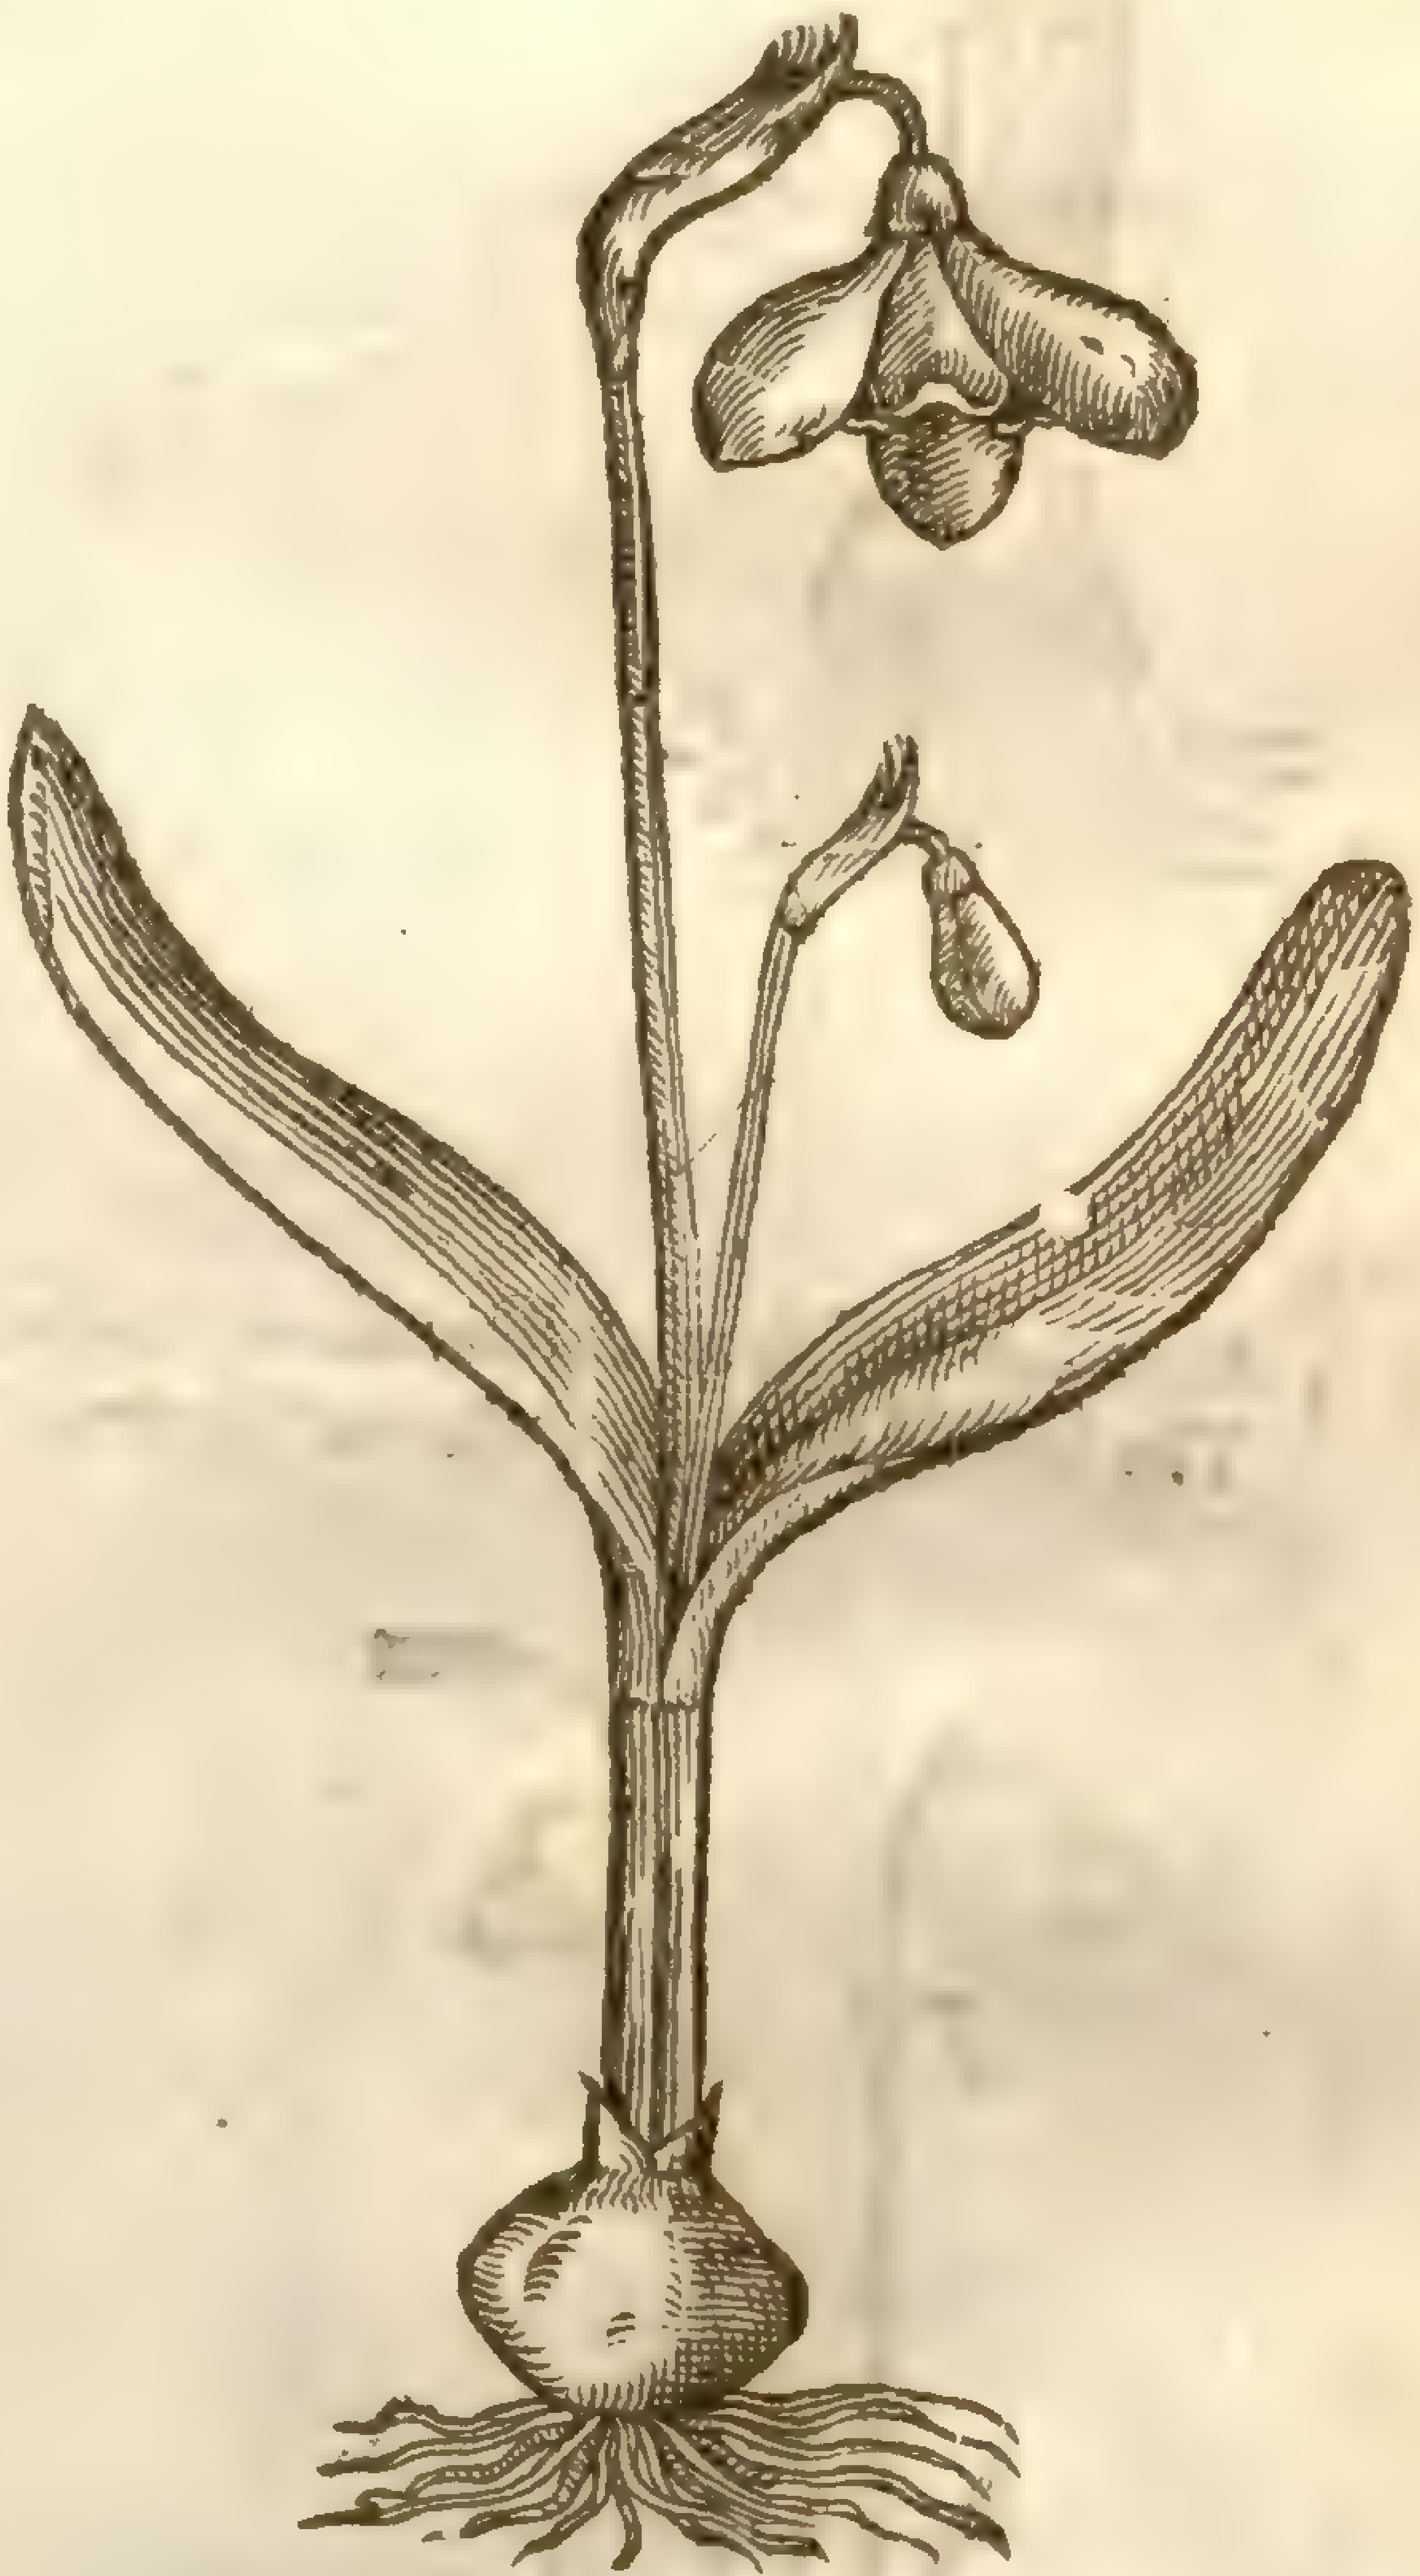
¶ *The Kindes.*

Theophraſtus hath mentioned one kind of bulbous *Leucoion*, which *Gaza* tranſlates, *Viola alba*, or the white Violet. Of this *Viola Theophraſti*, or *Theophraſtus* his Violet, wee haue obſerued three ſorts, whereof ſome bring forth many floures and leaues, others fewer; ſome floure very early, and others later, as ſhall be declared.



1 *Leucoium bulboſum præcox minus.*
Timely flouring bulbous Violet.

Galanthus nivalis — mihi dict. Lin. sp. 2.129



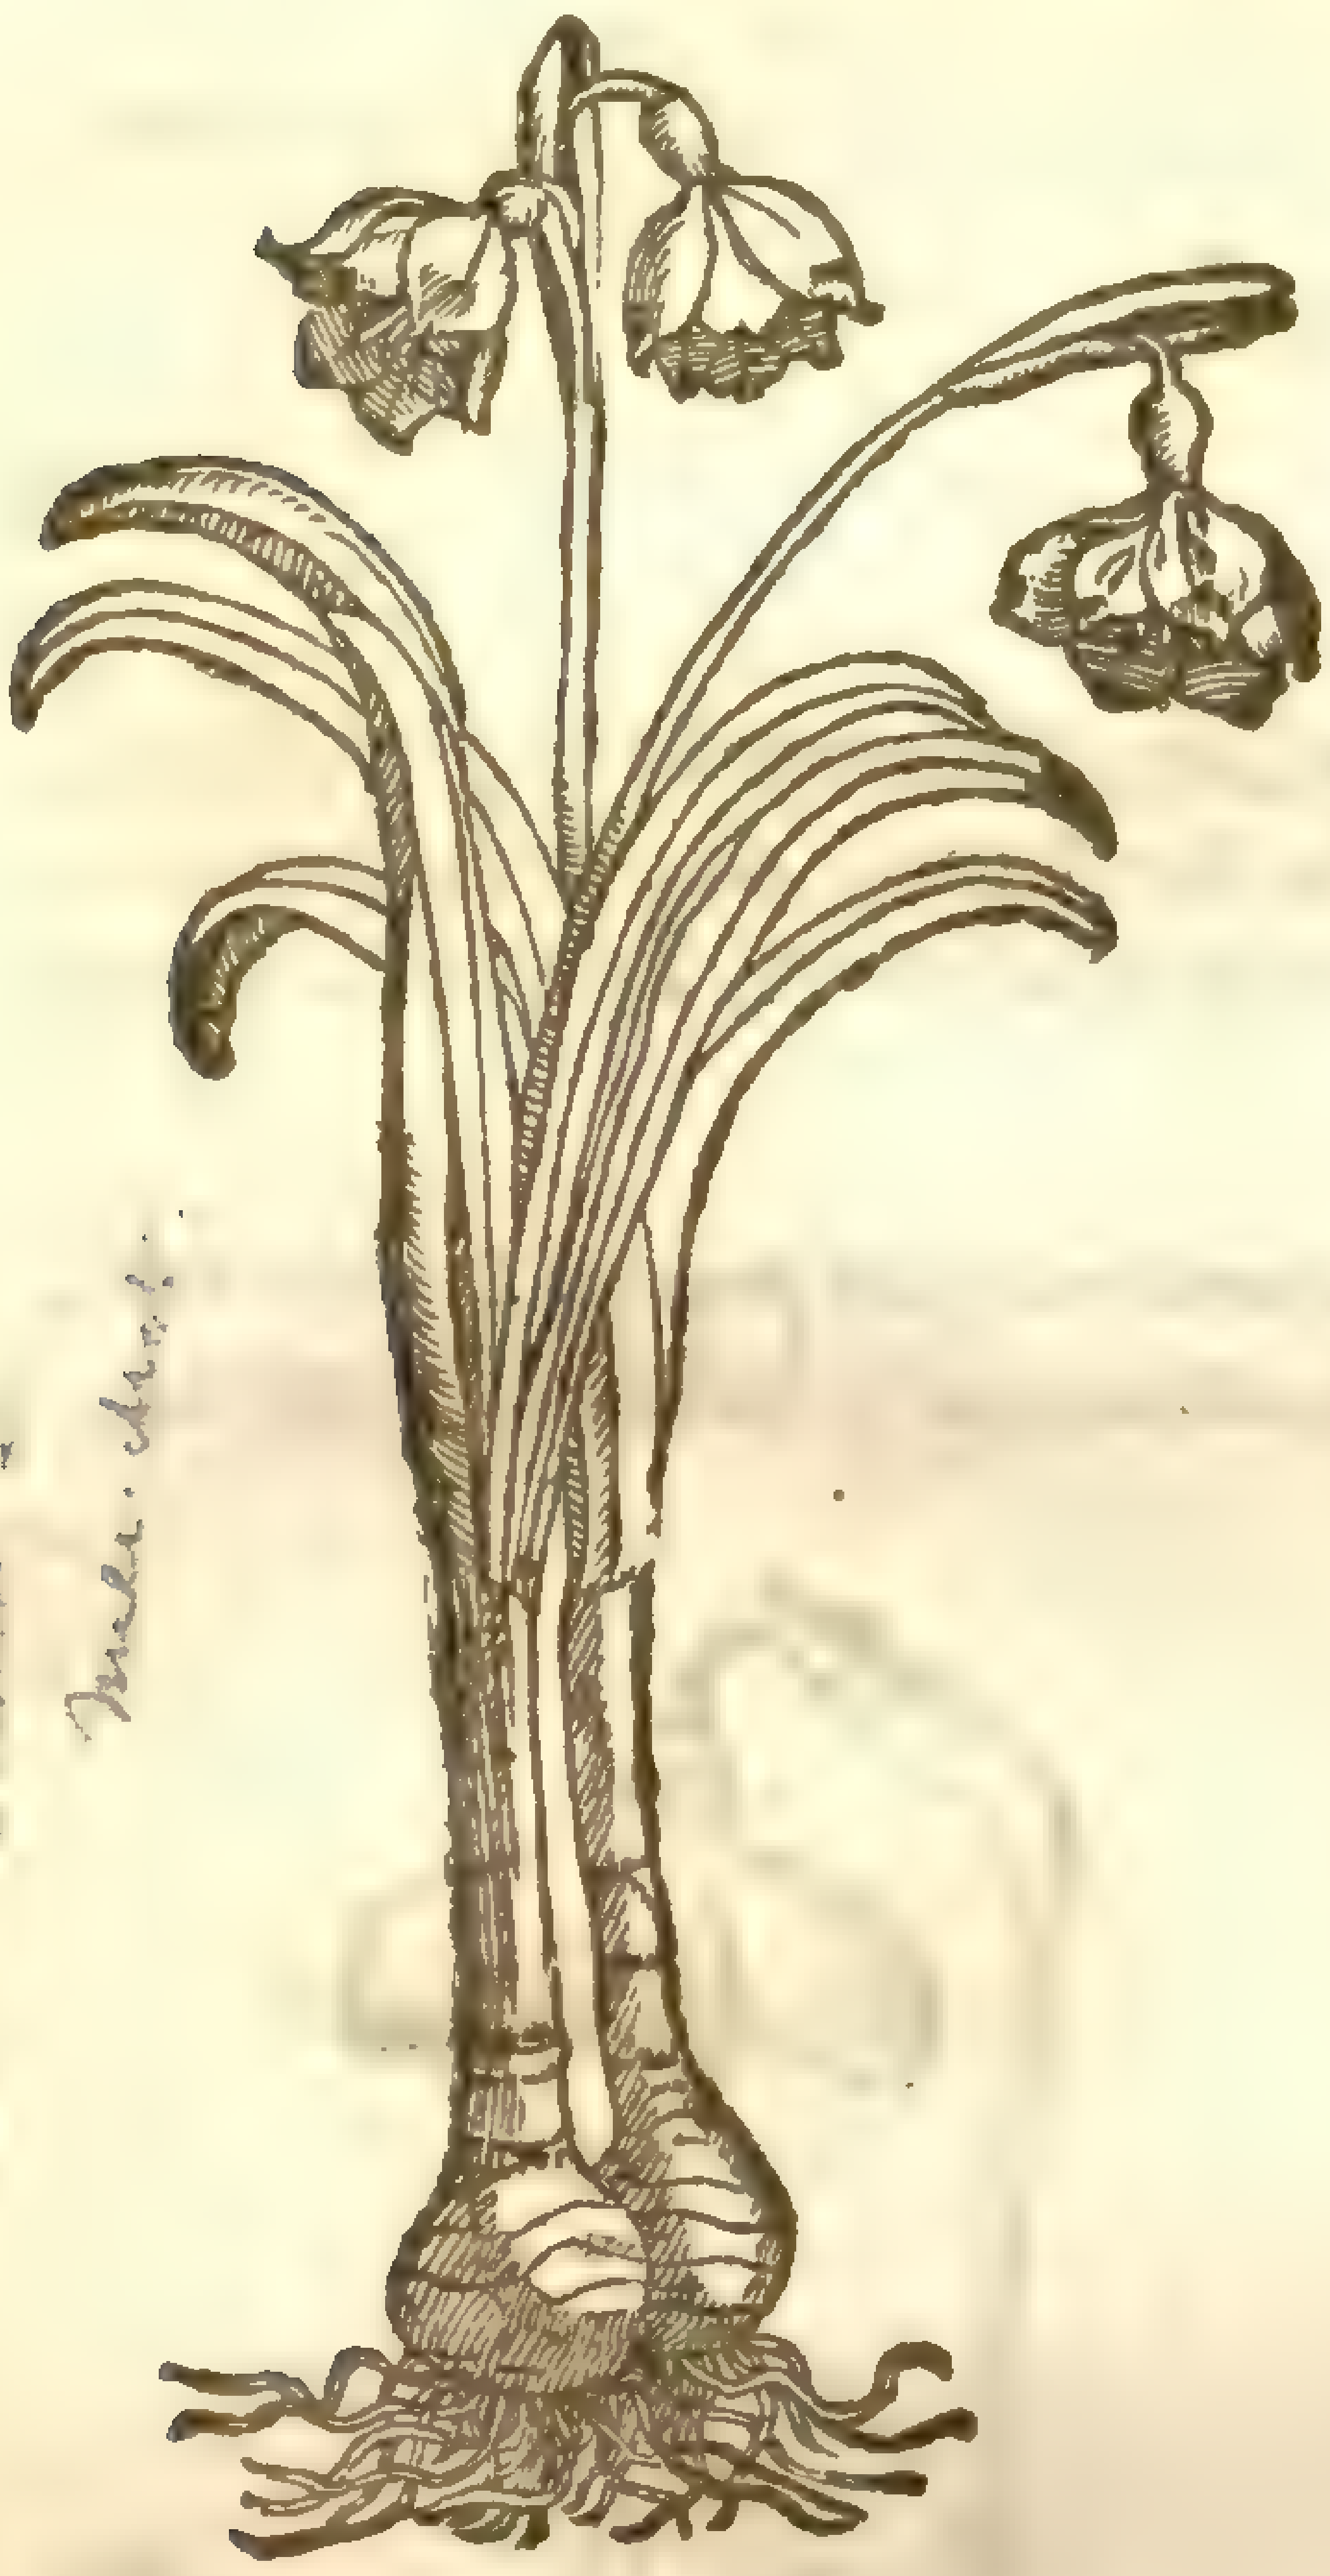
‡ 2 *Leucoium bulboſum præcox Byzantinum.*
The Byzantine early bulbous Violet.

¶ *The Deſcription.*

1 The firſt of theſe bulbous Violets riſeth out of the ground, with two ſmall leaues flat and creſted, of an ouerworne greene colour, betweene the which riſeth vp a ſmall and tender ſtalke of two hands high; at the top whereof commeth forth of a skinny hood a ſmall white floure of the bigneſſe of a Violet, compact of ſix leaues, three bigger, and three leſſer, tipped at the points with a light greene; the ſmaller are faſhioned into the vulgar forme of an heart, and prettily edged about with green: the other three leaues are longer, and ſharpe pointed. The whole floure hangeth downe his head, by reaſon of the weake foot-ſtalke whereon it groweth. The root is ſmall, white, and bulbous.

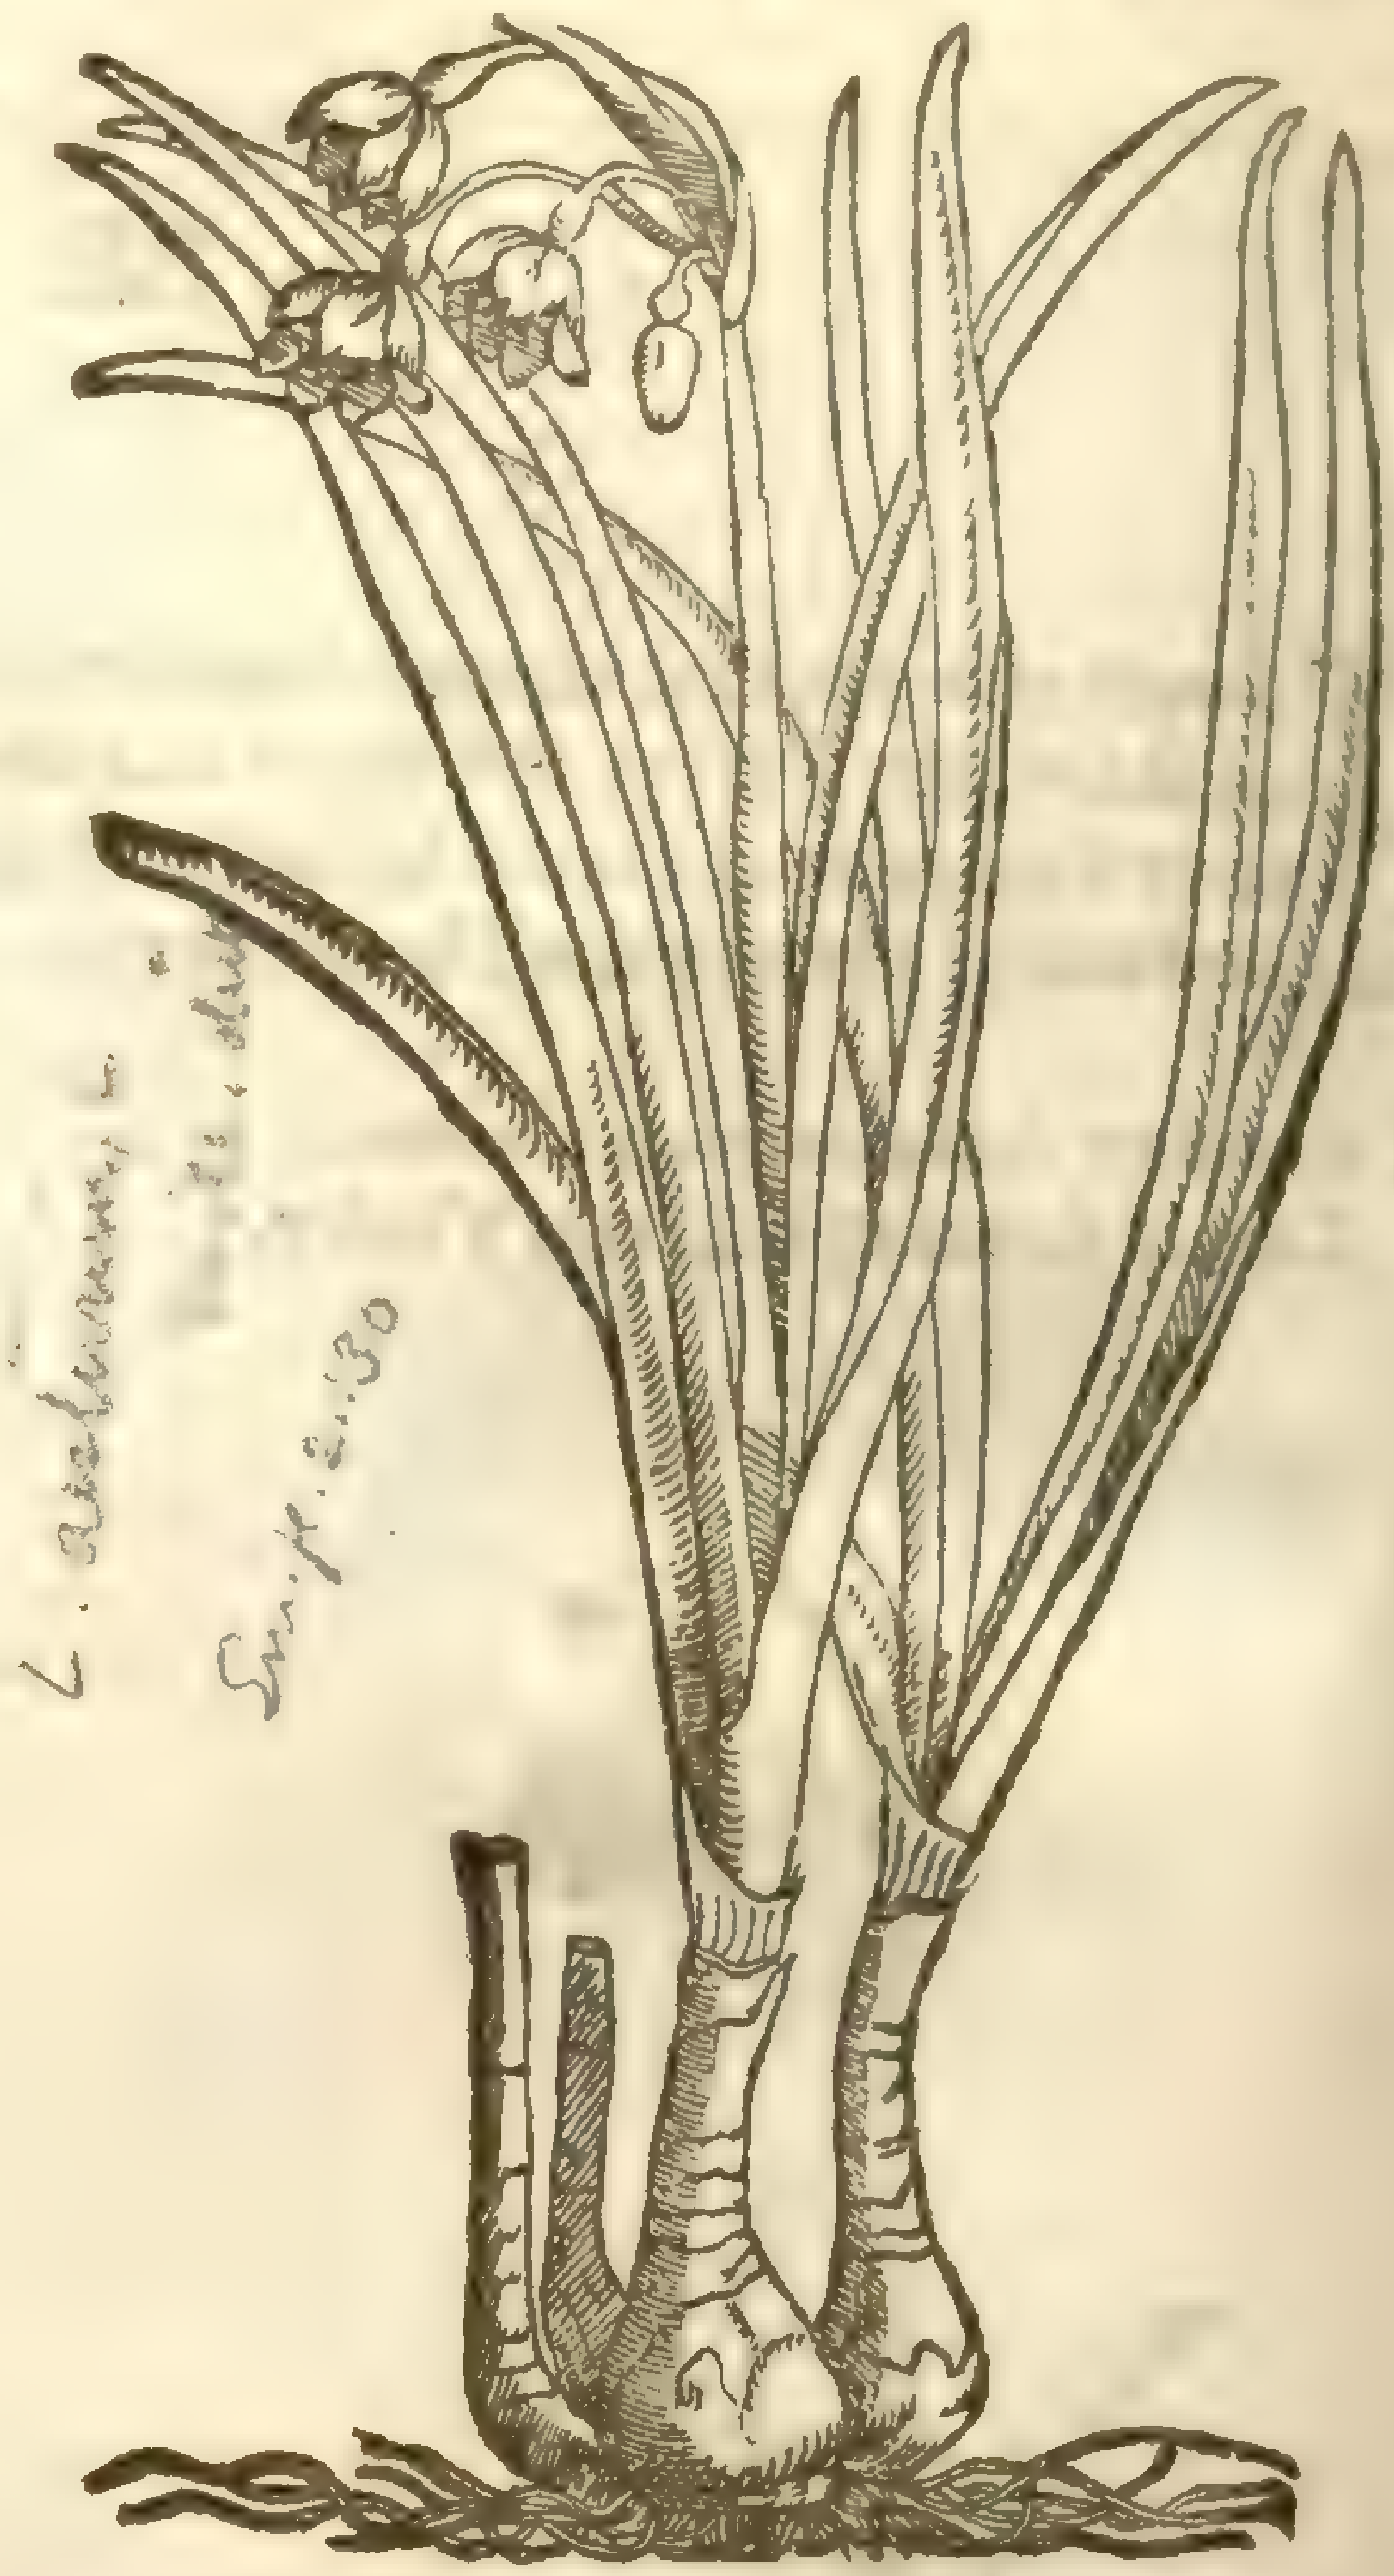
‡ 2 There are two varieties of this kind which differ little in ſhape, but the firſt hath a floure as bigge againe as the ordinarie one, and *Cluſius* calls it *Leucoium bulboſum præcox Byzantinum*, The greater early Conſtantinopolitan bulbous Violet. The other is mentioned by *Lobel*, and differs onely in colour of floures; wherefore he calls it *Leucoium triphyllum flore cæruleo*, The blew floured bulbous Violet. ‡

3 *Leucoium bulboſum ſerotinum.*
Late flouring bulbous Violet.



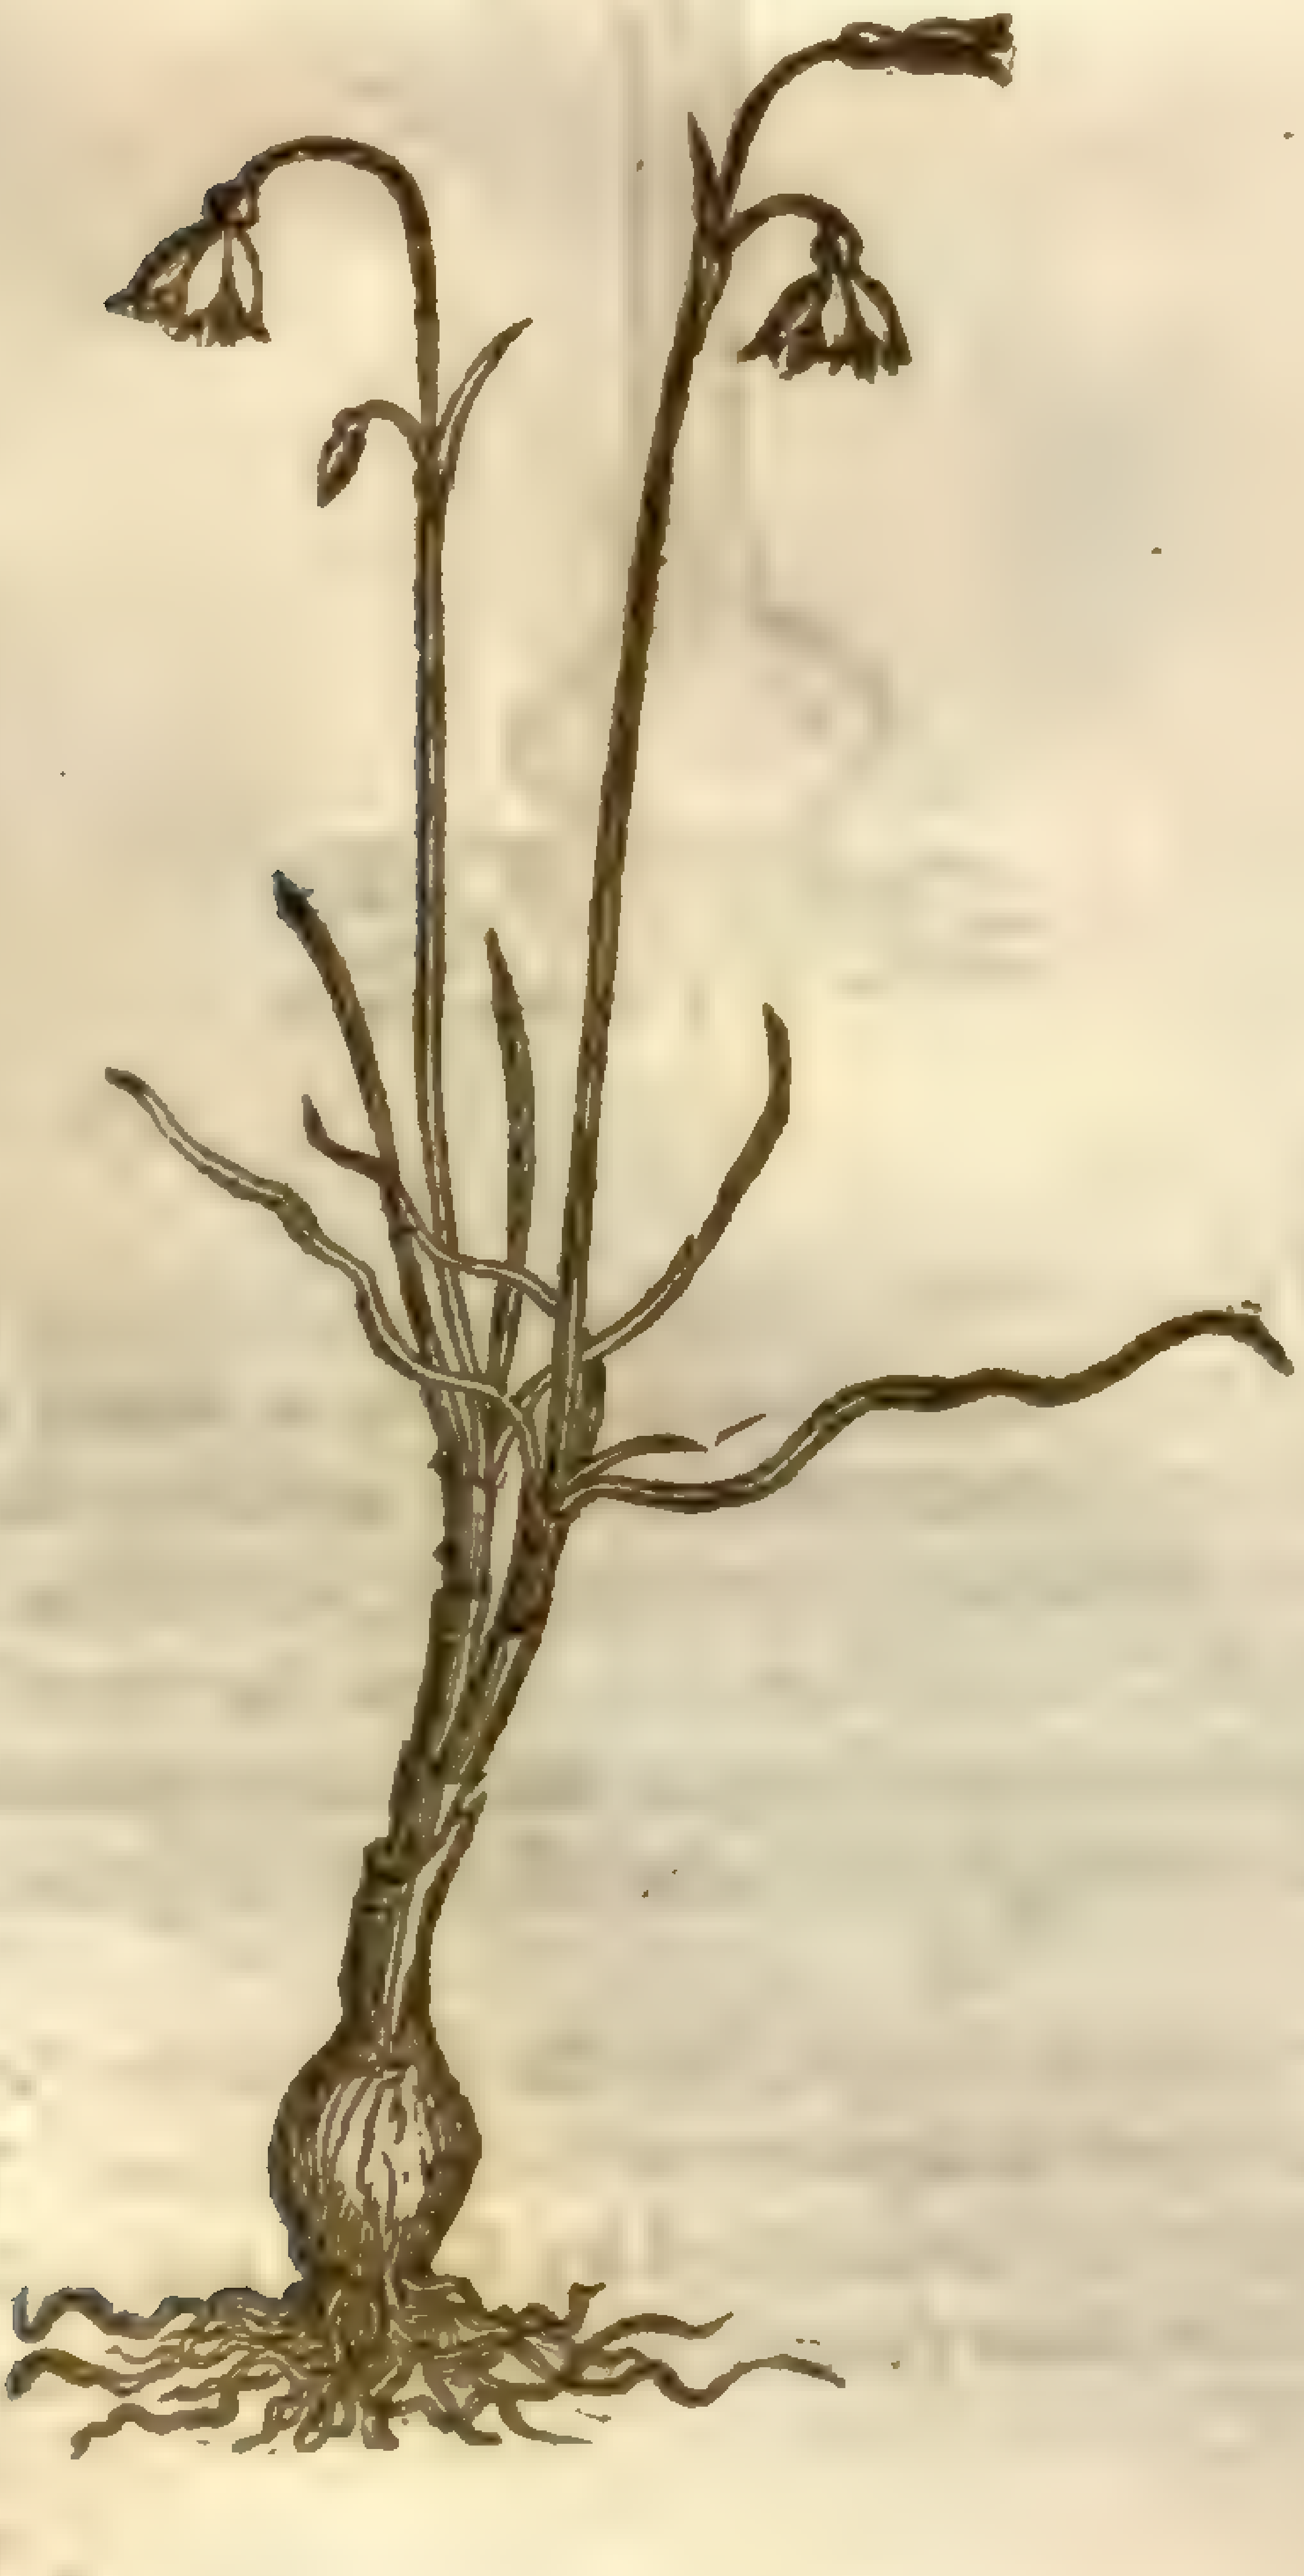
L. aestivum –
Mill. dict.

4 *Leucoium bulboſum majus polyanthemum.*
The many floured great bulbous Violet.



L. aestivum, [illegible]
Sup. 2.30

‡ 5 *Leucoium bulboſum Autumnale minimum.*
The leaſt Autumne bulbous Violet.



L. autumnale, b
Mill. dict.

8 The third ſort of bulbed Violets hath narrow leaues like thoſe of the Leeke, but leſſer and ſmoother, not vnlike to the leaues of the baſtard Daffodill. The ſtalks be ſlender and naked, two hands high; whereupon do grow faire white floures tipped with a yellowiſh green colour, with many ſmall chiues or threds in the middeſt of the floure. The ſeed is contained in ſmall round buttons. The root is white and bulbous.

4 The great bulbed Violet is like vnto the third in ſtalke and leaues, yet grearer & higher. It bringeth forth on euerie ſtalke not one floure onely, but fiue or ſix blowing or flouring one after another, altogether like the other floures in forme and bigneſſe.

‡ 5 This ſmall bulbous plant may be annexed to the former: the root is ſmall, compact of many coats: the leaues are alſo ſmal, and the ſtalke an handfull high, at the top whereof there hang down one or two white floures conſiſting of ſix leaues apiece much reſembling the laſt deſcribed, but far leſſe. It floures in Autumne.

6 Beſides theſe, *Cluſius* makes mention of a ſmall one much like this, which floureth in the Spring, and the floures are ſomewhat reddiſh nigh the ſtalk, and ſmell ſweet. *Cluſius* calls this, *Leucoium bulboſum vernum minimum*, The ſmalleſt Spring bulbous Violet.

¶ *The*

¶ *The Place.*

Theſe plants doe grow wilde in Italy and the places adiacent. Notwithſtanding our London gardens haue taken poſſeſſion of moſt of them many yeares paſt.

¶ *The Time.*

The firſt floureth in the beginning of Ianuary; the ſecond in September; and the third in May; the reſt at their ſeaſons mentioned in their deſcriptions.

¶ *The Names.*

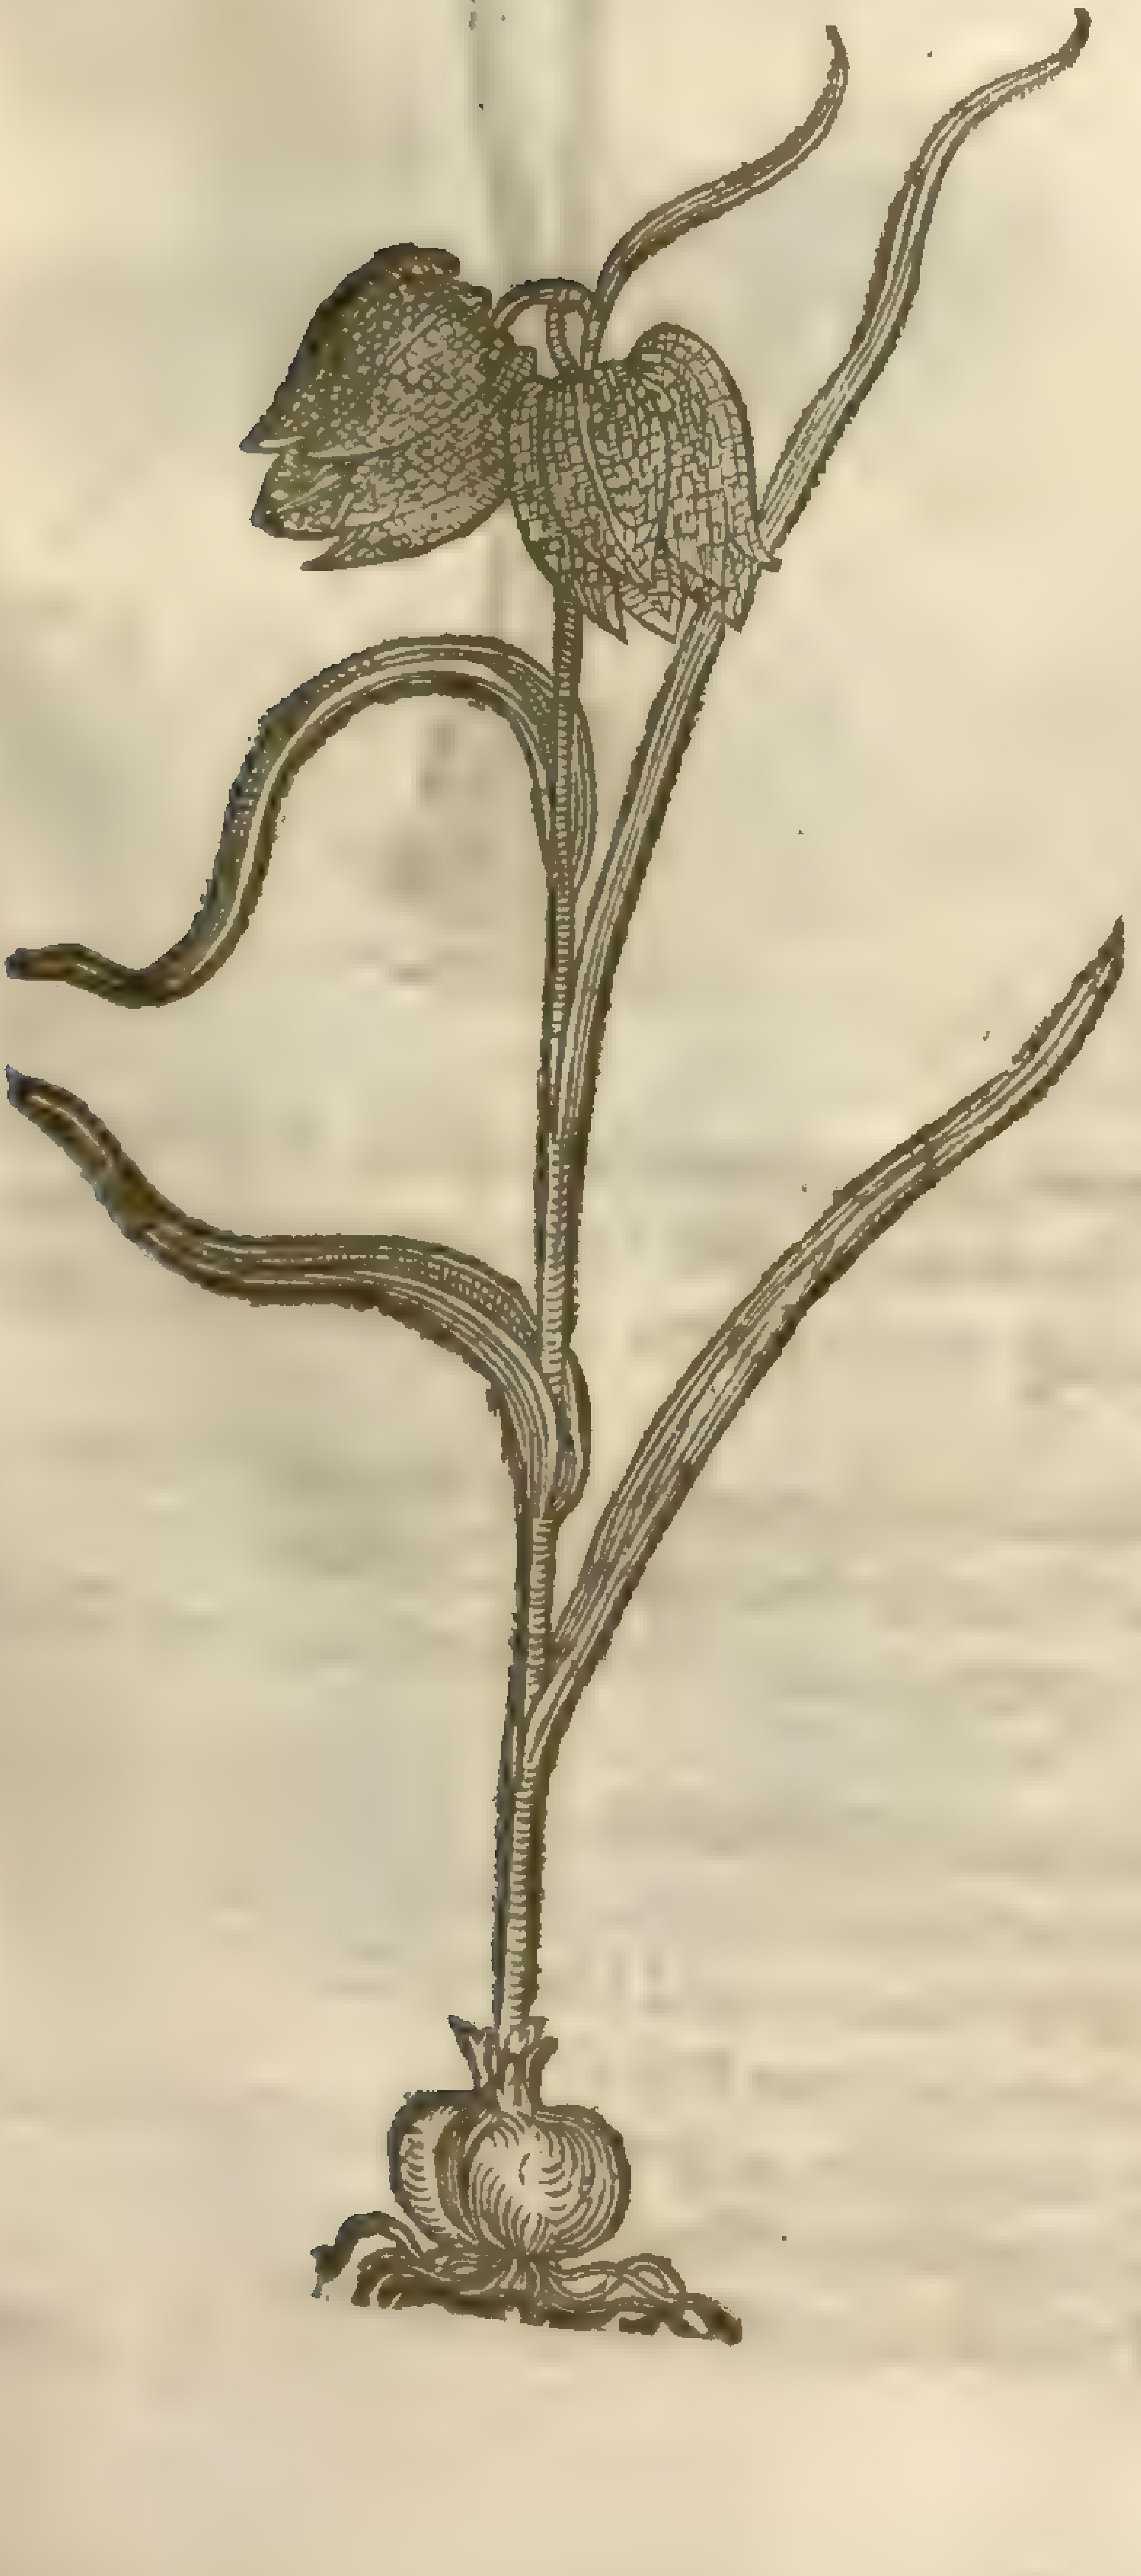
† The firſt is called of *Theophraſtus*, Λευκόϊον; which *Gaza* renders *Viola alba*, and *Viola Bulboſa*, or bulbed Violet. *Lobelius* hath from the colour and ſhape called it *Leuconarciſſolirion*, and that very properly, conſidering how it doth as it were participate of two ſundry plants, that is to ſay, the root of the *Narciſſus*, the leaues of the ſmall Lillie, and the white colour; taking the firſt part *Leuco*, of his whiteneſſe; *Narciſſo*, of the likeneſſe the roots haue vnto *Narciſſus*; and *Lirium*, of the leaues of Lillies, as aforeſaid. In Engliſh we may call it the bulbous Violet; or after the Dutch name, **Somer ſottekens**; that is, Sommer fooles, and **Druyſkens**. Some call them alſo Snow drops. This name *Leucoium*, without his Epithite *Bulboſum*, is taken for the Wall-floure, and ſtocke Gilloſloure, by all moderne Writers.

¶ *The Nature and Vertues.*

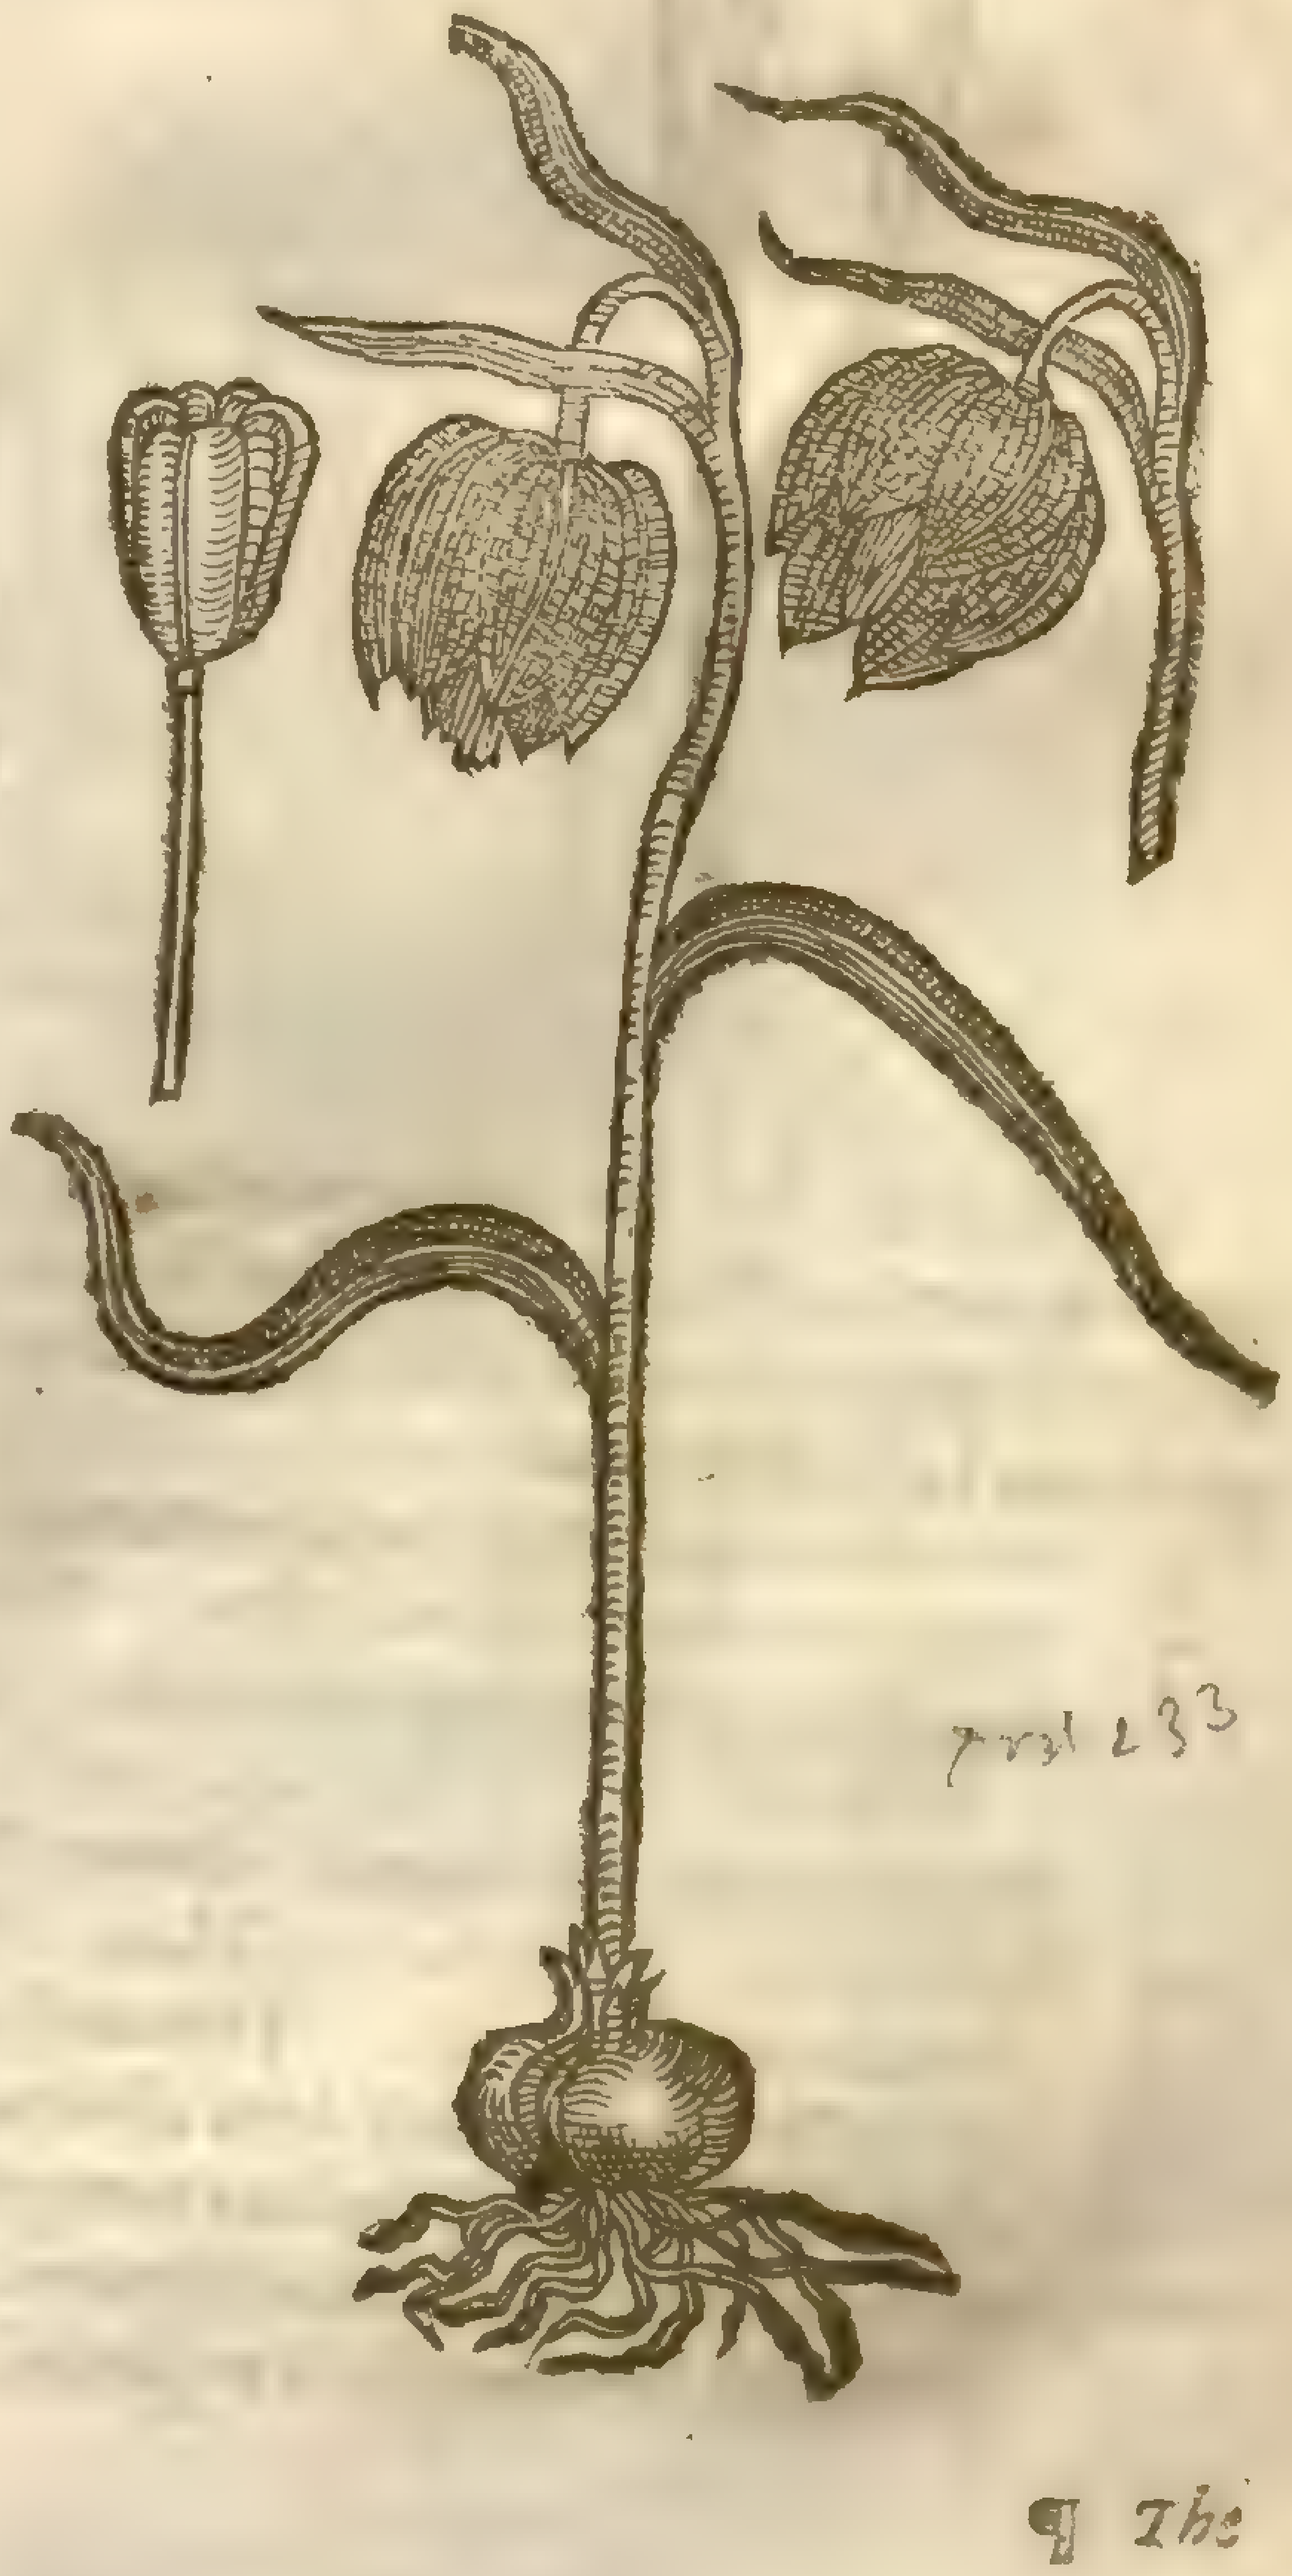
Touching the faculties of theſe bulbous Violets we haue nothing to ſay, ſeeing that nothing is ſet downe hereof by the antient Writers, nor any thing obſerued by the moderne; onely they are maintained and cheriſhed in gardens for the beautie and rareneſſe of the floures, and ſweetneſſe of their ſmell.

Chap. 89. *Of Turkie or Ginny-hen Floure.*

1 *Frittillaria.*
Checquered Daffodill.



2 *Frittillaria variegata.*
Changeable Checquered Daffodill.

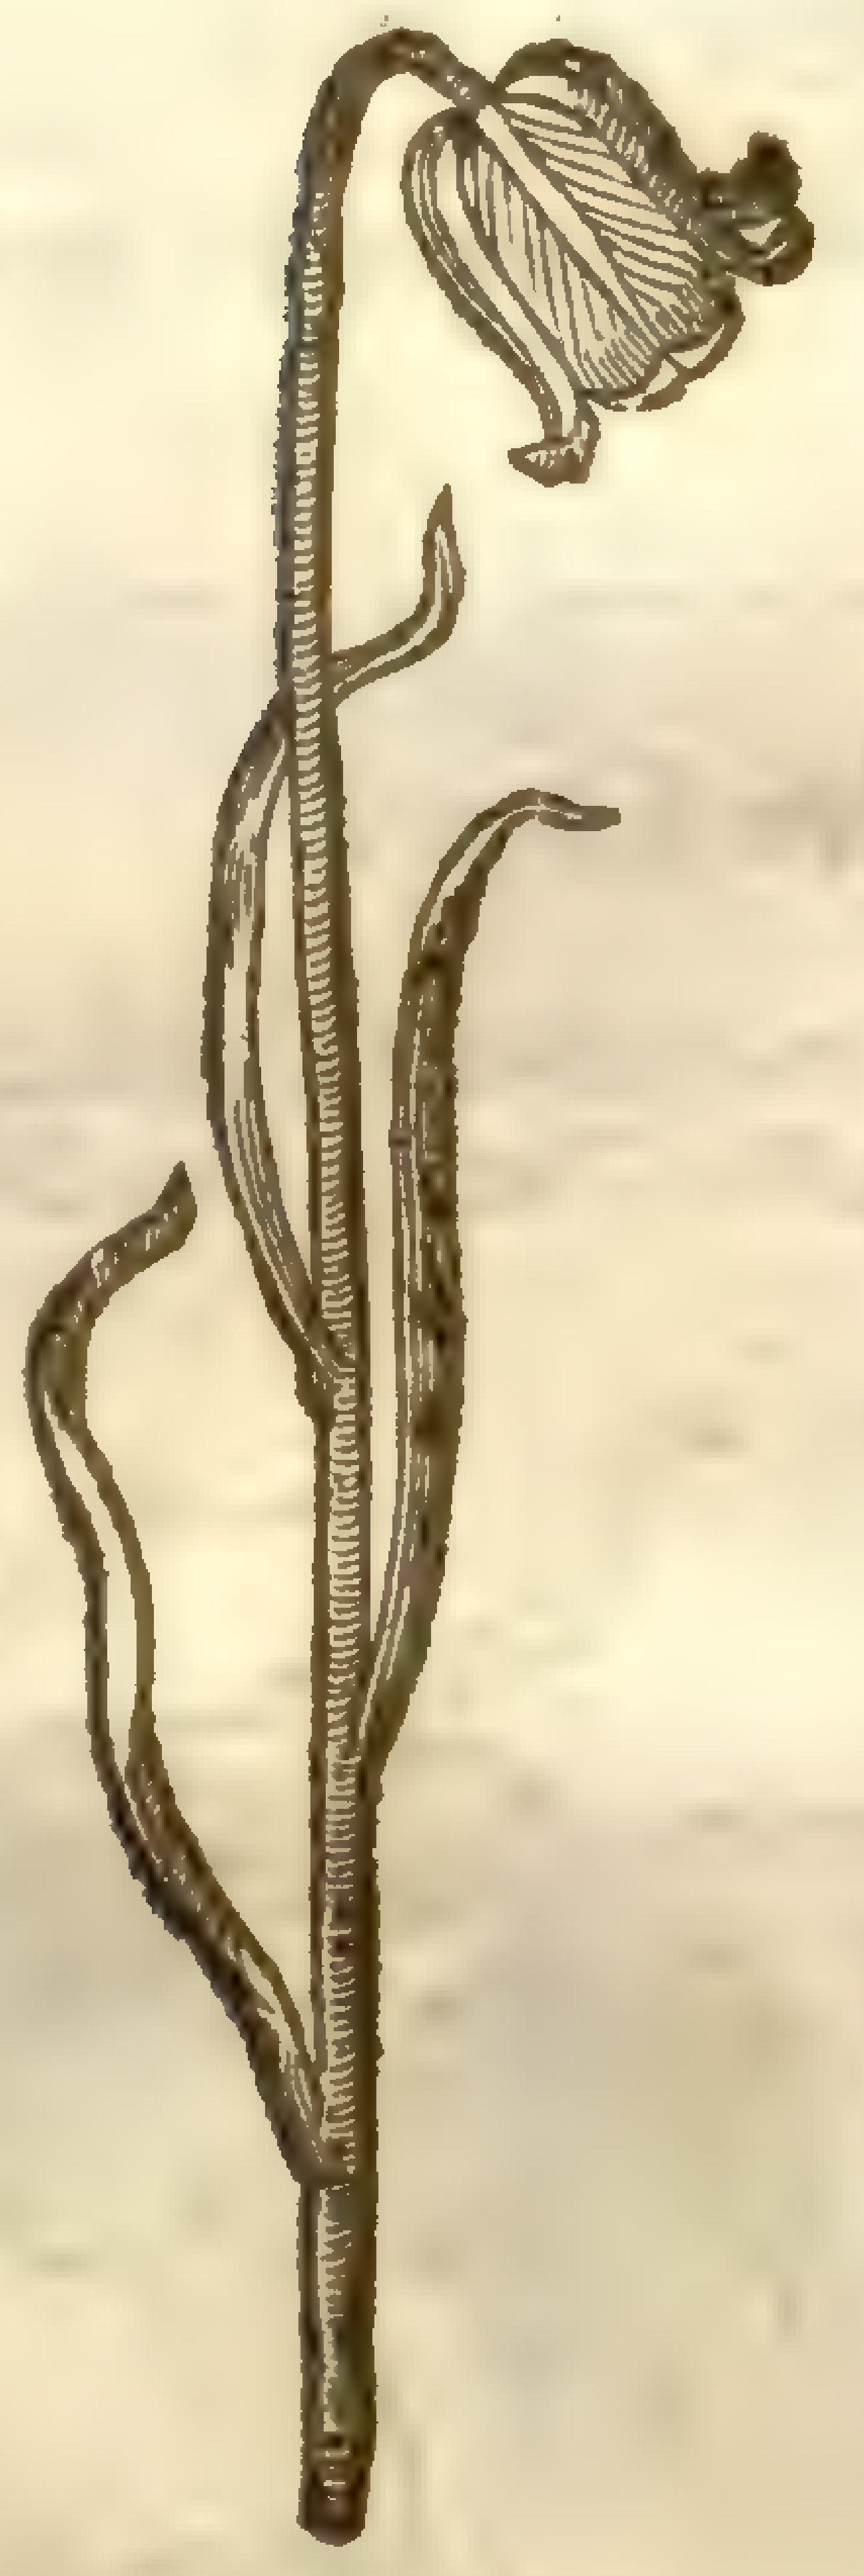


¶ *The Deſcription.*

1 The Checquered Daffodill, or Ginny-hen Floure, hath ſmall narrow graſſie leaues, among which there riſeth vp a ſtalke three hands high, hauing at the top one or two floures, and ſometimes three, which conſiſteth of ſix ſmall leaues checquered moſt ſtrangely: wherein Nature, or rather the Creator of all things, hath kept a very wonderfull order, ſurpaſſing (as in all other things) the curiouſeſt painting that Art can ſet downe. One ſquare is of a greeniſh yellow colour, the other purple, keeping the ſame order as well on the backſide of the floure as one the inſide, although they are blackiſh in one ſquare, and of a Violet colour in an other; inſomuch that euery leafe ſeemeth to be the feather of a Ginny hen, whereof it tooke his name. The root is ſmall, white, and of the bigneſſe of halfe a garden beane.

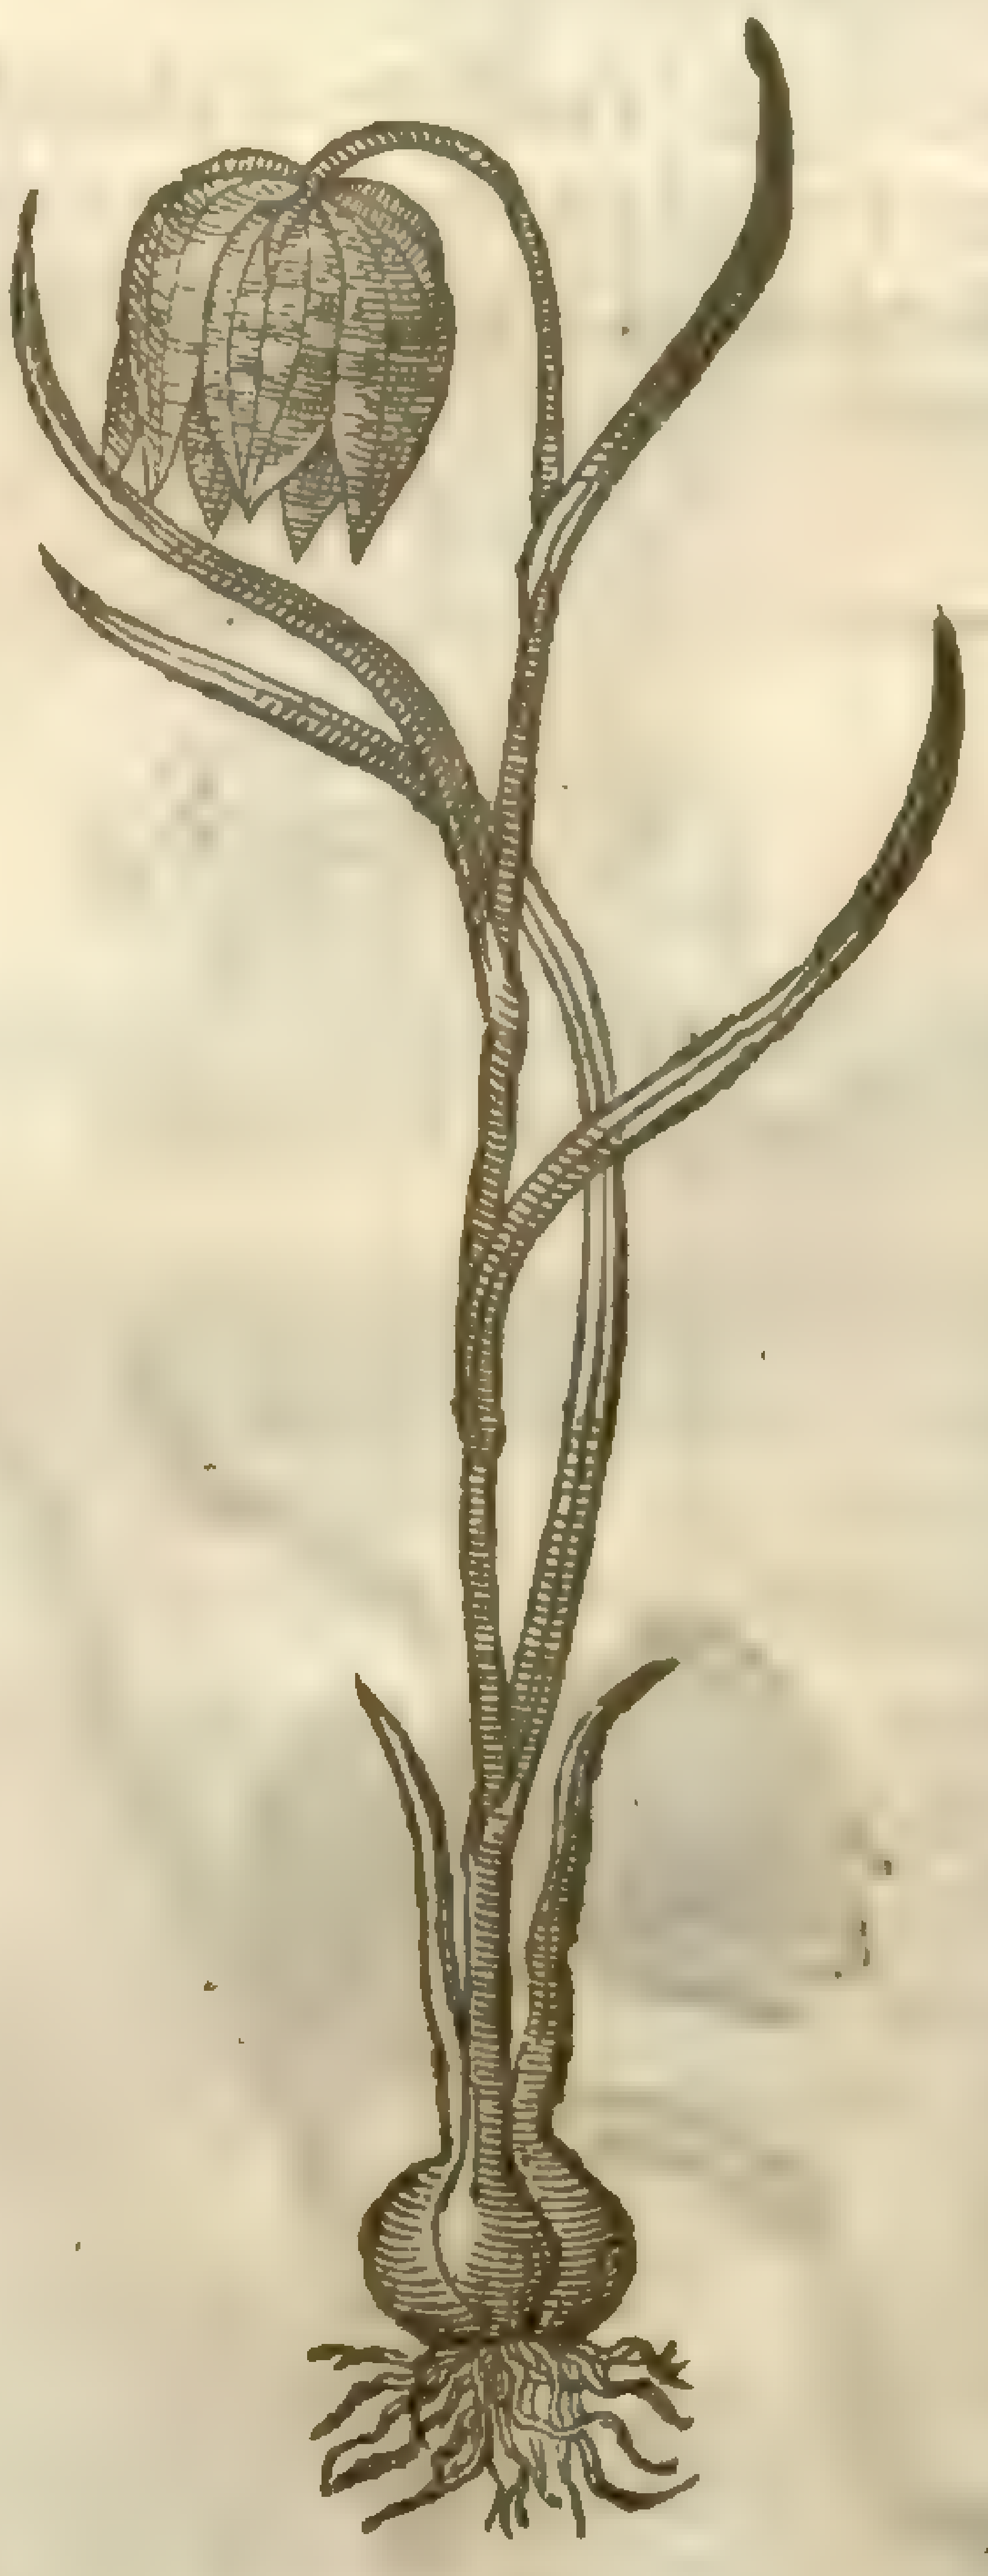
2 The ſecond kinde of Checquered Daffodill is like vnto the former in each reſpect, ſauing that this hath his floure daſht ouer with a light purple, and is ſomewhat greater than the other, wherein conſiſteth the difference.

‡ 3 *Fritillaria Aquitanica minor flore luteo obſoleto.*
The leſſer darke yellow Fritillarie.



Fritillaria pyrenaica, & [illegible]

‡ 9 *Frittilaria alba præcox.*
The early white Fritillarie.



‡ There are ſundry differences and varieties of the floure, taken from the colour, largenes, doubleneſſe, earlineſſe and lateneſſe of flouring, as alſo from the many or few branches bearing floures. We will onely ſpecifie their varieties by their names, ſeeing their forme differs little from thoſe you haue here deſcribed:

4 *Fritillaria maxima ramoſa purpurea.* The greateſt branched purple checquered Daffodill.
5 *Fritillaria flore purpureo pleno.* The double purple floured checquered Daffodill.
6 *Fritillaria polyanthos flauoviridis.* The yellowiſh greene many floured checquered Daffodill.
7 *Fritillaria lutea* Someri. *Somers* his yellow checquered Daffodill.
8 *Fritillaria alba purpureo teſſulata.* The white Fritillarie checquered with purple.
9 *Fritillaria alba præcox.* The early white Fritillarie or checquered Daffodill.
10 *Fritillaria minor flore luteo obſoleto.* The leſſer darke yellow Fritillarie.
11 *Fritillaria anguſtifolia lutea variegata paruo flore, & Altera flore majore.* Narrow leaued yellow variegated Fritillarie with ſmall floures; and another with a larger floure.
12 *Fritillaria minima pluribus floribus.* The leaſt Fritillarie with many floures.

13 *Fritilla-*

Fritillaria Hiſpanica vmbellifera, The Spaniſh Fritillaria with the floures ſtanding as it were in an vmbell. ‡

¶ *The Names.*

The Ginny hen floure is called of *Dodonæus, Flos Meleagris*: of *Lobelius, Lilio-narciſſus variegata,* for that it hath the floure of a Lilly, and the root of *Narciſſus*: it hath beene called *Fritillaria,* of the table or boord vpon which men play at Cheſſe, which ſquare checkers the floure doth very much reſemble; ſome thinking that it was named *Fritillus*: whereof there is no certainty; for *Martial* ſeemeth to call *Fritillus, Abacus,* or the Tables whereon men play at Dice, in the fifth booke of his Epigrams, writing to *Galla.*

Iam triſtis, Nucibus puer relictis,
Clamoſo reuocatur à magiſtro:
Et blando malè proditus Fritillo
Arcana modò raptus è popina
Ædilem rogat vdus aleator, &c.
The ſad Boy now his nuts caſt by,
Is call'd to Schoole by Maſters cry:
And the drunke Dicer now betray'd
By flattering Tables as he play'd,
Is from his ſecret tipling houſe drawne out,
Although the Officer he much beſought, &c.

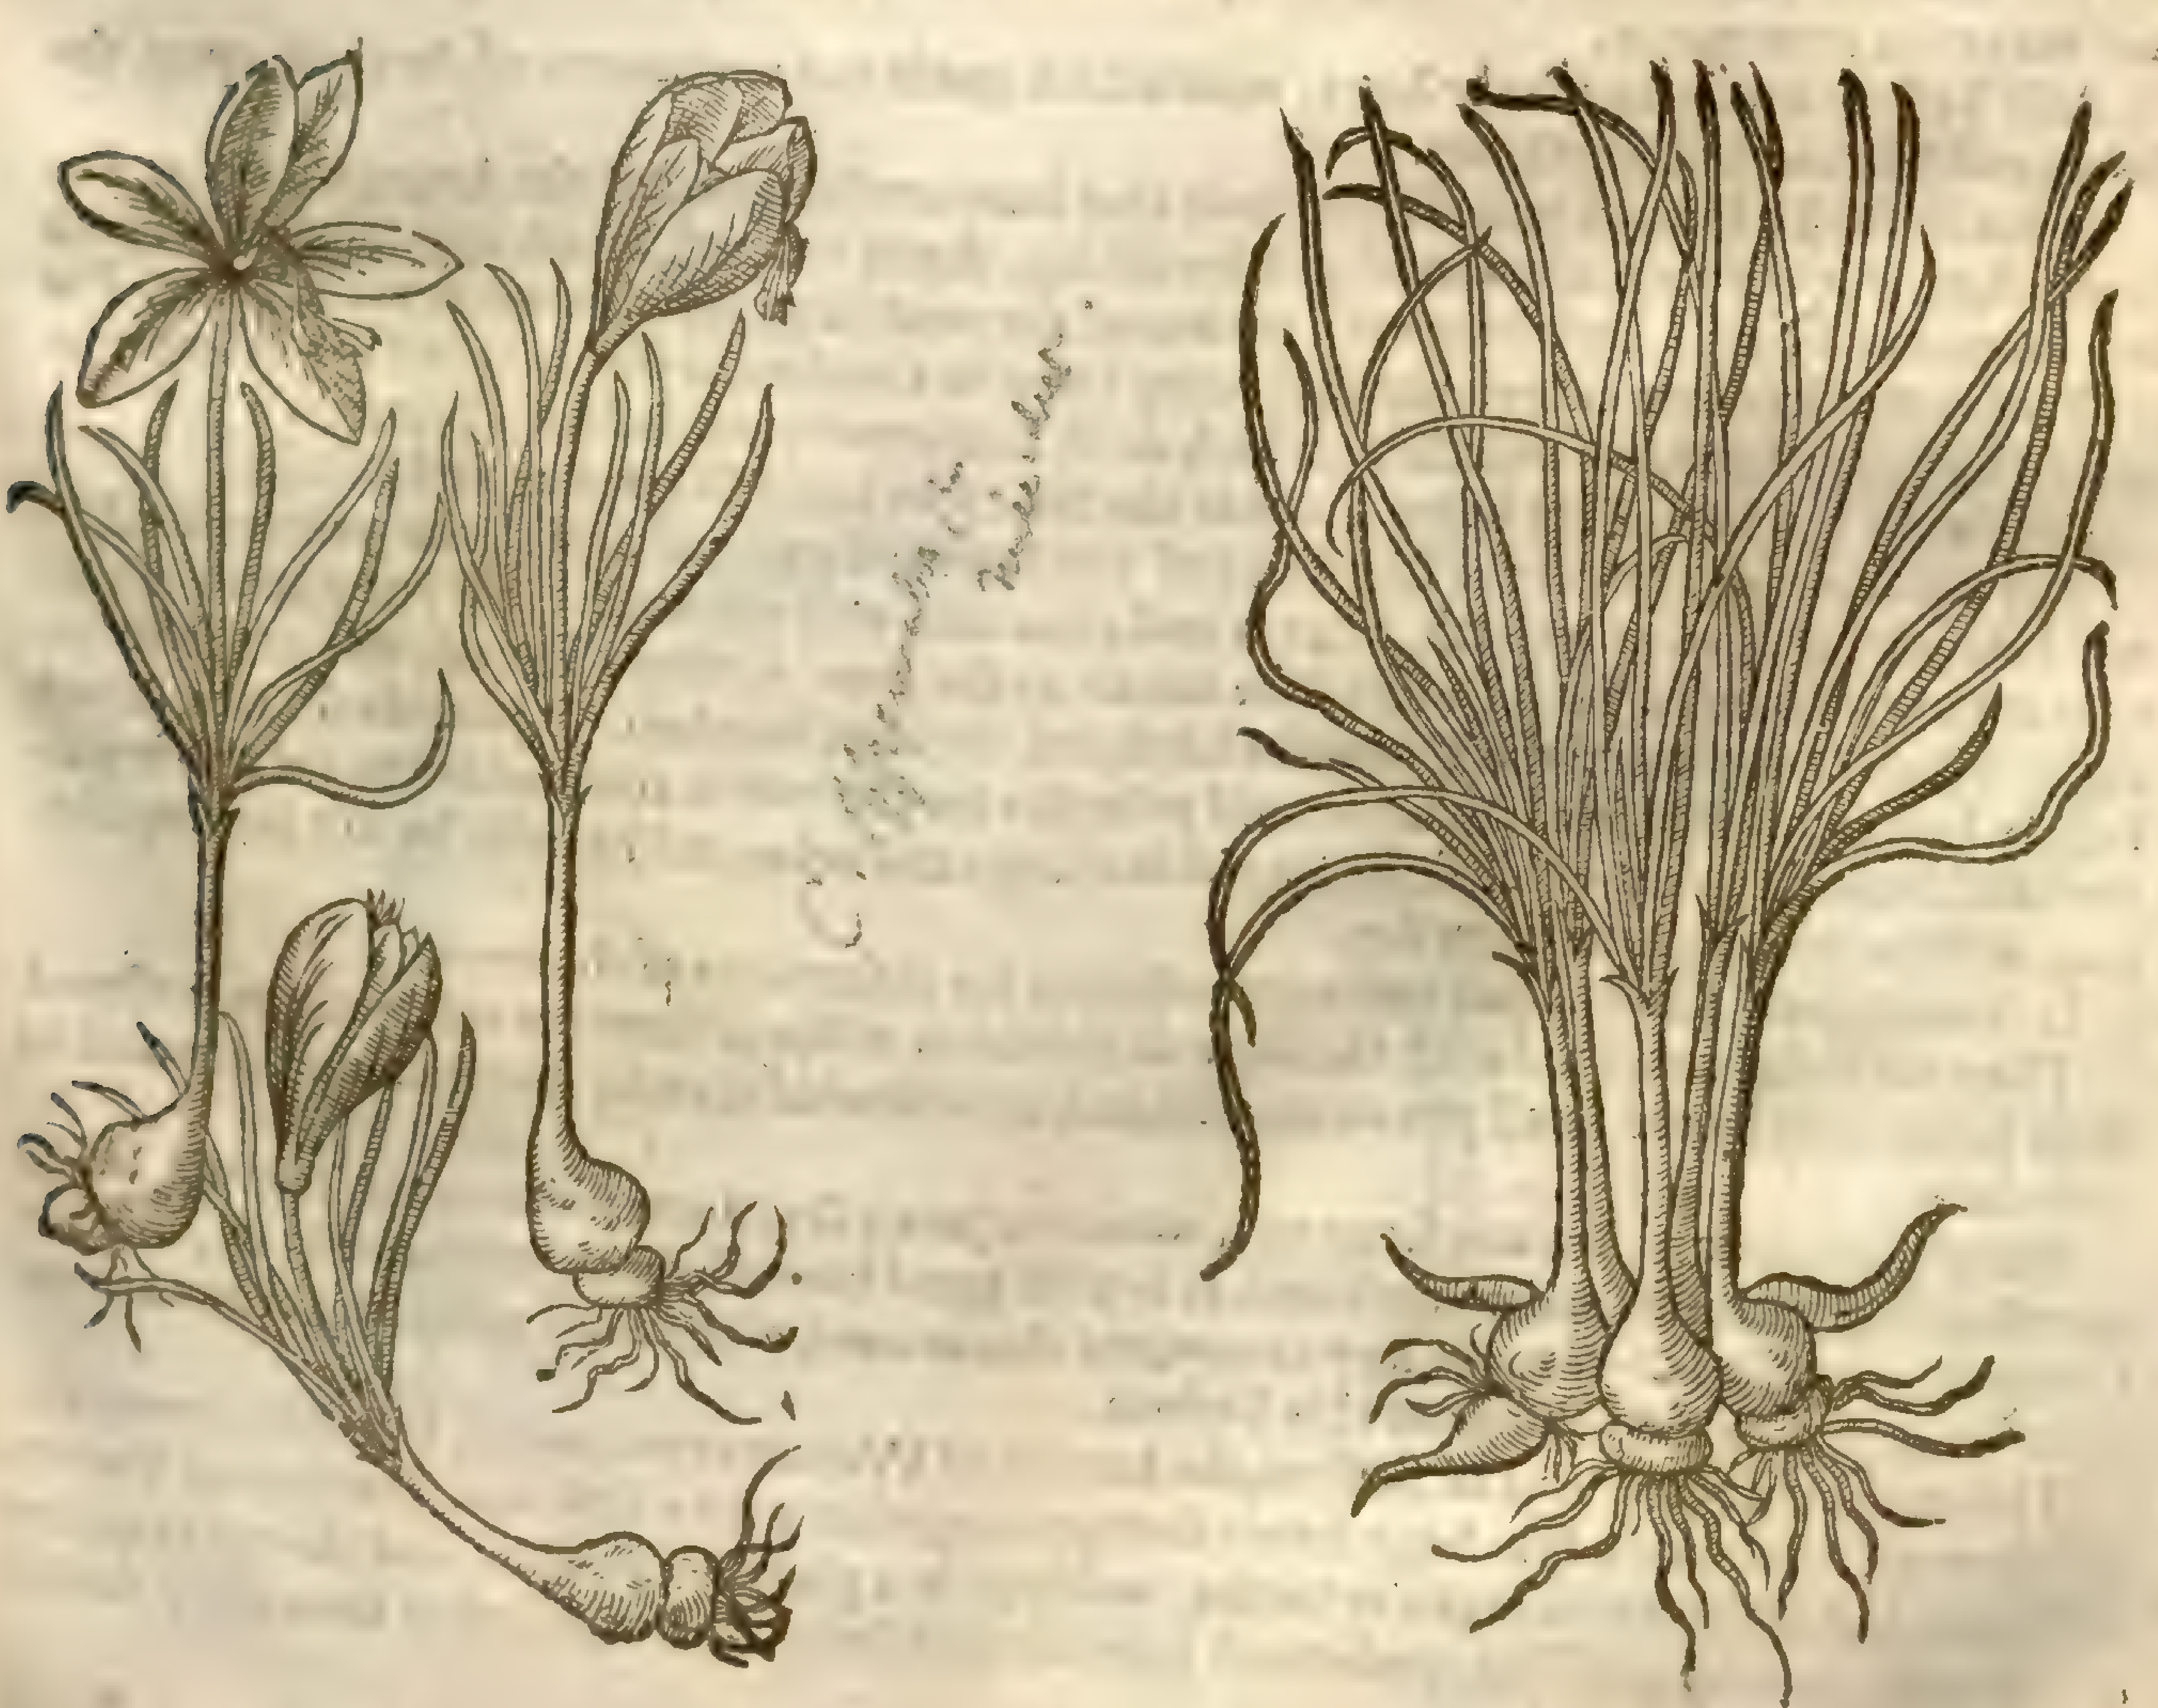
In Engliſh we may call it Turky-hen or Ginny-hen Floure, and alſo Checquered Daffodill, and Fritillarie, according to the Latine.

¶ *The Temperature and Vertues.*

Of the facultie of theſe pleaſant floures there is nothing ſet downe in the antient or later Writer, but are greatly eſteemed for the beautifying of our gardens, and the boſoms of the beautifull.

Chap. 90. *Of true Saffron, and the wilde or Spring Saffron.*

Crocus florens & ſine flore. Saffron with and without floure.



[illegible]

C sativus
Sm. fl. 1.46

¶ *The Deſcription.*

Although I haue expreſſed two pictures of Saffron, as you ſee, yet are you to vnderſtand, that theſe two do but ſet forth one kinde of plant, which could not ſo eaſily be perceiued by one figure as by two, becauſe his floure doth firſt riſe out of the ground nakedly in September, and his long ſmal graſſie leaues ſhortly after the floure, neuer bearing floure and leafe at once. The which to expreſſe, I thought it conuenient to ſet downe two figures before you, with this deſcription, *viz*. The root is ſmall, round, and bulbous. The floure conſiſteth of ſix ſmall blew leaues tending to purple, hauing in the middle many ſmall yellow ſtrings or threds; among which are two, three, or more thicke fat chiues of a fierie colour ſomewhat reddiſh, of a ſtrong ſmell when they be dried, which doth ſtuffe and trouble the head. The firſt picture ſetteth forth the plant when it beareth floures, and the other expreſſeth nothing but leaues.

¶ *The Place.*

Common or beſt knowne Saffron groweth plentifully in Cambridge-ſhire, Saffron-Waldon, and other places thereabout, as corne in the fields.

¶ *The Time.*

Saffron beginneth to floure in September, and preſently after ſpring vp the leaues, and remaine greene all the Winter long.

¶ *The Names.*

Saffron is called in Greeke Κρόκος: in Latine, *Crocus*: in Mauritania, *Saffaran*: in Spaniſh, *Açafron*: in Engliſh, Saffron: in the Arabicke tongue, *Zahafaran*.

¶ *The Temperature.*

Saffron is a little aſtringent or binding; but his hot qualitie doth ſo ouer-rule in it, that in the whole eſſence it is in the number of thoſe herbs which are hot in the ſecond degree, and dry in the firſt: therefore it alſo hath a certaine force to concoct, which is furthered by the ſmall aſtriction that is in it, as *Galen* ſaith.

¶ *The Vertues.*

A *Avicen* affirmeth, That it cauſeth head-ache, and is hurtfull to the braine, which it cannot do by taking it now and then, but by too much vſing of it; for the too much vſing of it cutteth off ſleep, through want whereof the head and ſences are out of frame. But the moderat vſe thereof is good for the head, and maketh the ſences more quicke and liuely, ſhaketh off heauy and drowſie ſleepe, and maketh a man merry.

B Alſo Saffron ſtrengthneth the heart, concocteth crude and raw humors of the cheſt, opens the lungs, and remoueth obſtructions.

C It is alſo ſuch a ſpeciall remedie for thoſe that haue conſumption of the lungs, and are, as wee terme it, at deaths doore, and almoſt paſt breathing, that it bringeth breath again, and prolongeth life for certaine dayes, if ten or twenty graines at the moſt be giuen with new or ſweet Wine. For we haue found by often experience, that being taken in that ſort, it preſently and in a moment remoueth away difficulty of breathing, which moſt dangerouſly and ſuddenly hapneth.

D *Dioſcorides* teacheth, That being giuen in the ſame ſort it is alſo good againſt a ſurfet.

E It is commended againſt the ſtoppings of the liuer and gall, and againſt the yellow jaundiſe: and hereupon *Dioſcorides* writeth, That it maketh a man well coloured. It is put into all drinkes that are made to helpe the diſeaſes of the intrals, as the ſame Author affirmeth, and into thoſe ſpecially which bring downe the fleures, the birth, and the after-burthen. It prouoketh vrine, ſtirreth fleſhly luſt, and is vſed in cataplaſmes and pulteſſes for the matrix and fundament, and alſo in plaiſters and ſeare-cloathes which ſerue for old ſwellings and aches, and likewiſe for hot ſwellings that haue alſo in them S. Anthonies fire.

F It is with good ſucceſſe put into compoſitions for infirmities of the eares.

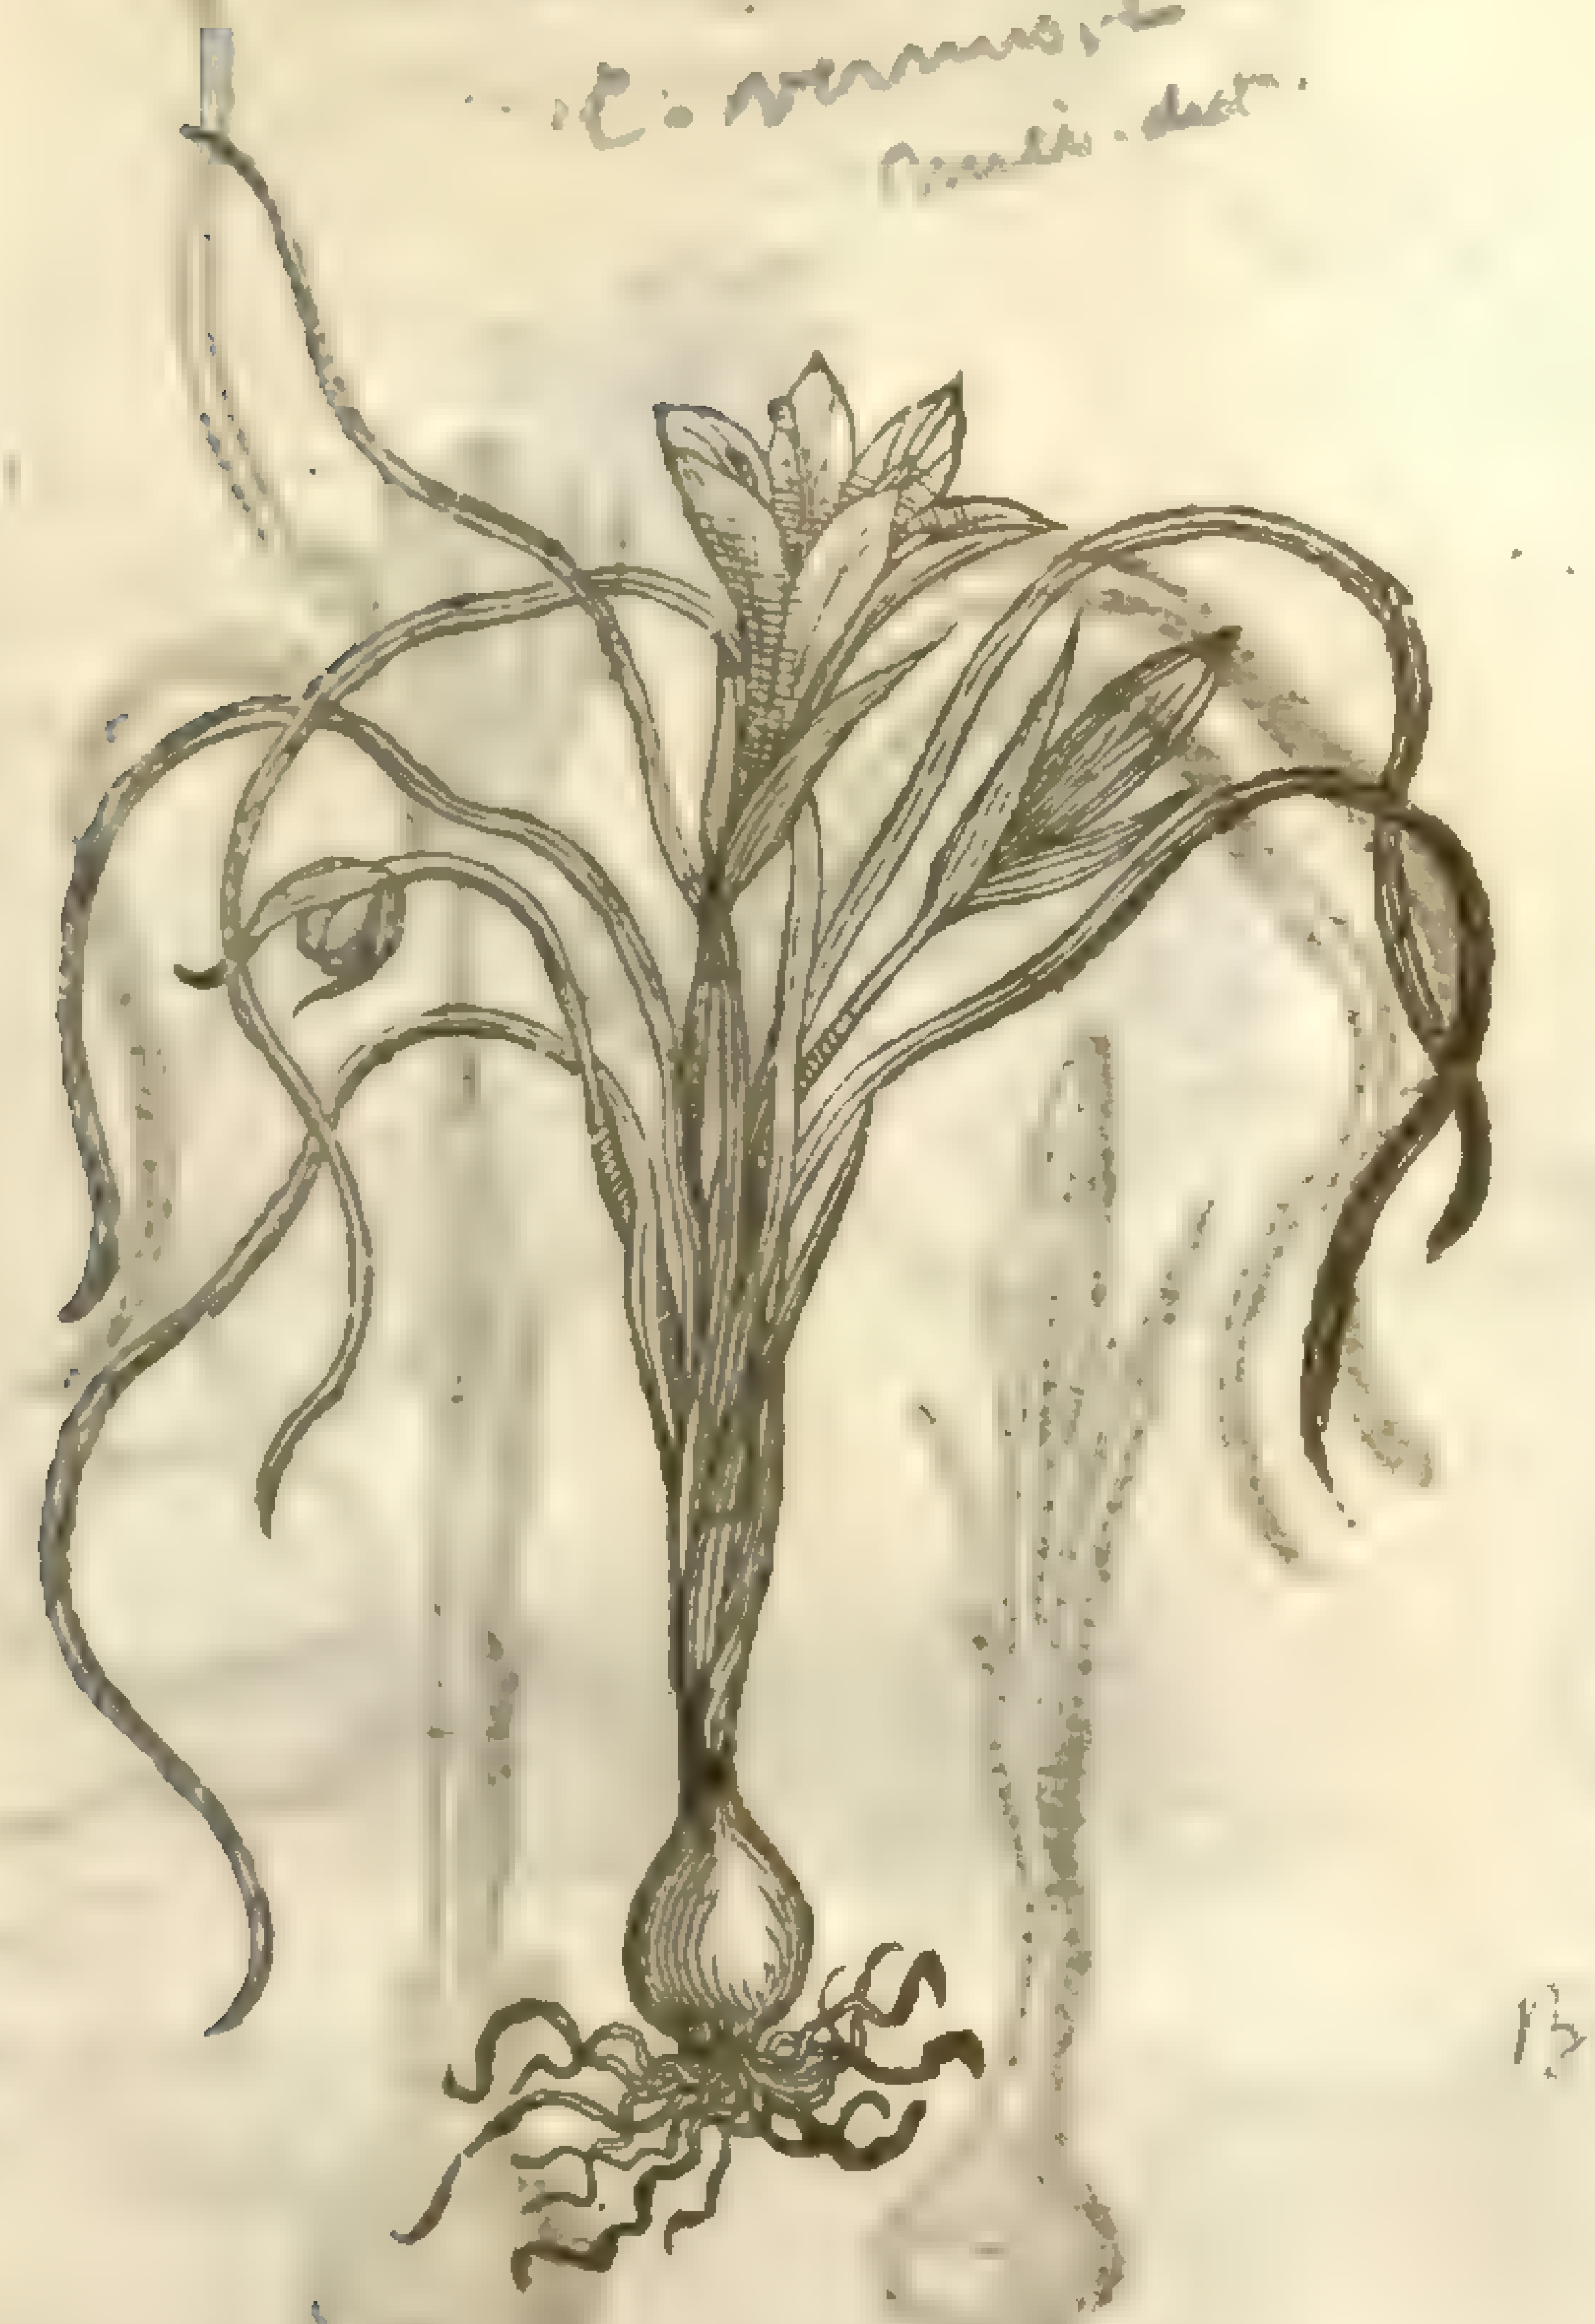
G The eyes being anointed with the ſame diſſolued in milke or fennel or roſe water, are preſerued from being hurt by the ſmall pox or meaſels, and are defended thereby from humors that would fal into them.

H The chiues ſteeped in water ſerue to illumine or (as we ſay) limne pictures and imagerie, as alſo to colour ſundry meats and confections. It is with good ſucceſſe giuen to procure bodily luſt. The Confections called *Crocomagna*, *Oxycroceum*, and *Diacurcuma*, with diuers other emplaiſters and electuaries, cannot be made without this Saffron.

I The weight of ten grains of Saffron, the kernels of Walnuts two ounces, Figs two ounces, Mithridate one dram, and a few Sage leaues ſtamped together with a ſufficient quantitie of Pimpernel water, and made into a maſſe or lumpe, and kept in a glaſſe for your vſe, and thereof 12 graines giuen in the morning faſting, preſerueth from the peſtilence, and expelleth it from thoſe that are infected.

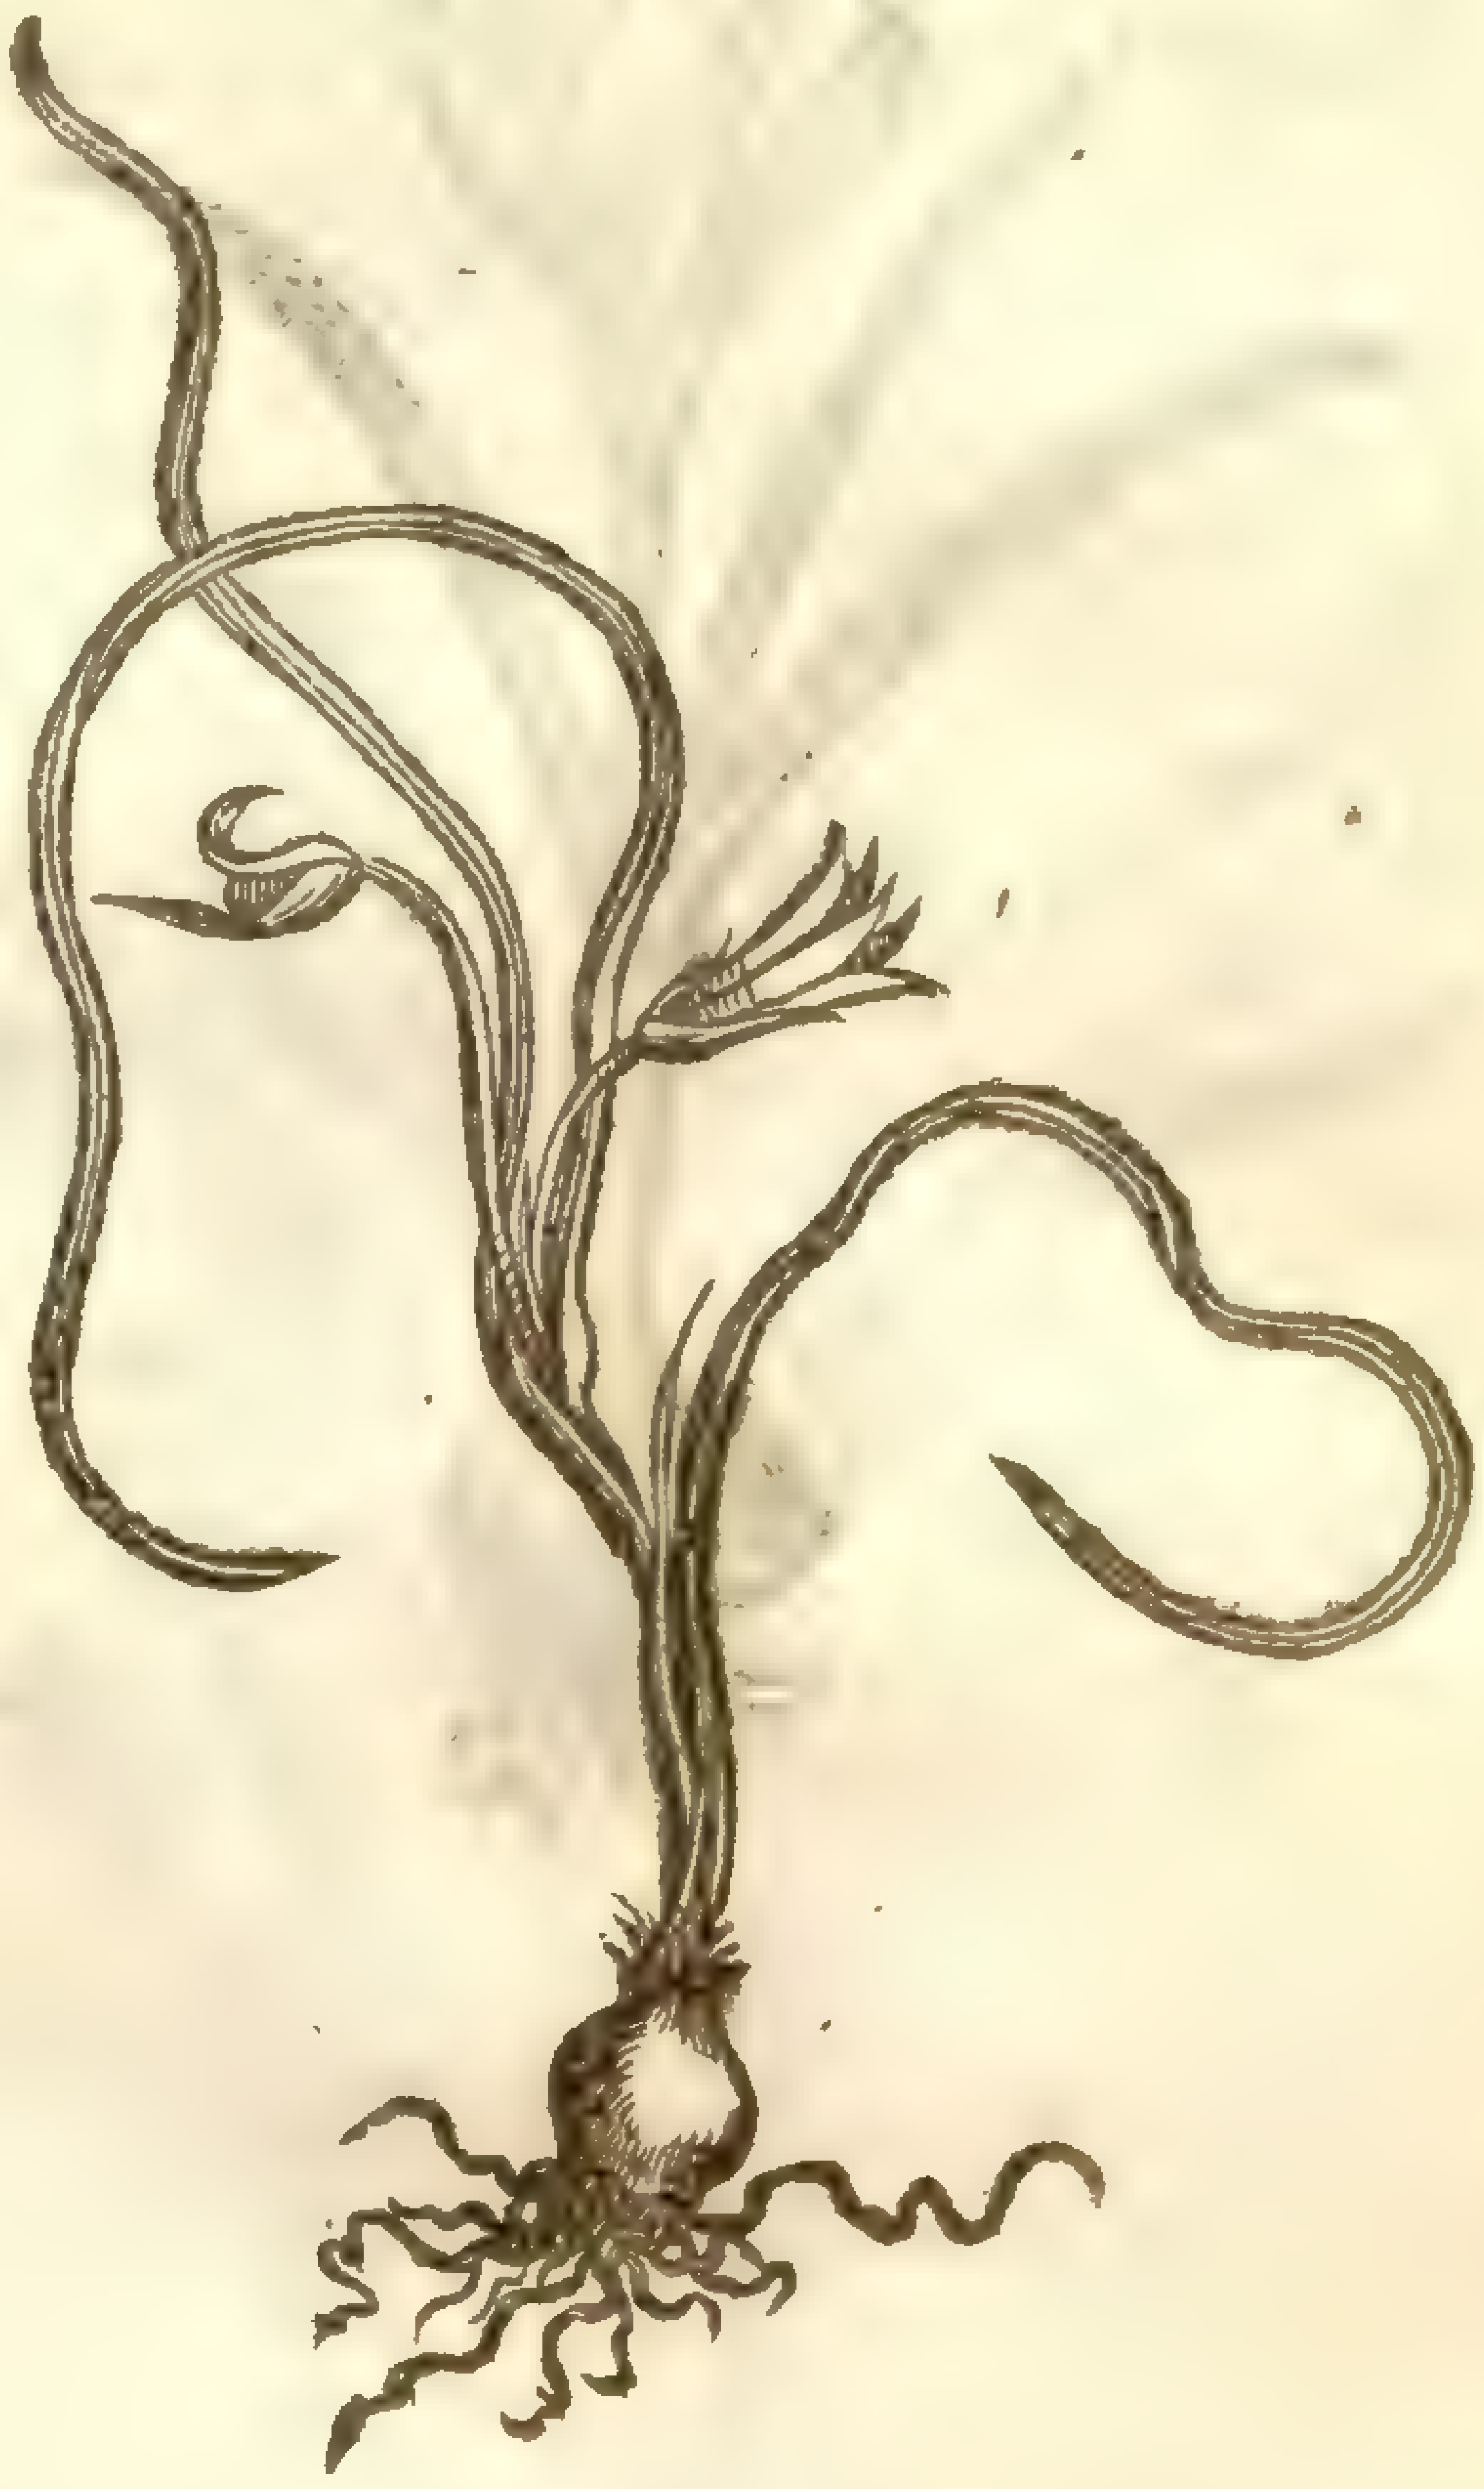
1 *Crocus vernus.*
Early flouring wilde Saffron.

C. vernus 2
Clusii dict.

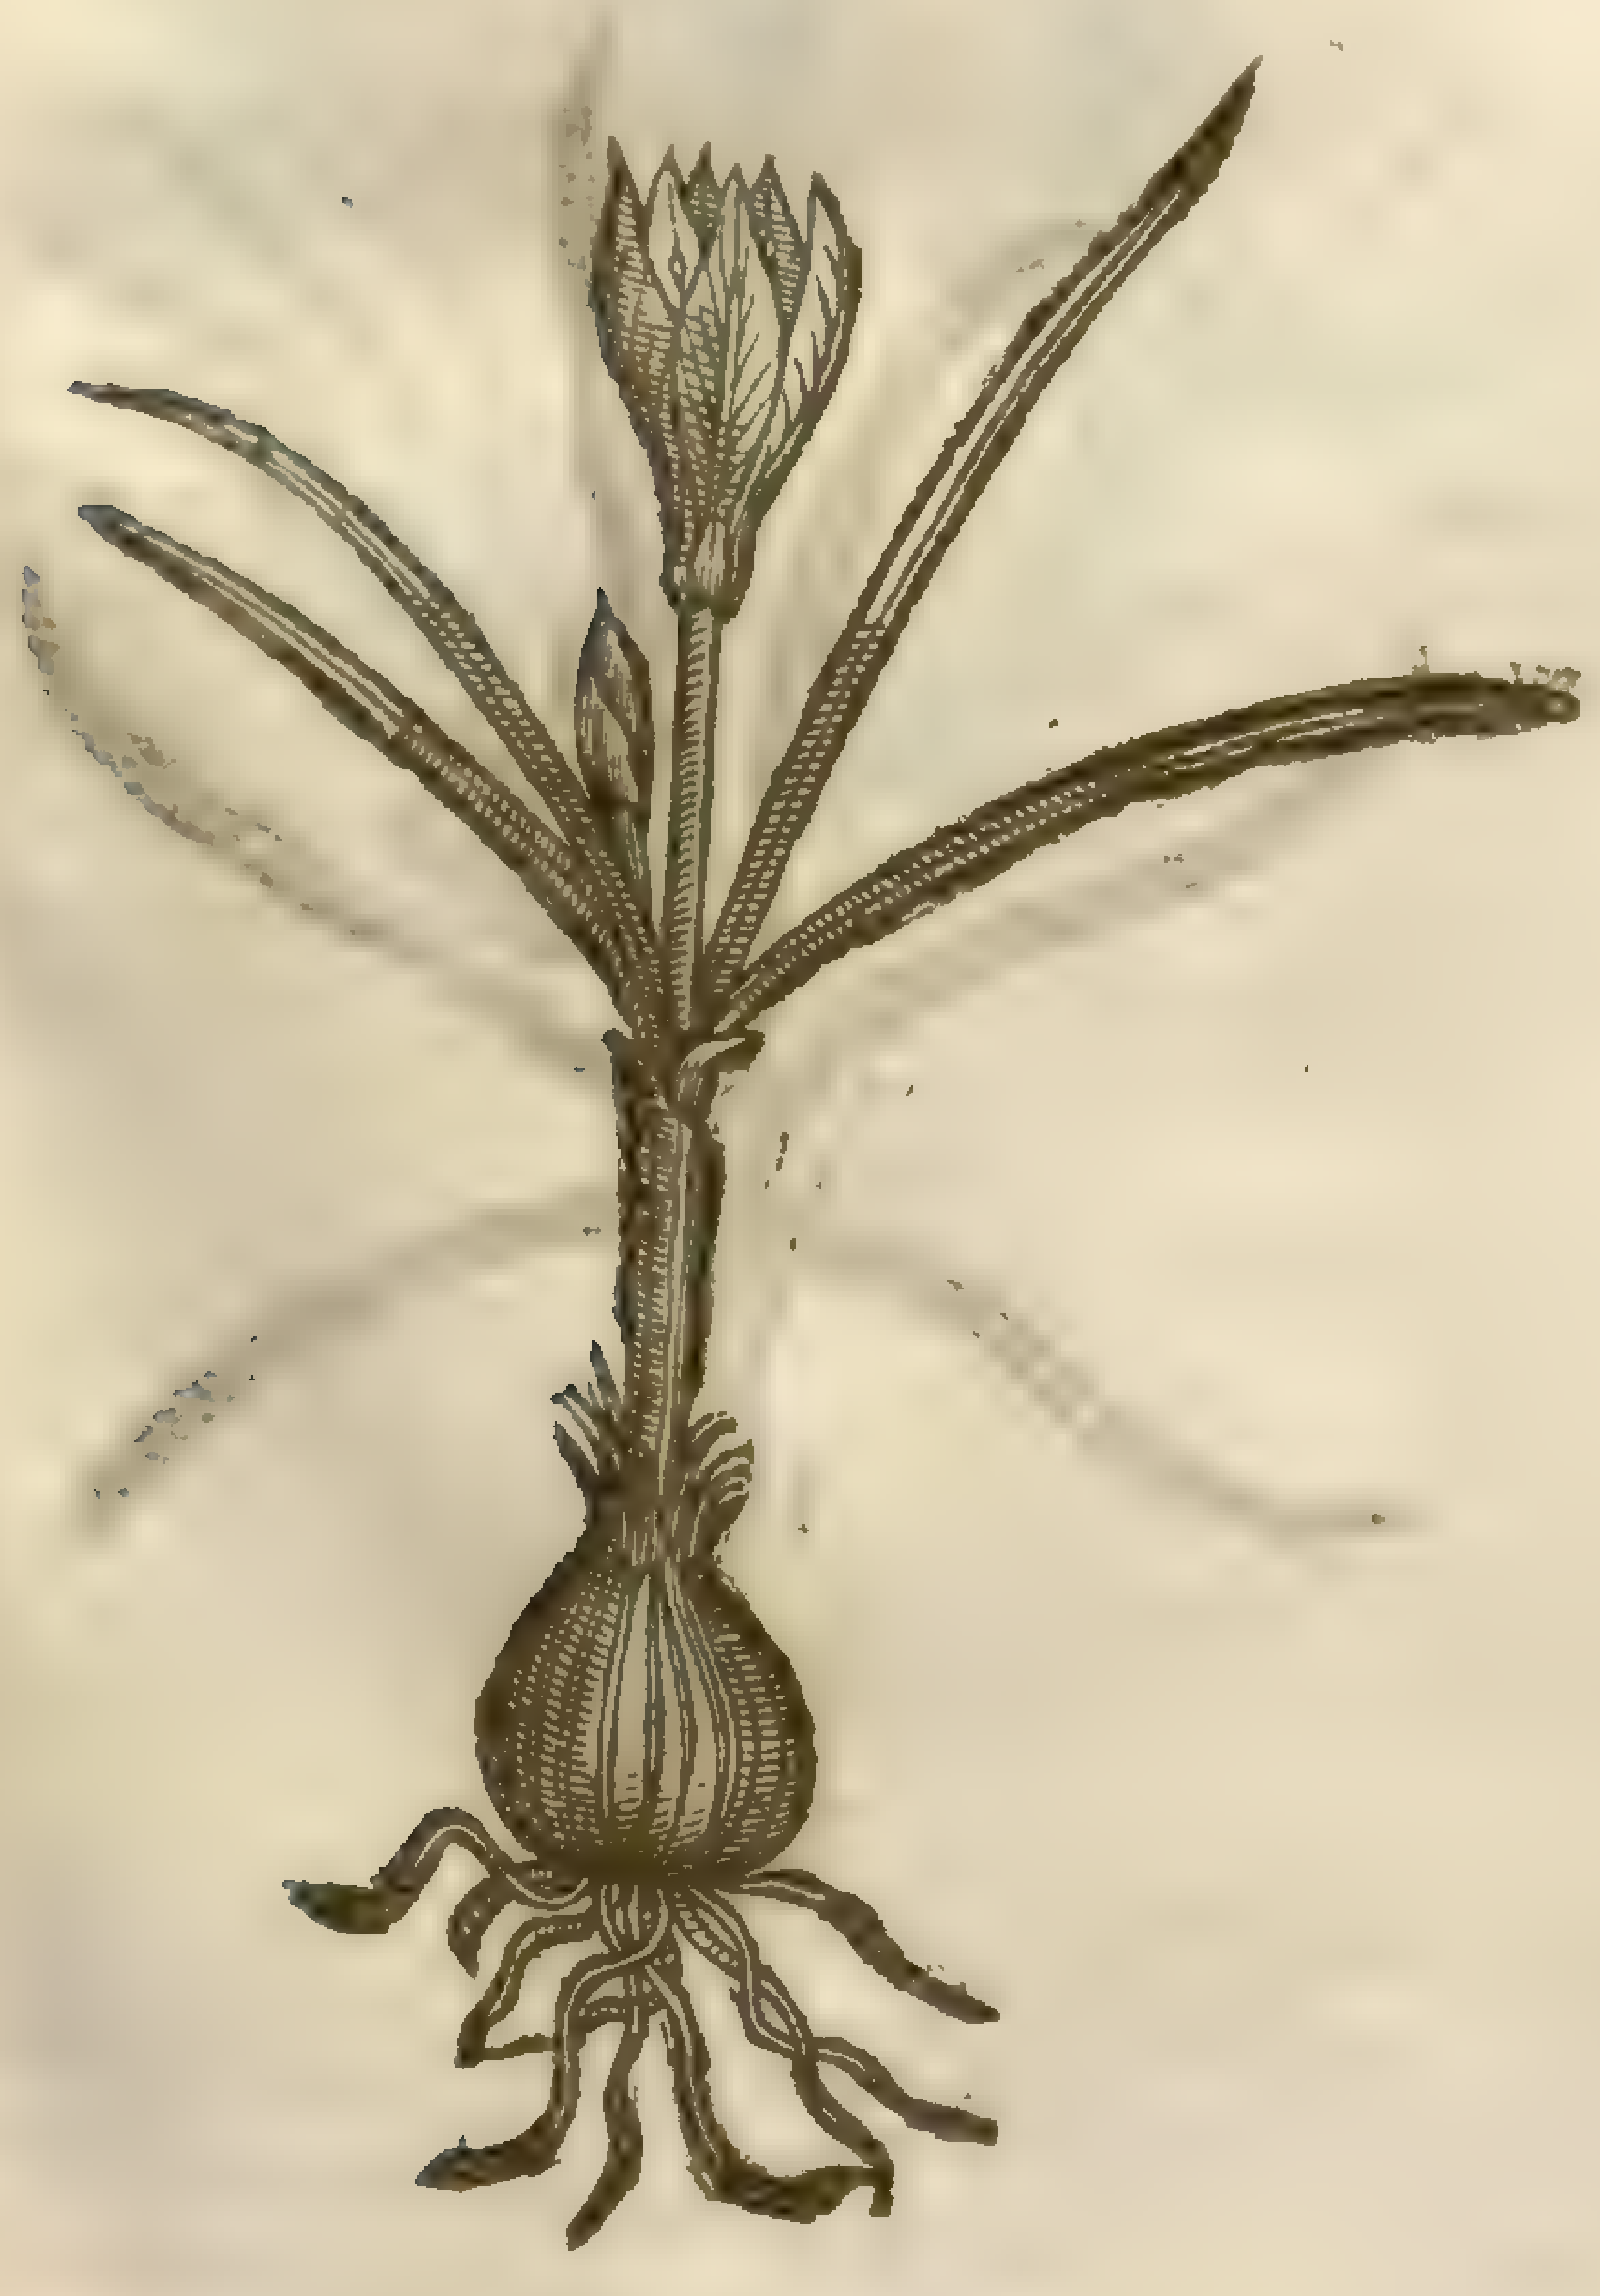


B.M. Thicke[illegible] Saffron [illegible]

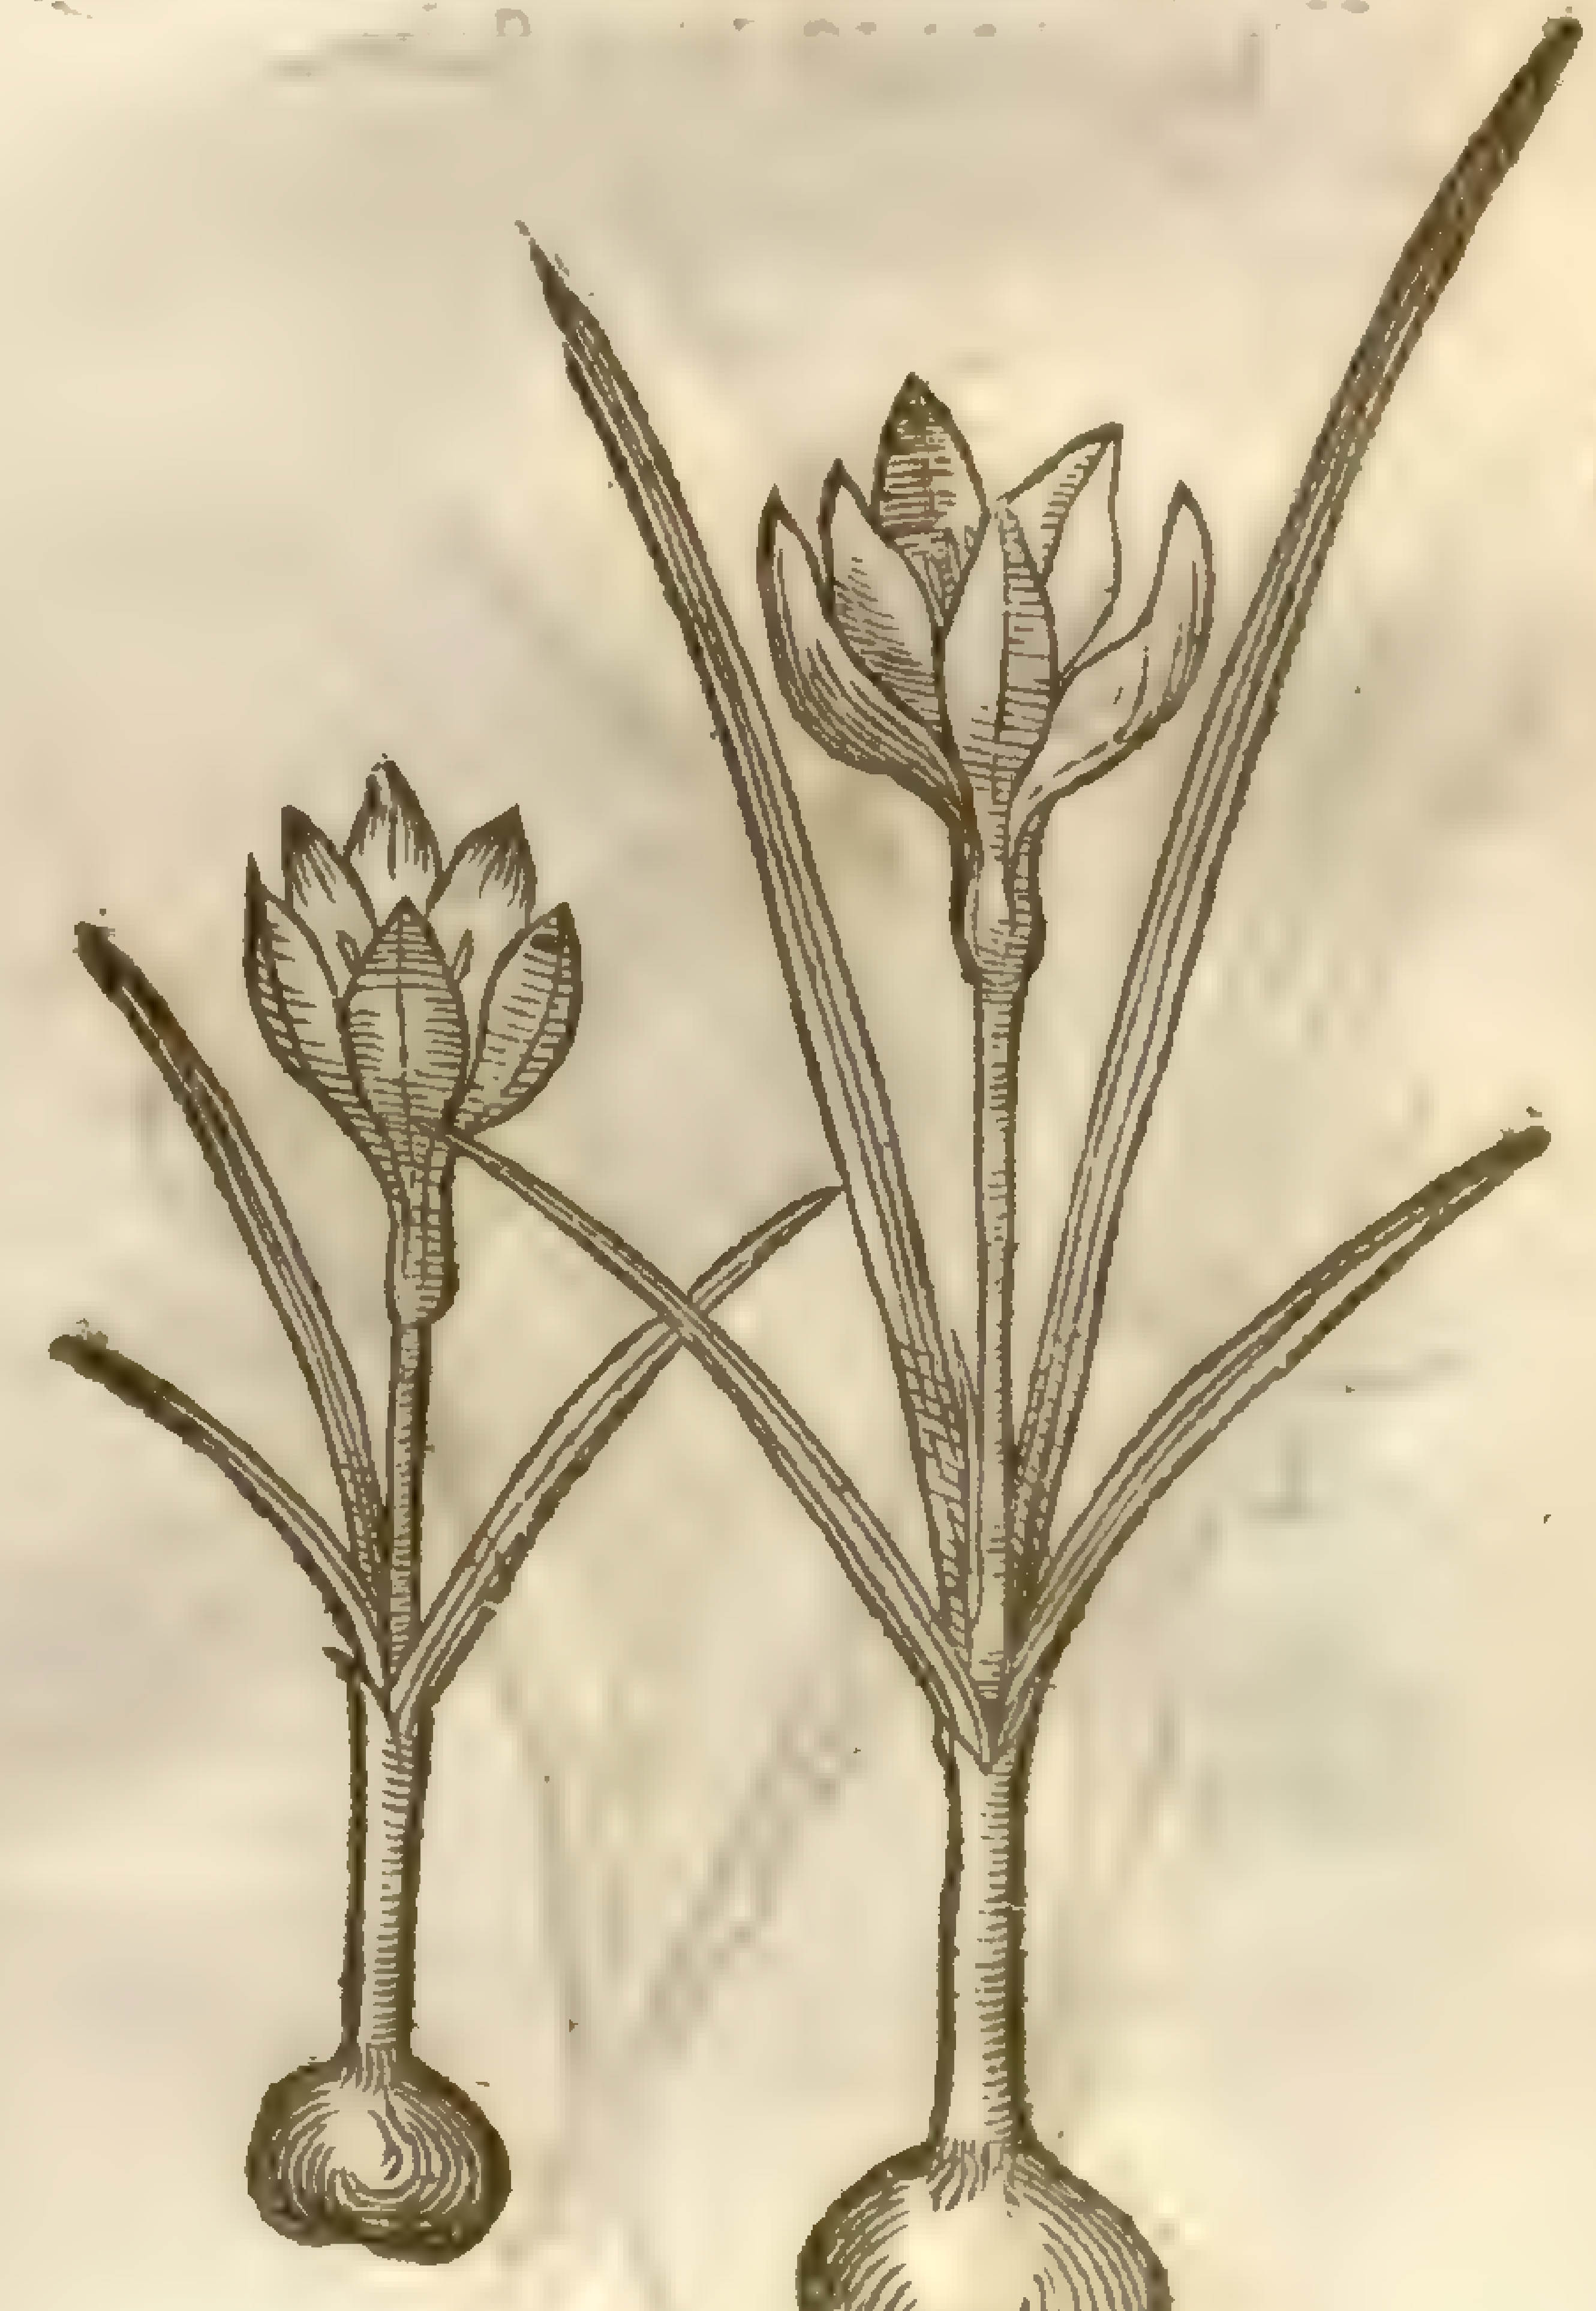
2 *Crocus vernus minor.*
Small wilde Saffron.



‡ 3 *Crocus vernus flore luteo.*
Yellow Spring Saffron.

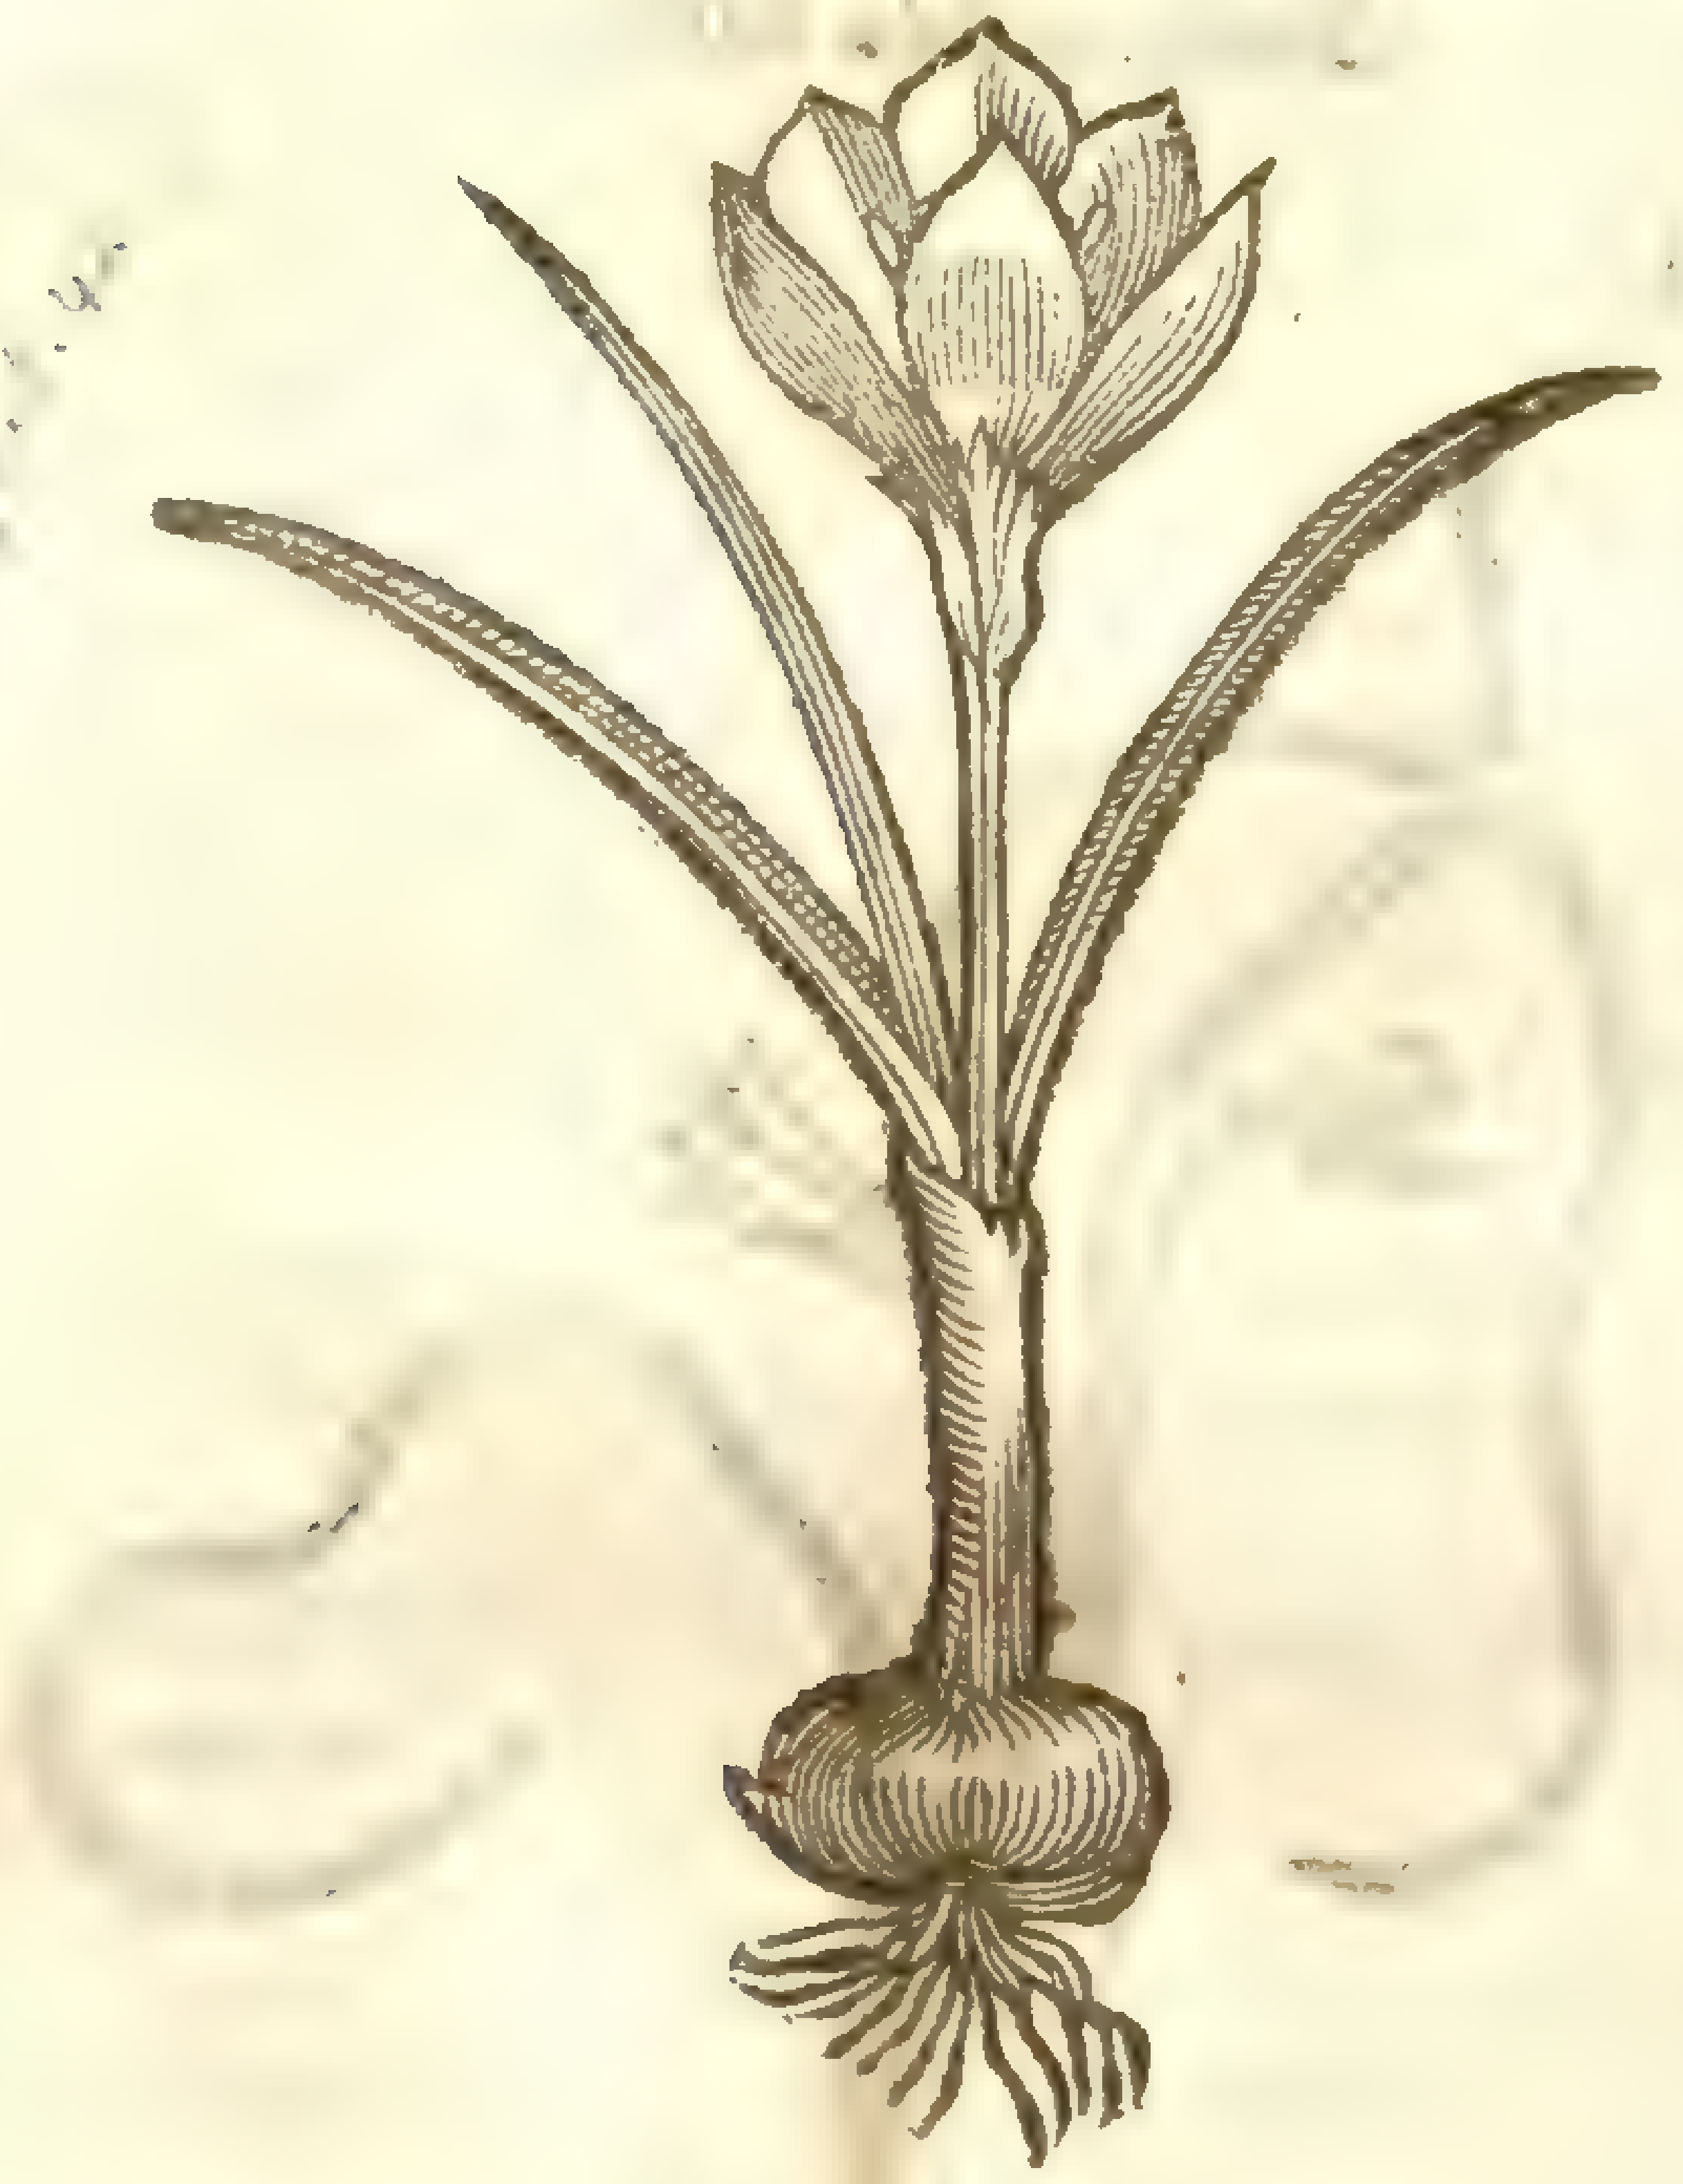


‡ 4 *Crocus vernus flore albo.*
White Spring Saffron.



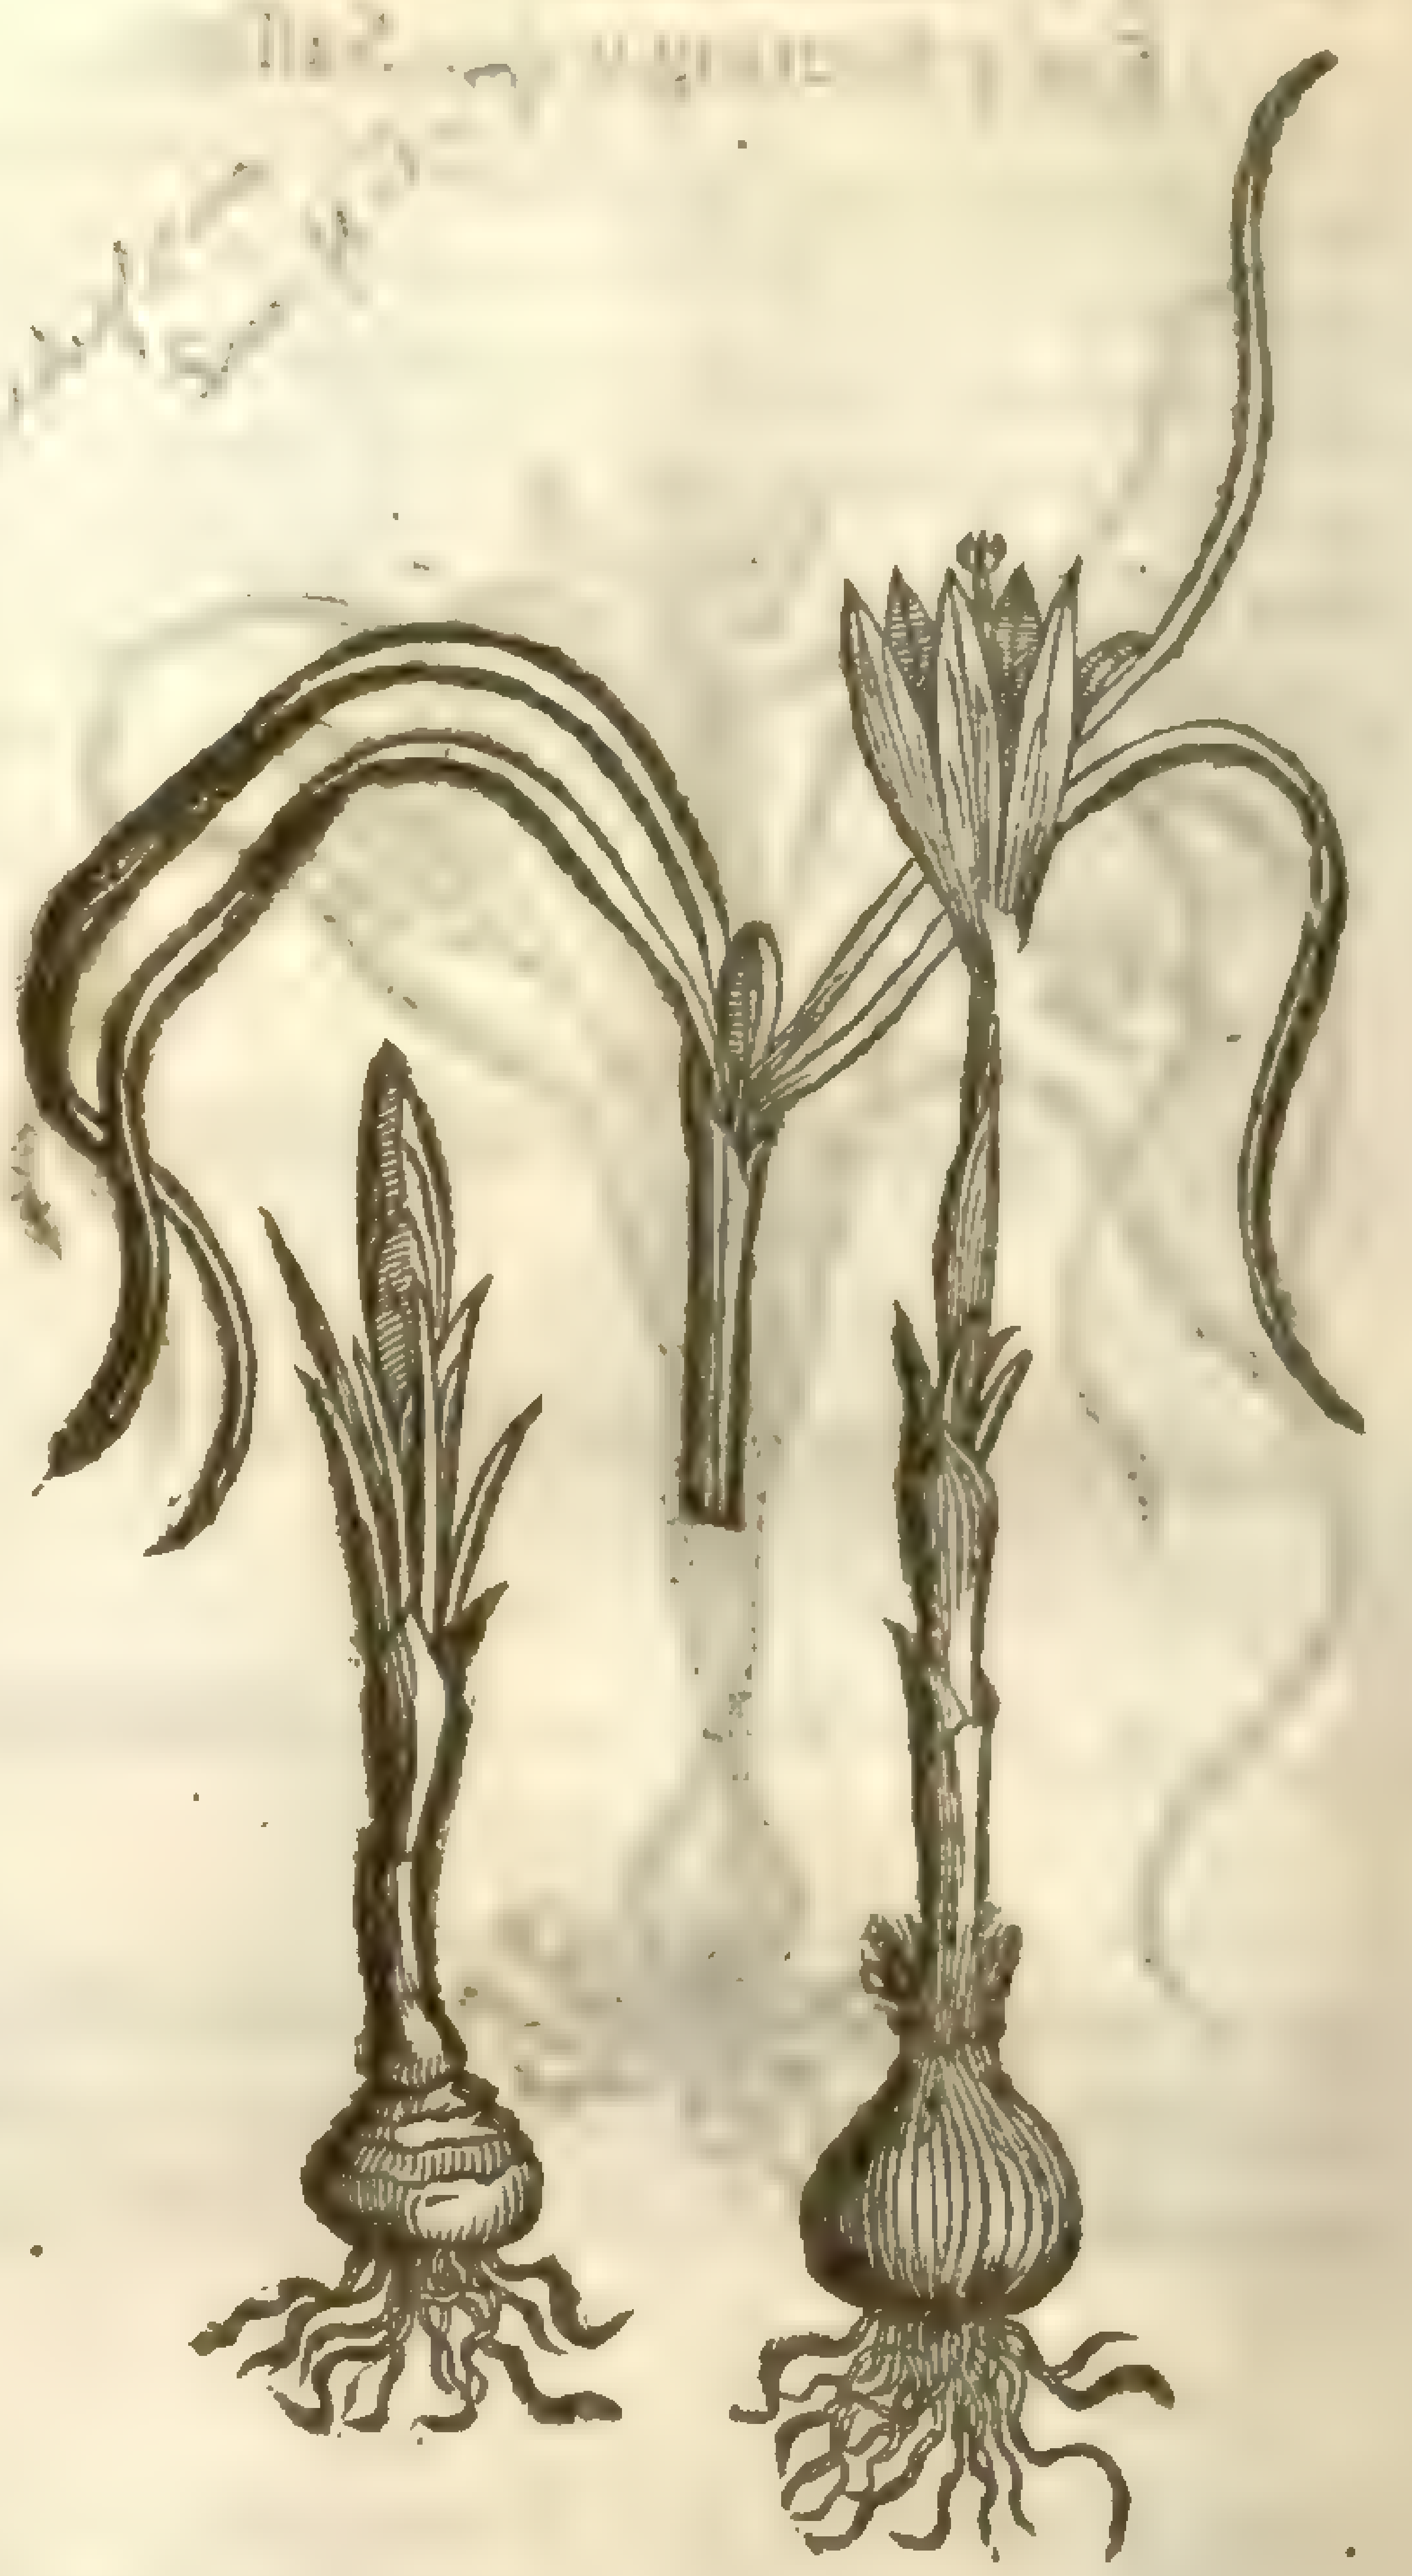
‡ 5 *Crocus vernus flore purpureo.*
Purple Spring Saffron.

[illegible]

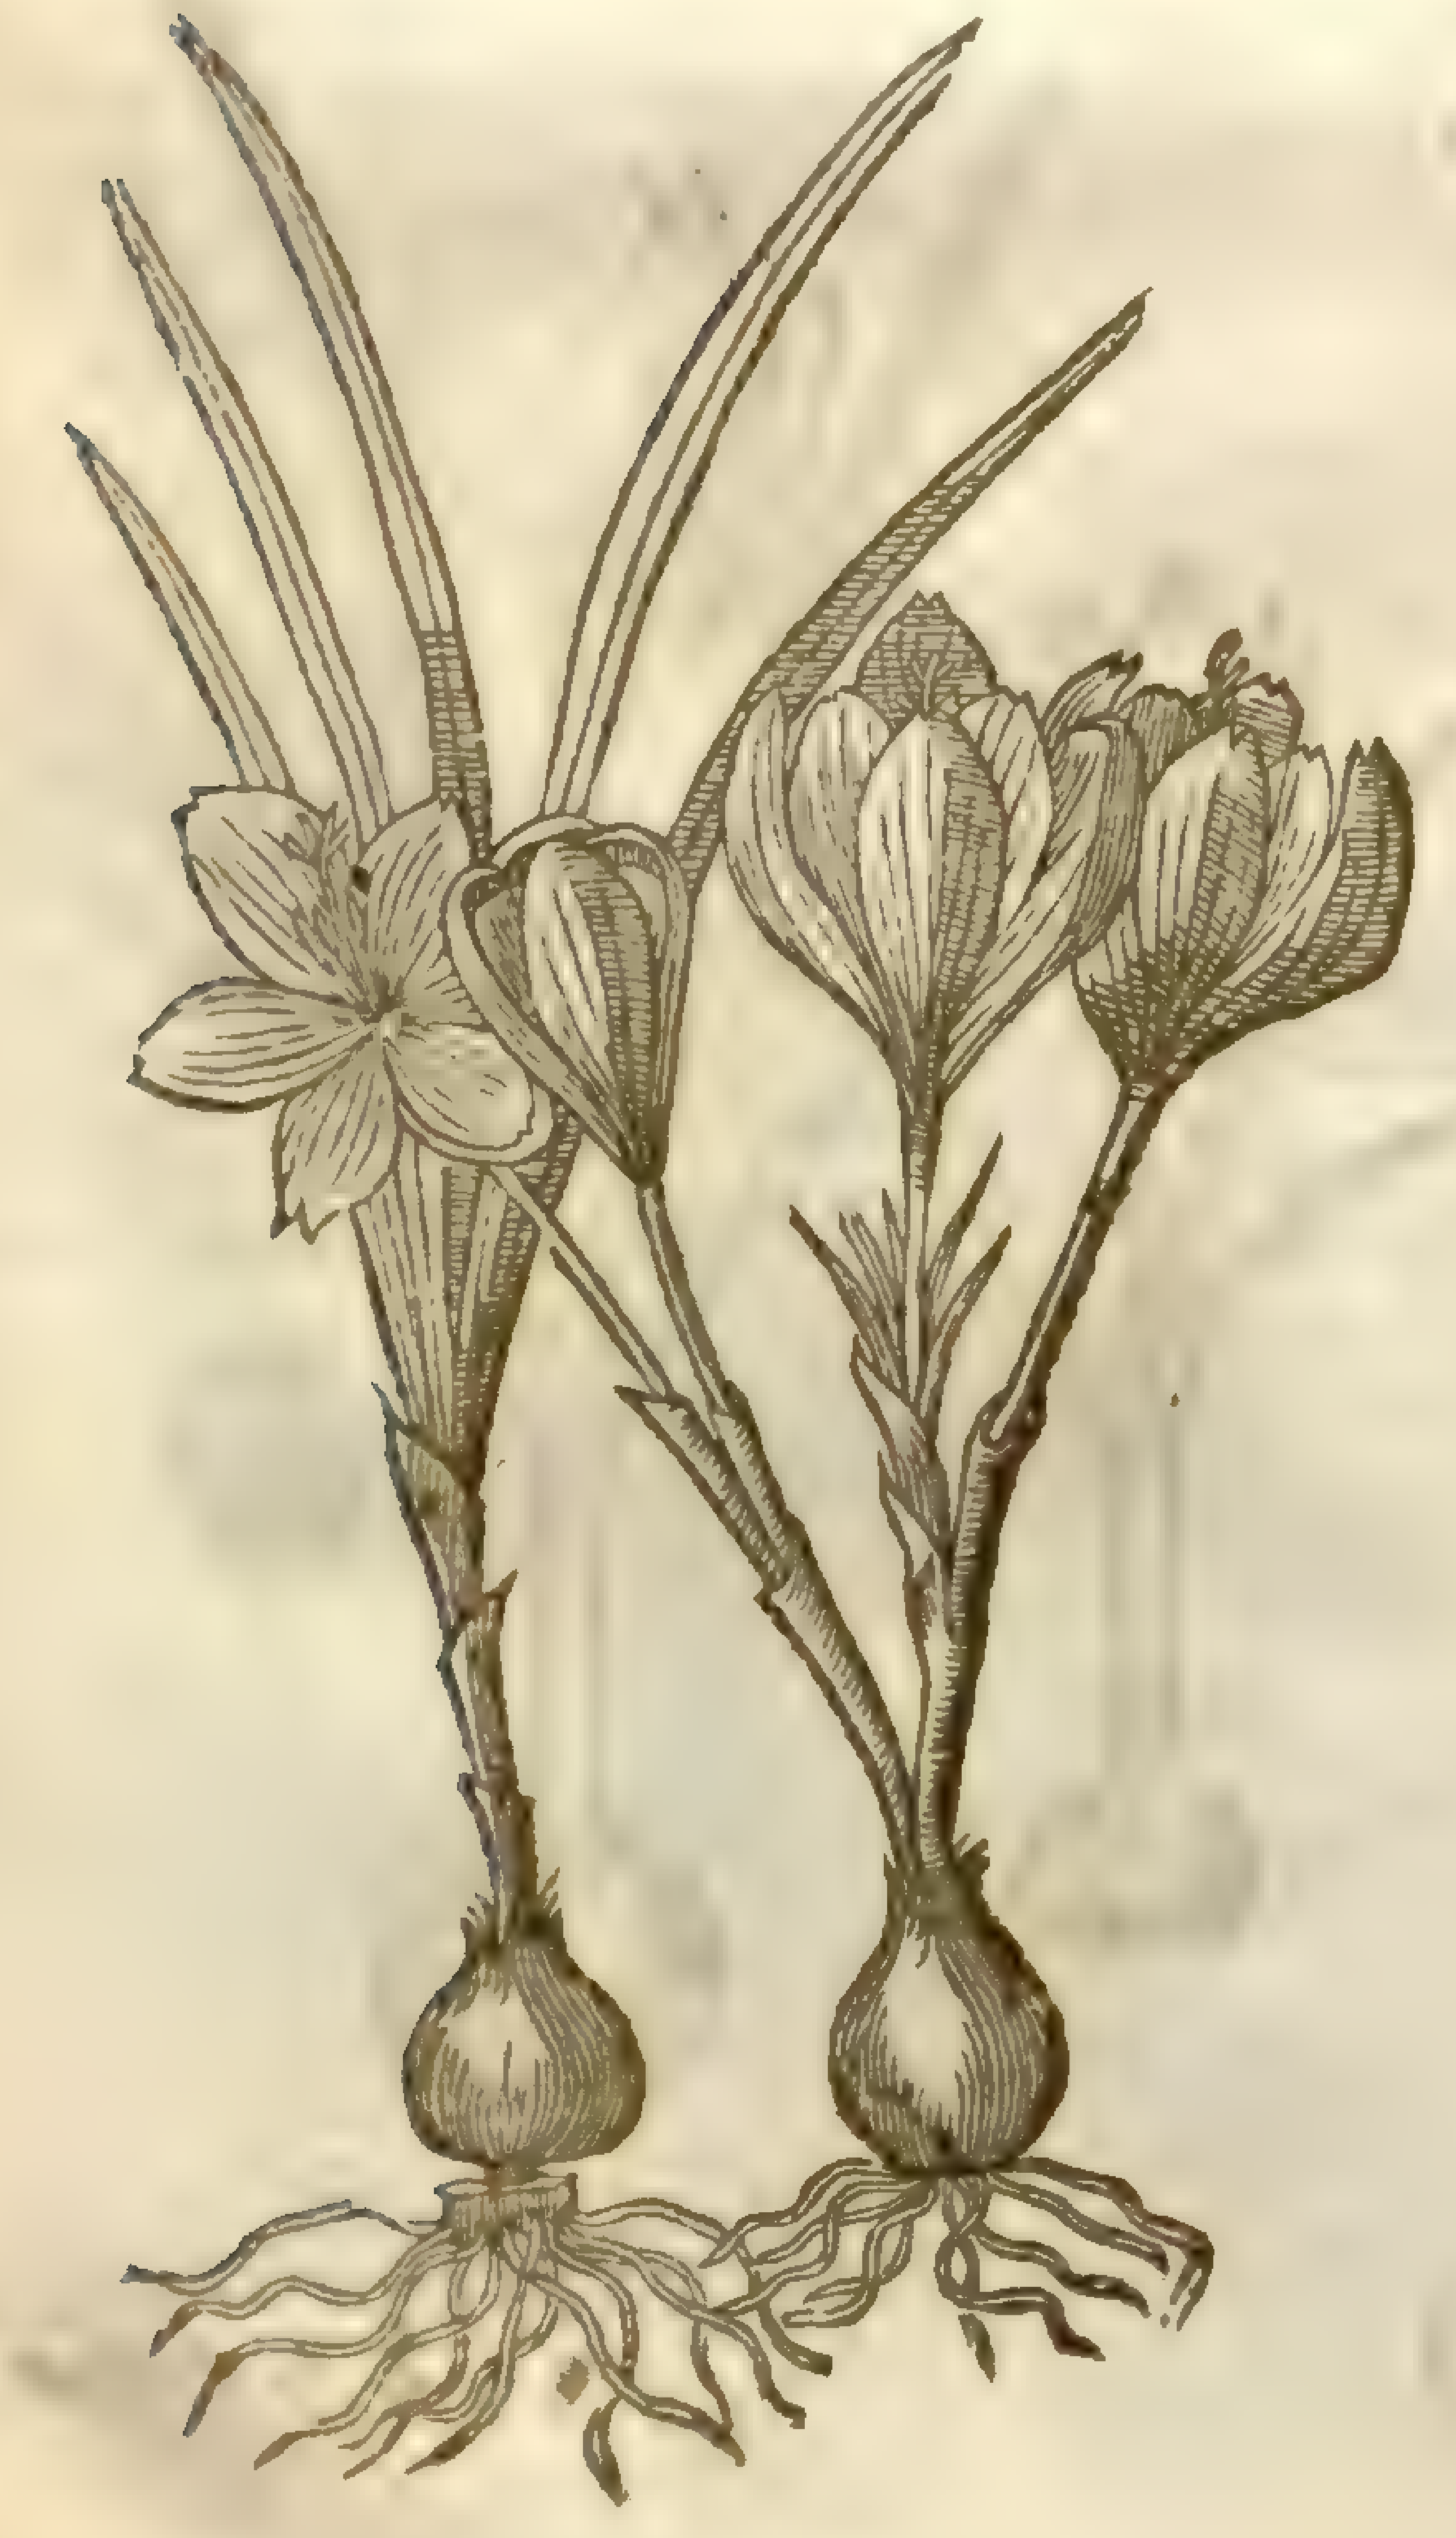


‡ 6 *Crocus montanus Autumnalis.*
Autumne mountaine Saffron.

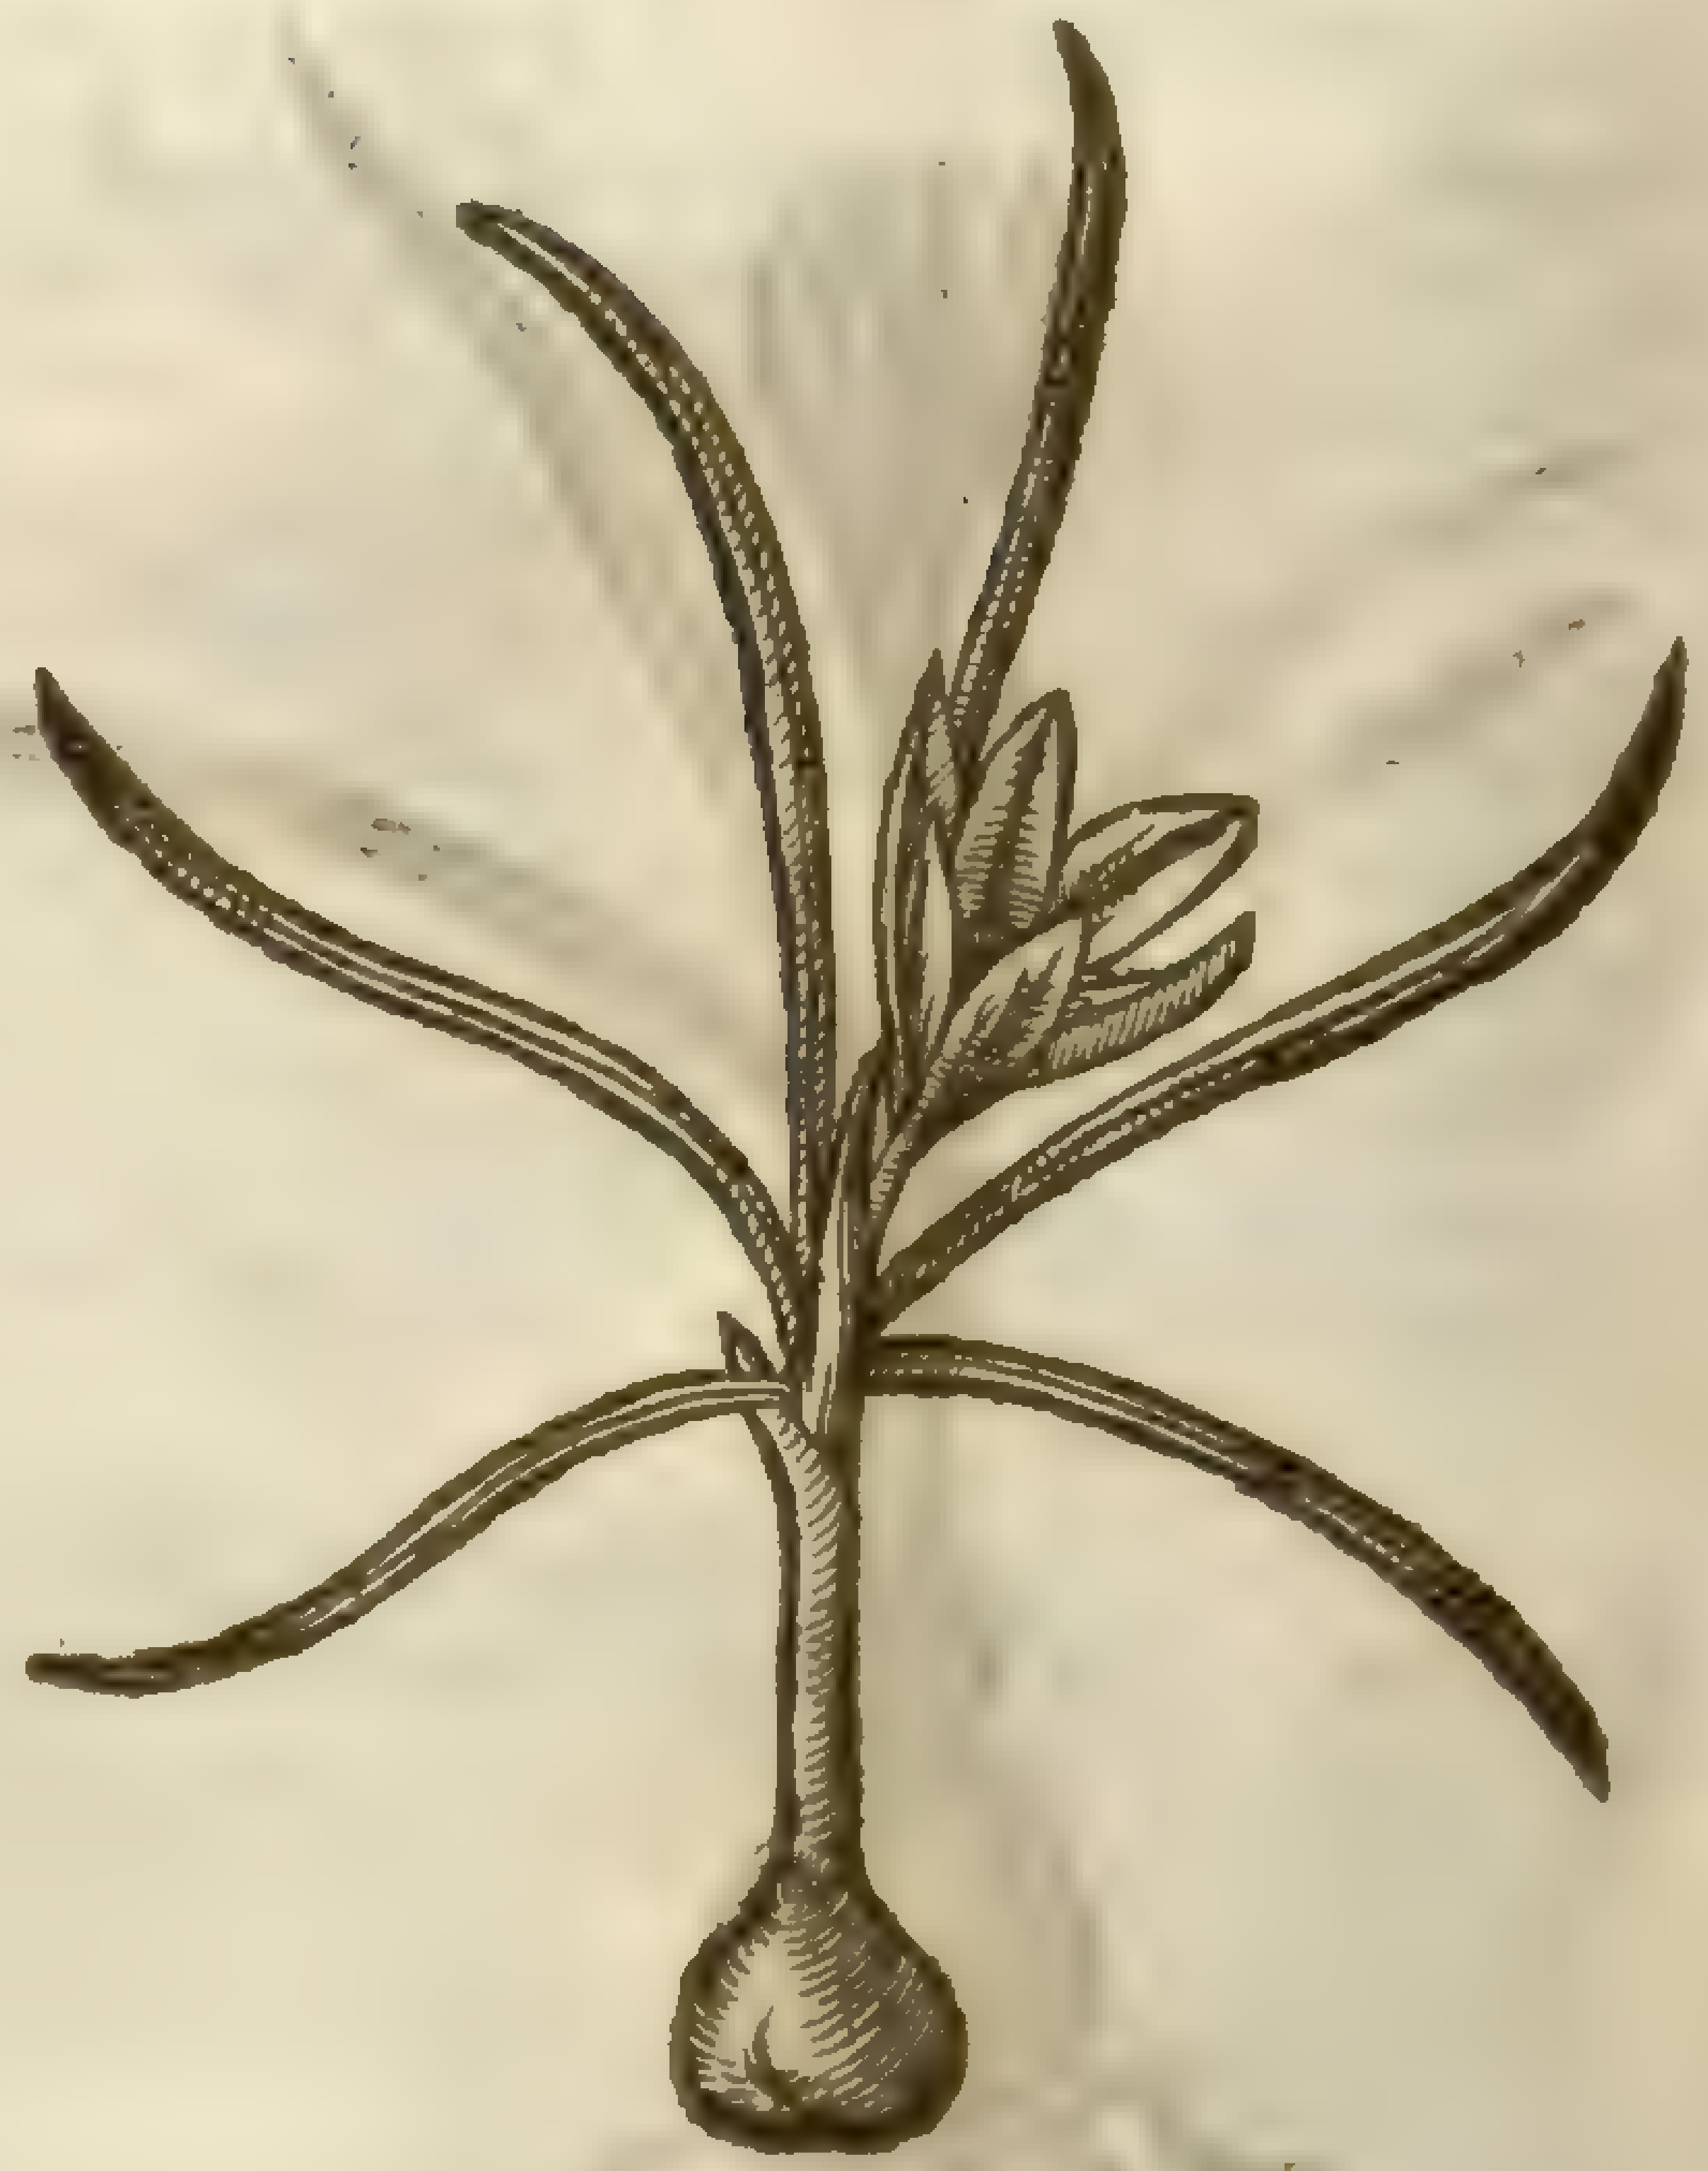
[illegible]



‡ 7 *Crocus montanus Autumnalis flore maiore albido cæruleo.*
Autumne mountaine Saffron with a large whitiſh blew floure.

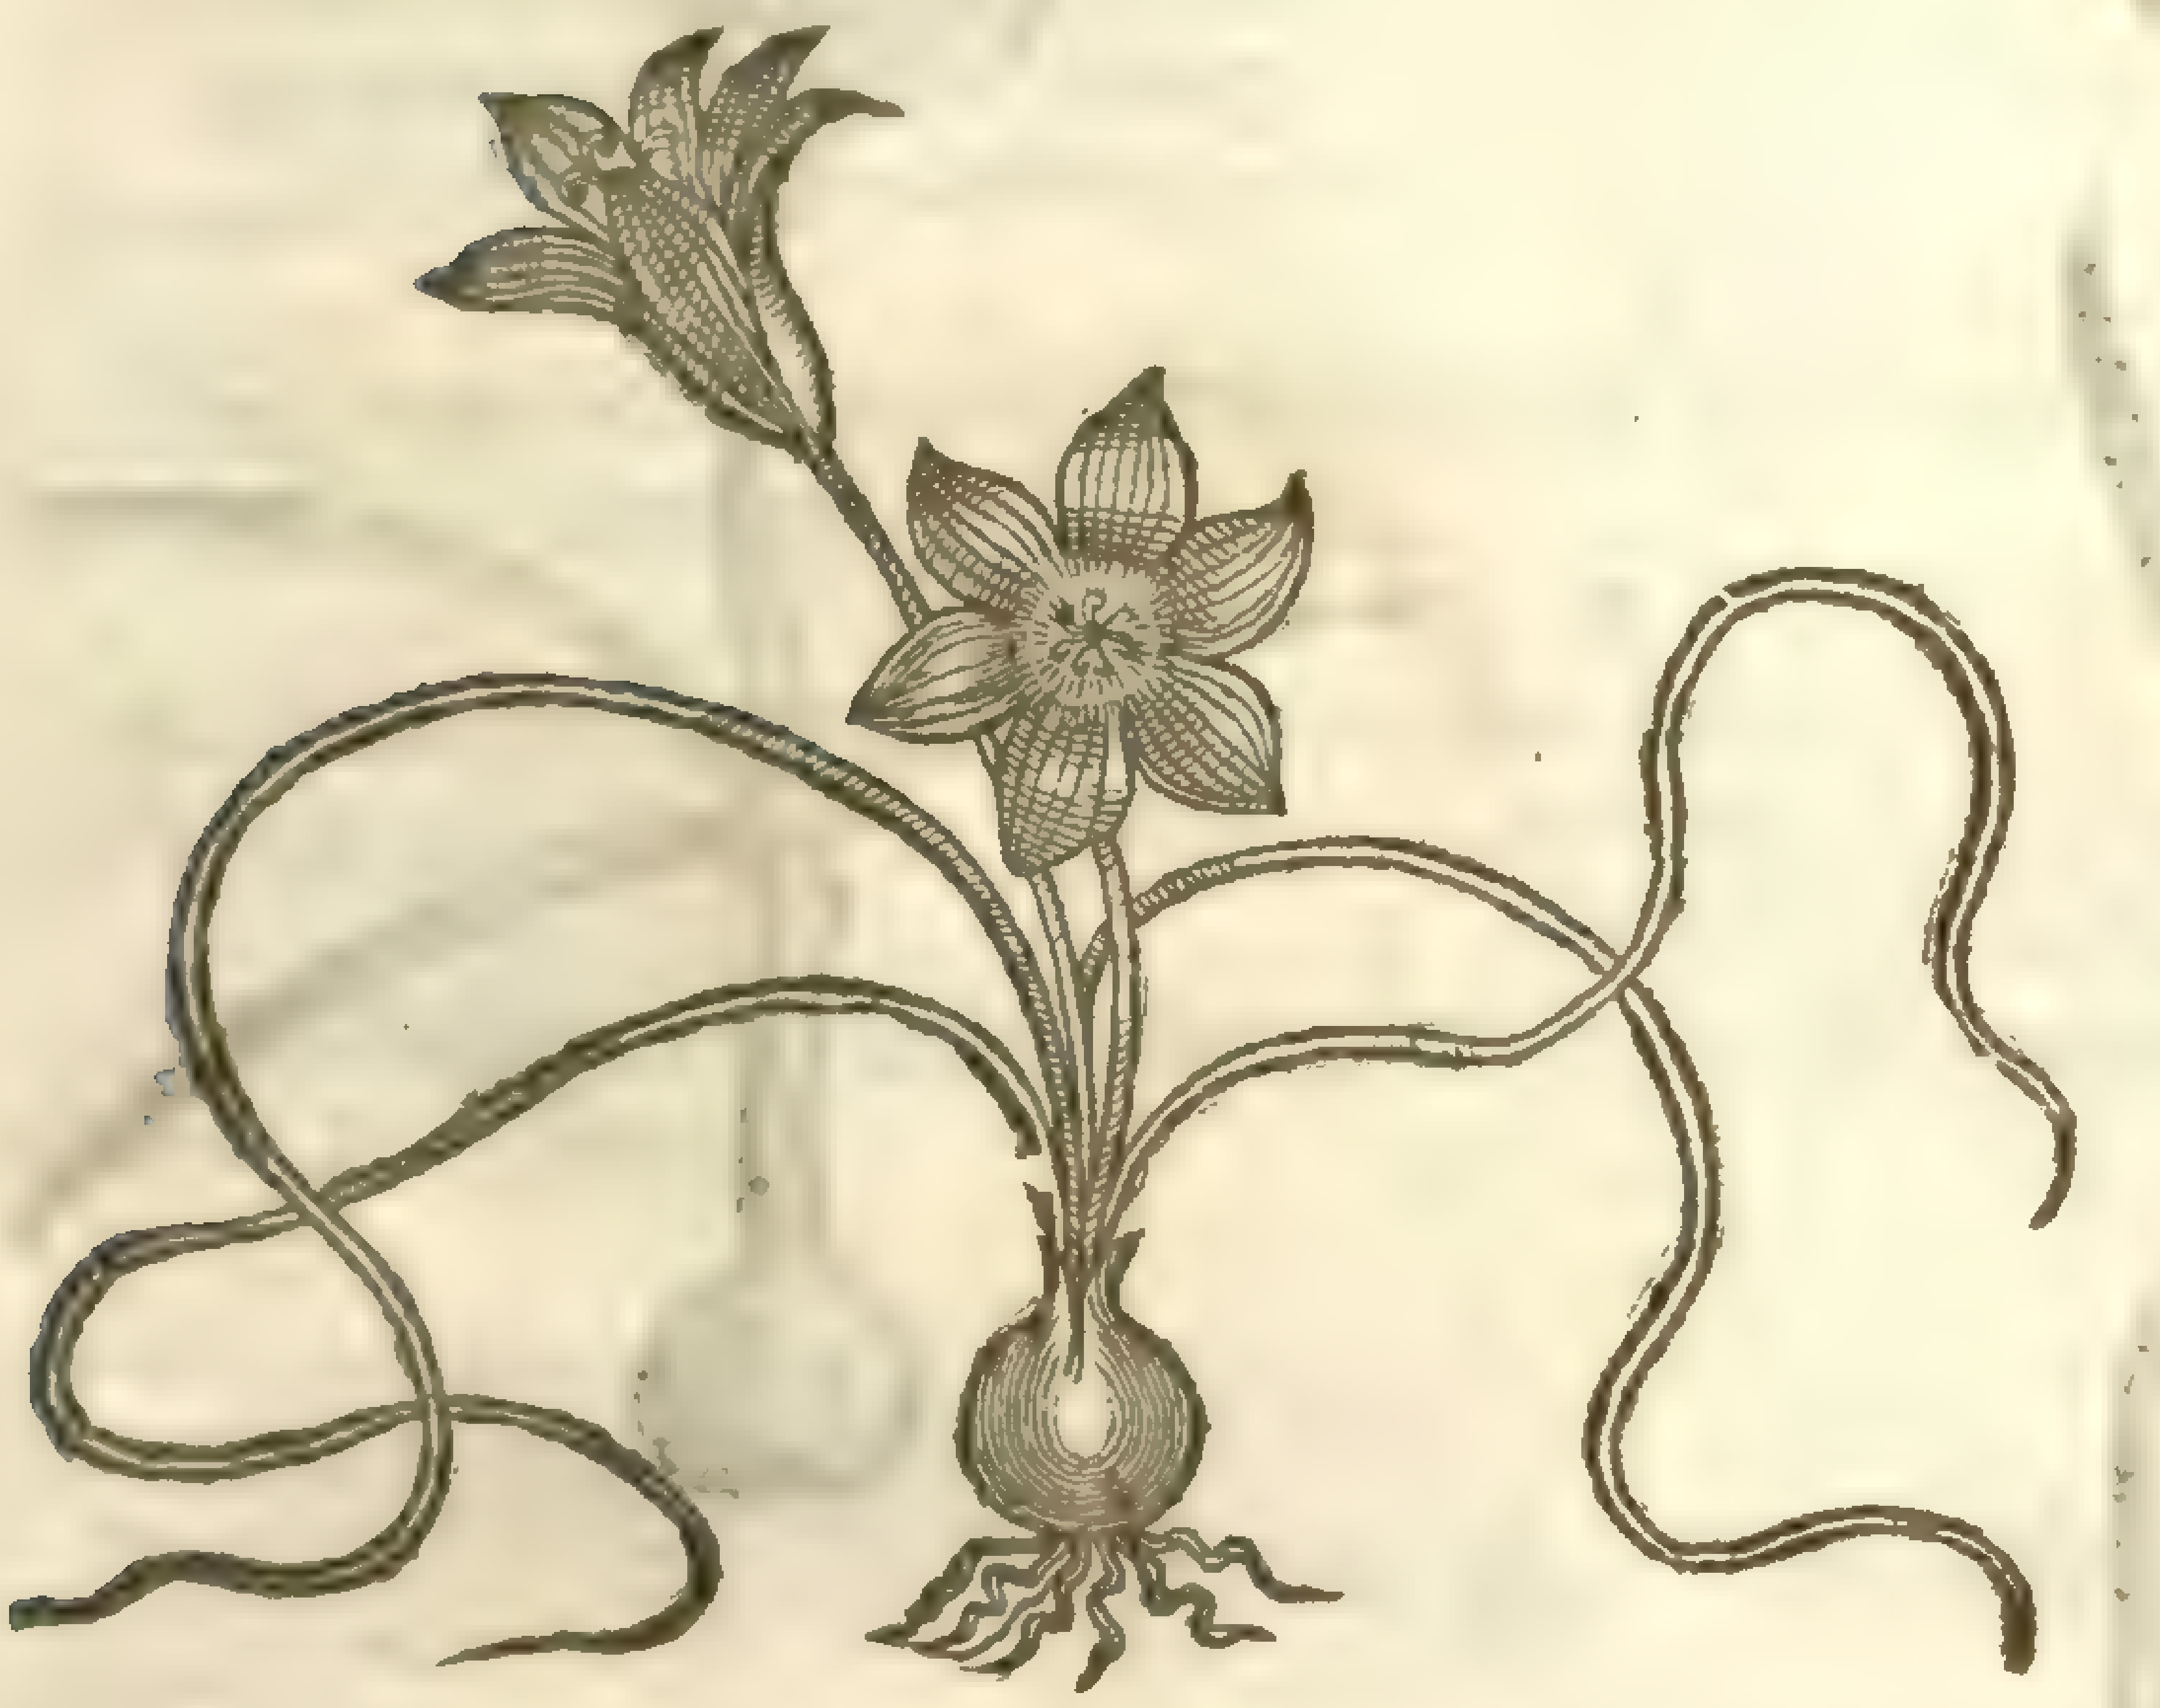


‡ 8 *Crocus Autumnalis flore albo.*
White Autumne Saffron.

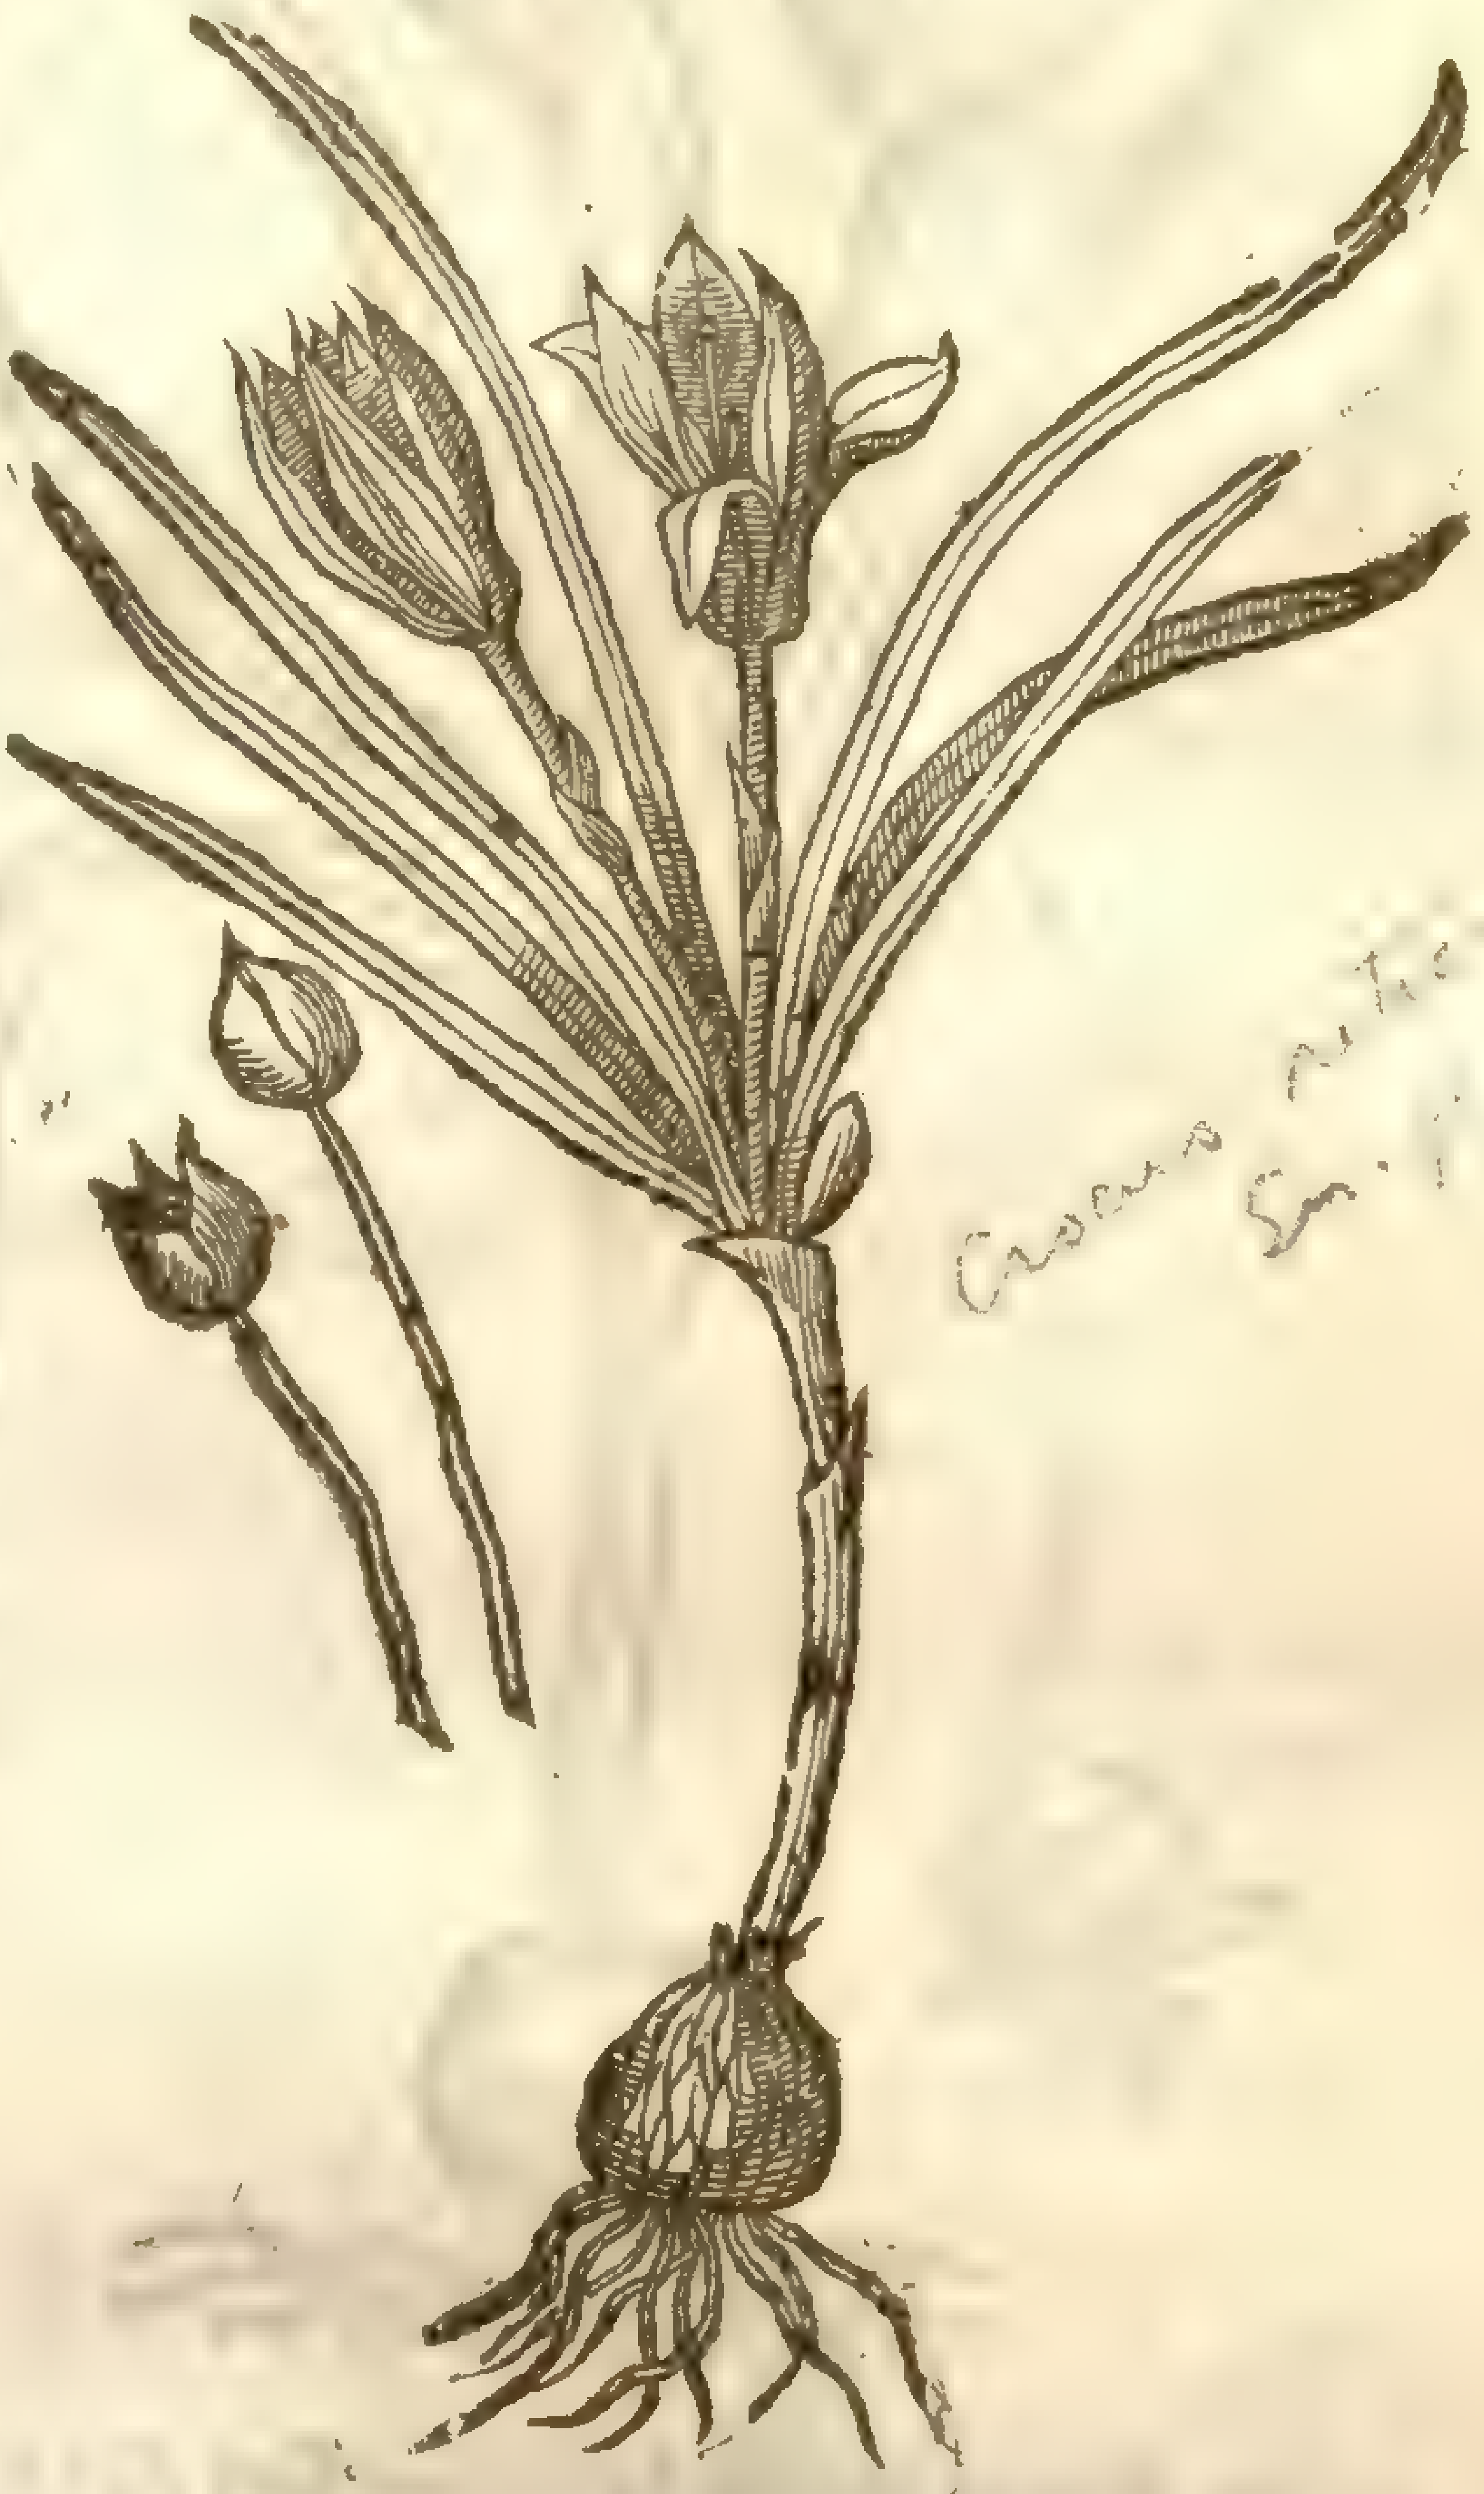


¶ The

‡ 9 *Crocus vernus anguſtifolius flore violaceo.*
Narrow leafed Spring Saffron with a violet floure.

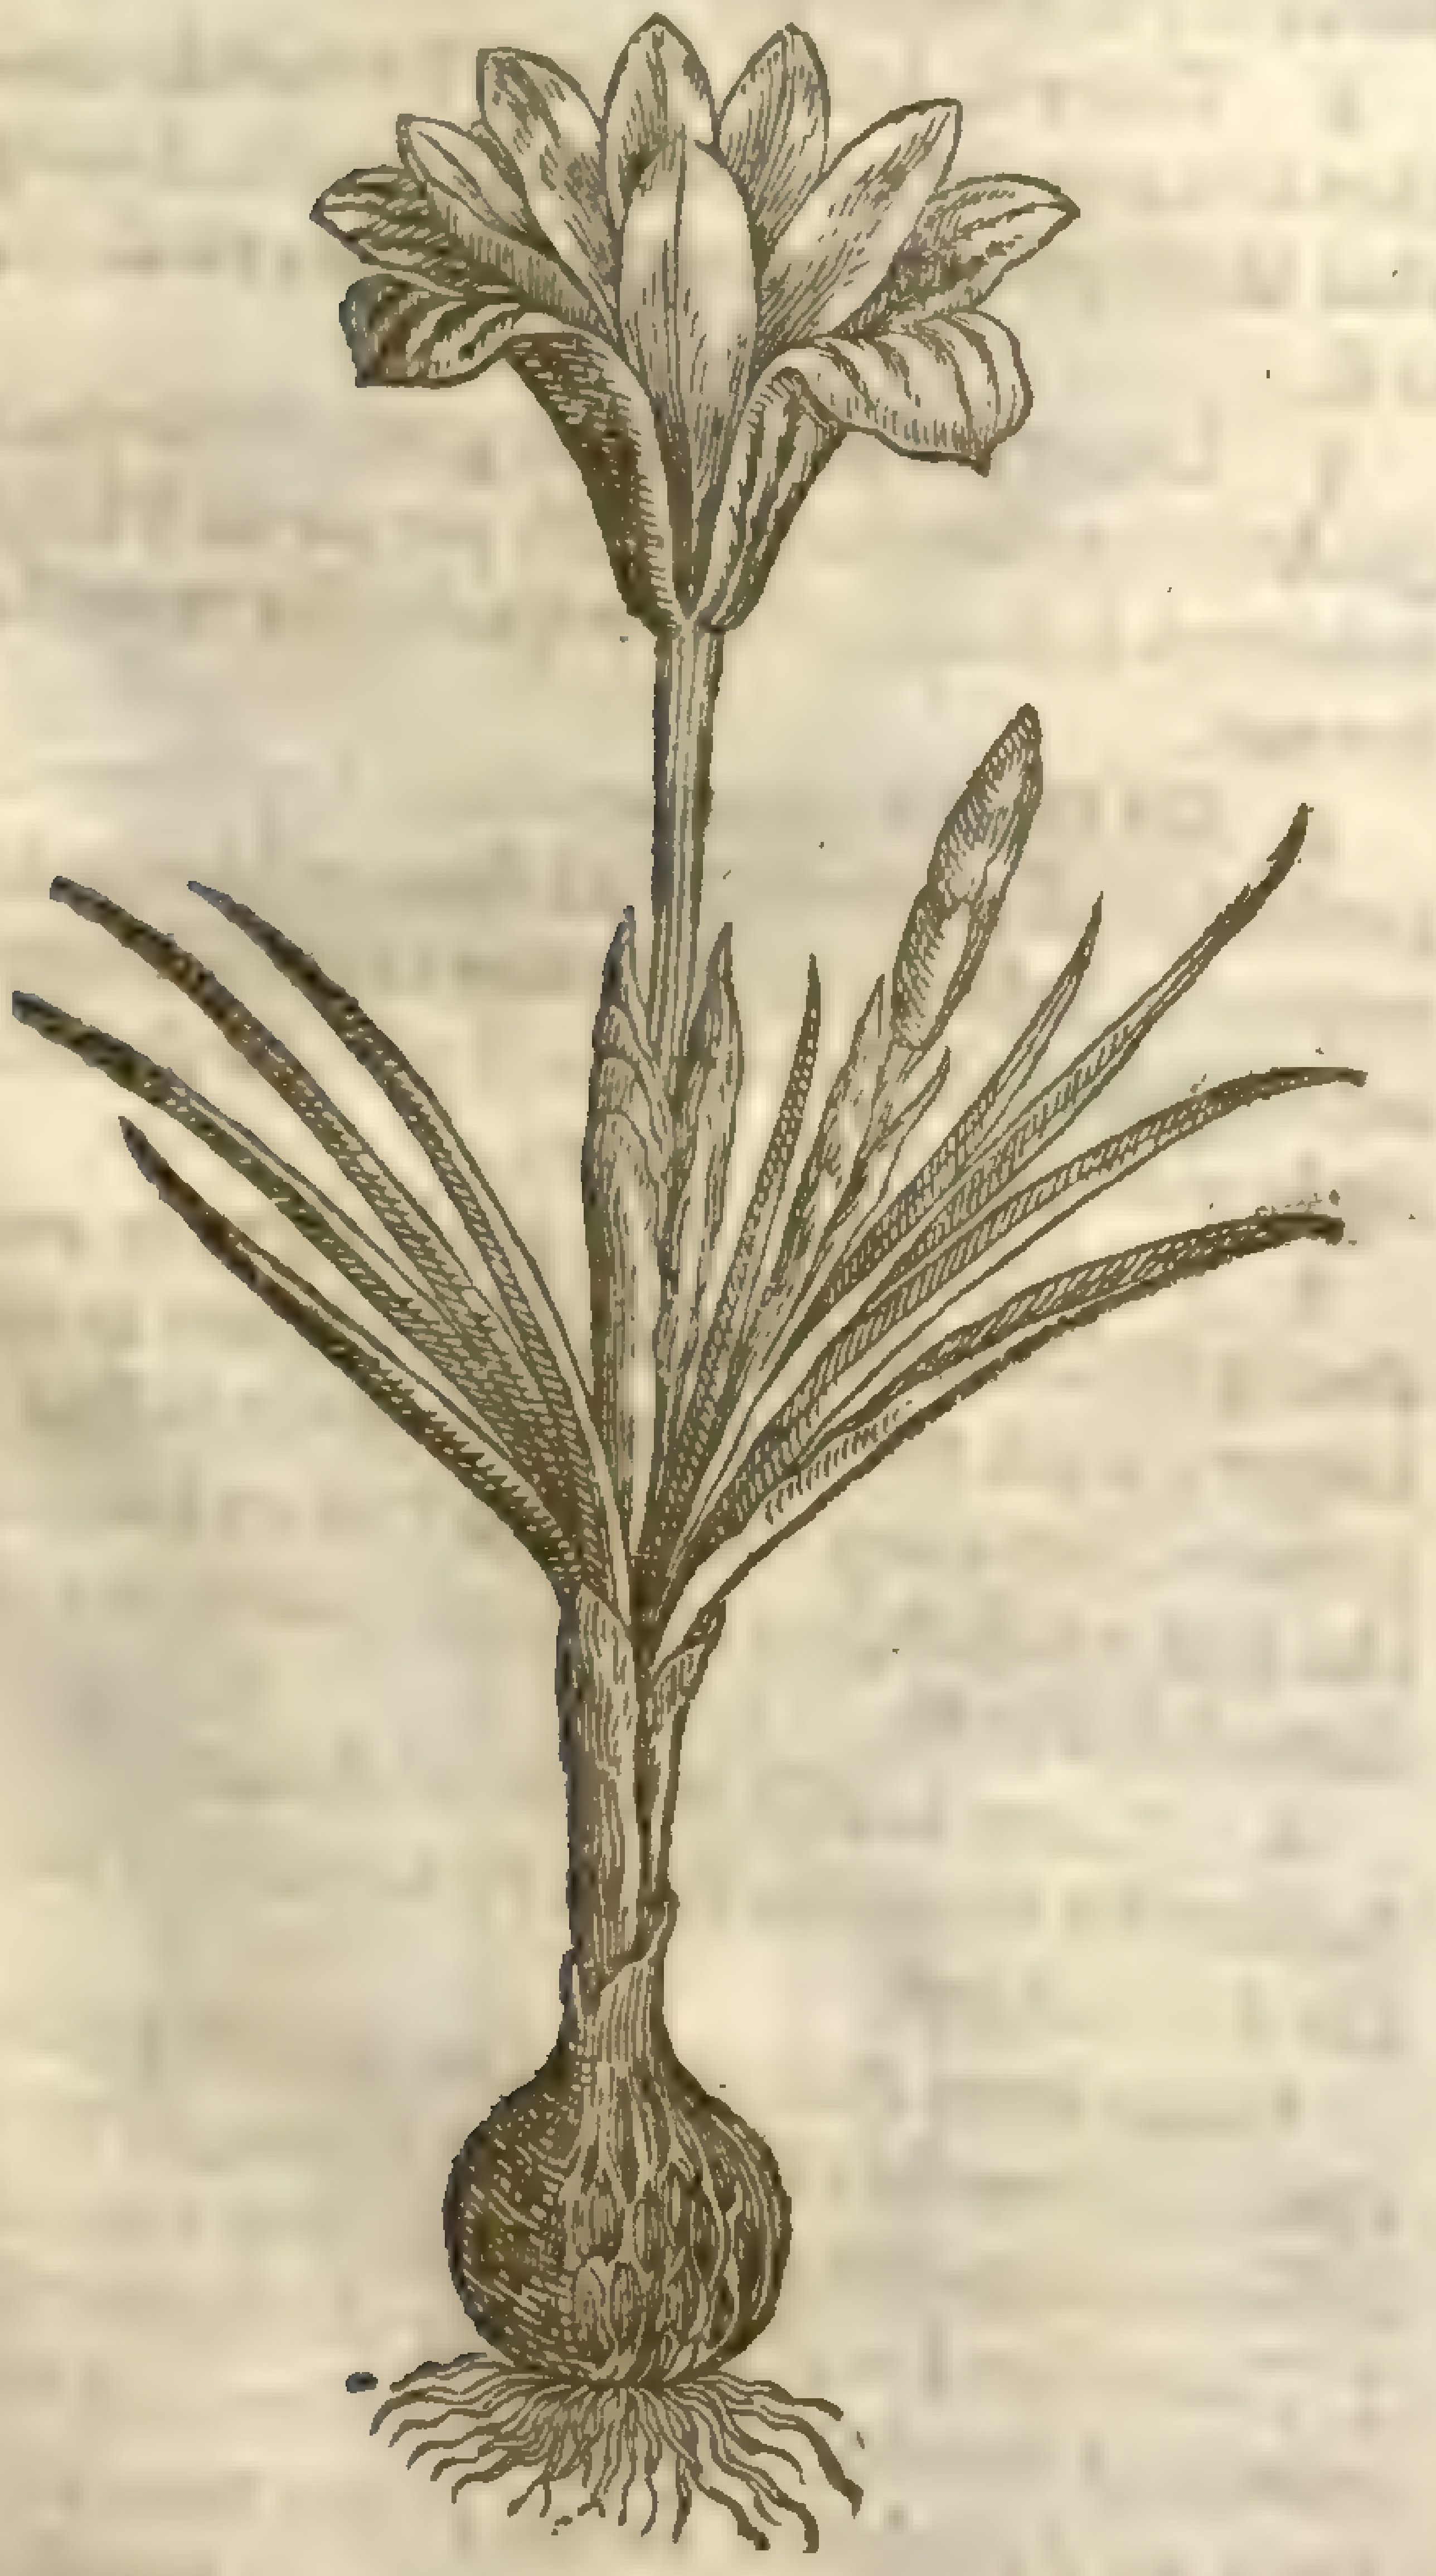


‡ 10 *Crocus vernus latifolius flore flavo ſtrijs violaceis.*
Broad leafed Spring Saffron with a yellow floure and purple ſtreaks.



Crocus reticulatus, See
Sm. [illegible] 262

‡ 11 *Crocus vernus latifolius ſtriatus flore duplici.*
Double floured ſtreaked Spring Saffron.



¶ *The Kindes of Spring Saffron.*

OF wild Saffrons there be ſundry ſorts, differing as well in the colour of the floures, as alſo in the time of his flouring. Of which, moſt of the figures ſhall be ſet forth vnto you.

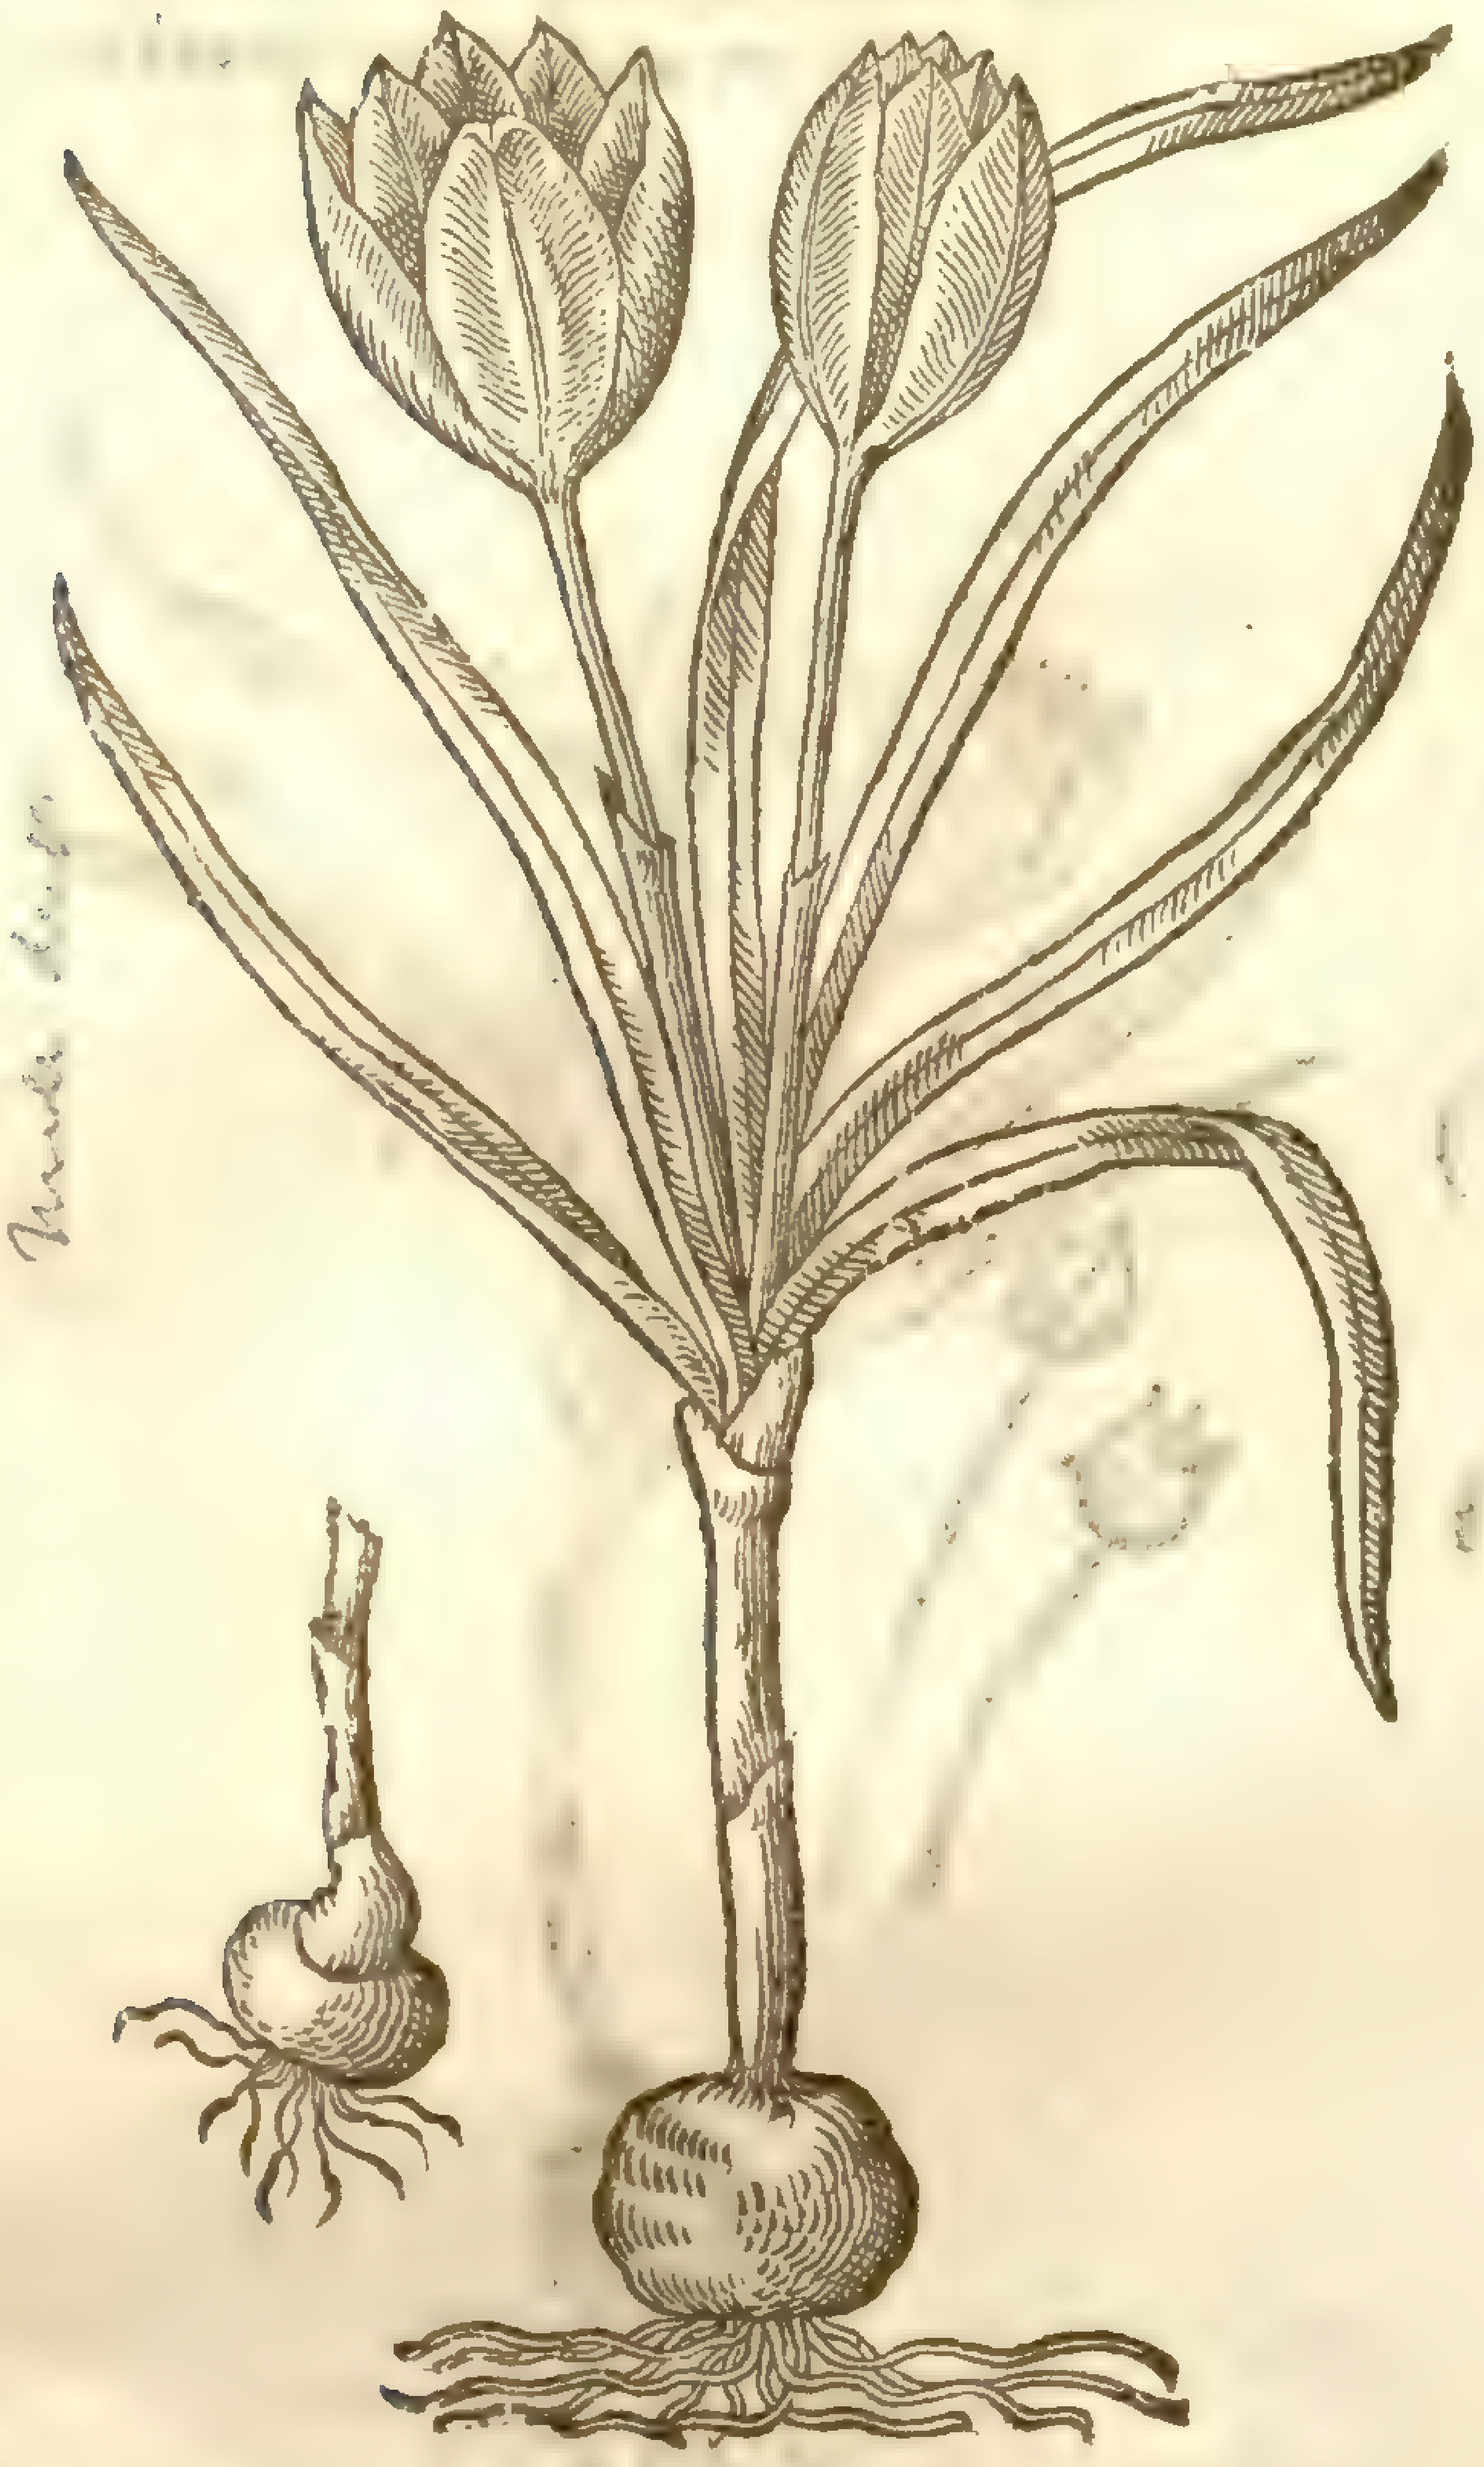
¶ *The deſcription of wilde Saffron.*

1 THe firſt kind of wilde Saffron hath ſmall ſhort graſſie leaues, furrowed or channelled downe the midſt with a white line or ſtreak: among the leaues riſe vp ſmall floures in ſhape like vnto the common Saffron, but differing in color; for this hath floures of mixt colors; that is to ſay, the ground of the floure is white, ſtripped vpon the backe with purple, and daſht ouer on the inſide with a bright ſhining murrey color; the other not. In the middle of the floures come forth many yellowiſh chiues, without any ſmell of Saffron at all. The root is ſmall, round, and couered with a browne skin or filme like vnto the roots of common Saffron.

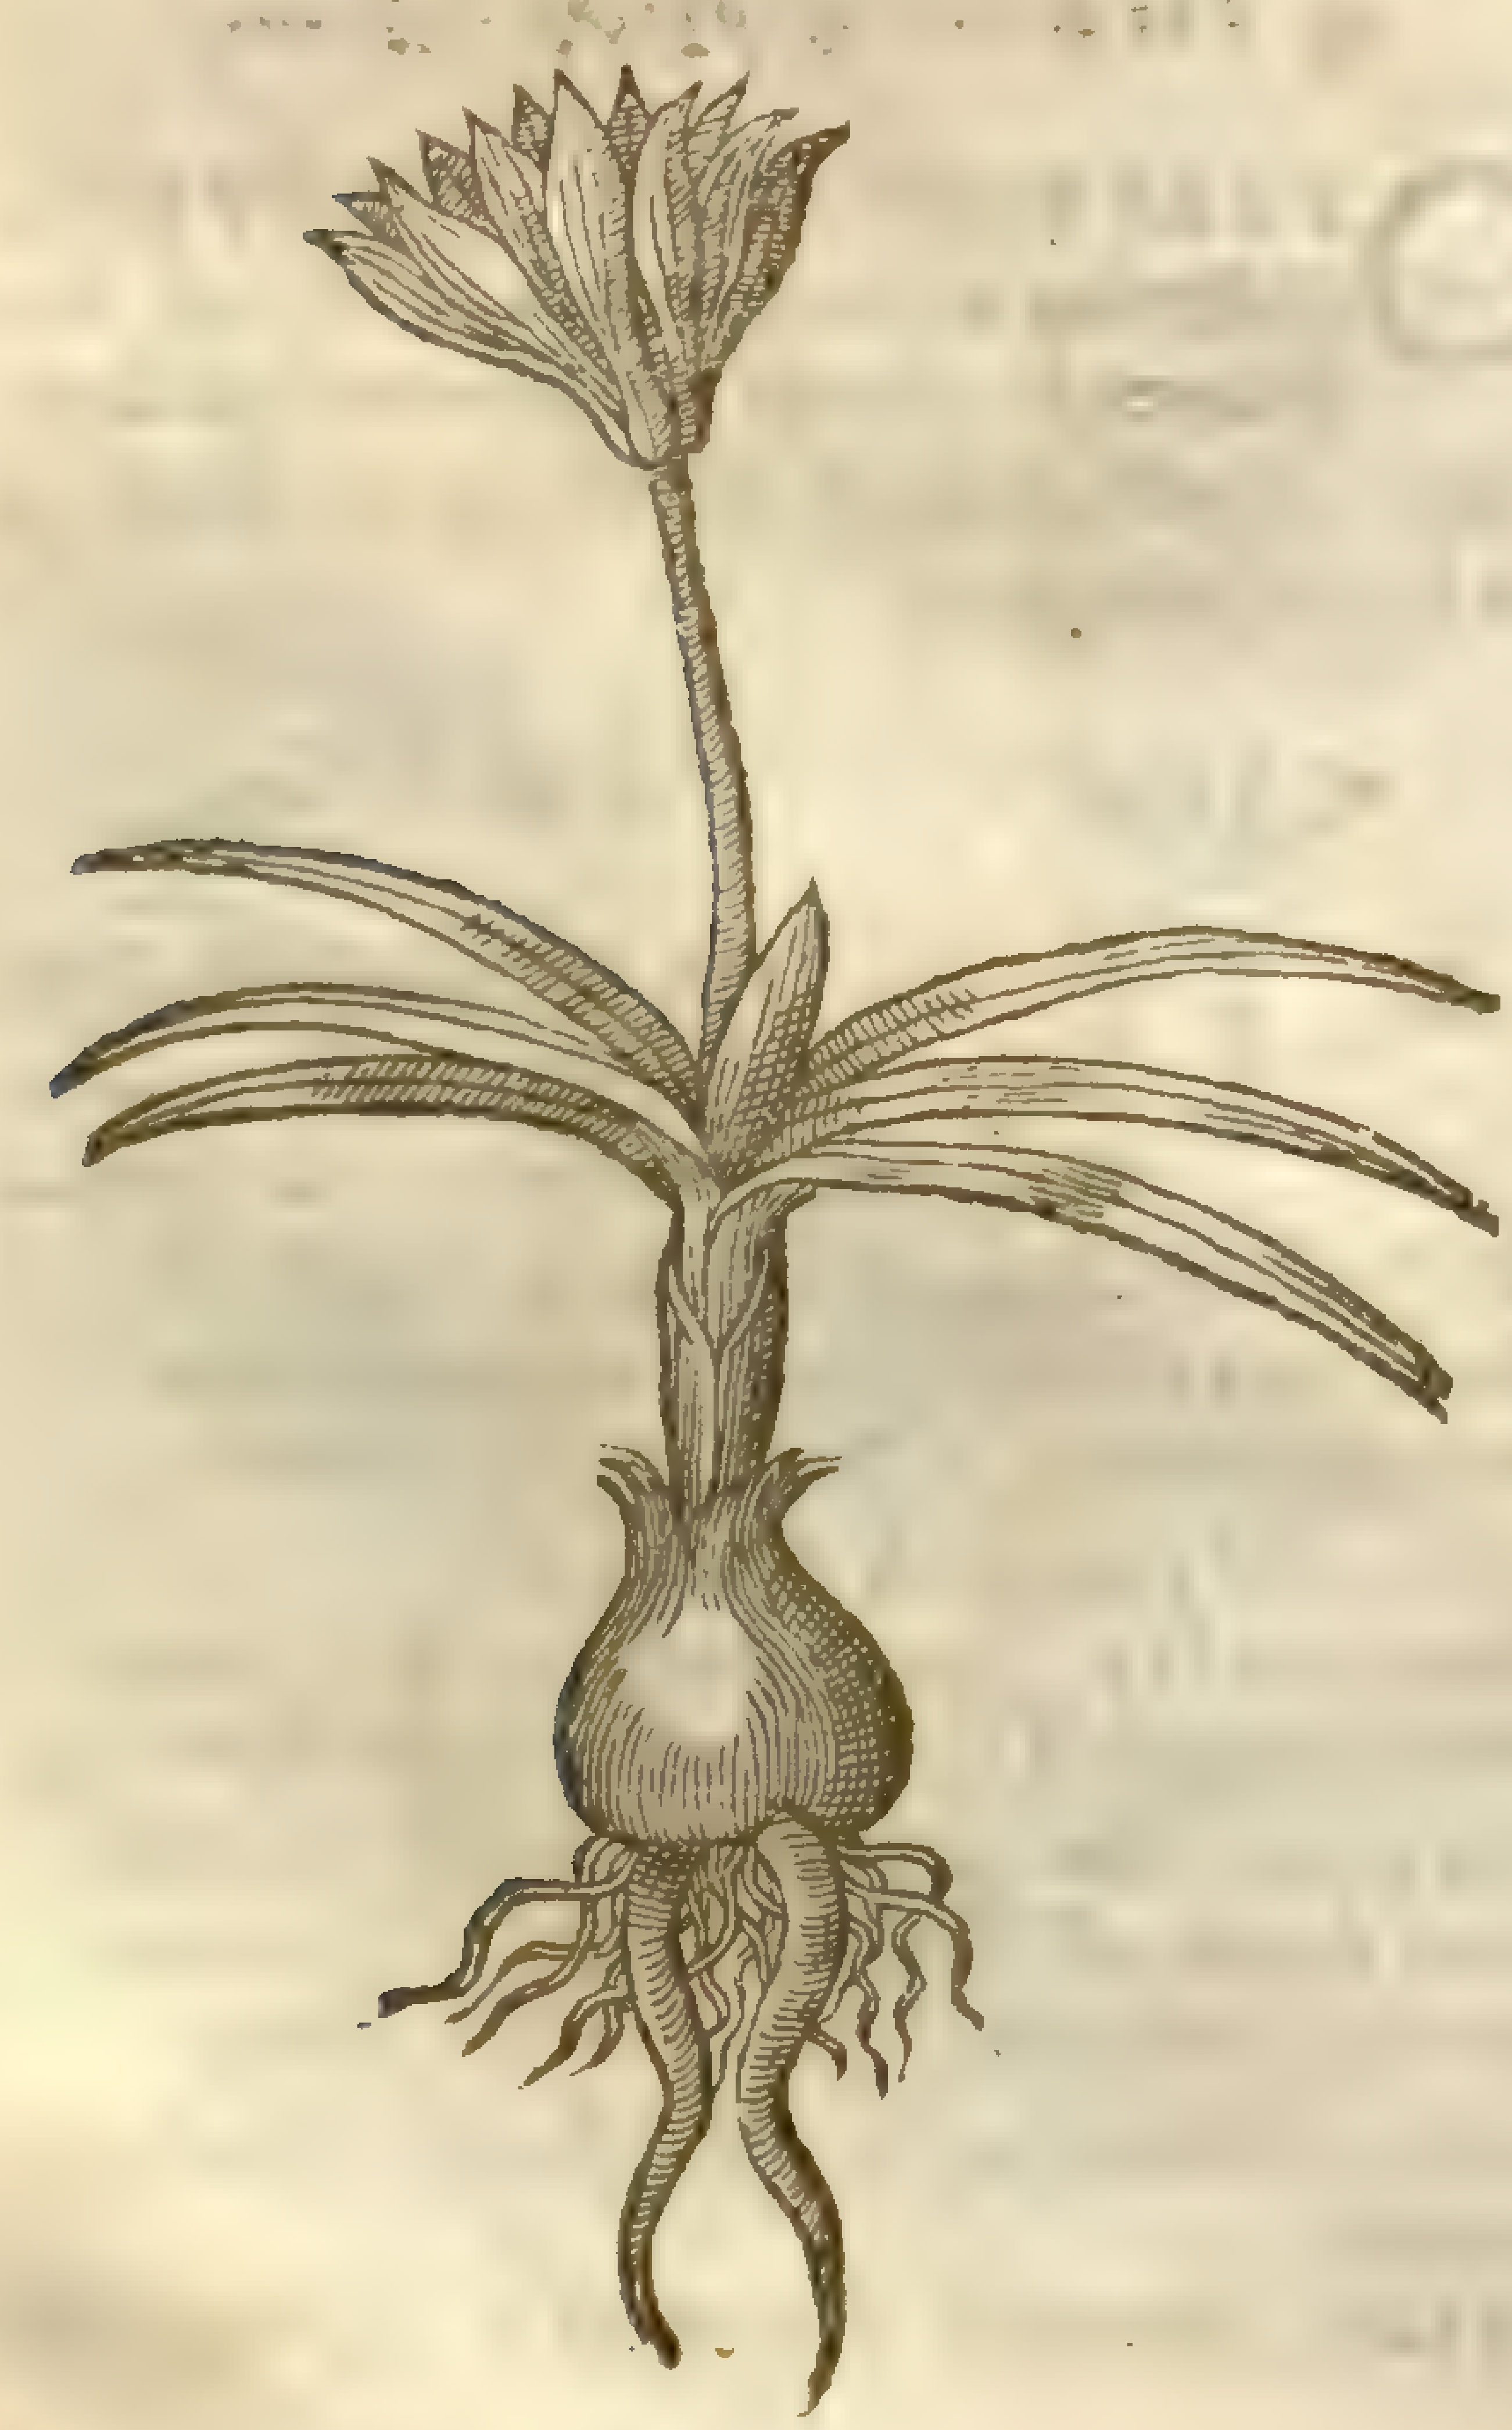
2 The ſecond wilde Saffron in leaues, roots, and floures is like vnto the precedent, but altogether leſſer, and the floures of this are of a purple violet colour.

3 We haue likewiſe in our London gardens another ſort, like vnto the other wilde Saffrons in

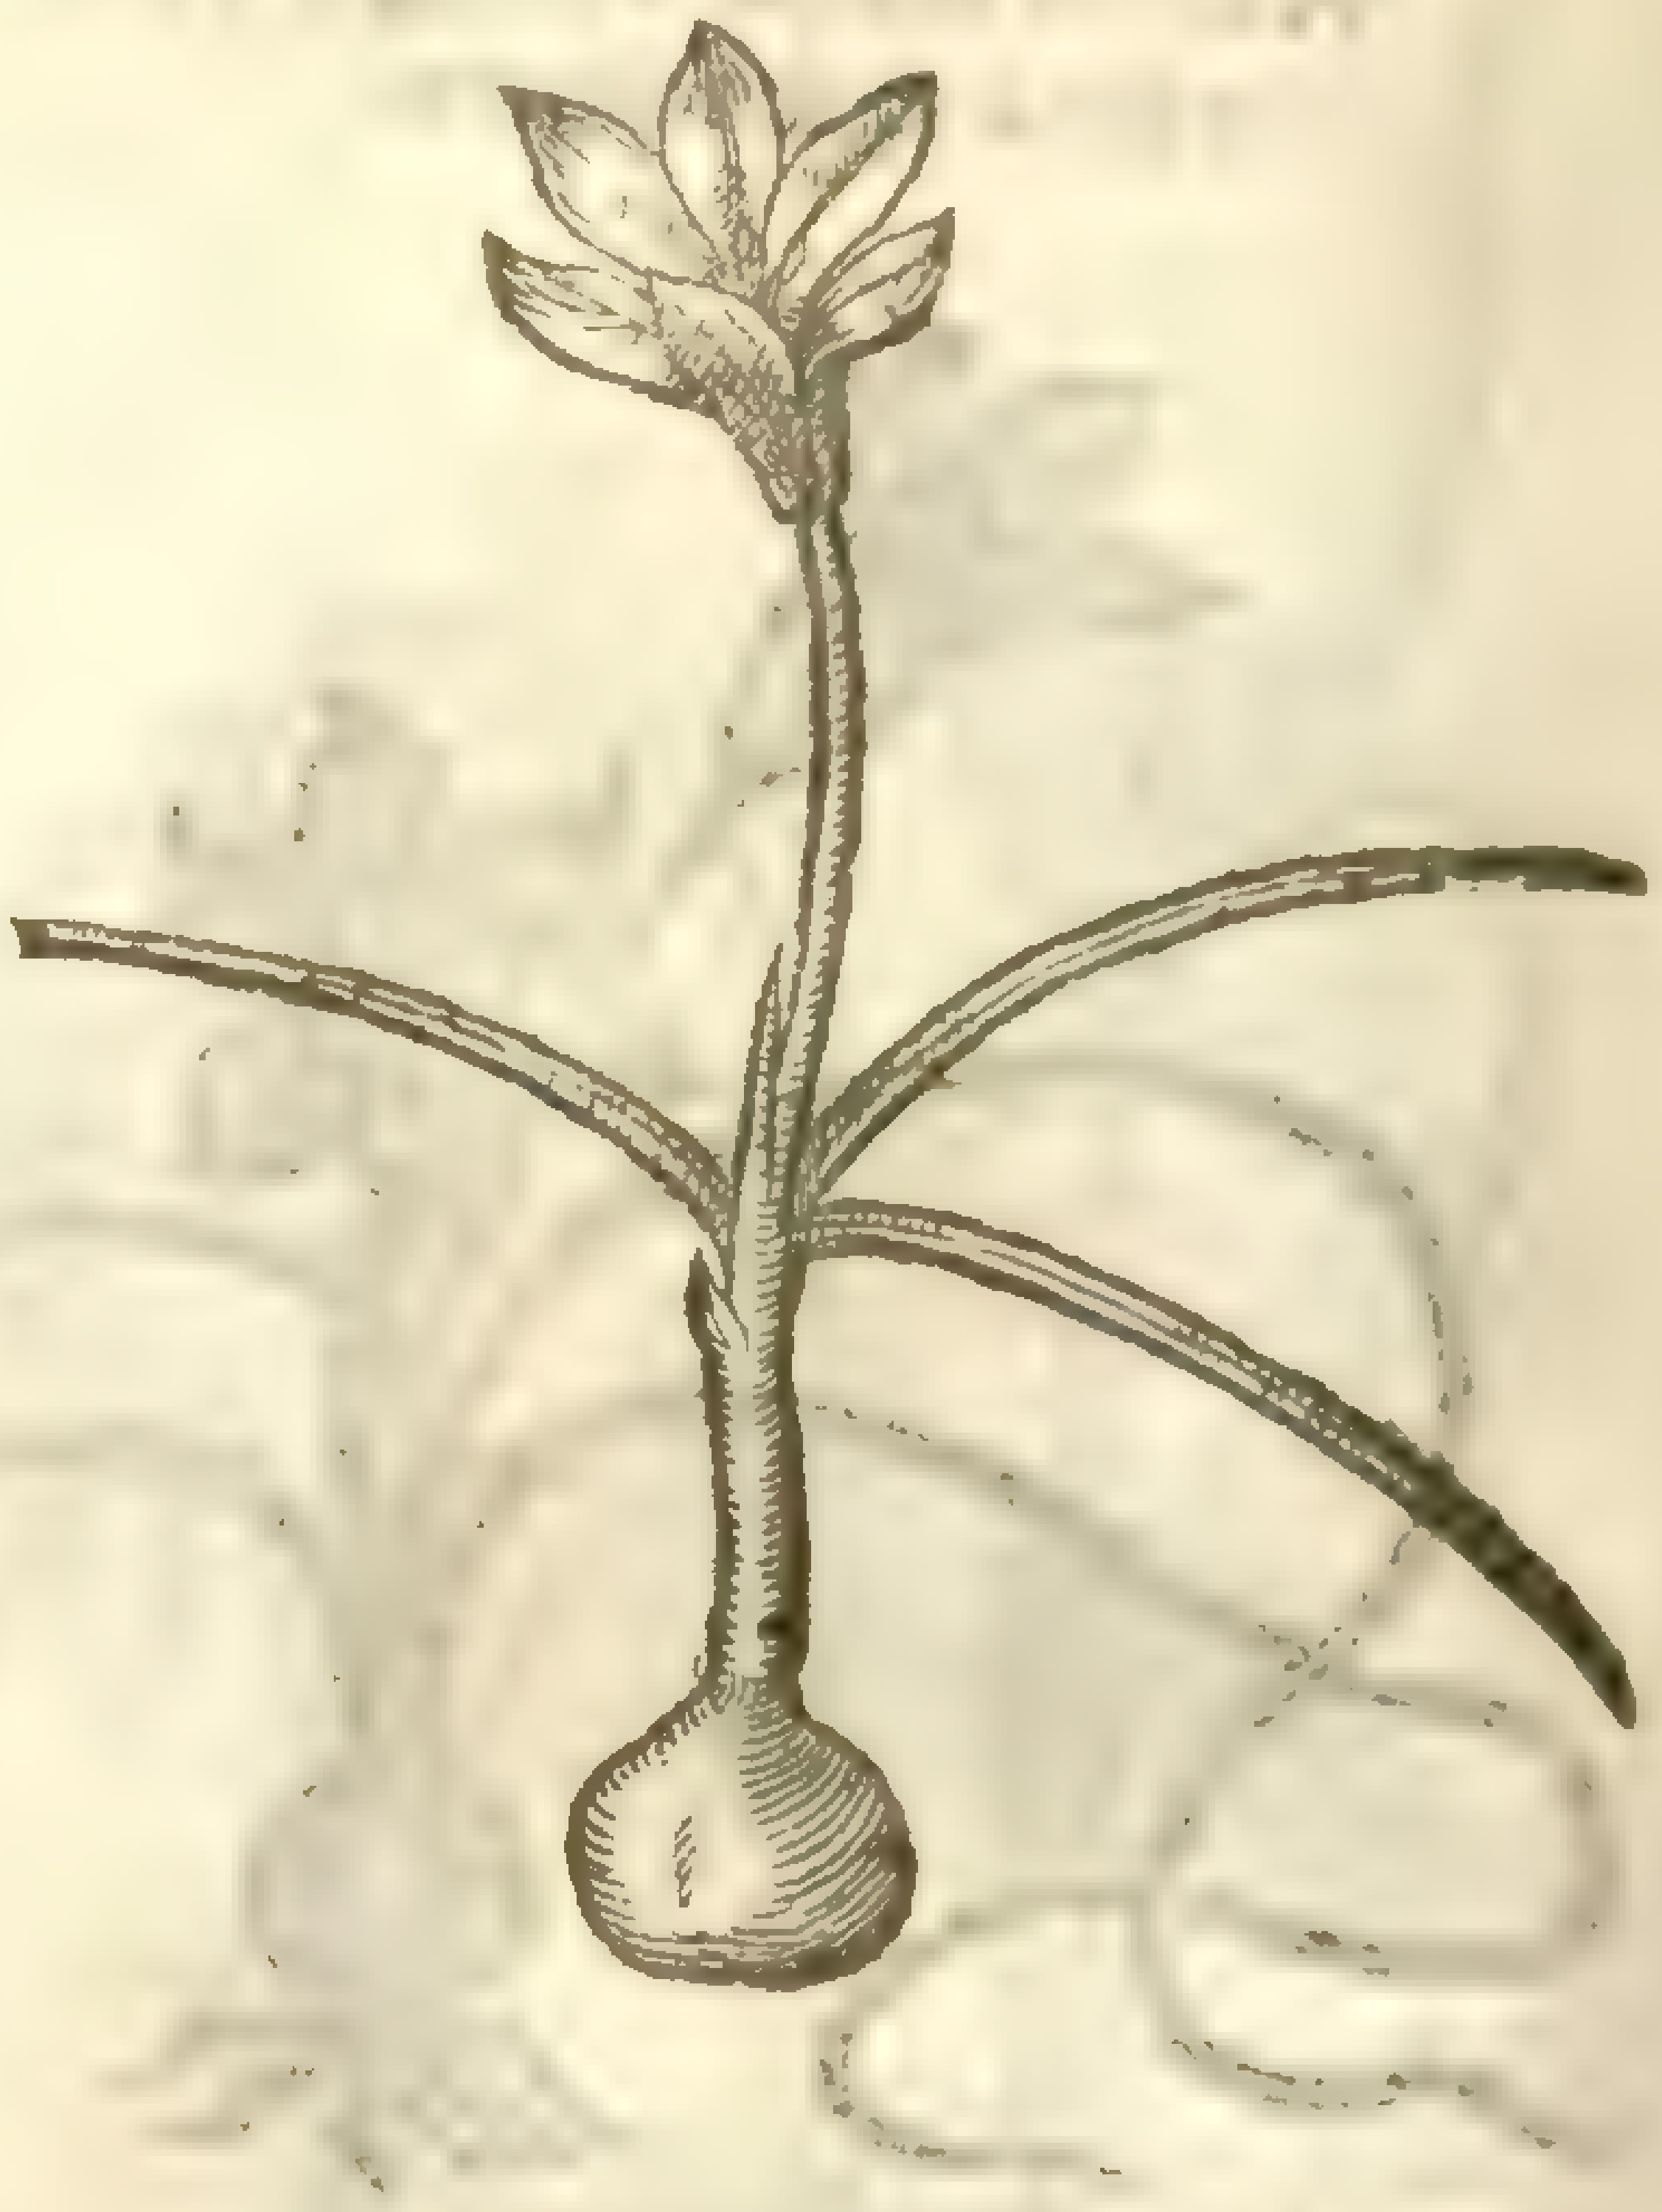
‡ 12 *Crocus vernus latifolius flore purpureo.*
Broad leaued Spring Saffron with the purple floure.



‡ 14 *Crocus vernus latifolius flore flavo-vario duplici.*
Broad leaued Spring Saffron with a double floure yellow and ſtreaked.



‡ 13 *Crocus vernus flore cinereo ſtriato.*
Spring Saffron with an Aſh-coloured ſtreaked floure.



in euery point, ſauing that this hath floures of a moſt perfect ſhining yellow colour, ſeeming a far off to be a hot glowing cole of fire, which maketh the difference.

4 There is found among Herbariſts another ſort, not differing from the others, ſauing that this hath white floures, contrary to all the reſt.

5 Louers of plants haue gotten into their gardens one ſort hereof with purple or Violet coloured flours, in other reſpects like vnto the former.

6 Of theſe we haue another that floureth in the fall of the leafe, with floures like to the common Saffron, but deſtitute of thoſe chiues which yeeld the colour, ſmell, or taſte that the right manured Saffron hath.

‡ 7 And of this laſt kinde there is another with broader leaues, and the floure is alſo larger, with the leaues thereof not ſo ſharpe pointed, but more round; the colour being at the firſt whitiſh, but afterward intermixt with ſome blewneſſe. ‡

8 There is alſo another of Autumne wild Saffrons with white floures, which ſets forth the diſtinction.

Many ſorts there are in our gardens beſides thoſe before ſpecified, which I thought needleſſe to intreat of, becauſe their vſe is not great ‡ Therefore I will onely giue the figures and names of ſome of the chiefe of them, and refer ſuch as delight to ſee or pleaſe themſelues with the varieties (for they are no ſpecifique differences) of theſe plants, to the gardens and the bookes of Floriſts, who are onely the preſeruers and admirers of theſe varieties, not ſought after for any vſe but delight. ‡

¶ The

¶ *The Place.*

All theſe wilde Saffrons we haue growing in our London gardens. Thoſe which doe floure in Autumne do grow vpon certaine craggy rocks in Portugall, not farre from the ſea ſide. The other haue been ſent ouer vnto vs, ſome out of Italy, and ſome out of Spaine, by the labour and diligence of that notable learned Herbariſt *Carolus Cluſius*; out of whoſe Obſeruations, and partly by ſeeing them in our owne gardens, we haue ſet downe their deſcription.

That pleaſant plant that bringeth forth yellow floures was ſent vnto me from *Robinus* of Paris, that painfull and moſt curious ſearcher of Simples.

¶ *The Time.*

They floure for the moſt part in Ianuarie and Februarie; that of the mountain excepted, which floureth in September.

¶ *The Names.*

All theſe Saffrons are vnprofitable, and therefore they be truly ſaid to be *Croci ſylveſtres*, or wild Saffrons: in Engliſh, Spring Saffrons, and vernall Saffrons.

¶ *The Nature and Vertues.*

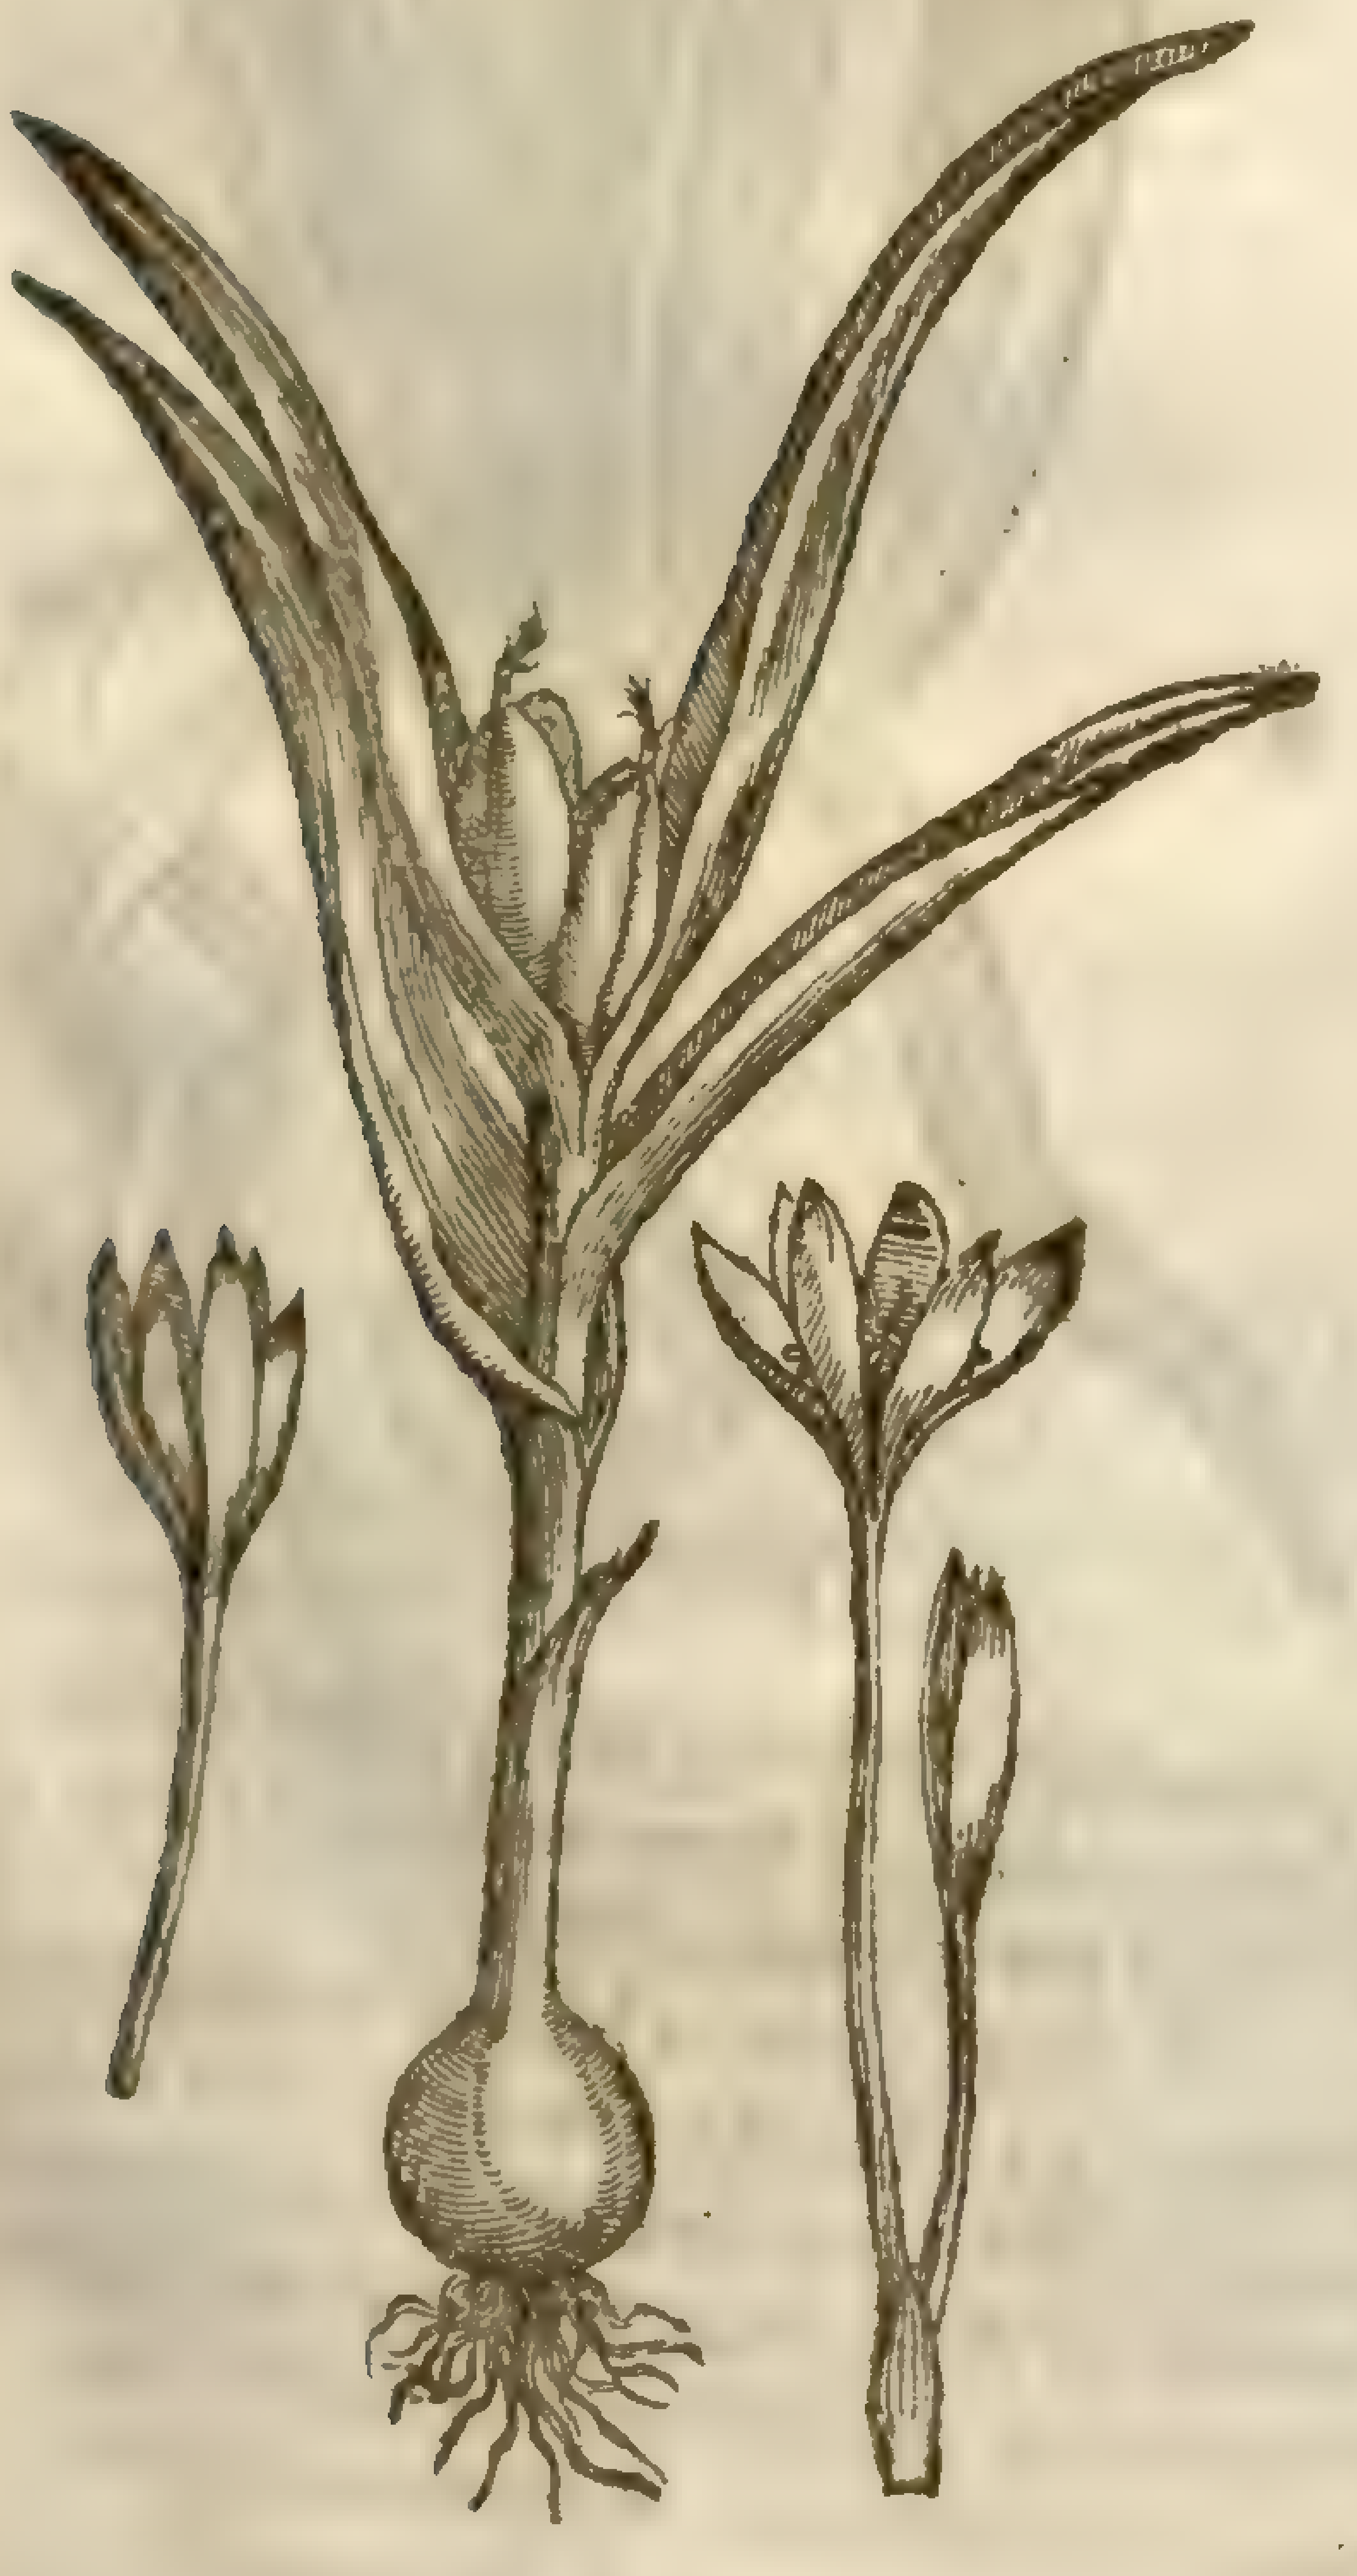
Of the faculties of theſe we haue nothing to ſet downe, for that as yet there is no knowne vſe of them in Phyſicke.

Chap. 91. *Of Medow Saffron.*

¶ *The Kindes.*

There be ſundry ſorts of medow Saffrons, differing very notably as well in the colour of their floures, as alſo in nature and country from whence they had their being, as ſhall be declared.

1 *Colchicum Anglicum purpureum.*
Purple Engliſh Medow Saffron.

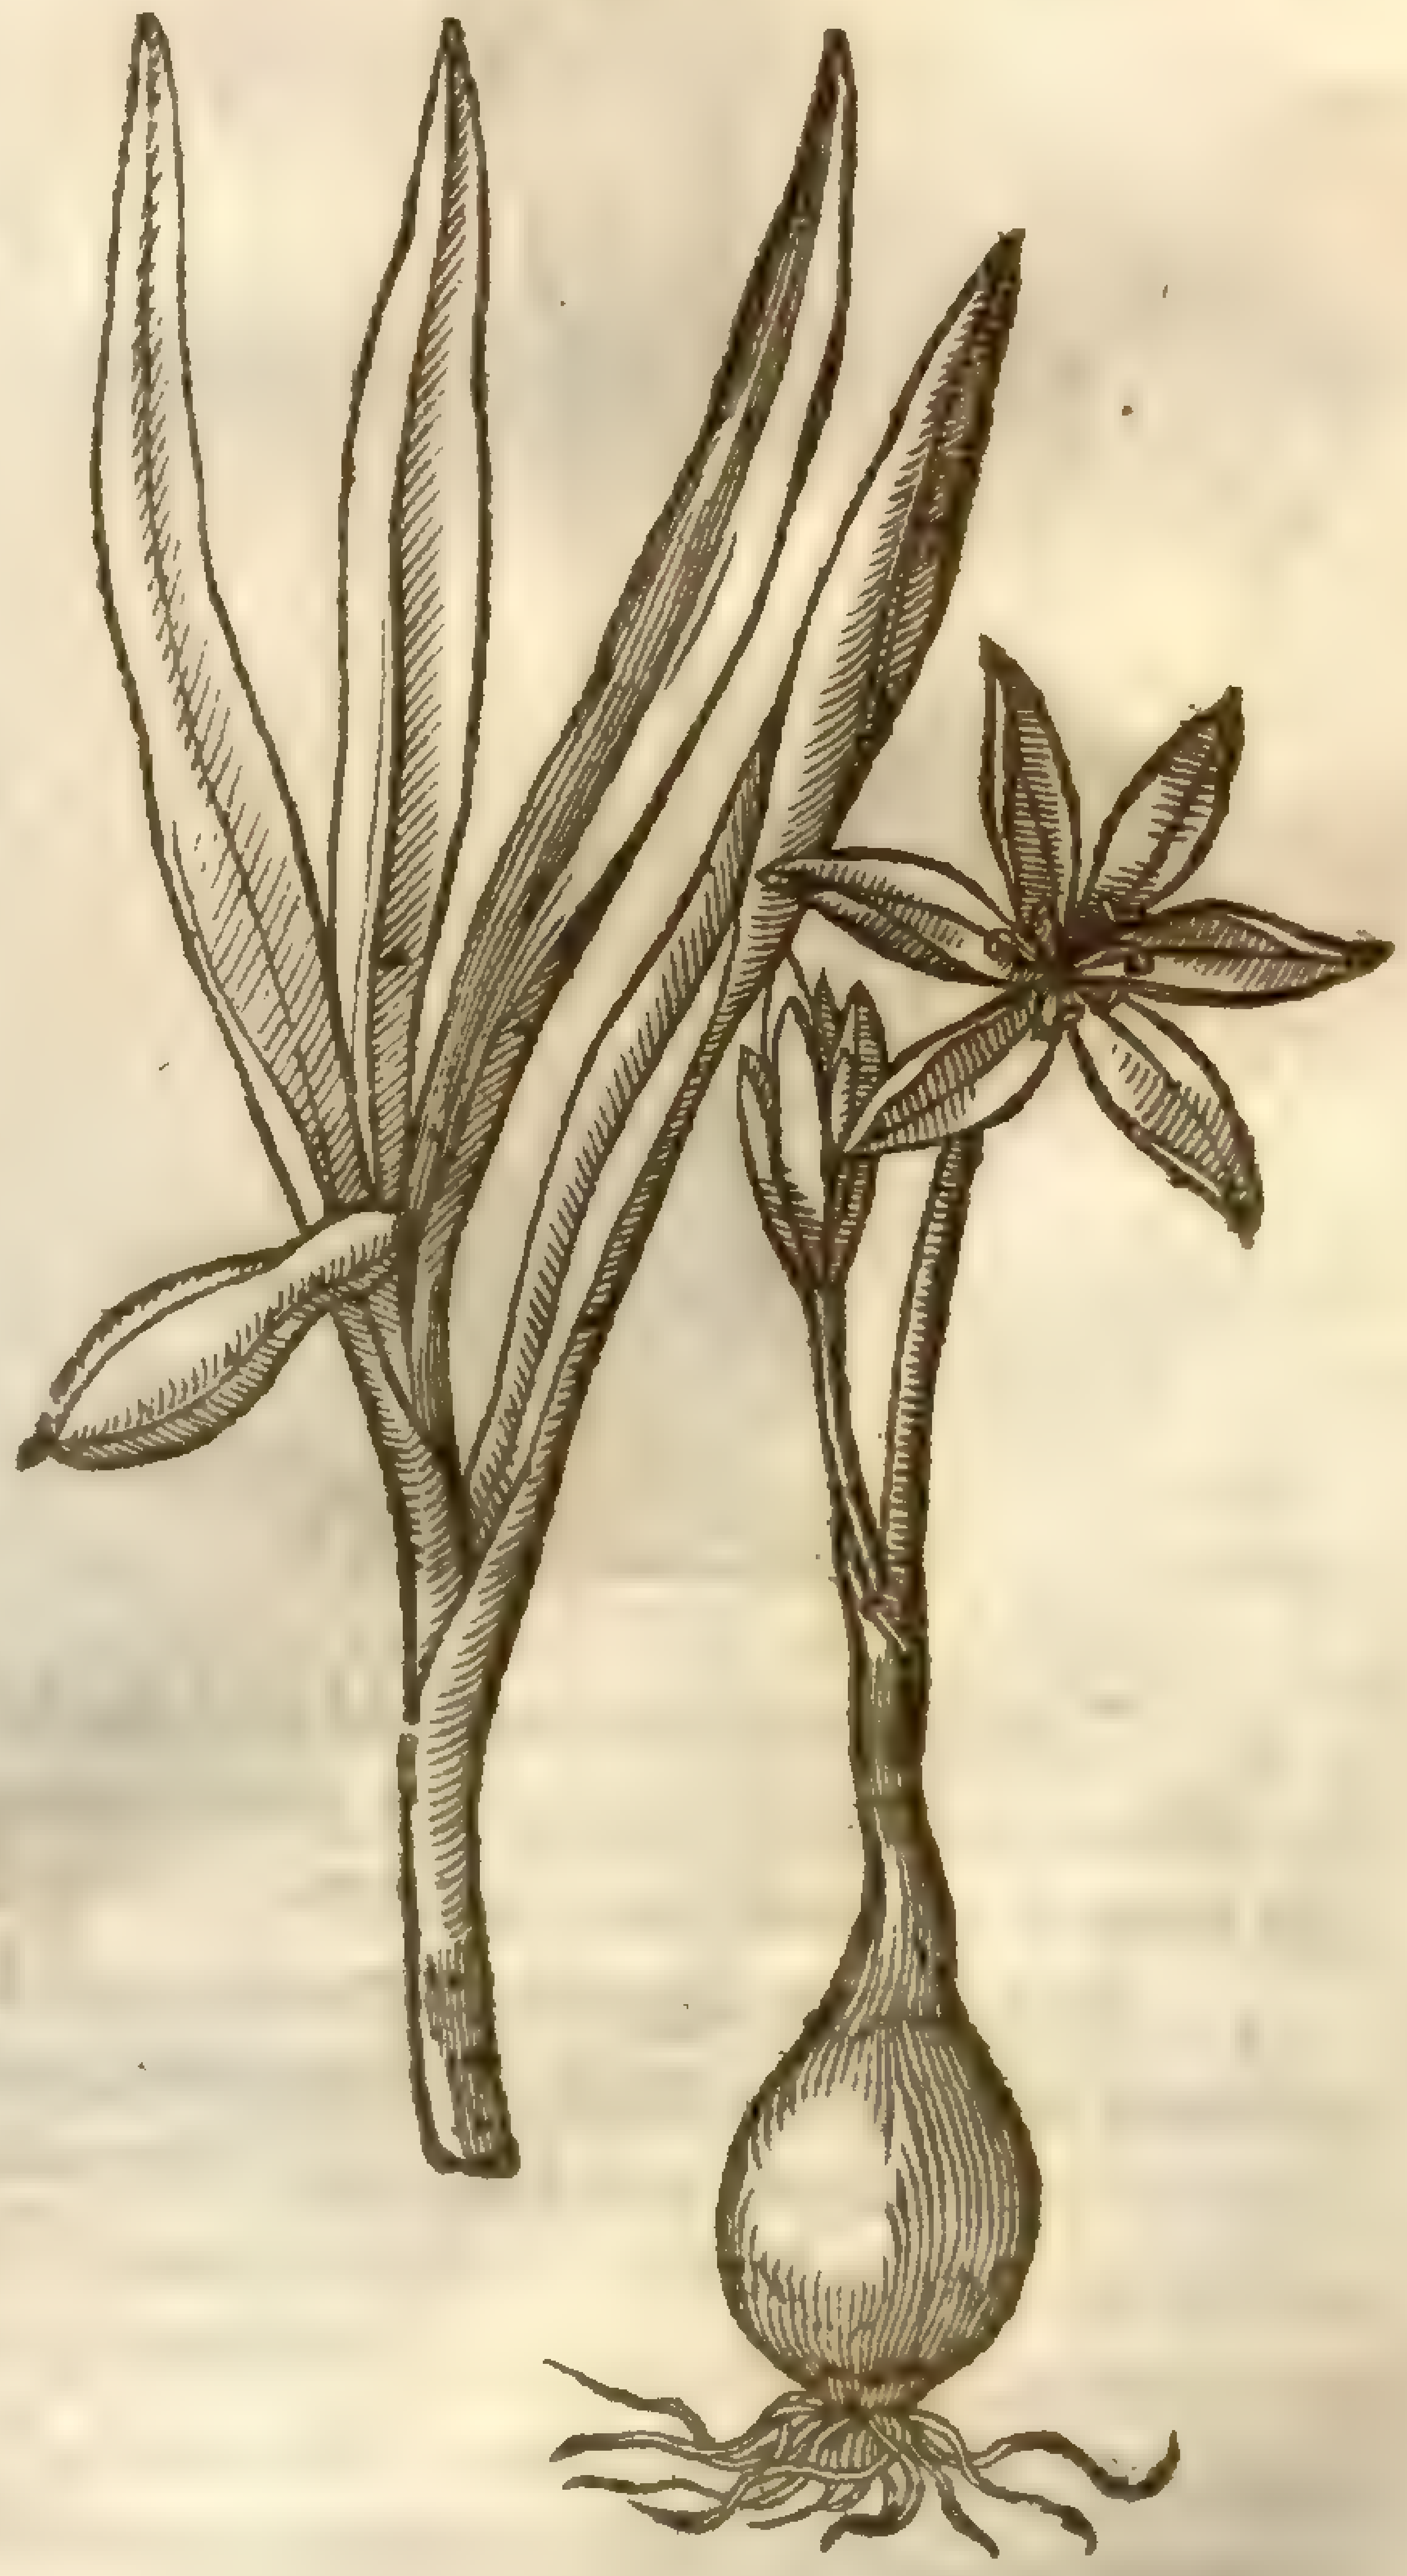


C. autumnale, L.

[illegible]

Sm. [illegible] 2. 202

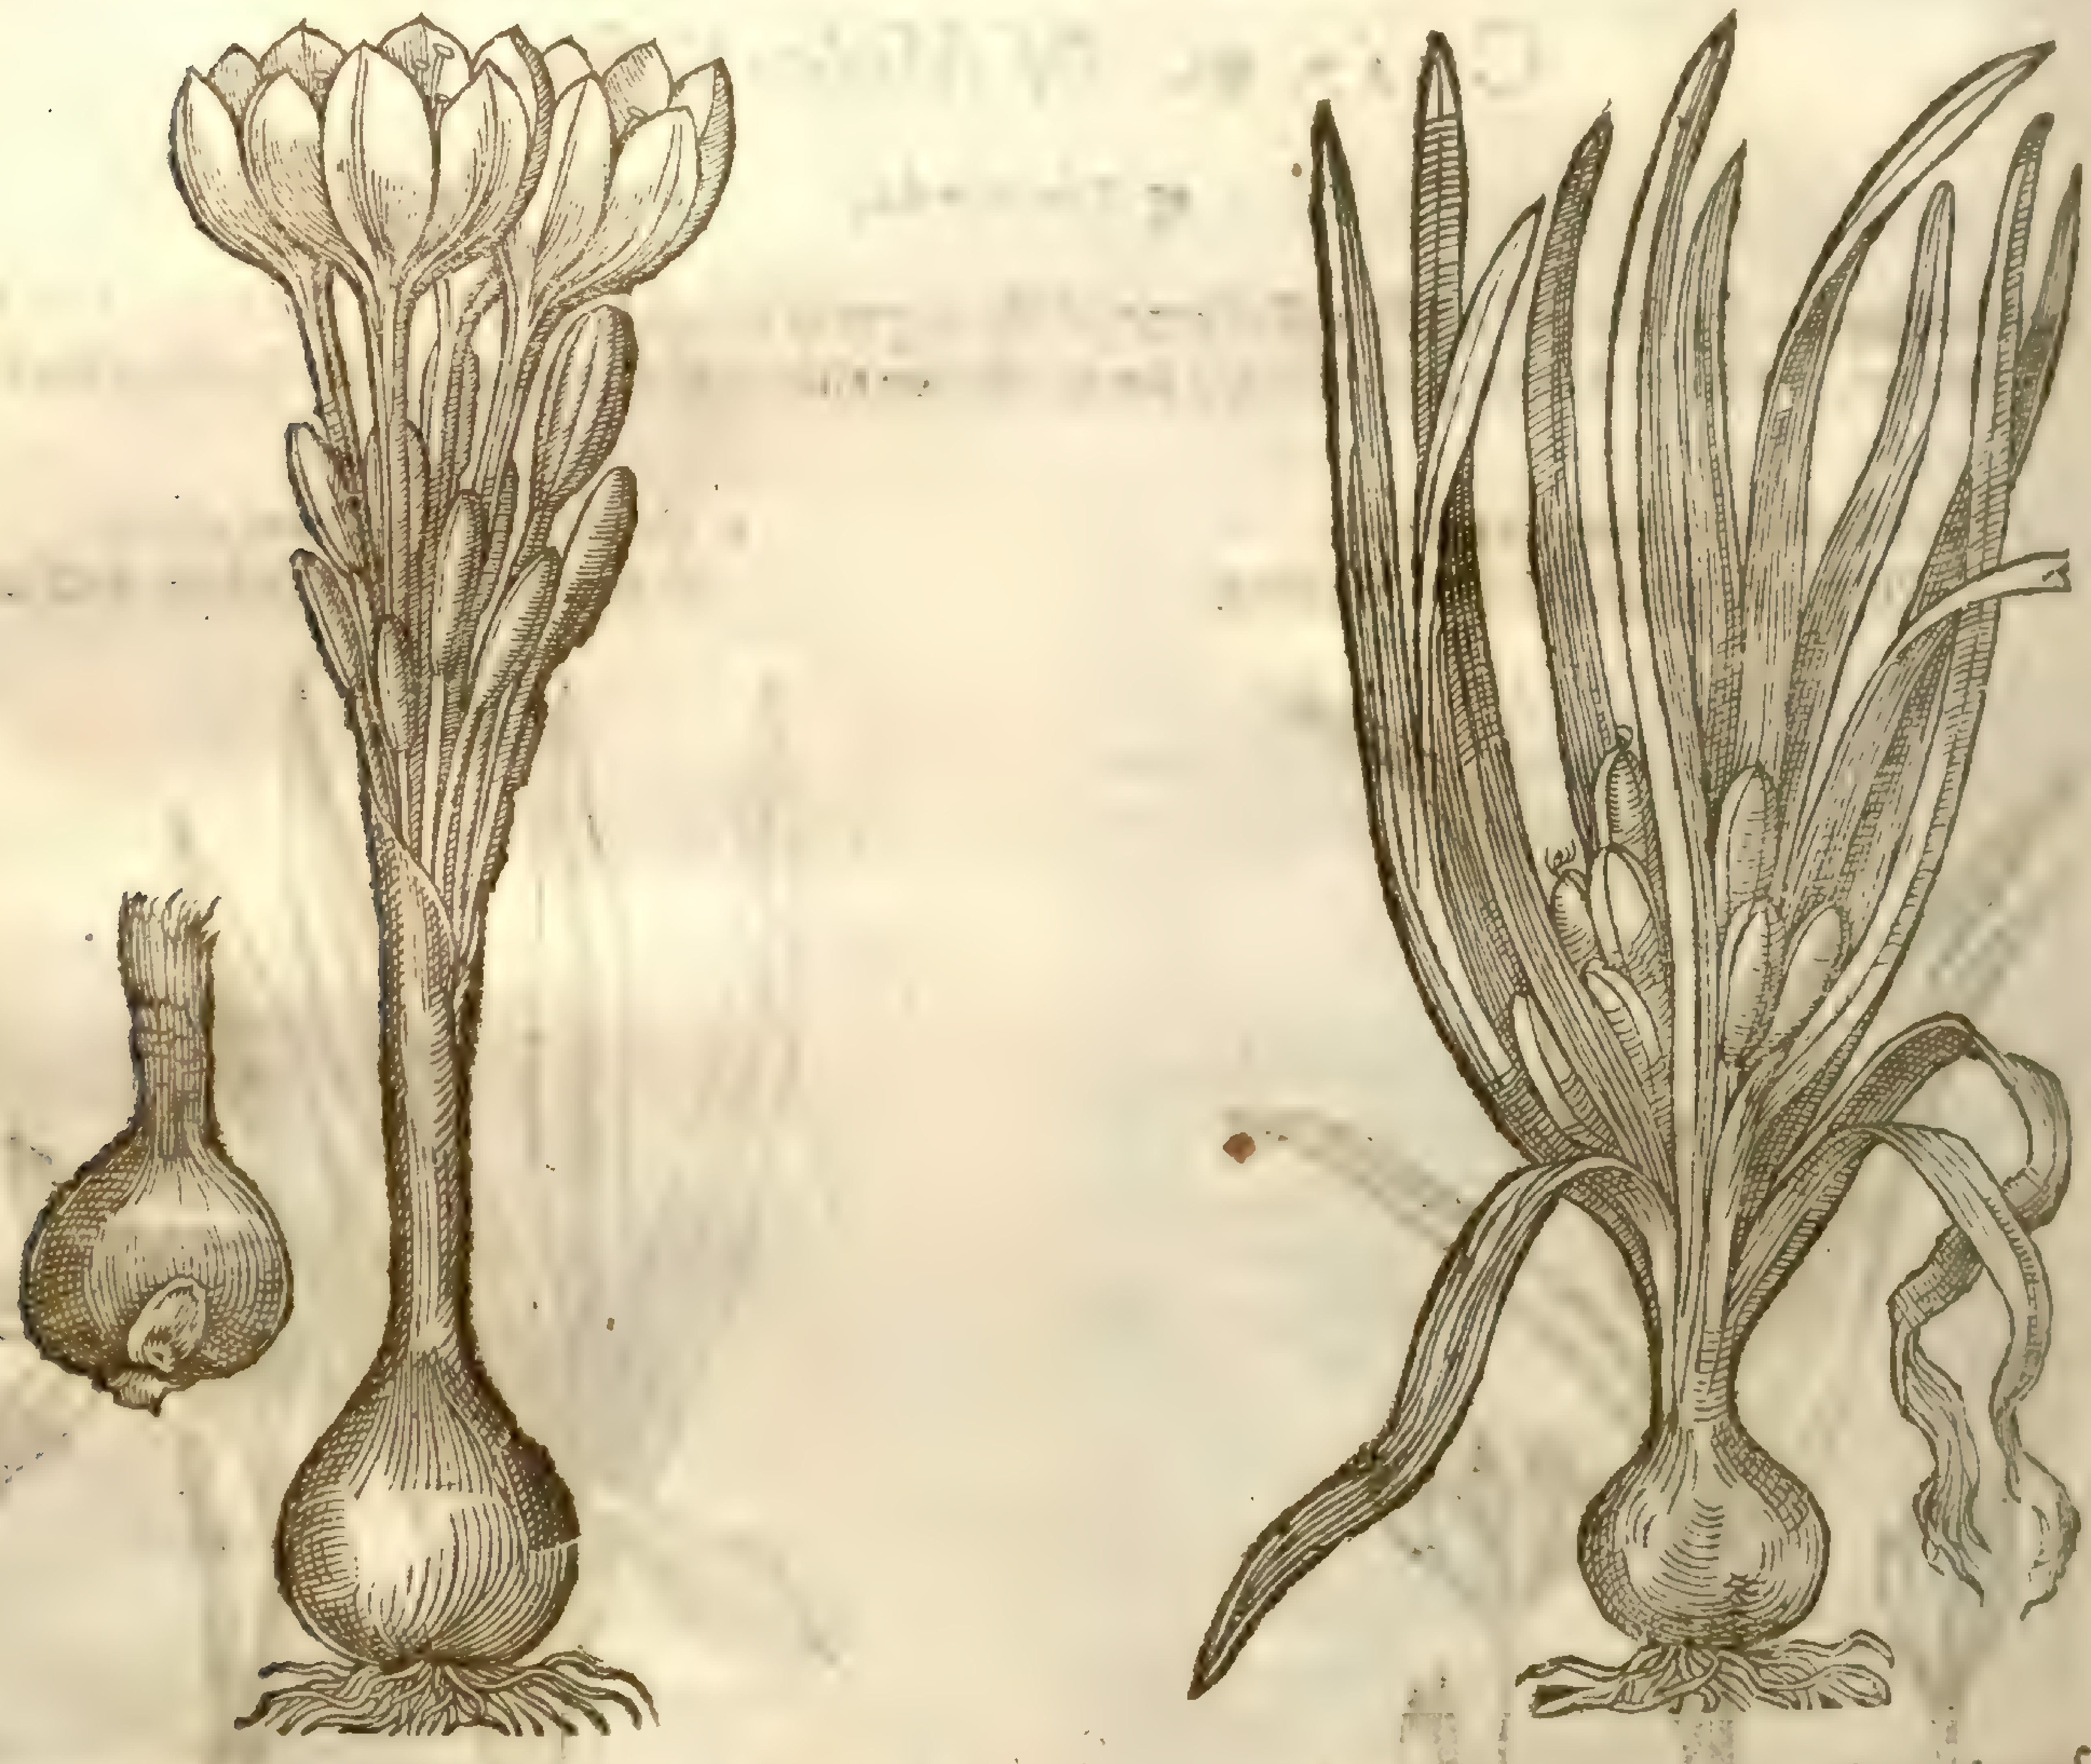
2 *Colchicum Anglicum album.*
White Engliſh Medow Saffron.



¶ *The Deſcription.*

1 MEdow Saffron hath three or foure leaues riſing immediately forth of the ground, long, broad, ſmooth, fat, much like to the leaues of the white Lillie in forme and ſmoothneſſe: in the middle whereof ſpring vp three or foure thicke cods of the bigneſſe of a ſmall Wall-nut, ſtanding vpon ſhort tender foot-ſtalkes, three ſquare, and opening themſelues when they be ripe, full of ſeed ſomething round, and of a blackiſh red colour: and when this ſeed is ripe, the leaues together with the ſtalkes doe fade and fall away. In September the floures bud forth, before any leaues appeare, ſtanding vpon ſhort tender and whitiſh ſtemmes, like in forme and colour to the floures of Saffron, hauing in the middle ſmall chiues or threds of a pale yellow colour, altogether vnfit for meat or medicine. The root is round or bulbous, ſharper at the one end than at the other, flat on the one ſide, hauing a deepe clift or furrow in the ſame flat ſide when it floureth, and not at any time elſe: it is couered with blackiſh coats or filmes: it ſendeth downe vnto the loweſt part certaine ſtrings or threds. The root it ſelfe is full of a white ſubſtance, yeelding a juyce like milke, whileſt it is greene and newly digged out of the earth. It is in taſte ſweet, with a little bitterneſſe following, which draweth water out of the mouth.

3 *Colchicum Pannonicum florens & ſine flore.*
Hungary Mede Saffron with and without floure.



2 The ſecond kinde of Mede Saffron is like the precedent, differing onely in the colour of the floures, for that this plant doth bring forth white leaues, which of ſome hath beene taken for the true *Hermodactylus*; but in ſo doing they haue committed the greater error.

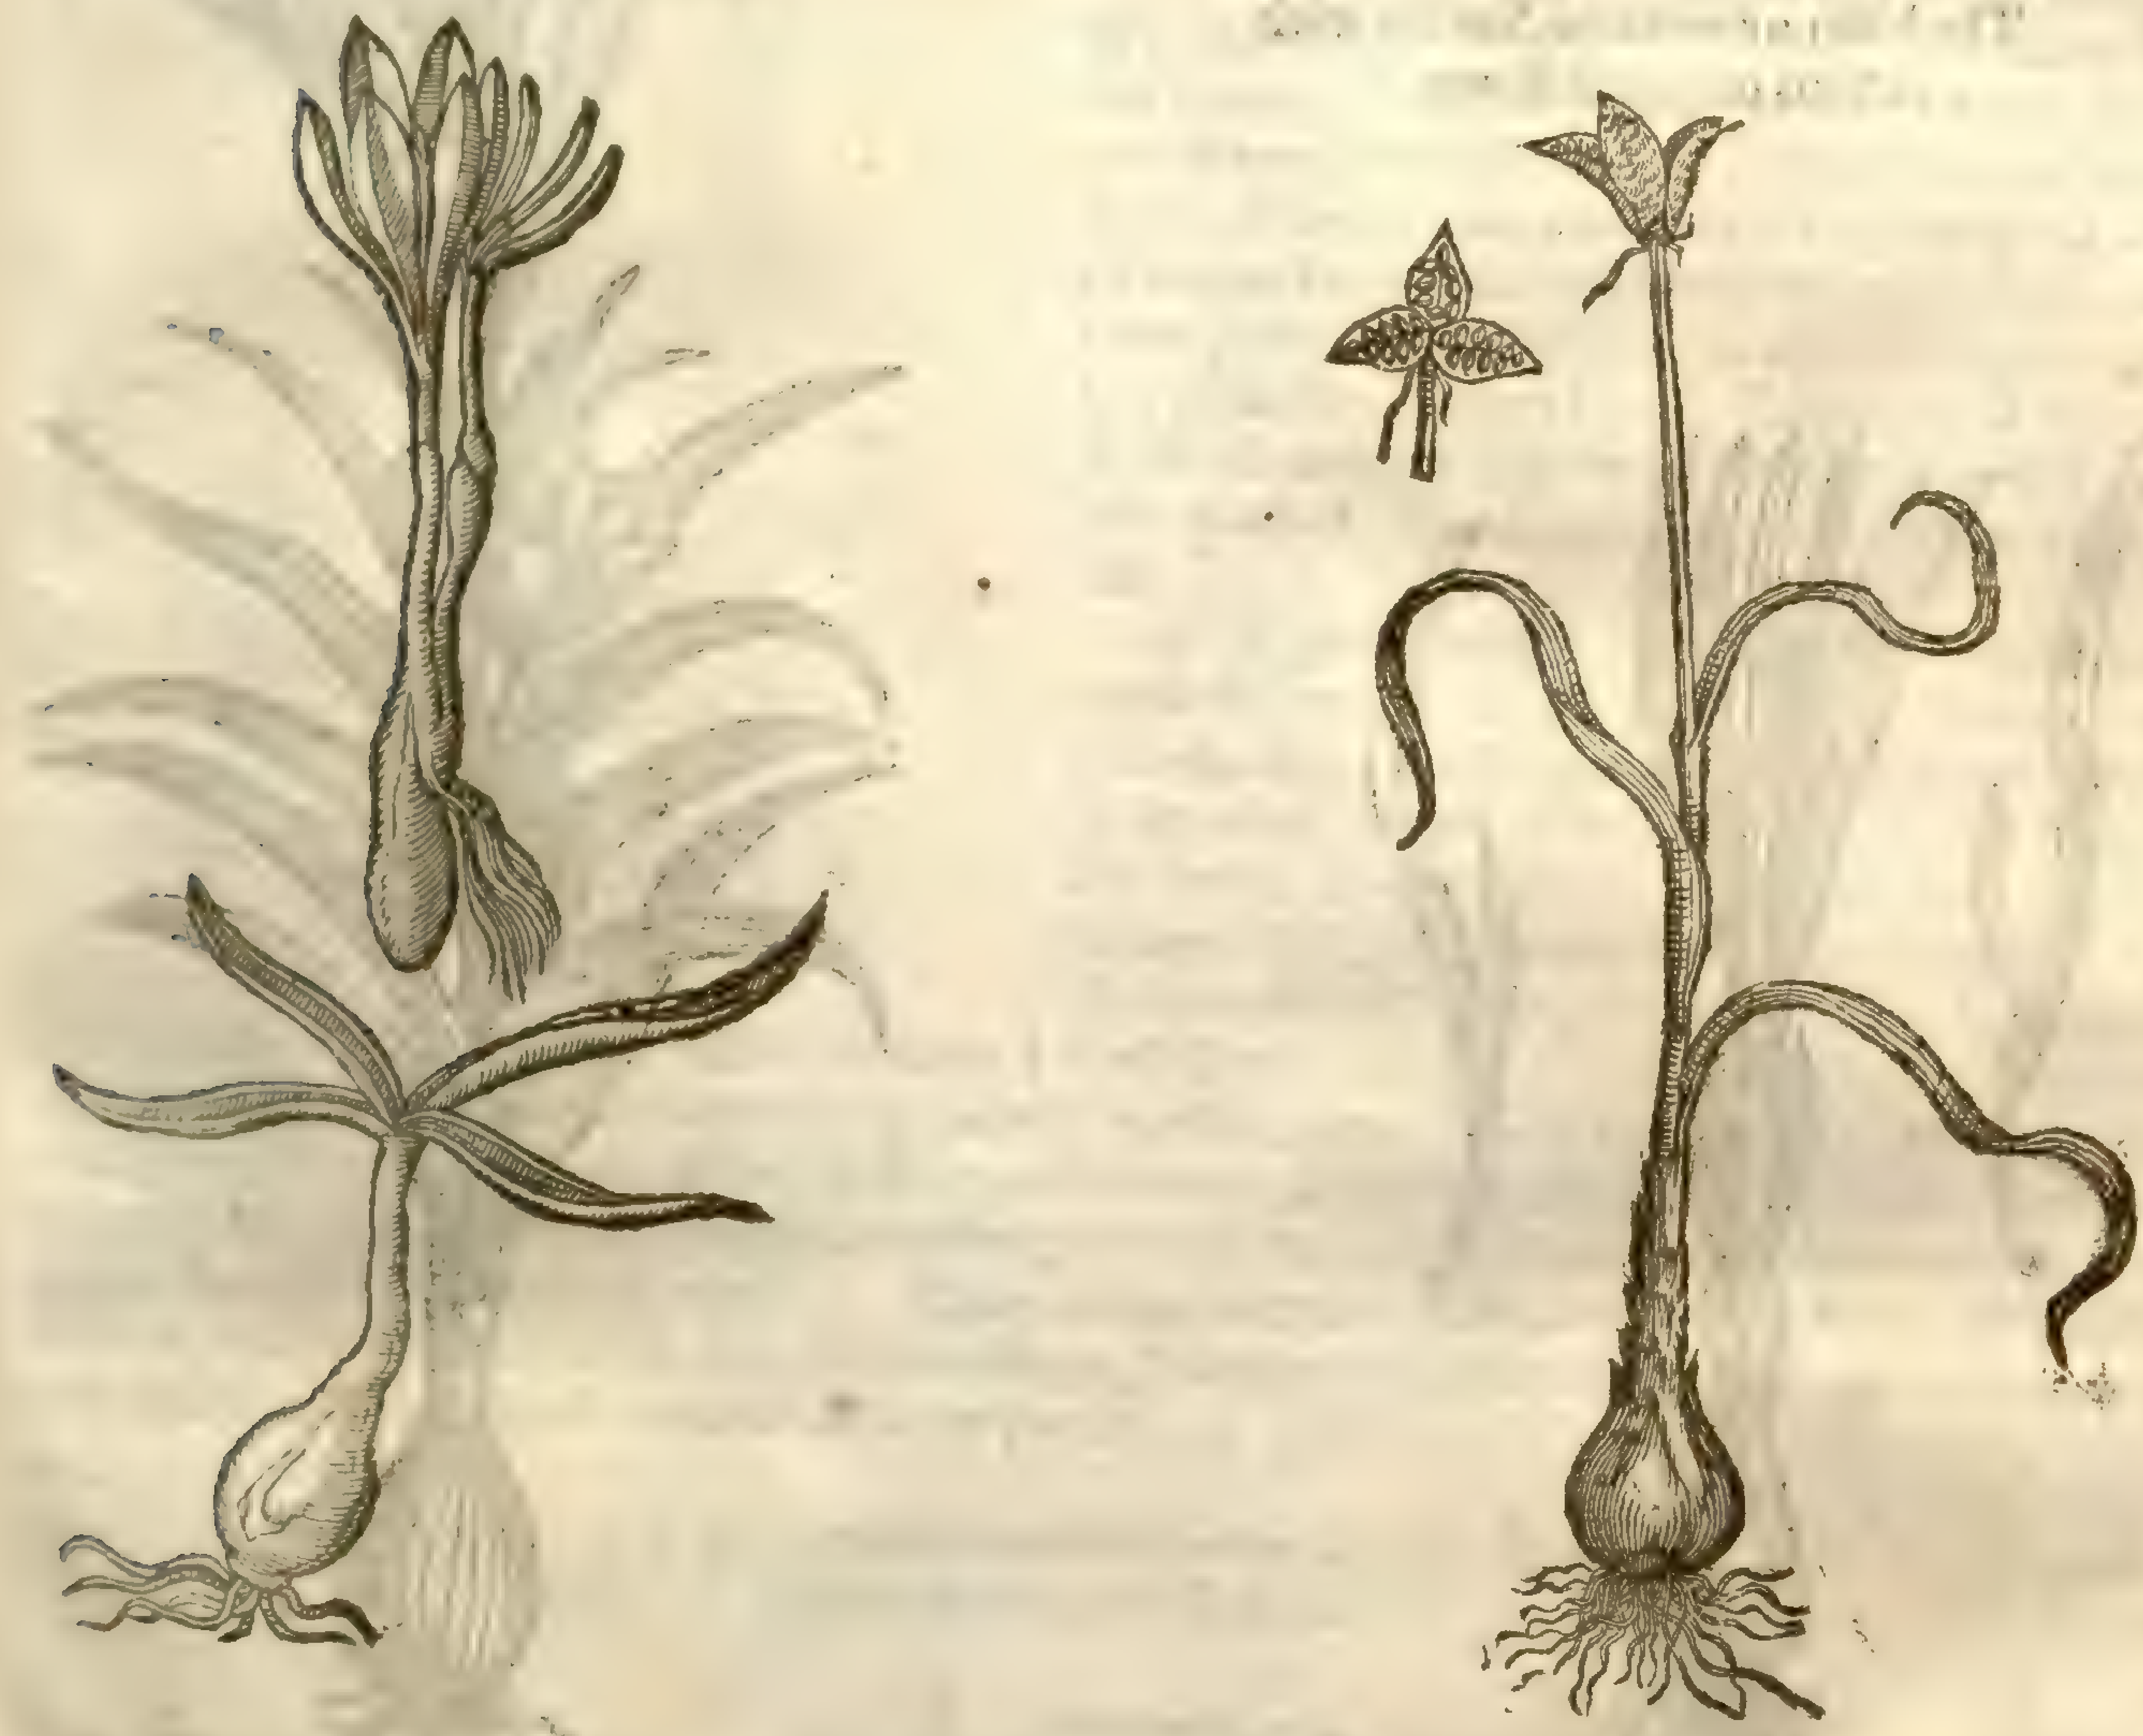
3 Theſe two figures expreſſe both but one and the ſelfe ſame plant, which is diſtinguiſhed becauſe it neuer beareth floures and leaues both at one time. So that the firſt figure ſets it forth when it is in leaues and ſeed, and the other when it floureth; and therefore one deſcription ſhall ſuffice for them both. In the Spring of the yeare it bringeth forth his leaues, thicke, fat, ſhining, and ſmooth, not vnlike the leaues of Lillies, which doe continue greene vnto the end of Iune; at which time the leaues do wither away, but in the beginning of September there ſhooteth forth of the ground naked milke white floures without any greene leafe at all: but ſo ſoone as the Plant hath done bearing of floures, the root remaines in the ground, not ſending forth any thing vntill Februarie in the yeare following.

‡ It beares plentifull ſtore of reddiſh ſeed in looſe triangular heads. The root hereof is bigger than that of the laſt deſcribed. ‡

† 4 The ſmall Medow Saffron hath three or foure thicke fat leaues narrower than any of the reſt. The floure appeareth in the fall of the leafe, in ſhape, colour and manner of growing like the common mede Saffron, but of a more reddiſh purple colour, and altogether leſſer. The leaues in this, contrary to the nature of theſe plants, preſently follow after the floure, and ſo continue all the Winter and Spring, euen vntill May or Iune. The root is bulbous and not great; it is couered with many blackiſh red coats, and is white within.

‡ 5 This medow Saffron hath roots and leaues like to thoſe of the laſt deſcribed, but the leaues of the floure are longer and narrower, and the colour of them is white on the inſide, greene on the middle of the backe part, and the reſt thereof a certaine fleſh colour.

4 *Colchicum montanum minus Hiſpanicum cum flore & ſemine.*
Small Spaniſh Medow Saffron in floure and ſeed.



6 The medow Saffron of Illyria hath a great thicke and bulbous root, full of ſubſtance: from which riſeth vp a fat, thicke, and groſſe ſtalke, ſet about from the lower part to the top by equall diſtances, with long, thicke and groſſe leaues, ſharpe pointed, not vnlike to the leaues of leekes; among which leaues do grow yellowiſh floures like vnto the Engliſh medow Saffron, but ſmaller.

7 The Aſſyrian medow Saffron hath a bulbous root, made as it were of two pieces; from the middle cleft whereof riſeth vp a ſoft and tender ſtalke ſet with faire broad leaues from the middle to the top: among which commeth forth one ſingle floure like vnto the common medow Saffron, or the white Anemone of *Matthiolus* deſcription.

8 The mountaine wilde Saffron, is a baſe and low plant, but in ſhape altogether like the common medow Saffron, but much leſſer. The floures are ſmaller, and of a yellow colour, which ſetteth forth the difference. ‡ The leaues and roots (as *Cluſius* affirmes) are more like to the Narciſſes; and therefore he calls this *Narciſſus autumnalis minor*, the leſſer Autumne Narciſſe. ‡

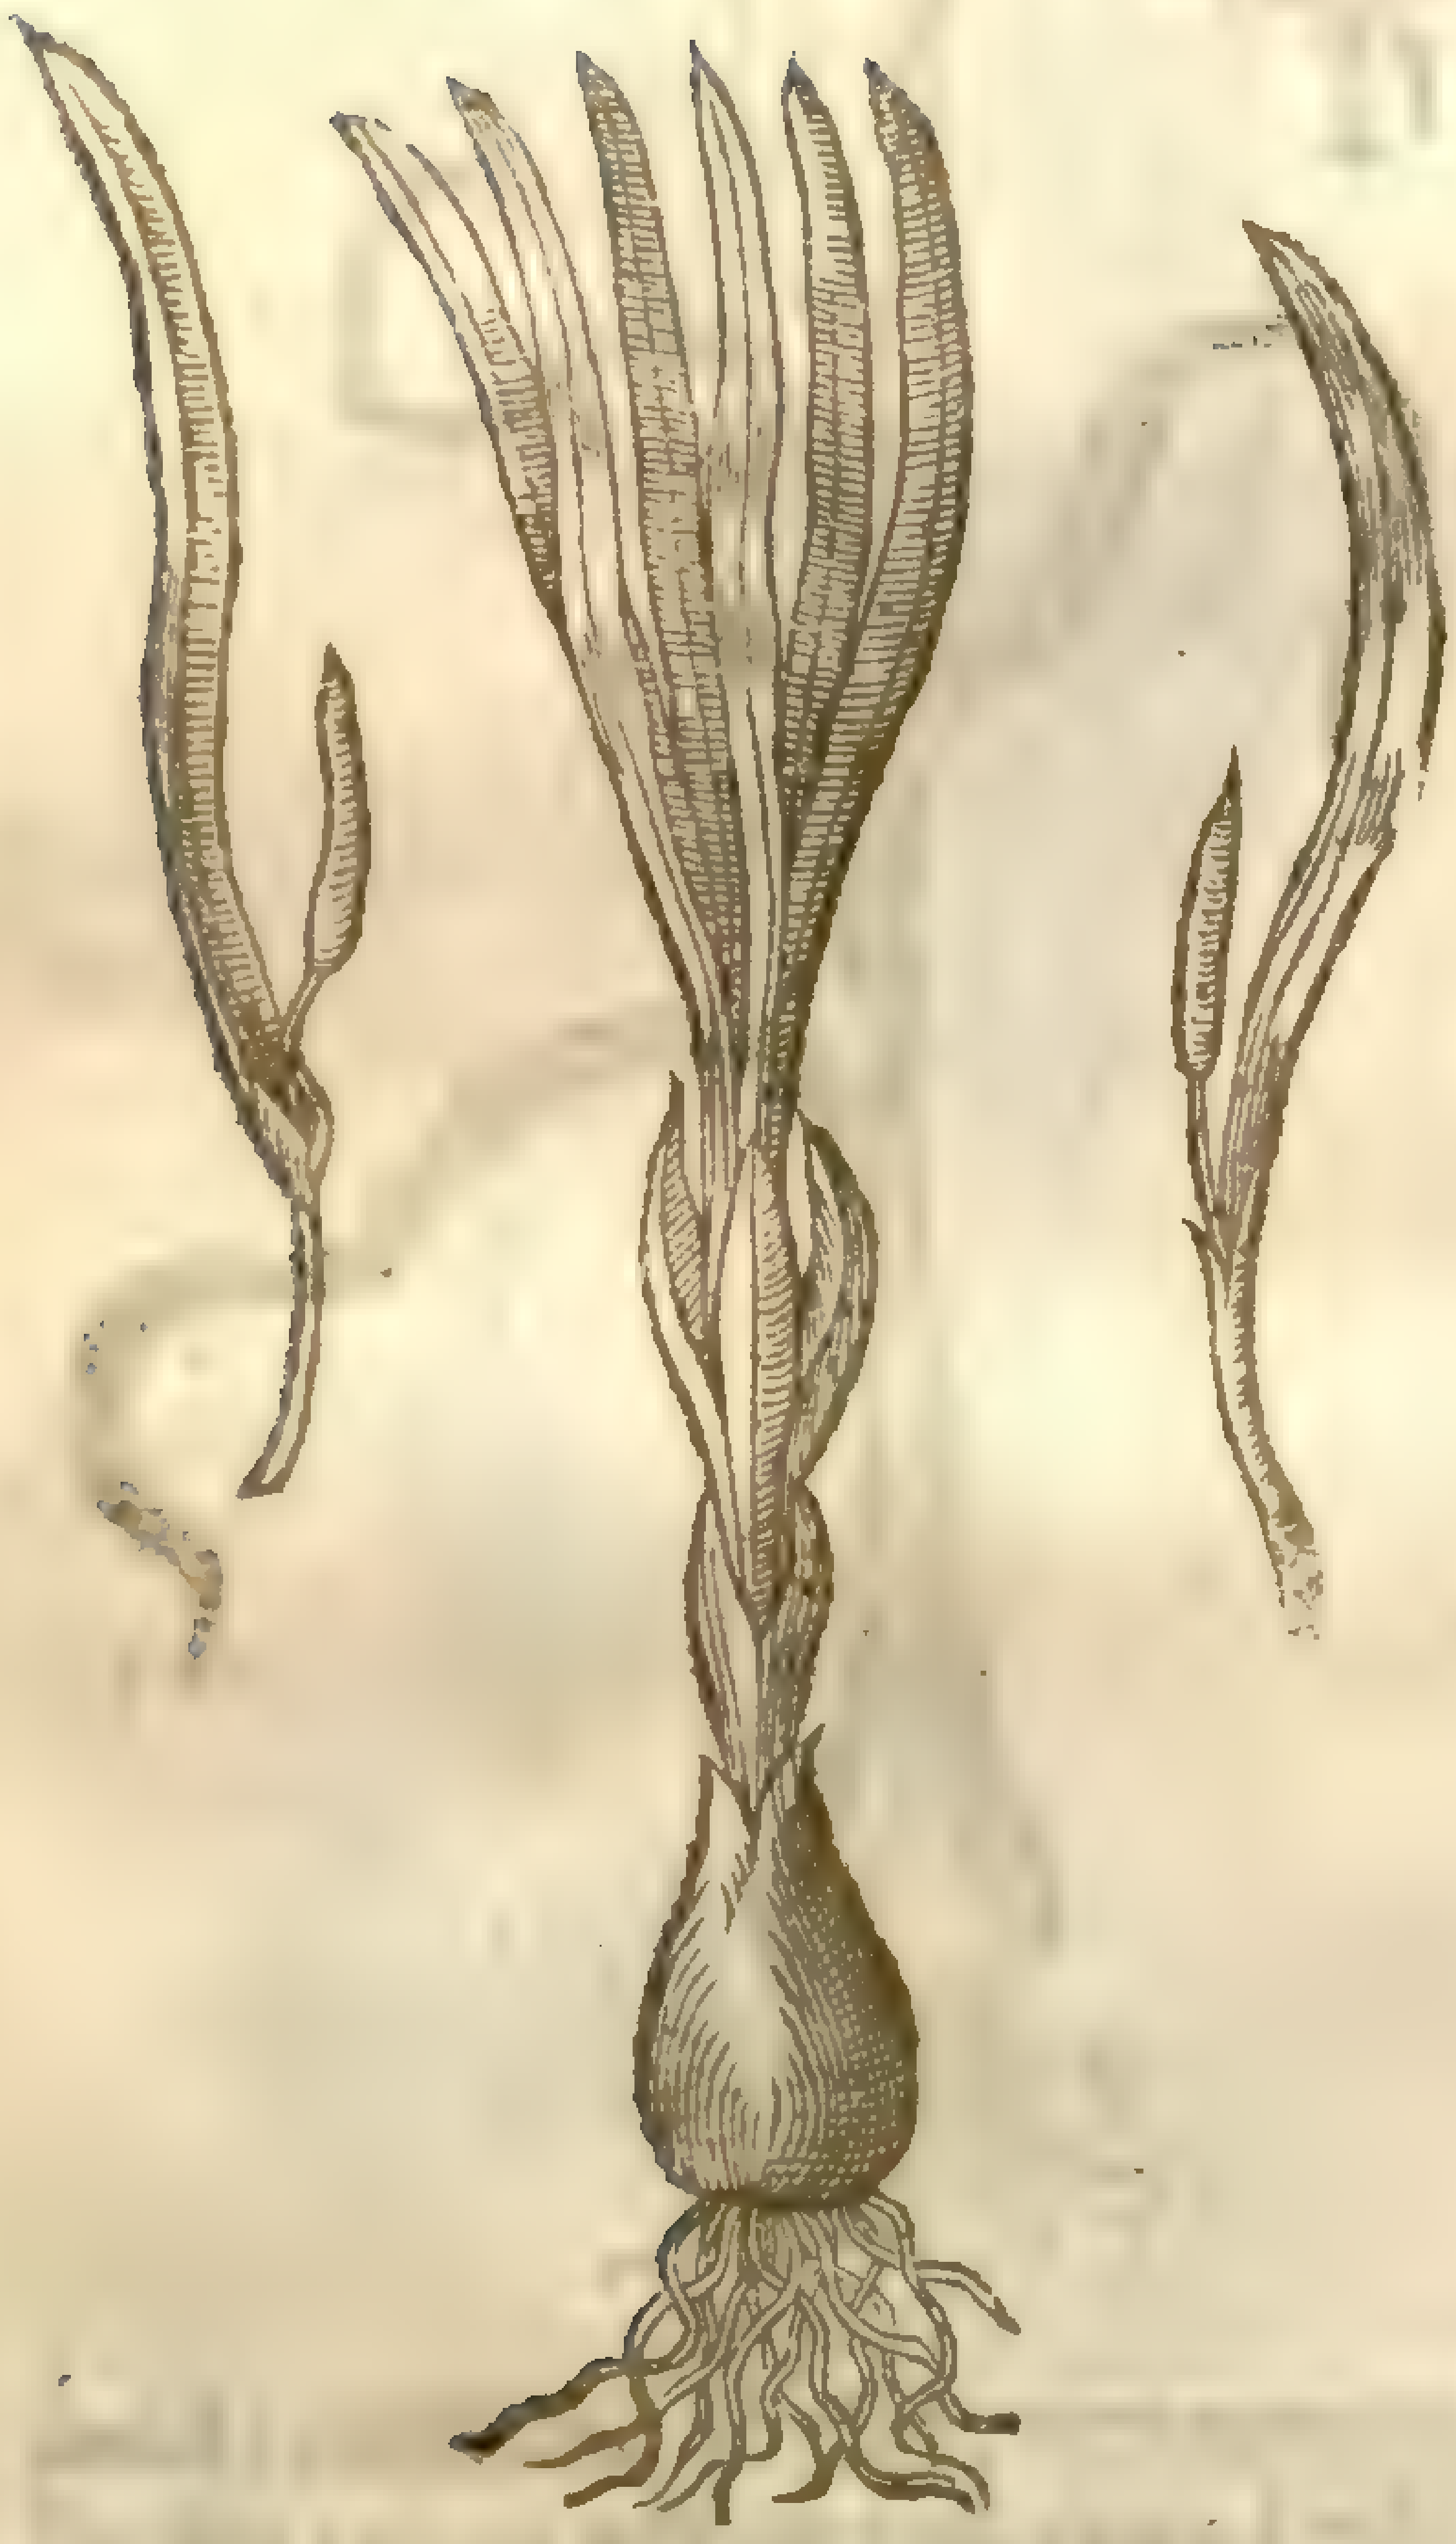
‡ 9 This, whoſe figure we here giue you, is by *Cluſius* called *Colchicum Bizantinum latifolium*, The broad leaued *Colchicum* of Conſtantinople. The leaues of this are not in forme and magnitude much vnlike to thoſe of the white Hellebor, neither leſſe neruous, yet more greene. It beares many floures in Autumne, ſo that there comes ſometimes twenty from one root. Their forme and colour are much like the ordinary ſort, but that theſe are larger, and haue thicker ſtalkes. They

are of a lighter purple without, and of a deeper on the inſide, and they are marked with certaine veines running alongſt theſe leaues. The roots and ſeeds of this plant are thrice as large as thoſe of the common kinde.

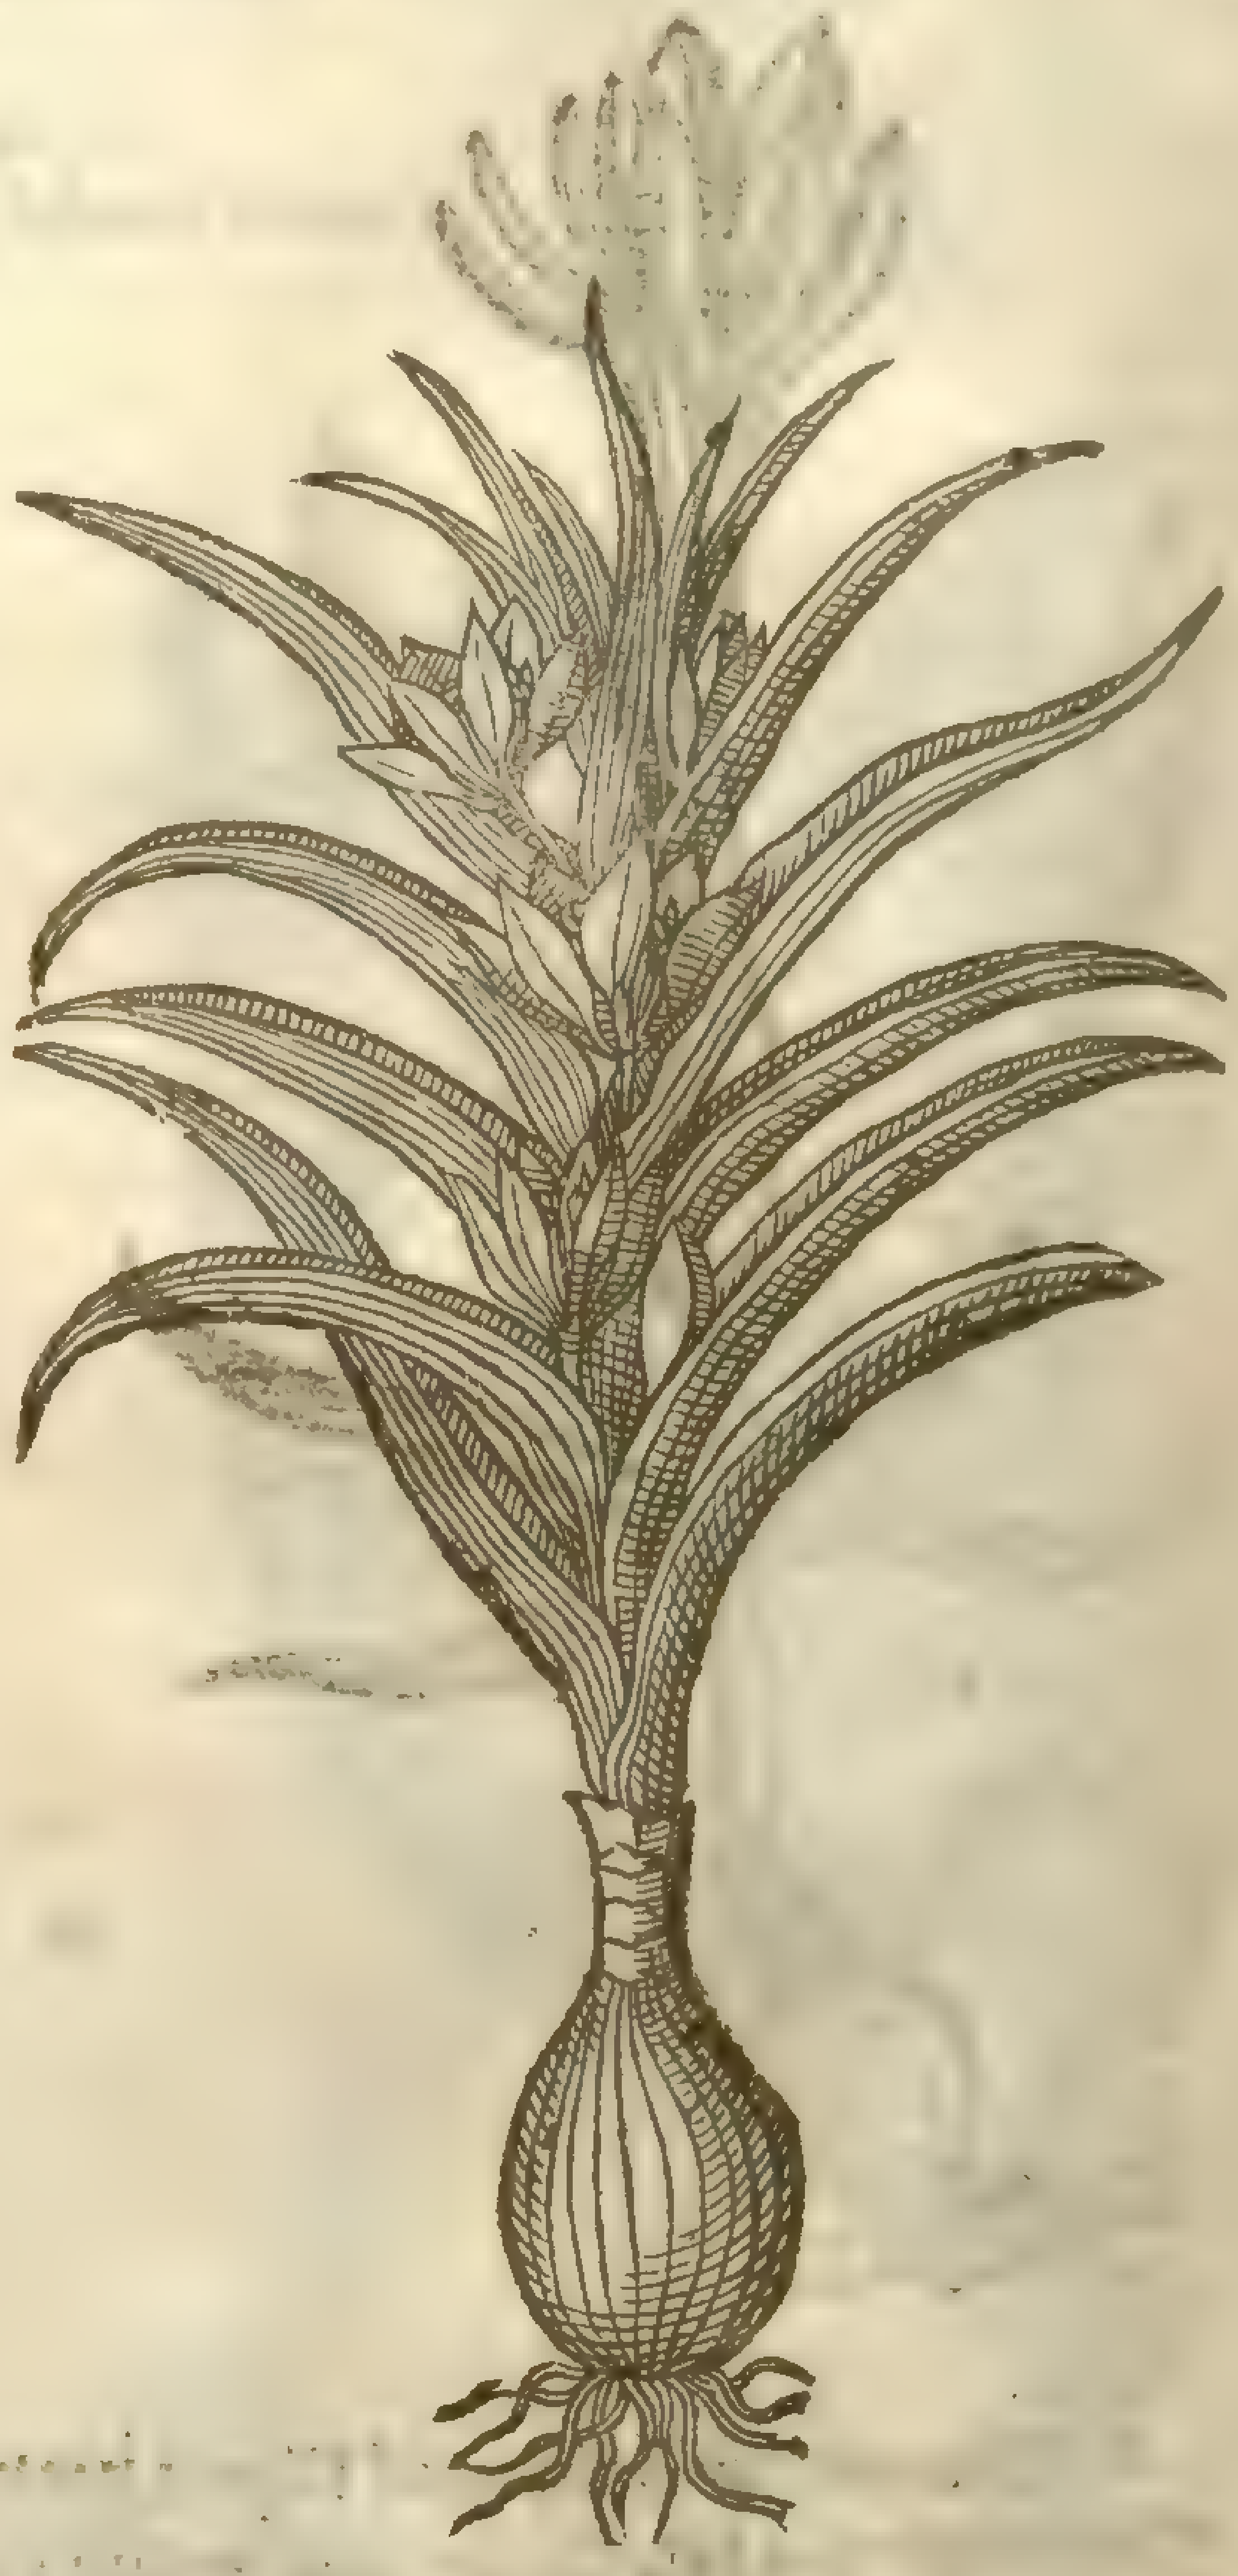
10 This hath roots and leaues like to the firſt deſcribed, but the floure is ſhorter, and growes vpon a ſhorter ſtalke, ſo that it riſeth but little aboue the earth: the three inner leaues are of a reddiſh purple; the three out leaues are either wholly white, or purpliſh on the middle in the inſide, or ſtreaked with faire purple veins, or ſpotted with ſuch coloured ſpots: all the leaues of the floure are blunter and rounder than in the common kinde.

11 This in leaues, roots, manner and time of growing, as alſo in the colour of the floures, differs not from the firſt deſcribed, but the floures, as you may perceiue by the figure here expreſſed, are very double, and conſiſt of many leaues.

‡ 5 *Colchicum montanum minus verſicolore flore.*
The leſſer mountaine Saffron with a various coloured floure.



6 *Colchicum Illyricum.*
Greeke medow Saffron.



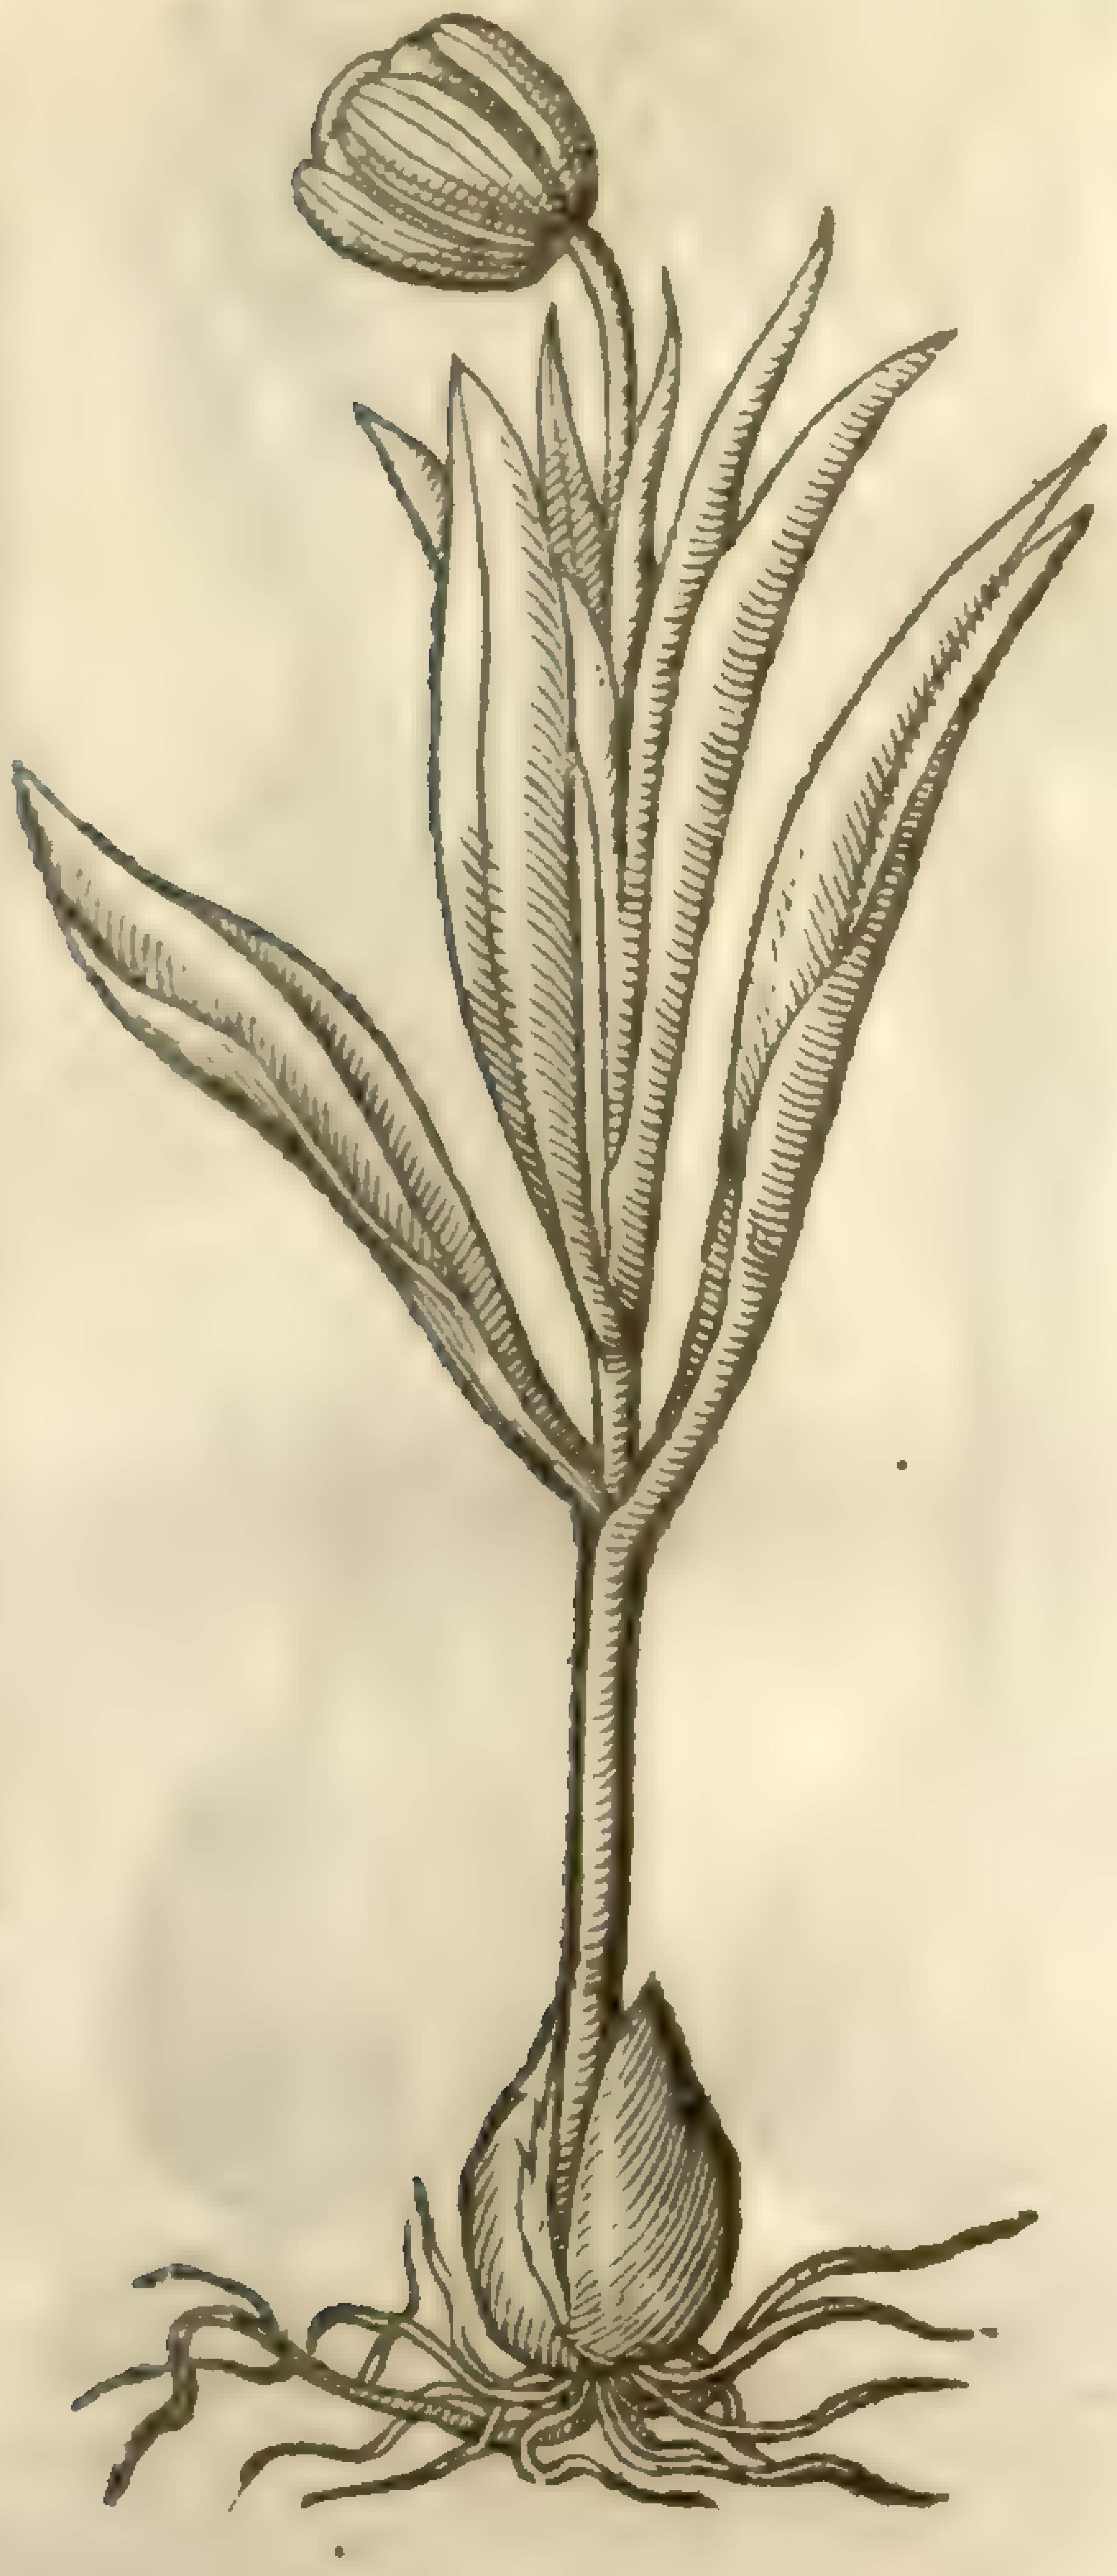
12 This *Colchicum* differs little from the firſt ordinary one, but that the floures are ſomewhat leſſe, and the three out-leaues are ſomewhat bigger than the three inner leaues; the colour is a little deeper alſo than that of the common one; but that wherein the principall difference conſiſts, is, That this floures twice in a yeare, to wit, in the Spring and Autumne: and hence *Cluſius* hath called it *Colchicum biflorum*, Twice flouring Mede Saffron.

13 This alſo in the ſhape of the root and leaues is not much differing from the ordinary, but the leaues of the floure are longer and narrower, the colour alſo when they begin to open and ſhew themſelues, is white, but ſhortly after they are changed into a light purple: each leafe of the floure hath a white thread tipt with yellow growing out of it, and in the middle ſtands a white three forked one longer than the reſt. The floure growes vp betweene three or foure leaues, narrower than thoſe of the ordinary one, and broader than thoſe of the ſmall Spaniſh kinde. *Cluſius*, to whom we are beholden for this, as alſo for moſt of the reſt, calls it *Colchicum vernum*, or Spring Mede-Saffron, becauſe it then floures together with the Spring Saffrons and Dogs Tooth.

14 There are other Mede-Saffrons beſides theſe I haue mentioned, but becauſe they may be

referred

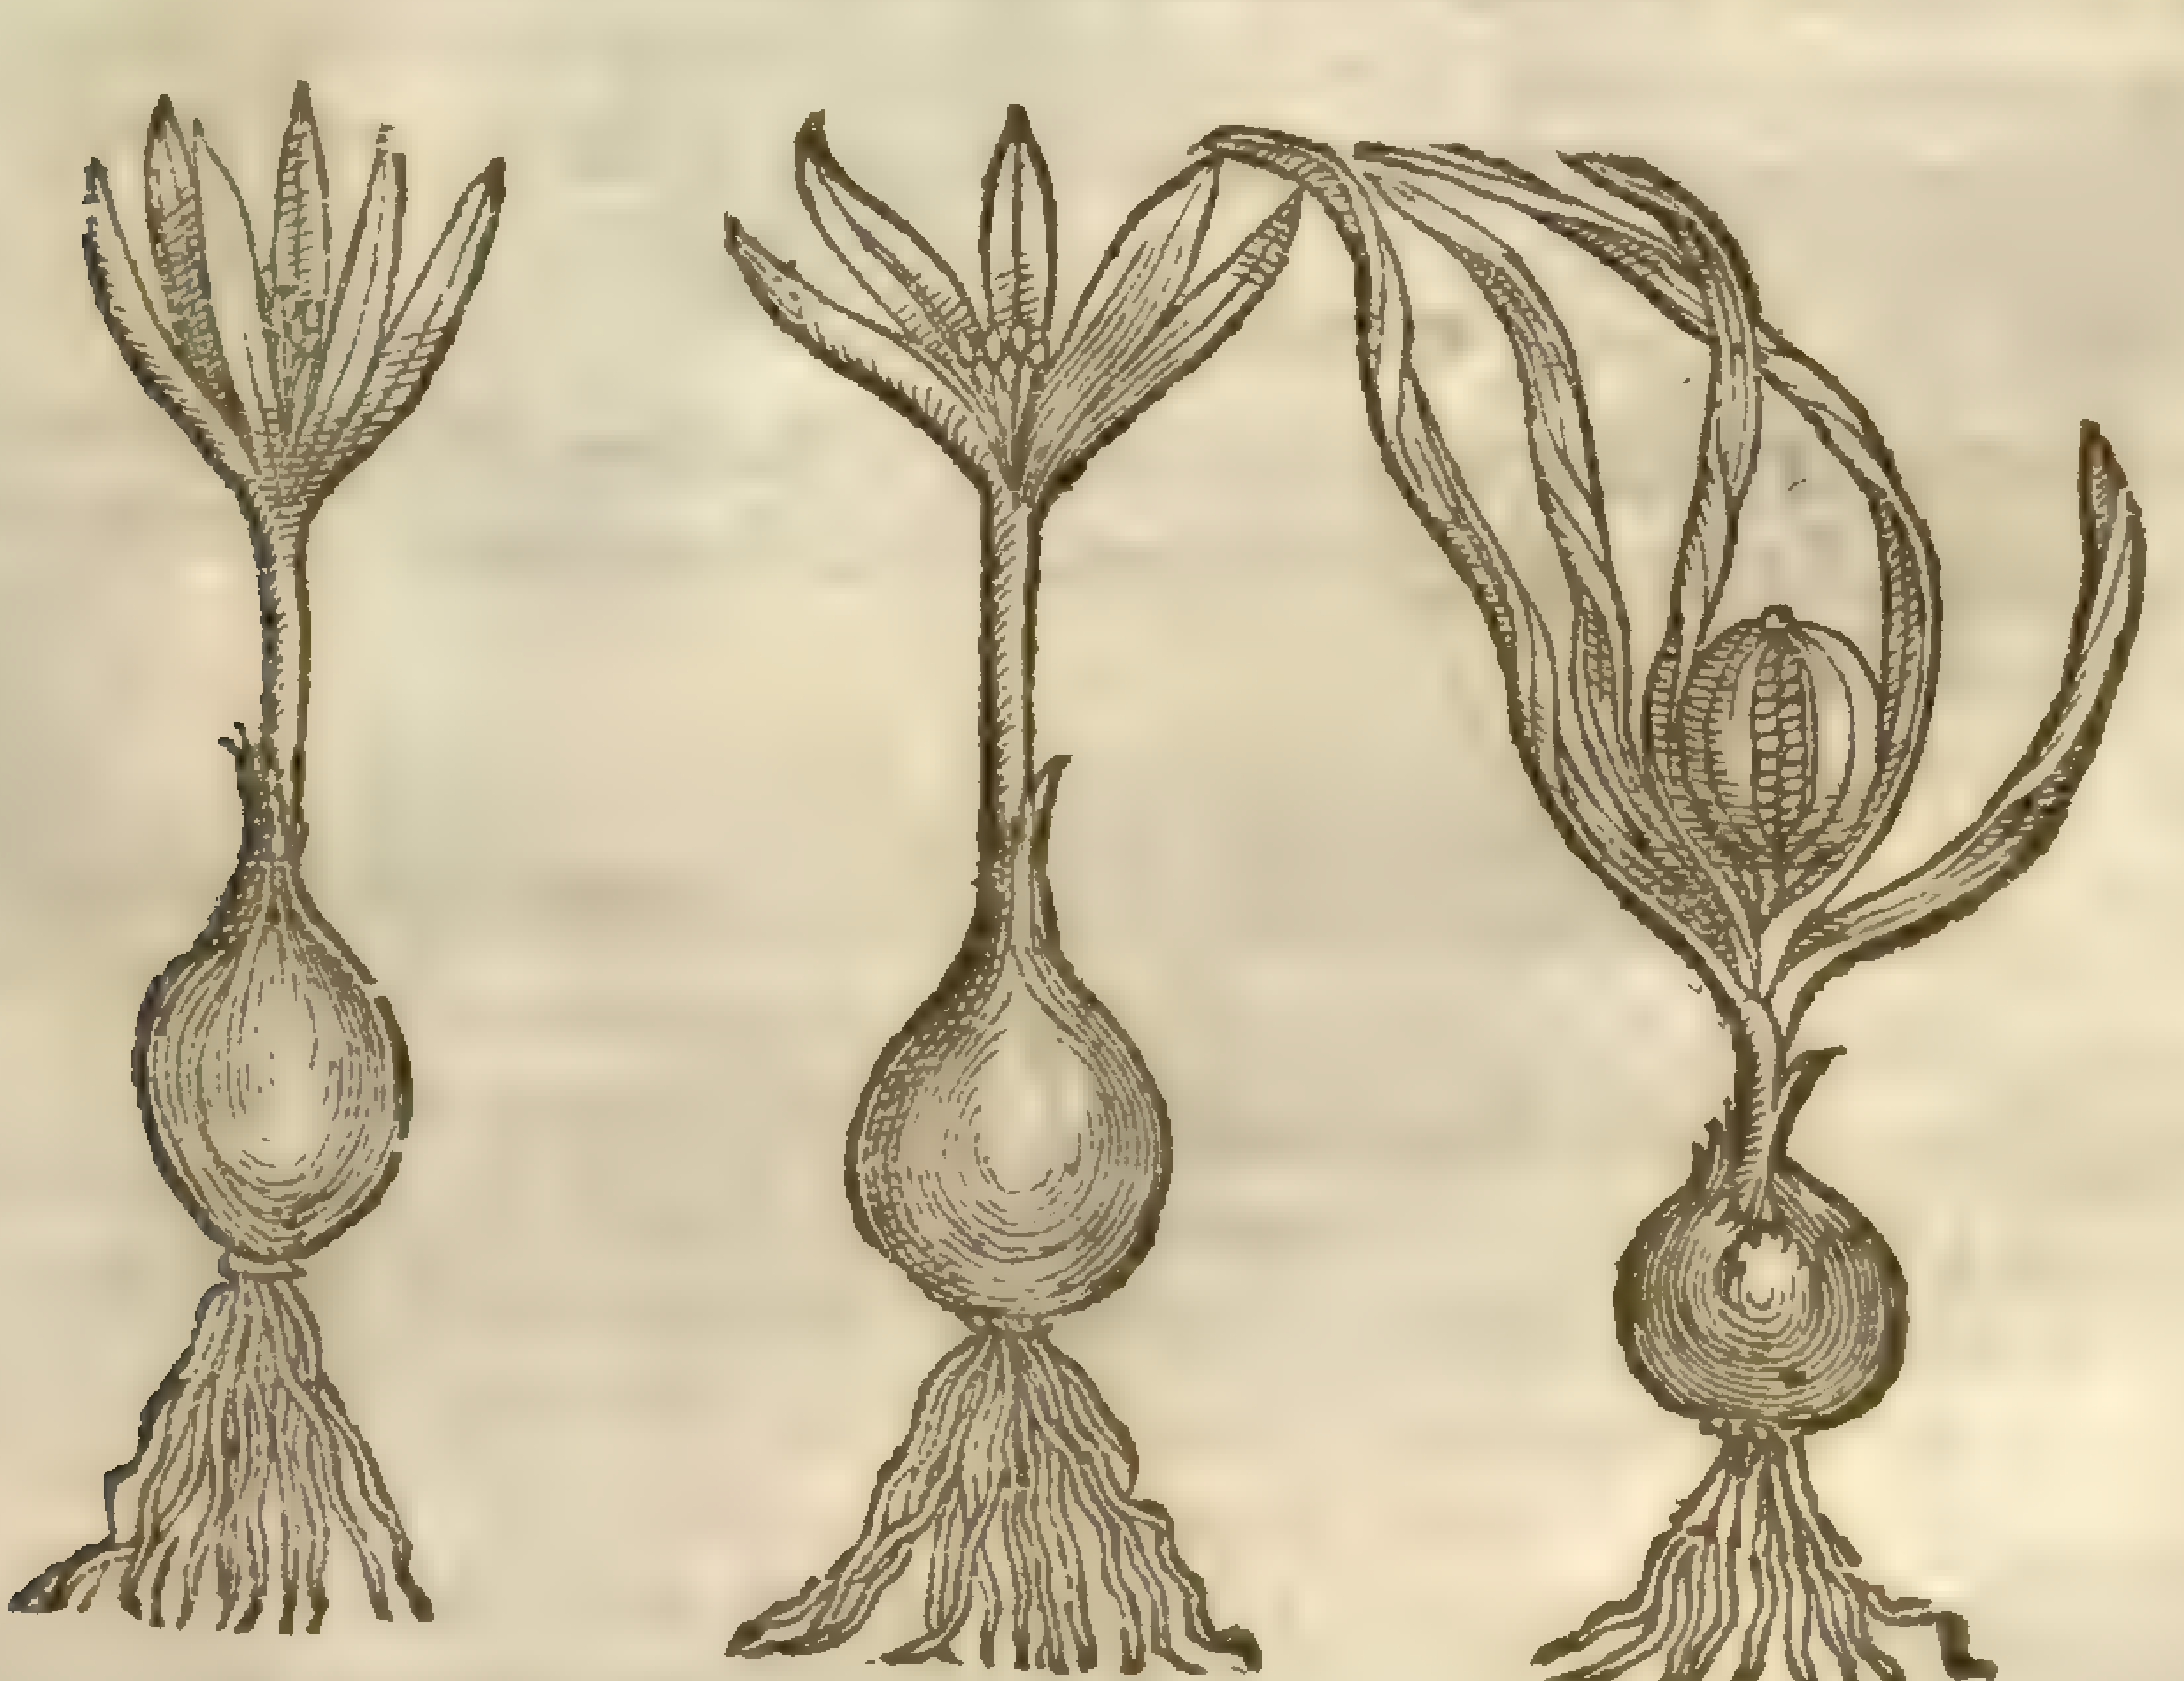
7 *Colchicum Syriacum Alexandrinum.*
Aſſyrian Mede Saffron.



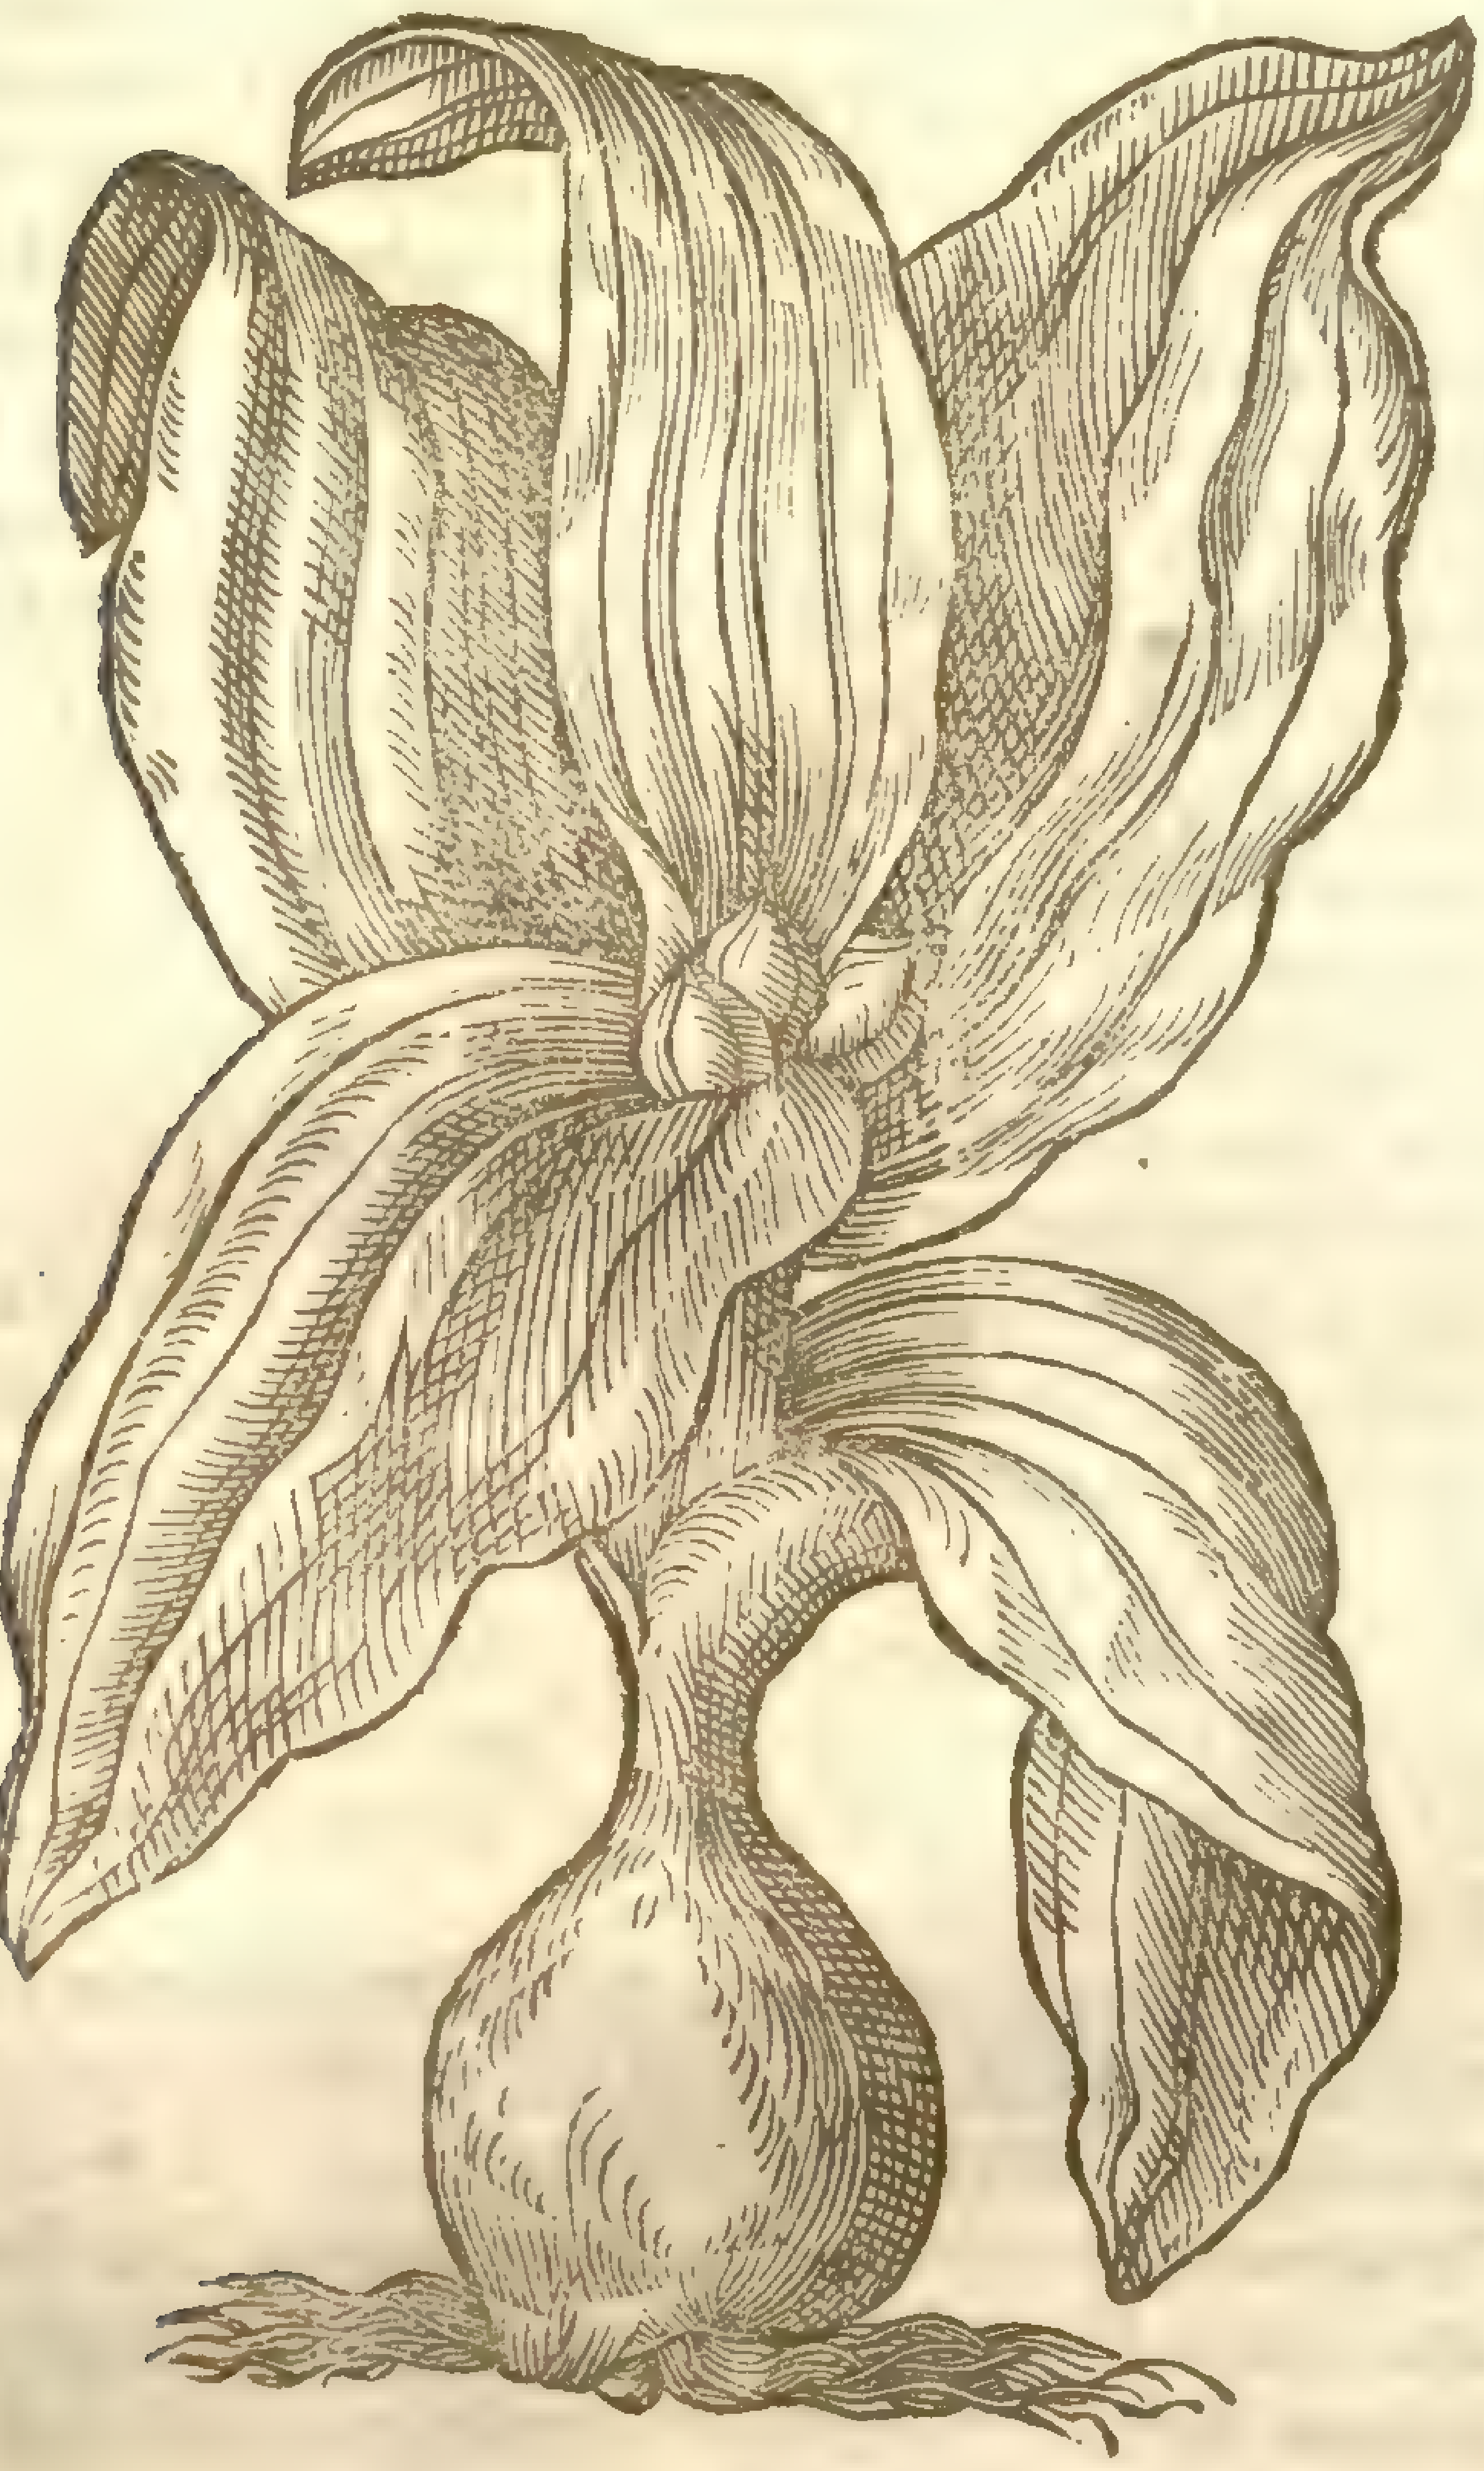
referred eaſily to ſome of theſe, for that their difference chiefely conſiſts either in the doubleneſſe or colour of the floures, whereof ſome are ſtriped, ſome fraided, others variegated, I will not inſiſt vpon them, but referre ſuch as deſire their further acquaintance to look into the gardens of our Floriſts, as Mr. *Parkinſons*, Mr. *Tuggies, &c.* or elſe into the booke of floures ſet forth not long ſince by Mr. *Parkinſon*, where they ſhall finde them largely treated of. Yet I cannot paſſe ouer in ſilence that curious *Colchicum* which is called by ſome, *Colchicum variegatum Chienſe*. The floure thereof is very beautiful, conſiſting of ſix pretty broad and ſharp pointed leaues, all curiouſly checkered ouer with deepe blew or purple, the reſt of the floure being of a light whitiſh color: the leaues, that riſe vp in the Spring, are not very long, but ſomewhat broad and ſharpe pointed; the root is like others of this kinde. I haue giuen you an exact and large figure of this, as I tooke it from the growing floure ſome three yeares agone, it being at that time amongſt her Maieſties floures kept at Edgcome in Surry, in the Garden of my much honoured friend Sir *Iohn Tunſtall*, Gentleman Vſher vnto her Maieſtie.

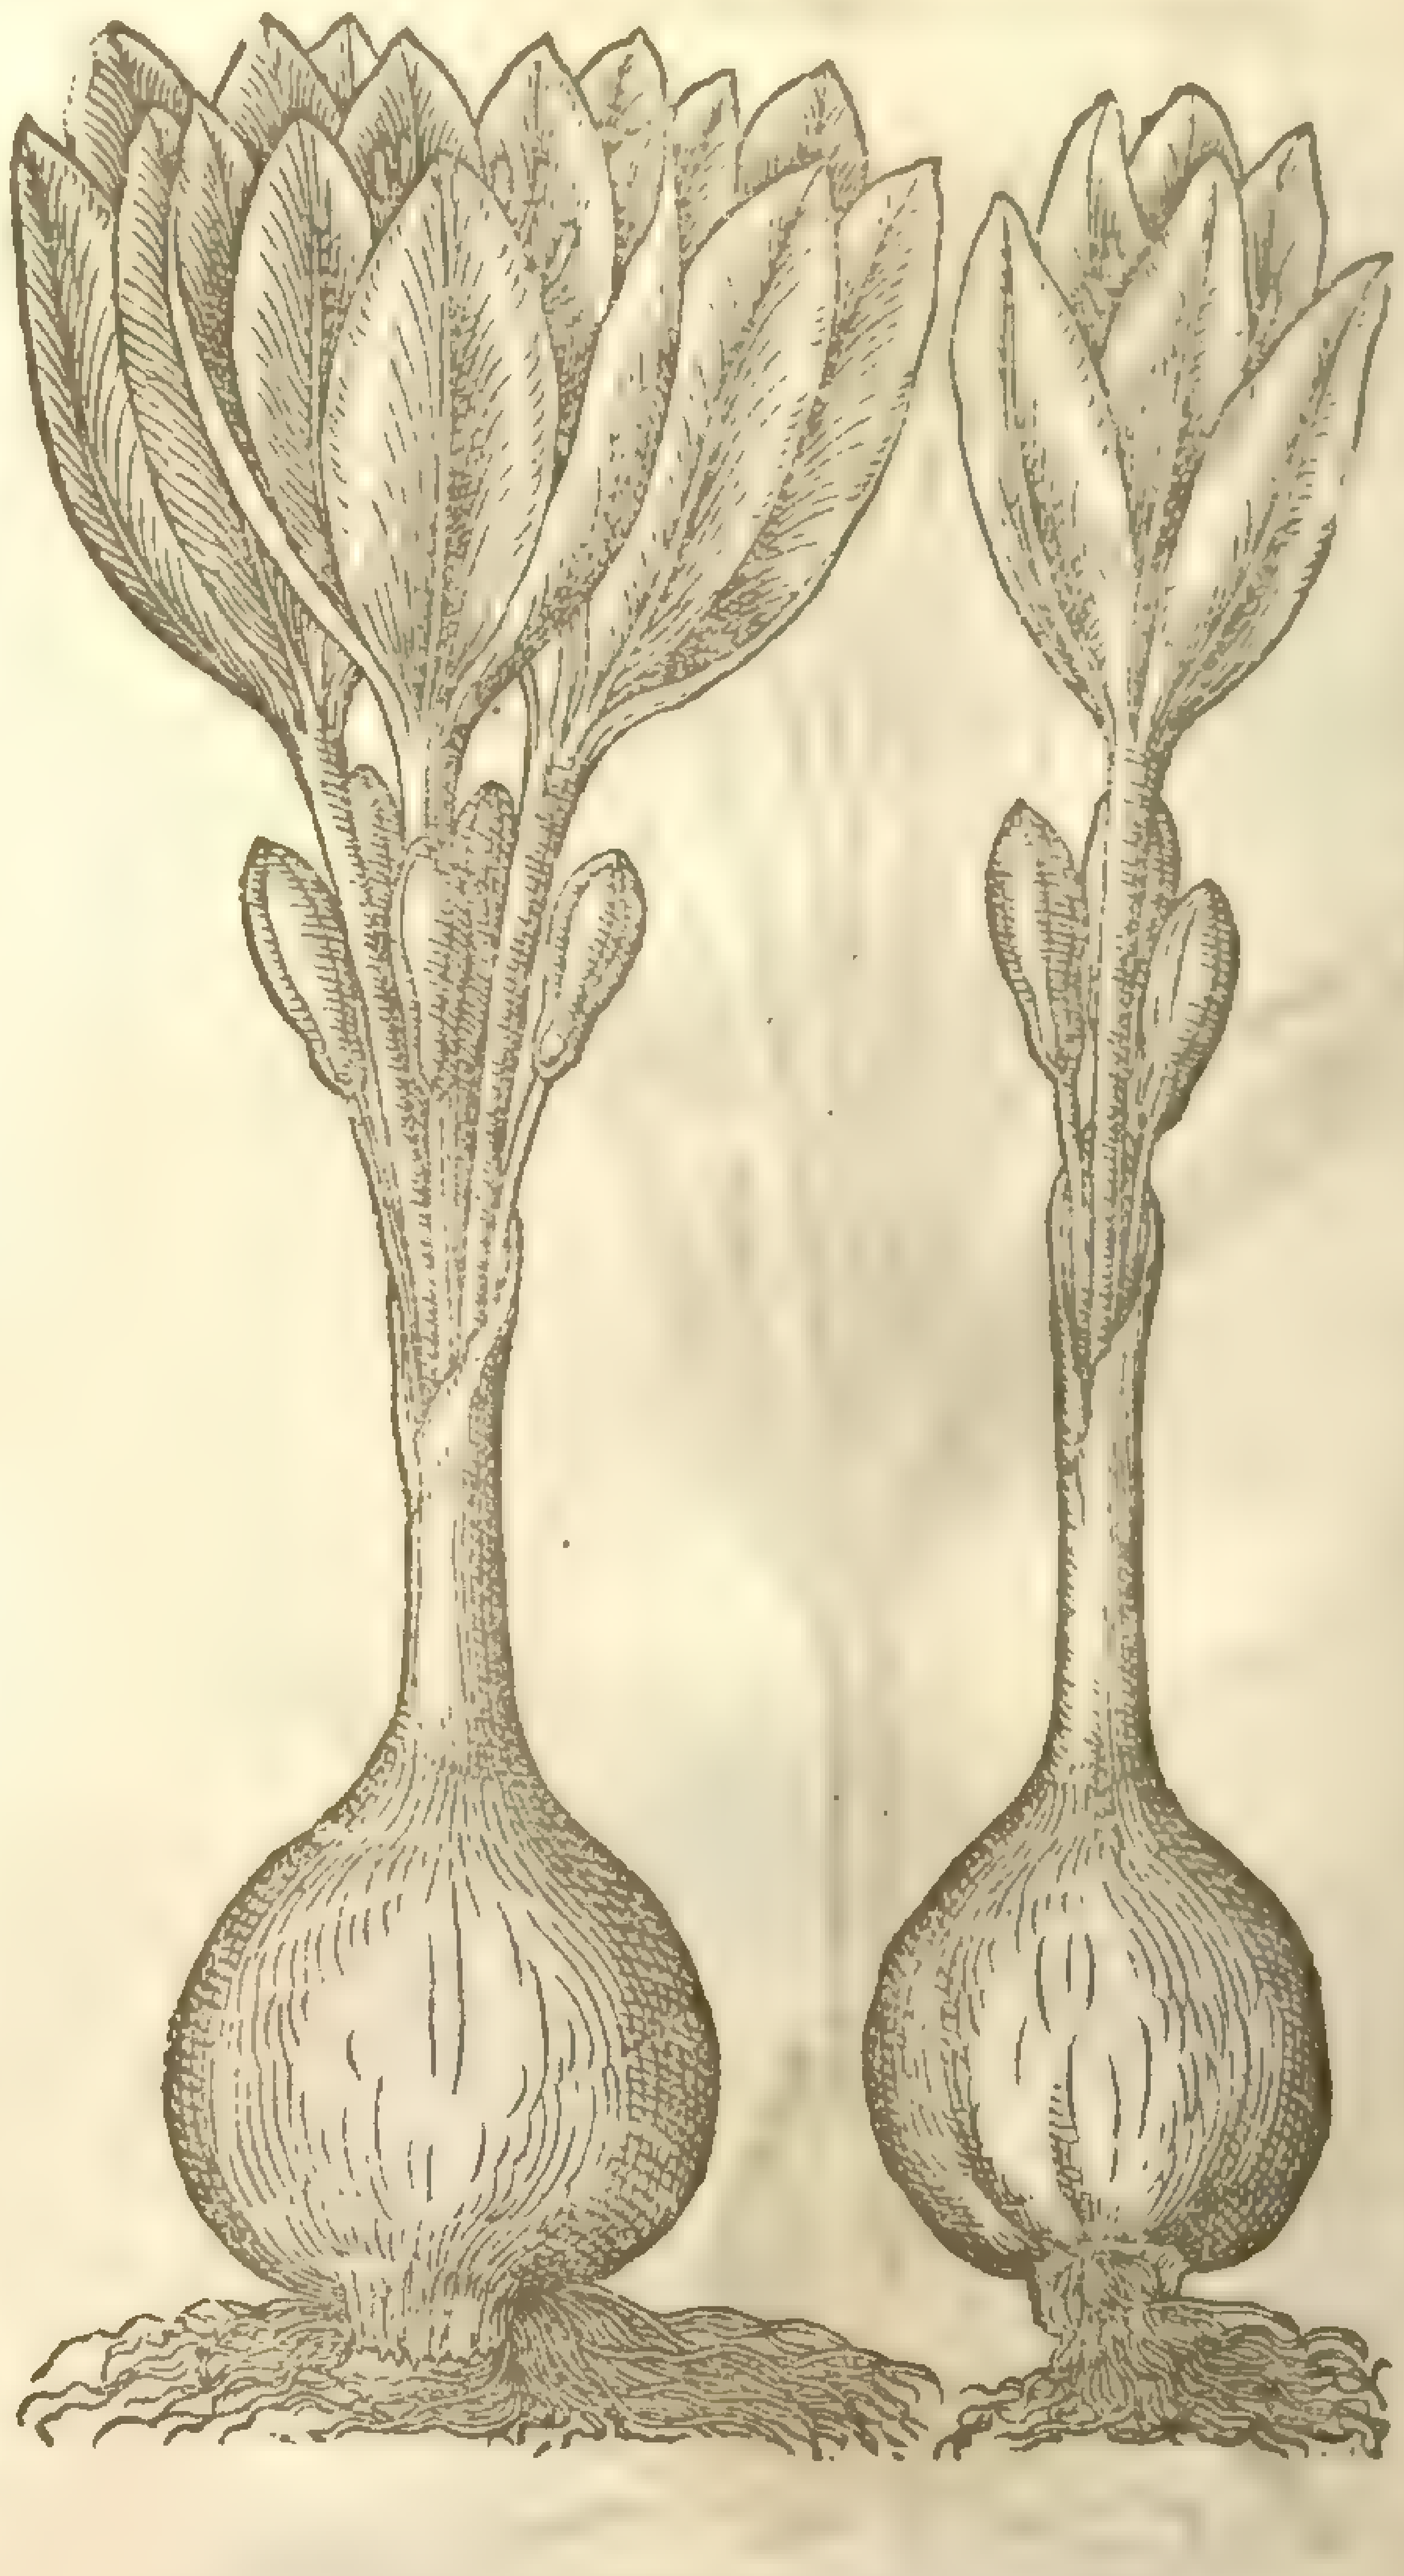
15 I giue you here in this place the true Hermodactill of the ſhops, which probably by all is adiudged to this Tribe, though none can certainly ſay what floures or leaues it beares: the Roots are onely brought to vs, and from what place I cannot tell; yet I coniecture from ſome part of Syria or the adiacent countries. Now how hard it is to iudge of Plants by one part or particle, I ſhall ſhew you more at large when I come to treat of *Piſtolochia*, wherefore I will ſay nothing thereof in this place. Theſe roots, which wanting the maligne qualitie of *Colchicum*, either of their owne nature, or by dryneſſe, are commonly about the bigneſſe of a Cheſnut, ſmooth, flattiſh, and ſharpe at the one end, but ſomewhat full at the other, where the ſtalke of the floure comes vp. Their colour is either white, browne, or blackiſh on the outſide, and very white within, but thoſe are the beſt that are white both without and within, and may eaſily be made into a fine white meale or pouder. ‡

8 *Colchicum parvum montanum luteum.*
Yellow mountaine Saffron.



‡ 9 *Colchicum latifolium.* Broad leaued Mede Saffron.





‡ 10 *Colchicum verſicolore flore.* Party-coloured Mede Saffron.

¶ *The Place.*

Medow Saffron, or *Colchicum*, groweth in Meſſinia, and in the Iſle of Colchis, whereof it tooke his name. The titles of the reſt do ſet forth their natiue countries; notwithſtanding our London gardens are poſſeſſed with the moſt part of them.

The two firſt do grow in England in great aboundance in fat and fertile medowes, as about Vilford and Bathe, as alſo in the medowes neere to a ſmall village in the Weſt part of England, called Shepton Mallet, in the medowes about Briſtoll, in Kingſtrop medow neere vnto a water mil as you go from Northampton to Holmby houſe, vpon the right hand of the way, and likewiſe in great plenty in Nobottle wood two miles from Northampton, and in many other places.

‡ The reſt for the moſt part may be found in the gardens of the Floriſts among vs. ‡

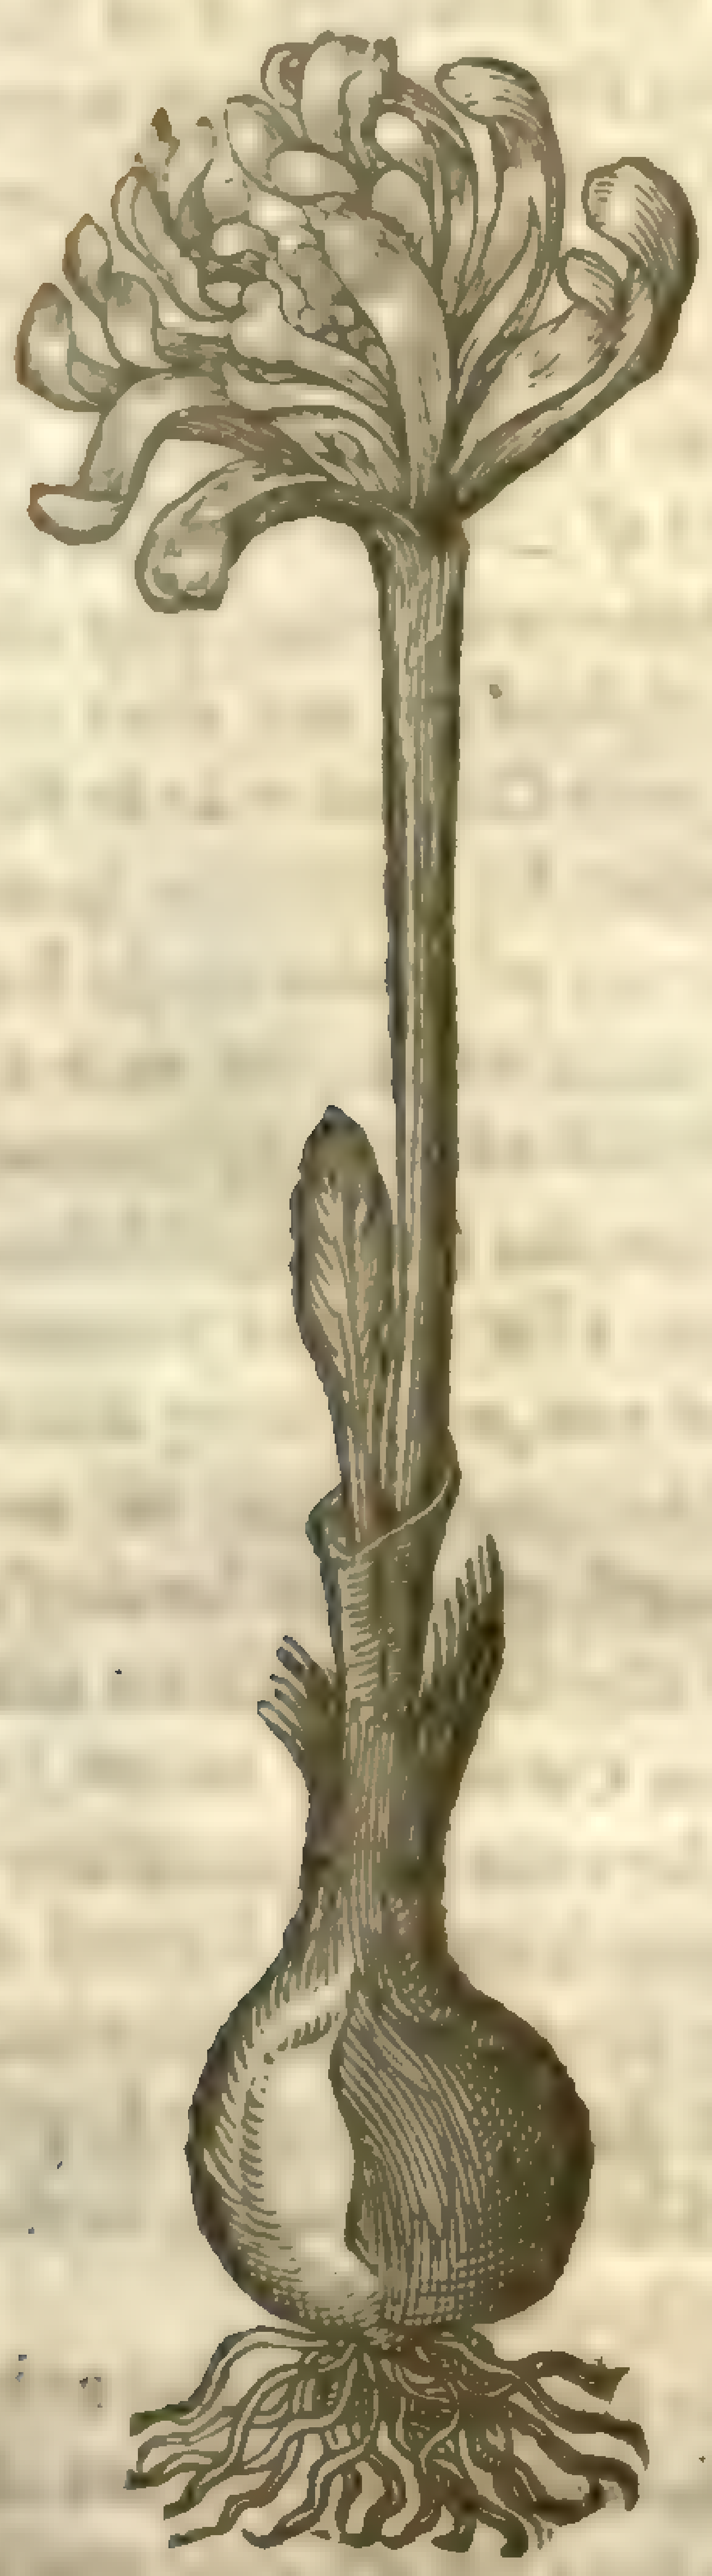
¶ *The Time.*

The leaues of all the kindes of Mede Saffron doe begin to ſhew themſelues in Februarie. The ſeed is ripe in Iune. The leaues, ſtalks, and ſeed do periſh in Iuly, and their pleaſant floures do come forth of the ground in September.

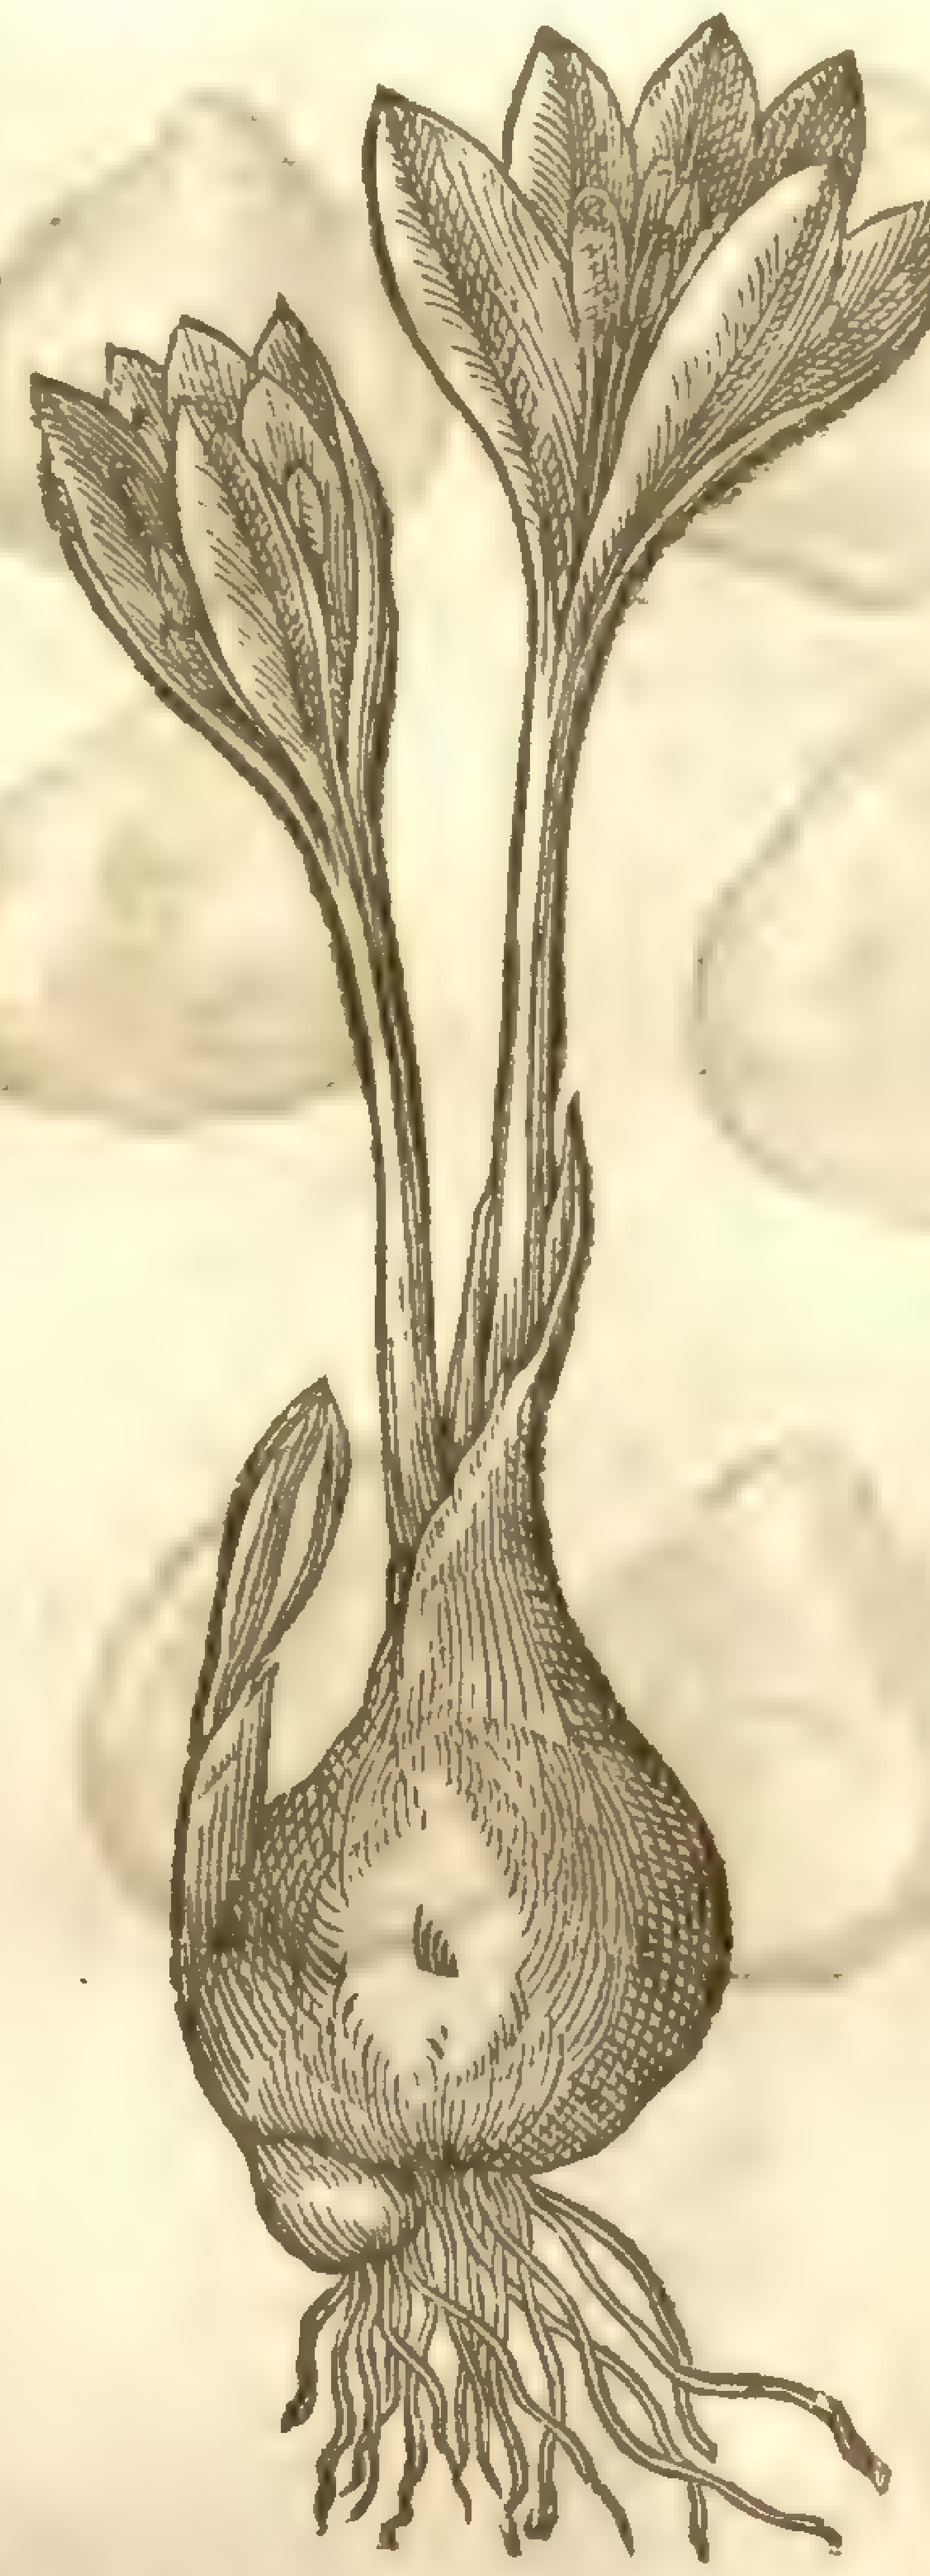
¶ *The Names.*

Dioſcorides calleth Medow Saffron Κολχικὸν: ſome, Ἐφήμερον: notwithſtanding there is another *Ephemeron* which is not deadly. Diuers name it in Latine *Bulbus agreſtis*, or wild Bulbe: in high Dutch it is called **Zeitlooſen**: in low Dutch, **Tilcelooſen**: in French, *Mort au chien*. Some haue taken it to be the true Hermodactyl, yet falſely. Other ſome call it *Filius ante patrem*, although there is a kinde of *Lyſimachia* or Looſe-ſtrife ſo called, becauſe it firſt bringeth forth his long cods with ſeed, and then the floure after, or at the ſame time at the end of the ſaid cod. But in this Mede Saffron it is far otherwiſe, becauſe it bringeth forth leaues in Februarie, ſeed in May, and floures in September; which is a thing cleane contrarie to all other plants whatſoeuer, for that they doe firſt floure, and after ſeed: but this Saffron ſeedeth firſt, and foure moneths after brings forth floures: and therefore ſome haue thought this a fit name for it, *Filius ante Patrem*: and we accordingly may call

‡ 11 *Colchicum flore pleno.*
Double floured Mede Saffron.

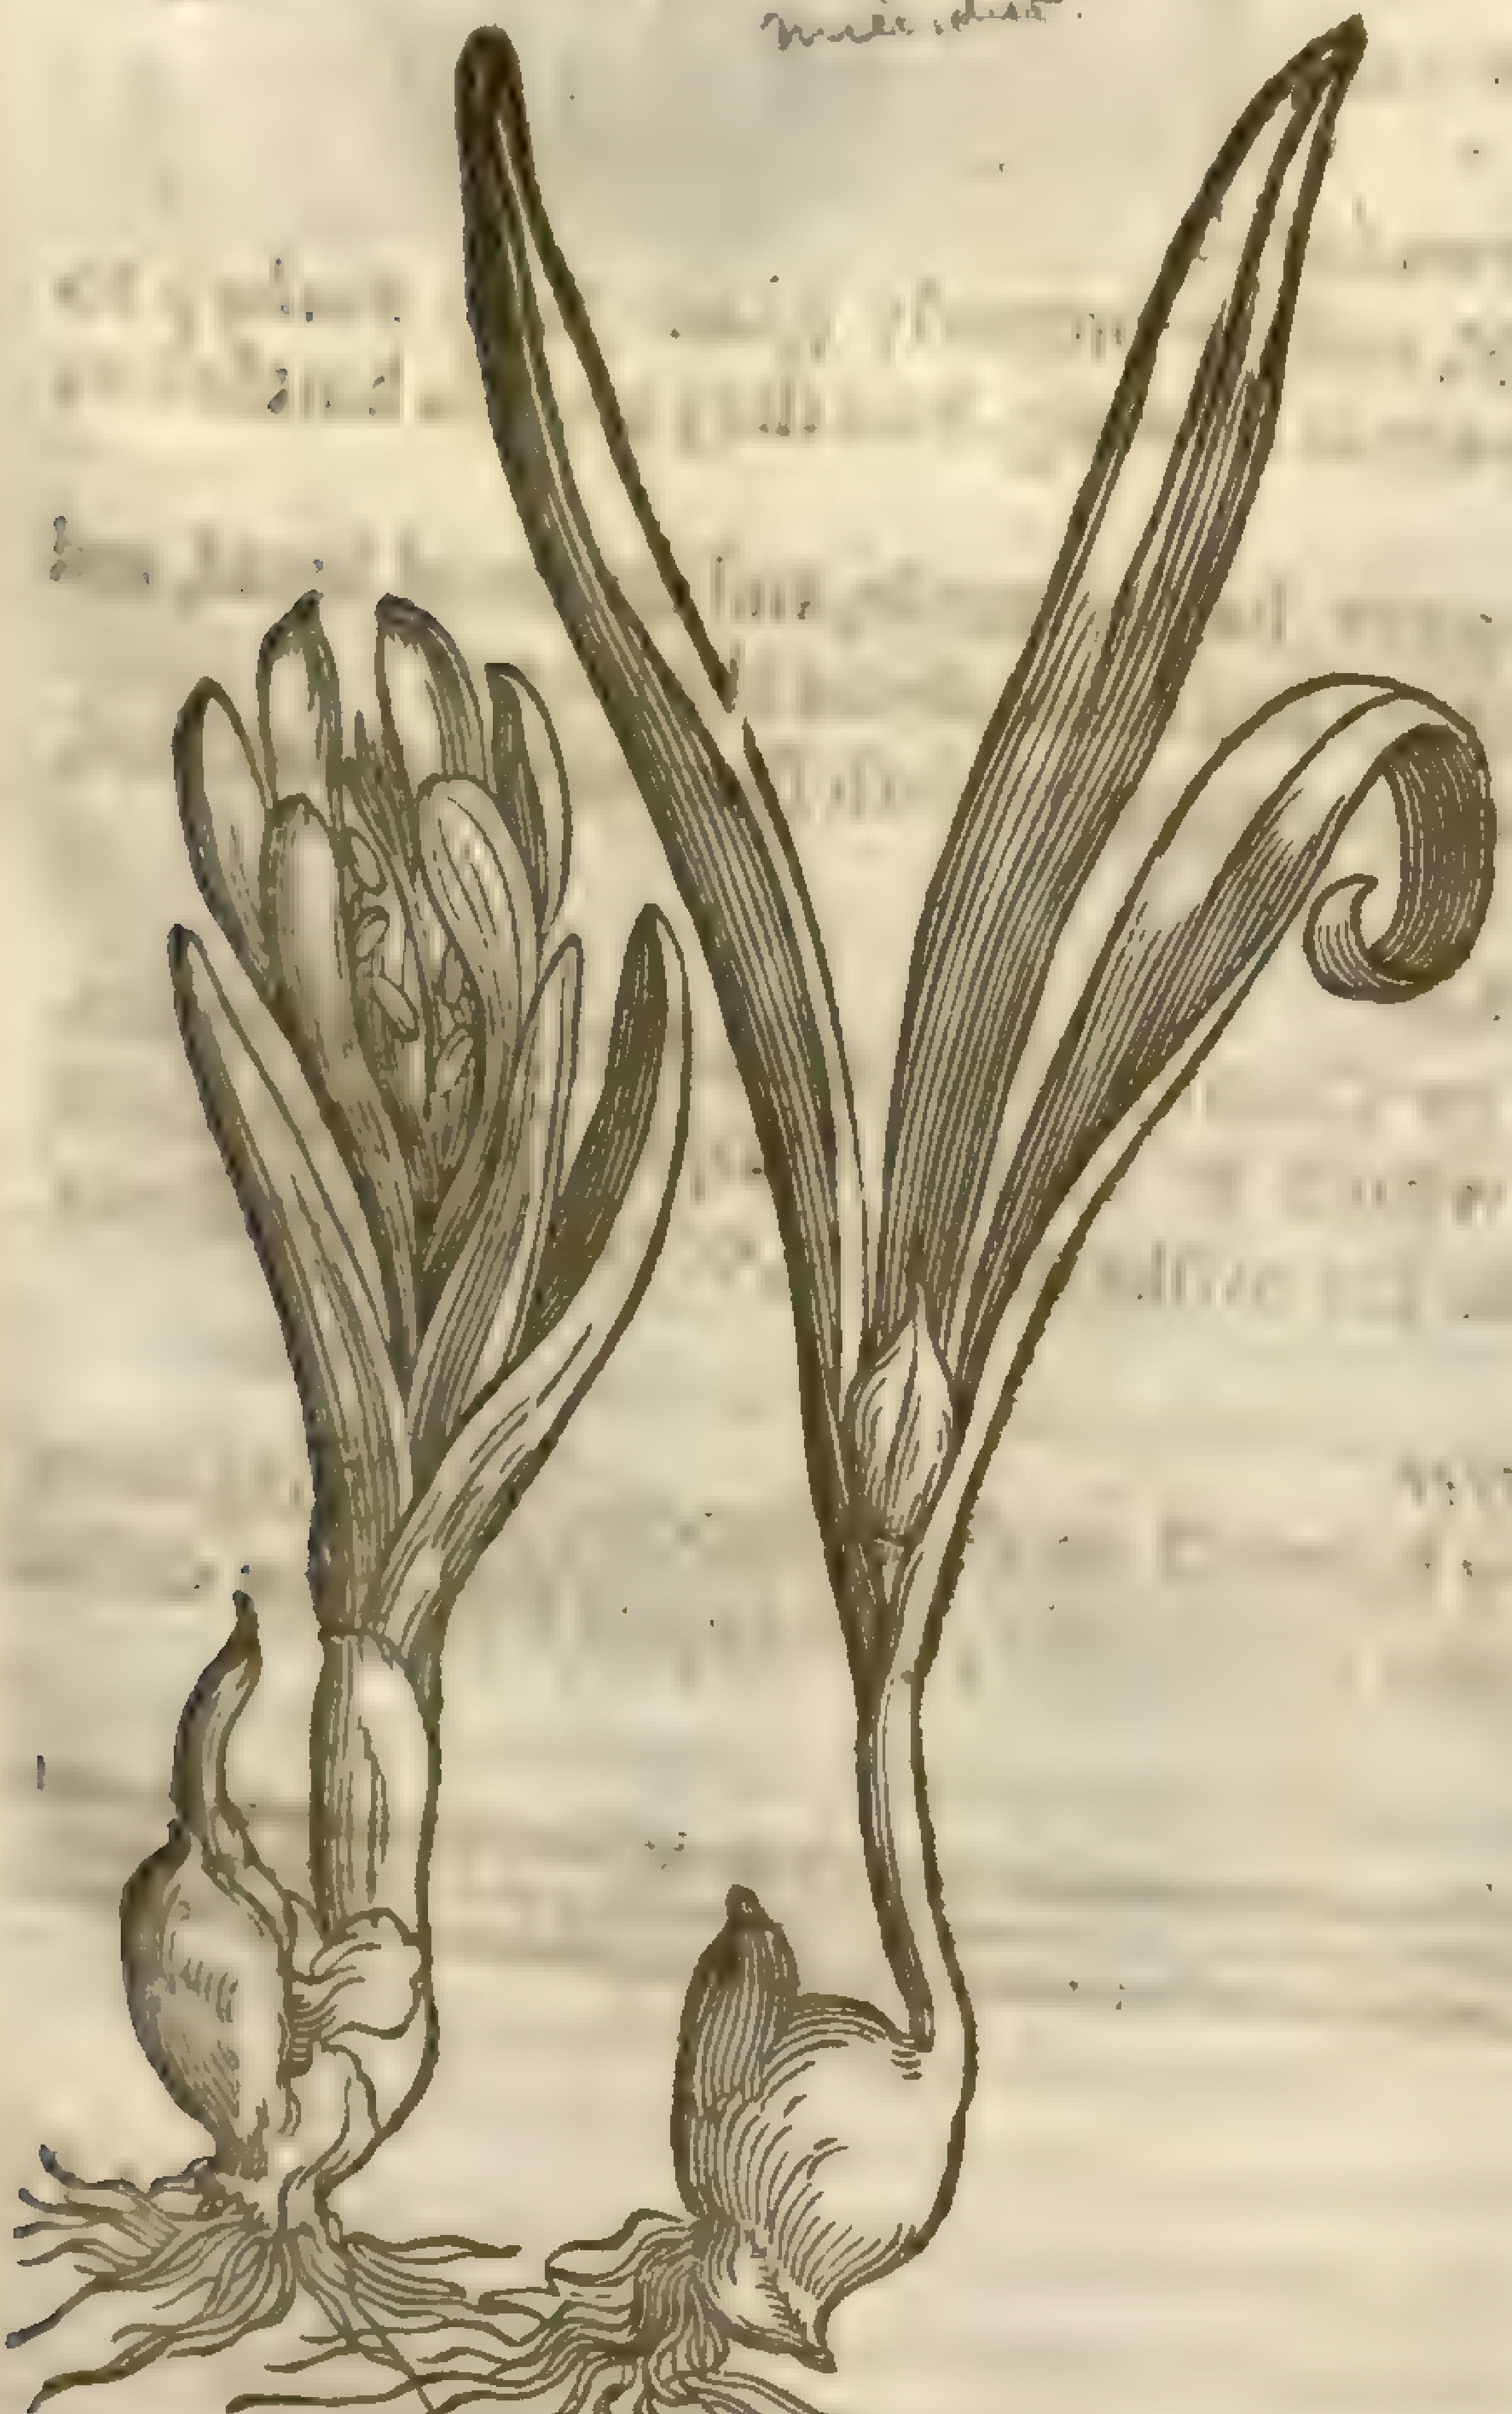


‡ 12 *Colchicum biflorum.*
Twice flouring Mede Saffron.

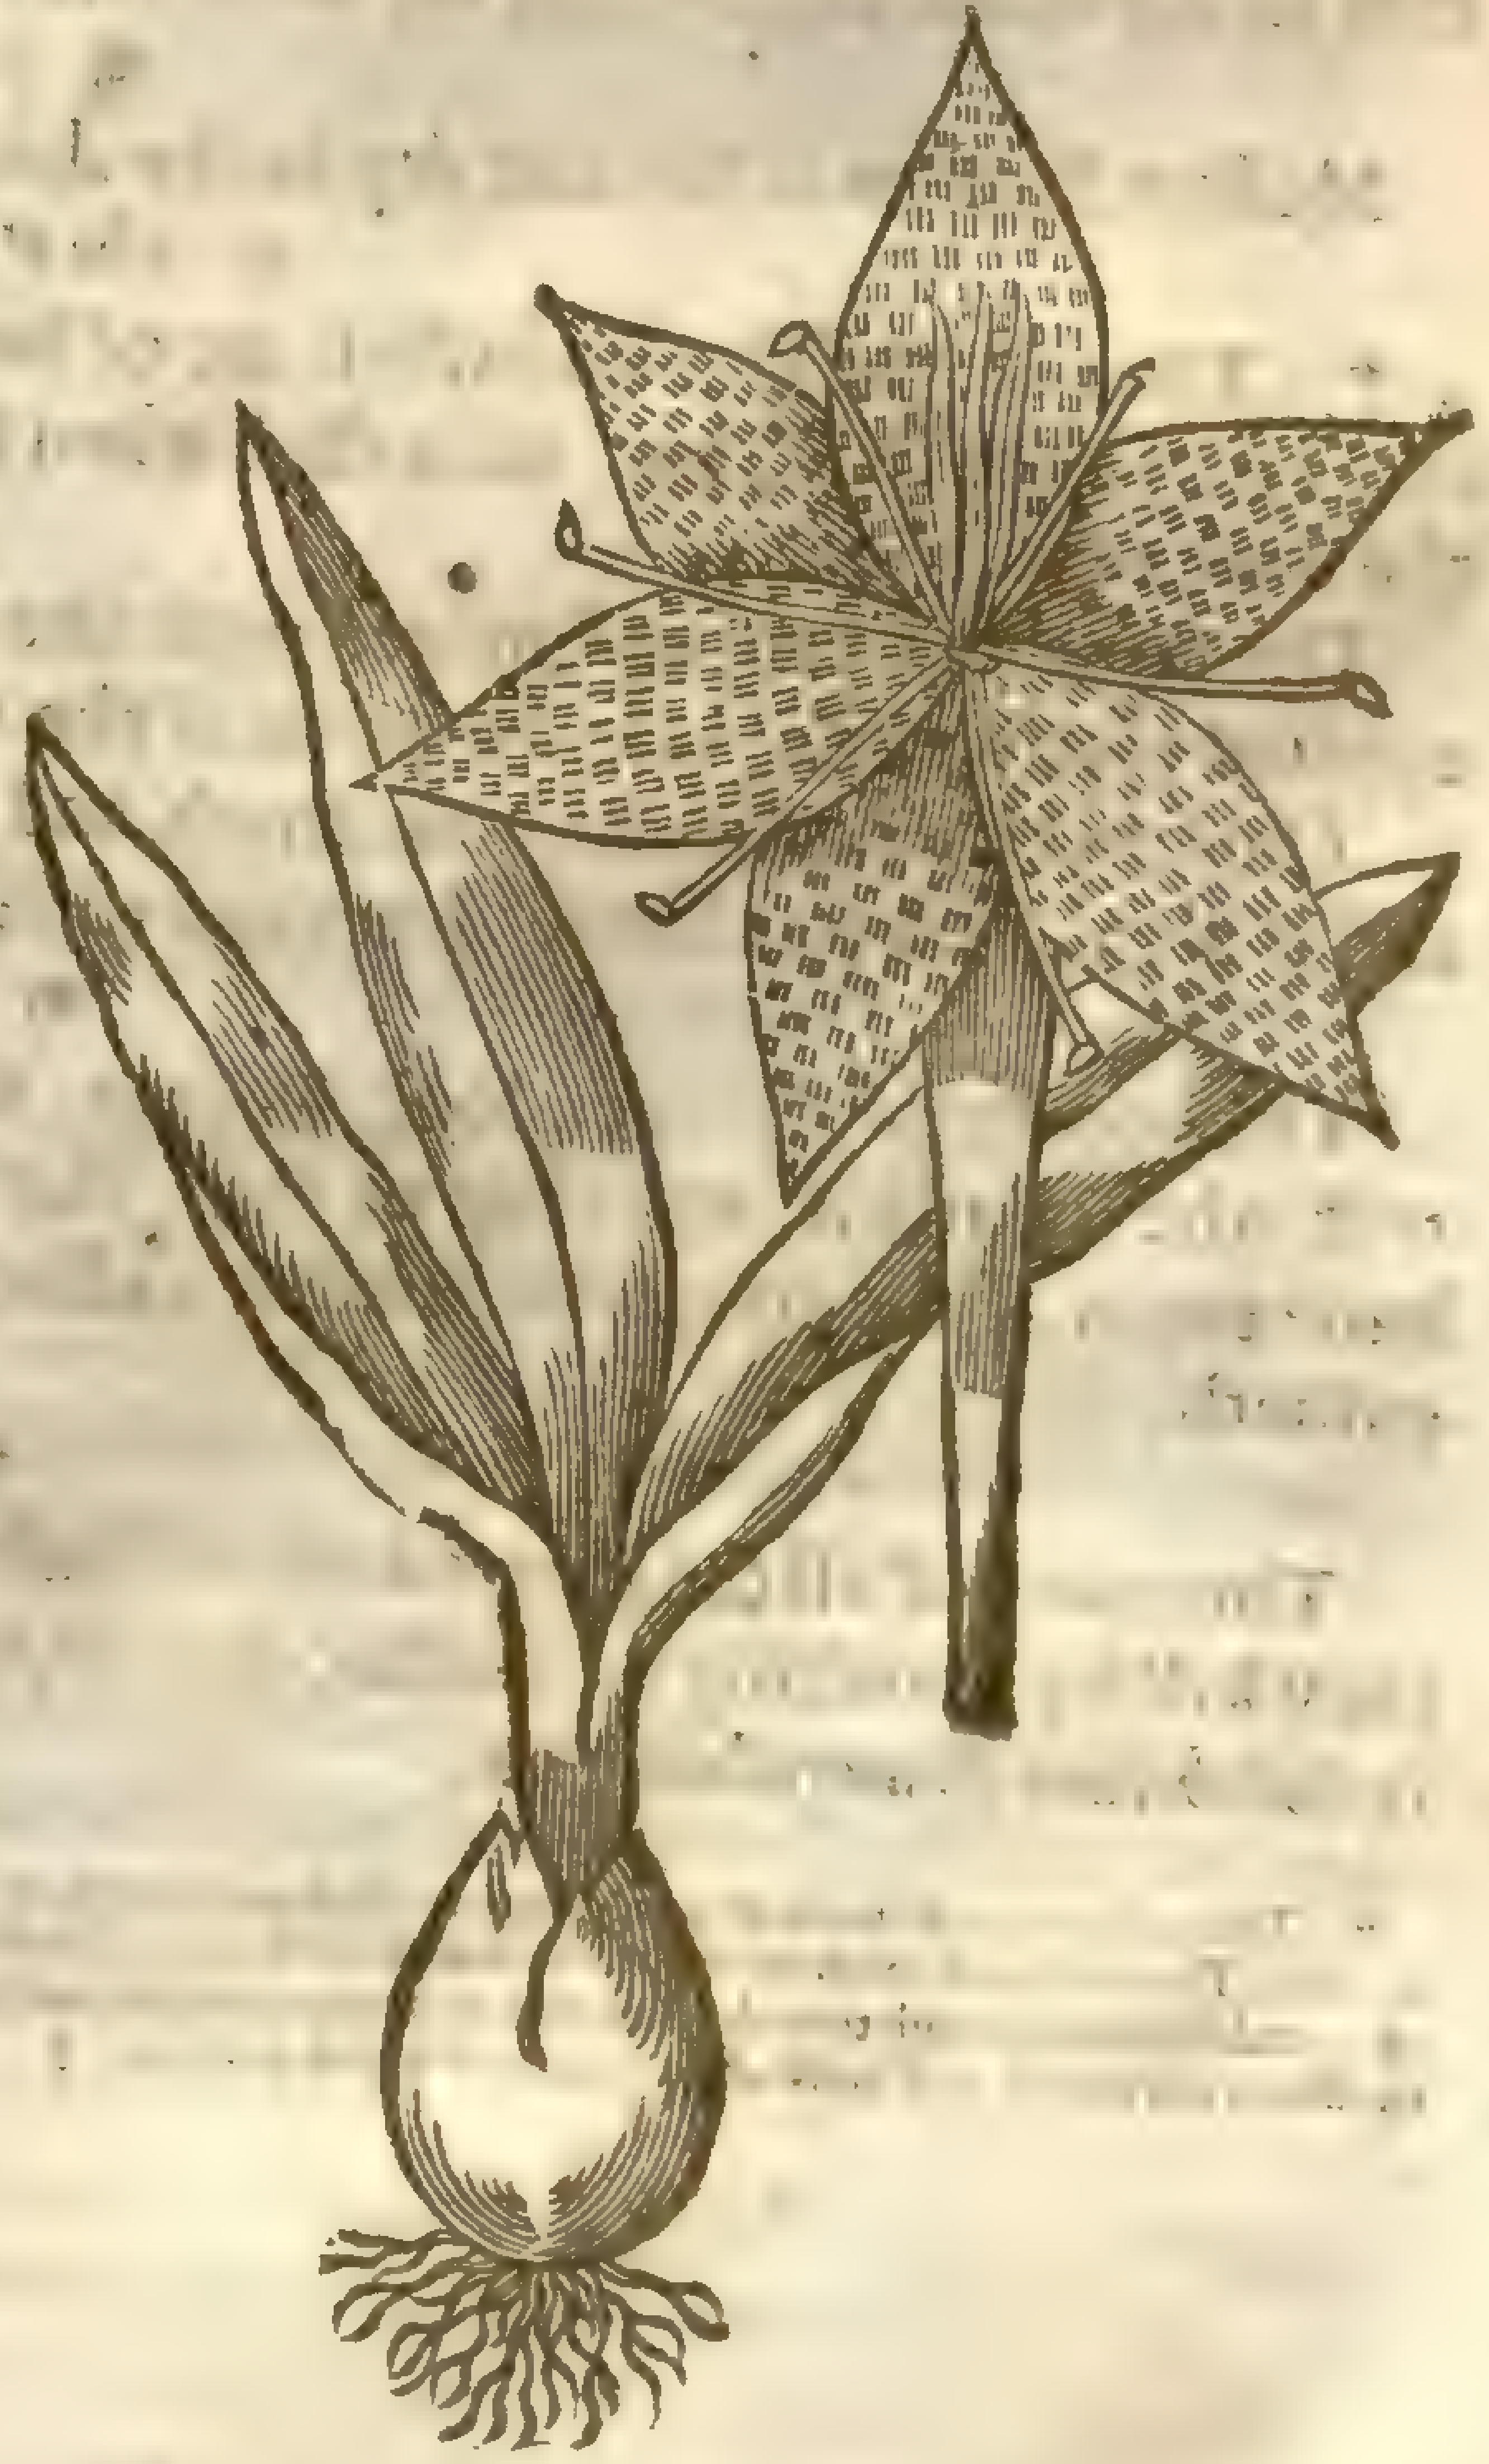


‡ 13 *Colchicum vernum.*
Spring Mede Saffron.

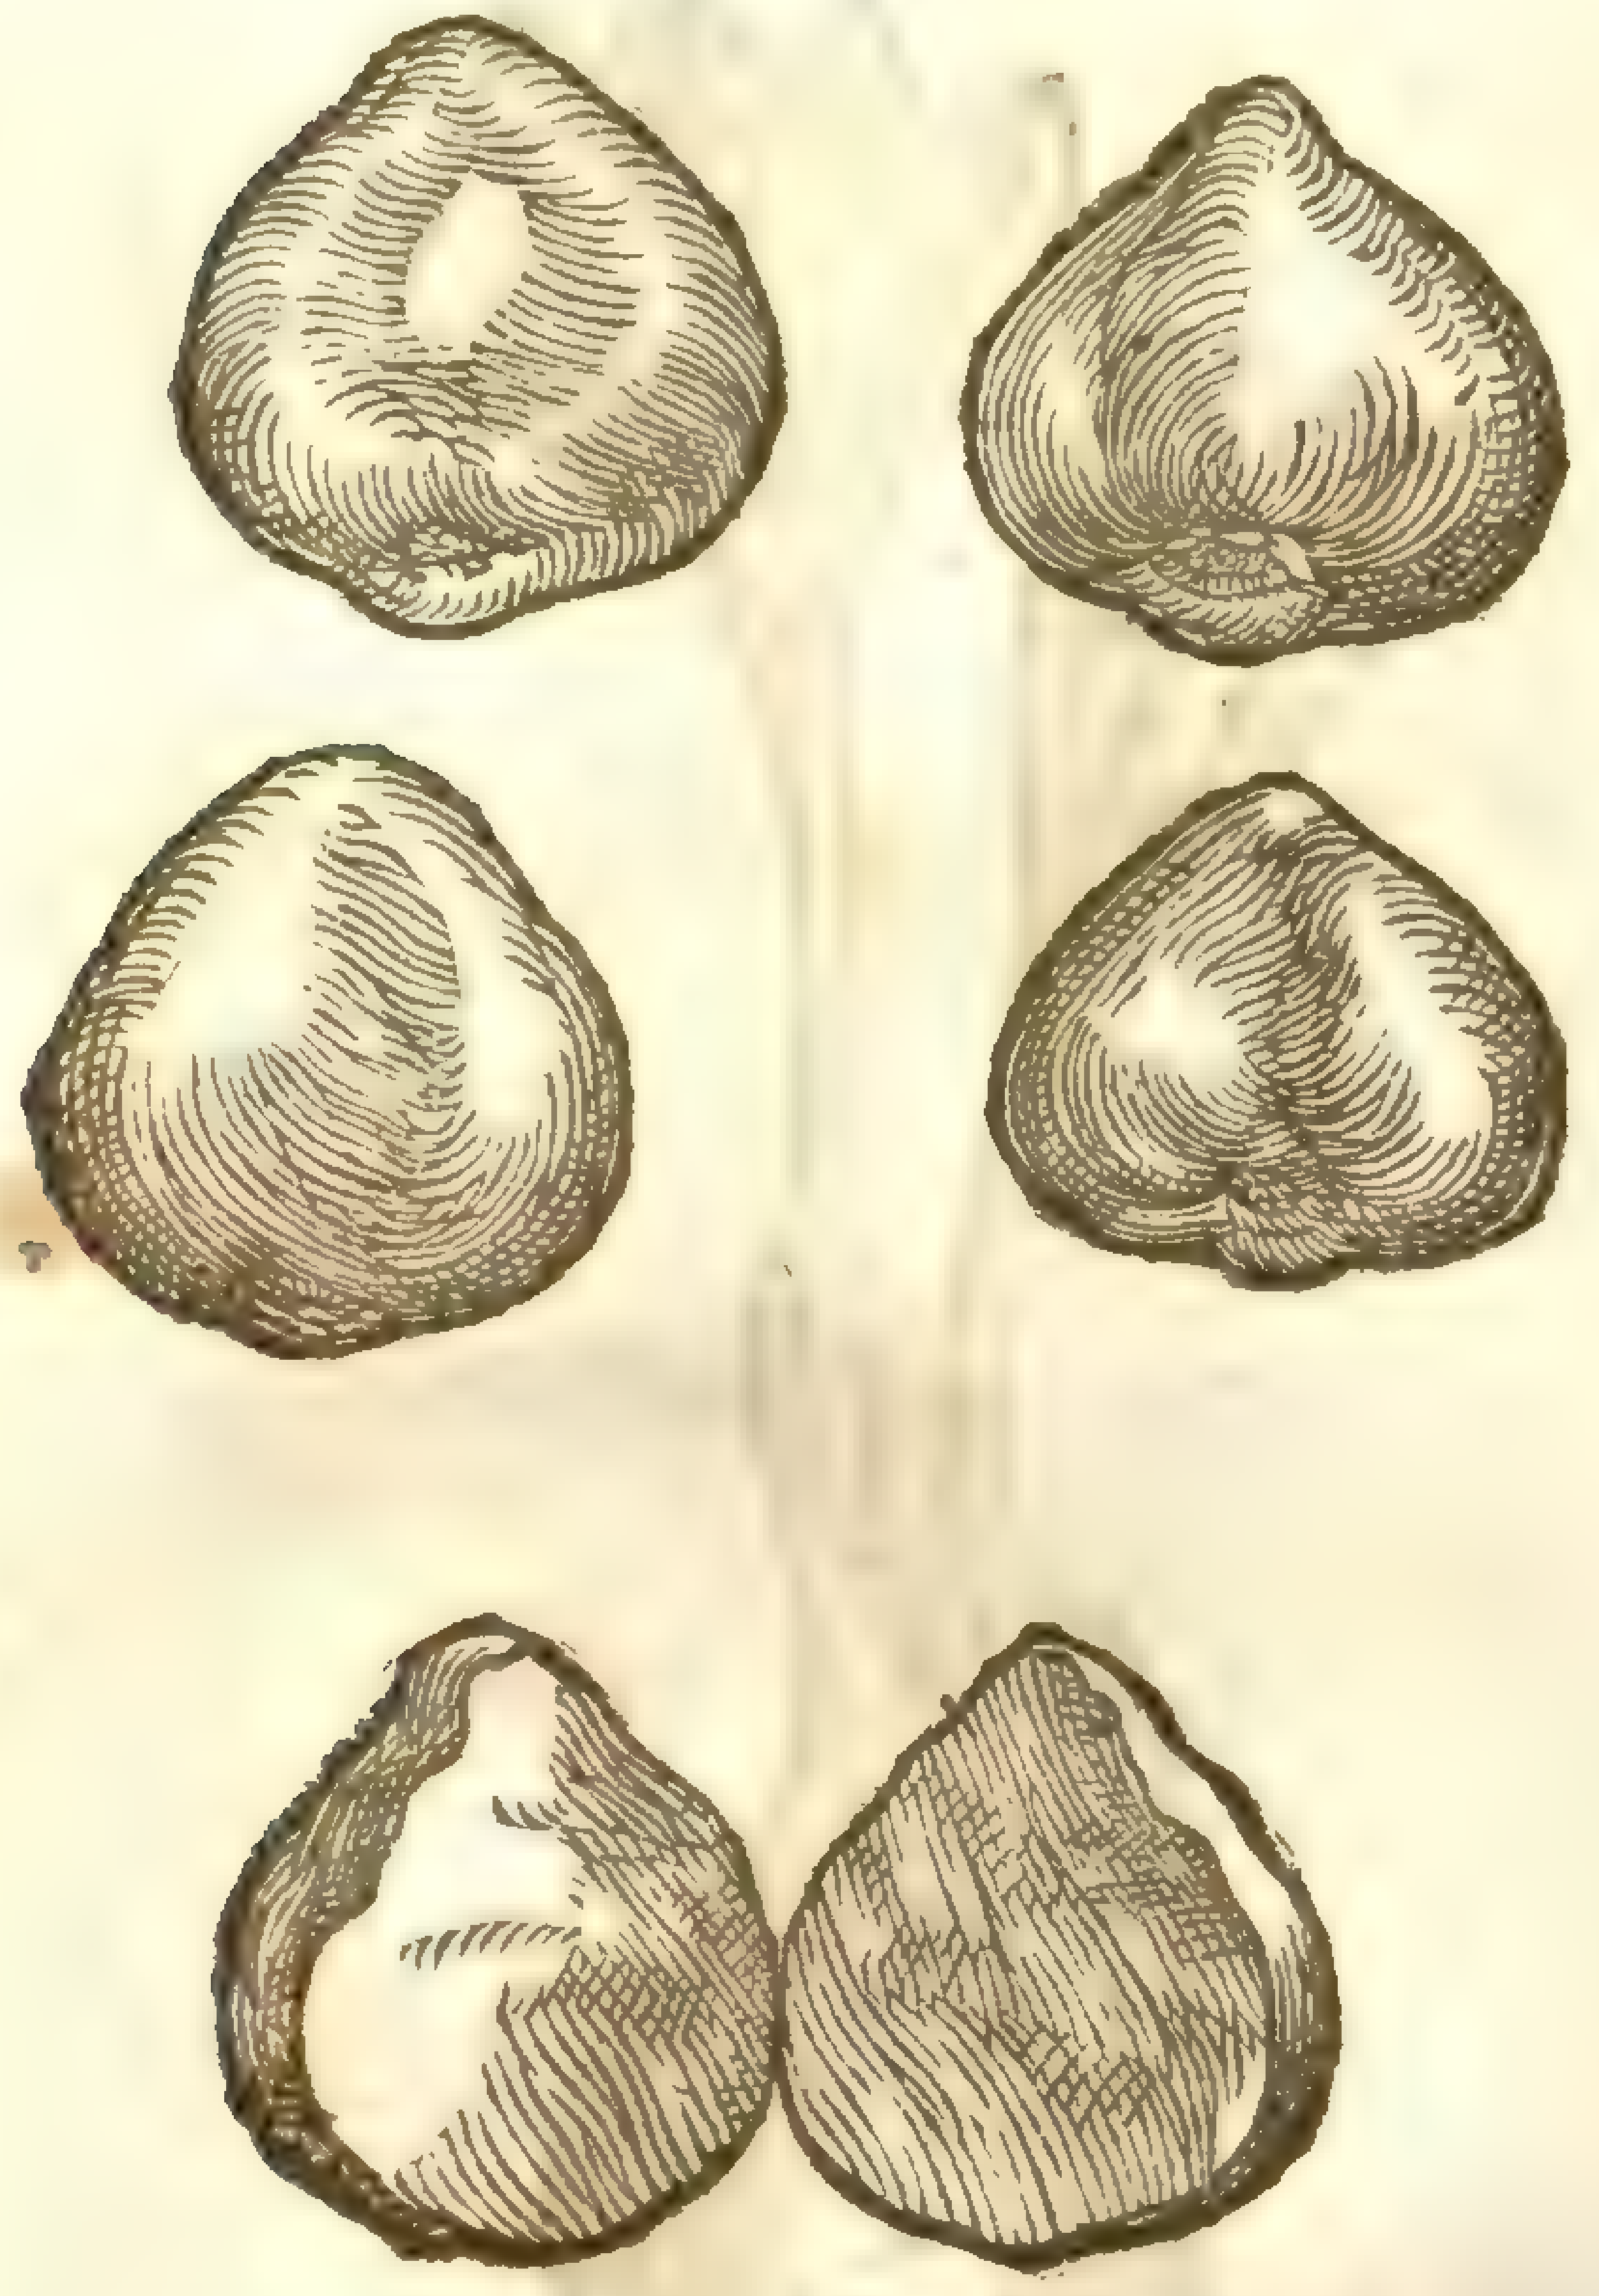
Bulbocodium vernum, [illegible]



‡ 14 *Colchicum variegatum Chienſe.*
Checquered Mede Saffron of Chio.



‡ 15 *Hermodactyli Officinarum.*
The true Hermodactyls of the ſhops.



call it, The Sonne before the Father.

‡ Our Author in this chapter was of many mindes; for firſt, in the deſcription of *Colchicum Anglicum*, being the ſecond, hee reproues ſuch as make that white floured *Colchicum* the true Hermodactyl. Then in the deſcription of the eighth hee hath theſe words, which being omitted in that place I here ſet downe. *Of all theſe kindes* (ſaith he) *of Medow Saffrons it hath not beene certainely knowne which hath been the true Hermodactyll; notwithſtanding wee haue certaine knowledge that the Illyrian Colchicum is the Phyſicall Hermodactyll.* Yet when he comes to ſpeake of the names, after that out of *Dodonæus* he had ſet downe the truth in theſe words; *But notwithſtanding that Hermodactyl which we do vſe in compound medicines, differeth from this* (to wit, *Colchicum*) *in many notable points, for that the true Hermodactyll hath a bulbe or round root, which being dried continueth very white within, and without not wrinkled at all, but full and ſmooth, of a meane hardneſſe*; and that he had out of the ſame Authour alledged the words of *Valerius Cordus* and *Auicen*, (which are here omitted) he concludes contrary to the truth, his firſt admonition, and ſecond aſſertion, That the white Medow Saffron which wee haue in the Weſt part of England, growing eſpecially about Shepton Mallet, is the Hermodactyll vſed in ſhops.

Thoſe we haue in ſhops ſeeme to be the Hermodactyls of *Paulus Ægineta*; yet not thoſe of *Nicholaus* and *Actuarius*, which were cordial, and increaſers of ſperme; the which the Authours of the *Aduerſaria, pag.* 55. thinke to be the *Behen album & rubrum* of the Arabians. And to theſe vnknowne ones are the vertues ſet downe by our Author in the third place vnder C, to be referred. ‡

¶ *The Temperature.*

Medow Saffron is hot and dry in the third degree.

¶ *The Vertues of Hermodactyls.*

A † The roots of Hermodactyls are of force to purge, and are properly giuen (ſaith *Paulus*) to thoſe that haue the Gout, euen then when the humors are in flowing. And they are alſo hurtfull to the ſtomacke.

B The ſame ſtamped, and mixed with the whites of egges, barley meale, and crums of bread, and applied plaiſterwiſe, eaſe the paine of the Gout, ſwellings and aches about the joynts.

C The ſame ſtrengthneth, nouriſheth, and maketh good juyce, encreaſeth ſperme or naturall ſeed, and is alſo good to cleanſe vlcers and rotten ſores.

¶ *The Correction.*

The pouder of Ginger, long Pepper, Anniſe ſeed or Cumine ſeed, and a little Maſticke, correct the churliſh working of that Hermodactyll which is vſed in Shops. But thoſe which haue eaten of the common Medow Saffon muſt drinke the milke of a cow, or elſe death preſently enſueth.

¶ *The Danger.*

The roots of all the ſorts of Mede Saffrons are very hurtfull to the ſtomacke, and being eaten they kill by choaking as Muſhromes do, according vnto *Dioſcorides*; whereupon ſome haue called it *Colchicum ſtrangulatorium.*

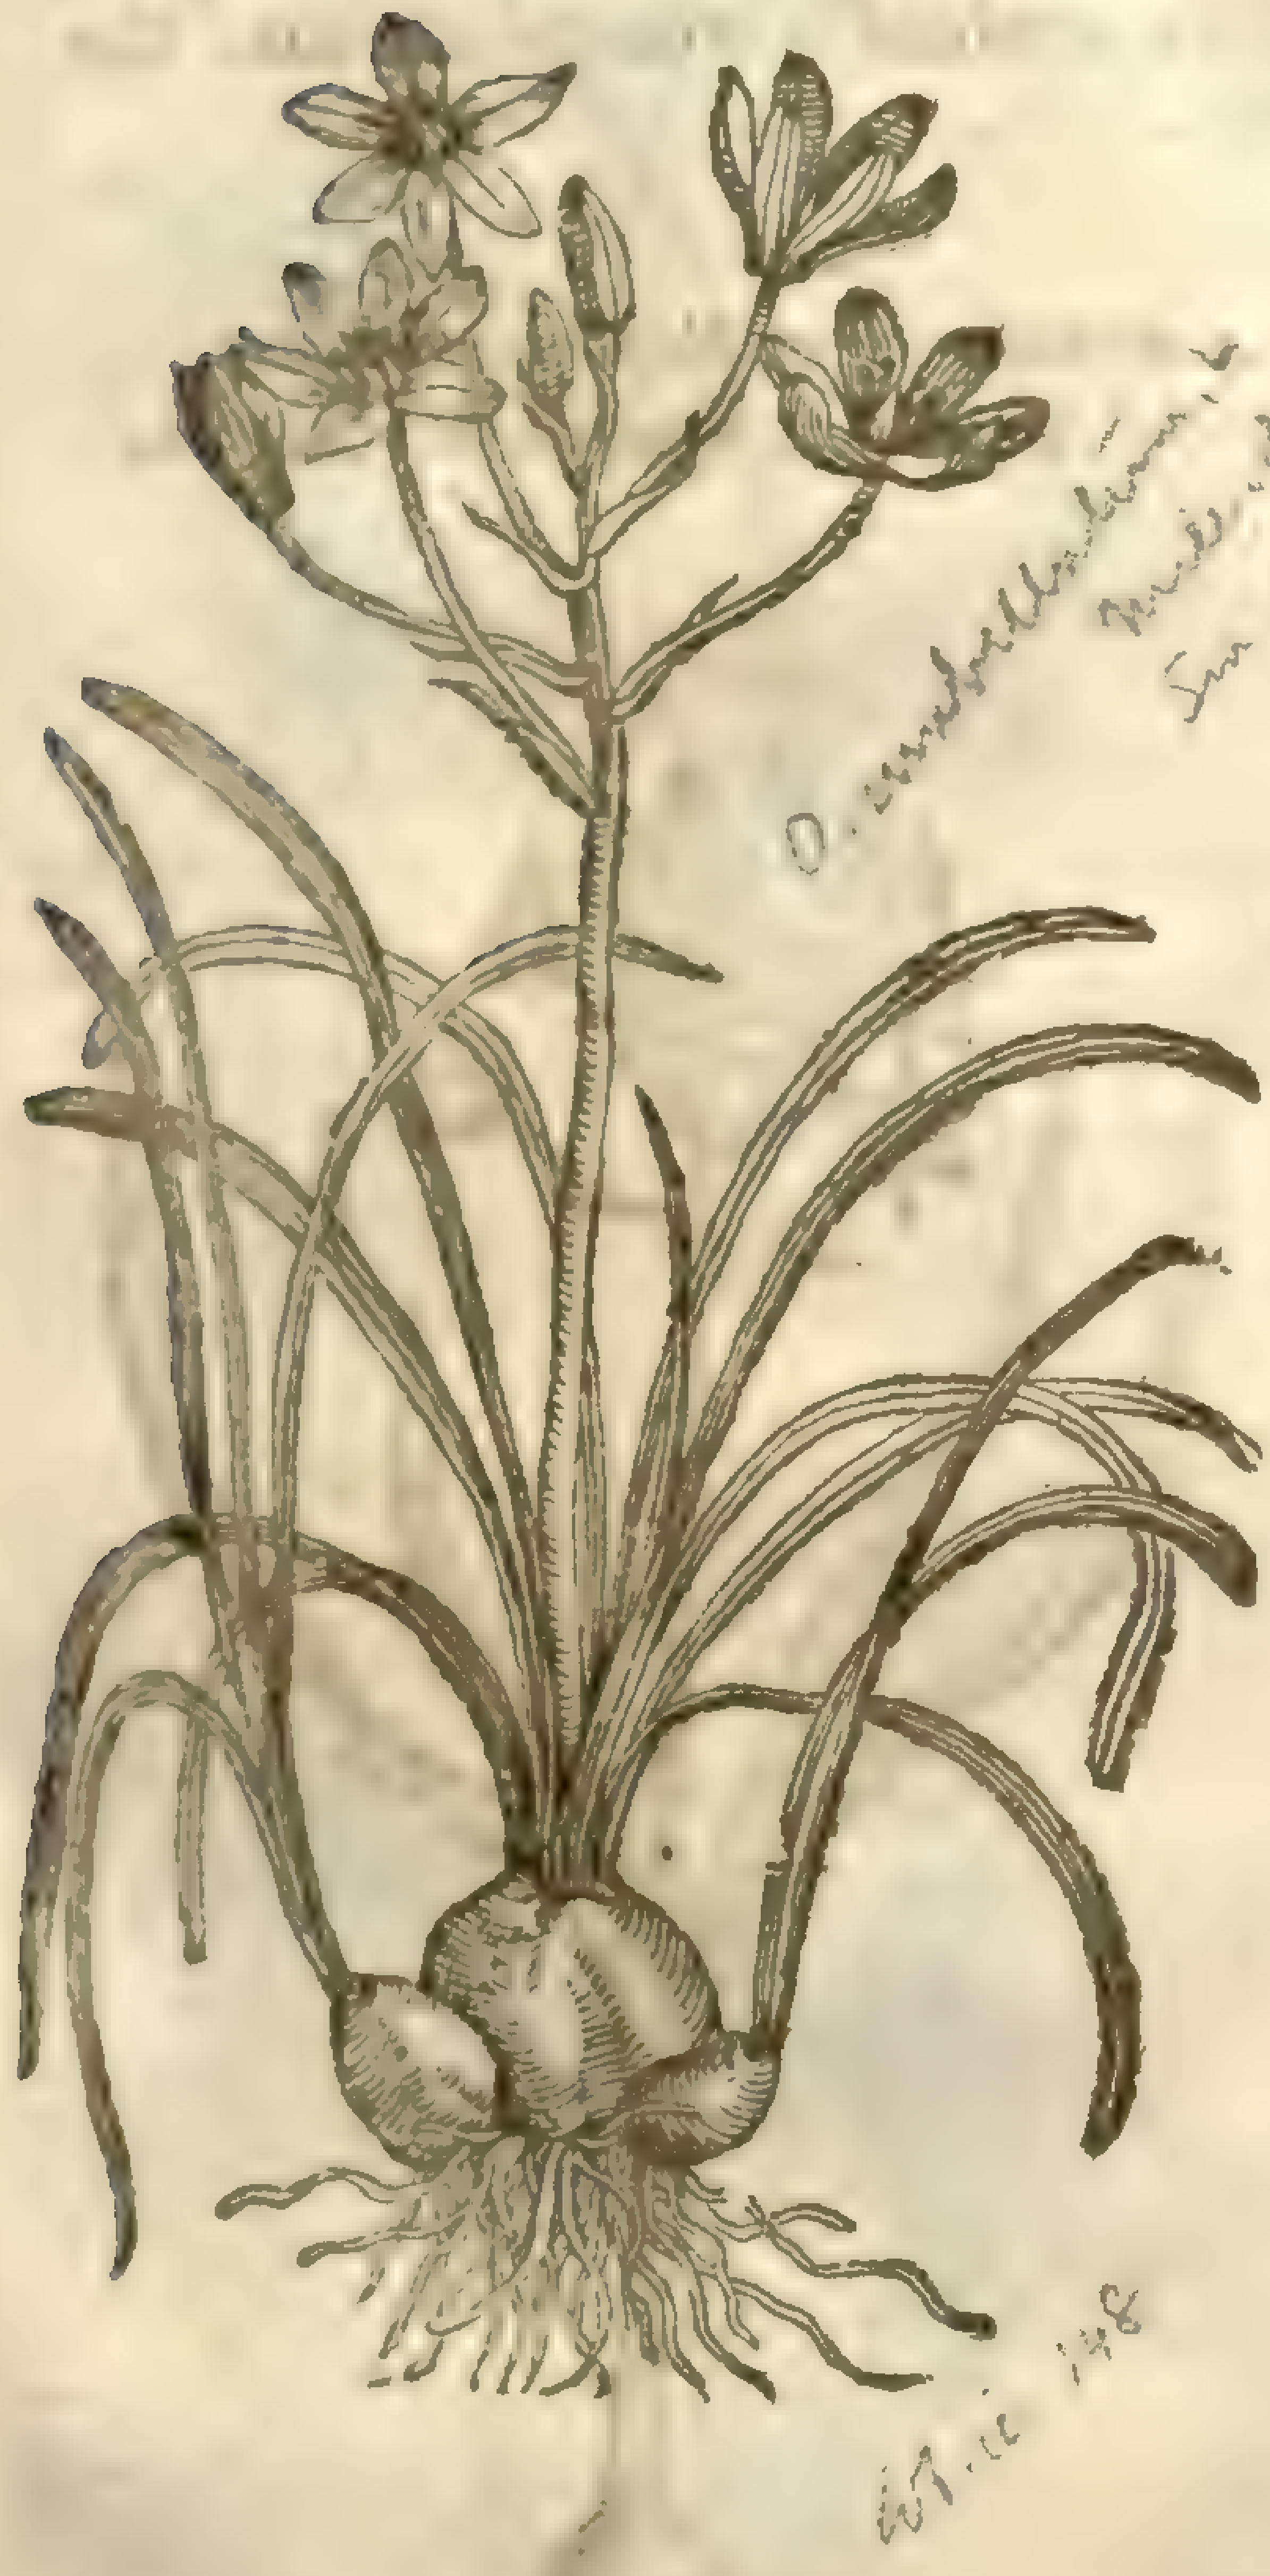
† That which was ſet forth by our Author in the fourth place, vnder the title of *Colchicum montanum minus*, was nothing but the former *Colchicum minus* expreſſed in ſeed. The ninth and tenth were the ſame with the firſt and ſecond. The ſixth and ſeuenth, which are *Colchicum Illyricum* and *Syriacum* I haue left with their figures and hiſtorie, though they be ſuſpected to be counterfeits: and *Cluſius* probably gueſſes, that the later is the Apennine Tulip, the Painter making the leaues of the floure too round, and thoſe of the plant too broad and ſhort †

CHAP. 92. *Of Star of Bethlem.*

¶ *The Kindes.*

There be ſundry kindes of wilde field Onions called Stars of Bethlem, differing in ſtature, taſt and ſmell, as ſhall be declared.

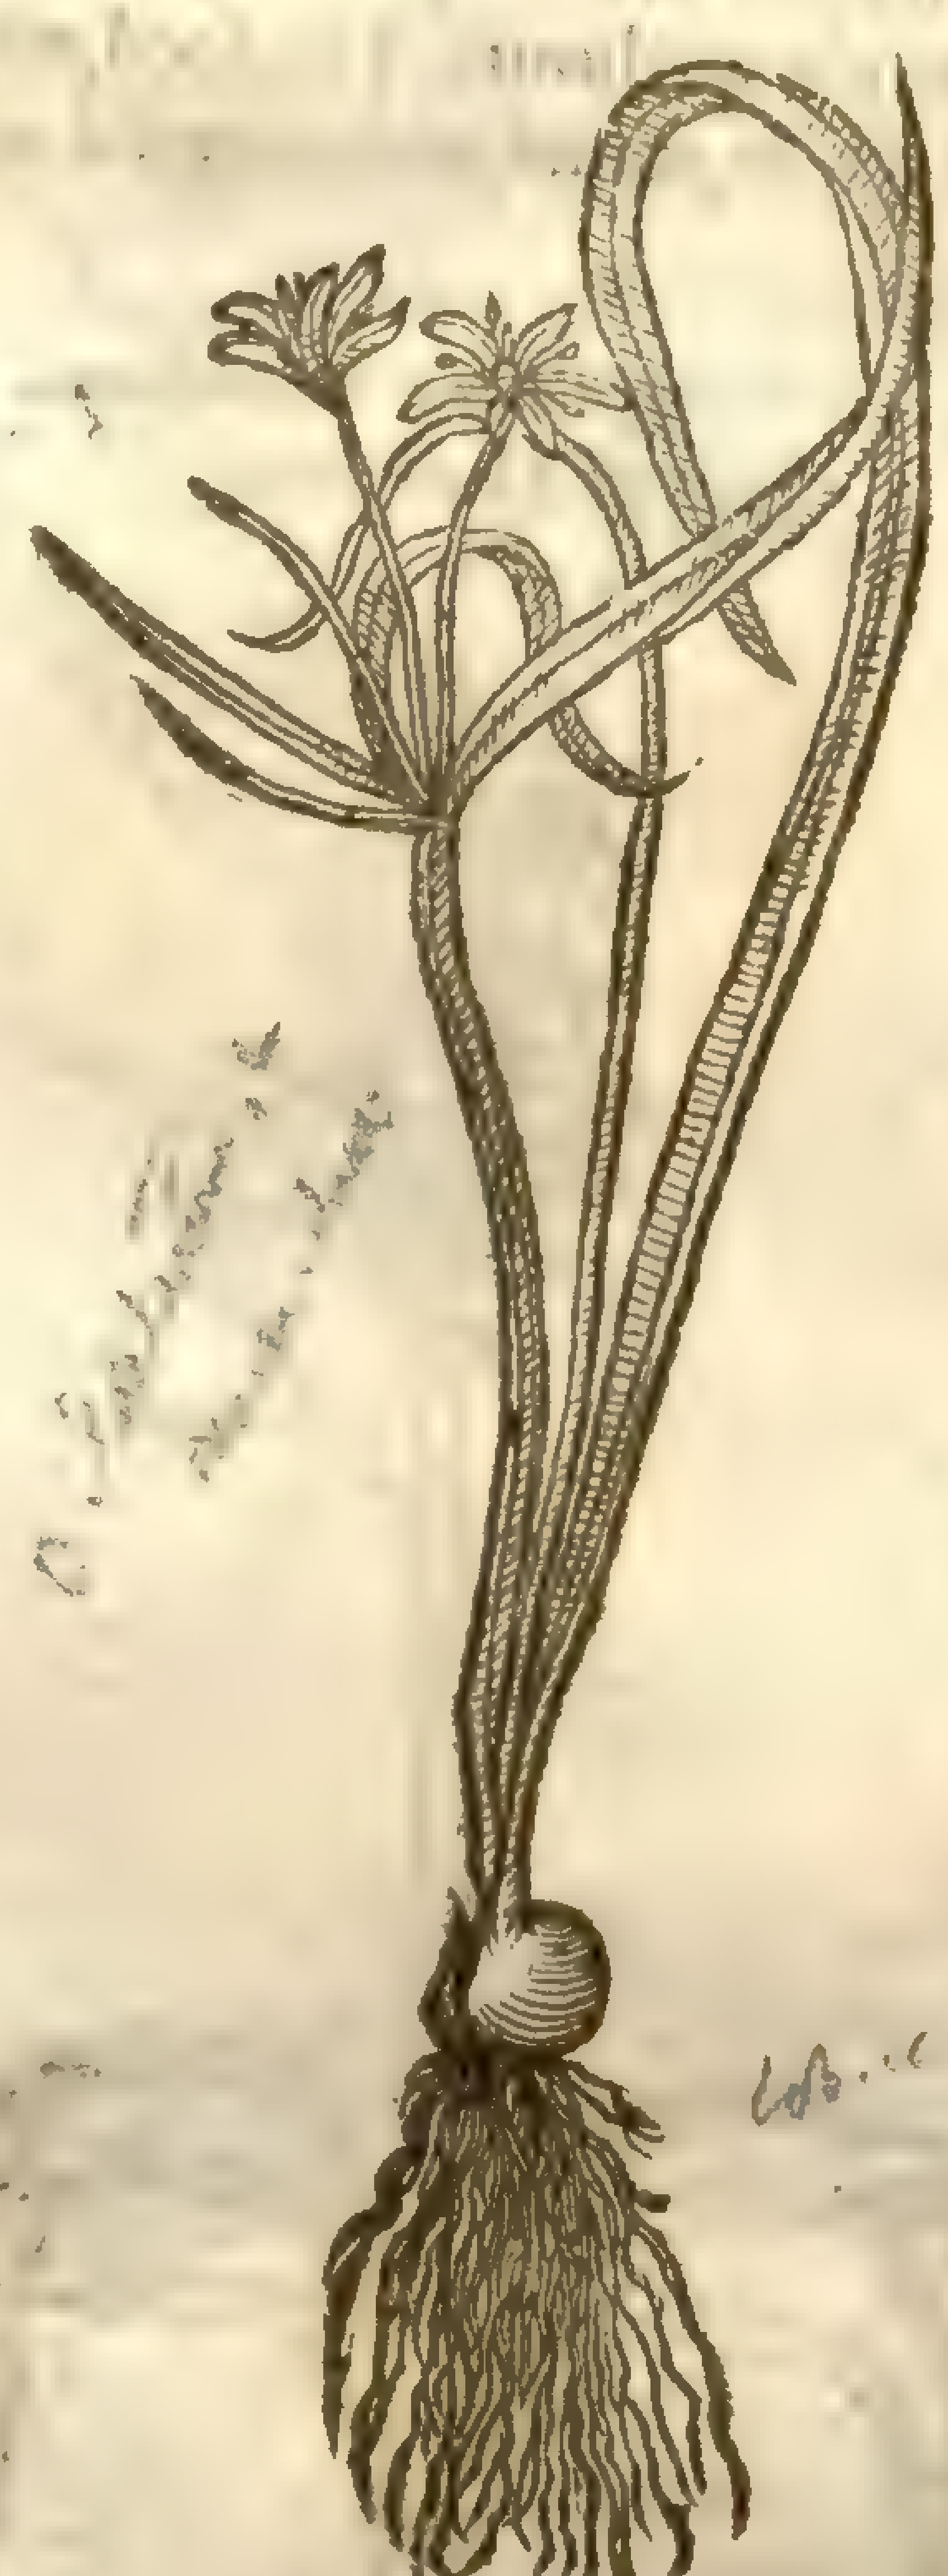
1 *Ornithogalum.*
Star of Bethlem.



O. umbellatum [illegible] Sm. fl. B. [illegible]

Lob. ic. 148

2 *Ornithogalum luteum, ſiue Cepe agraria.*
Yellow or wilde Star of Bethlem.



O. luteum [illegible]

Lob. ic. 149

¶ *The Deſcription.*

1 Our common Starre of Bethlehem hath many narrow leaues, thicke, fat, full of juice, and of a very greene colour, with a white ſtreake downe the middle of each leafe: among the which riſe vp ſmall naked ſtalkes, at the top whereof grow floures compact of ſix little leaues, ſtripped on the backe ſide with lines of greene, the inſide being milke-white. Theſe floures open themſelues at the riſing of the Sunne, and ſhut againe at the Sun-ſetting; whereupon this plant hath been called by ſome, *Bulbus Solſequius*. The floures being paſt, the ſeed doth follow, incloſed in three cornered huskes. The root is bulbous, white both within and without.

† 2 The ſecond ſort hath two or three graſſy leaues proceeding from a clouen bulbous root. The ſtalke riſeth vp in the midſt naked, but toward the top there doe thruſt forth more leaues like vnto the other, but ſmaller and ſhorter; among which leaues doe ſtep forth very ſmall weake and tender foot-ſtalks. The floures of this are on the backeſide of a pale yellow, ſtripped with greene, on the inſide of a bright ſhining yellow colour, with Saffron coloured threds in their middles. The ſeed is contained in triangular veſſels.

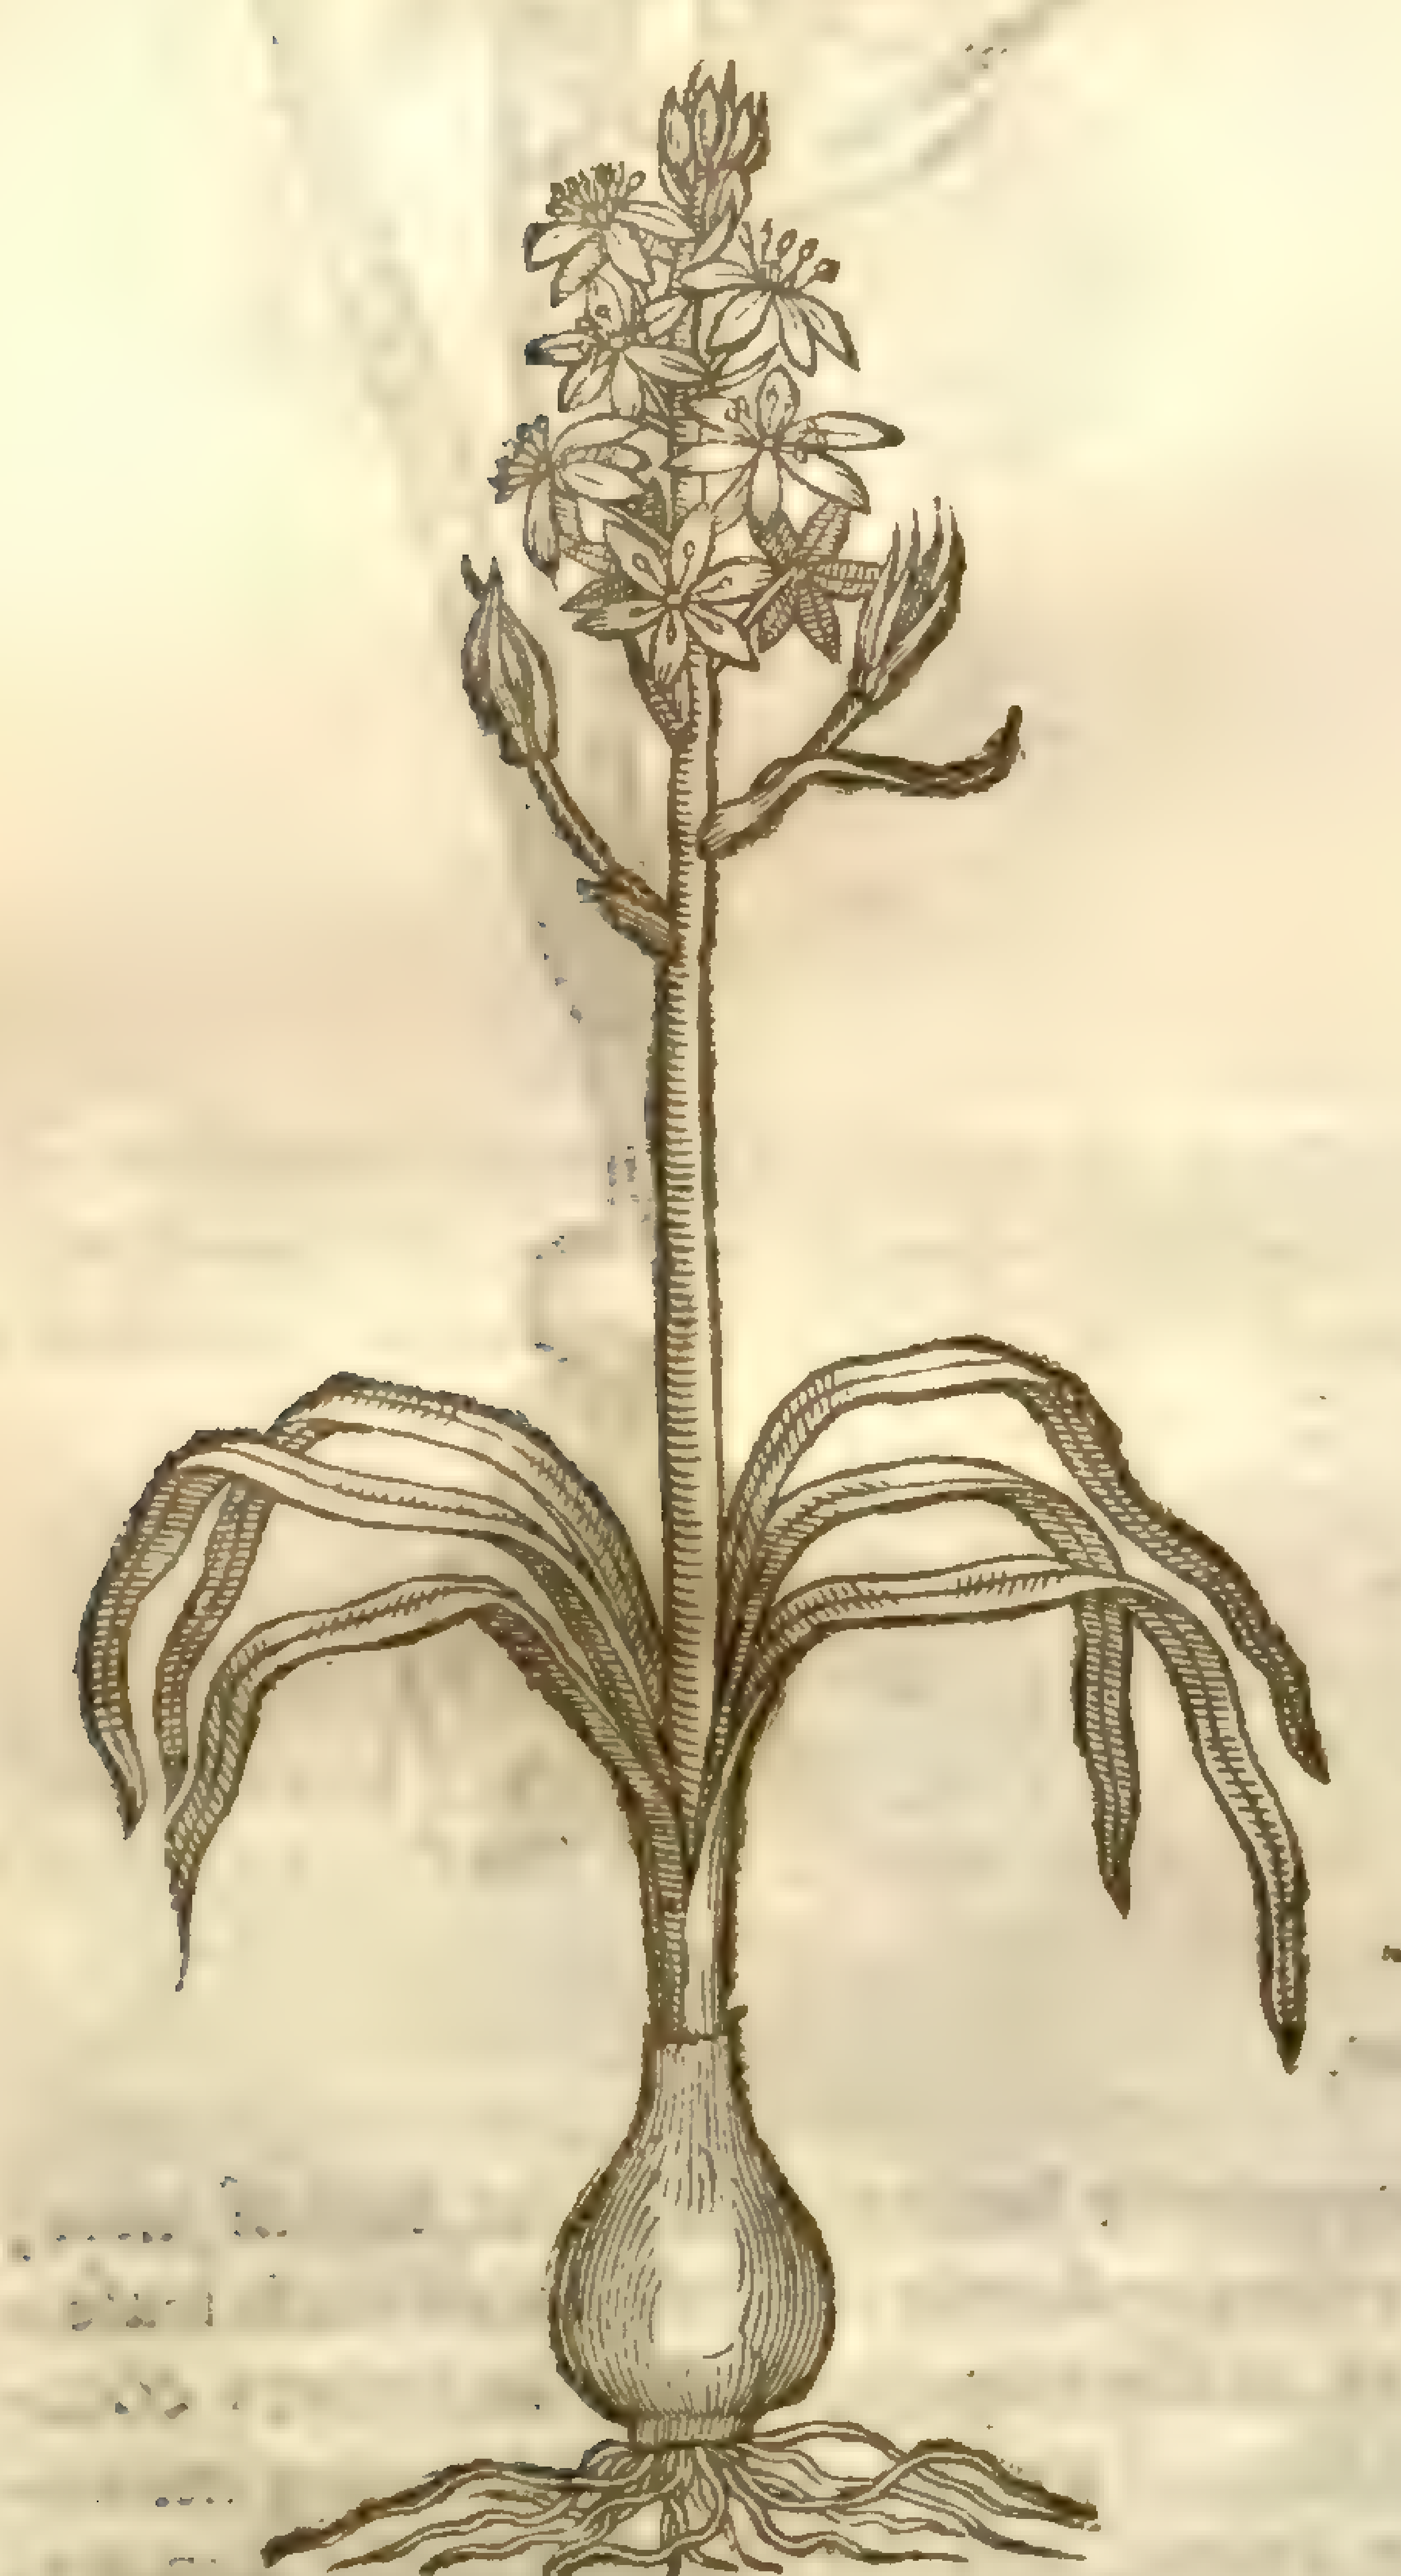
† 3 This Starre of Hungarie, contrarie to the cuſtome of other plants of this kinde, ſendeth forth before Winter fiue or ſix leaues ſpread vpon the ground, narrow, and of ſome fingers length, ſomewhat whitiſh greene, and much reſembling the leaues of Gilloſloures, but ſomewhat roughiſh. In Aprill the leaues beginning to decay, amongſt them riſes vp a ſtalke bearing at the top a

ſpoke of floures,which conſiſting of ſix leaues apiece ſhew themſelues open in May. They in colour are like the firſt deſcribed, as alſo in the greene ſtreake on the lower ſide of each leafe. The ſeed is blacke,round,and contained in triangular heads. The root is bulbous,long, and white. †

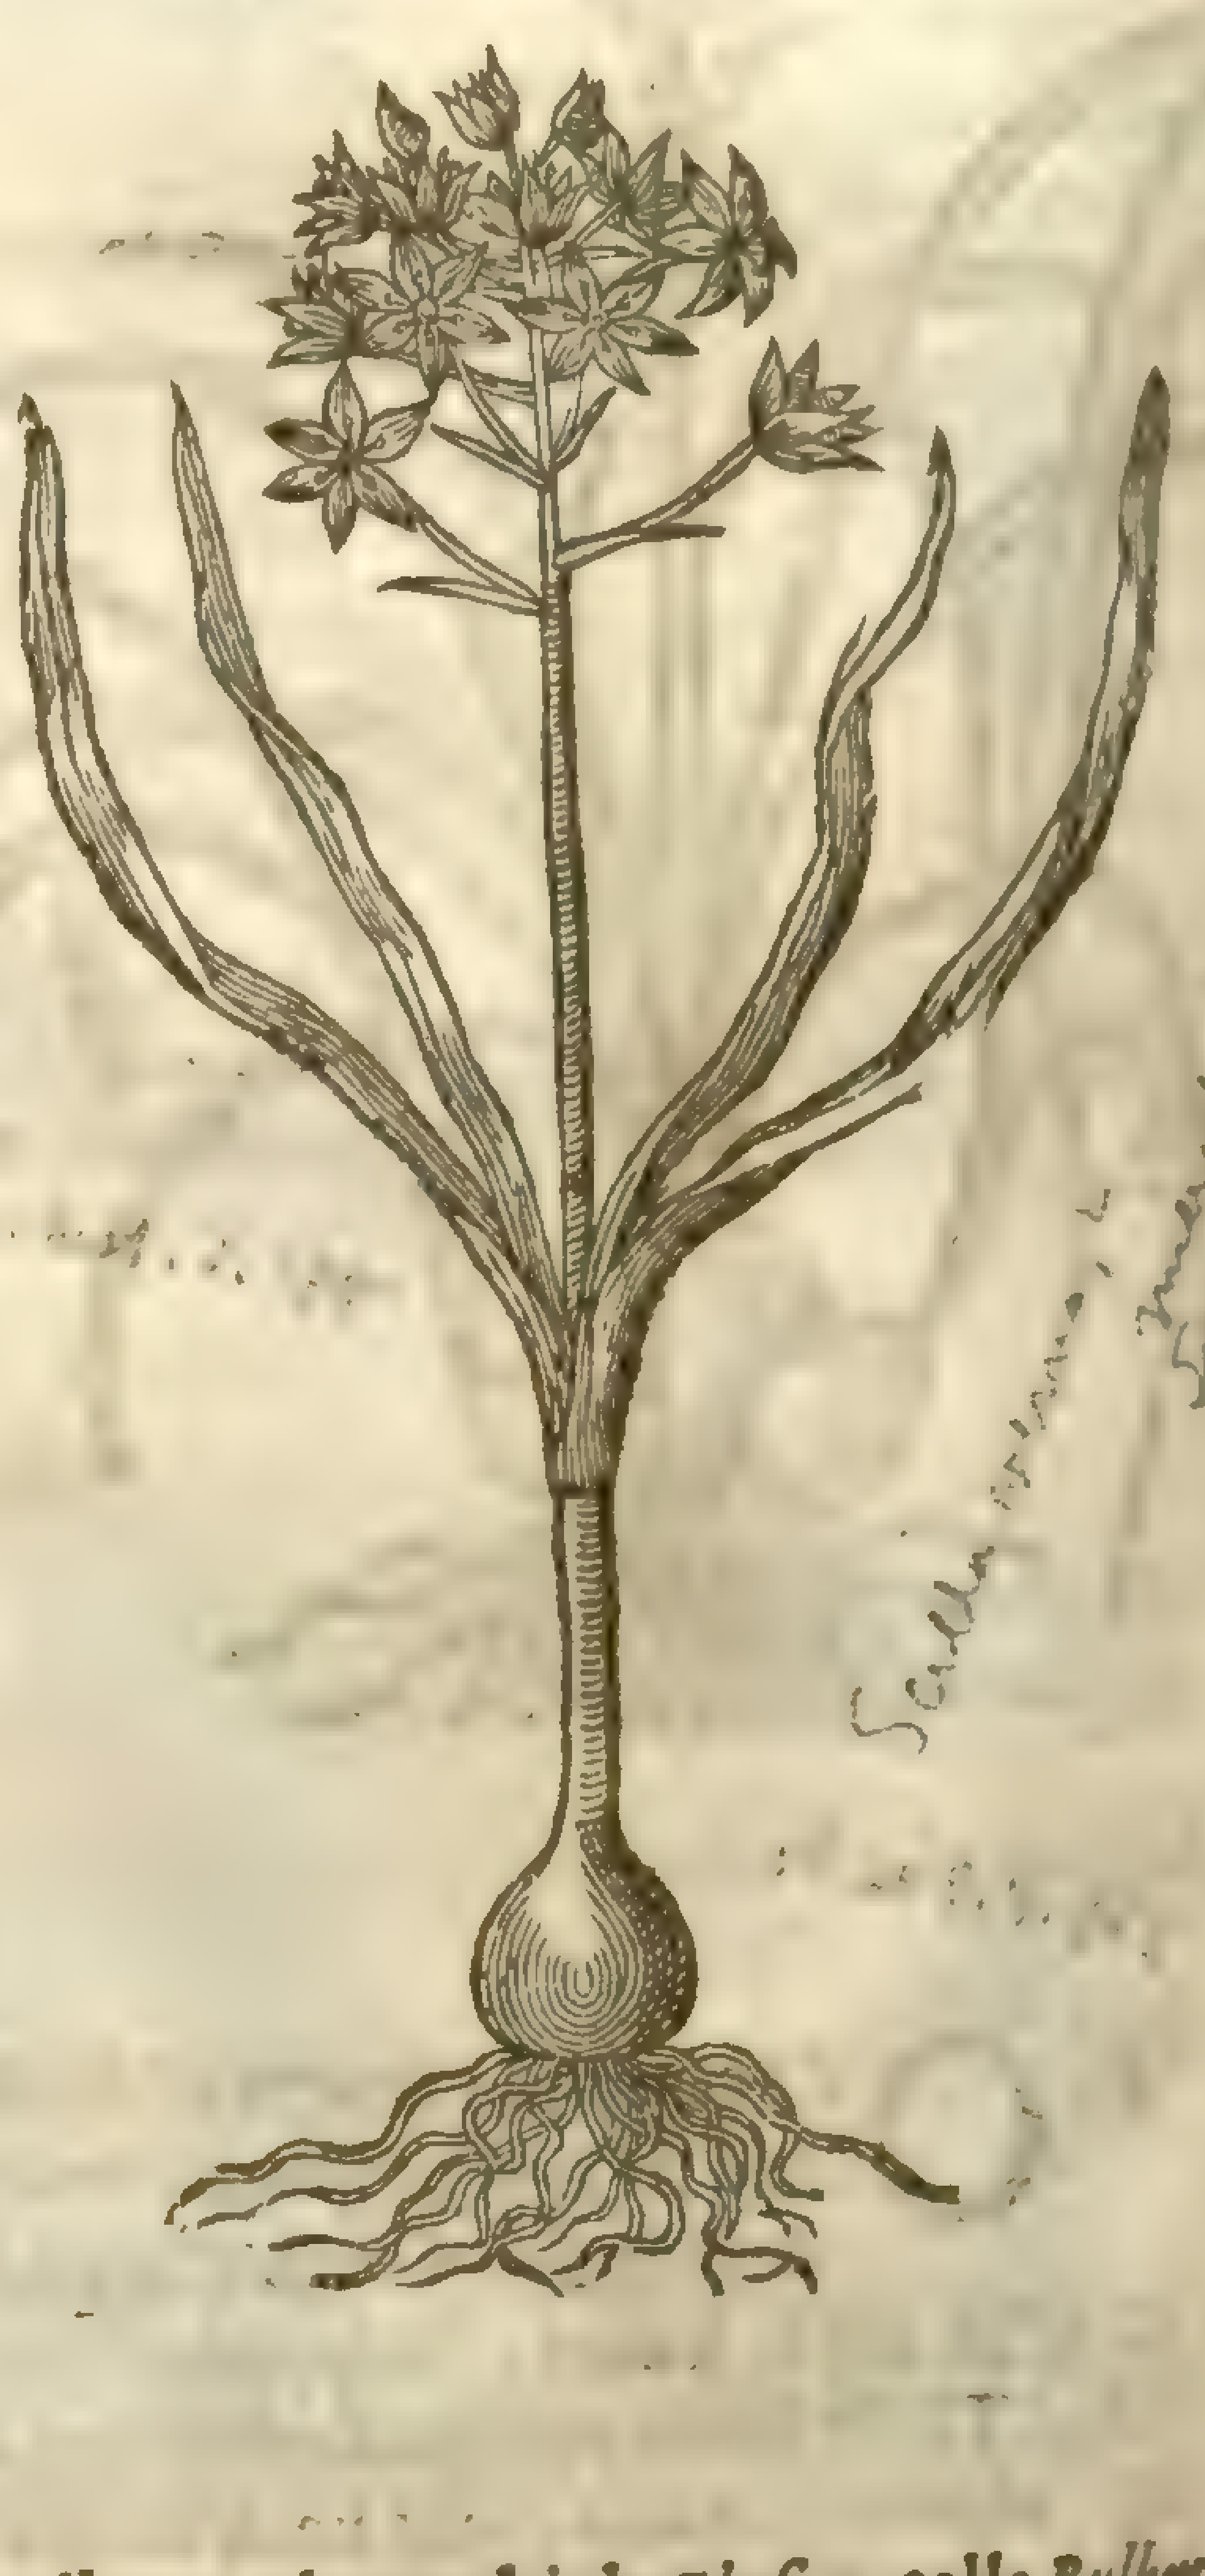
‡ 4 This fourth,which is the *Ornithogalum Hiſpanicum minus* of *Cluſius*,hath a little white root which ſends forth leaues like the common one,but narrower, and deſtitute of the white line wherwith the other are marked. The ſtalke is ſome two handfulls high,bearing at the top thereof ſome ſeuen or eight floures,growing each aboue other,yet ſo,as that they ſeem to make an vmbel: each of theſe floures hath ſix leaues of a whitiſh blew colour, with ſo many white chiues or threds, and a little blewiſh vmbone in the midſt. This floures in Aprill.

5 This fifth, firſt ſends vp one only leafe two or three inches long,narrow, and of a whitiſh colour,and of an acide taſte: nigh whereto riſeth vp a ſmall ſtalke ſome inch or two high, hauing one or two leaues thereon,betweene which come forth ſmall ſtarre floures,yellow within,and of a greeniſh purple without. The ſeed,which is reddiſh and ſmall,is contained in triangular heads. The root is white,round,and couered with an Aſh-coloured filme.

3 *Ornithogalum Pannonicum.*
Star of Hungarie.



‡ 4 *Ornithogalum Hiſpanicum minus.*
The leſſer Spaniſh Star-floure.

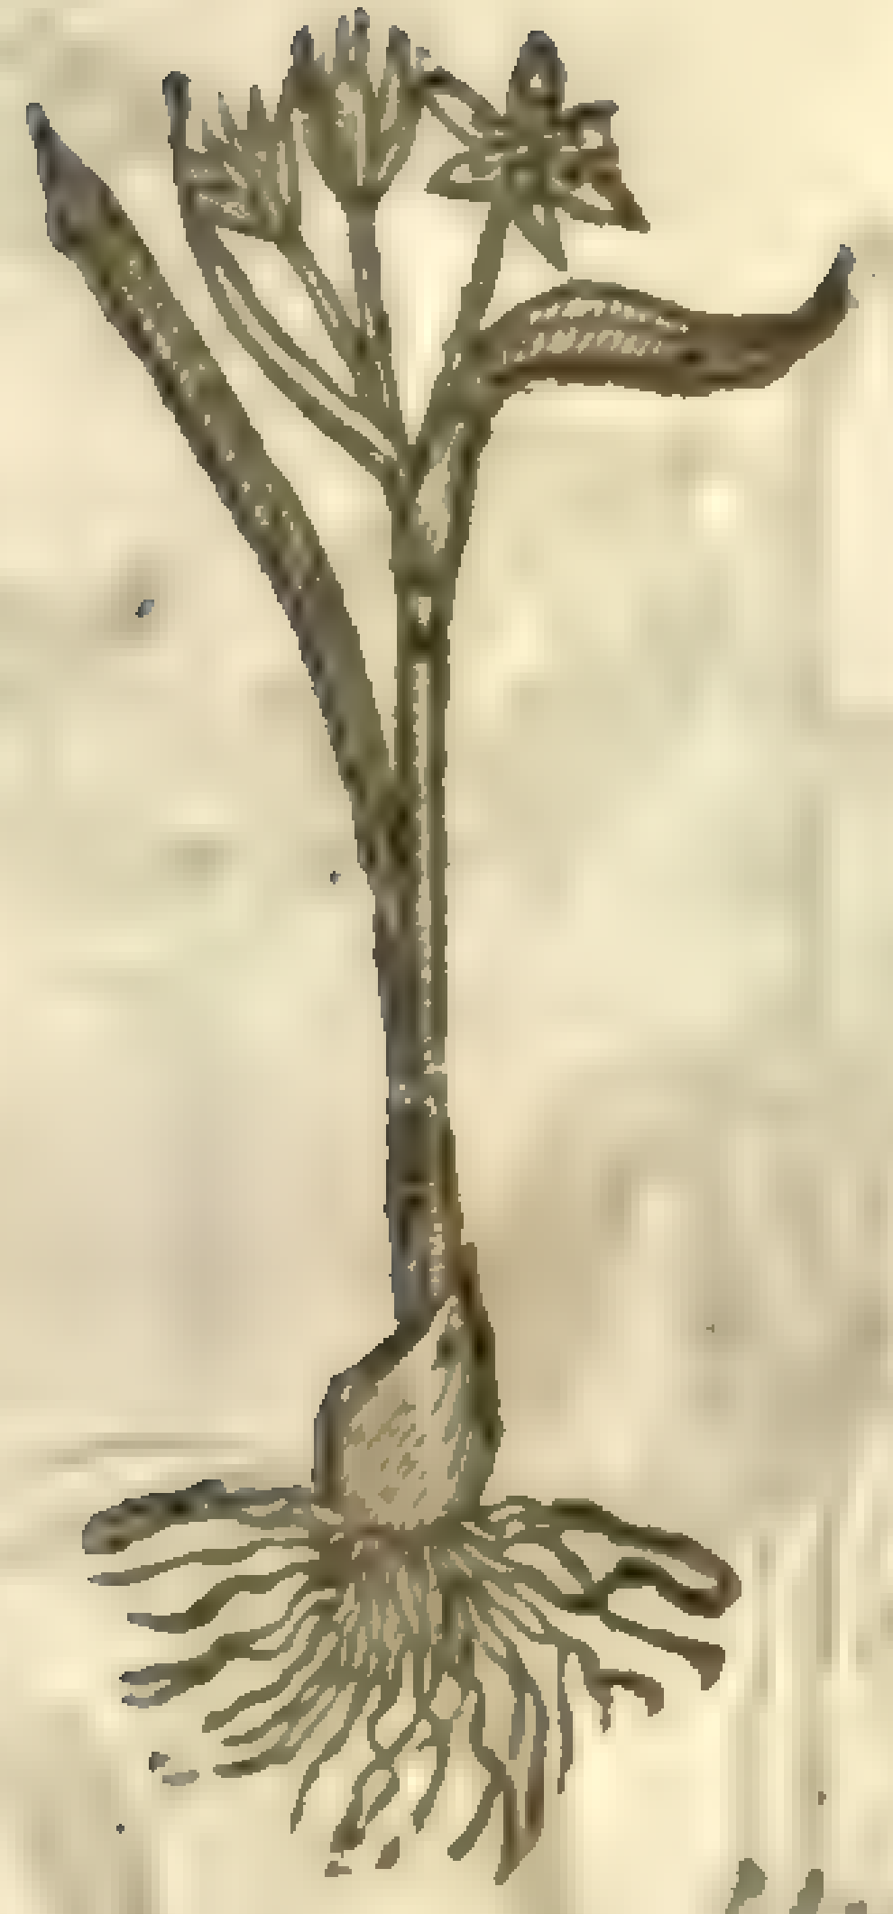


Scilla [illegible]

6 I thinke it not amiſſe hereto to adde another ſmall bulbous plant,which *Cluſius* calls *Bulbus* μονόφυλλος, The one leaued Bulbe. This from a ſmall root ſends forth one ruſh leafe of ſome foot in length,which about two inches aboue the earth,being ſomewhat broader than in the other places, and guttered,ſends forth a little ſtalke ſome three inches long, whoſe top is ſet with three little floures,each ſtanding aboue other,about the bigneſſe here preſented vnto your view in the figure: each of thoſe conſiſteth of ſix very white leaues,and are not much vnlike the floures of the Graſſe of Parnaſſus,but yet without leaues to ſuſtain the floure,as it hath: ſix white threds tipt with yellow, and a three ſquare head with a white pointall poſſeſſe the midſt of the floure; the ſmel thereof is ſomewhat like that of the floures of the Hawthorne. It floures in the midſt of Iune.

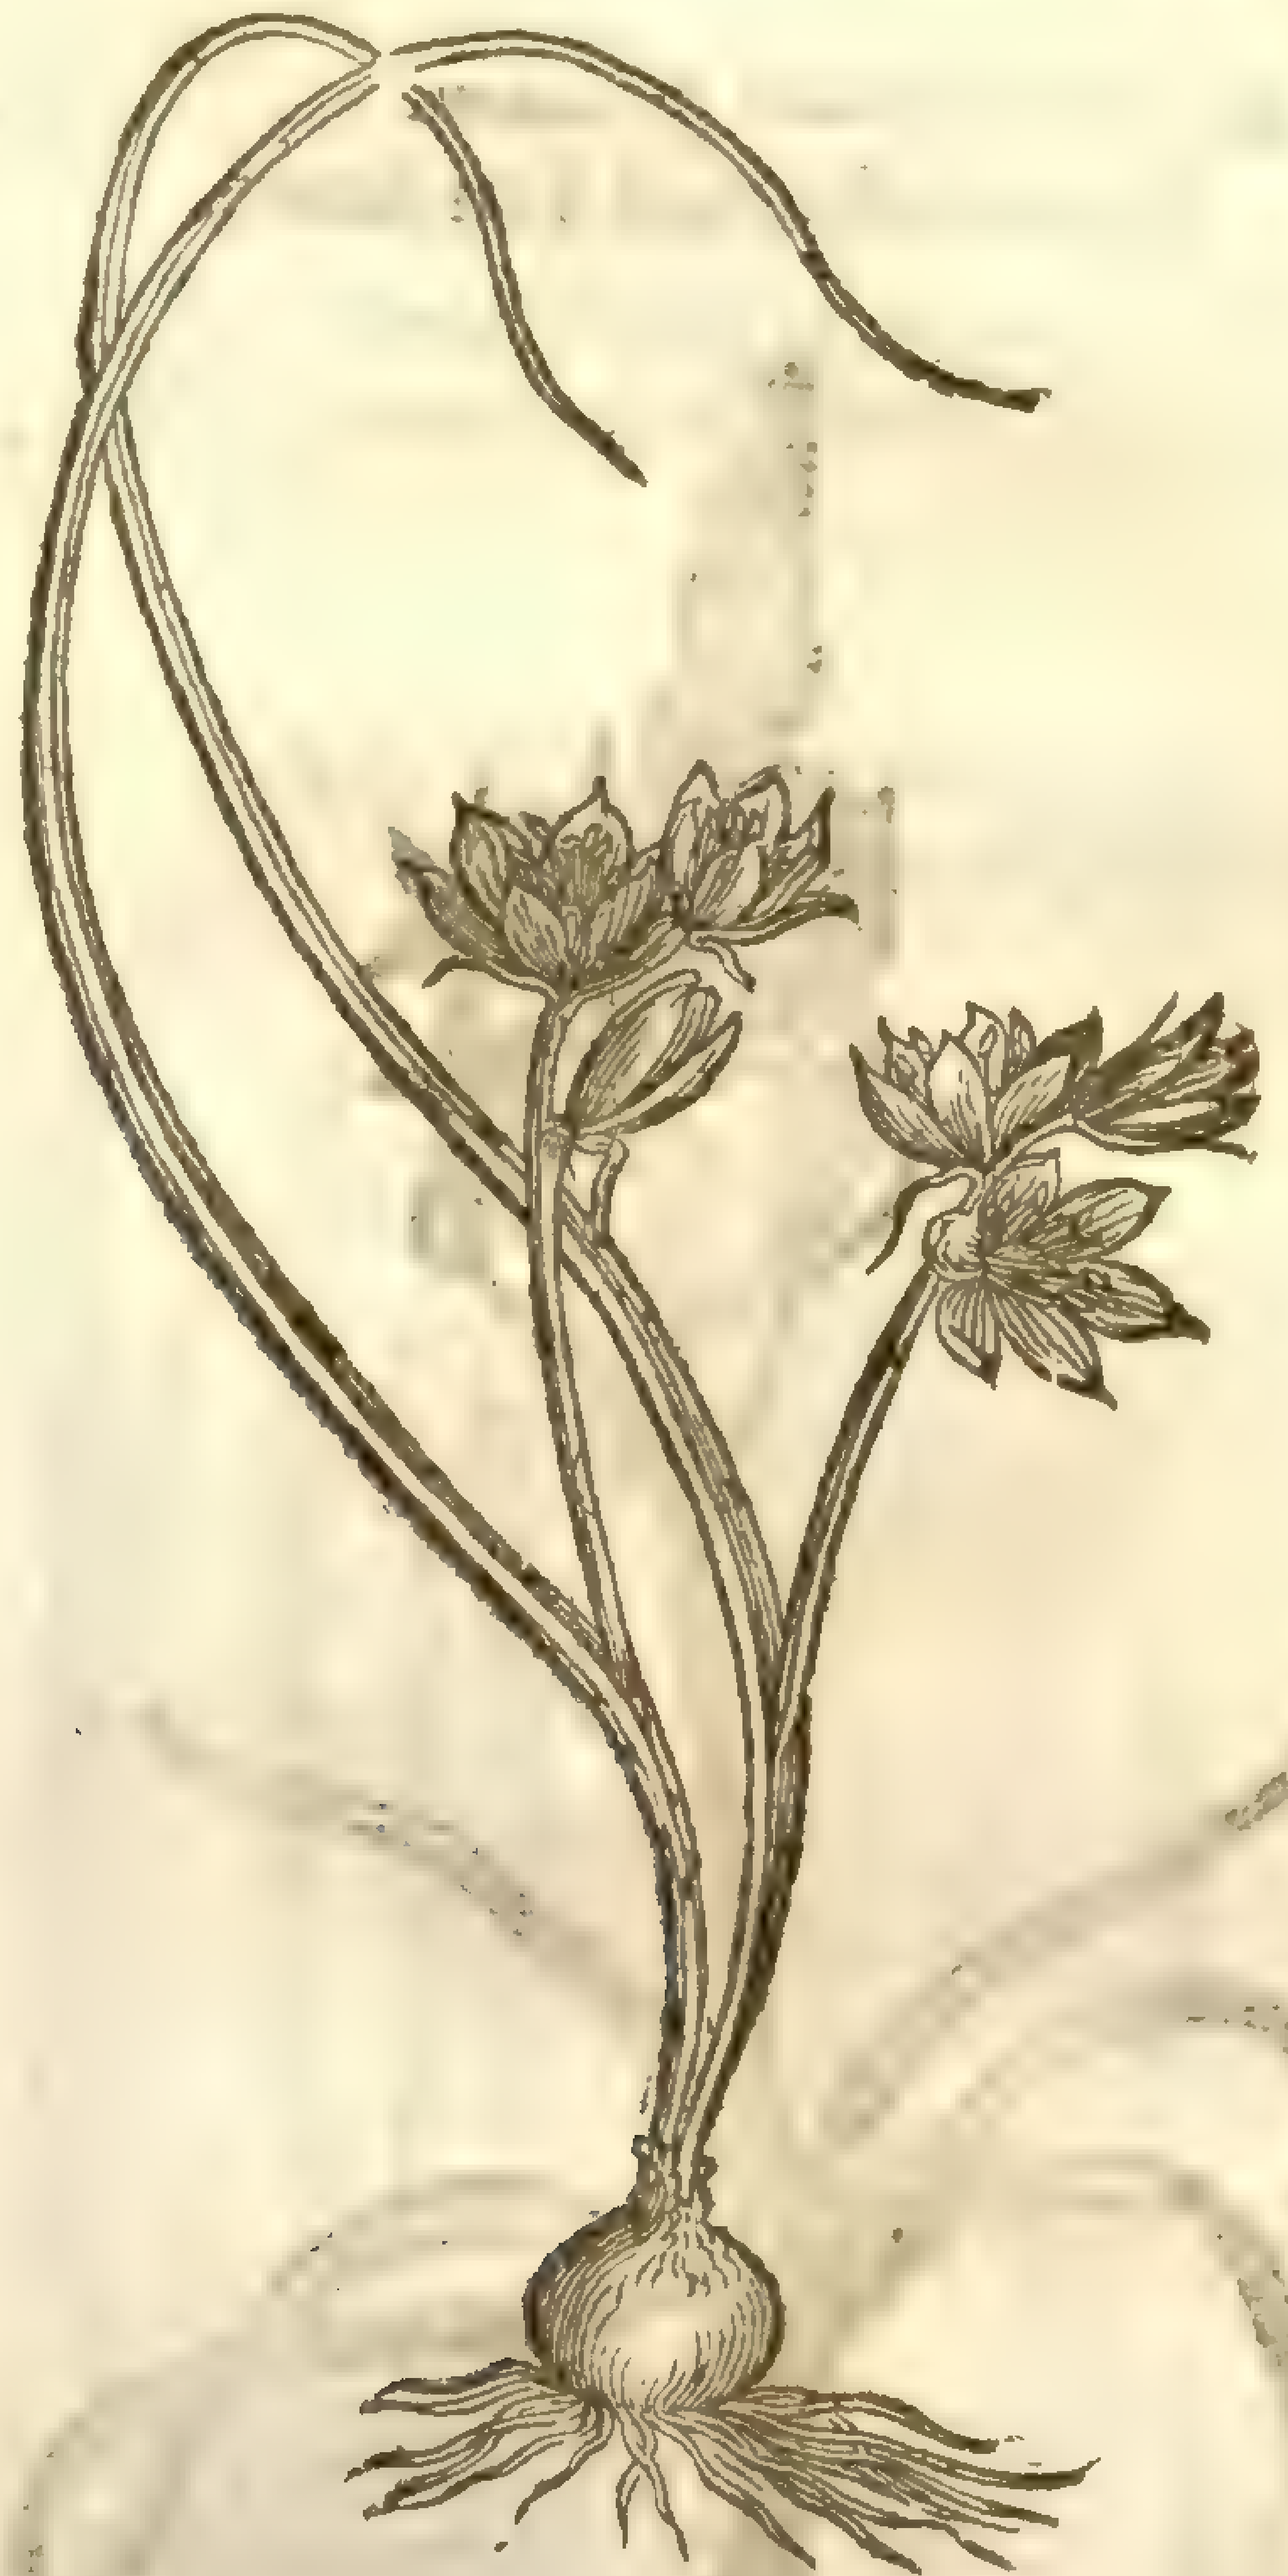
7 Hauing done with theſe two ſmall plants, I muſt acquaint you with three or foure larger, belonging alſo to this Claſſis. The firſt of theſe is that which *Dodonaus* calls *Ornithogalum majus*, and *Cluſius*, *Ornithogalum Arabicum*: This by *Lobel* and ſome others is called *Lilium Alexandrinum*, or

‡ 5 *Ornithogalum luteum parvum.*
Dwarfe yellow Star of Bethlehem.

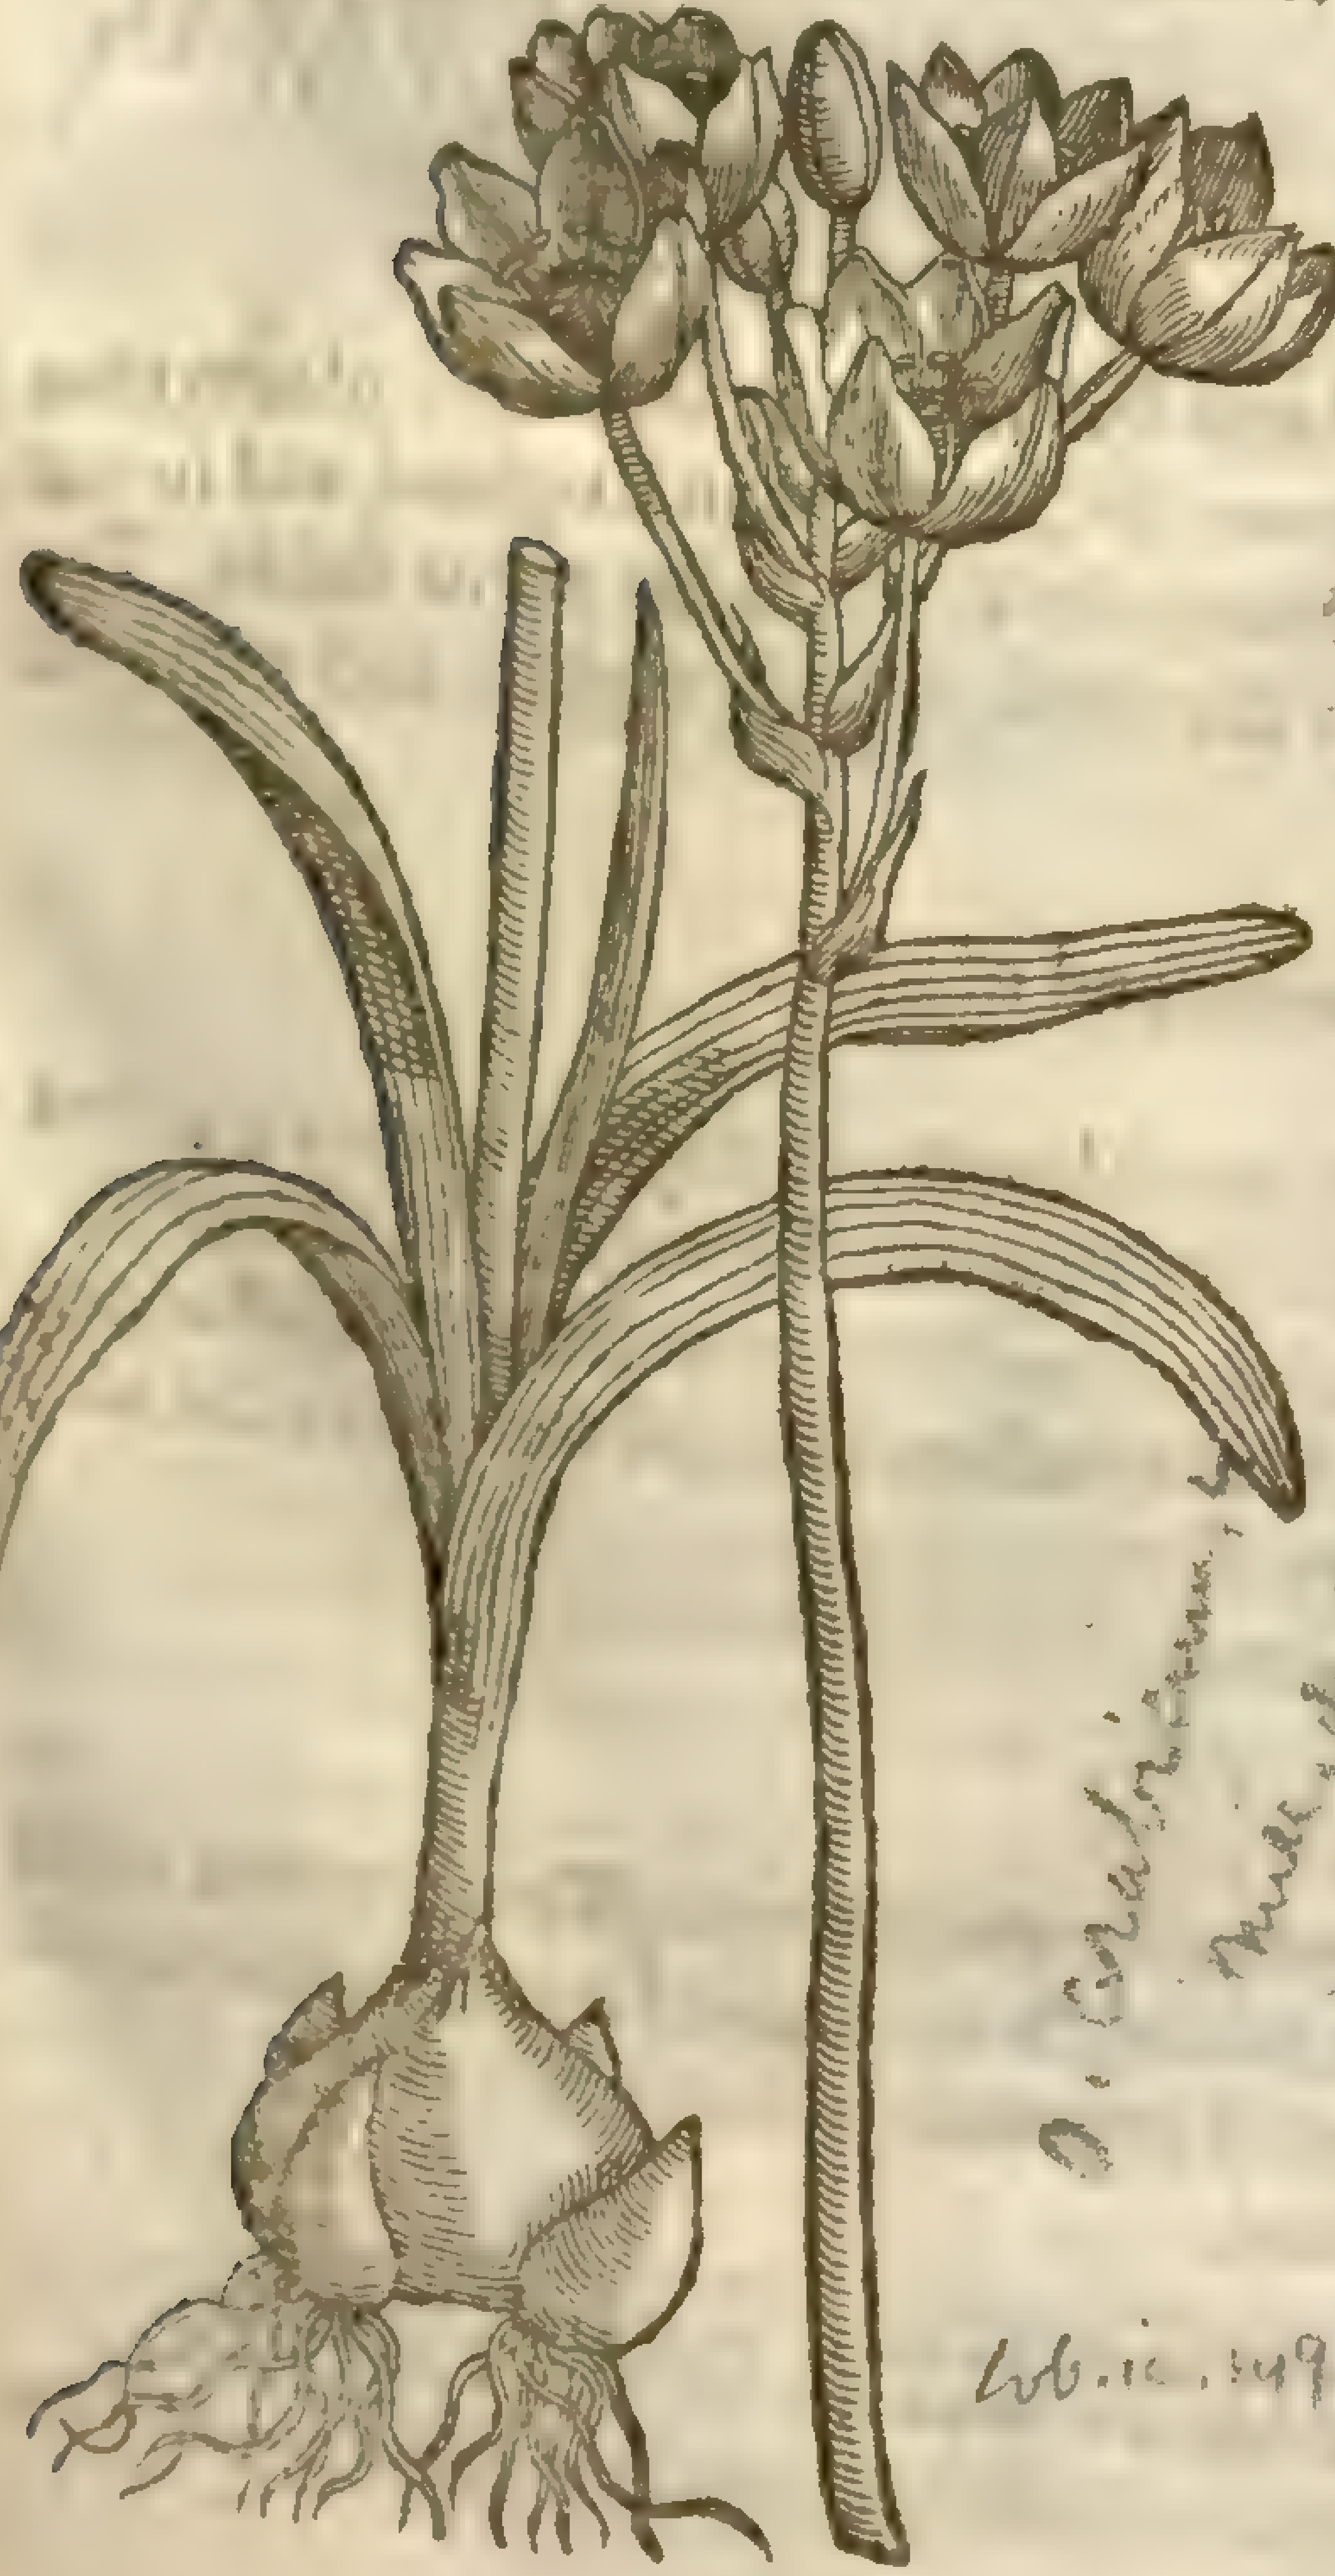


Clus. [illegible]

‡ 6 *Bulbus vnifolius.*
The one leaued Bulbe.



‡ 7 *Ornithogalum majus Arabicum.*
The great Arabicke Star-floure.



O. arabicum, L. [illegible]

Lob. ic. 149

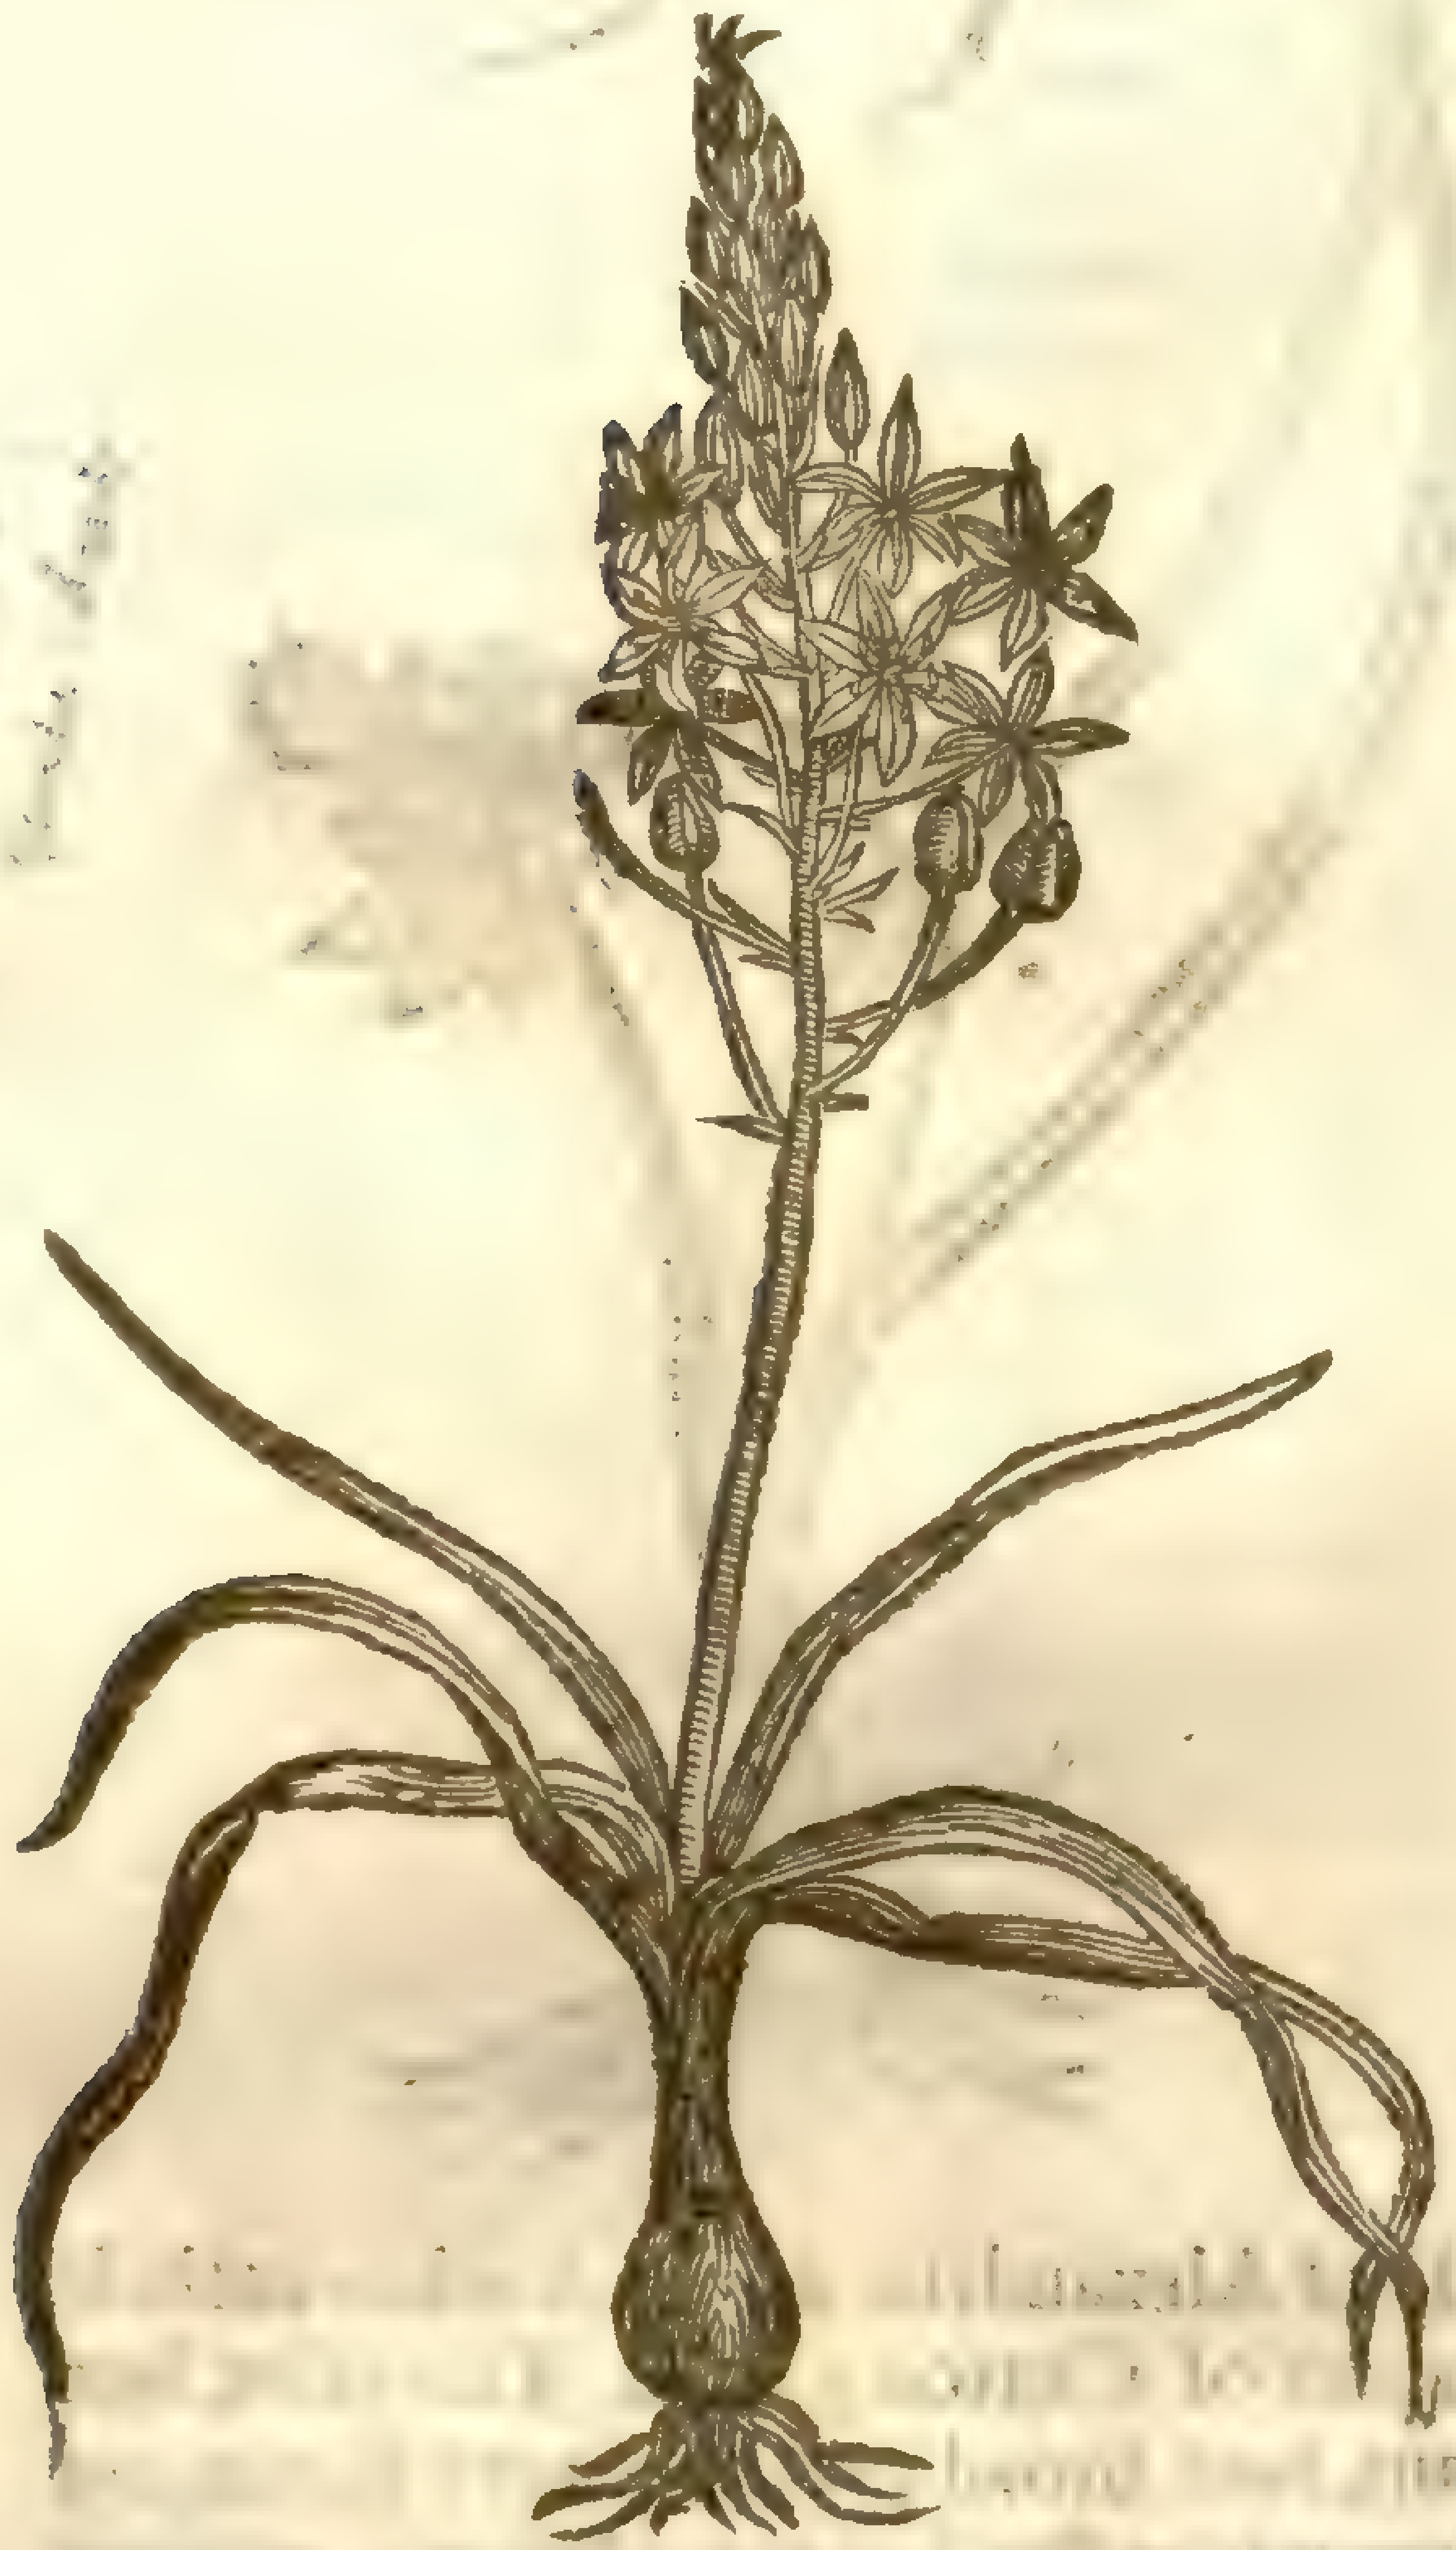
or the Lilly of Alexandria, as our Author calls it in the Chapter of Cotton graſſe. This faire, but tender plant, hath broad greene leaues comming from a large white flat bottomed root; amongſt which riſeth vp a ſtalke ſome cubit high, whoſe top is garniſhed with ſundry pretty large floures made of ſix pretty white leaues, with a ſhining blackiſh head, ingirt with ſix white threds tipped with yellow. This floures in May.

8 This, which is commonly called *Ornithogalum ſpicatum*, hath large leaues and roots, and the ſtalke growes ſome cubit or more high, whereon grow many ſtarre-floures in ſhape and colour like thoſe of the ordinarie, but larger, and they begin to floure below, and floure vpwards to the top. There is a larger ſort of this *Spicatum*, whoſe flours are not ſtreaked with greene on their backs. There is alſo a leſſer, differing from the firſt of theſe only in bigneſſe.

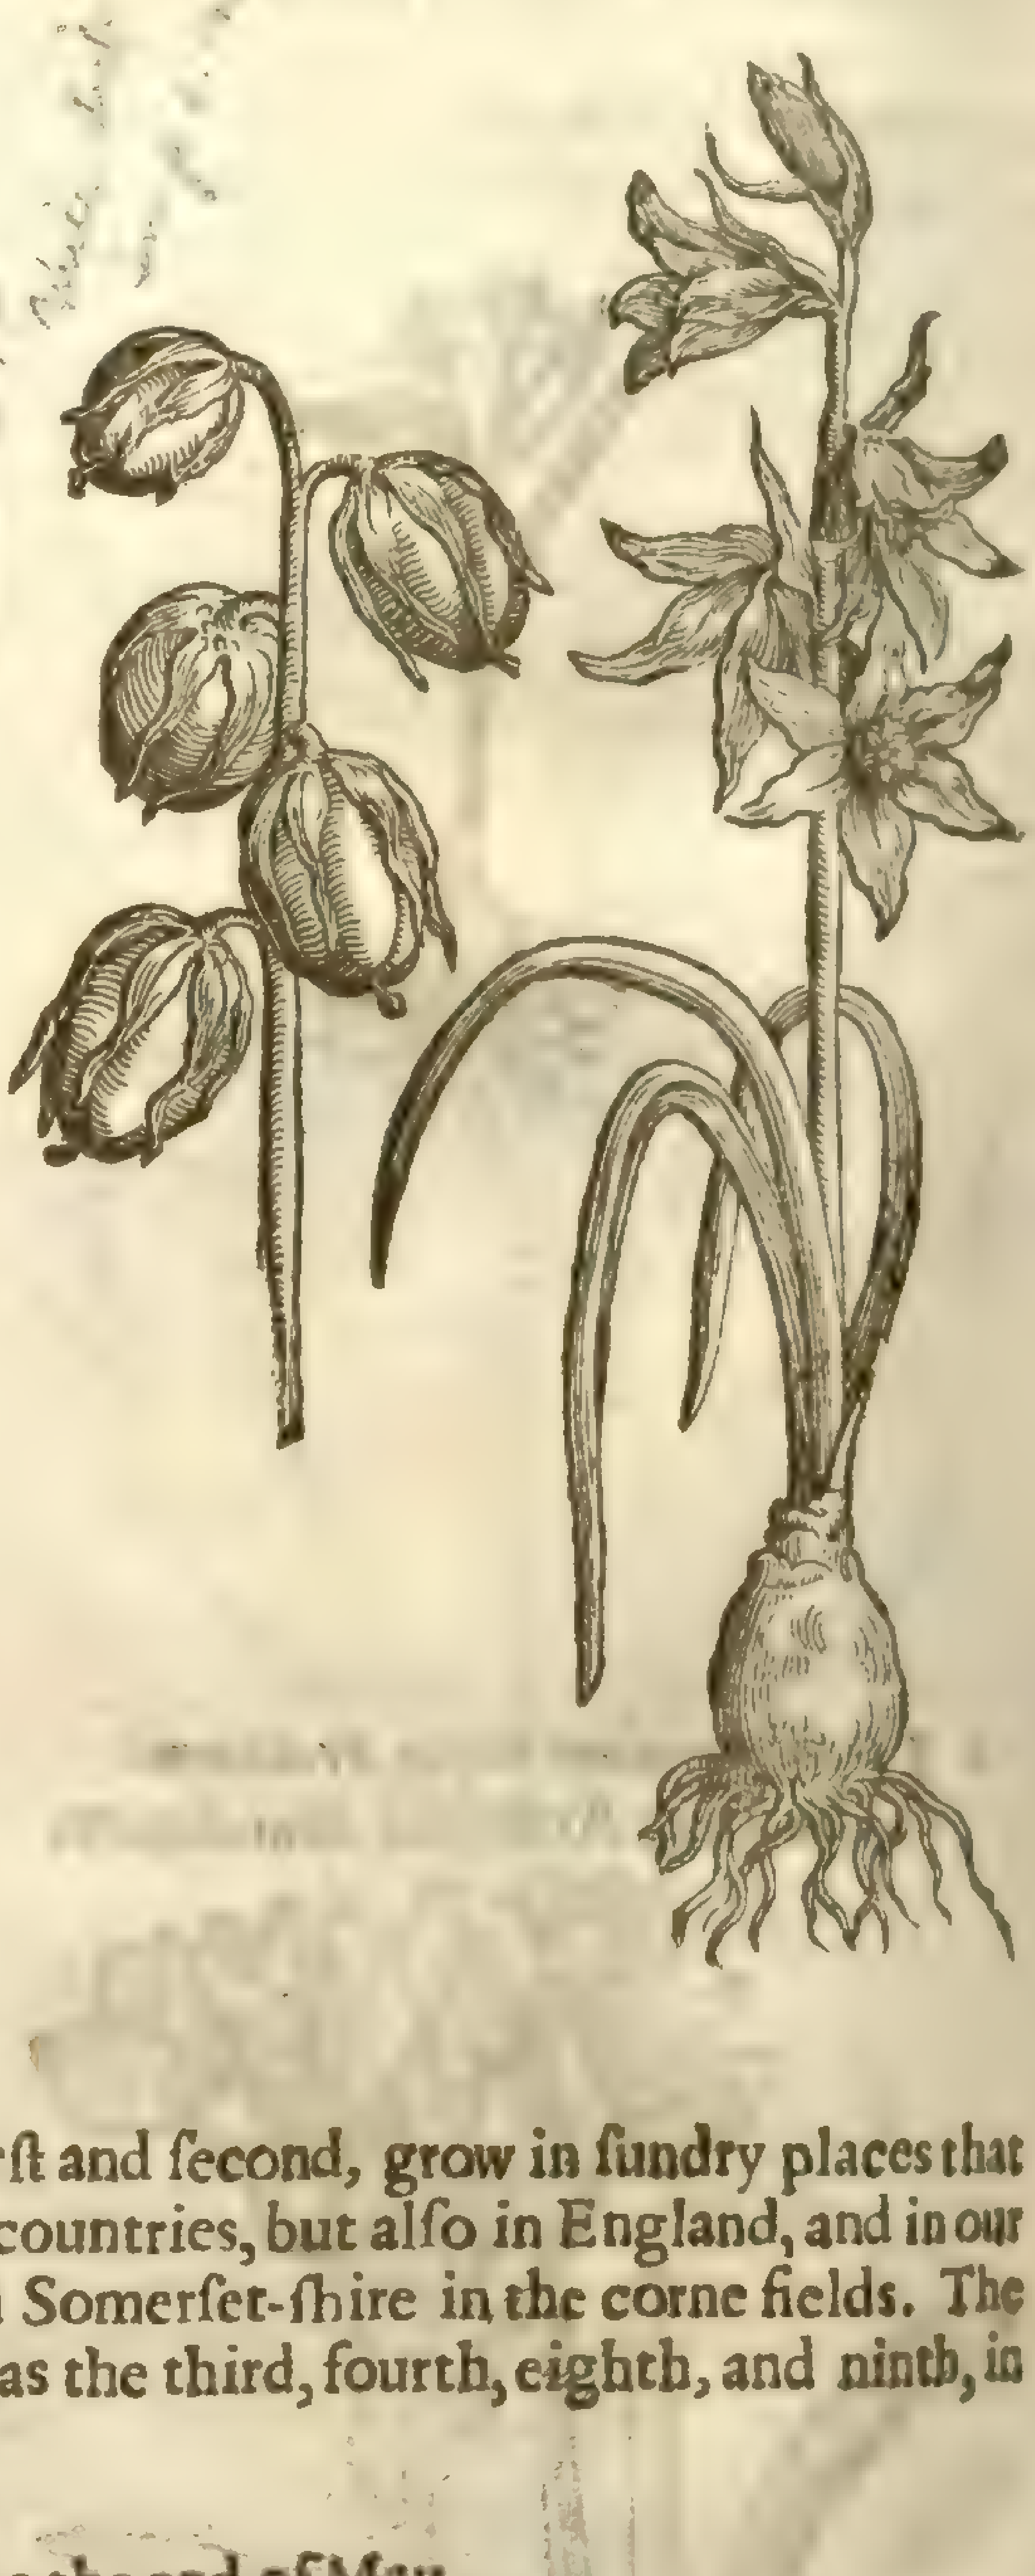
9 This Neapolitan hath three or foure long leaues not much vnlike thoſe of the Hyacinths, but narrower. The ſtalke is pretty thicke, ſome foot high, and hath vſually growing thereon ſome fiue or ſix floures hanging one way, though their ſtalkes grow alternately out of each ſide of the maine ſtemme. Theſe floures are compoſed of ſix leaues, being about an inch long, and ſome quarter of an inch broad, white within, and of an Aſh-coloured greene without, with white edges,

the middle of the floure is poſſeſſed by another little floure, conſiſting alſo of ſix little leaues, hauing in them ſix threds headed with yellow, and a white pointall. A blacke wrinkled ſeed is contained in three cornered heads, which by reaſon of their bigneſſe weigh downe the ſtalke. This floures in Aprill.

‡ 8 *Ornithogalum ſpicatum.*
Spike faſhioned Star floure.



‡ 9 *Ornithogalum Neapolitanum.*
The Neapolitan Star-floure.



¶ *The Place.*

Stars of Bethlehem, or Star-floures, eſpecially the firſt and ſecond, grow in ſundry places that lie open to the aire, not onely in Germany and the Low-countries, but alſo in England, and in our gardens very common. The yellow kinde *Lobel* found in Somerſet-ſhire in the corne fields. The reſt are ſtrangers in England; yet we haue moſt of them, as the third, fourth, eighth, and ninth, in ſome of our choice gardens.

¶ *The Time.*

Theſe kindes of bulbed plants do floure from Aprill to the end of May.

¶ *The Names.*

Touching the names, *Dioſcorides* calls it Ὀρνιθόγαλον: *Pliny*, *Ornithogale*: in high Dutch it is called **Feldz wibel, Ackerz wibel**: as you ſhould ſay, *Cepa agraria*: in Engliſh, Stars of Bethlehem.

‡ The reſt are named in their titles & hiſtories: but *Cluſius* queſtions whether the *Bulbus vnifolius* be not *Bulbine* of *Theophraſtus*, 7. *hiſt*. 13. *Bauhinus* ſeemes to affirm the *Spicatum* to be the *Moly* of *Dioſcorides* and *Theophraſtus*, and *Epimedium* of *Pliny*. ‡

¶ *The Temperature.*

Theſe are temperate in heate and drineſſe.

¶ *The Vertues.*

A The vertues of moſt of them are vnknown: yet *Hieronymus Tragus* writeth, That the root of the Star of Bethlehem roſted in hot embers, and applied with honey in manner of a cataplaſme or pulteſſe, healeth old eating vlcers, and ſoftens and diſcuſſes hard tumora.

The roots, ſaith *Dioſcorides*, are eaten both raw and boiled.

---

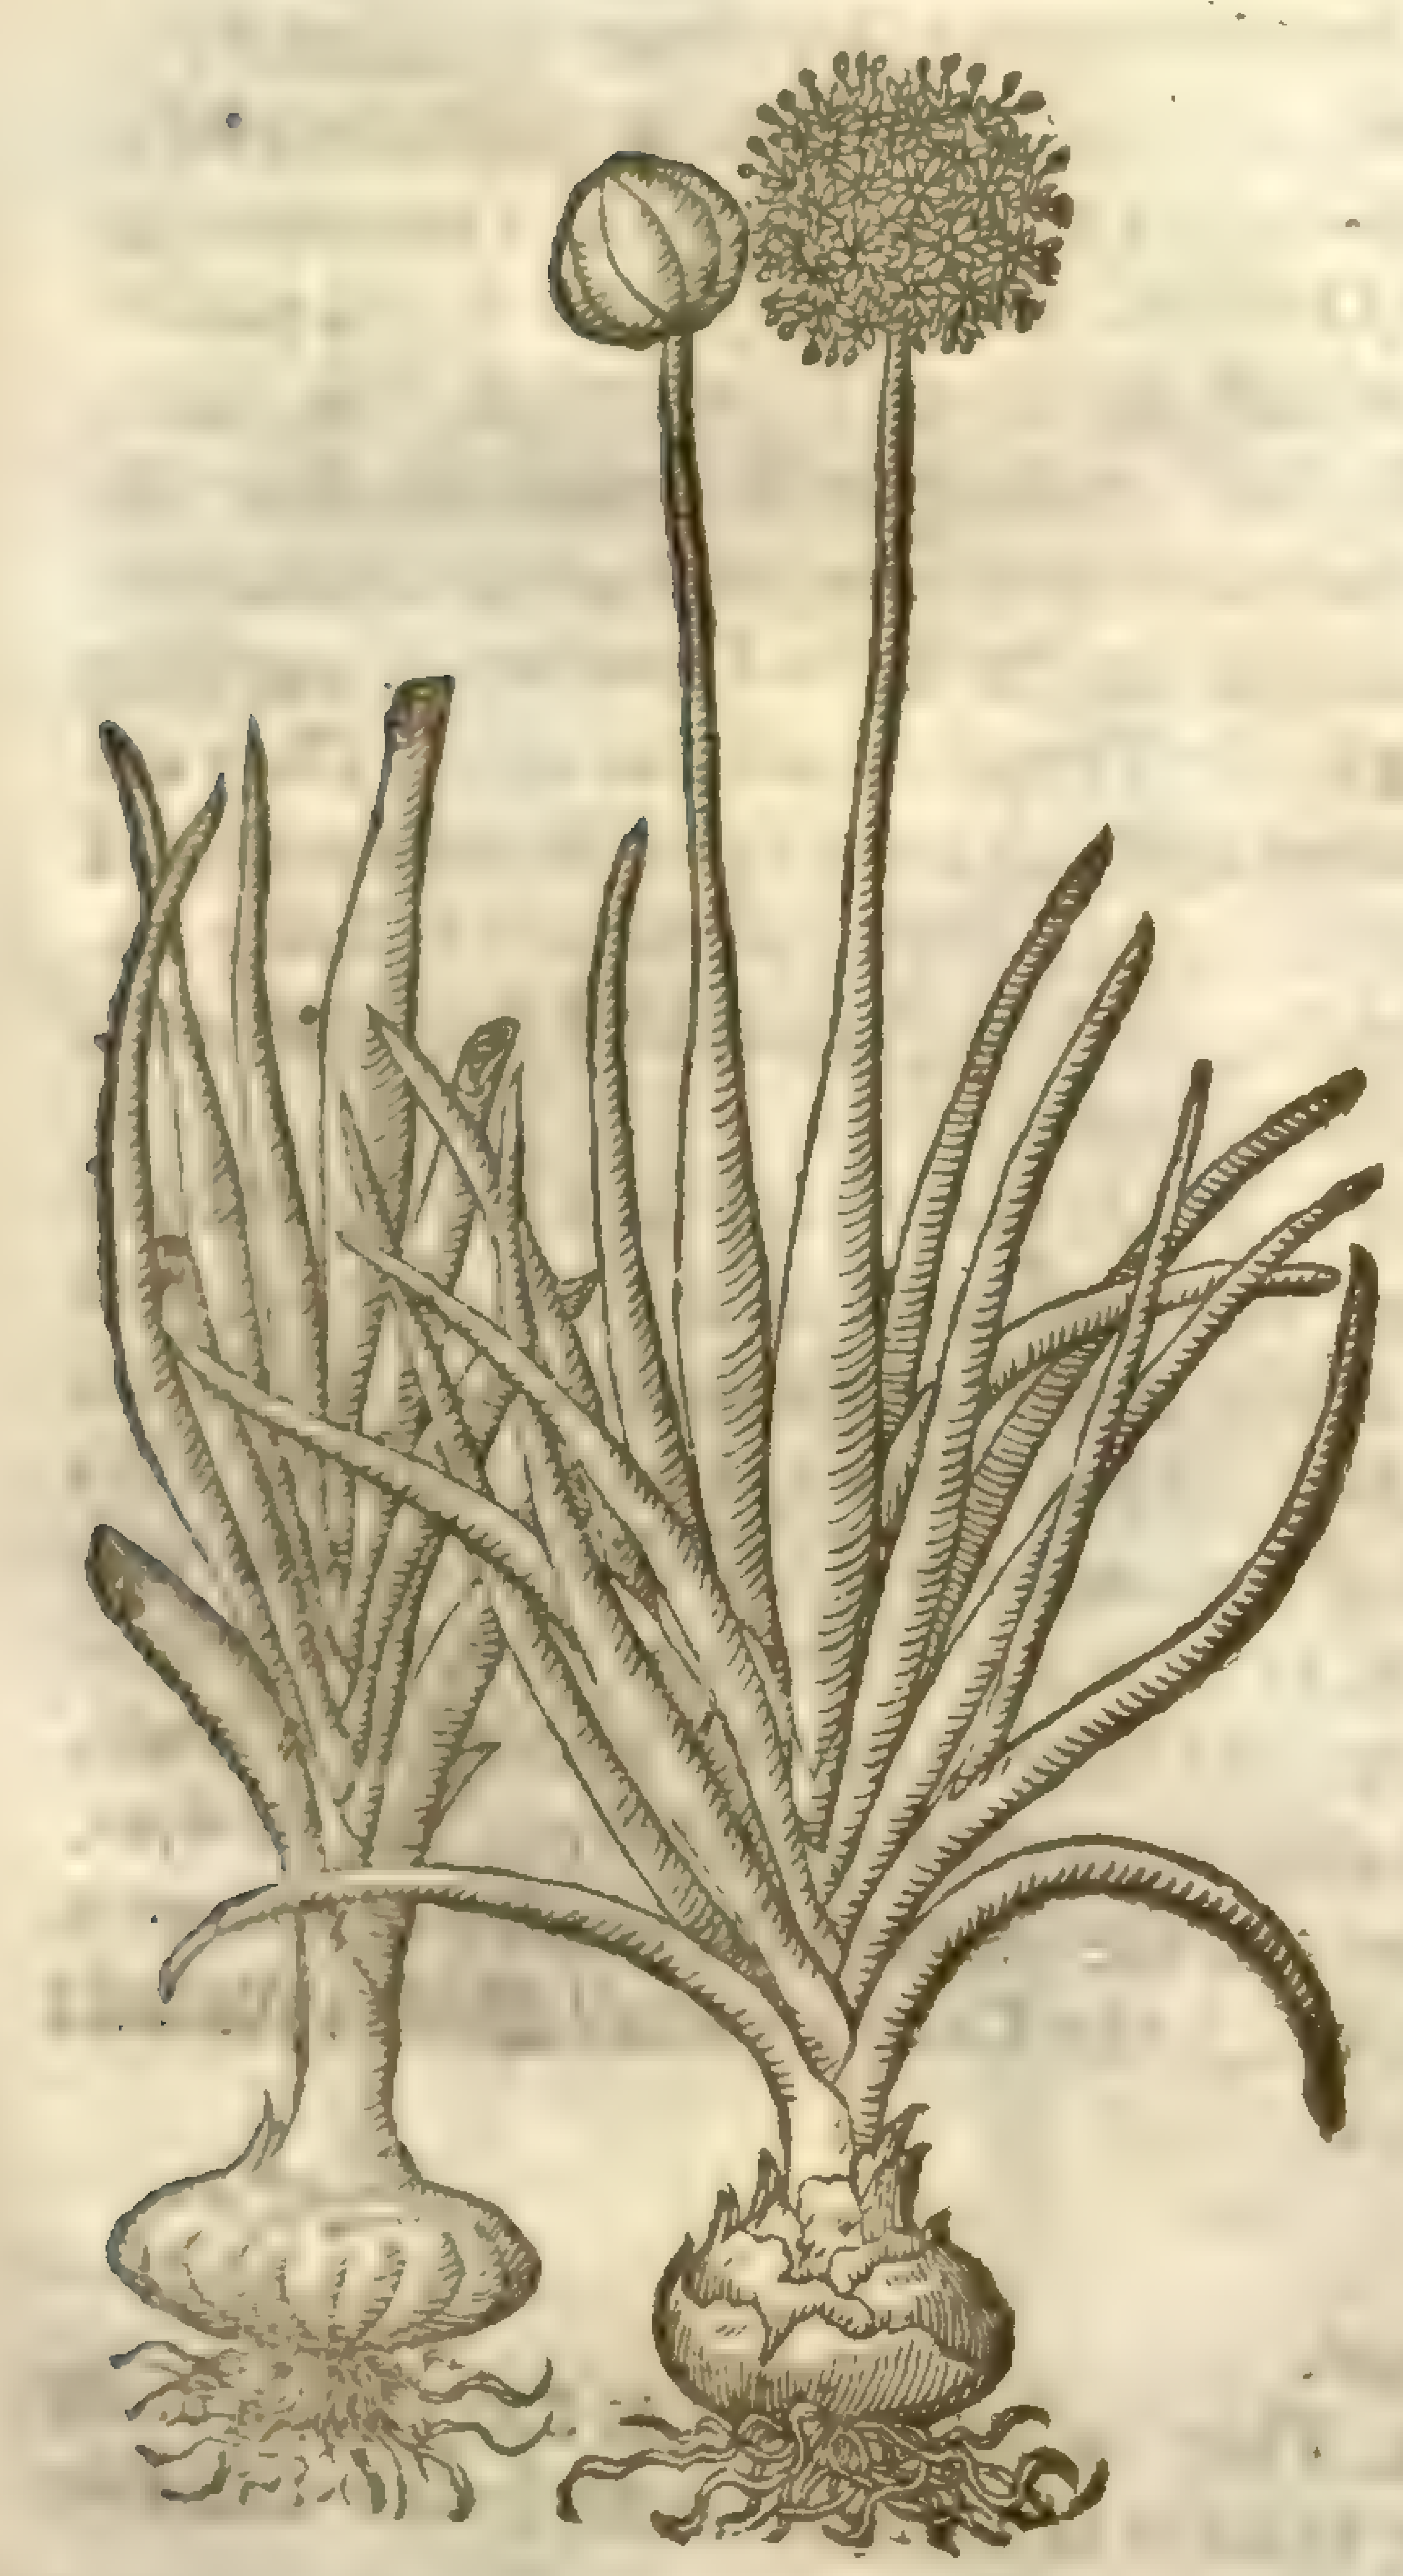
† That which was the ſecond of our Author, vnder the title of *Cepa agraria*, and the third vnder *Ornithogalum luteum*, were figures of the ſame plant, but in the later, as *Bauhine* obſerues, the bottome leaues are omitted, becauſe they fall away when as it is growne vp to a floure.

CHAP. 93. *Of Onions.*

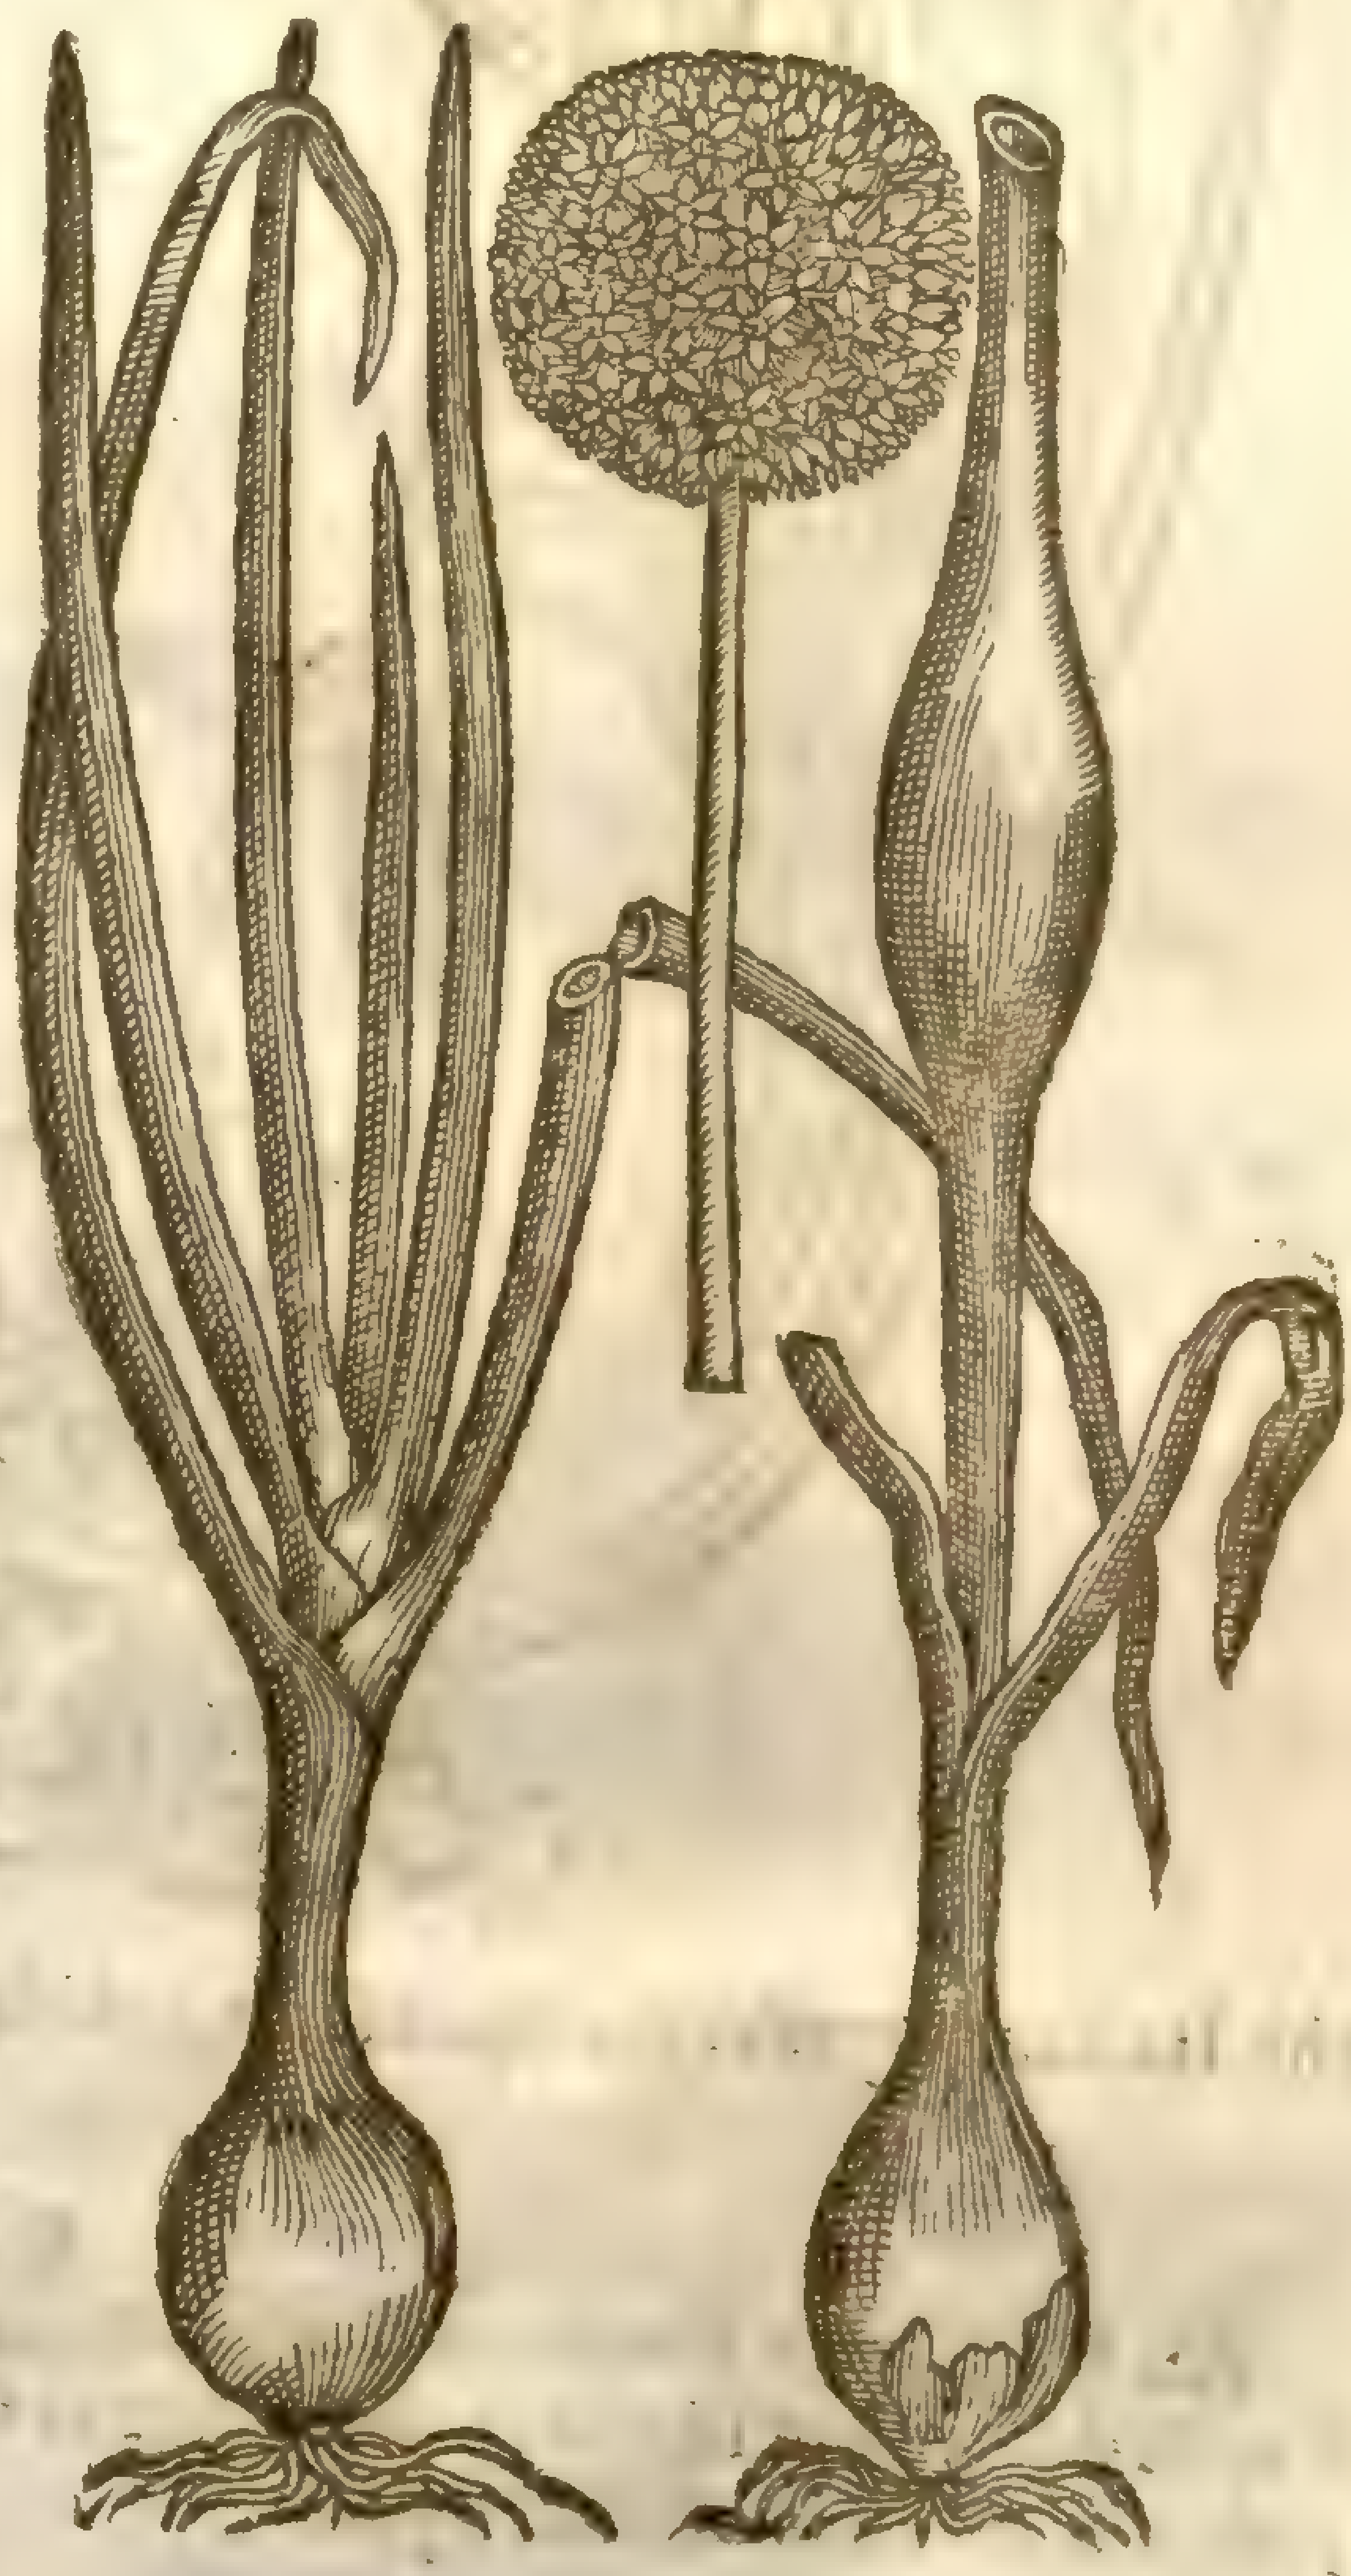
¶ *The Kindes.*

THere be, ſaith *Theophraſtus*, diuers ſorts of Onions, which haue their ſyr-names of the places where they grow: ſome alſo leſſer, others greater; ſome be round, and diuers long, but none wilde, as *Pliny* writeth.

1 *Cepa alba.*
White Onions.



‡ 3 *Cepa Hiſpanica oblonga.*
Longiſh Spaniſh Onions.



¶ *The Deſcription.*

1 THe Onion hath narrow leaues, and hollow within; the ſtalke is ſingle, round, biggeſt in the middle, on the top whereof groweth a round head couered with a thin skin or film, which being broken, there appeare little white floures made up in form of a ball, and afterward blacke ſeed three cornered, wrapped in thin white skins. In ſtead of the root there is a bulbe or round head compact of many coats, which oftentimes becommeth great in manner of a Turnep, many times long like an egge. To be briefe, it is couered with very fine skins for the moſt part of a whitiſh colour.

2 The red Onion differeth not from the former but in ſharpneſſe and redneſſe of the roots; in other reſpects there is no difference at all.

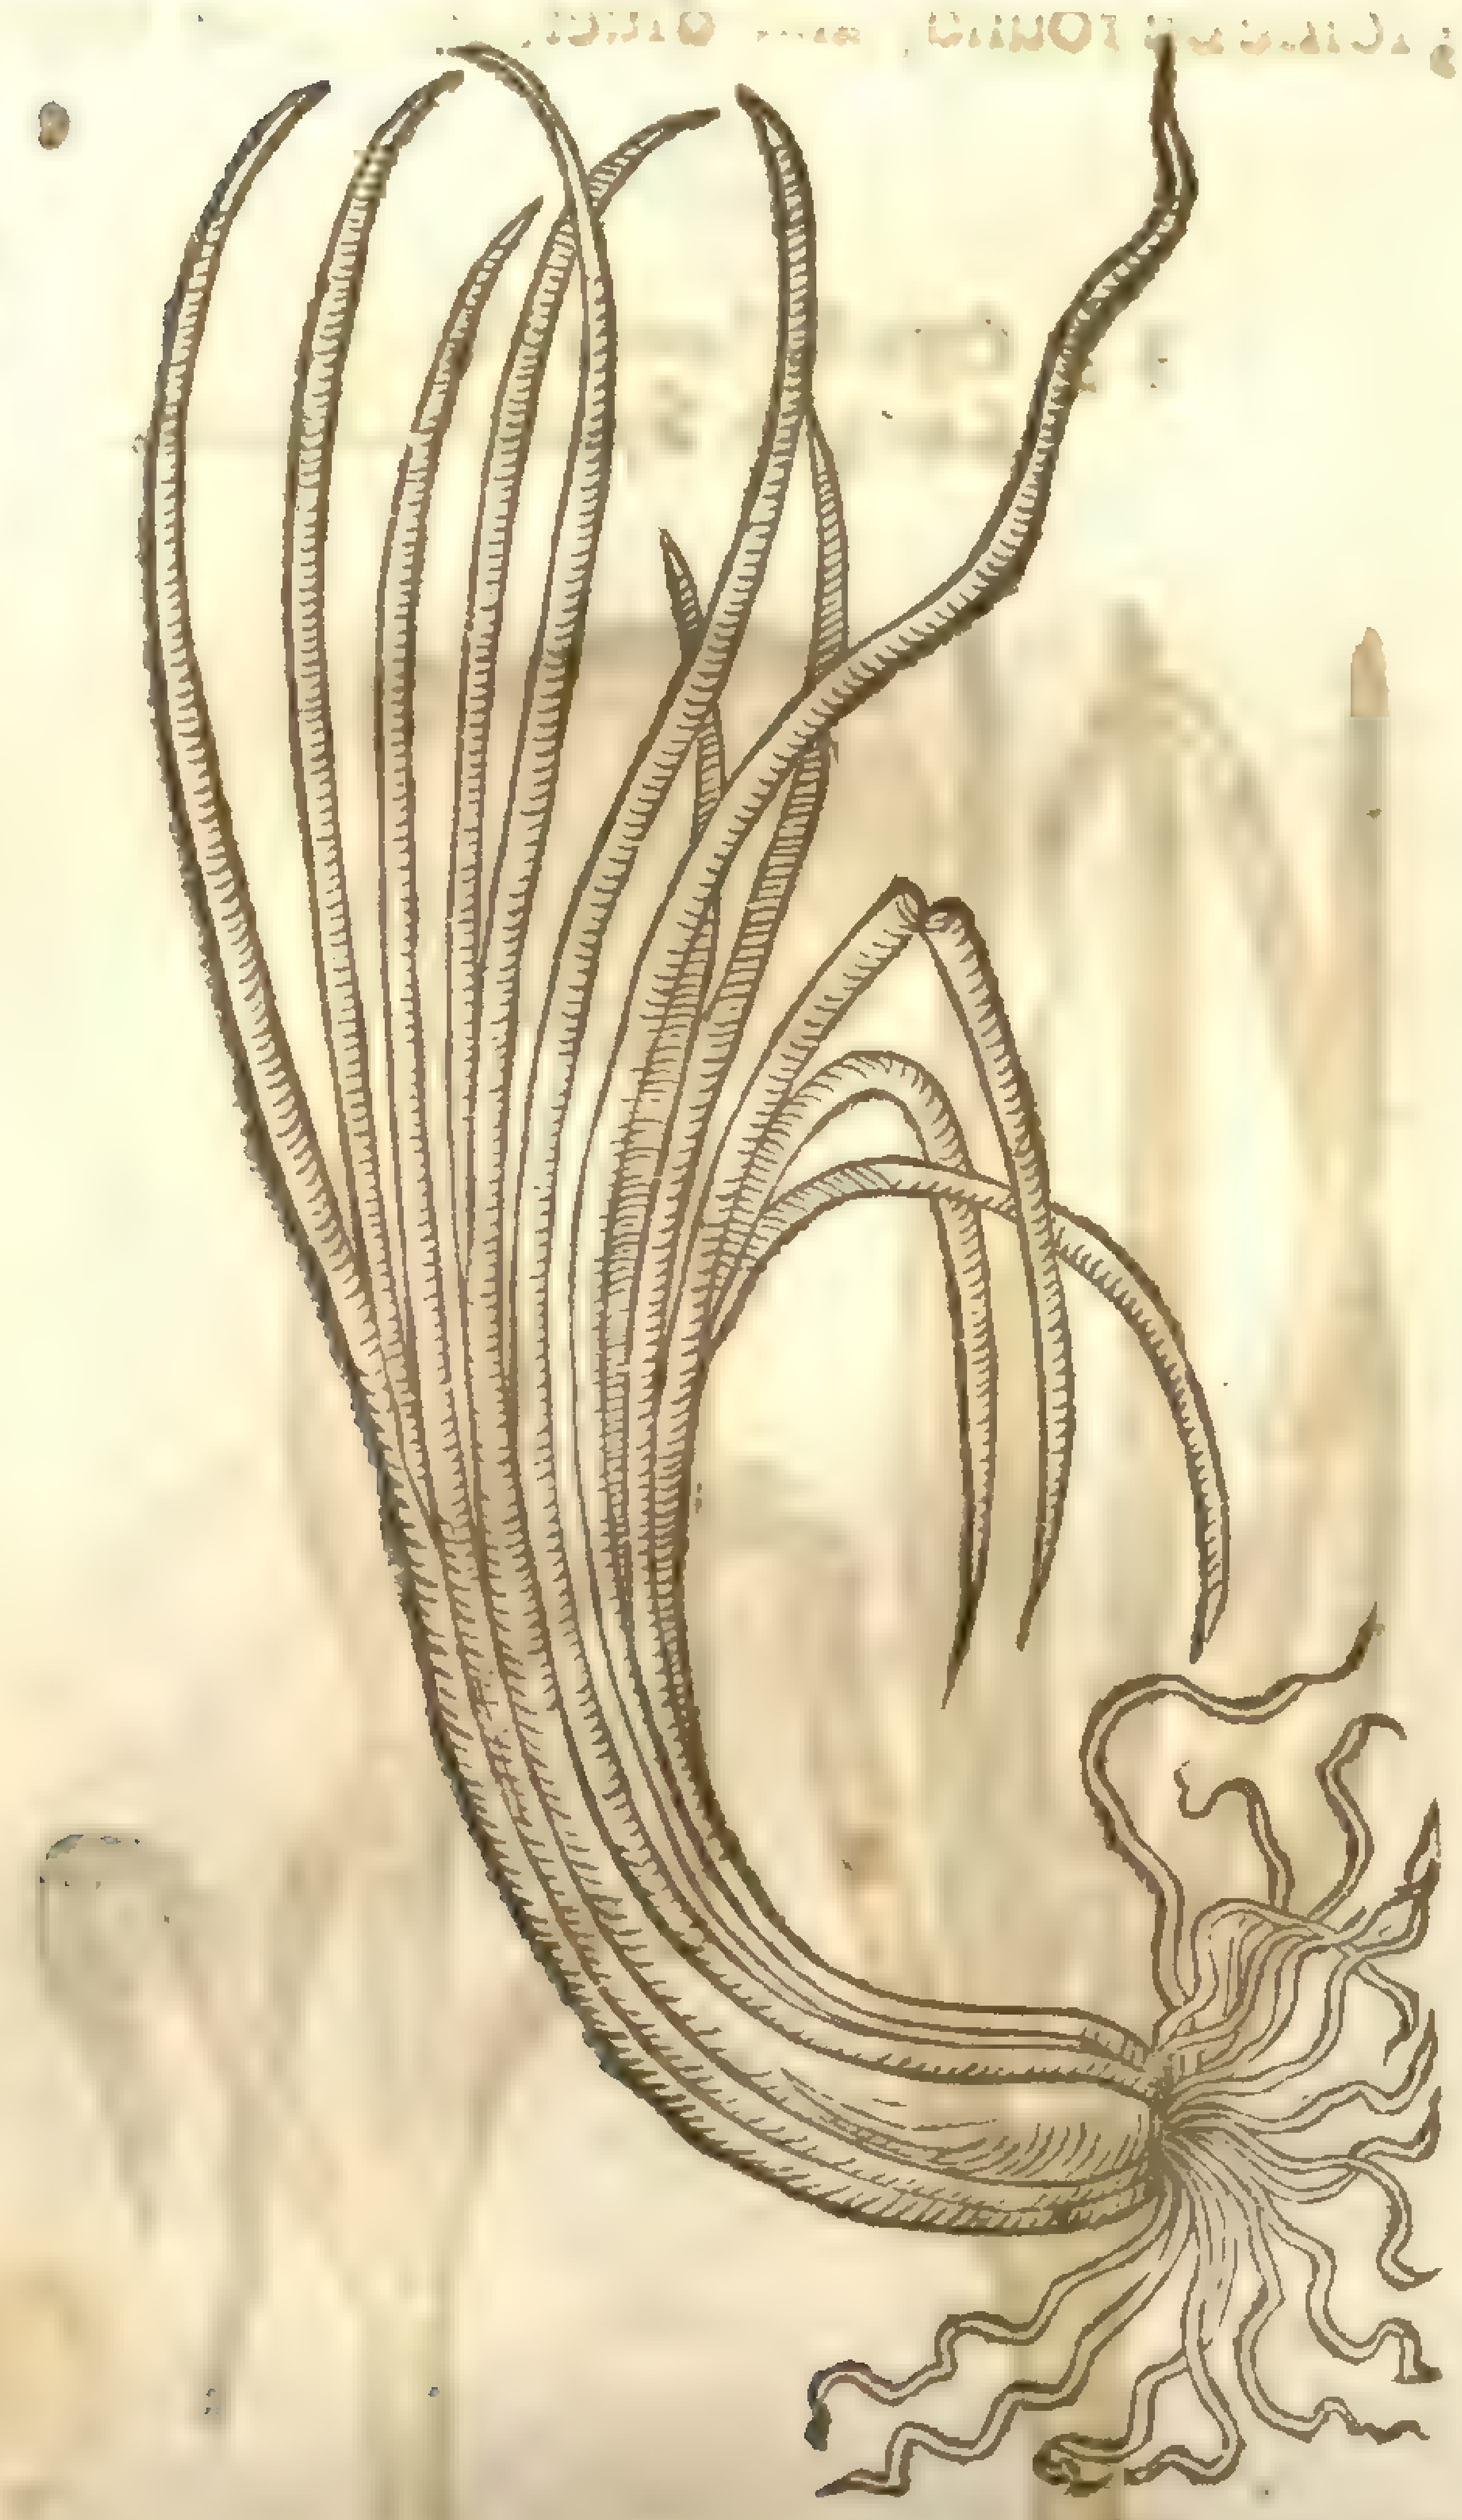
‡ 3 There is alſo a Spaniſh kinde, whoſe root is longer than the other, but in other reſpects very little different.

4 There is alſo another ſmall kinde of Onion, called by *Lobel*, *Aſcalonitis Antiquorum*, or Scallions; this hath but ſmall roots, growing many together. The leaues are like to Onions, but leſſe. It ſeldome beares either ſtalke, floure, or ſeed. It is vſed to be eaten in ſallads. ‡

¶ *The Place.*

The Onion requireth a fat ground well digged and dunged, as *Palladius* ſaith. It is cheriſhed euerie where in kitchen gardens, now and then ſowne alone, and many times mixed with other herbs, as with Lettuce, Parſeneps, and Carrets. *Palladius* liketh well that it ſhould be ſowne with Sauorie, becauſe, ſaith *Pliny*, it proſpereth the better, and is more wholeſome.

‡ 4 *Aſcalonitides.*
Scallions.



¶ *The Time.*

It is ſowne in March or Aprill, and ſomtimes in September.

¶ *The Names.*

The Onion is called in Greeke, κρόμμυον: in Latine *Cepa*, and many times *Cepe* in the neuter gender: the Shops keepe that name. The old Writers haue giuen vnto this many ſyr-names of the places where they grow, for ſome are named *Cypriæ*, *Sardiæ*, *Creticæ*, *Samothraciæ*, *Aſcaloniæ* of a towne in Iudæa otherwiſe called *Pompeiana*: in Engliſh, Onions. Moreouer, there is one named *Mariſco*, which the Countreymen call *Vnio*, ſaith *Columella*; and thereupon it commeth that the French men call it *Oignon*, as *Ruellius* thinketh: and peraduenture the Low-Dutch men name it **Aueuin**, of the French word corrupted. They are called *Setaniæ*, which are very little and ſweet; and theſe are thought to be thoſe which *Palladius* nameth *Cepullæ*, as though he called them *parvæ Cepæ*, or little Onions.

There is an Onion which is without an head or bulbe, and hath as it were a long necke, and ſpends it ſelf wholly in the leaues, and it is often cropped or cut for the pot, like the Leeks. This *Theophraſtus* names γήθυον: Of this *Pliny* alſo writeth, *Lib.* 19. *Cap.* 6. There is with vs two principall ſorts of Onions, the one ſeruing for a ſauce, or to ſeaſon meat with, which ſome call *Gethyon*, *Pállacana*: and the other is the headed or common Onion, which the Germanes call **Onion zwibel**: the Italians, *Cepolla*: the Spaniards, *Cebolla*, *Beba*, and *Cebola*.

¶ *The Temperature.*

All Onions are ſharpe, and moue teares by the ſmell. They be hot and dry, as *Galen* ſaith, in the fourth degree, but not ſo extreme hot as Garlicke. The juice is of a thinne waterie and airie ſubſtance: the reſt is of thicke parts.

¶ *The Vertues.*

A The Onions do bite, attenuate or make thin, and cauſe dryneſſe: being boiled they do loſe their ſharpneſſe, eſpecially if the water be twice or thrice changed, and yet for all that they doe not loſe their attenuating qualitie.

B They alſo break wind, prouoke vrine, and be more ſoluble boiled than raw; and raw they nouriſh not at all, and but a little though they be boiled.

C They be naught for thoſe that be cholericke, but good for ſuch as are replete with raw and phlegmaticke humors; and for women that haue their termes ſtayed vpon a cold cauſe, by reaſon they open the paſſages that are ſtopt.

D *Galen* writeth, That they prouoke the hemorrhoids to bleed if they be laid vpon them either by themſelues, or ſtamped with vineger.

E The juice of Onions ſnuffed vp into the noſe, purgeth the head, and draweth forth raw flegmaticke humors.

F Stamped with Salt, Rue, and Honey, and ſo applied, they are good againſt the biting of a mad Dog.

G Roſted in the embers and applied, they ripen and breake cold Apoſtumes, Biles, and ſuch like.

The juice of Onions mixed with the decoction of Penniroyall, and anointed vpon the goutie member with a feather, or a cloath wet therein, and applied, eaſeth the ſame very much. H

The juice anointed vpon a pild or bald head in the Sun, bringeth the haire againe very ſpeedily. I

The juice taketh away the heat of ſcalding with water or oile, as alſo burning with fire & gunpouder, as is ſet forth by a very ſkilfull Surgeon Mr *William Clowes* one of the Queens Surgeon; and before him by *Ambroſe Parey*, in his treatiſe of wounds made by gun-ſhot. K

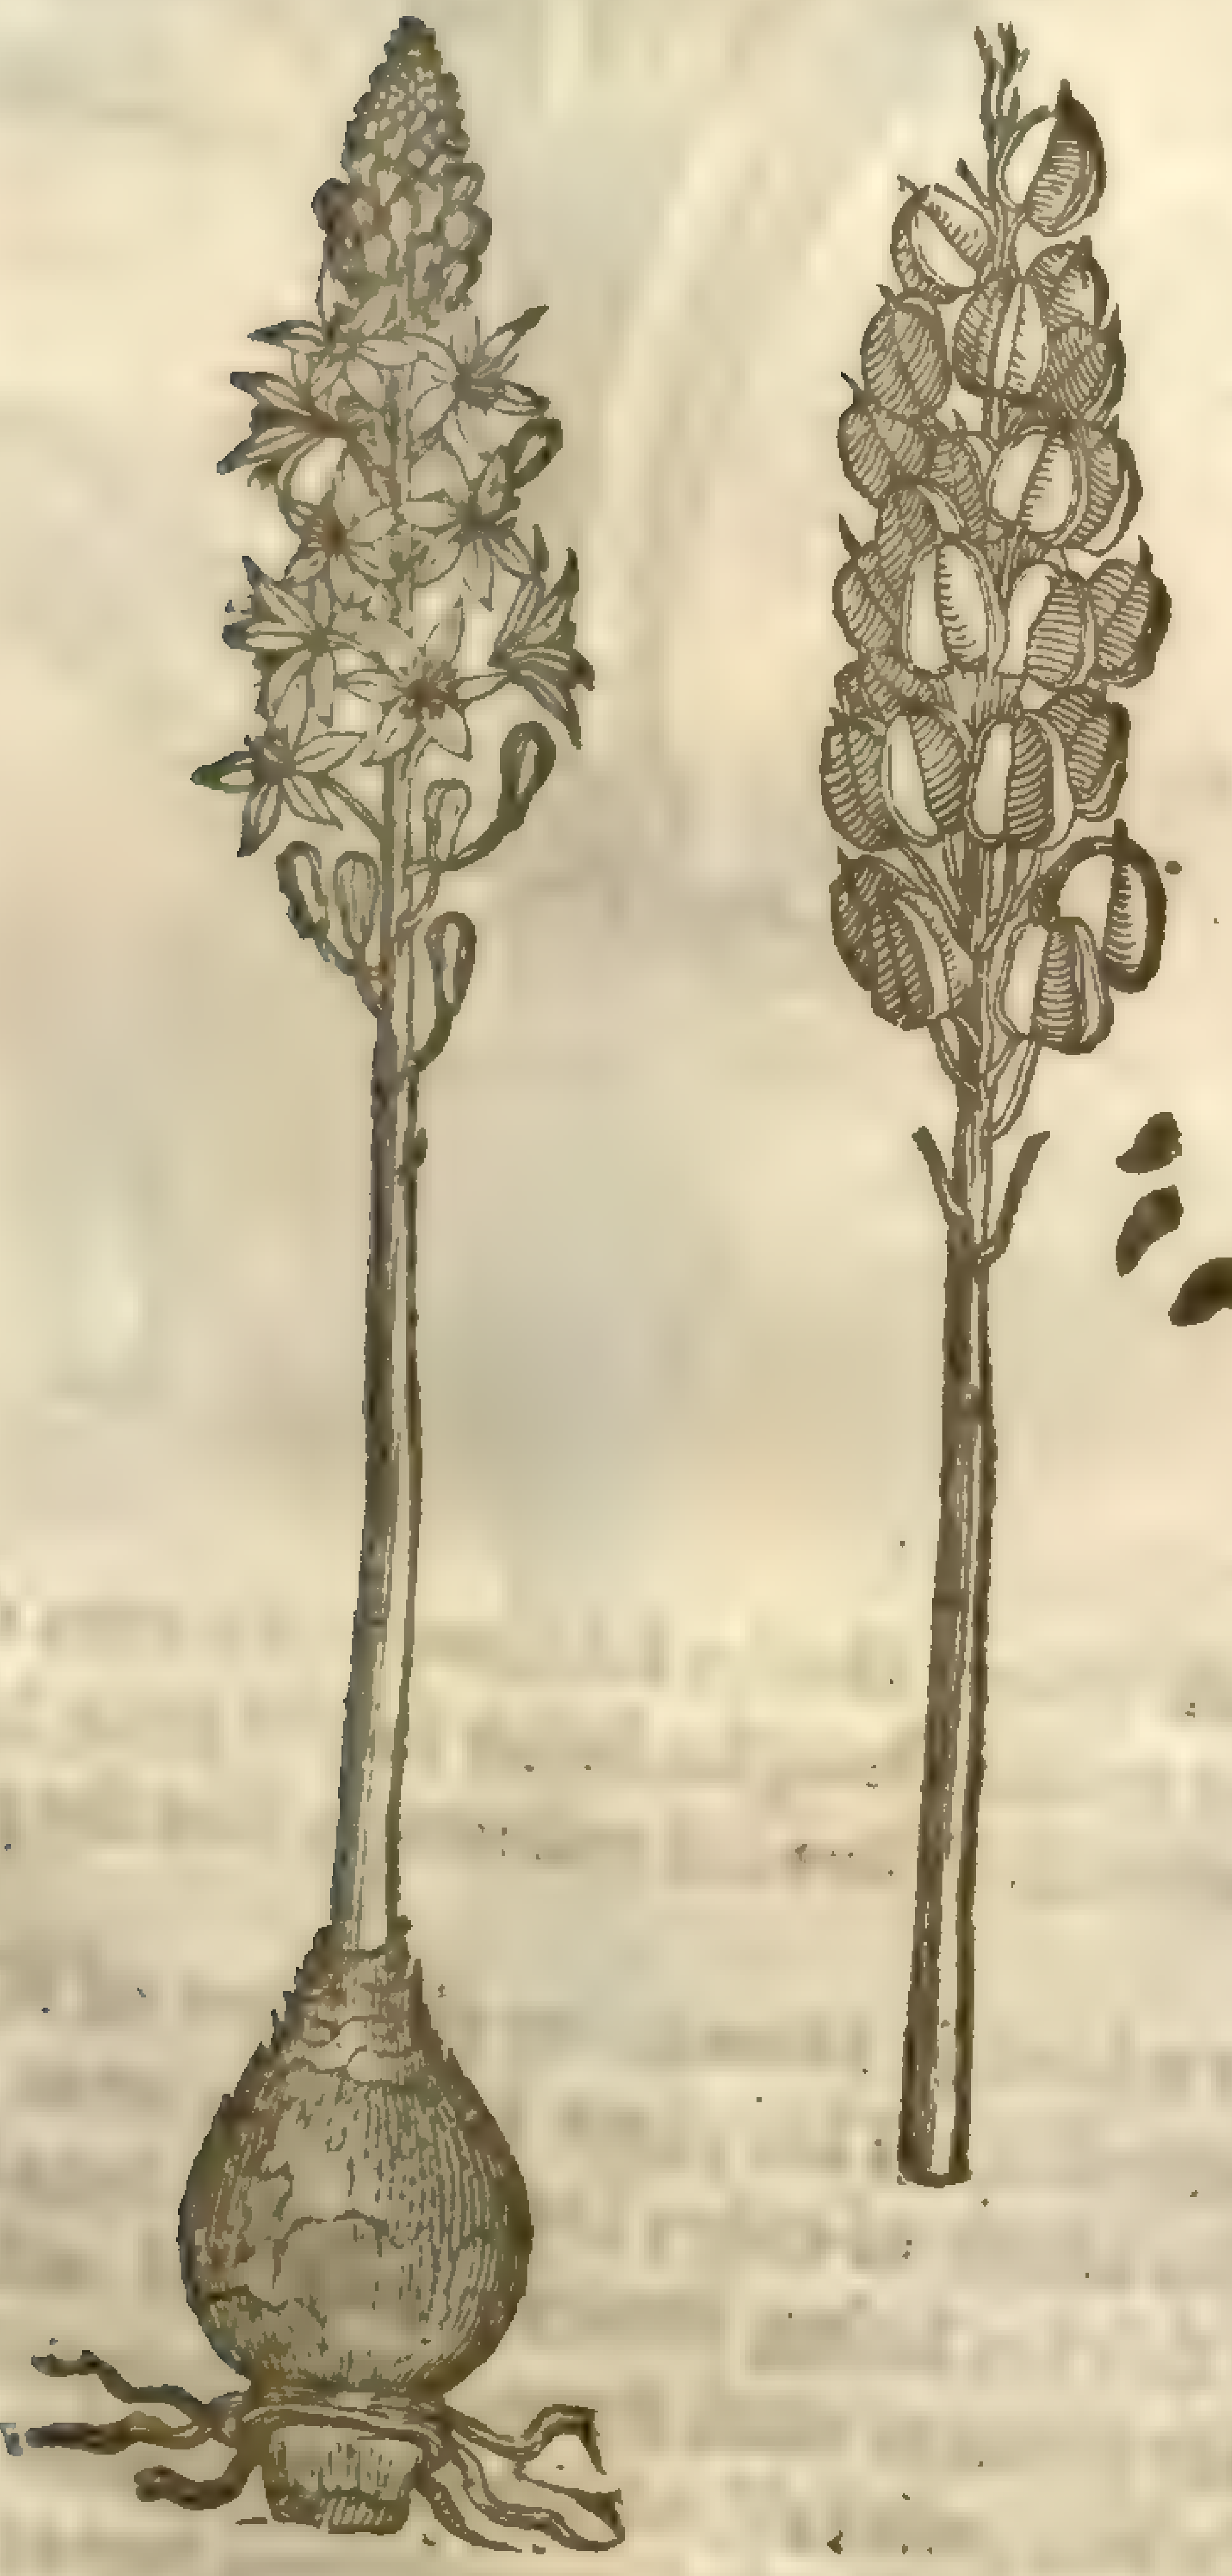
Onions ſliced and dipped in the juice of Sorrell, and giuen vnto the Sicke of a tertian Ague, to eat, takes away the fit in once or twice ſo taking them. L

¶ *The Hurts.*

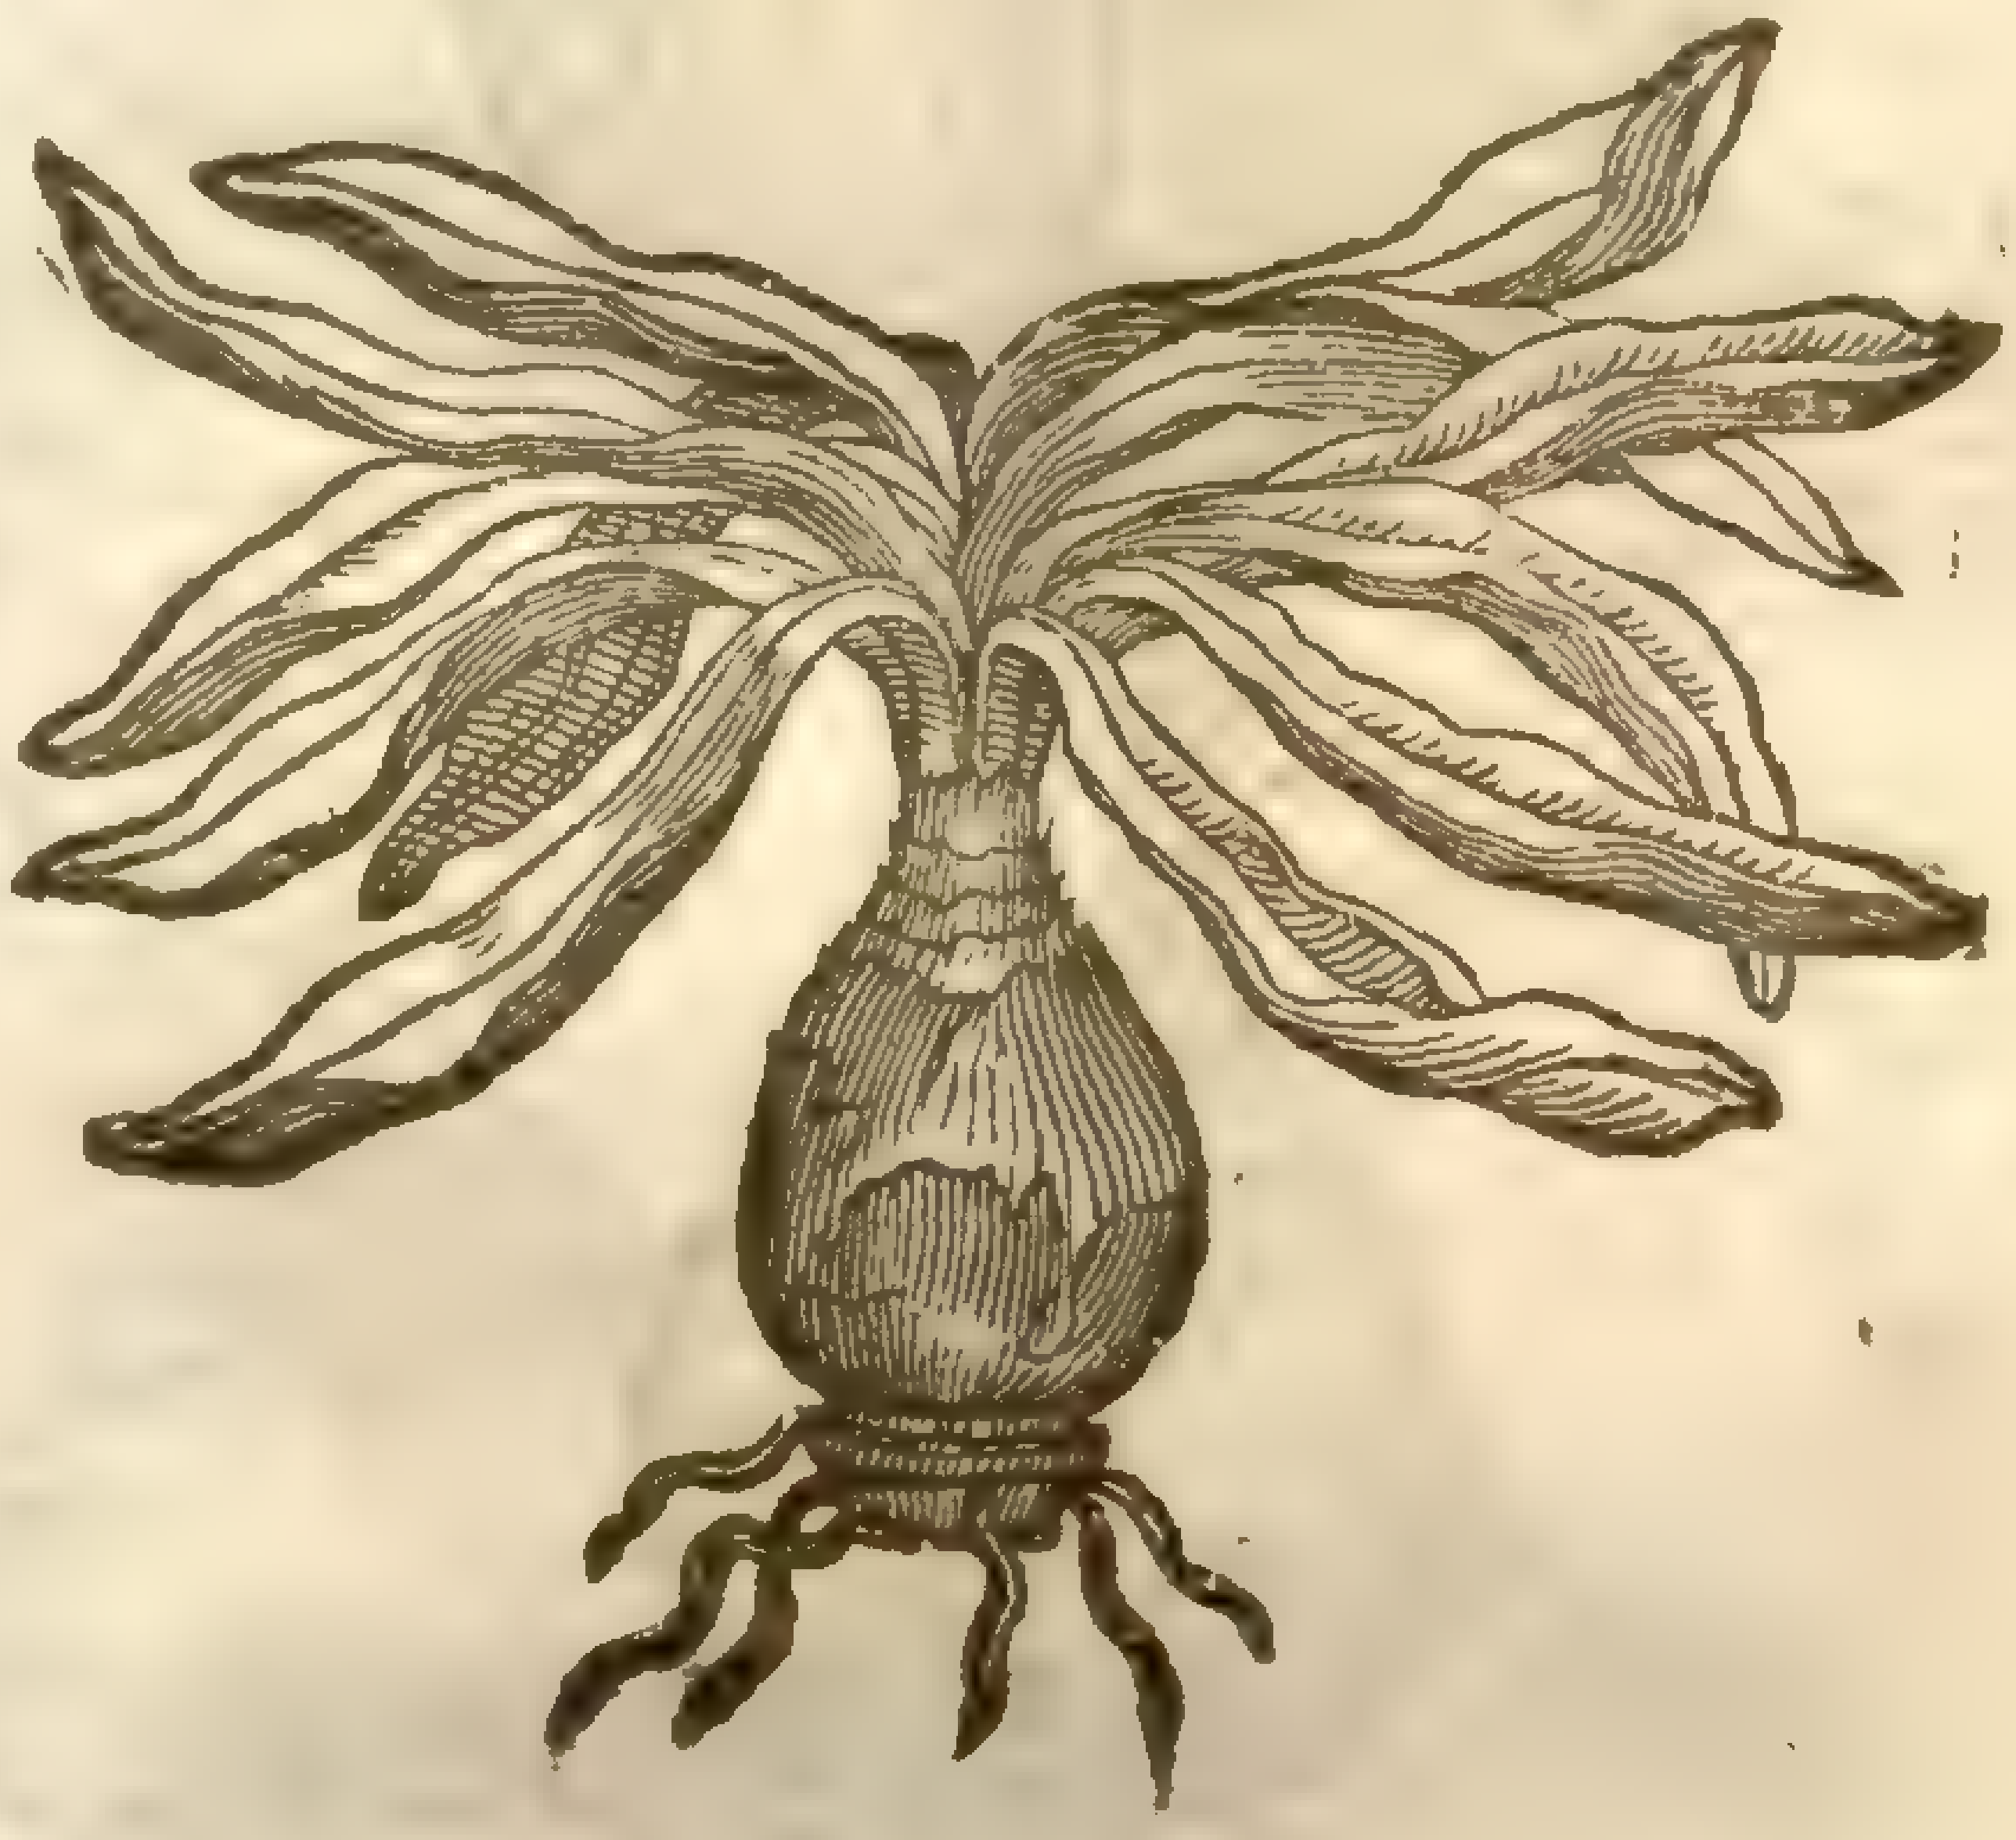
The Onion being eaten, yea though it be boiled, cauſeth head-ache, hurteth the eyes, and maketh a man dim ſighted, dulleth the ſences, ingendreth windineſſe, and prouoketh ouermuch ſleep, eſpecially being eaten raw.

CHAP. 94. *Of Squills or Sea Onions.*

‡ 1 *Scilla Hiſpanica vulgaris.* The common Spaniſh Squill.



Scilla maritima, Lin. [illegible]



¶ *The Deſcription.*

‡ 1 THe ordinarie Squill or ſea Onion hath a pretty large root compoſed of ſundry white coats filled with a certain viſcous humiditie, and at the bottome thereof grow forth ſundry white and thicke fibres. The leaues are like thoſe of Lillies, broad, thicke, and very greene, lying ſpred vpon the ground, and turned vp on the ſides. The ſtalke groweth ſome cubit or more high, ſtraight, naked without leaues, beautified at the top with many ſtarre-faſhioned floures, very like thoſe of the bigger *Ornithogalum*. The ſeed is contained in chaffie three cornered ſeed-veſſels, being it ſelfe alſo blacke, ſmooth, and chaffie. It floures in Auguſt and September, and the ſeed is ripe in October. The leaues ſpring vp in Nouember and December, after that the ſeed is ripe, and ſtalke decayed. ‡

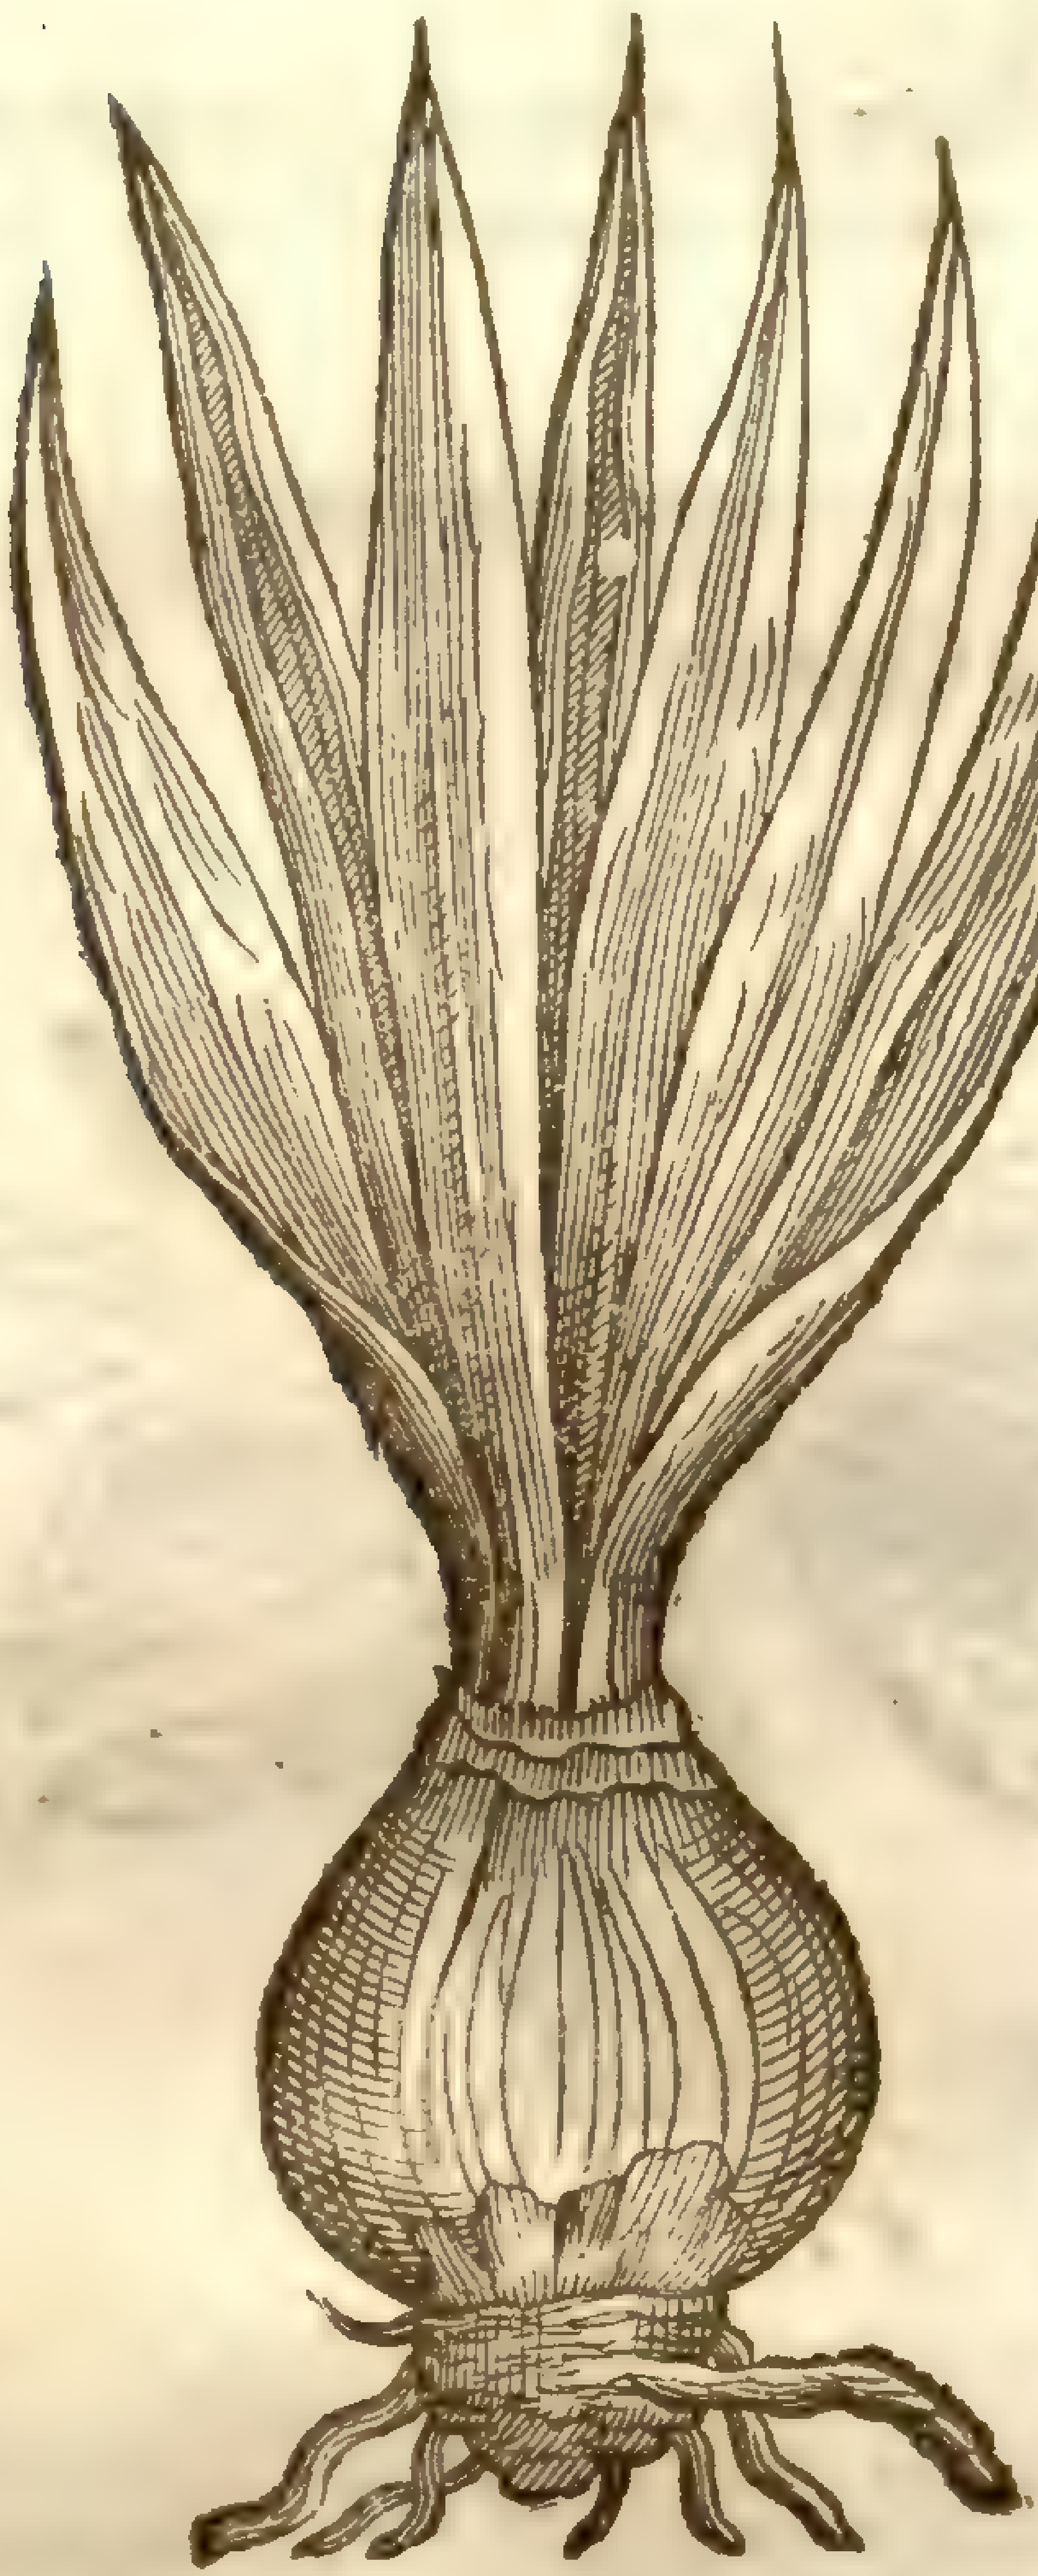
2 The great ſea Onion, which *Cluſius* hath ſet forth in his Spaniſh Hiſtorie, hath very great and broad leaues, as *Dioſcorides* ſaith, longer than thoſe of the Lilly, but narrower. The bulbe or headed root is very great, conſiſting of many coats or ſcaly filmes of a reddiſh colour. The floure is ſometimes yellow, ſomtimes purple, and ſomtimes of a light blew. ‡ *Cluſius* ſaith it is like that of the former, I thinke he means both in ſhape and colour. ‡

3 The ſea Onion of Valentia, or rather the ſea Daffodill, hath many long and fat leaues, and narrow like thoſe of Narciſſus, but ſmoother and weaker, lying vpon the ground; amongſt which riſeth vp a ſtalke a foot high, bare and naked, bearing at the top a tuft of white floures, in ſhape like

vnto our common yellow Daffodill. The ſeed is incloſed in thicke knobby husks, blacke, fat, and thicke, very ſoft, in ſhape like vnto the ſeeds of *Ariſtolochia longa*, or long Birth-wort. The root is great, white, long, and bulbous.

4 Red floured Sea Daffodill or ſea Onion hath a great bulbe or root like to the precedent, the leaues long, fat, and ſharpe pointed, the ſtalke bare and naked, bearing at the top ſundry faire red floures, in ſhape like to the laſt deſcribed.

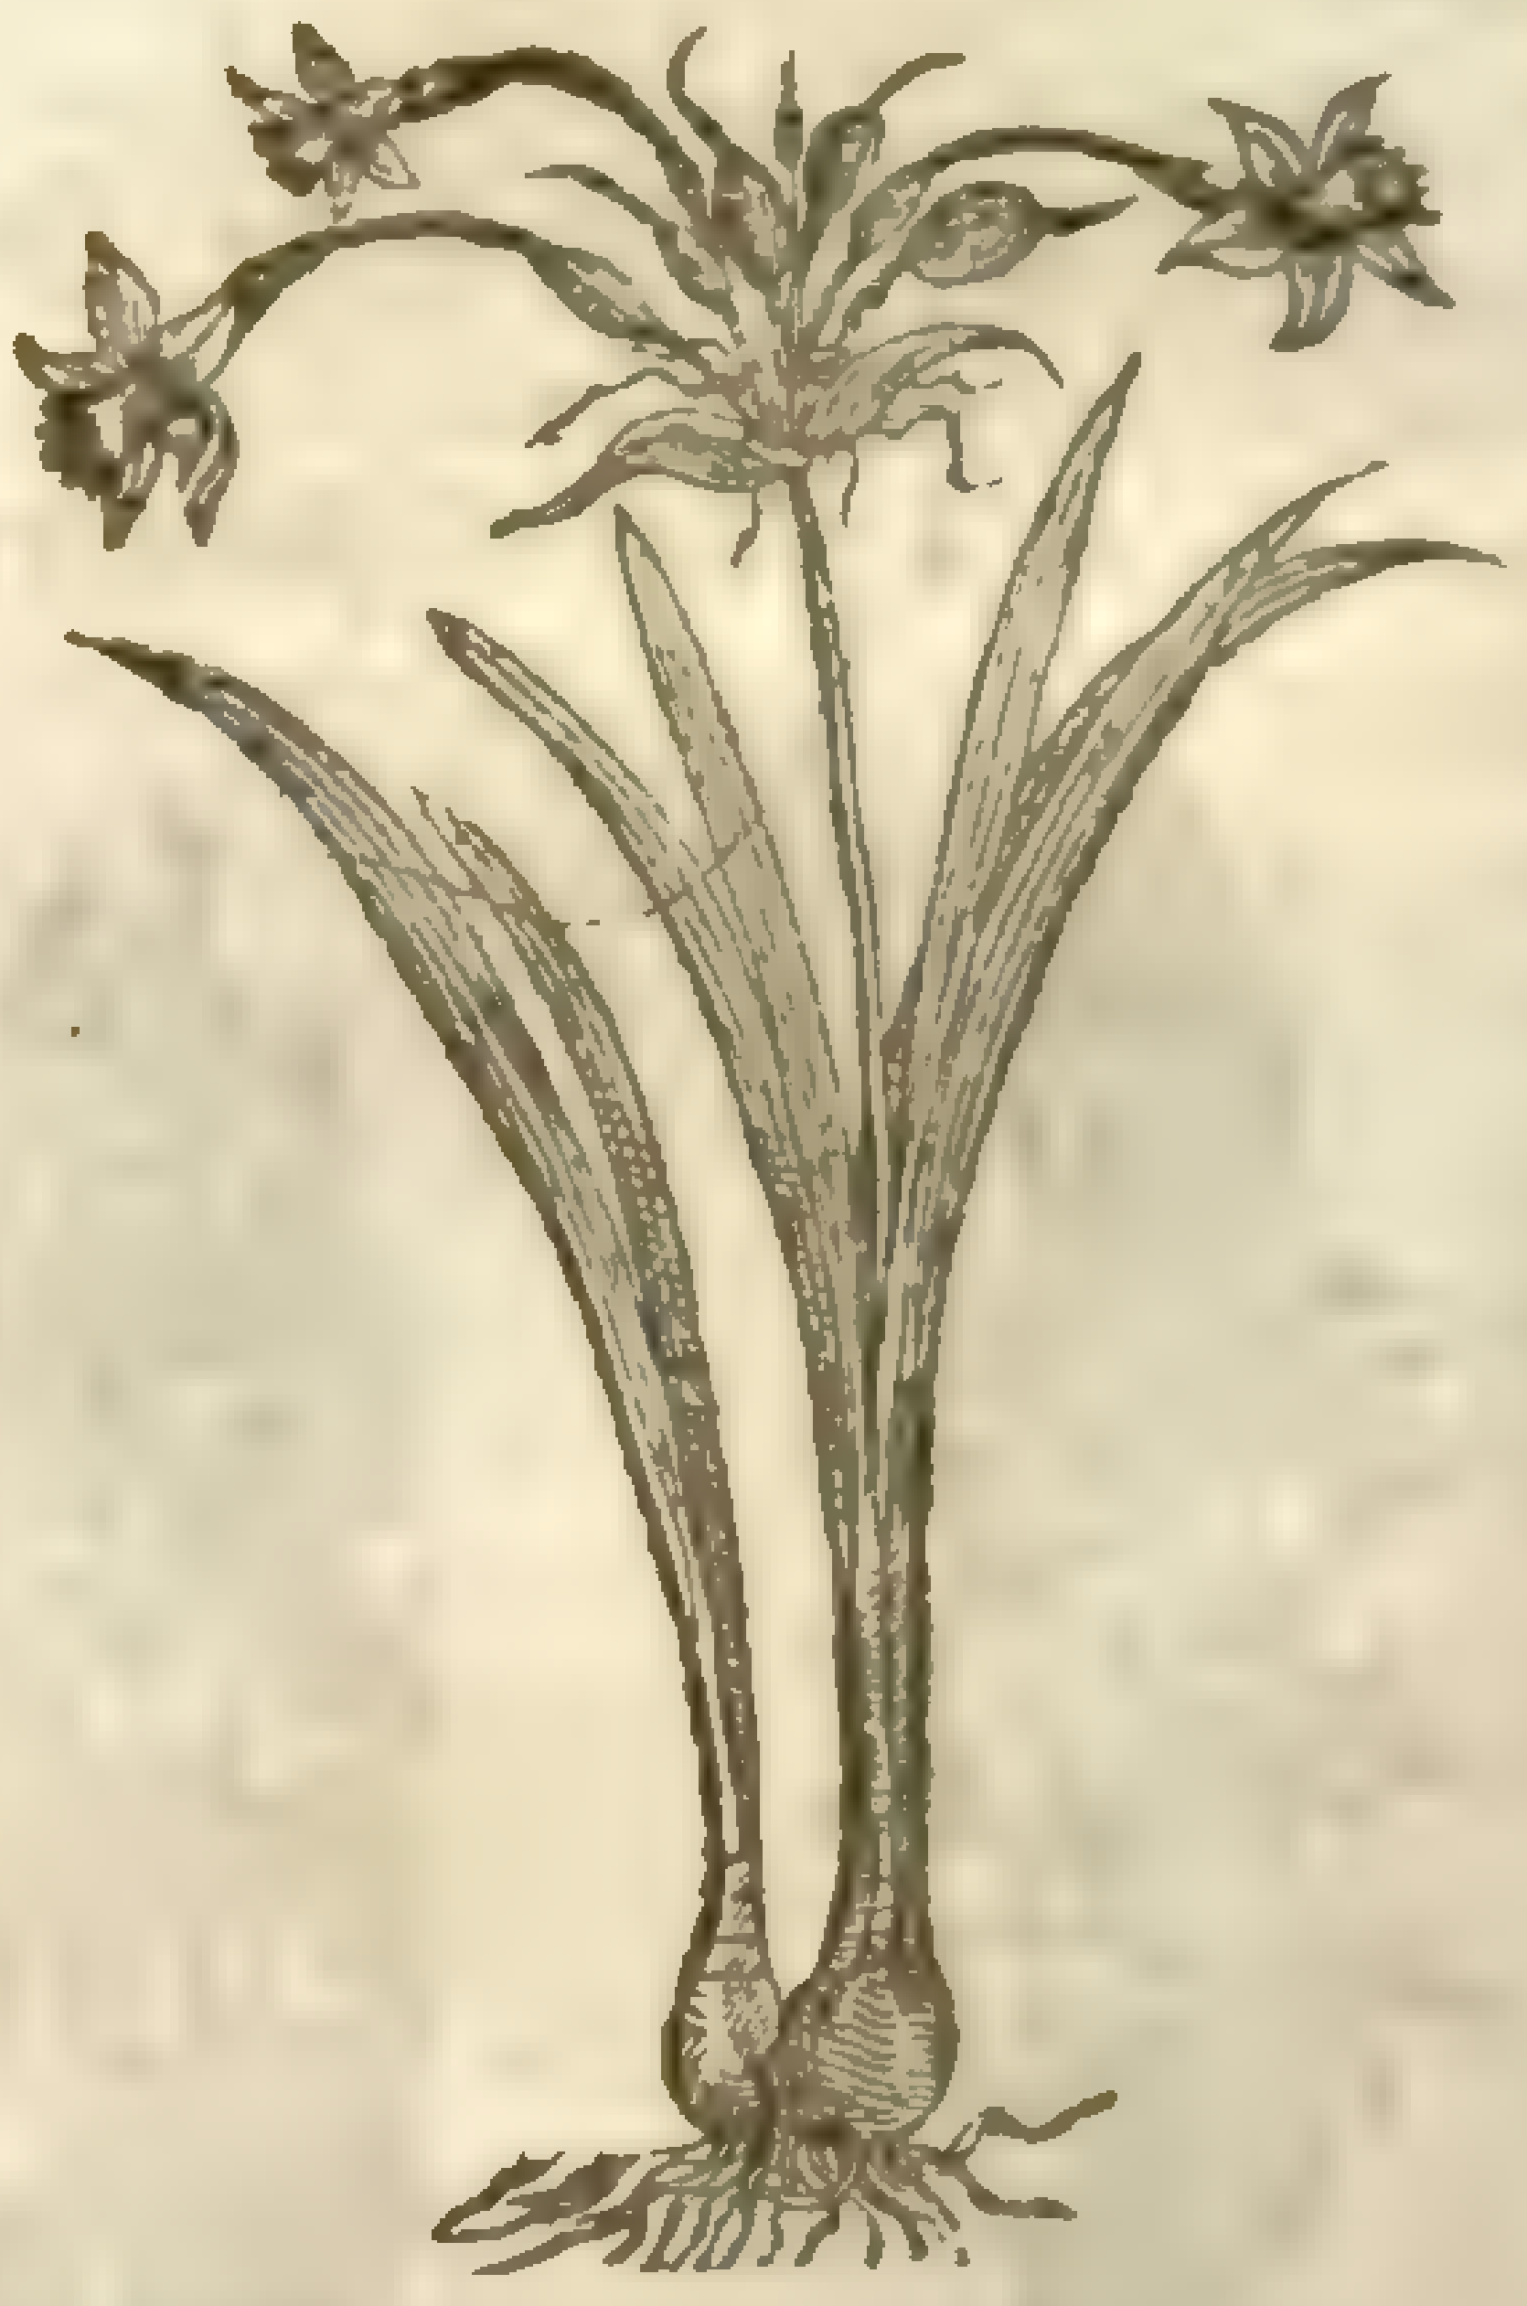
2 *Pancratium Cluſij.*
Great Squill or Sea Onion.



Scilla maritima = [illegible]

P. maritimum, = [illegible]

3 *Pancratium marinum.*
Sea Onion of Valentia.



5 The yellow floured Sea Daffodill or ſea Onion hath many thicke fat leaues like vnto the common Squill or ſea Onion, among the which riſeth vp a tender ſtraight ſtalke full of juice, bearing at the top many floures like the common yellow Daffodil. The ſeed and root is like the precedent.

‡ 6 To theſe may fitly be added that elegant plant which is knowne by the name of *Narciſſus tertius* of *Matthiolus*, and may be called white ſea Daffodill. This plant hath large roots, as big ſometimes as the ordinarie Squill. The leaues are like thoſe of other Daffodils, but broader, rounder pointed, and not very long. The ſtalke is pretty thicke, being ſometimes round, otherwhiles cornered, at the top whereof grow many large white floures: each floure is thus compoſed; it hath ſix long white leaues, in the midſt growes forth a white pointall, which is incompaſſed by a welt or cap diuided into ſix parts, which ſix are again by threes diuided into eighteen jags or diuiſions, a white thred tipt with greene, of an inch long, comming forth of the middle of each diuiſion. This floureth in the end of May. It is ſaid to grow naturally about the ſea coaſt of Illyria. ‡

¶ *The Place.*

The firſt is found in Spaine and Italy, not far from the ſea ſide.

The ſecond alſo neere vnto the ſea, in Italy, Spaine, and Valentia. I haue had plants of them brought me from ſundry parts of the Mediterranean ſea ſide, as alſo from Conſtantinople, where it is numbred among the kindes of Narciſſus.

The third groweth in the ſands of the ſea in moſt places of the coaſt of Narbone, and about Montpellier.

The fourth groweth plentifully about the coaſts of Tripolis and Aleppo, neere to the ſea, and alſo in ſalt marſhes that are ſandy and lie open to the aire.

¶ The Time.

They floure from May to the end of Iuly, and their ſeed is ripe in the end of Auguſt.

¶ The Names.

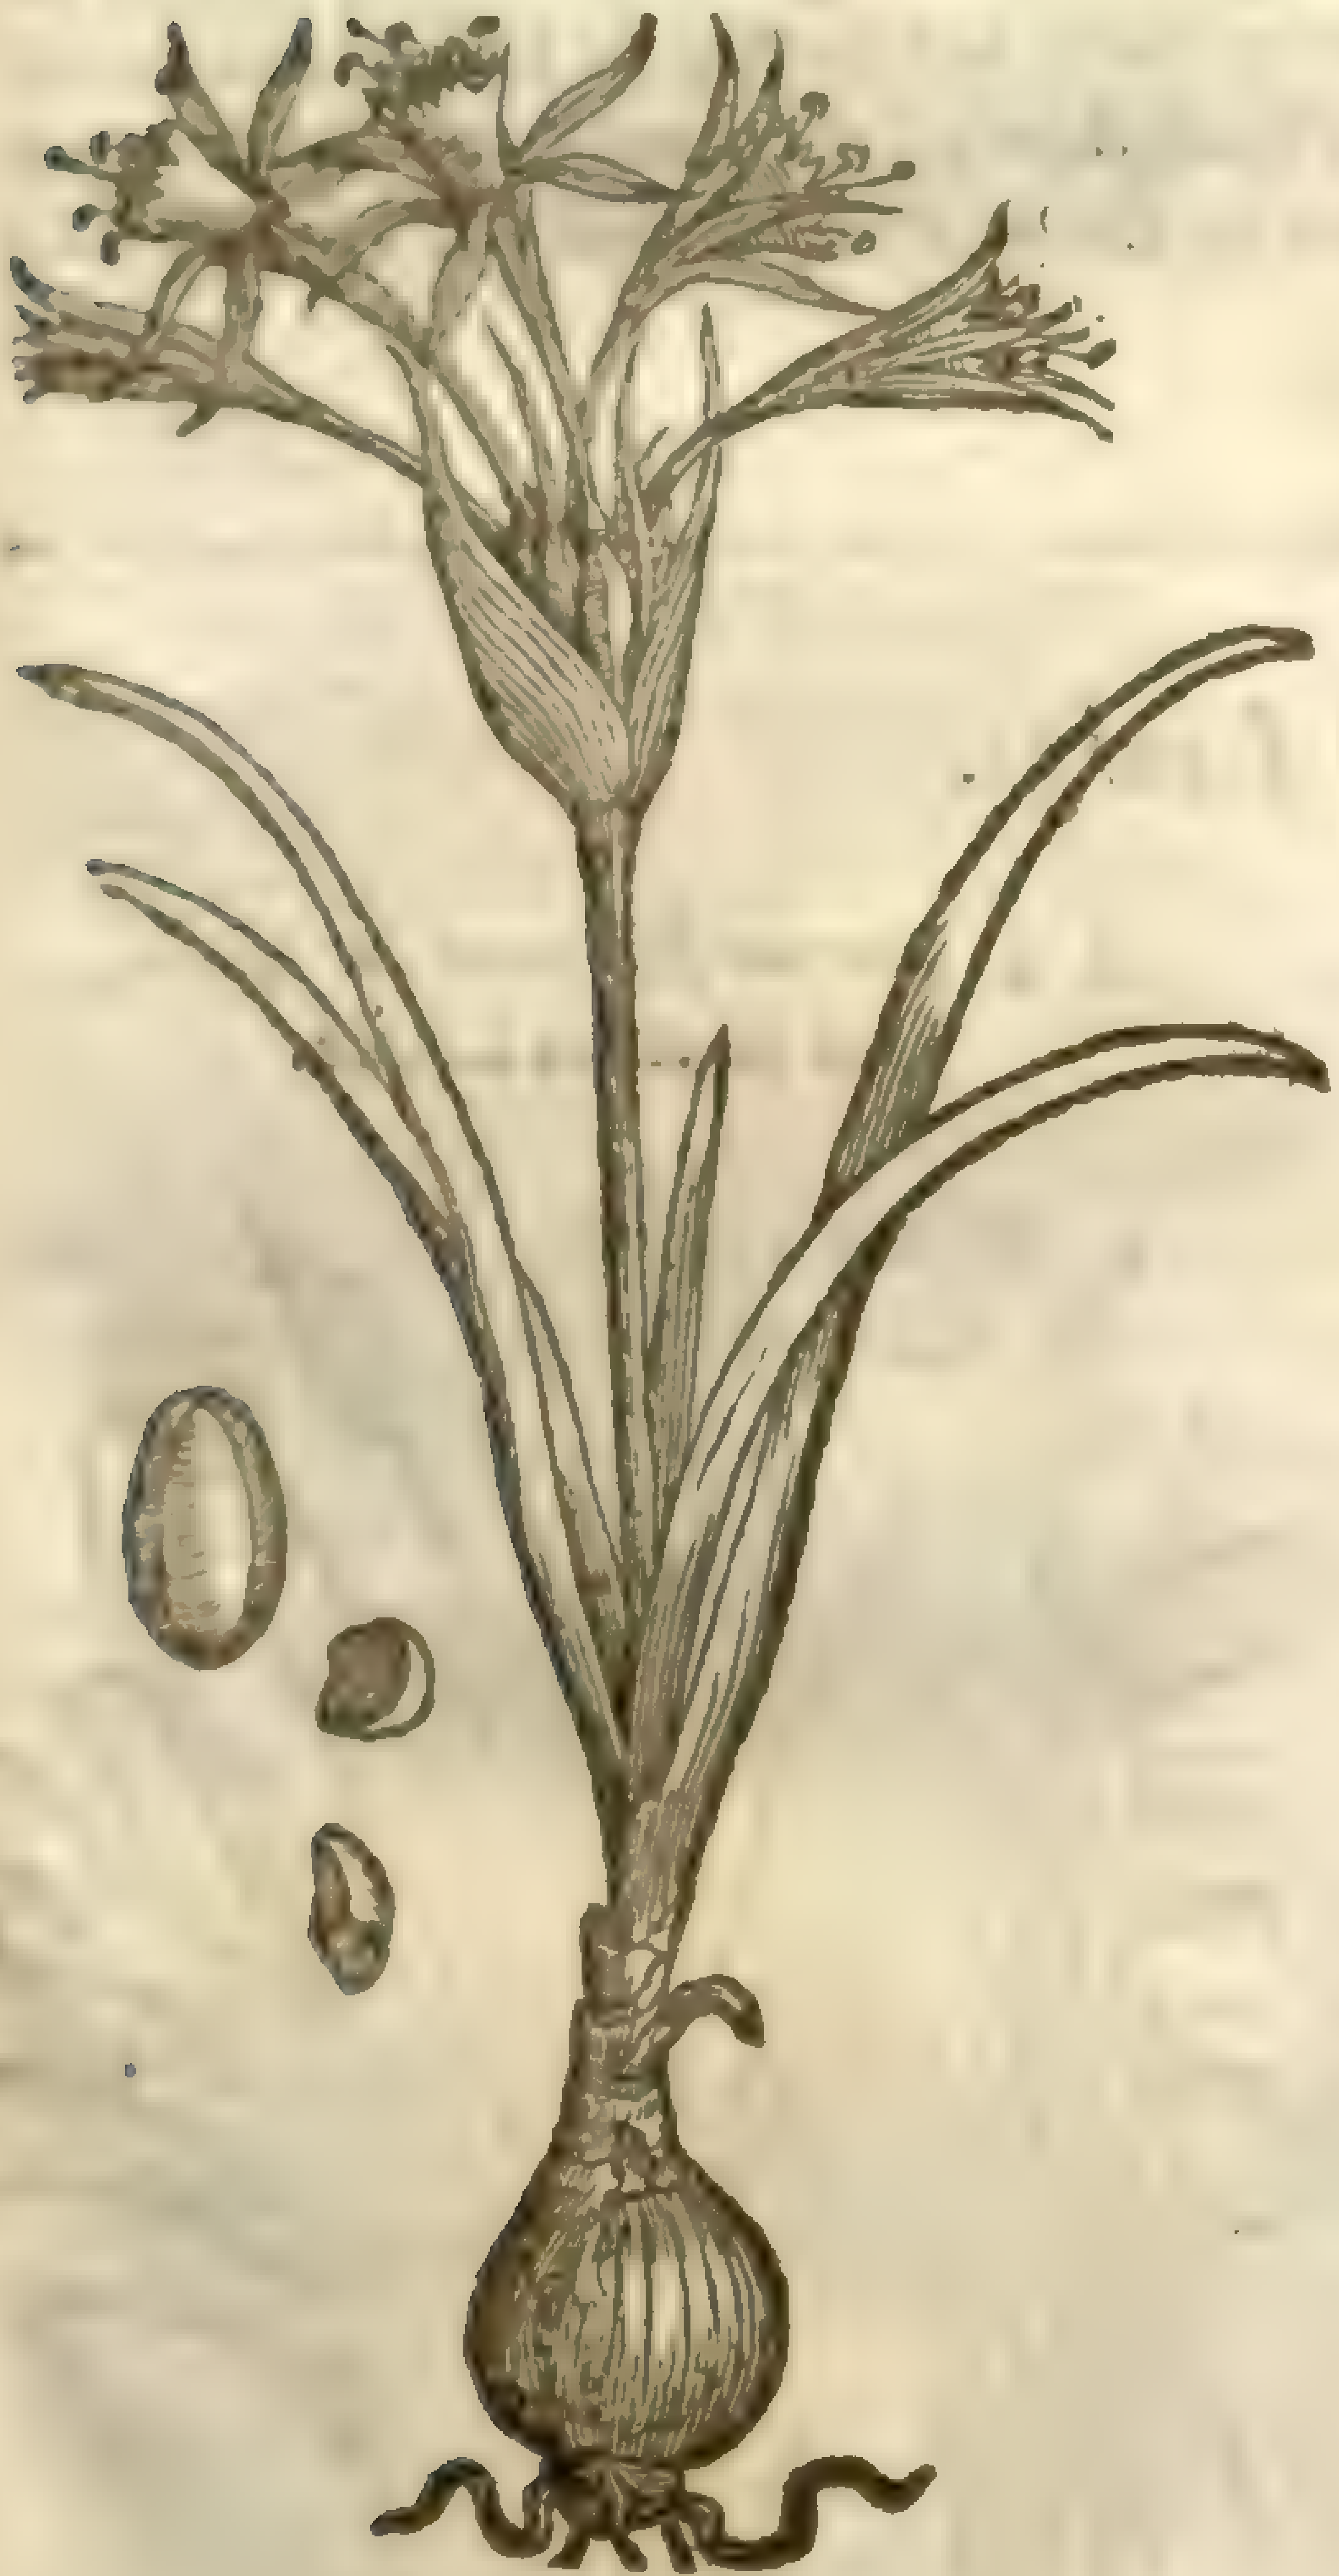
The firſt is called of the Grecians, σκίλλα: and of the Latines alſo *Scilla*: the Apothecaries name it, *Squilla*: Diuers, *Cepa maris*: the Germanes, **Meer zwibel**: the Spaniards, *Cebolla albarrana*: the French-men, *Oignon de mer*: in Engliſh, Squill, and Sea Onion.

‡ The ſecond is called, Παγκράτιον, and *Scilla rubra maior*.

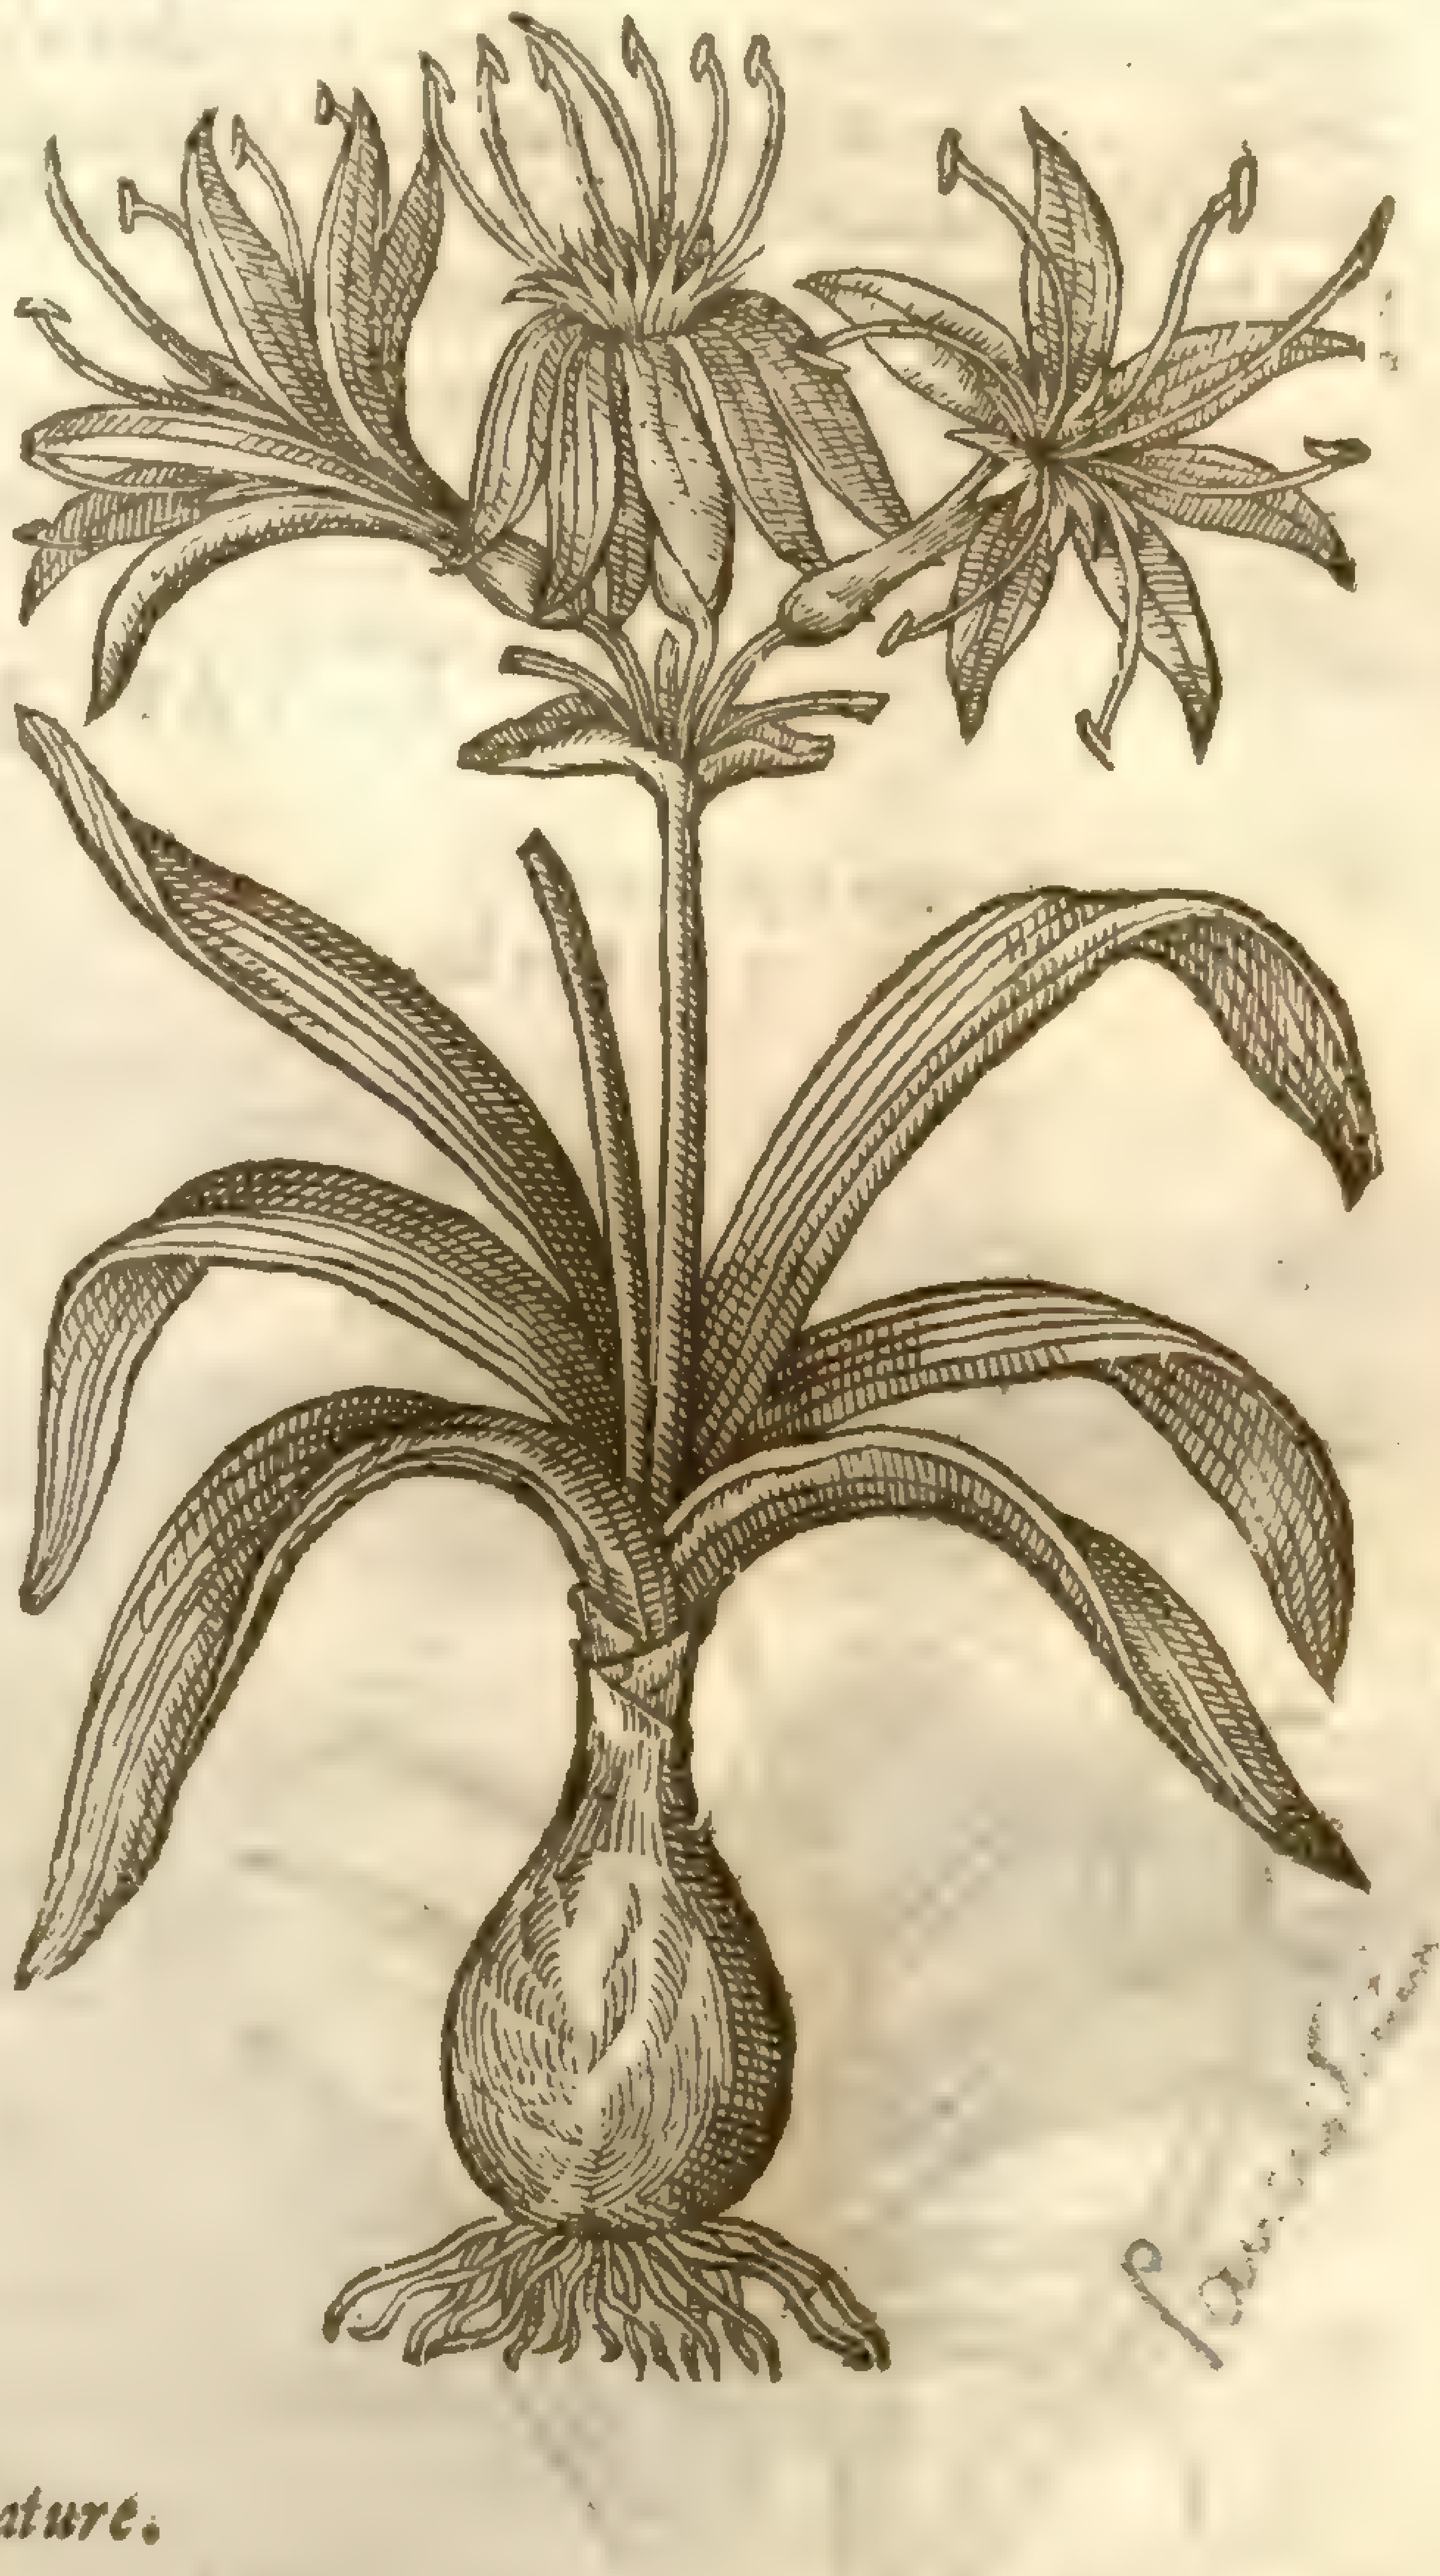
3, 4, 5. Theſe are all figures of the ſame plant, but the leaſt (which is the worſt) is the figure of the *Aduerſaria*, where it is called *Pancratium marinum*: *Doaonæus* calls it *Narciſſus marinus*: and *Cluſius*, *Hemerocallis Valentina*: and it is iudged to be the Ἡμεροκαλλὶς of *Theophraſtus*, *Lib. 6. Hiſt. cap. 1.* The Spaniards call this, *Amores mios*: the Turkes, *Con zambach*: the Italians, *Giglio marino*. Theſe three (as I ſaid) differ no otherwiſe than in the colour of their floures.

The ſixth is *Narciſſus tertius*, or *Conſtantinopolitanus*, of *Matthiolus*: *Cluſius* calls it, *Lilionarciſſus Hemerocallidis facie*. ‡

4 *Pancratium floribus rubris.*
Red floured ſea Daffodill.



‡ 6 *Narciſſus tertius Matthioli.*
The white ſea Daffodill.



Pancratium illyricum L.
[illegible]

¶ The Temperature.

The ſea Onion is hot in the ſecond degree, and cutteth very much, as *Galen* ſaith. It is beſt when it is taken baked or roſted, for ſo the vehemency of it is taken away.

¶ The Vertues of Squills.

A The root is to be couered with paſte or clay, (as *Dioſcorides* teacheth, and then put into an ouen to be baked, or elſe buried in hot embers till ſuch time as it be throughly roſted: for not being ſo baked or roſted it is very hurtfull to the inner parts.

B It is likewiſe baked in an earthen pot cloſe couered and ſet in an ouen. That is to be taken eſpecially which is in the midſt, which being cut in pieces muſt be boyled, but the water is ſtill to be changed, till ſuch time as it is neither bitter nor ſharpe: then muſt the pieces be hanged on a thread, and dried in the ſhadow, ſo that no one piece touch another. ‡ Thus vſed it loſeth moſt of the ſtrength, therefore it is better to vſe it lightly dried, without any other preparation. ‡

C These ſlices of the Squill are vſed to make oile, wine, or vineger of Squill. Of this vineger of Squil is made an Oxymel; the vſe whereof is to cut thicke tough and clammy humors, as alſo to be vſed in vomits.

D This Onion roſted or baked is mixed with potions and other medicines which prouoke vrine, and open the ſtoppings of the liuer and ſpleene, and is alſo put into treacles. It is giuen to thoſe that haue the dropſie, the yellow jaundiſe, and to ſuch as are tormented with the gripings of the belly, and is vſed in a licking medicine againſt an old rotten cough, and ſhortneſſe of breath.

E One part of this Onion being mixed with eight parts of ſalt, and taken in the morning faſting, to the quantitie of a ſpoonfull or two, looſeth the belly.

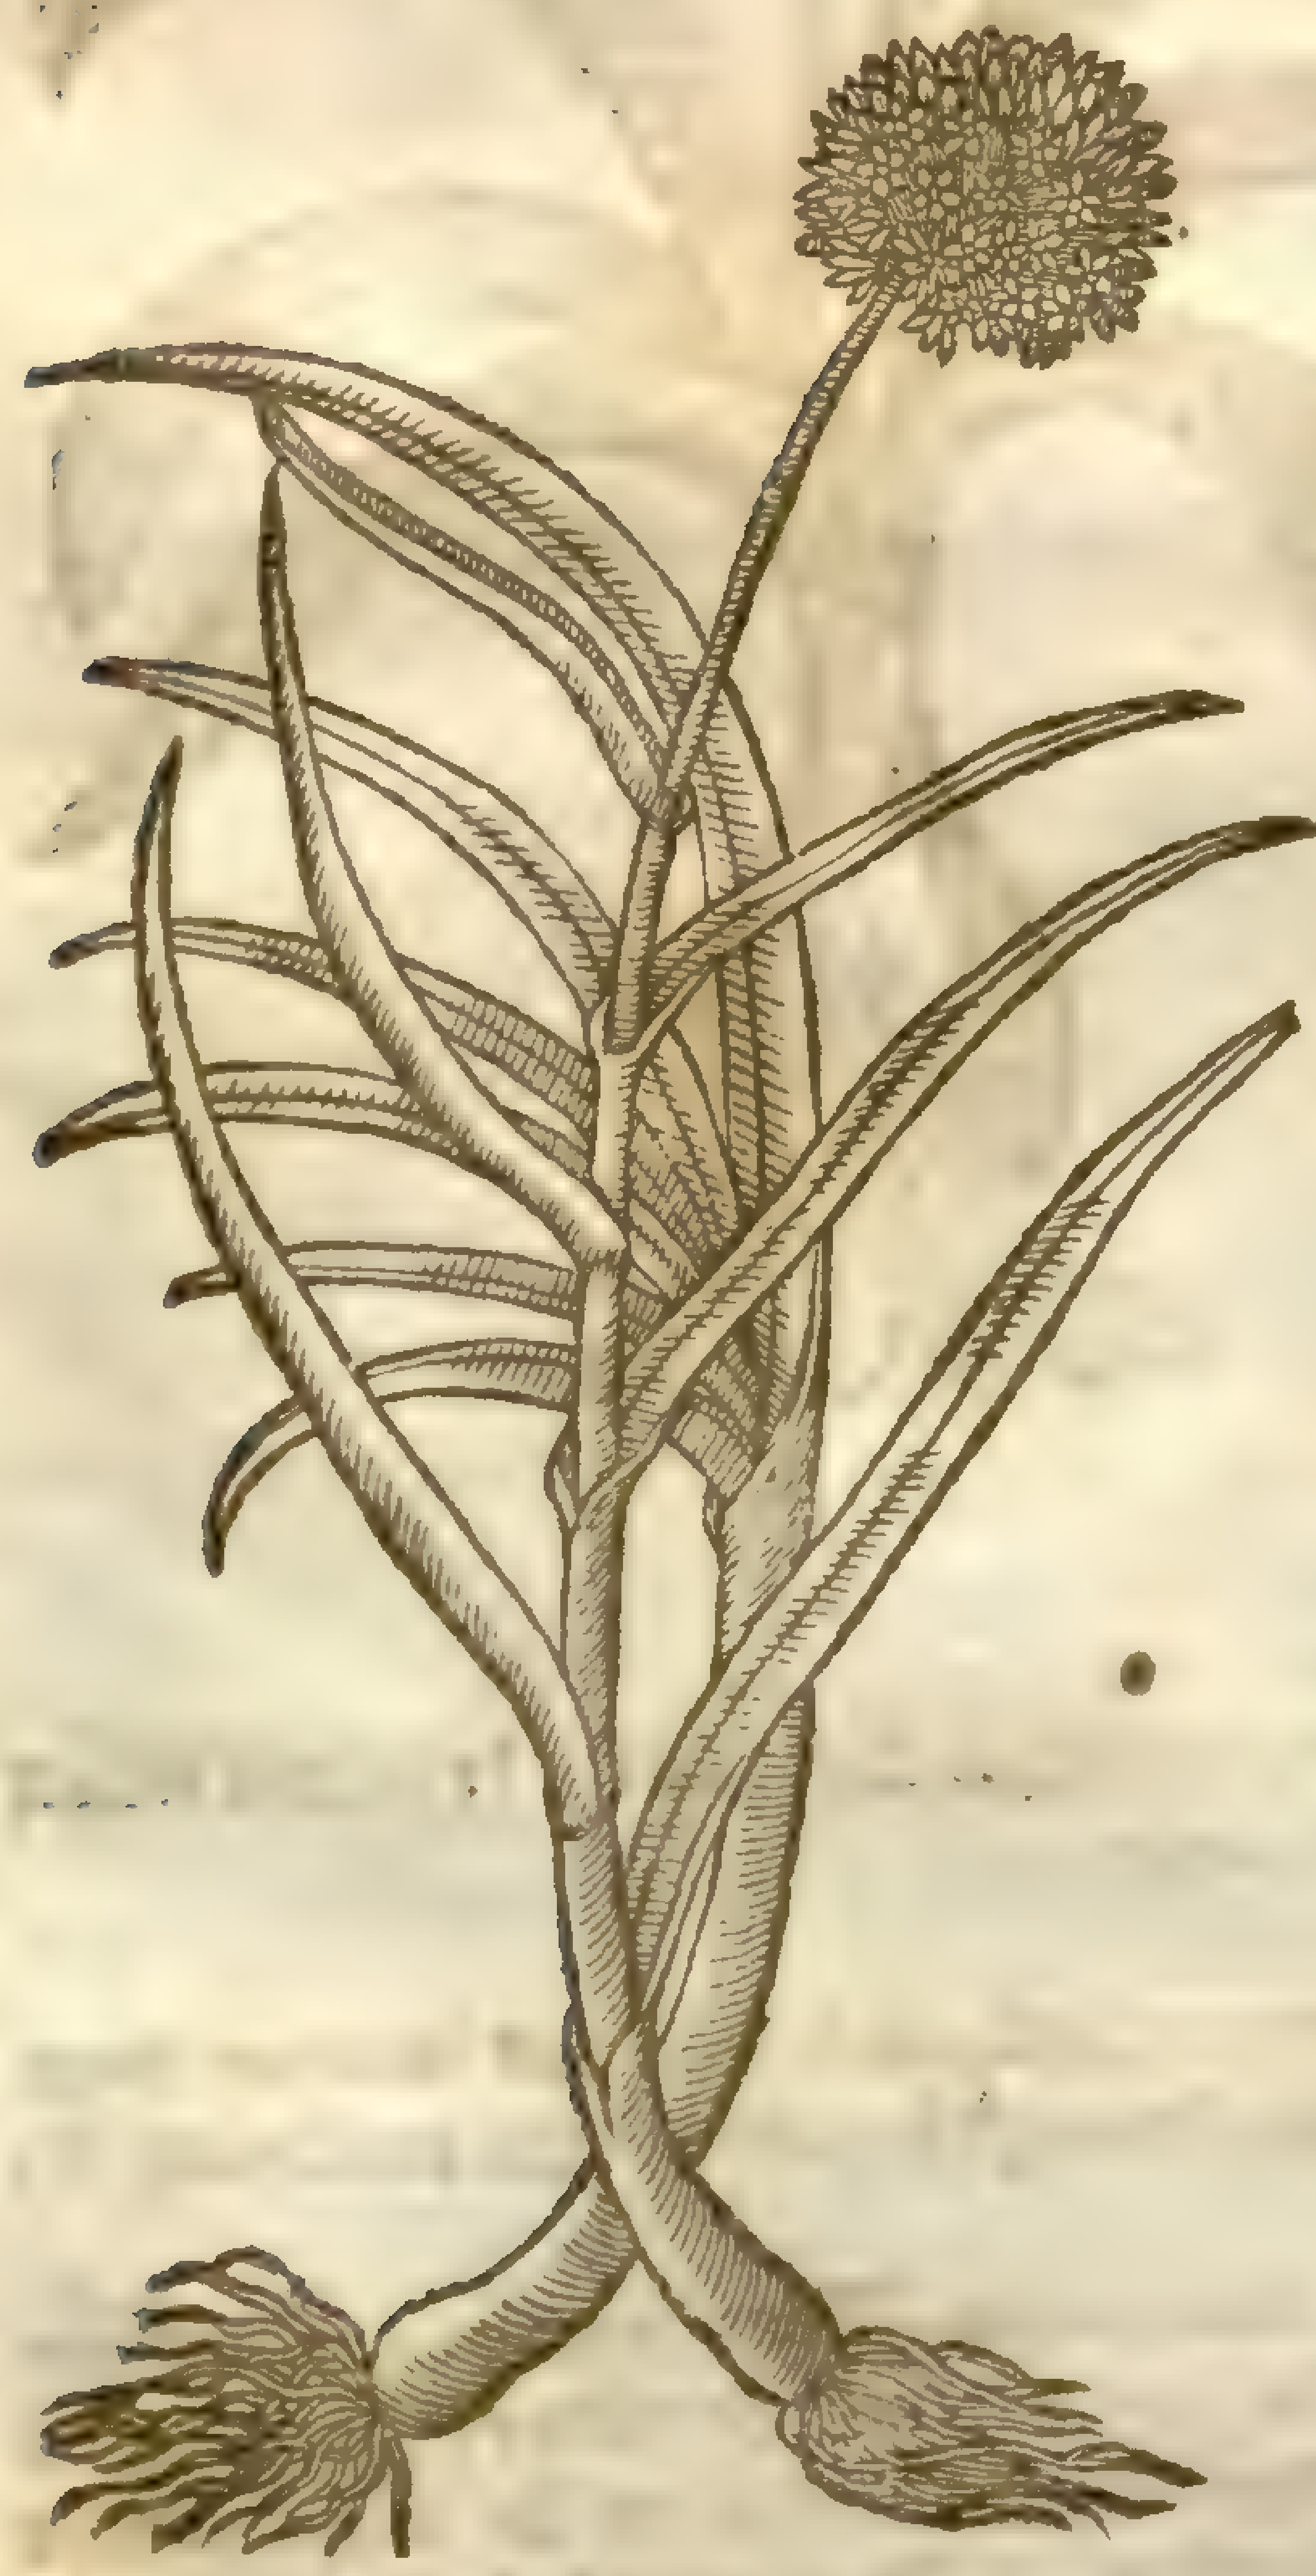
F The inner part of Squilla boiled with oile and turpentine, is with great profit applied vnto the chaps or chilblanes of the feet or heeles.

G It driueth forth long and round wormes, if it be giuen with hony and oile.

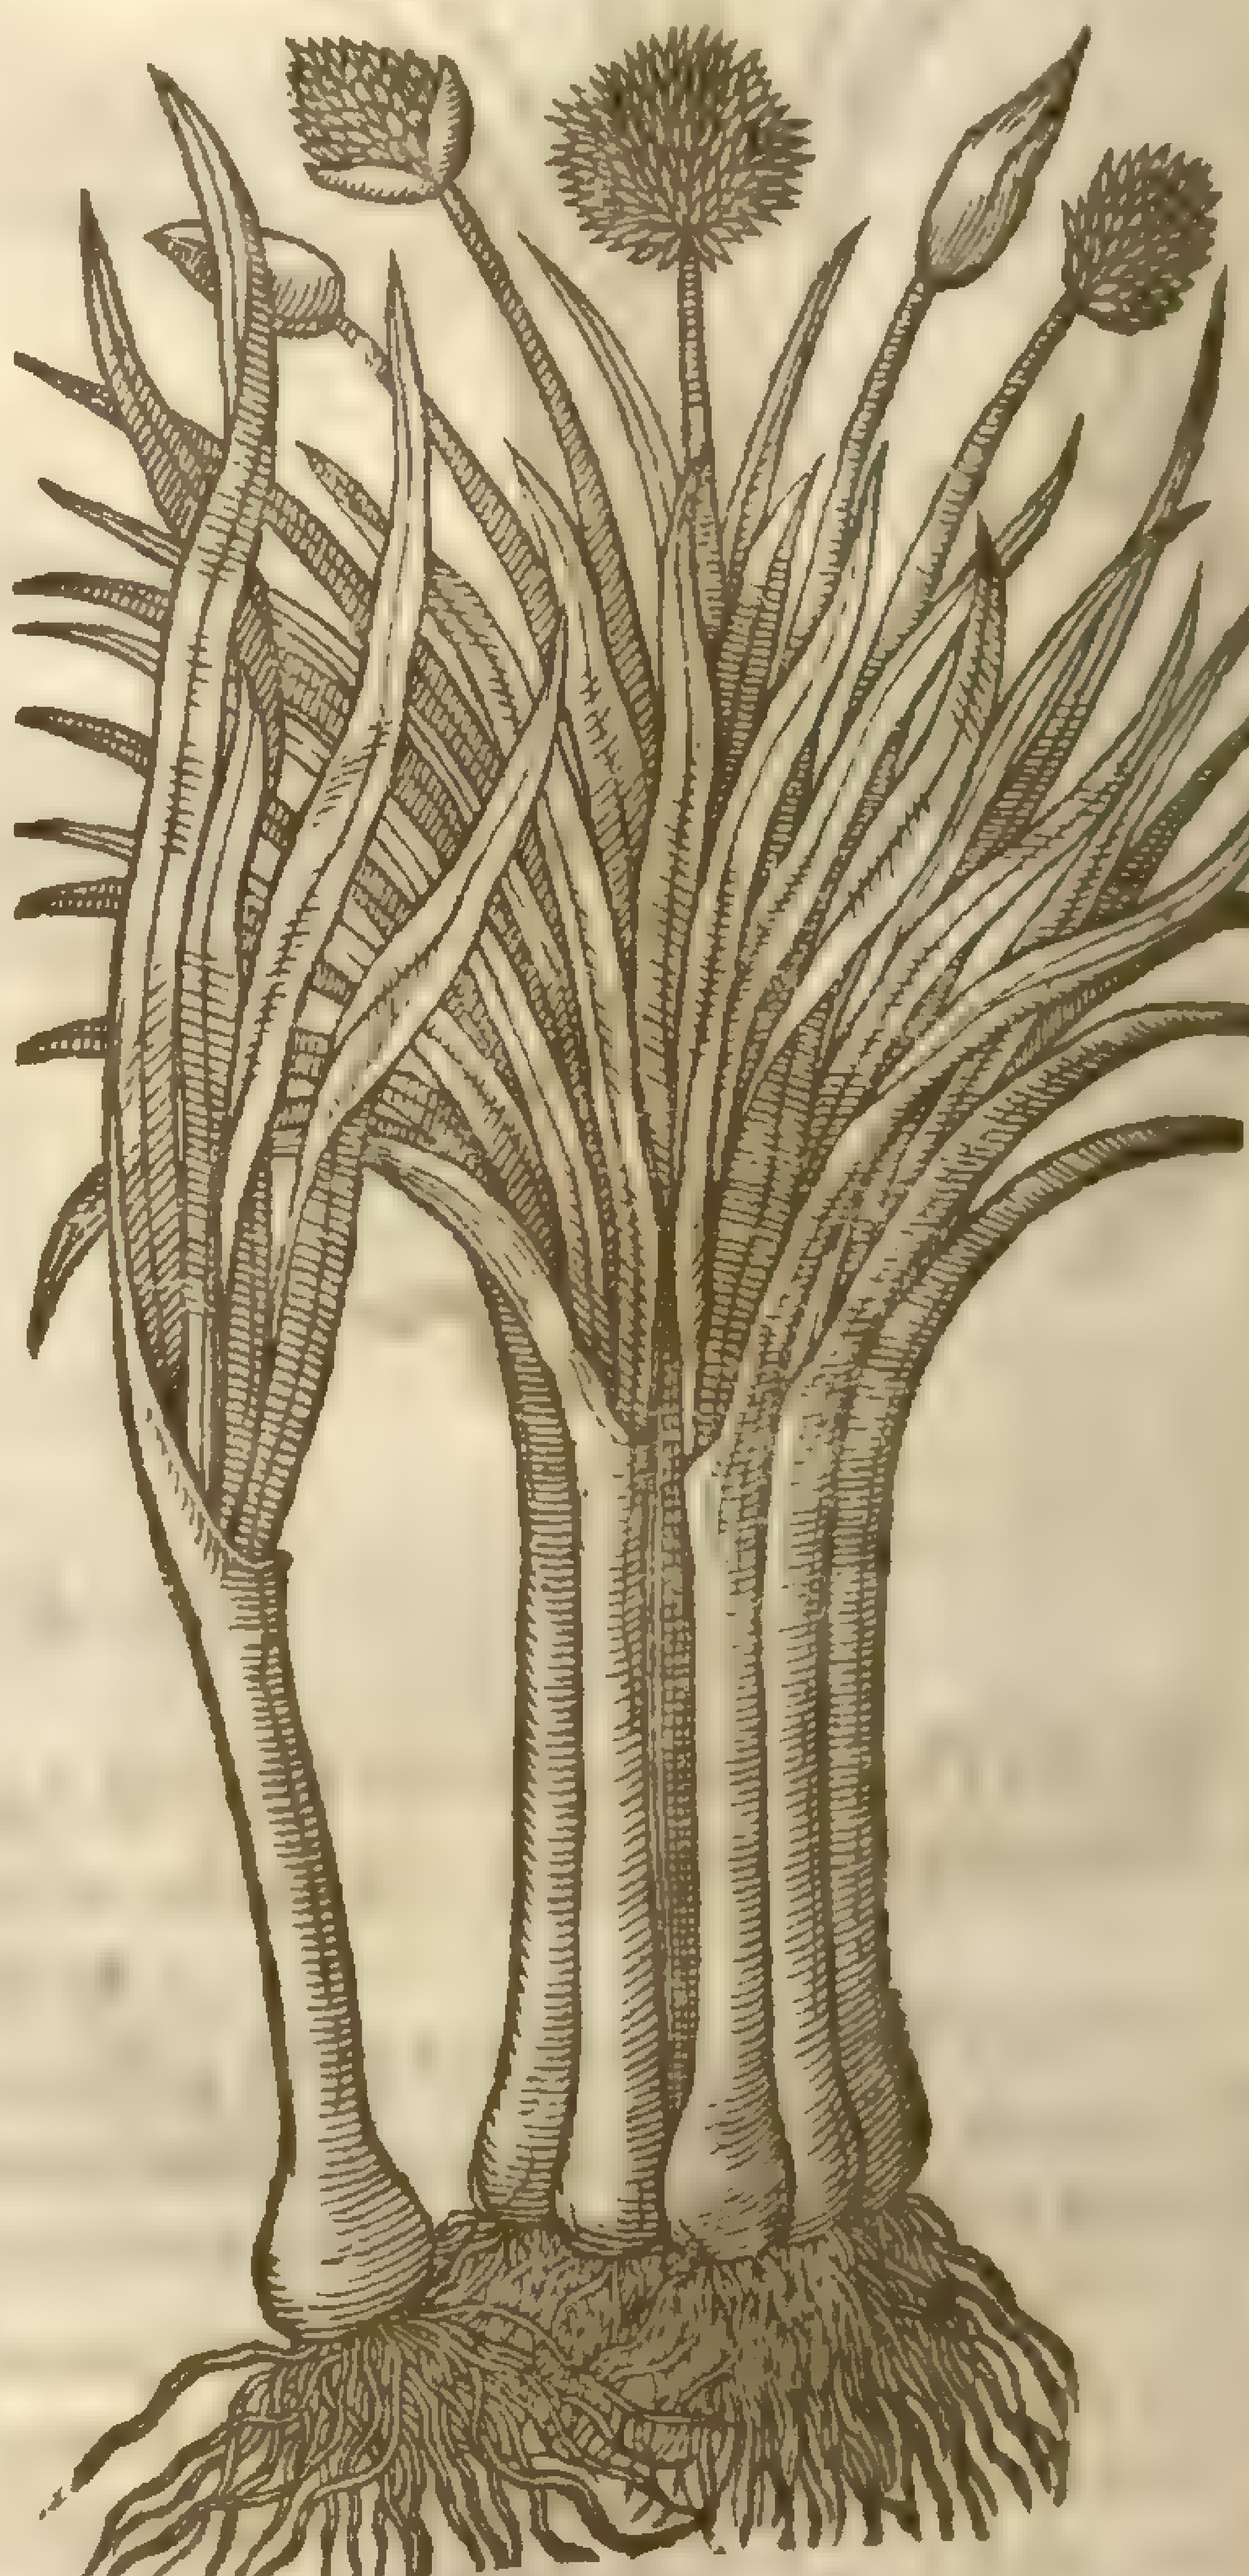
‡ The *Pancratium marinum*, or *Hemerocallis Valentina* (ſaith *Cluſius*) whenas I liued with *Rondeletius* at Montpellier, was called *Scilla*; and the Apothecaries made the trochiſces thereof for the compoſition of treacle. Afterwards it began to be called *Pancratium flore Lilij*. *Rondeletius* alſo was wont to tell this following ſtory concerning the poyſonous and maligne qualitie thereof. There were two fiſhermen, whereof the one lent vnto the other (whom he hated) his knife, poiſoned with the juice of this Hemerocallis, for to cut his meat withall: he ſuſpecting no treacherie, cut his victuals therewith, and ſo eat them, the other abſtaining therefrom, and ſaying he had no ſtomacke. Some few dayes after, he that did eat the victuals died: which ſhewed the ſtrong and deadly qualitie of this plant, which therefore (as *Cluſius* ſaith) cannot be the *Scilla Epimenidia* of *Pliny*, which was eatable and without malignitie. ‡

Chap. 95. *Of Leekes.*

1 *Porrum capitatum.*
Headed or ſet Leeke.



‡ 2 *Porrum ſectivum aut tonſile.*
Cut or vnſet Leeke.



¶ The

¶ *The Deſcription.*

1 THe leaues or the blades of the Leeke be long, ſomewhat broad, and very many, hauing a keele or creſt in the backſide, in ſmell and taſte like to the Onion. The ſtalkes, if the blades be not often cut, do in the ſecond or third yeare grow vp round, bringing forth on the top floures made vp in a round head or ball as doth the Onion. The ſeeds are like. The bulbe or root is long and ſlender, eſpecially of the vnſet Leeke. That of the other Leeke is thicker and greater.

‡ 2 Moſt Writers diſtinguiſh the common Leeke into *Porrum capitatum & ſectivum*; and *Lobel* giues theſe two figures wherewith we here preſent you. Now both theſe grow of the ſame ſeed, and they differ onely in culture; for that which is often cut for the vſe of the kitchen is called *Sectivum*: the other which is headed, is not cut, but ſpared, and remooued in Autumne. ‡

¶ *The Place.*

It requireth a meane earth, fat, well dunged and digged. It is very common euery where in other countries, as well as in England.

¶ *The Time.*

It may be ſowne in March or Aprill, and is to be remooued in September, or October.

¶ *The Names.*

The Grecians call it πράσον: the Latines, *Porrum*. The Emperour *Nero* had great pleaſure in this root, and therefore he was called in ſcorne, *Porrophagus*. But *Palladius* in the maſculine gender called it *Porrus*: the Germanes, **Lauch**: the Brabanders, **Porreye**: the Spaniards, *Puerro*: the French, *Porreau*: the Engliſh-men, Leeke, or Leekes.

¶ *The Temperature.*

The Leeke is hot and dry, and doth attenuate or make thinne as doth the Onion.

¶ *The Vertues.*

Being boiled it is leſſe hurtfull, by reaſon that it loſeth a great part of his ſharpeneſſe: and yet being ſo vſed it yeeldeth no good juyce. But being taken with cold herbes his too hot quality is tempered. A

Being boyled and eaten with Ptiſana or barley creame, it concocteth and bringeth vp raw humors that lie in the cheſt. Some affirme it to be good in a loch or licking medicine, to clenſe the pipes of the lungs. B

The juyce drunke with hony is profitable againſt the biting of venomous beaſts, and likewiſe the leaues ſtamped and laid thereupon. C

The ſame juice, with vinegre, frankincenſe and milke, or oyle of roſes, dropped into the eares, mitigateth their paine, and is good for the noyſe in them. D

Two drams of the ſeed, with the like weight of myrtill berries drunke, ſtop the ſpitting of bloud which hath continued a long time. The ſame ingredients put into Wine keepe it from ſouring, and being already ſoure, amend the ſame, as diuers write. It cutteth and attenuateth groſſe and tough humors. E

‡ *Lobel* commends the following Loch as very effectuall againſt phlegmatick Squinancies, and other cold catarrhes which are like to cauſe ſuffocation. This is the deſcription thereof; Take blanched almonds three ounces, foure figs, ſoft *Bdellium* halfe an ounce, juyce of Liquorice, two ounces, of ſugar candy diſſolued in a ſufficient quantity of juyce of Leekes, and boyled in *Balneo* to the height of a Syrrup, as much as ſhall be requiſit to make the reſt into the forme of an *Eclegma*. ‡ F

¶ *The Hurts.*

It heateth the body, ingendreth naughty bloud, cauſeth troubleſome and terrible dreames, offendeth the eies, dulleth the ſight, hurteth thoſe that are by nature hot and cholericke, and is noyſome to the ſtomacke, and breedeth windineſſe.

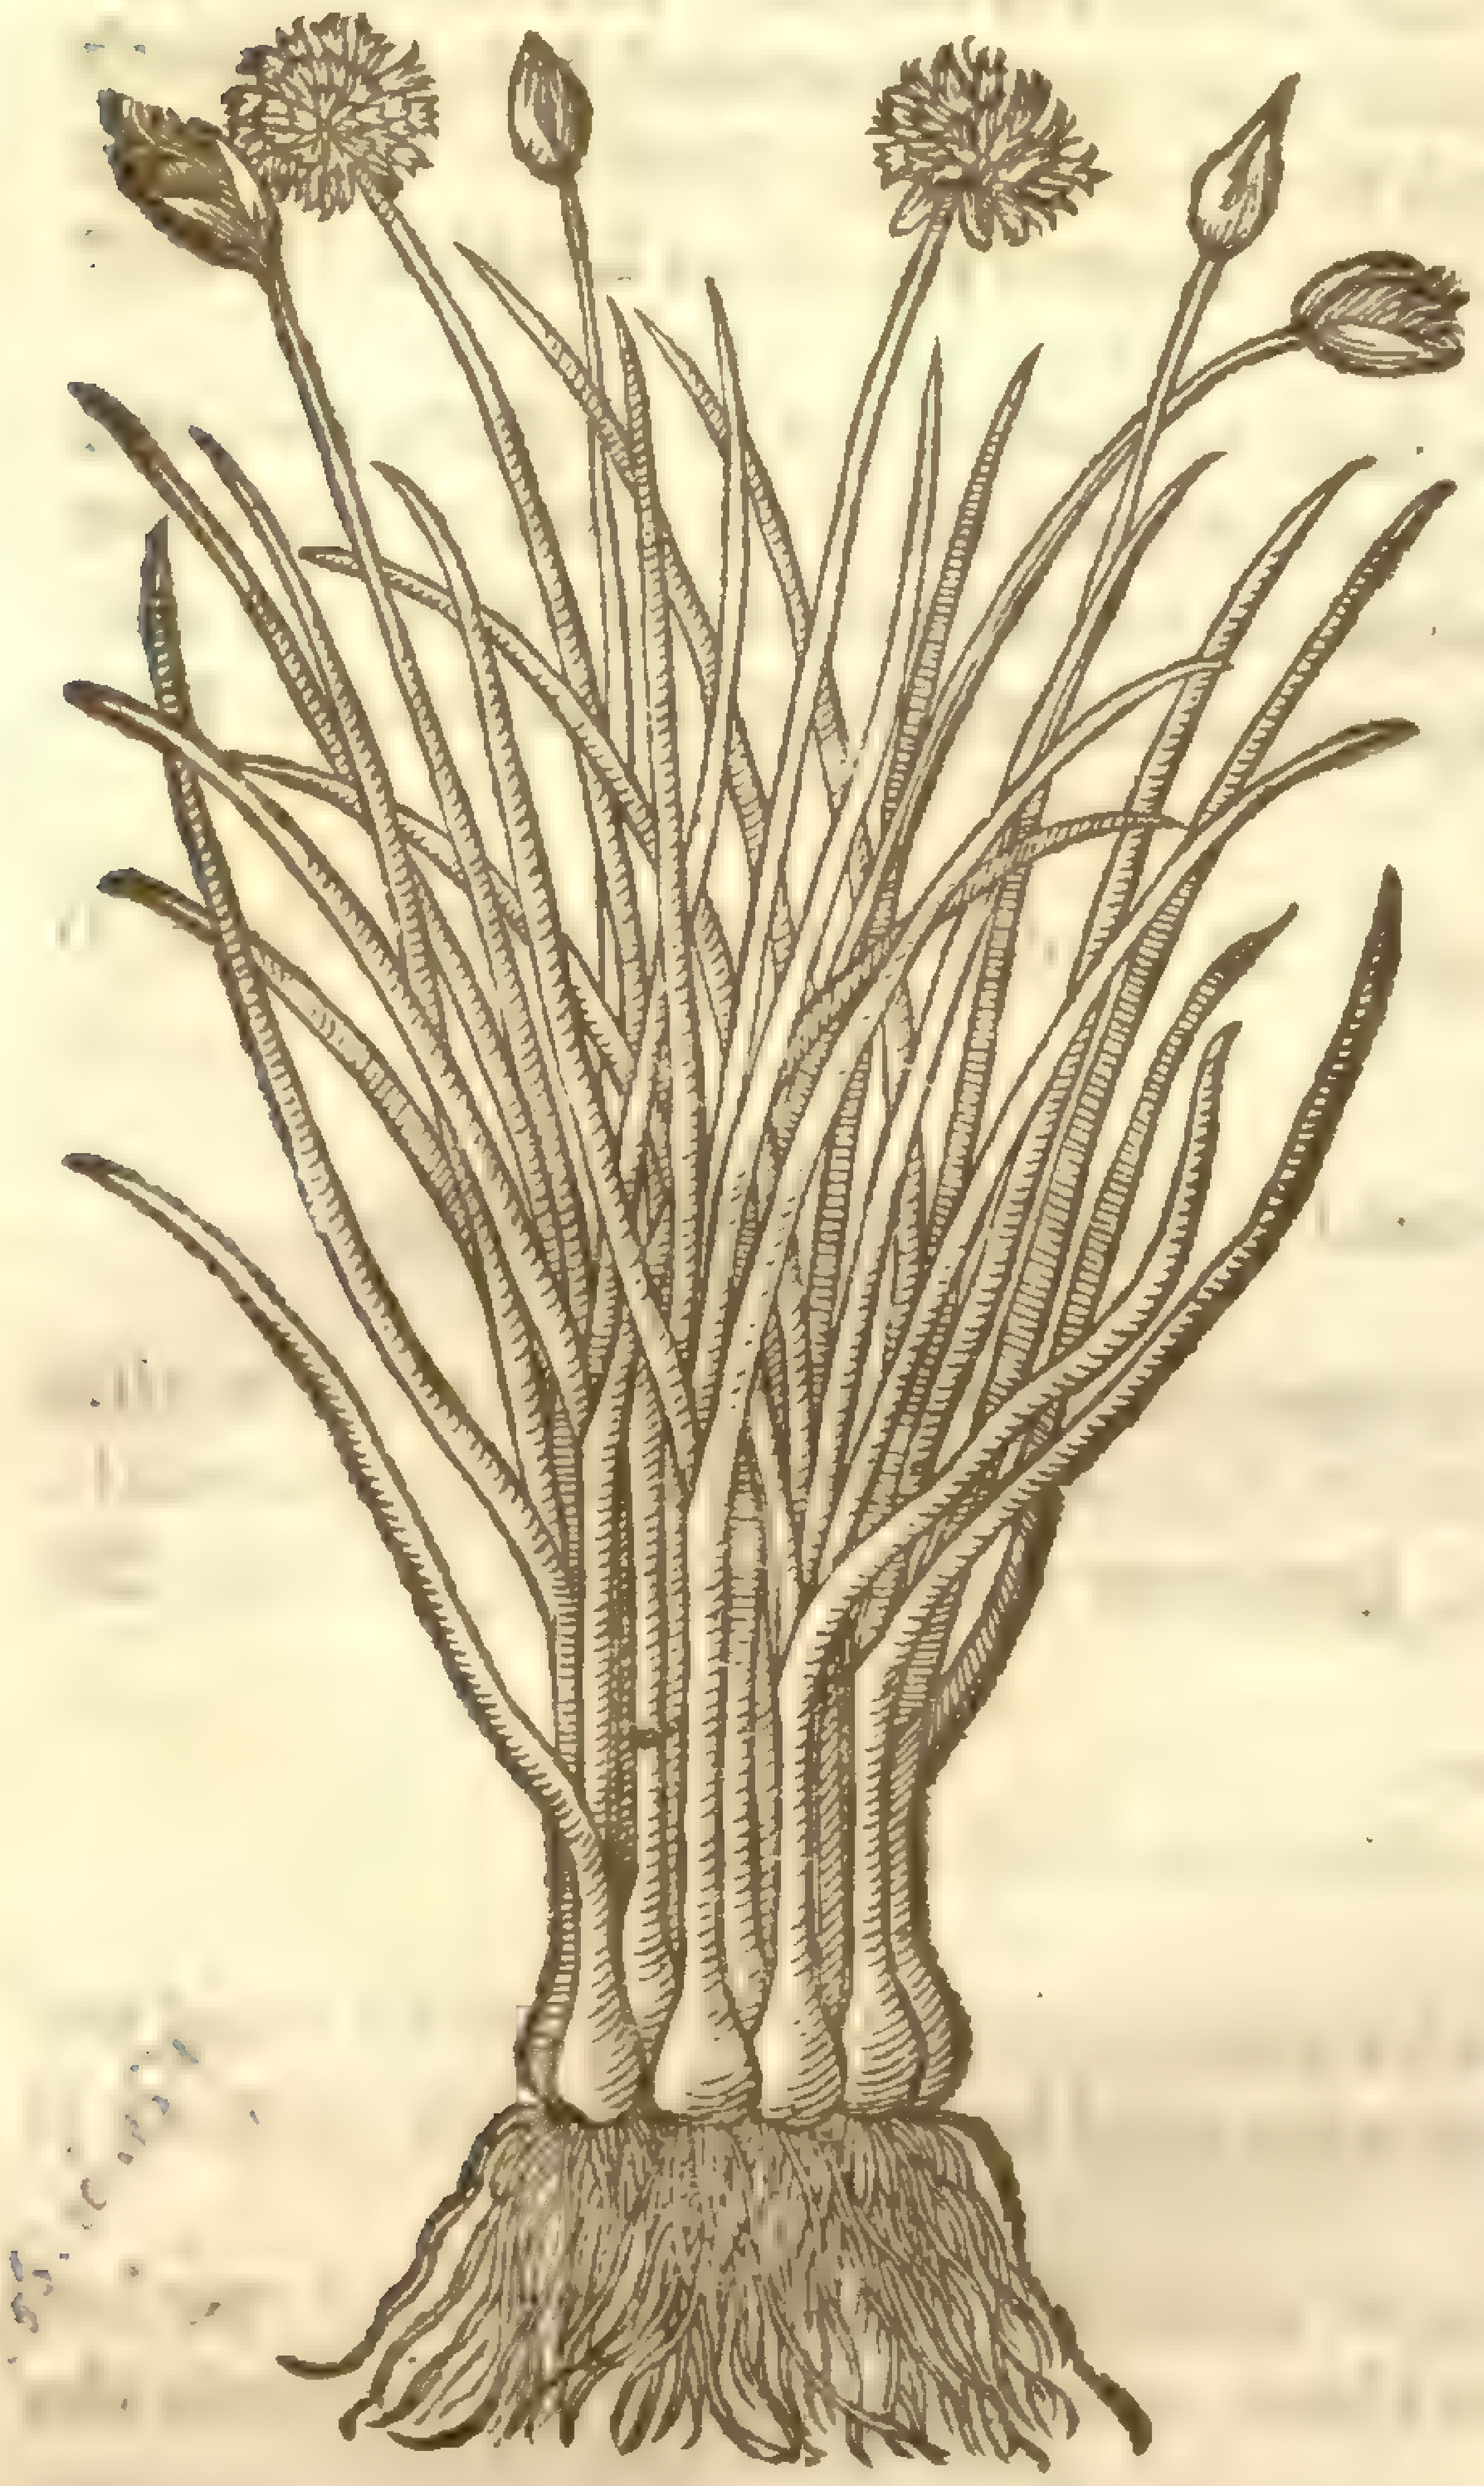
CHAP. 96.

Of Ciues or Chiues, And wilde Leekes.

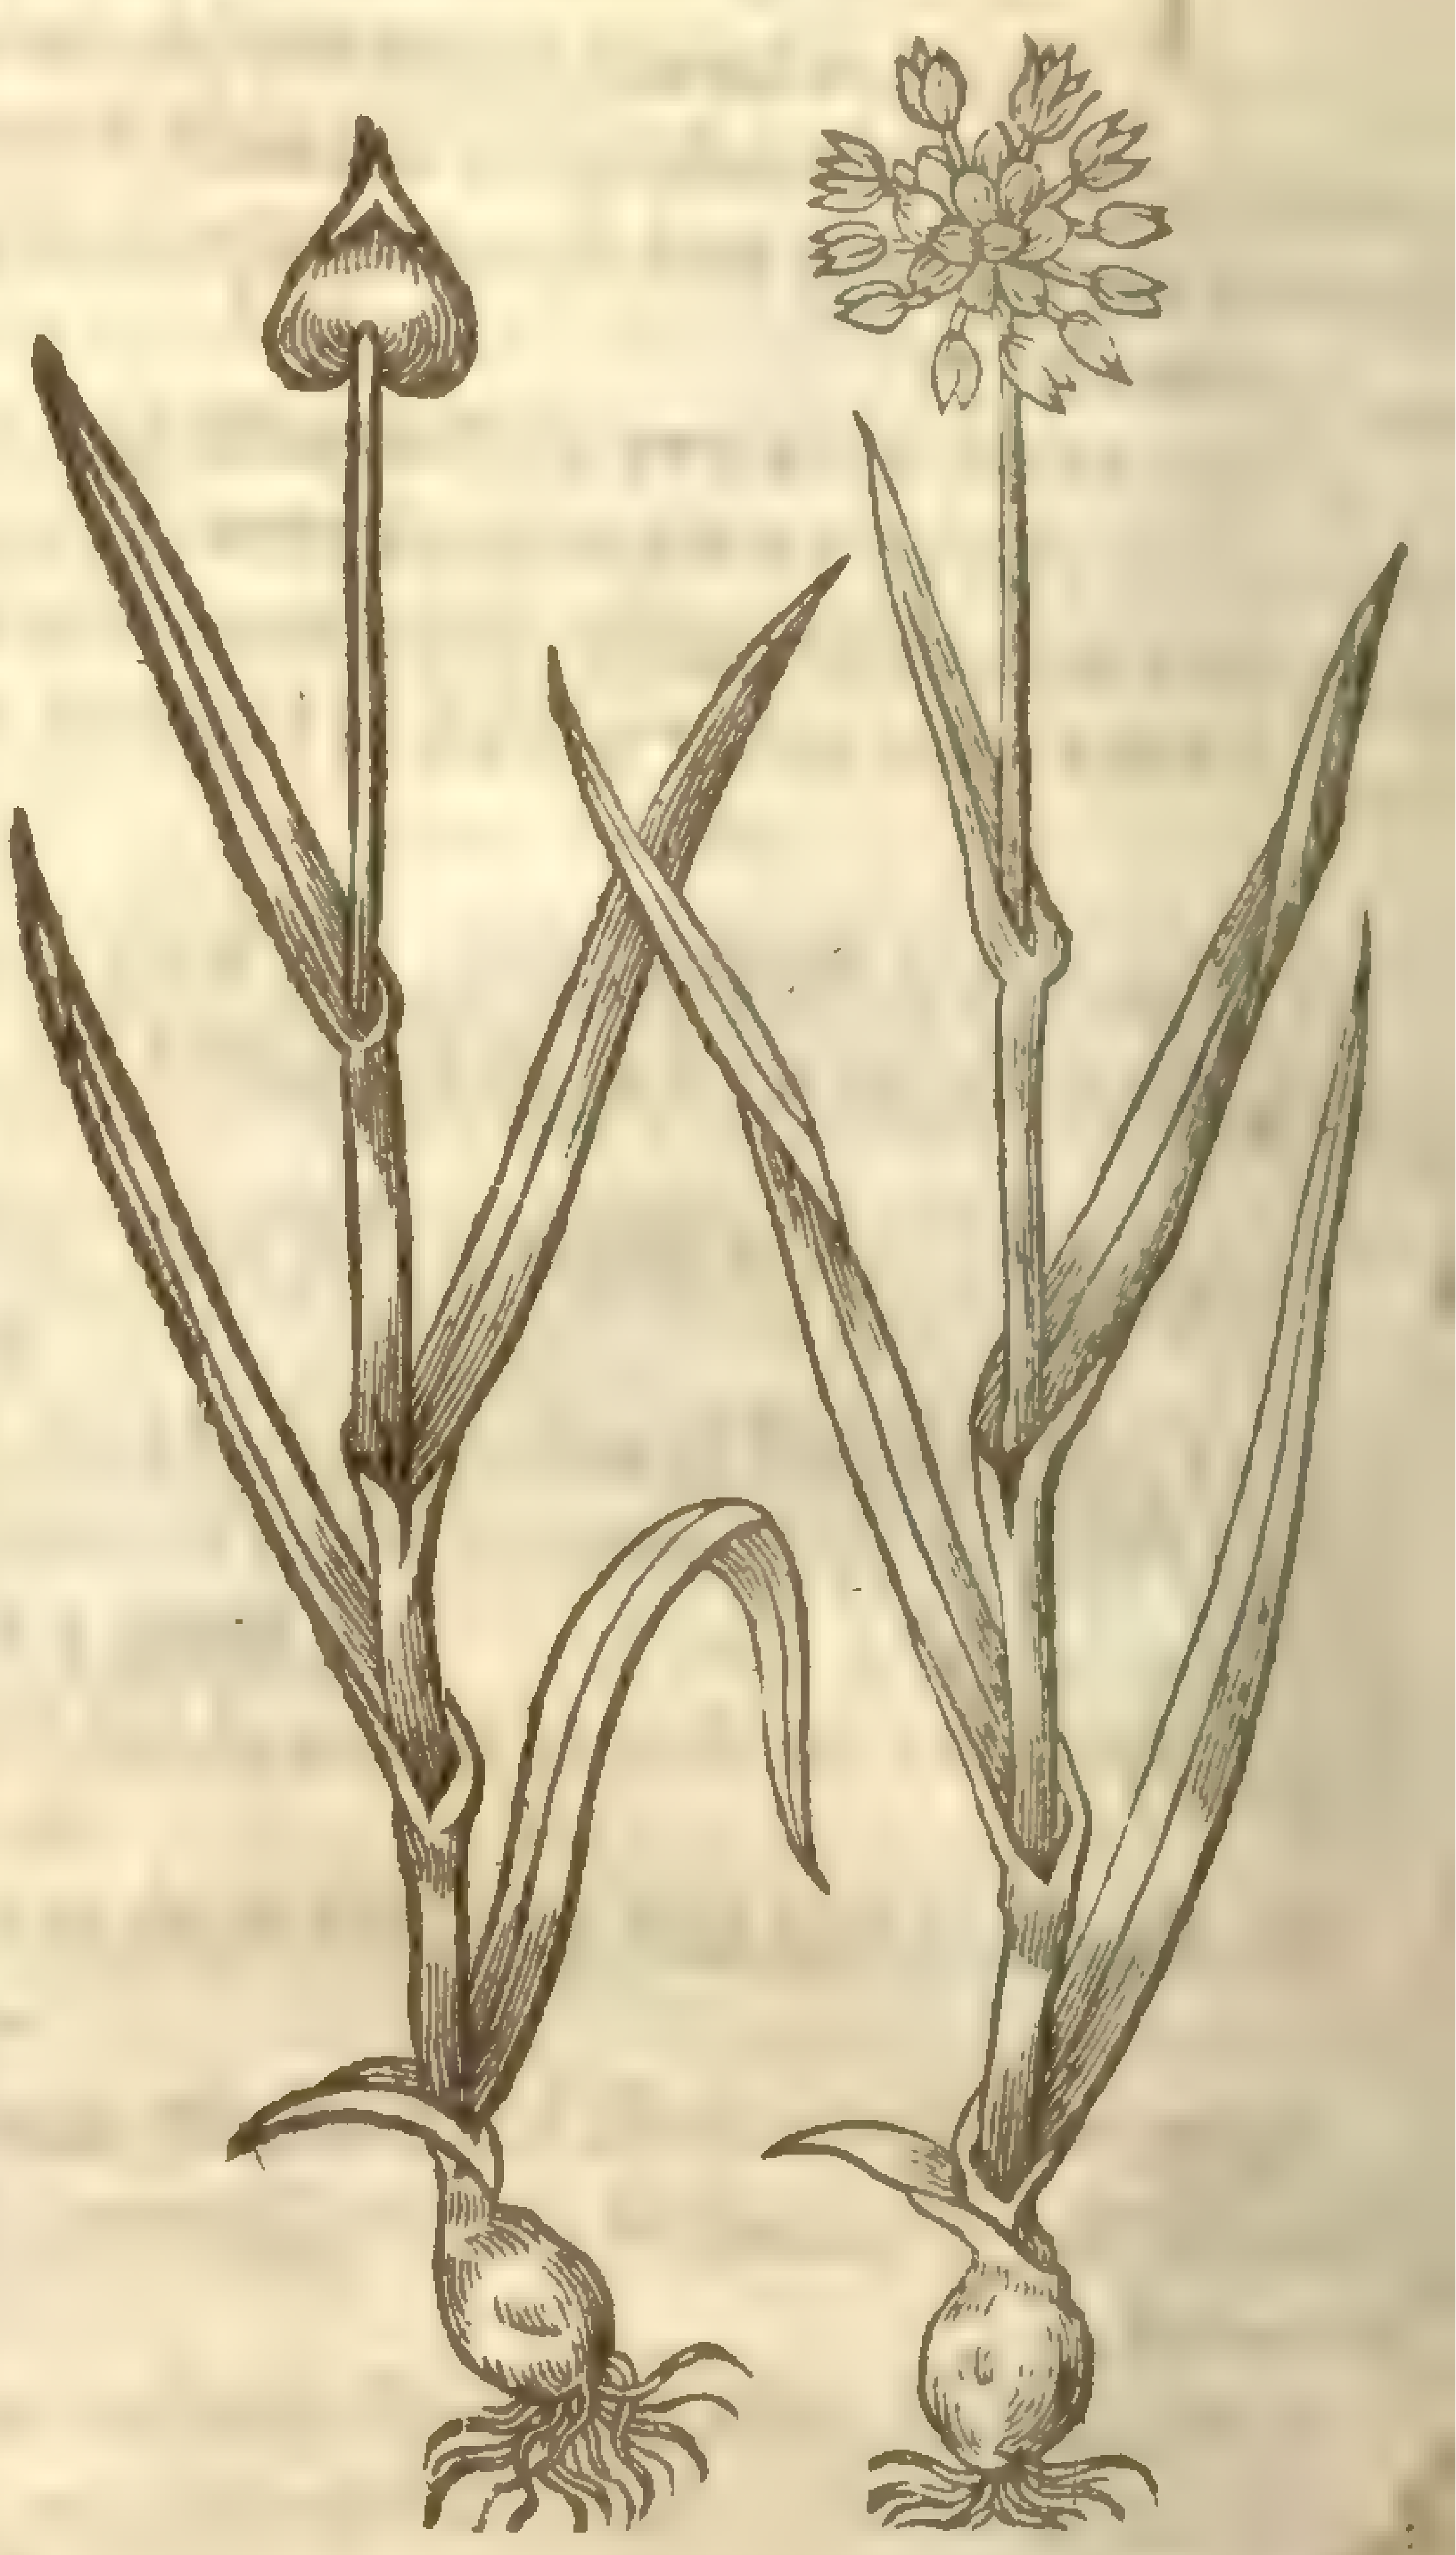
¶ *The Kindes.*

THere be diuers kindes of Leekes, ſome wilde, and ſome of the Garden, as ſhall be declared. Thoſe called Ciues haue beene taken of ſome for a kinde of wilde Onion: but all the Authors that I haue beene acquainted with, do accord that there is not any wilde Onion.

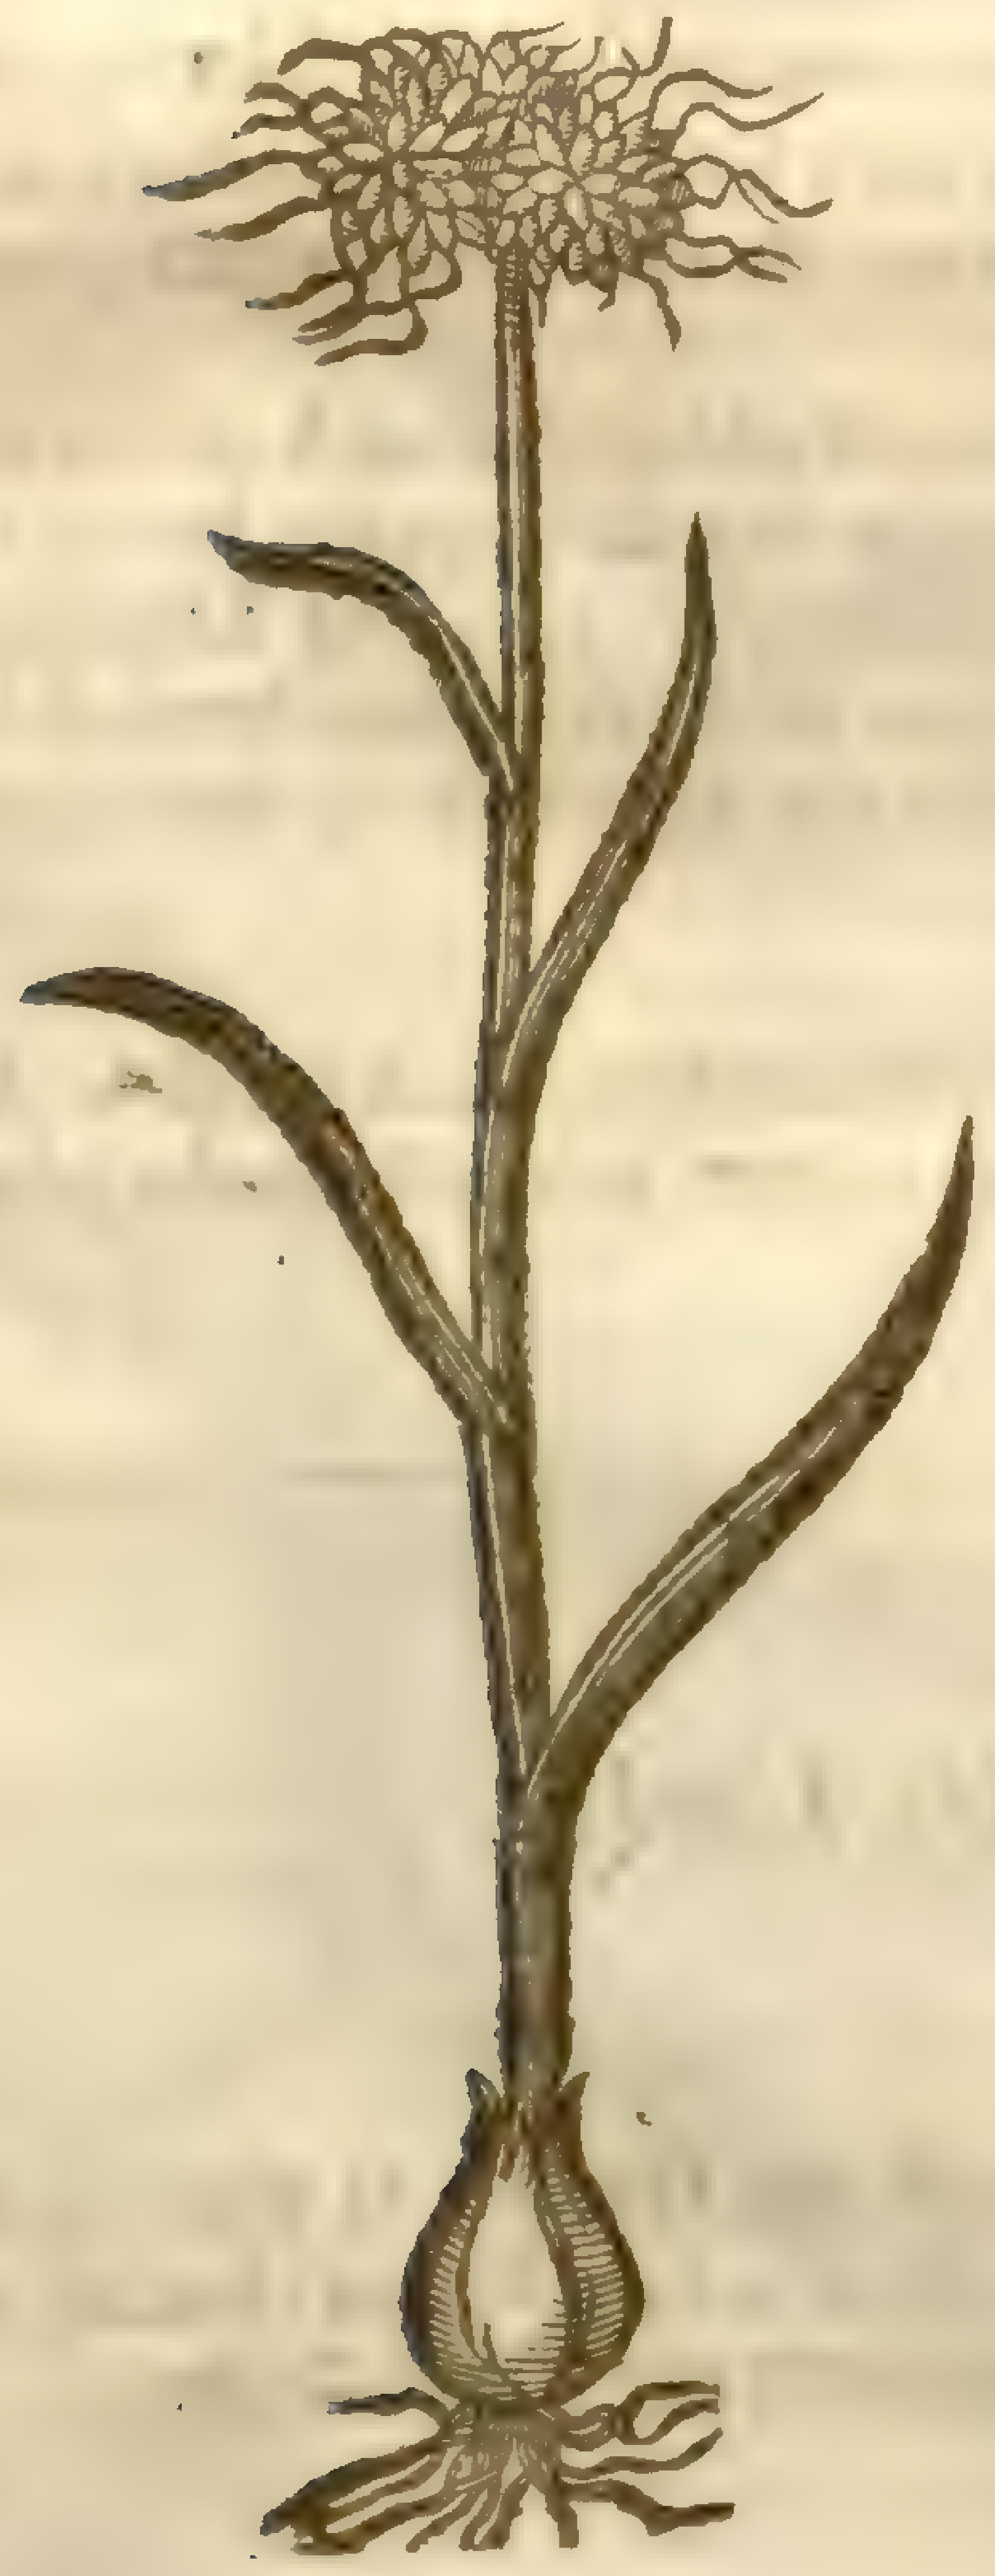
1 *Schœnopraſon.*
Ciues or Chiues.



2 *Porrum vitigineum.*
French Leeks, or Vine Leekes.



3 *Ampelopraſon ſiue porrum ſilueſtre.*
Wilde Leeke.



¶ *The Deſcription.*

1 Ciues bring forth many leaues about a hand-full high, long, ſlender, round like to little ruſhes; amongſt which grow vp ſmall and tender ſtalkes, ſending forth certaine knops with floures like thoſe of the Onion, but much leſſer. They haue many little bulbes or headed roots faſtned together: out of which grow downe into the earth a great number of little ſtrings, and it hath both the ſmell and taſte of the Onion and Leeke, as it were participating of both.

2 The Vine Leeke or French Leeke groweth vp with blades like thoſe of Leekes: the ſtalke is a cubit high, on the top whereof ſtandeth a round head or button, couered at the firſt with a thinne ſkinne, which being broken, the floures and ſeeds come forth like thoſe of the Onion. The bulbe or headed root is round, hard, and ſound, which is quickly multiplied by ſending forth many bulbes.

‡ 3 The wilde Leeke hath leaues much like vnto thoſe of Crow-garlicke, but larger, and more acride. The floures and ſeeds alſo reſemble thoſe of the Crow-garlicke, the ſeeds being about the bigneſſe of cornes of wheat, with ſmal ſtrings comming forth at their ends. ‡

¶ *The Place and Time.*

1 Ciues are ſet in gardens, they flouriſh long and continue many yeares, they ſuffer the cold of winter: they are cut and polled often, as is the vnſet Leeke.

2 The Vine-Leeke grows of it ſelfe in Vineyards, and neere vnto Vines in hot regions, whereof it both tooke the name Vine-Leeke and French Leeke. It beareth his greene leaues in Winter, and withereth away in the Sommer. It groweth in moſt gardens of England.

‡ Thus far our Author deſcribes and intimates to you a garden Leek, much like the ordinary in all reſpects, but ſomewhat larger. But the following names belong to the wilde Leeke, which here we giue you in the third place. ‡

¶ *The Names.*

Ciues are called in Greeke σχοινόπρασον, *Shœnopraſum*: in Dutch, **Bieſloack**: as though you ſhould ſay *Iunceum Porrum*, or Ruſh-leeke: in Engliſh, Ciues, Chiues, Ciuet, and Sweth: in French, *Brelles.*

† 2 The Vine-leeke, or rather wilde Leeke, is called in Greeke Ἀμπελόπρασον, of the place where it naturally groweth: it may be called in Latine *Porrum vitium*, or *Vitigineum Porrum*: in Engliſh, after the Greeke and Latine, Vine-leeke, or French Leeke.

¶ *The Temperature.*

Ciues are like in facultie vnto the Leeke, hot and dry. The Vine-Leek heateth more than doth the other Leeke.

¶ *The Vertues.*

Ciues attenuate or make thin, open, prouoke vrine, ingender hot and groſſe vapors, and are hurtfull to the eyes and braine. They cauſe troubleſome dreames, and worke all the effects that the Leeke doth. A

The Vine-leeke or Ampelopraſon prouoketh vrine mightily, and bringeth downe the floures. It cureth the bitings of venomous beaſts, as *Dioſcorides* writeth. B

† The figure of *Ampelopraſum* was in the firſt place, in the Chapter next but one, by the name of *Allium ſylveſtre*,

Chap. 97. *Of Garlicke.*

¶ *The Deſcription.*

1 The bulbe or head of Garlicke is couered with moſt thin skins or filmes of a very light white purple colour, conſiſting of many cloues ſeuered one from another, vnder which in the ground below groweth a taſſel of threddy fibres: it hath long green leaues like thoſe of the Leeke, among which riſeth vp a ſtalke at the end of the ſecond or third yeare, whereupon doth grow a tuft of floures couered with a white skin, in which, being broken when it is ripe appeareth round blacke ſeeds.

‡ 2 There is alſo another Garlicke which groweth wilde in ſome places of Germanie and France, which in ſhape much reſembles the ordinarie, but the cloues of the roots are ſmaller and redder. The floure is alſo of a more dusky and darke colour than the ordinarie. ‡

¶ *The Place and Time.*

Garlick is ſeldome ſowne of ſeed, but planted in gardens of the ſmall cloues in Nouember and December, and ſometimes in Februarie and March.

¶ *The Names.*

It is called in Latine *Allium*: in Greeke Σκόροδον: The Apothecaries keepe the Latine name: the Germanes call it **Knoblauch**: the Low-Dutch **Look**: the Spaniards, *Aios, Alho*: the Italians *Aglio*: the French, *Ail* or *Aux*: the Bohemians *Czeſnec*: in Engliſh, Garlick, and poore mans treacle.

¶ *The Temperature.*

Garlicke is very ſharpe, hot and dry (as *Galen* ſaith) in the fourth degree, and exulcerates the skin by raiſing bliſters.

¶ *The Vertues.*

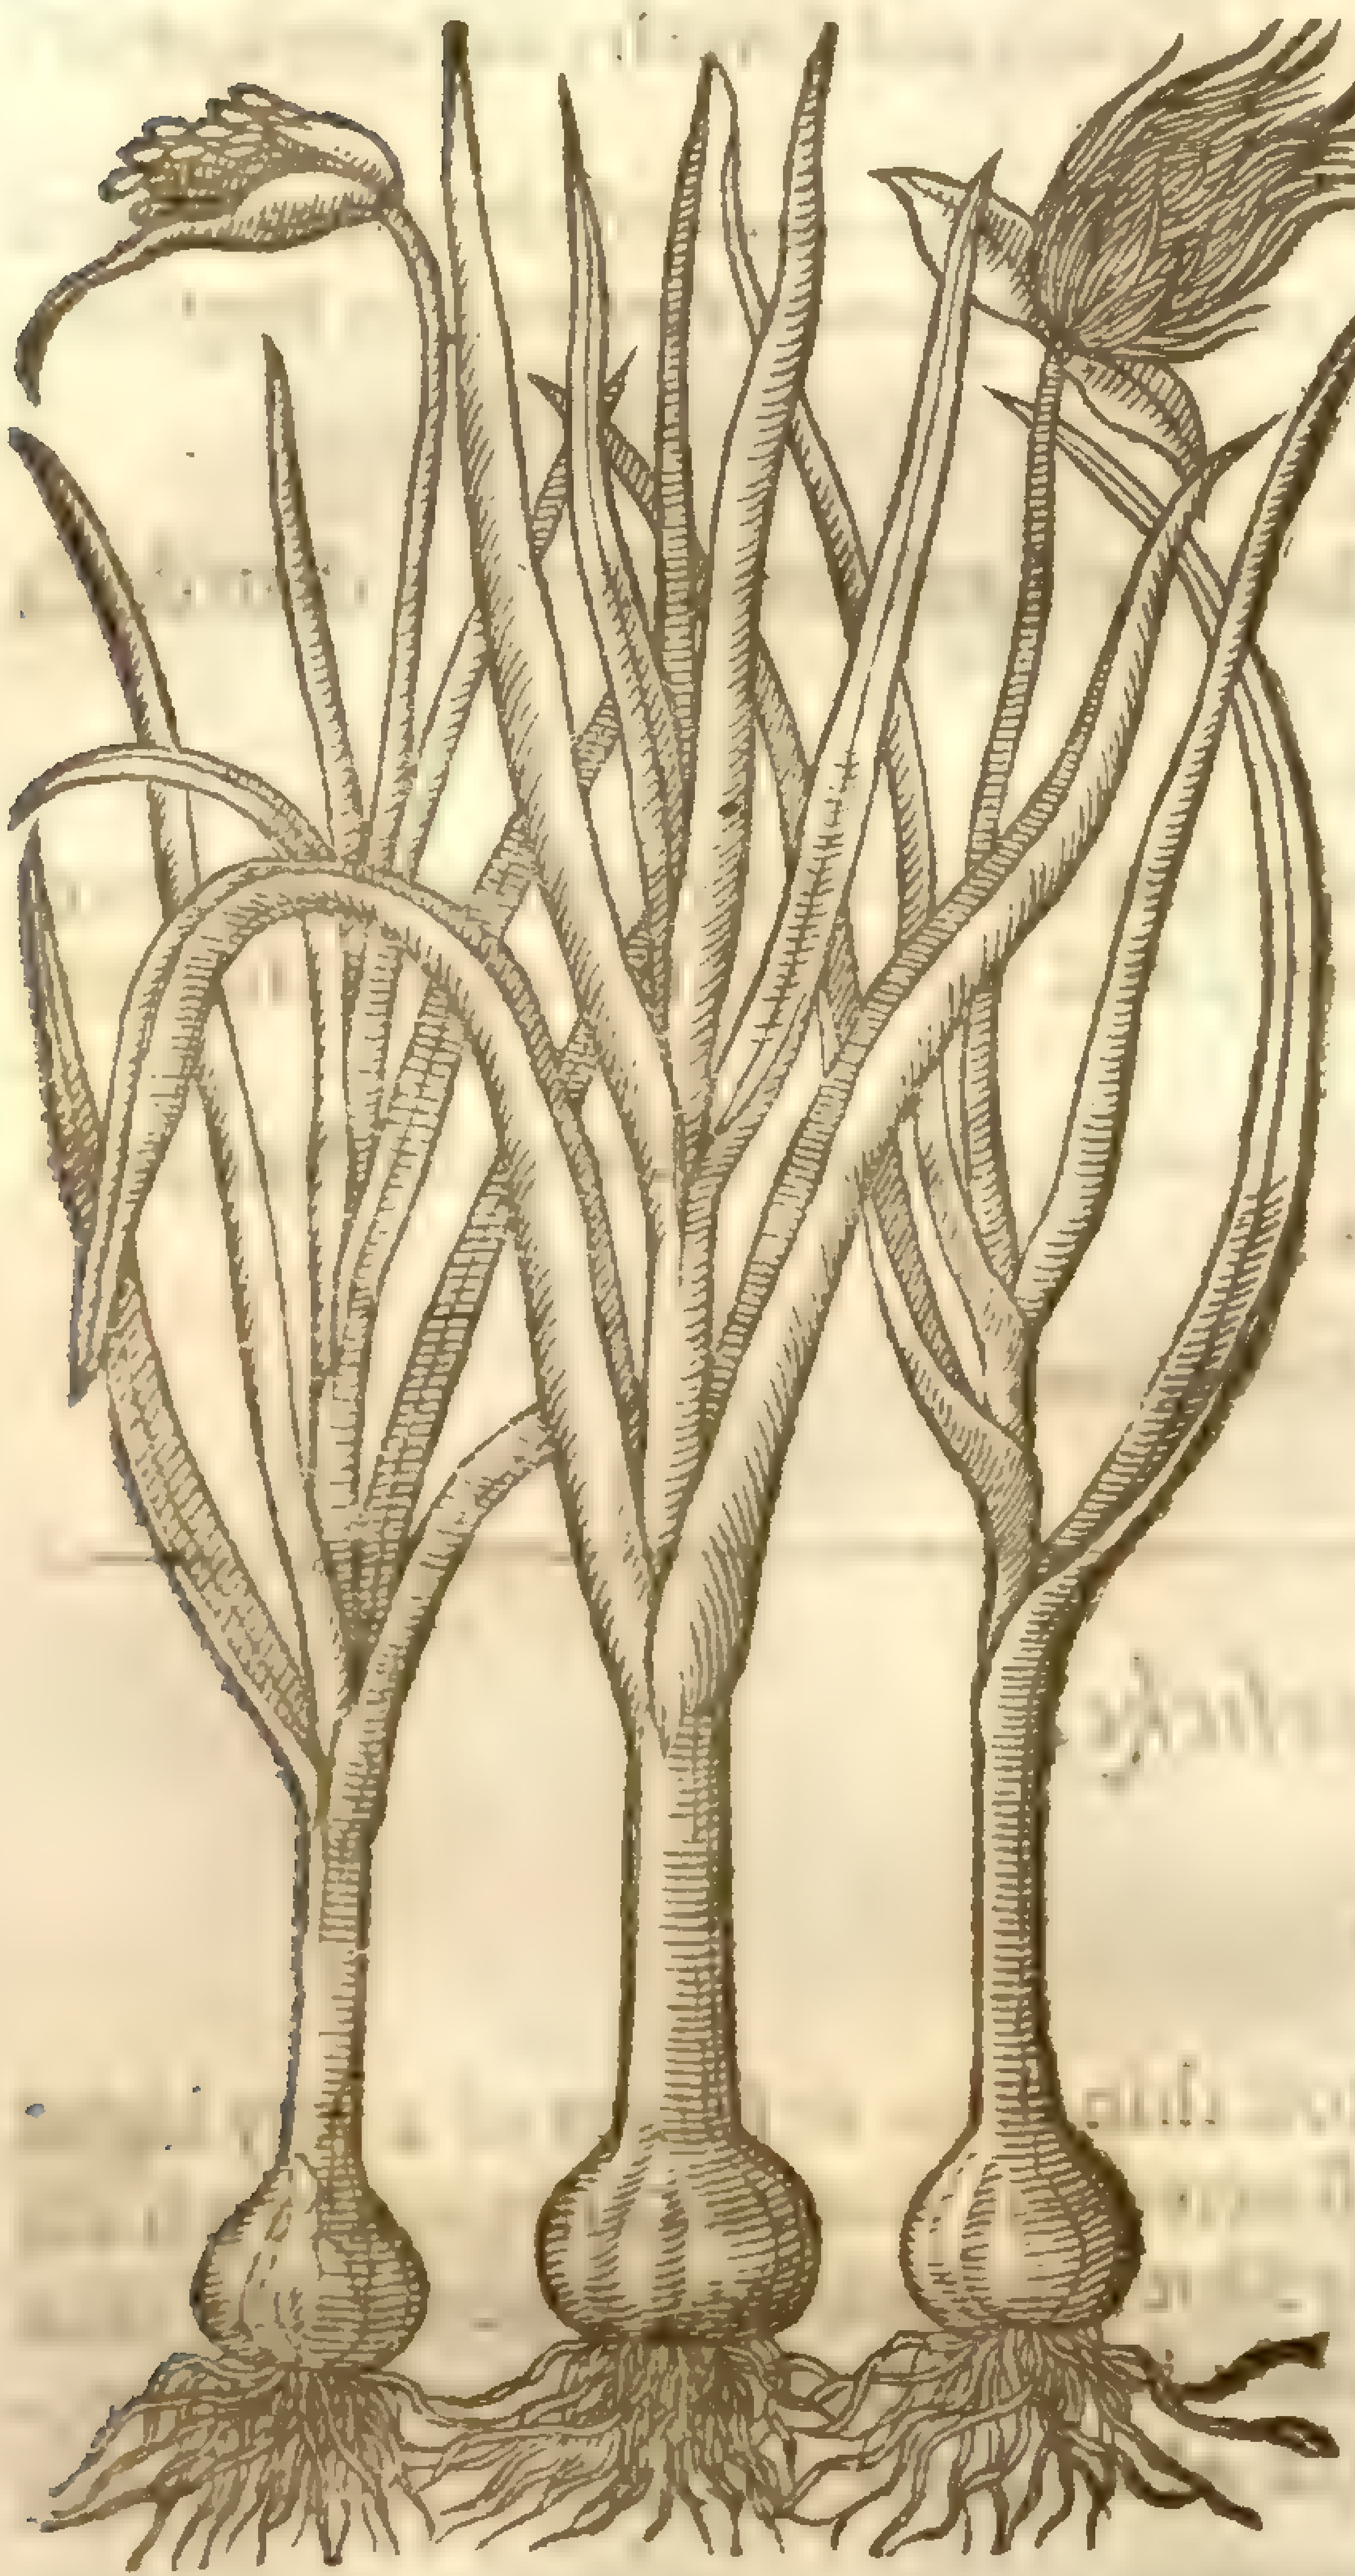
Being eaten it heateth the body extremely, attenuateth and maketh thin thicke and groſſe humors, cutteth ſuch as are tough and clammy, digeſteth and conſumeth them, alſo openeth obſtructions, is an enemie to all cold poyſons, and to the bitings of venomous beaſts: and therfore *Galen* nameth it *Theriacum Ruſtica*, or the Husbandmans Treacle. A

It yeeldeth to the body no nouriſhment at all, it ingendreth naughty and ſharpe bloud. Therefore B fore ſuch as are of a hot complexion muſt eſpecially abſtaine from it. But if it be boiled in water vntill ſuch time as it hath loſt his ſharpeneſſe, it is the leſſe forcible, and retaineth no longer his euill juice, as *Galen* ſaith.

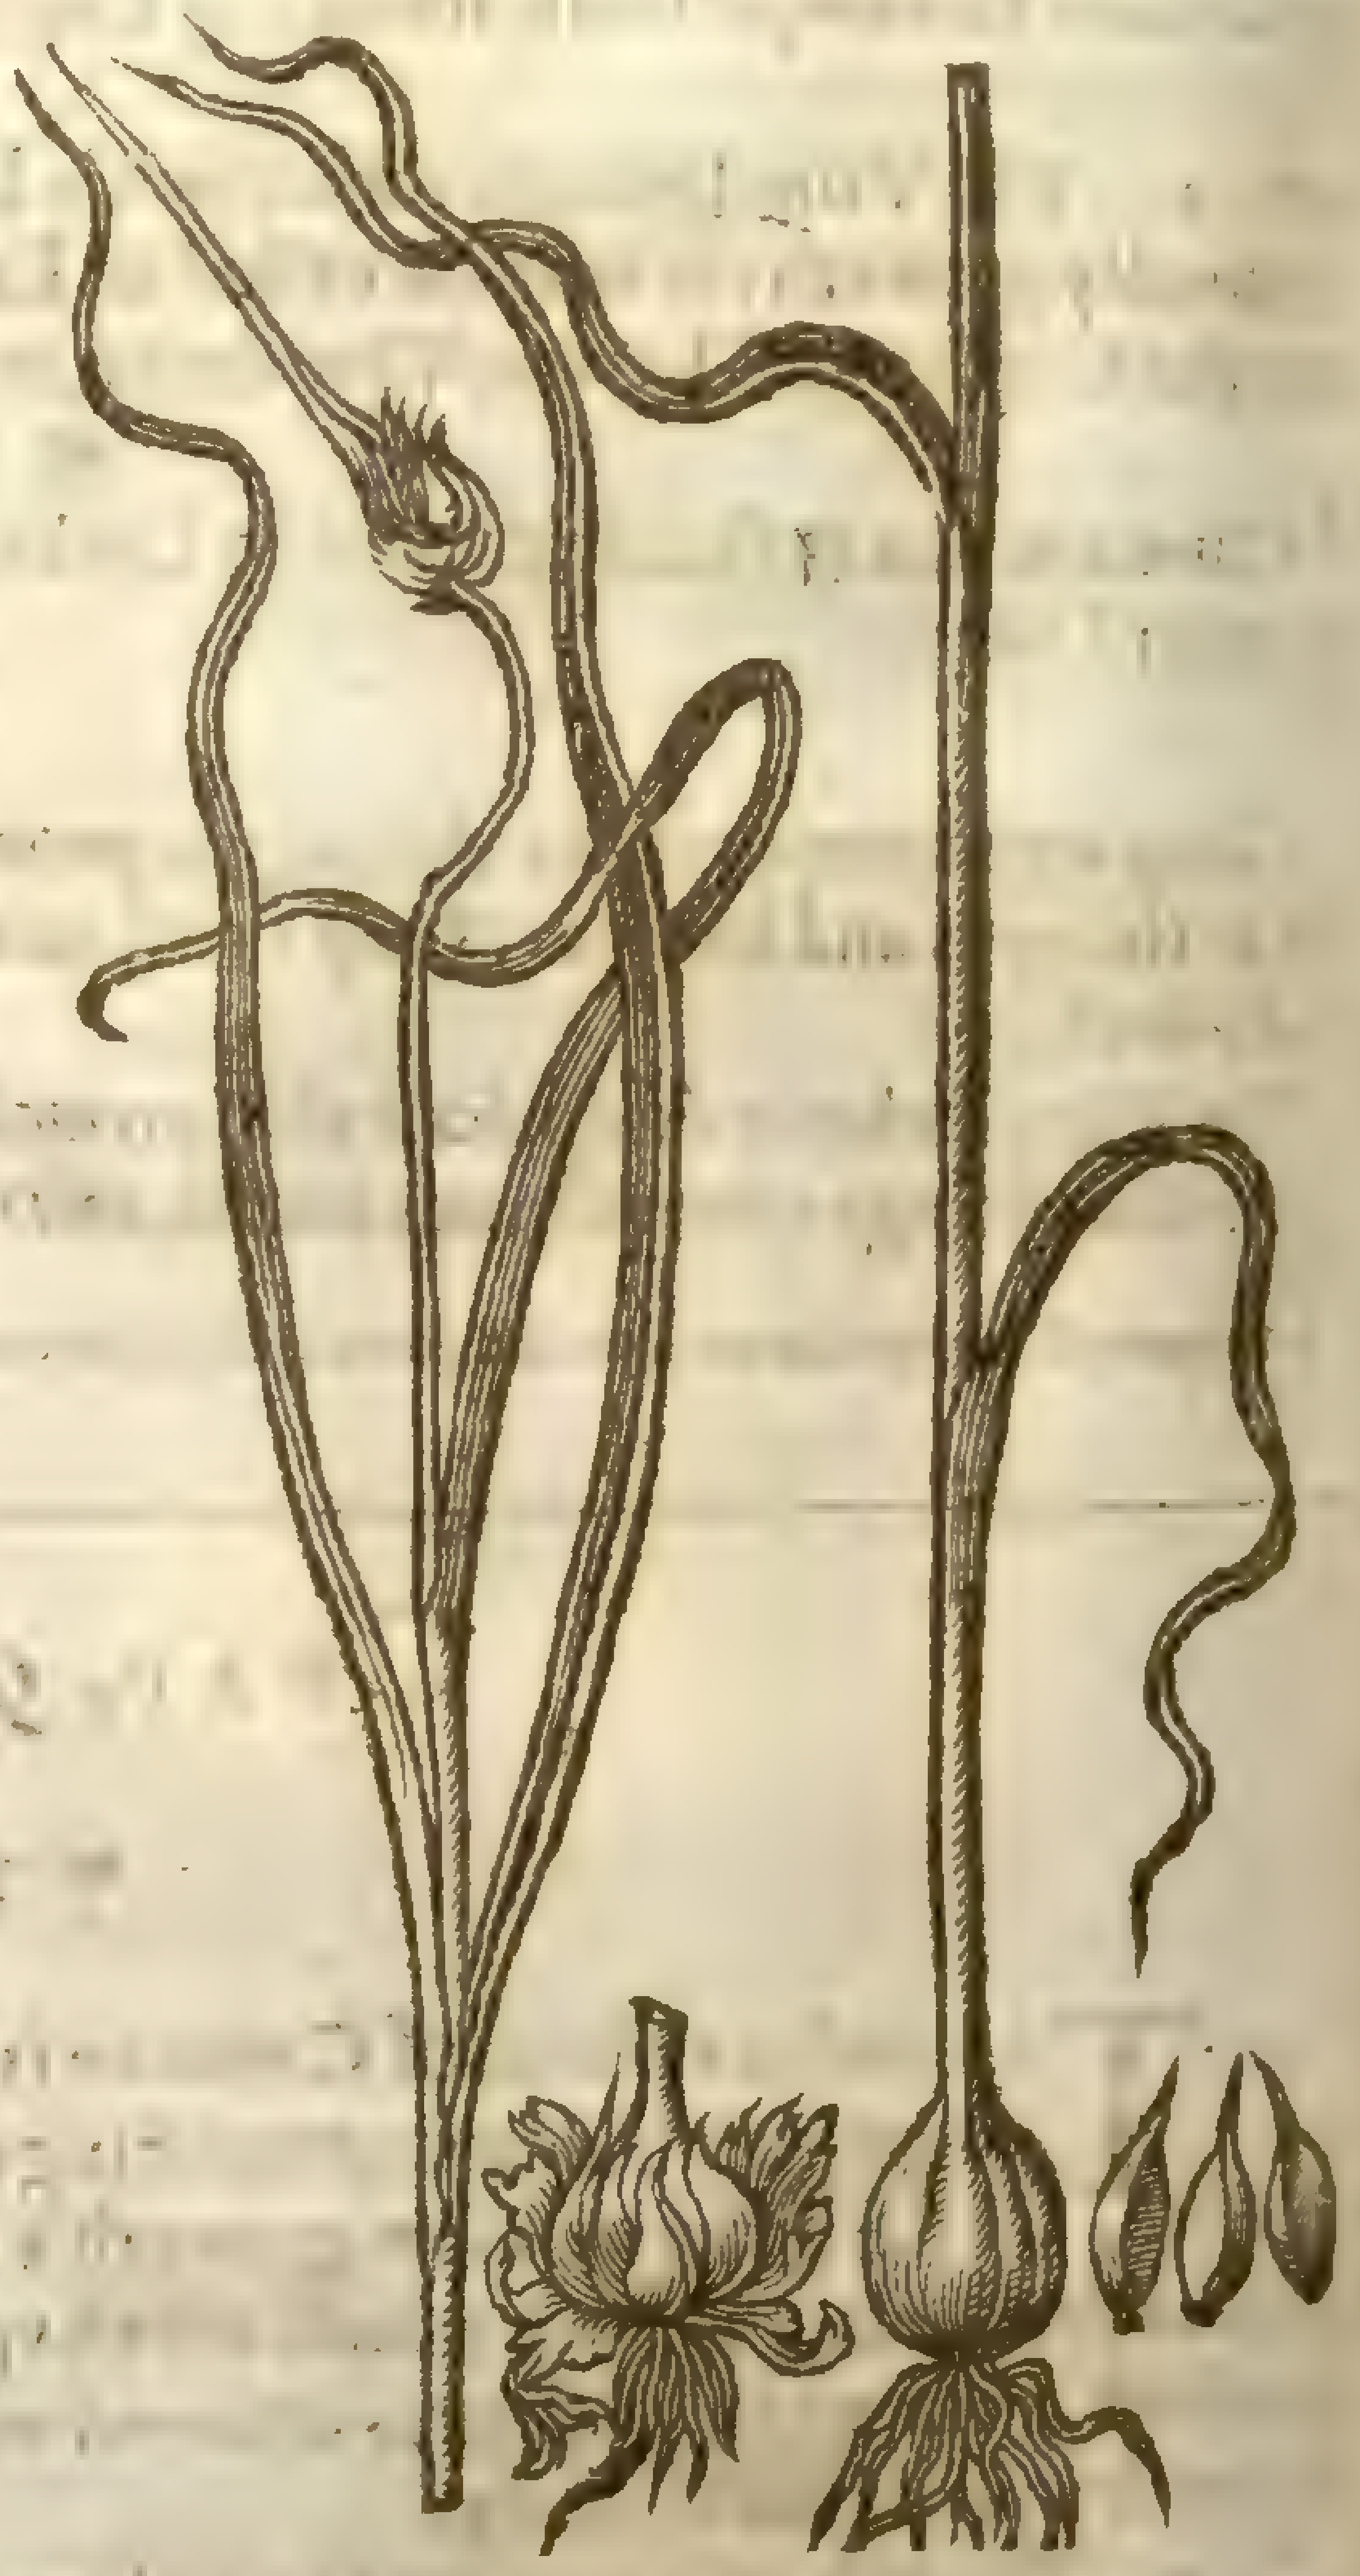
C It taketh away the roughneſſe of the throat, it helpeth an old cough, it prouoketh vrine; it breaketh and conſumeth wind, and is alſo a remedie for the Dropſie which proceedeth of a cold cauſe.

D It killeth wormes in the belly, and driueth them forth. The milke alſo wherein it hath bin ſodden is giuen to yong children with good ſucceſſe againſt the wormes.

1 *Allium.*
Garlicke.



‡ 2 *Allium ſylveſtre rubentibus nucleis.*
Wilde Garlicke with red cloues,



E It helpeth a very cold ſtomacke, and is a preſeruatiue againſt the contagious and peſtilent aire.

F The decoction of Garlicke vſed for a bath to ſit ouer, bringeth downe the floures & ſecondines or after-burthen, as *Dioſcorides* ſaith.

G It taketh away the morphew, tettars or ring-wormes, ſcabbed heads in children, dandraffe, and ſcurfe, tempered with honey, and the parts anointed therewith.

H With Figge leaues and Cumin it is laid on againſt the bitings of the Mouſe called in Greeke Μυγαλῆ: in Engliſh, a Shrew.

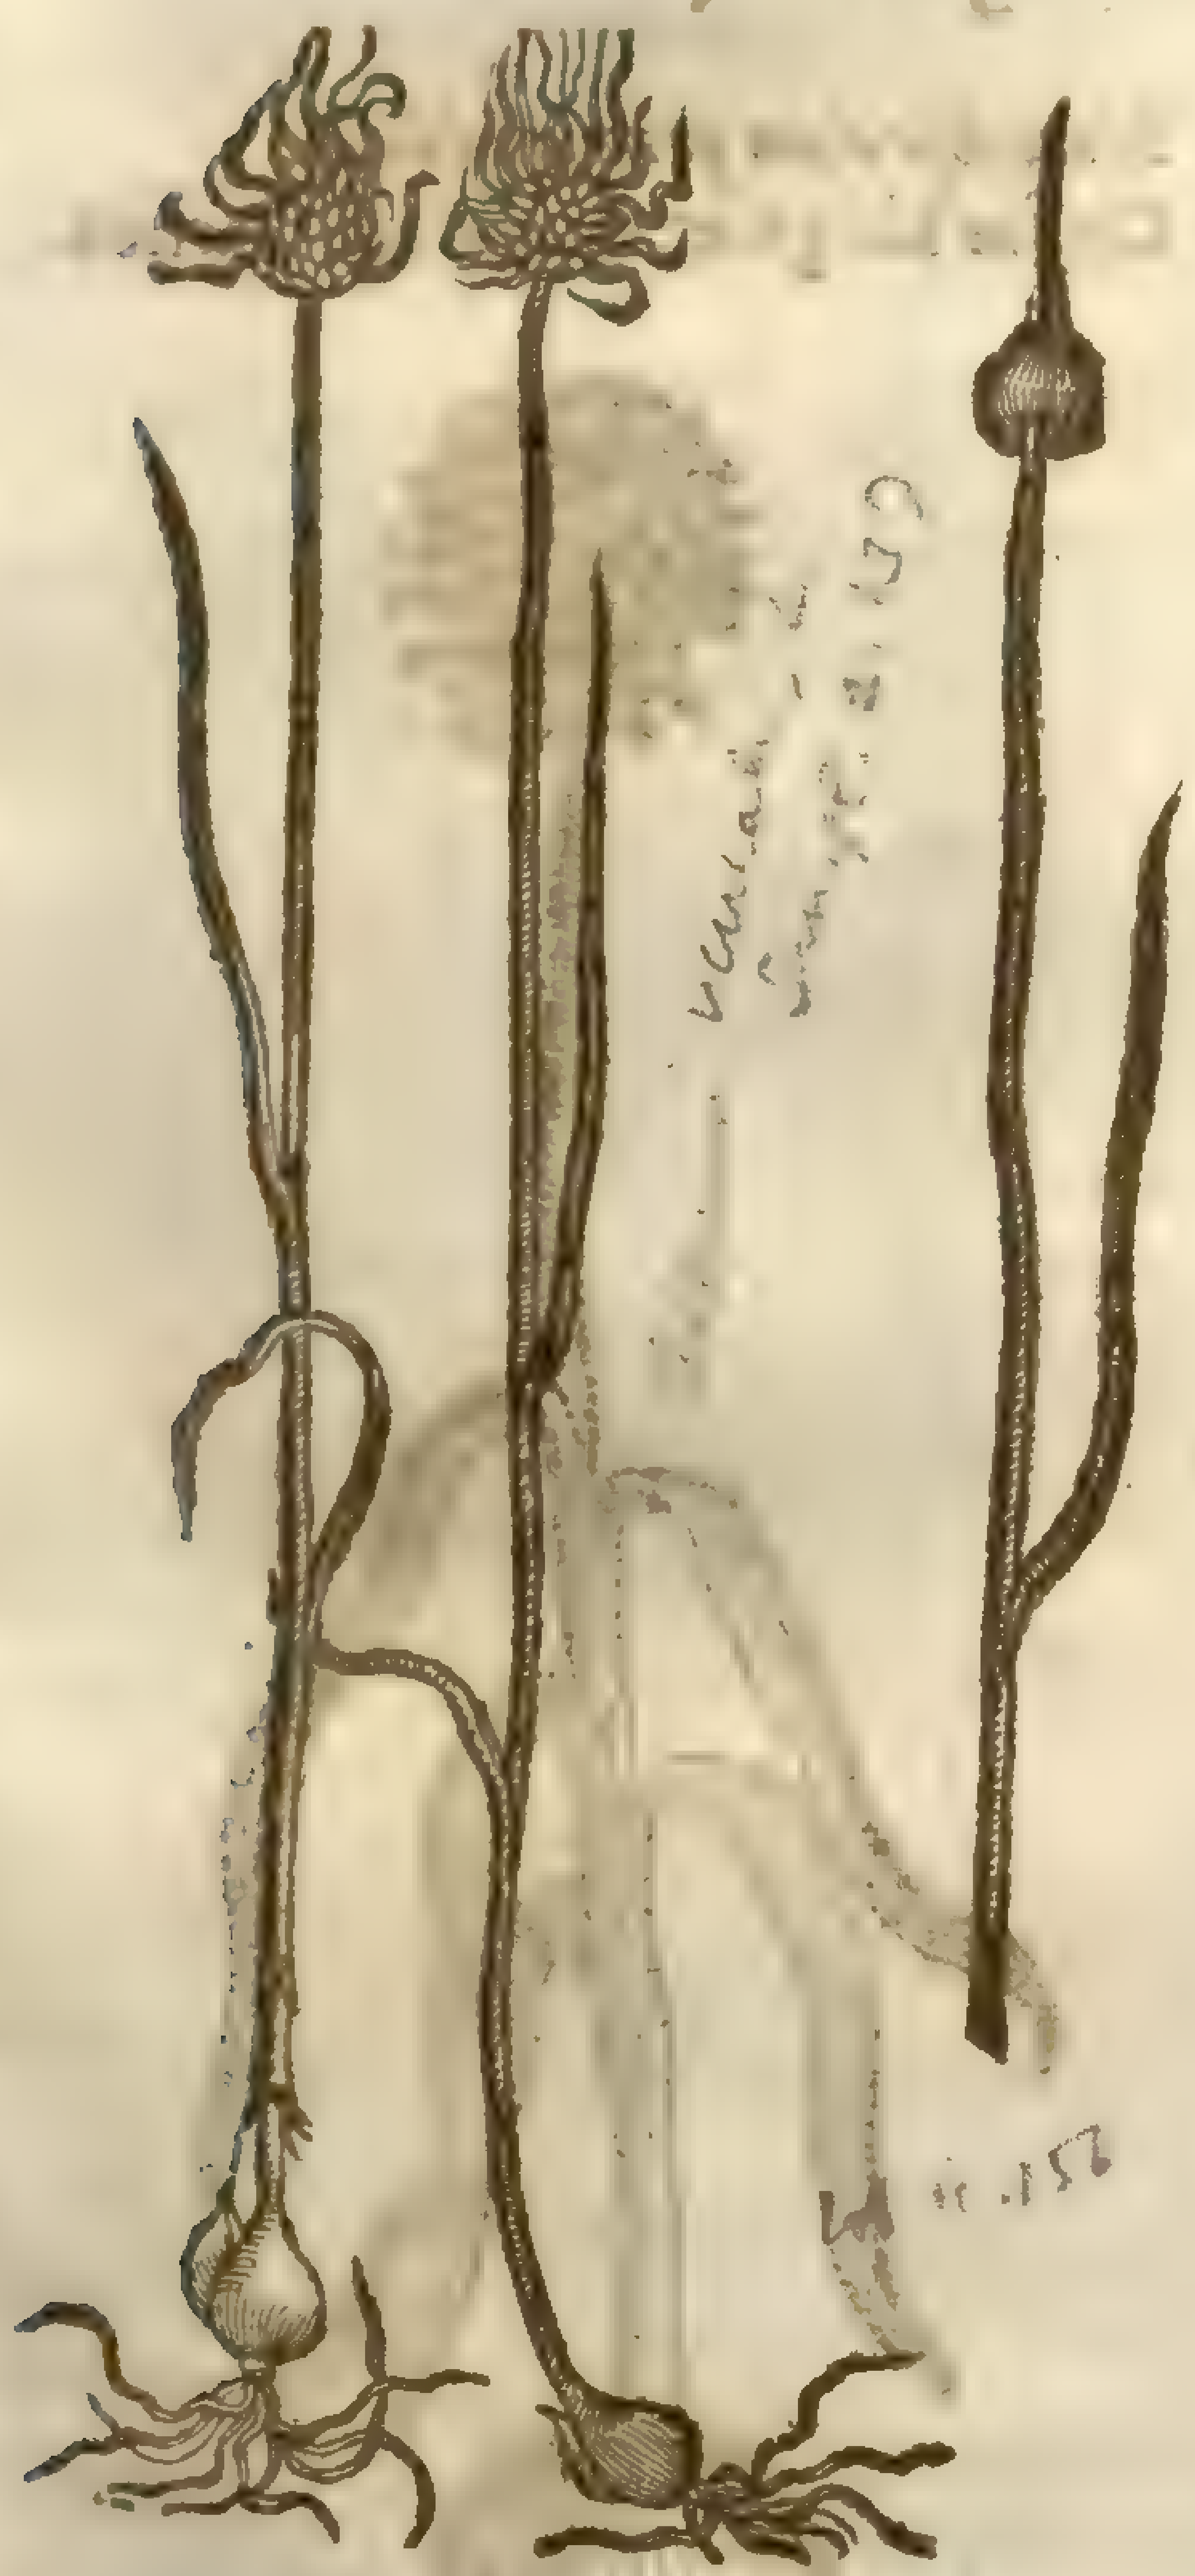
Chap. 98. *Of Crow-Garlicke and Ramſons.*

¶ *The Deſcription.*

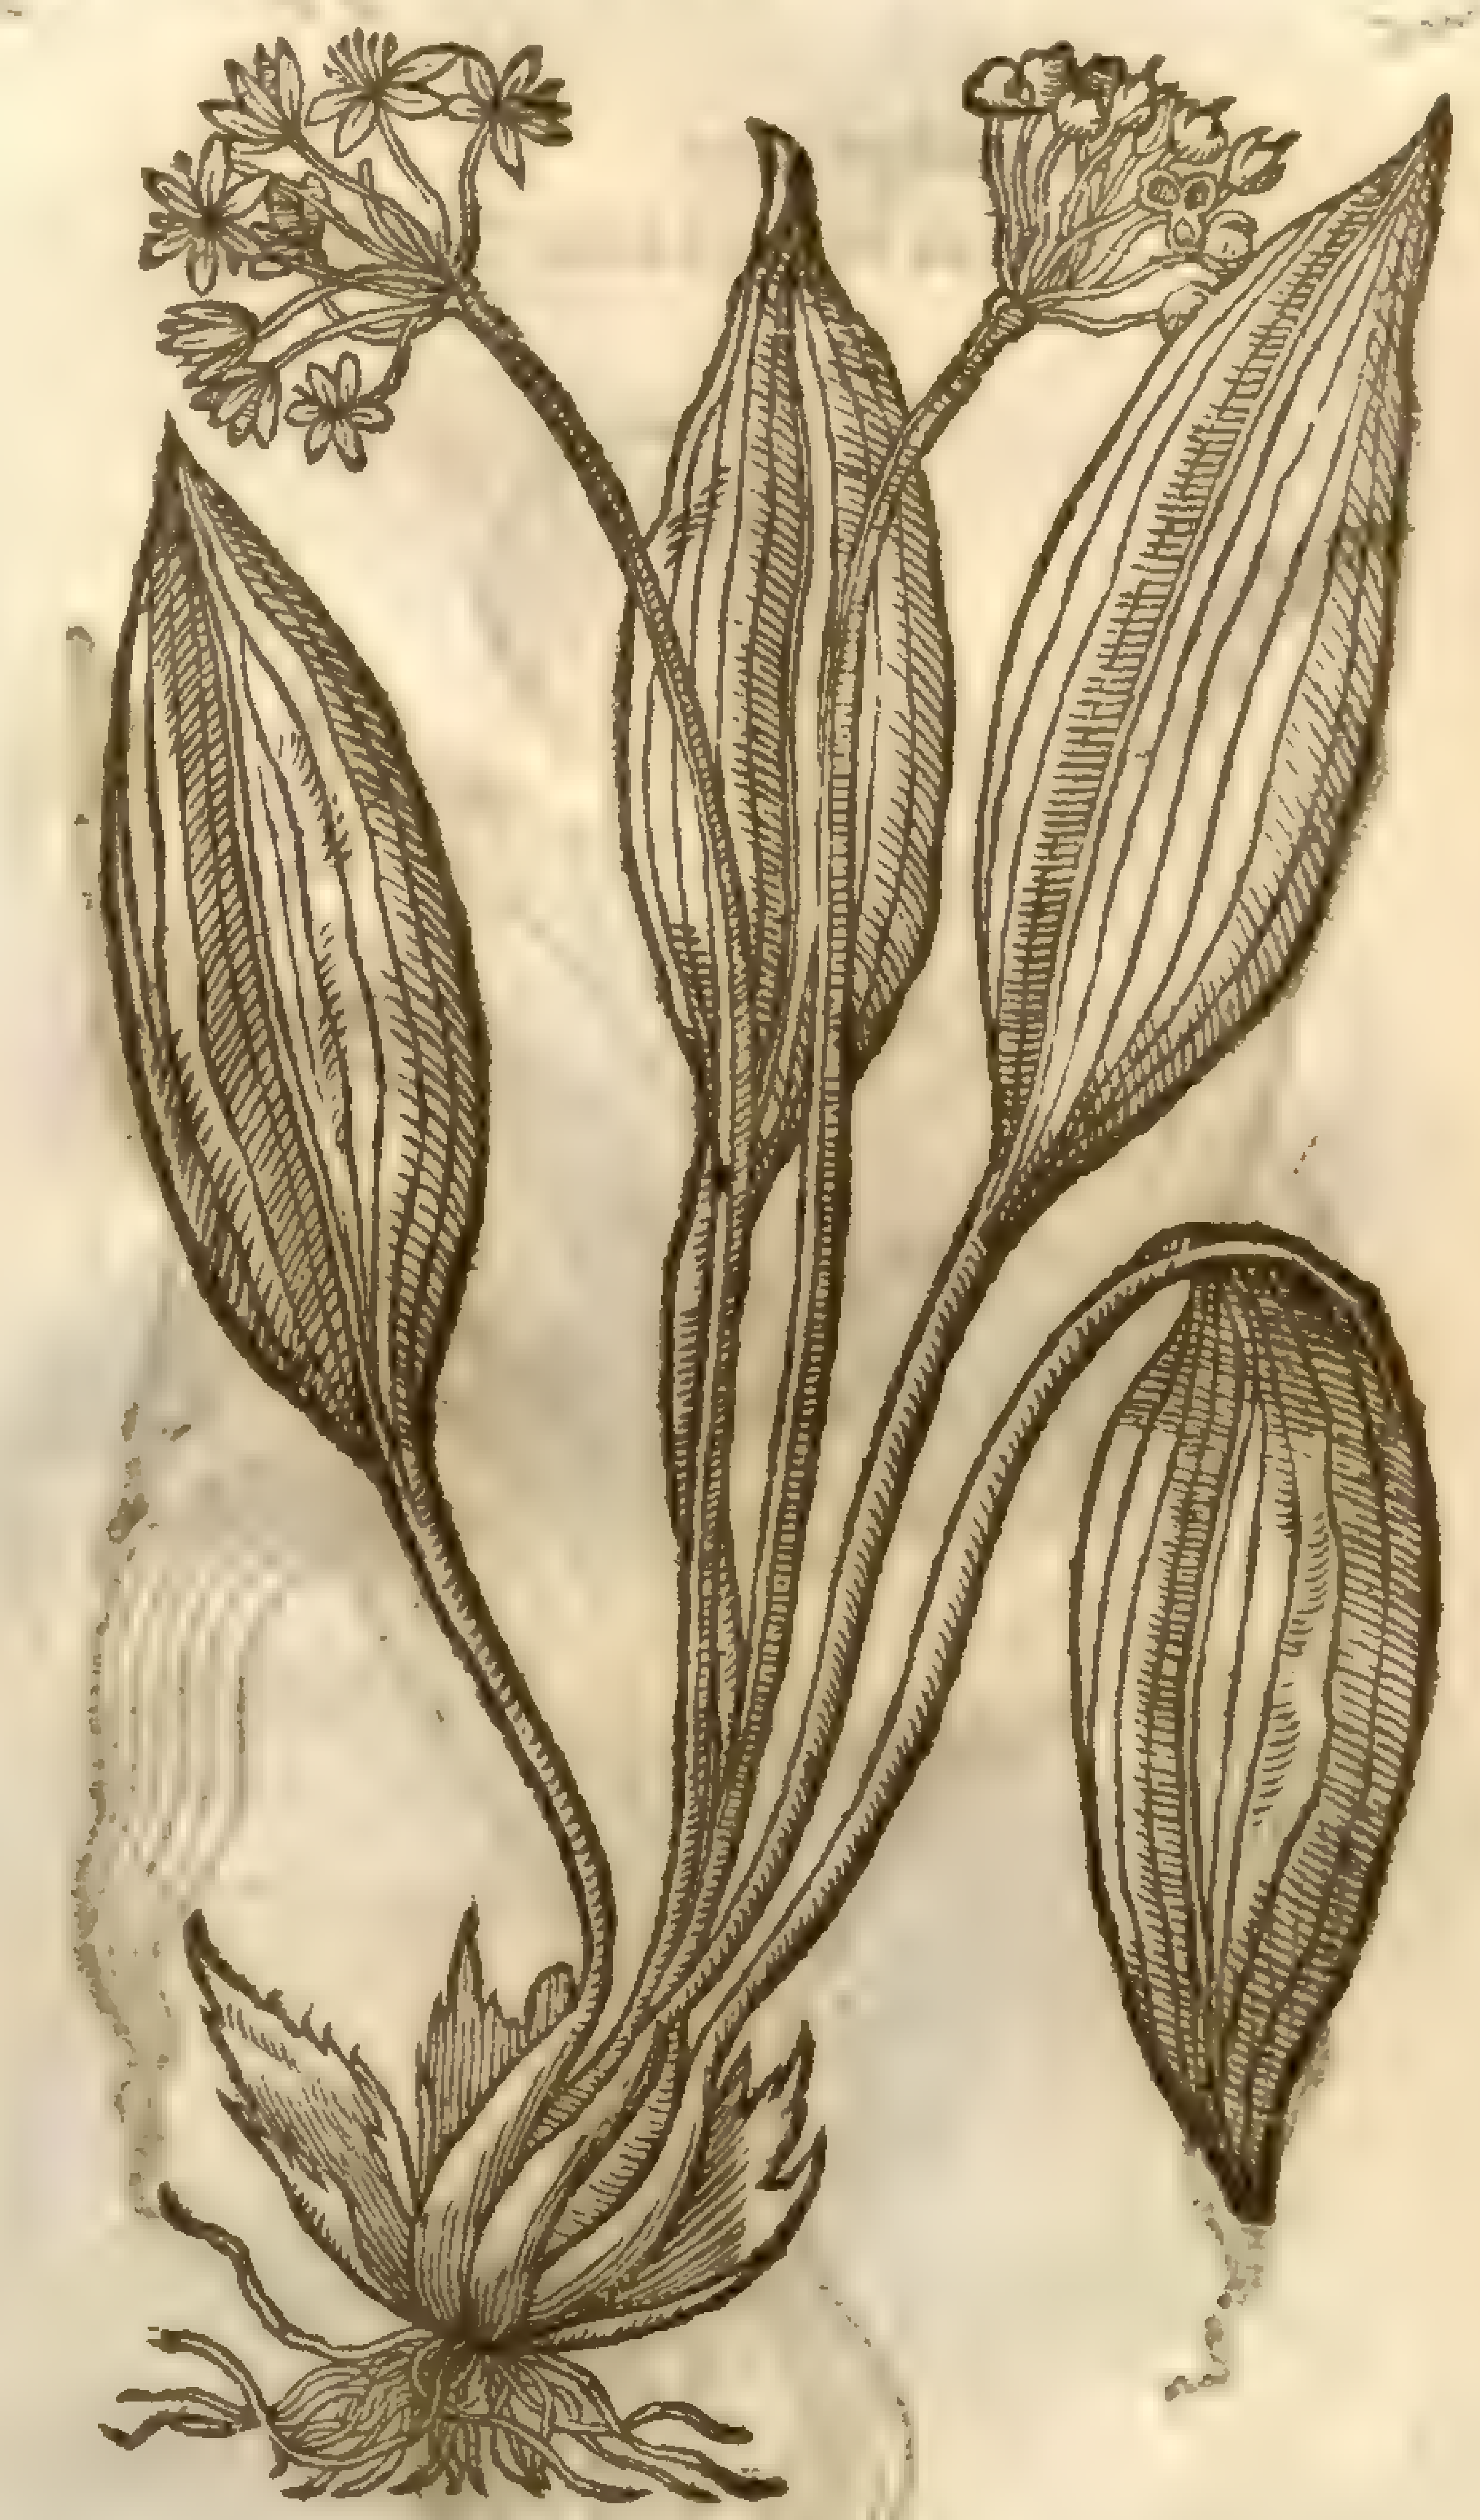
1 The wilde Garlicke or Crow garlick hath ſmall tough leaues like vnto Ruſhes,ſmooth and hollow within,among which groweth vp a naked ſtalke,round, ſlipperie, hard and ſound,on the top whereof,after thē floures be gon,grow little ſeeds made vp in a round cluſter like ſmall kernels,hauing the ſmell and taſte of garlicke. In ſtead of a root there is a bulbe or round head,without any cloues at all.

2 Ramſons do ſend forth two or three broad longiſh leaues ſharpe pointed,ſmooth, and of a light greene colour. The ſtalke is a ſpan high, ſmooth and ſlender, bearing at the top a cluſter of white ſtar-faſhioned floures. In ſtead of a root it hath a long ſlender bulbe,which ſendeth down a multitude of ſtrings,and is couered with skins or thicke coats.

† 1 *Allium ſylveſtre.*
Crow Garlicke.



2 *Allium vrſinum.*
Ramſons.



¶ *The Time.*

They ſpring vp in Aprill and May: their ſeed is ripe in Auguſt.

¶ *The Place.*

The Crow Garlicke groweth in fertile paſtures in all parts of England. I found it in great plentie in the fields called the Mantels,on the backe ſide of Iſlington by London.

Ramſons grow in the woods and borders of fields vnder hedges,amongſt the buſhes. I found it in the next field vnto Boobies barn, vnder that hedge that bordereth vpon the lane; and alſo vpon the left hand,vnder an hedge adioining to a lane that leadeth to Hampſted,both places neere vnto London.

¶ *The*

¶ *The Names.*

Both of them be wilde Garlicke, and may be called in Latine *Allia ſylveſtria*: in Greeke, Σκόροδα ἄγρια: the firſt by *Dodonæus* and *Lobel* is called *Allium ſylveſtre tenuifolium*.

Ramſons are named of the later practitioners *Allium ſylveſtre*, or Beares Garlicke: *Allium latifolium*, and *Moly Hippocraticum*: in Engliſh, Ramſons, Ramſies, and Buckrams.

¶ *The Nature.*

The temperatures of the wilde Garlicks are referred vnto thoſe of the gardens.

¶ *The Vertues.*

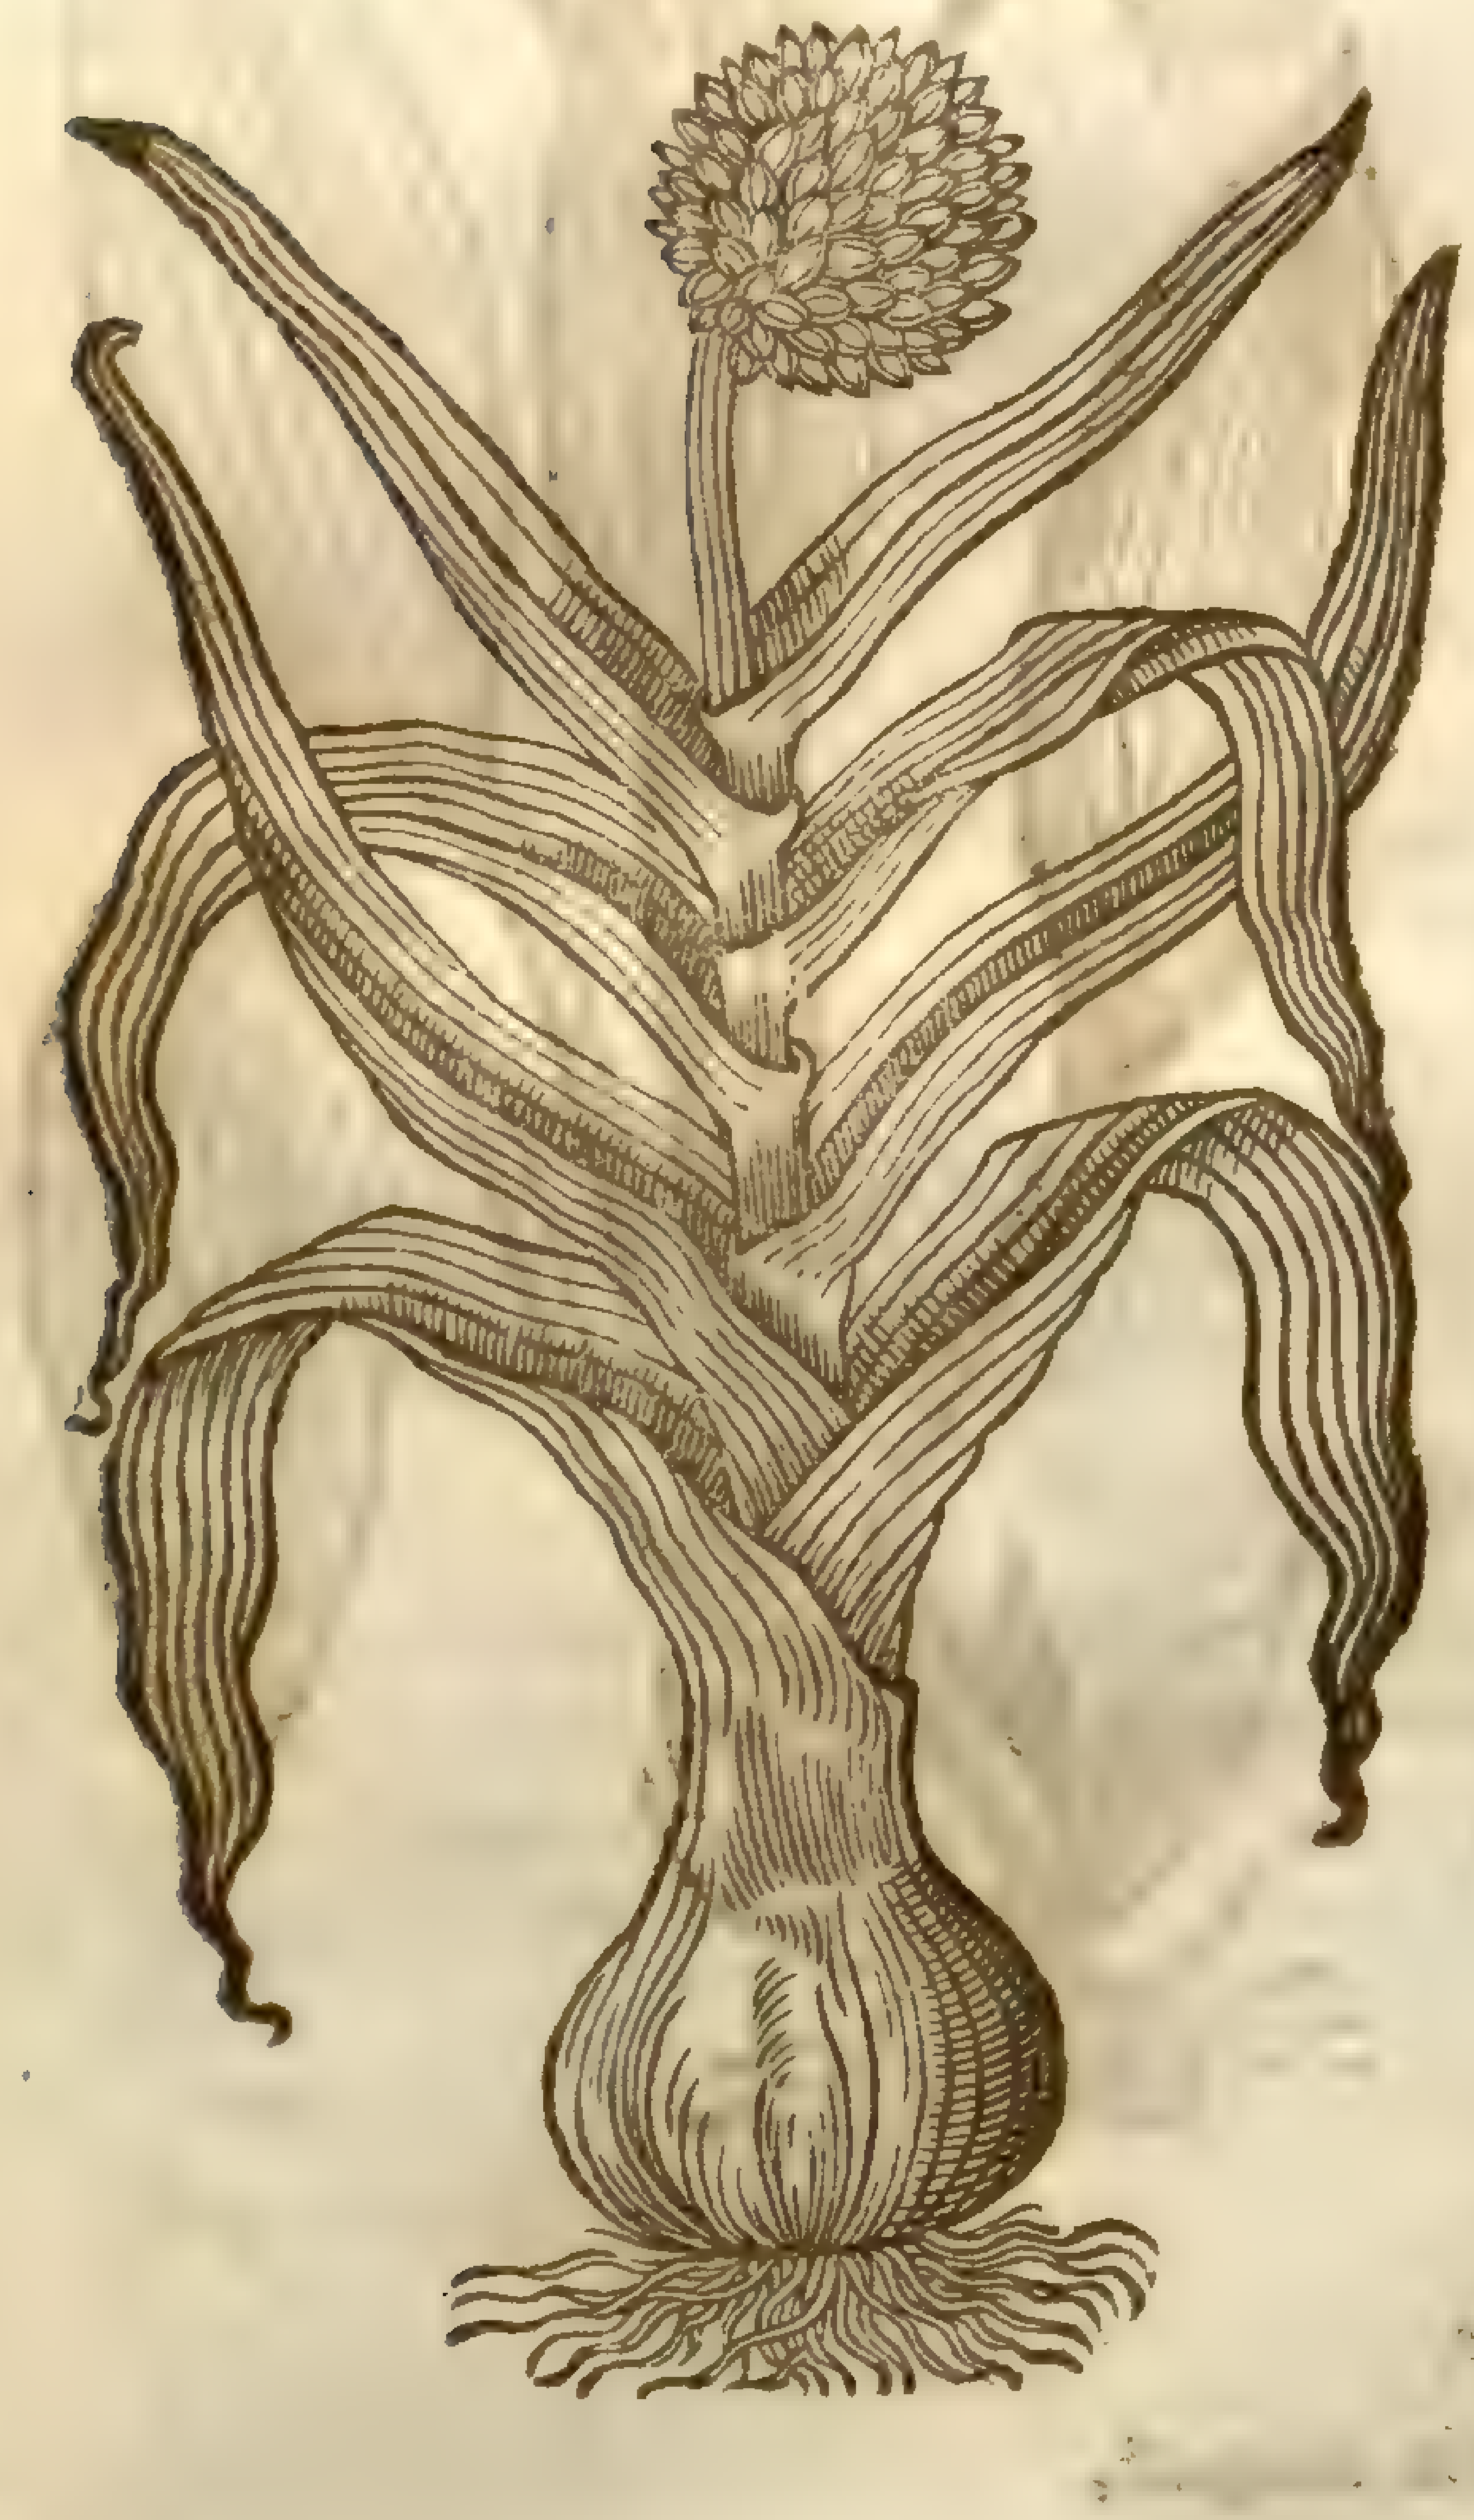
H Wild Garlicke or Crow-Garlicke, as *Galen* ſaith, is ſtronger and of more force than the garden Garlicke.

B The leaues of Ramſons be ſtamped and eaten of diuers in the Low-Countries, with fiſh for a ſauce, euen as we do eat green-ſauce made with ſorrell.

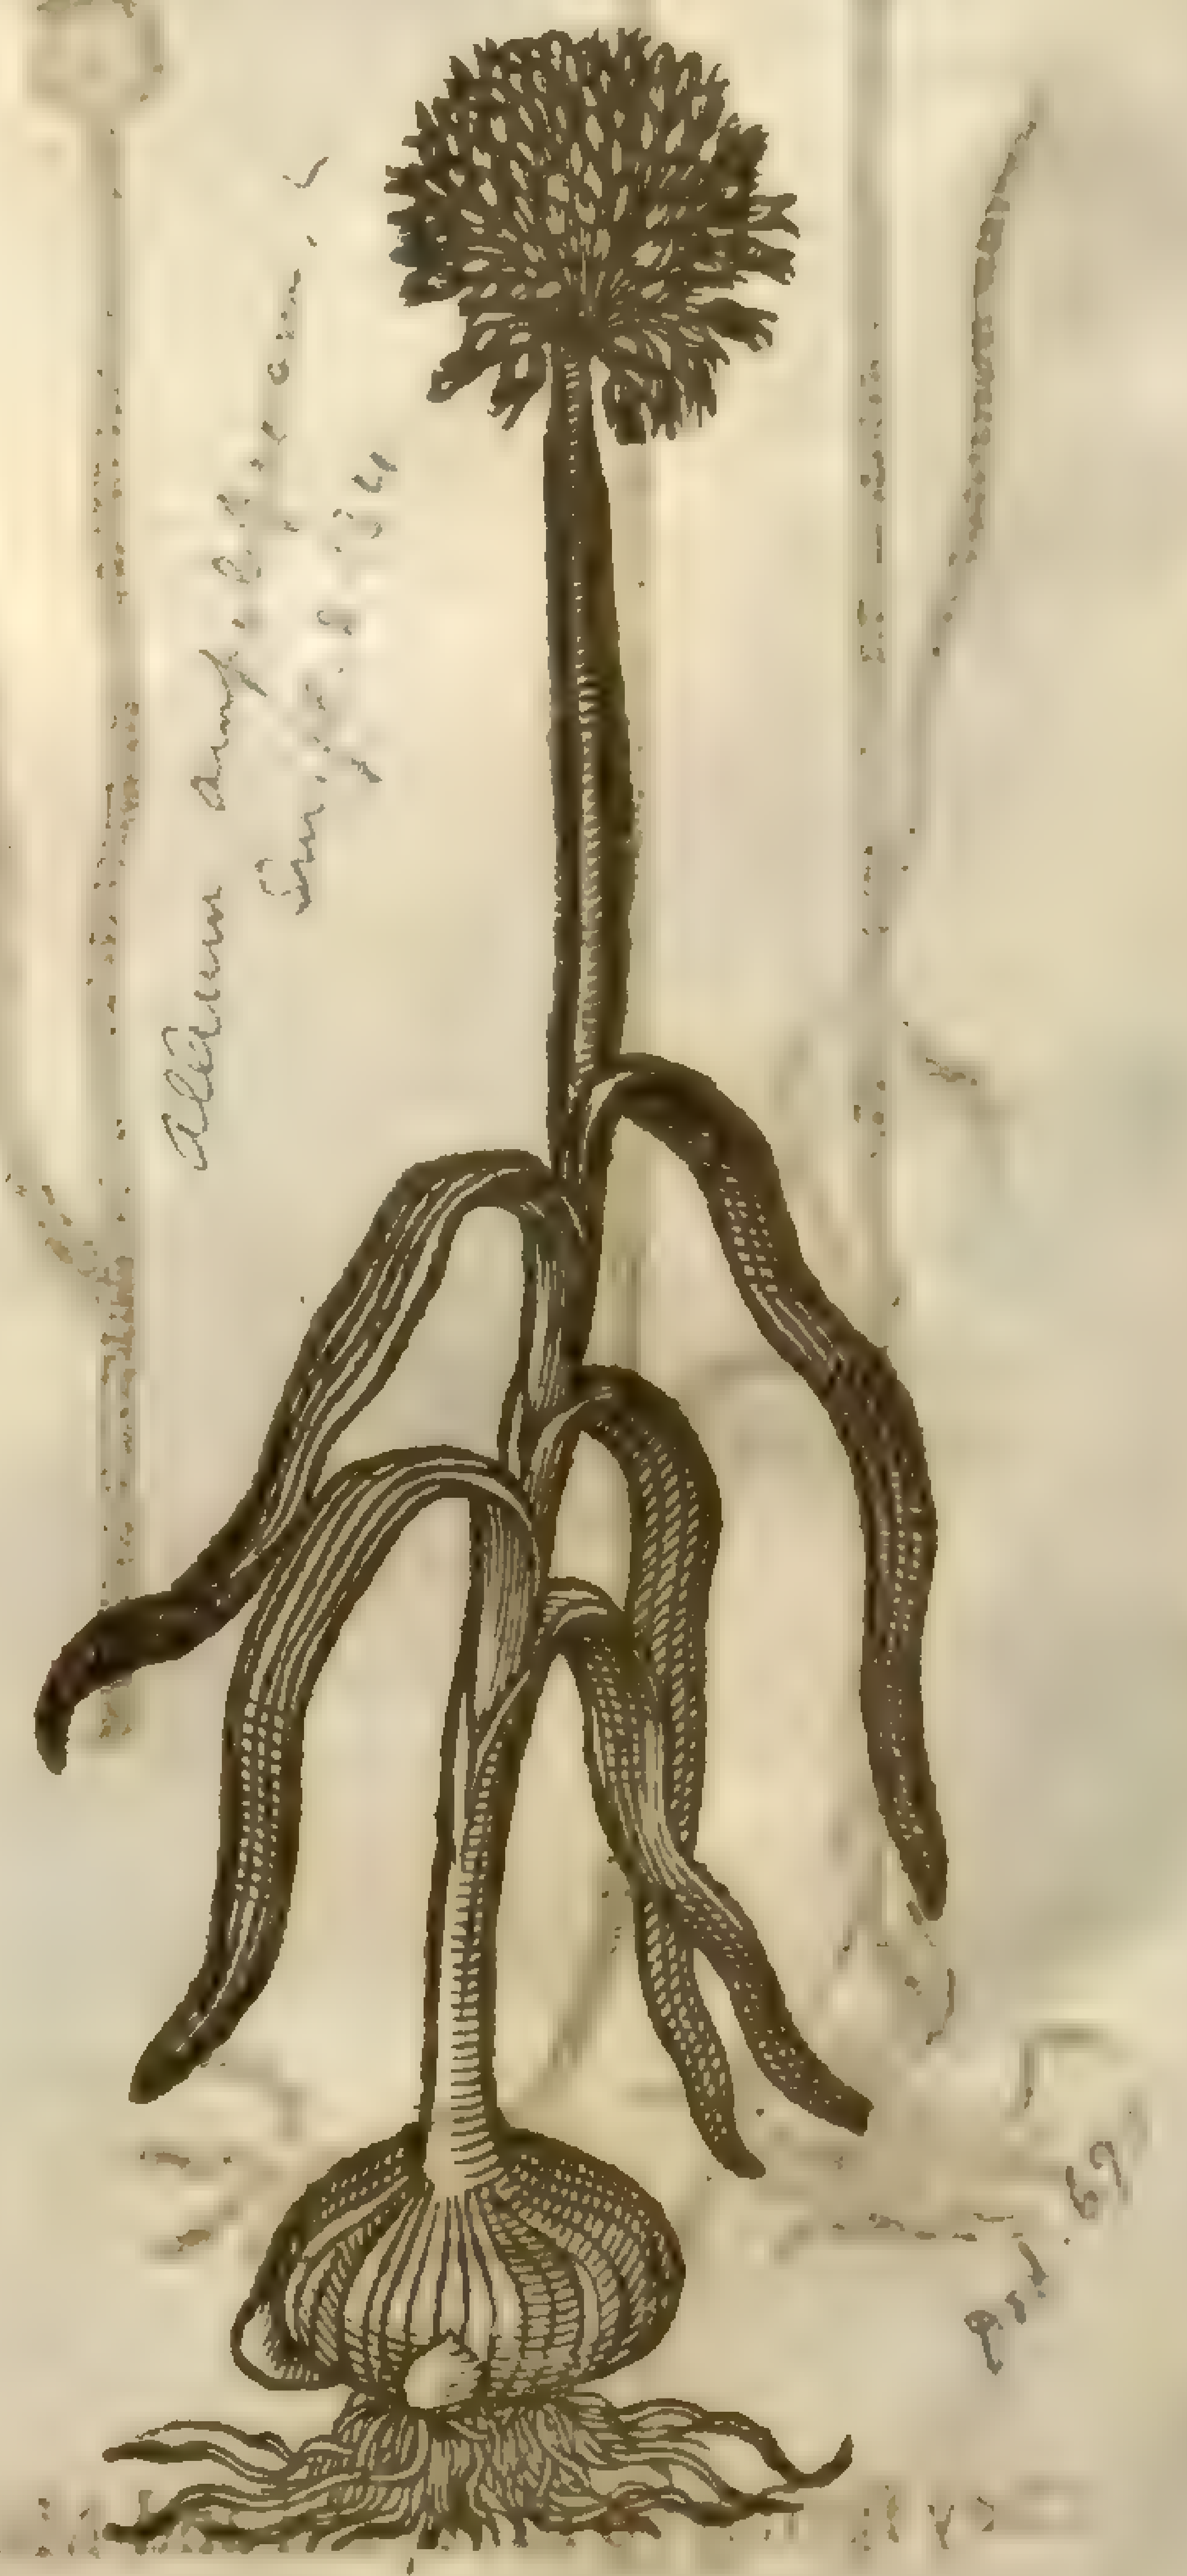
C The ſame leaues may very well be eaten in Aprill and May with butter, of ſuch as are of a ſtrong conſtitution, and laboring men.

D The diſtilled water drunke breaketh the ſtone, and driueth it forth, and prouoketh vrine.

Chap. 99. *Of Mountaine Garlicke.*



1 *Scorodopraſum.*
Great mountaine Garlicke.



‡ 2 *Scorodopraſum primum Cluſij.*
Cluſius his great mountain Garlick.

Allium ampeloprasum
Lin. sp. pl. 294

Prd. 69

¶ *The Deſcription.*

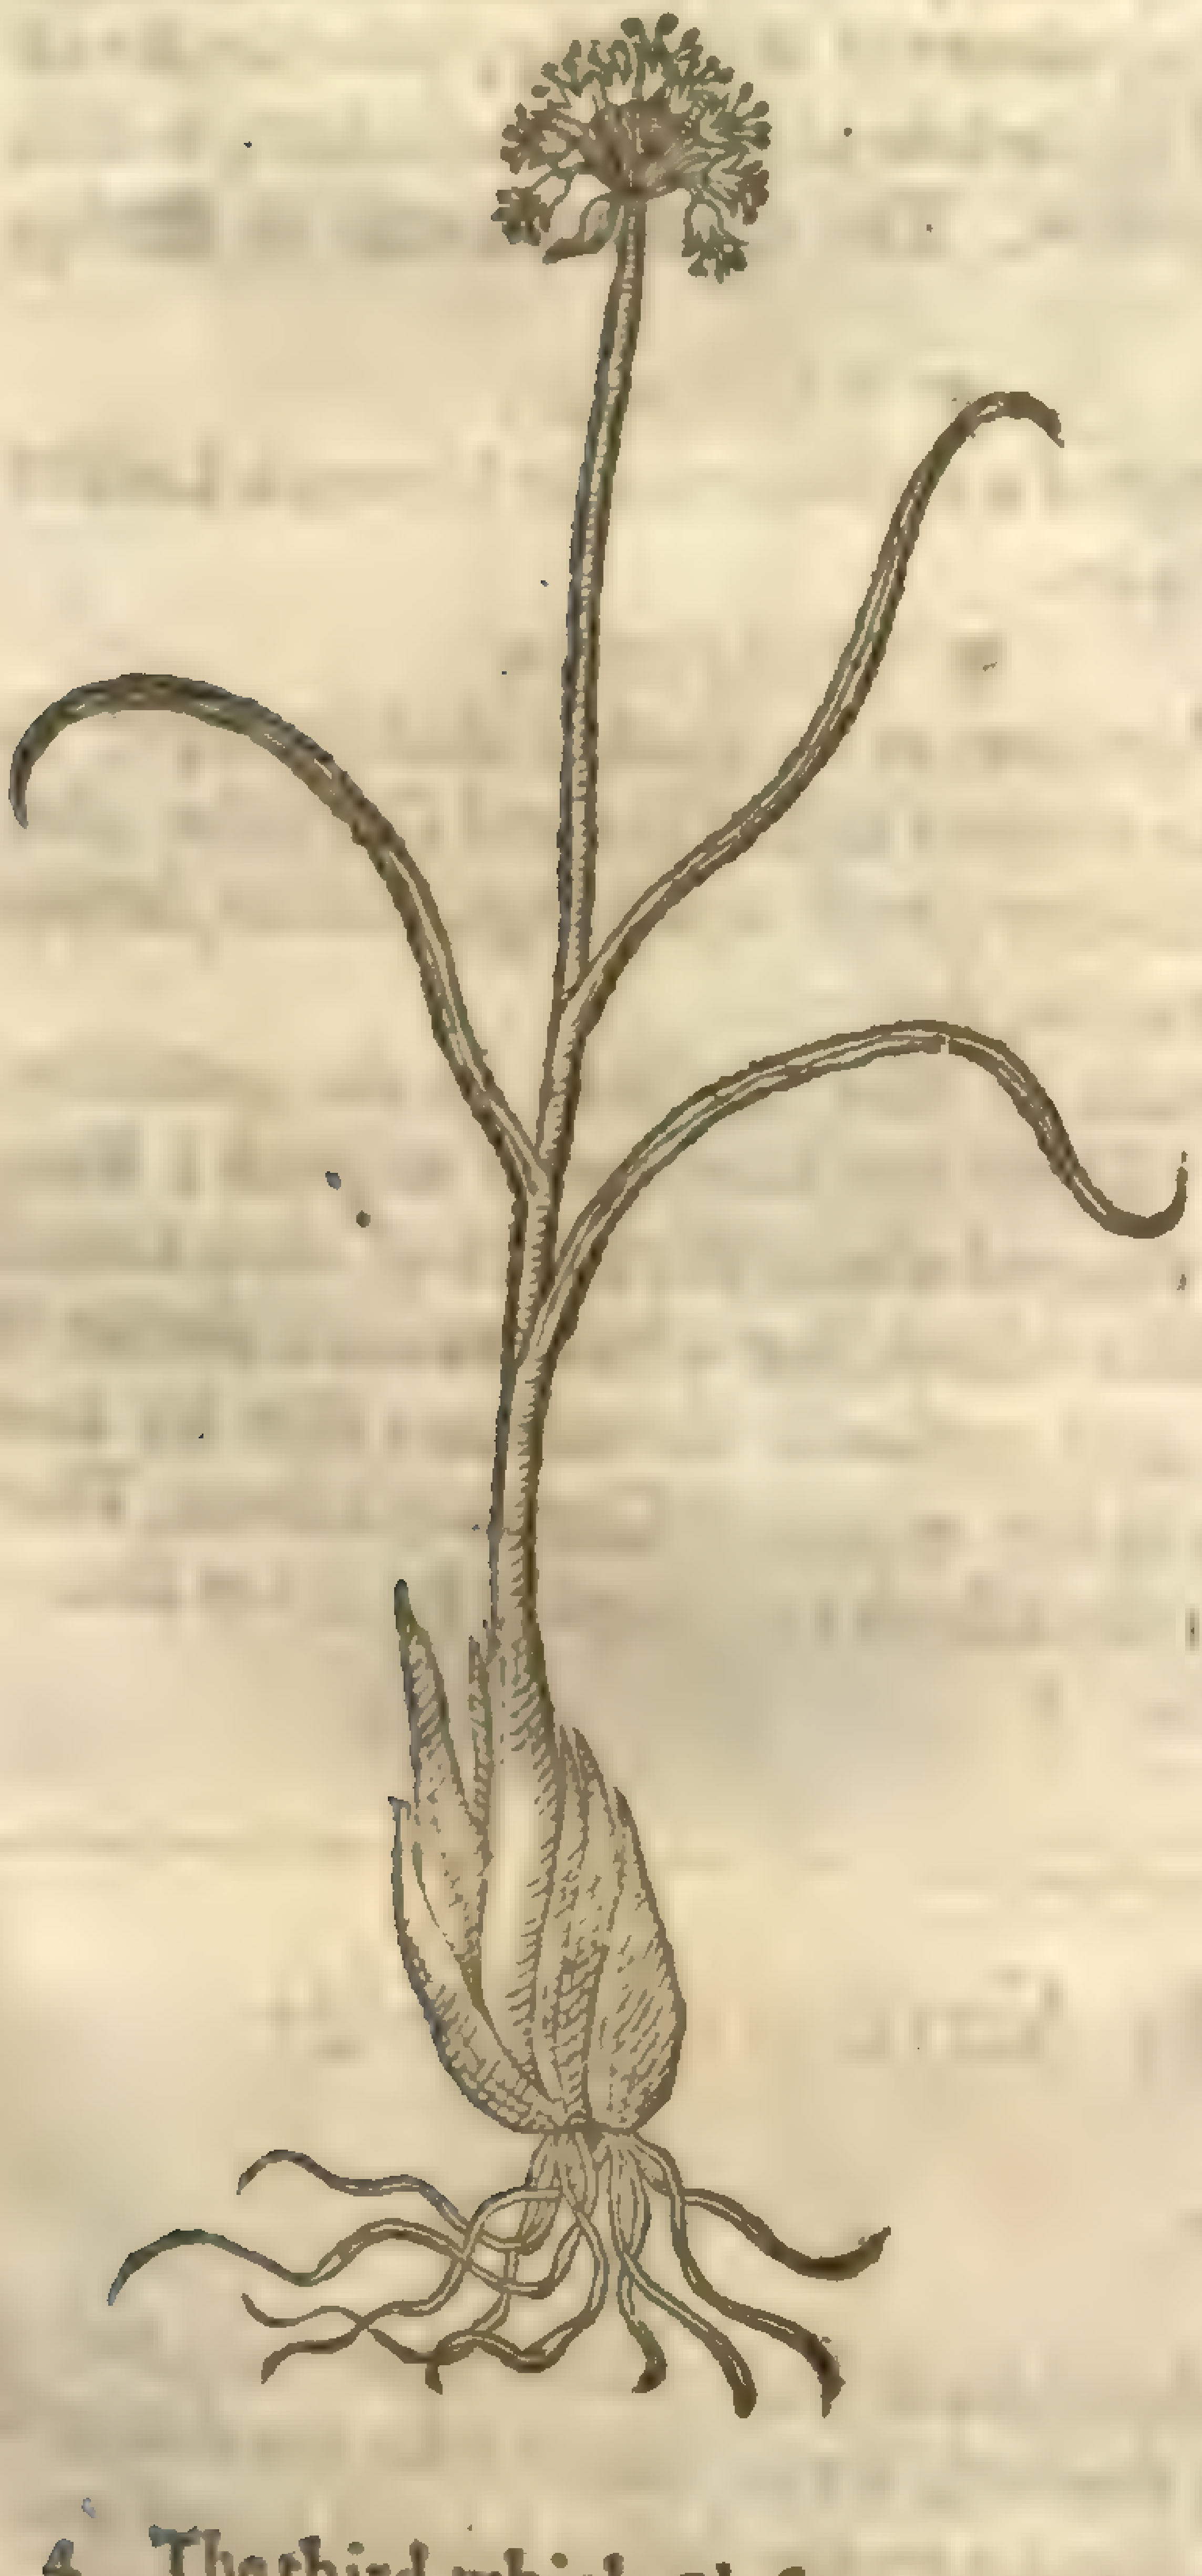
1 . 2 THe great mountaine Garlicke hath long and broad leaues like thoſe of Leeks, but much greater and longer, embracing or claſping about a great thicke ſtalke, ſoft and full of iuyce, bigger than a mans finger, and bare towards the top; vpon which is ſet a great head bigger than a tenniſe ball, couered with a skinne after the manner of an Onion. The skinne when it commeth to perfection breaketh, and diſcouereth a great multitude of whitiſh floures: which being paſt, blacke ſeeds follow incloſed in a three cornered huske. The root is bulbous, of the bigneſſe of a great Onion. The whole plant ſmelleth very ſtrong like vnto

Garlicke and is in ſhew a Leeke, whereupon it was called *Scorodopraſum*, as if we ſhould ſay, Garlicke Leeke; participating of the Leeke and Garlicke, or rather a degenerate Garlicke growne monſtrous.

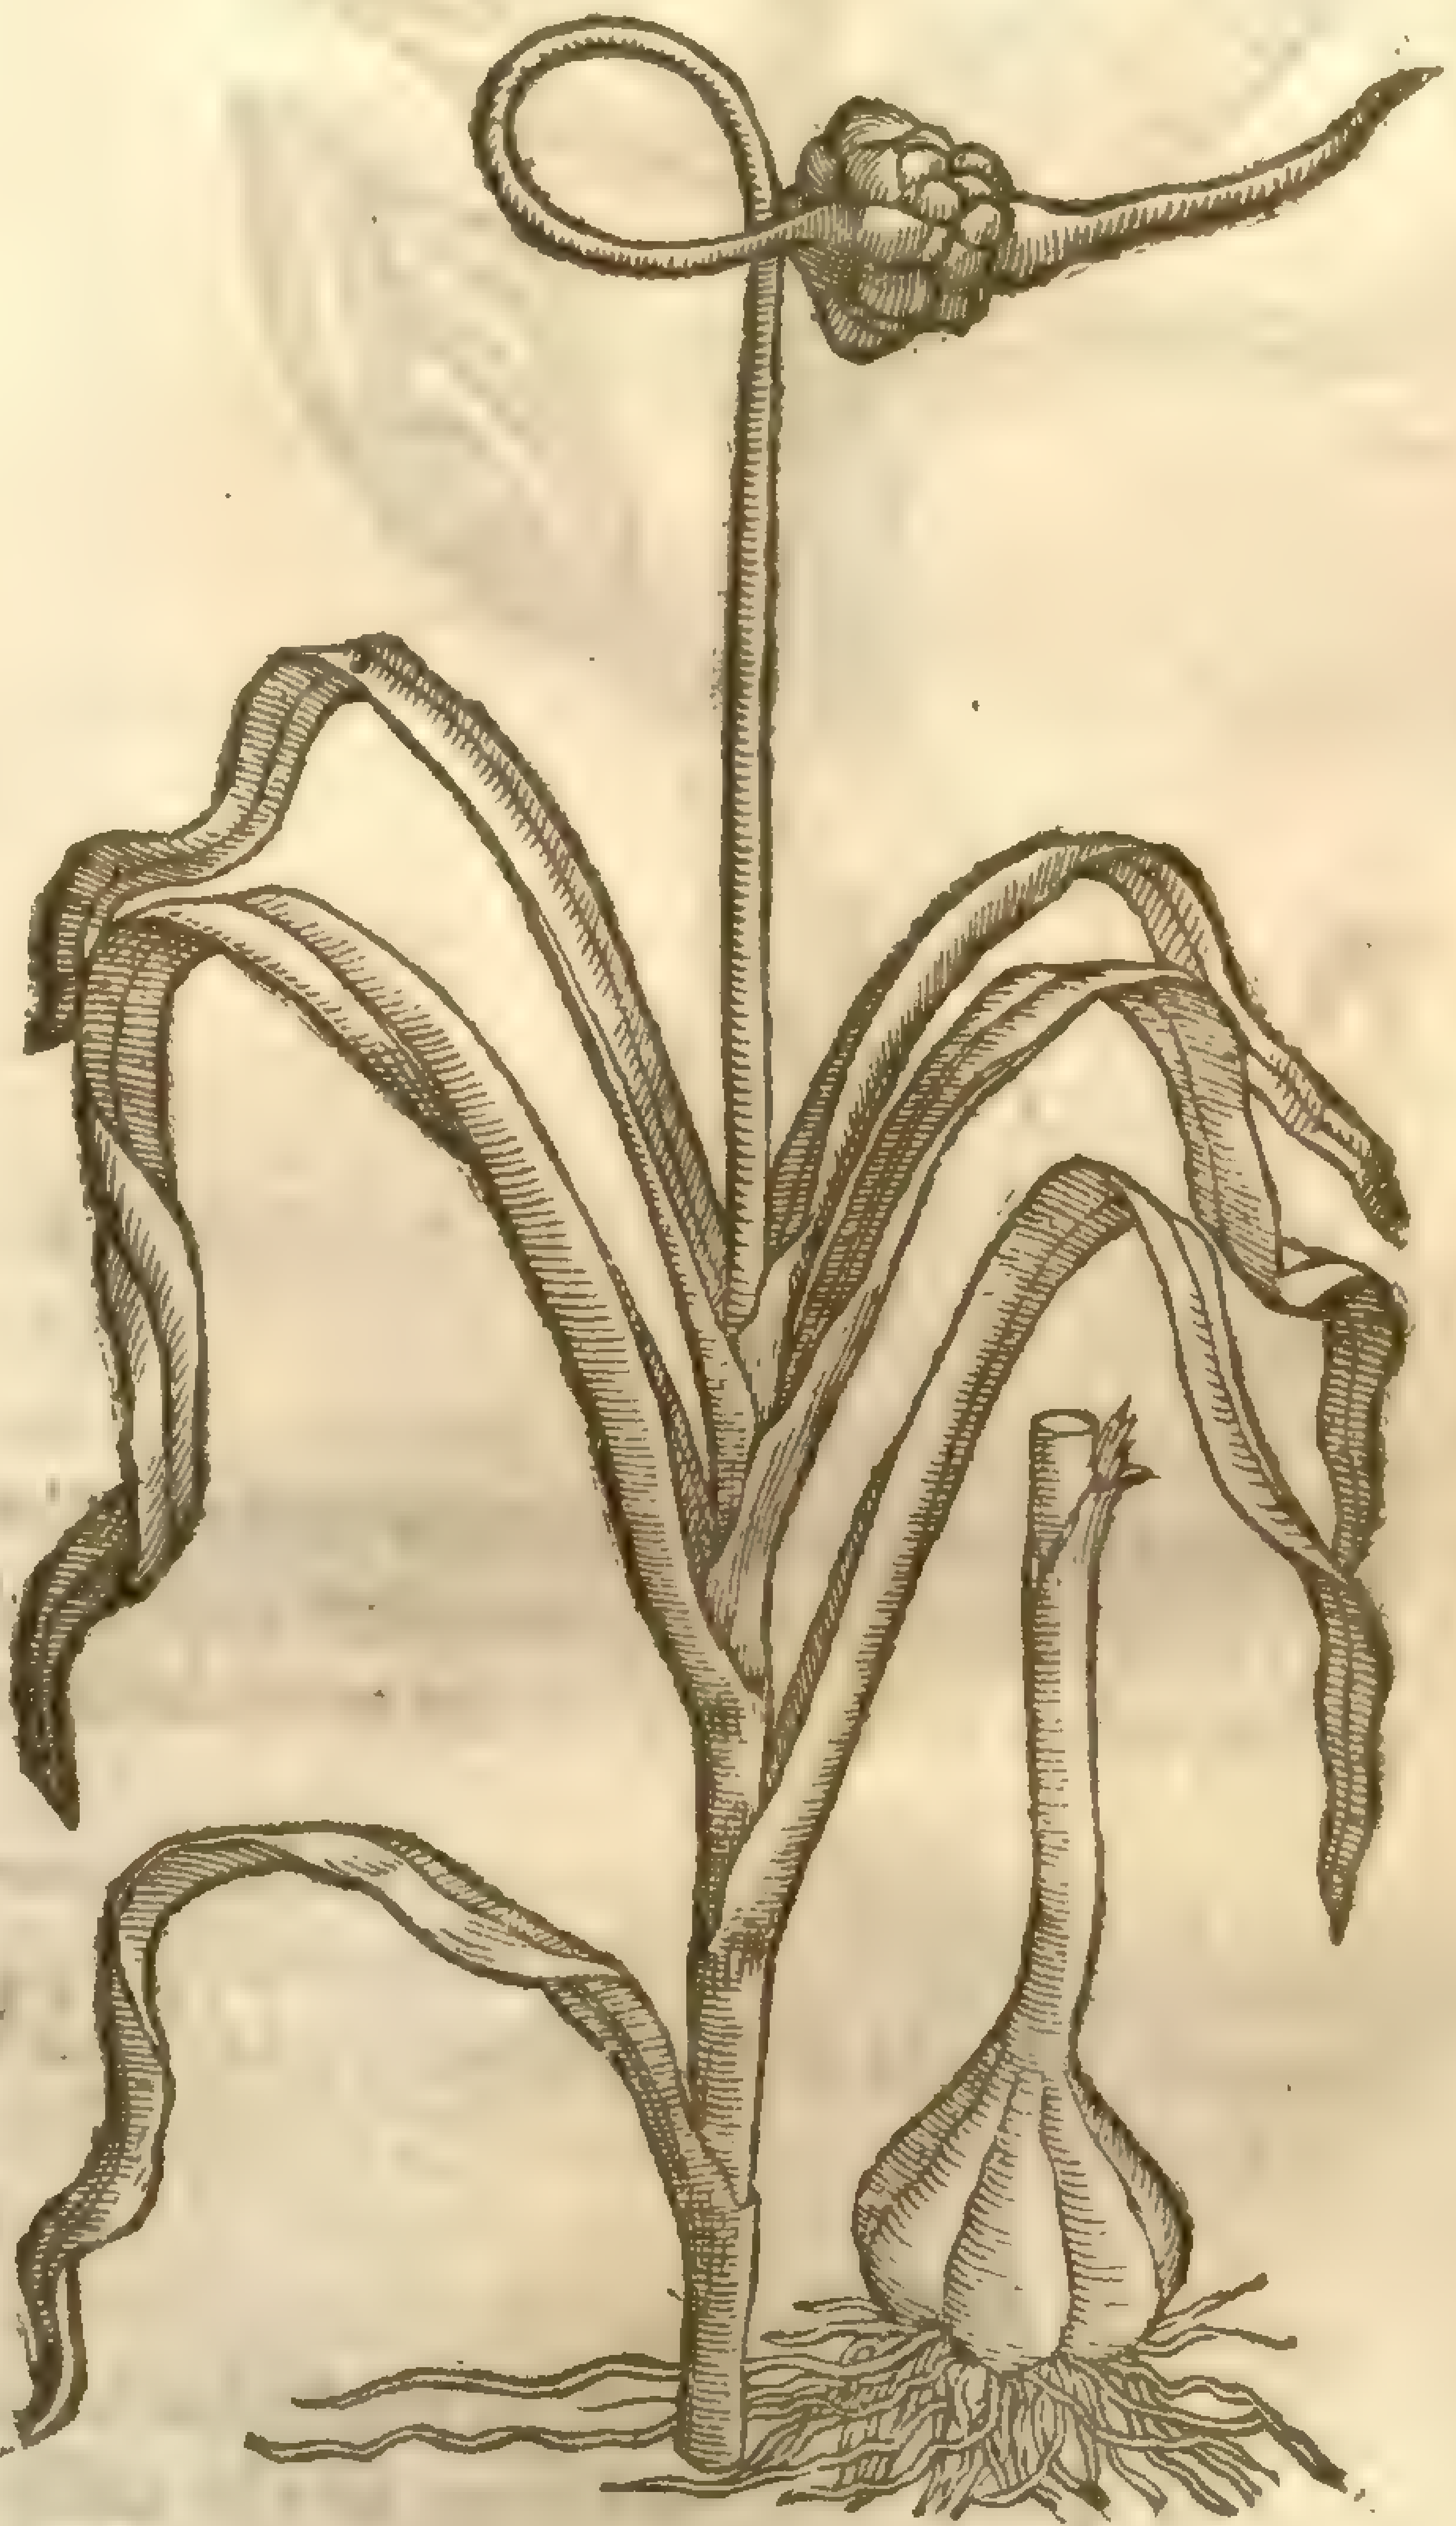
‡ I cannot certainely determine what difference there may be betweene the plants expreſſed by the firſt figure, which is our Authors, and the ſecond figure which is taken out of *Cluſius*. Now the hiſtory which *Cluſius* giues vs to the ſecond, the ſame is (out of him) giuen by our Author to the firſt: ſo that by this reaſon they are of one and the ſame plant. To the which opinion I rather incline, than affirme the contrary with *Bauhine*, who diſtinguiſhing them, puts the firſt amongſt the Leekes, vnder the name of *Porrum folio latiſsimo*: following *Tabernamontanus*, who firſt gaue this figure, vnder the name of *Porrum Syriacum*.

3 This plant is leſſer in all the parts than the former; the root is ſet about with longer and ſlenderer bulbes wrapped in browniſh skinnes; the floures and leaues are like, yet ſmaller than Garlicke.

‡ 3 *Scorodopraſum minus.*
The leſſer Leeke-leaued Garlicke.



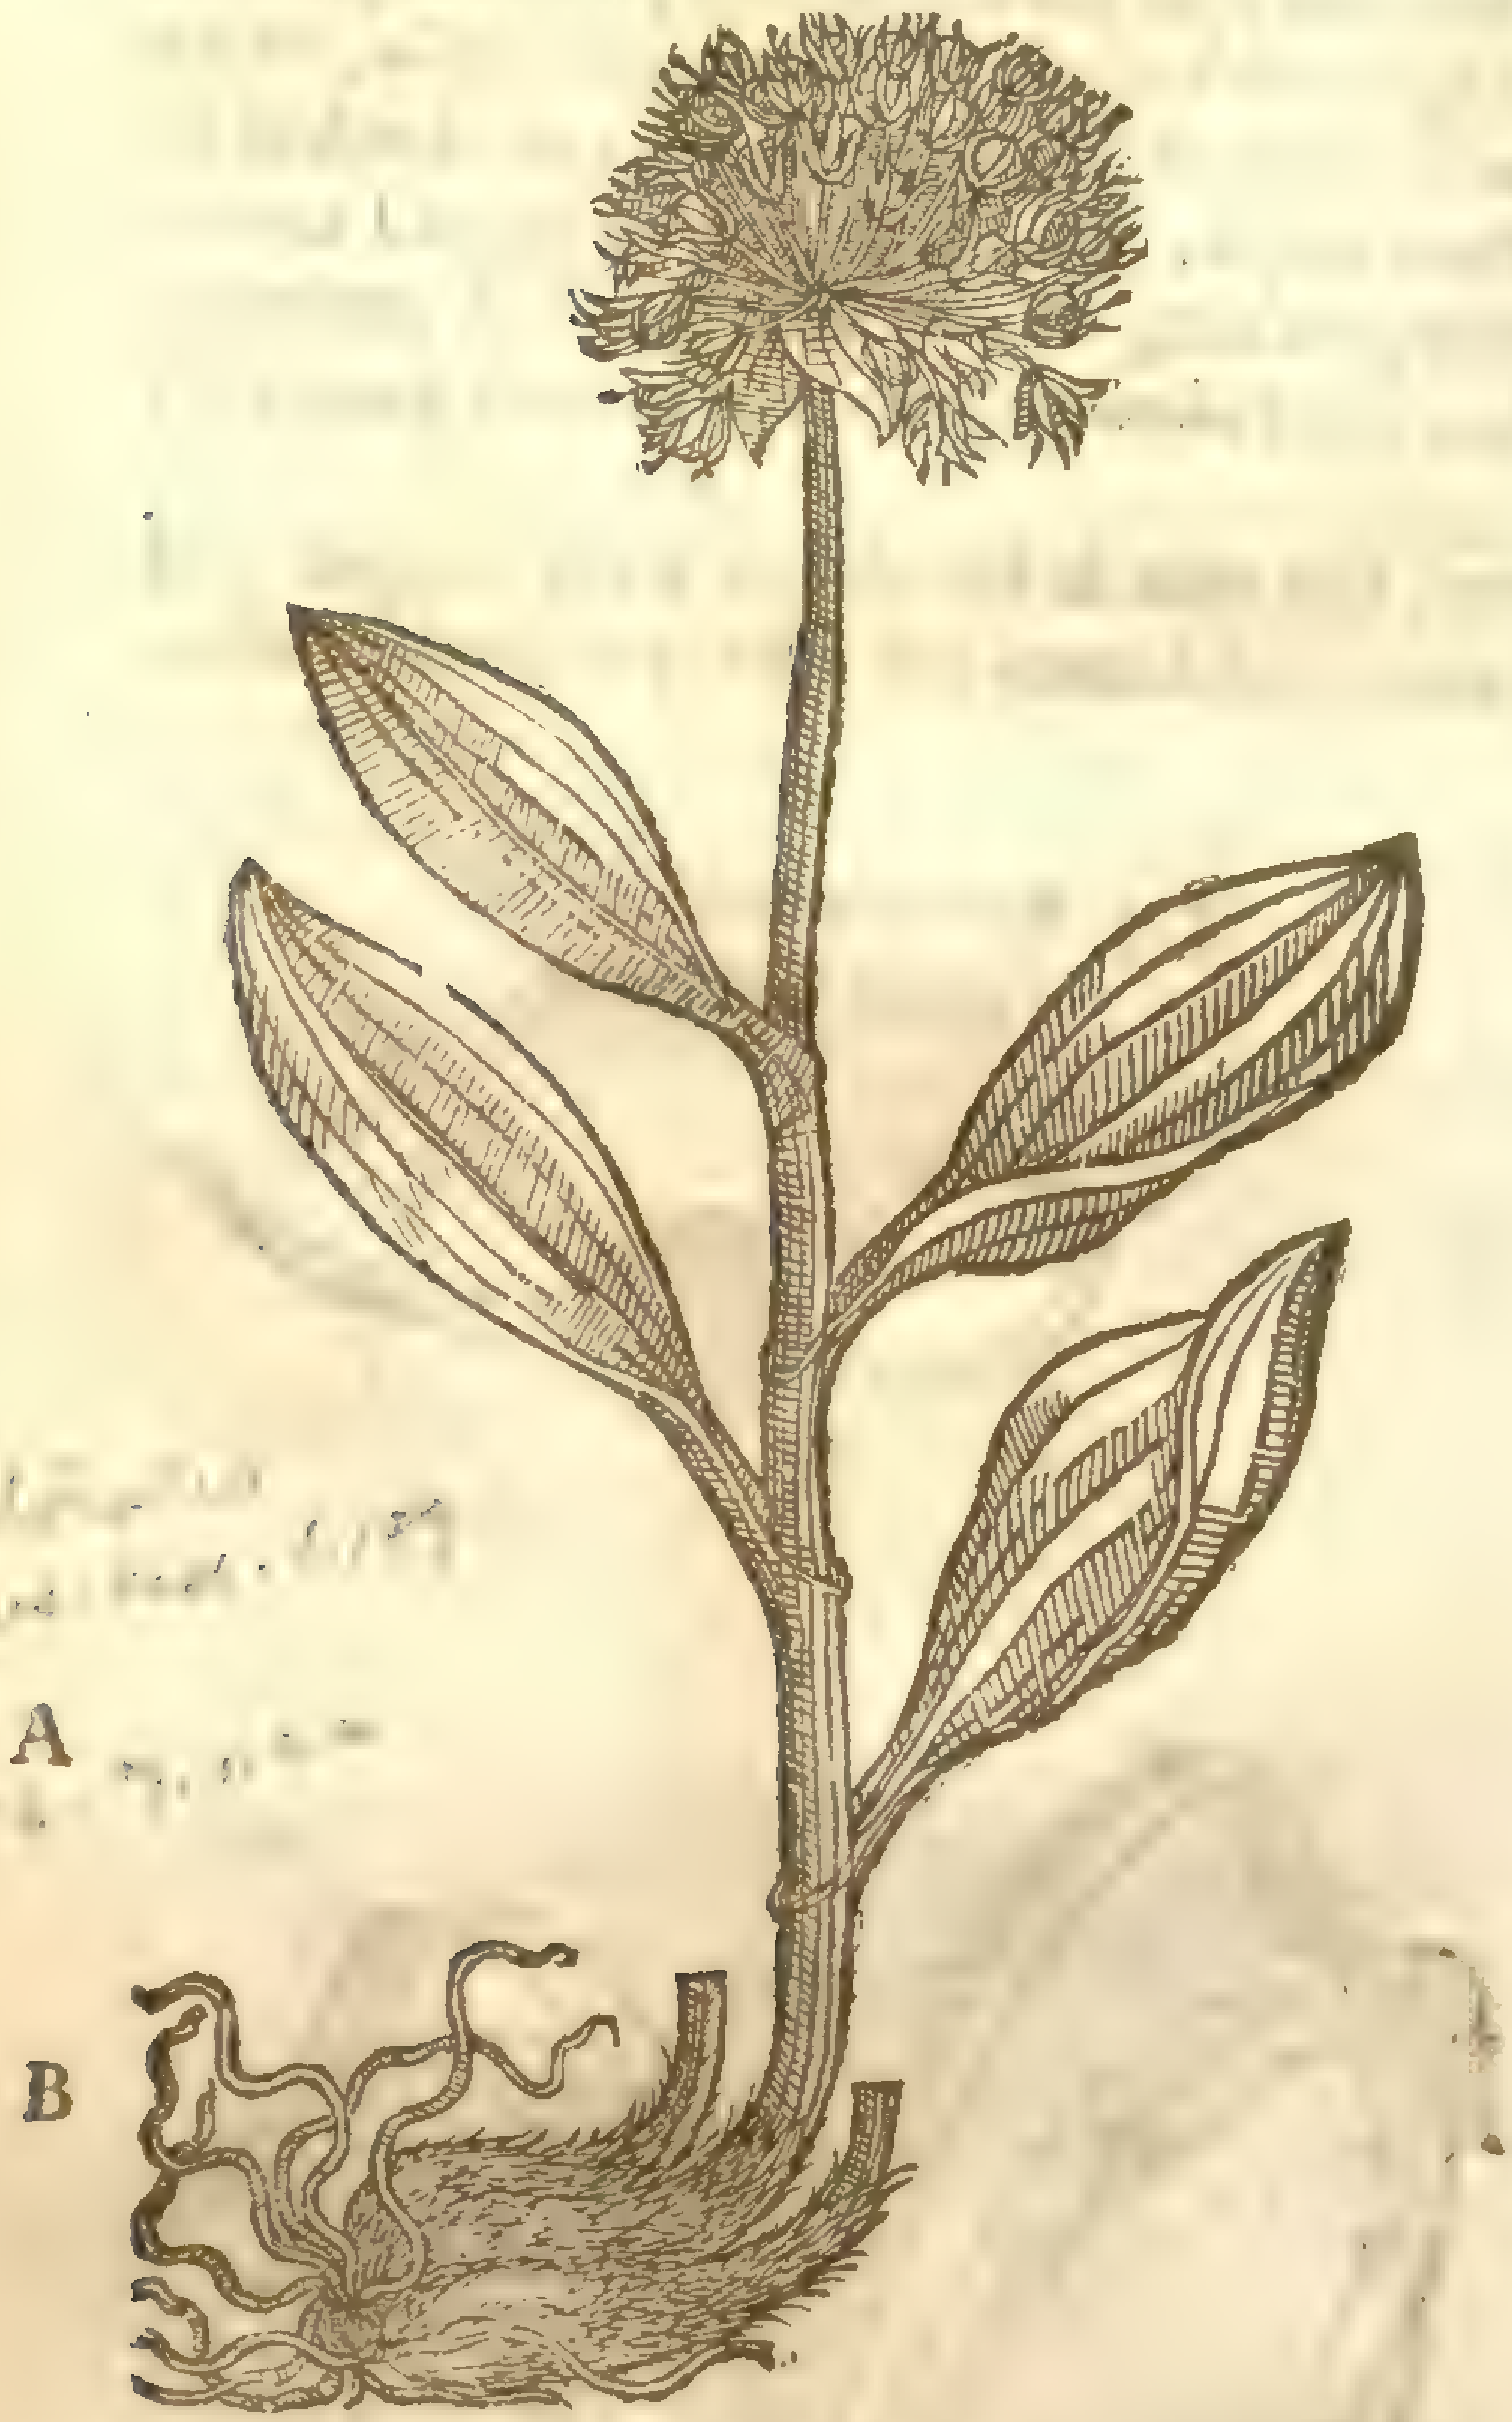
‡ 4 *Ophioſcoridon.*
Vipers Garlicke.



4 The third, which *Cluſius* makes his ſecond *Scorodopraſum*, hath ſtalkes ſome two cubits high, hauing many leaues like thoſe of Leekes from the bottome of the ſtalke to the middle thereof; their ſmell is betweene that of Leekes and Garlicke; the reſt of the ſtalke is naked, greene, ſmooth, ſuſtaining at the top a head compoſed of many bulbes, couered with a whitiſh skinne ending in a long greene point; which skinne by the growth of the bulbe being broken, they ſhew themſelues, being firſt of a purpliſh, and afterwards of a whitiſh colour, amongſt which are ſome floures. The top of the ſtalke at firſt twines it ſelfe, ſo that it in ſome ſort repreſents a ſerpent; then by little it vntwines againe, and beares the head ſtreight vp. The root conſiſts of many cloues much like that of Garlicke. ‡

5 The broad leaued mountaine Garlicke, or rather the Mountaine Ramſons, riſeth vp with a ſtalke a cubit high, a finger thicke, yet very weake, full of a ſpongeous ſubſtance, neere to the bottome of a purpliſh colour, and greene aboue, bearing at the top a multitude of ſmall whitiſh floures, ſomwhat gaping, ſtar-faſhion. The leaues are three or foure, broad ribbed like the leaues of great Gentian, reſembling thoſe of Ramſons, but greater The root is great and long, couered with many ſcaly coats and hairy ſtrings.

5 *Allium Alpinum latifolium, ſeu Victorialis.*
Broad leaued Mountaine Garlicke.



¶ *The Place.*

The great mountaine Garlicke growes about Conſtantinople, as ſaith *Cluſius*. I receiued a plant of it from Mr *Thomas Edwards* Apothecary of Exceſter, who found it growing in the Weſt part of England.

Victorialis groweth in the mountaines of Germany, as ſaith *Carolus Cluſius*, and is yet a ſtranger in England for any thing that I do know.

¶ *The Time.*

‡ Moſt of theſe plants floure in the months of Iune and Iuly.

¶ *The Names.*

Of the firſt and ſecond I haue ſpoken already. The third is *Scorodopraſum minus* of *Lobel*. The fourth is *Allium ſatiuum ſecundum* of *Dodonæus*, and *Scorodopraſum ſecundum* of *Cluſius*. The fifth is *Allium anguinum* of *Matthiolus*; *Ophioſcoridon* of *Lobel*, and *Victorialis* of *Cluſius* and others, as alſo *Allium Alpinum*. The Germanes call it, **Seigwurtz.**

¶ *The Temper.*

They are of a middle temper between Leekes and Garlicke.

¶ *Their Vertues.*

Scorodapraſum, as it partakes of the temper, ſo alſo of the vertues of Leekes and Garlicke; that is, it attenuates groſſe and tough matter, helpes expectoration, &c.

Victorialis is like Garlicke in the operation thereof. Some (as *Camerarius* writeth) hang the root thereof about the necks of their cattell being falne blinde, by what occaſion ſoeuer it happen, and perſuade themſelues that by this meanes they will recouer their ſight. Thoſe that worke in the mines of Germany affirme, That they find this root very powerfull in defending them from the aſſaults of impure ſpirits or diuels, which often in ſuch places are troubleſome vnto them. *Cluſ.* ‡

Chap. 100. *Of Moly, or the Sorcerers Garlicke.*

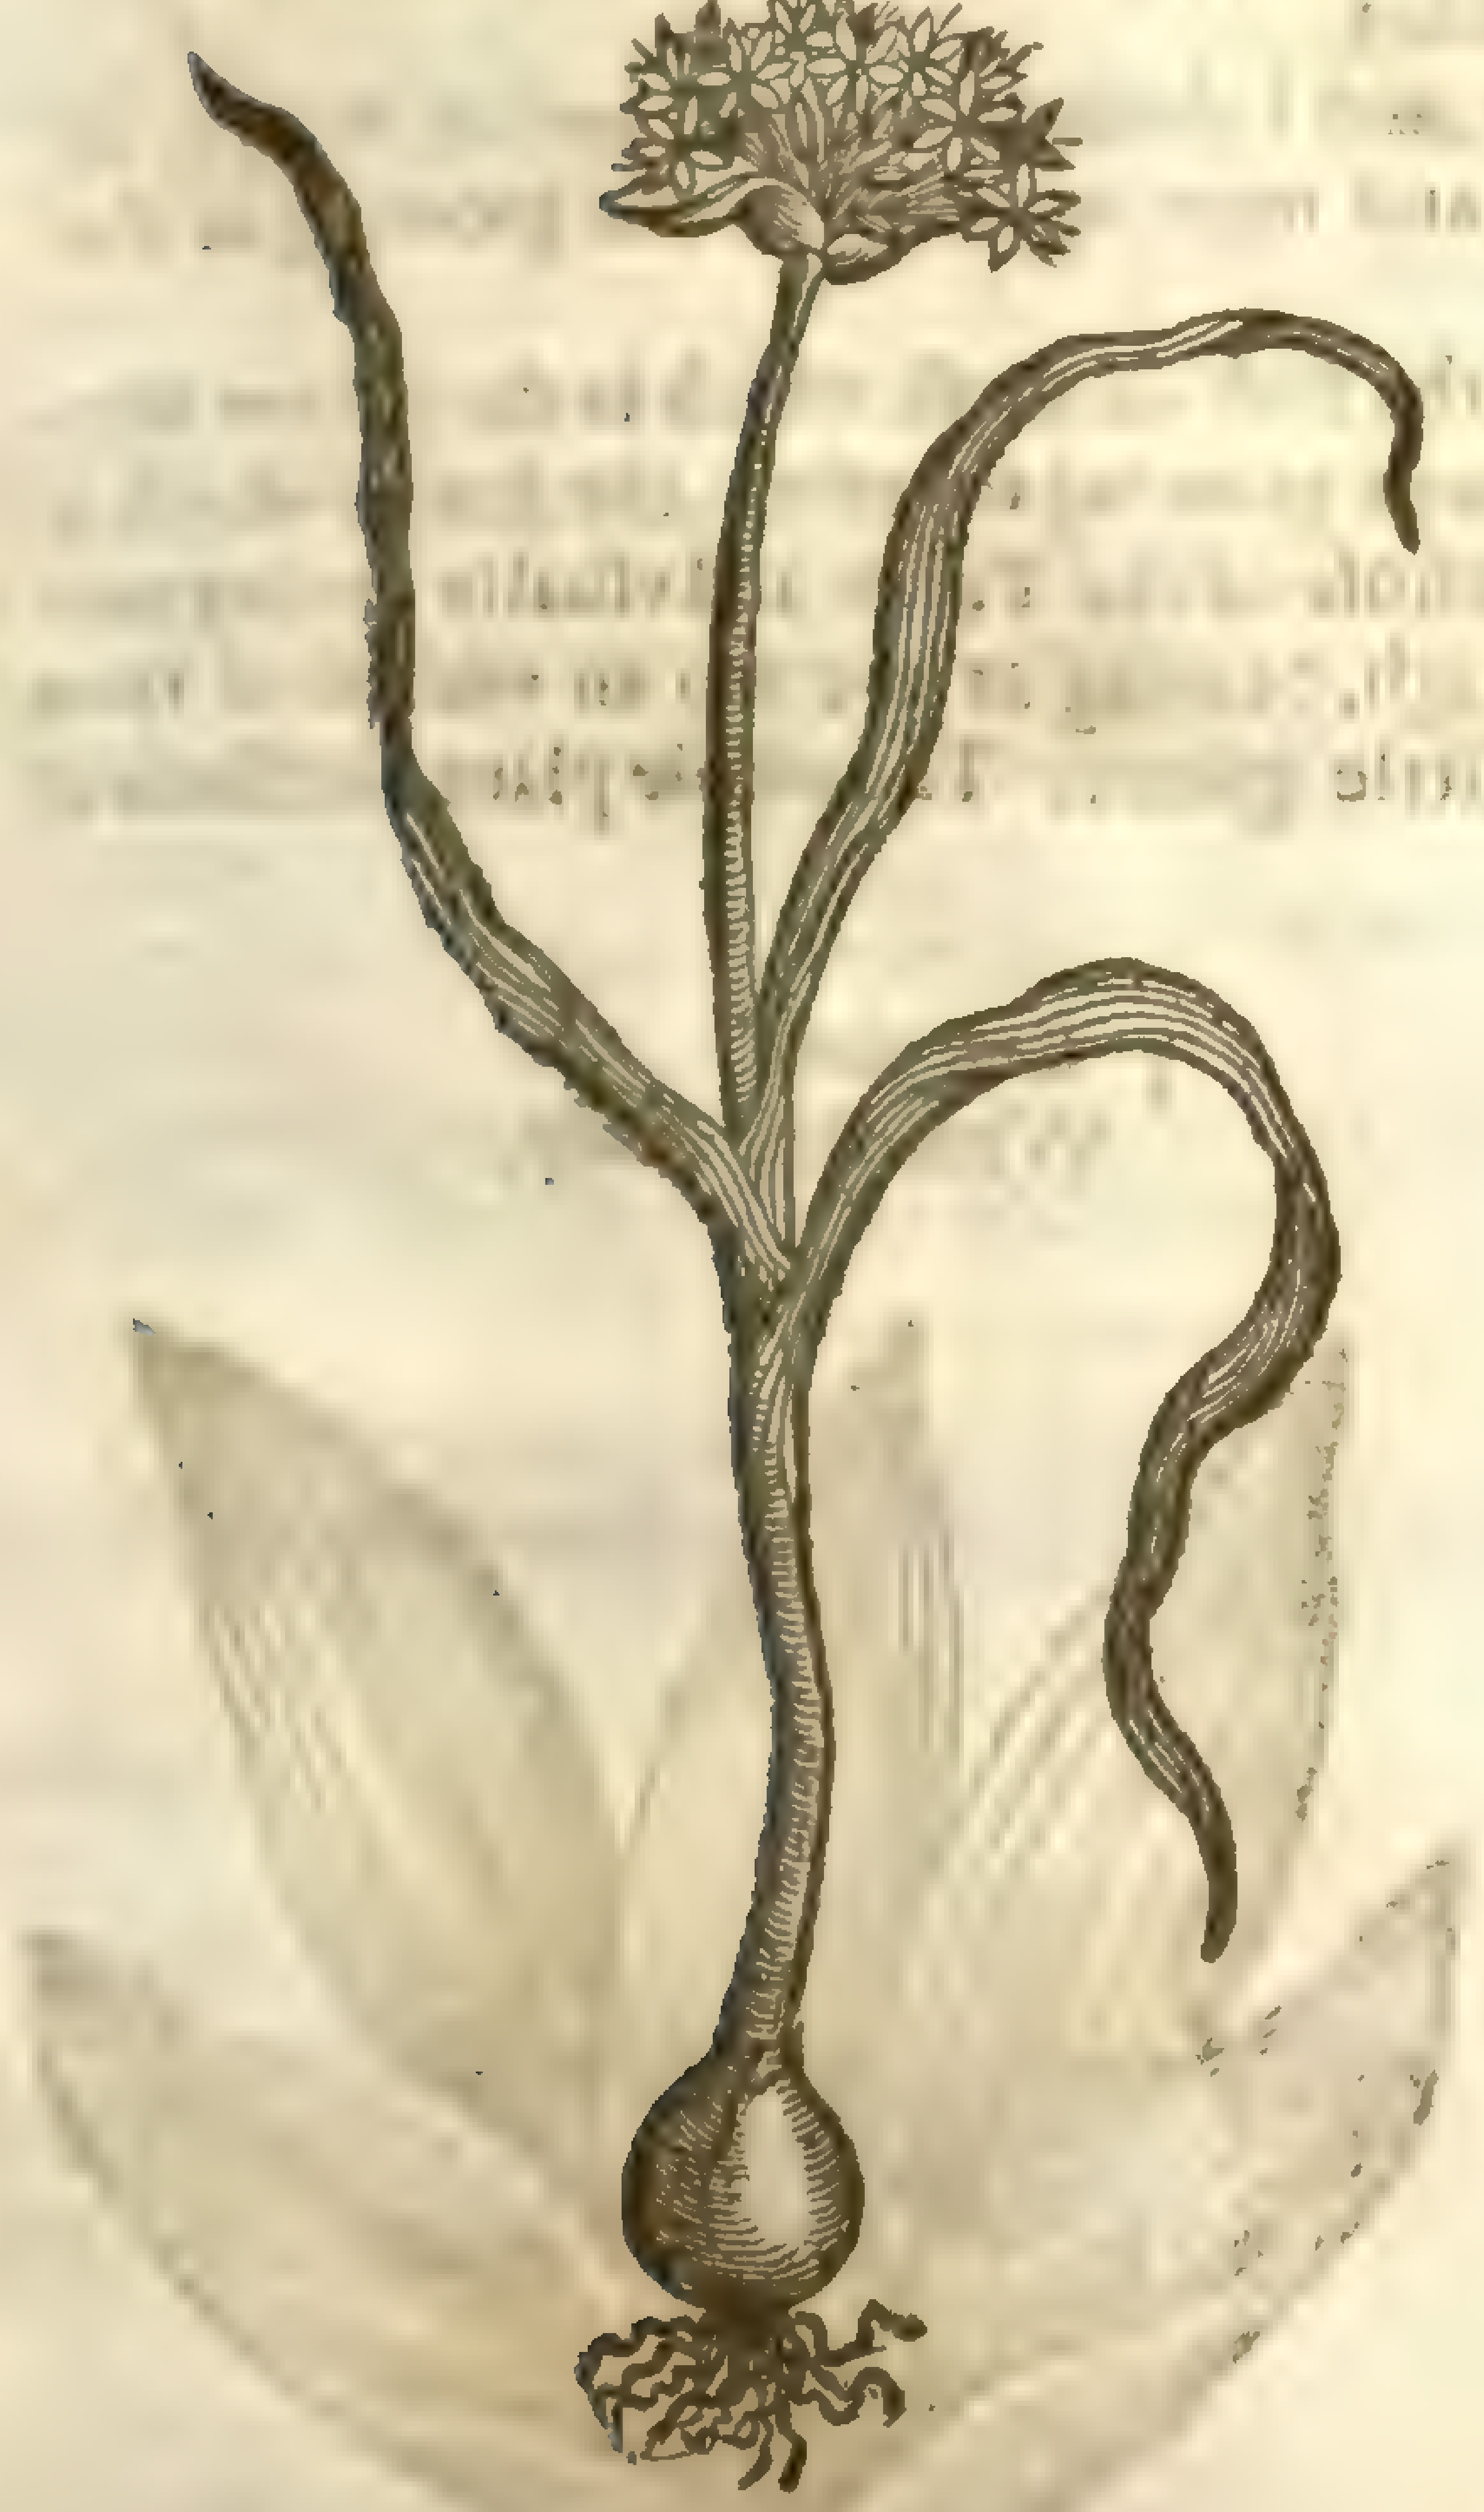
¶ *The Deſcription.*

1 The firſt kinde of Moly hath for his root a little whitiſh bulbe ſomewhat long, not vnlike to the root of the vnſet Leeke, which ſendeth forth leaues like the blades of corne or graſſe: among which doth riſe vp a ſlender weake ſtalke, fat, and full of juyce: at the top whereof commeth forth of a skinny filme a bundle of milke-white floures, not vnlike to thoſe of Ramſons. The whole plant hath the ſmell and taſte of Garlicke, whereof no doubt it is a kinde.

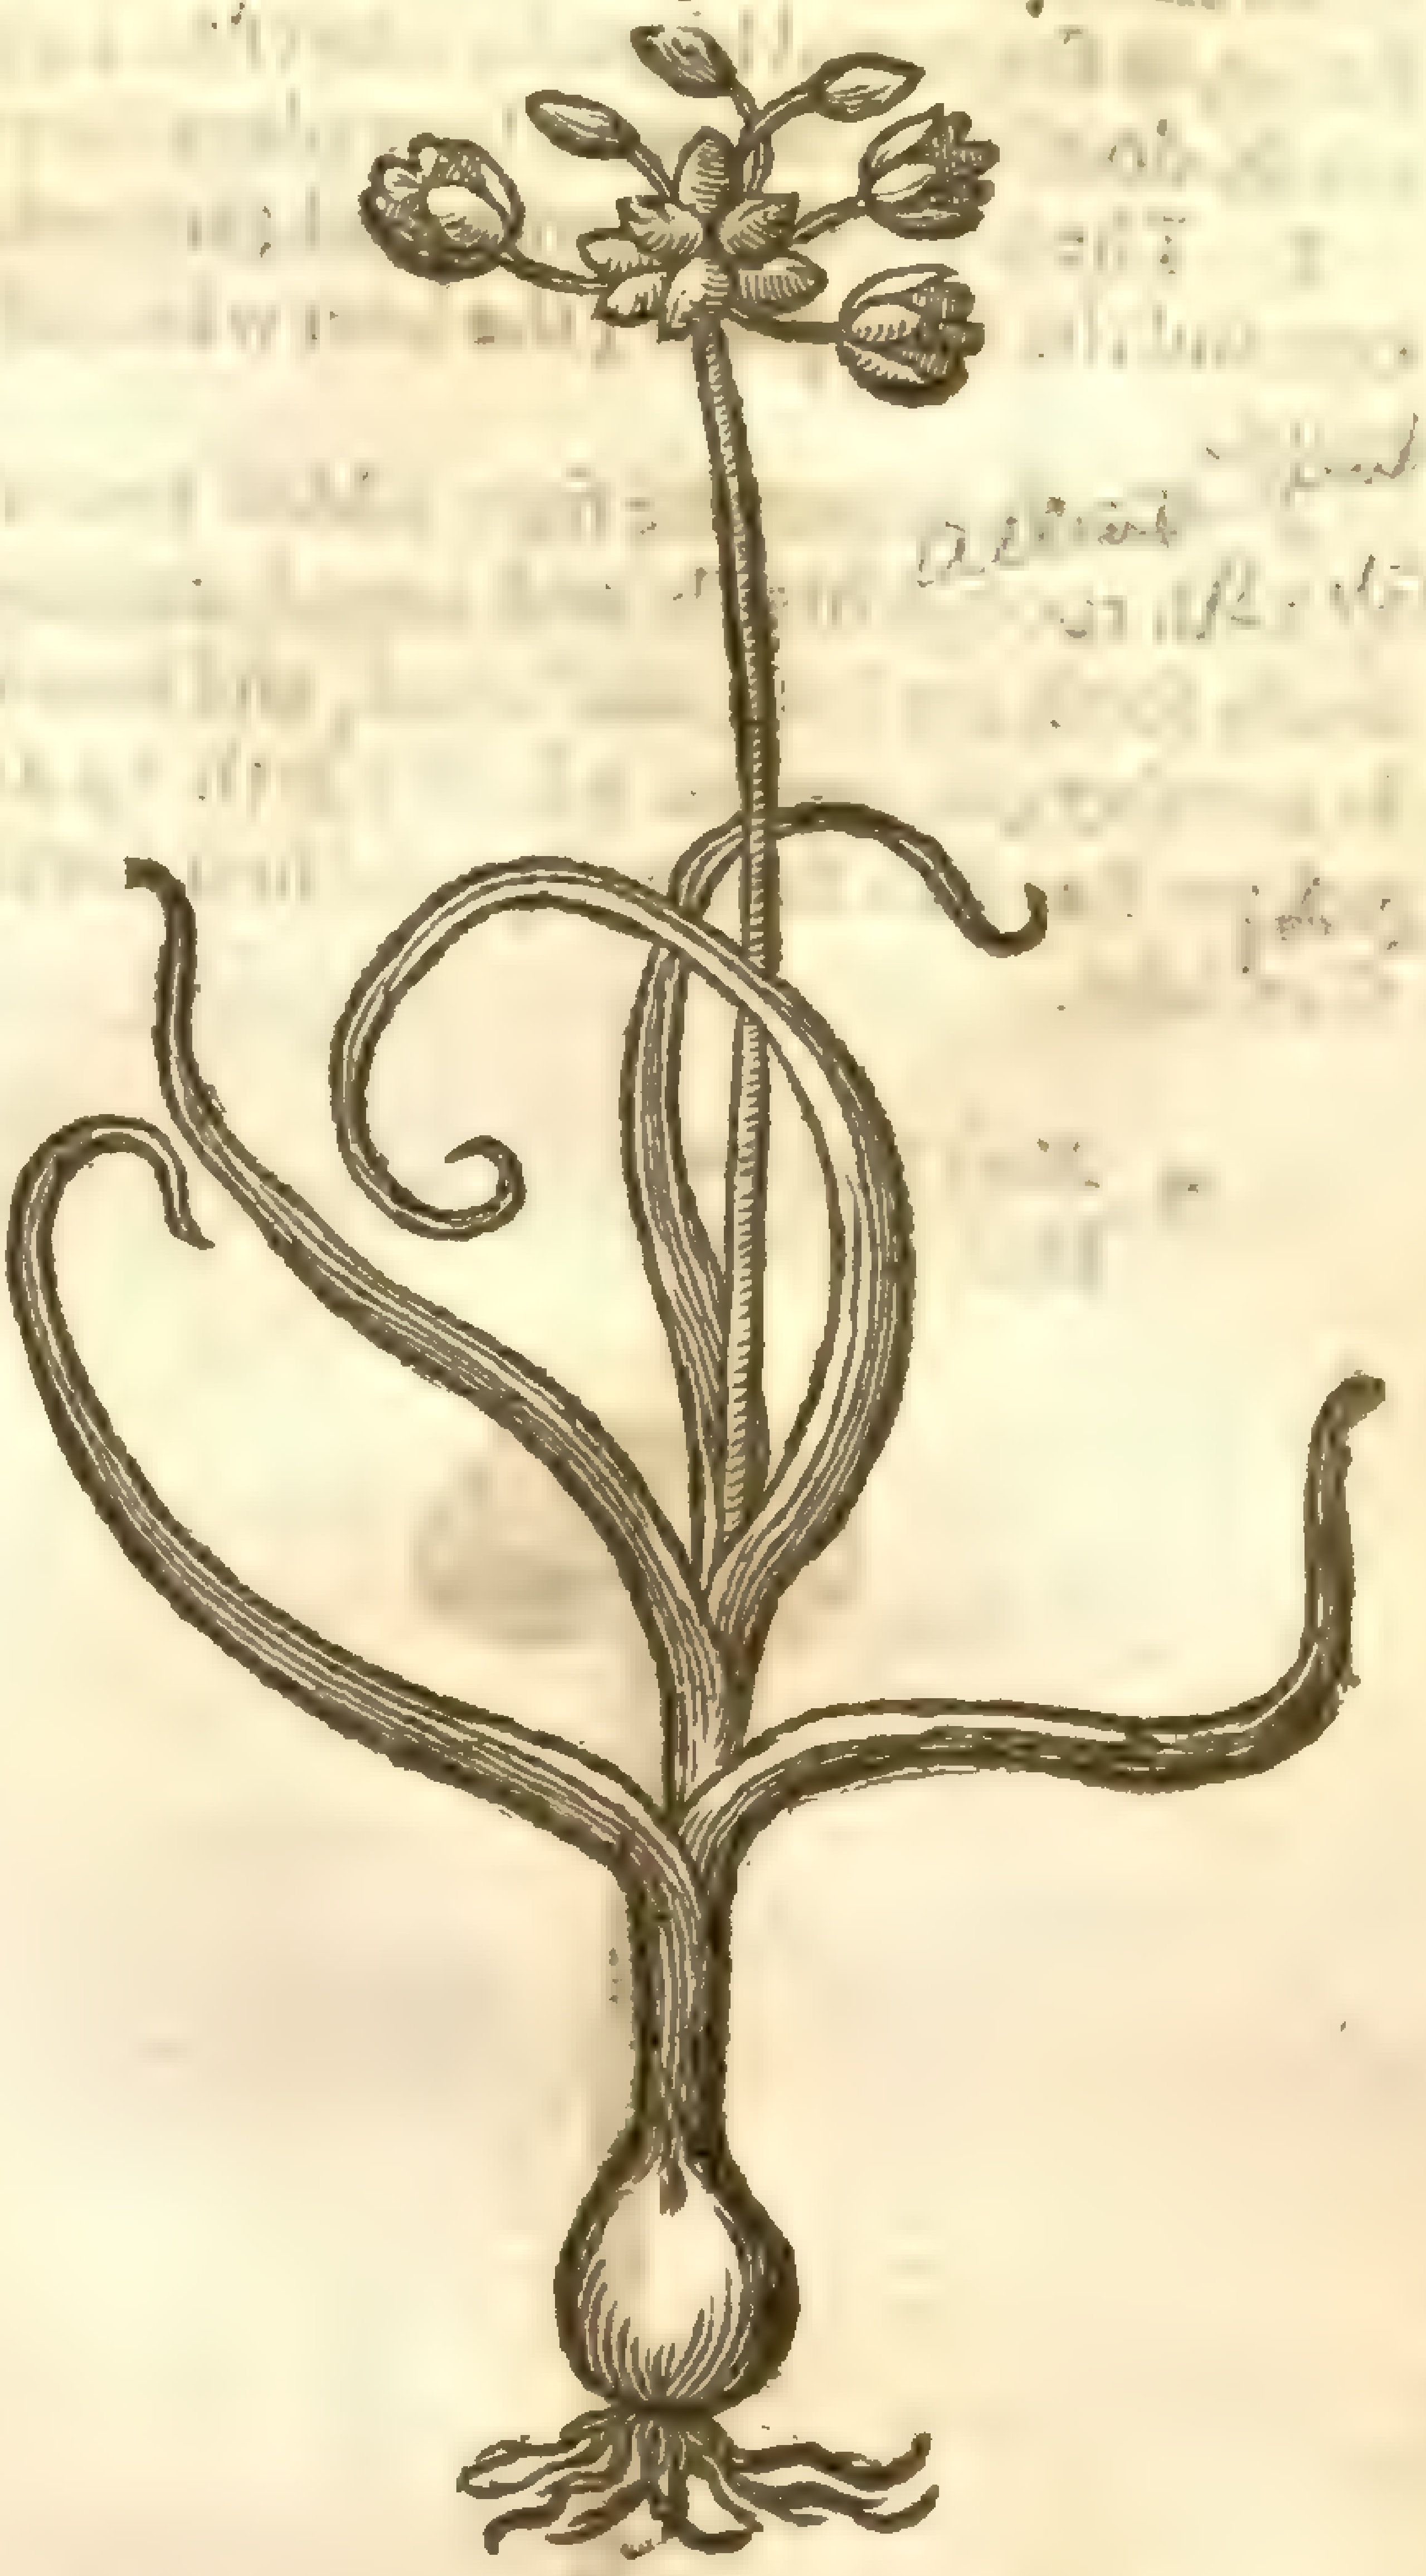
2 Serpents Moly hath likewiſe a ſmall bulbous root with ſome fibres faſtned to the bottom, from which riſe vp weake graſſie leaues of a ſhining greene colour, crookedly winding and turning themſelues towards the point like the taile of a Serpent, whereof it tooke his name: the ſtalke is tough, thicke, and full of juyce, at the top whereof ſtandeth a cluſter of ſmall red bulbes, like vnto the ſmalleſt cloue of Garlicke, before they be pilled from their skinne. And among thoſe bulbes there doe thruſt forth ſmall and weake foot-ſtalkes, euery one bearing at the end one ſmall white floure tending to a purple colour: which being paſt, the bulbes doe fall downe vpon the ground, where they without helpe do take hold and root, and thereby greatly encreaſe, as alſo by the infinite bulbes that the root doth caſt off: all the whole plant doth ſmell and taſte of Garlicke, whereof it is alſo a kinde.

3 *Homers* Moly hath very thicke leaues, broad toward the bottome, ſharpe at the point, and

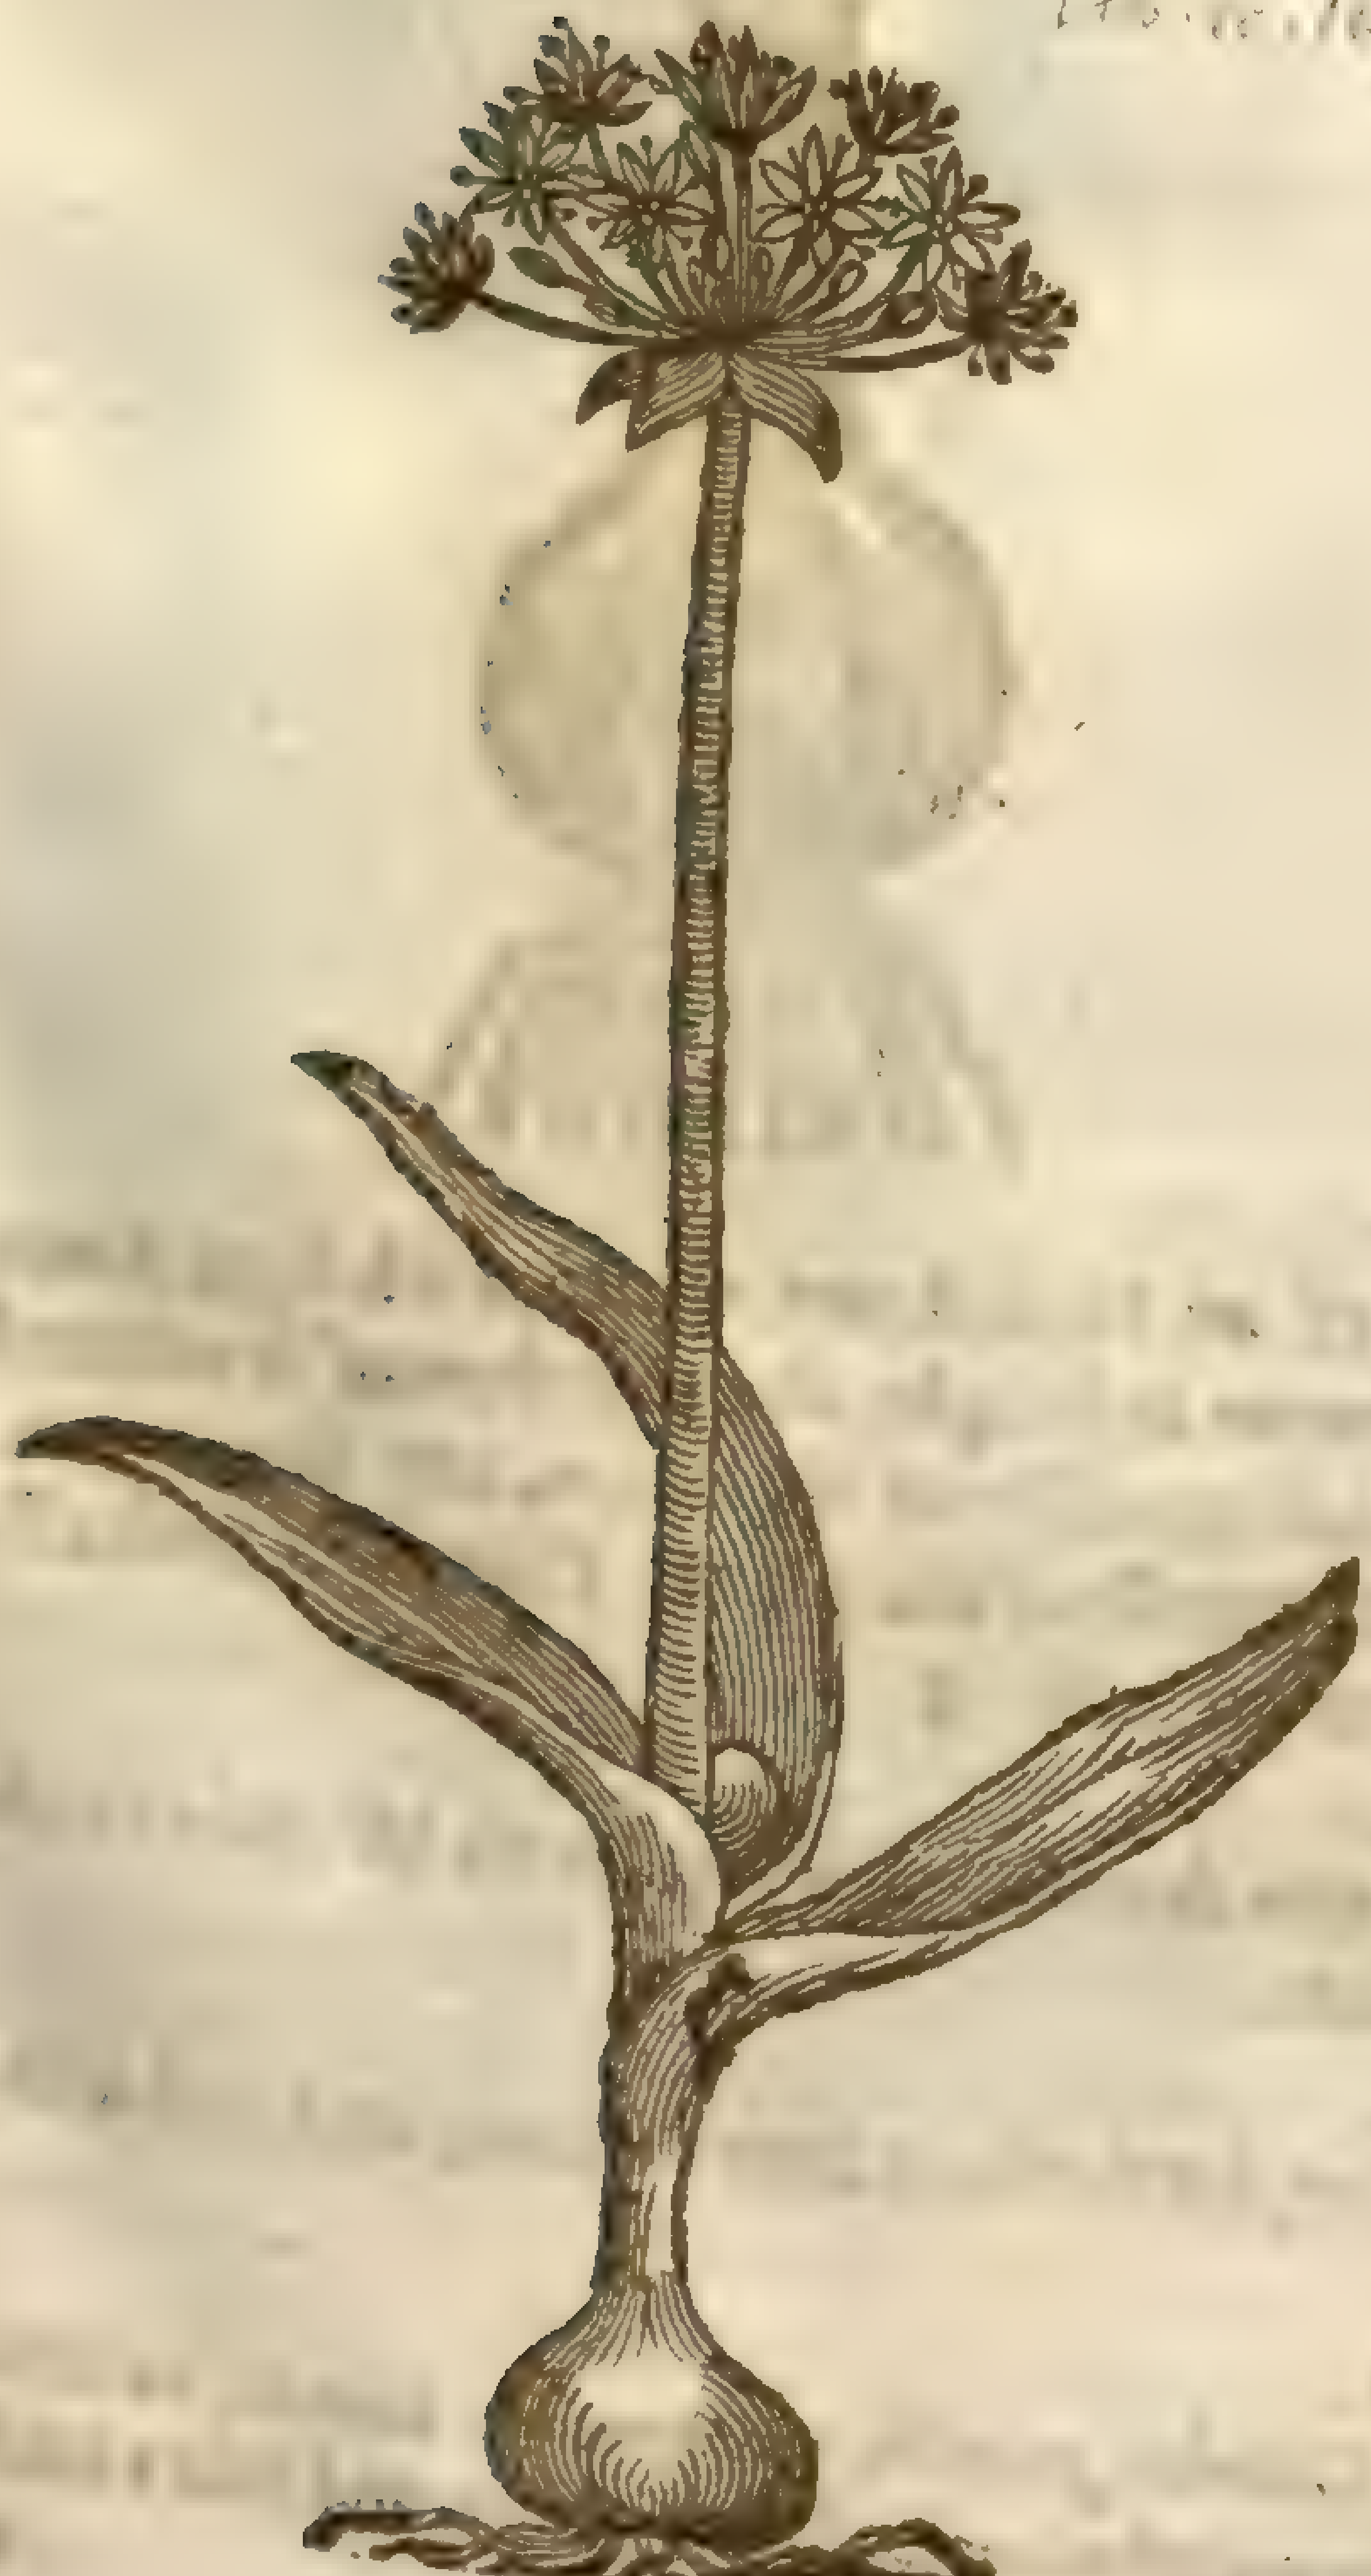
1 *Moly Dioſcorideum.*
Dioſcorides his Moly.



2 *Moly Serpentinum.*
Serpents Moly.



3 *Moly Homericum.*
Homers Moly.



hollowed like a trough or gutter, in the boſome of which leaues neere vnto the bottom commeth forth a certain round bulbe or ball of a gooſe turd greene colour: which being ripe and ſet in the ground, groweth and becommeth a faire plant ſuch as is the mother. Among thoſe leaues riſes vp a naked ſmooth thicke ſtalke two cubits high, as ſtrong as a ſmall walking ſtaffe: at the top of the ſtalke ſtandeth a bundle of faire whitiſh floures, daſhed ouer with a waſh of purple colour ſmelling like the floures of Onions. When they be ripe there appeareth a black ſeed wrapped in a white skin or huske. The root is great and bulbous, couered with a blackiſh skin on the out ſide, and white within, and of the bigneſſe of a great onion.

4 Indian Moly hath very thick fat ſhort leaues, ſharp pointed, in the boſome whereof commeth forth a thicke knobby bulbe like that of *Homers* Moly. The ſtalke is alſo like the precedent, bearing at the top a cluſter of ſcaly bulbs, included in a large thin skin or filme. The root is great, bulbous faſhion, and full of juice.

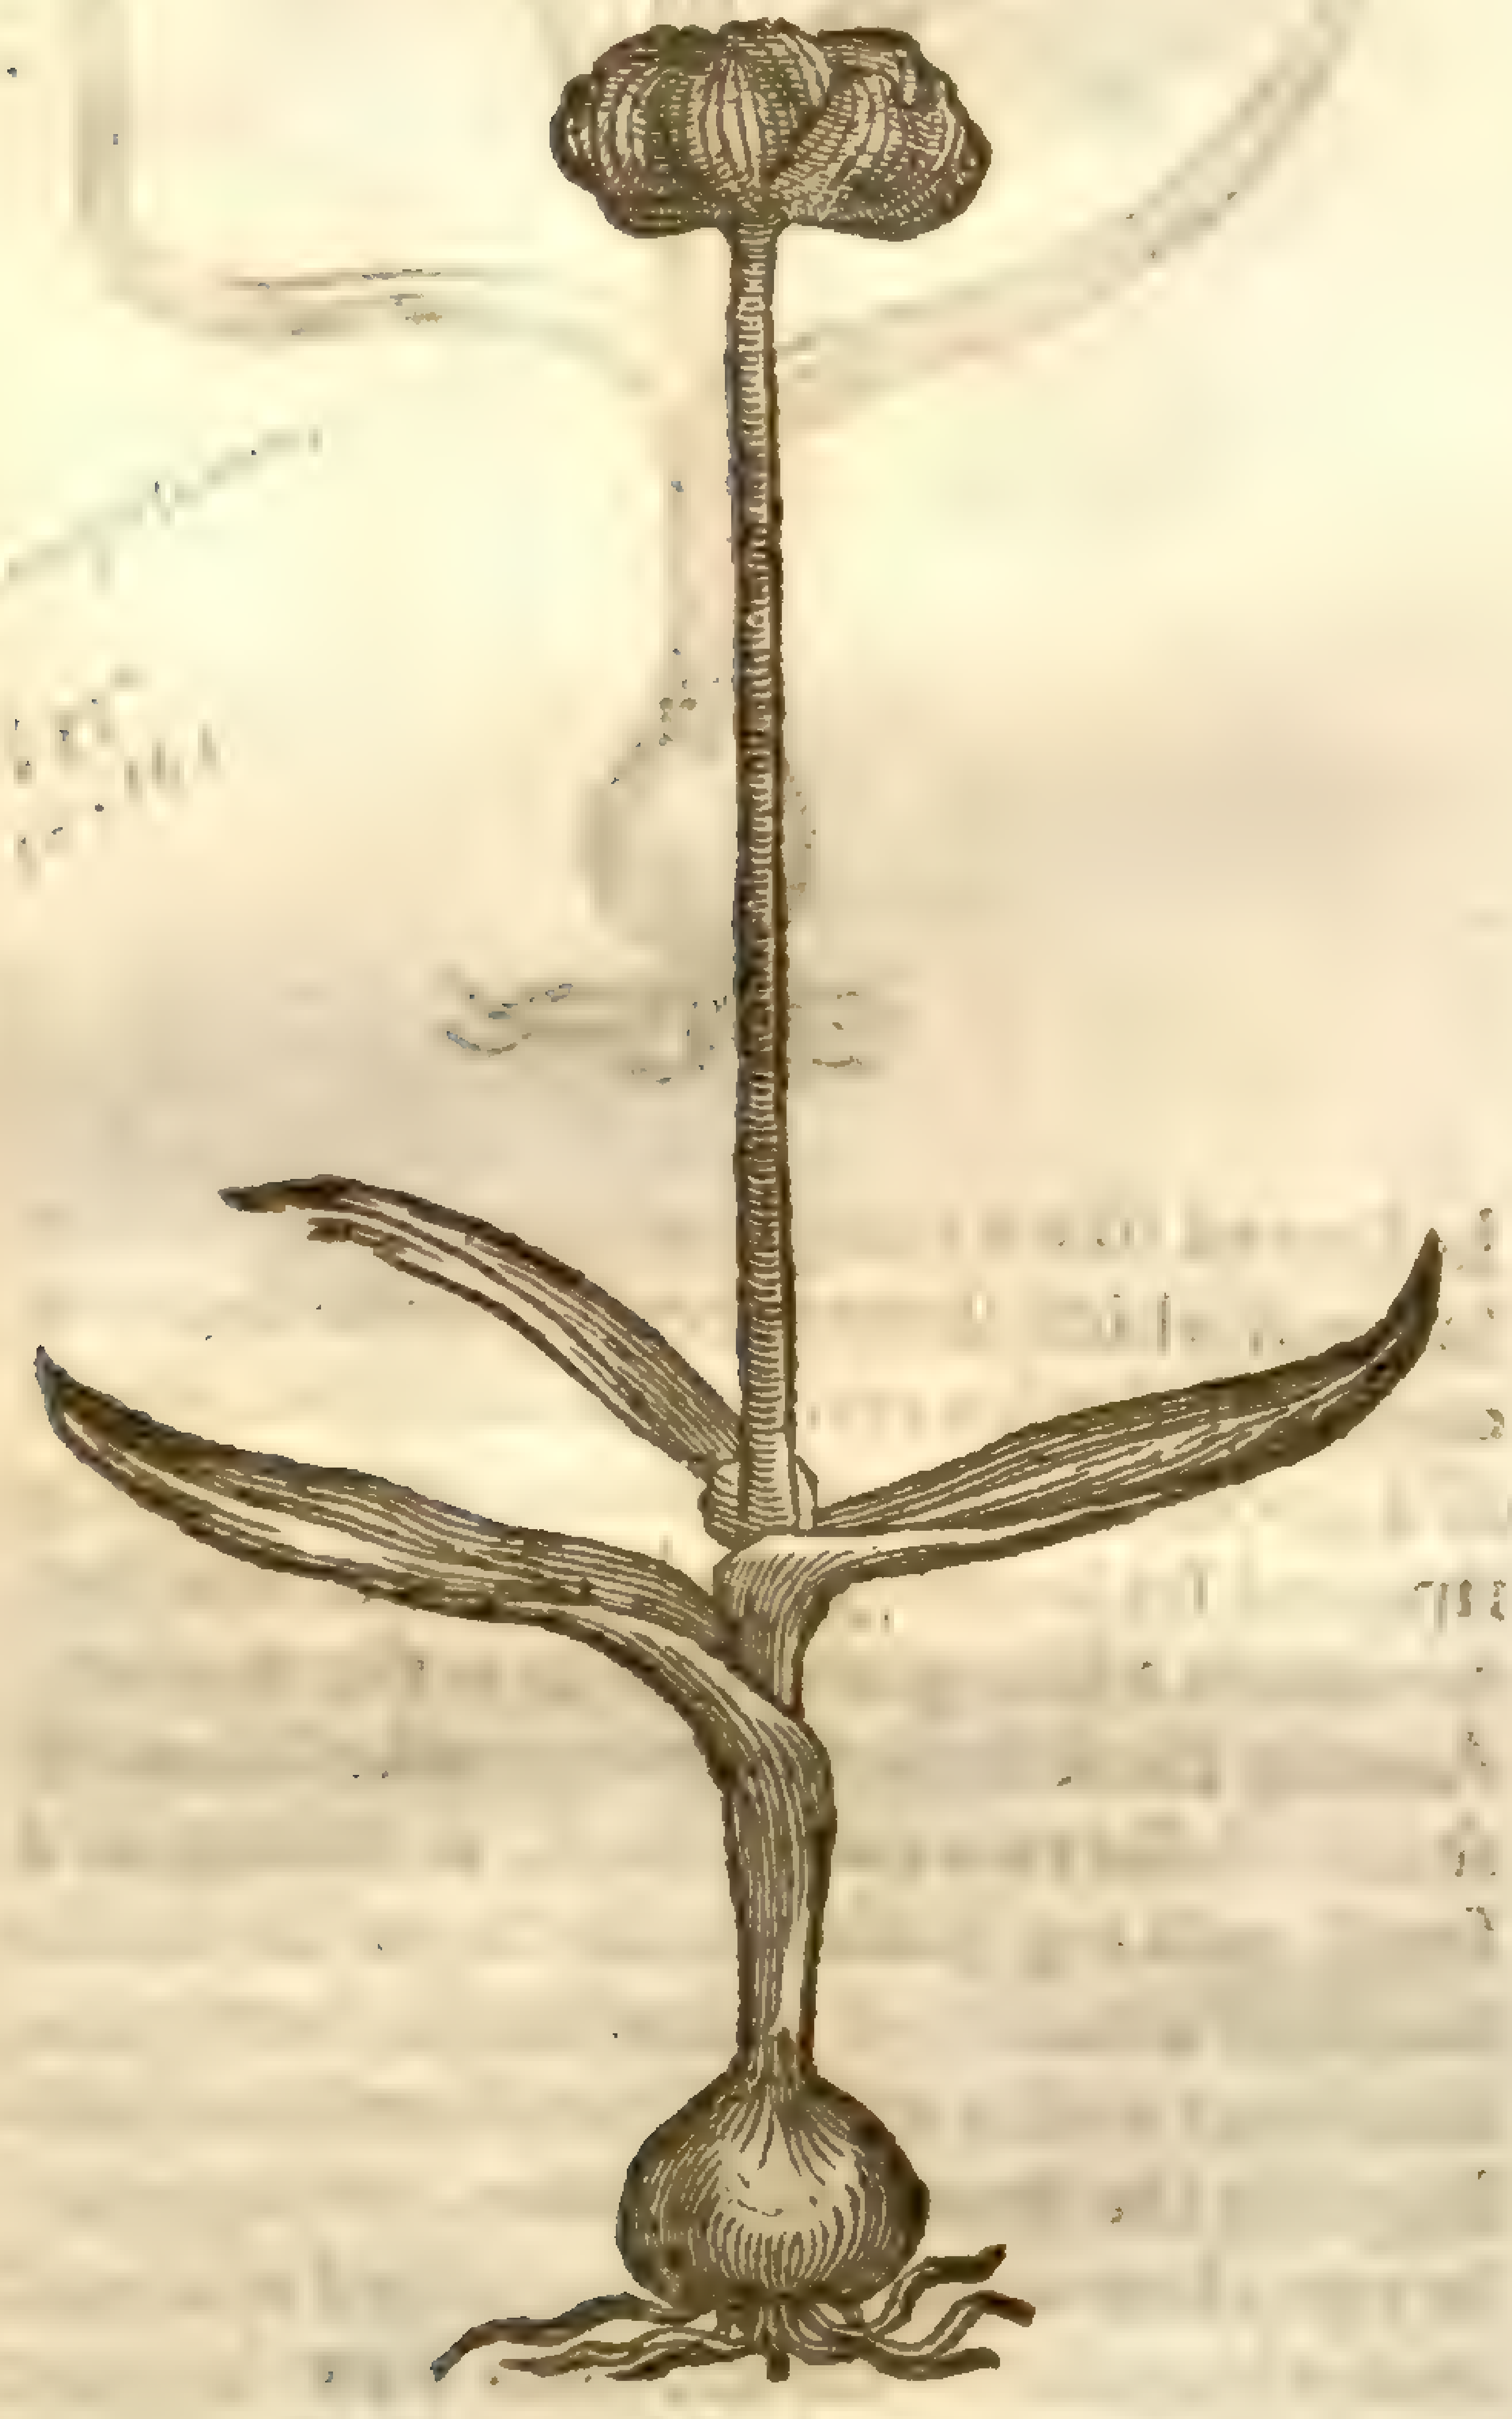
5 *Caucaſon*, or withering Moly, hath a very great bulbous root greater than that of *Homers* Moly, and fuller of a ſlimie juice; from which do ariſe three or foure great thick and broad leaues withered alwaies at the point;

wherein conſiſteth the difference betweene theſe leaues and thoſe of *Homers* Moly, which are not ſo. In the middle of the leaues riſeth vp a bunch of ſmooth greeniſh bulbes ſet vpon a tender footſtalke, in ſhape and bigneſſe like vnto a great garden Worme, which being ripe and planted in the earth, do alſo grow vnto a faire plant like vnto their mother.

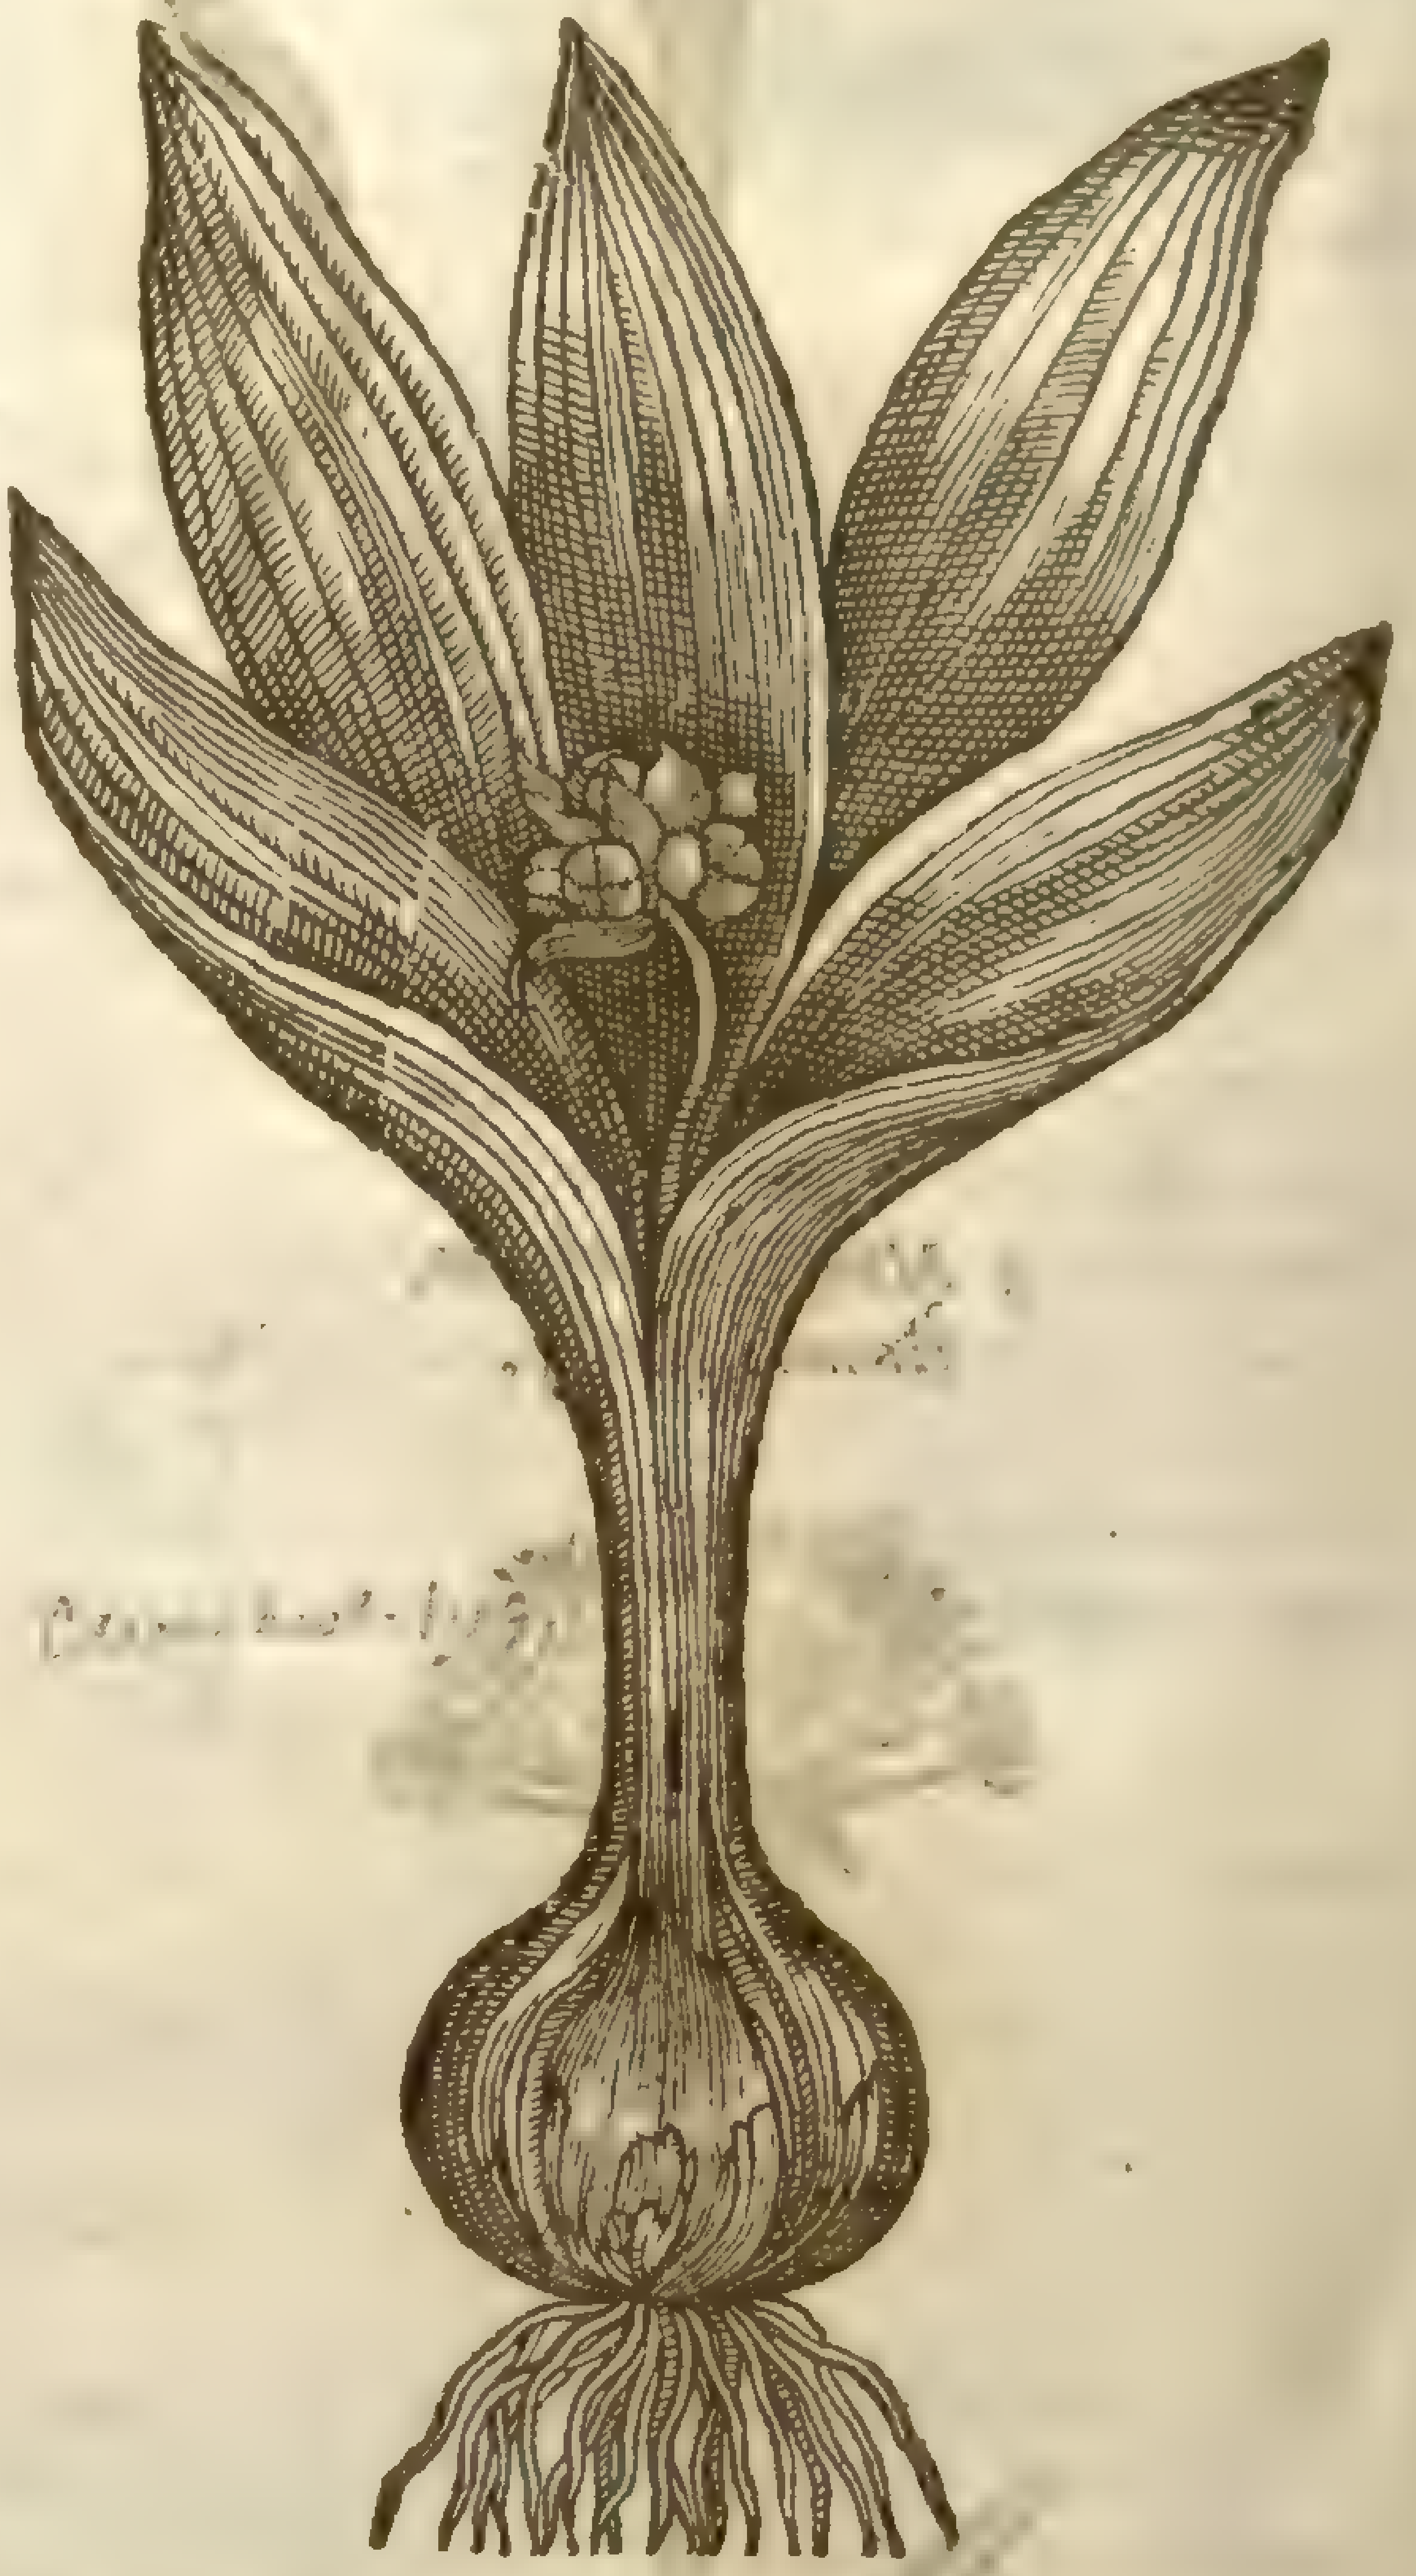
‡ Theſe two laſt mentioned (according to *Bauhine*, and I thinke the truth) are but figures of one and the ſame plant; the later whereof is the better, and more agreeing to the growing of the plant.

6 To theſe may be fitly added two other Molyes: the firſt of theſe which is the yellow Moly, hath roots whitiſh and round, commonly two of them growing together; the leaues which it ſends forth are long and broad, and ſomwhat reſemble thoſe of the Tulip, and vſually are but two in number; betweene which riſeth vp a ſtalke a foot high, bearing at the top an vmbell of faire yellow ſtar-like floures tipt on their lower ſides with a little greene. The whole plant ſmelleth of Garlicke.

4 *Moly Indicum.*
Indian Moly.



5 *Caucaſon.*
Withering Moly.



7 This little Moly hath a root about the bigneſſe of an Haſell nut, white, with ſome fibres hanging thereat; the ſtalke is of an handfull or little more in height, the top thereof is adorned with an vmbel of ten or twelue white floures, each of which conſiſts of ſix leaues, not ſharpe pointed, but turned round, and pretty large, conſidering the bigneſſe of the plant. This plant hath alſo vſually but two leaues, but thoſe like thoſe of Leekes but far leſſe. ‡

¶ *The Place.*

† Theſe plants grow in the garden of Mr *Iohn Parkinſon* Apothecarie, and with Mr *Iohn Tradeſcant* and ſome others, ſtudious in the knowledge of plants.

¶ *The Time.*

They ſpring forth of the ground in February, and bring forth their floures, fruit, and ſeed in the end of Auguſt.

¶ *The Names.*

† Some haue deriued the name *Moly* from the Greeke words, Μωλύειν τὰς νόσους: that is, to driue away diſeaſes. It may probably be argued to belong to a certaine bulbous plant, and that a kinde

of Garlicke, by the words Μώλυζα and Μώλυξ. The former, *Galen* in his *Lexicon* of ſome of the more difficult words vſed by *Hippocrates*, thus expounds: Σκόροδον ἁπλῆν τ̃ κεφαλὴν ἔχον, ἢ μὴ διαλυομένην εἰς ἀγλίθας. τινὲς δὲ τὸ μῶλυ. That is, *Molyza* is a Garlicke hauing a ſimple or ſingle head, and not to be parted or diſtinguiſhed into cloues. Some terme it *Moly*: *Erotianus* in his *Lexicon* expounds it thus: Μώλυξ (ſaith hee) [illegible] &c. That is, *Molyx* is a head of garlick round, and not to be parted into cloues. ‡

¶ *The Names in particular.*

‡ 1 This is called *Moly* by *Matthiolus*: *Moly Anguſtifolium* by *Dodonæus*; *Moly Dioſcorideum*, by *Lobel* and *Clusius*.

2 This, *Moly Serpentinum vocatum*, by *Lobel* and the Author of the *Hiſt. Lugd.*

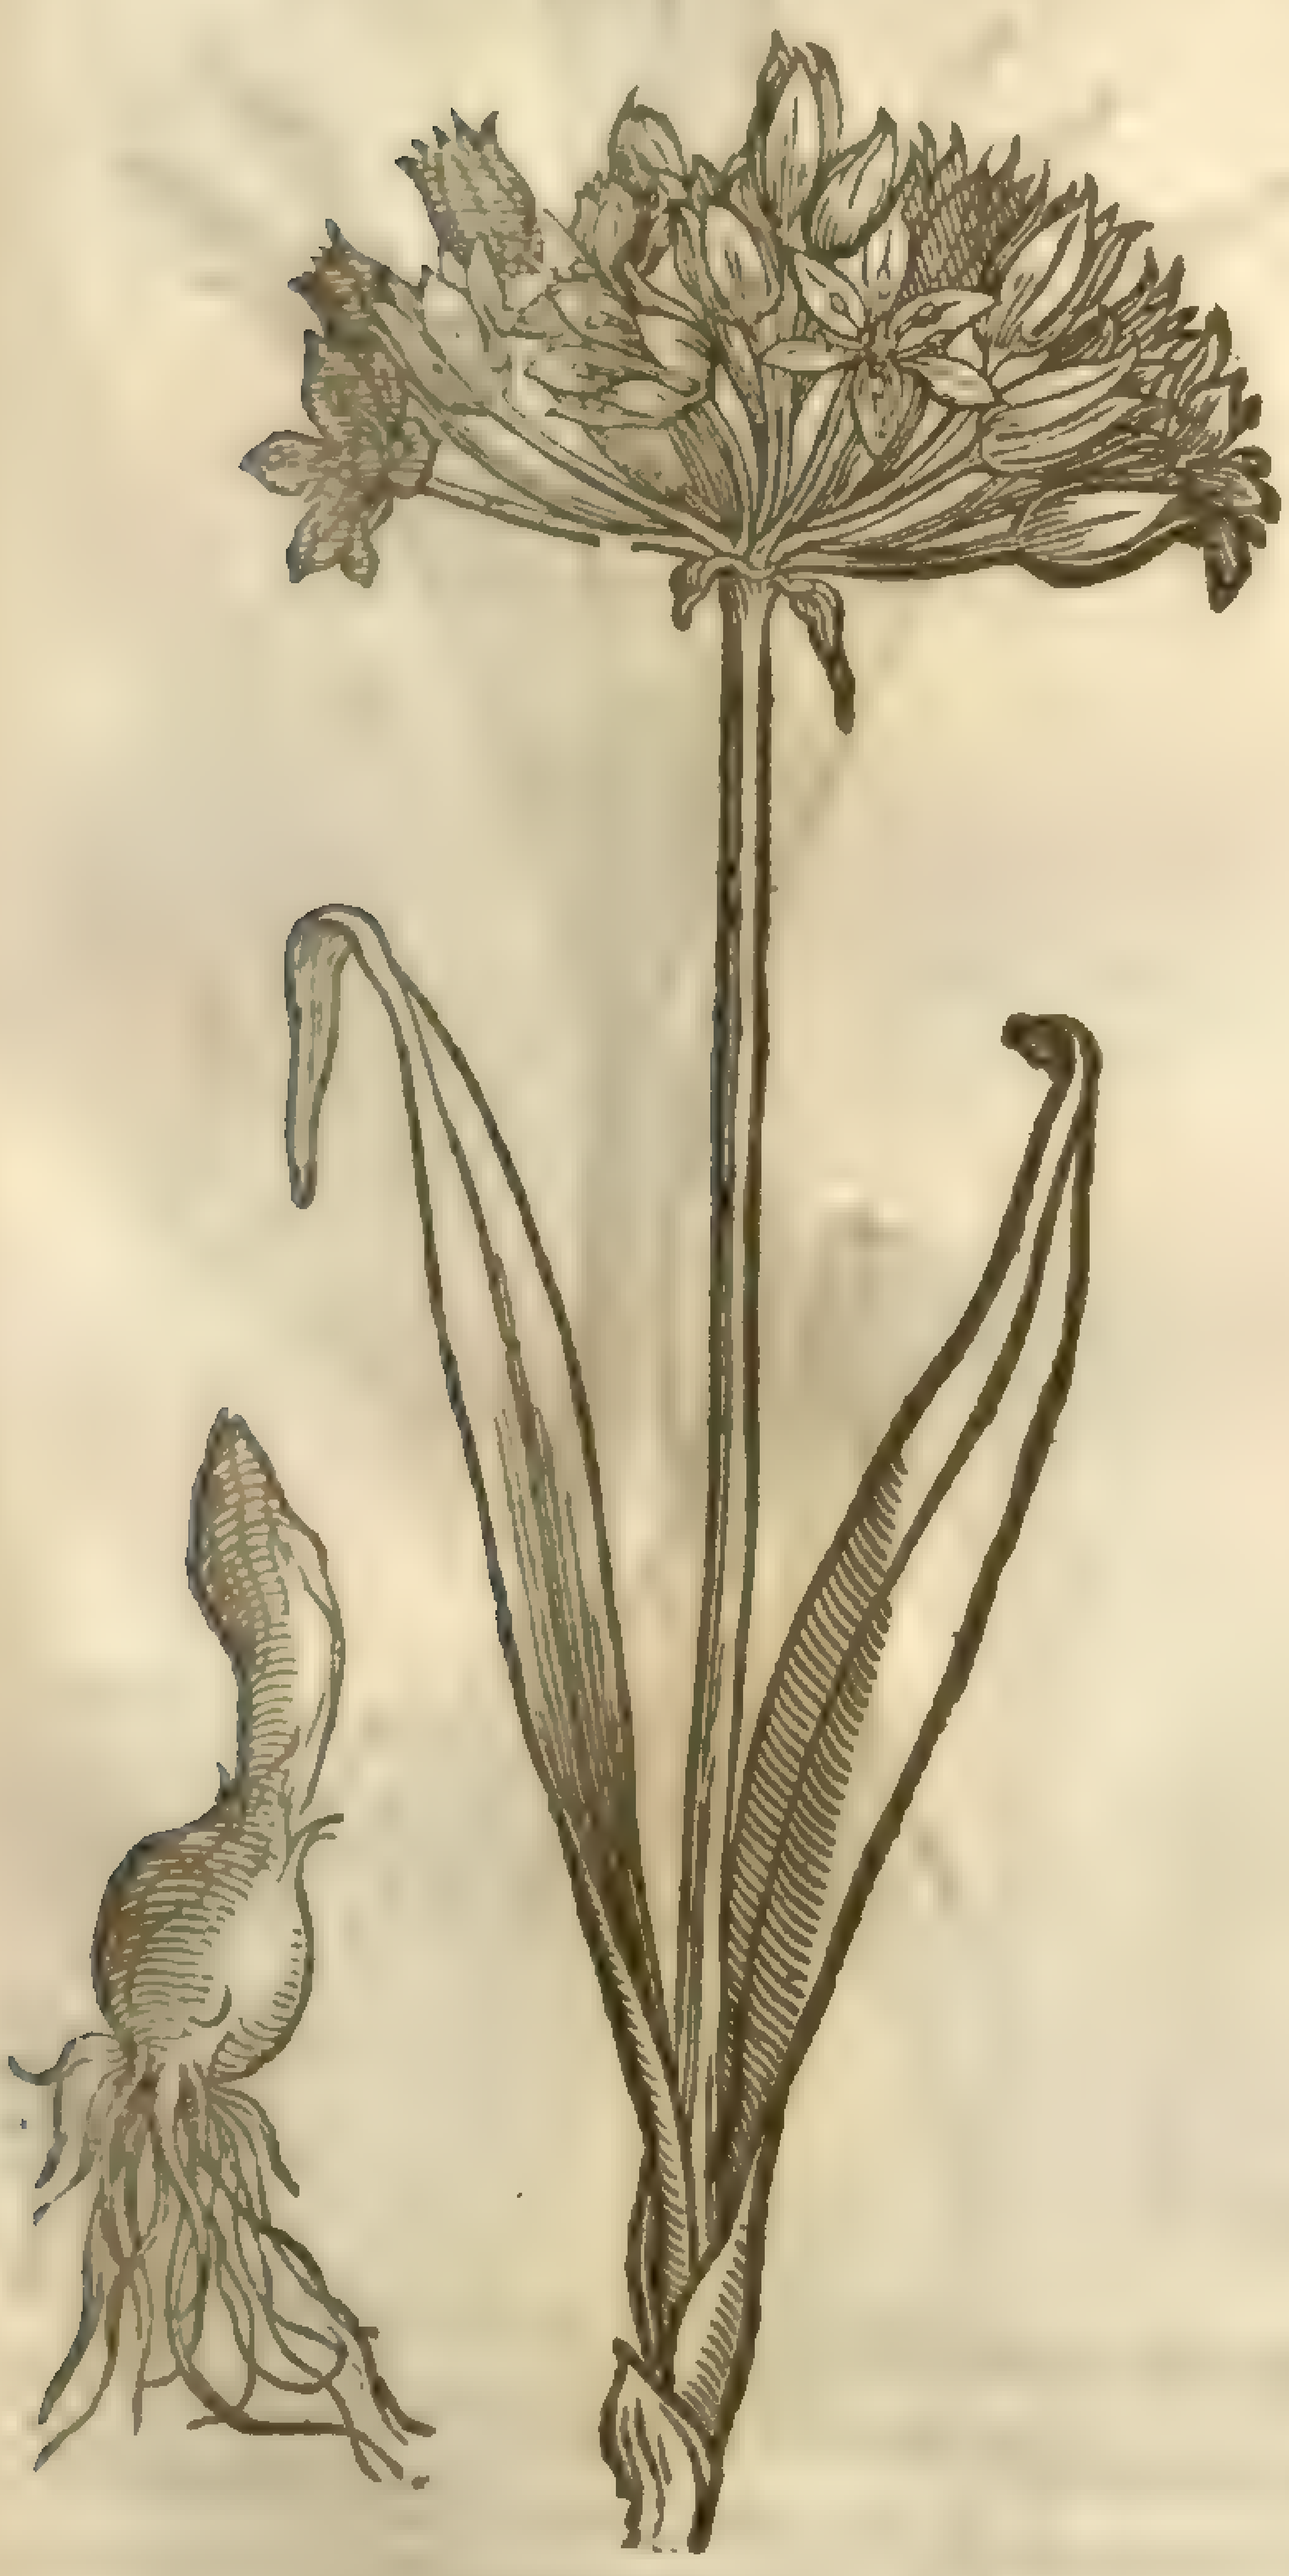
3 This ſame is thought to be the *Moly* of *Theophraſtus* and *Pliny*, by *Dodonæus*, *Cluſius*, &c. and ſome alſo would haue it to be that of *Homer* mentioned in the twentieth *Odyſſ.* *Lobel* calls it *Moly Liliflorum*.

4. 5 The fourth and fifth being one, are called *Caucaſon*, and *Moly Indicum*, by *Lobel*, *Cluſius*, and others.

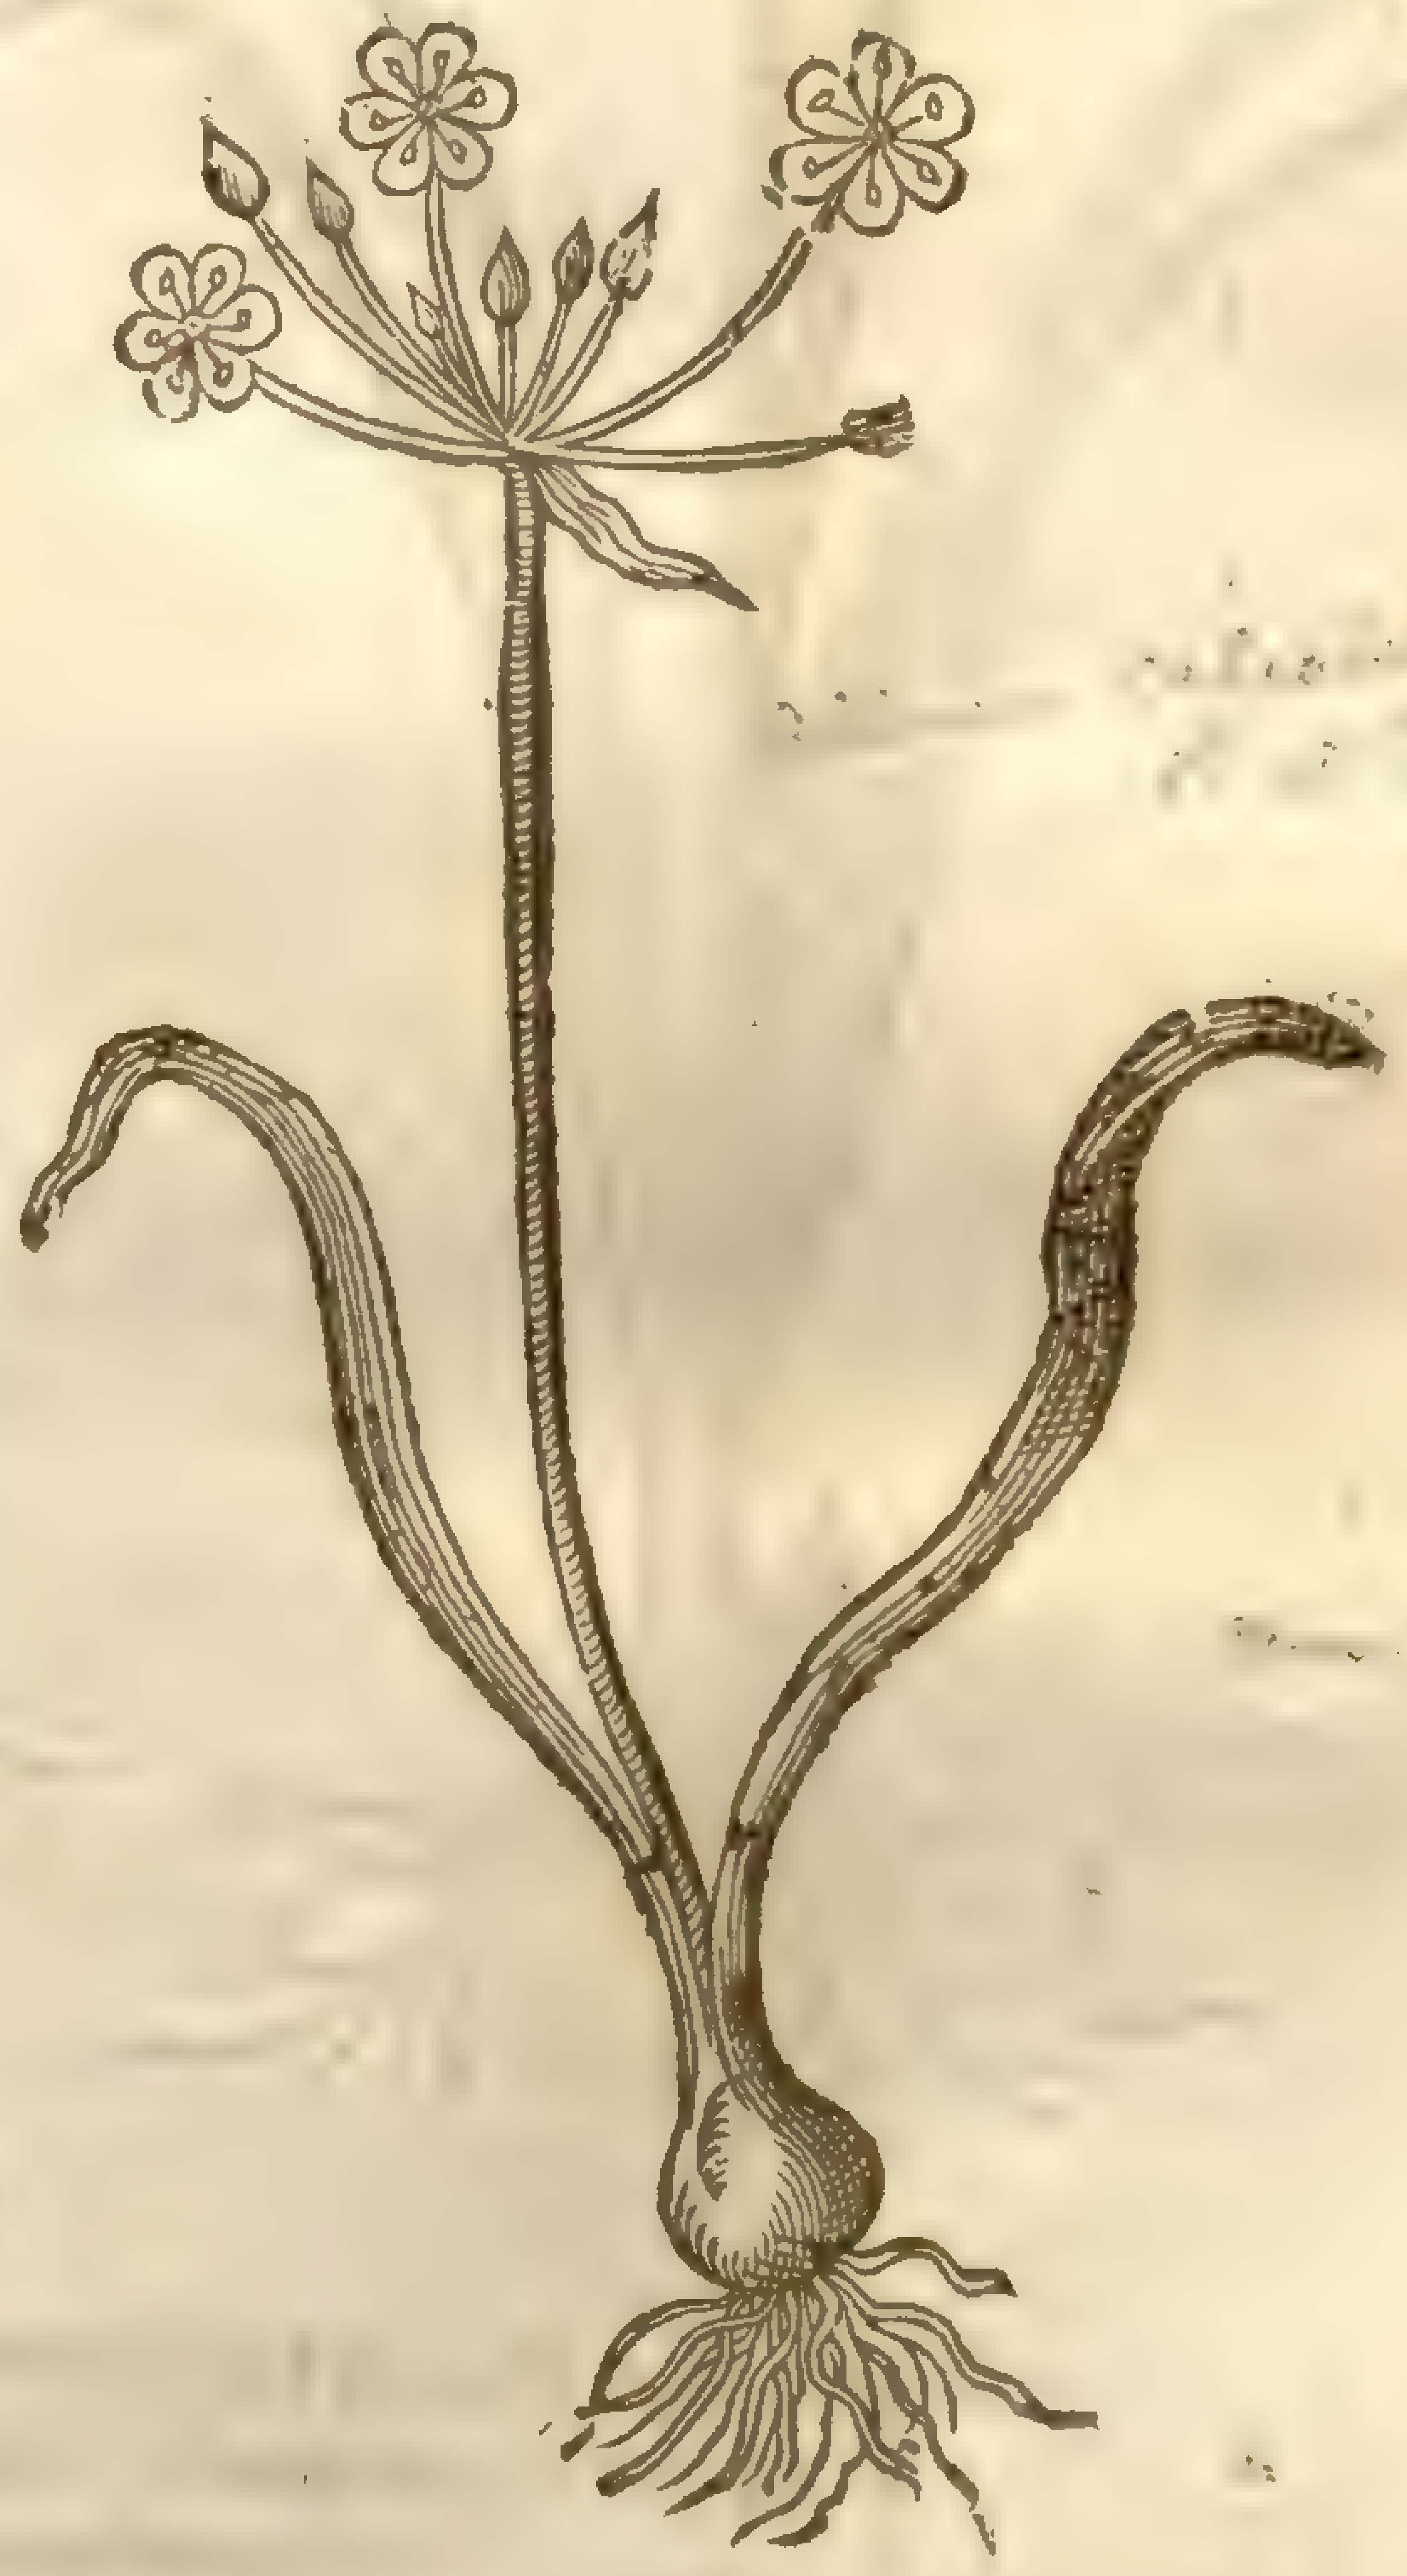
6 This is *Moly montanum latifolium flavo flore* of *Cluſius*, and *Moly luteum* of *Lobel*, *Aduerſ. par. 2.*

7 This ſame is *Moly minus* of *Cluſius*. ‡

‡ 6 *Moly latifolium flore flauo.*
Broad leaued Moly with the yellow floure.



‡ 7 *Moly minus flore albo.*
Dwarfe white floured Moly.

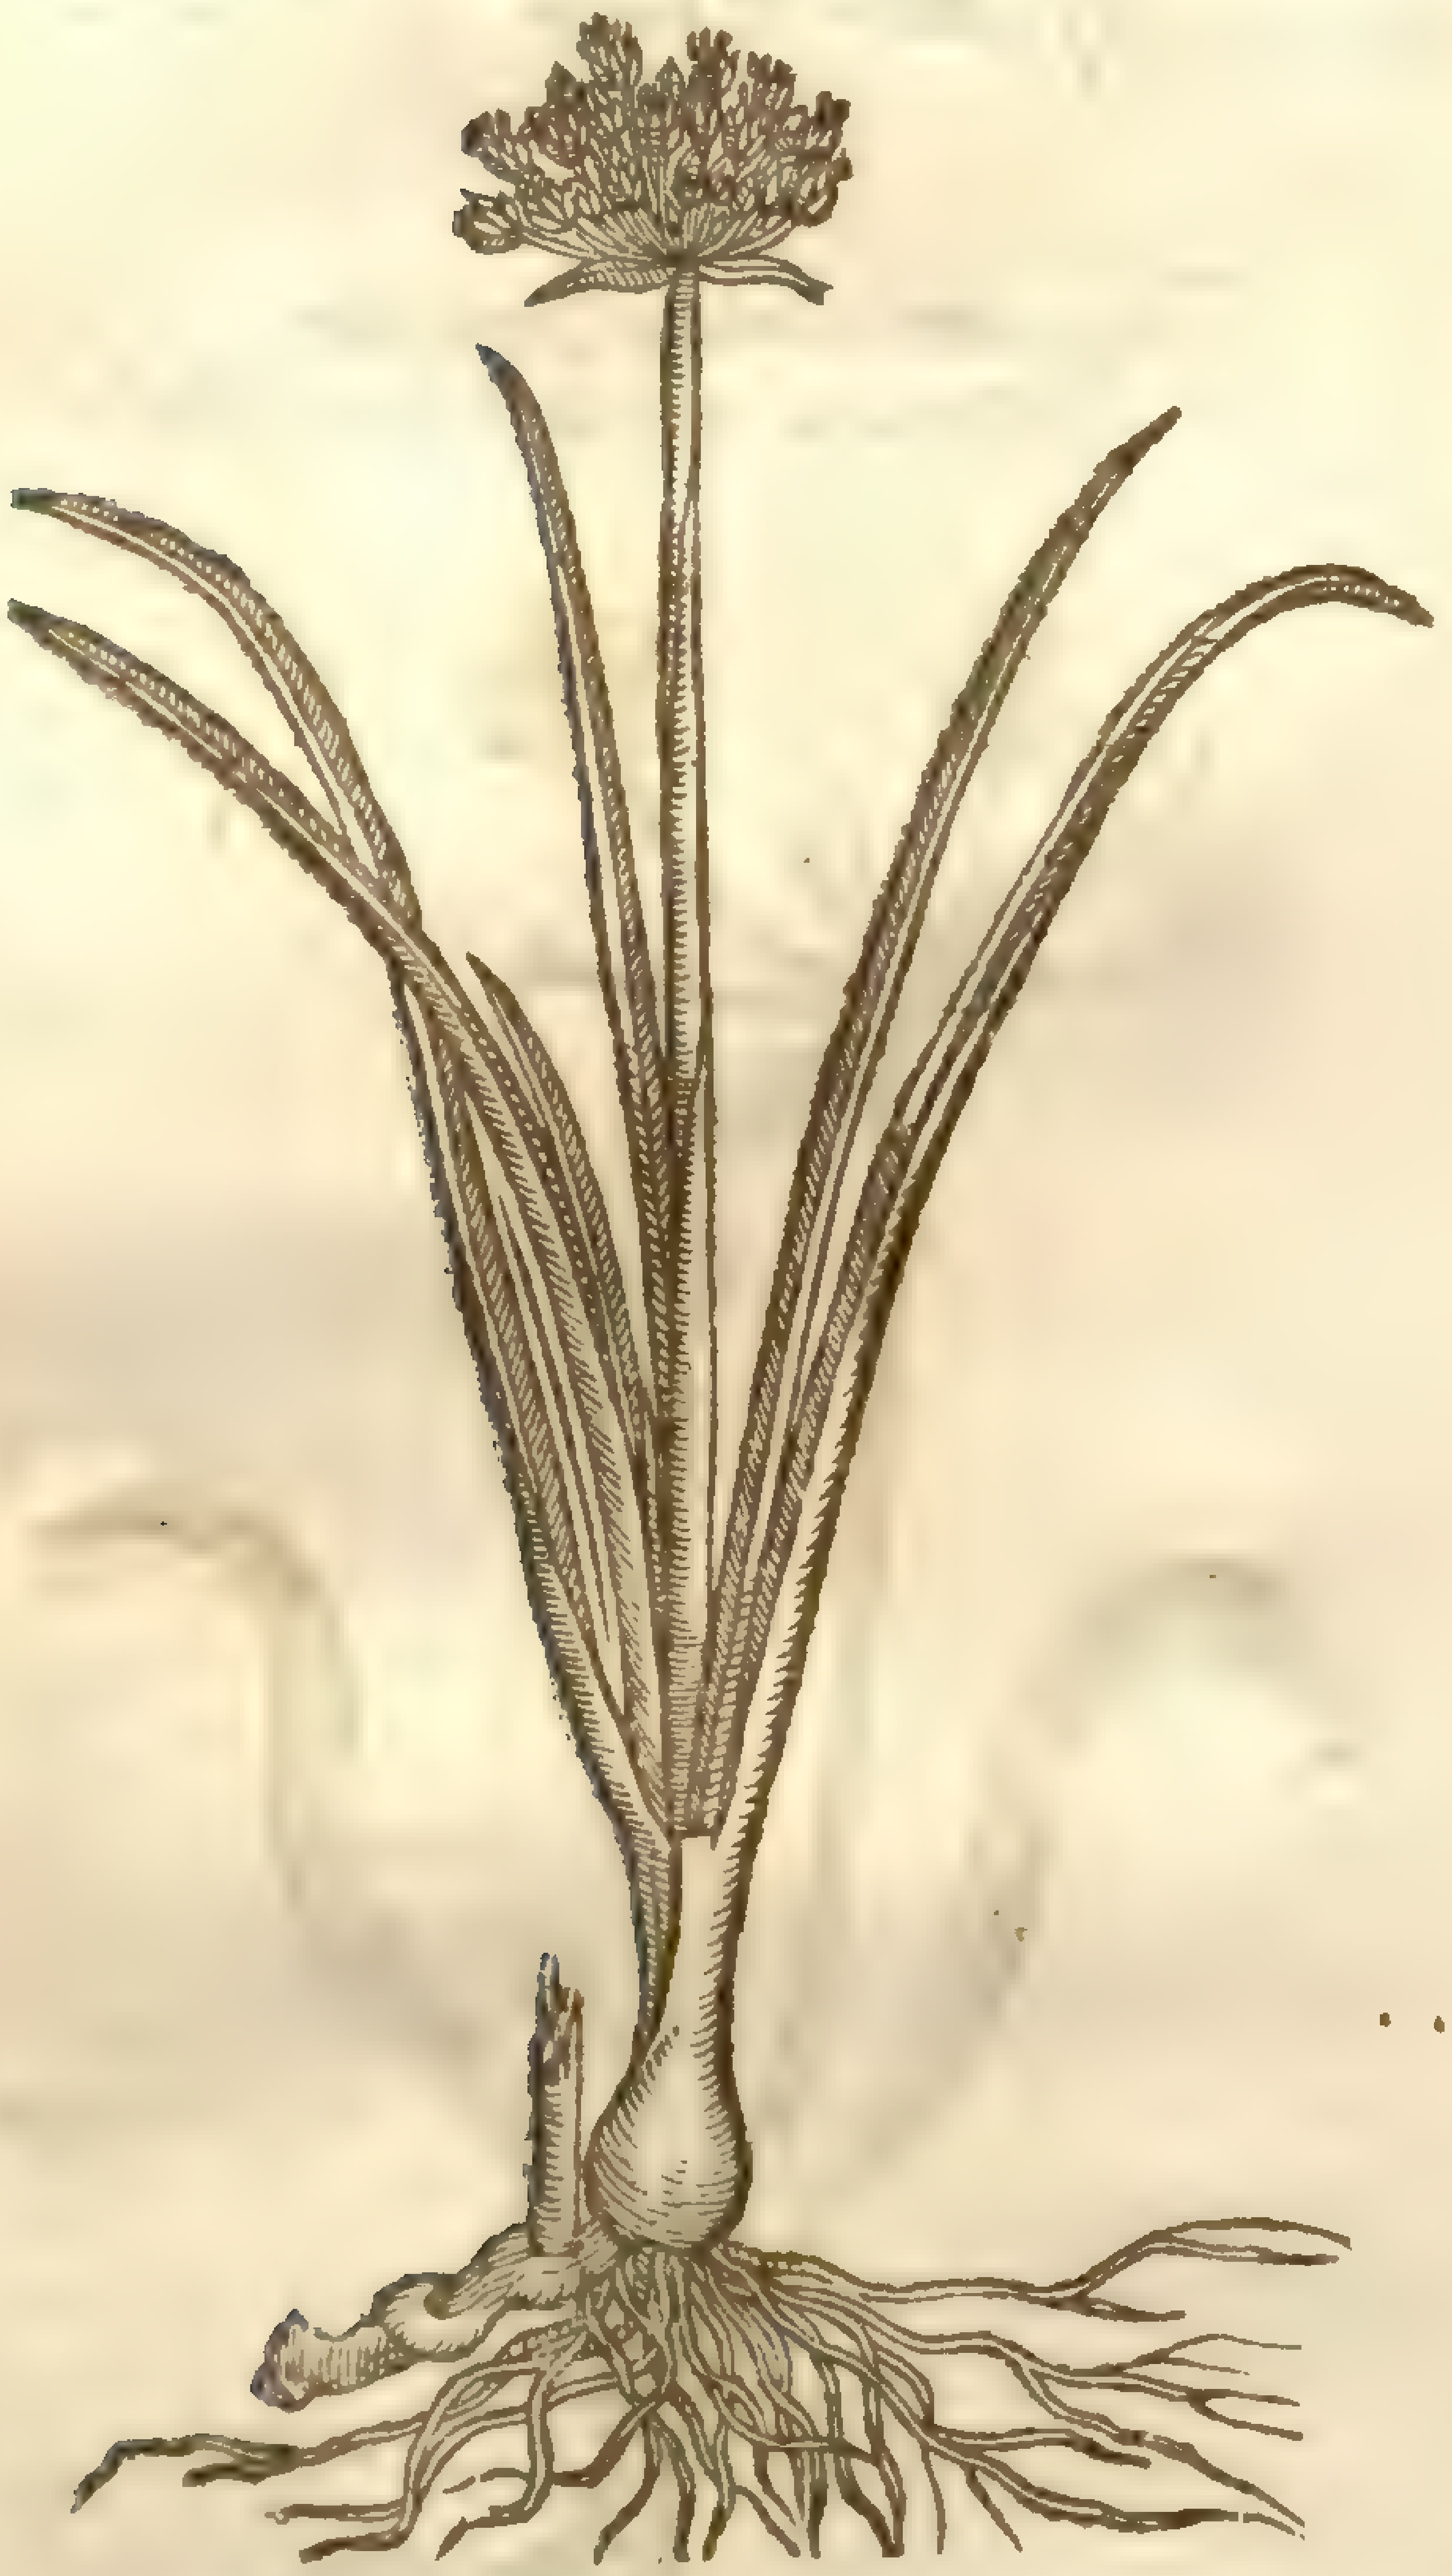


¶ *The Temperature and Vertues.*

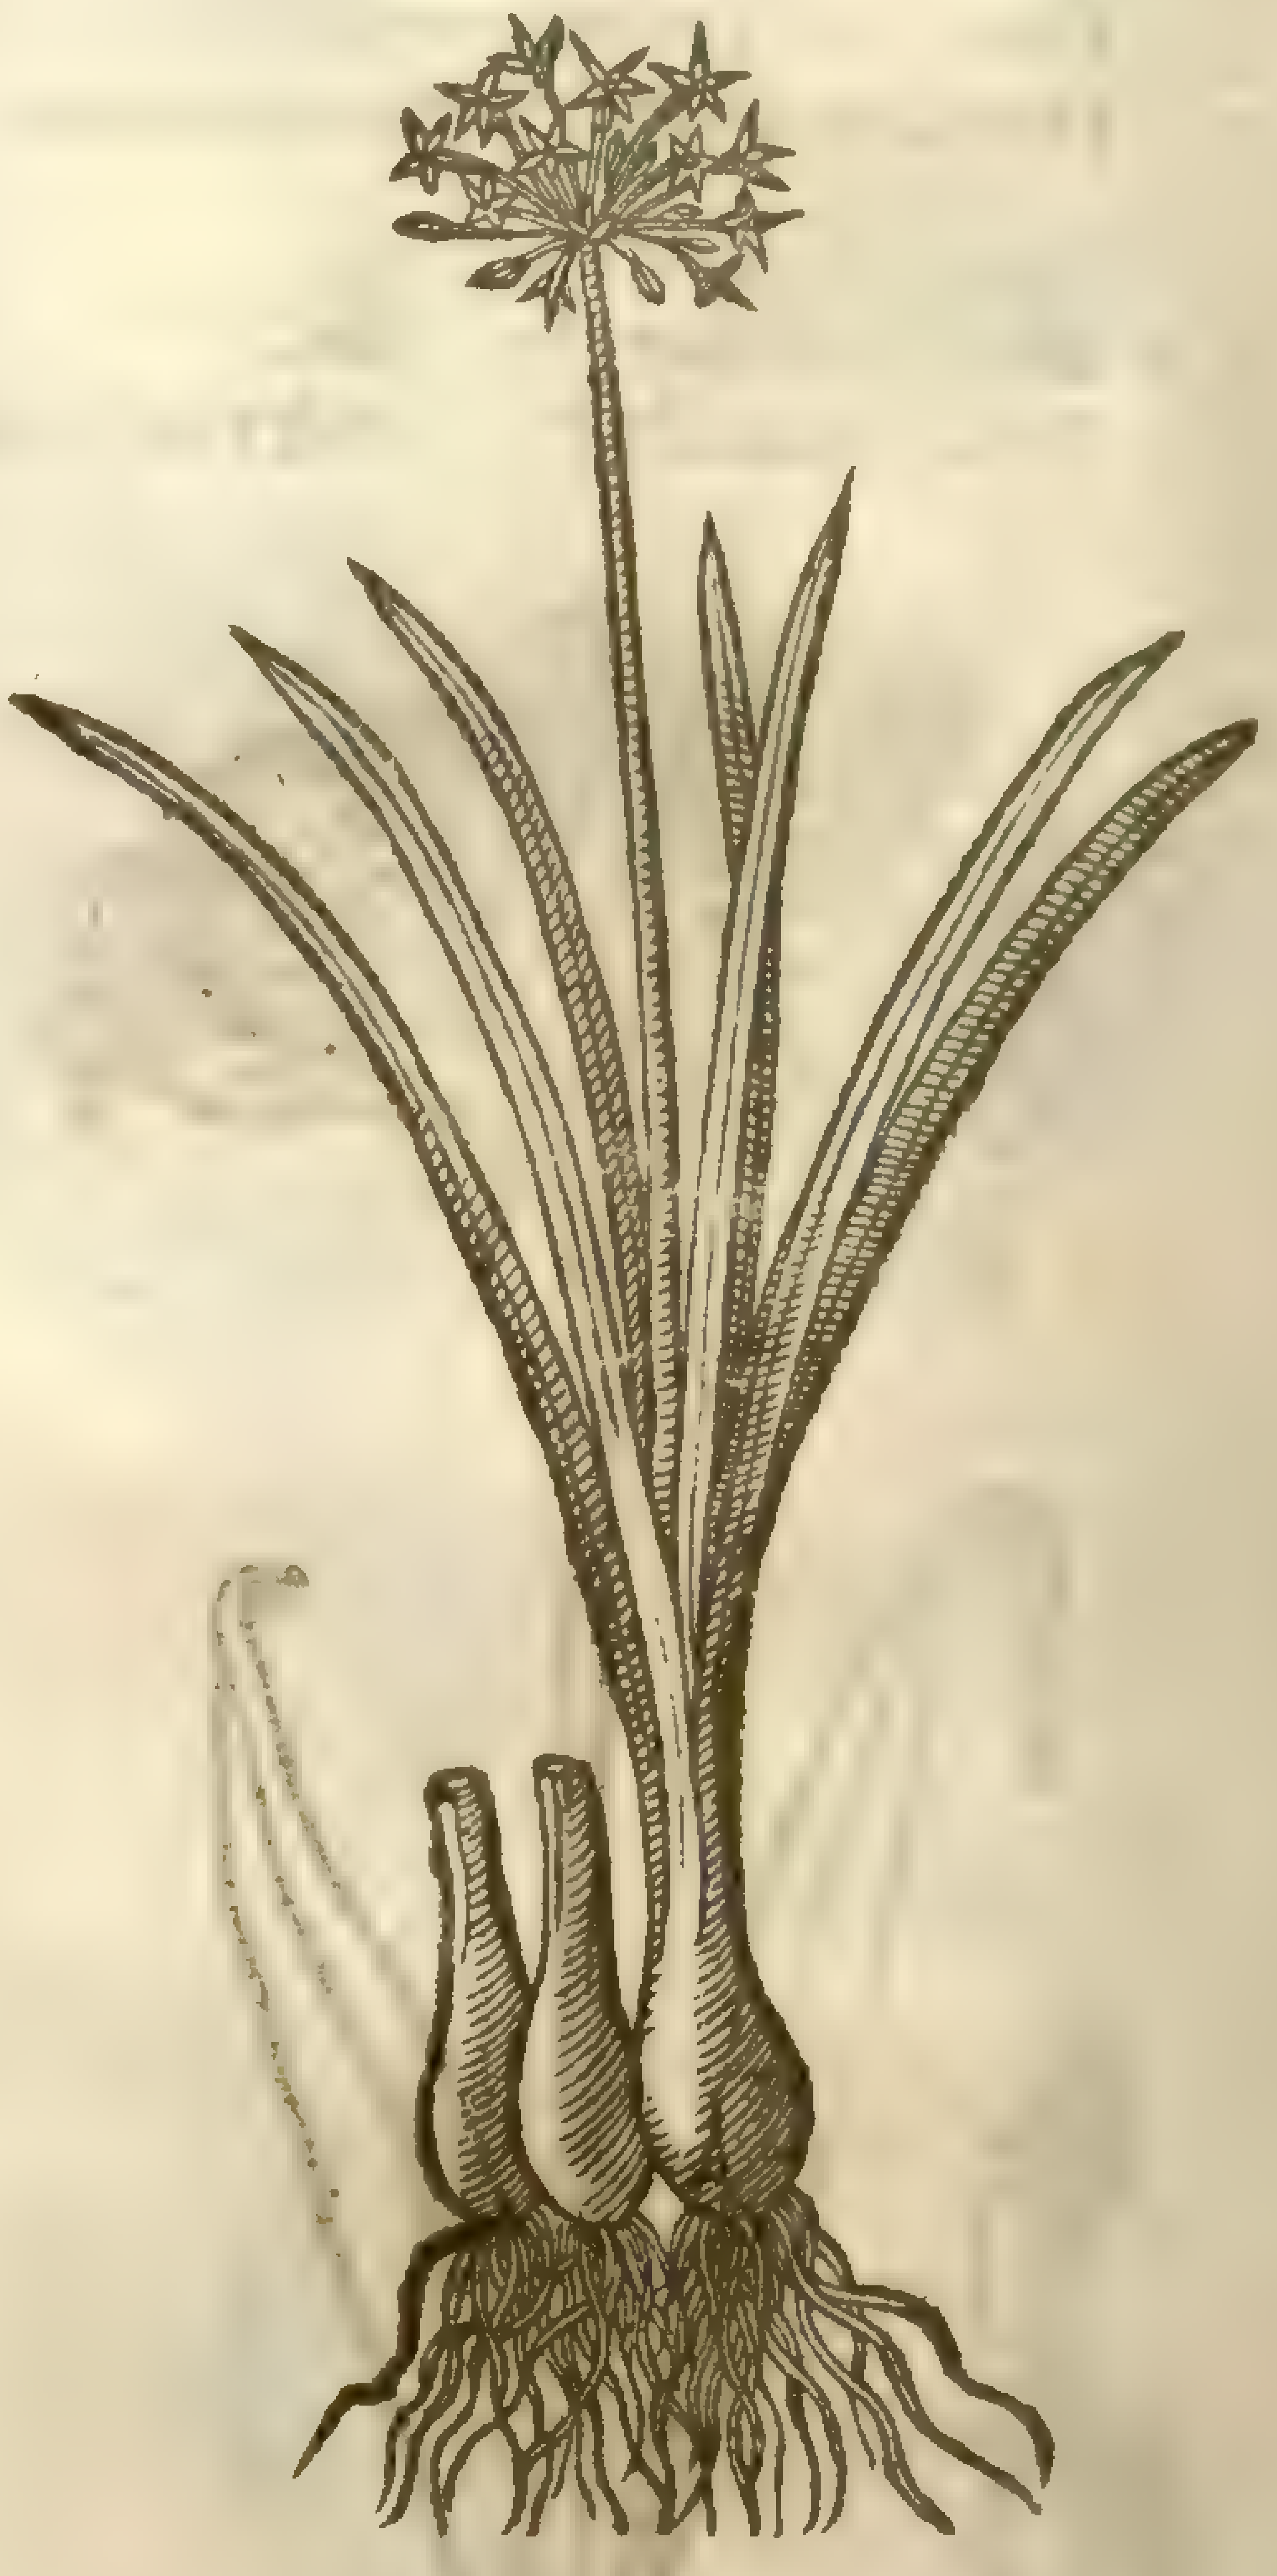
These Molyes are very hot, approching to the nature of Garlicke, and I doubt not but in time ſome excellent man or other will find out as many good vertues in them, as their ſtately & comely proportion ſhould ſeeme to be poſſeſſed with. But for my part, I haue neither proued, nor heard of others, nor found in the writings of the Antients, any thing touching their faculties. Only *Dioſcorides* reporteth, That they are of a maruellous efficacie to bring down the termes, if one of them be ſtamped with oile of Floure de-luce according to art, and vſed in maner of a peſſarie or mother ſuppoſitorie.

‡ CHAP. 101. *Of diuers other Molyes.*

‡ BEſides the Garlickes and Molyes formerly mentioned by our Author, and thoſe I haue iu this edition added, there are diuers others, which, mentioned by *Cluſius*, and belonging to this tribe, I thought good here to ſet forth. Now for that they are more than conueniently could be added to the former chapters, (which are ſufficiently large) I thought it not amiſſe to allot them a place by themſelues.



‡ 1 *Moly Narciſſinis folijs primum.*
The firſt Narciſſe-leaued Moly.



‡ 2 *Moly Narciſſinis folijs ſecundum.*
The ſecond Narciſſe-leaued Moly.

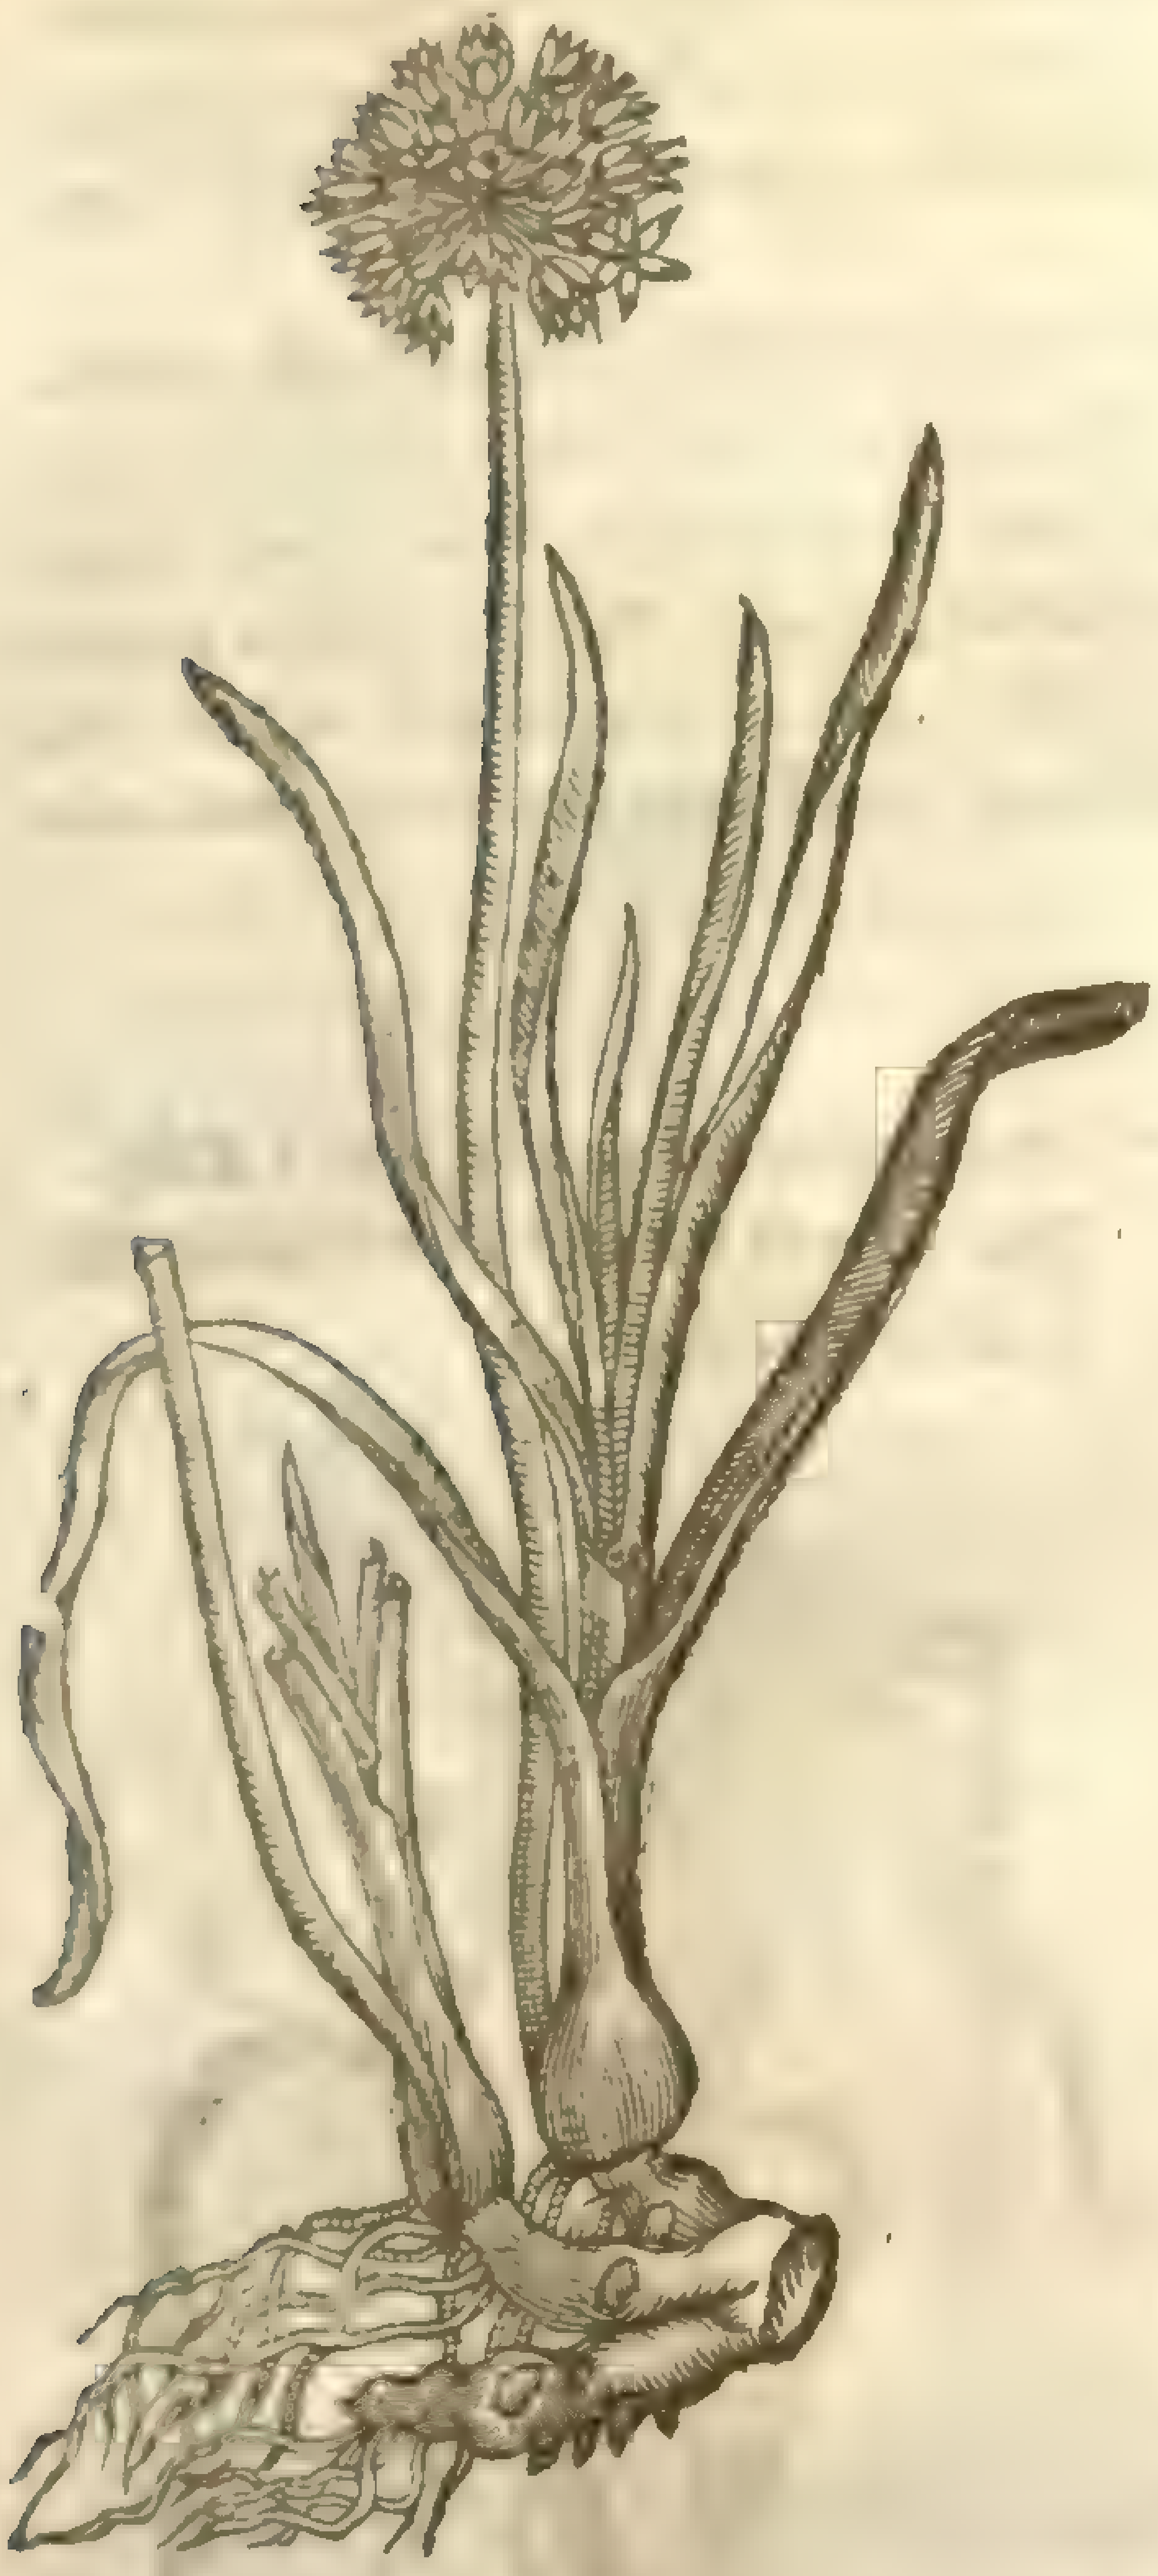
¶ *The Deſcription.*

‡ 1 THis, which in face nigheſt repreſenteth the Molyes deſcribed in the laſt Chapter, hath a root made of many ſcales, like as an onion in the vpper part, but the lower part is knotty, and runnes in the ground like as *Solomons* Seale; the Onion-like part hath many fibres hanging thereat; the leaues are like thoſe of the white Narciſſe, very greene and ſhining, amongſt which riſeth vp a ſtalke of a cubit high, naked, firme, greene, and creſted. At the top come forth many floures conſiſting of ſix purpliſh leaues, with as many chiues on their inſides: after which follow three-ſquare heads, opening when they are ripe, and containing a round blacke ſeed.

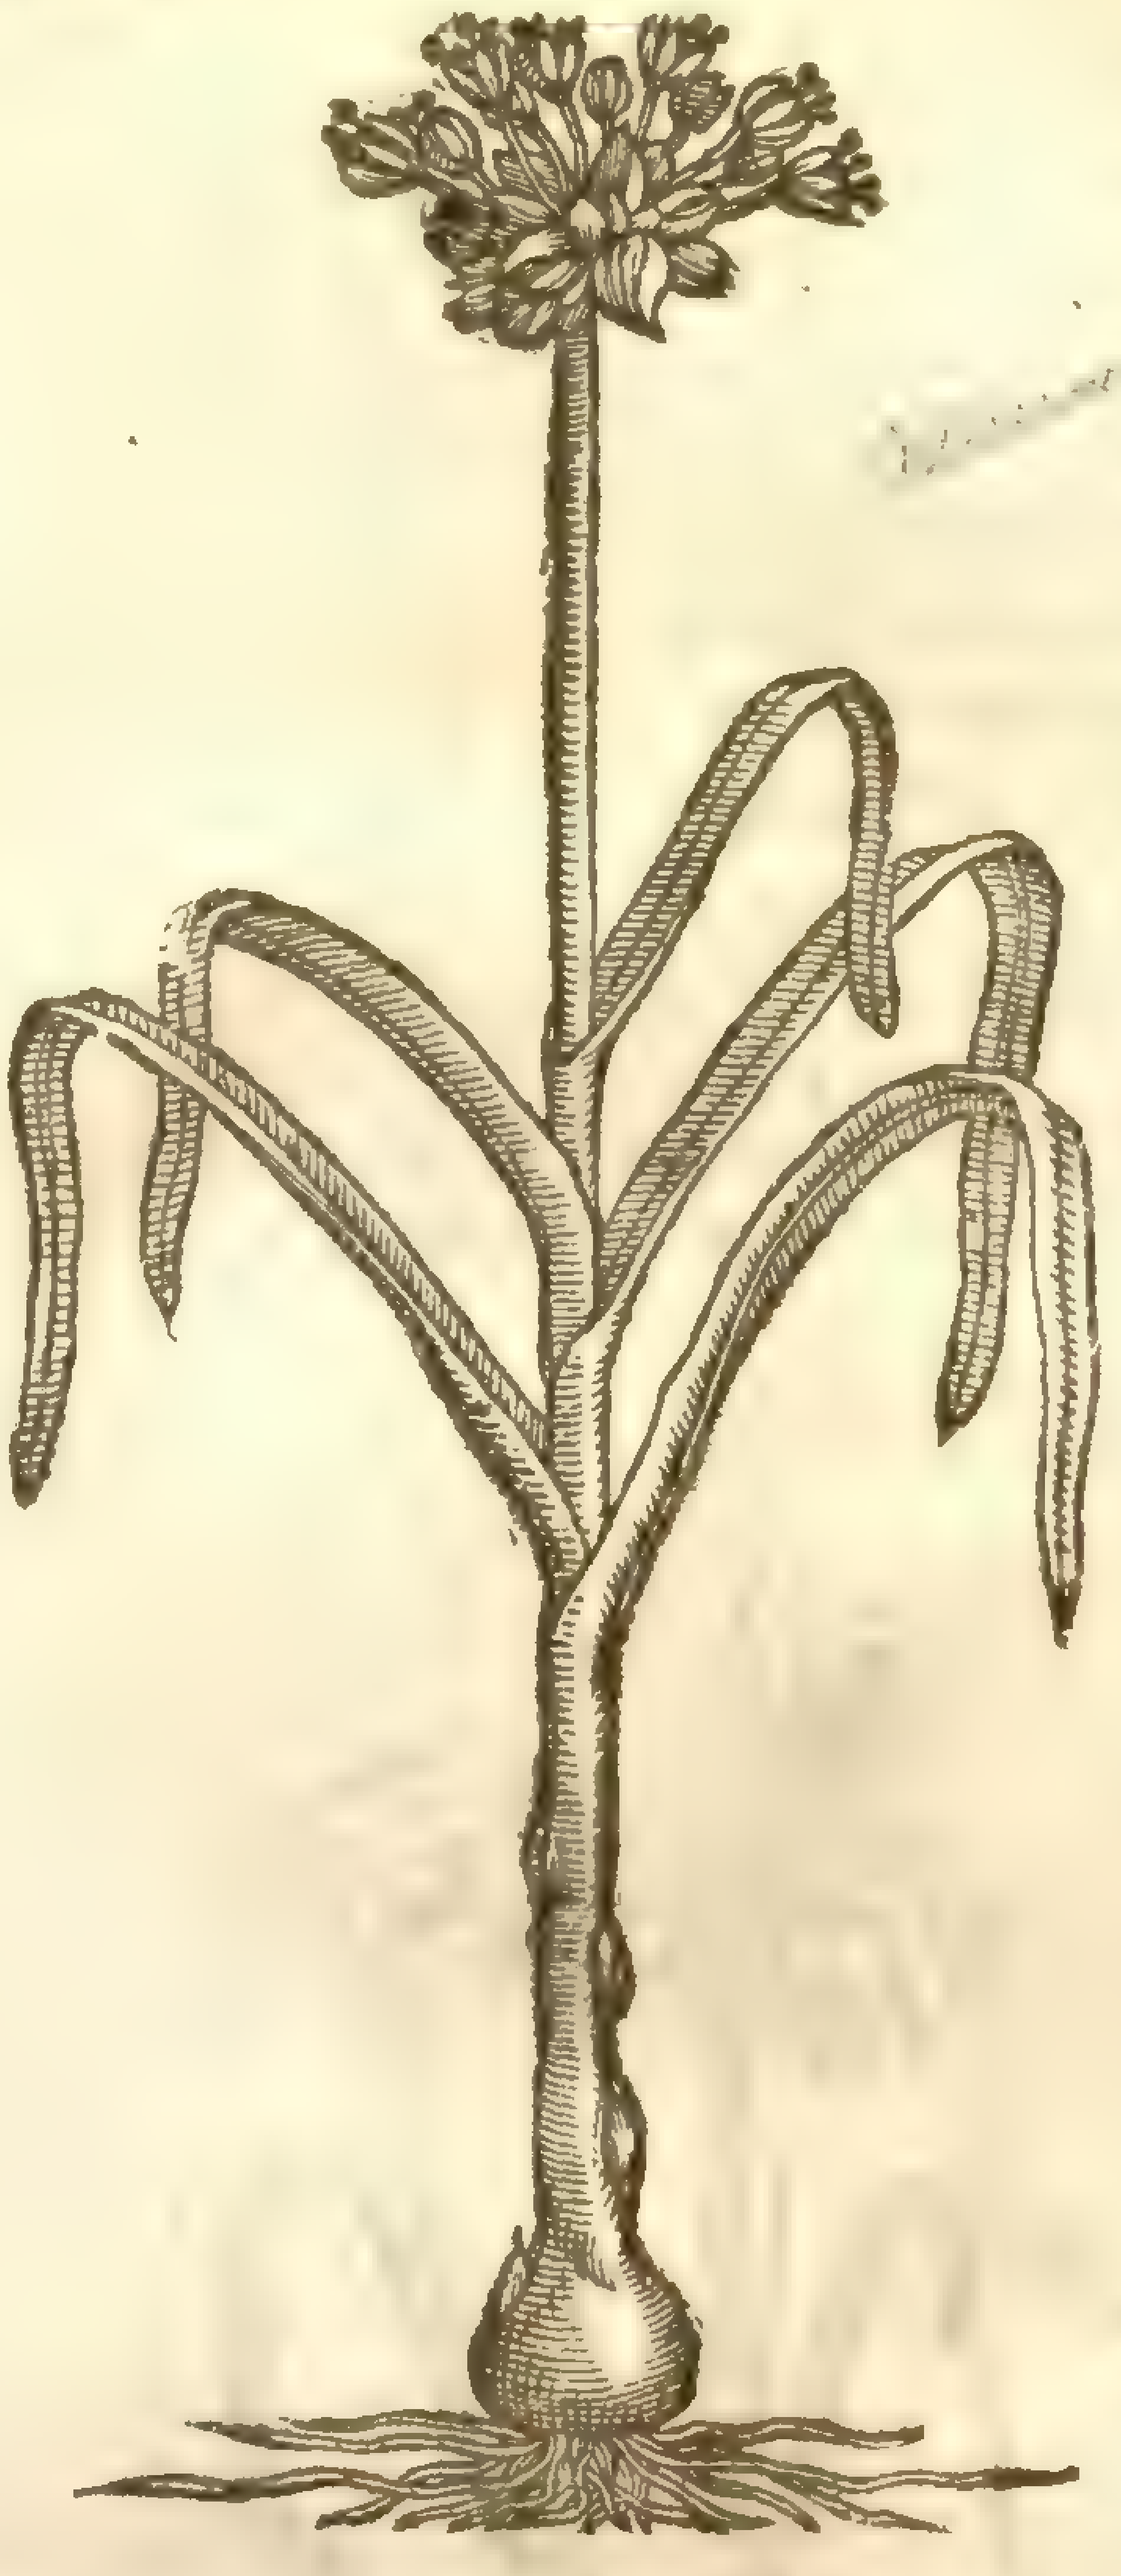
2 This other being of the ſame kinde, and but a varietie of the former, hath ſofter & more aſh coloured leaues, with the floures of a lighter colour. Both theſe floure at the end of Iune, or in July.

3 This hath fiue or ſix leaues equally as broad as thoſe of the laſt deſcribed, but not ſo long, being ſomewhat twined, greene, and ſhining. The ſtalke is ſome foot in length, ſmaller than that of the former, but not leſſe ſtiffe, creſted, and bearing in a round head many floures, in manner of growing and ſhape like thoſe of the former, but of a more elegant purple colour. In ſeed and root it

‡ 3 *Moly Narciſsinis folijs tertium.*
The third Narciſſe-leaued Moly.

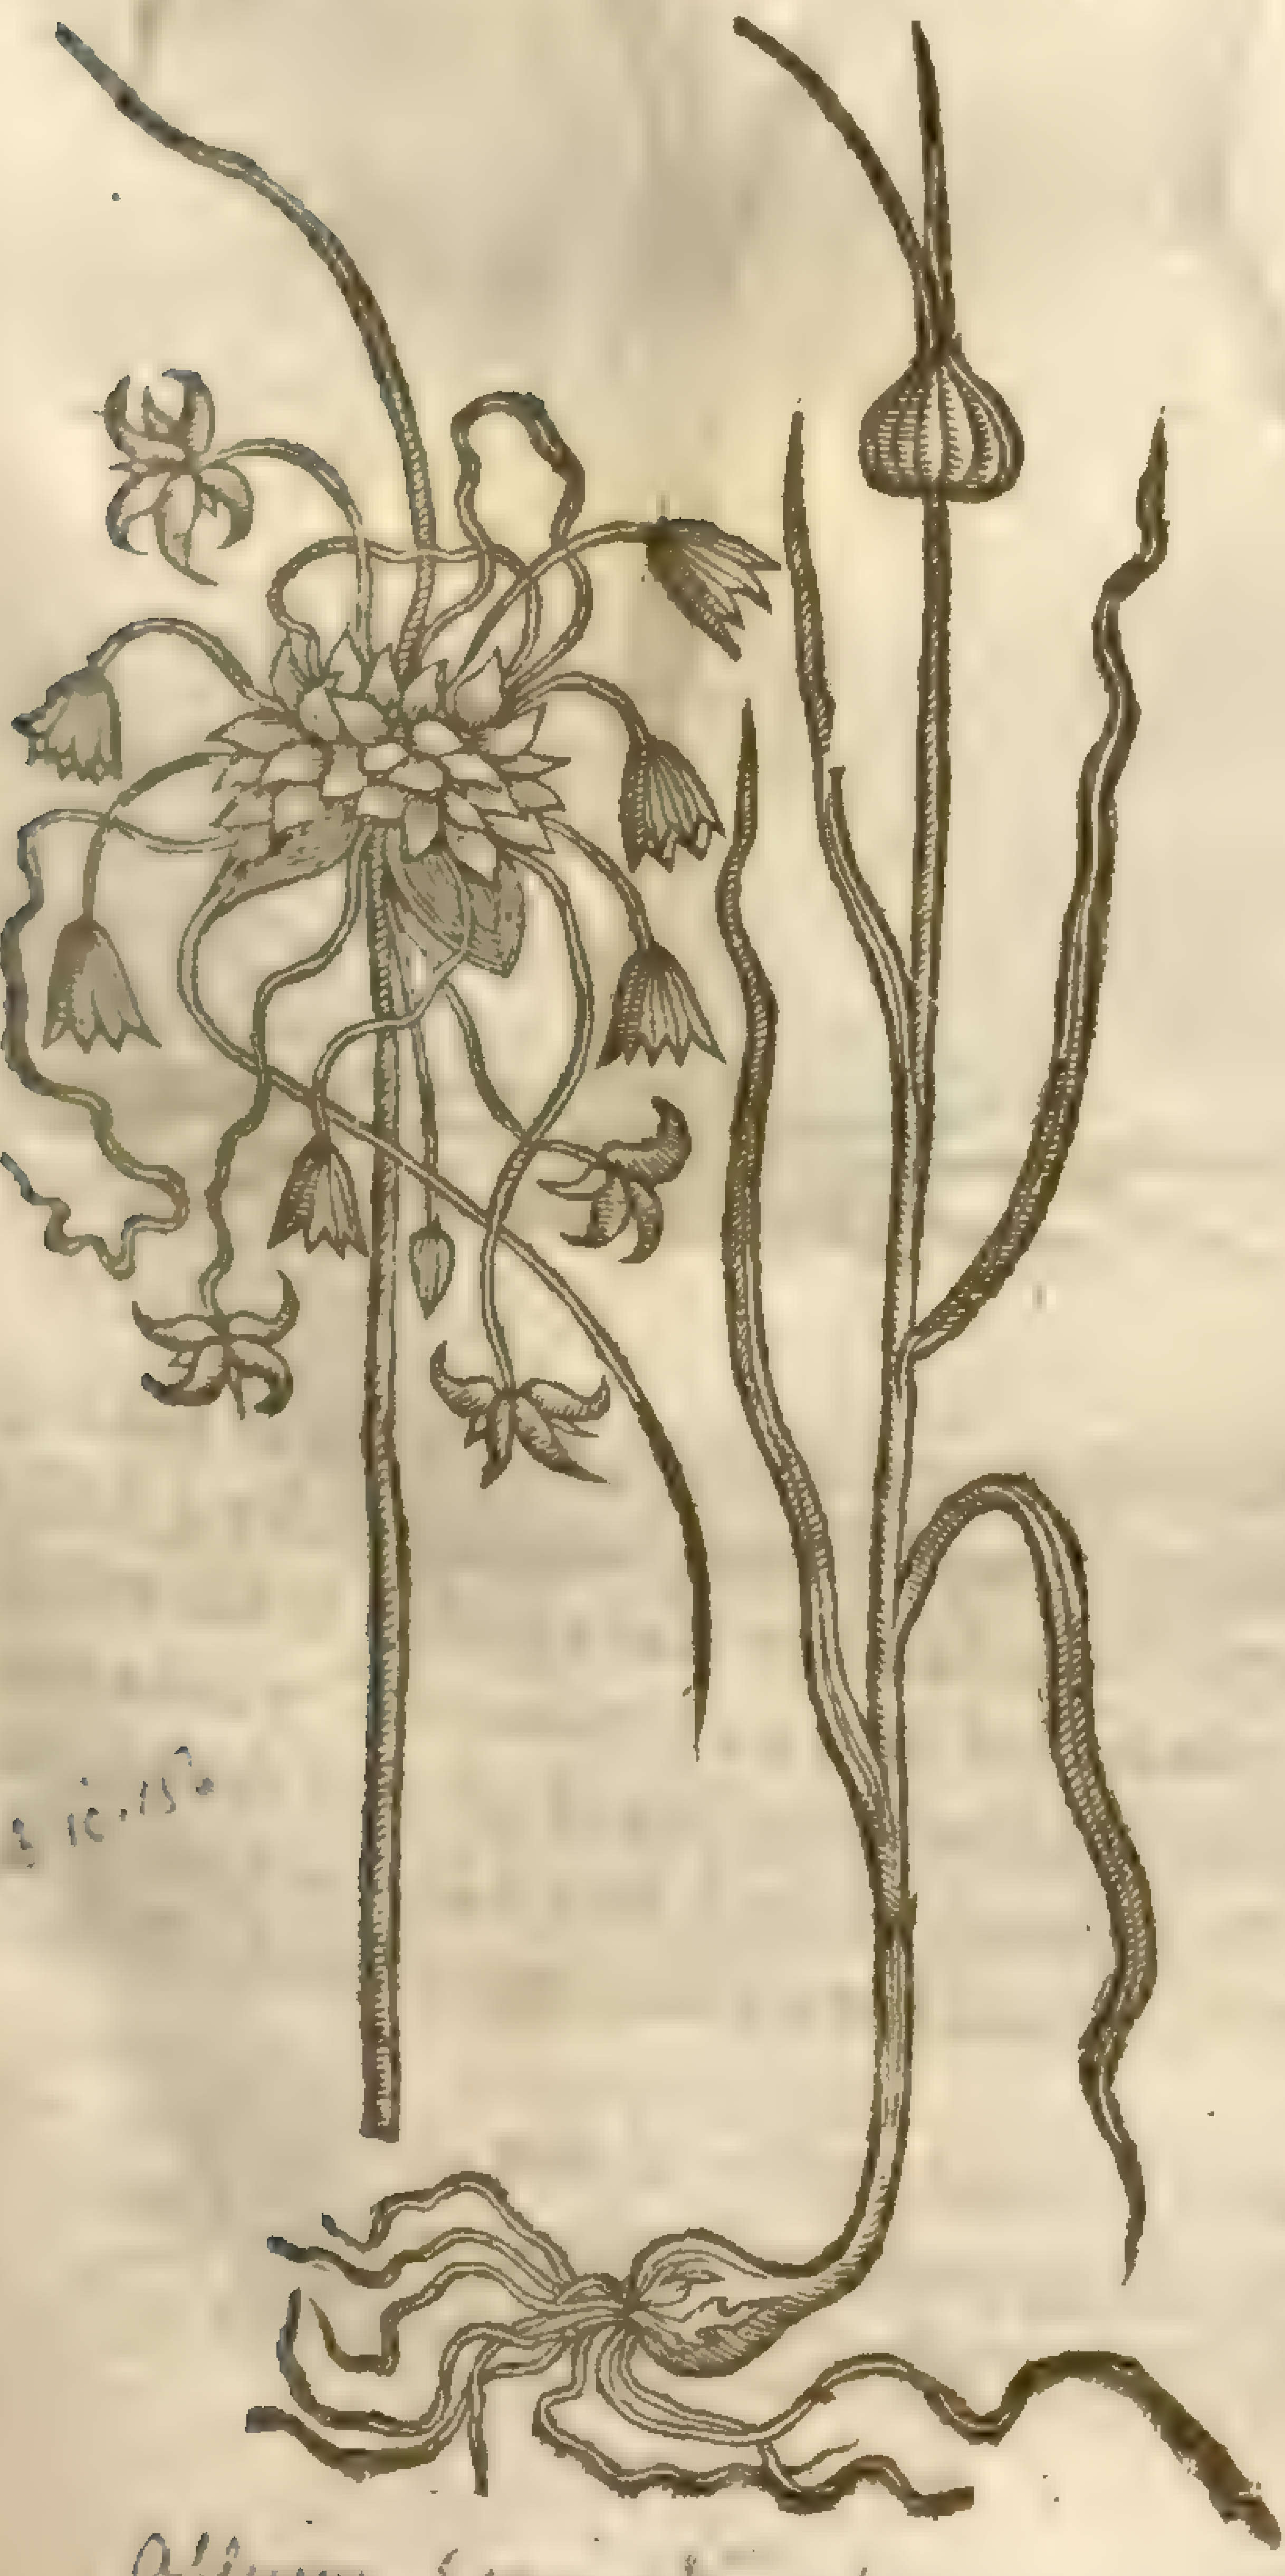


‡ 4 *Moly montanum latifolium* 1 *Cluſij.*
The firſt broad leaued mountain Moly.



Allium arenarium, 2
Syn. p. 2.135

‡ 5 *Moly montanum ſecundum Cluſij.*
The ſecond mountain Moly.



J.B. ii.158

Allium Carinatum, 6
Vide Observ-
Syn. p. 2.136.

it reſembles the precedent. There is alſo a varietie of this kinde, with leaues longer and narrower, neither ſo much twined, the ſtalkes weaker, and floures much lighter coloured.

This floures later than the former, to wit, in Iuly and Auguſt.

All theſe plants grow naturally in Leitenberg and other hils neere to Vienna in Auſtria, where they were firſt found and obſerued by *Carolus Cluſius*.

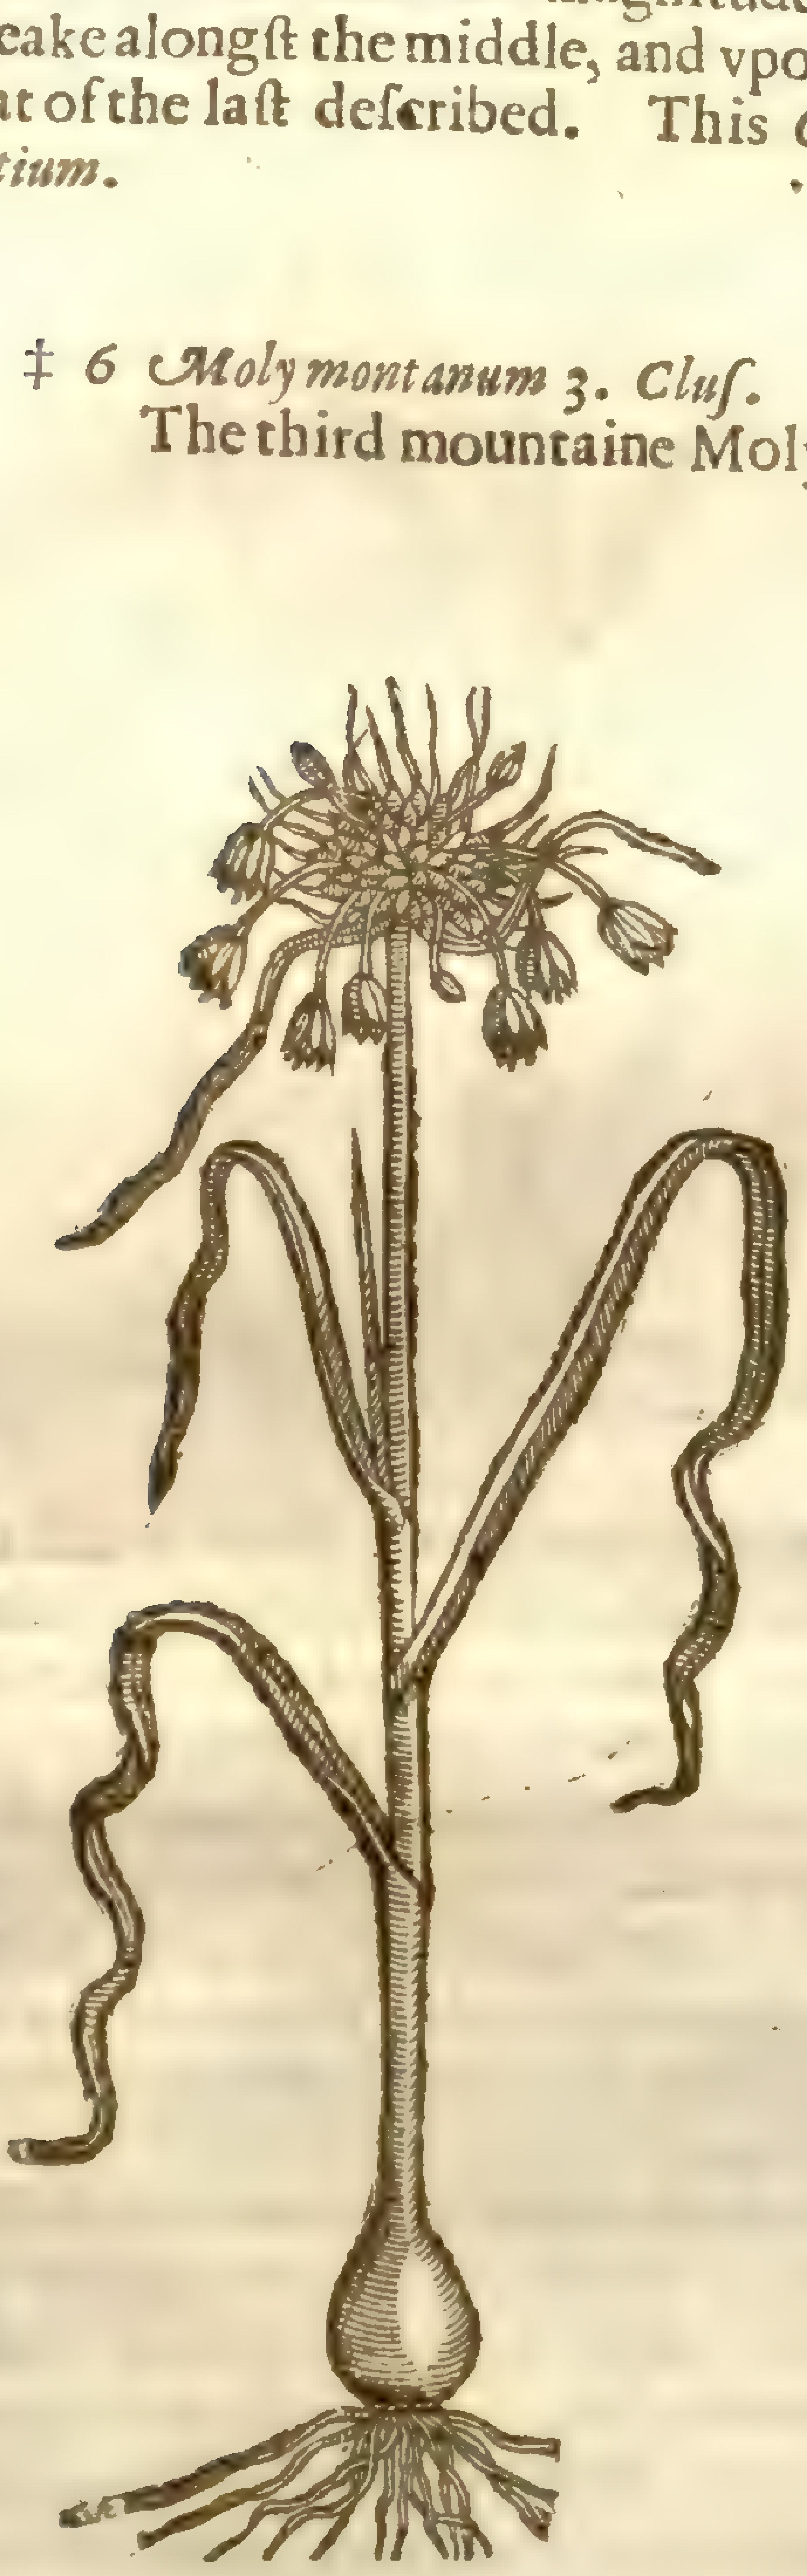
4 This hath a ſtalk ſome two cubits high, which euen to the midſt is incompaſſed with leaues much longer and broader than thoſe of Garlick, and very like thoſe of the Leek: on the top of the ſmooth & ruſh-like ſtalke groweth a tuft conſiſting of many dark purple coloured bulbes growing cloſe together, from amongſt which come forth pretty long ſtalkes bearing light purple ſtar faſhioned floures, which are ſucceeded by three cornered ſeed-veſſels. The root is bulbous, large, conſiſting of many cloues and hauing many white fibres growing forth therof. Moreouer, there grow out certain round bulbes about the root, almoſt like thoſe which grow in the head, and being planted apart, they produce plants of the ſame kind. This is *Allium, ſiue Moly montanum latifolium* 1. *Cluſij*.

5 This hath a ſmooth round greene ſtalke ſome cubit high, whereon doe grow moſt commonly

monly three leaues narrower than thoſe of the former,and as it were graſſy. The top of the ſtalke ſuſtaines a head wrapped in two lax filmes,each of them running out with a ſharpe point like two hornes,which opening themſelues,there appeare many ſmall bulbs heaped together,among which are floures compoſed of ſix purpliſh little leaues,and faſtned to long ſtalks.The root is round and white,with many long white fibres hanging thereat. *Cluſius* calls this *Allium, ſive Moly montanum ſecundum*. And this is *Lobels Ampelopraſon proliferum*.

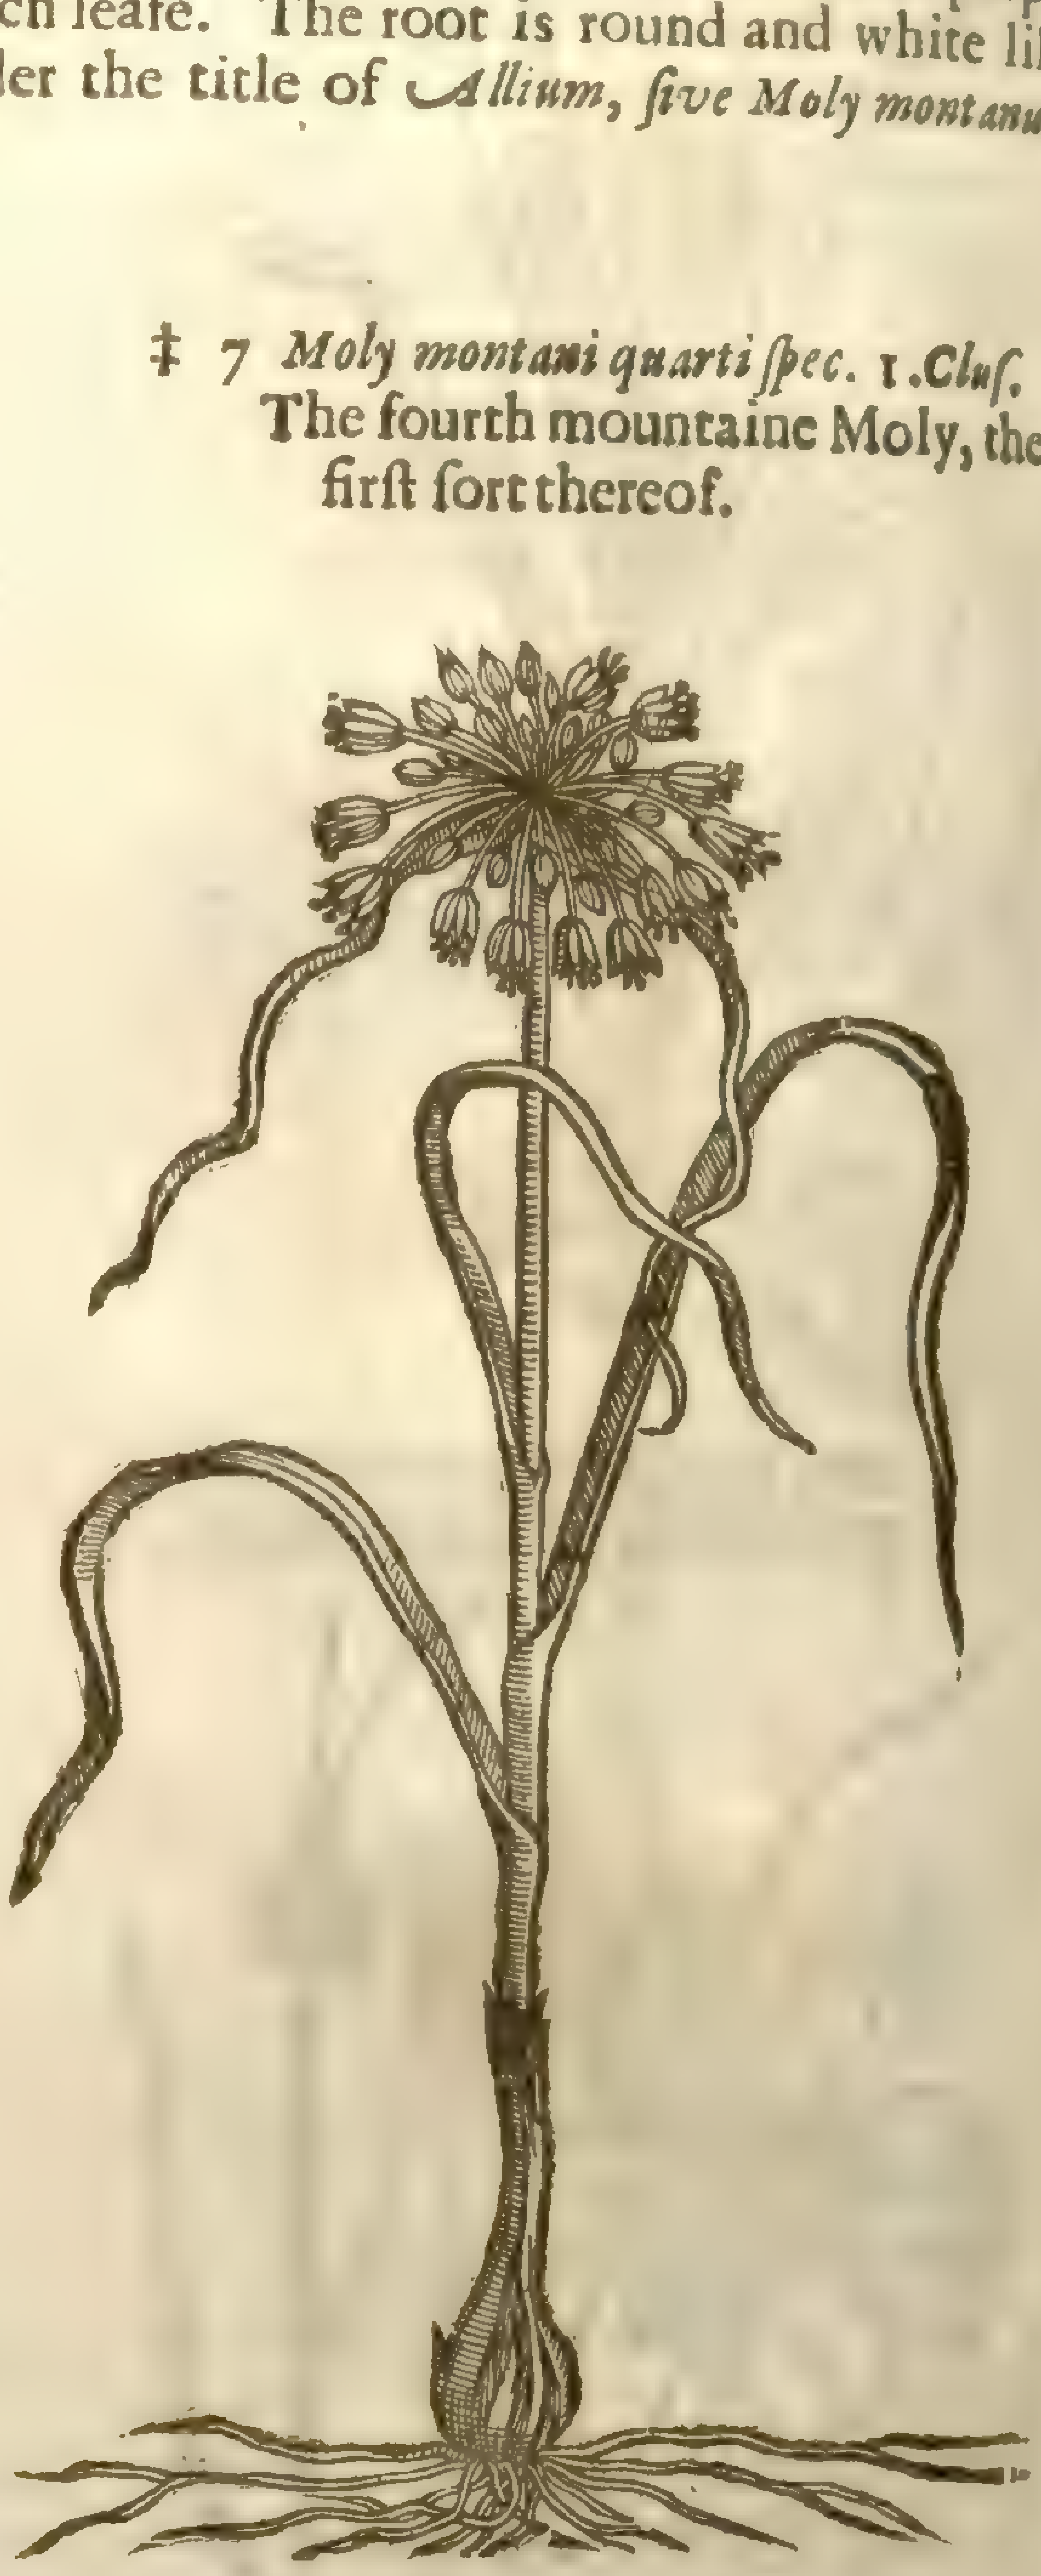
6 Like to the laſt deſcribed is this in height and ſhape of the ſtalke and leaues,as alſo in the forked or horned skin involving the head,which conſiſteth of many ſmall bulbs of a reddiſh green colour,and ending in a long green point ; amongſt which vpon long and ſlender ſtalks hang down floures like in forme and magnitude to the former , but of a whitiſh colour , wirh a darke purple ſtreake alongſt the middle, and vpon the edges of each leafe. The root is round and white like that of the laſt deſcribed. This *Cluſius* giueth vnder the title of *Allium, ſive Moly montanum tertium.*

‡ 6 *Moly montanum 3. Cluſ.*
The third mountaine Moly.



Allium flexuosum Supp. 2. 132

‡ 7 *Moly montani quarti ſpec. 1. Cluſ.*
The fourth mountaine Moly, the firſt ſort thereof.



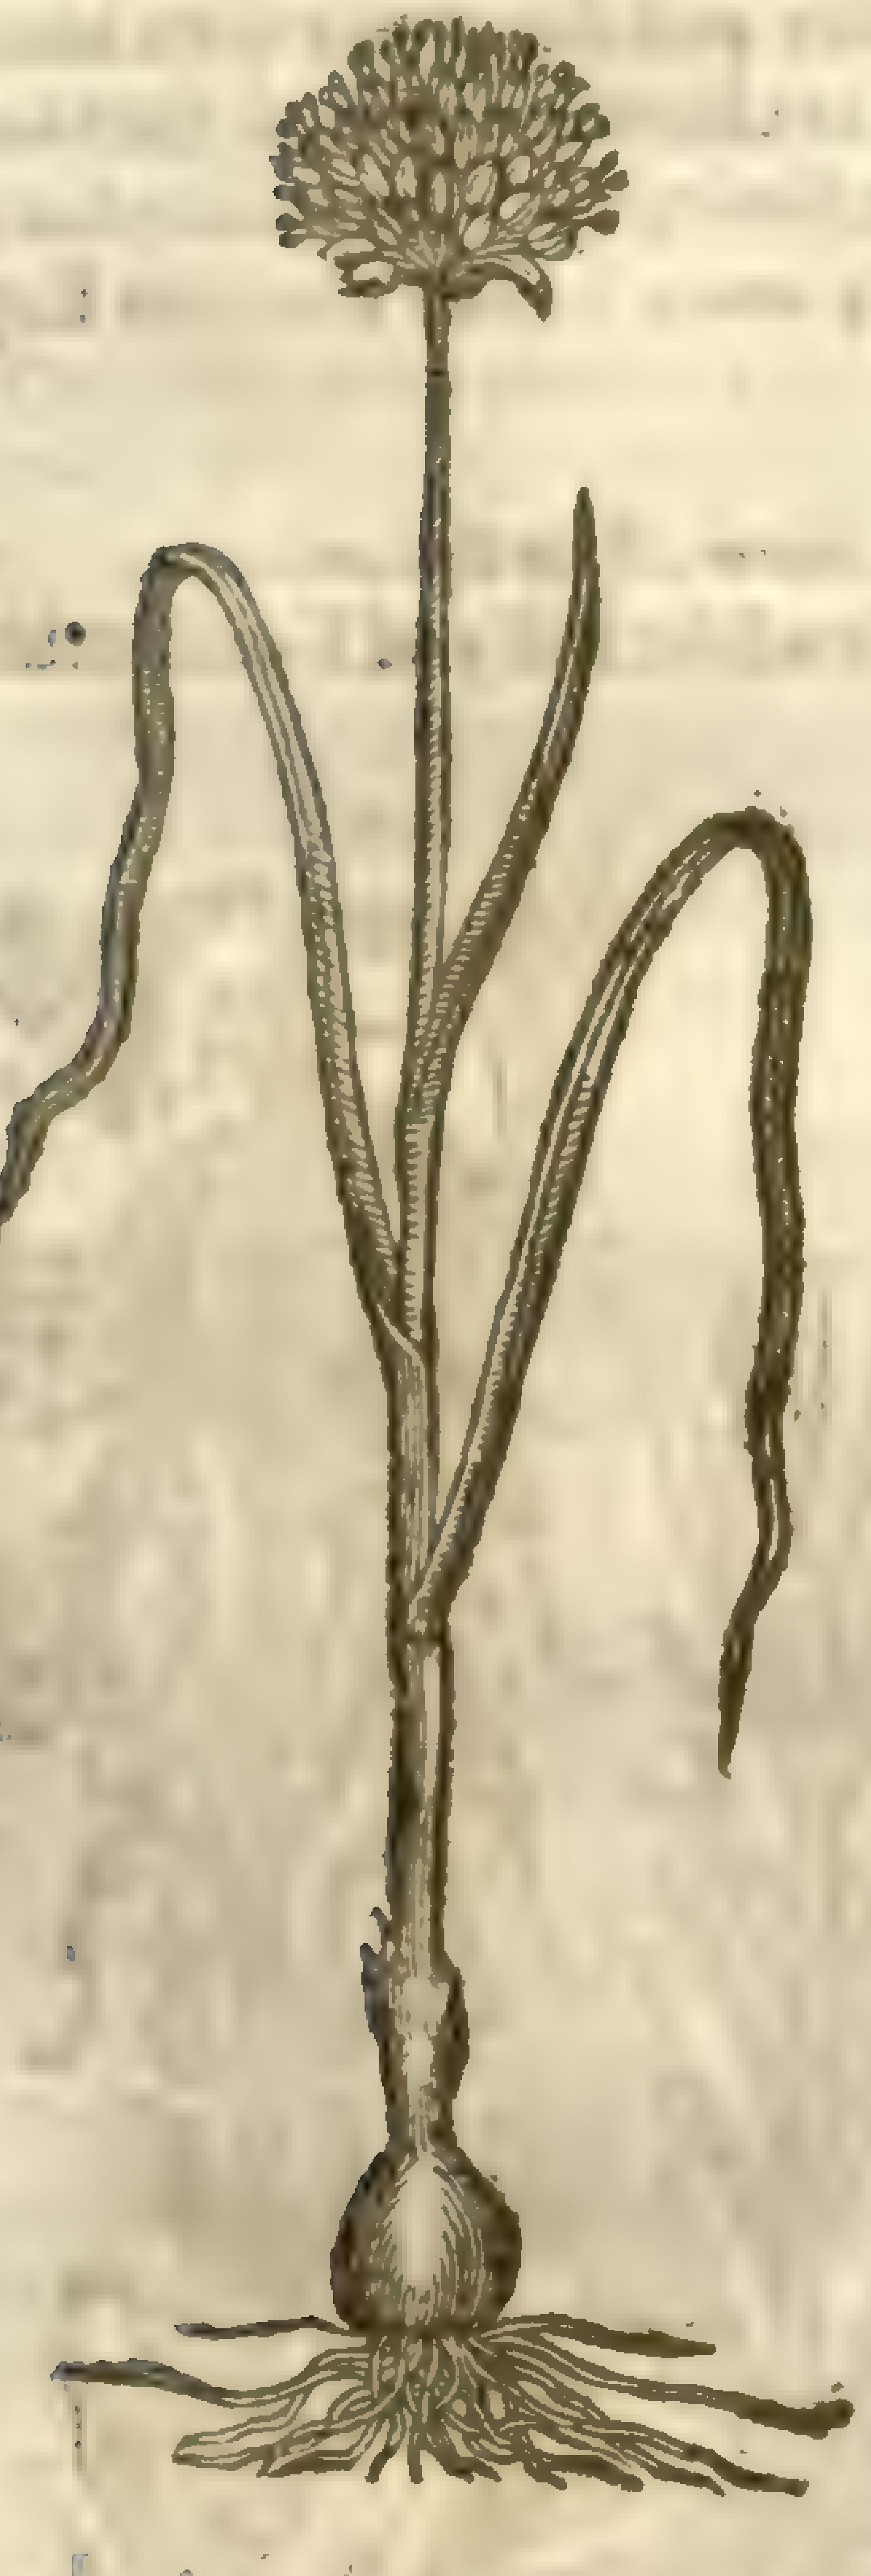
7 This alſo hath three ruſhy leaues,with a round ſtalk ſome cubit high, whoſe top is likewiſe adorned with a forked membrane, containing many pale coloured floures hanging on long ſtalks, each floure conſiſting of ſix little leaues,with the like number of chiues,and a peſtill in the midſt. This tuſt of floures cut off with the top of the ſtalke, and carried into a chamber,will yeeld a pleaſant ſmel(like that which is found in the floures of the earlier *Cyclamen*)but it quickly decays. After theſe floures are paſt,ſucceed three cornered heads containing a black ſmall ſeed not much vnlike Gilloſloure ſeed. The root is round like the former, ſometimes yeelding off-ſets. This is *Alij montani 4. ſpecies* of *Cluſius*.

8 There is another kinde of this laſt deſcribed,which growes to almoſt the ſame height , and hath like leaues,and the head ingirt with the like skinny long pointed huskes ; but the floures of this are of a very darke colour. The roots are like the former, with off-ſets by their ſide. This is *Cluſius*

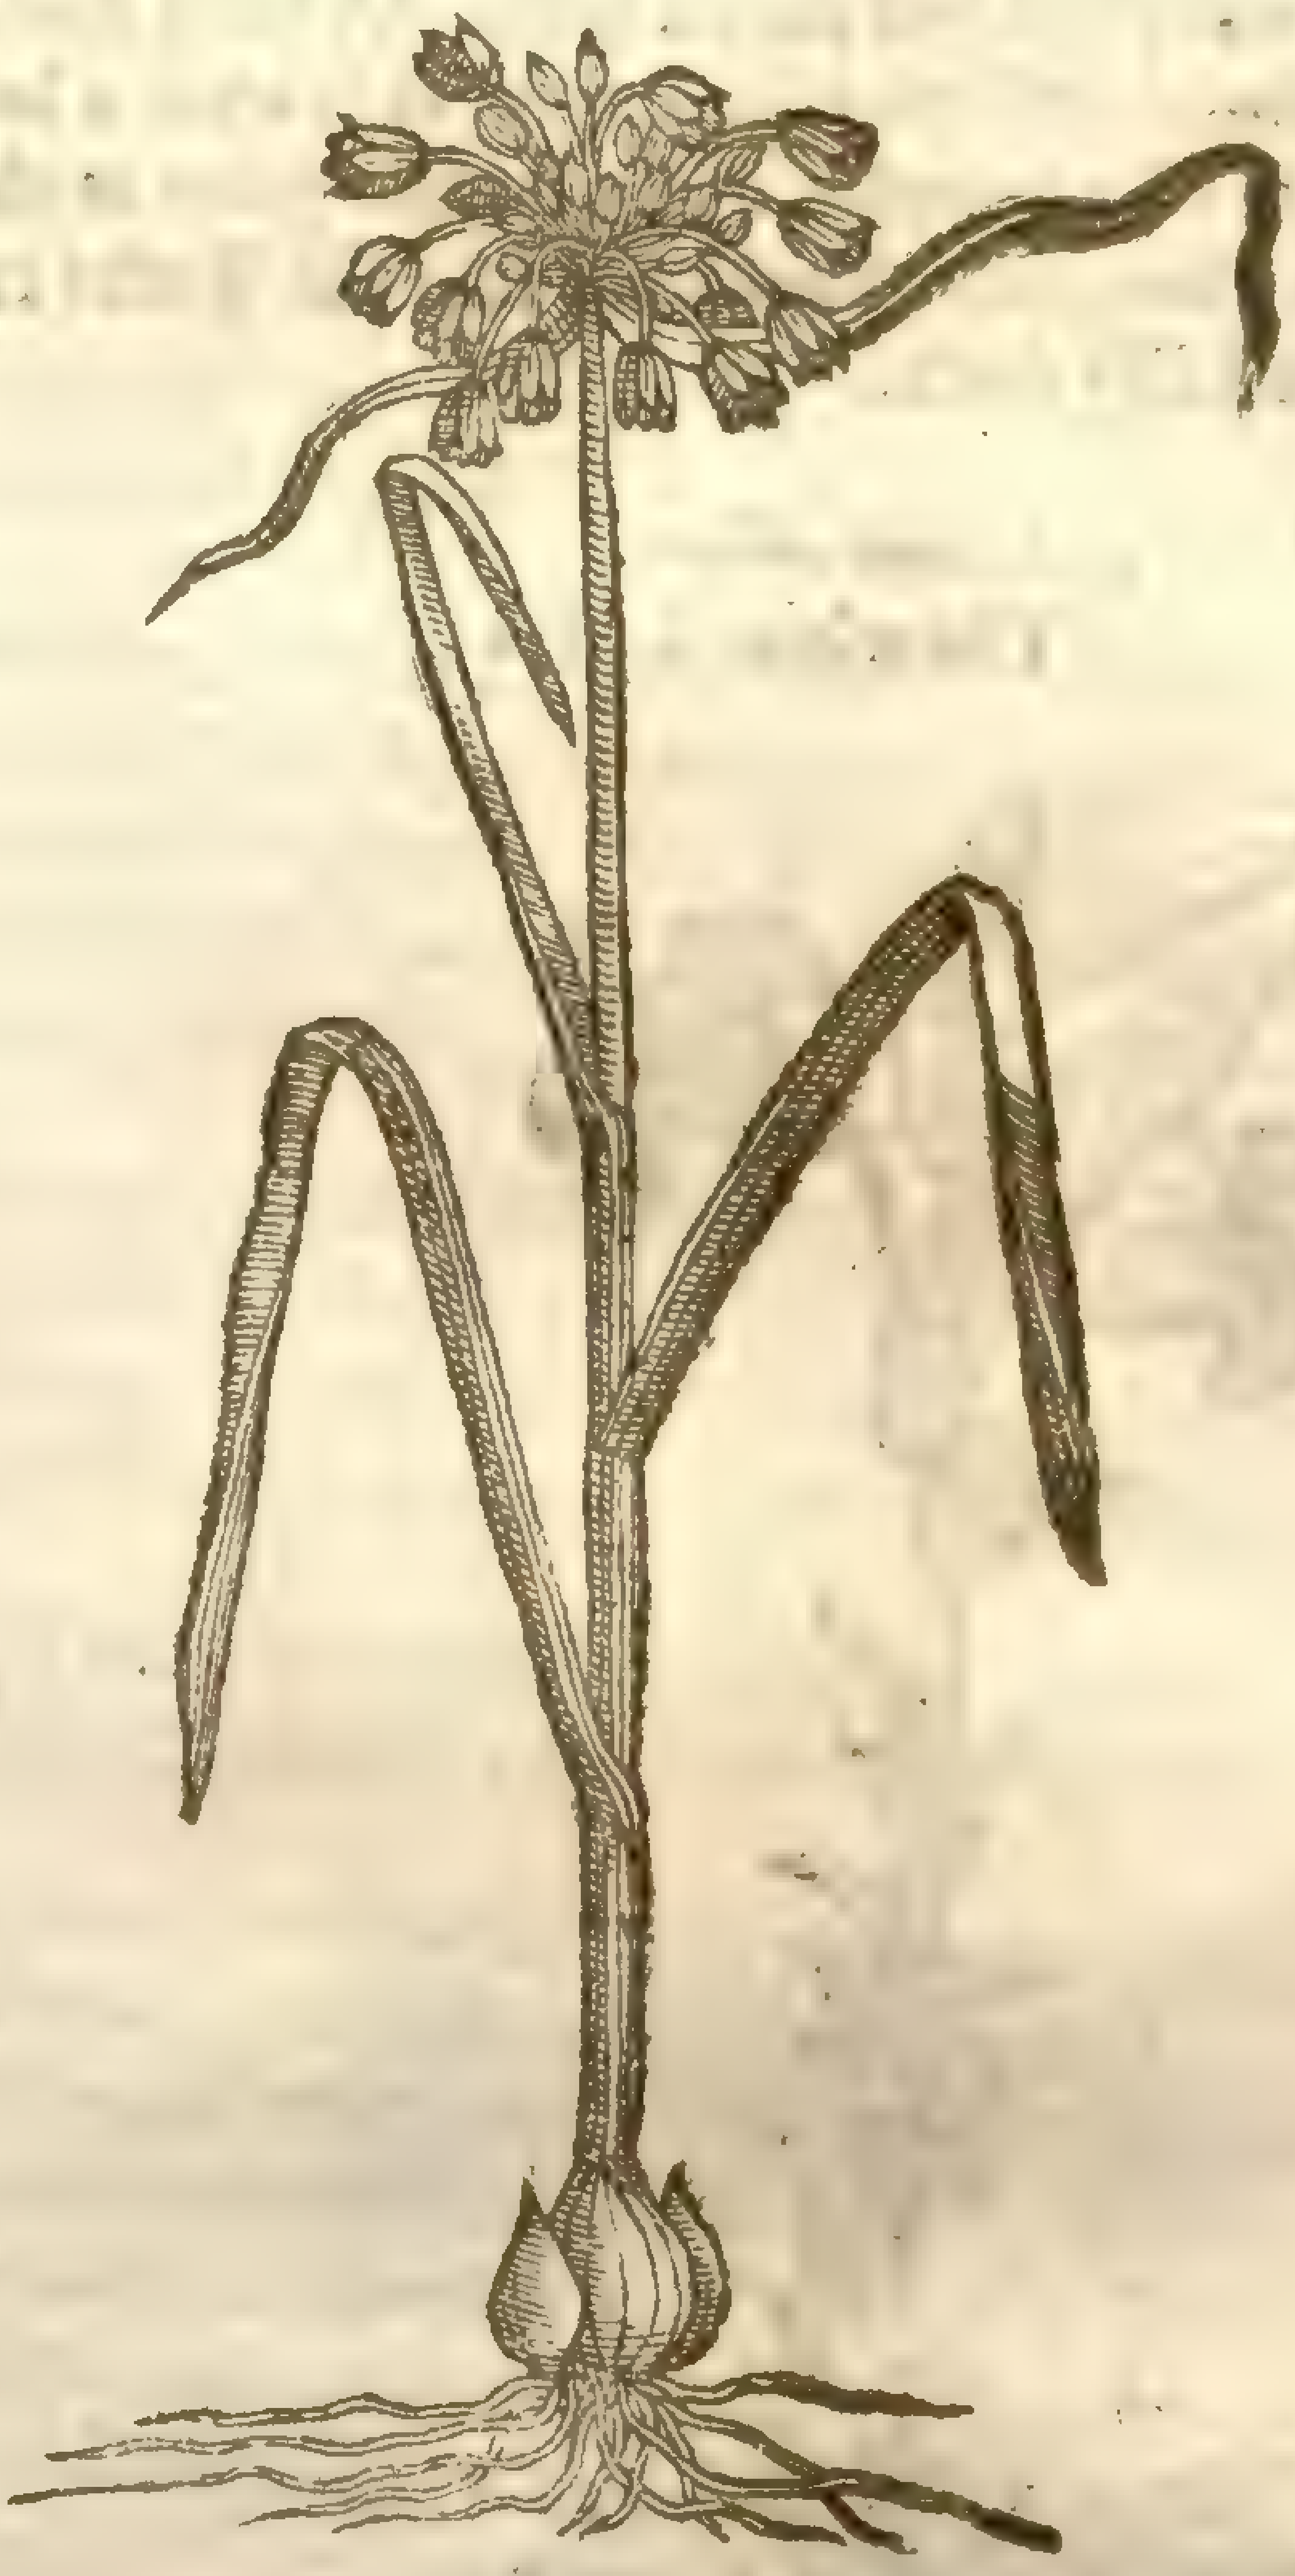
Cluſius his *Moly montani quarti ſpecies ſecunda*. The roots of the three laſt deſcribed ſmel of garlicke, but the leaues haue rather an herby or graſſe-like ſmell.

The fiſt and ſixt of theſe grow naturally in the Styrian and Auſtrian Alps. The ſeuenth growes about Presburg in Hungarie, about Niclaſpurg in Morauia, but moſt abundantly about the baths in Baden.

‡ 8 *Moly montani quarti ſpecies ſecunda Cluſij.*
The ſecond kinde of the fourth
mountaine Moly.



‡ 9 *Moly montanum quintum Cluſij.*
The fifth mountain Moly.



9 This growes to the like height as the former, with a green ſtalke, hauing few leaues thereupon, and naked at the top, where it carrieth a round head conſiſting of many ſtar-like ſmall floures, of a faire purple colour, faſtned to ſhort ſtalks, each floure being compoſed of ſix little leaues, with as many chiues, and a peſtill in the middle. The root is bulbous and white, hauing ſomtimes his off-ſets by his ſides. The ſmell of it is like Garlick. This groweth alſo about Presburgh in Hungarie, and was there obſerued by *Cluſius* to beare his floure in May and Iune. He calleth this *Allium, ſeu Moly montanum quintum*.

Chap. 102. *Of White Lillies.*

¶ *The Kindes.*

There be ſundry ſorts of Lillies, whereof ſome be wilde or of the field, others tame or of the garden; ſome white, others red; ſome of our own countries growing, others from beyond the ſeas: and becauſe of the variable ſorts, we wil diuide them into chapters, beginning with the two white Lillies, which differ little but in the natiue place of growing.

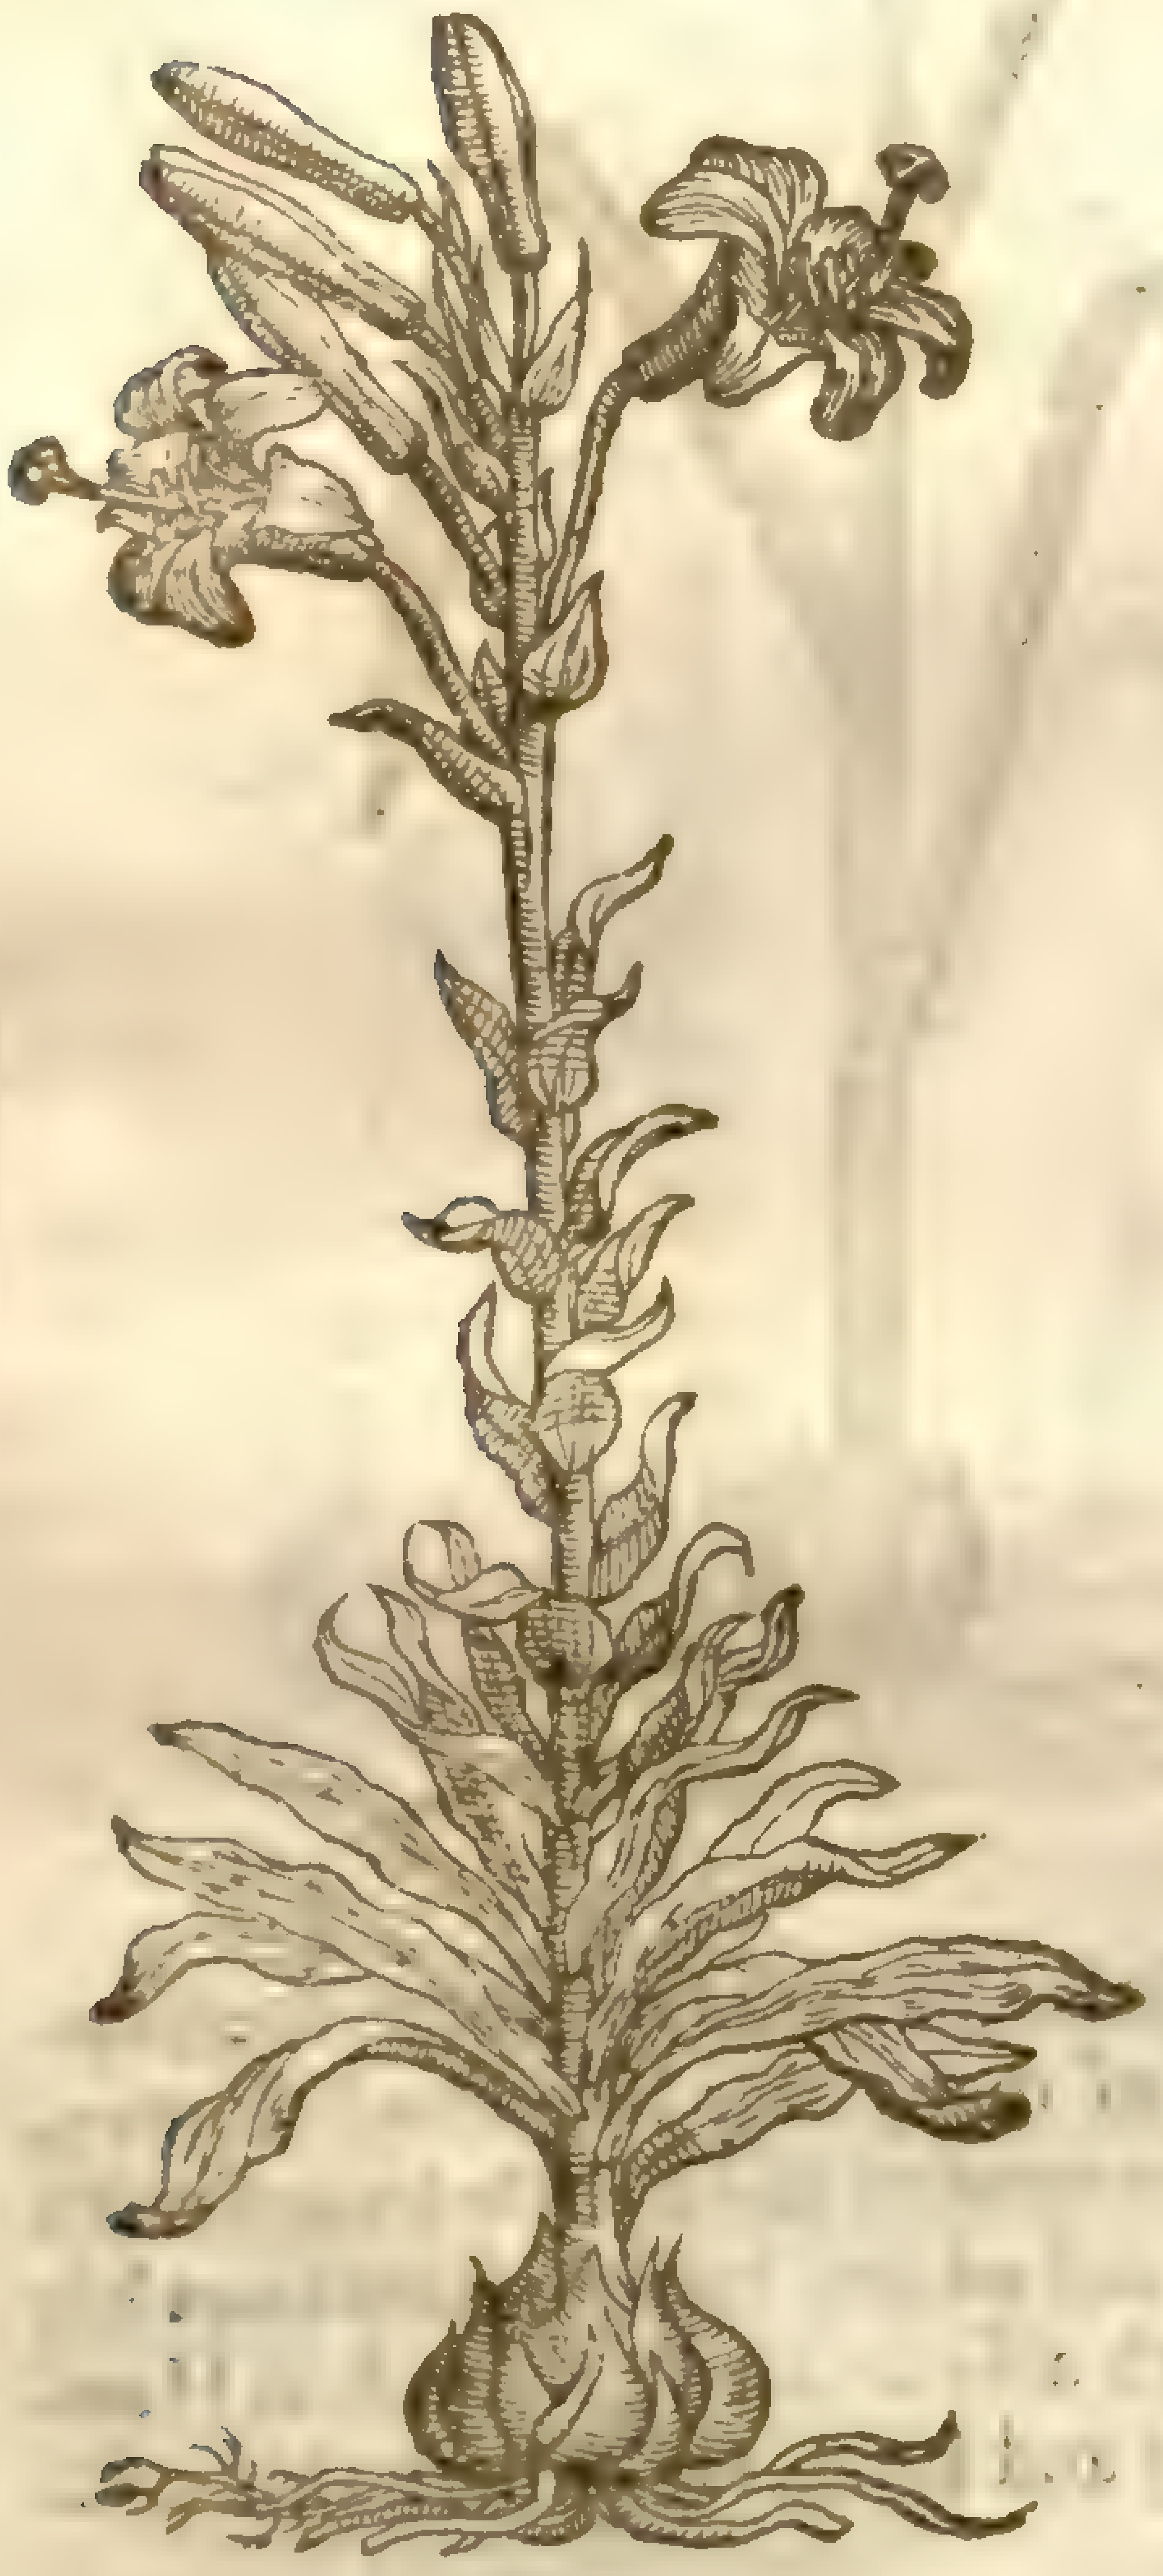
¶ *The Deſcription.*

1 The white Lilly hath long ſmooth and full bodied leaues of a graſſie or light green colour. The ſtalks be two cubits high, and ſomtimes more, ſet or garniſhed with the like leaues, but growing ſmaller and ſmaller toward the top; and vpon them do grow faire white floures ſtrong of ſmell, narrow toward the foot of the ſtalke whereon they do grow, wide or open in the mouth like a bell. In the middle part of them doe grow ſmall tender pointals tipped with a duſty yellow colour, ribbed or chamfered on the back ſide, conſiſting of ſix ſmall leaues thicke and fat. The root is a bulb made of ſcaly cloues, full of tough and clammy juice, wherewith the whole plant doth generally abound.

2 The white Lilly of Conſtantinople hath very large & fat leaues like the former, but narrower and leſſer. The ſtalke riſeth vp to the height of three cubits, ſet and garniſhed with leaues alſo like the precedent, but much leſſe. Which ſtalke oftentimes doth alter and degenerat from his naturall roundneſſe to a flat forme, as it were a lath of wood furrowed or chanelled alongſt the ſame, as it were ribs or welts. The floures grow at the top like the former, ſauing that the leaues doe turne themſelues more backward like the Turks cap, and beareth many more floures than our Engliſh white Lilly doth.

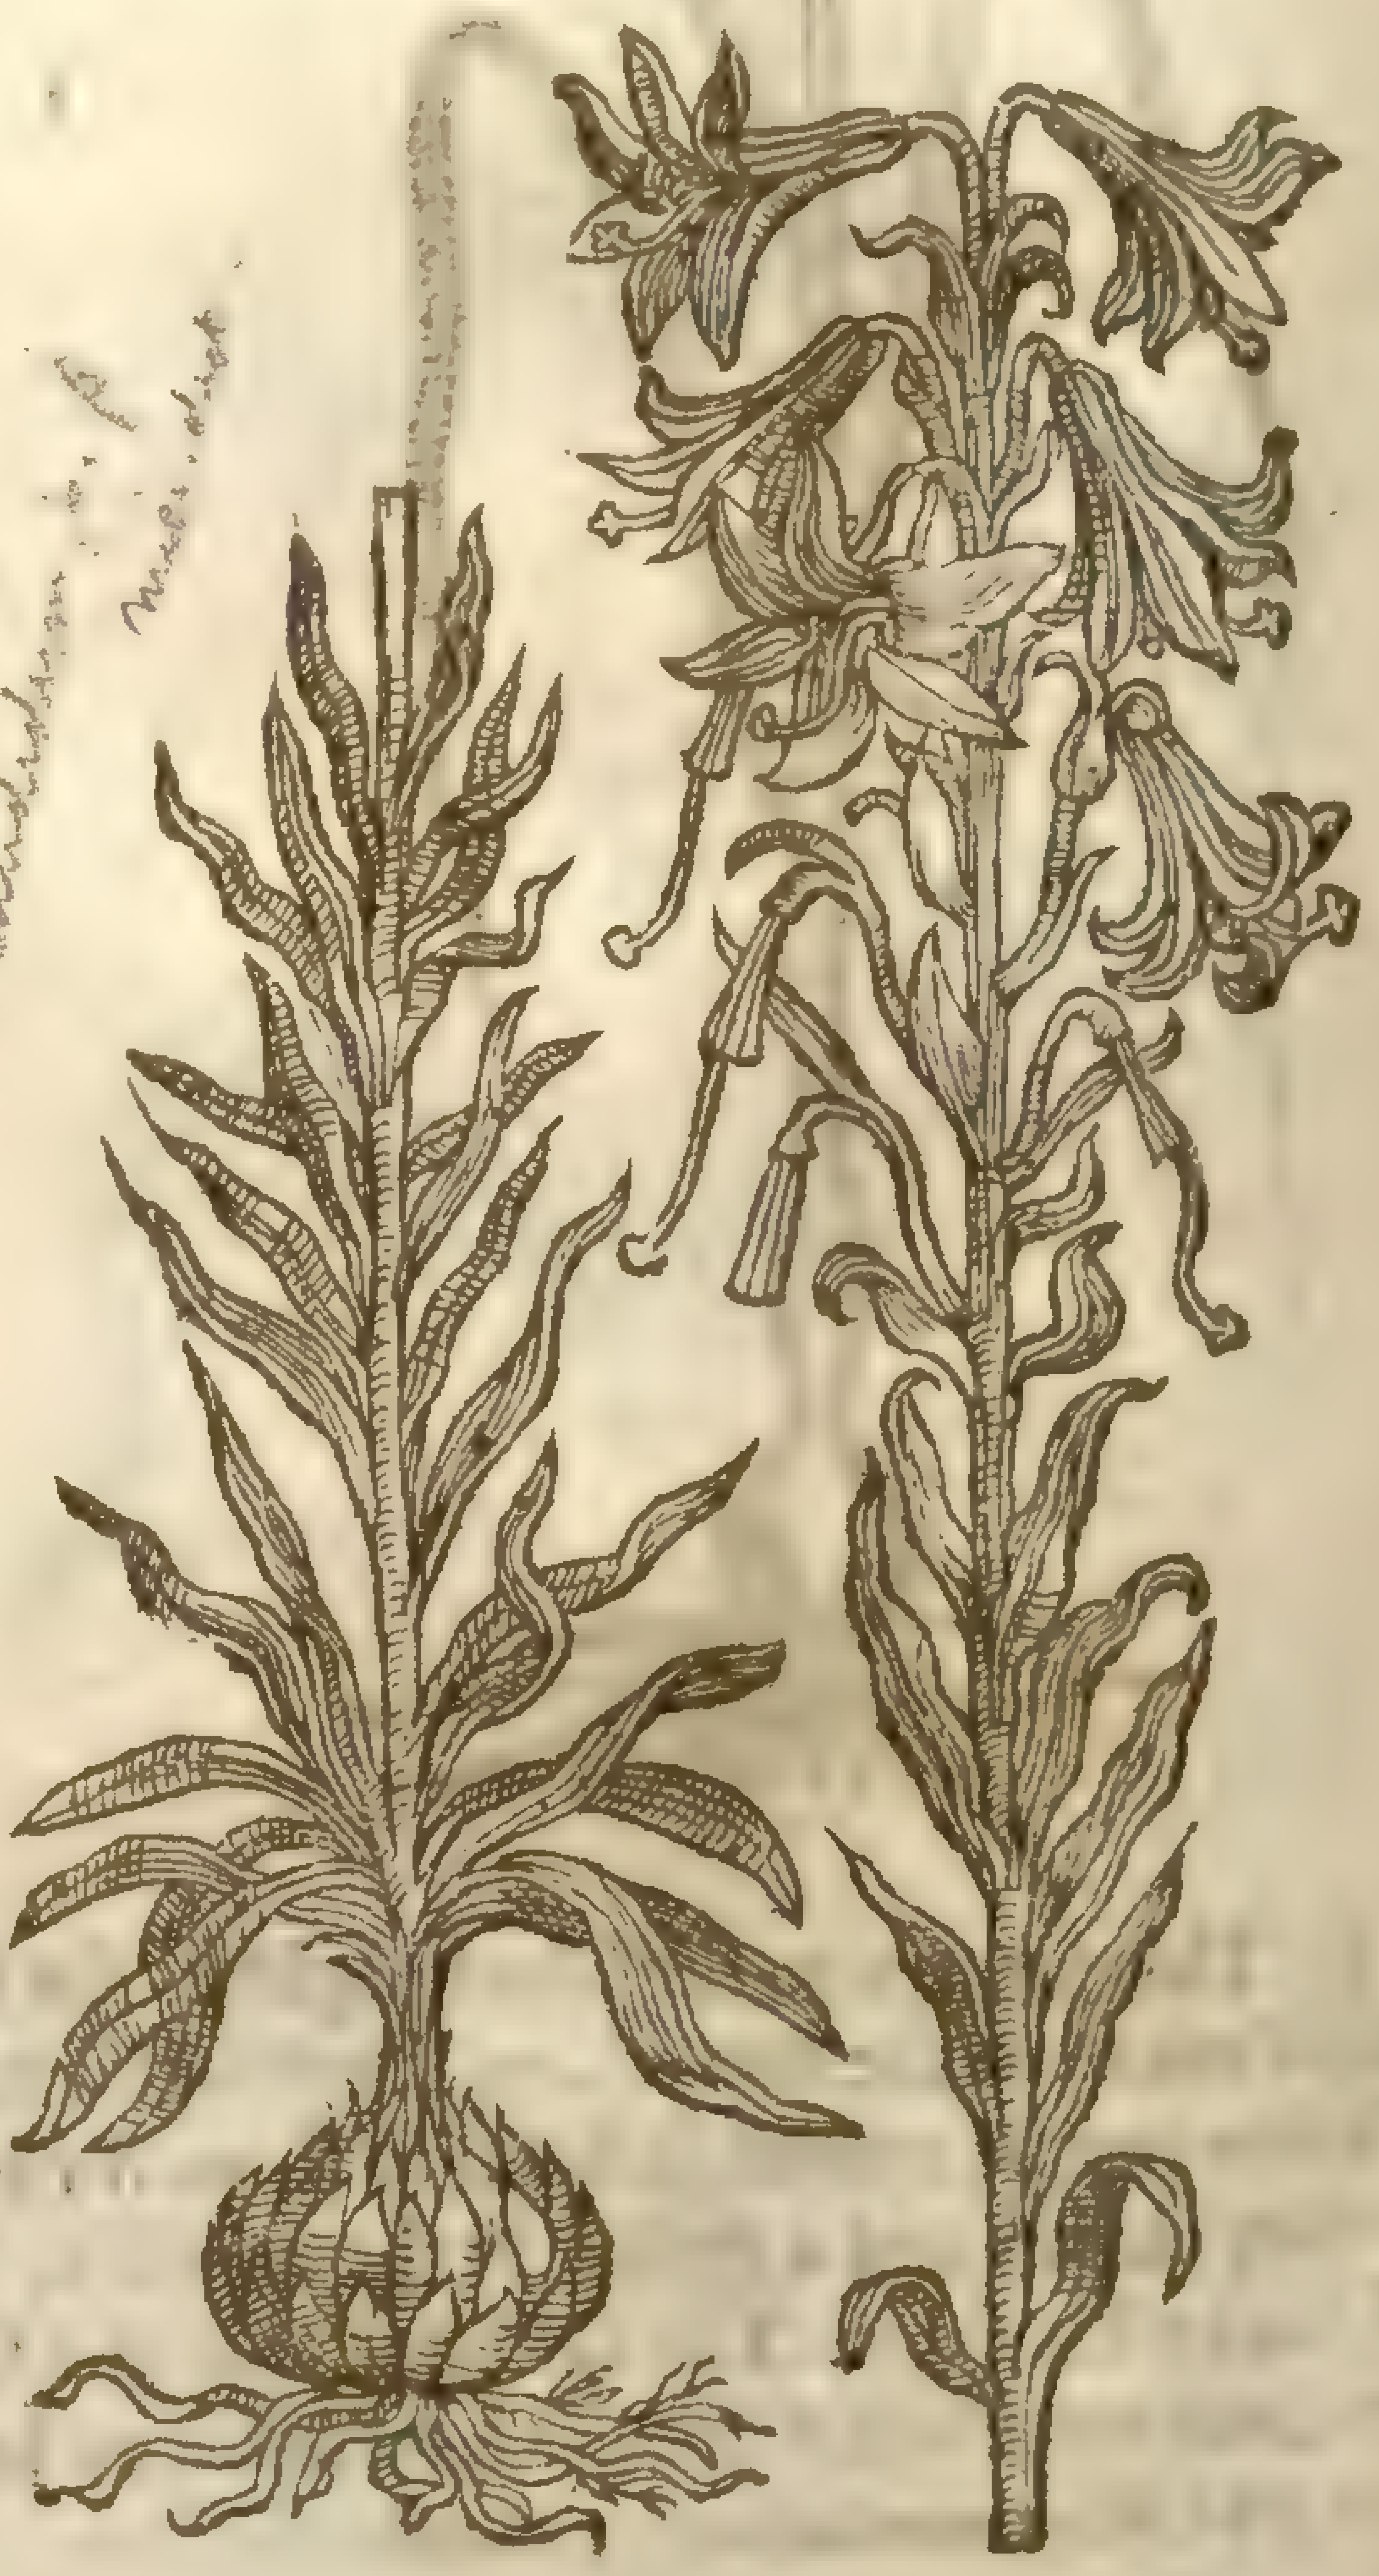
1 *Lilium album.*
The white Lilly.

L. Candidum [illegible]
Mill. dict.



2 *Lilium album Byzantinum.*
The white Lilly of Conſtantinople.

L. candidum [illegible]
Mill. dict.



¶ *The Place.*

Our Engliſh white Lilly groweth in moſt gardens of England. The other groweth naturally in Conſtantinople and the parts adiacent, from whence we had plants for our Engliſh gardens, where they flouriſh as in their owne countrey.

¶ *The Time.*

The Lillies floure from May to the end of Iune.

¶ *The Names.*

The Lilly is called in Greeke κρίνον: in Latine, *Lilium*, and alſo *Roſa Iunonis*, or *Iuno's* Roſe, becauſe as it is reported it came vp of her milke that fell vpon the ground. But the Poets feign, That *Hercules*, who *Iupiter* had by *Alcumena*, was put to *Iuno's* breaſts whileſt ſhee was aſleepe; and after the ſucking there fell away aboundance of milk, and that one part was ſpilt in the heauens, and the other vpon the earth; and that of this ſprang the Lilly, and of the other the circle in the heauens called *Lacteus Circulus*, or the Milky way, or otherwiſe in Engliſh Watling ſtreet. S.*Baſil* in the explication of the 44 Pſalm ſaith, That no floure ſo liuely ſets forth the frailty of mans life as the Lilly. It is called in high-Dutch, **Weiſz Gilgen**: in low-Dutch, **Witte Lilien**: in Italian, *Giglio*: in Spaniſh, *Lirio blanco*: in French, *Lys blanc*: in Engliſh, the white Lilly.

The other is called *Lilium album ByZantinum*, and alſo *Martagon album ByZantinum*: in Engliſh, the white Lilly of Conſtantinople: of the Turks themſelues, *Sultan Zambach*; with this addition, (that they might be the better knowne which kinde of Lilly they meant when they ſent Roots of them into theſe countries) *Fa fiora grandi Bianchi*: ſo that *Sultan Zambach fa fiora grandi Bianchi* is as much to ſay as, Sultans great Lilly with white floures.

¶ *The Nature.*

The white Lilly is hot, and partly of a ſubtill ſubſtance. But if you regard the root, it is dry in the firſt degree, and hot in the ſecond.

¶ *The Vertues.*

The root of the garden Lilly ſtamped with hony gleweth together ſinues that be cut in ſunder. It conſumeth or ſcoureth away the vlcers of the head called Achores, and likewiſe all ſcuruineſſe of the beard and face. A

The roots ſtamped with vineger, the leaues of Henbane, or the meale of Barley, cureth the tumors and impoſtumes of the priuy parts. It bringeth the haire again vpon places which haue bin burned or ſcalded, if it be mingled with oile or greaſe, and the place anointed therewith. B

The ſame root roſted in the embers, and ſtamped with ſome leauen of Rie bread & hogs greaſe, breaketh peſtilential botches. It ripeneth apoſtumes in the flanks, comming of venerie and ſuch like. C

The floures ſteeped in oile Oliue, and ſhifted two or three times during Sommer, and ſet in the Sun in a ſtrong glaſſe, is good to harden the ſoftneſſe of ſinues, and the hardneſſe of the matrix. D

Florentinus a writer of Husbandry ſaith, That if the root be curiouſly opened, and therein be put ſome red, blew, or yellow colour that hath no cauſticke or burning qualitie, it will cauſe the floure to be of the ſame colour. E

Iulius Alexandrinus the Emperours Phyſitian ſaith, That the water thereof diſtilled and drunke, cauſeth eaſie and ſpeedy deliuerance, and expelleth the ſecondine or after-burthen in moſt ſpeedy manner. F

He alſo ſaith, The leaues boiled in red wine, and applied to old wounds or vlcers, do much good and forward the cure, according to the doctrine of *Galen, lib.7. de ſimpl. med. facultat.* G

The root of a white Lilly ſtamped and ſtrained with wine, and giuen to drinke for two or three dayes together, expelleth the poiſon of the peſtilence, and cauſeth it to breake forth in bliſters in the outward part of the skin, according to the experience of a learned Gentleman Mr *William Godorus*, Sergeant Surgeon to the Queens Majeſtie; who alſo hath cured many of the dropſie with the juice thereof tempered with Barly meale, and baked in cakes, and ſo eaten ordinarily for ſome moneth or ſix weeks together with meat, but no other bread during that time. H

Chap. 103. *Of Red Lillies.*

¶ *The Kindes.*

There be likewiſe ſundry ſorts of Lillies, which we do comprehend vnder one generall name in Engliſh, Red Lillies, whereof ſome are of our owne countries growing, and others of beyond the ſeas, the which ſhall be diſtinguiſhed ſeuerally in this chapter that followeth.

¶ *The Deſcription.*

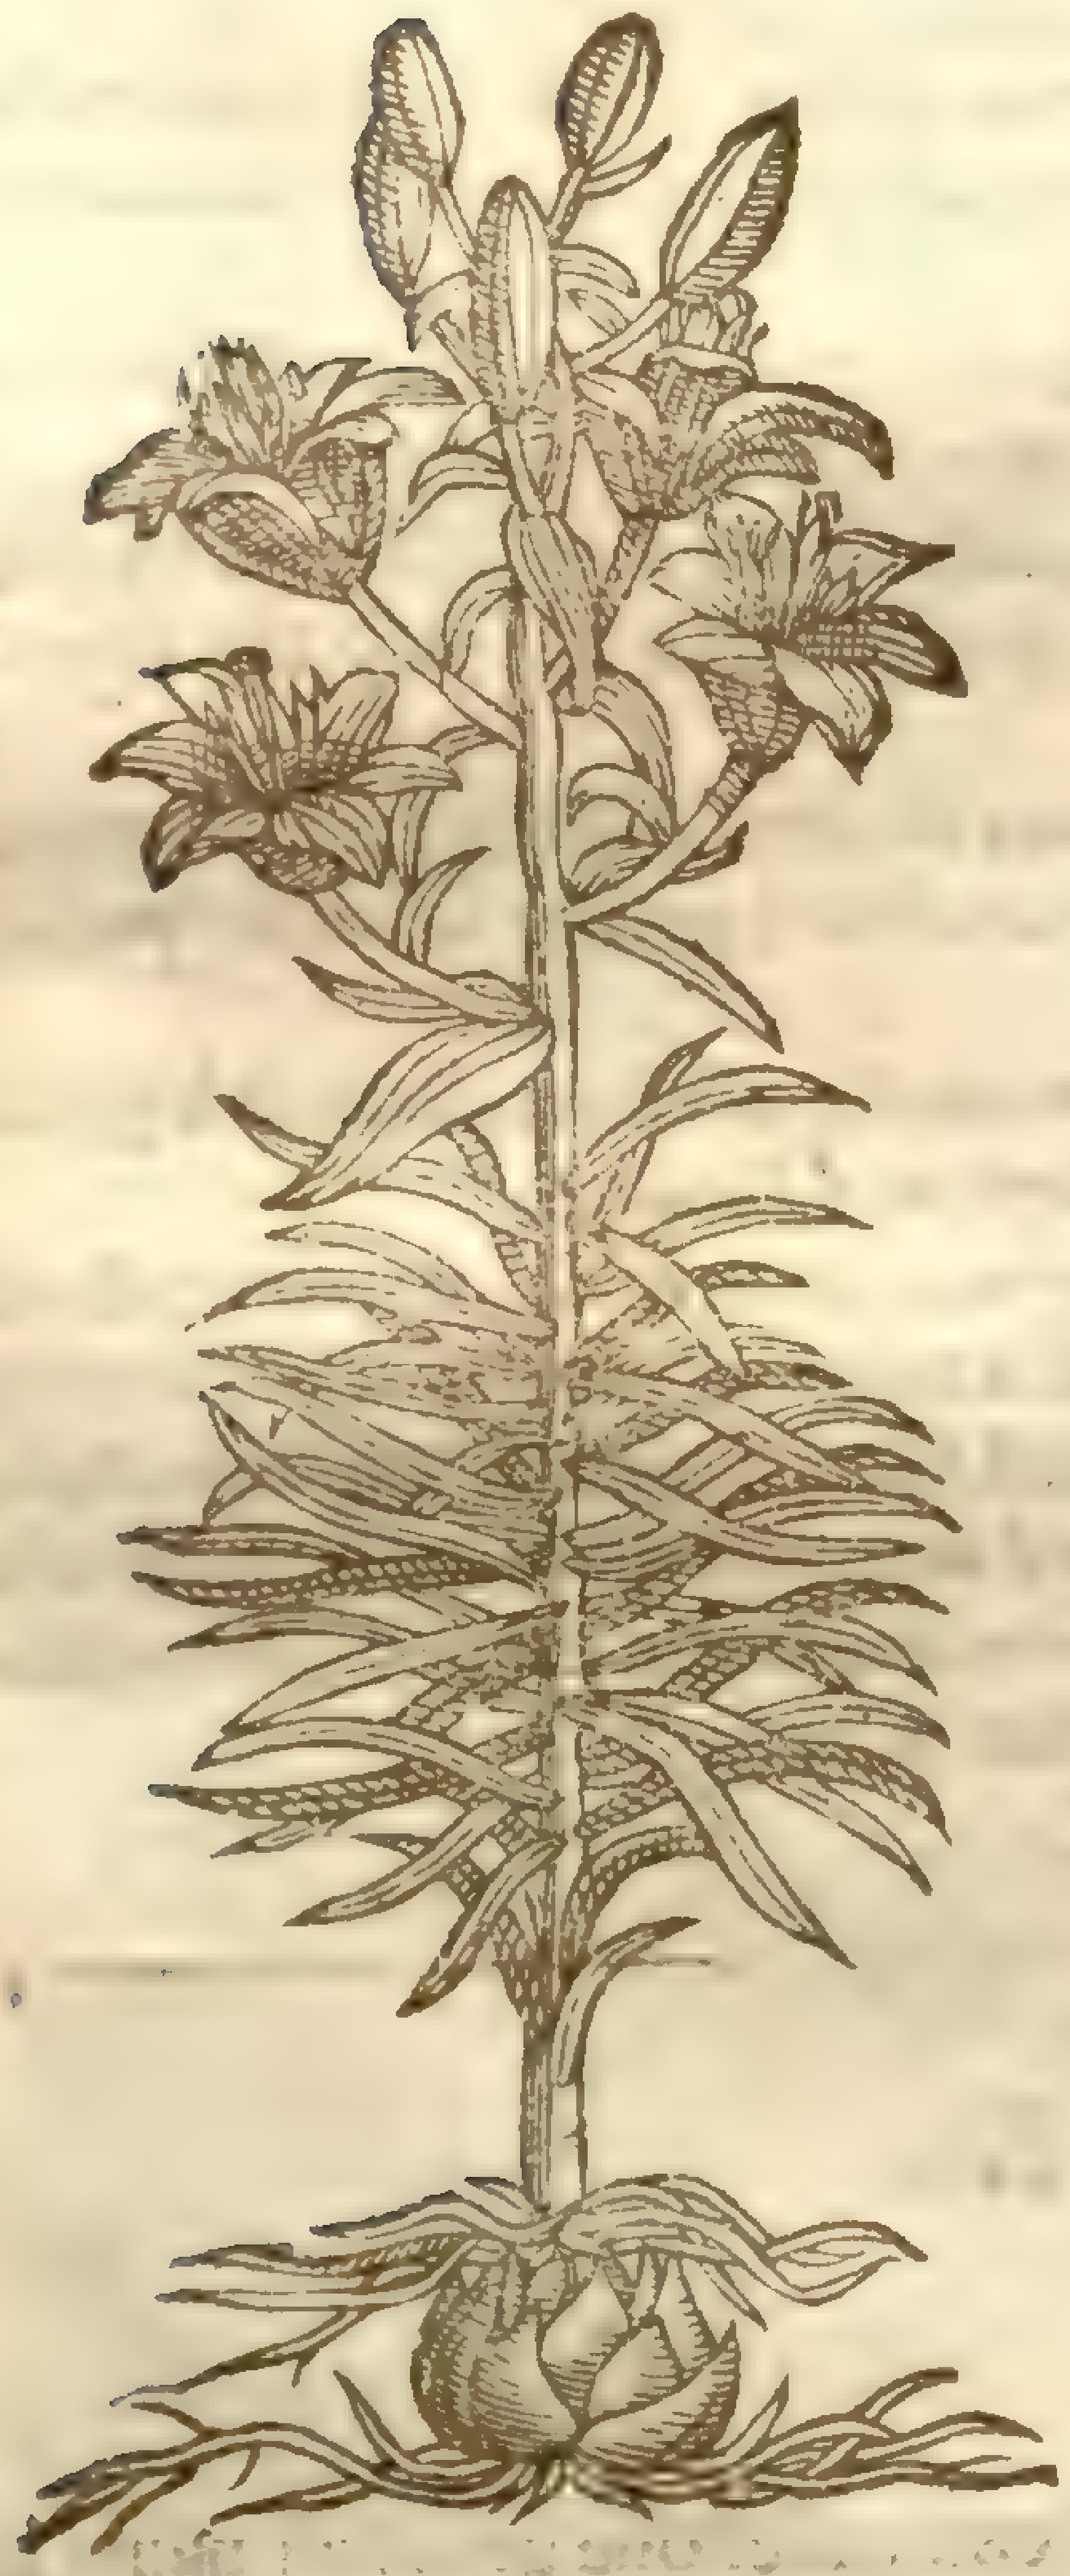
1 The gold-red Lilly groweth to the height of two, and ſomtimes three cubits, and often higher than thoſe of the common white Lilly. The leaues be blacker and narrower, ſet very thicke about the ſtalke. The floures in the top be many, from ten to thirty, according to the age of the plant, and fertilitie of the ſoile, like in forme and greatneſſe to thoſe of the white Lilly, but of a white colour tending to a Saffron, ſprinckled or poudred with many little blacke ſpecks, like to rude vnperfect draughts of certaine letters. The roots be great bulbs, conſiſting of many cloues, as thoſe of the white Lilly.

‡ 2 In ſtead of the Plantain leaued Red Lilly, deſcribed and figured in this ſecond place by our Author out of *Tabernamontanus*, for that I iudge both the figure and deſcription counterfeit, I haue omitted them, and here giue you the many-floured red Lilly in his ſtead. This hath a root like that of the laſt deſcribed, as alſo leaues and ſtalks; the floure alſo in ſhape is like that of the former, but of a more light colour, and in number of floures it exceedeth the precedent, for ſometimes it beares ſixty floures vpon one ſtalke. ‡

† 3 This red Lilly is like vnto the former, but not ſo tall; the leaues be fewer in number, broader, and downy towards the top of the ſtalke, where it bears ſome bulbes. The floures in ſhape are like the former, ſauing that the colour hereof is more red, and thicke daſht with black ſpeckes. The root is ſcaly like the former.

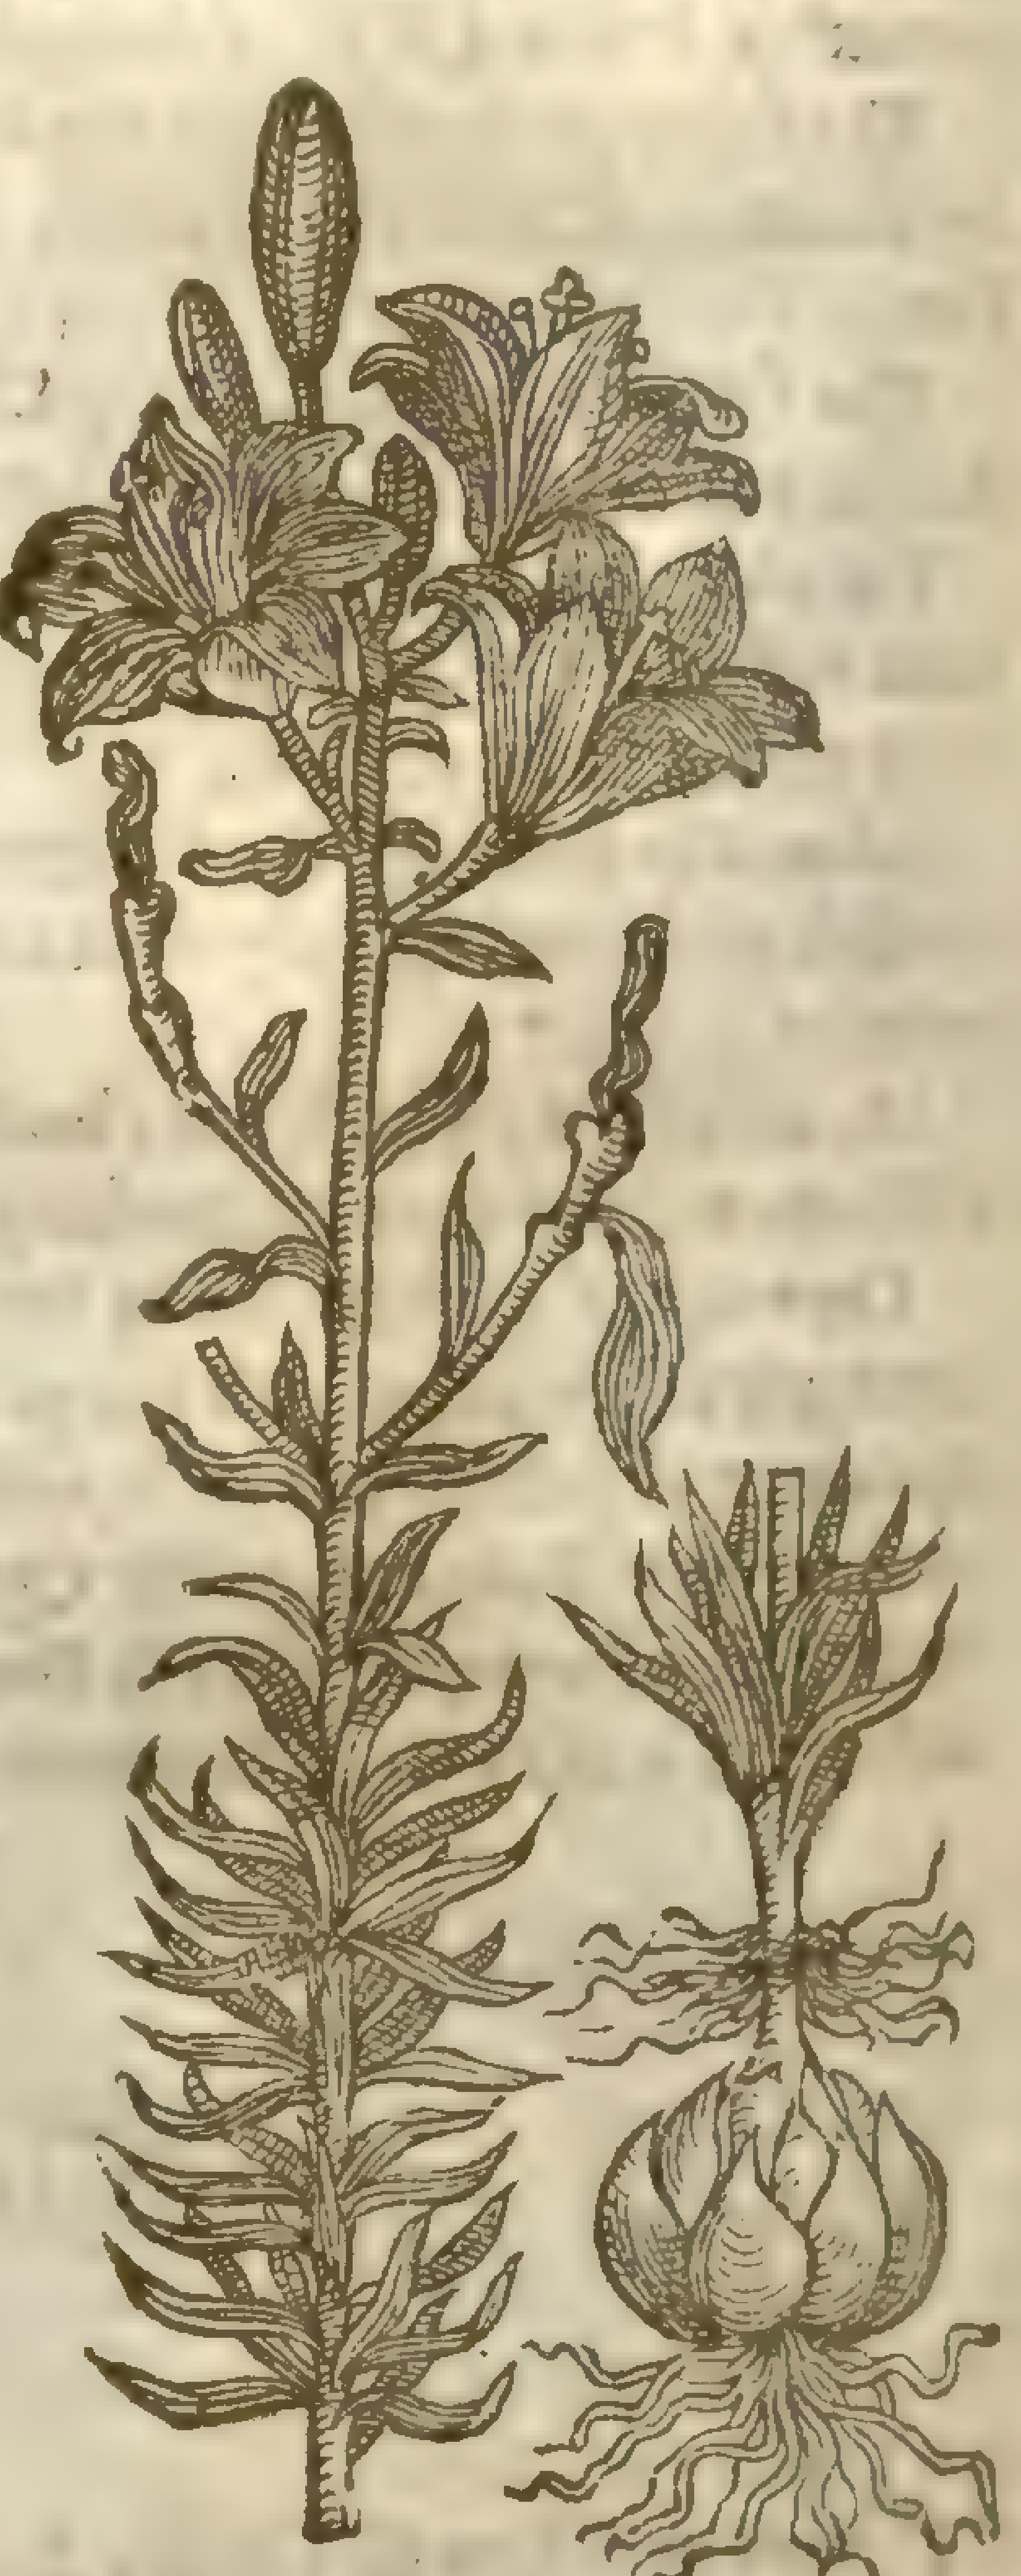
4 There is another red Lilly which hath many leaues ſomewhat ribbed, broader than the laſt mentioned, but ſhorter, and not ſo many in number. The ſtalke groweth to the height of two cubits, and ſomtimes higher, whereupon do grow floures like the former: among the foot-ſtalkes of which floures come forth certaine bulbes or cloued roots, browne of colour, tending vnto rednes, which do fall in the end of Auguſt, vpon the ground, taking root and growing in the ſame place, whereby it greatly encreaſeth; for ſeldome or neuer it bringeth forth ſeed for his propagation.

1 *Lilium aureum.*
Gold-red Lilly.



L. bulbiferum L. 5.
Mill. dict.

2 † *Lilium rubrum.*
The red Lilly.



L. bulbiferum L. 5.
Mill. dict.

5 There is another ſort of red Lilly hauing a faire ſcaly or cloued root, yellow aboue, and browne toward the bottom; from which riſeth vp a faire ſtiffe ſtalk creſted or furrowed, of an ouerworne browne colour, ſet from the lower part to the branches, whereon the floures do grow, with many leaues, confuſedly placed without order. Among the branches cloſe by the ſtem grow forth certaine cloues or roots of a reddiſh colour, like vnto the cloues of garlicke before they be pilled: which beeing fallen vpon the ground at their time of ripeneſſe, doe ſhoot forth certaine tender ſtrings or roots that do take hold of the ground, whereby it greatly encreaſeth. The floures are in ſhape like the other red Lillies, but of a darke Orange colour, reſembling a flame of fire ſpotted with blacke ſpots.

‡ 6 This hath a much ſhorter ſtalke, being but a cubit or leſſe in height, with leaues blac-

kiſh, and narrower than thoſe aforeſaid. The floures, as in the reſt, grow out of the top of the ſtalk, and are of a purpliſh Saffron colour, with ſome blackiſh ſpots. The root in ſhape is like the precedent. ‡

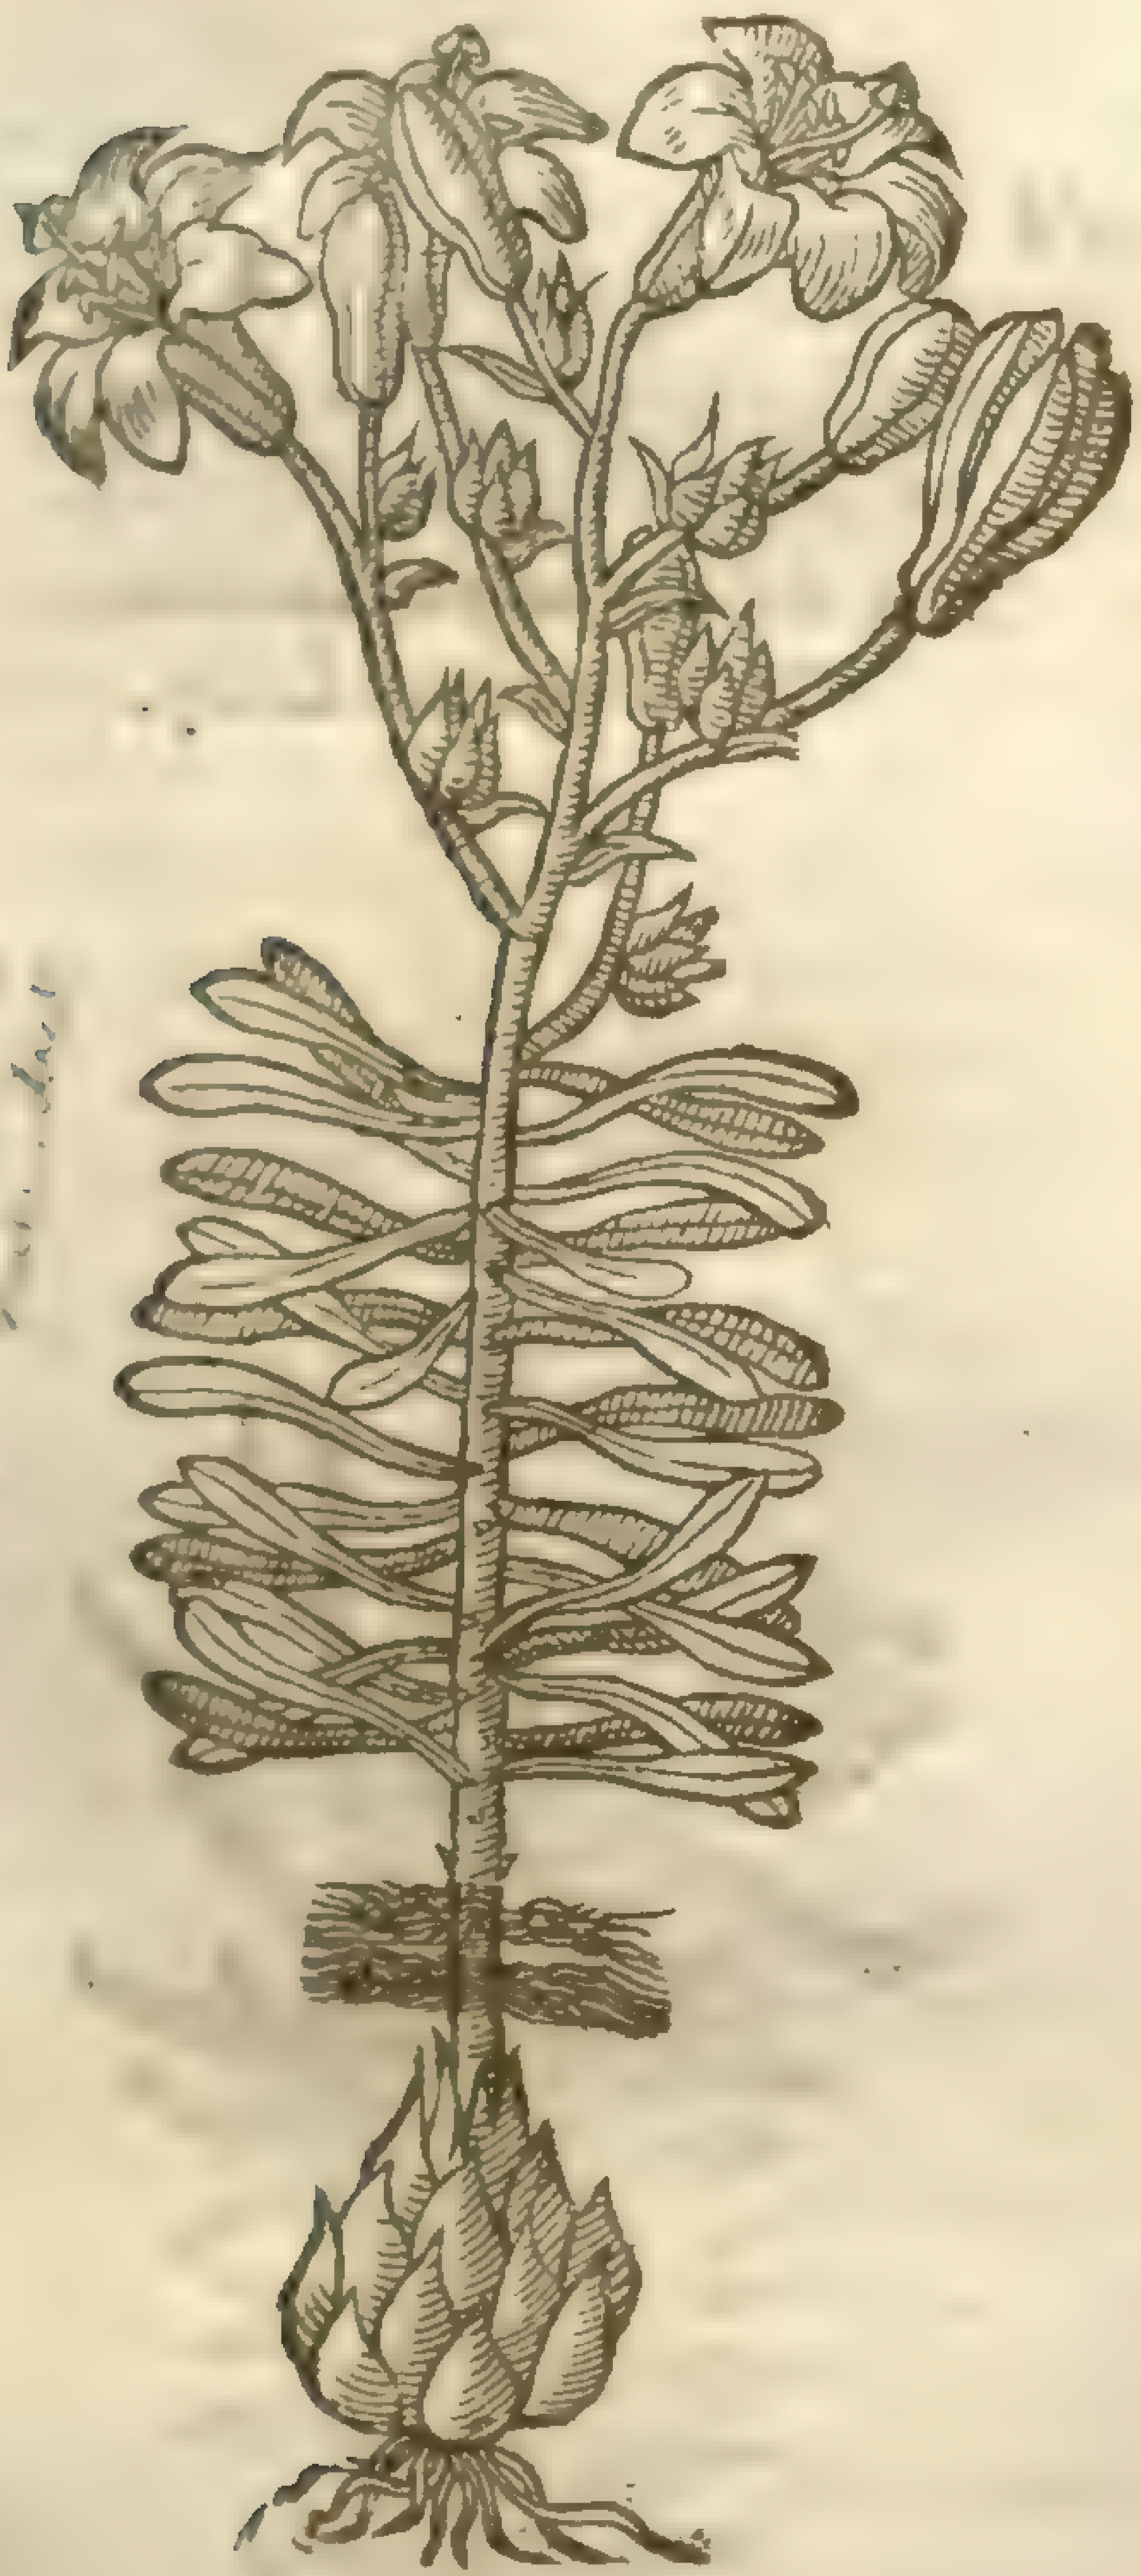
¶ *The Place.*

Theſe Lillies do grow wilde in the plowed fields of Italy and Languedocke, in the mountaines and vallies of Hetruria and thoſe places adiacent. They are common in our Engliſh gardens, as alſo in Germanie.

¶ *The Time.*

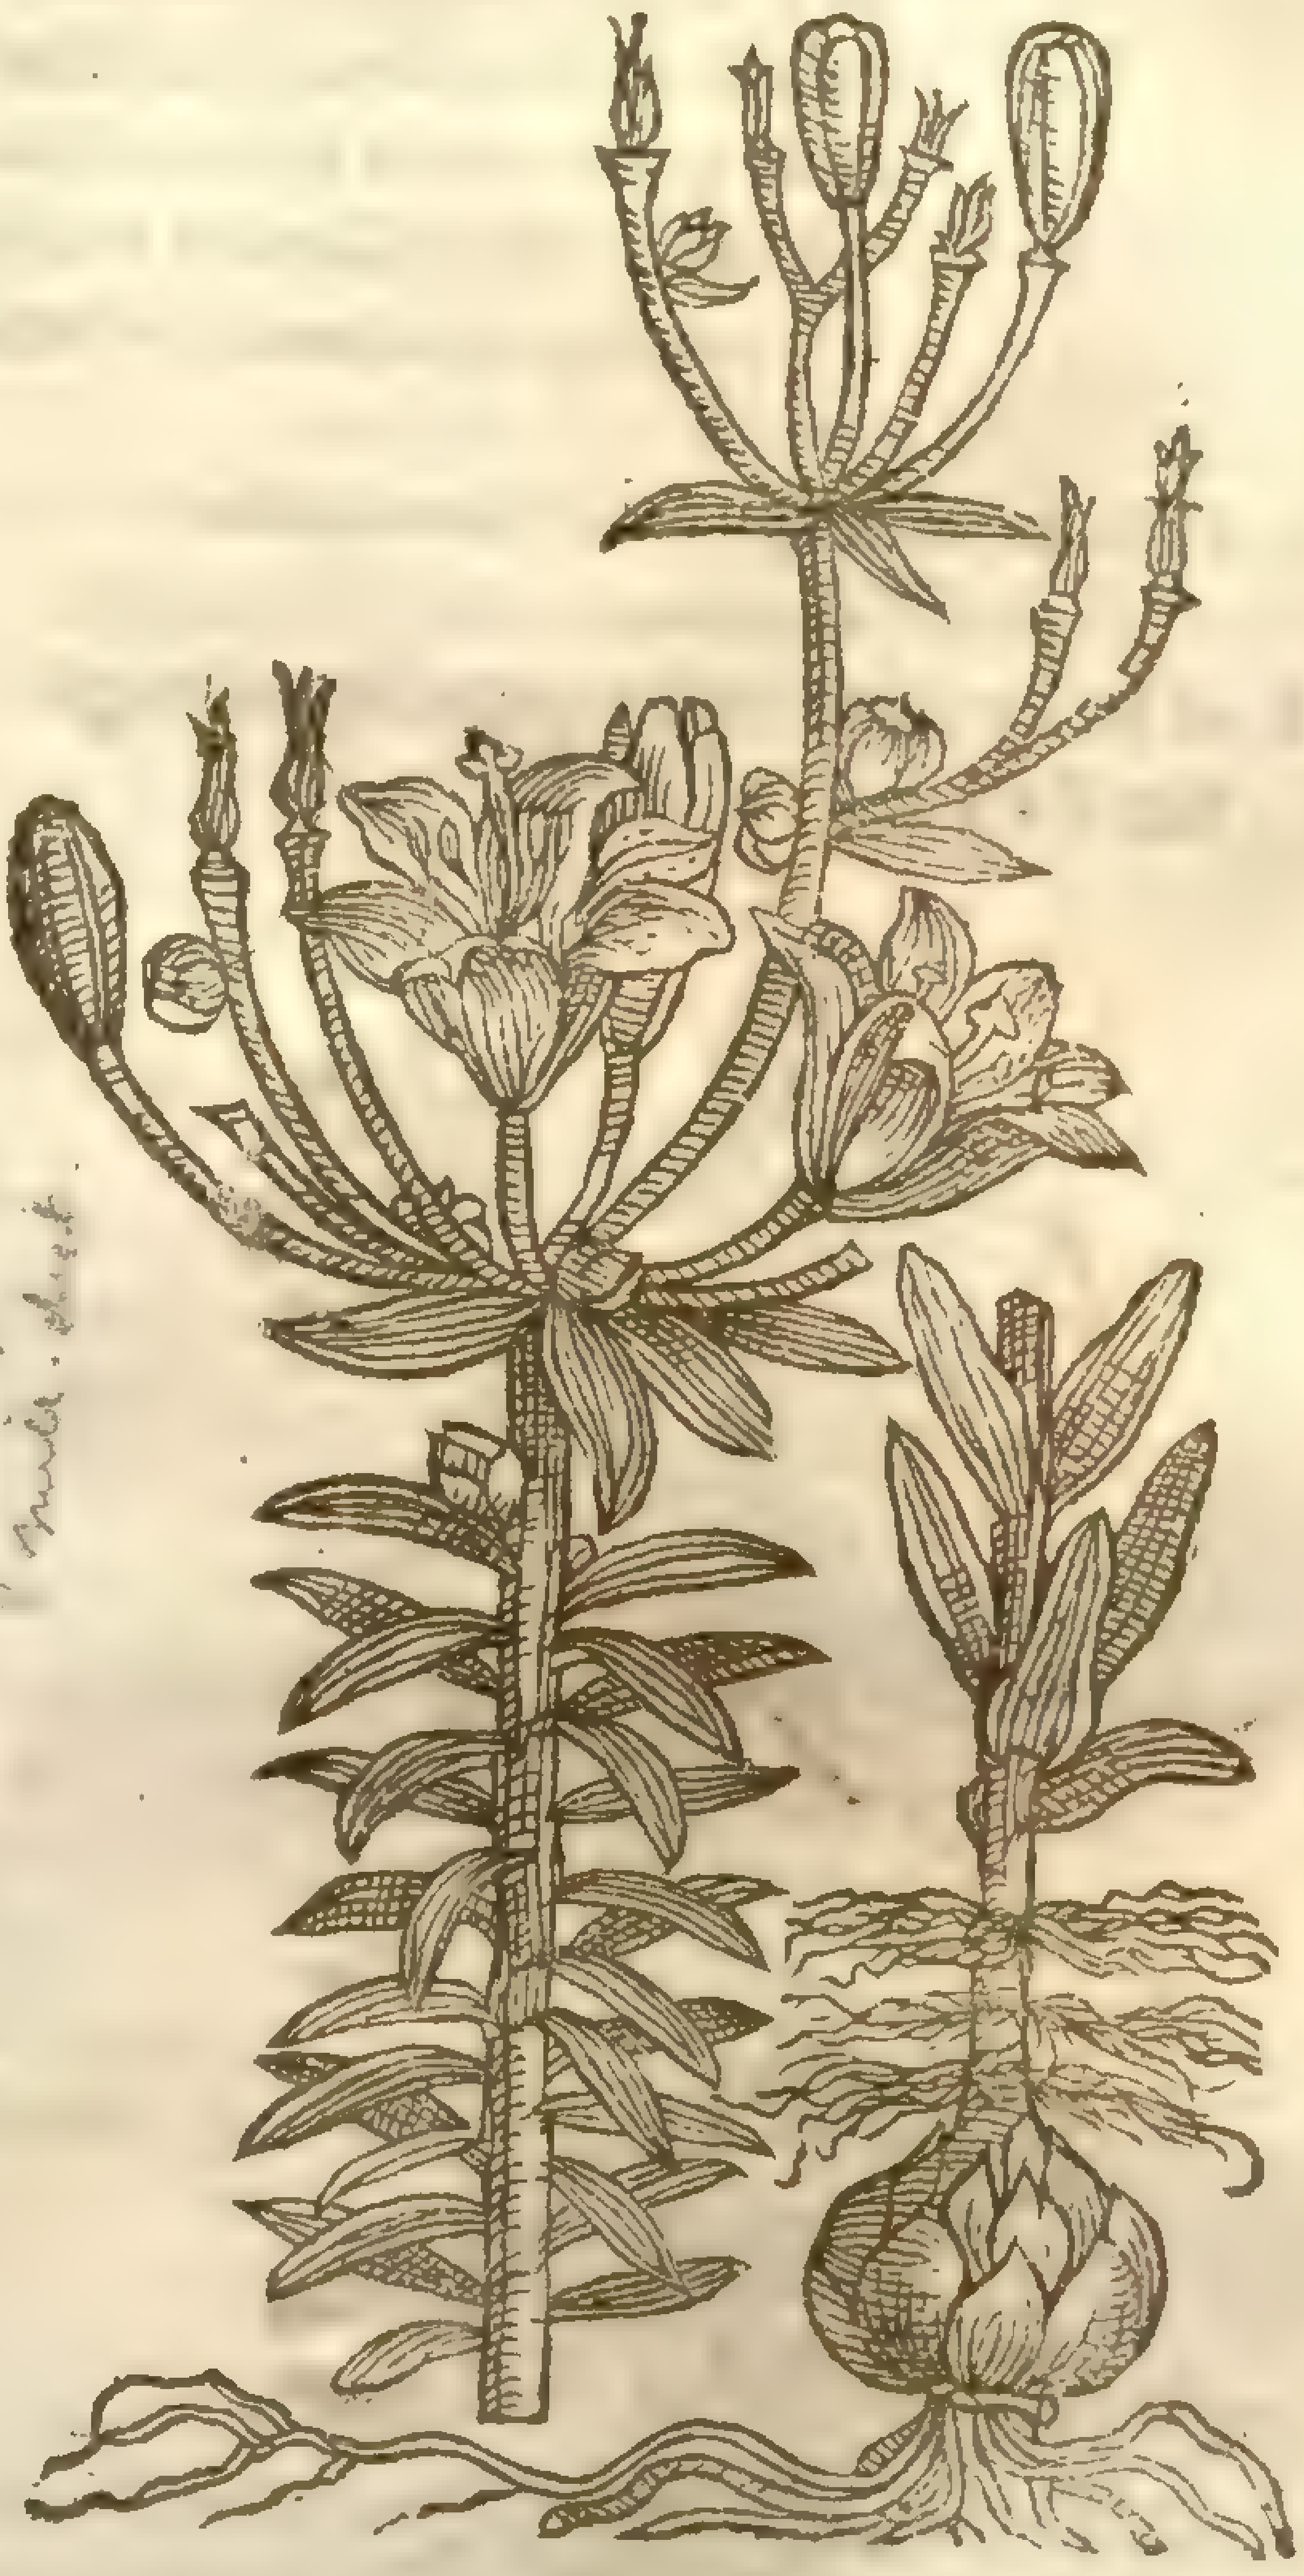
Theſe red Lillies do floure commonly a little before the white lillies, and ſometimes together with them.

3 *Lilium cruentum latifolium.*
The fiery red Lilly.



bulbiferum L.

‡ 4 ***Lilium cruentum bulbiferum.***
Red bulbe-bearing Lilly.



L. bulbiferum L.

¶ *The Names.*

‡ 1 The firſt of theſe is thought by ſome to be the *Bulbus cruentus* of *Hippocrates*: as alſo the *Lilium purpureum* of *Dioſcorides*. Yet *Matthiolus* and ſome others would haue it his *Hemerocallis*. *Dodonæus* and *Bapt. Porta* think it the *Hyacinthus* and *Coſmoſandalos* of the Poets, of which you ſhal find more hereafter. It is the *Martagon Chymiſtarum* of *Lobel*; and the *Lilium aureum majus* of *Tabernamontanus*.

2 This is *Martagon Chymiſtarum alterum* of *Lobel*. 3 This is *Cluſius* his *Martagon bulbiferum ſecundum*. 4 *Martagon bulbiferum primum* of *Cluſius*. 5 This *Dodonæus* cals *Lilium purpureum tertium*, and it is *Martagon bulbiferum tertium* of *Cluſius*. 6 This laſt *Lobel* and *Dodonæus* call *Lilium purpureum minus*.

I haue thought good here alſo to giue you that diſcourſe touching the Poets Hyacinth, which being tranſlated out of *Dodonæus*, was formerly vnfitly put into the chapter of Hyacinths, which therefore I there omitted, and haue here reſtored to his due place, as you may ſee by *Dodon. Pemp.* 2 *lib.* 2. *cap.* 2. ‡

† There is a Lilly which *Ovid, Metamorph. lib.* 10. calls *Hyacinthus*, of the boy *Hyacinthus*, of whoſe bloud he feigned that this floure ſprang, when hee periſhed as he was playing with *Apollo*

for whoſe ſake he ſaith that *Apollo* did print certain letters and notes of his mourning. Theſe are his words:

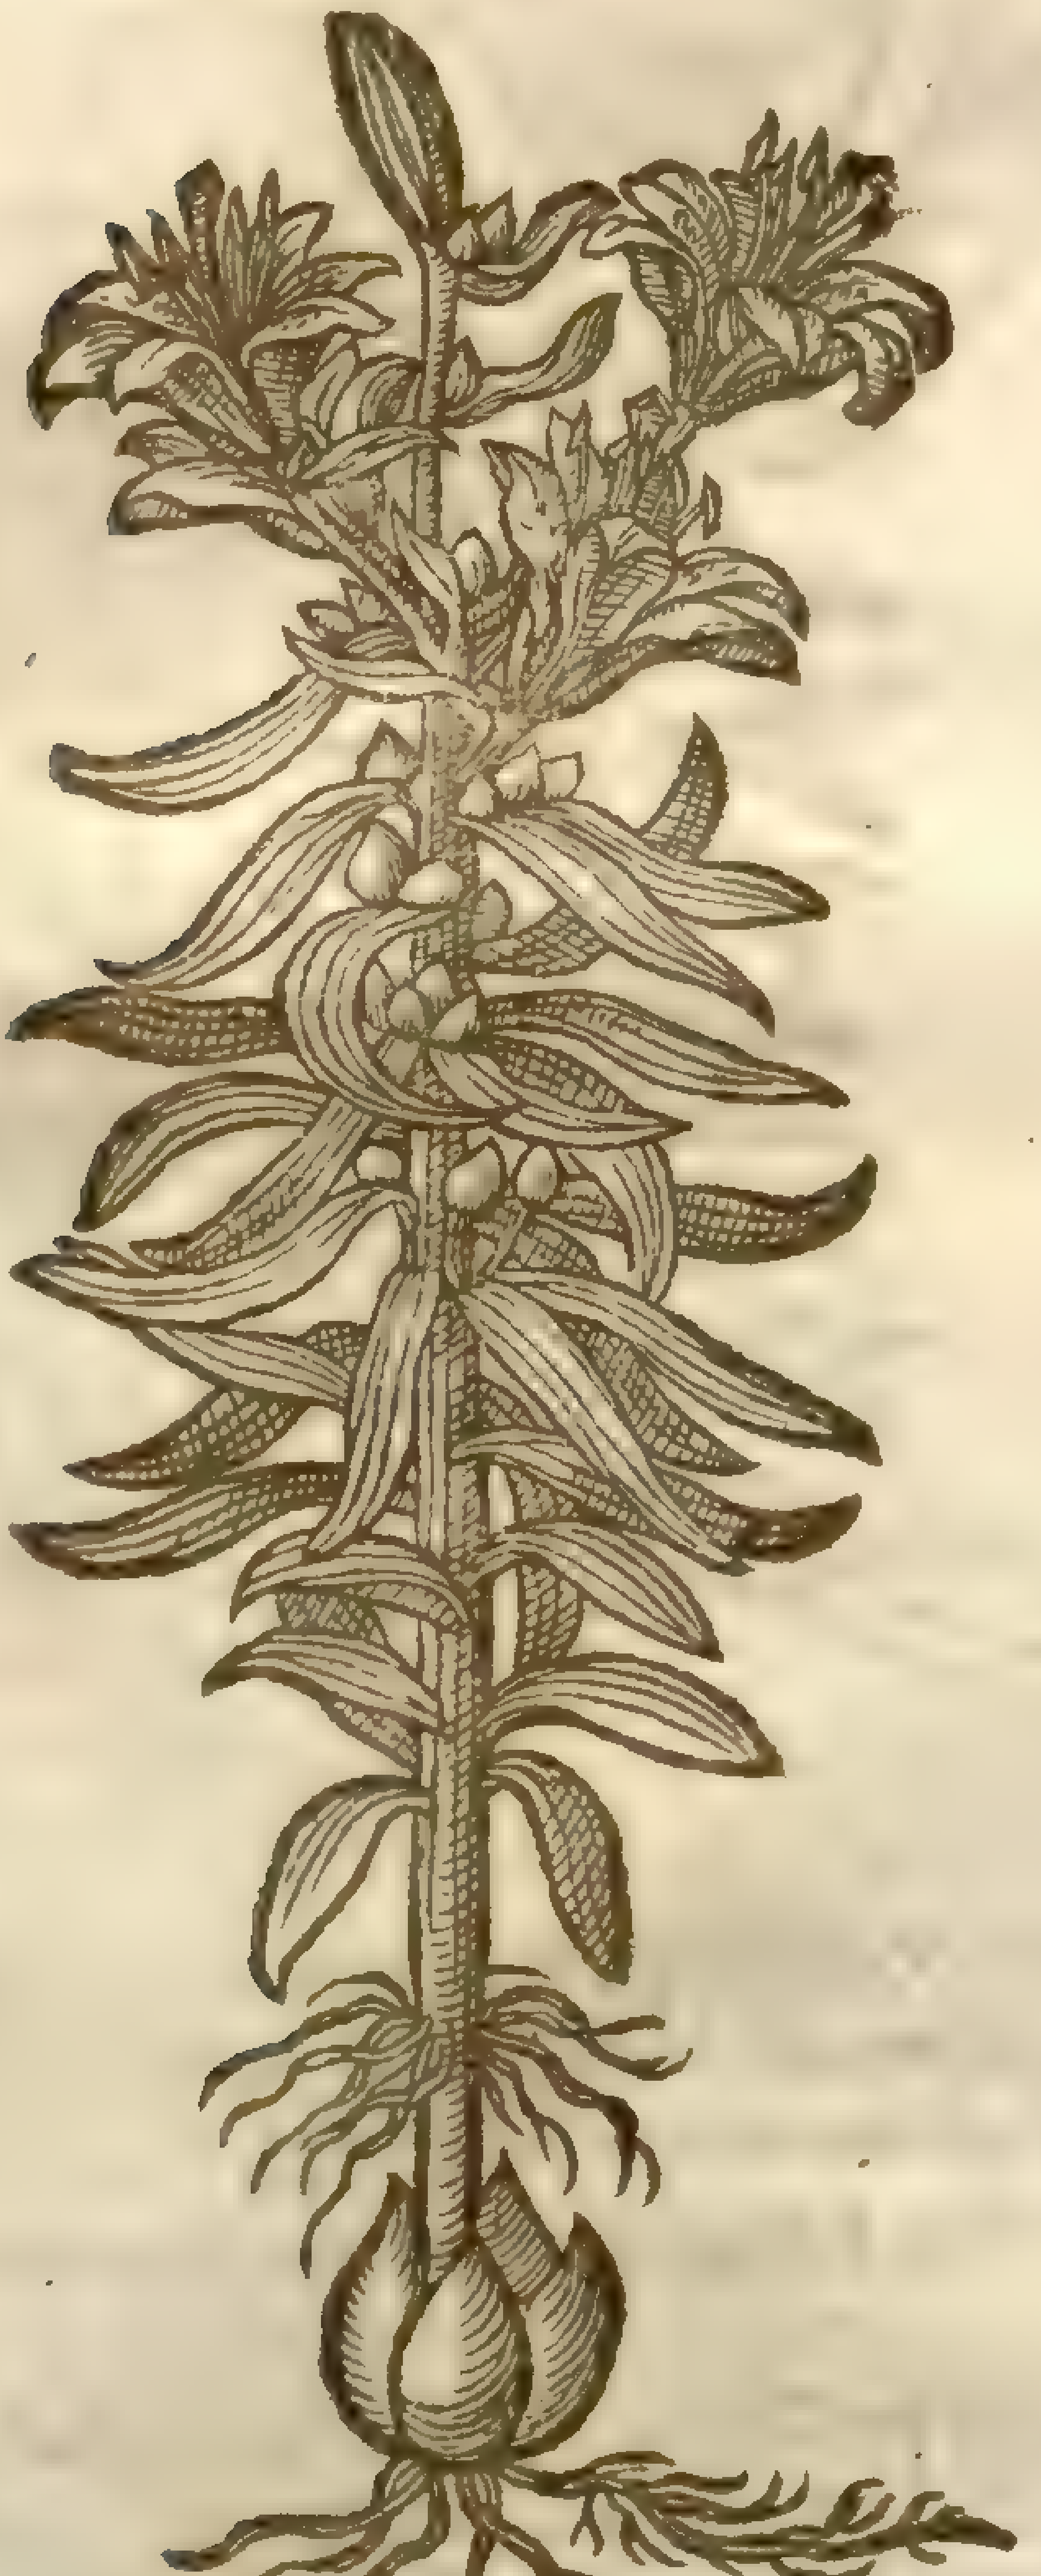
Ecce cruor, qui fuſus humo ſignauerat herbas,
Deſinit eſſe cruor, Tyrioque nitentior oſtro
Flos oritur, formamque capit, quam Lilia, ſi non
Purpureus color his argenteus eſſet in illis.
Non ſatis hoc Phœbo eſt, (is enim fuit auctor honoris)
Ipſe ſuos gemitus folijs inſcribit, & ai ai,
Flos habet inſcriptum, funeſtaque litera ducta eſt.

Which lately were elegantly thus rendred in Engliſh by Mr *Sands*:

Behold! the bloud which late the graſſe had dy'de
Was now no bloud: from whence a floure full blowne,
Far brighter than the Tyrian skarlet ſhone:
Which ſeem'd the ſame, or did reſemble right
A Lilly, changing but the red to white.
Nor ſo contented, (for the youth receiv'd
that grace from *Phœbus*) in the leaues he weav'd
The ſad impreſſion of his ſighs, Ai, Ai,
They now in funerall characters diſplay.

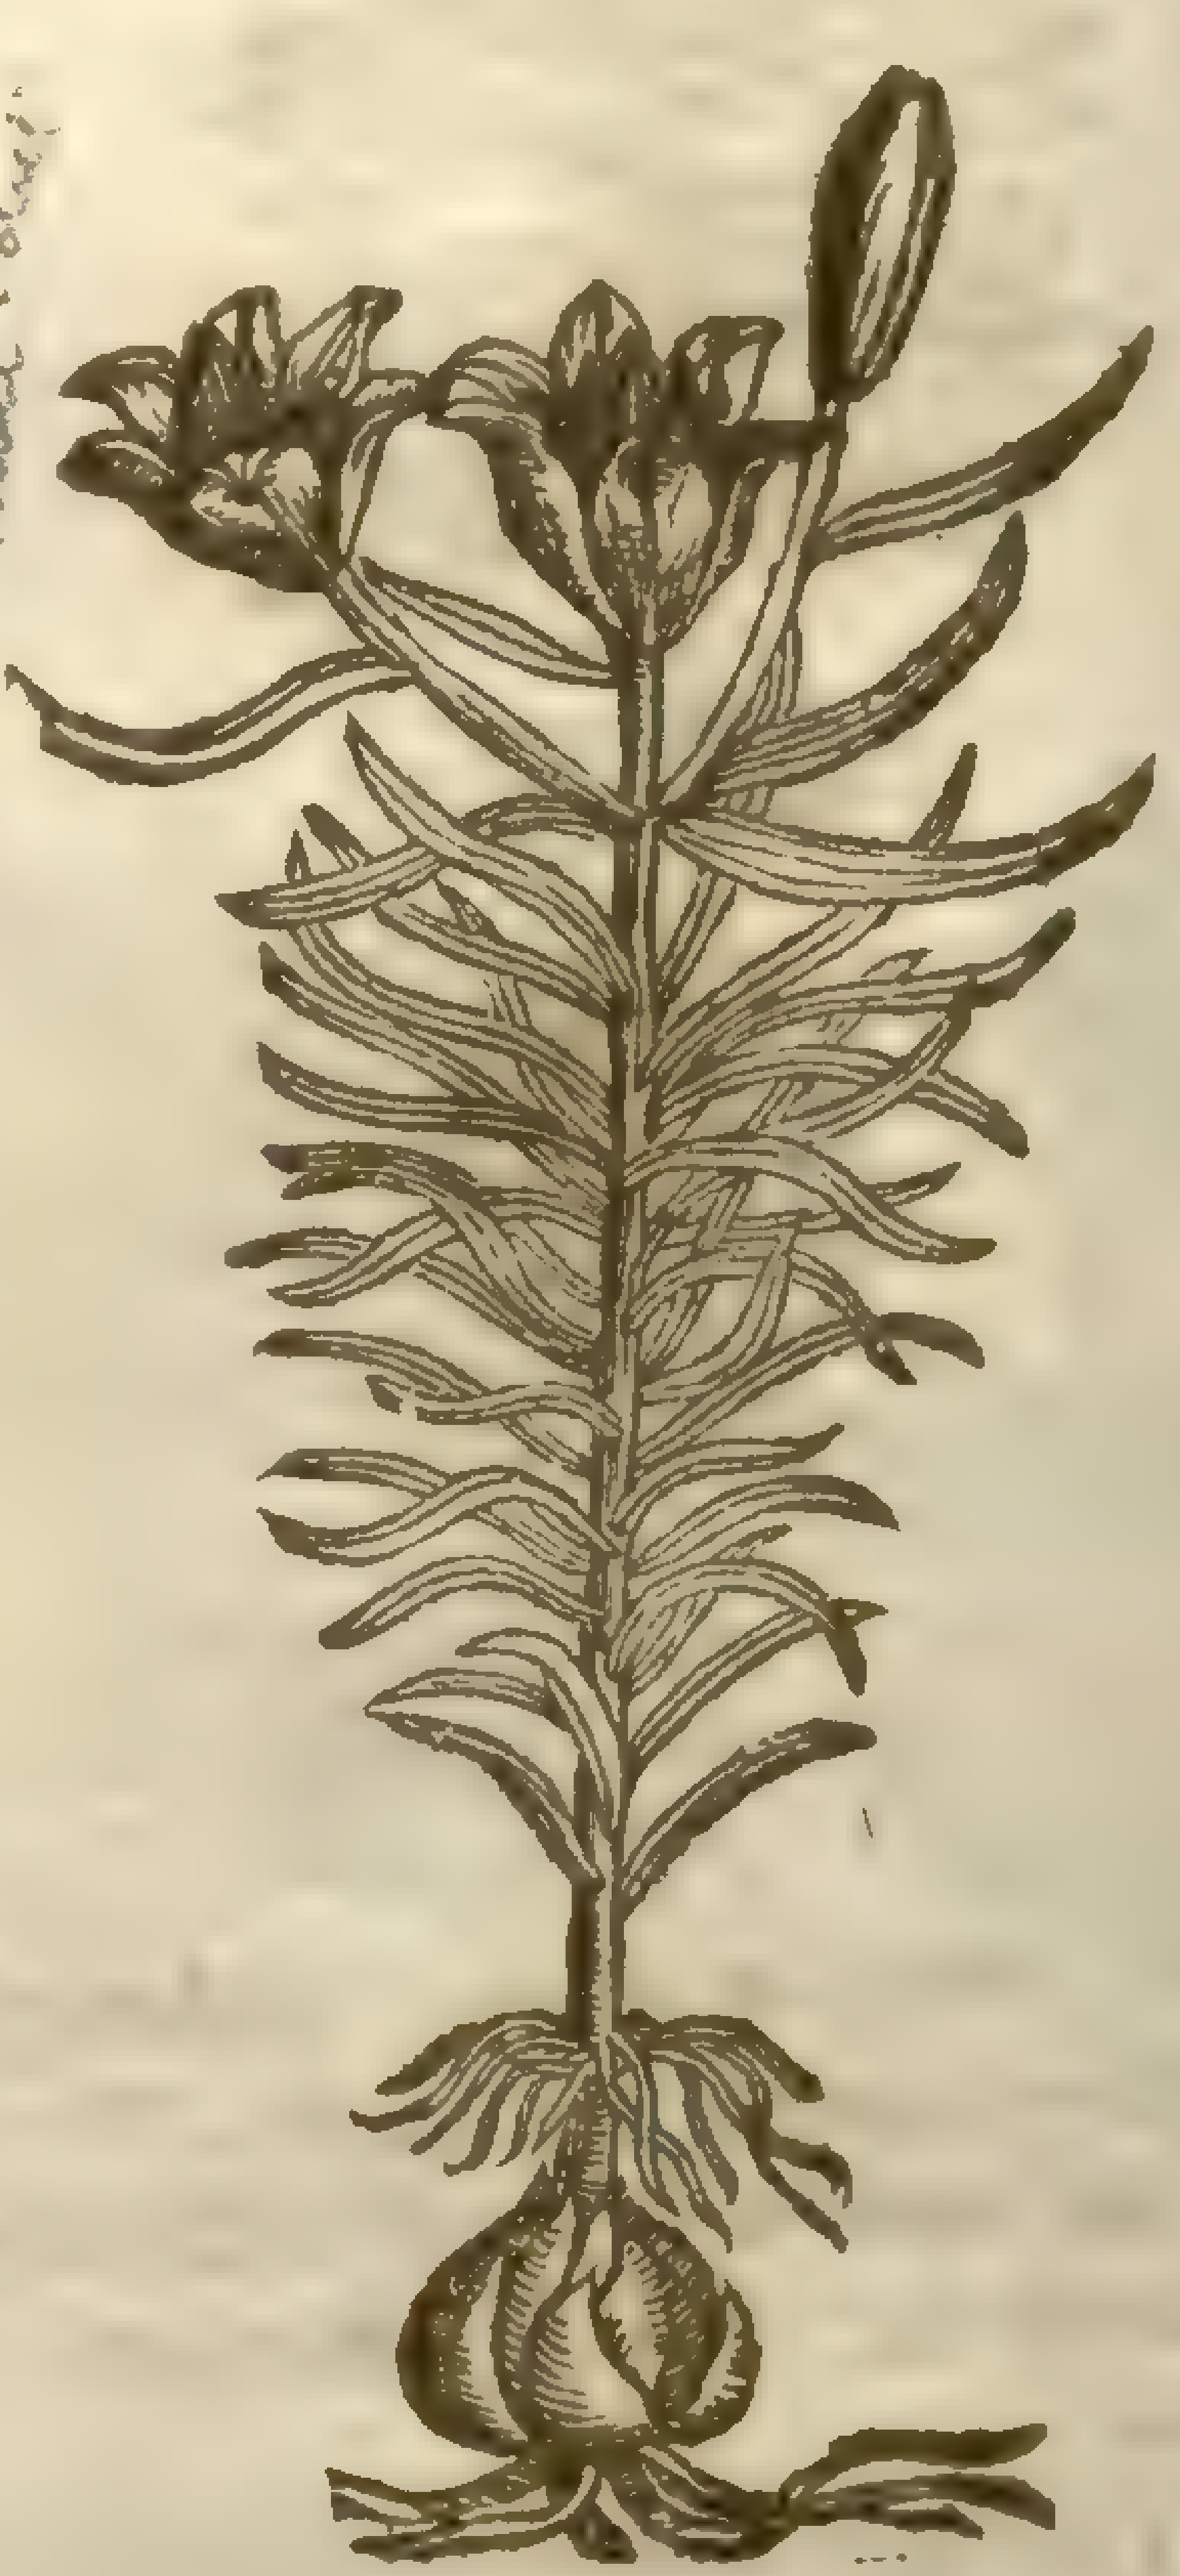
‡ 5 *Lilium cruentum ſecundum caulem bulbulis donatum.*
Red Lilly with bulbs growing alongſt the ſtalke.

L. bulbif[illegible]



‡ 6 *Lilium purpureum minus.*
The ſmall red Lilly.

L. bulbiferum, [illegible] [illegible] minus [illegible]



Theocritus alſo hath made mention of this Hyacinth in *Bions* Epitaph, in the 19 Eidyl, which Eidyl by ſome is attributed to *Moſchus*, and made his third. The words are theſe:

Νῦν ὑάκινθε λάλει τὰ σὰ γράμματα καὶ πλέον αἶ αἶ·
Λάμβανε σοῖς πετάλοισι.

In Engliſh thus:
Now Iacinth ſpeake thy letters, and once more
Imprint thy leaues with Ai, Ai, as before.

Likewiſe *Virgil* hath written hereof in the third *Eclog* of his *Bucolicks*.

Et me Phœbus amat, Phœbo ſua ſemper apud me
Munera ſunt, Lauri & ſuave rubens Hyacinthus.

Phœbus loues me, his gifts I alwayes haue,
Thee're green Laurel and the Iacinth braue.

In like maner alſo *Nemetianus* in the 2 *Eclog* of his *Bucolicks*:

Te ſine me miſero mihi Lilia nigra videntur,
Pallenteſque Roſæ, nec dulce rubens Hyacinthus:
At ſi tu venias, & candida Lilia fient
Purpureaque Roſæ & dulce rubens Hyacinthus.

Without thee, Loue, the Lillies blacke do ſeem,
The Roſes pale, and Hyacinths I deeme
Not louely red. But if thou com'ſt to me,
Lillies are white, red Roſe and Iacinths be.

The Hyacinths are ſaid to be red which *Ovid* calleth purple; for the red colour is ſometimes termed purple. Now it is thought that *Hyacinthus* is called *Ferrugineus*, for that it is red of a ruſtie iron colour: for as the putrifaction of braſſe is named *Ærugo*, ſo the corruption of iron is called *Ferrugo*, which from the reddiſh colour is ſtiled alſo *Rubigo*. And certainly they are not a few that would haue *Color ferrugineus* to be ſo called from the ruſt which they thinke *Ferrugo*. Yet this opinion is not allowed of by all men; for ſome iudge, that *Color ferrugineus* is inclining to a blew, for that when the beſt iron is heated and wrought, when as it is cold againe it is of a colour neere vnto blew, which from *Ferrum* (or iron) is called *Ferrugineus*. Theſe later ground themſelues vpon *Virgils* authoritie, who in the ſixt of his *Æneids* deſcribeth *Charons* ferrugineous barge or boat, and preſently calleth the ſame blew. His words are theſe:

Ipſe ratem conto ſubigit veliſque miniſtrat,
Et ferruginea ſubvectat corpora Cymba,

He thruſting with a pole, and ſetting ſailes at large,
Bodies tranſports in ferrugineous barge.

And then a little after he addes,

Cæruleam advertit puppim, ripæque propinquat.

He then turnes in his blew barge, and the ſhore
Approches nigh to.

And *Claudius* alſo in his ſecond booke of the carrying away of *Proſerpina*, doth not a little confirme their opinions; who writeth, That the Violets are painted *ferrugine dulci*, with a ſweet iron colour.

Sanguineo ſplendore roſas, vaccinea nigro
Induit, & dulci violas ferrugine pingit.

He trimmes, the Roſe with bloudy bright,
And Prime-tree berries blacke he makes;
And decks the Violet with a ſweet
Darke iron colour which it takes.

But let vs return to the proper names from which we haue digreſſed. Moſt of the later herbariſts call this plant *Hyacinthus Poeticus*, or the Poets Iacinth. *Pauſanias* in his ſecond booke of Corinthiacks hath made mention of *Hyacinthus* called of the Hermonians *Comoſandalos*, ſetting down the ceremonies done by them on their feſtiuall dayes in honor of the goddeſſe *Chthonia*. The Prieſts (ſaith he) and the magiſtrats for that yeare do leade the troupe of the pomp; the women & men follow after; the boyes ſolemnly leade forth the goddeſſe with a ſtately ſhew: they go in white veſtures, with garlands on their heads made of a floure which the inhabitants cal *Comoſandalos*, which is the blew or sky-coloured Hyacinth, hauing the marks and letters of mourning as aforeſaid.

¶ *The Temperature.*

The floure of the red Lilly, as *Galen* ſaith, is of a mixt temperature, partly of a thin and partly of an earthly eſſence. The root and leaues doe dry and clenſe, and moderatly digeſt and waſte or conſume away.

¶ *The Vertues.*

A The leaues of the herbe applied are good againſt the ſtinging of Serpents.

B The ſame boiled and tempered with vineger are good againſt burnings, and heale green wounds and vlcers.

C The root roſted in the embers, and pouned with oile of Roſes, cureth burnings, and ſoftneth the hardneſſe of the matrice.

The

D The ſame ſtamped with honey cureth the wounded ſinewes and members out of joint. It takes away the morphew, wrinkles, and deformities of the face.

E Stamped with Vineger, the leaues of Henbane, and wheat meale, it remoueth hot ſwellings of the ſtones, the yard, and matrice.

F The roots boiled in Wine, ſaith *Pliny*, cauſeth the cornes of the feet to fall away within few dayes, with remouing the medicine vntill it haue wrought his effect.

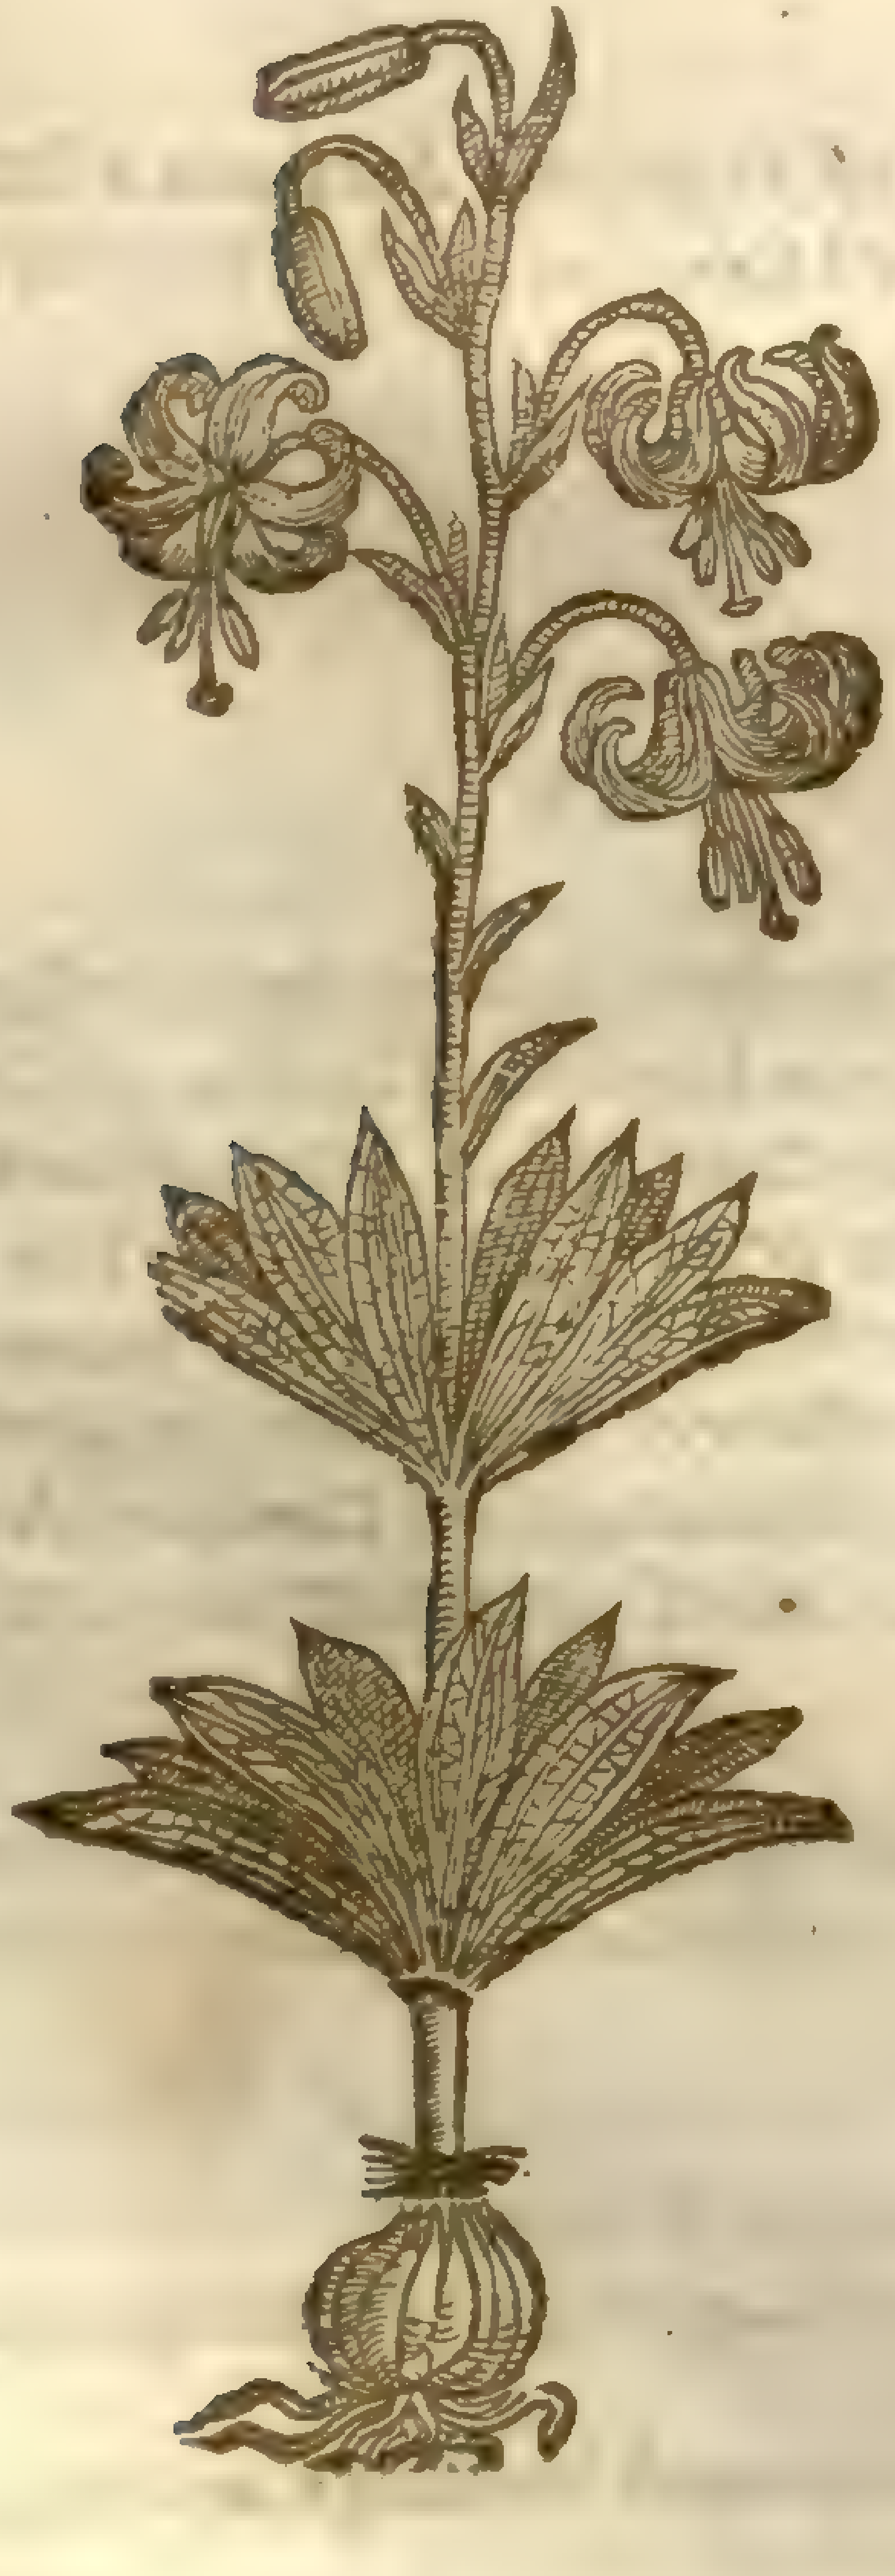
G Being drunke in honied water, they driue out by ſiege vnprofitable bloud.

Chap. 104. *Of Mountaine Lillies.*

¶ *The Deſcription.*

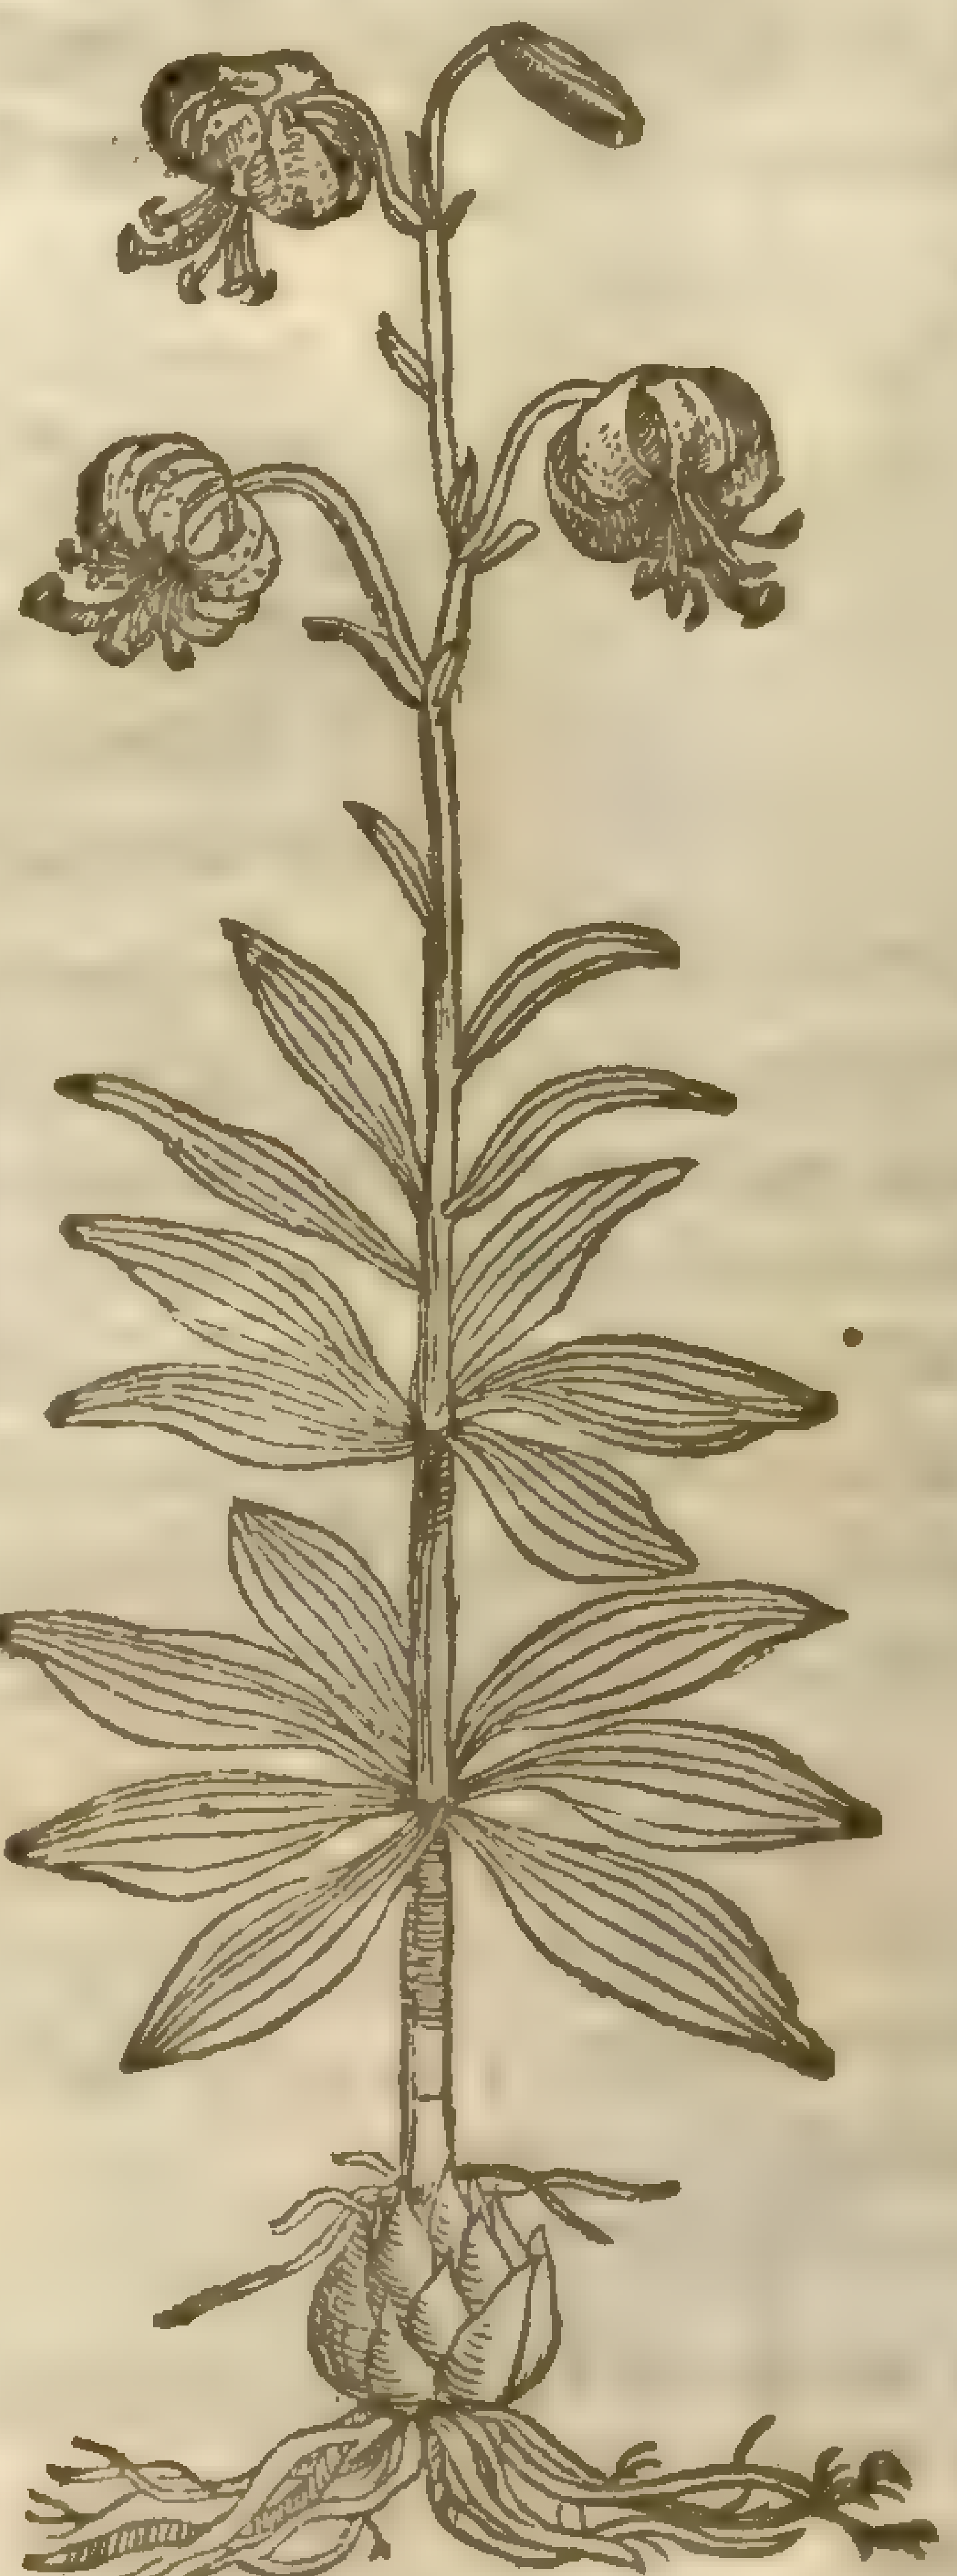
1 THe great mountain Lilly hath a cloued bulb or ſcaly root like thoſe of the red Lilly, yellow of colour, very ſmall in reſpect of the greatneſſe of the plant; from the which riſeth vp a ſtalke, ſomtimes two or three, according to the age of the plant, whereof the middle ſtalke commonly turneth from his roundneſſe into a flat forme, as thoſe of the white Lilly of Conſtantinople. Vpon theſe ſtalks do grow faire leaues of a blackiſh greene colour, in roundles and ſpaces as the leaues of Woodroofe, not vnlike to the leaues of white Lilly, but ſmaller at the top of the ſtalkes. The floures be in number infinite, or at the leaſt hard to be counted, very thicke ſet or thruſt together, of an ouerworne purple, ſpotted on the inſide with many ſmal ſpecks of the colour of ruſty iron. The whole floure doth turne it ſelfe backward at ſuch time as the ſun hath caſt his beames vpon it, like vnto the Tulipa or Turks cap, as the Lilly or Martagon of Conſtantinople doth; from the middle whereof do come forth tender pendants hanging thereat, of the colour the floure is ſpotted with.

1 *Lilium montanum majus.*
The great mountaine Lilly.



martagon, b. β mill. dict.

2 *Lilium montanum minus.*
Small mountaine Lilly.



L. Martagon, b. C mill. dict.

2 The ſmall mountain Lilly is very like vnto the former in root, leafe, ſtalk, and floures: differing in theſe points, The whole plant is leſſe, the ſtalke neuer leaueth his round forme, and beareth fewer floures.

‡ There are two or three more varieties of theſe plants mentioned by *Cluſius*; the one of this leſſer kinde, with floures on the out ſide of a fleſh colour, and on the inſide white, with blackiſh ſpots; as alſo another wholly white without ſpots. The third varietie is like the firſt, but differs in that the floures blow later, and ſmell ſweet.

Theſe plants grow in the woody mountaines of Styria and Hungarie, and alſo in ſuch like places on the North of Francfort, vpon the Mœne. ‡

The ſmall ſort I haue had many yeares growing in my garden, but the greater I haue not had til of late, giuen me by my louing friend Mr *Iames Garret* Apothecarie of London.

¶ *The Time.*

Theſe Lillies of the mountaine floure at ſuch time as the common white Lilly doth, and ſometimes ſooner.

¶ *The Names.*

The great mountain Lilly is called of *Tabernamontanus*, *Lilium Saracenicum*, receiued by Mr *Garret* aforeſaid from Liſle in Flanders, by the name of *Martagon Imperiale*: of ſome, *Lilium Saracenicum mas*. It is *Hemerocallis flore rubello* of *Lobel*.

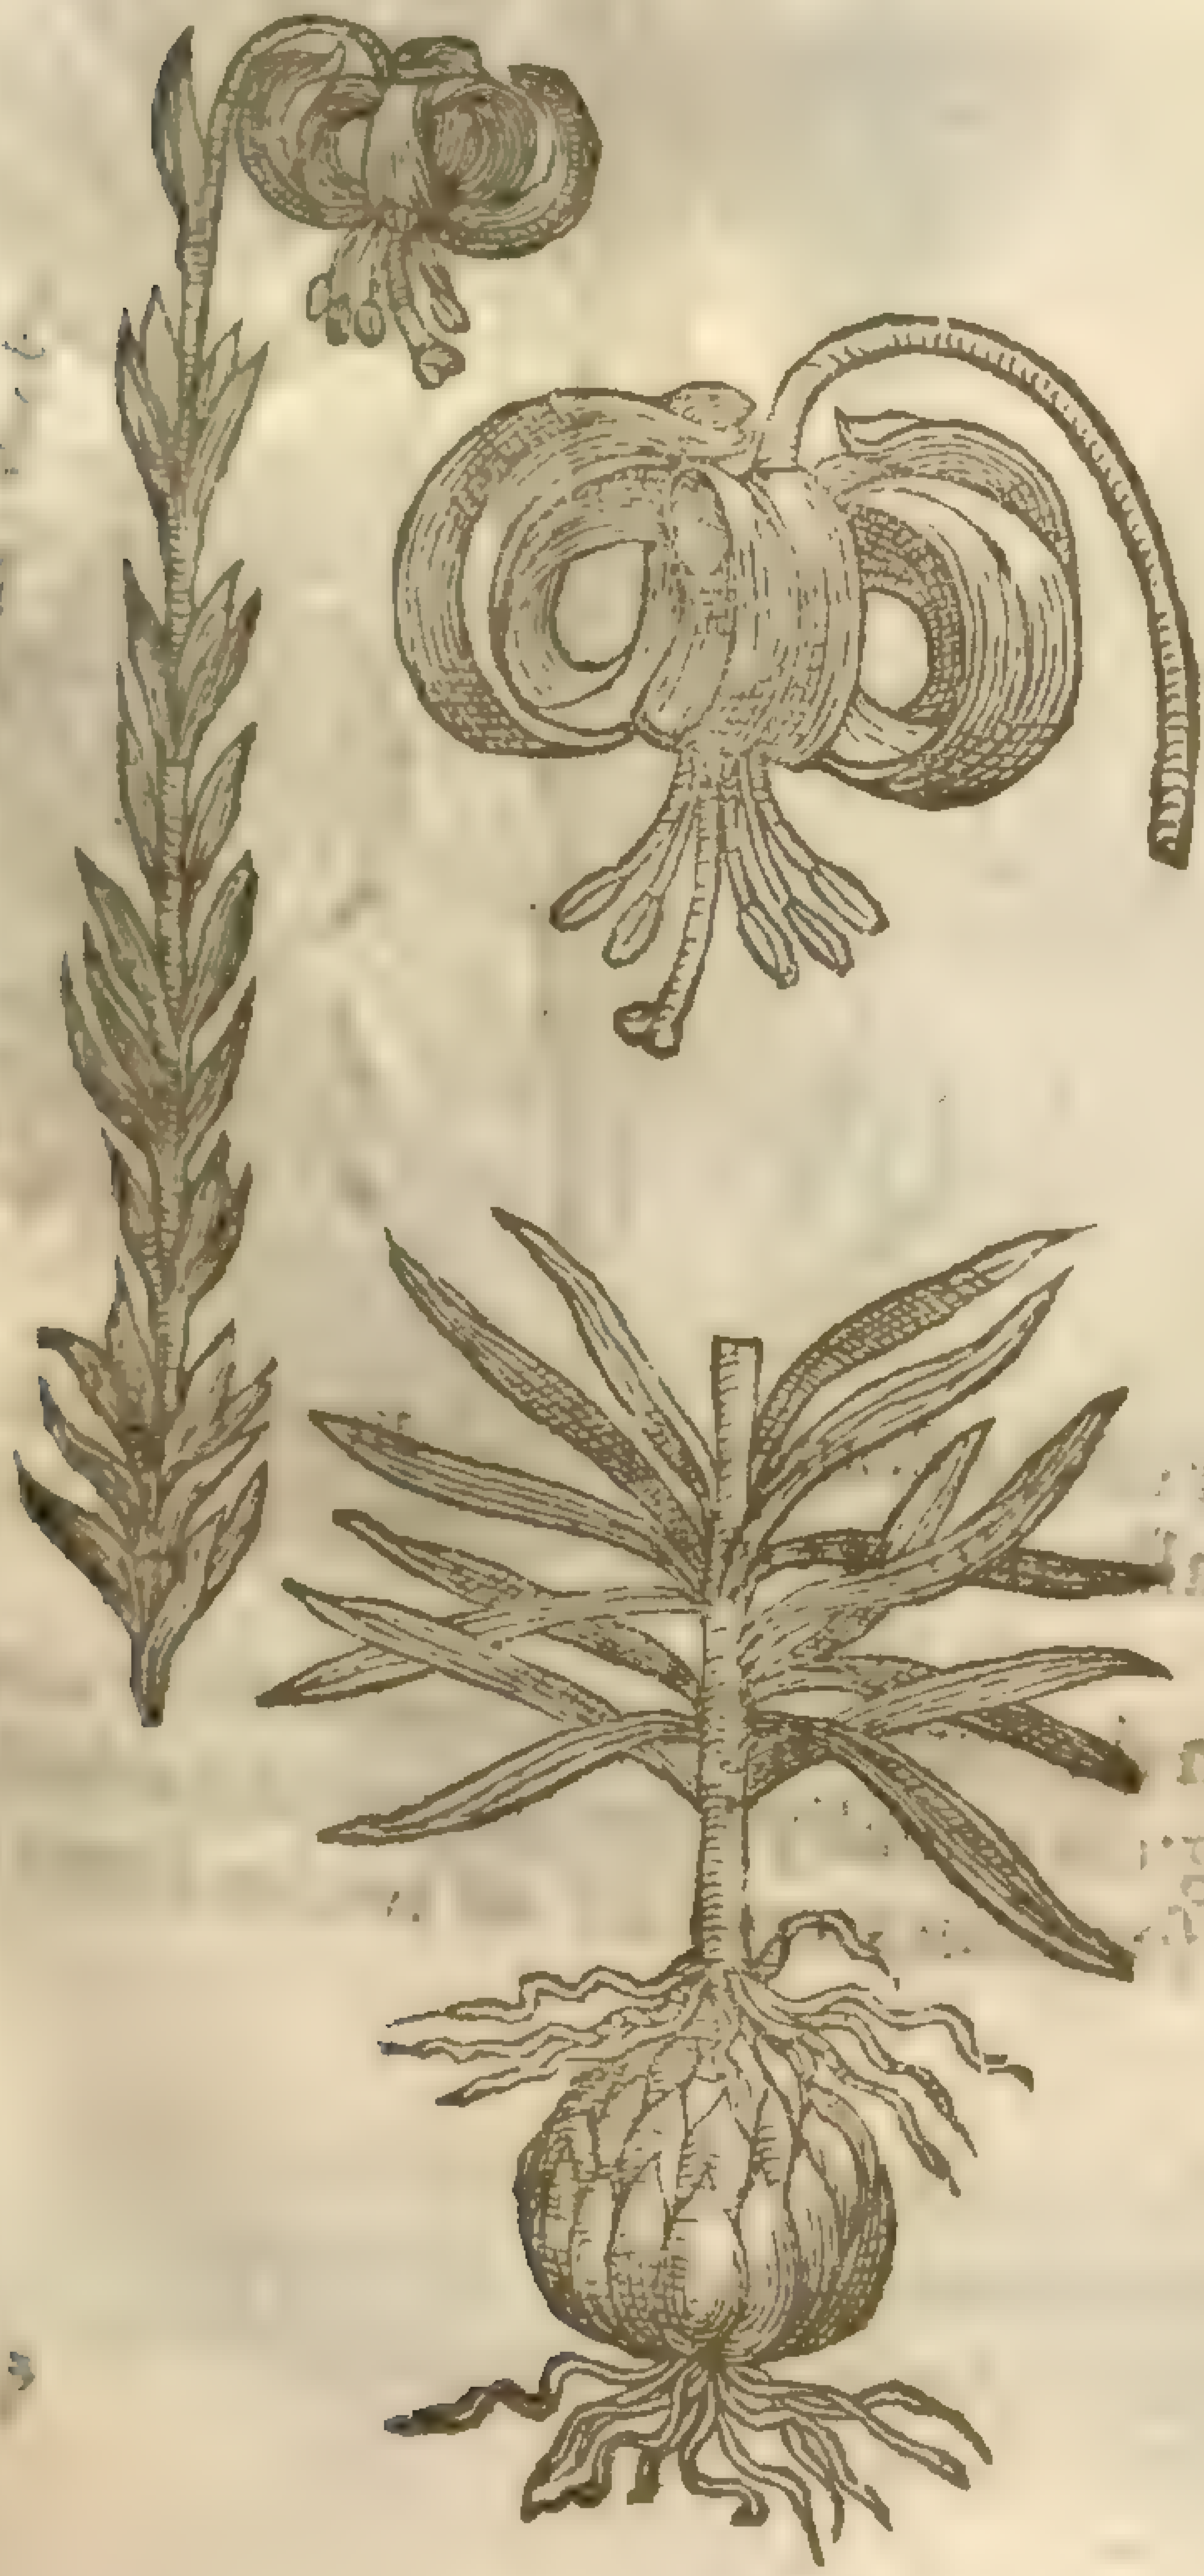
The ſmall mountain Lilly is called in Latine *Lilium montanum*, & *Lilium ſylveſtre*: of *Dodonæus*, *Hemerocallis*: of others, *Martagon*: but neither truly, for that there is of either, other plants properly called by the ſame names. In high-Dutch it is called **Goldwurtz**, from the yellowneſſe of the roots: in low-Dutch, **Lilikens van Caluarien**: in Spaniſh, *Lirio Amarillo*: in French, *Lys Sauvage*: in Engliſh, Mountain Lilly.

¶ *The Nature and Vertues.*

There hath not bin any thing left in writing either of the nature or vertues of theſe plants: notwithſtanding we may deem, that God which gaue them ſuch ſeemely and beautifull ſhape, hath not left them without their peculiar vertues, the finding out whereof we leaue to the learned and induſtrious ſearcher of Nature.

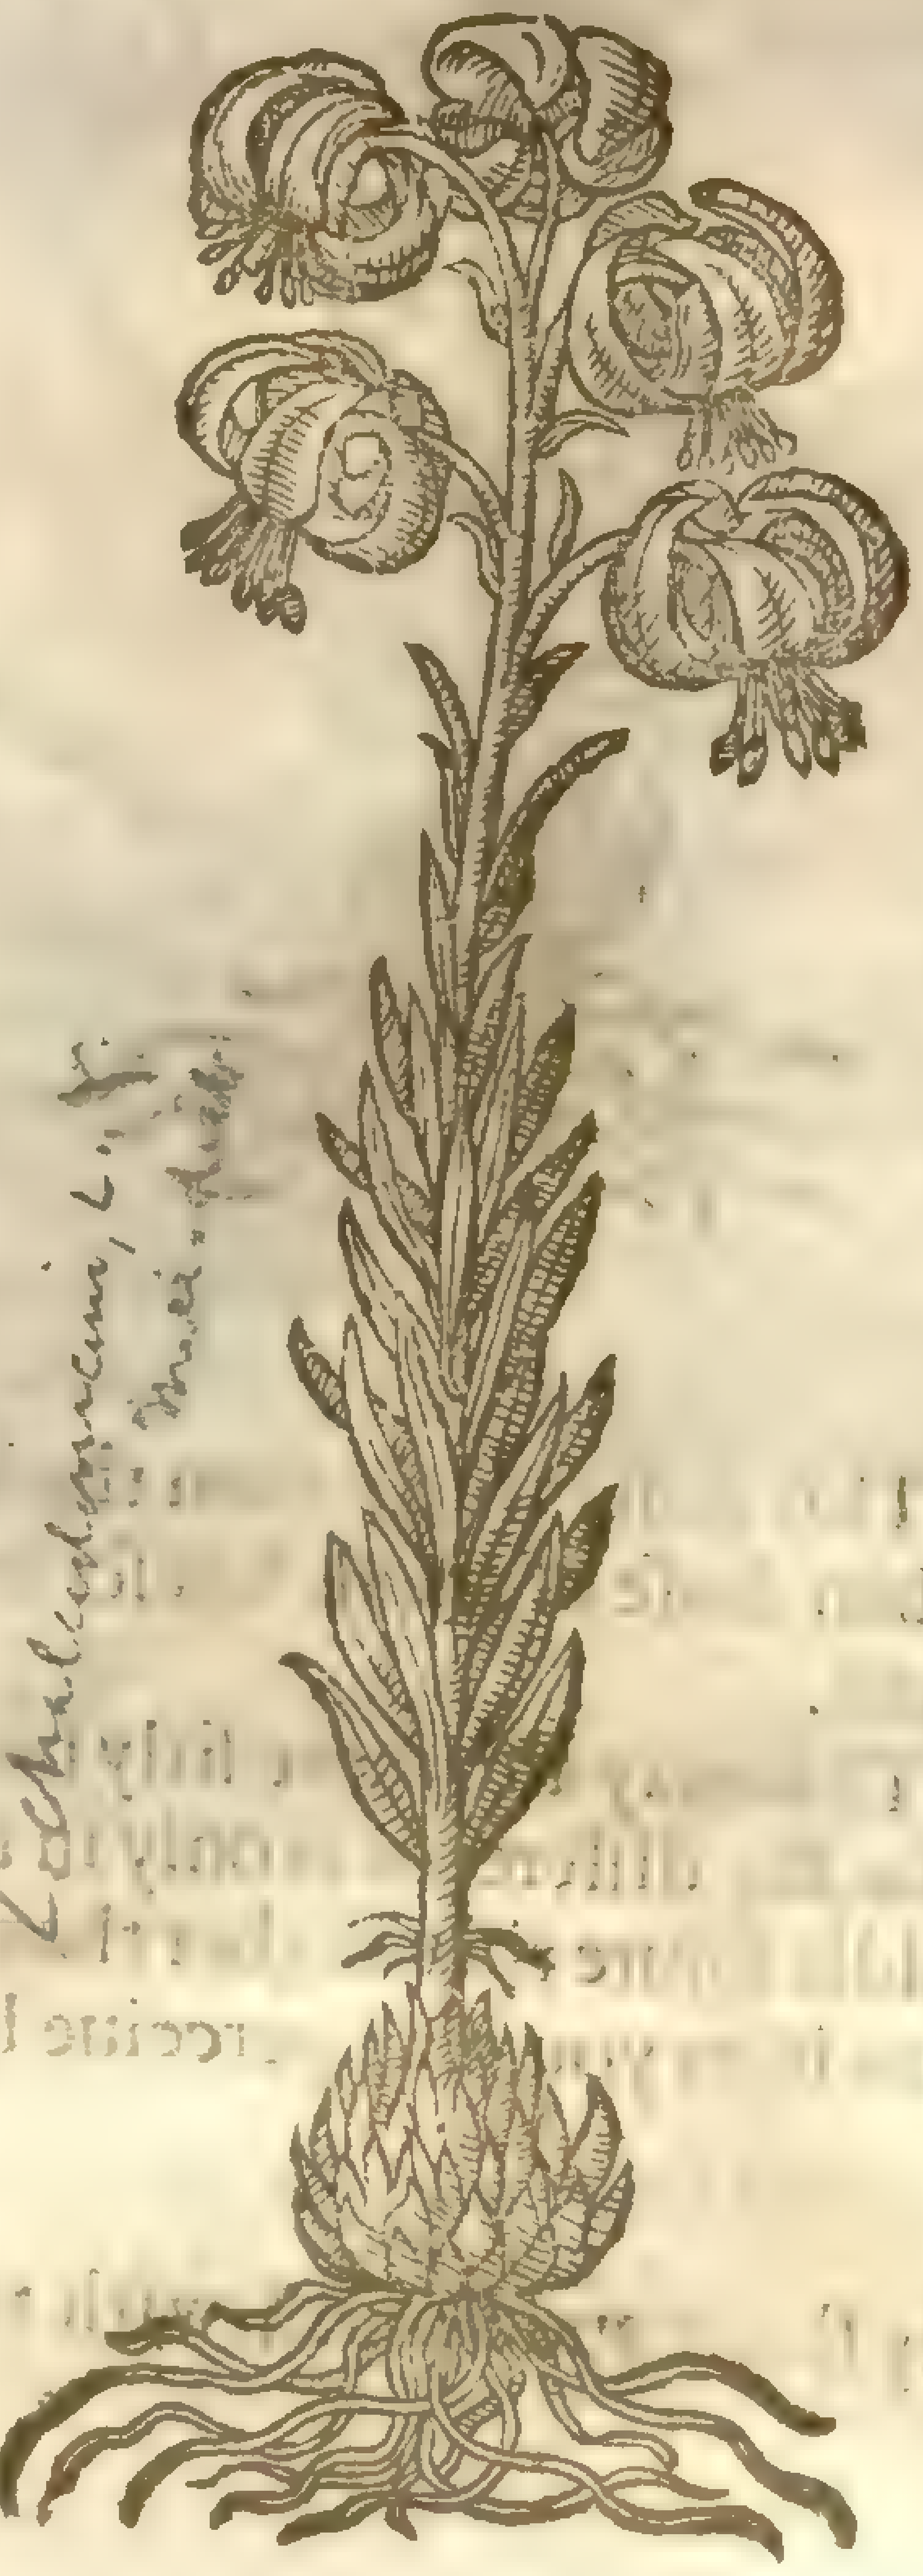
CHAP. 105. *Of the Red Lilly of Conſtantinople.*

1 *Lilium Byzantinum.*
The red Lilly of Conſtantinople.



[illegible]

‡ 2 *Lilium Byzantinum flo. purpuro ſanguineo.*
The Byzantine purpliſh ſanguine-coloured Lilly.



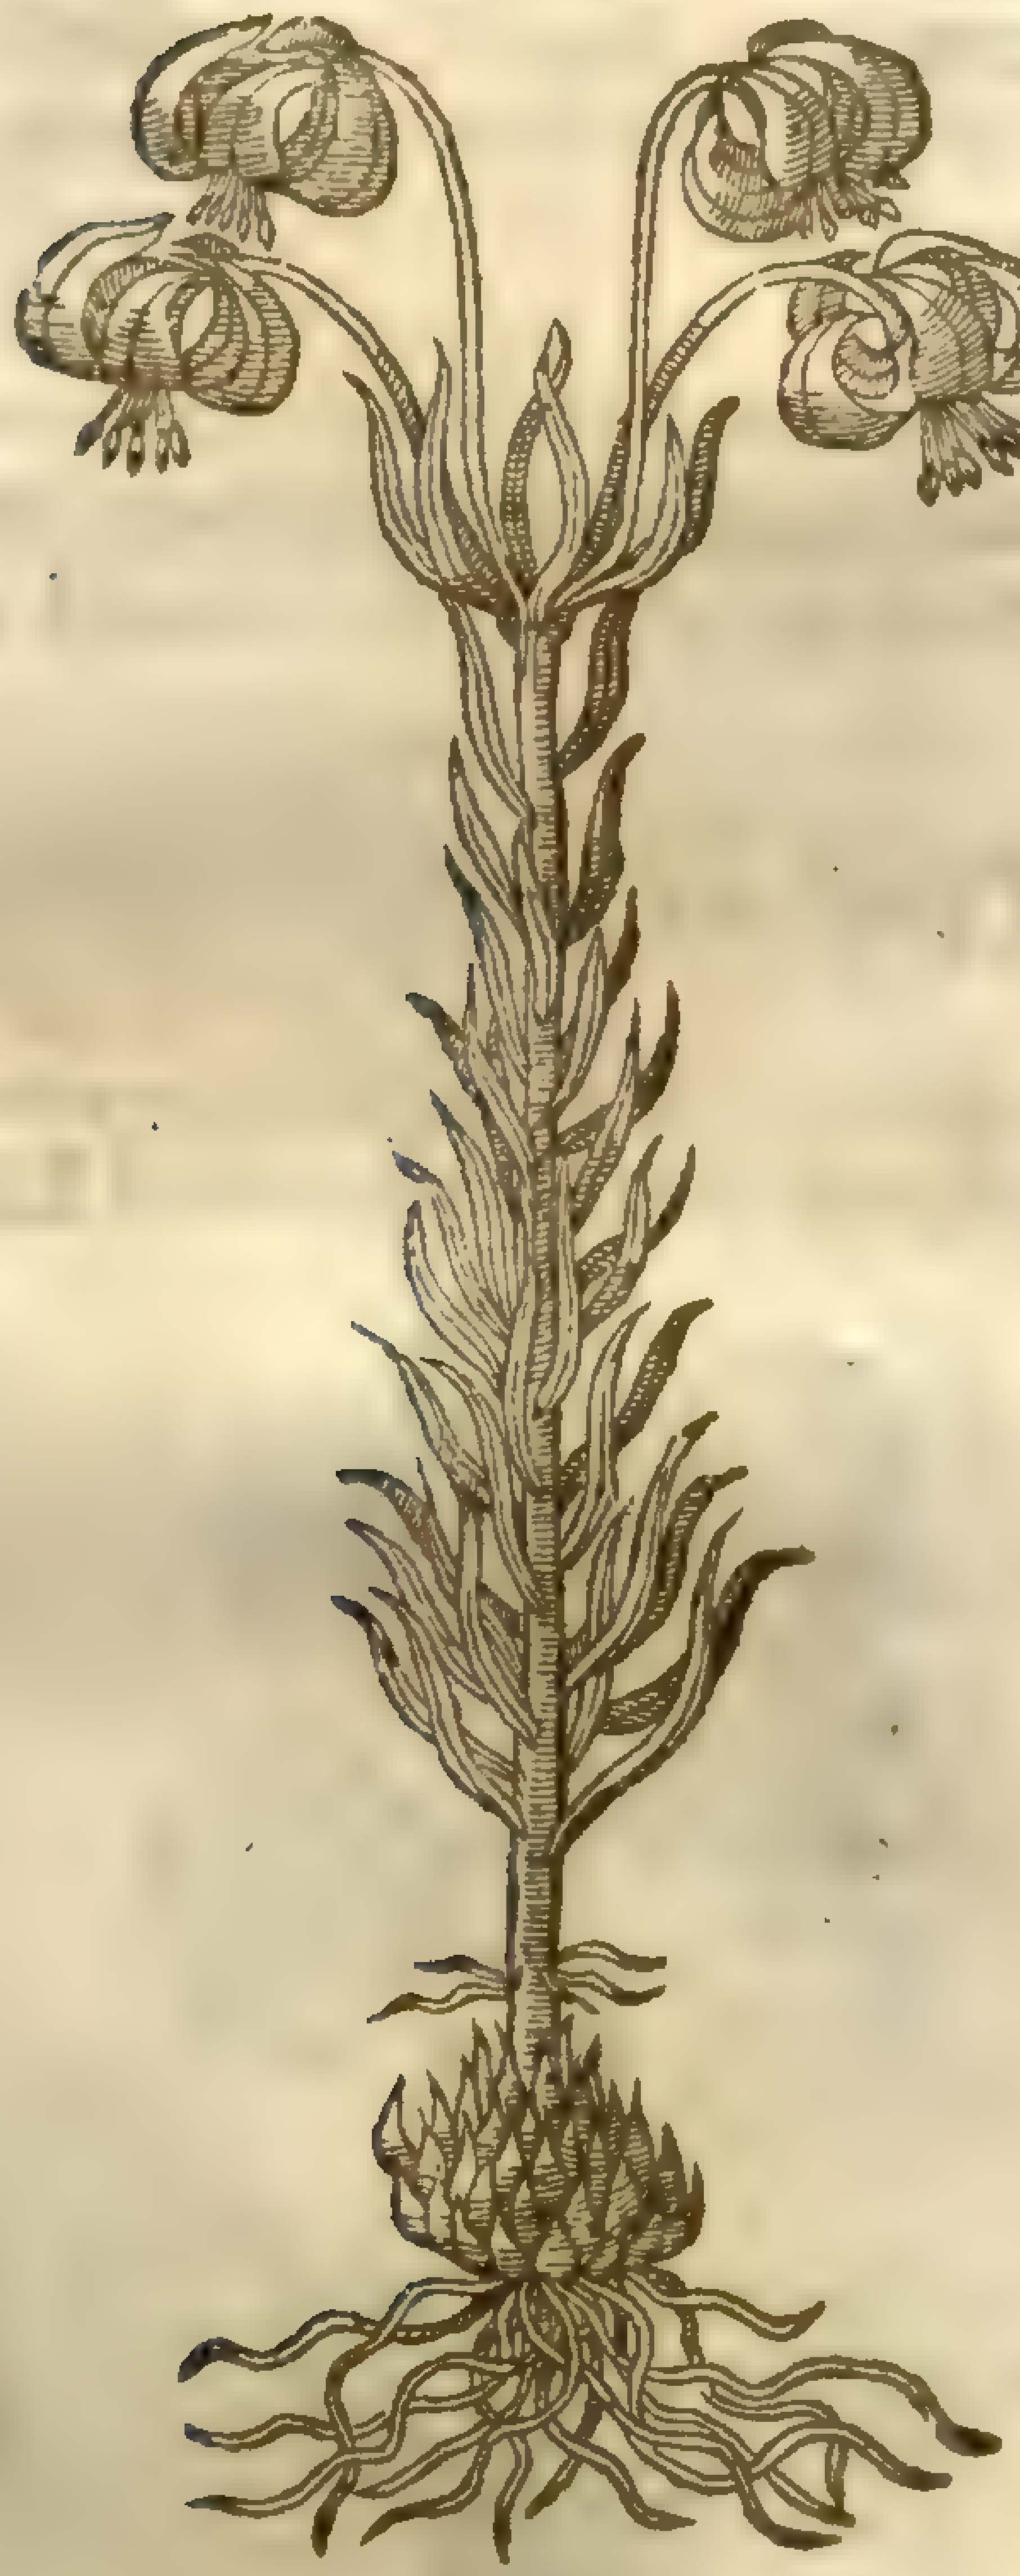
L. Chalcedonicum, L.
[illegible]

¶ *The Deſcription.*

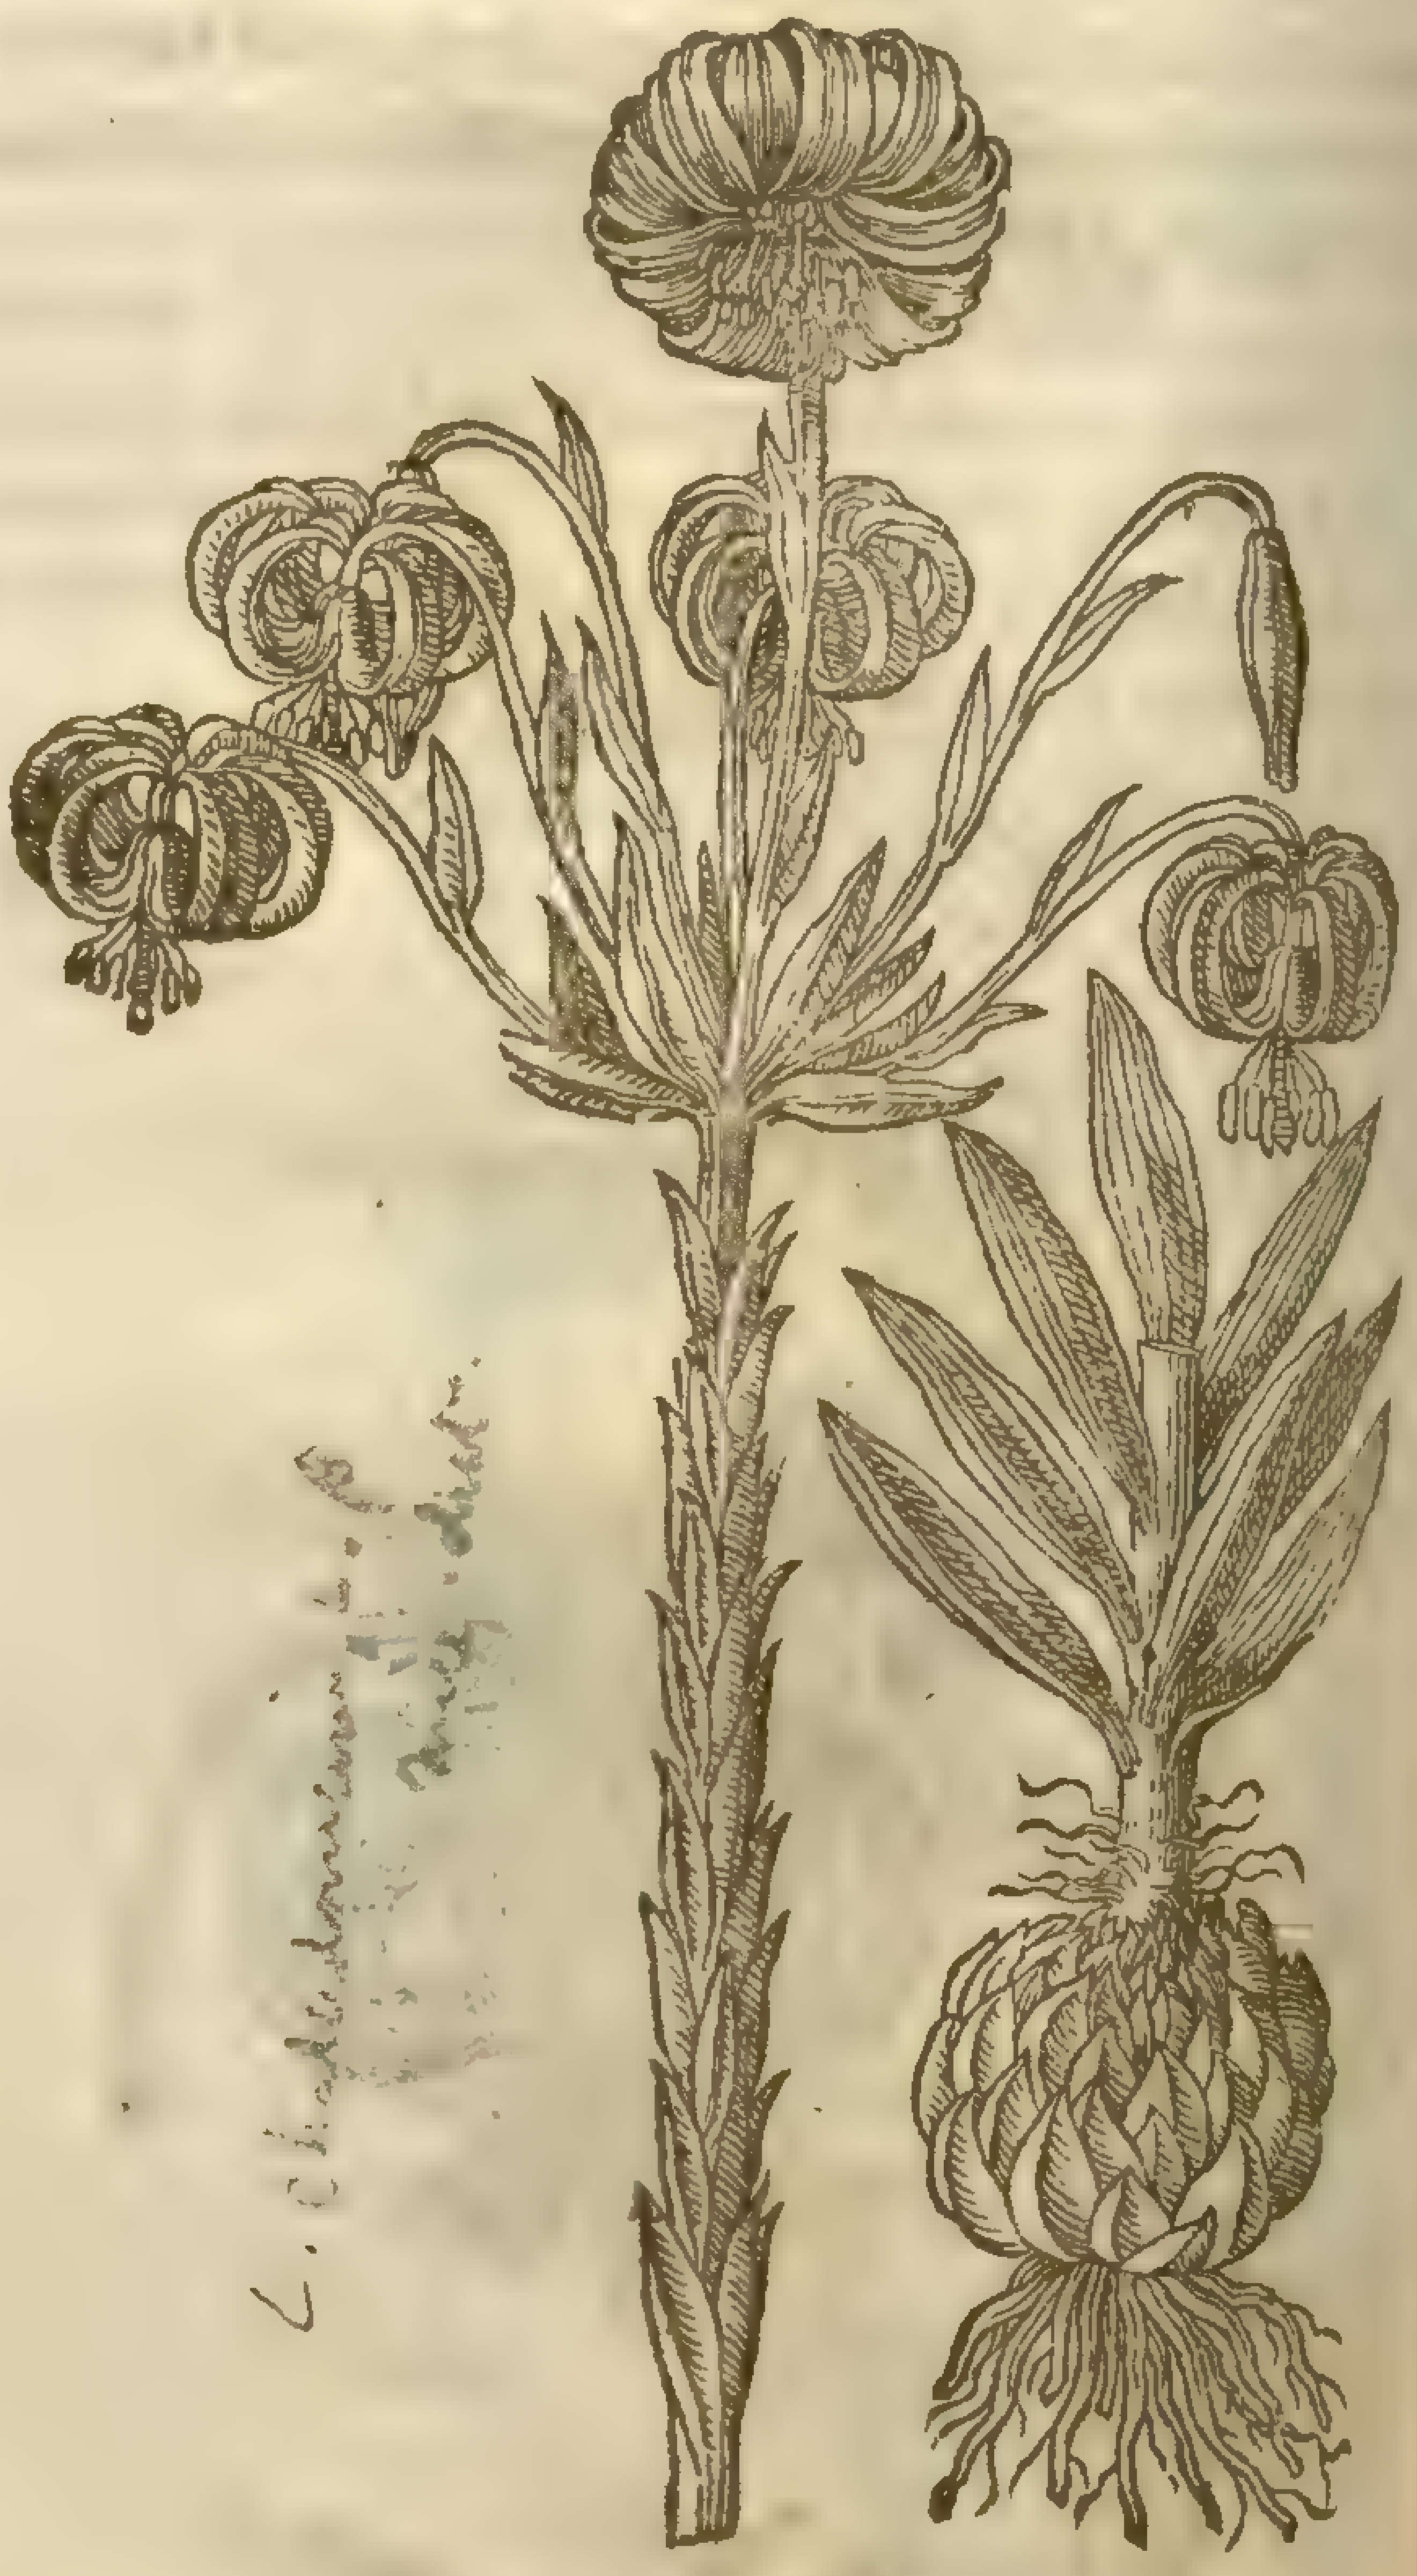
1 The red Lilly of Conſtantinople hath a yellow ſcaly or cloued root like to the mountain Lilly, but greater: from the which ariſeth vp a faire fat ſtalke a finger thicke, of a darke purpliſh colour toward the top; which ſometimes doth turne from his naturall roundneſſe into a flat forme, like as doth the great mountain Lilly: vpon which ſtalk grow ſundry faire and moſt beautiful floures, in ſhape like thoſe of the mountaine Lilly: but of farre greater beauty, ſeeming as it were framed of red wax, tending to a red lead colour. From the middle of the floure commeth forth a tender pointal or peſtell, and likewiſe many ſmall chiues tipped with looſe pendants. The floure is of a reaſonable pleaſant ſauor. The leaues are confuſedly ſet about the ſtalk like thoſe of the white Lilly, but broader and ſhorter.

‡ 2 This hath a large Lilly-like root, from which ariſeth a ſtalke ſome cubit or more high, ſet confuſedly with leaues like the precedent. The floures alſo reſemble thoſe of the laſt deſcribed, but vſually more in number, and they are of a purpliſh ſanguine colour.

‡ 3 *Lilium Byzantinum flo. dilute rubente.*
The light red Byzantine Lilly.



‡ 4 *Lilium Byzantinum miniatum polyanthos.*
The Vermilion Byzantine many-floured Lilly.



L. Chalcedonicum [illegible]

3 This differs little from the laſt, but in the colour of the floures, which are of a lighter red color than thoſe of the firſt deſcribed. The leaues and ſtalks alſo, as *Cluſius* obſerueth, are of a lighter greene.

4 This may alſo more fitly be termed a variety from the former, than otherwiſe: for according to *Cluſius*, the difference is only in this, that the floures grow equally from the top of the ſtalk, and the middle floure riſes higher than any of the reſt, and ſomtimes conſiſts of twelue leaues as it were a twin, as you may perceiue by the figure. ‡

¶ *The Time.*

They floure and flouriſh with the other Lillies.

¶ The

¶ *The Names.*

The Lilly of Conſtantinople is called likewiſe in England, Martagon of Conſtantinople: of *Lobel, Hemerocallis Chalcedonica*, and likewiſe *Lilium ByZantinum*: of the Turkes it is called *Zufiniare*: of the Venetians, *Marocali*.

¶ *The Temperature and Vertues.*

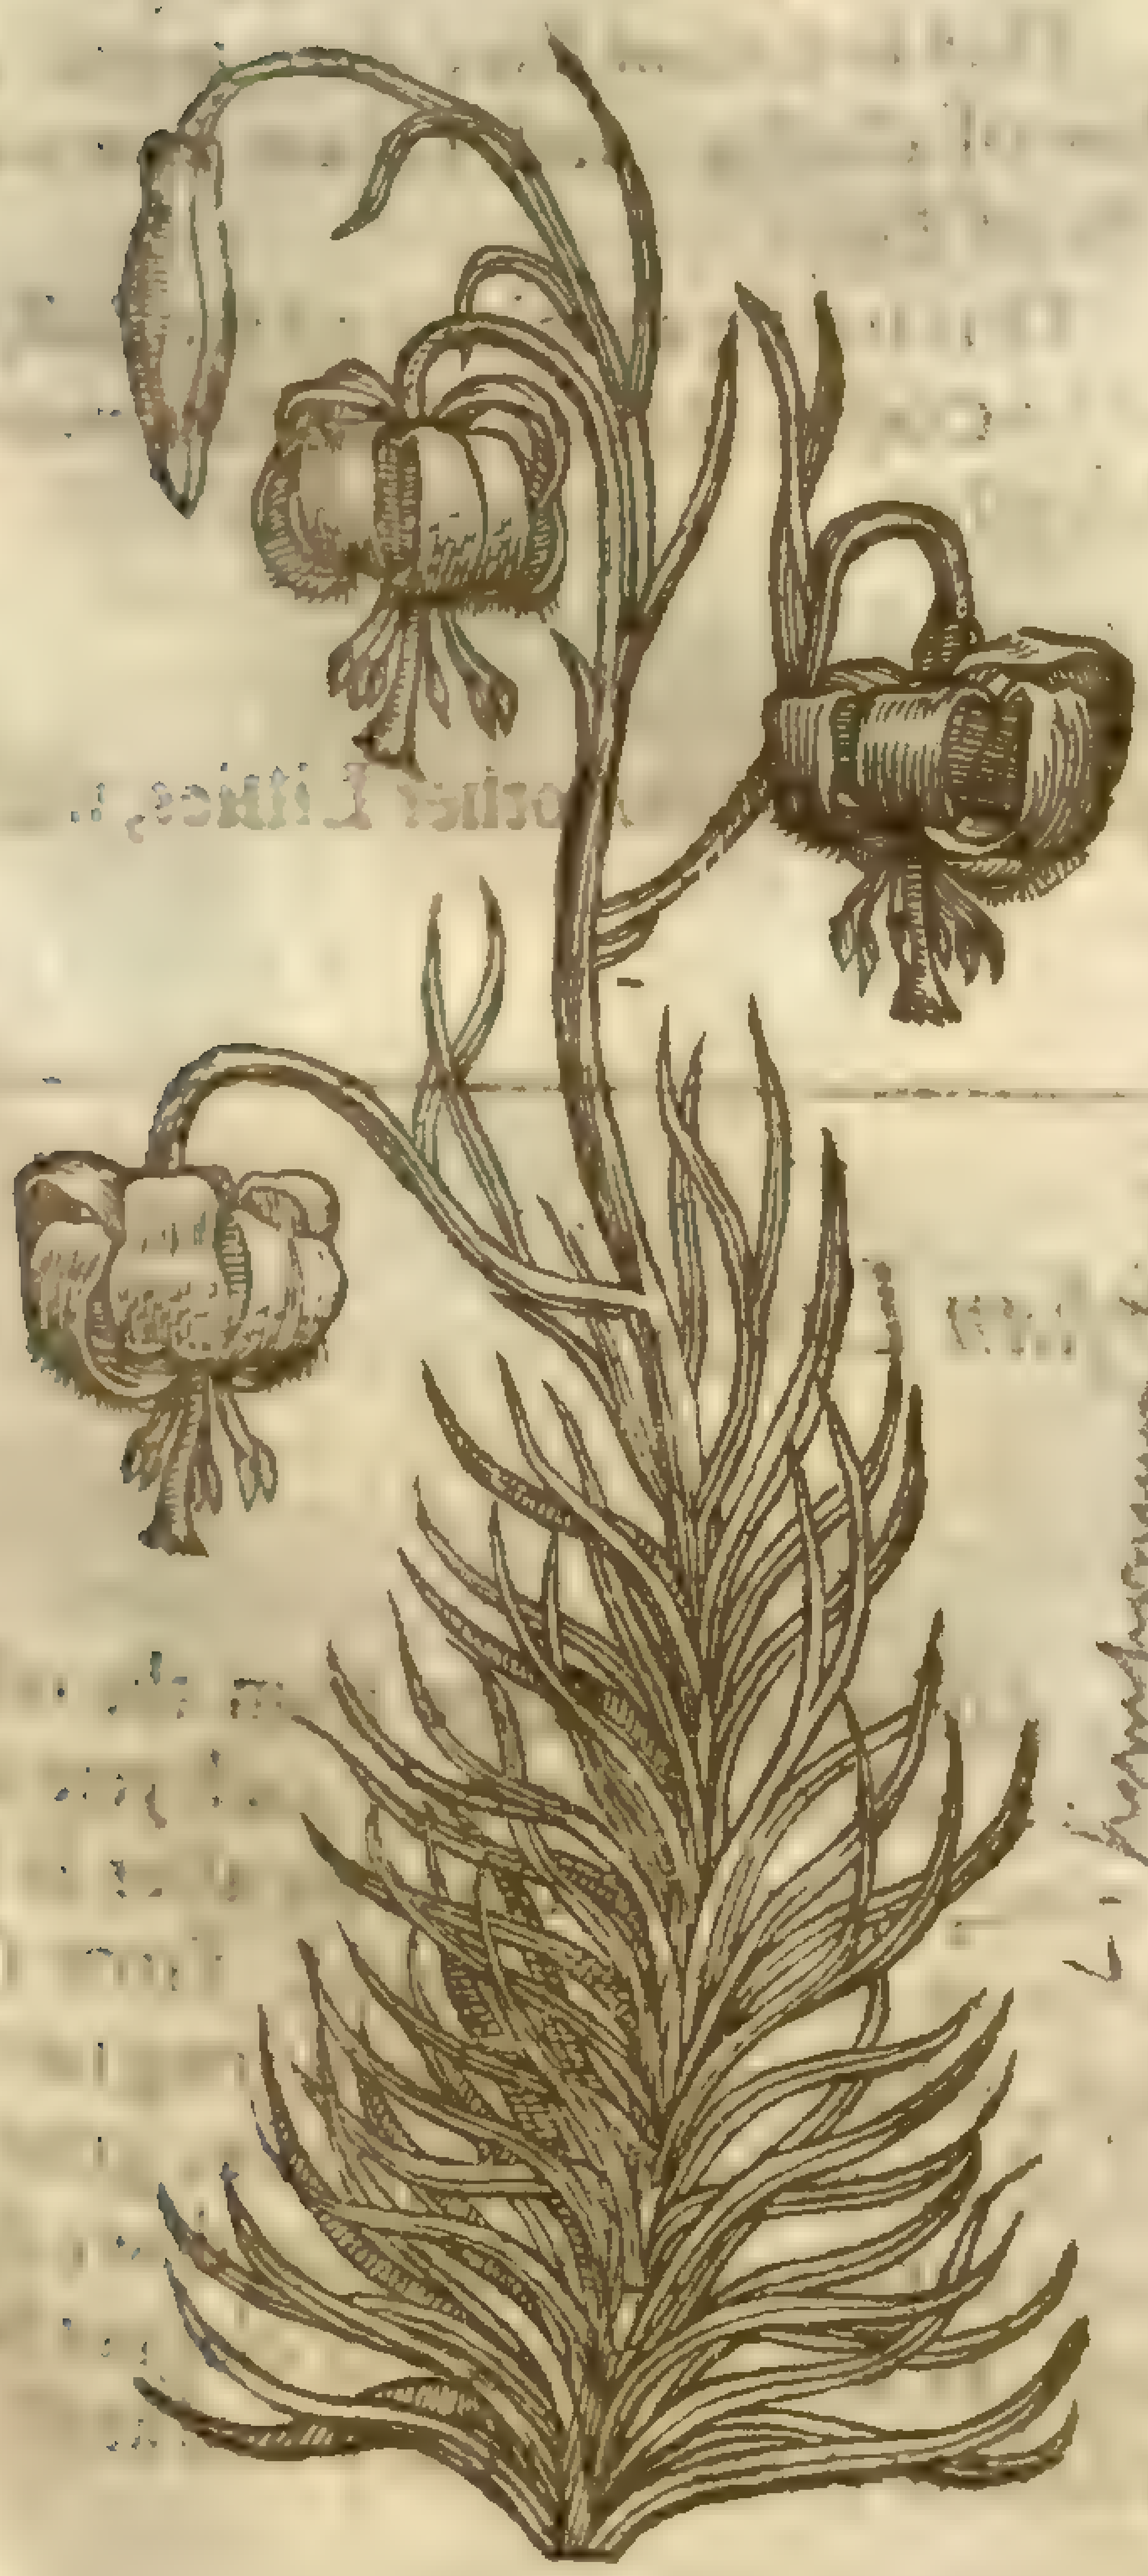
Of the nature or vertues there is not any thing as yet ſet down, but it is eſteemed eſpecially for the beauty and rareneſſe of the floure: referring what may be gathered hereof to a farther conſideration.

‡ Chap. 106. *Of the narrow leaued reflex Lillies.*

¶ *The Deſcription.*

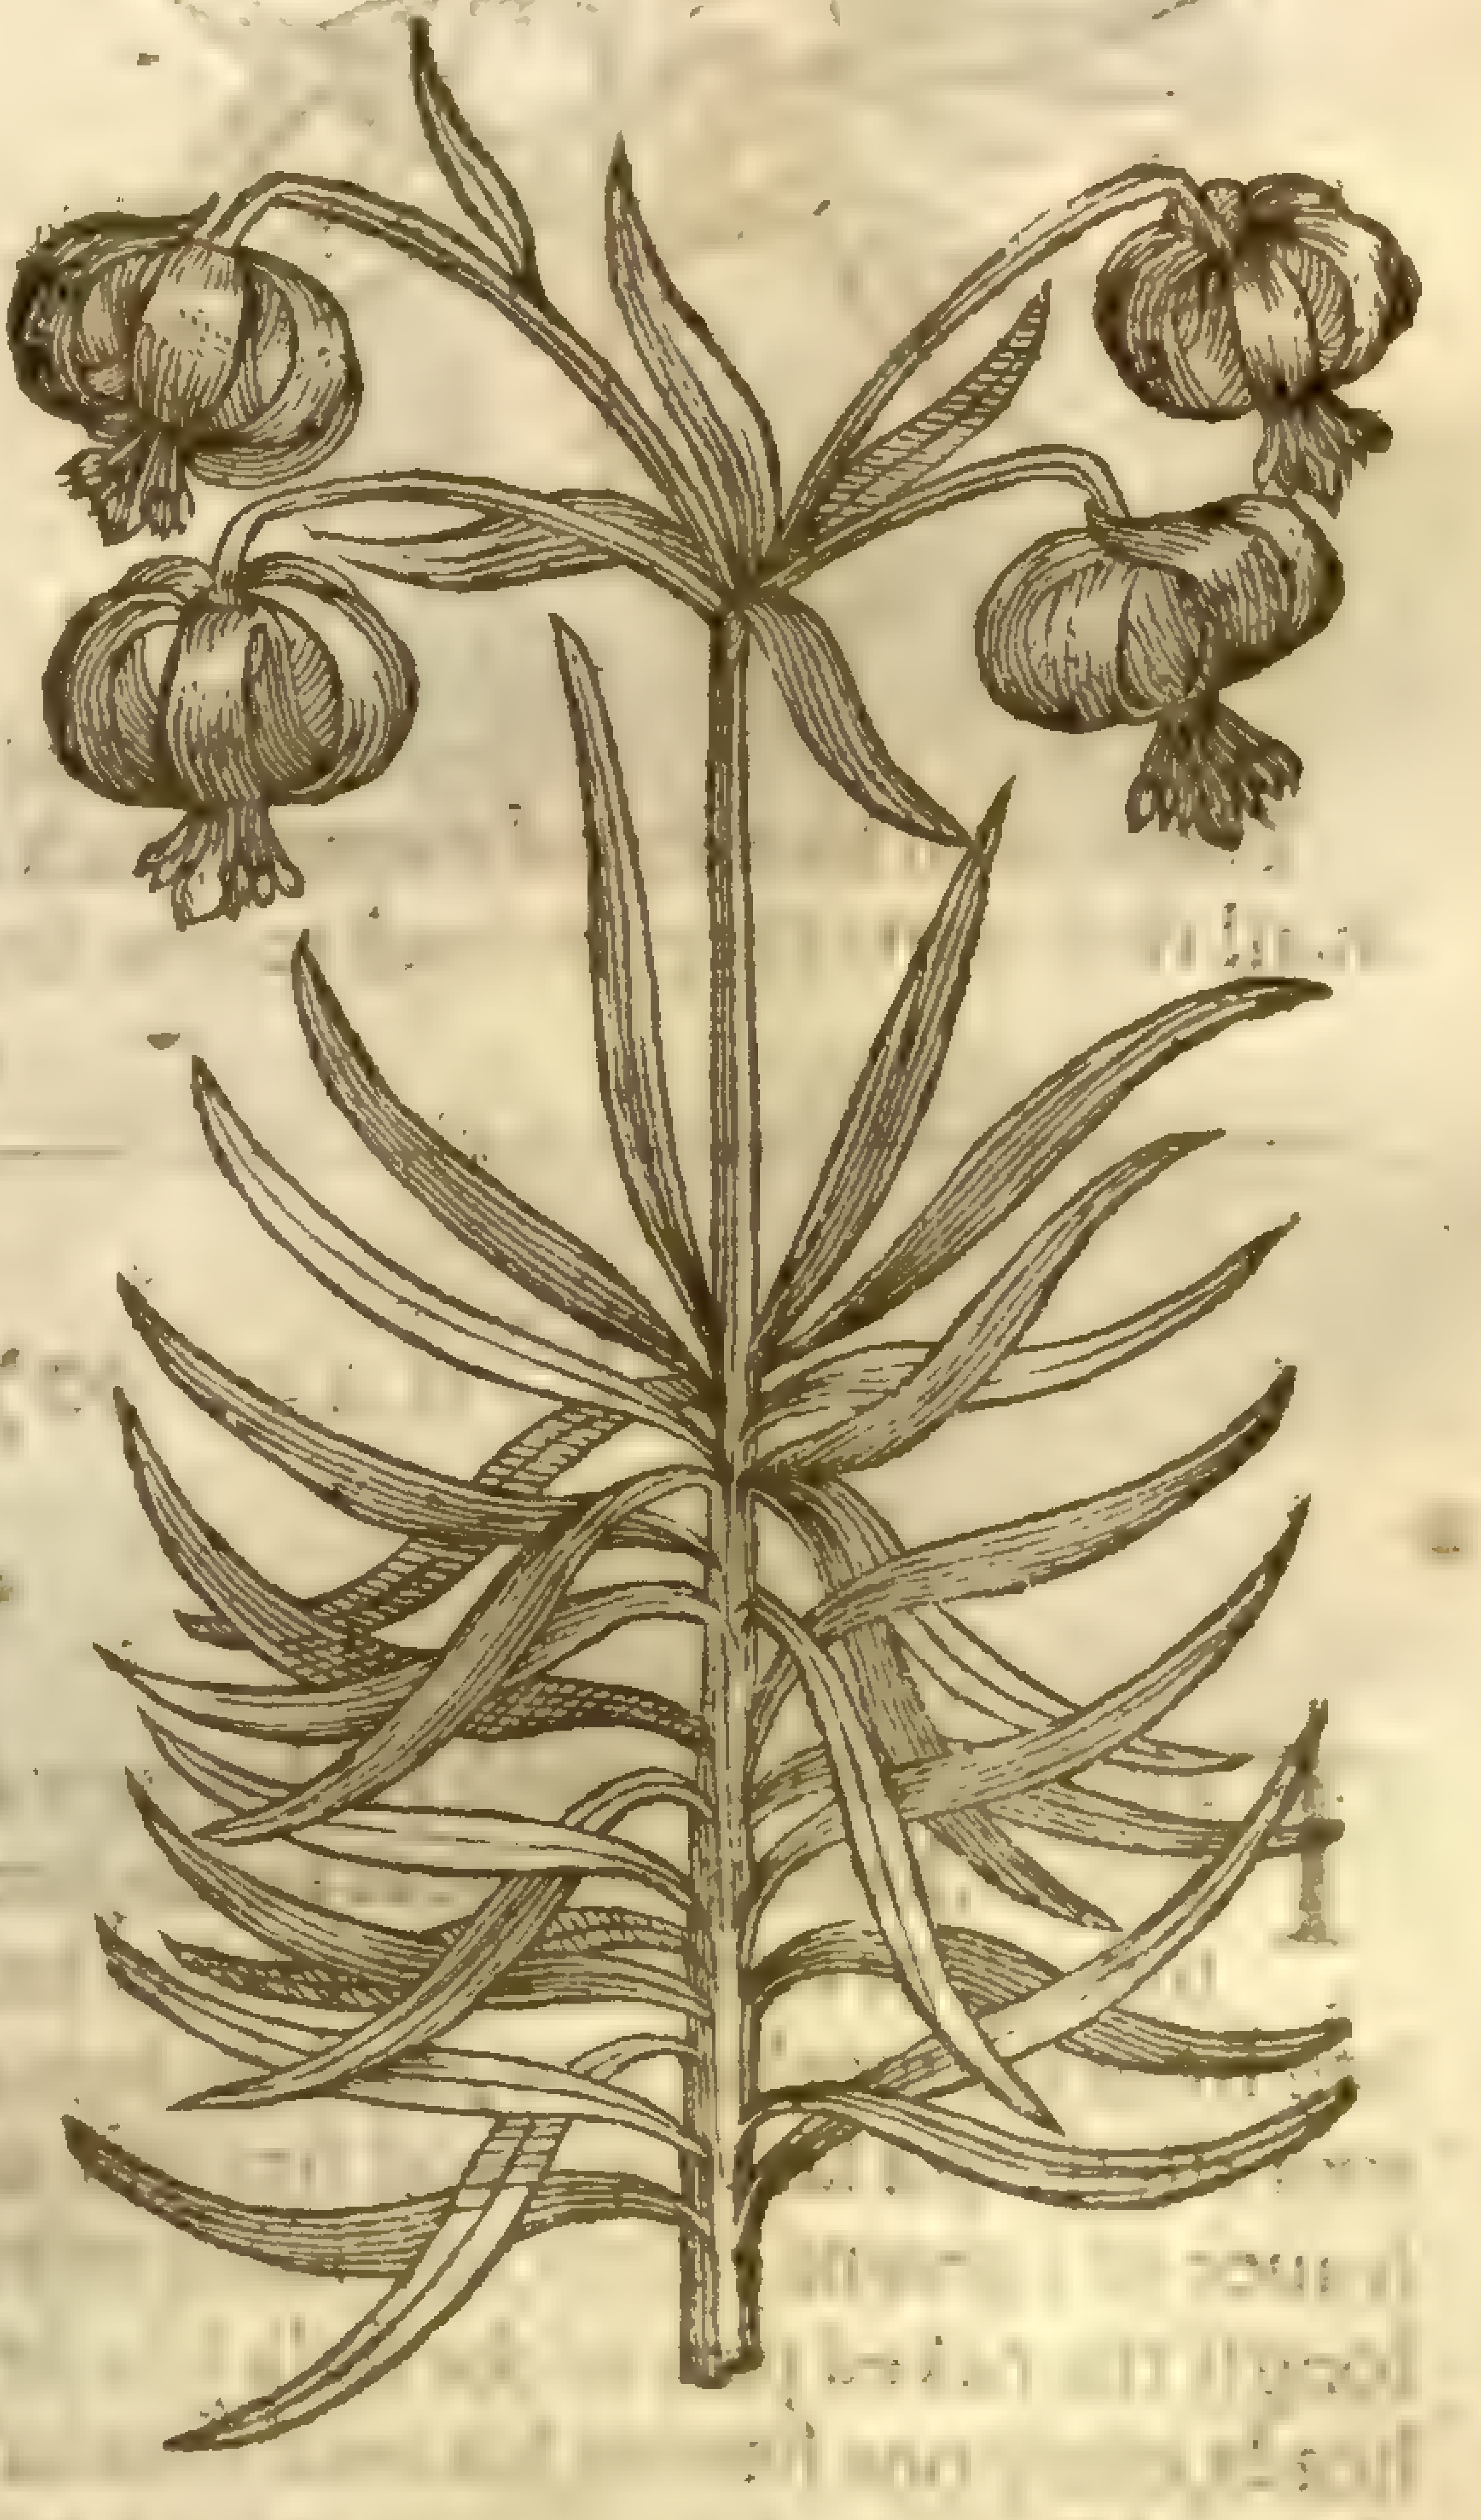
‡ 1 The root of this is not much vnlike that of other Lillies: the ſtalke is ſome cubit high or better; the leaues are many and narrow, and of a darker greene than thoſe of the ordinarie Lilly; the floures are reflex like thoſe treated of in the laſt Chapter, of a red or vermilion colour. This floures in the end of May: wherefore *Cluſius* calls it *Lilium rubrum præcox*, The early red Lilly.

‡ 1 *Lilium rubrum anguſtifolium.*
The red narrow leaued Lilly.



L. pomponium L.
Mill. dict.

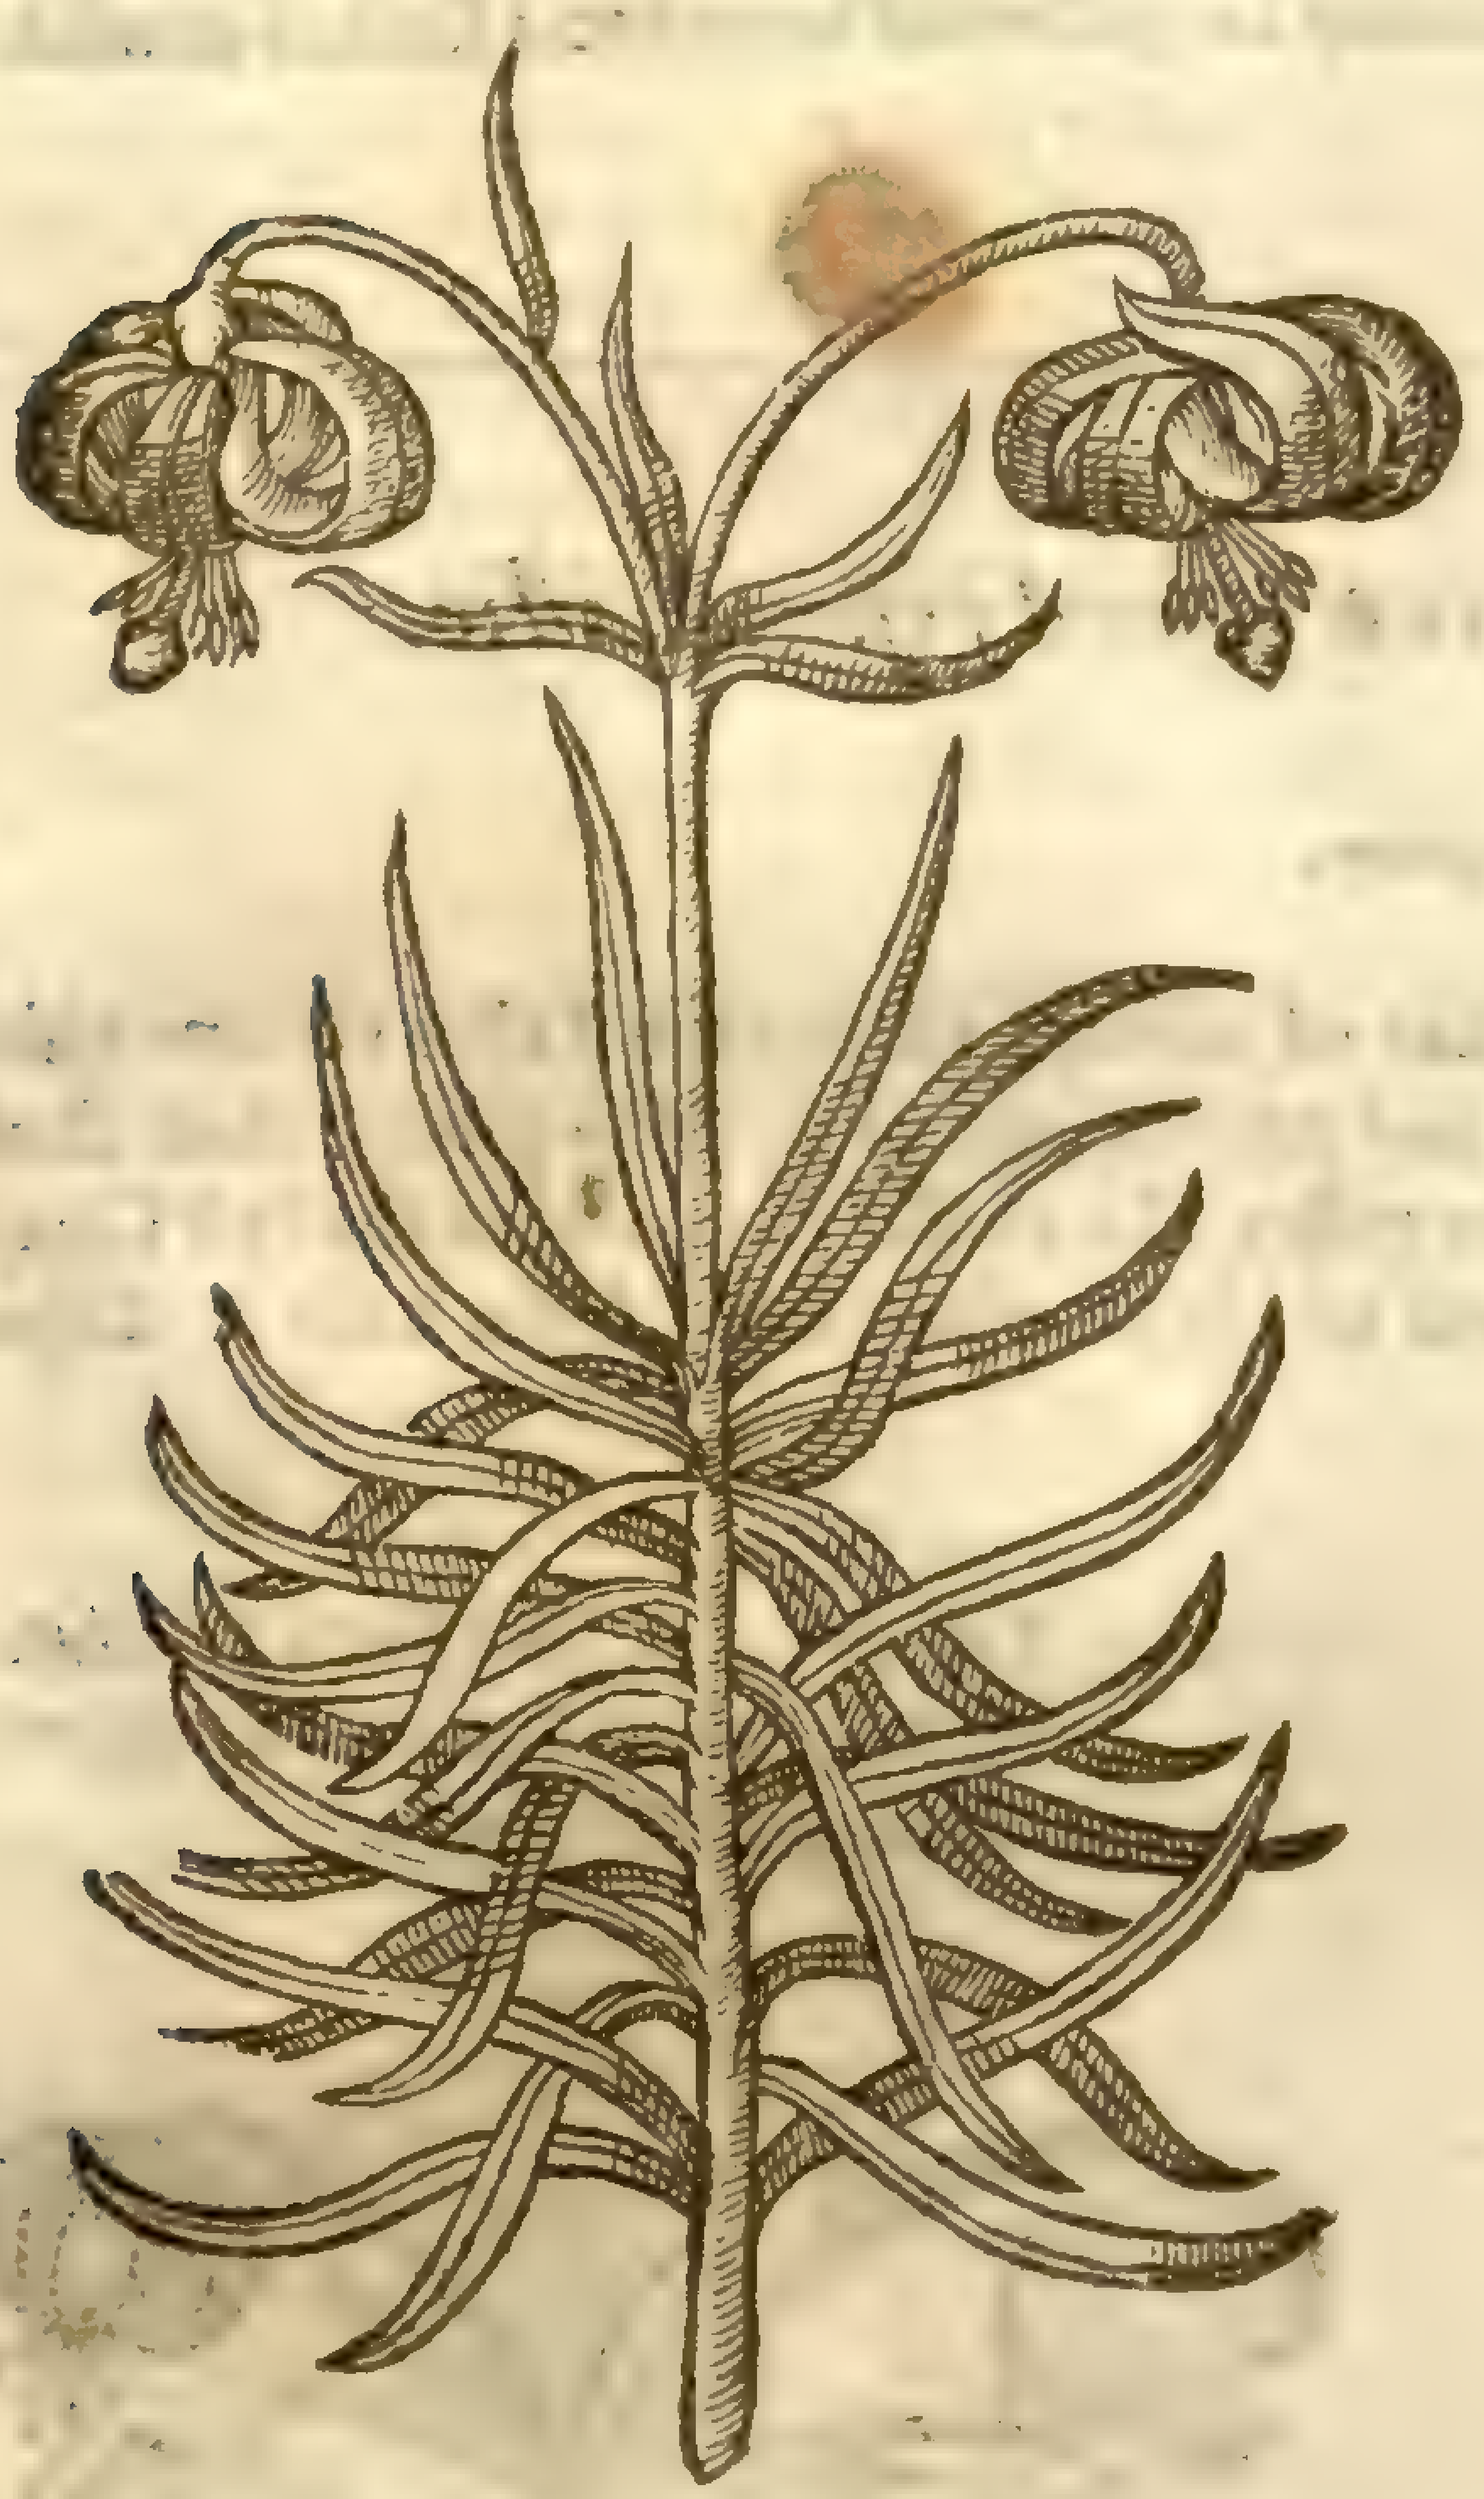
‡ 3 *Lilium mont. flore flavo punctato.*
The yellow mountain Lilly with the ſpotted floure.



2 This plant is much more beautifull than the laſt deſcribed; the roots are like thoſe of Lillies, the ſtalke ſome cubit and an halfe in height, beeing thicke ſet with ſmall graſſie leaues. The floures grow out one aboue another, in ſhape and colour like thoſe of the laſt deſcribed, but oftentimes

times are more in number, ſo that ſome one ſtalke hath borne 48 floures. The root is much like the former.

‡ 4 *Lilium mont. flore flavo non punctato.*
The yellow mountain Lilly with the vnſpotted floure.



3 This in roots is like thoſe afore deſcribed; the ſtalke is ſome 2 cubits high, ſet confuſedly with long narrow leaues, with three conſpicuous nerues running along them. The floures are at firſt pale coloured; afterwards yellow, conſiſting of ſix leaues bended back to their ſtalks, & marked with blackiſh purple ſpots.

4 There is alſo another, differing from the laſt deſcribed ouly in that the floure is not ſpotted as that of the former.

¶ *The Place.*

Theſe Lillies are thought Natiues of the Pyrenæan mountains, and of late yeres are become denizons in ſome of our Engliſh gardens

¶ *The Time.*

The firſt (as I haue ſaid) floures in the end of May: the reſt in Iune.

¶ *The Names.*

1 This is called by *Cluſius*, *Lilium rubrum præcox.*

2 *Cluſius* names this, *Lilium rubrum præcox 3 anguſtifol.* *Lobel* ſtiles it, *Hemerocallis Macedonica*, and *Martagon Pomponeum.*

3 This is *Lilium flavo flore maculis diſtinctum* of *Cluſius*: and *Lilium montanum flavo flo.* of *Lobel.*

4 This being a varietie of the laſt, is called by *Cluſius*, *Lilium flavo flore maculis non diſtinctum.*

¶ *The Temperature and Vertues.*

Theſe in all likelihood cannot much differ from the temper and vertues of other Lillies, which in all their parts they ſo much reſemble. ‡

Chap. 107. *Of the Perſian Lilly.*

¶ *The Deſcription.*

THe Perſian Lilly hath for his root a great white bulbe, differing in ſhape from the other Lillies, hauing one great bulbe firme or ſolid, full of juice, which commonly each yere ſetteth off or encreaſeth one other bulbe, and ſometimes more, which the next yere after is taken from the mother root, and ſo bringeth forth ſuch floures as the old plant did. From this root riſeth vp a fat thicke and ſtraight ſtem of two cubits high, whereupon is placed long narrow leaues of a greene colour, declining to blewneſſe as doe thoſe of the woad. The floures grow alongſt the naked part of the ſtalk like little bels, of an ouerworn purple colour, hanging down their heads, euery one hauing his own footſtalke of two inches long, as alſo his peſtell or clapper from the middle part of the floure; which being paſt and withered, there is not found any ſeed at all, as in other plants, but is encreaſed only in his root.

¶ *The Place.*

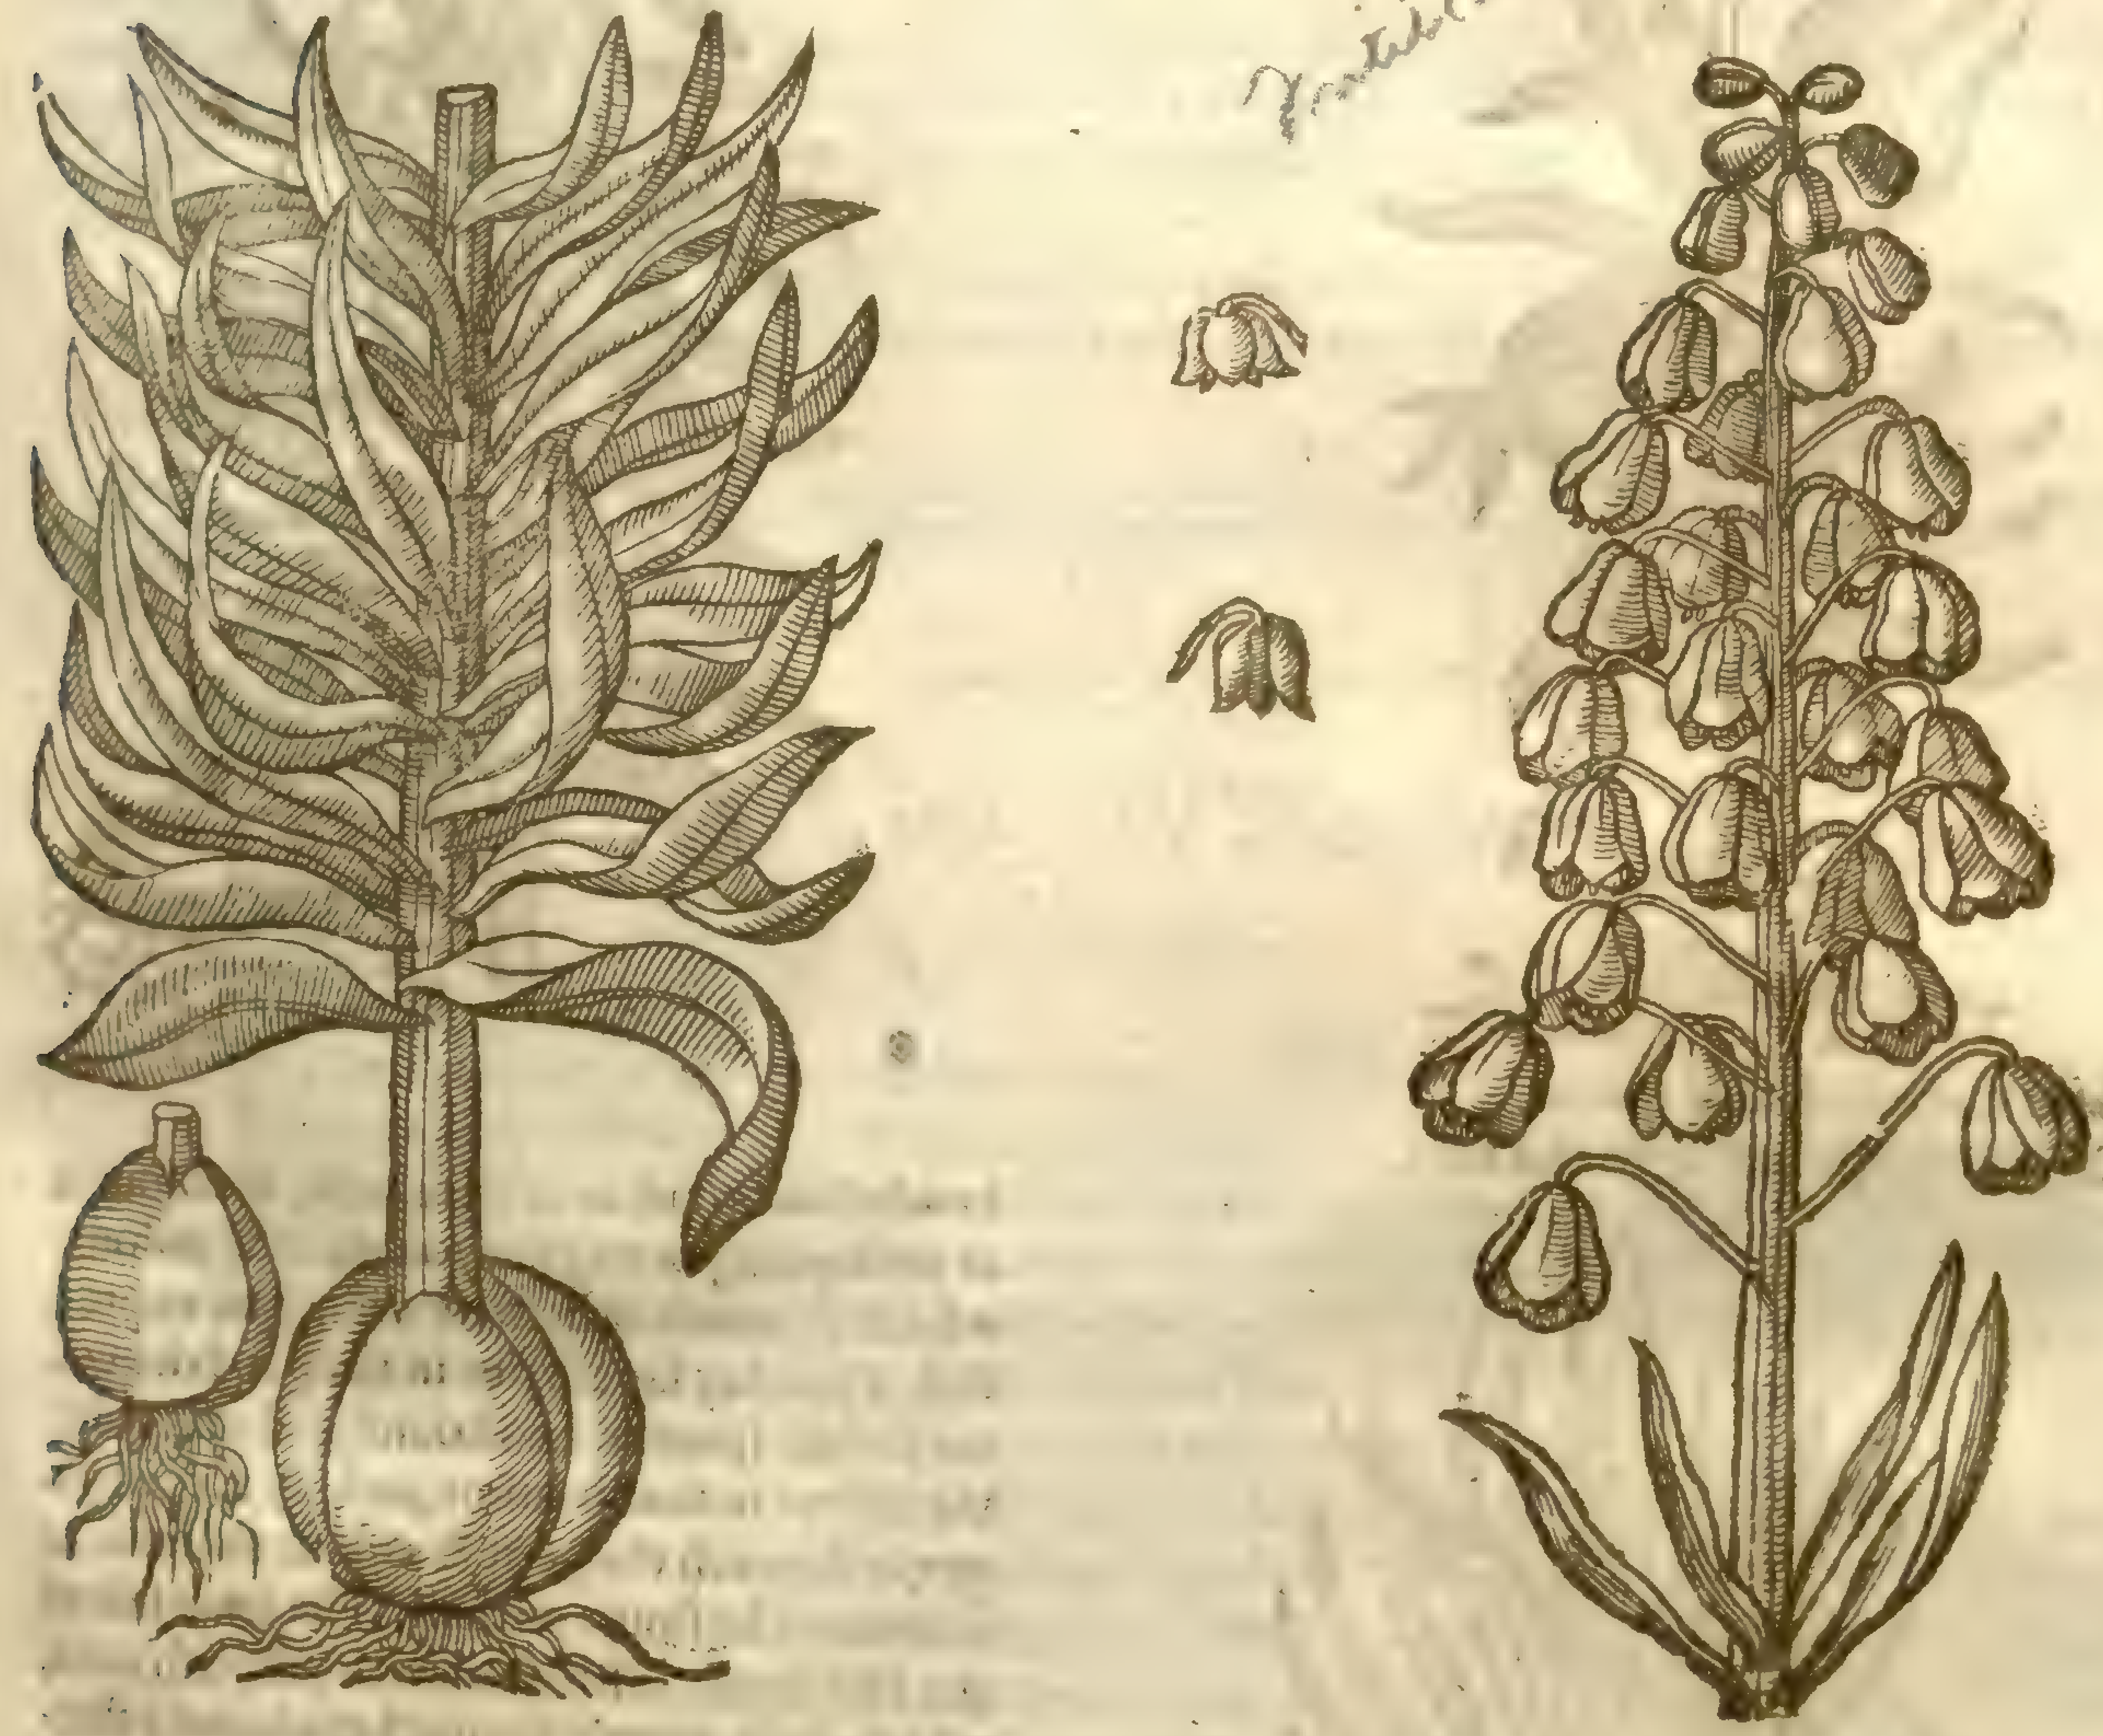
This Perſian Lilly groweth naturally in Perſia and thoſe places adiacent, whereof it tooke his name, and is now (by the induſtry of Trauellers into thoſe countries, louers of plants) made a denizon in ſome few of our London gardens.

¶ *The Time.*

This plant floureth from the beginning of May to the end of Iune.

¶ *The Names.*

This Perſian Lilly is called in Latine, *Lilium Perſicum, Lilium Suſianum, Pennacio Perſiano*, and *Pennacio Perſiano*, either by the Turks themſelues, or by ſuch as out of thoſe parts brought them into England, but which of both is vncertain. *Alphonſus Pancius*, Phyſitian to the duke of Ferrara, when as he ſent the figure of this plant vnto *Carolus Cluſius*, added this title, *Pennacio Perſiano è Pianta belliſſima & è ſpecie di Giglio ó Martagon, diuerſo della corona Imperiale*: That is in Engliſh, This moſt elegant plant *Pennacio* of Perſia, is a kinde of Lilly or Martagon, differing from the floure called the Crowne Imperiall.



Lilium Perſicum.
The Perſian Lilly.

Fritillaria persica [illegible]

¶ *The Temperature and Vertues.*

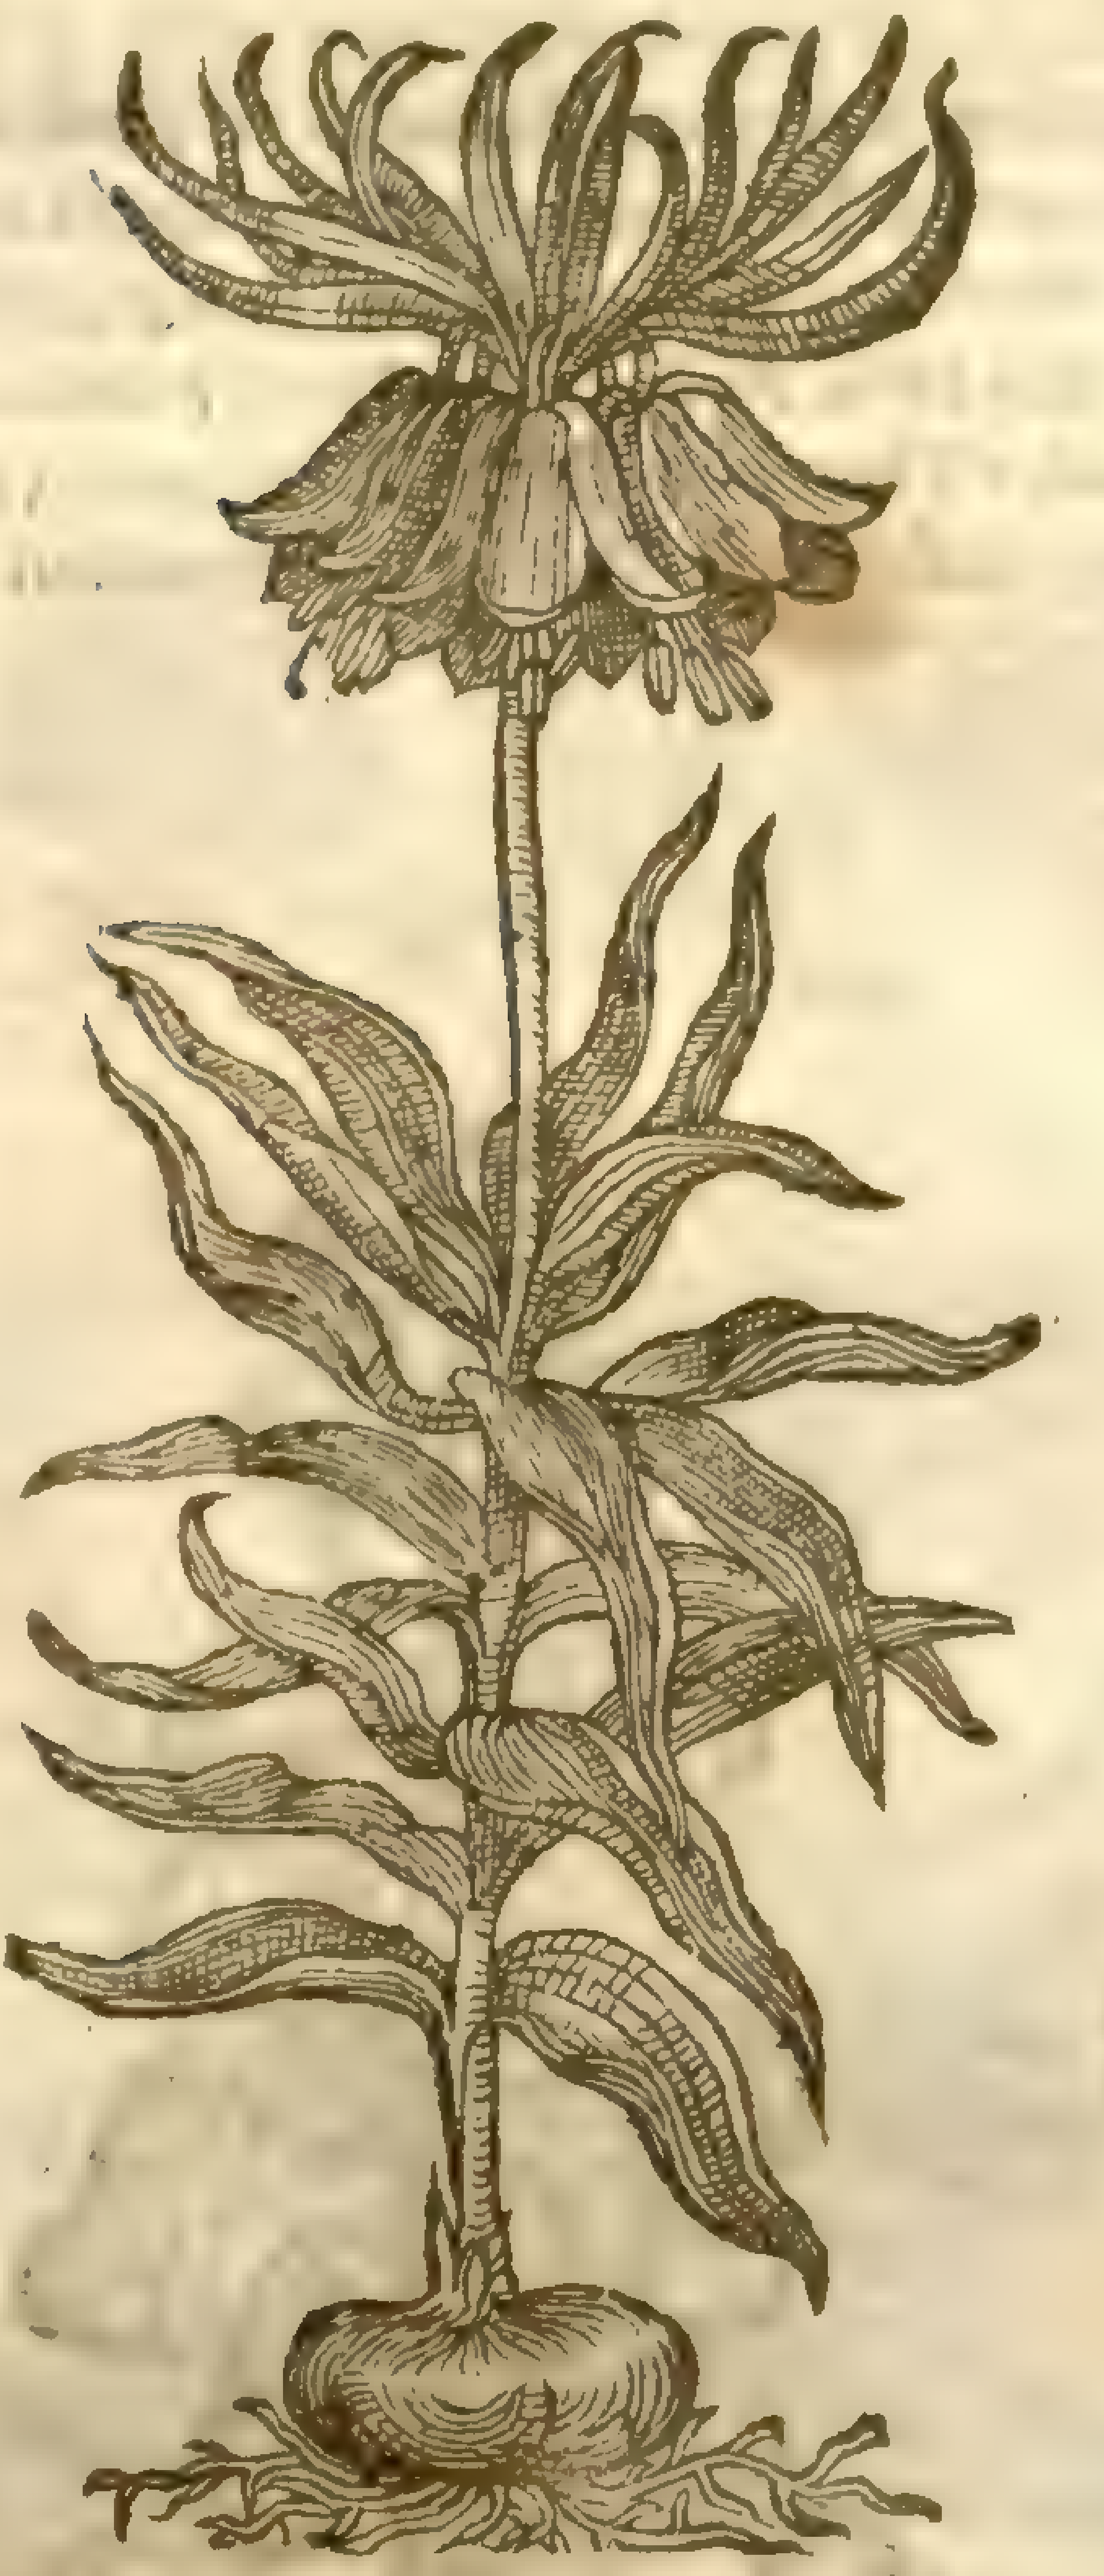
There is not any thing known of the nature or vertues of this Perſian Lilly, eſteemed as yet for his rareneſſe and comely proportion; although (if I might bee ſo bold with a ſtranger that hath vouchſafed to trauell ſo many hundreds of miles for our acquaintance) wee haue in our Engliſh fields many ſcores of floures in beauty far excelling it.

Chap. 108. *Of the Crowne Imperiall.*

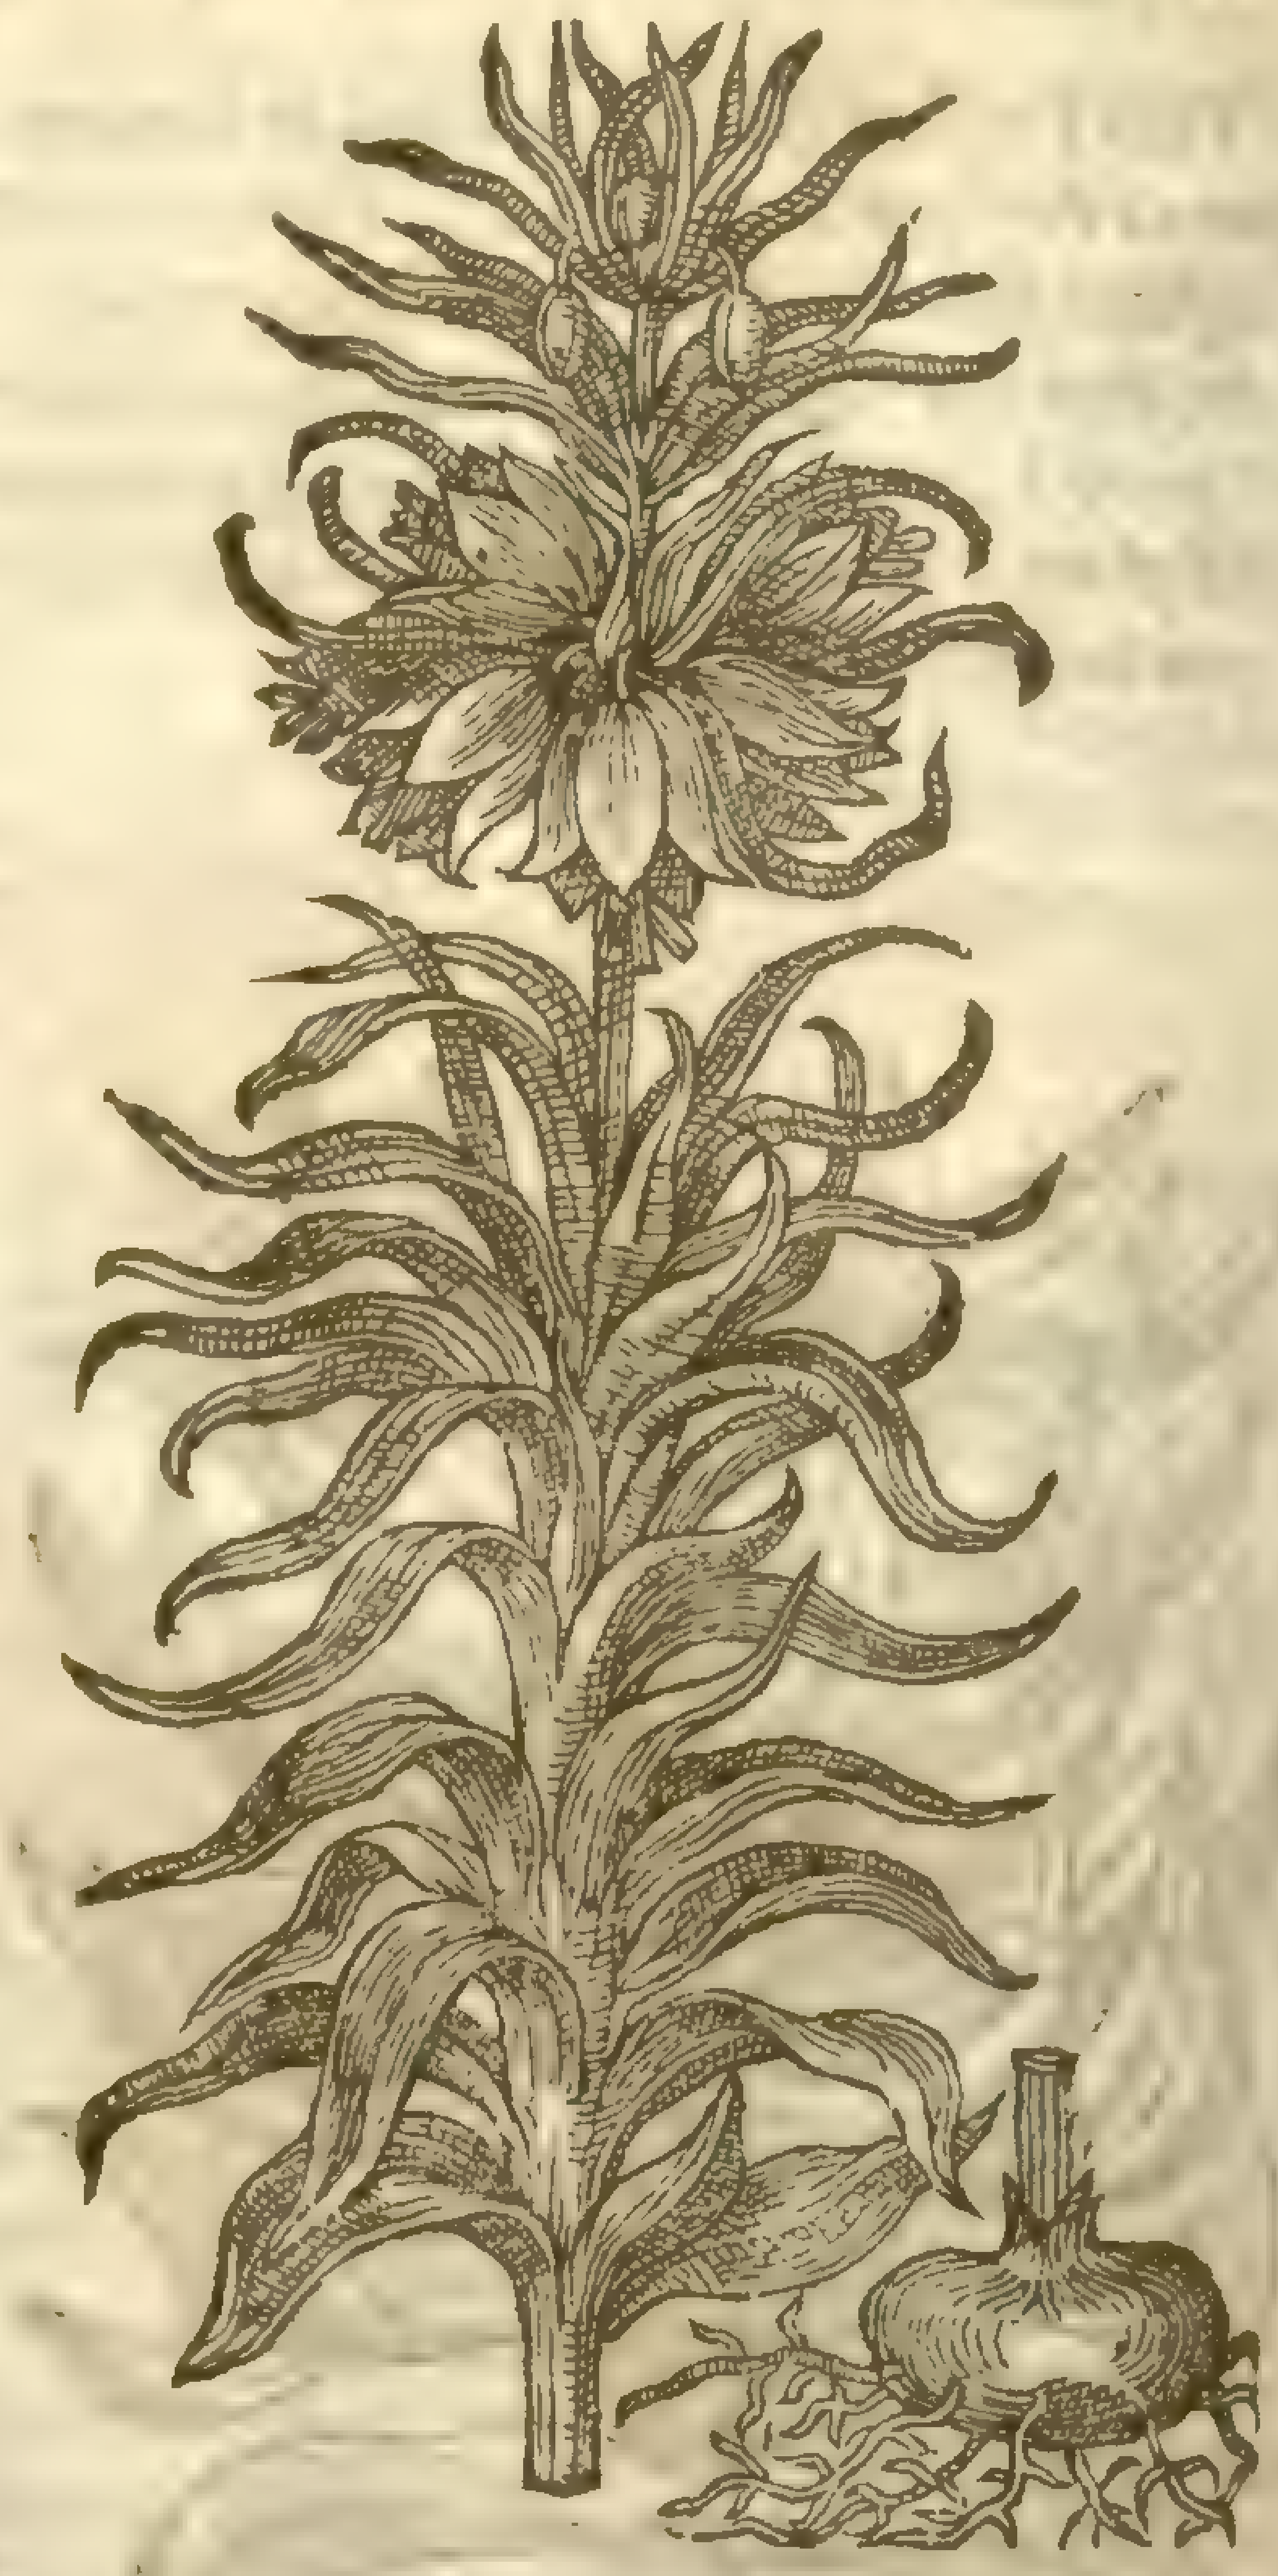
¶ *The Deſcription.*

The Crowne Imperiall hath for his root a thicke firme and ſolid bulbe, couered with a yellowiſh filme or skinne, from the which riſeth vp a great thicke fat ſtalke two cubits high, in the bare and naked part of a darke ouerworne dusky purple colour. The leaues grow confuſedly about the ſtalke like thoſe of the white Lilly, but narrower: the floures grow at the top of the ſtalke, incompaſſing it round, in forme of an Imperiall Crowne, (whereof it tooke his name) hanging their

Corona Imperialis.
The Crowne Imperiall.

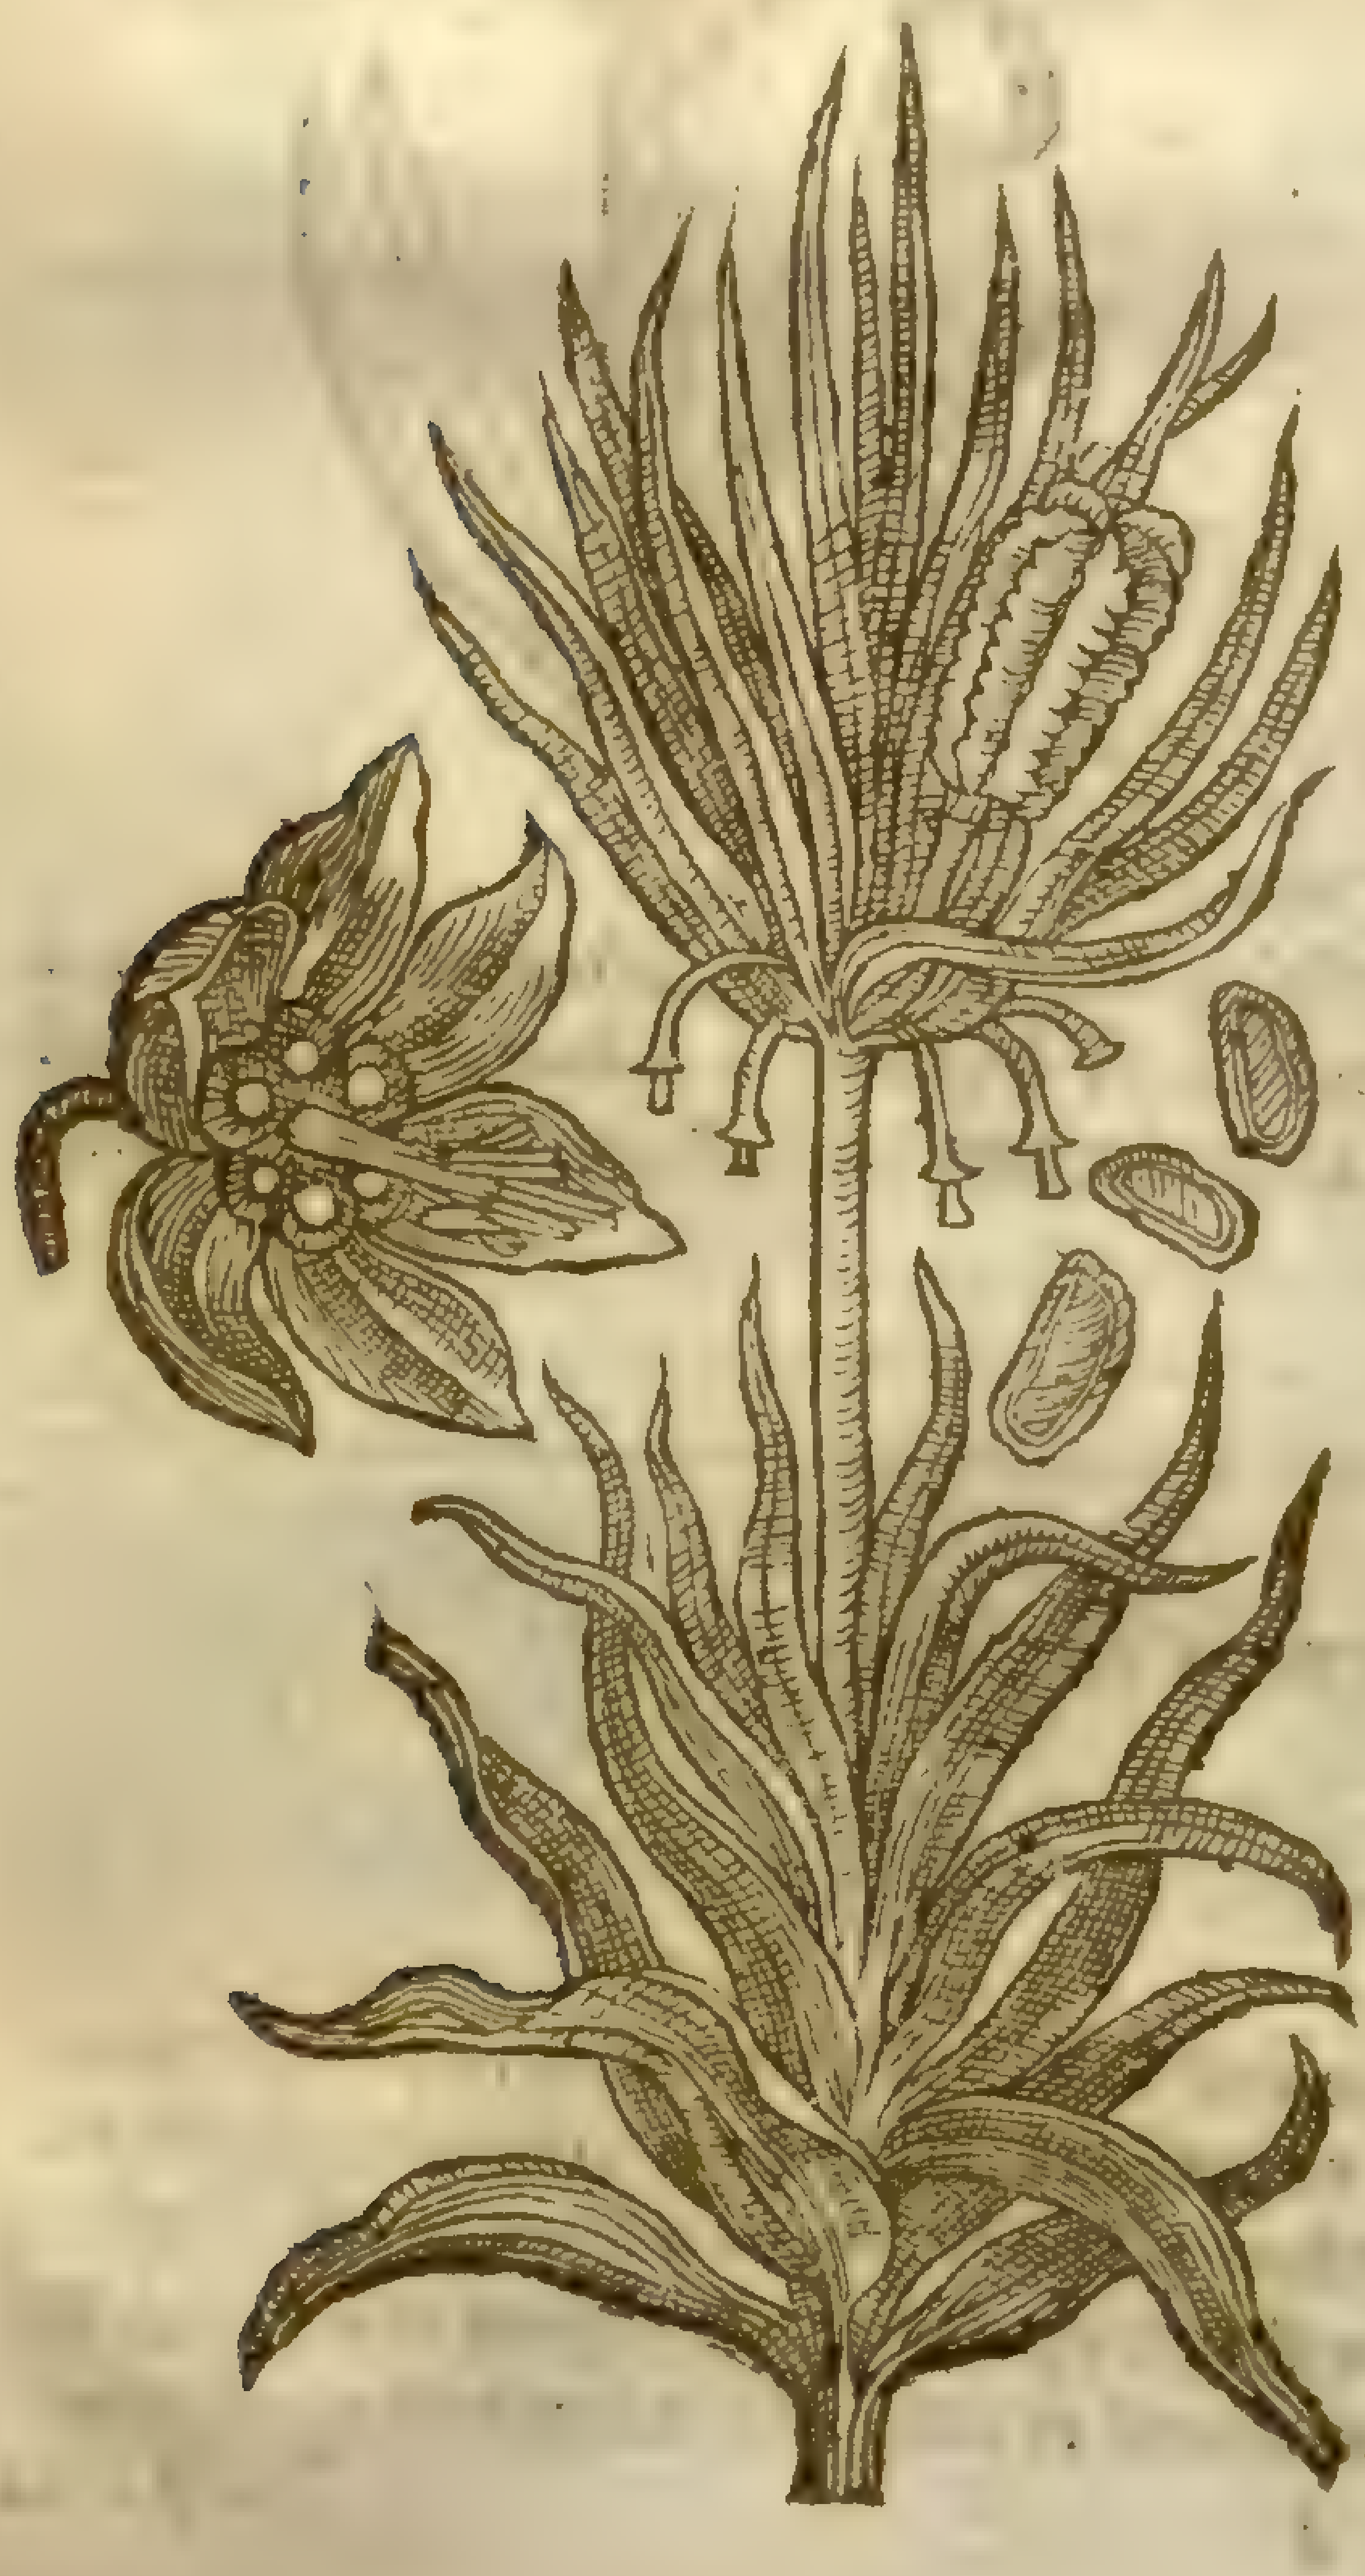


Corona Imperialis duplici corona.
The double Crowne Imperiall.



Fritillaria imperialis, —
Mill. dict.

Corona Imperialis cum ſemine.
Crowne Imperiall with the ſeed.



heads downward as it were bels; in colour it is yellowiſh; or to giue you the true colour, which by words otherwiſe cannot be expreſſed, if you lay ſap berries in ſteep in faire water for the ſpace of two houres, and mix a little ſaffron in that infuſion, and lay it vpon paper, it ſheweth the perfect colour to limne or illumine the floure withall. The back ſide of the ſaid floure is ſtreaked with purpliſh lines, which doth greatly ſet forth the beauty thereof. In the bottom of each of theſe bels there is placed ſixe drops of moſt cleare ſhining ſweet water, in taſte like ſugar, reſembling in ſhew faire orient pearles; the which drops if you take away, there do immediatly appeare the like: notwithſtanding if they may be ſuffered to ſtand ſtill in the floure according to his own nature, they will neuer fall away, no not if you ſtrike the plant vntill it be broken. Among theſe drops there ſtandeth out a certain peſtel, as alſo ſundry ſmall chiues tipped with ſmall pendants like thoſe of the Lilly: aboue the whole floures there groweth a tuft of green leaues like thoſe vpon the ſtalke, but ſmaller. After the floures be faded, there follow cods or ſeed-veſſels ſix ſquare, wherein is contained flat ſeeds tough & limmer, of the colour of Mace: the whole plant, as wel roots as floures do ſauor or ſmell very like a fox. As the plant groweth old, ſo doth it wax rich, bringing forth a Crowne of floures amongſt the vppermoſt green leaues, which ſome make a ſecond kinde, although in truth they are but one and the ſelfe ſame, which in time is thought to grow to a triple crowne, which hapneth by the age of the root, and fertilitie of the ſoile, whoſe figure or tipe I haue thought good to ioyne with that picture alſo which in the time of his infancie it had.

¶ *The Place.*

This plant likewiſe hath been brought from Conſtantinople amongſt other bulbous roots, and made denizons in our London gardens, whereof I haue great plenty.

¶ *The Time.*

It floureth in Aprill, and ſometimes in March, when as the weather is warme and pleaſant. The ſeed is ripe in Iune.

¶ *The Names.*

This rare and ſtrange Plant is called in Latine, *Corona Imperialis*, & *Lilium Byzantinum*: the Turks do call it *Caualc lale*, and *Tuſai*. And as diuers haue ſent into theſe parts of theſe roots at ſundry times, ſo haue they likewiſe ſent them by ſundry names: ſome by the name *Tuſai*: others, *Touſai*, and *Tuyſchiachi*, and likewiſe *Turſani*, and *Turfanda*. ‡ *Cluſius*, and that not without good reaſon, iudgeth this to be the *Hemerocallis* of *Dioſcorides*, mentioned, *lib*. 3. *cap*. 120. ‡

¶ *The Temperature and Vertues.*

The vertue of this admirable plant is not yet knowne, neither his faculties or temperature in working.

† If this be the *Hemerocallis* of *Dioſcorides*, you may finde the vertues thereof ſpecified, *pag*. 99. of this Worke, where in my iudgment they are not ſo fitly placed as they might haue beene here: yet we at this day haue no knowledge of the phyſicall operation, either of thoſe plants mentioned in that place, or of this treated of in this Chapter.

Chap. 109. *Of Dogs Tooth.*

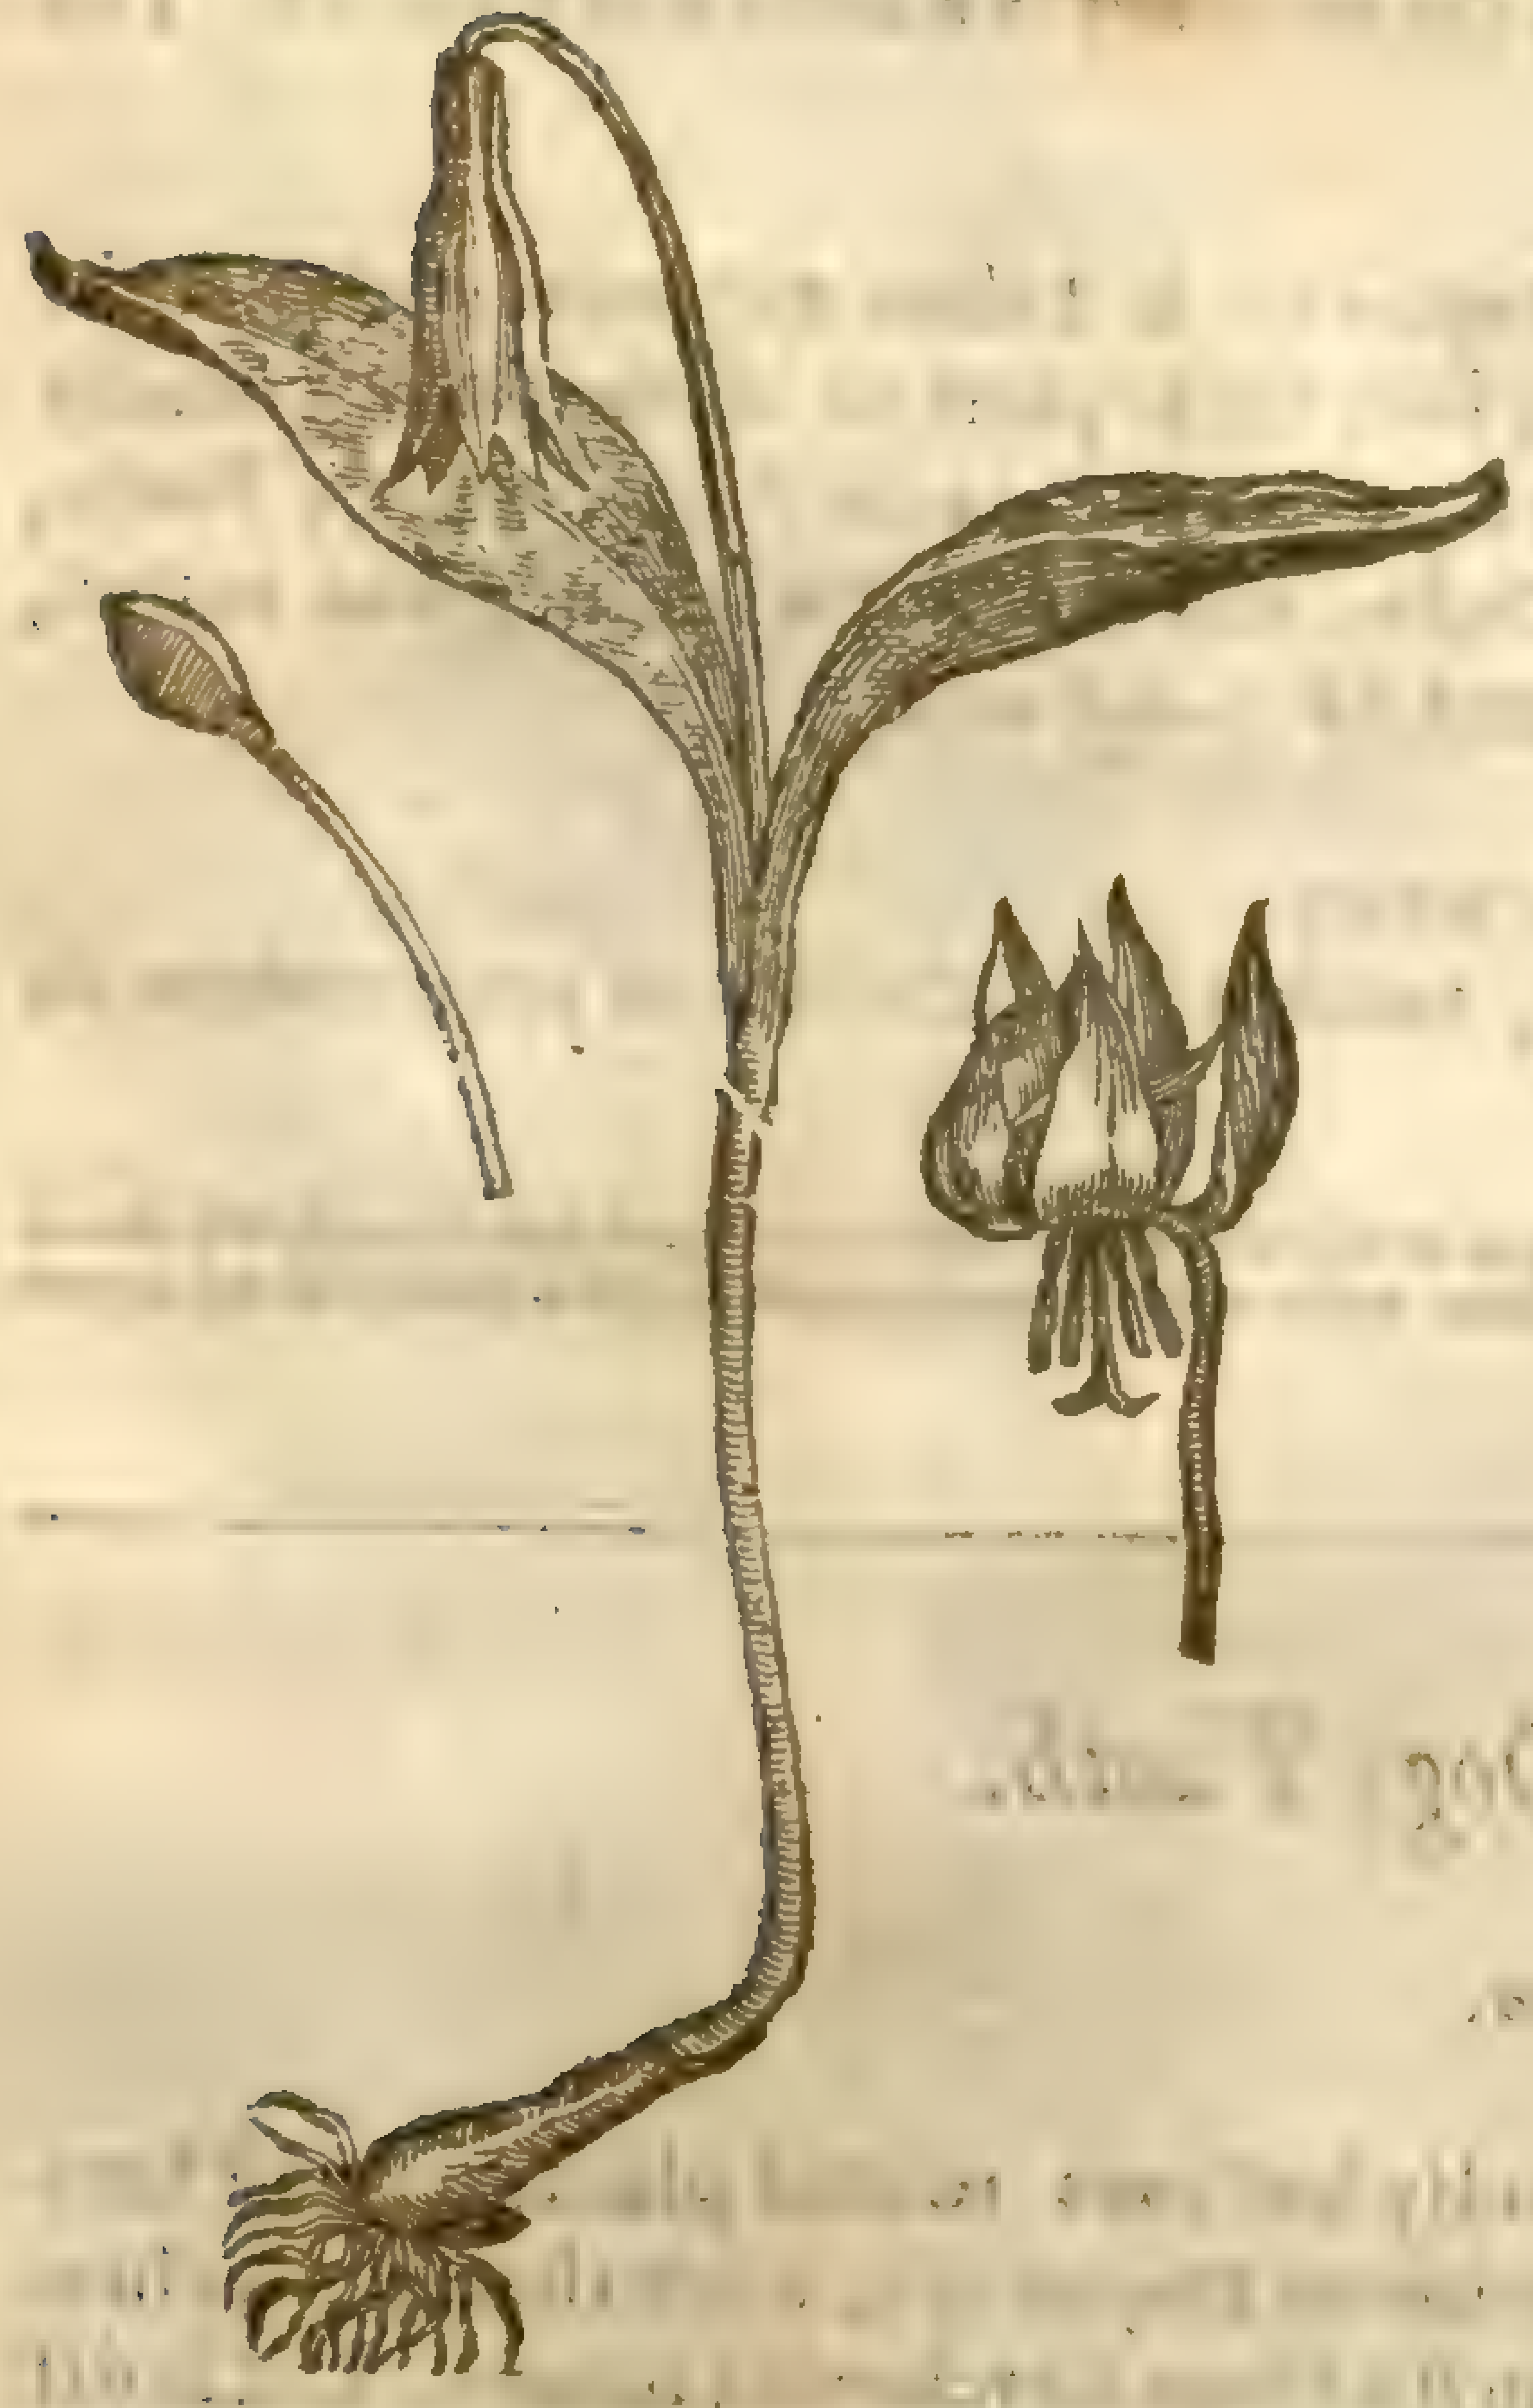
¶ *The Deſcription.*

1 There hath not long ſince bin found out a goodly bulbous rooted plant, termed Satyrion, which was ſuppoſed to be the true Satyrion of *Dioſcorides*, after that it was cheriſhed, and the vertues thereof found out by the ſtudious ſearchers of nature. Little difference hath bin found betwixt that plant of *Dioſcorides*, and this *Dens Caninus*, except in the color, which (as you know) doth commonly vary according to the diuerſitie of places where they grow, as it falls out in Squilla, Onions, and the other kinds of bulbed plants. It hath moſt commonly two leaues, very ſeldom three; which leafe in ſhape is very like to *Allium Vrſinum*, or Ramſons, though far leſſe. The leaues turn down to the groundward; the ſtalk is tender and flexible like to *Cyclamen* or Sow-bread, about an handfull high, bare and without leaues to the root. The proportion of the floure is like that of Saffron or the Lilly floure, full of ſtreams of a purpliſh white colour: the root is big, and like vnto a date, with ſome fibres growing from it: vnto the ſaid root is a ſmall flat halfe round bulb adioyning, like vnto *Gladiolus* or Corn-flag.

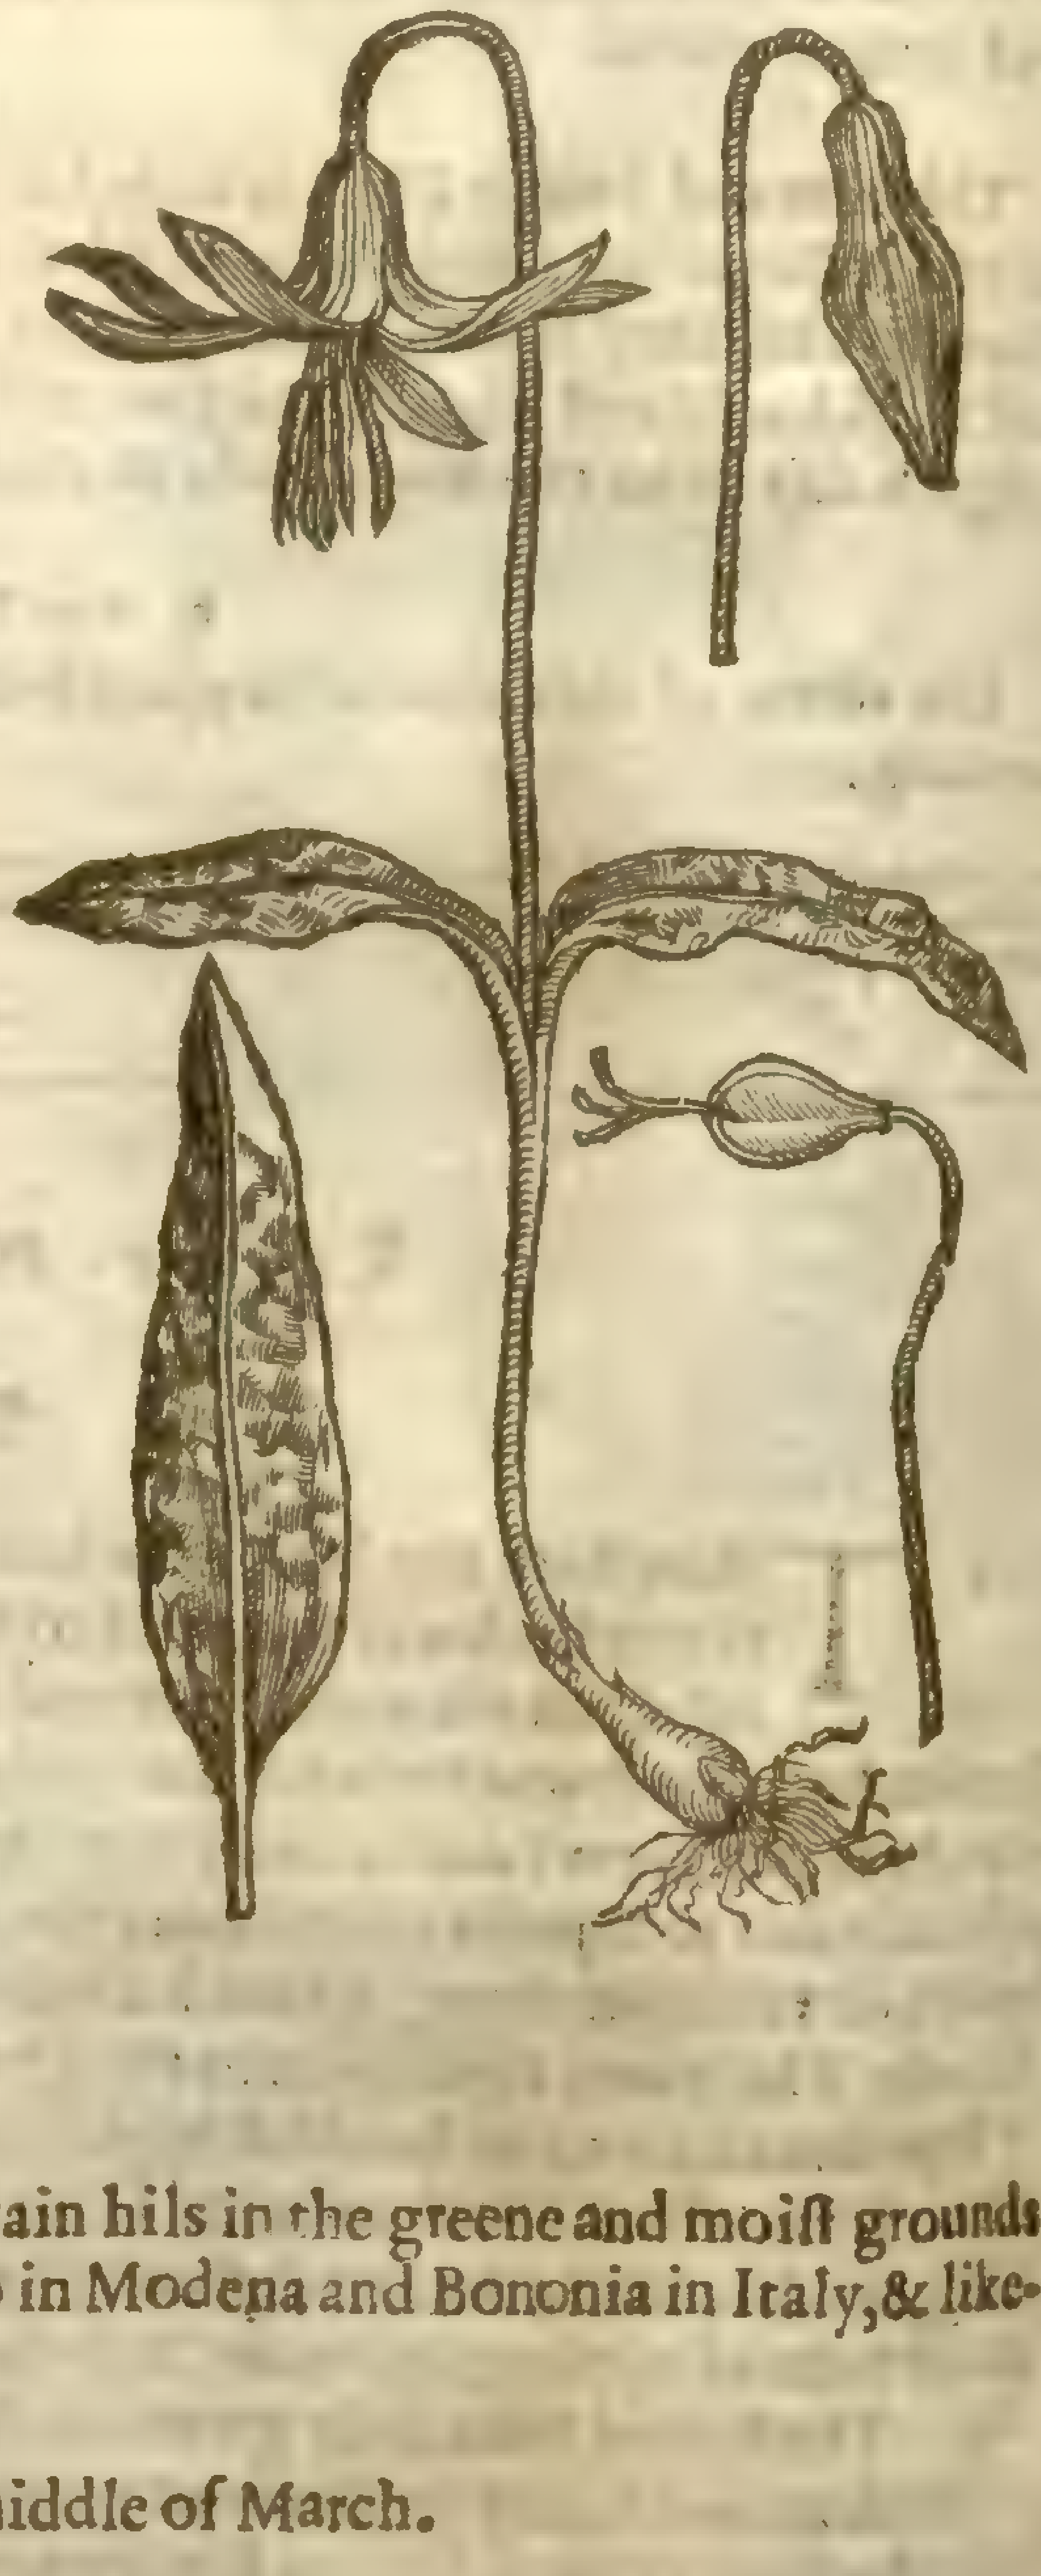
2 The ſecond kind is far greater and larger than the firſt, in bulb, ſtalke, leaues, floure, and cod. It yeeldeth two leaues for the moſt part, which do cloſe one within another, and at the firſt they do hide the floure (for ſo long as it brings not out his floure) it ſeemes to haue but one leafe like the Tulipa's, and like the Lillies, though ſhorter, and for the moſt part broader; wherefore I haue placed it and his kinds next vnto the Lillies, before the kinds of *Orchis* or ſtones. The leaues which it beareth are ſpotted with many great ſpots of a darke purple colour, and narrow below, but by little and little toward the top wax broad, and after that grow to be ſharp pointed, in form ſomewhat neere Ramſons, but thicker and more oleous. When the leaues be wide opened the floure ſheweth it ſelfe vpon his long weake naked ſtalke, bowing toward the earth-ward; which floure conſiſts of ſix very long leaues of a fine delayed purple colour, which with the heate of the Sun opens it ſelfe, and bendeth his leaues backe againe after the manner of the Cyclamen floure, within which there are ſix purple chiues, and a white three forked ſtile or peſtell. This floure is of no pleaſant ſmell, but commendable for the beauty. When the floure is faded, there ſucceedeth a three ſquare huske or head wherein are the ſeeds, which are very like them of *Leucoium bulboſum præcox*, but longer, ſlenderer, and of a yellow colour. The root is long, thicker below than aboue, ſet with many white fibres, waxing very tender in the vpper part, hauing one or more off-ſets or yong ſhoots, from which the ſtalke riſeth out of the ground (as hath bin ſaid) bringing forth two leaues, and not three, or only one, ſaue when it will not floure.

3 The third kind is in all things like the former, ſaue in the leaues, which are narrower, and in the colour of the floure, which is altogether white, or conſiſting of a color mixt of purple & white. Wherefore ſith there is no other difference, it ſhall ſuffice to haue ſaid thus much for the Deſcription.

1 *Dens Caninus.*
Dogs tooth.



2 *Dens Caninus flore albo anguſtioribus folijs.*
White Dogs tooth.



¶ *The Place.*

Theſe three plants grow plentifully at the foot of certain hils in the greene and moiſt grounds of Germany and Italy, in Stiria not far from Gratz, as alſo in Modena and Bononia in Italy, & likewiſe in ſome of the choice gardens of this Country.

¶ *The Time.*

They floure in Aprill, and ſomtimes ſooner, as in the middle of March.

¶ *The Names.*

This plant is called in Latine, *Dens Caninus*; and ſome haue iudged it *Satyrium Erythronium.* *Matthiolus* cals it *Pſeudohermodactylus*: the men of the Countrey where it groweth call it **Schoſtwurtz**; and the phyſitians about Styria call it *Dentali.* The ſecond may for diſtinctions ſake be termed *Dens caninus flore albo, anguſtioribus folijs*; that is, Dogs tooth with the white floure and narrow leaues.

¶ *The Nature.*

Theſe are of a very hot temperament, windy, and of an excrementitious nature, as may appear by the Vertues.

¶ *The Vertues.*

A The women that dwel about the place where theſe grow haue with great profit put the meale or pouder of it into their childrens pottage, againſt the worms of the belly.

B Being drunk with wine, it hath bin proued maruelouſly to aſſwage the Colique paſſion.

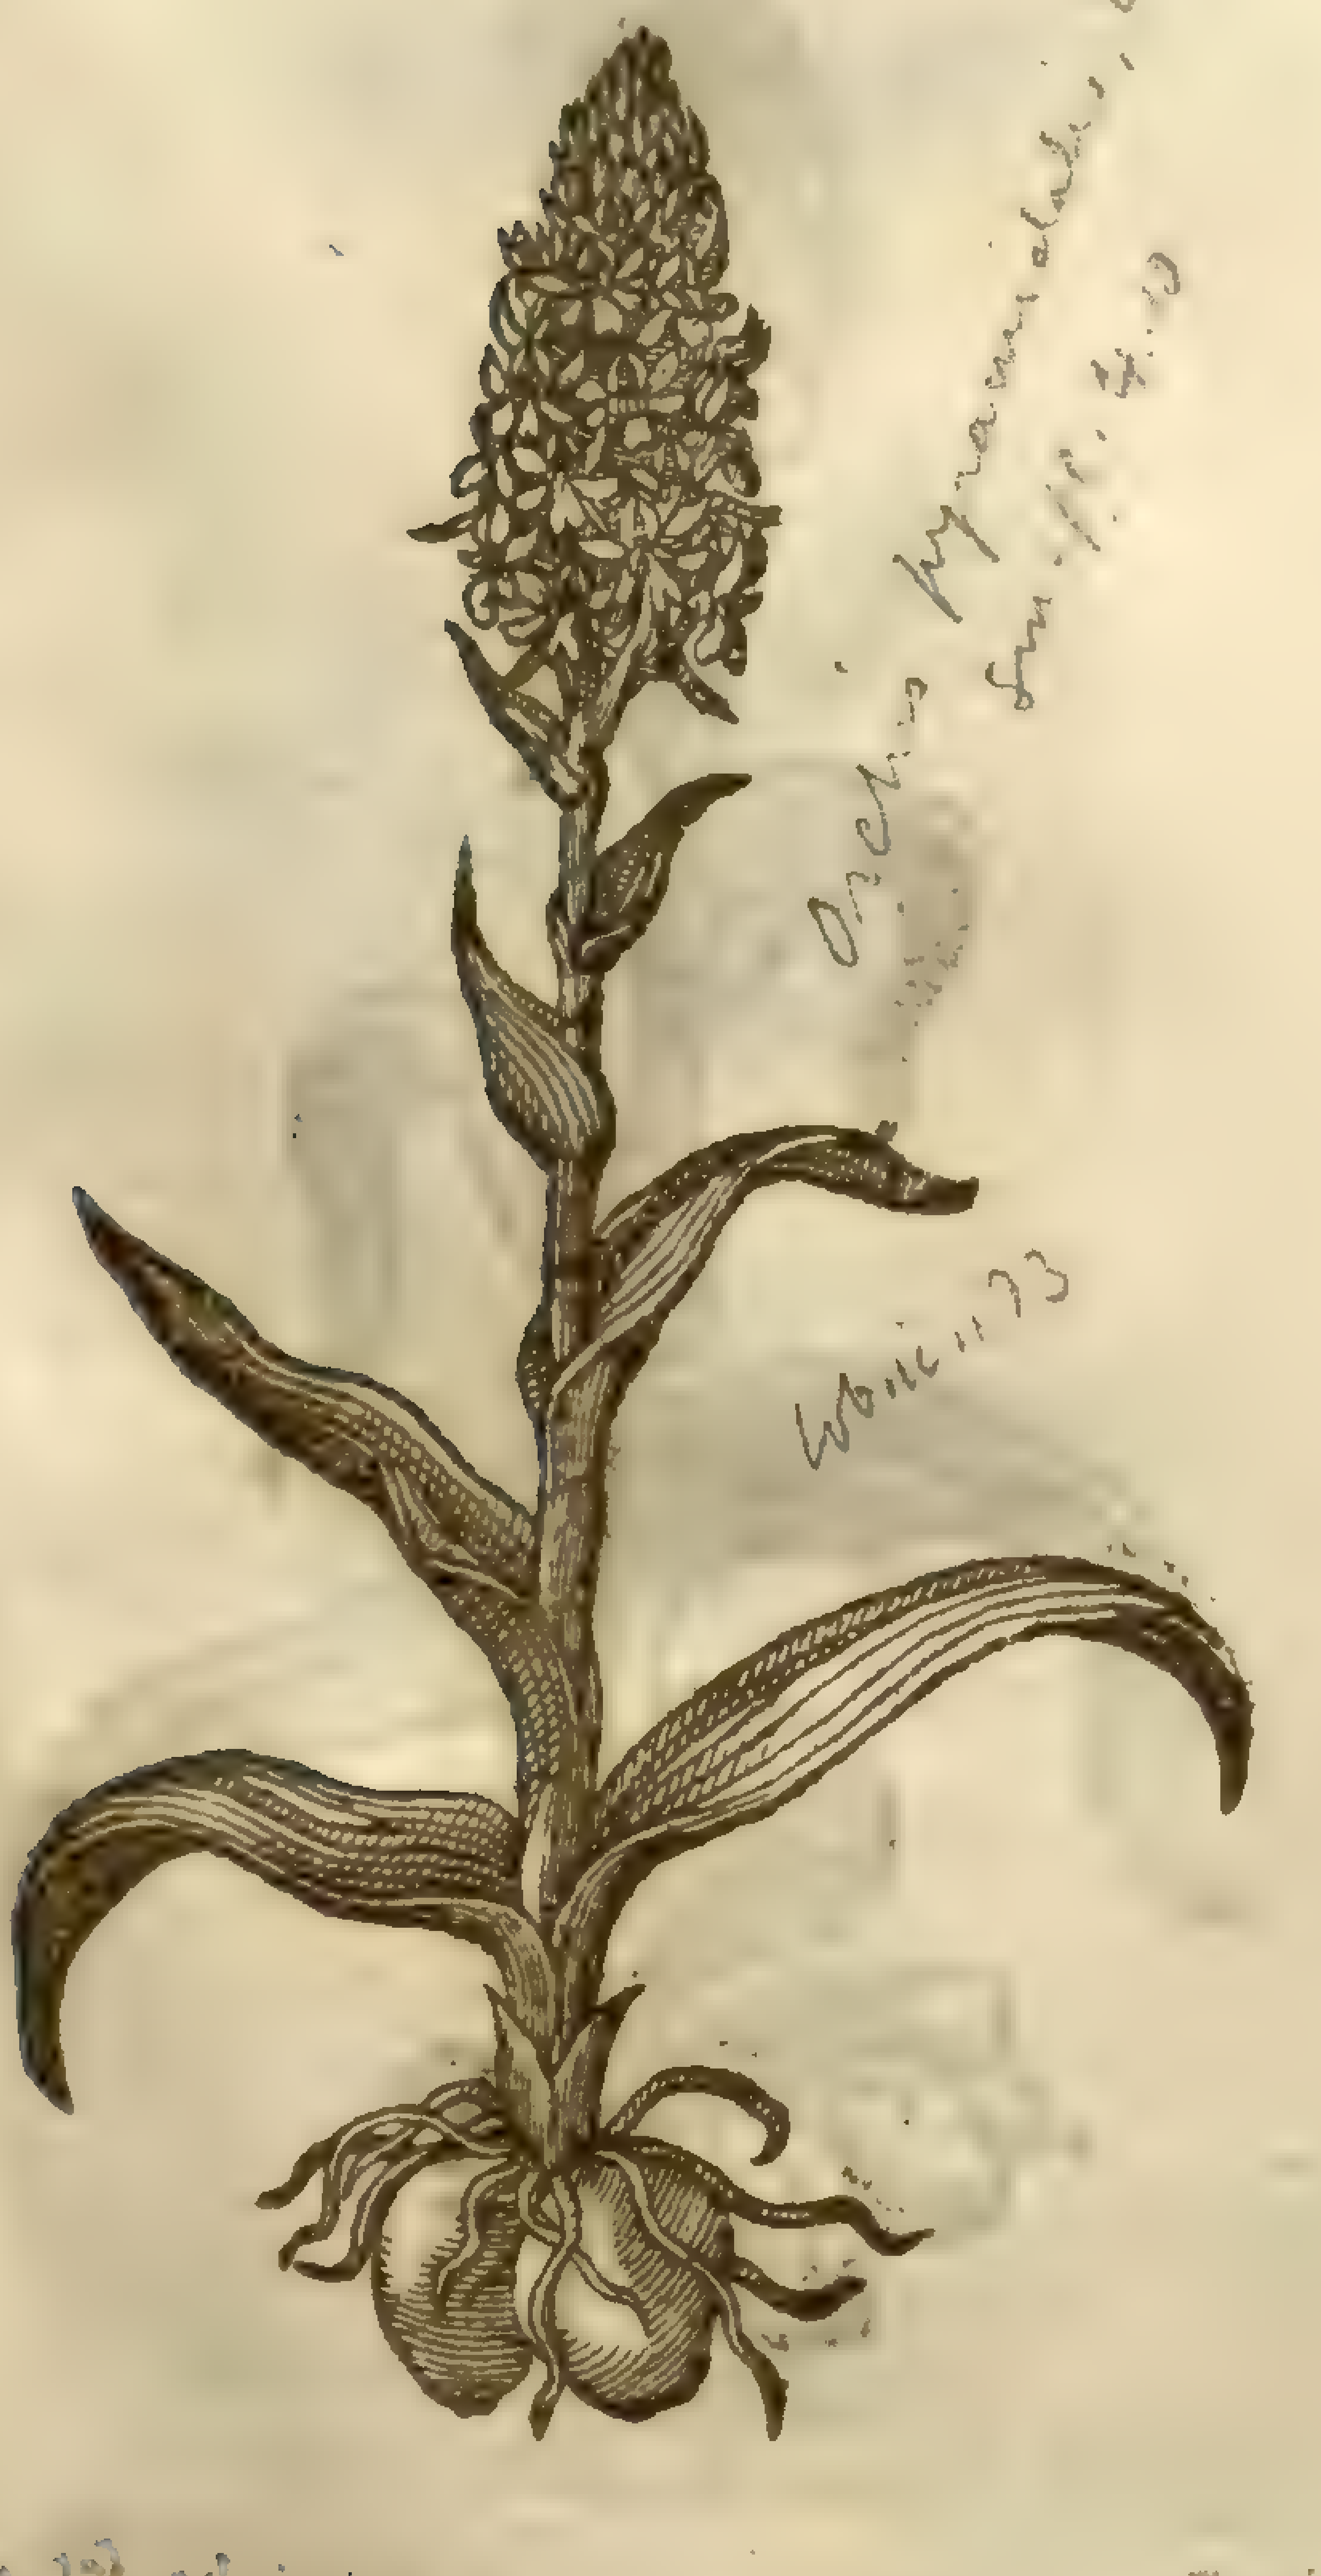
C It ſtrengthneth and nouriſheth the body in great meaſure, and being drunke with water, it cures children of the falling ſickneſſe.

Chap. 110. *Of Dogs Stones.*

¶ *The Kindes.*

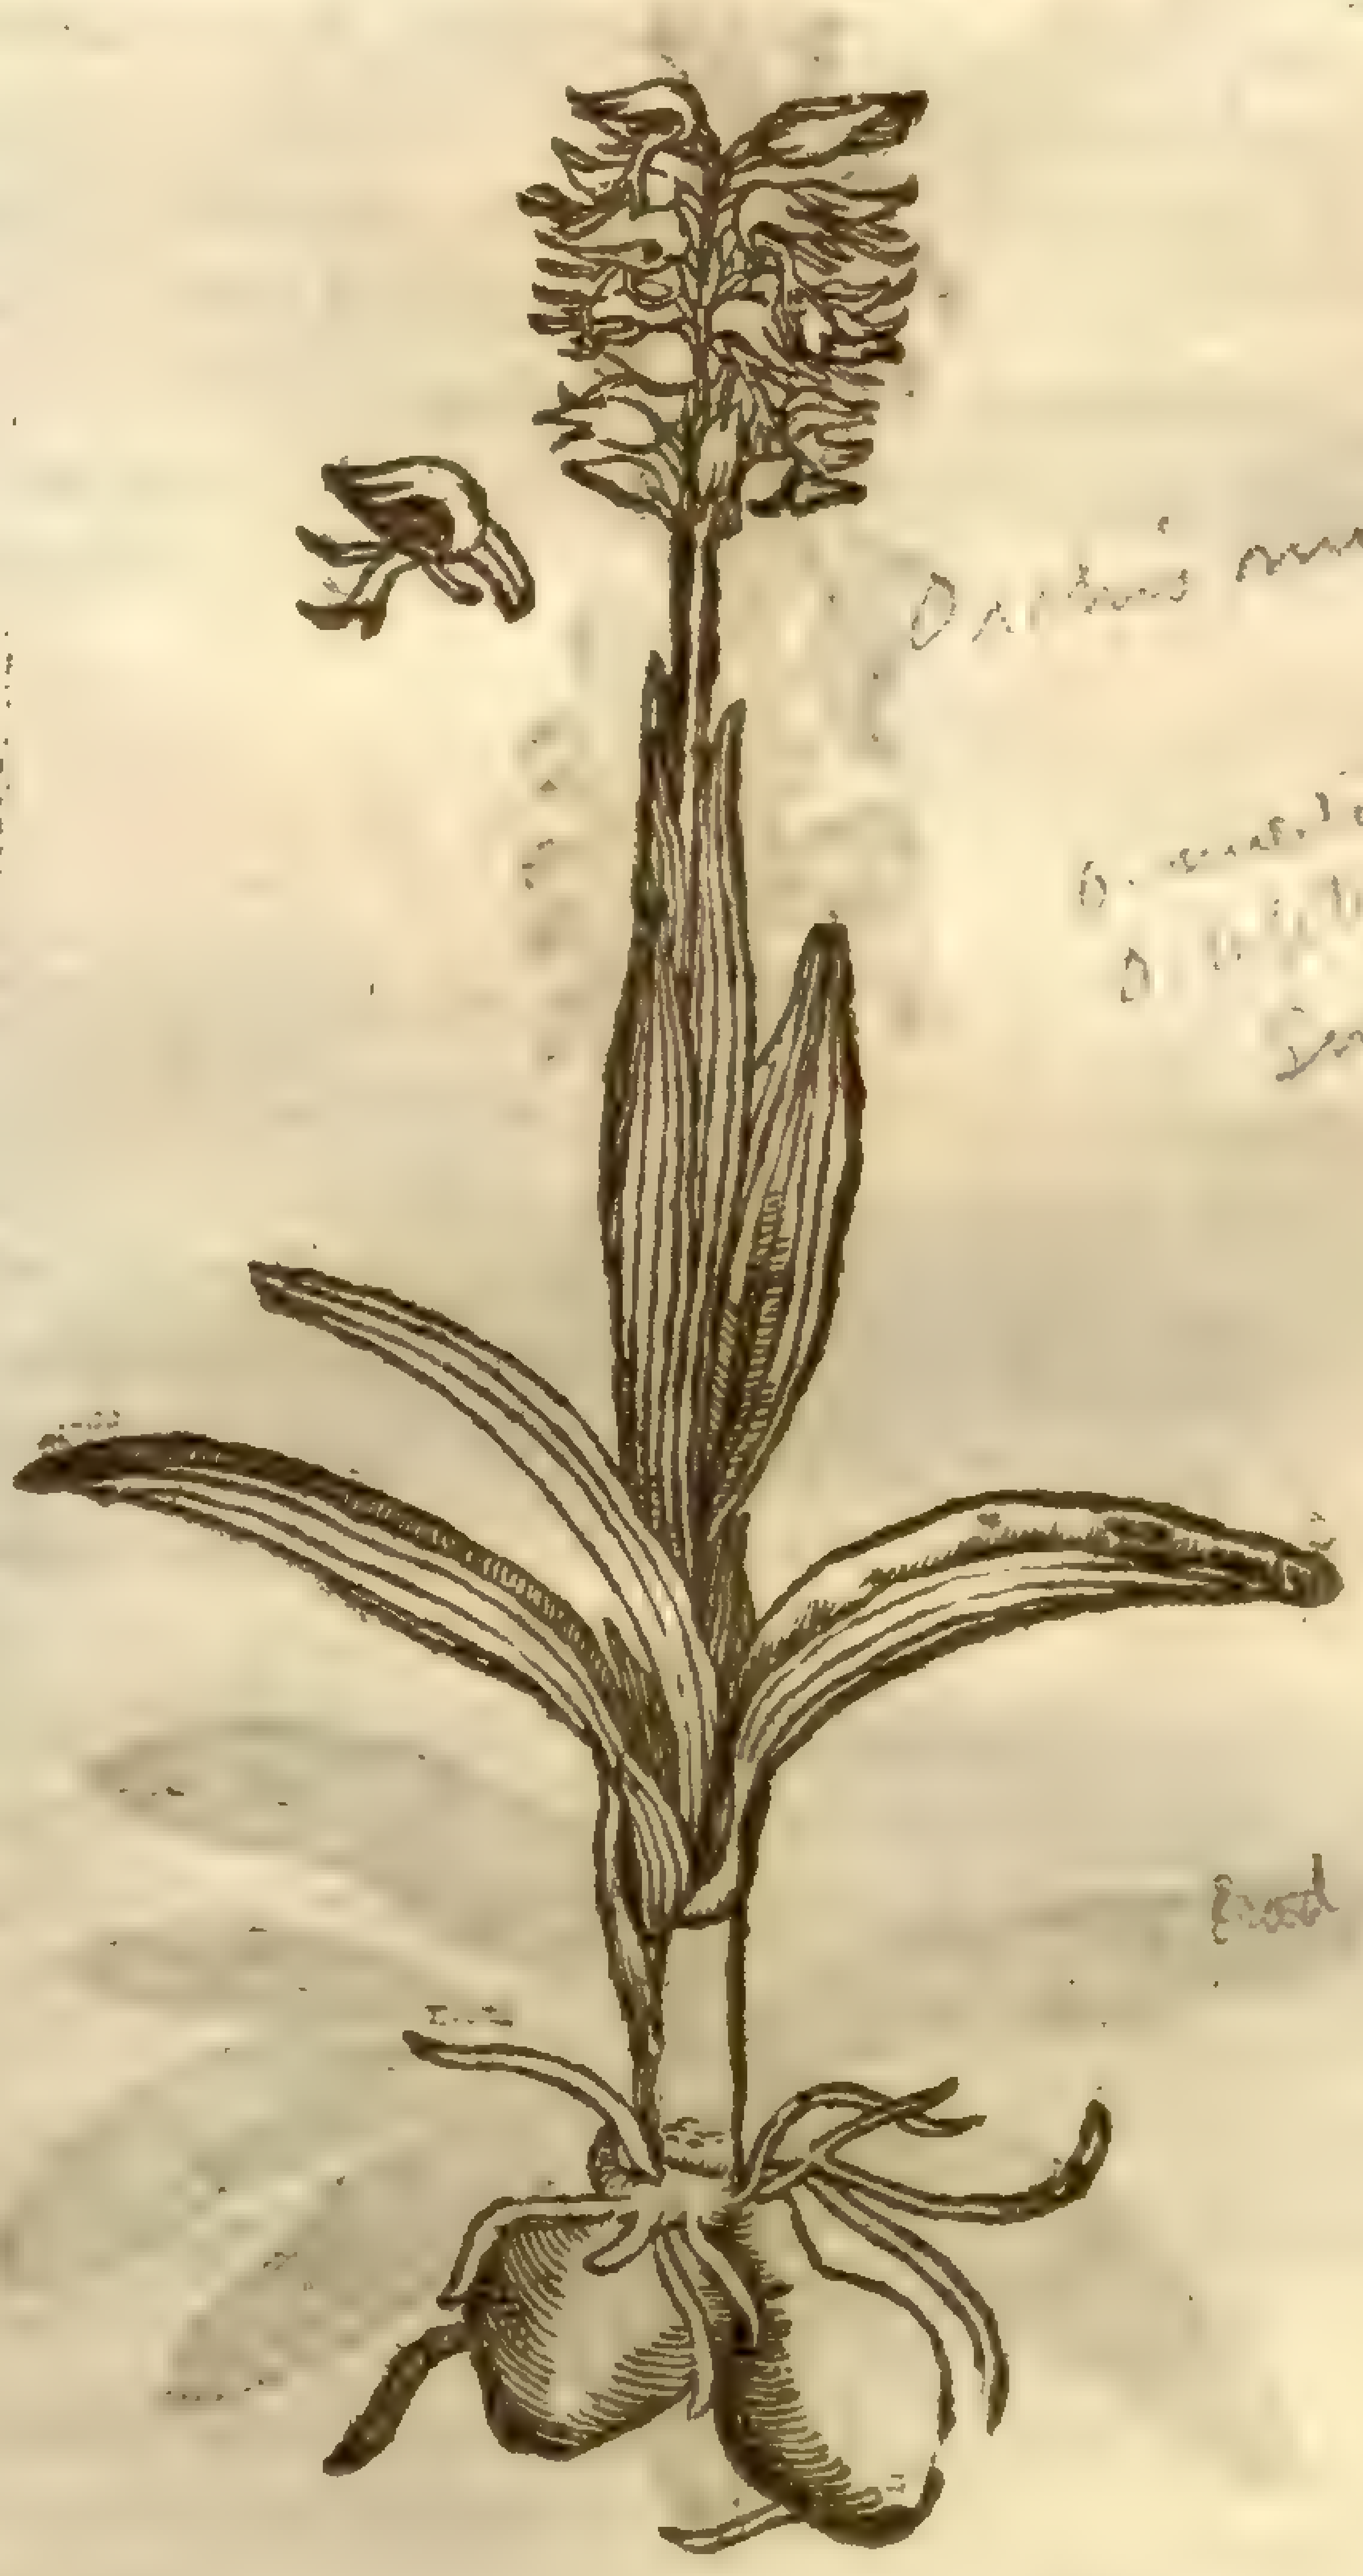
STones or Teſticles, as *Dioſcorides* ſaith, are of two ſorts, one named *Cynoſorchis*, or Dogs Stones; the other, *Orchis Serapias*, or Serapias ſtones. But becauſe there be many and ſundry other ſorts differing one from another, I ſee not how they may be contained vnder theſe two kinds only: therfore I haue thought good to diuide them as followeth; the firſt kind I haue named *Cynoſorchis*, or Dogs ſtones: the ſecond, *Teſticulus Morionis*, or Fools ſtones: the third, *Tragorchis*, or goats ſtones: the fourth, *Orchis Serapias*, or Serapias ſtones: the fift, *Teſticulus odoratus*, or ſweet-ſmelling Stones, or after *Cordus*, *Teſticulus Pumilio*, or Dwarfe ſtones.

† 1 *Cynoſorchis major.*
Great Dogs ſtones.



Orchis pyramidalis L.

† 2 *Cynoſorchis major altera.*
White Dogs ſtones.



Orchis militaris

¶ *The Deſcription.*

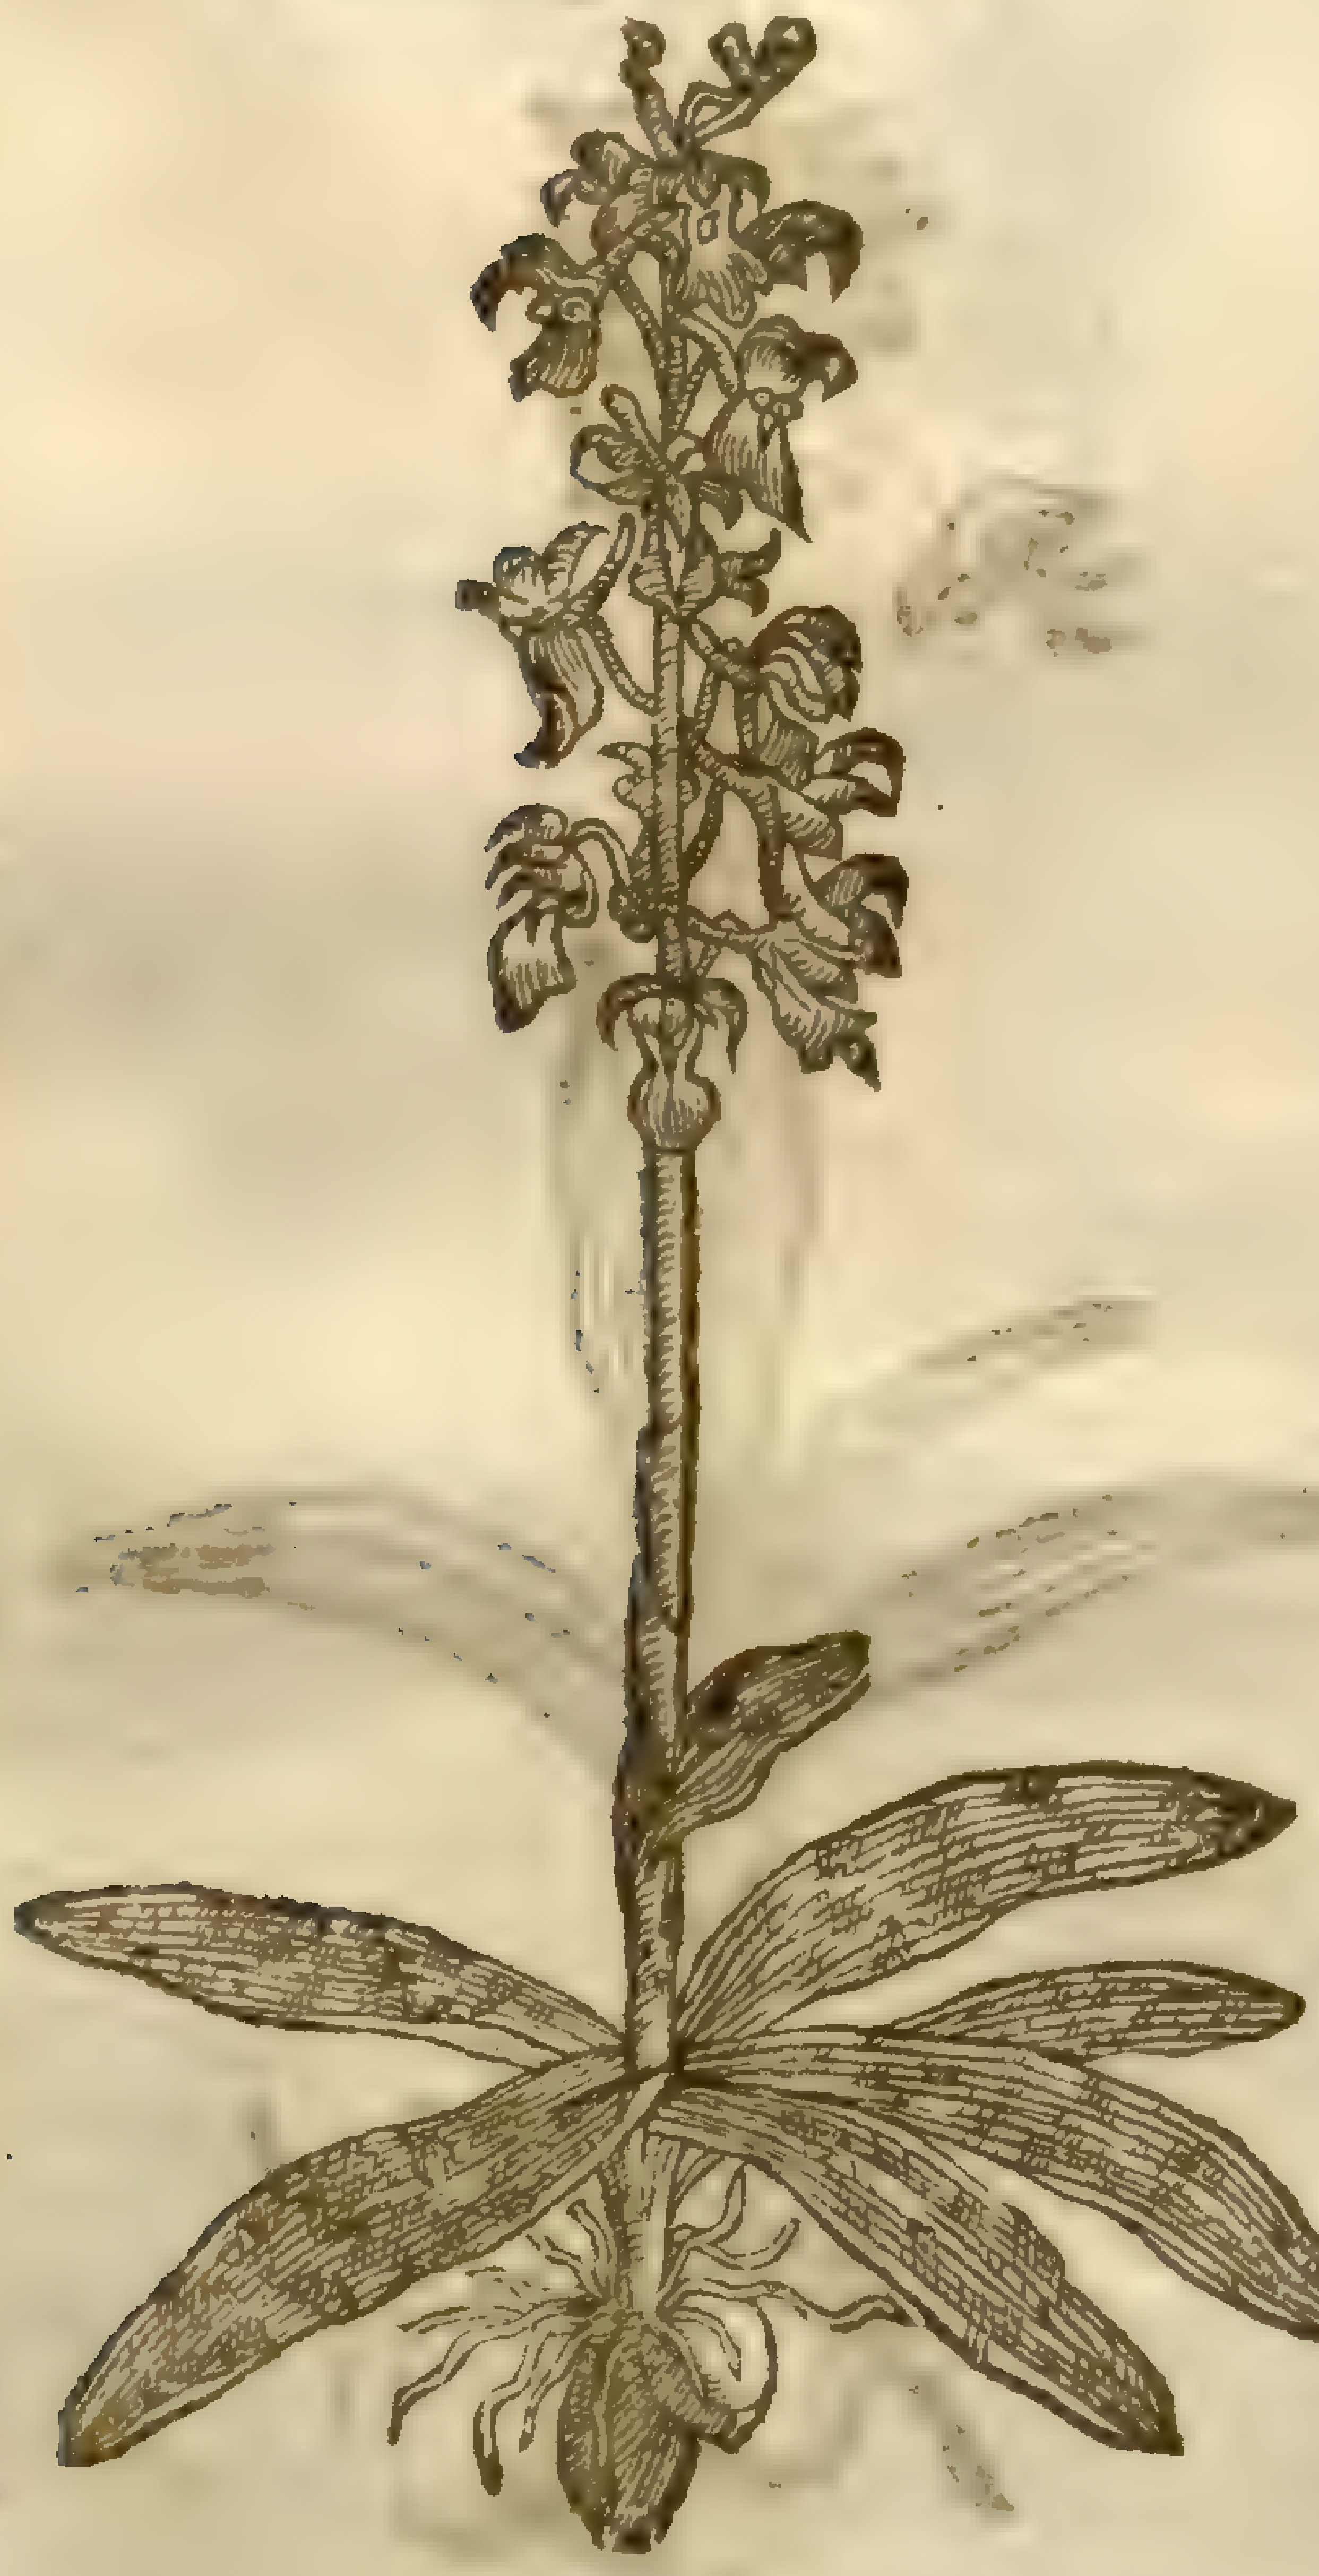
1 GReat Dogs ſtones hath foure and ſometimes fiue great broad thick leaues, ſomewhat like thoſe of the garden lilly, but ſmaller. The ſtalk riſeth vp a foot or more in height; at the top whereof groweth a thick tuft of carnation or horſe-fleſh coloured floures, thick and cloſe thruſt together, made of many ſmall floures ſpotted with purple ſpots, in ſhape like to an open hood or helmet. And from the hollow place there hangeth forth a certain ragged chiue or taſſel, in ſhape like to the skin of a dog or ſome ſuch other fourfooted beaſt. The roots be round like vnto the ſtones of a dog, or two oliues, one hanging ſomewhat ſhorter than the other, whereof the higheſt or vppermoſt is the ſmaller, but fuller and harder. The loweſt is the greateſt, lighteſt, and moſt wrinkled or ſhrieueled, not good for any thing.

2 Whitiſh Dogs ſtones hath likewiſe ſmooth long broad leaues, but leſſer and narrower than thoſe of the firſt kinde. The ſtalk is a ſpan long, ſet with fiue or ſix leaues claſping or embracing the ſame round about. His ſpiky floure is ſhort, thicke, buſhy, compact of many ſmall whitiſh

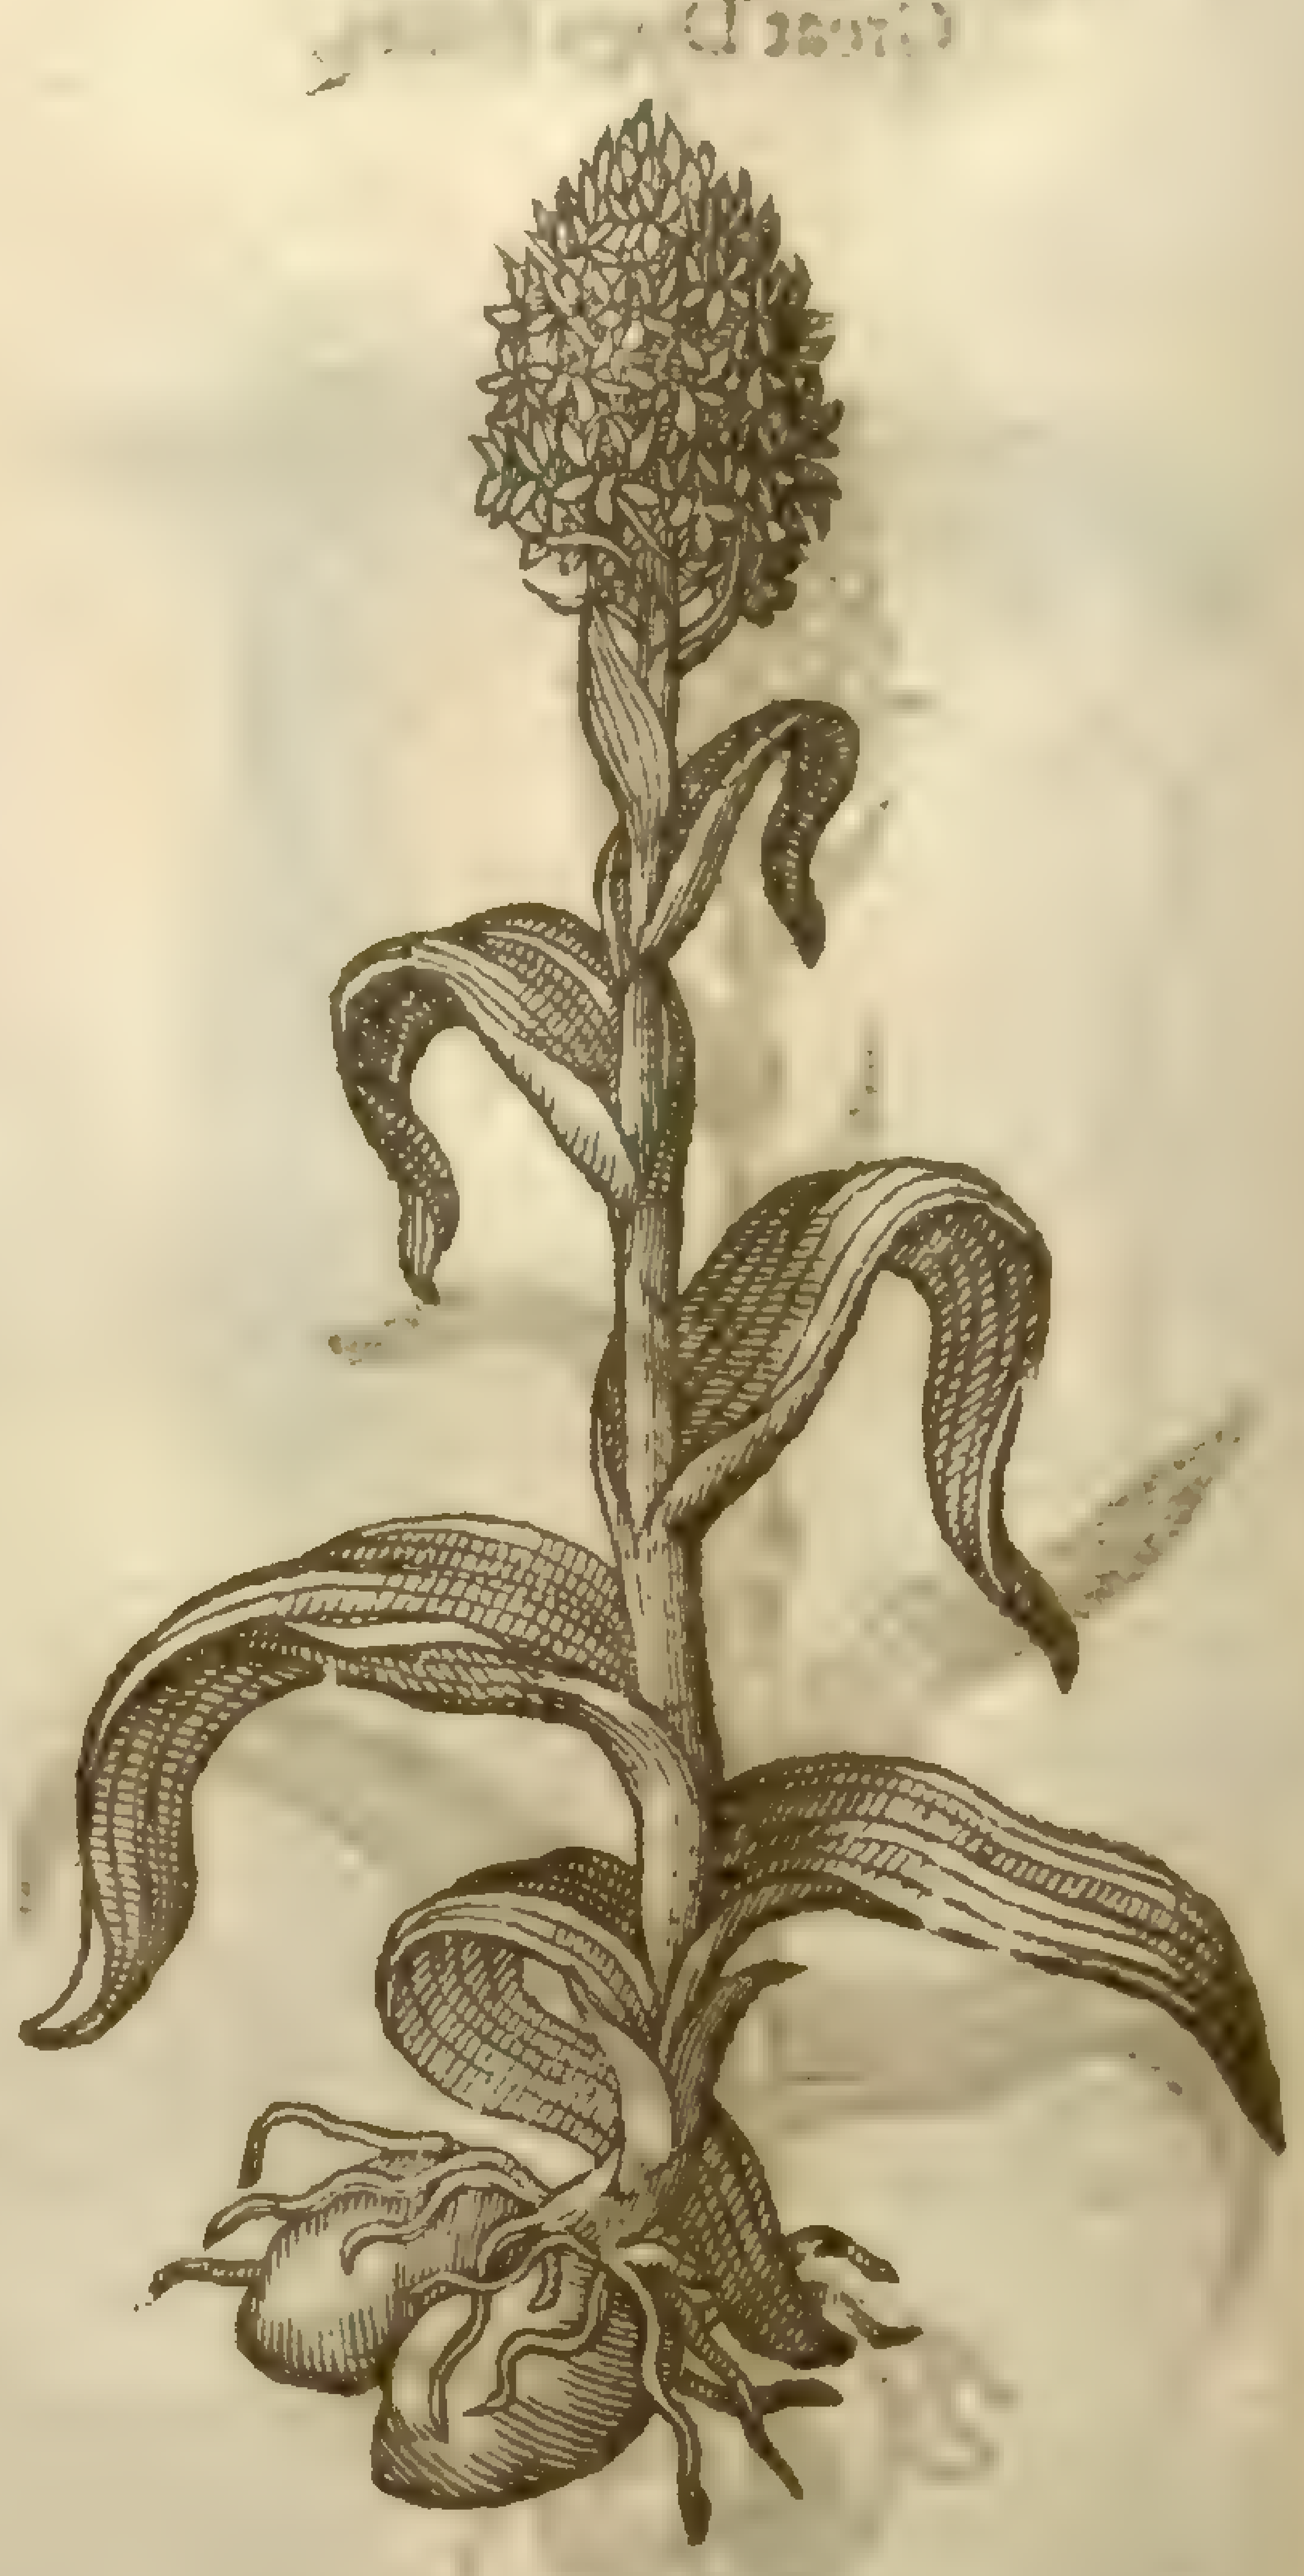
purple colored flours, ſpotted on the inſide with many ſmall purple ſpots & little lines or ſtreaks. The ſmall floures are like an open hood or helmet, hauing hanging out of euerie one as it were the body of a little man without a head, with arms ſtretched forth, and thighs ſtradling abroad, after the ſame maner almoſt that the little boyes are wont to be pictured hanging out of *Saturns* mouth. The roots be like the former.

3 Spotted Dogs ſtones bring forth narrow leaues, ribbed in ſome ſort like vnto the leaues of narrow Plaintain or Rib-wort, daſht with many black ſtreaks and ſpots. The ſtalke is a cubit and more high, at the top whereof doth grow a tuſt or eare of violet coloured floures, mixt with a dark purple, but in the hollowneſſe thereof whitiſh, not of the ſame forme or ſhape that the others are of, but leſſer, and as it were reſembling ſomwhat the floures of Larkes-ſpur. The roots be like the former.

4 Mariſh Dogs ſtones haue many thicke blunt leaues next the root, thicke ſtreaked with lines or nerues like thoſe of Plantain. The floure is of a whitiſh red or carnation: the ſtalk and roots be like the former.



† 3 *Cynoſorchis maculata.*
Spotted Dogs ſtones.



4 *Cynoſorchis paluſtris.*
Mariſh Dogs ſtones.

‡ 5 This hath fiue or ſix little leaues: the ſtalk is ſome handfull or better in height, ſet about with ſomewhat leſſe leaues; the tuft of floures at the top of the ſtalke are of a purple colour, ſmall, with a white lip diuided into foure partitions hanging downe, which alſo is lightly ſpotted with purple: it hath a little ſpur hanging down on the hinder part of each floure. The ſeed is ſmal, and contained in ſuch twined heads as in other plants of this kinde. The roots are like the former, but much leſſe. ‡

¶ *The Place.*

Theſe kinds of Dogs ſtones do grow in moiſt and fertil medows. The mariſh Dogs ſtones grow for the moſt part in moiſt and wateriſh woods, and alſo in mariſh grounds. ‡ The fift groweth in many hilly places of Auſtria, Germany, and England. ‡

¶ *The Time.*

They floure from the beginning of May to the end of Auguſt.

¶ *The Names.*

The firſt and ſecond are of that kinde which *Dioſcorides* calleth *Cynoſorchis*; that is in Engliſh, Dogs ſtones, after the common or vulgar ſpeech; the one the greater, the other the leſſer.

‡ 1 This is *Cynoſorchis prior* of *Dodonæus*; *Cynoſorchis noſtra maior* of *Lobel.*

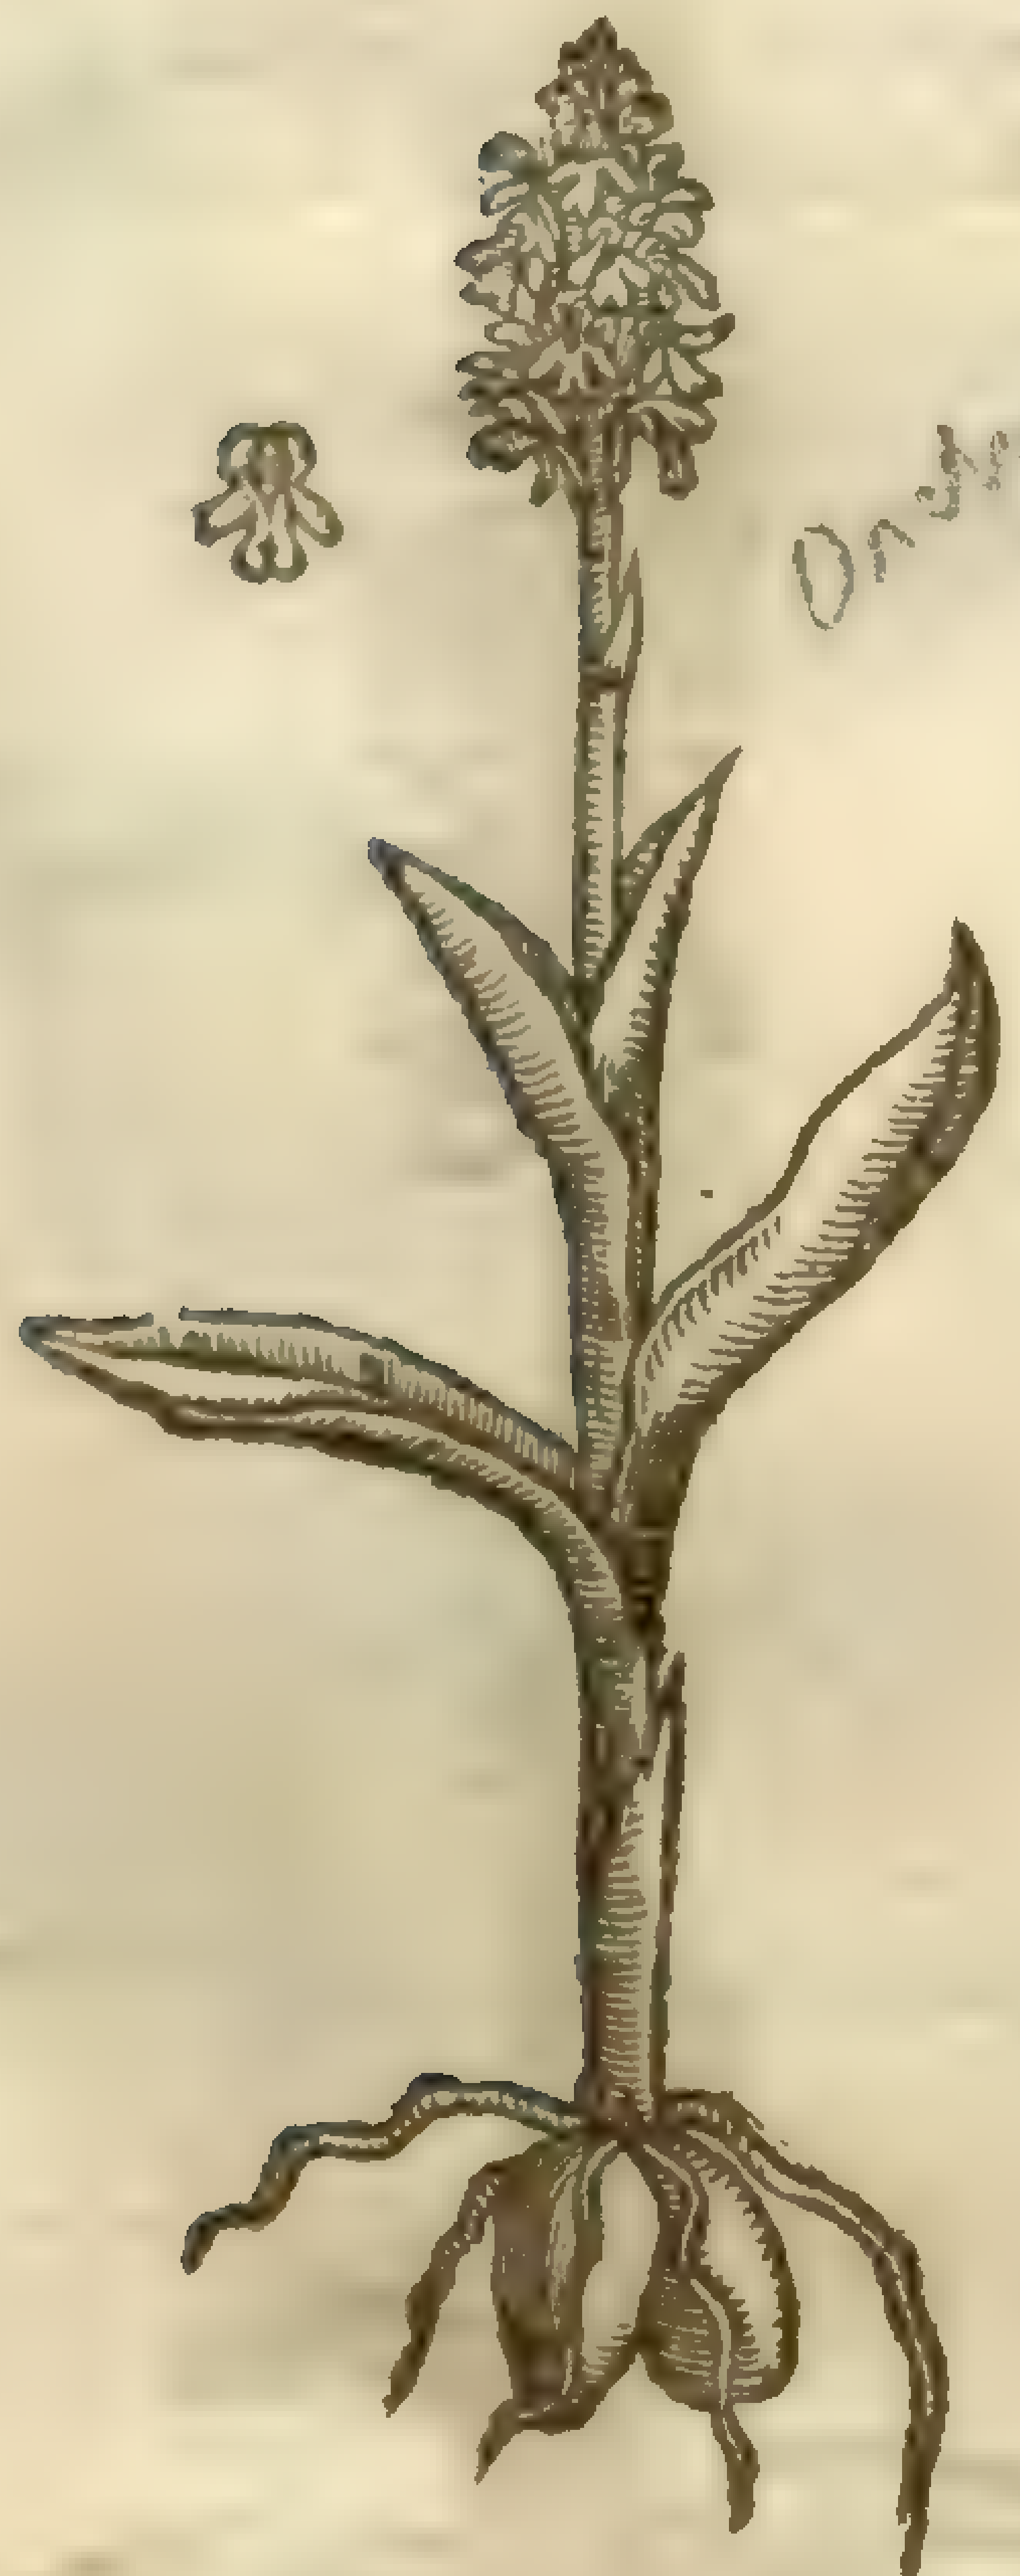
2 *Dodonæus* names this, *Cynoſorchis altera*: *Lobel, Cynoſorchis maioris ſecunda ſpcies.*

3 This *Lobel* calls *Cynoſorchis Delphinia, &c. Tabern. Cynoſorchis maculata.*

4 *Dodonæus* cals this, *Cynoſorchis tertia*: *Lobel, Cynoſorchis maior altera noſtras*: *Tabern. Cynoſorchis maior quarta.*

5 This is *Cluſius* his *Orchis Pannonica quarta.*

‡ 5 *Cynoſorchis minor Pannonica.*
The leſſer Auſtrian Dogs ſtones.



Orchis ustulata [illegible]
Sw. K. 4. 13

¶ *The Temperature.*

Theſe kinds of Dogs ſtones be of temperature hot and moiſt, but the greater or fuller ſtone ſeemes to haue much ſuperfluous windineſſe, and therefore being drunk it ſtirreth vp fleſhly luſt.

The ſecond, which is leſſer, is quite contrary in nature, tending to a hot and dry temperature; therefore his root is ſo farre from mouing venerie, that contrariwiſe it ſtayeth and keepeth it back, as *Galen* teacheth:

He alſo affirmeth, that Serapias ſtones are of a more dry faculty, & do not ſo much preuaile to ſtir vp the luſt of the fleſh.

¶ *The Vertues.*

A *Dioſcorides* writes, that it is reported, That if men do eat of the great full or fat roots of theſe kinds of Dogs ſtones, they cauſe them to beget male children; and if women eat of the leſſer dry or barren root which is withered or ſhriueled, they ſhall bring forth females. Theſe are ſome Doctours opinions only.

B It is further reported, That in Theſſalia the women giue the ful and tender root to be drunk in goats milk, to moue bodily luſt; and the dry to reſtrain the ſame.

¶ *The Choice.*

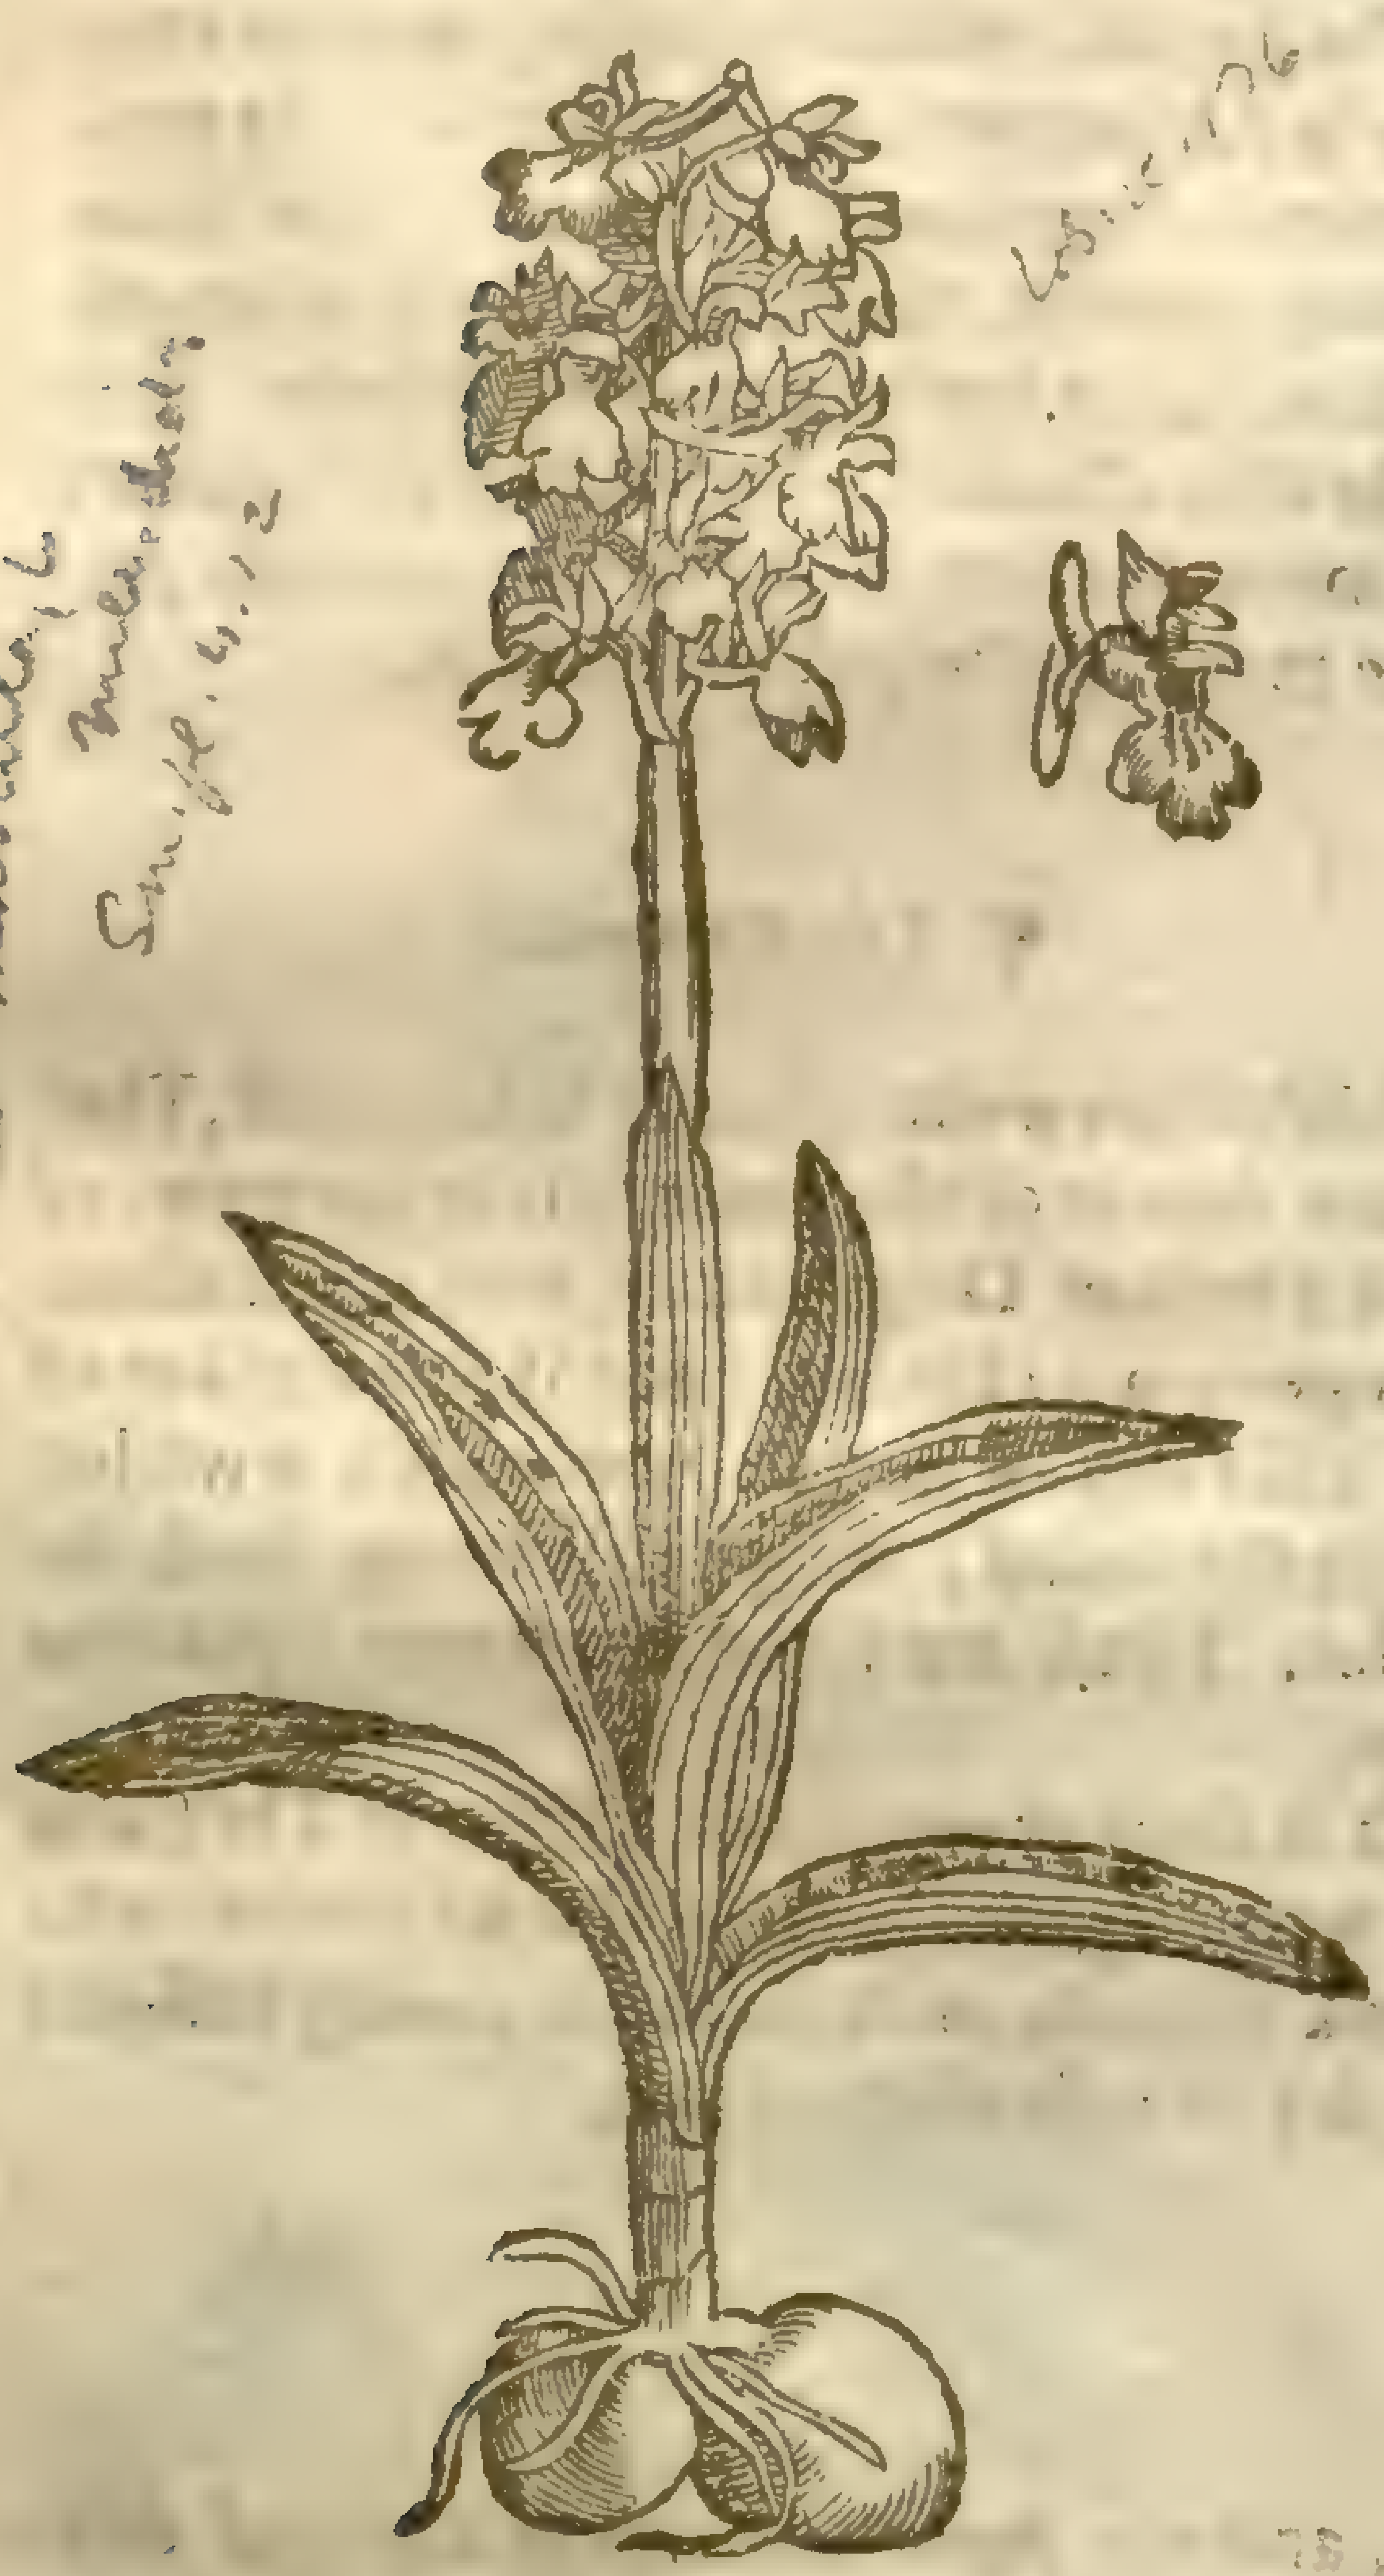
Our age vſeth all the kindes of ſtones to ſtir vp venery, and the Apothecaries mix any of them indifferently with compoſitions ſeruing for that purpoſe. But the beſt and moſt effectual are theſe Dogs ſtones, as moſt haue deemed: yet both the bulbs or ſtones are not to be taken indifferently, but the harder and fuller, and that which containes moſt quantitie of juice; for that which is wrinkled is leſſe profitable, or not fit at all to be vſed in medicine. And the fuller root is not alwayes the greater, but often the leſſer, eſpecially if the roots be gathered before the plant hath ſhed his floure, or when the ſtalke firſt commeth vp; for that which is fuller of iuyce is not the greateſt before the ſeed be perfectly ripe. For ſeeing that euery other yeare by courſe, one ſtone or bulb waxeth full, the other empty and periſheth, it cannot be that the harder and fuller of juice ſhould be alwaies the greater; for at ſuch time as the leaues come forth, the fuller then begins to encreaſe, and whileſt the ſame by little and little encreaſeth, the other doth decreaſe and wither till the ſeed be ripe: then the whole plant, together with the leaues aud ſtalkes, doth forthwith fall away & periſh, and that which in the meane time encreaſed, remaineth ſtil freſh and full vnto the next yeare.

‡ The figures of the firſt and ſecond were tranſpoſed in the former edition: the third was of the *Cynoſorchis Morio mas*, following in the next Chapter.

Chap. III. *Of Fooles Stones.*

¶ *The Deſcription.*

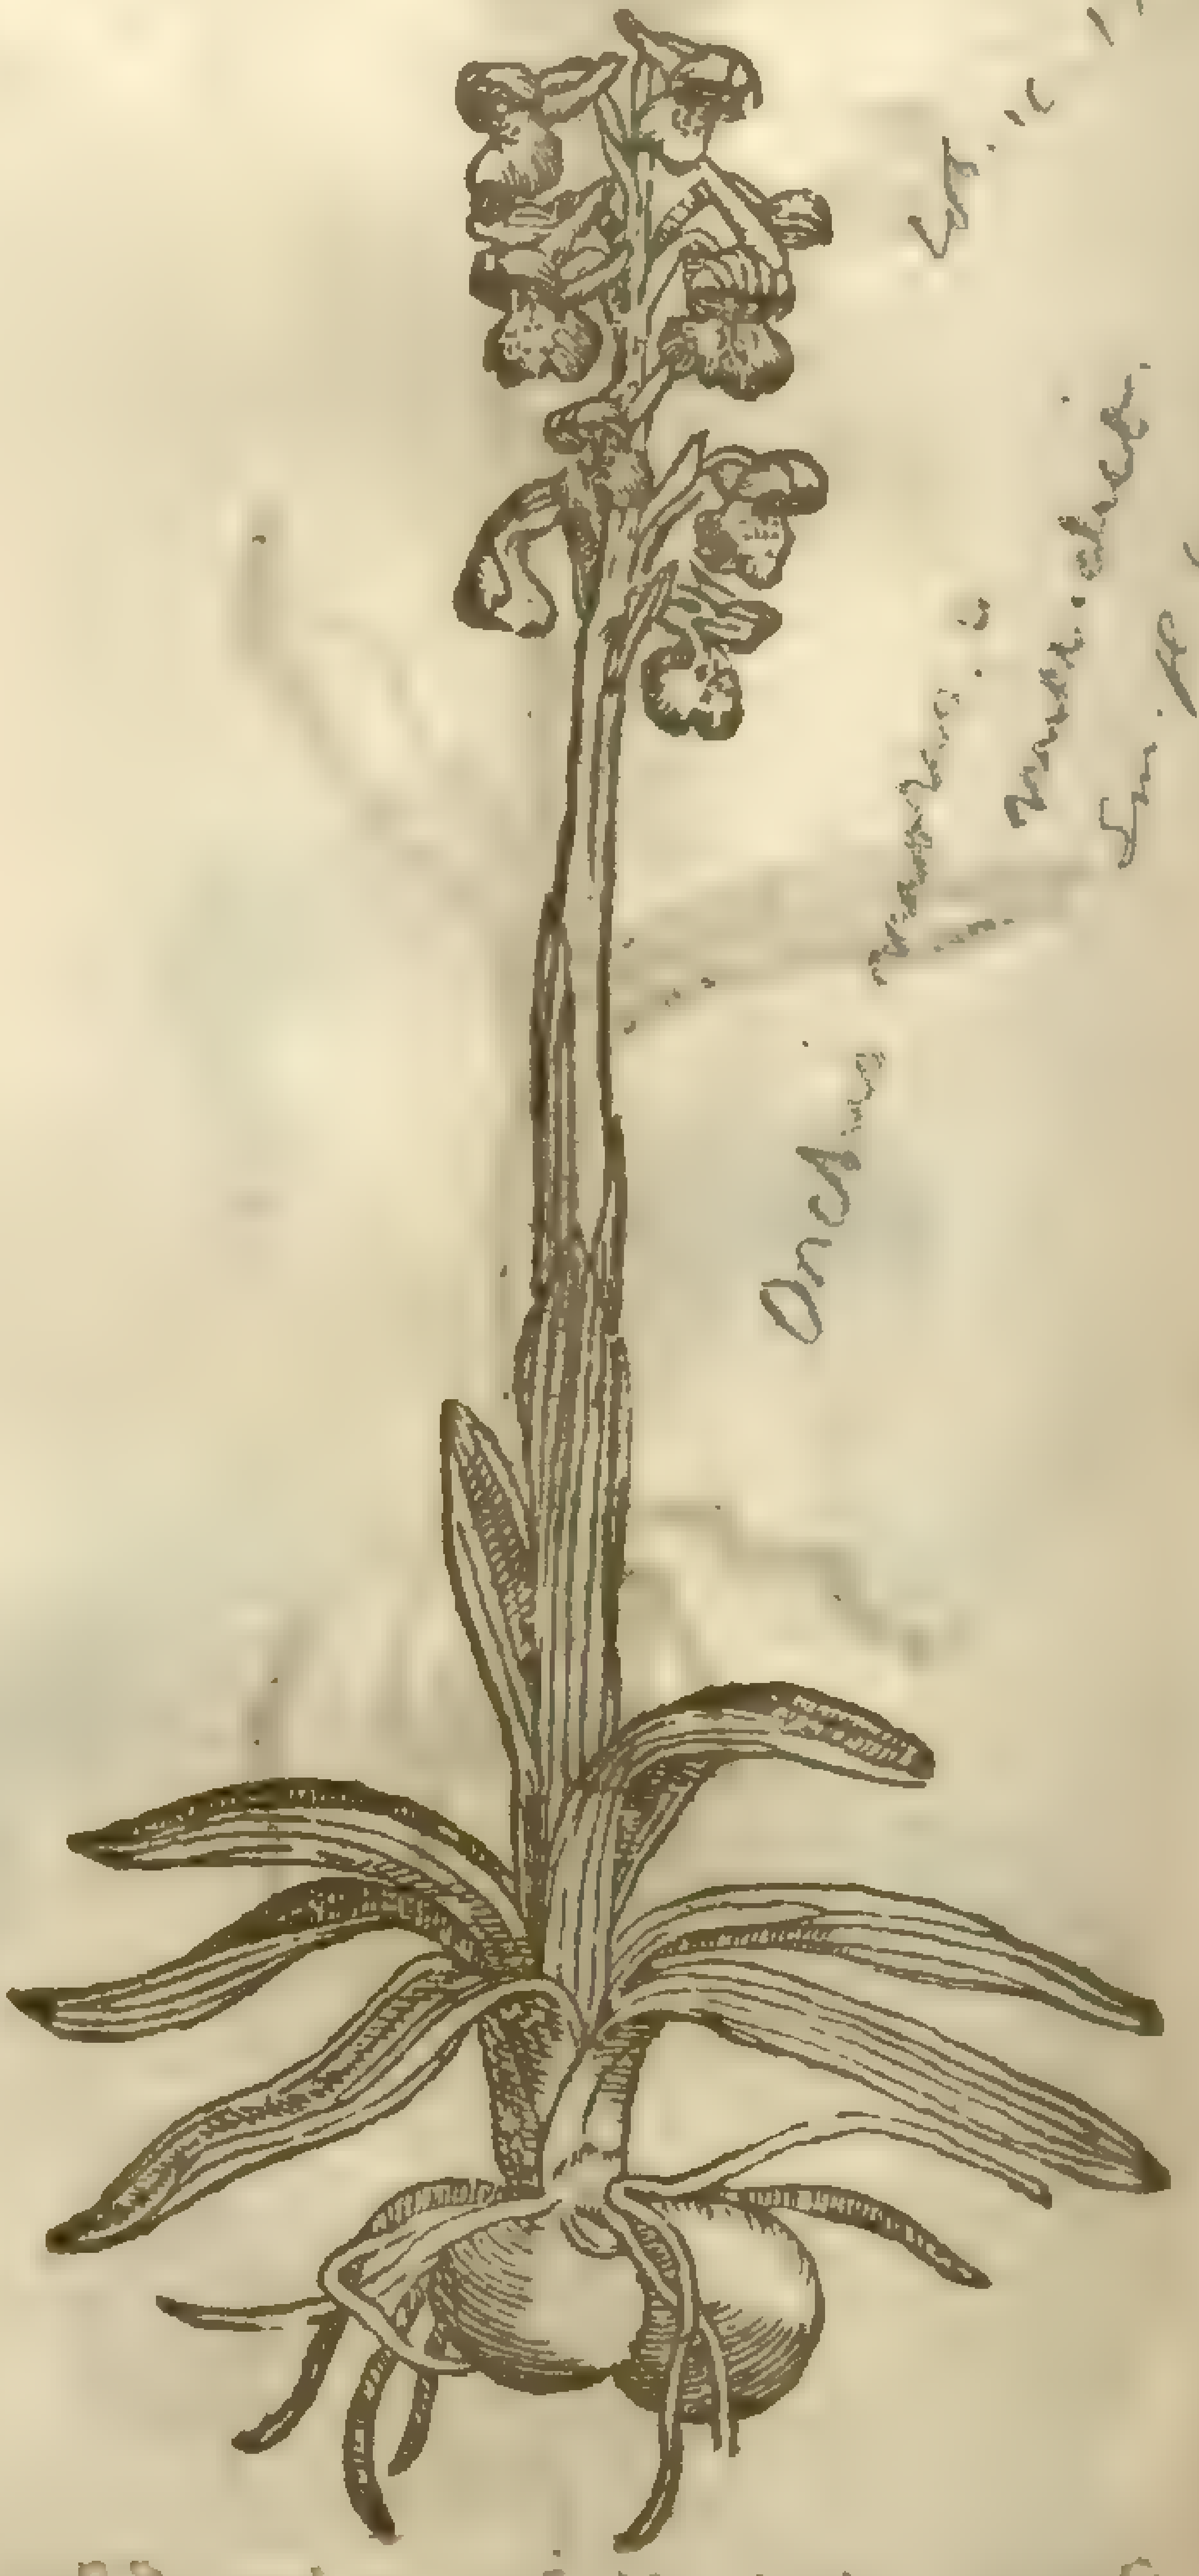
1 The male Foole ſtones hath fiue, ſomtimes ſix long broad and ſmooth leaues, not vnlike to thoſe of the Lilly, ſauing that they are daſht & ſpotted in ſundry places with black ſpots and ſtreaks. The floures grow at the top, tuft or ſpike faſhion, ſomewhat like the former, but thruſt more thicke together, in ſhape like to a fooles hood or cocks-combe, wide open, or gaping before, and as it were creſted aboue, with certain eares ſtanding vp by euery ſide, and a ſmall taile or ſpur hanging downe, the back ſide declining to a violet colour, of a pleaſant ſauour or ſmell.



† 1 *Cynoſorchis Morio mas.*
The male Foole ſtones.

Orchis mascula [illegible]

Lob. ic. 176



2 *Cynoſorchis Morio fœmina.*
The female Foole ſtones.

Orchis [illegible]

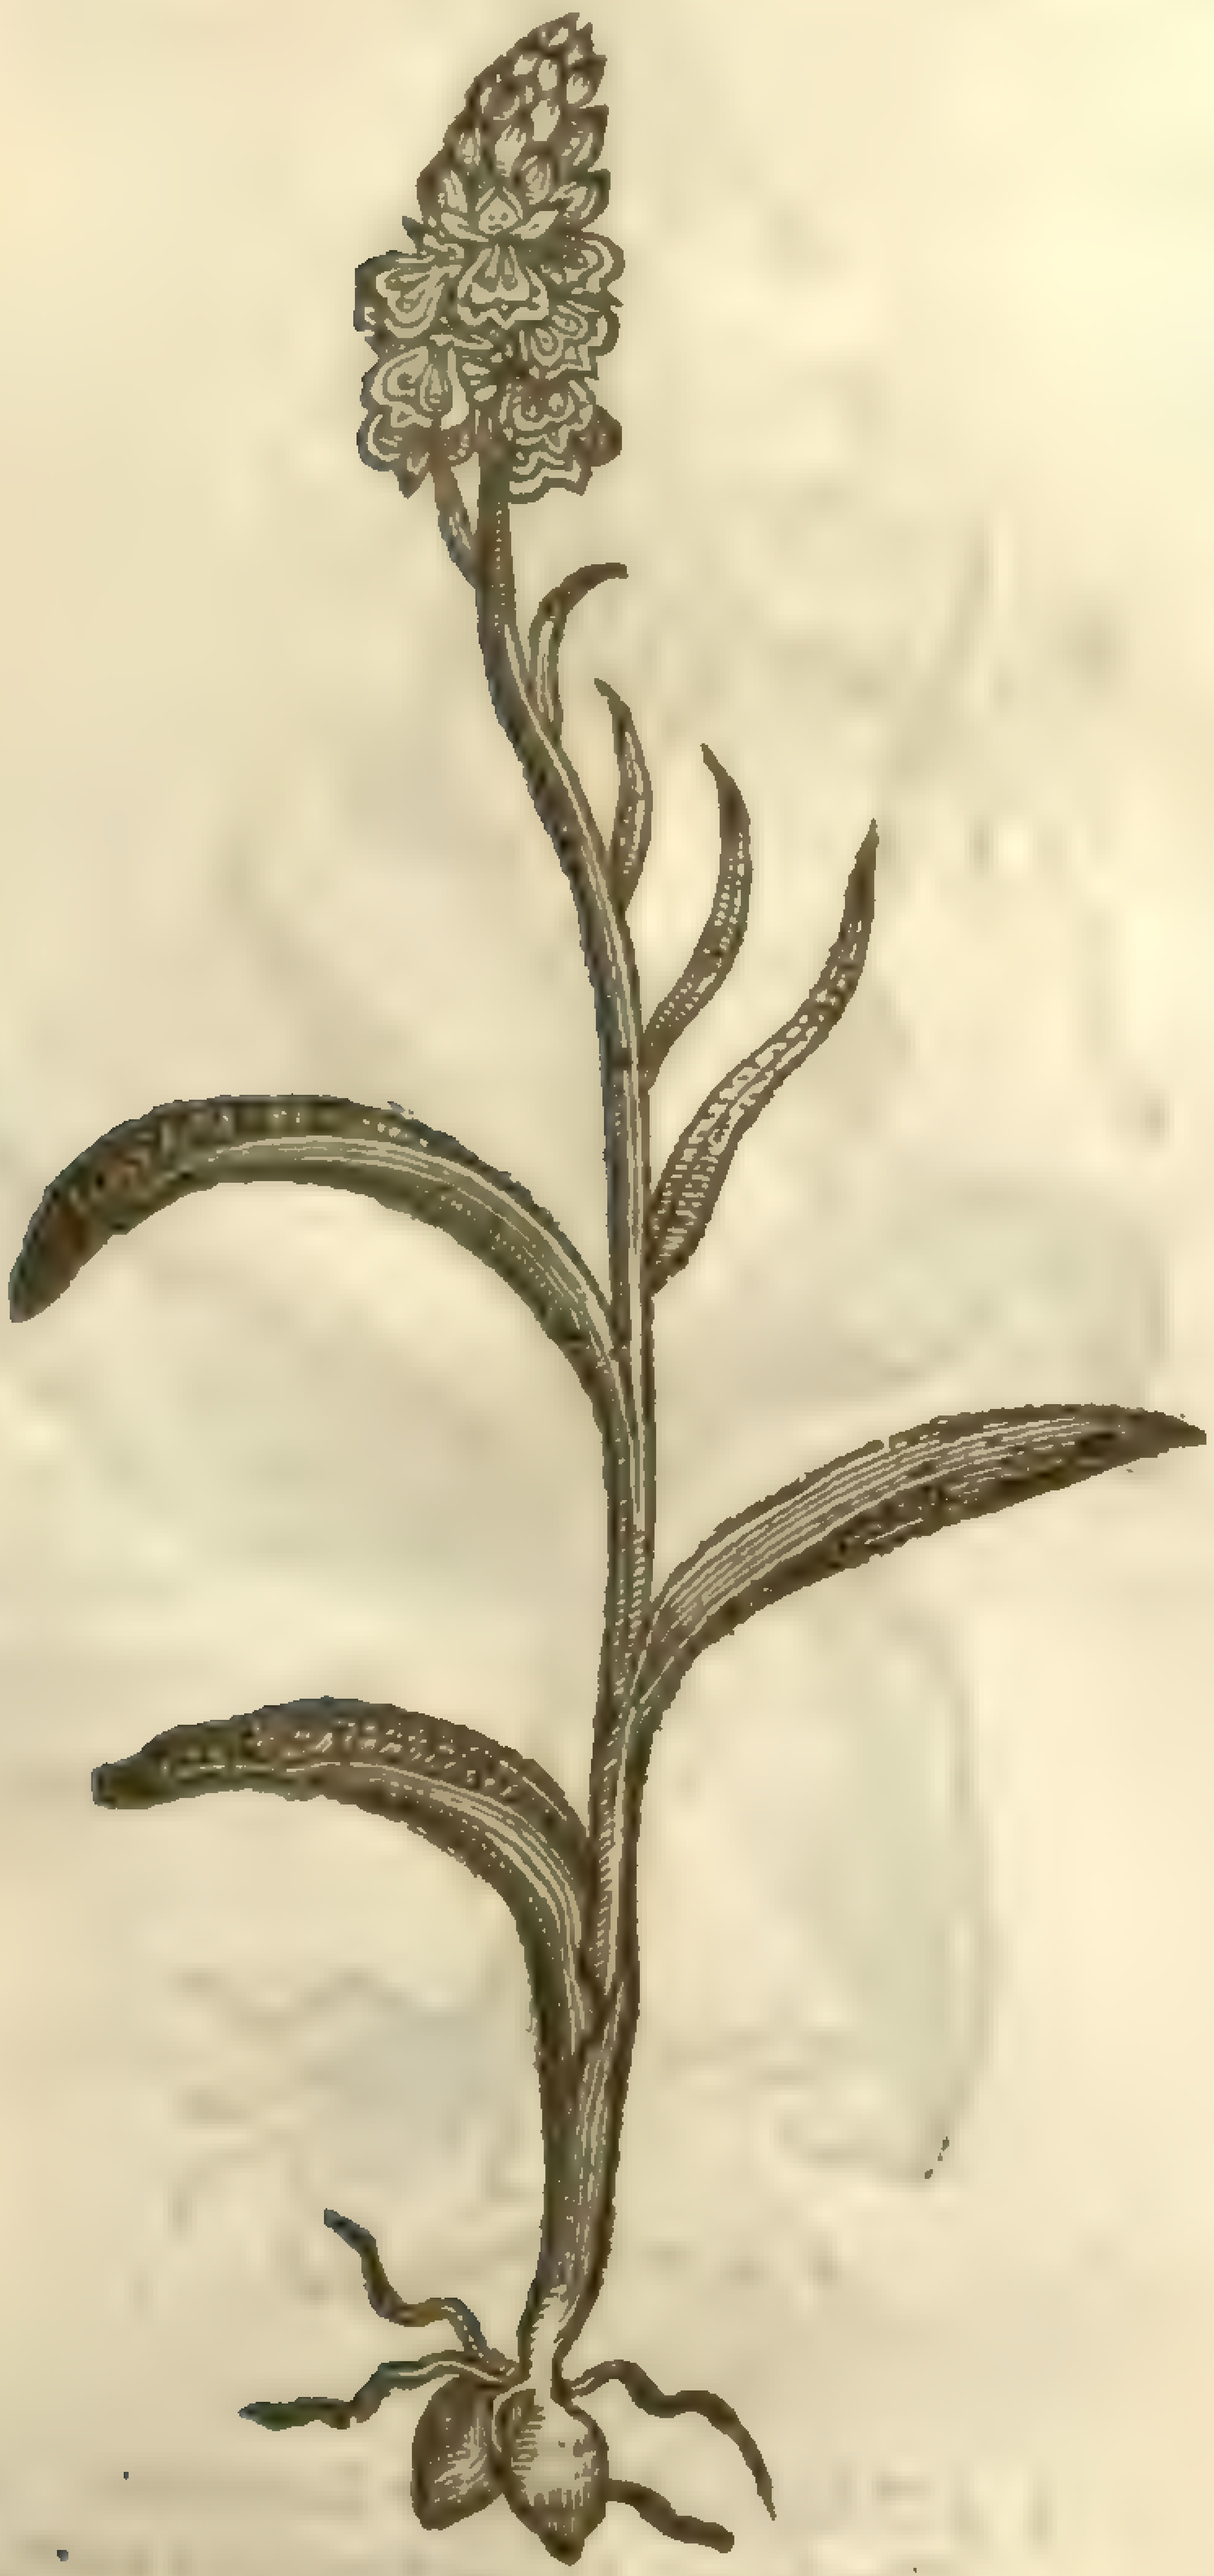
Lob. ic. 176

2 The female Fooles ſtones haue alſo ſmooth narrow leaues, ribbed with nerues like thoſe of Plantain. The floures be likewiſe gaping, and like the former, as it were open hoods, with a little horne or heele hanging behind euerie one of them, and ſmall green leaues ſorted or mixed among them, reſembling cocks-combes with little eares, not ſtanding ſtraight vp, but lying flat vpon the hooded floure, in ſuch ſort that they cannot at the ſudden view be perceiued. The roots are a paire of ſmall ſtones like the former. The floures of this ſort do vary infinitely in colour, according to the ſoile or countrey where they doe grow: ſome bring forth their floures of a deep violet colour, ſome as white as ſnow, ſome of a fleſh colour, and ſome garniſhed with ſpots of diuers colours, which are not poſſible to be diſtinguiſhed.

‡ 3 This hath narrow ſpotted leaues, with a ſtalke ſome foot or more high, at the top whereof growes a tuft of purple floures, in ſhape much like thoſe of the laſt deſcribed, each floure conſiſting of a little hood, two ſmall wings or ſide leaues, and a broad lip or leafe hanging downe. ‡

¶ The

‡ 3 *Cynoſorchis Morio minor.*
The leſſer ſpotted Fooles ſtones.



† The firſt was of *Cynoſorchis maculata*, being the third in the former chapter.

¶ *The Place.*

Theſe kinds of Fools ſtones grow naturally to their beſt liking in paſtures and fields that ſeldom or neuer are dunged or manured.

¶ *The Time.*

They floure in May and Iune: their ſtones are to be gathred for medicine in September, as are thoſe of the Dogs ſtones.

¶ *The Names.*

The firſt is called *Cynoſorchis Morio*: of *Fuchſius*, *Orchis mas anguſtifolia*: of *Apuleius*, *Satyrion*: and alſo it is the *Orchis Delphinia* of *Cornelius Gemma.*

‡ The ſecond is *Cynoſorchis Morio fœmina* of *Lobel*: *Orchis anguſtifolia fœmin.* of *Fuchſius*: *Teſticulus Morionis fœmina* of *Dodonæus.*

3 This is *Cynoſorchis minimis & ſecundum caulem, &c. maculoſis folijs*, of *Lobel.* ‡

¶ *The Temperature.*

Fools ſtones both male and female are hot and moiſt of nature.

¶ *The Vertues.*

Theſe Fooles ſtones are thought to haue the vertues of Dogs ſtones, whereunto they are referred.

CHAP. 112. *Of Goats ſtones.*

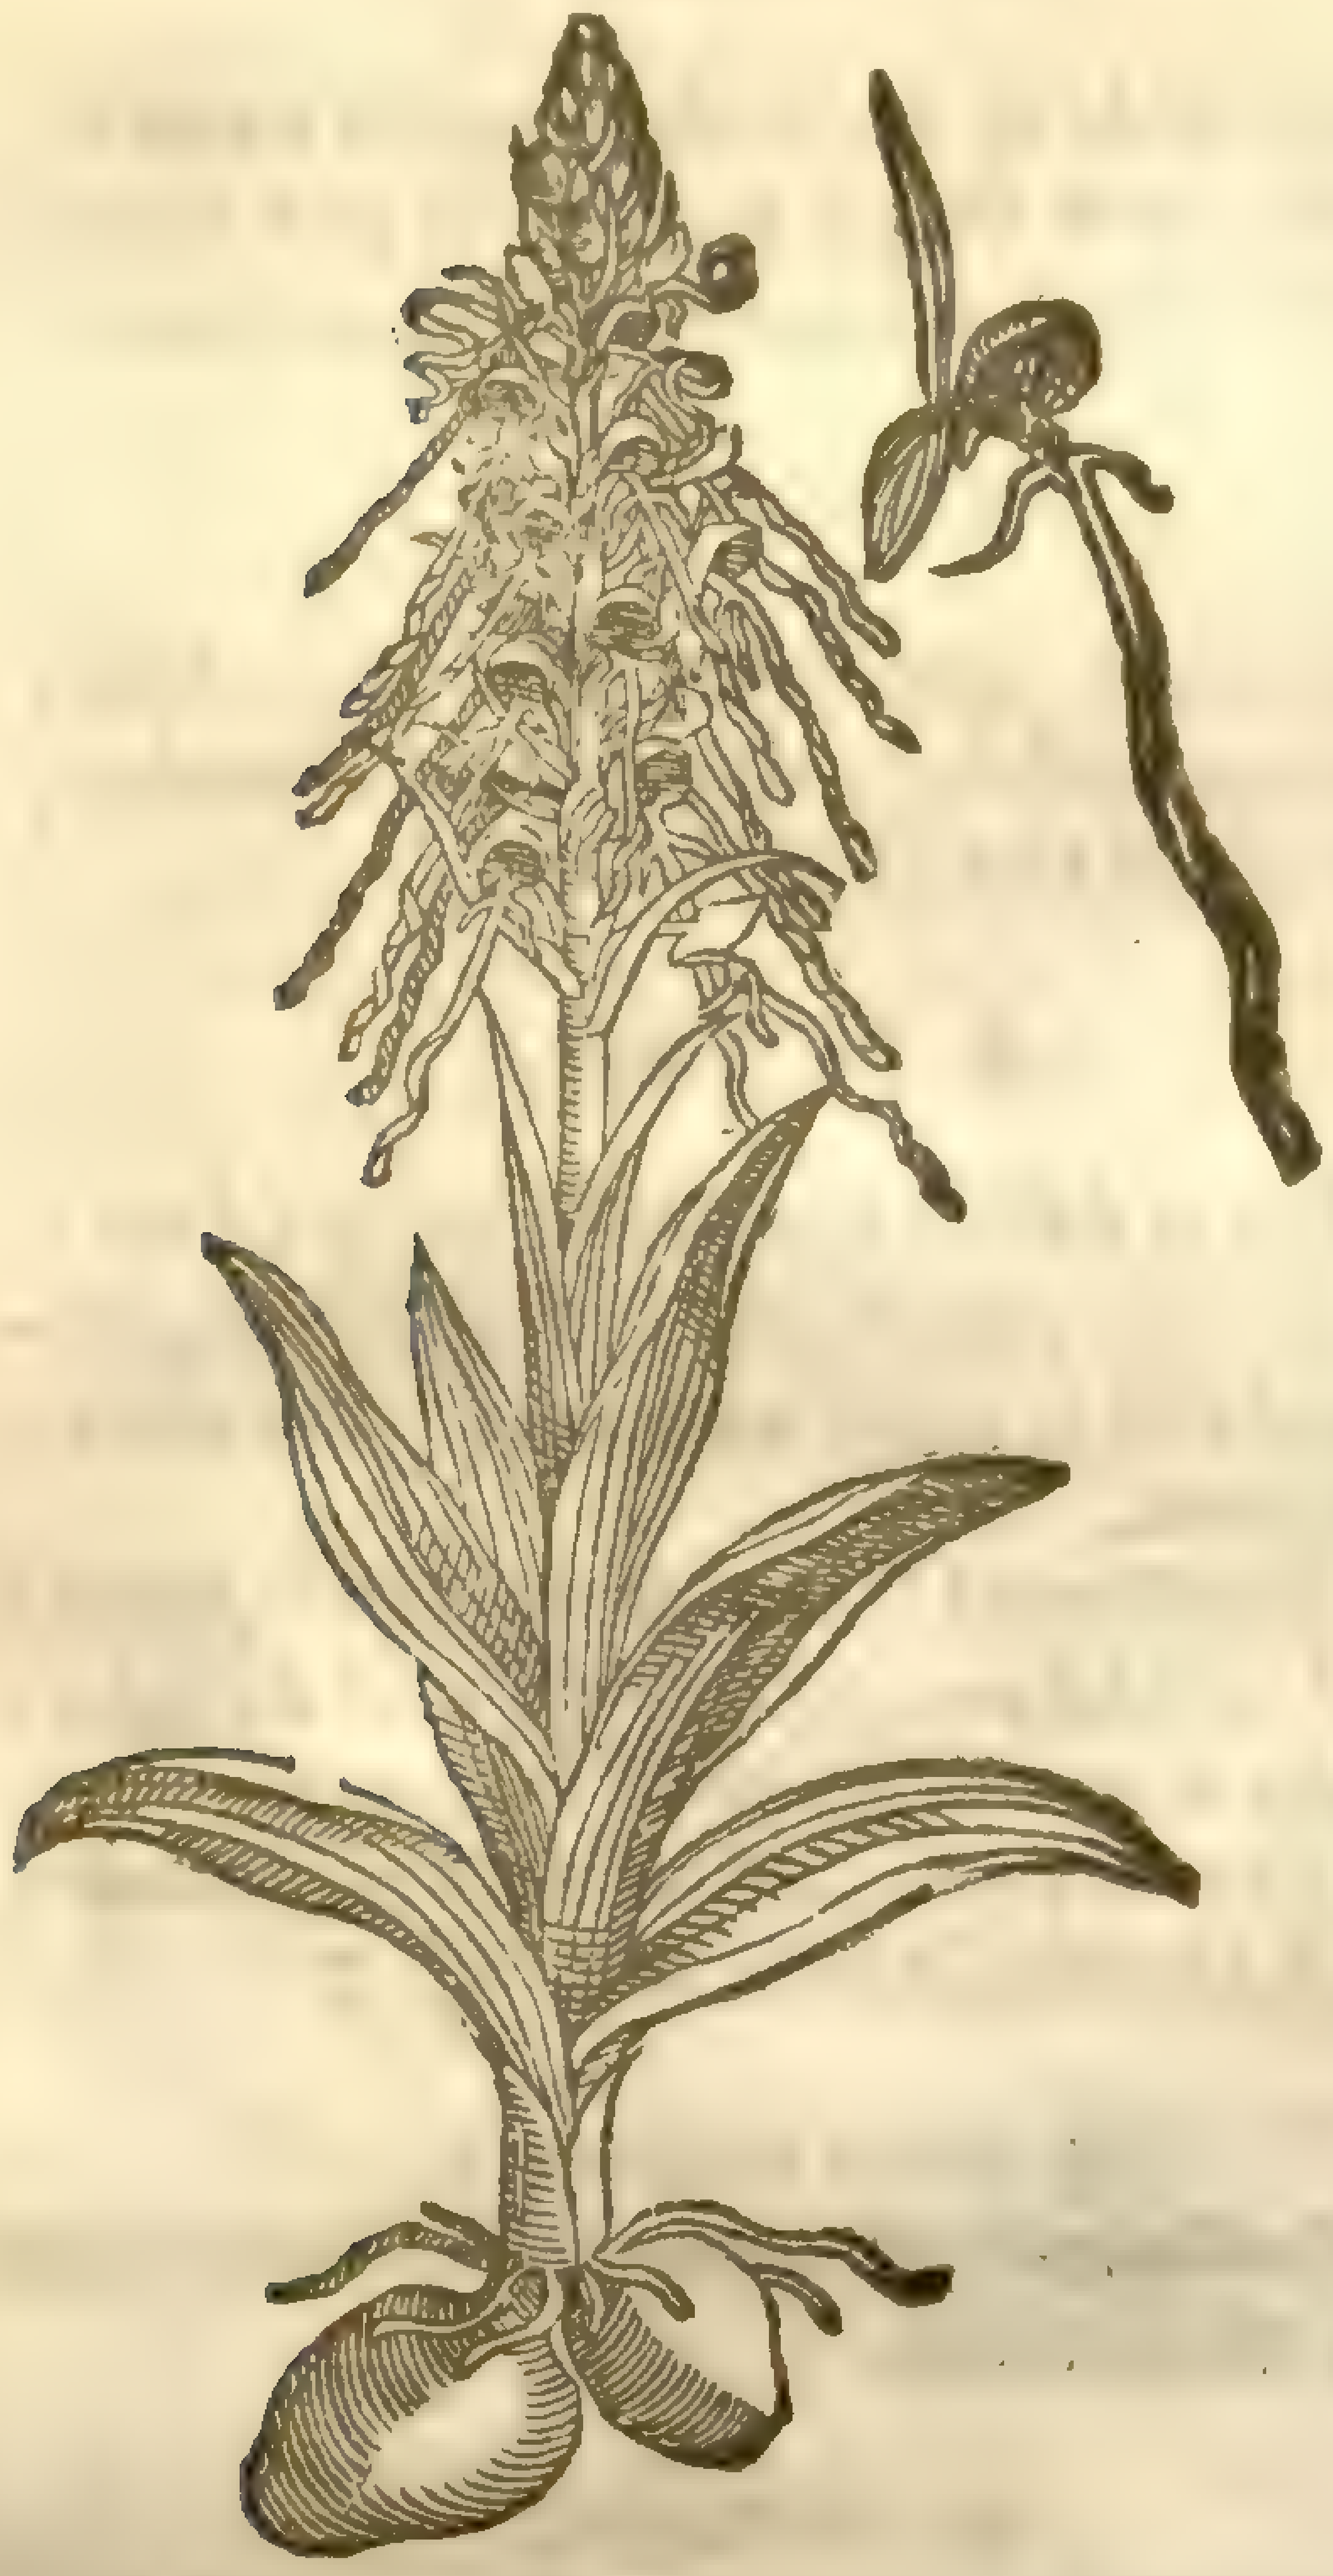
¶ *The Deſcription.*

‡ THe greateſt of the Goats ſtones bringeth forth broad leaues, ribbed in ſome ſort like
vnto the broad leaued Plantaine, but larger: the ſtalke groweth to the height of a cu-
bit, ſet with ſuch great leaues euen to the top of the ſtalke by equal diſtances. The tuft
or buſh of floures is ſmall and flat open, with many tender ſtrings or laces comming from the mid-
dle part of thoſe ſmall flours, crookedly tangling one with another like to the ſmall tendrels of the
Vine, or rather the laces or ſtrings that grow vpon the herb Sauory. The whole floure is of a purple
colour. The roots are like the reſt of the Orchides, but greater.

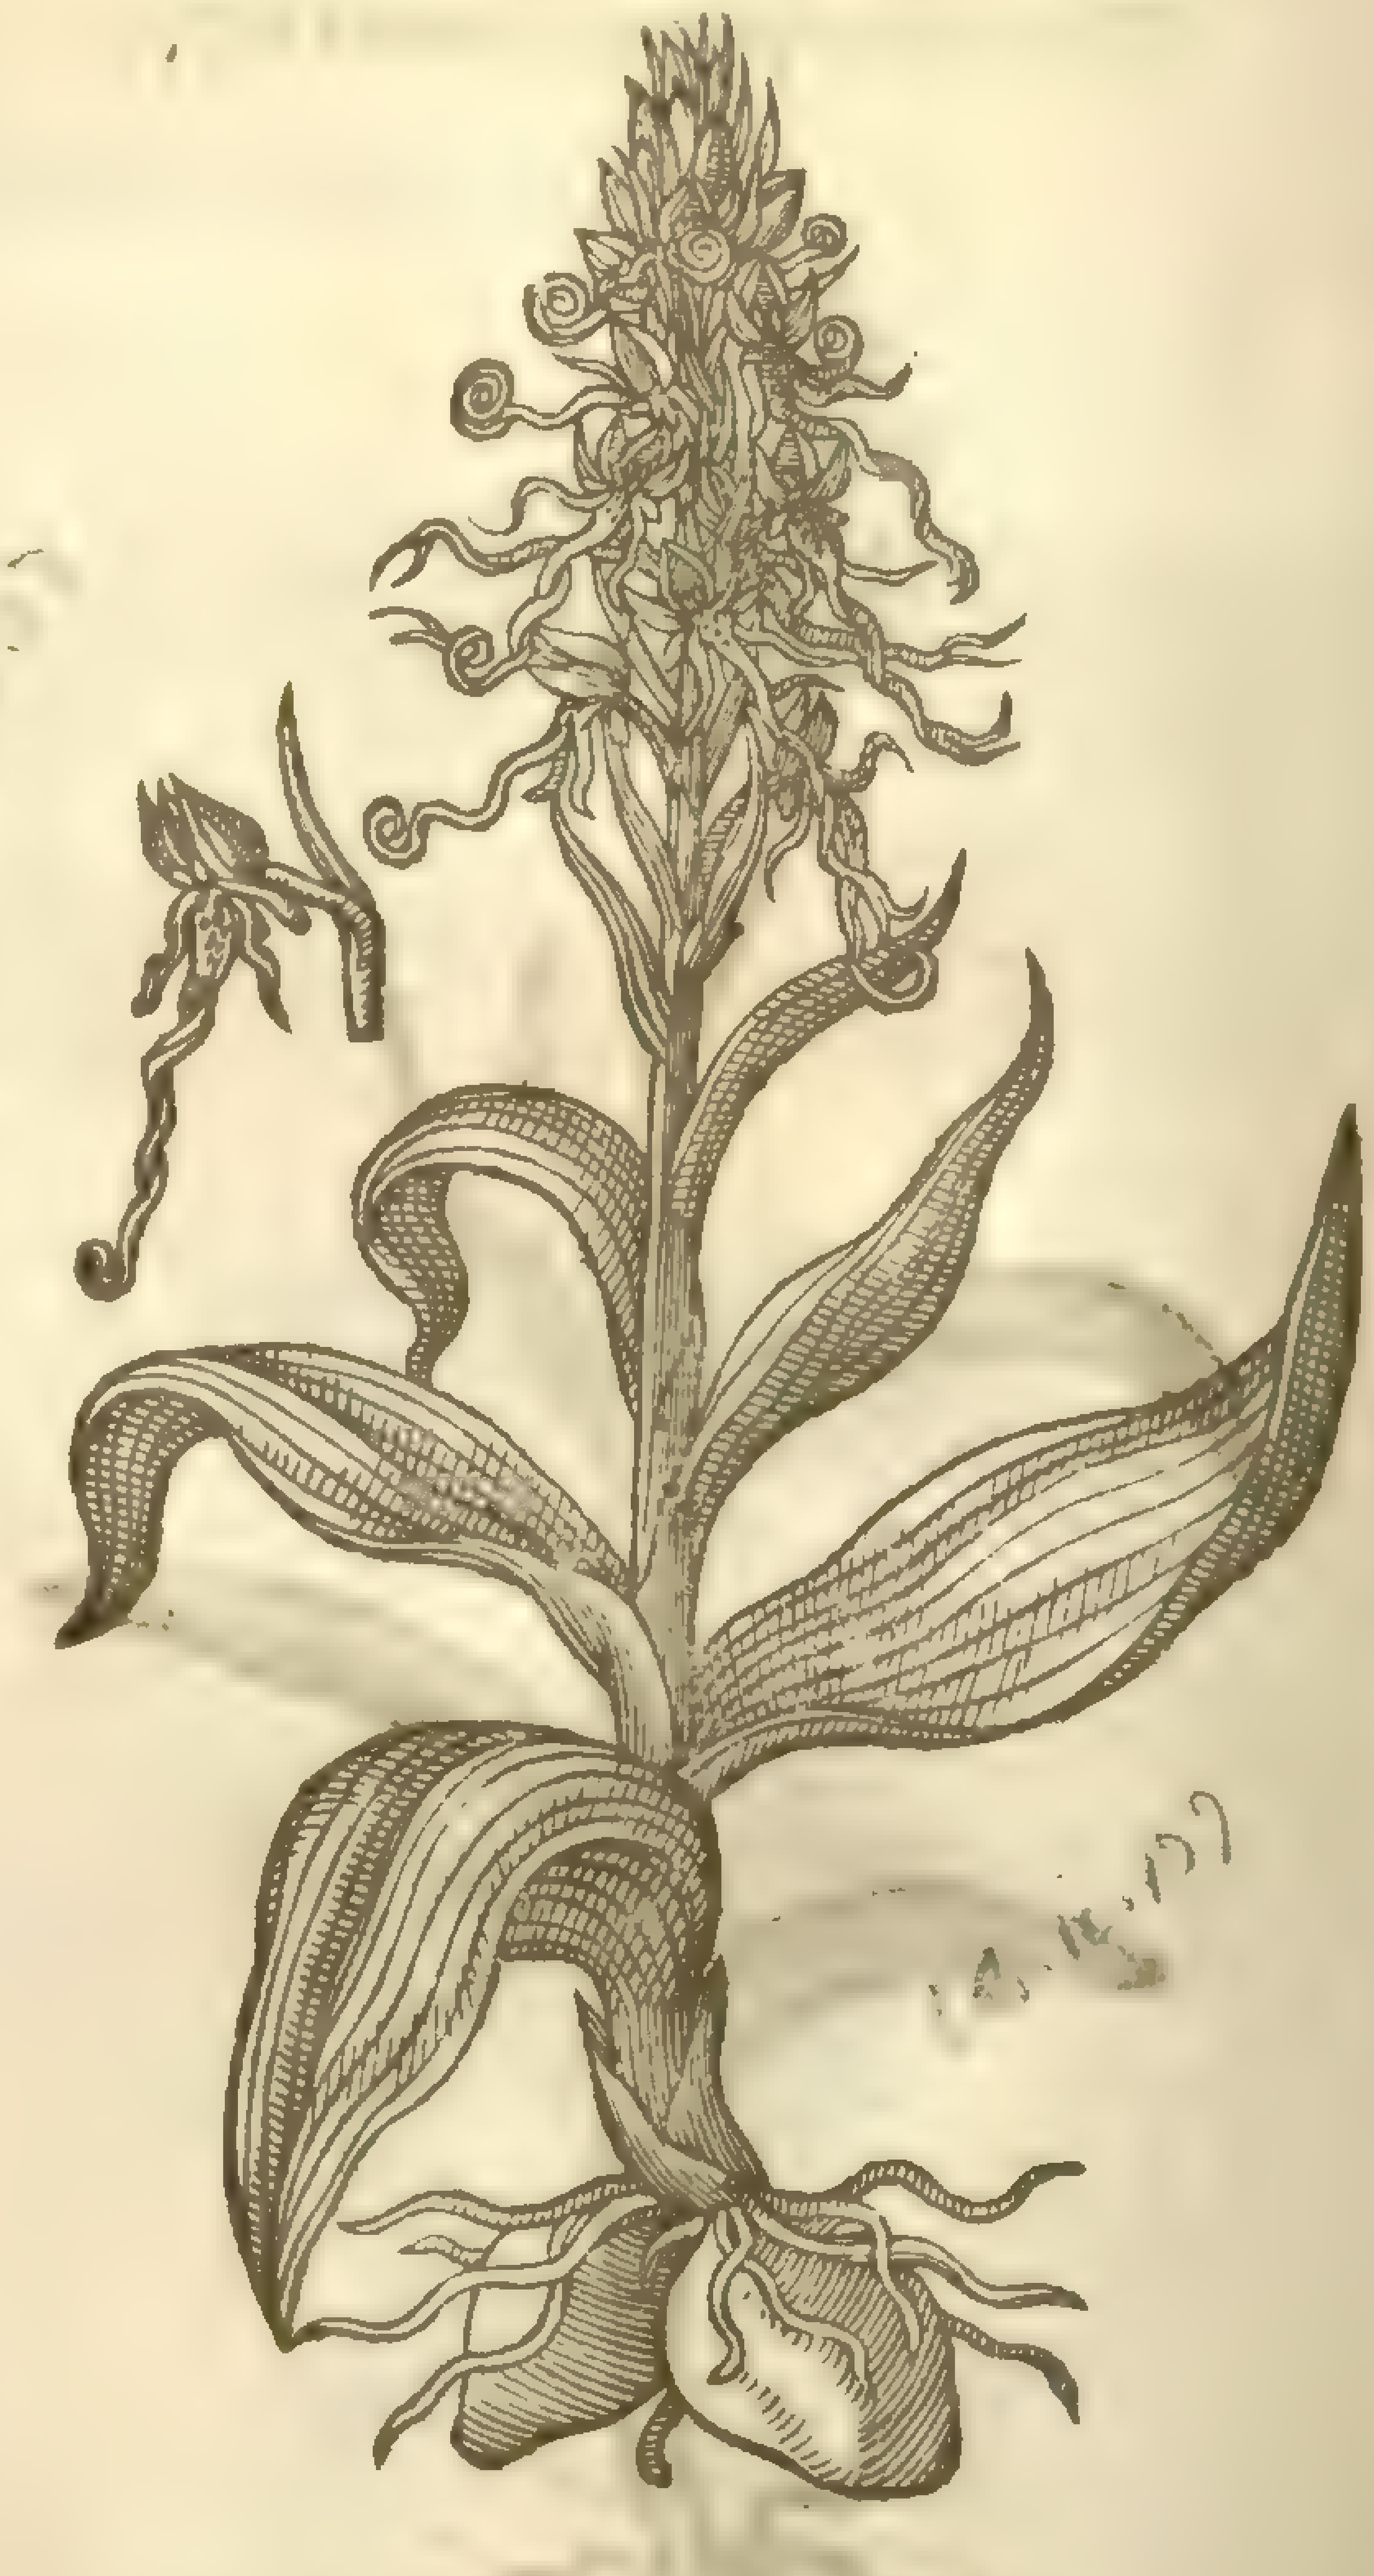
2 The male Goats ſtones haue leaues like to thoſe of the garden Lilly, with a ſtalke a foot
long, wrapped about euen to the tuft of the floure with thoſe his leaues. The floures which grow
in this buſh or tuft be very ſmall, in form like to a Lizard, becauſe of the twiſted or writhen tailes,
and ſpotted heads. Euery of theſe ſmall floures is at the firſt like a round cloſe husk, of the bignes
of a peaſe, which when it openeth, there commeth out of it a little long and tender ſpurre or taile,
white toward the ſetting of it to the floure; the reſt ſpotted with red daſhes, hauing vpon each ſide
a ſmall thing adioyning vnto it like to a little leg or foot; the reſt of the ſaid taile is twiſted croo-
kedly about, and hangeth downward. The whole plant hath a ranke or ſtinking ſmell or ſauor like
the ſmell of a goat, whereof it tooke his name.

3 The female Goats ſtones haue leaues like the male kinde, ſauing that they be much ſmaller
hauing many floures on the tuft reſembling the flies that feed vpon fleſh, or rather ticks. In ſtones
or roots and in ſmell it is like the former.

1 *Tragorchis maximus.*
The greateſt Goat ſtones.



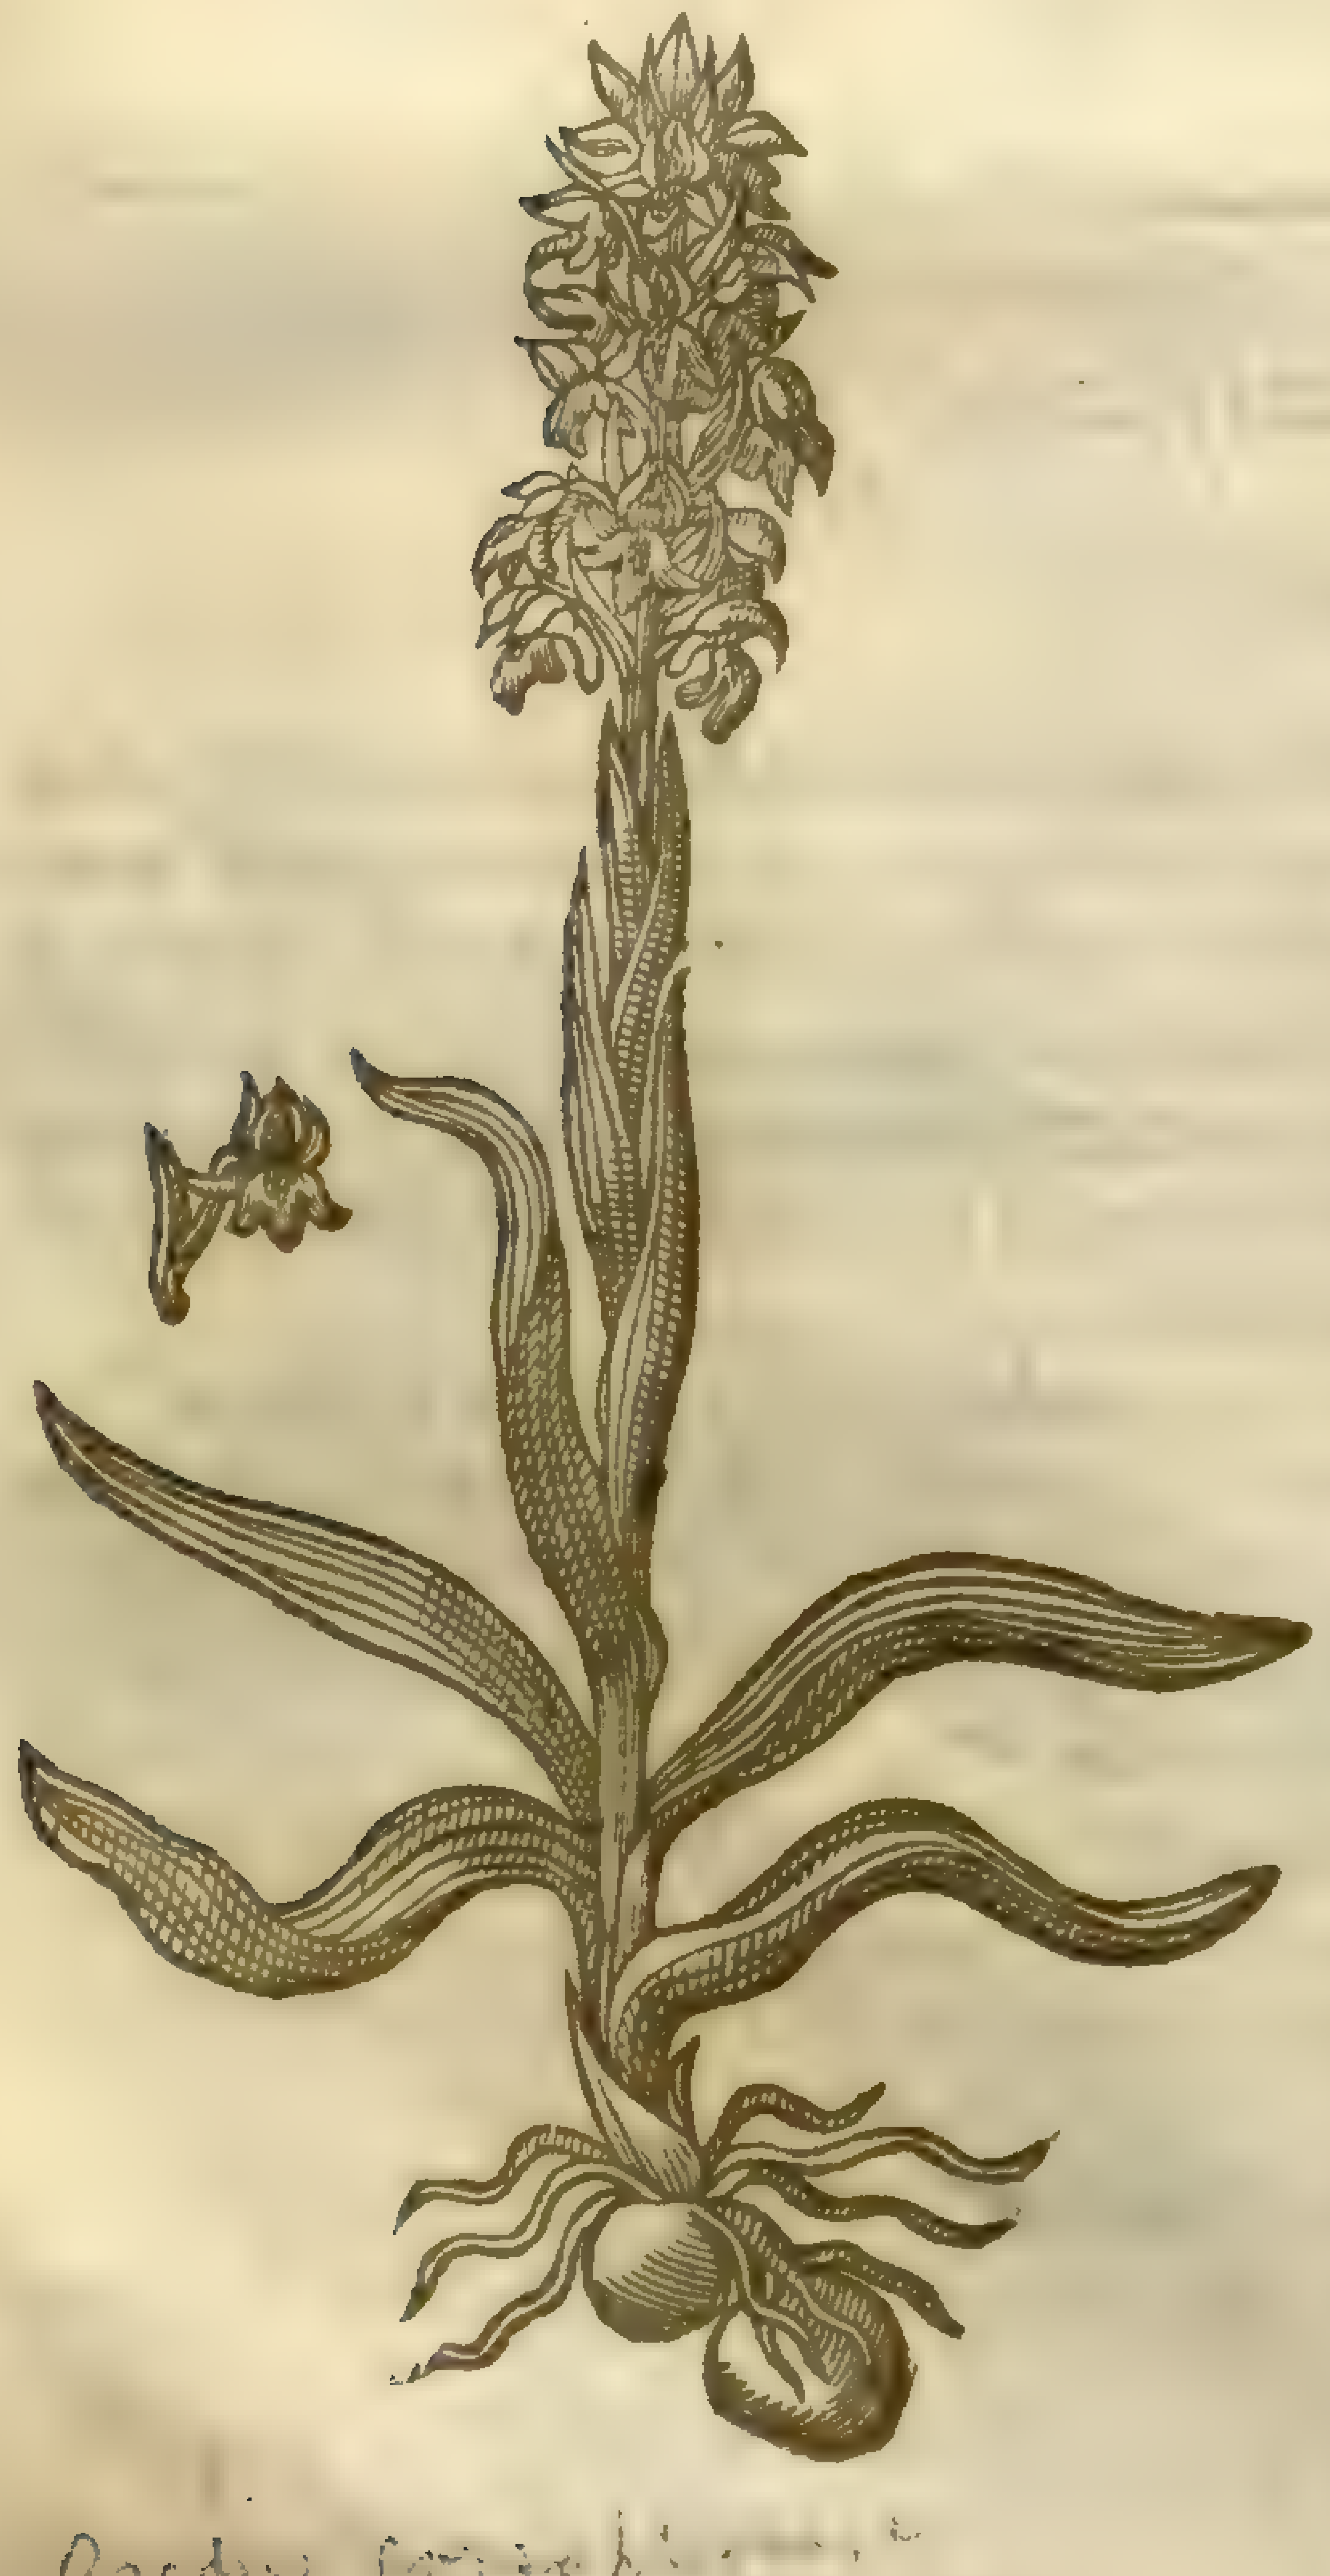
2 *Tragorchis mas.*
The male Goat ſtones.



Satyrium hircinum L. [illegible]

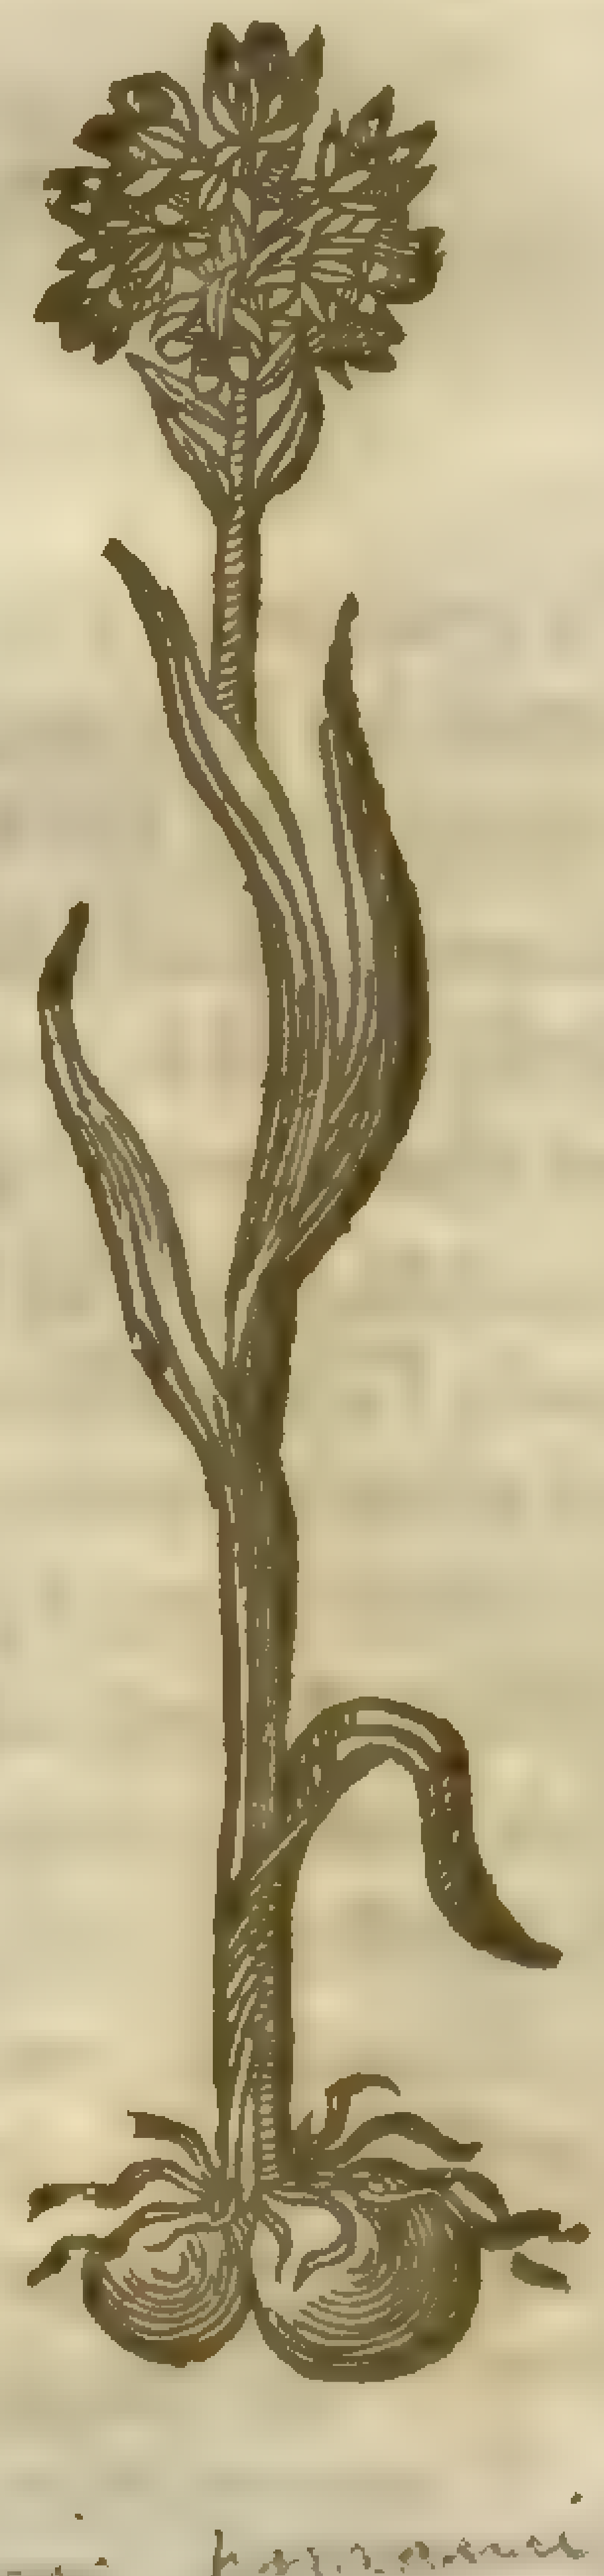
[illegible]

3 *Tragorchis fœmina.*
The female Goat ſtones.



Orchis coriophora. L.
mas dict

‡ 4 *Tragorchis minor Batavica.*
The ſmall Goat ſtones of Holland.



Orchis pyramidalis. L.
mas dict.

‡ 4 This alſo becauſe of the vnpleaſant ſmell may fitly be referred to this Claſſis. The roots hereof are ſmall, and from them ariſe a ſtalke ſome halfe a foot high, beſet with three or foure narrow leaues. The tuft of floures which groweth on the top of this ſtalke is ſmall, and the colour of them is red without, but ſomwhat paler within; each floure hanging down a lip parted in three. ‡

¶ The Place.

1. 2. 3. Theſe kinds of Goats ſtones delight to grow in fat clay grounds, and ſeldom in any other ſoile to be found.

‡ 4 This grows vpon the ſea banks in Holland, and alſo in ſome places neere vnto the Hage. ‡

¶ The Time.

They floure in May and Iune with the other kinds of Orchis.

¶ The Names.

† 1 Some haue named this kind of Goat ſtones in Greeke, τραγόρχις: in Latine, *Teſticulus Hircinus*, and alſo *Orchis Saurodes*, or *Scincophora*, by reaſon that the floures reſemble Lizards.

The ſecond may be called *Tragorchis mas*, male Goats ſtones; and *Orchis Saurodes*, or *Scincophora*, as well as the former.

The third, *Tragorchis fœmina*, as alſo *Corioſmites*, and *Coriophora*, for that the floures in ſhape and their vngratefull ſmell reſemble Ticks, called in Greeke κόρεις. †

¶ The Temperature and Vertues.

The temperature and vertues of theſe are referred to the Fooles ſtones, notwithſtanding they are ſeldome or neuer vſed in phyſick, in regard of the ſtinking and loathſome ſmell and ſauor they are poſſeſſed with.

¶ The

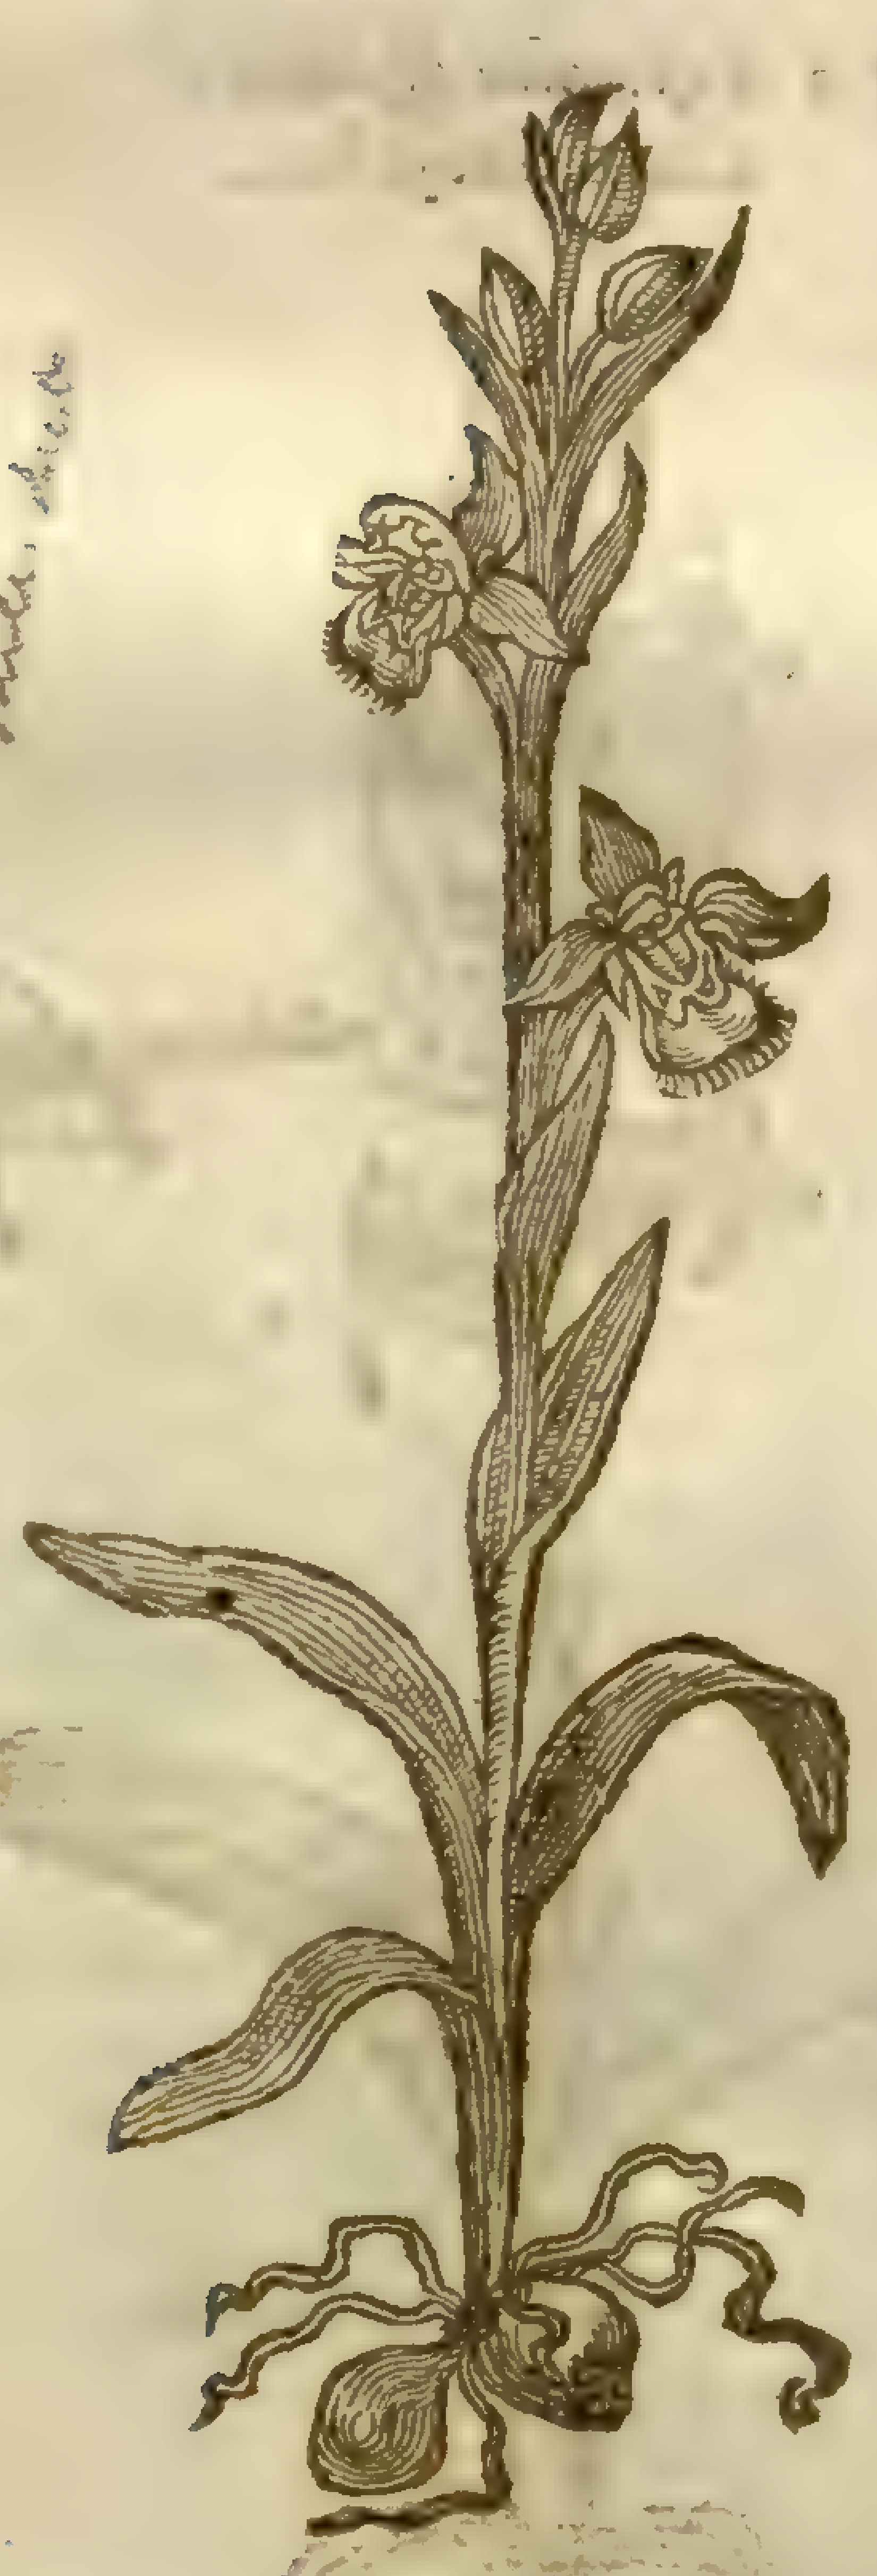
¶ *The Kindes.*

THere be diuers kindes of Fox-ſtones, differing very much in ſhape of their leaues, as alſo in floures: ſome haue floures, wherein is to be ſeen the ſhape of ſundry ſorts of liuing creatures; ſome the ſhape and proportion of flies, in other gnats, ſome humble bees, others like vnto honey Bees; ſome like Butter-flies, and others like Waſpes that be dead; ſome yellow of colour, others white; ſome purple mixed with red, others of a brown ouerworne colour: the which ſeuerally to diſtinguiſh, as well thoſe here ſet downe, as alſo thoſe that offer themſelues daily to our view and conſideration, would require a particular volume; for there is not any plant which doth offer ſuch varietie vnto vs as theſe kinds of ſtones, except the Tulipa's, which go beyond all account: for that the moſt ſingular Simpleſt that euer was in theſe later ages, *Carolus Cluſius* (who for his ſingular induſtry and knowledge herein is worthy triple honor) hath ſpent at the leaſt 35 yeares, ſowing the ſeeds of Tulipa's from yeare to yeare, and to this day he could neuer attain to the end or certainty of their ſeuerall kinds of colours. The greateſt reaſon thereof that I can yeeld is this, That if you take the ſeeds of a Tulipa that bare white floures, and ſow them in a pan or tub with earth, you ſhal receiue from that ſeed plants of infinite colours. Contrariwiſe, if you ſow the ſeeds of a plant that beareth flours of variable colours, the moſt of thoſe plants will be nothing like the plant from whence the ſeed was taken. It ſhall be ſufficient therefore to ſet downe moſt of the varieties, and comprehend them in this chapter.

¶ *The Deſcription.*

1 BVtterfly Orchis or Satyrion beares next the root two very broad leaues like thoſe of the Lilly, ſeldome three: the floures be white of colour, reſembling the ſhape of a Butterfly: the ſtalke is a foot high: the root is two ſtones like the other kindes of Stones or Cullions, but ſomwhat ſharper pointed.

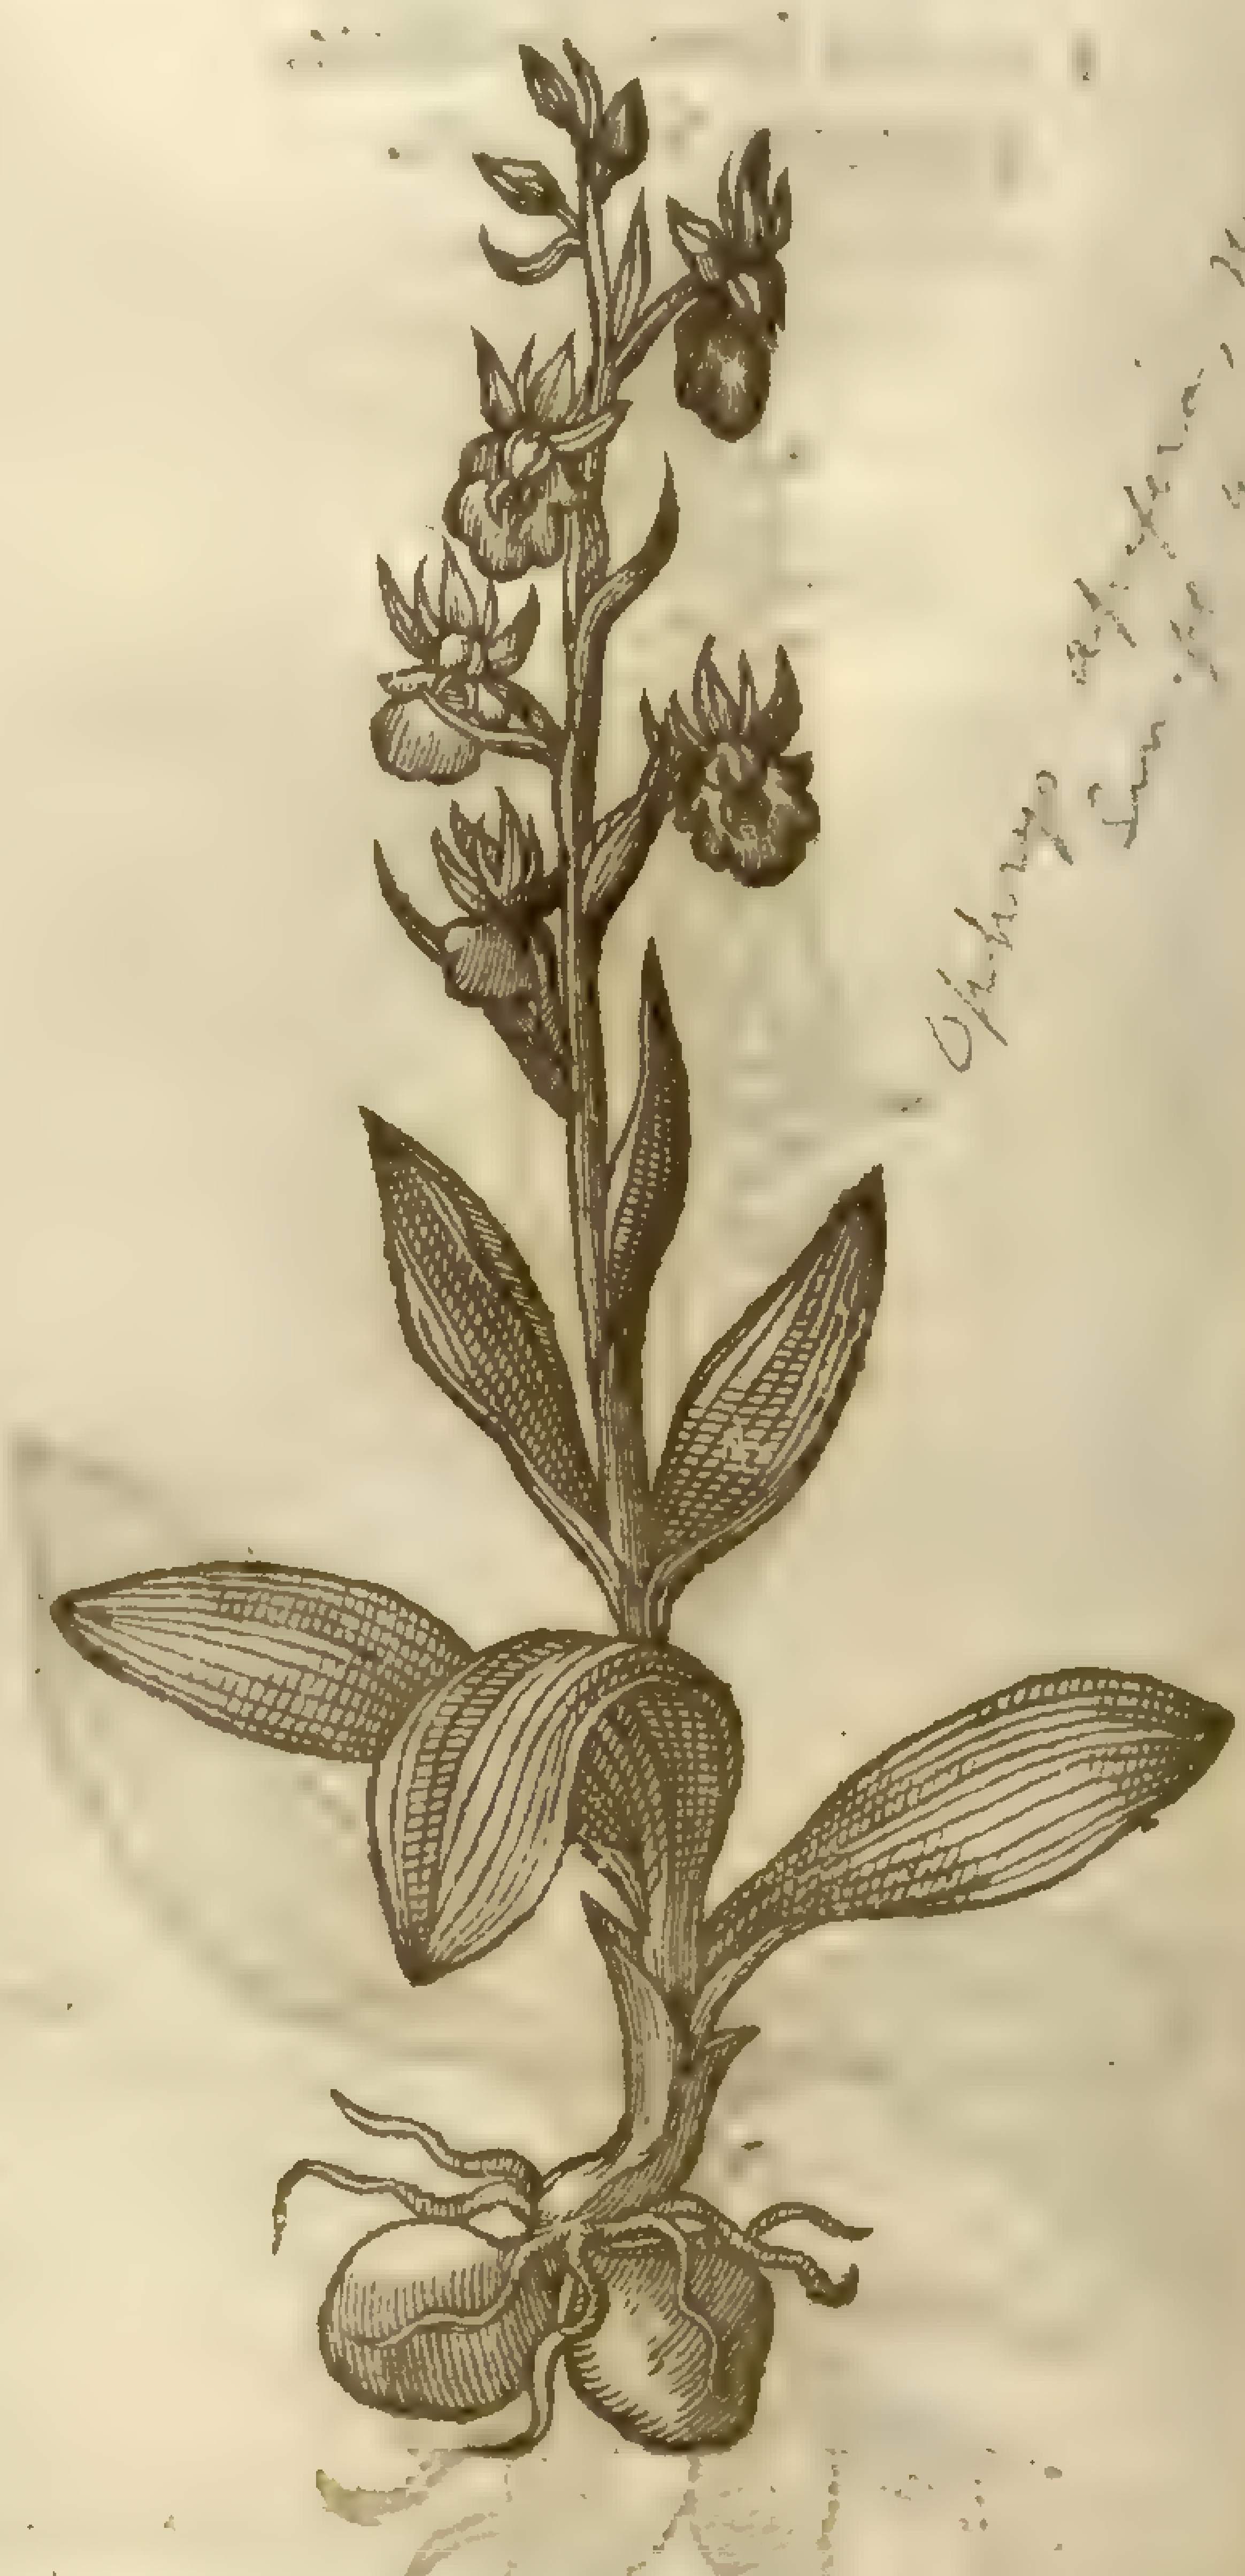
† 3 *Teſticulus Vulpinus* 2 *ſphegodes.*
Humble-bee Orchis.



Ophrys aranifera, Huds.
Smi. dict.

Ophrys apifera, Huds.
Smi. dict.

† 4 *Teſticulus Vulpinus major ſphegodes.*
Waſpe Orchis.



Ophrys apifera, Huds.
[illegible] 33

2 Gnat Satyrion commeth forth of the ground, bearing two, ſometimes three leaues like the former, but much ſmaller. The ſtalke groweth to the height of an hand, whereon are placed verie orderly ſmall floures like in ſhape to Gnats, and of the ſame colour. The root is like the former.

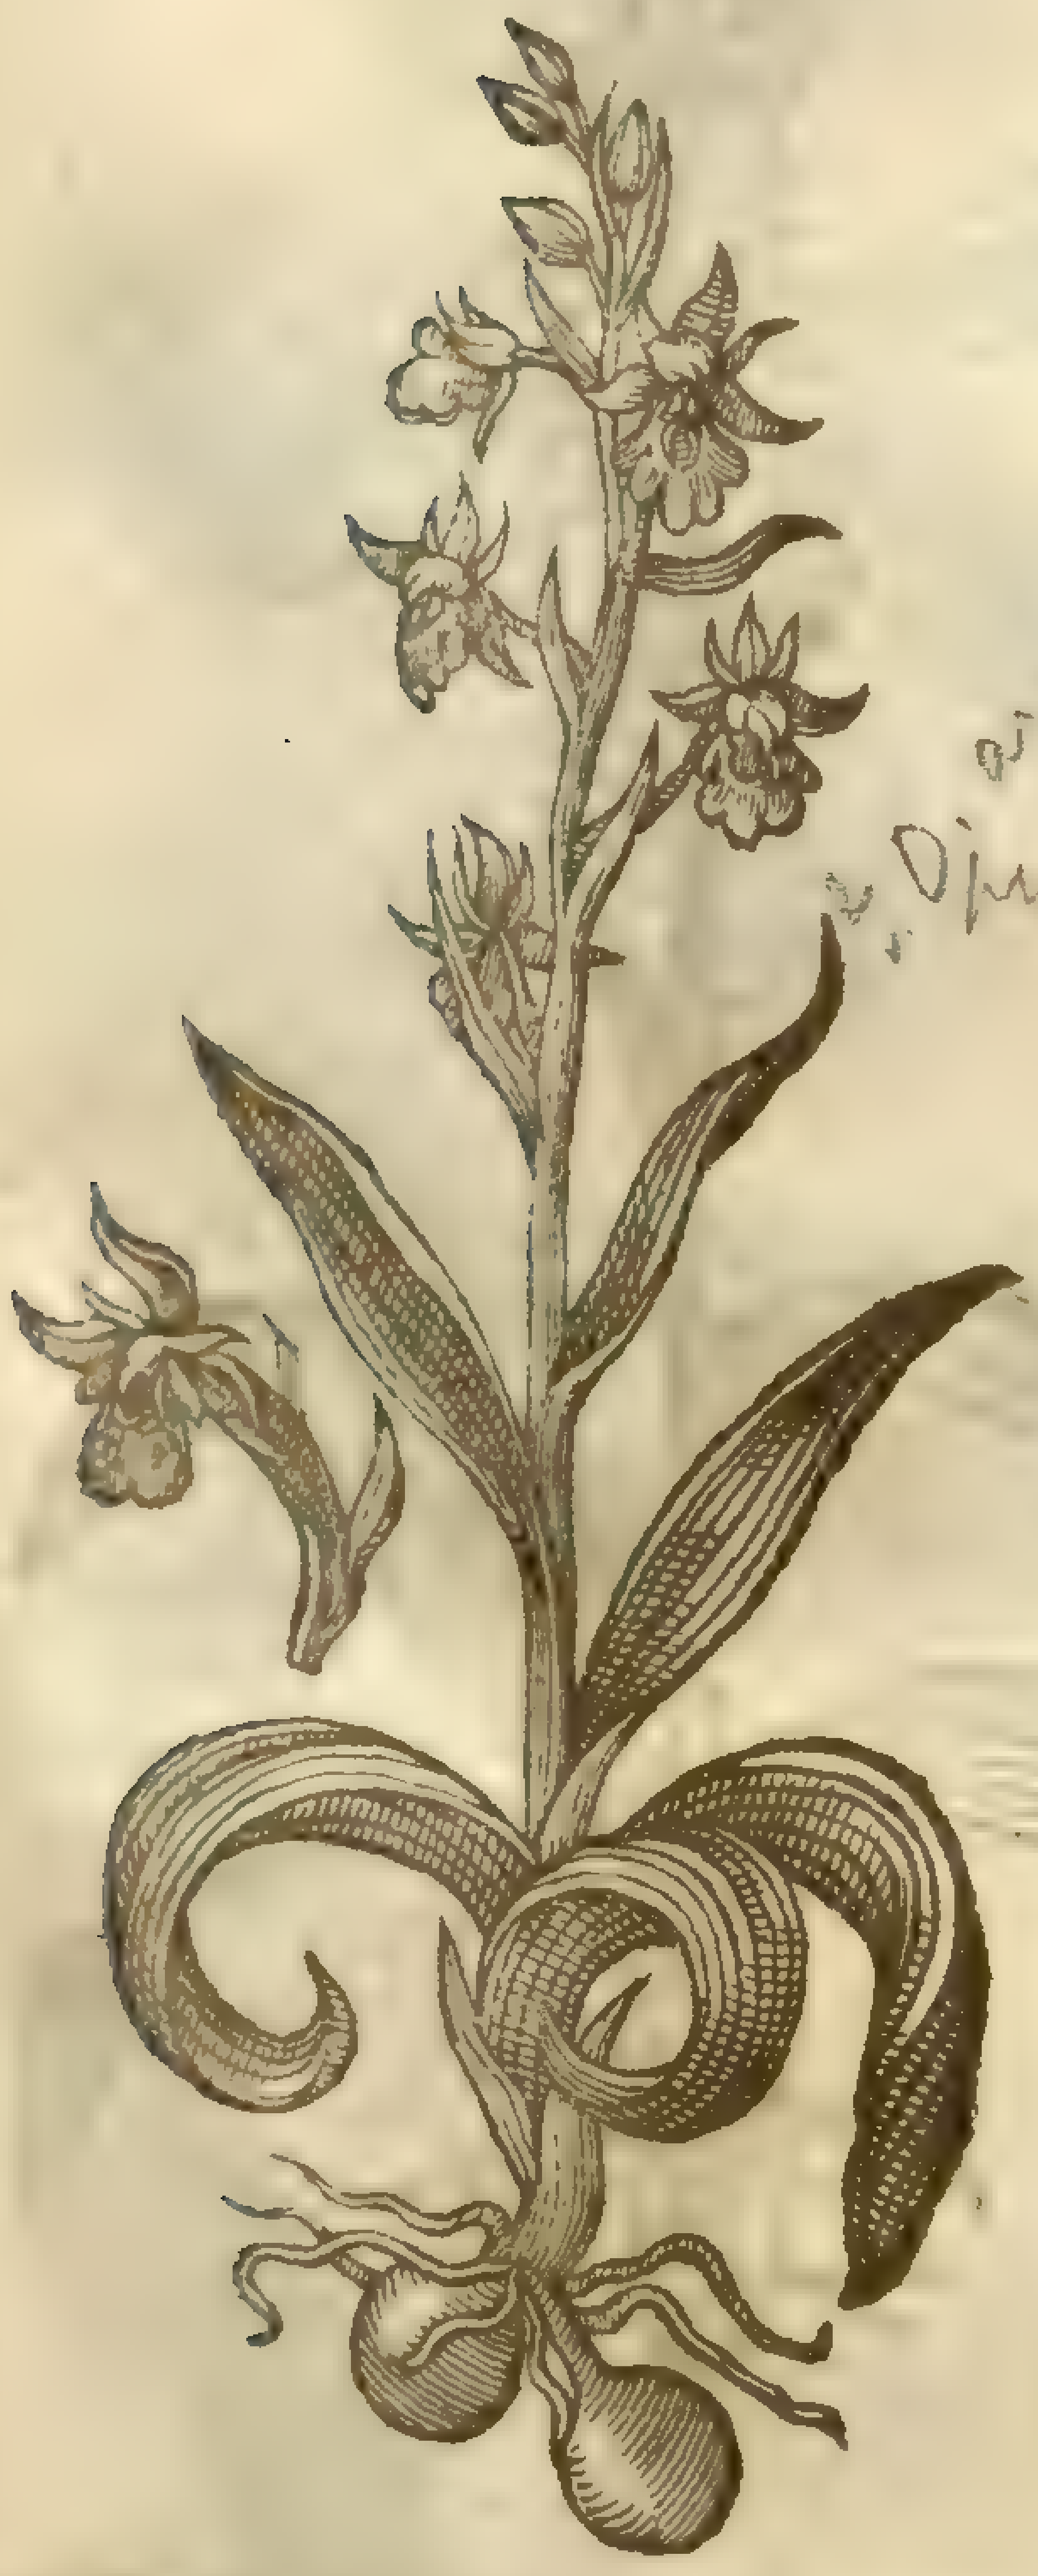
3 The Humble-Bee Orchis hath a few ſmall weake and ſhort leaues, which grow ſcatteringly about the ſtalk : the floures grow at the top among the ſmall leaues, reſembling in ſhape the humble Bee. The root conſiſteth of two ſtones or bulbes, with ſome few threds anexed thereunto.

4 The Waſpe Satyrion groweth out of the ground, hauing ſtalks ſmall and tender: the leaues are like the former, but ſomwhat greater, declining to a brown or dark colour. The flours be ſmall, of the colour of a dry oken leafe, in ſhape reſembling the great Bee called in Engliſh an Hornet, or drone Bee. The root is like the other.

5 The leaues of Bee Satyrion are longer than the laſt before mentioned, narrower, turning themſelues againſt the Sun as it were round. The ſtalk is round, tender, and very fragile. At the top grow the floures, reſembling in ſhape the dead carkaſſe of a Bee. The ſtones or bulbes of the roots be ſmaller and rounder than the laſt deſcribed.

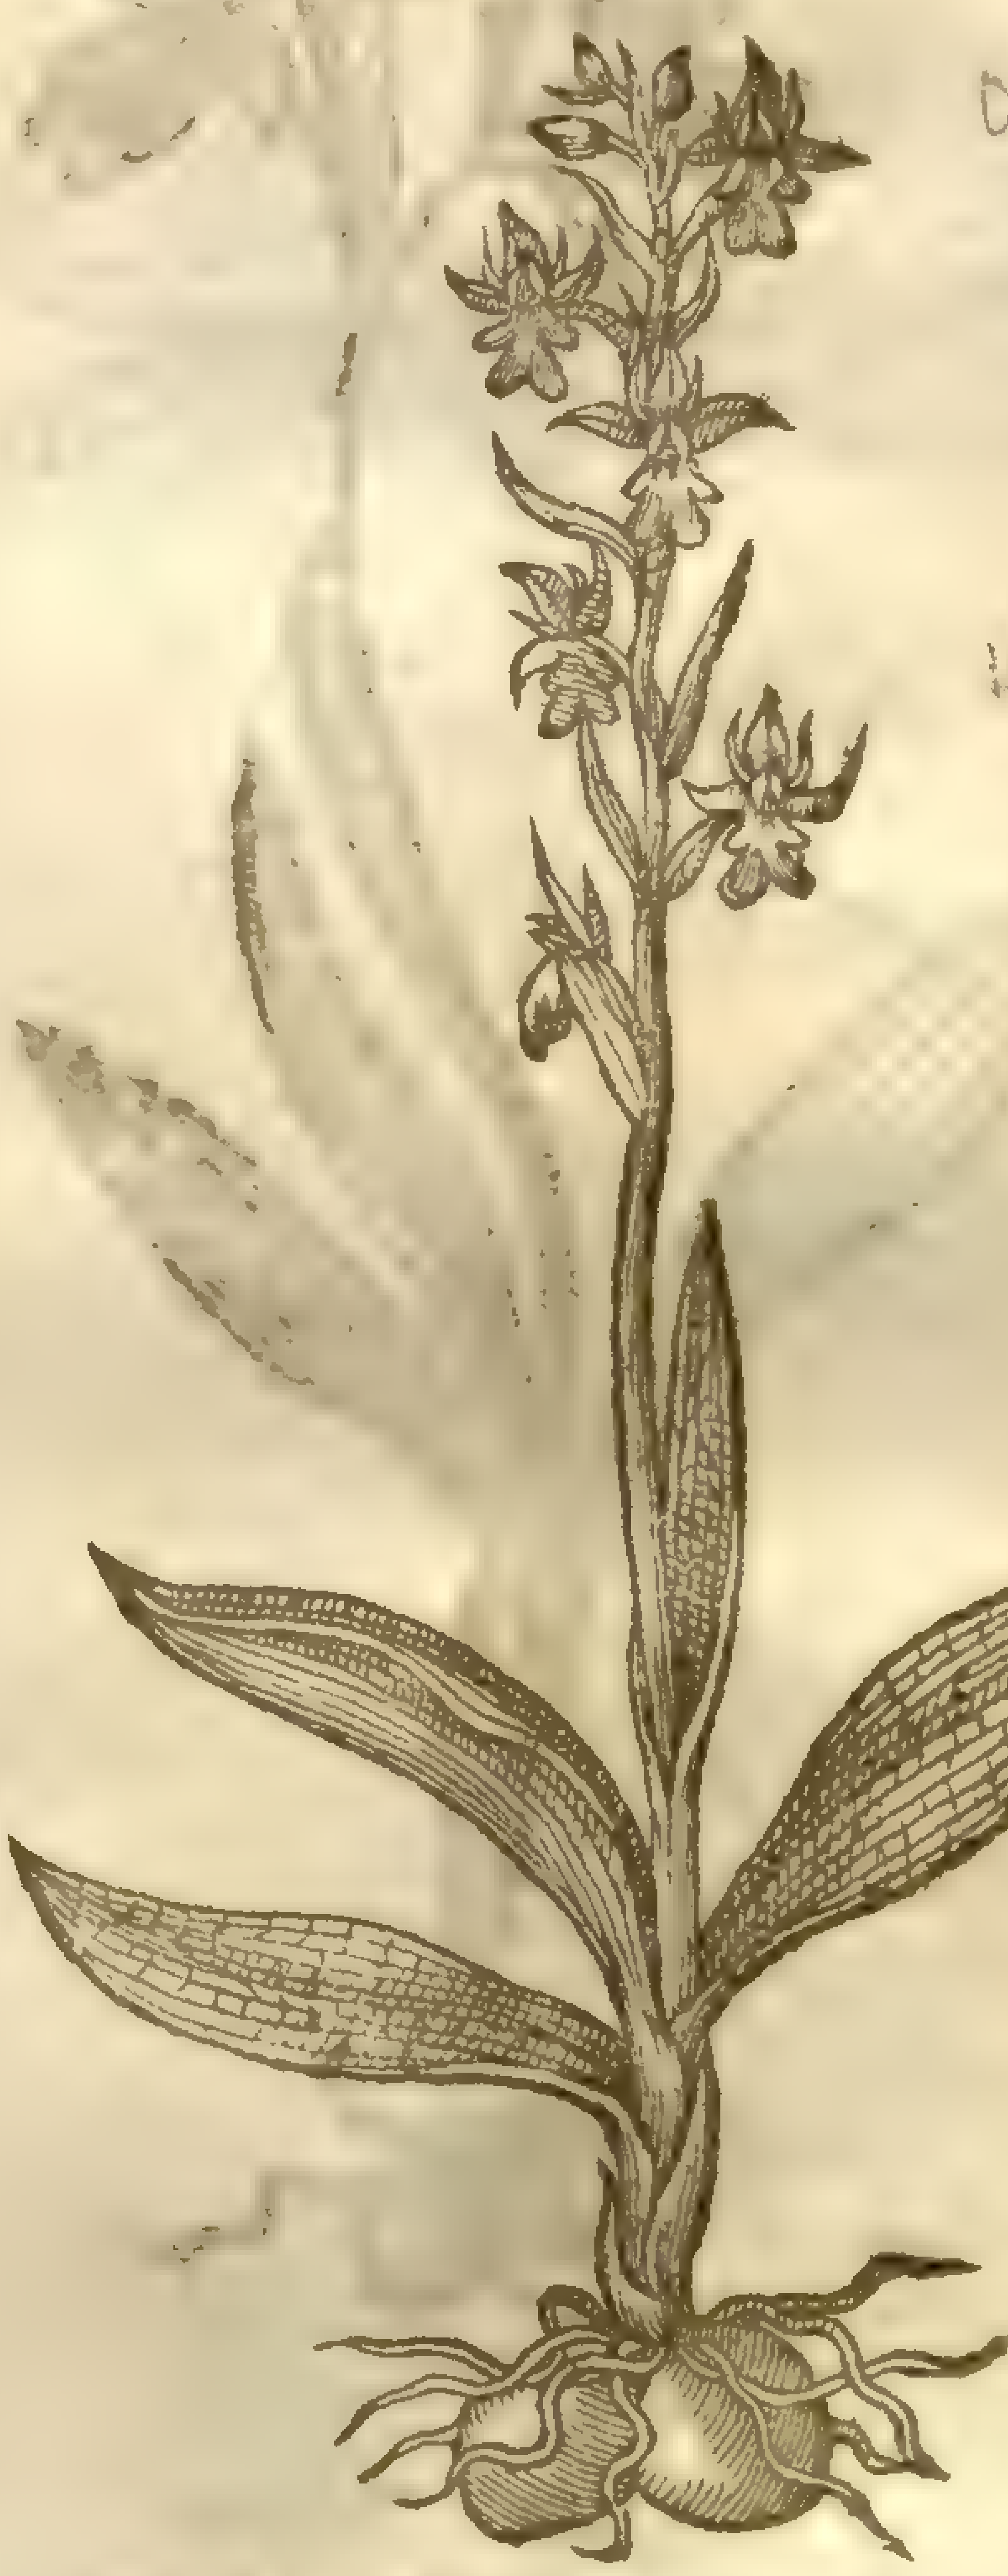
6 The Fly Satyrion is in his leaues like the other, ſauing that they be not of ſo dark a colour : the floures be ſmaller, and more plentifully growing about the ſtalke, in ſhape like vnto Flies, of a darke greeniſh colour, euen almoſt blacke.

† 5 *Orchis Melittias.*
Bee Orchis.



v. Ophrys arachnites, [illegible]
Sm pl. [illegible]

† 6 *Orchis Myodes.*
Fly Satyrion.



O. muscifera, [illegible]
Sm pl. [illegible]

7 Yellow Orchis riſeth out of the ground with brown leaues ſmaller than the laſt before mentioned : the ſtalk is tender and crooked : the floures grow at the top, yellow of colour, in ſhape reſembling the yellow flies bred in the dung of kine after raine.

8 The ſmall yellow Satyrion hath leaues ſpred vpon the ground at the firſt comming vp ; the ſlender ſtalke riſeth vp in the midſt, halfe a hand high ; the floures grow ſcatteringly towards the top, reſembling the flies laſt before mentioned, dark or ruſty of colour : the ſtones or bulbs are very round.

9 Birds Orchis hath many large ribbed leaues, ſpred vpon the ground like vnto thoſe of Plantain : among the which riſe vp tender ſtalkes couered euen to the tuft of the floures with the like leaues, but leſſer, in ſuch ſort as the ſtalks cannot be ſeen for the leaues. The flours grow at the top, not ſo thick ſet or thruſt together as the others, purple of colour, like in ſhape vnto little birds, with their wings ſpred abroad ready to fly. The roots be like the former.

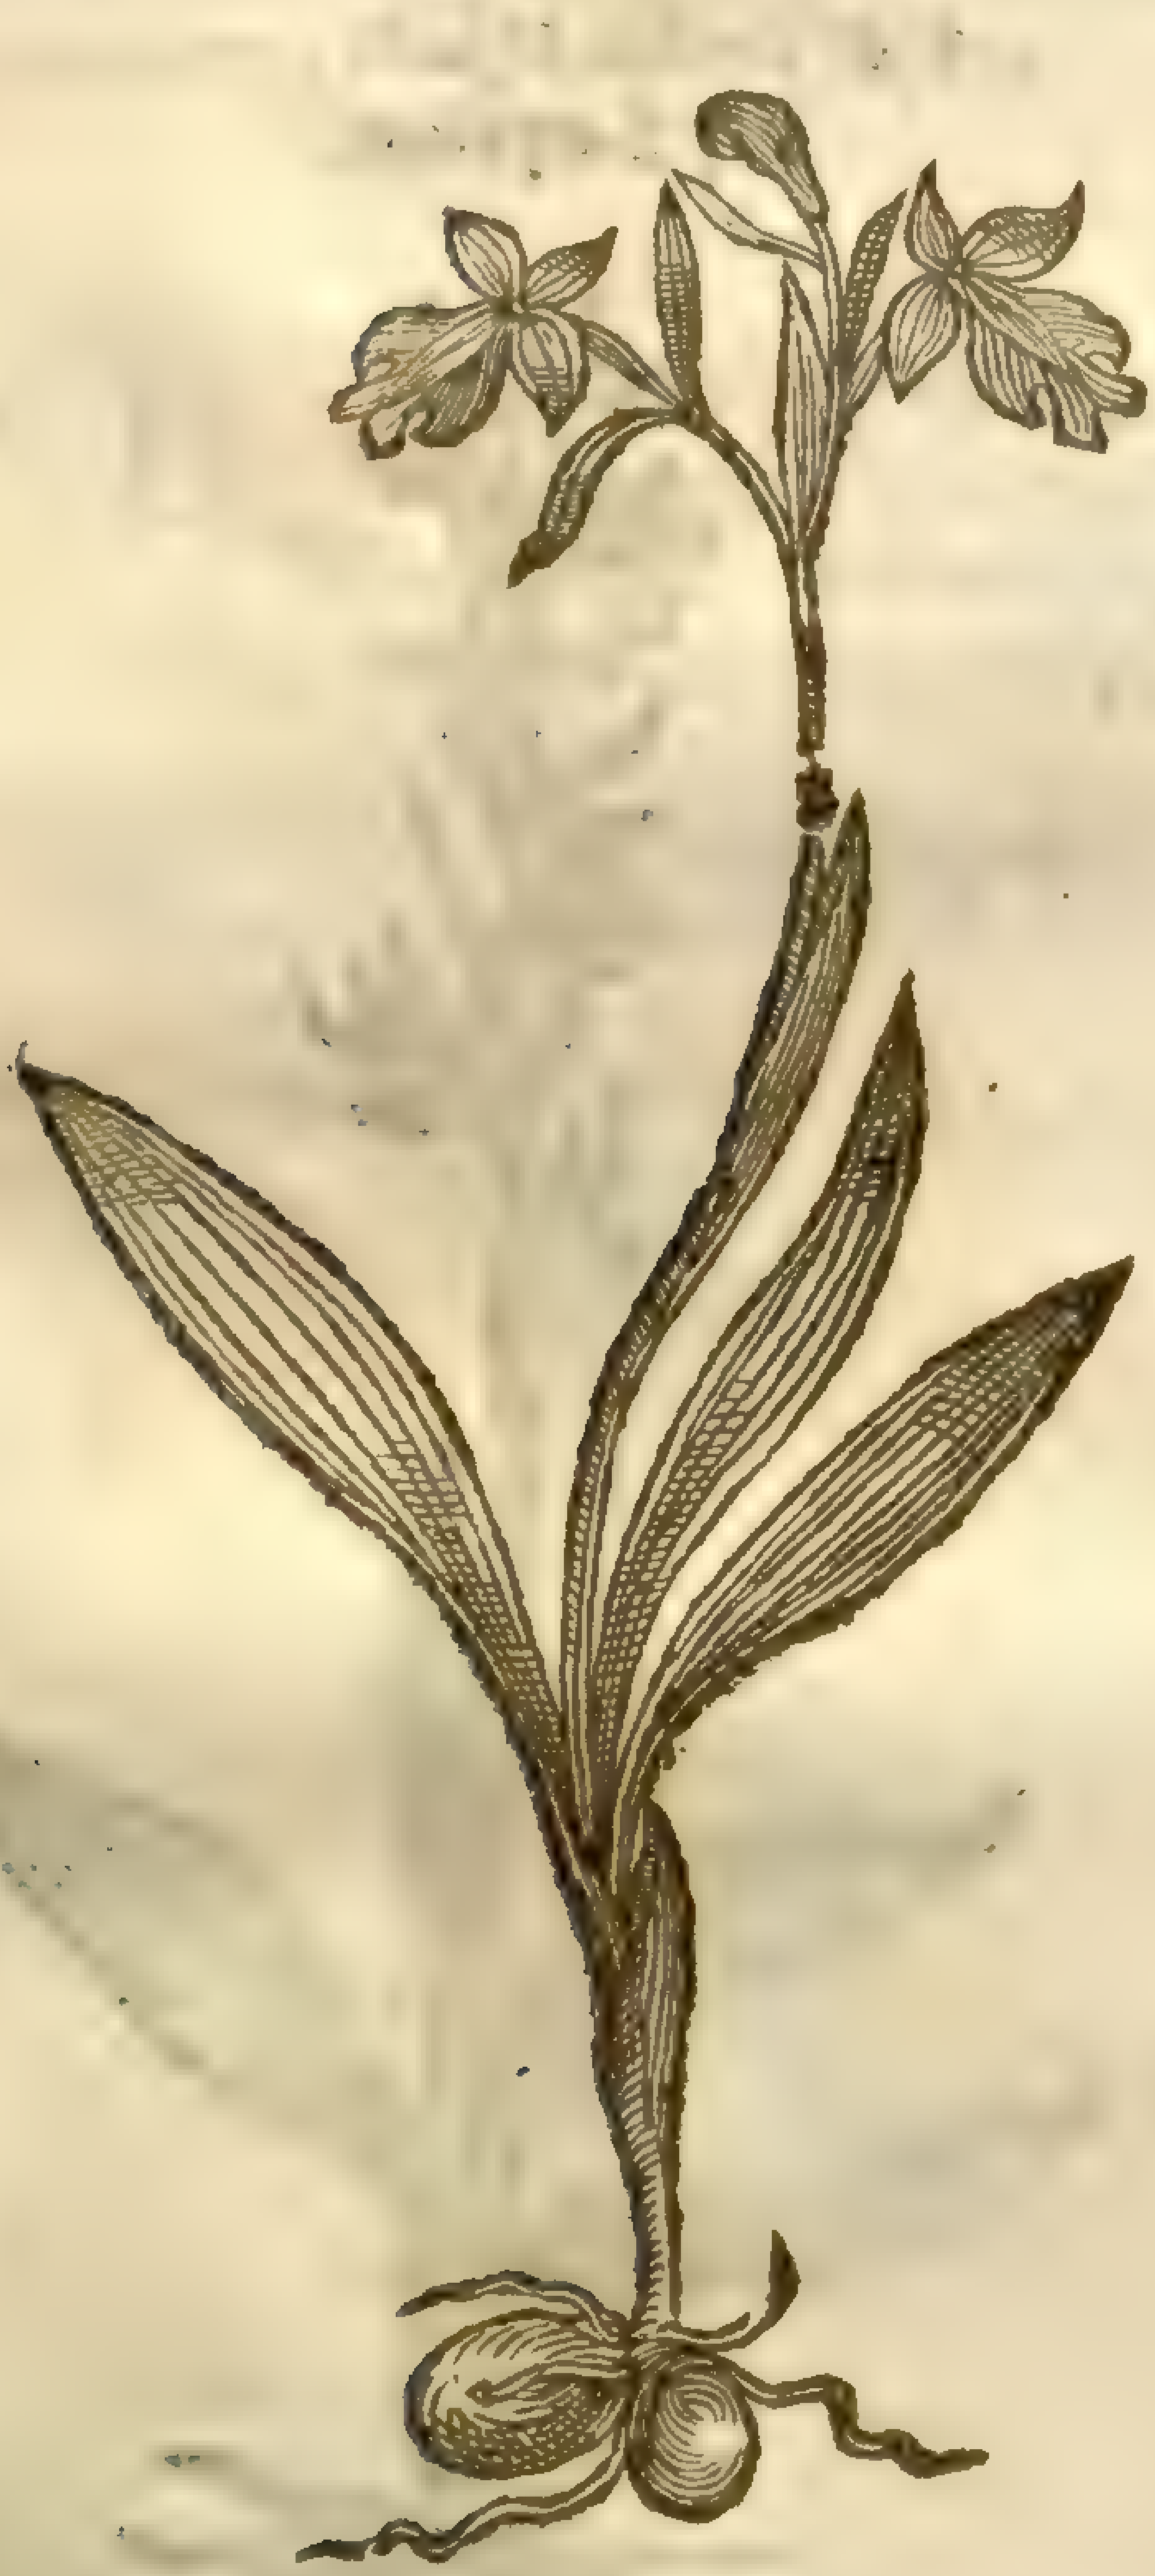
10 Spotted Birds Satyrion hath leaues like vnto the former, ſauing that they be daſhed or

ſpotted here and there with darke ſpots or ſtreakes, hauing a ſtalke couered with the like leaues, ſo that the plants differ not in any point, except the black ſpots, which this kind is daſht with.

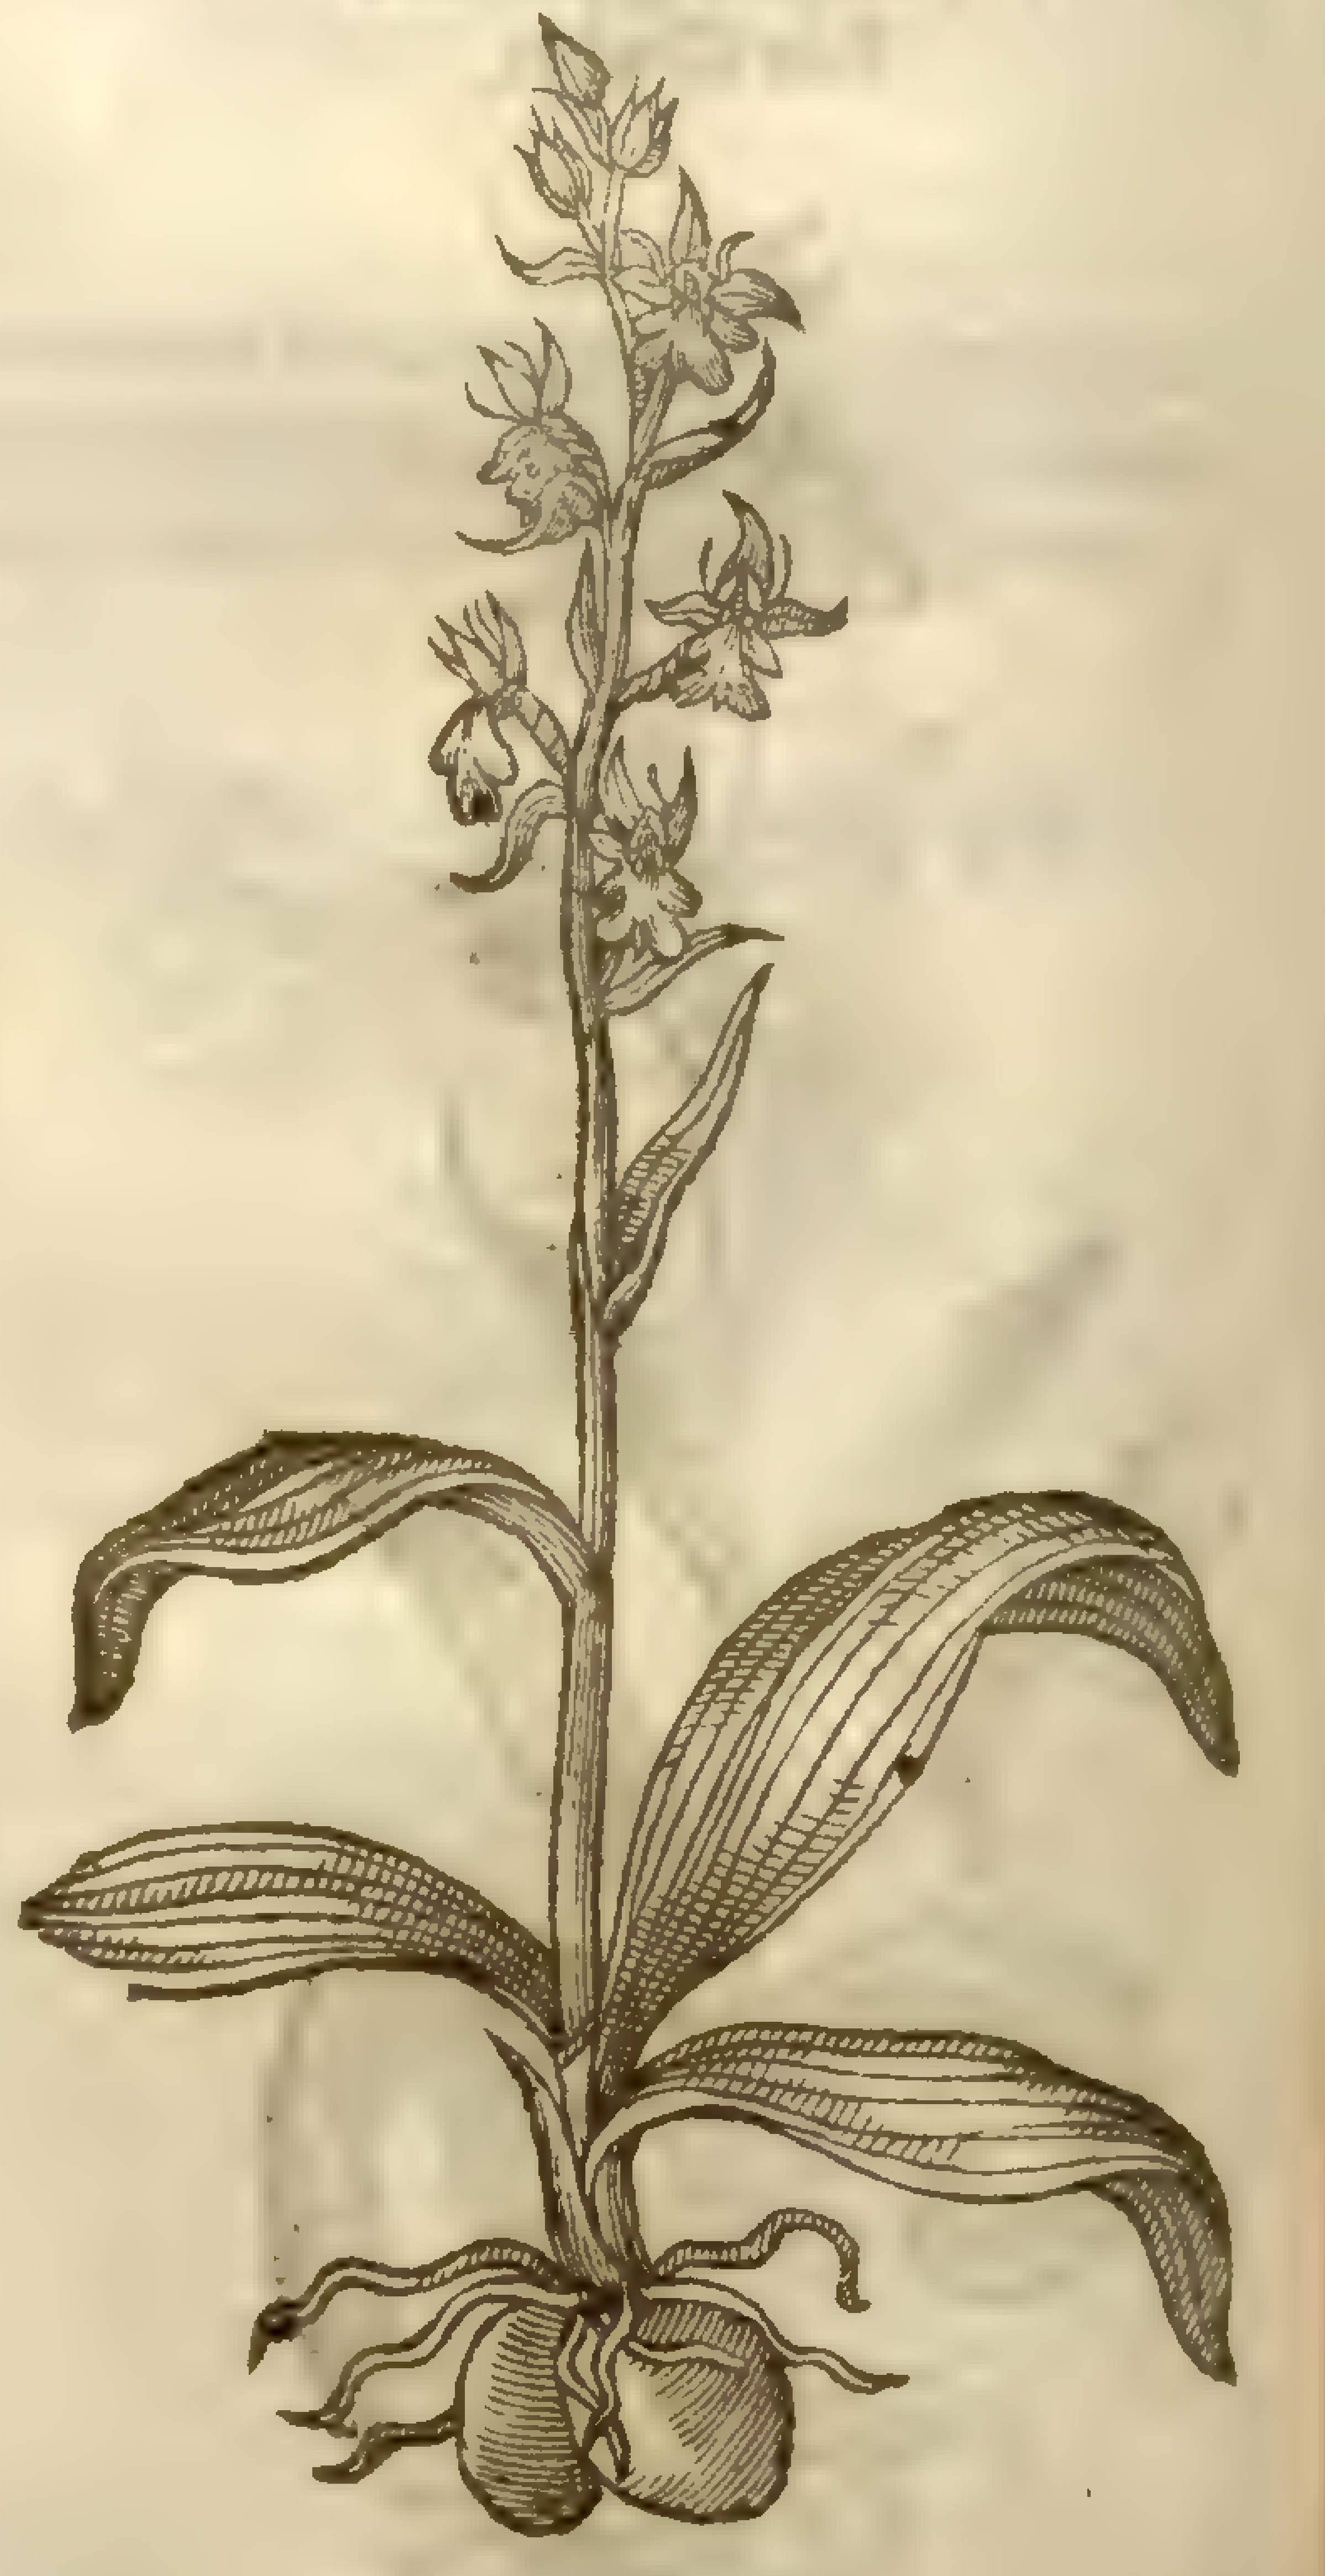
11 White Birds Satyrion hath leaues riſing immediately forth of the ground like vnto the blades or leaues of Leeks, but ſhorter; among the which riſeth vp a ſlender naked ſtalk two handfuls high; on the top whereof be white floures reſembling the ſhape or form of a ſmall bird ready to fly, or a white Butterfly with her wings ſpred abroad. The roots are round, and ſmaller than any of the former.

12 Soldiers Satyrion bringeth forth many broad large and ribbed leaues, ſpred on the ground like vnto thoſe of the great Plantain: amongſt the which riſeth vp a fat ſtalke full of ſap or juice, cloathed or wrapped in the like leaues euen to the tuft of floures, whereupon do grow little floures reſembling a little man hauing an helmet vpon his head, his hands and legs cut off, white vpon the inſide, ſpotted with many purple ſpots, and the back part of the floure of a deeper colour tending to redneſſe.

† 7 *Orchis Myodes Lutea.*
Yellow Satyrion.



† 8 *Orchis Myodes minor.*
Small yellow Satyrion.



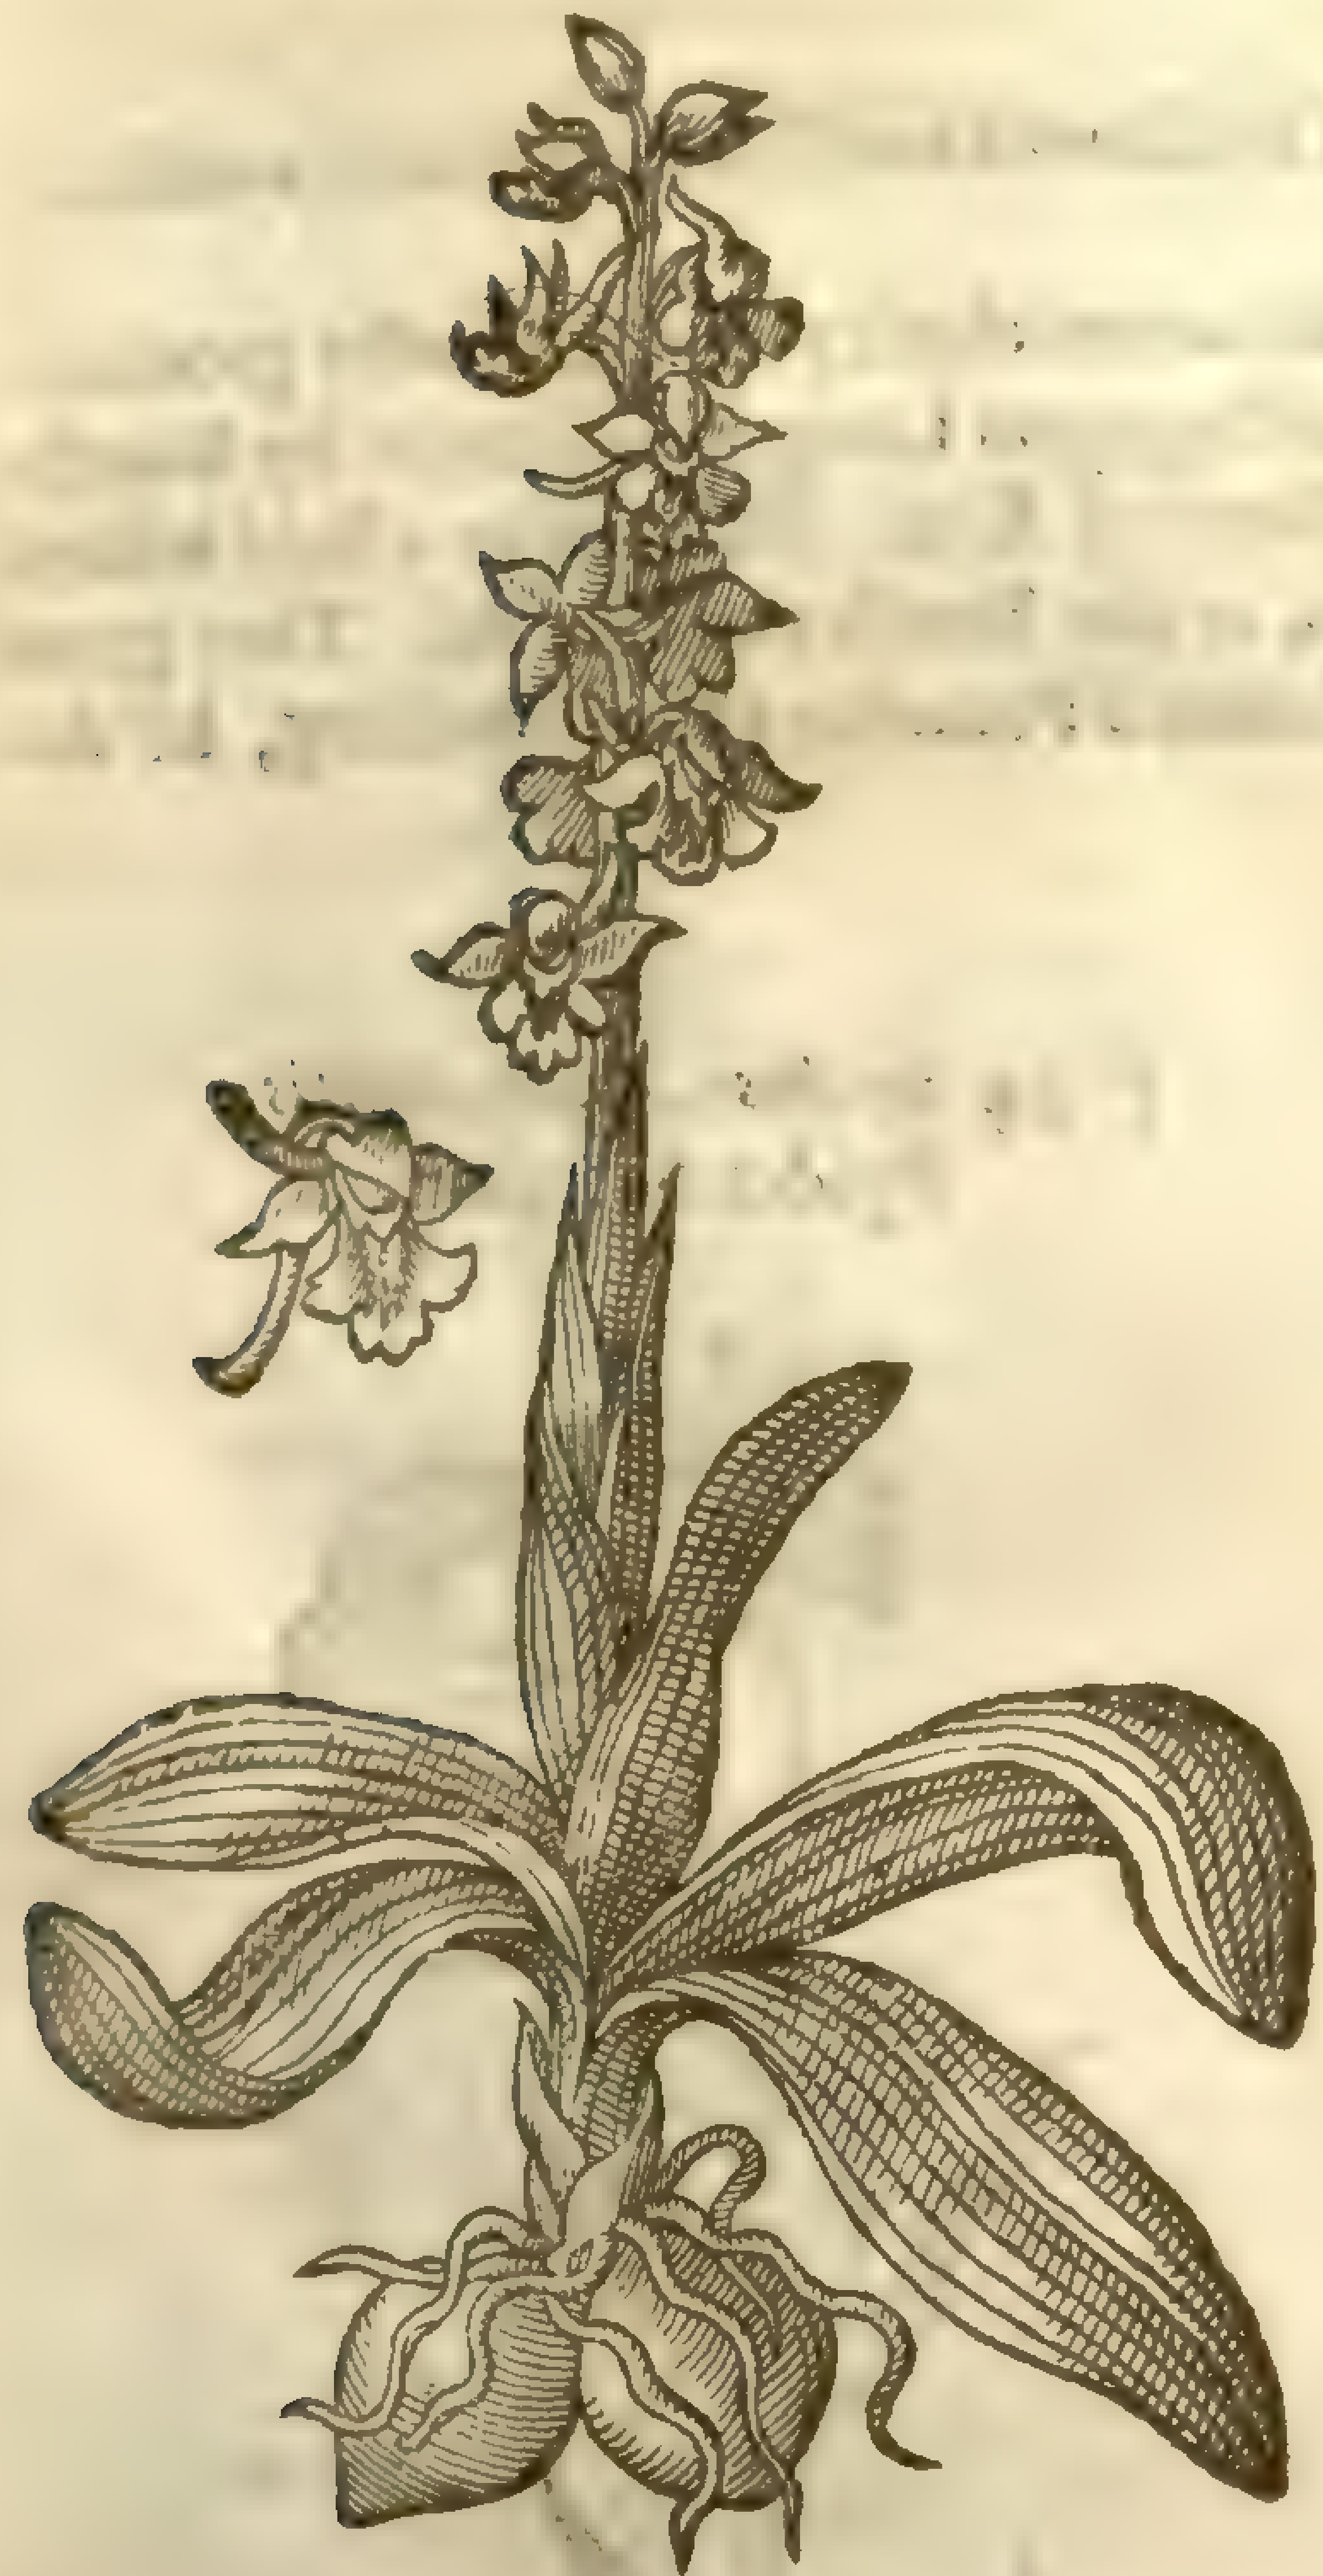
13 Soldiers Cullions hath many leaues ſpread vpon the ground, but leſſer than the ſouldiers Satyrion, as is the whole plant. The backſide of the floures are ſomewhat mixed with whiteneſſe, and ſometimes are aſh-coloured. The inſide of the floure is ſpotted with white likewiſe.

14 Spider Satyrion hath many thin leaues like vnto thoſe of the Lilly, ſcatteringly ſet vpon a weake and feeble ſtalk; whereupon doth grow ſmall floures, reſembling as well in ſhape as colour, the body of a dead humble Bee, ‡ or rather of a Spider; and therefore I thinke *Lobel*, who was the Author of this name, would haue ſaid *Arachnitis*, of Ἀράχνης, a Spider. ‡

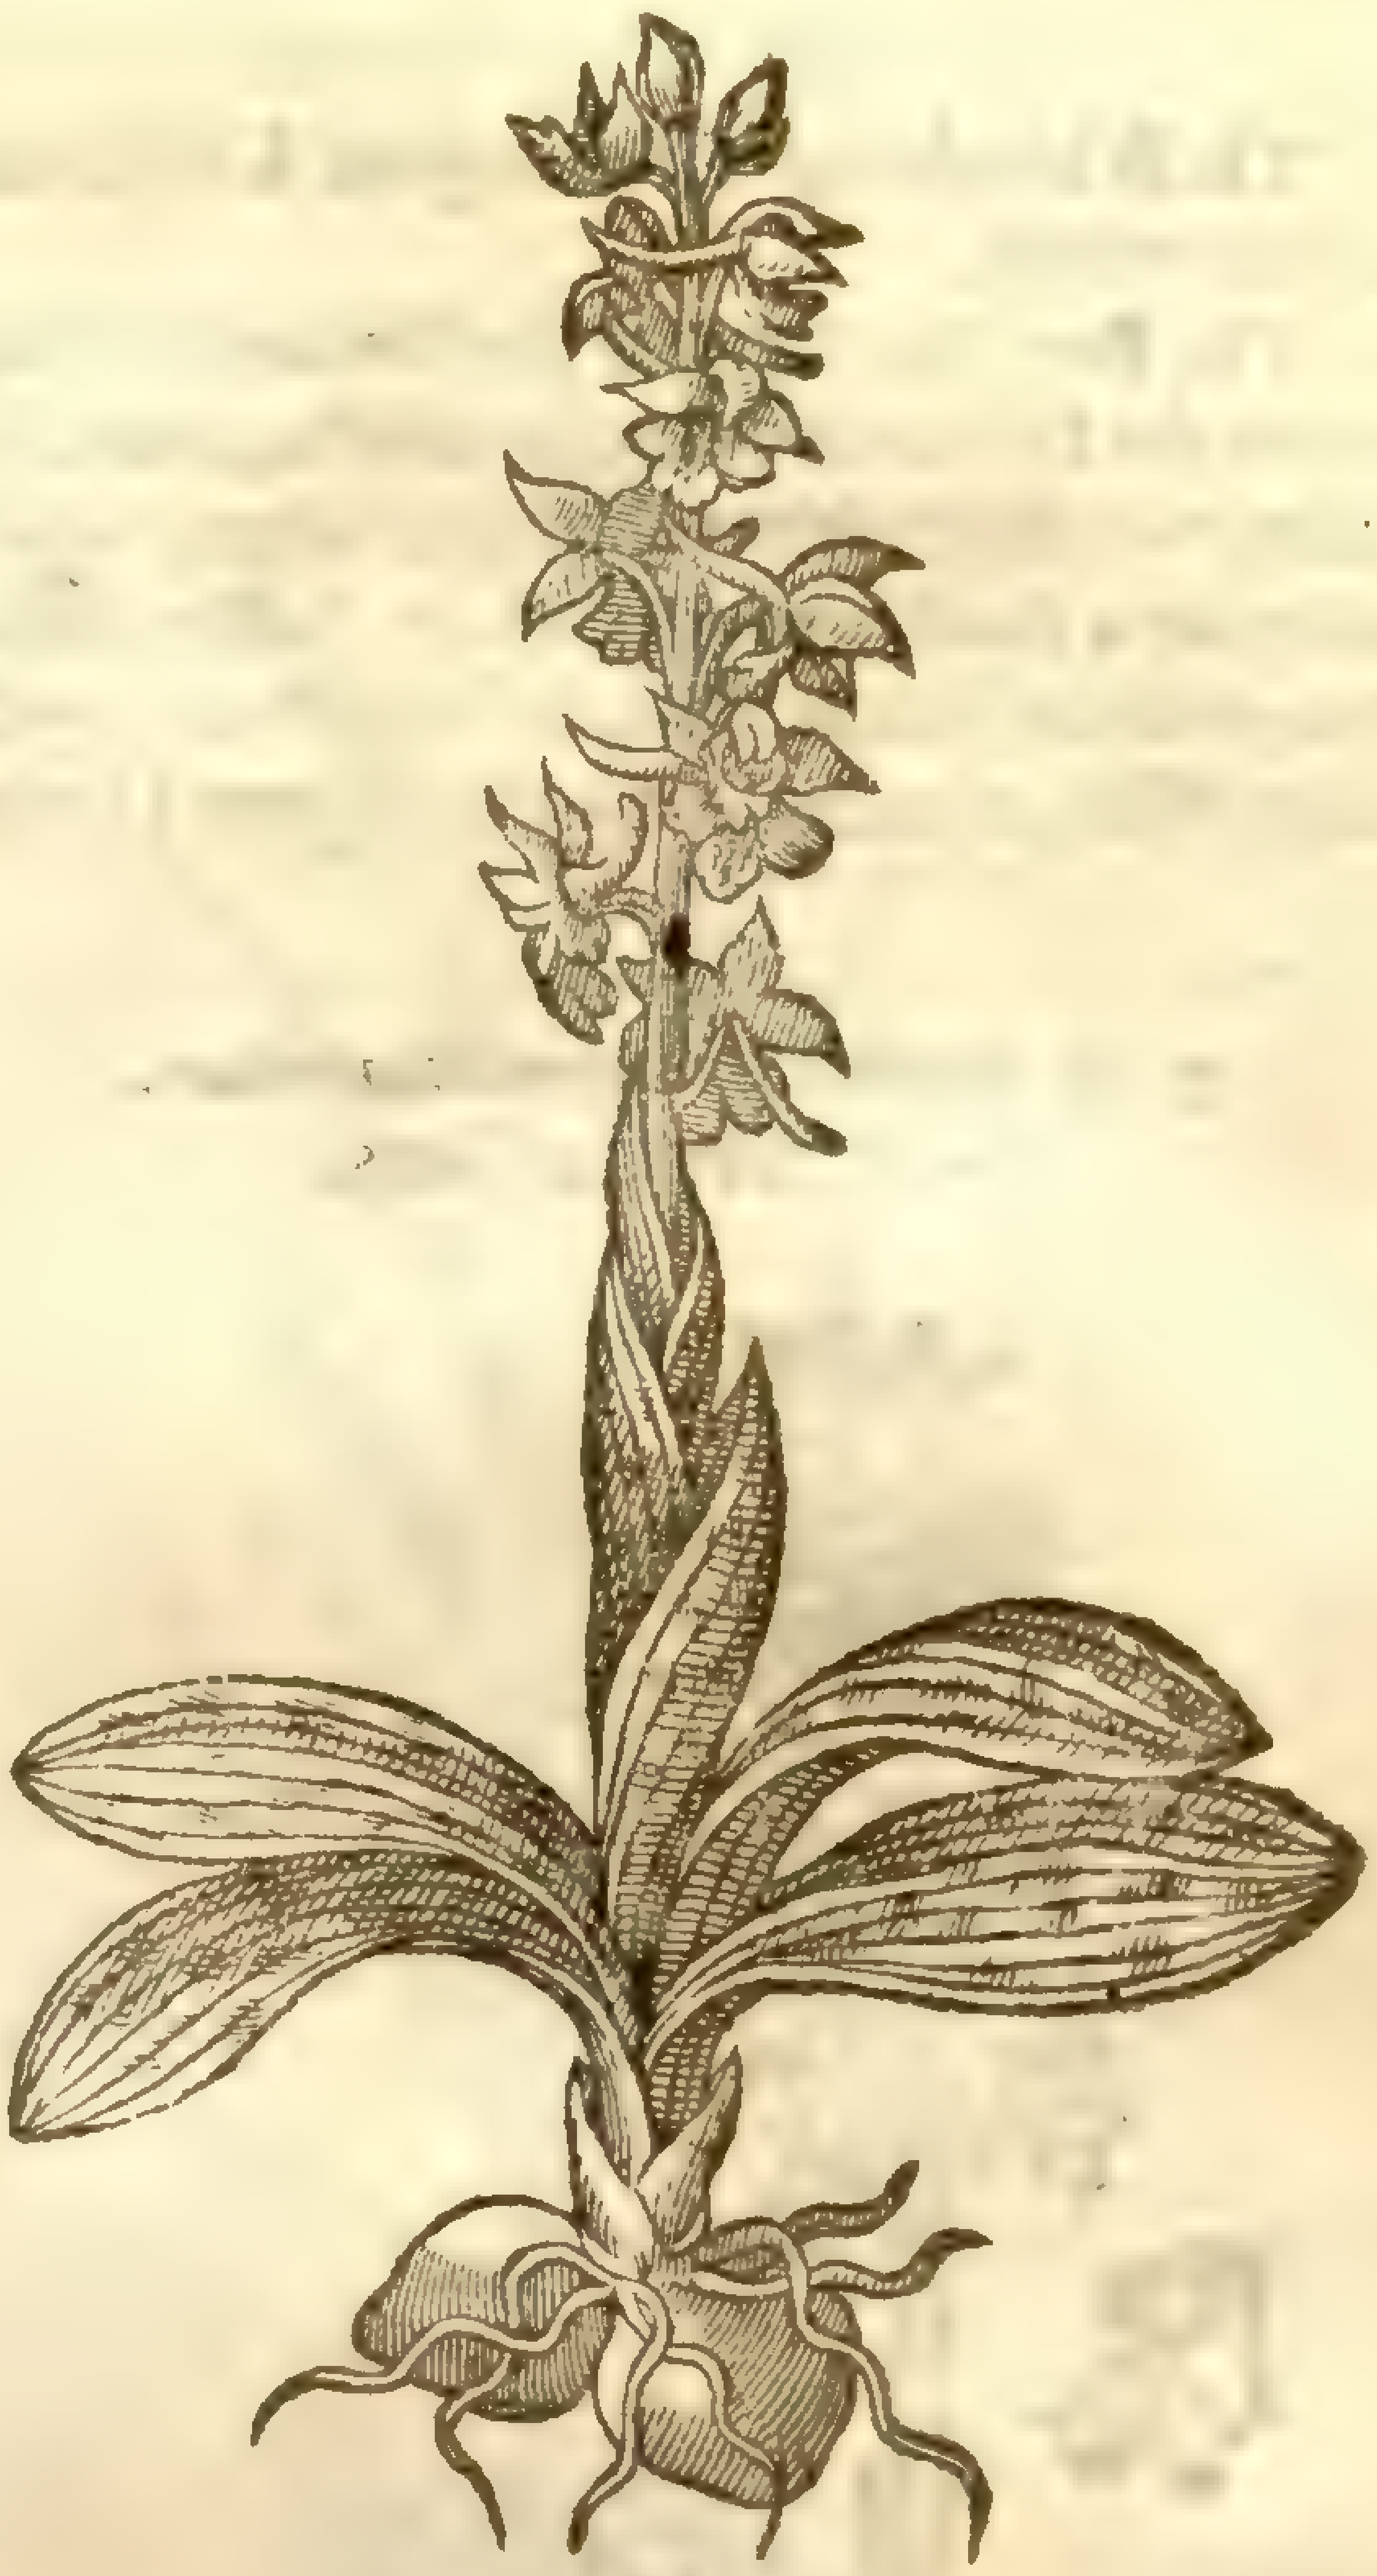
‡ 15 Thisby right ſhould haue bin put next the Gnat Satyrion, deſcribed in the ſecond place. It hath ſhort, yet pretty broad leaues, and thoſe commonly three in number, beſides thoſe ſmall ones ſet vpon the ſtem. The floures are ſmall, and much like thoſe of the ſecond formerly deſcribed.

‡ 16 Our Author gaue you this figure in the fourteenth place, vnder the title of *Orchis Andrachnitis*: but it is of the *Orchis 16 minor* of *Tabern.* or *Orchis Anguſtifolia* of *Bauhinus*. This Orchis is of the kinde of the *Myodes*, or Fly Satyrions, but his leaues are farre longer and narrower than

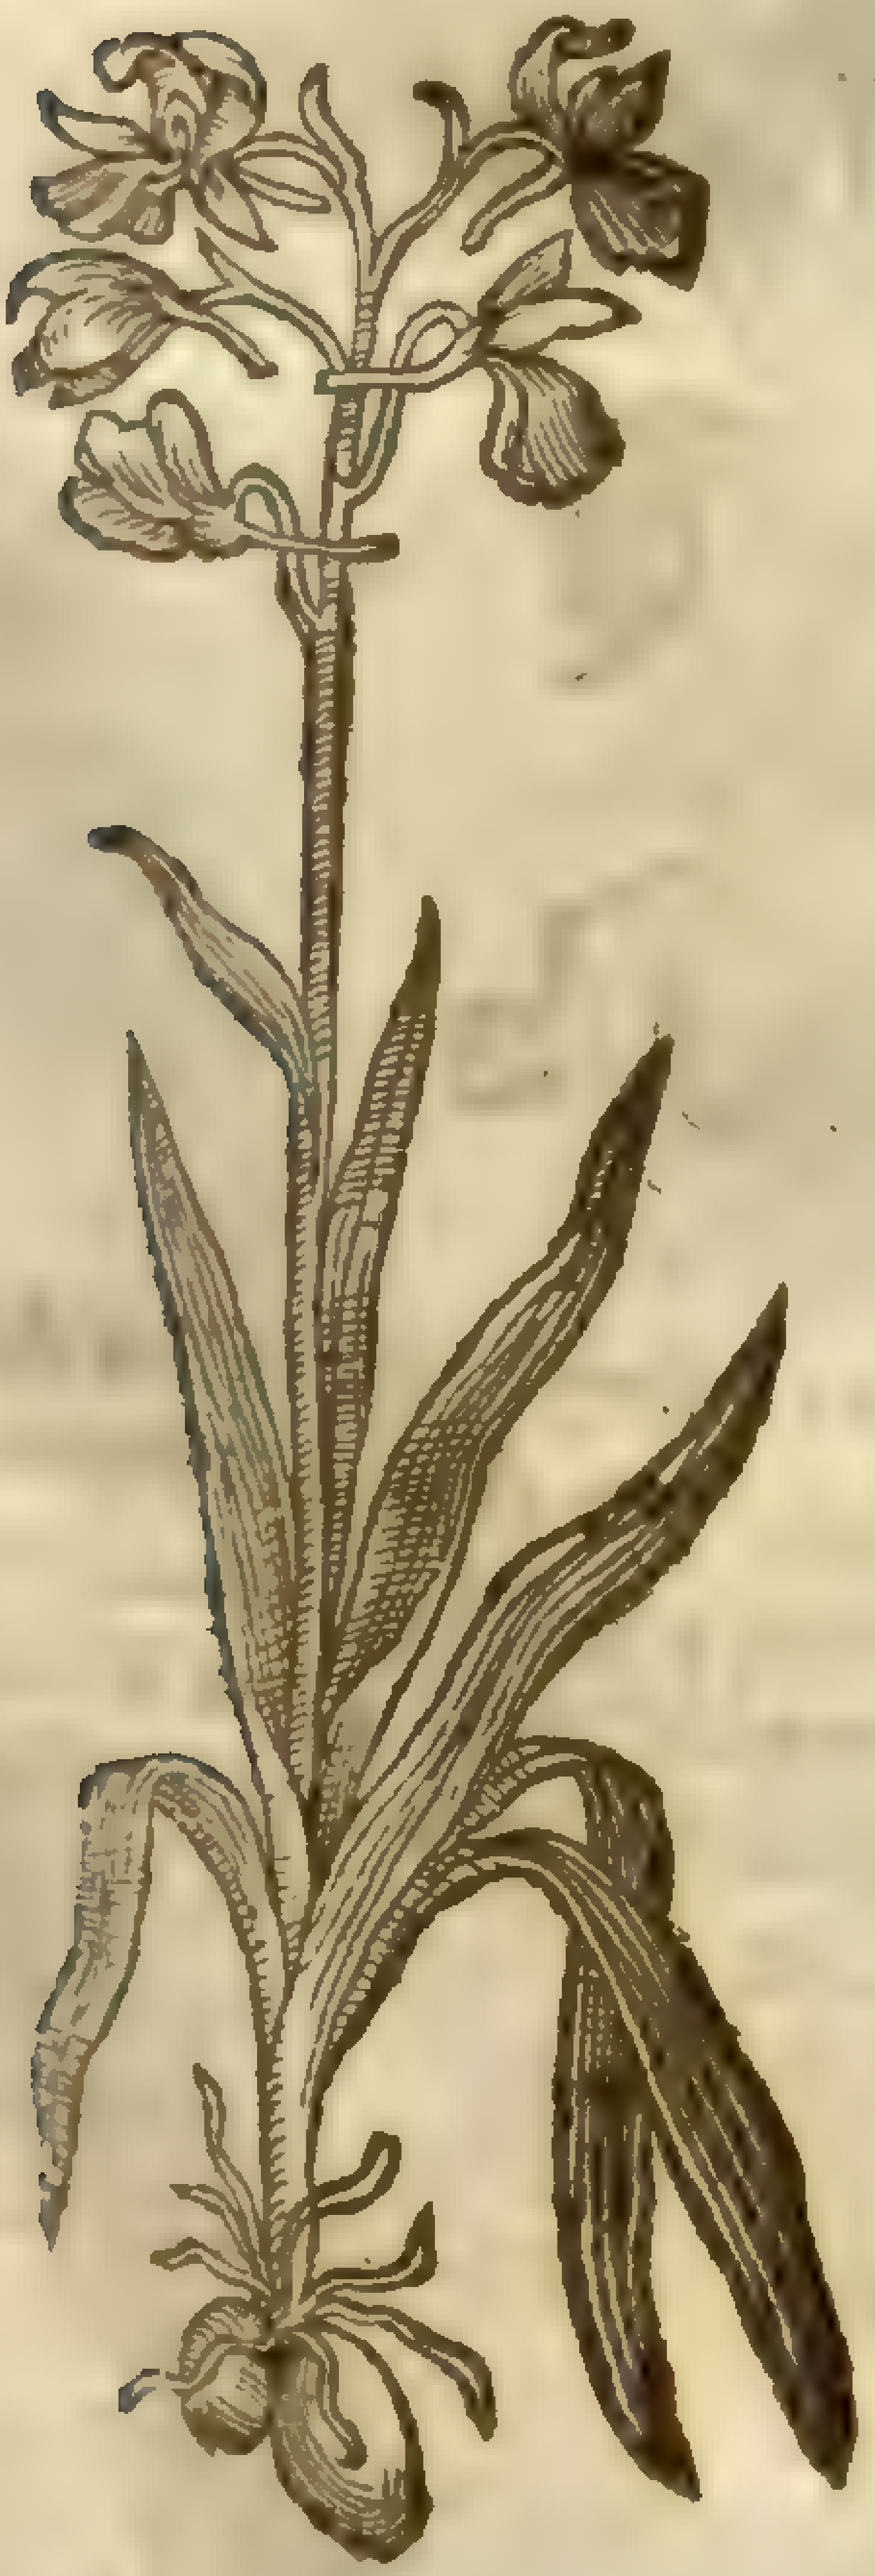
† 9 *Orchis Ornithopora.*
Birds Satyrion.



† 10 *Orchis Ornithopora folio maculoſo.*
Spotted Birds Orchis.

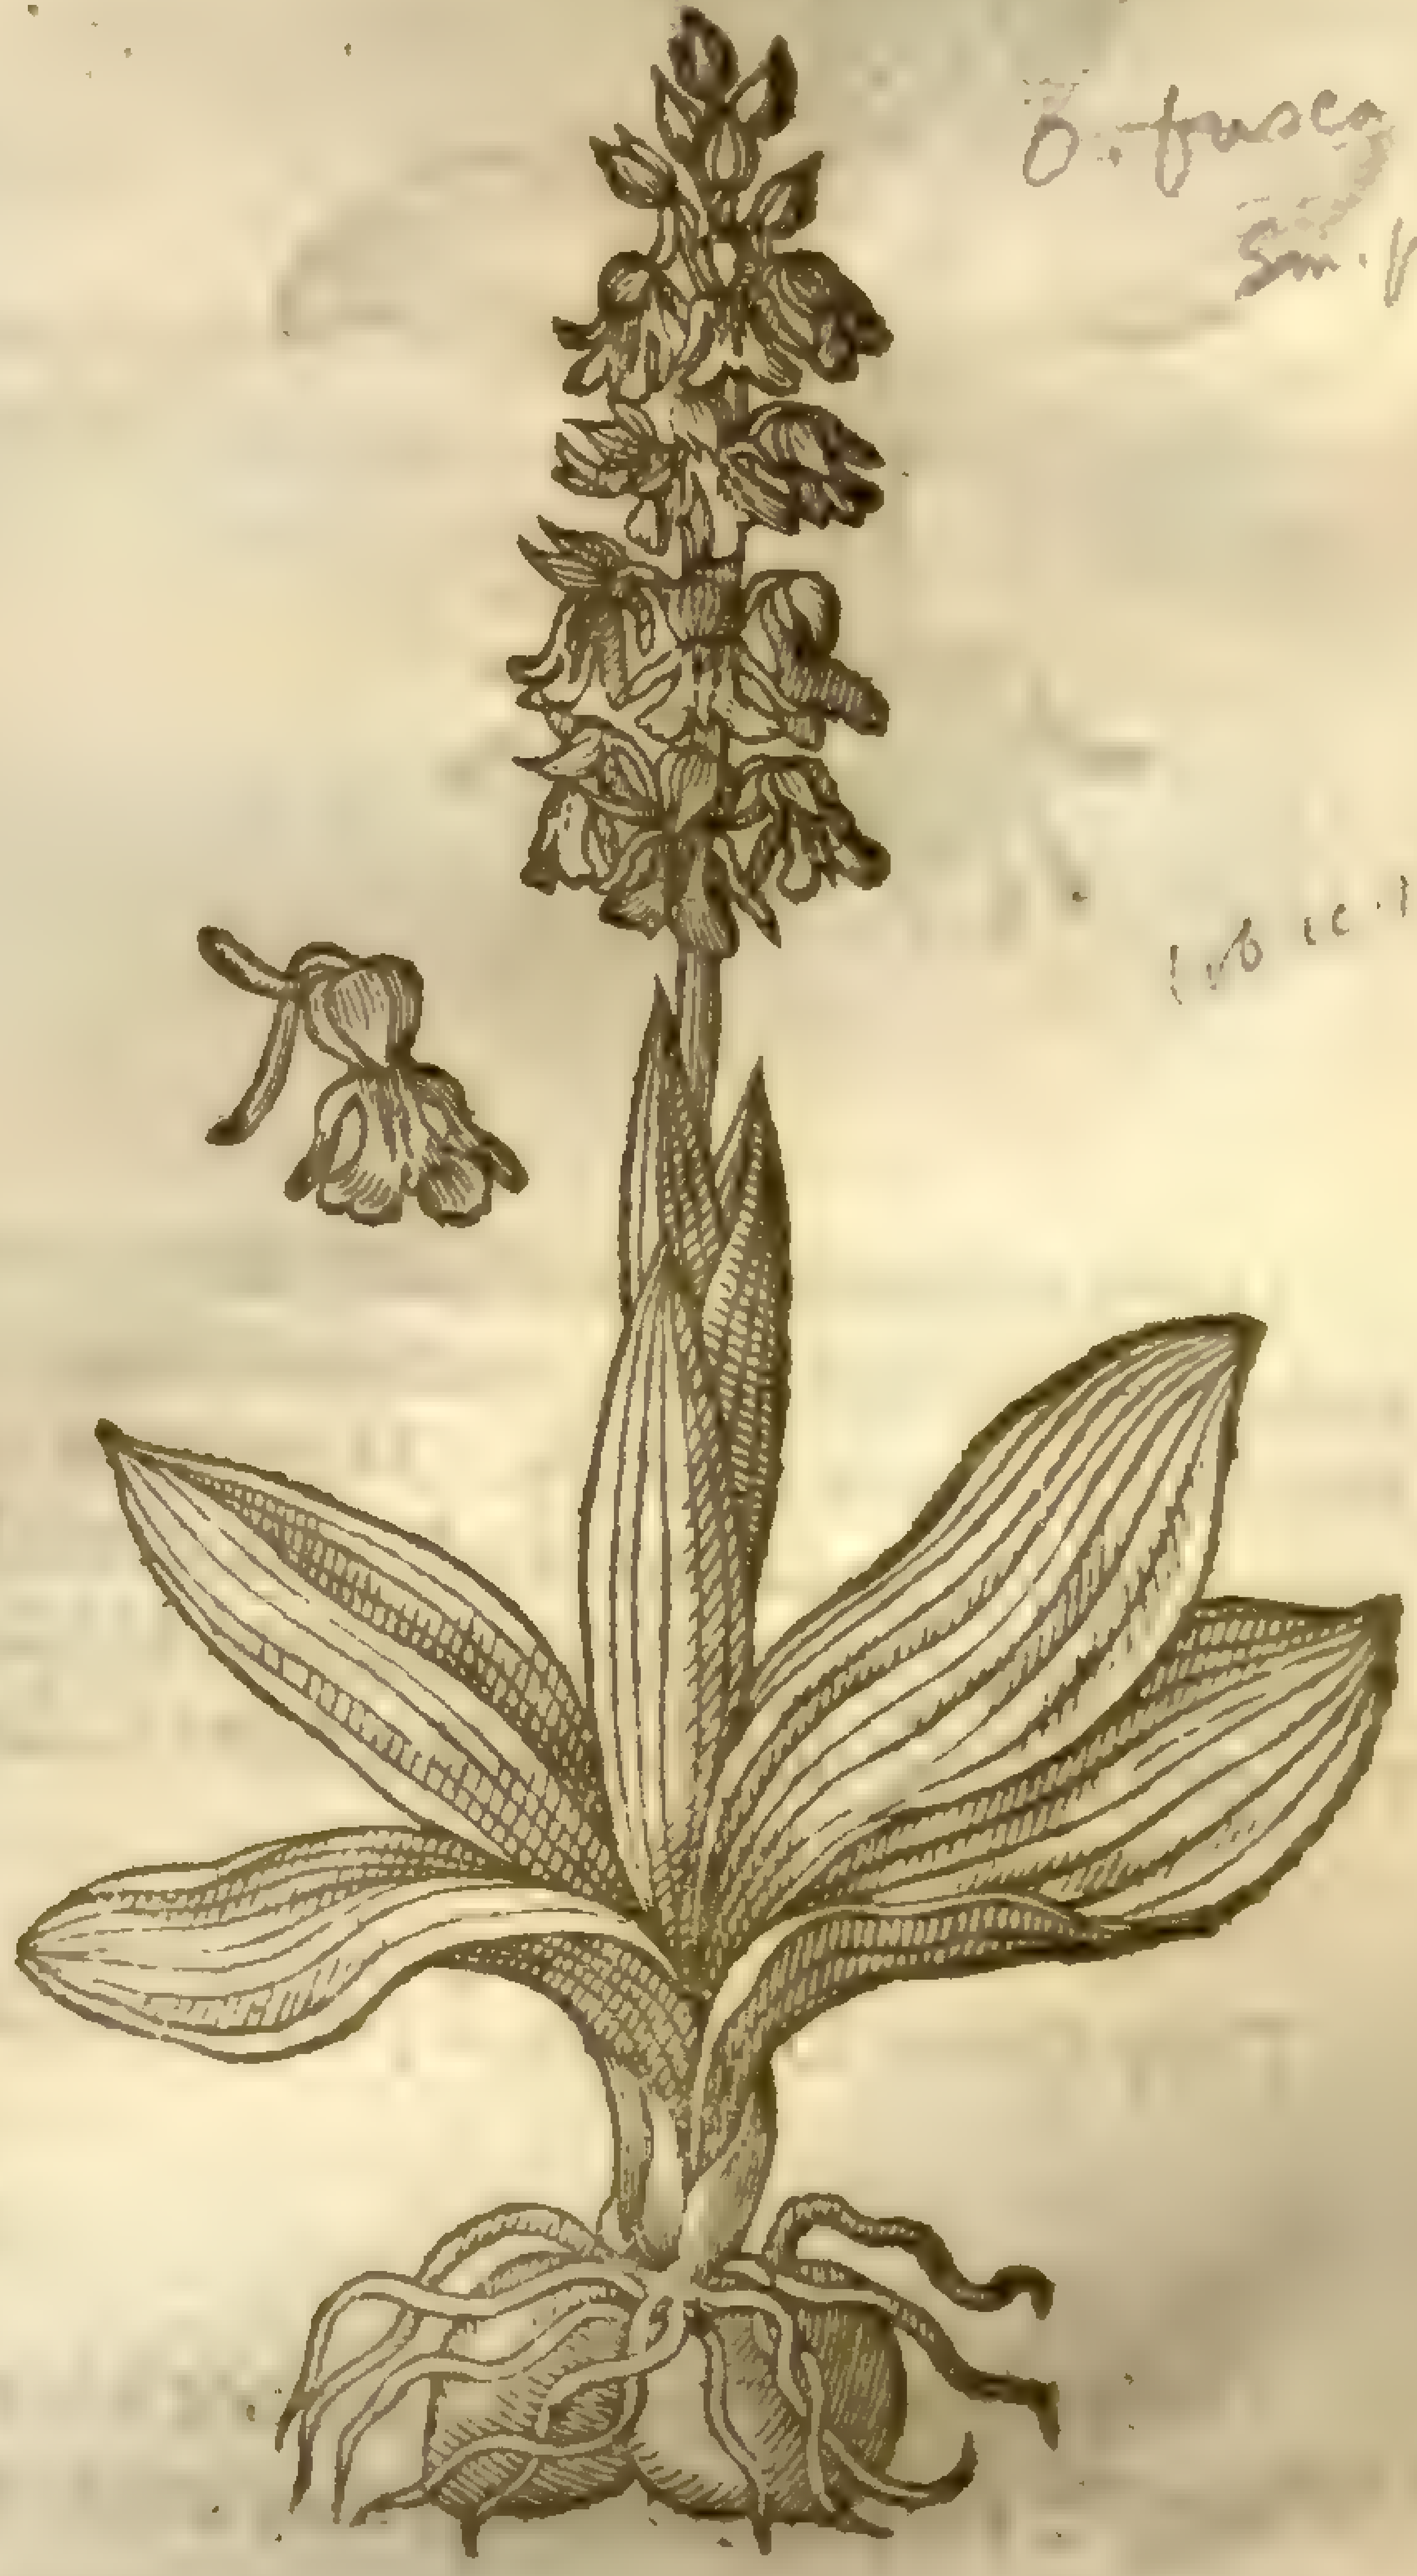


† 11 *Orchis Ornithopora candida.*
White Birds Orchis.



† 12 *Orchis Strateumatica.*
Souldiers Satyrion.

O. fusca. Jacq.
Sm. fl. 4.13



Lob. ic. 181

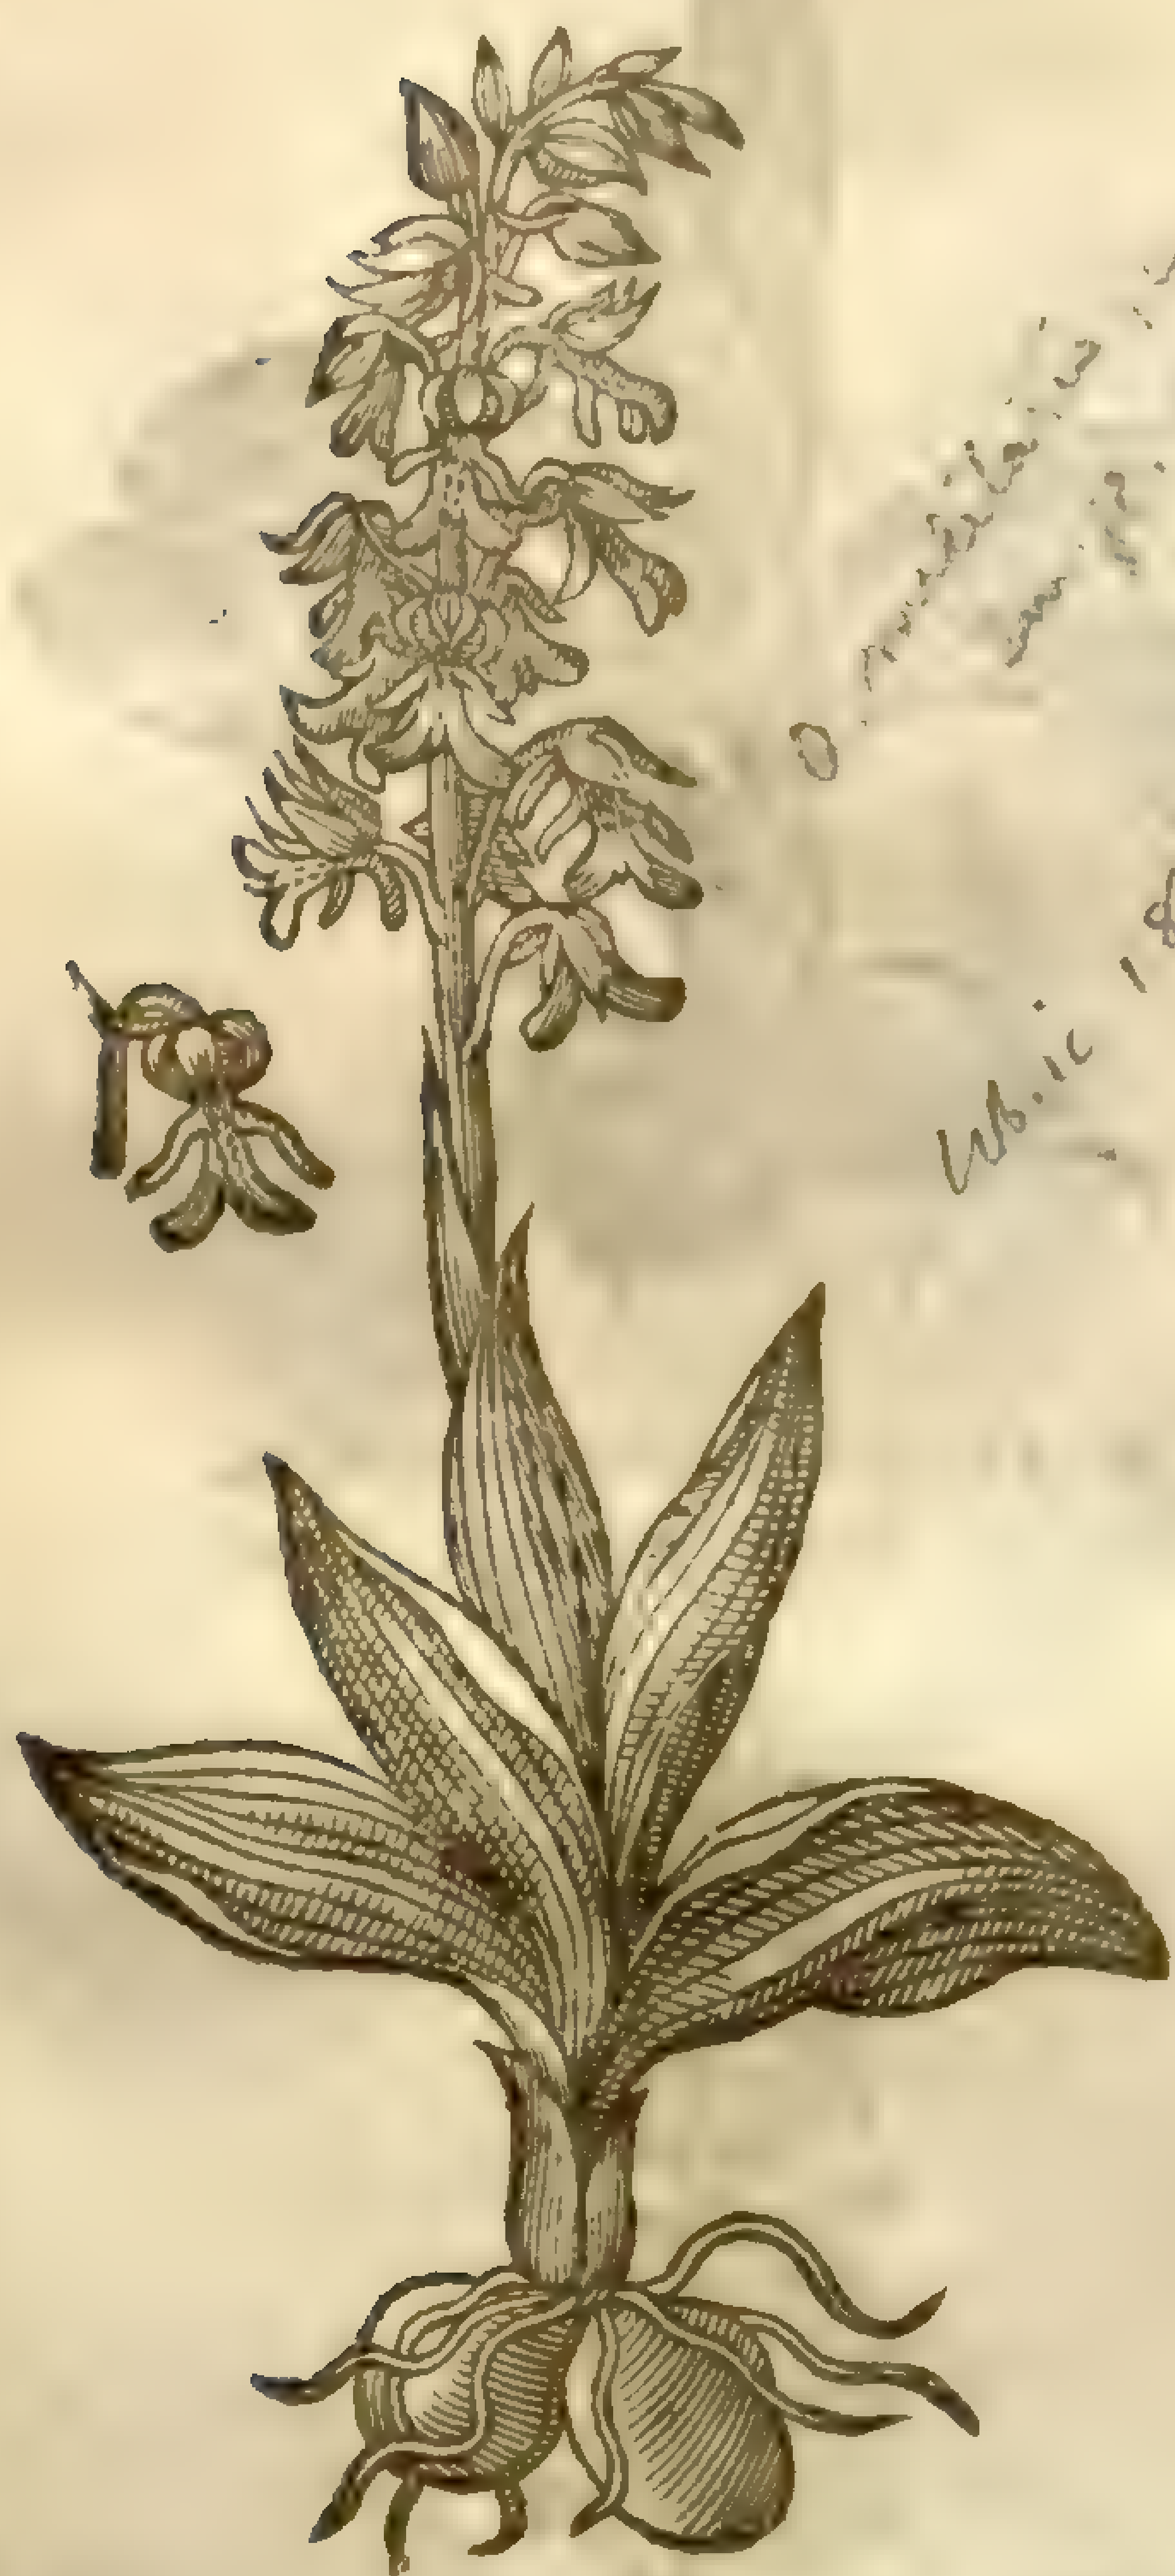
than any of the reſt of that kind,and therein conſiſts the only and chiefeſt difference.‡

¶ *The Place.*

Theſe kindes of Orchis grow for the moſt part in moiſt medowes and fertile paſtures, as alſo in moiſt woods.

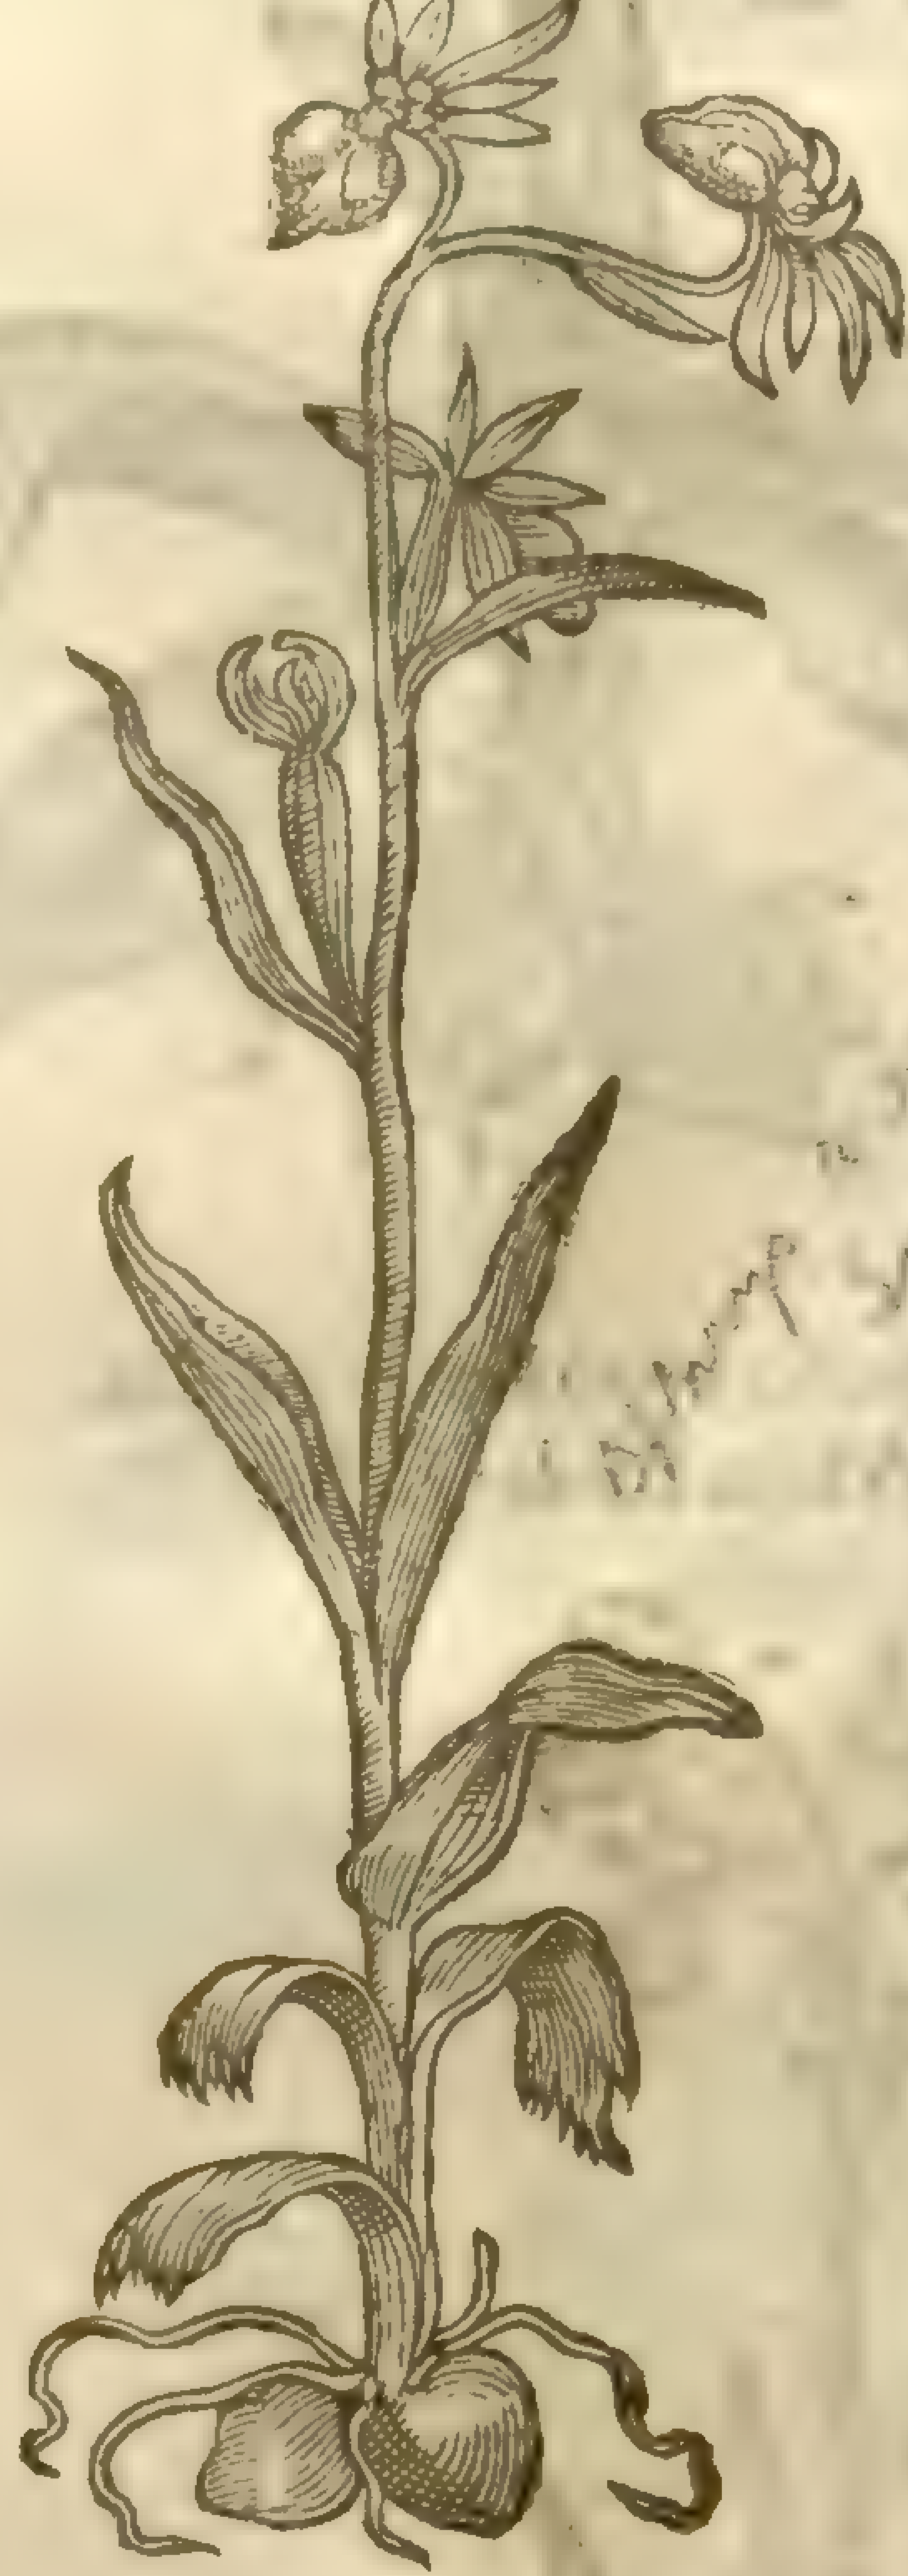
The Bee, the Fly, and the Butter-fly Satyrions grow vpon barren chalky hils, & heathy grounds, vpon the hils adioyning to a village in Kent named Greenhithe, vpon Long-field downs by Southfleet, two miles from the ſame place, and in many other places of Kent: likewiſe in a field adioyning to a ſmall groue of trees, halfe a mile from S. Albons, at the South end thereof. They grow likewiſe at Hatfield neere S. Albons, by the relation of a learned Preacher there dwelling, Mr *Robert Abbot*, an excellent and diligent Herbariſt.

† 13 *Orchis Strateumatica minor.*
Souldiers Cullions.



O. militaris [illegible]
Wh.ic 1821

† 14 *Orchis Andrachnitis.*
Spider Satyrion.



[illegible]

That kind which reſembleth the white Butter-fly groweth vpon the declining of the hill at the end of Hampſted heath, neere to a ſmall cottage there in the way ſide, as yee goe from London to Henden a village there by. It groweth in the fields adioyning to the fold or pin-fold without the gate, at a village called High-gate, neere London: and likewiſe in the wood belonging to a Worſhipfull gentleman of Kent named Mr *Sidley*, of Southfleet: where doe grow likewiſe many other rare and dainty ſimples, that are not to be found elſewhere in a great circuit.

¶ *The Time.*

They floure for the moſt part from May to the end of Auguſt, and ſome of them ſooner.

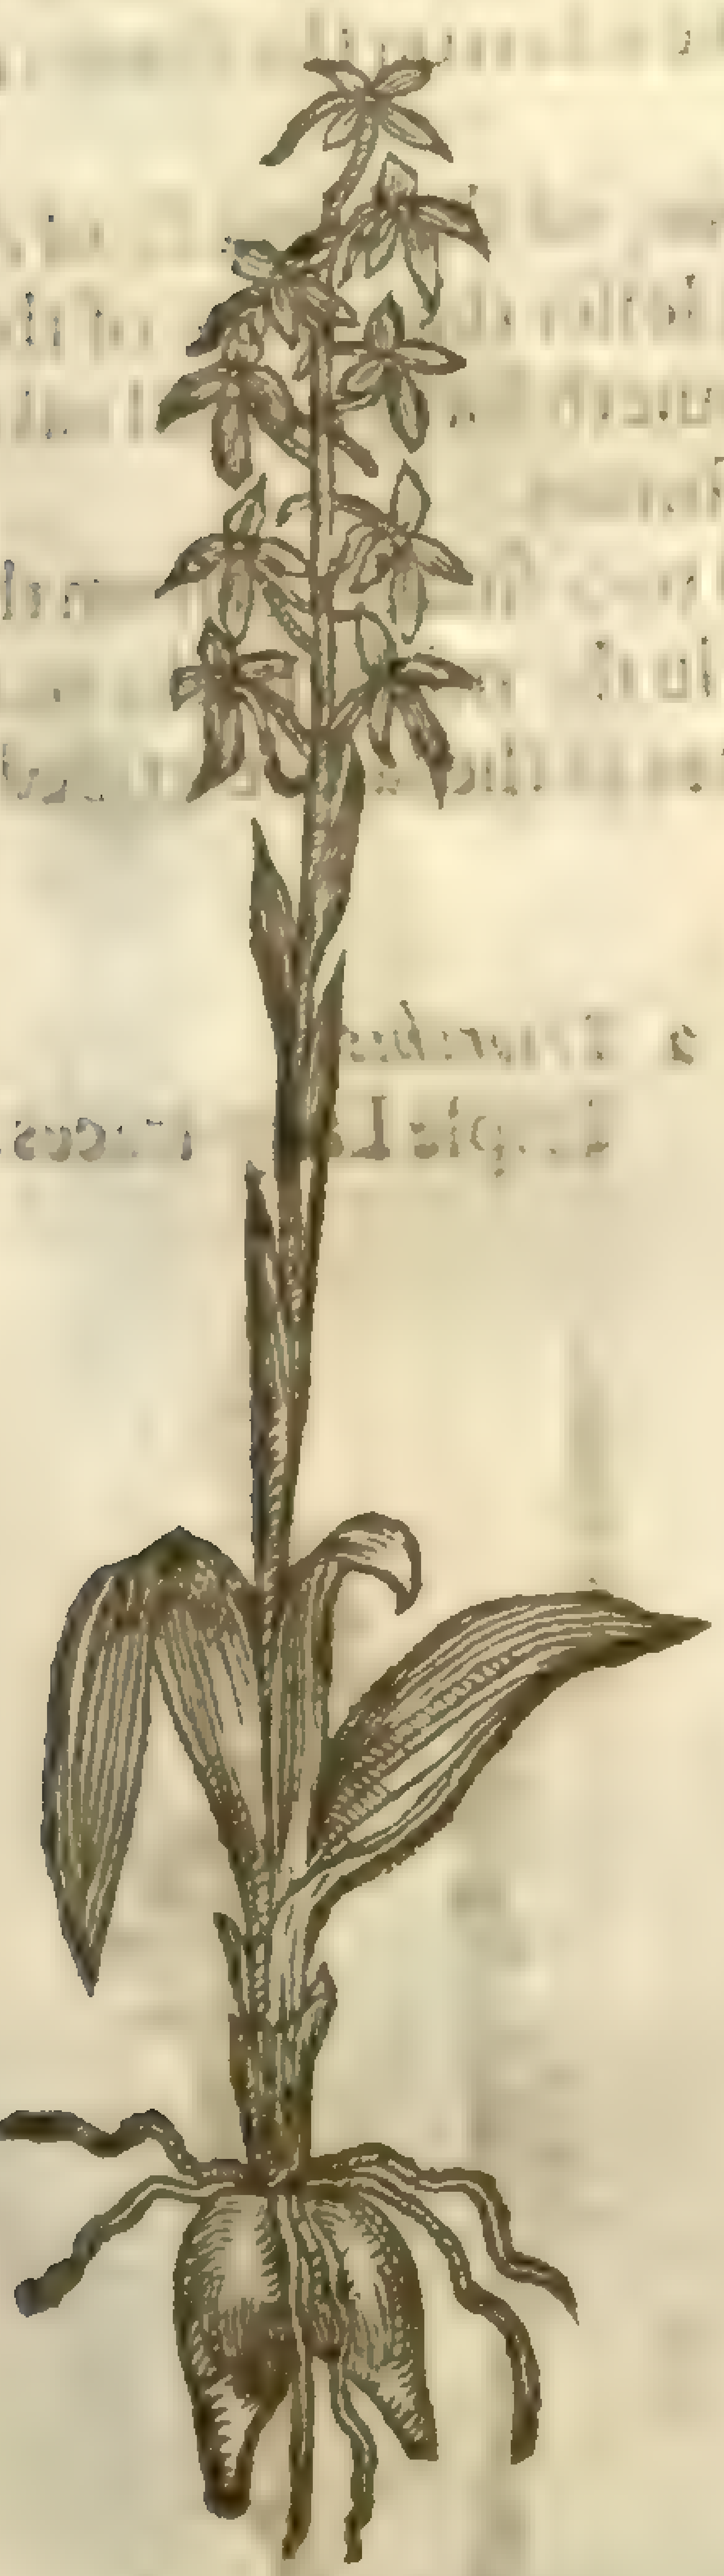
¶ *The Names.*

Theſe kindes of Orchis haue not bin much written of by the Antients, neither by the late writers to any purpoſe; ſo that it may content you for this time to receiue the names ſet down in their

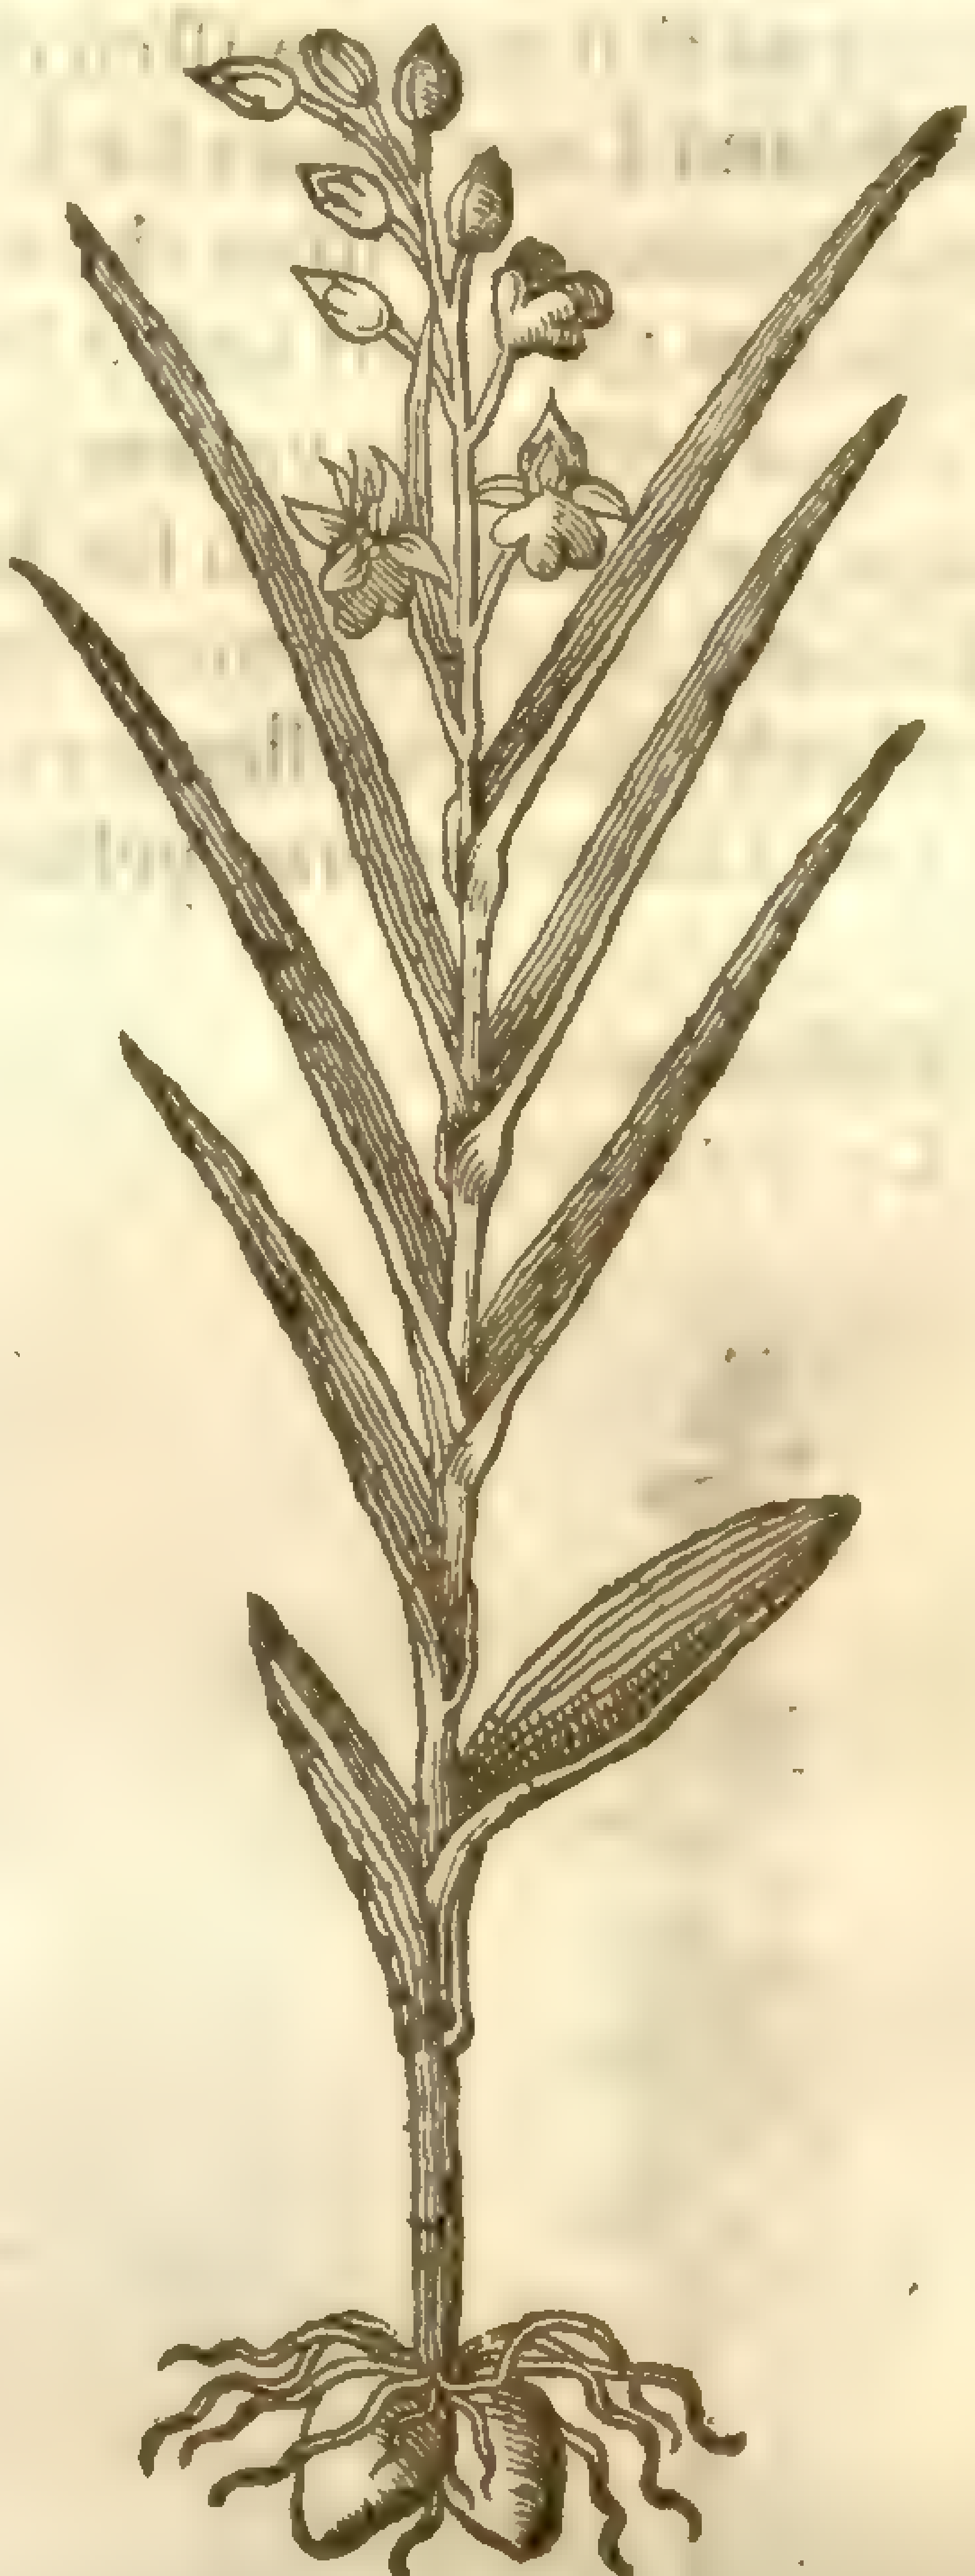
ſeueral

ſeuerall titles,reſeruing what elſe might be ſaid as touching the Greeke, French, or Dutch names, or any generall definition,vntill a further conſideration.

‡ 15 *Orchis trifolia minor.*
Small Gnat Satyrion.



‡ 16 *Orchis anguſtifolia.*
Narrow leaued Satyrion.



¶ *The Temperature and Vertues.*

The nature and vertues of theſe kinds of Orchis are referred vnto the others, namely to thoſe of the Fox ſtones; notwithſtanding there is no great vſe of theſe in phyſicke, but they are chiefly regarded for the pleaſant and beautifull floures wherewith Nature hath ſeemed to play and diſport her ſelfe.

† Theſe figures in this Chapter were formerly much diſplaced: as thus; The ſecond was of *Orchis Ornith. fol. macul.* being the tenth. The third was of *Trior-* minor of Tabernam. being a varietie of *Cynoſorchis morio fœmina.* The fift was of *Orchis Batrachitis.* The ſixt, of *Orchis Melittias.* The ſeuenth and eighth were only tranſpoſed, or put the one for the other. The ninth was of the ſecond, called formerly *Teſticulus ſphegodes.* The tenth was of the third, called *Teſticulus Vul-* pus. The eleuenth was of *Strateumatica.* The twelfth was of *Strateumatica minor.* The thirteenth was a varietie of the fourth. The fourteenth was of *Orchis Angu-* ſtifolia, which we here giue you in the ſixteenth place.

Chap. 114. *Of ſweet Cullions.*

¶ *The Kindes.*

There be ſundry ſorts of ſweet ſmelling Teſticles or Stones, whereof the firſt is moſt ſweet and pleaſant in ſmell, the others of leſſe ſmell or ſauour, differing in floure and roots. Some haue white floures, others yellow; ſome fleſh-colored, ſome daſht vpon white with a little reddiſh waſh: ſome haue two ſtones, others three, and ſome foure, wherein their difference conſiſteth.

¶ *The Deſcription.*

1 The firſt kinde of ſweet Stones is a ſmall baſe and low plant in reſpect of all the reſt: The leaues be ſmall, narrow, and ſhort, growing flat vpon the ground; amongſt the which riſeth vp a ſmall weake and tender ſtalke of a finger long, whereupon doe grow

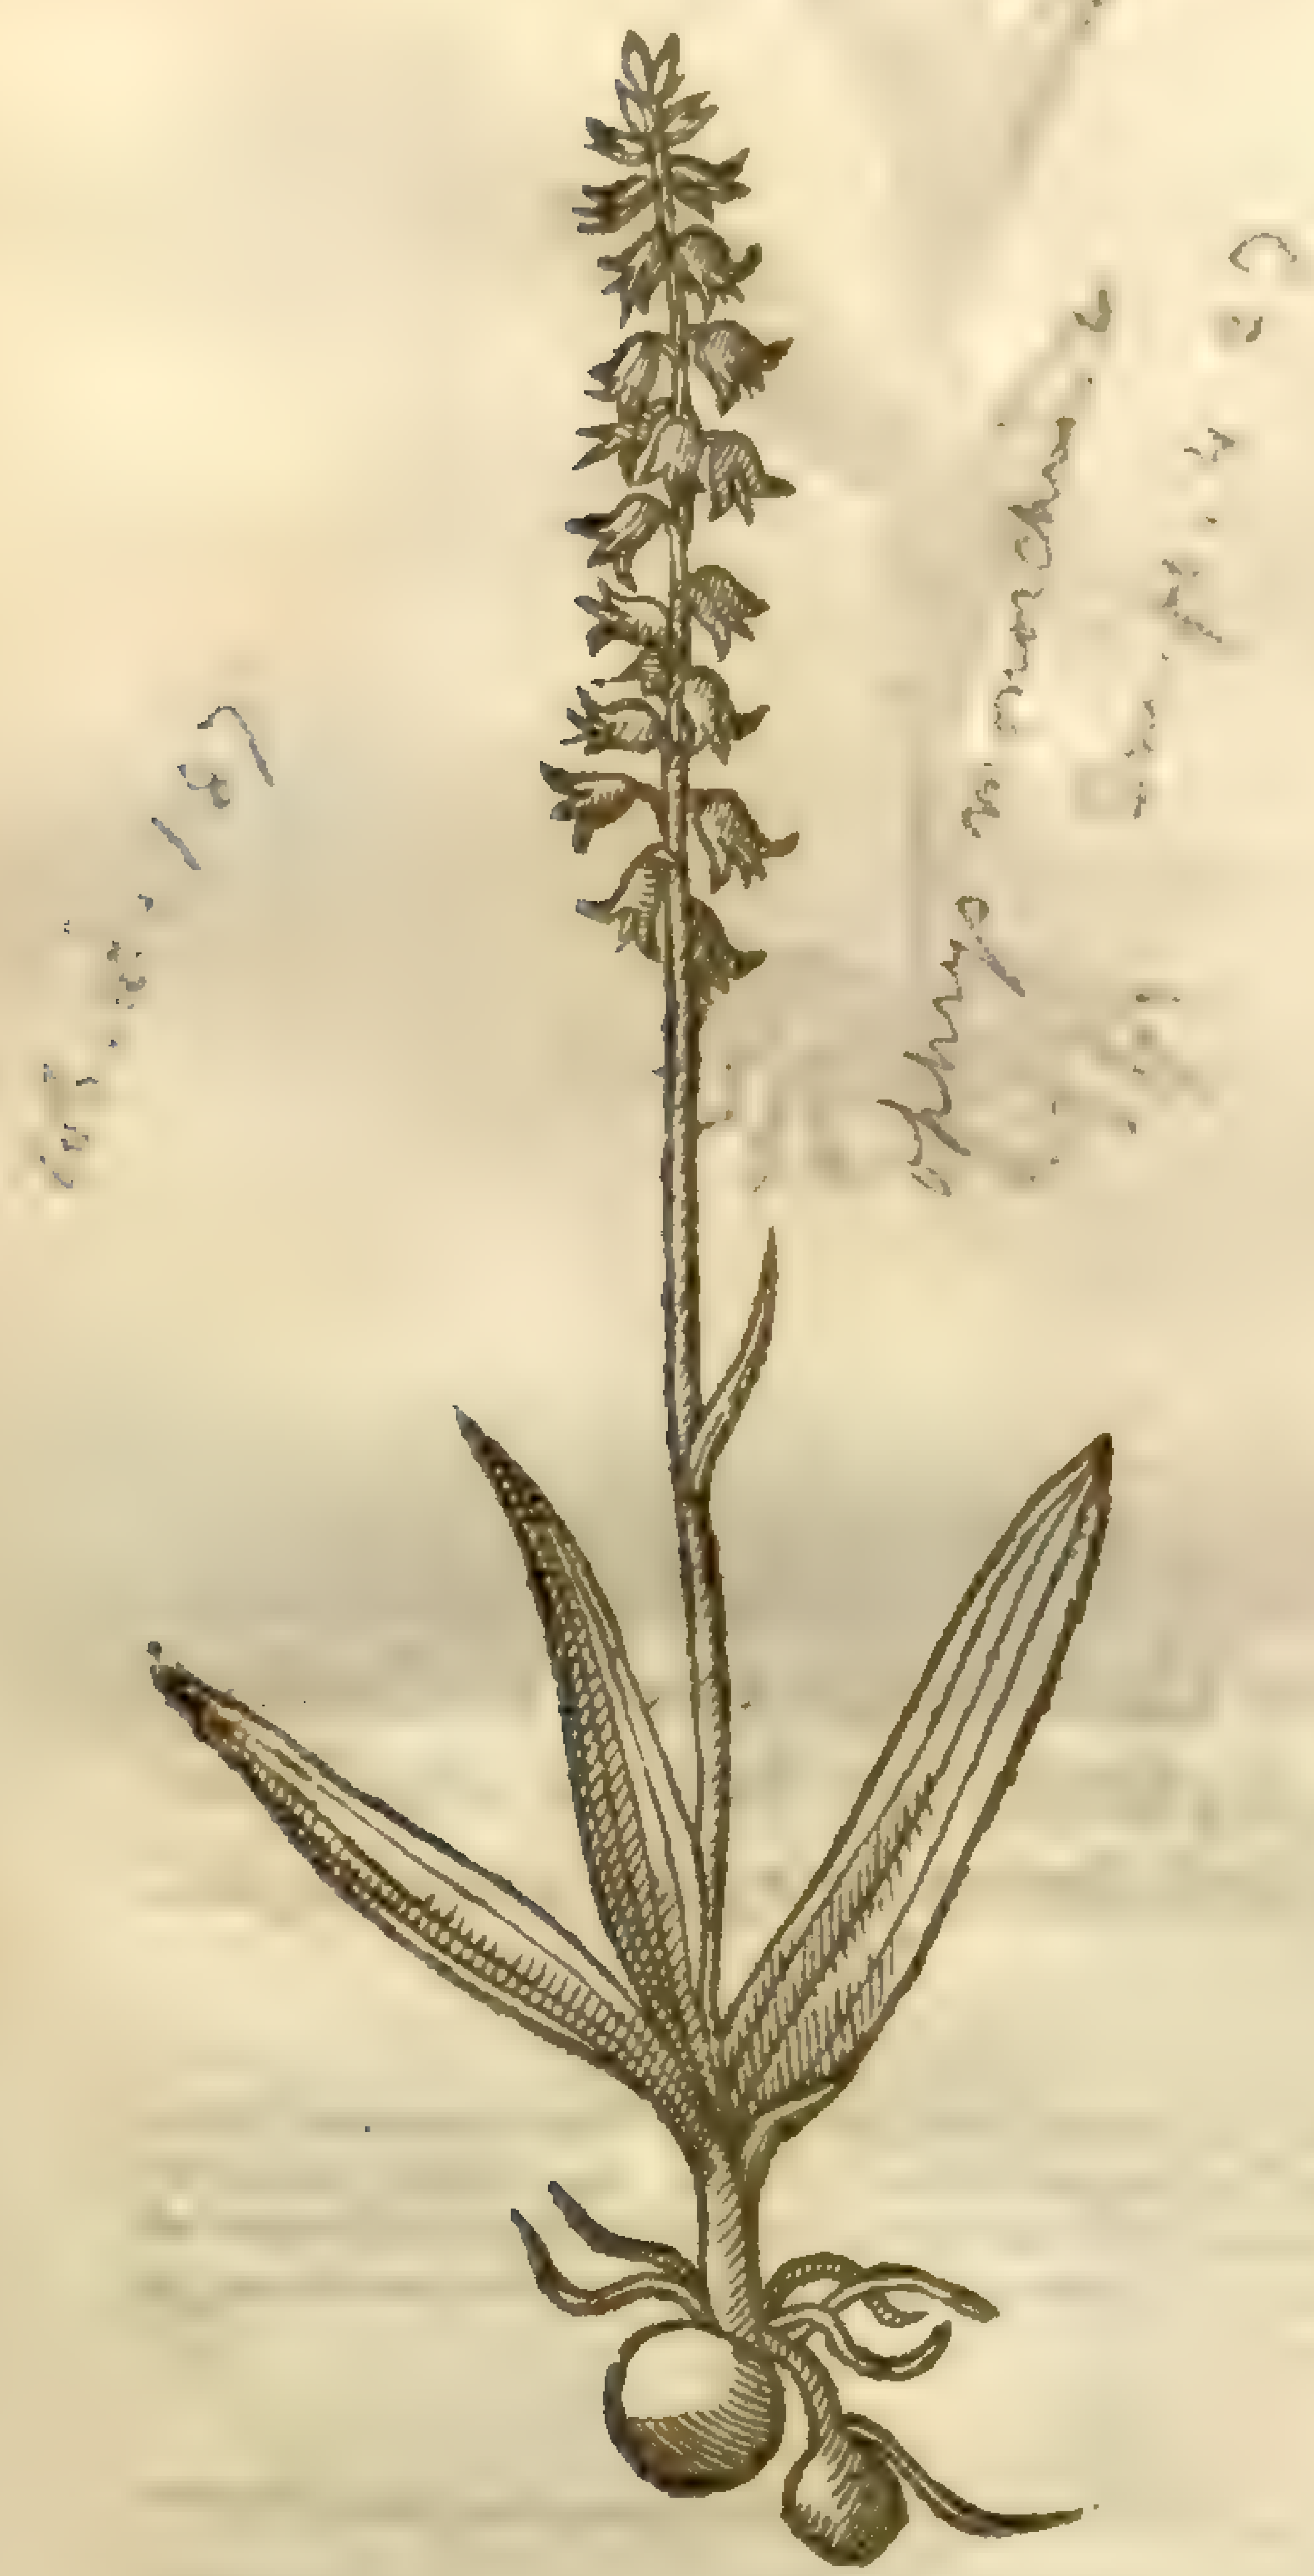
ſmall white floures ſpike-faſhion,of a pleaſant ſweet ſmel. The roots are two ſmal ſtones in ſhape like the other.

2 Triple Orchis hath commonly three,yet ſomtimes foure bulbs or tuberous roots, ſomwhat long, ſet with many ſmall fibres or ſhort threds; from the which roots riſe immediatly many flat and plain leaues,ribbed with nerues alongſt them like thoſe of Plantain: among the which come forth naked ſtalks ſmall and tender,wherupon are placed certain ſmal white floures,trace-faſhion, not ſo ſweet as the former in ſmel and ſauor. ‡ The top of the ſtalke whereon the floures do grow, is commonly as if it were twiſted or writhen about. ‡

3 Frieſeland Lady traces hath two ſmall round ſtones or bulbes, of the bigneſſe of the peaſe that we call Rouncifals; from the which riſe vp a few hairy leaues leſſer than thoſe of the Triple Stones,ribbed as the ſmall leafed Plantain: among the which commeth forth a ſmall naked ſtalke ſet round about with little yellow floures,not trace-faſhion as the former.

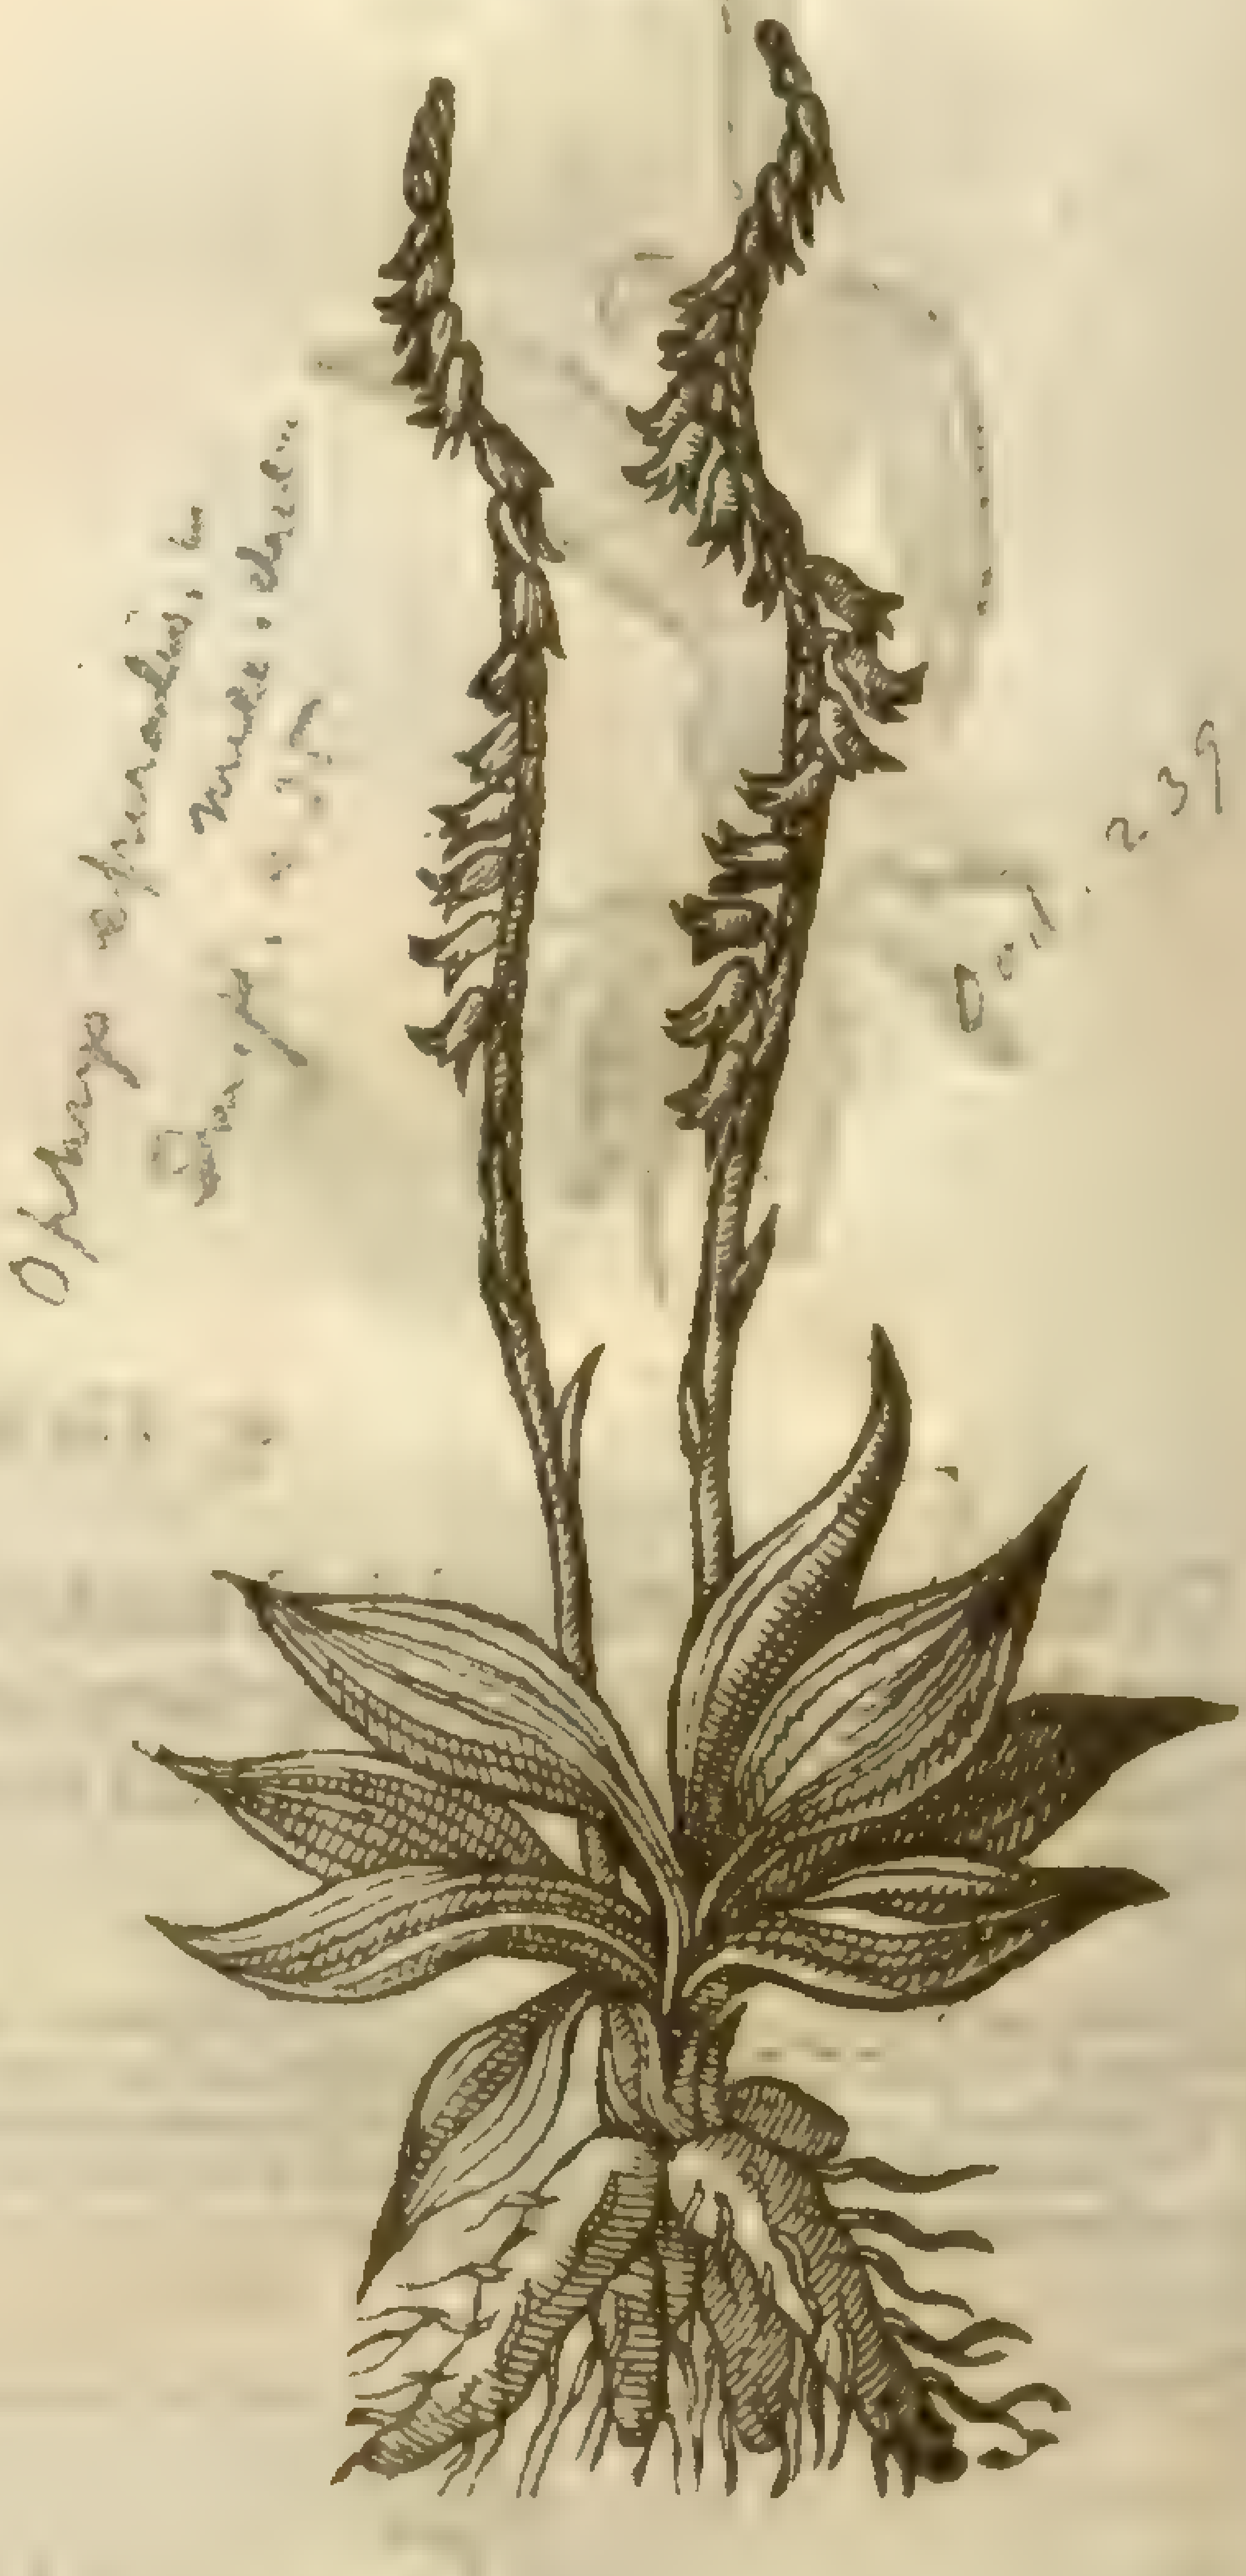
4 Liege Lady traces hath for his roots two greater ſtones, and two ſmaller; from the which come vp two and ſomtimes more leaues,furrowed or made hollow in the middeſt like to a trough, from the which riſeth vp a ſlender naked ſtalke, ſet with ſuch floures as the laſt deſcribed, ſauing that they be of an ouerworne yellow colour.

1 *Teſticulus odoratus.*
Lady-traces.



Ophrys monorchis

2 *Triorchis.*
Triple Lady-traces.



Ophrys spiralis

Oct. 2. 39

¶ *The Place.*

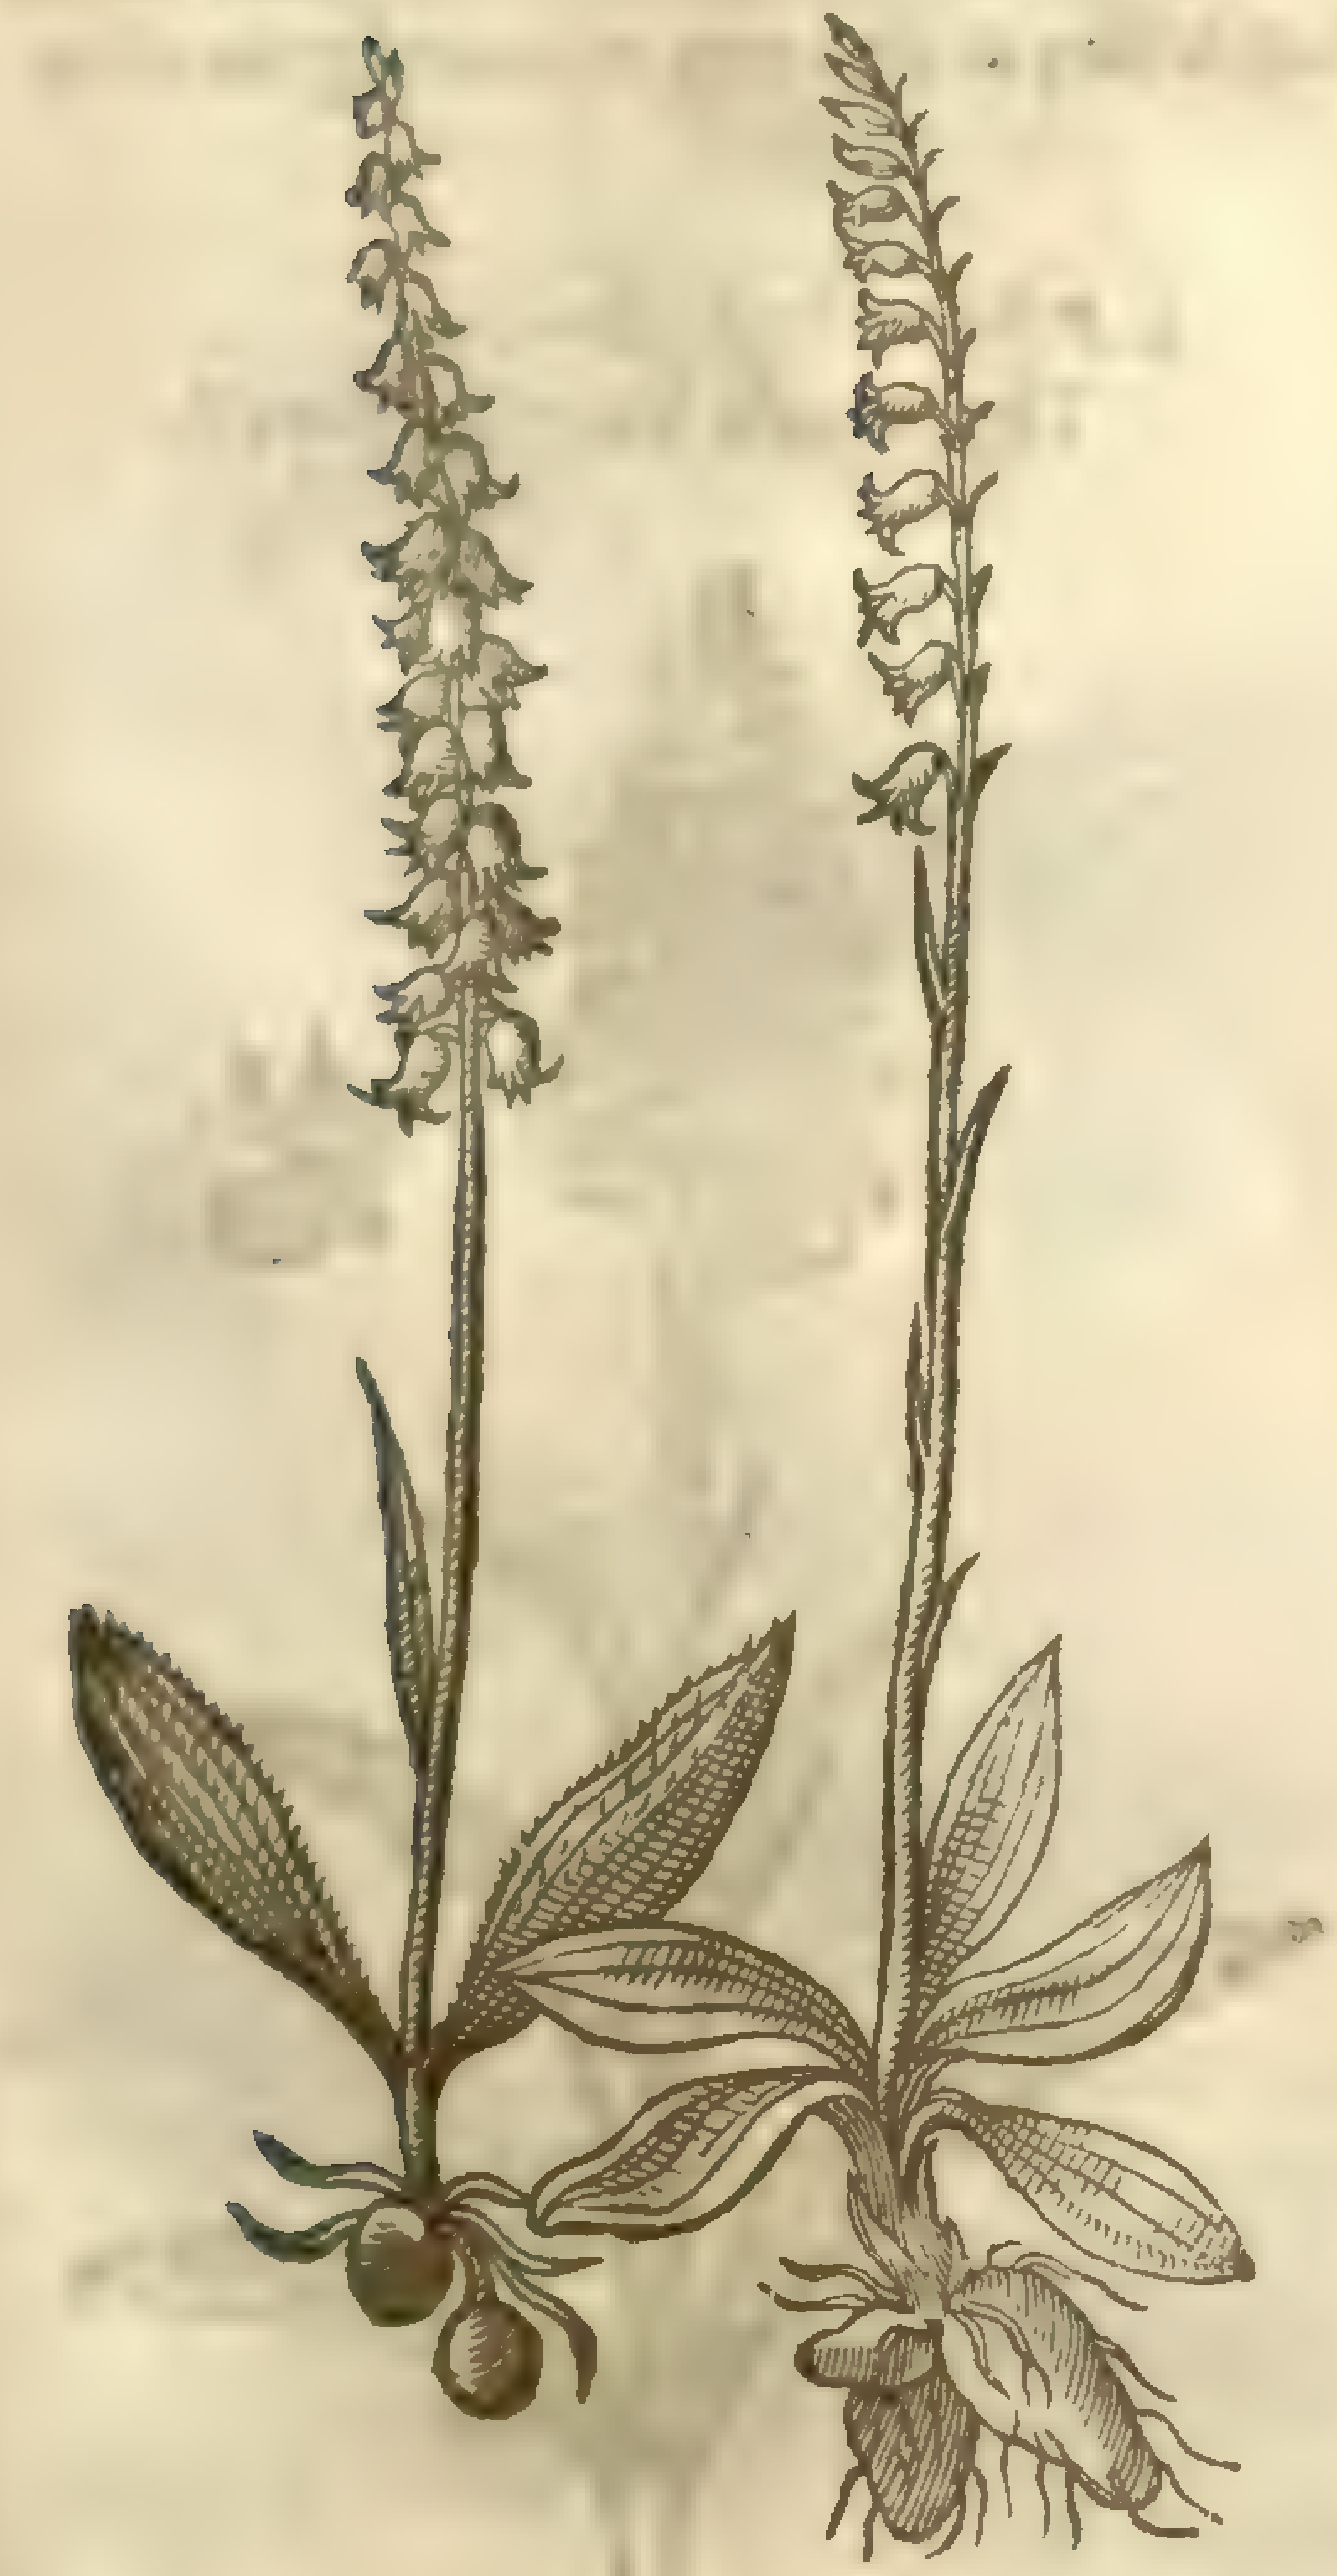
Theſe kinds of Stones or Cullions do grow in dry paſtures or heaths,and likewiſe vpon chalky hils,the which I haue found growing plentifully in ſundry places,as in the field by Iſlington neere London,where there is a bowling place vnder a few old ſhrubby Okes. They grow likewiſe vpon the heath at Barn-elmes,neere vnto the head of a conduit that ſendeth water to the houſe belonging to the late Sr *Francis Walſingham*. They grow in the field next vnto a village called Thiſtleworth,as you go from Branford to her Maieſties houſe at Richmond; alſo vpon a common heath by a village neere London called Stepney,by the relation of a learned merchant of London named Mr *Iames Cole*,exceedingly well experienced in the knowledge of Simples.

The yellow kindes grow in barren paſtures and borders of fields about Ouenden and Clare in

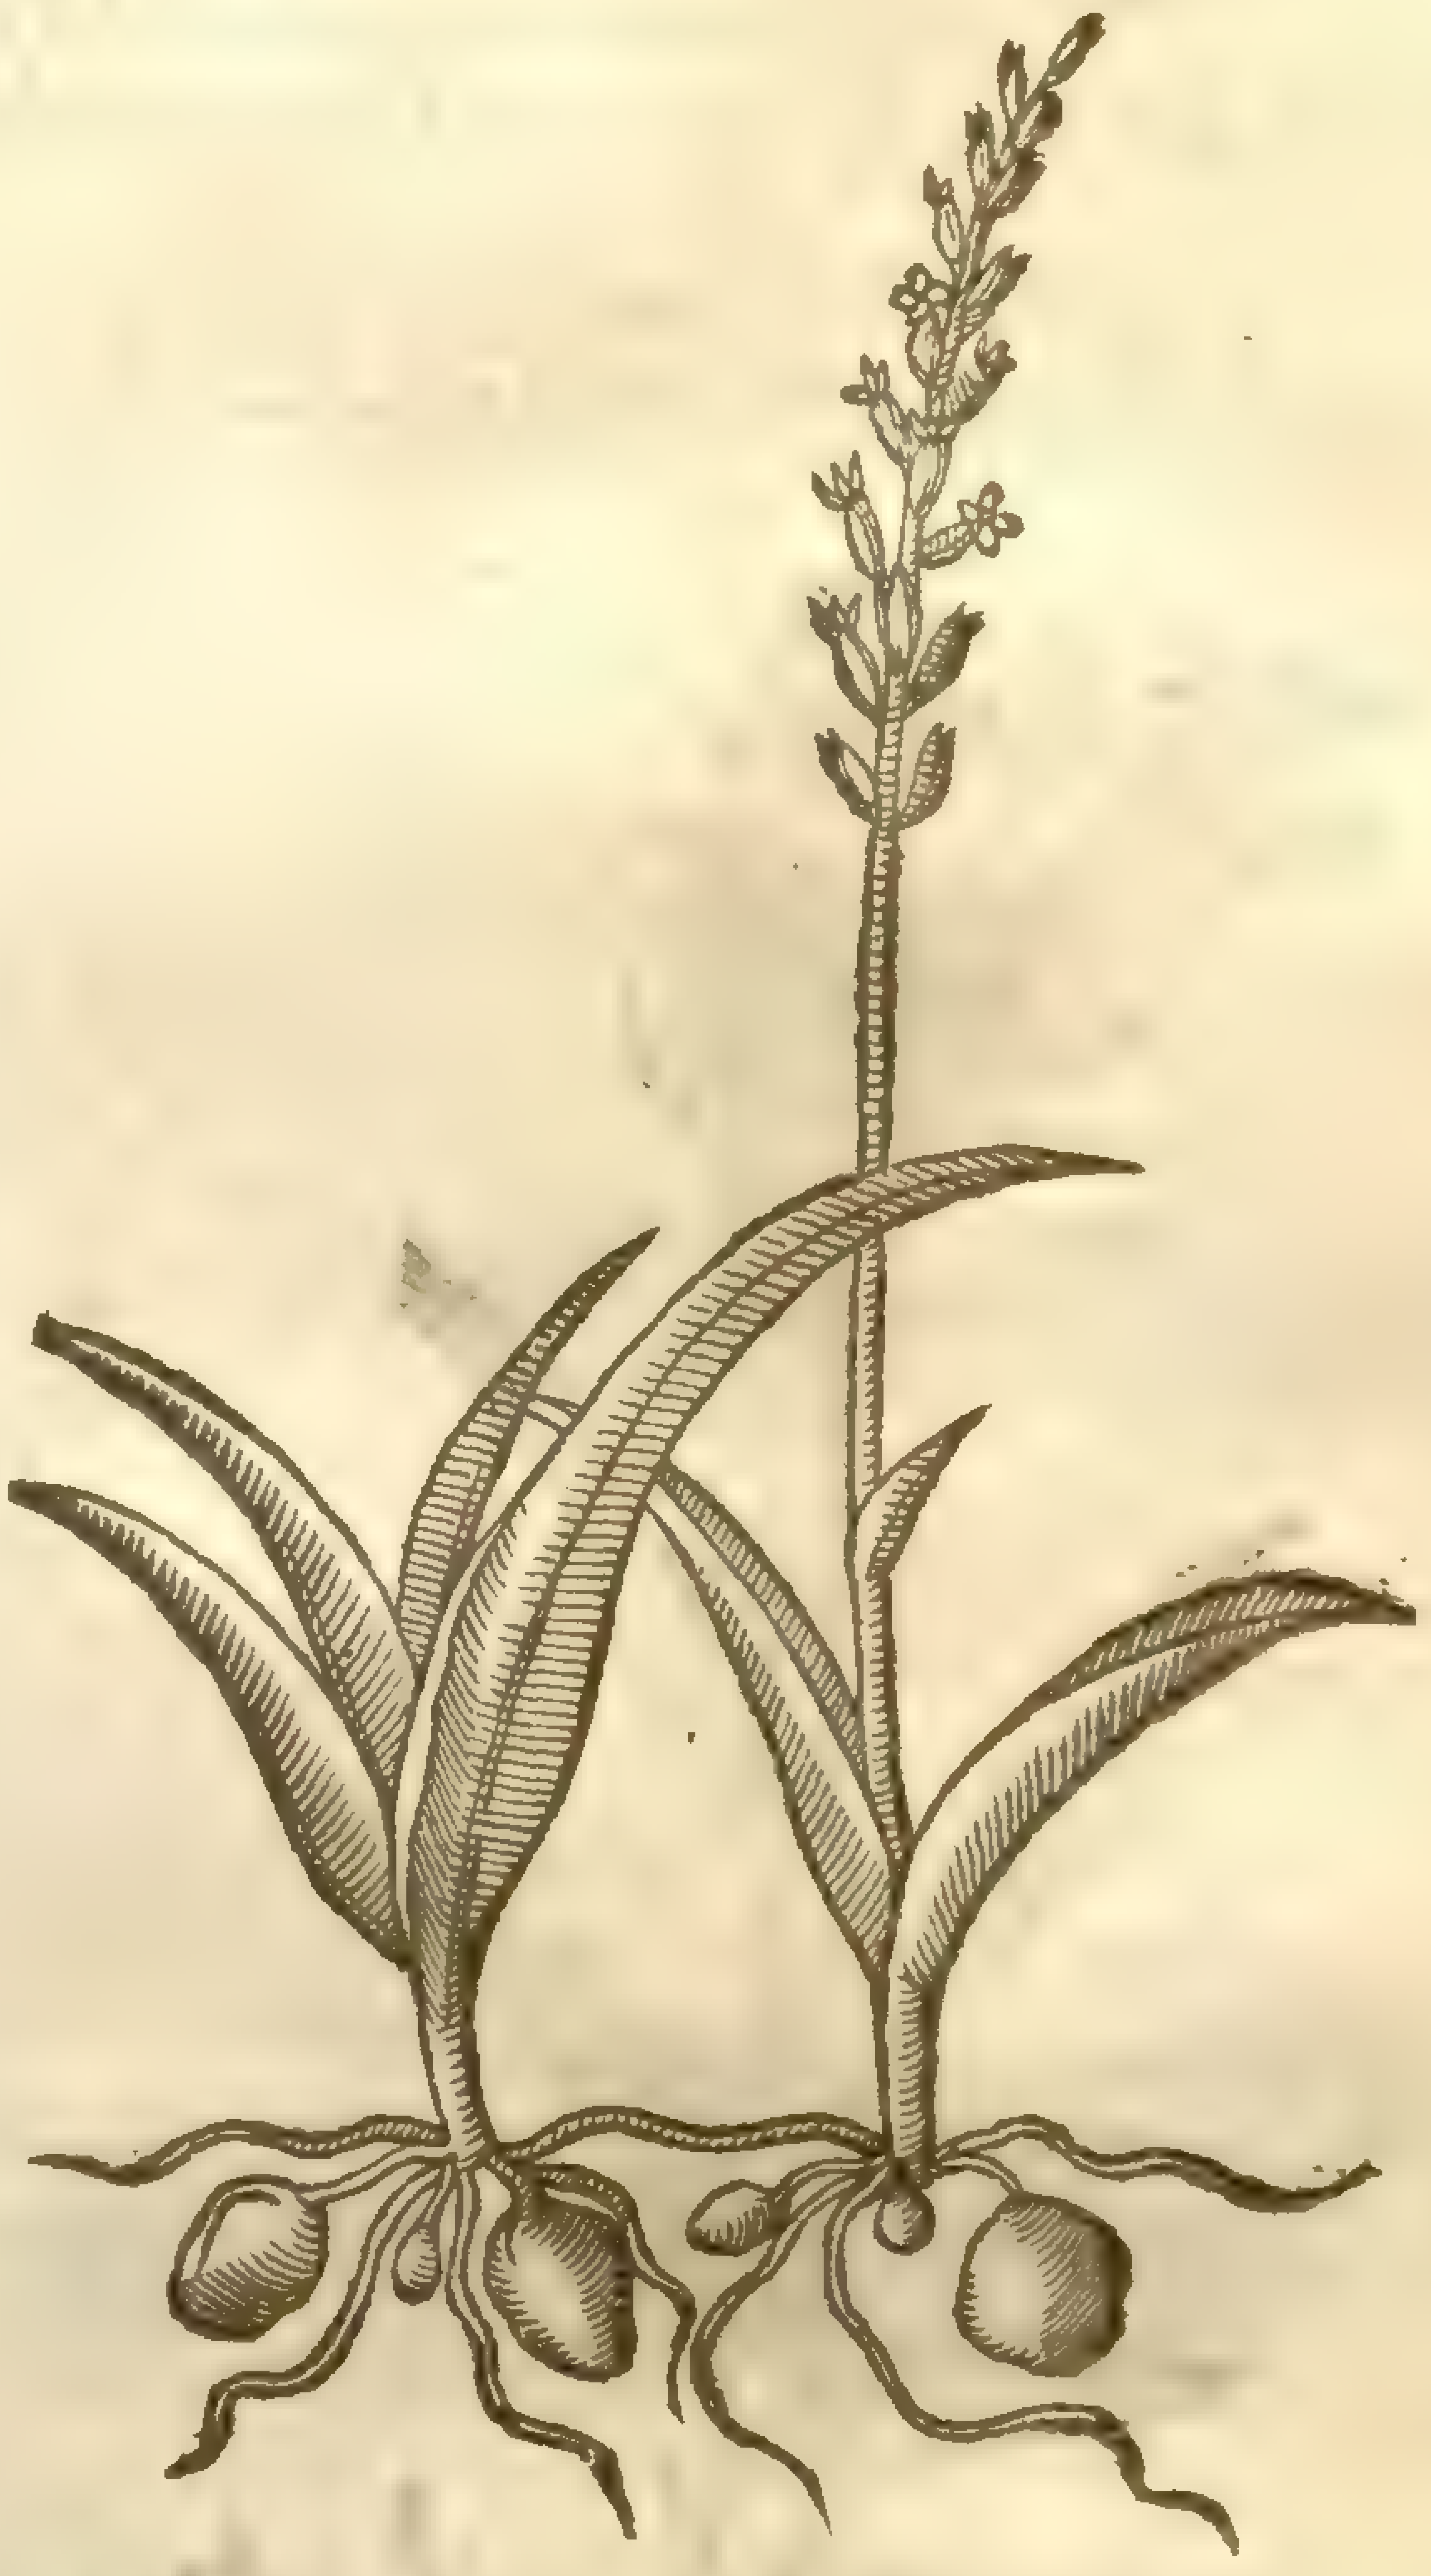
Eſſex. Likewiſe neer vnto Muche Dunmow in Eſſex, where they were ſhewed me by a learned gentleman Mr *Iames Twaights*, excellently well ſeen in the knowledge of plants.

‡ I receiued ſome roots of the ſecond from my kind friend Mr *Thomas Wallis* of Weſtminſter, the which he gathered at Dartford in Kent, vpon a piece of ground commonly called the Brimth: but I could not long get them to grow in a garden, neither do any of the other Satyrions loue to be pent vp in ſuch ſtraight bounds. ‡

3 *Orchis Friſia lutea.*
Frieſeland Lady-traces.



4 *Orchis Leodienſis.*
Liege Lady-traces.



¶ *The Time.*

Theſe kinds of ſtones do floure from Auguſt to the end of September.

¶ *The Names.*

The firſt is called in Latine *Teſticulus odoratus*: in Engliſh, ſweet-ſmelling Teſticles or ſtones; not of the ſweetneſſe of the roots, but of the floures. It is called alſo *Orchis ſpiralis*, or *Autumnalis*, for that this, as alſo that which is ſet forth in the next place, hath the top of the ſtalk as it were twiſted or twined ſpire faſhion, and for that it comes to flouring in Autumne: of our Engliſh women they be called Lady-traces: but euery countrey hath a ſeuerall name; for ſome call them Sweet-Ballocks, ſweet Cods, ſweet Cullions, and Stander graſſe: in Dutch, **Knabencraut**, and **Stondelcraut**: in French, *Satyrion*.

The ſecond ſort is called *Triorchis*, and alſo *Tetrorchis*: in Engliſh, Triple Lady-traces, or white Orchis.

The third is called *Orchis Friſia*: in Engliſh, Friſeland Traces.

The laſt of theſe kindes of Teſticles or Stones is called of ſome in Latine, *Orchis Leodienſis*, and *Orchis lutea*, as alſo *Baſilica minor Scrapias*, and *Triorchis Æginetæ*: in Engliſh, yellow Lady-traces.

¶ *The Temperature.*

Theſe kinds of ſweet Cullions are of nature and temperature like the Dogs ſtones, although not vſed in phyſick in times paſt: notwithſtanding late writers haue attributed ſome vertues vnto them as followeth.

¶ *The Vertues.*

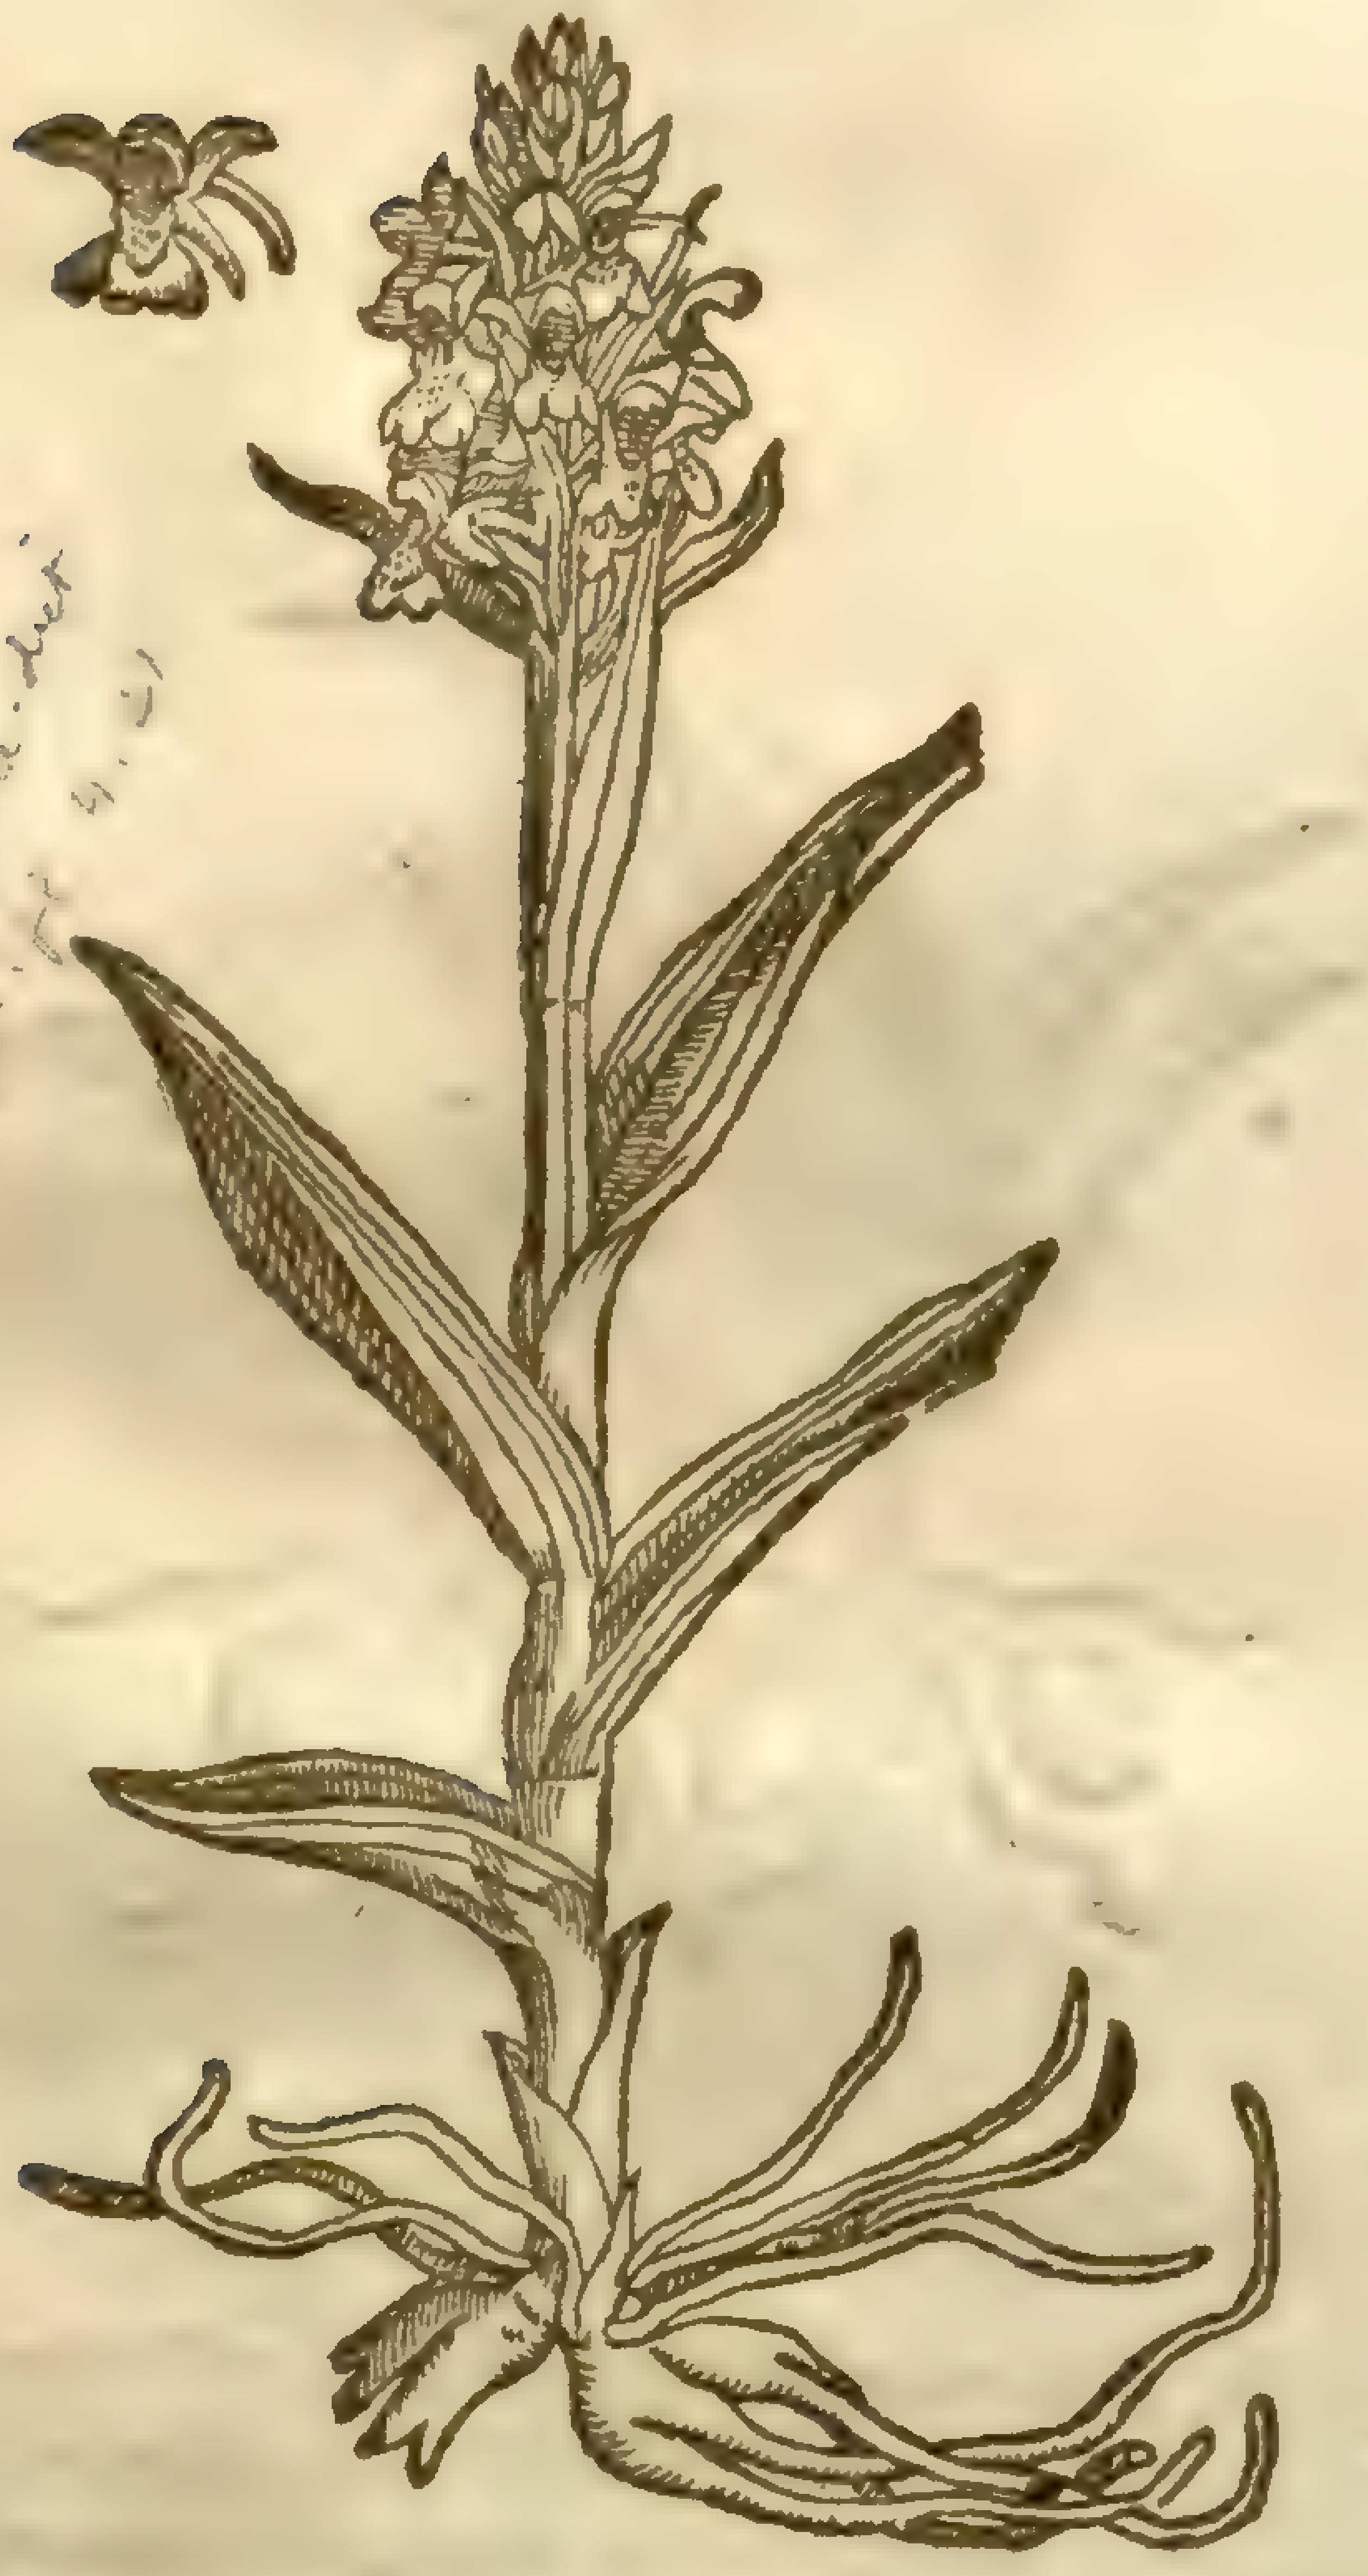
A The full and ſappy roots of Lady-traces eaten or boiled in milke, and drunke, prouoke venerie, nouriſh and ſtrengthen the body, and be good for ſuch as be fallen into a Conſumption or Feauer Hectique.

CHAP. 115. *Of Satyrion Royall.*

¶ *The Deſcription.*

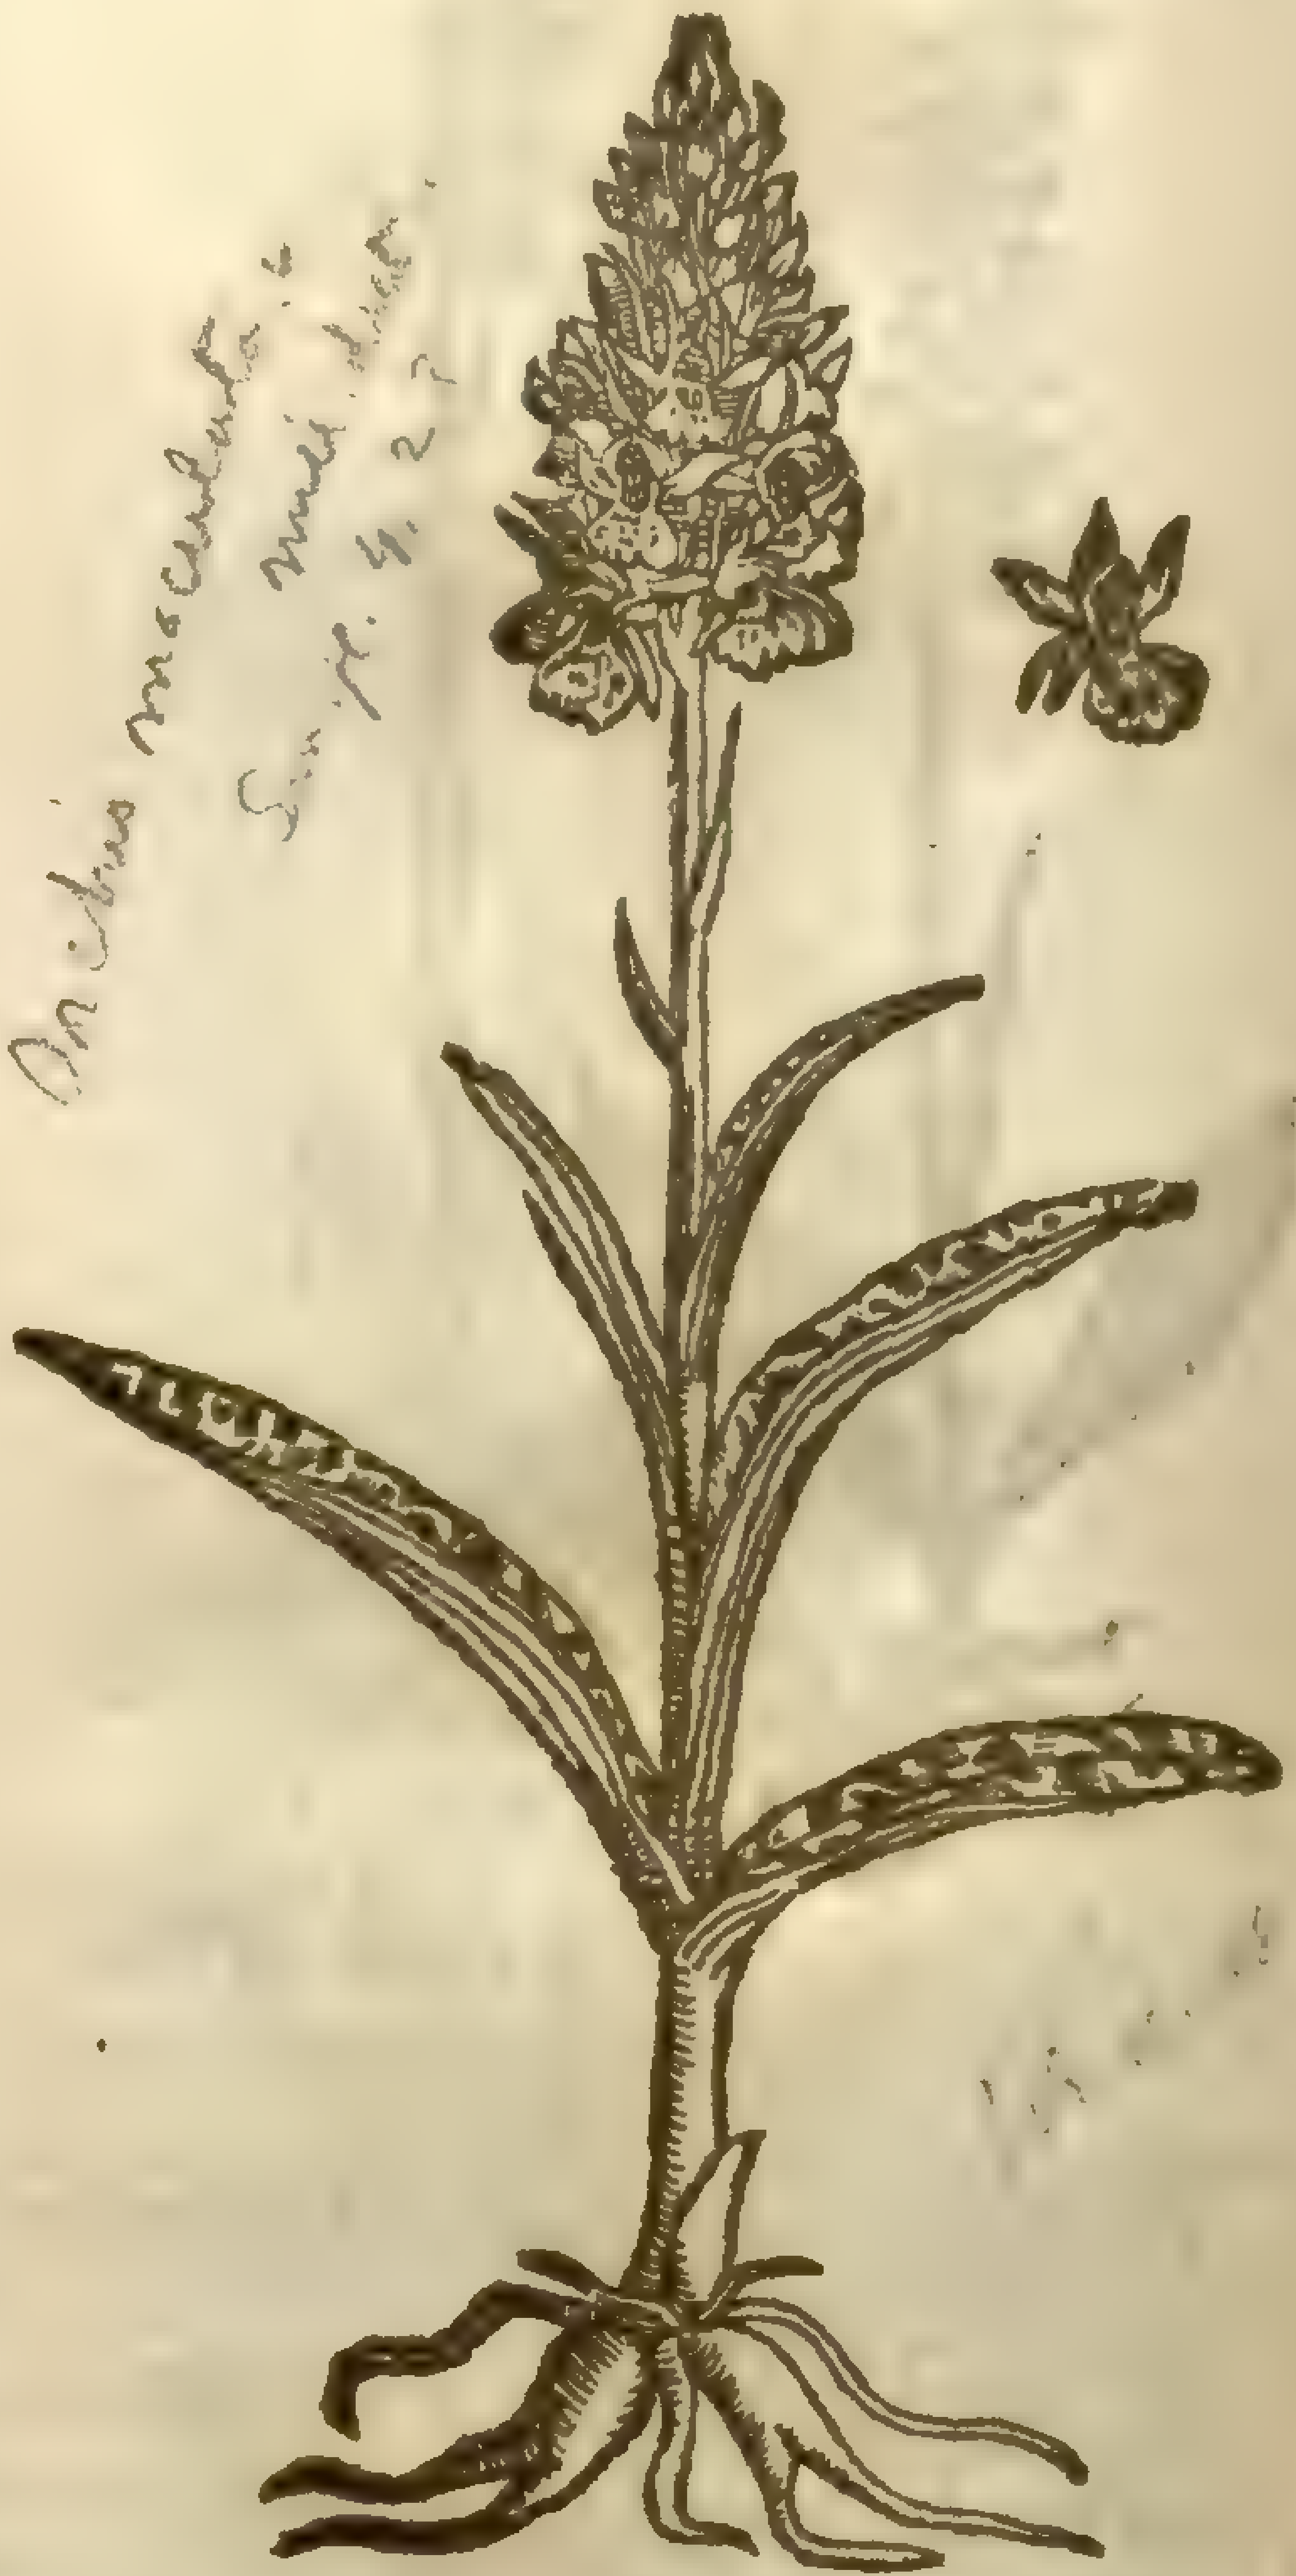
1 THe male Satyrion Royal hath large roots,knobbed,not bulbed as the others,but branched or cut into ſundry ſections like an hand, from the which come vp thicke and fat ſtalks ſet with large leaues like thoſe of Lillies,but leſſe ; at the top whereof groweth a tuft of floures ſpotted with a deep purple colour.

1 *Palma Chriſti mas.*
The male Satyrion royall.



Orchis latifolia
mult. dict.
Sm. fl. 4. 21

2 *Palma Chriſti fœmina.*
The female Satyrion royall.



Orchis maculata
mult. dict.
Sm. fl. 4. 27

2 The female Satyrion hath clouen or forked roots, with ſome fibres ioyned thereto. The leaues be like the former,but ſmaller and narrower, and confuſedly daſhed or ſpotted with blacke ſpots : from which ſpringeth vp a tender ſtalke,at the top whereof groweth a tuft of purple floures in faſhion like vnto a friers hood,changing and varying according to the ſoile and clymat, ſometimes red,ſometimes white,and ſometimes light carnation or fleſh colour.

3 This in roots & leaues is like the former,but that the leaues want the black ſpots, the ſtalk is but low,and the top thereof hath floures of a whitiſh colour, not ſpotted : they on the foreſide reſemble gaping hoods,with ears on each ſide,and a broad lip hanging down; the backe part ends in a broad obtuſe ſpur. Theſe floures ſmell like Elder bloſſoms.

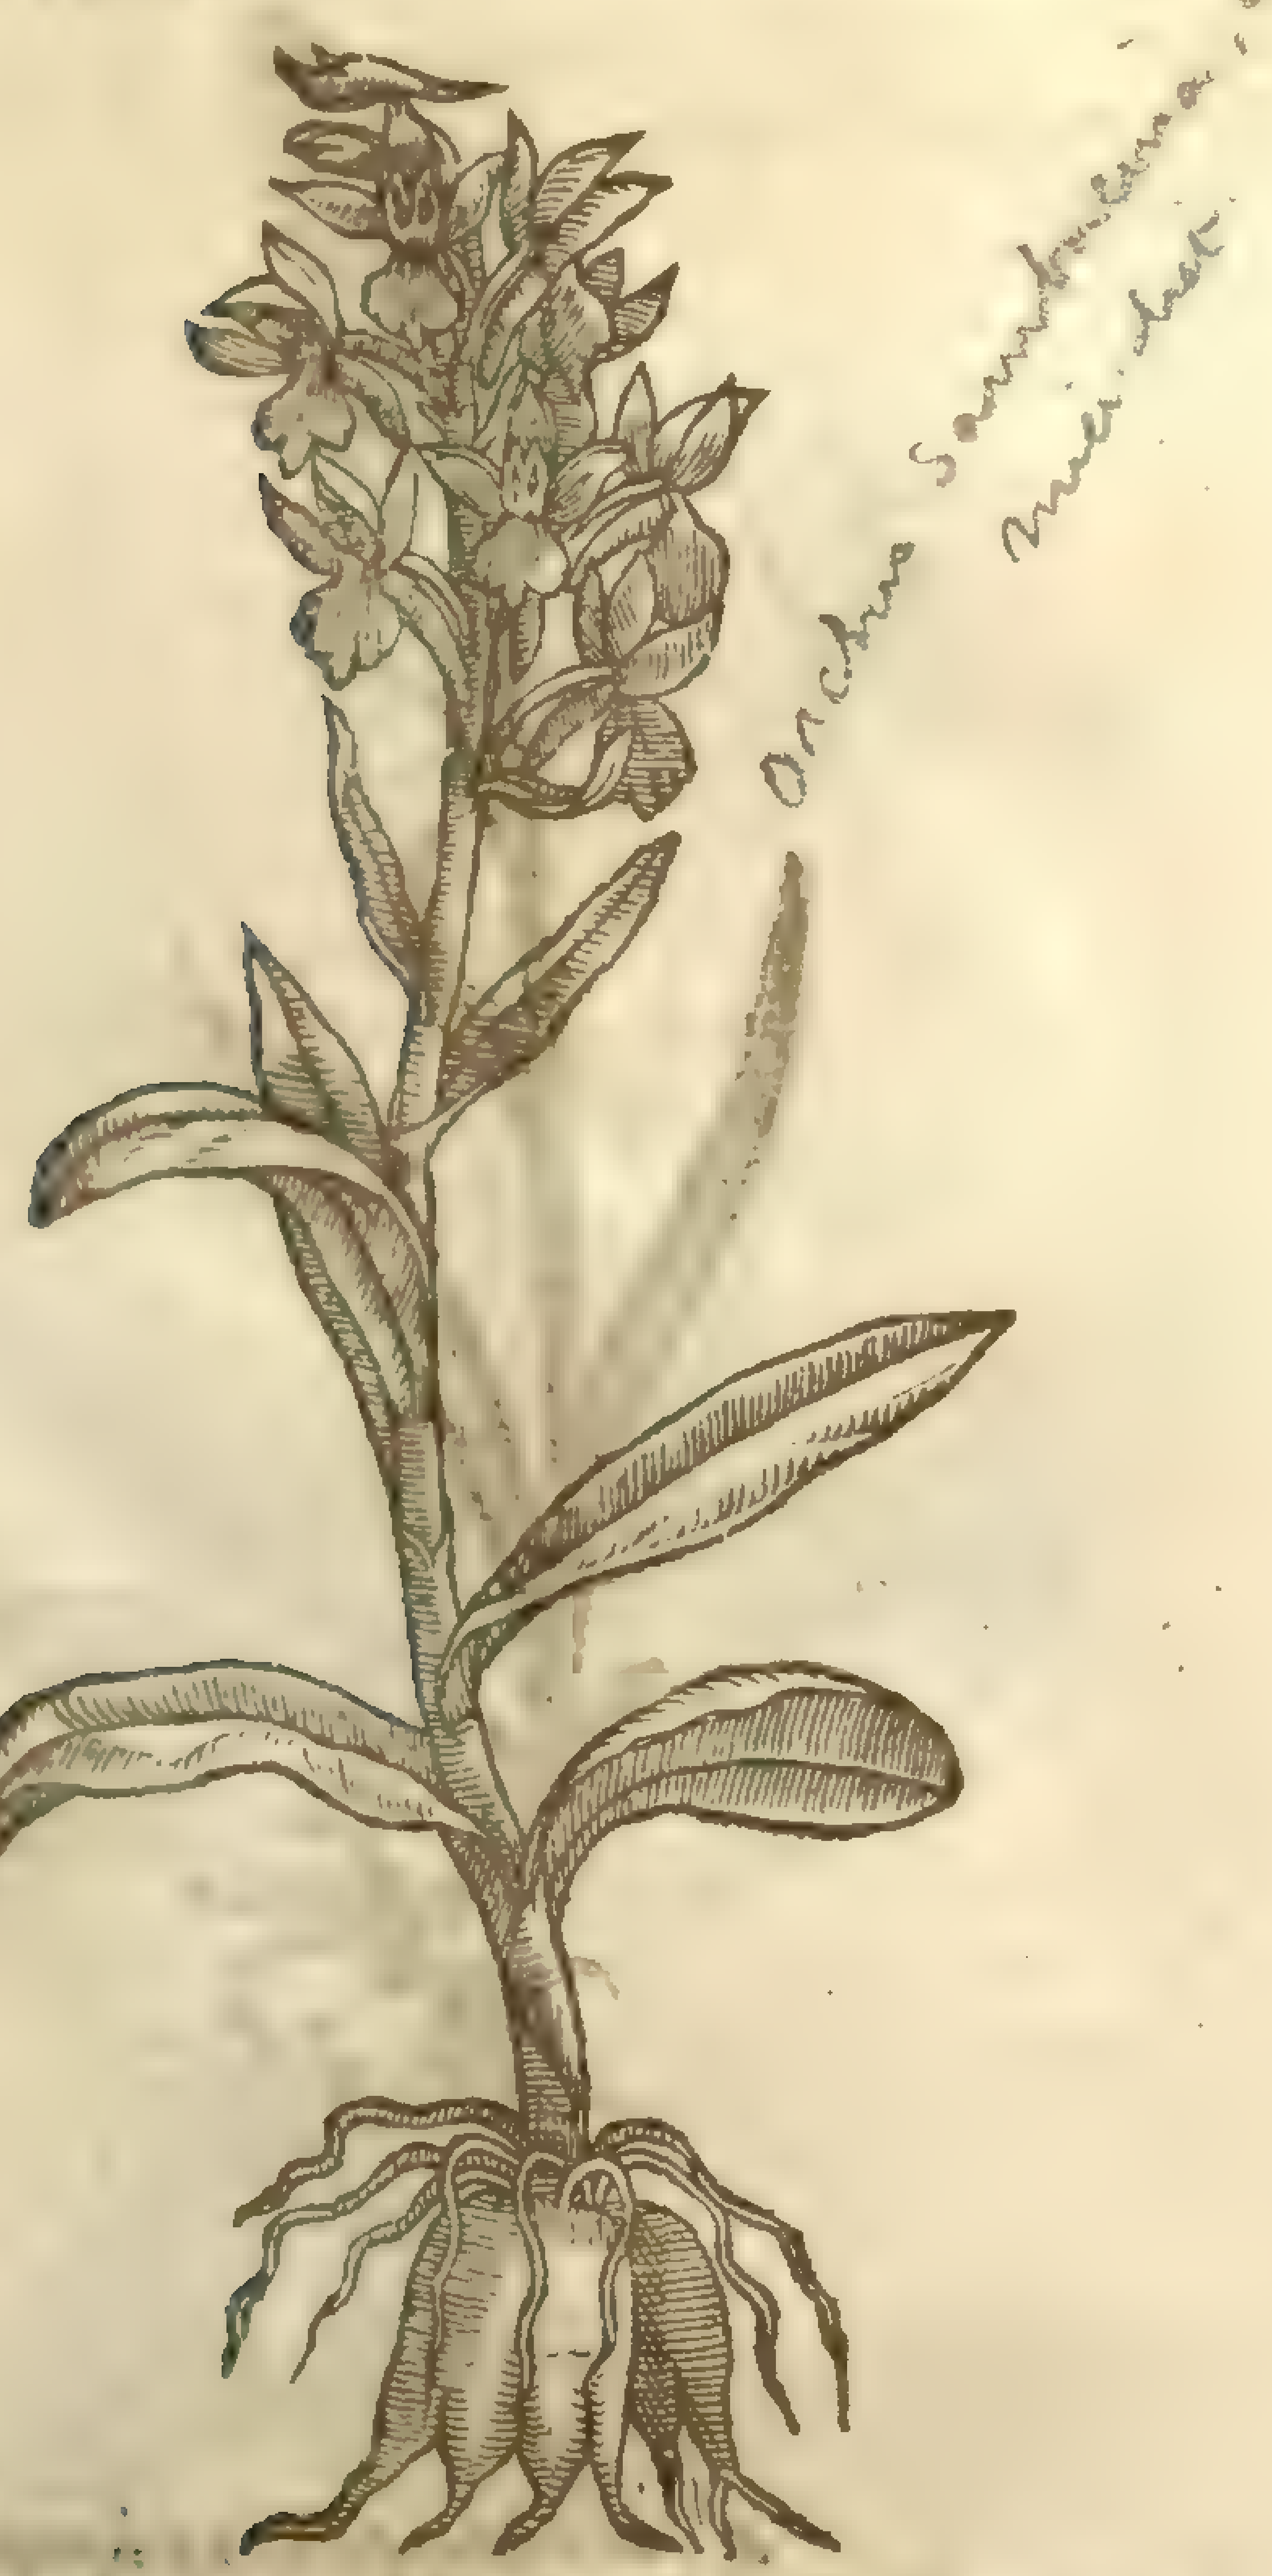
¶ *The Place.*

The Royal Satyrions grow for the moſt part in moiſt and fenny grounds,medowes,and Woods that are very moiſt and ſhadowie. I haue found them in many places, eſpecially in the midſt of a wood in Kent called Swaineſcombe wood neere to Grauefend, by the village Swaineſcombe, and likewiſe in Hampſted wood foure miles from London.

¶ *The Time.*

They floure in May and Iune,but ſeldome later.

‡ 3 *Orchis Palmata Pannonica* 8. *Cluſ.*
The Auſtrian handed Satyrion.



Orchis Sambucina
mihi dubit

¶ *The Names.*

† Royal Satyrion or finger Orchis is called in Latine *Palma Chriſti*; notwithſtanding there is another hearbe or plant called by the ſame name, which otherwiſe is called *Ricinus*. This plant is called likewiſe of ſome, *Satyrium Baſilicum*, or *Satyrium regium*. Some would haue it to be *Buzeiden*, or *Buzidan Arabum*. But *Avicen* ſaith, *Buzeiden* is a woody Indian medicin: and *Serapio* ſaith, *Buzeiden* be hard white roots like thoſe of *Behen album*, and that it is an Indian drug: but contrariwiſe the roots of *Palma Chriſti* are nothing leſſe than woody, ſo that it cannot be the ſame. *Matthiolus* would haue Satyrion royal to be the *Digiti Citrini* of *Auicen*; finding fault with the Monkes which ſet forth Commentaries vpon *Meſues* Compoſitions, for doubting, and leauing it to the iudgement of the diſcreet Reader. Yet do we better allow of the Monks doubt, than of *Matthiolus* his aſſertion: for *Avicens* words be theſe; What is *Aſabaſafra*, or *Digiti Citrini*? and anſwering the doubt himſelfe, he ſaith, It is in floure or ſhape like the palm of a mans hand, of a mixt colour between yellow and white, and it is hard, in which there is a little ſweetneſſe, and there is a Citrine ſort duſty & without ſweetneſſe. *Rhaſis* alſo in the laſt booke of his Continent calls theſe, *Digiti Crocei*, or Saffron fingers; and hee ſaith it is a gum or vein for Diers. Now theſe roots are nothing leſſe than of a Saffron colour, and wholly vnfit for dying. Wherefore doubtleſſe theſe words of *Avicen* and *Rhaſis* in the eares of men of iudgement do confirme, That Satyrion roiall, or *Palma Chriſti*, are not thoſe *Digiti Citrini*. The Germans call it **Creutzblum**: in low-Dutch, **Handekens cruyt**: the French, *Satyrion Royal*.

¶ *The Temperature and Vertues.*

The roots of Satyrion royall are like to *Cynoſorchis*, or Dogs ſtones, both in ſauor and taſte, and therefore are thought by ſome to be of like faculties. Yet *Nicolaus Nicolus*, in the Chapter of the cure of a quartan Ague, ſaith, That the roots of *Palma Chriſti* are of force to purge vpward & downward; and that a piece of the root as long as ones thumbe ſtamped and giuen with wine before the fit commeth, is a good remedie againſt old Quartans after purgation: and reporteth, That one *Babolus* after he had endured 44 fits, was cured therewith.

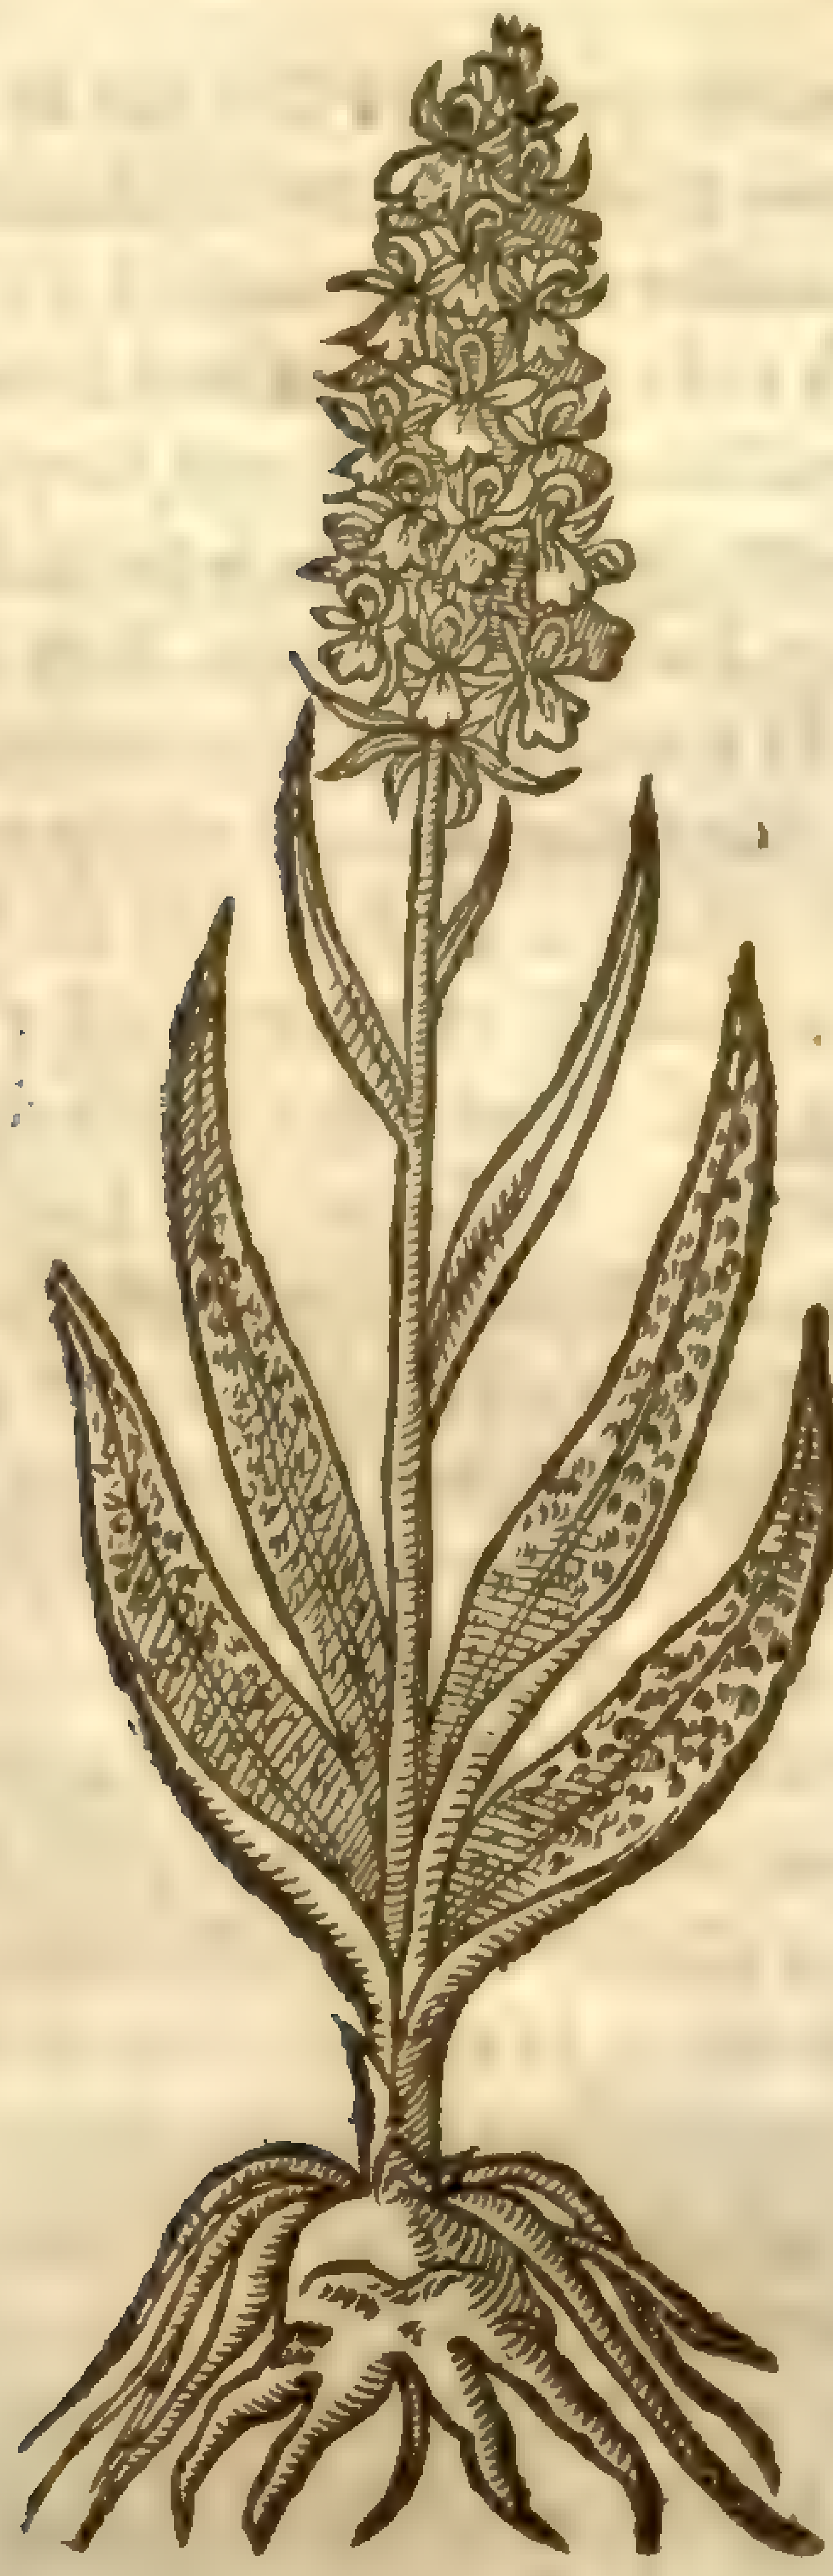
† This facultie of purging and vomiting, which our Author out of *Dodonæus*, and he out of *Nicolus*, giue to the root of *Palma Chriſti*, I doubt is miſtaken & put in the wrong place: for I iudge it to belong to the *Ricinus*, which alſo is called *Palma Chriſti*: for that *Nicolus* ſaith a piece of root muſt be taken as long as ones thumbe: now the whole root of this plant is not ſo long. And beſides, *Ricinus* is knowne to haue a vomitorie purging faculty.

Chap. 116. *Of Serapia's ſtones.*

¶ *The Kindes.*

There be ſundry ſorts of Serapia's ſtones, whereof ſome be male, others female; ſome great, and ſome of a ſmaller kind; varying likewiſe in colour of the floures, wherof ſome be white, others purple, altering according to the ſoile or clymat, as the greateſt part of bulbous roots do. Moreouer, ſome grow in marſhie and fenny grounds, and ſome in fertil paſtures lying open to the Sun; varying likewiſe in the ſhape of their floures; retaining the form of flies, butterflies, and gnats, like thoſe of the Fox-ſtones.

1 *Serapias candido flore.*
White handed Orchis.



2 *Serapias minor nitente flore.*

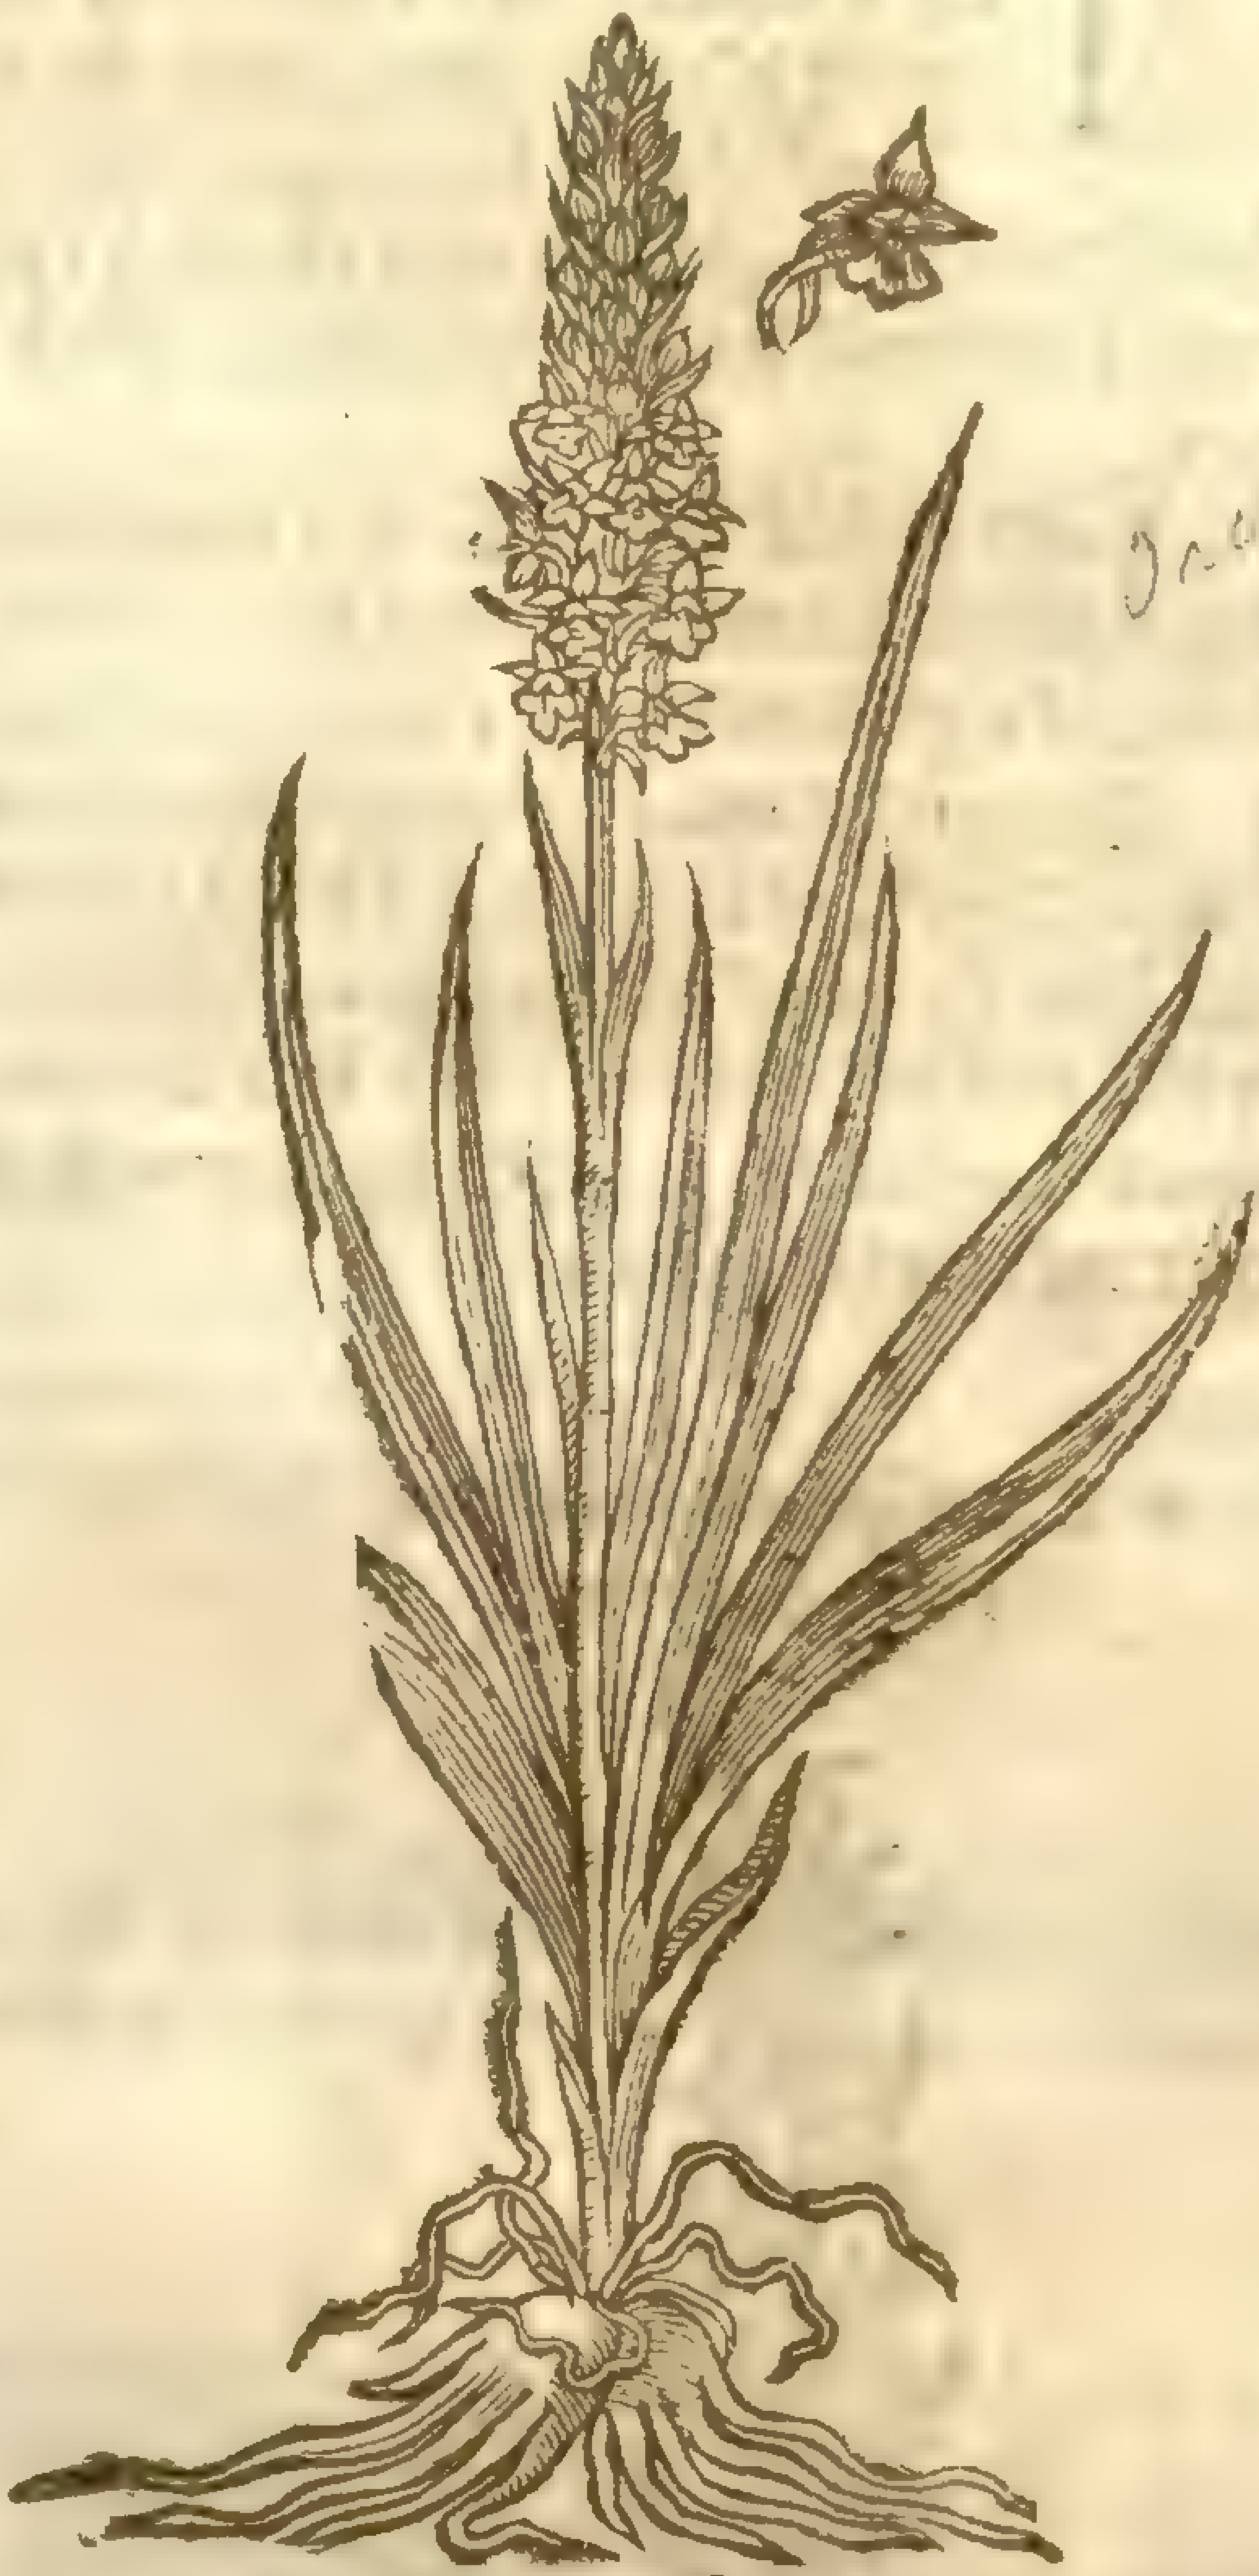
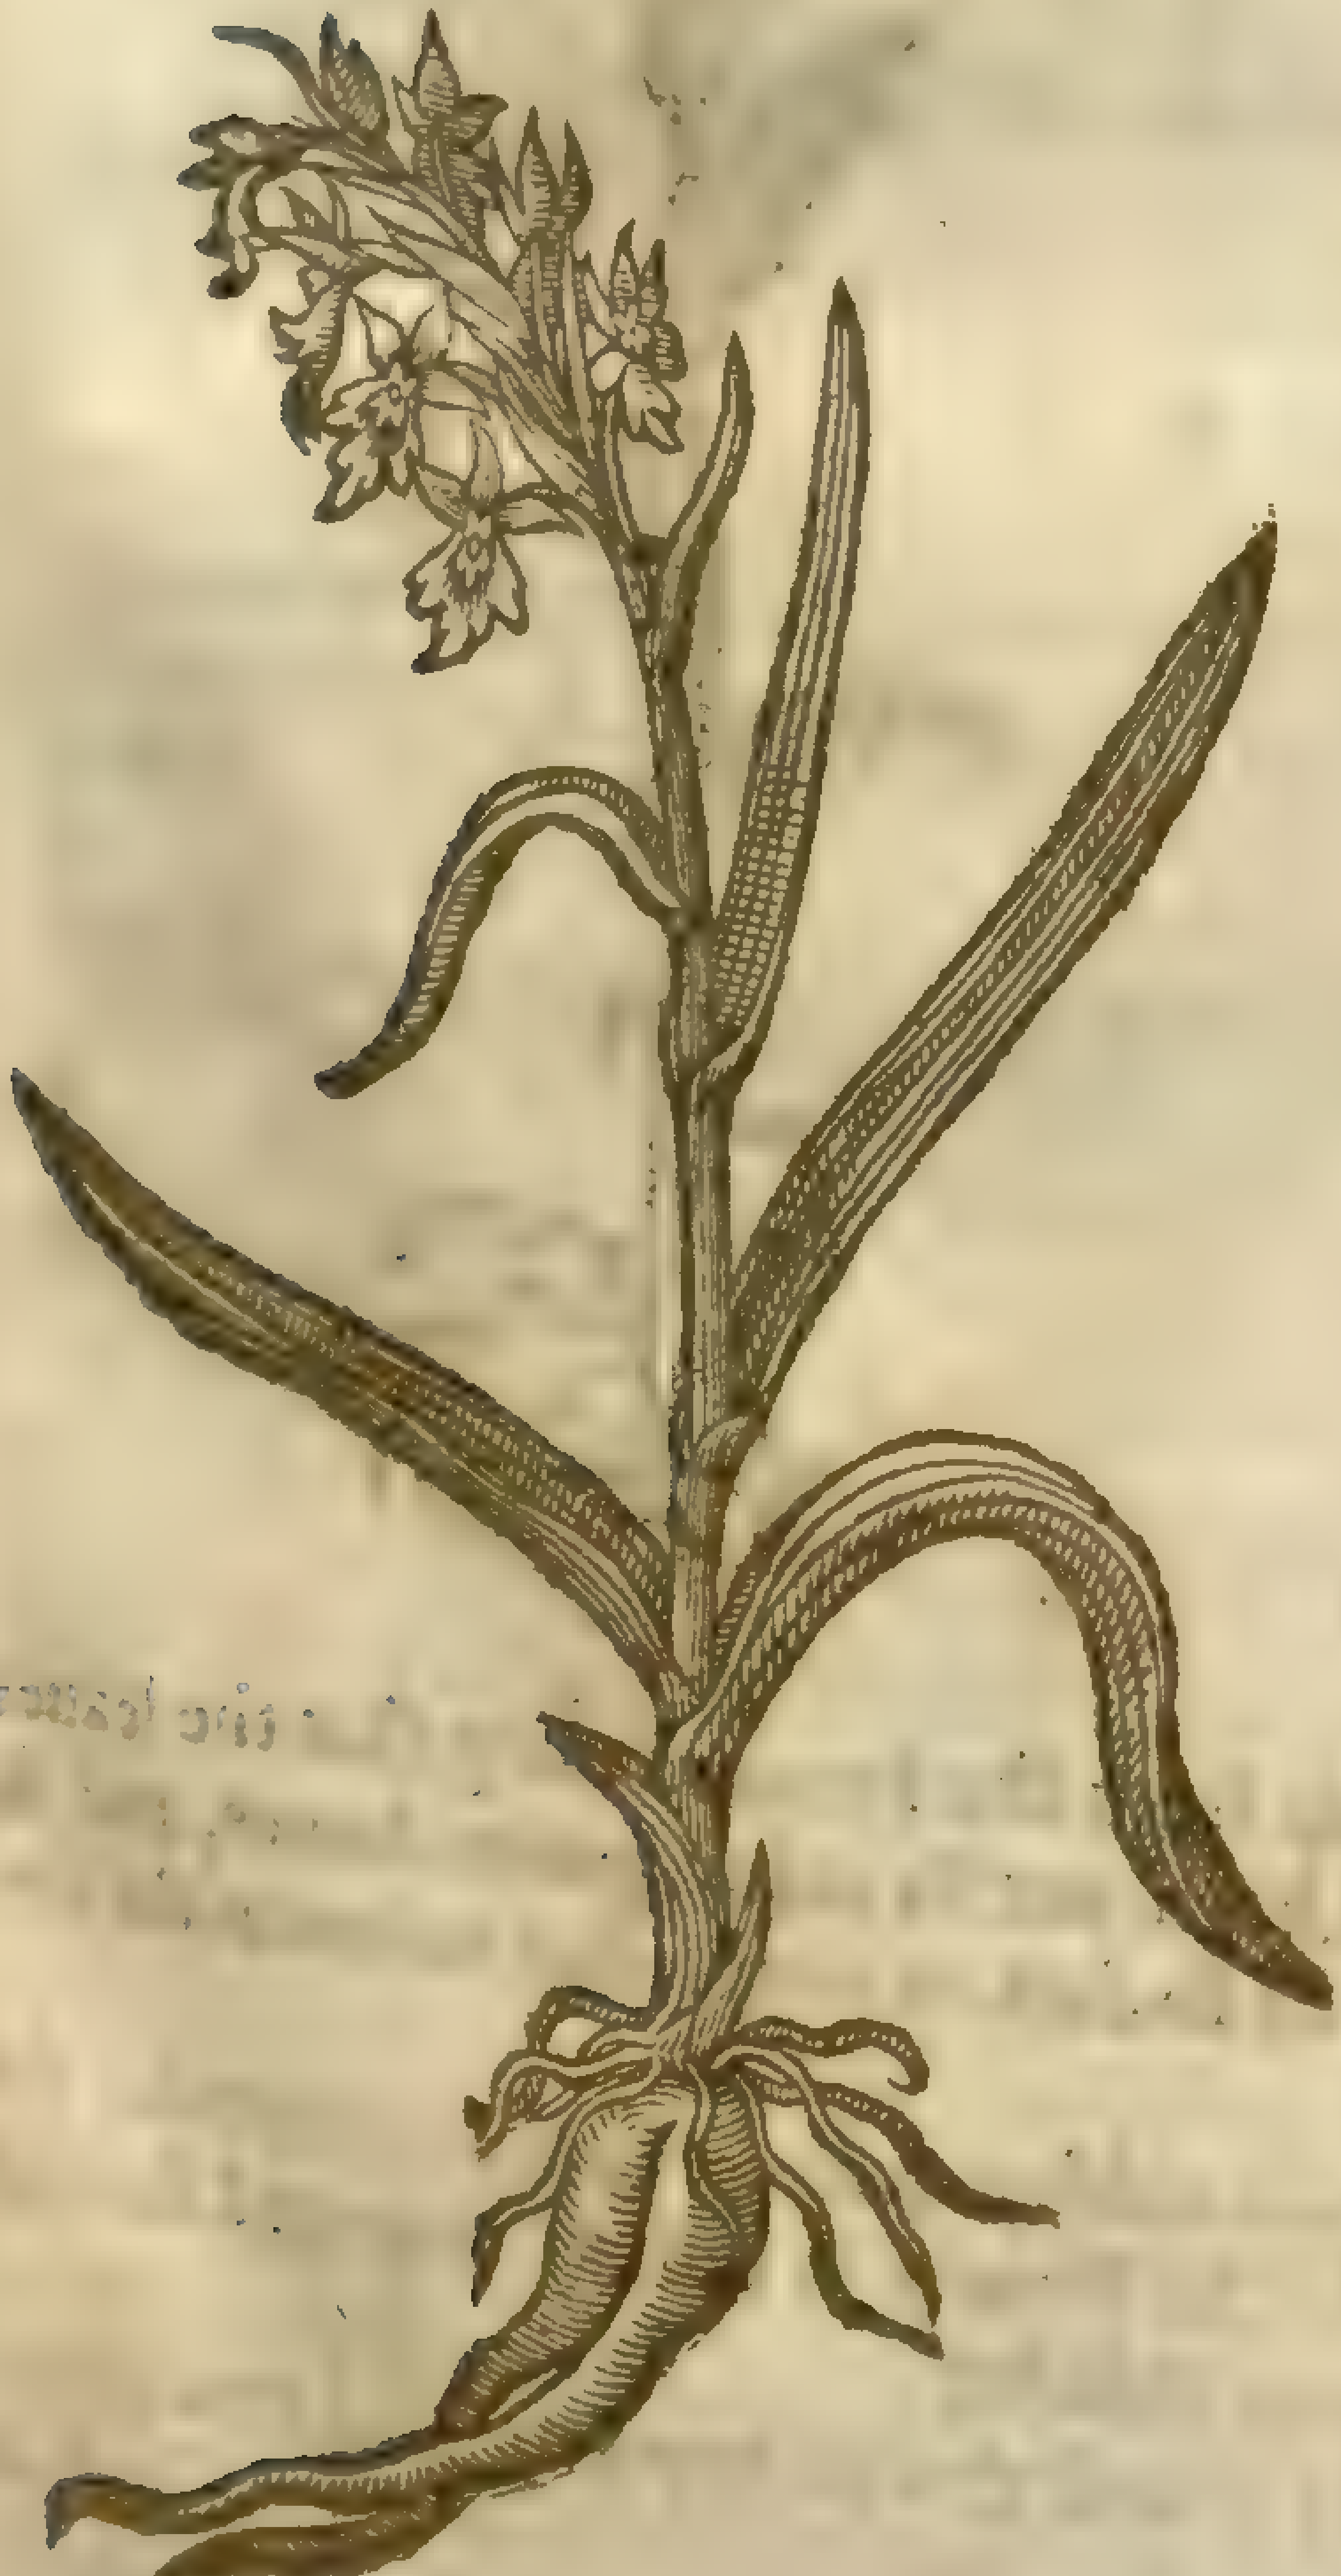
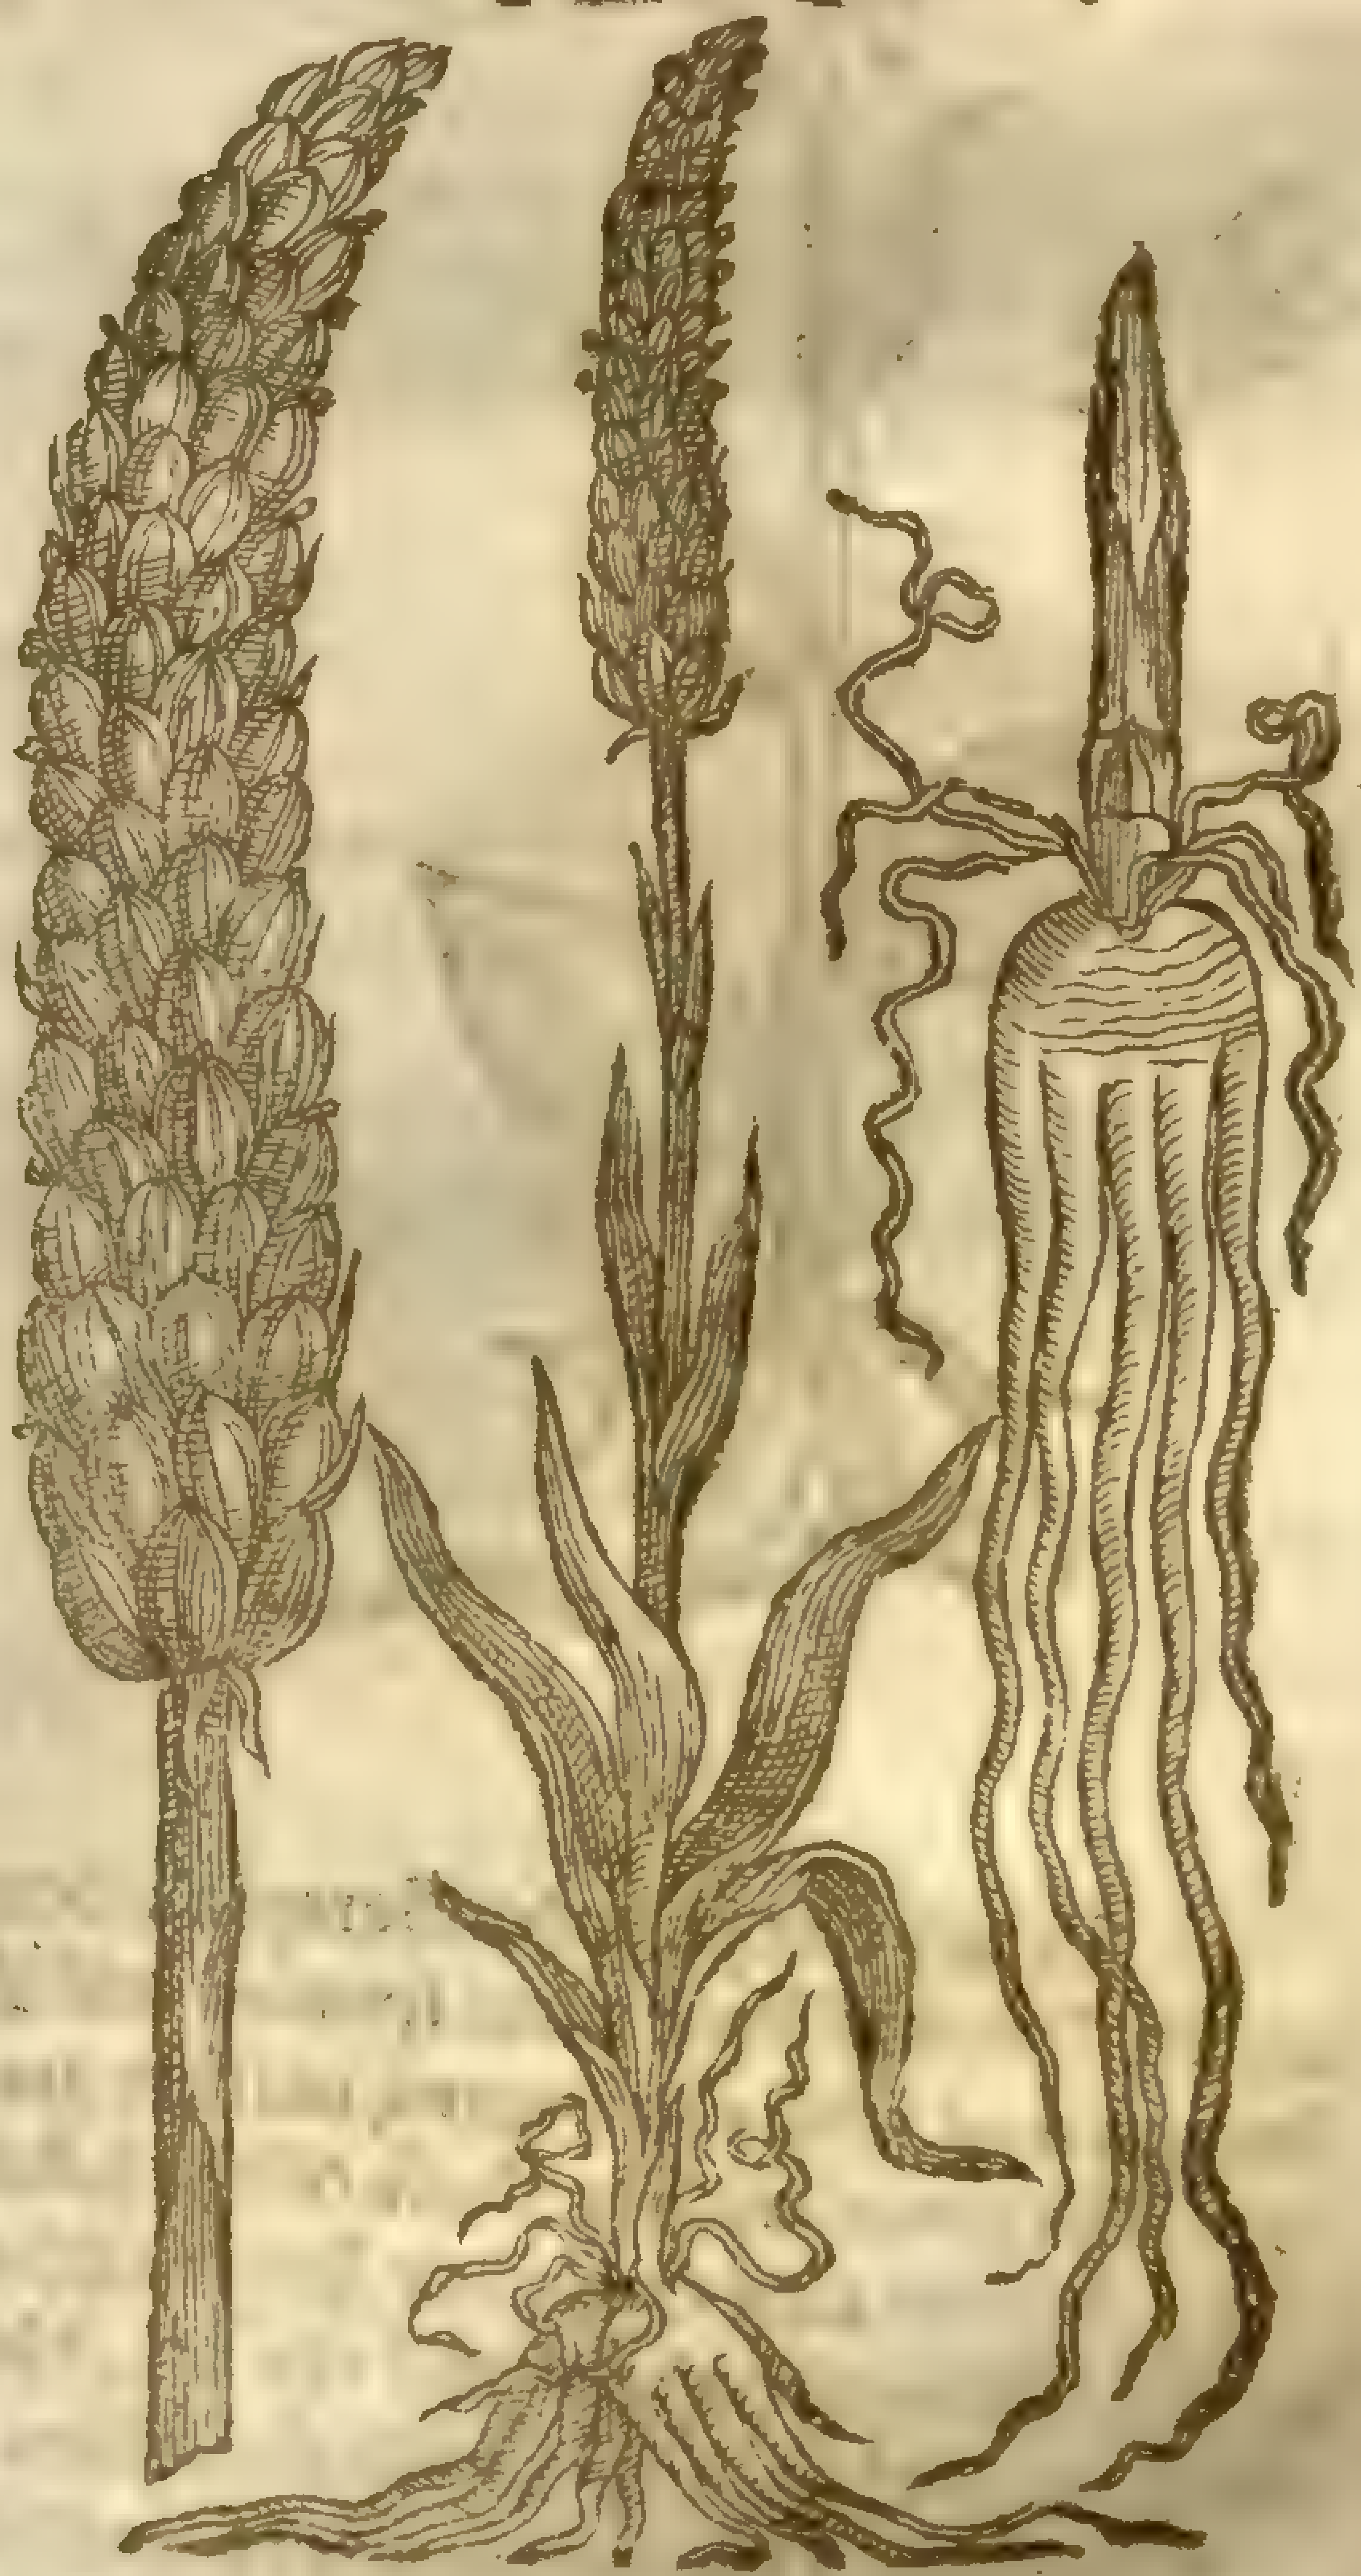
Sweet-ſmelling Satyrion, with the root and ſeed expreſt at large.



Orchis [illegible]
See [illegible]

7 *Serapias caſtrata.*
Gelded Satyrion.





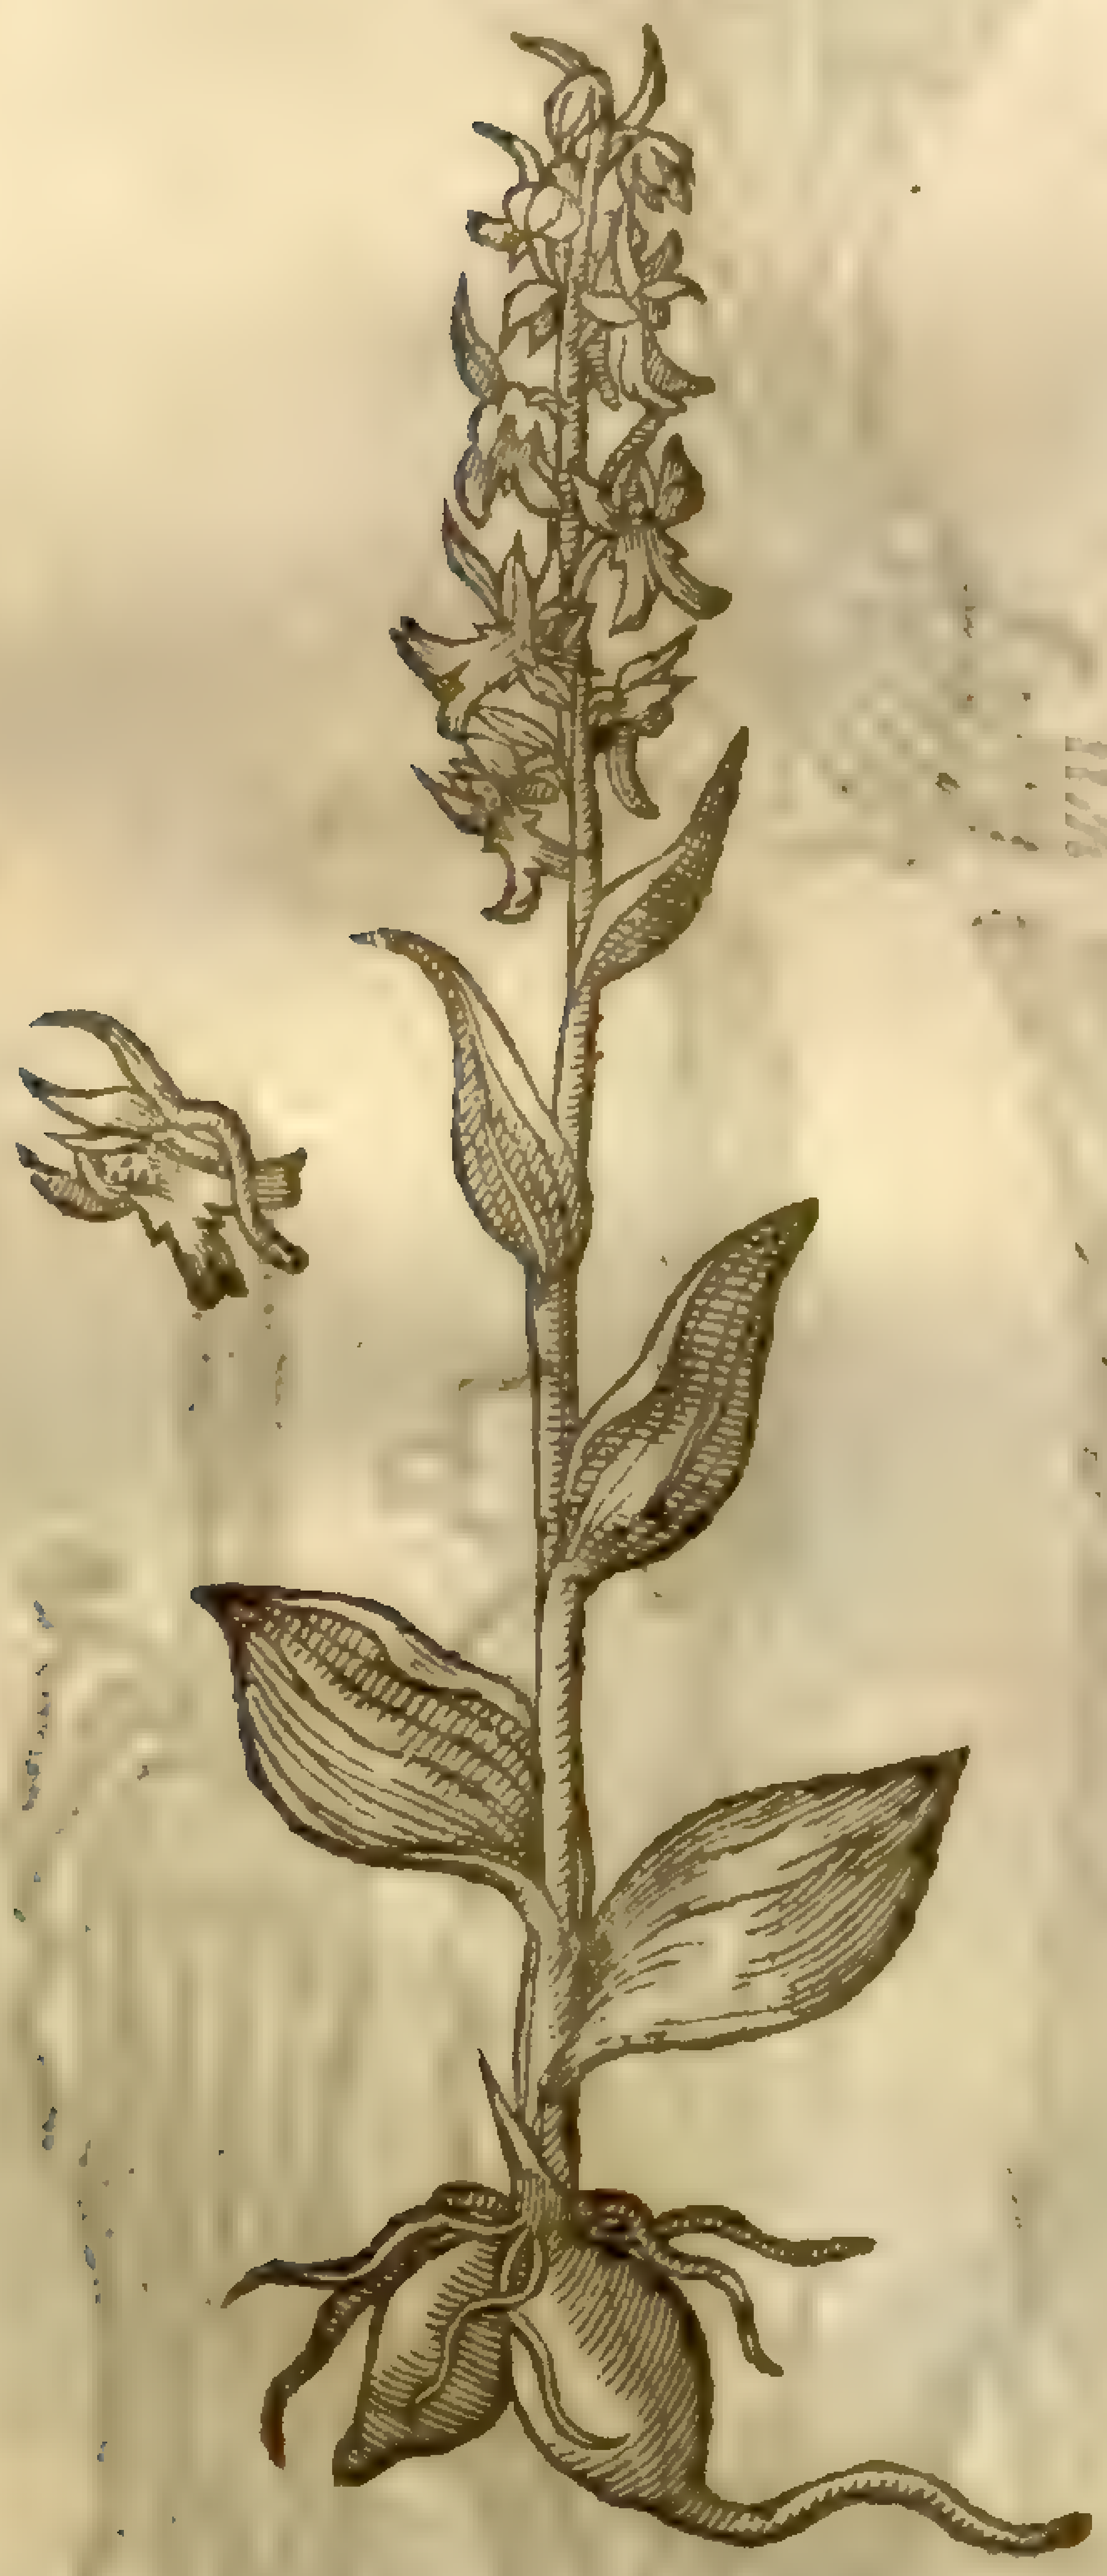
¶ *The Deſcription.*

1 The white handed Orchis or Satyrion hath long and large leaues, ſpotted and daſhed with blacke ſpots, from the which doth riſe vp a ſmall fragile or brittle ſtalke of two hands high, hauing at the top a buſh or ſpoky tuft of white floures, like in ſhape vnto thoſe of *Palma Chriſti*, whereof this is a kinde. The root is thicke, fat, and full of iuyce, faſhioned like the hand and fingers of a man, with ſome tough and fat ſtrings faſtened vnto the vpper part thereof.

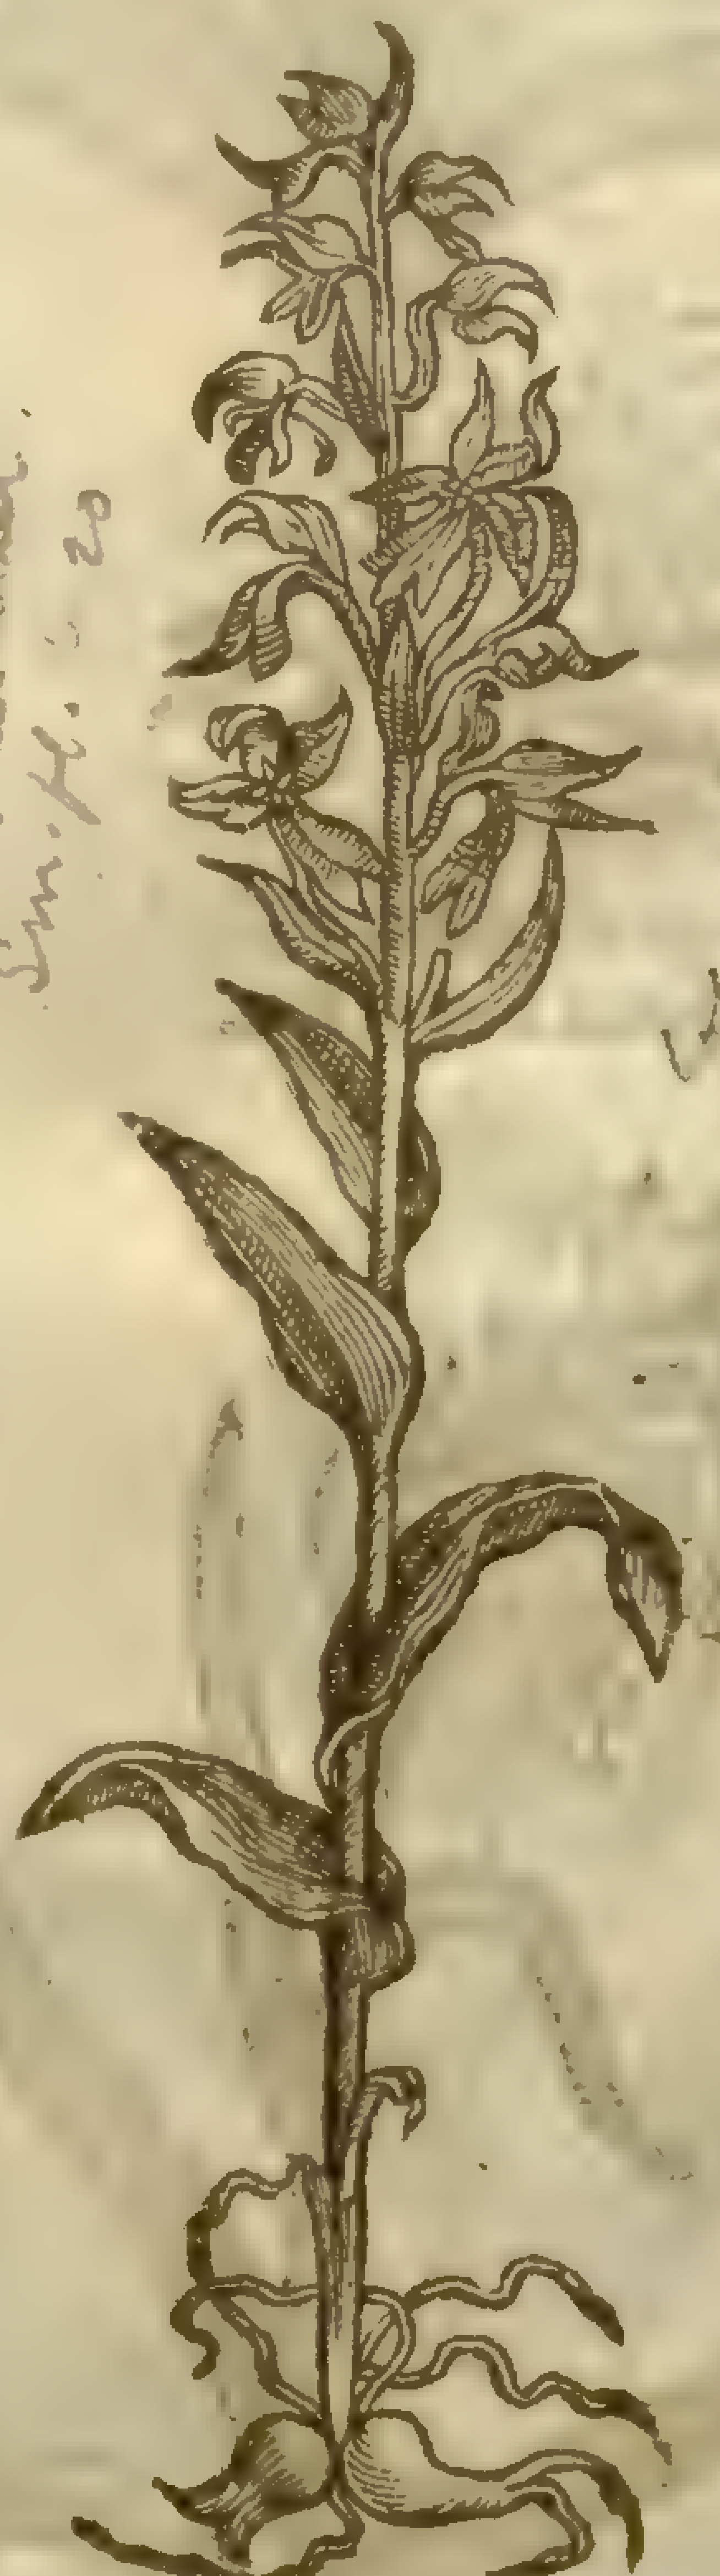
2 Red handed Satyrion is a ſmall low and baſe herb, hauing a ſmall tender ſtalk ſet with two or three ſmall leaues like vnto thoſe of the Leeke, but ſhorter. The floure groweth at the top tuftfaſhion, of a gliſtering red colour, with a root faſhioned like an hand, but leſſer than the former.

3 Serapia's ſtones or mariſh Satyrion hath a thick knobby root, diuided into fingers like thoſe of *Palma Chriſti*, whereof it is a kind: from which riſe thick fat and ſpongeous ſtalks ſet with broad leaues like thoſe of plantain, but much longer, euen to the top of the tuft of floures; but the higher they riſe toward the top, the ſmaller they are. The floure conſiſts of many ſmall hooded floures ſomewhat whitiſh, ſpotted within with deep purple ſpots; the back ſide of theſe little floures are Violet mixt with purple.

† 8 ***Serapias Batrachites.***
Frog Satyrion.



‡ 9 ***Serapias Batrachites altera.***
The other Frog Satyrion.



Satyrium viride, L.
[illegible] Sm. fl. 20

Feb. 10. 93

4 Fenny Satyrion (or Serapia's ſtones) differeth little from the former, ſauing that the leaues are ſmaller, and ſomewhat ſpotted, and the tuft of floures hath not ſo many greene leaues, nor ſo long, mixed with the floures, neither are they altogether of ſo dark or purpliſh a colour as the former. The roots are like thoſe of the laſt deſcribed.

5 Mountaine Orchis or Satyrion hath thicke fat and knobby roots, the one of them for the moſt part being handed, and the other long. It growes like the former in ſtalks, leaues, and floures, but is ſomewhat bigger, with the leaues ſmoother and more ſhining.

6 Cloue Satyrion, or ſweet-ſmelling Orchis, hath flat and thicke roots diuided into fingers

like thoſe of *Palma Chriſti*, ſauing that the fingers are longer, ſmaller, and more in number: from the which riſe vp long and narrow leaues like thoſe of Narciſſus or Daffodil: among which commeth forth a ſmall tender ſtalke, at the top whereof groweth a purple tuft compact of many ſmall floures reſembling Flies, but in ſauor and ſmell like the Cloue or Cloue Gilloſloure; but far ſweeter and pleaſanter, as my ſelfe with many others can witneſſe now liuing, that haue both ſeene and ſmelt them in my garden. ‡ After the floure is paſt, come many ſeed-veſſels filled with a ſmall ſeed, and growing after the manner as you ſee them heere at large expreſſed in a figure, together with the root alſo ſet forth at full. ‡

7 Gelded Satyrion hath leaues with nerues and ſinues like thoſe of Daffodill, ſet vpon a weak and tender ſtalk, with floures at the top white of colour, ſpotted within the floure, and in ſhape they are like gnats and little flies. The ſtalk is gelded as it were, or the ſtones and hands cut off, leauing for the root two long legs or fingers, with many ſtrings faſtned vnto the top.

8 Frog Satyrion hath ſmal flat leaues ſet vpon a ſlender weak ſtem: at the top wherof growes a tuft of floures compact of ſundry ſmall floures, which in ſhape do reſemble little frogs, whereof it took his name. The root is likewiſe gelded, only reſeruing two ſmall miſhapen lumps, with certaine fibres anexed thereto.

‡ 9 This alſo may fitly be added to the laſt deſcribed, the root ſhewing it to be of a kinde between the Serapia's and Orchis. It groweth to the height of the former, with ſhort leaues ingirting the ſtalke at their ſetting on. The floures on the top reſemble a Frog, with their long leaues; and if you looke vpon them in another poſture, they will ſomwhat reſemble little flies; wherefore *Lobel* calls it as well *Myodes*, as *Batrachites*. ‡

¶ *The Time.*

Theſe plants flouriſh in the moneth of May and Iune, but ſeldome after, except ſome degenerat kinde, or that it hath had ſome impediment in the time when it ſhould haue floured, as often hapneth.

¶ *The Names.*

We haue called theſe kindes Serapia's ſtones, or Serapiades, eſpecially for that ſundry of them do bring forth floures reſembling flies and ſuch like fruitful and laſciuious Inſects, as taking their name from *Serapias* the god of the citiſens of Alexandria in Egypt, who had a moſt famous temple at Canopus, where he was worſhipped with all kind of laſciuious wantonneſſe, ſongs, and dances; as we may reade in *Strabo*, in his ſeuenteenth booke. *Apuleius* confounds the Orchides and Serapiades, vnder the name of both the Satyrions; and withall ſaith it is called *Entaticos*, *Panion*, and of the Latines, *Teſticulus Leporinus*: in Engliſh wee may call them Satyrions, and finger Orchis, and Hares ſtones.

¶ *The Temperature and Vertues.*

Serapia's ſtones are thought to be in nature, temperature, and vertues like vnto the Satyrion roiall; and although not ſo much vſed in phyſicke, yet doubtleſſe they worke the effect of the other Stones.

---

‡ The fifth was the figure of *Satyrium trifolium* of *Tabern.* and is a kind of *Teſticulus pſeudes*; 6 In this place formerly was the figure of the laſt before, to wit, *Serapias minor*. 8 Here was the figure of *Myodes*, which ſhould haue bin in the ſixth place in the 101 Chapter of the former edition, being the 113 of this.

Chap. 117.

Of Fenny ſtones.

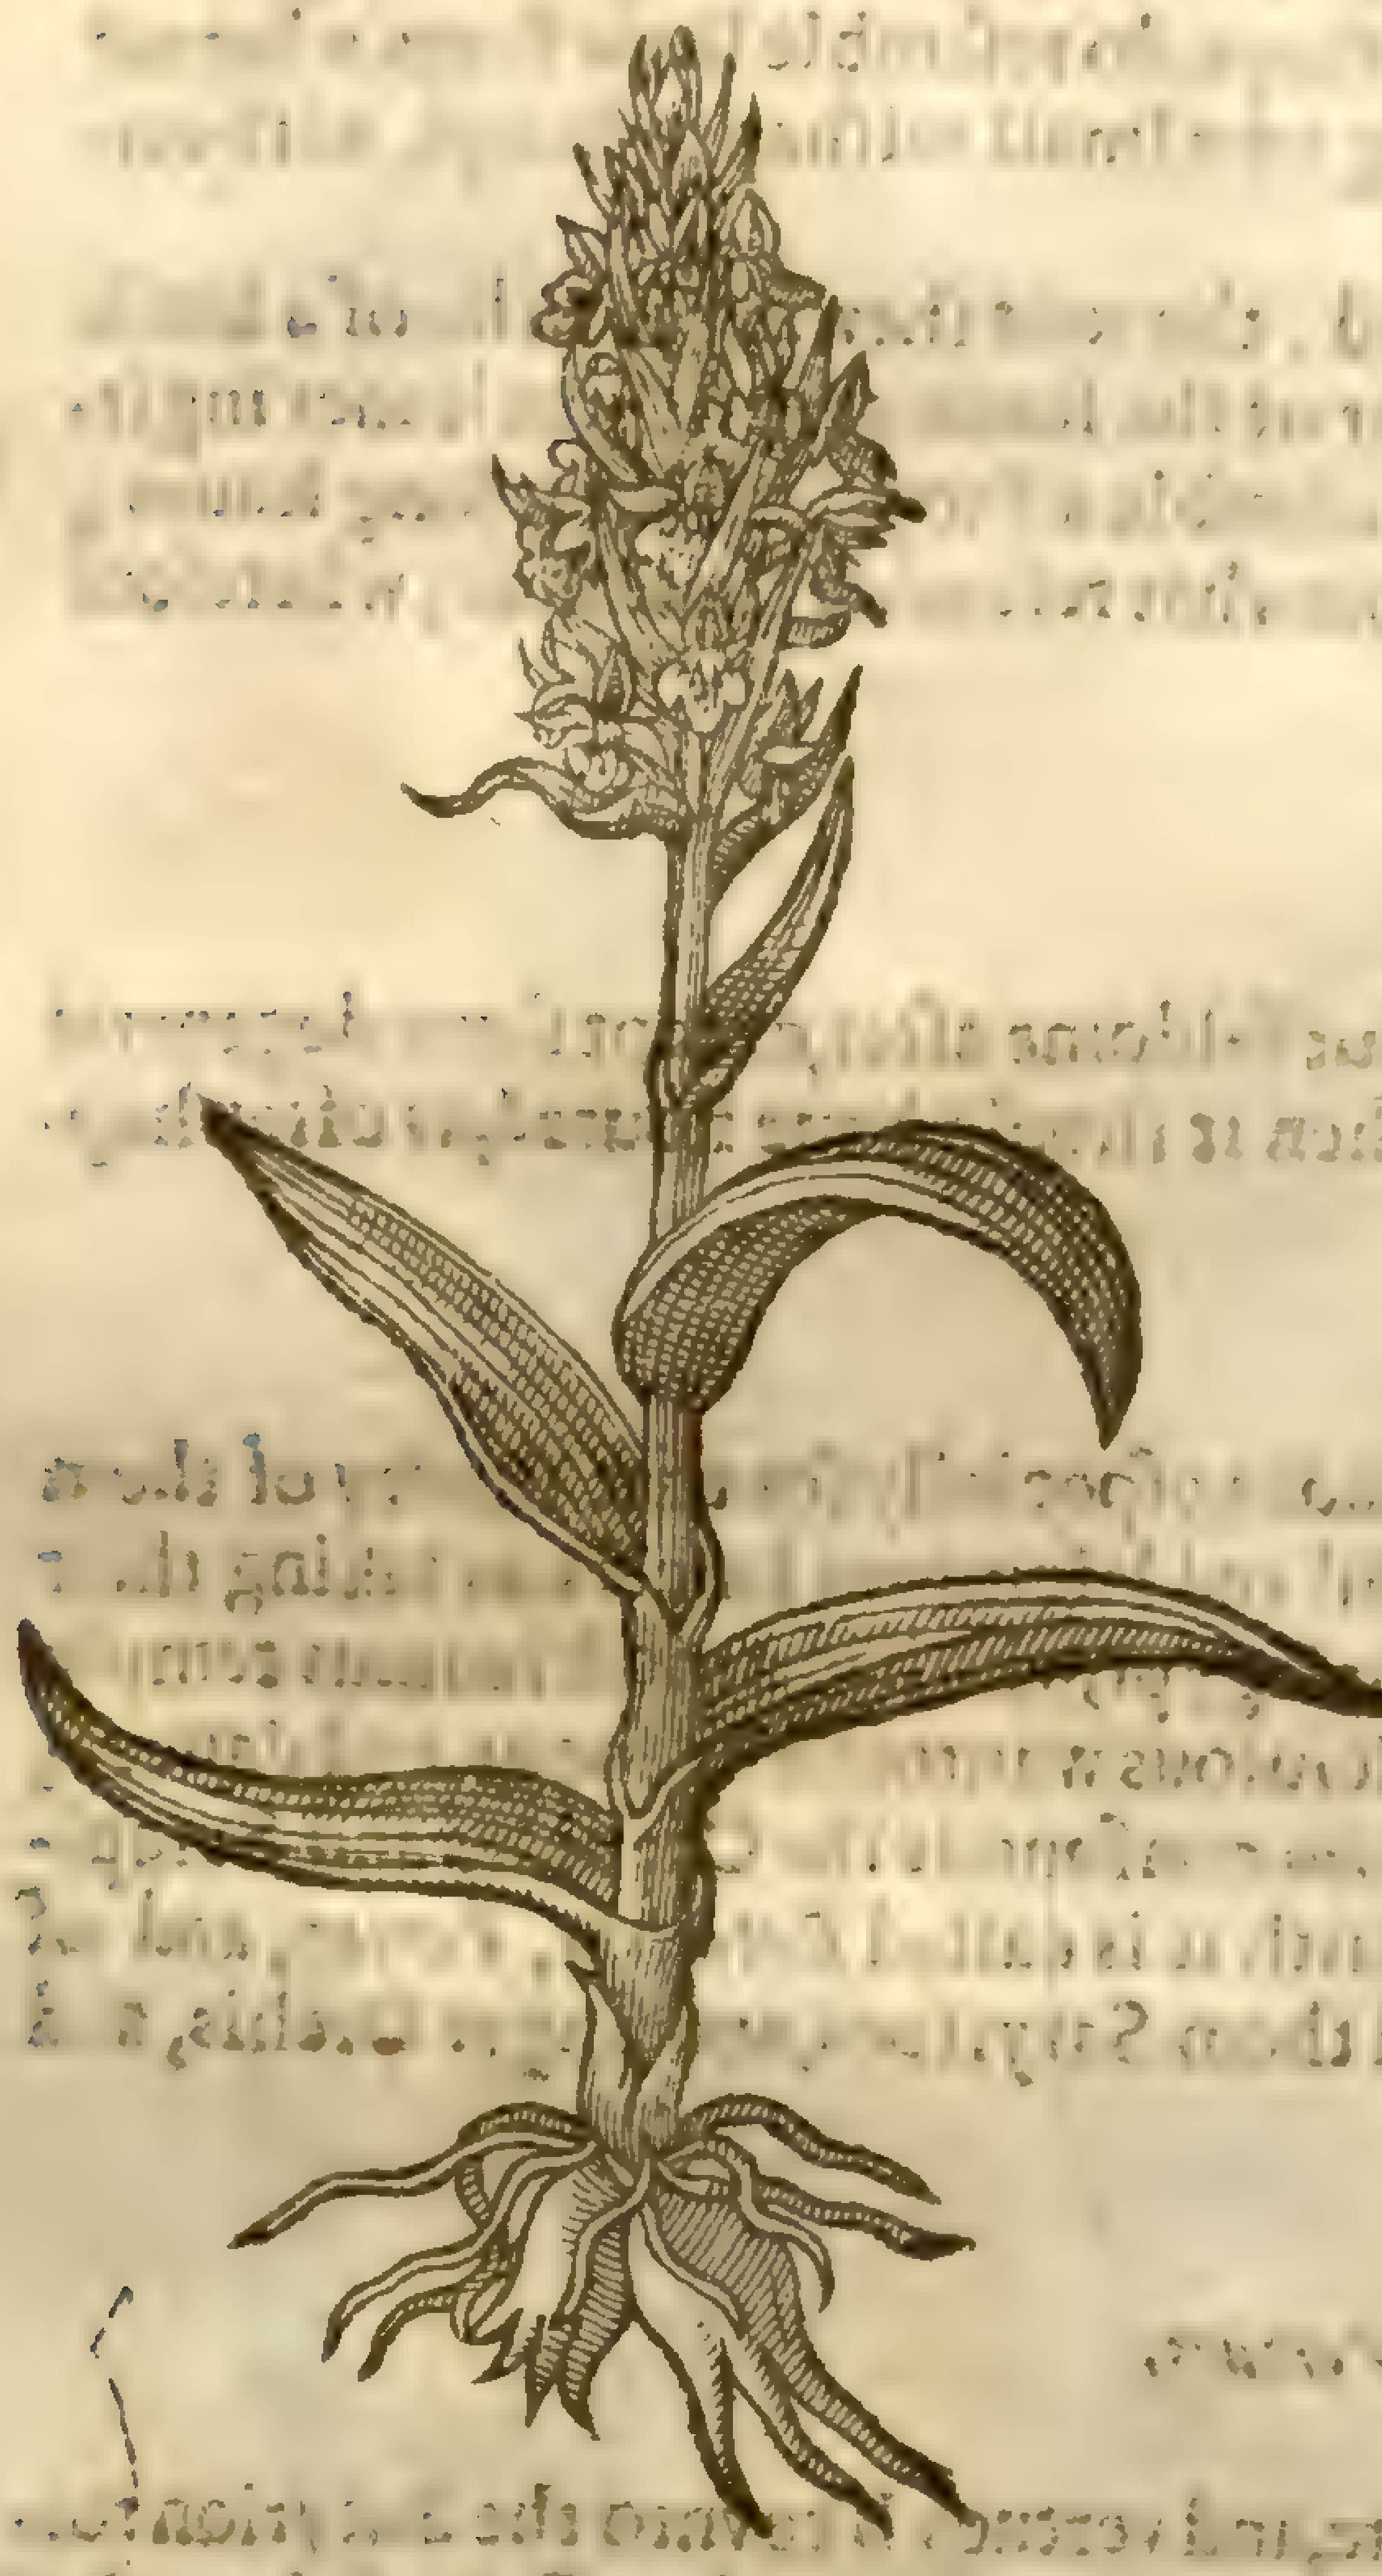
¶ *The Deſcription.*

‡ 1 This hath cleft or diuided roots like fingers, much like vnto the roots of other *Palma Chriſti's*; whereof this is a kinde: from the which riſeth vp a ſtalke of a foot high, ſet here and there with very faire Lilly-like leaues, of colour red, the which do clip or embrace the ſtalkes almoſt round about, like the leaues of Thorow-wax. At the

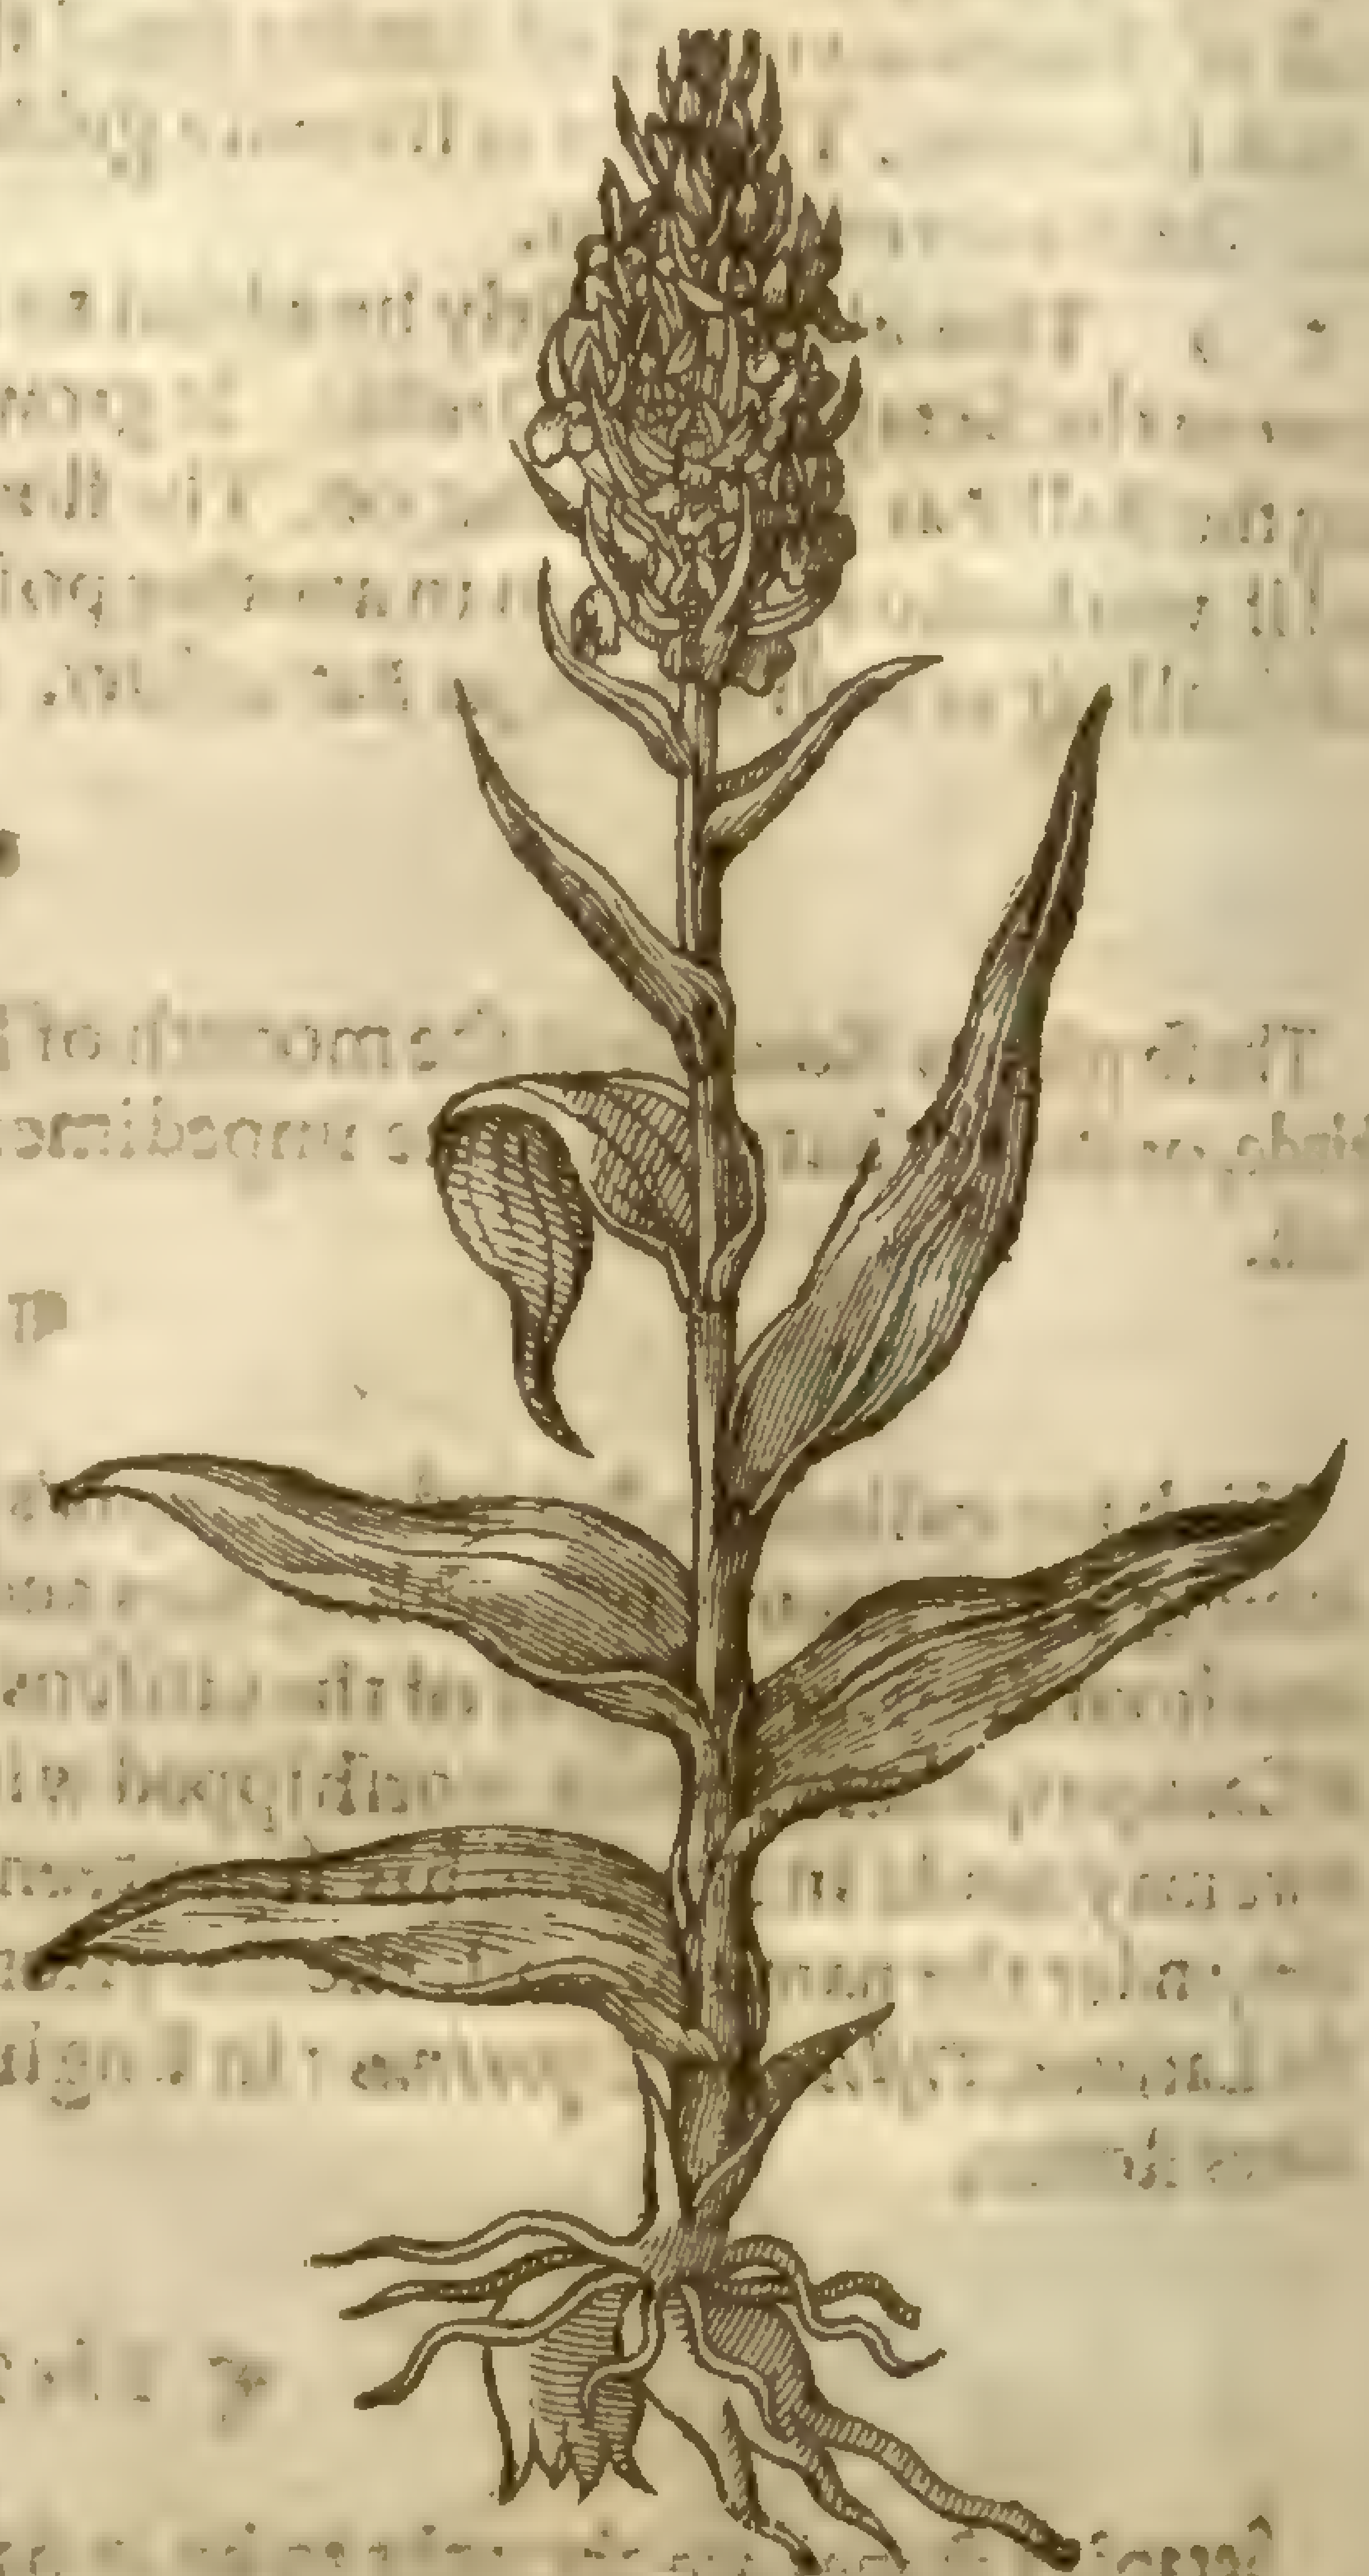
top of the ſtalke groweth a faire buſh of very red floures, among the which floures do grow many ſmall ſharpe pointed leaues. The ſeed I could neuer obſerue, being a thing like duſt that flieth in the winde.

2 The other mariſh handed Satyrion differeth little from the precedent, but in the leaues and floures, for that the leaues are ſmaller and narrower, and the floures are faire white, gaping wide open; in the hollowneſſe whereof appeare certain things obſcurely hidden, reſembling little helmets, which ſetteth forth the difference.

† 1 *Serapias Dracontias paluſtris.*
Mariſh Dragon Satyrion.



† 2 *Serapias paluſtris leptophylla altera.*
The other mariſh handed Satyrion.

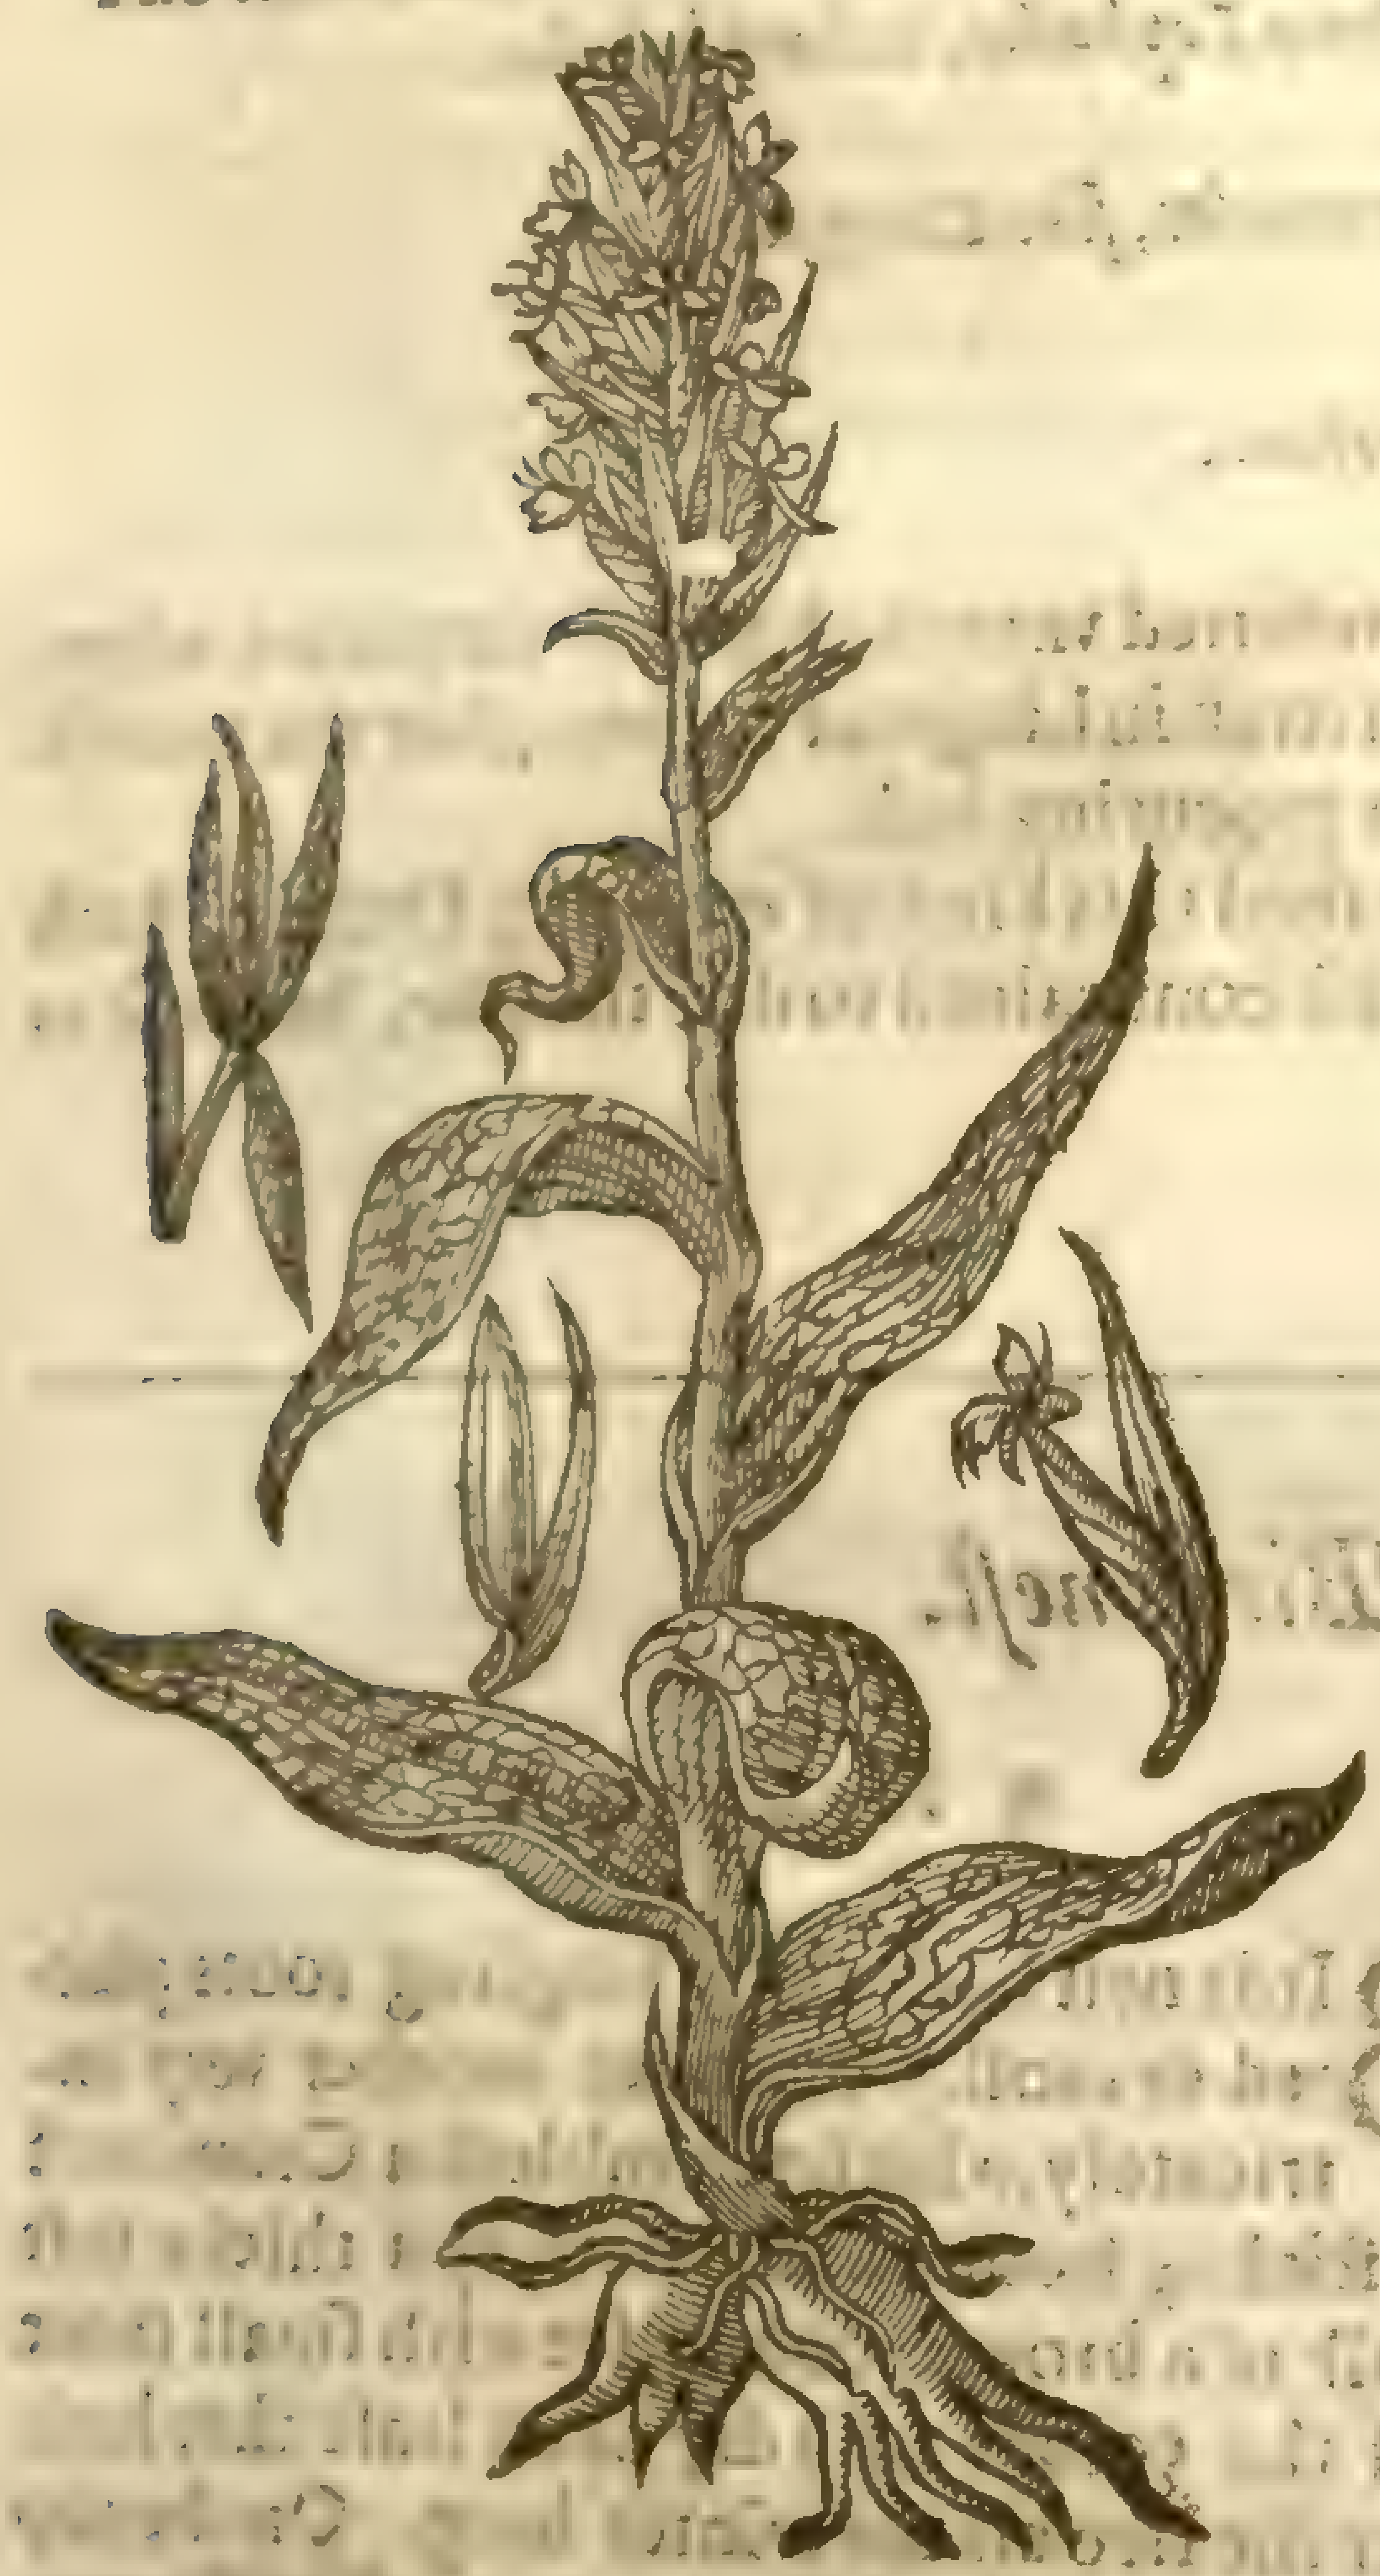


3 This third handed Satyrion hath roots faſhioned like an hand, with ſome ſtrings faſtned to the vpper part of them; from which riſeth vp a faire ſtiffe ſtalke armed with large leaues, very notably daſht with blackiſh ſpots, clipping or embracing the ſtalke round about: at the top of the ſtalke ſtandeth a faire tuft of purple floures, with many greene leaues mingled amongſt the ſame, which maketh the buſh or tuft much greater. The ſeed is nothing elſe but as it were duſt, like the other of his kinde: ‡ And it is contained in ſuch twined veſſels as you ſee expreſt apart by the ſide of the figure; which veſſels are not peculiar to this, but common to moſt part of the other Satyrions. ‡

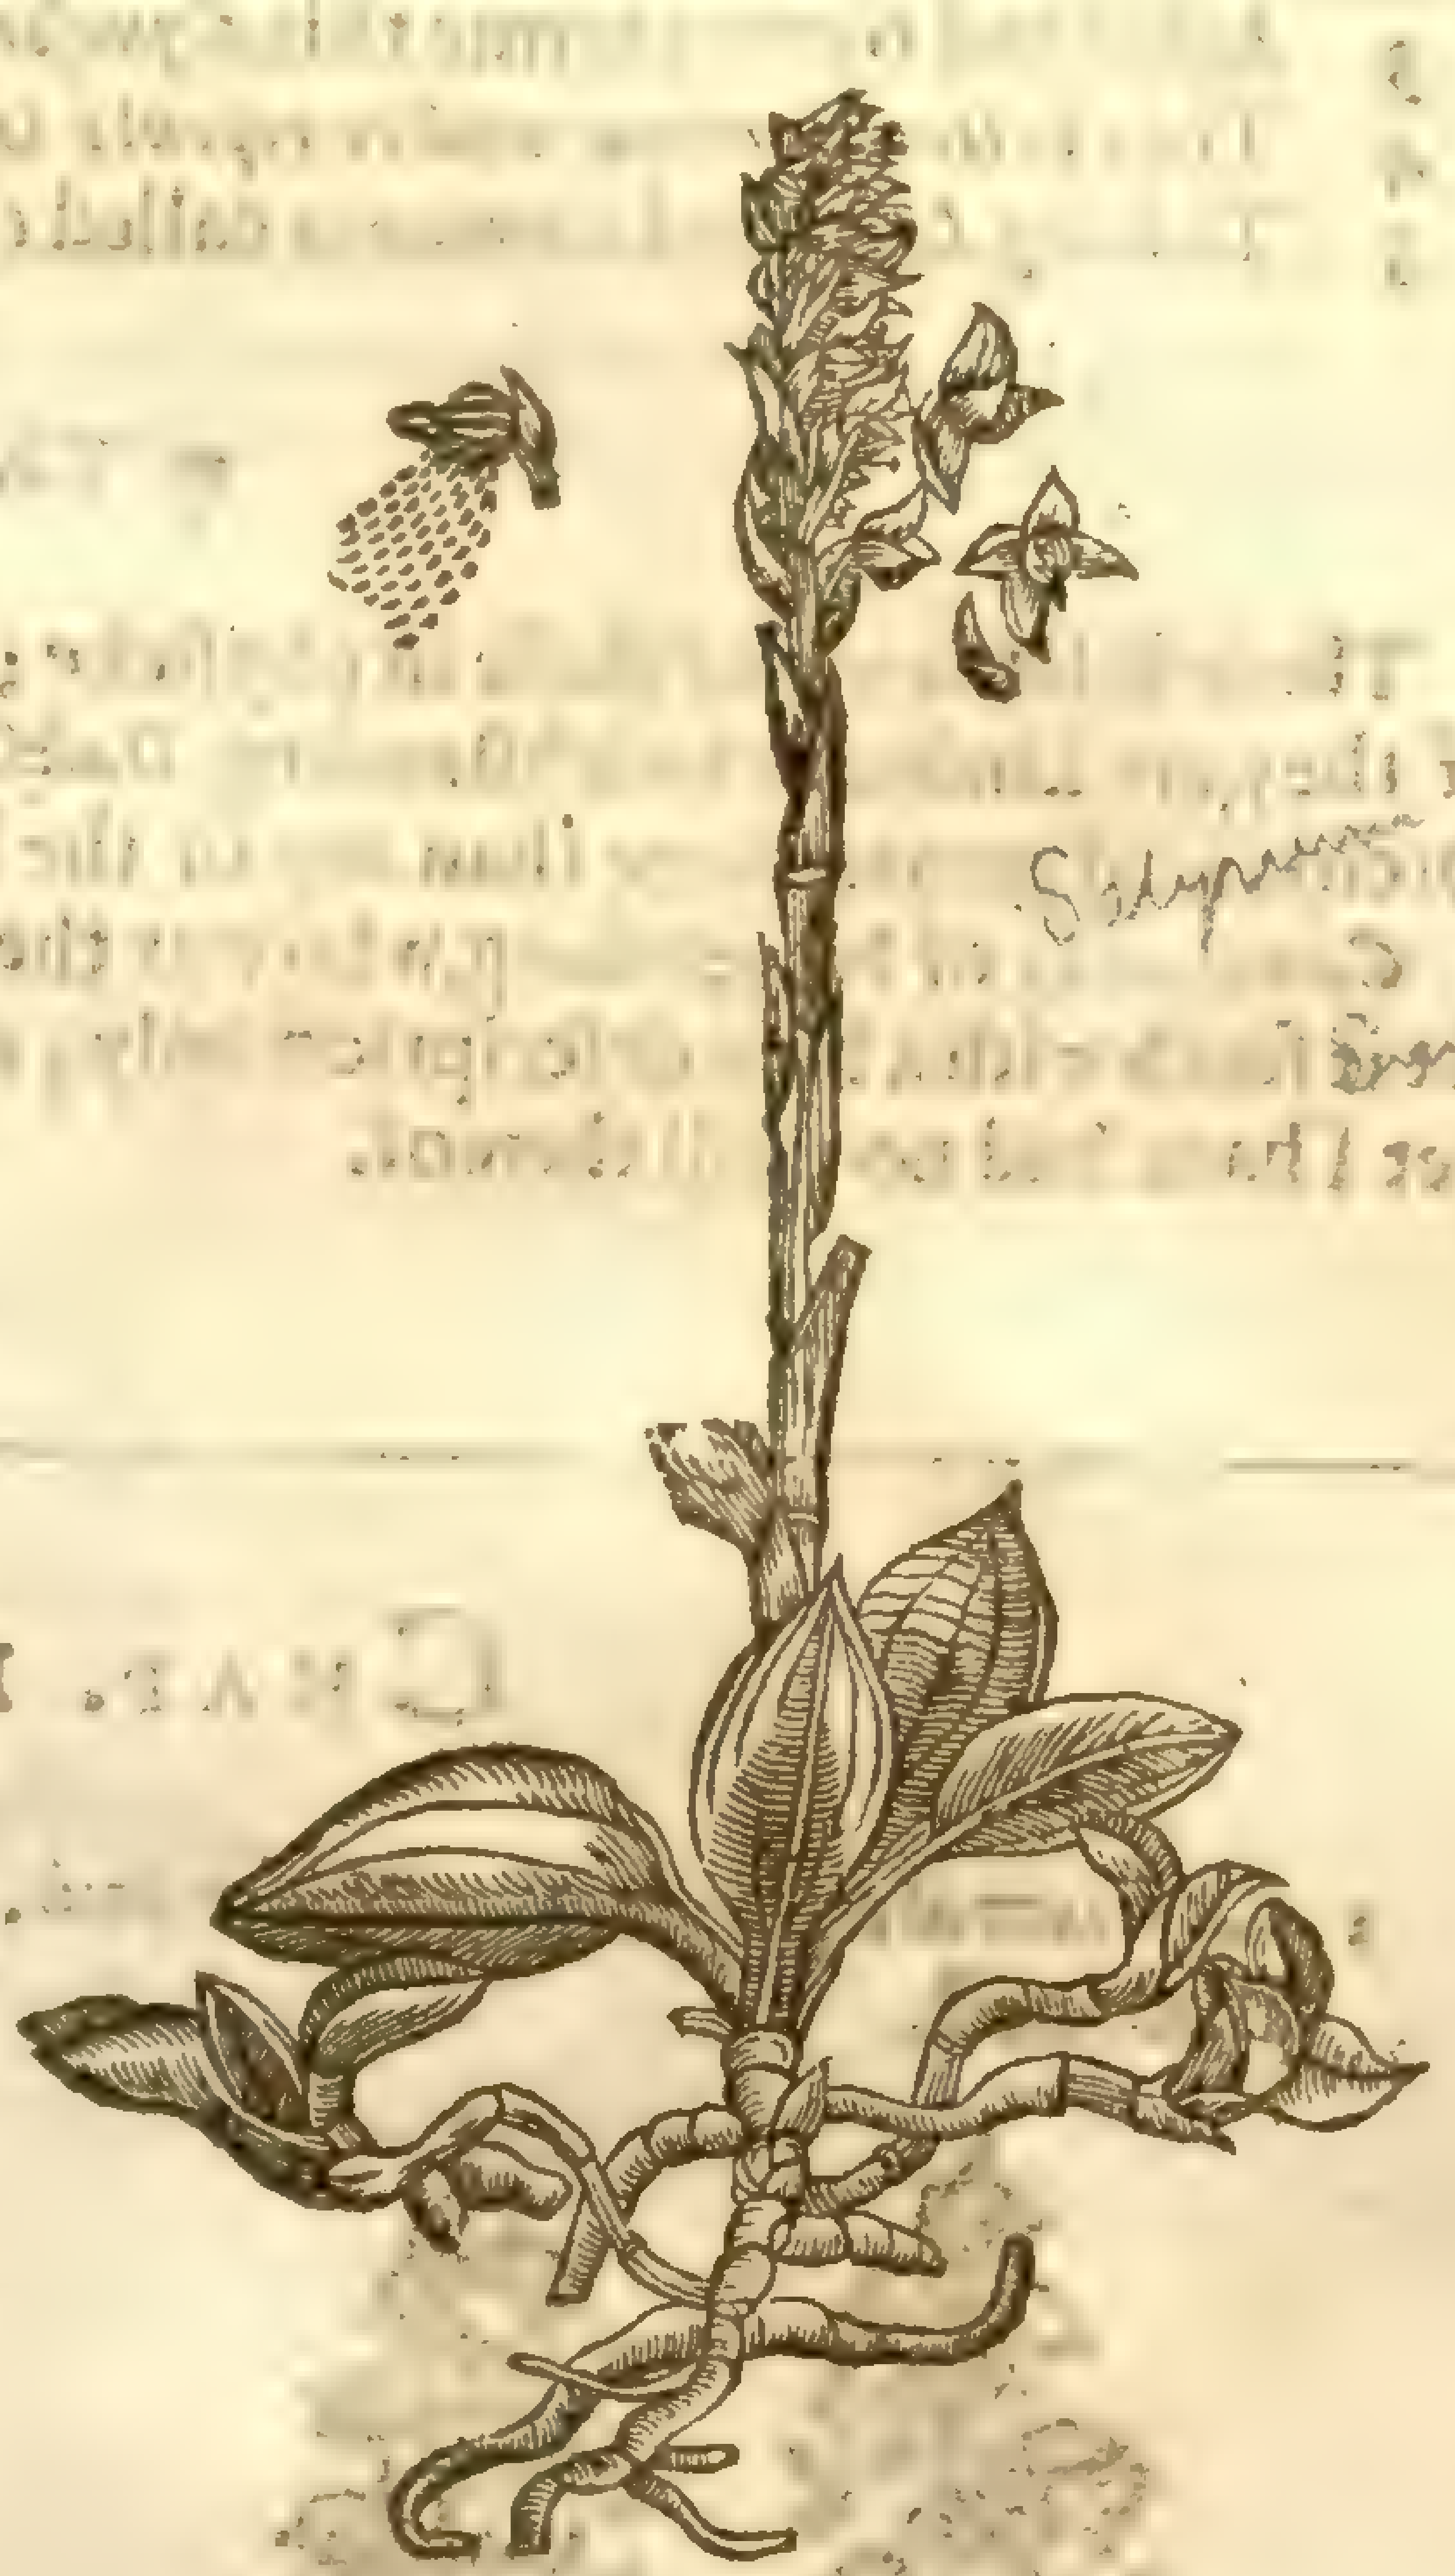
4 The creeping rooted Orchis or Satyrion without teſticles, hath many long roots diſperſing themſelues, or creeping far abroad in the ground, contrarie to all the reſt of the Orchides: which roots are of the bigneſſe of ſtrawes, in ſubſtance like thoſe of Sope-wort; from the which immediatly doth riſe foure or fiue broad ſmooth leaues like vnto the ſmall Plantaine: from the which ſhooteth vp a ſmal and tender ſtalke, at the top whereof groweth a pleaſant ſpiky eare of a whitiſh colour, ſpotted on the inſide with little ſpeckes of a bloudy colour. The ſeed alſo is verie ſmall.

‡ 5 This from handed roots like others of this kinde, ſendeth vp a large ſtalke, ſomtimes attaining to the height of two cubits; the leaues are much like vnto thoſe of the mariſh Satyrions; the floures are of an elegant purple, with little hoods like the top of an helmet (whence *Gemma*

3 *Palma Chriſti paluſtris.*
The third handed mariſh Satyrion.

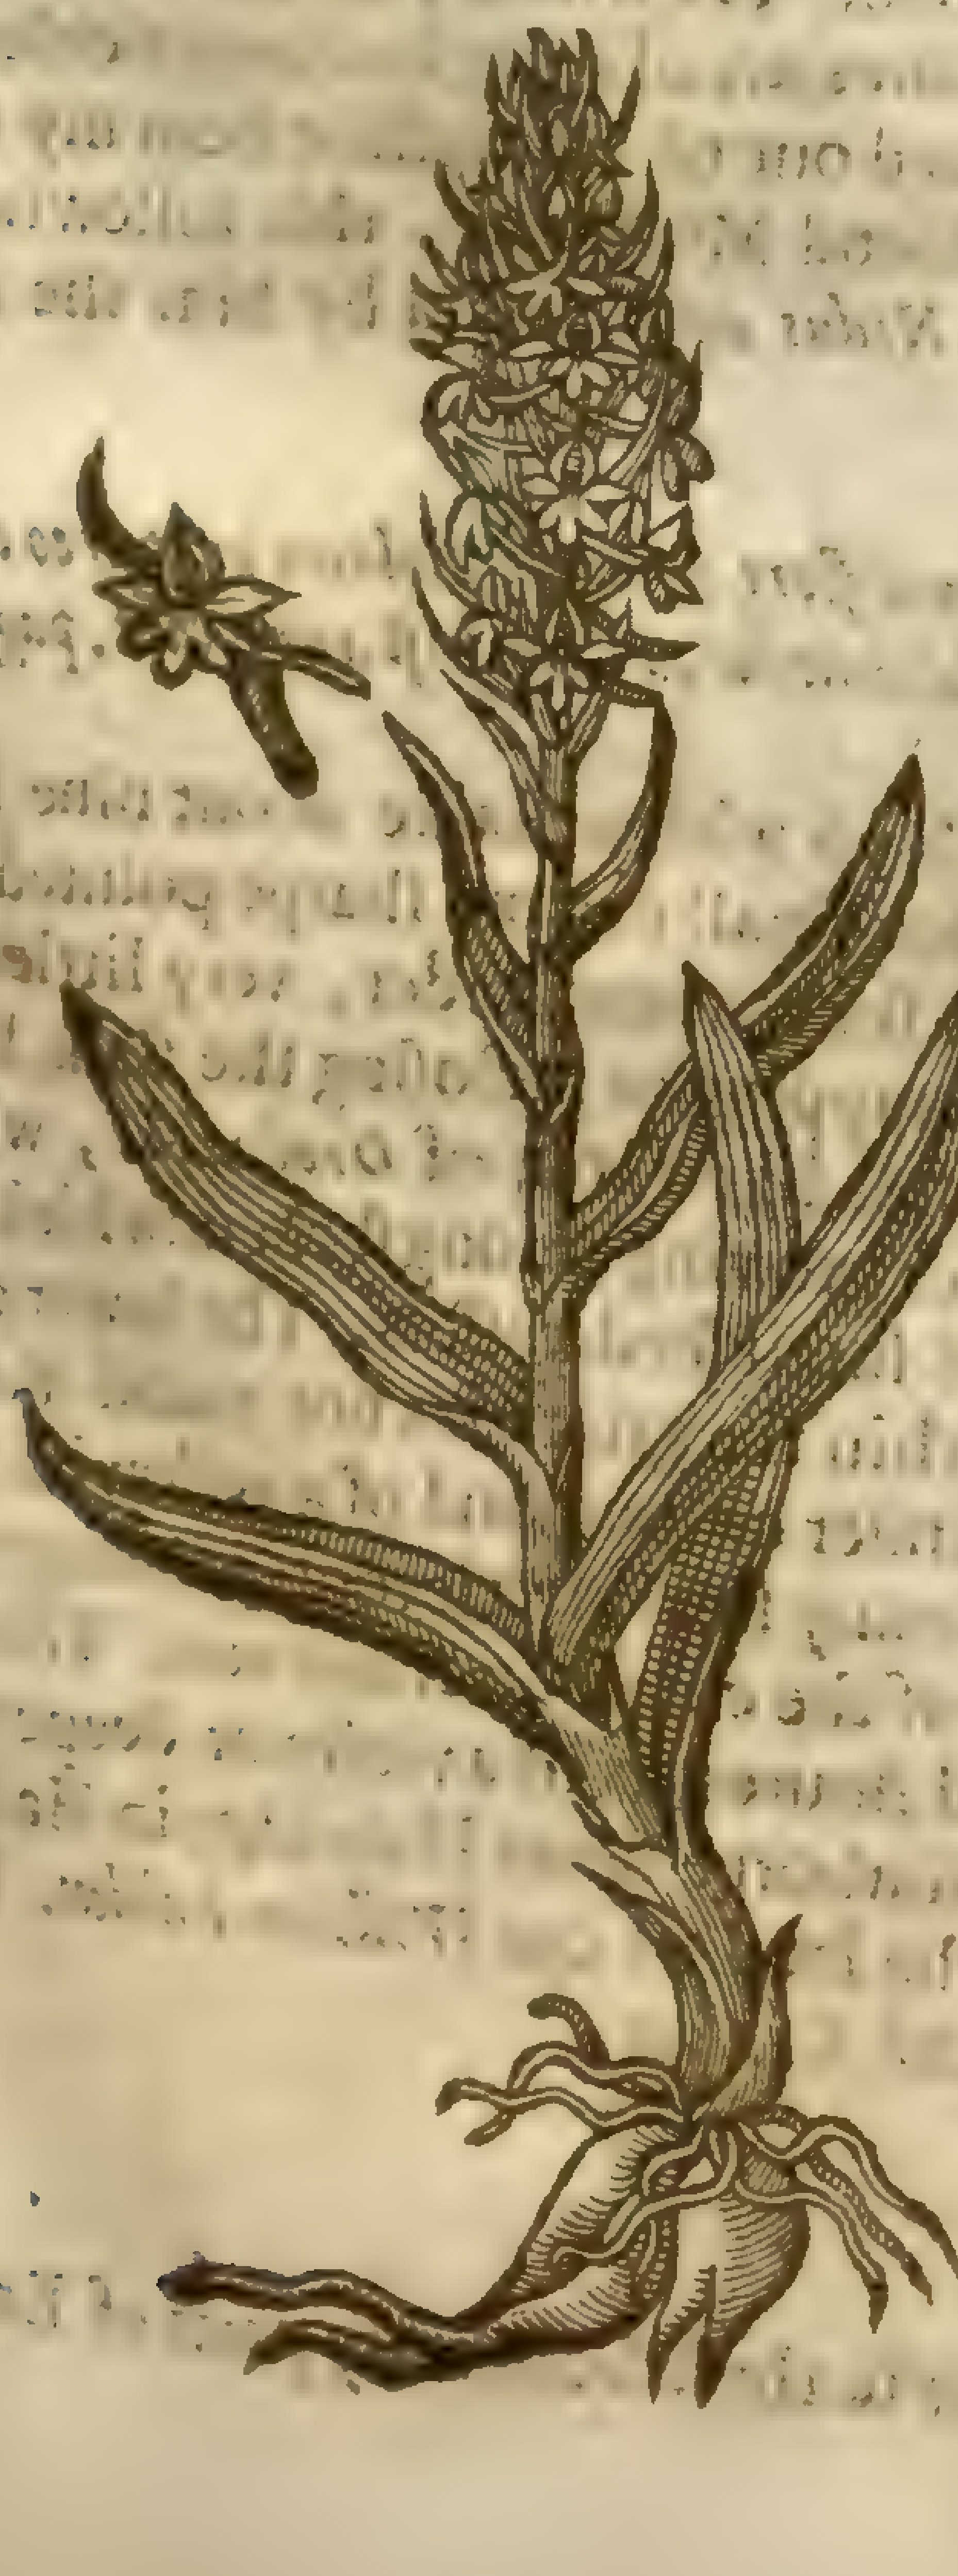


4 *Palma Chriſti radice repente.*
Creeping Satyrion.



Satyrium repens [illegible]
f. 4. 3.

‡ 5 *Palma Chriſti maxima.*
The greateſt handed Satyrion.



termed the plant, *Cynoſorch. conopſæa*; and from the height he called it *Macrocaulos.*) Theſe floures ſmell ſweet,& are ſucceeded by ſeeds like thoſe of the reſt of this kindred.

It delights to grow in grounds of an indifferent temper,not too moiſt nor too dry. It flours from mid May to mid-Iune. ‡

¶ *The Place.*

They grow in mariſh and fenny grounds, & in ſhadowie woods that are very moiſt.

The fourth was found by a learned Preacher called Mr *Robert Abbot*,of Biſhops Hatfield, in a boggie groue where a conduit head doth ſtand,that ſendeth water to the queens houſe in the ſame towne.

‡ It grows alſo plentifully in Hampſhire, within a mile of a market towne called Peters-field, in a moiſt medow named Wood-mead, neere the path leading from Peters-field toward Beryton. ‡

¶ *The Time.*

They flour and flouriſh about the months of May and Iune.

‡ ¶ *The Names.*

‡ 1 This is *Cynoſorchis Dracuntias* of *Lobel* and *Gemma.*

2 This is *Cynoſorchis paluſtris altera Leptaphylla* of *Lobel* : *Teſticulus Galericulatus*, of *Tabernamontanus*.

3 *Lobell* and *Gemma* terme this, *Cynoſorchis paluſtris altera Lophodes, vel nephelodes*.

4 This is *Orchis minor radice repente* of *Camerarius*.

5 This by *Lobel* and *Gemma* is called *Cynoſorchis macrocaulos, ſiue Conopſæa*.

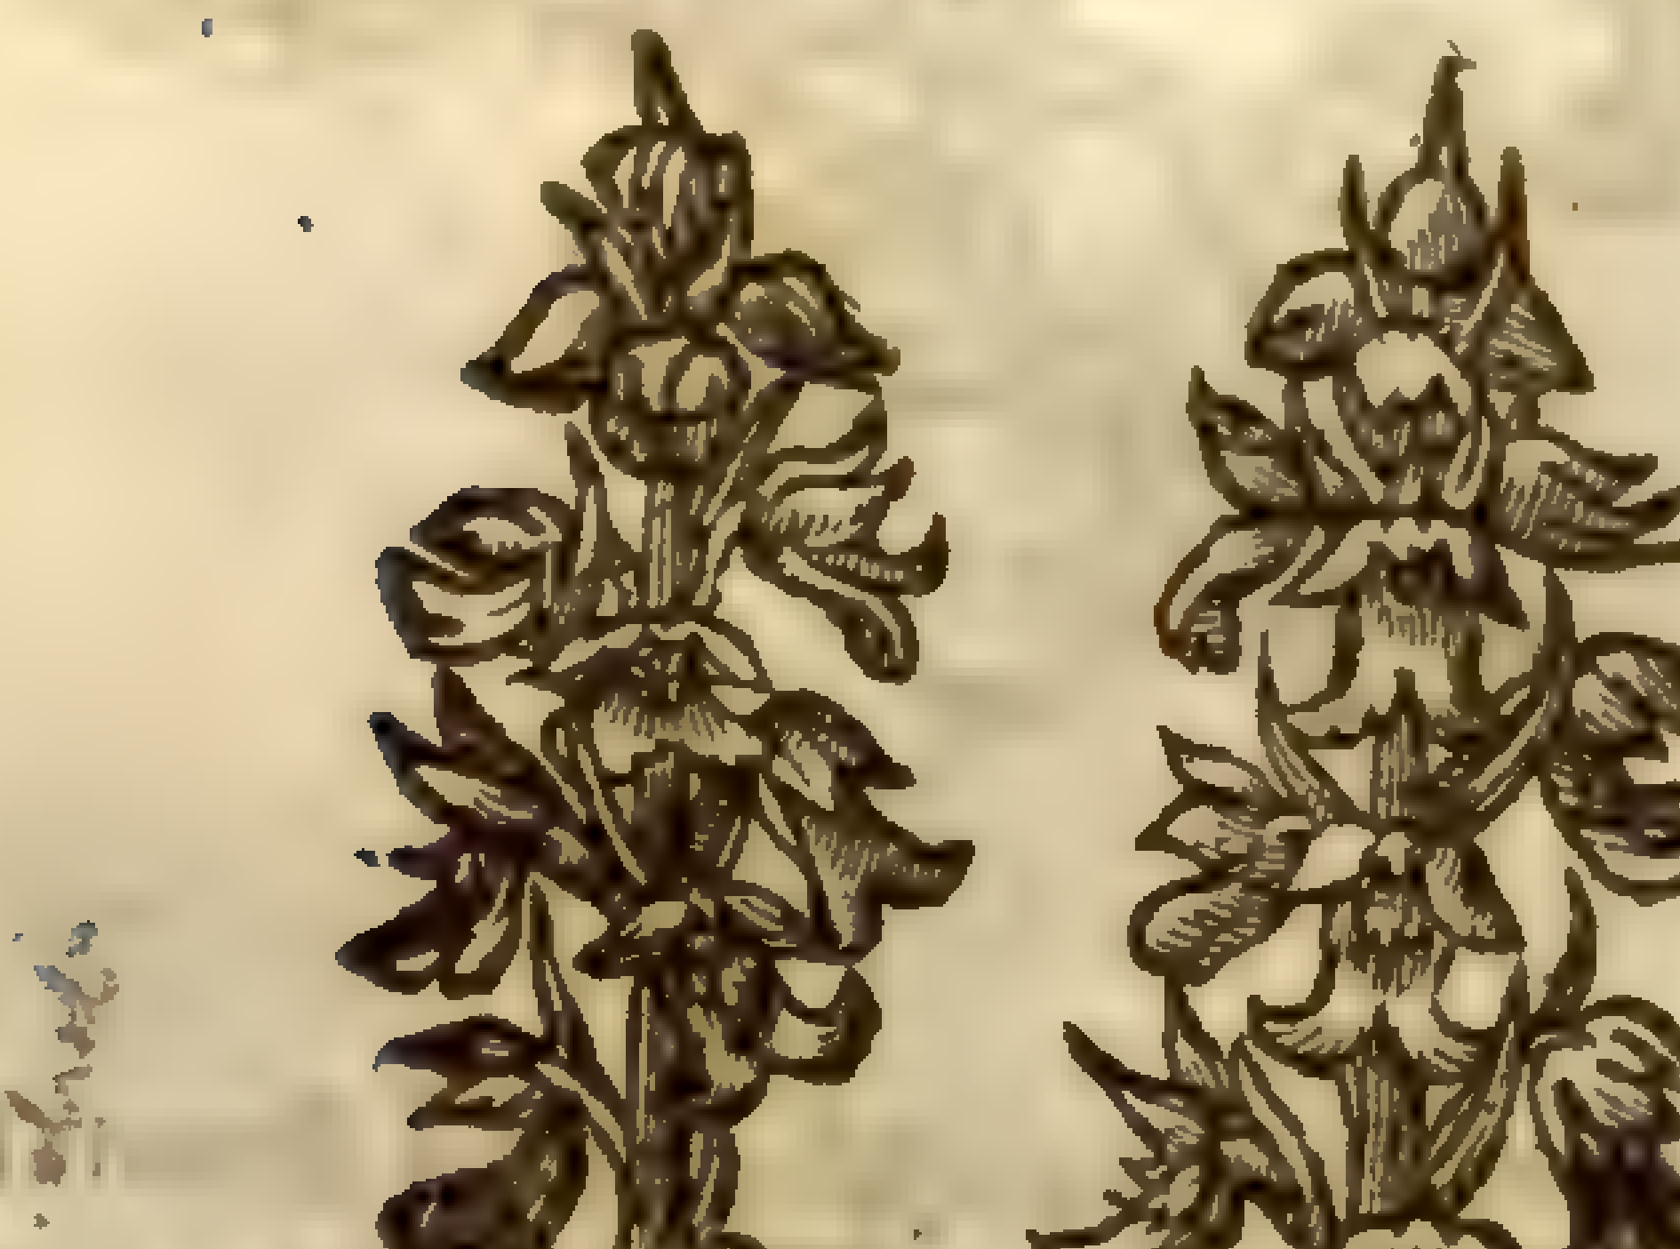
¶ *The Nature and Vertues.*

There is little vſe of theſe in phyſicke ; only they are referred vnto the handed Satyrions, wherof they are kinds : notwithſtanding *Daleſcampius* hath written in his great volume, that the mariſh Orchis is of greater force than any of the Dogs ſtones in procuring luſt.

Camerarius of Noremberg, who was the firſt that deſcribed this kind of creeping Orchis, hath ſet it forth with a bare deſcription only ; and I am likewiſe conſtrained to doe the like, becauſe as yet I haue had no triall thereof.

Chap. 118. *Of Birds neſt.*

1 *Satyrium abortivum, ſive Nidus avis.*
Birds neſt.



¶ *The Deſcription.*

1 Birds neſt hath many tangling roots platted or croſſed one ouer another very intricately, which reſembleth a Crows neſt made of ſticks ; from which riſeth vp a thicke ſoft groſſe ſtalk of a browne colour, ſet with ſmall ſhort leaues of the colour of a dry oken leafe that hath lien vnder the tree all the winter long. On the top of the ſtalke groweth a ſpiky eare or tuft of floures, in ſhape like vnto maimed Satyrion, whereof doubtleſſe it is a kinde. The whole plant, as well ſtickes, leaues, and floures, are of a parched brown colour.

‡ I receiued out of Hampſhire from my often remembred friend Mr *Goodyer*, this following deſcription of a *Nidus avis*, found by him the 29 of Iune, 1621.

¶ *Nidus avis flore & caule violaceo purpureo colore ; an Pſeudoleimodoron Cluſ. hiſt. rar. plant. pag. 270.*

This riſeth vp with a ſtalke about nine inches high, with a few ſmall narrow ſharpe pointed ſhort skinny leaues ſet without order, very little or nothing at all wrapping or incloſing the ſtalk, hauing a ſpike of floures like thoſe of *Orobanche*, without tailes or leaues growing amongſt them : which fallen there ſucceed ſmall ſeed-veſſels. The lower part of the ſtalke within the ground is not round like *Orobanche*, but ſlender or long, and of a yellowiſh white colour, with many ſmal brittle roots growing vnderneath confuſedly, wrapped or folded together like thoſe of the common *Nidus avis*. The whole plant as it appeareth aboue ground, both ſtalkes, leaues, and floures, is of a violet or deepe purple colour. This I found wilde in the border of a field called Marborne, neere Habridge in Haliborn, a mile from a towne called Alton in Hampſhire, being the land of one *William Balden*. In this place alſo groweth wilde the thiſtle called *Corona fratrum*. *Ioh. Goodyer*.

¶ *The Place.*

This baſtard or vnkindely Satyrion is very ſeldome ſeene in theſe Southerly parts of England.

It is reported,that it groweth in the North parts of England, neere vnto a village called Knaesborough. I found it growing in the middle of a wood in Kent two miles from Graueſend, neere vnto a worſhipfull gentlemans houſe called Mr *William Swan*,of Howcke green. The wood belongs to one Mr *Iohn Sidley*. Which plant I did neuer ſee elſewhere; and becauſe it is very rare, I am the more willing to giue you all the markes in the wood for the better finding it,becauſe it doth grow but in one piece of the wood: that is to ſay, The ground is couered all ouer in the ſame place neere about it with the herb Sanicle,as alſo with the kind of Orchis called *Hermaphroditica*, or Butterfly Satyrion.

¶ *The Time.*

It floureth and flouriſheth in Iune and Auguſt. The duſty or mealy ſeed (if it may bee called ſeed) falleth in the end of Auguſt: but in my iudgment it is an vnprofitable or barren duſt, and no ſeed at all.

¶ *The Names.*

It is called *Satyrium abortivum*: of ſome, *Nidus avis*: in French, *Nid d'oiſeau*: in Engliſh, Birds neſt, or Gooſe neſt: in Low-Dutch, **Vogels neſt**: in High-Dutch, **Margen dꝛehen.**

¶ *The Nature and Vertues.*

It is not vſed in phyſicke, that I can finde in any authoritie either of the antient or later writers, but is eſteemed as a degenerat kind of Orchis, and therefore not vſed.

THE

THE SECOND BOOKE OF THE HISTORIE OF PLANTS.

Containing the Deſcription, Place, Time, Names, Nature, and Vertues of all ſorts of Herbes, for meat, medicine, or ſweet-ſmelling vſe, &c.

WE haue in our firſt booke ſufficiently deſcribed the Graſſes, Ruſhes, Flags, Corne, and bulbous rooted Plants, which for the moſt part are ſuch as with their braue and gallant floures deck and beautifie gardens, and feed rather the eies than the belly. Now there remain certain other bulbs, whereof the moſt, though not all, ſerue for food: of which we will alſo diſcourſe in the firſt place in this booke, diuiding them in ſuch ſort, that thoſe of one kinde ſhal be ſeparated from another. ‡ In handling theſe and ſuch as next ſucceed them, we ſhal treat of diuers, yea the moſt part of thoſe herbs that the Greeks call by a generall name Λάχανα: and the Latines, *Olera*: and we in Engliſh, Sallet-herbs. When we haue paſt ouer theſe, we ſhal ſpeake of other plants, as they ſhal haue reſemblance each to other in their externall form.

Chap. 1. *Of Turneps.*

¶ *The Kindes.*

THere be ſundry ſorts of Turneps, ſome wild, ſome of the garden; ſome with round roots globe faſhion, other ouall or peare-faſhion; and another ſort longiſh or ſomewhat like a Radiſh: and of all theſe there are ſundry varieties, ſome being great, and ſome of a ſmaller ſort.

¶ *The Deſcription.*

1 THe Turnep hath long rough and greene leaues, cut or ſnipt about the edges with deepe gaſhes. The ſtalke diuideth it ſelfe into ſundry branches or armes, bearing at the top ſmall floures of a yellow colour, and ſometimes of a light purple: which being paſt, there do ſucceed long cods full of ſmall blackiſh ſeed like Rape ſeed: the root is round like a bowle, and ſometimes a little ſtretched out in length, growing very ſhallow in the ground, and often ſhewing it ſelfe aboue the face of the earth.

‡ 2 This is like the precedent in each reſpect, but that the root is not made ſo globous or bowle-faſhioned as the former, but ſlenderer, and much longer, as you may perceiue by the figure we here giue you. ‡

3 The ſmall Turnep is like vnto the firſt deſcribed, ſauing that it is leſſer. The root is much ſweeter in taſte, as my ſelfe haue often proued.

4 There is another ſort of ſmall Turnep ſaid to haue red roots; ‡ and there are other-ſome whoſe roots are yellow both within and without; ſome alſo are greene on the out-ſide, and other-ſome blackiſh.

¶ *The Place.*

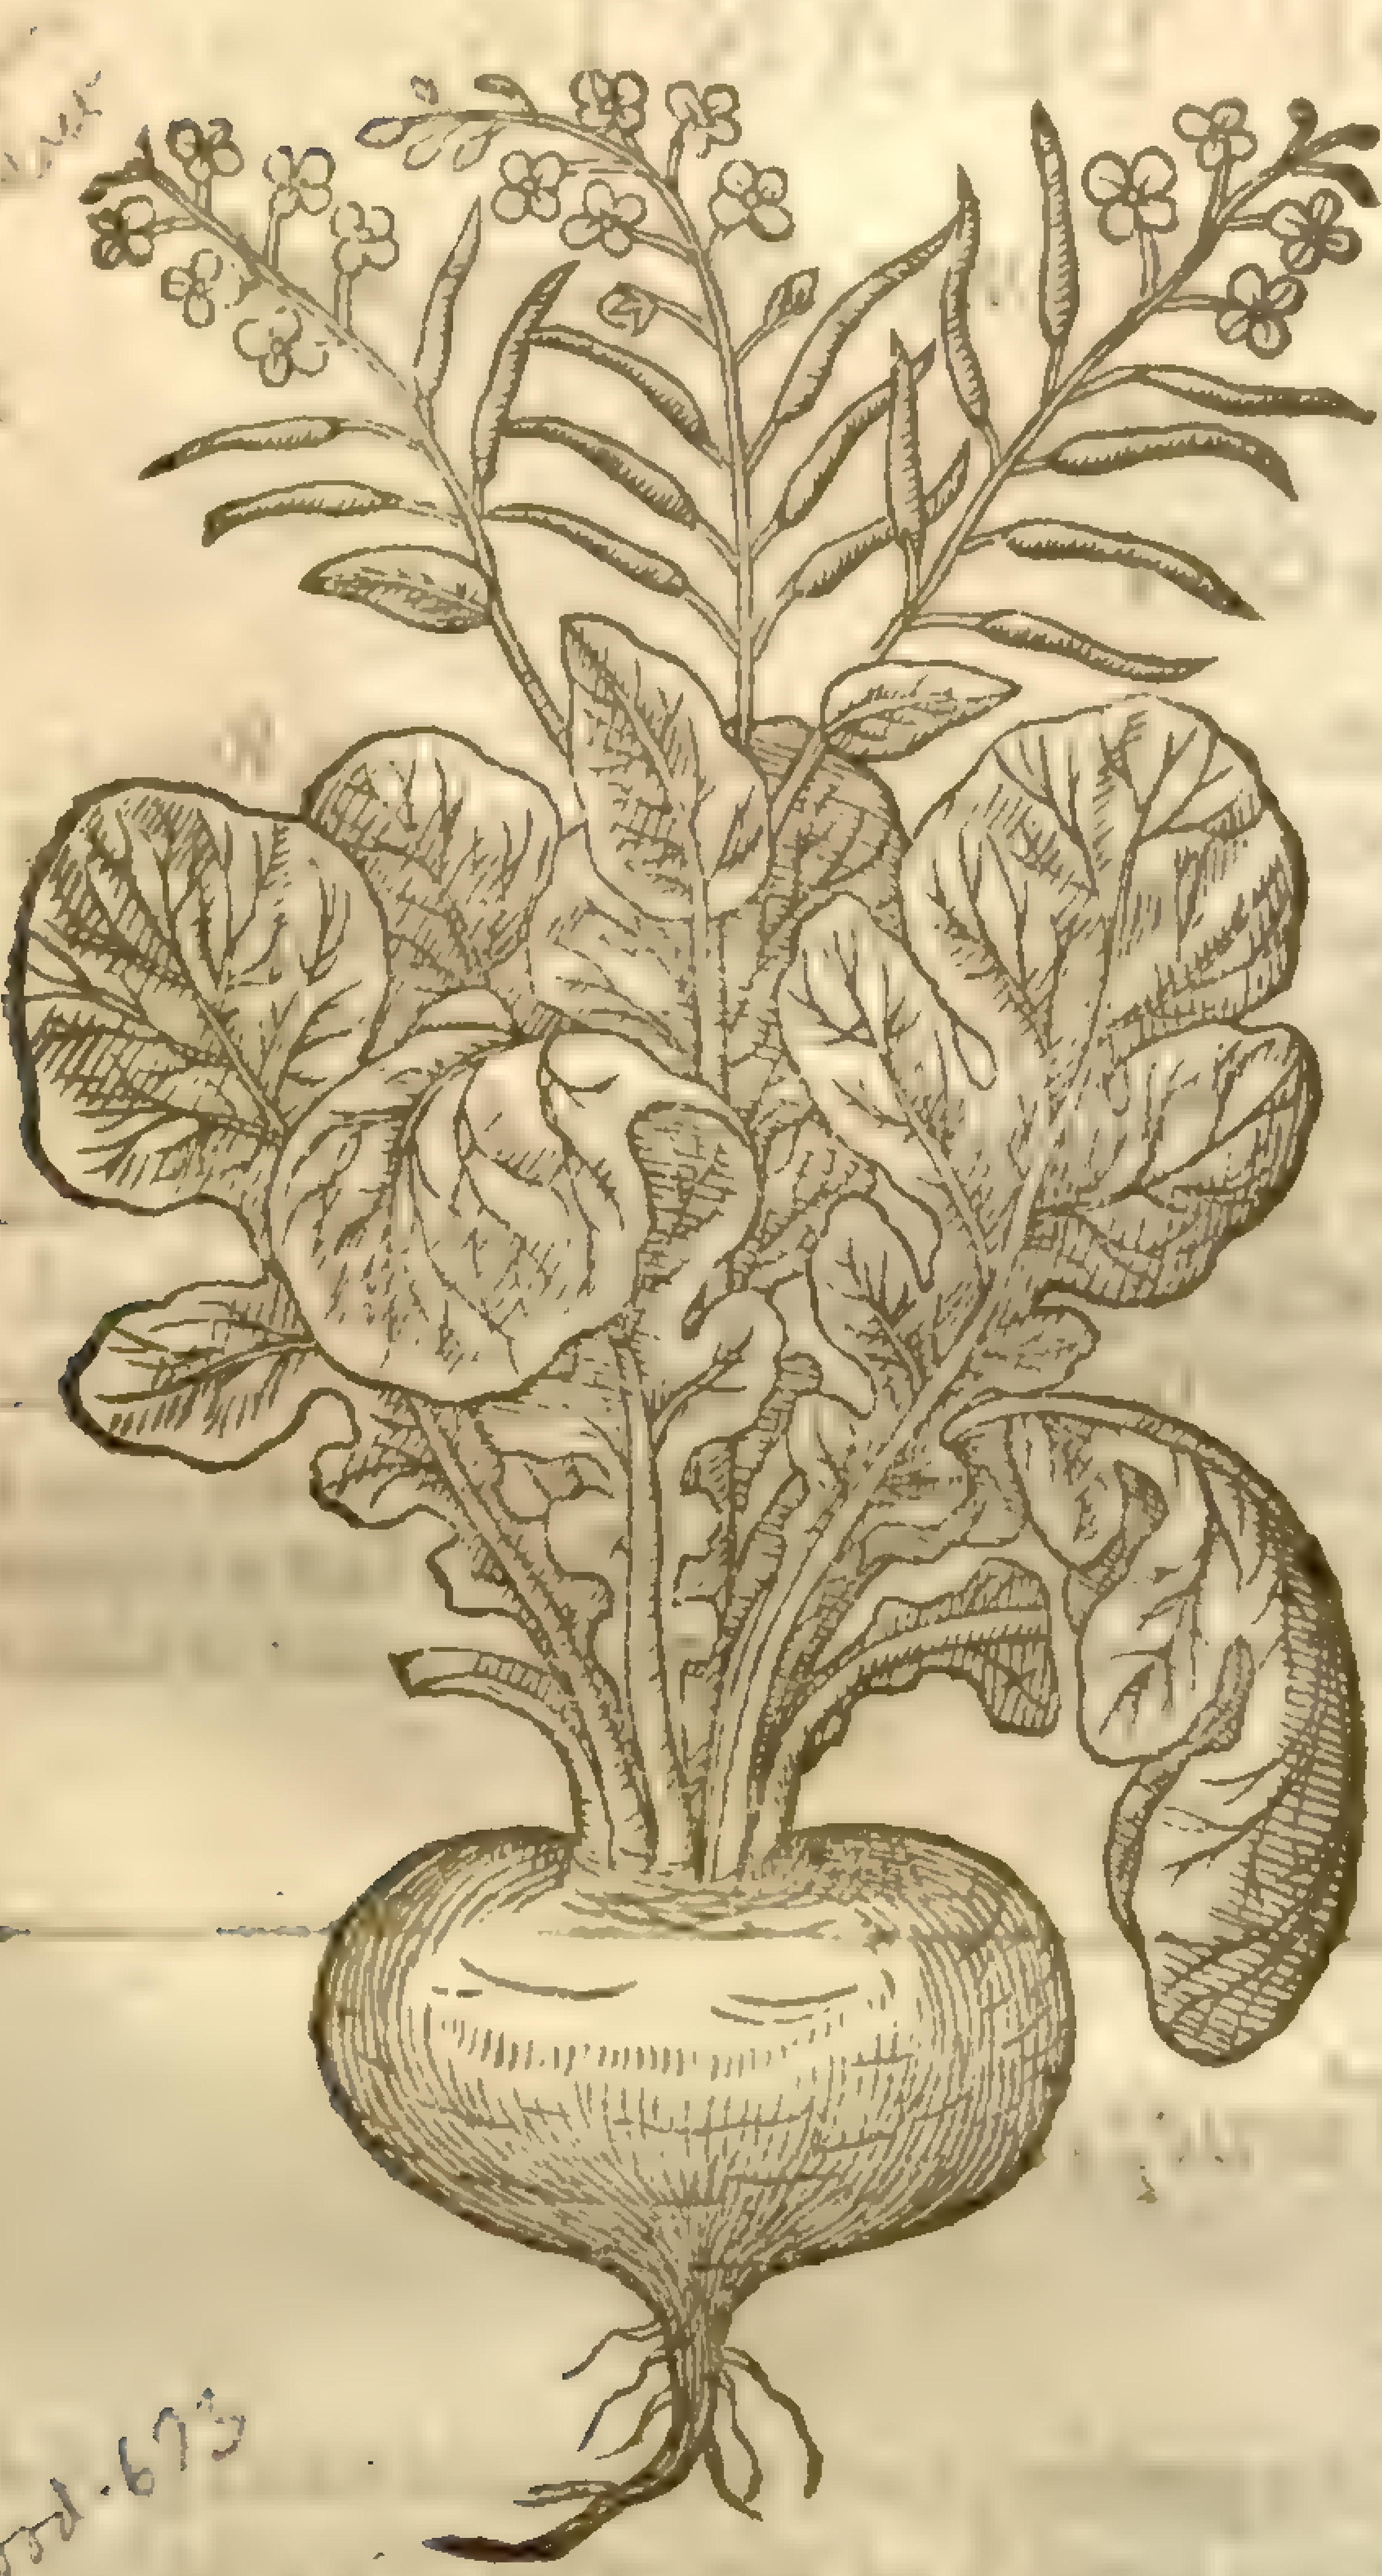
The Turnep proſpereth well in a light looſe and fat earth, and ſo looſe, as *Petrus Creſcentius* ſaith, that it may be turned almoſt into duſt. It groweth in fields and diuers vineyards and hop-gardens in moſt places of England.

The ſmall Turnep growes by Hackney in a ſandy ground, and thoſe that are brought to Cheapſide market from that village are the beſt that euer I taſted.

¶ *The Time.*

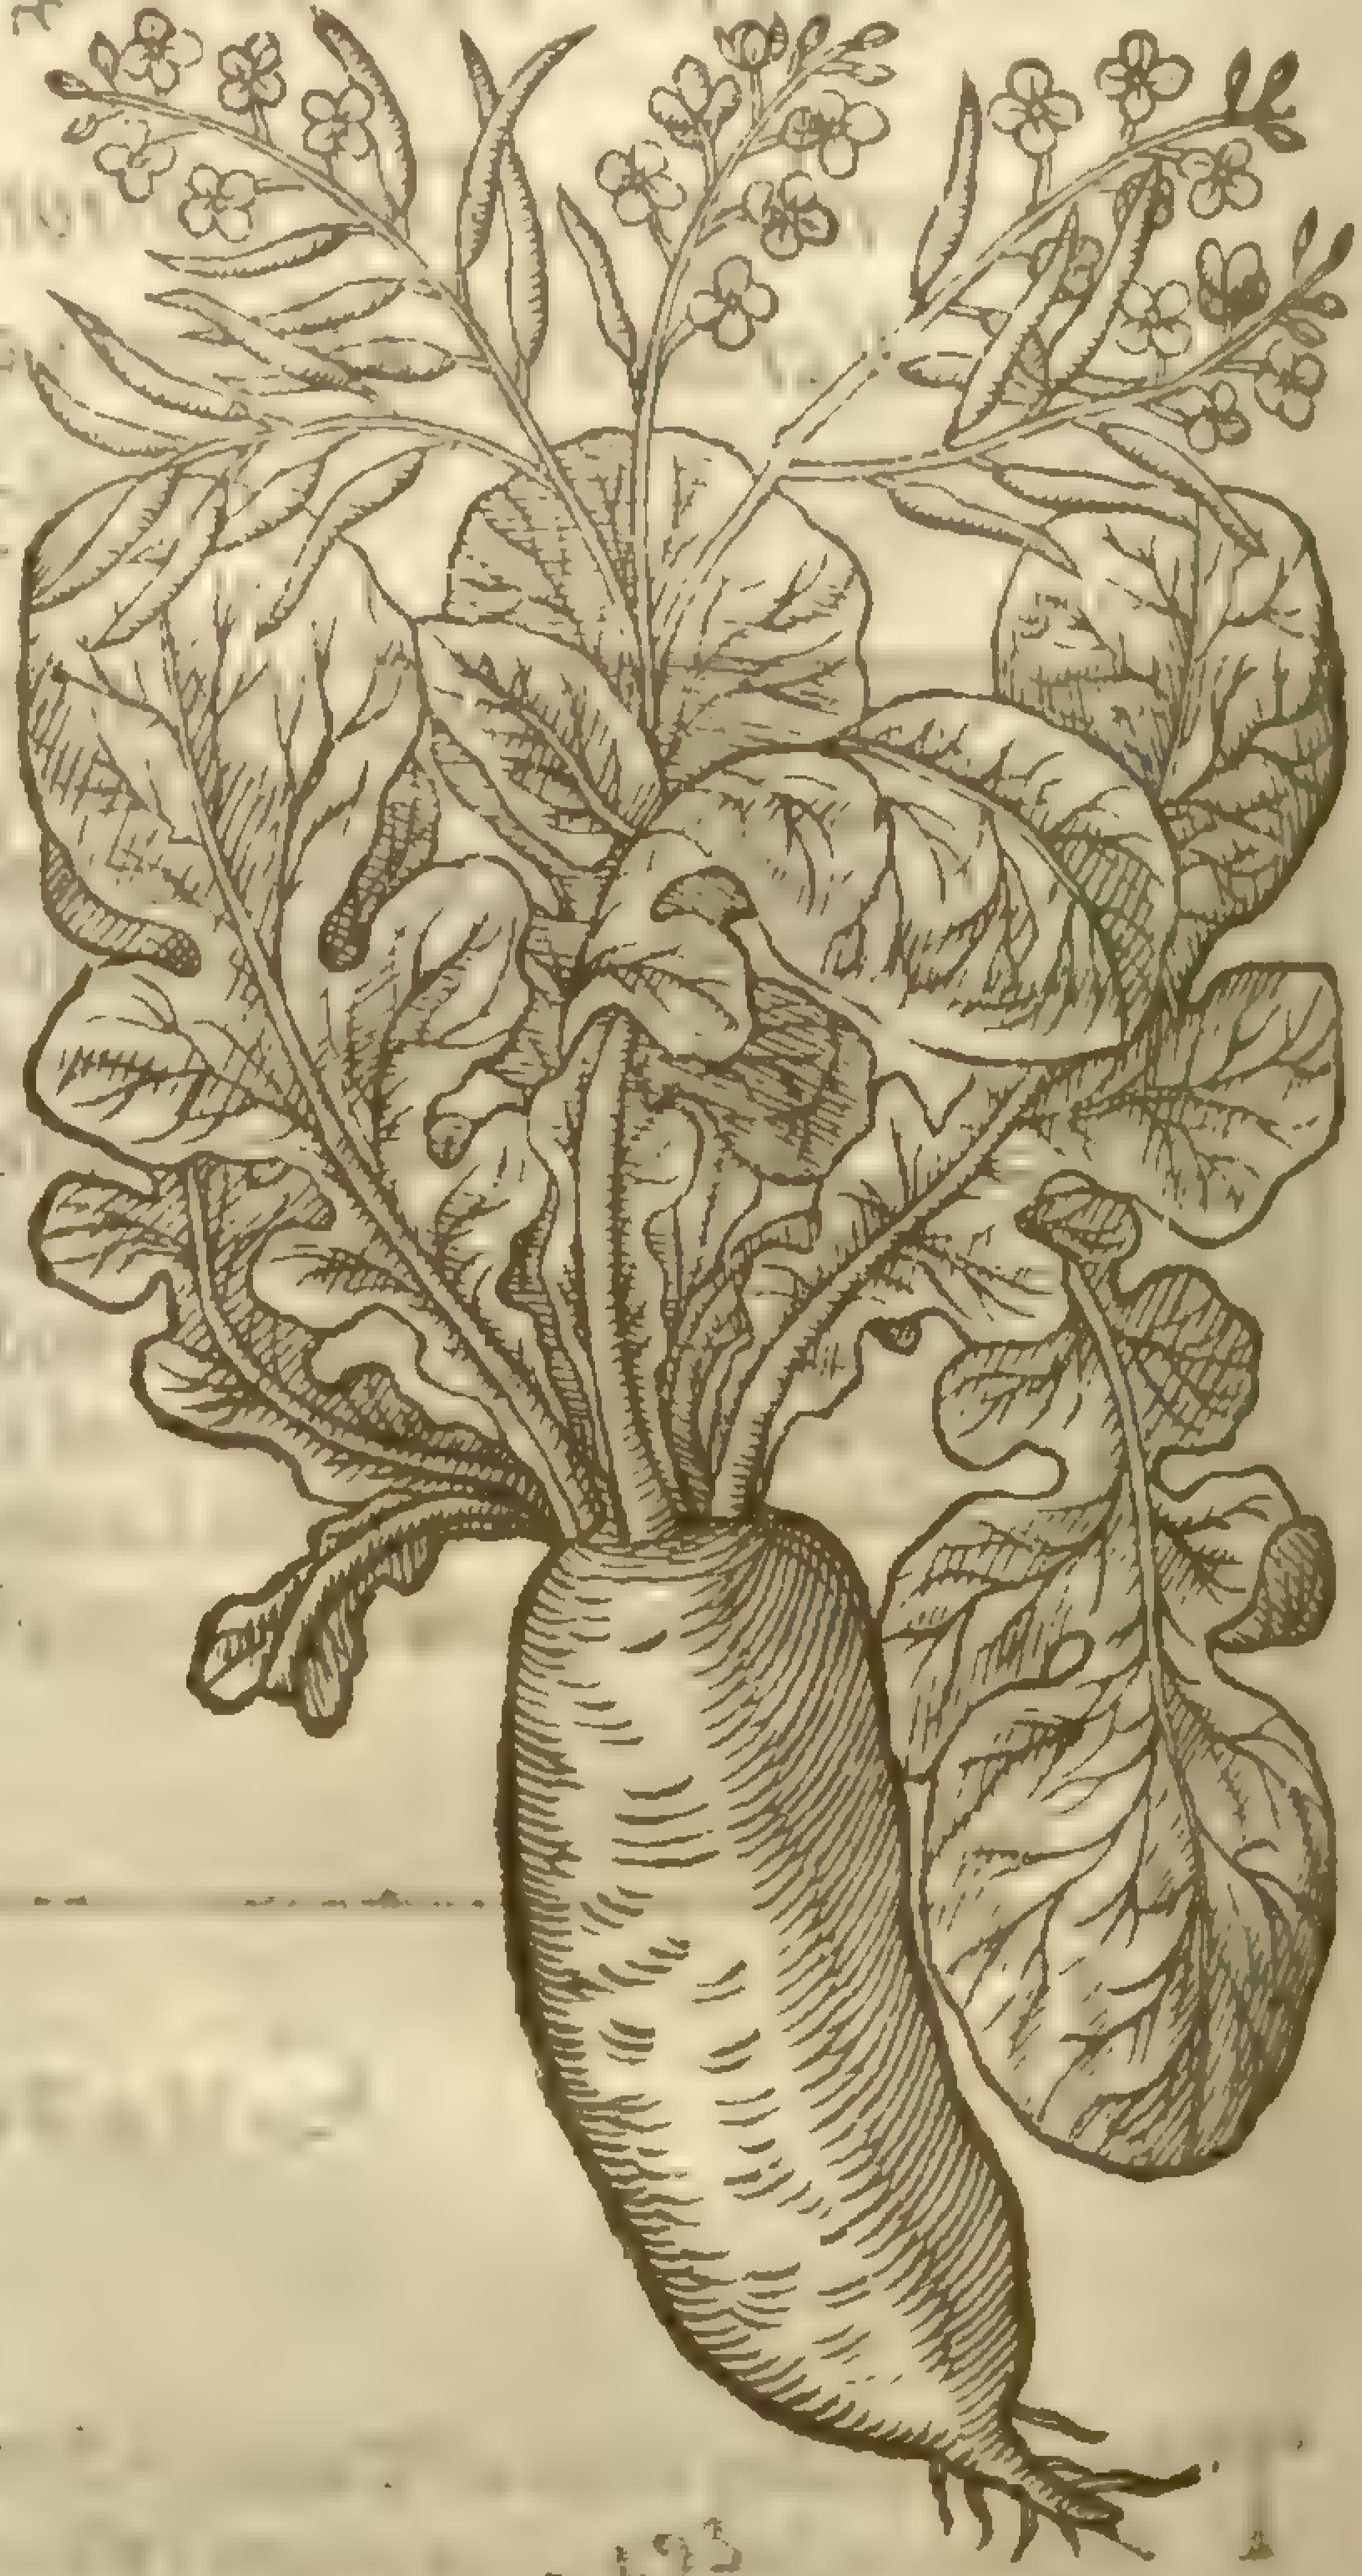
Turneps are ſown in the ſpring, as alſo in the end of Auguſt. They floure and ſeed the ſecond yeare after they are ſowne: for thoſe that floure the ſame yeare that they are ſown, are a degenerat kind, called in Cheſhire about the Namptwich, Madneps, of their euill qualitie in cauſing frenſie and giddineſſe of the brain for a ſeaſon.

1 *Rapum majus.*
Great Turnep,



pod. 673

‡ 2 *Rapum radice oblonga.*
Longiſh rooted Turnep.



pod. 673

¶ *The Names.*

The Turnep is called in Latine, *Rapum*: in Greek, γογγύλη: the name commonly vſed in ſhops and euery where, is *Rapa*. The Lacedemonians call it γαστήρ: the Boetians, ζεκελτῖς, as *Athenæus* reporteth: in high-Dutch, **Ruben**: in low-Dutch, **Rapen**: in French, *Naveau rond*: in Spaniſh, *Nabo*: in Engliſh, Turnep, and Rape.

¶ *The Temperature and Vertues.*

The bulbous or knobbed root, which is properly called *Rapum* or Turnep, and hath giuen name to the plant, is many times eaten raw, eſpecially of the poore people in Wales, but moſt commonly boiled. The raw root is windy, and engendreth groſſe and cold bloud: the boiled doth coole leſſe, and ſo little, that it cannot be perceiued to coole at all, yet is it moiſt and windy.

B It auaileth not a little after what maner it is prepared; for being boiled in water, or in a certain broth, it is more moiſt, and ſooner deſcendeth, and maketh the body more ſoluble; but being roſted or baked, it drieth, and ingendreth leſſe winde, and yet it is not altogether without wind: but howſoeuer they be dreſſed, they yeeld more plenty of nouriſhment than thoſe that are eaten raw: they do encreaſe milke in womens breſts, and naturall ſeed, and alſo prouoke vrin.

C The decoction of Turneps is good againſt the cough and hoarſeneſſe of the voice, being drunke in the euening with a little ſugar, or a quantitie of clarified hony.

D *Dioſcorides* writeth, That the Turnep it ſelfe being ſtamped, is with good ſucceſſe applied vpon mouldy or kibed heeles, and that alſo oile of Roſes boiled in a hollow turnep vnder the hot embers doth cure the ſame.

The yong and tender ſhoots or ſprings of Turneps at their firſt comming forth of the ground, boiled and eaten as a ſallad prouoke vrin. E

The ſeed is mixt with Counterpoiſons and Treacles, and beeing drunke it is a remedie againſt poiſons. F

They of the Low-countries do giue the oile which is preſſed out of the ſeed, againſt the afterthrowes of women newly brought to bed, and alſo miniſter it to yong children againſt the worms, which it both killeth and driueth forth. G

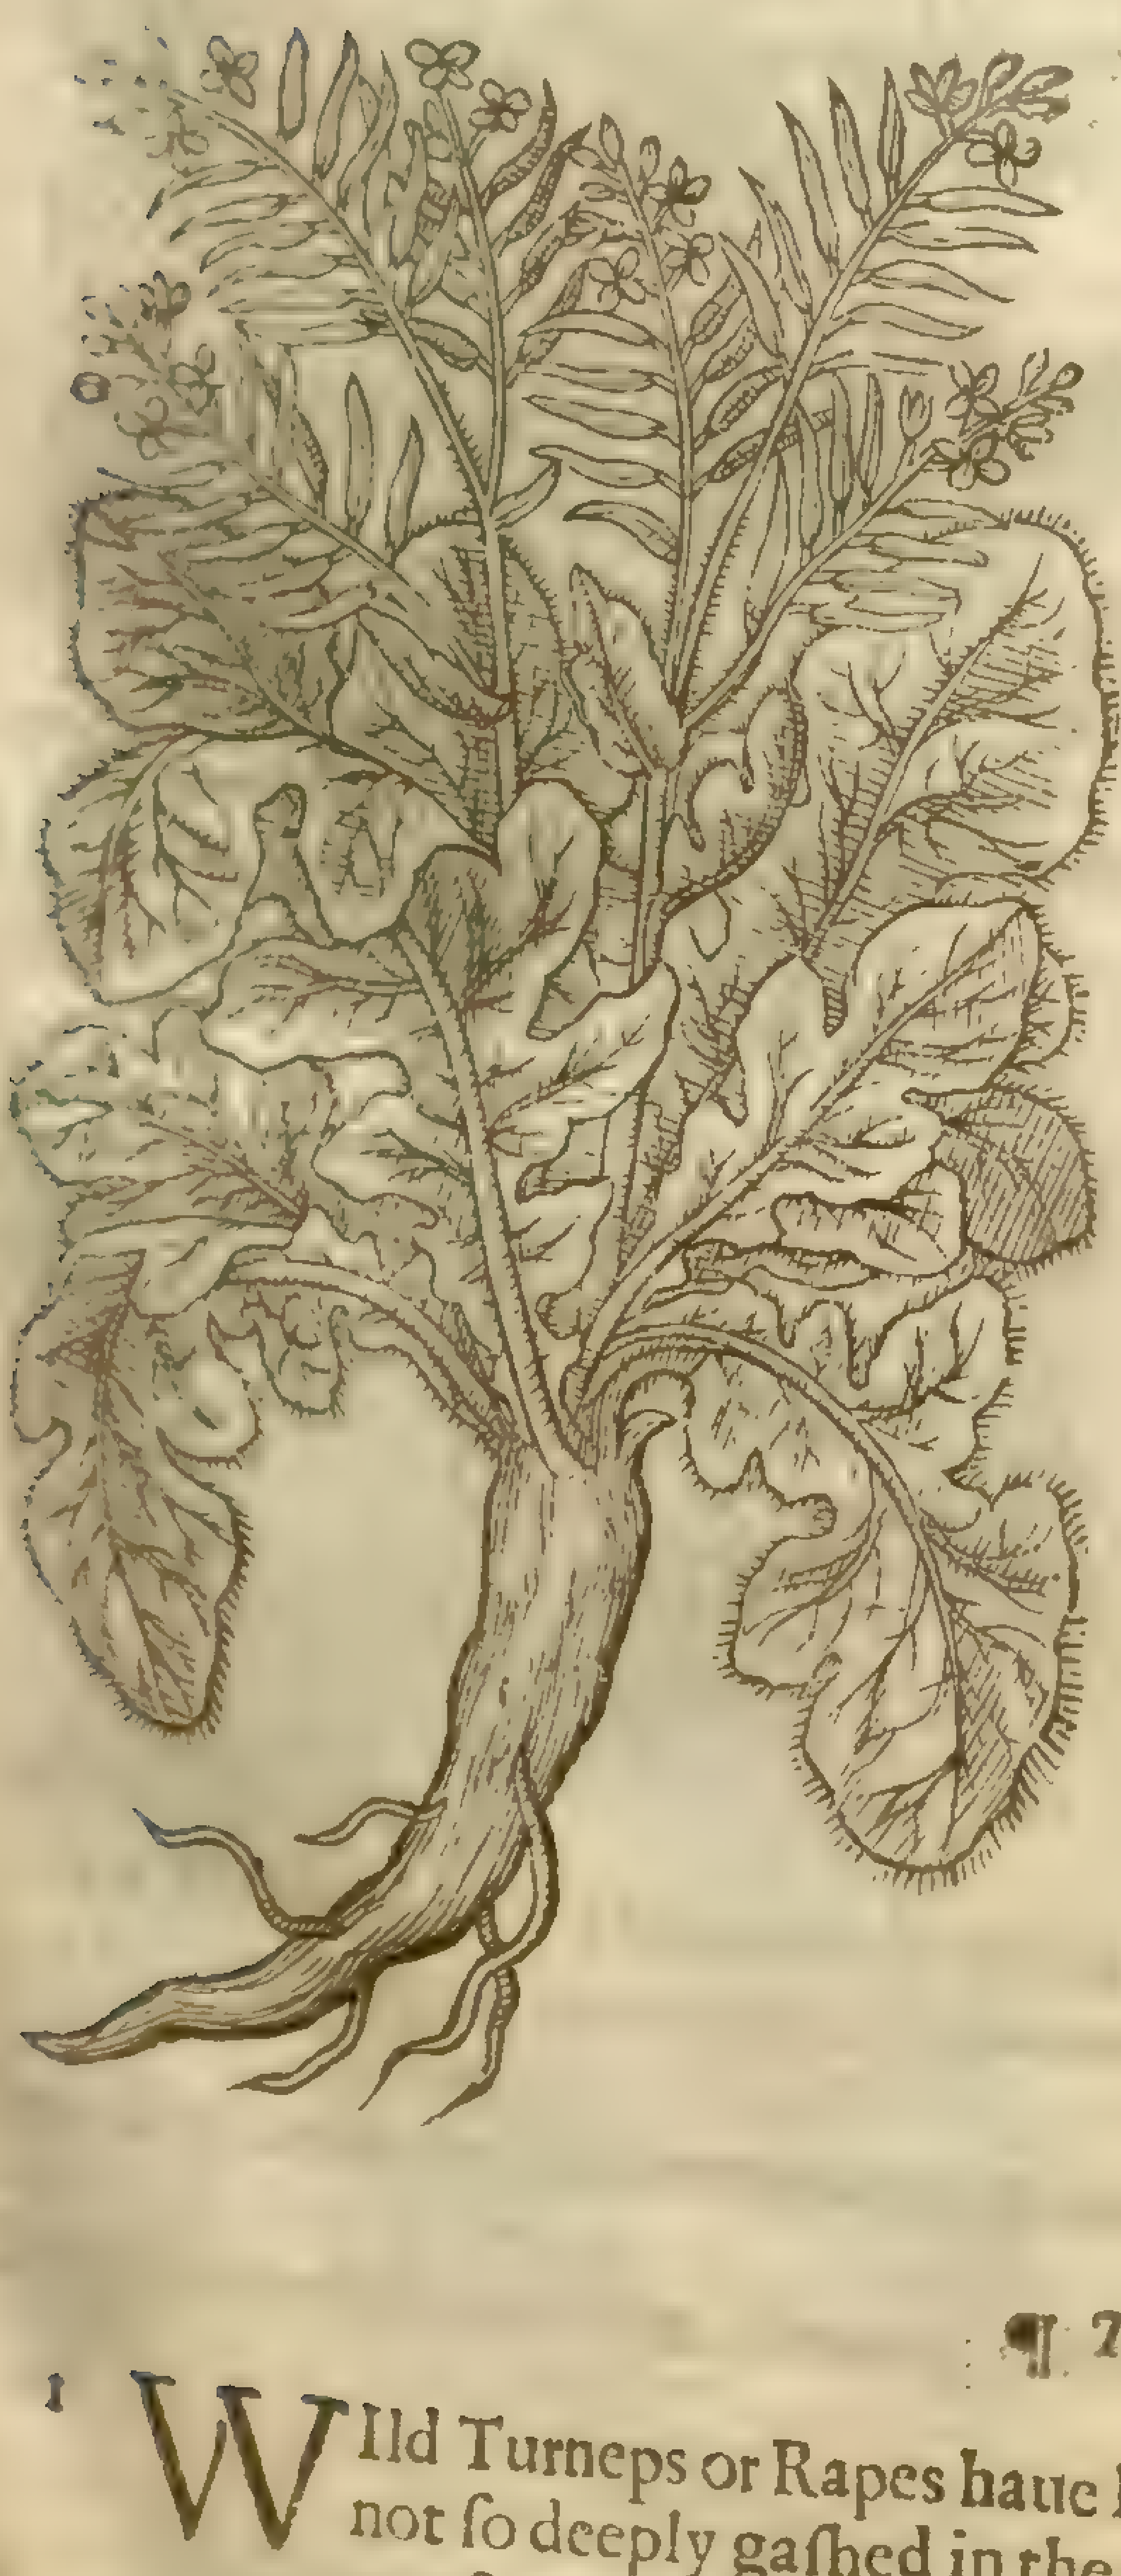
The oile waſhed with water doth allay the feruent heat and ruggedneſſe of the skin. H

CHAP. 2. *Of wilde Turneps.*

¶ *The Kindes.*

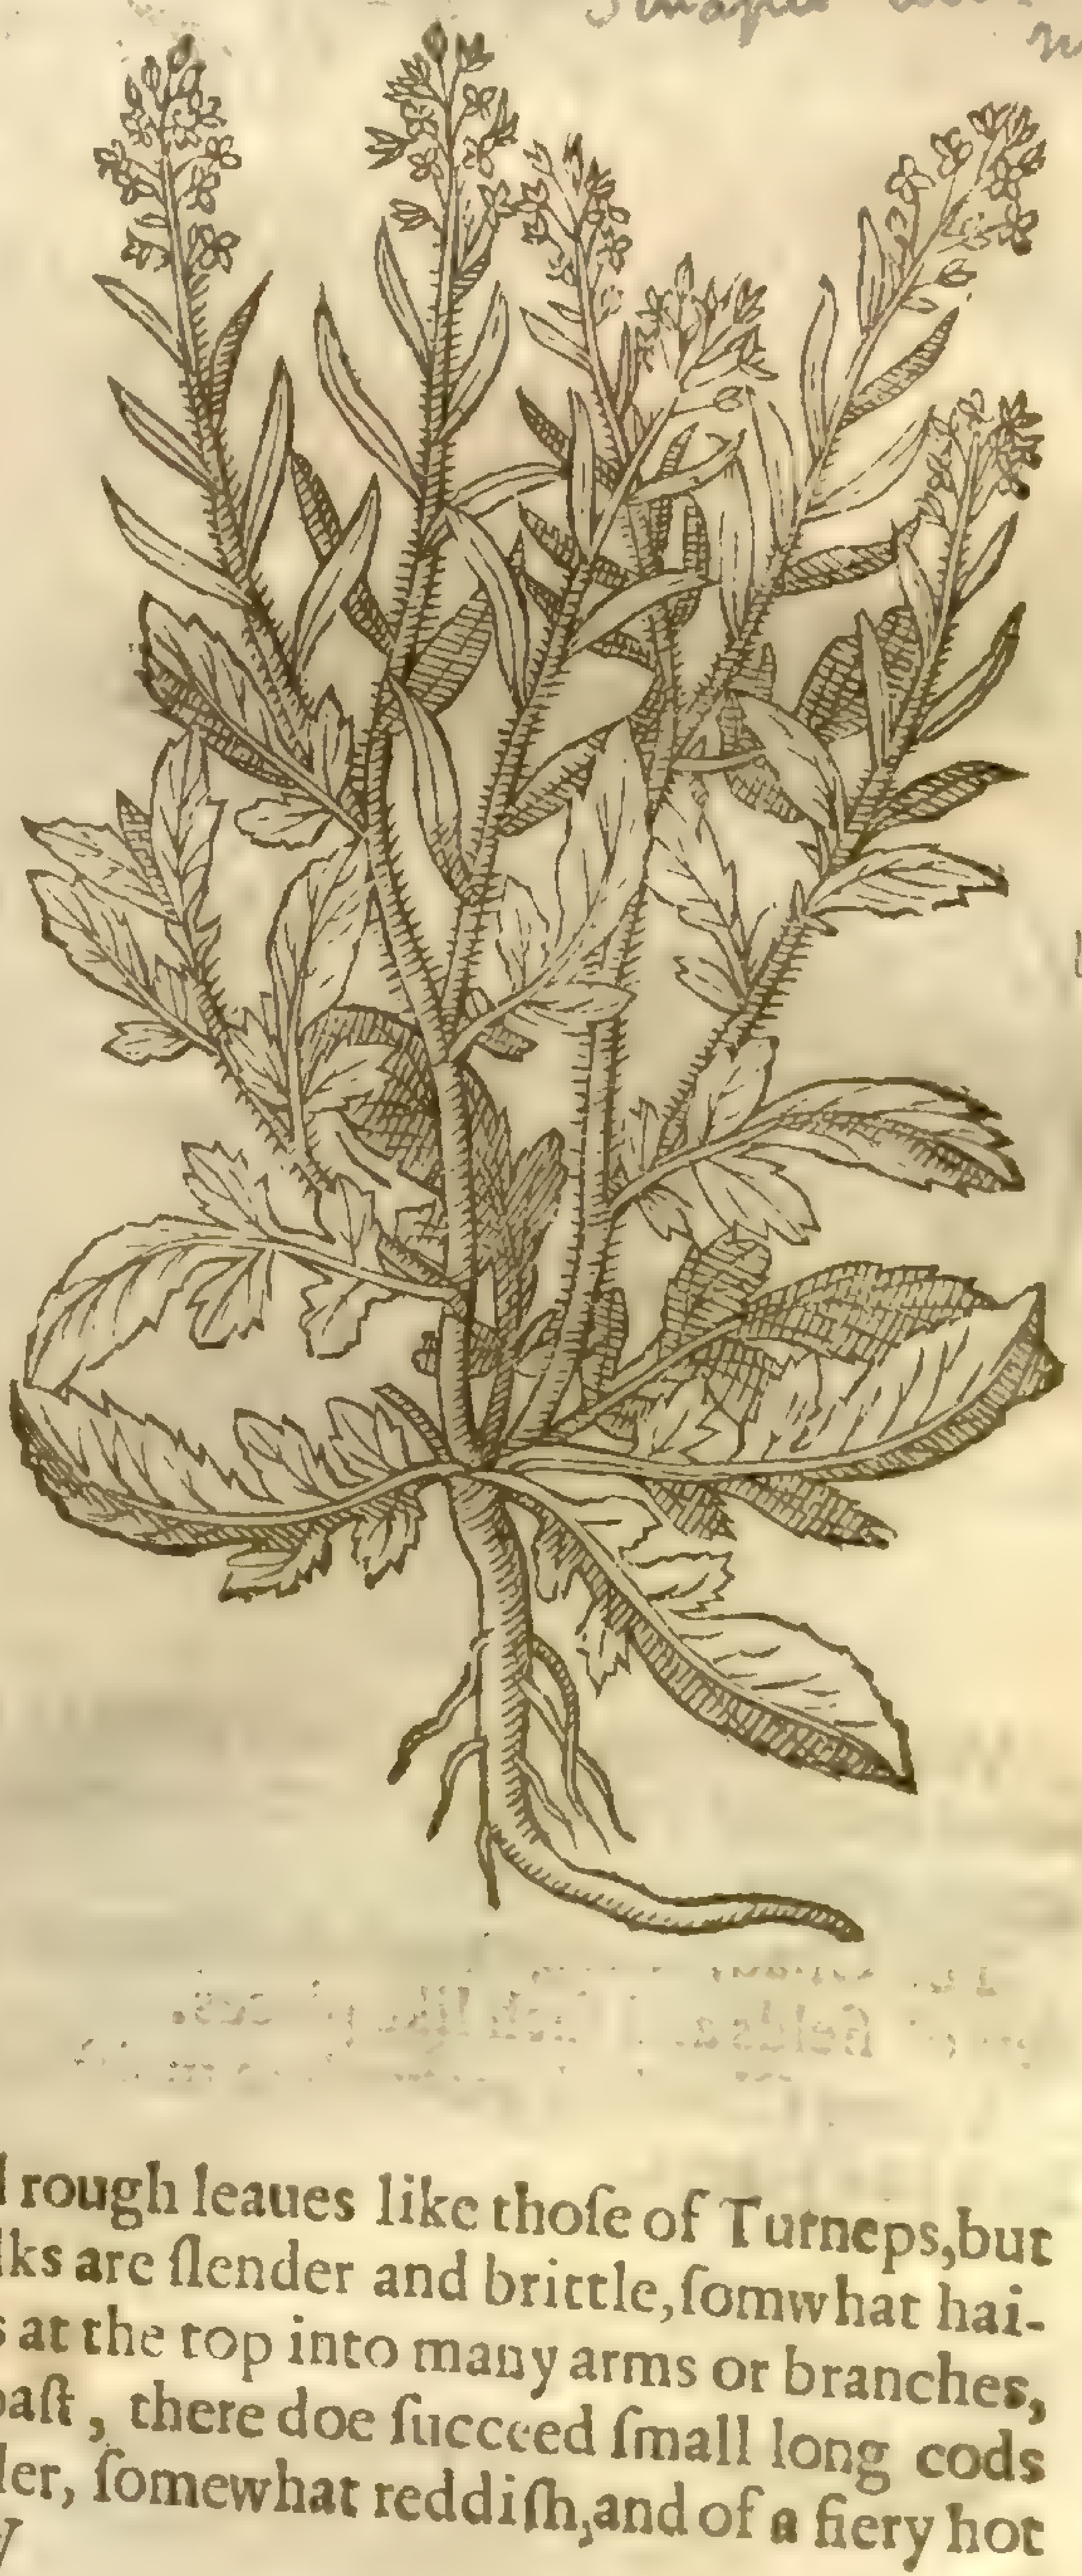
THere be three ſorts of wild Turneps; one our common Rape which beareth the ſeed whereof is made Rape oile, and feedeth ſinging birds: the other the common enemy to corn, which we call Charlock; whereof there be two kinds, one with a yellow or els purple floure, the other with a white floure: there is alſo another of the water and mariſh grounds.

1 *Rapum ſylveſtre.*
Wilde Turneps.



2 *Rapiſtrum arvorum.*
Charlock or Chadlock.

Sinapis arvensis, [illegible]



Lob. ic. 198

¶ *The Deſcription.*

1 WIld Turneps or Rapes haue long broad and rough leaues like thoſe of Turneps, but not ſo deeply gaſhed in the edges, The ſtalks are ſlender and brittle, ſomwhat hairy, of two cubits high, diuiding themſelues at the top into many arms or branches, whereon doe grow little yellowiſh floures: which being paſt, there doe ſucceed ſmall long cods which containe the ſeed like that of the Turnep, but ſmaller, ſomewhat reddiſh, and of a fiery hot

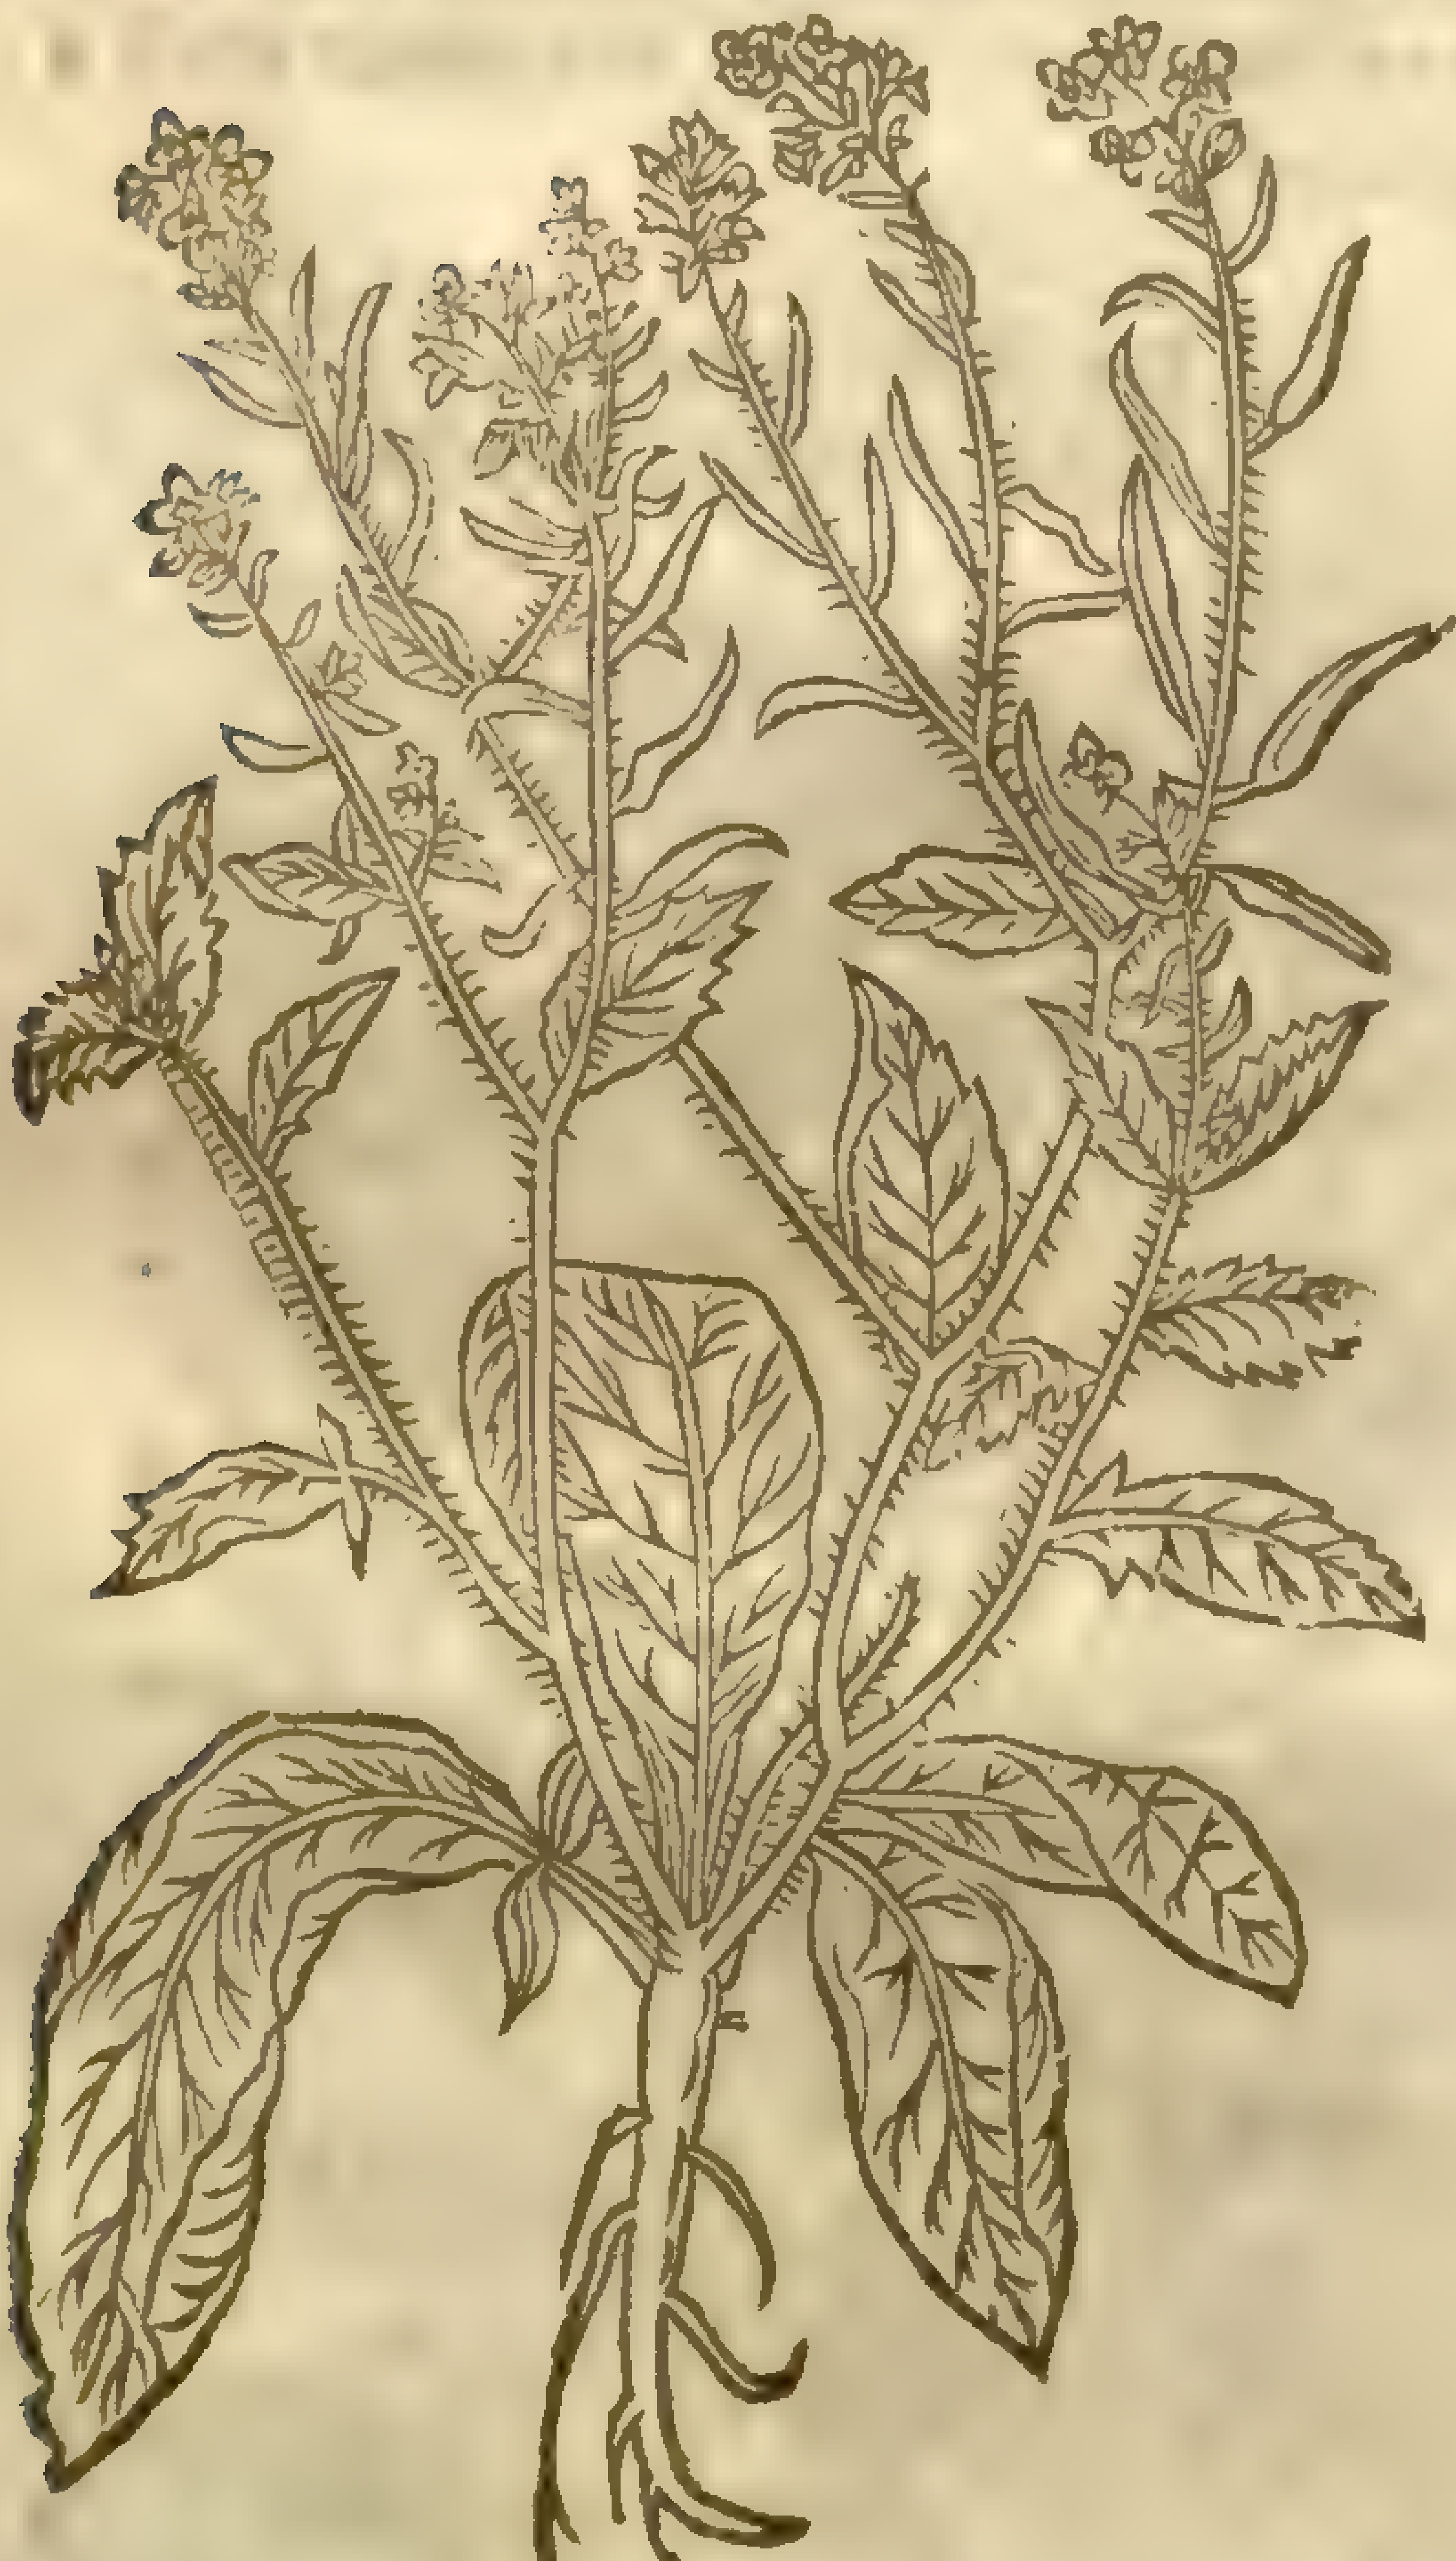
and biting taſte as is the muſtard, but bitterer. The root is ſmall, and periſheth when the ſeed is ripe.

2 Charlocke or wild Rape hath leaues like vnto the former, but leſſer, the ſtalk and leaues being alſo rough. The ſtalks be of a cubit high, ſlender and branched: the floures are ſomtimes purpliſh, but more often yellow. The roots are ſlender, with certaine threds or ſtrings hanging vpon them.

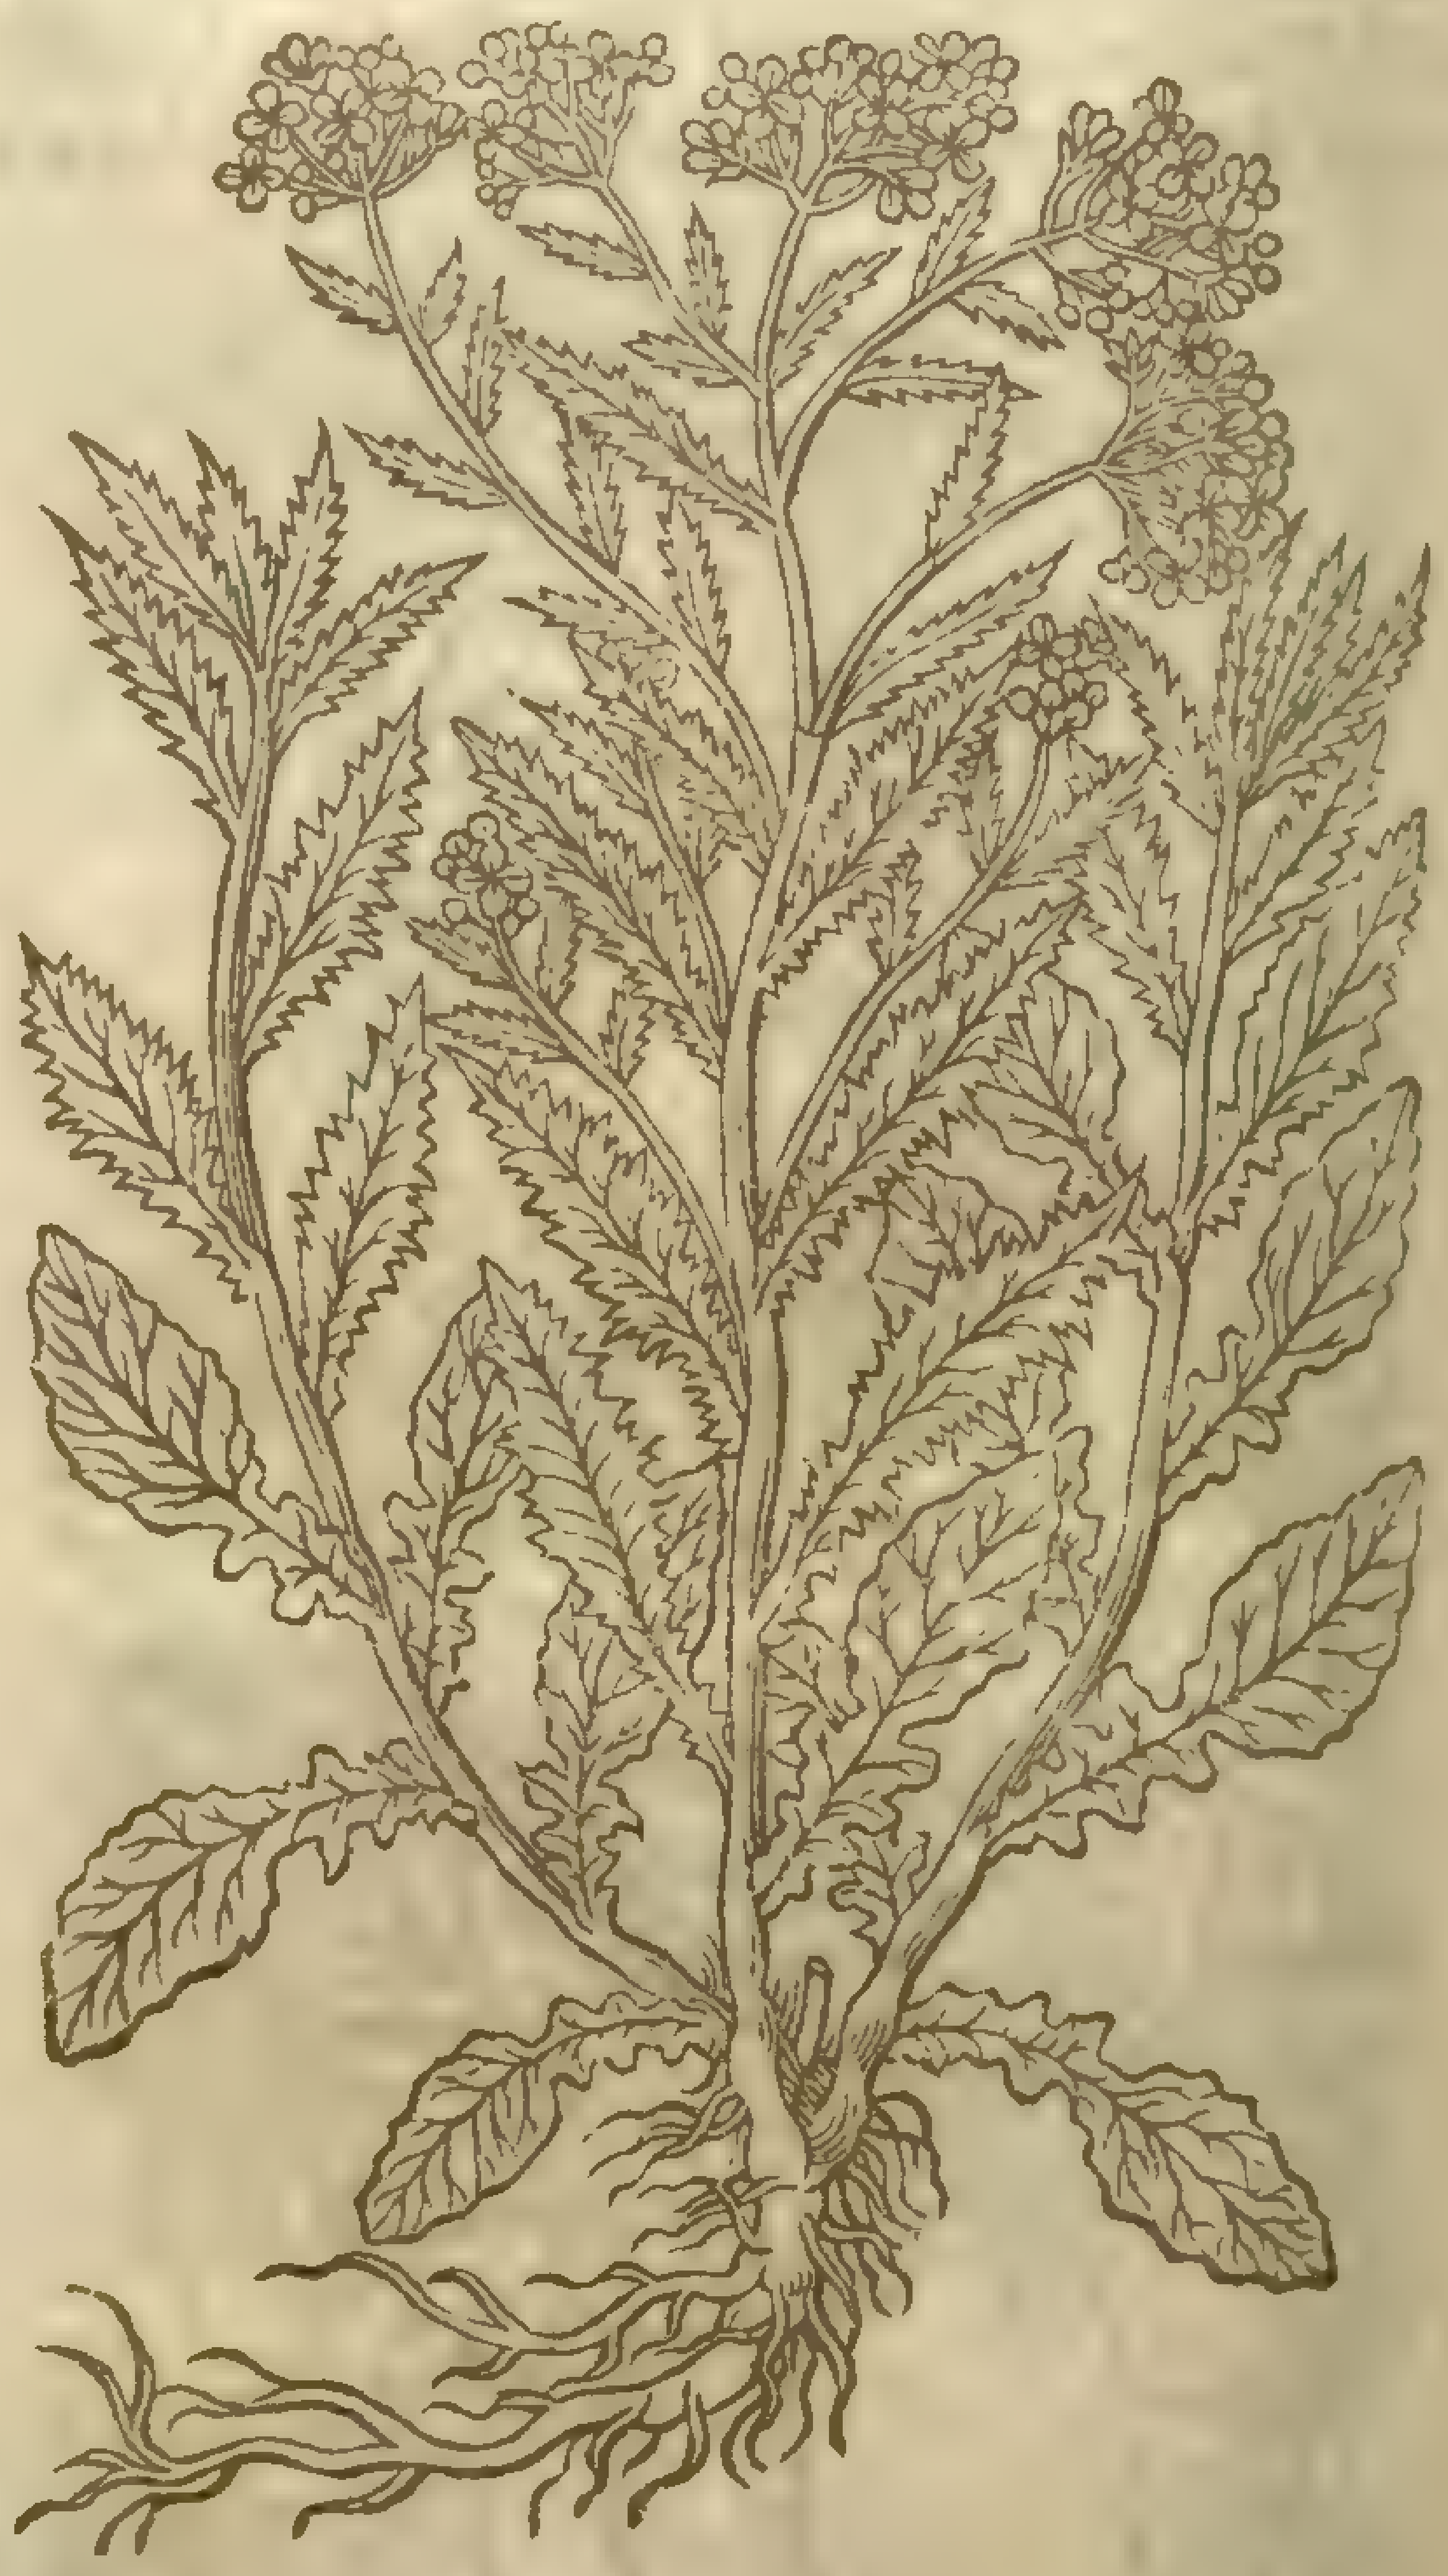
‡ There is alſo another varietie hereof, with the leaues leſſe diuided, and much ſmoother than the two laſt deſcribed, hauing yellow floures and cods not ſo deeply ioynted as the laſt deſcribed: this is that which is ſet forth by *Matthiolus* vnder the name of *Lampſana.*

2 Water Chadlock groweth vp to the height of three foot and ſomwhat more, with branches ſlender and ſmooth in reſpect of any of the reſt of his kinde, ſet with rough ribbed leaues deepely indented about the lower part of the leafe. The floures grow at the top of the branches, vmble or tuft faſhion ſometimes of one colour, and ſometimes of another. ‡ The root is long, tough, and full of ſtrings, creeping and putting forth many ſtalks: the ſeed-veſſels are ſhort and ſmal. *Bauhine* hath this vnder the title of *Raphanus aquaticus alter.* ‡

2 *Rapiſtrum arvenſe alterum.*
Another wilde Charlocke.



2 *Rapiſtrum aquaticum.*
Water Chadlocke.



¶ *The Place.*

Wilde Turneps or Rapes doe grow of themſelues in fallow fields, and likewiſe by high-wayes neere vnto old walls, vpon ditch banks, and neere vnto towns and villages, and in other vntoiled and rough places.

The Chadlocke groweth for the moſt part among corn in barren grounds, and often by the borders of fields and ſuch like places.

Water Chadlock groweth in moiſt medowes and mariſh grounds, as alſo in water ditches and ſuch like places.

¶ *The Time.*

Theſe do floure from March, till Summer be far ſpent, and in the mean ſeaſon the ſeed is ripe.

¶ *The Names.*

Wilde Turnep is called in Latine, *Rapiſtrum, Rapum ſylveſtre*; and of ſome, *Sinapi ſylveſtre*, or wilde muſtard: in high-Dutch, **Hederich**: in Low-Dutch, **Herick**: in French, *Velar*: in Engliſh, Rape, and Rape ſeed. *Rapiſtrum arvorum* is called Charlock, and Carlock.

¶ *The Temperature.*

The ſeed of theſe wild kinds of Turneps, as alſo the water Chadlock, are hot and dry as muſtard ſeed is. Some haue thought that Charlock hath a drying and clenſing qualitie, and ſomwhat digeſting.

¶ *The Vertues.*

Diuers vſe the ſeed of Rape in ſtead of Muſtard ſeed, who either make herof a ſauce bearing the name of Muſtard, or elſe mix it with muſtard ſeed; but this kind of ſauce is not ſo pleaſant to the taſte, becauſe it is not ſo bitter. A

Galen writeth, That theſe being eaten ingender euill bloud; yet *Dioſcorides* ſaith, they warm the ſtomacke, and nouriſh ſomewhat. B

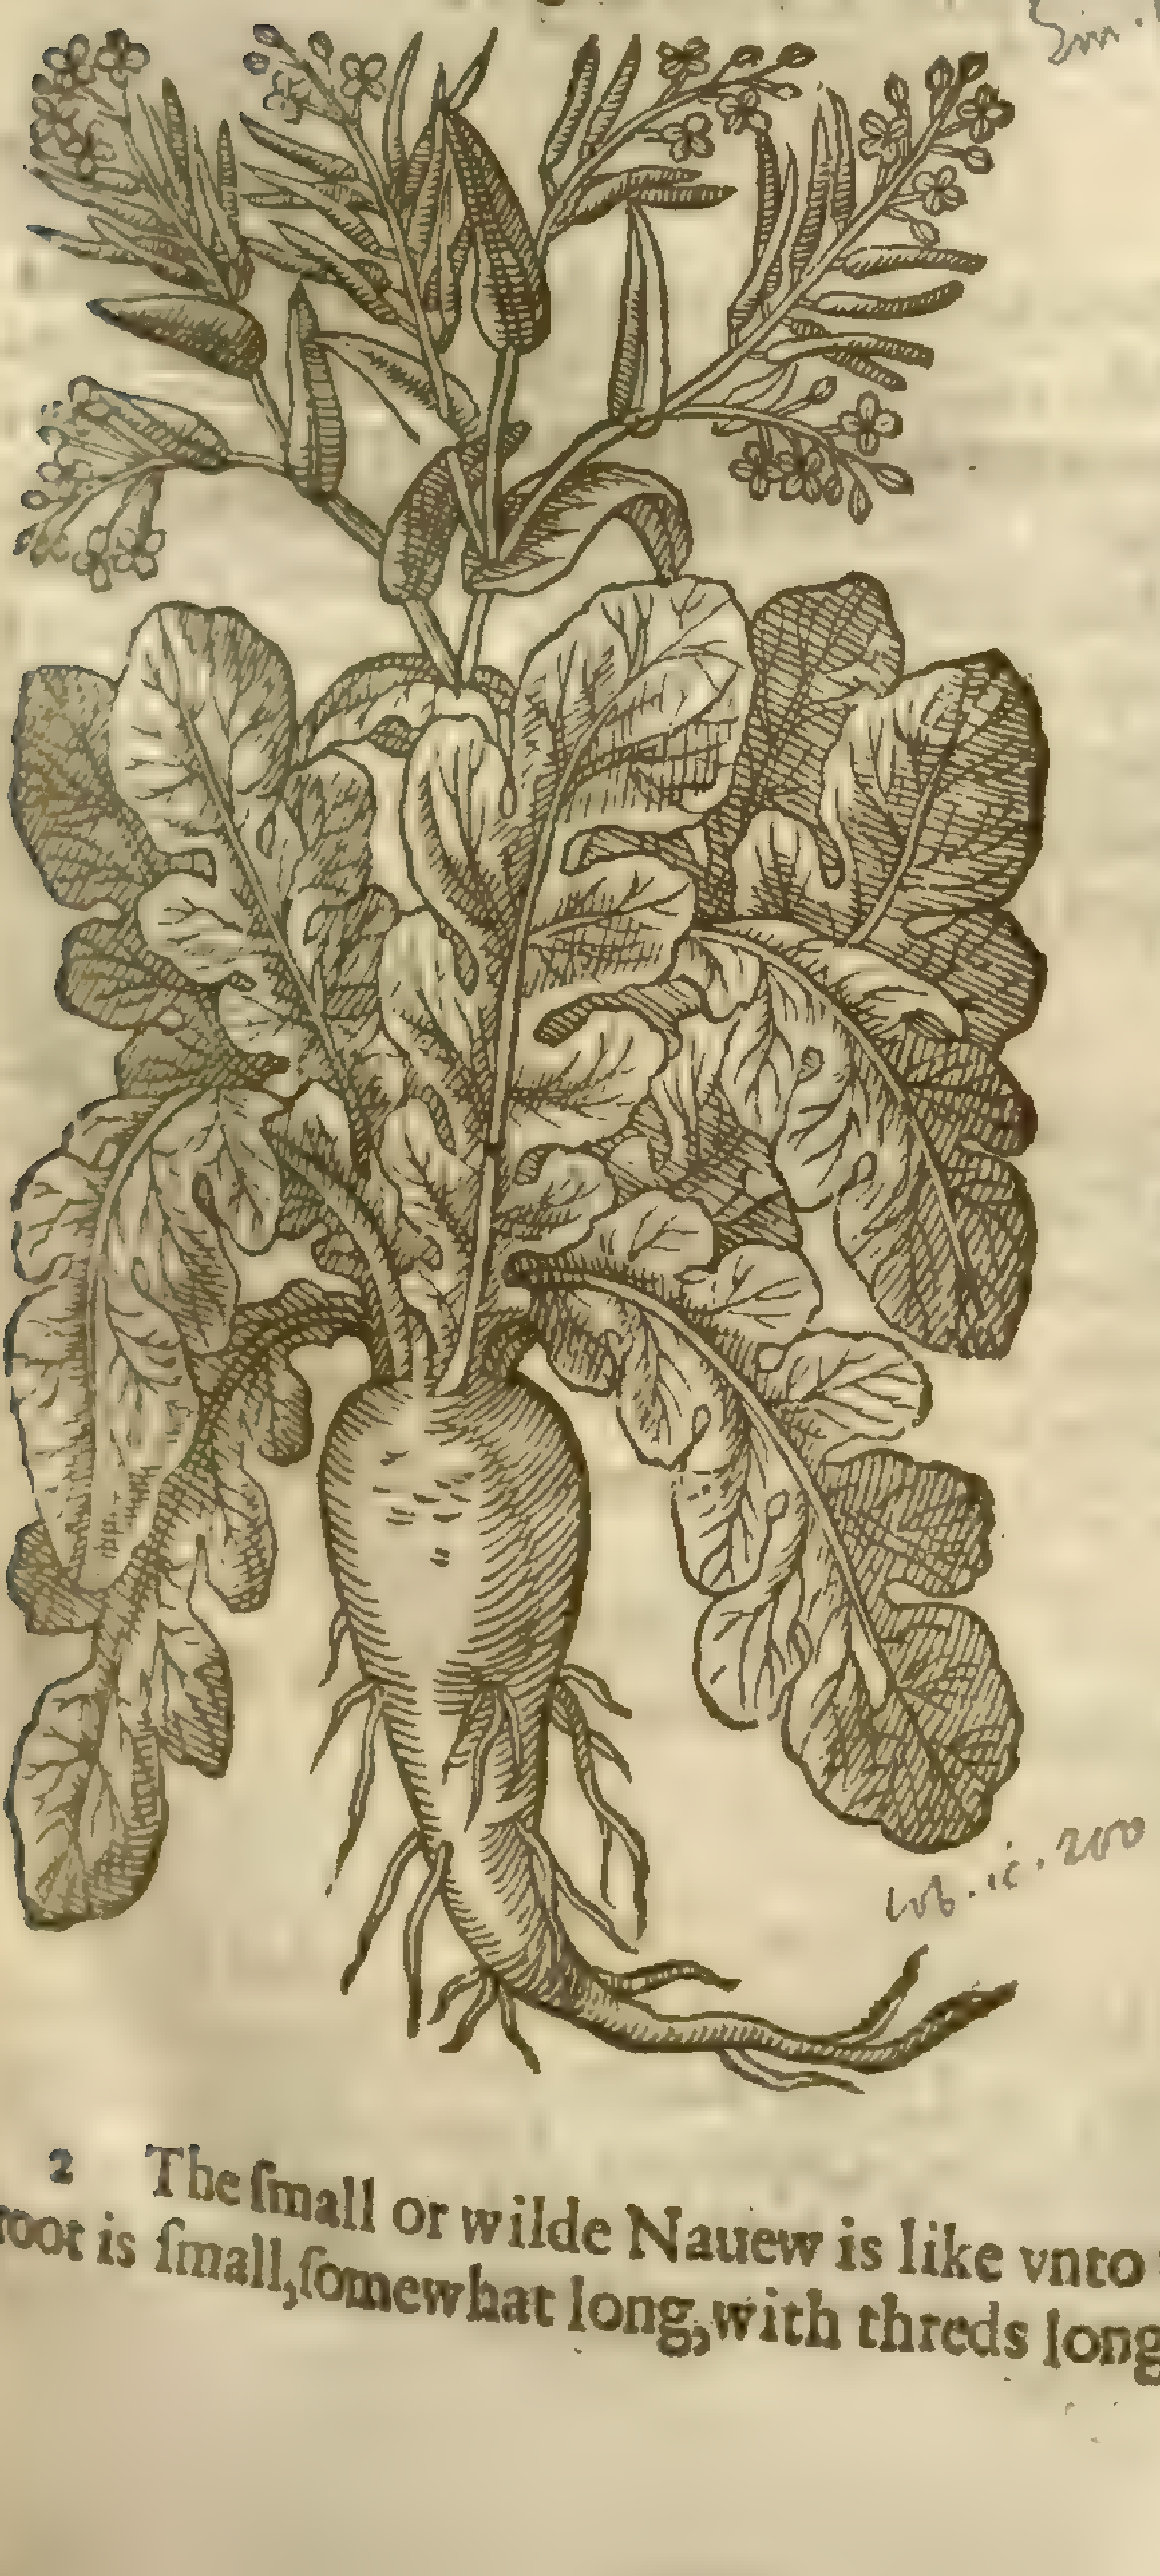
CHAP. 3. *Of Nauewes.*

¶ *The Kindes.*

There be ſundry kinds of Nape or Nauewes degenerating from the kinds of Turnep; of which, ſome are of the garden, and other wild or of the field.

¶ *The Deſcription.*

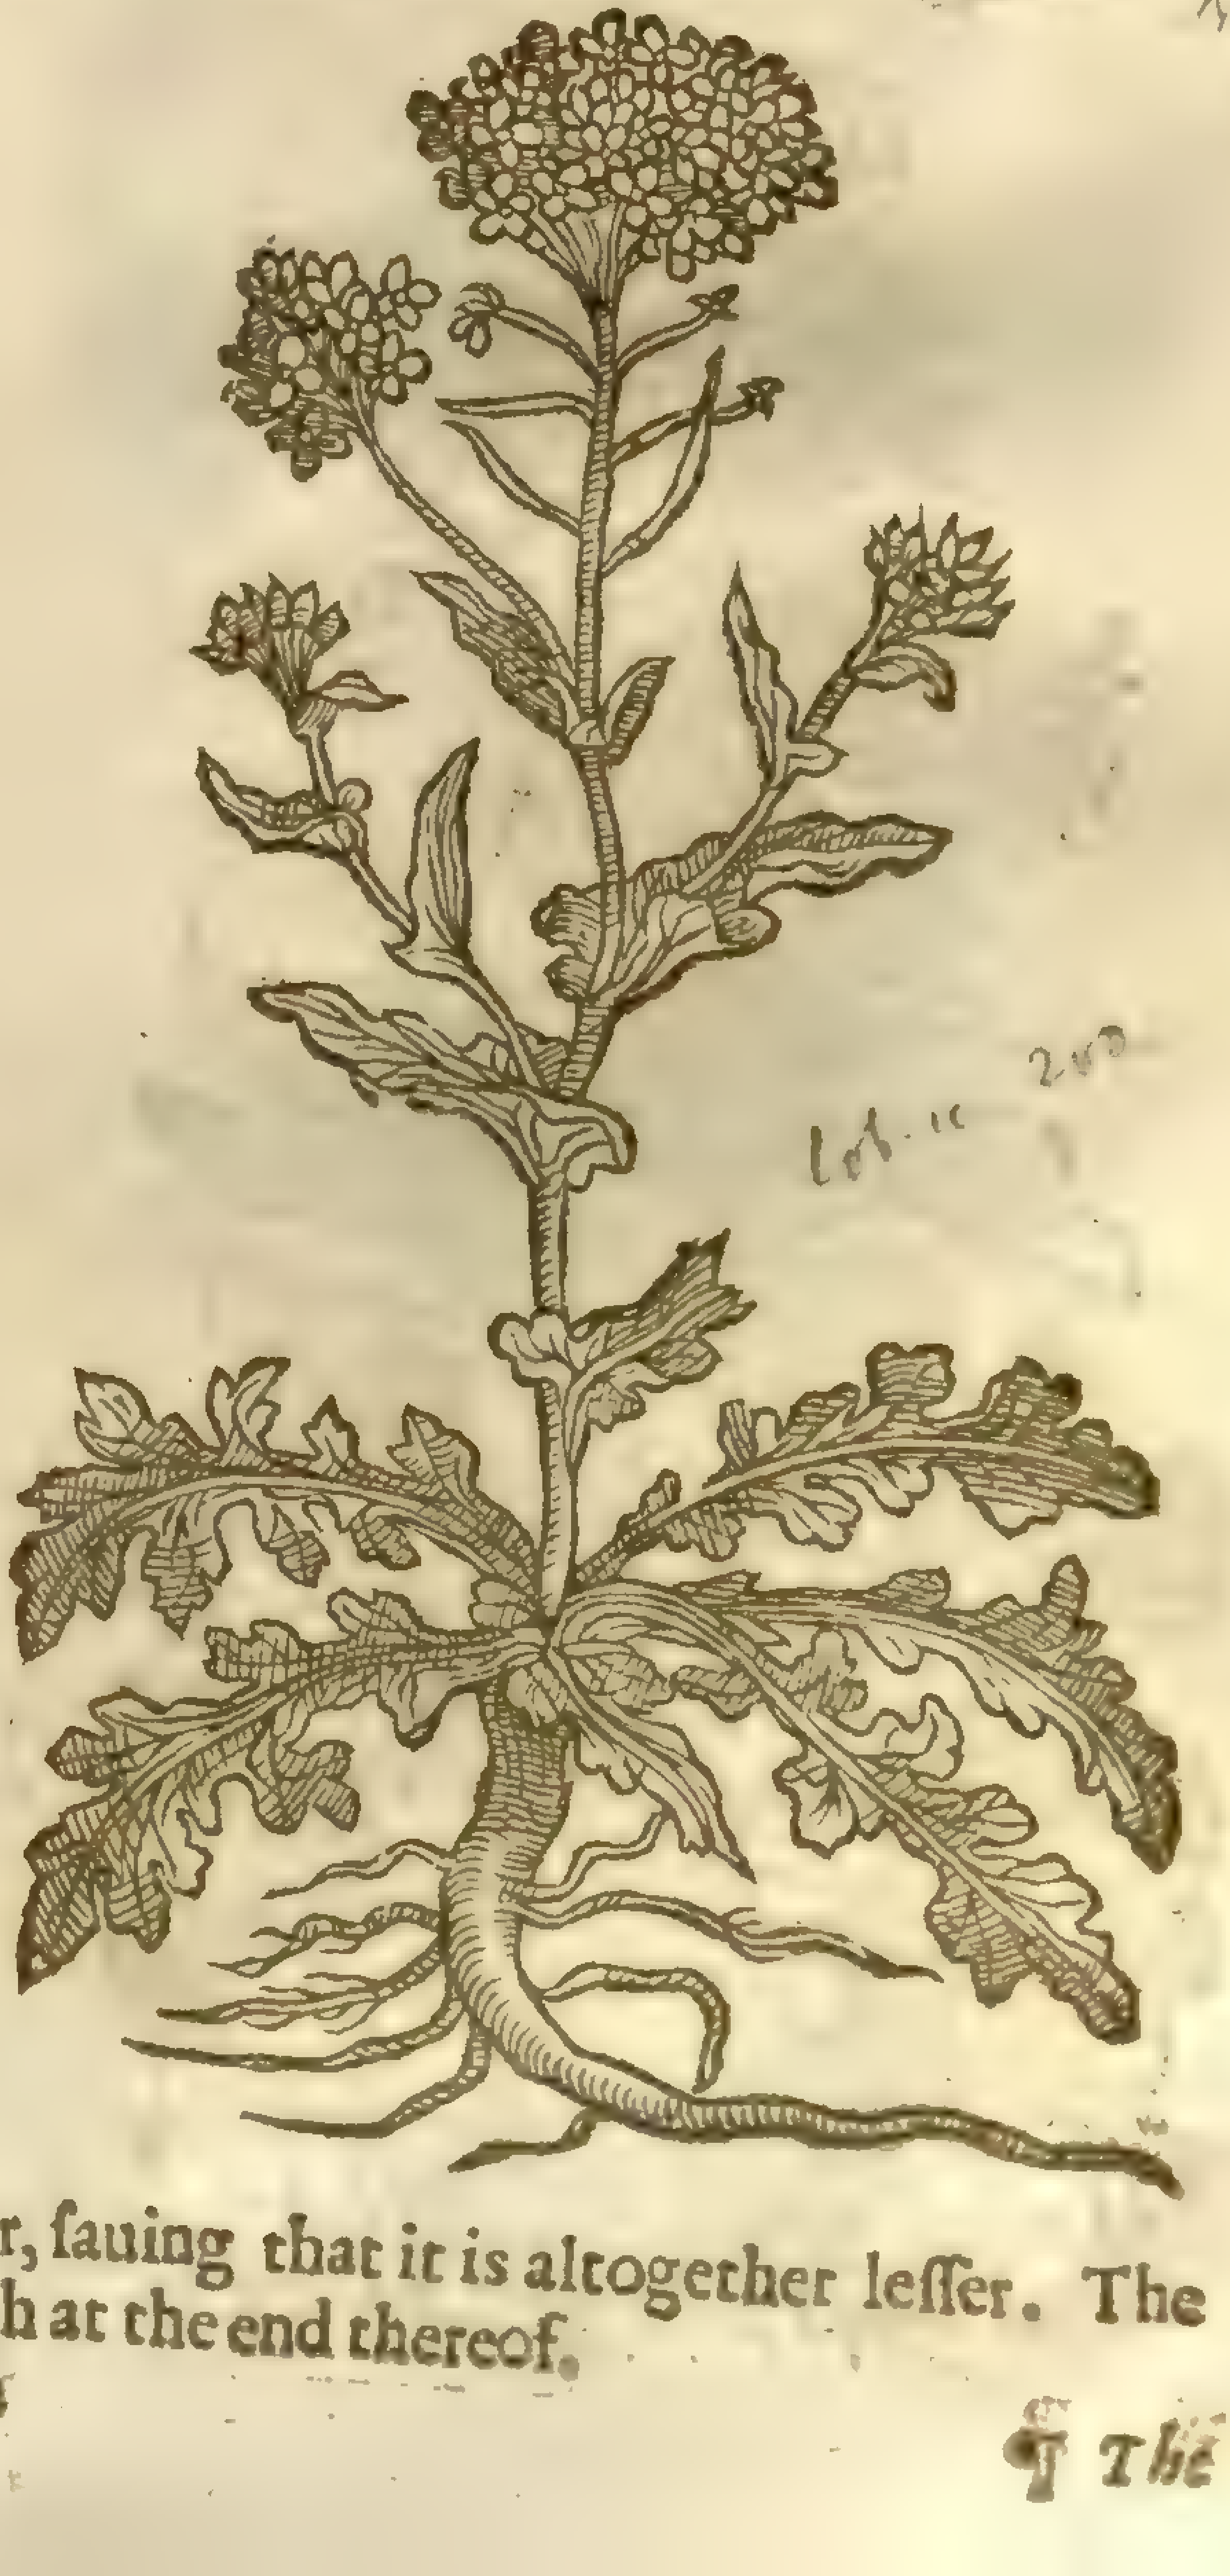
1 Nauew gentle is like vnto Turneps in ſtalks, floures, and ſeed, as alſo in the ſhape of the leaues, but thoſe of the Nauew are much ſmoother; it alſo differs in the root: the Turnep is round like a globe, the Nauew root is ſomewhat ſtretched forth in length.



† 1 *Bunias.*
Nauew gentle.

Brassica napus, β
[illegible]
Sim. pl. 3, 217

Lob. ic. 200



† 2 *Bunias ſylveſtris Lobelij.*
Wilde Nauew.

[illegible]
Sim. pl. [illegible] 217

Lob. ic. 200

2 The ſmall or wilde Nauew is like vnto the former, ſauing that it is altogether leſſer. The root is ſmall, ſomewhat long, with threds long and tough at the end thereof.

¶ *The Place.*

Nauew-gentle requireth a looſe and yellow mould euen as doth the Turnep, and proſpers in a fruitfull ſoile: it is ſowne in France, Bauaria, and other places, in the fields, for the ſeeds ſake, as is likewiſe that wilde Colewort called of the old writers *Crambe*; for the plentifull encreaſe of the ſeeds bringeth no ſmall gain to the husbandmen of that country, becauſe that being preſſed they yeeld an oile, which is vſed not only in lamps, but alſo in the making of ſope; for of this oile and a lie made of certain aſhes, is boiled a ſope which is vſed in the Low-Countries euerie where to ſcoure and waſh linnen cloathes. I haue heard it reported, that it is at this day ſowne in England for the ſame purpoſe.

This wilde Nauew groweth vpon ditch banks neere vnto villages and good townes, as alſo vpon freſh marſhie banks in moſt places.

¶ *The Time.*

The Nauew is ſown, floureth, and ſeedeth at the ſame time that the Turnep doth.

¶ *The Names.*

The Nauew is called in Latine *Napus*, and *Bunias*: in Greeke, Βουνιάς: the Germanes call it **Steckruben**: the Brabanders, **Steckropen**: in Spaniſh, *Naps*: in Italian, *Nauo*: the Frenchmen, *Naveau*: in Engliſh, Nauew gentle, or French Naueau. The other is called *Napus ſylveſtris*, or Wild Nauew.

¶ *The Temperature and Vertues.*

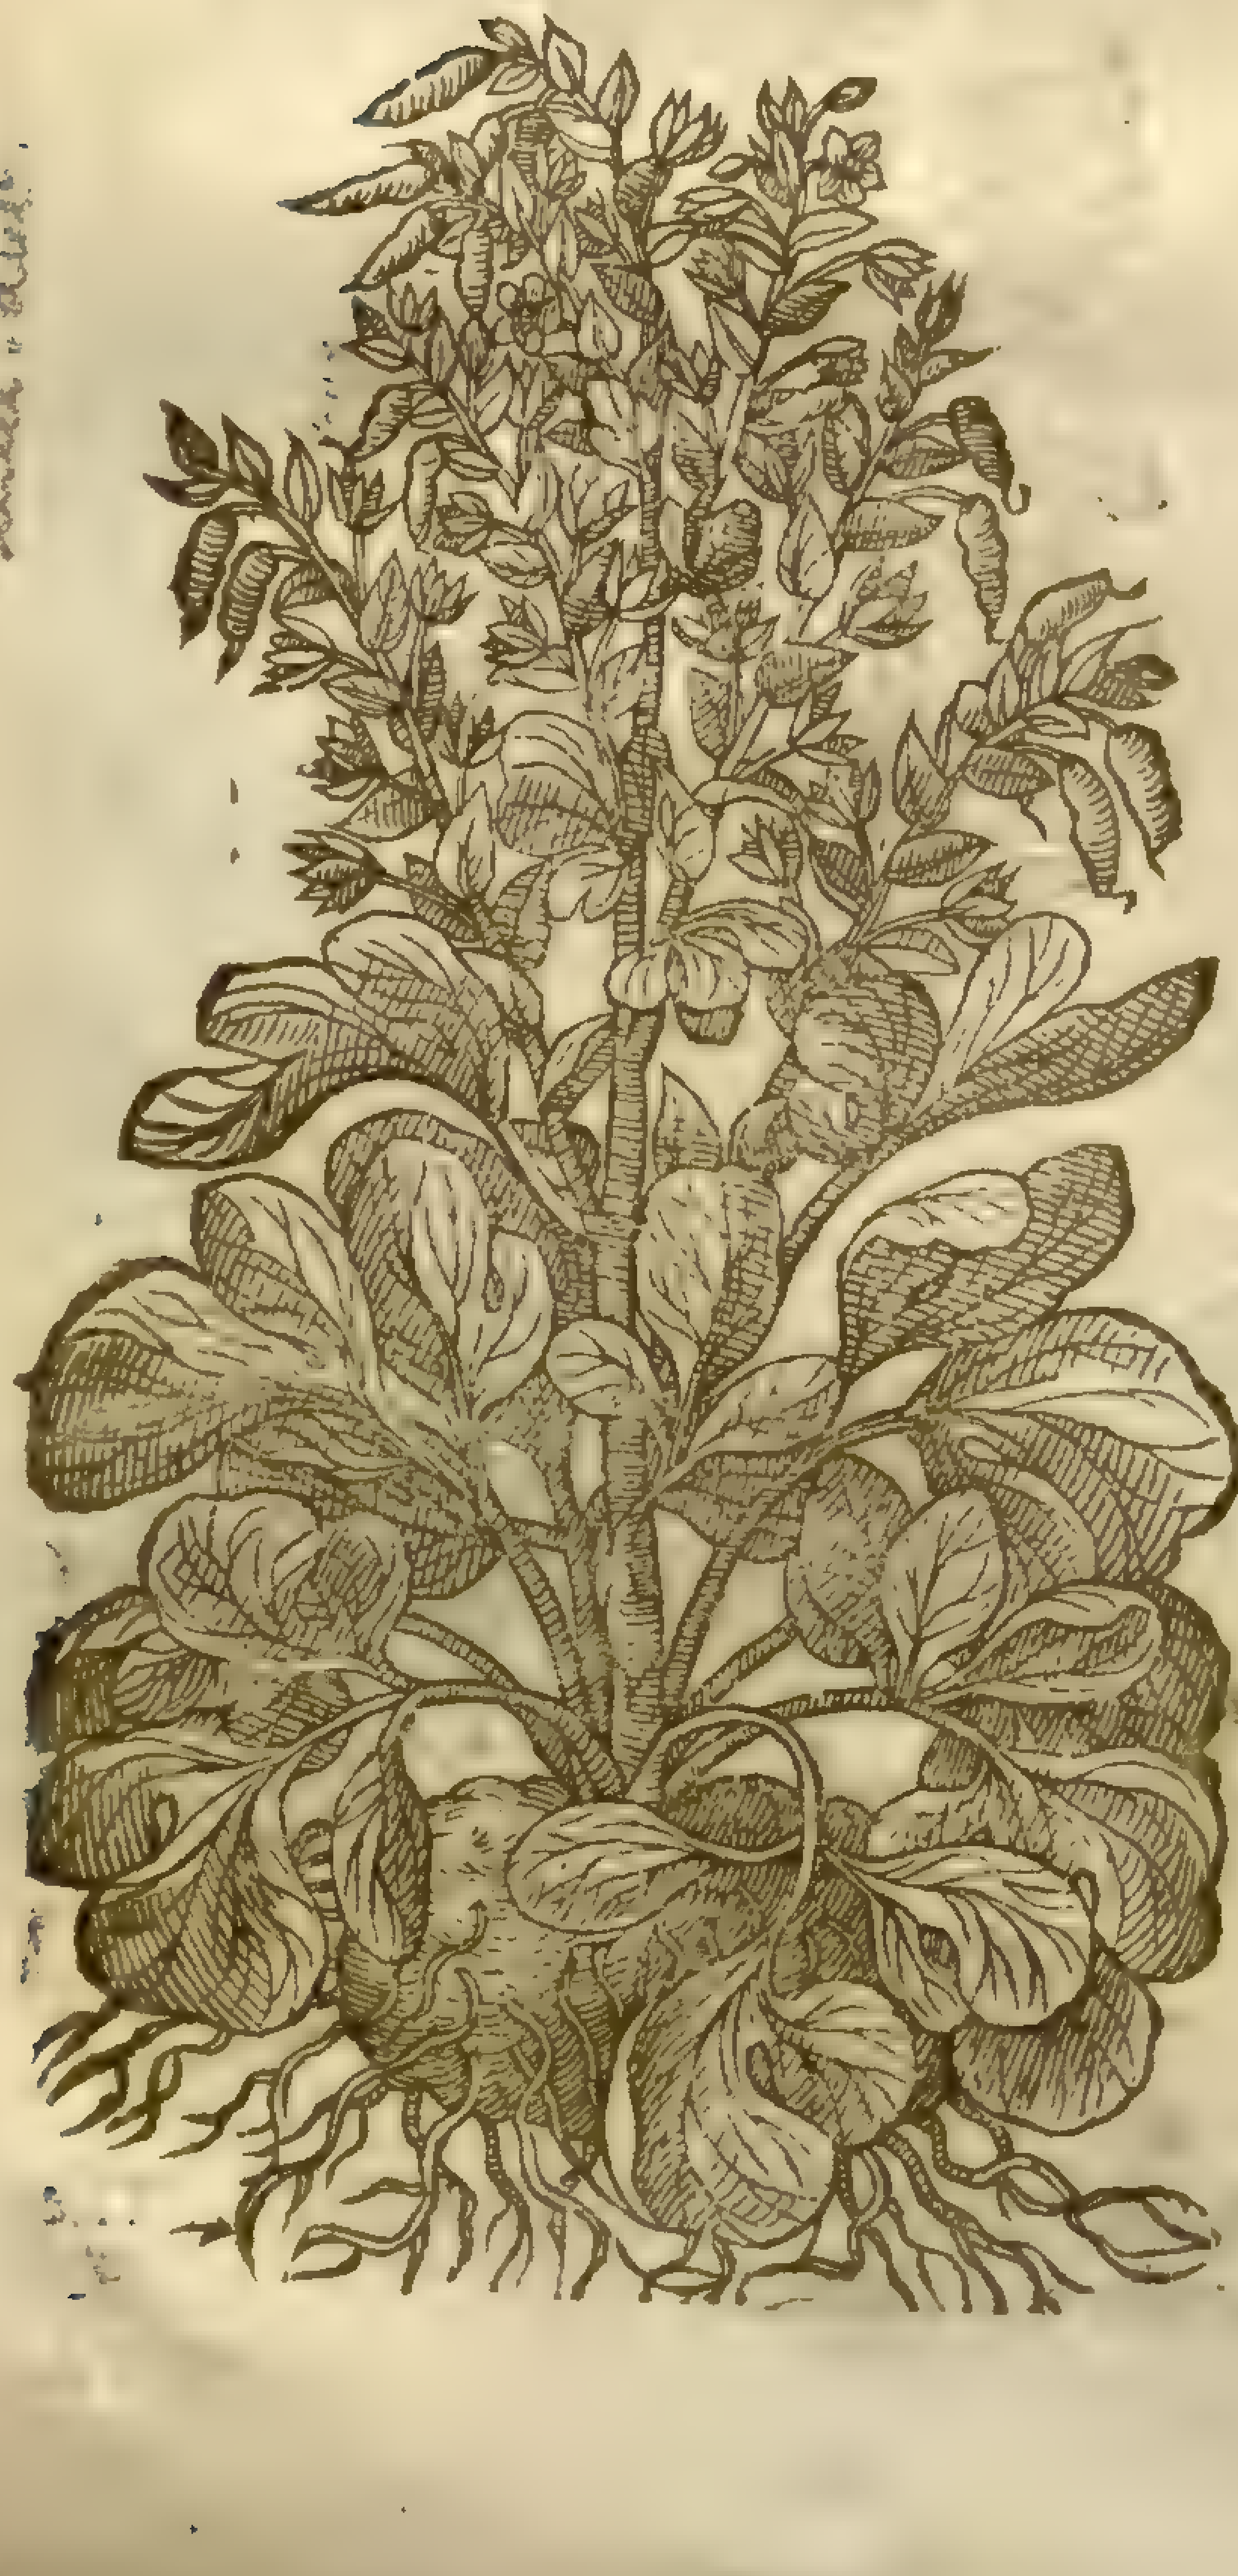
A The Nauew and the Turnep are all one in temperature and vertues, yet ſome ſuppoſe that the Nauew is a little drier, and not ſo ſoone concocted, nor paſſeth downe ſo eaſily and doth withall ingender leſſe winde. In the reſt it is anſwerable vnto the Turnep.

B ‡ The ſeeds of theſe taken in drinke or broth are good againſt poyſon, and are vſually put into antidotes for the ſame purpoſe.

† The figure that was in the firſt place is a kinde of the long Turnep, deſcribed by me in the ſecond place of the firſt chapter of this ſecond booke. And that in the ſecond place was a leſſer kinde of the ſame.

CHAP. 4. *Of Lyons Turnep or Lions leafe.*

Leontopetalon.
Lions Leafe.



Leontice [illegible]

¶ *The Deſcription.*

Lions turnep or Lions leafe hath broad leaues like vnto Coleworts, or rather like the Peonies, cut & diuided into ſundry great gaſhes: the ſtalke is two foot long, thick, and full of juice, diuiding it ſelfe into diuers branches or wings, in the tops whereof there ſtand red flours: afterward there appeareth long cods, in which lie the ſeeds, like vnto tares or wild Chichs. The root is great, bumped like a Turnep, and black without.

¶ *The Place.*

It groweth among corn in diuers places of Italy, in Candy alſo, and in other prouinces towards the South and Eaſt. The right noble Lord *Zouch* brought a plant hereof from Italy at his returne into England, the which was planted in his garden. But as far as I know it periſhed.

¶ *The Time.*

It floureth in winter, as witneſſeth *Petrus Bellonius*.

¶ *The Names.*

The Grecians call it Λεοντοπέταλον: that is, *Leonis folium*, or Lyons Leafe. *Pliny* doth alſo call it *Leontopetalon*: *Apuleius*, *Leontopodion*: yet there is another plant alſo called by the ſame name. There be many baſtard names giuen vnto it, as

Rapeium, Papauerculum, Semen Leoninum, Pes Leoninus, and *Brumaria*: in Engliſh, Lions leafe, & Lions Turnep.

¶ *The Nature.*

Lions Turnep is of force to digeſt. It is hot and dry in the third degree, as *Galen* teacheth.

¶ *The Vertues.*

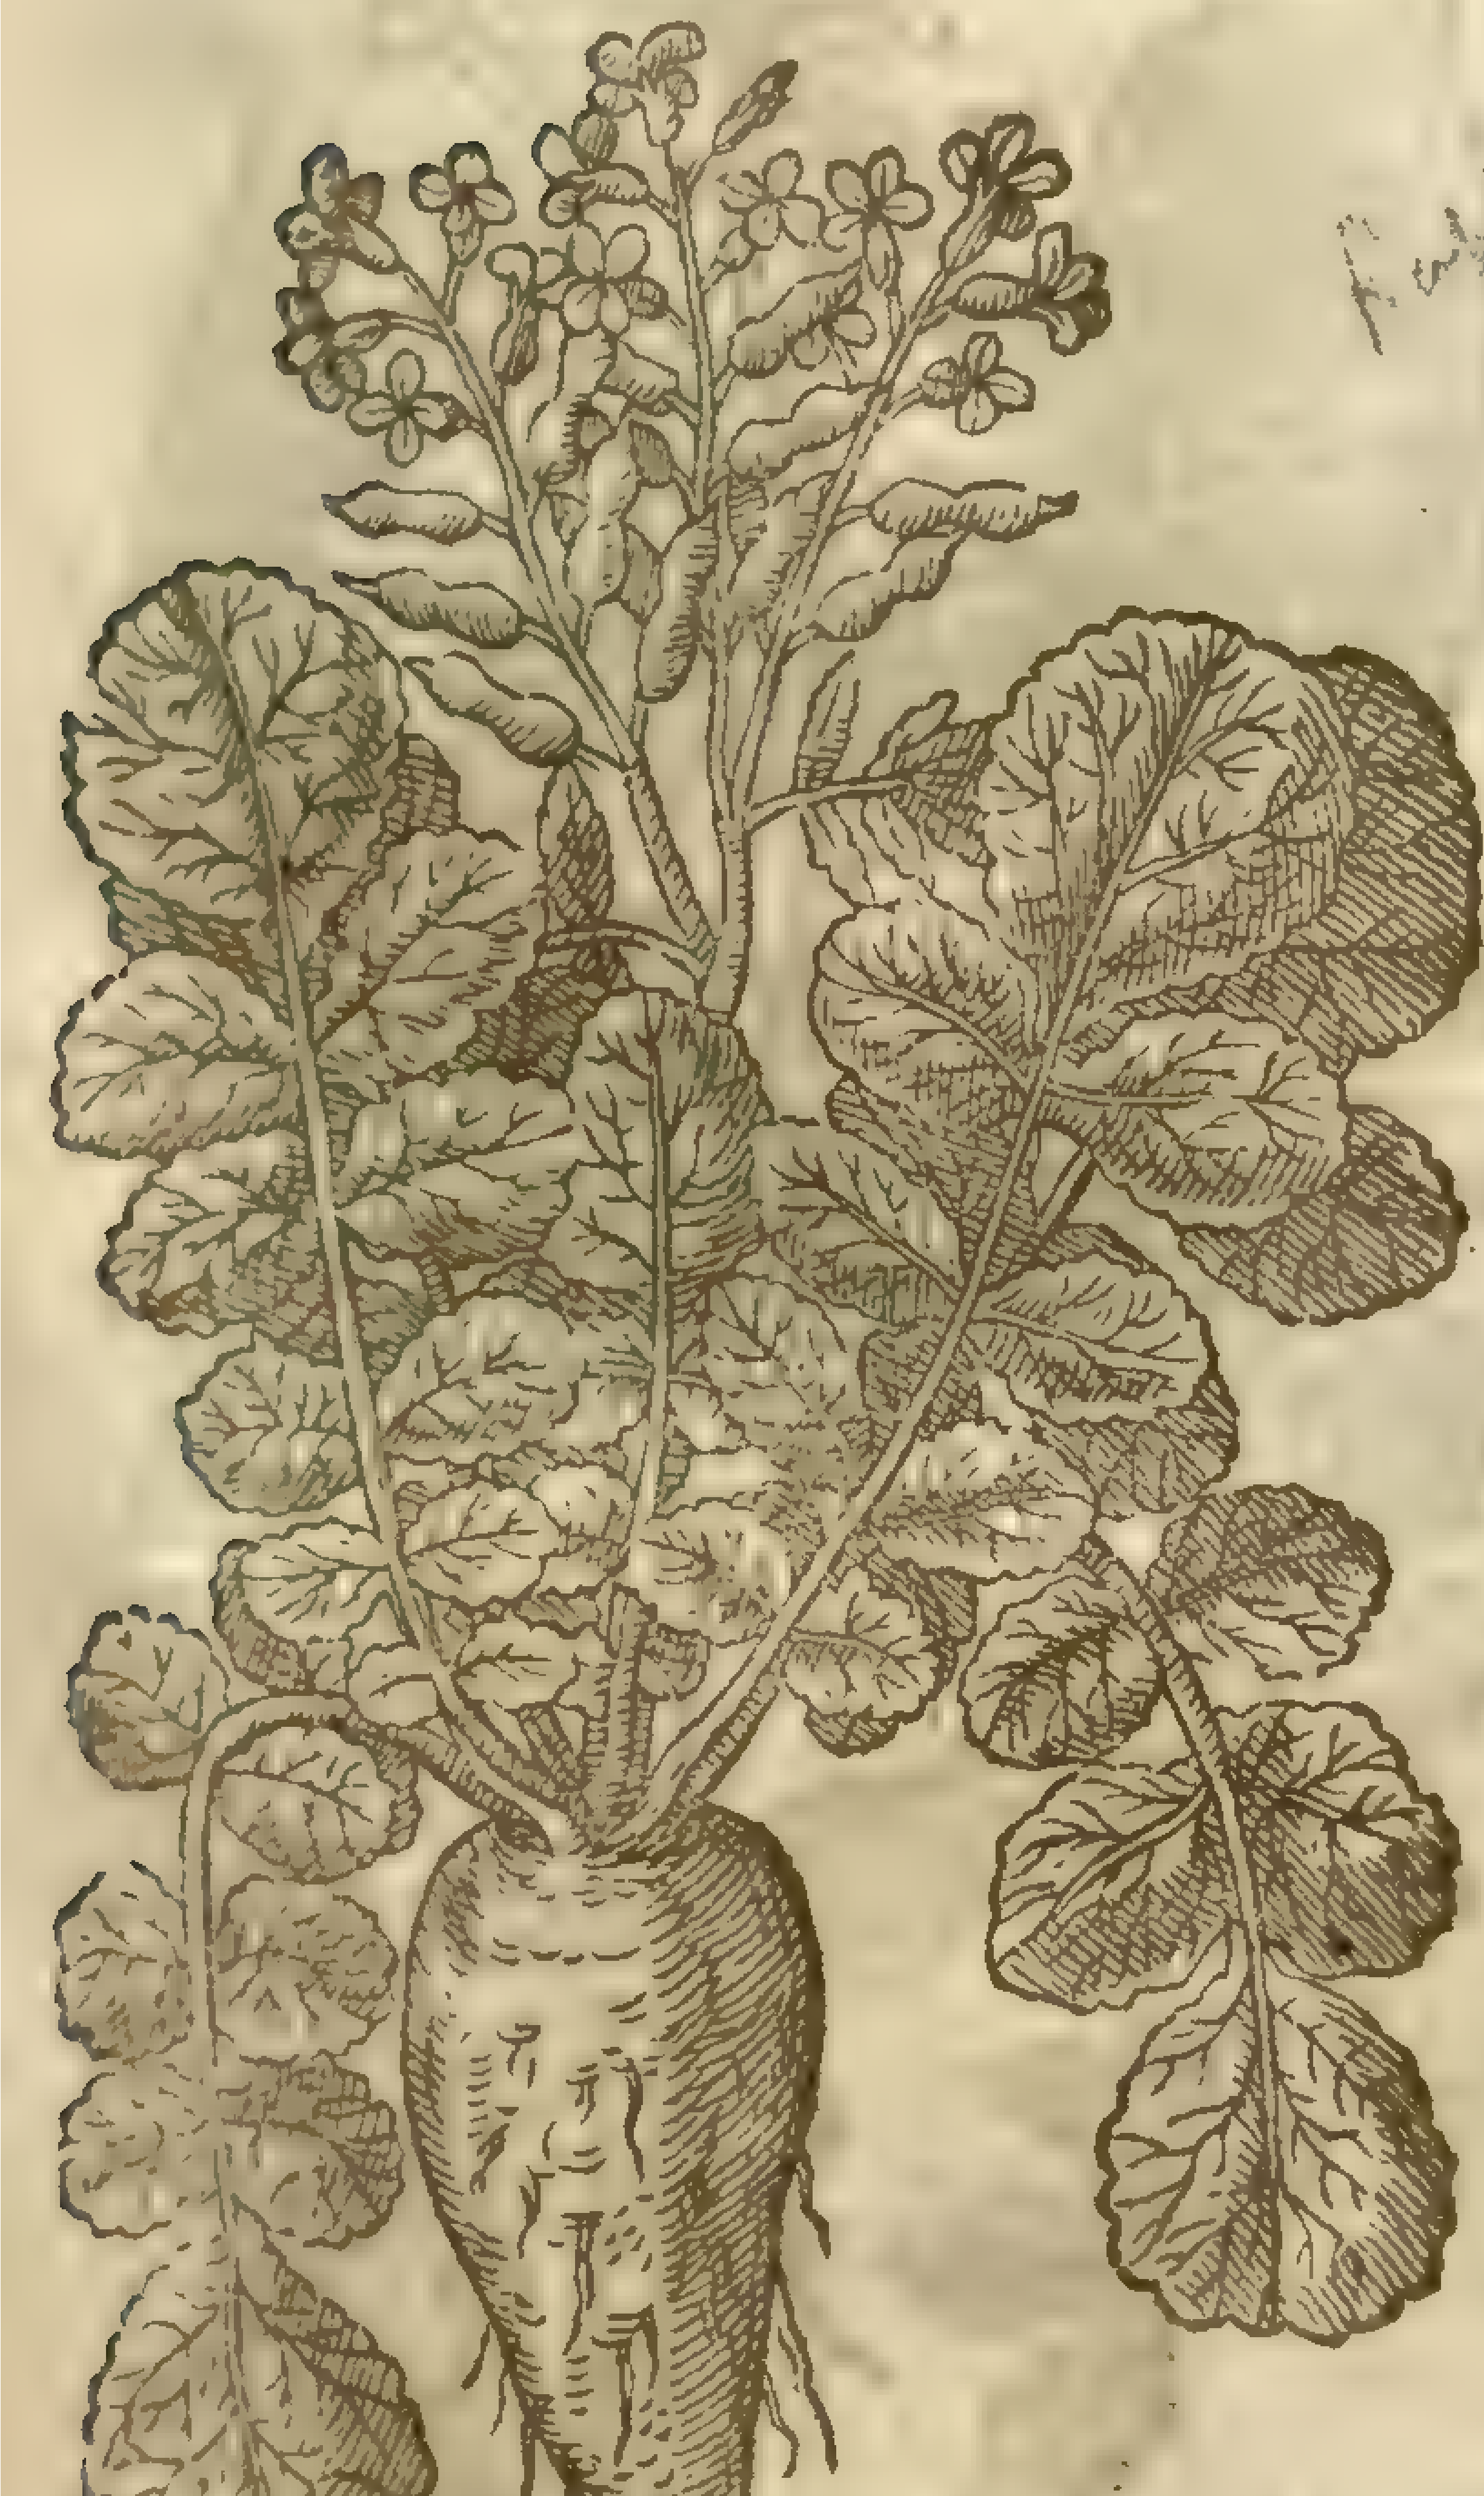
The root (ſaith *Dioſcorides*) taken in wine, helpeth them that are bitten of Serpents, and ſpeedily allaieth the paine. It is put into Cliſters which are made for them that be tormented with the Sciatica.

Chap. 5. *Of Radiſh.*

¶ *The Kindes.*

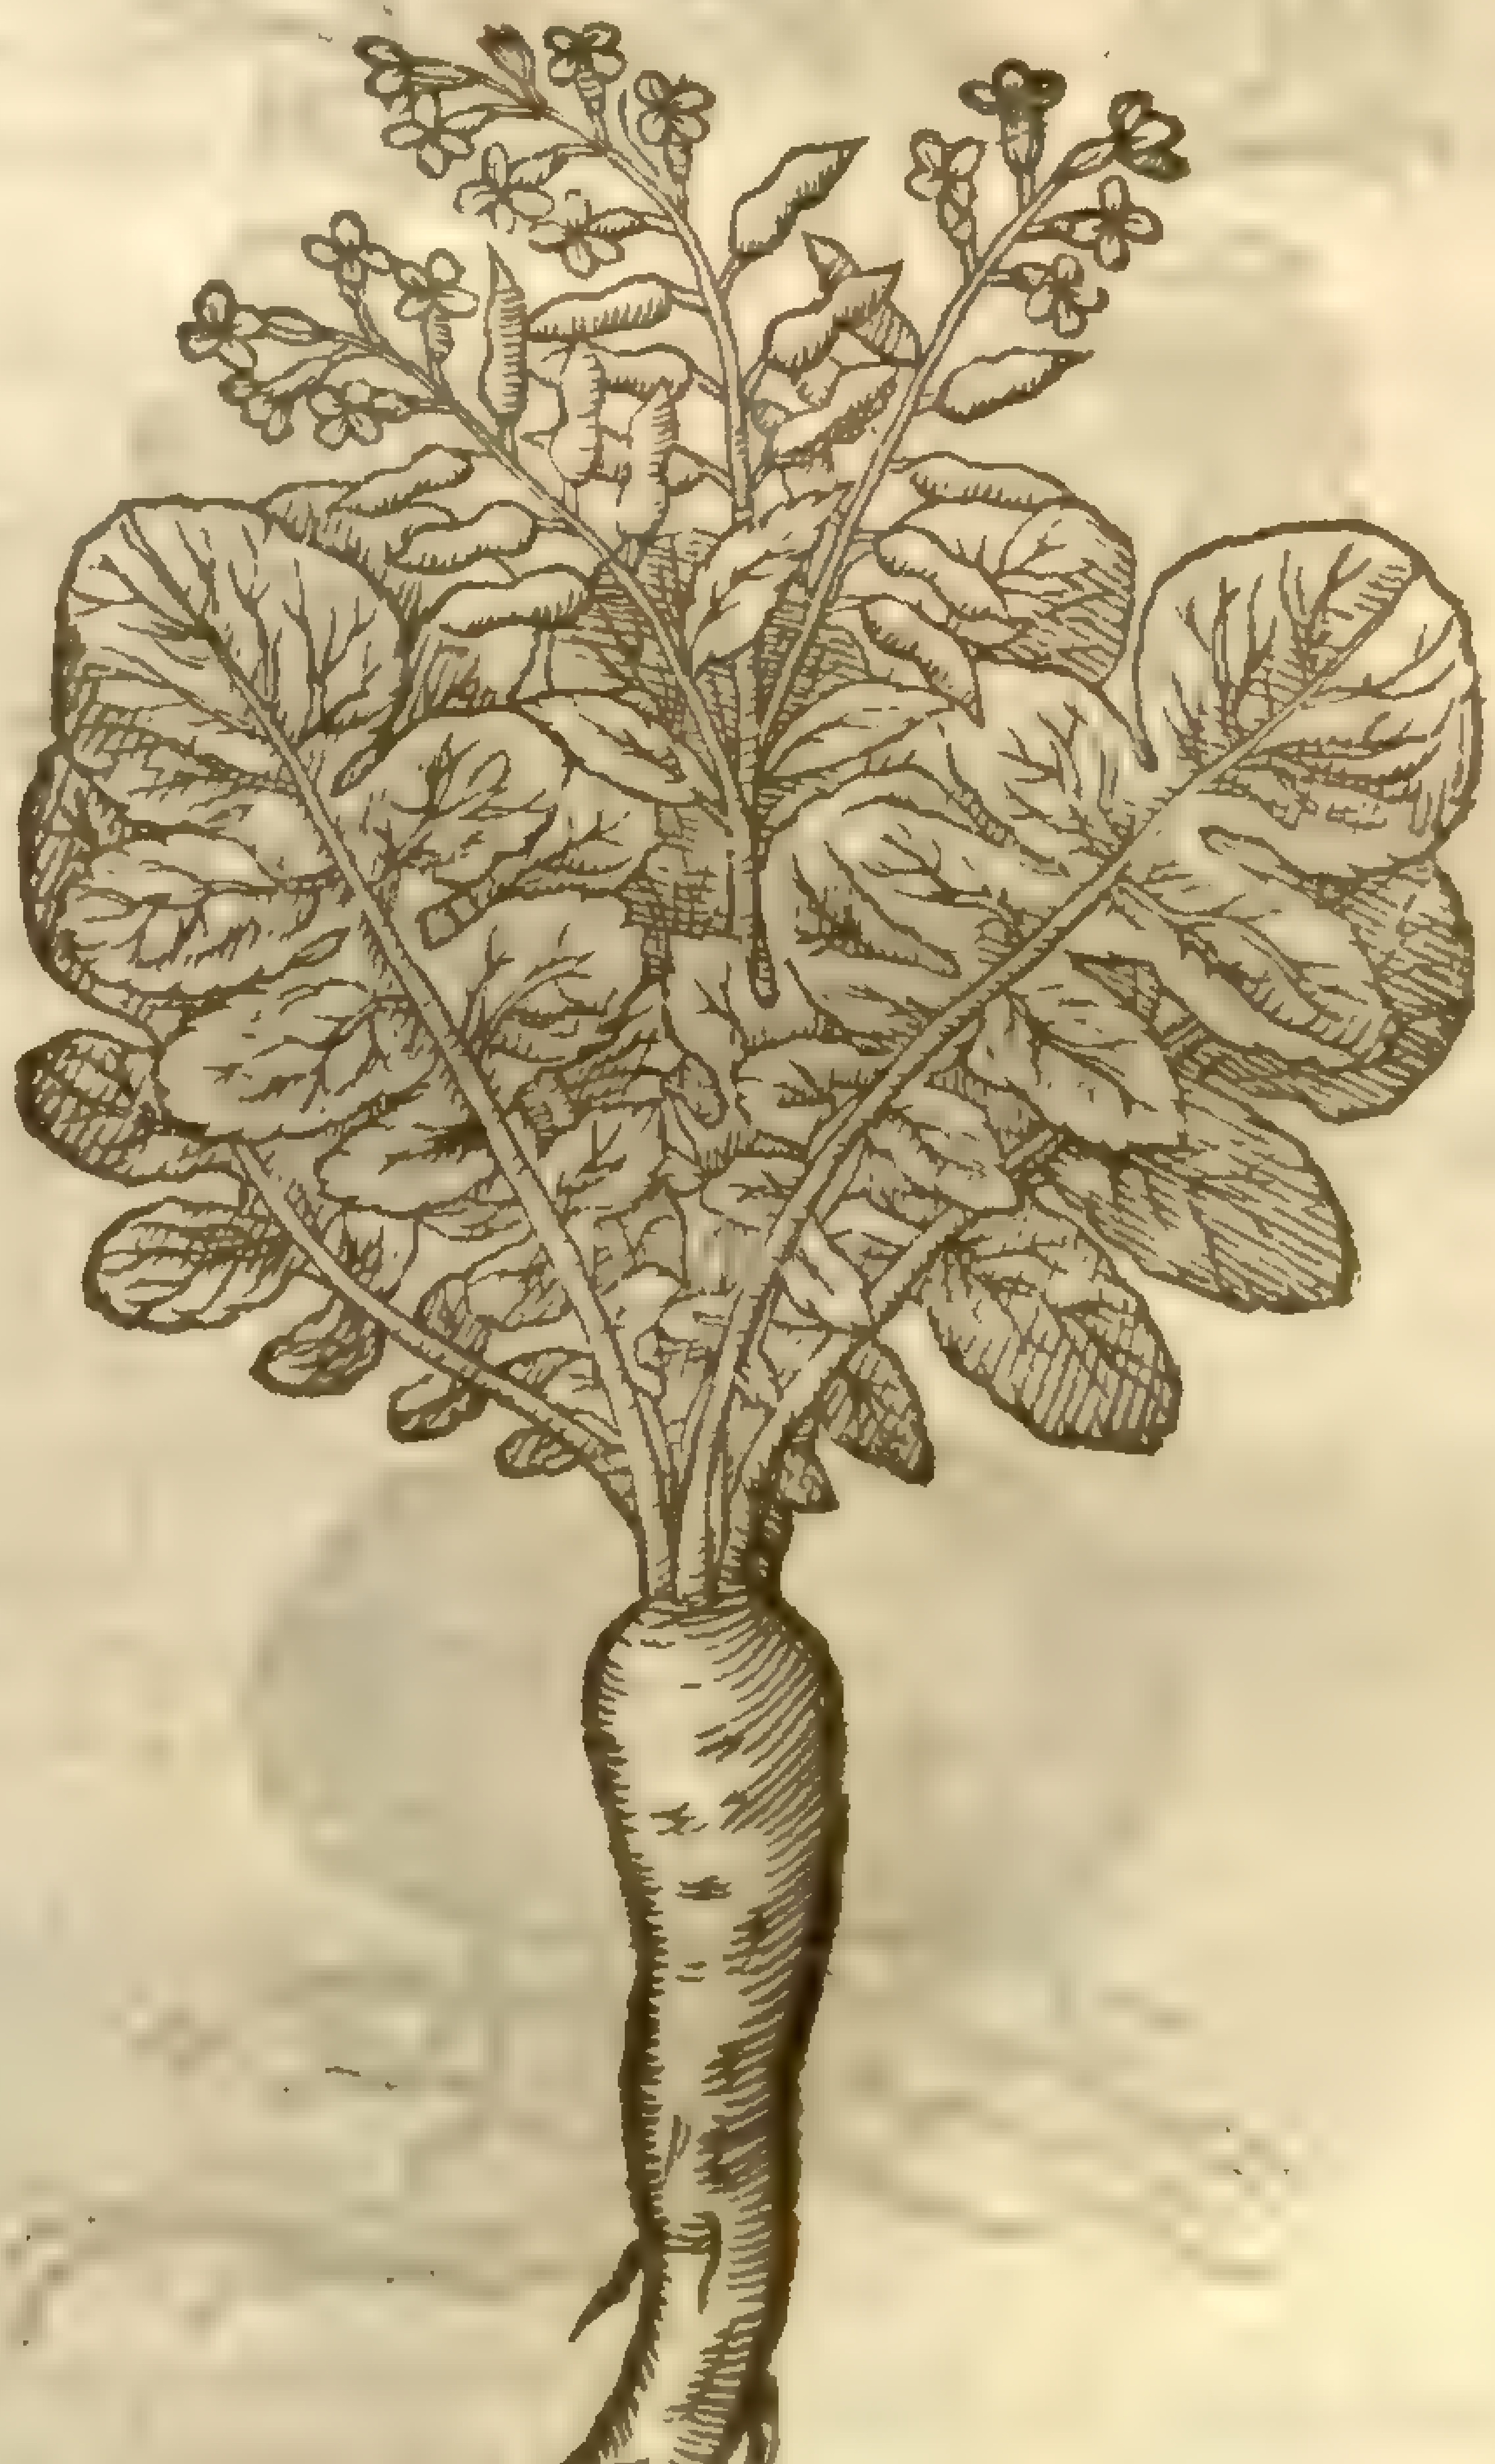
There be ſundry ſorts of Radiſh, whereof ſome be long and white, others long and black; ſome round and white, others round or of the form of a peare, and blacke of colour; ſome wild or of the field, and ſome tame or of the garden; whereof we will treat in this preſent chapter.

† 1 *Raphanus ſativus.*
Garden Radiſh.



Raphanus sat[illegible]
[illegible]

† 2 *Radicula ſativa minor.*
Small garden Radiſh.



¶ *The Deſcription.*

1. The garden Radiſh ſends forth great and large leaues, greene, rough, cut on both ſides with deepe gaſhes not vnlike to the garden Turnep, but greater. The ſtalks be round, and parted into many branches, out of which ſpring ſmall flours of a light purple colour, made of foure little leaues: and when they be paſt, there come in place ſharpe pointed cods puſt or blown vp toward the ſtalke, full of ſpungeous ſubſtance, wherein is contained the ſeed, of a light brown colour, ſomwhat greater than the ſeeds of Turneps or Coleworts. The root is groſſe, long, and white both within and without, and of a ſharp taſte.

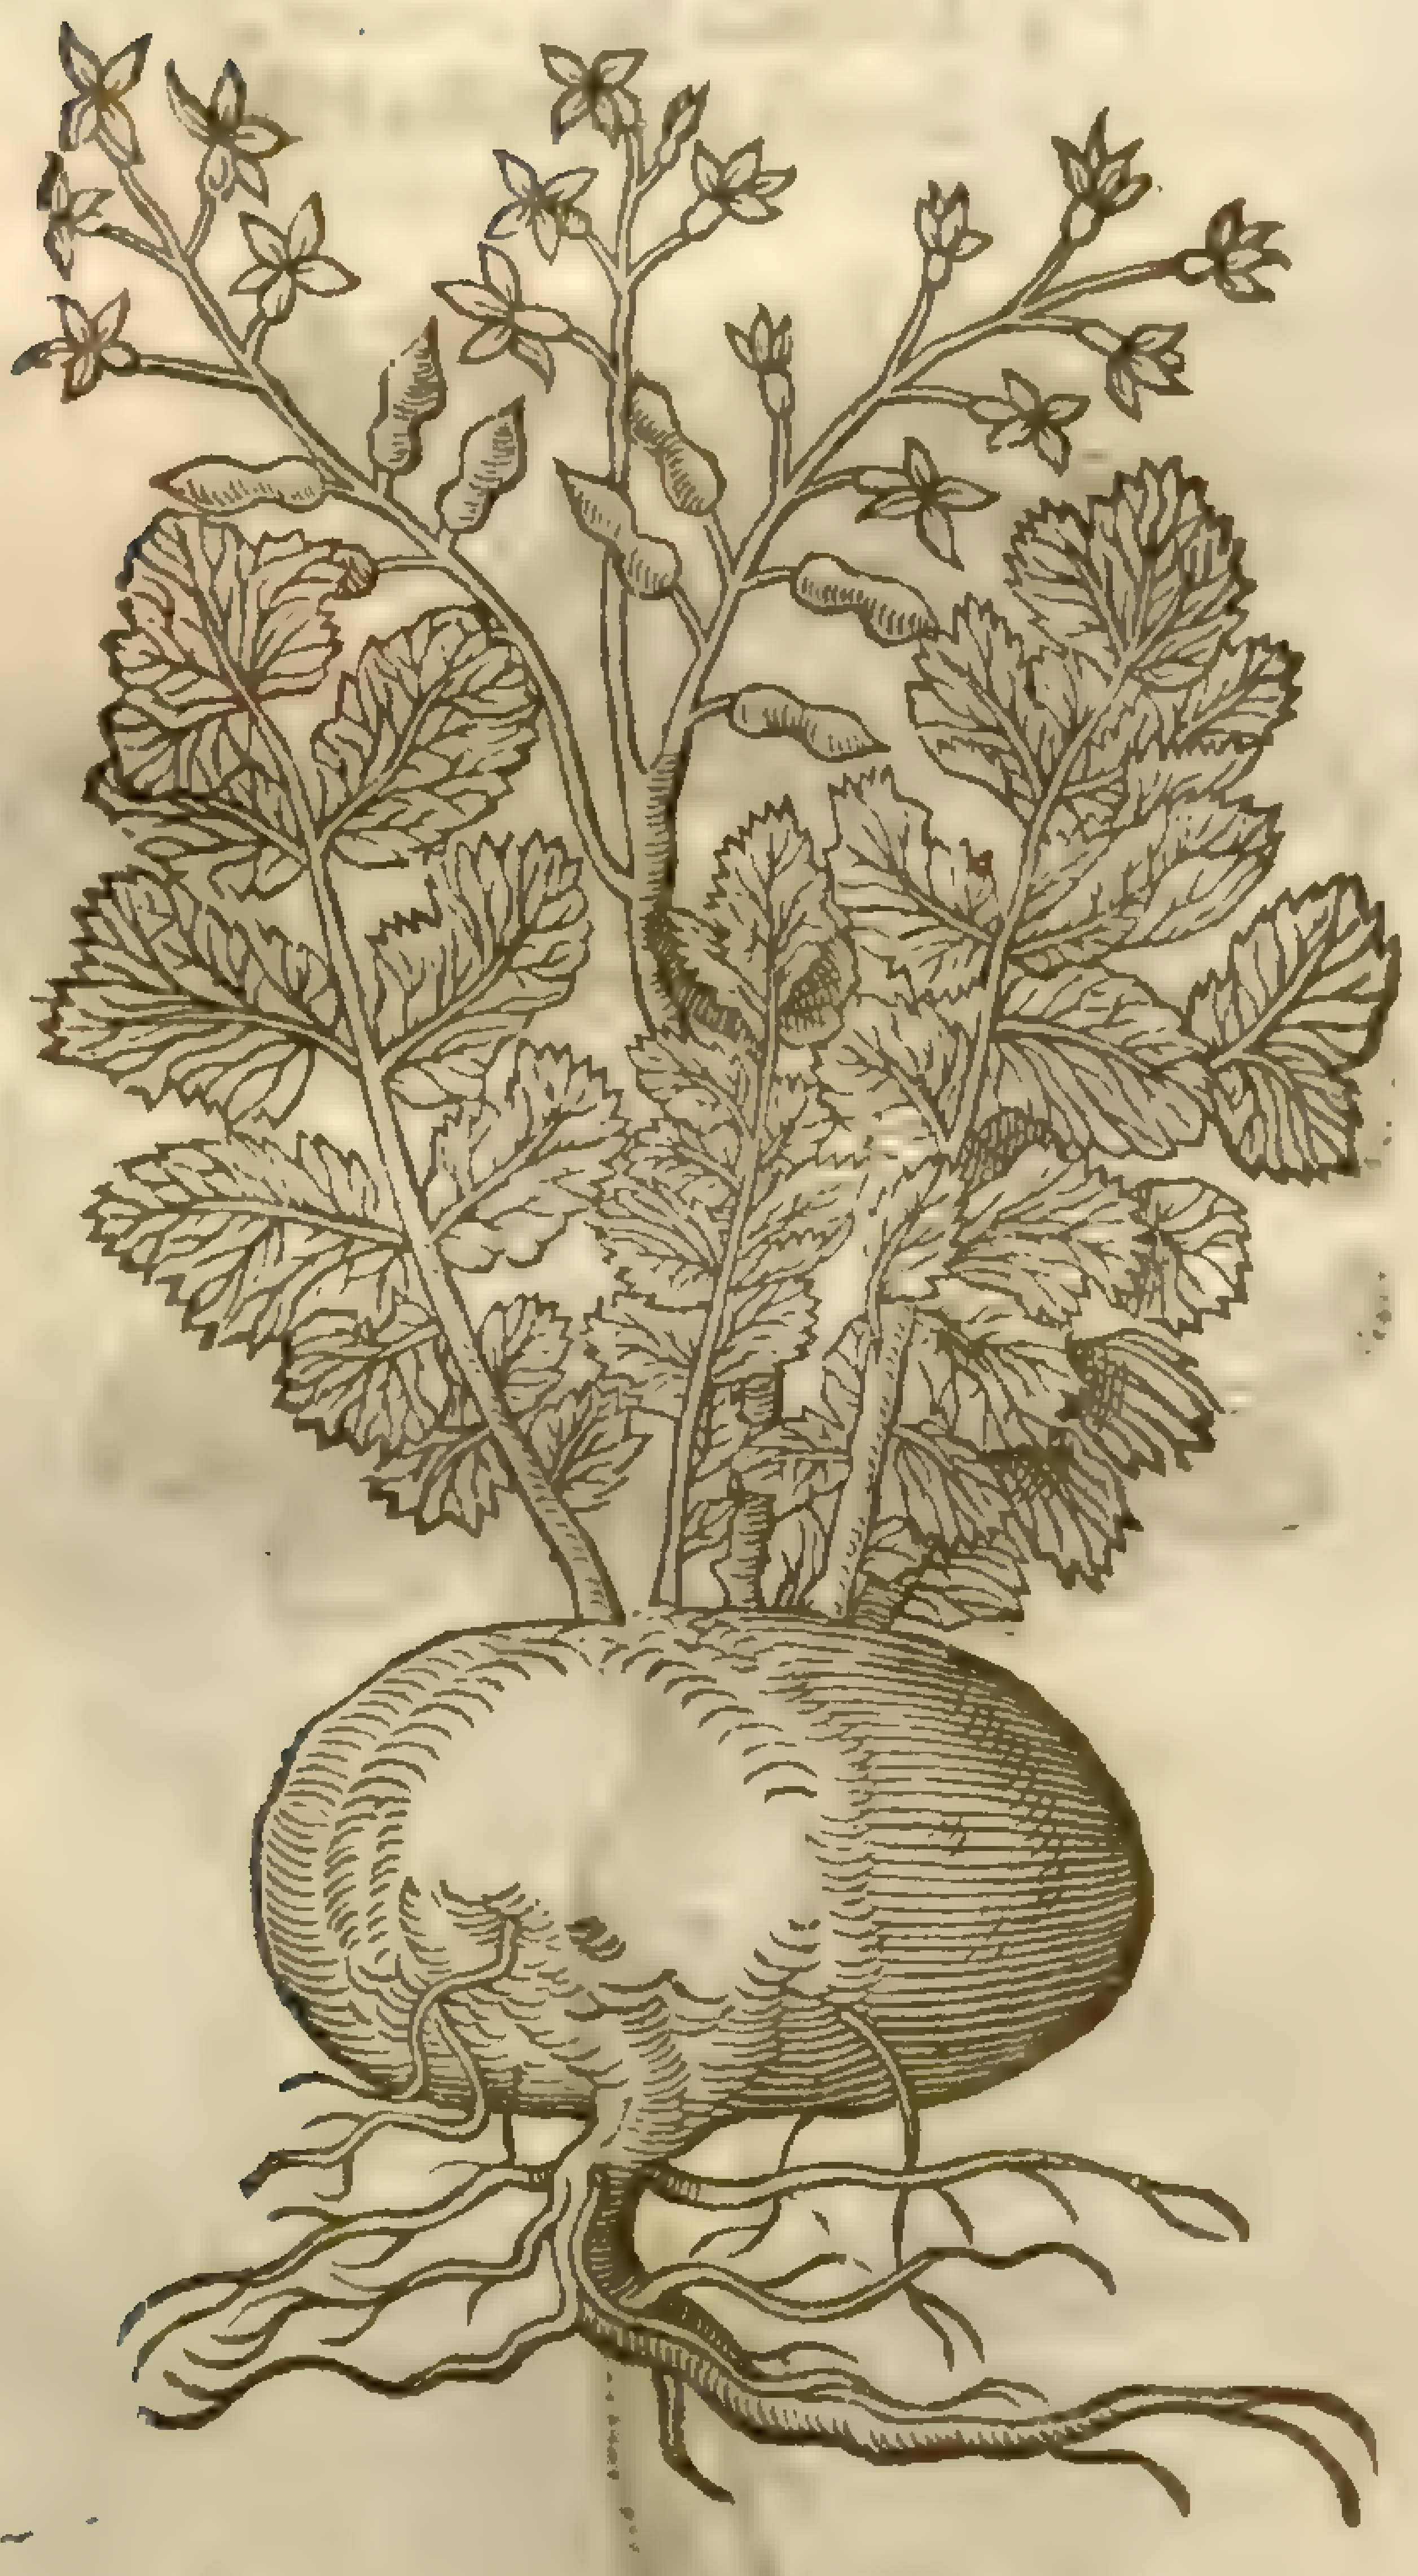
2 The ſmall garden Radiſh hath leaues like the former, but ſmaller, and more brittle in handling. The ſtalke is two cubits high, whereon be the floures like the former. The ſeed is ſmaller, and not ſo ſharpe in taſte. The root is ſmall, long, white both within and without, except a little that ſhewes it ſelfe aboue the ground, of a reddiſh colour.

3 Radiſh with a round root hath leaues like the garden Turnep: among which leaues ſprings vp a round and ſmooth ſtalke, diuiding it ſelfe toward the top into two or three branches, whereon grow ſmall purpliſh floures made of foure leaues apiece: which beeing paſt, there come in place ſmall cods puft vp or bunched in two, and ſometimes three places, full of pith as the common Radiſh; wherein is contained the ſeed, ſomewhat ſmaller than the Colewort ſeed, but of an hotter taſte. The root is round and firme, nothing wateriſh like the common Radiſh, more pleaſant in taſt, wholſomer, not cauſing ſuch ſtinking belchings as the garden radiſh doth.

4 The Radiſh with a peare-faſhioned root groweth to the height of three or foure cubits, of a bright reddiſh colour. The leaues are deepely cut or jagged like thoſe of the Turnep, ſomewhat rough. The floures are made of foure leaues of a light carnation or fleſh colour. The ſeed is contained in ſmall bunched cods like the former. The root is faſhioned like a Peare or long Turnep, black without, and white within, of a firme and ſolid ſubſtance. The taſt is quick and ſharp, biting the tongue as the other kinds of Radiſh, but more ſtrongly.

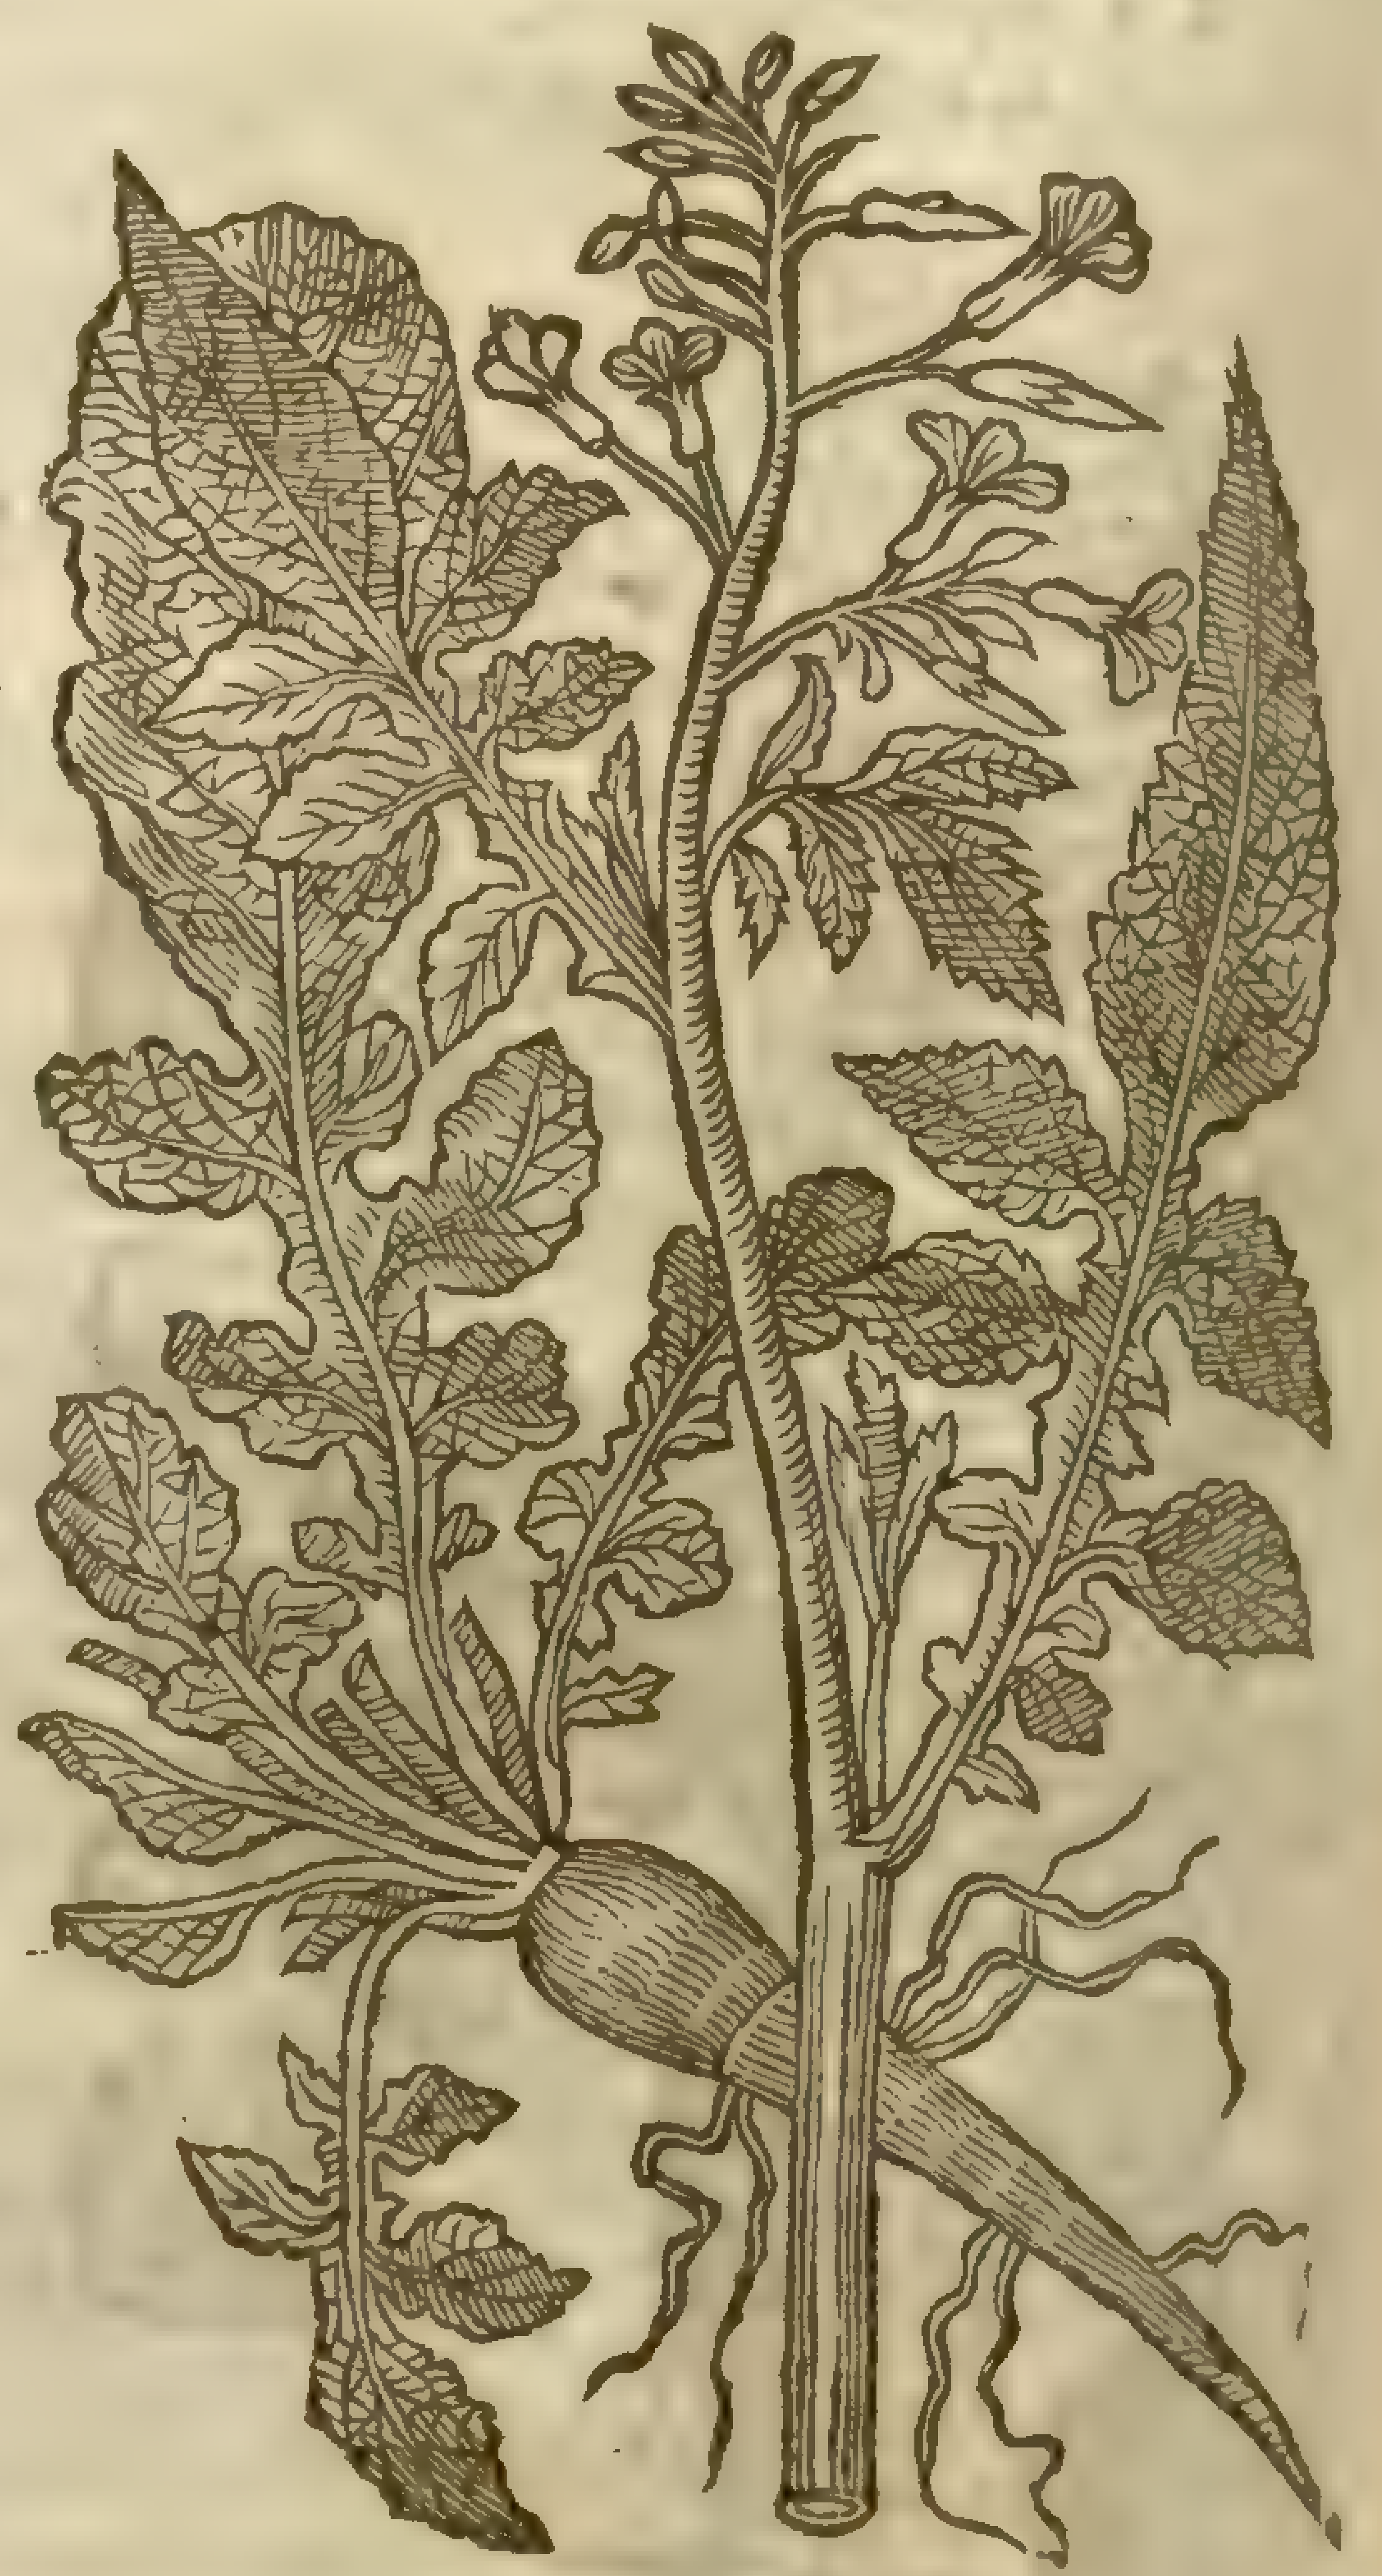
3 *Raphanus orbiculatus.*
Round Radiſh.

R. sativus, L. γ
[illegible]



4 *Raphanus pyriformis, ſiue radice nigra.*
The blacke or Peare-faſhion Radiſh.

R. sativus, L. [illegible]
[illegible]



¶ *The Place.*

All the kindes of Radiſh require a looſe ground which hath bin long manured, and is ſomewhat fat. They proſper wel in ſandy ground, where they are not ſo ſubiect to worms as in other grounds.

¶ *The Time.*

Theſe kinds of Radiſh are moſt fitly ſown after the Summer ſolſtice, in Iune or Iuly; for being ſown betimes in the ſpring, they yeeld not their roots ſo kindely nor profitably, for then they doe for the moſt part quickly run vp to the ſtalk and ſeed, where otherwiſe they do not floure and ſeed till the next ſpring following. They may be ſown ten moneths in the yeare, but as I ſaid, the beſt time is in Iune and Iuly.

¶ *The Names.*

Radiſh is called in Greek, of *Theophraſtus, Dioſcorides, Galen*, & other old writers ῥαφανίς; in ſhops, *Raphanus*, and *Sativa radicula*: in high-Dutch, **Rettich**: in low-Dutch, **Radys**: in French, *Raifort*: in Italian, *Raphano*: in Spaniſh, *Rauano*: in Engliſh, Radiſh, and Rabone: in the Bohemian tongue, **Rzedkew.** *Cælius* affirmeth, that the ſeed of Radiſh is called of *Marcellus Empericus, Bacanon*: and ſo alſo of *Aëtius, lib.* 2. *cap.* 2. of his Tetrabible: yet *Cornarius* doth not reade *Bacanon*, but *Cacanon*. The name of *Bacanum* is alſo found in *N. Myrepſus*, in the 255 Compoſition of his firſt booke.

¶ *The Temperature.*

Radiſh doth manifeſtly heat and dry, open and make thin by reaſon of the biting qualitie that ruleth in it. *Galen* makes them hot in the third degree, and dry in the ſecond, and ſheweth that it is rather a ſauce than a nouriſhment.

¶ *The Vertues.*

A Radiſh are eaten raw with bread in ſtead of other food; but in that manner they yeeld very little nouriſhment, and that faulty and il. But for the moſt part they are vſed as ſauce with meats to procure appetite, and in that ſort they ingender leſſe bad bloud, than eaten alone or with bread only: but ſeeing they be of harder digeſtion than meats, they are oftentimes troubleſom to the ſtomack; neuertheleſſe they ſerue to diſtribute and diſperſe the nouriſhment, eſpecially beeing eaten after meat: taken before meat, they cauſe belchings, and ouerthrow the ſtomacke.

B Before meat they cauſe vomiting, eſpecially the rind; which as it is more biting than the inner ſubſtance, ſo doth it with more force cauſe that effect, if it be giuen with Oxymel, a ſyrrup made with vineger and hony.

C Moreouer, Radiſh prouoketh vrine, and diſſolueth cluttered ſand, driuing it forth, if a good draught of the decoction thereof be drunke in the morning. *Pliny* and *Dioſcorides* write, That it is good againſt an old Cough, and to make thinne, thicke and groſſe flegme which ſticketh in the cheſt.

D In ſtead whereof, the Phyſitions of our age vſe the diſtilled water, which likewiſe procures vrin mightily, and driues forth ſtones in the kidnies.

E The root ſliced and laid ouer-night in white or Rheniſh wine, and drunke in the morning, driues out vrine and grauell mightily, but in taſte and ſmell it is very loathſome.

F The root ſtamped with honey and the pouder of a ſheepes heart dried, cauſeth haire to grow in ſhort ſpace.

G The ſeed cauſeth vomit, prouoketh vrin, and being drunke with honied vineger, it killeth & driueth forth wormes.

H The root ſtamped with the meale of Darnel and a little white wine vineger, takes away all black and blew ſpots, and bruiſed blemiſhes of the face.

I The root boiled in broth, and the decoction drunke, is good againſt an old cough; it moues womens ſickneſſe, and cauſeth much milke.

† Thoſe figures that were in the firſt and ſecond place were varieties of the long Turnep, deſcribed in the ſecond place, *Cap.* 1. of this ſecond booke.

CHAP. 6. *Of wilde Radiſh.*

¶ *The Deſcription.*

1 Wilde Radiſh hath a ſhorter narrower leafe than the common Radiſh, & more deeply cut or jagged, almoſt like the leaues of Rocket, but much greater. The ſtalke is ſlender and rough, of two cubits high, diuided toward the top into many branches. The floures are ſmall and white, the cod is long, ſlender, and jointed, wherein is the ſeed. The root is a finger thick, white within and without, of a ſharp and biting taſte.

2 The water Radiſh hath long and broad leaues deepely indented or cut euen to the middle rib. The ſtalke is long, weake, and leaneth this way and that way, being not able to ſtand vpright without a prop, inſomuch that ye ſhall neuer find it, no not when it is very yong, but leaning down vpon the mud or mire where it groweth. The floures grow at the top made of foure ſmall yellow leaues. The root is long, ſet in ſundry ſpaces with ſmall fibres or threds like the rowell of a ſpurre, hot and burning in taſte more than any of the garden Radiſhes.

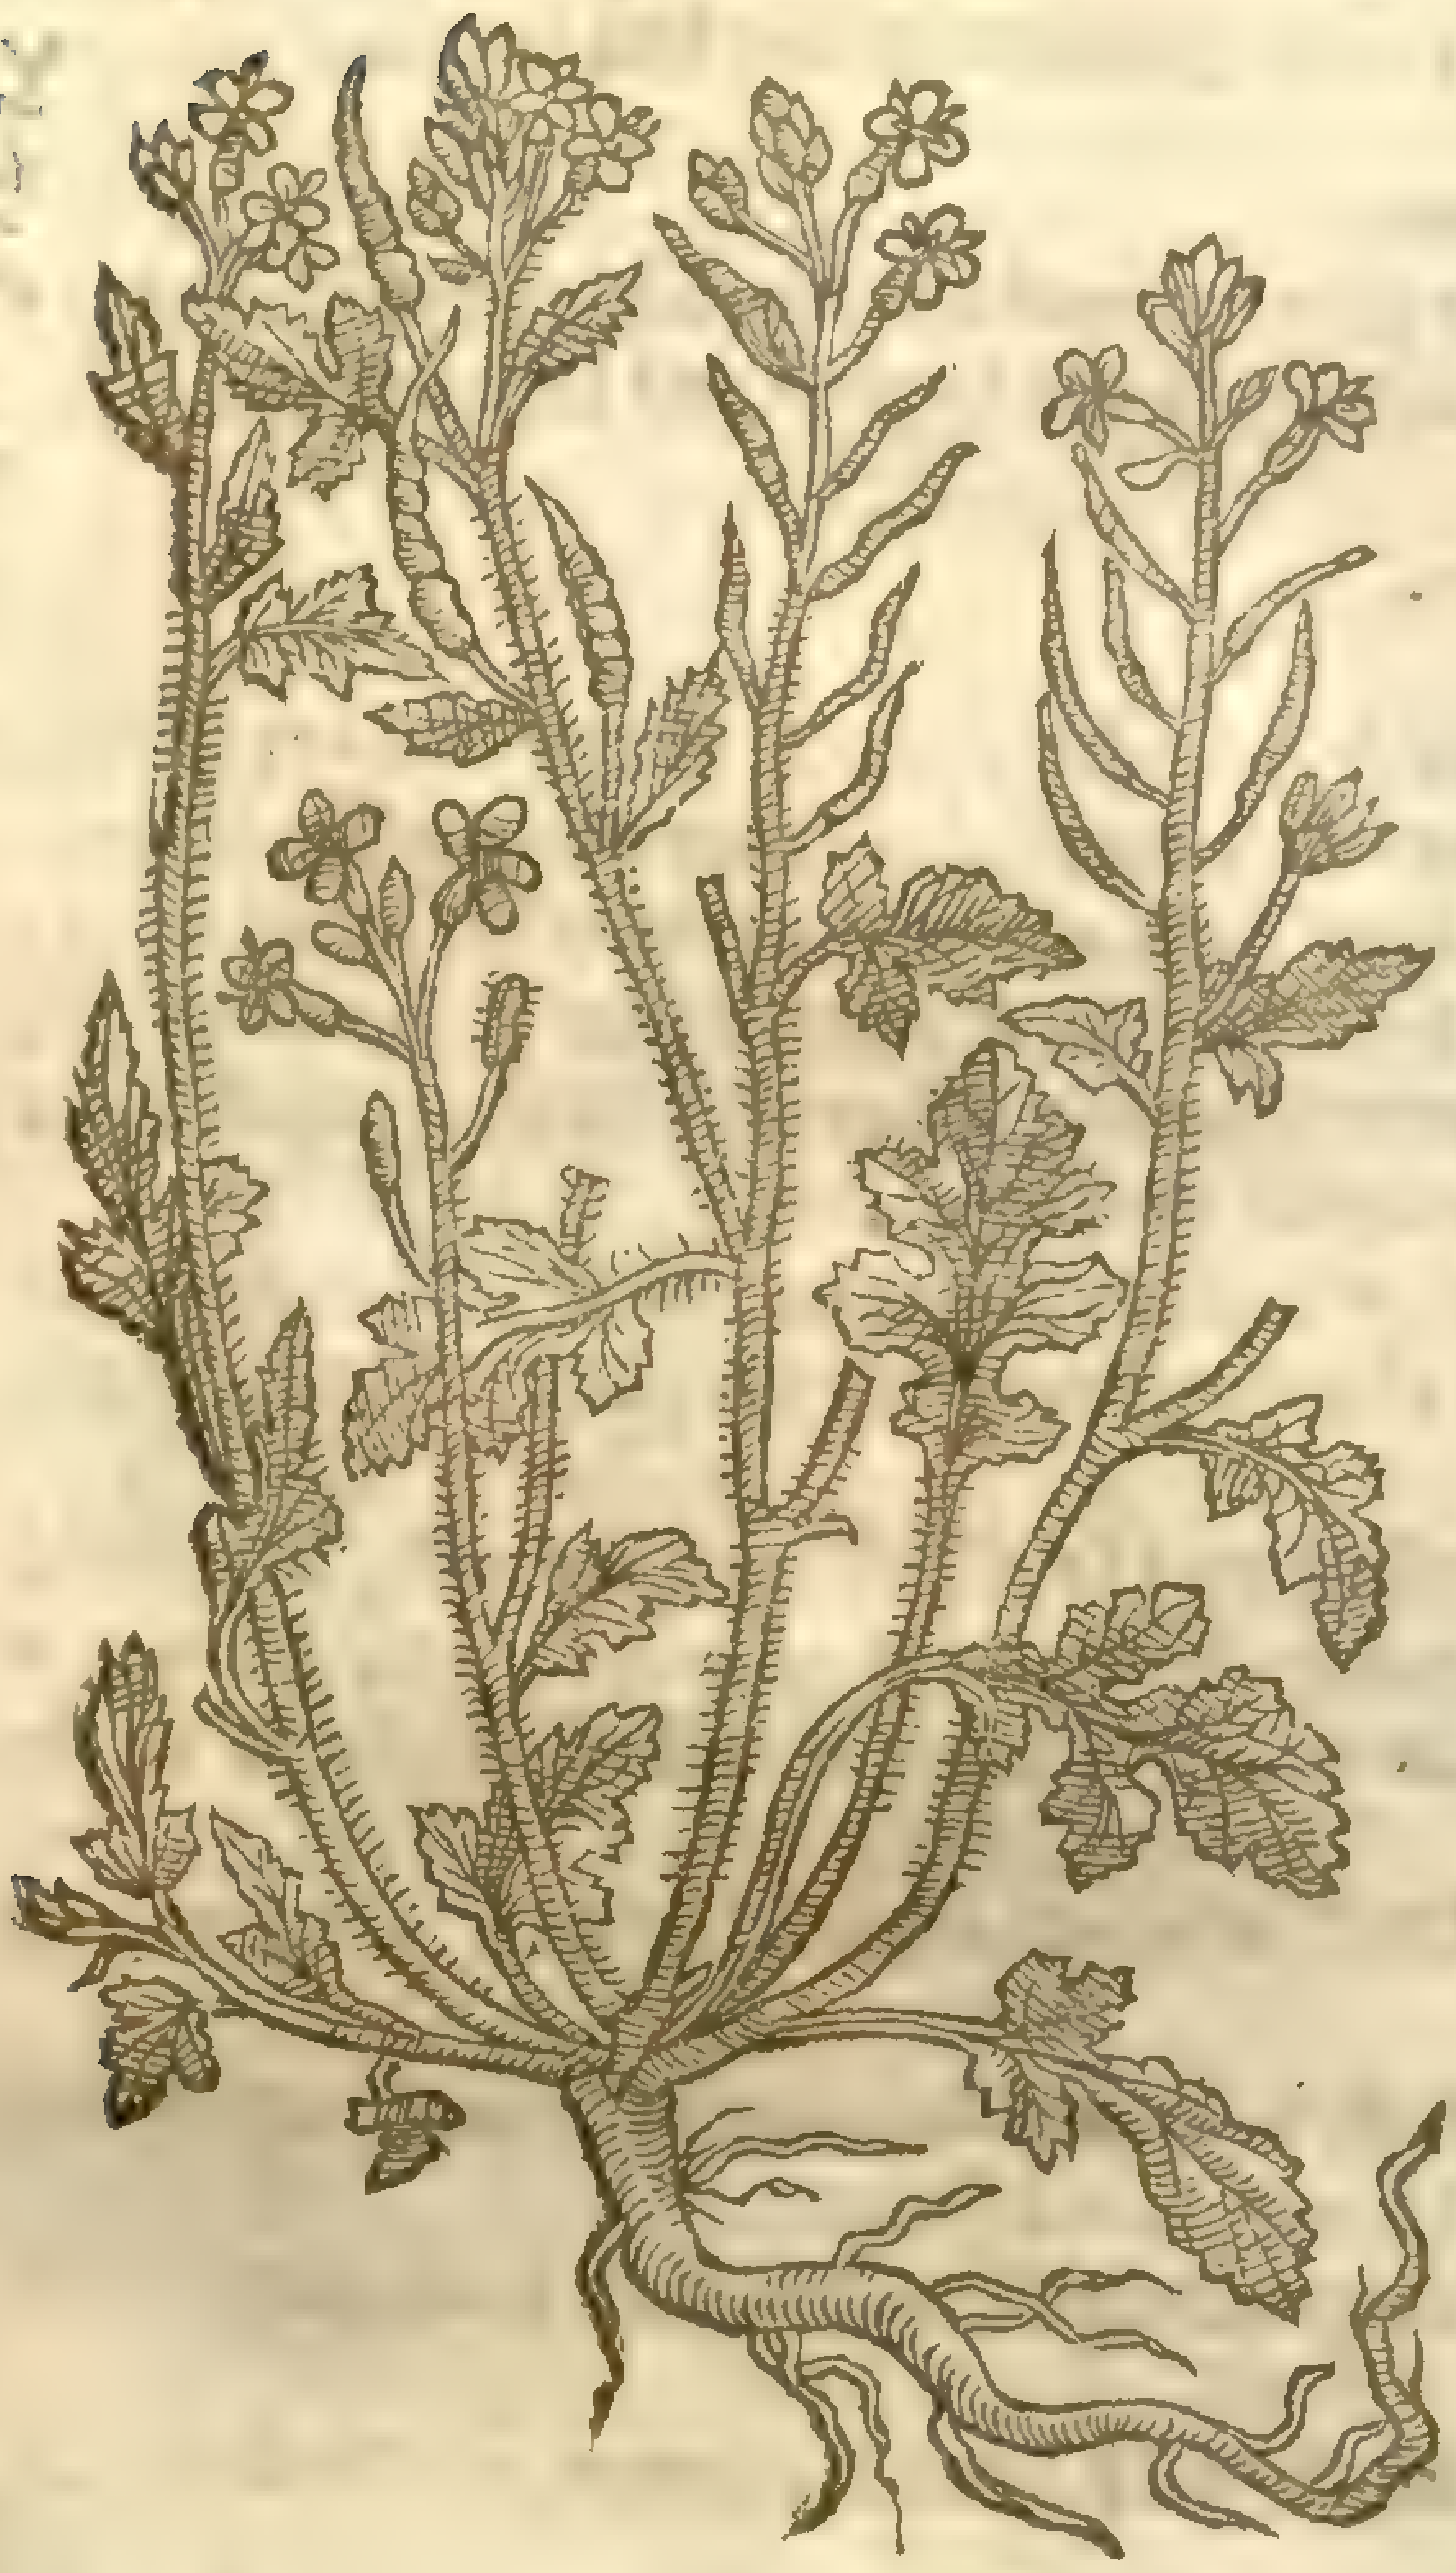
¶ *The Place.*

The firſt growes vpon the borders of banks and ditches caſt vp, and in the borders of fields.

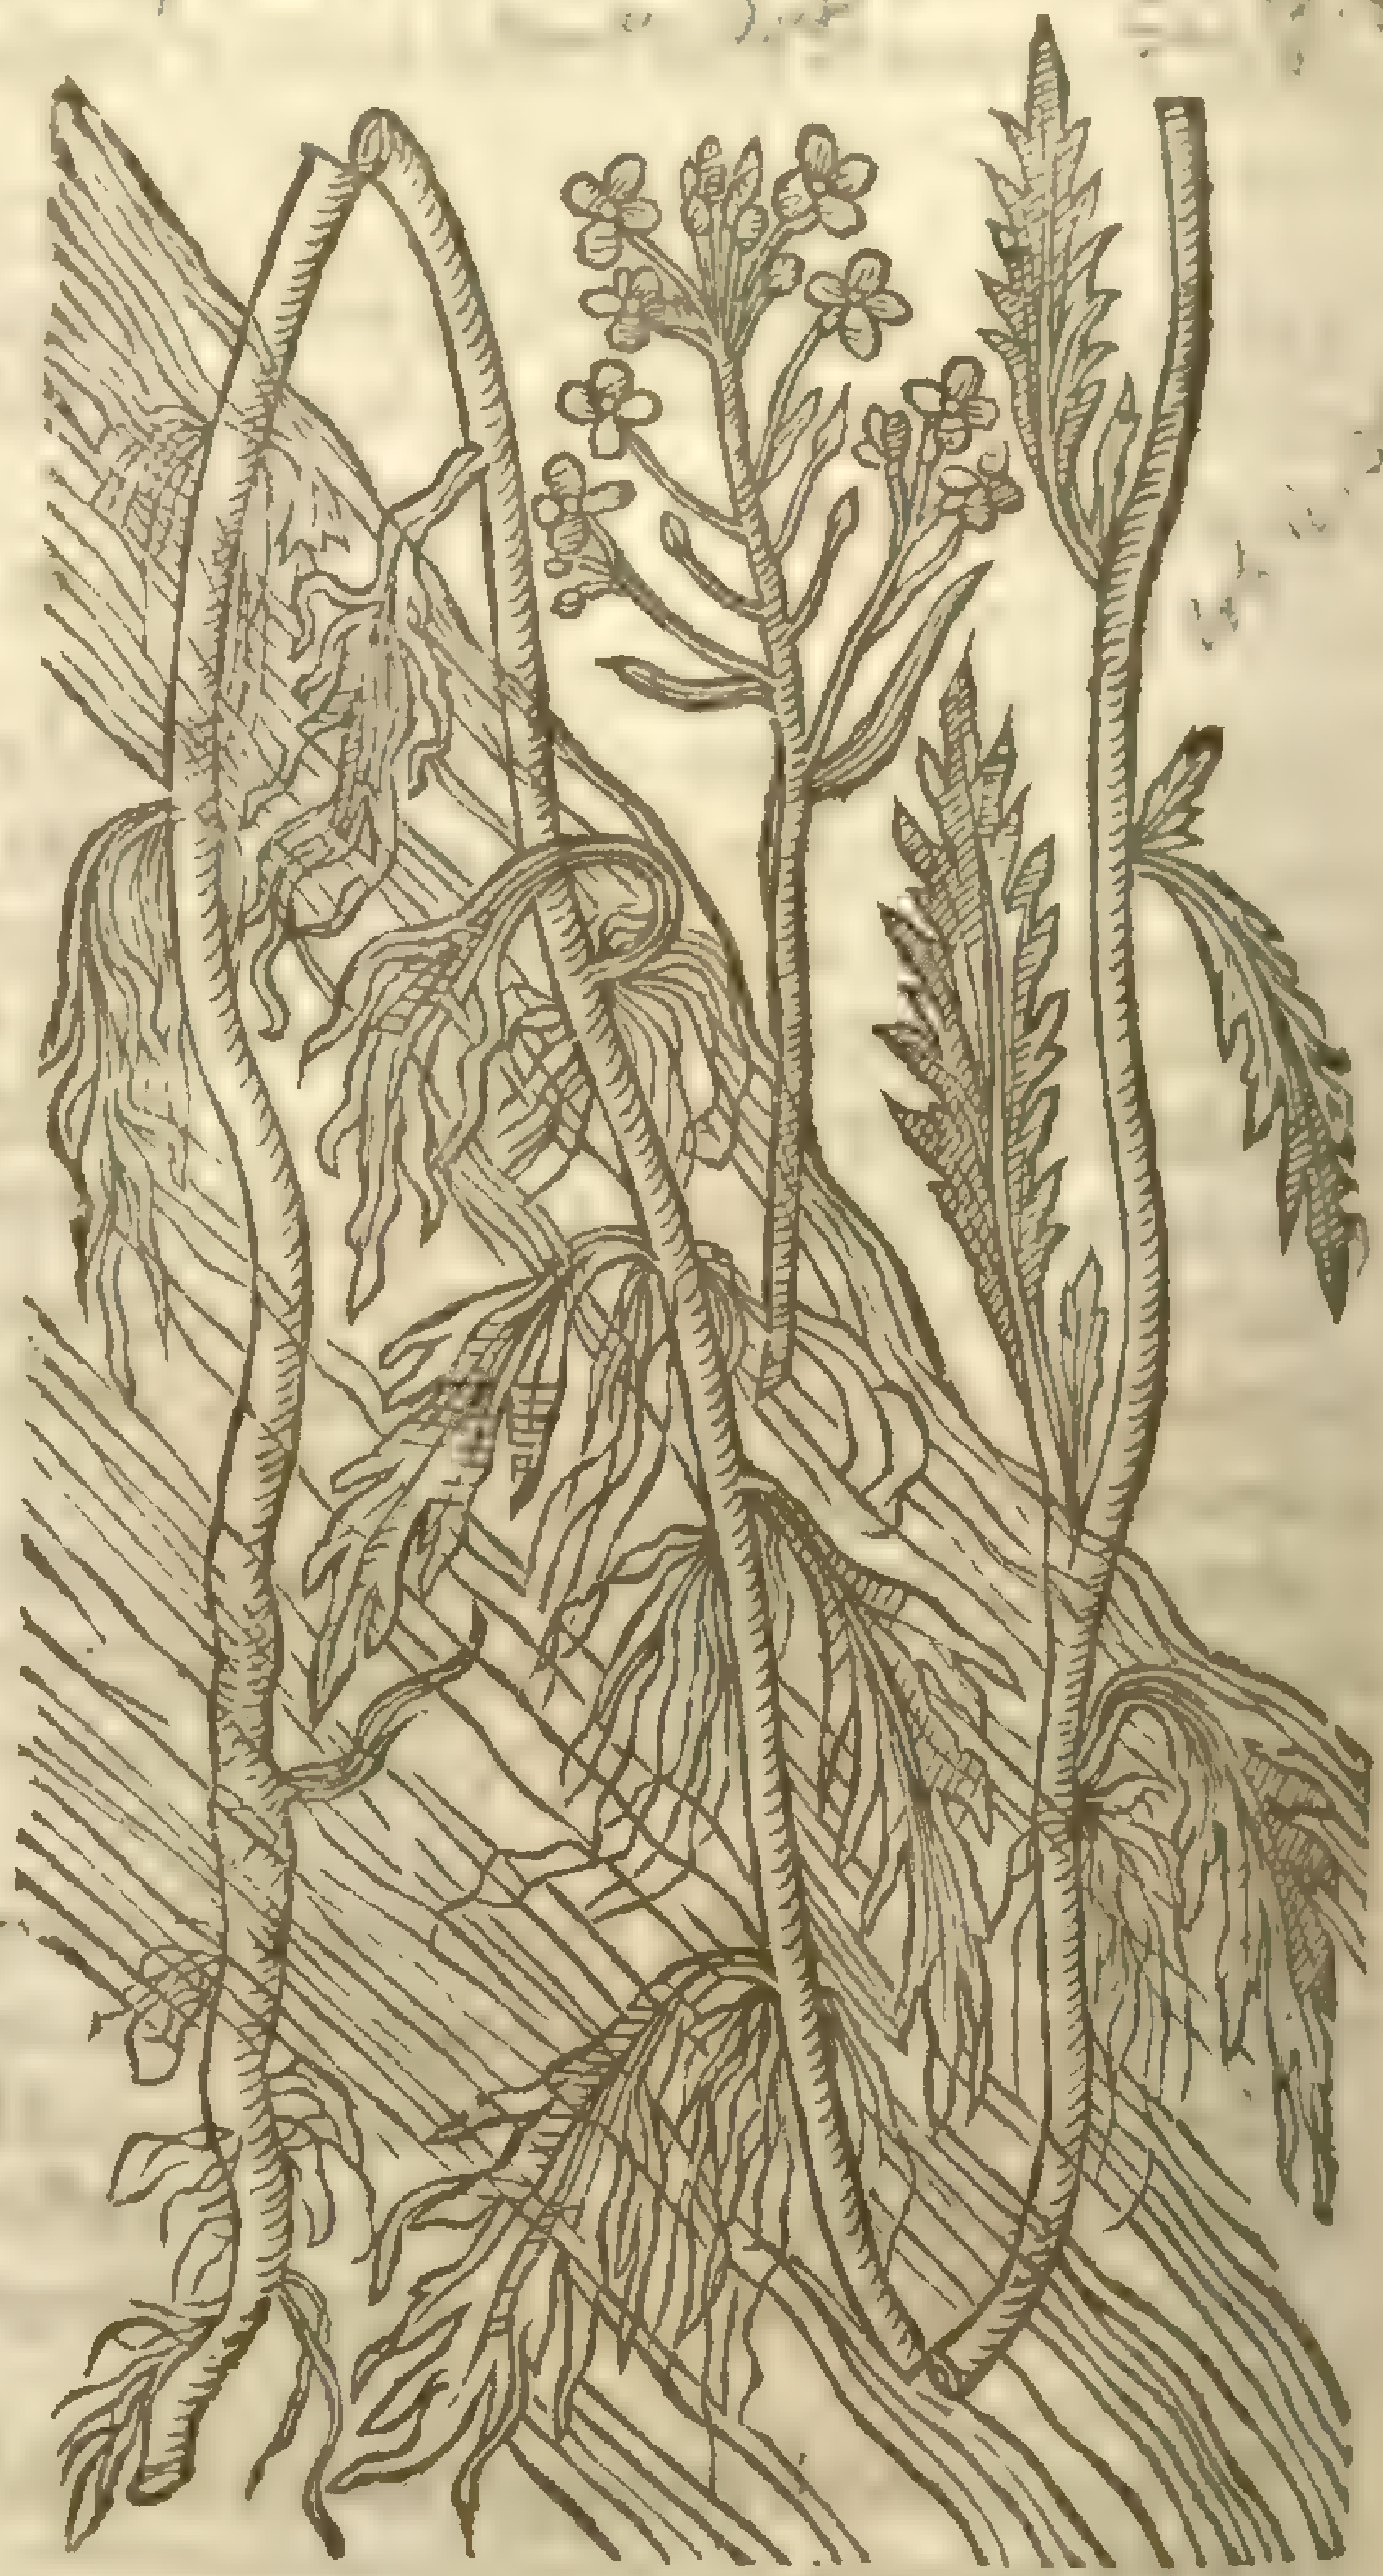
The ſecond growes by ditches, ſtanding waters, and riuers; as on the ſtone wall that bordereth vpon the riuer Thames by the Sauoy in London.

1 *Raphanus ſylveſtris.*
Wilde Radiſh.

Raphanus raphanistrum, L.
[illegible]



2 *Raphanus aquaticus.*
Water Radiſh.



¶ *The Time.*

They floure in Iune, and the ſeed is ripe in Auguſt.

¶ *The Names.*

† The firſt of theſe is *Rapiſtrum flore albo Erucæ folijs* of *Lobel*: *Armoratia*, or *Rapiſtrum album* of *Tabern.* and *Raphanus ſylveſtris* of our Author: in Engliſh, Wilde Radiſh.

The ſecond is *Radicula ſylveſtris* of *Dodonæus*: *Raphanus aquaticus* or *paluſtris* of others: in Engliſh, Water Radiſh.

¶ *The Temperature.*

The wild Radiſhes are of like temperature with the garden Radiſh, but hotter and drier.

¶ *The Vertues.*

Dioſcorides writeth, That the leaues are receiued among the pot-herbes, as alſo the boiled root, which, as he ſaith, doth heate, and prouoke vrine.

Chap. 7. *Of Horſe-Radiſh.*

¶ *The Deſcription.*

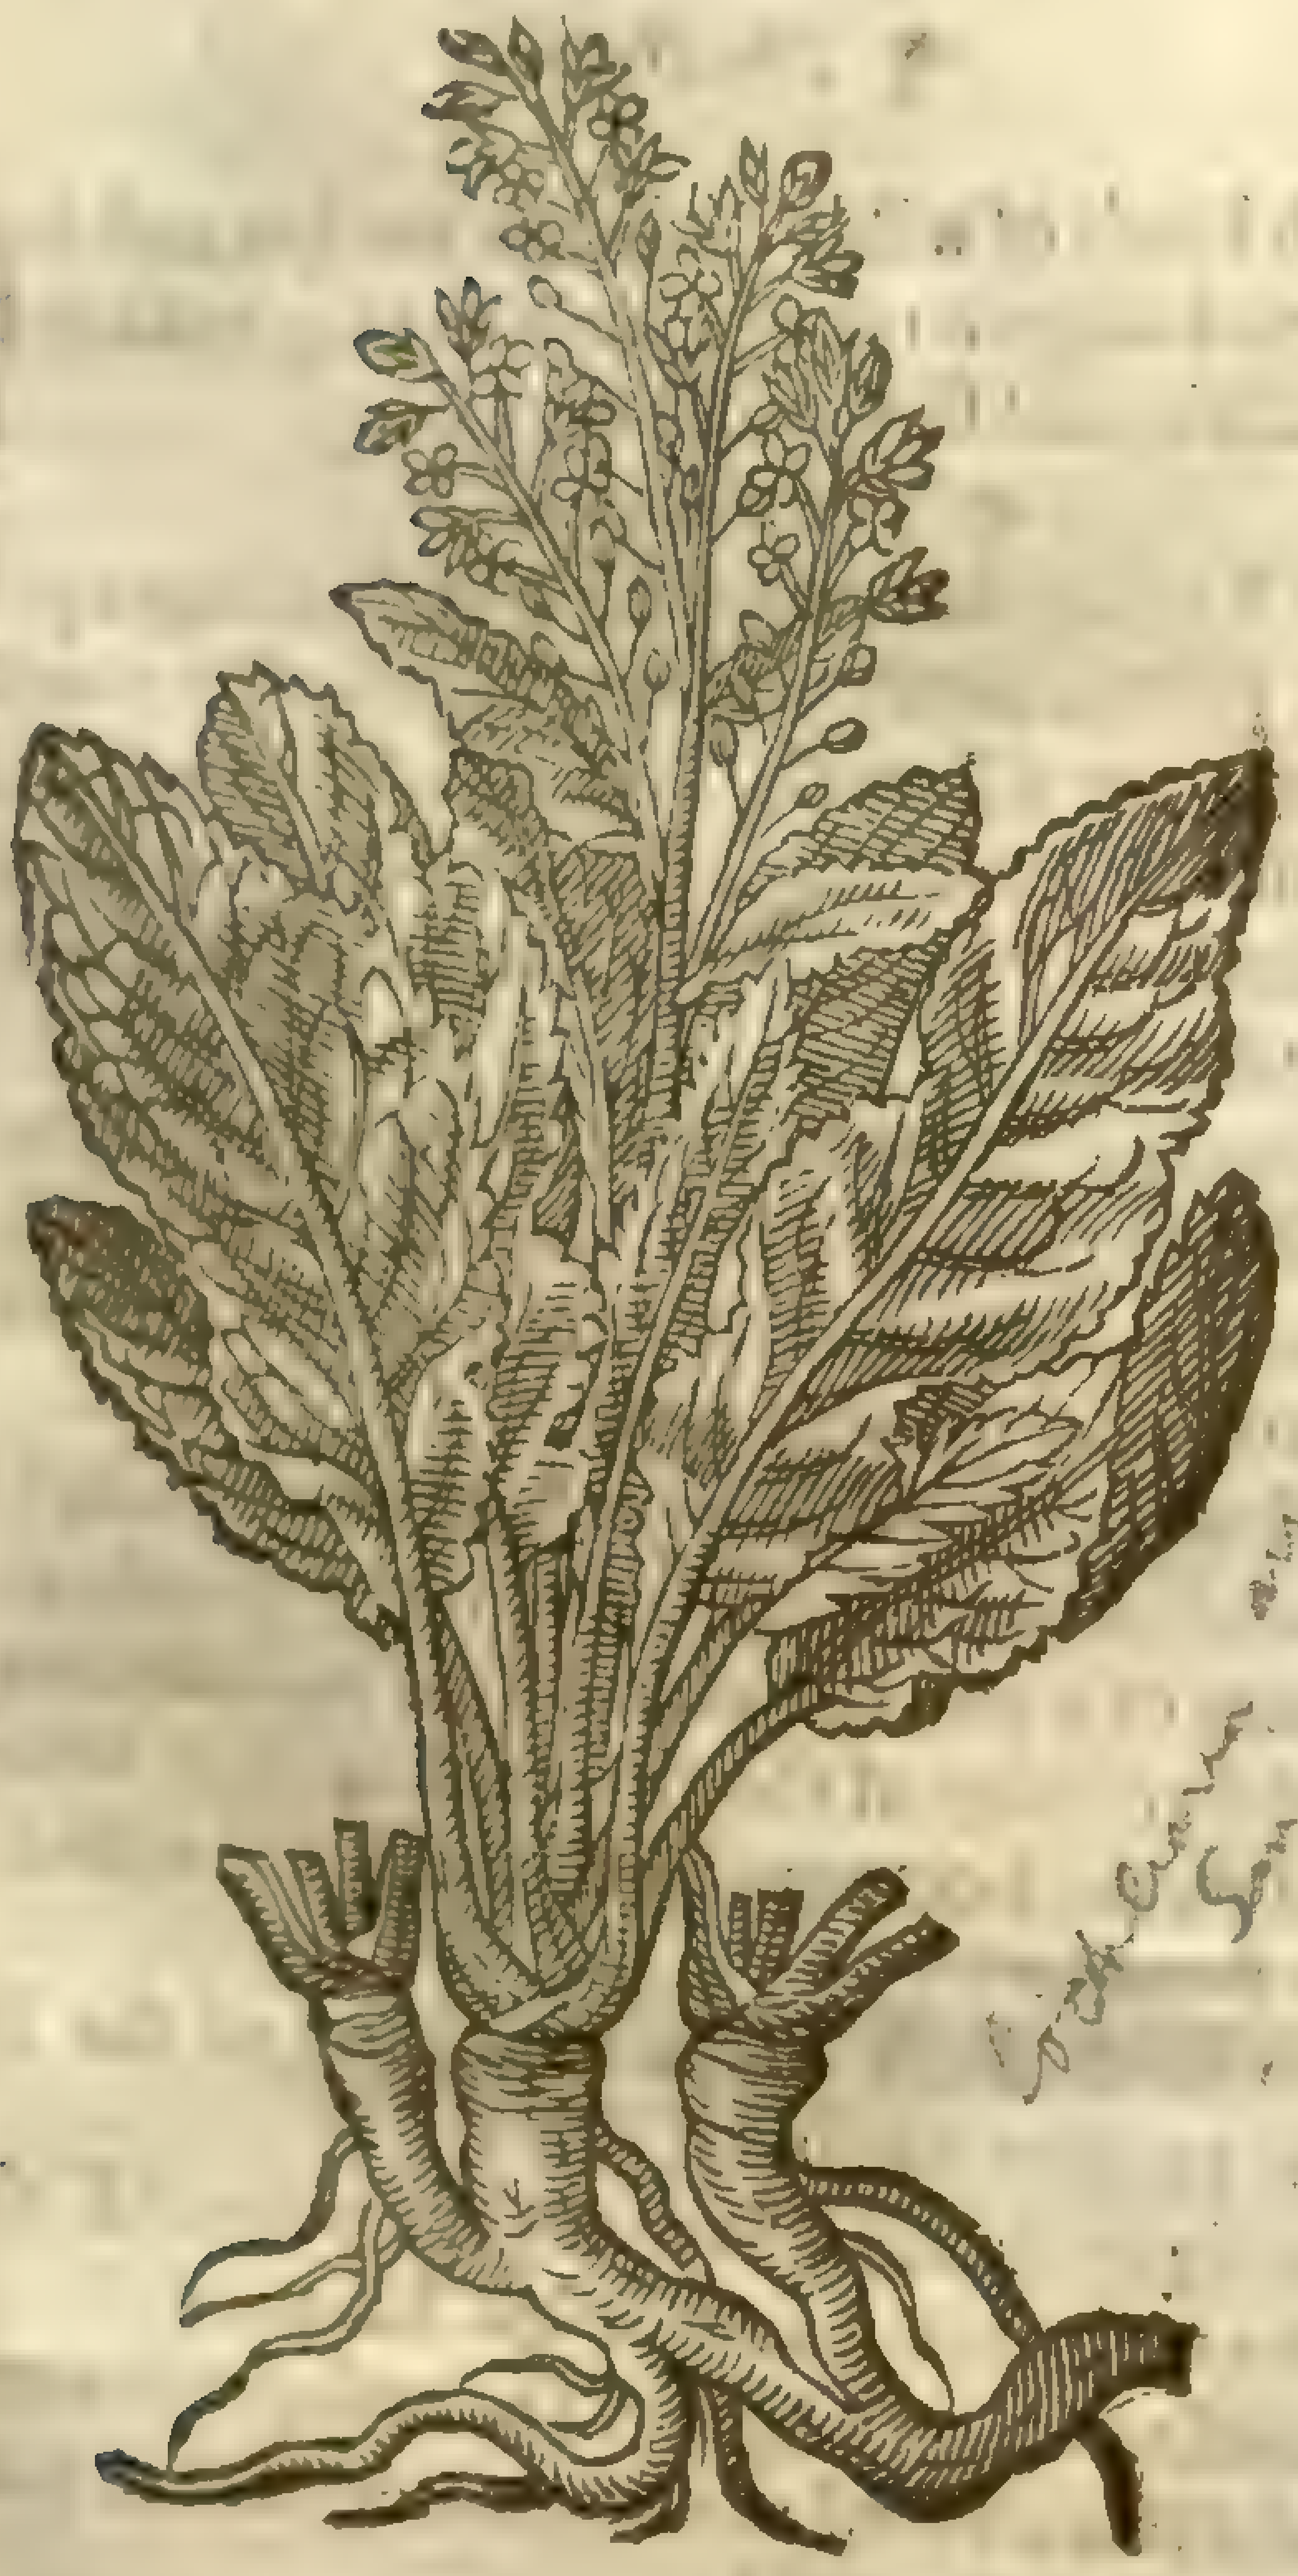
1 Horſe Radiſh brings forth great leaues, long, broad, ſharpe pointed, and ſnipt about the edges, of a deepe greene colour like thoſe of the great garden Dock, (called of ſome, Monks Rubarb, of others Patience) but longer and rougher. The ſtalke is ſlender and brittle, bearing at the top ſmall white floures: which being paſt, there follow ſmal cods, wherein is the ſeed. The root is long and thick, white of colour, in taſt ſharp, and very much biting the tongue like Muſtard.

2 Dittander or Pepperwort hath broad leaues long and ſharpe pointed, of a blewiſh greene colour like Woad, ſomewhat ſnipt or cut about the edges like a Saw. The ſtalke is round and

tough: vpon the branches whereof grow little white floures. The root is long and hard, creeping far abroad in the ground, in ſuch ſort that when it is once taken in a ground, it is not poſſible to root it out, for it wil vnder the ground creep and ſhoot vp and bud forth in many places far abroad. The root alſo is ſharpe and biteth the tongue like pepper, whereof it tooke the name Pepperwort.

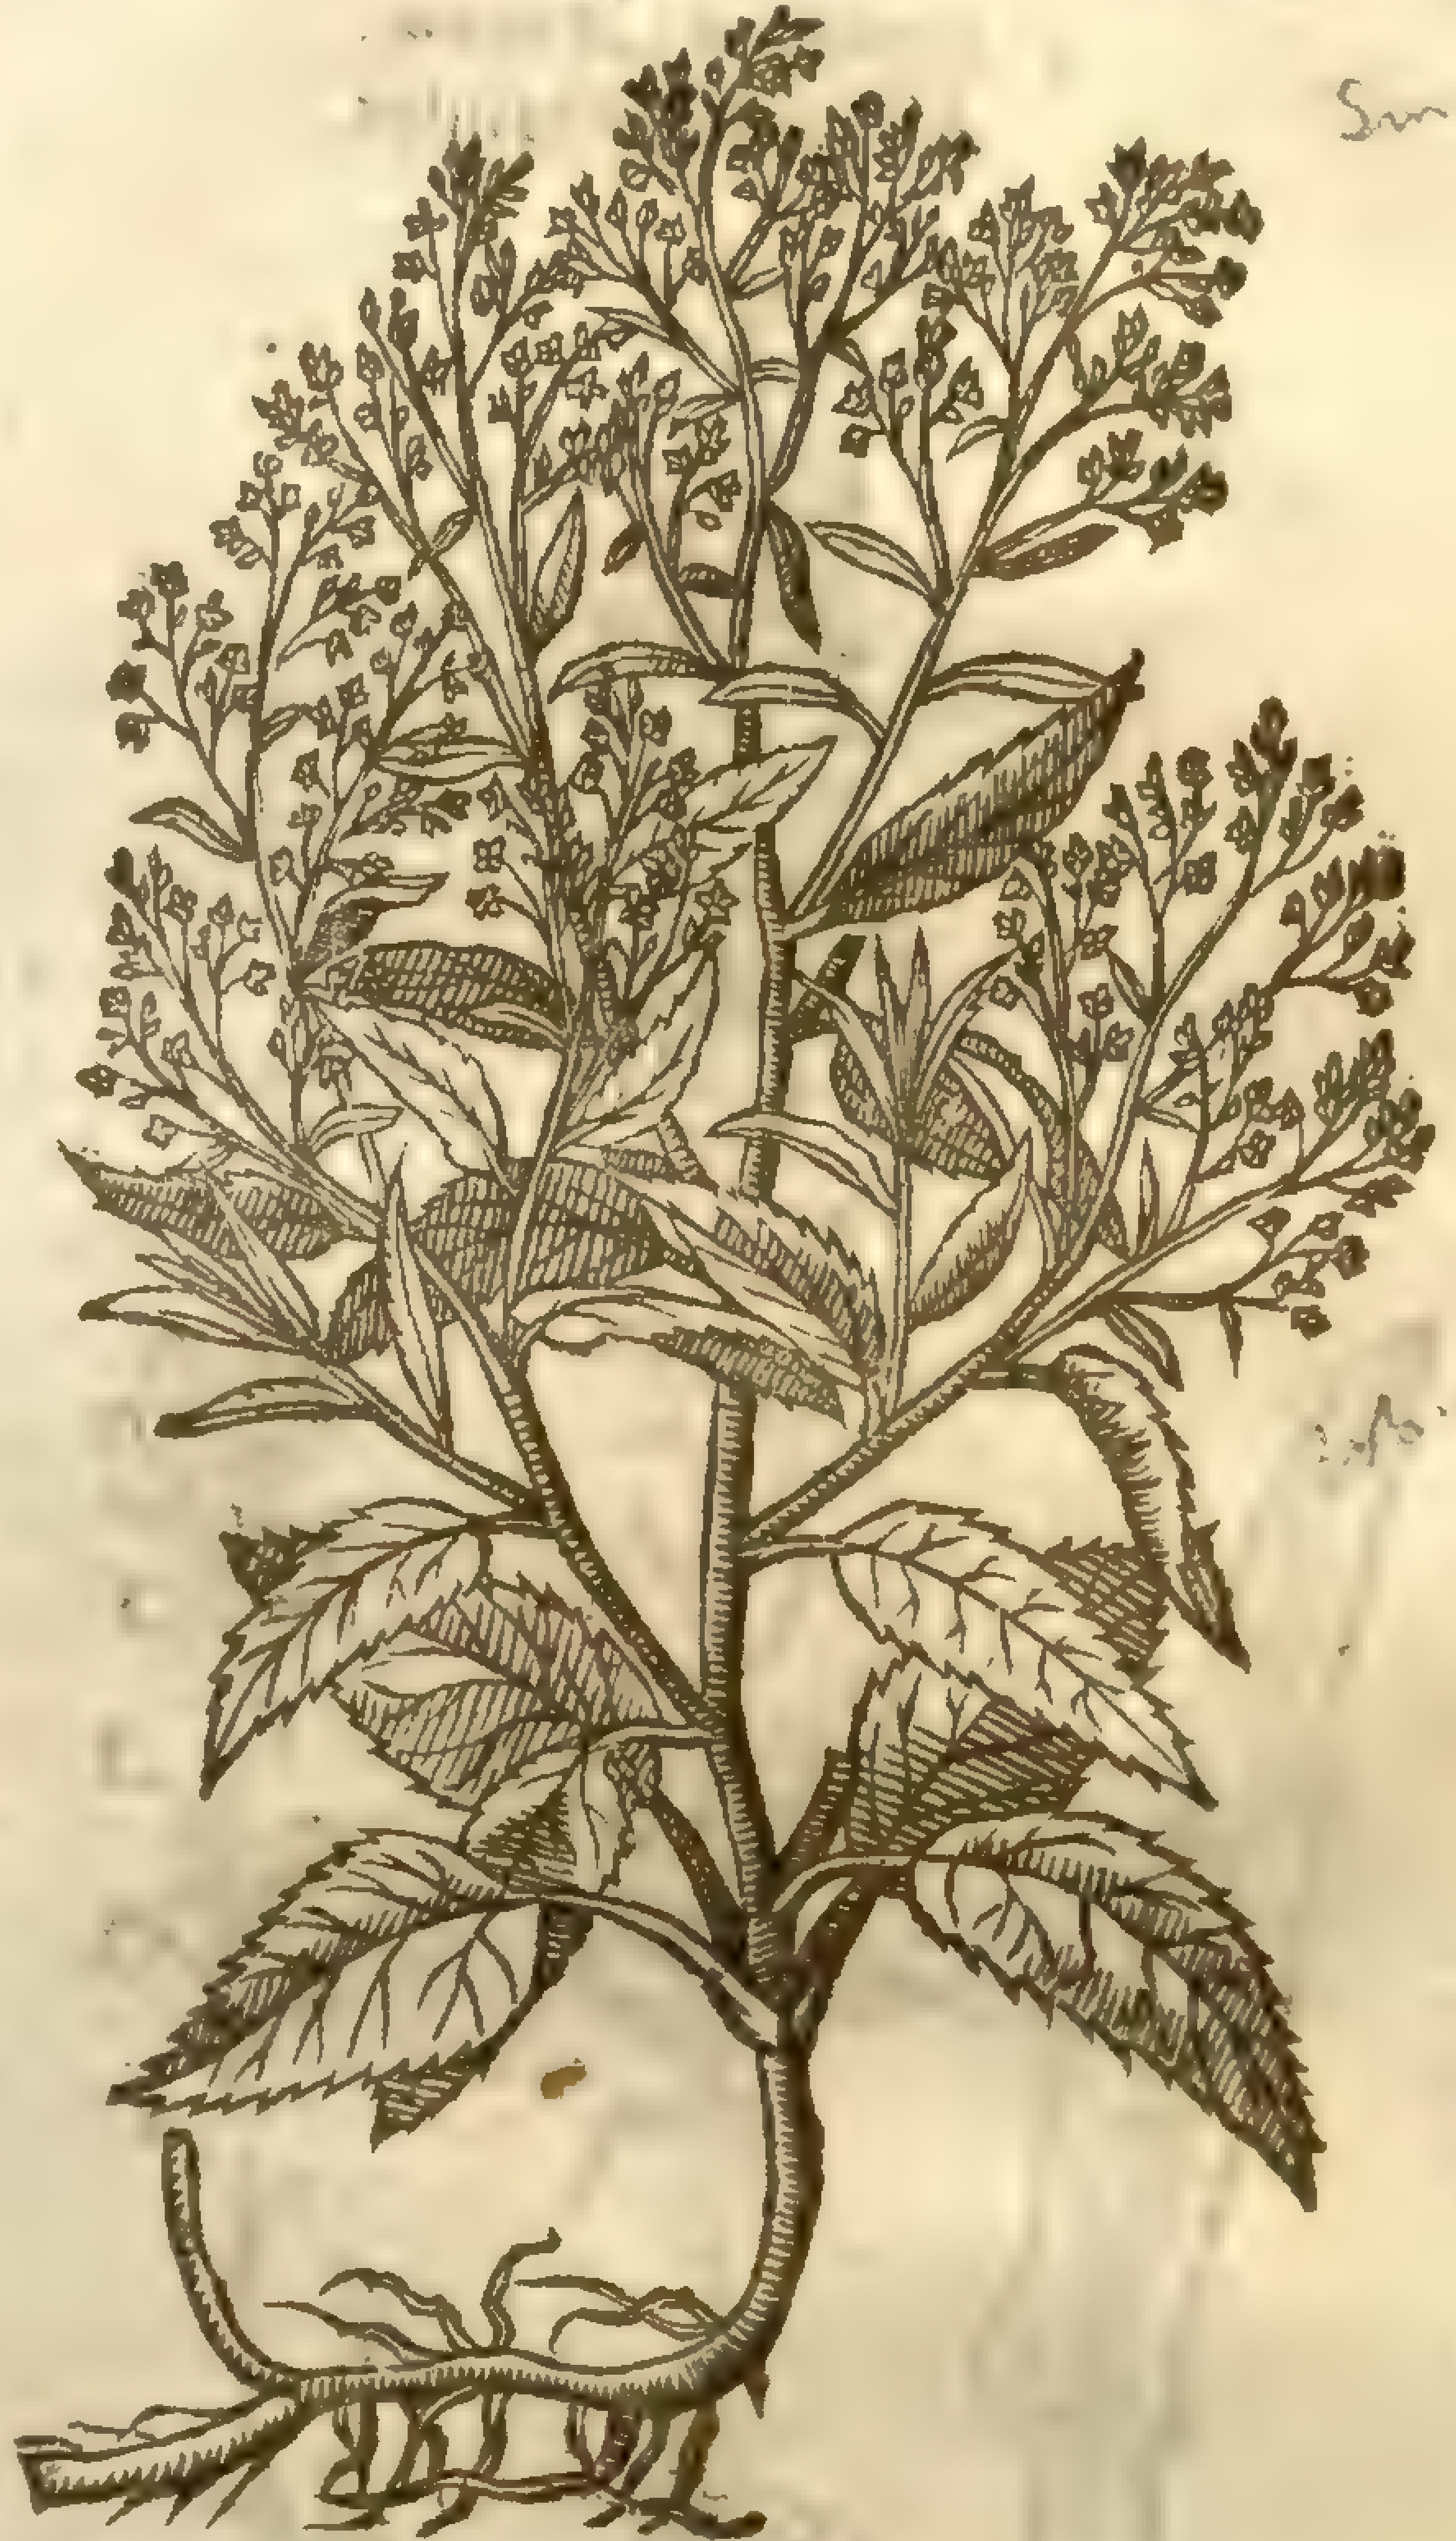
‡ 3 This which we giue you in the third place hath a ſmall fibrous root, the ſtalke groweth vp to the height of two cubits, and it is diuided into many branches furniſhed with white floures; after which follow ſeeds like in ſhape and taſte to Thlaſpi or Treacle muſtard. The leaues are ſomewhat like thoſe of Woad. This is nouriſhed in ſome gardens of the Low-Countries, and *Lobel* was the firſt that gaue the figure hereof, and that vnder the ſame title as we here giue you it. ‡

1 *Raphanus Ruſticanus.*
Horſe-Radiſh.



Cochlearia armoracia [illegible] Sm. fl. 3. 38

2 *Raphanus ſylveſtris Offic. Lepidium Æginetæ Lob.*
Dittander, or Pepperwort.



Lepidium latifolium [illegible]
Sm. fl. 3. [illegible]

¶ *The Place.*

HorſeRadiſh for the moſt part groweth and is planted in gardens; yet haue I found it wilde in ſundry places, as at Namptwich in Cheſhire, in a place called the Milne eye; as alſo at a ſmall village neere London called Hogſdon, in the field next to a farme houſe leading to Kings-land, where my very good friend Mr *Bredwel*, practioner in phiſicke, a learned and diligent ſearcher of ſimples, and Mr. *William Martin* one of the fellowſhip of Barbers Surgeons, my deare and louing friend, in company with him found it, and gaue me knowledge of the place, where it flouriſheth to this day.

Dittander is planted in gardens, and is to be found wild alſo in ſundry places of England, as at Clare by Ouenden in Eſſex, at the Hall of Brinne in Lancaſhire, and neere to Exceſter in the Weſt parts of England. It delighteth to grow in ſandy and ſhadowie places ſomewhat moiſt.

¶ *The Time.*

Horſe-Radiſh floureth for the moſt part in Aprill or May, and the ſeed is ripe in Auguſt, & that ſo rare or ſeldome ſeen, as that *Petrus Placentius* hath written, that it brings forth no ſeed at all. Dittander floures in Iune and Iuly.

¶ *The Names.*

Horſe-Radiſh is commonly called *Raphanus ruſticanus*, or *magnus*, and of diuers ſimply *Raphanus ſylueſtris*;

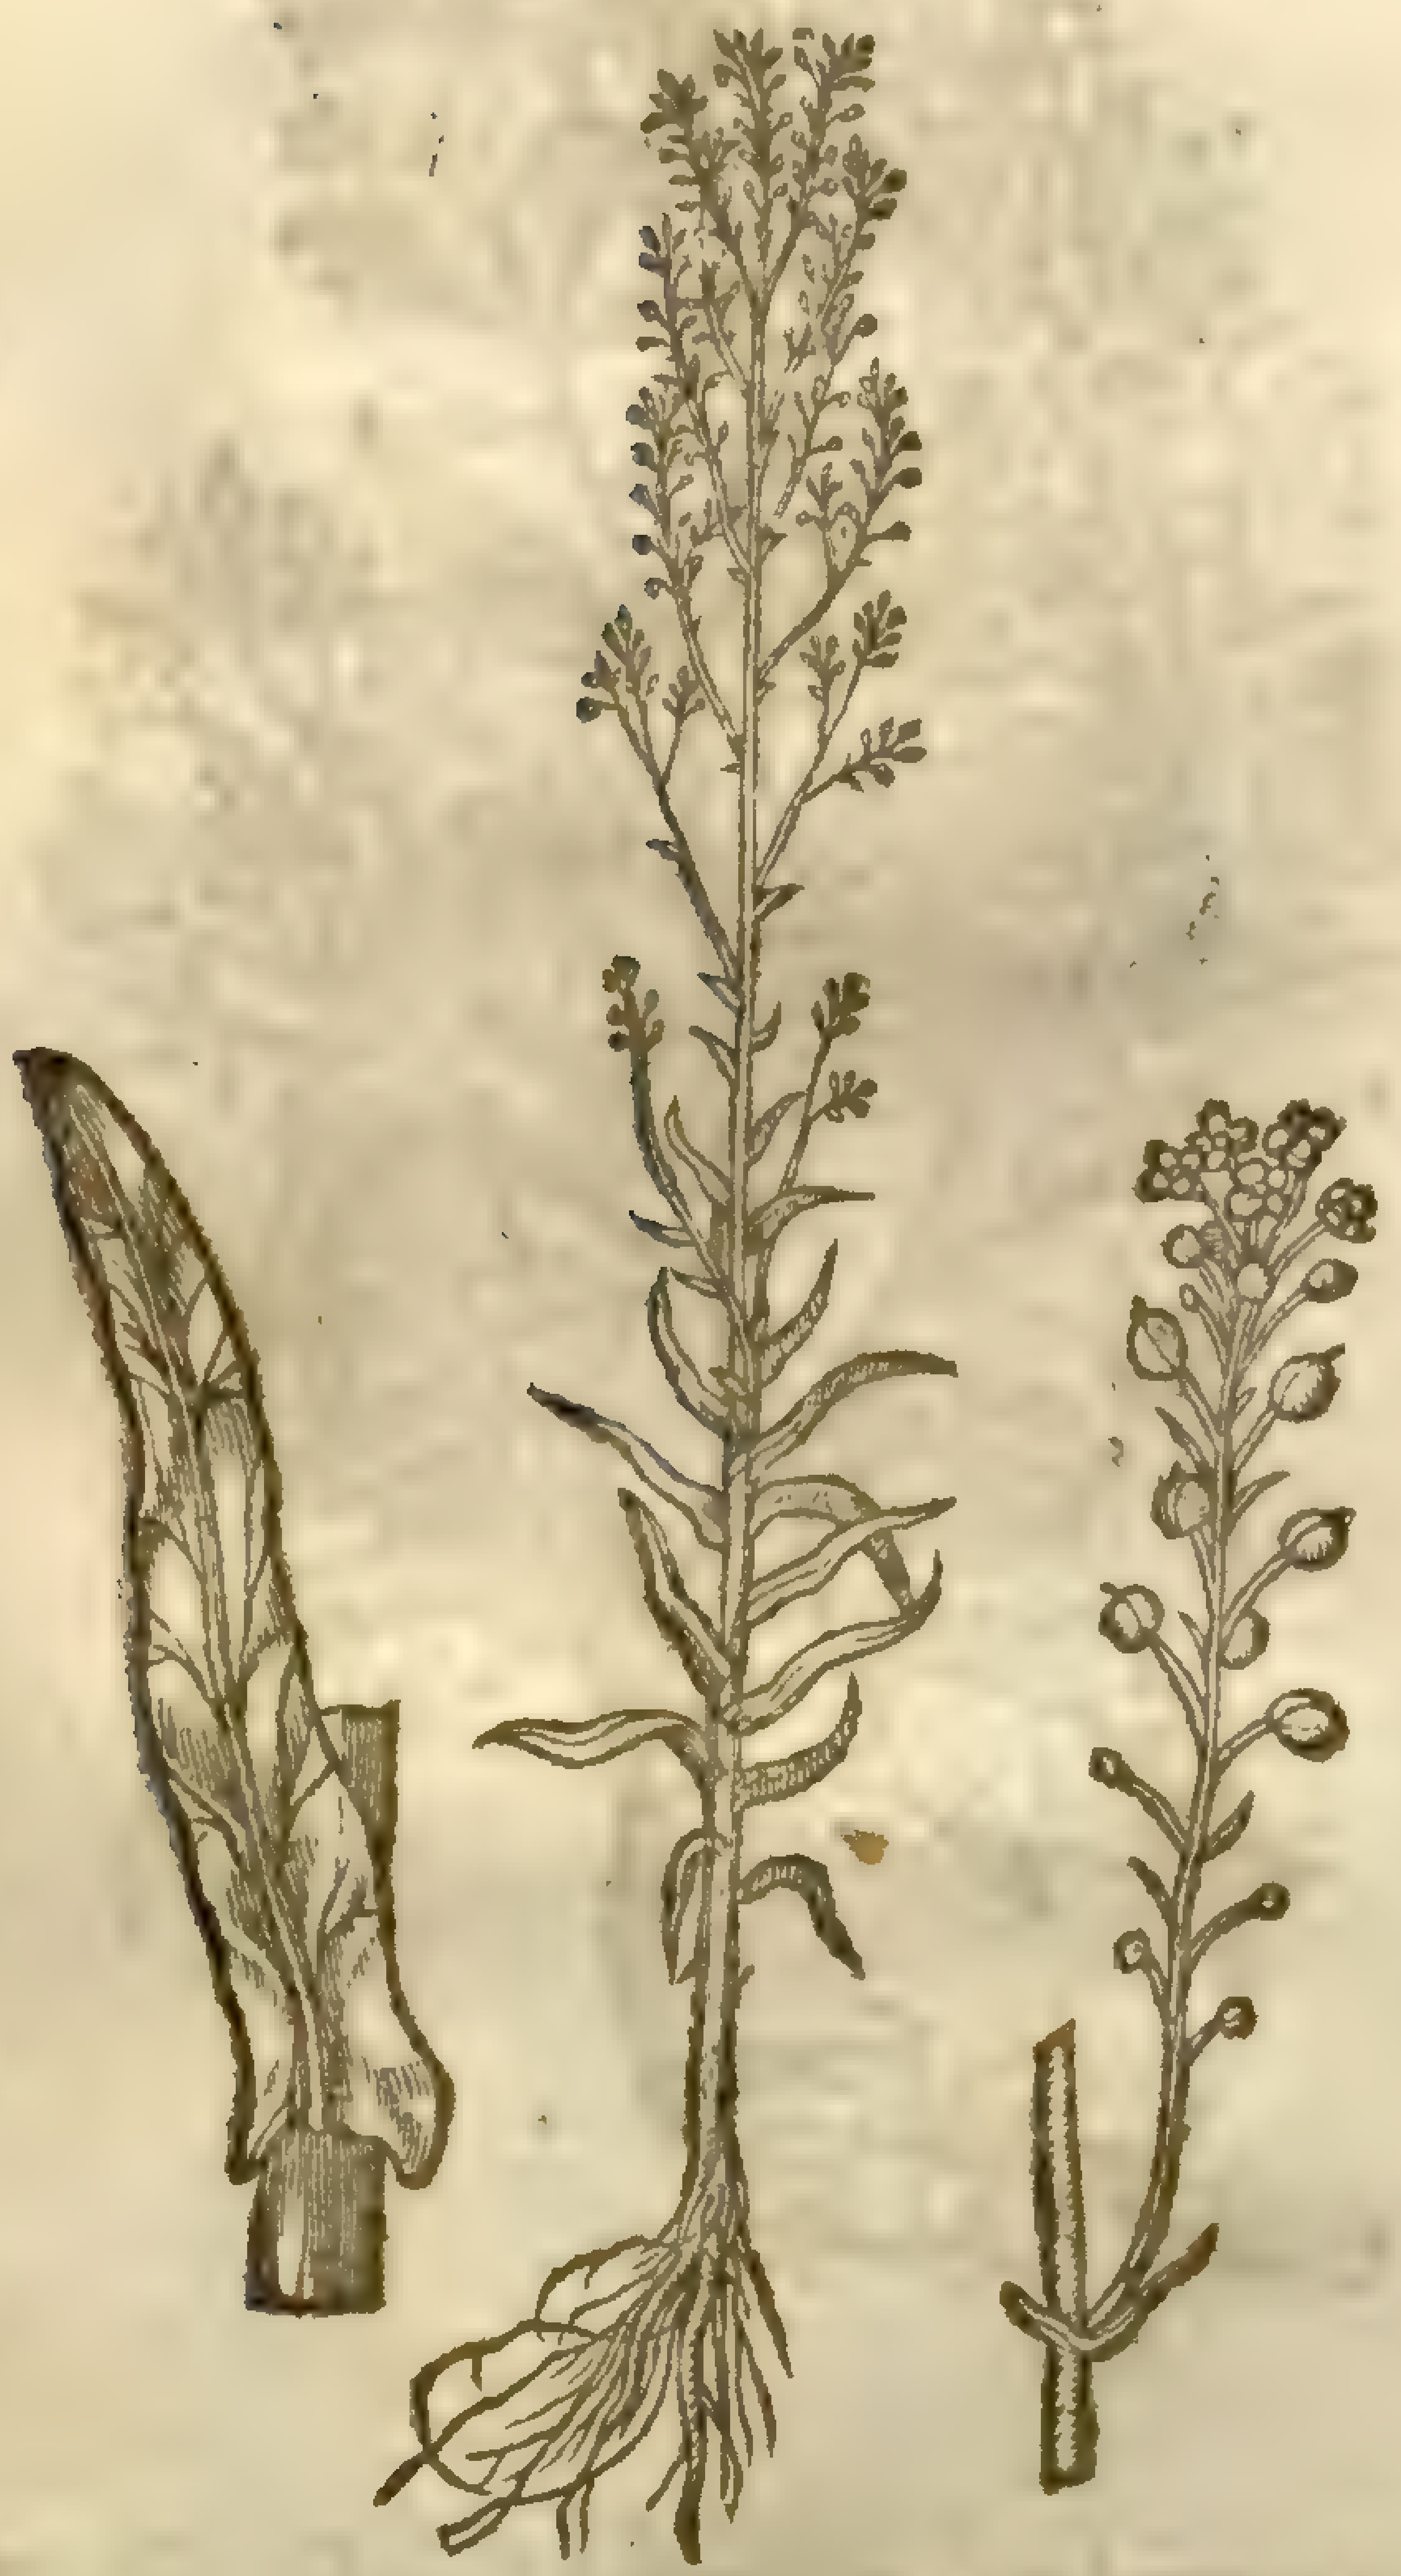
ſylveſtris: of the high-Dutch men, **Merrettich, Krain**, or **Kren**: in French, *Grand Raifort*: in low-Dutch, **Merradus**: in English, Mountain Radiſh, great Raifort, and Horſe Radiſh, It is called in the North part of England, Redcole.

Diuers thinke that this Horſe-Radiſh is an enemy to Vines, and that the hatred between them is ſo great, that if the root hereof be planted neere to the Vine, it bendeth backward from it, as not willing to haue fellowſhip with it.

It is alſo reported, That the root hereof ſtamped, and caſt into good and pleaſant wine, turneth it forthwith to vineger. But the old writers doe aſcribe this enmitie to the Vine and Braſſica, our Coleworts, which the Antients haue named κράμβη.

Pliny, lib. 19. cap. 9, deſcribes Dittander by the name of *Lepidium*; and *Ægineta* alſo names it ſo: in ſhops, *Raphanus ſylveſtris*, and *Piperitis*: the Germans call it **Pfefferkraut**: the low-Dutch men, **Peppercruyt**: in English, Dittander, Dittany, and Pepperwort.

3 *Lepidium Anuum.*
Annual Dittander.



¶ *The Nature.*

Theſe kinds of wilde Radiſhes are hot and dry in the third degree: they haue a drying and cleanſing qualitie, and ſomewhat digeſting.

¶ *The Vertues.*

A Horſe Radiſh ſtamped, with a little vineger put thereto, is commonly vſed among the Germanes for ſauce to eat fiſh with, and ſuch like meats, as we do muſtard: but this kind of ſauce doth heat the ſtomack better, and cauſeth better digeſtion than muſtard.

B Oxymel, or ſyrrup made with vineger & hony, in which the rinds of horſe-Radiſh haue been infuſed three daies, cauſeth vomit, and is commended againſt the quartan ague.

C The leaues boiled in wine, and a little oile Oliue added thereto, & laid vpon the grieued parts in manner of a pultis, doe mollifie and take away the hard ſwellings of the liuer and milt; & being applied to the bottome of the belly is a remedie for the ſtrangurie.

D It profiteth much in the expulſion of the ſecondine or after-birth.

E It mitigateth and aſſwageth the paine of the hip or haunch, commonly called Sciatica.

F It profiteth much againſt the colique, ſtrangurie, and difficultie of making water, vſed in ſtead of Muſtard as aforeſaid.

G The root ſtamped and giuen to drinke killeth the worms in children. The juice giuen doth the ſame. An ointment made thereof doth the like, being anointed vpon the belly of the childe.

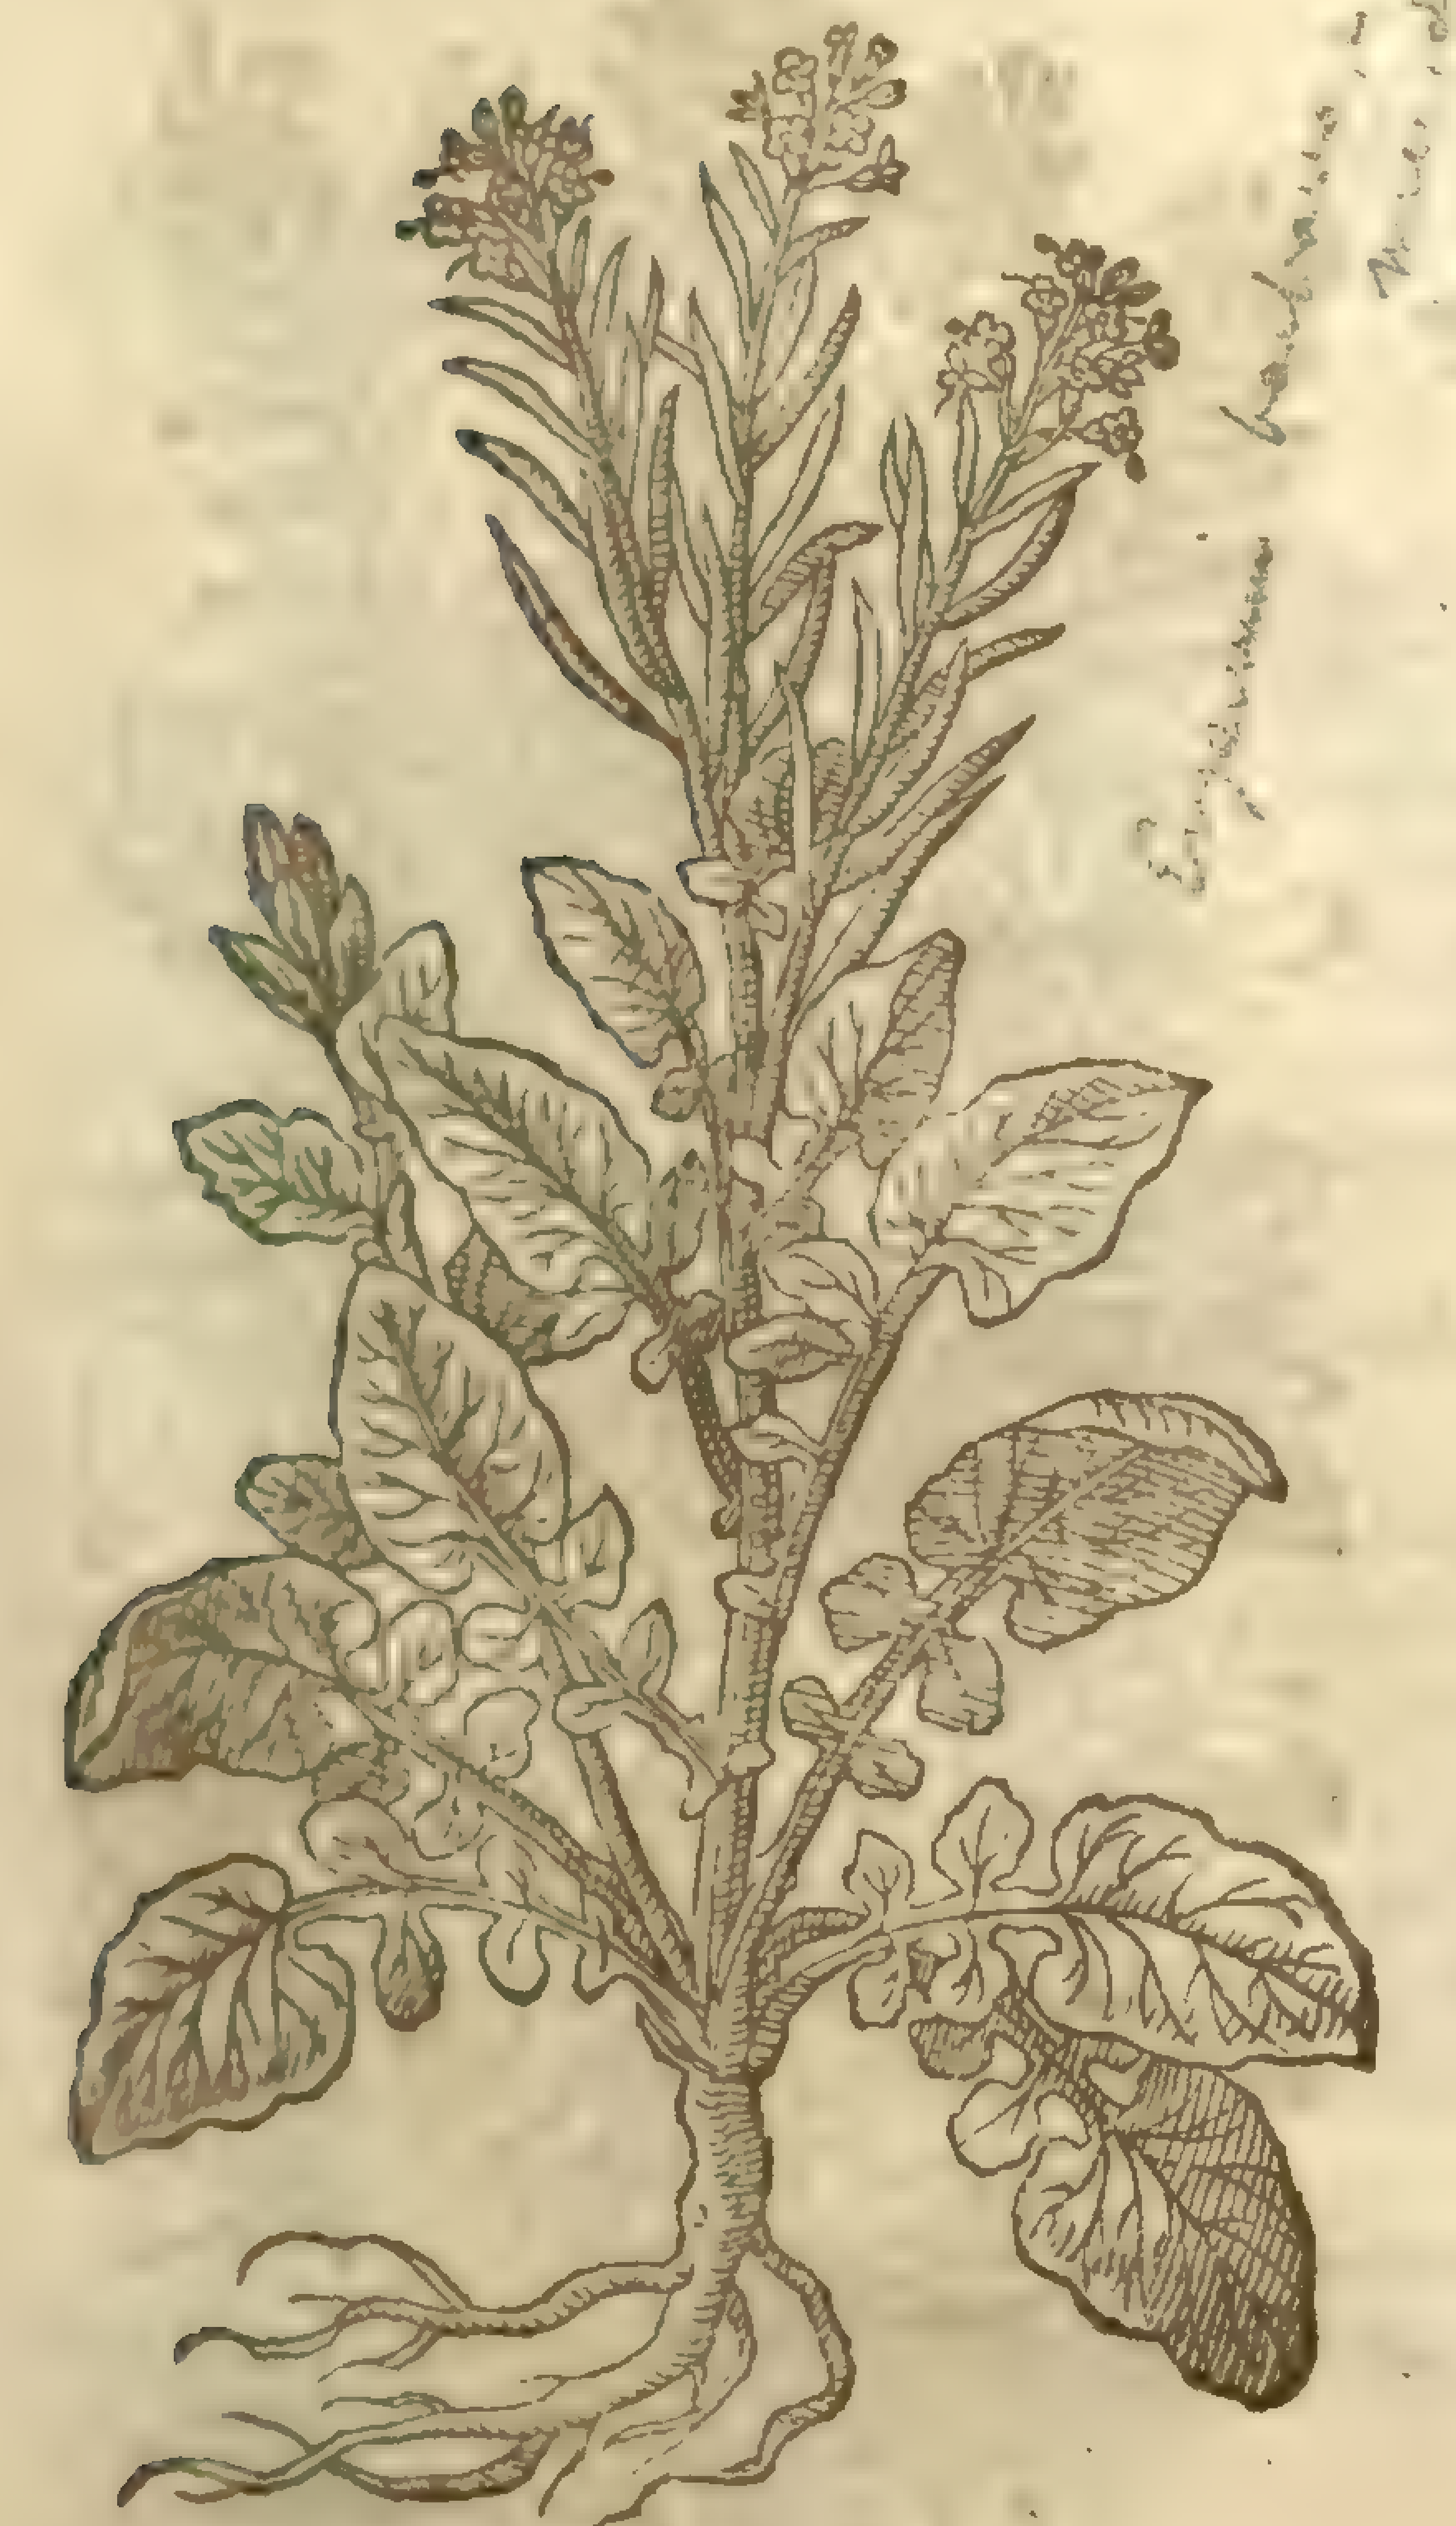
H The leaues of Pepperwort, but eſpecially the roots, be extreme hot, for they haue a burning and bitter taſte. It is of the number of ſcorching and bliſtring ſimples, ſaith *Pliny, lib. 20. cap. 17.* and therefore by his hot qualitie it mendeth the skin in the face, and taketh away ſcabs, ſcars, & manginesſe, if any thing remain after the healing of vlcers and ſuch like.

Chap. 8. *Of Winter-Creſſes.*

¶ *The Deſcription.*

The Winter-Creſſes haue many greene broad ſmooth and flat leaues like vnto the common Turneps, whoſe ſtalkes be round and full of branches, bringing forth at the top ſmall yellow floures: after them follow ſmall cods, wherein is contained ſmall reddiſh ſeed.

Barbarea.
Winter Creſſes.



¶ *The Place.*

It groweth in gardens among pot herbes, and very common in the fields neere vnto paths and highwaies almoſt euery where.

¶ *The Time.*

This herbe is greene all winter long, it floureth in May and ſeedeth in Iune.

¶ *The Names.*

Winter Creſſe is called of the Latines, *Cardamum*, or *Naſturtium Hibernum*: of ſome, *Barbarea*, and *Pſeudobunium*: the Germans call it **S. Barberen kraut**: in Low-Dutch, **Winter Kerſſe.**

It ſeems to be *Dioſcorides* his ψευδοβούνιον: that is to ſay, falſe or baſtard *Bunium*: in Engliſh, winter Creſſes, or herb S. Barbara.

¶ *The Nature.*

This herbe is hot and dry in the ſecond degree.

¶ *The Vertues.*

The ſeed of Winter Creſſe cauſeth one to make water, and driueth forth grauell, and helps the ſtrangurie. A

The iuyce thereof mundifieth corrupt and filthy vlcers, being made in form of an vnguent with wax, oile, and turpentine. B

In winter when ſalad herbes be ſcarce, this herbe is thought to be equall with Creſſes of the garden, or Rocket. C

This herbe helpeth the ſcuruy, being boiled among ſcuruy graſſe, called in Latine *Cochlearia*, cauſing it to worke the more effectually. D

CHAP. 9. *Of Muſtard.*

¶ *The Deſcription.*

1 THe tame or garden Muſtard hath great rough leaues like to thoſe of the Turnep, but rougher and leſſer: the ſtalke is round, rough, and hairy, of three cubits high, diuided into many branches, whereon do grow ſmall yellow floures, & after them ſucceed cods ſlender and rough, wherin is contained round ſeed bigger than Rape ſeed, of colour yellow, of taſt ſharpe and biting the tongue, as doth our common field muſtard.

† 2 Our ordinarie Muſtard hath leaues like Turneps, but not ſo rough, the ſtalks are ſmooth and grow ſometimes to three, foure, or fiue cubits high, they haue many branches, and the leaues vpon theſe branches, eſpecially the vppermoſt, are long and narrow, and hang downeward on ſmall ſtalks; the cods are ſhort, and lie flat and cloſe to the branches, and are ſomwhat ſquare: the ſeed is reddiſh or yellow. ‡

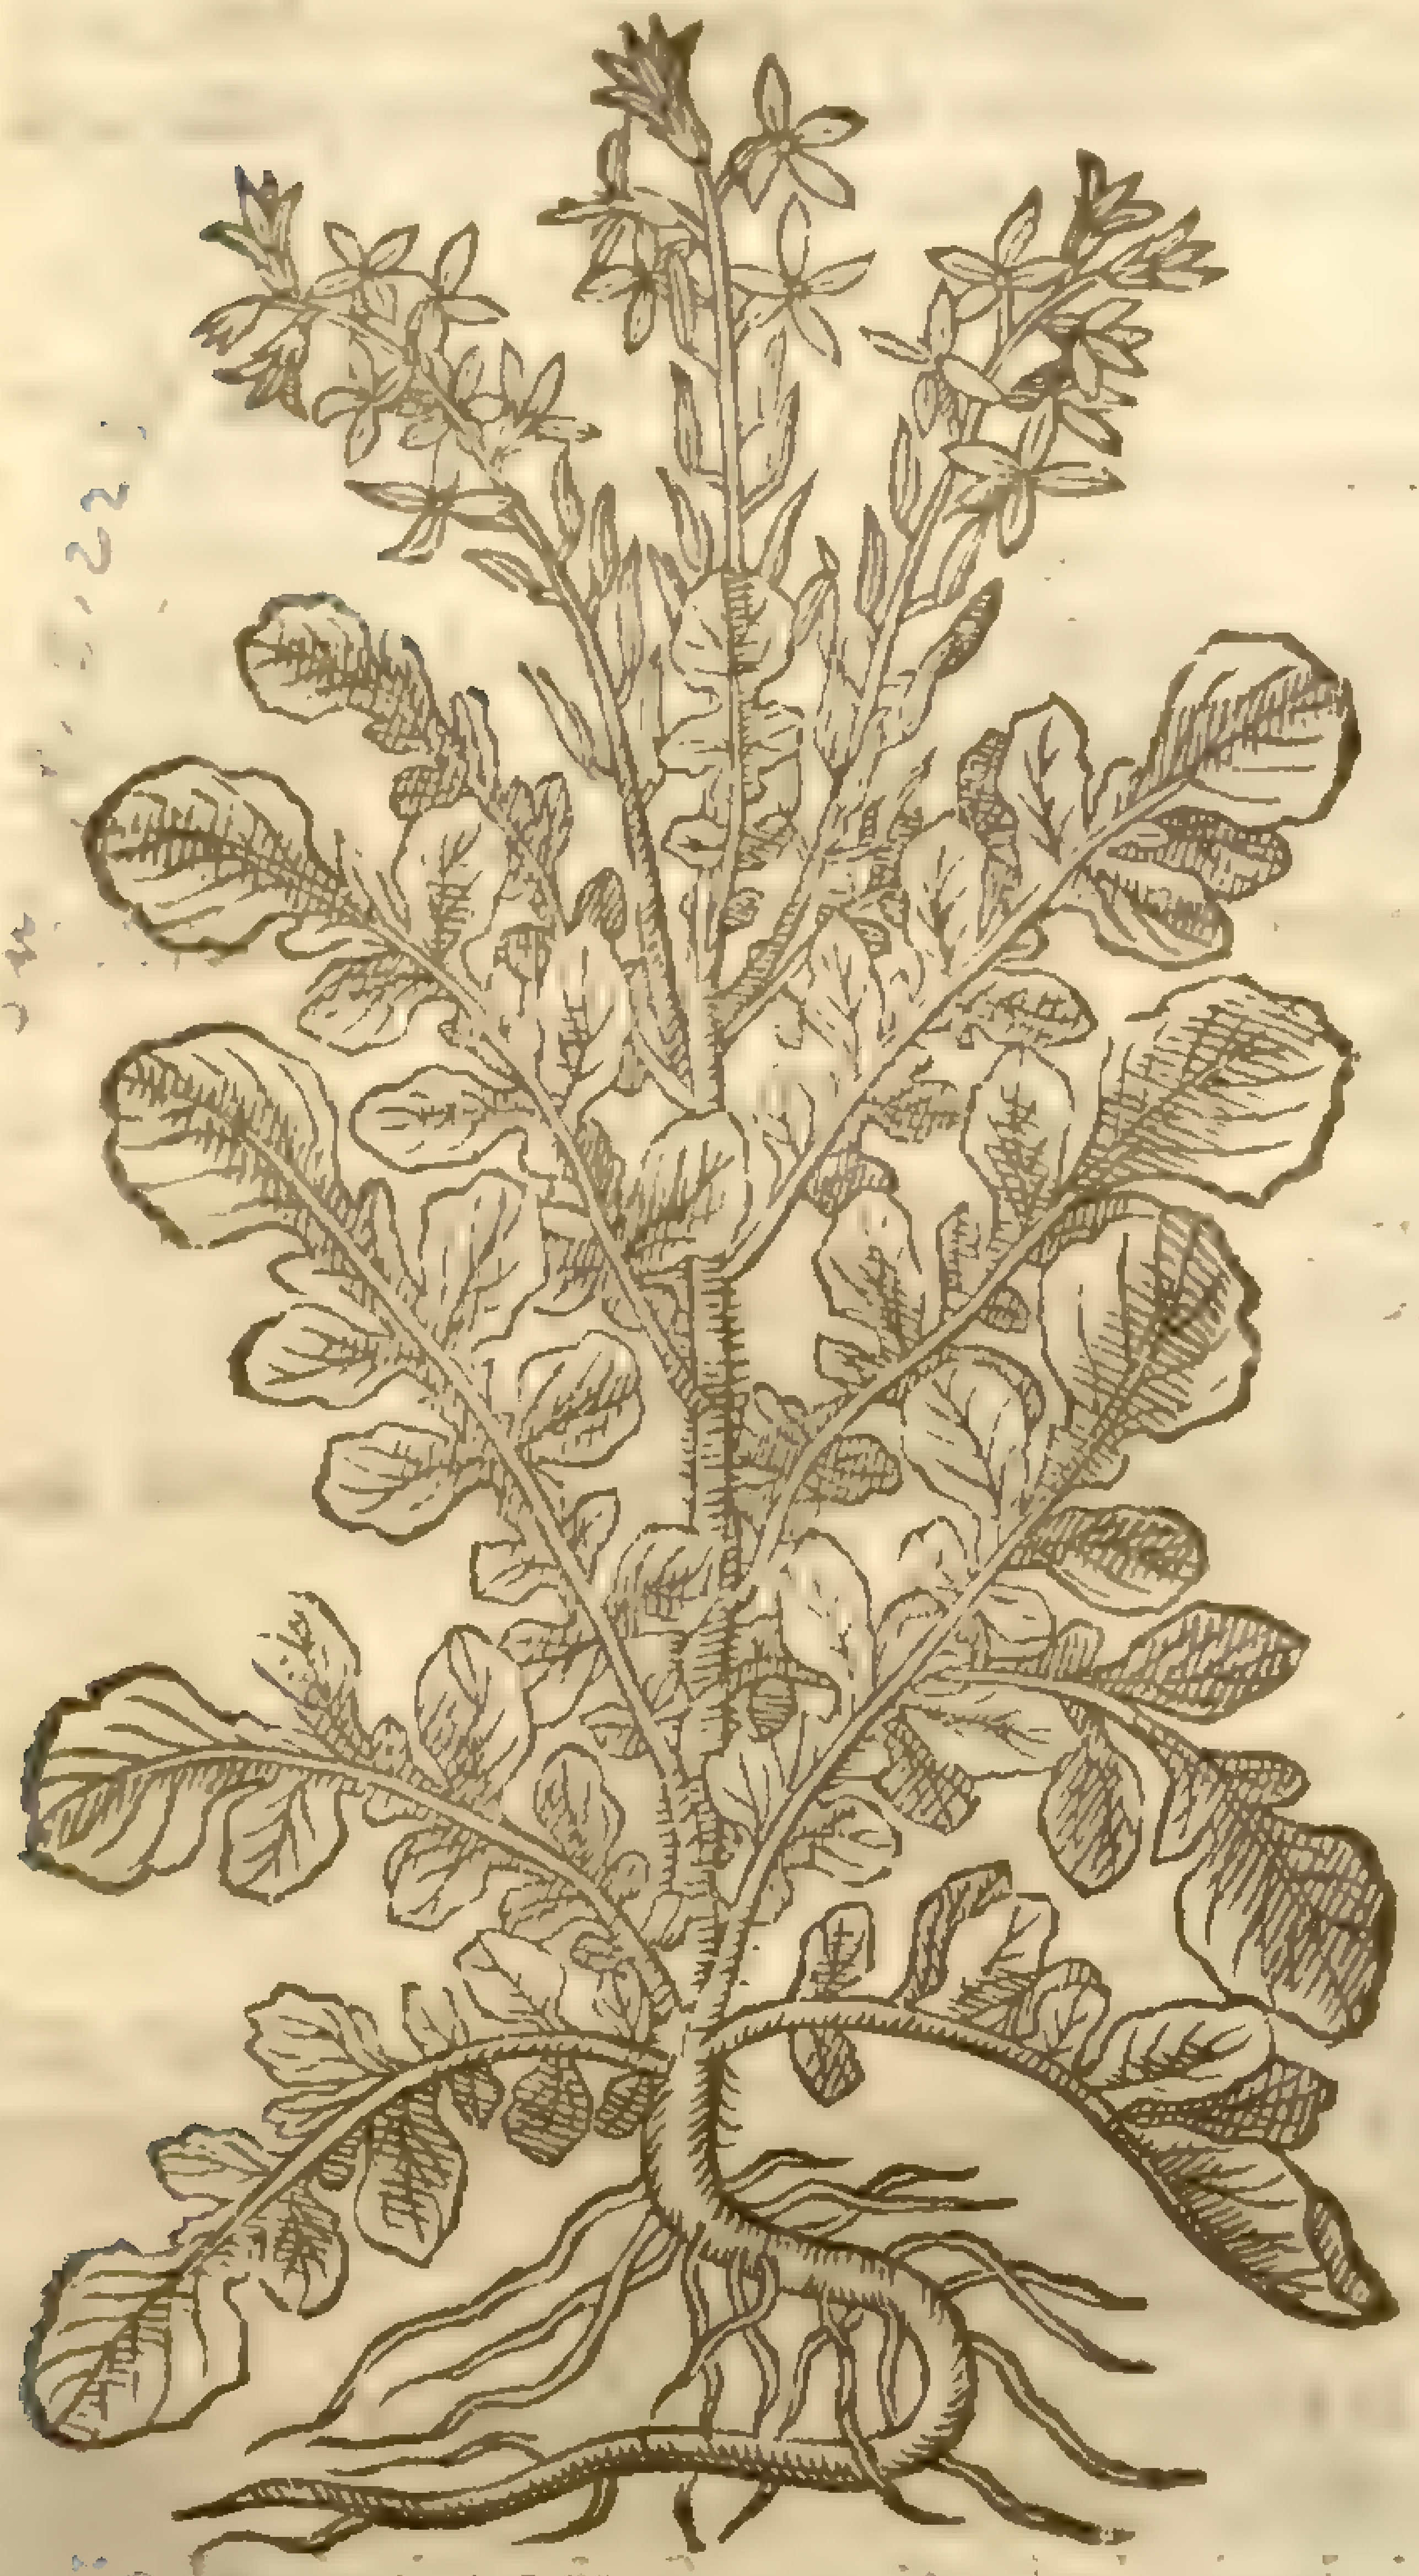
3 The other tame Muſtard is like to the former in leaues and branched ſtalks, but leſſer, and they are more whitiſh and rough. The floures are likewiſe yellow, and the ſeed browne like Rape ſeed, which is alſo not a little ſharp or biting.

‡ 4 This which I giue you here (being the *Sinapi ſativum alterum* of *Lobel*, and the *Sinapi album* of the ſhops) growes but low, and it hath rough crooked cods, and whitiſh ſeeds; the ſtalkes, floures, and leaues are much like the firſt deſcribed. ‡

5 The wilde Muſtard hath leaues like thoſe of Shepheards purſe, but larger, and more deeply indented, with a ſtalke growing to the height of two foot, bearing at the top ſmall yellow floures made of two leaues: the cods be ſmall and ſlender, wherein is contained reddiſh ſeed, much ſmaller than any of the others, but not ſo ſharpe and biting.

† 1 *Sinapi ſativum.*
Garden Muſtard.

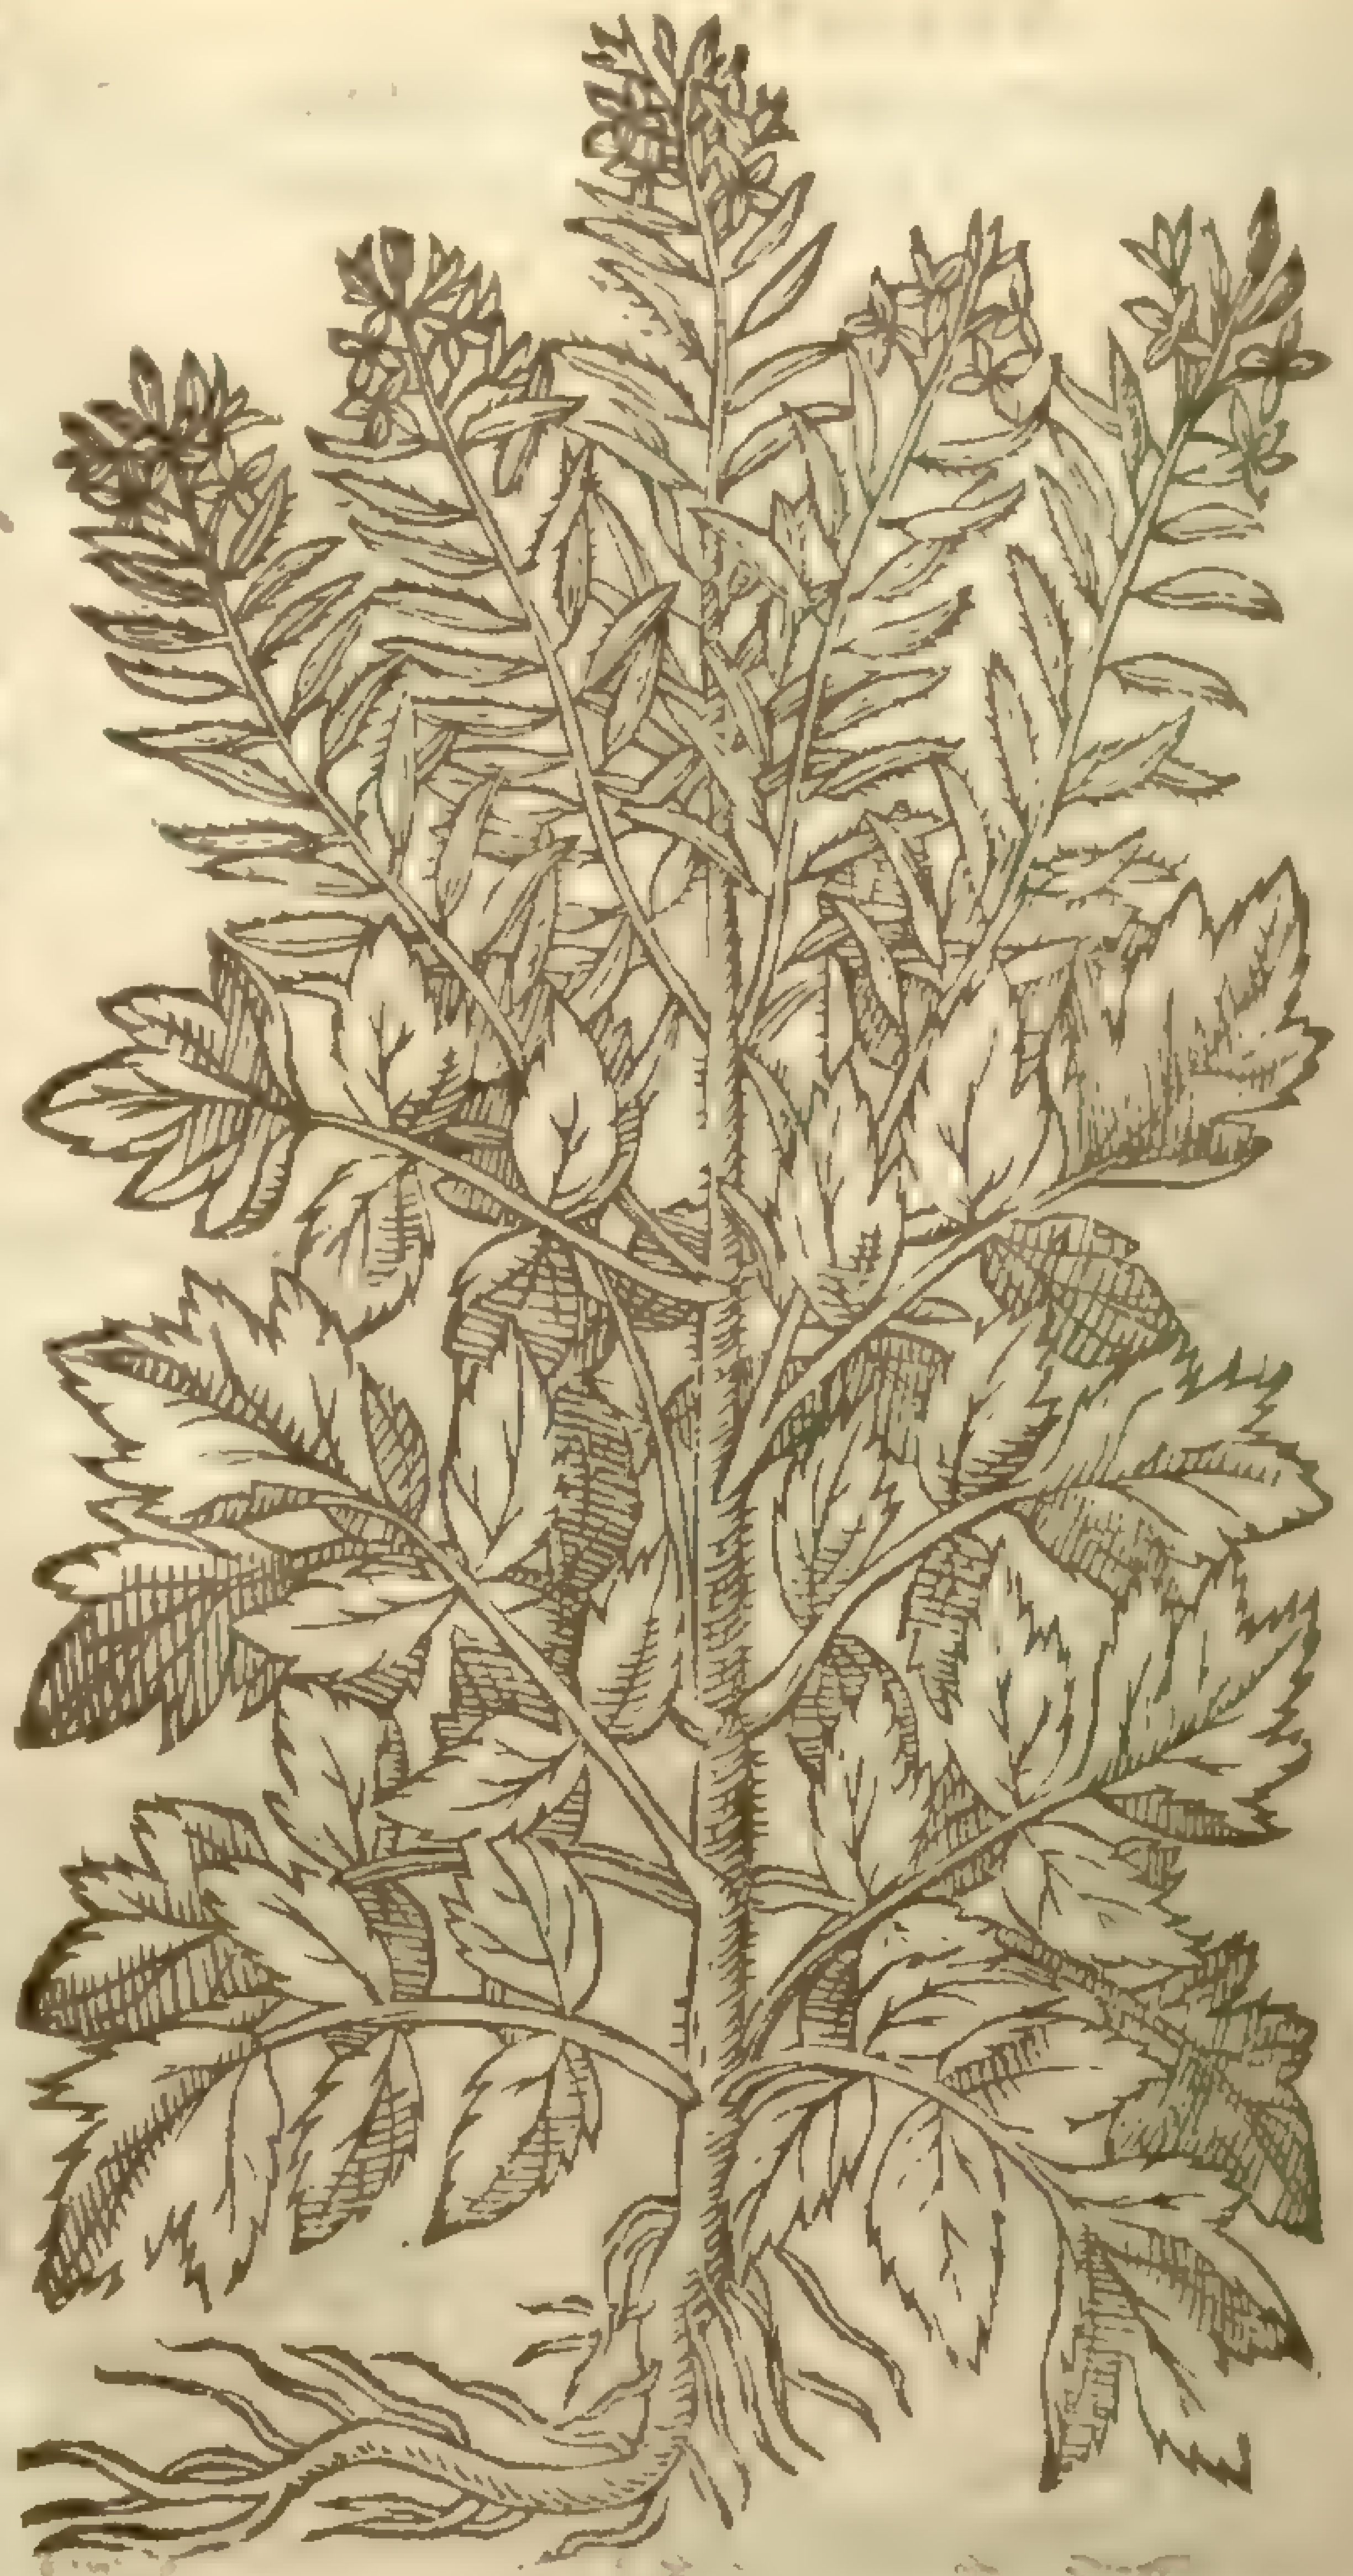
S. nigra, L.
Sin. Fed. 706
Sm. ... 5. 22.



† 2 *Sinapi ſativum alterum, Dod.*
Field Muſtard.

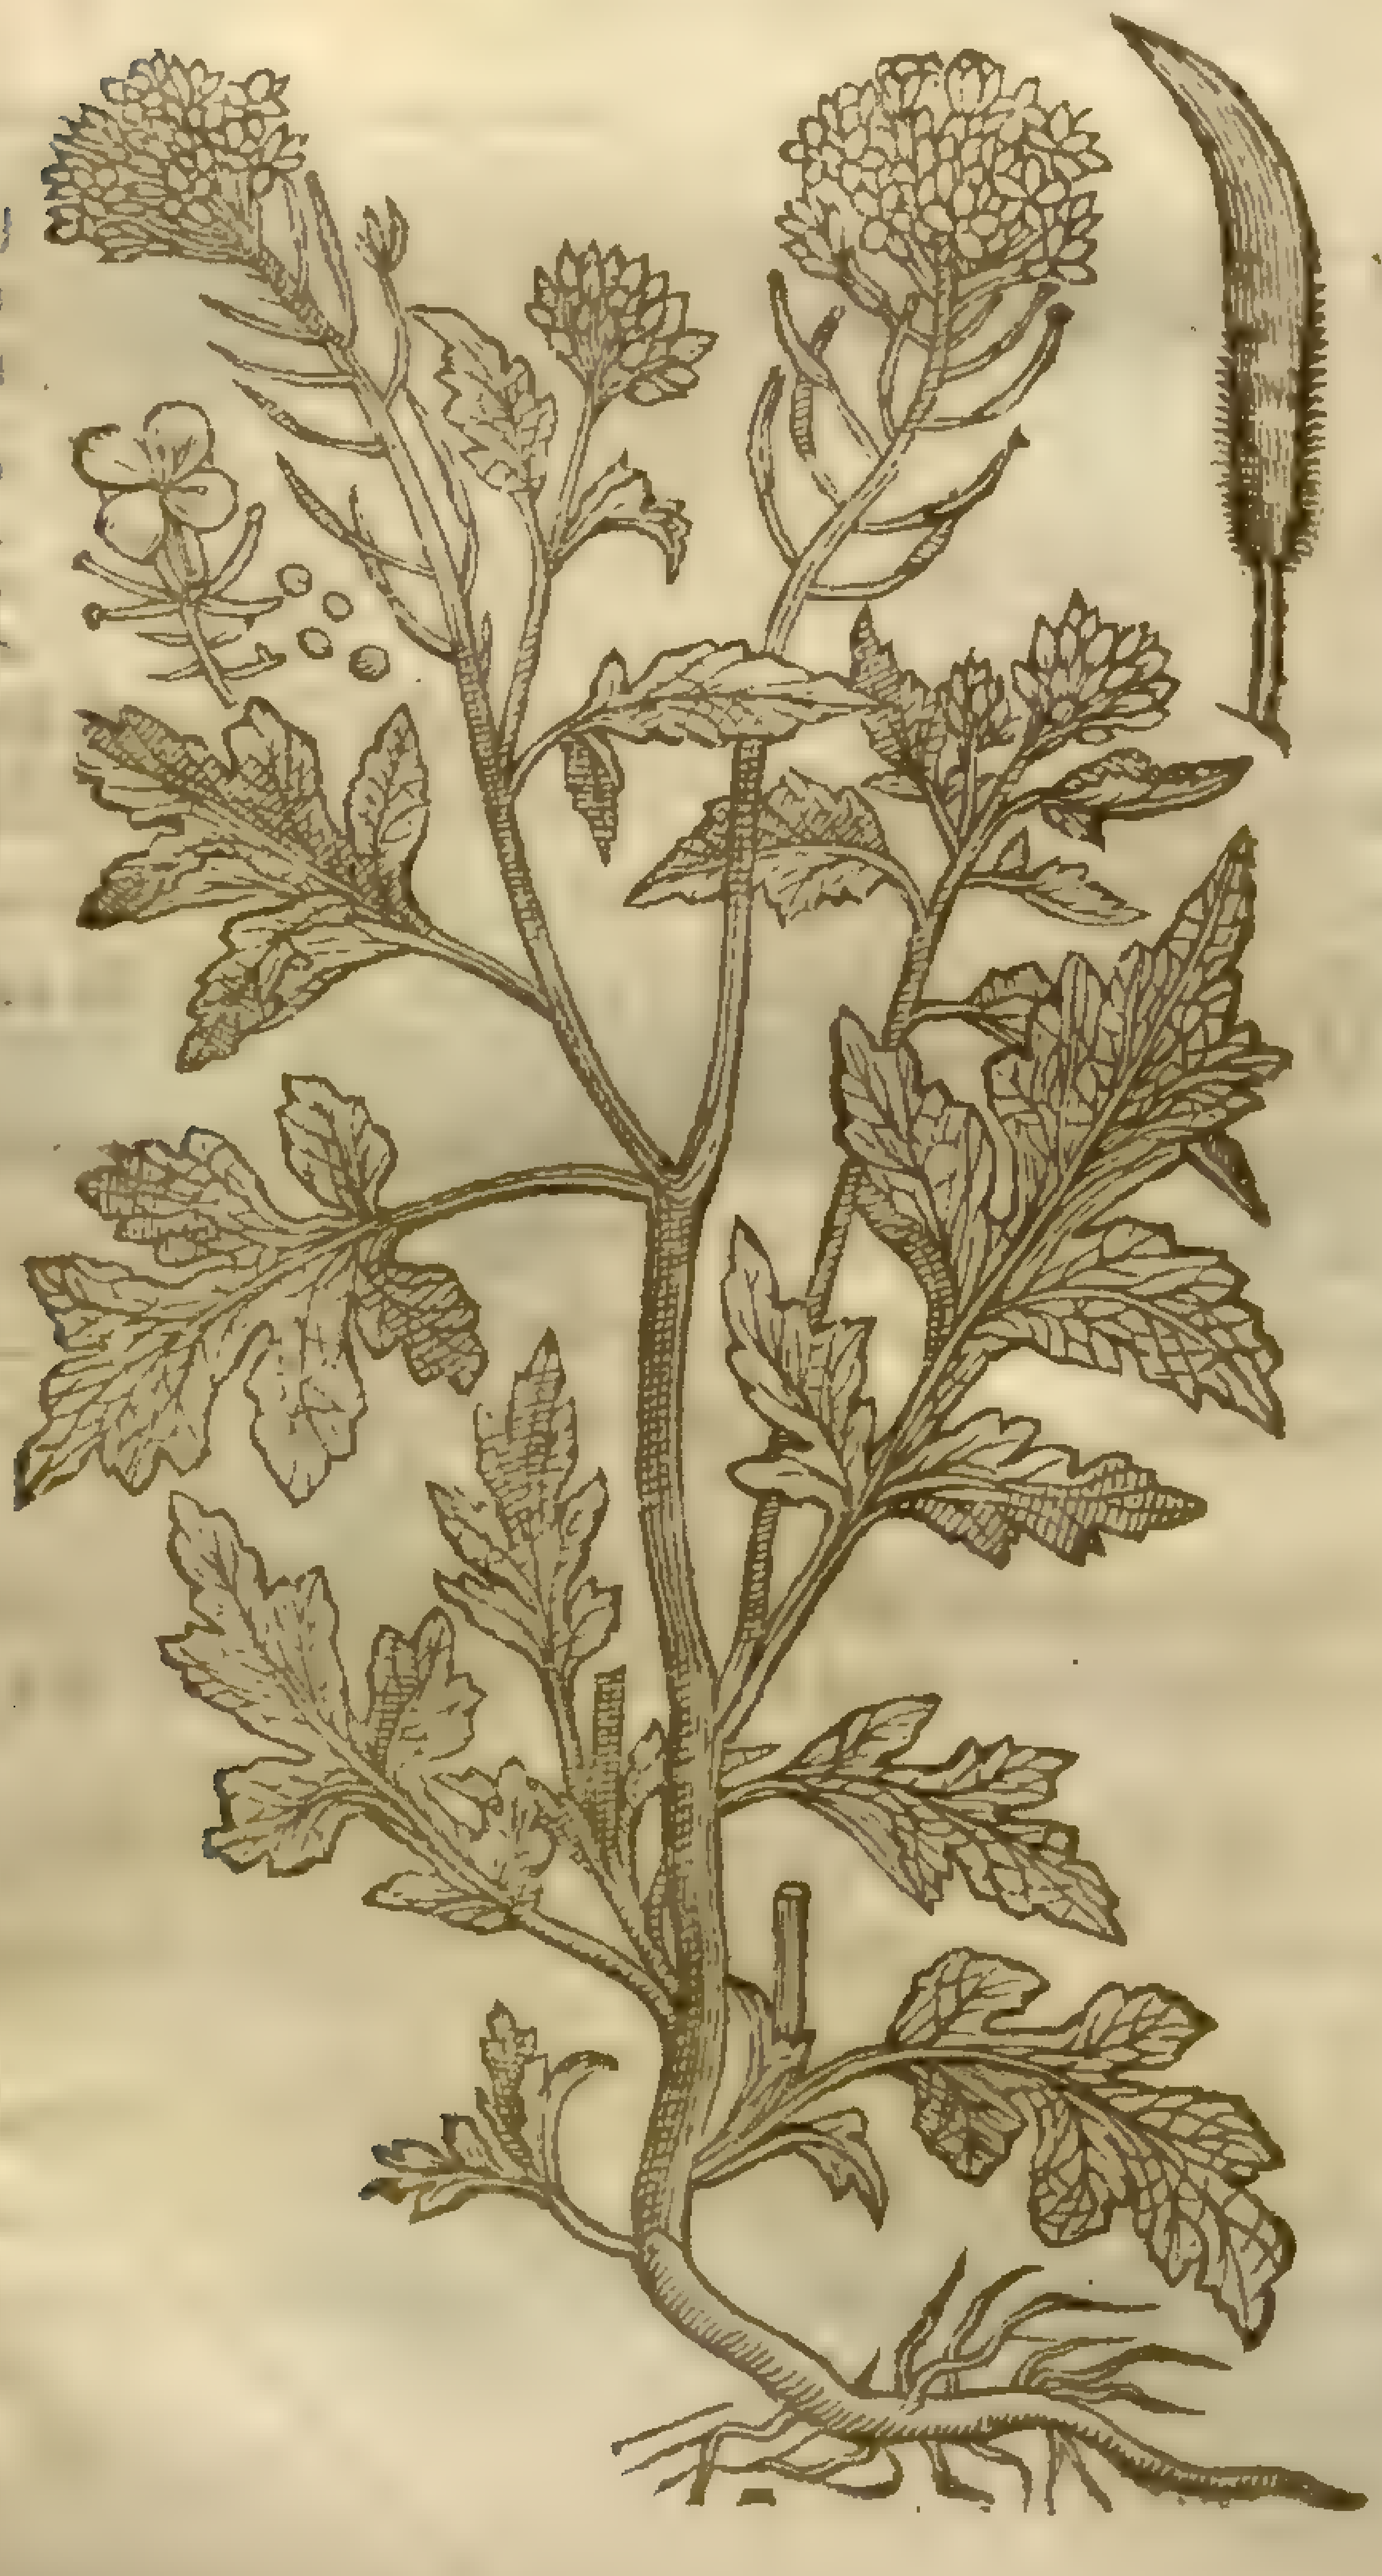
S. nigra L.
mus. dict.

Sinapis alba, L.
Sm. Fed. 707

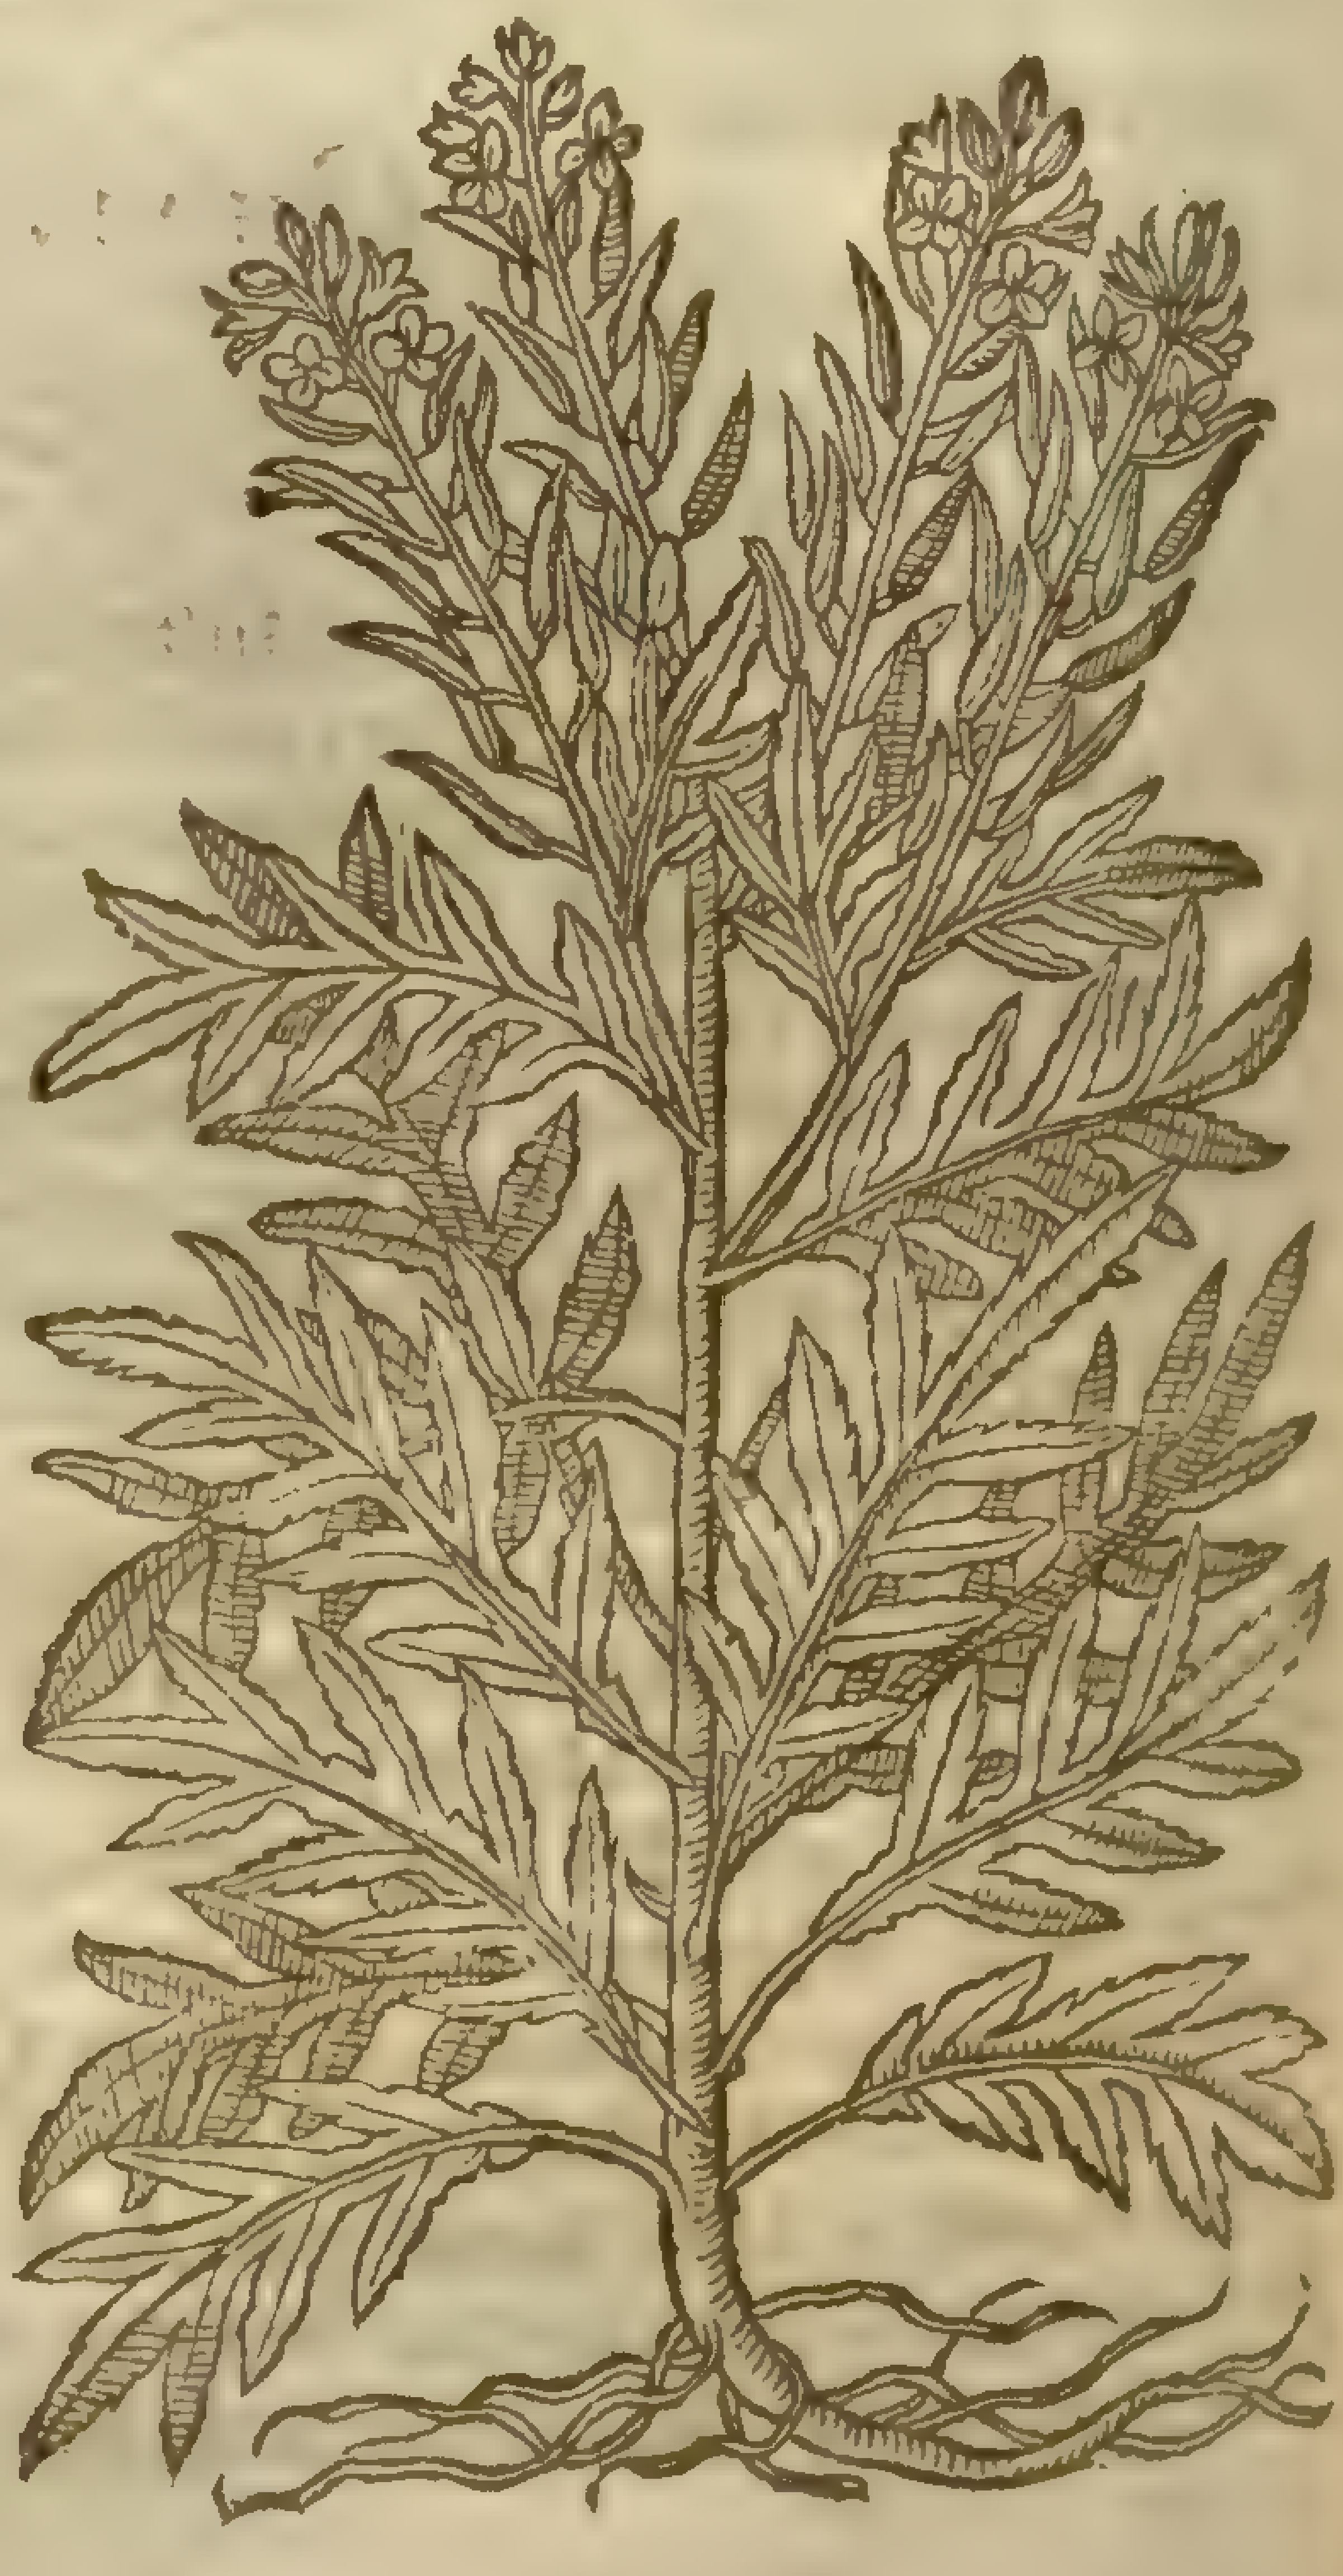


‡ 4 *Sinapi album.*
White Muſtard.

S. alba, L.
Mus. dict.
Em. ... 3. 22



† 5 *Sinapi ſylveſtre minus.*
Small wild Muſtard.



¶ *The Place.*

‡ Our ordinarie Muſtard (whoſe deſcription I haue added) as alſo the wilde and ſmall grow wilde in many places of this kingdome, and may all three be found on the banks about the backe of Old-ſtreet, and in the way to Iſlington. ‡

¶ *The Time.*

Muſtard may be ſowne in the beginning of the Spring: the ſeed is ripe in Iuly or Auguſt; It commeth to perfection the ſame yeare that it is ſowne.

¶ *The Names.*

The Greekes call Muſtard, σίναπι: the Athenians called it νάπυ: the Latines, *Sinapi*: the rude and barbarous, *Sinapium*: the Germans, **Senff**: the French, *Seneue*, and *Mouſtarde*: the low-Dutchmen, **Moſtaert ſaet**: the Spaniards, *Moſtaza*, and *Moſtalla*: the Bohemians, *Horcice*: *Pliny* calls it *Thlaſpi*, whereof doubtleſſe it is a kind: and ſome haue called it *Saurion*.

‡ Theſe kinds of Muſtard haue been ſo briefly treated of by all writers, that it is hard to giue the right diſtinctions of them, and a matter of more difficultie than is expected in a thing ſo vulgarly knowne and vſed. I will therefore endeauor in a few words to diſtinguiſh thoſe kinds of Muſtard which are vulgarly written of.

1 The firſt is *Sinapi primum* of *Matthiolus* and *Dodonæus*: and *Sinapi ſatiuum Erucæ aut Rapi folio* of *Lobel*.

2 The ſecond I cannot iuſtly refer to any of thoſe that are written of by Authors; for it hath not a cod like Rape, as *Pena* and *Lobel* deſcribe it; nor a ſeed bigger than it, as *Dodonæus* affirmeth; yet I ſuſpect, & almoſt dare affirm, that it is the ſame with the former mentioned by them, though much differing from their figures and deſcription.

3 The third (which alſo I ſuſpect is the ſame with the fourth) is *Sinapi alterum* of *Matthiolus*; and *Sinapi agreſte Apij, aut potius Laueris folio*, of *Lobel*: and *Sinapi ſatiuum alterum* of *Dodonæus*.

4 The fourth is by *Lobel* called *Sinapi alterum ſatiuum*; and this is *Sinapi album officinarum*, as *Pena* and *Lobel* affirme, *Adverſ. pag. 68.*

5 The fift is *Sinapi ſylveſtre* of *Dodonæus*: and *Sinapi ſylveſtre minus Burſæ paſtoris folio*, of *Lobel*. It is much like Rocket, and therefore *Bauhine* fitly calls it *Sinapi Erucæ folio*: in Engliſh it may be called ſmall wilde Muſtard. ‡

¶ *The Temperature.*

The ſeed of Muſtard, eſpecially that which we chiefely vſe, doth heate and make thin, and alſo draweth forth. It is hot and dry in the fourth degree, according to *Galen*.

¶ *The Vertues.*

The ſeed of Muſtard pound with vineger is an excellent ſauce, good to be eaten with any groſſe meats either fiſh or fleſh, becauſe it doth help digeſtion, warmeth the ſtomacke, and prouoketh appetite. A

It is giuen with good ſucceſſe in like manner to ſuch as be ſhort winded, and are ſtopped in the breſt with tough flegme from the head and brain. B

It appeaſeth the tooth-ache, being chewed in the mouth. C

They vſe to make a gargariſme with hony, vineger, and muſtard ſeed, againſt the ſwelling of the uvula, and the almonds about the throat and root of the tongue. D

Muſtard drunke with water and hony prouoketh the terms and vrin. E

The ſeed of muſtard beaten and put into the noſthrils cauſeth ſneeſing, and raiſeth women ſicke of the Mother out of their fits. F

It is good againſt the falling ſickneſſe, and ſuch as haue the Lethargie, if it be laid plaiſterwiſe vpon the head (after ſhauing) being tempered with figs. G

It helpeth the Sciatica, or ache in the hip or huckle bone: it alſo cureth all maner of pains proceeding of a cold cauſe. H

It is mixed with good ſucceſſe with drawing plaiſters, and with ſuch as waſt and conſume nodes and hard ſwellings. I

It helpeth thoſe that haue their haire pulled off; it taketh away the blew and black marks that come of bruiſings. K

‡ The ſeed of the white muſtard is vſed in ſome Antidotes, as *Electuarium de ovo, &c.* L

---

† The three figures in the former edition were all falſe: the firſt was of *Barbarea*, deſcribed in the precedent chapter: the ſecond, of *Eruca aquatica maior* of *Tabern.* The third, of *Eruca aquat. minor* of *Tabern.*

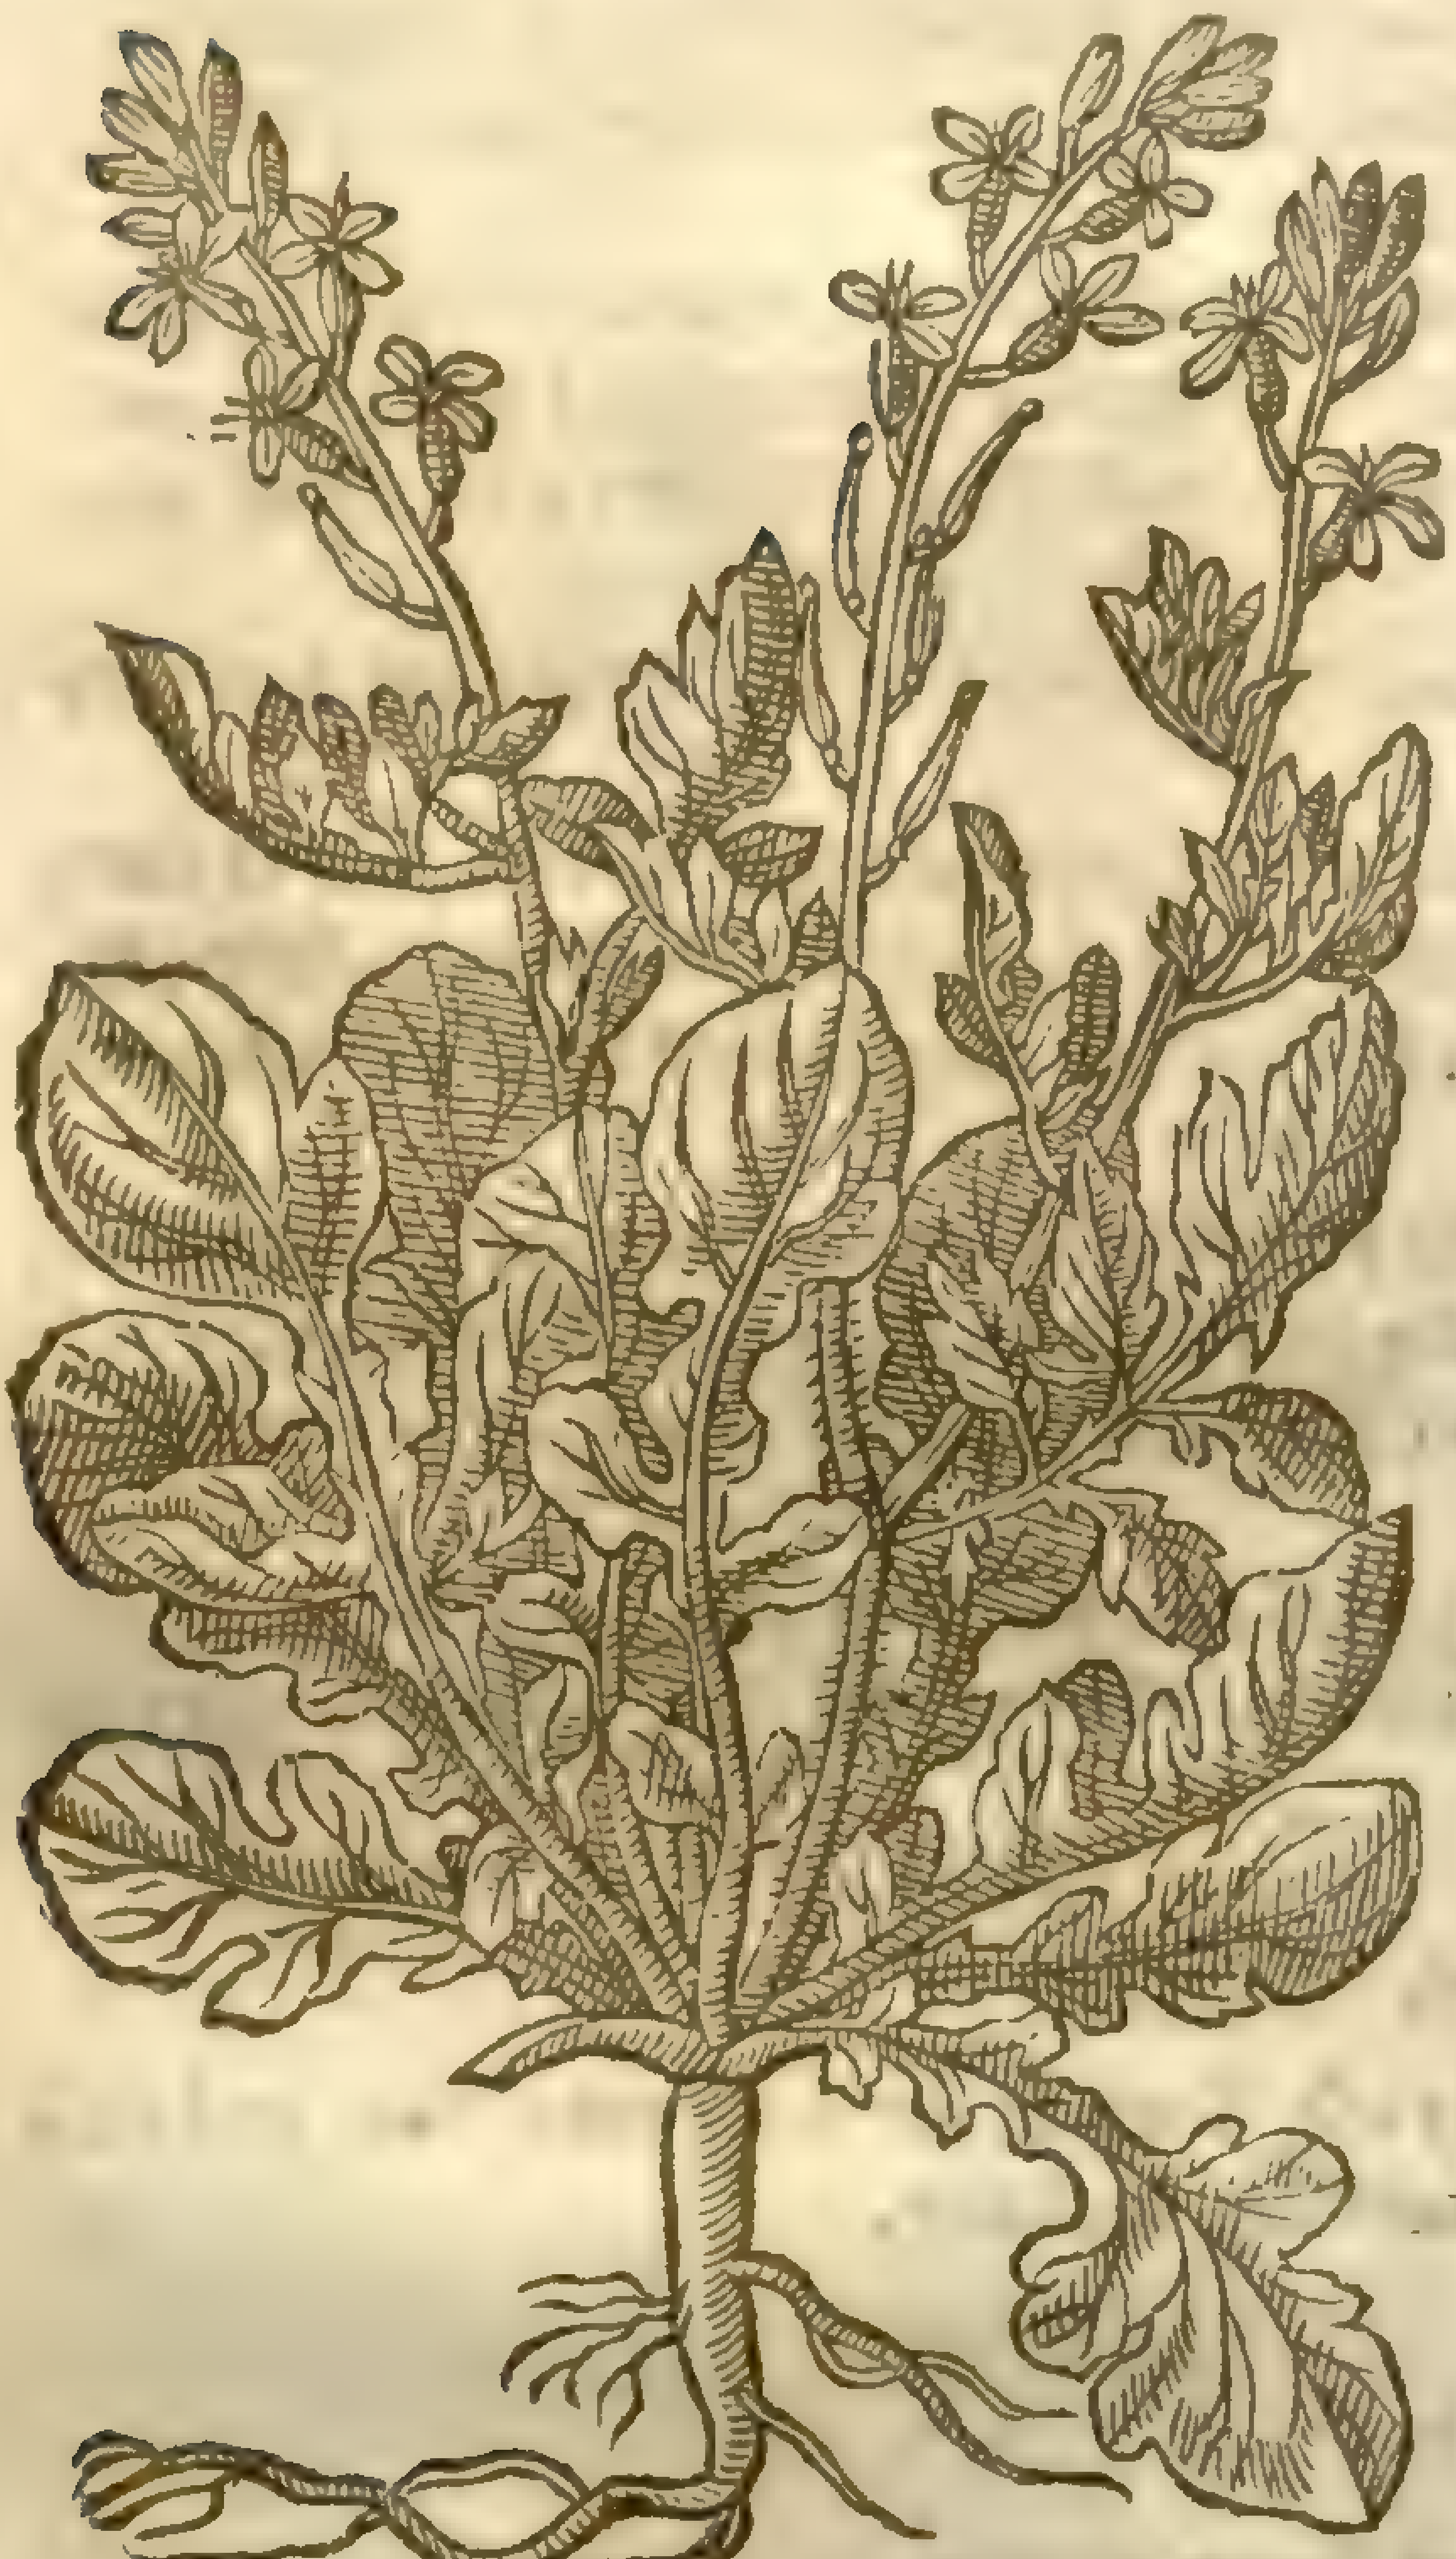
Chap. 10. *Of Rocket.*

¶ *The Kindes.*

There be ſundry kinds of Rocket; ſome tame or of the garden; ſome wild or of the field; ſome of the water, and of the ſea.

† 1 *Eruca ſativa.*
Garden Rocket.

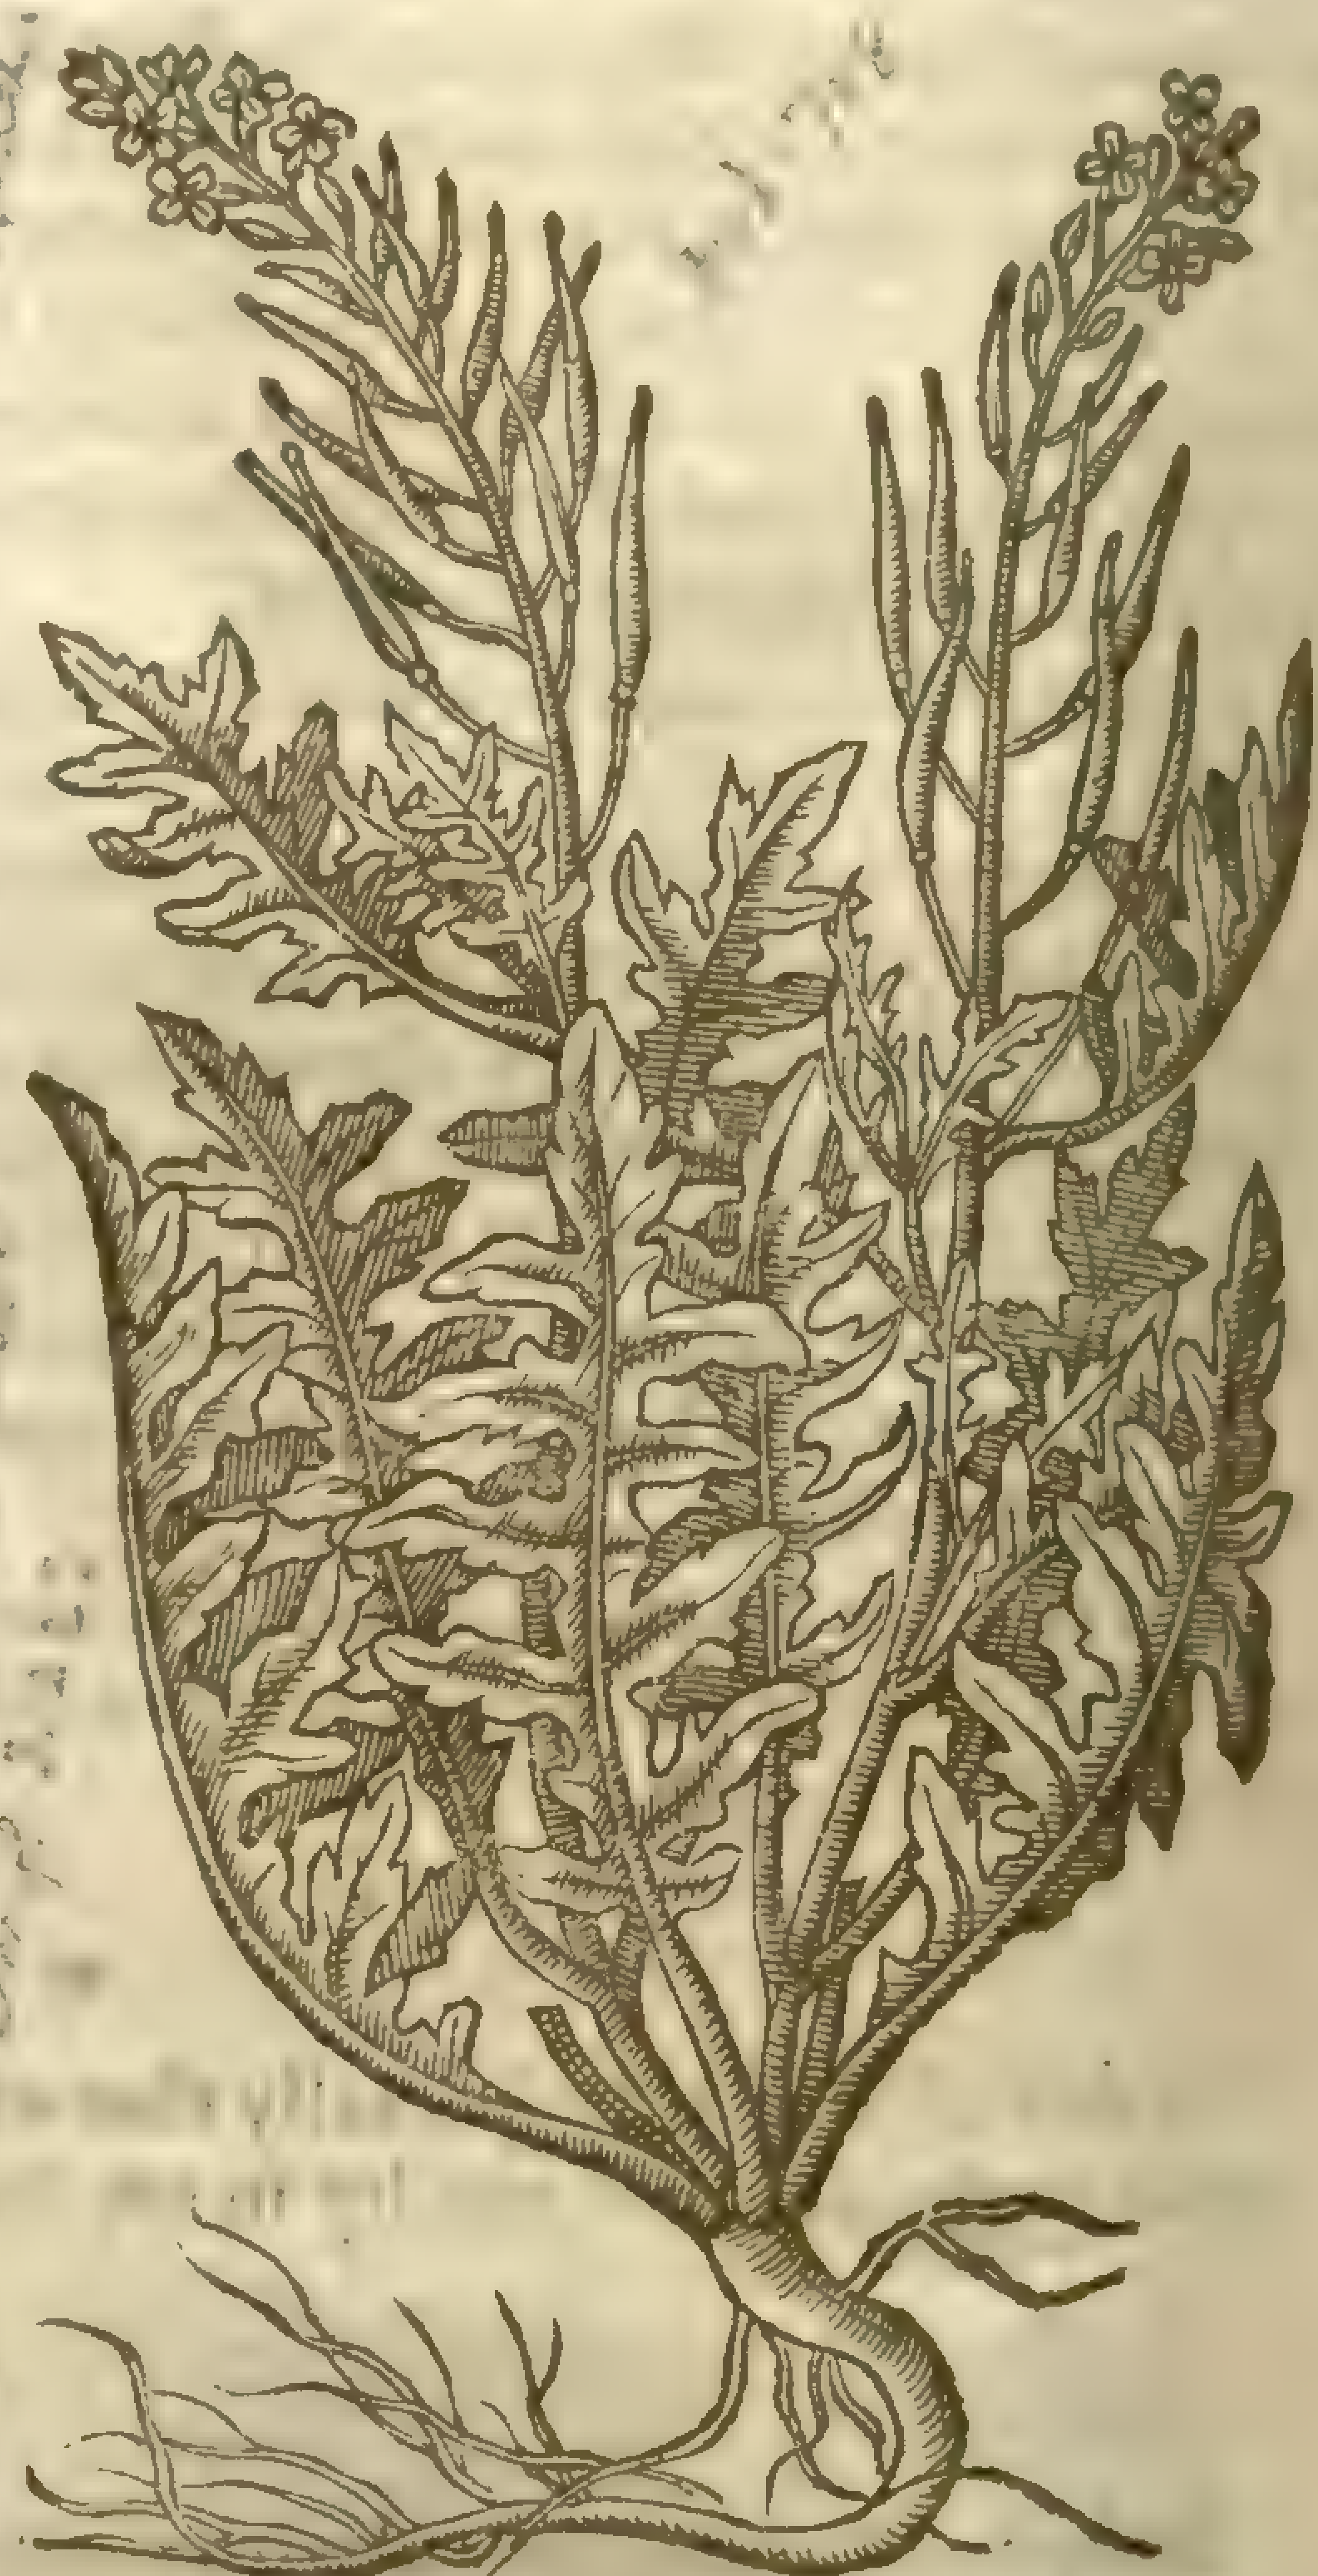
Brassica eruca, b
Mill. dict.



2 *Eruca ſylveſtris.*
Wilde Rocket.

Brassica muralis Huds.
Smith. dict.

Sisymbrium [illegible]
[illegible]



¶ *The Deſcription.*

1 Garden Rocket or Rocket gentle hath leaues like thoſe of turneps, but not neer ſo great nor rough. The ſtalks riſe vp of a cubit and ſomtimes two cubits high, weak and brittle; at the top whereof grow the floures of a whitiſh colour, and ſomtimes yellowiſh: which being paſt, there ſucceed long cods which containe the ſeed, not vnlike to Rape ſeed, but ſmaller.

2 The common Rocket, which ſome keepe in gardens, and which is vſually called the Wild Rocket, is leſſer than the Roman Rocket, or Rocket gentle, the leaues and ſtalks narrower and more jagged. The floures be yellow, the cods alſo ſlenderer, the ſeed thereof is reddiſh, and biteth the tongue.

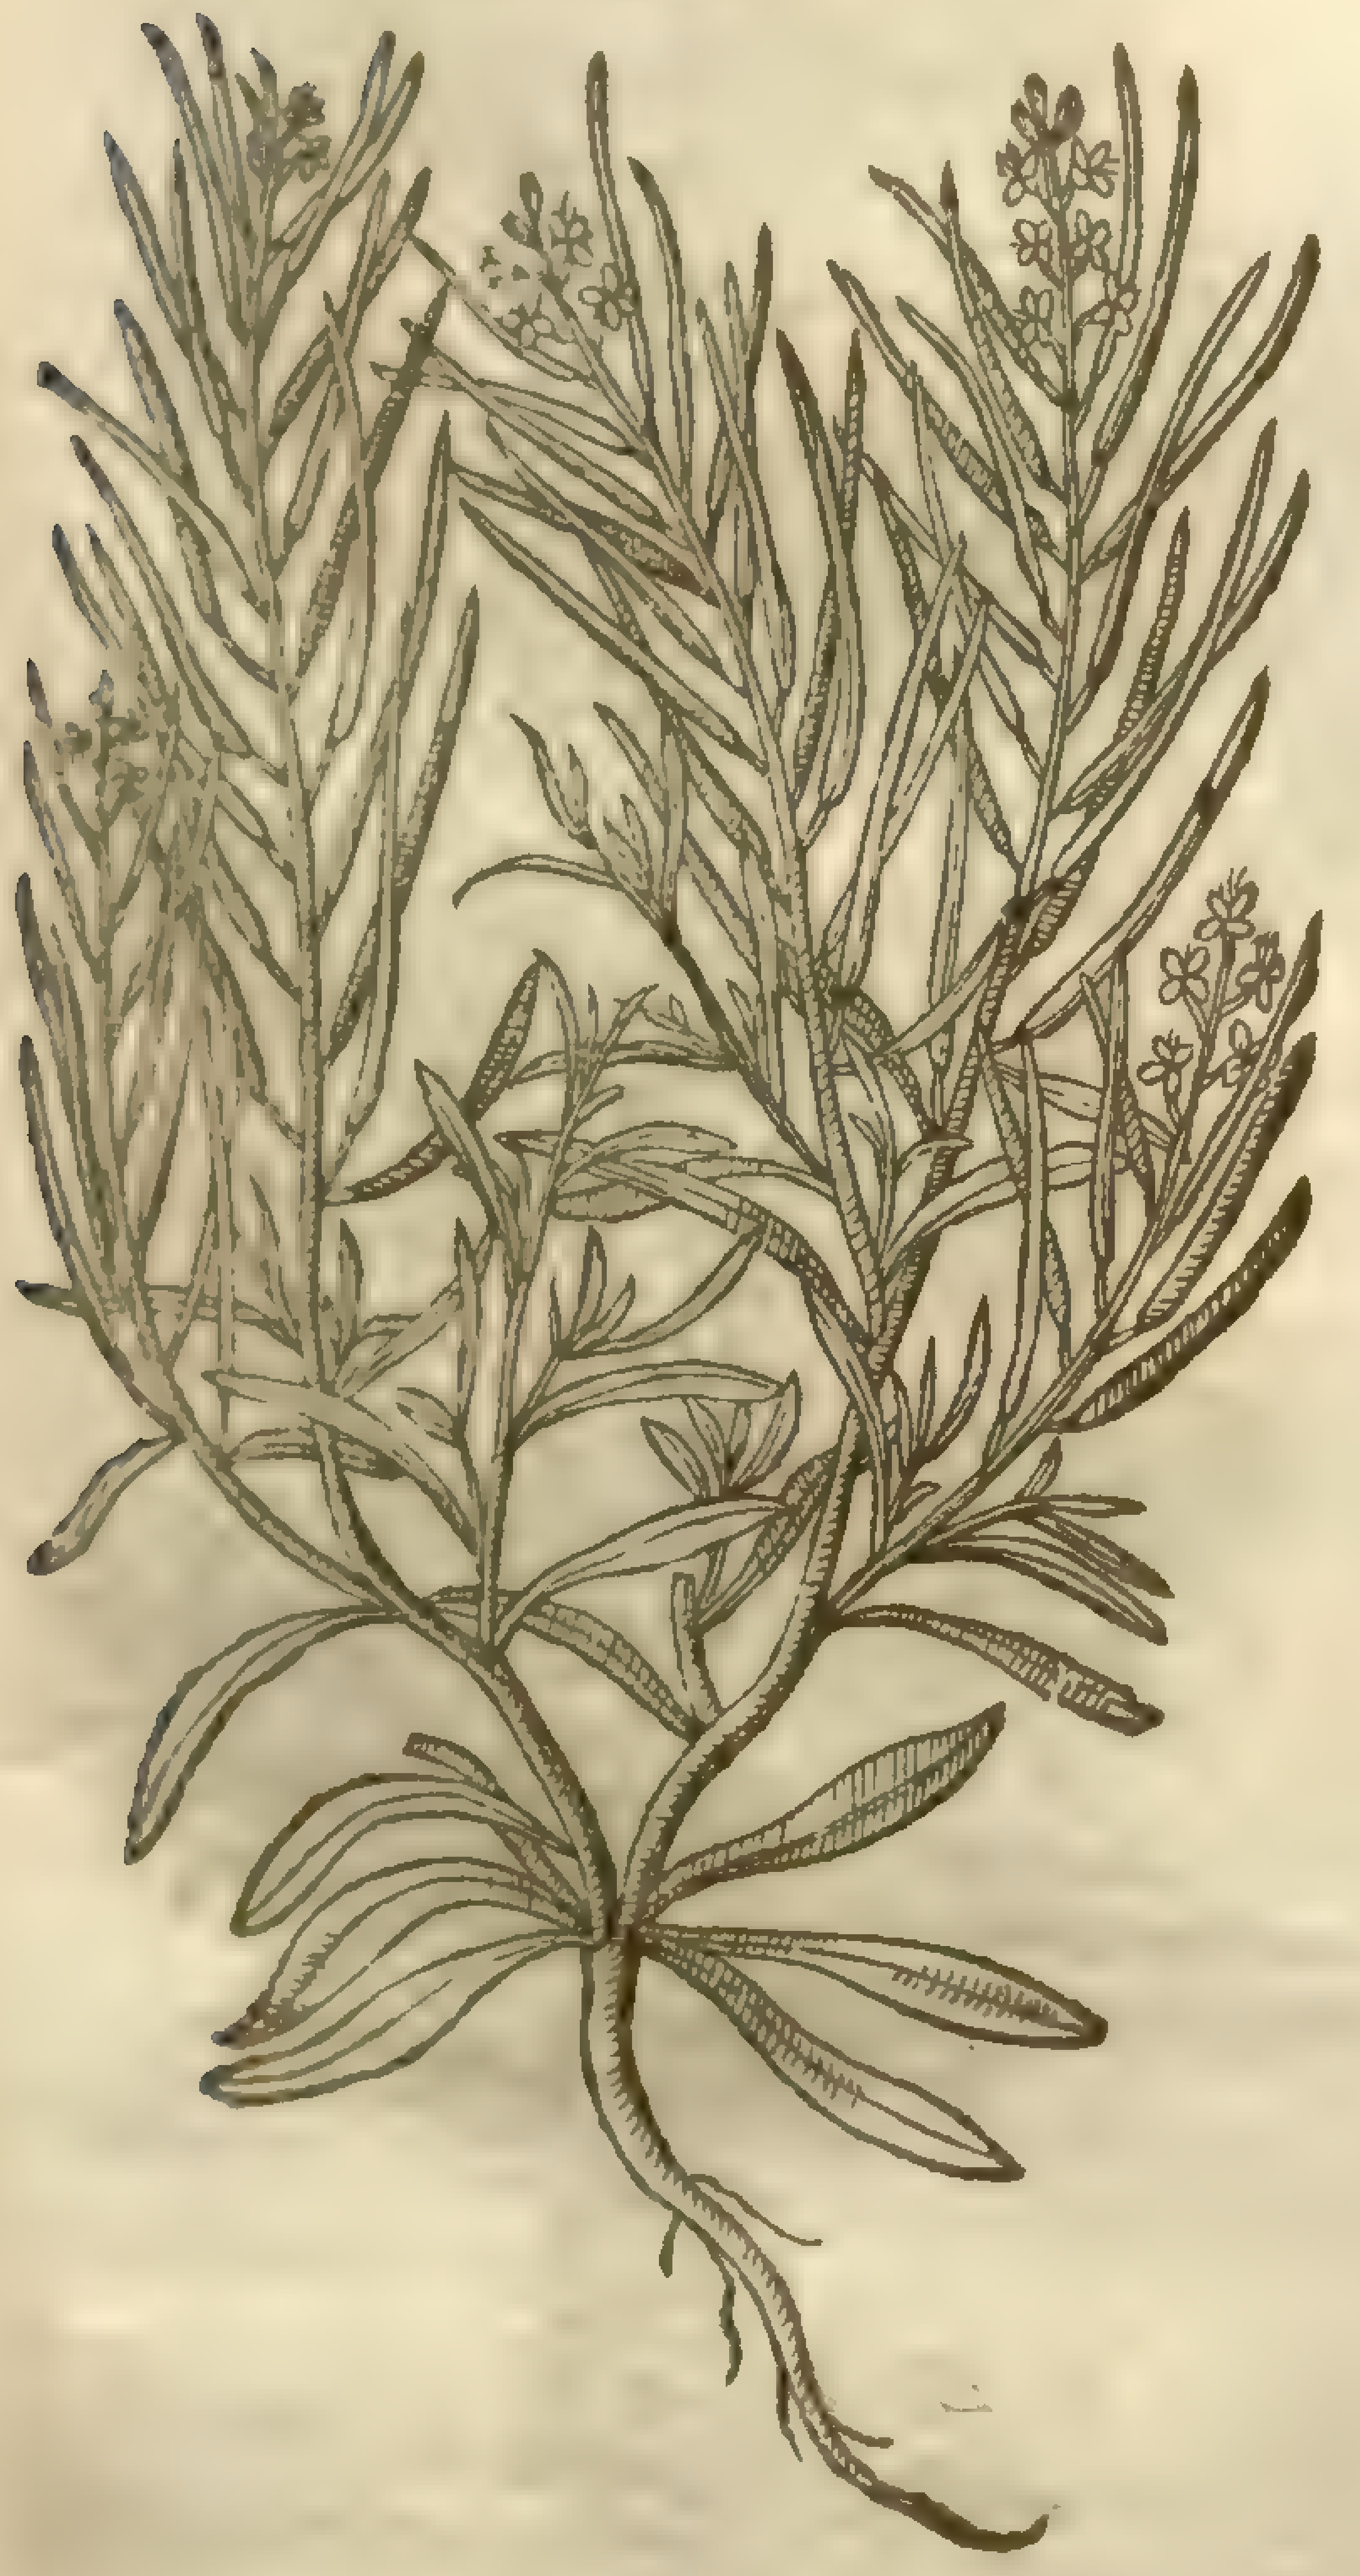
3 This kind of Rocket hath long narrow leaues almoſt ſuch as thoſe of Tarragon, but thicker and fatter, reſembling rather the leaues of Myagrum, altogether vnlike any of the reſt of the Rockets, ſauing that the branch, floure, and ſeed are like the garden Rocket.

4 There is another kinde of Rocket, thought by that reuerend and excellent herbariſt *Carolus Cluſius* to be a kind of Creſſes, if not Creſſes it ſelfe, yet couſin germane at leaſt. Vnto whoſe cenſure *Lobel* is indifferent, whether to call it Rocket with thin and narrow leaues, or to joine it with the kindes of Creſſes, hauing the taſte of the one, and the ſhape of the other. The leaues are much diuided, and the floures yellow.

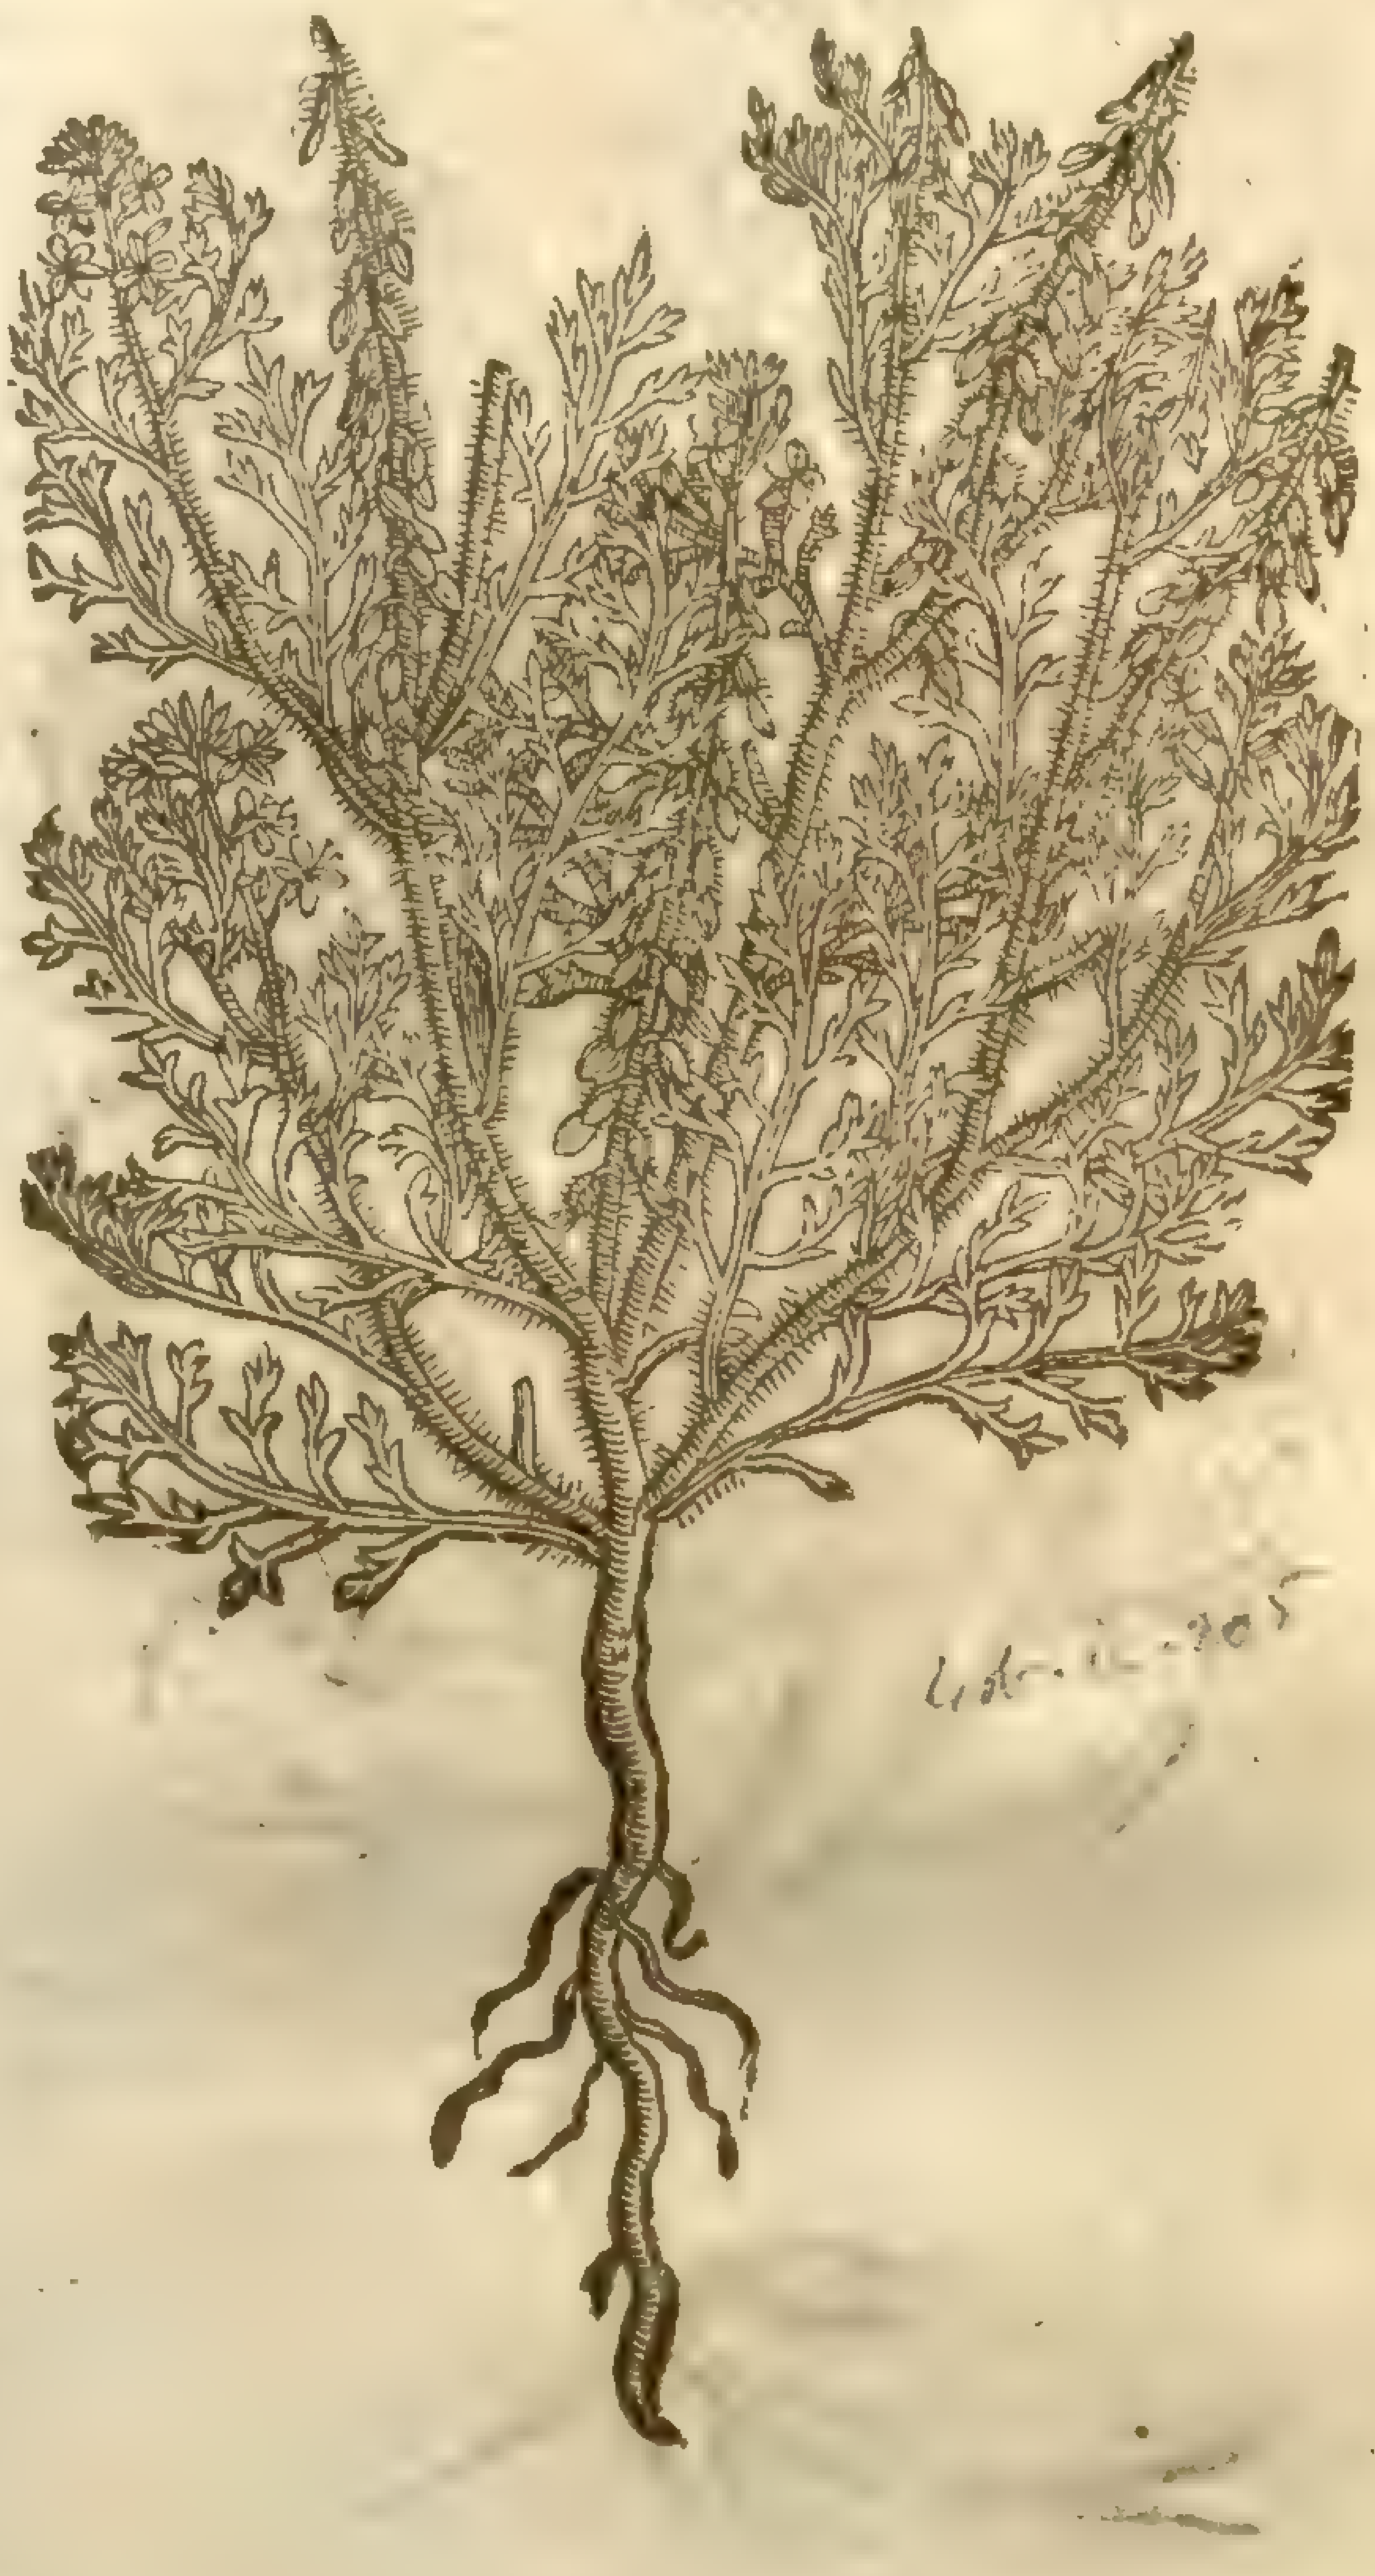
5 There is a wilde kinde of ſea-Rocket which hath long weake and tender branches trailing

vpon the ground,with long leaues like vnto common Rocket, or rather Groundſwell, hauing ſmall and whitiſh blew floures;in whoſe place commeth ſmall cods, wherein is contained ſeed like that of Barley.

‡ 6 Beſides theſe there is another plant, whoſe figure which here I giue was by our Author formerly ſet forth in the precedent Chapter,vnder the title of *Sinapi ſylueſtre*; together with a large kinde thereof,vnder the name of *Sinapi ſativum alterum*. Now I will onely deſcribe the later,which I haue ſometimes found in wet places : the root is wooddy : the ſtalke ſome foot long, creſted, and hauing many branches lying on the ground : the leafe is much diuided, and that after the manner of the wilde Rocket : the floures are of a bright yellow, and are ſucceeded by ſhort crooked cods, wherein is contained a yellowiſh ſeed. ‡



† 3 *Eruca ſylueſtris Anguſtifolia.*
Narrow leaued wilde Rocket.



‡ 4 *Eruca naſturtio cognata tenuifolia.*
Creſſy-Rocket.

Valla annua, l
[illegible]
Sm. fl. 3. 150

[illegible] 205

¶ *The Place.*

Romane Rocket is cheriſhed in gardens.

Common or wilde Rocket groweth in moſt gardens of it ſelfe : you may ſee moſt brick and ſtone walls about London and elſewhere couered with it.

The narrow leaued Rocket groweth neere vnto water ſides, in the chinkes and creuiſes of ſtone walls among the morter. I found it as you go from Lambeth bridge to the village of Lambeth, vnder a ſmall bridge that you muſt paſſe ouer hard by the Thames ſide.

I found Sea Rocket growing vpon the ſands neere vnto the ſea in the Iſle of Thanet, hard by a houſe wherein Sir *Henry Criſpe* did ſometimes dwell, called Queakes houſe.

¶ *The Time.*

Theſe Kindes of Rocket floure in the moneths of Iune and Iuly, and the ſeed is ripe in September.

The Romane Rocket dieth euery yeare, and recouereth it ſelfe againe by the falling of his owne ſeed.

¶ *The Names.*

Rocket is called in Greeke; εὔζωμον: in Latine, *Eruca*: in high Dutch, **Rauckenkraut**: in French, *Roquette*: in Low-Dutch, **Rakette**: in Italian, *Ruchetta*: in Spaniſh, *Oruga*; in Engliſh, Rocket, and Racket. The Poets do oft times name it *Herba ſalax*: *Eruca* doth ſignifie likewiſe a certaine canker worme, which is an enemy to pot-herbes, but eſpecially to Coleworts.

‡ The firſt is called *Eruca ſativa*, or *Hortenſis major*: Great Garden Rocket.

2 The ſecond, *Eruca ſylueſtris*: Wilde Rocket.

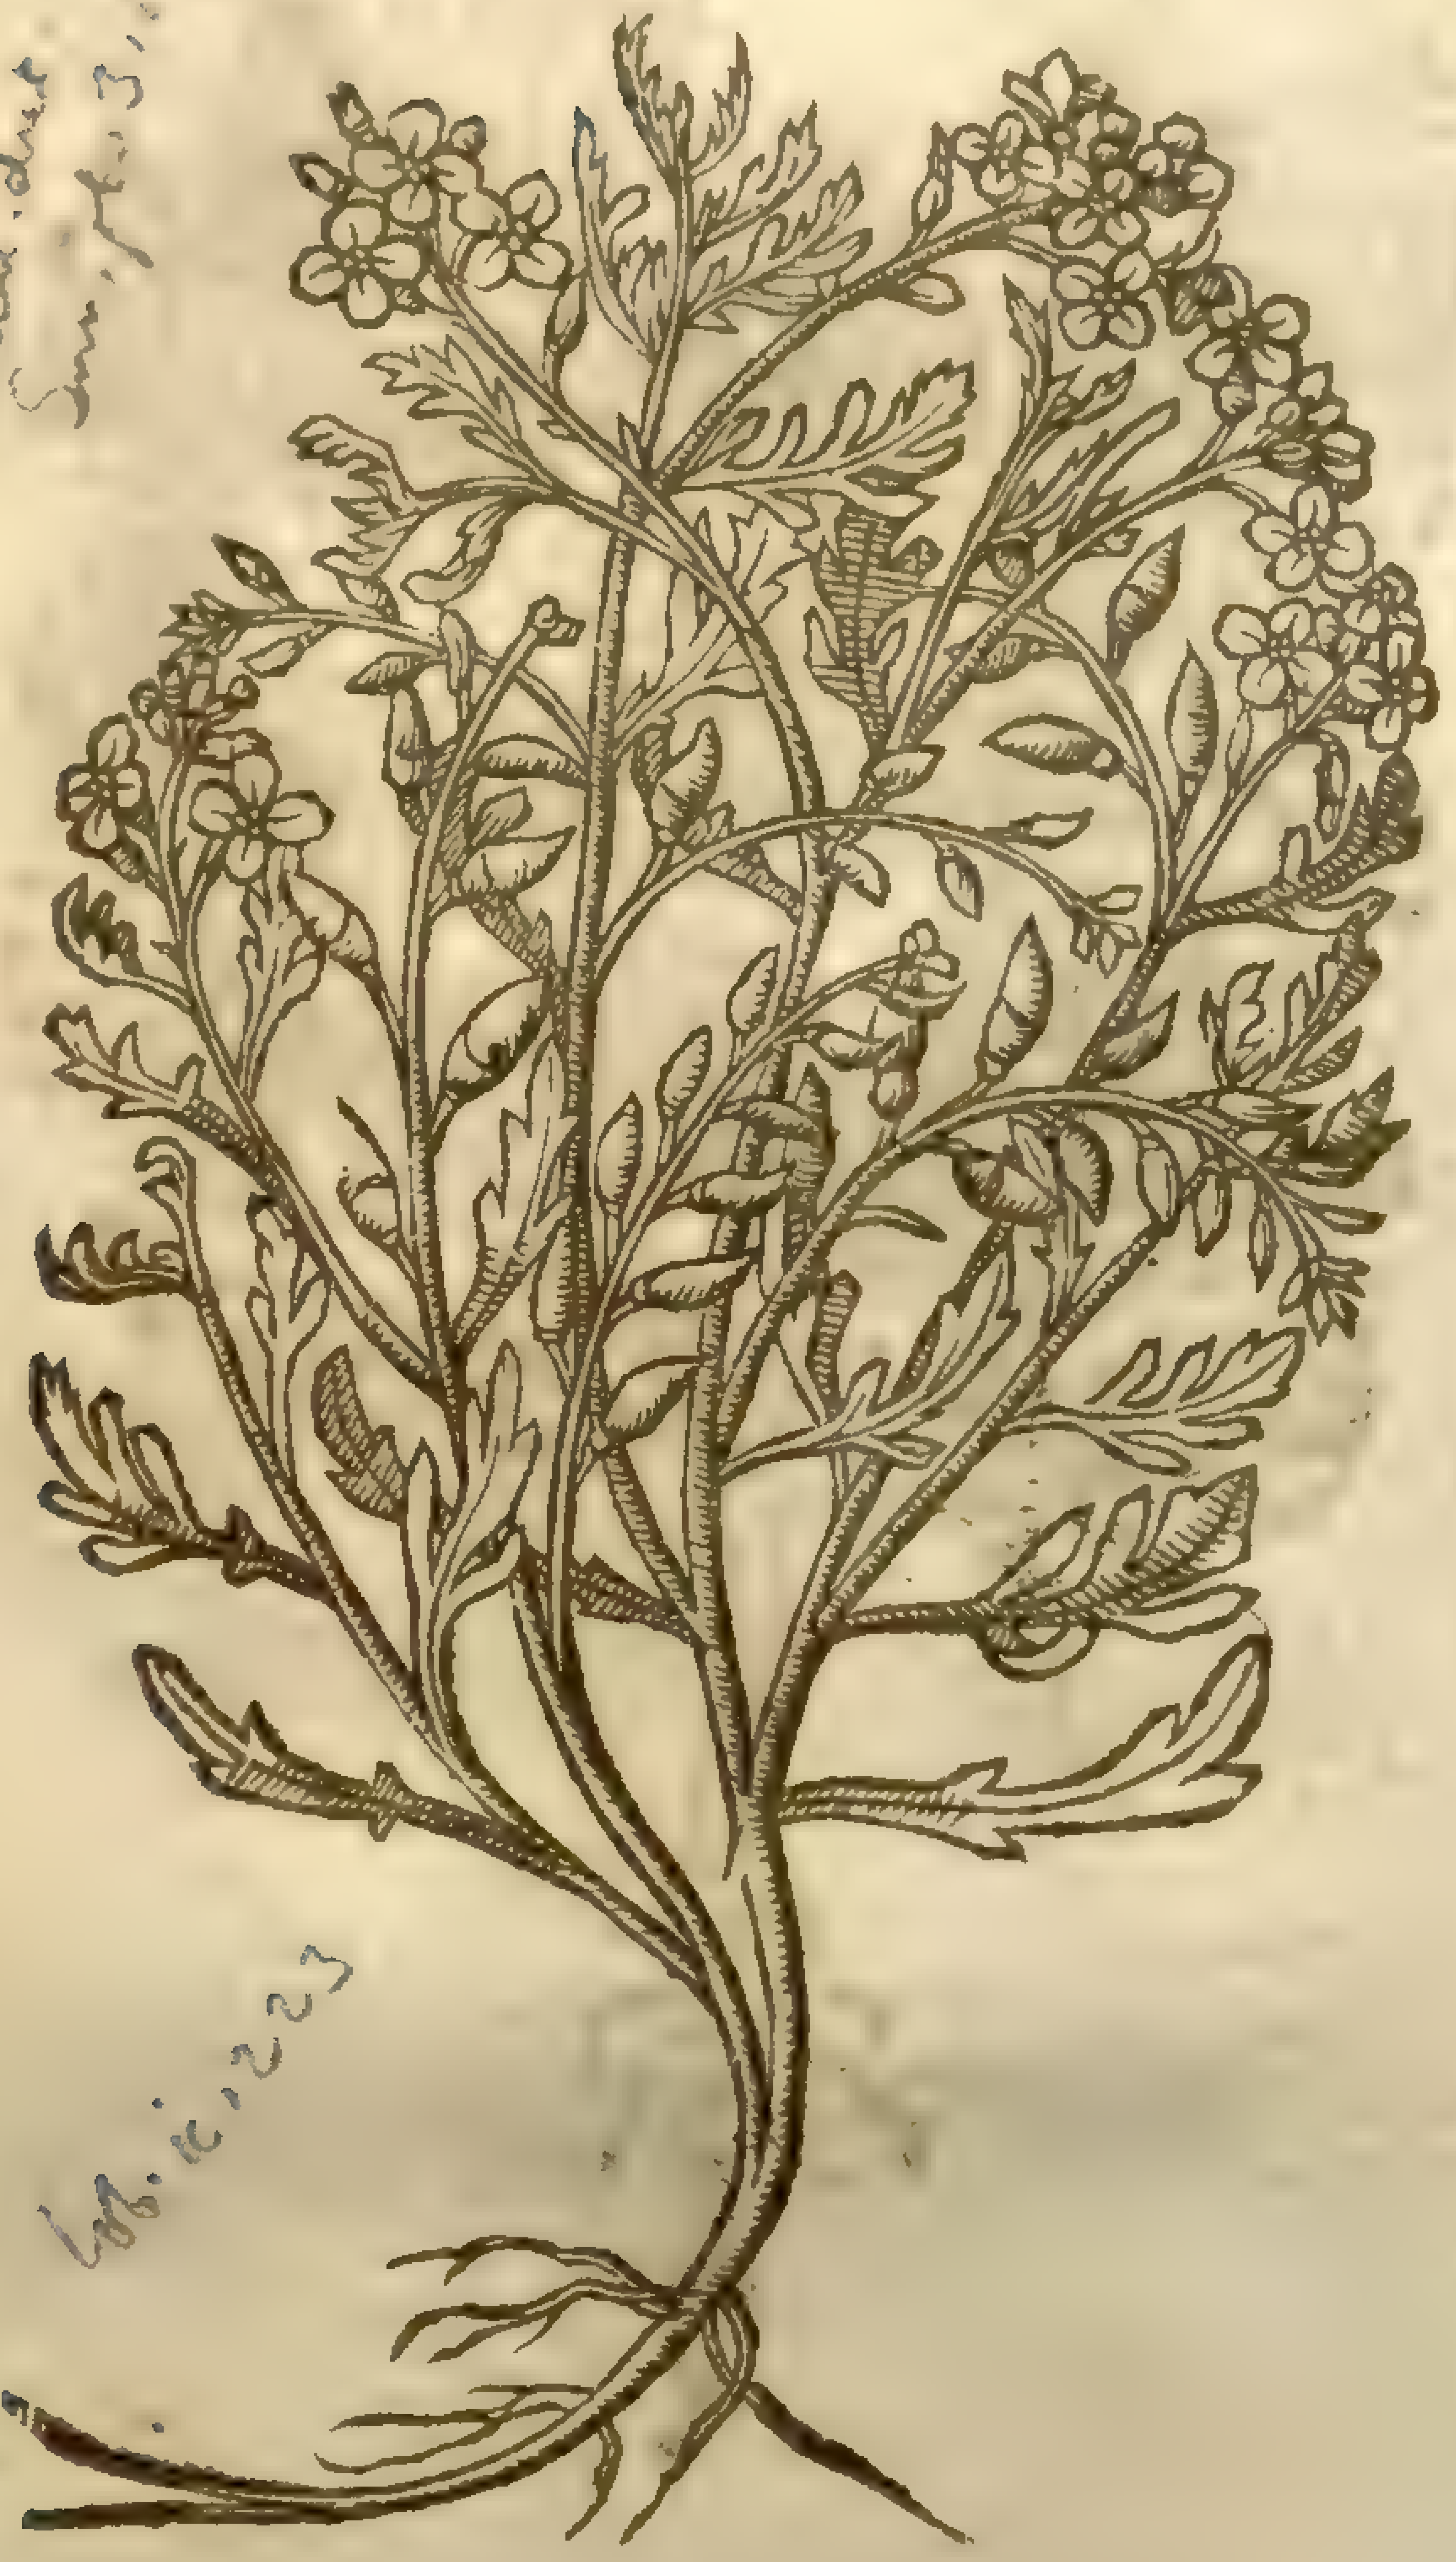
3 This third is by *Lobel* called *Eruca ſylueſtris anguſtifolia*: narrow leaued wilde Rocket.

4 *Cluſius* fitly calls this, *Naſturtium ſylueſtre*: and hee reprehendeth *Lobel* for altering the name into *Eruca Naſturtio cognata tenuifolia*: Creſſy-Rocket.

5 The fifth is *Eruca marina*, (thought by *Lobel* and others to be *Cakile Serapionis*,) Sea Rocket.

6 *Eruca aquatica*: Water Rocket.

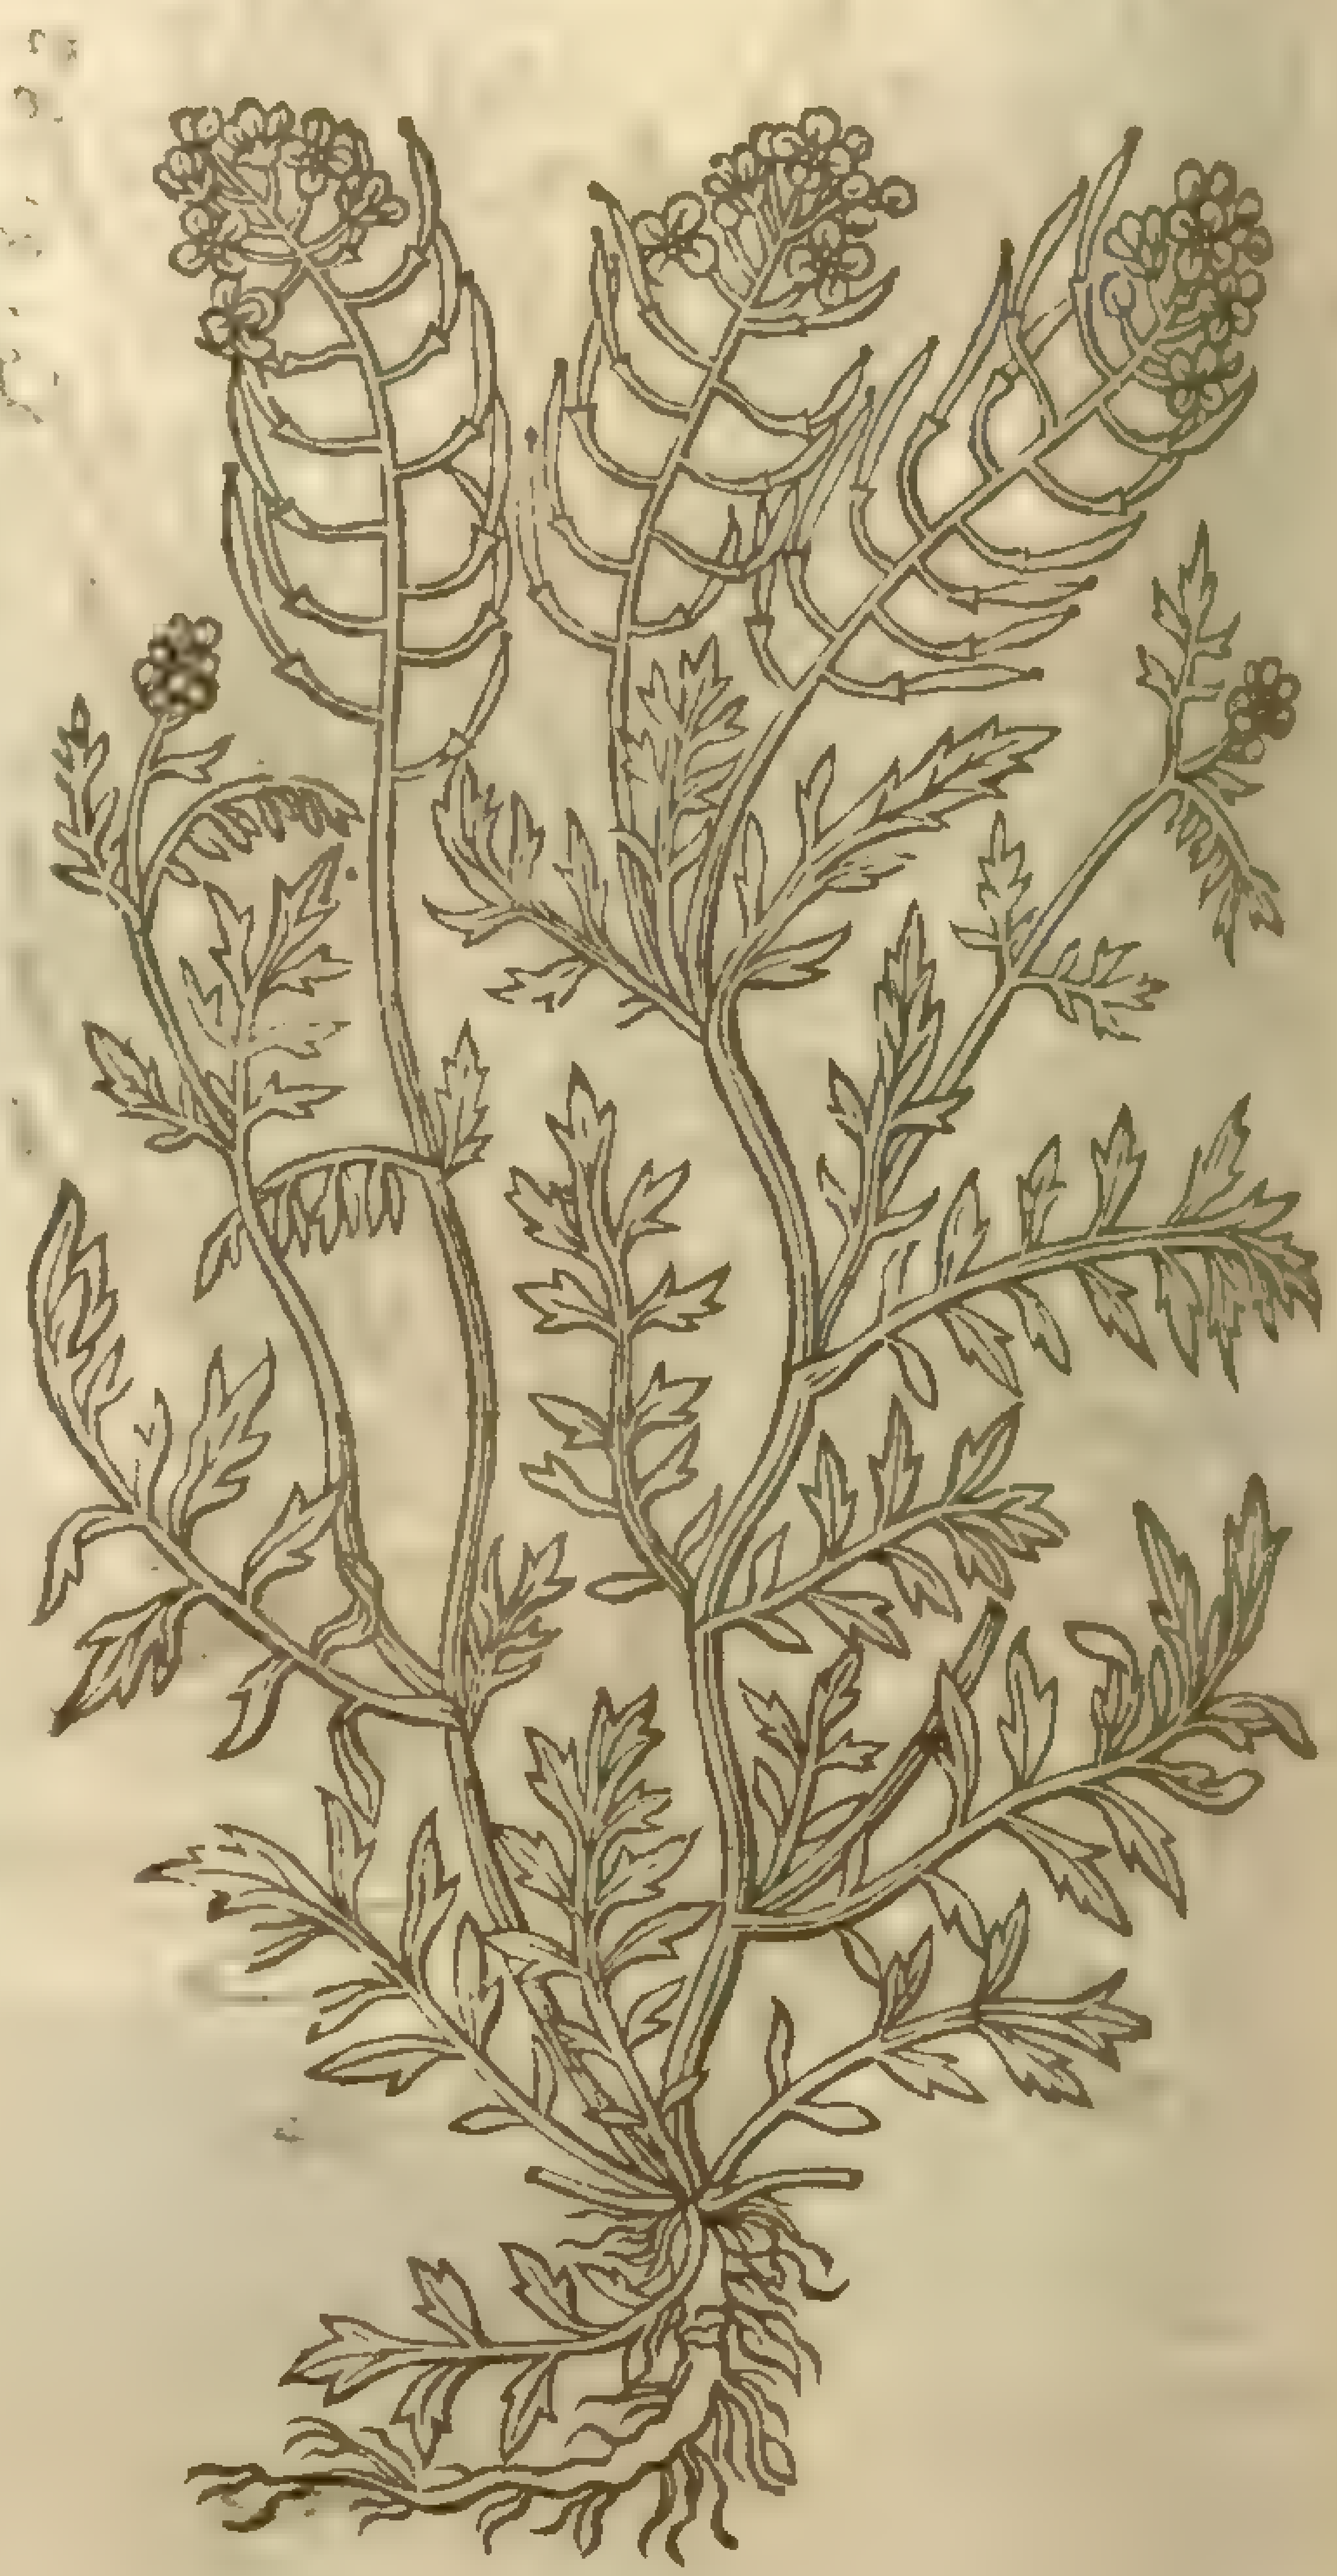
‡ 5 *Eruca marina.*
Sea Rocket.



R. [illegible] Cakile, [illegible] dict. Sm. pl. 3, 1[illegible]

[illegible] ii. 223

† 6 *Eruca aquatica.*
Water Rocket.



Sisymbrium sylvestre, [illegible] dict. Sm. pl. 3, 2

¶ *The Temperature.*

Rocket is hot and dry in the third degree, therefore ſaith *Galen* it is not fit nor accuſtomed to be eaten alone.

¶ *The Vertues.*

A Rocket is a good ſallet herbe, if it be eaten with Lettuce, Purſlane, and ſuch cold herbes; for being ſo eaten it is good and wholeſome for the ſtomacke, and cauſeth that ſuch cold herbes doe not ouer-coole the ſame: otherwiſe, to be eaten alone, it cauſeth head-ache, and heateth too much.

B The vſe of Rocket ſtirreth vp bodily luſt, eſpecially the ſeed.

C It prouoketh vrine, and cauſeth good digeſtion.

D *Pliny* reporteth, That whoſoeuer taketh the ſeed of Rocket before he be whipt, ſhall be ſo hardened, that he ſhall eaſily indure the paines.

E The root and ſeed ſtamped, and mixed with vineger and the gall of an Oxe, taketh away freckles, lentiles, blacke and blew ſpots, and all ſuch deformities of the face.

---

† The figure that was in the third place, vnder the title of *Eruca ſyl anguſtifolia*, is of the ſame plant that in the Chapter of *Turritis* is called *Camelina*, where you ſhall finde it treated of at large. And that in the firſt place is *Eryſimum ſecundum* of *Tabern.* and I queſtion whether it be not of *Sinapi ſylueſtre minus*.

Chap.

Chap. 11. *Of Tarragon.*

Draco herba.
Tarragon.

[illegible]

¶ *The Deſcription.*

Tarragon the ſallade herbe hath long and narrow leaues of a deep green colour, greater and longer than thoſe of common Hyſſope, with ſlender brittle round ſtalkes two cubites high: about the branches whereof hang little round floures, neuer perfectly opened, of a yellow colour mixed with blacke, like thoſe of common Wormewood. The root is long and fibrous, creeping far abroad vnder the earth, as doe the roots of Couch-graſſe, by which ſprouting forth it increaſeth, yeelding no ſeed at all, but as it were a certaine chaffie or duſtie matter that flieth away with the winde.

¶ *The Place.*

Tarragon is cheriſhed in gardens, and is encreaſed by the young ſhoots: *Ruellius* and ſuch others haue reported many ſtrange tales hereof ſcarce worth the noting, ſaying, that the ſeed of flax put into a Raddiſh root or ſea Onion, and ſo ſet, doth bring forth this herbe Tarragon.

¶ *The Time.*

It is greene all Summer long, and a great part of Autumne, and floureth in Iuly.

¶ *The Names.*

It is called in Latine, *Draco*, *Dracunculus hortenſis*, and *Tragum vulgare* by *Cluſius*; of the Italians, *Dragoncellum*; in French, *Dragon*; in Engliſh, Tarragon.

It is thought to be that *Tarchon* which *Auicen* mentioneth in his *686*. chapter: but he writeth ſo little thereof, as that nothing can certainly be affirmed of it. *Simeon Sethi* the Greeke alſo maketh mention of *Tarchon*.

¶ *The Temperature and Vertues.*

Tarragon is hot and dry in the third degree, and not to be eaten alone in ſallades, but joyned with other herbs, as Lettuce, Purſlain, and ſuch like, that it may alſo temper the coldneſſe of them, like as Rocket doth, neither do we know what other vſe this herbe hath.

Chap. 12. *Of Garden Creſſes.*

¶ *The Deſcription.*

1 Garden Creſſes or Towne Creſſes hath ſmall narrow jagged leaues, ſharpe and burning in taſte. The ſtalkes be round, a cubite high, which bring forth many ſmall white floures, and after little flat husks or ſeed veſſels, like to thoſe of ſhepheards purſe, wherin are contained ſeeds of a browne reddiſh colour. The root dieth when the ſeed is ripe.

2 There is another kinde in taſte like the former, but in leaues far different, which I recouered of ſeeds, ſent me from *Robinus* dwelling in Paris. The ſtalkes riſe vp to the height of a foot, garniſhed with many broad leaues deeply cut or indented about the edges: the middle of the leafe is decked and garniſhed with many little ſmall leaues or rather ſhreds of leaues, which make the ſame like a curlde fanne of feathers. The ſeed is like the former in ſhape.

3 Spaniſh Creſſes riſeth forth of the ground like vnto Baſill; afterwards the leaues grow larger and broader, like thoſe of Marigolds; amongſt the which riſeth vp a crooked lymmer ſtalk,

whereupon doe grow ſmall tufts or ſpokie rundles of white floures. The ſeed followeth, browne of colour, and bitter in taſte. The whole plant is of a loathſome ſmell and ſauour.

4 Stone-Creſſe groweth flat vpon the ground, with leaues jagged and cut about the edges like the Oke leafe, reſembling well the leaues of Shepheards purſe. I haue not ſeene the floures, and therefore they be not expreſt in the figure; notwithſtanding it is reported vnto mee, that they be ſmal and white of colour, as are thoſe of the garden Creſſes. The ſeed is contained in ſmal pouches or ſeed veſſels, like thoſe of Treacle muſtard or Thlaſpi.

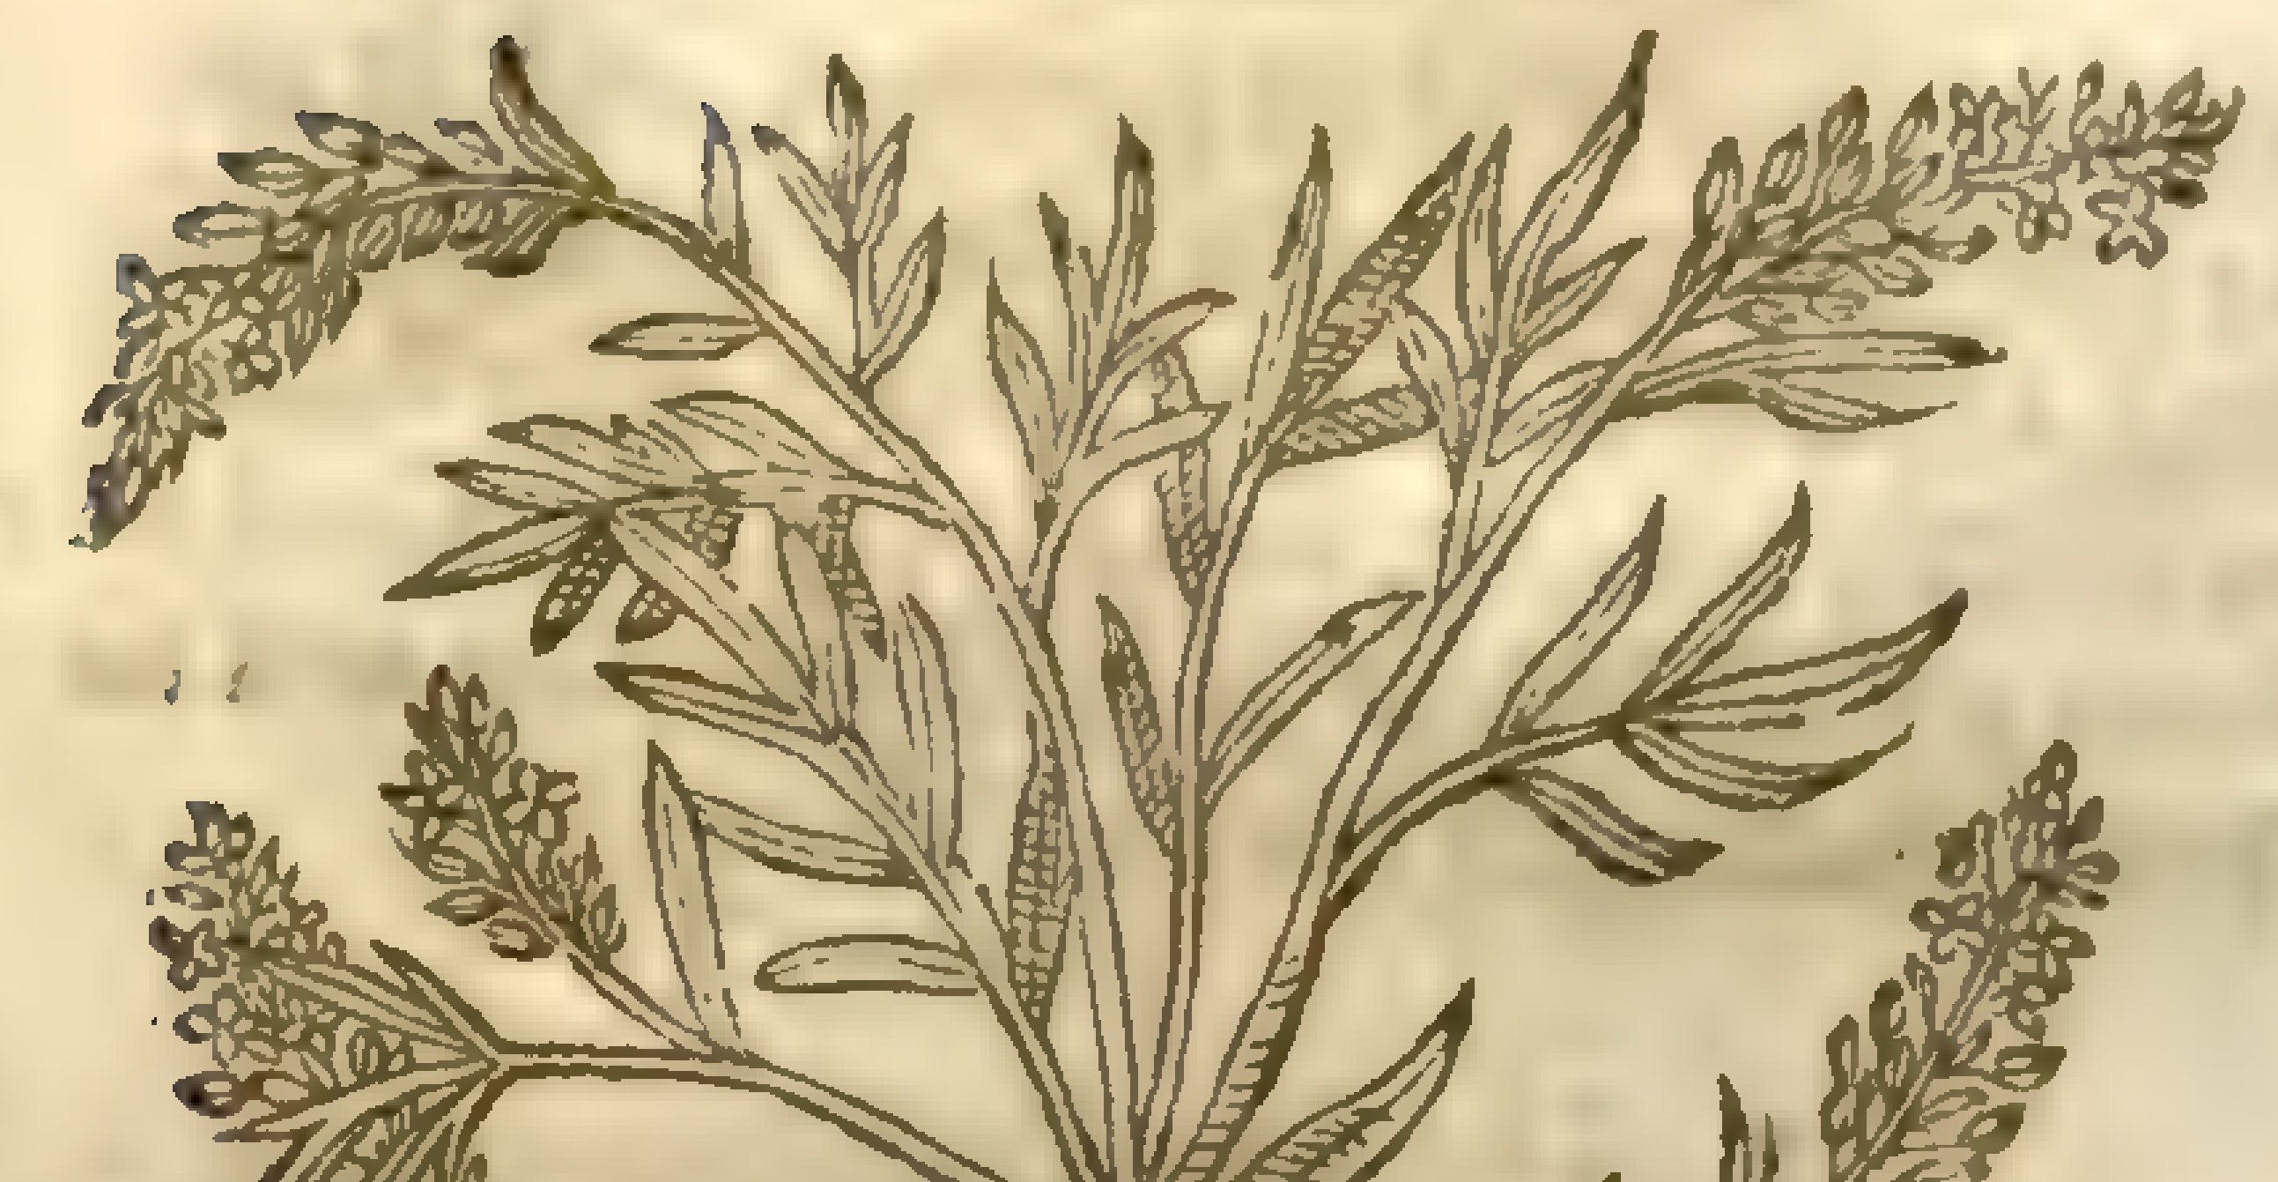
¶ *The Place.*

Creſſes are ſowne in gardens, it skils not what ſoile it be; for that they like any ground, eſpecially if it be well watered. ‡ Mr. *Bowles* found the fourth growing in Shropſhire in the fields about Birch in the pariſh of Eleſmere, in the grounds belonging to Mr. *Richard Herbert*, and that in great plenty. As alſo on the further ſide of Blacke heath, by the highway ſide leading from Greenewich to Luſam. ‡

¶ *The Time.*

It may be ſowne at any time of the yeare, vnleſſe it be in Winter; it groweth vp quickely, and bringeth forth betimes both ſtalke and ſeed: it dieth euery yeare, and recouereth it ſelfe of the fallen or ſhaken ſeed.

1 *Naſturtium hortenſe.*
Garden Creſſes.



Lepidium sativum, 6 Mill. Dict.

¶ *The Names.*

Creſſes is called in Greeke κάρδαμον: in Latine *Naſturtium*: in Engliſh, Creſſes: the Germans cal it **Kerſſe**: and in French, *Creſſon*: the Italians *Naſturtio*, and *Agretto*: of ſome, Towne Creſſes, and garden Karſſe. It is called *Naſturtium*, as *Varro* and *Pliny* thinke, *à narribus torquendis*, that is to ſay, of writhing the noſthrils, which alſo by the loathſome ſmell and ſharpeneſſe of the ſeed doth cauſe ſneezing. ‡ The firſt is called *Naſturtium hortenſe*, Garden Creſſes. 2 *Naſturtium hortenſe Criſpum*, Garden Creſſes with criſpe, or curled leaues. 3 *Naſturtium Hiſpanicum*, or *Latifolium*: Spaniſh Creſſes or broad leaued Creſſes. 4 This is *Naſturtium petræum* of *Tabernamontanus* (and not of *Lobel*, as our Author termed it.) Stone Creſſes. ‡

¶ *The Temperature.*

The herb of Garden Creſſes is ſharpe and biting the tongue; and therefore it is very hot and drie, but leſſe hot whileſt it is young and tender, by reaſon of the waterie moiſture mixed therewith, by which the ſharpneſſe is ſomwhat allaied.

The ſeed is much more biting than the herbe, and is hot and dry almoſt in the fourth degree.

¶ *The Vertues.*

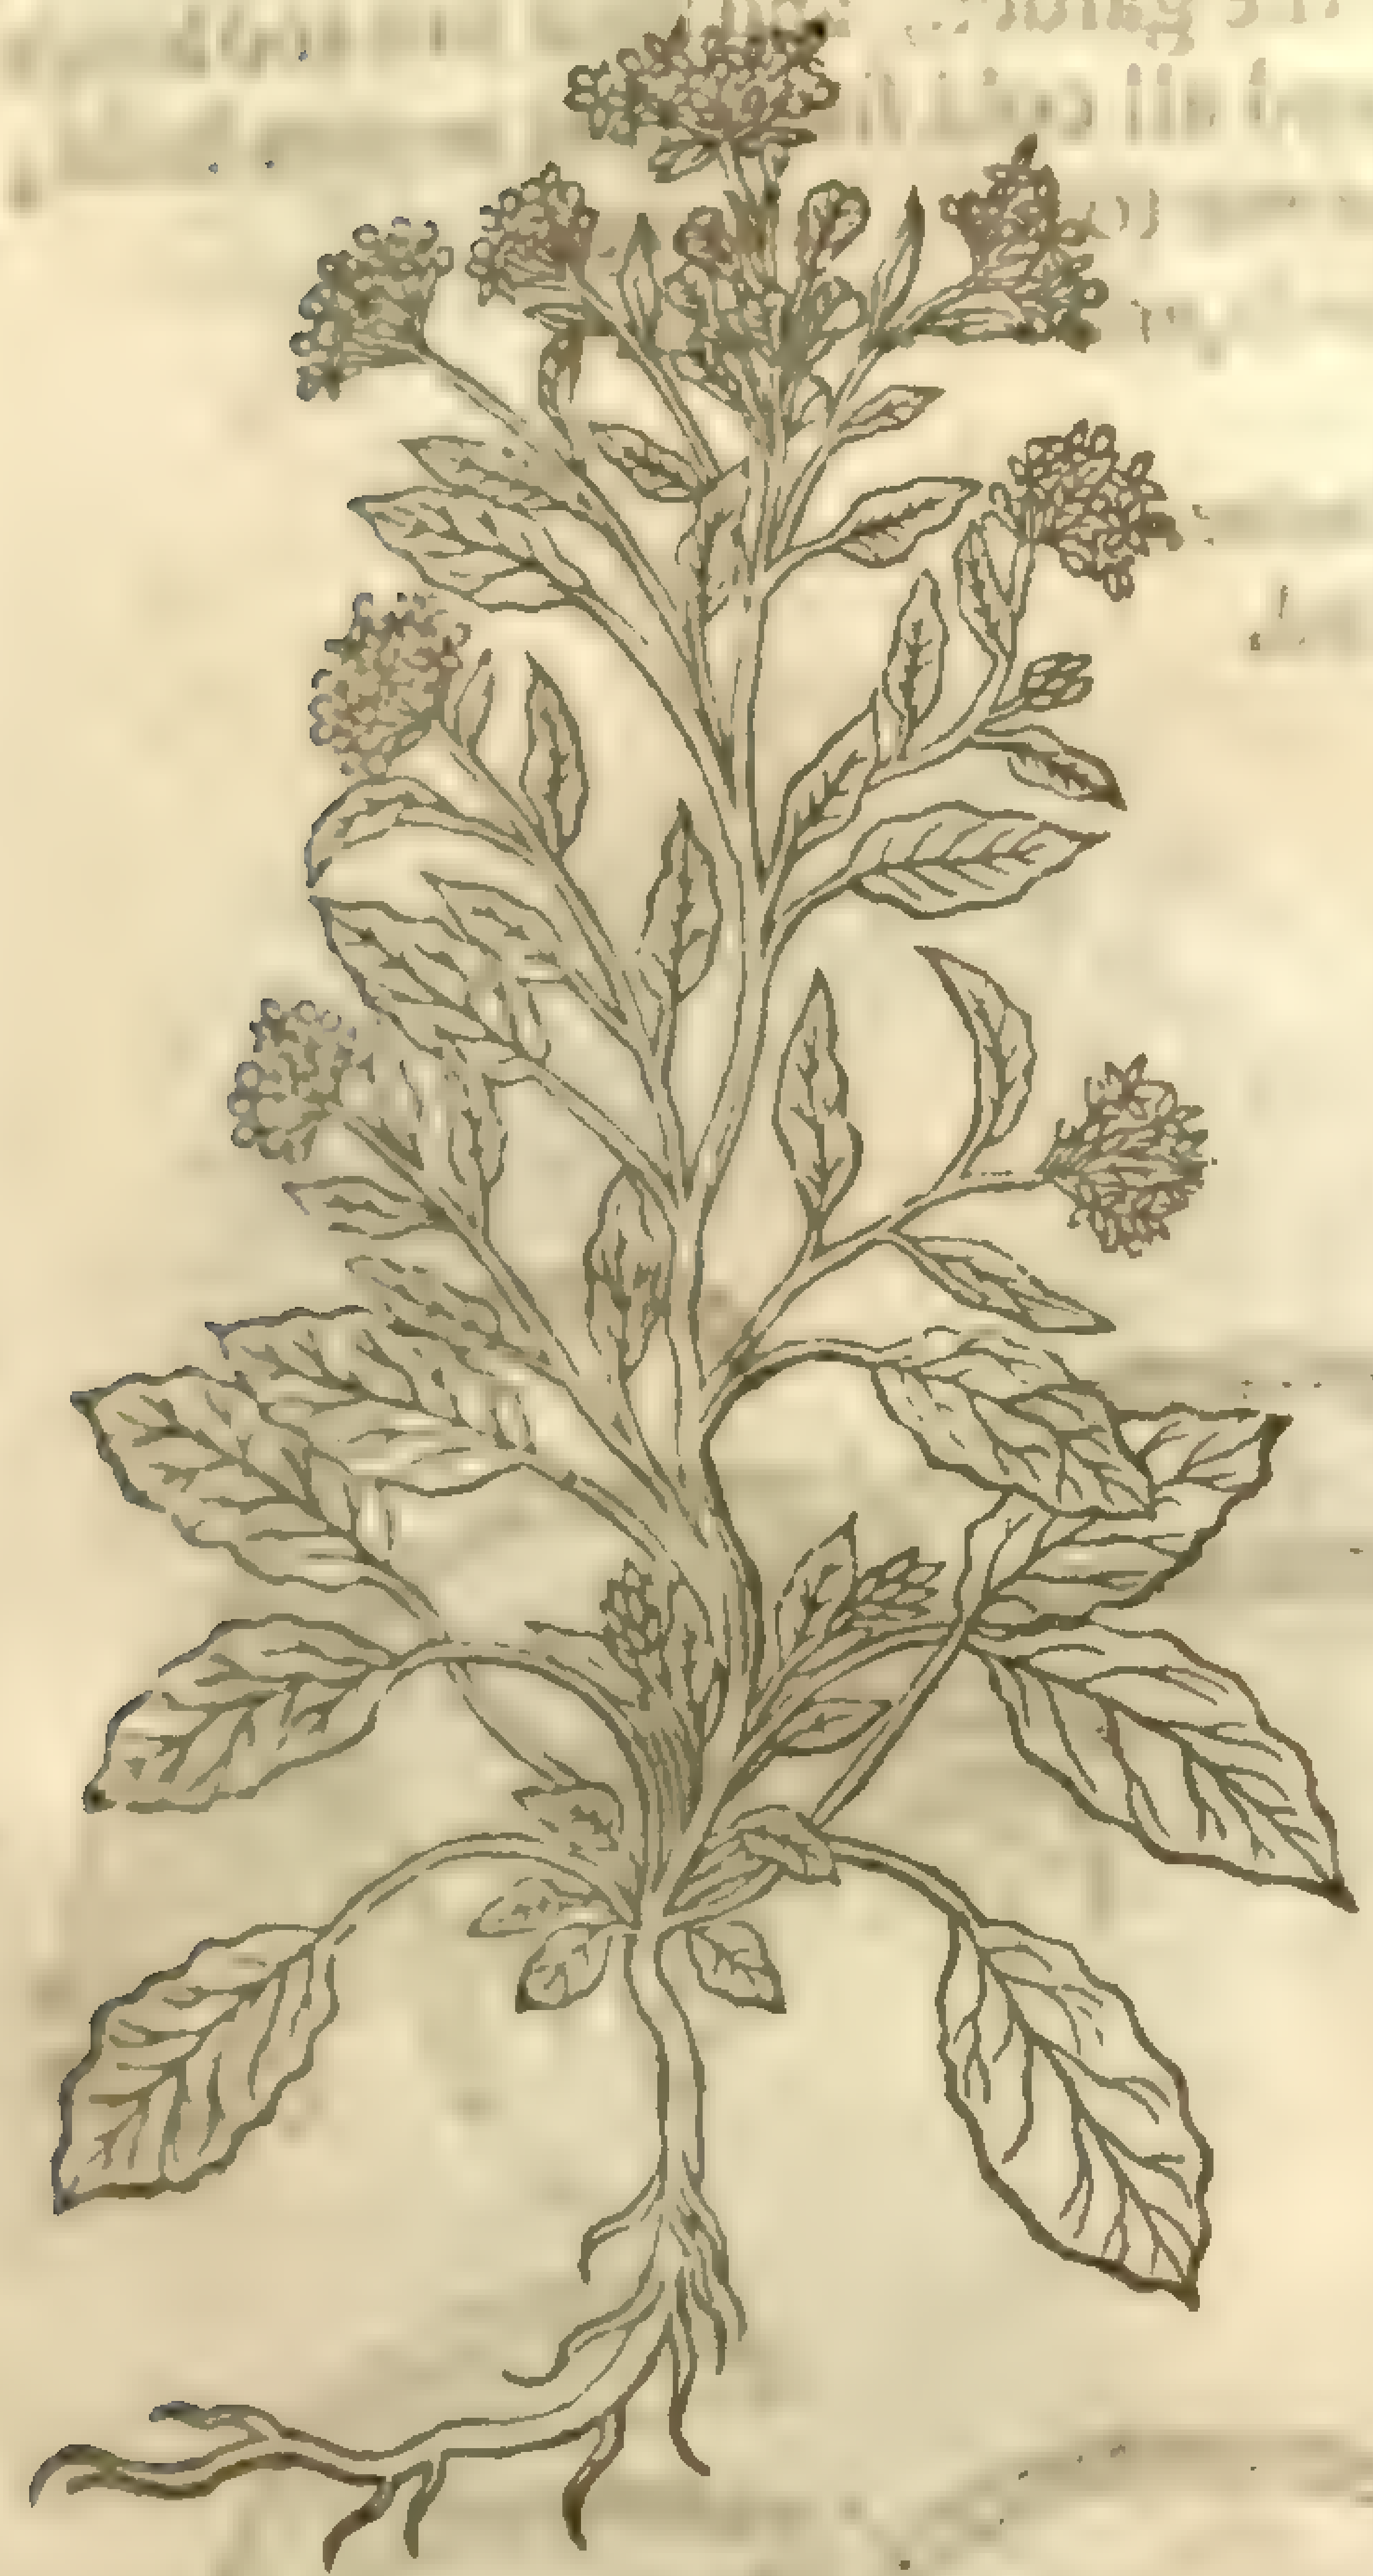
A *Galen* ſaith that the Creſſes may be eaten with bread *Veluti obſonium*, and ſo the antient Spartanes vſually did; and the low Country men many times do, who commonly vſe to feed of Creſſes with bread and Butter. It is eaten with other ſallade herbs, as Tarragon and Rocket: and for this cauſe it is chiefely ſowne.

B It is good againſt the diſeaſe which the Germanes call **Scorbuch** and **Scorbuye**: in Latine, *Scorbutus*: which we in England call the Scuruie, and Scurby, and vpon the ſeas the Skyrby: it is as good and as effectuall as the Scuruie graſſe, or water Creſſes.

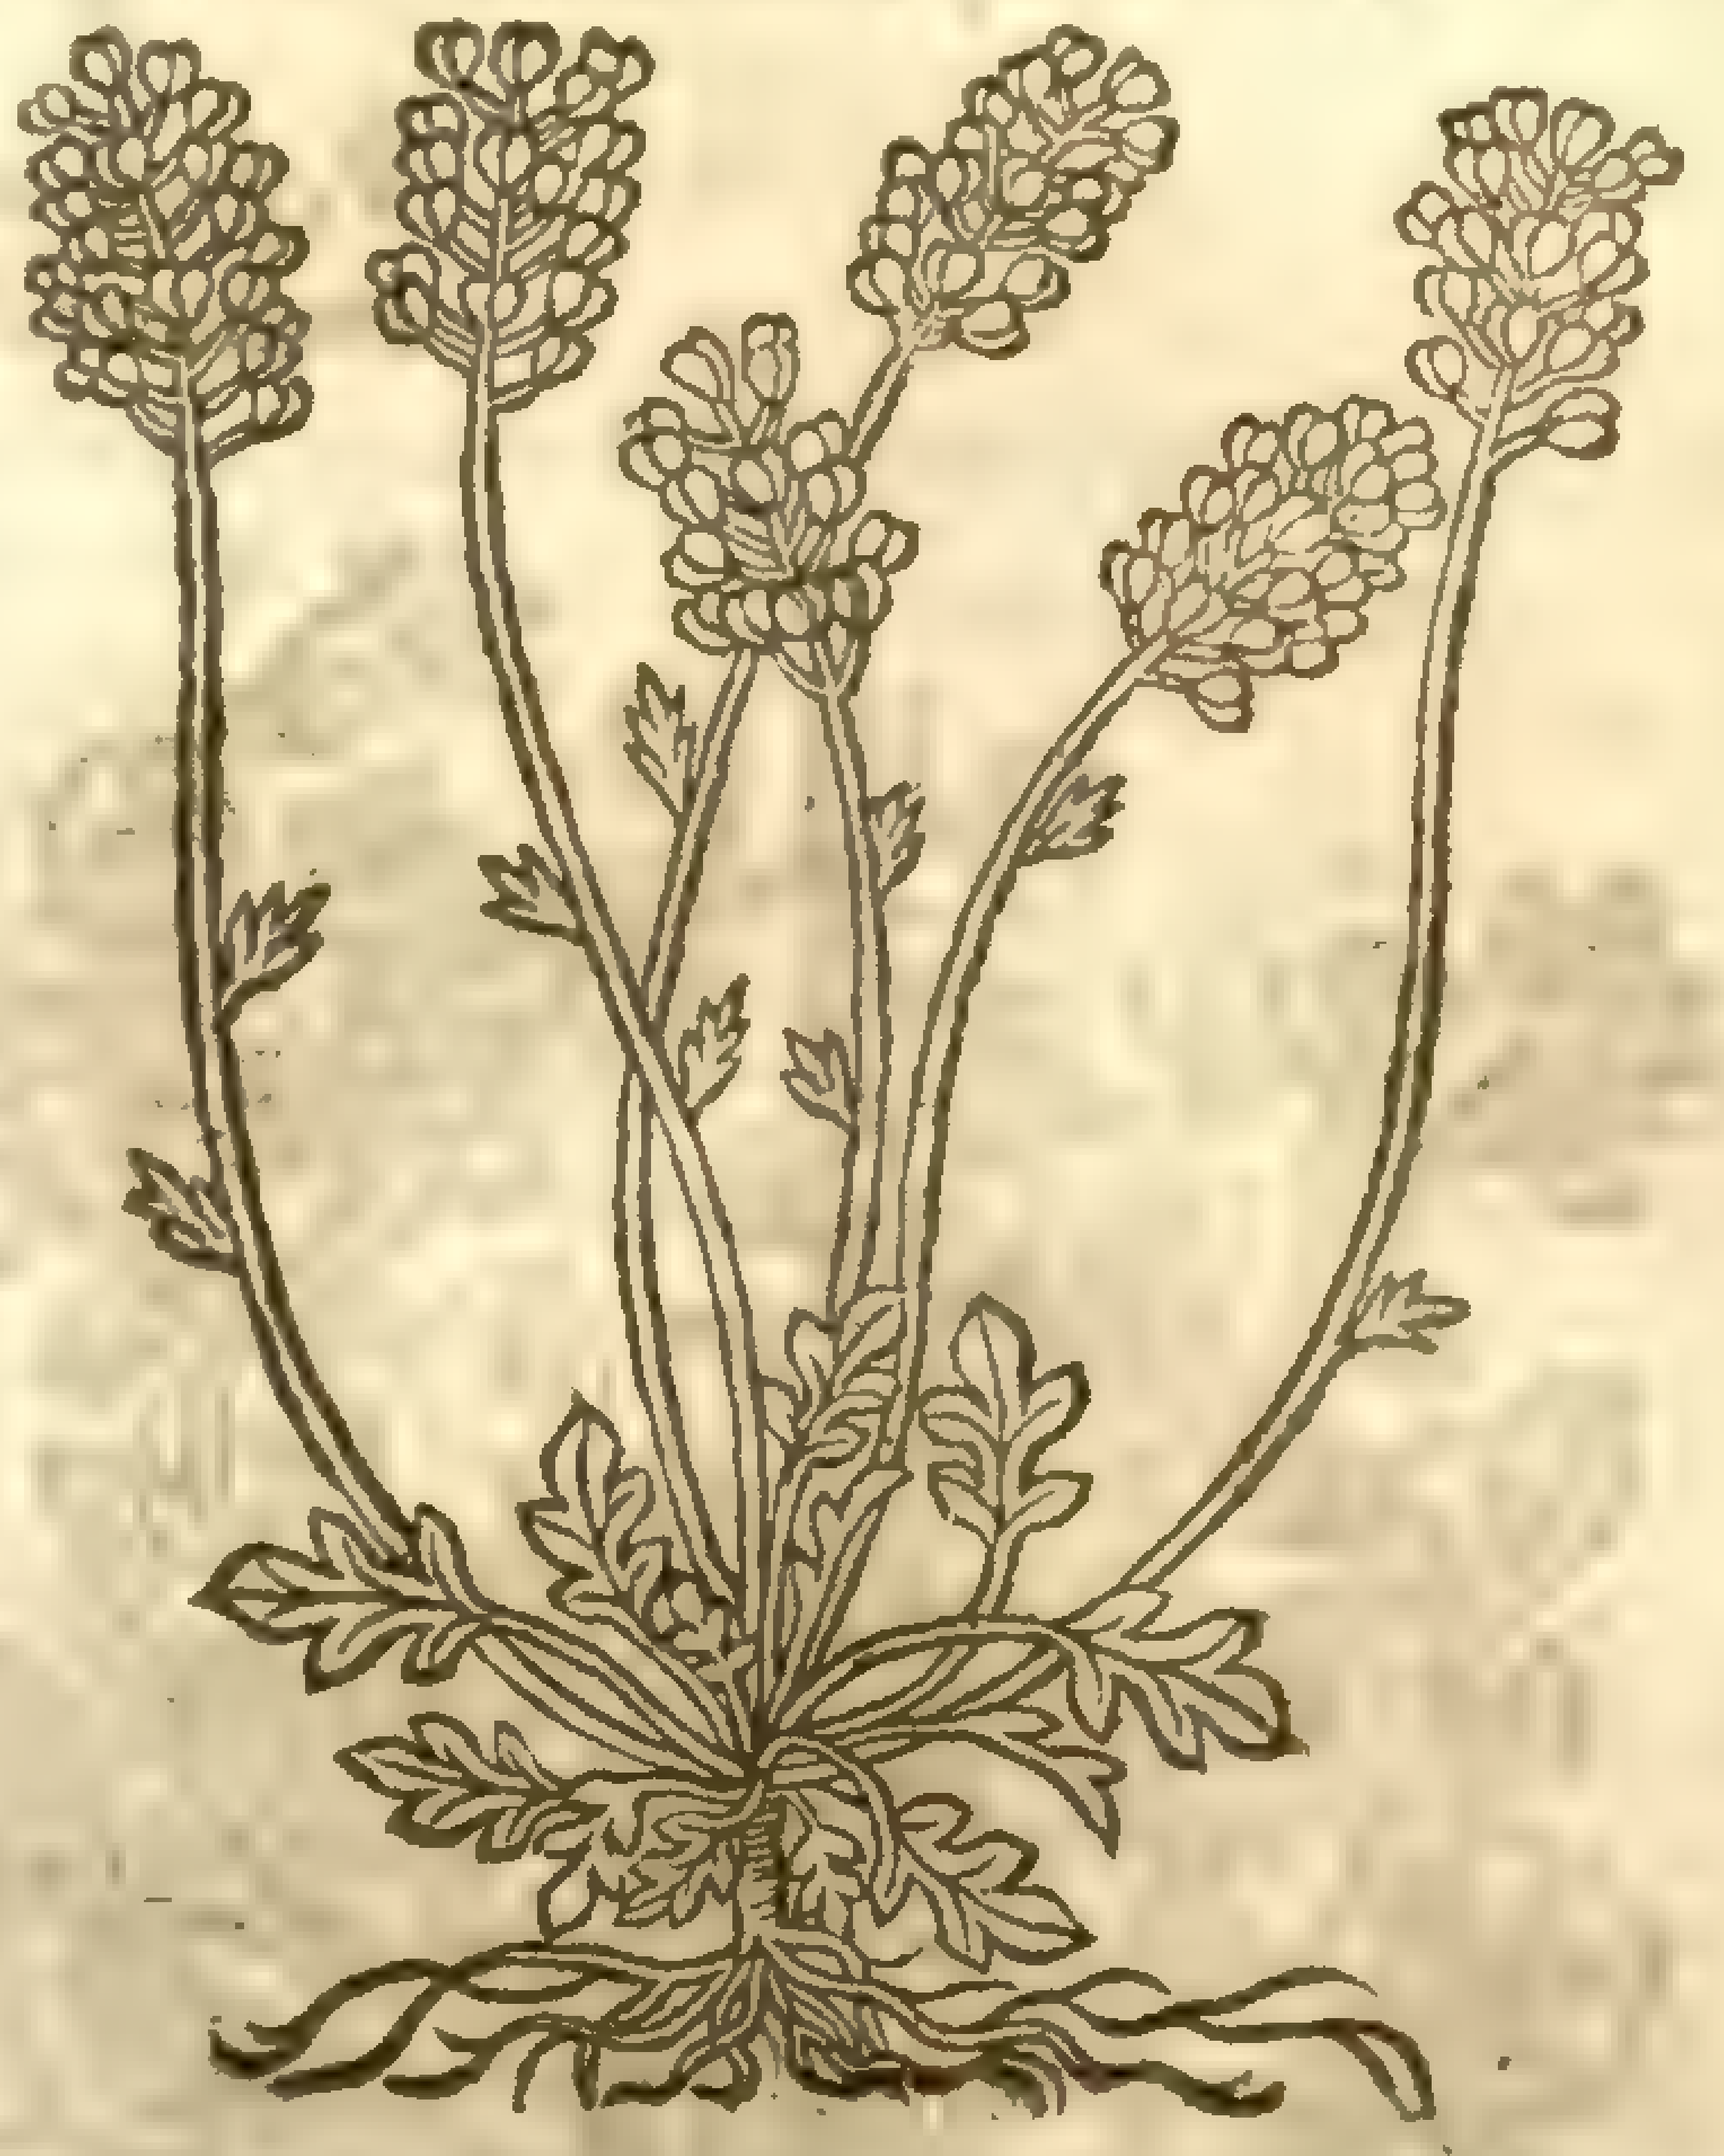
C *Dioſcorides* ſaith, if the ſeed be ſtamped and mixt with hony, it cureth the hardneſſe of the milt: with vineger and Barley meale parched it is a remedy againſt the Sciatica, and taketh away hard ſwellings and inflammations. It ſcoureth away tettars mixed with brine: it ripeneth felons, called in Greeke, δοθιῆνες: it forcibly cutteth and raiſeth vp thicke and tough humors of the cheſt, if it be mixed with things proper againſt the ſtuffing of the lungs.

D *Dioſcorides* ſaith it is hurtfull to the ſtomacke, and troubleth the belly.

3 *Naſturtium Hiſpanicum.*
Spaniſh Creſſes.



4 *Naſturtium petræum.*
Stone Creſſes.



It driueth forth wormes, bringeth downe the floures, killeth the childe in the mothers wombe, and prouoketh bodily luſt. E

Being inwardly taken, it is good for ſuch as haue fallen from high places: it diſſolueth clutte- F
red bloud, and preuenteth the ſame that it do not congeale and thicken in any part of the body: it procureth ſweat, as the later Phyſitians haue found and tried by experience.

CHAP. 13. *Of Indian Creſſes.*

¶ *The Deſcription.*

CReſſes of India haue many weake and feeble branches, riſing immediatly from the ground, diſperſing themſelues far abroad; by meanes whereof one plant doth occupie a great circuit of ground, as doth the great Bindeweede. The tender ſtalks diuide themſelues into ſundry branches, trailing likewiſe vpon the ground, ſomewhat bunched or ſwollen vp at euery joint or knee, which are in colour of a light red, but the ſpaces betweene the joints are greene. The leaues are round like wall peniwort, called Cotyledon, the foot-ſtalke of the leafe commeth forth on the backeſide almoſt in the middeſt of the leafe, as thoſe of Frogbit, in taſte and ſmell like the garden Creſſes. The flours are diſperſed throughout the whole plant, of colour yellow, with a croſſed ſtar ouerthwart the inſide, of a deepe Orange colour: vnto the backe-part of the ſame doth hang a taile or ſpurre, ſuch as hath the Larkes heele, called in Latine *Conſolida Regalis*; but greater, and the ſpur or heele longer; which beeing paſt there ſucceed bunched and knobbed coddes or ſeed veſſells, wherein is contained the ſeed, rough, browne of colour, and like vnto the ſeeds of the beete, but ſmaller.

¶ *The Place.*

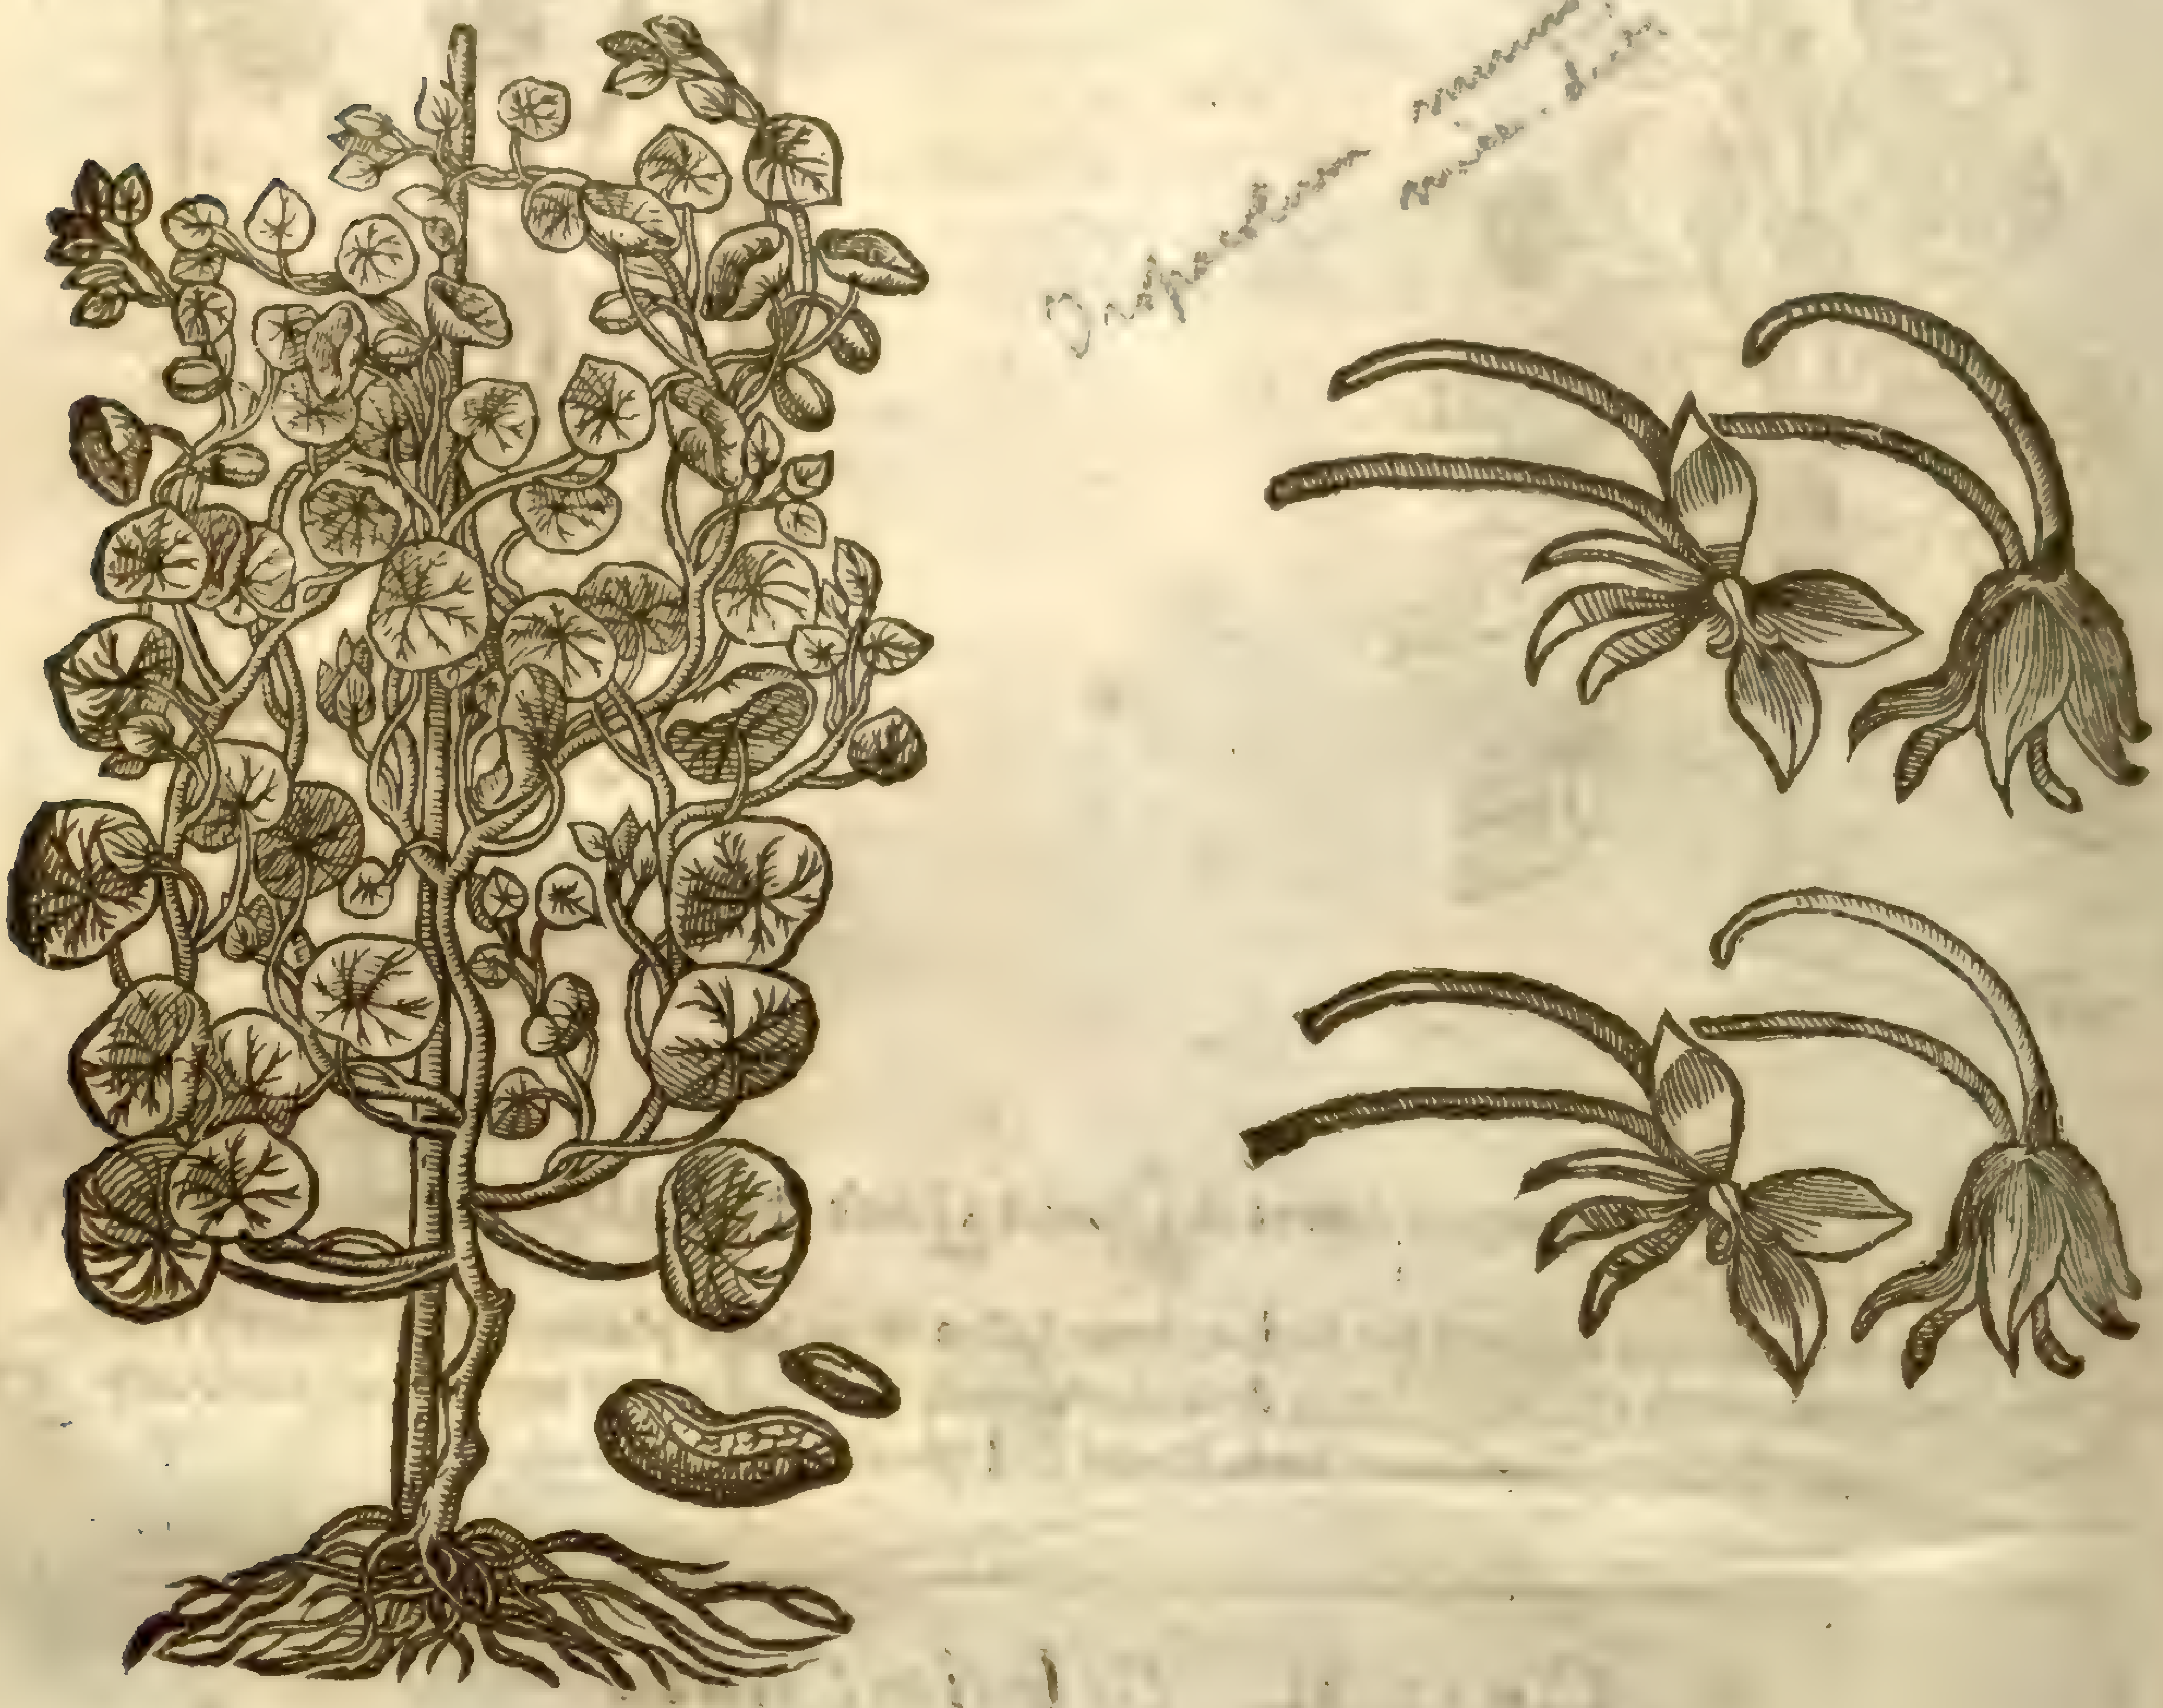
The ſeeds of this rare and faire plant came from the Indies into Spaine, and thence into France and Flanders, from whence I receiued ſeed that bore with mee both floures & ſeed, eſpecially thoſe I receiued from my louing friend *Iohn Robin* of Paris.

¶ *The Time.*

The ſeedes muſt be ſowen in the beginning of Aprill, vpon a bed of hot horſe dung, and ſome fine ſifted earth caſt thereon of an handful thicke. The bed muſt be couered in ſundry places with hoopes or poles, to ſuſtaine the mat or ſuch like thing that it muſt be couered with in the night, and laied open to the Sunne in the day time. The which being ſprung vp, and hauing gotten three leaues, you muſt replant them abroad in the hotteſt place of the garden, and moſt fine and fertile mold. Thus may you do with Muske-Melons, Cucumbers, and all cold fruits that require haſte; for that otherwiſe the froſt will ouertake them before they come to fruit-bearing.

‡ They may alſo be ſowne in good mold like as other ſeeds, and vſually are. ‡

Naſturtium Indicum cum flore & ſemine.
Indian Creſſes with floure and ſeed.



Tropaeolum minus [illegible]

¶ *The Names.*

This beautifull Plant is called in Latine, *Naſturtium Indicum*: in Engliſh, Indian Creſſes. Although ſome haue deemed it a kind of *Conuolvulus*, or Binde-weed; yet I am well contented that it retaine the former name, for that the ſmell and taſte ſhew it to be a kinde of Creſſes.

¶ *The Nature and Vertues.*

We haue no certaine knowledge of his nature and vertues, but are content to referre it to the kindes of Creſſes, or to a further conſideration.

Chap. 14. *Of Sciatica Creſſes.*

¶ *The Deſcription.*

1 Sciatica Creſſes hath many ſlender branches growing from a ſtalk of a cubit high, with ſmall long and narrow leaues like thoſe of Garden Creſſes. The floures be very ſmall, and yellow of colour: the ſeed veſſels be little flat chaffie huskes, wherein is the ſeed of a reddiſh gold colour, ſharp and very bitter in taſt. The root is ſmal, tough, white within and without, and of a biting taſte.

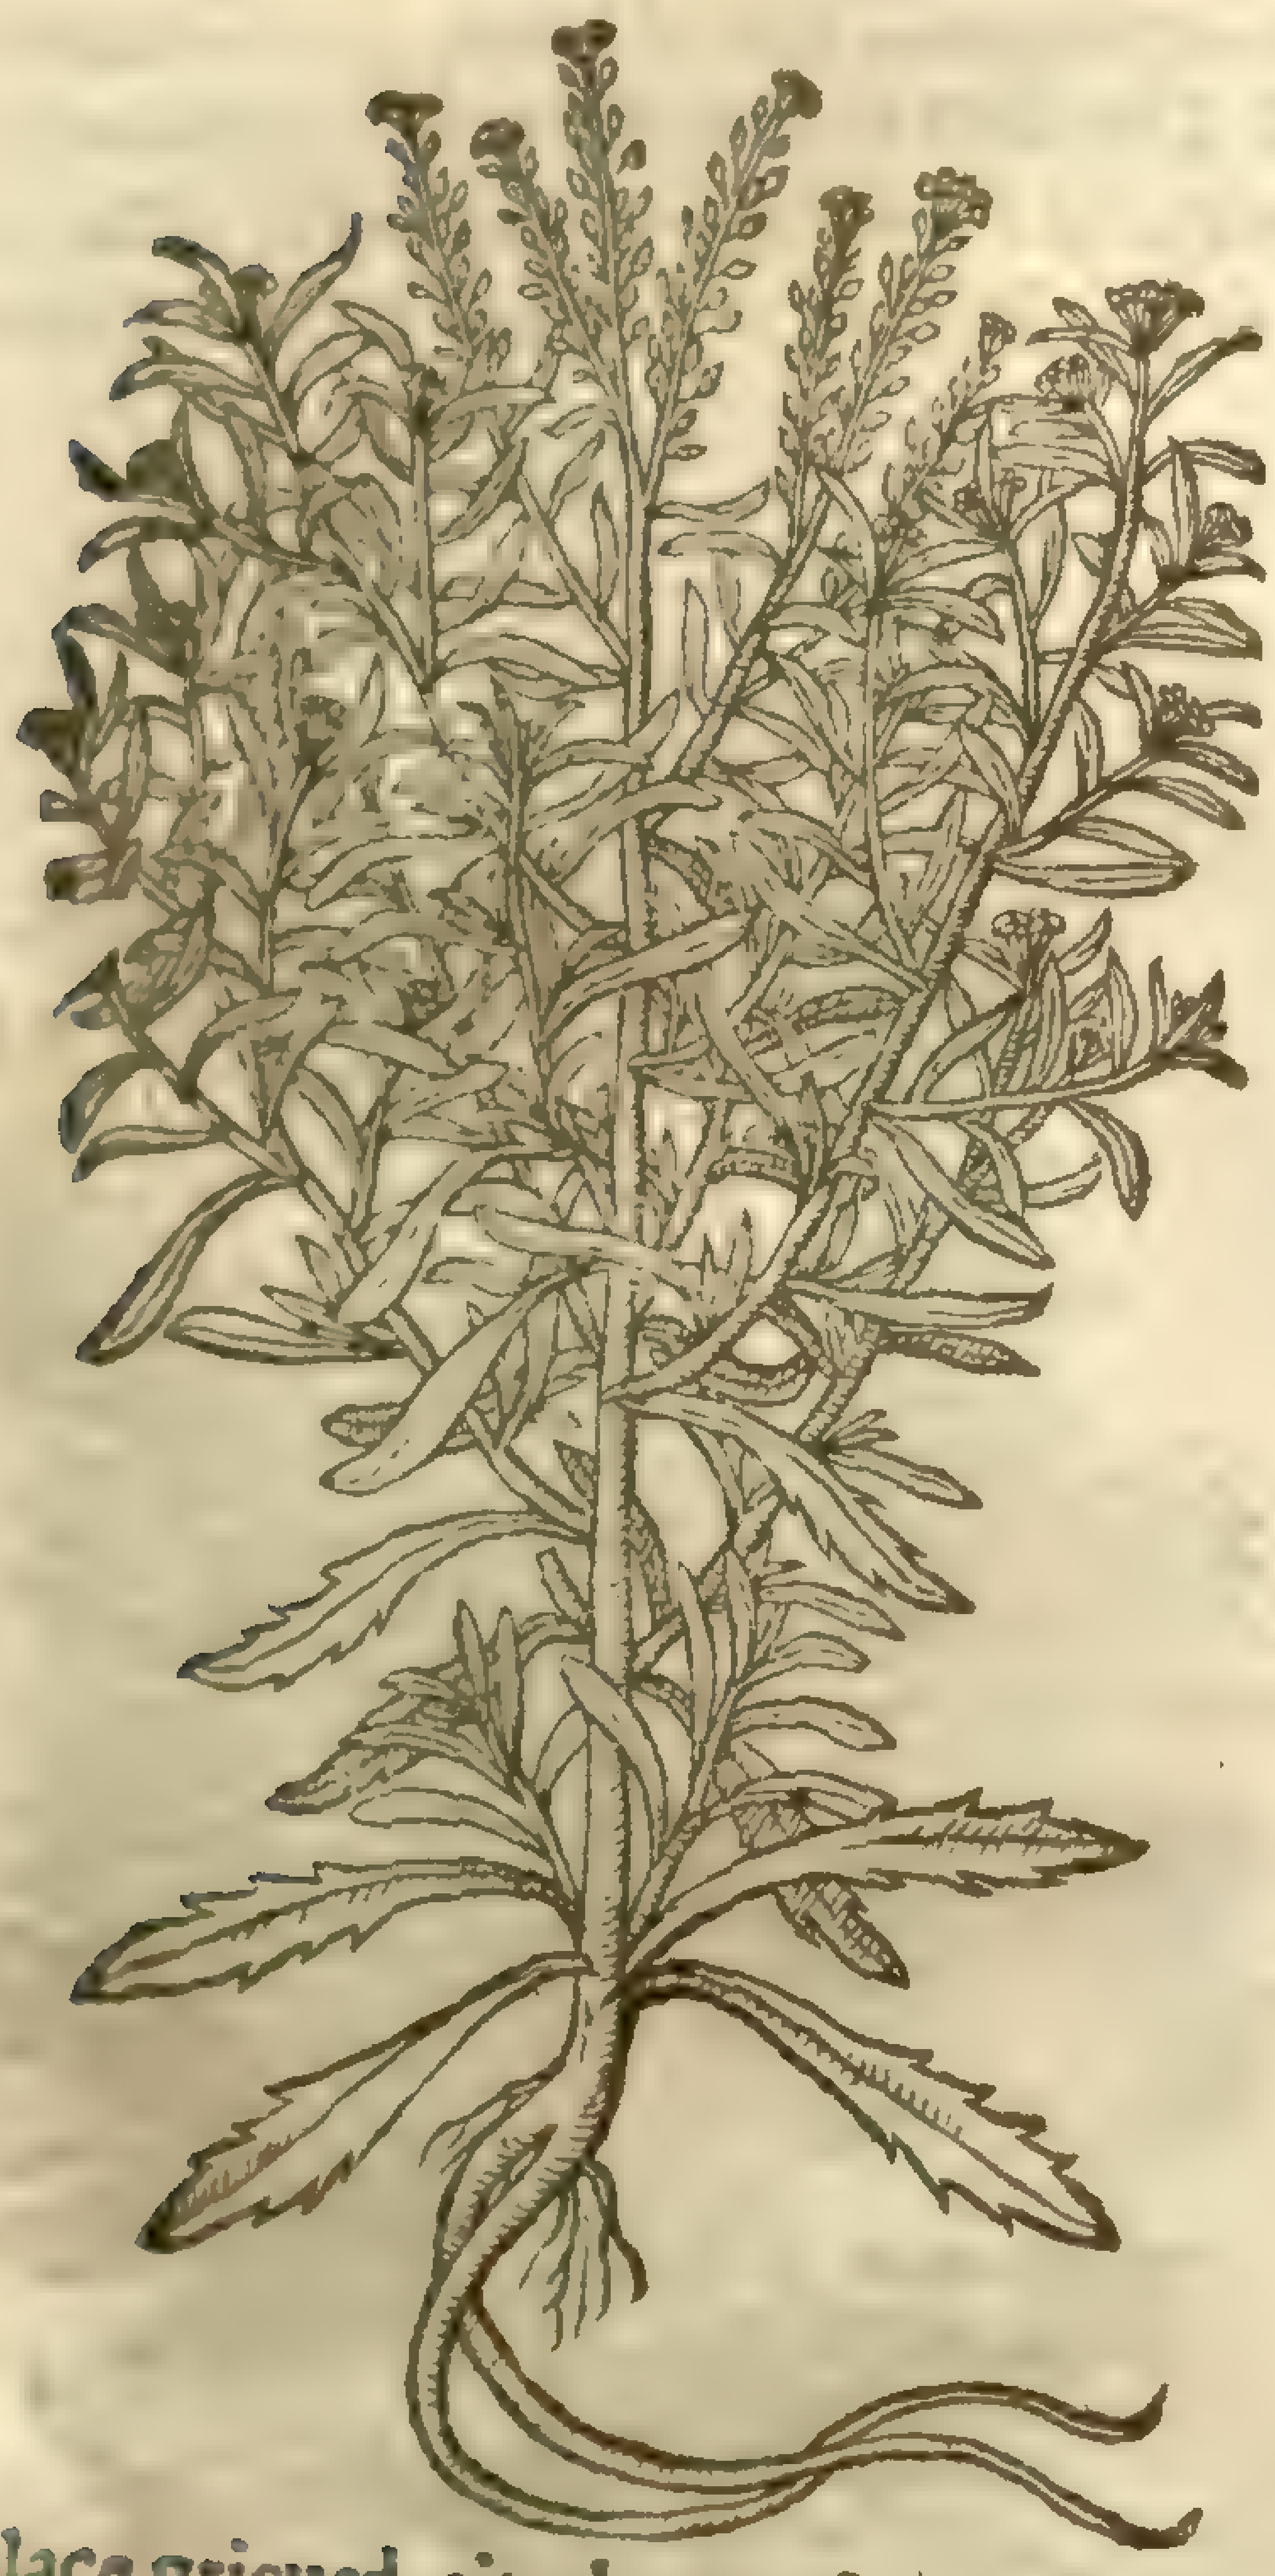
‡ The plant whoſe figure I here giue you in ſtead of that with the narrower leaues of our Author, hath leaues ſomewhat like Rocket, but not ſo deep cut in, being only ſnipt about the edges:

the vpper leaues are not ſnipt, nor diuided at all, and are narrower. The floures decking the tops of the branches are ſmall and white, the ſeed veſſels are leſſe than thoſe of Creſſes, and the ſeed it ſelfe exceeding ſmall, and of a blackiſh colour; the root is woody, ſometimes ſingle, otherwhiles diuided into two branches. ‡

¶ *The Place.*

It groweth vpon old wals and rough places by high waies ſides, and ſuch like: I haue found it in corne fields about Southfleet neare to Grauesend in Kent.

Iberis Cardamantica.
Sciatica Creſſes.



¶ *The Time.*

It floureth according vnto the late or early ſowing of it in the fields, in Iune and Iuly.

¶ *The Names.*

Sciatica Creſſes is called in Greeke ἰβηρὶς, and καρδαμαντικὴ: in Latine *Iberis*: of *Pliny*, *Heberis*, and *Naſturtium ſylueſtre*, and in like manner alſo *Lepidium*: There is another *Lepidium* of *Pliny*: in Engliſh, Sciatica Creſſe. ‡ The firſt deſcribed may bee called *Iberis Cardimantica tenuifolia*, Small leaued Sciatica Creſſes. The ſecond, *Iberis latiore folio*, broad leaued Sciatica Creſſes. ‡

¶ *The Nature.*

Sciatica Creſſe is hot in the fourth degree, and like to Garden Creſſes both in ſmell and in taſte.

¶ *The Vertues.*

A The roots gathered in Autumne, ſaith *Dioſcorides*, doe heat and burne, and are with good ſucceſſe with ſwines greaſe made vp in manner of a plaiſter, and put vpon ſuch as are tormented with the Sciatica: it is to lie on the grieued place but foure houres at the moſt, and then taken away, and the patient bathed with warme water, and the place afterwards annointed with oile and wooll laied on it; which things *Galen* in his ninth booke of medicines, according to the place grieued, citeth out of *Democrates*, in certaine verſes tending to that effect.

Chap. 15. *Of Banke Creſſes.*

¶ *The Deſcription.*

1 Banke Creſſes hath long leaues, deeply cut or jagged vpon both ſides, not vnlike to thoſe of Rocket, or wilde muſtard. The ſtalkes be ſmall, limber, or pliant, yet very tough, and will twiſt and writhe as doth the Ozier or water Willow, whereupon do grow ſmall yellow floures, which being paſt there do ſucceed little ſlender cods, full of ſmall ſeeds, in taſte ſharpe biting the tongue as thoſe of Creſſes.

2 The ſecond kinde of banke Creſſes hath leaues like vnto thoſe of Dandelion, ſomewhat reſembling Spinach. The branches be long, tough, and pliant like to the other. The floures be yellowiſh, which are ſucceeded by ſmall long cods, hauing leaues growing amongſt them: in theſe cods is contained ſmall biting ſeed like the other of this kinde. The ſmell of this plant is very vngratefull.

¶ *The Place.*

Banke Creſſes is found in ſtonie places among rubbiſh, by path waies, vpon earth or mud walls, and in other vntoiled places.

The ſecond kinde of banke Creſſes groweth in ſuch places as the former doth: I found it growing at a place by Chelmes ford in Eſſex called little Baddowe, and in ſundry other places.

‡ If our Author meant this which I haue deſcribed and giuen you the figure of, (as it is probable he did) I doubt he ſcarce found it wilde: I haue ſeen it in the Garden of Maſter *Parkinſon*, and it groweth wilde in many places of Italy. ‡

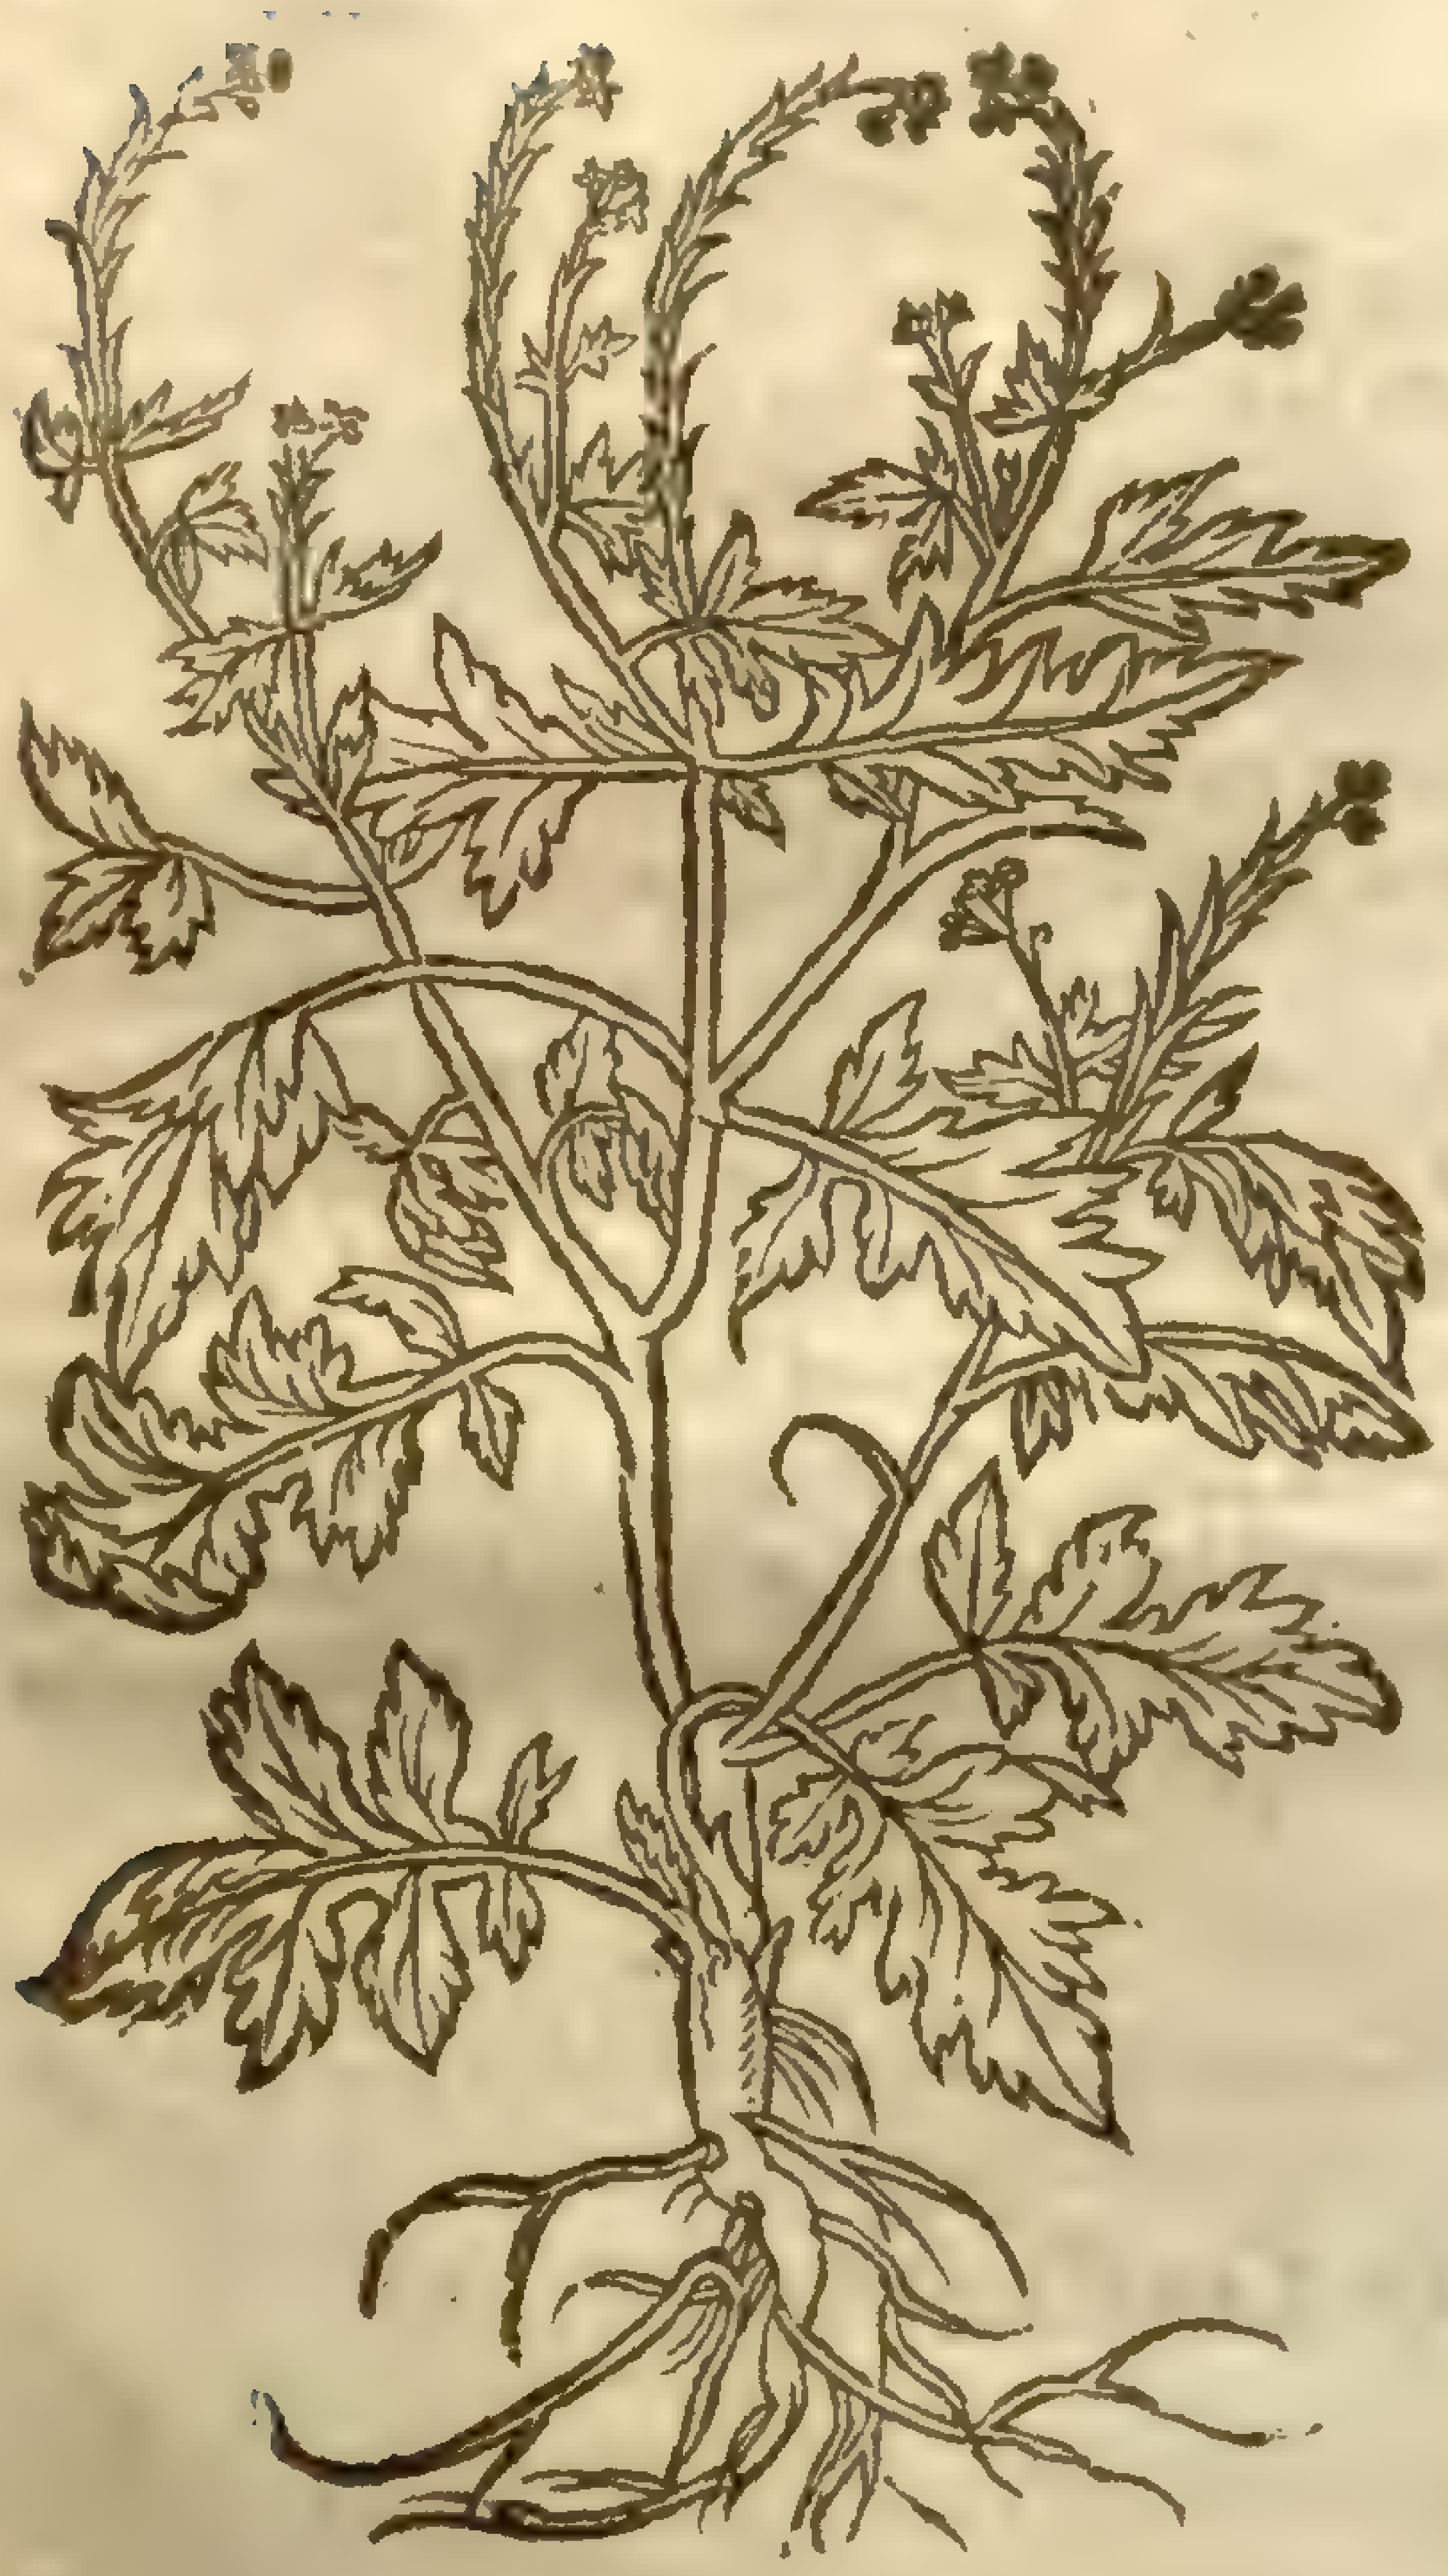
¶ *The Time.*

They floure in Iune and Iuly, and the ſeed is ripe in Auguſt and September.

¶ *The Names.*

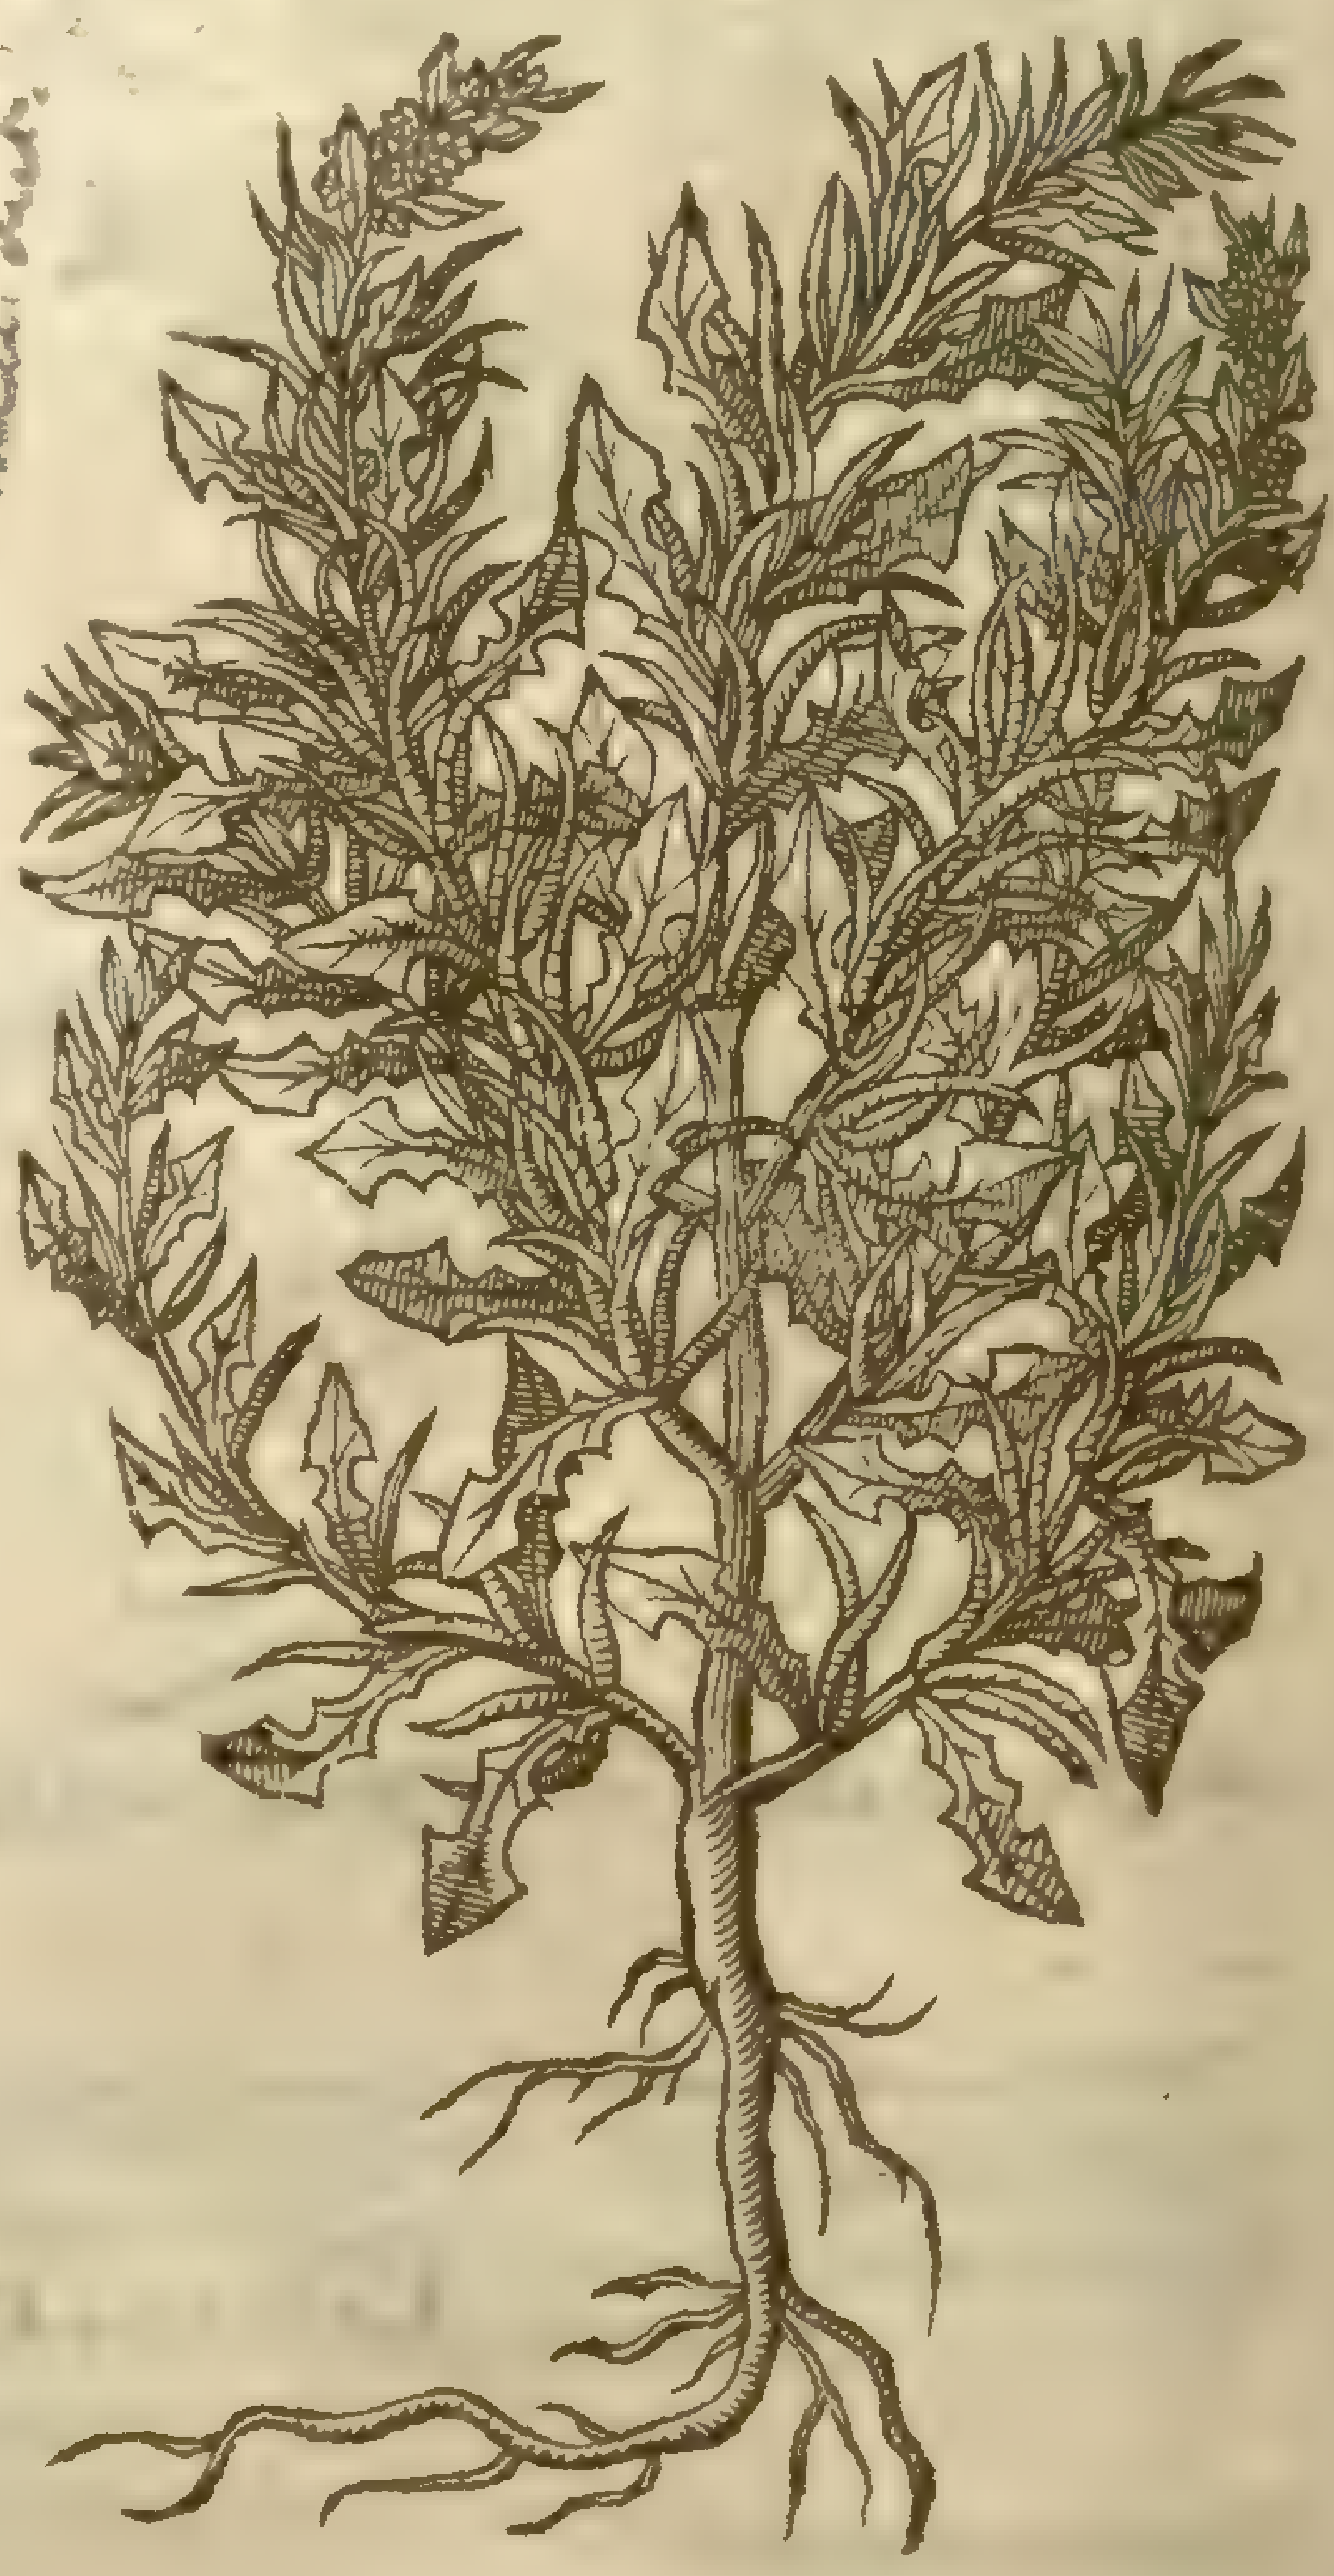
Banke Creſſes is called in Latine *Irio* and *Eryſimum*: in Greeke ἐρύσιμον, and of ſome, χαμαίπλιον, according to *Dioſcorides*: *Theophraſtus* hath another *Eryſimum*. ‡ The firſt is called *Irio*, or *Eryſimum* by *Matthiolus Dodonæus*, and others. *Turner, Fuchſius* and *Tragus* call it *Verbena fœmina* or *recta*. The ſecond is *Irio alter* of *Matthiolus*, and *Saxifraga Romanorum, Lugd.* It may bee called Italian Banke Creſſes: or Romane Saxifrage. ‡

1 *Eryſimum Dioſcoridis, Lobelij.*
Bancke Creſſes.



E. officinale, L.
[illegible]

† 2 *Eryſimum alterum Italicum.*
Italian Bancke Creſſes.



Sisymbrium polyceratium, L.
[illegible]

¶ *The Nature.*

The ſeed of bancke Creſſes is like in taſte to garden Creſſes, and is as *Galen* ſaith of a fierie temperature, and doth extreamly attenuate or make thinne.

¶ *The Vertues.*

A The ſeed of banke Creſſes is good againſt the rheume that falleth into the cheſt, by rotting the ſame.

B It remedieth the cough, the yellow jaundiſe, and the Sciatica or ache of the huckle-bones, if it be taken with hony in manner of a lohoch, and often licked.

C It is alſo drunke againſt deadly poiſons, as *Dioſcorides* addeth: and beeing made vp in a plaſter with water and hony and applied, it is a remedy againſt hidden cankrous apoſtumes behind the ears, hard ſwellings and inflammations of the paps and ſtones.

D ‡ The ſeeds of the Italian Banke Creſſes, or Roman Saxifrage taken in the weight of a dram, in a decoction of graſſe roots, effectually clenſe the reins, and expel the ſtone, as the Author of the *Hiſt. Lugd.* affirmeth. ‡

---

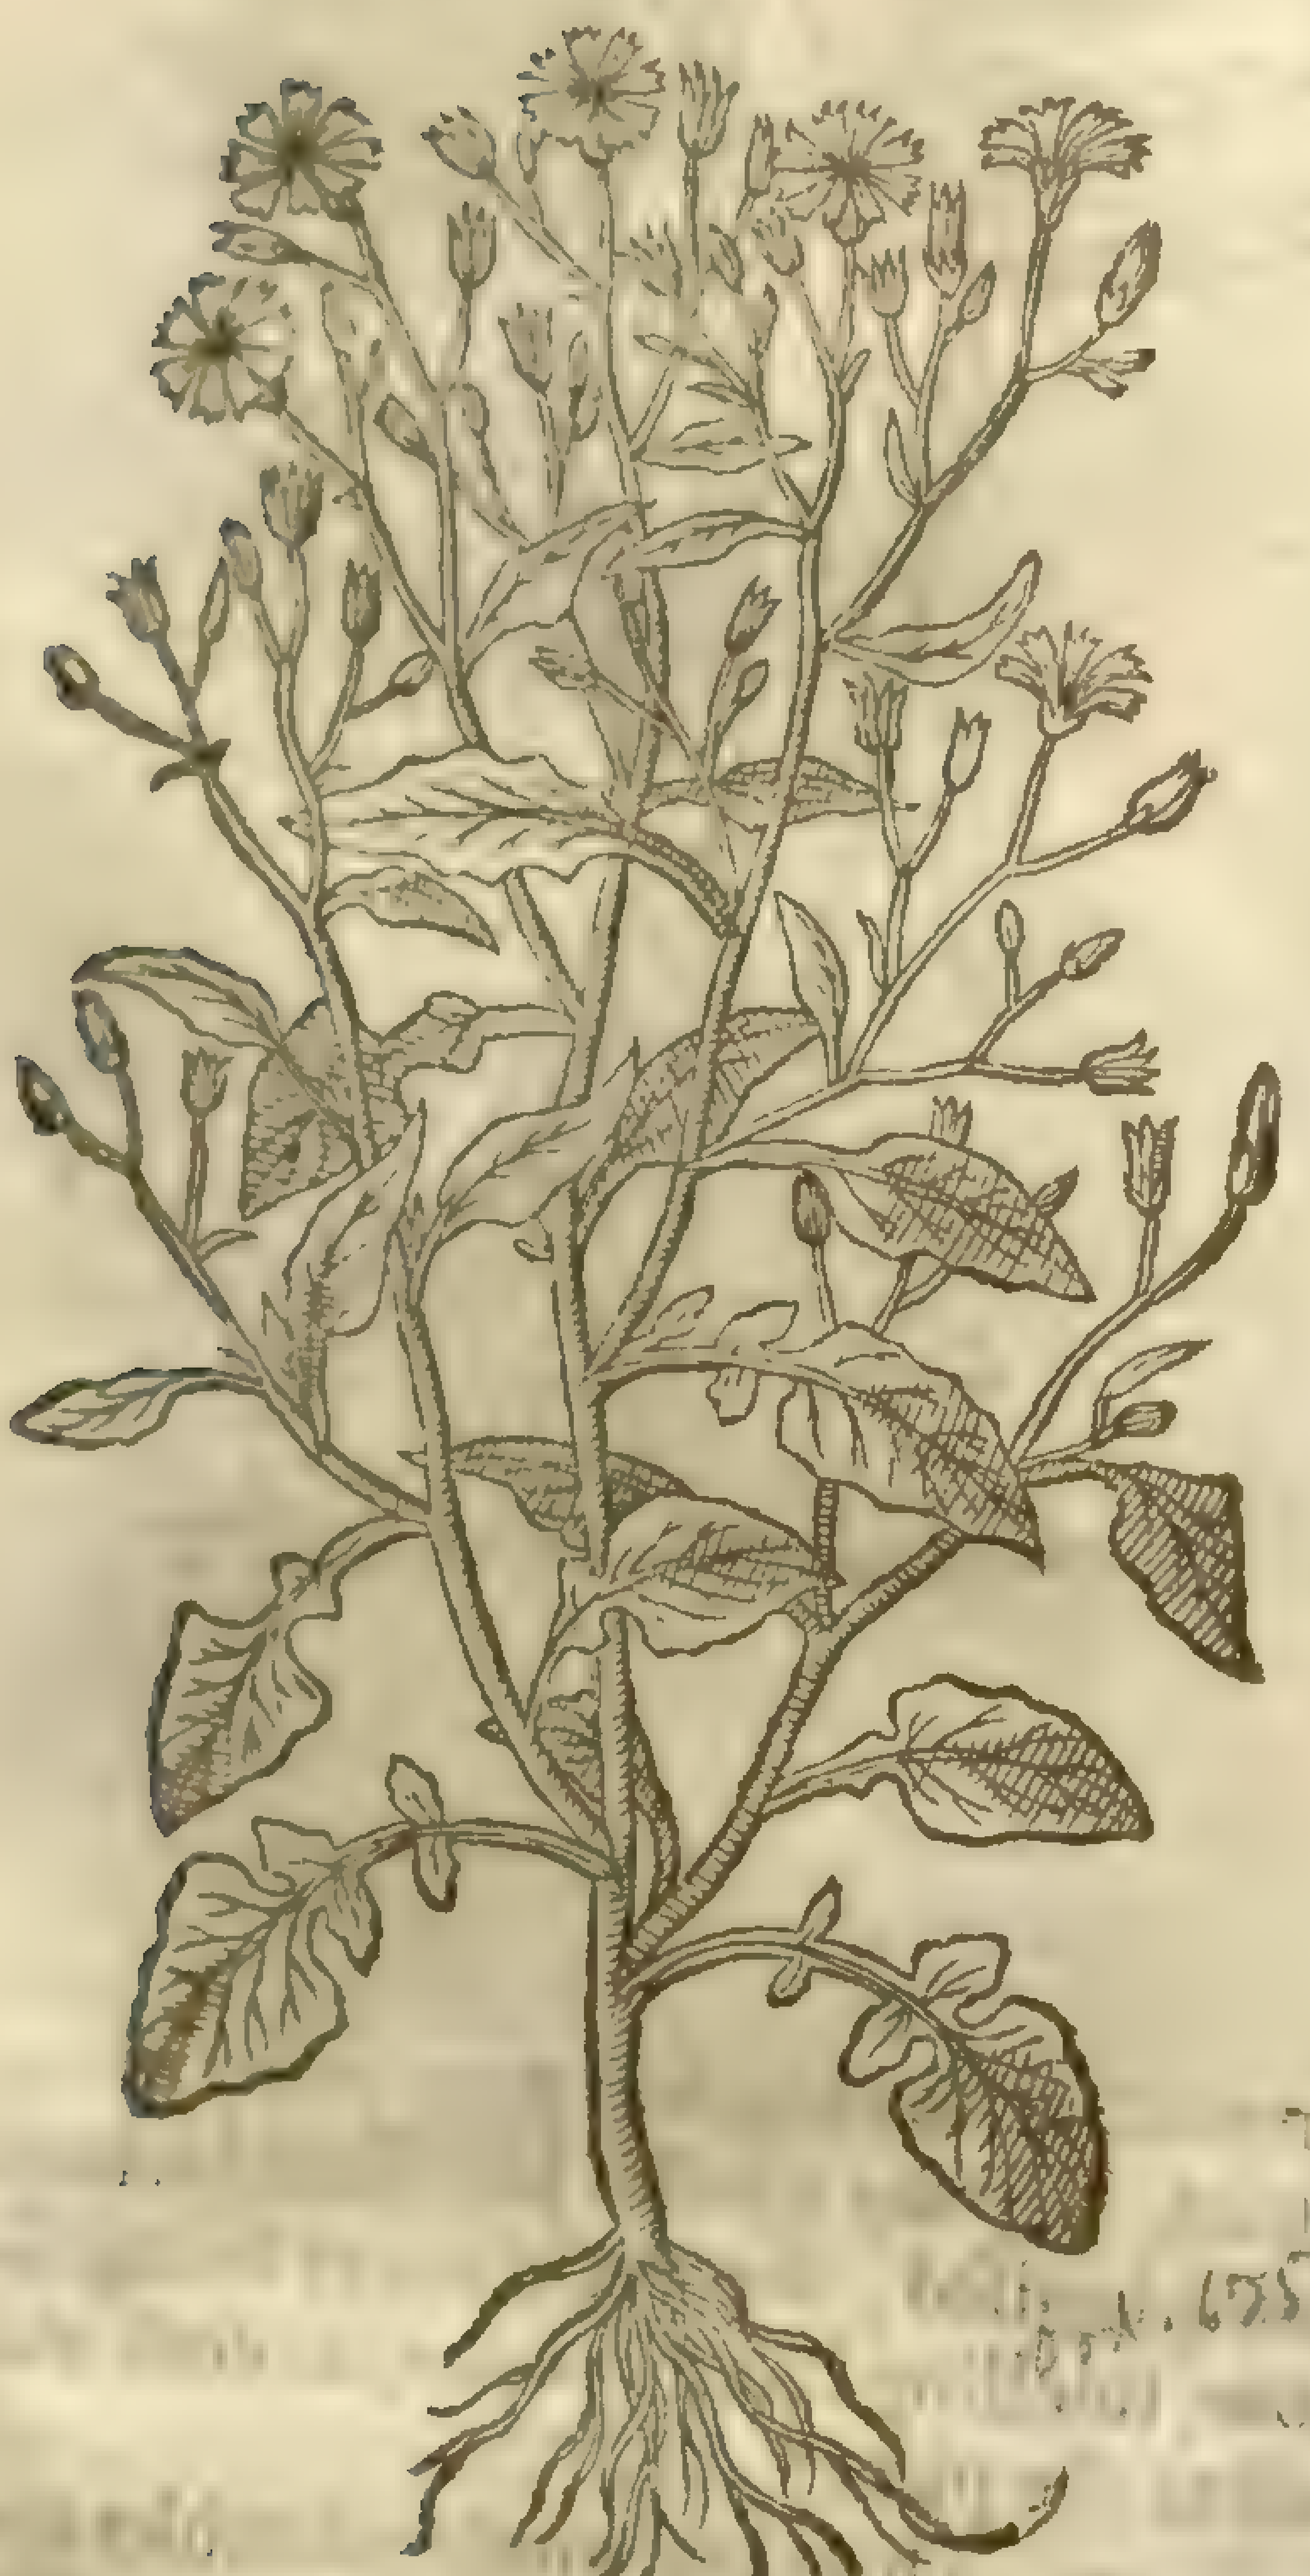
† The figure that was here in the ſecond place was of the *Sonchus ſylvaticus*, or *Libanotis Theophraſti ſterilis* of *Tabern.* You ſhall find mention of it among the *Sonchi* or Sow-Thiſtles.

CHAP. 16. *Of Dock-Creſſes.*

[illegible] communis, [illegible]

Sm. H. 3. 377

† *Lampſana.*
Dock-Creſſes.



¶ *The Deſcription.*

† Dock-Creſſes is a wilde Wort or pot-herbe, hauing roughiſh hairy leaues of an ouerworn green colour, deepely cut or indented vpon both ſides like the leaues of ſmall Turneps. The ſtalkes grow to the height of two or three cubits, and ſomtimes higher, diuiding themſelues toward the top into ſundry little branches, whereon grow many ſmall floures like thoſe of *Hieracium* or Hawk-weed; which decaying, are ſucceeded by little creſted heads containing a longiſh ſmall ſeed ſomewhat like Lettice ſeed, but of a yellowiſh colour: the plant is alſo milky, the ſtalk woody, and the root ſmall, fibrous, and white.

¶ *The Place.*

Dock-Creſſes grow euery where by highwayes, vpon walls made of mud or earth, and in ſtony places.

¶ *The Time.*

It floureth from May to the end of Auguſt: the ſeed is ripe in September.

¶ *The Names.*

Dock-Creſſes are called in Greeke, λαμψάνη: in Latine, *Lampſana*, and *Napium*, by *Dodonæus*: *Tabernamontanus* calls this, *Sonchus ſylvaticus*: *Camerarius* affirmeth, That in Pruſſia they call it *Papillaris.*

¶ *The Temperature.*

Dock-Creſſes are of nature hot, and ſomwhat abſterſiue or clenſing.

¶ *The Vertues.*

A Taken in meat, as *Galen* and *Dioſcorides* affirme, it ingendreth euill juice and bad nouriſhment.

B ‡ *Camerarius* affirmeth, That it is vſed with good ſucceſſe in Pruſſia againſt vlcerated or ſore breaſts. ‡

---

‡ The figure that was here, was of the *Rapiſtrum arvorum* deſcribed in the ſecond chapter of this booke; and the true figure of this plant here deſcribed, was 0[illegible] vnder the name of *Sonchus ſylvaticus.*

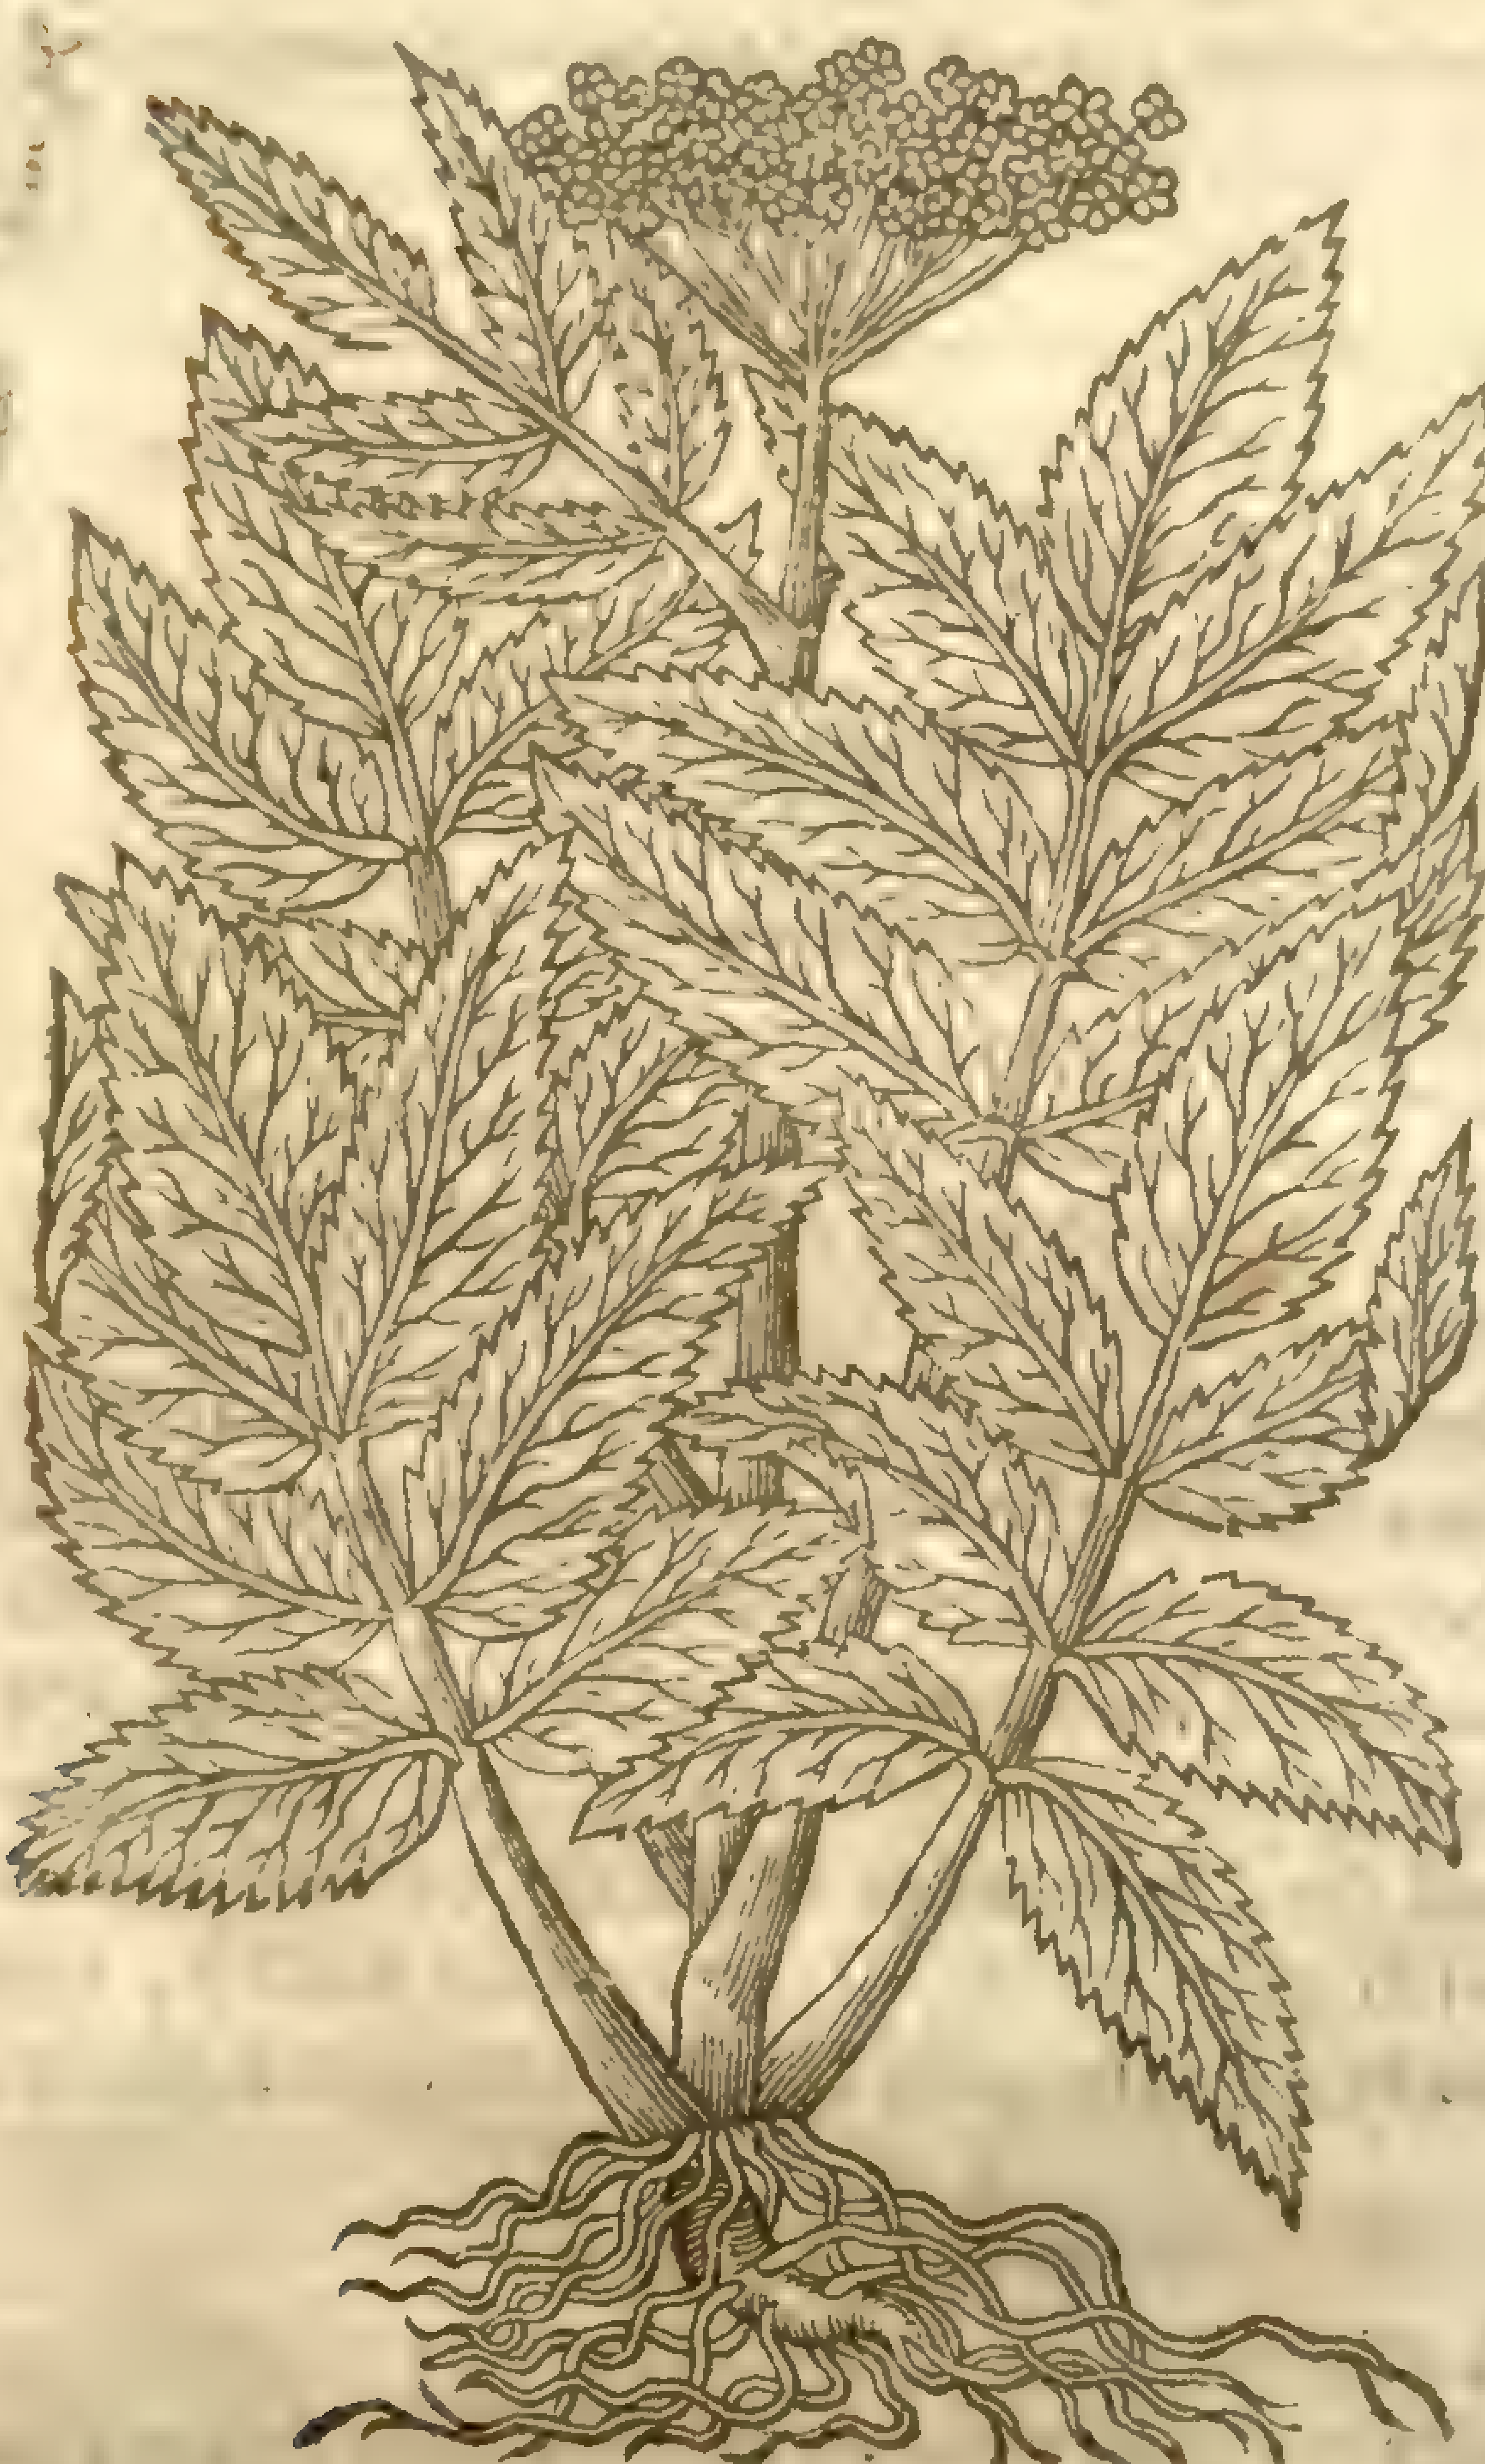
CHAP. 17. *Of water-Parſenep and water-Creſſes.*

1 Great water-Parſenep groweth vpright, and is deſcribed to haue leaues of a pleaſant ſauor, fat and full of juice, as thoſe of Alexanders, but ſomewhat leſſe, reſembling the garden Parſenep: the ſtalke is round, ſmooth, and hollow like to Kex or Caſhes: the root conſiſteth of many ſmall ſtrings or threds faſtened vnto the ſtalke within the water or myrie

ground:

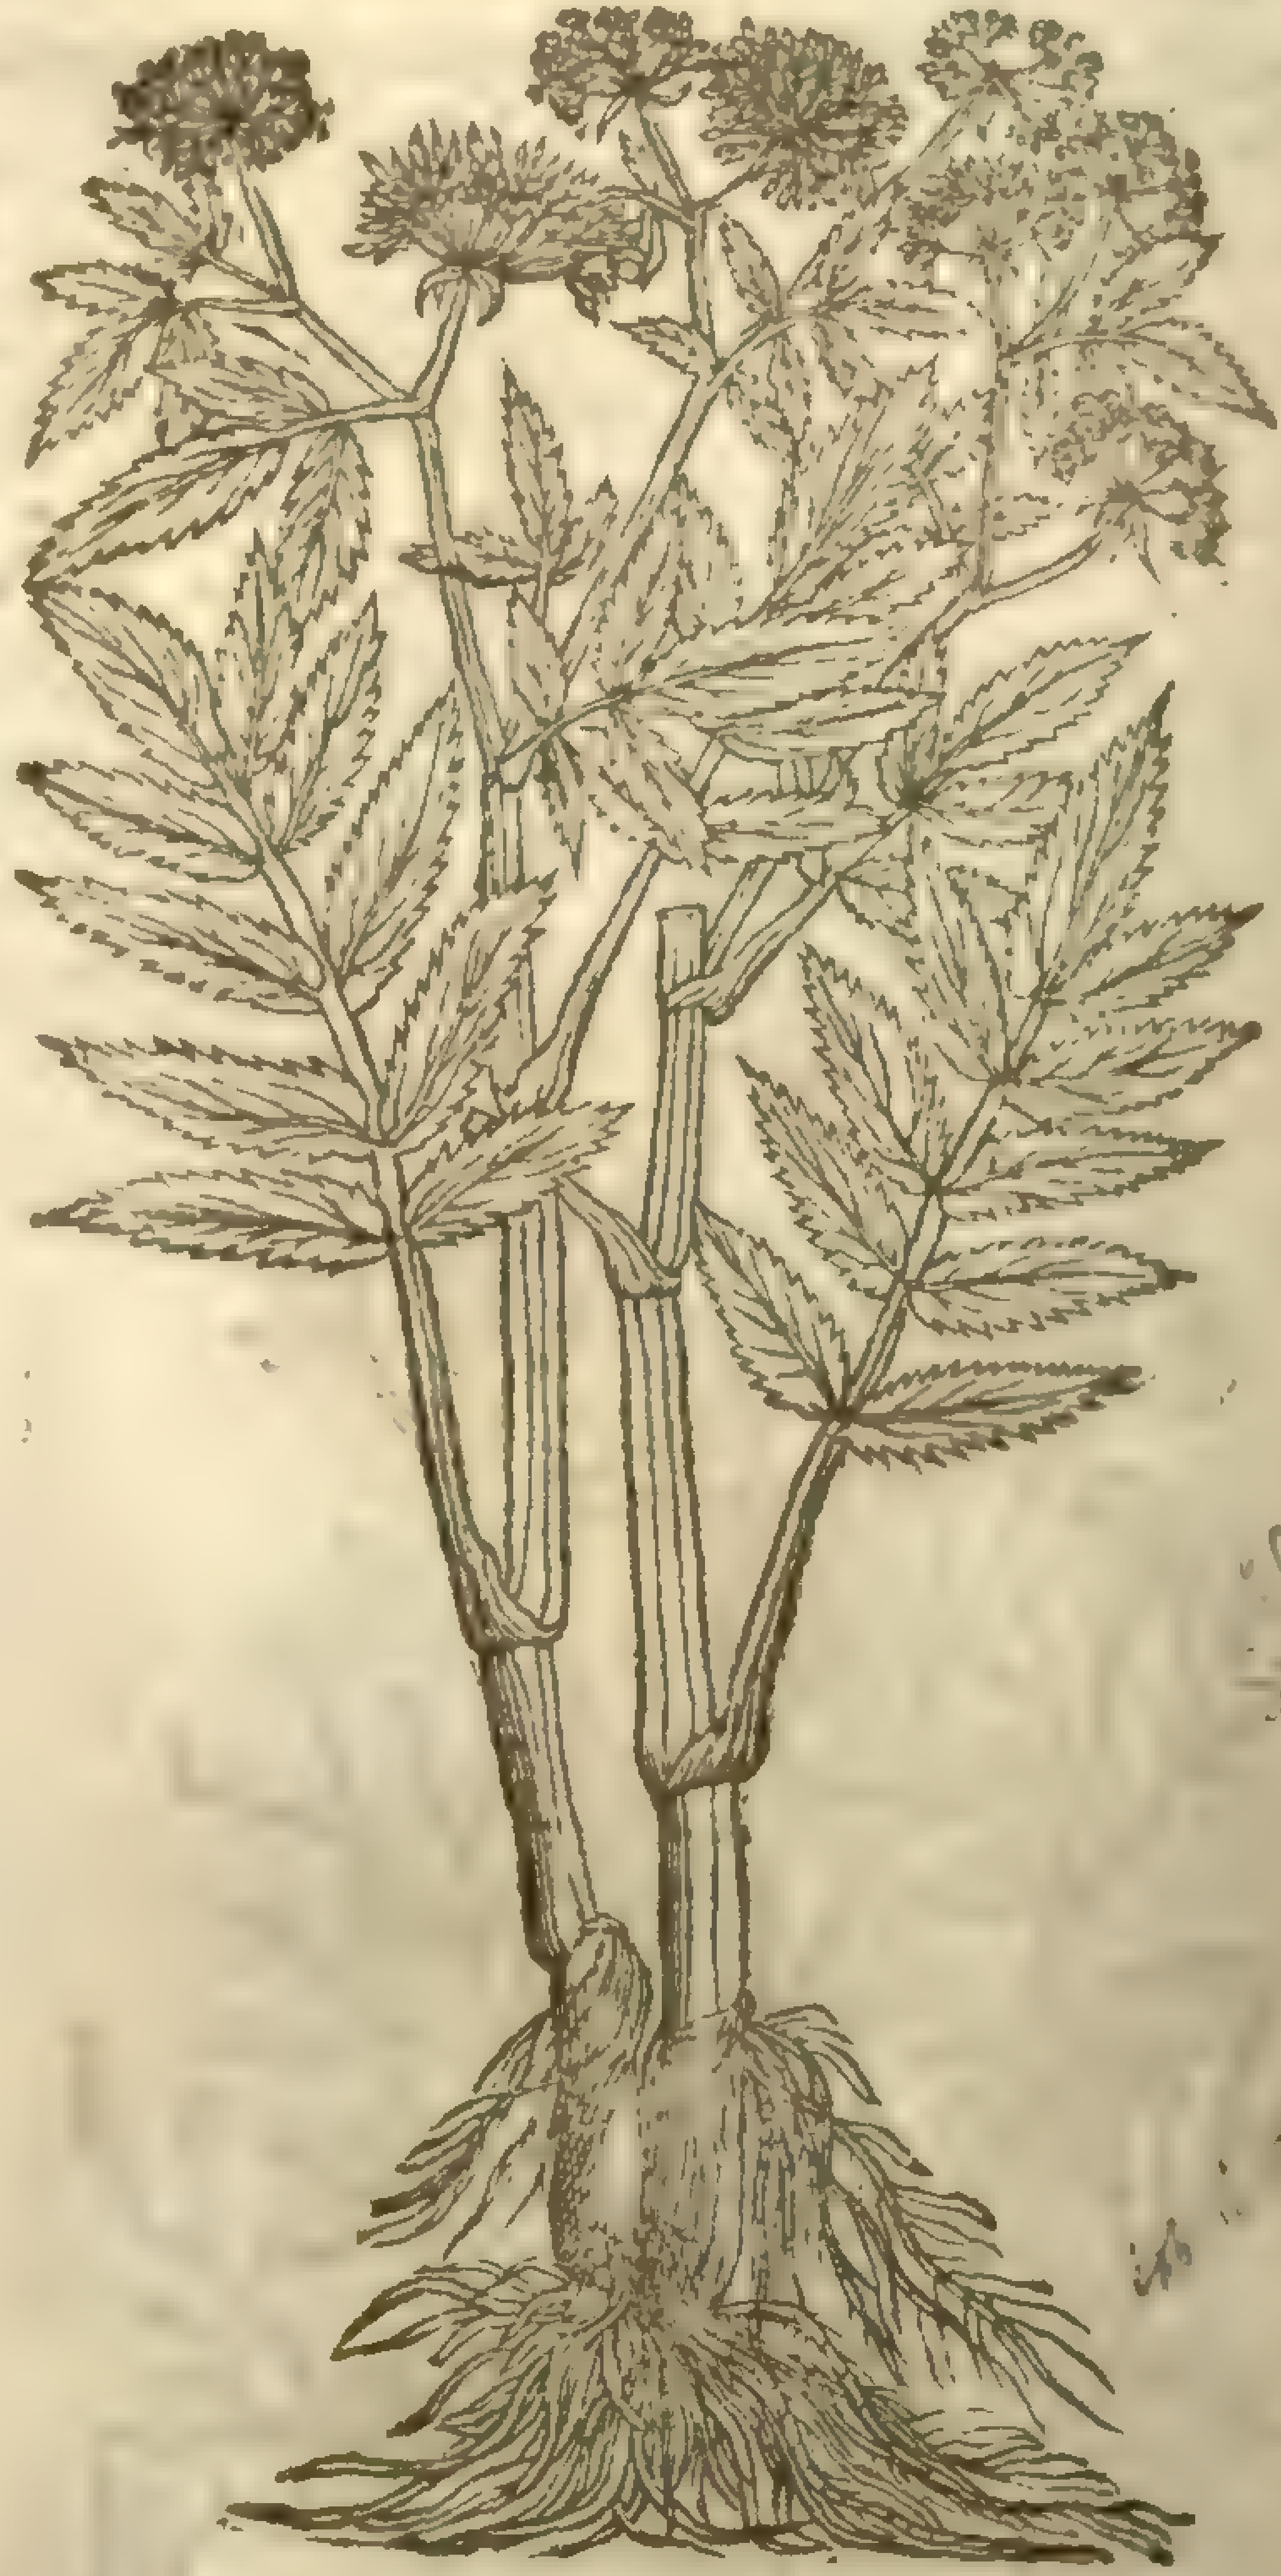
1 *Sium majus latifolium.*
Great water-Parſenep.

Sium latifolium, L [illegible]

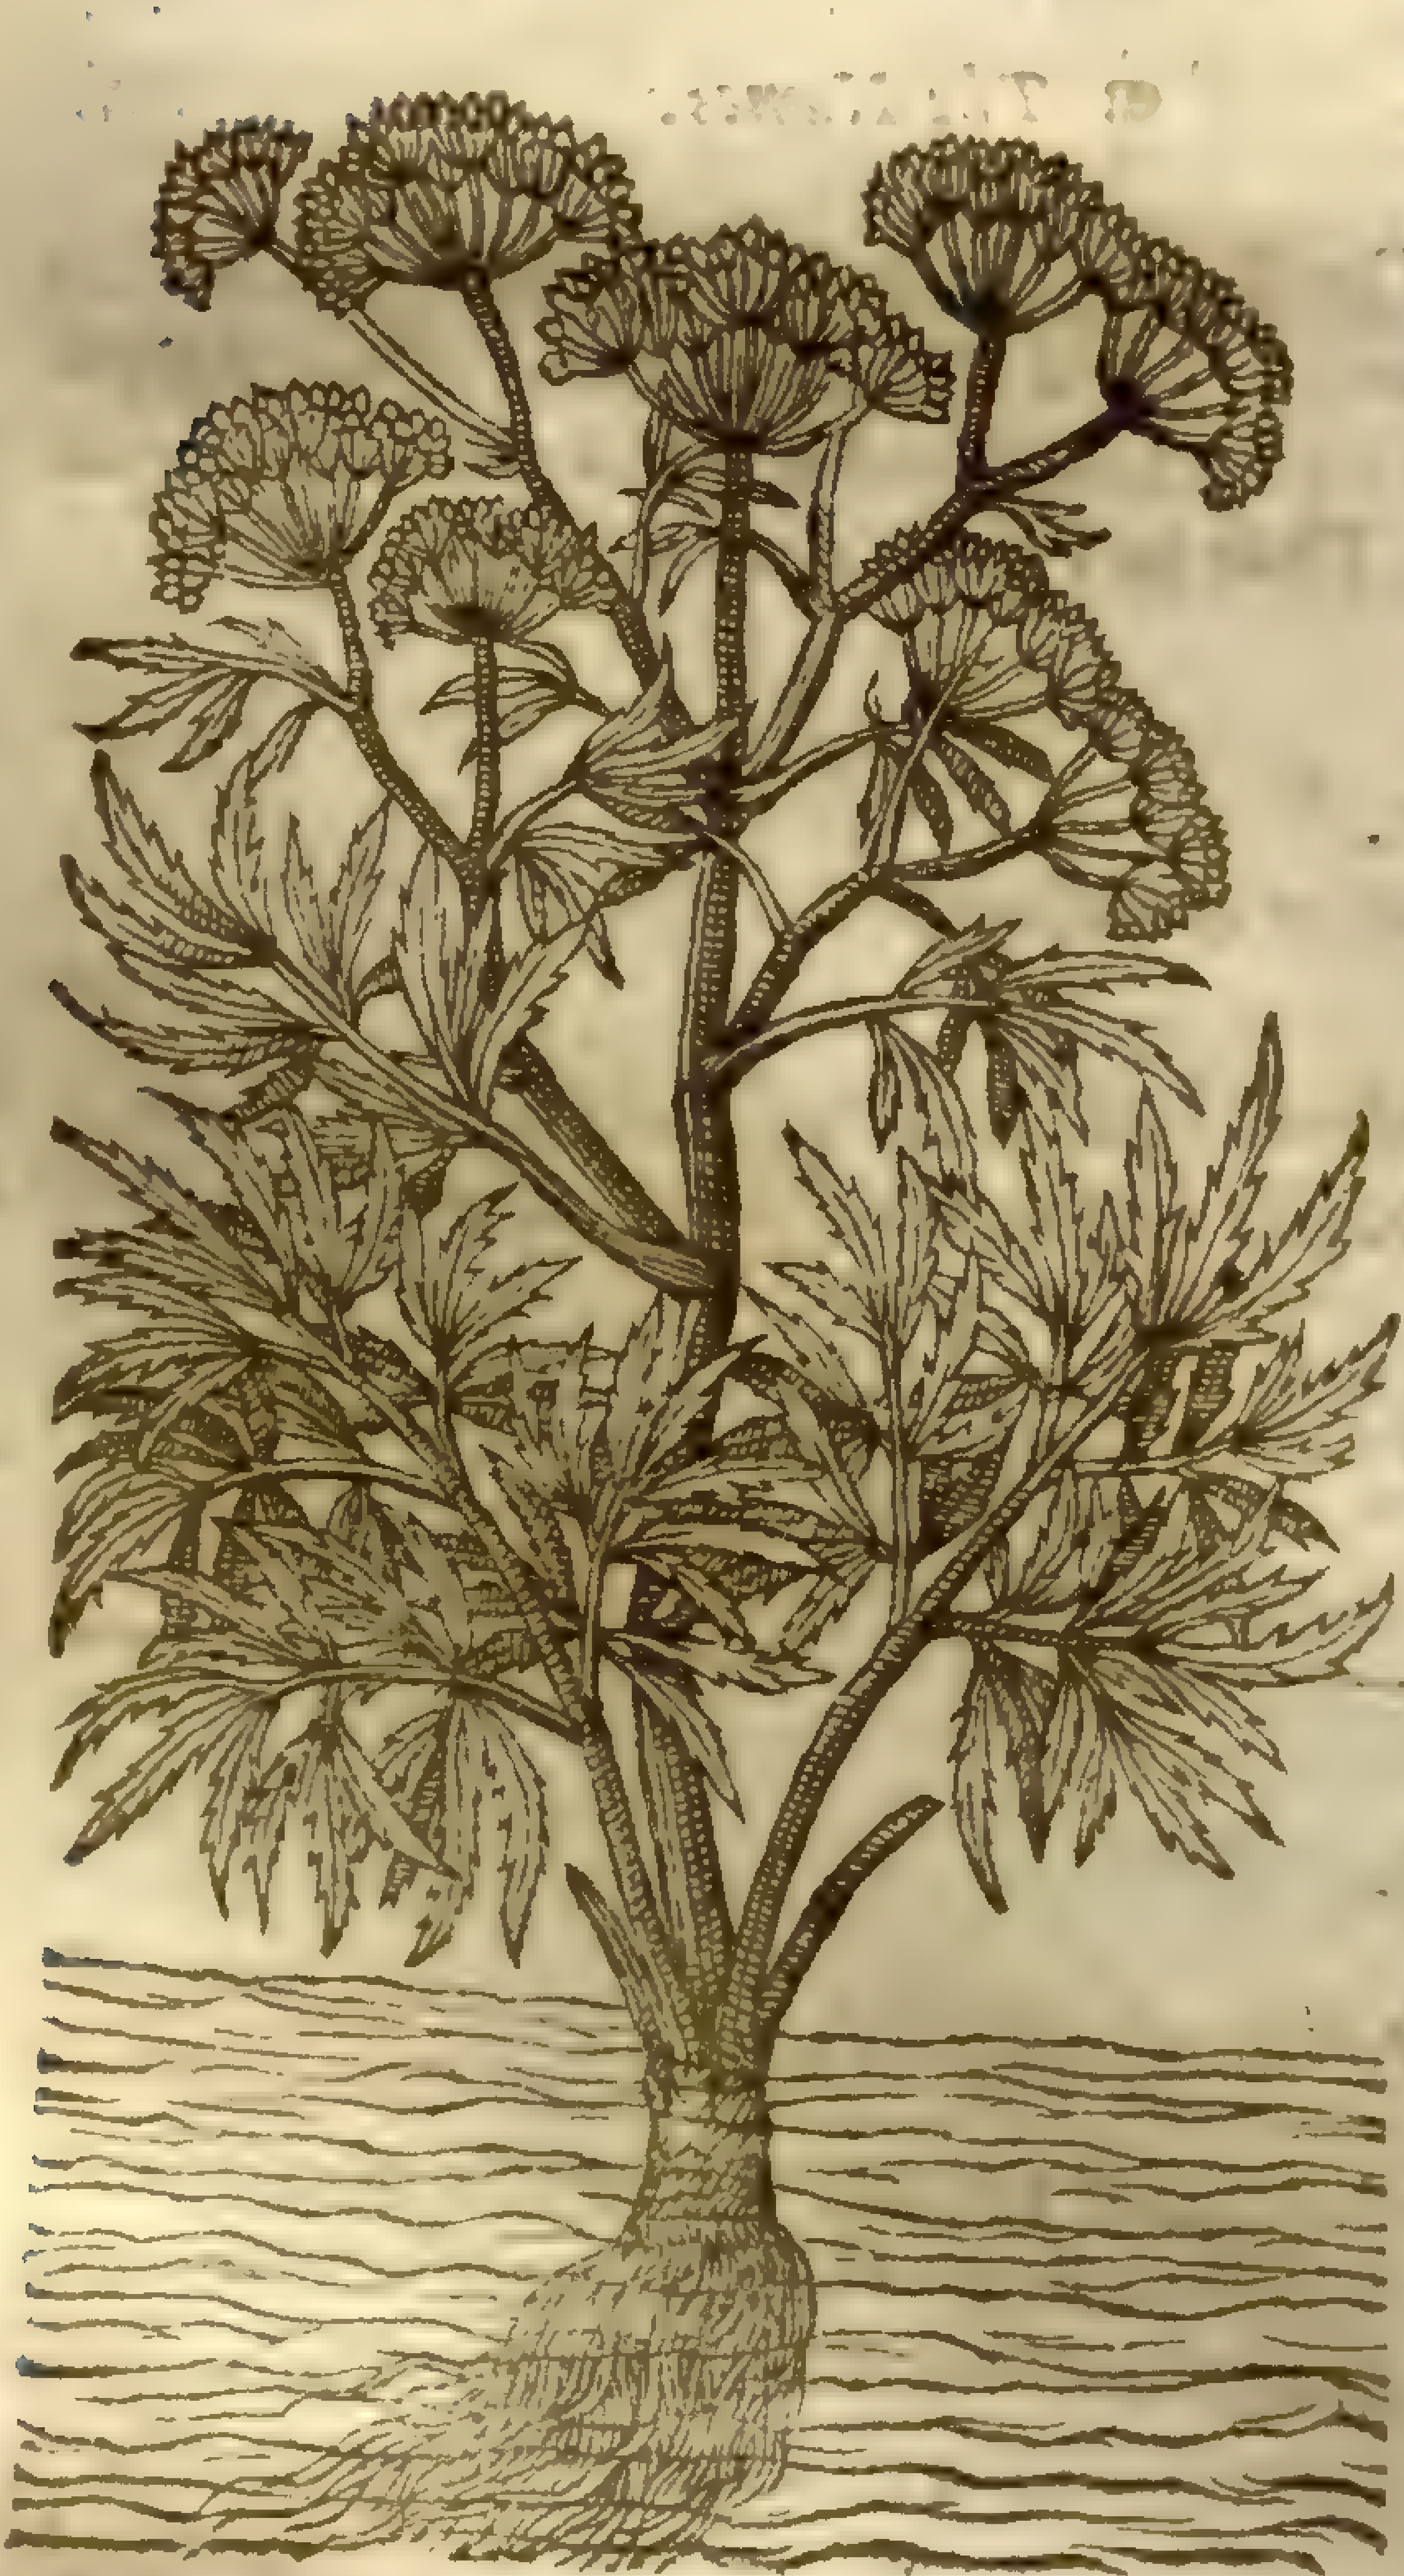


† 2 *Sium majus anguſtifolium.*
The leſſer water Parſnep.

Sium anguſtifolium [illegible]



‡ 4 *Sium alterum Oluſatri facie.*
Long leaued water-Creſſes.



ground: at the top doe grow many white flours, in ſpoky rundles like fennel, which being bruiſed, doe yeeld a very ſtrong ſauour, ſmelling like *Petroleum*, as doth the reſt of the plant.

‡ 2 This plant much reſembles the laſt deſcribed, and groweth vp ſome cubit and a halfe, with many leaues finely ſnipt about the edges, growing vpon one ribbe, and commonly they ſtand bolt vpright. The vmbel conſiſts of little white floures: the root is ſmall, and conſiſteth of many ſtrings.

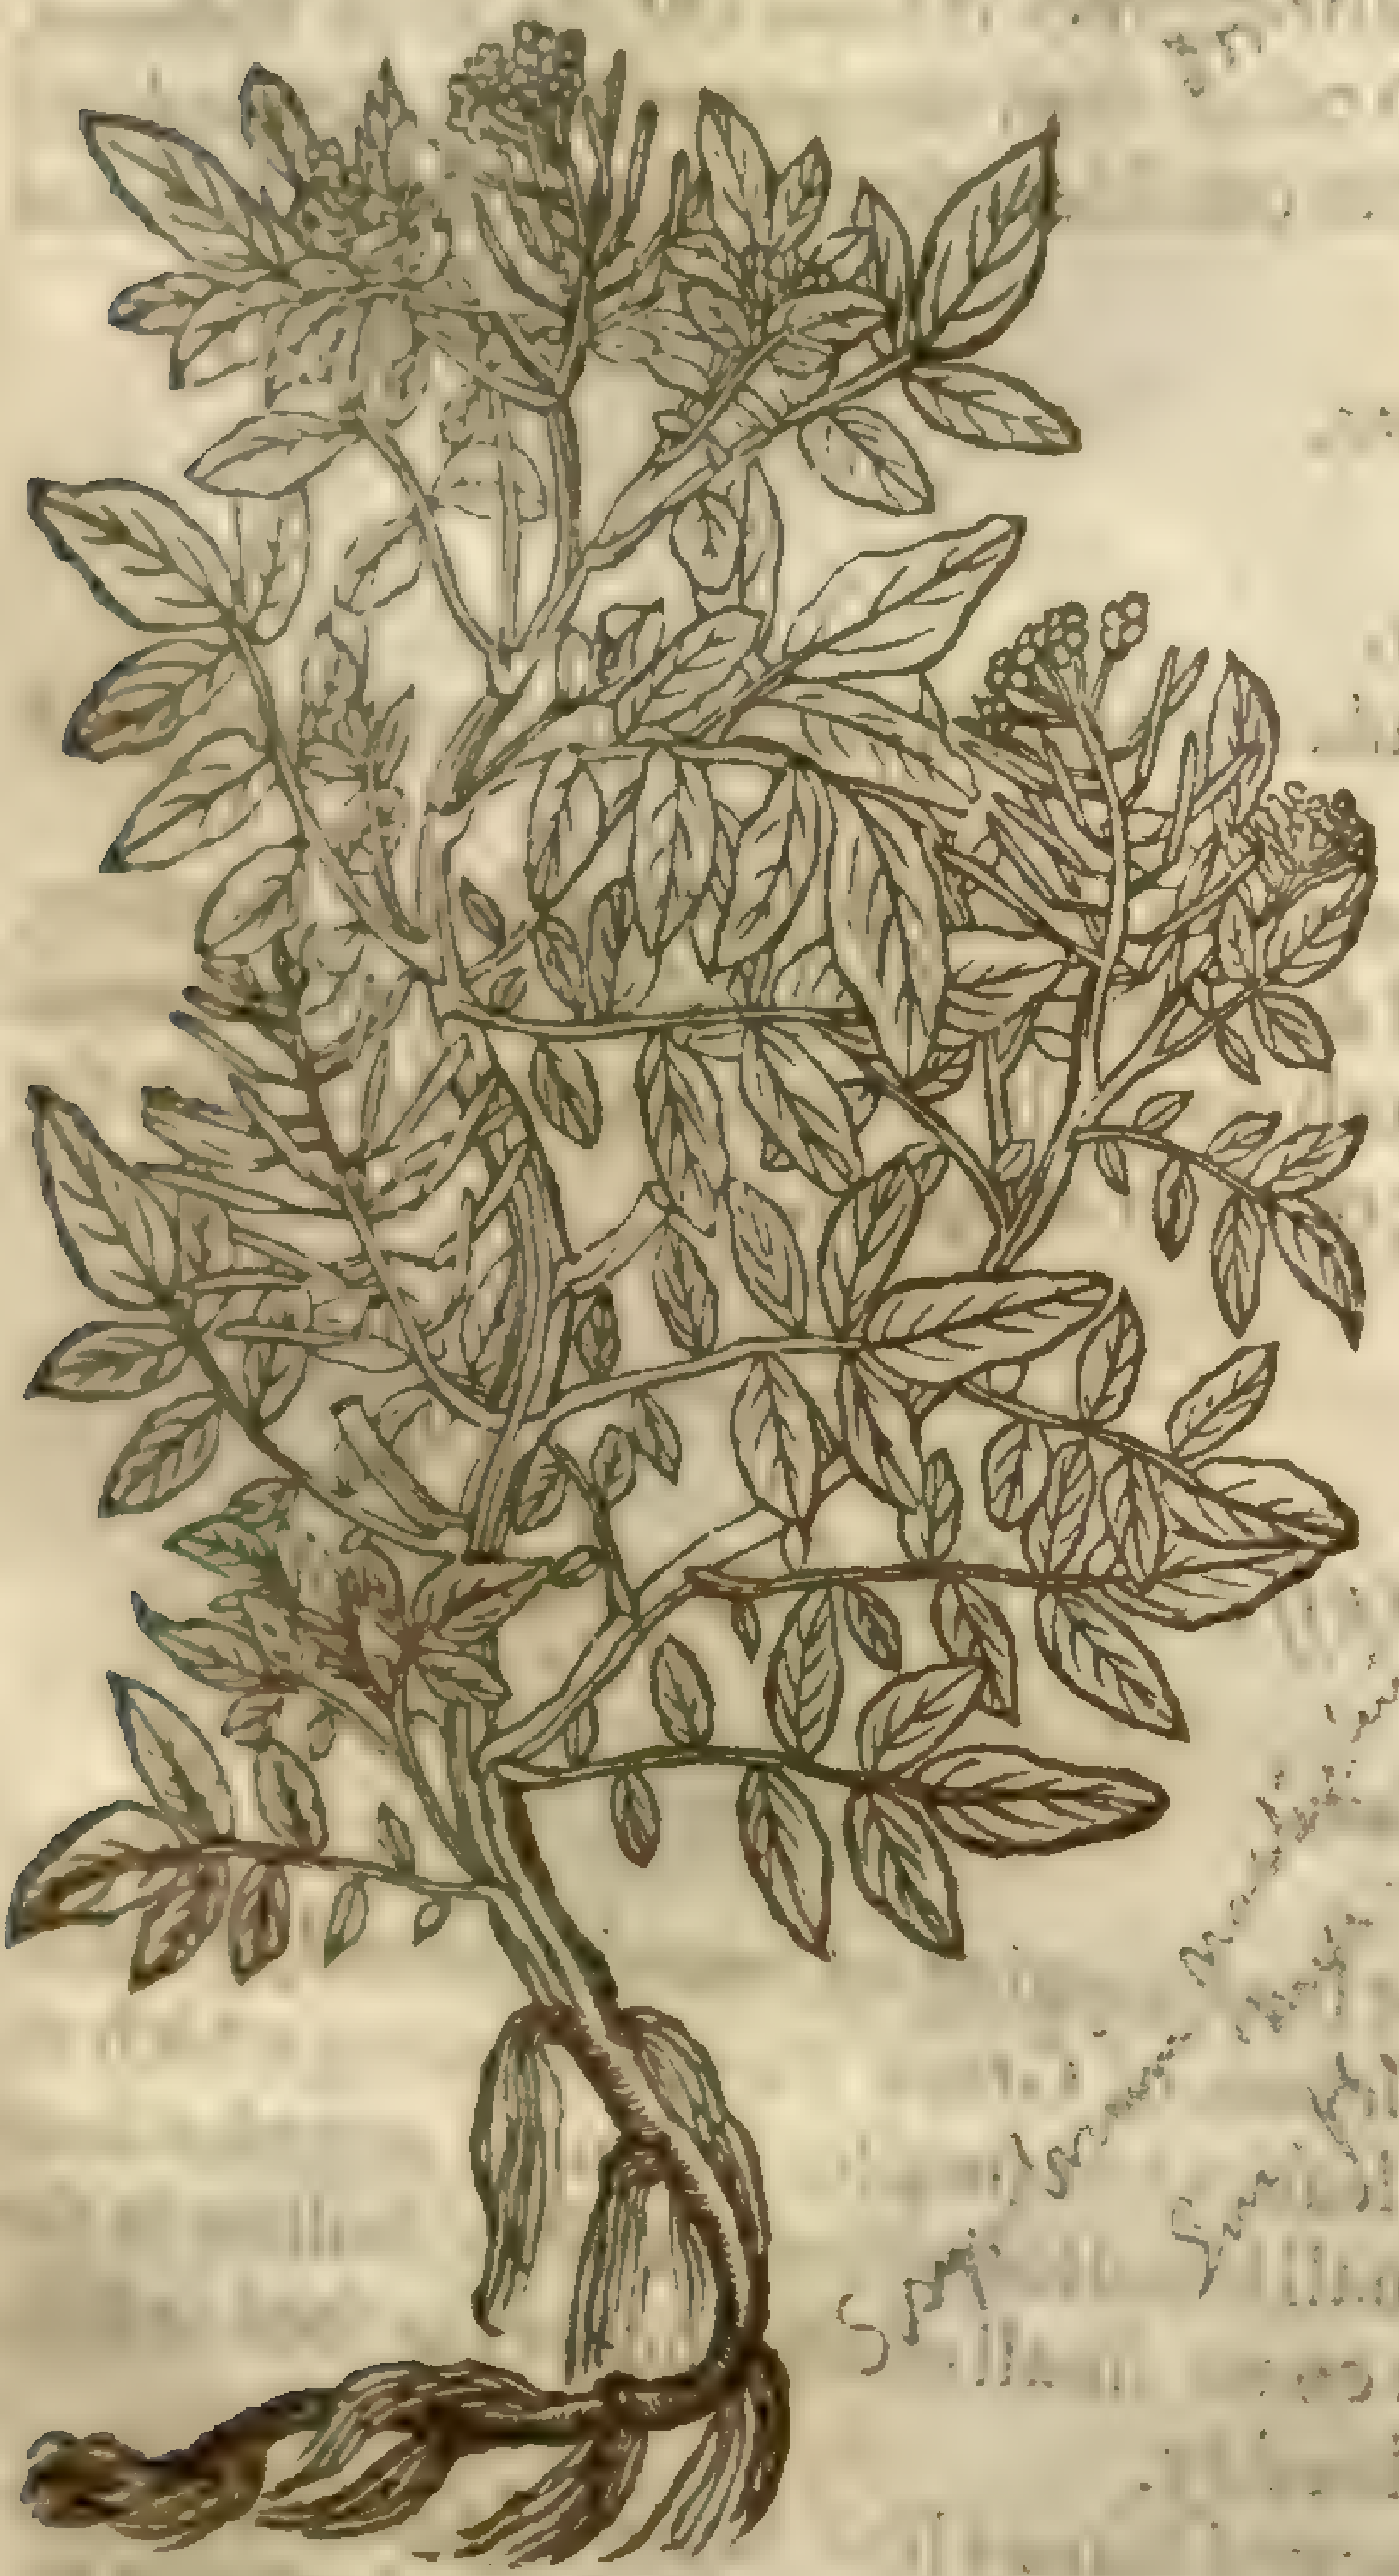
‡ 3 There is another very like this, but they thus differ; the ſtalks and leaues of this later are leſſe than thoſe of the precedent, and not ſo many vpon one rib: the other grows vpright, to ſome yard or more high: this neuer growes vp, but alwayes creepes, & almoſt at euery joint puts forth an vmbel of floures.

4 To theſe may bee added another, whoſe root conſiſts of aboundance of writhen and ſmall blacke fibres. The ſtalkes are like Hemlock, ſome three cubits high; the leaues are long, narrow, and ſnipped

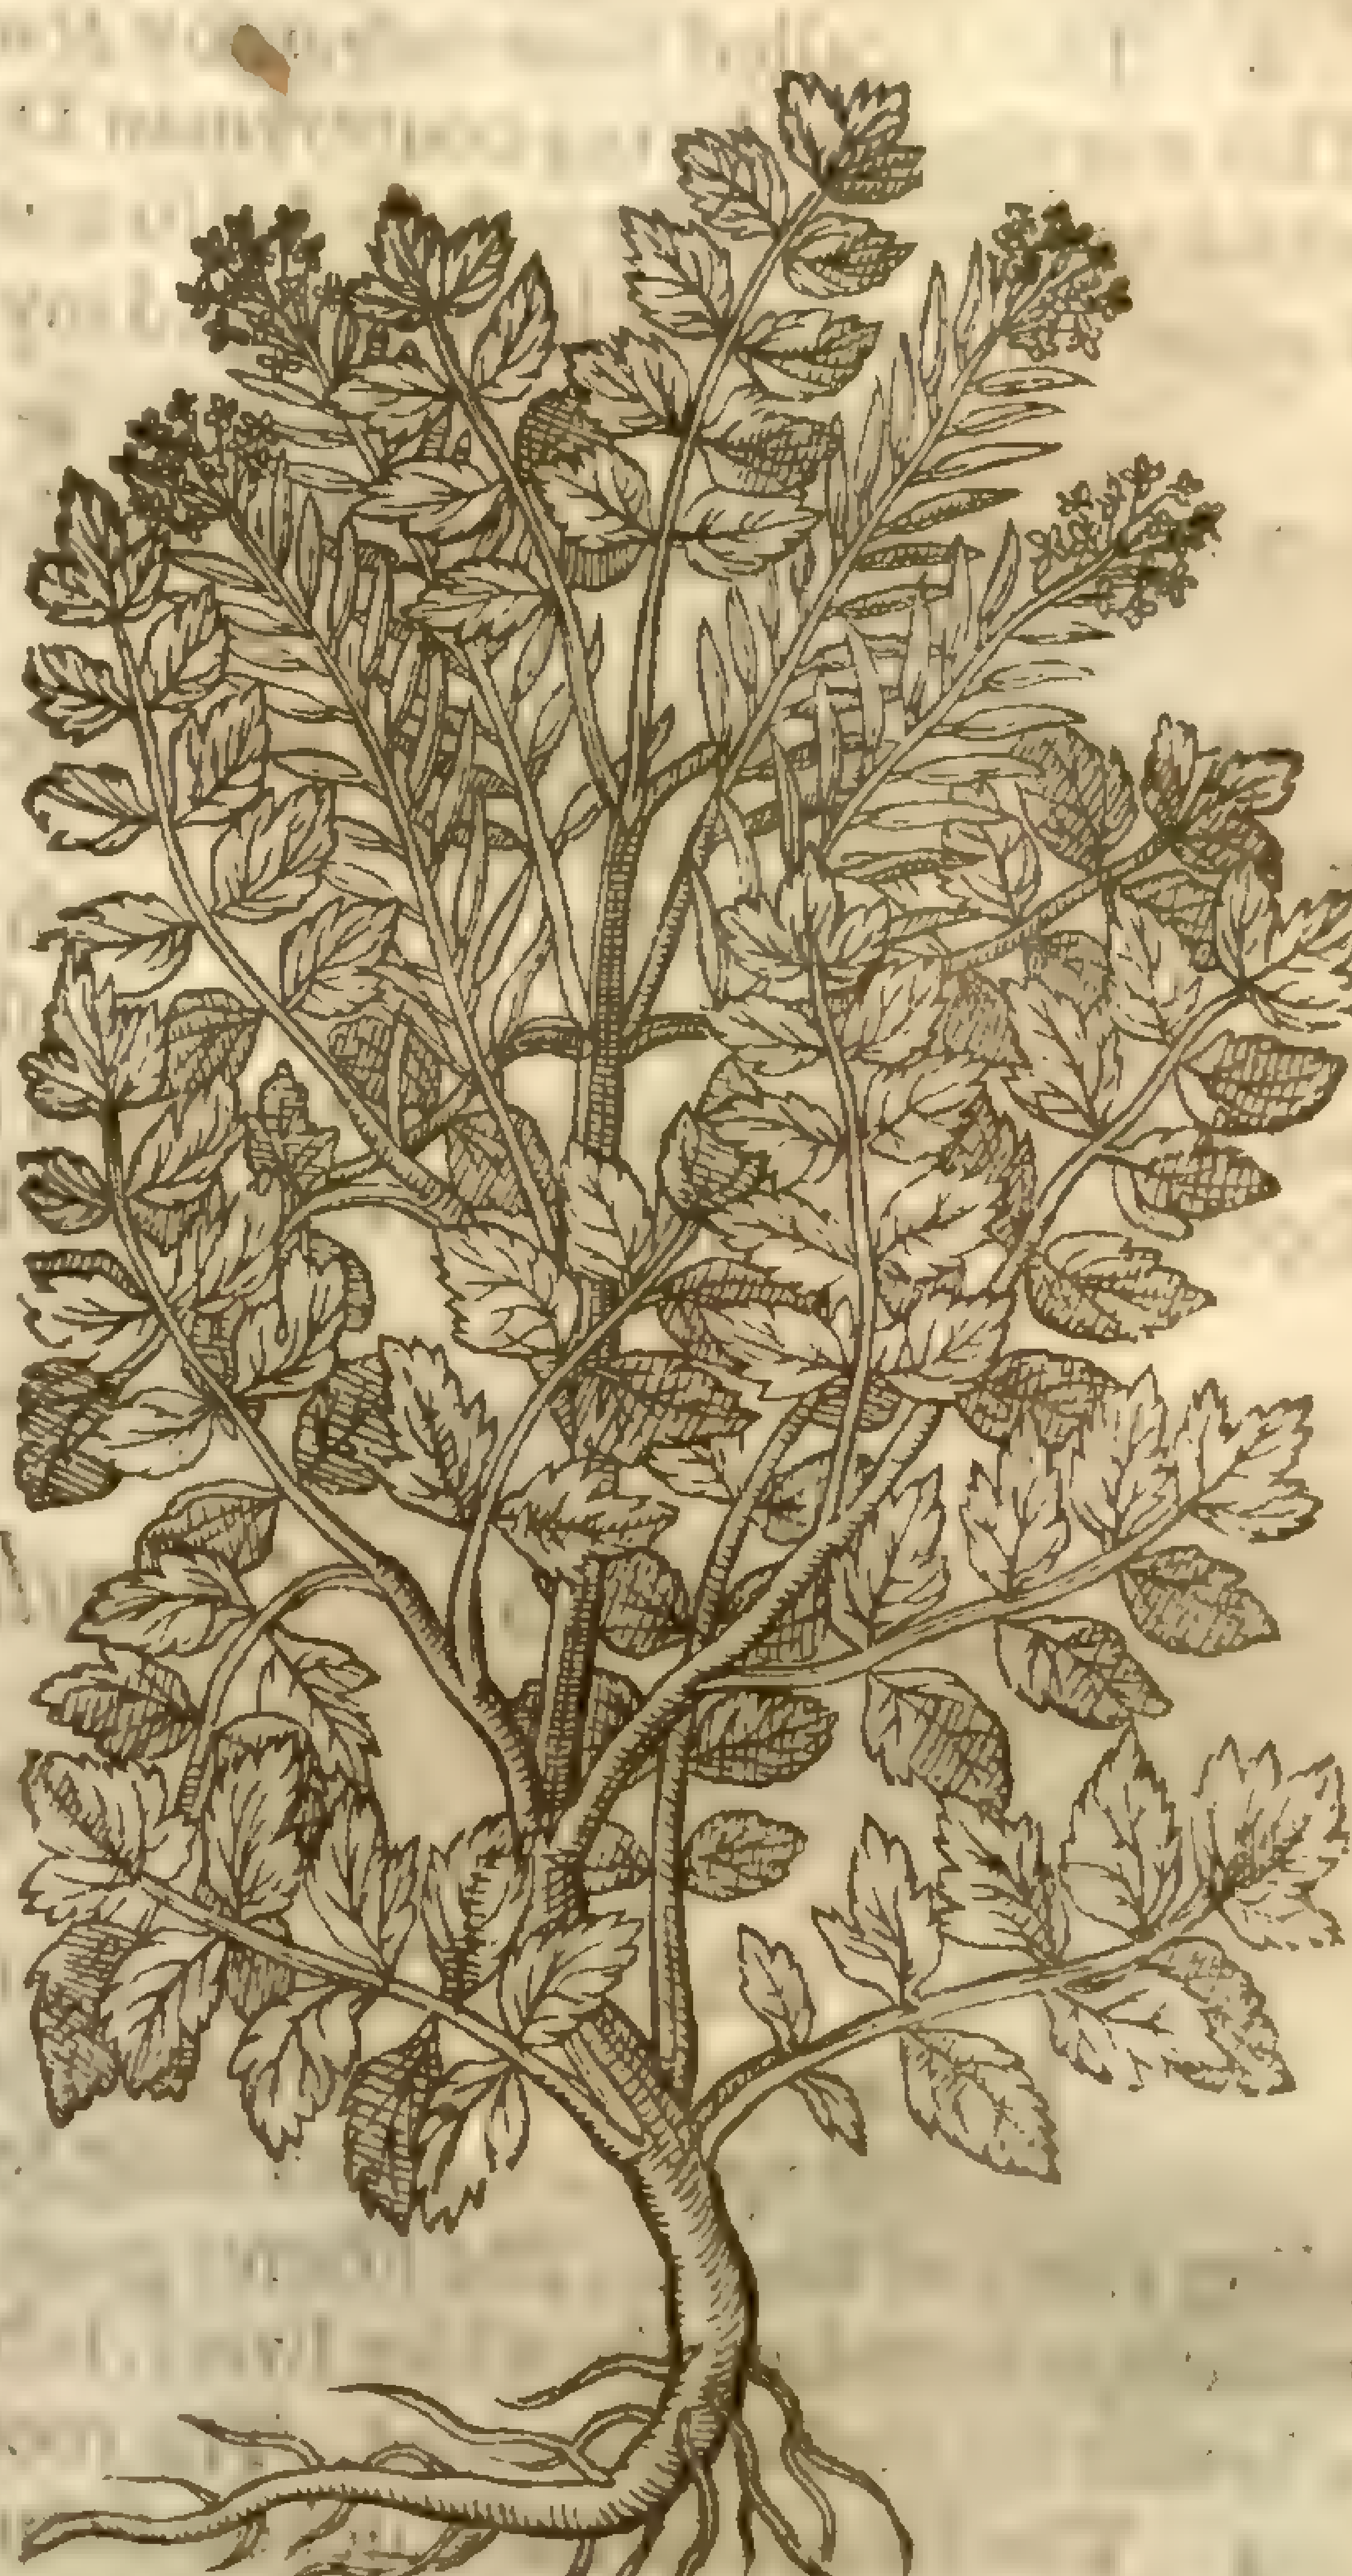
about the edges, growing commonly two or three together: the vmbel of floures is commonly of a yellowiſh green: the ſeed is like parſly ſeed, but in taſte ſomwhat reſembles Cumin, *Dautus Creticum*, and the rind of a pomegranat.

5 Water-Creſſe hath many fat and weake hollow branches trailing vpon the grauell & earth where it groweth, taking hold in ſundry places as it creepeth; by means whereof the plant ſpreads ouer a great compaſſe of ground. The leaues are likewiſe compact and winged with many ſmall leaues ſet vpon a middle rib one againſt another, except the point leafe, which ſtands by it ſelfe, as doth that of the aſh, if it grow in his naturall place, which is in a grauelly ſpring. The vpper face of the whole plant is of a browne colour, and greene vnder the leaues, which is a perfect marke to know the phyſicall kinde from the others. The white floures grow alongſt the ſtalkes, and are ſucceeded by cods wherein the ſeed is contained. The root is nothing elſe but as it were a thrum or bundle of threds.

† 5 *Naſturtium aquaticum, ſiue Crateuæ Sium.*
Common water-Creſſes.



‡ 6 *Sium Matthioli & Italorum.*
Italian Water-Creſſe.



6 There is alſo another kinde hereof hauing leaues growing many on one ſtalke, ſnipt about the edges, being in ſhape betwixt the garden Creſſes and Cuckow floures: the ſtalk is creſted and diuided into many branches; the floures white, and are ſucceeded by cods like thoſe of our ordinarie water-Creſſe laſt deſcribed.

¶ *The Place.*

‡ 1 The firſt of theſe I haue not found growing, nor as yet heard of within this kingdome.

2 The ſecond I firſt found in the company of M. *Robert Lorkin*, going betweene Redriffe and Deptford, in a rotten boggy place on the right hand of the way.

3 The third growes almoſt in euery watery place about London.

4 This is more rare, and was found by M. *Goodyer* in the ponds about Moore Parke; and by M. *George Bowles* in the ditches about Elleſmere, and in diuers ponds in Flint-ſhire.

5 The fifth is as frequent as the third, and commonly they grow neere together.

6 This *Lobel* ſaith he found in Piemont in riuelets amongſt the hills: I haue not yet heard that it growes with vs. ‡

¶ *The Time.*

They ſpring and wax green in Aprill,and floure in Iuly.

The water-Creſſe to be eaten in ſallads ſheweth it ſelf in March when it is beſt, and floureth in Summer with the reſt.

¶ *The Names.*

‡ 1 The firſt of theſe is *Sium majus latifolium* of *Tabernamontanus.*

2 This is *Sion odoratum Tragi*; *Sium* of *Matthiolus*,*Dodonæus*,and others: it is taken to be *Sium* or *Lauer* of *Dioſcorides*. *Lobel* calls it alſo *Paſtinaca aquatica*,or water Parſenep.

Sium [illegible]

3 This may be called *Sium vmbellatum repens*, Creeping water Parſenep. Of this there is a reaſonable good figure in the *Hiſt.Lugdunenſis,pag.1092.* vnder the title of *Sium verum Matthioli*; but the deſcription is of that we here giue you in the ſixt place.

4 This is *Sium alterum* of *Dodonæus*: and *Sium alterum Oluſatri facie* of *Lobel.*

5 Many iudge this to be the *Siſymbrium alterum*,or *Cardamine* of *Dioſcorides*: as alſo the *Sion* of *Crateuas*: and therefore *Lobel* termes it *Sion Cratiuæ erucæfolium.* It is called by *Dodonæus*, and vulgarly in ſhops known by the name of *Naſturtium aquaticum*, or water Creſſes.

6 This is called *Sium vulgare* by *Matthiolus*: *Lobel* alſo termes it *Sium Matthioli & Italorum.* This was thought by our countryman D^r *Turner* to be no other than the ſecond here deſcribed: of which opinion I muſt confeſſe I alſo was; but vpon better conſideration of that which *Lobel* and *Bauhine* haue written,I haue changed my mind.

¶ *The Temperature.*

Water-Creſſe is euidently hot and dry.

¶ *The Vertues.*

Water-Creſſe being boiled in wine or milke,and drunke for certain daies together,is very good againſt the Scuruy or Scorbute.

Being chopped or boiled in the broth of fleſh, and eaten for thirty daies together at morning, noone,and night,it prouoketh vrine,waſts the ſtone,and driueth it forth. Taken in the ſame manner it cureth yong maidens of the green ſickneſſe,bringeth down the termes, and ſendeth into the face their accuſtomed liuely colour loſt by the ſtopping of their *Menſtrua.*

Chap. 18. *Of wilde water-Creſſes or Cuckow-floures.*

¶ *The Deſcription.*

1 THe firſt of the Cuckow flours hath leaues at his ſpringing vp ſomwhat round,& thoſe that ſpring afterward grow jagged like the leaues of Greek Valerian;among which riſeth vp a ſtalk a foot long,ſet with the like leaues,but ſmaller and more jagged,reſembling thoſe of Rocket. The floures grow at the top in ſmall bundles,white of colour, hollow in the middle,reſembling the white ſweet-Iohn: after which come ſmall chaffie huskes or ſeed-veſſels, wherein the ſeed is contained. The root is ſmall and threddy.

2 The ſecond ſort of Cuckow floures hath ſmall jagged leaues like thoſe of the ſmall Valerian,agreeing with the former in ſtalks and roots: the floures be white, ouerdaſht or declining toward a light carnation.

‡ 3 The leaues and ſtalks of this are like thoſe of the laſt deſcribed, nor are the floures which firſt ſhew themſelues much vnlike them; but when as they begin to faile, in their middle riſe vp heads of pretty double floures made of many leaues,like in colour to theſe of the ſingle. ‡

4 The fourth ſort of Cuckow floures groweth creeping vpon the ground,with ſmall threddy ſtalks,whereupon grow leaues like thoſe of the field Clauer or three-leaued Graſſe: among which do come vp ſmall and tender ſtalks two handfuls high,hauing floures at the top in greater quantitie than any of the reſt,of colour white; and after them follow cods containing a ſmall ſeed. The root is nothing elſe but as it were a bundle of thrums or threds.

5 Milk-white Lady-ſmock hath ſtalks riſing immediatly from the root,diuiding themſelues into ſundry ſmall twiggy and hard branches, ſet with leaues like thoſe of *Serpillum.* The floures grow at the top,made of foure leaues of a yellowiſh colour: the root is tough and woody, with ſome fibres anexed thereto. ‡ This is no other than the firſt deſcribed,differing only therefrom in that the floures are milke white, as our Author truly in the title of his figure made them. Yet forgetting himſelfe in his deſcription, he maketh them yellowiſh, contrary to himſelfe and the truth. ‡

6 Mountaine

[illegible]

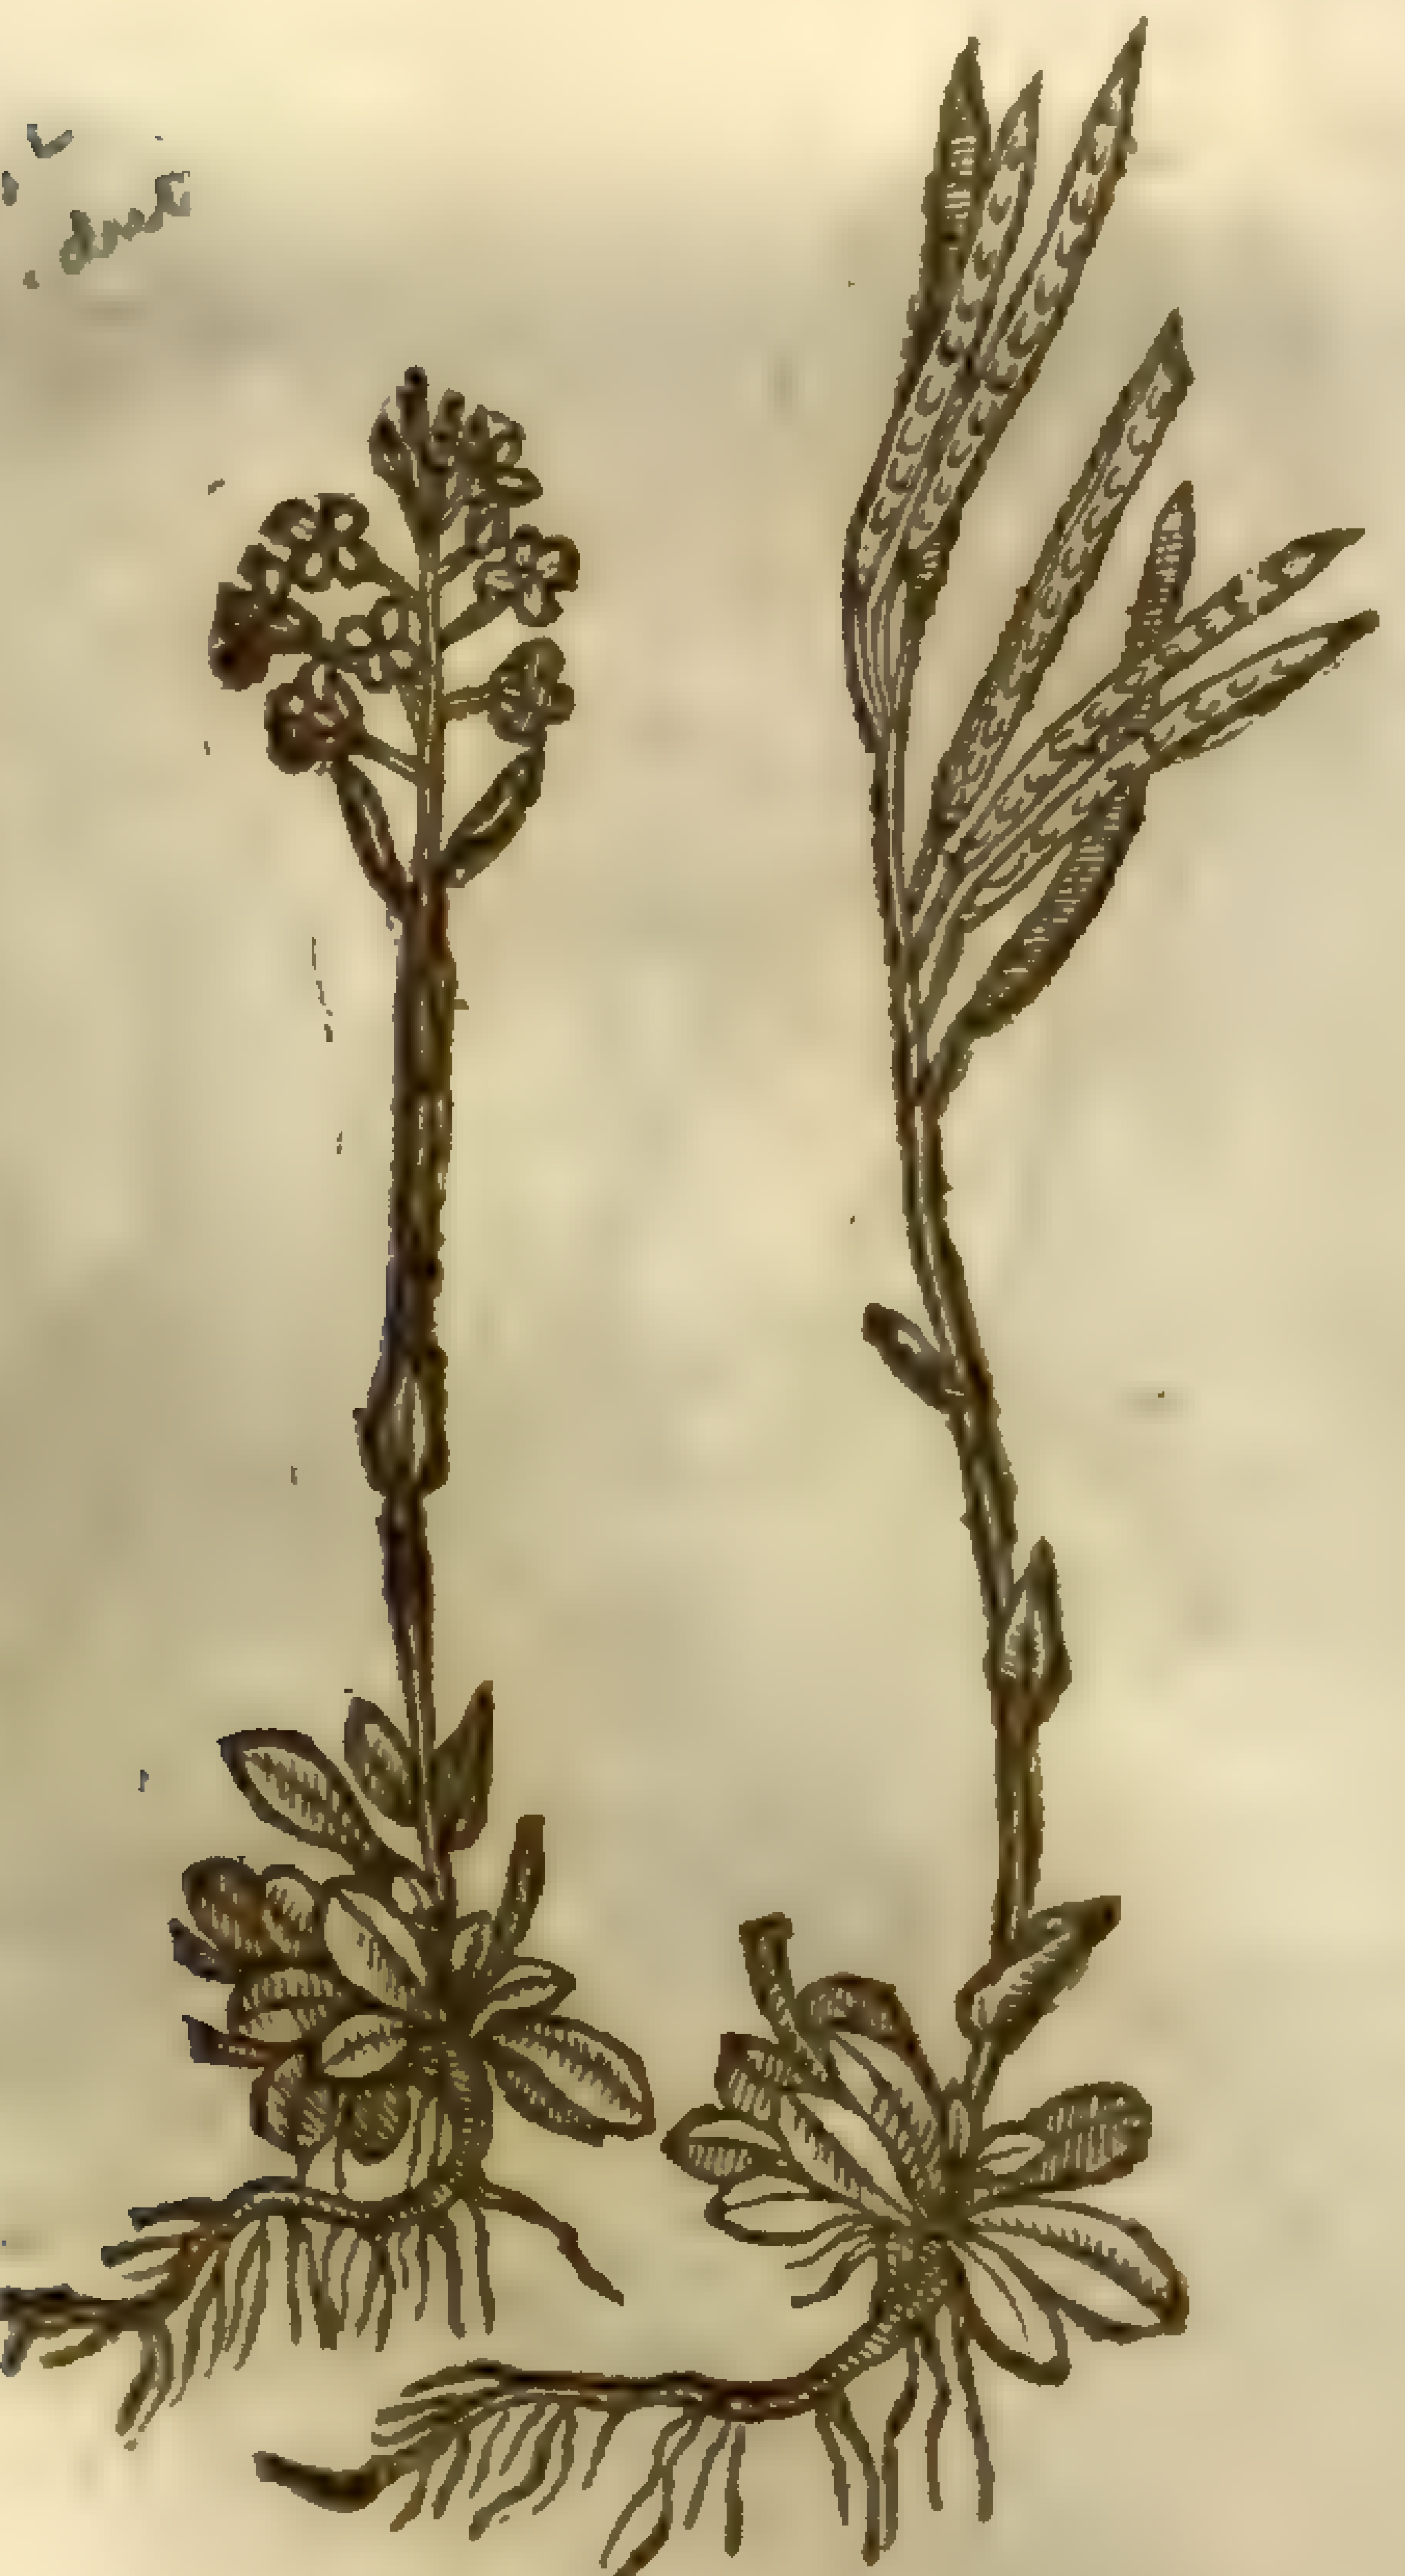
8 *Cardamine pumila Bellidis folio Alpina.*
The dwarfe Daiſie-leaued Lady-ſmock
of the Alps.

Arabis bellidifolia, L.
not [illegible]



6 Mountain Lady-ſmock hath many roots, nothing elſe but as it were a bundle of threddy ſtrings, from the which doe come forth three or foure ſmall weake and tender leaues, made of ſundry ſmal leaues, in ſhew like to thoſe of ſmal water Valerian. The ſtalks be ſmal and brittle; whereupon doe grow ſmall floures like the firſt kind.

‡ 7 I ſhould be blame-worthy if in this place I omitted that prety conditioned *Sium* which is kept in diuers of our London gardens, and was firſt brought hither by that great Treaſurer of Natures rarities, M^r^ *Iohn Tradeſcant*. This Plant hath leaues ſet many on a rib like as the other *Sium* deſcribed in the ſecond place hath, but are cut in with two or three pretty deep gaſhes: The ſtalke is ſome cubit high, & diuided into many branches, which haue ſmall white floures growing vpon them: after theſe floures are paſt, there follow ſmall long cods containing a ſmal white ſeed. Now the nature of this plant is ſuch, that if you touch but the cods when the ſeed is ripe, though you doe it neuer ſo gently, yet will the ſeed fly al abroad with violence, as diſdaining to be touched: whence they vſually call it *Noli me tangere*; as they for the like quality name the *Perſicaria ſiliquoſa*. The nature of this plant is ſomewhat admirable; for if the ſeeds, as I ſaid, be fully

ripe, though you put but your hand neere them, as profering to touch them, though you doe not, yet will they fly out vpon you, and if you expect no ſuch thing, perhaps make you afraid, by reaſon of the ſuddenneſſe thereof. This herbe is written of only by *Proſper Alpinus*, vnder the title of *Sium minimum*; and it may be called in Engliſh, Impatient Lady-ſmock, or Cuckow floure. It is an annual, and yearely ſowes it ſelfe by the falling ſeeds. ‡

‡ 8 The leaues of this ſomewhat reſemble thoſe of Daiſies, but leſſe, and lie ſpred vpon the ground, amongſt which riſes vp a weake and ſlender ſtalke ſet with three or foure leaues at certain diſtances, it being ſome handful high: the top is adorned with ſmal white flours conſiſting of foure leaues apiece, after which follow large and long cods, conſidering the ſmalneſſe of the plant: within theſe in a double order is contained a ſmal reddiſh ſeed of ſomwhat a biting taſt. The root creepeth vpon the top of the ground, putting vp new buds in diuers places. *Cluſius* found this growing vpon the rocks on the Etſcherian mountain in Auſtria, and hath giuen vs the hiſtorie and figure of it vnder the name of *Plantula Cardamines emula*, and *Sinapi pumulum Alpinum*.

¶ *The Place and Time.*

That of the Alpiſh mountains is a ſtranger in theſe cold countries: the reſt are to be found euerie where as aforeſaid, eſpecially in the caſtle ditch at Clare in Eſſex. ‡ 7 This grows naturally in ſome places of Italy: alſo I found it and the eighth about Bath & other parts of this kingdome. ‡

Theſe floure for the moſt part in Aprill and May, when the Cuckow begins to ſing her pleaſant notes without ſtammering.

¶ *The Names.*

They are commonly called in Latine *Flos Cuculi*, by **Brunfelius** and **Dodonæus**, for the reaſon beforeſaid; and alſo ſome call them *Naſturtium aquaticum minus*, or leſſer water-Creſſe: of ſome, *Cardamine*, and *Siſymbrium alterum* of *Dioſcorides*: it is called in the Germane tongue **Wilderkreſz**: in French, *Paſſerage ſauvage*: in Engliſh, Cuckow-flours: in Norfolk, Canturbury bels: at the Namptwich in Cheſhire my natiue country, Lady-ſmockes; which hath cauſed me to name it after their faſhion.

¶ *The Nature and Vertues.*

Theſe herbs be hot and dry in the ſecond degree: wee haue no certaine proofe or authoritie of their vertues, but ſurely from the kinds of water-Creſſe they cannot much differ, and therefore to them they may be referred in their vertues.

† The figure that was in the fourth place, being of the ſame plant that is deſcribed in the firſt place; the counterfeit ſtalkes and heads being taken away, as Bauhine rightly hath obſerued; as alſo the deſcription thereof, which (as many other) our Author frames by looking vpon the figure, and the ſtrength of his owne fancie, I haue omitted as impertinent.

Chap. 19. *Of Treacle Muſtard.*

¶ *The Deſcription.*

1 Treacle muſtard hath long broad leaues, eſpecially thoſe next the ground, the others leſſer, ſleightly indented about the edges like thoſe of Dandelion. The ſtalks be long and brittle, diuided into many branches euen from the ground to the top, where grow many ſmall idle flours tuft-faſhion: after which ſucceed large flat thin chaffie husks or ſeed veſſels heart-faſhion, wherein are contained brown flat ſeeds, ſharp in taſt, burning the tongue as doth muſtard ſeed, leauing a taſt or ſauor of garlick behind for a farewell.

2 Mithridate muſtard hath long narrow leaues like thoſe of Woad or rather Cow Baſil. The ſtalks be incloſed with ſmall ſnipt leaues euen to the branches, pyramidis faſhion, that is, ſmaller and ſmaller toward the top, where it is diuided into ſundry branches, whereon do grow ſmal flours: which being paſt, the cods, or rather thin chaffie husks do appeare, full of ſharpe ſeed like the former. The root is long and ſlender.

3 The third kind of Treacle muſtard, named Knaues muſtard (for that it is too bad for honeſt men) hath long fat and broad leaues like thoſe of Dwale or deadly Nightſhade, in taſte like thoſe of *Vulvaria* or ſtinking Orach, ſet vpon a round ſtalke two cubits high, diuided at the top into ſmal arms or branches, whereon grow ſmall fooliſh white ſpoky floures. The ſeed is contained in flat pouches like thoſe of Shepheards purſe, brown, ſharp in taſte, and of an ill ſauor.

4 Bowyers muſtard hath the lower leaues reſembling the ordinarie Thlaſpi, but the vpper are very ſmall like Tode-flax, but ſmaller. The leaues be ſmall, ſlender, and many; the floures be ſmall and white, each conſiſting of foure leaues: the ſeeds be placed vpon the branches from the loweſt part of them vnto the top, exceeding ſharp and hot in taſte, and of a yellowiſh colour. The root is ſmall and wooddy.

5 Grecian muſtard hath many leaues ſpred vpon the ground, like thoſe of the common Daiſie, of a darke greeniſh colour: from the middeſt whereof ſpring vp ſtalkes two foot long, diuided

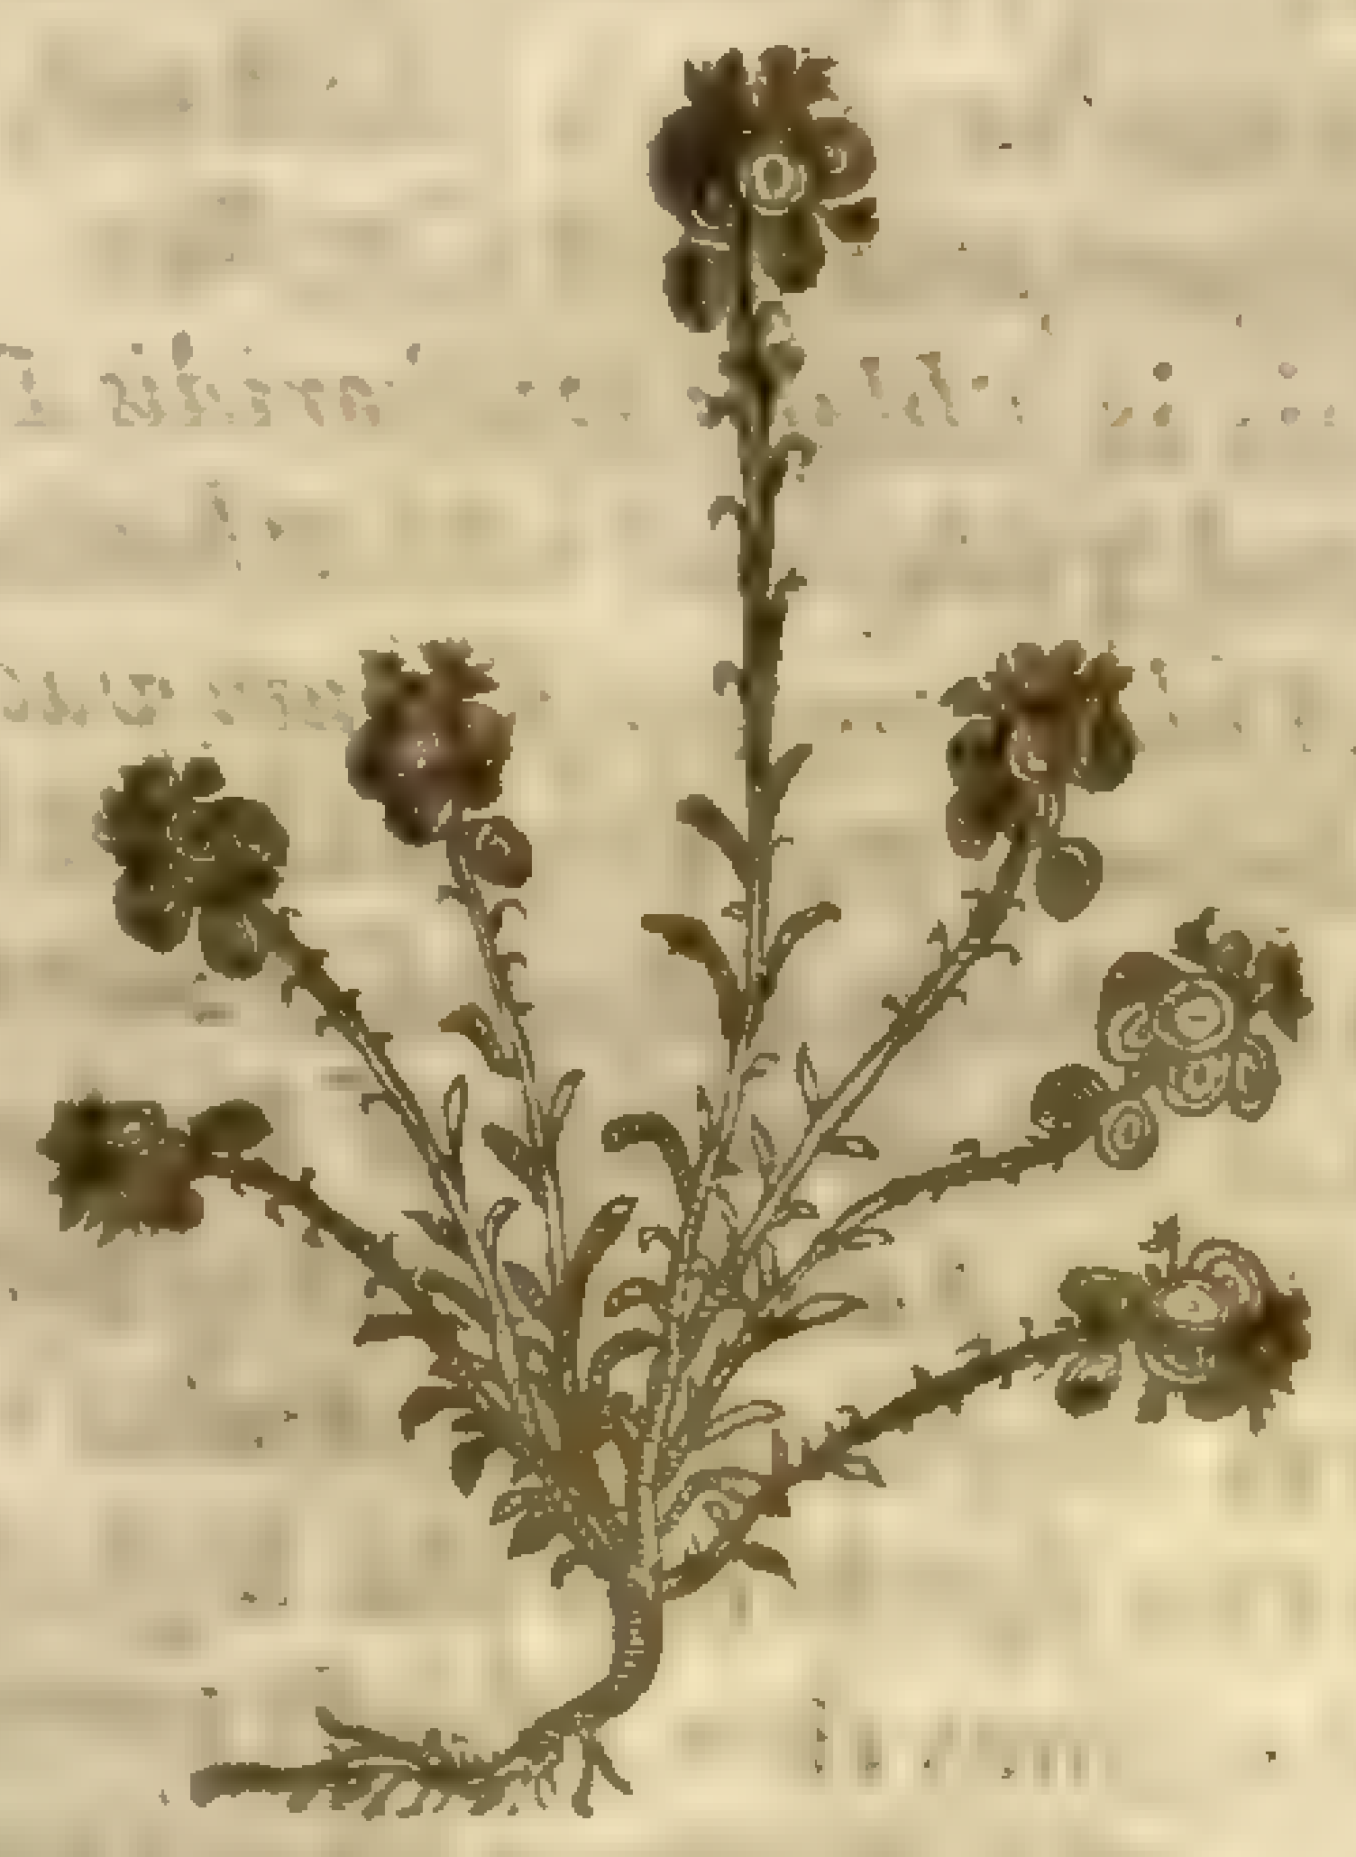
Small Buckler muſtard.



into many ſmall branches,whereupon grow ſmall white floures compoſed of 4 leaues, after which ſucceed round flat husks or ſeed veſſels,ſet vpon the ſtalke by couples, as it were ſundry paires of ſpectacles,wherein the ſeed is contained, ſharpe and biting as the other. This is ſometimes ſeene with yellow floures.

† 6 Clownes muſtard hath a ſhort white fibrous root,from whence ariſeth vp a ſtalke of the height of a foot,which a little aboue the root diuides it ſelfe into ſome four or fiue branches,and theſe again are ſubdiuided into other ſmaller, ſo that it reſembles a little ſhrub: longiſh narrow leaues notched after the manner of Sciatica Creſſes by turnes garniſh theſe branches, and theſe leaues are as bitter as the ſmaller Centaurie. The floures ſtand thick together at the tops of theſe branches in manner of little vmbels,and are commonly of a light blew and white mixed together, being ſeldome only white or yellow. After the flours ſucceed ſeed-veſſels after the maner of other plants of this kind,and in them is contained a ſmall hot ſeed. †

7 Buckler muſtard hath many large leaues ſpred vpon the ground like *Hieracium* or Hawkeweed,ſomewhat more toothed or ſnipt about the edges: among which comes vp ſtalks ſmall and brittle,a cubit high,garniſhed with many ſmall pale yellowiſh flours: in whoſe place ſucceed many round flat cods or pouches,buckler-faſhion,containing a ſeed like vnto the others.

8 Small Buckler muſtard is a very ſmall baſe or low plant,hauing whitiſh leaues like thoſe of wild Time, ſet vpon ſmall weake and tender branches. The floures grow at the top like the other Buckler muſtard. The ſeed-veſſels are like,not ſo round, ſomwhat ſharpe pointed,ſharp in taſt,and burning the tongue. The whole plant lieth flat vpon the ground like wild Tyme.

¶ *The Place.*

Treacle or rather Mithridate muſtard growes wild in ſundry places in corne fields,ditch banks, and in ſandy dry and barren ground. I haue found it in corn fields betwixt Croidon and Godſtone in Surrey,at Southfleet in Kent,by the path that leads from Harnſey (a ſmall village by London) vnto Waltham croſſe,and in many other places.

The other grow vnder hedges oftentimes in fields,and in ſtony and vntoiled places. They grow plentifully in Bohemia and Germany:they are ſeen likewiſe on the ſtony banks of the riuer Rhine. They are likewiſe to be found in England in ſundry places wilde, the which I haue gathered into my garden. ‡ I haue found none but the firſt and ſecond growing wilde in any part of England as yet; yet I deny not,but that ſome of the other may be found,but not all. ‡

¶ *The Time.*

Theſe Treacle muſtards are found with their flours from May to Iuly,and the ſeed is ripe in the end of Auguſt.

¶ *The Names.*

The Grecians call theſe kinds of herbs, θλάσπι, θλασπίδιον, Σίνηπι ἄγριον, of the husk or ſeed-veſſell, which is like a little ſhield. They haue alſo other names which be found amongſt the baſtard words: As *Scandulaceum*,*Capſella*,*Pes gallinaceus*.Neither be the later writers without their names,as *Naſturtium tectorum*,and *Sinapi ruſticum*: it is called in Dutch, **Wilde kerſe**: in French,*Seneue ſauvage*:in Engliſh, Treacle muſtard, diſh Muſtard, Bowyers muſtard: of ſome, *Thlaſpi*, after the Greeke name, Churles muſtard,and wild Creſſes.

‡ 1 This is *Thlaſpi Dioſcoridis Drabæ, aut Chamelinæ folio* of *Lobel*: *Thlaſpi Latius* of *Dodonæus*: and the ſecond,*Thlaſpi* of *Matthiolus*.

2 This,*Thlaſpi vulgatiſſimum vaccariæ folio* of *Lobel*: the firſt *Thlaſpi* of *Matthiolus*, and the ſecond of *Dodonæus*; and this is that *Thlaſpi* whoſe ſeed is vſed in ſhops.

3 This is *Thlaſpi majus* of *Tabernamontanus*.

4 This is *Thlaſpi minus* of *Dodonæus*,*Thlaſpi anguſtifolium* of *Fuchſius*: *Thlaſpi minus hortenſe Oſyridis folio*,*&c*.of *Lobel*: and *Naſturtium ſylveſtre* of *Thalius*.

5 This is *Alyſſon* of *Matthiolus*: *Thlaſpi Græcum polygonati folio* of *Lobel* and *Tabern*.

6 This the Author of the *Hiſt. Lugd.* calls *Naſturtium ſylveſtre*: *Tabern.* calls it *Thlaſpi amarum*.

7 *Lobel* termes this *Thlaſpi parvum Hieracifolium*, and *Lunaria lutea Monſpelienſium*.

8 This is *Thlaſpi minus clypeatum Serpillifolio* of *Lobel*. ‡

† The figures of theſe two laſt mentioned were tranſpoſed in the former edition.

¶ *The Temperature.*

The ſeeds of theſe kinds of Treacle muſtards be hot and dry in the end of the third degree.

¶ *The Vertues.*

A The ſeed of Thlaſpi or Treacle muſtard eaten,purgeth choler both vpward and downward, prouoketh floures,and breaketh inward apoſtumes.

B The ſame vſed in clyſters helpeth the Sciatica, and is good vnto thoſe purpoſes for which Muſtard ſeed ſerueth.

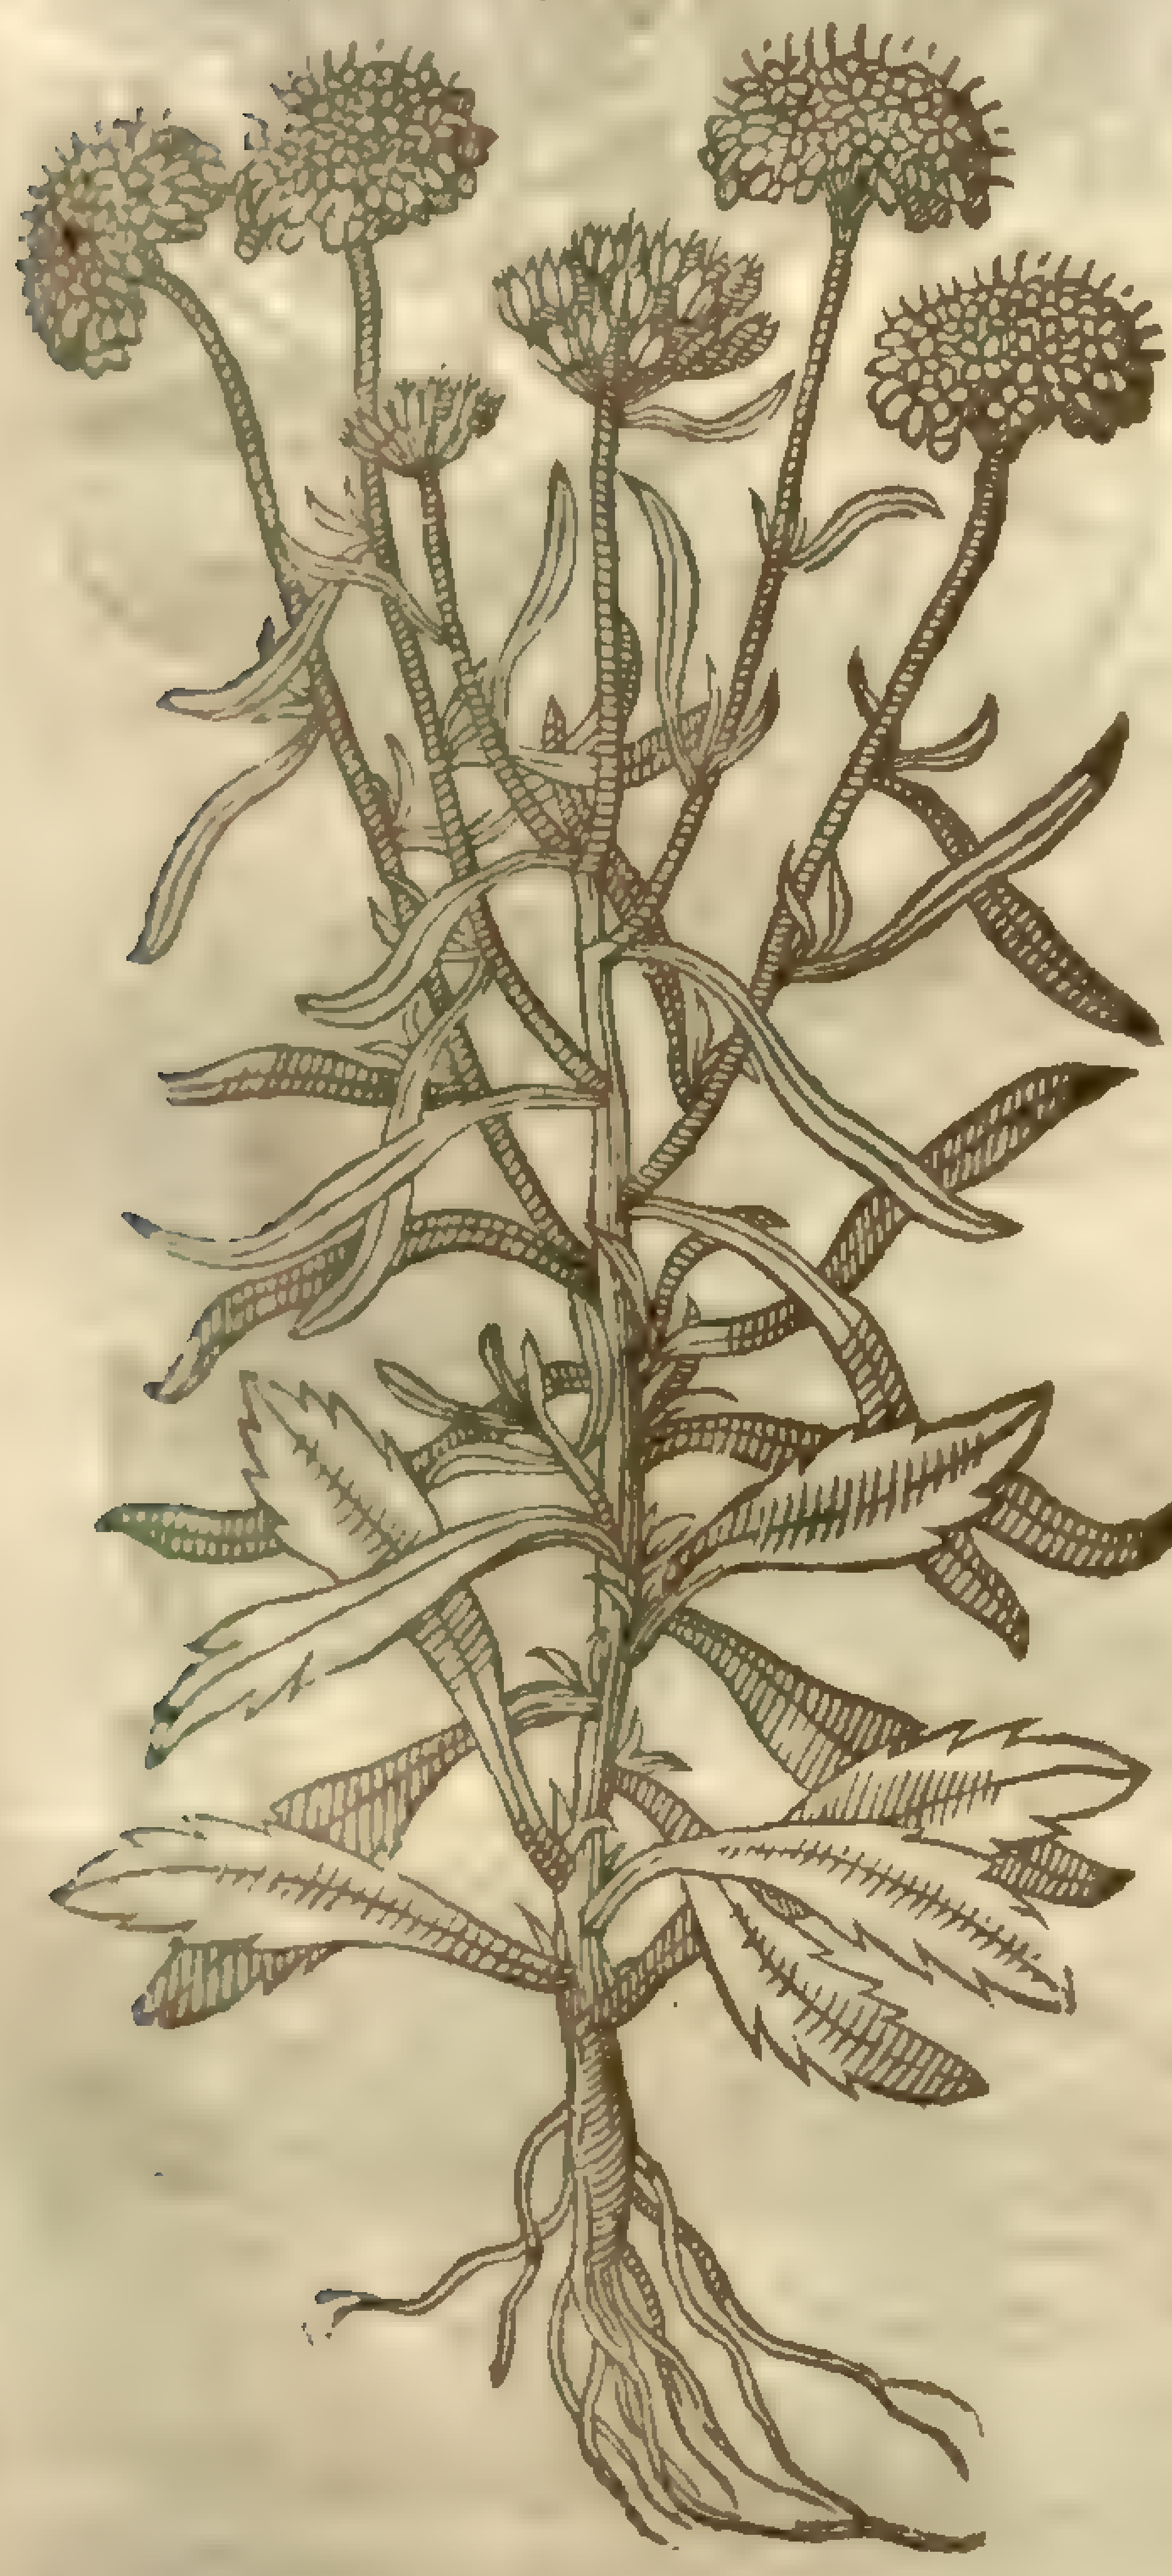
¶ *The Danger.*

The ſeeds of theſe herbes be ſo extreme hot and vehement in working, that beeing taken in too great quantitie, purgeth and ſcoureth euen vnto bloud, and is hurtfull to women with childe, and therefore great care is to be had in giuing them inwardly in any great quantitie.

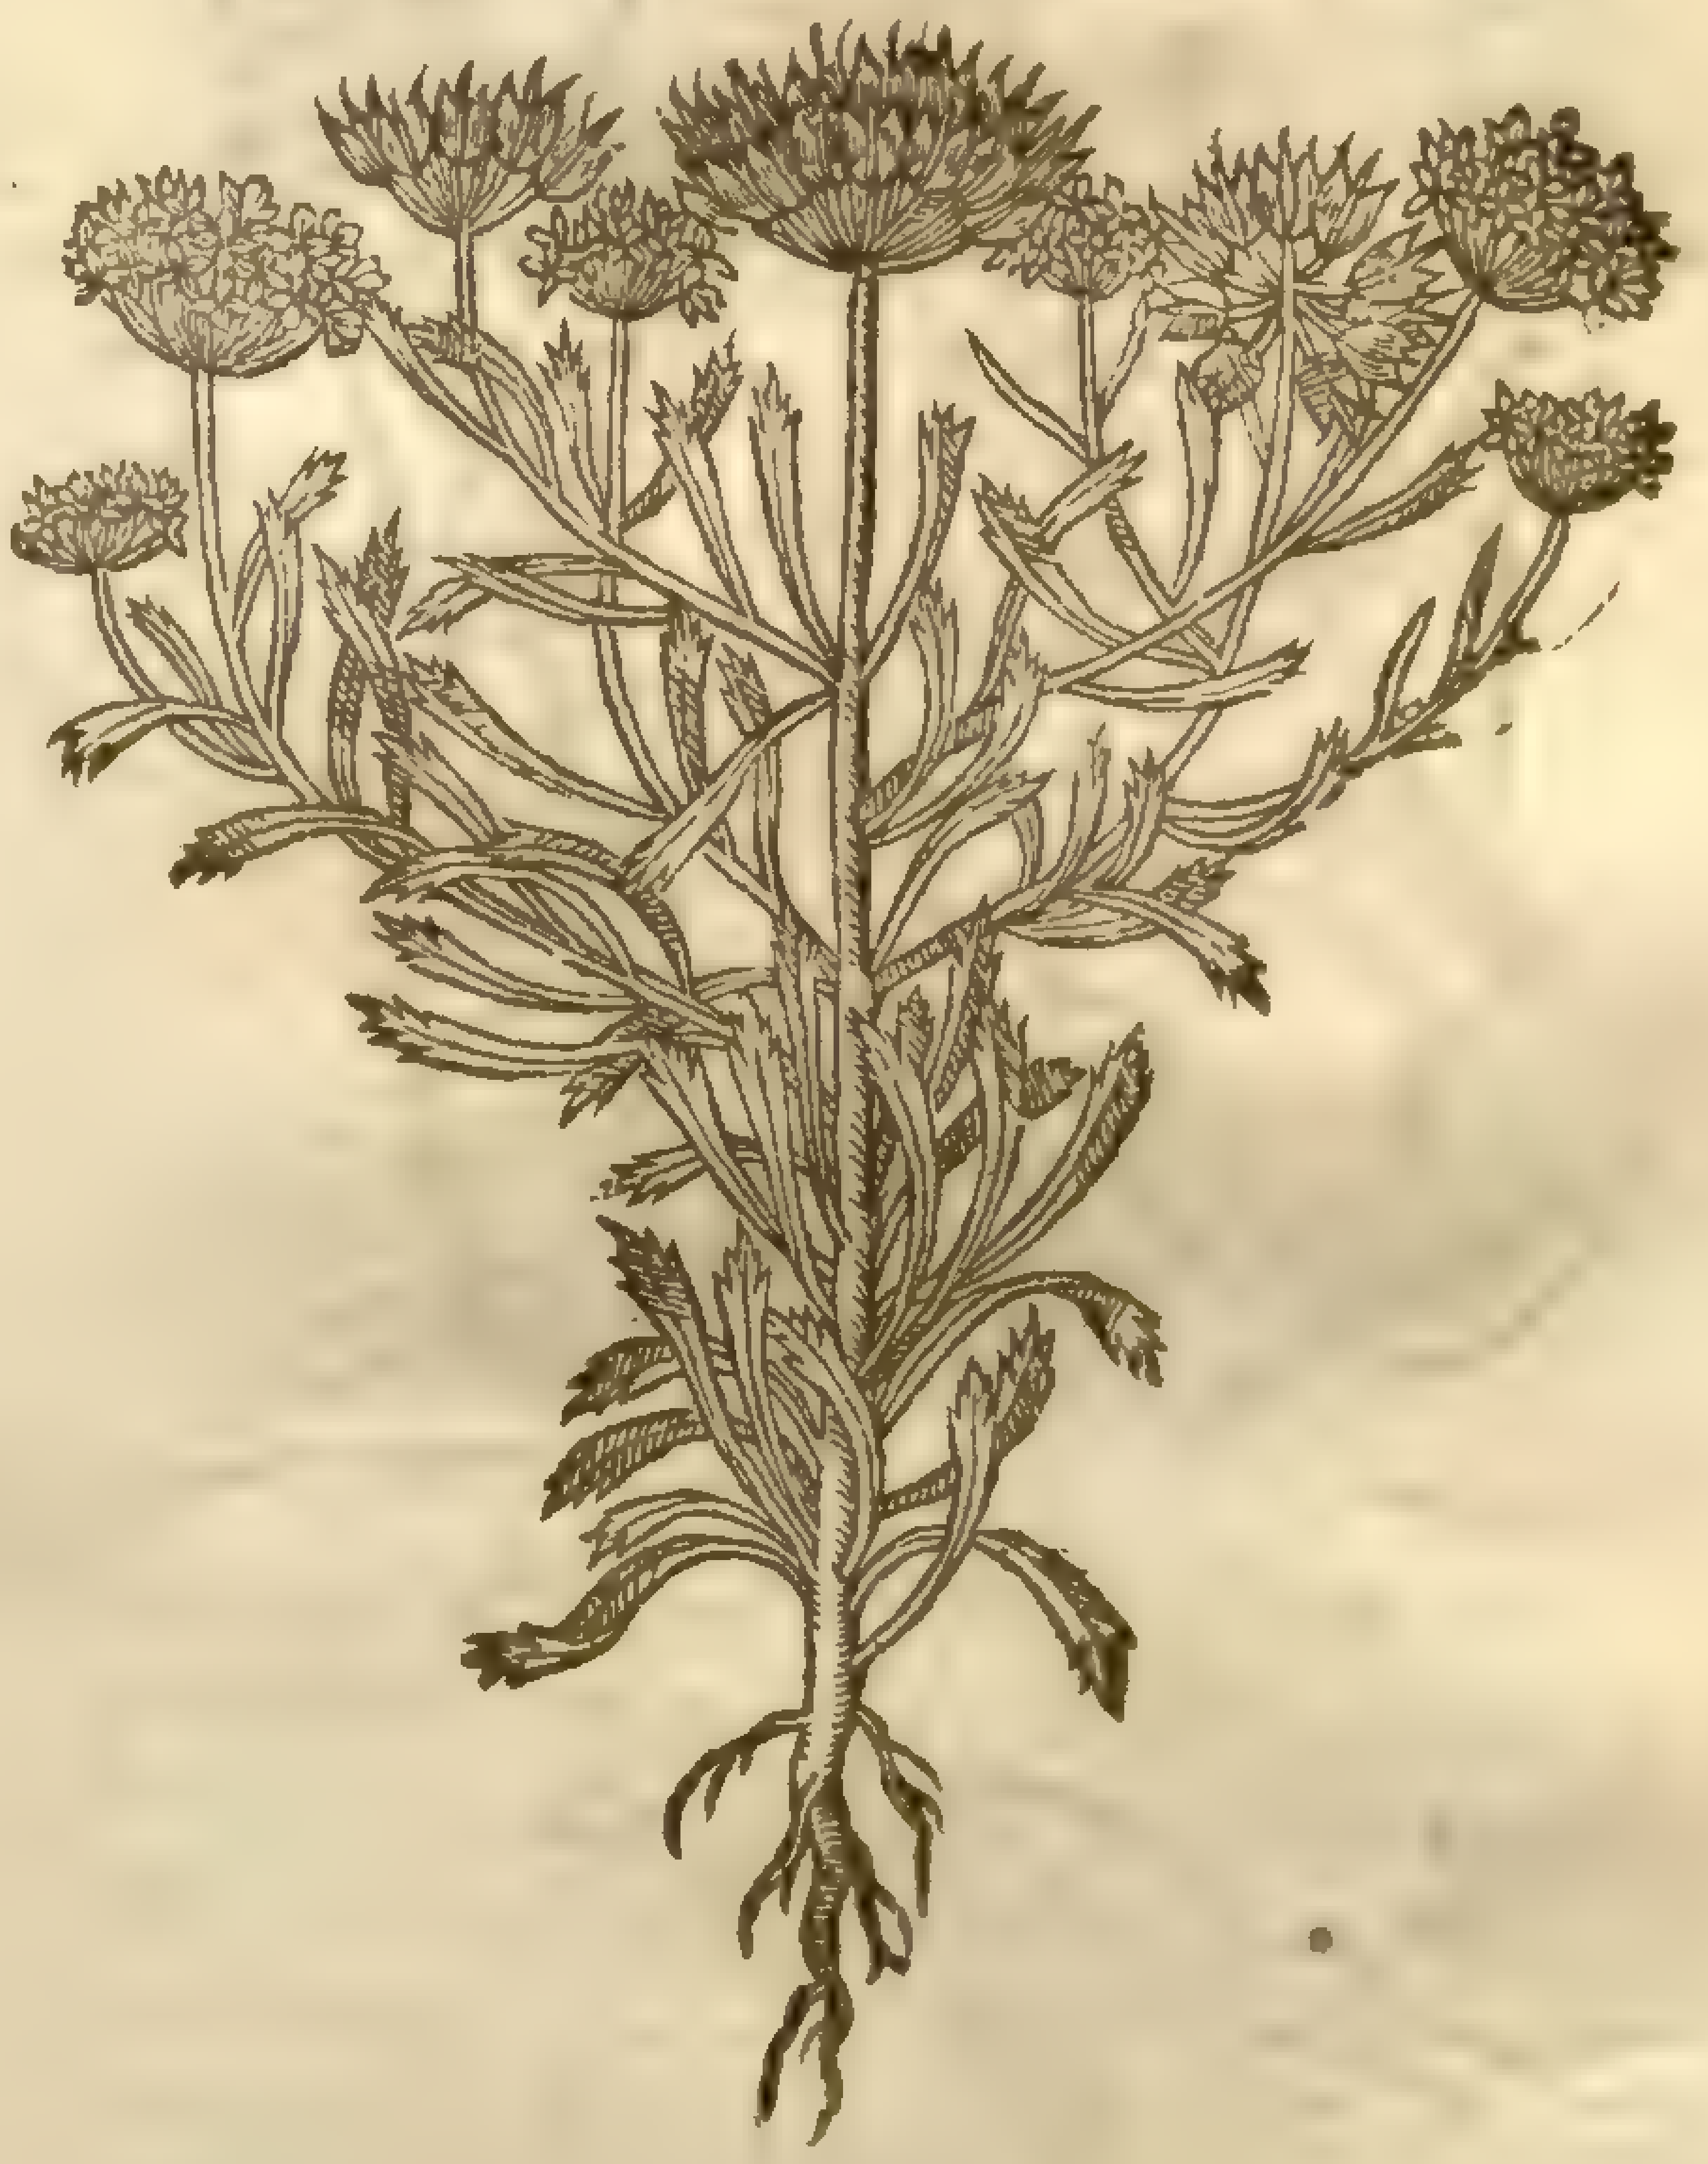
Chap. 20. *Of Candy Muſtard.*

¶ *The Deſcription.*

Candy Muſtard excelleth all the reſt, as well for the comely floures that it brings forth for the decking vp of gardens and houſes, as alſo for that it goeth beyond the reſt in his phyſical vertues; it riſeth vp with a very brittle ſtalke of a cubit high, which diuideth it ſelfe into ſundry boughs or branches ſet with leaues like thoſe of ſtock gilliflоures, of a gray or ouerworn green colour. The floures grow at the top of the ſtalk, round, thick cluſtering together, like thoſe of Scabious or Diuels bit, ſomtimes blew, often purple, carnation, or horſe-fleſh, but ſeldome white for any thing that I haue ſeen, varying according to the ſoile or clymat. The ſeed is reddiſh, ſharp, aud biting the tongue, wrapped in little husks faſhioned like an heart. ‡ There is a leſſe varietie of this, with white well ſmelling floures, in other reſpects little differing from the ordinarie. ‡



Thlaſpi Candiæ.
Candy Muſtard.



‡ *Thlaſpi Candiæ paruum flore albo.*
Small Candy Muſtard with a white floure.

¶ *The Place.*

This growes naturally in ſome places of Auſtria, as alſo in Candy, Spain, and Italy, whence I receiued ſeeds of the right honorable the lord *Ed. Zouch*, at his return into England from thoſe parts. ‡ *Cluſius* found the later as he trauelled through Switzerland into Germany. ‡

¶ *The Time.*

It floureth from the beginning of May to the end of September, at which time you ſhall haue floures and ſeeds vpon one branch, ſome ripe, and ſome that will not ripen at all.

¶ *The Names.*

† This plant is called by *Dodonæus* (but not rightly) *Arabis* and *Draba*; as alſo *Thlaſpi Candiæ*: which laſt name is retained by moſt writers: in Engliſh, Candy Thlaſpi, or Candy Muſtard. †

¶ *The Temperature.*

The ſeed of Candy Muſtard is hot and dry in the end of the ſecond degree, as is that called *Scorodothlaſpi*, or Treacle muſtard.

CHAP. 21. *Of Treacle Muſtard.*

¶ *The Deſcription.*

1 ROund leaued Muſtard hath many large leaues laid flat on the ground like the leaues of the wild Cabbage, and of the ſame colour; amongſt which riſe vp many ſlender ſtalks of ſome two handfulls high or thereabouts, which are ſet with leaues far vnlike thoſe next the ground, encloſing or embracing the ſtalks as doe the leaues of *Perfoliatum*, or Thorow-wax. The floures grow at the top of the branches, white of colour: which being paſt, there do ſucceed flat husks or pouches like to thoſe of Shepheards purſe, with hot ſeed biting the tongue.

1 *Thlaſpi rotundifolium.*

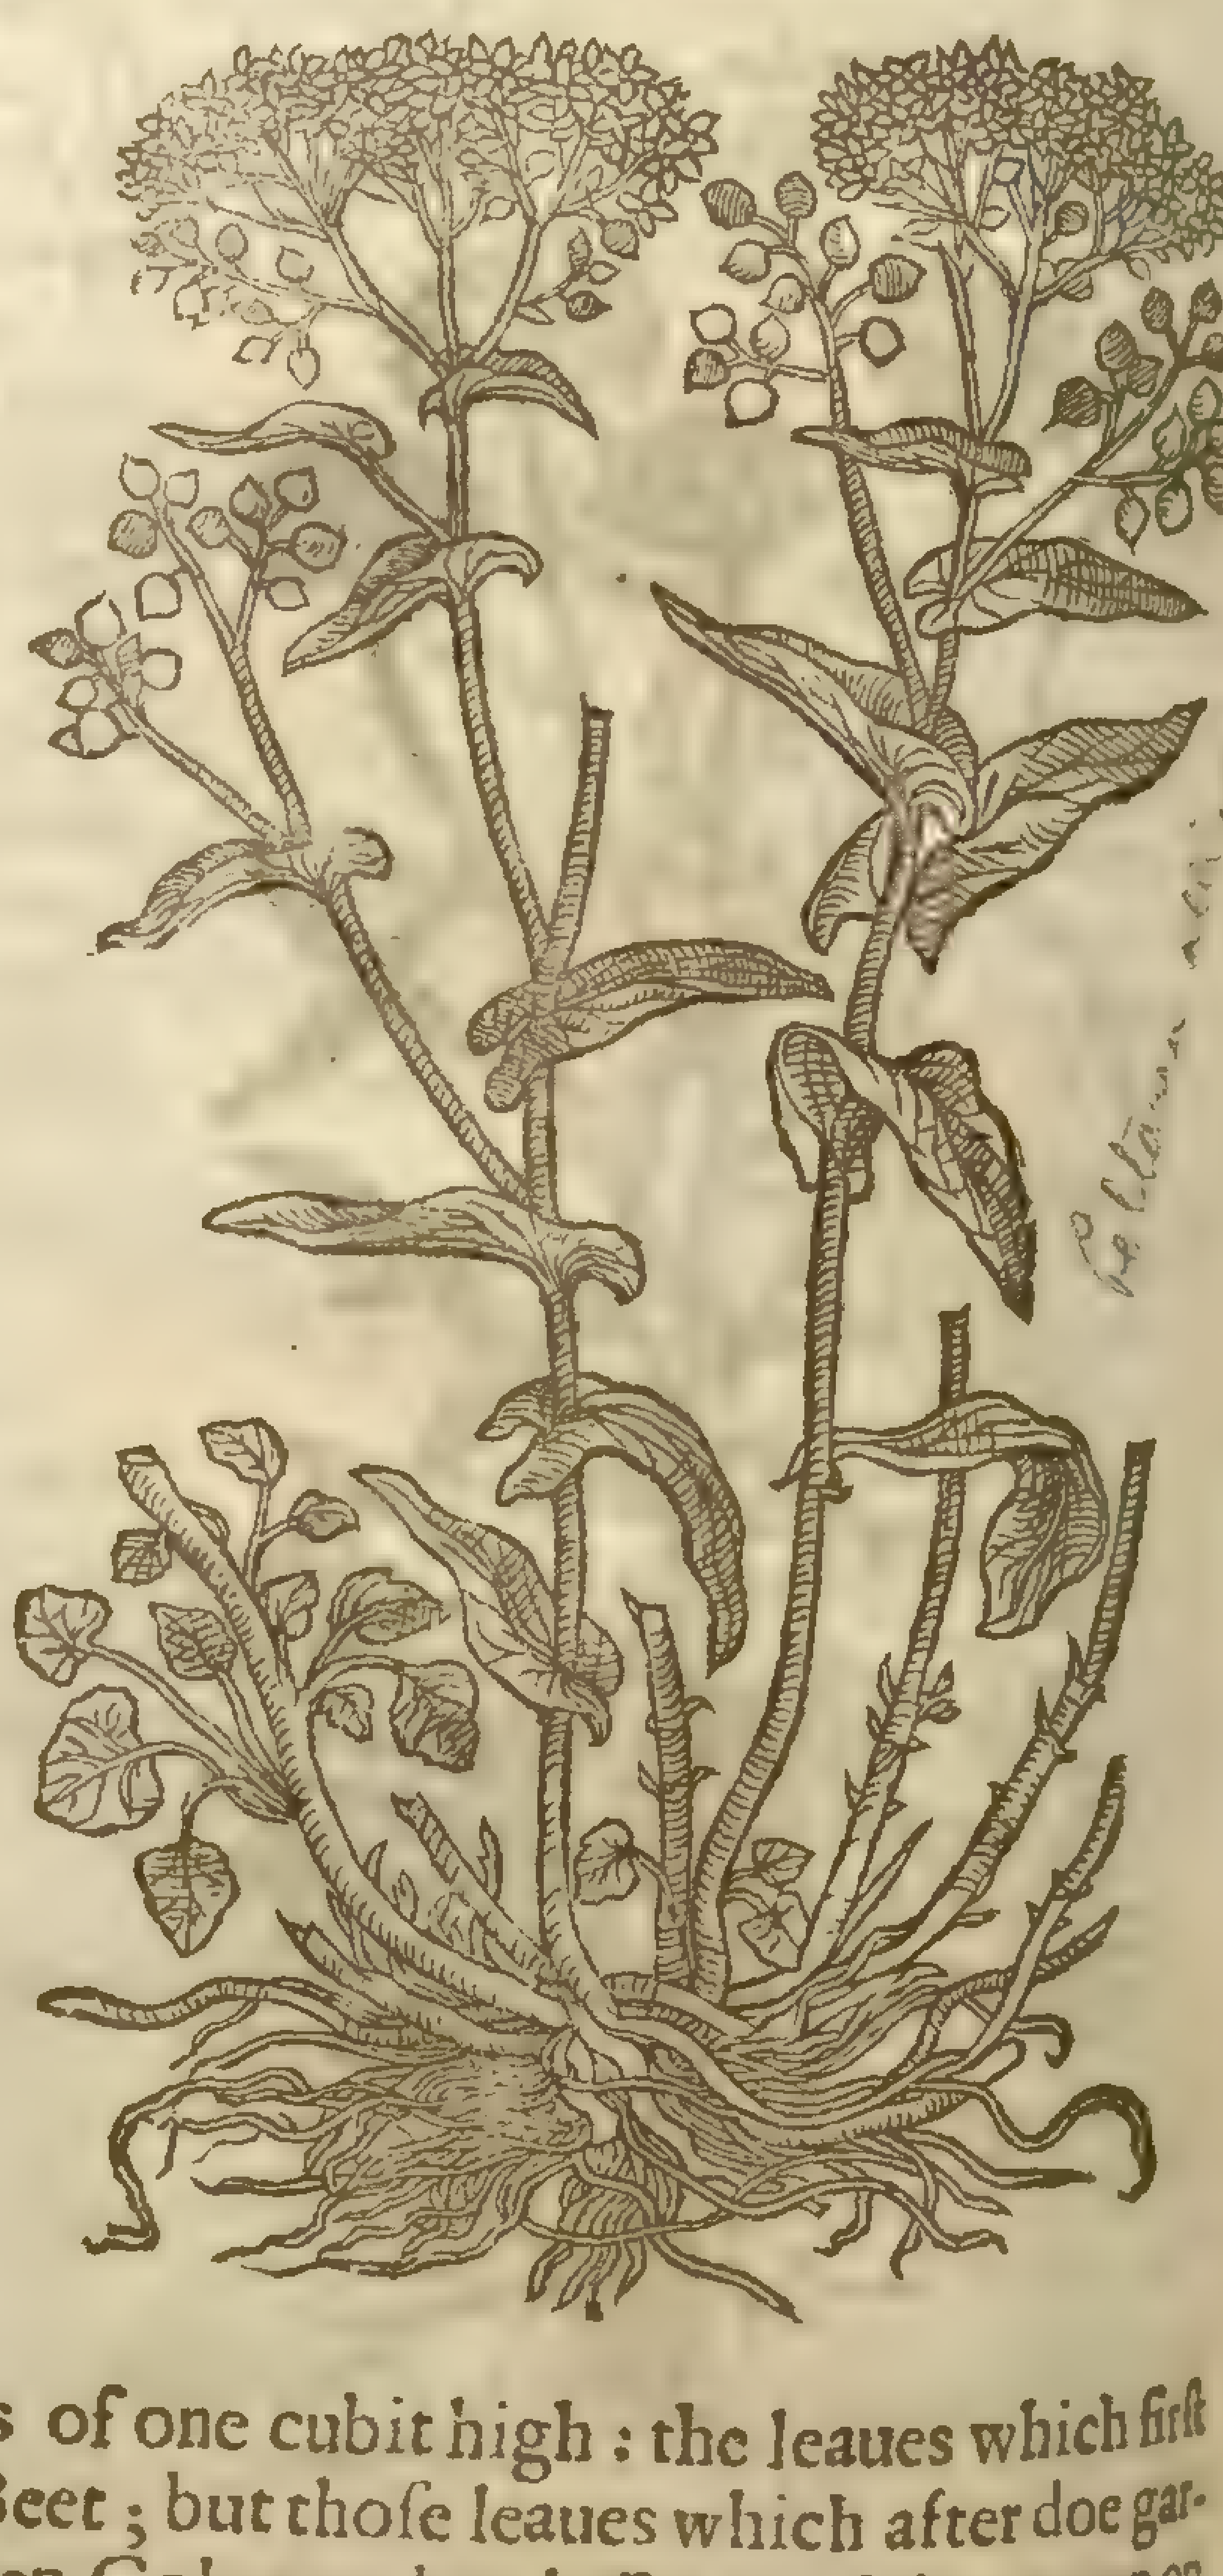
T. perfoliatum, &
merid. dist.
Sm. fl. 3.172

2 *Thlaſpi Pannonicum Cluſij.*
Hungary Muſtard.



Peltaria alliacea

2 Hungary Muſtard bringeth forth ſlender ſtalkes of one cubit high: the leaues which firſt appeare are flat, ſomwhat round like thoſe of the wild Beet; but thoſe leaues which after doe garniſh the ſtalks are long and broad like thoſe of the garden Colewort, but leſſer and ſofter, green on the vpper ſide, and vnder declining to whiteneſſe, ſmelling like Garlicke. The floures be ſmall and white, conſiſting of foure ſmall leaues, which in a great tuft or vmbell do grow thicke thruſt together: which being paſt, there followes in euery ſmall huske one duskiſh ſeed and no more, bitter, and ſharpe in taſte. The root is white and ſmal, creeping vnder the ground far abroad like the roots of Couch-graſſe; preparing new ſhoots and branches for the yeare following, contrarie to all the reſt of his kind, which are encreaſed by ſeed, and not otherwiſe.

3 Churles muſtard hath many ſmall twiggy ſtalks, ſlender, tough, and pliant, ſet with ſmall leaues like thoſe of Cudweed or Lauander, with ſmall white floures, the husks and ſeeds are ſmall, few, ſharpe, bitter, and vnſauorie: the whole plant is of a whitiſh colour.

4 Peaſants muſtard hath many pretty large branches, with thin and jagged leaues like thoſe of Creſſes, but ſmaller, in ſauor and taſte like to the ordinarie *Thlaſpi*: the floures be whitiſh, & grow in a ſmall ſpoky tuft. The ſeed in taſte aud ſauor is equall with the other of his kind and countrey, or rather exceeds them in ſharpneſſe.

3 *Thlaſpi Narbonenſe Lobelij.*
Churles Muſtard.

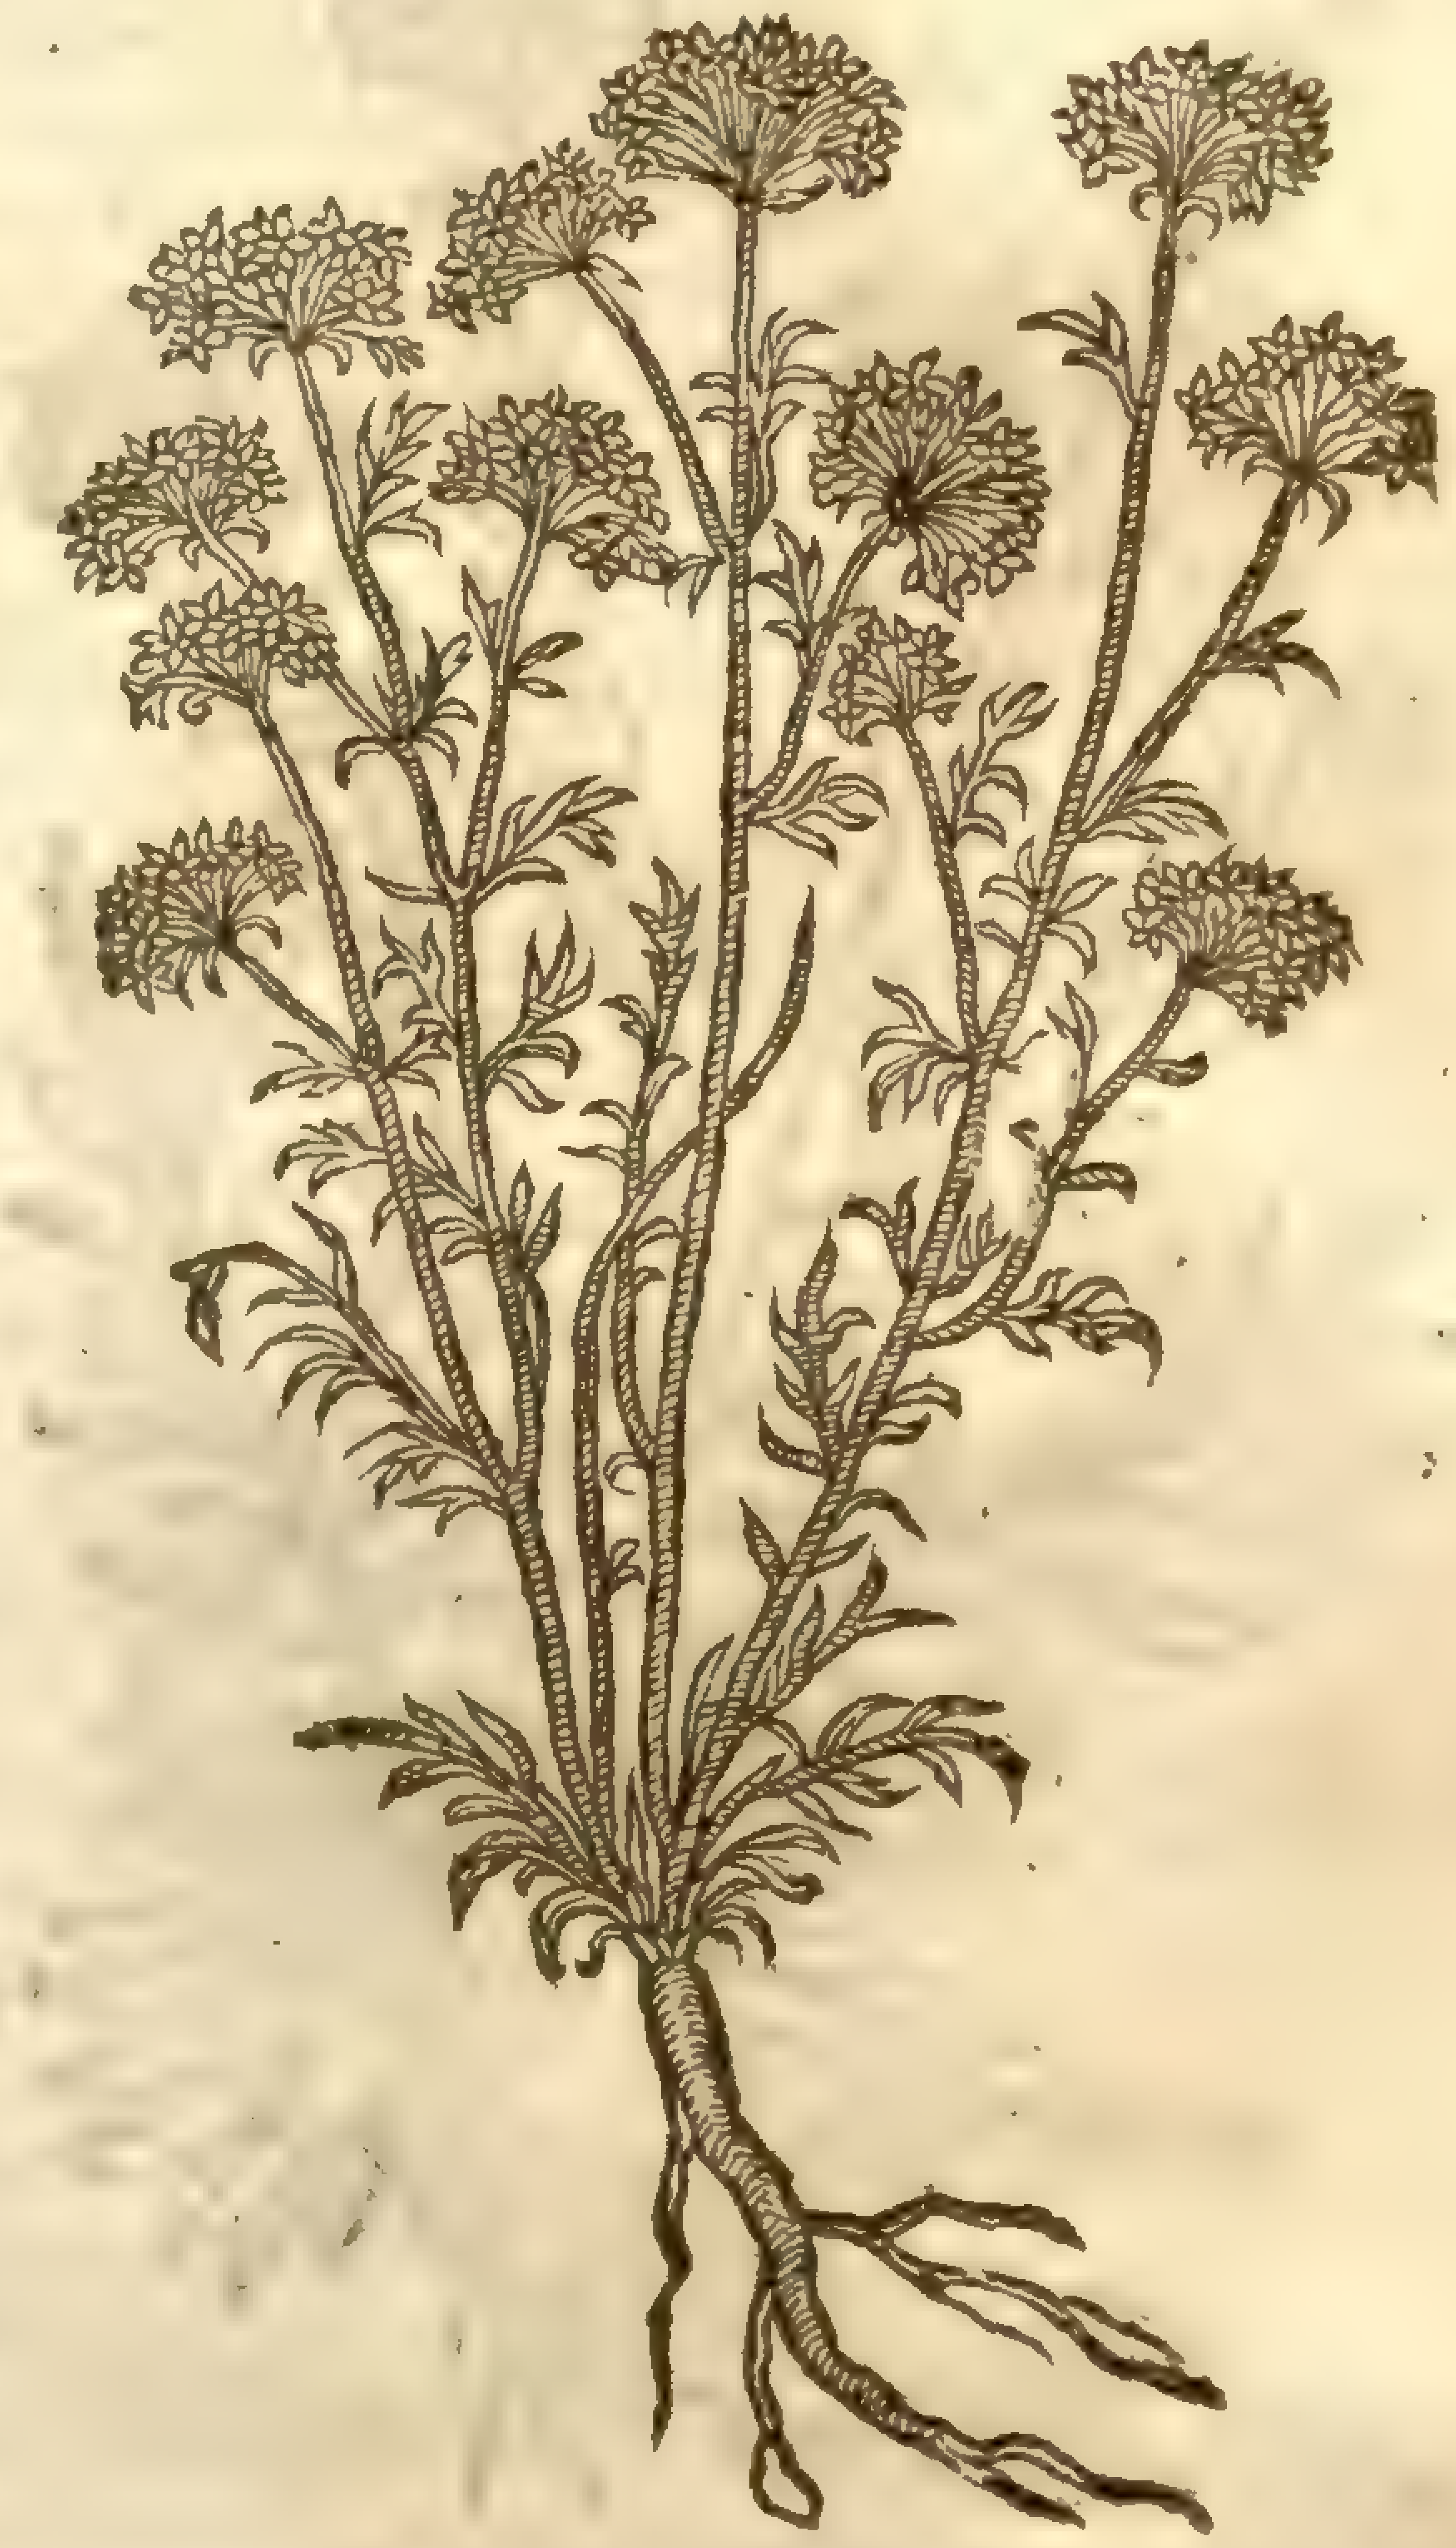
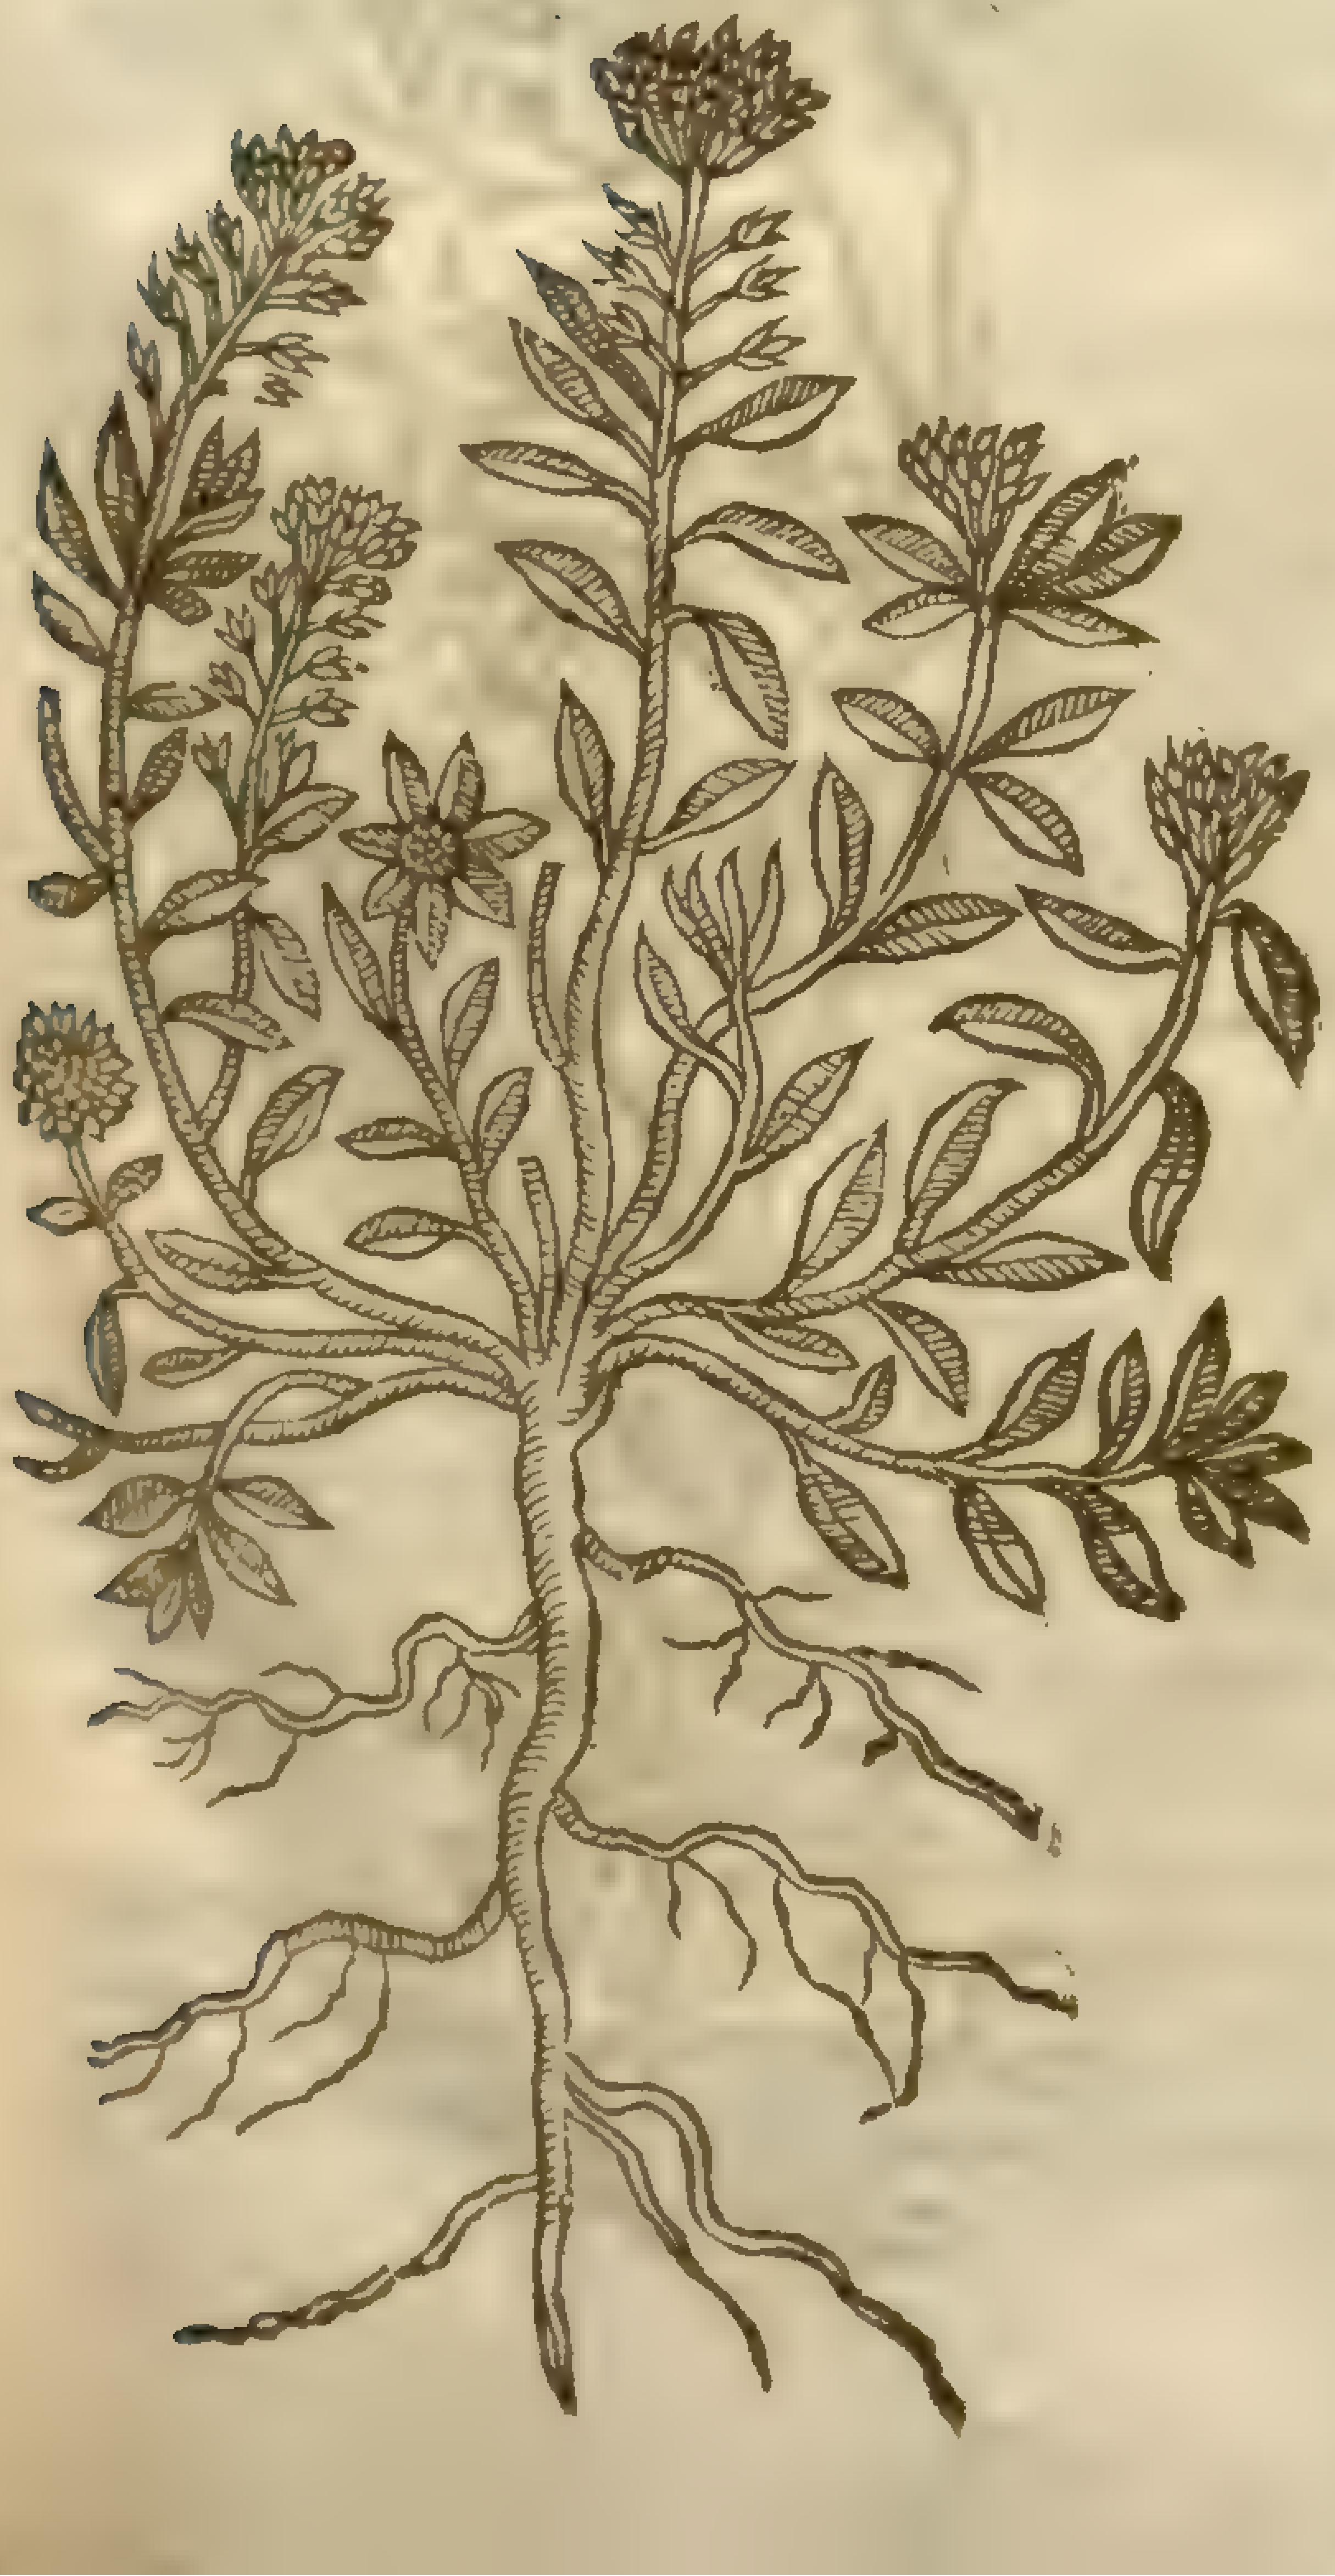
4 *Thlaſpi vmbellatum Narbonenſe.*
Peaſants Muſtard of Narbone.

Iberis [illegible] mihi dict.



† 5 *Thlaſpi ſupinum luteum.*
Yellow Muſtard.



5 Yellow Muſtard hath an exceeding number of whitiſh leaues ſpred vpon the ground in manner of a turfe or haſſocke, from the midſt whereof riſeth vp an vpright ſtalke of three foot high, putting forth many ſmall branches or armes: at the top whereof grow many ſmal yellow floures like thoſe of the wall-floure, but much leſſer: which being paſt, the husks appeare flat, pouch-faſhion, wherein is the ſeed like Treacle-Muſtard, ſharp alſo and biting.

6 White Treacle Muſtard hath leaues ſpred vpon the ground like the other, but ſmaller: the ſtalks riſe vp from the middeſt thereof, branched, ſet with leaues ſmaller than thoſe that lie vpon the ground euen to the top, where groweth a tuft of white floures in faſhion like to thoſe of the other Thlaſpies: the ſeed is like the other: ‡ The cods of this are ſometimes flat, and otherwhiles round: the floures alſo grow ſometimes ſpike-faſhion, otherwhiles an vmbel. I haue giuen you two figures expreſſing both theſe varieties. ‡

7 The

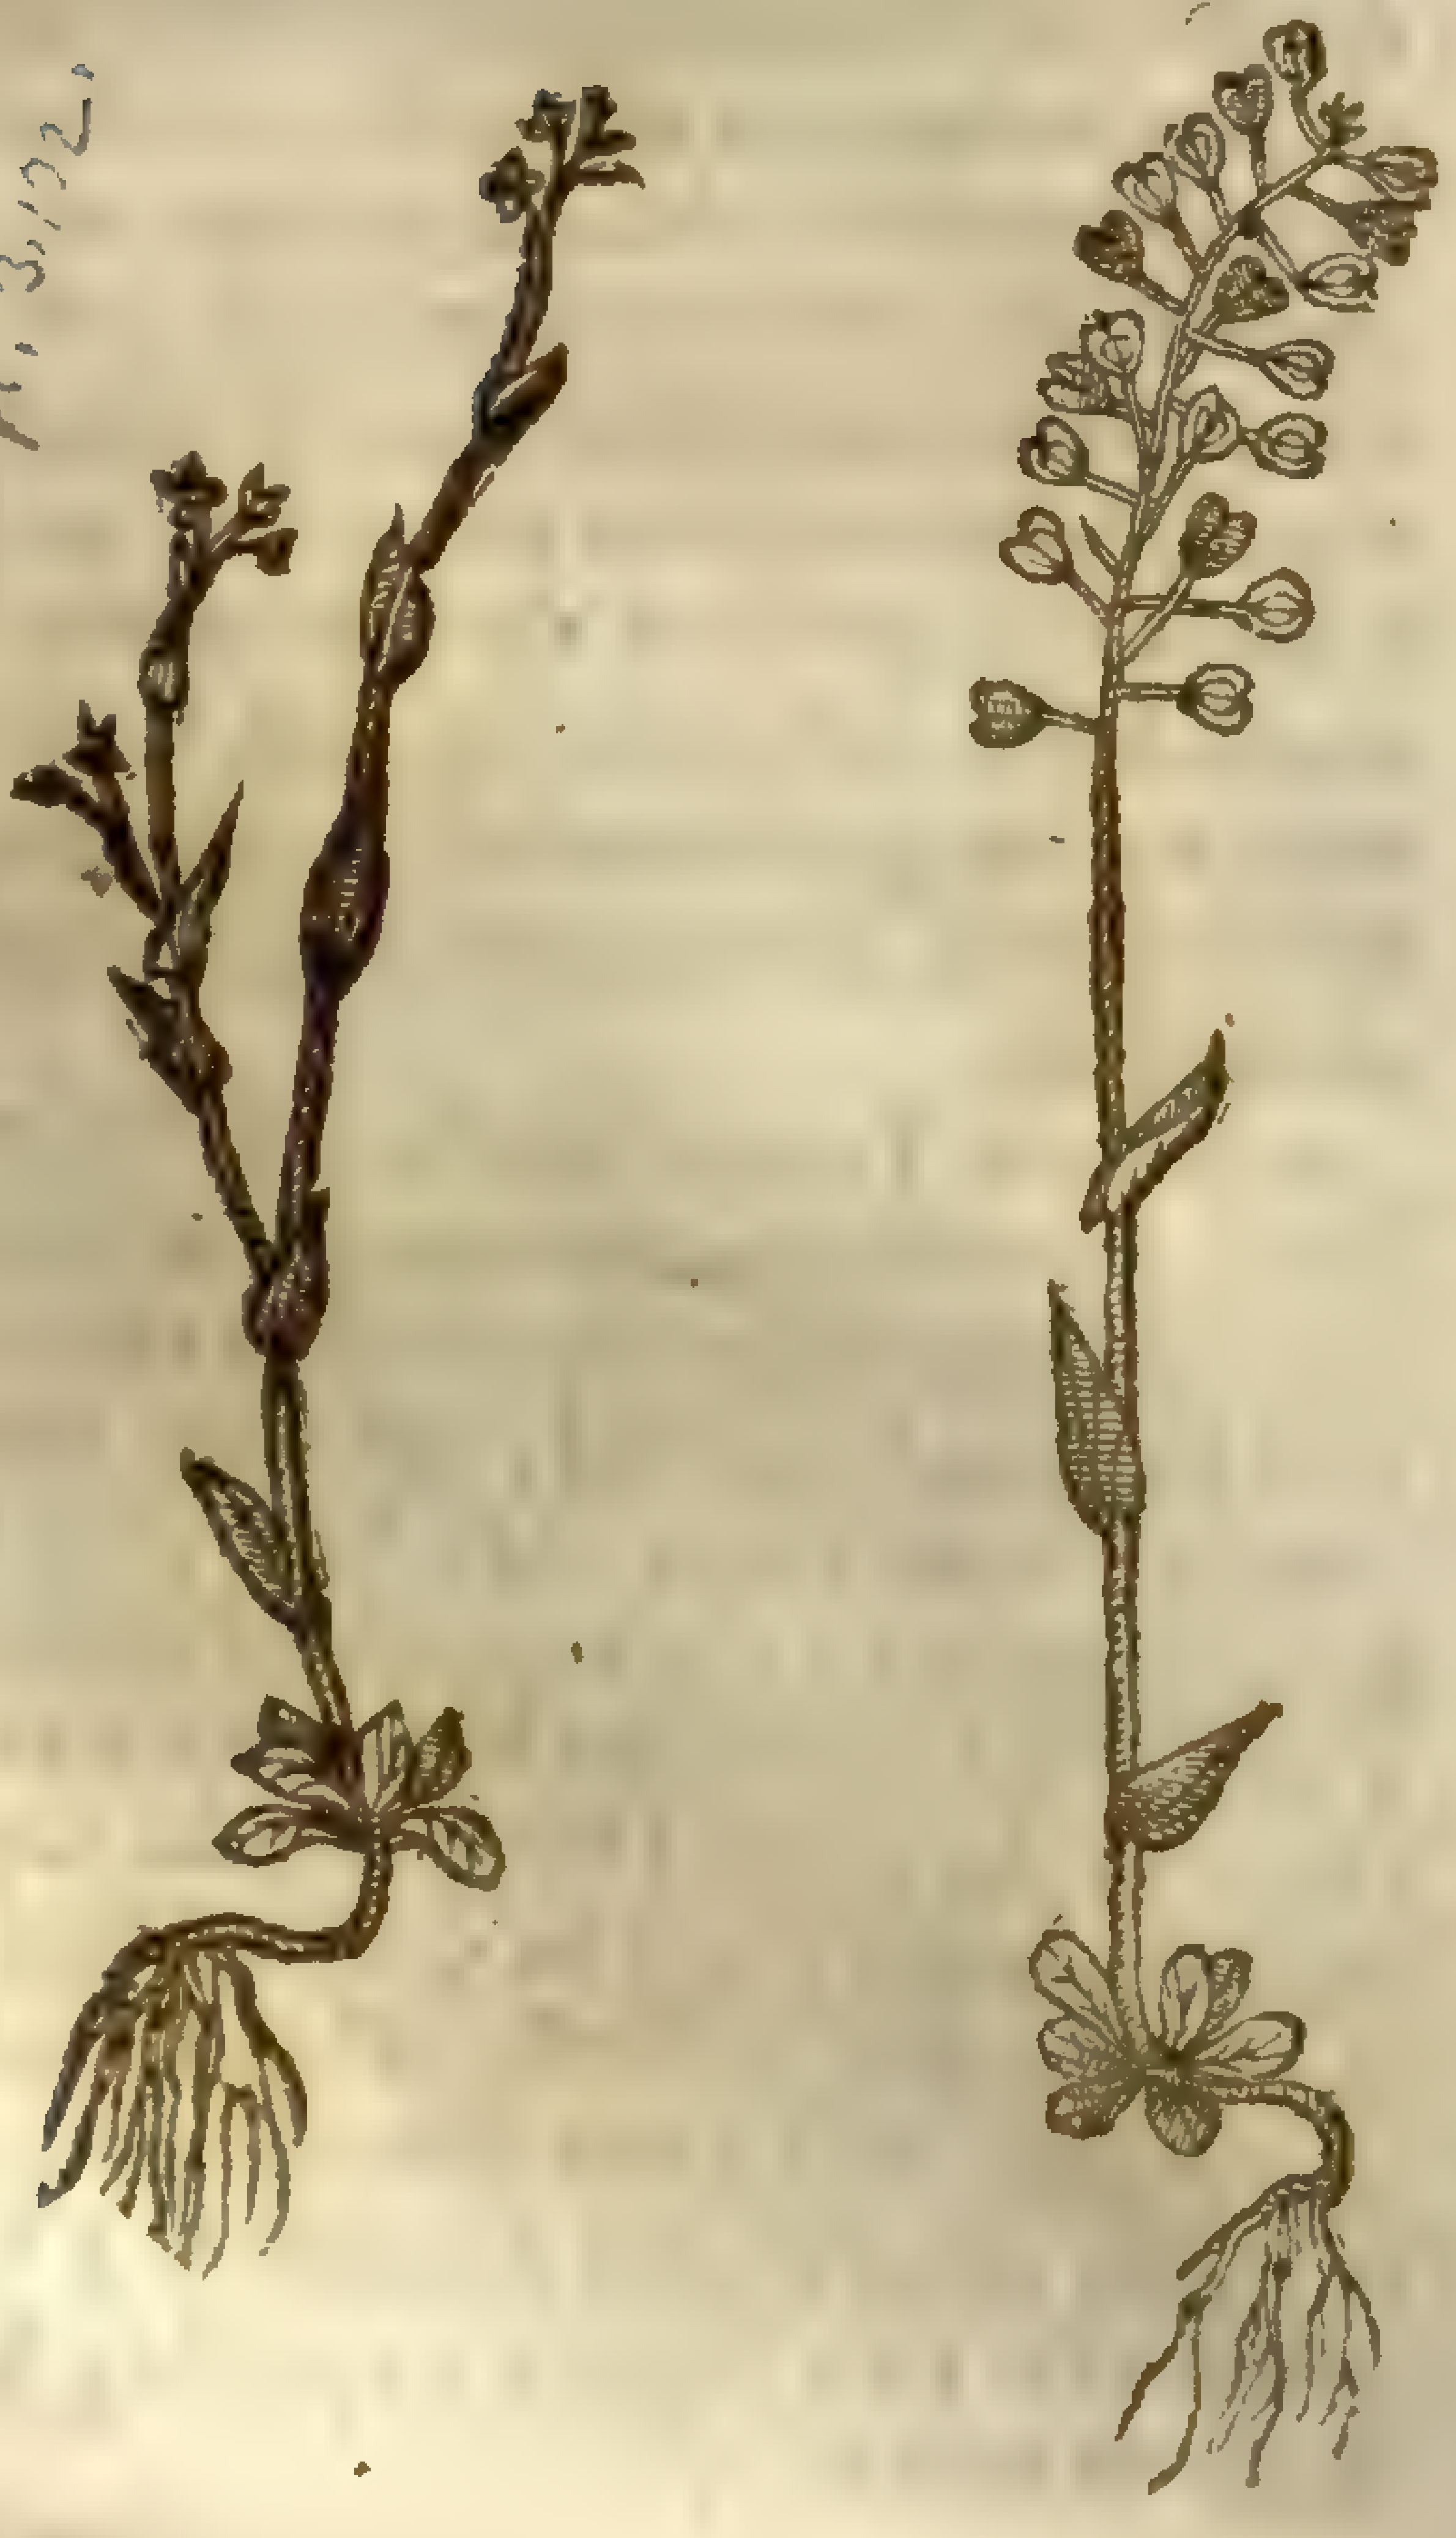
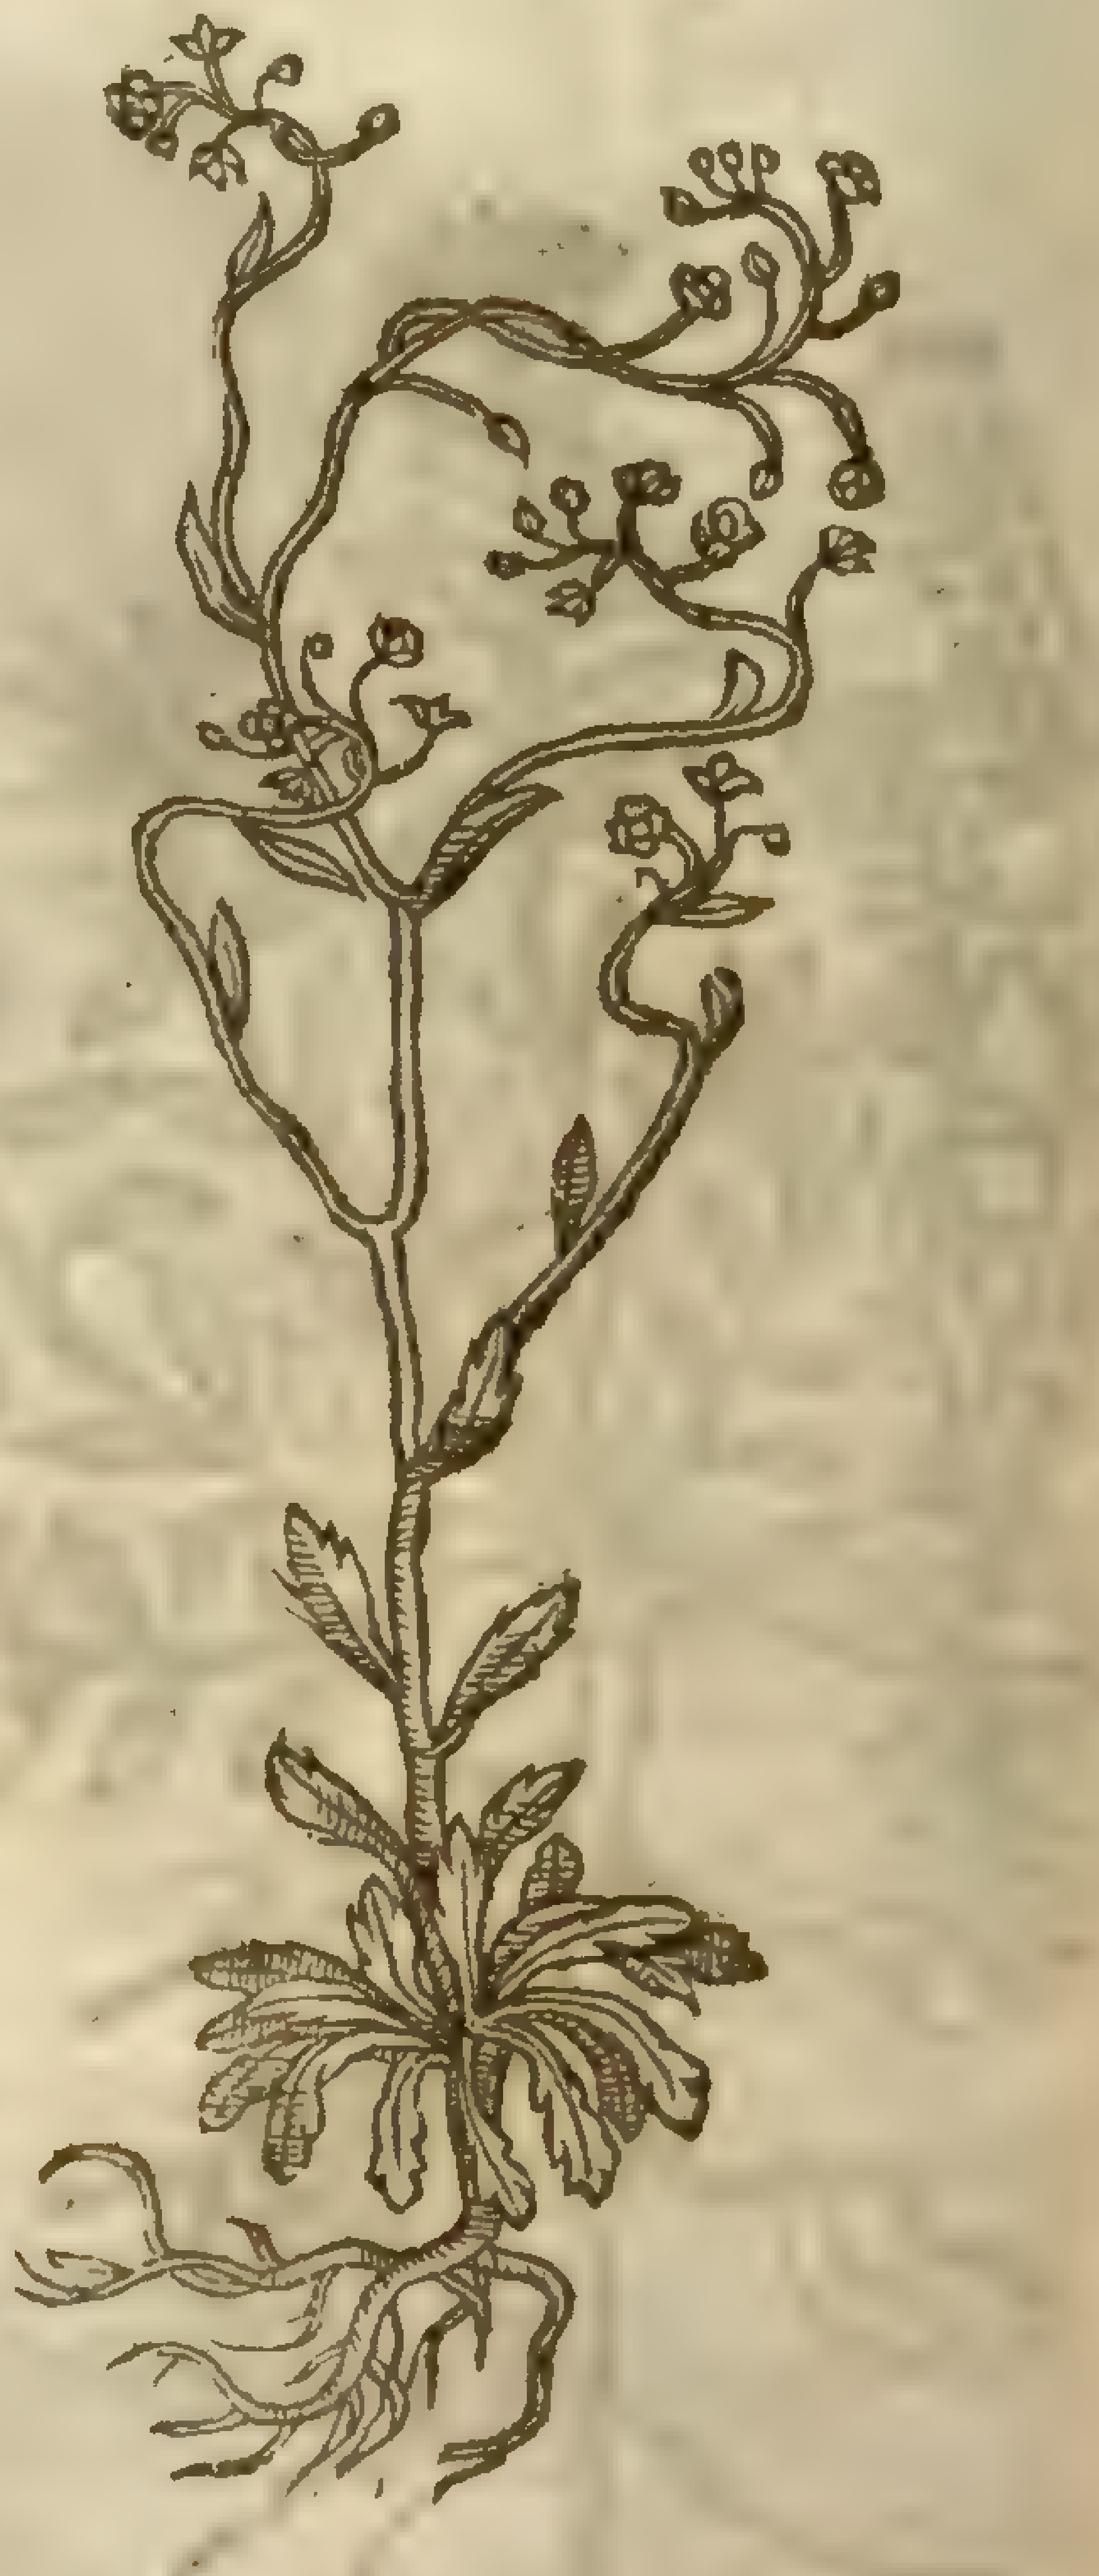
7 *Thlaſpi minus Cluſij.*
Cluſius his ſmall Muſtard.



Thlaspi perfoliatum, c
mati: dict.
Sm. pl. 3,172.

‡ 8 *Thlaſpi petræum minus.*
Small Rock Muſtard.



This ſmall kinde of muſtard hath a few ſmall leaues ſpred vpon the ground like thoſe of the leſſer Daiſie, but of a blewiſher green colour: from which riſe vp ſmall ſlender ſtalkes ſet with three, and ſomtimes foure ſmall ſharpe pointed leaues; the floures grow at the top, ſmal & white: the cods are flat, pouch-faſhion like thoſe of Shepheards purſe, and in each of them there is contained two or three yellowiſh ſeeds.

‡ 8 To theſe we may fitly adde another ſmall mountain Thlaſpi, firſt deſcribed by that diligent and learned Apothecary *Iohn Pona* of Verona, in his deſcription of mount Baldus. This from a threddy root bringeth forth many ſmall whitiſh leaues lying ſpred vpon the ground, and a little nicked about their edges. Among theſe riſeth vp a ſtalke ſome two or three handfulls high, diuaricated toward the top into diuers ſmall branches, vpon which grow white little floures conſiſting of foure leaues apiece: which fading, there follow round ſeed-veſſels like vnto thoſe of *Myagrum*; whence *Pona* the firſt deſcriber thereof calls it *Thlaſpi petræum Myagrodes*. The ſeed is as ſharpe and biting as any of the other Thlaſpies. This growes naturally in the chinks of the rocks, in that part of Baldus which is termed *Vallis frigida*, or the cold Valley.

¶ *The Place.*

Theſe kinds of Treacle muſtards grow vpon hils and mountains in corne fields, in ſtony barren and grauelly grounds.

¶ *The Time.*

Theſe floure in May, Iune, and Iuly. The ſeed is ripe in September.

¶ *The Names.*

‡ 1 This is *Thlaſpi oleraceum* of *Tabernamontanus*: *Thlaſpi primum* of *Daleſchampius*: *Thlaſpi mitius rotundifolium* of *Columna*. Our Author confounded it with that whoſe figure is the firſt in the enſuing chapter, and called it *Thlaſpi incanum*.

2 *Thlaſpi montanum peltatum* of *Cluſius*: and *Thlaſpi Pannonicum* of *Lobel* and *Tabern.*

3 *Thlaſpi Narbonenſe centunculi anguſtifolio* of *Lobel*: and *Thlaſpi maritimum* of *Daleſchamp.*

4 *Thlaſpi vmbellatum Naſturtij hortenſis folio Narbonenſe* of *Lobel*. The figures of this and the precedent were tranſpoſed in the former edition.

5 *Thlaſpi ſupinum luteum* of *Lobel*. Our Authors figure was a varietie of the next following.

6 *Thlaſpi album ſupinum* of *Lobel*: *Thlaſpi montanum ſecundum* of *Cluſius*.

7 *Thlaſpi pumilum* of *Cluſius*: *Thlaſpi minimum* of *Tabern.*

8 *Thlaſpi petræum Myagrodes* of *Pona*: *Thlaſpi tertium ſaxatile* of *Camerarius*, in his *Epit.* of *Matthiolus*. ‡

¶ *The Temperature and Vertues.*

The ſeeds of theſe churliſh kinds of Treacle muſtard haue a ſharp or biting qualitie, breake inward apoſtumes, bring down the flours, kil the birth, and help the Sciatica or pain in the hip. They purge choler vpward and downward, if you take two ounces and a halfe of them, as *Dioſcorides* writeth. They are mixed in counterpoiſons, as Treacle, Mithridate, and ſuch like compoſitions.

Chap. 22.

Of wooddy Muſtard.

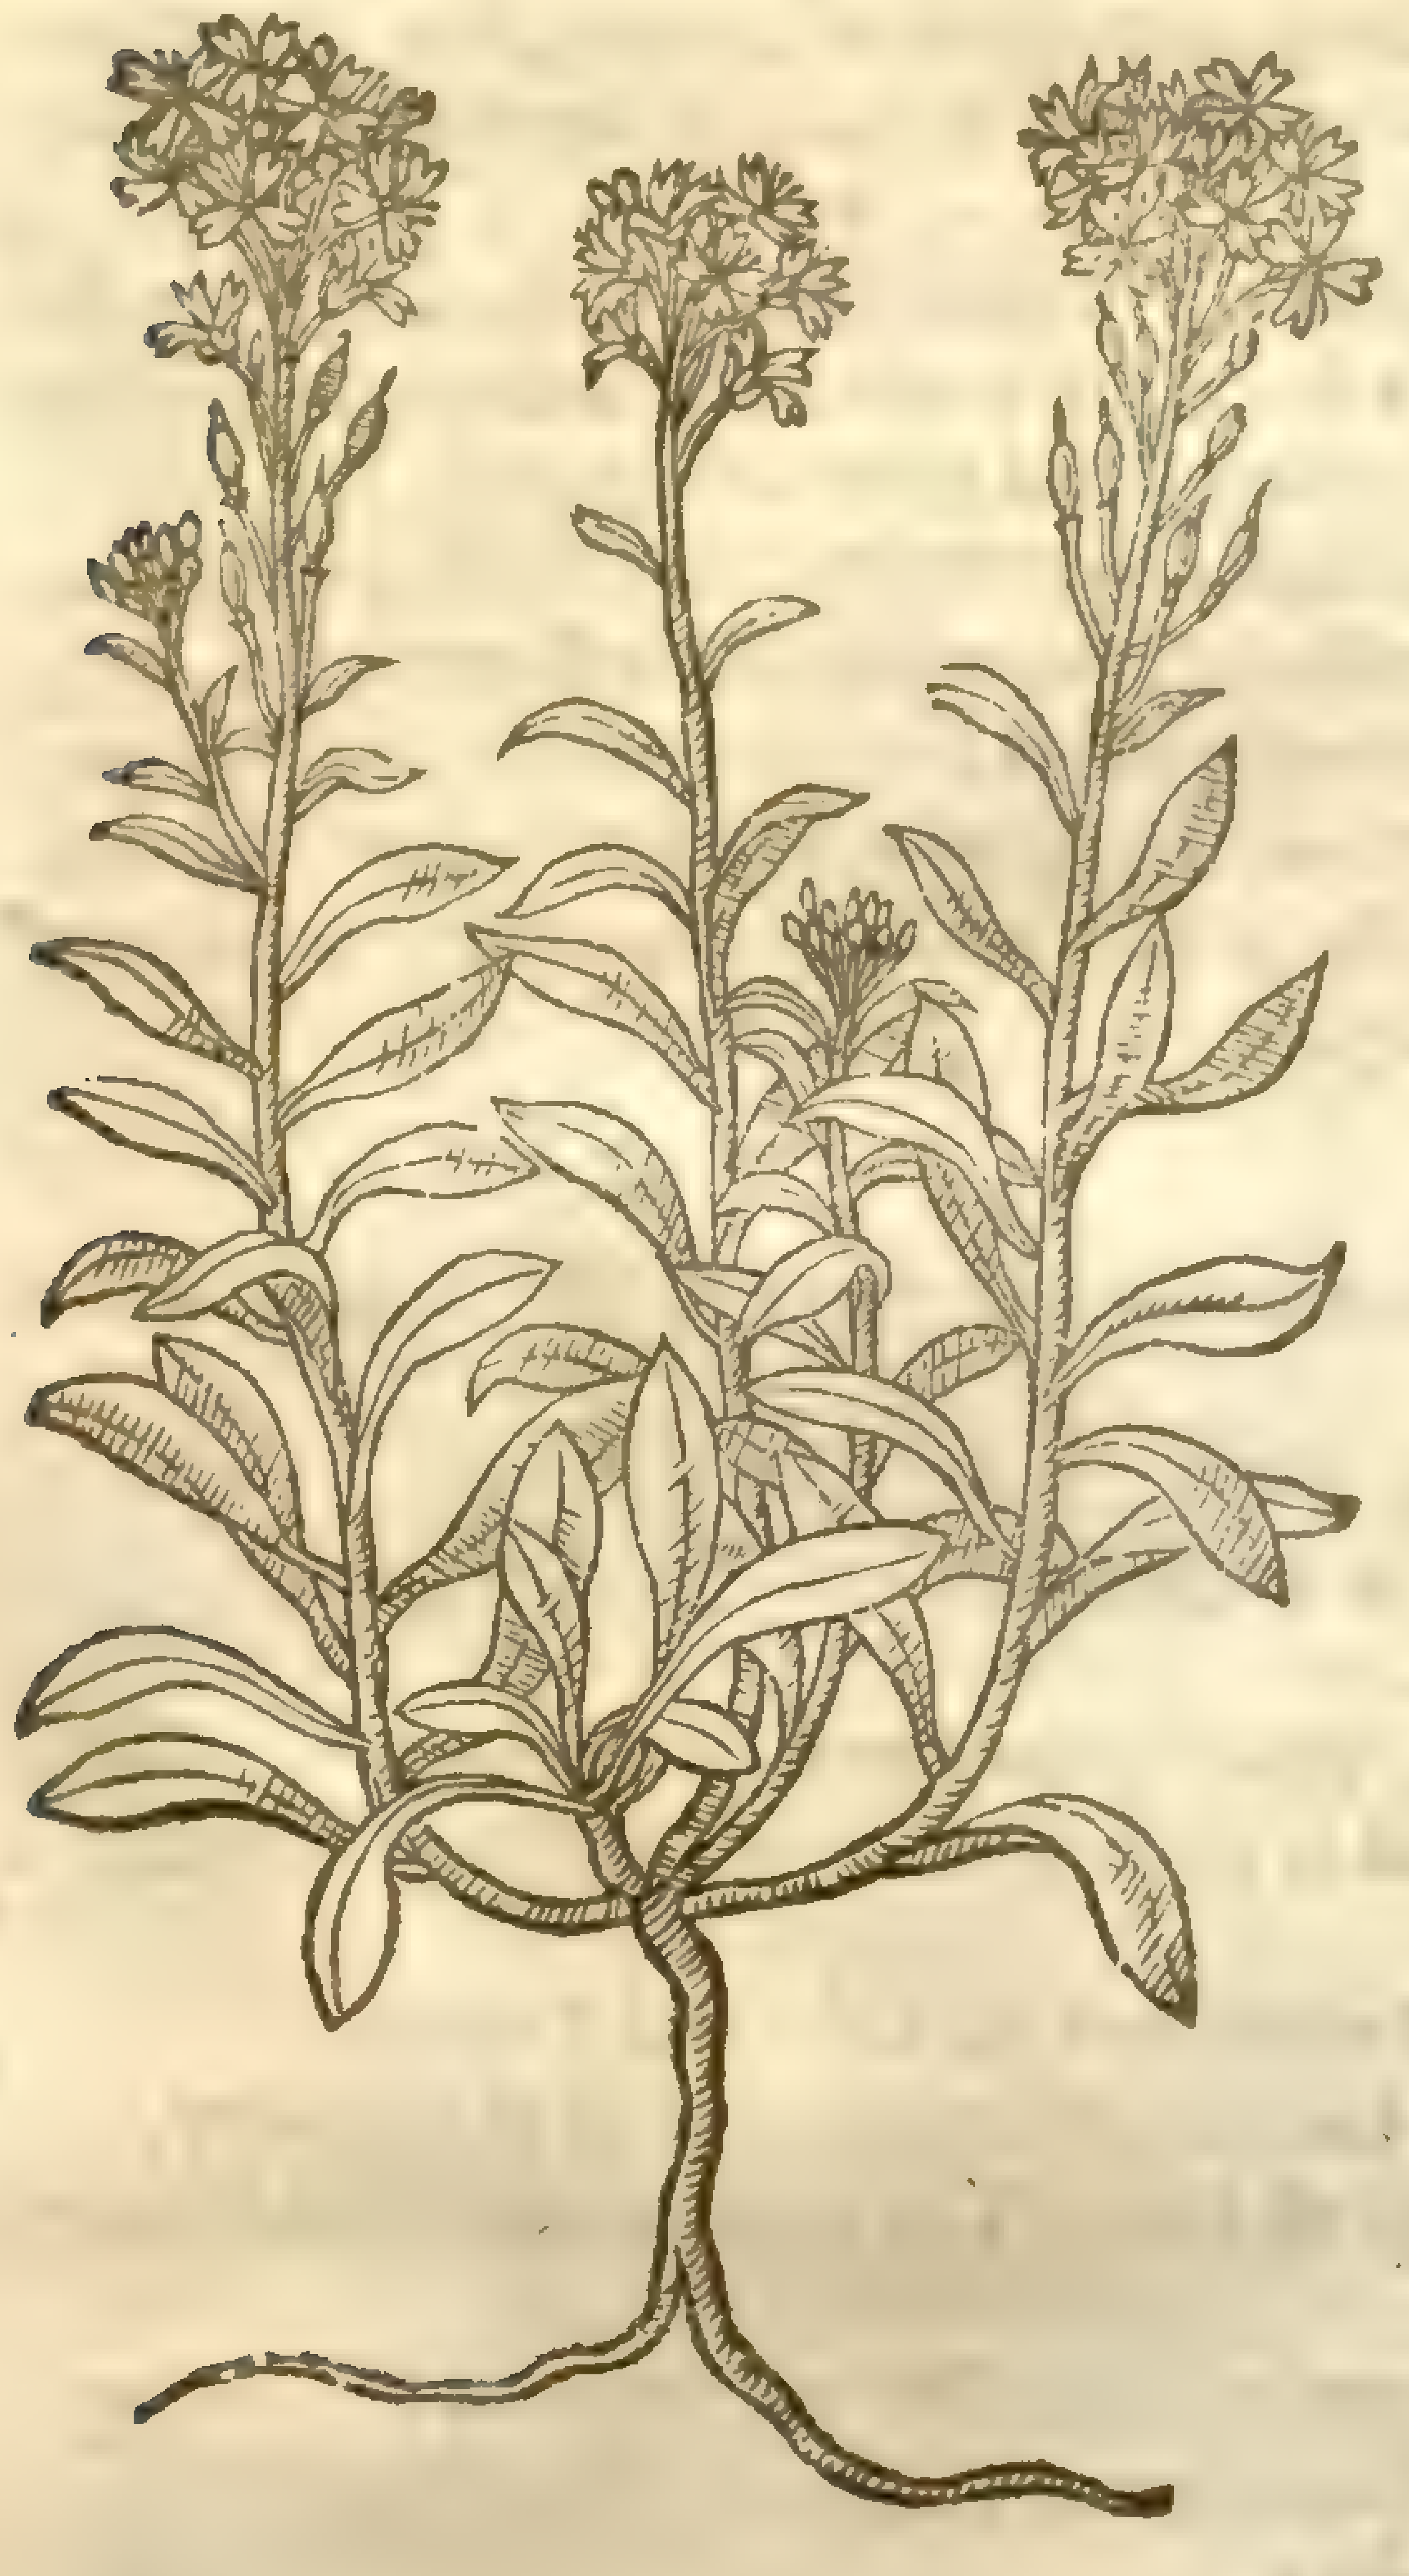
¶ *The Deſcription.*

2 Wooddy muſtard hath long narrow leaues declining to whiteneſſe, like thoſe of the ſtock Gillofloure, very like the leaues of Roſemary, but ſomewhat broader, with rough ſtalks very tough & pliant, being of the ſubſtance of wood: the flours grow at the top, white of colour: the ſeeds follow, in taſte ſharp and biting. The huſks or ſeed-veſſels are round and ſomewhat longiſh.

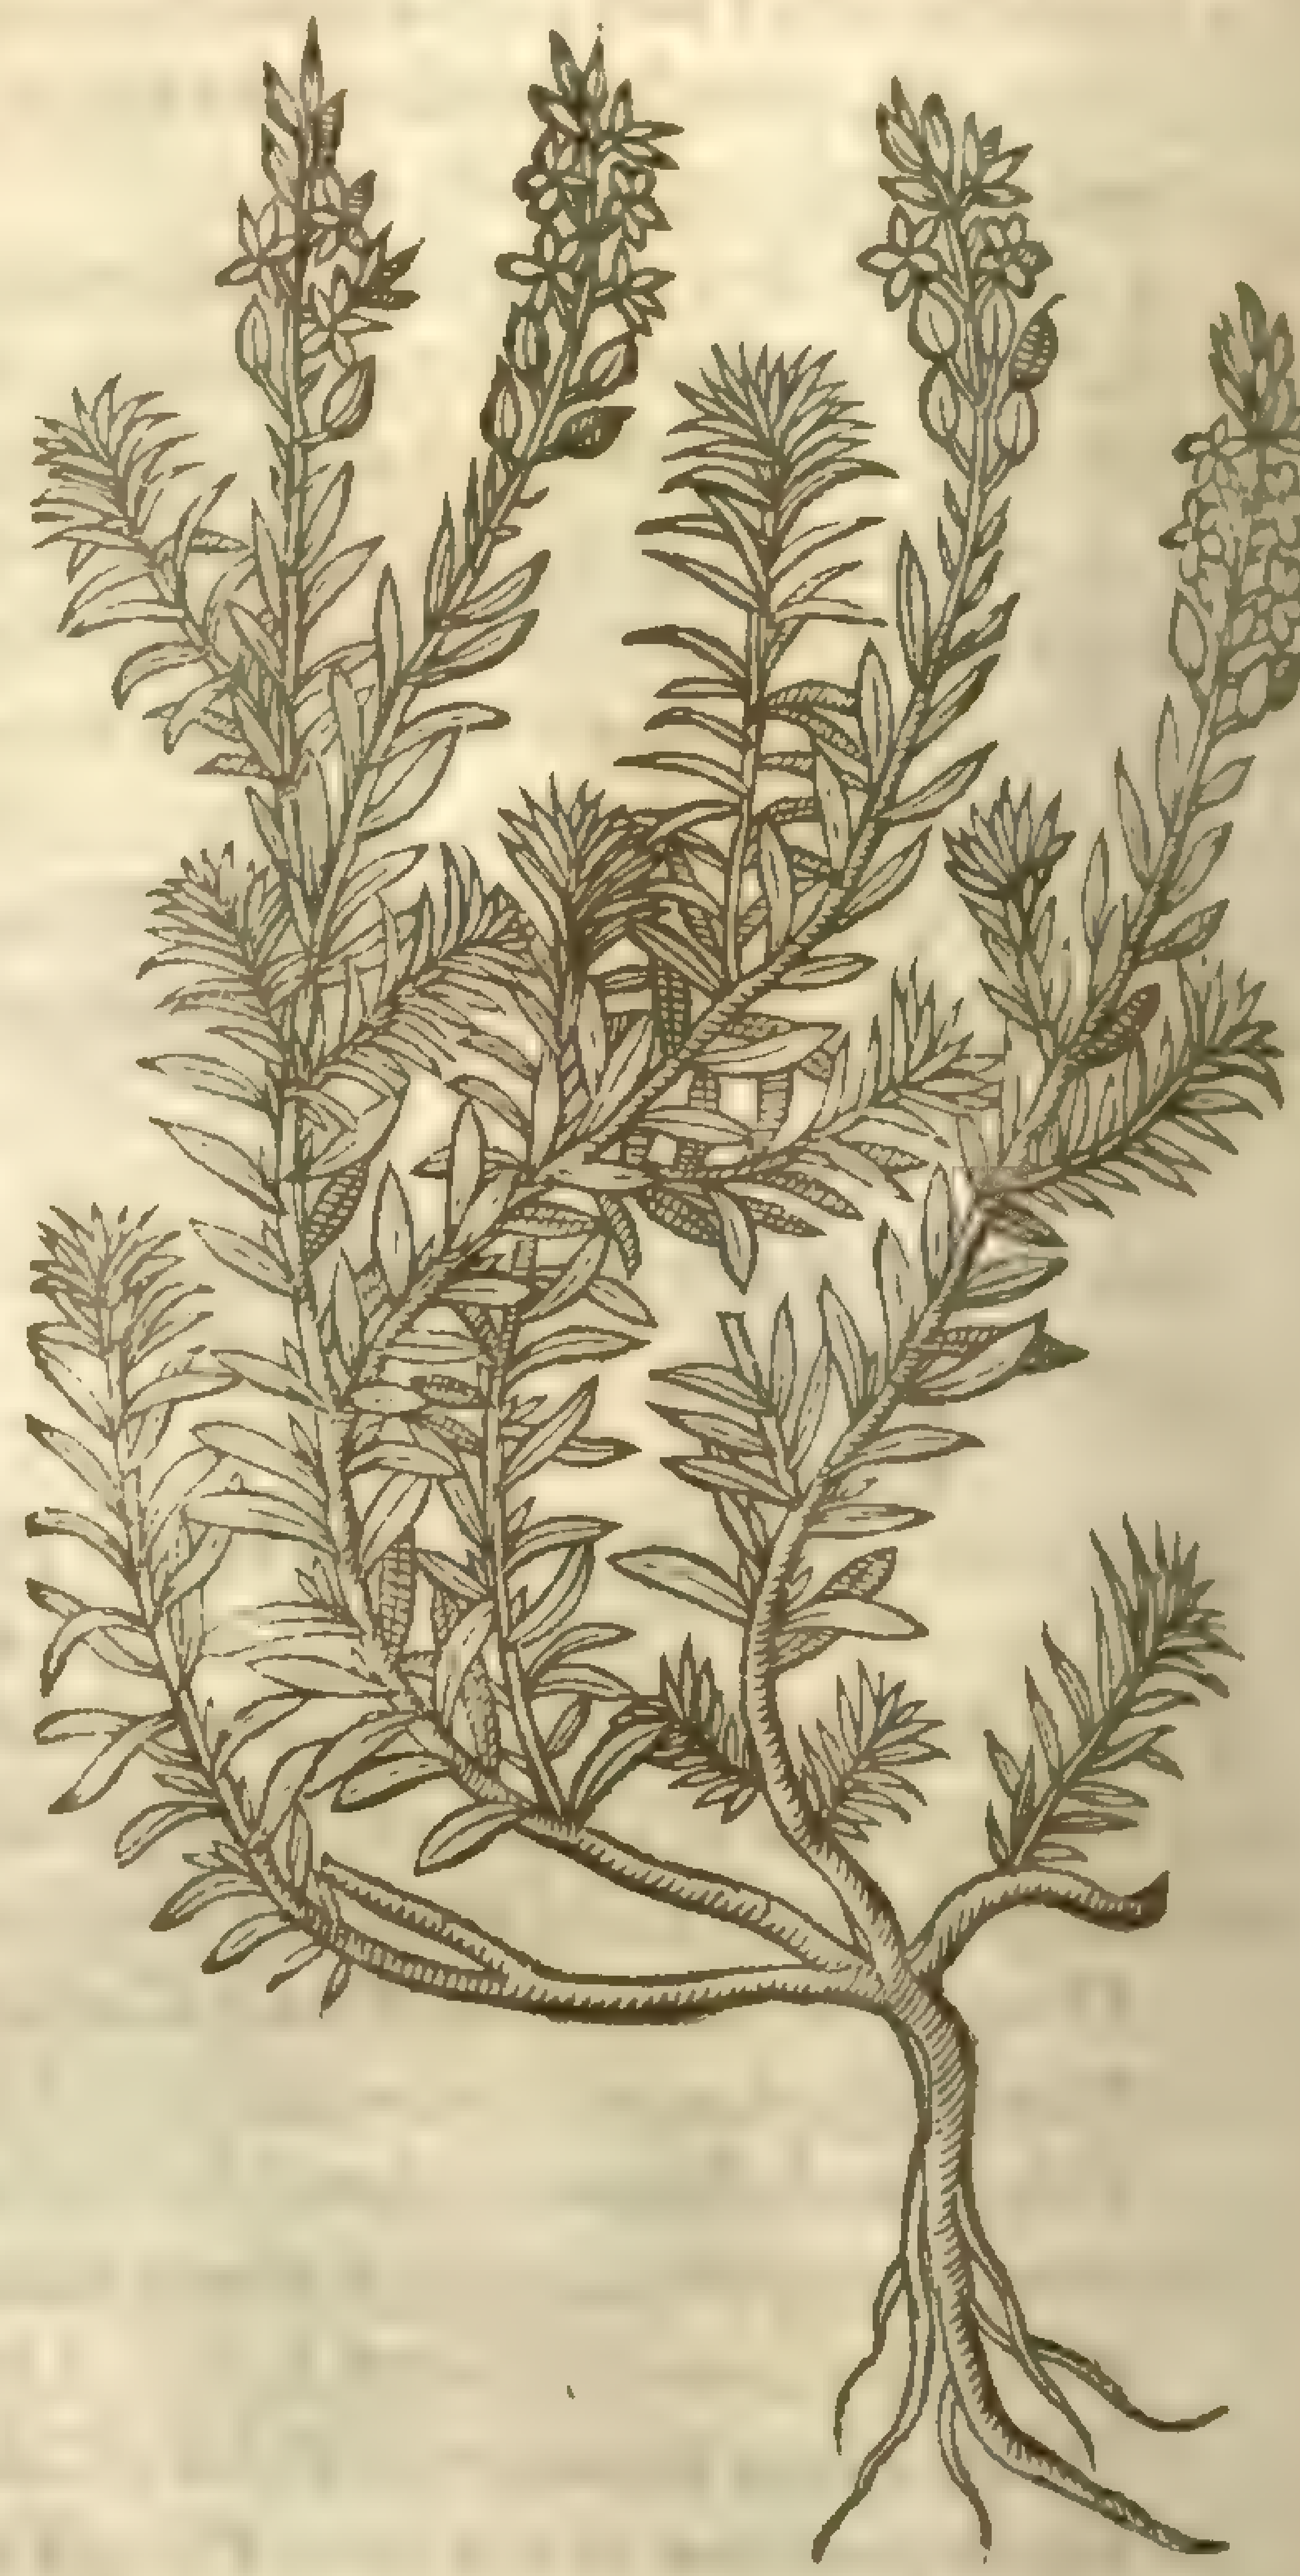
2 Small wooddy muſtard growes to the height of two cubits, with many ſtalks ſet with ſmal narrow leaues like thoſe of Hyſſop, but rougher; and at the top grow floures like thoſe of Treacle muſtard, or Thlaſpi. The whole plant groweth as a ſhrub or hedge-buſh.

3 Thorny muſtard groweth vp to the height of foure cubits, of a wooddy ſubſtance like vnto a hedge-buſh or wild ſhrub, with ſtalks beſet with leaues, floures, and ſeeds like the laſt before mentioned; agreeing in all points, ſaue in the cruell pricking ſharpe thornes wherewith this plant is armed; the other not. The root is tough, woody, and ſome ſtrings or fibres anexed thereto.

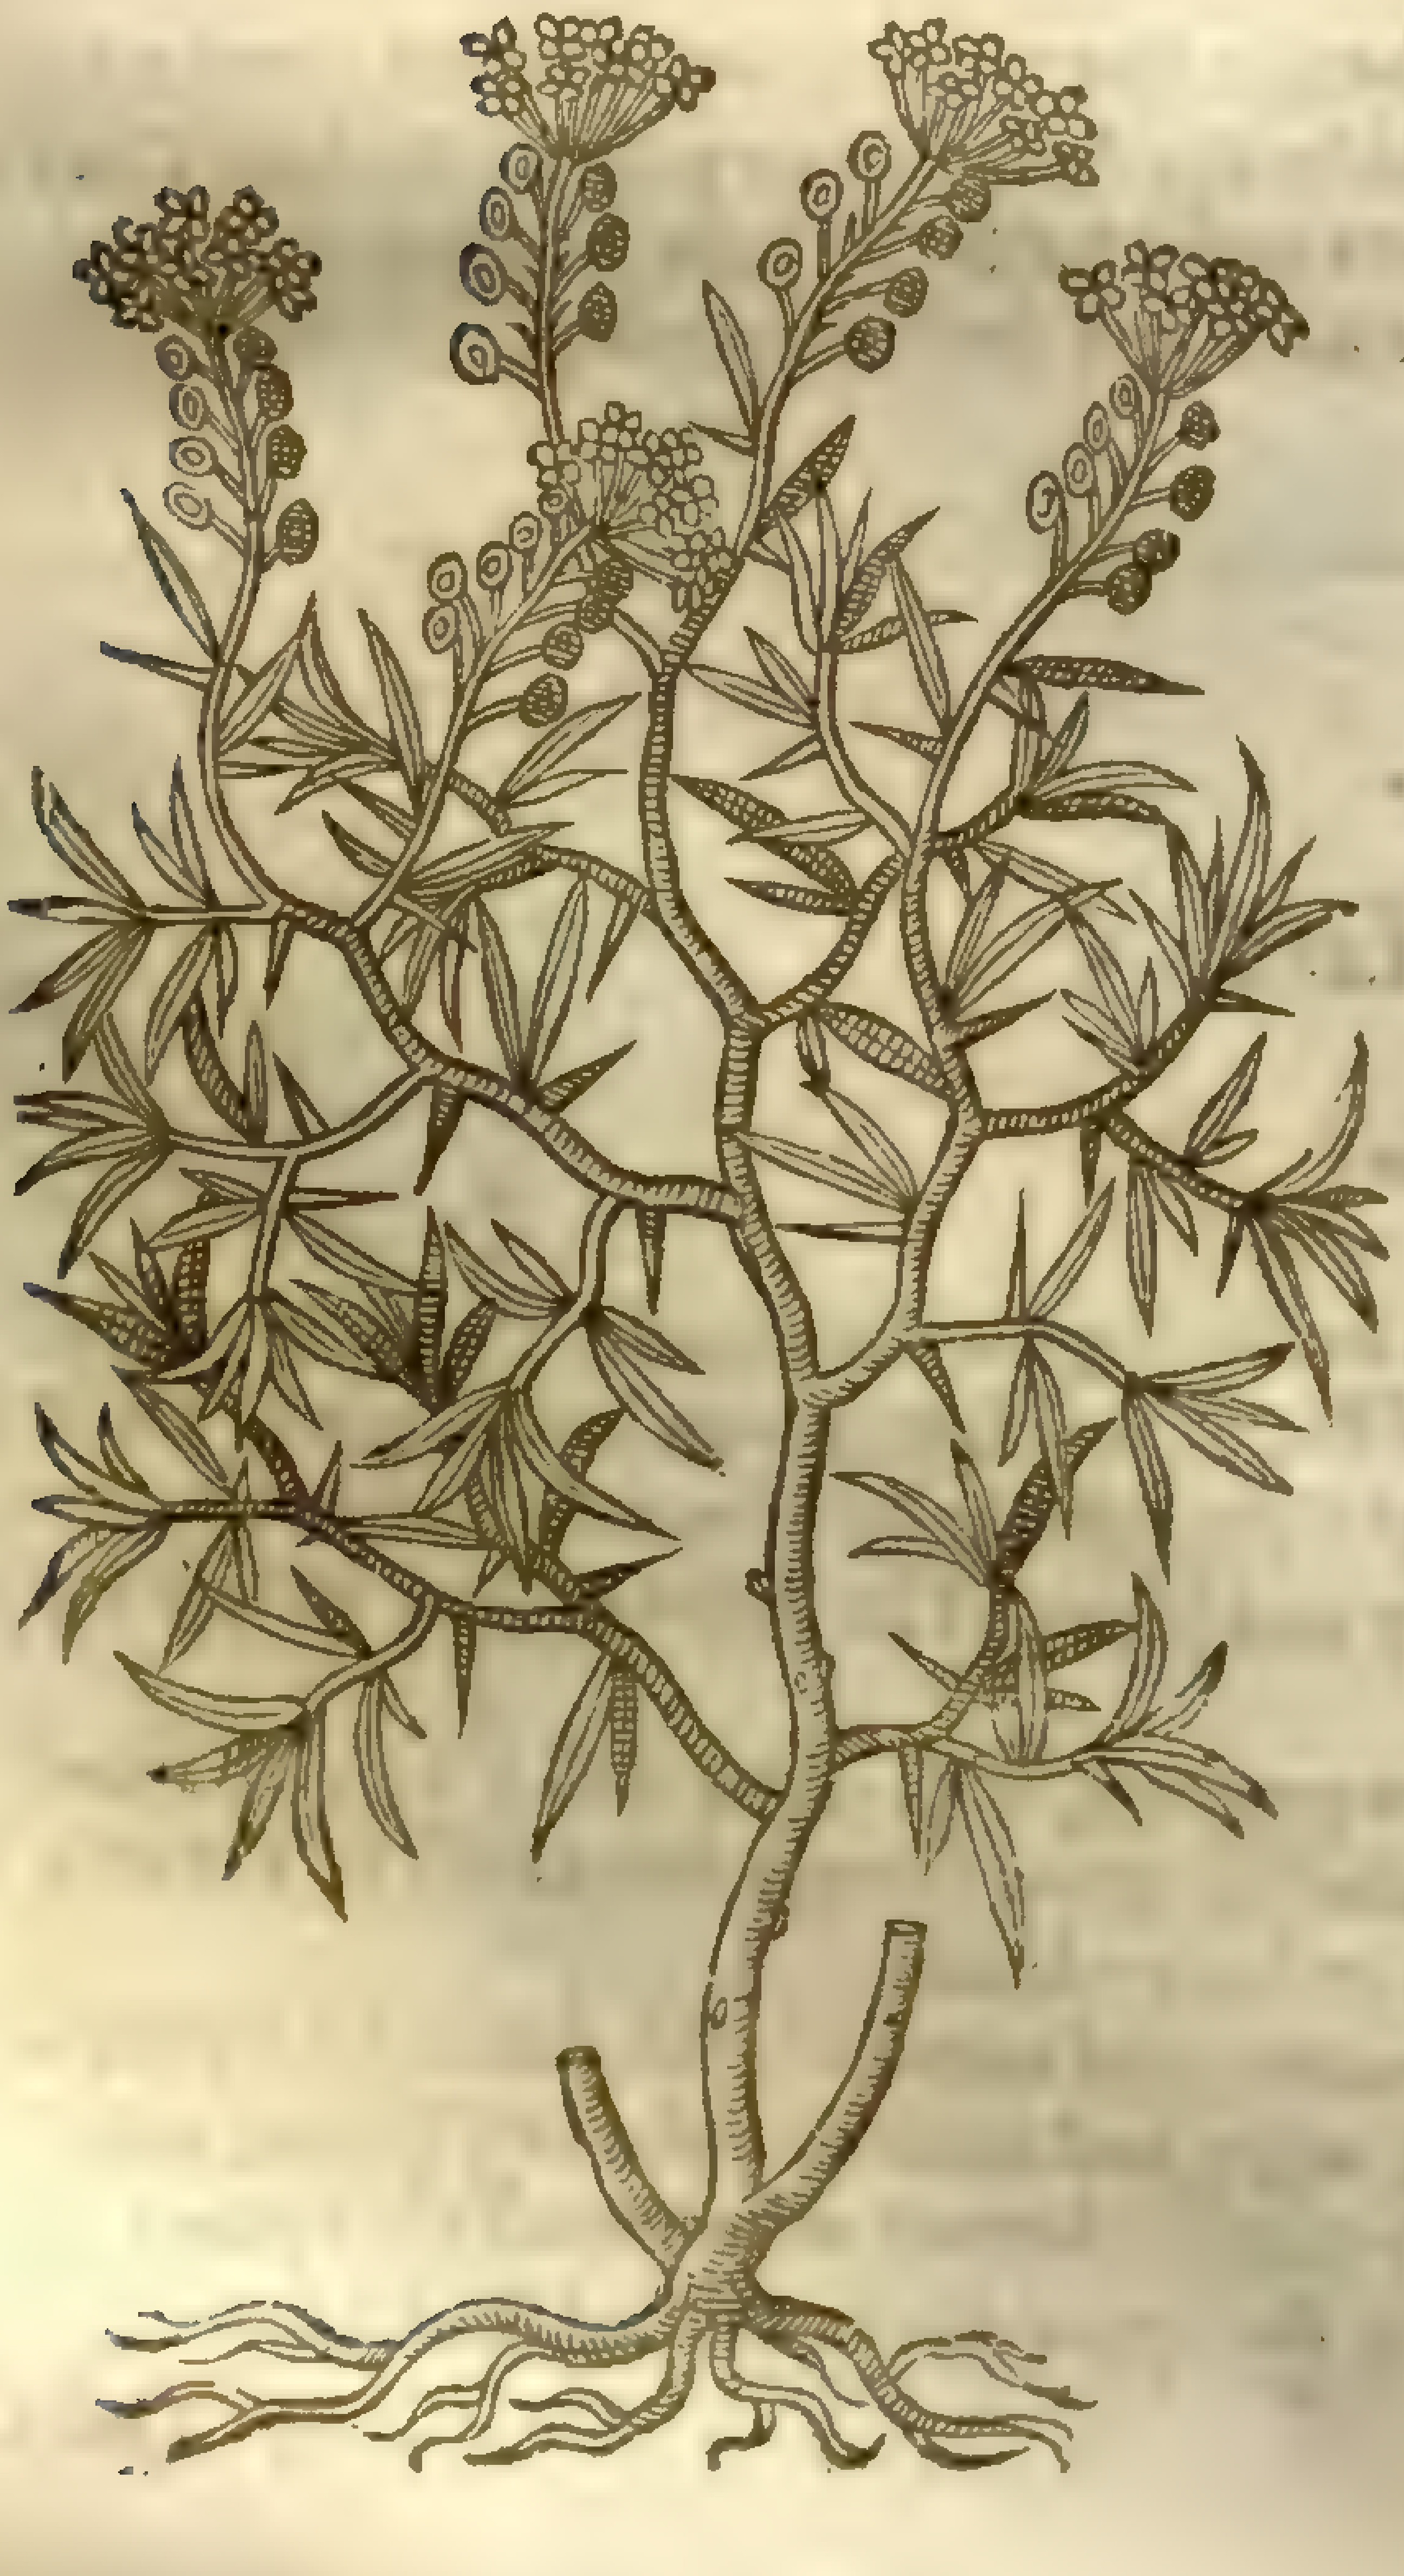
1 *Thlaſpi fruticoſum incanum.*
Hoary wooddy muſtard.



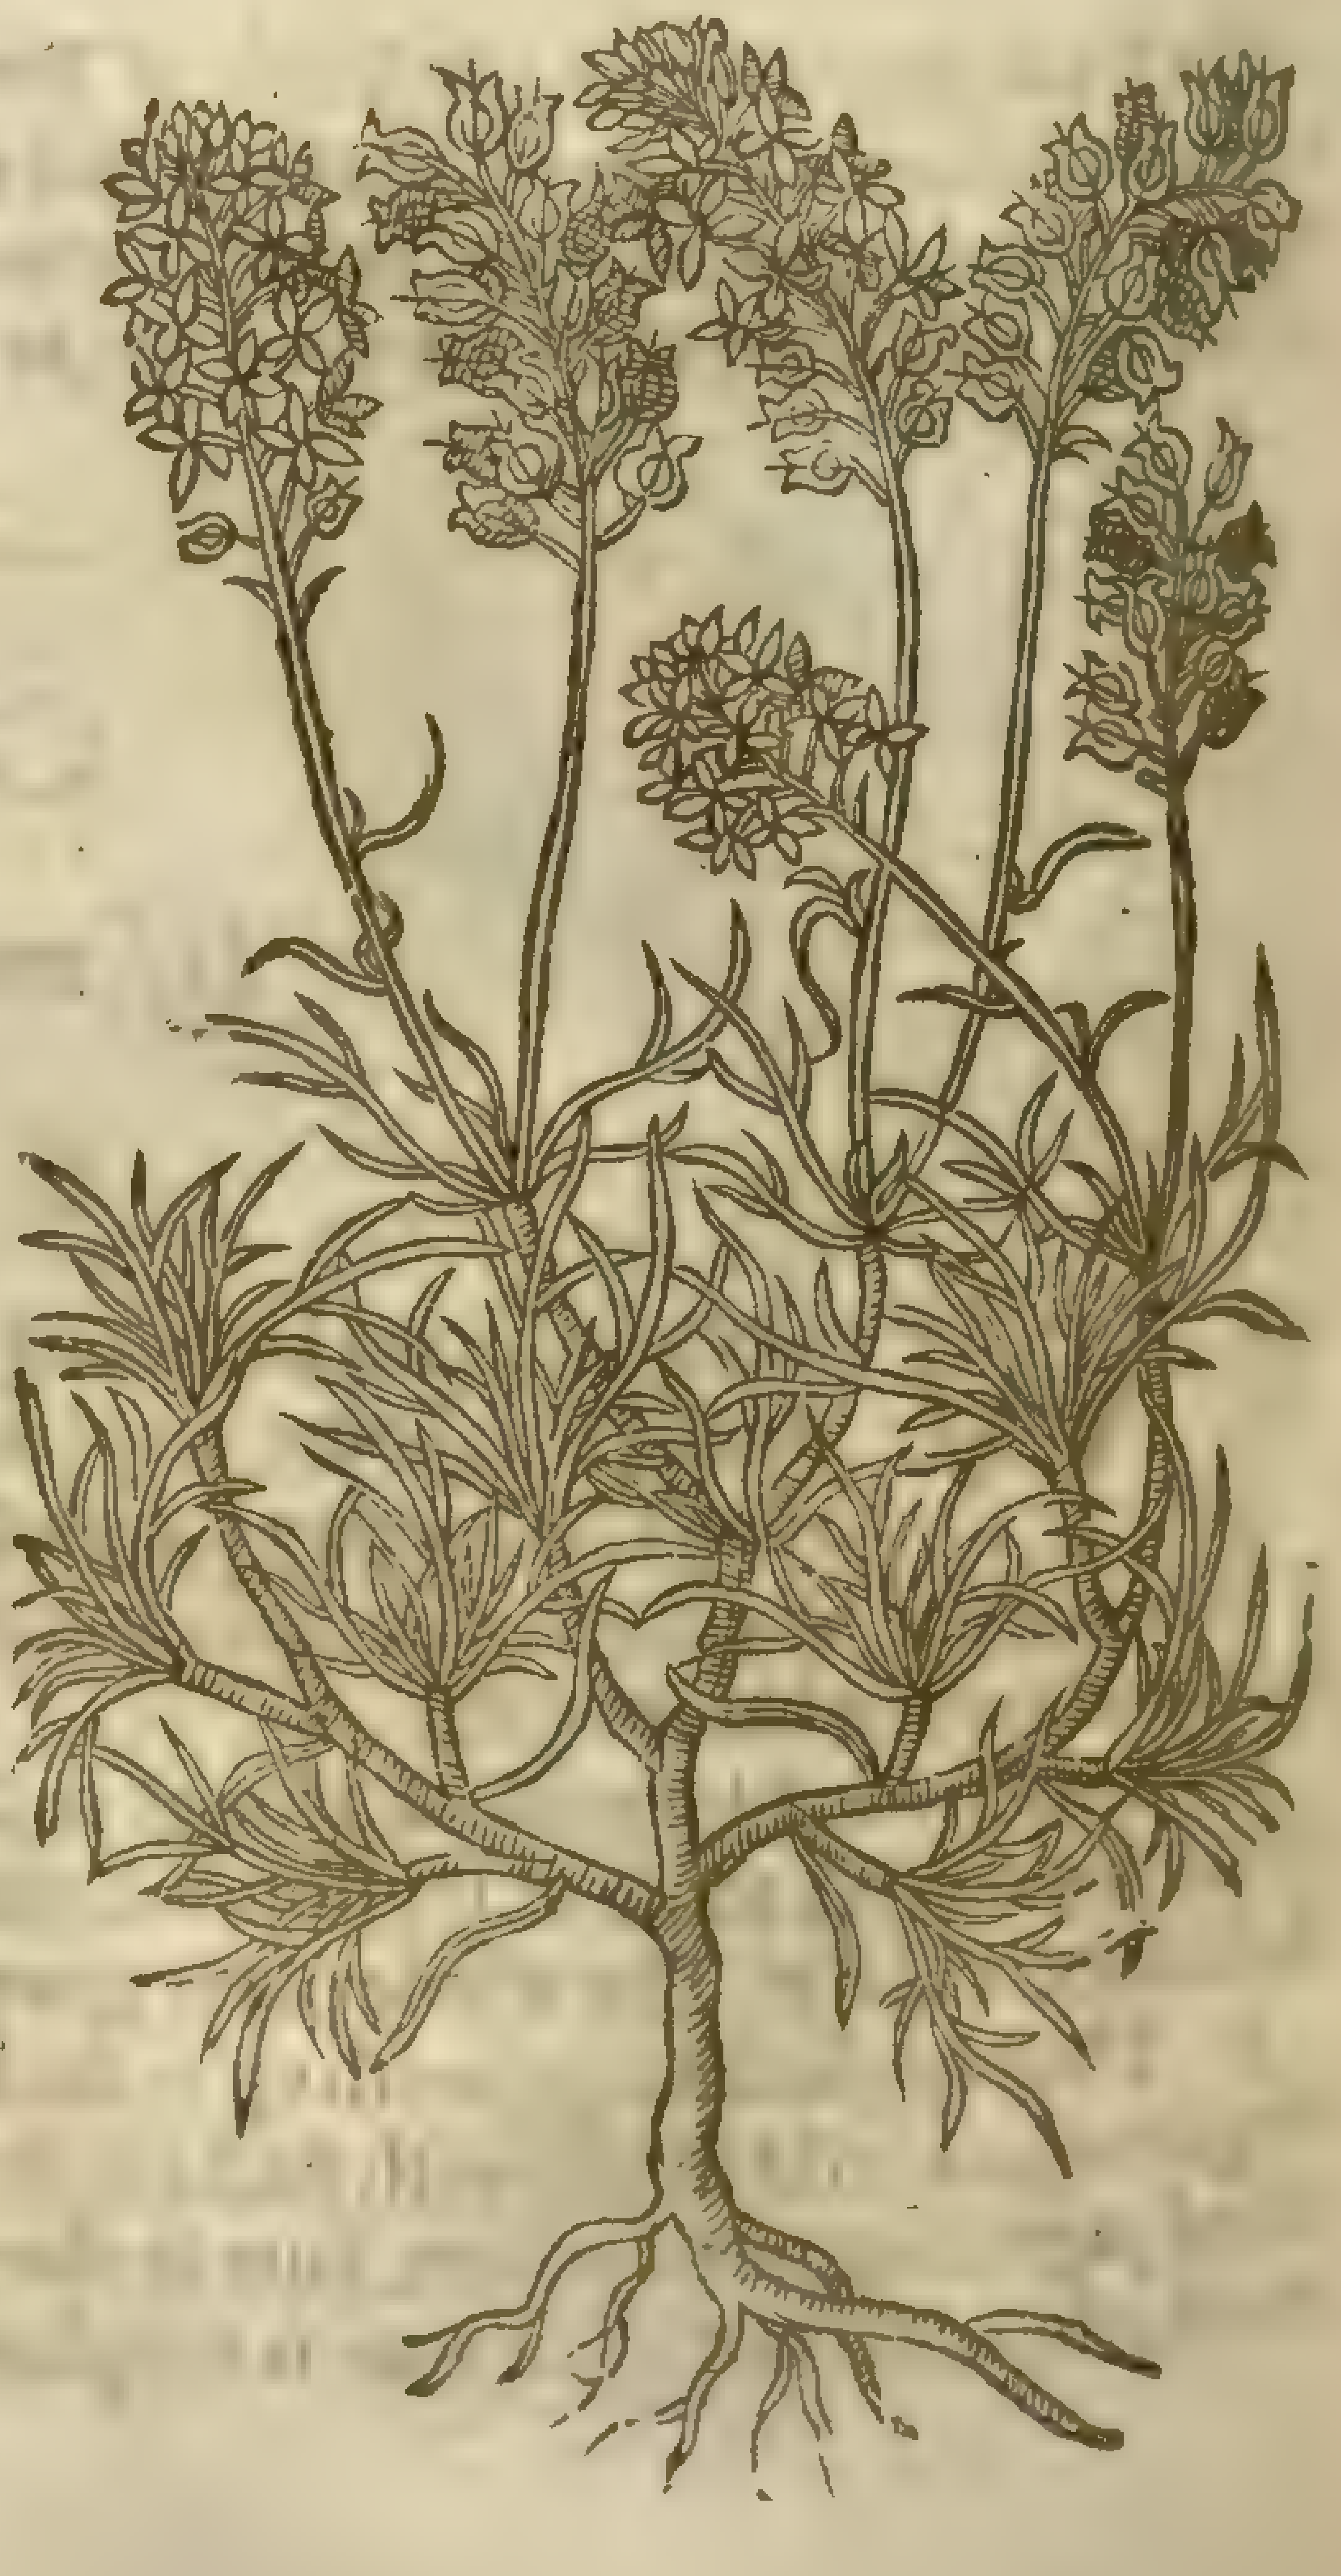
2 *Thlaſpi fruticoſum minus.*
Small wooddy Muſtard.



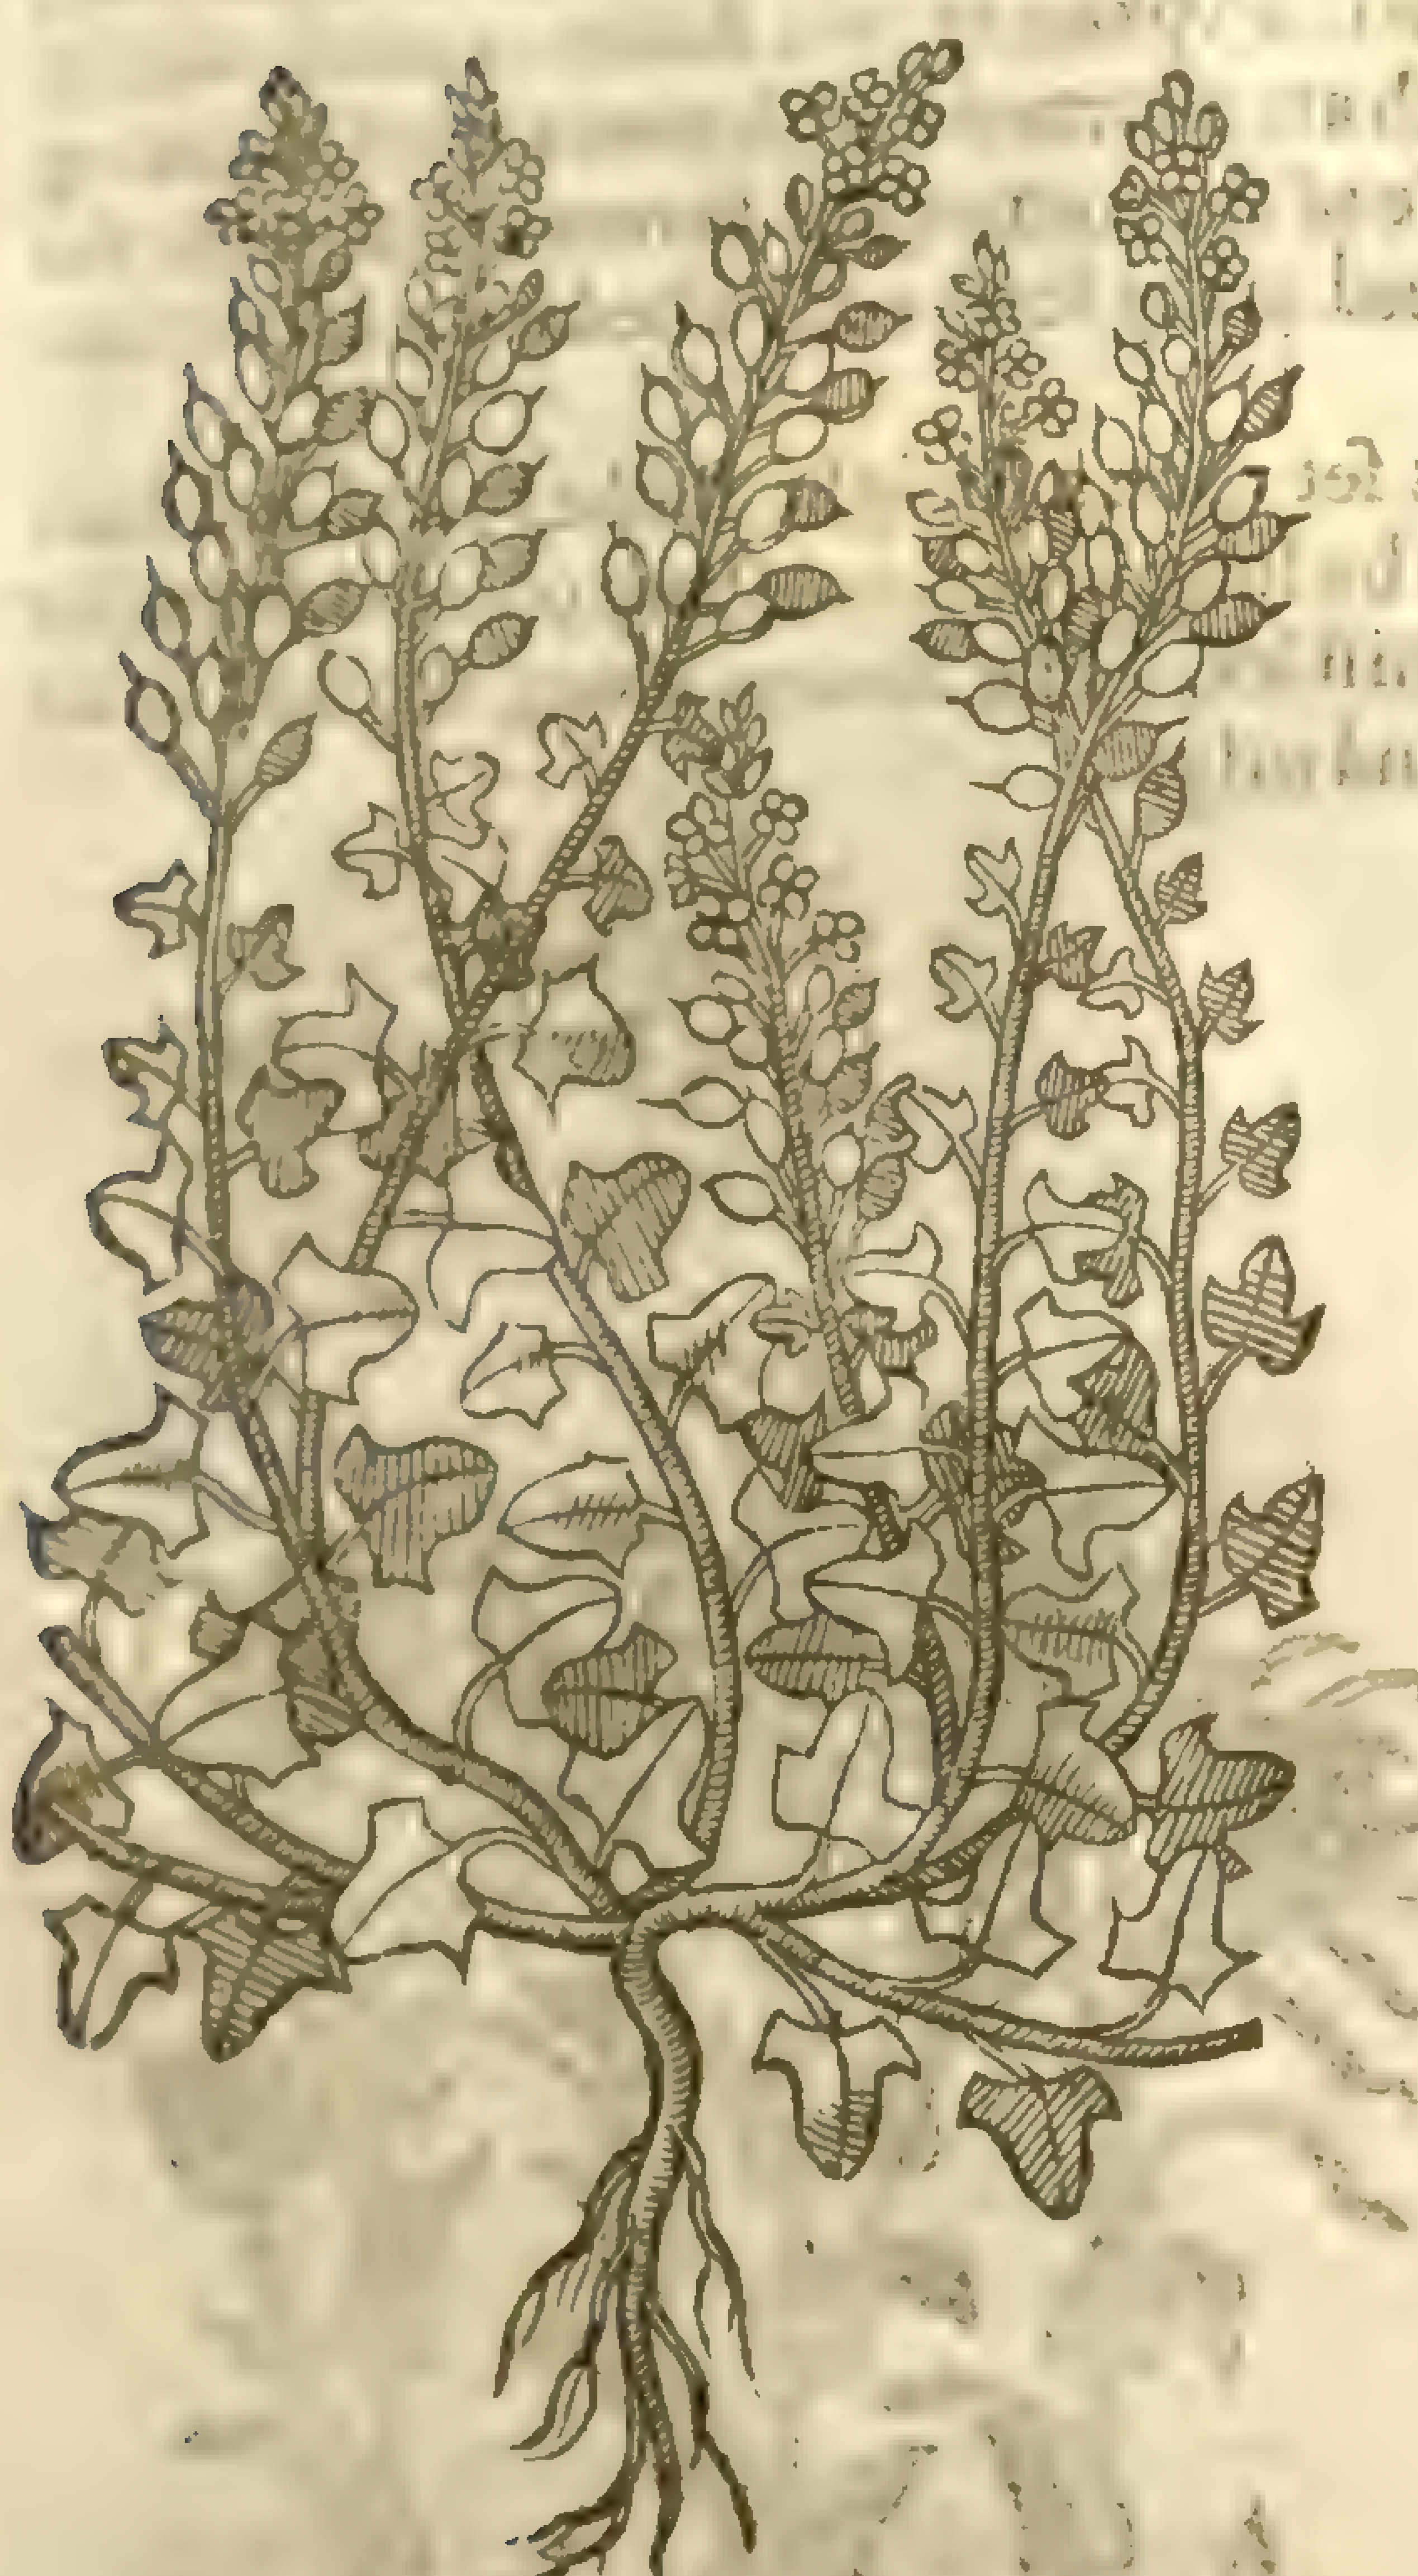
3 *Thlaſpi ſpinoſum.*
Thorny Muſtard.



‡ 4 *Thlaſpi fruticoſum folio Leucoij marin.*
Buſhy Muſtard.



‡ 5 *Thlaſpi hederacium.*
Ivy muſtard.



Cochlearia danica, [illegible] See p. 3.177

4 There is another ſort of wooddy muſtard growing in ſhadowy and obſcure mountaines and rough ſtony places, reſembling the laſt deſcribed; ſauing that this plant hath no prickes at all; but many ſmal branches ſet thicke with leaues, reſembling thoſe of the leſſer ſea *Leucoion*: the floures are many and white: the ſeed like the other Thlaſpies: the root is wooddy and fibrous.

‡ 5 There is (ſaith *Lobel*) in Portland and about Plimouth, and vpon other rockes on the ſea coaſt of England, a creeping little herbe hauing ſmall red creſted ſtalkes about a ſpanne high: The leaues are thicke, and faſhioned like Ivy: the white floures and ſmall ſeeds do in taſt and ſhape reſemble the Thlaſpies. ‡

¶ *The Place.*

‡ 1 The firſt of theſe groweth about Mechline.

2. 3. 4. Theſe plants grow vpon the Alpiſh and Pyrene mountaines: in Piemont and in Italy, in ſtony and rocky grounds.

¶ *The Time.*

They floure when the other kinds of Thlaſpies do; that is, from May to the end of Auguſt.

¶ *The Names.*

‡ 1 This *Cluſius* and *Lobel* call *Thlaſpi incanum Mechlinienſe*: *Bauhine* thinks it to be the *Iberis prima* of *Tabernamontanus*, whoſe figure retained this place in the former edition.

2 This is *Thlaſpi fruticoſum alterum* of *Lobel*: *Thlaſpi 5 Hiſpanicum* of *Cluſius*.

3 *Lobel* calls this, *Thlaſpi fruticoſum ſpinoſum*.

4 *Camerarius* calls this, *Thlaſpi ſempervirens biflorum folio Leucoij, &c.* *Lobel*, *Thlaſpi fruticoſum folio Leucoij, &c.*

5 This *Lobel* calls *Thlaſpi hederaceum*. †

¶ *The Nature and Vertues.*

I finde nothing extant of their nature or vertues; but they may be referred to the kinds of Thlaſpies, whereof no doubt they are of kindred and affinitie, as well in facultie as forme.

Chap. 23. *Of Towres Muſtard.*

¶ *The Deſcription.*

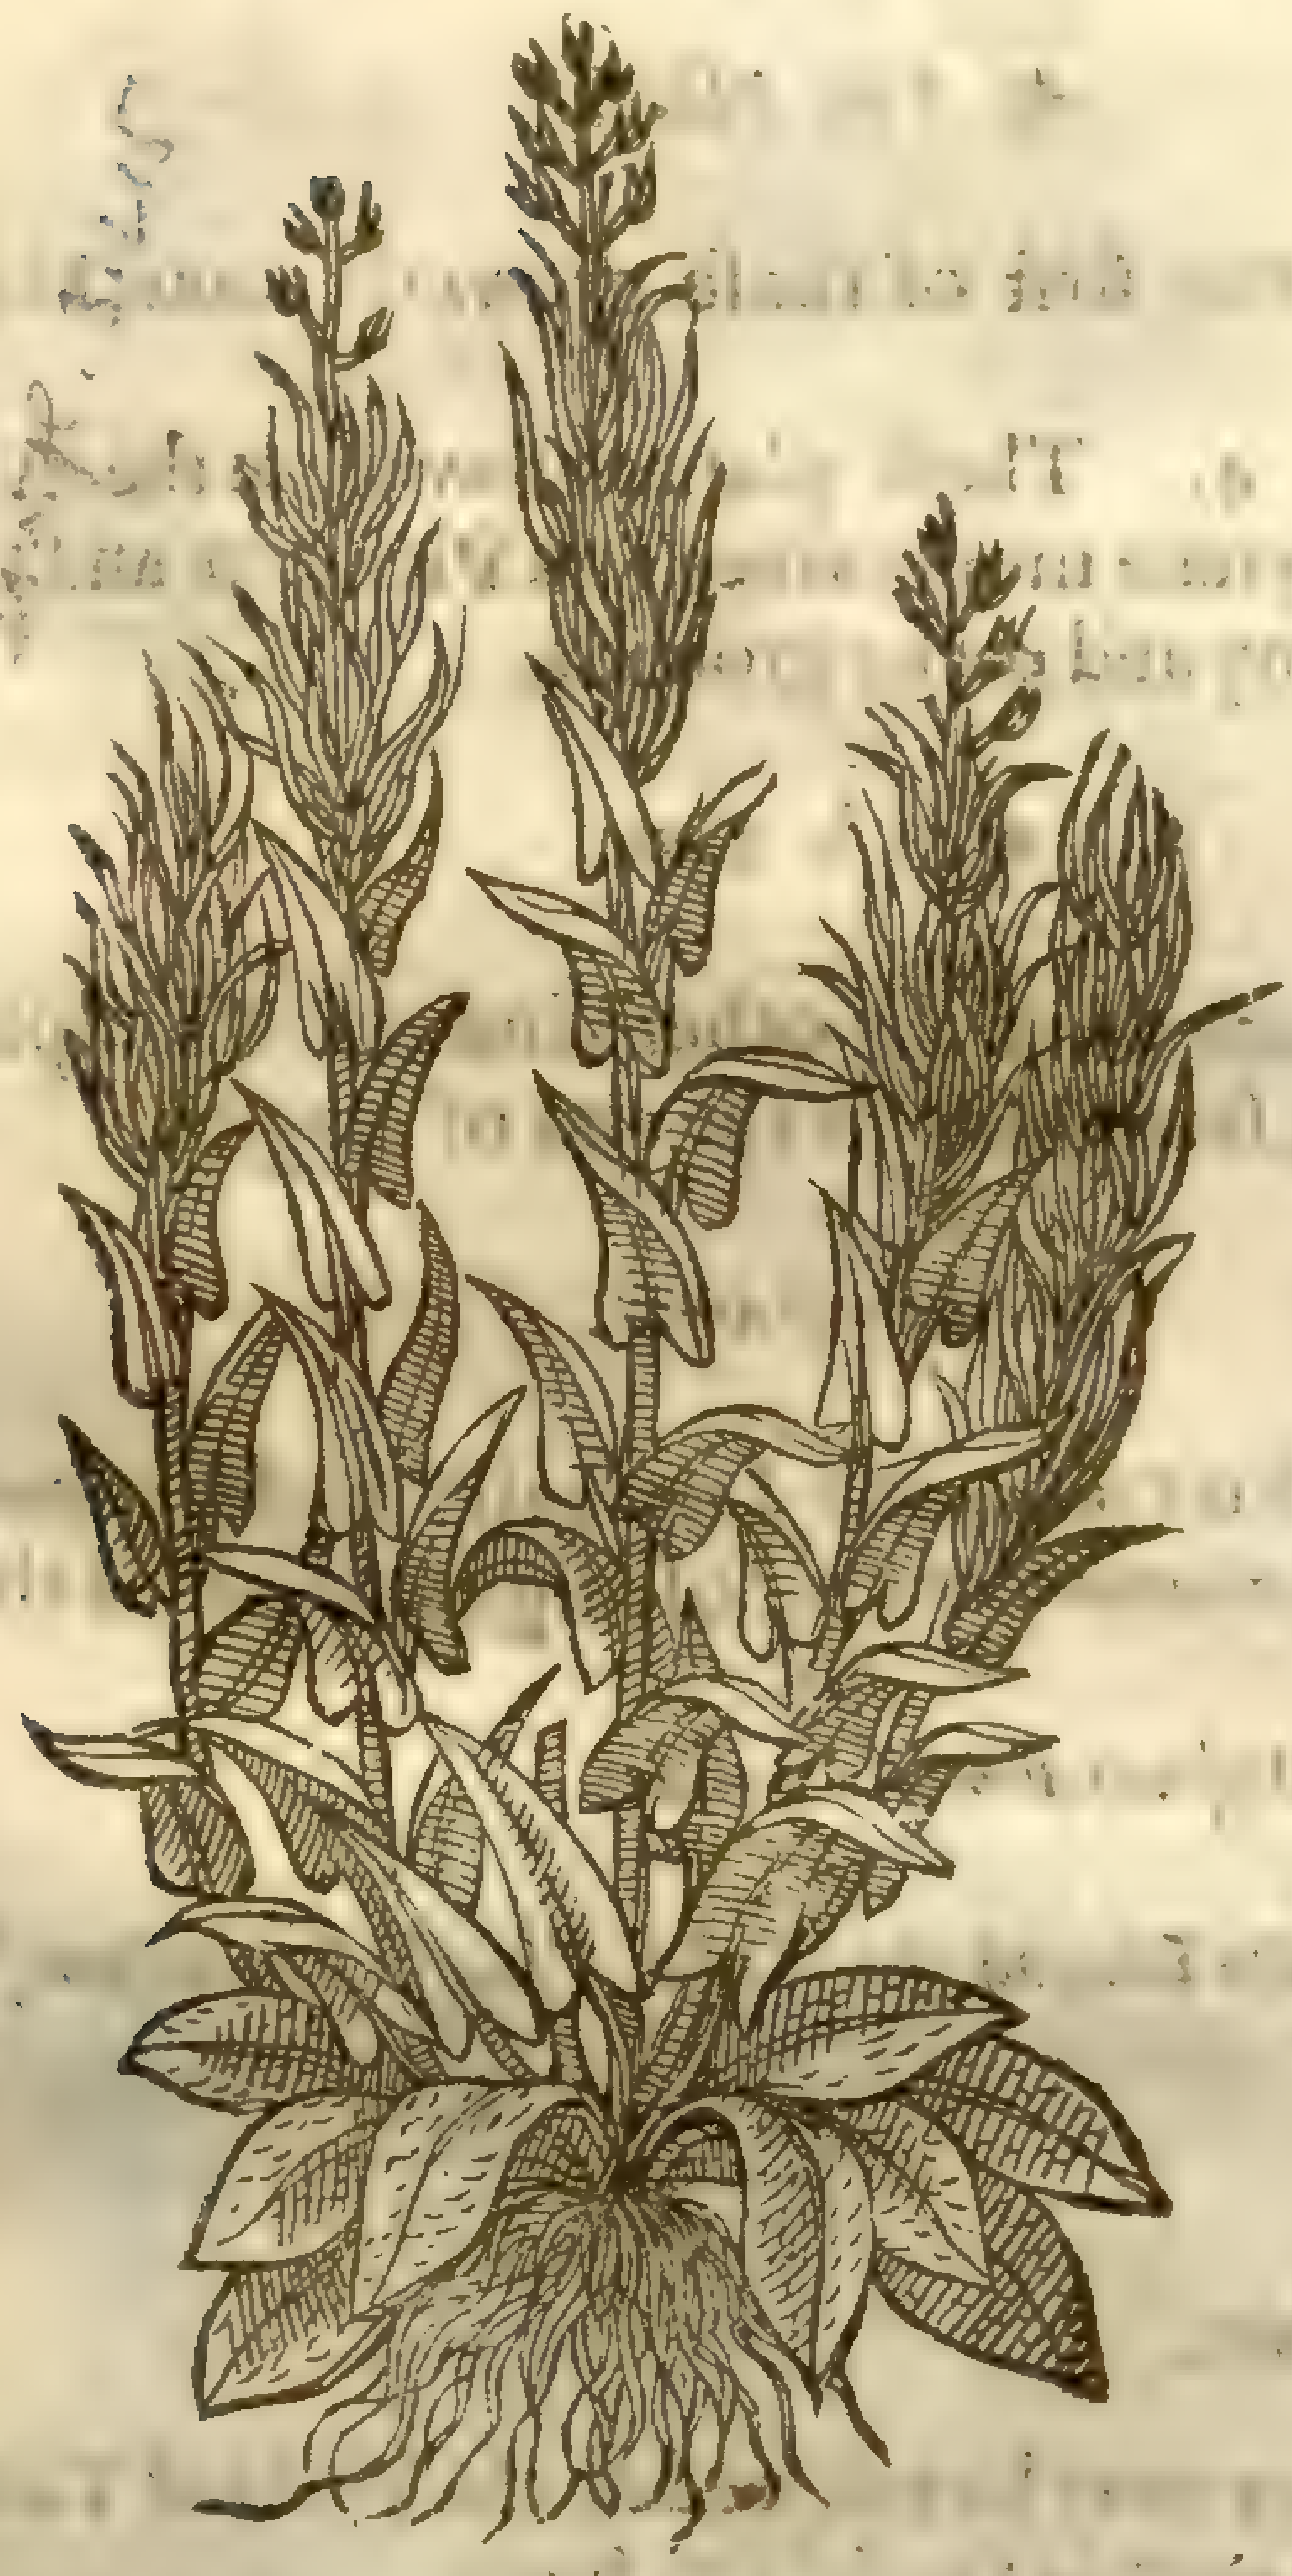
1 Towers Muſtard hath bin taken by ſome for a kind of Muſtard, and referred by them to it: of ſome, for one of the Muſtards, and ſo placed amongſt the Thlaſpies as a kinde thereof; and therefore my ſelfe muſt needs beſtow it ſomewhere with others. Therefore I haue with *Cluſius* and *Lobel* placed it among the Thlaſpies as a kind thereof. It comes out of the ground with many long and large rough leaues, like thoſe of Hounds tongue, eſpecially thoſe next the ground: among which riſeth vp a long ſtalke a cubit or more high, ſet about with ſharpe pointed leaues like thoſe of Woad. The floures grow at the top, if I may terme them floures, but they are as it were a little duſty chaffe driuen vpon the leaues and branches with the winde: after which come very ſmall cods, wherein is ſmal reddiſh ſeed like vnto that of Chameline or Engliſh Worm-ſeed, with a root made of a tuft full of innumerable threds or ſtrings.

‡ 2 This ſecond kinde hath a thicker and harder root than the precedent,hauing alſo fewer fibres; the leaues are bigger than thoſe of the laſt deſcribed,ſomwhat curled or ſinuated, yet leſſe rough,and of a lightiſh green : in the midſt of theſe there riſe vp one or two ſtalkes or more,vſually ſome two cubits high,diuided into ſome branches,which are adorned with leaues almoſt ingirting them round at their ſetting on.The floures are like thoſe of the former,but ſomewhat larger,& the colour is either white,or a pale yellow : after theſe ſucceed many long cods filled with a ſeed ſomwhat larger than the laſt deſcribed. ‡

3 Gold of pleaſure is an herbe with many branches ſet vpon a ſtreight ſtalke,round,and diuided into ſundry wings,in height two cubits. The leaues be long,broad,and ſharp pointed,ſomwhat ſnipt or indented about the edges like thoſe of Sow-Thiſtles. The floures along the ſtalkes are white : the ſeed contained in round little veſſels is fat and oily.

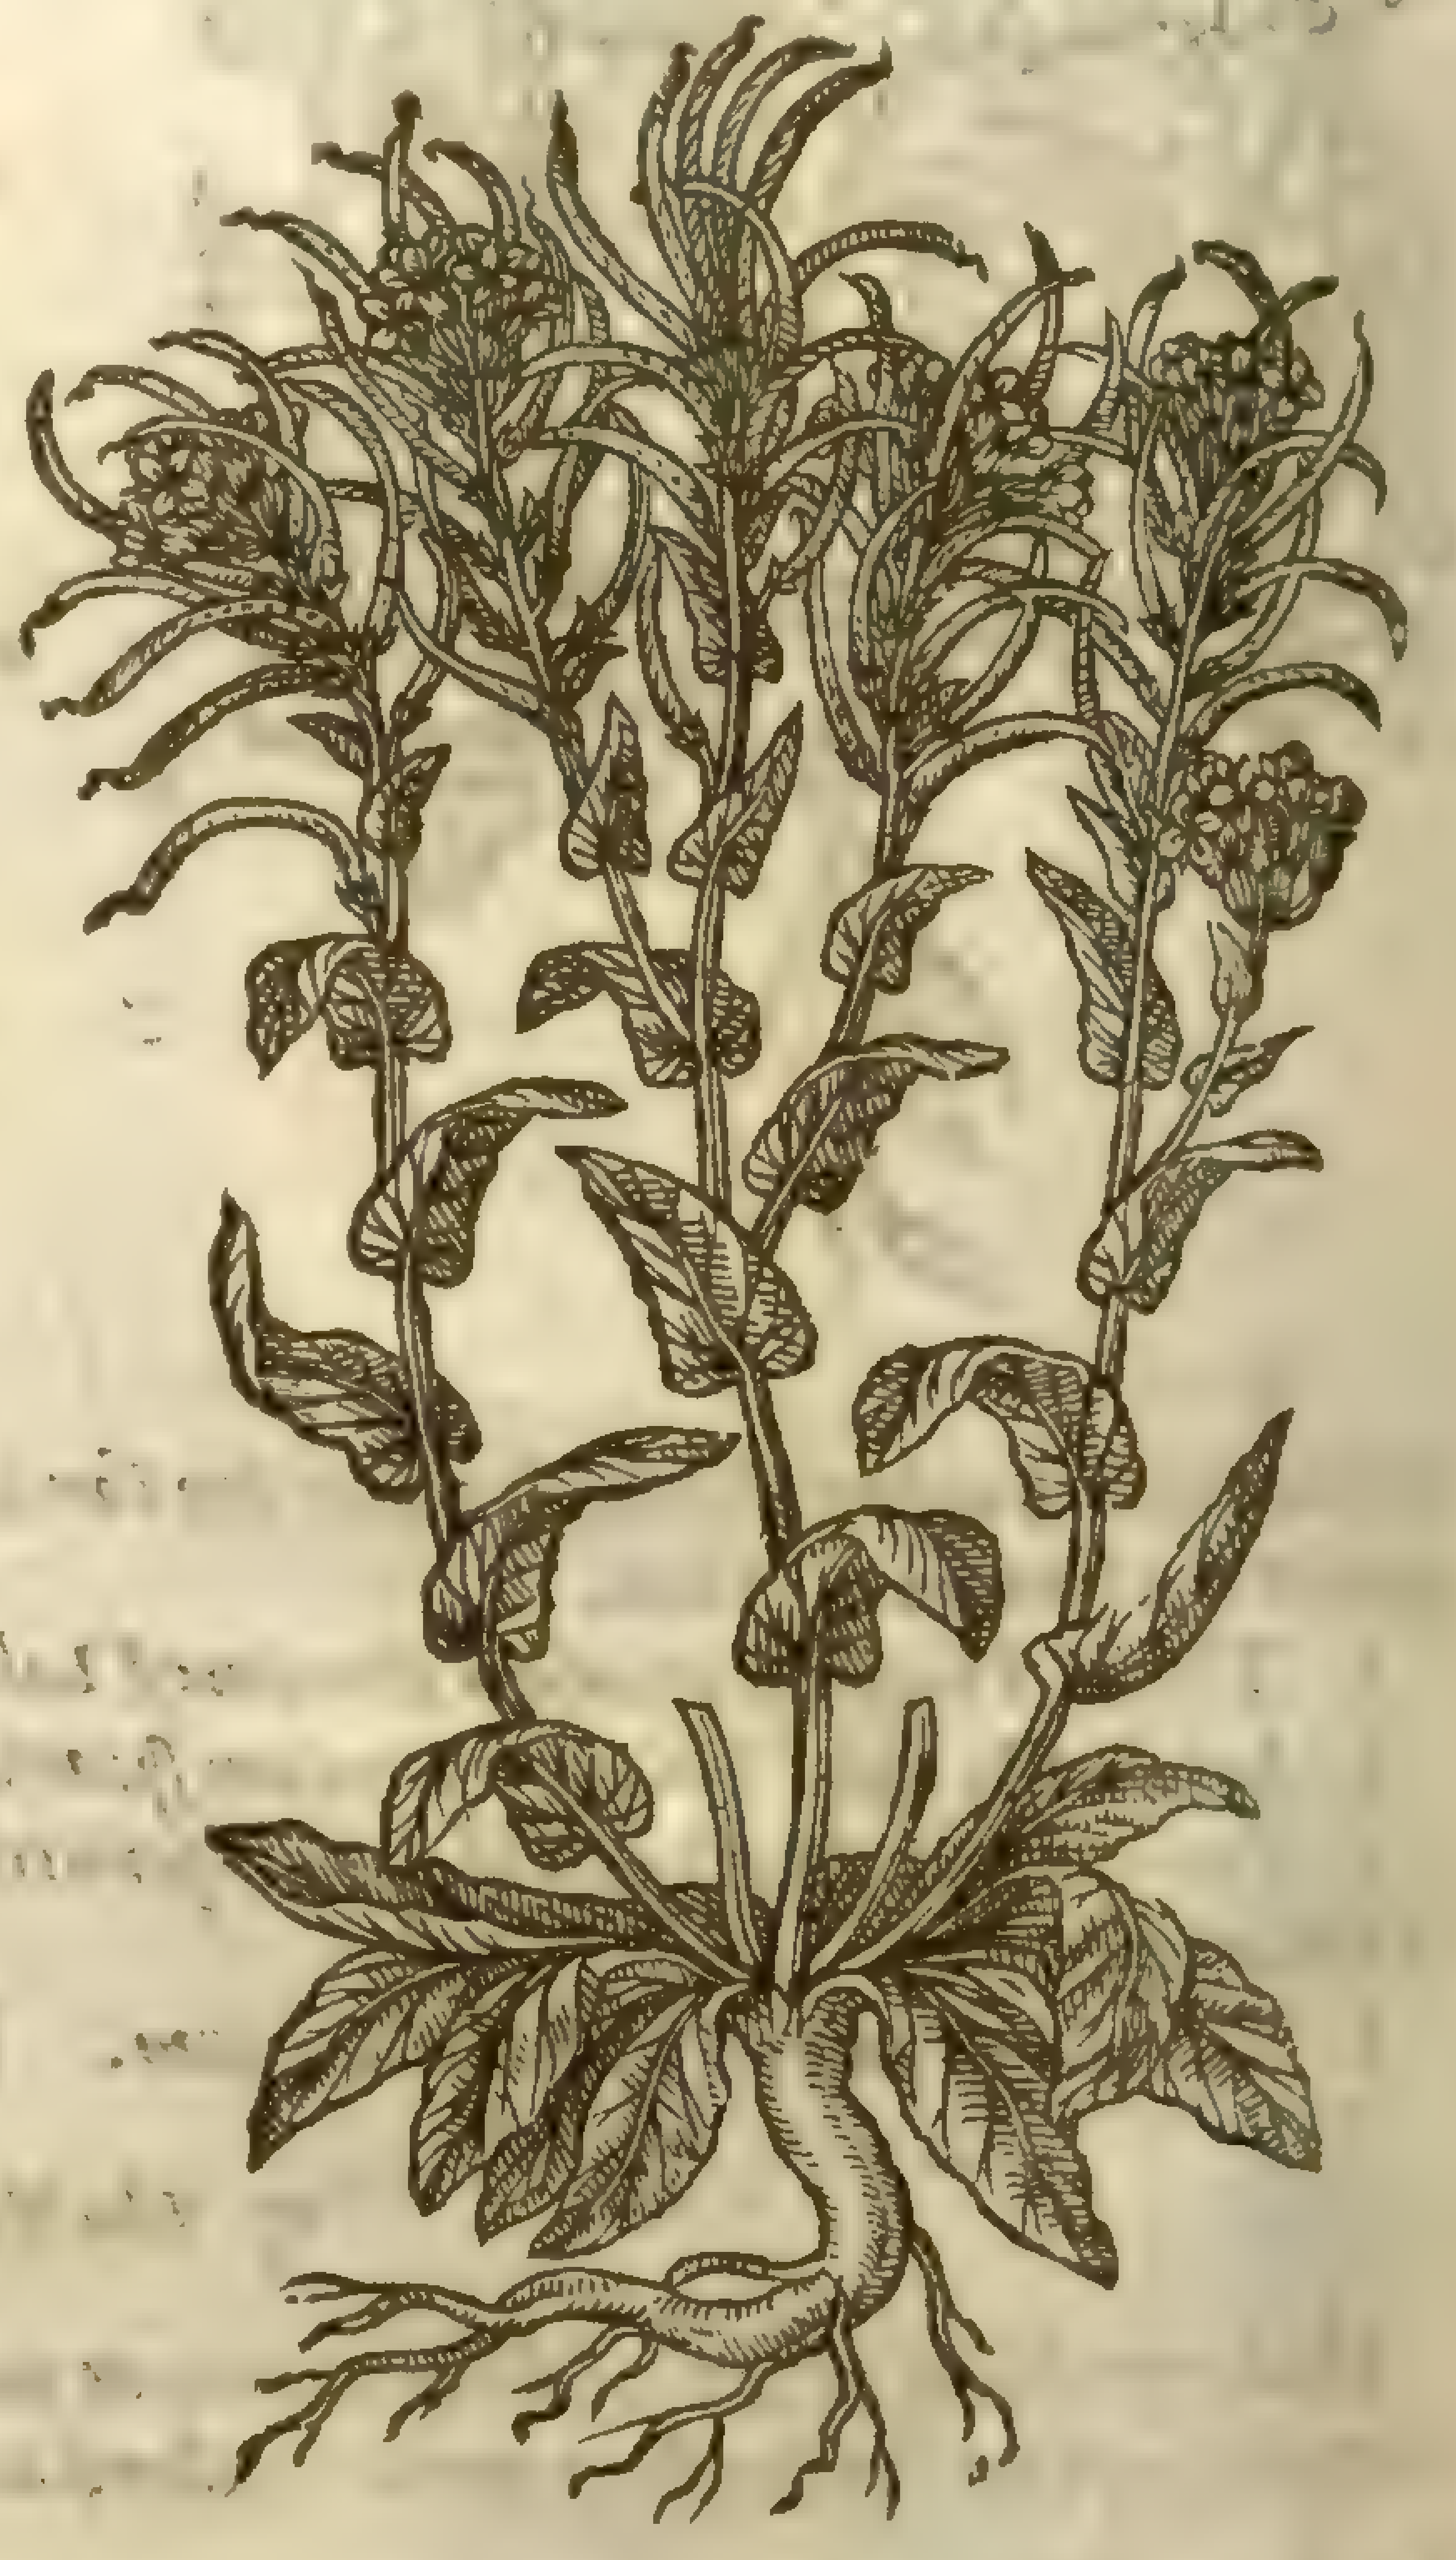
1 *Turritis.*
Towers Muſtard.

T. glabra [illegible]



‡ 2 *Turritis major.*
Great Tower Muſtard.

Arabis turrita [illegible]



4 Treacle Wormſeed riſeth vp with tough and pliant branches,wherupon grow many ſmal yellow floures; after which come long ſlender cods like Flix-weed or *Sophia*, wherein is contained ſmall yellowiſh ſeed bitter as wormſeed or Colliquintida. The leaues are ſmall,& dark of colour, ſhaped like thoſe of wild ſtock Gillouers,but not ſo thick nor fat.The root is ſmall and ſingle.

¶ *The Place.*

Towers Treacle groweth in the Weſt part of England, vpon dunghils and ſuch like places. I haue likewiſe ſeene it in ſundry other places, as at Pyms by a village called Edmonton neere London,by the city walls of Weſt-Cheſter in corn fields, and where flax did grow about Cambridge. ‡ The ſecond is a ſtranger with vs,yet I am deceiued if I haue not ſeen it growing in Mr *Parkinſons* garden. ‡

The other grow in the territorie of Leiden in Zeeland, and many places of the Low-countries; and likewiſe wild in ſundry places of England.

¶ *The Time.*

Theſe herbs do floure in May and Iune,and their ſeed is ripe in September.

¶ *The Names.*

‡ 1 This is *Turritis* of *Lobel* : *Turrita vulgatior* of *Cluſius*.

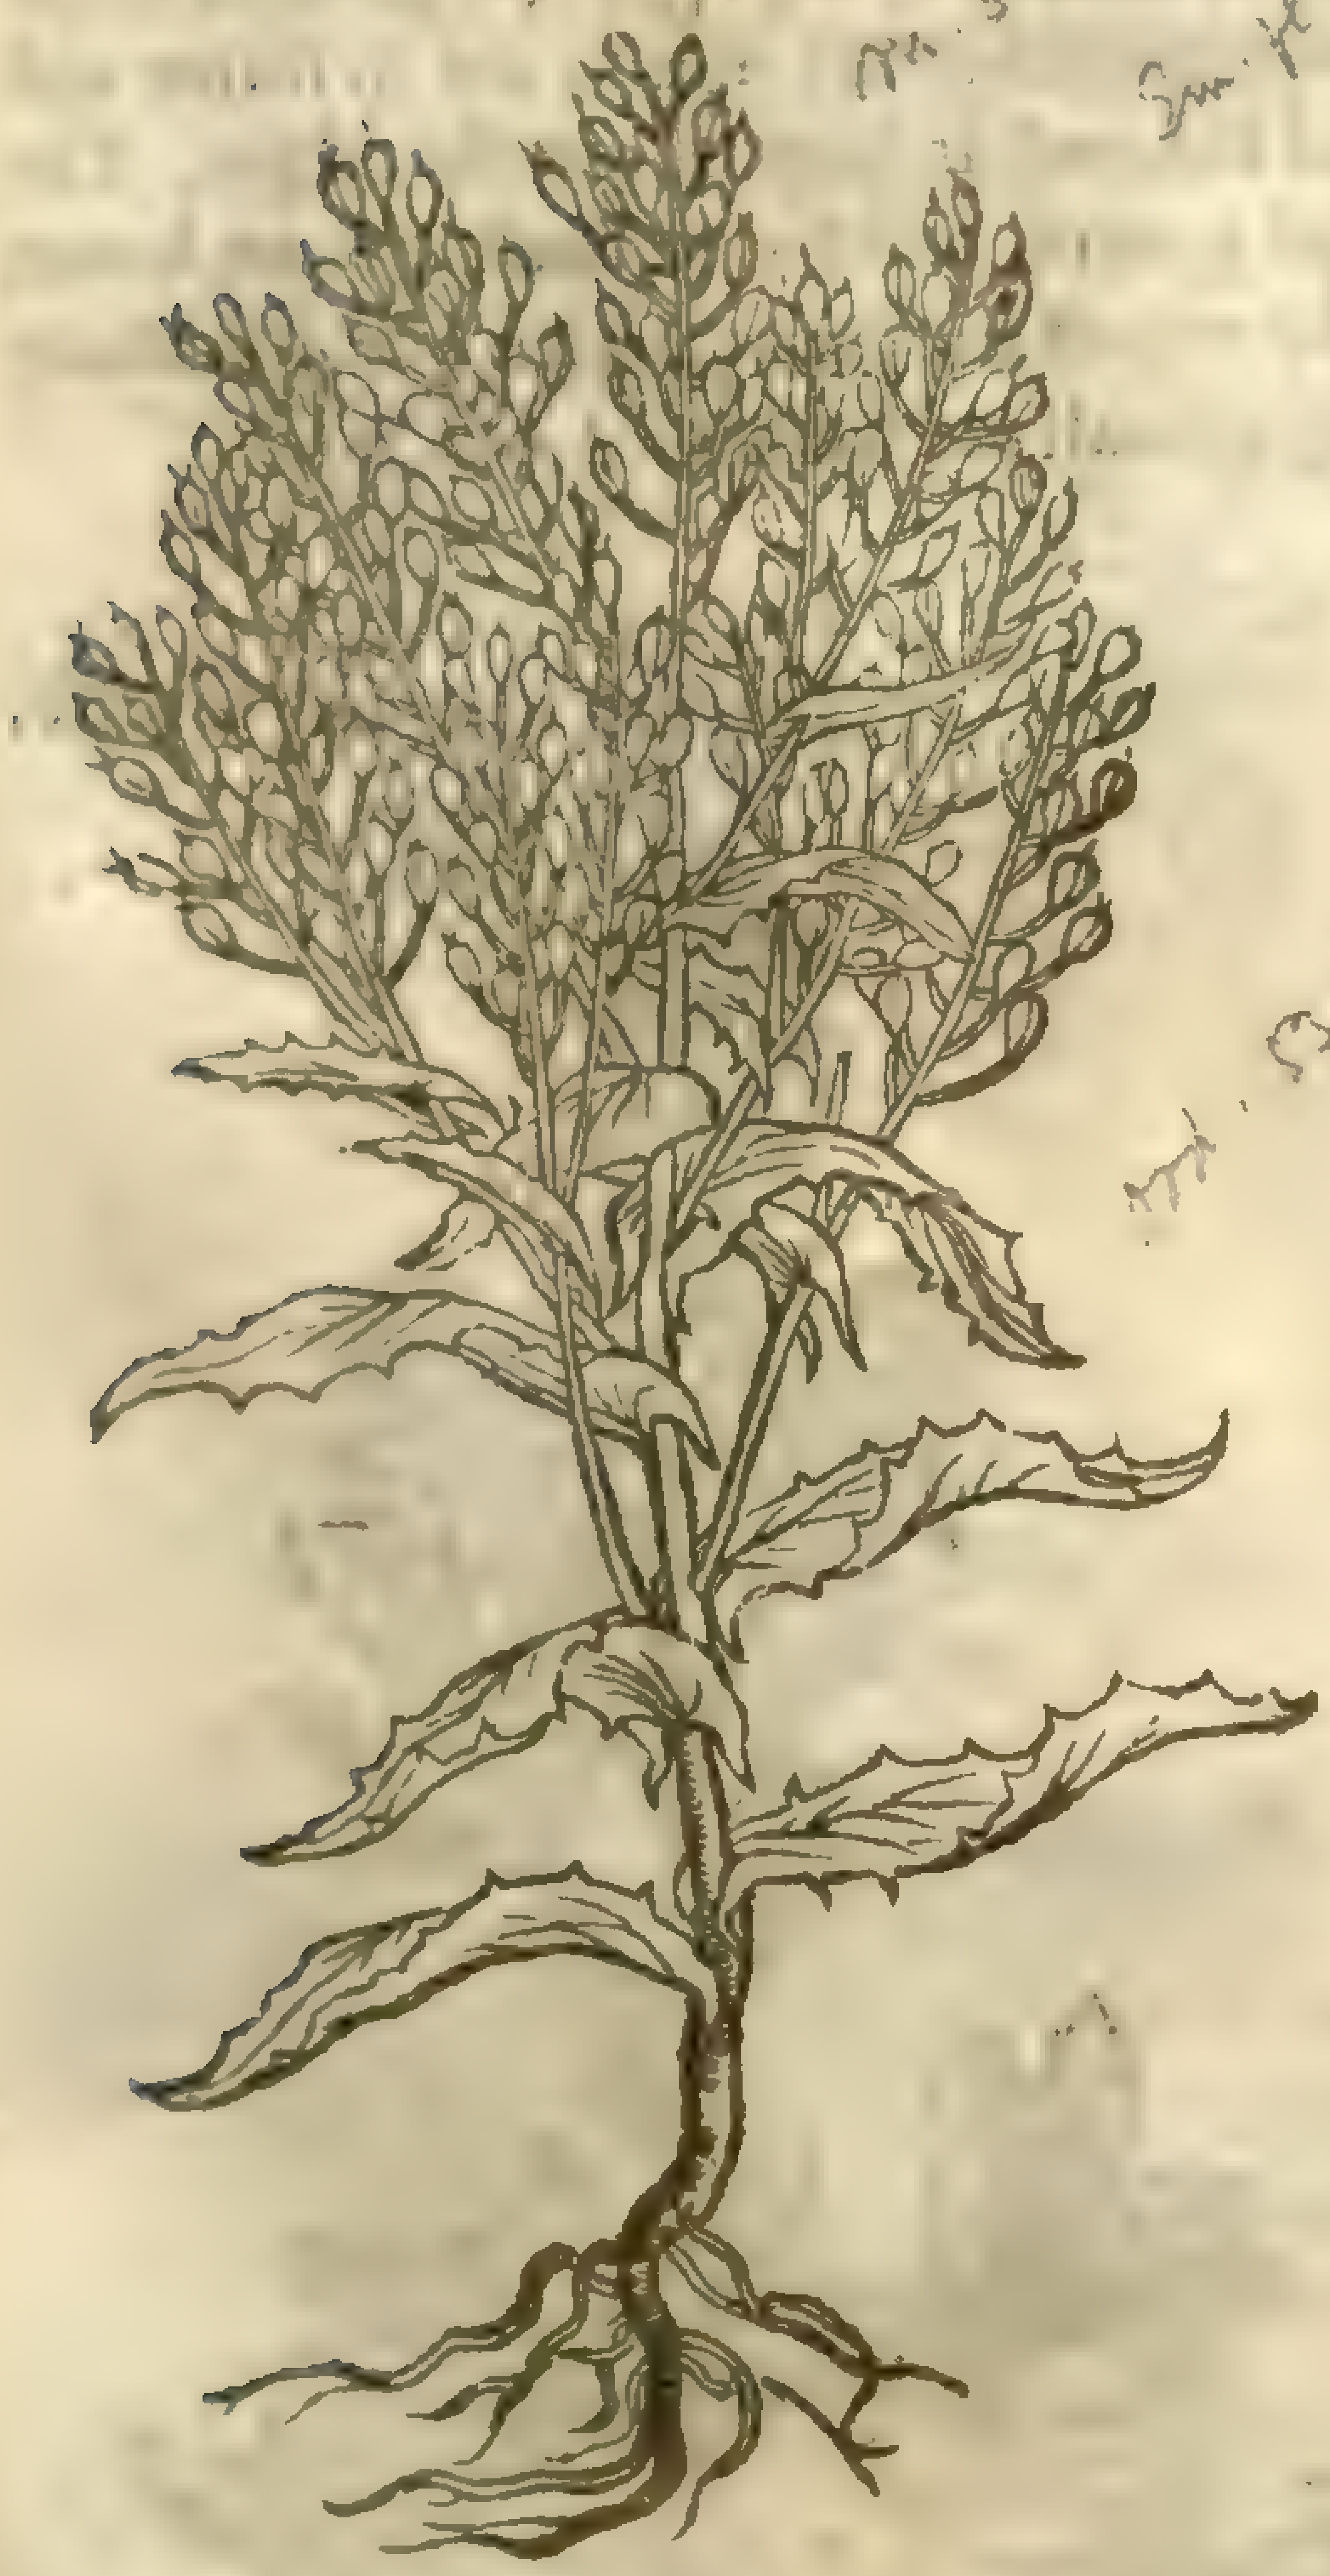
2 This is *Turrita major* of *Cluſius*; who thinks it to be *Braßica virgata* of *Cordus*.

3 *Matthiolus* calls this, *Pſeudomyagrum*: *Tragus* calls it, *Seſamum*: *Dodonæus*, *Lobel*, and others call it *Myagrum*.

4 This *Lobel* calls *Myagrum thlaſpi effigie*. *Tabernamontanus* hath it twice; firſt vnder the name of *Eryſimum tertium*: ſecondly, of *Myagrum ſecundum*. And ſo alſo our Author (as I formerly noted) had it before vnder the name of *Eruca ſylueſtris anguſtifolia*; and here vnder the name of *Camelina*. ‡

3 *Myagrum*.
Gold of pleaſure.

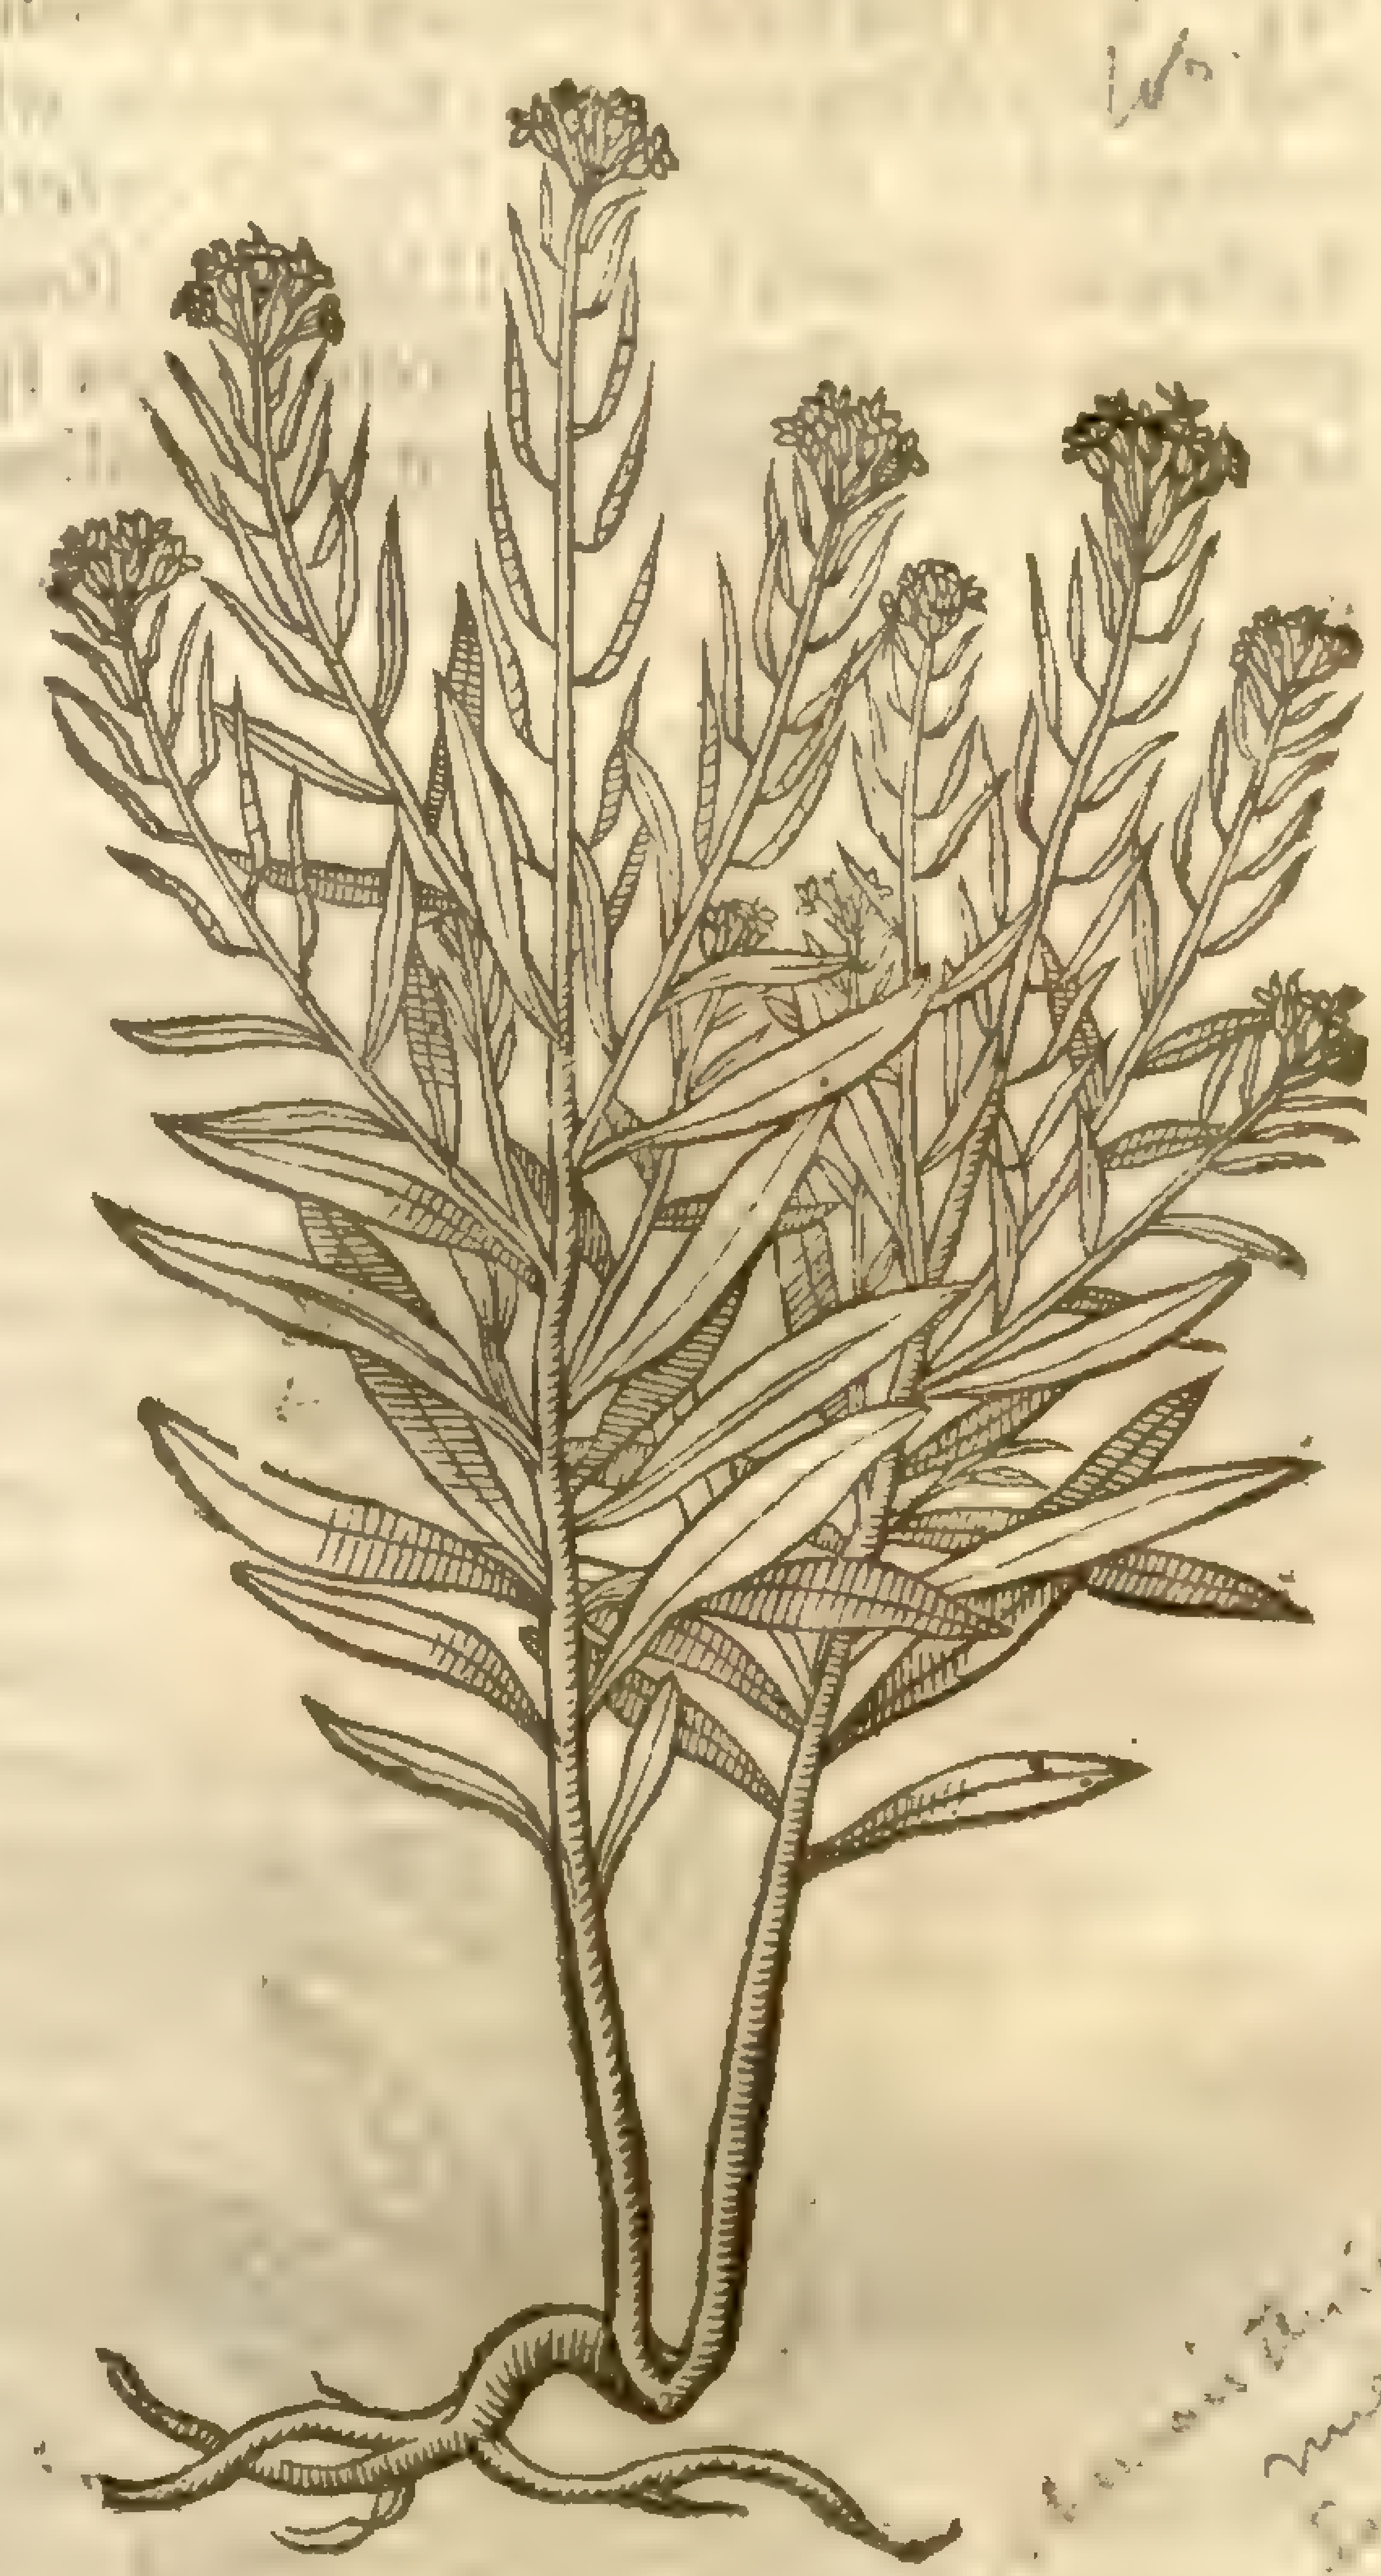
Ms. sativum [illegible] Sm. fl. 3. 164



[illegible] 152

4 *Camelina*.
Treacle Worme-ſeed.

Wo



Erysimum [illegible] Sm. fl. [illegible]

¶ *The Temperature.*

Theſe plants be hot and dry in the third degree.

¶ *The Vertues.*

It is thought, ſaith *Dioſcorides*, That the roughneſſe of the skinne is poliſhed and made ſmooth with the oilie fatneſſe of the ſeed of *Myagrum*. A

Ruellius teacheth, That the juice of the herbe healeth vlcers of the mouth; and that the poore peaſant doth vſe the oile in banquets, and the rich in their lamps. B

The ſeed of *Camelina* ſtamped, and giuen children to drinke, killeth the Wormes, and driueth them forth both by ſiege and vomit. C

‡ The two Drabaes here omitted are treated of at large in the following Chapter.

‡ CHAP. 24. *Of Turky Creſſes.*

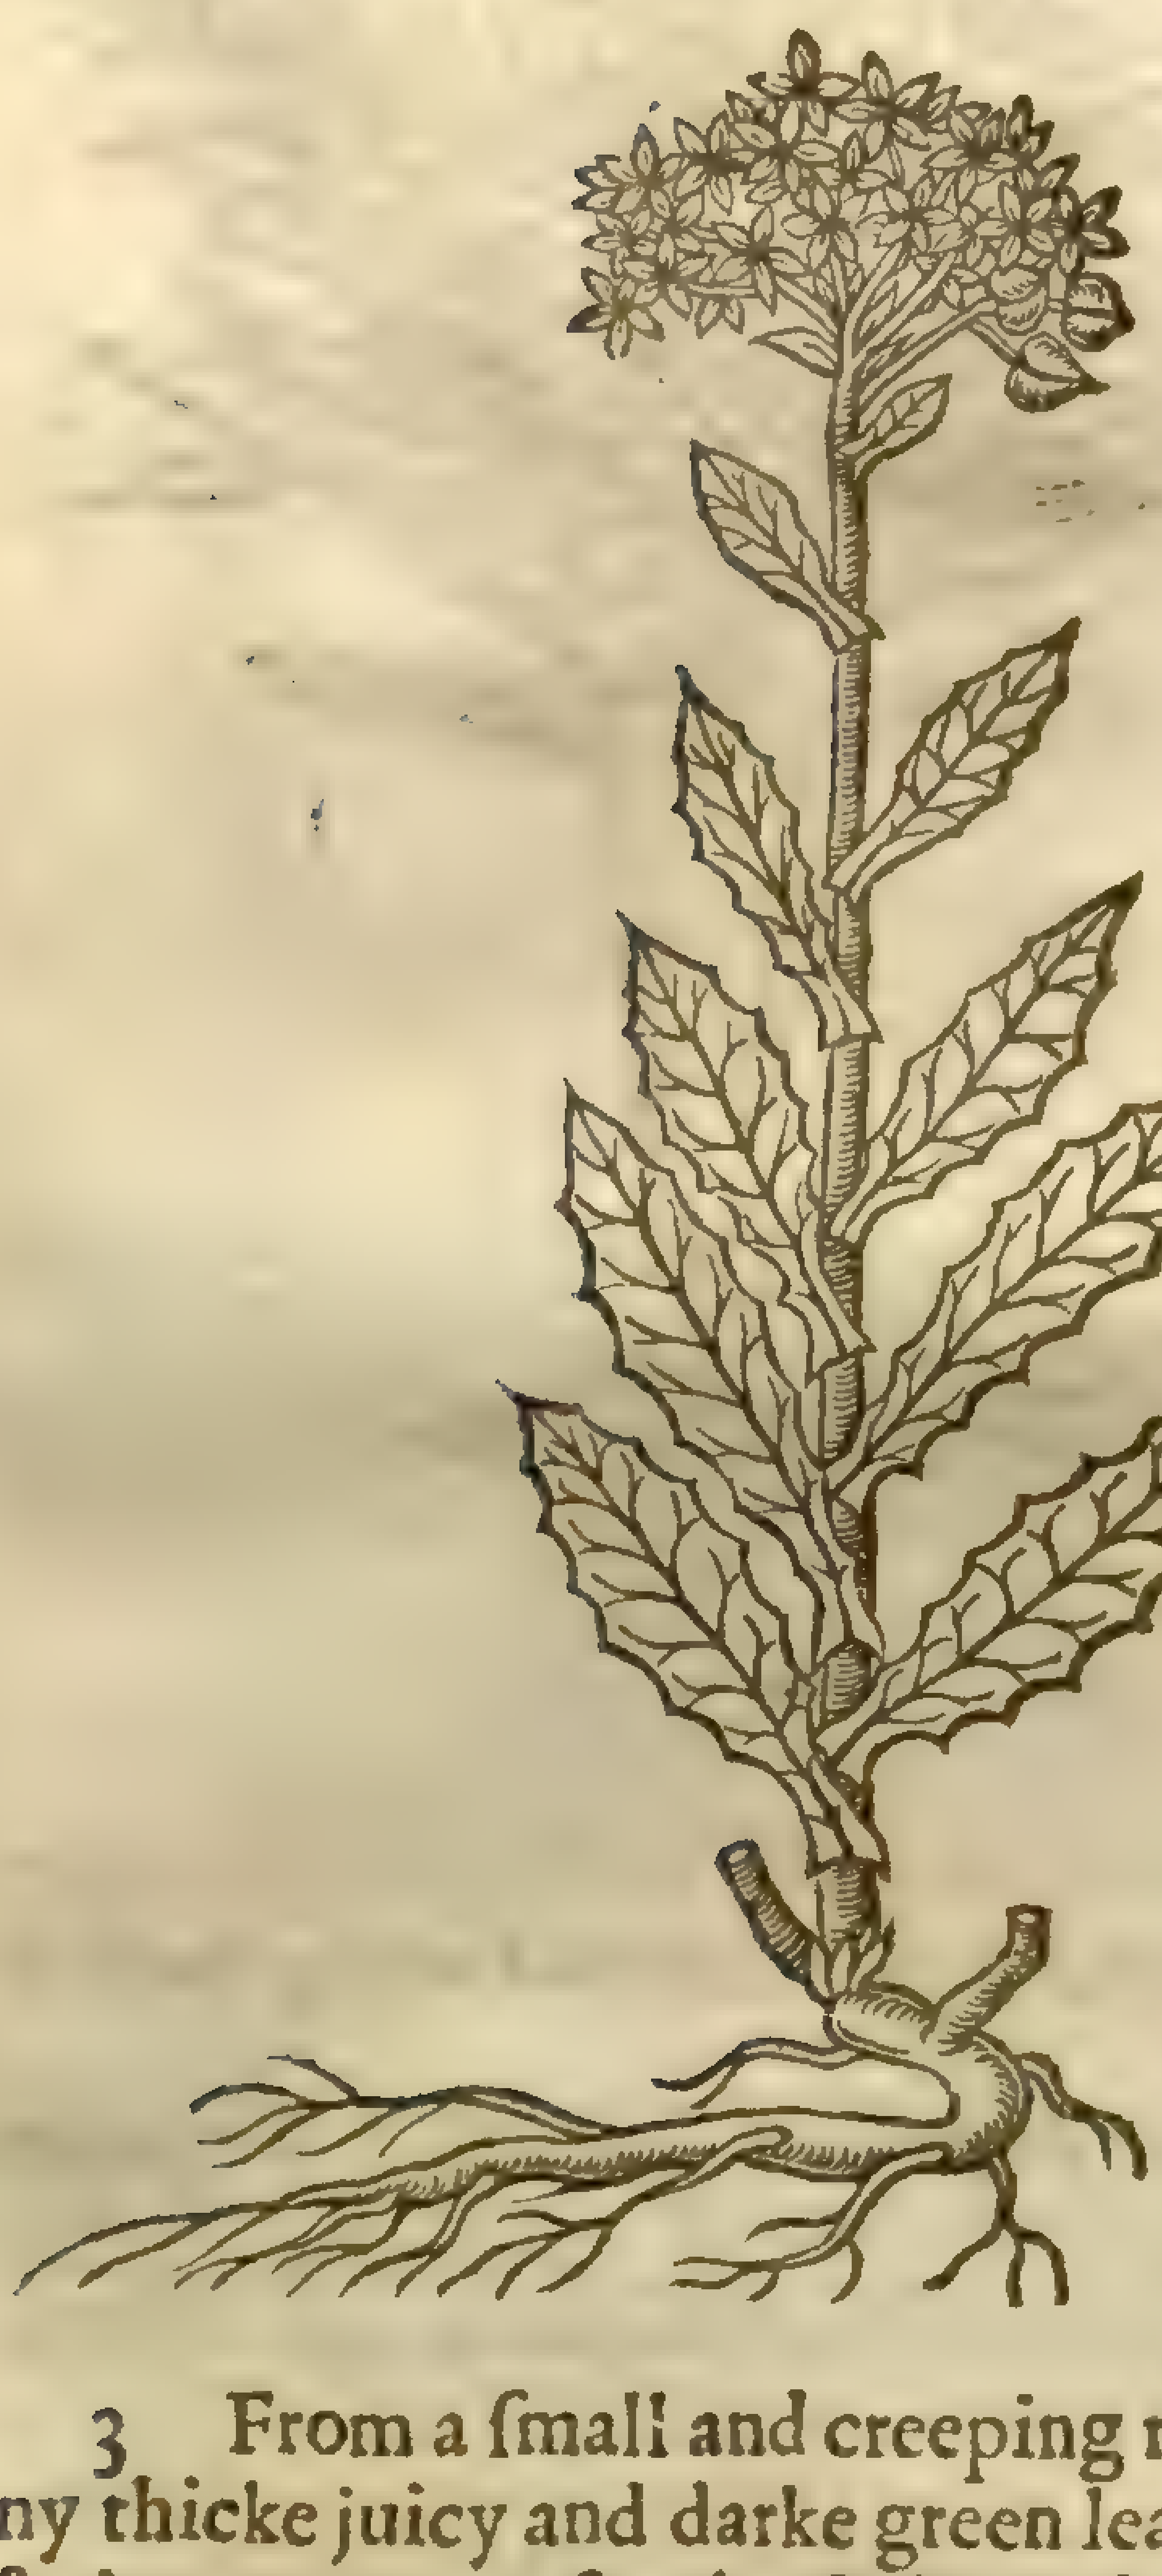
‡ OVr Author did briefely in the precedent Chapter make mention of the two plants wee firſt mention in this Chapter; but that ſo briefely, that I thought it conuenient to diſcourſe more largely of them, as alſo to adde to them other two, being by moſt Writers adjuged to be of the ſame Tribe or kindred. The vertues of the firſt were by our Author out of *Dodonæus* formerly put to the *Thlaſpi Candiæ*, Chapter 20. from whence I haue brought them to their proper place, in the end of this preſent Chapter.

¶ *The Deſcription.*

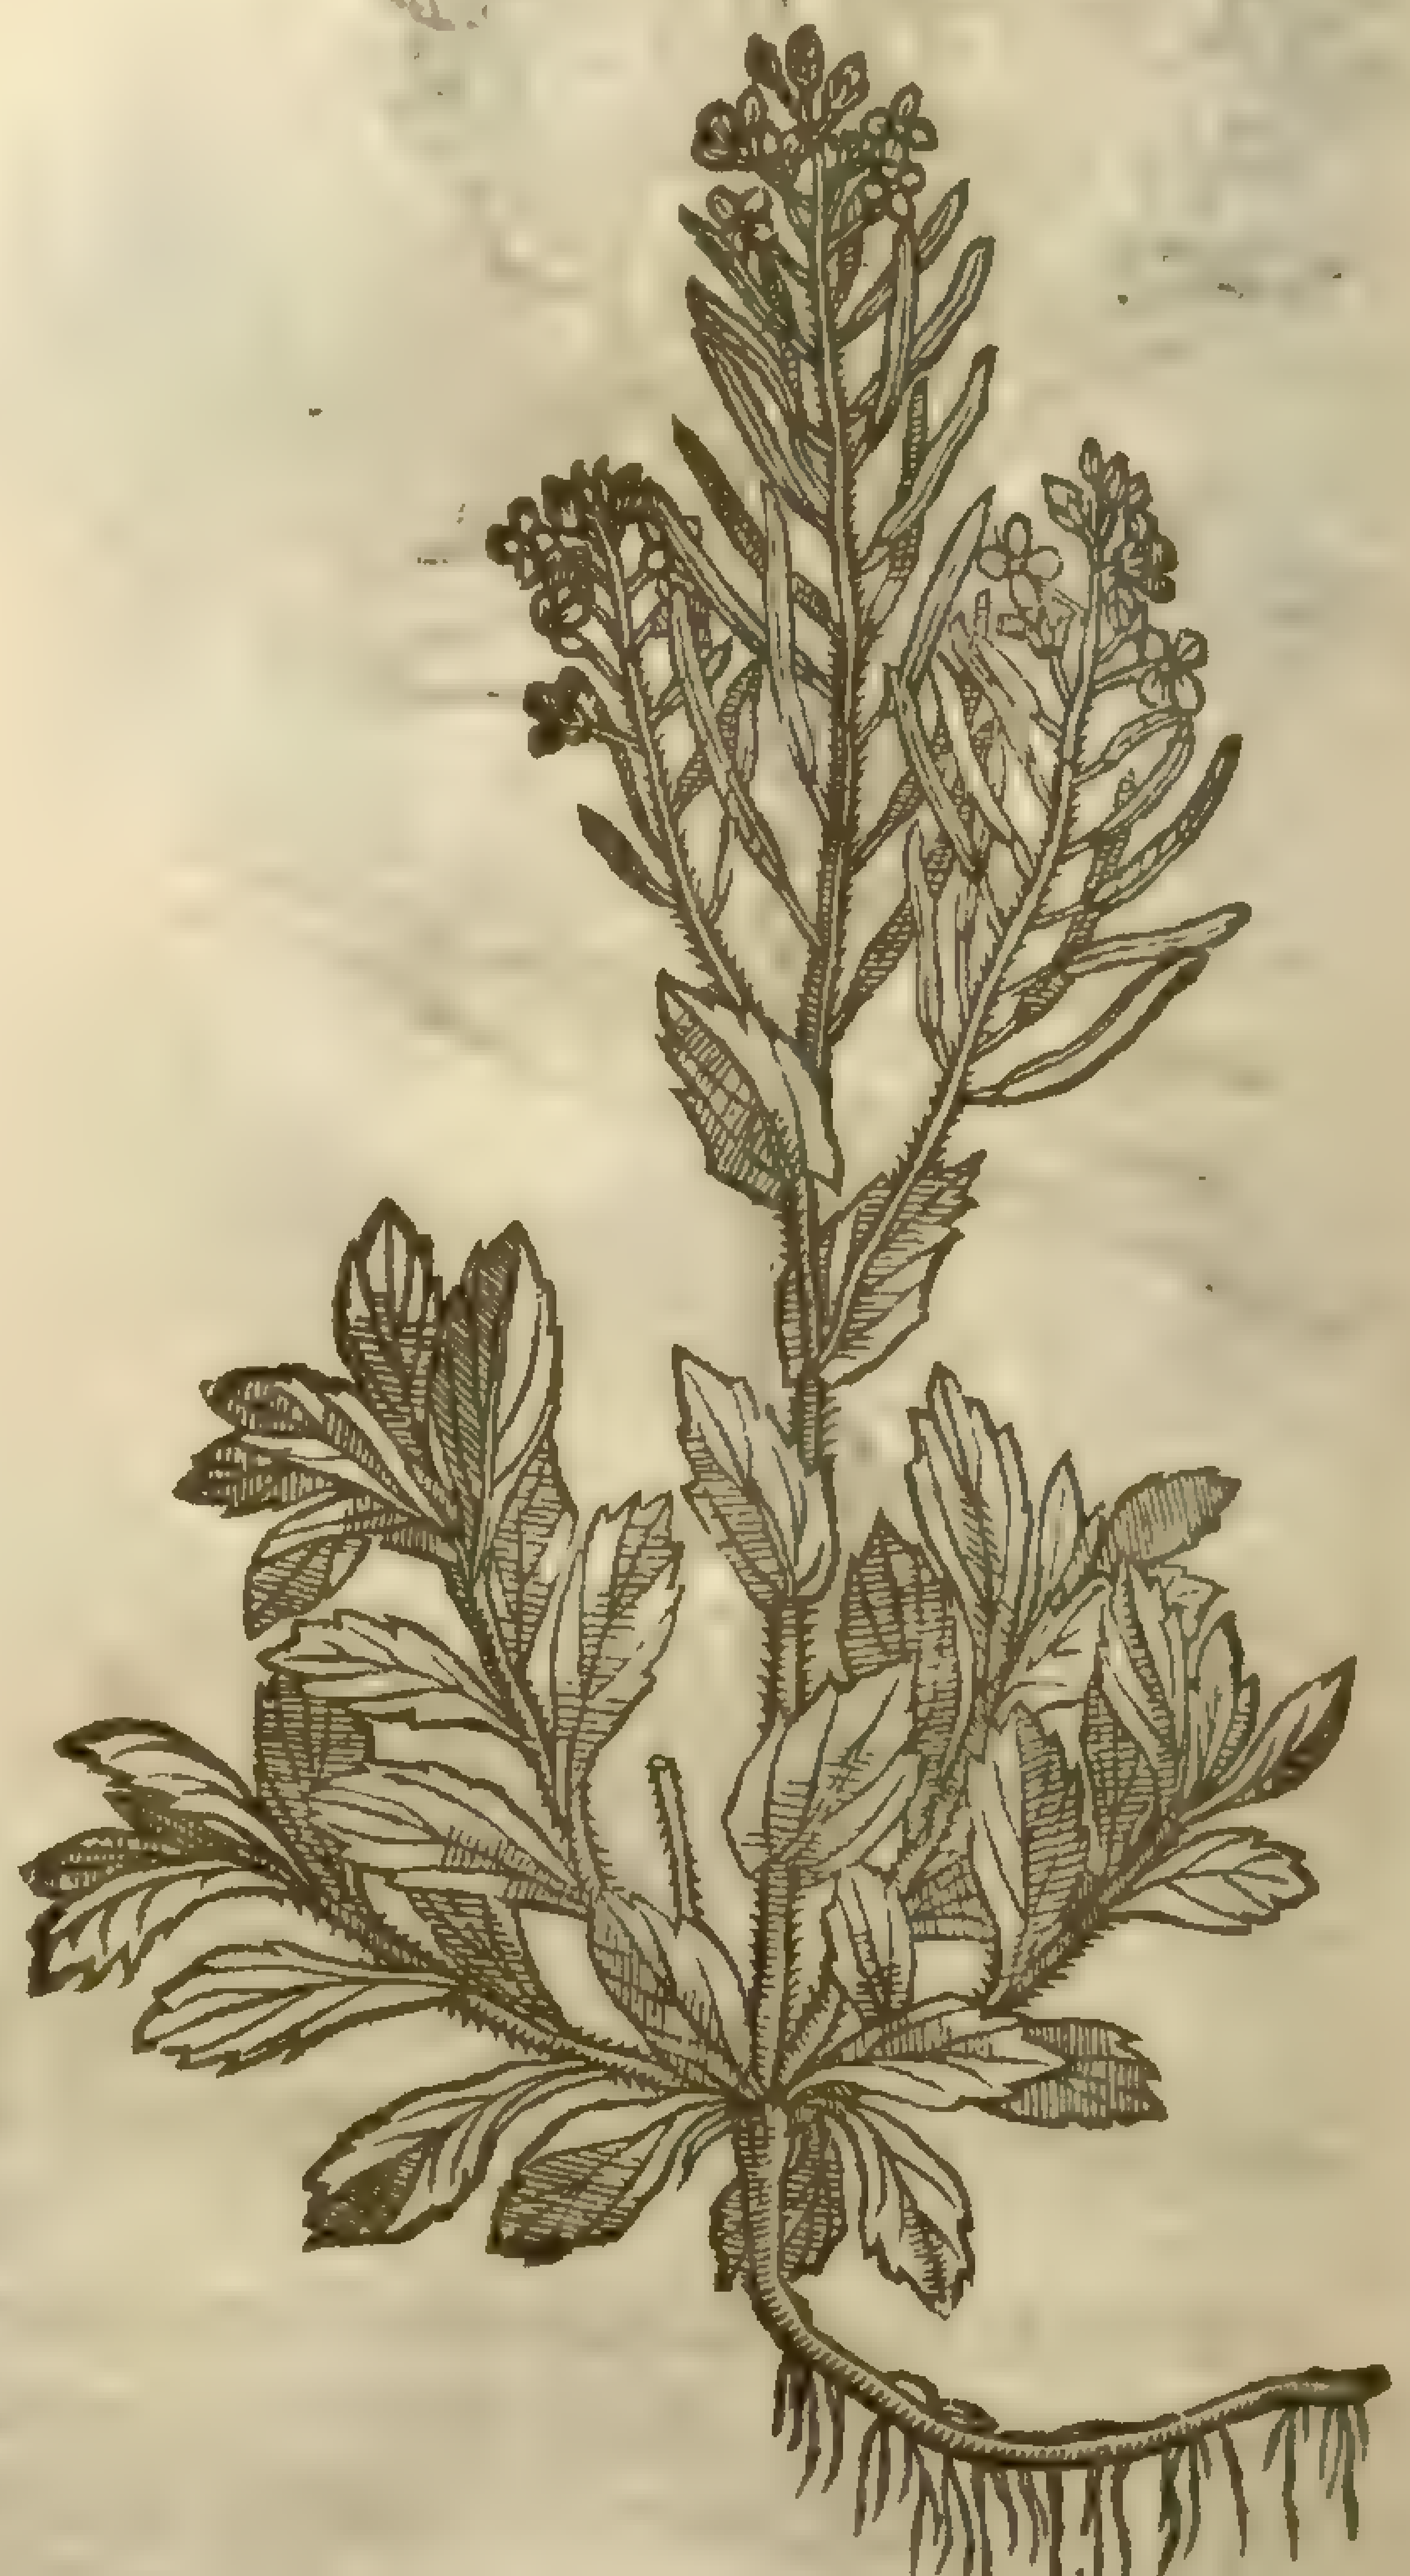
† 1 The firſt hath creſted ſlender, yet firme ſtalkes of ſome foot long; which are ſet with leaues of ſome inch in length, broad at the ſetting on, ſinuated about the edges, and ſharpe pointed; their colour is a whitiſh greene, and taſte acride; the leaues that are at the bottome of the ſtalk are many, and larger. The tops of the ſtalkes are diuided into many branches of an vnequall length, and ſuſtaine many floures: each whereof conſiſts of foure little white leaues, ſo that together they much reſemble the vmbell of the Elder when it is in floure. Little ſwolne ſeed veſſels diuided into two cells follow the fading floures: the ſeed is whitiſh, about the bigneſſe of Millet; the root alſo is white, ſlender and creeping.

† 2 This hath creeping roots, from which ariſe many branches lying vpon the ground heere and there, taking root alſo: the leaues, which vpon the lower branches are many, are in forme and colour much like thoſe of the laſt deſcribed, but leſſe, and ſomewhat ſnipt about the edges. The ſtalkes are about a handfull high, or ſomewhat more, round, greene, and hairy, hauing ſome leaues growing vpon them. The floures grow ſpoke faſhion at the top of the ſtalks, white, and conſiſting of foure leaues: which fallen, there follow cods containing a ſmall red ſeed.

1 *Draba Dioſcoridis.*
Turkie Creſſes.



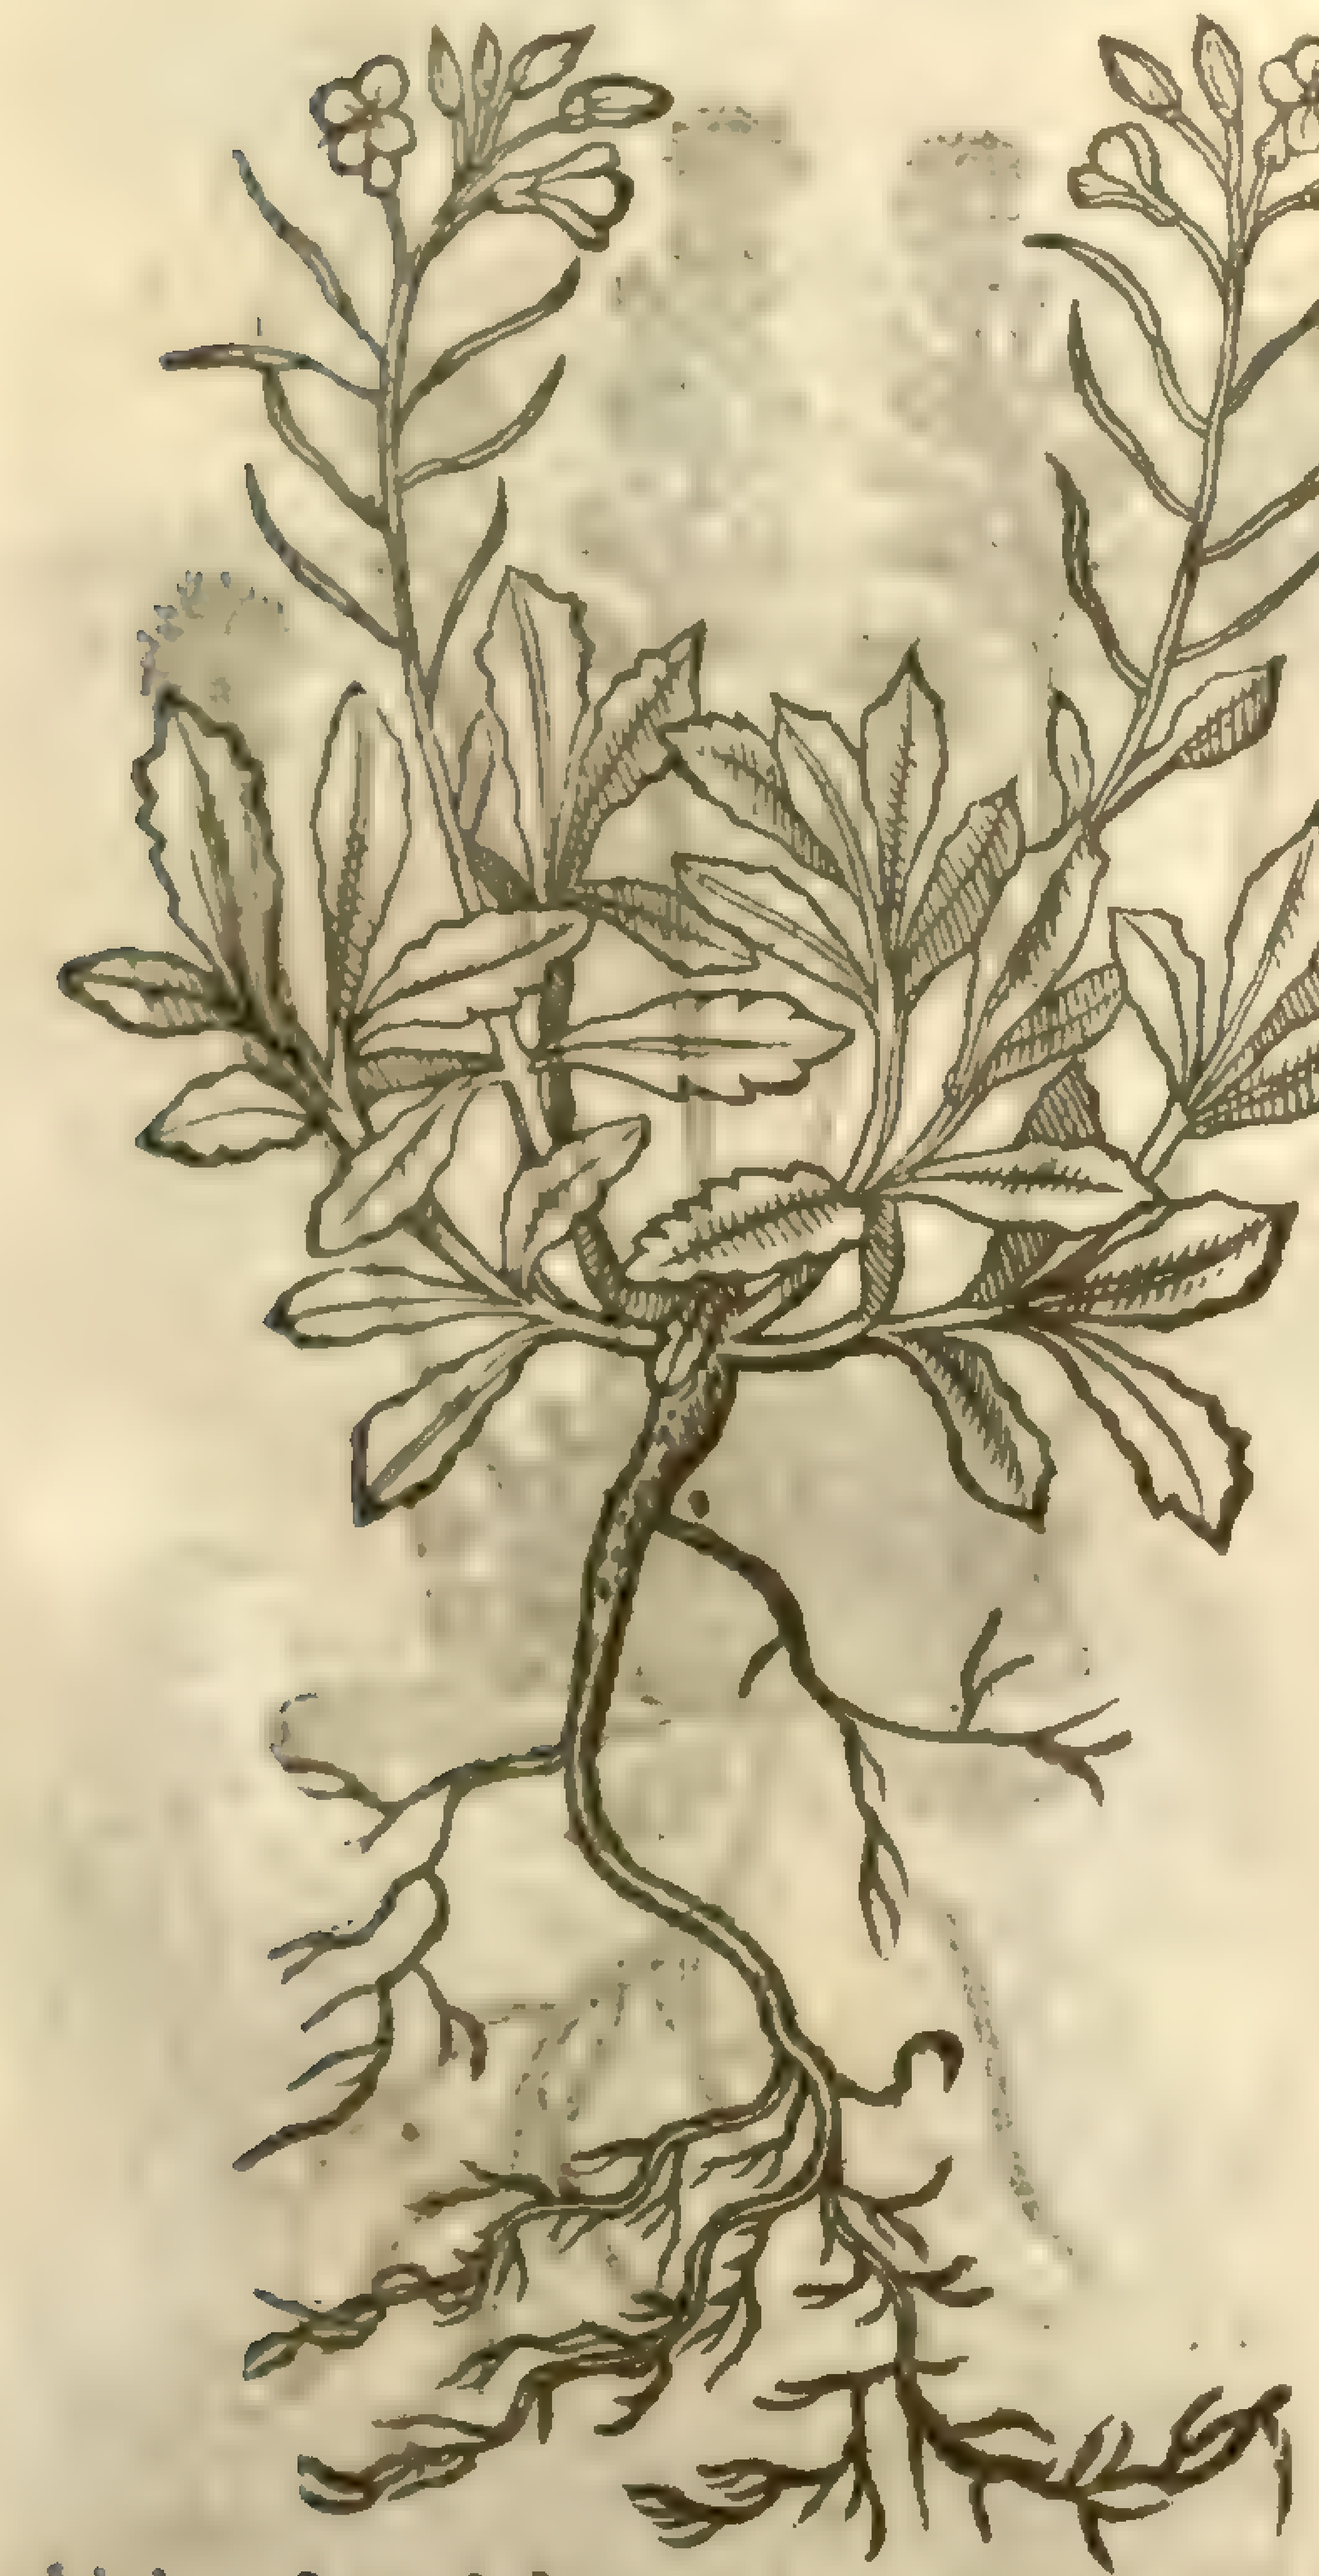
‡ 2 *Draba prima repens.*
The firſt creeping Creſſe.



3 From a ſmall and creeping root riſe vp many ſhoots, which while they are young haue many thicke juicy and darke green leaues roſe faſhion adorning their tops, out of the midſt of which ſpring out many ſlender ſtalkes of ſome foot high, which at certaine ſpaces are incompaſſed (as it were) with leaues ſomewhat leſſer than the former, yet broader at the bottome: the floures, cods, and ſeed are like the laſt mentioned.

4 There is a plant alſo by ſome referred to this Claſſis: and I for ſome reaſons thinke good to make mention thereof in this place. It hath a ſtrong and very long root of colour whitiſh, and of as ſharpe a taſte as Creſſes: the ſtalkes are many, and oft-times exceed the height of a man, yet ſlender, and towards their tops diuided into ſome branches, which make no vmbell, but carry their floures diſperſed; which conſiſt of foure ſmall yellow leaues: after the floure is paſt there follow long ſlender cods containing a ſmall, yellowiſh, acride ſeed. The leaues which adorne this plant are long, ſharpe pointed, and ſnipt about the edges, ſomewhat like thoſe of Saracens Conſound, but that theſe towards the top are more vnequally cut in.

‡ 3 *Draba altera repens.*
The other creeping Creſſe.



¶ *The Place.*

None of theſe (that I know of) are found naturally growing in this kingdom, the laſt excepted, which I thinke may be found in ſome places.

¶ *The Time.*

The firſt of theſe floure in May and the beginning of Iune: the 2 and 3 in Aprill. The fourth in Iune and Iuly.

¶ *The Names.*

1 This by a generall conſent of *Matthiolus, Anguillara, Lobel, &c.* is judged to be the *Arabis*, or *Draba* of the Antients.

2 *Draba altera* of *Cluſius.*

3 *Draba tertia ſucculento folio*, of *Cluſius*. *Eruca Muralis*, of *Daleſchampius.*

4 This by *Camerarius* is ſet forth vnder the name of *Arabis quorundam*, and hee affirmes in his *Hor. Med.* that he had it out of England vnder the name of *Solidago*; The which is verie likely, for without doubt this is the very plant that our Author miſtooke for *Solidago Sarracenica*, for hee bewraies himſelfe in the Chapter of *Epimedium*, whereas hee ſaith it hath cods like *Sarracens Conſound*; when as both he, and all other giue no cods at all to *Sarracens Conſound*. My very good friend Mr. *Iohn Goodyer* was the firſt, I thinke, that obſerued this miſtake in our Author; for which his obſeruation, together with ſome others formerly and hereafter to be remembred, I acknowledge my ſelfe beholden to him.

[illegible]

¶ *The Vertues attributed to the firſt.*

1 *Dioſcorides* ſaith, that they vſe to eat the dried ſeed of this herbe with meat, as we do pepper, eſpecially in Cappadocia. A

They vſe likewiſe to boyle the herbe with the decoction of Barley, called Ptiſana; which beeing ſo boiled, concocteth and bringeth forth of the cheſt tough and raw fleagme which ſticketh therein. B

The reſt are hot, and come neere to the vertues of the precedent. ‡ C

CHAP. 25. *Of Shepheards purſe.*

¶ *The Deſcription.*

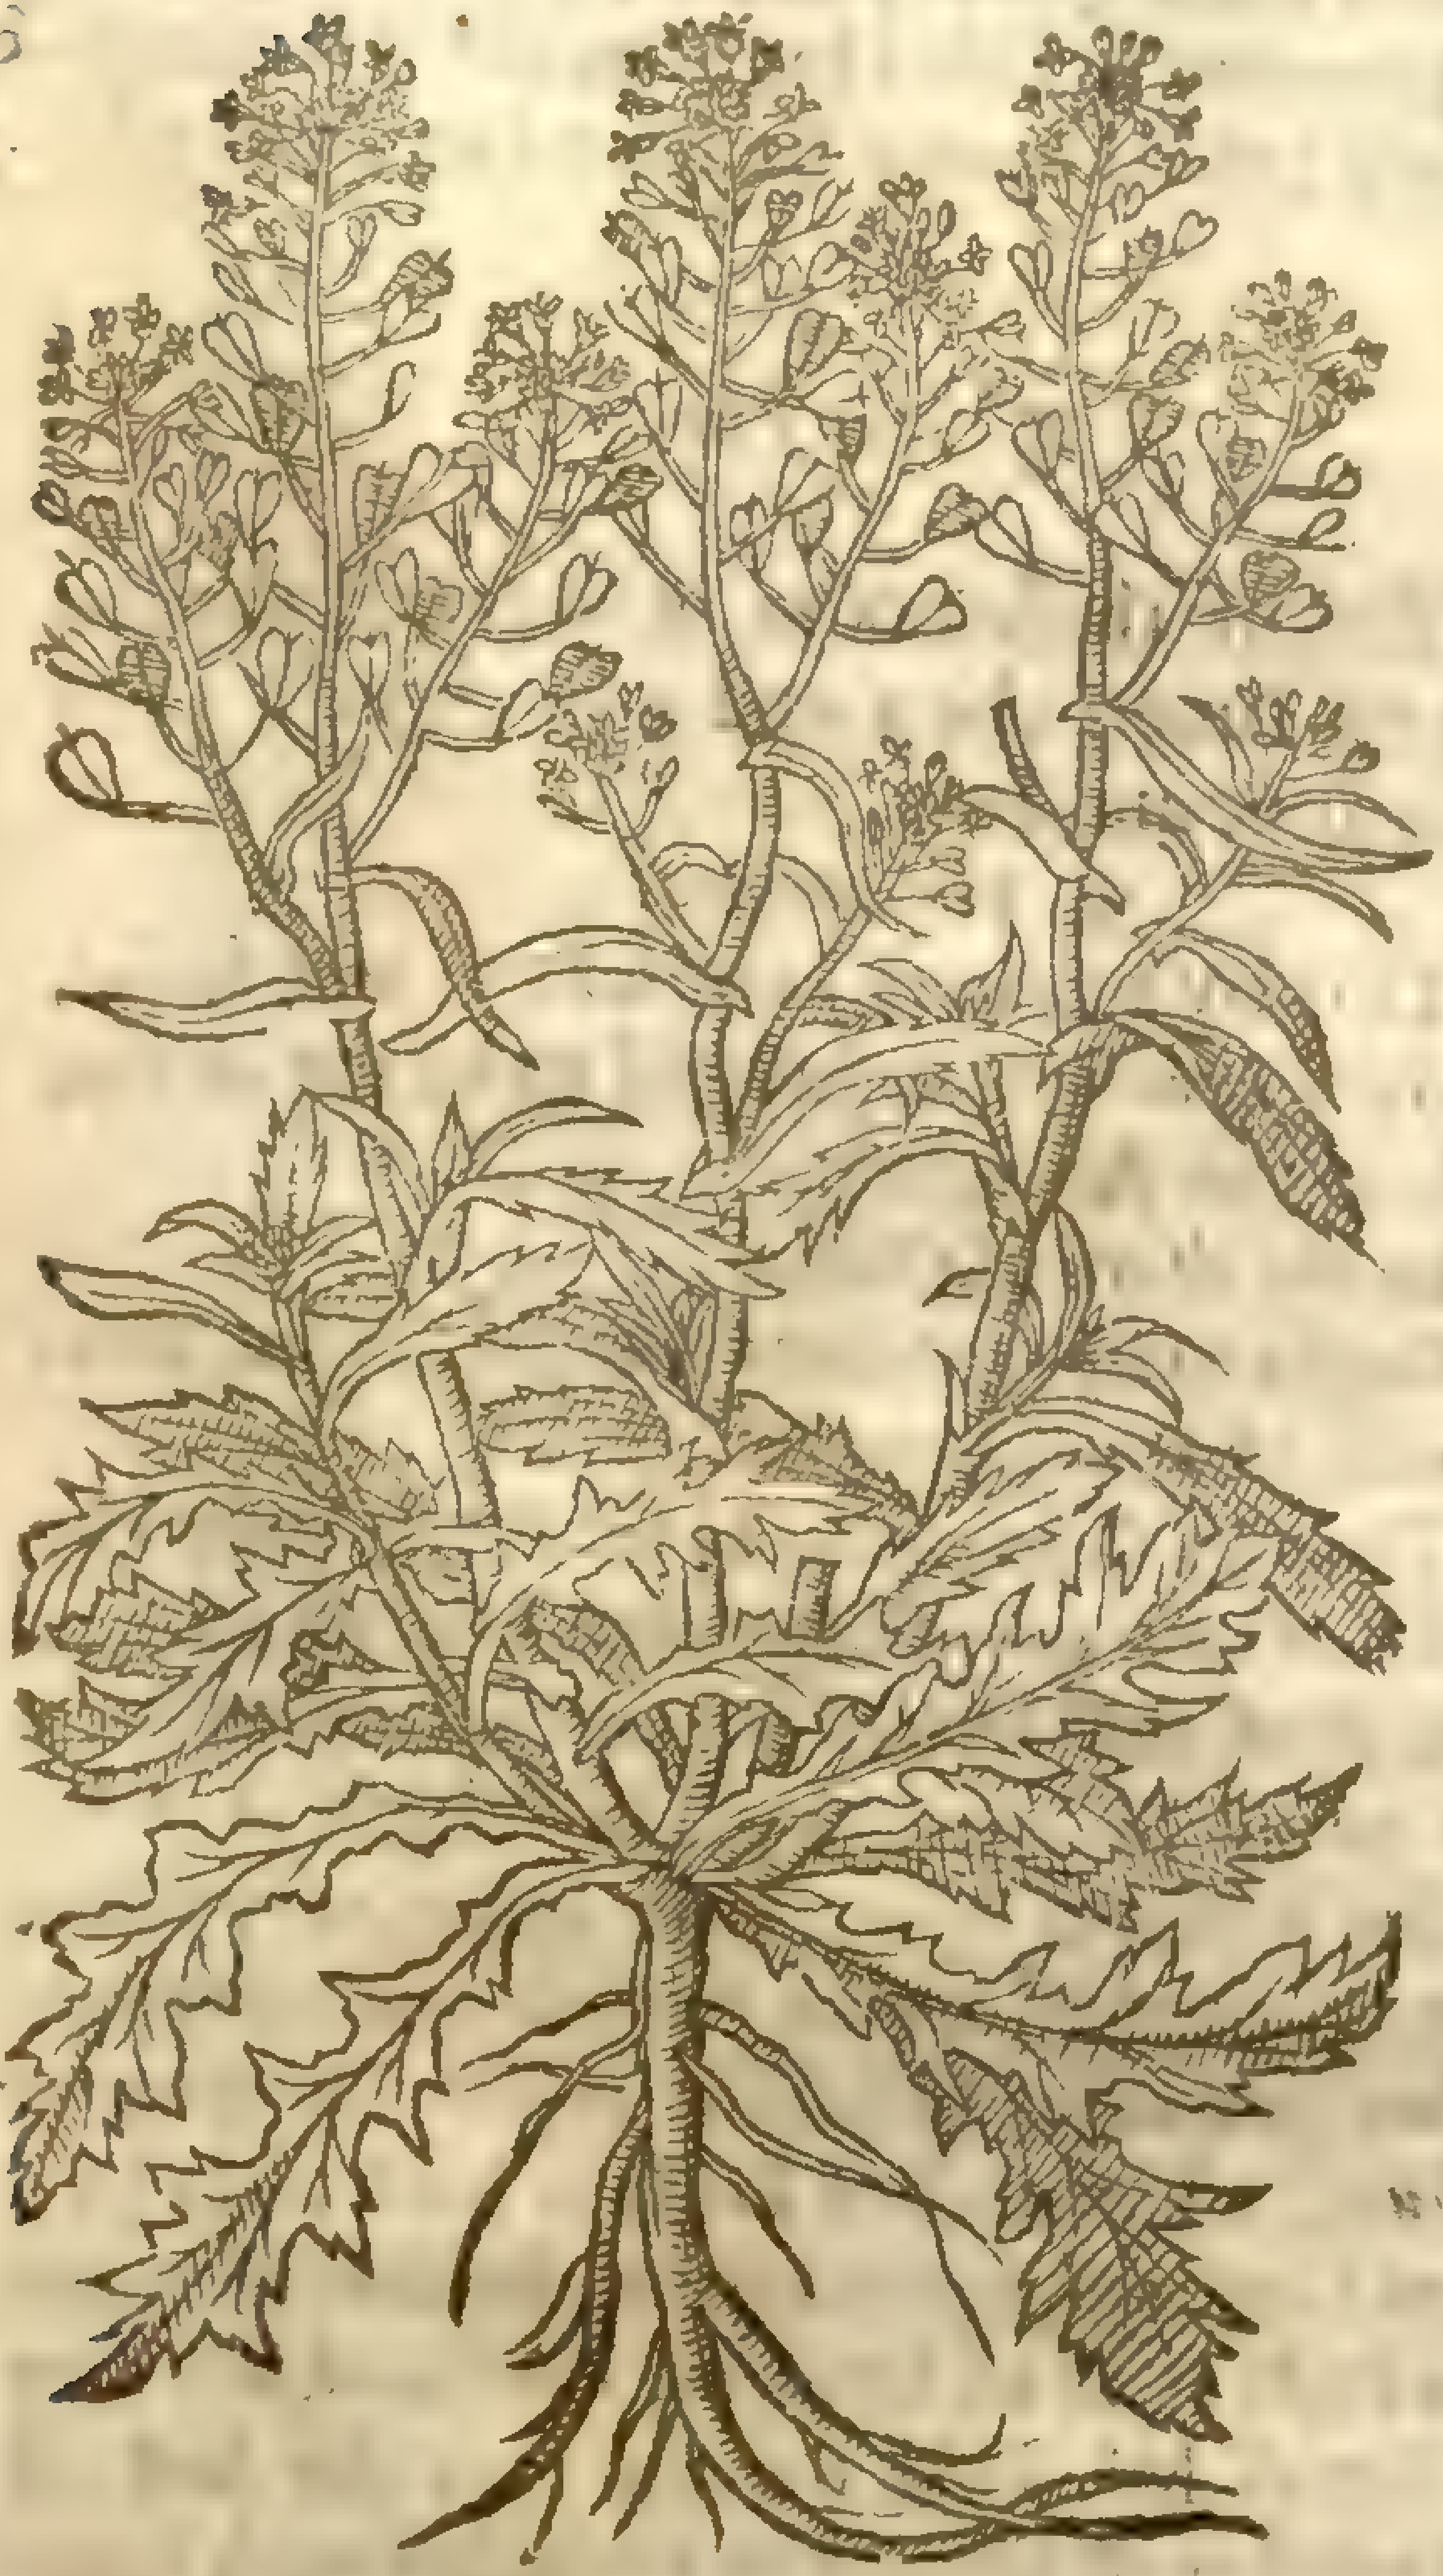
1 THe leaues of Shepheards purſe grow vp at the firſt long, gaſhed in the edges like thoſe of Rocket, ſpred vpon the ground: from theſe ſpring vp very many little weake ſtalkes diuided into ſundry branches, with like leaues growing on them, but leſſer; at the top whereof are orderly placed ſmall white floures: after theſe come vp little ſeed veſſels, flat, and cornered, narrow at the ſtemme like to a certaine little pouch or purſe, in which lieth the ſeed. The root is white not without ſtrings. ‡ There is another of this kinde with leaues not ſinuated or cut in. ‡

2 The ſmall Shepheards purſe commeth forth of the ground like the Cuckow floure, which I haue Engliſhed Ladie-ſmockes, hauing ſmall leaues deepely indented about the edges; amongſt which riſe vp many ſmall tender ſtalkes with floures at the top, as it were chaffe. The huskes and ſeed is like the other before mentioned.

¶ *The Place.*

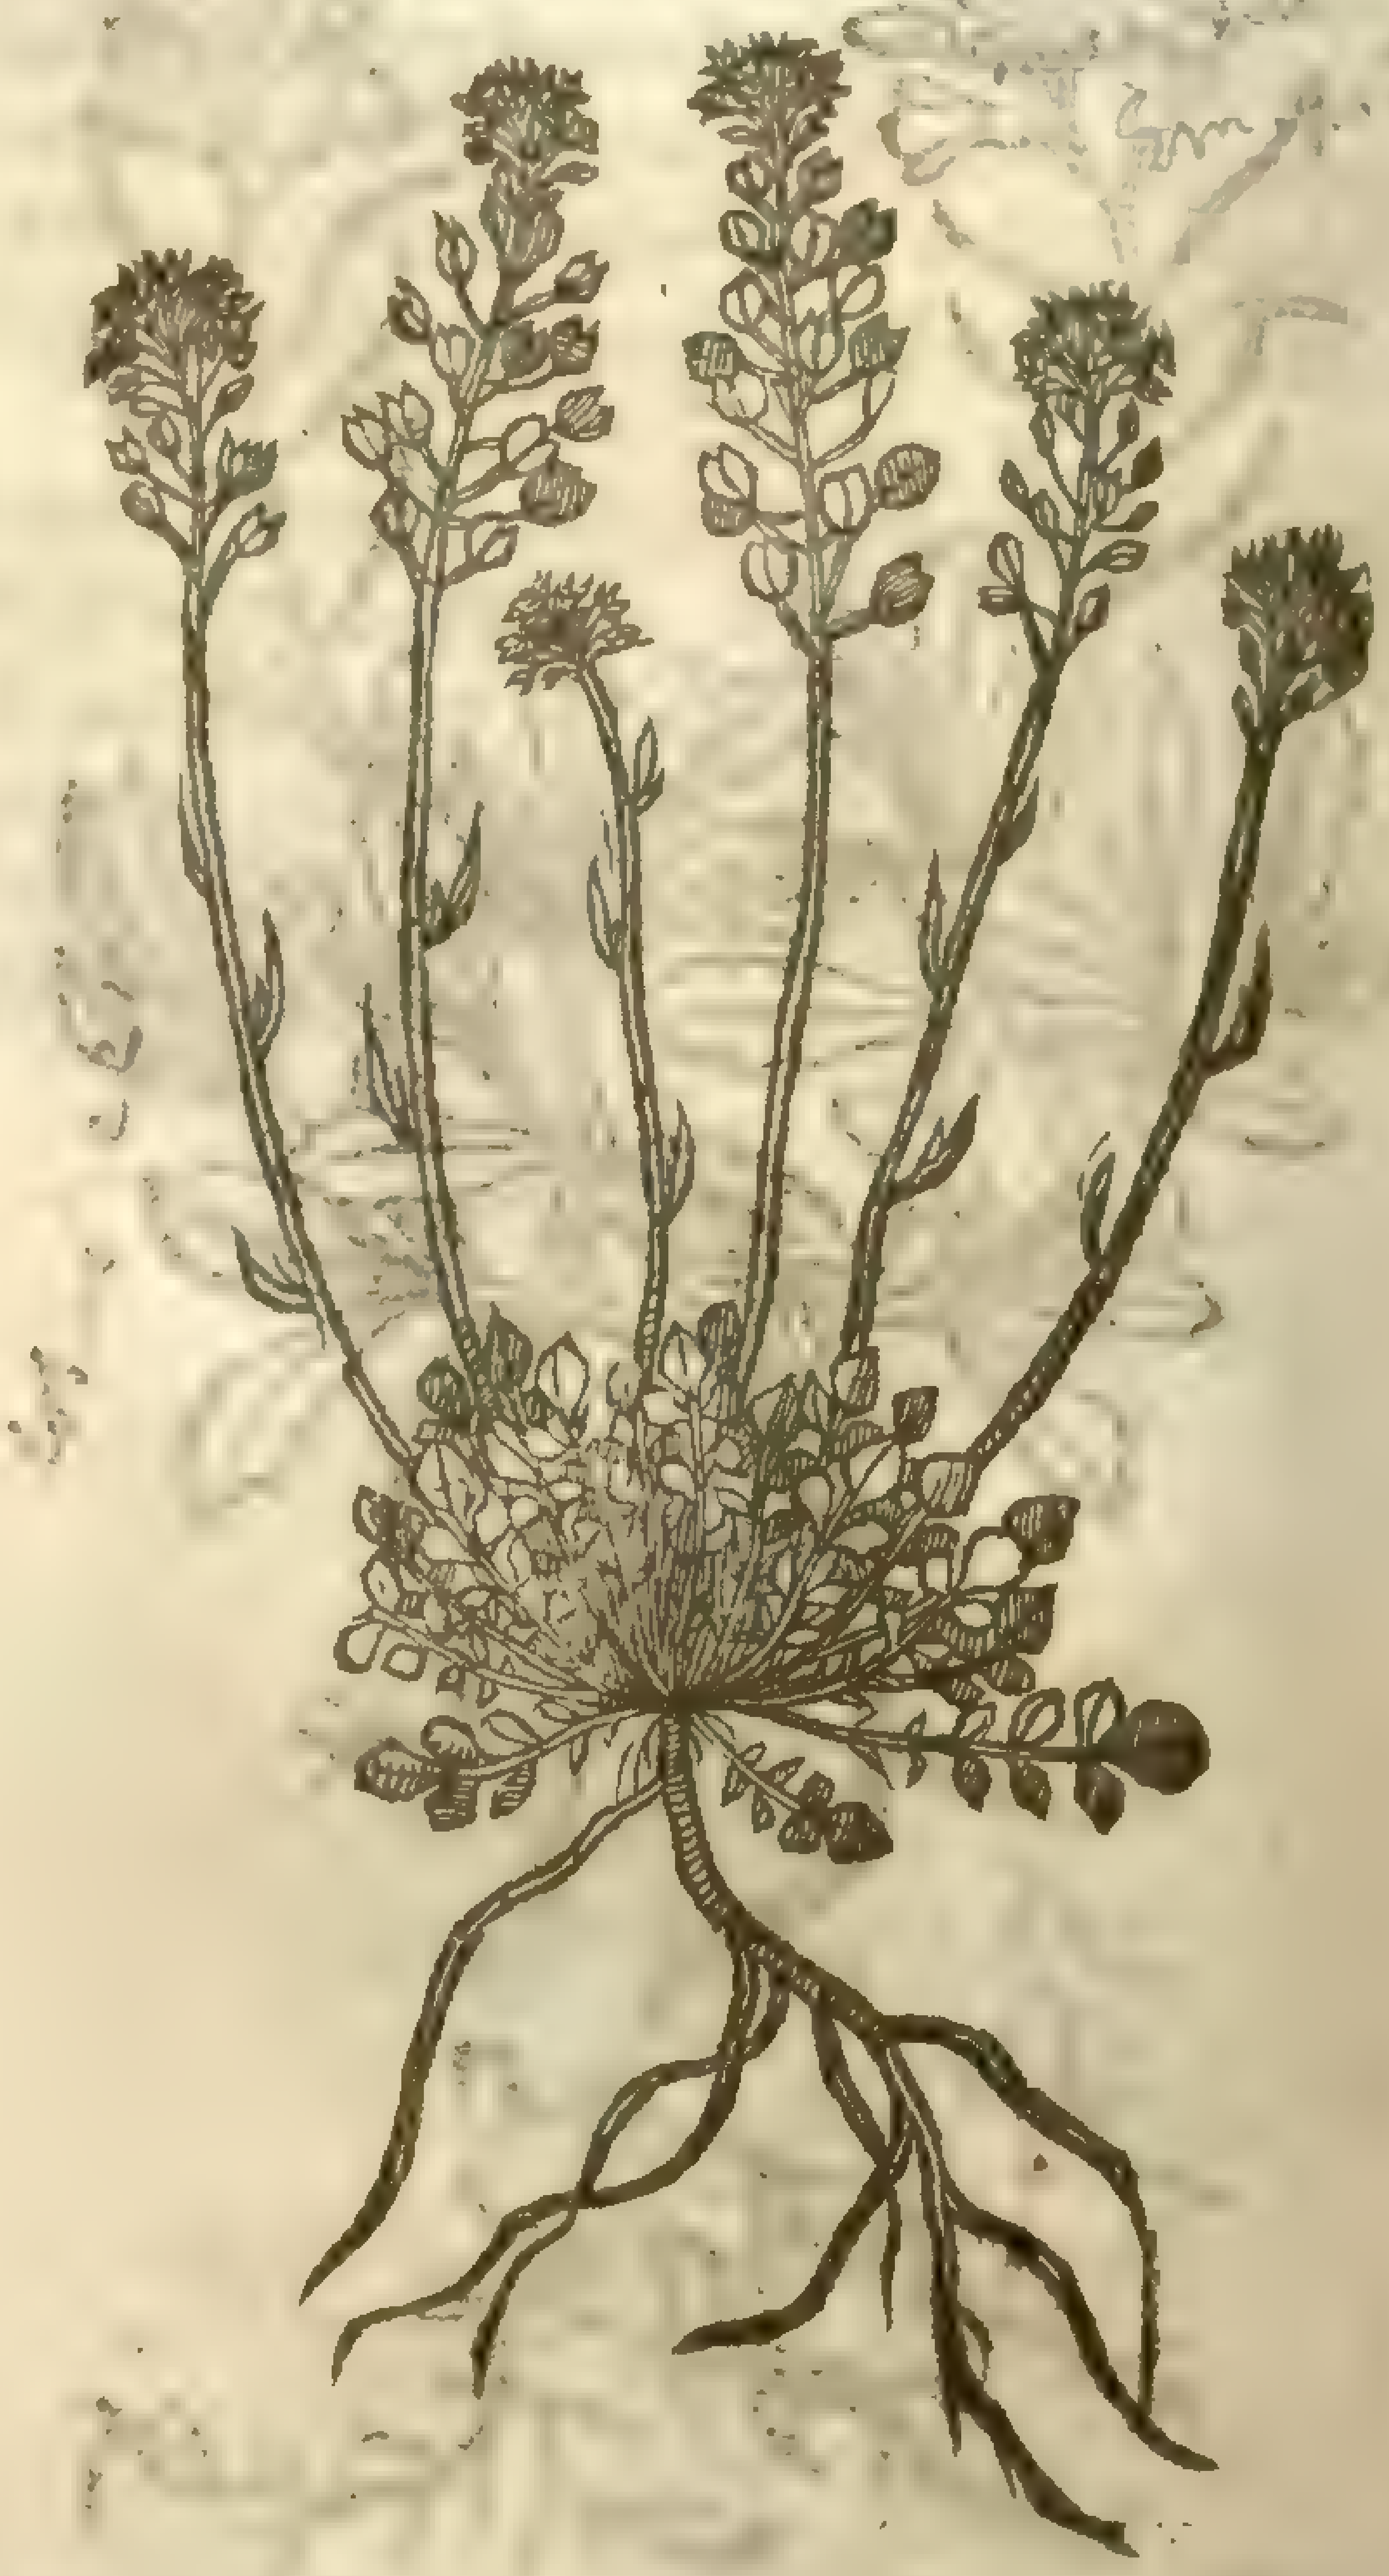
Theſe herbes doe grow of themſelues for the moſt part, neere common high waies, in deſart and vntilled places, among rubbiſh and old walls.

1 *Burſa paſtoris.*
Shepheards purſe.



Thlaspi bursa pastoris, [illegible]

2 *Burſa Paſtoria minima.*
Small ſhepheards purſe.



¶ *The Time.*

They floure, flouriſh and ſeed all the Summer long.

¶ *The Names.*

Shepheards purſe is called in Latine, *Paſtoris burſa*, or *Pera paſtoris*: in high Dutch, **Seckel**: in low-Dutch, **Borſekens cruyt**: in French, *Bourſe de paſteur ou Curè*: in Engliſh, Shepheards purſe or ſcrip: of ſome, Shepheards pouch, and poore mans Parmacetie: and in the North part of England, Toy-wort, Pick-purſe, and Caſe-weed.

¶ *The Temperature.*

They are of temperature cold and dry, and very much binding, after the opinion of *Ruellius*, *Matthiolus*, and *Dodonæus*; but *Lobel* and *Pœna* hold them to be hot and dry, iudging the ſame by their ſharpe taſt: which hath cauſed me to inſert them here among the kindes of Thlaſpi, conſidering the faſhion of the leaues, cods, ſeed, and taſte thereof: which do ſo wel agree together, that I might very well haue placed them as kindes thereof. But rather willing to content others that haue written before, than to pleaſe my ſelfe, I haue followed their order in marſhalling them in this place, where they may ſtand for couſine germanes.

¶ *The Vertues.*

A Shepheards purſe ſtaieth bleeding in any part of the body, whether the iuice or the decoction thereof be drunke, or whether it be vſed pulteſſe wiſe, or in bath, or any other way elſe.

B In a Clyſter it cureth the bloudy flix: it healeth greene and bleeding wounds: it is maruellous good for inflammations new begun, and for all diſeaſes which muſt be checked backe and cooled.

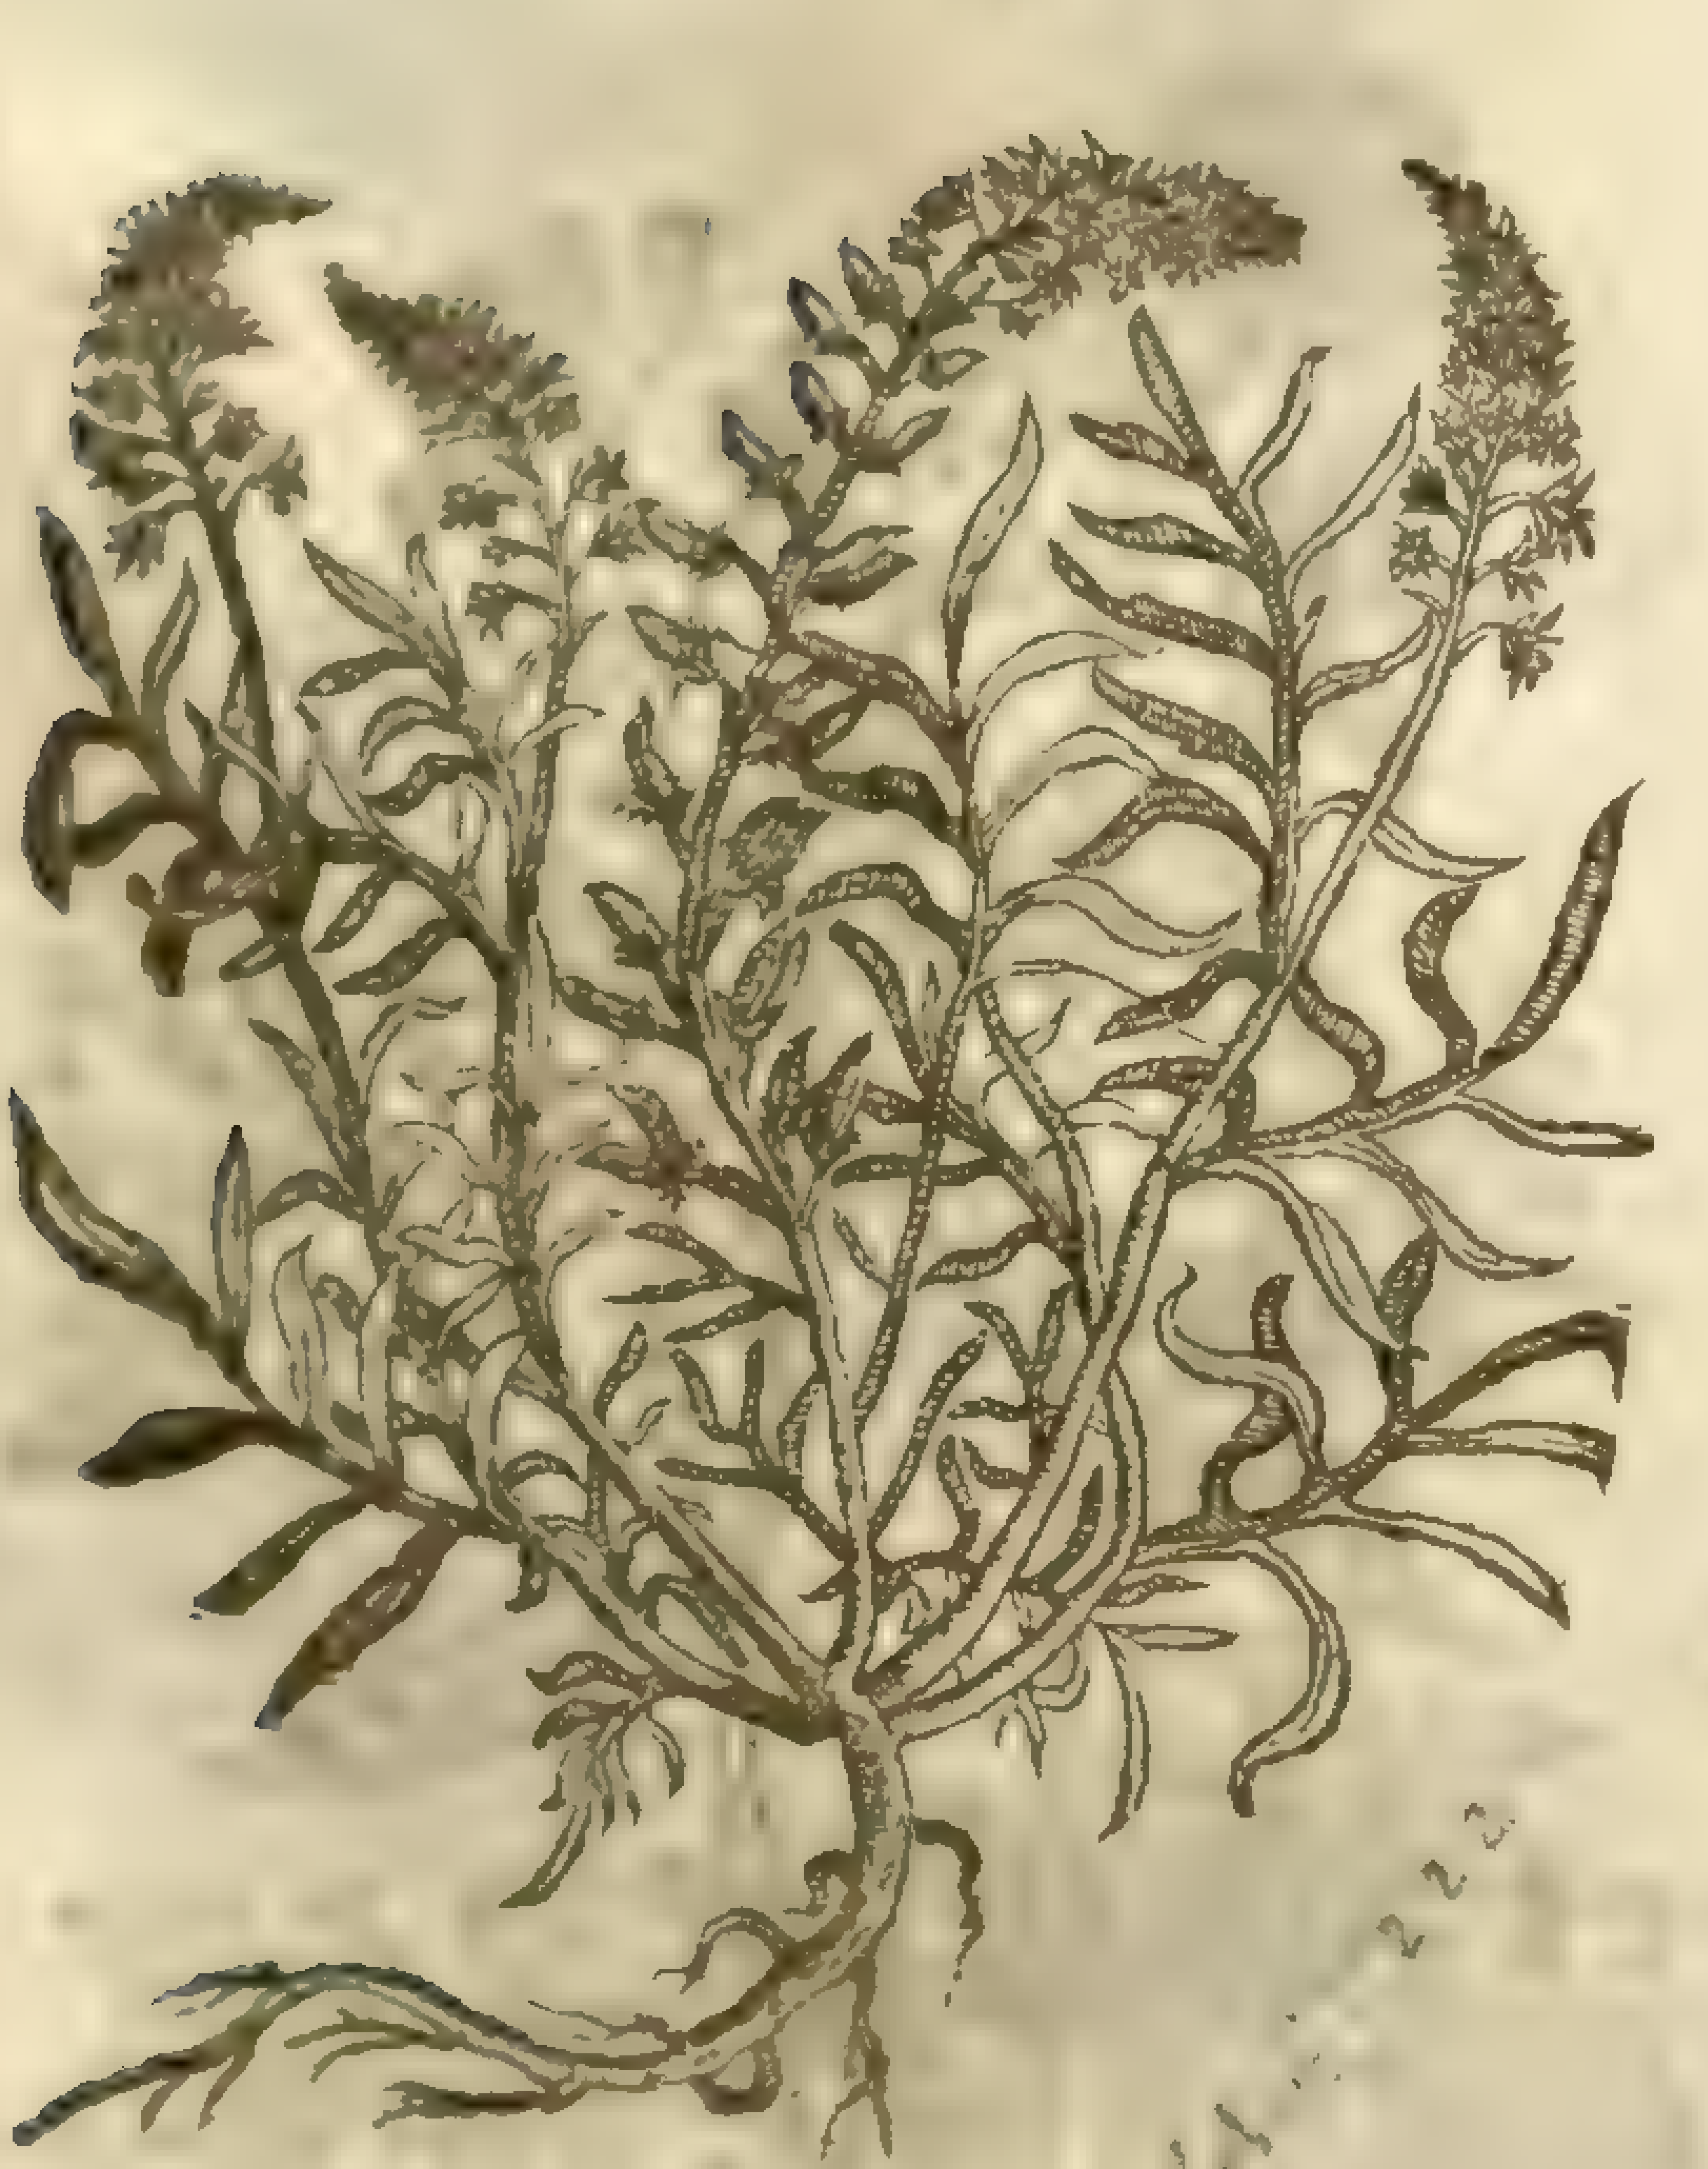
C The decoction doth ſtop the laske, the ſpitting and piſſing of bloud, and all other fluxes of bloud.

CHAP. 26. *Of Italian Rocket.*

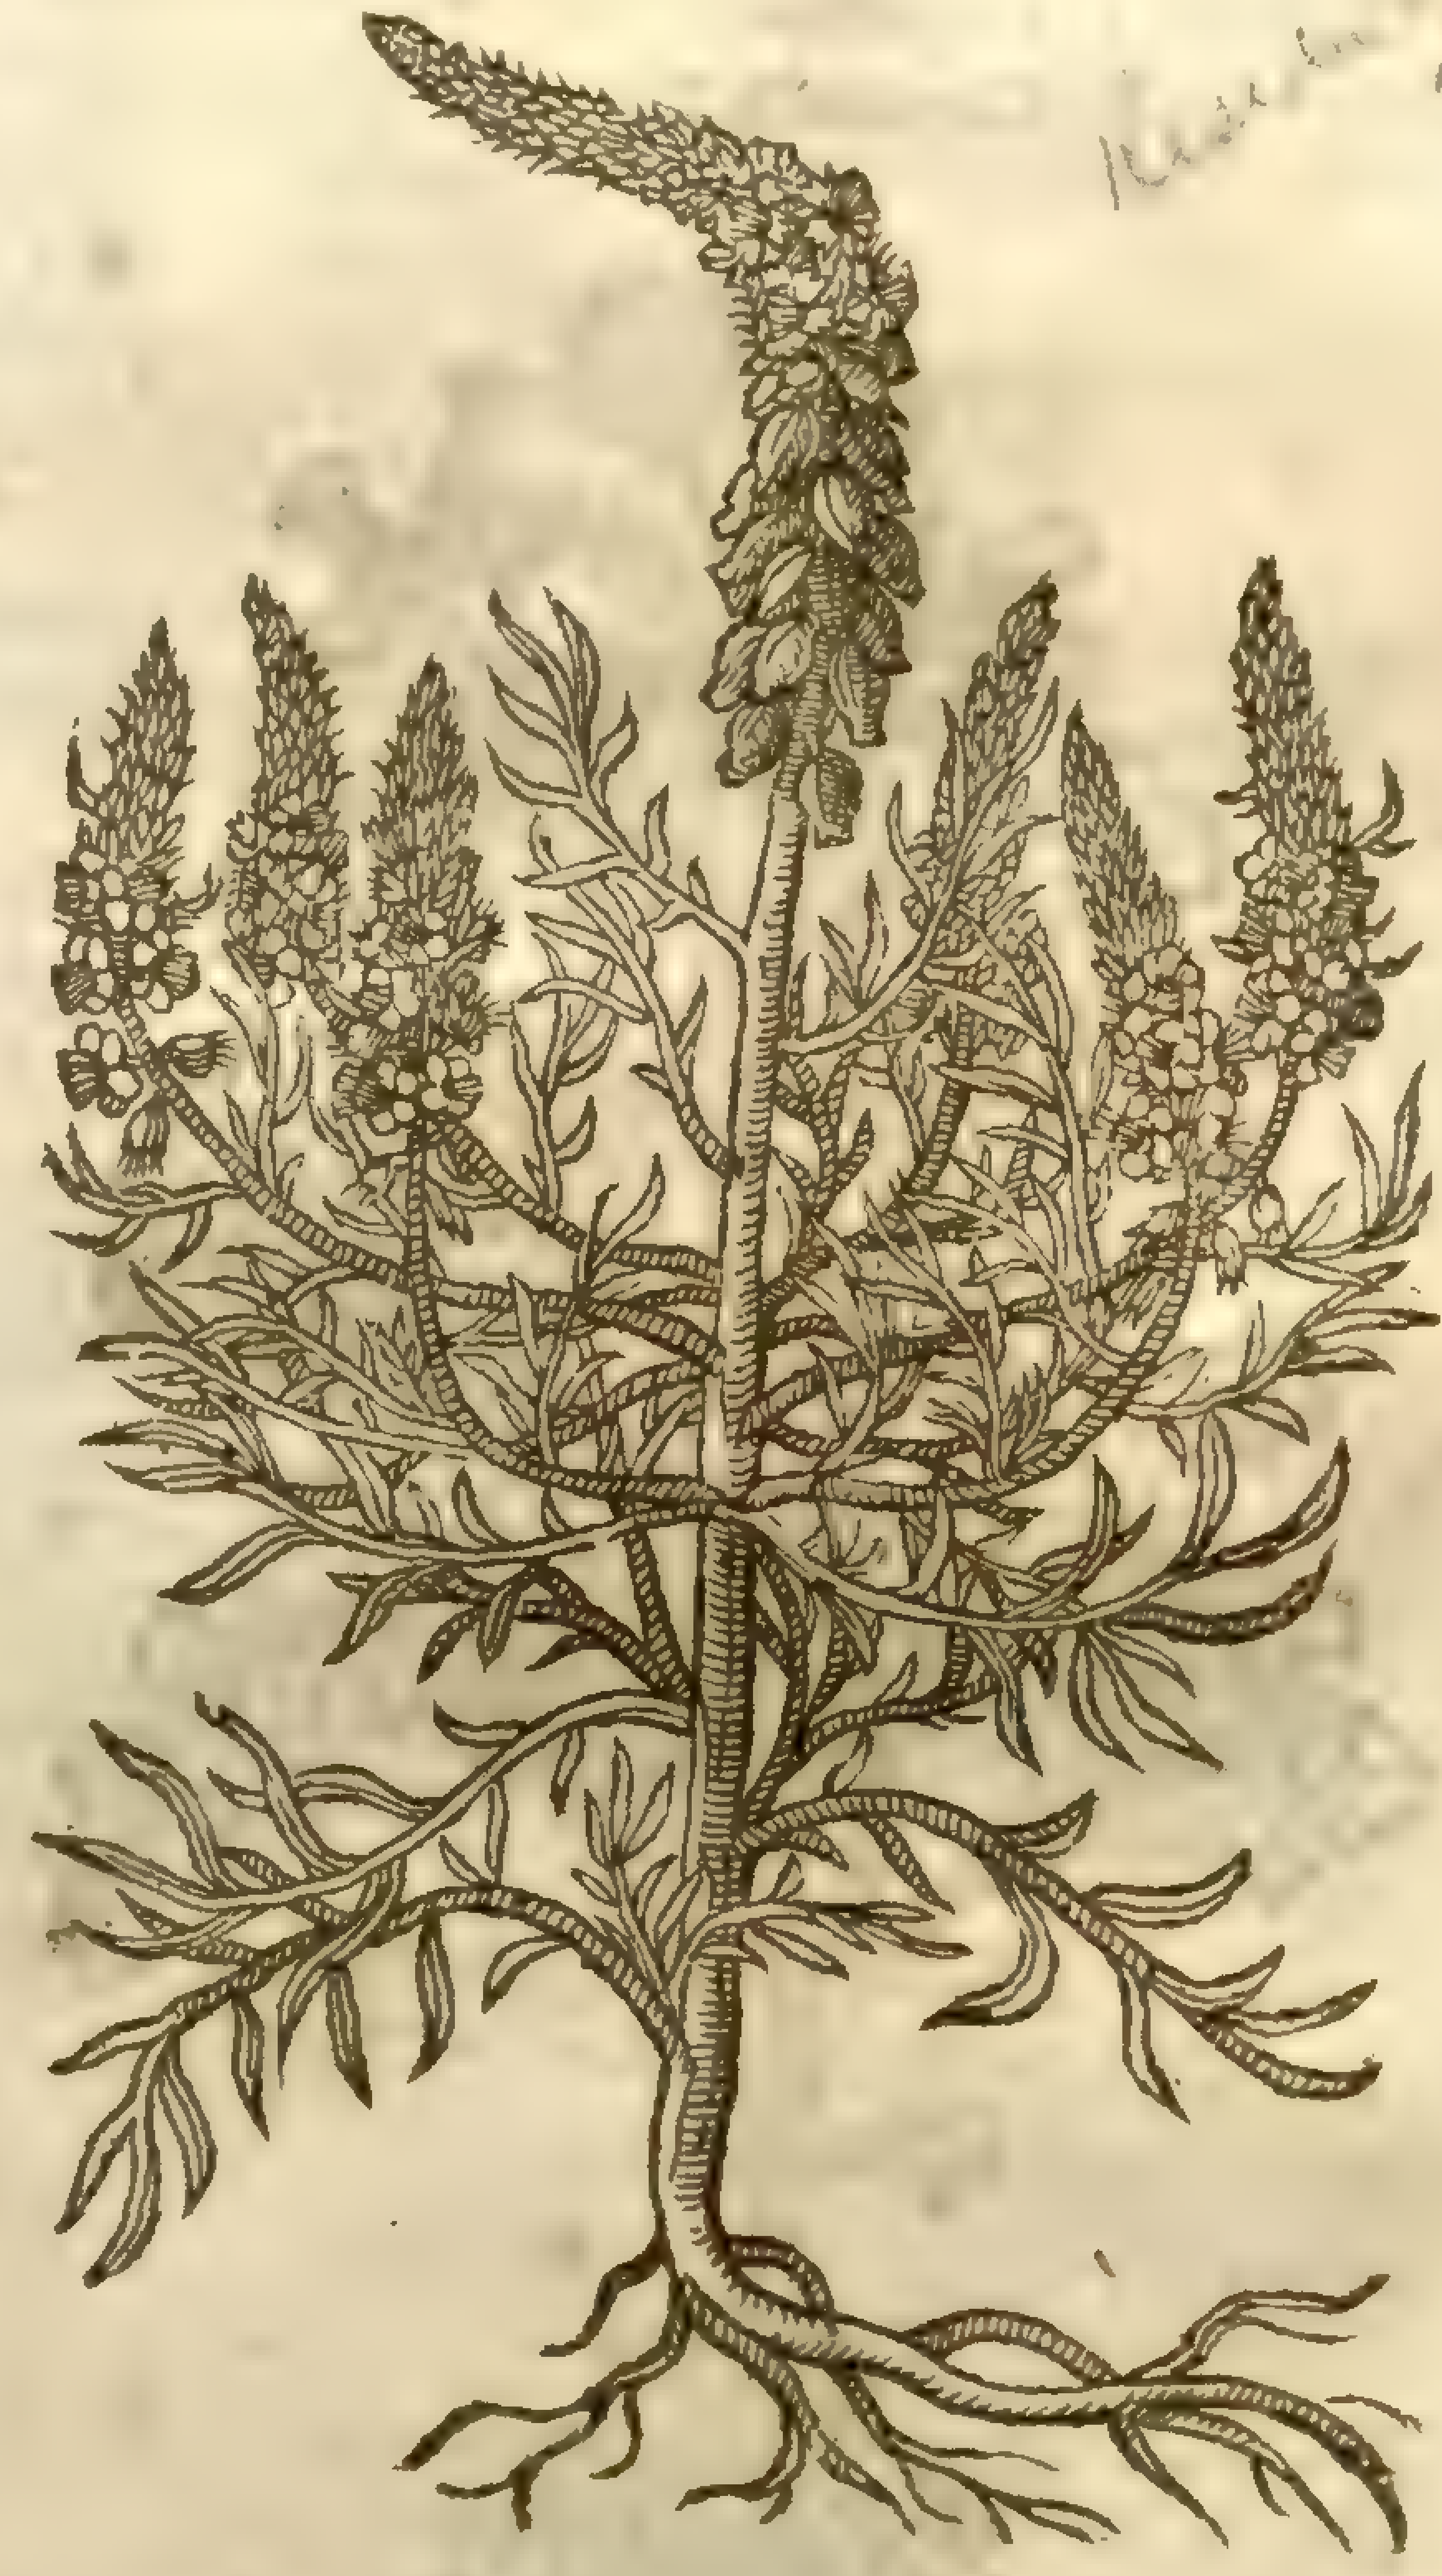
¶ *The Deſcription.*

1 ITalian Rocket hath long leaues cut into many parts or diuiſions like thoſe of the aſh tree; reſembling *Ruellius* his Bucks horne: among which riſe vp ſtalkes weake and tender, but thicke and groſſe, two foot high, garniſhed with many ſmall yellowiſh floures like the middle part of Tanſie floures, of a naughty ſauor or ſmell: the ſeed is ſmall like ſand or duſt, in taſt like Rocket ſeed, whereof in truth we ſuſpect it to be a kinde. The root is long and wooddy.

[illegible]



1 *Rheſeda Plinij.*
Italian Rocket.



2 *Rheſeda maxima.*
Crambling Rocket.

2 Crambling Rocket hath many large leaues cut into ſundry ſections, deeply diuided to the middle rib, branched like the horns of a ſtag or hart: among which riſe vp long fat & fleſhy ſtalks two cubits high, lying flat vpon the ground by reaſon of his weake and feeble branches. The flours grow at the top, cluſtering thicke together, white of colour, with browniſh threds in them. The ſeed is like the former. ‡ *Lobel* affirmes it growes in the Low-countrie gardens with writhen ſtalks, ſometimes ten or twelue cubits high, with leaues much diuided. ‡

¶ *The Place.*

Theſe plants grow in ſandy, ſtony, grauelly, and chalky barren grounds. I haue found them in ſundry places of Kent, as at Southfleet vpon Long-field downes, which is a chalky & hilly ground very barren. They grow at Greenhith vpon the hils, and in other places of Kent. ‡ The firſt grows alſo vpon the Wolds in Yorkſhire. The ſecond I haue not ſeen growing but in gardens, and much doubt whether it grow wild with vs or no. ‡

¶ *The Time.*

Theſe Plants do flouriſh in Iune, Iuly, and Auguſt.

¶ *The Names.*

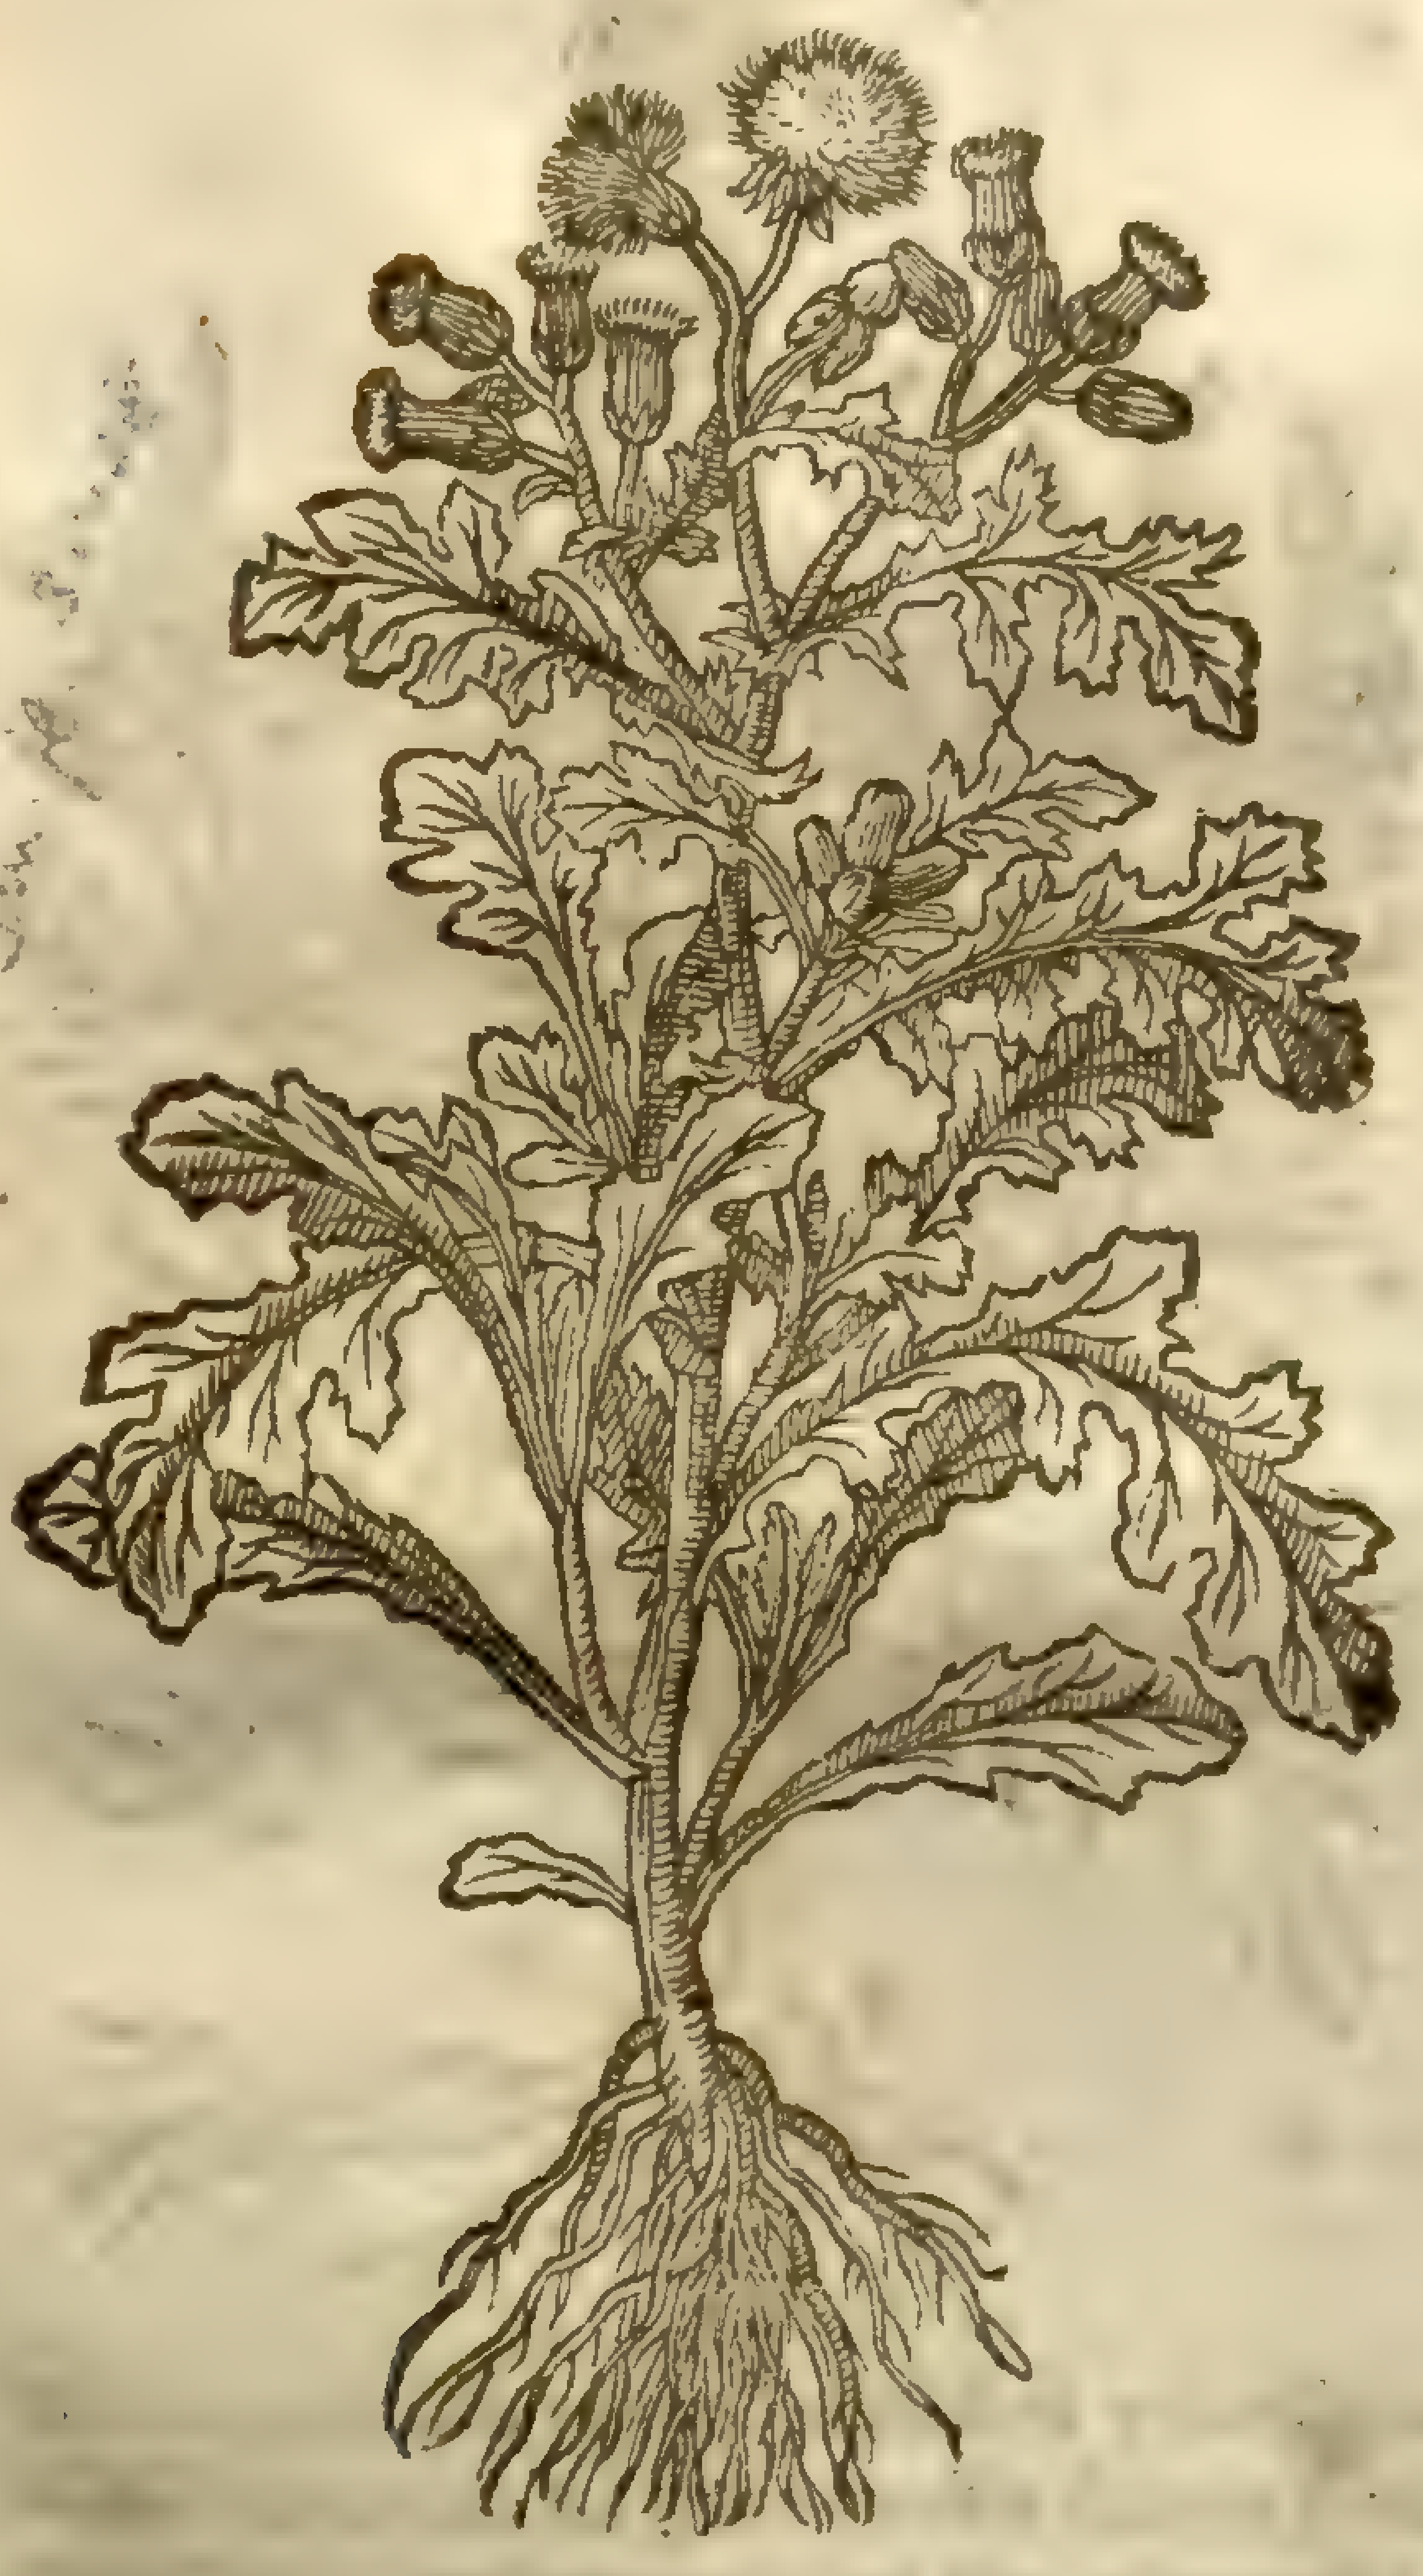
The firſt is called of *Pliny*, *Reſeda*, *Eruca peregrina*, & *Eruca Cantabrica*: in Engliſh, Italian Rocket. The ſecond is called *Reſeda maxima*: of *Anguillara*, *Pignocomon*: whereof I finde nothing extant worthy of memorie, either of temperature or vertues.

Chap. 27. *Of Groundſell.*

¶ *The Deſcription.*

1 The ſtalke of Groundſell is round, chamfered and diuided into many branches. The leaues be green, long, and cut in the edges almoſt like thoſe of Succorie, but leſſe, like in a manner to the leaues of Rocket. The floures be yellow, and turn to down, which is caried away with the wind. The root is full of ſtrings and threds.

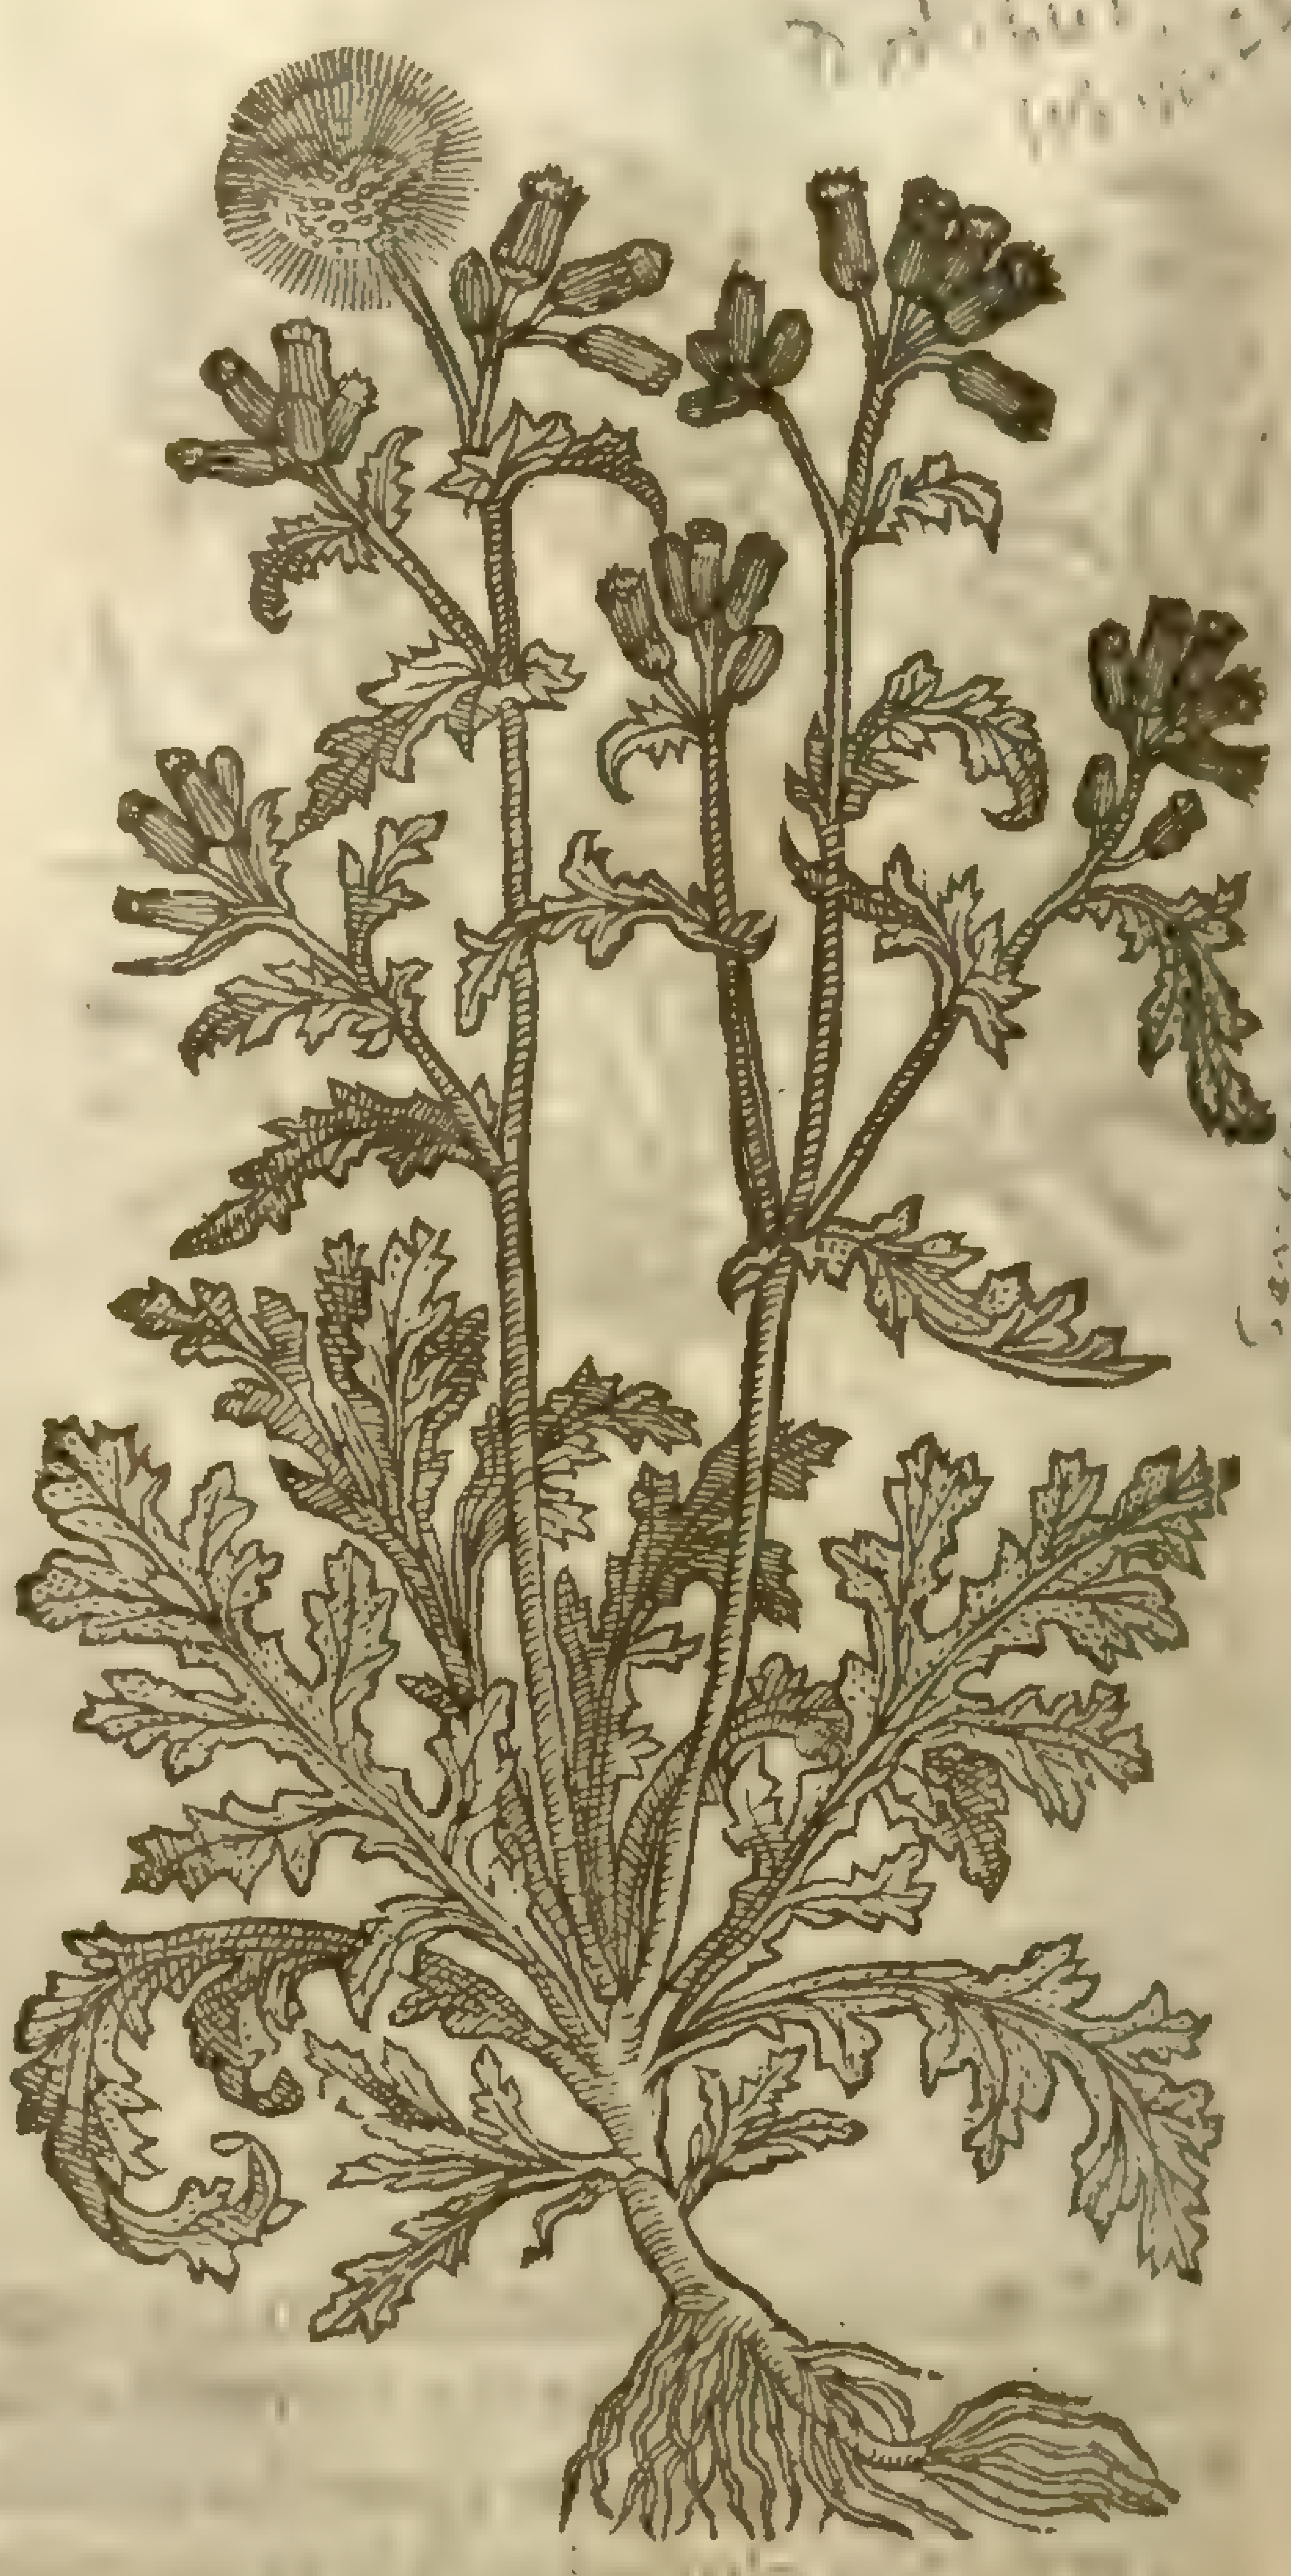
1 *Erigerum.*
Groundſell.



Senecio sylvaticus, a

Senecio vulgaris, b

2 *Erigerum tomentoſum.*
Cotton Groundſell.



2 Cotton Groundſel hath a ſtraight ſtalke of a brown purple colour, couered with a fine cotton or downy haire of the height of two cubits. The leaues are like thoſe of S. *Iames* wort or Ragwort; and at the top of the ſtalke grow ſmall knops, from which come floures of a pale yellow colour; which are no ſooner opened and ſpred abroad, but they change into down like that of the thiſtle, euen the ſame houre of his flouring, and is carried away with the winde: the root is ſmall and tender.

‡ 3 There is another with leaues more jagged, and finelier cut than the laſt deſcribed, ſoft alſo and downy: the floures are fewer, leſſe and paler than the ordinarie, but turne ſpeedily into down like as the former. ‡

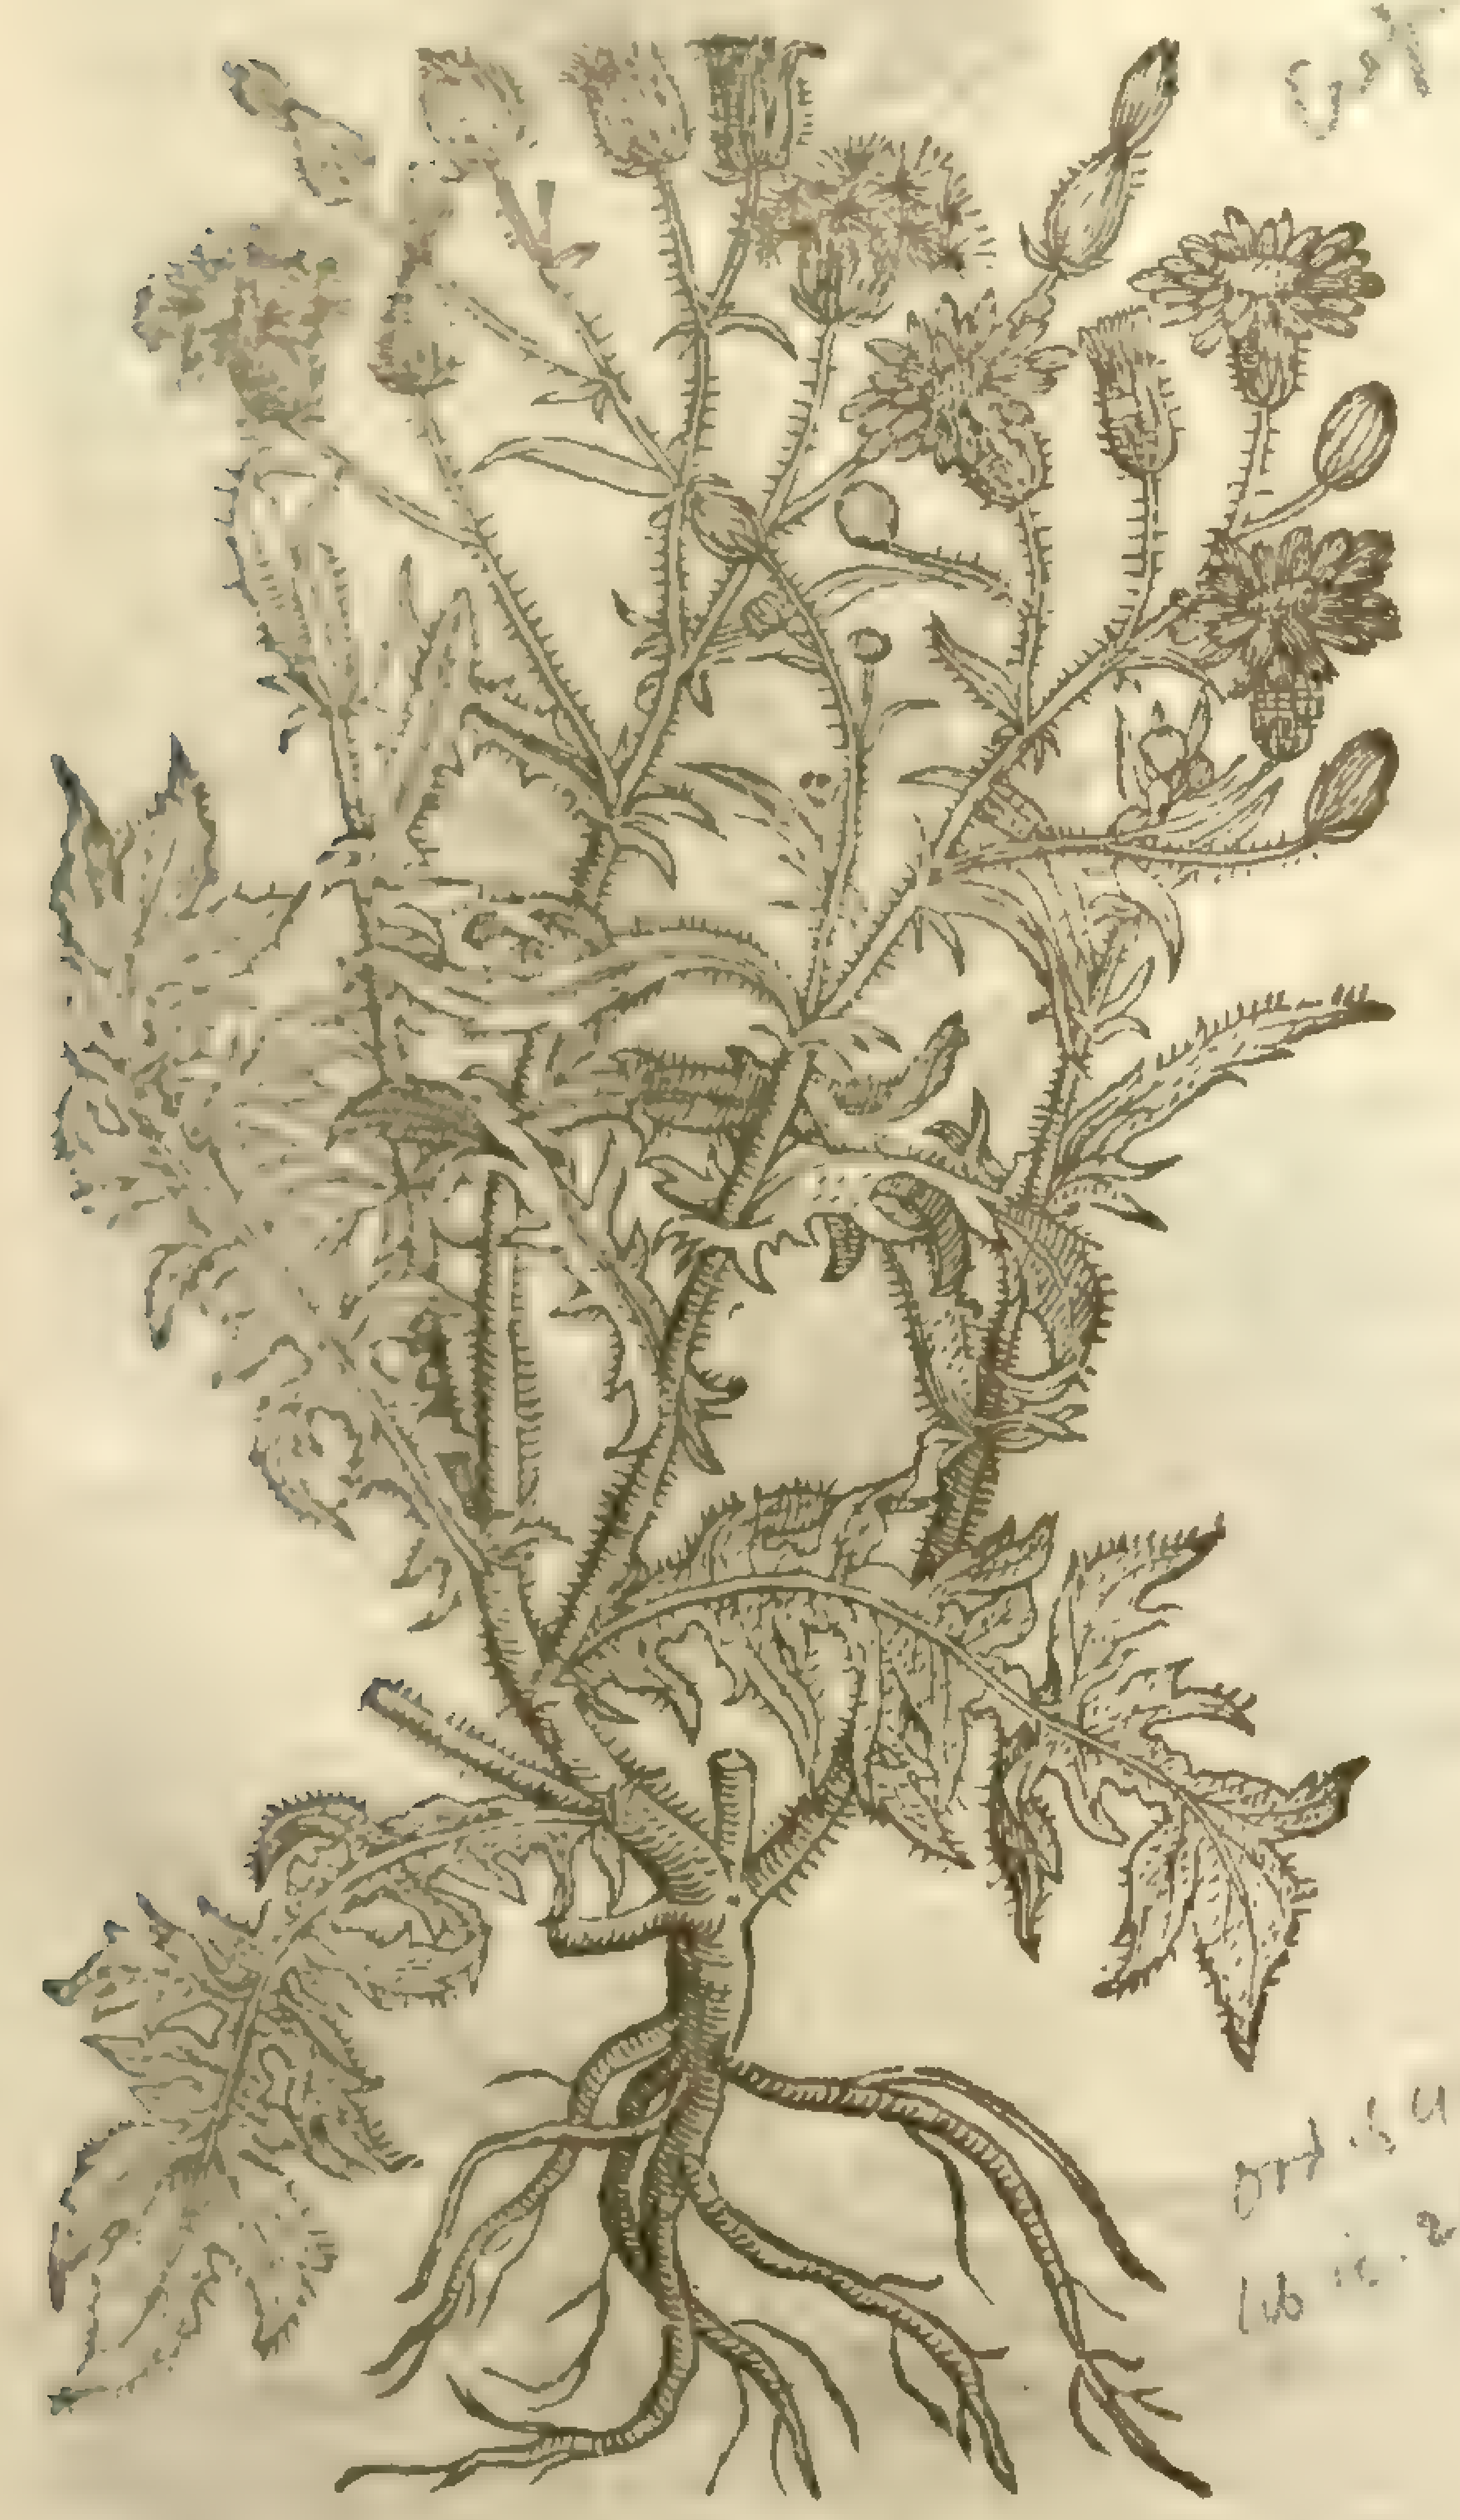
¶ *The Place.*

Theſe herbs are very common throughout England, and do grow almoſt euery where.

¶ *The Time.*

They flouriſh almoſt euery moneth of the yeare.

‡ 3 *Erigeron tomentoſum alterum.*
The other Cotton Groundſell.



¶ *The Names.*

Grounſel is called in Greeke, ἠριγέρων: in Latine, *Senecio*, becauſe it waxeth old quickly: by a baſtard name *Herbutum*: in Germany, **Creutzwurtz**: in low-Dutch, **Cruys cruyt**, and **Cruyſken cruyt**: in Spaniſh, *Yerva cana*: in Italian, *Cardoncello*, *Speliciosa*: in Engliſh, Groundſel.

Cotton Groundſel ſeems to be all one with *Theophraſtus* his *Aphace*: he maketh mention of *Aphace Lib*.7. which is not onely a kinde of pulſe, but an herbe alſo, vnto which this kinde of Groundſell is very like. For as *Theophraſtus* ſaith, The herbe *Aphace* is one of the pot-herbs & a kind of Succorie: adding further, That it floureth in haſte, but yet ſoon is old, and turneth into down; and ſuch a one is this kind of Groundſell. But *Theophraſtus* ſaith further, That it floureth all the winter, and ſo long as the ſpring laſteth; as my ſelfe haue often ſeene this Groundſell do.

¶ *The Nature.*

Groundſel hath mixt faculties: it cooleth, and withall digeſteth, as *Paulus Ægineta* writeth.

¶ *The Vertues.*

The leaues of Groundſel boiled in wine or water, and drunke, heale the paine and ach of the ſtomacke that proceeds of Choler. A

The leaues and floures ſtamped with a little hogs greaſe ceaſe the burning heat of the ſtones and fundament. By adding to a little Saffron or ſalt it helpeth the *Struma* or Kings euill. B

The leaues ſtamped and ſtrained into milke and drunke, helpe the red gums and frets in Children. C

Dioſcorides ſaith, That with the fine pouder of Frankincenſe it healeth wounds in the ſinues. The like operation hath the downe of the floures mixed with vineger. D

Boiled in ale with a little hony and vineger, it prouoketh vomit, eſpecially if you adde thereto a few roots of *Aſarabacca*. E

Chap. 28. *Of Saint Iames his Wort.*

¶ *The Kindes.*

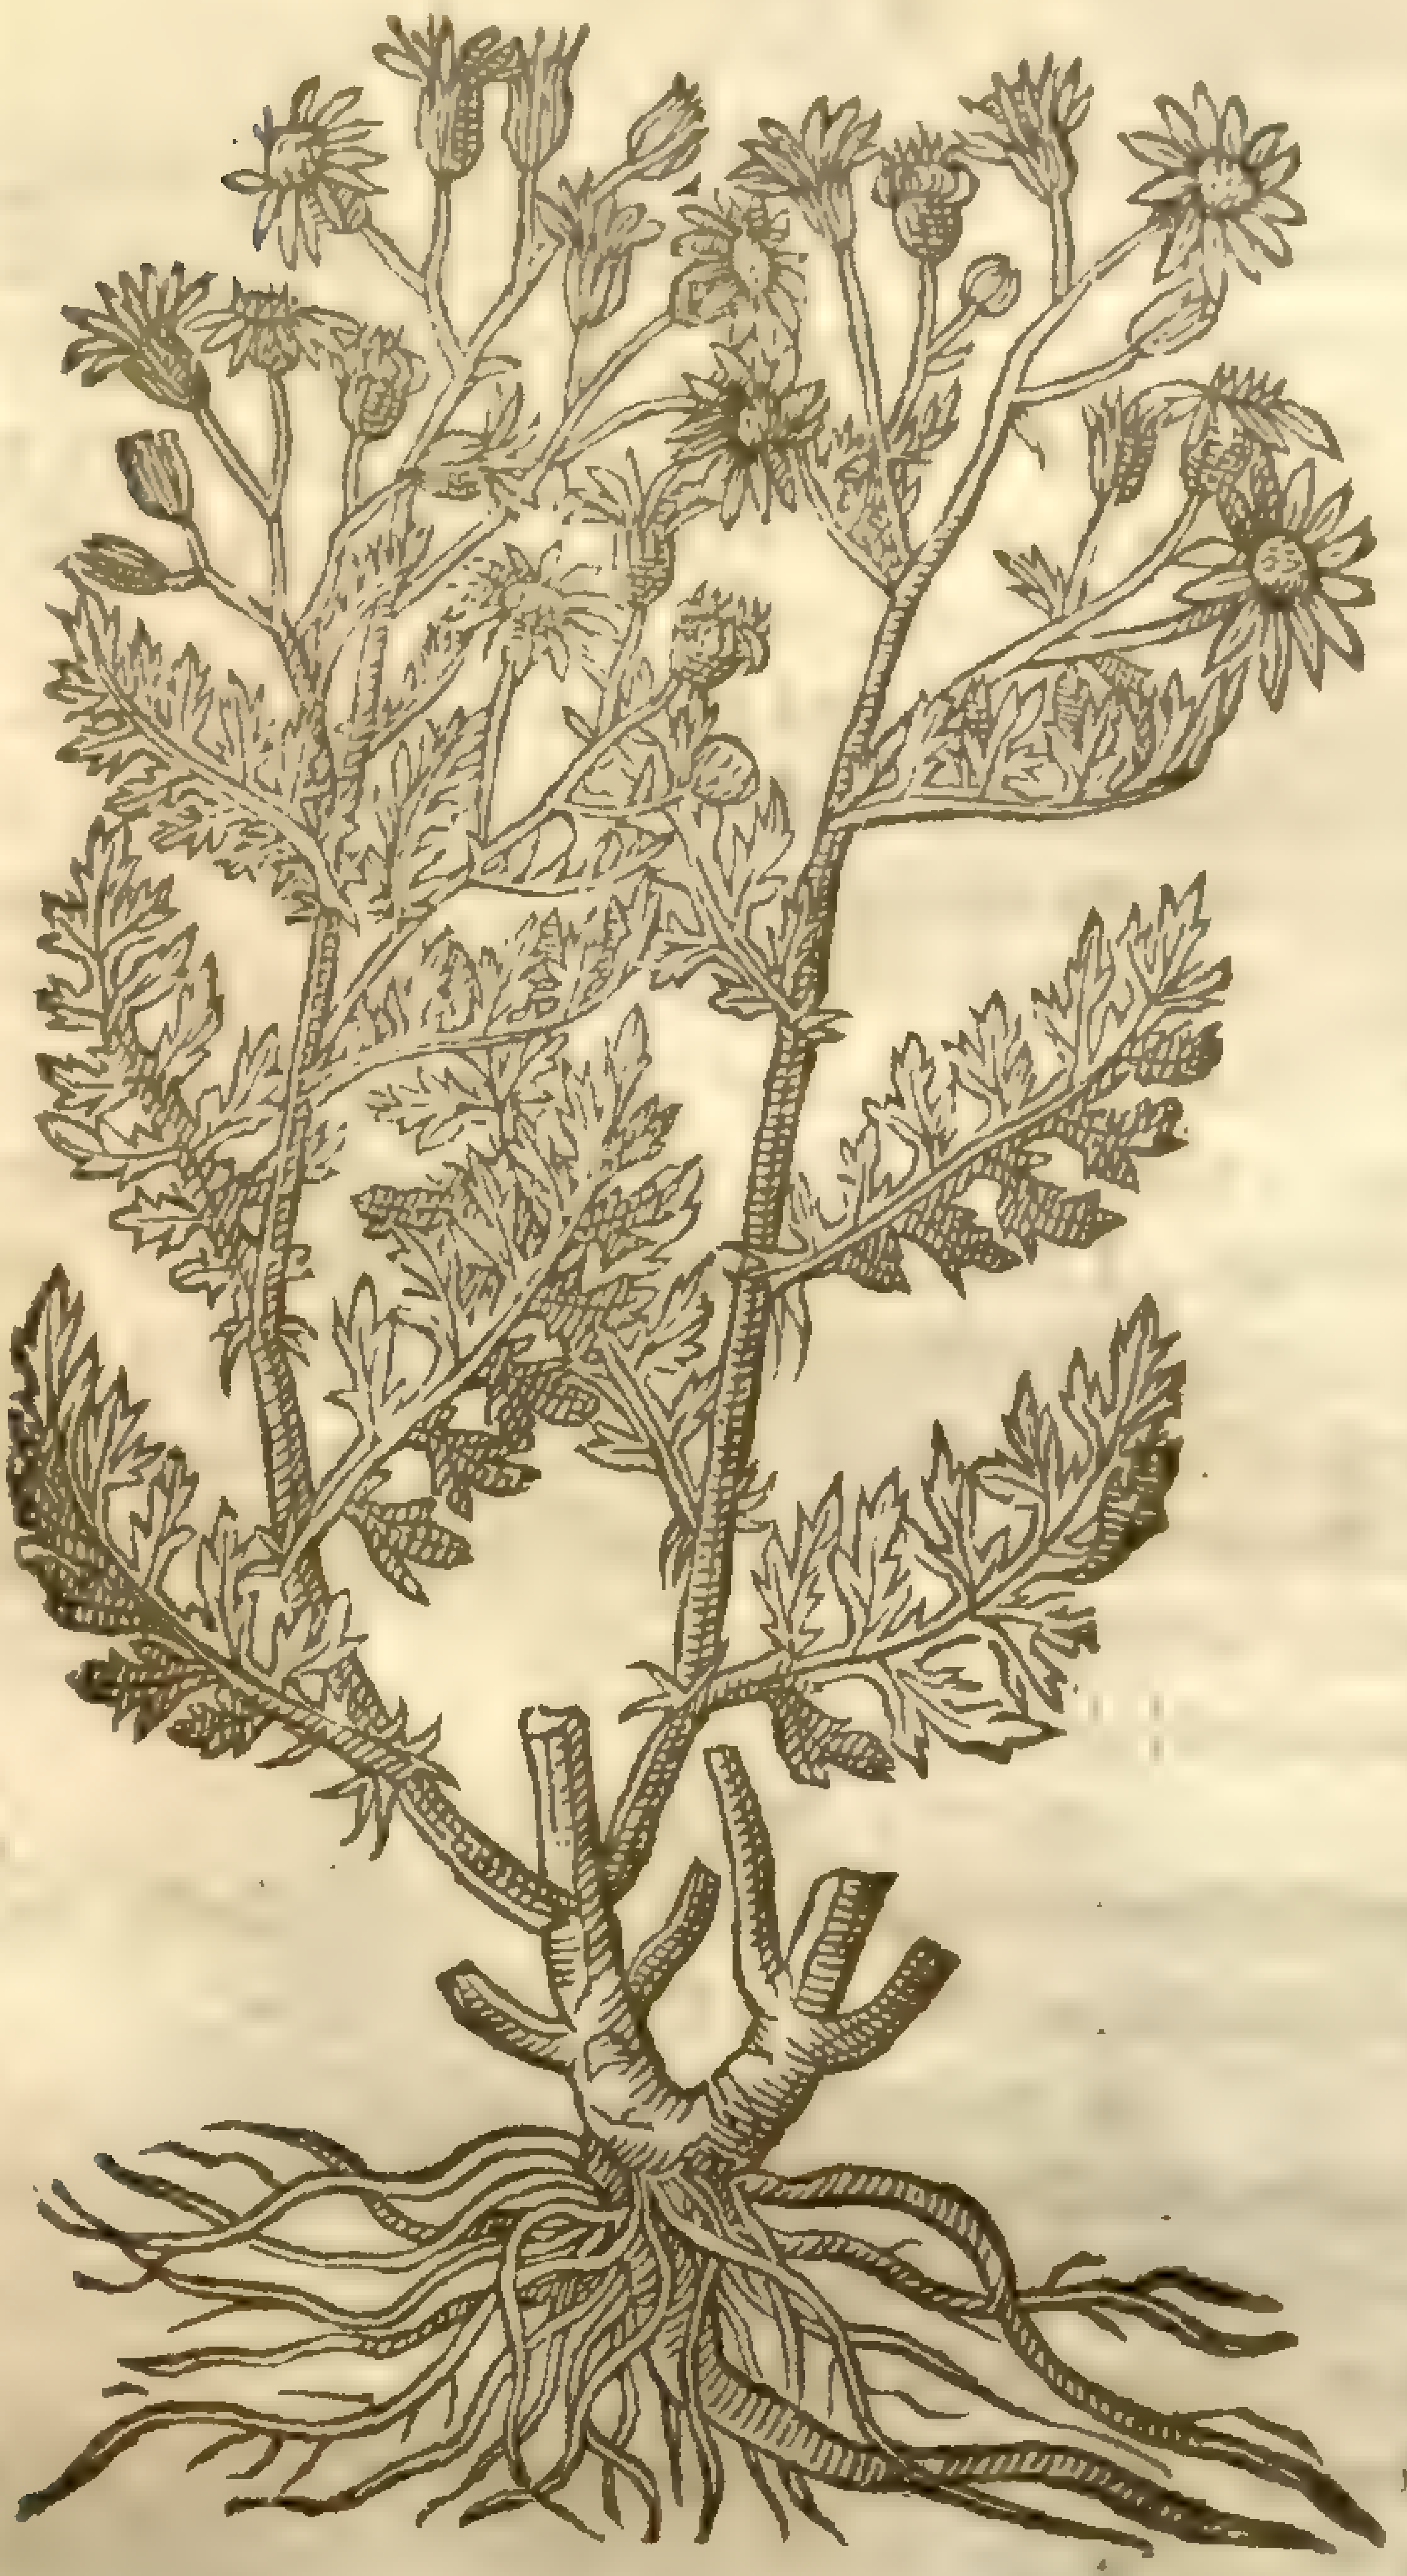
THe herb called Saint *Iames* his Wort is not without cauſe thought to be a kind of Groundſel: of which there be ſundry ſorts, ſome of the paſture, & one of the ſea; ſome ſweet ſmelling, and ſome of a loathſome ſauor. All which kinds I will ſet downe.

¶ *The Deſcription.*

1 SAint Iames his wort or Rag-wort is very well known euery where, and bringeth forth at the firſt broad leaues gaſhed round about like to the leaues of common Wormewood, but broader, thicker, not whitiſh or ſoft, of a deep green colour, with a ſtalke which riſeth vp aboue a cubit high, chamfered, blackiſh, and ſomwhat red withall. The armes or wings are ſet with leſſer leaues like thoſe of Groundſell or wilde Rocket. The floures at the top be of a yellow colour like Marigolds, as well the middle button, as the ſmall floures that ſtand in a pale round about, which turne into downe as doth Groundſel. The root is thready.

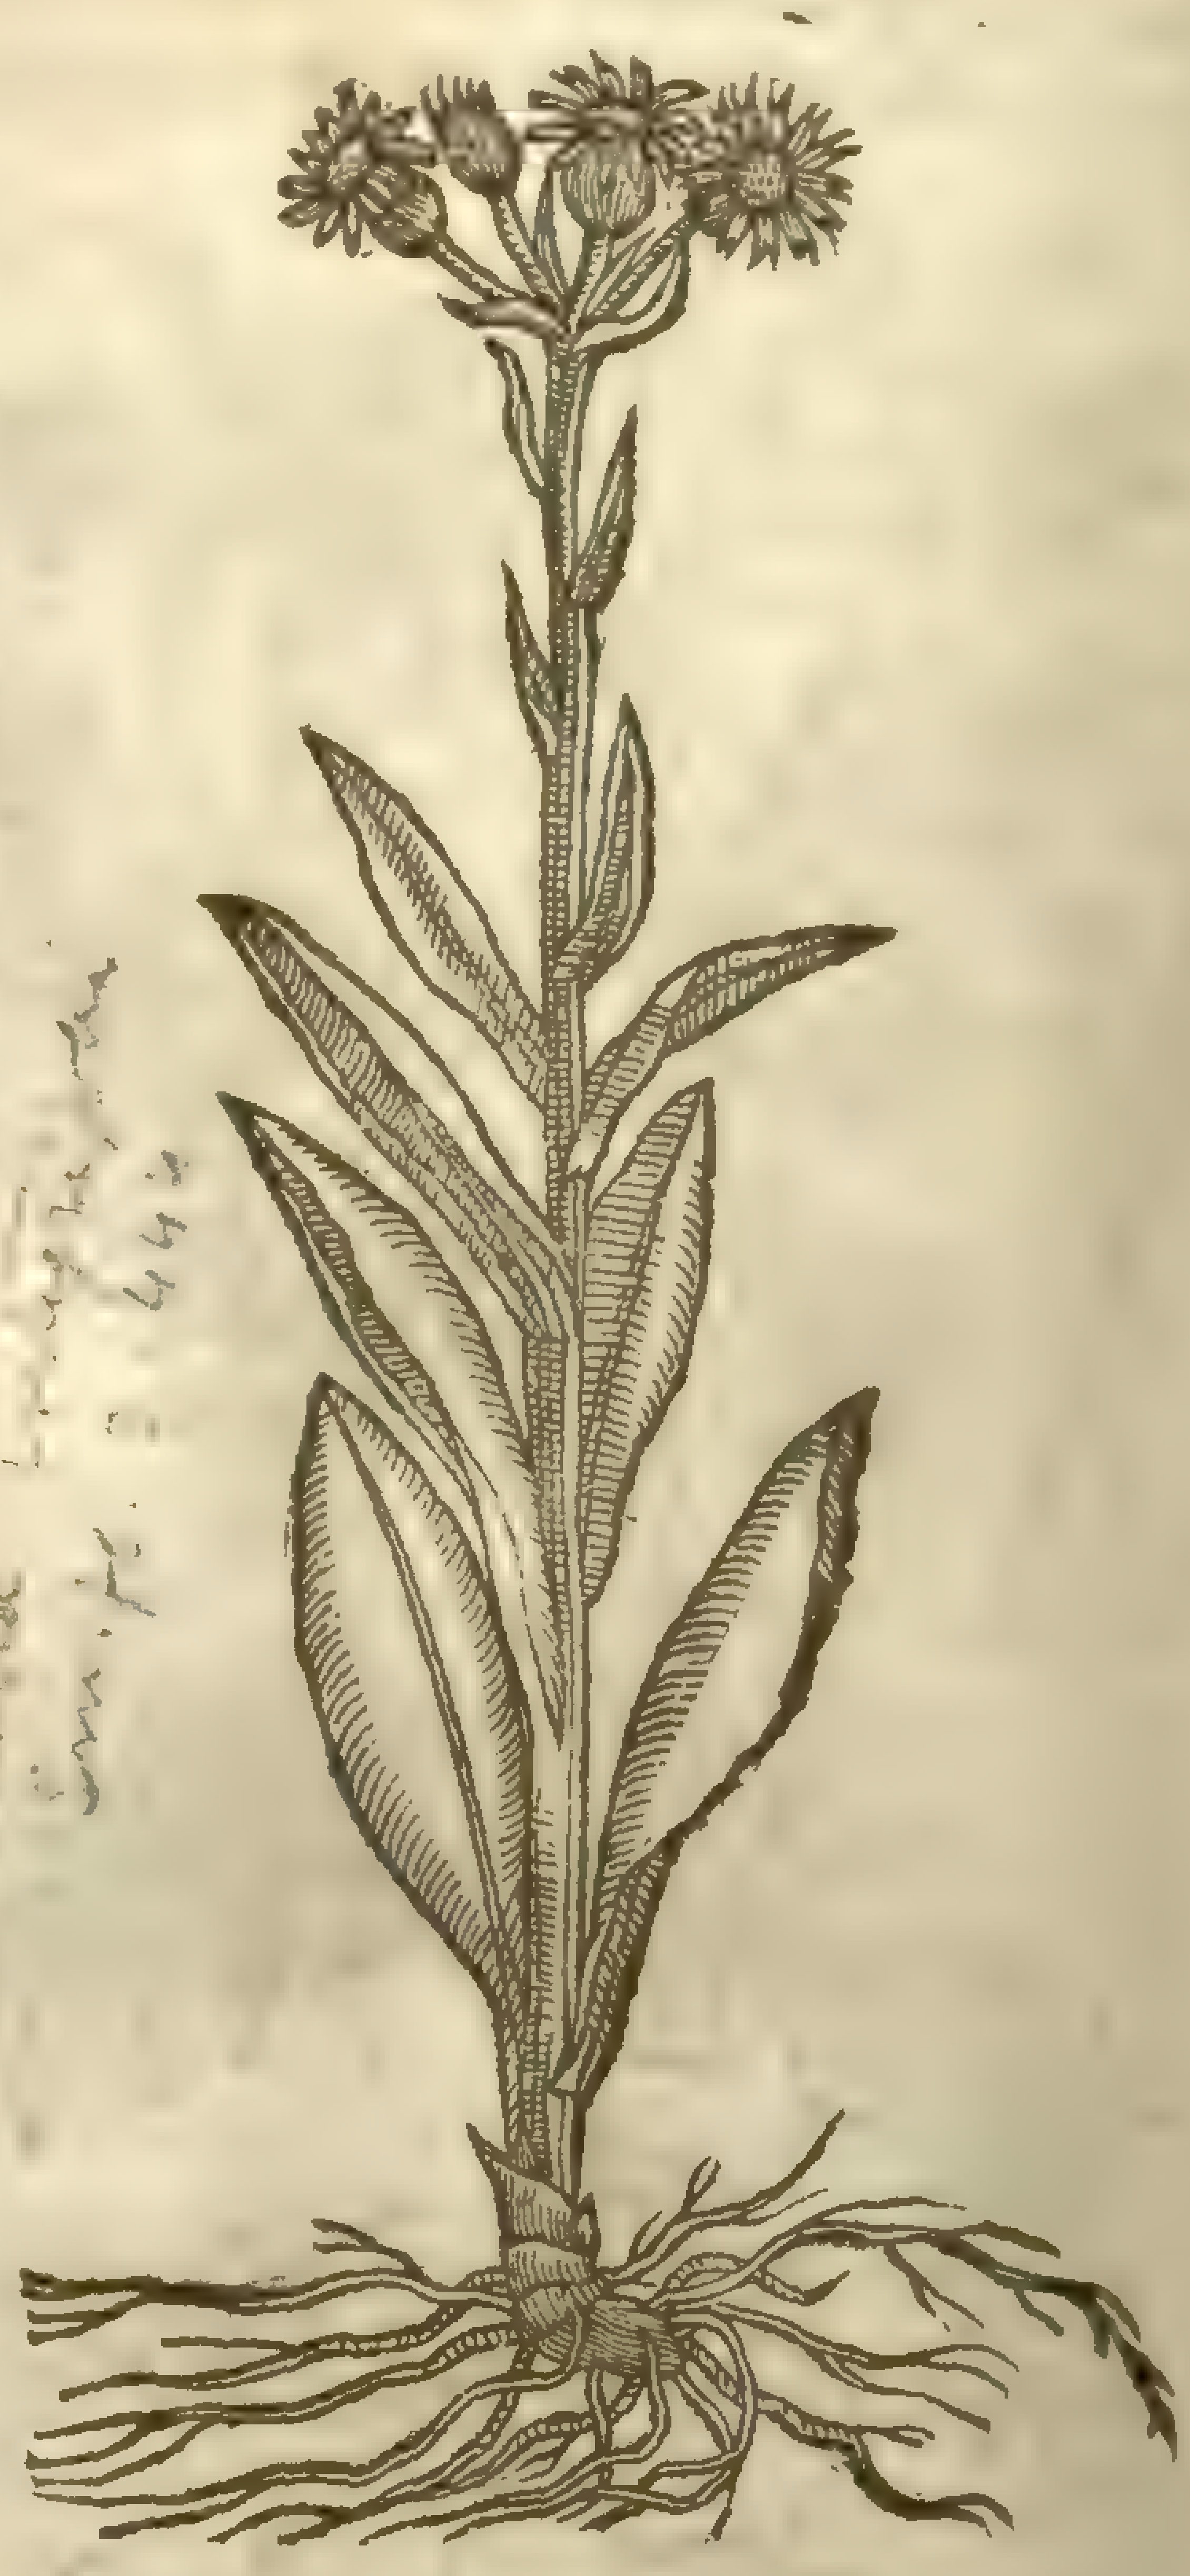
‡ 2 This hath ſtalks ſome cubit high, creſted, and ſet with long whitiſh leaues; the lower leaues are the ſhorter, but the vpper leaues the longer, yet the narrower: at the top of the ſtalke grow ſome foure or fiue floures as in an vmbell, which are of a darke red colour before they open themſelues,

1 *Iacobæa.* Rag-wort.



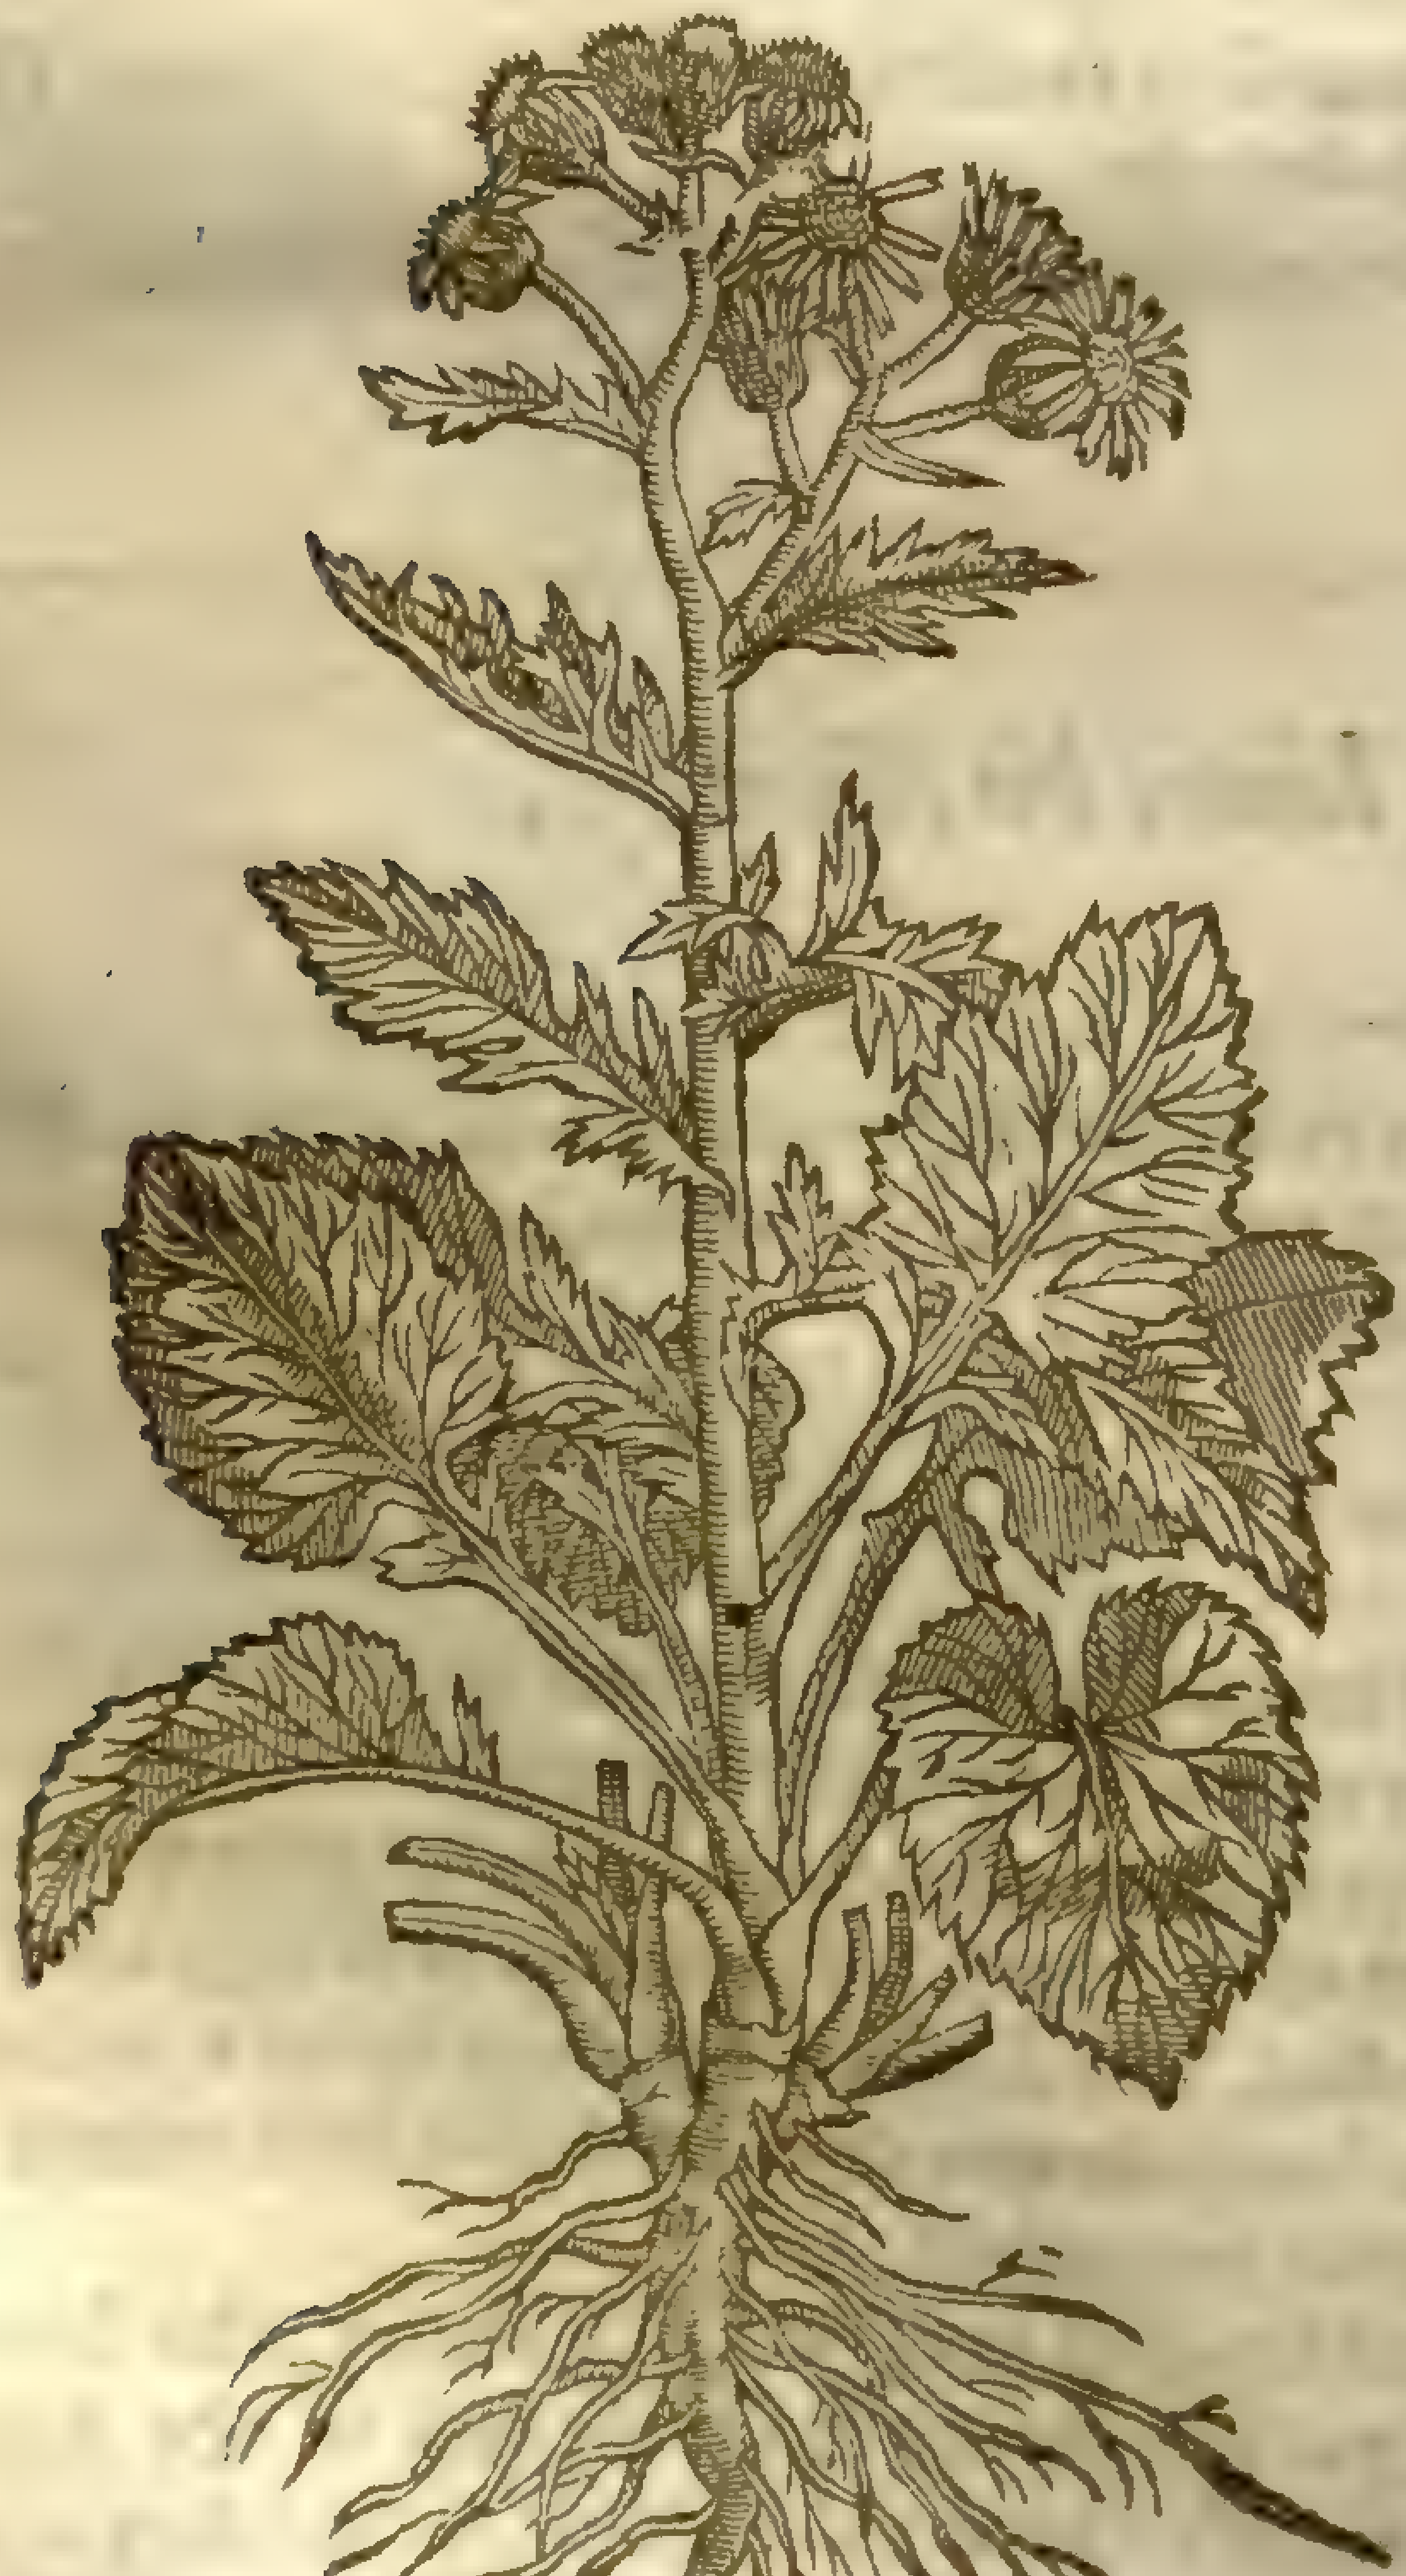
Senecio Jacobaea [illegible] Lin. pl. 3. [illegible]

‡ 2 *Iacobæa anguſtifolia.* Narrow leaued Rag weed.



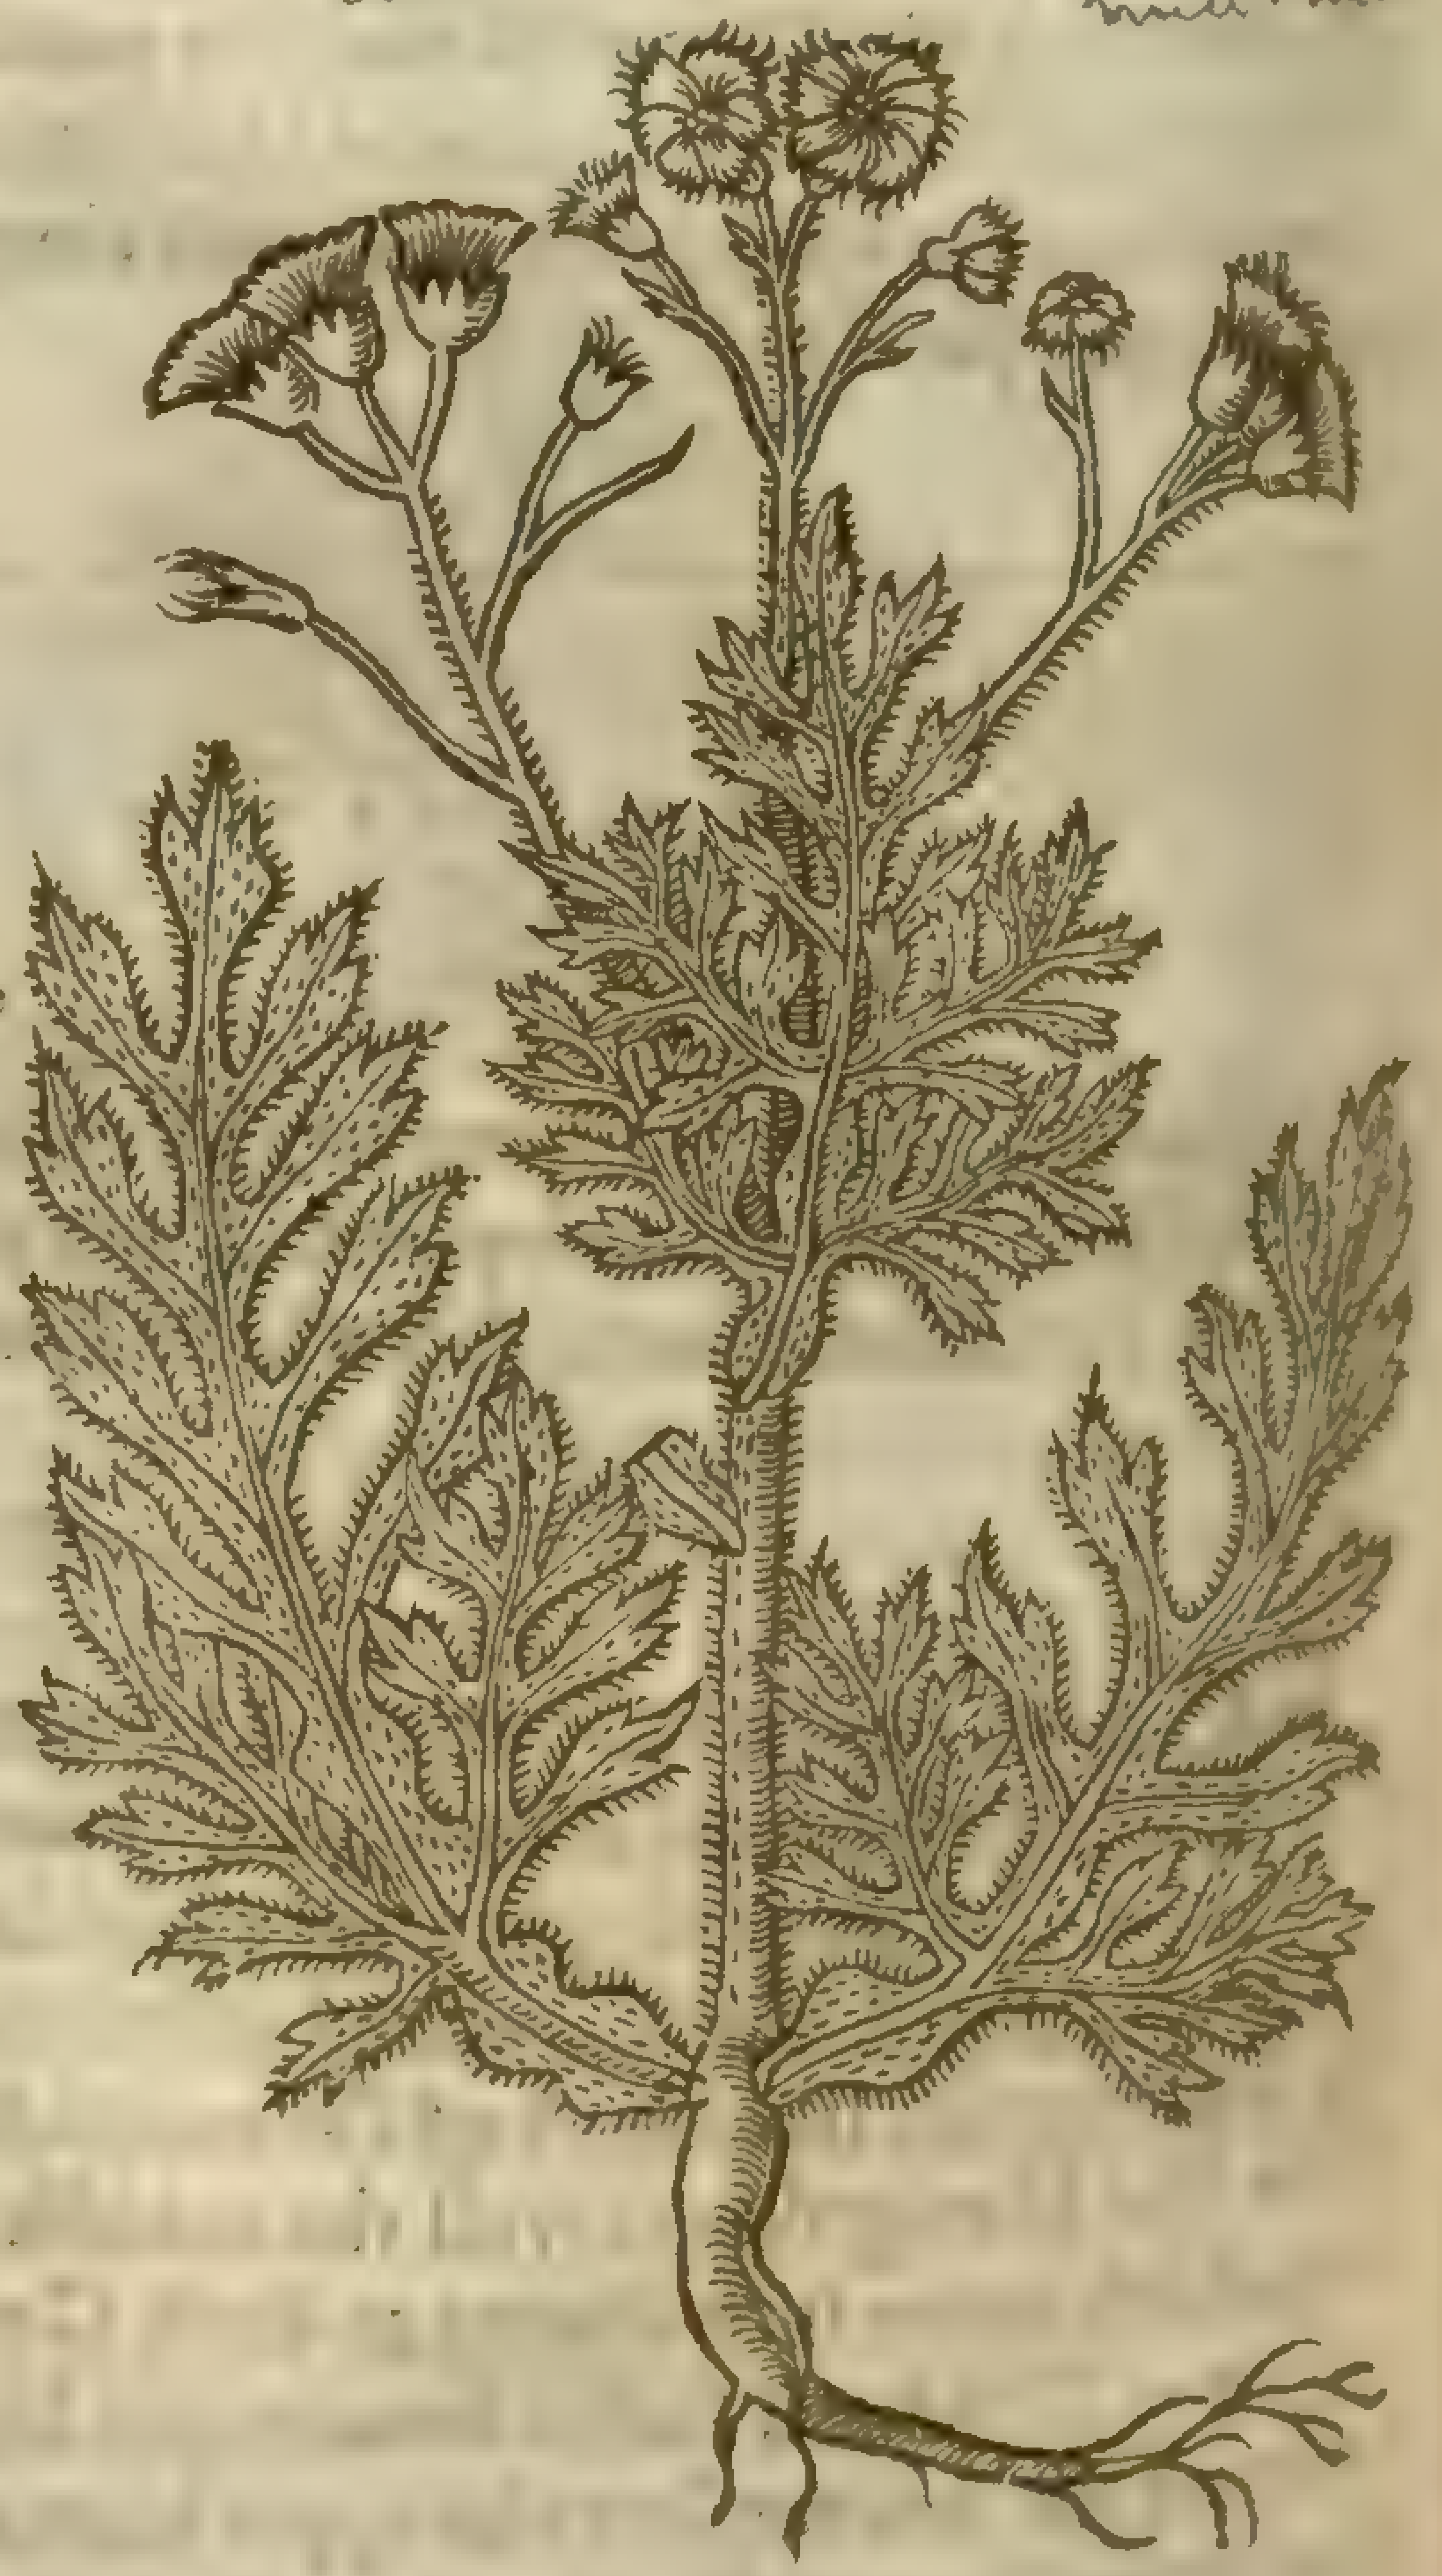
Cineraria [illegible] Lin. pl. 3. 1244

‡ 3 *Iacobæa latifolia.*
Broad leaued Ragweed.



4 *Iacobæa marina.*
Sea Rag-weed.

Cineraria maritima [illegible]



themſelues; but opened, of a bright golden colour, and thoſe are ingirt by fifteene or more little leaues, which are of a flame colour aboue, and red vnderneath. The floures flie away in downe, and the ſeed is blackiſh, and like that of the former. The roots are made of many ſtrings like thoſe of the precedent.

3 This broad leaued Rag-weed hath ſtiffe creſted ſtalkes, which are ſet with broad wrinckled ſharpe pointed leaues of a greene colour: the bottome leaues are the larger and rounder, the top leaues the leſſe, and more diuided. The floures grow at the top of the ſtalkes, in ſhape and colour like thoſe of the common Rag-weed, but much bigger: They alſo turne into downe as the former. ‡

4 Sea Rag-wort groweth to the height of two cubits: the ſtalkes be not reddiſh as the other, but contrariwiſe Aſh-coloured, gray, and hoary: the leaues be greater and broader than the other: the floures grow at the top, of a pale yellow colour, couered on the cup or huske of the floure, as alſo the leaues, with a certaine ſoft white downe or freeſe: the floures vaniſh into downe, and flie away with the winde.

¶ *The Place.*

Land Rag-wort groweth euery where in vntilled paſtures and fields, which are ſomewhat moiſt eſpecially, and neare vnto the borders of fields.

‡ 2 3 Theſe grow vpon the Auſtrian and Heluetian Alpes. ‡

The fourth kinde of Ragwort groweth neere the ſea ſide in ſundry places: I haue ſeene it in the field by Margate, by Queakes houſe, and by Byrchenton in the Iſle of Tenet: likewiſe it groweth neere the Kings ferry in the Iſle of Shepey, in the way leading to Shirland houſe, where Sr. *Edward Hobby* dwelleth: and likewiſe at Queenborough caſtle in the ſame Iſle; and in other places. ‡ I haue been at the former and later of theſe places to finde out plants, yet could I not ſee this plant. It growes in the garden of Mr. *Ralph Tuggy*, but I feare hardly wilde in this kingdome. ‡

¶ *The Time.*

They floure in Iuly and Auguſt, at which time they are carried away with the Down.

¶ *The Names.*

The firſt is called in Latine, *Herba S. Iacobi*, or *S. Iacobi flos*, and *Iacobæa*: in high Dutch, **Sant Jacobs bloumen**: in low-Dutch, **Sant Jacobs crupt**: in French, *Fluer de S. Iacquet*: in Engliſh, S. *Iames* his Wort: the countrey people doe call it Stagger-wort, and Staner-wort, and alſo Rag wort, ‡ and Rag-weed. In Holderneſſe in York-ſhire they call it Seggrum.

The ſecond is *Iacobæa Pannonica* 2. of *Cluſius*.

The third is his *Iacobæa latifolia*. *Geſner* calls it *Coniza montana*. ‡

The fourth is named *Cineraria*, or Aſh-coloured S. *Iames* Wort: ſome call it *Erigeron Marinum*, or Sea Groundſell: of ſome, *Artemiſia marina*. ‡ And by *Proſper Alpinus*, *Artemiſia alba*. ‡

¶ *The Temperature.*

S. *Iames* wort is hot and dry in the ſecond degree, and alſo clenſing, by reaſon of the bitterneſſe which it hath.

¶ *The Vertues.*

A It is commended by the later Phyſitians to bee good for greene wounds, and old filthy vlcers which are not ſcoured, mundified, and made cleane; it alſo healeth them, with the juyce heereof tempered with honey and May Butter, and boiled together vnto the forme of an Vnguent or ſalue.

B It is much commended, and not without cauſe, to helpe old aches and paines in the armes, hips, and legs, boiled in hogs greaſe to the forme of an ointment.

C Moreouer, the decoction hereof gargariſed is much ſet by as a remedy againſt ſwellings and impoſtumations of the throat, which it waſteth away and throughly healeth.

D The leaues ſtamped very ſmall, and boiled with ſome hogs greaſe vnto the conſumption of the juyce, adding thereto in the end of the boyling a little Maſticke and Olibanum, and then ſtrained, taketh away the old ache in the huckle bones called Sciatica.

E ‡ The Ægyptians (ſaith *Proſper Alpinus*) vſe the Sea Rag-wort, for many things: for they commend the decoction made with the leaues thereof againſt the ſtone in the kidnies and bladder, as alſo to helpe the old obſtructions of the inward parts, but principally thoſe of the wombe; as alſo the coldneſſe, ſtrangulation, barrenneſſe, inflation thereof, and it alſo brings downe the intercepted courſes: wherefore women troubled with the mother are much eaſed by baths made of the leaues and floures hereof. ‡

Chap. 29. *Of Garden Succorie.*

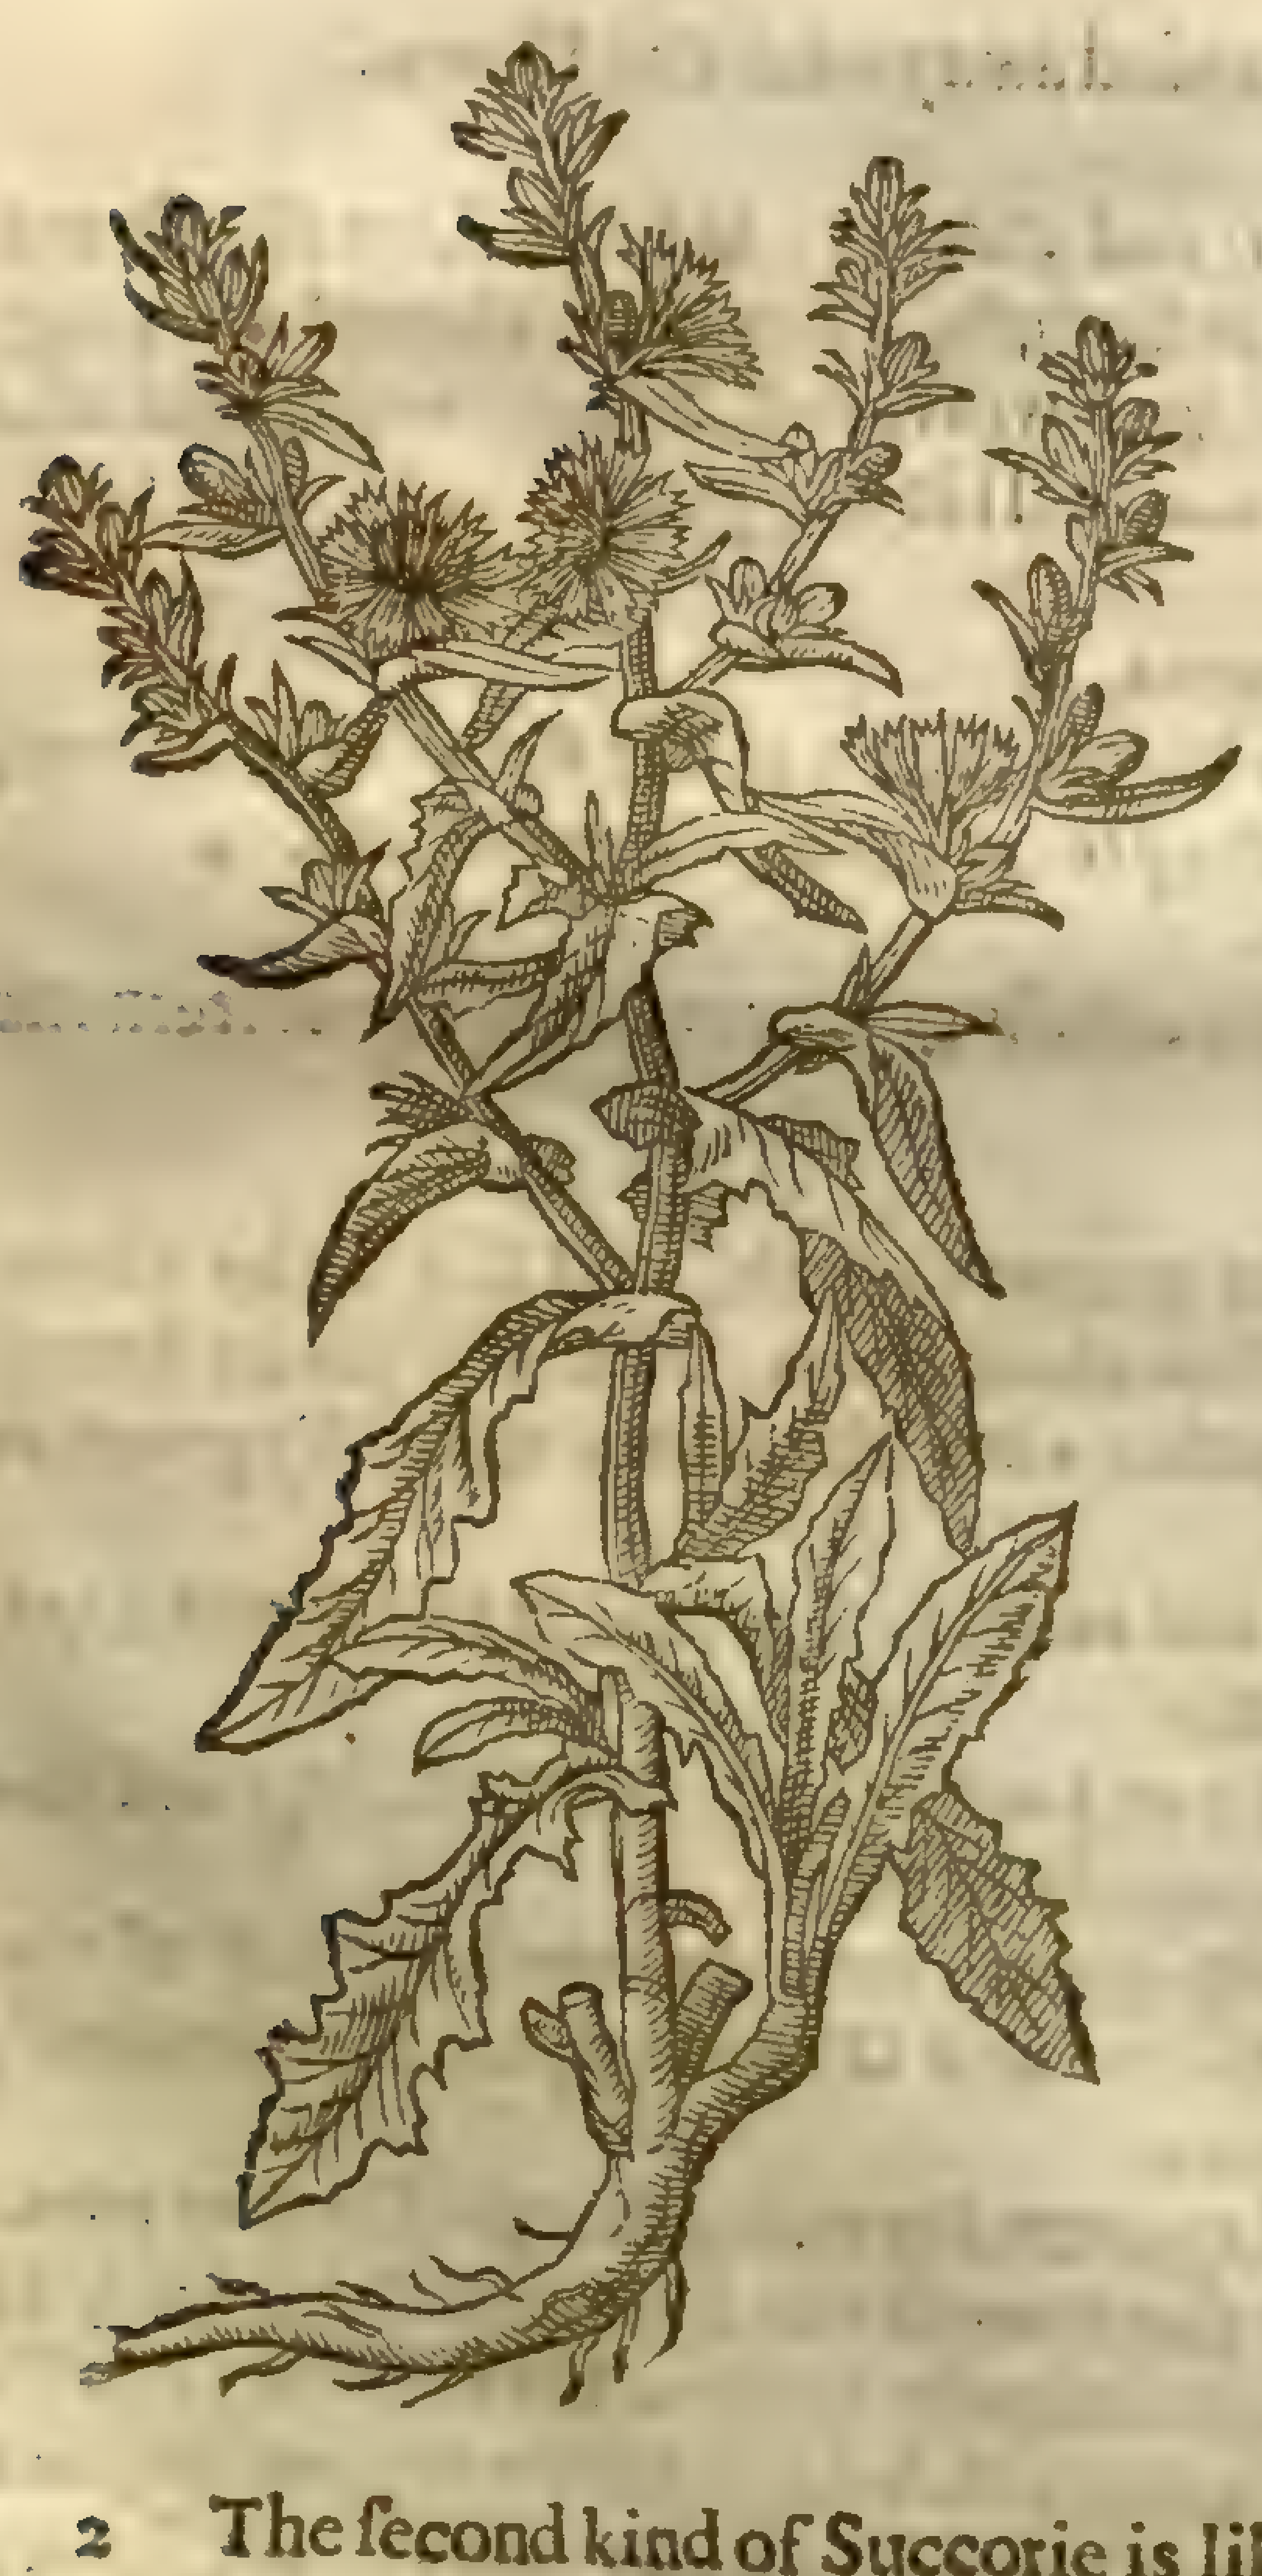
¶ *The Kindes.*

THere be ſundry ſorts of plants comprehended vnder the title of *Cichoracea*, that is to ſay, Cichorie, Endiue, Dandelion, &c. differing not ſo much in operation and working, as in ſhape and forme, which hath cauſed many to deeme them diuers, who haue diſtinguiſhed them vnder the titles aforeſaid: of euery which kinde there be diuers ſorts, the which ſhall be diuided in their ſeuerall chapters, wherein the differences ſhall be expreſt.

¶ *The Deſcription.*

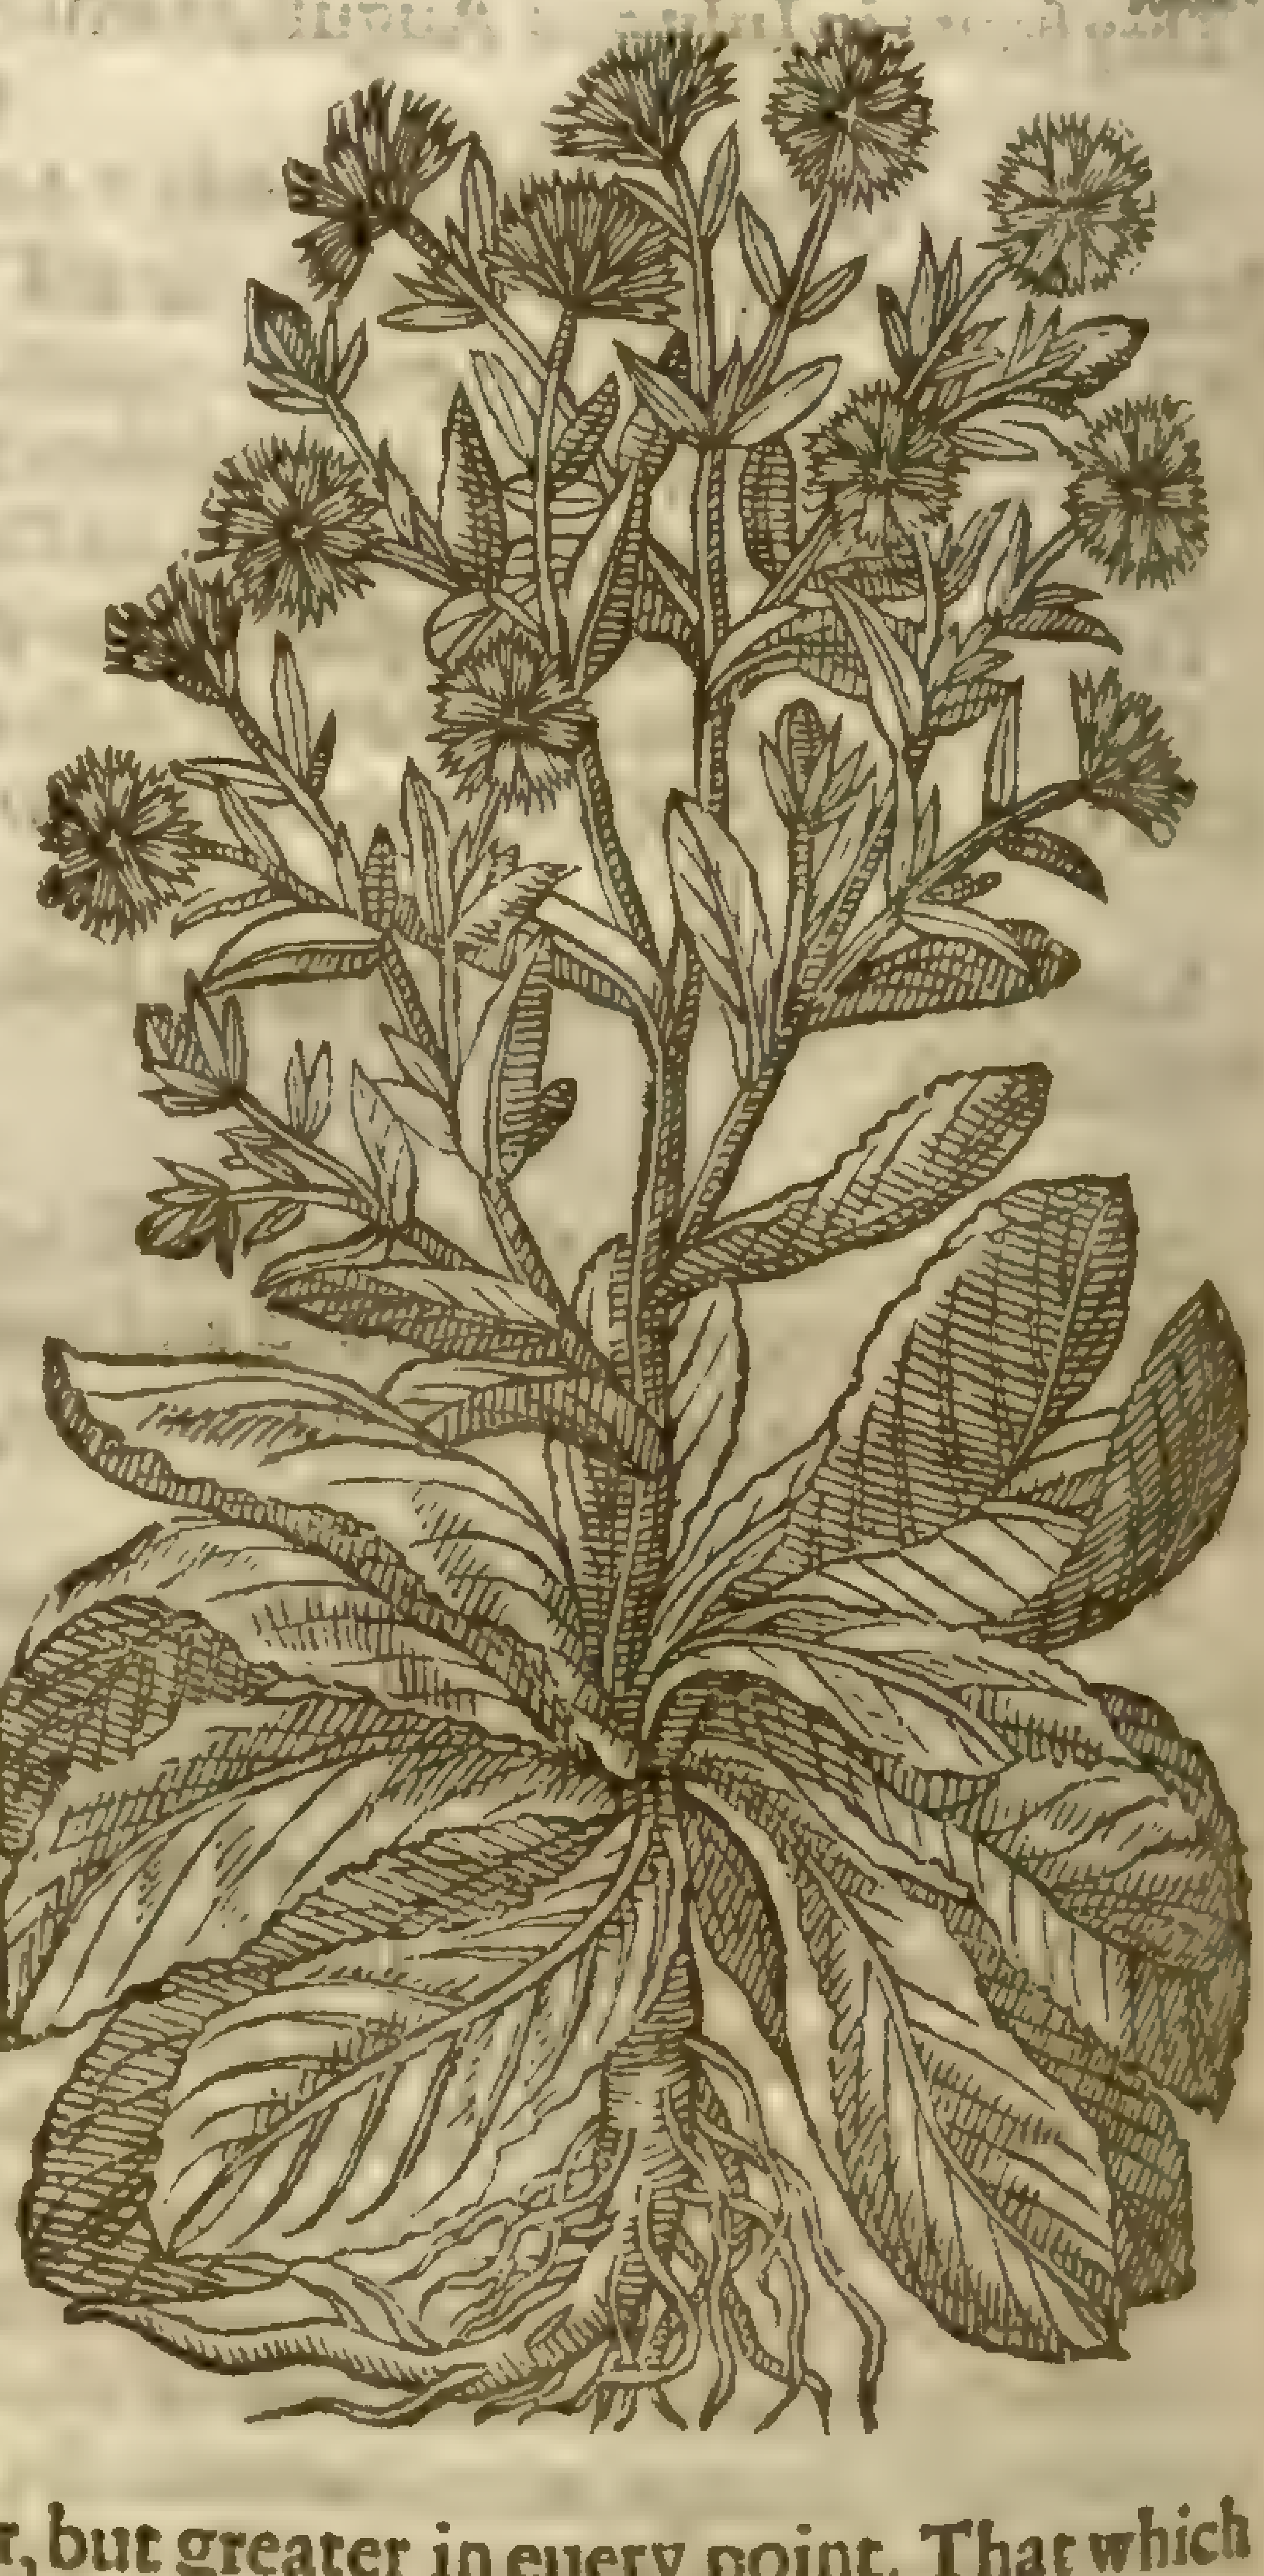
1 GArden Succory is of two ſorts, one with broad leaues, and the other with narrow, deeply cut and gaſhed on both ſides. The firſt hath broad leaues ſomwhat hairie, not much vnlike to Endiue, but narrower, amongſt which do riſe vp ſtalkes, whereon are placed the like leaues, but ſmaller. The ſtalke diuideth it ſelfe toward the top into many branches, whereon do grow little blew floures conſiſting of many ſmall leaues, after which followeth white ſeed. The root is tough, long, and white of colour, continuing many yeares; from the which as from euery part of the plant doth iſſue forth bitter and milkie juice. The whole plant is of a bitter taſte likewiſe.

1 *Cichorium ſatiuum.*
Garden Succorie.



3 *Intybus ſatiua.*
Garden Endiue.

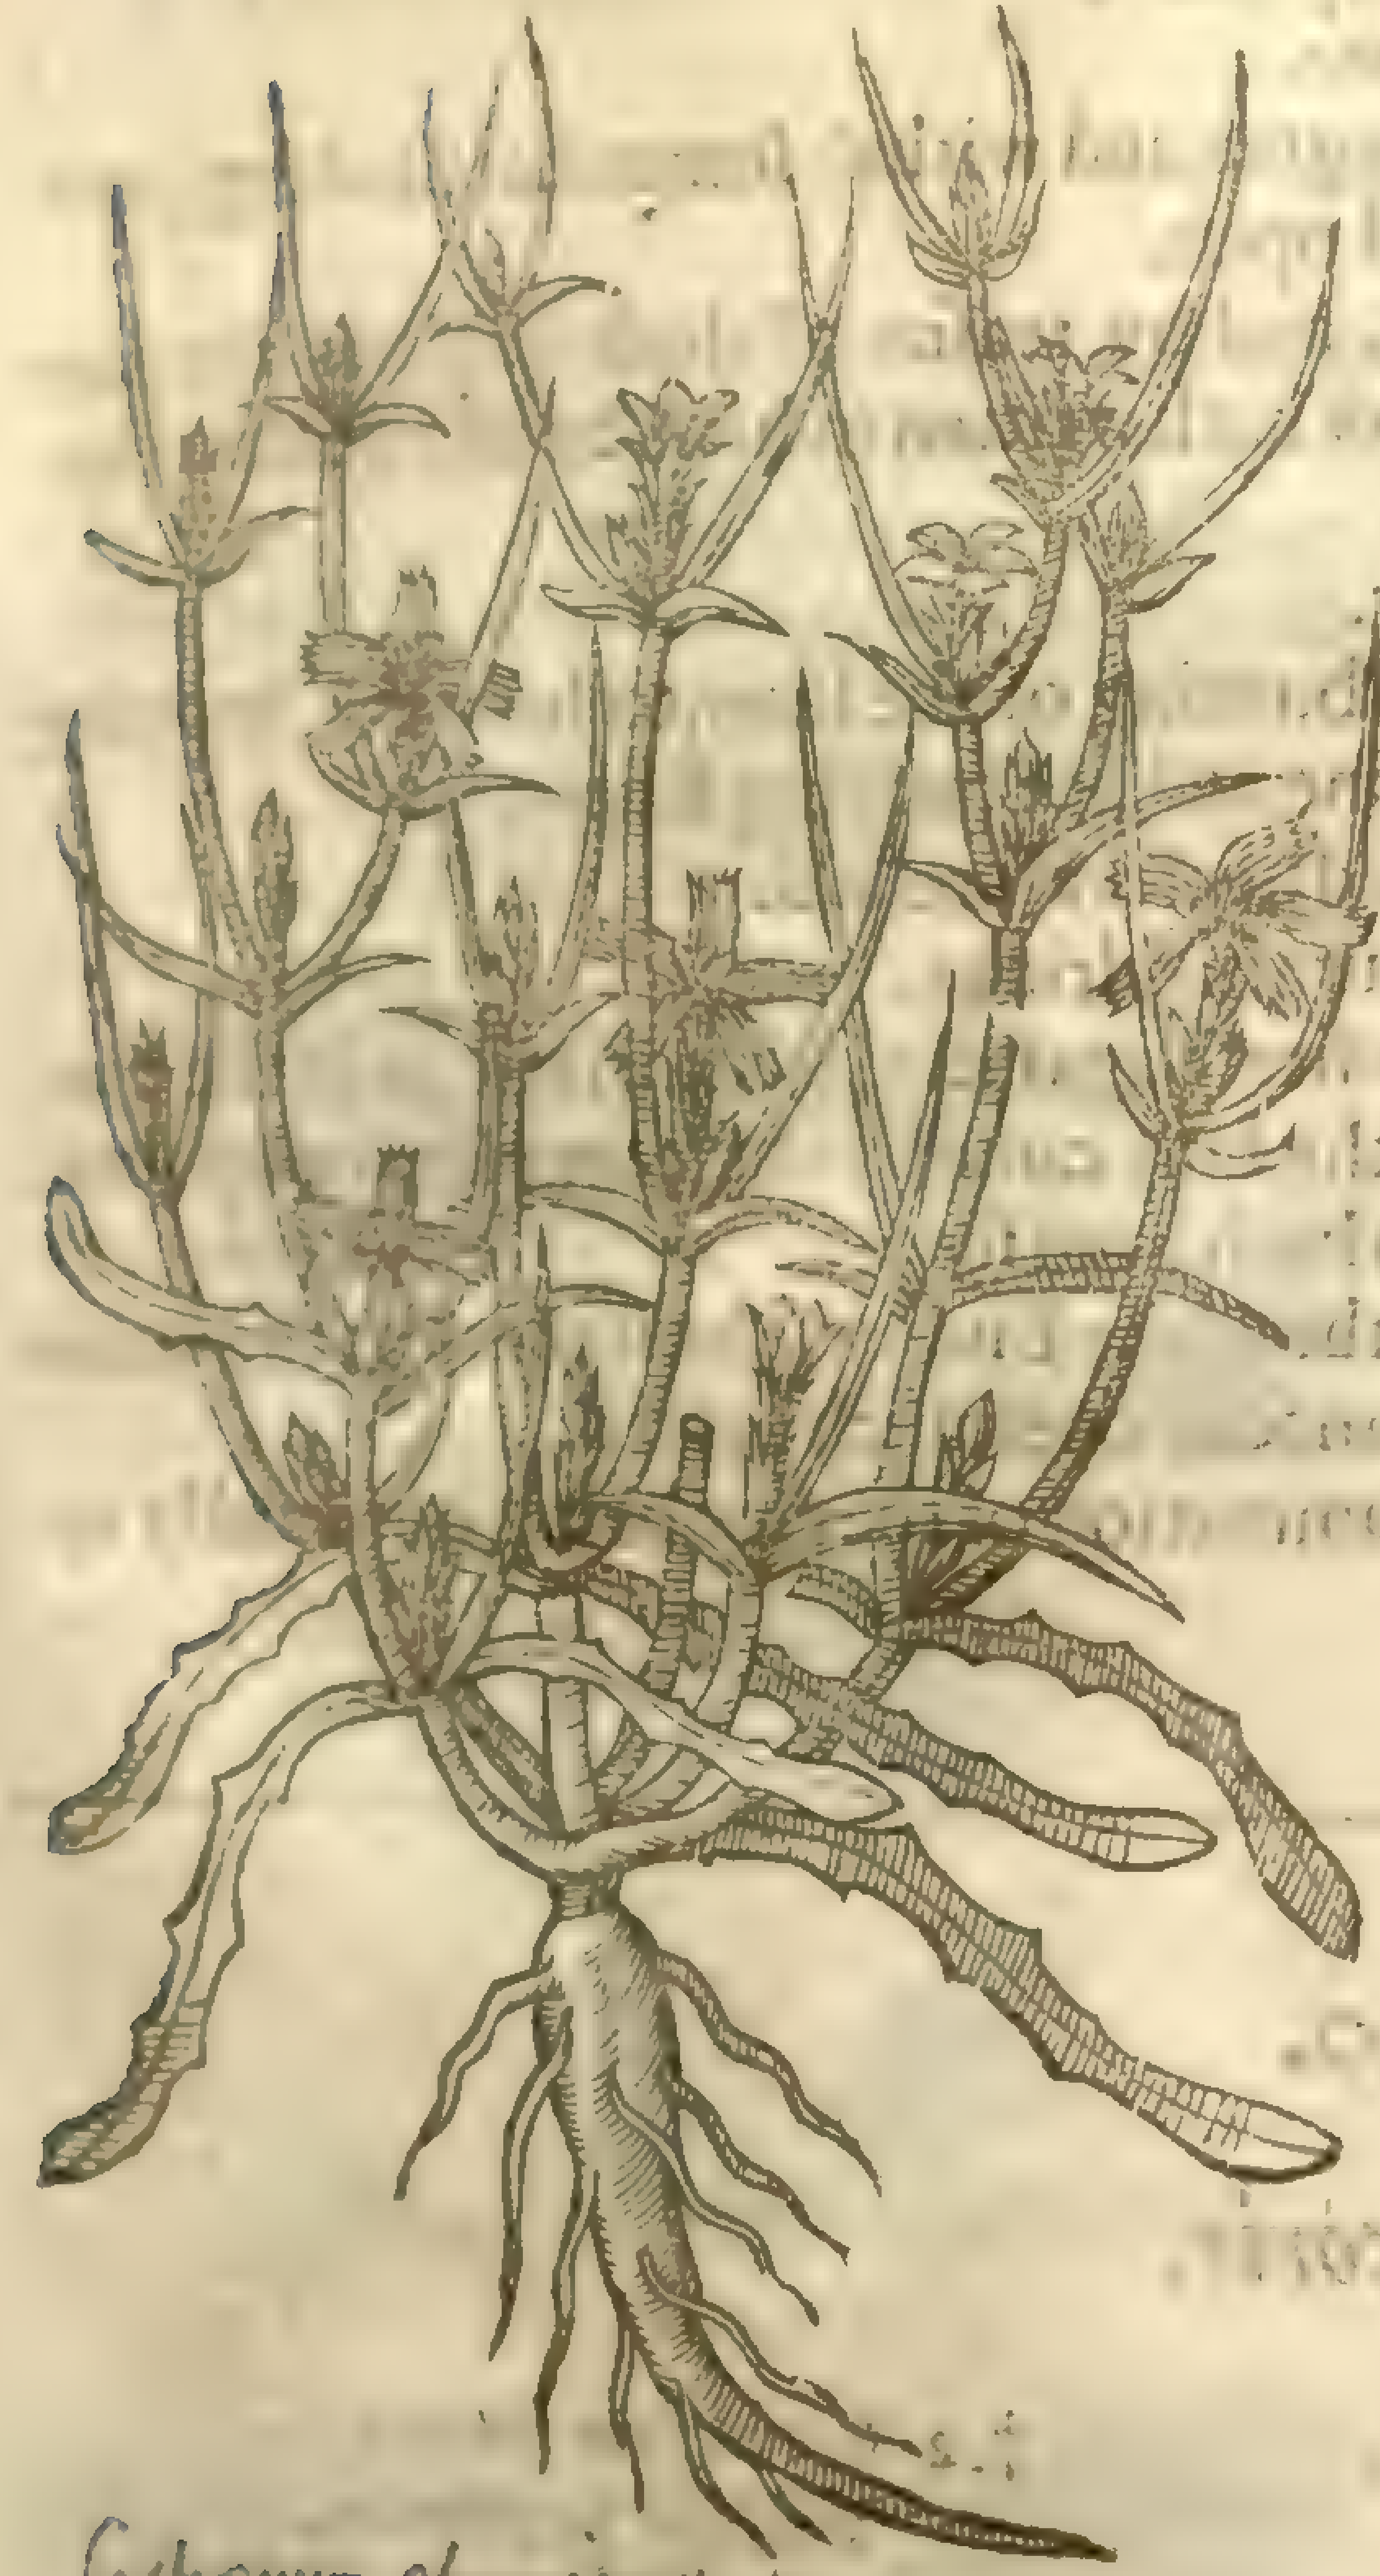
Cichorium endivia, L. [illegible]



2 The ſecond kind of Succorie is like vnto the former, but greater in euery point. That which cauſeth the difference is, that this beareth floures white of colour tending to blewneſſe; the others blew, as I haue ſaid.

3 Garden Endiue bringeth forth long leaues, broad, ſmooth, more greene than white, like almoſt to thoſe of lettuce, ſomething nicked in the edges. The ſtalke groweth vp among the leaues, being round and hollow, diuided into branches; out of which being broken or cut there iſſueth a juice like milke, ſomewhat bitter: the floures vpon the branches conſiſt of many leaues, in colour com-

‡ 5 *Cichorium ſpinoſum.*
Thorny Succorie.



Cichorium ſpinoſum [illegible]

commonly blew, ſeldome white. The root is long, white, with ſtrings growing thereat, which withers after the ſeed is ripe.

4 Curled Endiue hath leaues not vnlike thoſe of the curled or Cabbage Lettuce, but much greater; among which riſe vp ſtrong and thicke ſtalkes, ſet with the like leaues, but leſſe, and not ſo notably curled or criſped. The floures grow at the top, blew of colour. The root periſheth, as doth the whole plant, when it hath brought forth his ripe ſeed.

‡ 5 To to theſe may fitly be added the thorny or prickly Succorie of Candy, being of this kindred, and there vſed in defect of the true Succory, in ſtead therof. The root is pretty long, white, with few fibres hanging thereat: the ſtalk is hard, woody, & diuaricated into many branches, which commonly end in two or three pricks like hornes. The leaues are bitter, long, narrow, and ſharpe pointed, and lie ſpred vpon the ground, and are a little ſinuated or cut about the edges. The floures, which vſually grow vpon little footſtalkes, at the diuiſions of the branches, are much like thoſe of the ordinarie Succory, yet much leſſe, conſiſting of 5 blew leaues with yellow chiues in the middle. The is like thoſe of the common Succory. It floureth in Iuly and Auguſt. ‡

¶ *The Place and Time.*

This Succorie and theſe Endiues are only ſowne in gardens.

Endiue being ſowne in the ſpring quickly commeth vp to floure, which ſeedeth in harueſt, and afterward dieth. But being ſowne in Iuly, it remaineth till winter, at which time it is taken vp by the roots, and laid in the ſun or aire for the ſpace of two houres; then will the leaues be tough, and eaſily endure to be wrapped vpon an heap, and buried in the earth with the roots vpward, where no earth can get within, (which if it did would cauſe rottenneſſe) the which ſo couered, may be taken vp at times conuenient, and vſed in ſallads all the winter, as in London and other places is to be ſeen; and then it is called white Endiue: Whereof *Pliny* ſeemeth not to be ignorant, ſpeaking to the ſame purpoſe, *lib.* 20. *cap.* 8.

¶ *The Names.*

Theſe herbs be called by one name in Greeke, Σέριδες: notwithſtanding for diſtinctions ſake they called the garden Succorie, Σέρις ἥμερος, and the wilde Succorie, Σέρις ἀγρία. *Pliny* nameth the Succorie, *Hedypnois*; and the bitterer *Dioſcorides* calls πικρὶς: in Latine, *Intybum ſylveſtre*, *Intybum agreſte*, *Intybum erraticum*, and *Cichorium*: in ſhops it is called *Cichorea*; which name is not onely allowed of the later Phyſitions, but alſo of the Poet *Horace*, *lib.* 1. *Ode* 31.

—— *Me paſcunt Oliuæ,*
Me Cichorea, leueſque maluæ.

With vs, ſaith *Pliny*, *lib.* 20. *cap.* 8. they haue called it *Intybum erraticum*, or wilde Endiue, *Ambugia*, (others reade *Ambubeia*) and ſome there be that name it *Roſtrum porcinum*: others, as *Gulielmus Placentinus* and *Petrus Creſcentius* terme it *Sponſa ſolis*: the Germanes call it **Wegwarten**, which is as much to ſay, as the keeper of the waies: the Italians, *Cichorea*: the Spaniards, *Almerones*: the Engliſh, Cichory, and Succory: the Bohemians, *Czakanka*.

Endiue is named in Greeke, Σέρις ἥμερος: in Latine, *Intybum ſatiuum*: of ſome, *Endiuia*: of *Avicen* and *Serapio*, *Taraxacon*: of the Italians, *Scariola*, which name remaineth in moſt ſhops; alſo *Seriola*, as though they ſhould fitly call it *Seris*: but not ſo wel *Serriola*, with a double *r*; for *Serriola* is *Lactuca ſylveſtris*, or wilde Lettuce: it is called in Spaniſh, *Serraya Enuide*: in Engliſh, Endiue, & Scariole: and when it hath bin buried in the earth as aforeſaid, it is called white Endiue.

‡ 5 This was firſt ſet forth by *Cluſius*, vnder this name, *Chondryllæ genus elegans cæruleo flore*: ſince, by *Lobel* and *Bauhine*, by the title we giue you, to wit, *Cichorium ſpinoſum*. *Honorius Bellus* writes, that in Candy whereas it naturally groweth, they vulgarly terme it σταμναγκαθι, that is, *Hydriæ ſpina*, the

Pitcher-Thorne, becauſe the people fetch all their water in ſtone pots or pitchers, which they ſtop with this plant, to keepe mice and other ſuch things from creeping into them: and it groweth ſo round, that it ſeems by nature to be prouided for that purpoſe. ‡

¶ *The Temperature.*

Endiue and Succorie are cold and dry in the ſecond degree, and withal ſomewhat binding; and becauſe they be ſomething bitter they do alſo clenſe and open.

Garden Endiue is colder, and not ſo dry or cleanſing, and by reaſon of theſe qualties they are thought to be excellent medicines for a hot liuer, as *Galen* hath written in his 8 booke of the compoſition of medicines according to the places affected.

¶ *The Vertues.*

A These herbs being green haue vertue to coole the hot burning of the liuer, to help the ſtopping of the gall, yellow jaundiſe, lacke of ſleep, ſtopping of vrine, and hot burning feuers.

B A ſyrrup made thereof and ſugar is very good for the diſeaſes aforeſaid.

C The diſtilled water is good in potions, cooling and purging drinks.

D The diſtilled water of Endiue, Plantain, and Roſes, profiteth againſt the excoriations in the conduit of the yard, to be injected with a ſyringe, whether the hurt came by vncleanneſſe, or by ſmall ſtones and grauell iſſuing forth with the vrine; as often hath been ſeene.

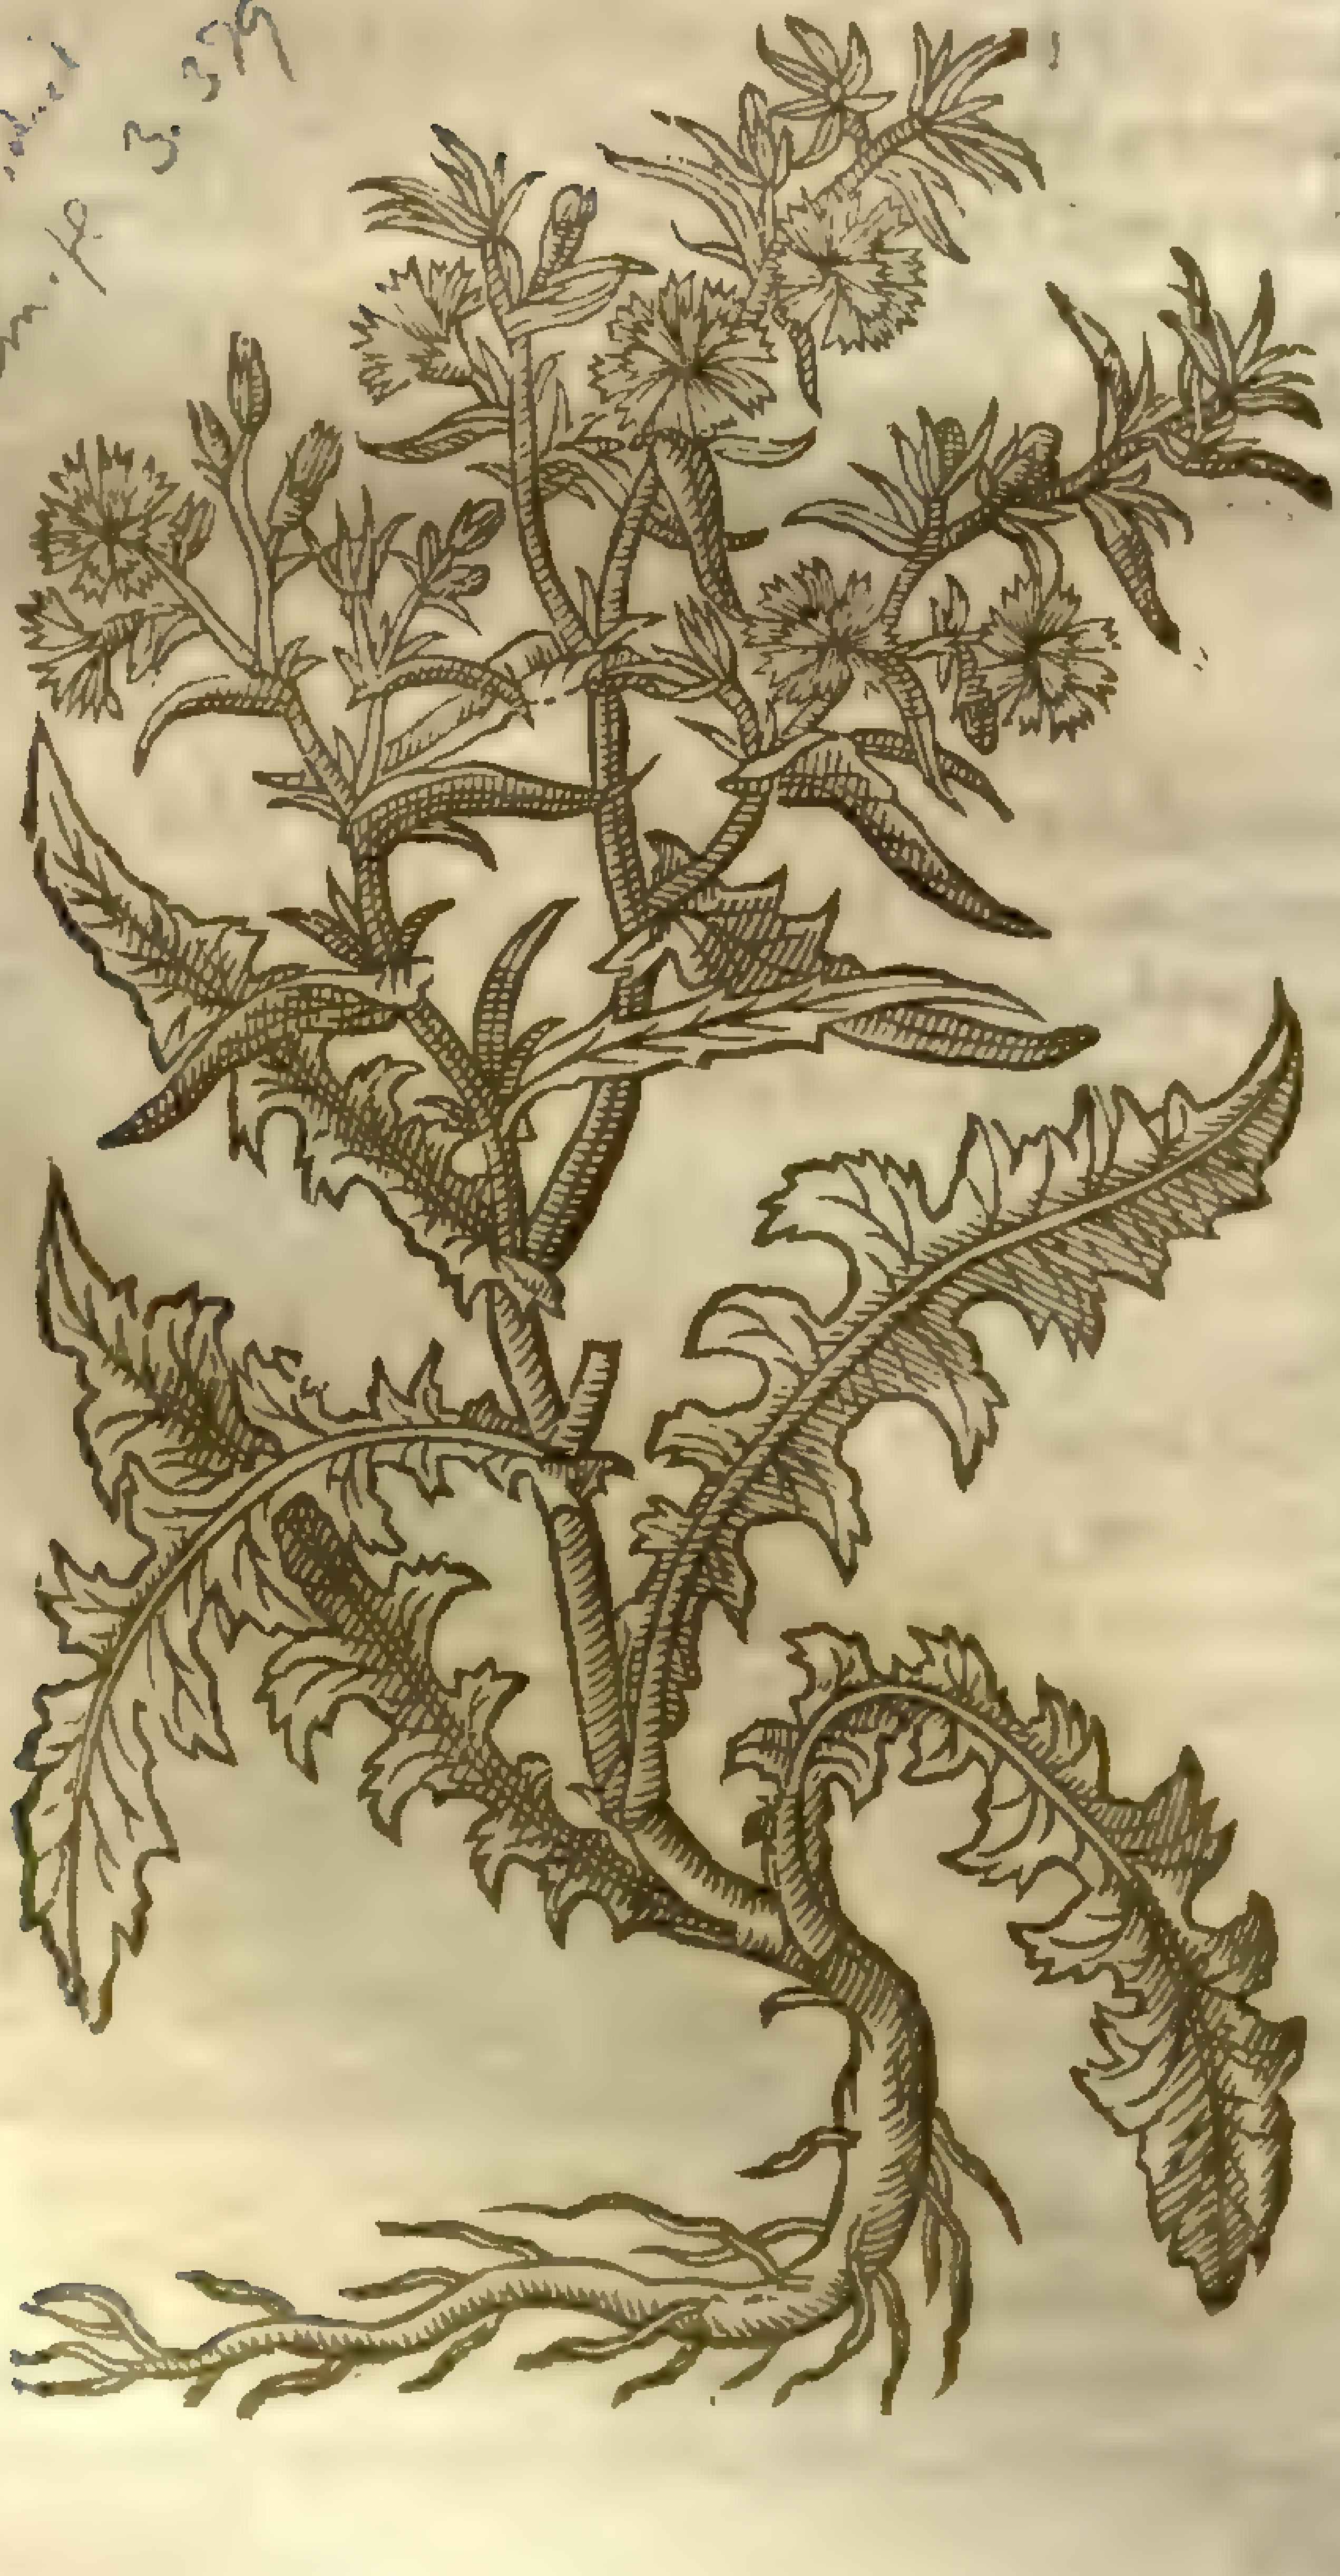
E Theſe herbs eaten in ſallads or otherwiſe, eſpecially the white Endiue, doth comfort the weake and feeble ſtomacke, and cooleth and refreſheth the ſtomacke ouermuch heated.

F The leaues of Succorie bruiſed are good againſt inflammation of the eies, being outwardly applied to the grieued place.

Chap. 30.

Of wilde Succorie.

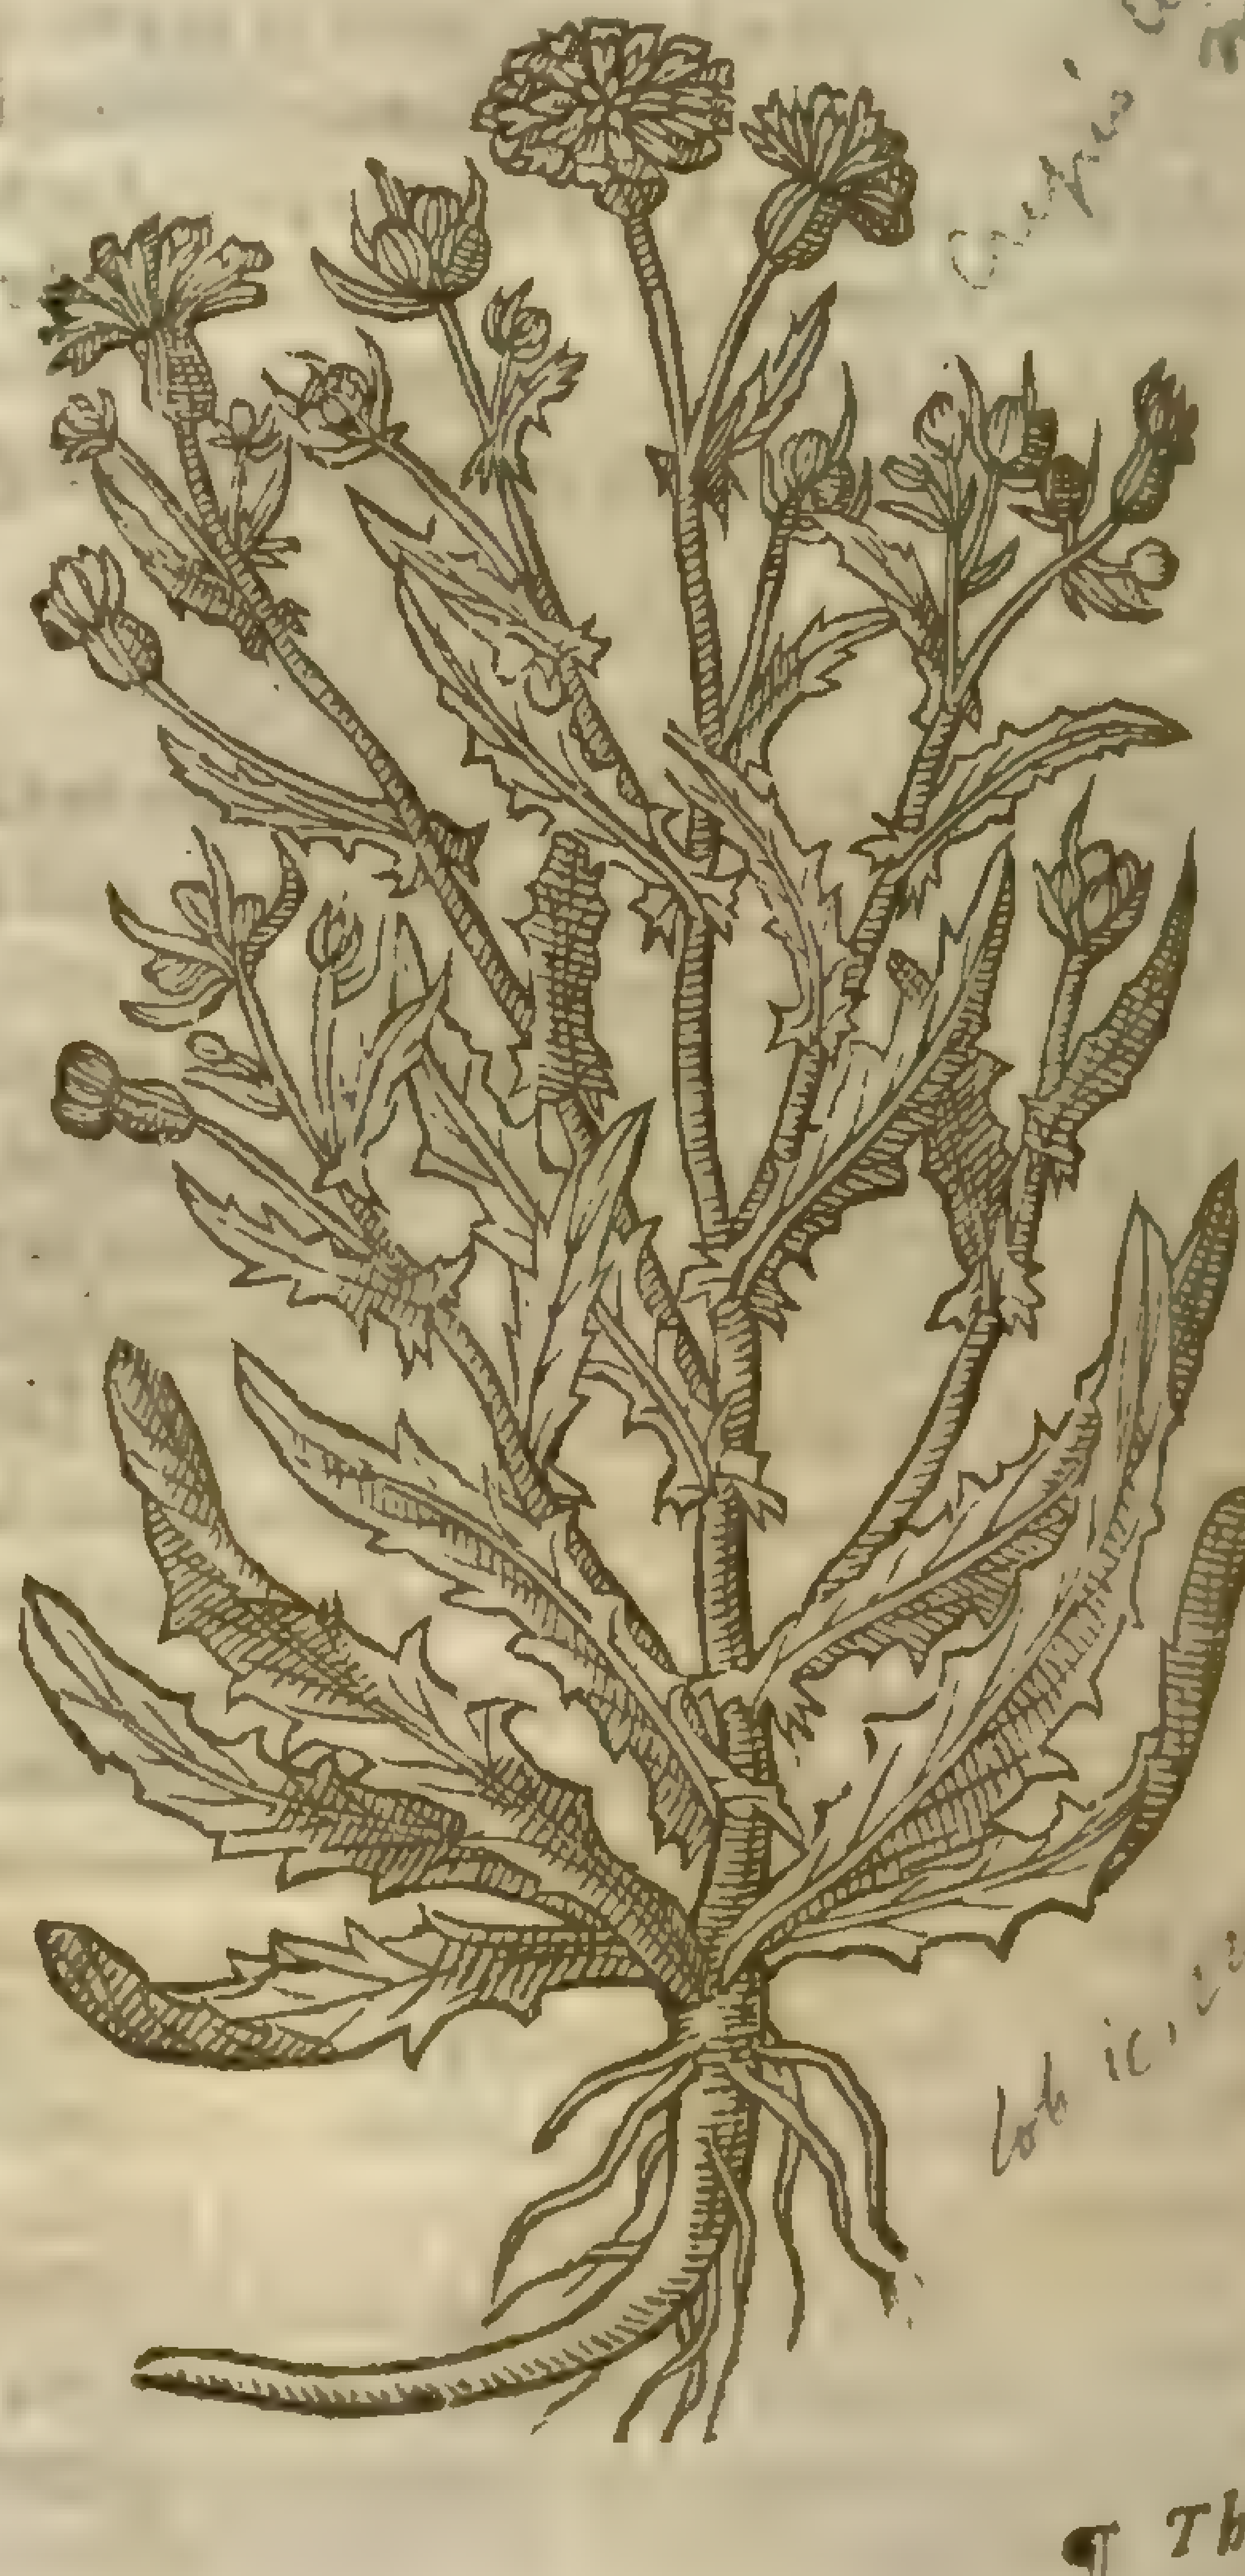
† 1 *Cichorium ſylveſtre.*
Wilde Succorie.



C. [illegible] Sm. p. 3. 379

Lob. ic. 228

† 2 *Cichorium luteum.*
Yellow Succorie.



lob ic. 22[illegible]

¶ *The*

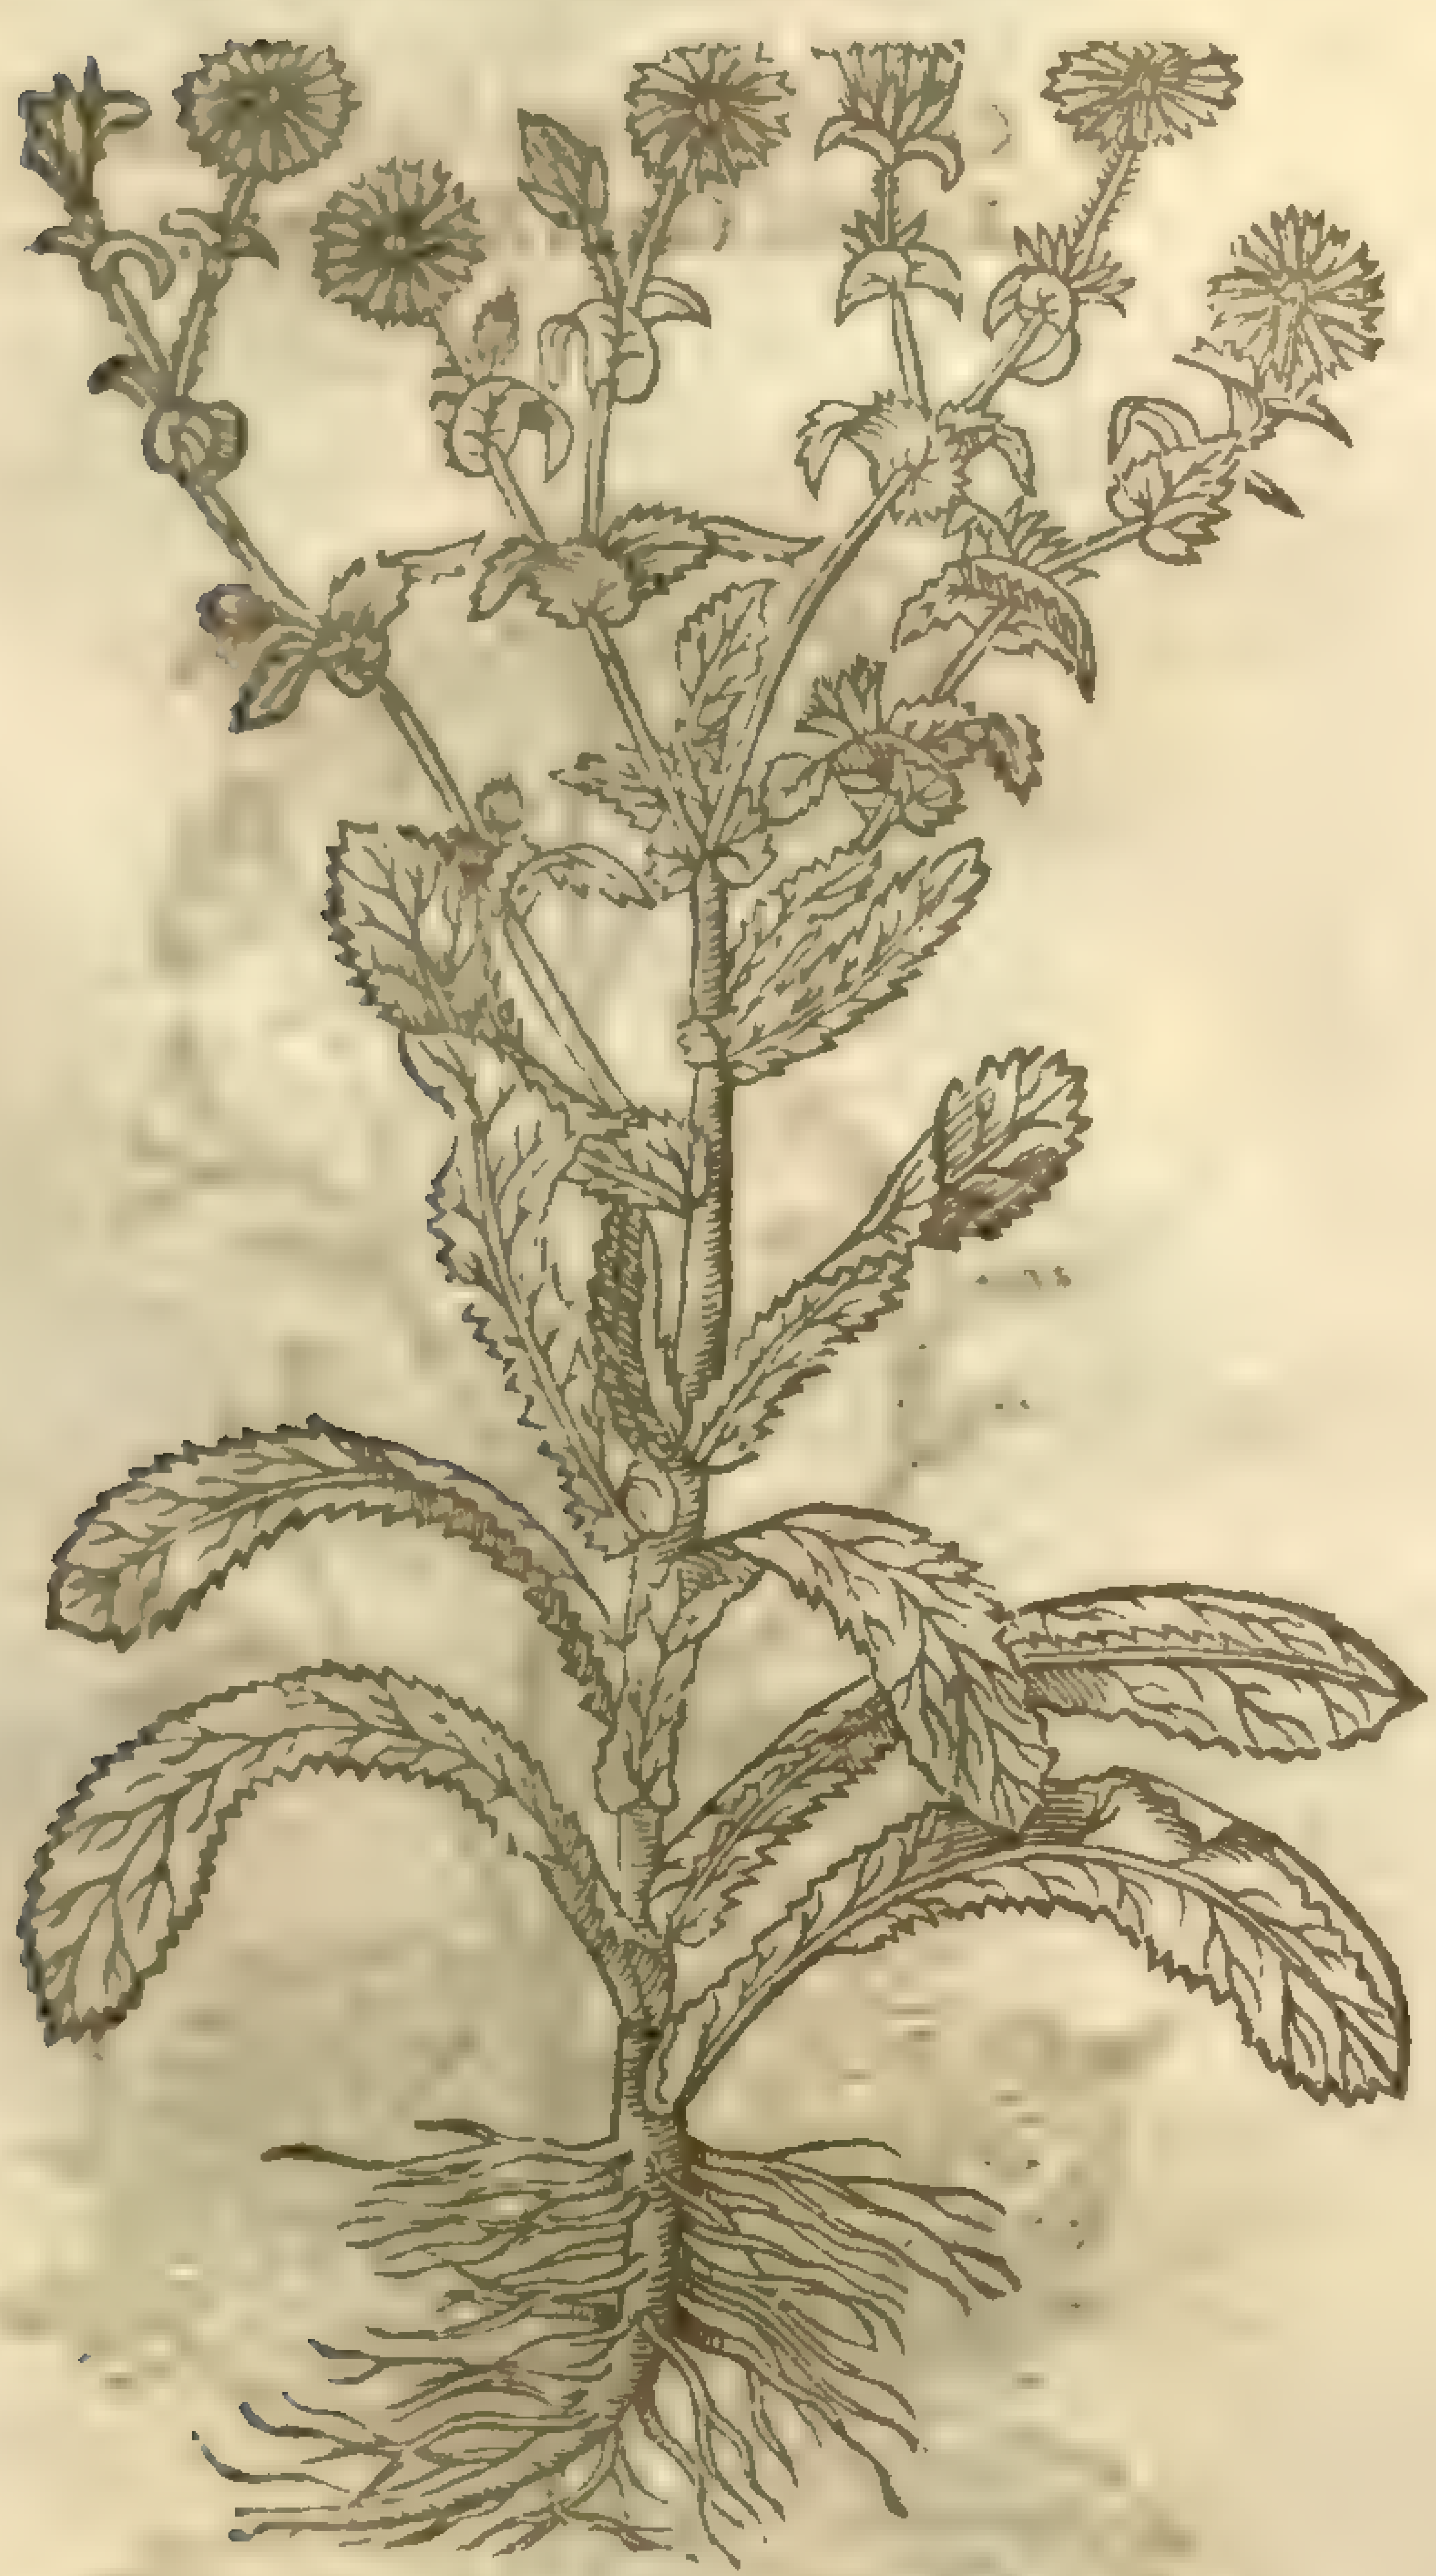
¶ *The Kindes.*

IN like manner as there be ſundry ſorts of Succories and Endiues, ſo is there wilde kindes of either of them.

¶ *The Deſcription.*

1 WIlde Succorie hath long leaues ſomewhat ſnipt about the edges like the leaues of Sow-thiſtle, with a ſtalk growing to the height of two cubits, which is diuided toward the top into many branches. The floures grow at the top, blew of colour: The root is tough and woody, with many ſtrings faſtned thereto.

3 *Intybum ſylveſtre.*
Wilde Endiue.



2 Yellow Succorie hath long and large leaues deeply cut about the edges like thoſe of Hawk-weed: the ſtalke is branched into ſundry arms, wheron grow yellow floures very double, reſembling the floures of Dandelion or Piſſe-a-bed; the which beeing withered, it flieth away in down with euery blaſt of winde.

3 Wilde Endiue hath long ſmooth leaues ſleightly ſnipt about the edges. The ſtalke is brittle and full of milky iuice, as is all the reſt of the plant: the floures grow at the top, of a blew or sky colour: the root is tough & threddie.

4 Medow Endiue, or Endiue with broad leaues, hath a thick tough and woody root with many ſtrings faſtened thereto; from which riſe vp many broad leaues ſpred vpon the ground like thoſe of garden Endiue, but leſſer, & ſomewhat rougher; among which riſe vp many ſtalks immediatly from the root; euery of them are diuided into ſundry branches, whereupon grow many floures like thoſe of the former, but ſmaller.

¶ *The Place.*

Theſe plants grow wilde in ſundry places of England, vpon wild & vntilled barren grounds, eſpecially in chalky and ſtony places.

¶ *The Time.*

They floure from the midſt to the end of Auguſt.

¶ *The Names.*

‡ The firſt of theſe is *Seris Pieris* of *Lobel*: or *Cichorium ſylveſtre*: or *Intybus erratica* of *Tabernamontanus*. ‡

Yellow Succorie is not without cauſe thought to be *Hyoſiris*, or (as ſome copies haue it) *Hyoſciris*; of which, *Pliny, lib.* 20. *cap.* 8. writeth: *Hyoſiris* (ſaith he) is like to Endiue, but leſſer & rougher. It is called of *Lobel, Hedypnois*: the reſt of the names ſet forth in their ſeuerall titles ſhall be ſufficient for this time.

¶ *The Temperature.*

They agree in temperature with the garden Succorie or Endiue.

¶ *The Vertues.*

A The leaues of theſe herbs are boiled in pottage or broths, for ſicke and feeble perſons that haue hot weake and feeble ſtomacks, to ſtrengthen the ſame.

B They are iudged to haue the ſame vertues with thoſe of the garden, if not of more force in working.

‡ The firſt figure was of *Cichoreum album ſatiuum* of *Tabern.* The ſecond is *Cichoreum luteum.* But the true figures of thoſe our Authour meant were vnder theſe titles. The firſt of *Hieracium latifolium.* The ſecond, *Dens leonis Cichorizata*; for that is *Lobels Hedypnois.*

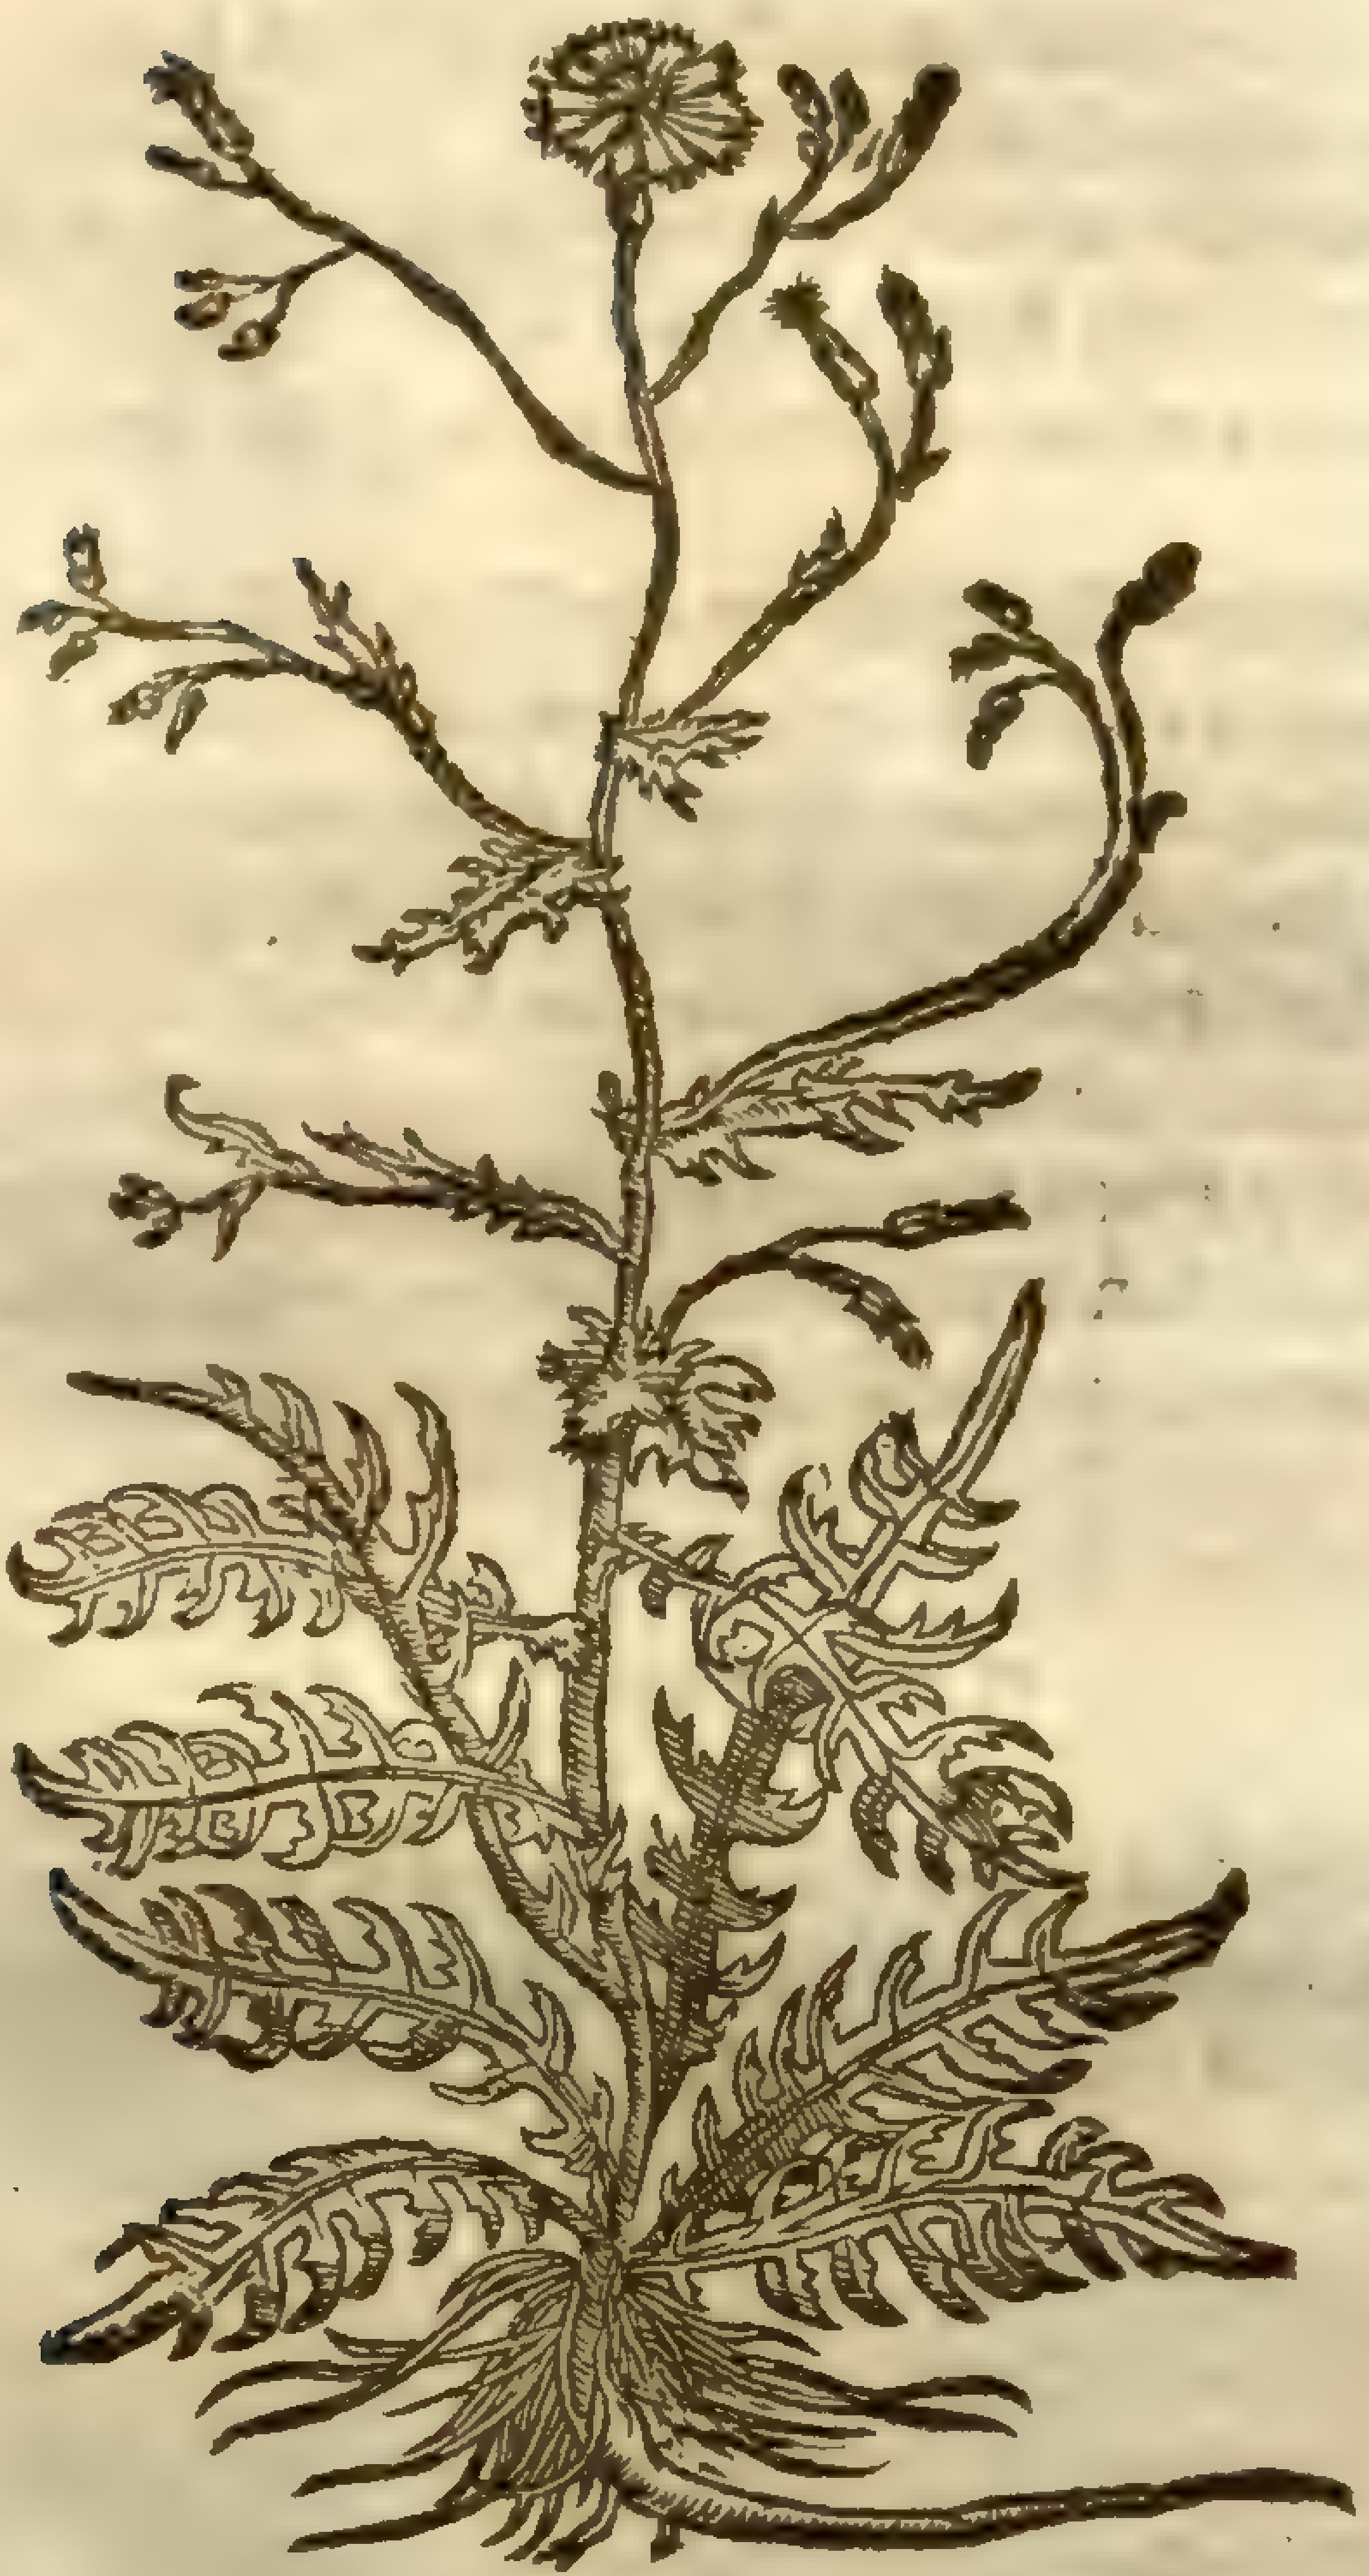
Chap. 31. *Of Gum Succorie.*

¶ *The Deſcription.*

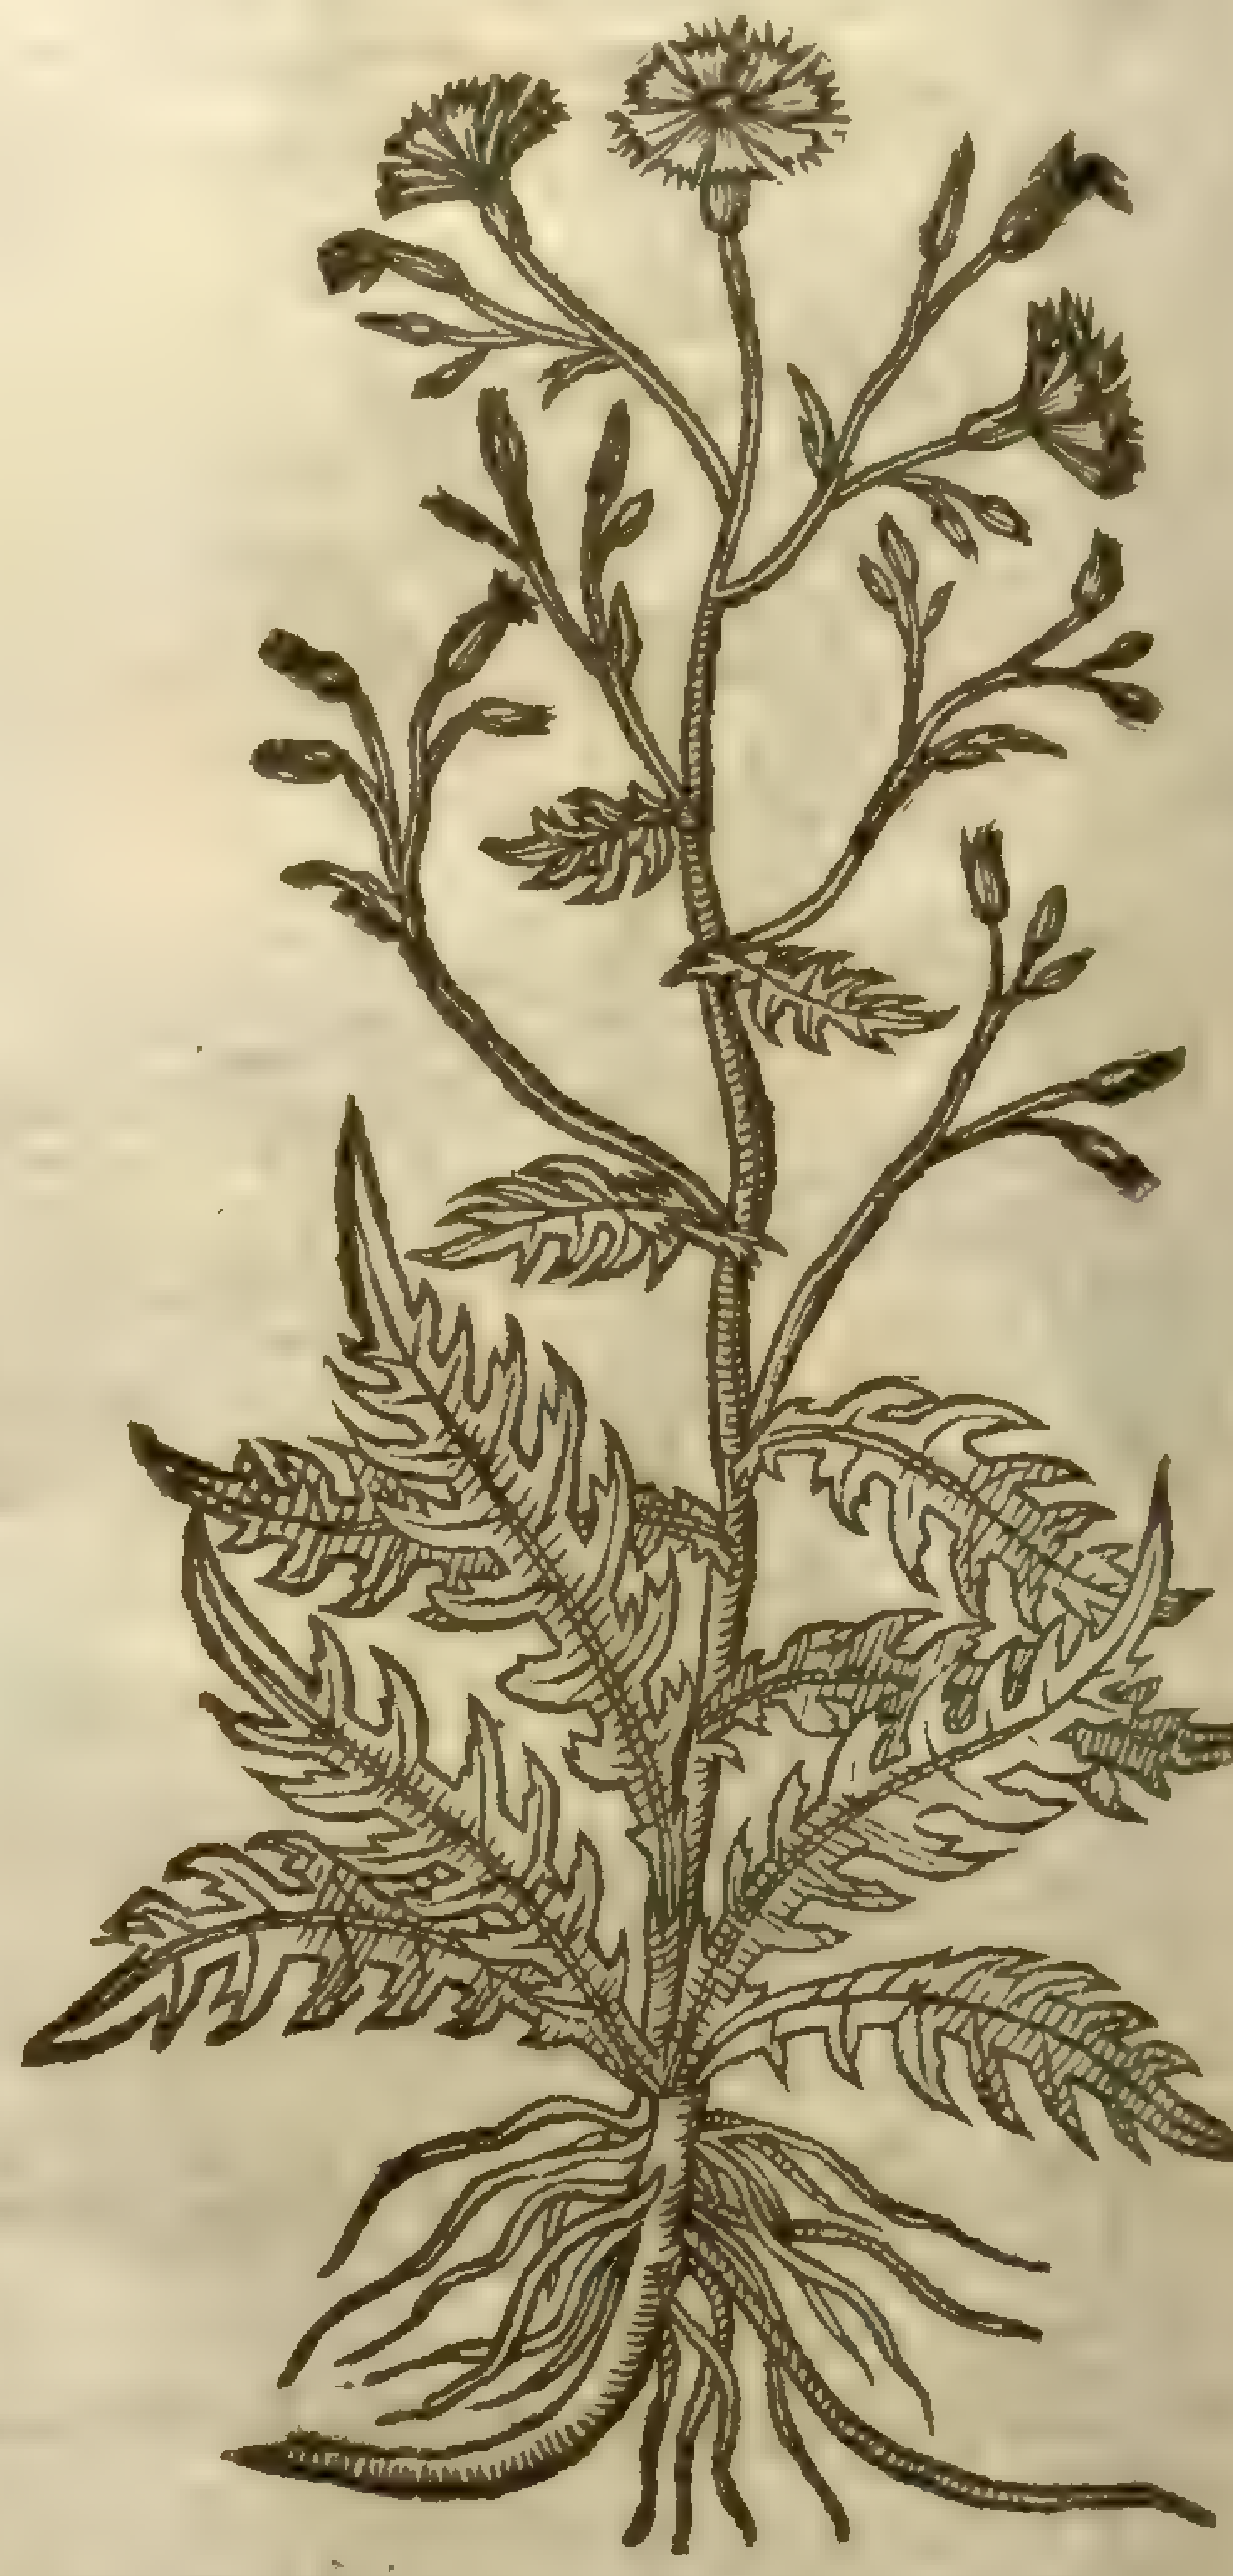
1 Gvm Succorie with blew floures hath a thick and tough root, with ſome ſtrings anexed thereto, full of a milky juice, as is all the reſt of the plant, the flours excepted: the leaues are great and long, in ſhape like thoſe of garden Succorie, but deeplier cut or jagged, ſomewhat after the maner of wild Rocket: among which riſe tender ſtalks very eaſie to be broken, branched toward the top in two or ſometimes three branches, bearing very pleaſant floures of an azure colour or deep blew: which being paſt, the ſeed flieth away in down with the wind.

Lactuca perennis, L. [illegible]

1 *Chondrilla cærulea.*
Blew Gum Succorie.



2 *Chondrilla cærulea latifolia.*
Robinus Gum Succorie.



2 Gum Succorie with broad leaues, which I haue named *Robinus* Gum Succorie, (for that he was the firſt that made any mention of a ſecond kind, which he ſent me as a great dainty, as indeed it was) in root is like the former: the leaues be greater, not vnlike to thoſe of Endiue, but cut more deeply euen to the middle rib: the ſtalks grow to the height of two foot: the floures likewiſe are of an azure colour, but ſprinkled ouer as it were with ſiluer ſand; which addeth to the floure great grace and beauty.

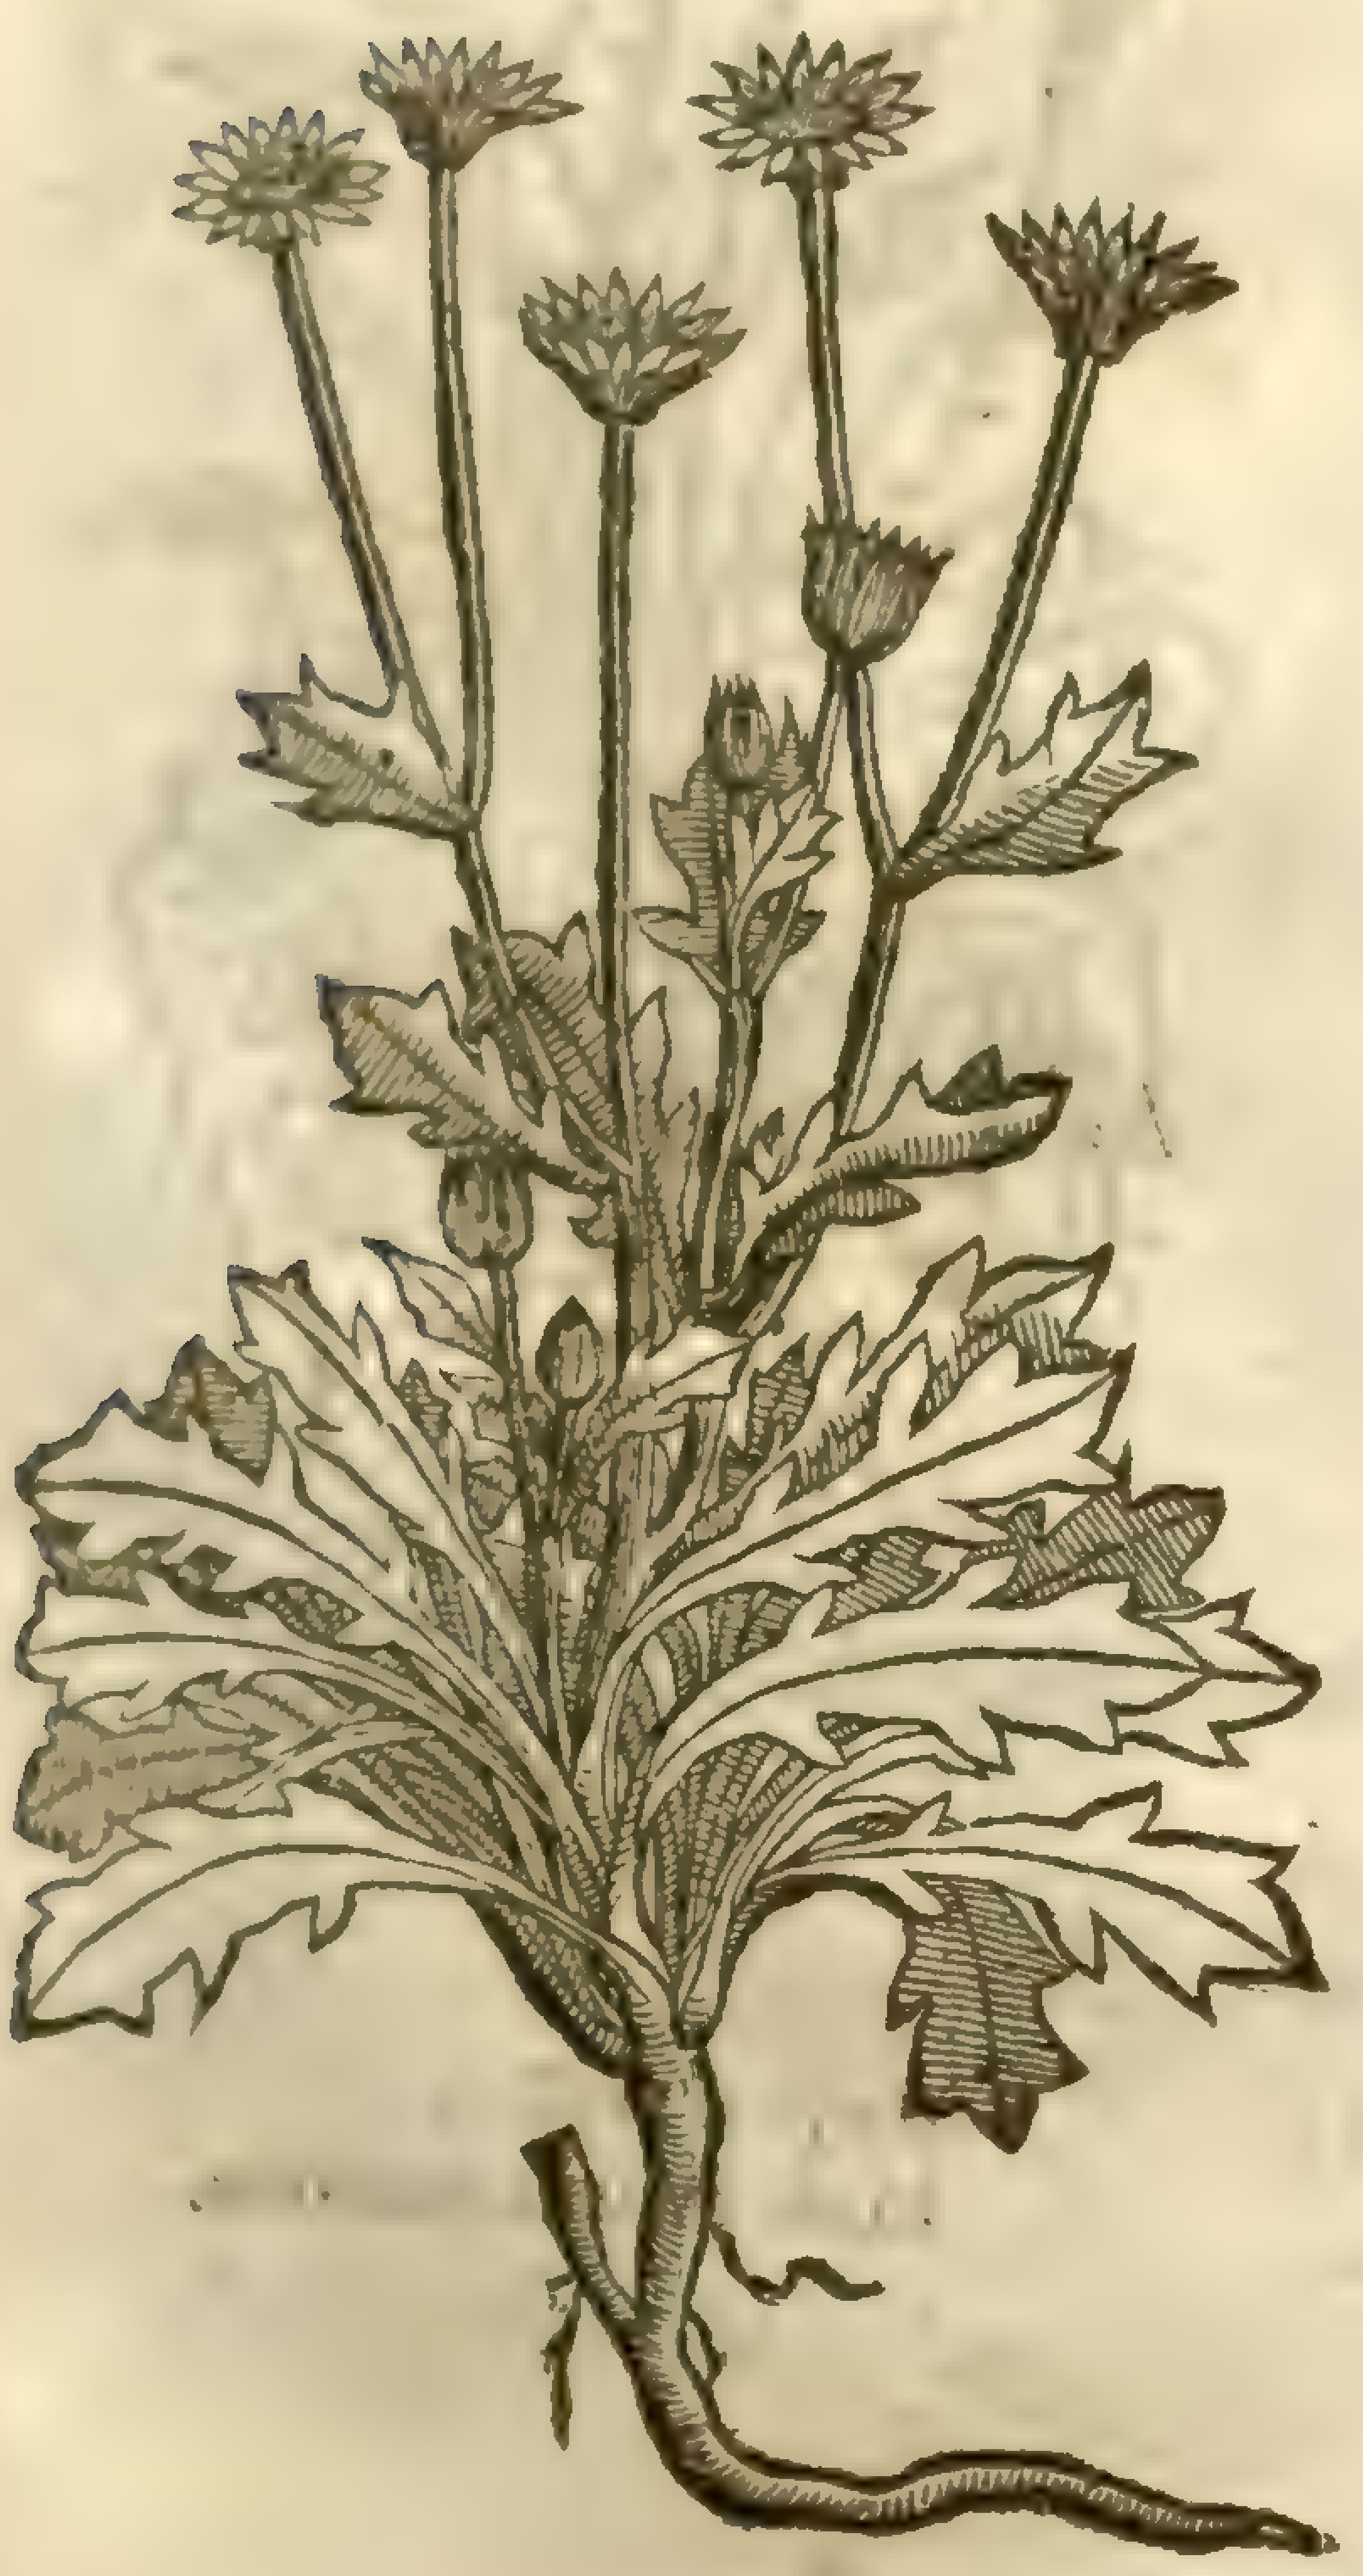
3 Yellow gum Succorie hath long leaues, like in form and diuiſion of the cut leaues to thoſe of wilde Succorie, but leſſer, couered all ouer with a hoary down. The ſtalk is two foot high, white and downy alſo, diuided into ſundry branches, whereon grow torne floures like thoſe of Succorie, but in colour yellow, which is turned into down that is carried away with the winde. The root is long, and of a mean thickneſſe; from which, as from all the reſt of the plant, iſſueth forth a milkie juice, which being dried is of a yellowiſh red, ſharp or biting the tongue. There is found vpon the branches hereof a gum, as *Dioſcorides* ſaith, which is vſed at this day in phyſick in the Iſle Lemnos, as *Bellonius* witneſſeth.

4 Spaniſh Gumme Succorie hath many leaues ſpred vpon the ground, in ſhape like thoſe of

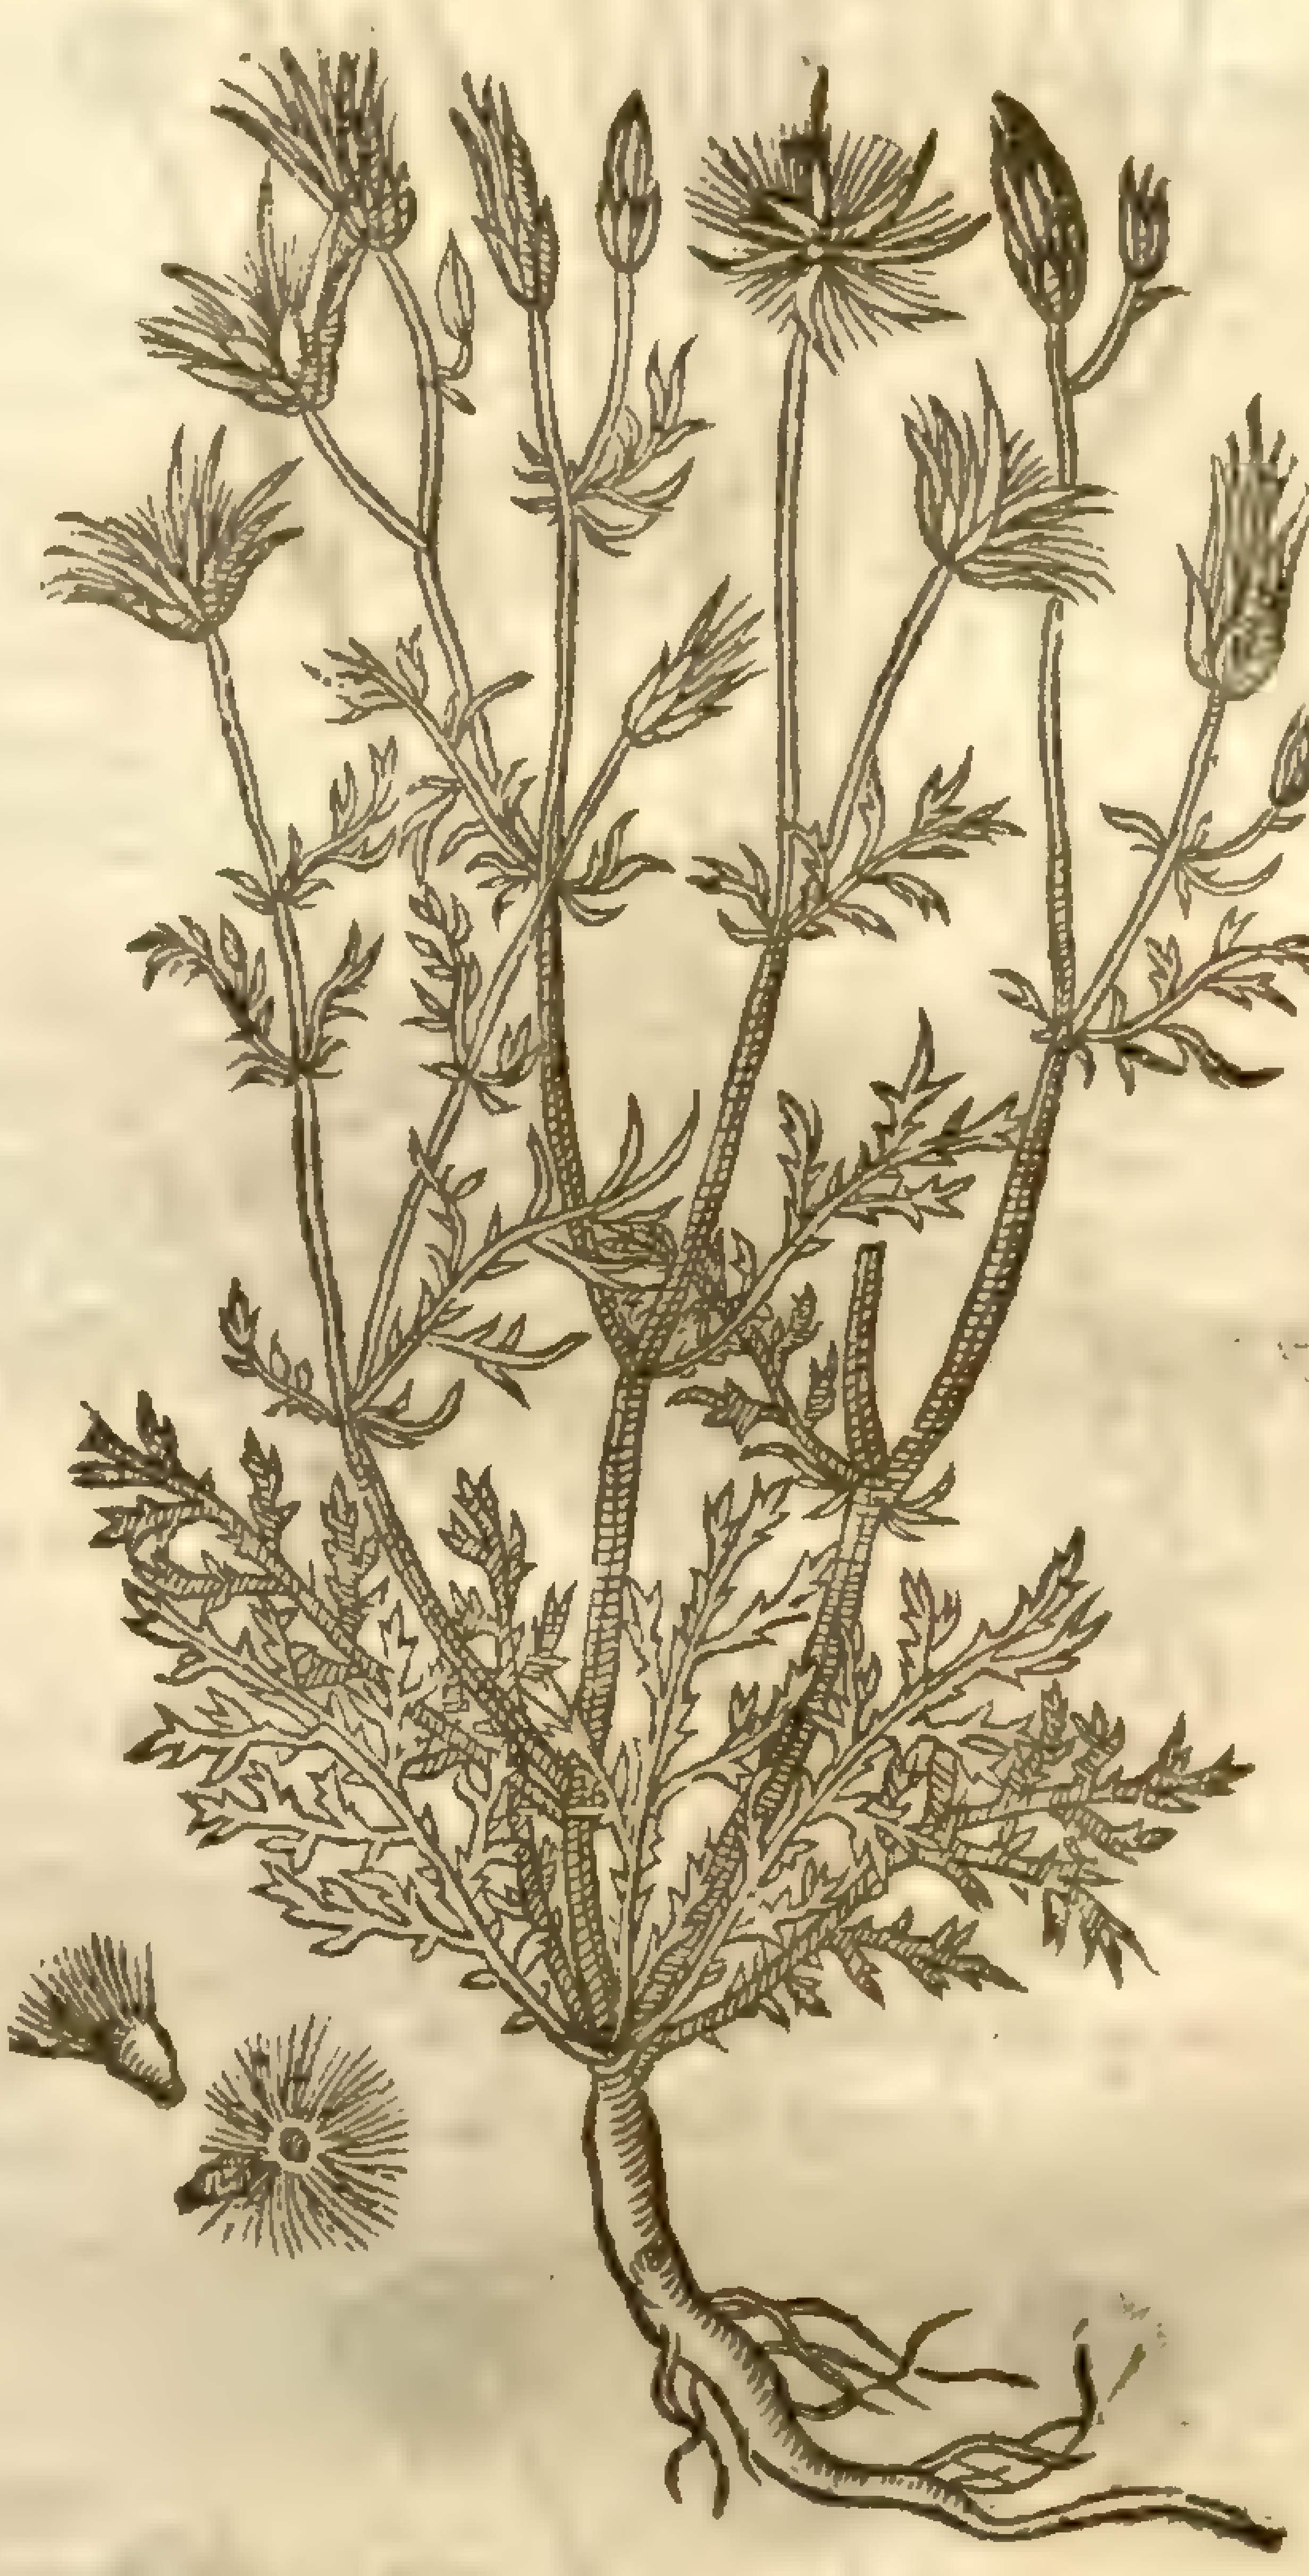
Groundſell,

Groundſel, but much more diuided, and not ſo thick nor fat: among which riſe vp branched ſtalks ſet with leaues like thoſe of *Stœbe Salamantica minor*, or Siluer-weed, whereof this is a kinde. The floures grow at the top, of an ouerworne purple colour, which do ſeldome ſhew themſelues abroad blown. ‡ The ſeed is like that of *Carthamus* in ſhape, but black and ſhining. ‡

† 3 *Chondrilla lutea.*
Yellow Gum Succory.



† 4 *Chondrilla Hiſpanica.*
Spaniſh Gum Succorie.



5 Ruſhy gumme Succory hath a tough and hard root, with a few ſhort threds faſtned thereto, from which riſe vp a few jagged leaues like thoſe of Succorie, but much more diuided: the ſtalke groweth vp to the height of two foot, tough and limmer like vnto Ruſhes, whereon are ſet many narrow leaues: the flours be yellow, ſingle, and ſmall, which being faded do fly away with the wind: the whole plant hauing milky juice like vnto the other of his kinde.

‡ There is another ſort of this plant to be found in ſome places of this kingdome, mentioned by *Bauhinus* vnder the name of *Chondrilla viſcoſa humilis*.

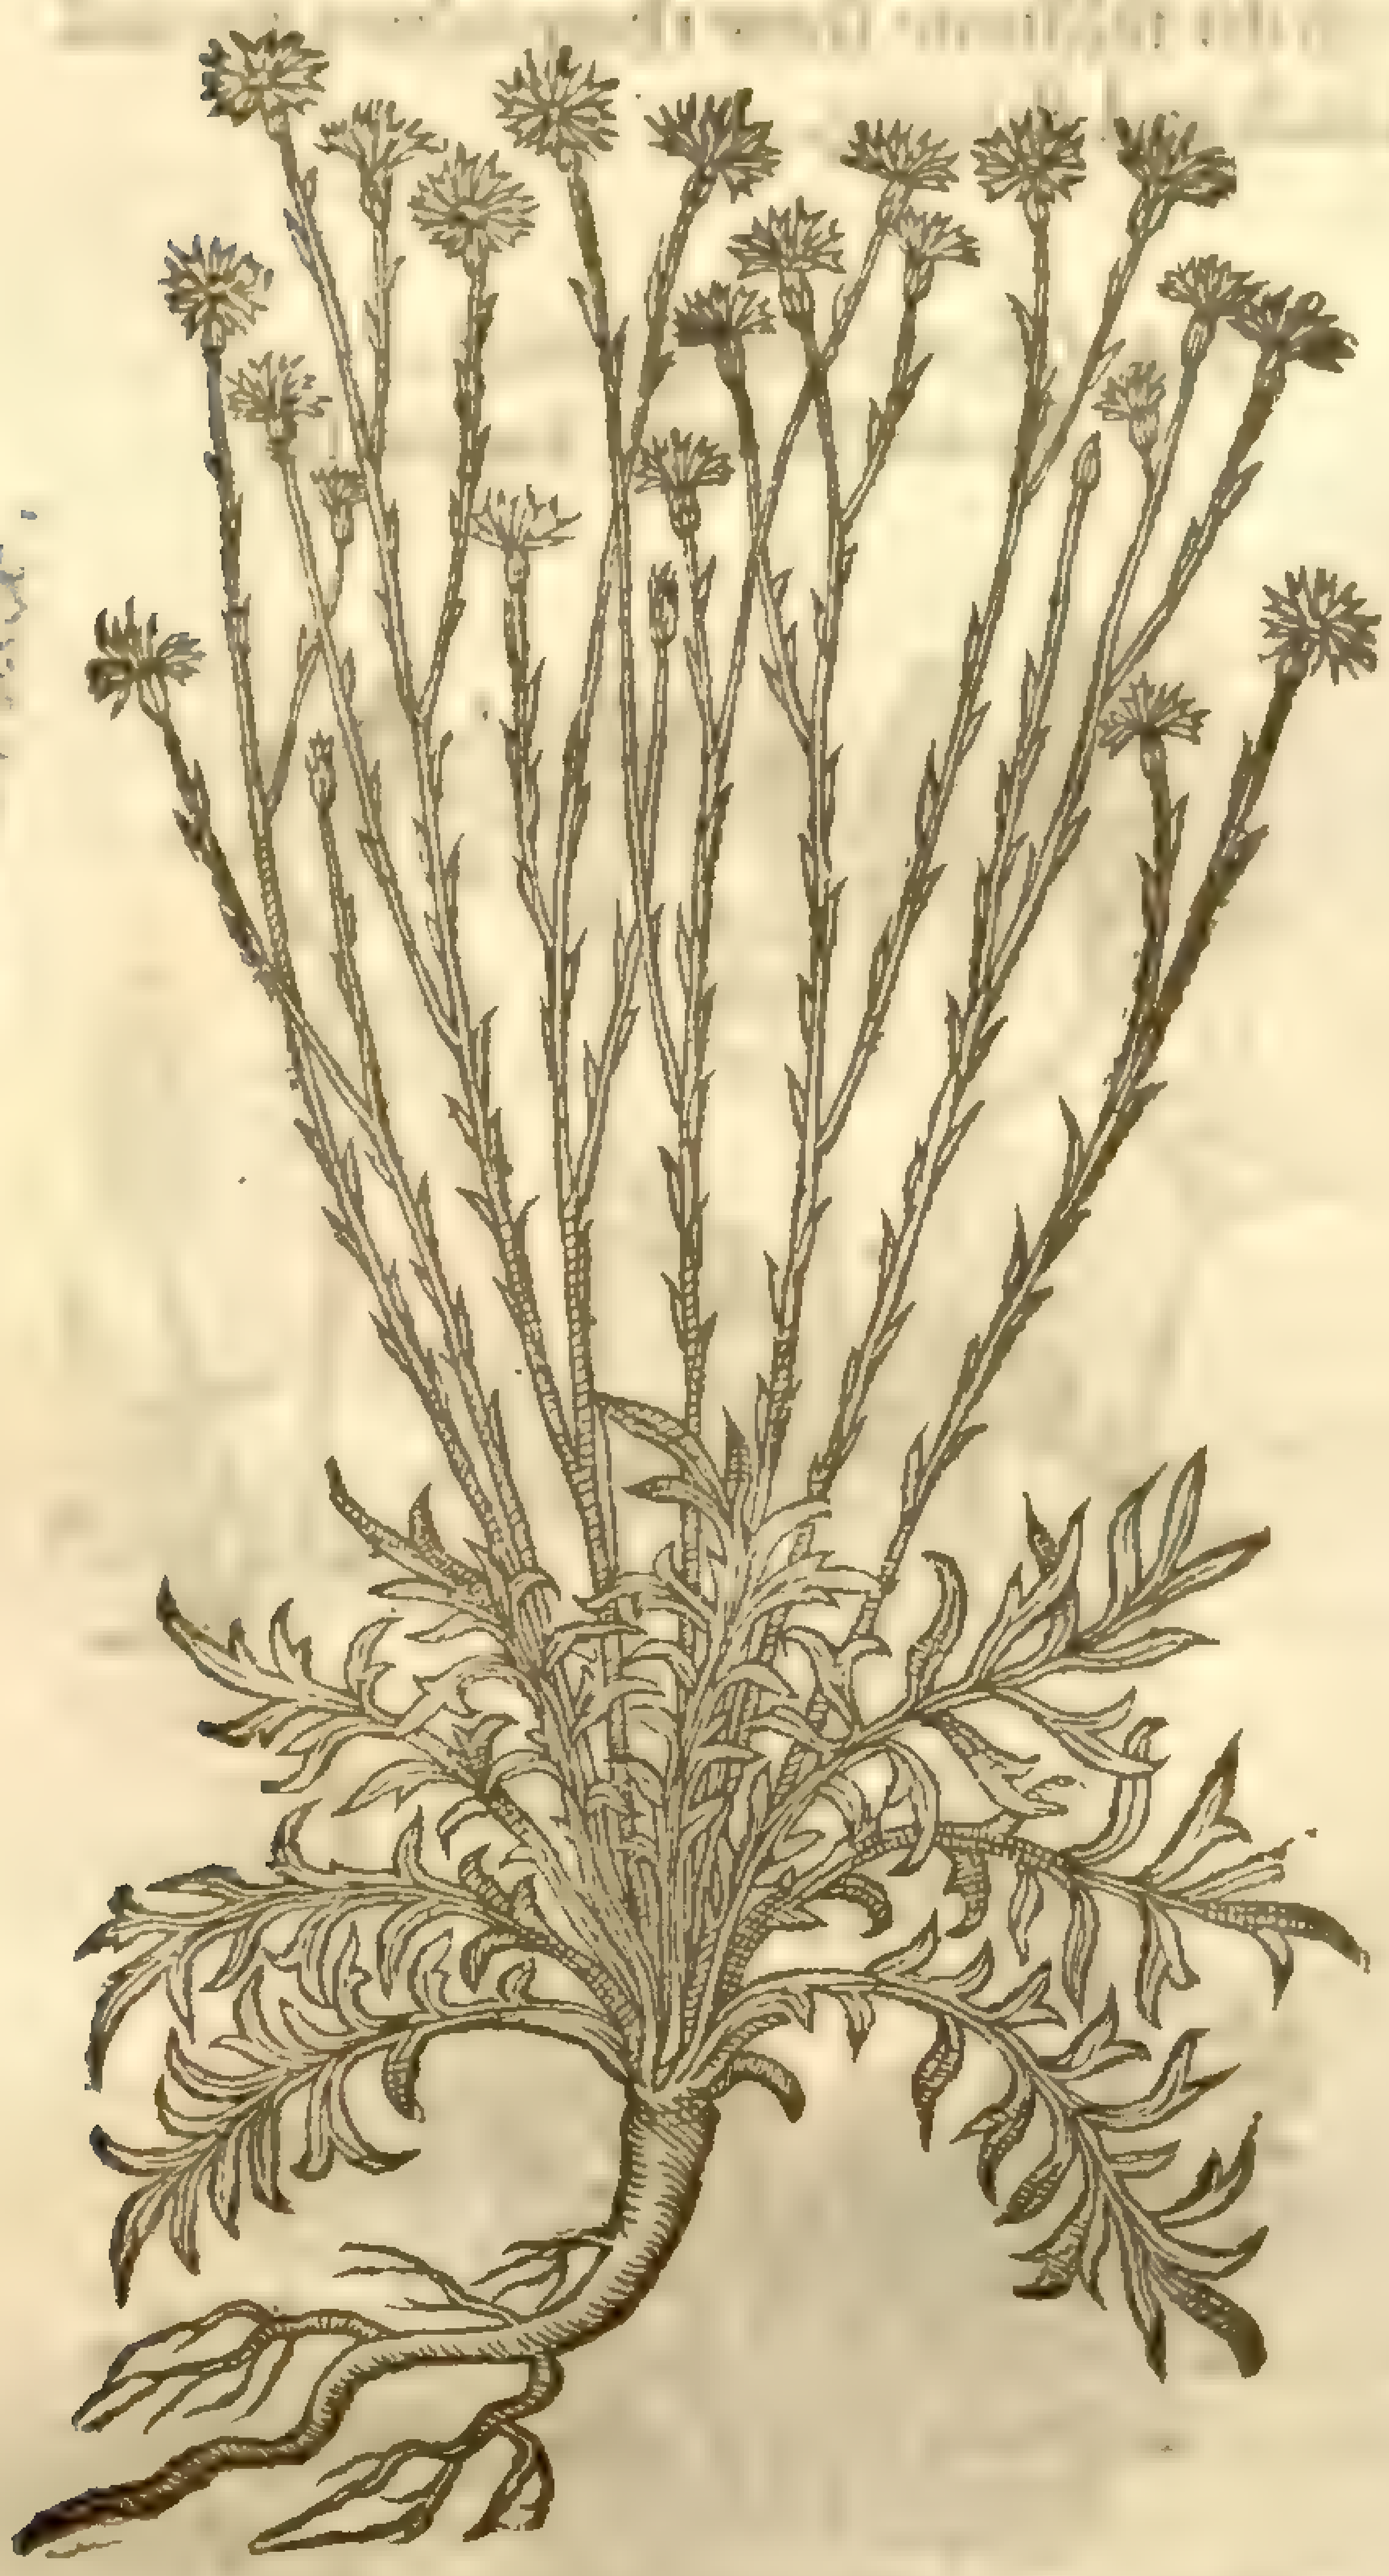
† 6 Sea gum Succorie hath many knobby or tuberous roots full of juice, of a whitiſh purple colour, with long ſtrings faſtned to them; from which immediatly riſe vp a few ſmall thin leaues faſhioned like thoſe of Succorie, narrower below, and ſomewhat larger toward their ends; among which ſpring vp ſmall tender ſtalks, naked, ſmooth, hollow, round, of ſome foot high or thereabout: each of theſe ſtalks haue one floure, in ſhape like that of the Dandelion, but leſſer. The whole plant is whitiſh or hoary, as are many of the ſea plants. †

7 Swines Succorie hath white ſmall and tender roots, from which riſe many indented leaues like thoſe of Dandelion, but much leſſe, ſpred or laid flat vpon the ground: from the midſt wherof riſe vp ſmall ſoft and tender ſtalks, bearing at the top double yellow floures like thoſe of Dandelion or Piſſe-abed, but ſmaller: the ſeed with the downy tuft flieth away with the wind.

8 The male Swines Succorie hath a long and ſlender root, with ſome few threds or ſtrings faſtned thereto; from which ſpring vp ſmall tender leaues about the bigneſſe of thoſe of Daiſies, ſpred vpon the ground, cut or ſnipt about the edges confuſedly, of an ouerworne colour, full of a milky juice: amongſt which riſe vp diuers ſmall tender naked ſtalkes, bearing at the top of euerie ſtalke one floure and no more, of a feint yellow colour, and ſomething double: which beeing ripe,

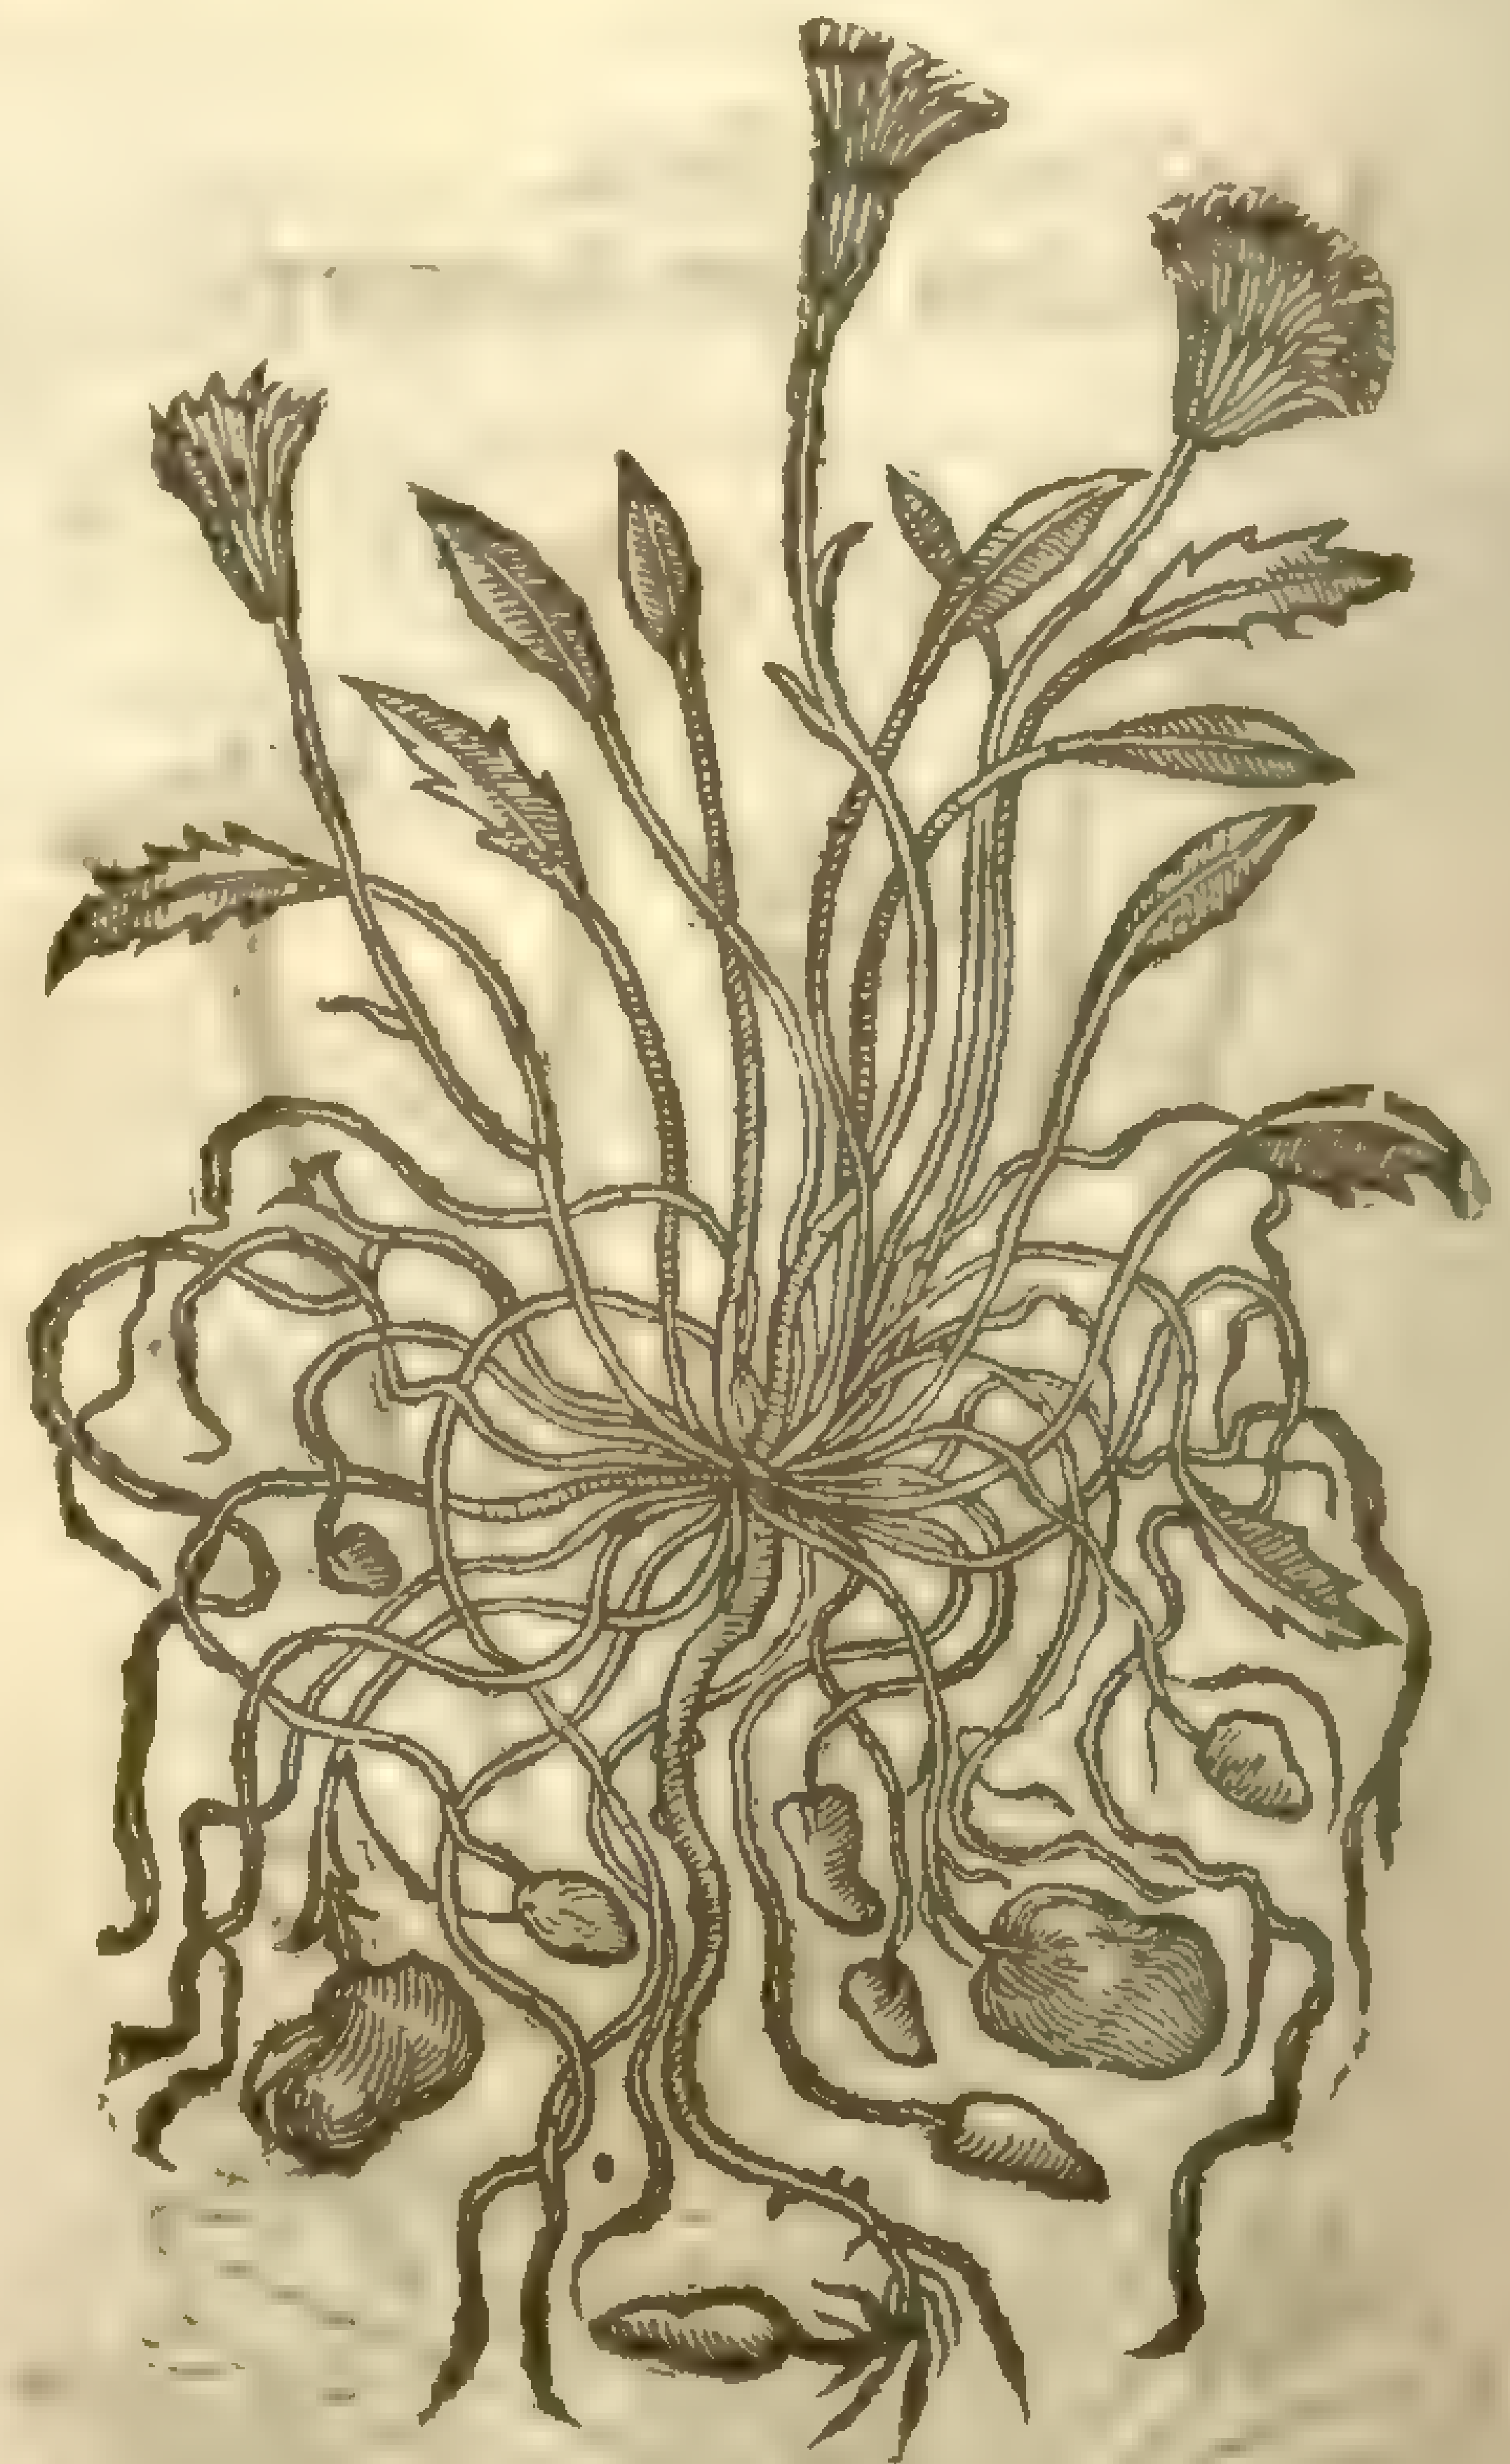
do

5 *Chondrilla juncea.*
Ruſhy Gum Succorie.

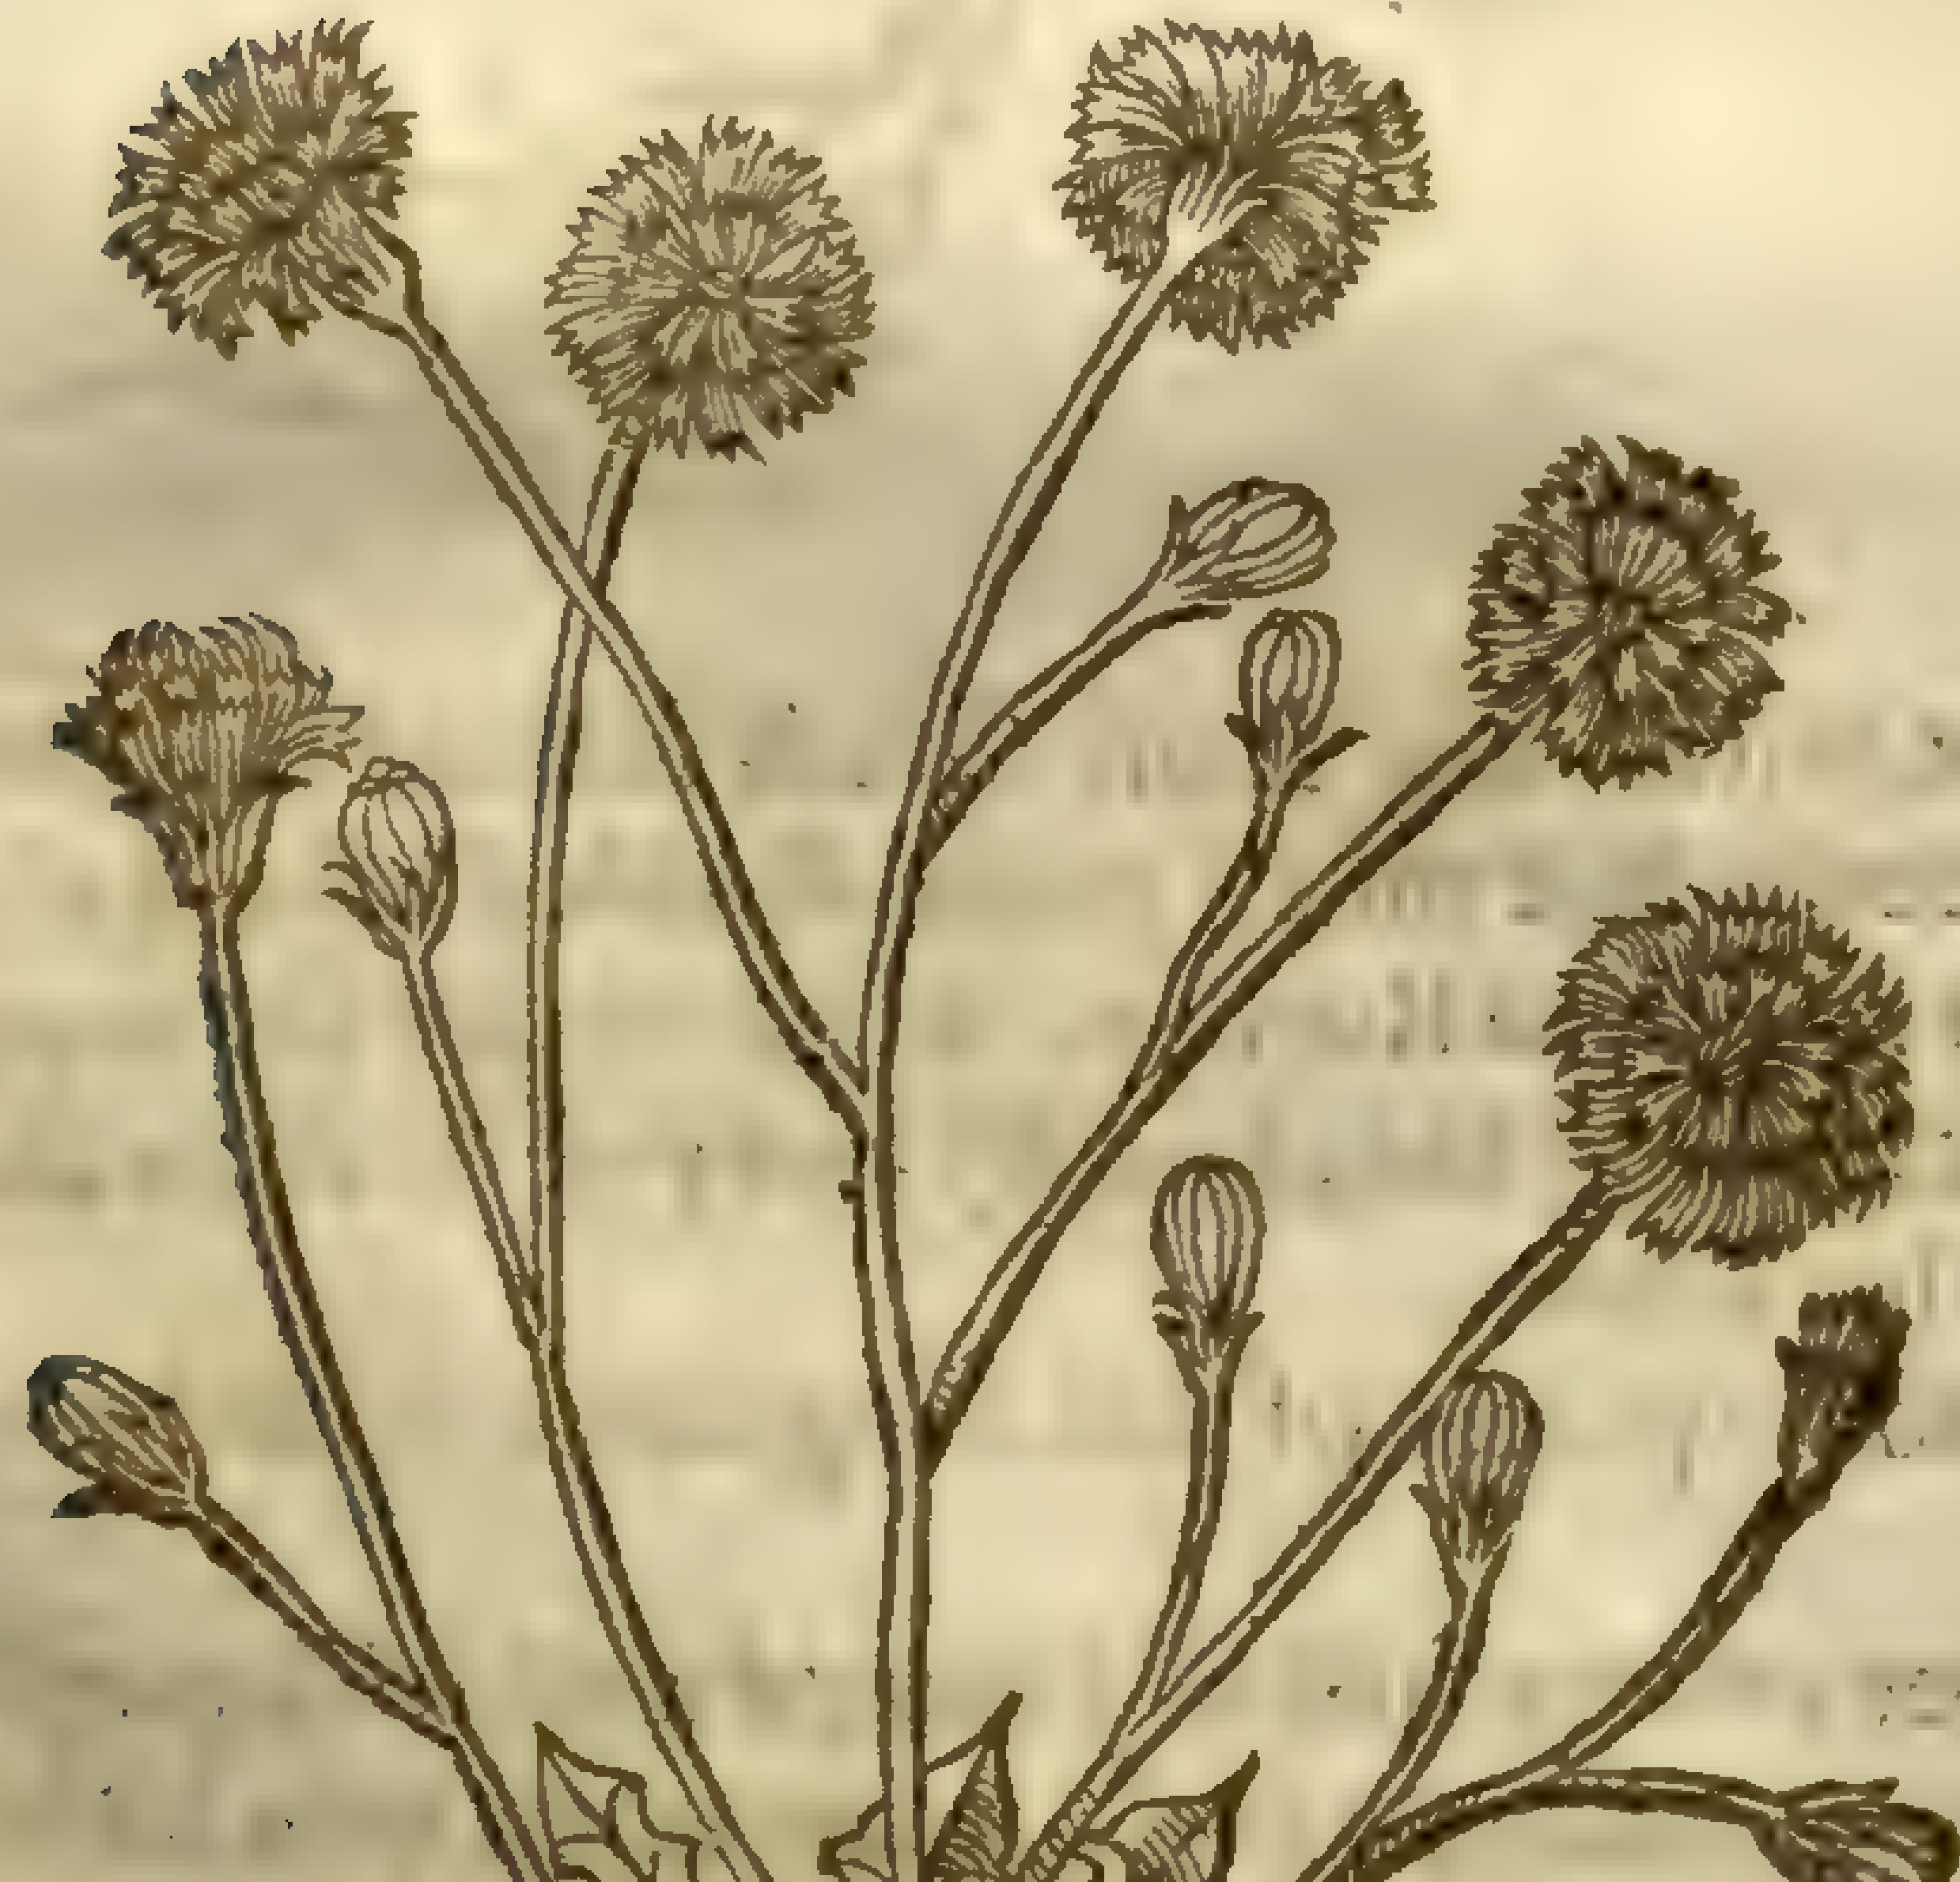


[illegible]

6 *Chondrilla marina Lobelij.*
Sea Gum Succorie.

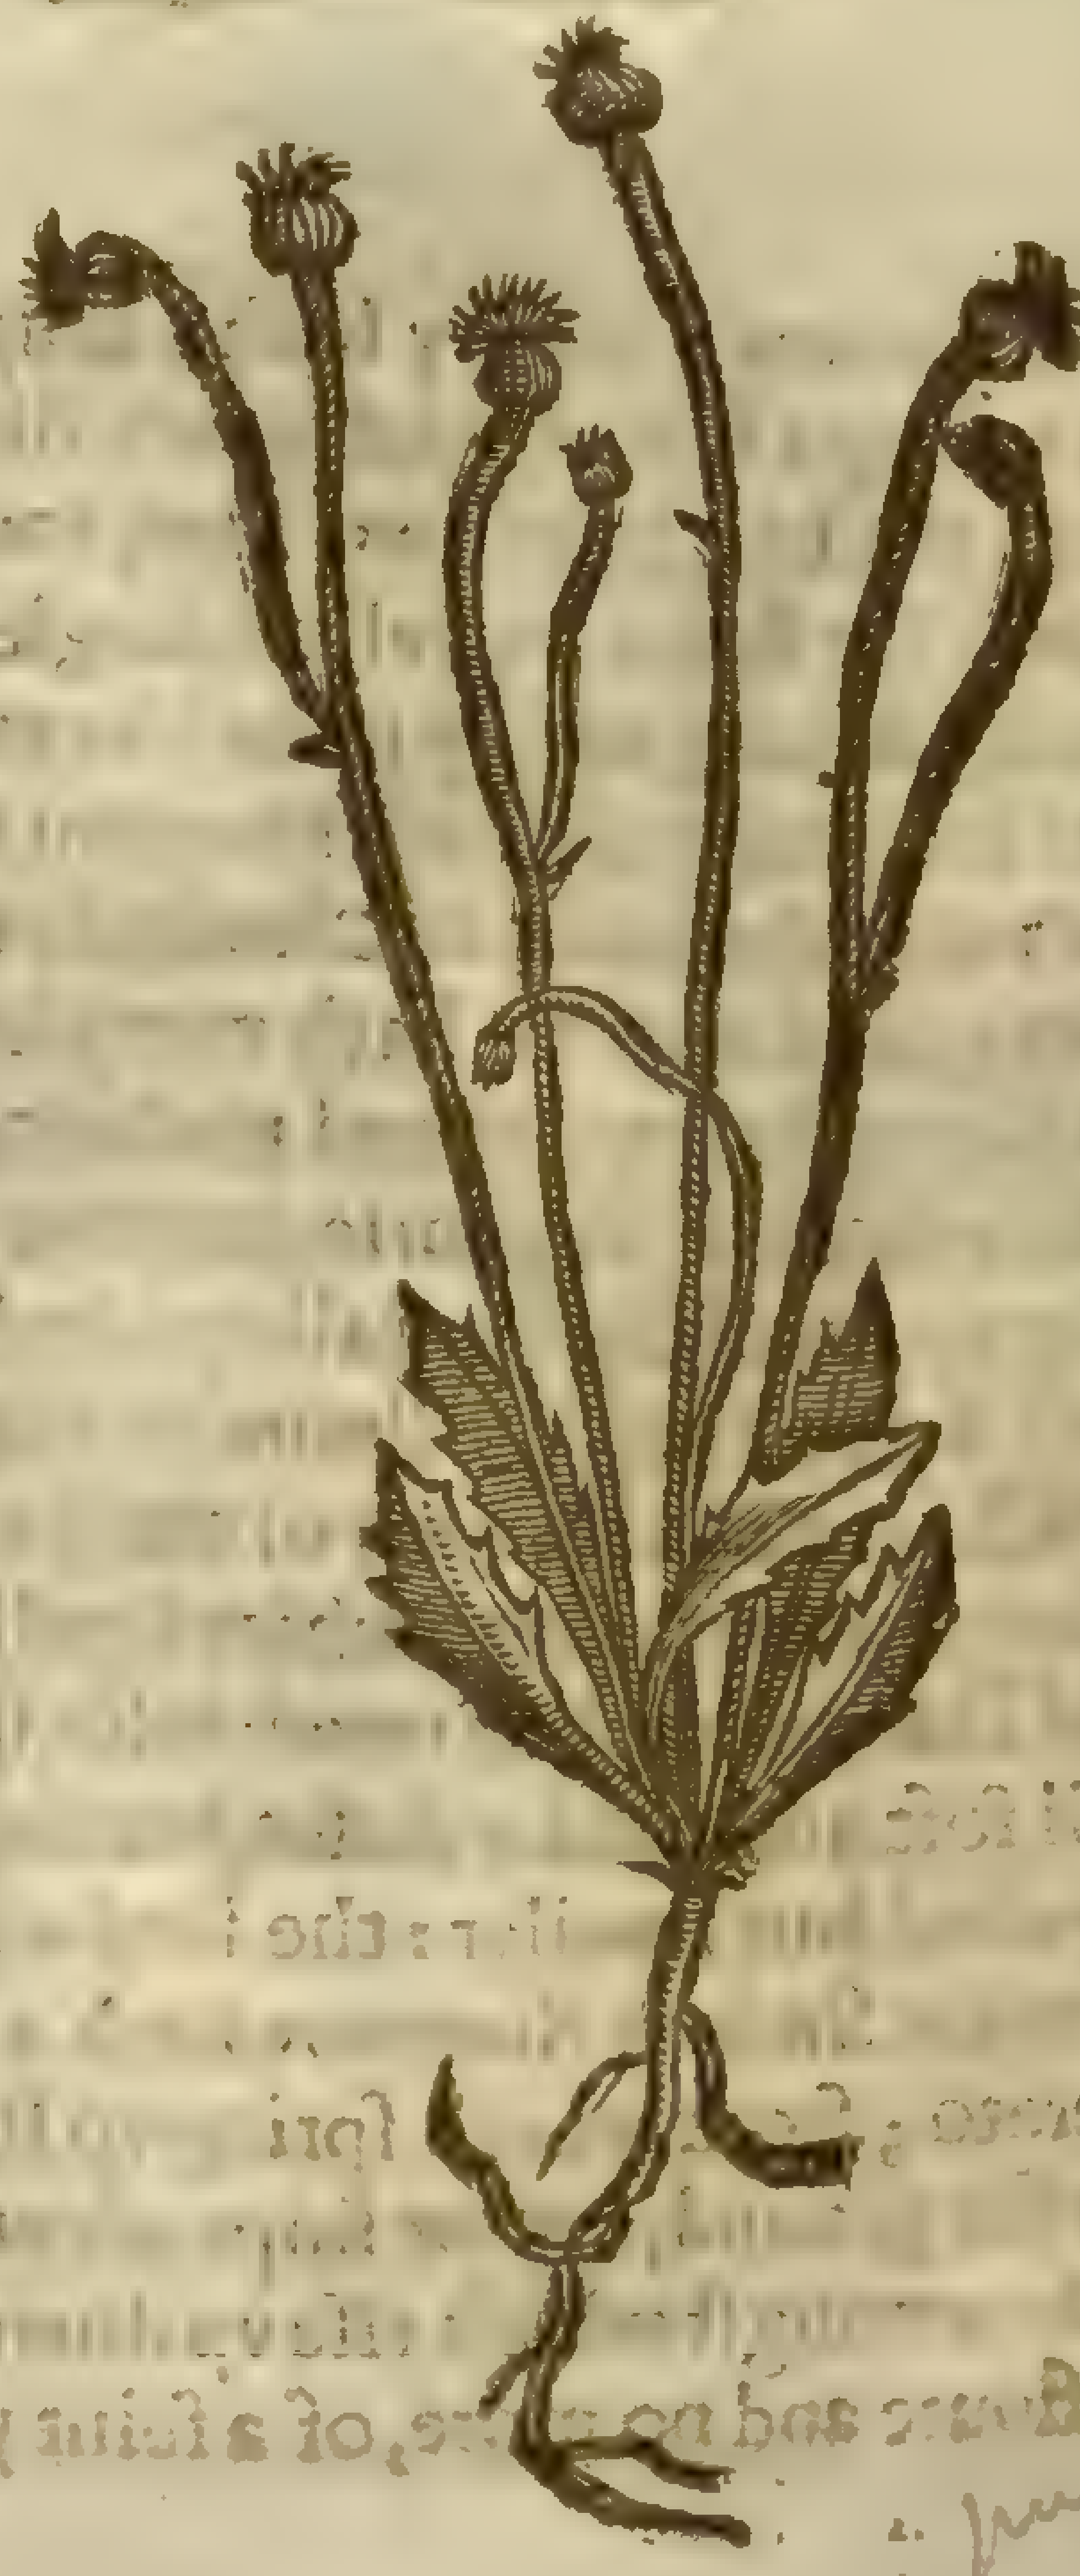


7 *Hypochæris Porcellia.*
Swines Succorie.



8 *Hyoſeris maſcula.*
Male Swines Succorie.

[illegible]



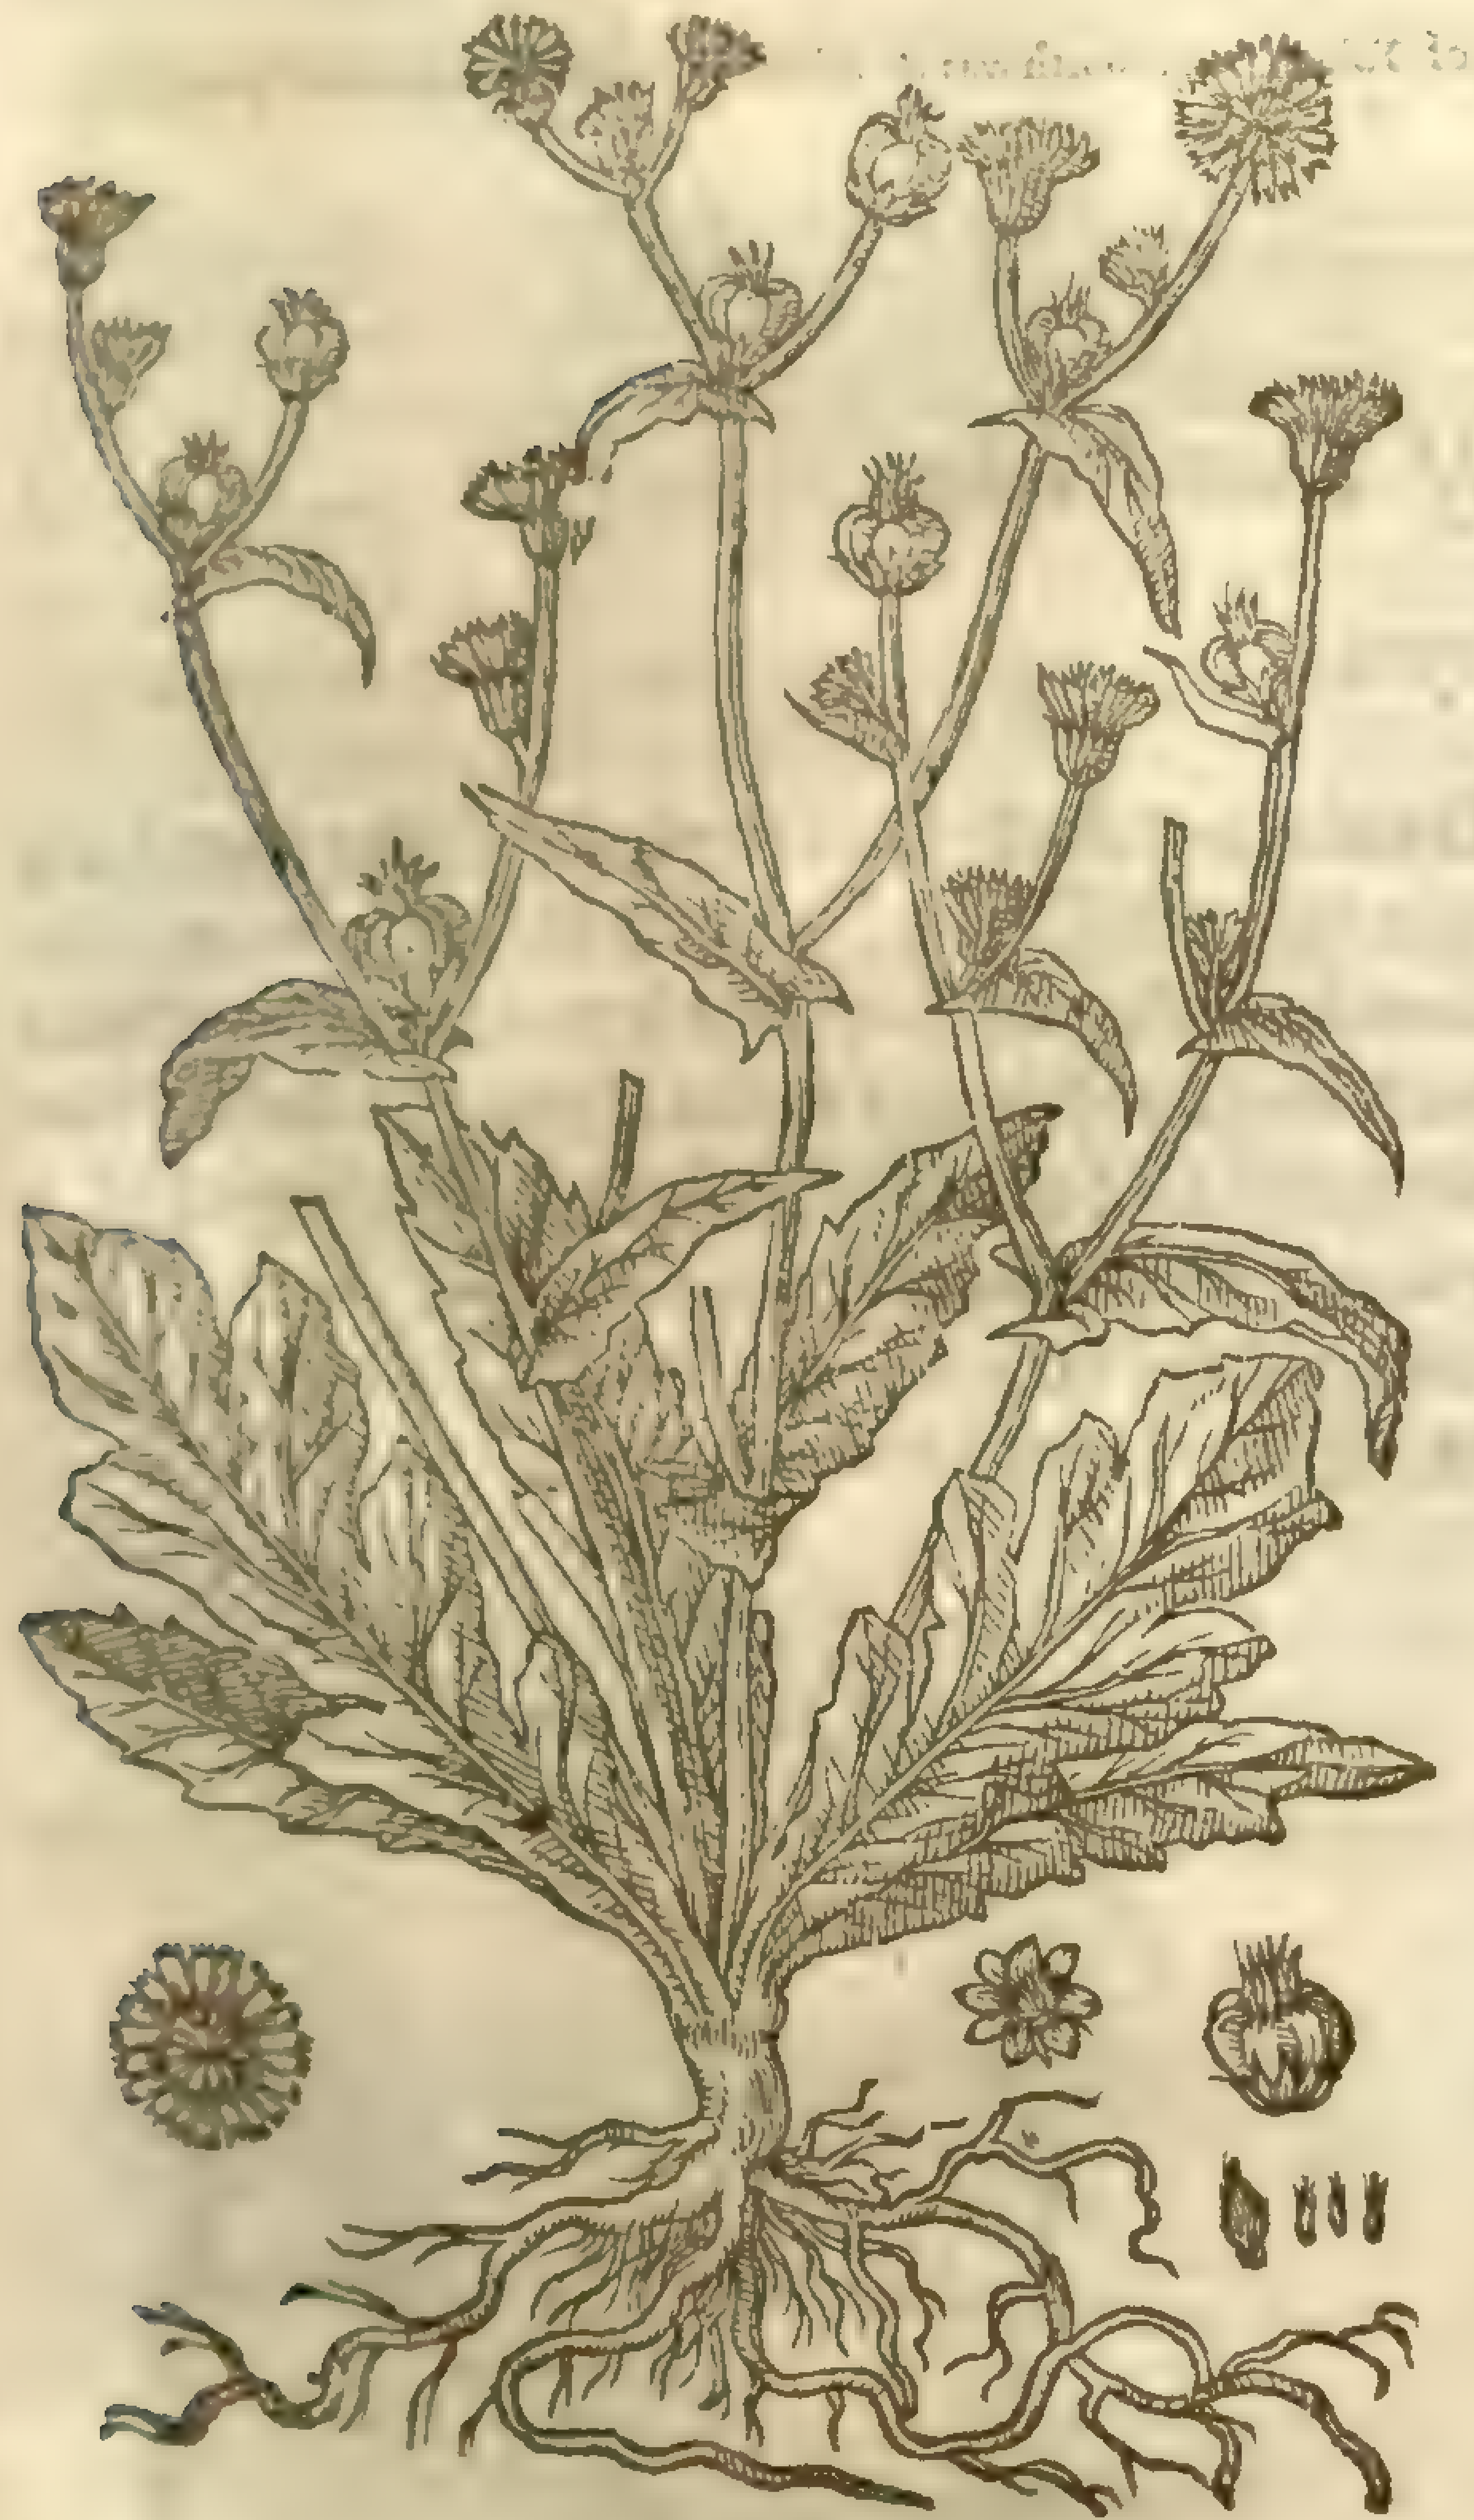
Lapsana pusilla
Sm. Fl. 3.377

do turn into down that is caried away with the wind: the ſeed likewiſe cleaueth to the ſaid down, and is alſo caried away with the wind. The whole plant periſheth when it hath perfected his ſeed, and recouereth it ſelfe again by the falling thereof.

‡ 9 I thinke it expedient in this place to deliuer vnto you the hiſtorie of the *Cichorium verrucarium*, or *Zacintha* of *Matthiolus*; of which our Author maketh mention in his Names and Vertues, although hee neither gaue figure, nor the leaſt deſcription therof. This wart Succorie (for ſo I will cal it) hath leaues almoſt like Endiue, greene, with pretty deep gaſhes on their ſides: the ſtalks are much creſted, and at the top diuided into many branches; between which and at their ſides grow many ſhort ſtalkes with yellow floures like thoſe of Succorie, but that theſe turne not into down, but into cornered and hard heads, moſt commonly diuided into 8 cells or parts, wherein the ſeed is contained. ‡

[illegible]

‡ 9 *Cichorium verrucarium.*
Wart-Succorie



¶ *The Place.*

† Theſe plants are found only in gardens in this country; the ſeuenth and eighth excepted, which peraduenture may be found to grow in vntilled places, vpon ditches banks and the borders of fields, or the like.

¶ *The Time.*

They floure from May to the end of Auguſt.

¶ *The Names.*

Gum Succorie hath beene called of the Grecians, χονδρίλλη: of the Latines, *Condrilla*, and *Chondrilla*: *Dioſcorides* and *Pliny* call it *Cichorion*, and *Seris*, by reaſon of ſome likeneſſe they haue with Succorie, eſpecially the two firſt, which haue blew floures as thoſe of the Succories. *Lobel* maketh *Cichorea verrucaria* to be *Zacintha* of *Matthiolus*.

¶ *The Names in particular.*

‡ 1 This is called *Condrilla cærulea Belgarum* of *Lobel*: *Apate* of *Daleſchampius*.

2 *Condrilla* 2 of *Matthiolus*: *Chondrilla latifolia cærulea* of *Tabernamontanus*.

3 *Chondrilla prior Dioſcoridis*, of *Cluſius* and *Lobel*.

4 *Chondrilla rara purpurea, &c.* of *Lobel*: *Chondrilla Hiſpanica Narbonenſis* of *Tabernamontanus*: *Senecio carduus Apulus*, of *Columna*.

5 *Chondrilla prima Dioſcoridis*, of *Columna* and *Bauhine*: *Viminea viſcoſa* of *Lobel* and *Cluſius*.

6 *Chondrilla altera Dioſcoridis*, of *Columna*: ſome thinke it to be [illegible] of *Theophraſtus*: *Lobel* calls it *Chondrilla puſilla marina lutea bulboſa*.

7 *Hypocharis porcellia* of *Tabernamontanus*.

8 *Hieracium minimum* 9 of *Cluſius*; *Hyoſeris latifolia* of *Tabern.* The two laſt ſhould haue beene put among the *Hieracia*.

9 *Cichorium verrucarium*, and *Zacinthus* of *Matthiolus* and *Cluſius*. ‡

¶ *The Temperature and Vertues.*

Theſe kinds of gum Succorie are like in temperature to the common Succorie, but drier.

A The root and leaues tempered with hony and made into trochisks or little flat cakes, with nitre or ſalt-petre added to them, clenſe away the morphew, ſun-burnings, and all ſpots of the face.

B The gum which is gathered from the branches, whereof it tooke his name, laieth down the ſtaring haires of the eie-brows and ſuch like places: and in ſome places it is vſed for maſtick, as *Bellonius* obſerues.

C The gum poudred with myrrh, and put into a linnen cloath, and a peſſary made thereof like a finger, and put vp, brings downe the terms in yong wenches and ſuch like.

D The leaues of *Zacintha* beat to pouder, and giuen in the decreaſing of the Moon to the quantitie of a ſpoonfull, takes away werts and ſuch like excreſcence, in what part of the body ſoeuer they be; the which medicine a certaine Surgeon of Padua did much vſe, whereby he gained great ſums of mony, as reporteth that antient phyſition *Ioachim Camerarius* of Noremberg, a famous city in Germany. And *Matthiolus* affirmes, that he hath known ſome helped of werts, by once eating the leaues hereof in a ſallad.

† The figure of the third was of the ſame plant as the firſt, and was *Chondrylla alba* of *Tabern.* The fourth was of *Hieracium montanum maius latifolium* of *Tabern.* which you ſhall finde in the tenth place, Chap. 34.

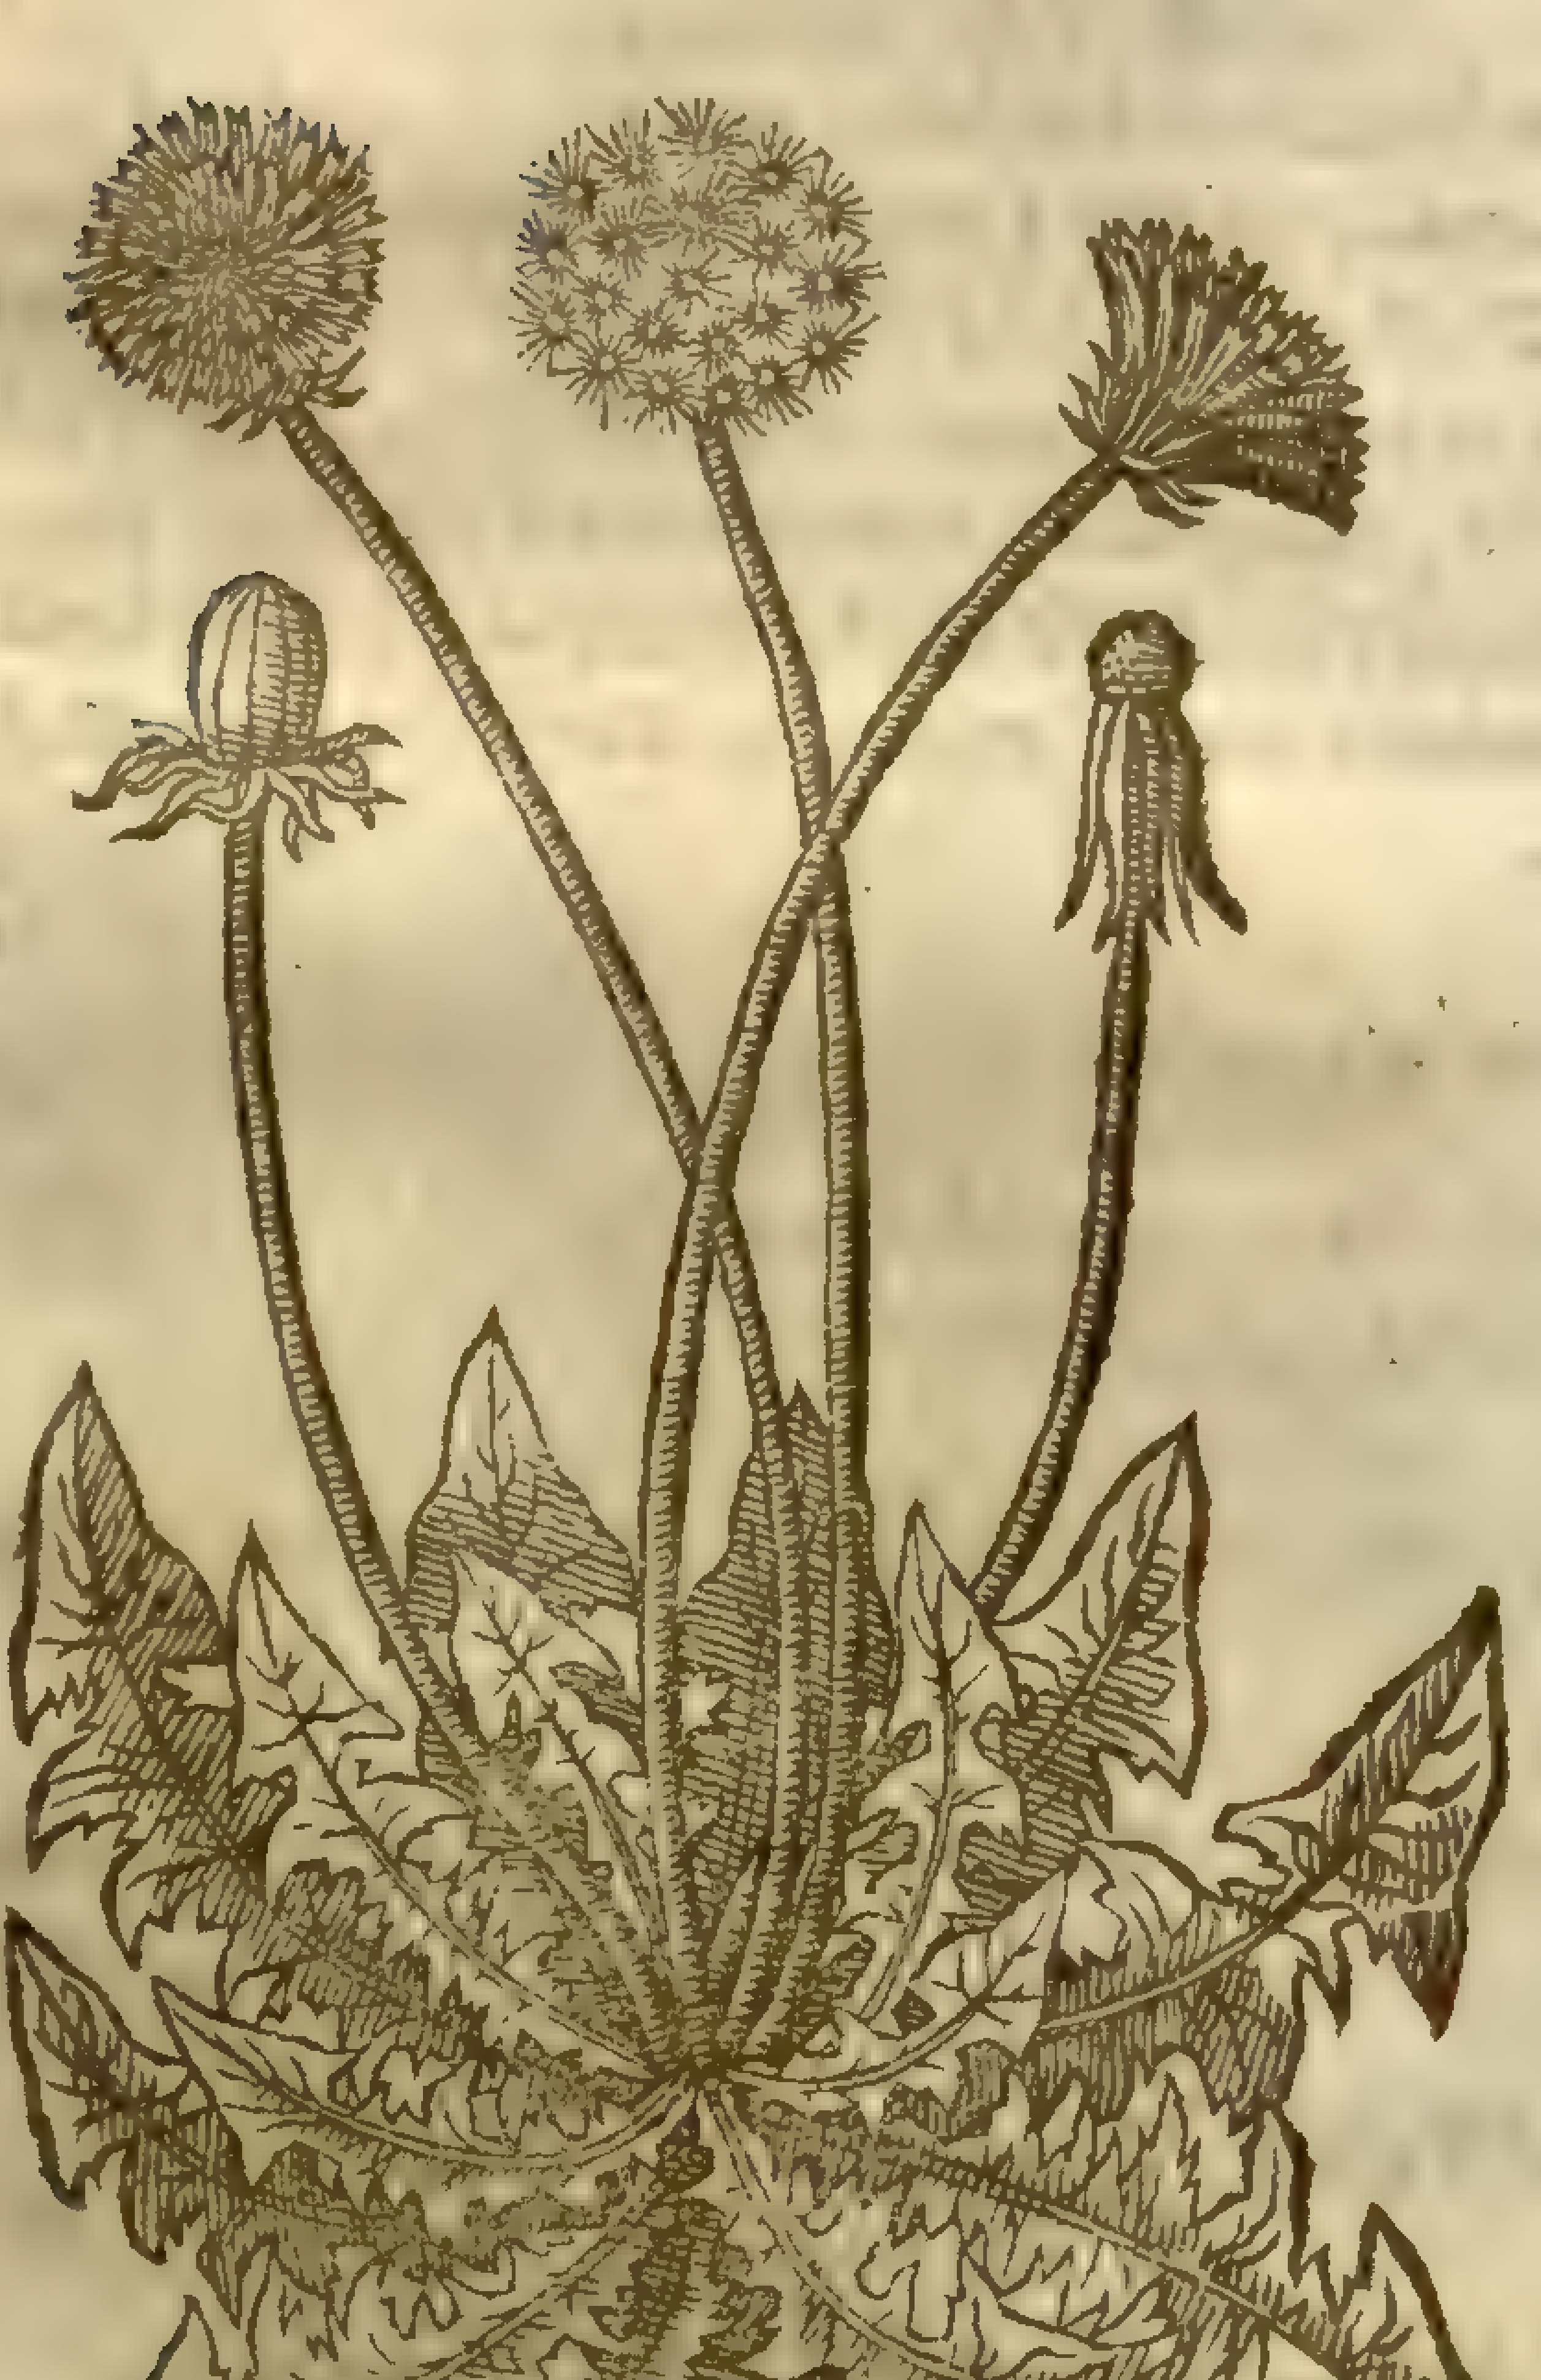
Chap. 32. *Of Dandelion.*

¶ *The Deſcription.*

1 The hearbe which is commonly called Dandelion doth ſend forth from the root long leaues deeply cut and gaſhed in the edges like thoſe of wild Succorie, but ſmoother: vpon euery ſtalke ſtandeth a floure greater than that of Succorie, but double, & thicke ſet together, of colour yellow, and ſweet in ſmell, which is turned into a round downy blowbal that is carried away with the wind. The root is long, ſlender, and full of milky juice, when any part of it is broken, as is the Endiue or Succorie, but bitterer in taſt than Succorie.

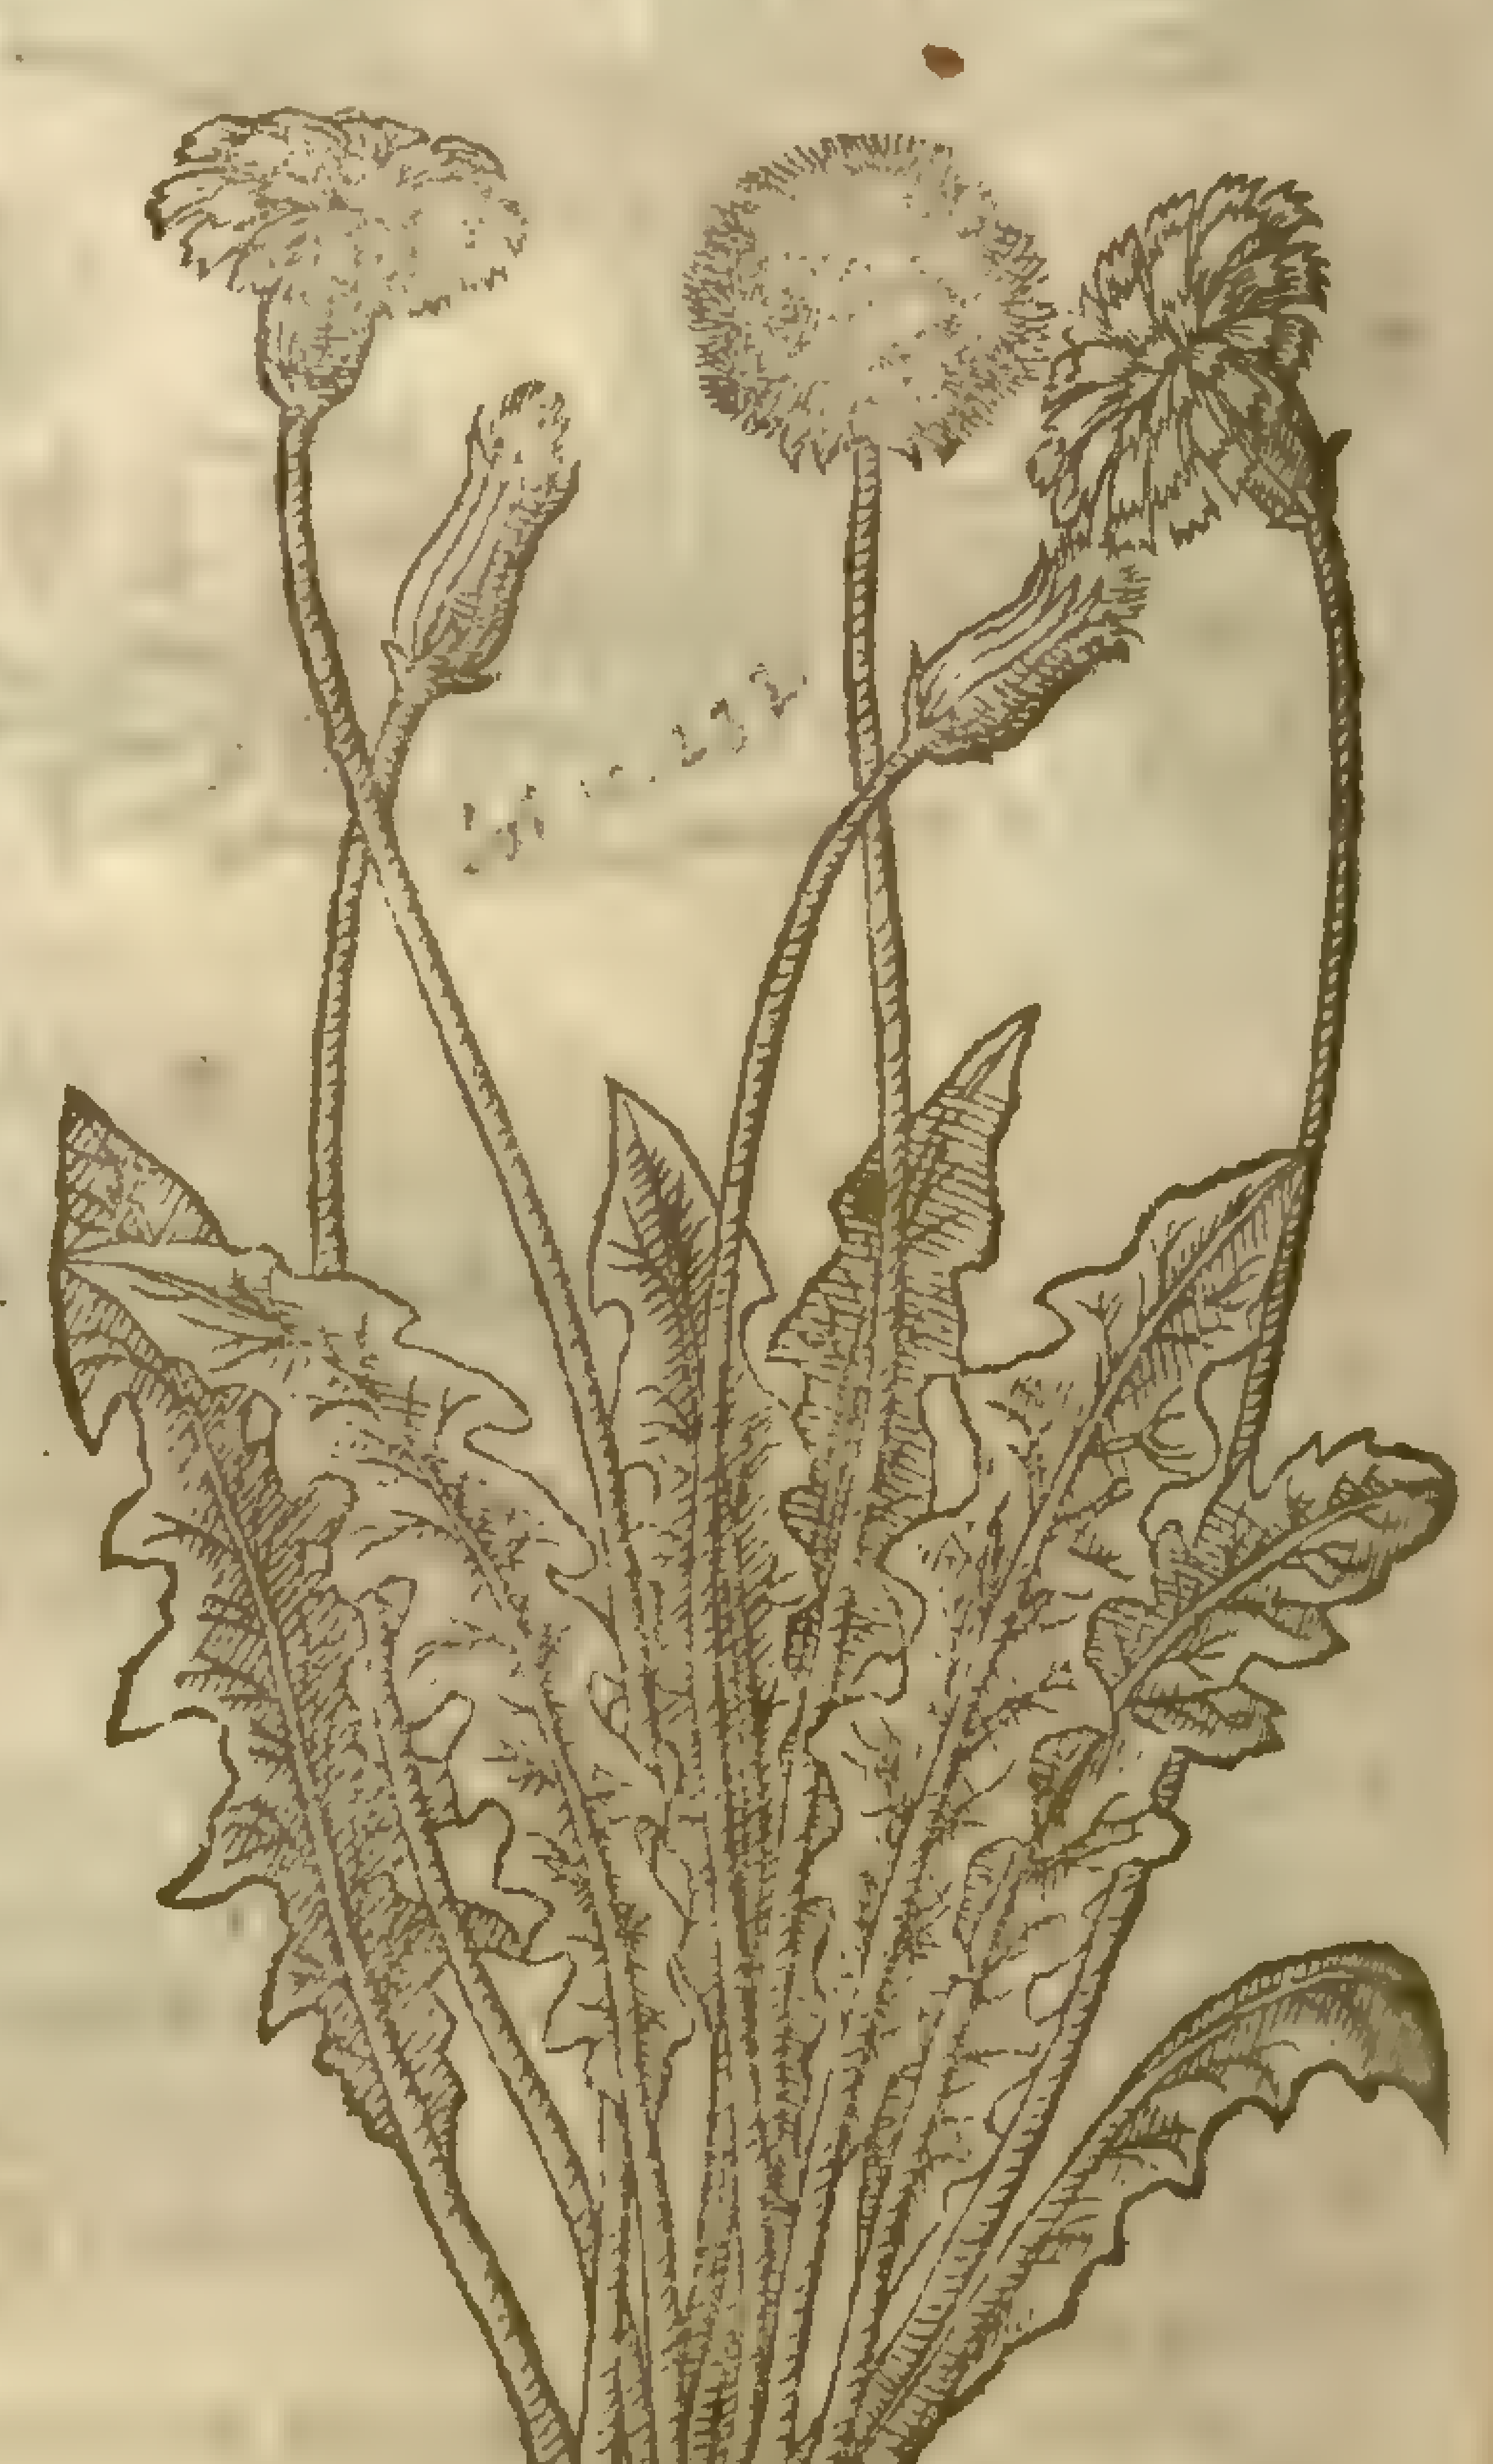
‡ There are diuers varieties of this plant, conſiſting in the largeneſſe, ſmallneſſe, deepeneſſe, or ſhallowneſſe of the diuiſions of the leafe, as alſo in the ſmoothneſſe, and roughneſſe thereof. ‡

1 *Dens Leonis.*
Dandelion.



Leontodon Taraxacum. [illegible]
Sm. fl. 3. 349
[illegible]

‡ 3 *Dens Leonis bulboſus.*
Knotty rooted Dandelion.



2 There is alſo another kinde of Succorie which may be referred hereunto, whoſe leaues are long, cut like thoſe of broad leafed Succory: the ſtalks are not vnlike, being diuided into branches as thoſe of Dandelion, but leſſer, which alſo vaniſheth into down when the ſeed is ripe, hauing a long and white root.

‡ 3 There is another *Dens Leonis* or Dandelion, which hath many knotty and tuberous roots

like thoſe of the Aſphodil; the leaues are not ſo deepely cut in as thoſe of the common Dandelion, but larger, and ſomewhat more hairy: the floures are alſo larger, and of a paler yellow, which flie away in ſuch downe as the ordinary. ‡

¶ *The Place.*

They are found often in medowes neere vnto water ditches, as alſo in gardens and high wayes much troden.

¶ *The Time.*

They floure moſt times in the yeare, eſpecially if the winter be not extreme cold.

¶ *The Names.*

Theſe plants belong to the Succory which *Theophraſtus* and *Pliny* call *Aphaca*, or *Aphace Leonardus*: *Fuchſius* thinketh that Dandelion is *Hydipnois Plinij*, of which he writeth in his 20 Booke, and 8. chapter, affirming it to be a wilde kinde of broad leafed Succorie, and that Dandelion is *Taraxacon*: as *Auicen* teacheth in his 692. chapter, is garden Endiue, as *Serapio* mentions in his 143. chapter; who citing *Paulus* for a witneſſe concerning the faculties, ſetteth downe theſe words which *Paulus* writeth of Endiue and Succorie. Diuers of the later Phyſitians do alſo call it *Dens Leonis*, or Dandelion: it is called in high Dutch, **Kolkraut**: in low-Dutch, **Papencruit**: in French, *Piſſenlit ou couronne de preſtre*, or *Dent de lyon*: in Engliſh, Dandelion: and of diuers, Piſſabed. The firſt is alſo called of ſome, and in ſhops *Taraxacon*, *Caput monachi*, *Roſtrum porcinum*, and *Vrinaria*. The other is *Dens Leonis Monſpelienſium* of *Lobel*, and *Cichoreum Conſtantinopolitanum*, of *Matthiolus*.

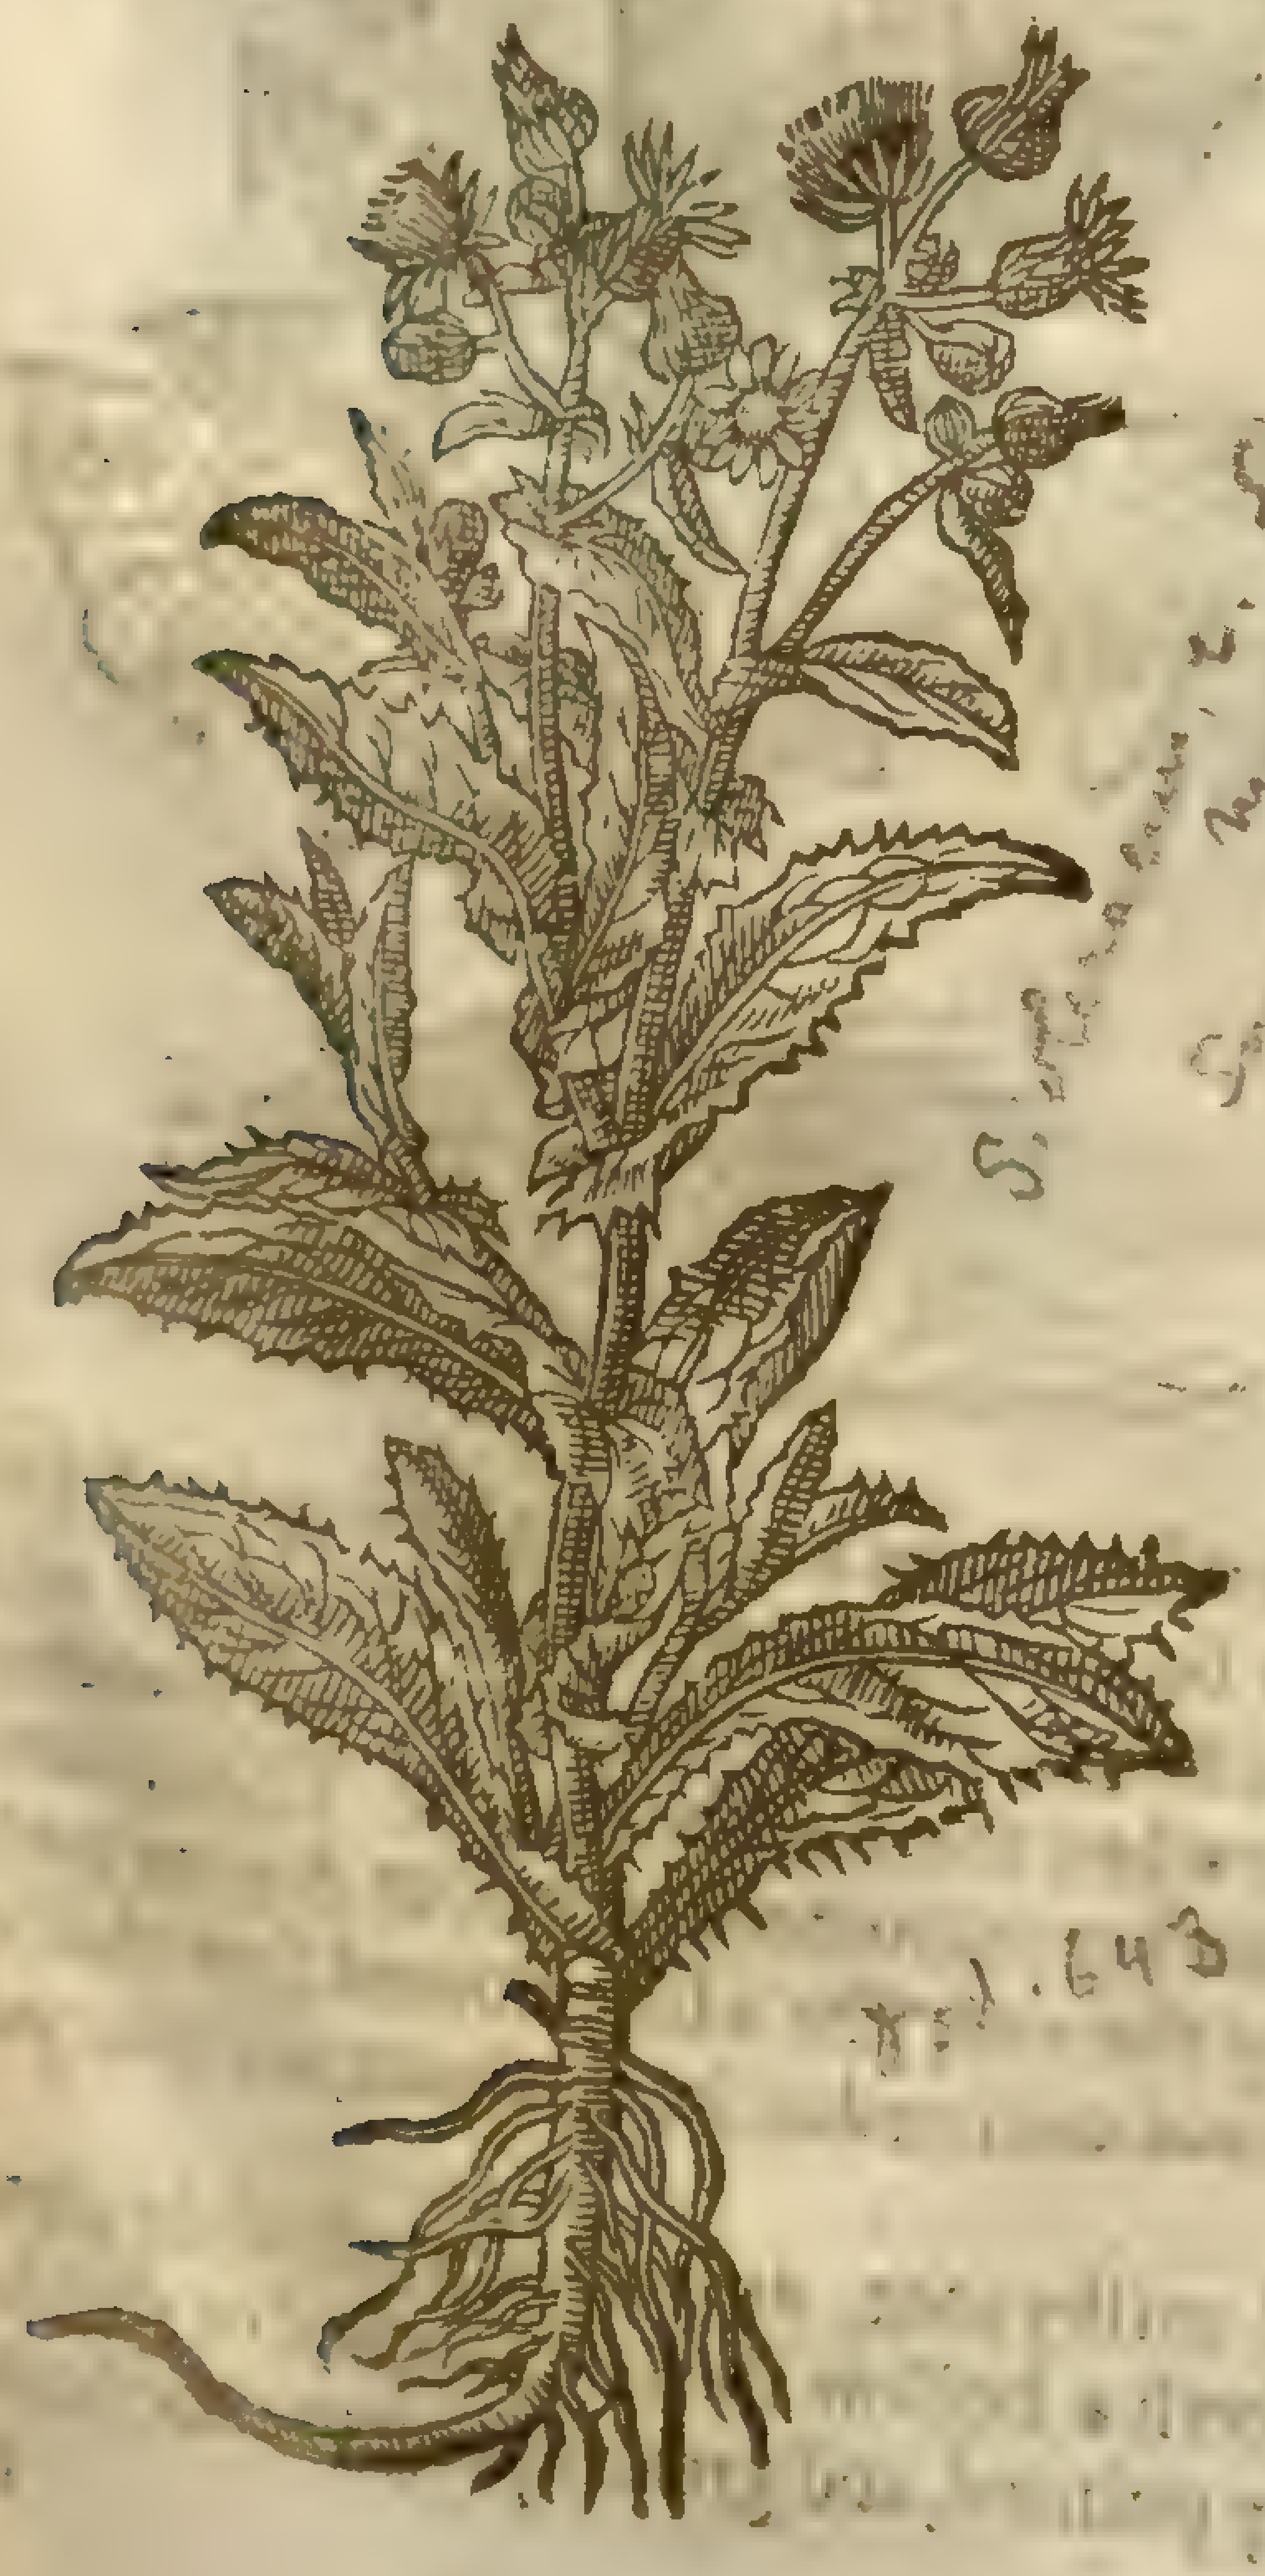
¶ *The Temperature and Vertues.*

Dandelion is like in temperature to Succorie, that is to ſay, to wilde Endiue. It is cold, but it drieth more, and doth withall cleanſe, and open by reaſon of the bitterneſſe which it hath joyned with it: and therefore it is good for thoſe things for which Succory is. ‡ Boiled it ſtrengthens the weake ſtomacke, and eaten raw it ſtops the belly, and helpes the Dyſentery, eſpecially beeing boiled with Lentiles; The juice drunke is good againſt the vnuoluntarie effuſion of ſeed: boyled in vineger, it is good againſt the paine that troubles ſome in making of water: a decoction made of the whole plant helps the yellow jaundiſe.

† The figure which wa[illegible] the 2 place was of the *Cich. Luteum*, where you may find it, but to what plant the deſcription may be referred, I cannot yet determine

Chap. 33. *Of Sow-Thiſtle.*

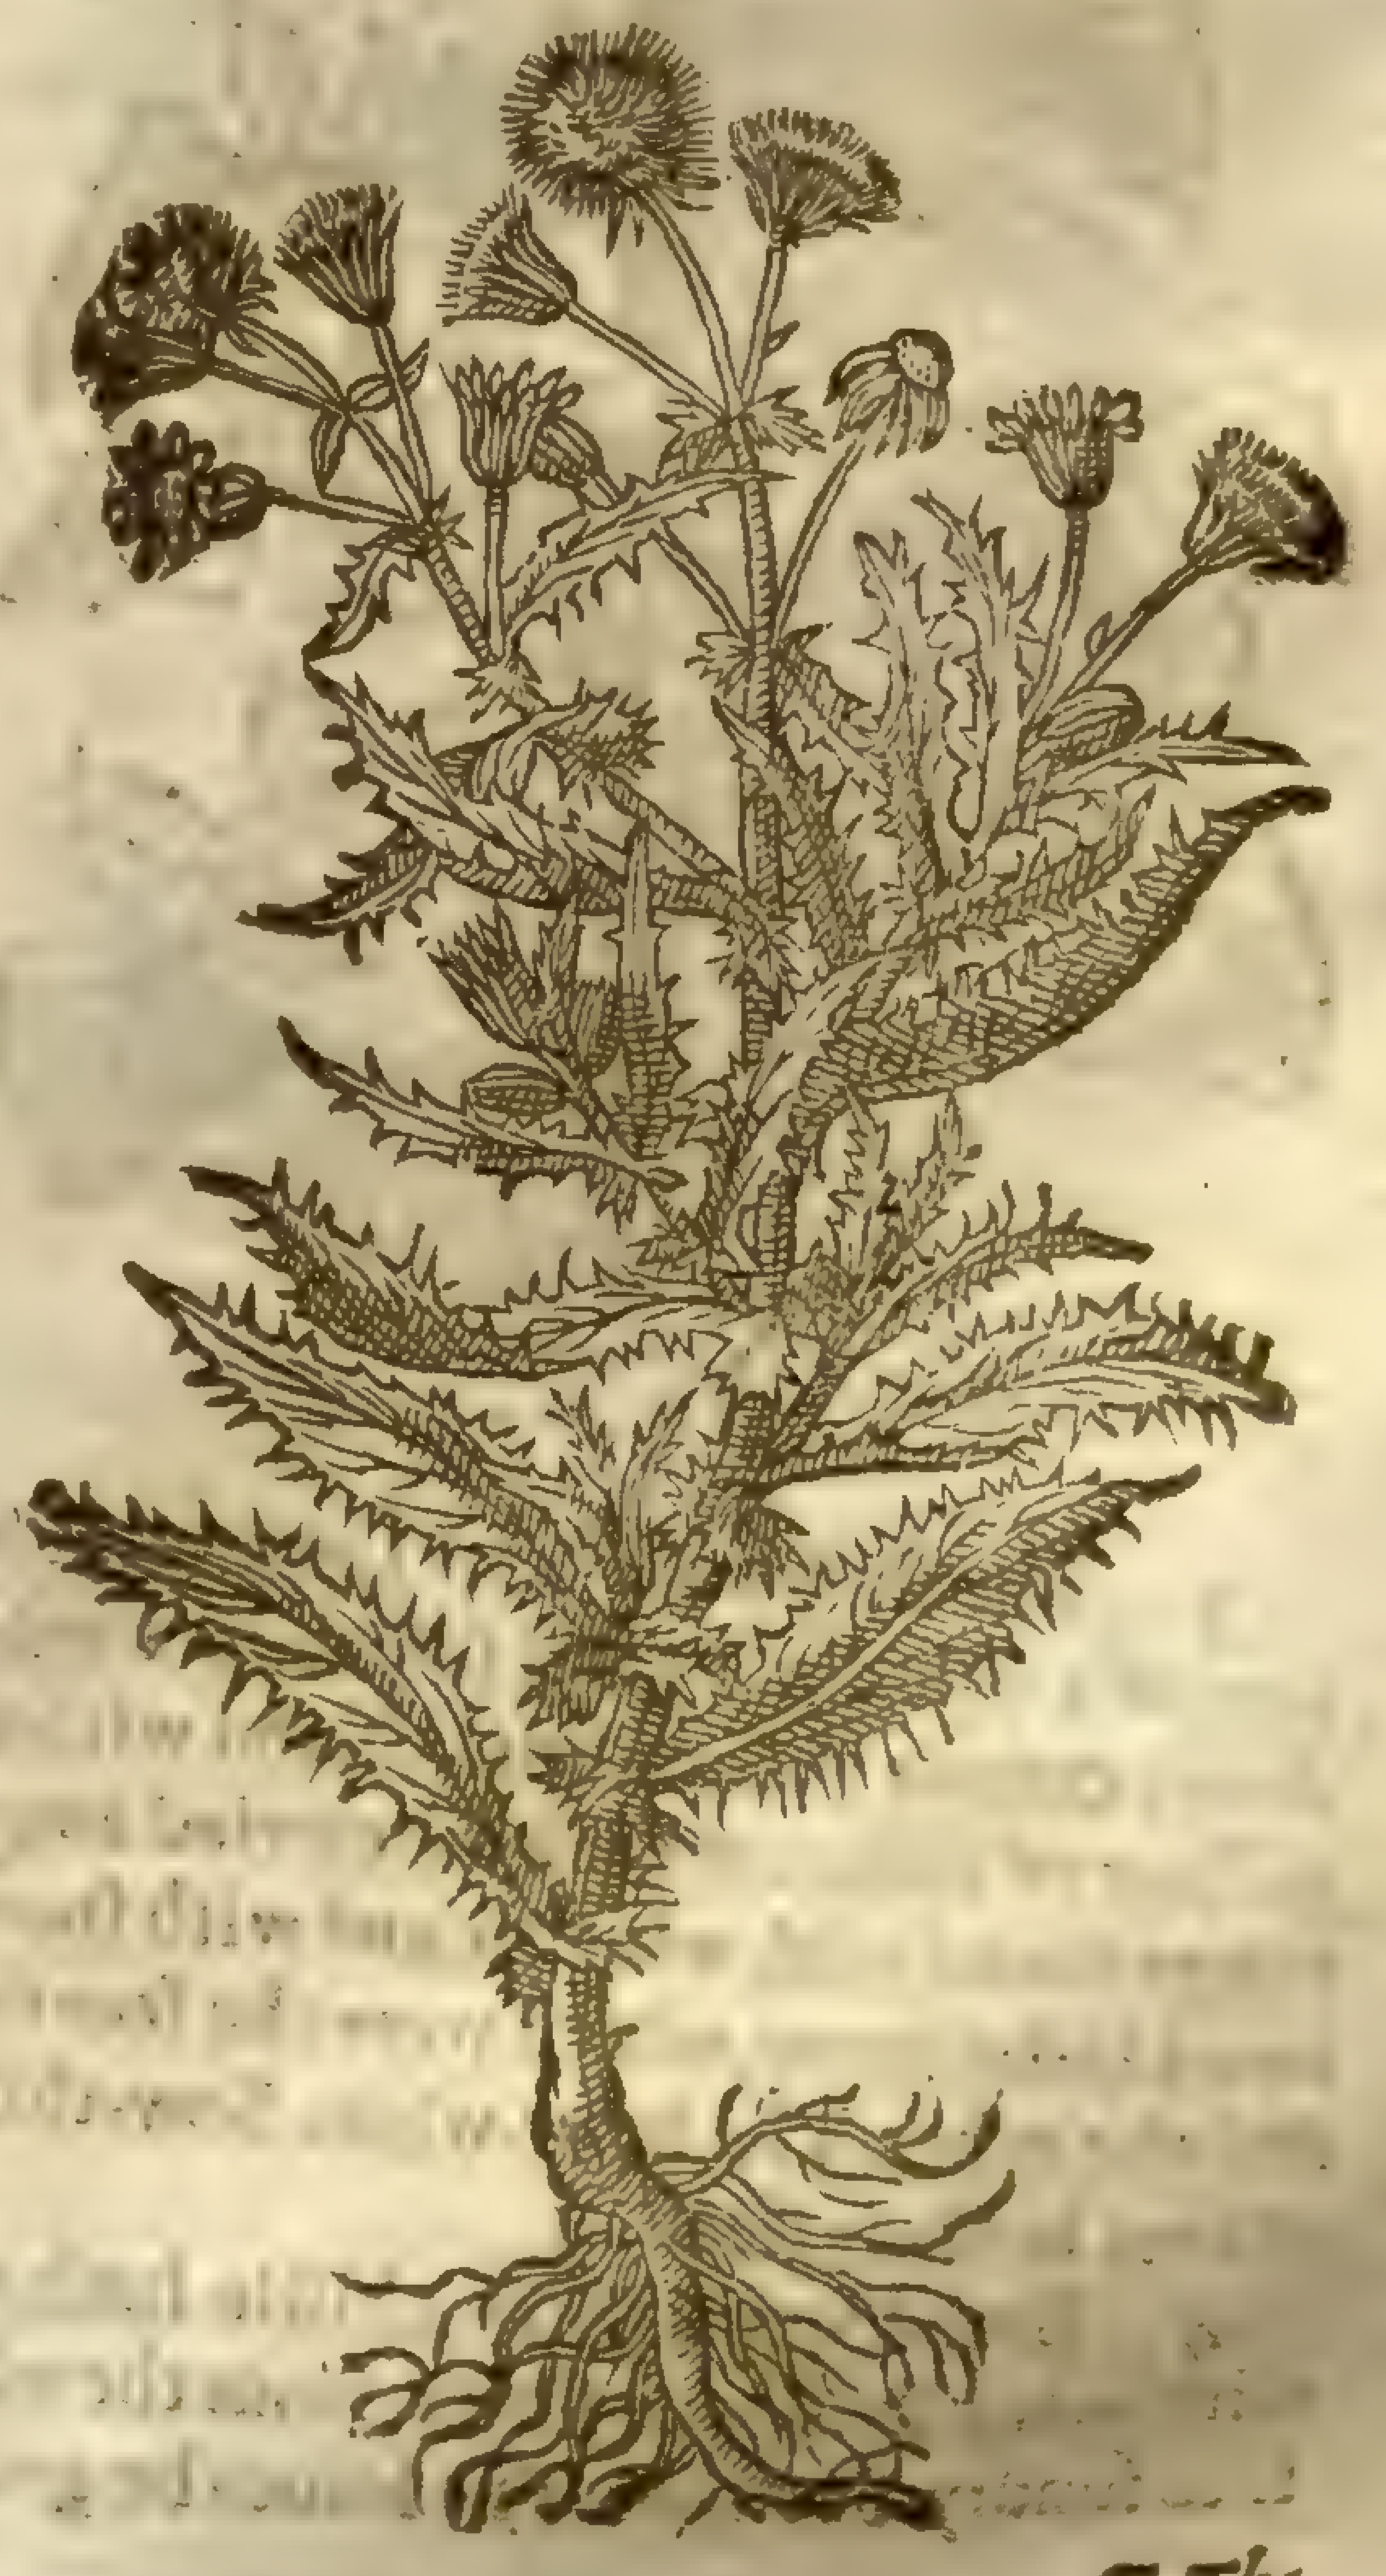
1 † *Sonchus aſper*. Prickly Sow-thiſtle.



S. [illegible]

[illegible] 1.643

‡ 2 *Sonchus aſperior*. The more prickly Sow-thiſtle.



¶ The

S. oleraceus, L. &

¶ *The Kindes.*

THere be two chiefe kindes of Sow-thiſtles; one tenderer and ſofter; the other more pricking and wilder: but of theſe there be ſundry ſorts more found by the diligence of the later Writers; all which ſhall be comprehended in this chapter, and euery one be diſtinguiſhed with a ſeuerall deſcription.

¶ *The Deſcription.*

1 THe prickly Sow-thiſtle hath long broad leaues cut very little in, but full of ſmal prickles round about the edges ſomething hard and ſharp, with a rough and hollow ſtalk: the floures ſtand on the tops of the branches, conſiſting of many ſmall leaues, ſingle, and yellow of colour; and when the ſeed is ripe it turneth into downe, and is carried away with the winde. The whole plant is full of a white milky juice.

‡ 2 There is another kinde of this, whoſe leaues are ſometimes prettily deepe cut in like as thoſe of the ordinary Sow-thiſtle; but the ſtalkes are commonly higher than thoſe of the laſt deſcribed, and the leaues more rough and prickly; but in other reſpects not differing from the reſt of this kinde. It is alſo ſometimes to be found with the leaues leſſe diuided. ‡

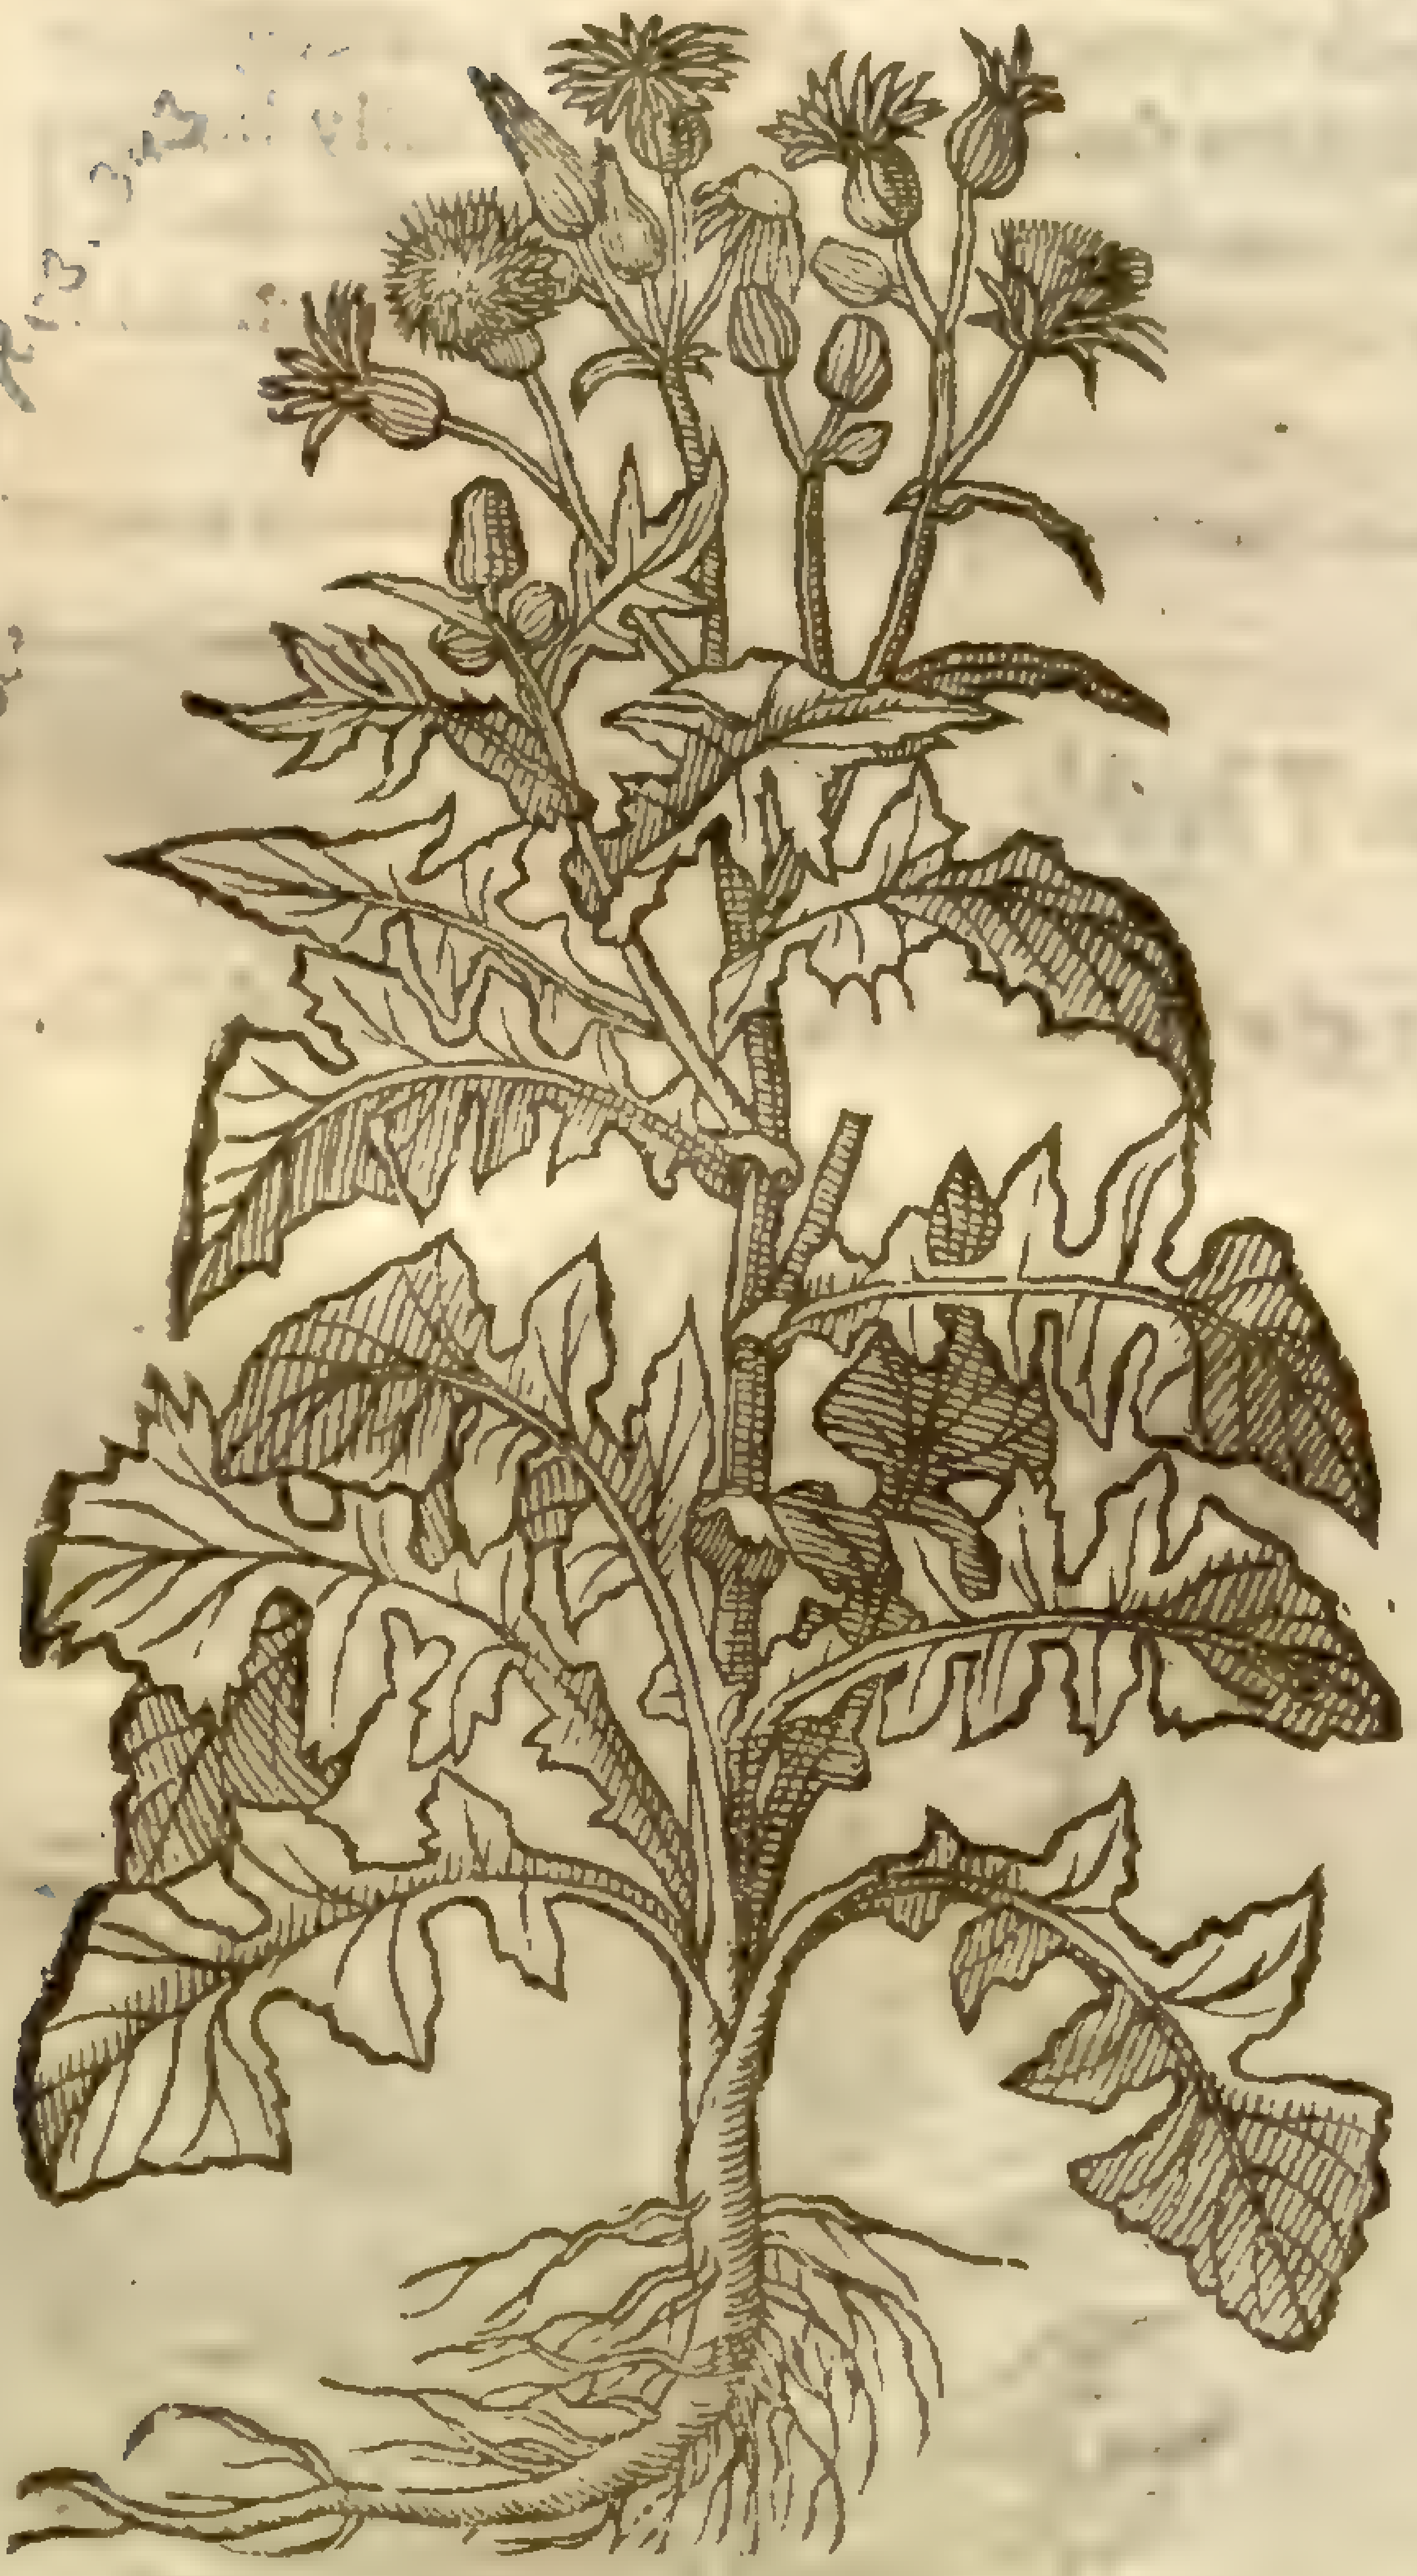
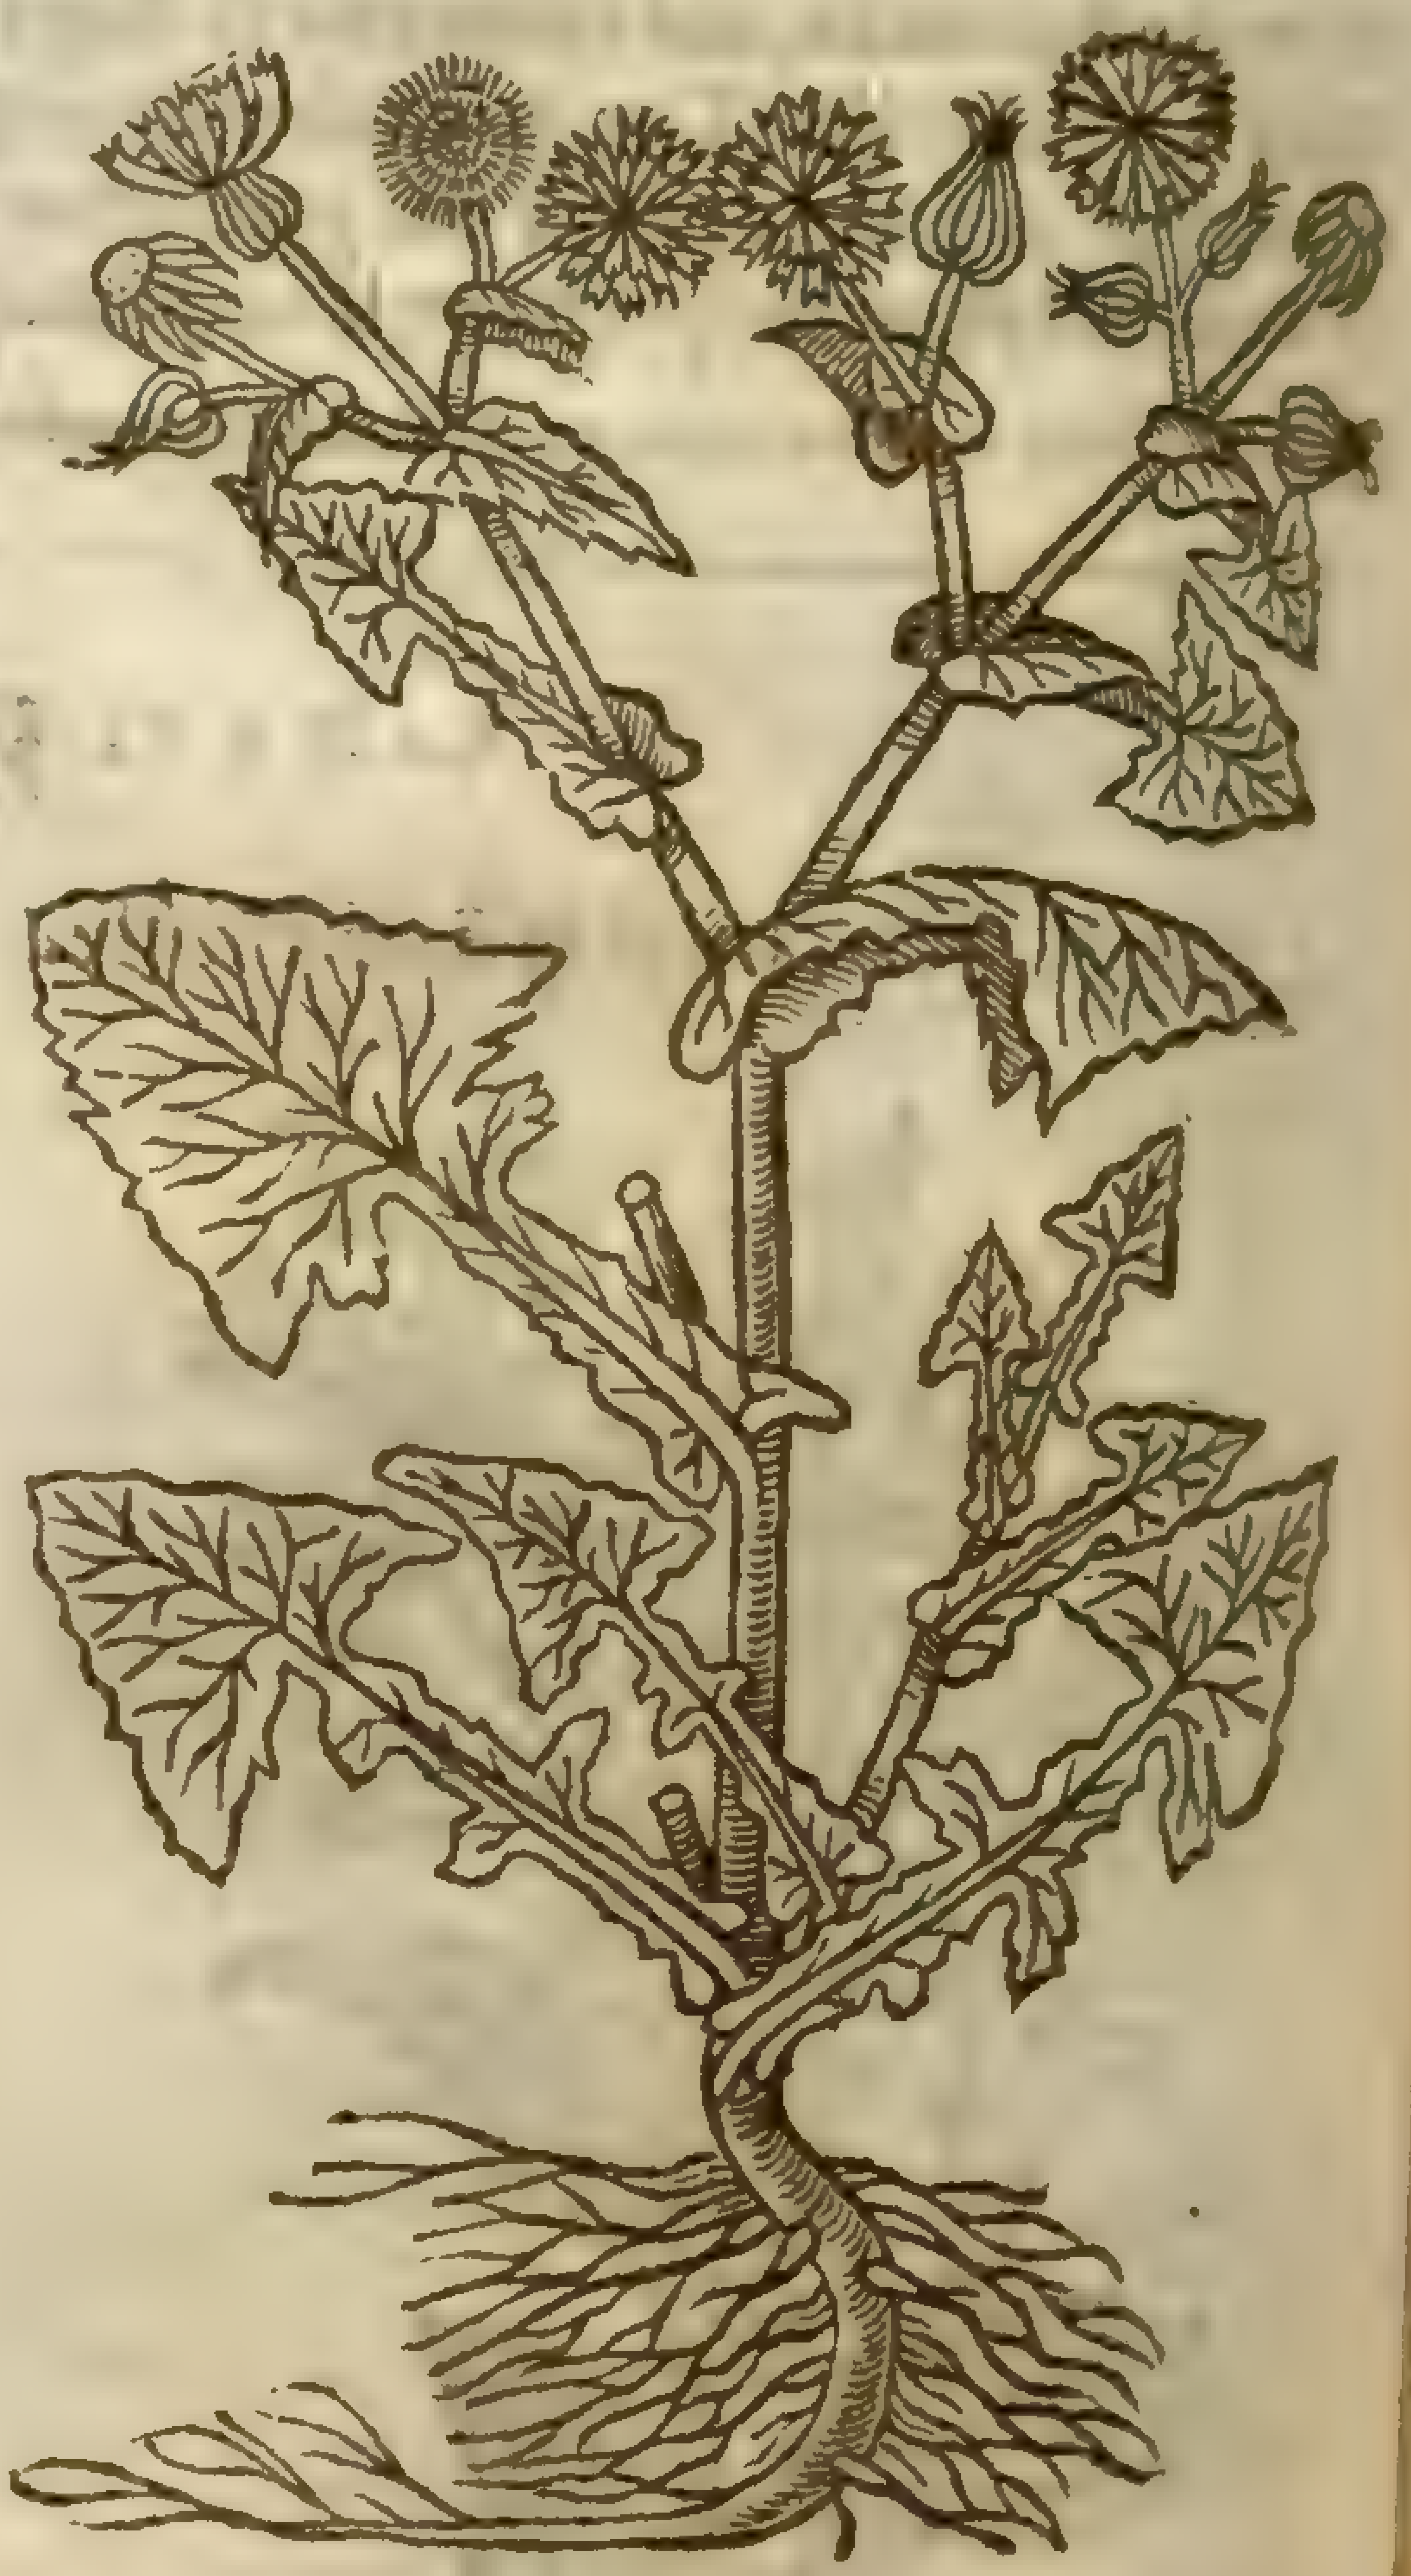
Ord. 643



4 *Sonchus Læuis latifolius.*
Broad leaued Sow-thiſtle.

S. oleraceus, v. β
mih. dict.



3 The ſtalke of Hares Lettuce, or ſmooth-Thiſtle is oftentimes a cubit high, edged and hollow, of a pale colour, and ſometimes reddiſh: the leaues be greene, broad, ſet round about with deepe cuts or gaſhes, ſmooth, and without prickles. The floures ſtand at the top of the branches, yellow of colour, which are carried away with the winde when the ſeed is ripe. ‡ This is ſometimes found with whitiſh, and with ſnow-white floures, but yet ſeldome: whence our Author made two kindes more, which were the fourth and fifth; calling the one, The white floured Sow-thiſtle; and the other, The ſnow-white Sow-thiſtle. But theſe I haue omitted as impertinent, and giue you others in their ſtead. ‡

4 Broad leaued Sow thiſtle hath a long thicke and milky root, as is all the reſt of the plant, with many ſtrings or fibres; from the which commeth forth a hollow ſtalke branched or diuided into ſundry Sections. The leaues be great, ſmooth, ſharp pointed, and green of colour: the floures

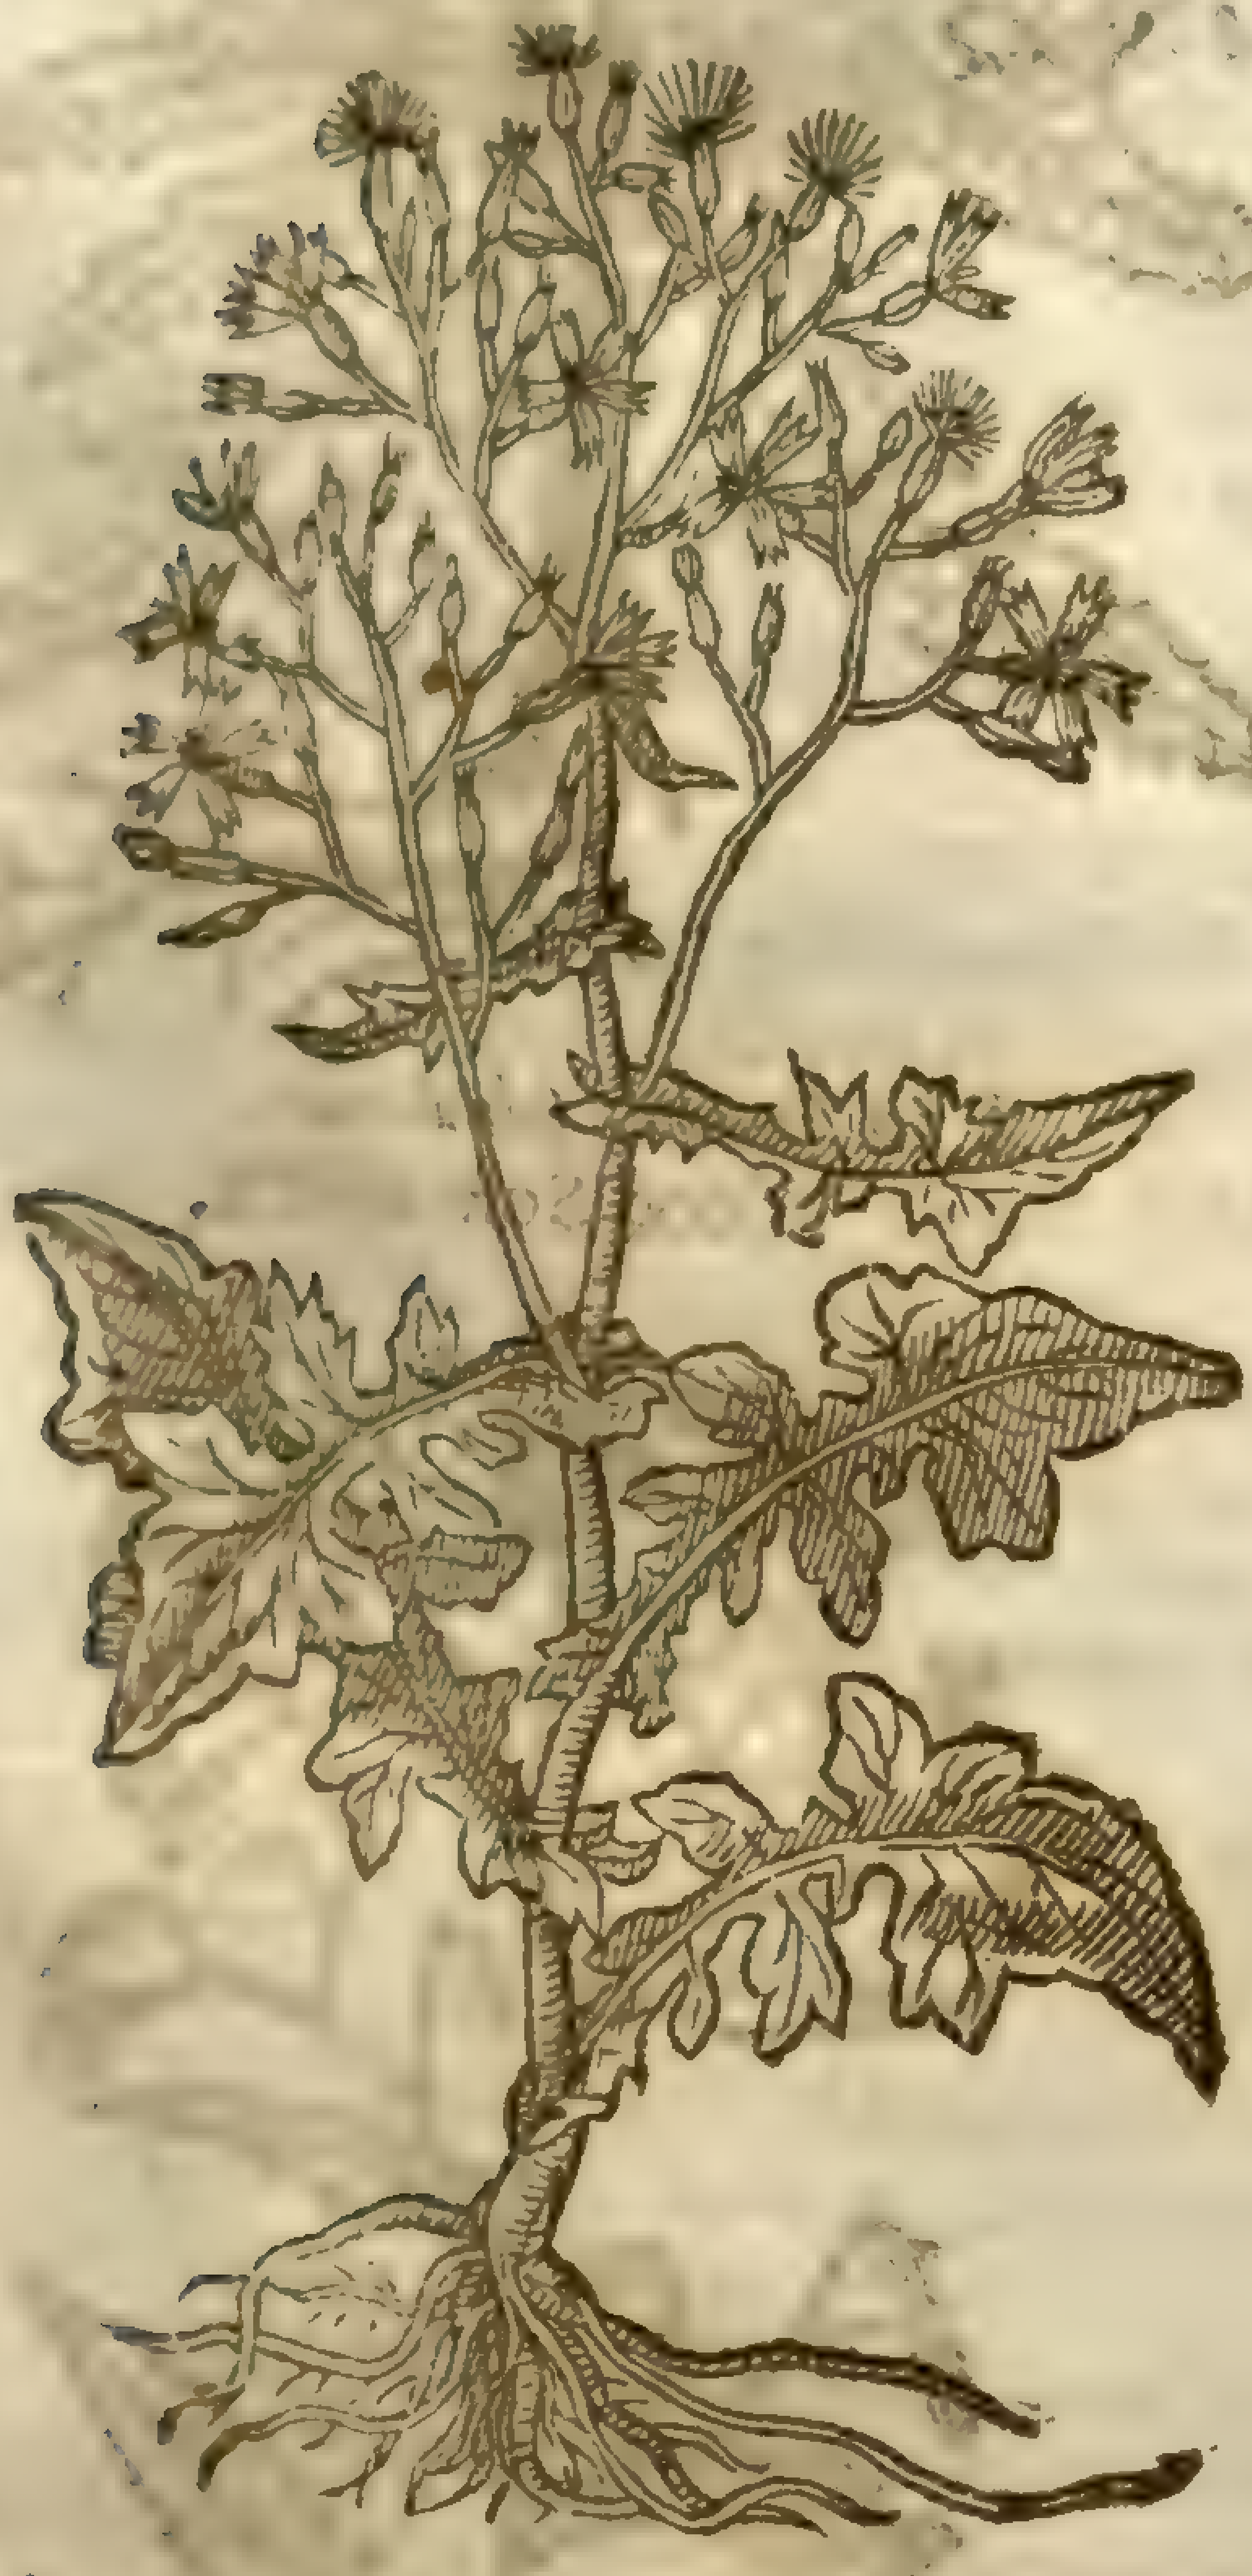
be white, in ſhape like the former. ‡ The floures of this are for the moſt part yellow like as the former. ‡

‡ 5 Wall Sow-thiſtle hath a fibrous wooddy root, from which riſes vp a round ſtalke not creſted: the leaues are much like to thoſe of the other Sow-thiſtles, broad at the ſetting on, then narrower, and after much broader, and ſharpe pointed, ſo that the end of the leafe much reſembles the ſhape of an yvie leafe; theſe leaues are very tender, and of ſomewhat a whitiſh colour on the vnder ſide; the top of the ſtalke is diuided into many ſmall branches, which beare little yellow floures that flie away in downe.

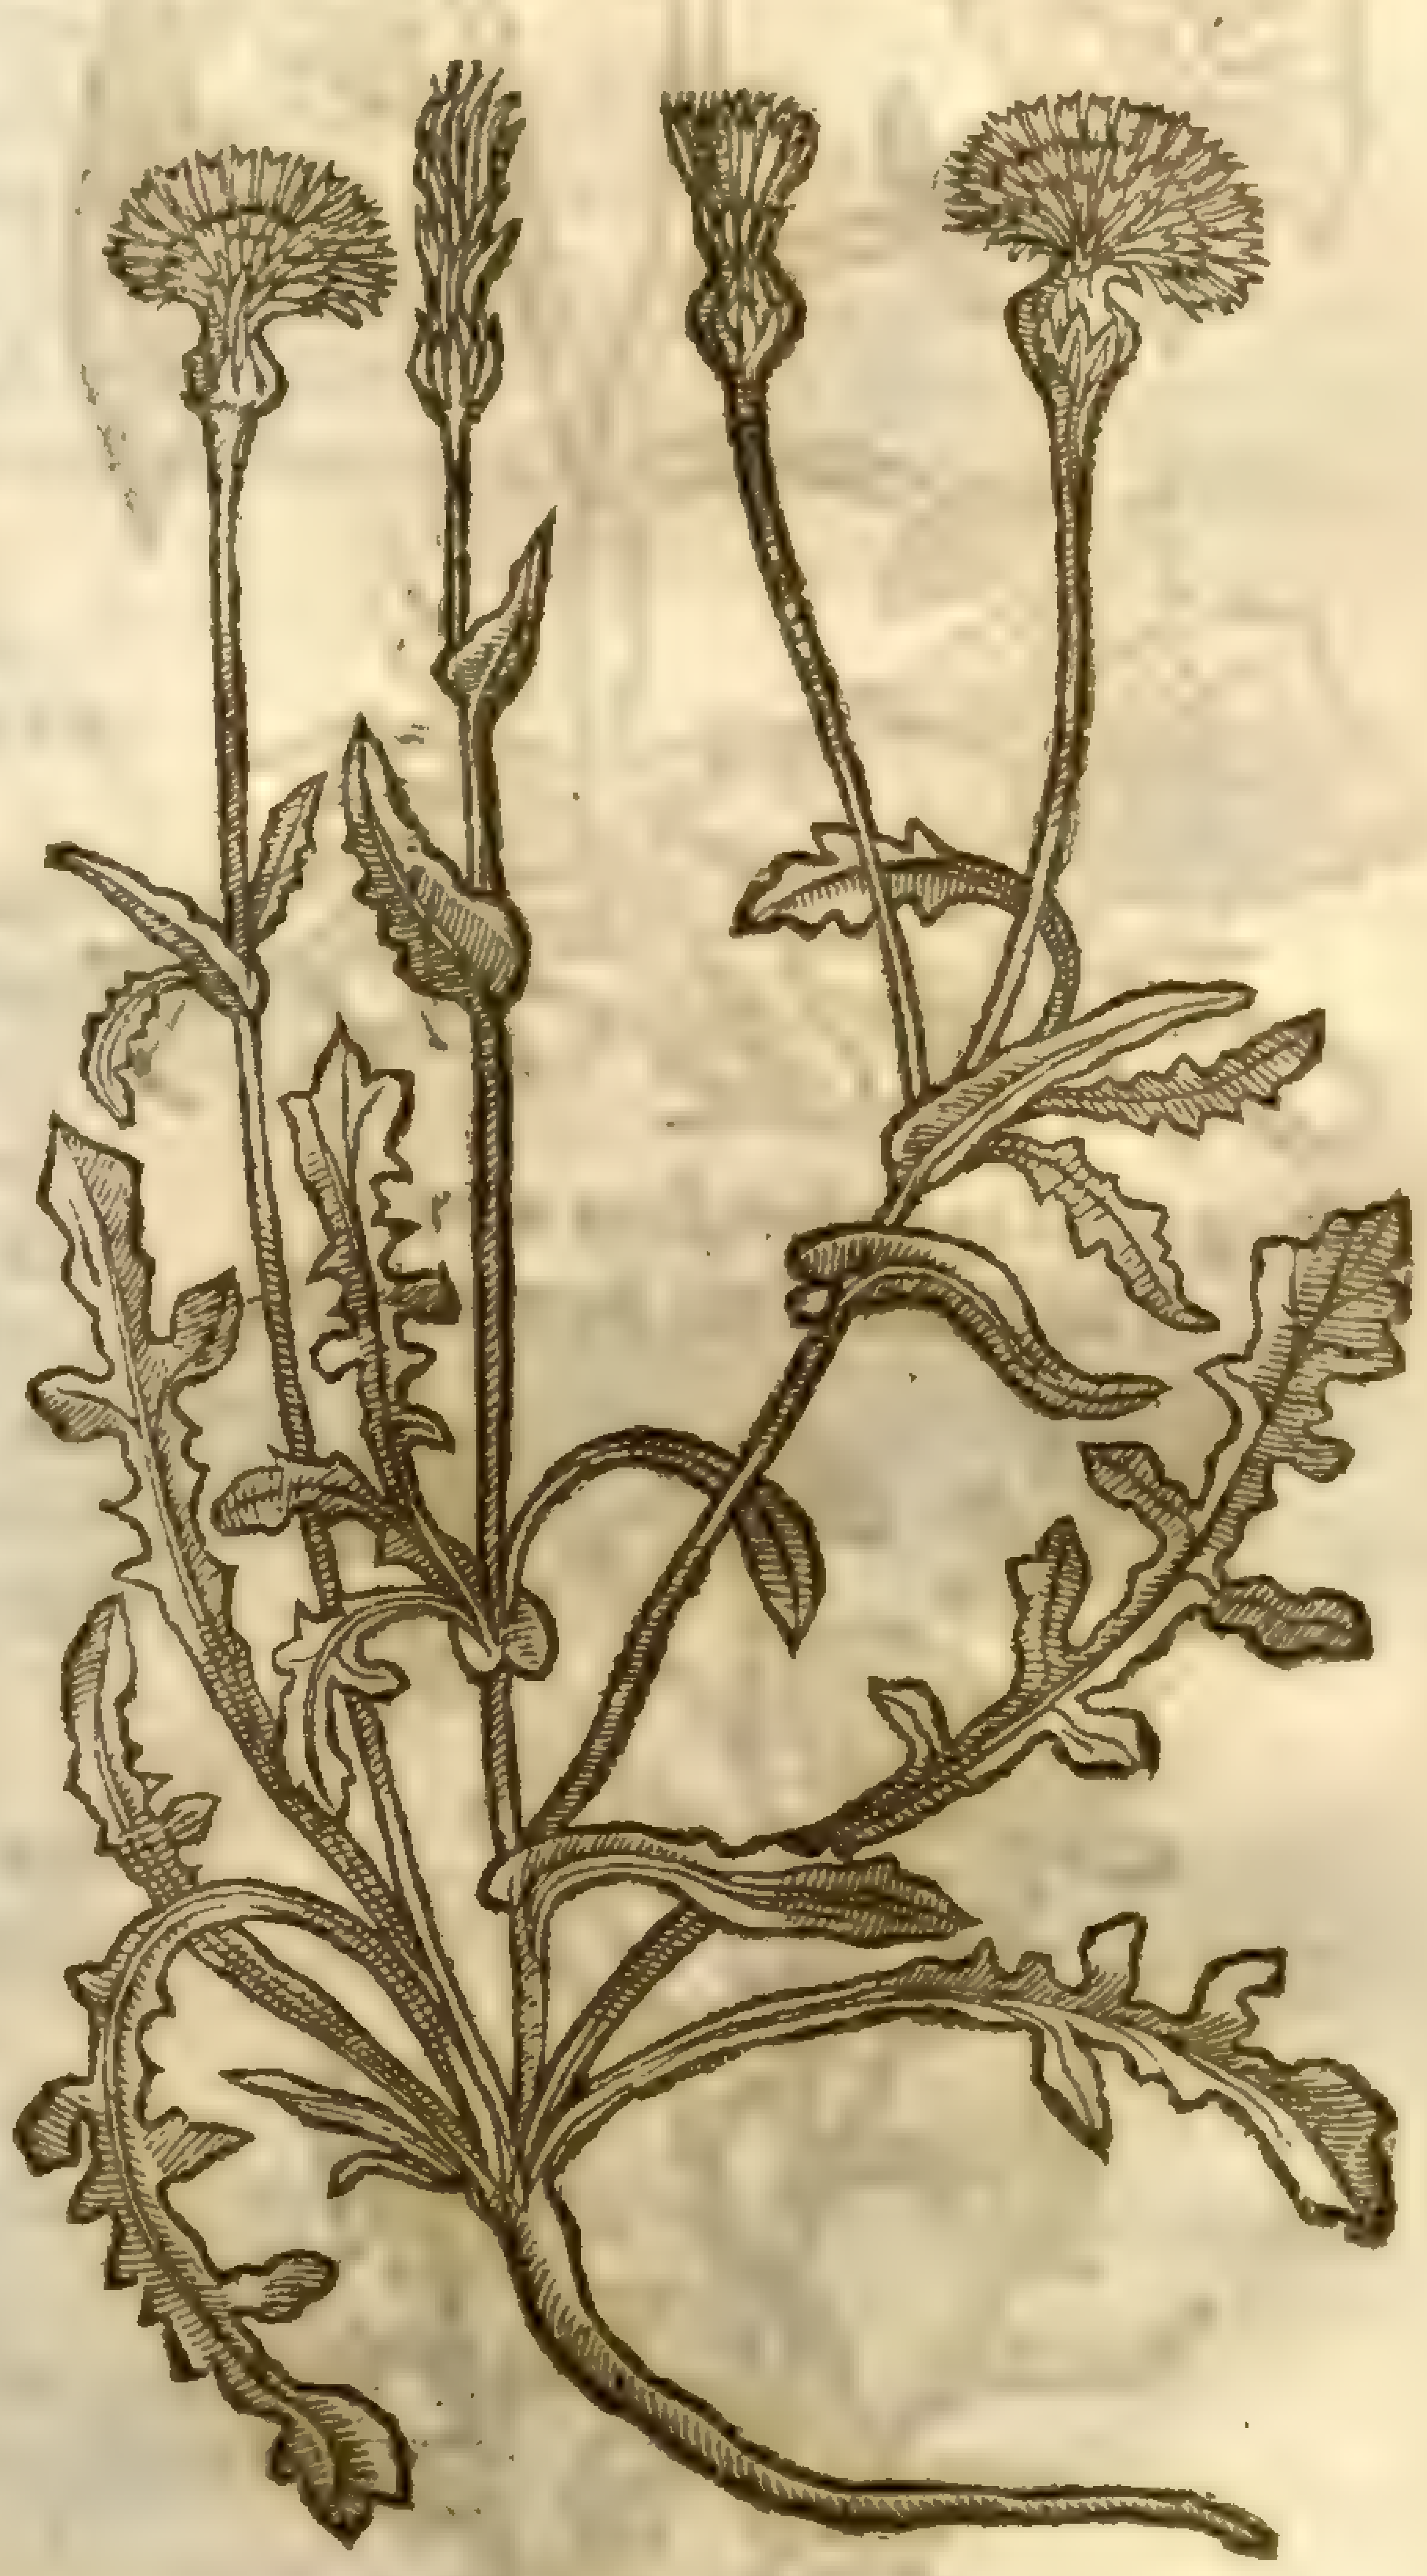
6 This hath longiſh narrow leaues ſoft and whitiſh, vnequally diuided about the edges. The ſtalkes grow ſome foot high, hauing few branches, and thoſe ſet with few leaues, broad at their ſetting on, and ending in a ſharpe point: the floures are pretty large like to the great Hawk-weed, and fly away in downe: the root is long, white, and laſting. It floures moſt part of Summer; and in Tuſcany, where it plentifully growes, it is much eaten in ſallets, with oile and vineger, hauing a ſweetiſh and ſomewhat aſtringent taſte. ‡

‡ 5 *Sonchus læuis muralis.*
Wall (or yvie-leaued) Sow thiſtle.

[illegible]



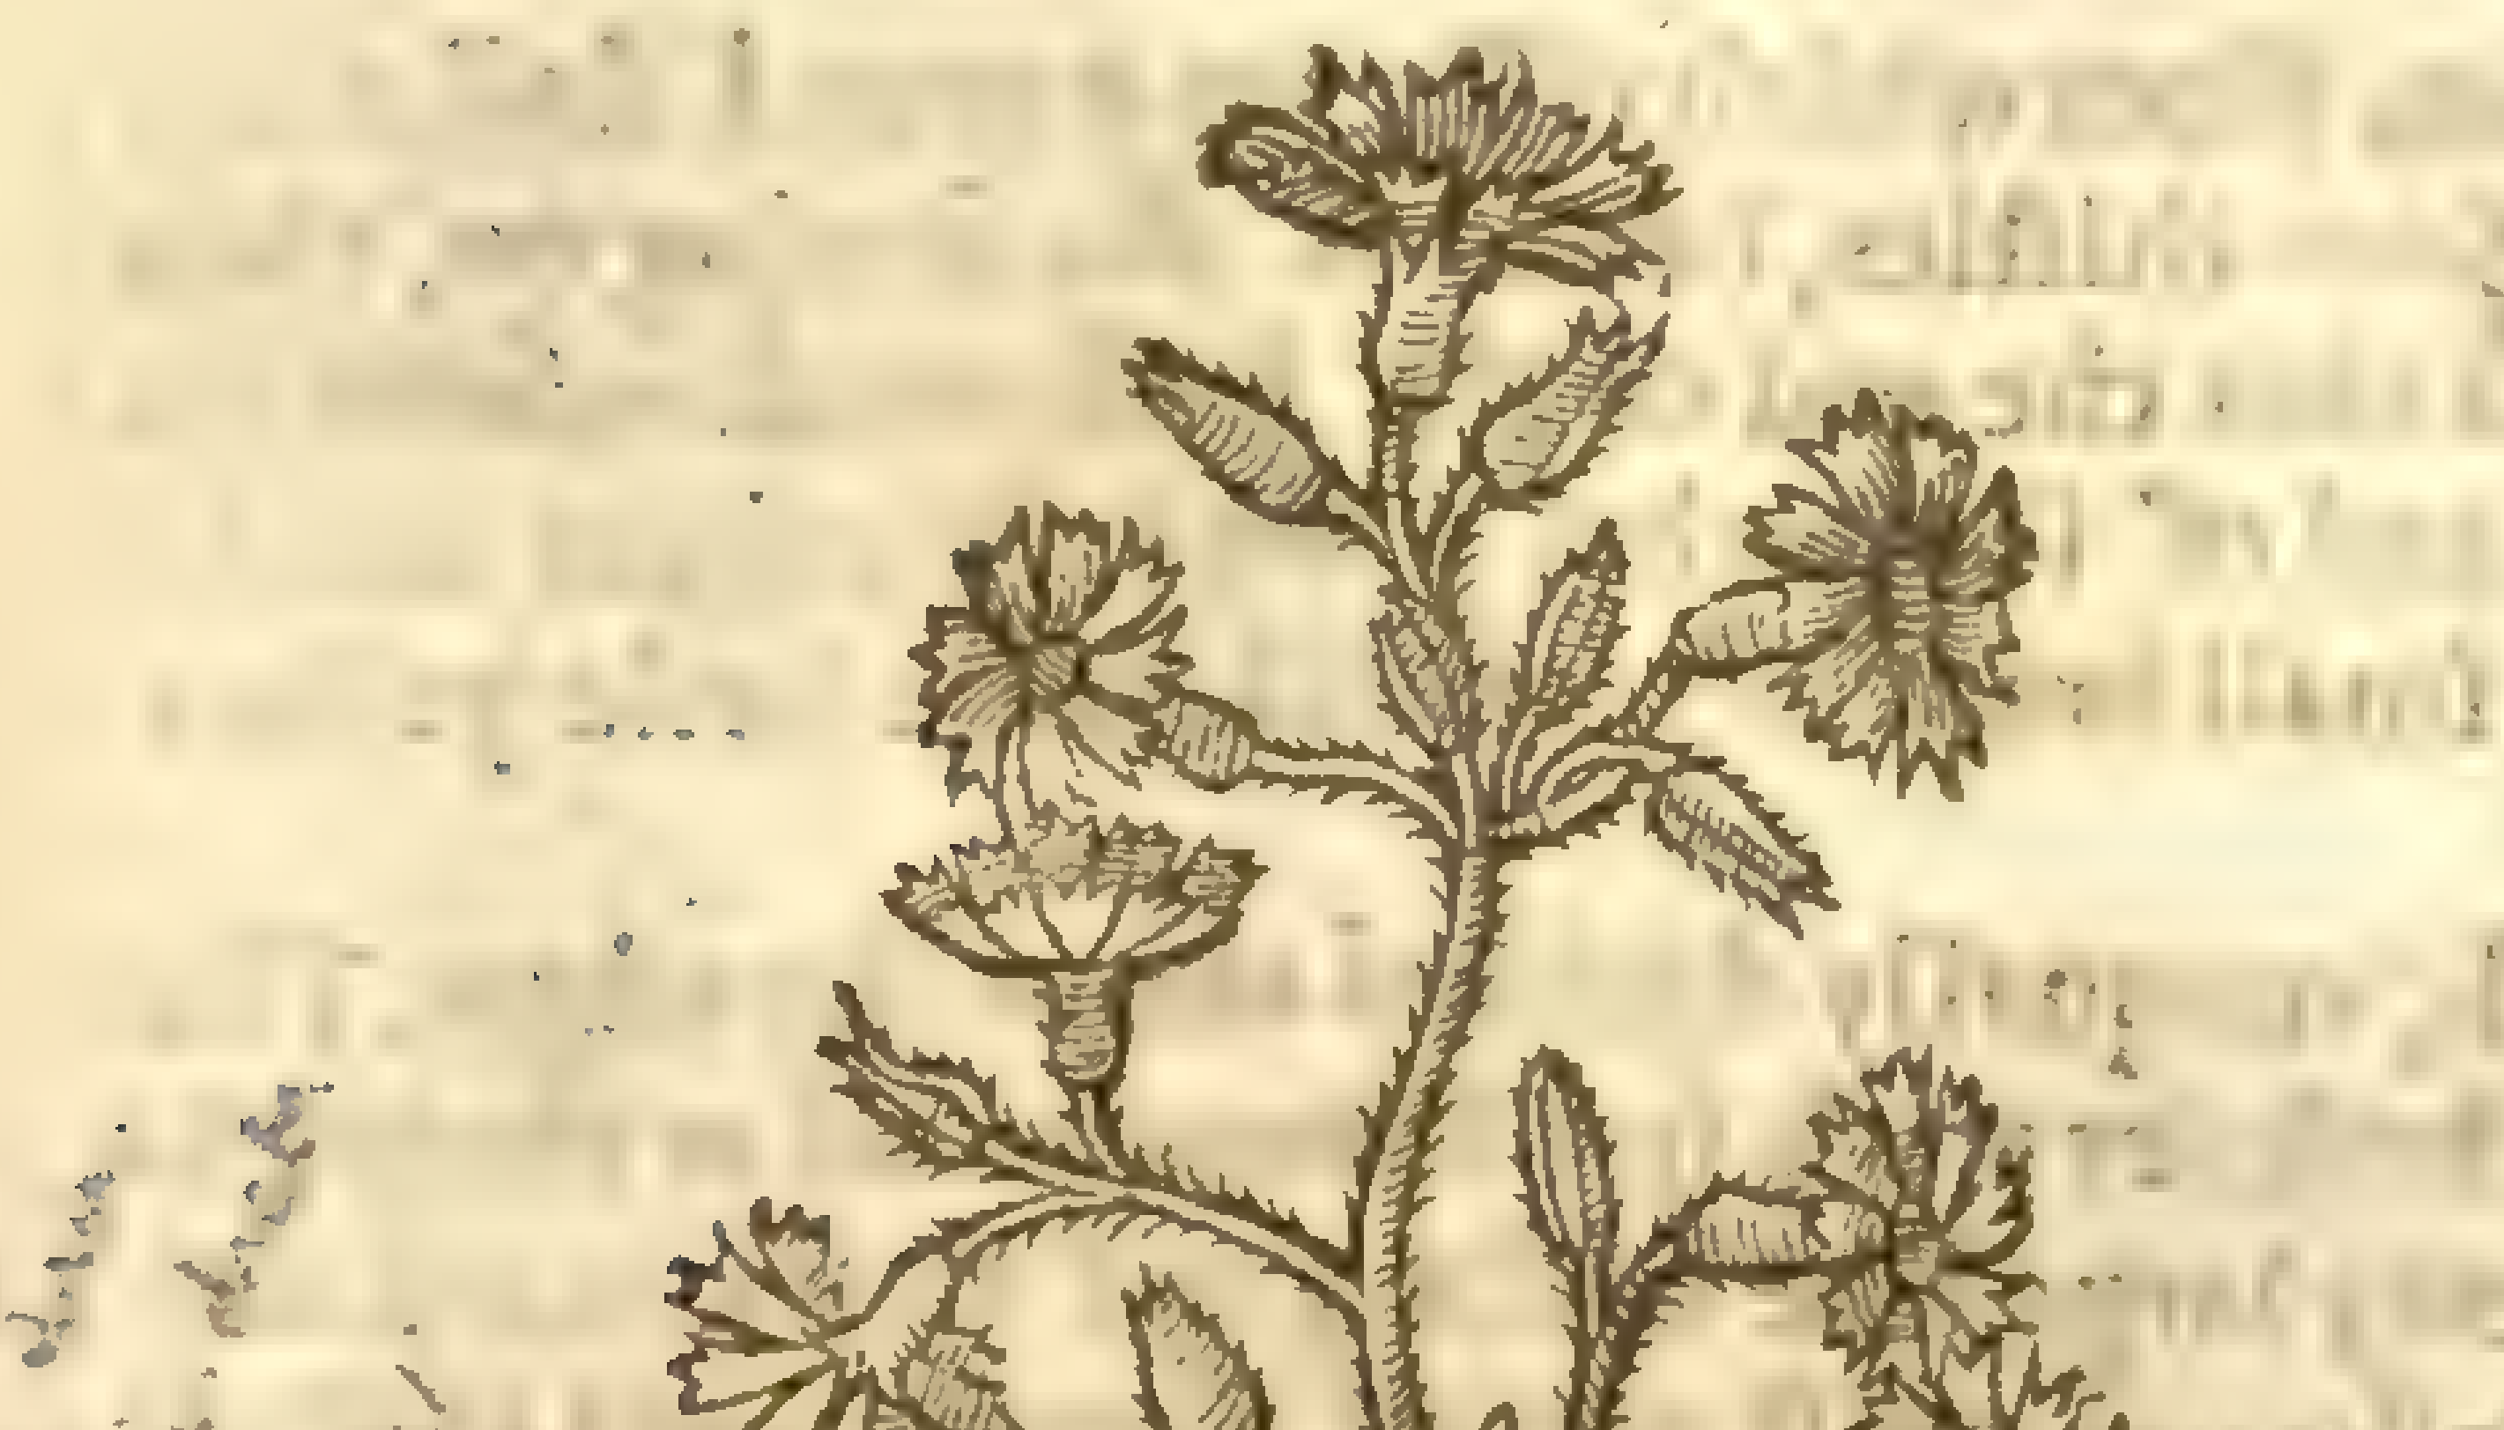
‡ 6 *Sonchus læuis anguſtifolius.*
Narrow leaued Sow-thiſtle.



† 7 This blew floured Sow-thiſtle is the greateſt of all the reſt of the kindes, ſomewhat reſembling the laſt deſcribed in leaues; but thoſe of this are ſomewhat rough and hairy on the vnder ſide: the floures are in ſhape like thoſe of the ordinary Sow-thiſtle, but of a faire blew colour, which fading, flie away in downe that carries with it a ſmall aſh-coloured ſeed. The whole plant yeeldeth milke as all the reſt doe. †

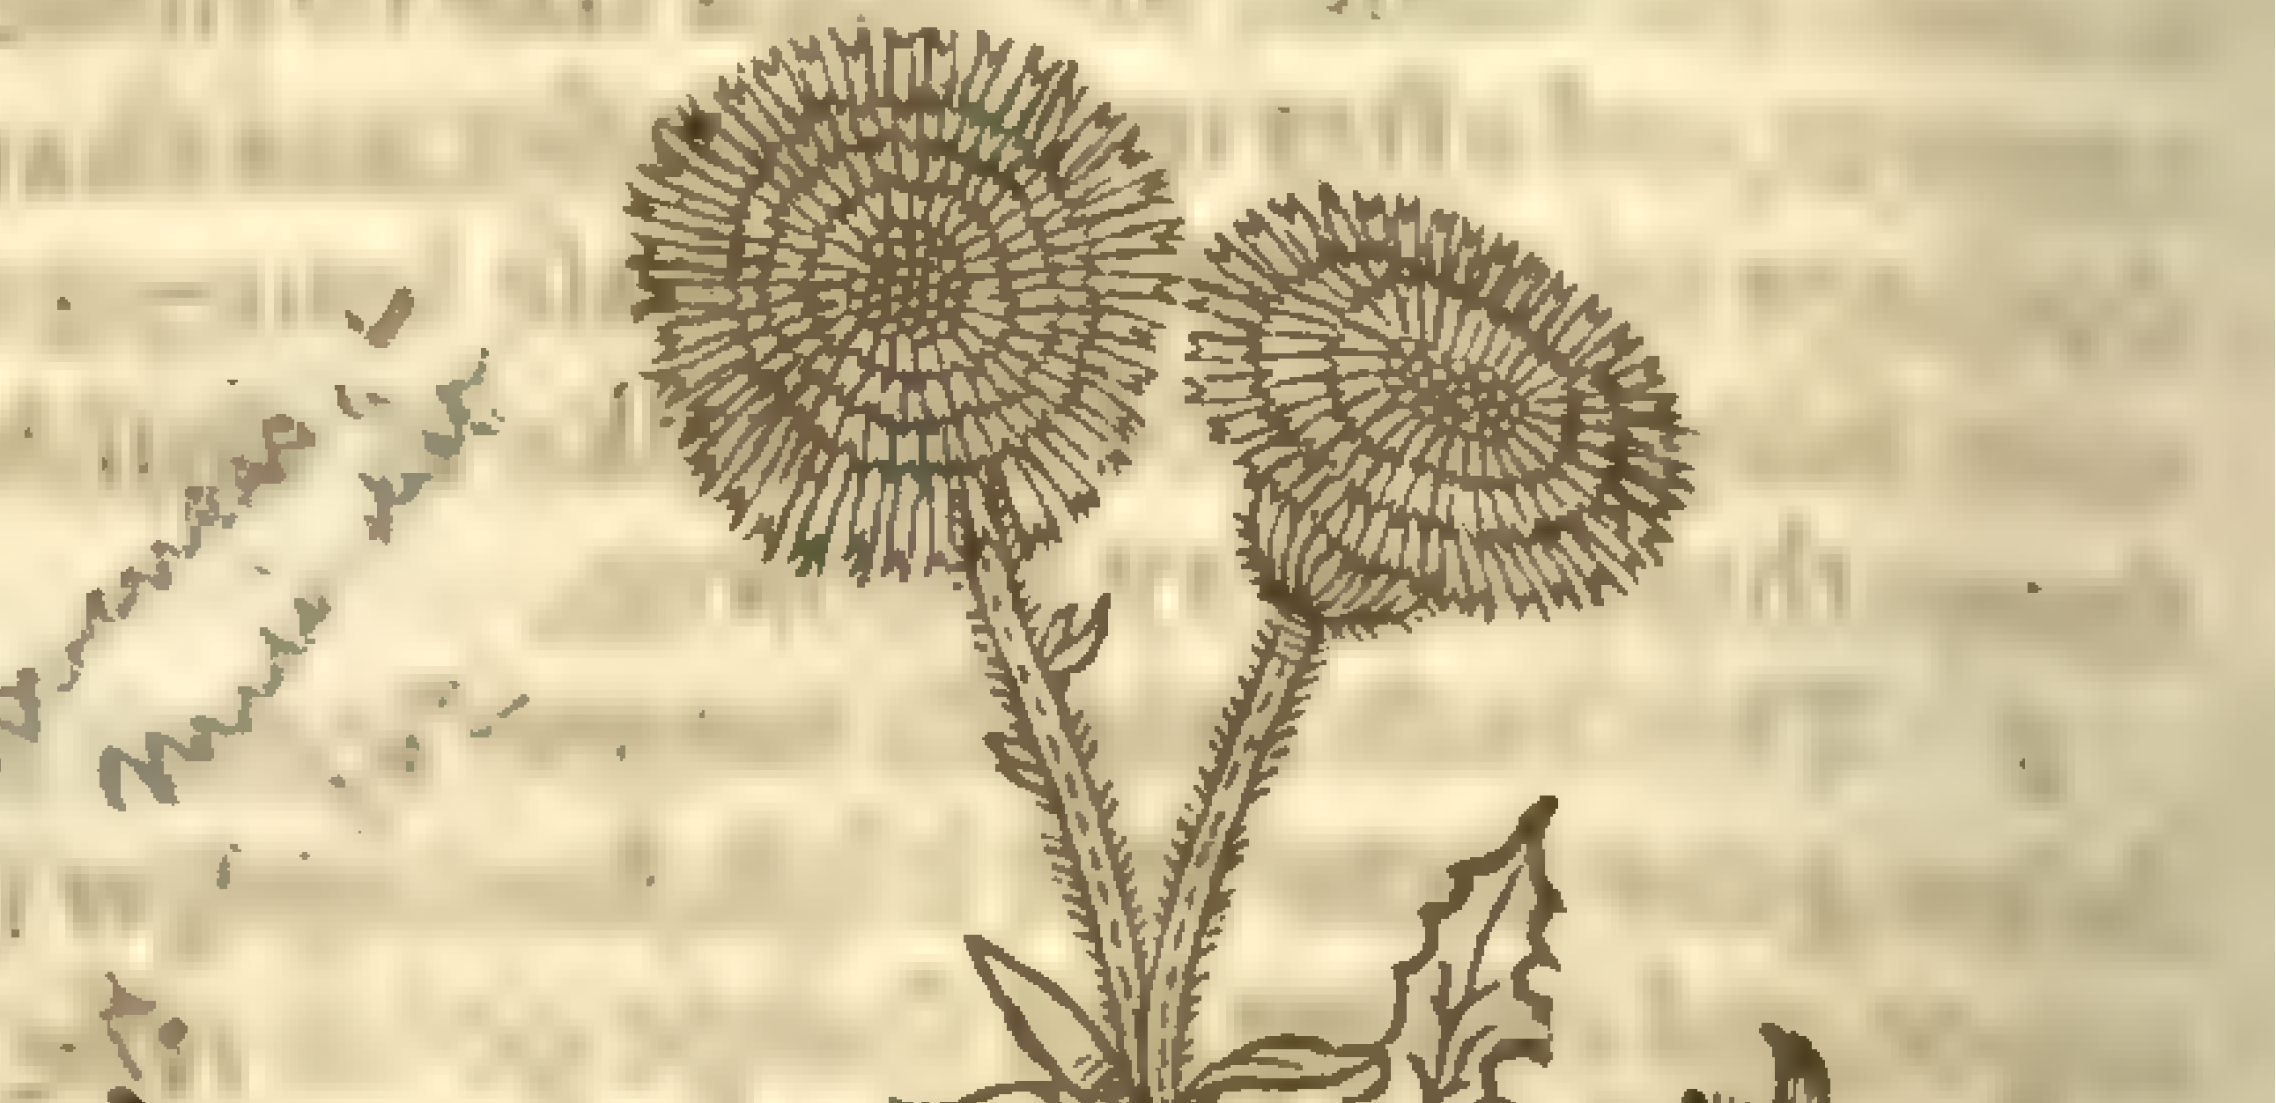
8 Tree Sow-thiſtle hath a very great thicke and hard root ſet with a few hairy threds; from which ariſeth a ſtrong and great ſtalke of a wooddy ſubſtance, ſet with long leaues not vnlike to Languedebeefe, but more deeply cut in about the edges, and not ſo rough: vpon which do grow faire double yellow floures, which turne into downe, and are carried away with the winde. The whole plant is poſſeſt with ſuch a milkie juice as are the tender and hearby Sow-thiſtles, which certainly ſheweth it to be a kinde thereof: otherwiſe it might be referred to the Hawke-weeds, whereunto in face and ſhew it is like. ‡ This hath a running root, and the heads and tops of the ſtalkes are very rough and hairy. ‡

7 *Sonchus flore cæruleo.*
Blew-floured Sow-thiſtle.



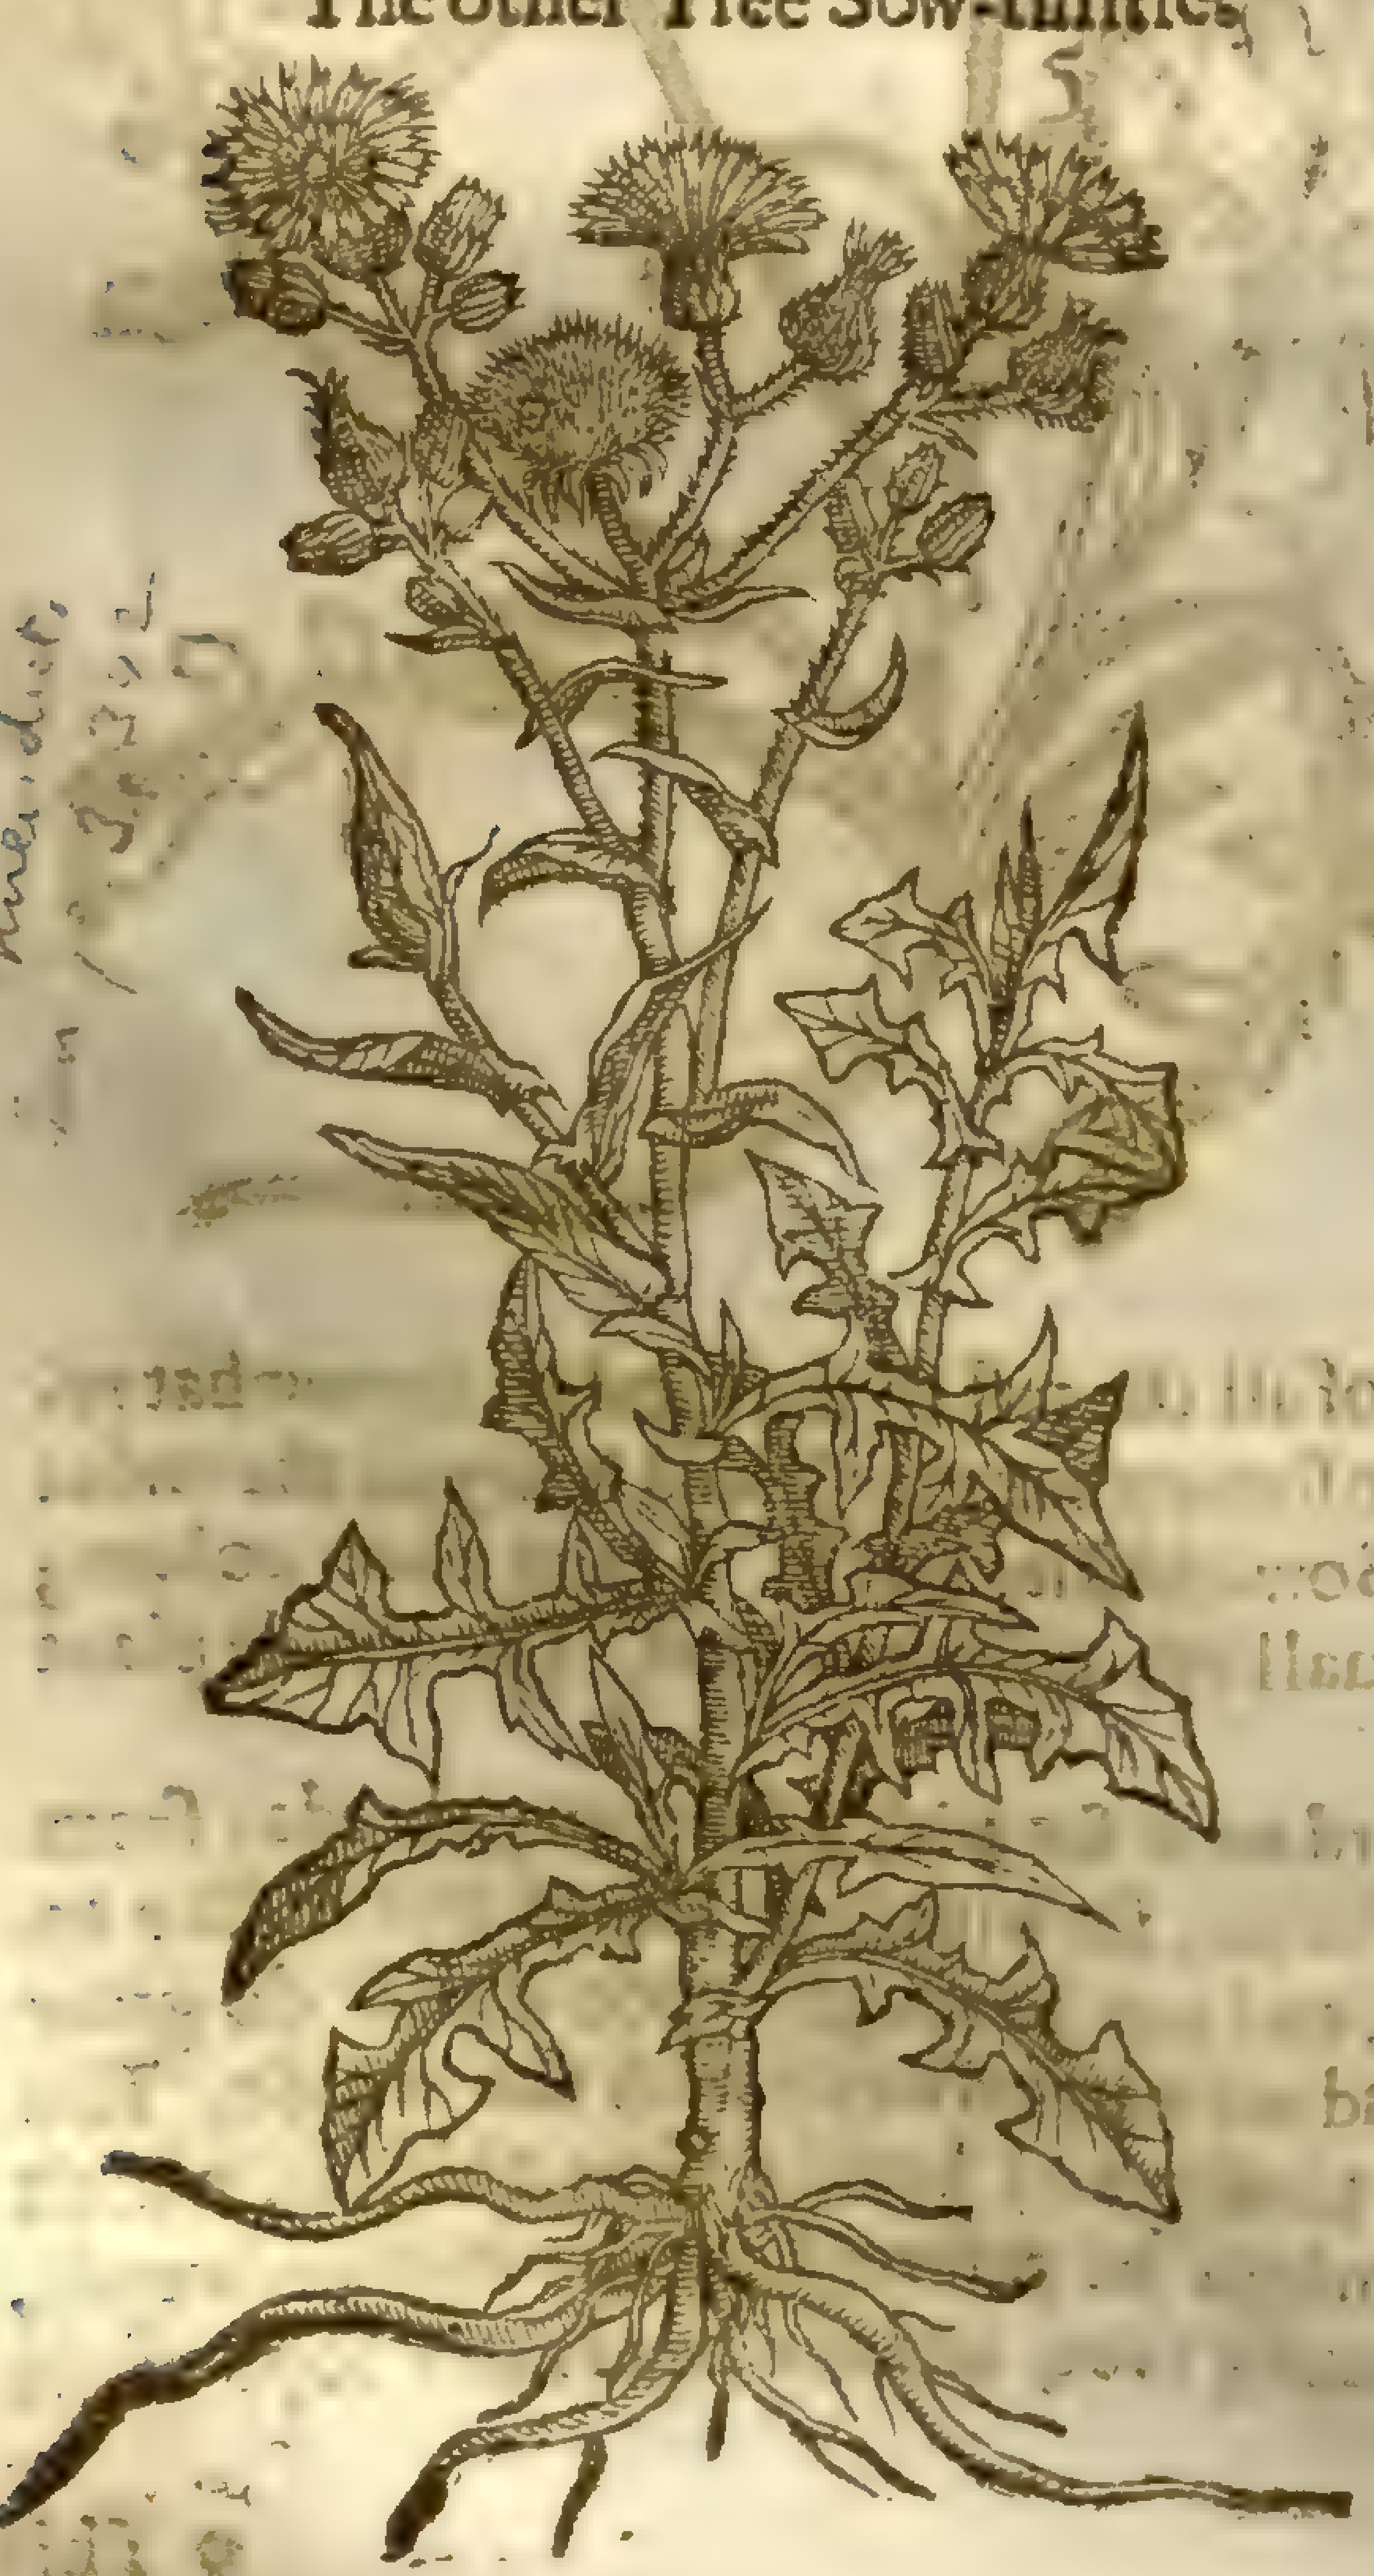
S. Coeruleus, Lin.
mill. dict.
in 8 . 3. 361

8 *Sonchus Arboreſcens.*
Tree Sow-thiſtle.



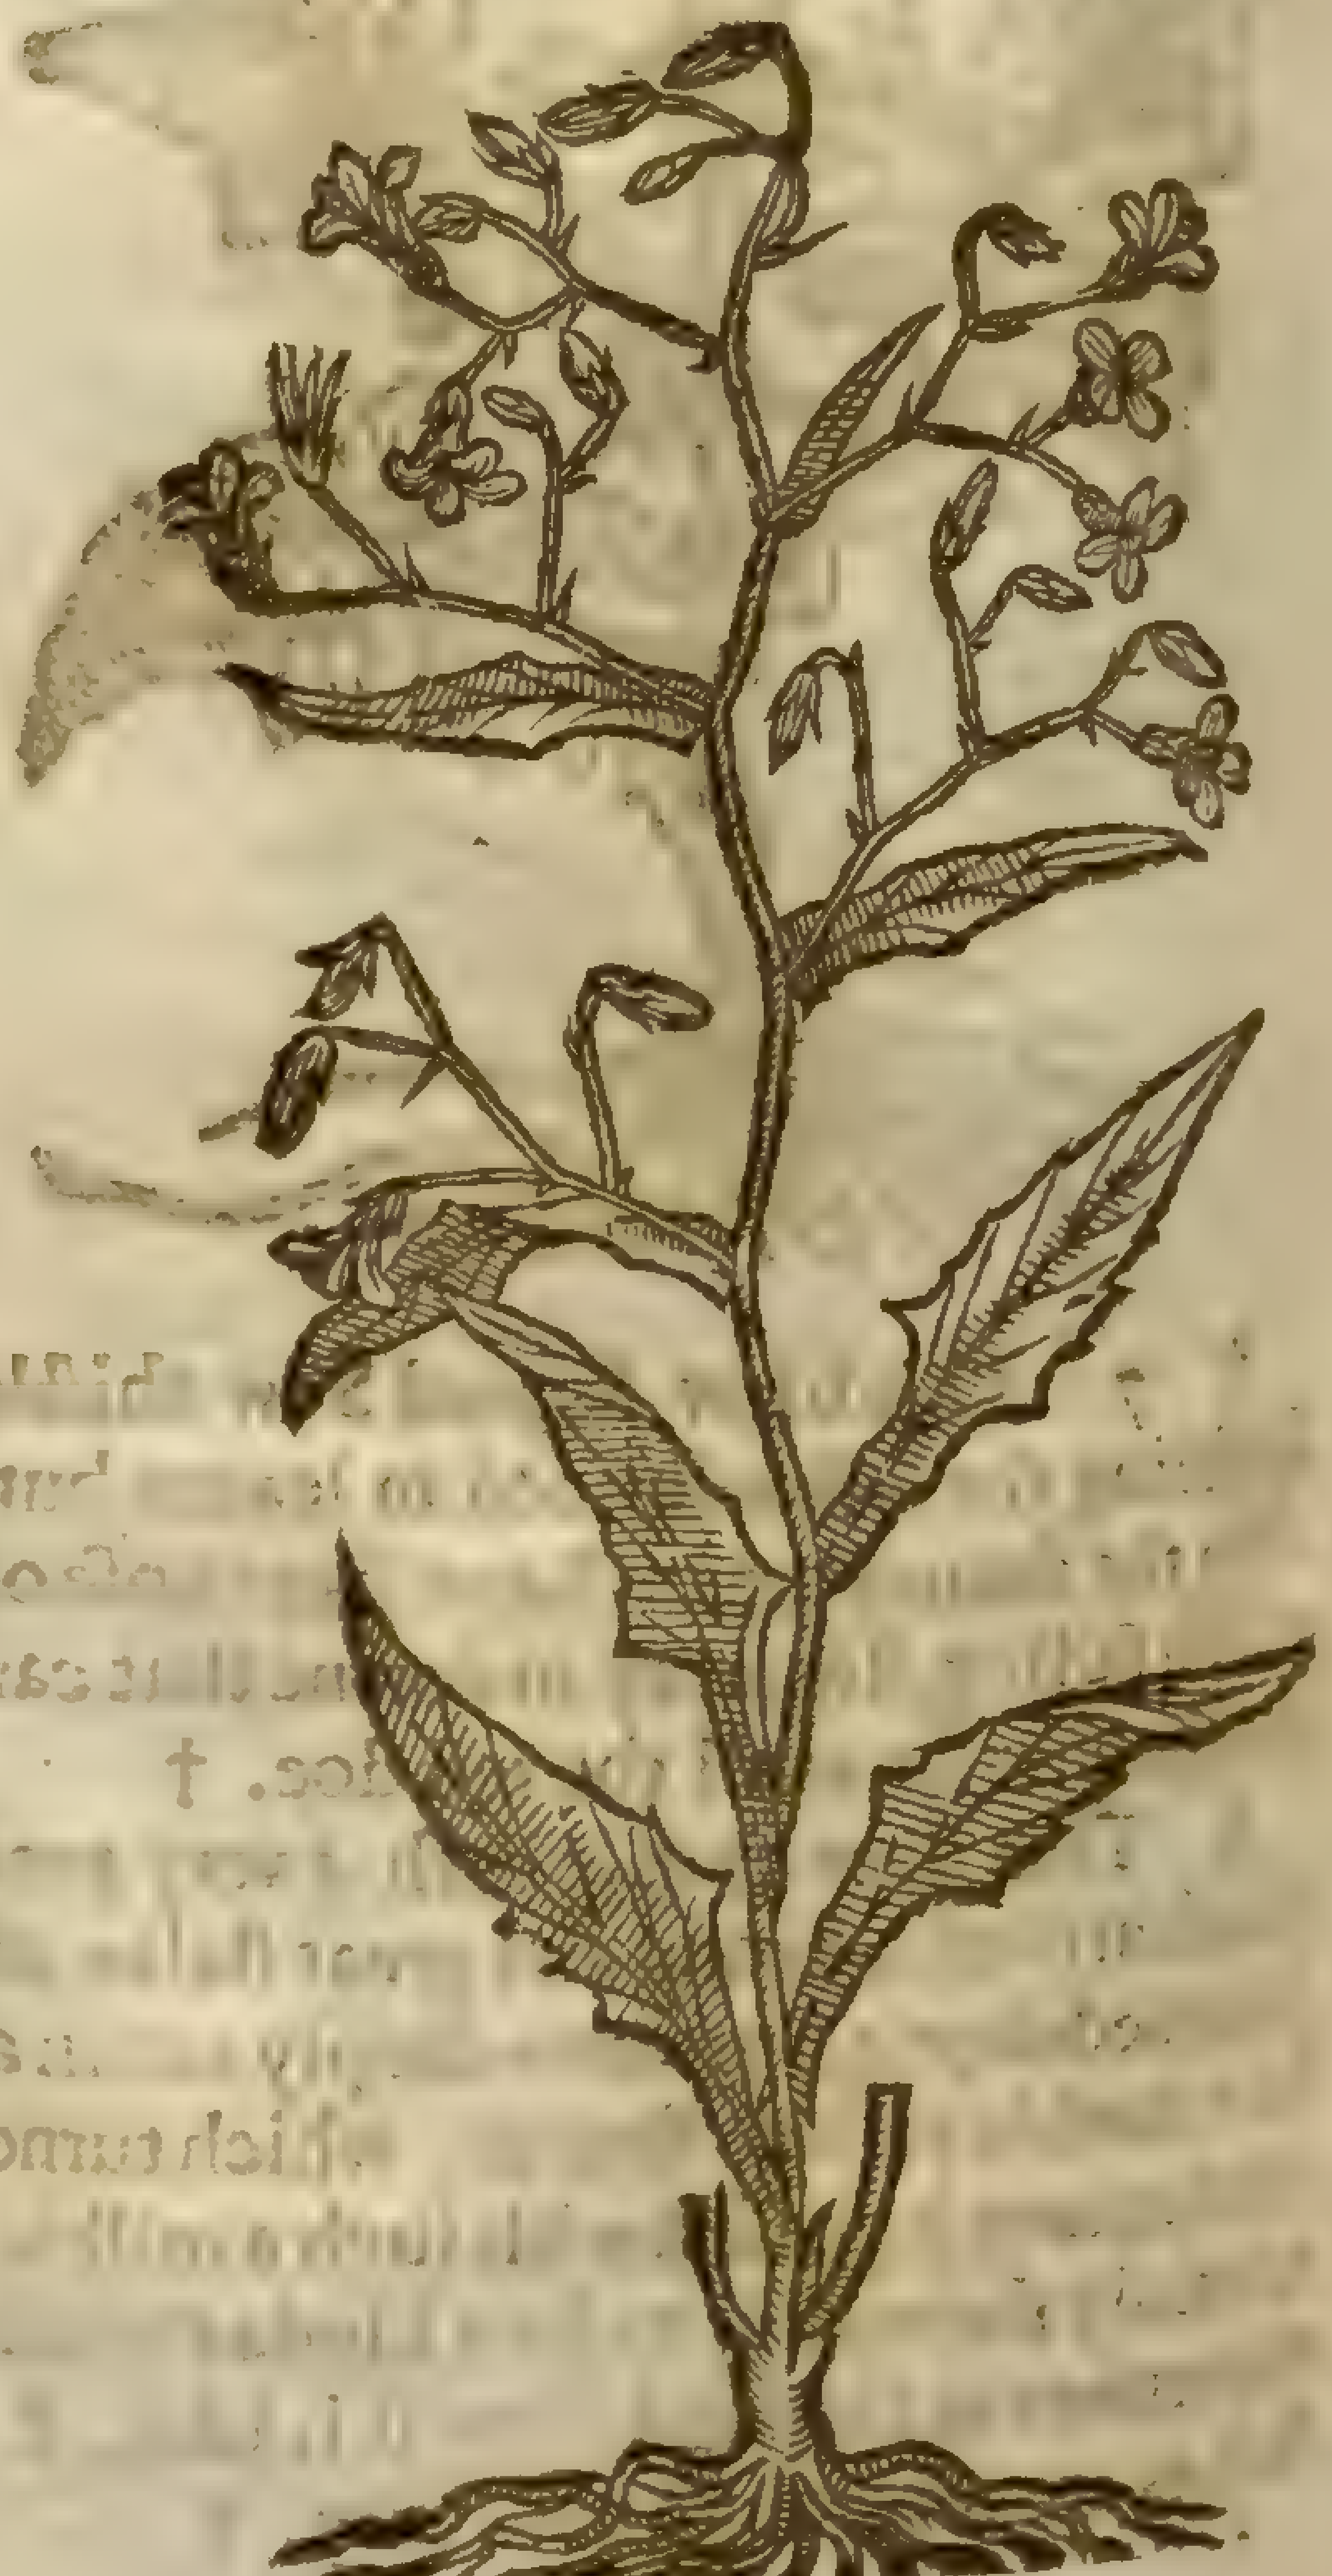
S. arvensis, L.
mill. dict.

‡ 9 *Sonchus arboreſcens alter.*
The other Tree Sow-thiſtle.



S. palustris, L.
mill. dict.
in 8 . 3. 372

† 10 *Sonchus ſyluaticus.*
Wood Sow-thiſtle.



Prenanthes purpurea, L.
mill. dict.

‡ 9 This other Tree Sow-thiſtle growes to a mans height or more, hauing a firme creſted ſtalke, ſmooth, without any prickles, and ſet with many leaues incompaſſing the ſtalke at their ſetting on, and afterwards cut in with foure, or ſometimes with two gaſhes onely: the vpper leaues are not diuided at all: the colour of theſe leaues is green on the vpper ſide, and grayiſh vnderneath: the top of the ſtalke is hairy, and diuided into many branches, which beare the floures in an equall height, as it were in an vmbel: the floures are not great, conſidering the largeneſſe of the plant, but vſually as big as thoſe of the common Sow-thiſtle, and yellow, hauing a hairy head or cap: the ſeed is creſted, longiſh, and aſhe coloured, and flies away with the downe: the root is thicke, whitiſh, hauing many fibres, putting out new ſhoots, and ſpreading euery yeare. *Bauhine* maketh this all one with the other, according to *Cluſius* his deſcription: but in my opinion there is ſome difference betweene them, which chiefely conſiſts, in that the former hath larger and fewer floures; the plant alſo not growing to ſo great a height. ‡

‡ 10 This plant (whoſe figure our Authour formerly gaue, *pag.* 148. vnder the title of *Eryſimum ſylueſtre*) hath long knotty creeping roots, from whence ariſeth a round ſlender ſtalk ſome two foot high, ſet at firſt with little leaues, which grow bigger and bigger as they come neerer the middle of the ſtalke, being pretty broad at their ſetting on, then ſomewhat narrower, and ſo broader againe, and ſharp pointed, being of the colour of the Wall (or Ivie leaued) Sow-thiſtle. The tops is diuided into many ſmall branches, which end in ſmall ſcaly heads like thoſe of the wilde Lettuce, containing floures conſiſting of foure blewiſh purple leaues, turned backe and ſnipped at their ends; there are alſo ſome threds in the middle of the floure, which turning into downe, carry away with them the ſeed, which is ſmall, and of an Aſh colour. *Bauhine* makes a bigger and a leſſer of theſe, diſtinguiſhing betweene that of *Cluſius* (whoſe figure I here giue you) and that of *Columna*; yet *Fabius Columna* himſelfe could finde no difference, but that *Cluſius* his plant had fiue leaues in the floure, and his but foure: which indeed *Cluſius* in his deſcription affirmes; yet his figure (as you may ſee) expreſſes but foure: adding, That the root is not well expreſſed; which notwithſtanding *Cluſius* deſcribes according to *Columna's* expreſſion. ‡

¶ *The Place.*

The firſt foure grow wilde in paſtures, medowes, woods, and mariſhes neere the ſea, and among pot-herbes.

The fifth growes vpon walls, and in wooddy mountainous places.

The Tree Sow-thiſtle growes amongſt corne in watery places.

The ſixth, ſeuenth and tenth are ſtrangers in England.

¶ *The Time.*

They floure in Iune, Iuly, Auguſt, and ſomewhat later.

¶ *The Names.*

Sow-thiſtle is called in Greeke, σόγχος: in Latine, *Sonchus*: of diuers, *Cicerbita*, *lactucella*, and *Lacterones*: *Apuleius* calleth it *Lactuca Leporina*, or Hares-thiſtle: of ſome, *Braſſica Leporina*, or Hares Colewort. The Engliſh names are ſufficiently touched in their ſeuerall titles: In Dutch it is called **Haſen Latouwe**: the French, *Palays de lieure.*

‡ ¶ *Names in particular.*

1 This is *Sonchus aſper major* of *Cordus*: *Sonchus tenerior aculeis aſperior* of *Lobel*: *Sonchus* 3. *aſperior* of *Dodonæus.*

2 This is *Sonchus aſper* of *Matthiolus*, *Fuchſius*, and others.

3 This, *Matthiolus*, *Dodonæus*, *Lobel*, and others call *Sonchus læuis*: *Tragus* calls it *Intybus erratica tertia.*

4 This *Tabernamontanus* only giues, vnder the title as you haue it here.

5 *Matthiolus* ſtiles this, *Sonchus læuis alter*: *Cæſalpinus* calls it *Lactuca murorum*: and *Tabern.* *Sonchus ſyluaticus quartus*: *Lobel*, *Sonchus alter folio ſinuato hederaceo.*

6 *Lobel* calls this, *Sonchus læuis Matthioli*: it is *Terracrepulus* of *Cæſalpinus*: and *Crepis* of *Daleſchampius.*

7 *Cluſius* and *Camerarius* giue vs this vnder the title of *Sonchus cæruleus.*

8 Onely *Tabern.* hath this figure, vnder the title our Author giues it: *Bauhine* puts it amongſt the *Hieracia*, calling it *Hieracium arboreſcens paluſtre.*

9 This *Bauhine* alſo makes an *Hieracium*, and would perſuade vs that *Cluſius* his deſcription belongs to the laſt mentioned, and the figure to this: to which opinion I cannot conſent. *Cluſius* giueth it vnder the name of *Sonchus* 3. *læuis altiſſimus.*

10 This *Cluſius* giues vnder the name of *Sonchius læuior Pannonicus* 4. *flore purp.* *Tabern.* calls it *Libanotis Theophraſti ſterilis*: *Columna* hath it by the name of *Sonchus montanus purpureus* πορφυρανθής: *Cordus*, *Geſner*, *Thalius*, and *Bauhine* refer it to the *Lactucæ ſylueſtres*: the laſt of them terming it *Lactuca montana purpuro cærulea.* ‡

¶ *The Temperature.*

The Sow-thiſtles, as *Galen* writeth, are of a mixt temperature; for they conſiſt of a watery and earthie ſubſtance, cold, and likewiſe binding.

¶ *The Vertues.*

A Whileſt they are yet young and tender they are eaten as other pot-herbes are: but whether they be eaten, or outwardly applied in manner of a pulteſſe, they do euidently coole: therefore they are good for all inflammations or hot ſwellings, if they be laied thereon.

B Sow-thiſtle giuen in broth taketh away the gnawings of the ſtomacke proceeding of an hot cauſe: and increaſe milke in the breſts of Nurſes, cauſing the children whom they nurſe to haue a good colour: and of the ſame vertue is the broth if it be drunken.

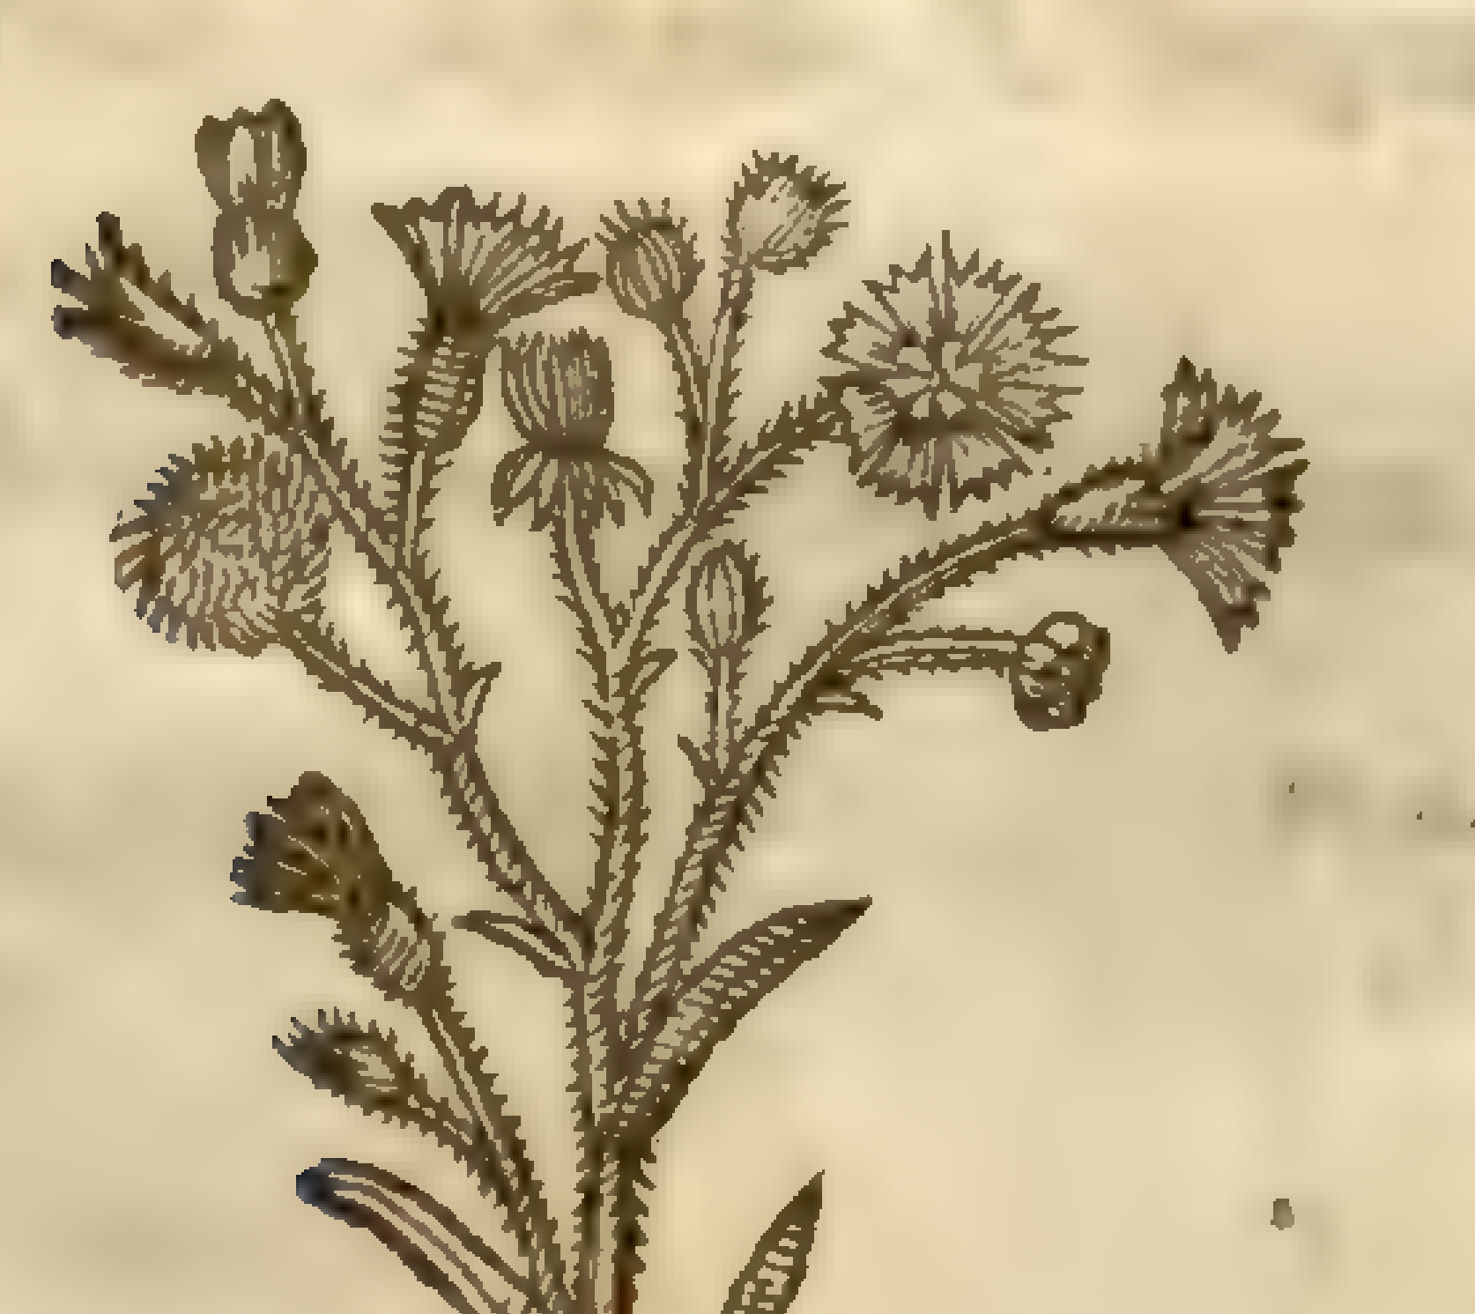
C The juyce of theſe herbes doth coole and temper the heat of the fundament aud priuy parts.

Chap. 34: *Of Hawke-weed.*

¶ *The Kindes.*

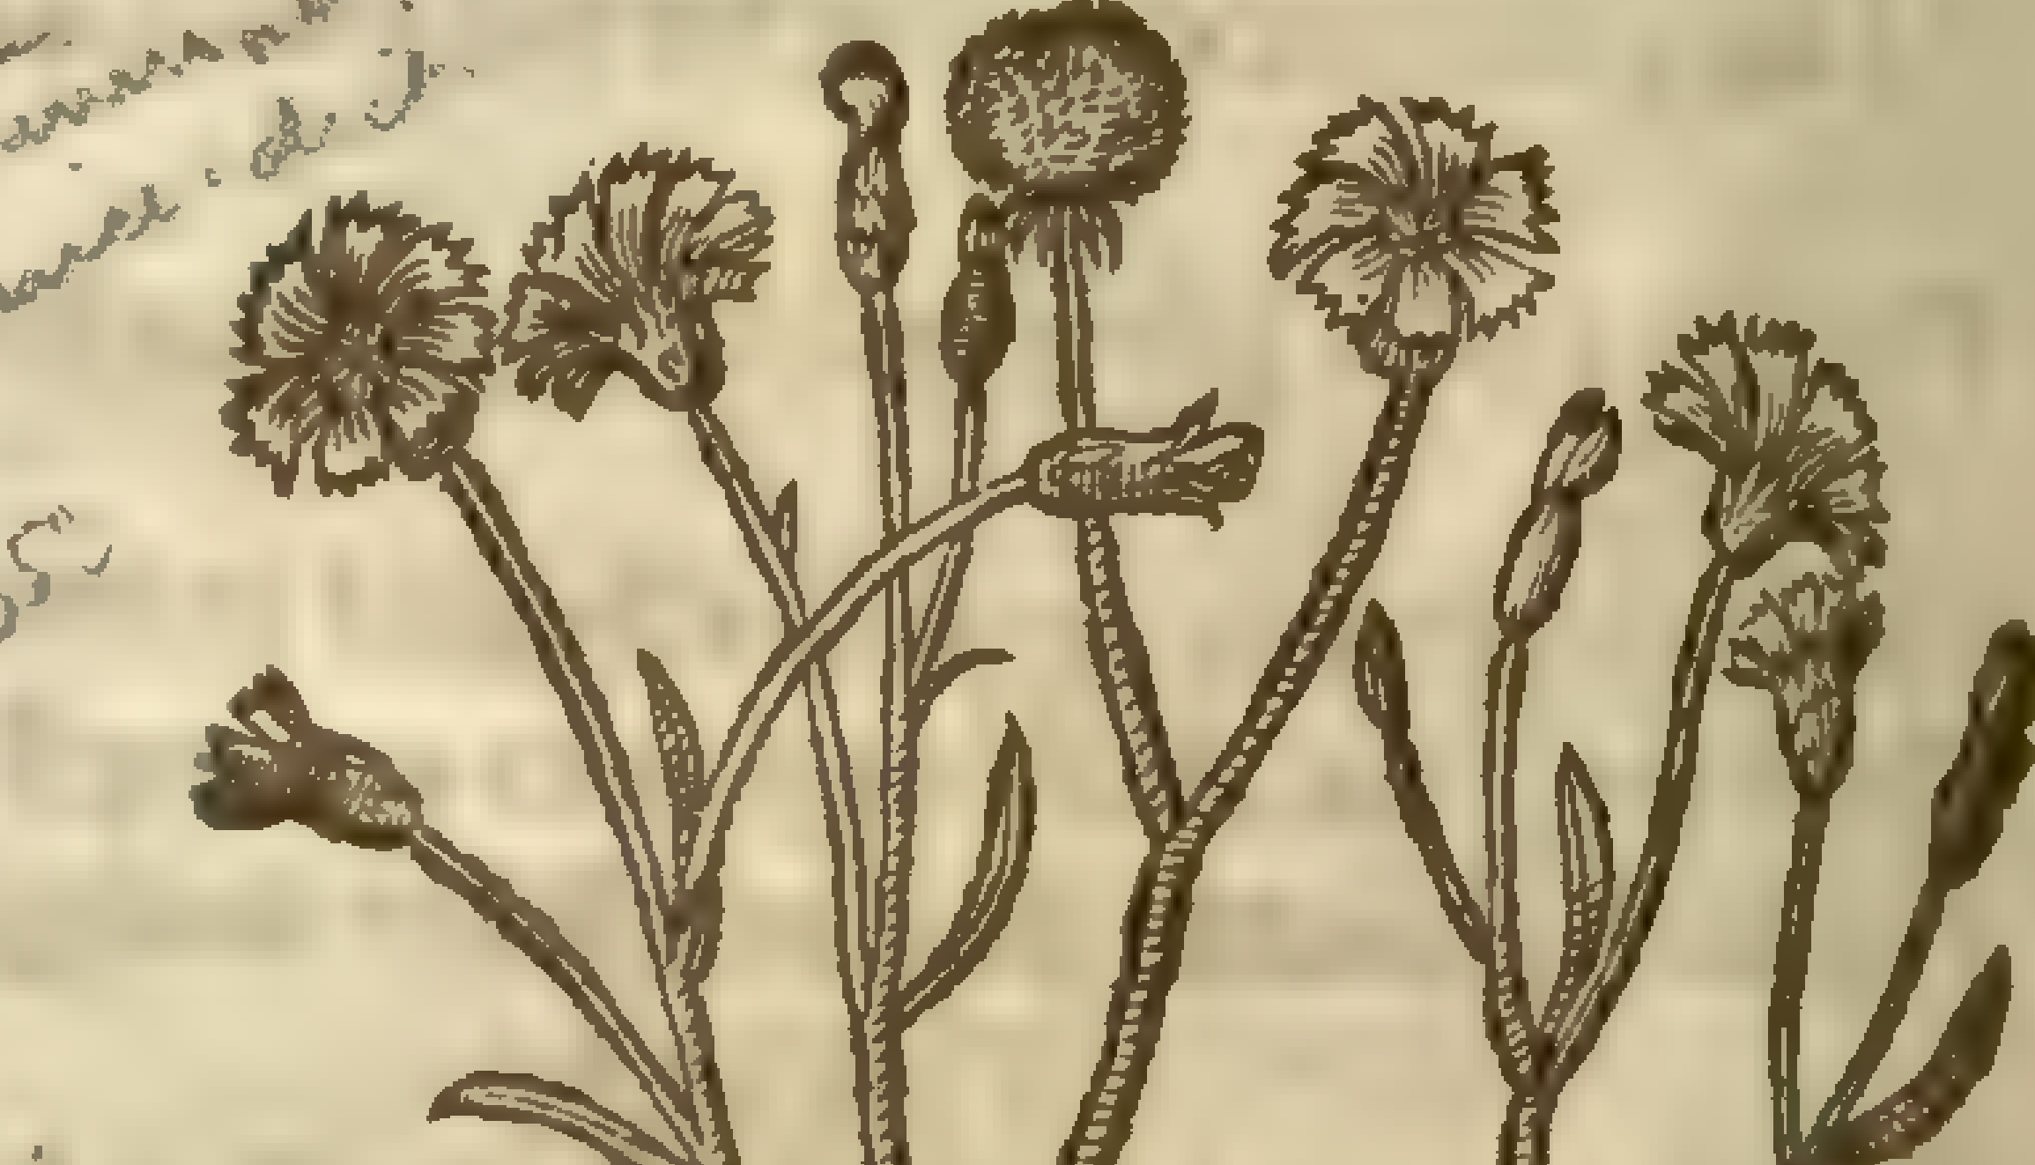
Hawke-weed is alſo a kinde of Succorie: of which *Dioſcorides* maketh two ſorts, and the later Writers more: the which ſhall be deſcribed in this chapter following, where they ſhall be diſtinguiſhed as well with ſeuerall titles as ſundry deſcriptions.

† 1 *Hieracium majus Dioſcoridis.*
Great Hawke-weed.



2 *Hieracium minus, ſiue Leporinum.*
Small Hares Hawke-weed, or Yellow Diuels-bit

Apargia autumnalis [illegible]
Sm. fl. 3. 55



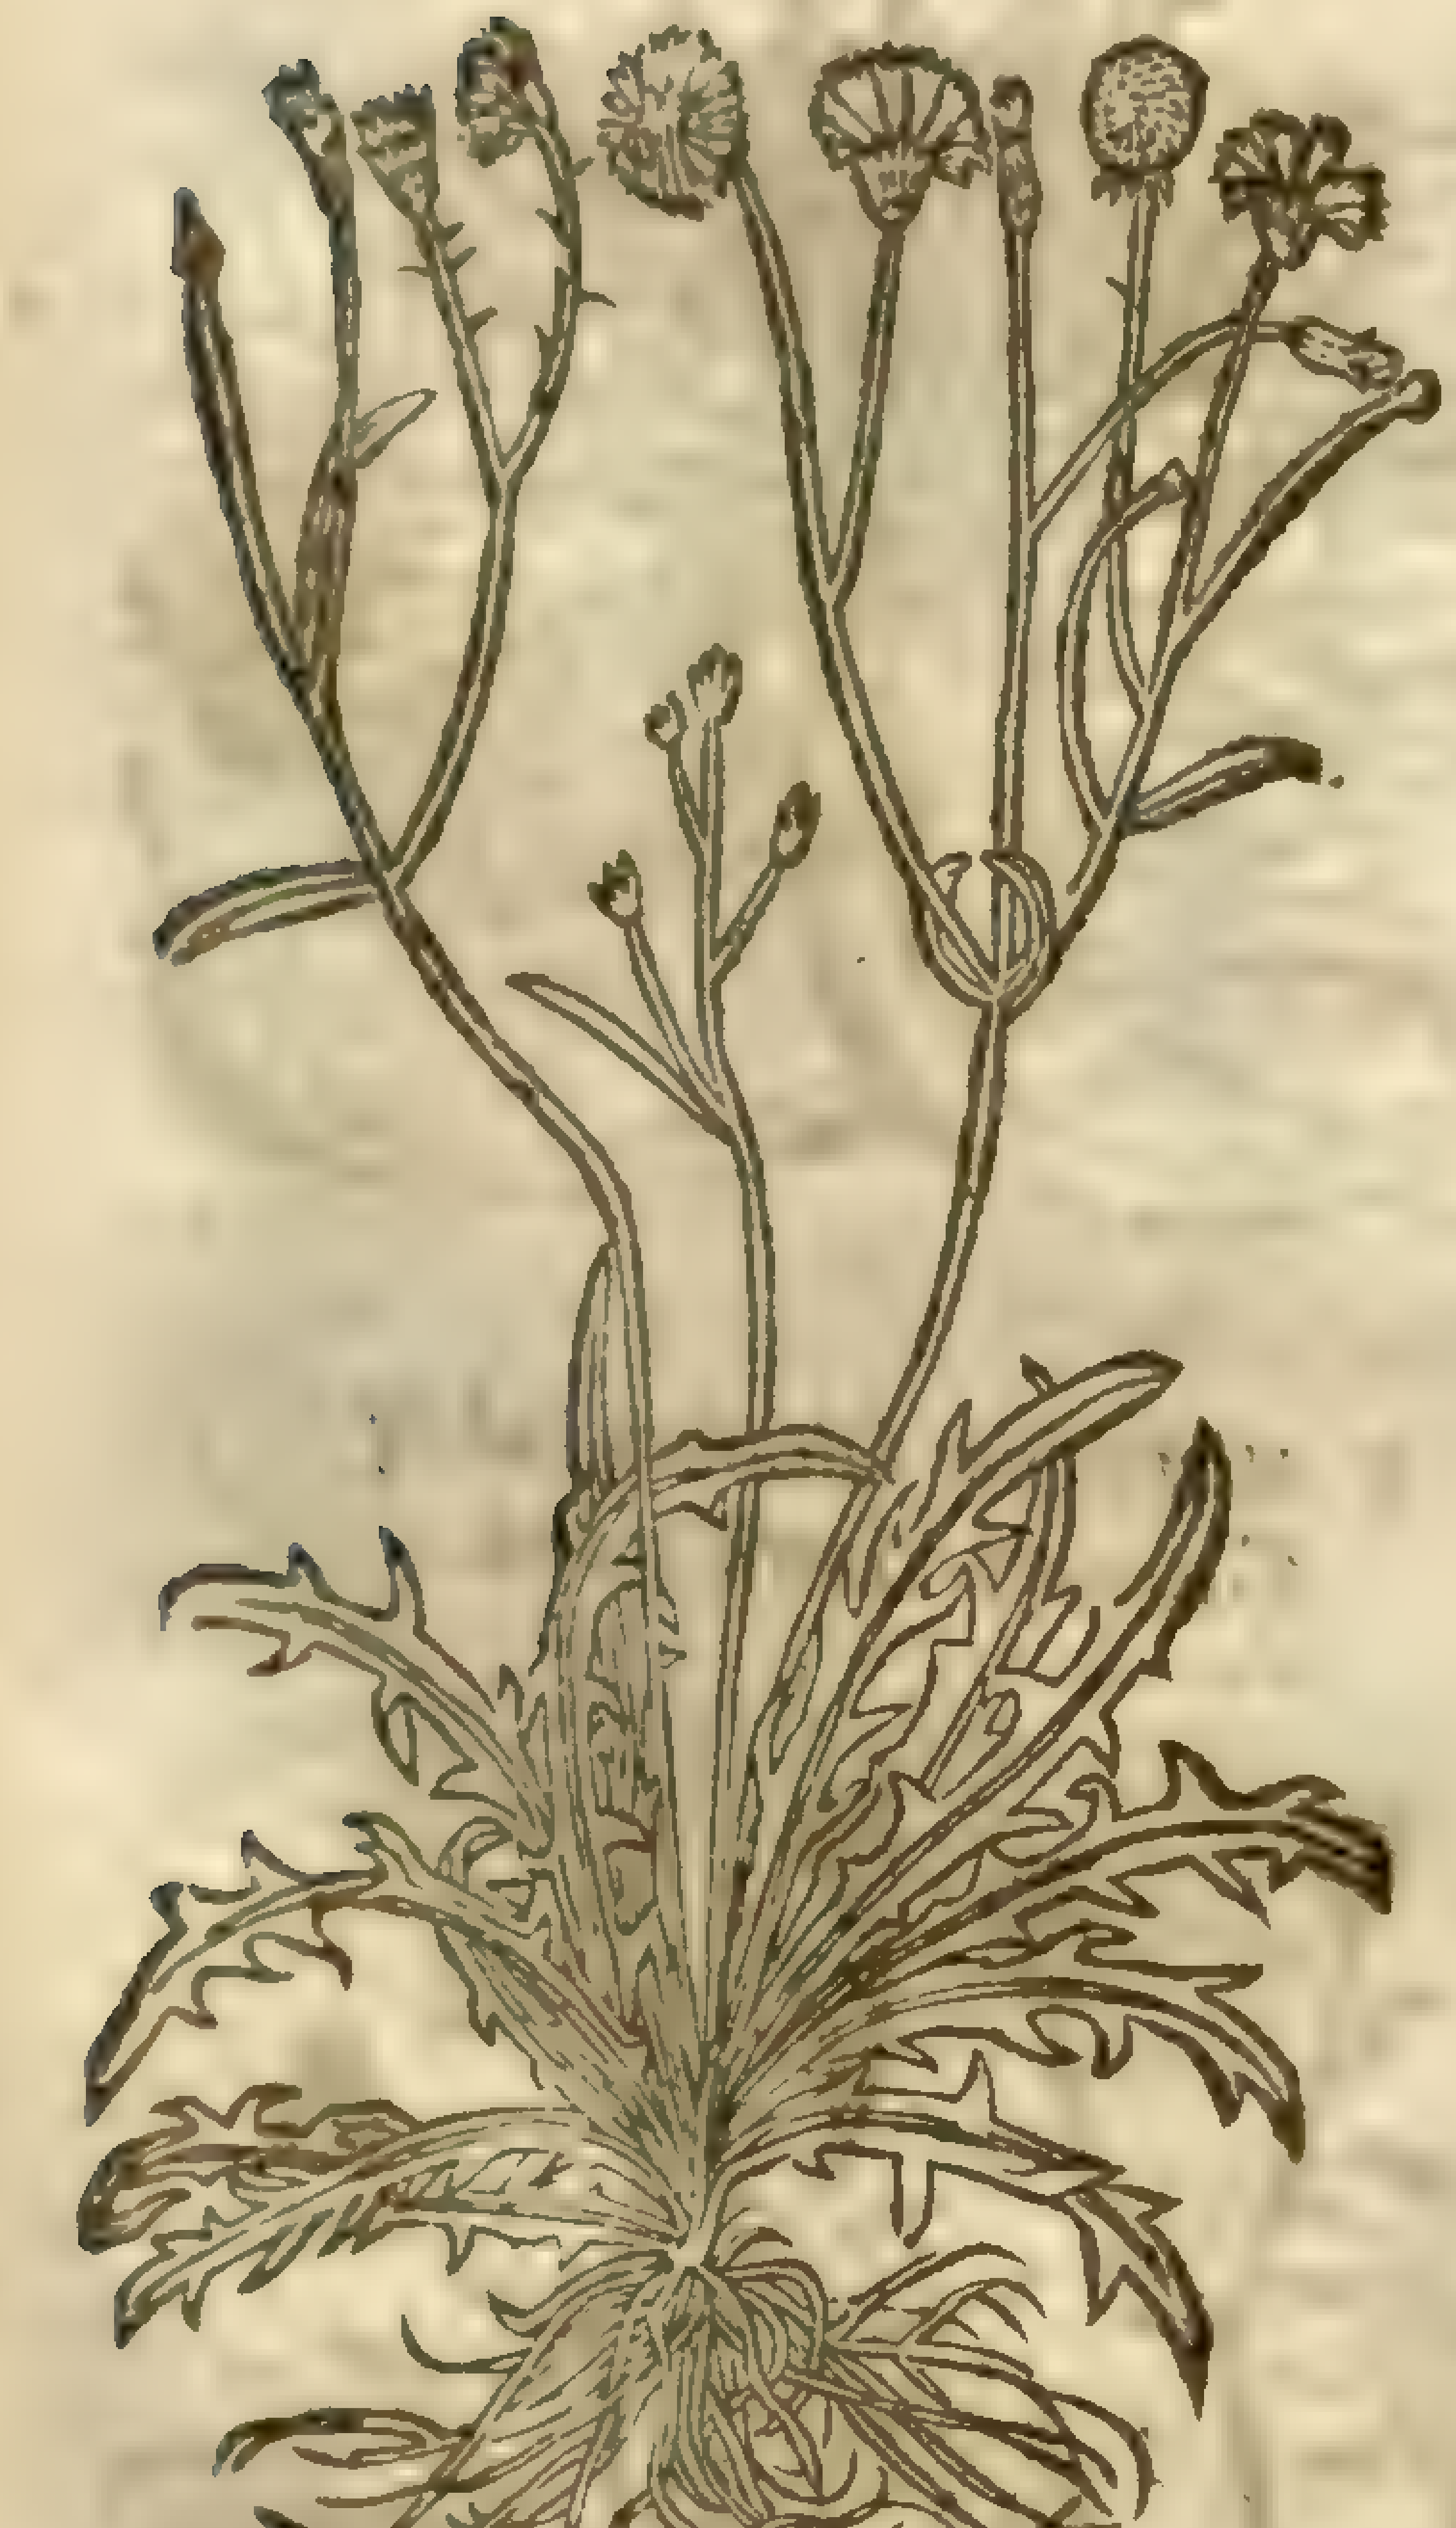
¶ *The Deſcription.*

1 The great Hawke-weed hath large and long leaues ſpred vpon the ground, in ſhape like thoſe of Sow-thiſtle: the ſtalk groweth to the height of two cubits, branched into ſundry armes or diuiſions, hollow within as the yong Kexe, reddiſh of colour: whereupon do grow yellow floures thicke and double, which turne into Downe that flieth away with the winde when the ſeed is ripe. The root is thicke, tough and threddy.

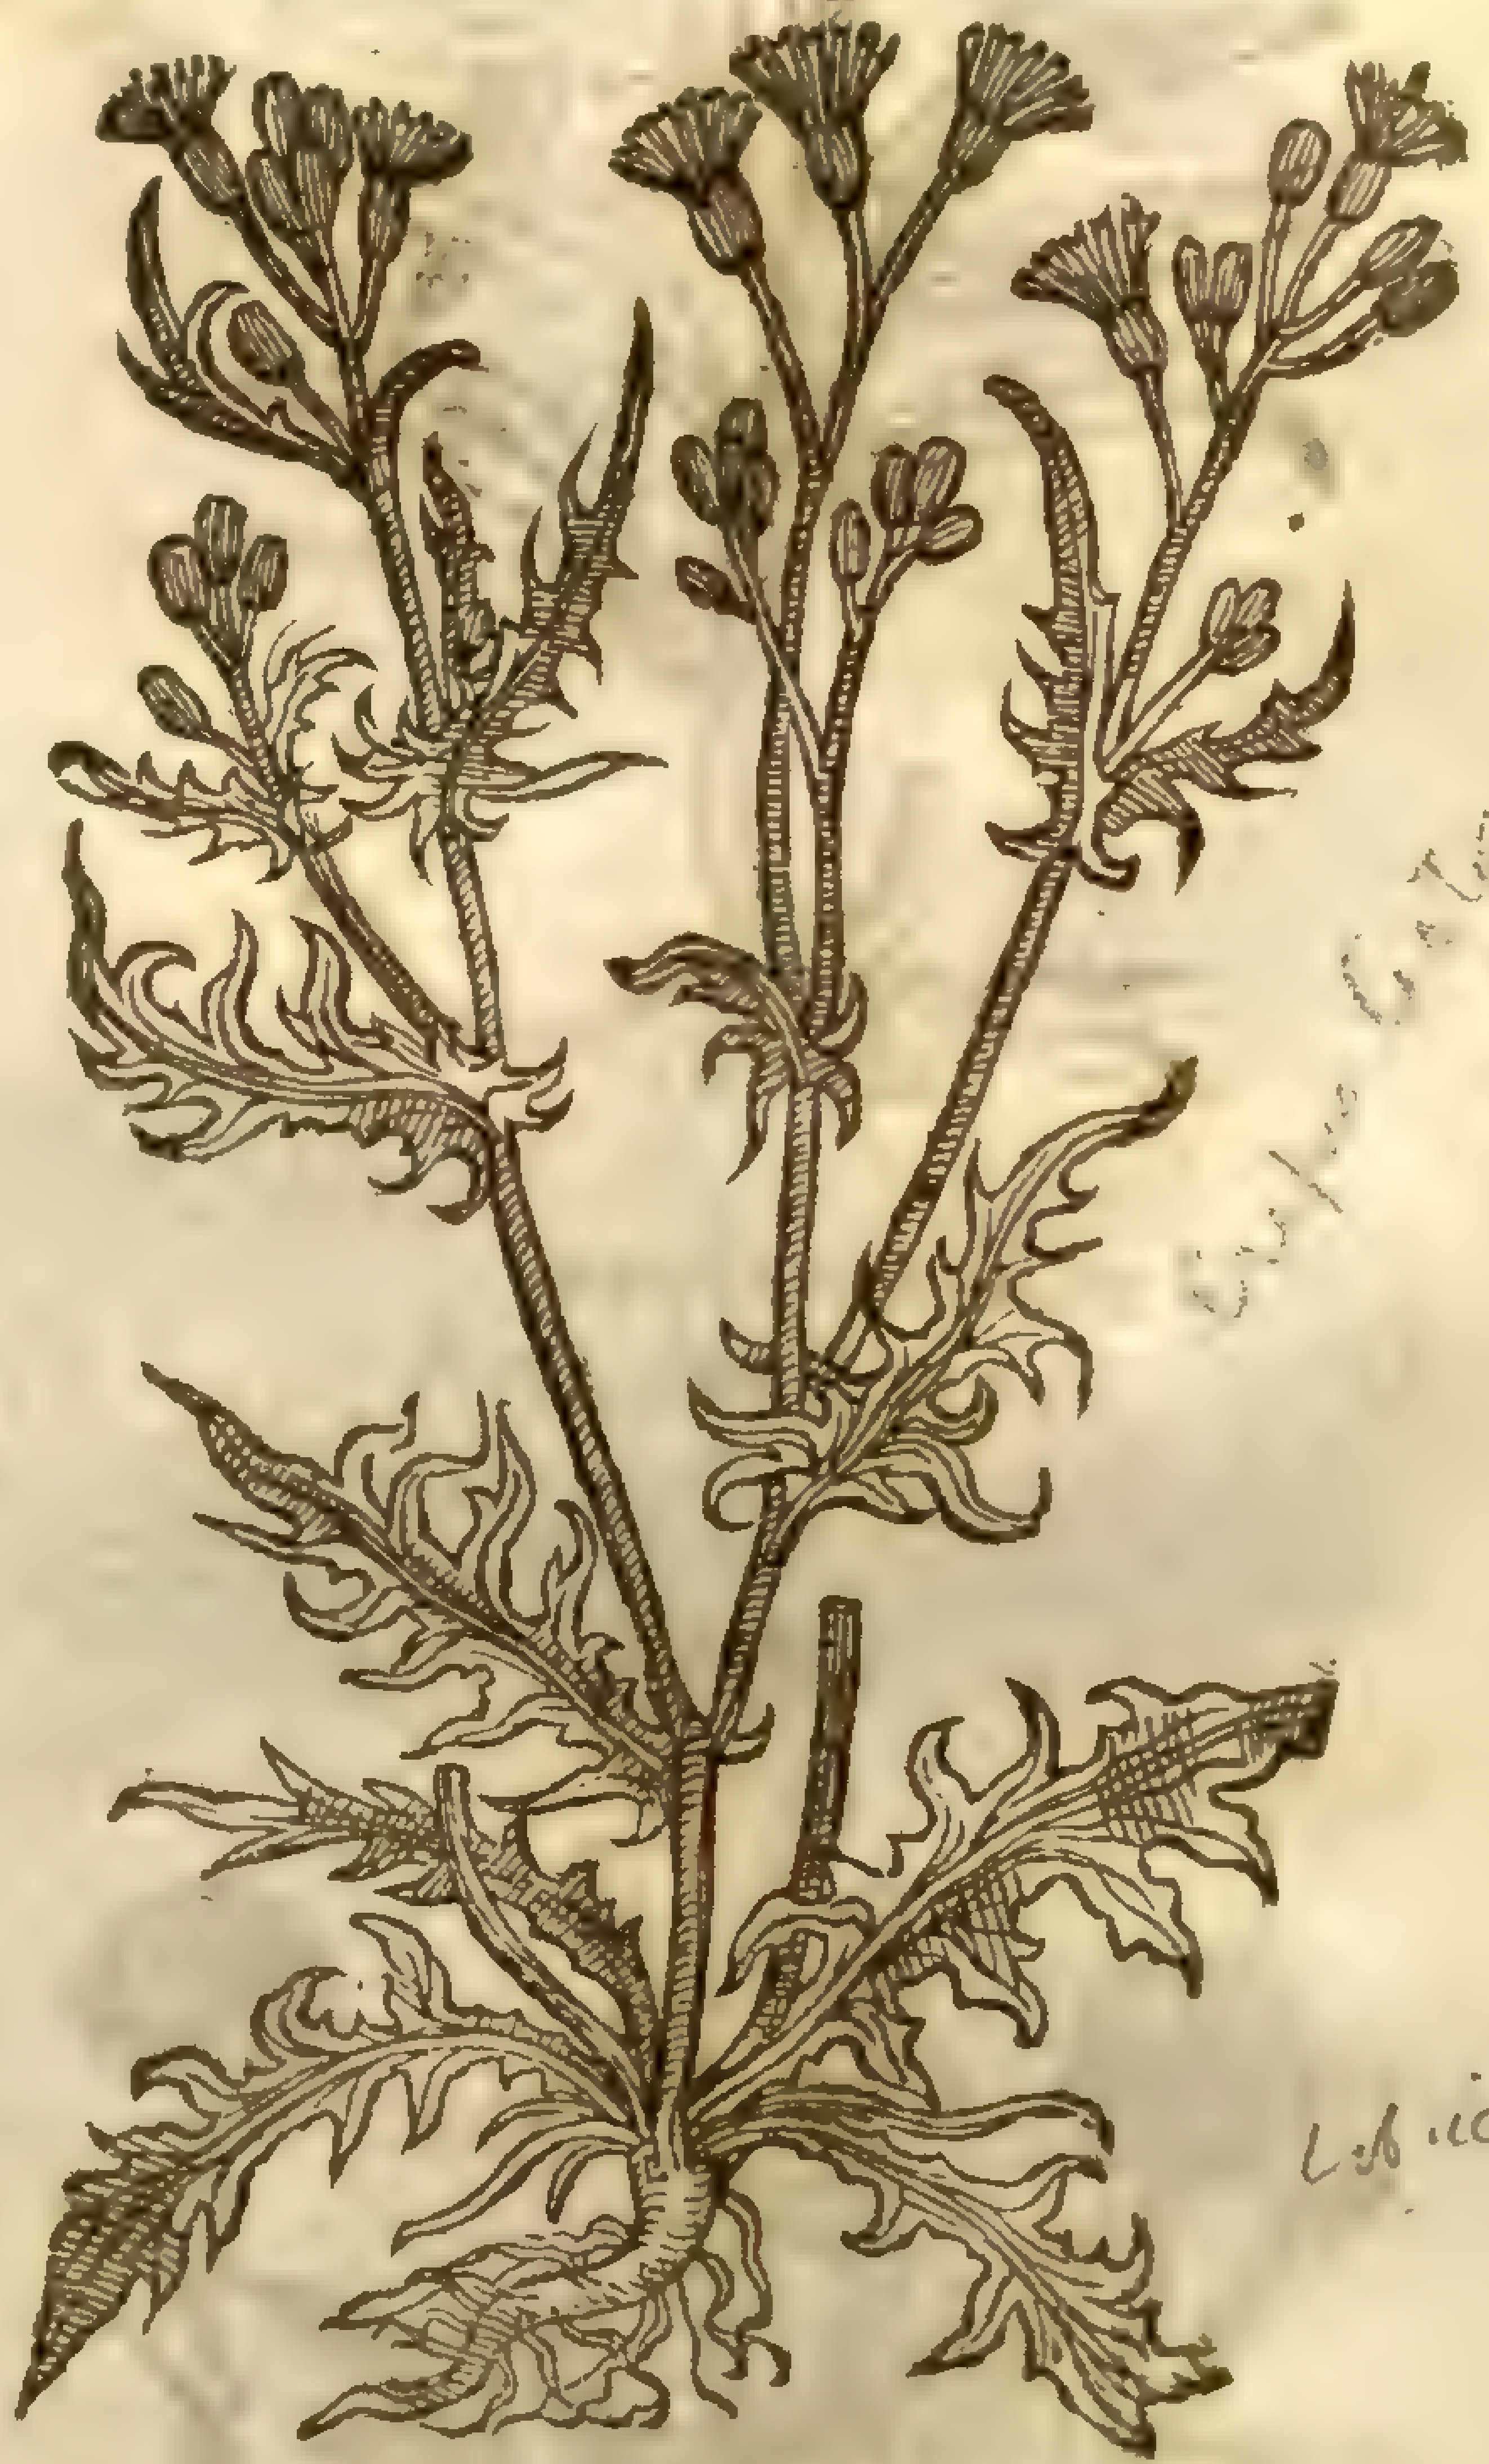
2 The ſmall Hawke-weed, which of moſt writers hath beene taken for Diuels-bit, hath long leaues deeply cut about the edges, with ſome ſharp roughneſſe thereon like vnto Sow-thiſtle. The ſtalks and floures are like the former: the root is compact of many ſmal ſtrings, with a ſmal knob, or as it were the ſtump of an old root in the middle of thoſe ſtrings, cut or bitten off; whereupon it took his name Diuels bit.

3 Blacke Hawk-weed hath very many long jagged leaues not much vnlike to thoſe of Buckshorne, ſpred flat and far abroad vpon the ground, which the picture cannot expreſſe as is requiſit, in ſo little room: among which riſe vp many ſtalks, ſlender and weake, the floures growing at the top yellow and very double: it hath alſo a threddy root.

‡ Our Author formerly gaue three figures and ſo many deſcriptions of this ſmall *Hieracium*, which I haue contracted into two; for the only difference that I can finde is, that the one hath the root as it were bitten off, with the leaues leſſe cut in: the other hath a root ſomwhat longer, and fibrous as the former: the leaues alſo in this are much more finely and deep cut in: in other reſpects there is no difference. ‡



3 *Hieracium nigrum.*
Black Hawk-weed.



4 *Hieracium Aphacoides.*
Succorie Hawkweed.

Crepis C[illegible] [illegible] Sm. Fl. 3. 332

Lob. ic. 239

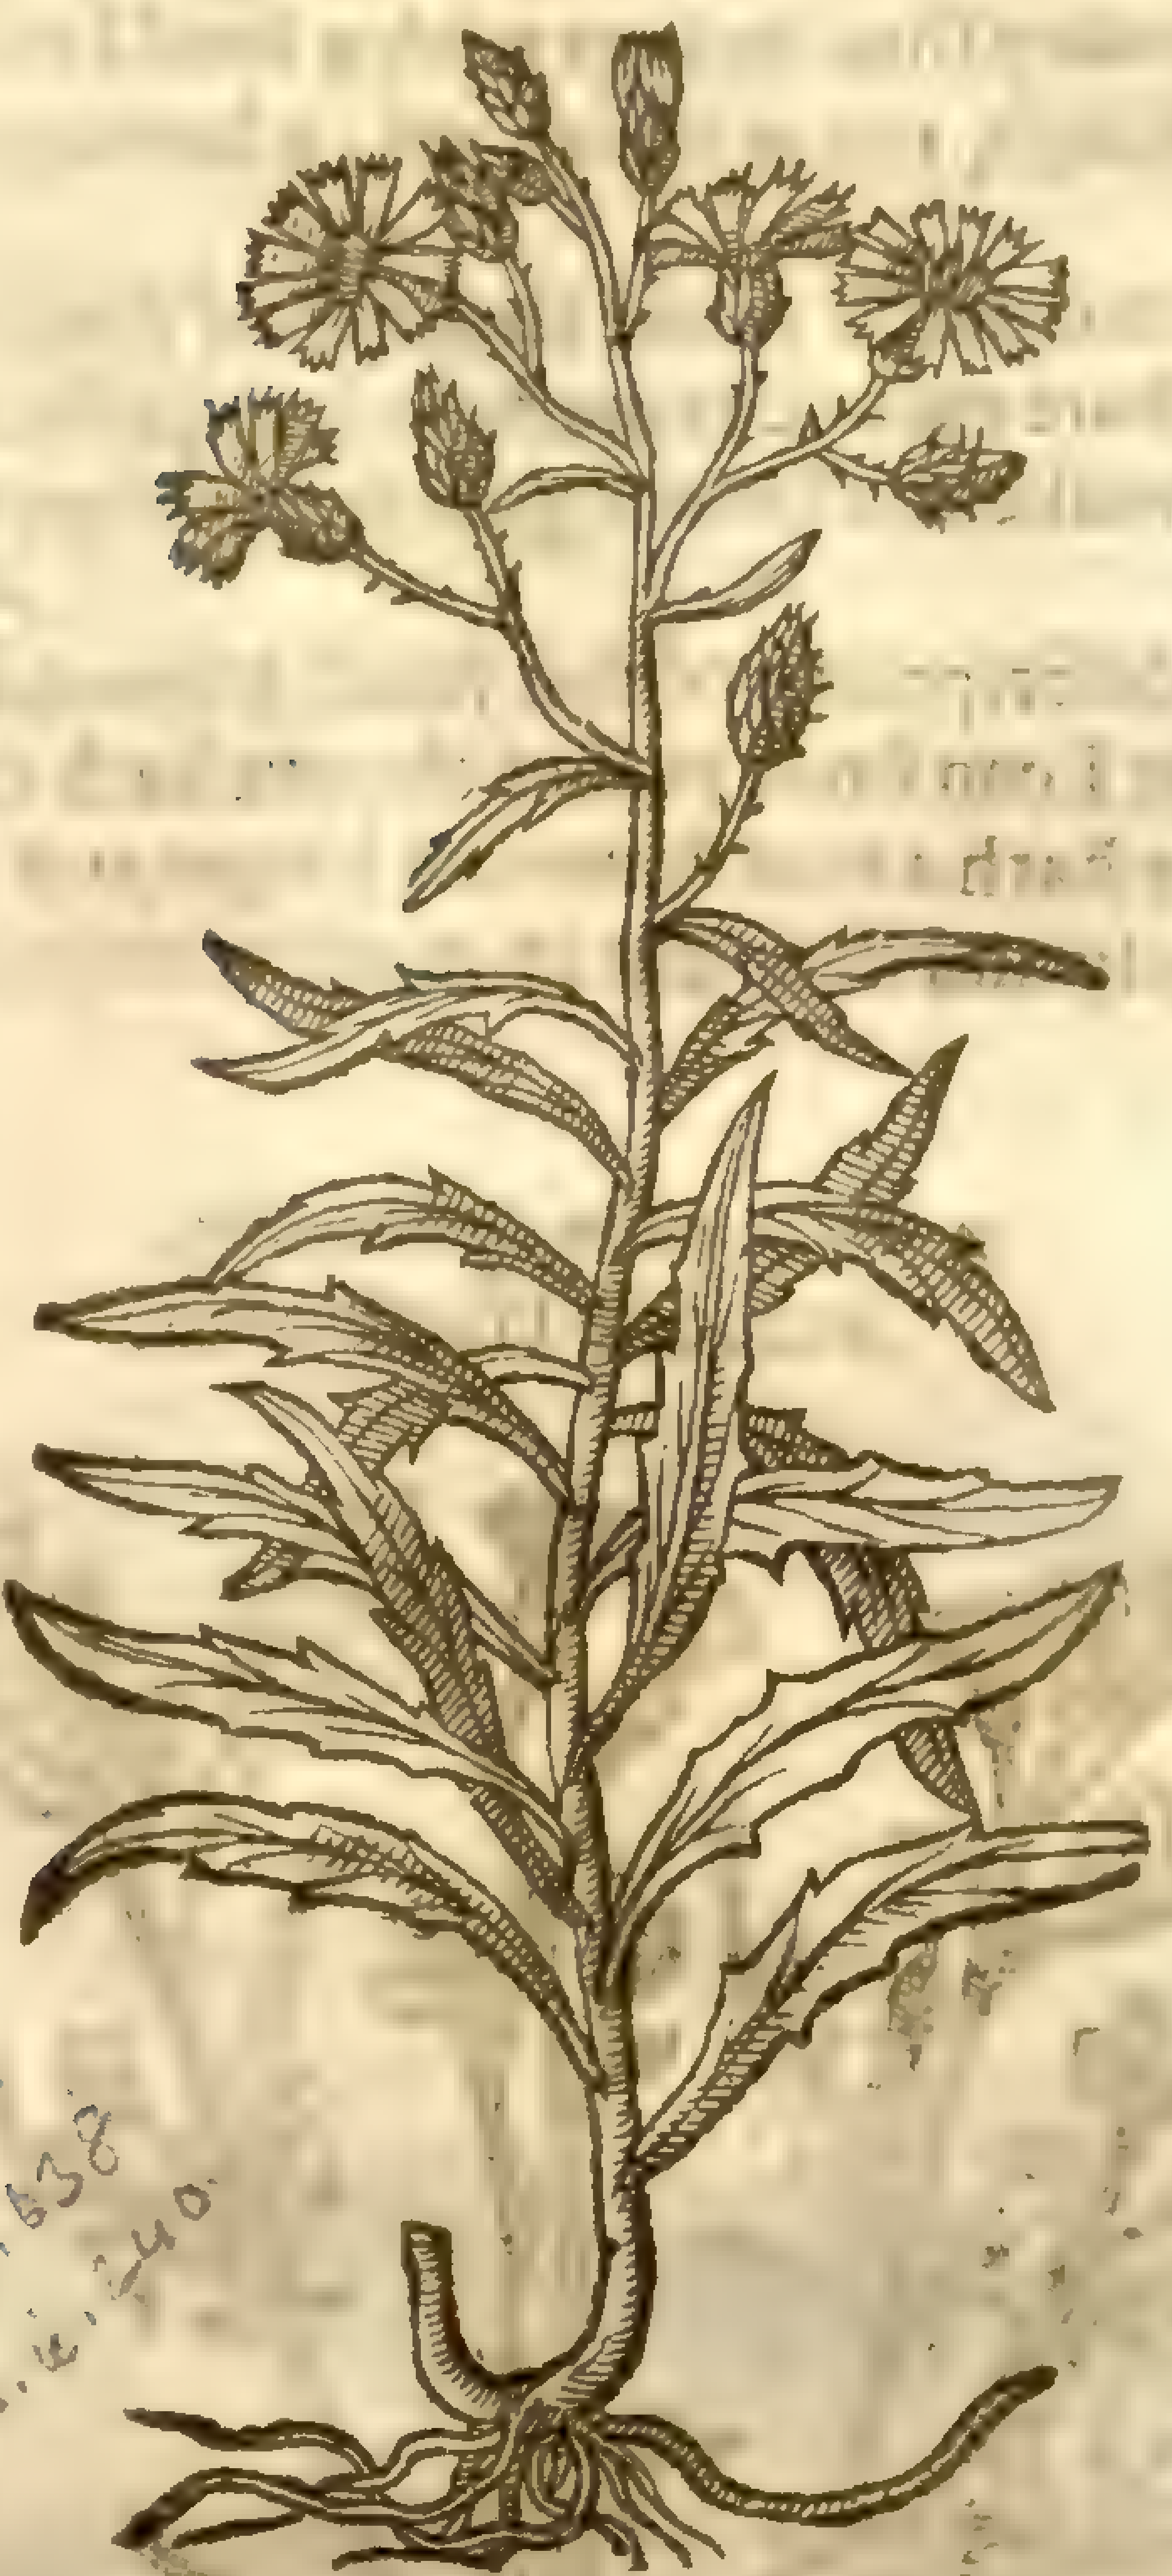
4 Succorie Hawke-weed hath many long and large leaues ſpred vpon the ground, deeply cut on both ſides almoſt to the middle rib; from which riſe vp ſmall ſtalkes and floures like thoſe of the leſſe Dandelion, but leſſer. The root conſiſteth of many ſmall threddy ſtrings.

5 Endiue Hawk-weed hath many broad leaues indented about the edges very like garden Endiue, but narrower: among which riſe vp ſtalks a foot or more high, ſlender, hairy, and brittle: the floures are yellow, and grow at the top double, and thicke ſet in a ſcaly huske like the Knapweed or *Iacea*, hauing great thicke and threddy roots. ‡ This hath a ſtalke ſometimes more and otherwhiles leſſe rough, with the leaues ſometimes more cut in, more long and narrow, and again otherwhiles more ſhort and broad. ‡

6 Long rooted Hawk-weed hath many broad leaues ſpred vpon the ground, ſleightly and confuſedly indented about the edges, with ſomwhat a bluntiſh point: among which leaues ſpring vp ſtrong and tough ſtalks a foot and halfe high, ſet on the top with faire double yellow floures much like vnto a Piſſe-abed. The root is very long, white, and tough.

7 Sharpe Hawke-weed hath leaues like thoſe of Languebeefe or Ox-tongue, but much narrower, ſharpe about the edges, and rough in the middle: the ſtalkes be long and ſlender, ſet with the like leaues, but leſſer: the floures grow at the top, double and yellow: the root is tough & threddie.

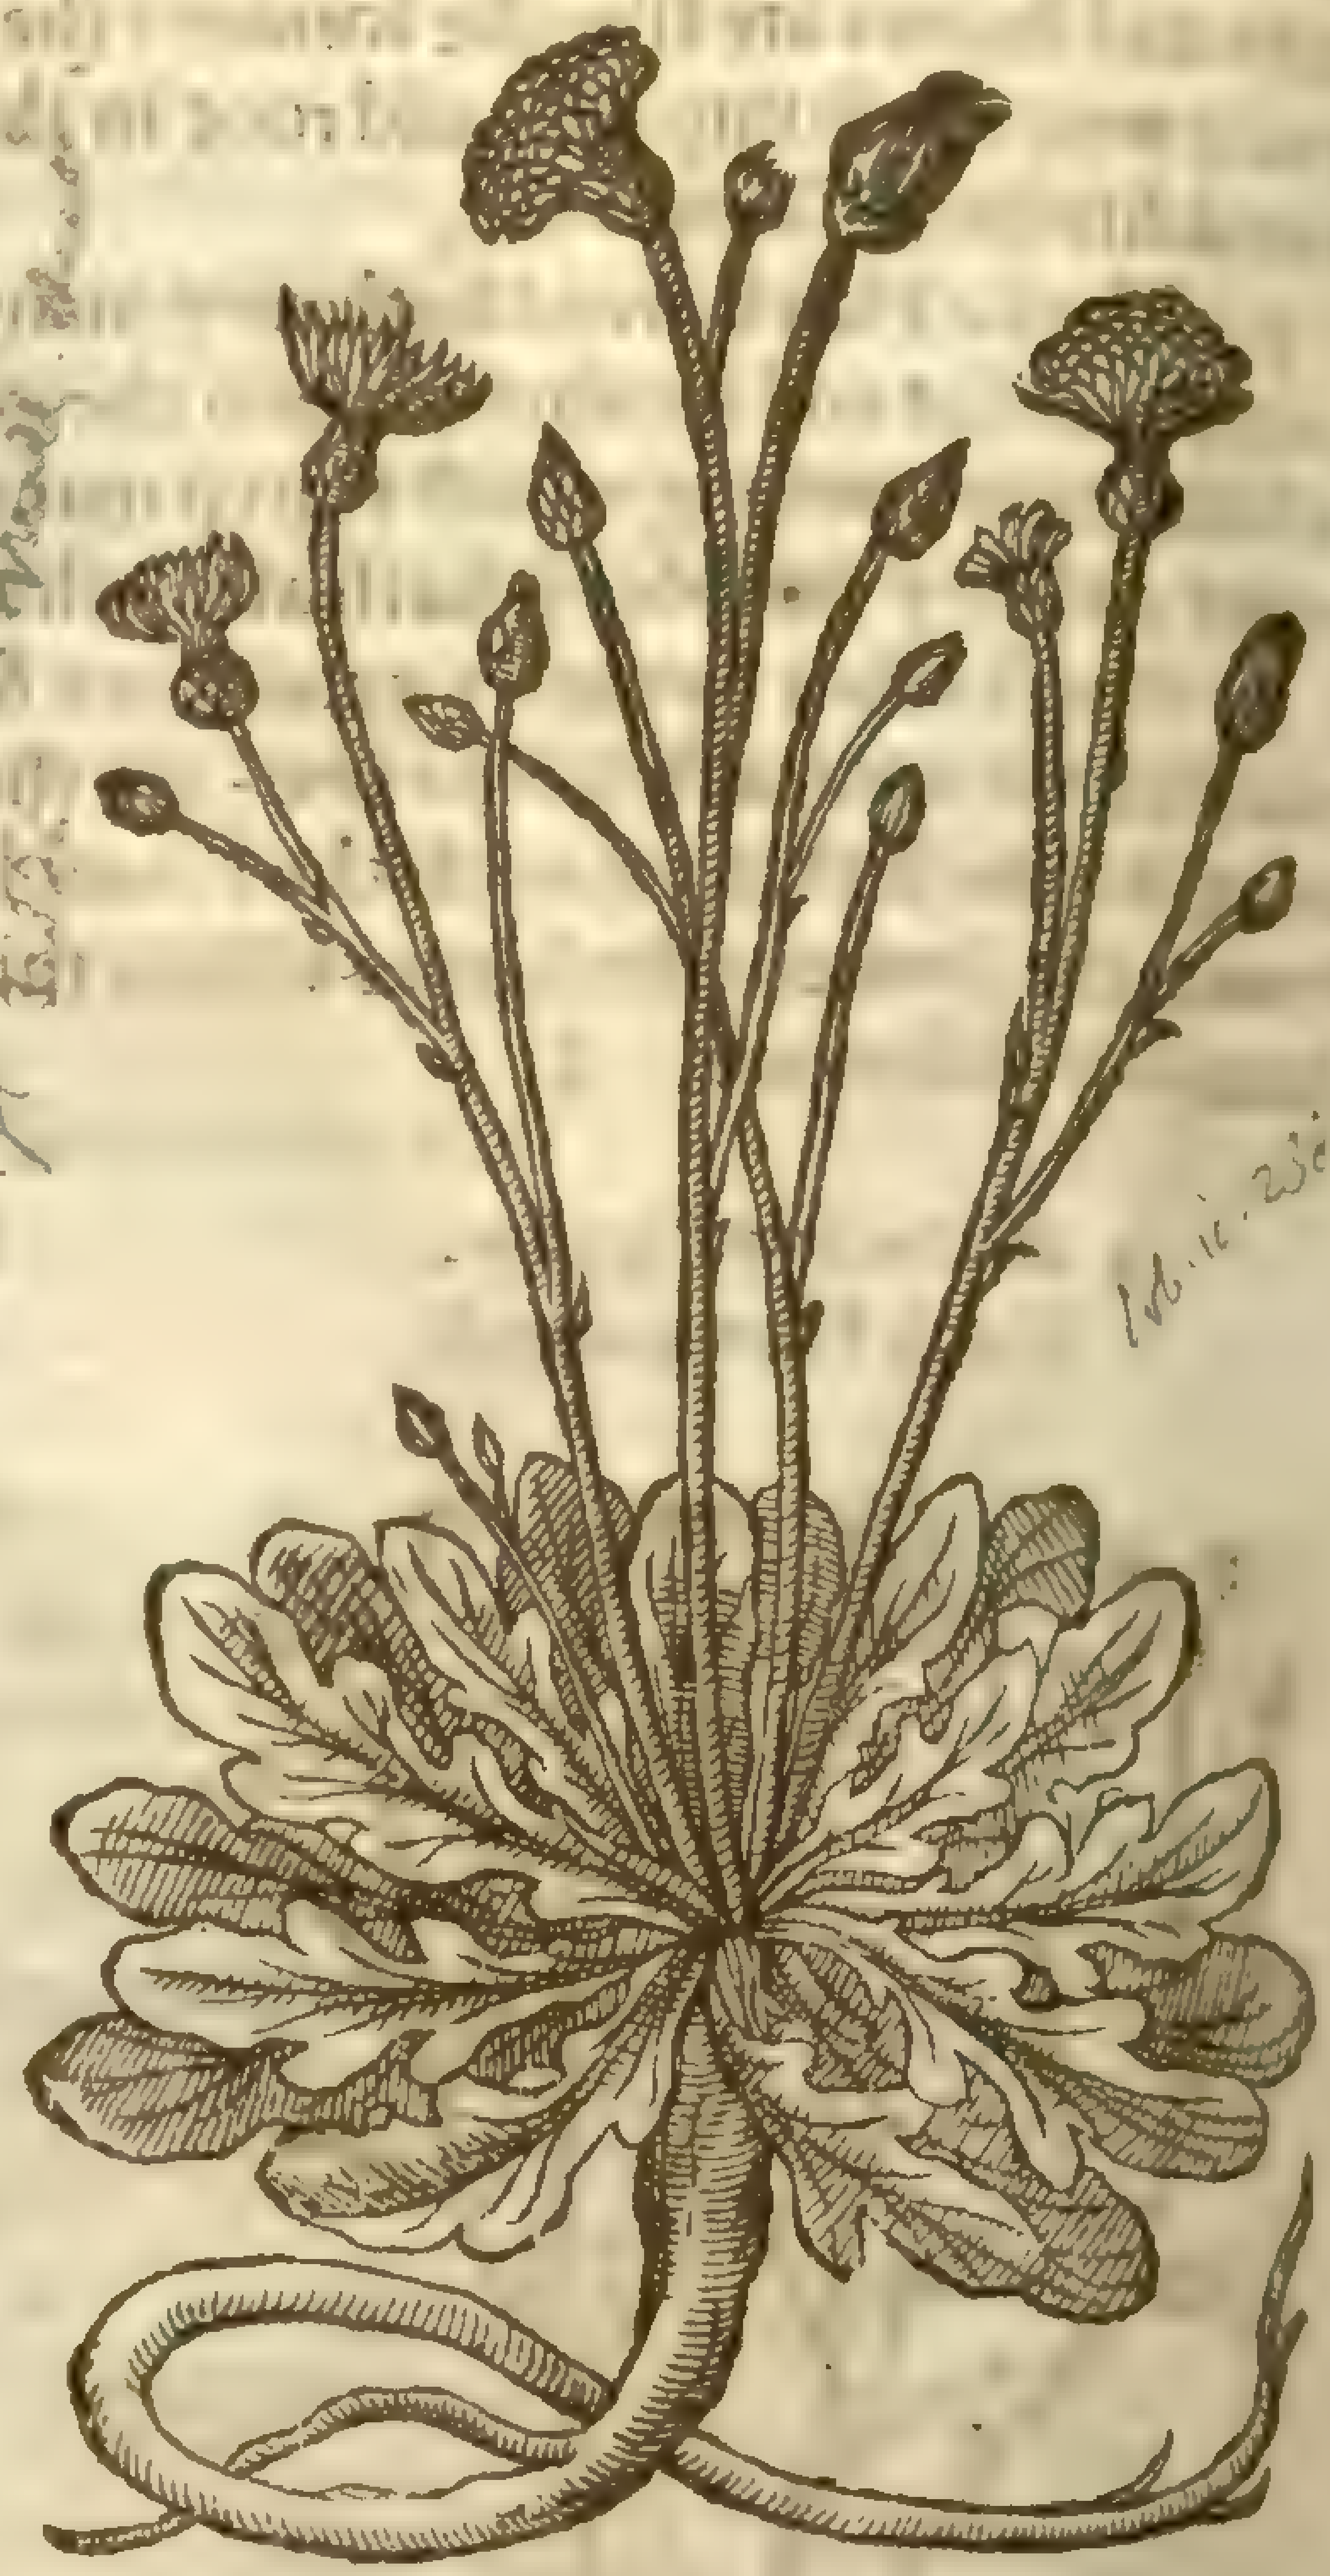
5 *Hieracium intybaceum.*
Endiue Hawk-weed.



H. umbellatum [illegible]

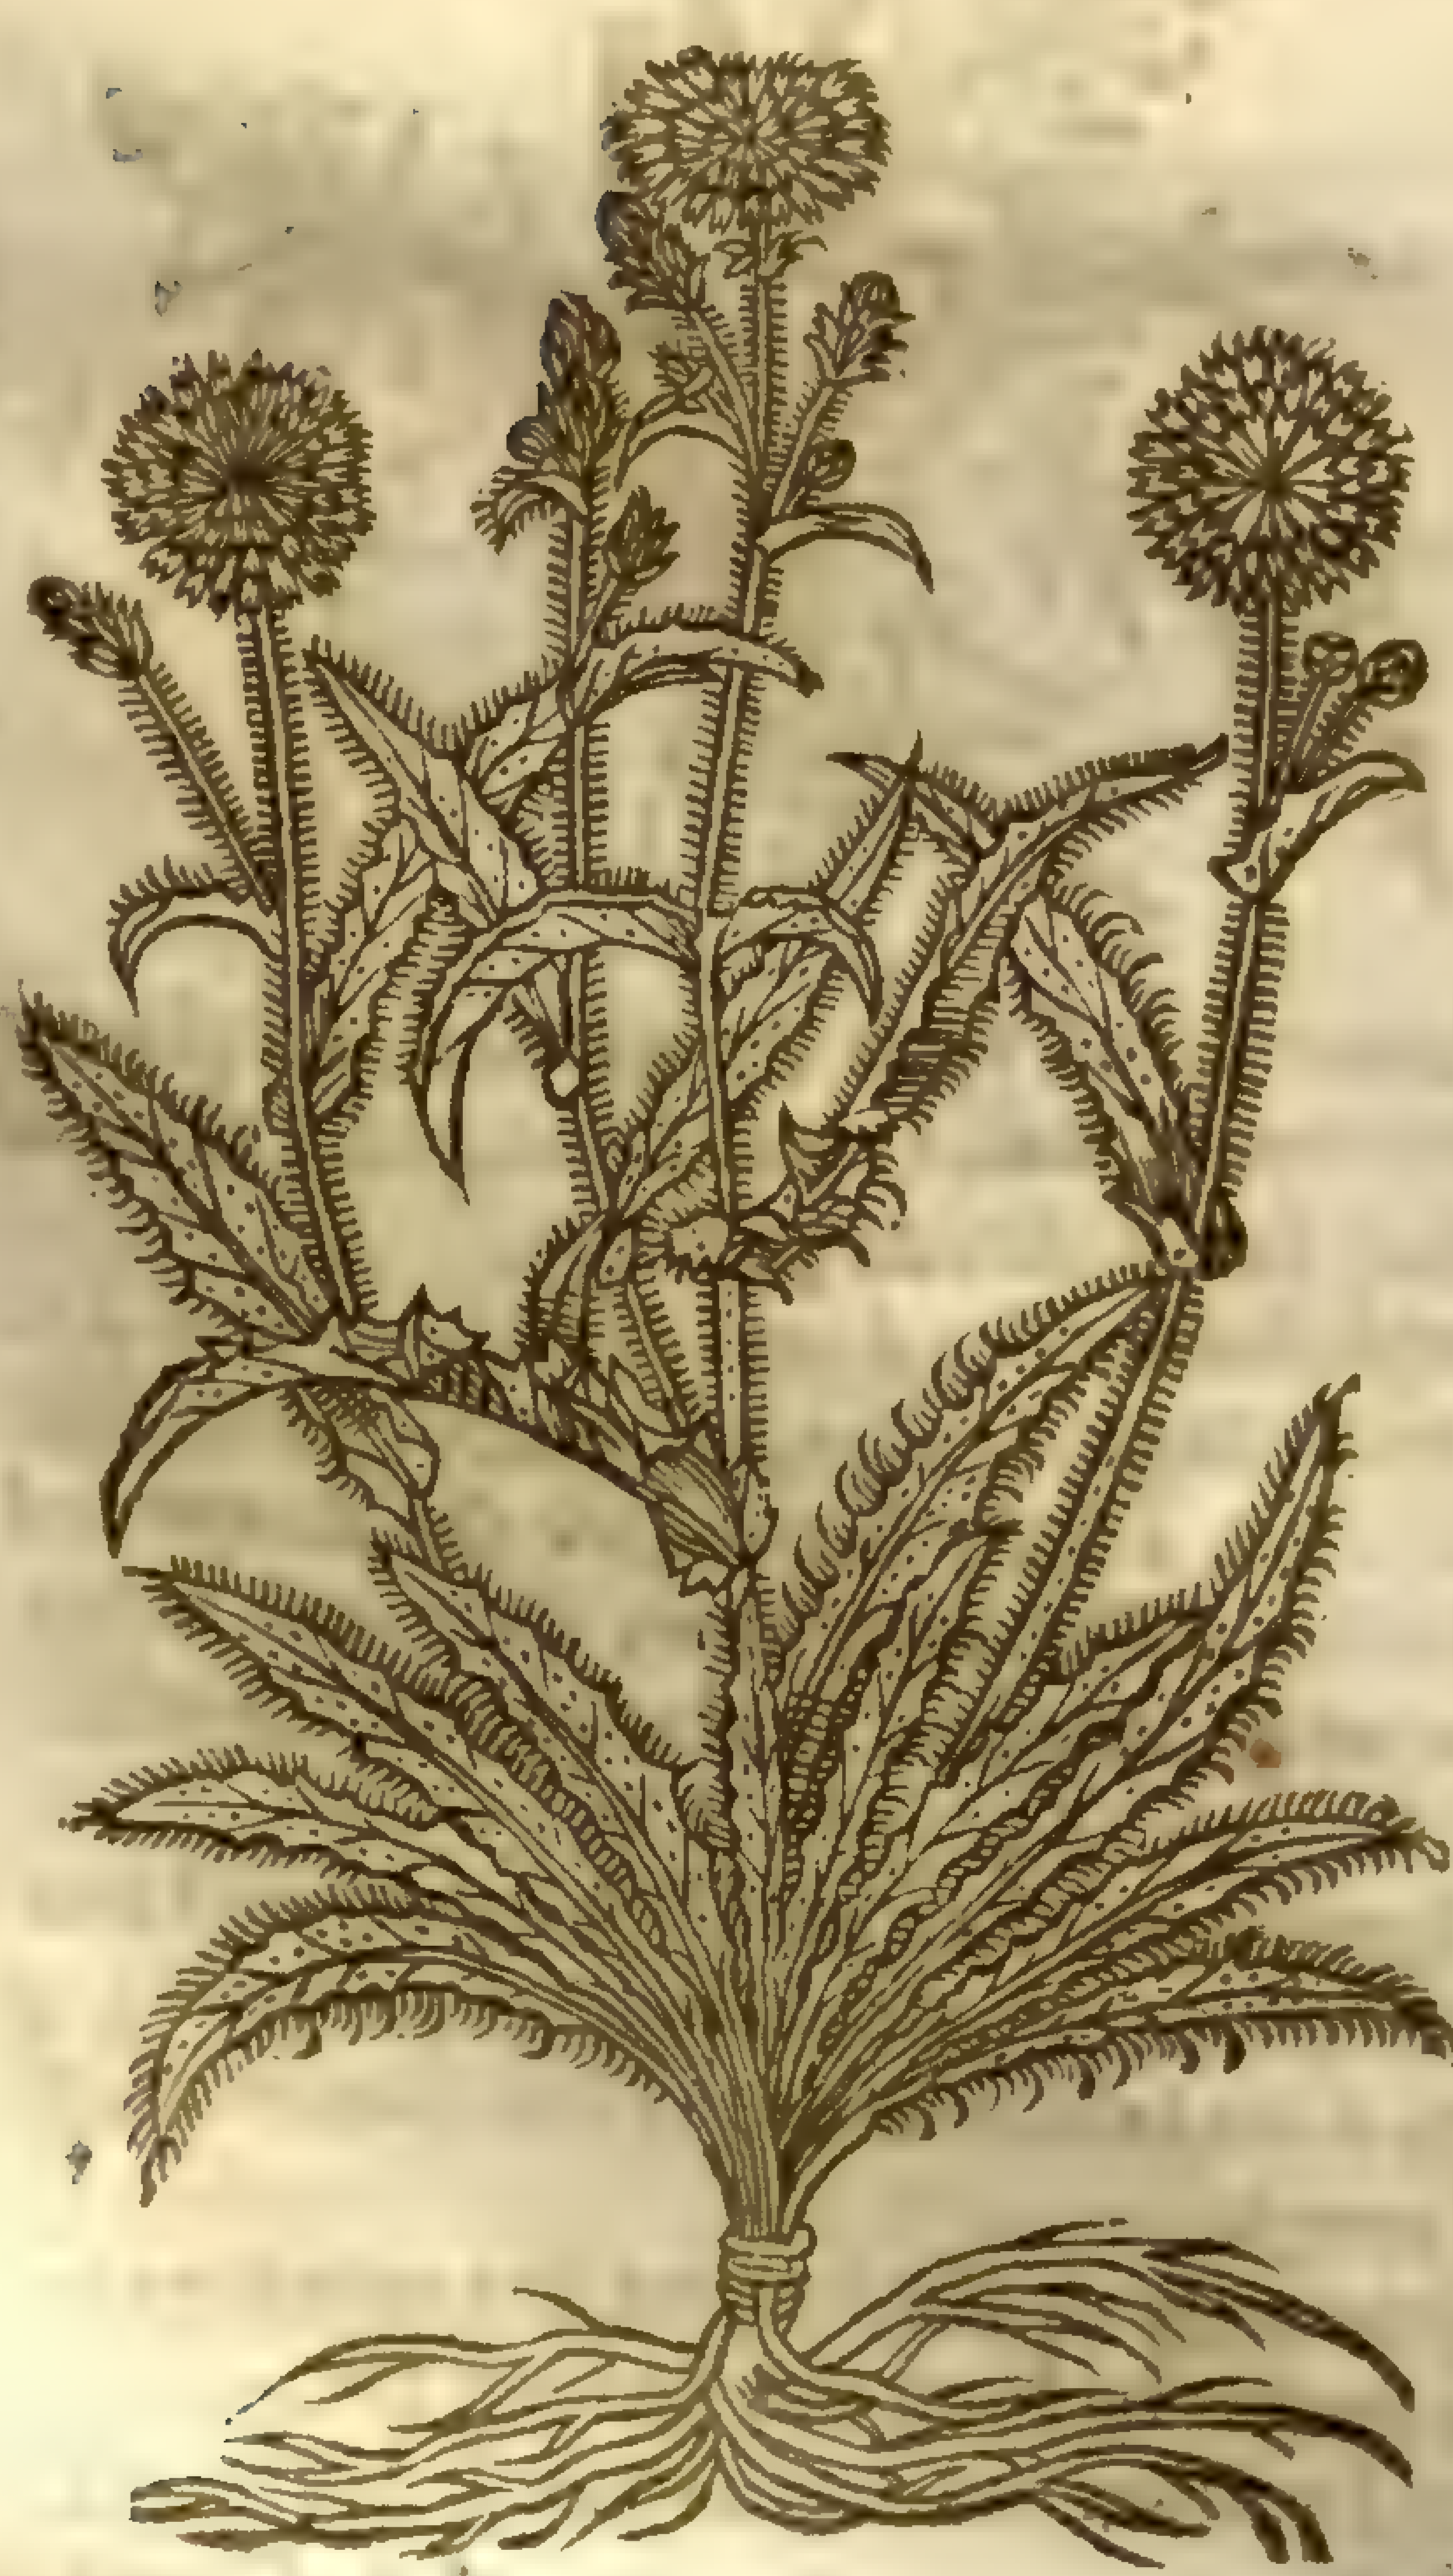
Odd. 638
Lob. ic. 240.

6 *Hieracium longius radicatum.*
Long rooted Hawk-weed.



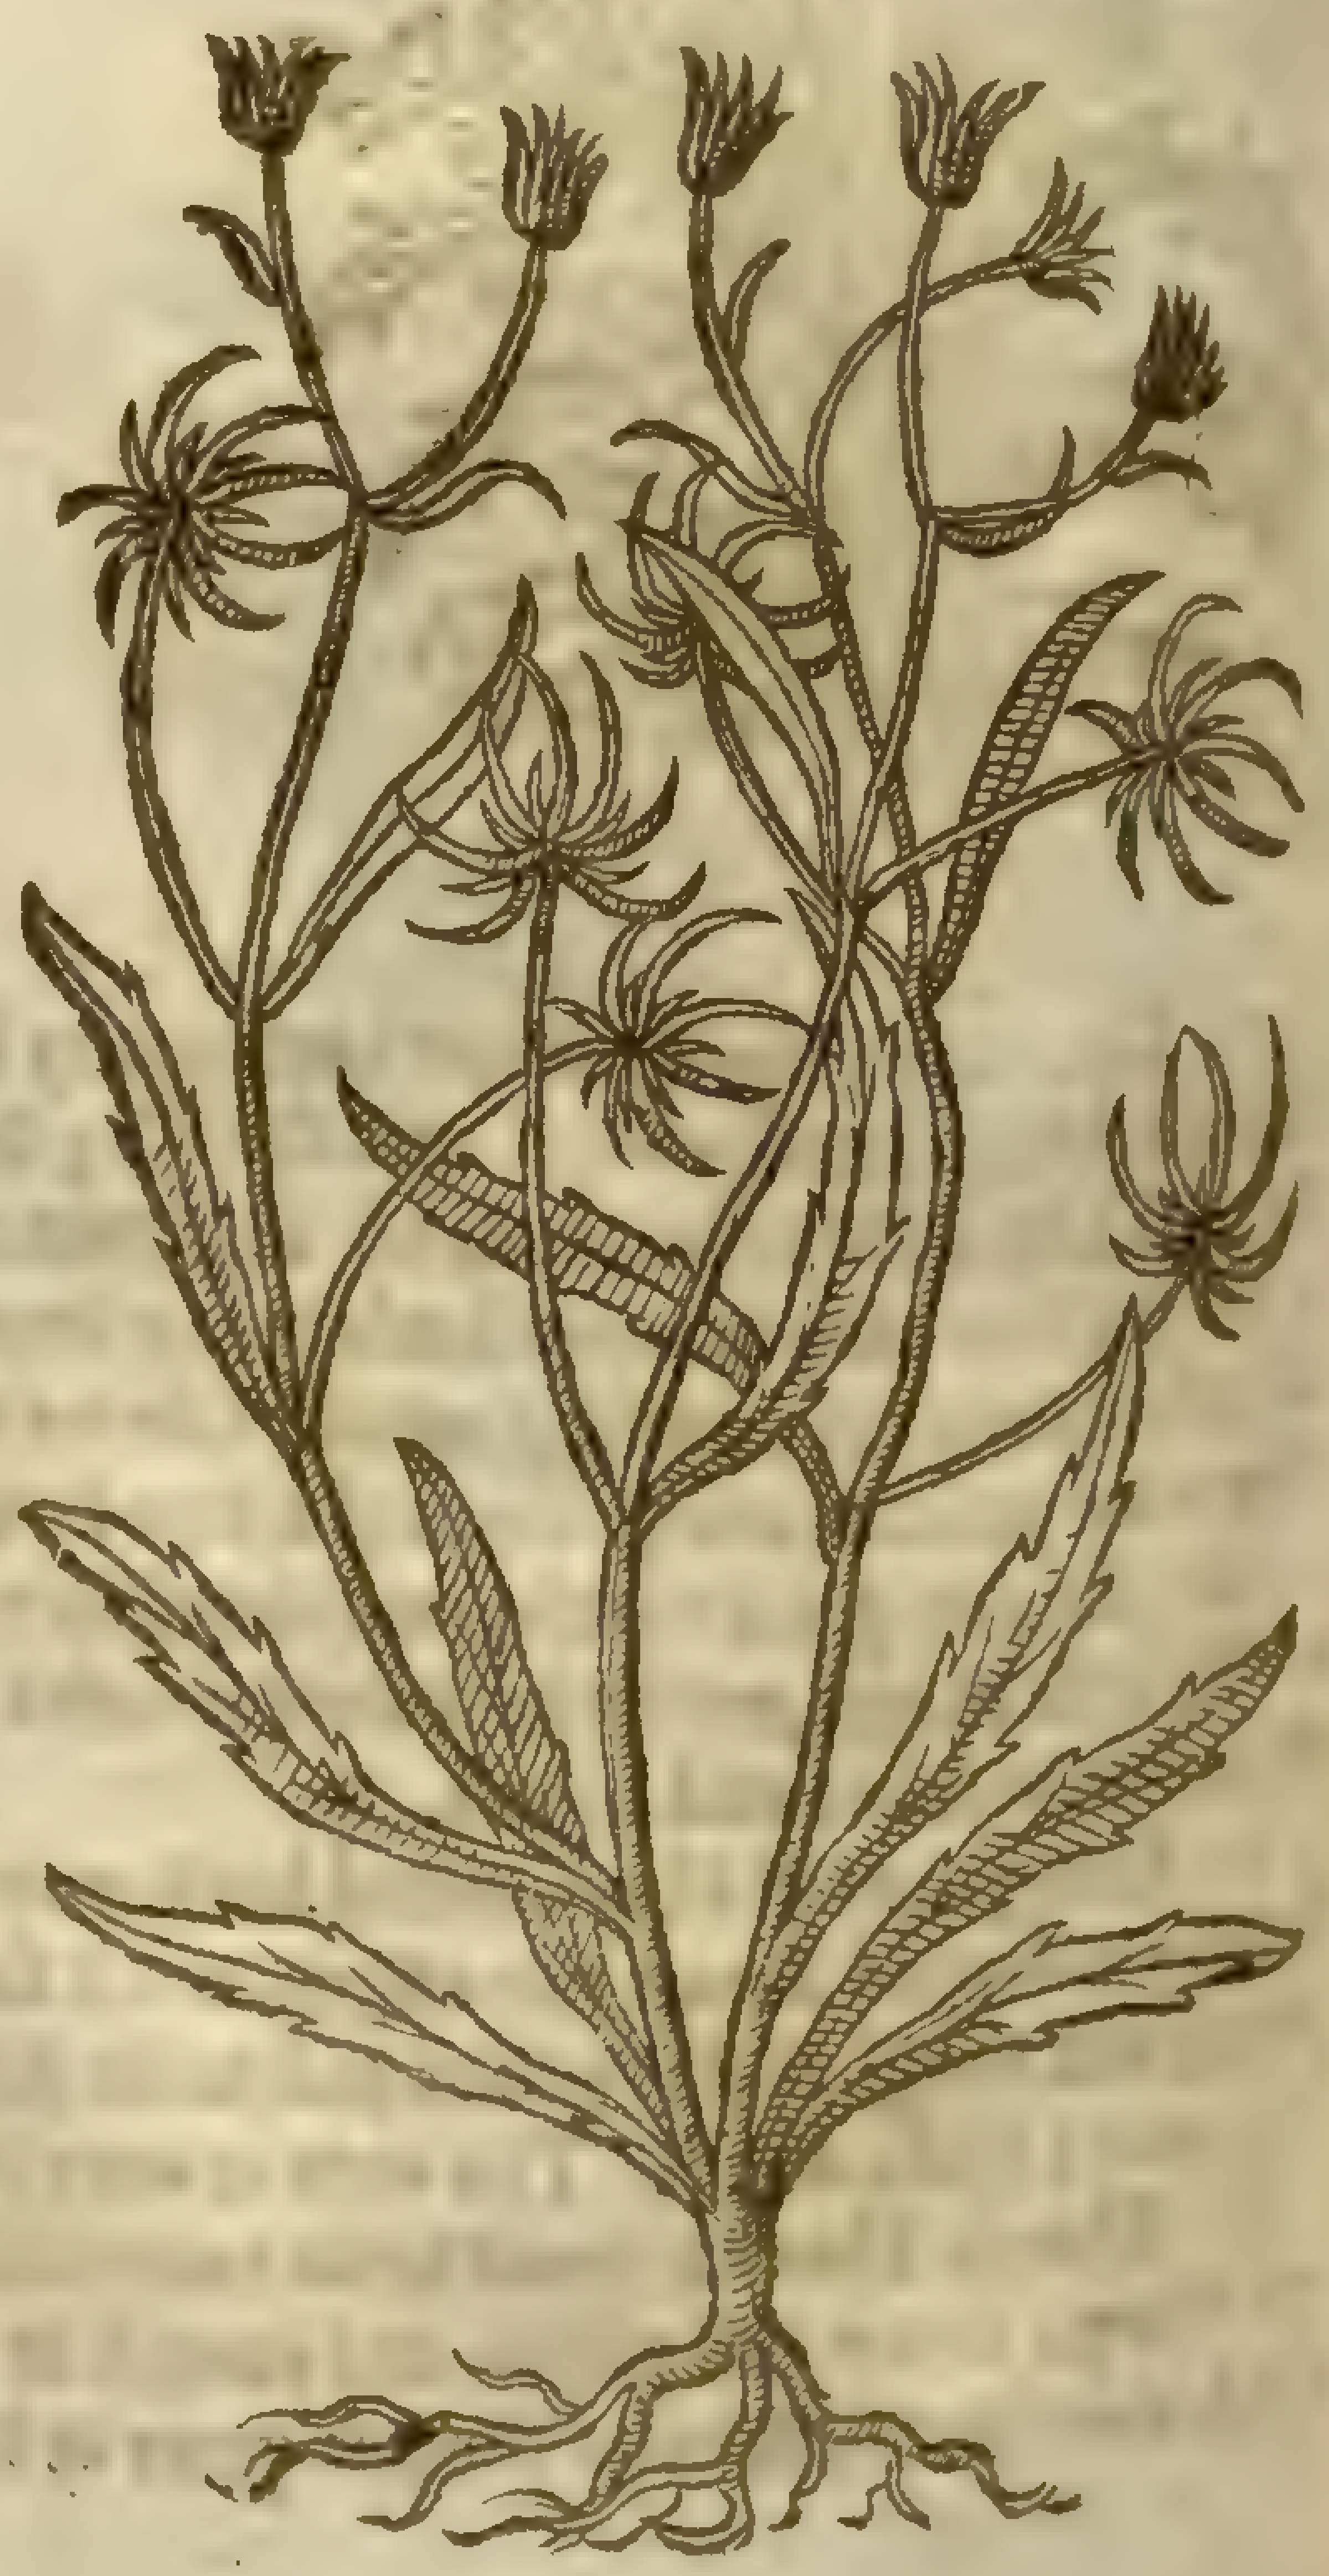
Lob. ic. 236

7 *Hieracium aſperum.*
Sharpe Hawk-weed.



Picris hieracioides [illegible]

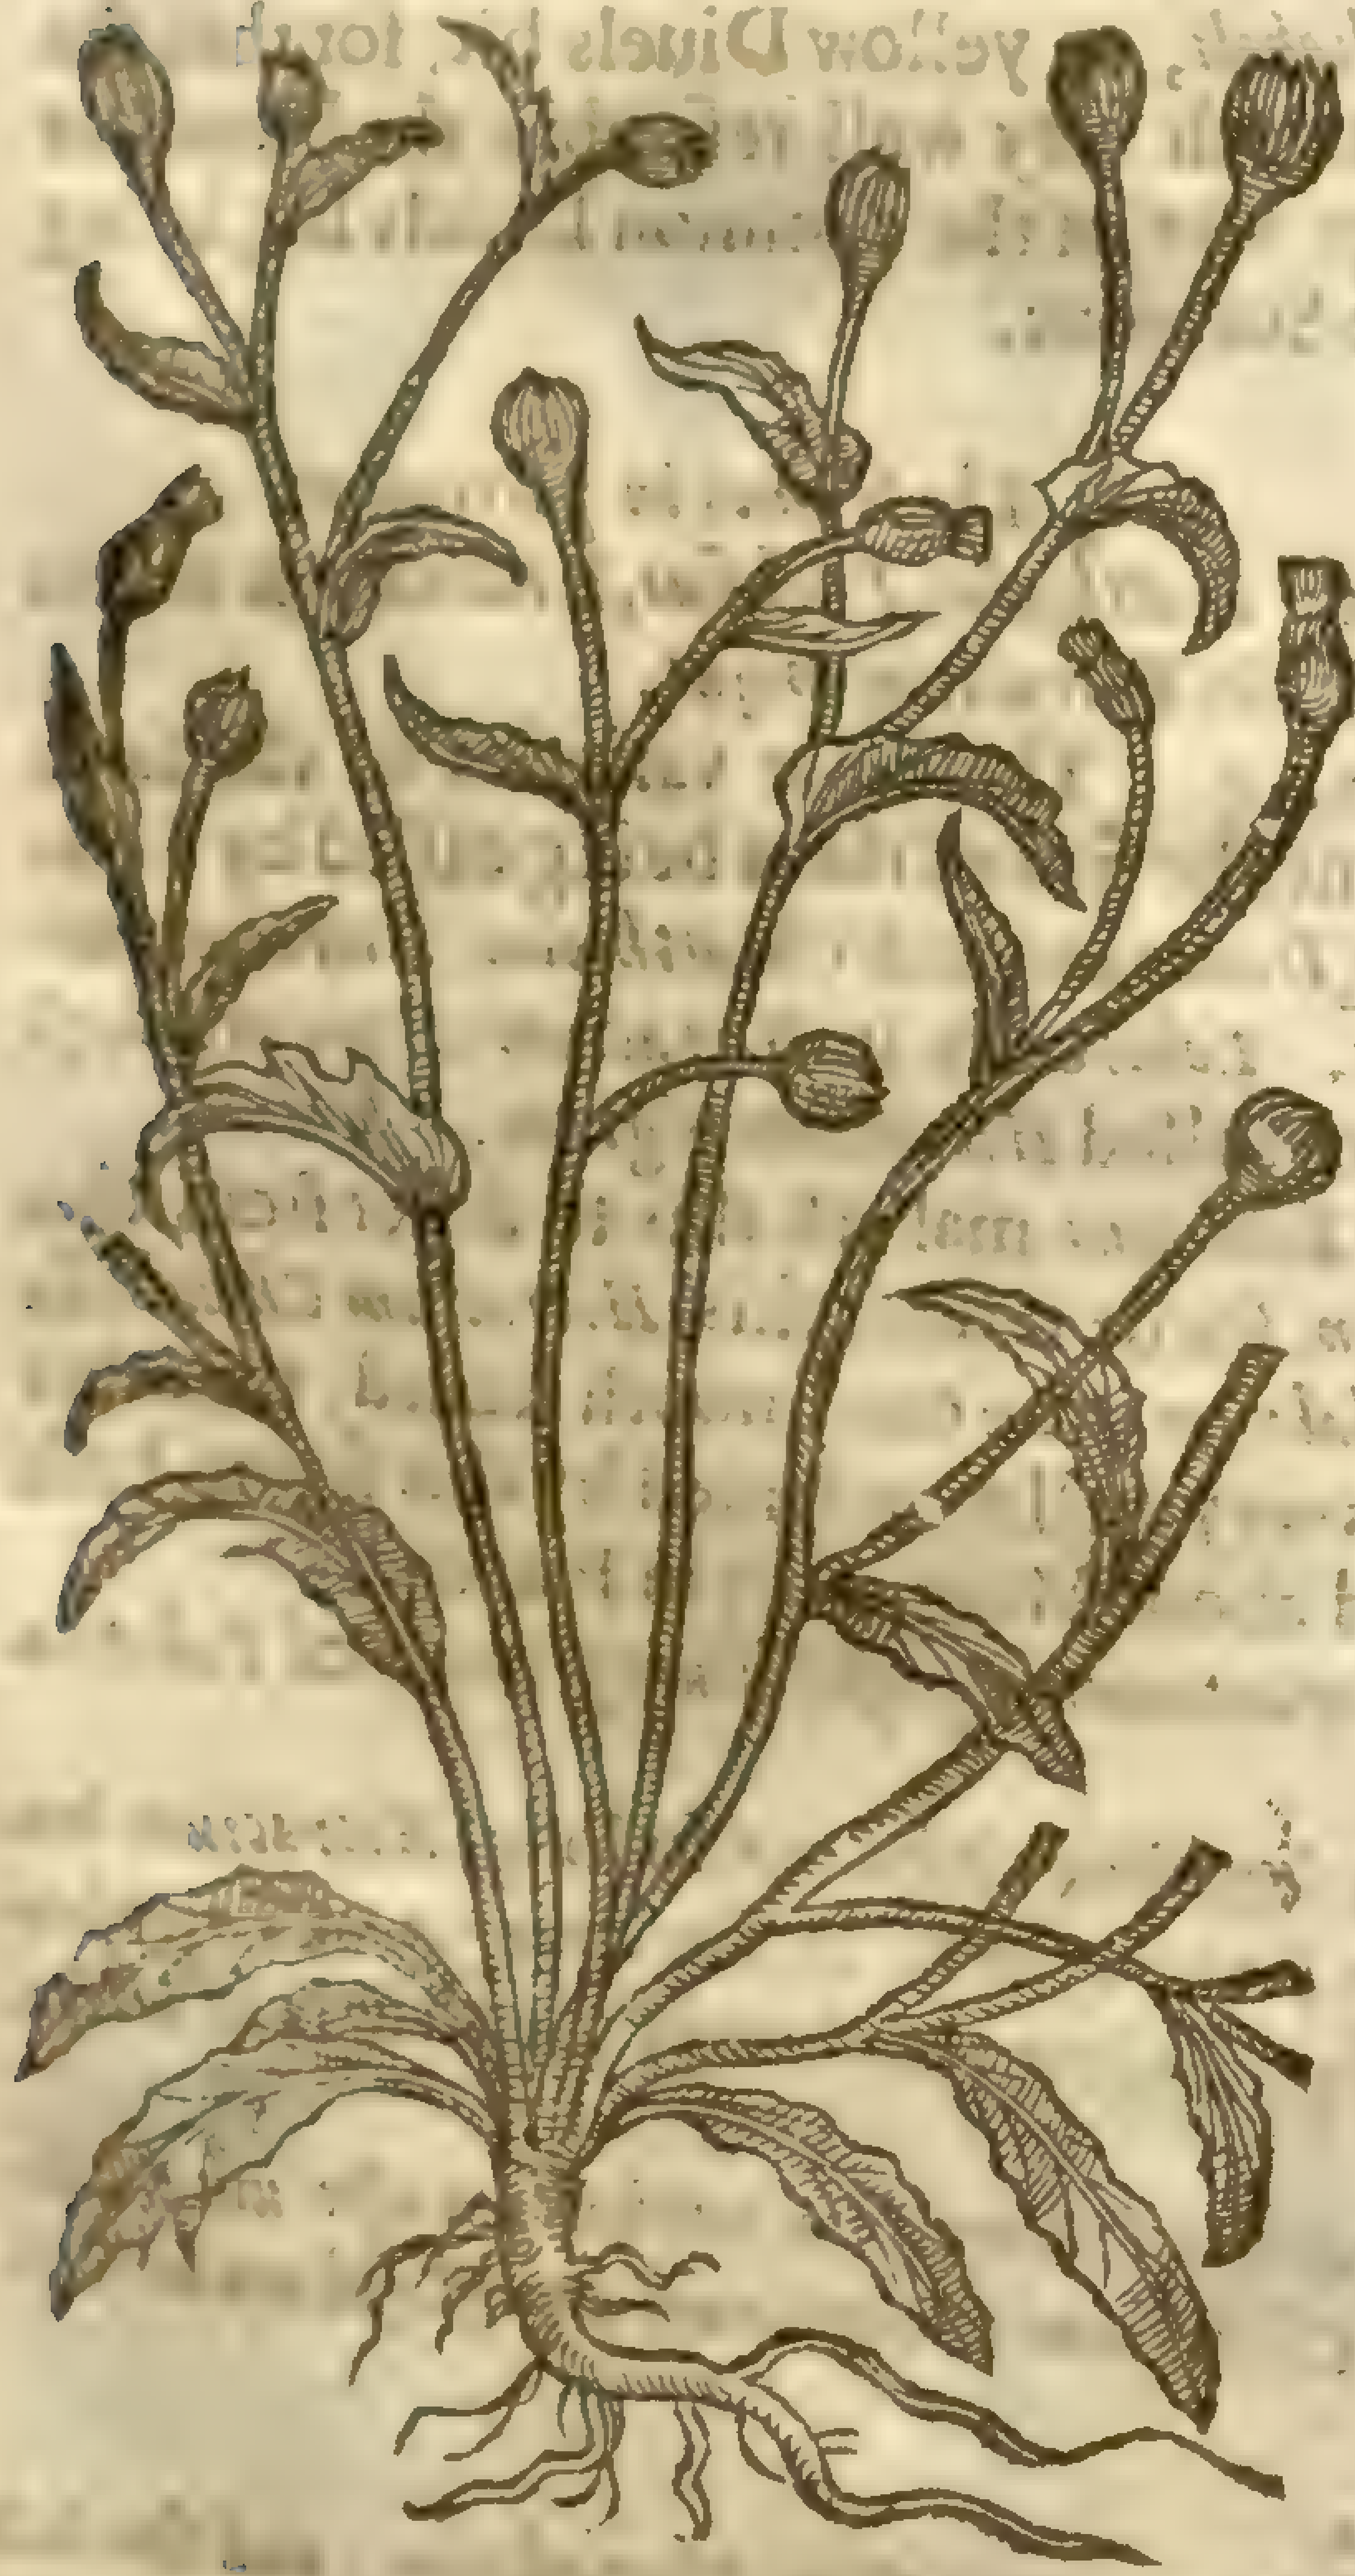
8 *Hieracium falcatum Lobelij.*
Crooked Hawk-weed.



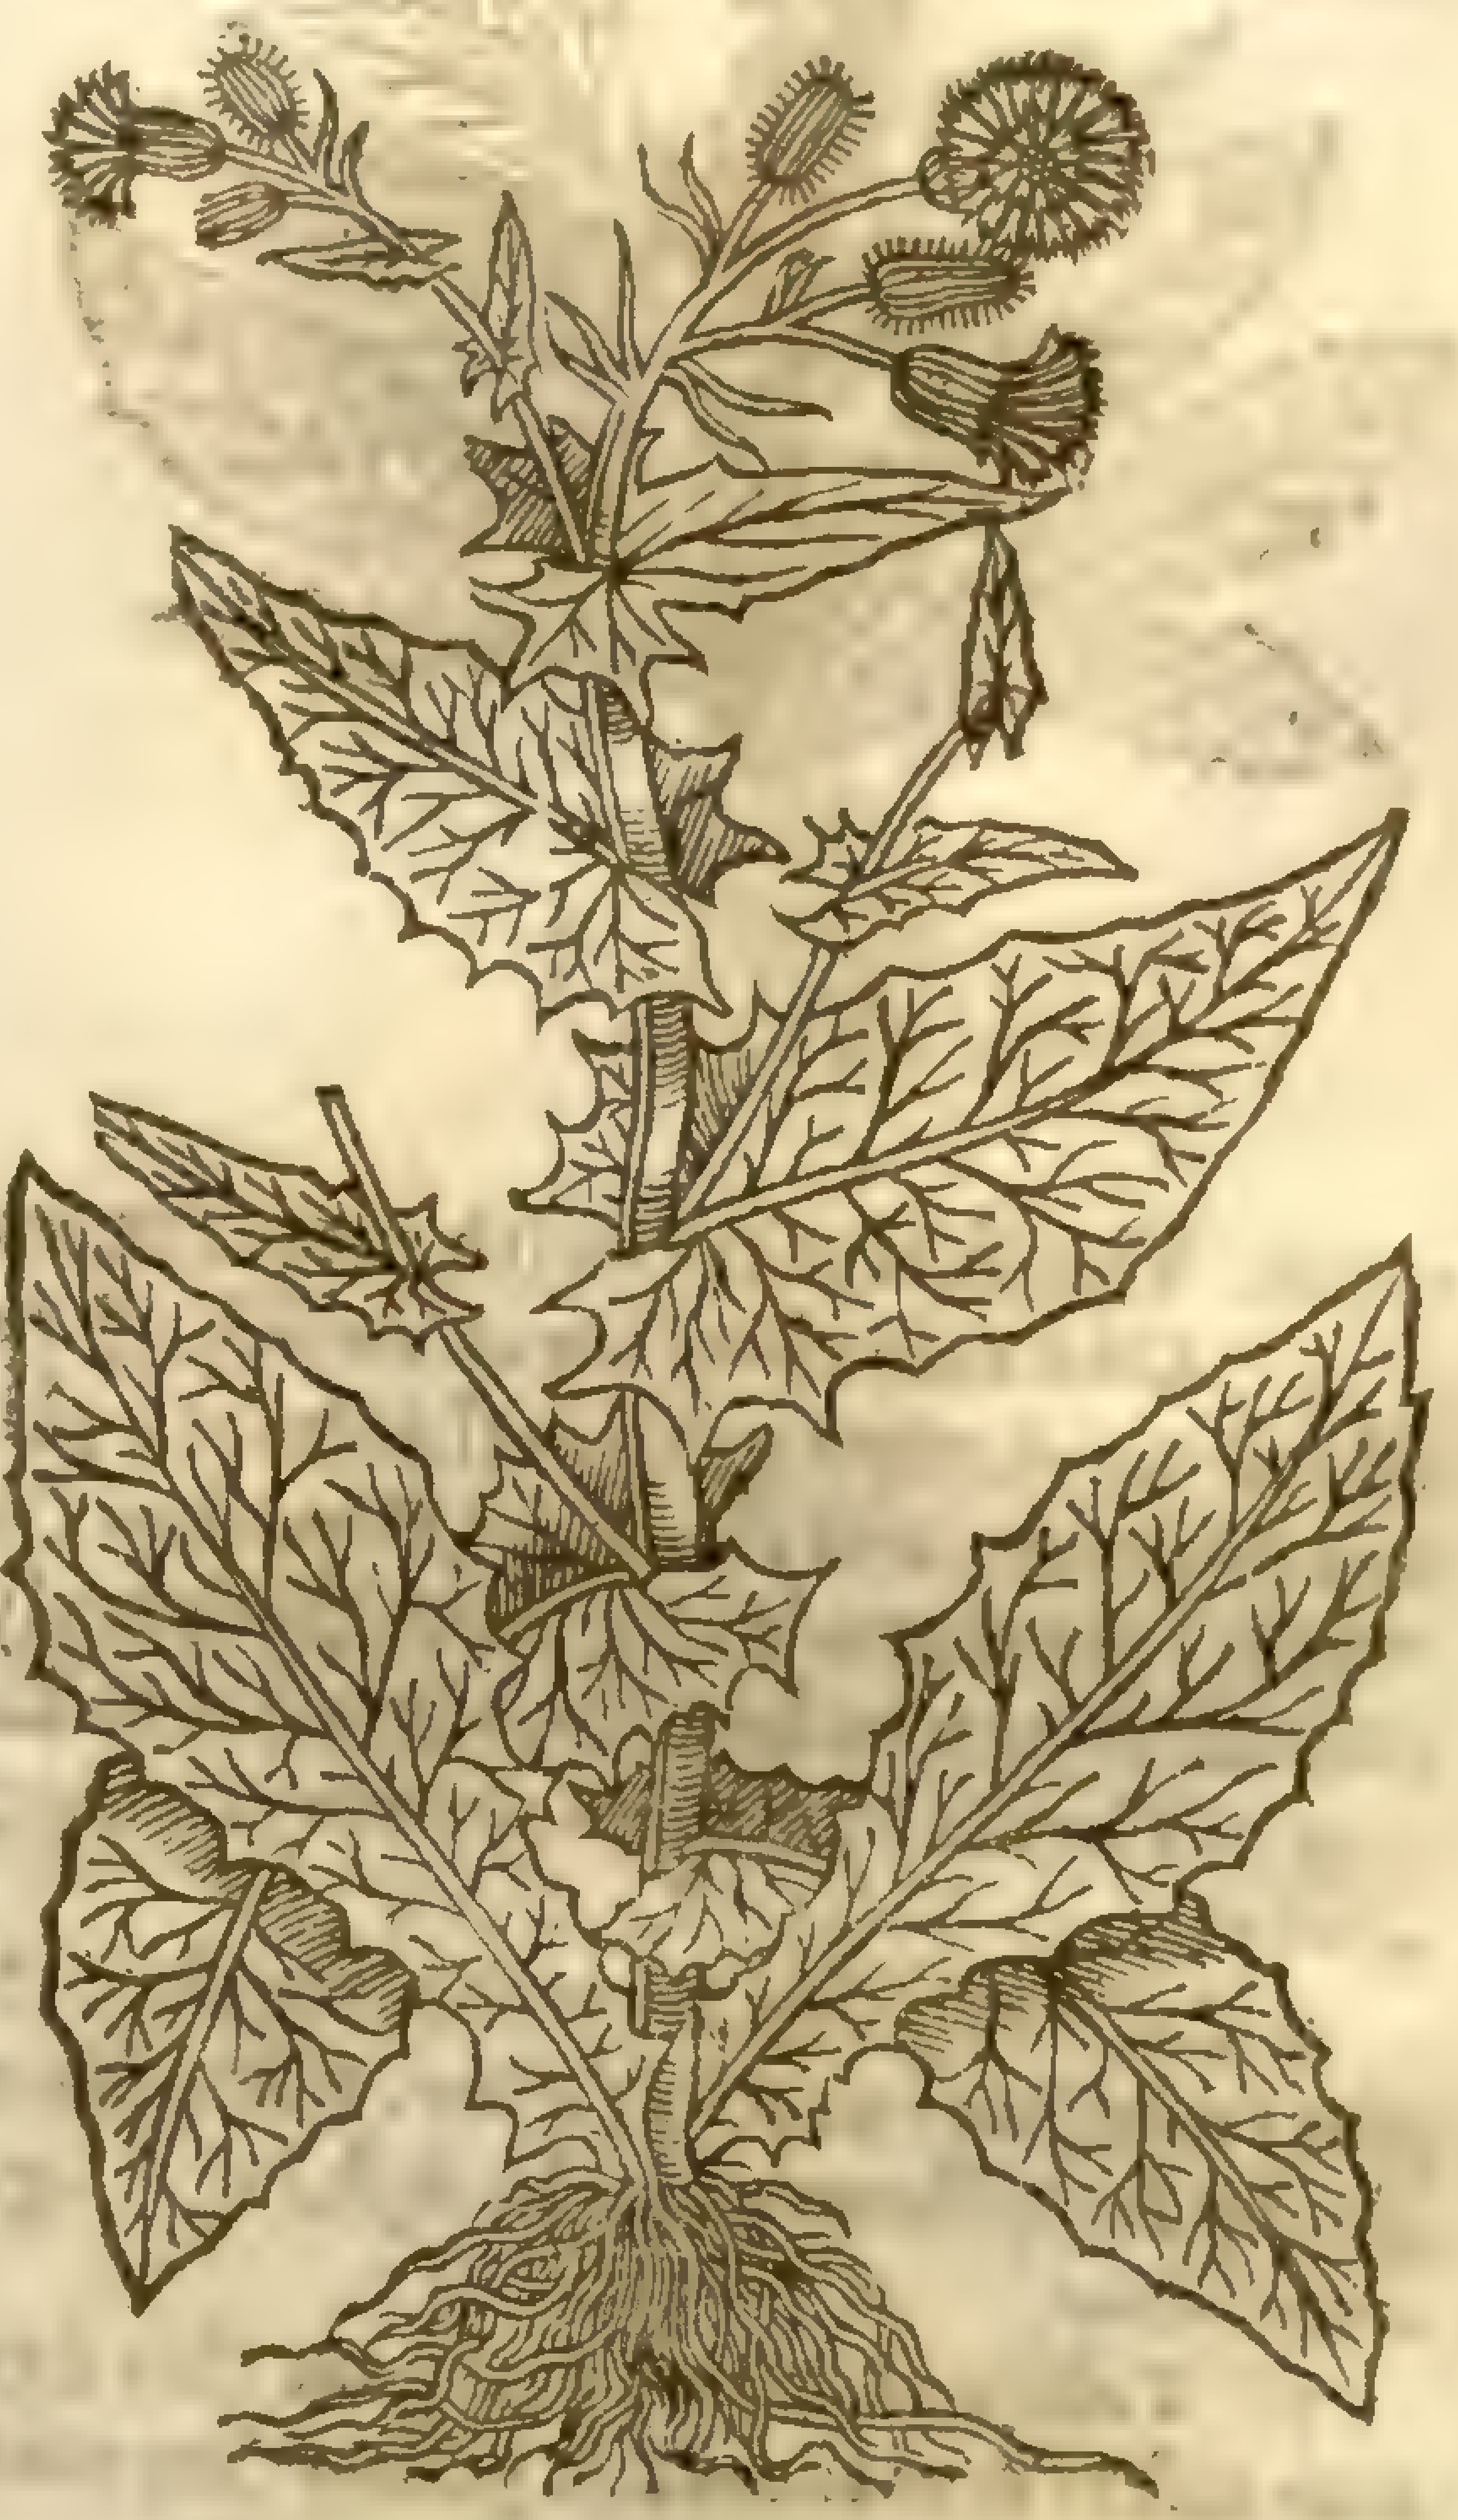
† 8 Crooked or falked Hawke-weed hath leaues like vnto the garden Succorie, yet much ſmaller, and leſſe diuided, ſleightly indented on both ſides, with tender weake and crooked ſtalks, whereupon grow floures like thoſe of *Lampſana*, of a black or pale yellow colour, and the root ſmal and threddy. The ſeeds are long, and falcated or crooked, ſo that they ſomewhat reſemble the foot or clawes of a bird, and from theſe ſeeds the plant hath this Epithit *Falcatum*, or crooked in maner of a Sicle or Sithe.

‡ 9 This in leaues is not much vnlike the laſt deſcribed, but that they are ſomwhat broader, and leſſe cut in, hauing little or no bitterneſſe, nor milkineſſe: the ſtalkes are ſome foot high, commonly bending or falling vpon the ground: the floures are ſmal and yellow, and ſeem to grow out of the midſt of the ſeed, when as indeed they grow at the top of them, the reſt being but an empty huske, which is falcated like that of the laſt deſcribed. This figure wee giue you was taken before the floures were blown, ſo that by that means the falcated or crooked ſeed-veſſels are not expreſt in this, but you may ſee their manner of growing by the former. ‡

† 9 *Hieracium falcatum alterum.*
The other crooked Hawkweed.



† 10 *Hieracium latifolium montanum.*
Broad leaued mountain Hawkweed.



10 The broad leaued mountain Hawkeweed hath broad long ſmooth leaues deeply indented toward the ſtalke, reſembling the leaues of the greateſt Sow-thiſtle. The ſtalke is hollow & ſpungeous, full of a milky juice, as is the reſt of the plant, as alſo all the other of his kinde: the floures grow at the top of the ſtalks, double and yellow.

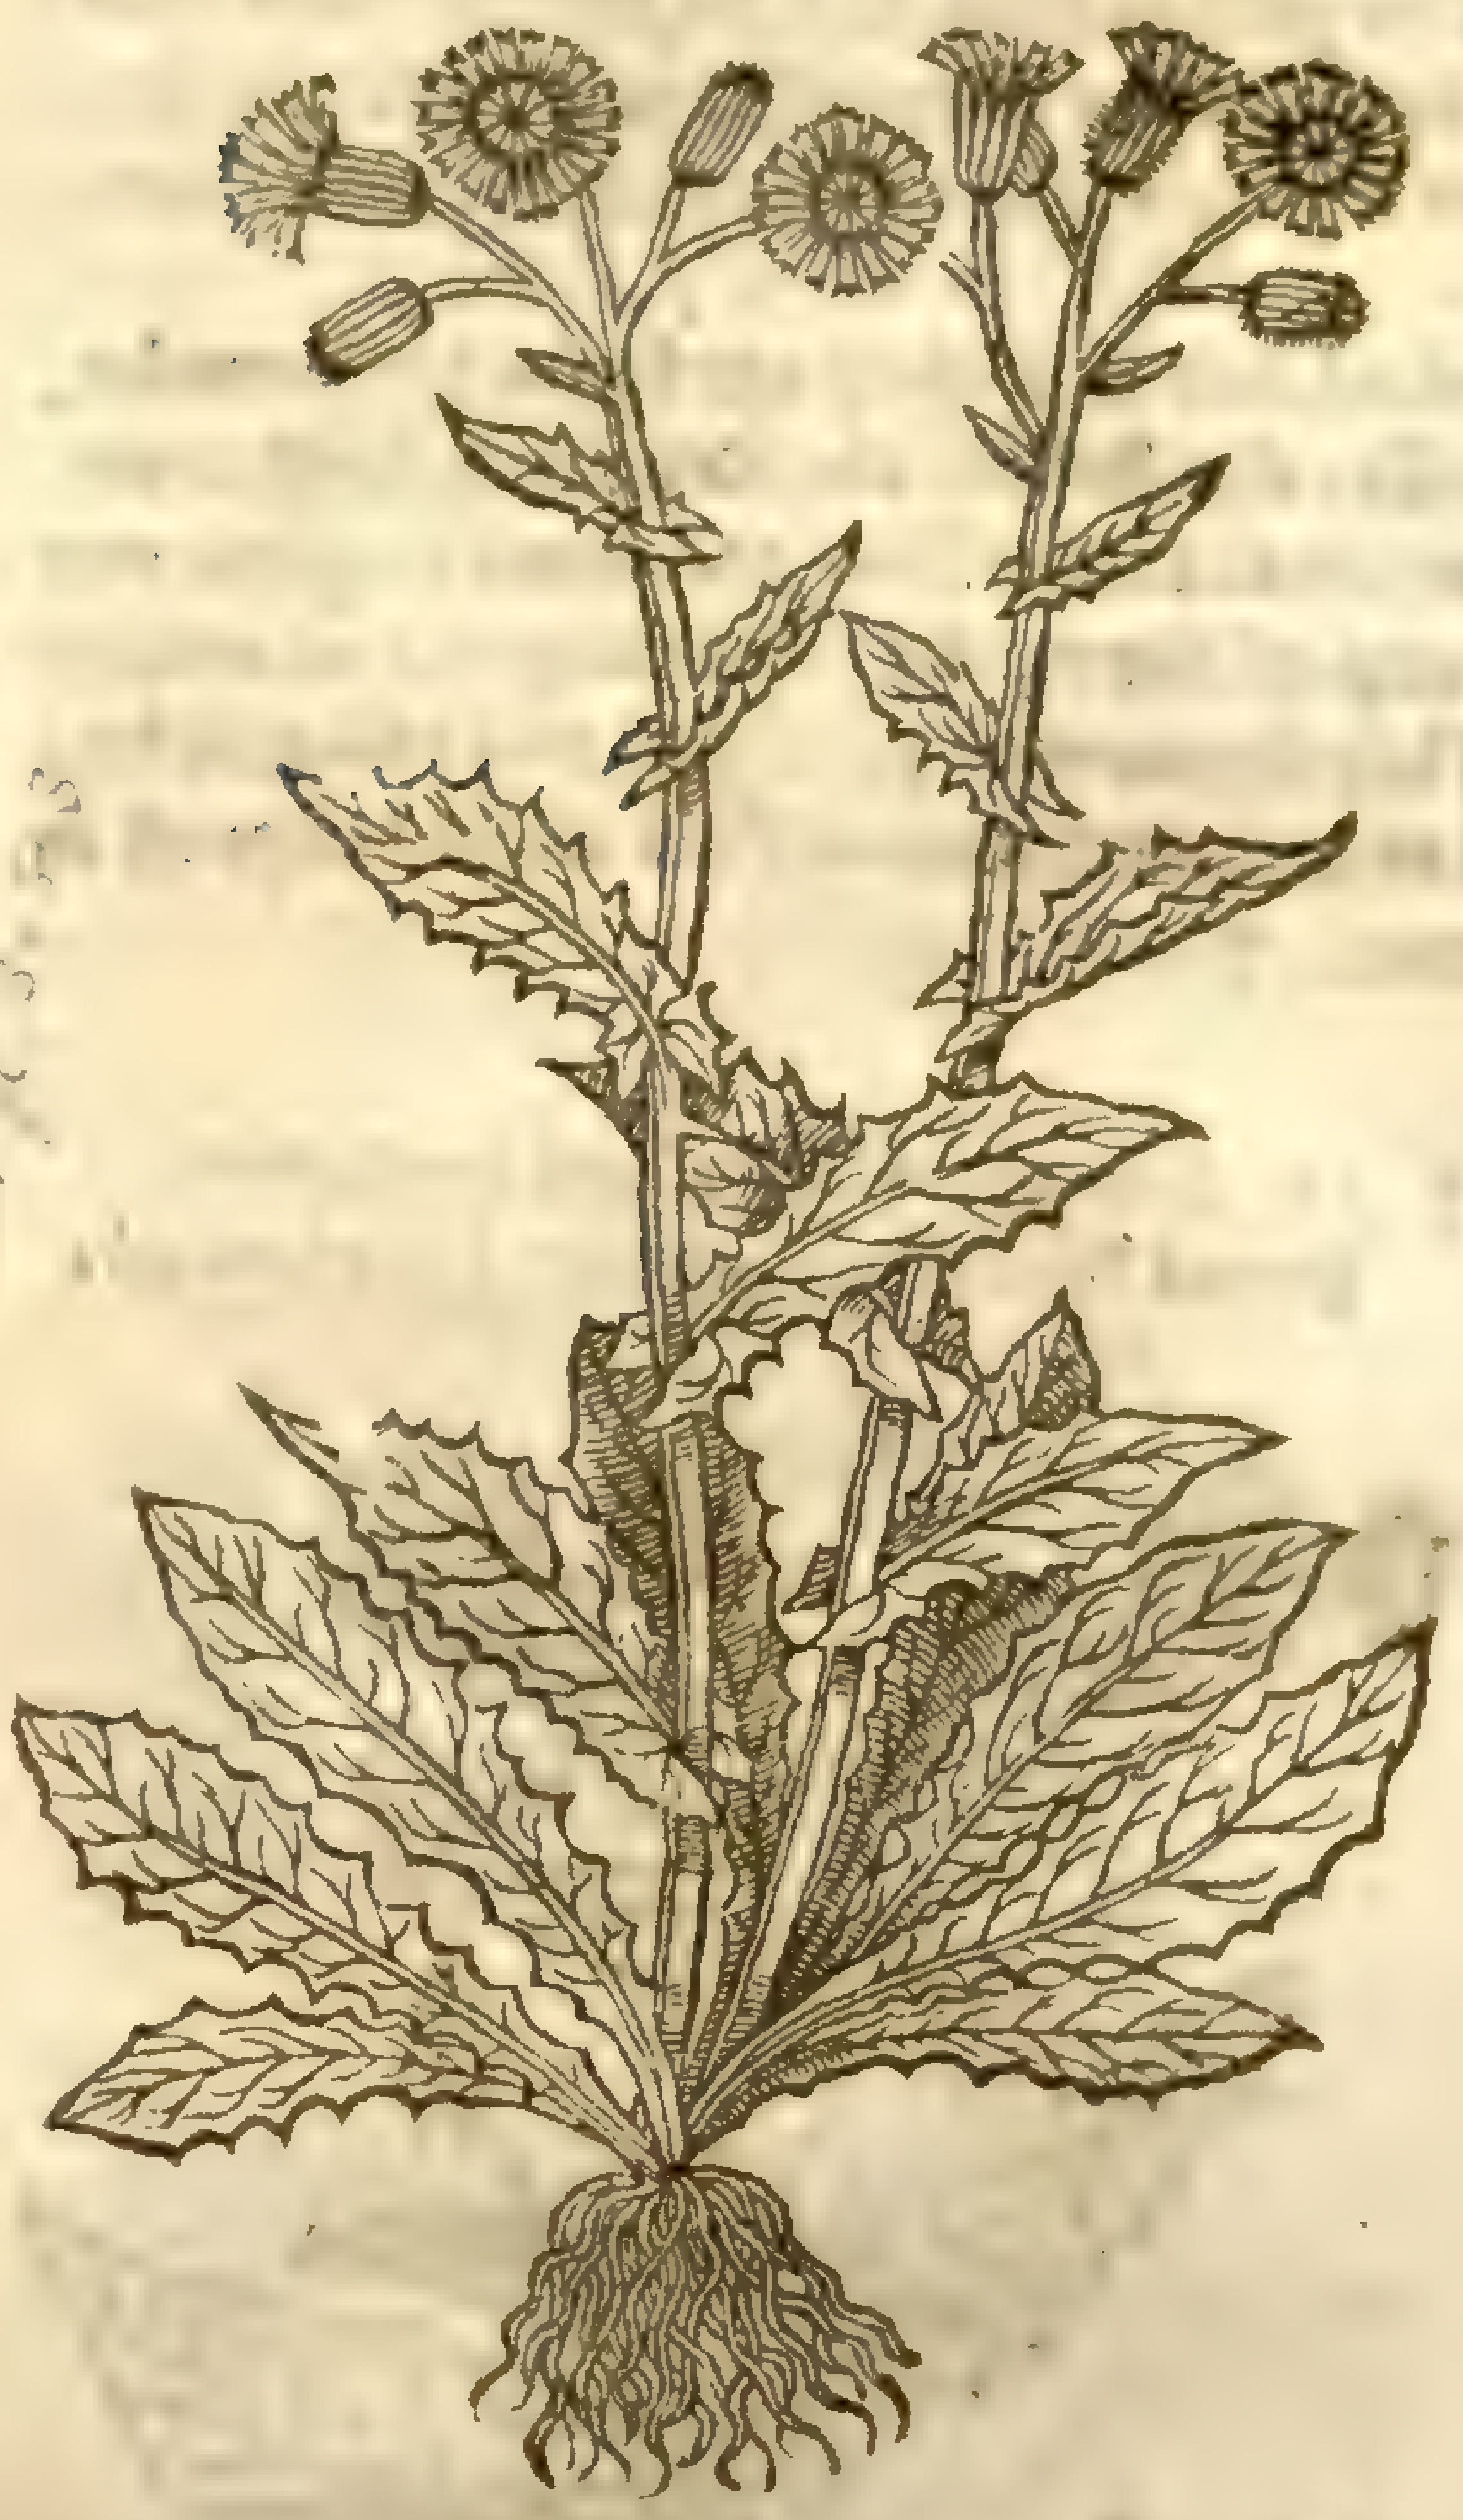
11 The narrow leaued mountaine Hawkeweed hath leaues like thoſe of the laſt deſcribed, but narrower. The ſtalks be fat, hollow, and full of milke: the floures grow at the top double, and yellow of colour. The root is ſmall and threddy.

There is a ſmall mountain Hawkweed hauing leaues like vnto the former, but more deeply cut about the edges, and ſharper pointed: the ſtalkes are tender and weake; the floures be double and yellow like thoſe of Piloſella or great Mouſe-eare: the root is ſmall and threddy.

¶ *The Place.*

Theſe kinds of herbs grow in vntoiled places neere vnto the borders of corn fields, in medowes, highwaies, woods, mountains, and hilly places, and neere to the brinks of ditches. ‡ The two falcated Hawkweeds grow only in ſome few gardens. ‡

11 *Hieracium montanum latifolium minus.*
The leſſer broad leaued mountain Hawkweed.



Hieracium paludoſum, in [illegible]

¶ *The Time.*

They floure for the moſt part all Summer long, ſome ſooner, ſome later.

¶ *The Names in generall.*

Theſe plants are all contained vnder the name of *Hieracium*, which is called in Greek alſo ἱεράκιον: diuers name it in Latine, *Accipitrina*; which is termed in French, *Cichoree iaulne*: in Engliſh, Hawkeweed. Theſe herbes took their name from a Hawke, which is called in Latine *Accipiter*, and in Greeke, ἱέραξ; for they are reported to cleare their ſight by conueying the juice hereof into their eyes. *Gaza* calleth it *Porcellia*; for it is numbred amongſt the Succories: they are called alſo *Lampuca*.

Yellow Hawkweed is called of ſome, *Morſus diaboli*, or yellow Diuels bit, for that the root doth very well reſemble the bitten or cropt root of the common Diuels bit, being like Scabious.

‡ ¶ *The Names in particular.*

1 *Matthiolus*, *Fuchſius*, *Dodonæus* & others call this *Hieracium majus*.

2, 3. Theſe are varieties of the ſame plant, the firſt of them being called by *Fuchſius*, *Dodonæus*, and *Matthiolus*, *Hieracium minus*. *Lobel* calls it, *Hieracium minus præmorſa radice*. That ſort of this with more cut leaues is by *Tabern.* called *Hieracium nigrum*.

4 *Lobel* calls this, *Hieracium folijs & facie Chondrillæ*: *Bauhinus* maketh this to differ from that which our Author gaue in this fourth place out of *Tabern.* for he termes this, *Hieracium Chondrillæ folio hirſutum*; and the other, *Hieracium Chondrillæ folio Glabrum*; the one ſmooth leaued, the other rough; yet that which growes frequently with vs, and is very well repreſented by this figure, hath ſmooth leaues, as he alſo obſerued it to haue in Italy, and about Montpelier in France.

5 This is *Hieracium alterum grandius*, and *Hieracium montanum anguſtifolium primum* of *Tabernamontanus*.

6 *Lobel* cals this, from the length of the root (though ſomtimes it be not ſo long) *Hieracium longius radicatum*: as alſo *Tabern. Hieracium macrorhizon*: it is thought to be the *Apargia* of *Theophraſtus*, by *Daleſchampius*, in the *hiſt. Lugd. pag.* 562. but the figure there that beares the title is of *Hieracium minus*.

7 *Tabernamontanus* firſt gaue this figure, vnder the name of *Hieracium intybaceum aſperum*: *Bauhine* refers it to the wilde yellow Succories, and calls it *Cichoreum Montanum anguſtifolium hirſutum aſperum*.

8 *Lobel* calls this, *Hieracium Narbonenſe falcata ſiliqua*.

9 He calls this, *Hieracium facie Hedypnois*: and *Cæſalpinus* termes this, *Rhagadiolus*: and the laſt mentioned, *Rhagadiolus alter*.

10 This by *Tabern.* is called *Hieracium montanum majus latifolium*. The figure of this was giuen by our Author, Chap. 30. vnder the title of *Chondrilla Hiſpanica*.

11 *Tabernamontanus* alſo ſtiles this, *Hieracium montanum latifolium minus*.

¶ *The Temperature.*

The kindes of Hawkweed are cold and dry, and ſomewhat binding.

¶ *The Vertues.*

A They are in vertue and operation like to *Sonchus* or Sow-Thiſtle, and being vſed after the ſame manner, be as good to all purpoſes that it doth ſerue vnto.

B They be good for the eye-ſight, if the iuyce of them be dropped into the eies, eſpecially of that called Diuels bit, which is thought to be the beſt, and of greateſt force.

Therefore

The refore as *Dioſcorides* writeth, it is good for an hot ſtomacke, and for inflammations if it bee laid vpon them. C

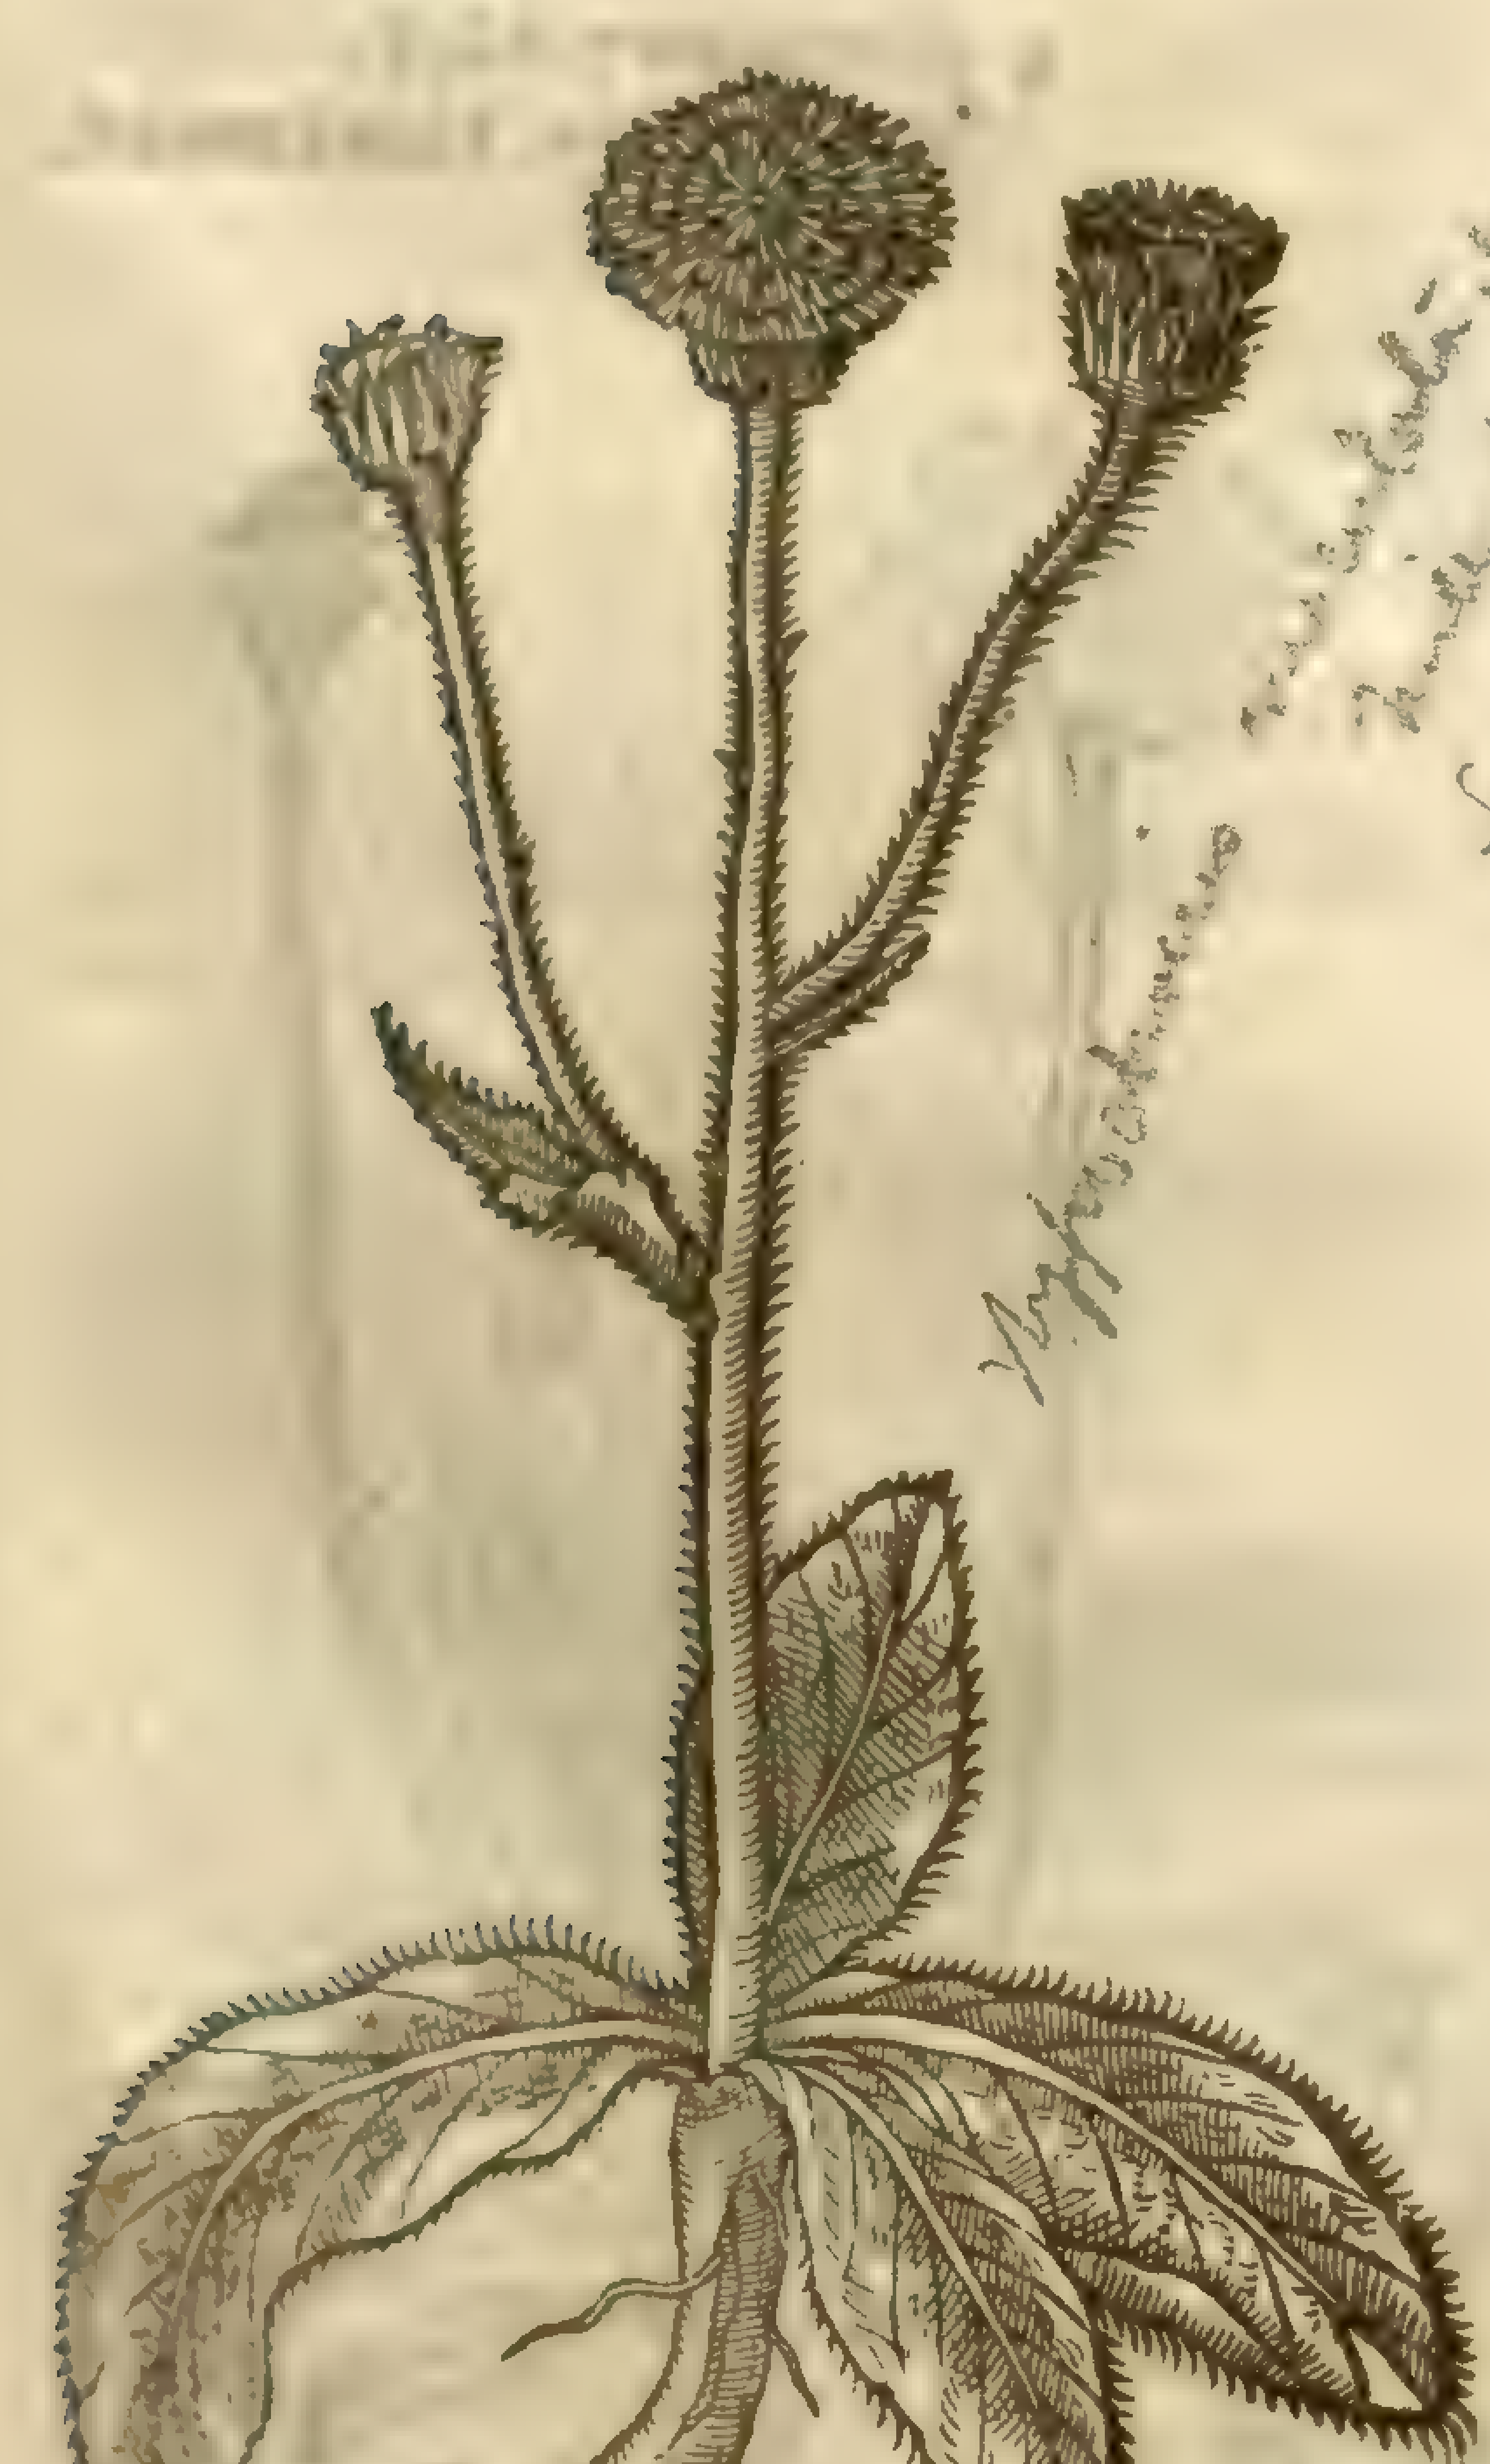
The herbe and root being ſtamped and applied, is a remedie for thoſe that be ſtung of the ſcorpion; which effect not onely the greater Hawkeweeds, but the leſſer ones alſo do performe. D

CHAP. 35. *Of* Cluſius *his Hawkeweeds.*

¶ *The Kindes.*

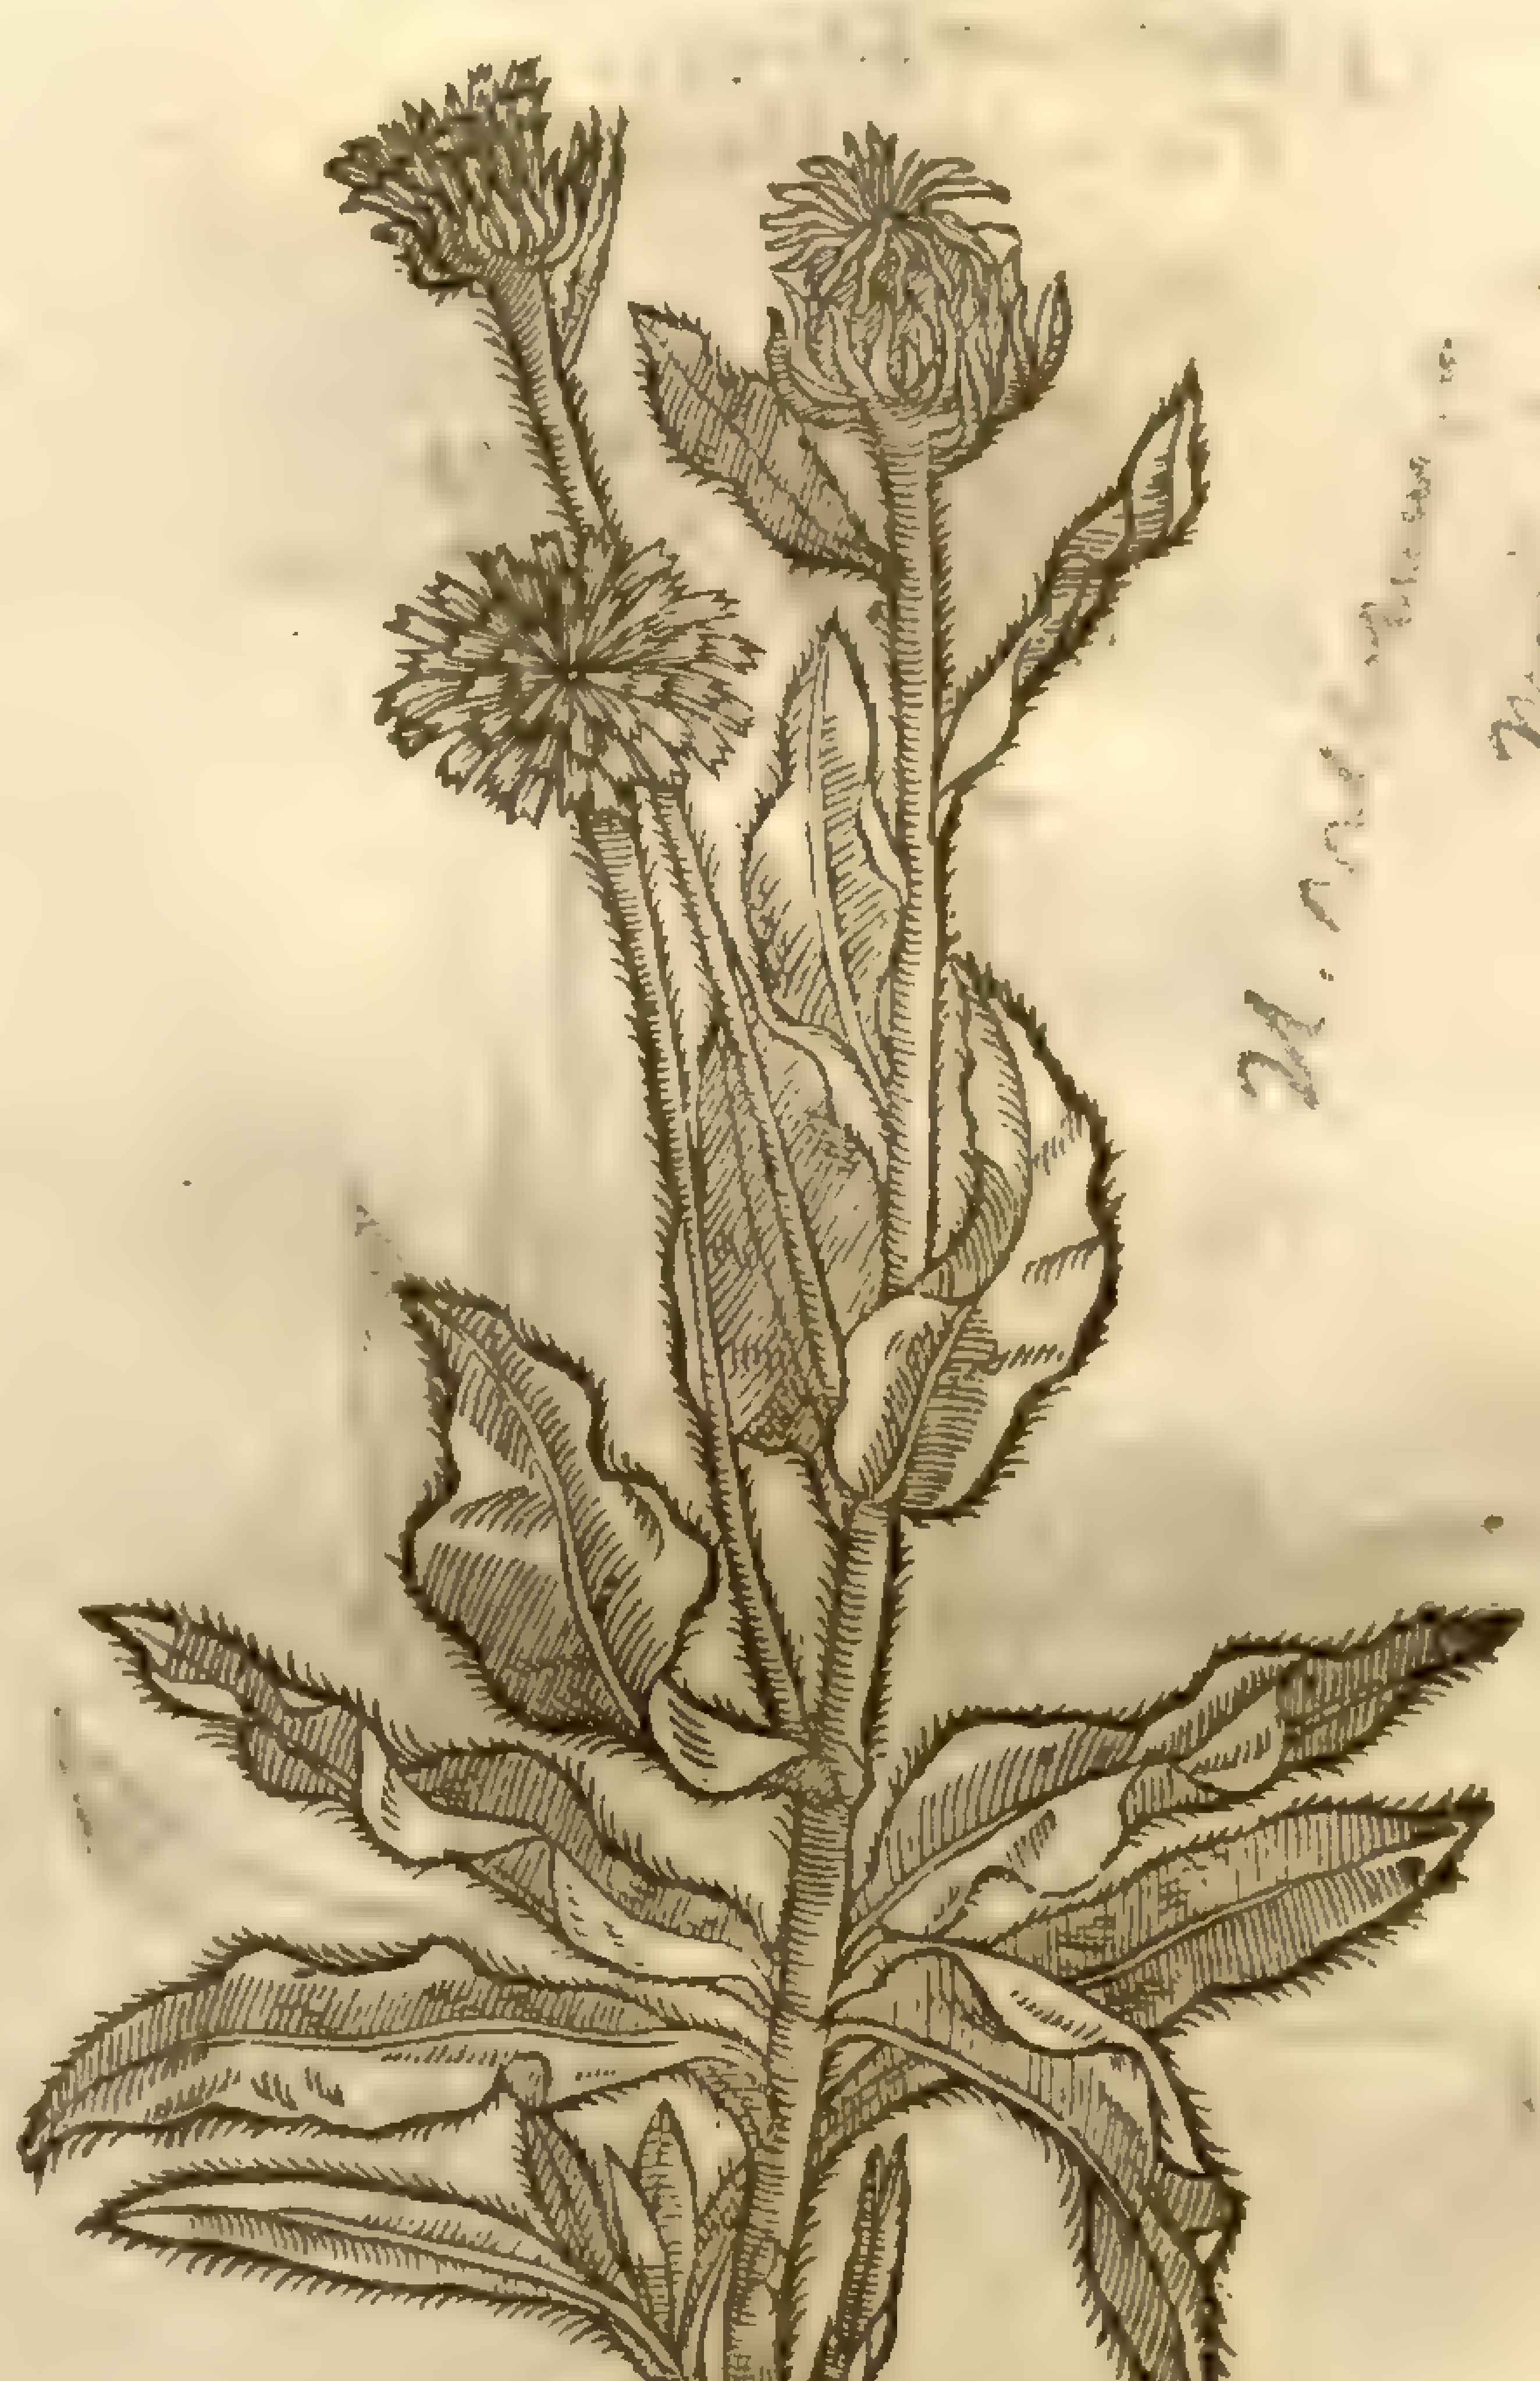
THere be likewiſe other ſorts of Hawkeweeds, which *Carolus Cluſius* hath ſet forth in his Pannonicke obſeruations, the which likewiſe require a particular chapter, for that they doe differ in forme very notably.

1 *Hieracium primum latifolium Cluſij.*
The firſt Hawkeweed of *Cluſius.*



Hypochæris [illegible]
[illegible]
Sm. Fl. B. 3. [illegible]

2 *Hieracium 5. Cluſij.*
Cluſius his 5. kinde of Hawkeweed.



H. molle [illegible]
[illegible]
Sm. Fl. 3. [illegible]

¶ *The Deſcription.*

1 THe firſt of *Cluſius* his Hawkeweeds hath great broad leaues ſpread vpon the ground, ſomewhat hairie about the edges, oftentimes a little jagged, alſo ſoft as is the leafe of Mullen or Higtaper, and ſometimes daſht here and there with ſome blacke ſpots, in ſhape like the garden Endiue, full of a milkie juice: among which riſeth vp a thicke hollow ſtalke of a cubit high, diuiding it ſelfe at the top into two or three branches, whereupon do grow ſweet ſmelling floures not vnlike to thoſe of yellow Succorie, ſet or placed in a blacke hoarie and woolly cup or huske, of a pale bleake yellow colour, which turneth into a downie blowball that is carried away with the winde: the root entereth deeply into the ground, of the bigneſſe of a finger, full of milke, and couered with a thicke blacke barke.

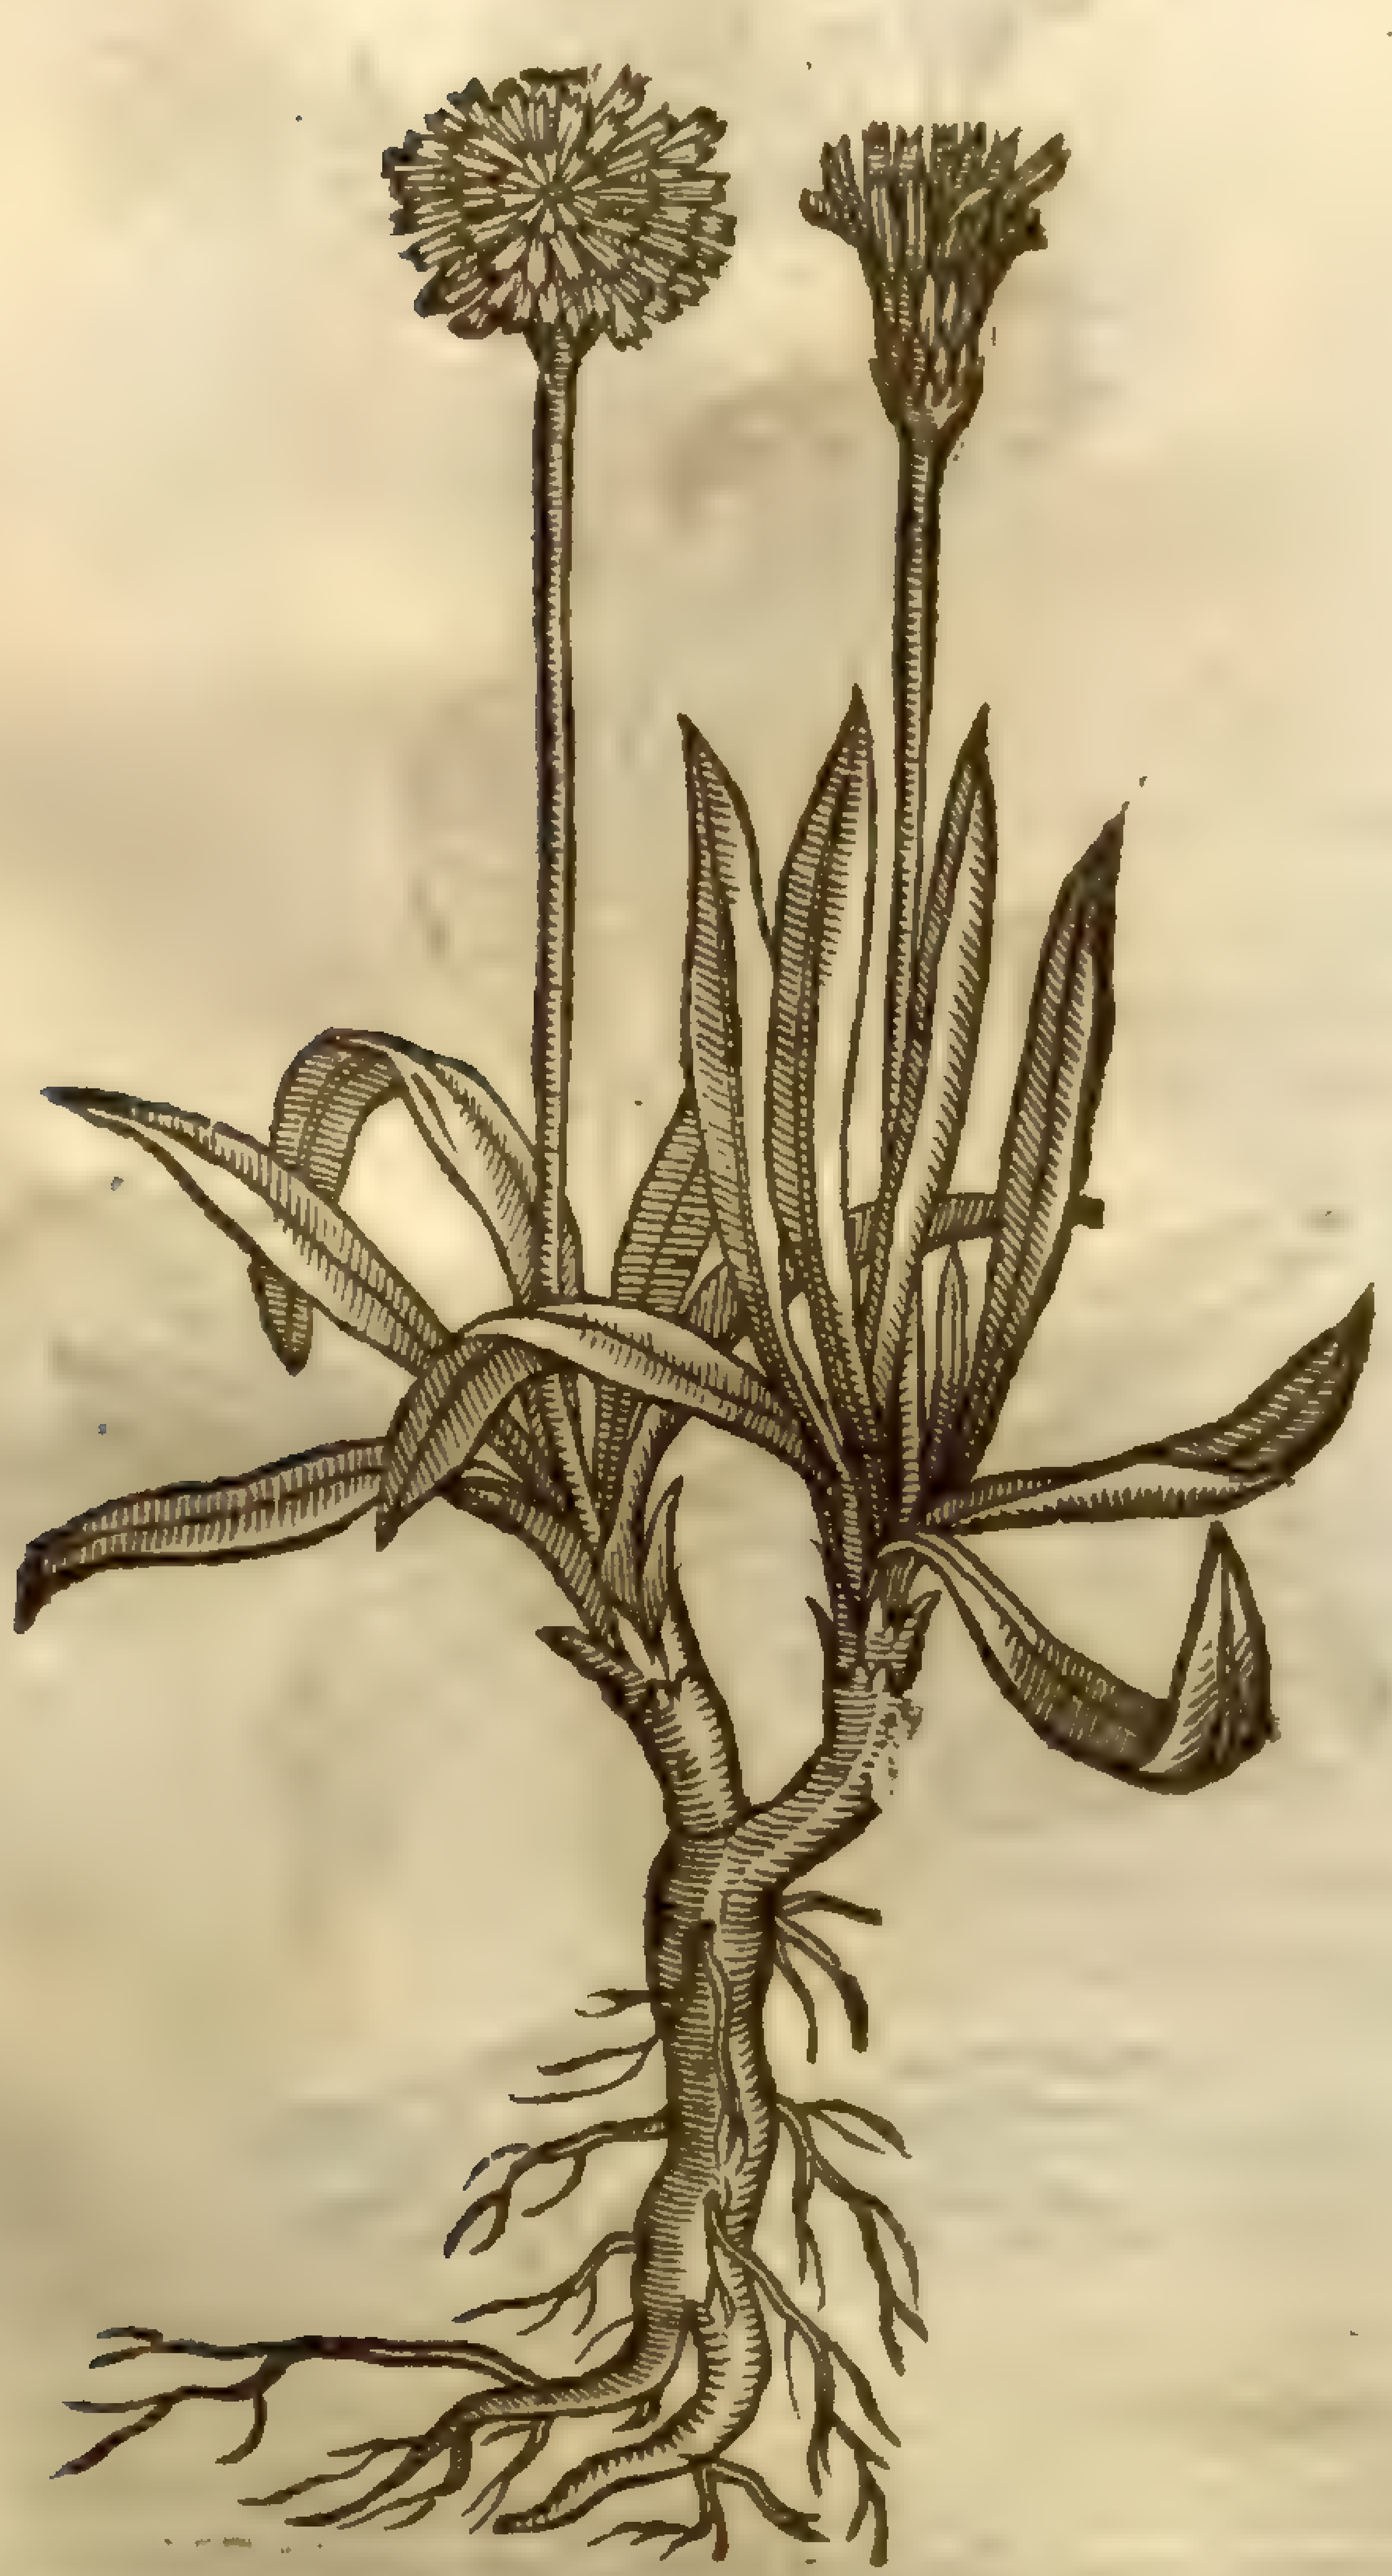
2 The ſecond ſort of great Hawkeweed according to my computation, and the 5. of *Cluſius*, hath leaues like the former, that is to ſay, ſoft and hoarie, and as it were couered with a kinde of

white woollineſſe or hairineſſe, bitter in taſte, of an inch broad. The ſtalke is a foot high, at the top whereof doth grow one yellow floure like that of the great Hawkweed, which is carried away with the winde when the ſeed is ripe. The root is blacke and full of milkie juice, and hath certain white ſtrings annexed thereto.

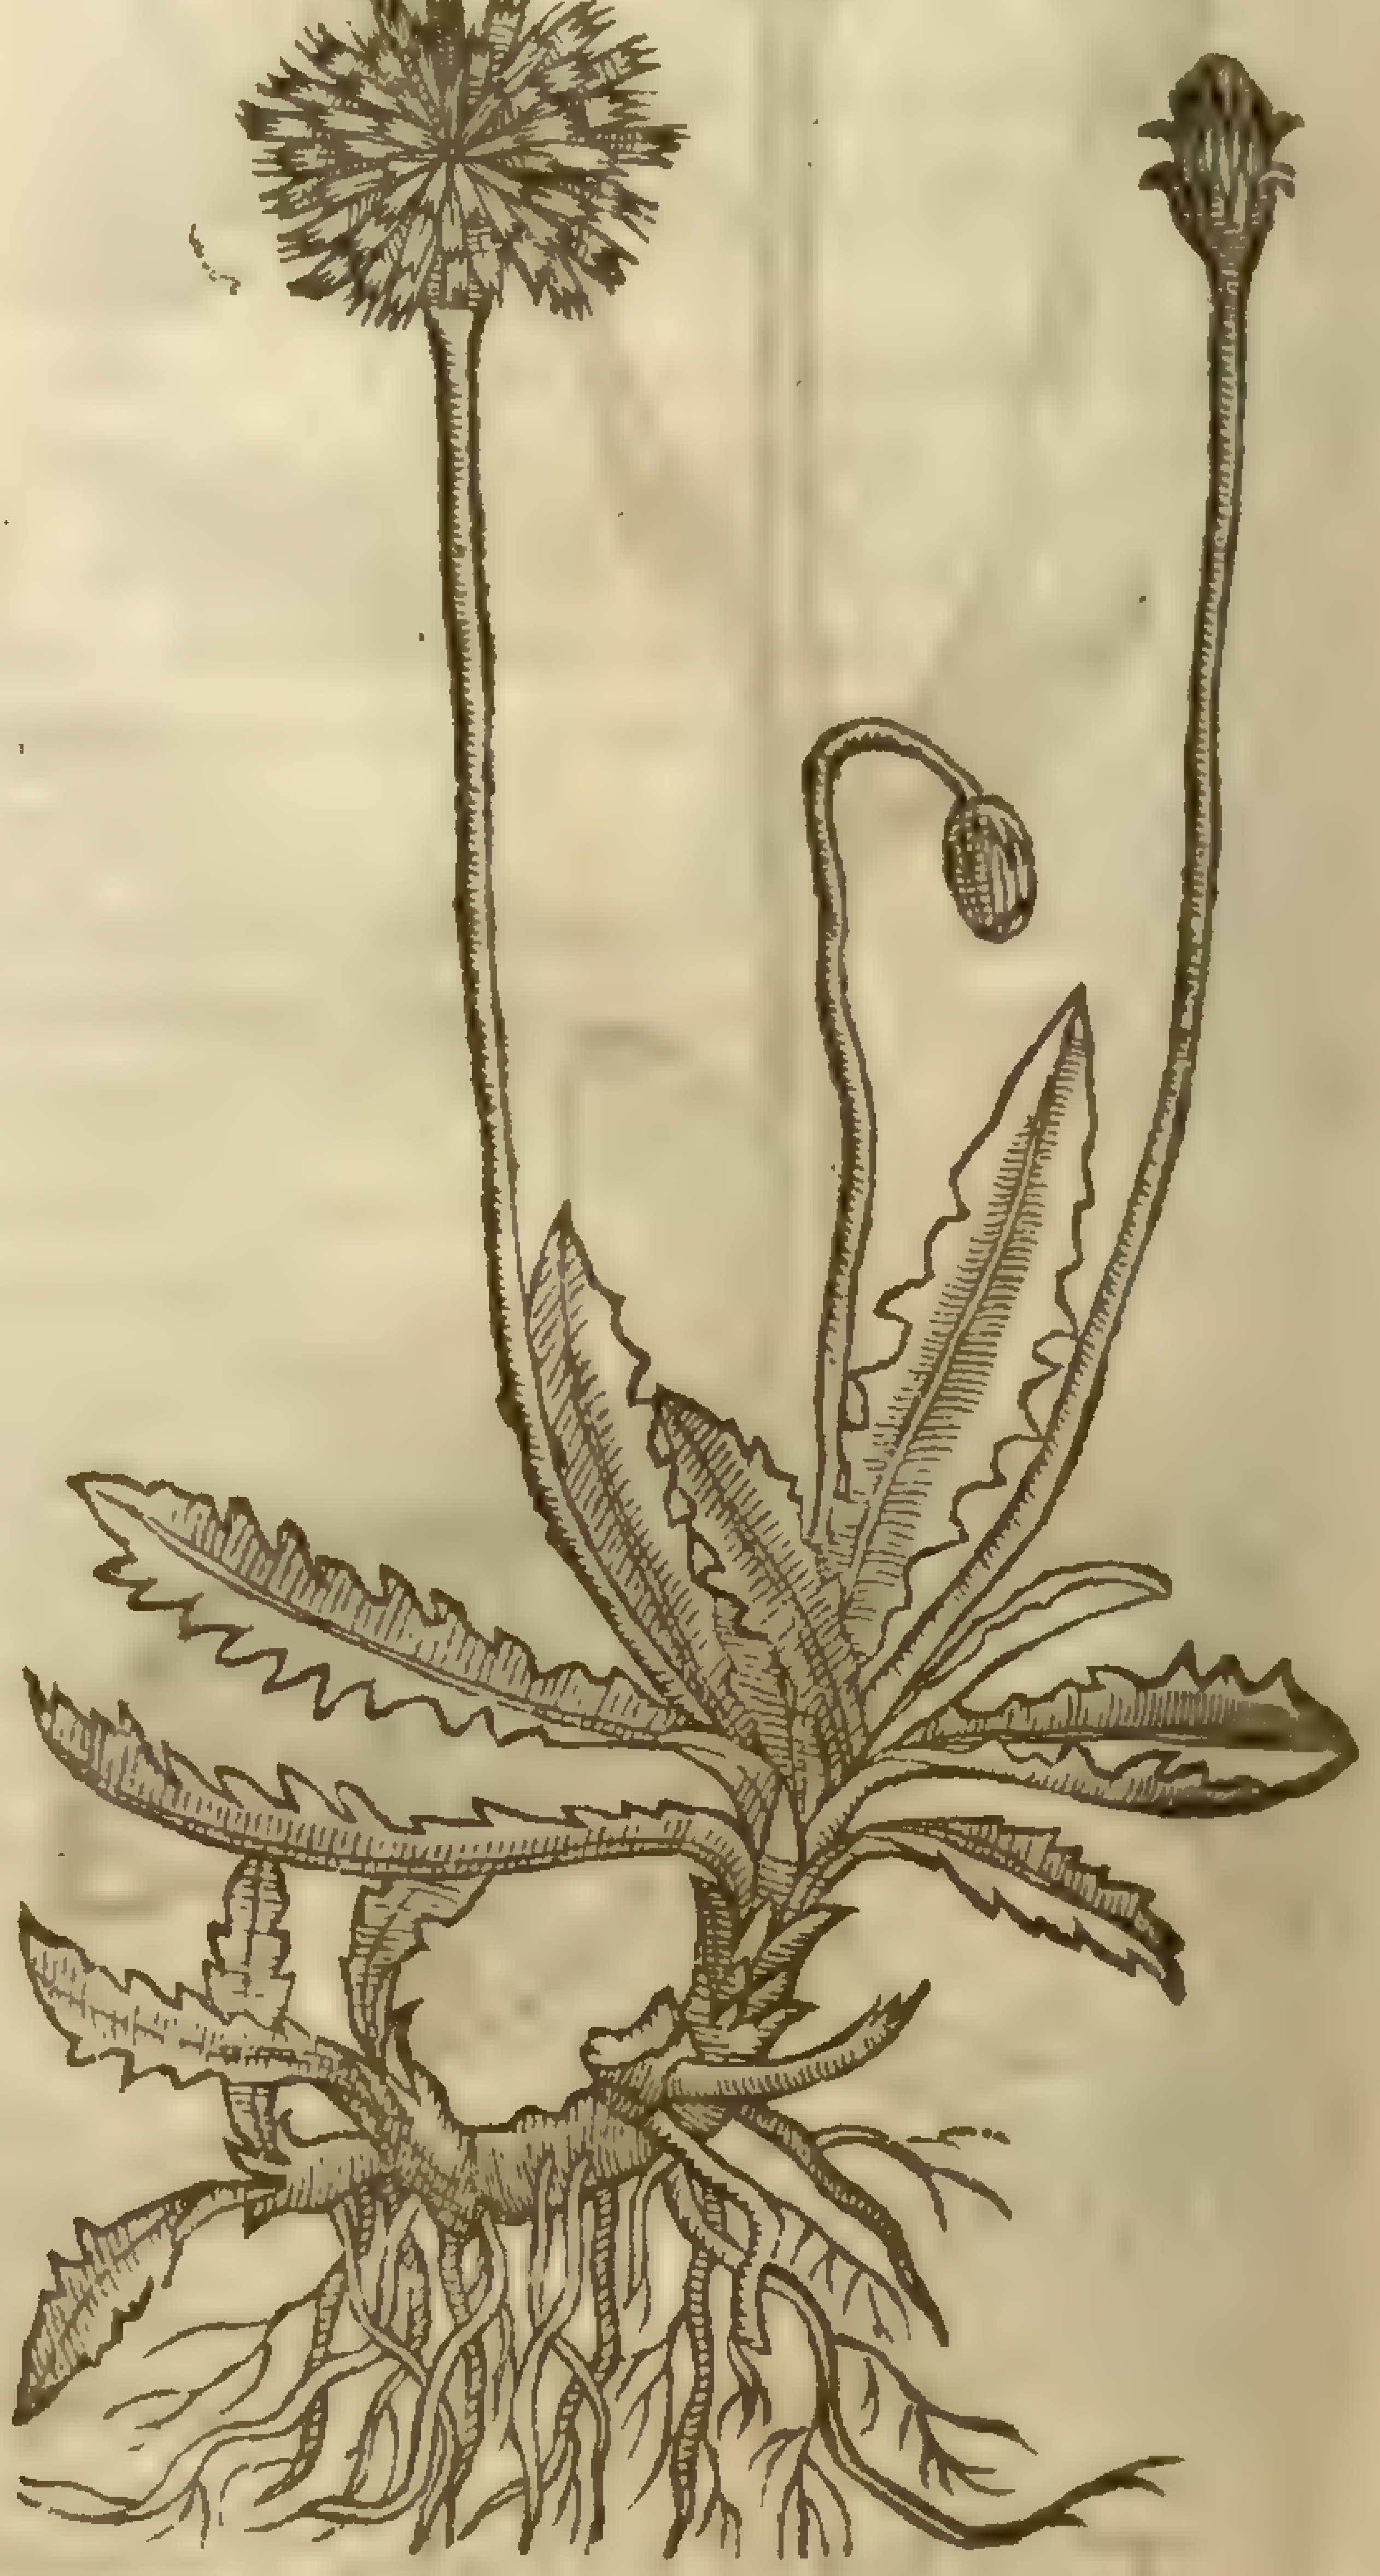
3 This kinde of Hawkeweed hath blacke roots a finger thicke, full of milkie juice, deepely thruſt into the ground, with ſome ſmall fibres belonging thereto: from which come vp many long leaues halfe an inch or more broad, couered with a ſoft downe or hairineſſe, of an ouerworne ruſſet colour: and amongſt the leaues come vp naked and hard ſtalks, whereupon do grow yellow floures ſet in a woollie cup or chalice, which is turned into downe, and carried away with his ſeed by the winde.

4 The fourth Hawkeweed hath a thicke root aboue a finger long, blackiſh, creeping vpon the top of the ground, and putting out ſome fibres, and it is diuided into ſome heads, each whereof at the top of the earth putteth out ſome ſix or ſeuen longiſh leaues ſome halfe an inch broad, and ſomewhat hoarie, hairie, and ſoft as are the others precedent, and theſe leaues are ſnipt about the edges, but the deepeſt gaſhes are neereſt the ſtalkes, where they are cut in euen to the middle rib, which is ſtrong and large. The ſtalke is ſmooth, naked, and ſomewhat high: the floures be yellow and double as the other.

3 *Hieracium 6. Cluſij.*
Cluſius his 6 Hawkeweed.



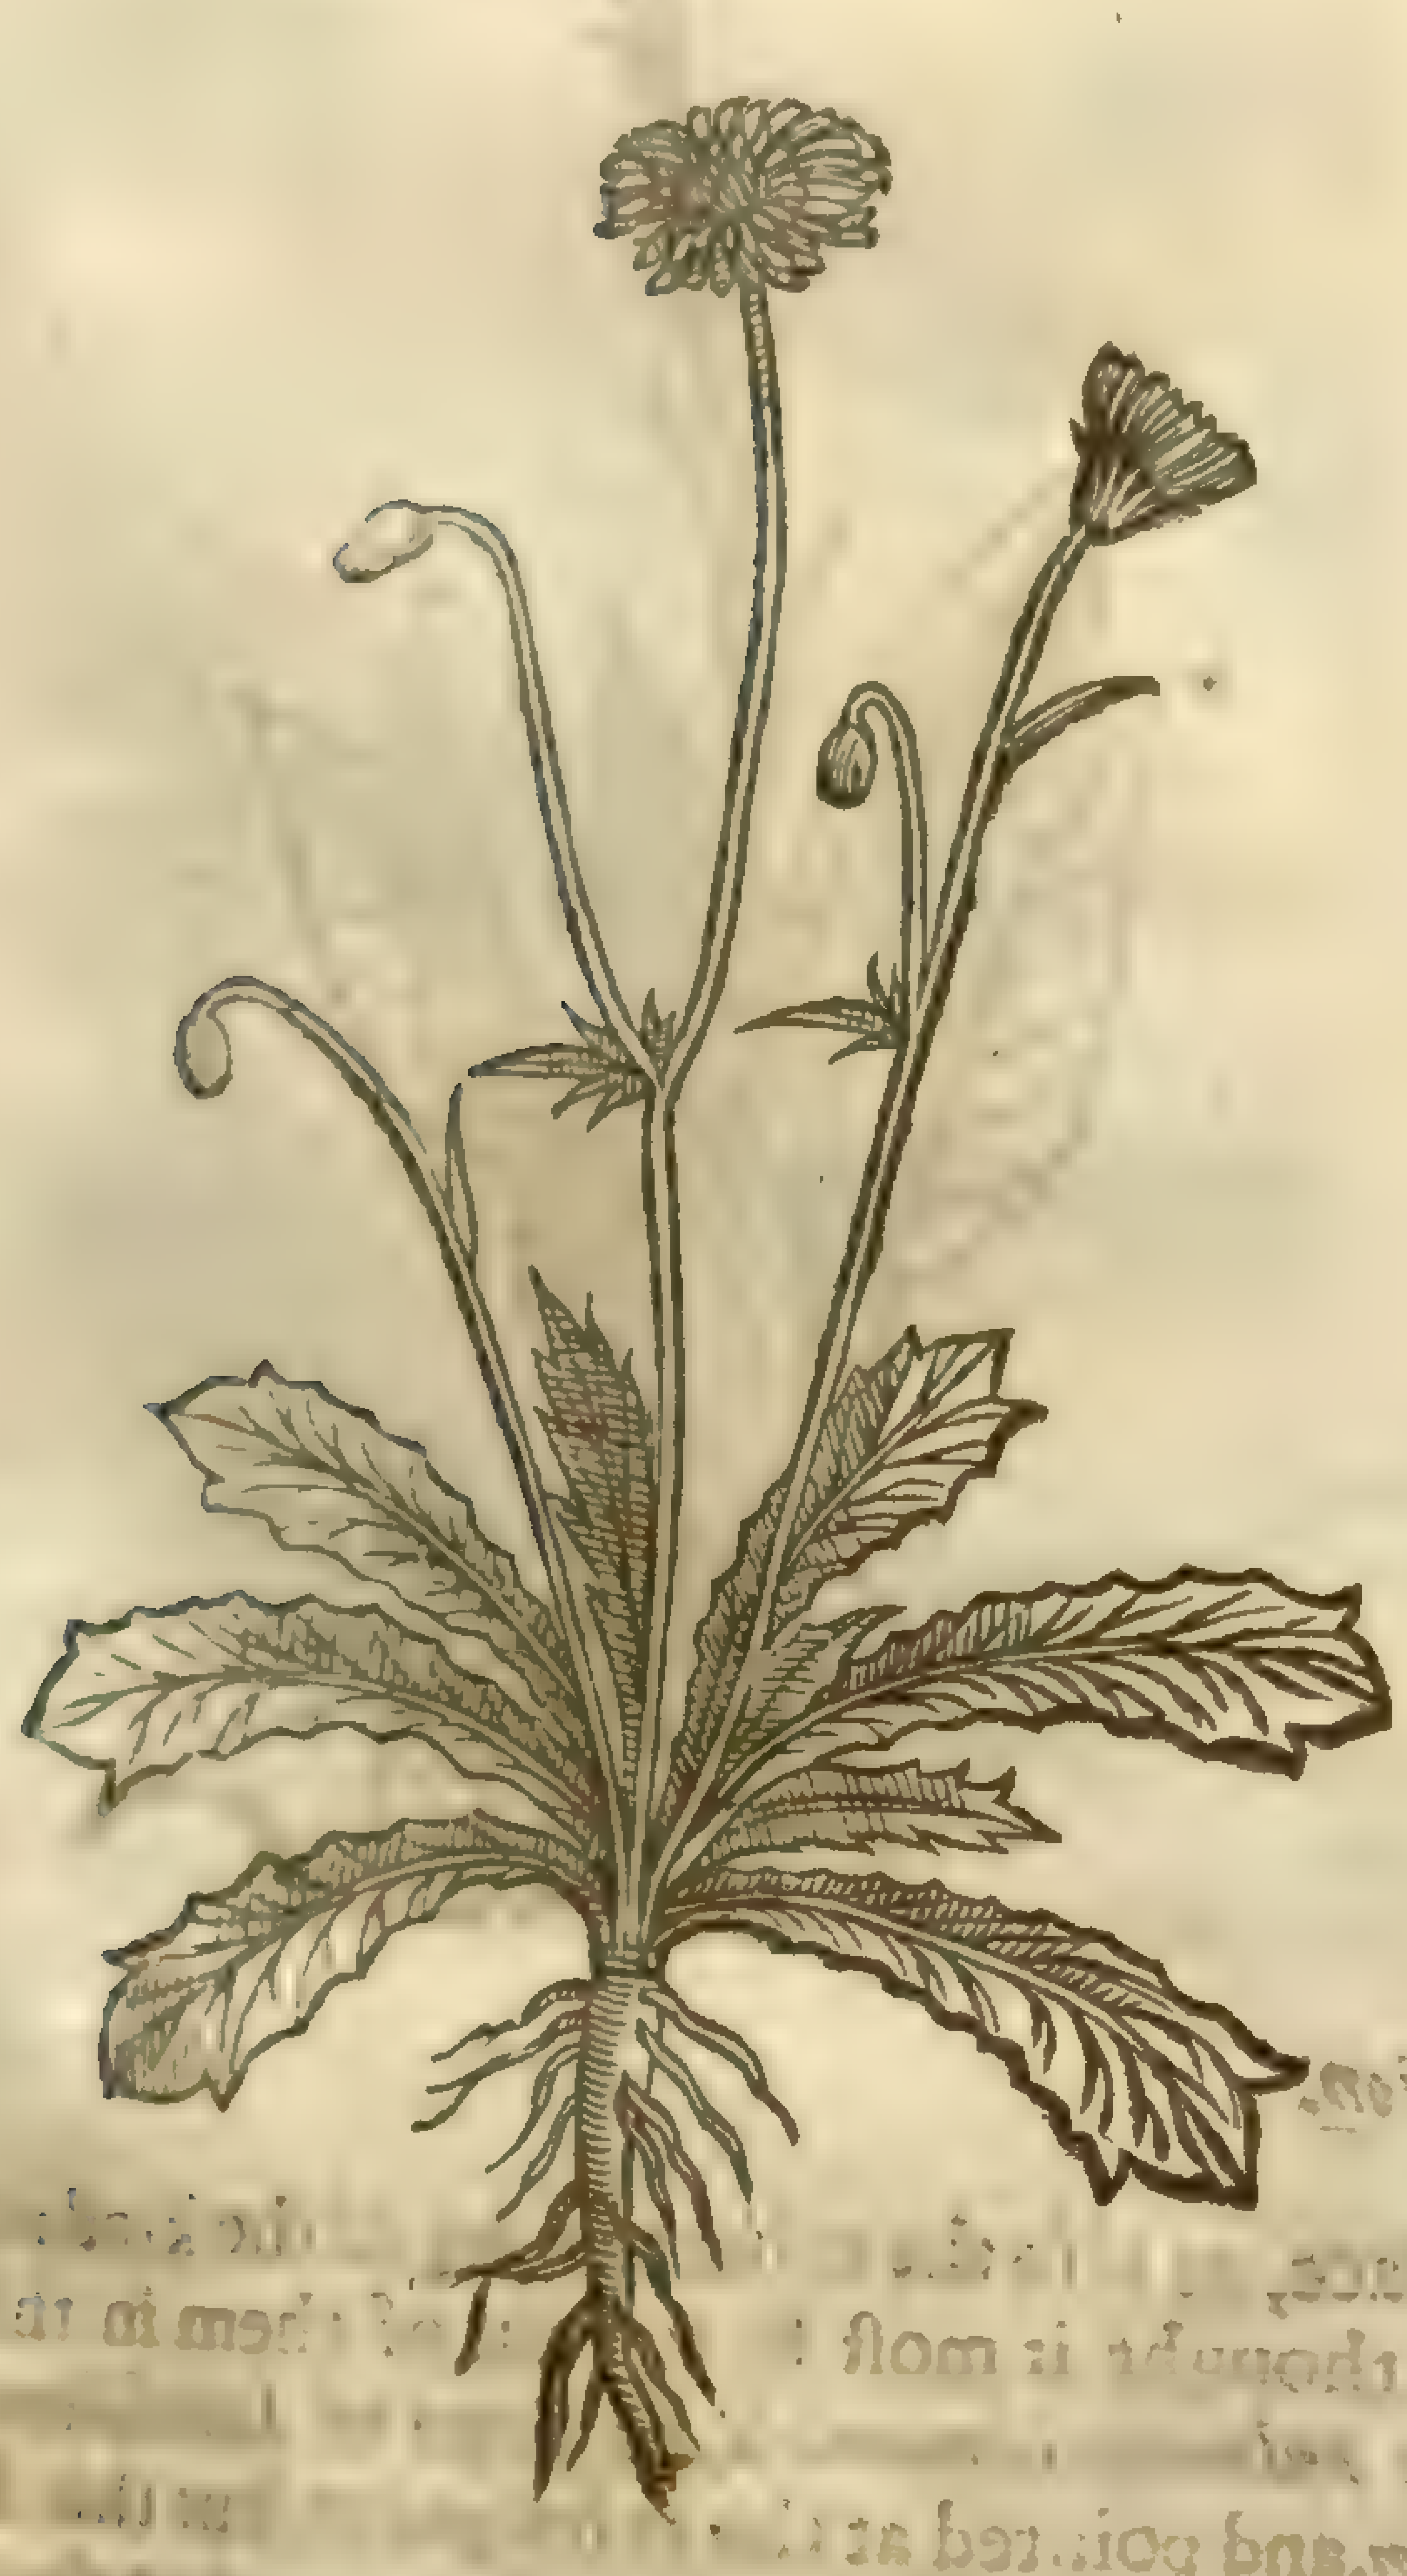
4 *Hieracium 7. Cluſij.*
Cluſius his 7. Hawkeweed.



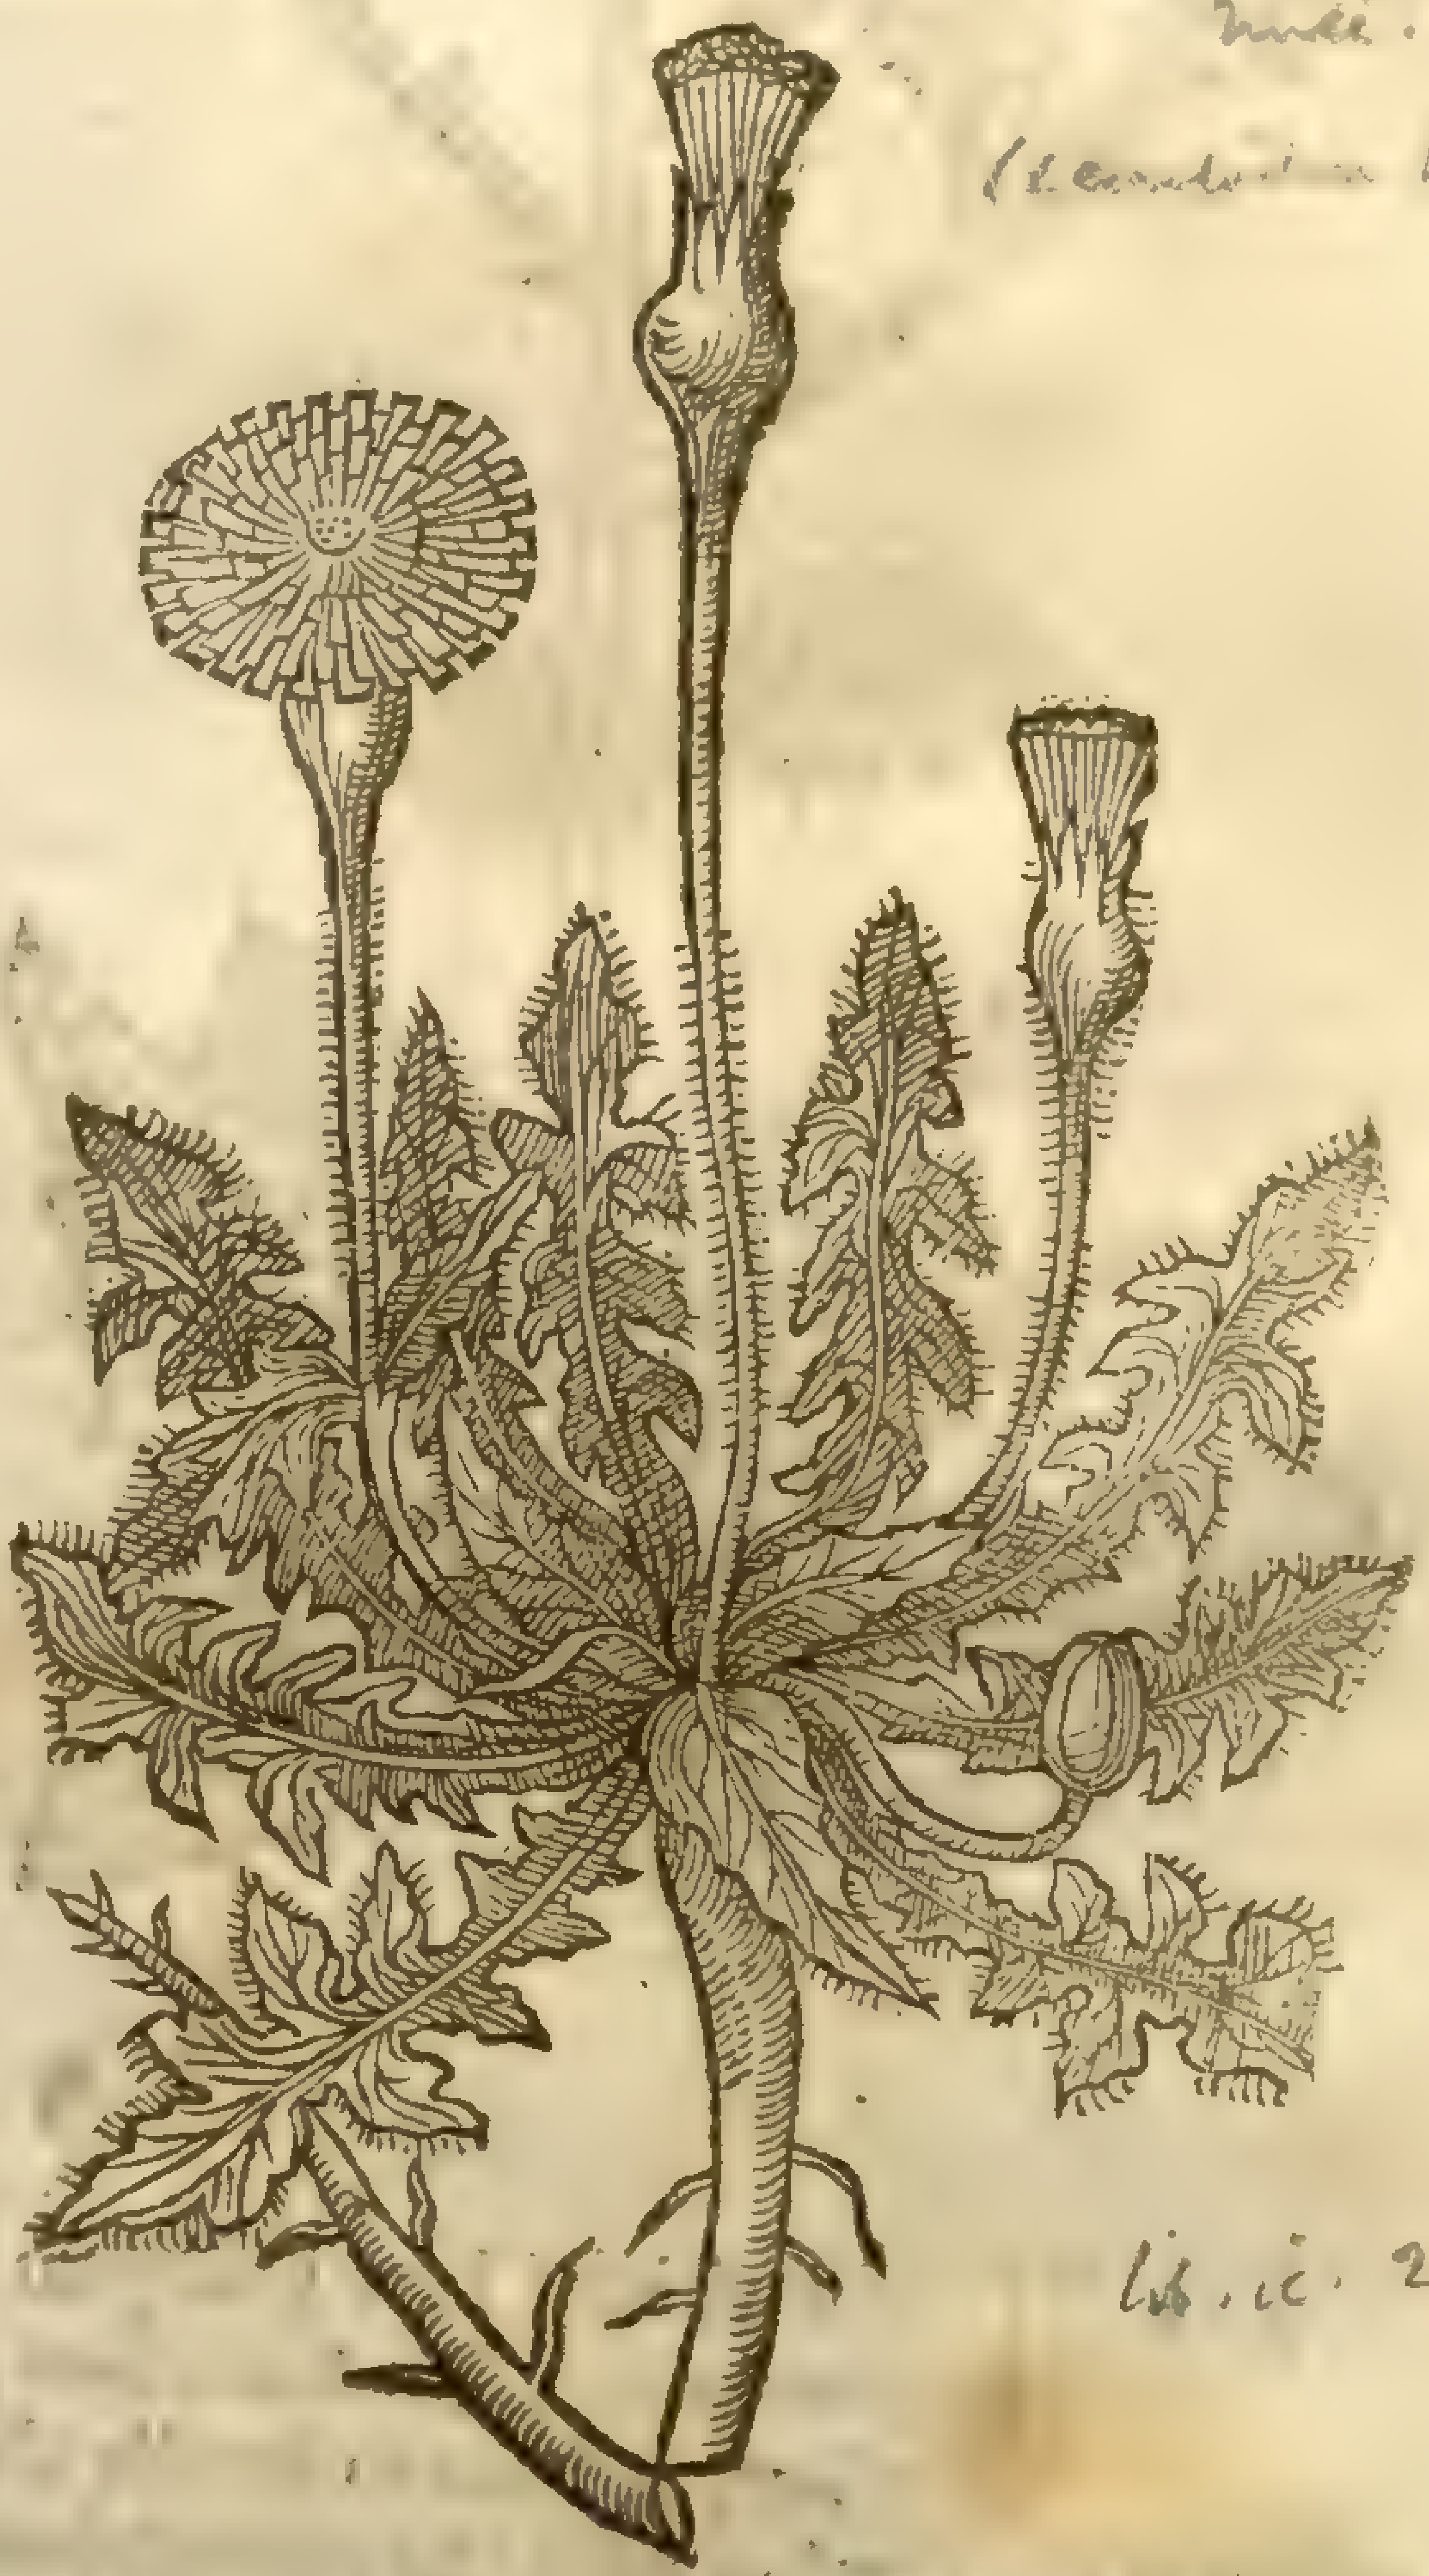
‡ 5 The ſame Author hath alſo ſet forth another *Hieracium*, vnder the name of *Hieracium paruum Creticum*, which he thus deſcribes; this is an elegant little plant ſpreading ſome ſix, or more leaues vpon the top of the ground, being narrower at that part whereas they adhere to the root, and broader at the other end, and cut about the edges, hauing the middle rib of a purple colour; amongſt theſe riſe vp two or three little ſtalkes about a foot high, without knot vntill you come almoſt to the top, whereas they are diuided into two little branches, at which place growes forth leaues much diuided; the floures grow at the top of a ſufficient bigneſſe, conſidering the magnitude of the plant, and they conſiſt of many little leaues lying one vpon another, on the vpper ſide wholly white, and on the vnder ſide of a fleſh colour, the root is ſingle, longiſh, growing ſmall

towards the end, and putting forth ſtringy fibres on the ſides. Thus much *Cluſius*, who receiued this figure and deſcription from his friend *Iaques Plateau* of Turnay. I conjecture this to be the ſame plant that *Bauhine* hath ſomewhat more accurately figured and deſcribed in his *Prod. pag.68.* vnder the title of *Chondrilla purpuraſcens fœtida*: which plant being an annuall, I haue ſeene growing ſome yeares ſince with Mr. *Tuggy* at Weſtminſter; and the laſt Summer with an honeſt and skilfull Apothecarie one Mr. *Nicholas Swayton* of Feuerſham in Kent: but I muſt confeſſe I did not compare it with *Cluſius*; yet now I am of opinion, that both theſe figures and deſcriptions are of one and the ſame plant. It floures in Iuly and Auguſt, at the later end of which moneth the ſeeds alſo come to ripeneſſe.

6 This other (not deſcribed by *Cluſius*, but by *Lobel*) hath long rough leaues cut in and toothed like to Dandelion, with naked hairy ſtalkes, bearing at their tops faire large and very double yellow floures, which fading fly away in downe. It growes in ſome medowes. ‡



‡ 5 *Hieracium parvum Creticum.*
Small Candy Hawk-weed.



‡ 6 *Hieracium Dentis leonis folio hirſutum,*
Dandelion Hawk-weed.

Apargia hispida, Will.
Will. arr.: Sm. 3.317
(Leontodon hispidum, L.)

lib. ii. 238

¶ *The Place.*

Theſe kindes of Hawke-weeds, according to the report of *Cluſius*, do grow in Hungary and Auſtria, and in the graſſy dry hills, and herby and barren Alpiſh mountaines, and ſuch like places: notwithſtanding if my memory faile me not I haue ſeene them growing in ſundry places of England, which I meane, God willing, better to obſerue hereafter, as opportunitie ſhall ſerue me.

¶ *The Time.*

He ſaith they floure from May to Auguſt, at what time the ſeed is ripe.

¶ *The Names.*

The Author himſelfe hath not ſaid more than here is ſet downe as touching the names, ſo that it ſhall ſuffice what hath now been ſaid, referring the handling thereof to a further conſideration.

¶ *The Nature and Vertues.*

I finde not any thing at all ſet downe either of their Nature or Vertues, and therefore I forbeare to ſay any thing elſe of them, as a thing not neceſſary to write of their faculties vpon my own conceit and imagination.

Chap. 36.

H. murorum, [illegible]

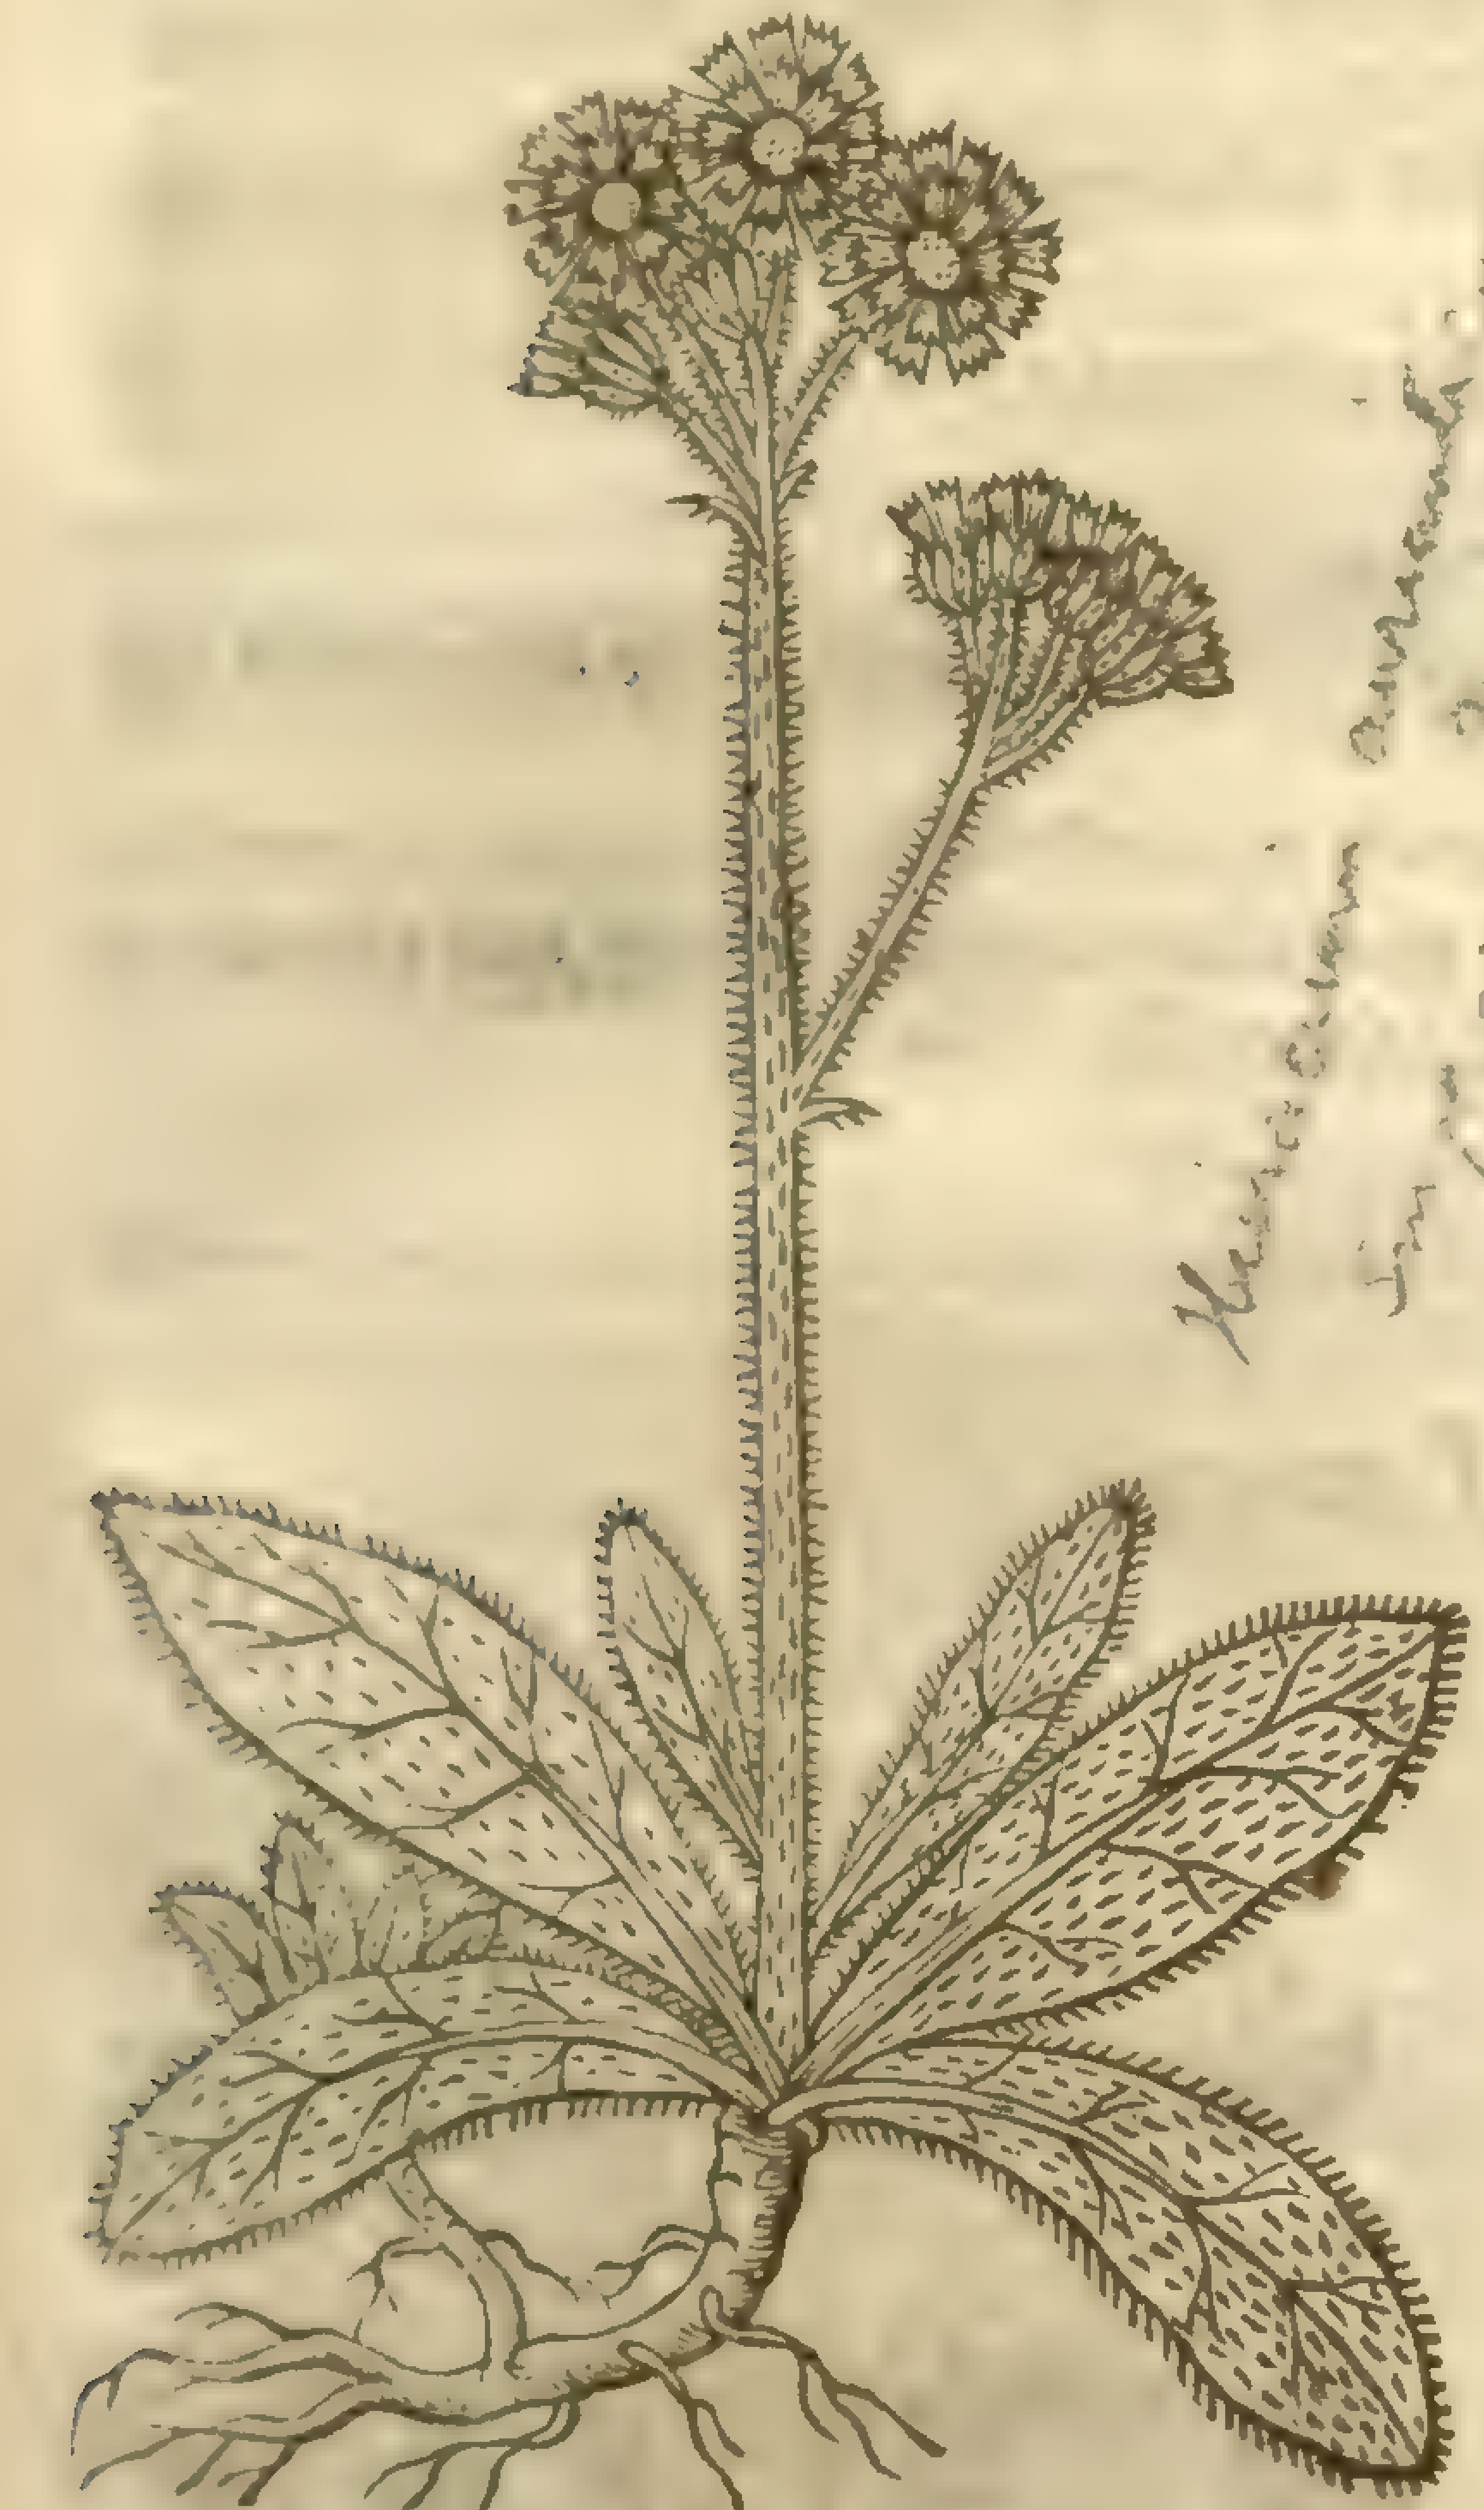
¶ *The Deſcription.*

‡ 1 This which I here giue you in the firſt place, as alſo the other two, are of the kinds of Hawke-weed, or *Hieratium*; wherefore I thought it moſt fit to treat of them in this place, and not to handle them with the *Pulmonaria maculoſa*, or Sage of Ieruſalem: whereas our Author gaue the name *Pulmonaria Gallorum*, and pointed at the deſcription; but this figure being falſe, and the deſcription imperfect, I judged it the beſt to place it here next to thoſe plants which both in ſhape and qualities it much reſembles. This firſt hath a pretty large yet fibrous and ſtringy root; from the which ariſe many longiſh leaues, hairy, ſoft, and vnequally diuided, and commonly cut in the deepeſt neereſt the ſtalke; they are of a darke greene colour, ſometimes broader and ſhorter, and otherwhiles narrower and longer (whence *Tabernamontanus* makes three ſorts of this, yet are they nothing but varieties of this ſame plant.) Amongſt theſe leaues grow vp one or two naked ſtalkes, commonly hauing no more than one leafe apiece, and that about the middle of the ſtalke; theſe ſtalkes are alſo hairie, and about a cubit high, diuided at their tops into ſundry branches, which beare double yellow floures of an indifferent bigneſſe, which fading and turning into downe, are together with the ſeed carried away with the winde. This whole plant is milkie like as the other Hawk-weeds.

2 This Plant (though confounded by ſome with the former) is much different from the laſt deſcribed; for the root is ſmall and fibrous; the leaues are ſmall, of the bigneſſe, and ſomewhat of the ſhape (though otherwiſe indented) of Daſie leaues, whitiſh and hoarie; the ſtalke is not aboue an handfull high, creſted, hoary, and ſet with many longiſh narrow leaues; and at the top on ſhort foot-ſtalkes it beares foure or fiue floures of a bright yellow colour, and pretty large,

conſidering

‡ 3 *Hieracium hortenſe latifolium, ſiue Piloſella maior.*
Golden Mouſe-eare, or Grim the Colliar.



Hieracium [illegible]

conſidering the ſmalneſſe of the plant: the floures (like as others of this kind) fly away in down, and carry the ſeed with them.

3 This plant (which ſome alſo haue confounded with the firſt deſcribed) hath a root at the top, of a reddiſh or browniſh colour, but whitiſh within the earth, and on the lower ſide ſending forth whitiſh fibres: it bringeth forth in good and fruitfull grounds leaues about a foot long, & two or three inches broad, of a darke green colour and hairy, little or nothing at all cut in about the edges. Amongſt theſe leaues riſeth vp a ſtalke ſome cubit high, round, hollow, and naked, but that it ſomtimes hath a leafe or two toward the bottom, and towards the top it puts forth a branch or two. The floures grow at the top as it were in an vmbel, and are of the bigneſſe of the ordinary Mouſeare, and of an orenge colour. The ſeeds are round and blackiſh, and are caried away with the downe by the wind. The ſtalks and cups of the flours are all ſet thicke with a blackiſh downe or hairineſſe as it were the duſt of coles; whence the women who keepe it in gardens for nouelties ſake, haue named it Grim the Colliar.

¶ *The Place.*

‡ 1 I receiued this from Mr. *Iohn Goodyer*, who found it May 27, 1631. in floure; and the third of the following May, not yet flouring, in a Copſe in Godlemen in Surrey, adioyning to the orchard of the Inne whoſe ſigne is the Antilope.

2 This I had from my kinde friend Mr *William Coote*, who wrot to mee, That hee found them growing on a hill in the Lady *Briget Kingſmills* ground at Sidmonton not far from Newberry, in an old Roman camp cloſe by the Decuman port, on the quarter that regards the Weſt South-Weſt, vpon the skirts of the hill.

3 This is a ſtranger, and only to be found in ſome few gardens.

¶ *The Time.*

All theſe floure in Iune, Iuly, and Auguſt, about the later part of which month they ripen their ſeed.

¶ *The Names.*

1 This was firſt ſet forth by *Tragus*, vnder the name of *Auricula muris major*: and by *Tabern.* (who gaue three figures expreſſing the ſeuerall varieties thereof) by the name of *Pulmonaria Gallica ſiue aurea*: *Daleſchampius* hath it vnder the name of *Corchorus*.

2 This was by *Lobel* (who firſt ſet it forth) confounded with the former, as you may ſee by the title of the figure in his Obſeruations, *pag.* 317. yet his figure doth much differ from that of *Tragus*, who neither in his figure nor deſcription allowes ſo much as one leafe vpon the ſtalke; and *Tabernamontanus* allowes but one, which it ſeldome wants. Now this by *Lobels* figure hath many narrow leaues, and by the Deſcription, *Adverſ. pag.* 253. it is no more than an handfull or handfull and halfe high: which very well agrees with the plant we here giue you, and by no means with the former, whoſe naked ſtalks are at leaſt a cubit high. So it is manifeſt that this plant I haue heere deſcribed is different from the former, and is that which *Pena* and *Lobel* gaue vs vnder the title of *Pulmonaria Gallorum flore Hieracij*. *Bauhine* alſo confounds this with the former.

3 *Baſil Beſler* in his *Hortus Eyſtettenſis* hath wel expreſt this plant vnder the title of *Hieracium latifolium peregrinum Phlomoides*: *Bauhinus* calls it *Hieracium hortenſe floribus atropurpuraſcentibus*; and ſaith that ſome call it *Piloſella major*: and I iudge it to be the *Hieracium Germanicum* of *Fabius Columna*. This alſo ſeemeth rather to be the herbe *Coſta* of *Camerarius*, than the firſt deſcribed; and I dare almoſt be bold to affirme it the ſame: for he ſaith that it hath fat leaues lying flat vpon the ground, and as much as he could diſcern by the figure, agreed with the *Hieracium latifolium* of *Cluſius*: to which indeed in the leaues it is very like, as you may ſee by the figure which is in the firſt place in the foregoing chapter, which very well reſembles this plant, if it had more and ſmaller floures.

¶ *The Temperature and Vertues.*

A I iudge theſe to be temperat in qualitie, and endued with a light aſtriction.

B 1 The decoction or the diſtilled water of this herb taken inwardly, or outwardly applied, conduce much to the mundifying and healing of green wounds; for ſome boile the herb in wine, and ſo giue it to the wounded Patient, and alſo apply it outwardly.

C It is alſo good againſt the internal inflammations and hot diſtempers of the heart, ſtomack, and liuer.

D The iuyce of this herb is with good ſucceſſe dropped into the ears, when they are troubled with any pricking or ſhooting paine or noiſe.

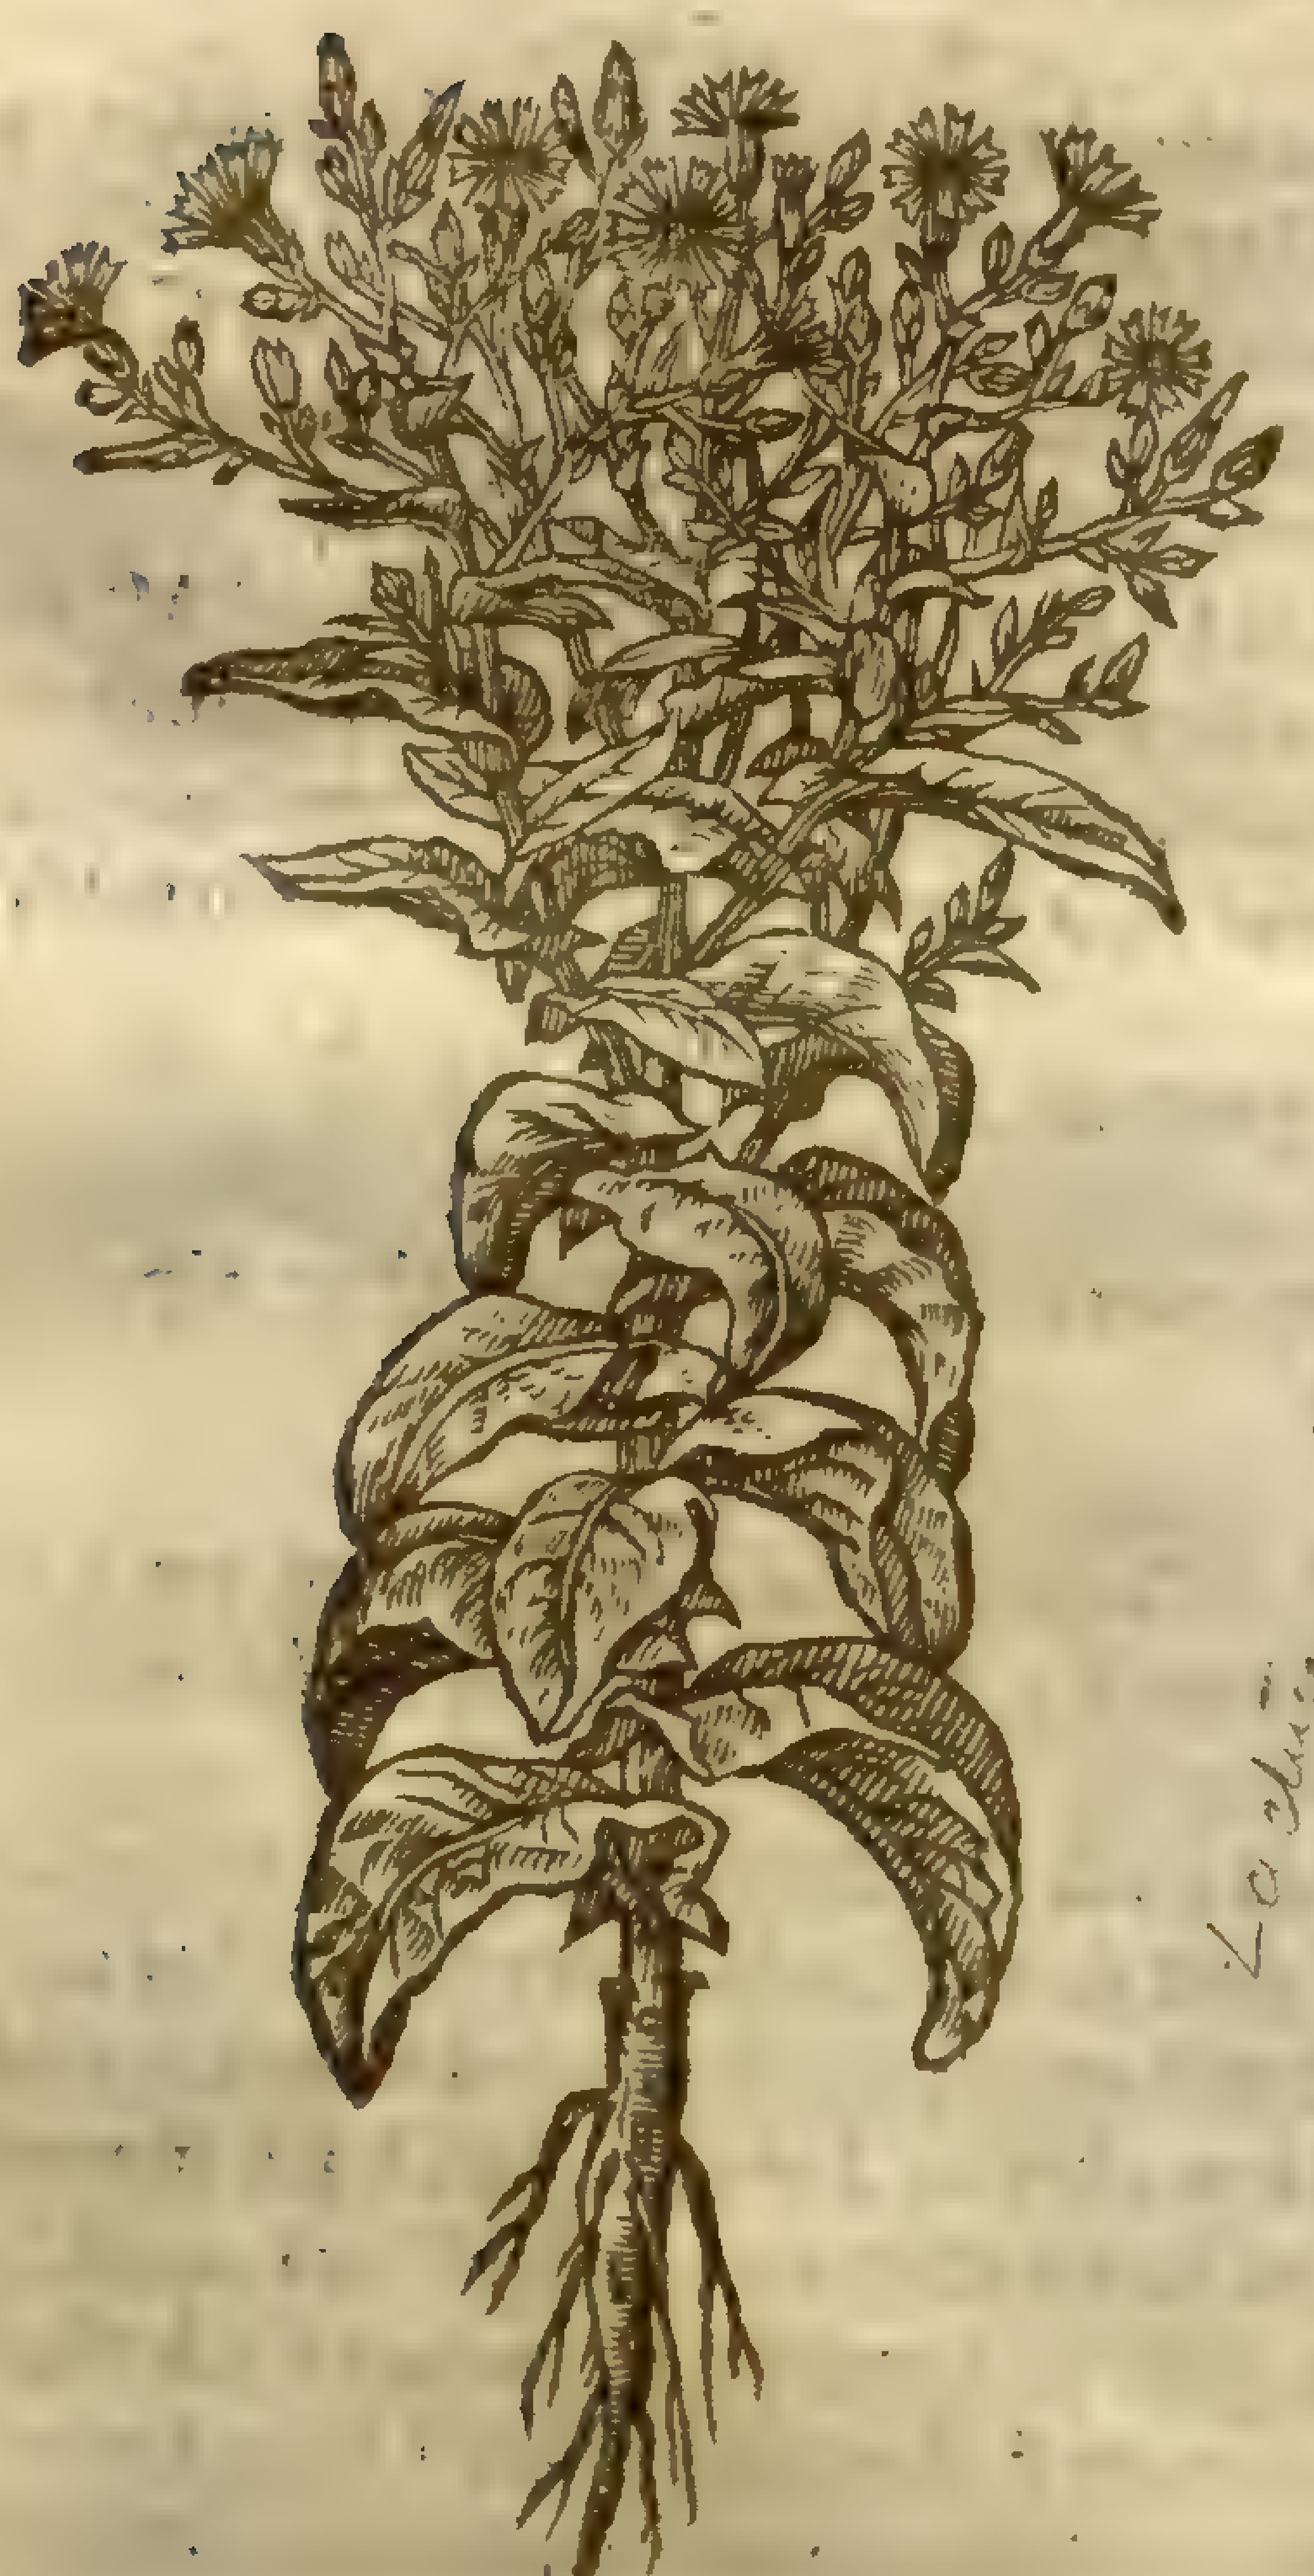
E Laſtly, the water hath the ſame qualitie as that of Succorie. *Tragus.*

2 *Pena* and *Lobel* affirme this to be commended againſt Whitlowes, and in the diſeaſes of the lungs.

F 3 This (if it be the *Coſta* of *Camerarius*) is of ſingular vſe in the Pthiſis, that is, the vlceration or conſumption of the lungs: whereupon in Myſnia they giue the conſerue, ſyrrup, and pouder of it for the ſame purpoſe: and they alſo vſe it in broths and otherwiſe. *Cam.* ‡

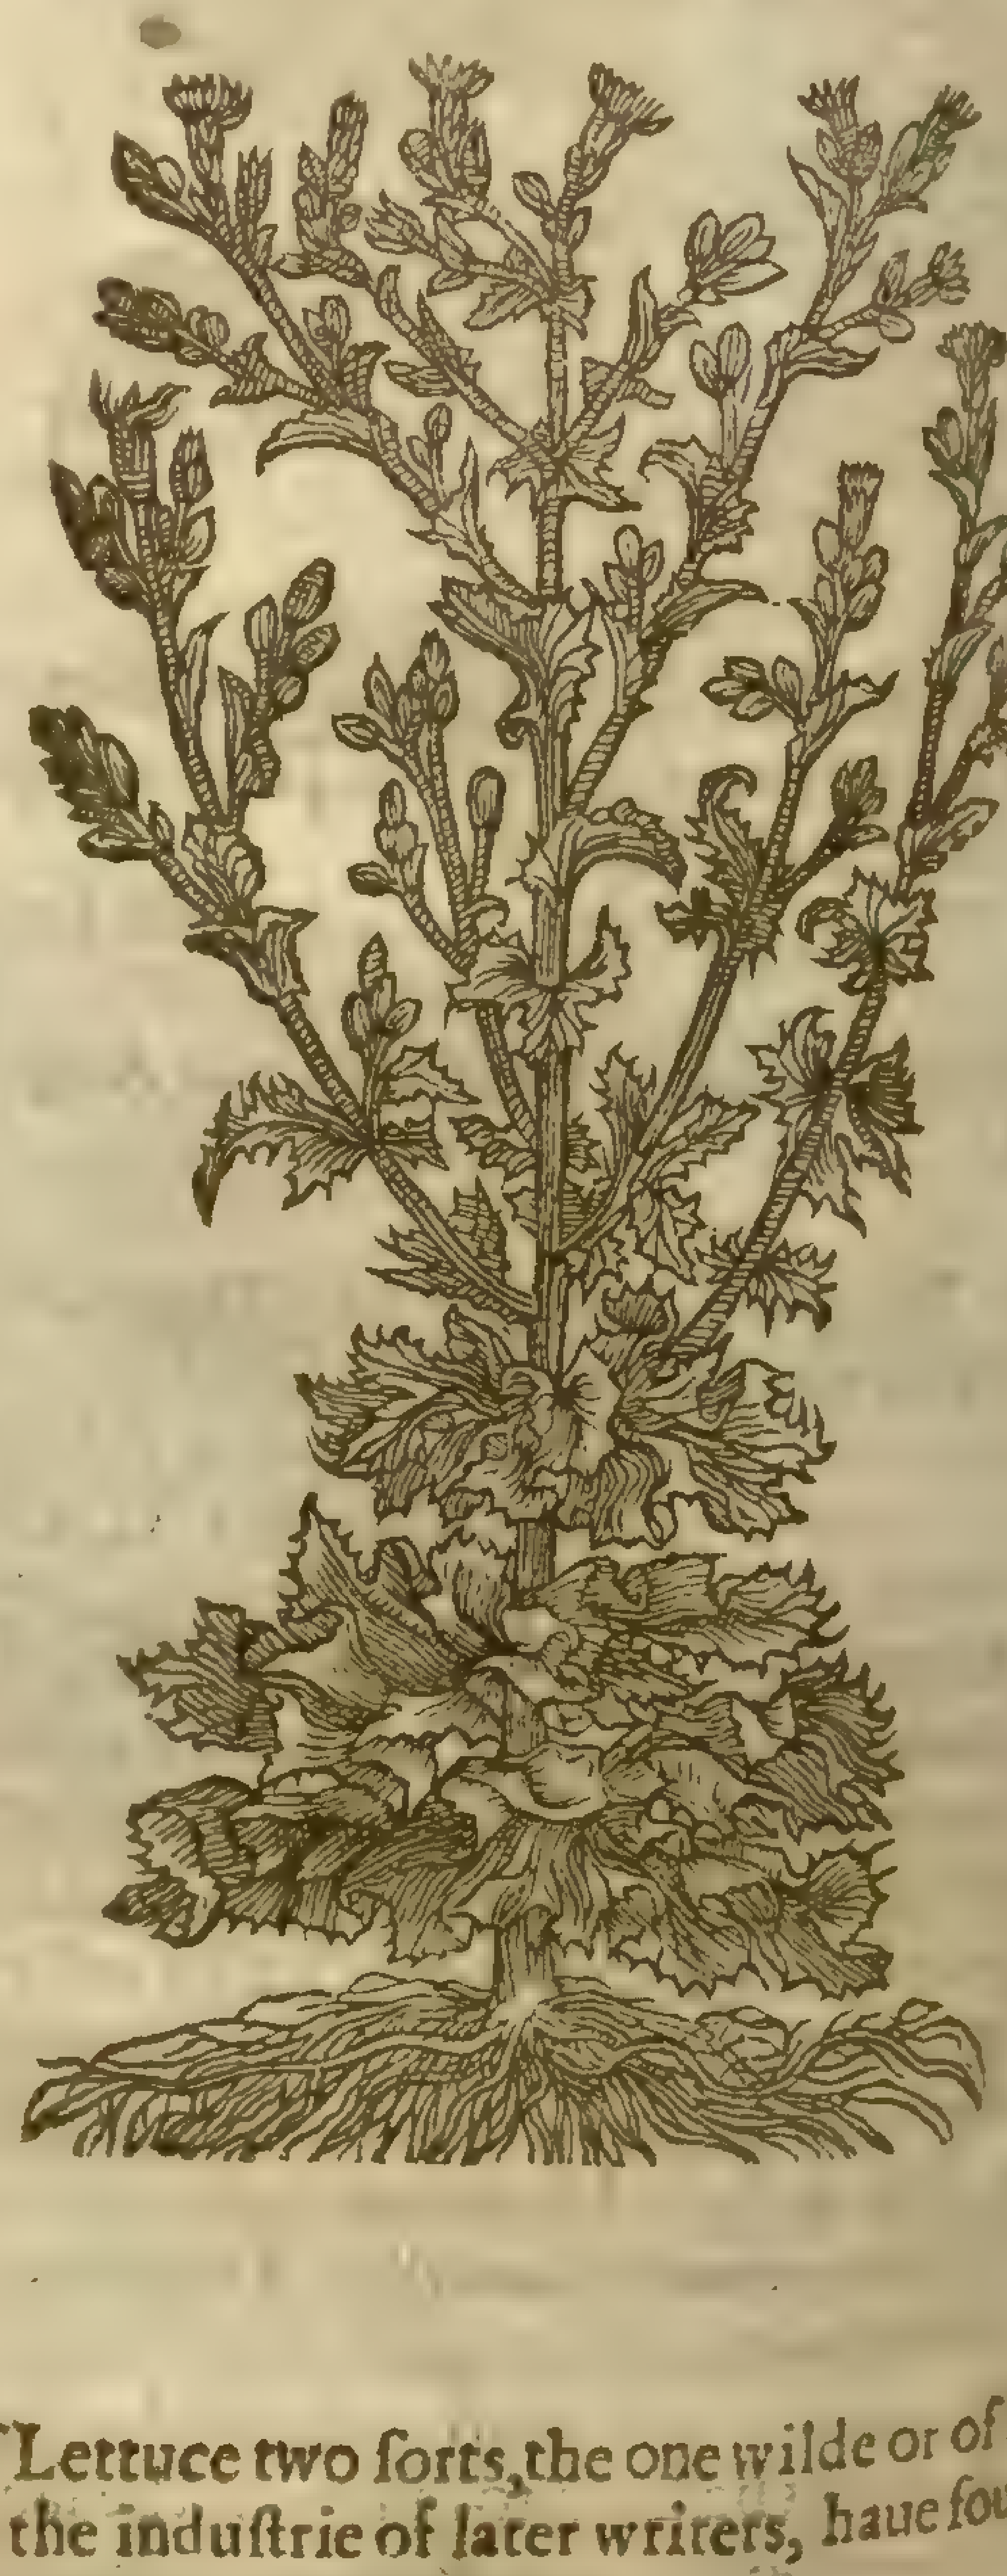
Chap. 37. *Of Lettuce.*

1 *Lactuca ſativa.*
Garden Lettuce.



Lactuca sativa, L. [illegible]
[illegible]

2 *Lactuca criſpa.*
Curled Lettuce.



¶ *The Kindes.*

There be according to the opinion of the Antients, of Lettuce two ſorts, the one wilde or of the field, the other tame or of the garden: but time, with the induſtrie of later writers, haue found out others both wilde and tame, as alſo artificiall, which I purpoſe to lay downe.

¶ The

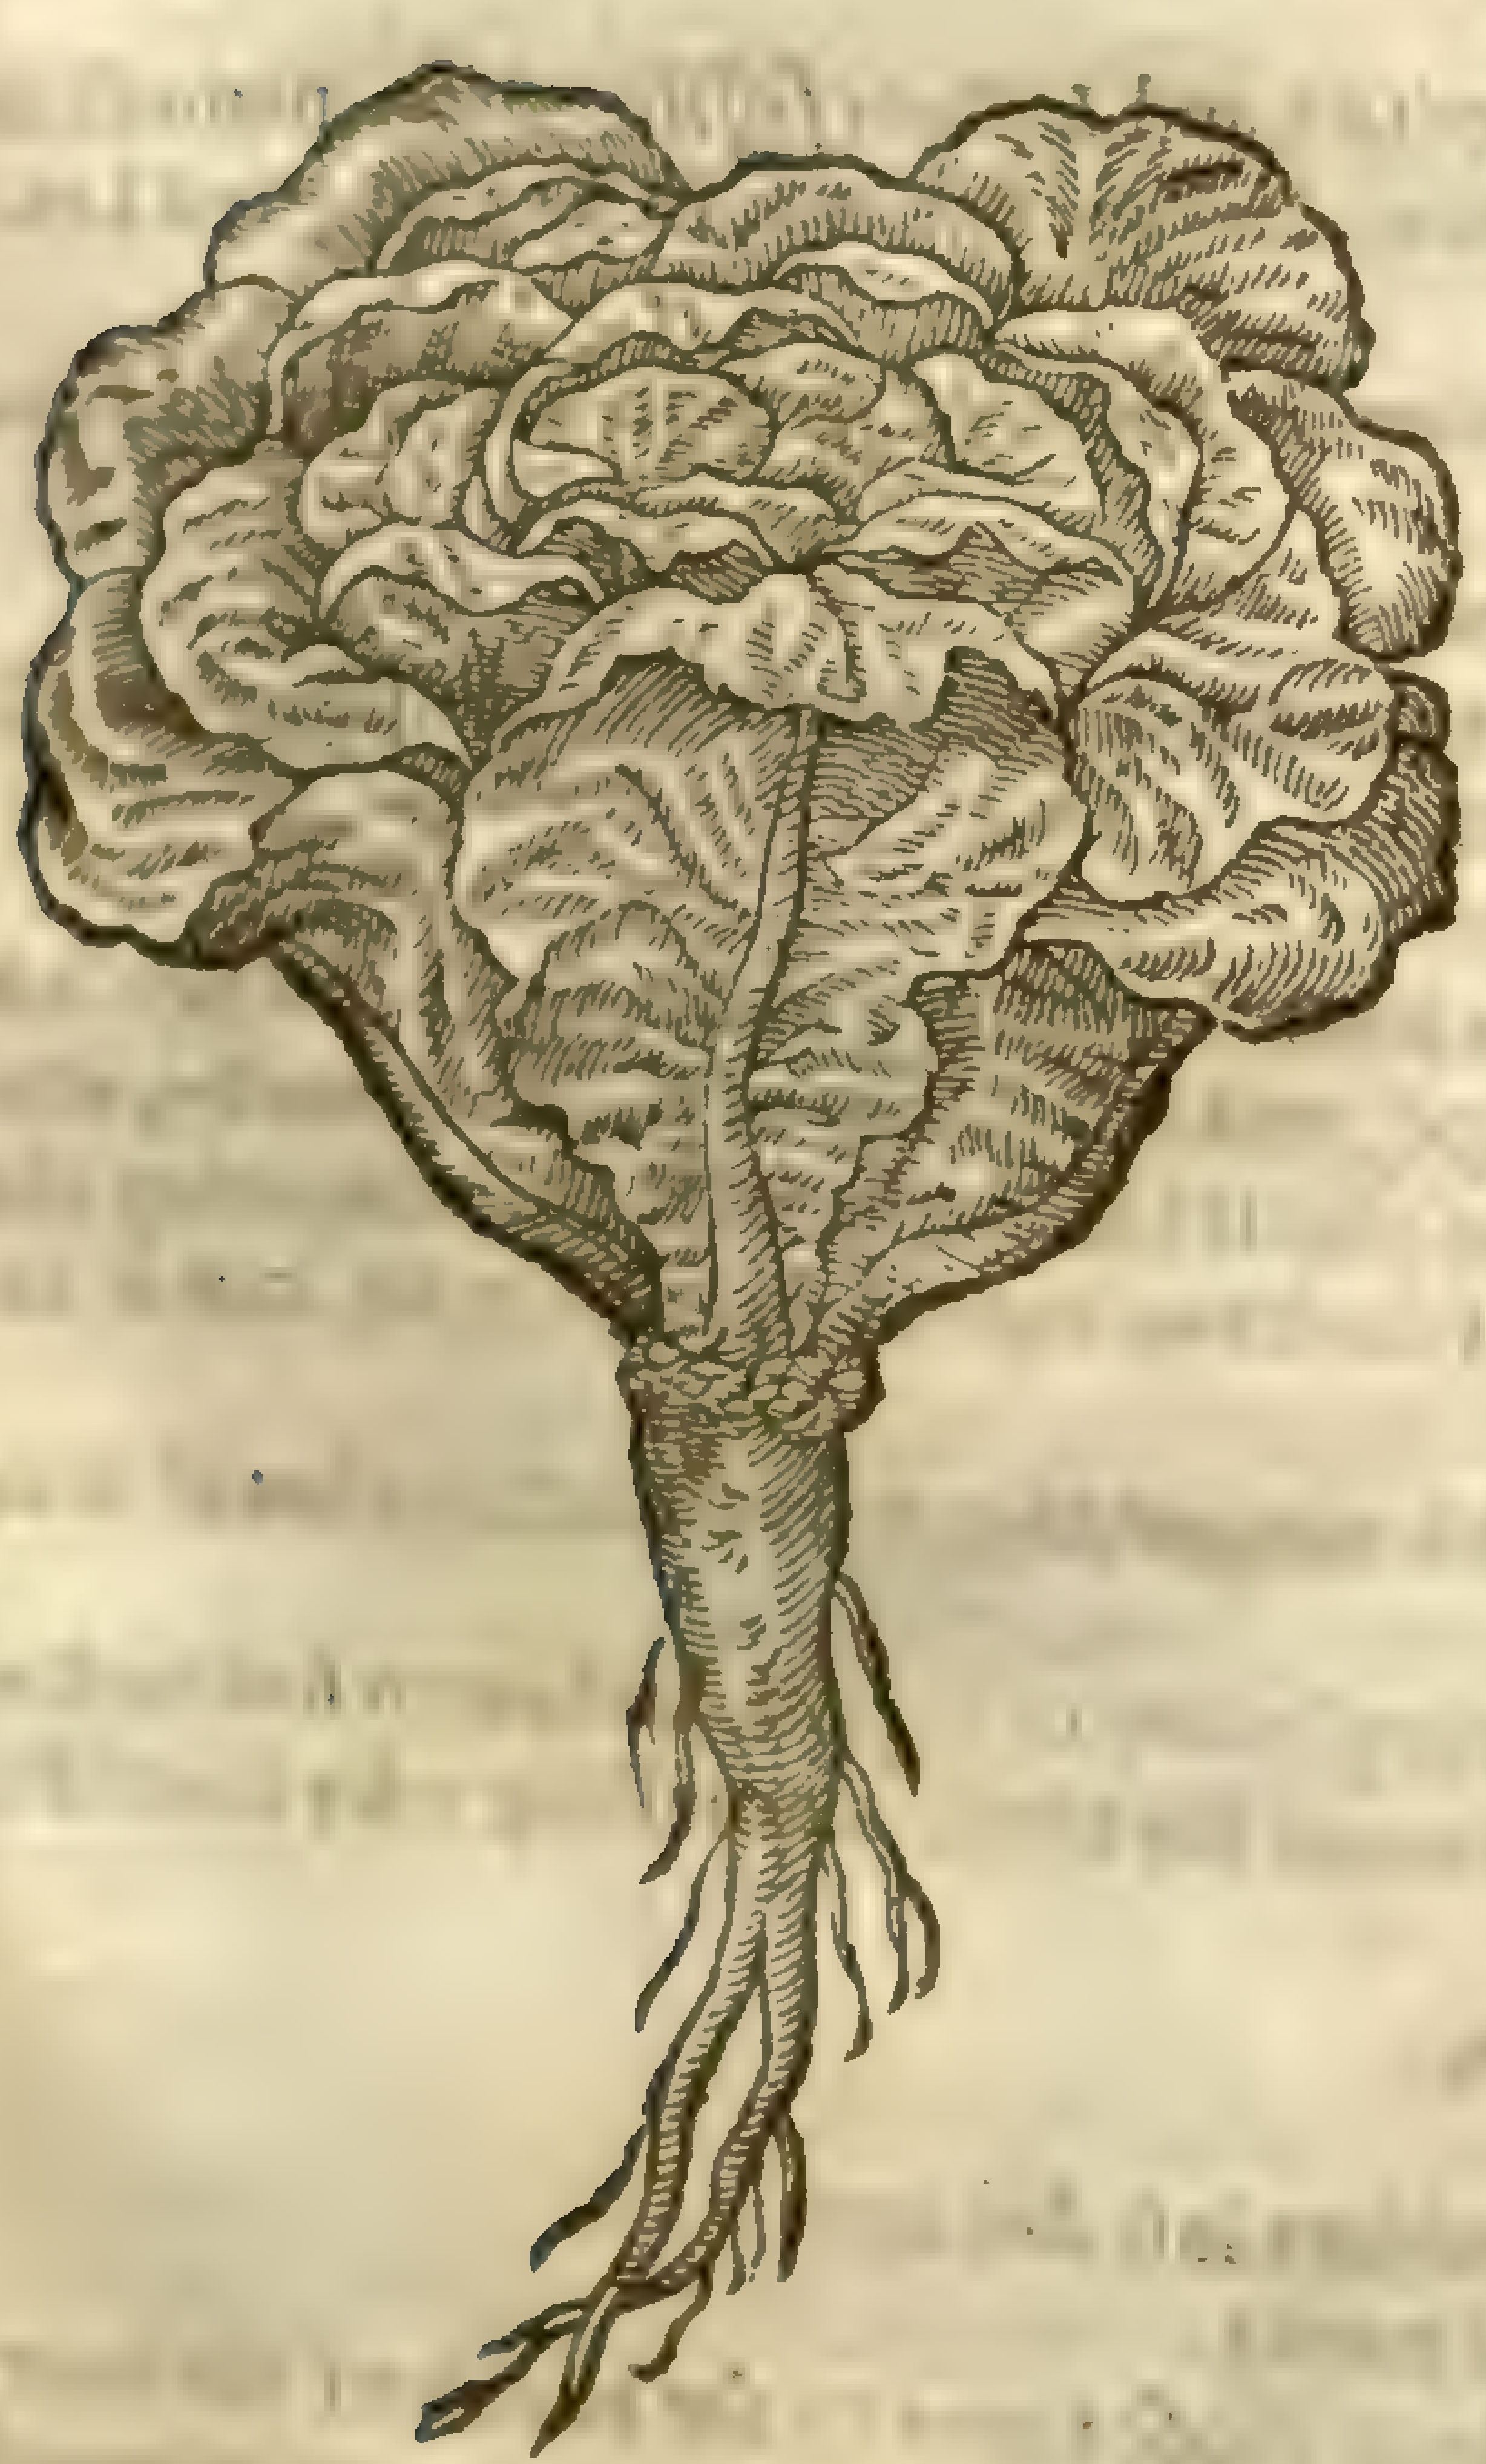
¶ *The Deſcription.*

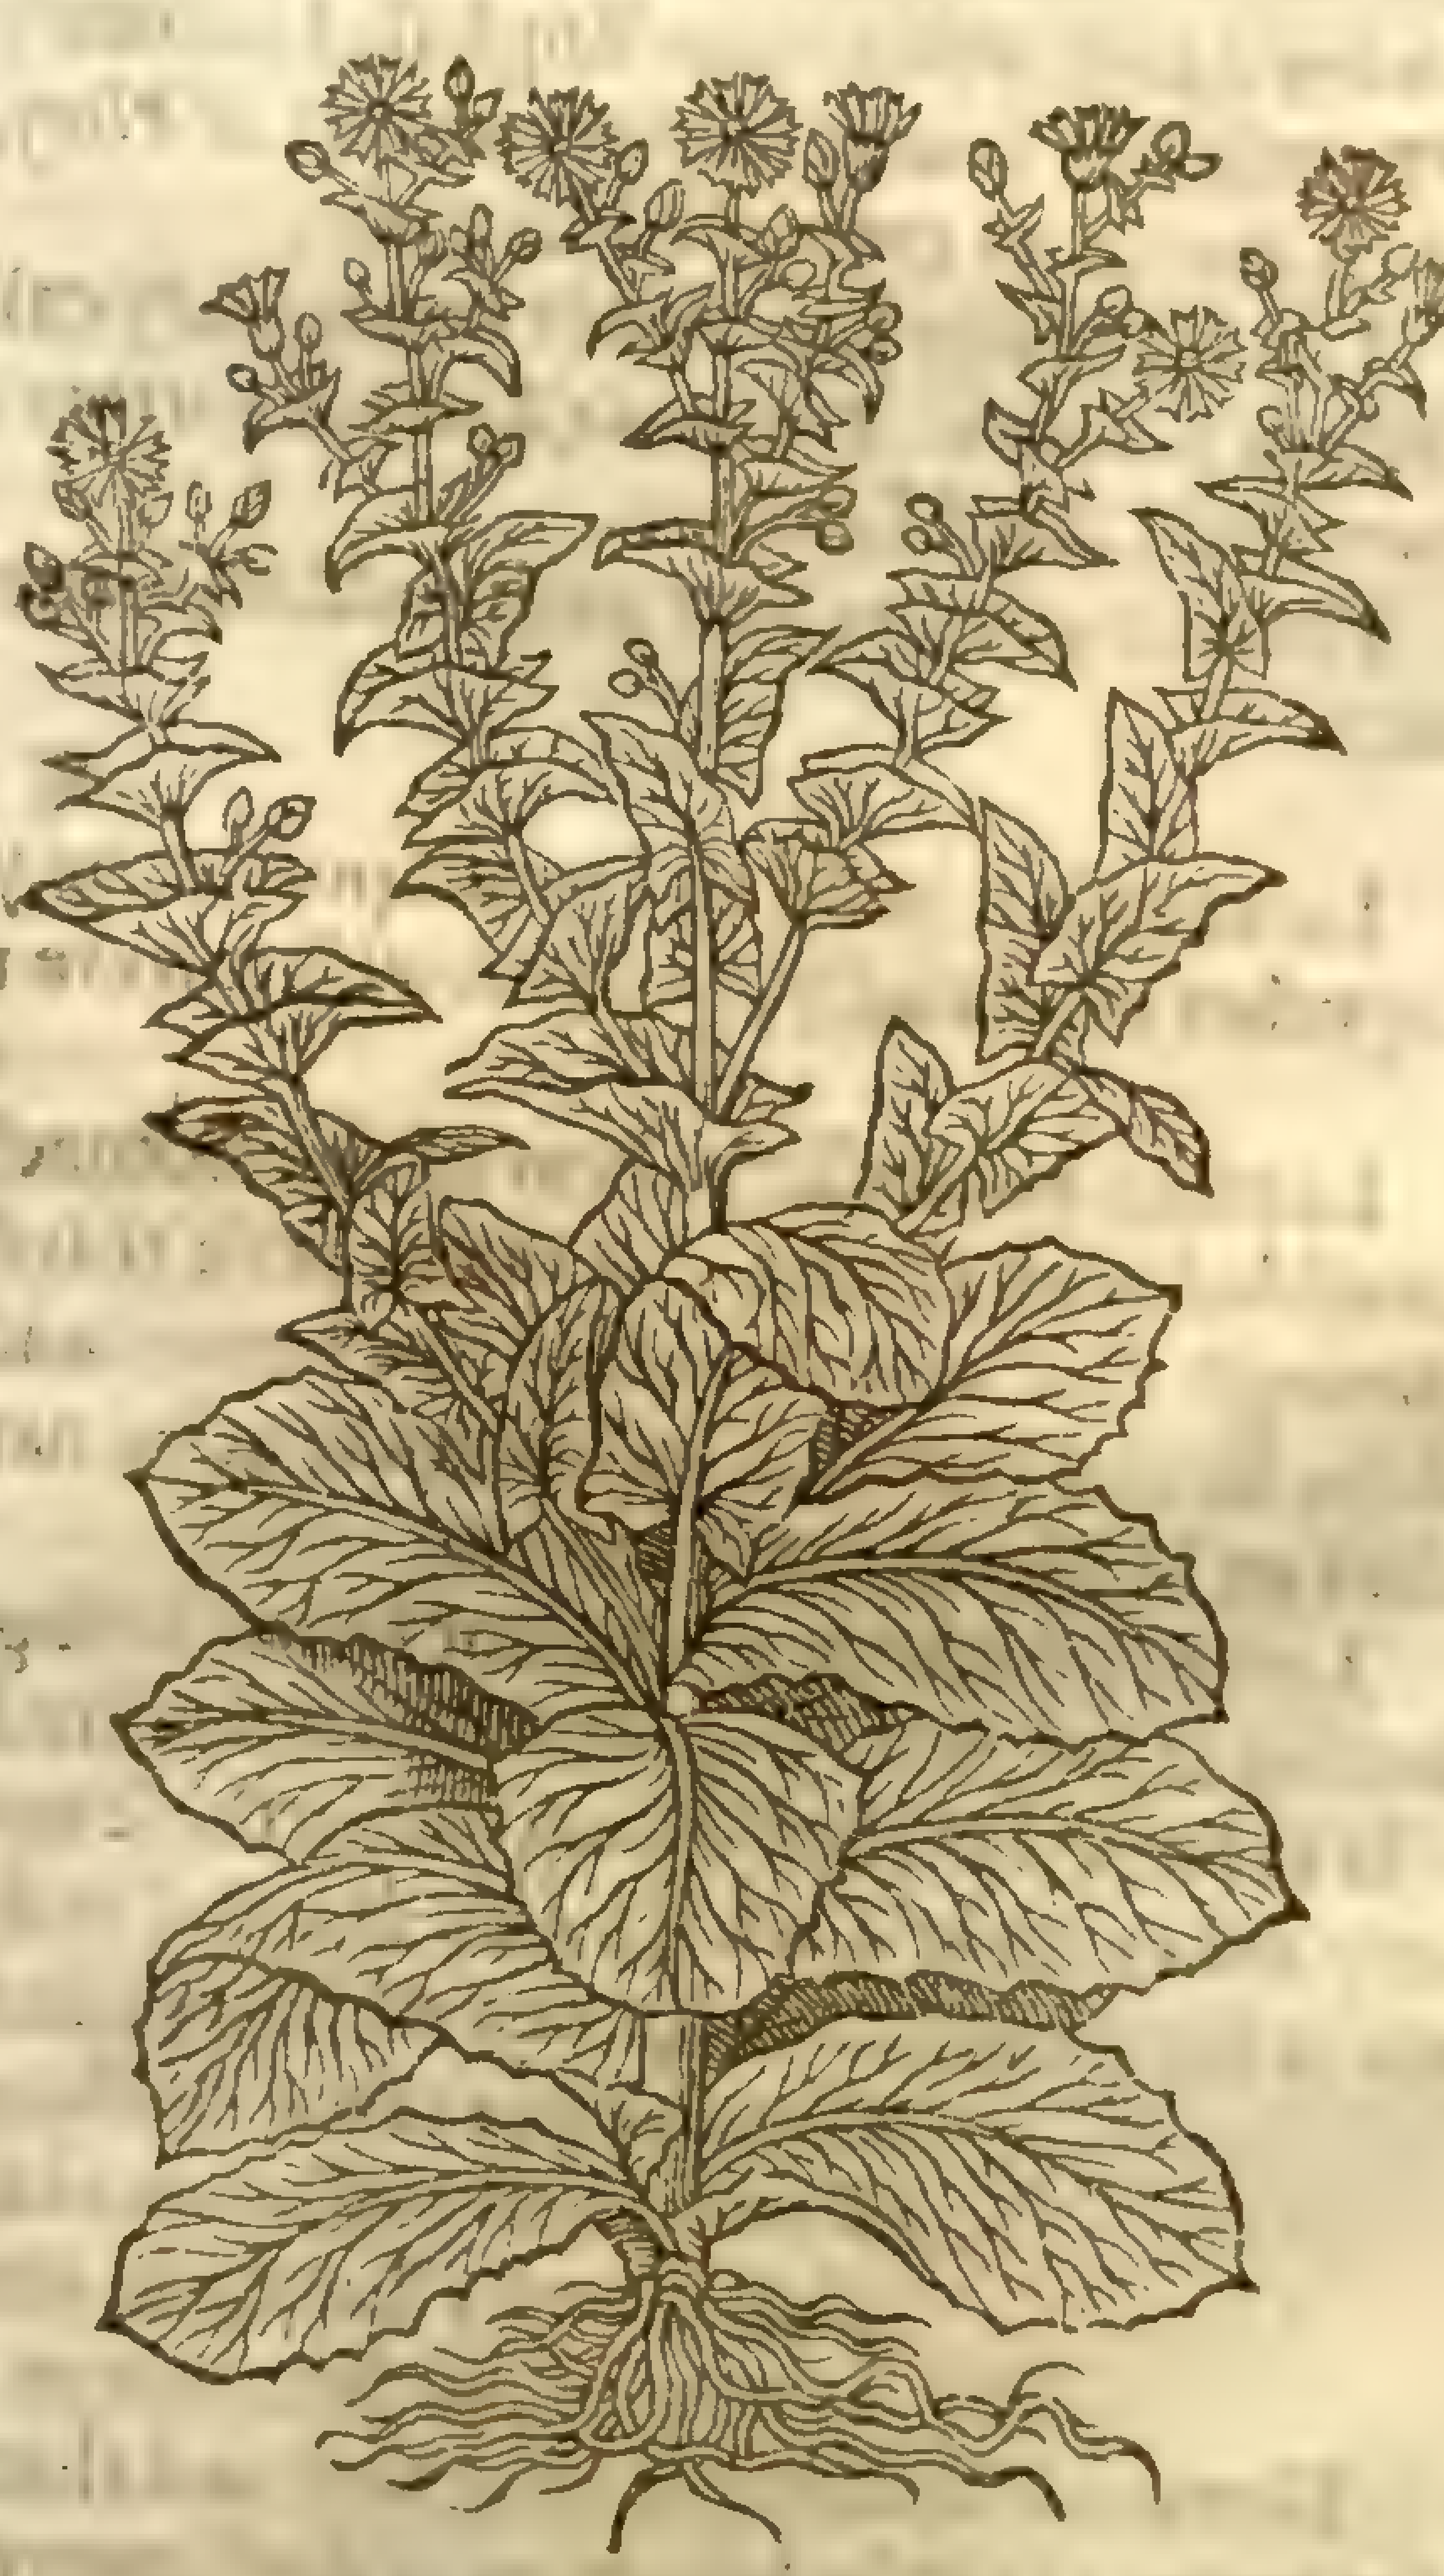
1 Garden Lettuce hath a long broad leafe, ſmooth, and of a light greene colour: the ſtalke is round, thicke ſet with leaues full of milky juice, buſhed or branched at the top: wherupon do grow yellowiſh floures, which turne into downe that is carried away with the winde. The ſeed ſticketh faſt vnto the cottony downe, and flieth away likewiſe, white of colour, and ſomewhat long: the root hath hanging on it many long tough ſtrings, which being cut or broken, do yeeld forth in like manner as doth the ſtalke and leaues, a juice like to milke. And this is the true deſcription of the naturall Lettuce, and not of the artificiall; for by manuring, tranſplanting, and hauing a regard to the Moone and other circumſtances, the leaues of the artificiall Lettuce are oftentimes transformed into another ſhape: for either they are curled, or elſe ſo drawne together, as they ſeeme to be like a Cabbage or headed Colewort, and the leaues which be within and in the middeſt are ſomething white, tending to a very light yellow.

5 *Lactuca capitata.*
Cabbage Lettuce.

6 *Lactuca intybacea.*
Lumbard Lettuce.

L. [illegible]





2 The curled Lettuce hath great and large leaues deeply cut or gaſhed on both the ſides, not plaine or ſmooth as the former, but intricately curled and cut into many ſections. The floures are ſmall, of a bleake colour, the which do turne into downe, and is carried away with the winde. The ſeed is like the former, ſauing that it changeth ſometime into blackneſſe, with a root like vnto the former.

3 This ſmall ſort of curled Lettuce hath many leaues hacked and torne in pieces very confuſedly, and withall curled in ſuch an admirable ſort, that euery great leafe ſeemeth to be made of many ſmall leaues ſet vpon one middle rib, reſembling a fan of curled feathers vſed among Gentlewomen: the floures, roots, and ſeeds agree with the former.

4 The Sauoy Lettuce hath very large leaues ſpred vpon the ground, at the firſt comming vp broad, cut or gaſht about the edges, criſping or curling lightly this or that way, not vnlike to the leaues of Garden Endiue, with ſtalkes, floures, and ſeeds like the former, as well in ſhape, as yeelding that milky iuice wherewith they do all abound.

5 Cabbage Lettuce hath many plain and ſmooth leaues at his firſt growing vp, which for the moſt part lie flat ſtill vpon the ground: the next that doe appeare are thoſe leaues in the middeſt, which turn themſelues together, embracing each other ſo cloſely, that it is formed into that globe

or round head, whereof the ſimpleſt is not ignorant. The ſeed hereof is blacke, contrary to all the reſt; which may be as it were a rule whereby ye may know the ſeed of Cabbage Lettuce from the other ſorts.

6 The Lumbard Lettuce hath many great leaues ſpred vpon the ground like vnto thoſe of the garden Endiue, but leſſer. The ſtalks riſe vp to the height of three foot: the floures be yellowiſh, which turne into downe and flie away with the winde: the ſeed is white as ſnow.

¶ *The Place.*

Lettuce delighteth to grow, as *Palladius* ſaith, in a mannured, fat, moiſt, and dunged ground: it muſt be ſowen in faire weather in places where there is plenty of water, as *Columella* ſaith, and proſpereth beſt if it be ſowen very thin.

¶ *The Time.*

It is certaine, ſaith *Palladius*, that Lettuce may well be ſowen at any time of the yeare, but eſpecially at euery firſt Spring, and ſo ſoone as Winter is done, till Summer be well nigh ſpent.

¶ *The Names.*

Garden Lettuce is called in Latine, *Lactuca ſativa*: *Galen* names it θριδακίνη, the Pythagorians εὐνοῦχιον: ſome judge it to be called *Lactuca, à Lacteo ſucco*, of the milky iuice which iſſueth forth of the wounded ſtalks and roots: the Germanes name it **Lattich**: the low Dutch, **Latouwe**: the Spaniards, *Lechuga*, and *Alface*: the Engliſh, Lettuce: and the French, *Laictue*: when the leaues of this kinde are curled or crumpled, it is named of *Pliny*, *Lactuca criſpa*: and of *Columella*, *Lactuca Ceciliana*: in Engliſh, curled or crompled Lettuce.

The Cabbage Lettuce is commonly called *Lactuca capitata*, and *Lactuca ſeſſilis*: *Pliny* nameth it *Lactuca Laconica*: *Columella*, *Lactuca Batica*: *Petrus Creſcentius*, *Lactuca Romana*: in Engliſh, red Lettuce, and Loued Lettuce.

There is another ſort with reddiſh leaues, called of *Columella*, *Lactuca Cypria*: in Engliſh, red Lettuce.

¶ *The Temperature.*

Lettuce is a cold and moiſt pot-herbe, yet not in the extream degree of cold or moiſture, but altogether mod eratly; for otherwiſe it were not to be eaten.

¶ *The Vertues.*

A Lettuce cooleth the heat of the ſtomacke, called the heart-burning; and helpeth it when it is troubled with choler: it quencheth thirſt, cauſeth ſleepe, maketh plenty of milke in nurſes, who through heat and drineſſe grow barren and drie of milke: for it breedeth milke by tempering the drineſſe and heat. But in bodies that be naturally cold, it doth not ingender milke at all, but is rather an hinderance thereunto.

B Lettuce maketh a pleaſant ſallad, being eaten raw with vineger, oile, and a little ſalt: but if it be boiled it is ſooner digeſted, and nouriſheth more.

C It is ſerued in theſe daies, and in theſe countries in the beginning of ſupper, and eaten firſt before any other meat: which alſo *Martiall* teſtifieth to be done in his time, maruelling why ſome did vſe it for a ſeruice at the end of ſupper, in theſe verſes.

> *Claudere quæ cœnas Lactuca ſolebat auorum,*
> *Dic mihi, cur noſtras incohat illa dapes?*
> Tell me why Lettuce, which our Grandſires laſt did eate,
> Is now of late become, to be the firſt of meat?

D Notwithſtanding it may now and then be eaten at both thoſe times to the health of the body: for being taken before meat it doth many times ſtir vp appetite: and eaten after ſupper it keepeth away drunkenneſſe which commeth by the wine; and that is by reaſon that it ſtaieth the vapours from riſing vp into the head.

E The iuice which is made in the veins by Lettuce is moiſt and cold, yet not il, nor much in quantity: *Galen* affirmeth that it doth neither binde the belly no looſe it, for it hath in it no harſhneſſe nor ſtipticke quality by which the belly is ſtaied, neither is there in it any ſharp or biting faculty, which ſcoureth and prouoketh to the ſtoole.

F But howſoeuer *Galen* writeth this, and howſoeuer the ſame wants theſe qualities, yet it is found by experience, that it maketh the body ſoluble, eſpecially if it be boiled; for by moiſtening of the belly it maketh it the more ſlippery: which *Martiall* very well knew, writing in his 11. Booke of Epigrams in this manner: *Prima tibi dabitur; ventri Lactuca mouendo*
——— *Vtilis.*

G Lettuce beeing outwardly applied mitigateth all inflammations; it is good for burnings and ſcaldings, if it be laid thereon with ſalt before the bliſters do appeare, as *Pliny* writeth.

H The iuice of Lettuce cooleth and quencheth the naturall ſeed if it be too much vſed, but procureth ſleepe.

‡ Chap.

‡ CHAP. 38. *Of wilde Lettuce.*

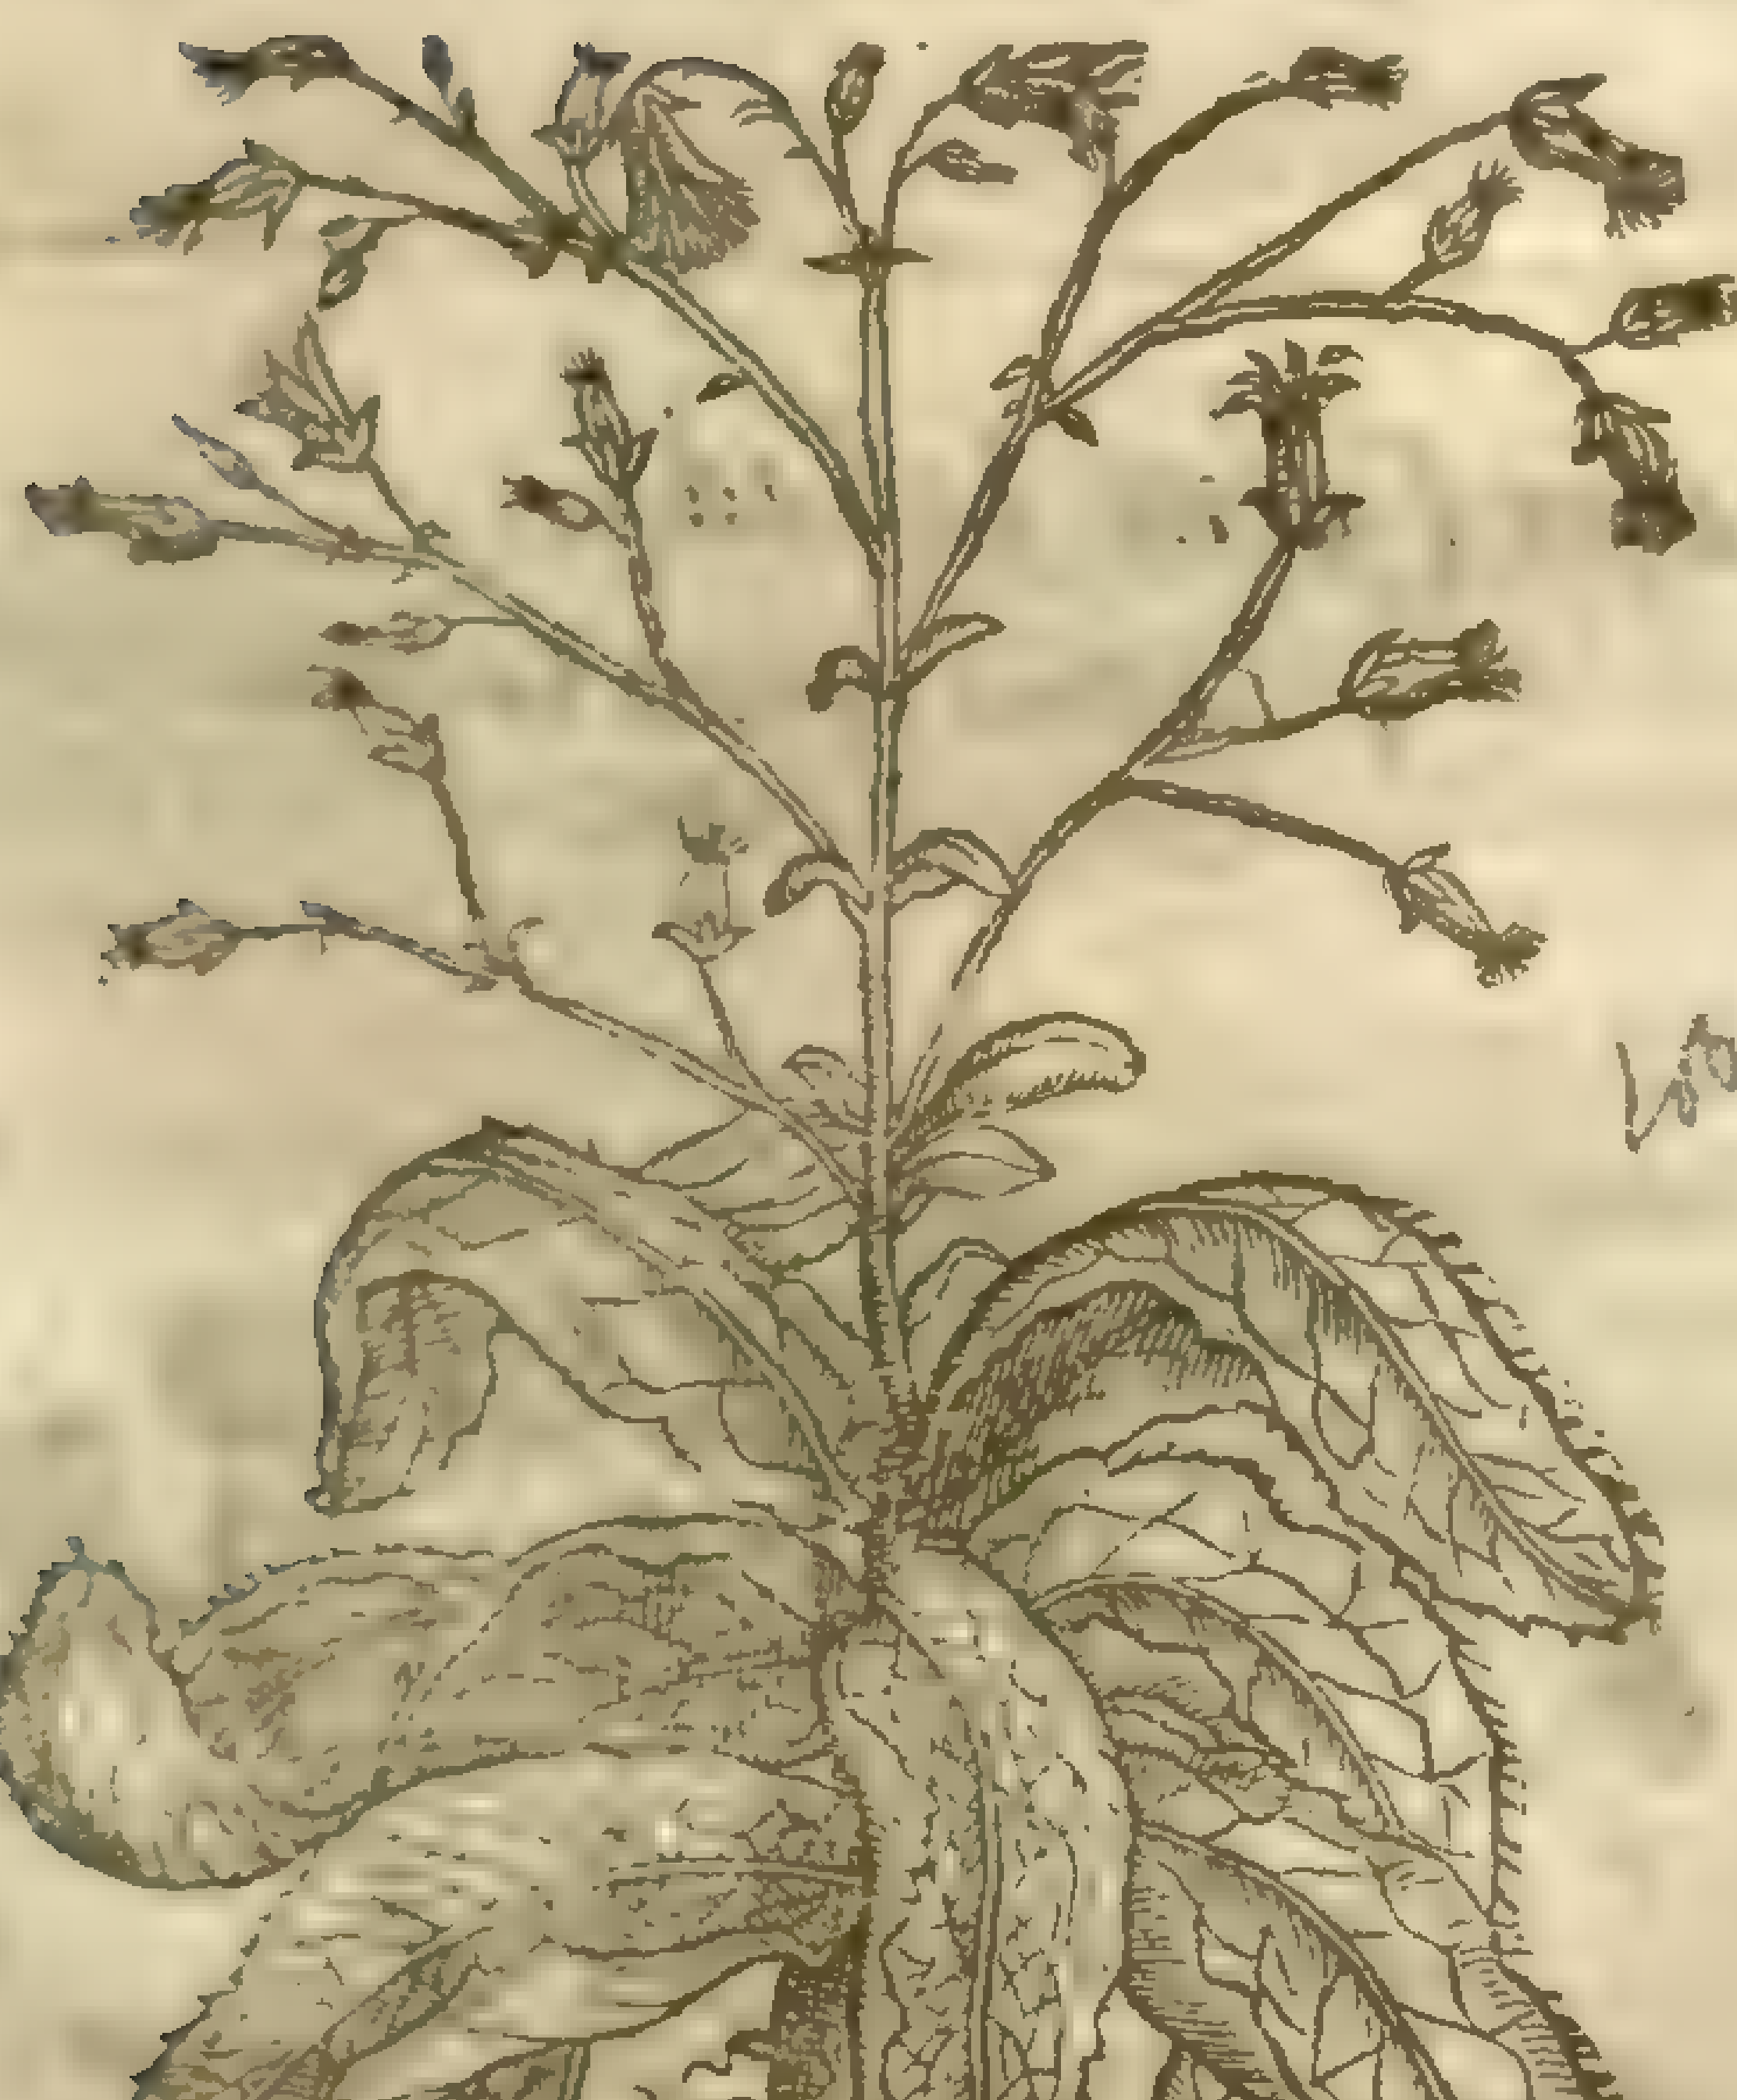
¶ *The Deſcription.*

‡ THere are three ſorts of of wild Lettuce growing wild here with vs in England, yet I know not any one that hath mentioned more than two; yet I thinke all three of them haue bin written of, though two of them be confounded together and made but one (a thing often happening in the hiſtory of Plants) and vnleſſe I had ſeene three diſtinct ones, I ſhould my ſelfe haue been of the ſame opinion.

1 The firſt and rareſt of theſe hath long and broad leaues, not cut in, but onely ſnipt about the edges, and thoſe leaues are they that are on the lower part of the ſtalke almoſt to the middle thereof: then come leaues from thence to the top, which are deeply diuided with large gaſhes: the ſtalk, if it grow in good grounds, exceeds the height of a man (for I haue ſeene it grow in a garden to the height of eight or nine foot) it is large, round, and ſmooth, and towards the top diuided into many branches which beare yellow floures ſomewhat like to the garden Lettuce, after which alſo ſucceed blackiſh ſeeds like to other plants of this kinde. The whole plant is full of a clammy milky juice, which hath a very ſtrong and grieuous ſmell of *Opium*.

‡ 1 *Lactuca ſyl. major odore Opij.*
The greater wilde Lettuce ſmelling of *Opium*.

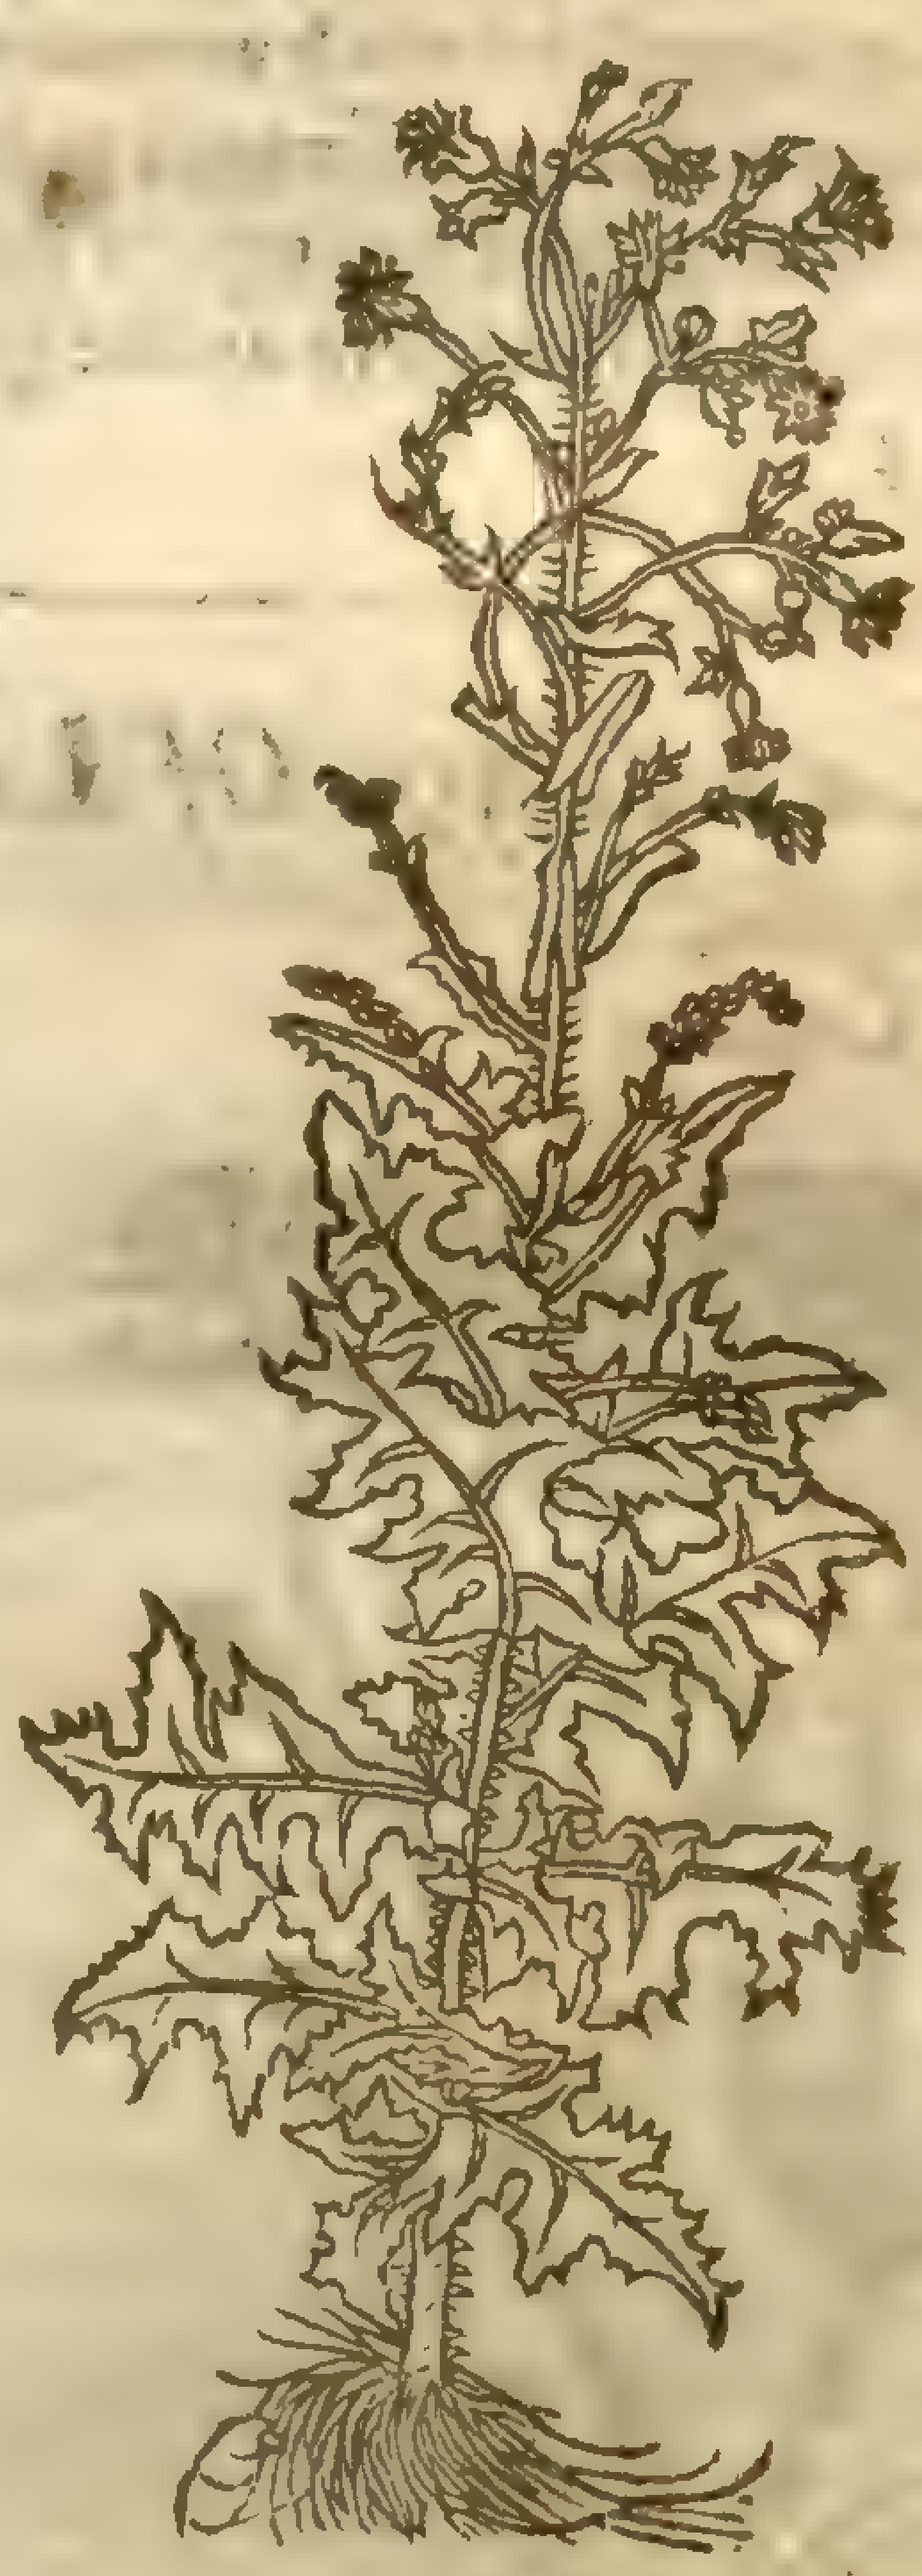
L. virosa, e
mei. dict.



Vol. ii. 2d

‡ 3 *Lactuca ſylveſtris folijs diſſectis.*
The wilde Lettuce with the diuided leafe.

L. scariola, e
mei. dict.
Sm. fl. 3. 346



2 This hath broad leaues onely cut about the edges, but not altogether ſo large as thoſe of the laſt deſcribed: the ſtalk, which commonly is two cubits or better high, is alſo ſmooth, and diuided into many branches, bearing ſuch floures and ſeeds as the laſt deſcribed; and this alſo hath a milkie juice of the ſame ſmell as the laſt deſcribed, from which it differs onely in the magnitude, and that this hath all the leaues whole, and not ſome whole and ſome diuided, as the former.

3 This in ſtalkes, floures and ſeeds is like to the laſt deſcribed, but the leaues are much different, for they are all deeply gaſhed or cut in like as the leaues of Succory, or Dandelion. This alſo is full of a milky juice, but hath not altogether ſo ſtrong a ſent of *Opium* as the two former, though it partake much thereof. The ſtalke of this is ſometimes a little prickly, and ſo alſo is the middle rib vpon the backſide of the leafe, both in this and the former. All theſe three haue woody roots which die euery yeare, and ſo they come vp againe of the ſcattered ſeed.

¶ *The Place.*

The firſt of theſe was found in Hampſhire by Mr. *Goodyer* & the ſeeds hereof ſent to Mr. *Parkinſon* in whoſe garden I ſaw it growing ſome two yeares ago. The other grow plentifully betweene London and Pancridge Church, about the ditches and highway ſide.

¶ *The Time.*

They come vp in the Spring, and ſometimes ſooner, and ripen their ſeed in Iuly and Auguſt.

¶ *The Names.*

1 I take the firſt of theſe to be the *Lactuca ſylueſtris* of *Dioſcorides* and the Antients, and that which the Authors of the *Aduerſaria* gaue vs vnder the title of *Lactuca agreſtis ſcariolæ hortenſis folio, Lactucæ flore, Opij odore vehementi, ſoporifero & viroſo.*

2 This is the *Endiuia* of *Tragus, pag.* 268. and the *Theſion* of *Daleſchampius, pag.* 564. *Bauhine* confounds this with the former.

3 This is the *Lactuca ſylueſtris prior*, of *Tragus* : the *Lactuca ſylueſtris* of *Matthiolus, Fuchſius, Dodonaus*, and others : it is the *Seris Domeſtica* of *Lobel.*

¶ *The Temperature.*

Theſe certainly, eſpecially the two firſt, are cold, and that in the later end of the third or beginning of the fourth degree (if *Opium* be cold in the fourth.)

¶ *The Vertues.*

A Some (ſaith *Dioſcorides*) mix the milkie juice hereof with *Opium* ; (for his *Meconium* is our *Opium*) in the making thereof.

B He alſo ſaith, that the juice hereof drunke in Oxycrate in the quantitie of 2 *oboli*, (which make ſome one ſcruple) purgeth wateriſh humors by ſtoole; it alſo clenſeth the little vlcer in the eie called *Argemon* in Greeke, as alſo the myſtineſſe or darkeneſſe of ſight.

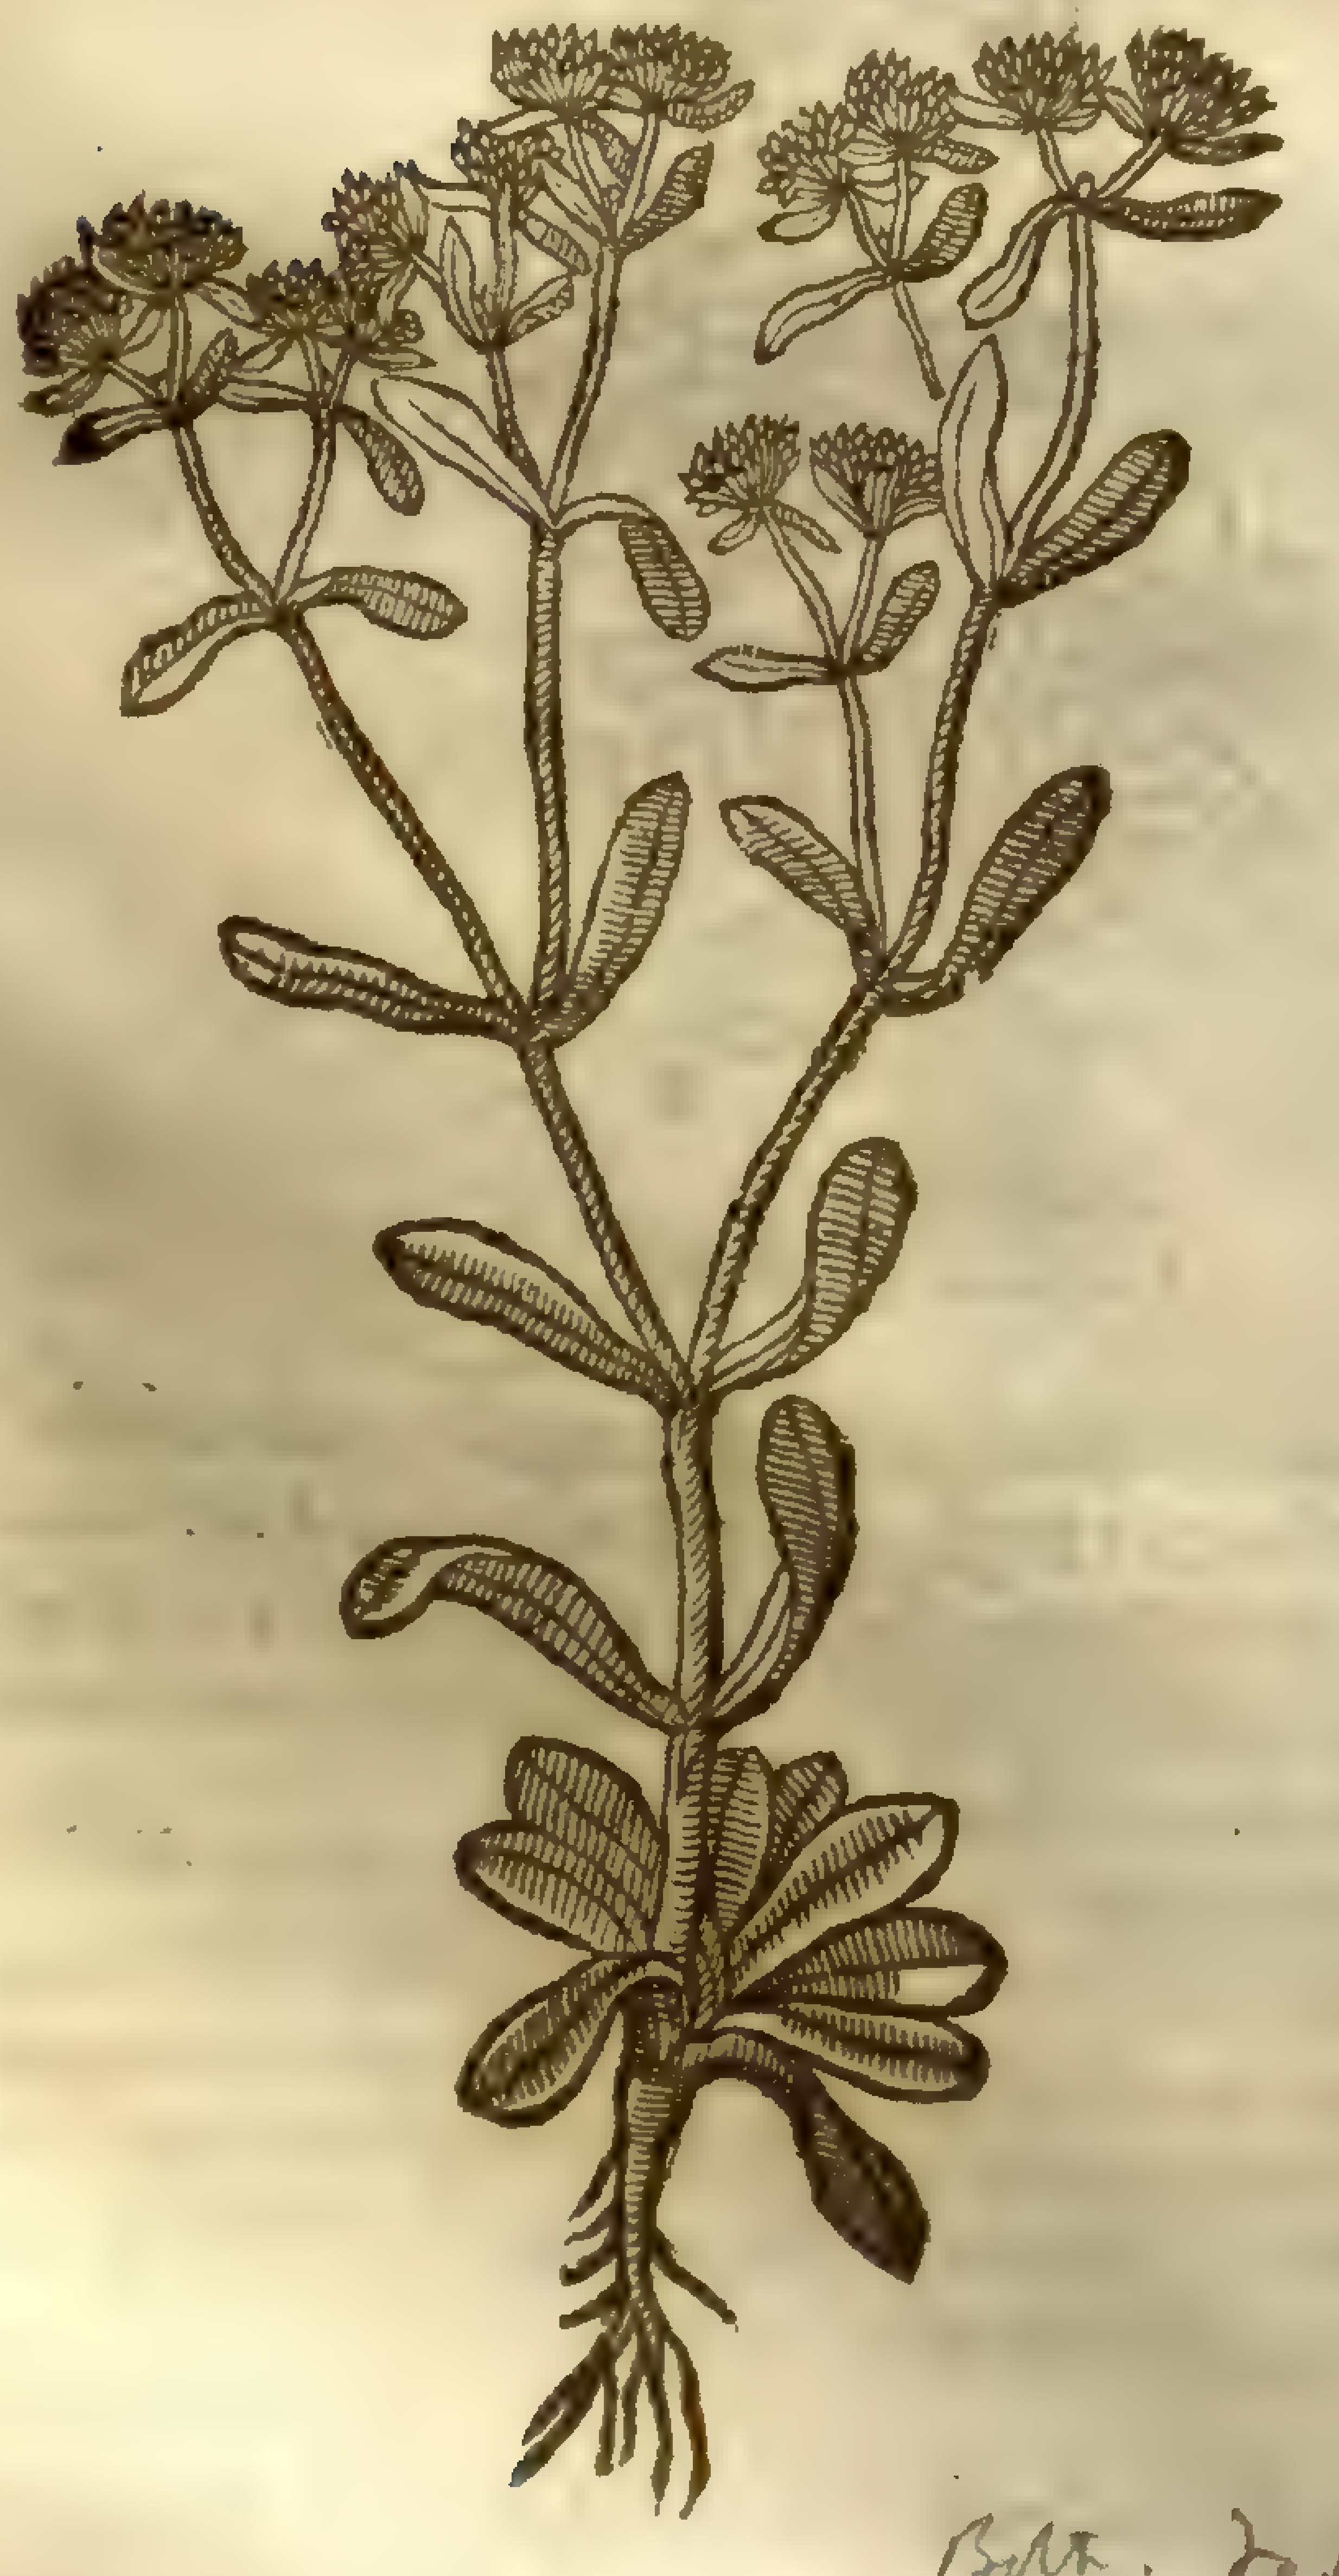
C Alſo beaten and applied with womans milke it is good againſt burnes and ſcaldes.

D Laſtly, it procures ſleepe, aſſwages paine, moues the courſes in women, and is drunke againſt the ſtingings of Scorpions, and bitings of ſpiders.

E The ſeed taken in drinke, like as the garden Lettuce, hindreth generation of ſeed and venereous imaginations. ‡

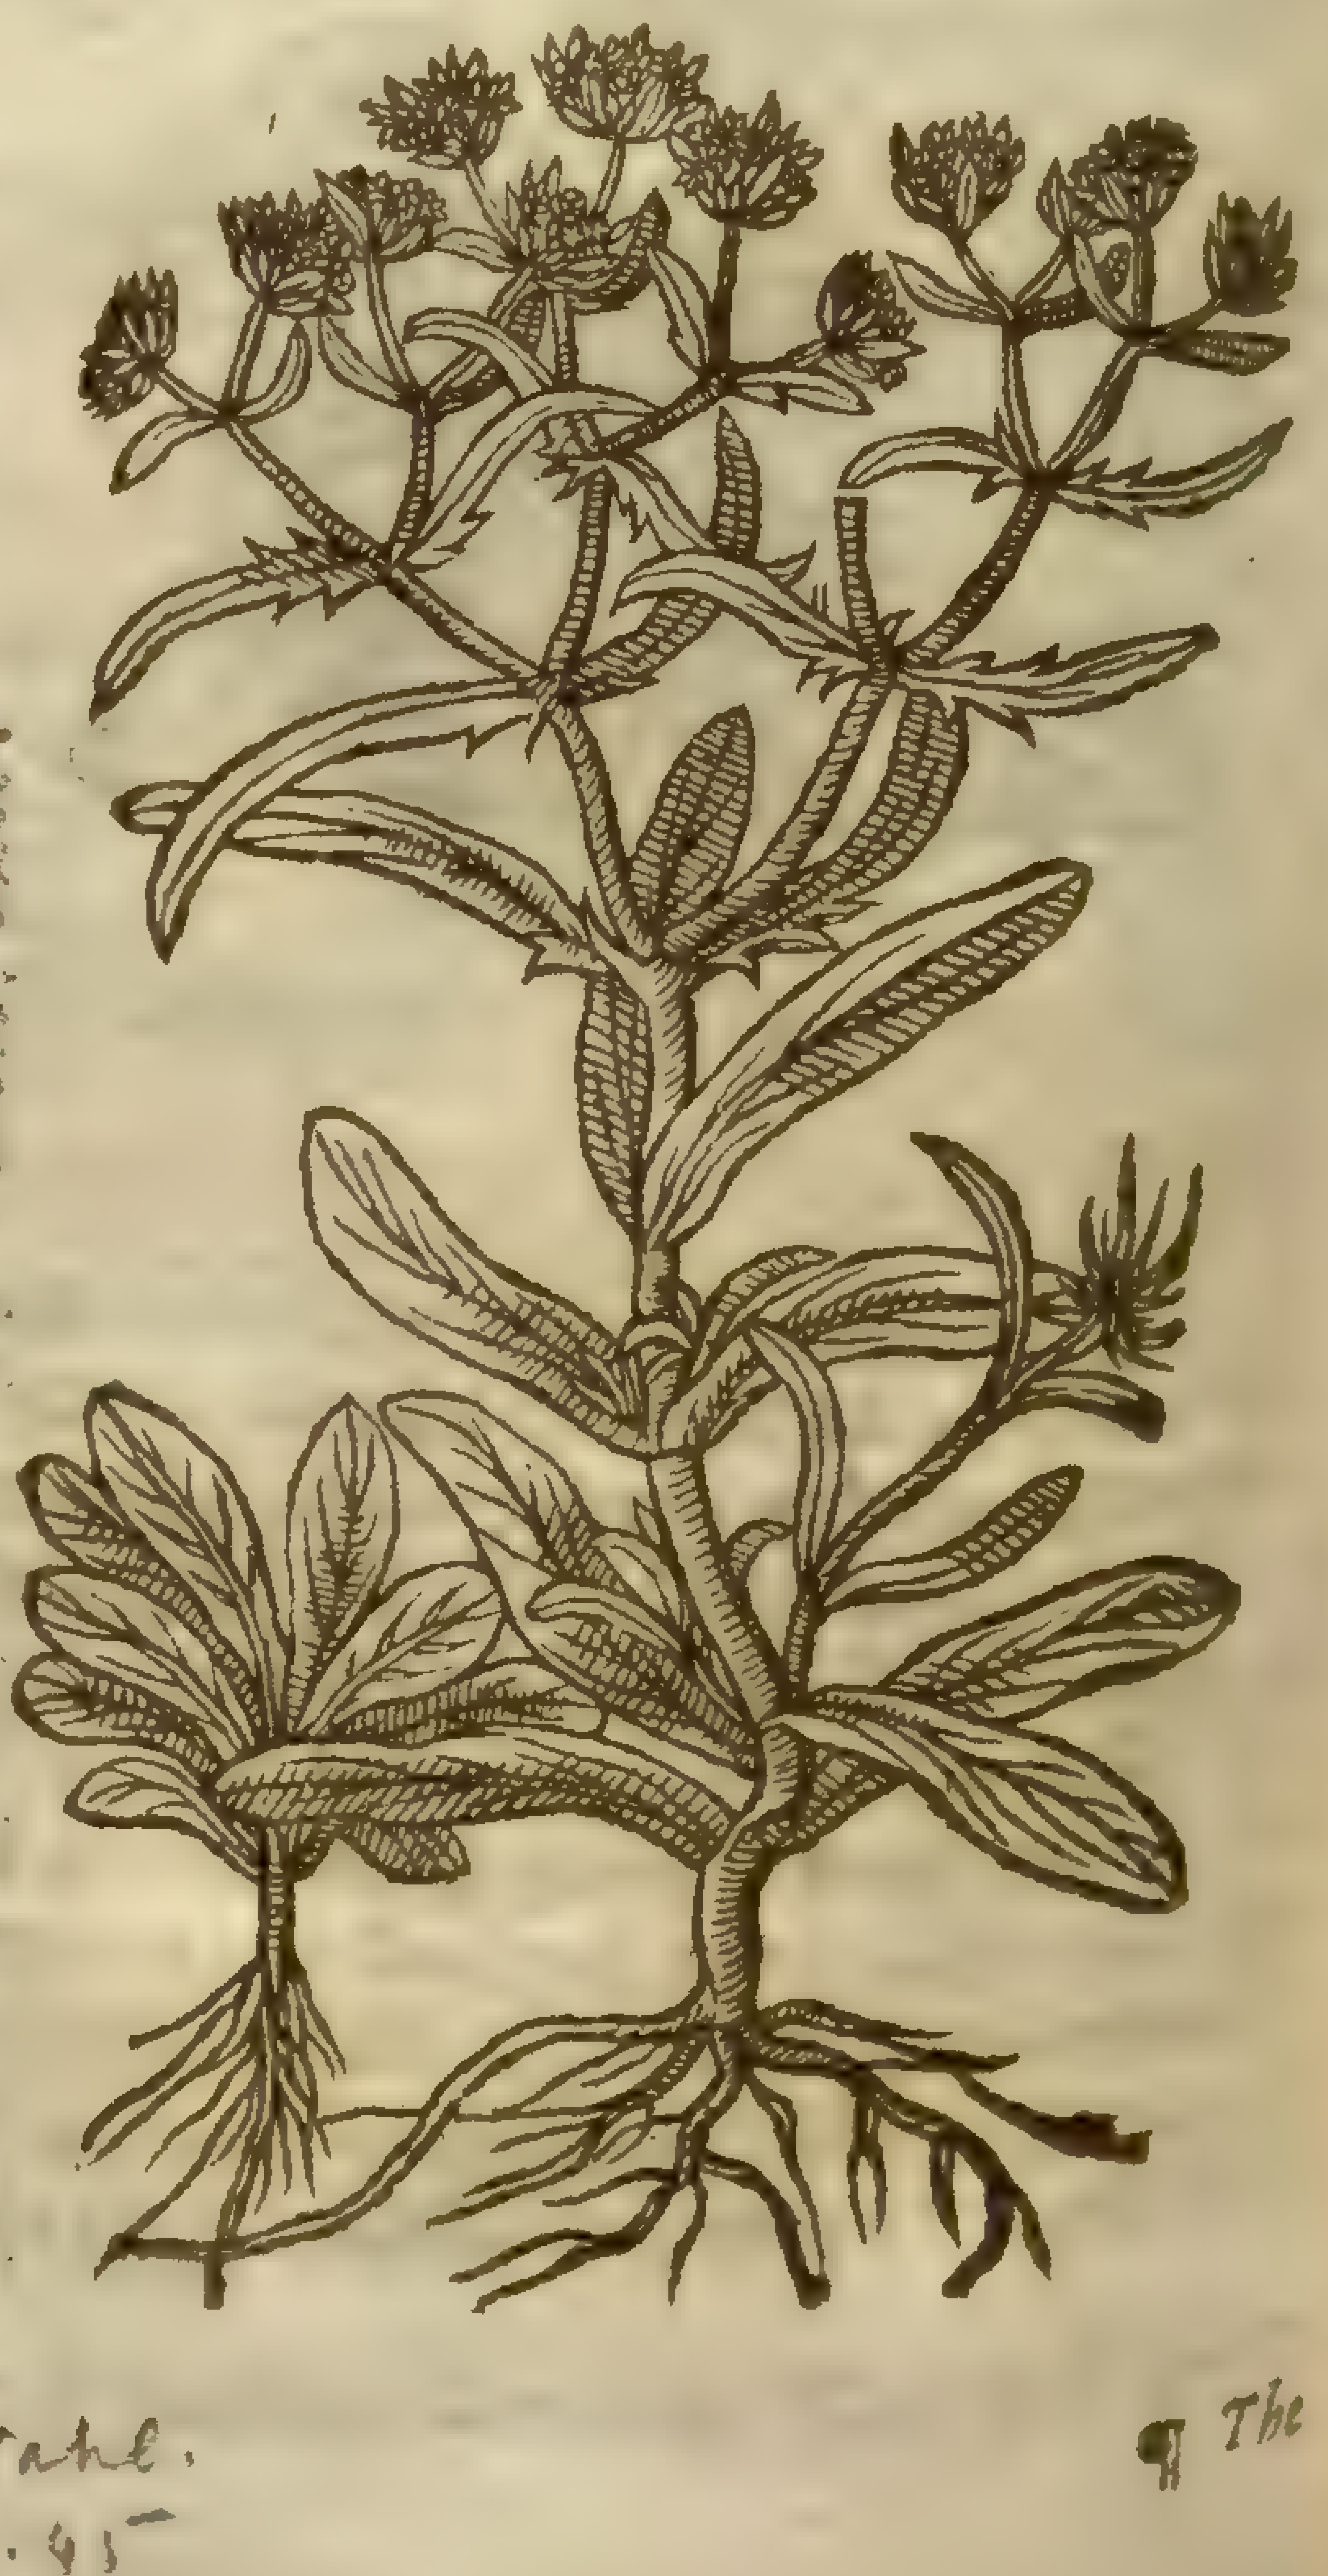
Chap. 39. *Of Lambs Lettuce, or Corne ſallad.*

1 *Lactuca Agnina.*
Lambs Lettuce.



Valeriana locusta, L. (V. olitoria, L. 2) mea dict.

2 *Lactuca Agnina latifolia.*
Corne ſallade.



V. olitoria, L. β. mea dict.

Brit. Fedia olitoria, Vahl.
Sm. ft. i. 45

¶ The

¶ *The Deſcription.*

1 THe Plant which is commonly called *Olus album*, or the white pot-herb (which of ſome hath bin ſet out for a kind of Valerian, but vnproperly, for that it doth very notably reſemble the Lettuce, as well in form, as in meat to be eaten; which property is not to be found in Valerian, and therefore by reaſon and authoritie I place it as a kind of Lettuce) hath many ſlender weak ſtalks trailing vpon the ground, with certain edges a foot high when it grows in moſt fertile ground; otherwiſe a hand or two high, with ſundry ioynts or knees: out of euery one whereof grow a couple of leaues narrow and long, not vnlike to Lettuce at the firſt comming vp, as well in tenderneſſe as taſte in eating; and on the top of the ſtalkes ſtand vpon a broad tuft as it were certaine white flourers that be maruellous little, which can ſcarſely bee knowne to bee floures, ſauing that they grow many together like a tuft or vmbel: it hath in ſtead of roots a few ſlender threads like vnto haires.

2 The other kinde of Lettuce, which *Dodonæus* in his laſt edition ſetteth forth vnder the name of *Album olus*: the Low-country men call it **Witmoes**, and vſe it for their meat called Wermoſe; with vs, Loblollie. This plant hath ſmall long leaues a finger broad, of a pale green colour; among which ſhooteth vp a ſmall cornered and ſlender ſtem halfe a foot high, jointed with two or three joints or knees, out of which proceed two leaues longer than the firſt, bearing at the top of the branches tufts of very ſmall white floures cloſely compact together, with a root like the former.

‡ Both theſe are of one plant, differing in the bigneſſe and broadneſſe of the leafe and the whole plant beſides. ‡

¶ *The Place.*

Theſe herbes grow wilde in the corne fields; and ſince it hath growne in vſe among the French and Dutch ſtrangers in England, it hath bin ſowne in gardens as a ſallad herbe.

¶ *The Time.*

They are found greene almoſt all Winter and Summer.

¶ *The Names.*

The Dutch-men do cal it **Wytmoes**: that is to ſay, *Album olus*: of ſome it is called **Veltcrop**: the French terme it *Sallade de Chanoine*: it may be called in Greeke, λευκολάχανον: in Engliſh, The White Pot-herbe; but commonly, Corne ſallad.

¶ *The Temperature and Vertues.*

This herbe is cold and ſomething moiſt, and not vnlike in facultie and temperature to the garden Lettuce; in ſtead whereof, in Winter and in the firſt moneths of the Spring it ſerues for a ſallad herbe, and is with pleaſure eaten with vineger, ſalt and oile, as other ſallads be; among which it is none of the worſt.

Chap. 40. *Of Coleworts.*

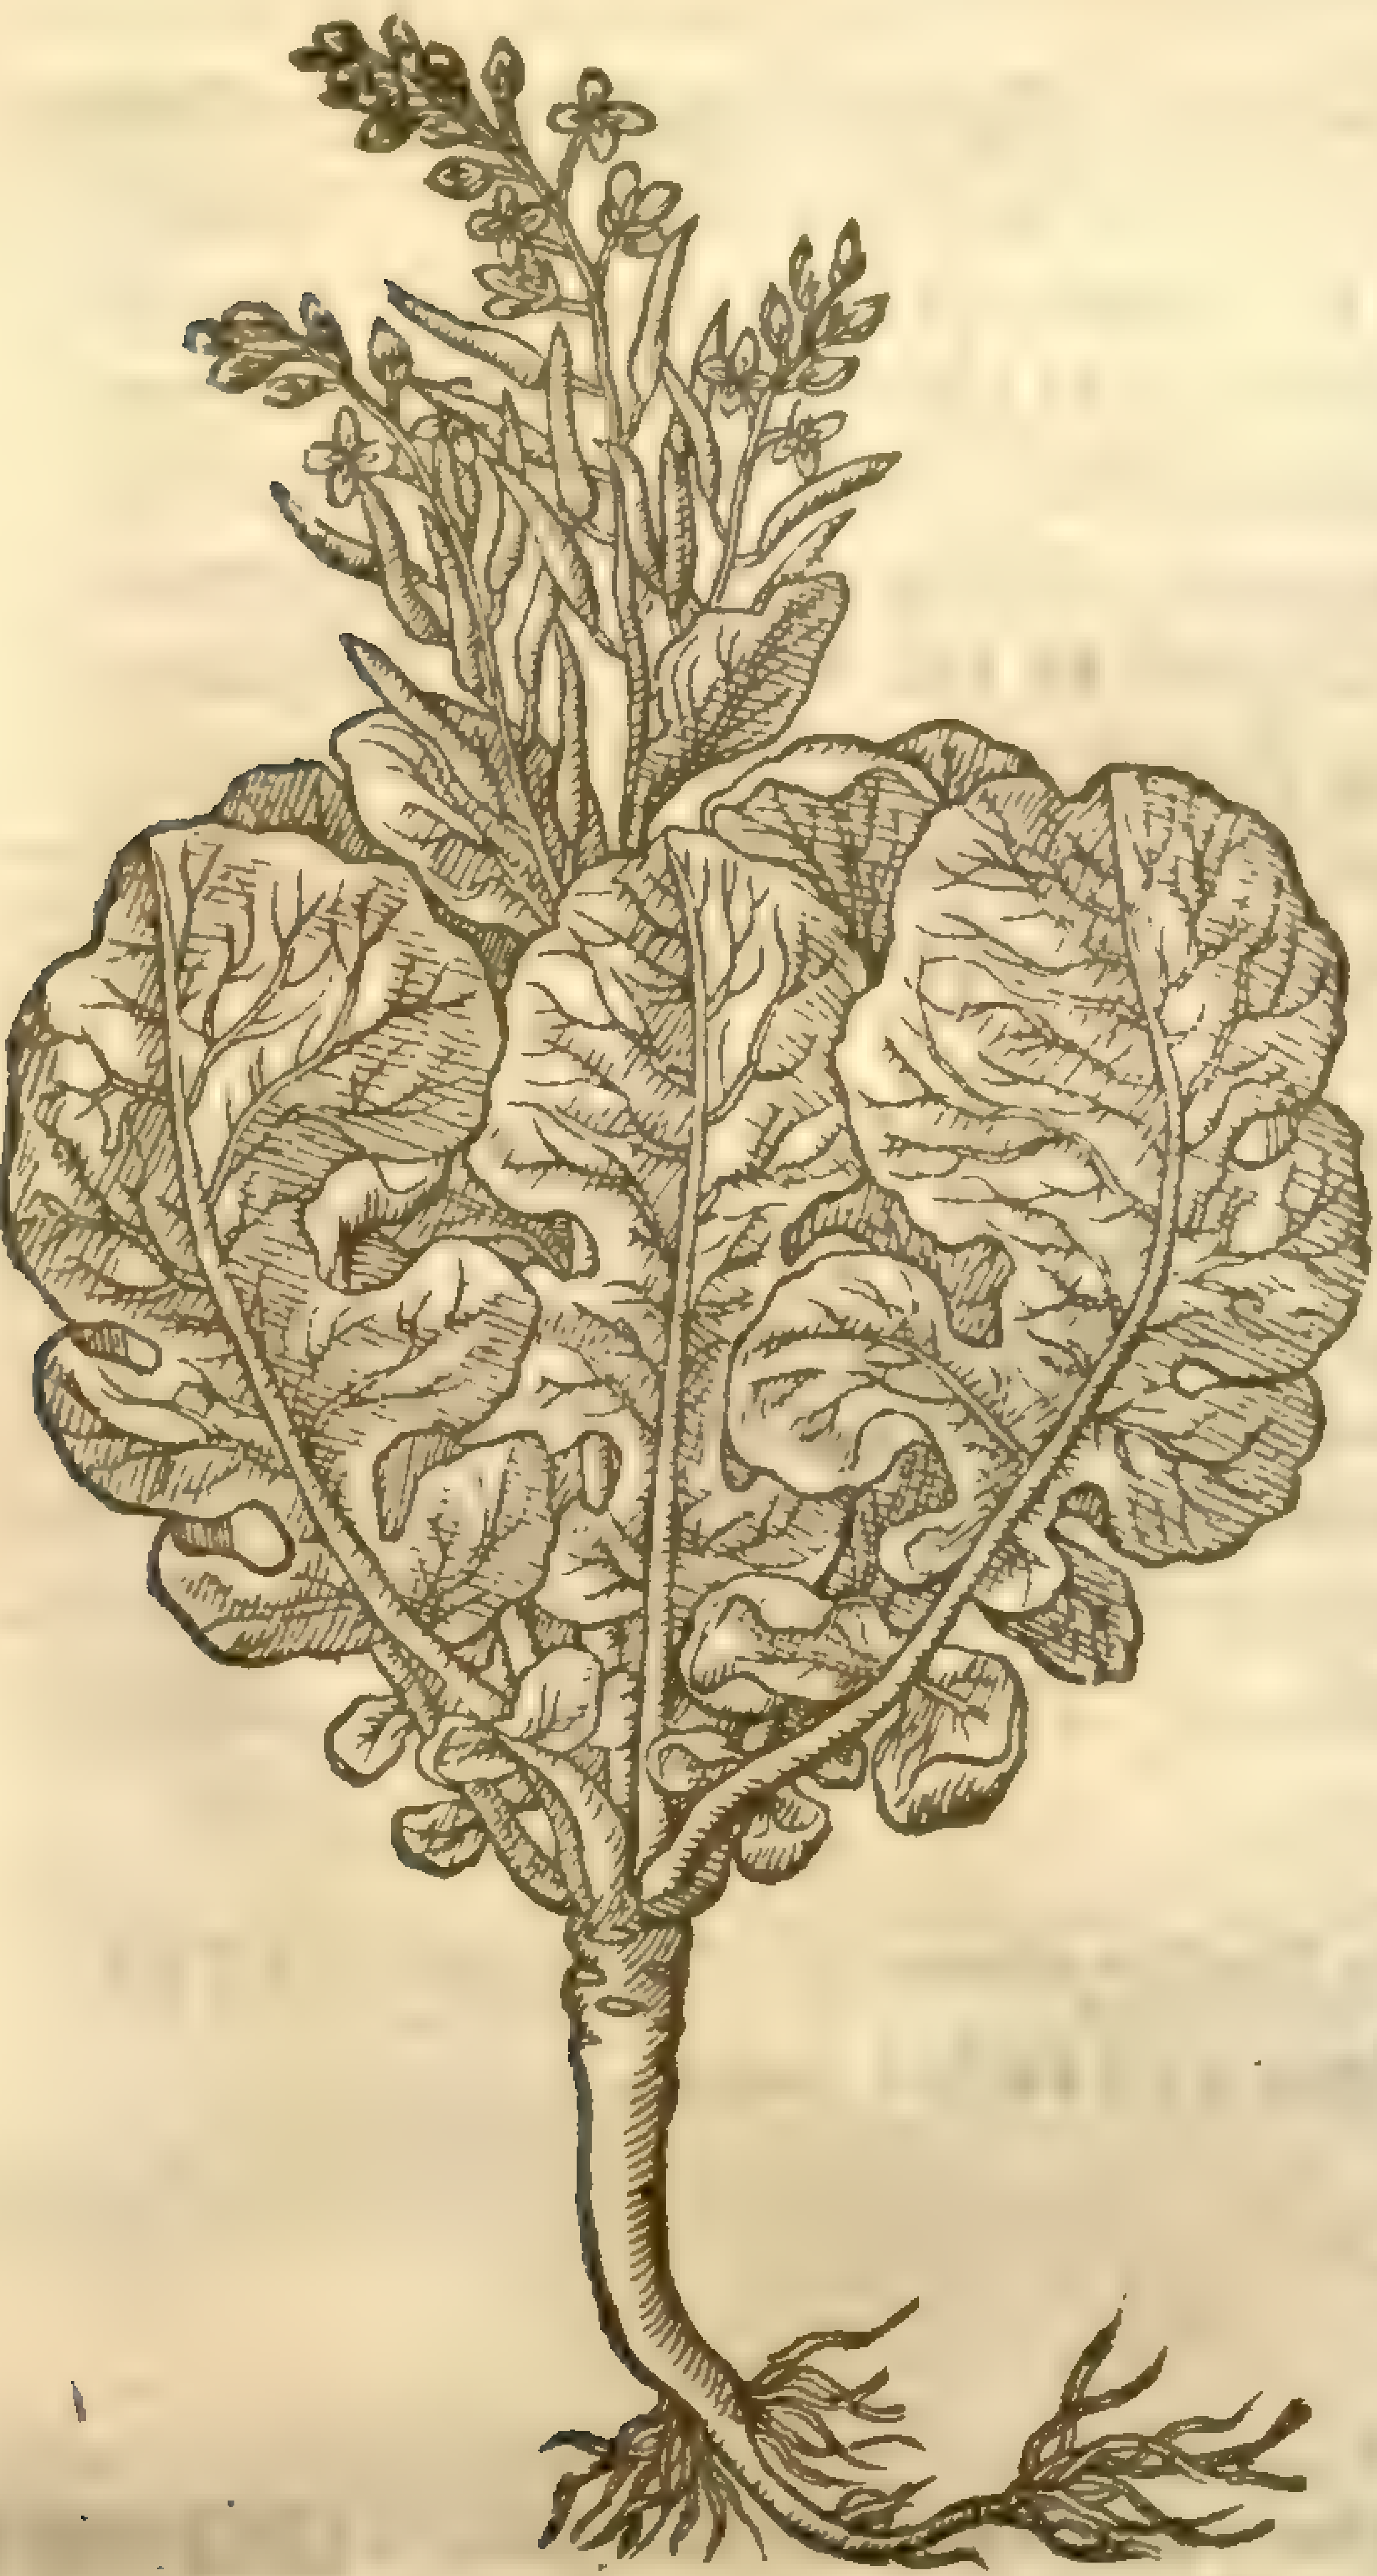
¶ *The Kindes.*

Dioſcorides maketh two kindes of Coleworts; the tame and the wilde: but *Theophraſtus* makes more kindes hereof: the ruffed or curled Cole, the ſmooth Cole, and the wilde Cole. *Cato* imitating *Theophraſtus*, ſetteth downe alſo three Coleworts: the firſt hee deſcribeth to bee ſmooth, great, broad leaued, with a big ſtalke: the ſecond ruffed: the third with little ſtalks, tender and very much biting. The ſame diſtinction alſo *Pliny* maketh, in his 20. Booke, and the ninth chapter: where he ſaith, That the moſt antient Romanes haue diuided it into three kindes: the firſt roughed, the ſecond ſmooth, and the third which is properly called κράμβη, or Colewort. And in his nineteenth booke he hath alſo added to theſe, other moe kindes: that is to ſay, *Tritianum*, *Cumanum*, *Pompeianum*, *Brutianum*, *Sabellium*, and *Lacuturrium*.

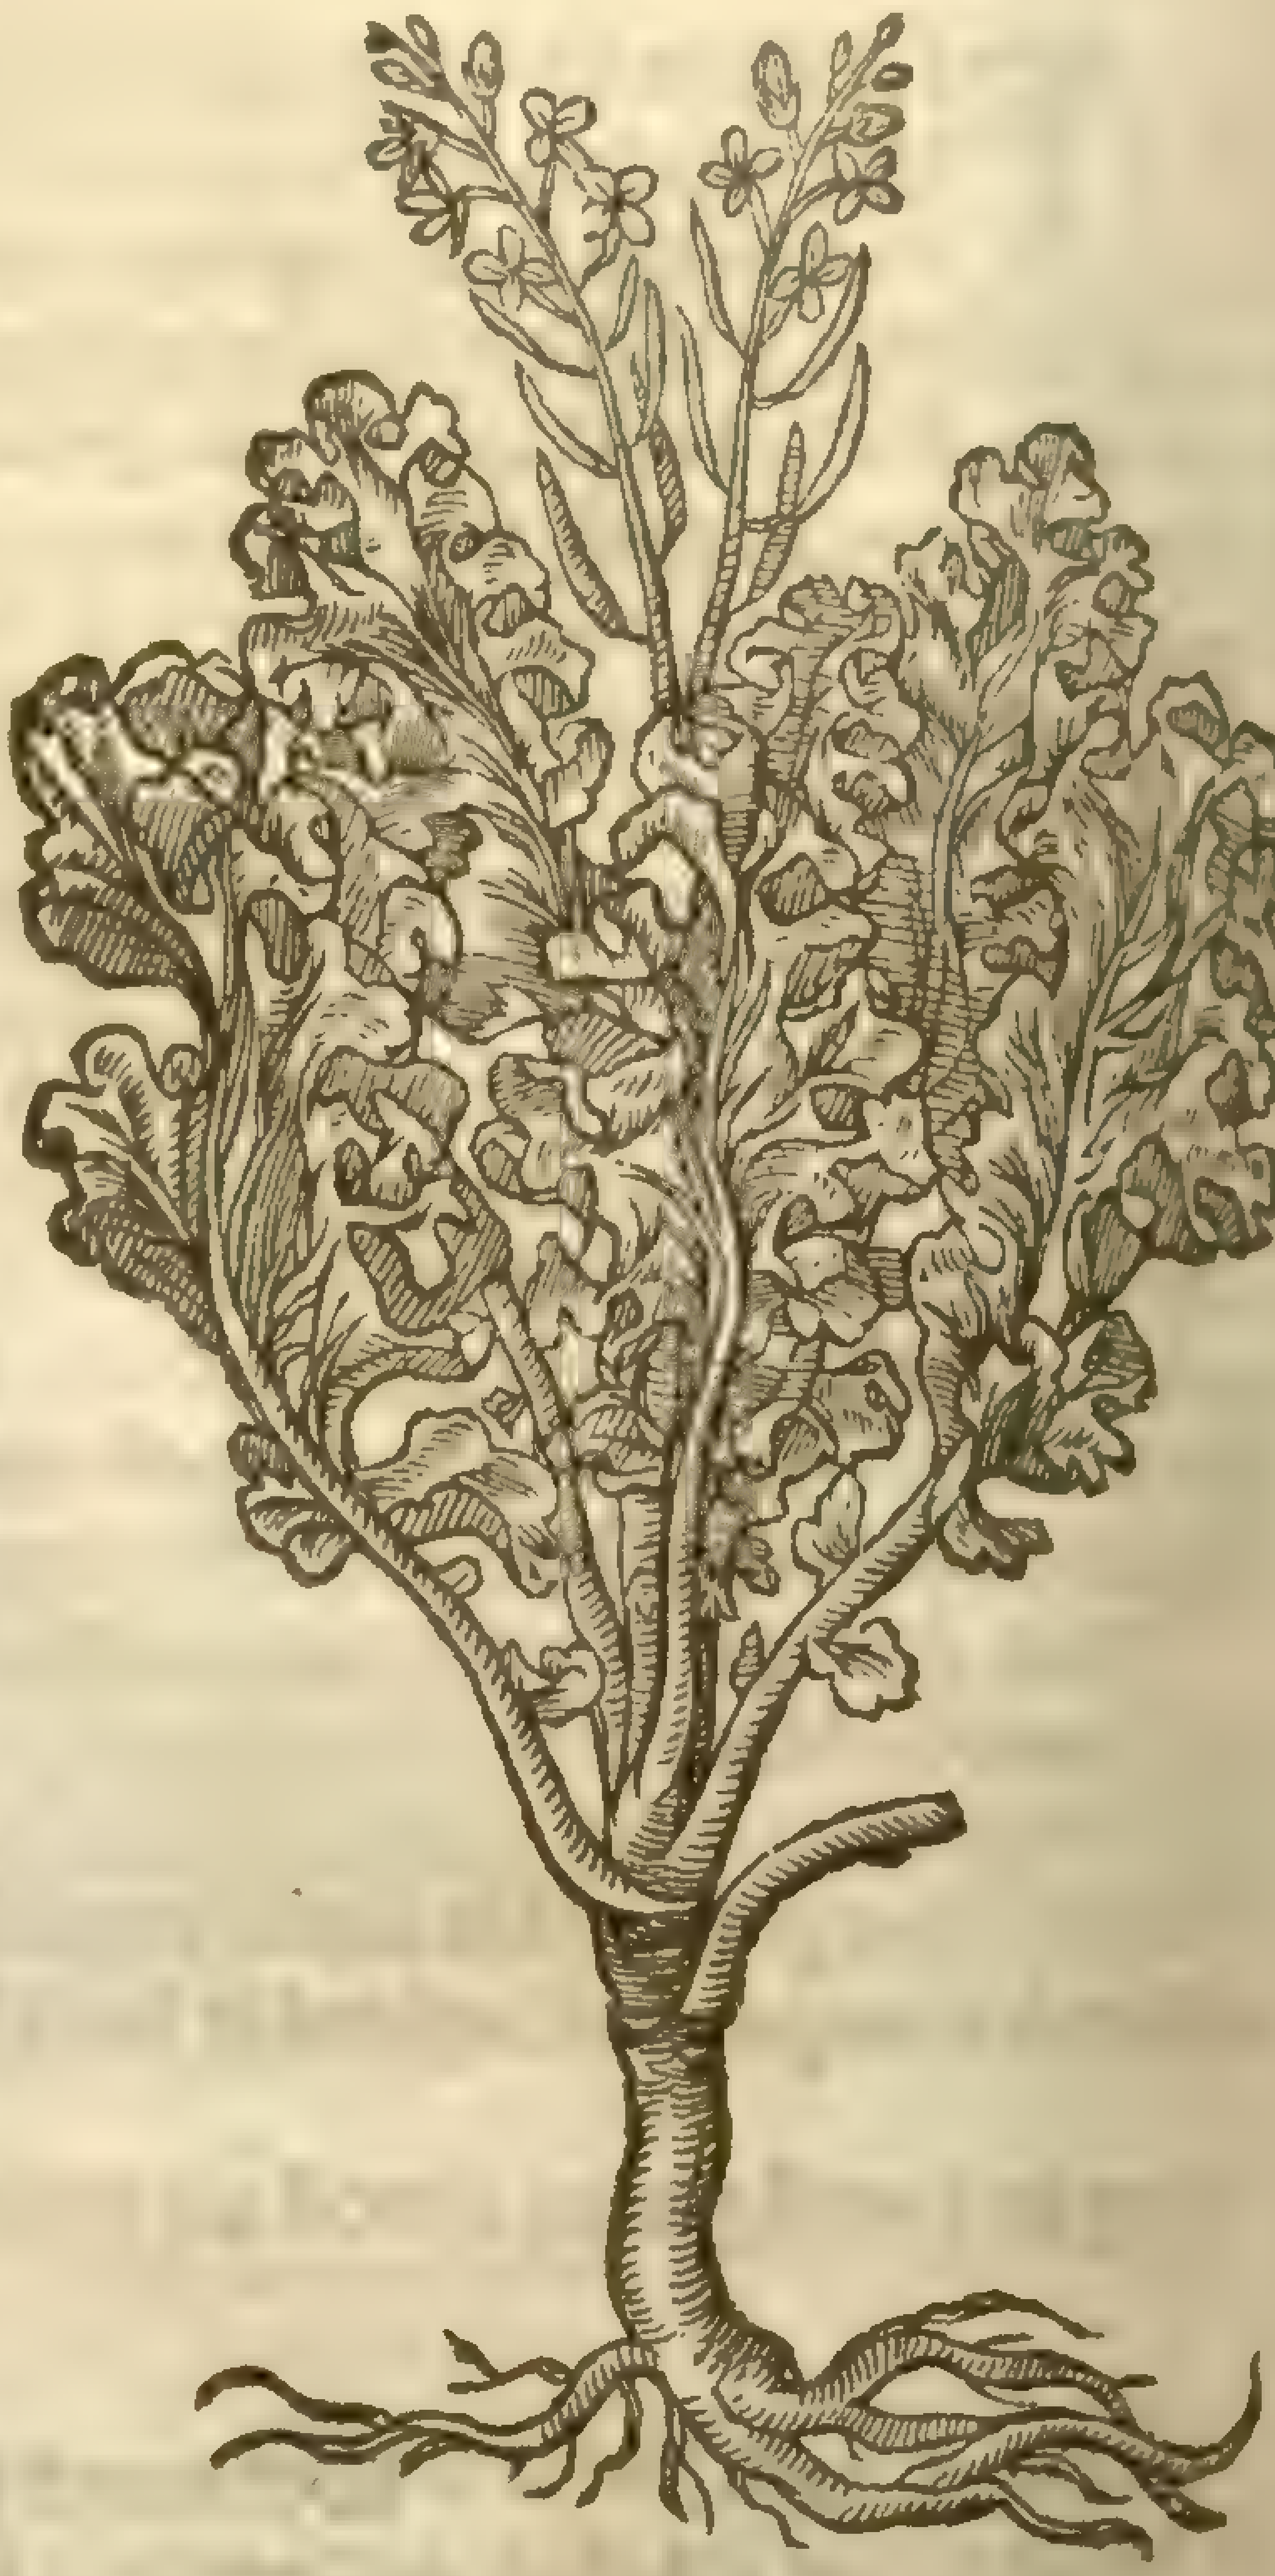
The Herbariſts of our time haue likewiſe obſerued many ſorts, differing either in colour, or els in forme: other headed with the leaues drawne together, moſt of them white, ſome of a deepe greene, ſome ſmooth leaued, and others curled or ruffed: differing likewiſe in their ſtalkes, as ſhall be expreſſed in their ſeuerall deſcriptions.

¶ The

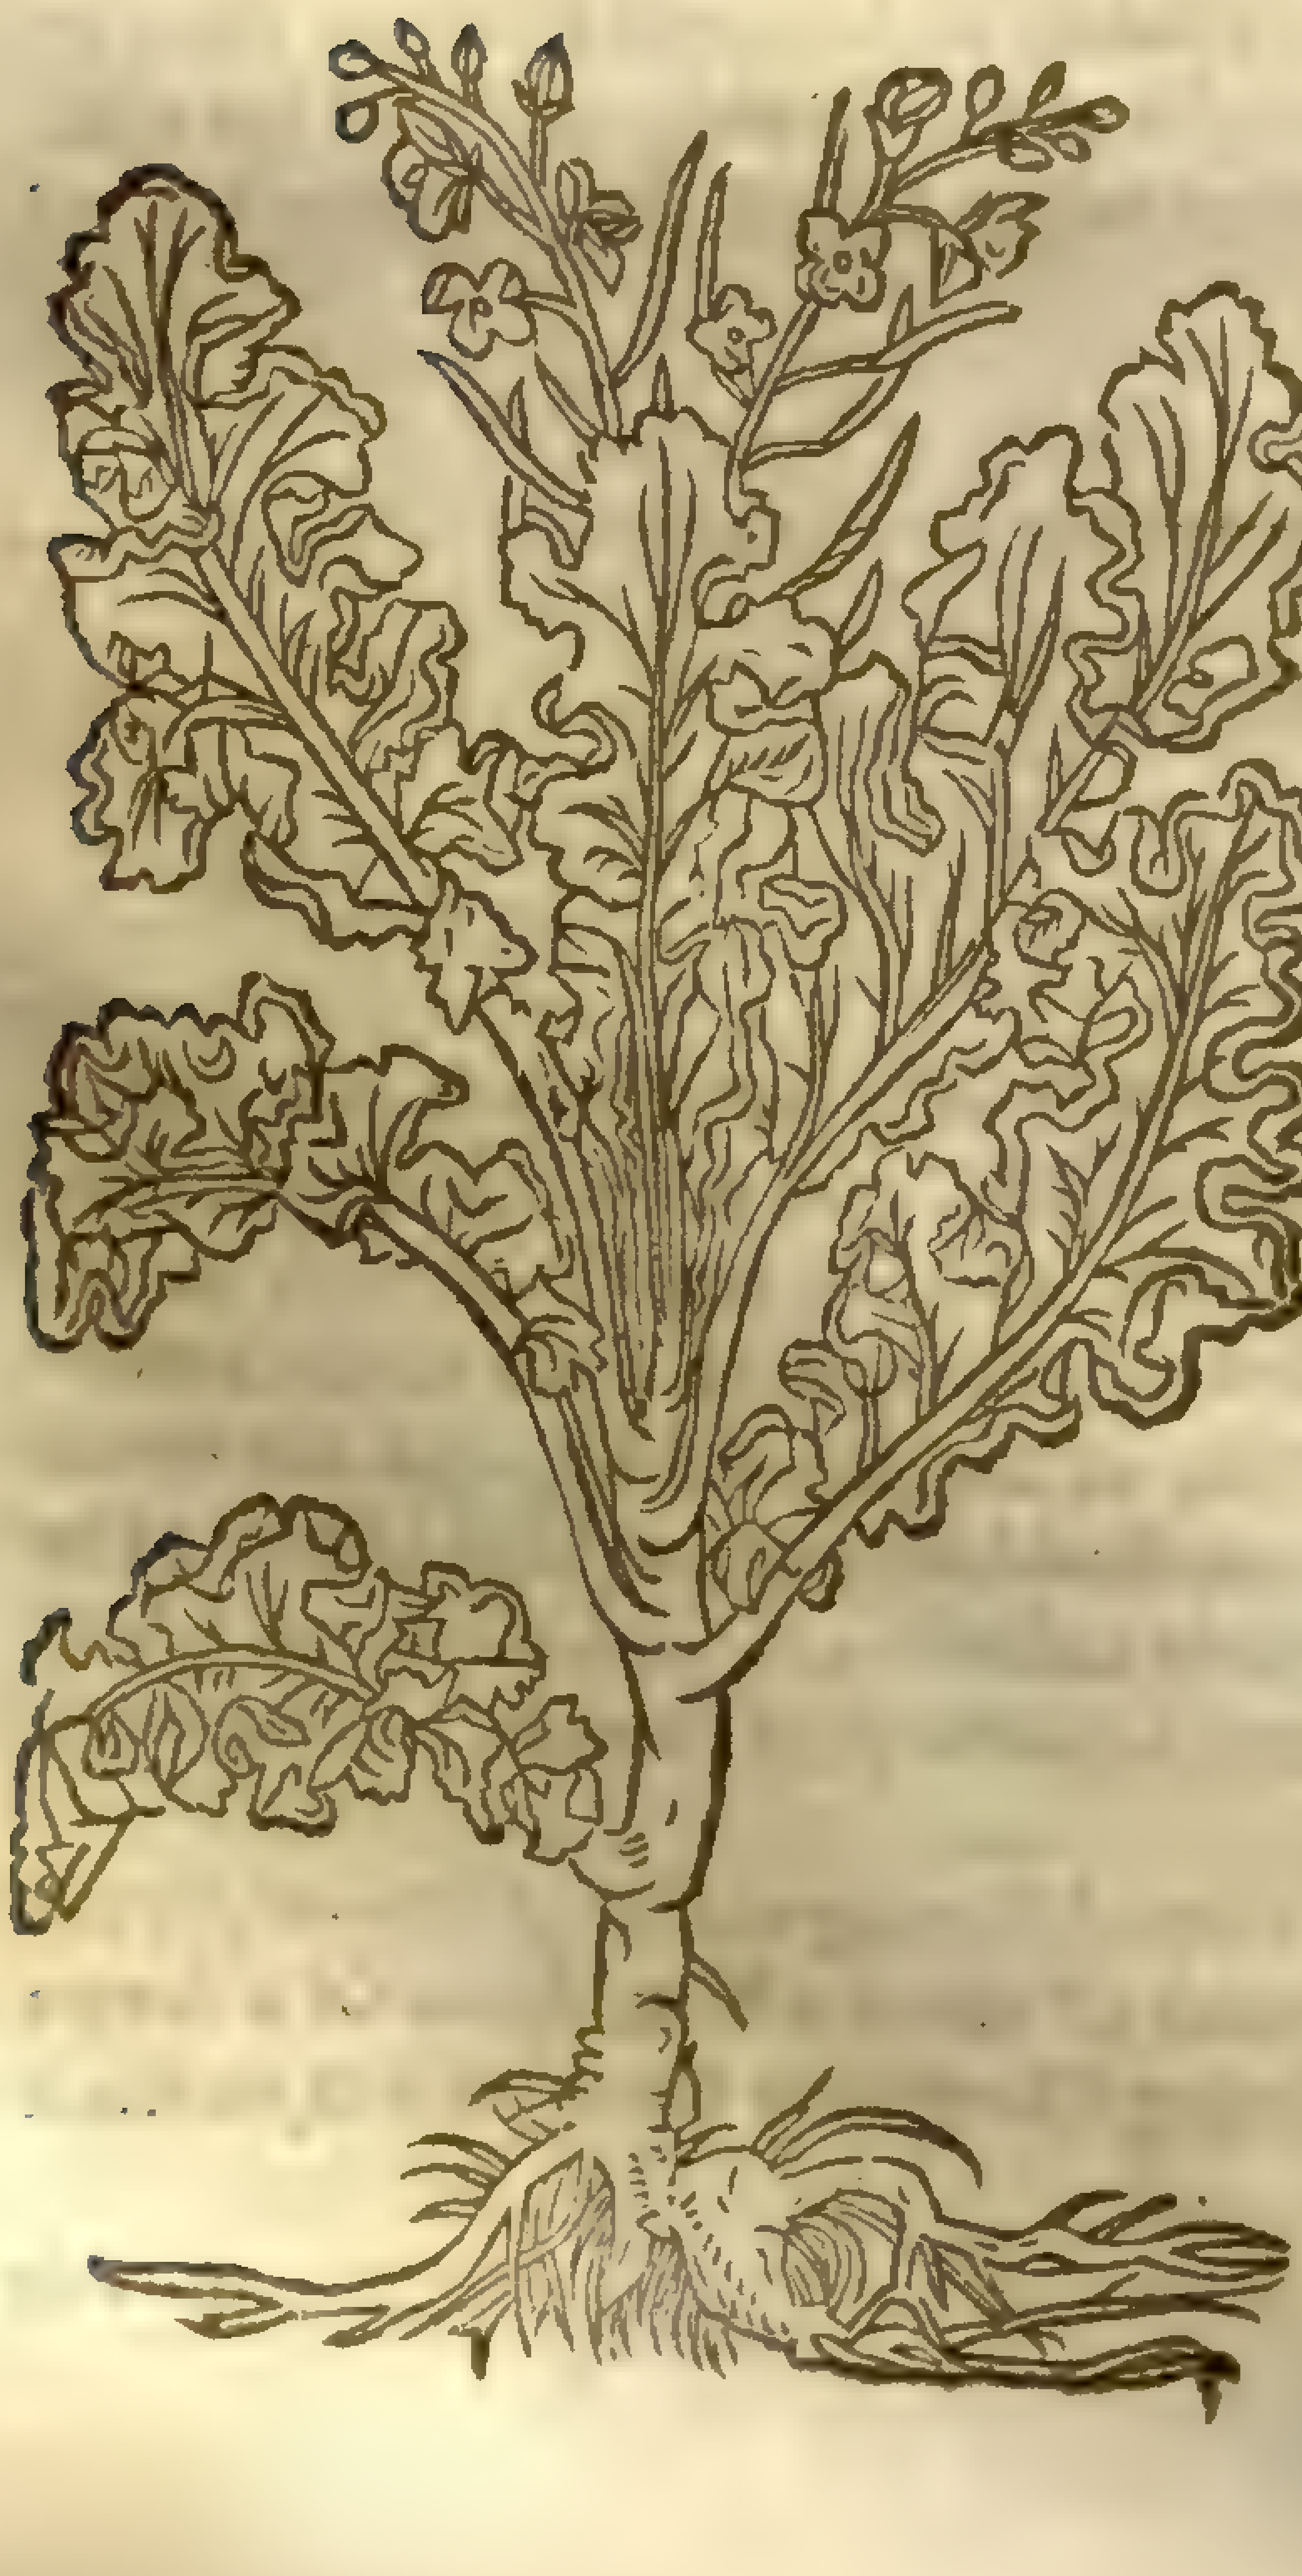
1 *Braſſica vulgaris ſatiua.*
Garden Colewort.



2 *Braſſica ſatiua criſpa.*
Curled Garden Cole.

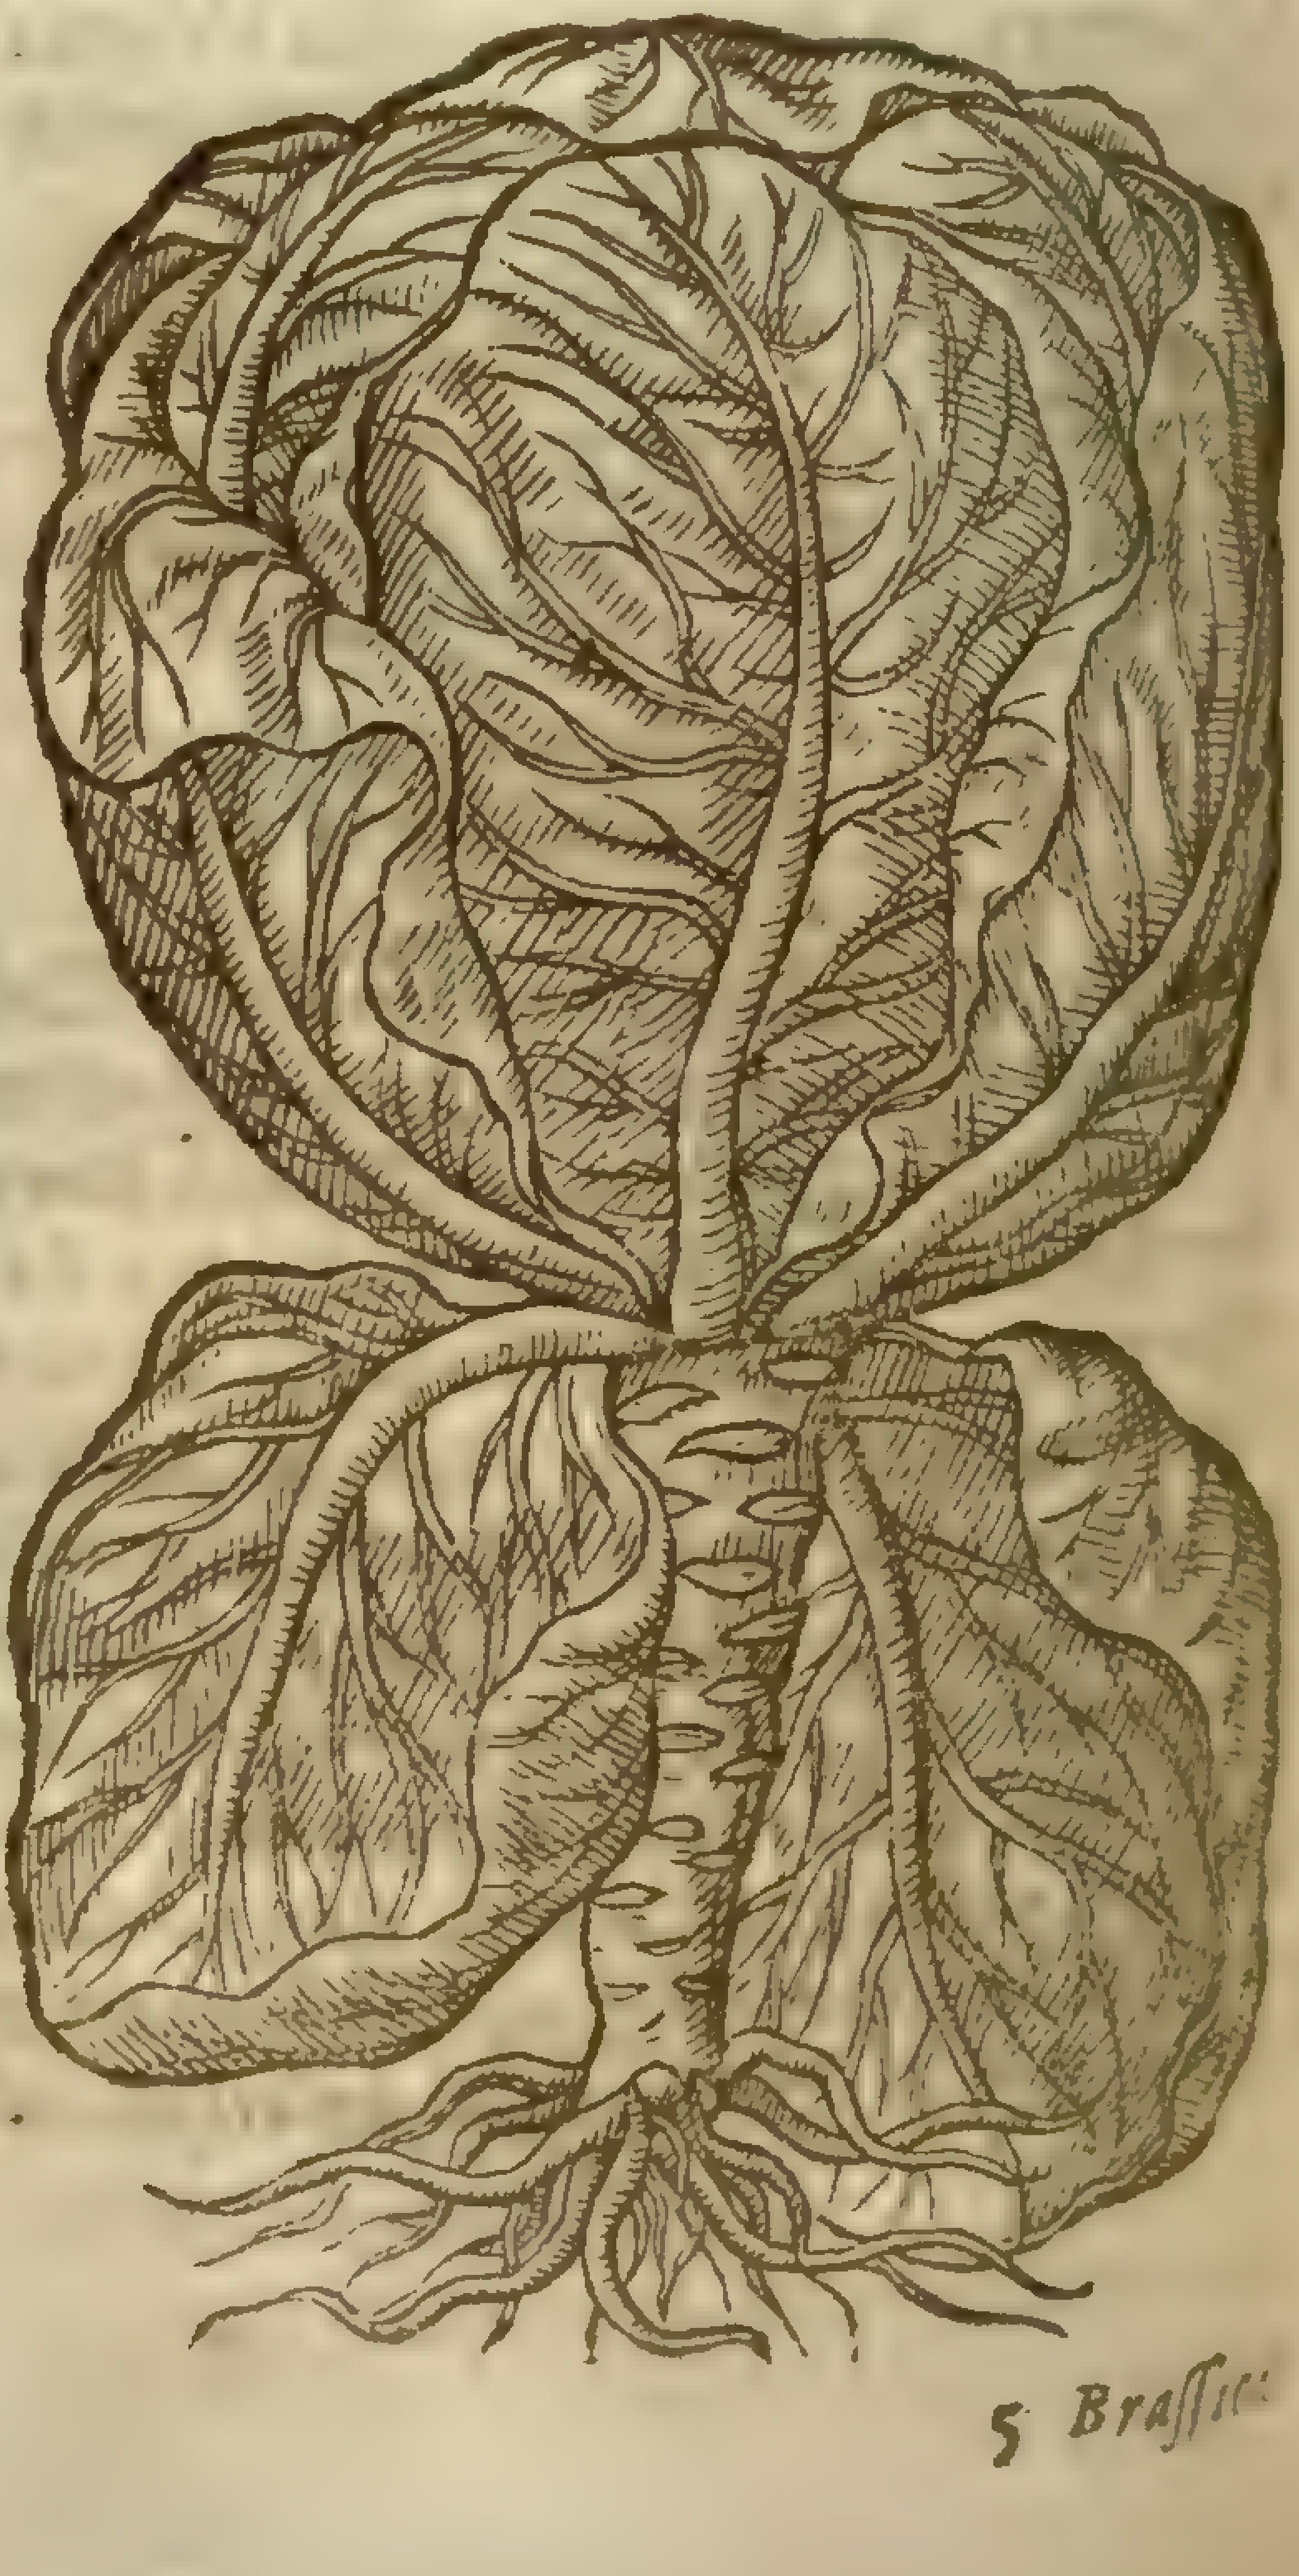


3 *Braſſica rubra.*
Red Colewort.



4 *Braſſica capitata alba.*
White Cabbage Cole.

B. [illegible]



5 *Braſſic*

¶ *The Deſcription.*

1 THe Garden Colewort hath many great broad leaues of a deepe blacke greene colour, mixed with ribs and lines of reddiſh and white colours: the ſtalke groweth out of the middeſt from among the leaues, branched with ſundry armes bearing at the top little yellow floures: and after they be paſt, there do ſucceed long cods full of round ſeed like thoſe of the Turnep, but ſmaller, with a wooddy root hauing many ſtrings or threds faſtned thereto.

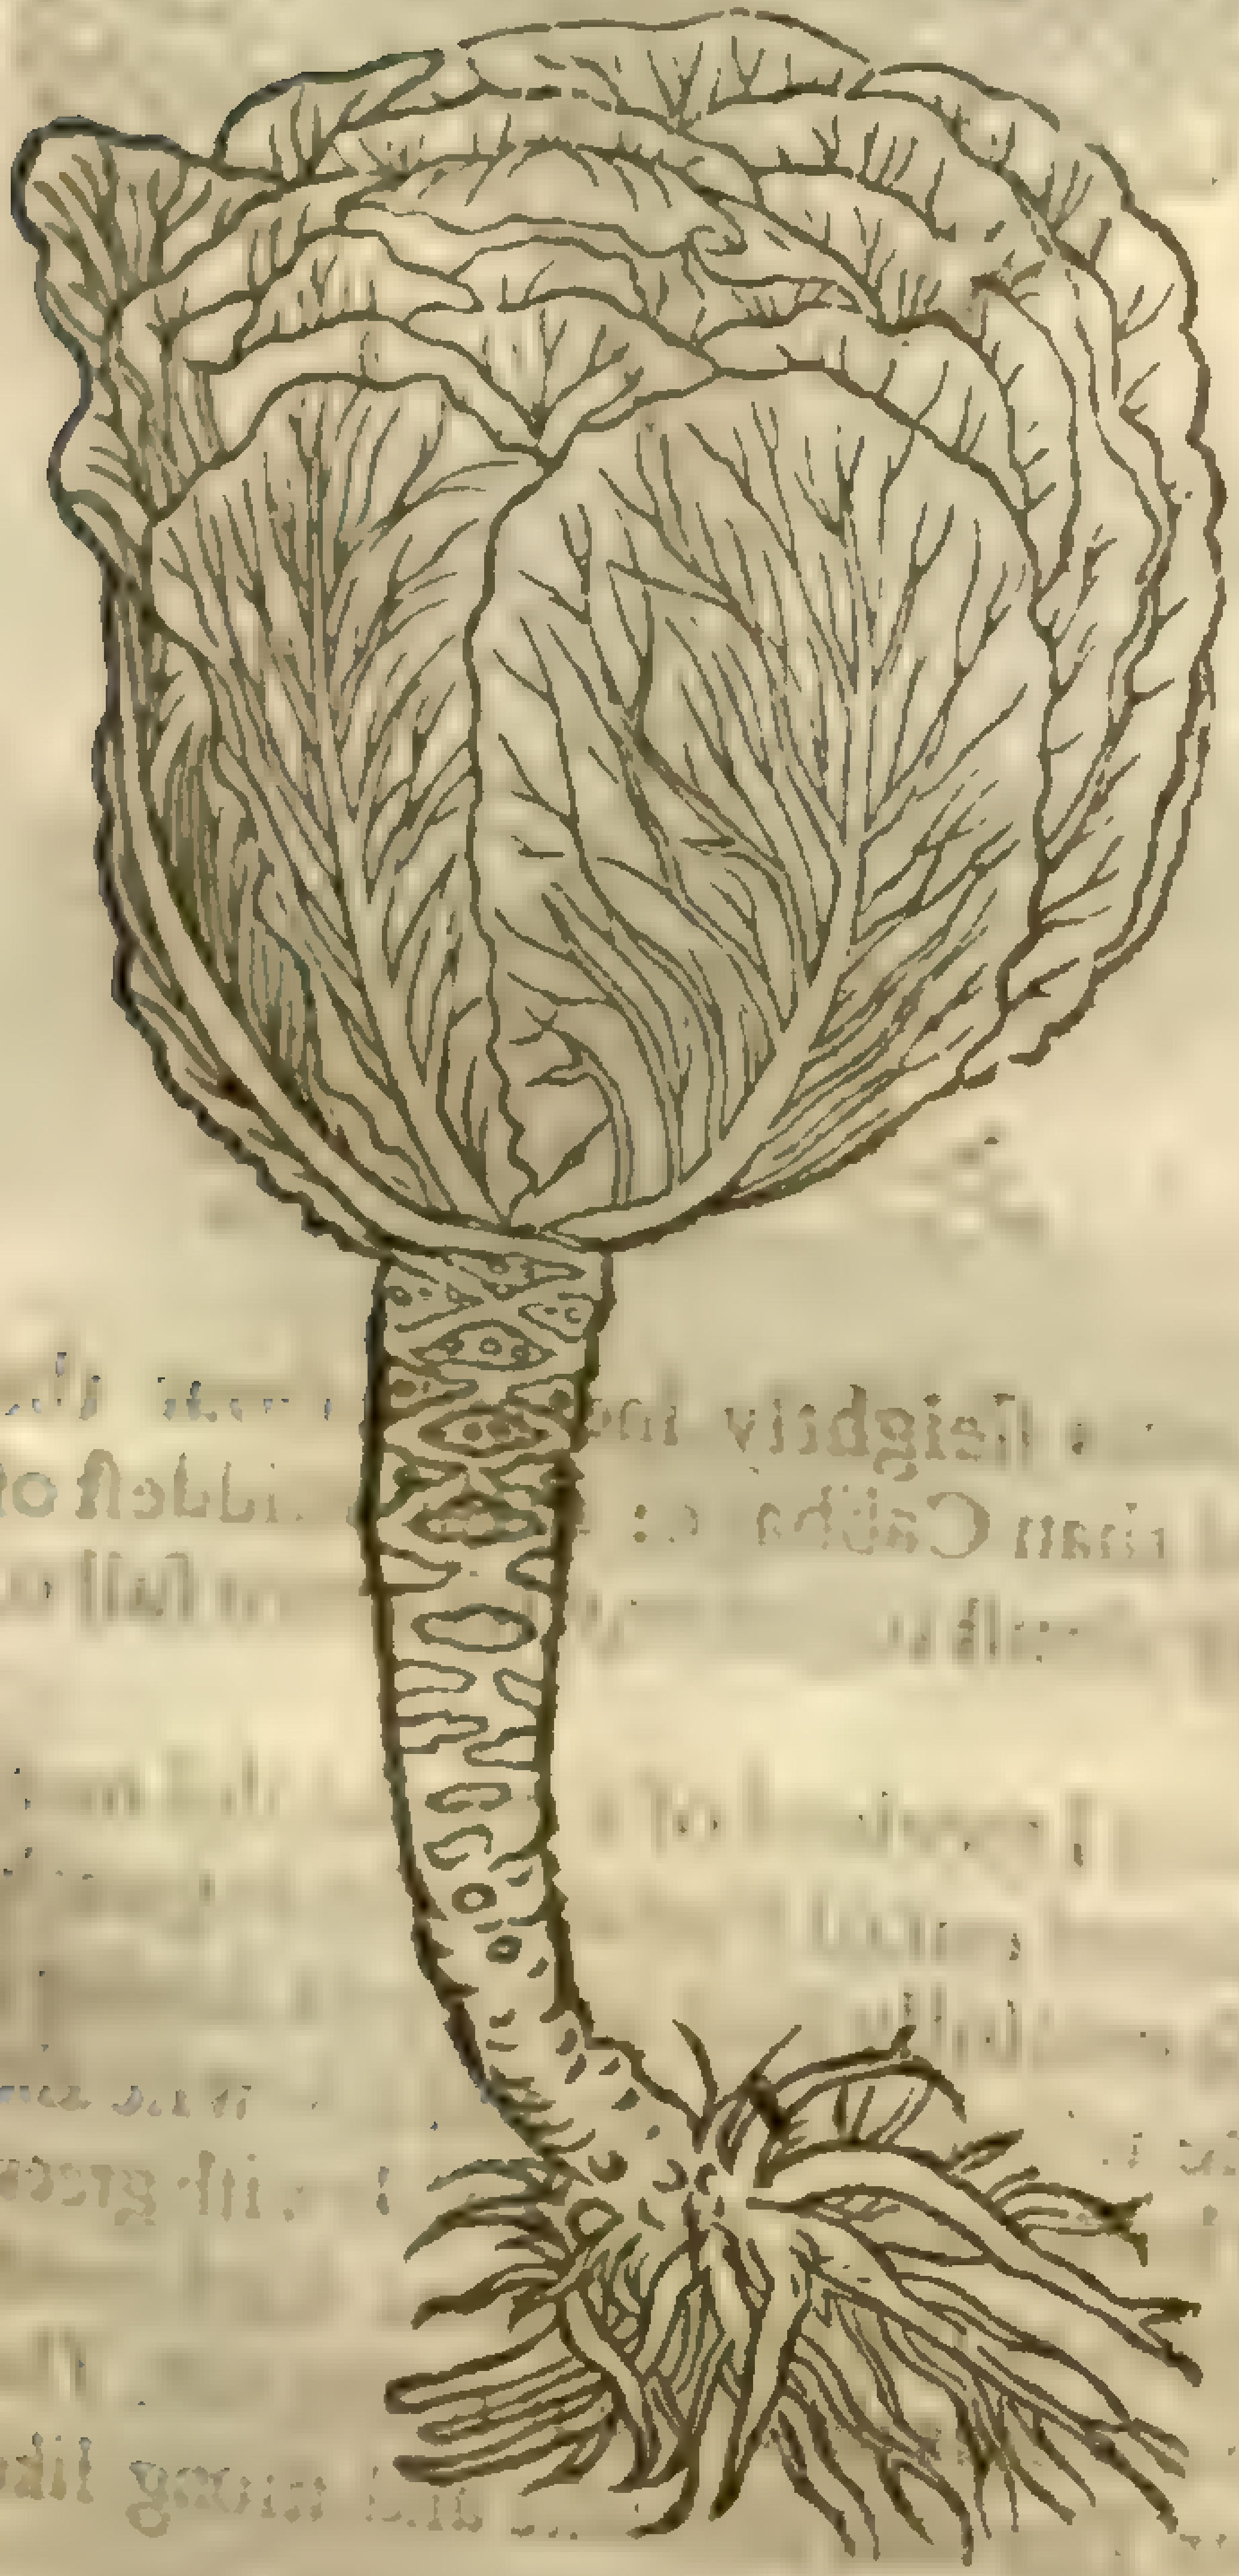
2 There is another leſſer ſort than the former, with many deepe cuts on both ſides euen to the middeſt of the rib, and very much curled and roughed in the edges; in other things it differeth not.

3 The red kinde of Colewort is likewiſe a Colewort of the garden, and differeth from the common in the colour of his leaues, which tend vnto redneſſe; otherwiſe very like.

4 There is alſo found a certaine kinde hereof wirh the leaues wrapped together into a round head or globe, whoſe head is white of colour, eſpecially toward Winter when it is ripe. The root is hard, and the ſtalks of a wooddy ſubſtance. ‡ This is the great ordinary Cabbage knowne euery where, and as commonly eaten all ouer this kingdome. ‡

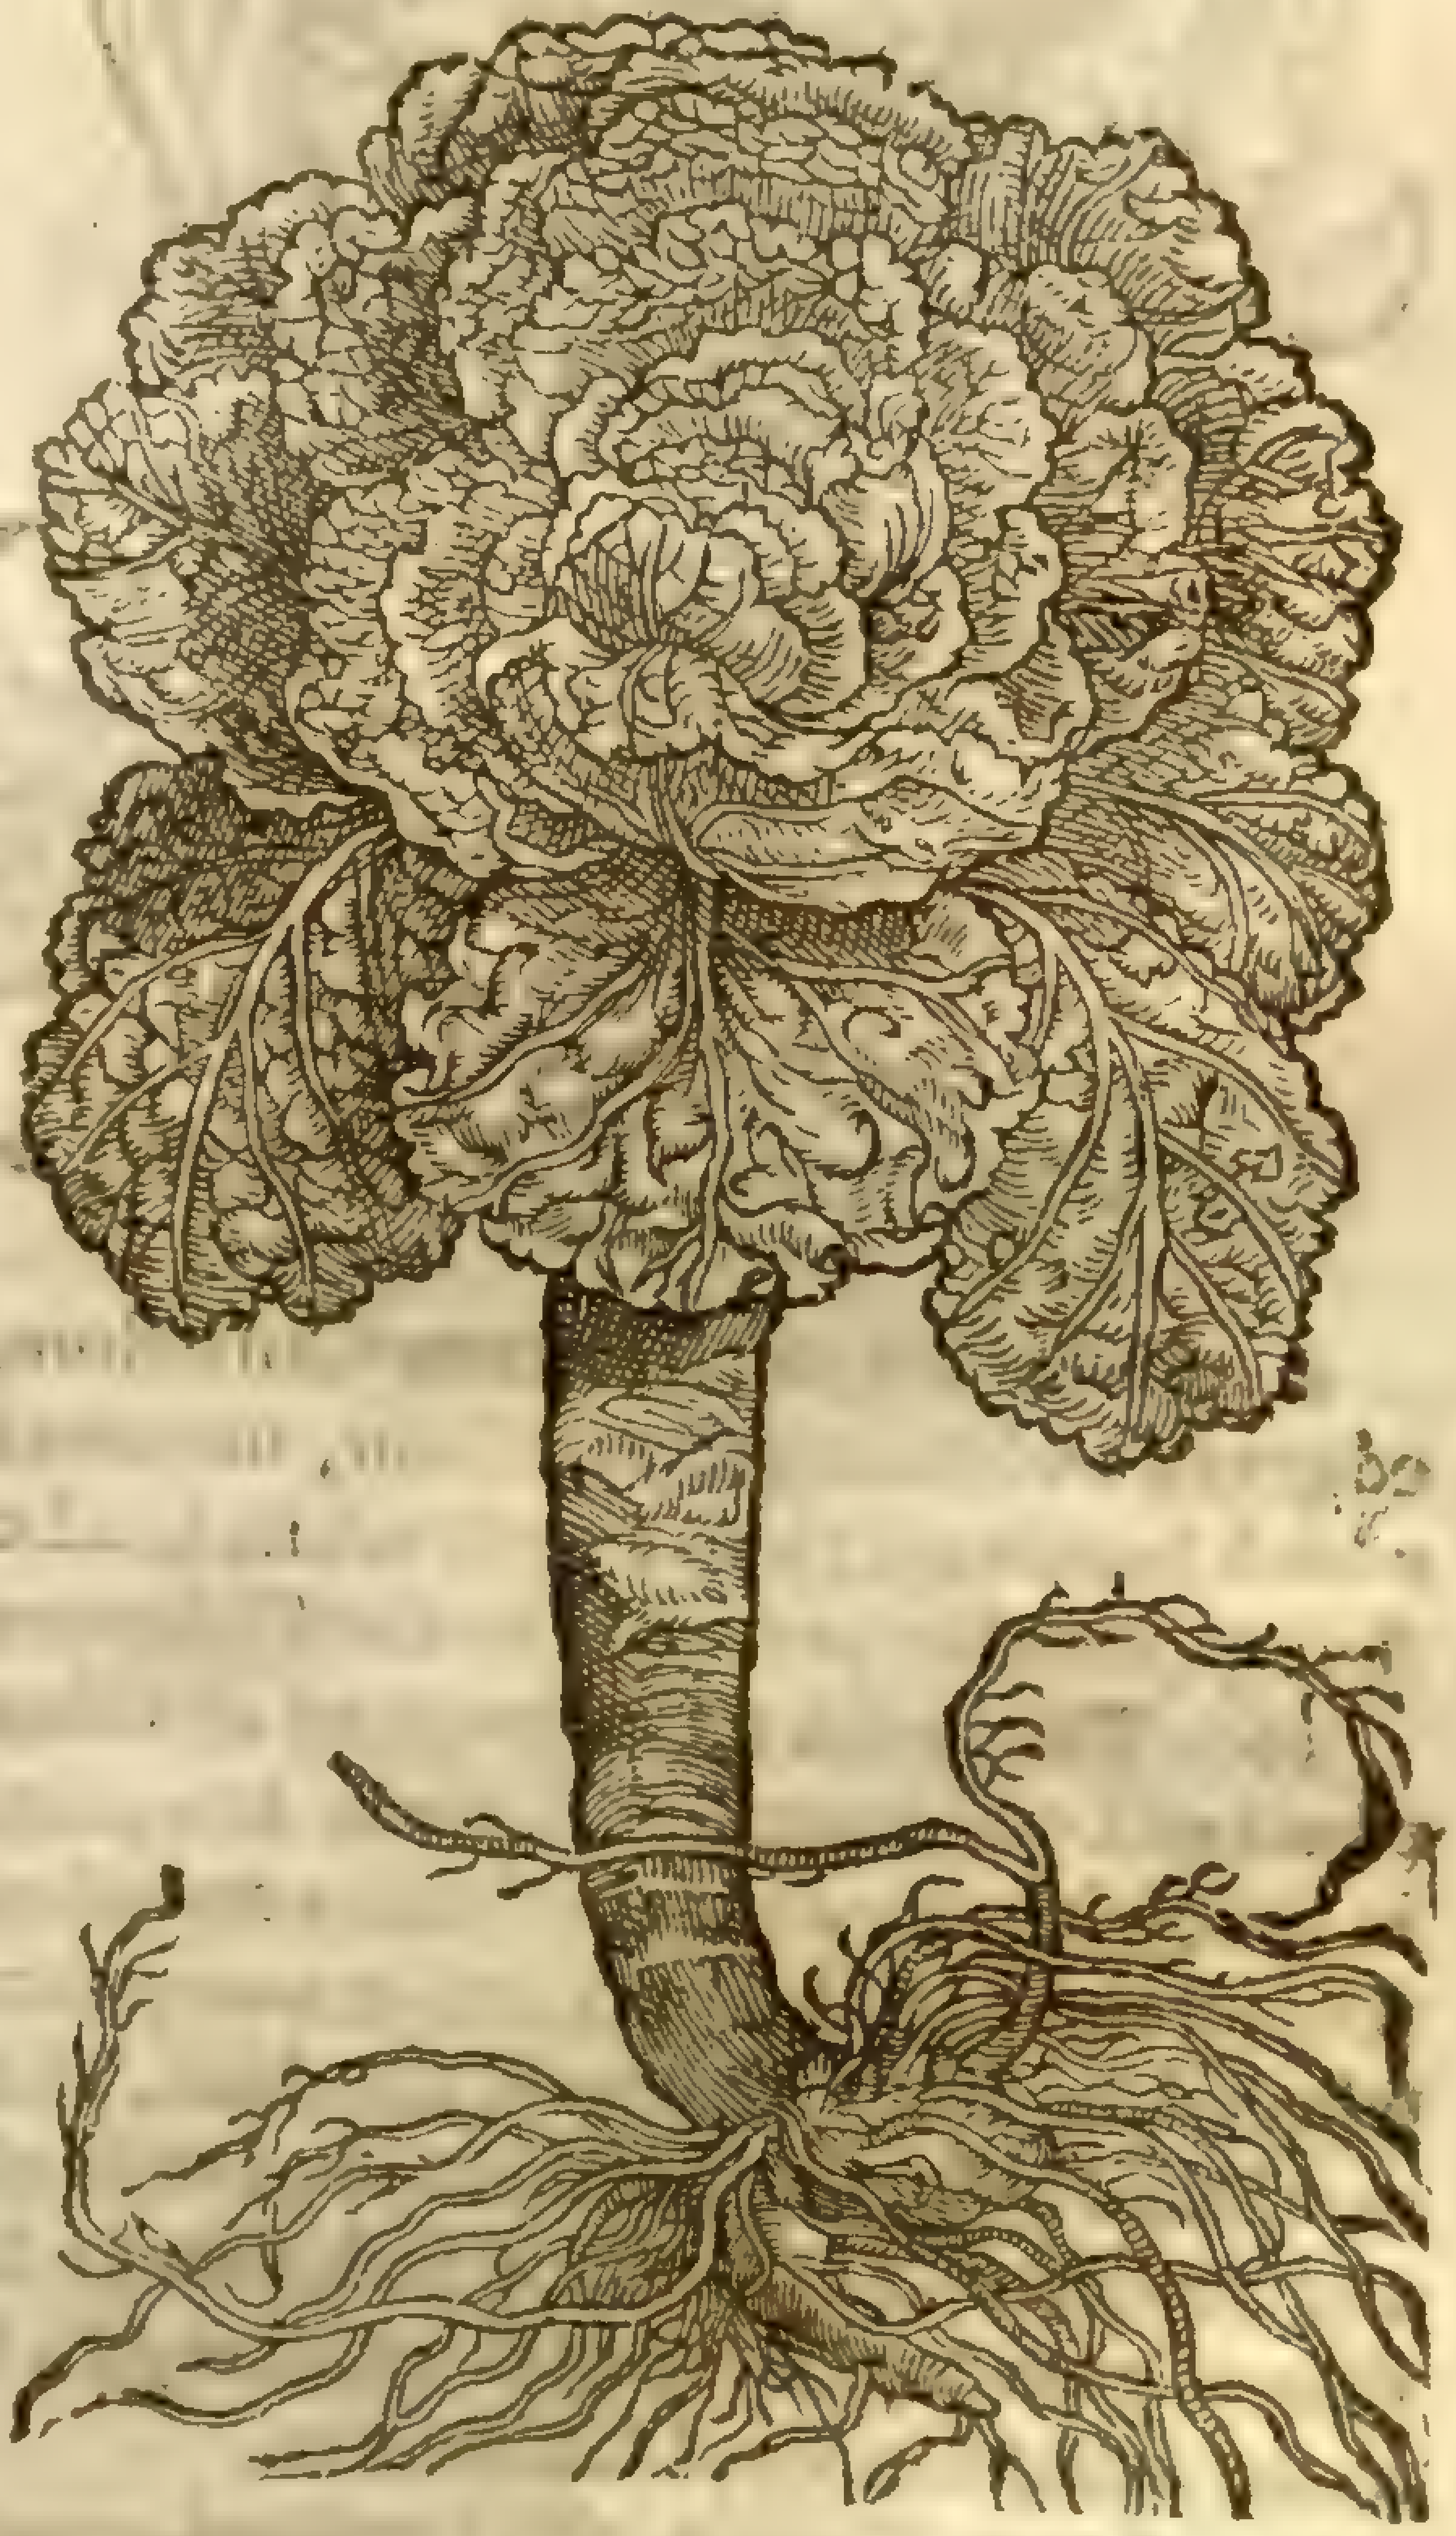
5 *Braſſica capitata rubra.*
Red Cabbage Cole.

B. oleracea, L. γ [illegible]



6 *Braſſica patula.*
Open Cabbage Cole.

B. oleracea, L. [illegible]



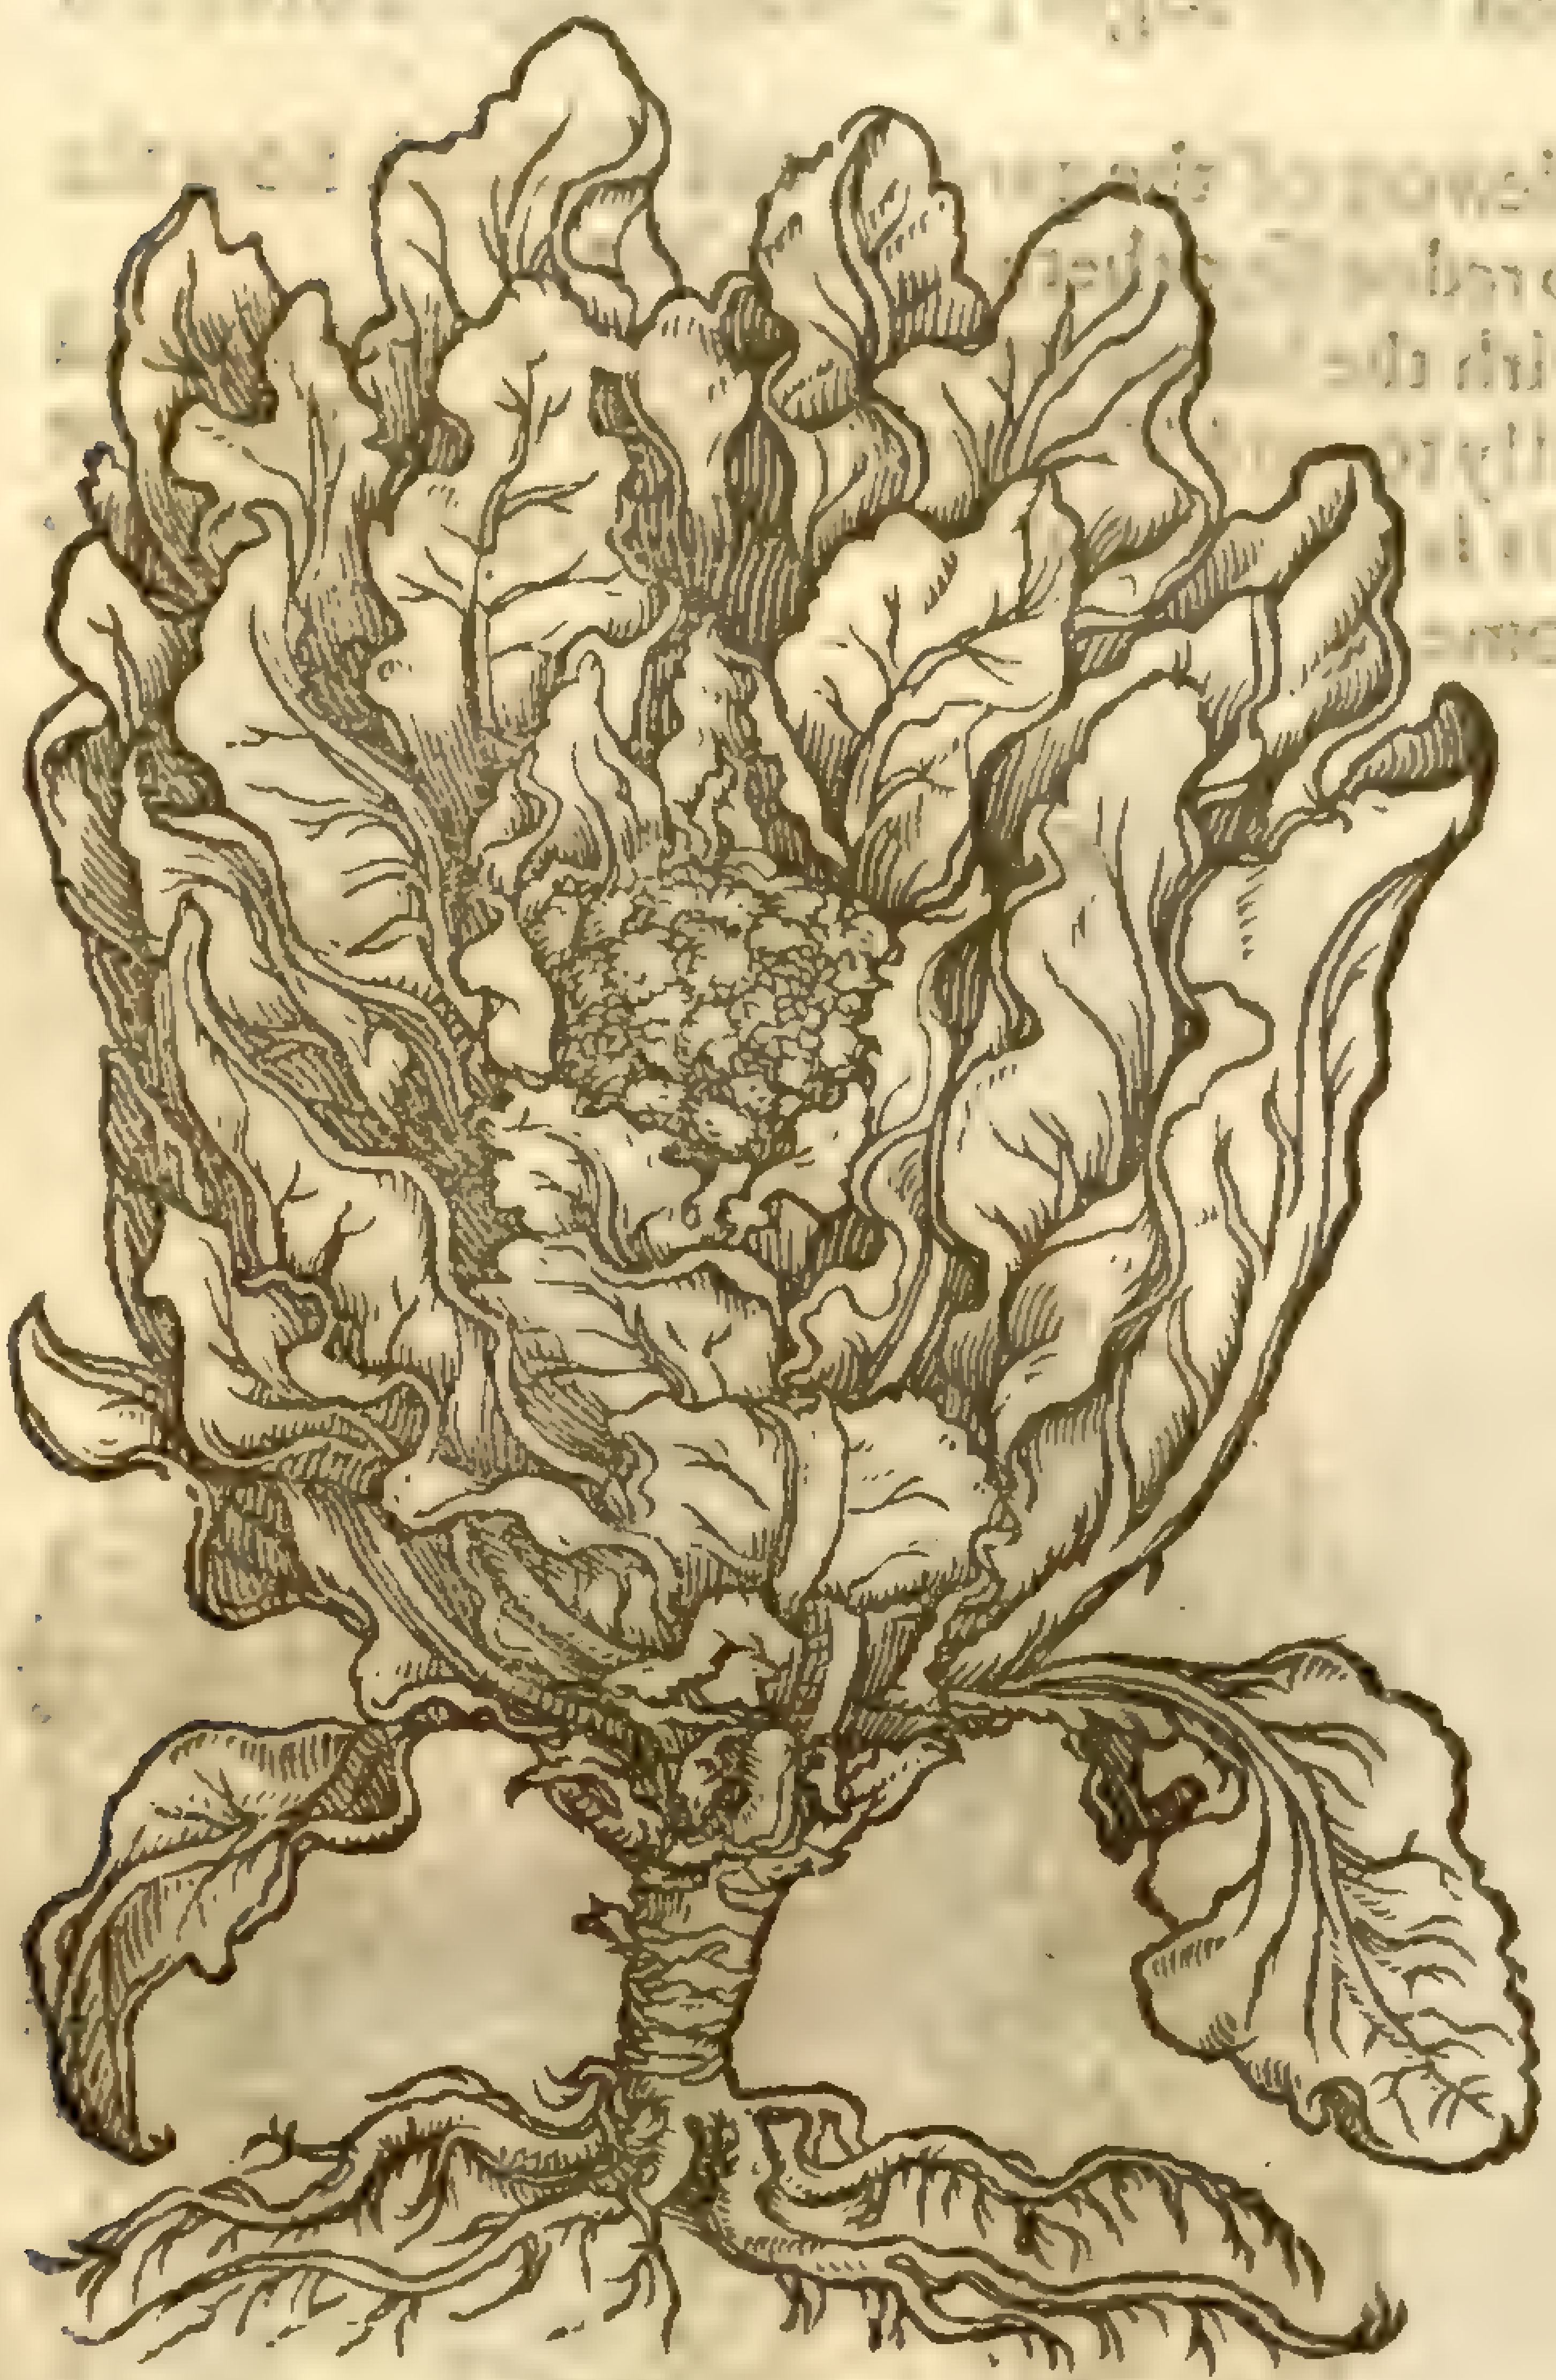
5 There is another ſort of Cabbage or loued Colewort which hath his leaues wrapped together into a round head or globe, yet leſſer than that of the white Cabbage, and the colour of the leaues of a lighter red than thoſe of the former.

6 The open loued Colewort hath a very great hard or wooddy ſtalke, whereupon do grow very large leaues of a white greene colour, and ſet with thick white ribs, and gathereth the reſt of the leaues cloſely together, which be leſſer than thoſe next the ground; yet when it commeth to the ſhutting vp or cloſing together, it rather dilateth it ſelfe abroad, than cloſeth all together.

7 Double Colewort hath many great and large leaues, whereupon doe grow here and there other ſmall jagged leaues, as it were made of ragged ſhreds and jagges ſet vpon the ſmall leafe, which giueth ſhew of a plume or fan of feathers. In ſtalk, root, and euery other part beſides it doth agree with the Garden Colewort.

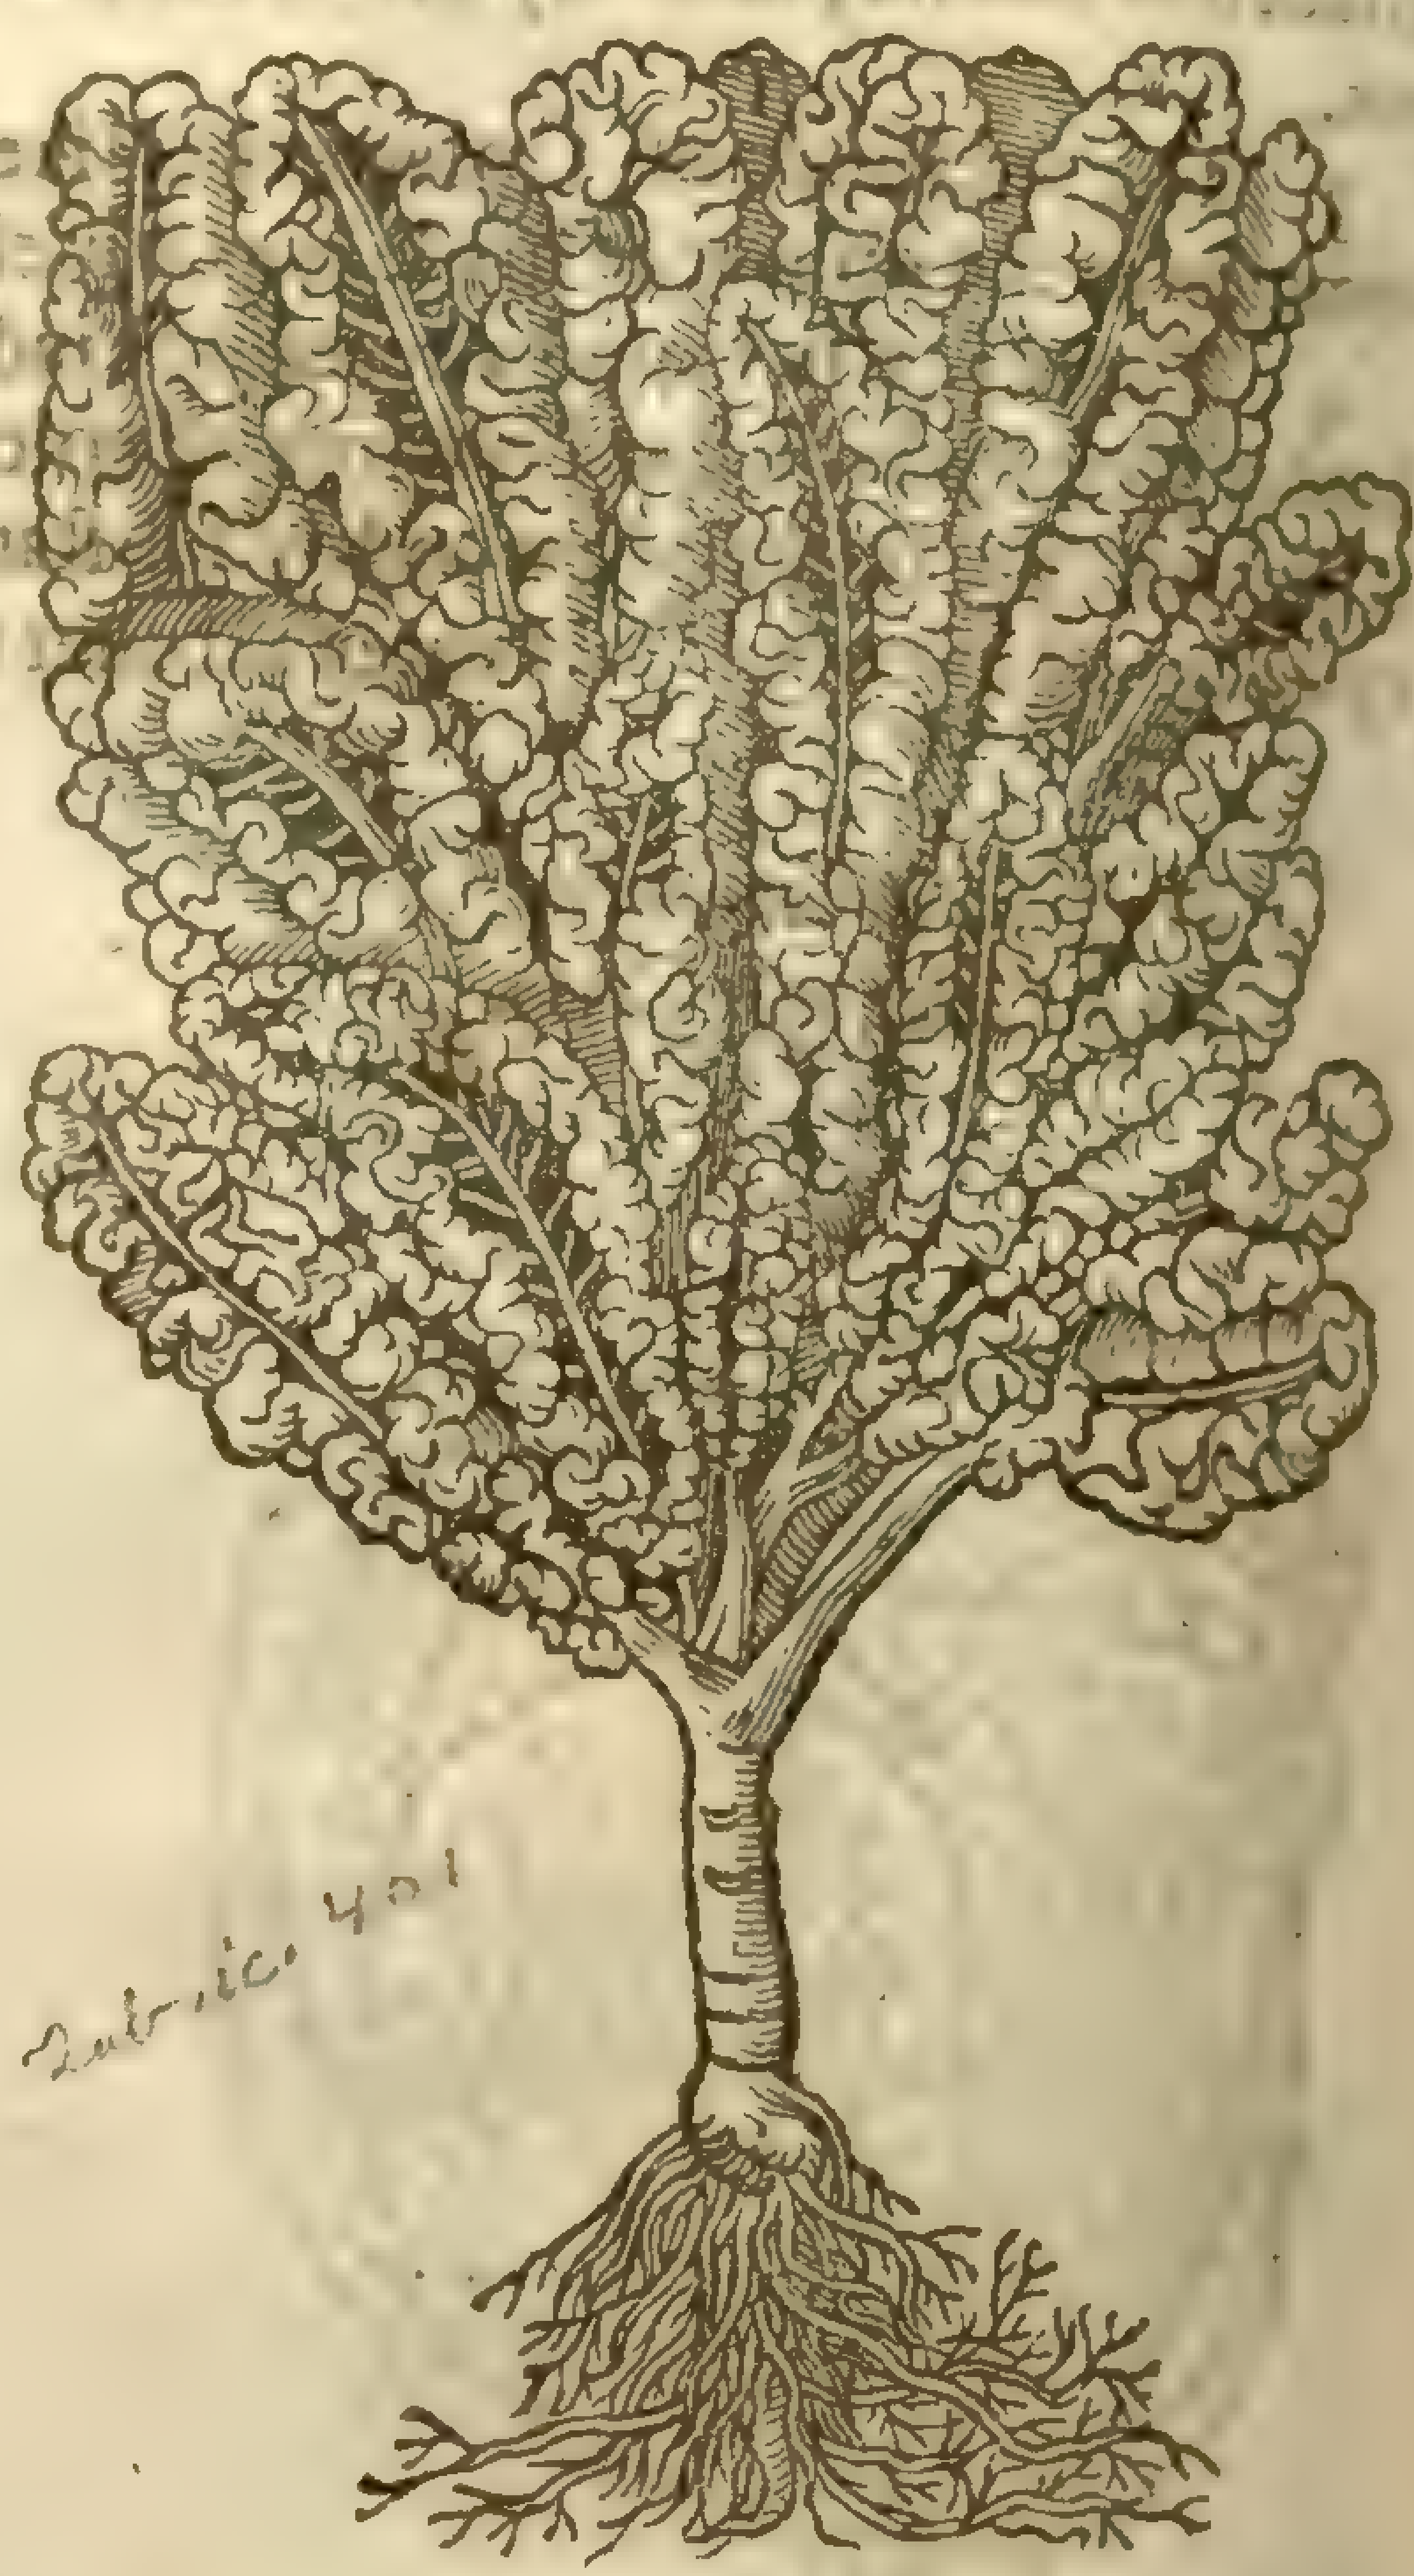
8 The double criſpe or curled Colewort agreeth with the laſt before deſcribed in euery reſpect, onely it differeth in the leaues, which are ſo intricately curled, and ſo thick ſet ouer with other ſmall cut leaues, that it is hard to ſee any part of the leafe it ſelfe, except ye take and put aſide ſome of thoſe jagges and ragged leaues with your hand.

9 *Braſſica florida.*
Cole-Florie.



[illegible]

10 *Braſſica Tophoſa.*
Swollen Colewort.



Tabric. 401

9 Cole flore, or after ſome Colieflore, hath many large leaues ſleightly indented about the edges, of a whitiſh greene colour, narrower and ſharper pointed than Cabbage: in the middeſt of which leaues riſeth vp a great white head of hard floures cloſely thruſt together, with a root full of ſtrings; in other parts like to the Coleworts

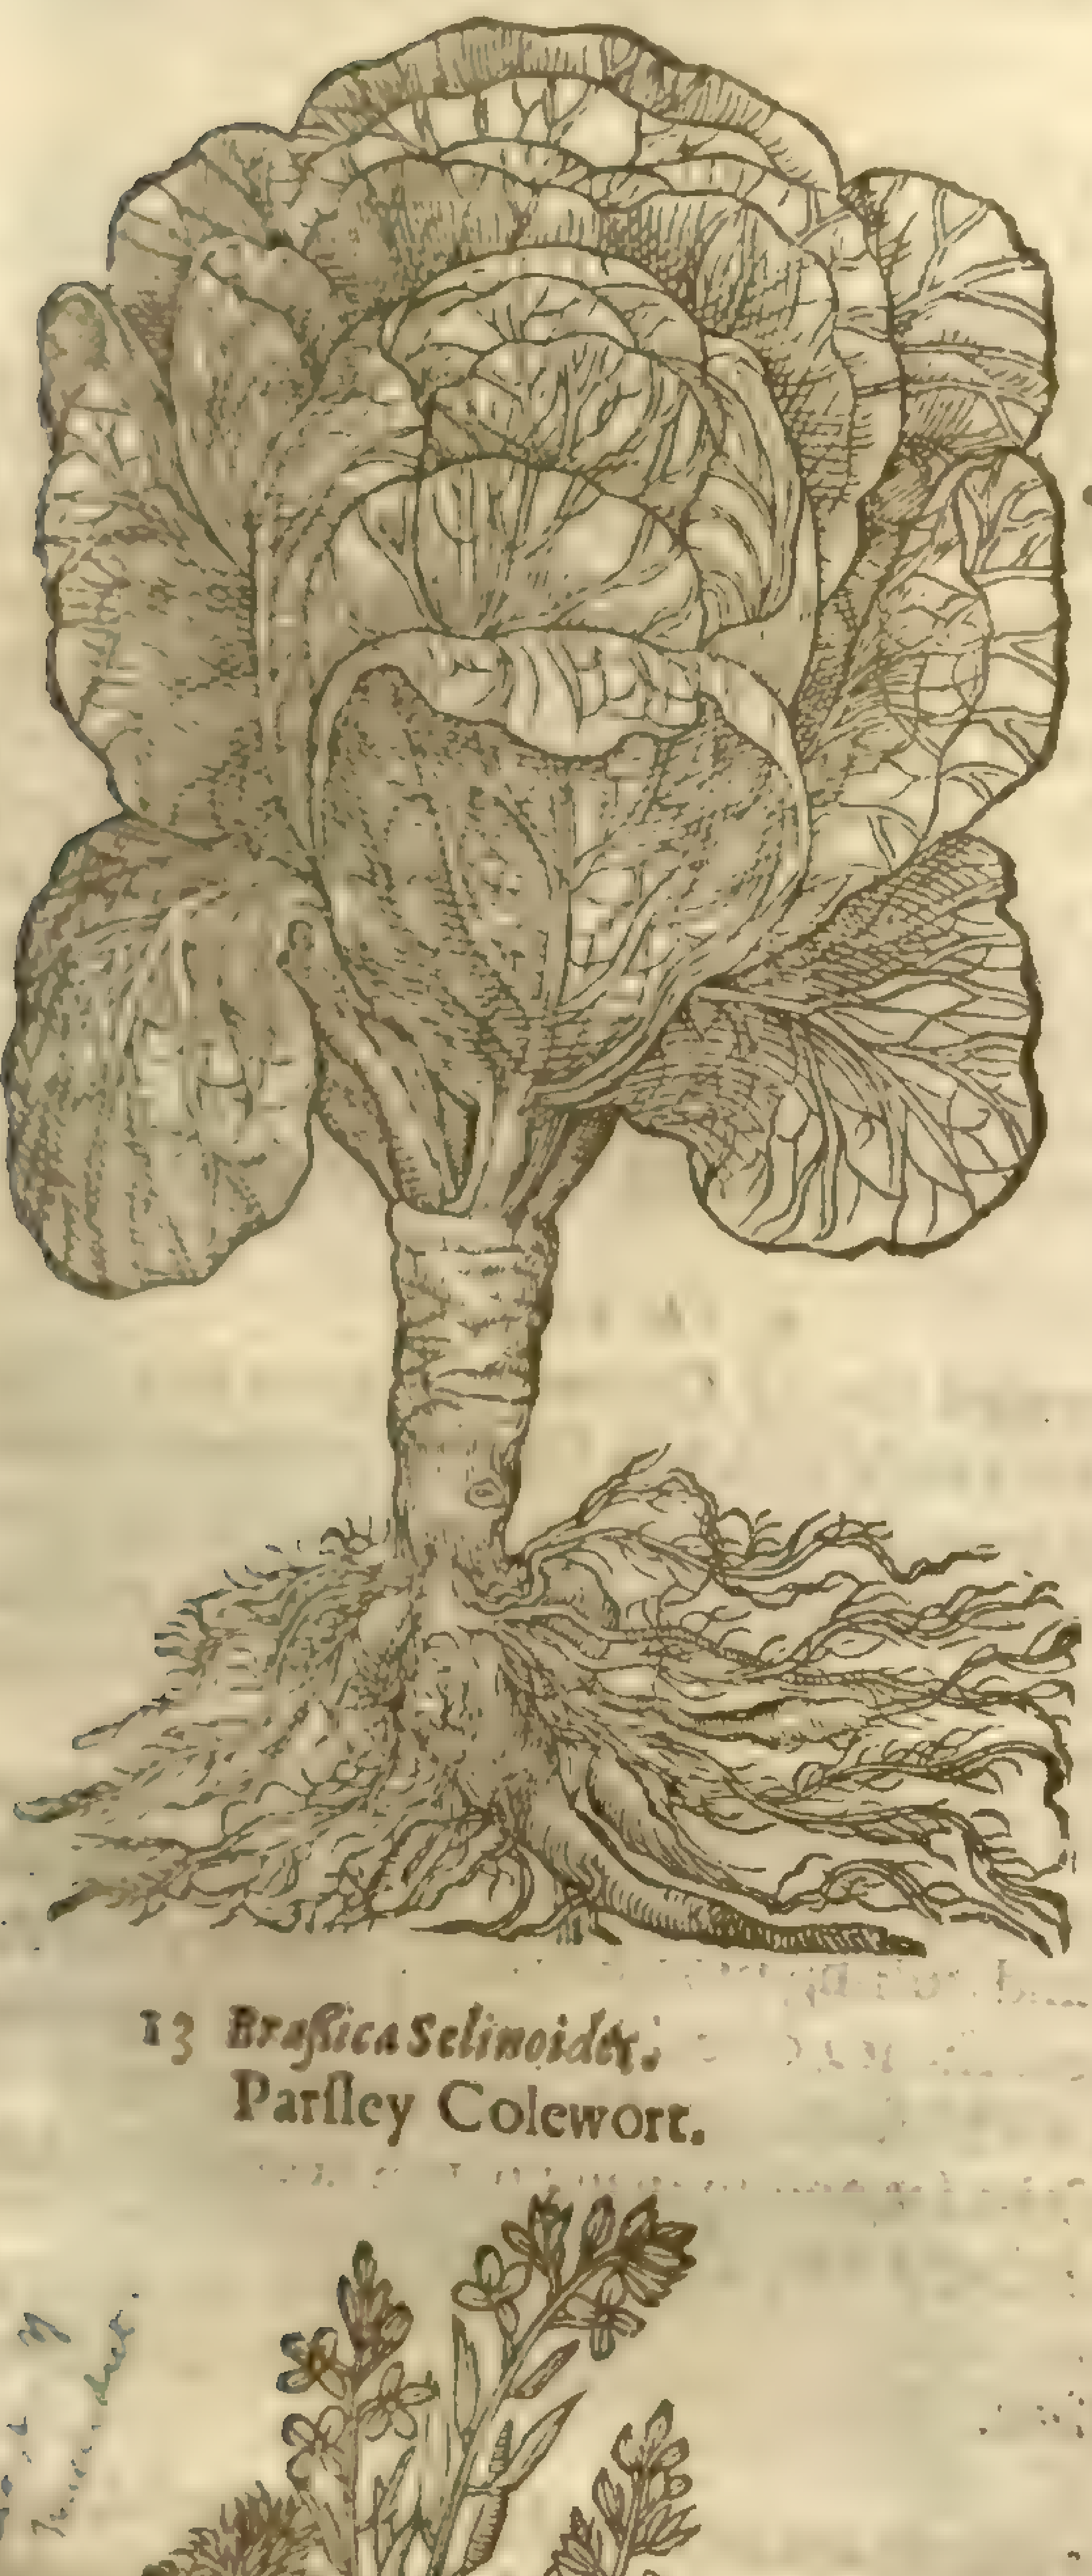
10 The ſwollen Colewort of all other is the ſtrangeſt, which I receiued of a worſhipful merchant of London maſter *Nicholas Lete*, who brought the ſeed thereof out of France; who is greatly in loue with rare and faire floures and plants, for which he doth carefully ſend into Syria, hauing a ſeruant there at Aleppo, and in many other countries, for the which my ſelfe and likewiſe the whole land are much bound vnto him. This goodly Colewort hath many leaues of a blewiſh greene or of the colour of Woad, bunched or ſwollen vp about the edges as it were a piece of leather wet and broiled on a gridiron, in ſuch ſtrange ſort that I cannot with words deſcribe it to the full. The floures grow at the top of the ſtalkes, of a bleake yellow colour. The root is thicke and ſtrong like to the other kindes of Coleworts.

11 Sauoy Cole is alſo numbred among the headed Coleworts or Cabbages. The leaues are great and large, very like to thoſe of the great Cabbage, which turne themſelues vpwards as though they would imbrace one another to make a loued Cabbage, but when they come to the ſhutting vp they ſtand at a ſtay, and rather ſhew themſelues wider open, than ſhut any neerer together; in other reſpects it is like vnto the Cabbage.

12 The curled Sauoy Cole in euery reſpect is like the precedent, ſauing that the leaues hereof doe ſomewhat curle or criſpe about the middle of the plant: which plant if it be opened in the Spring time, as ſometimes it is, it ſendeth forth branched ſtalkes, with many ſmall white floures at the top, which beeing paſt, there follow long cods and ſeeds like the common or firſt kinde deſcribed.

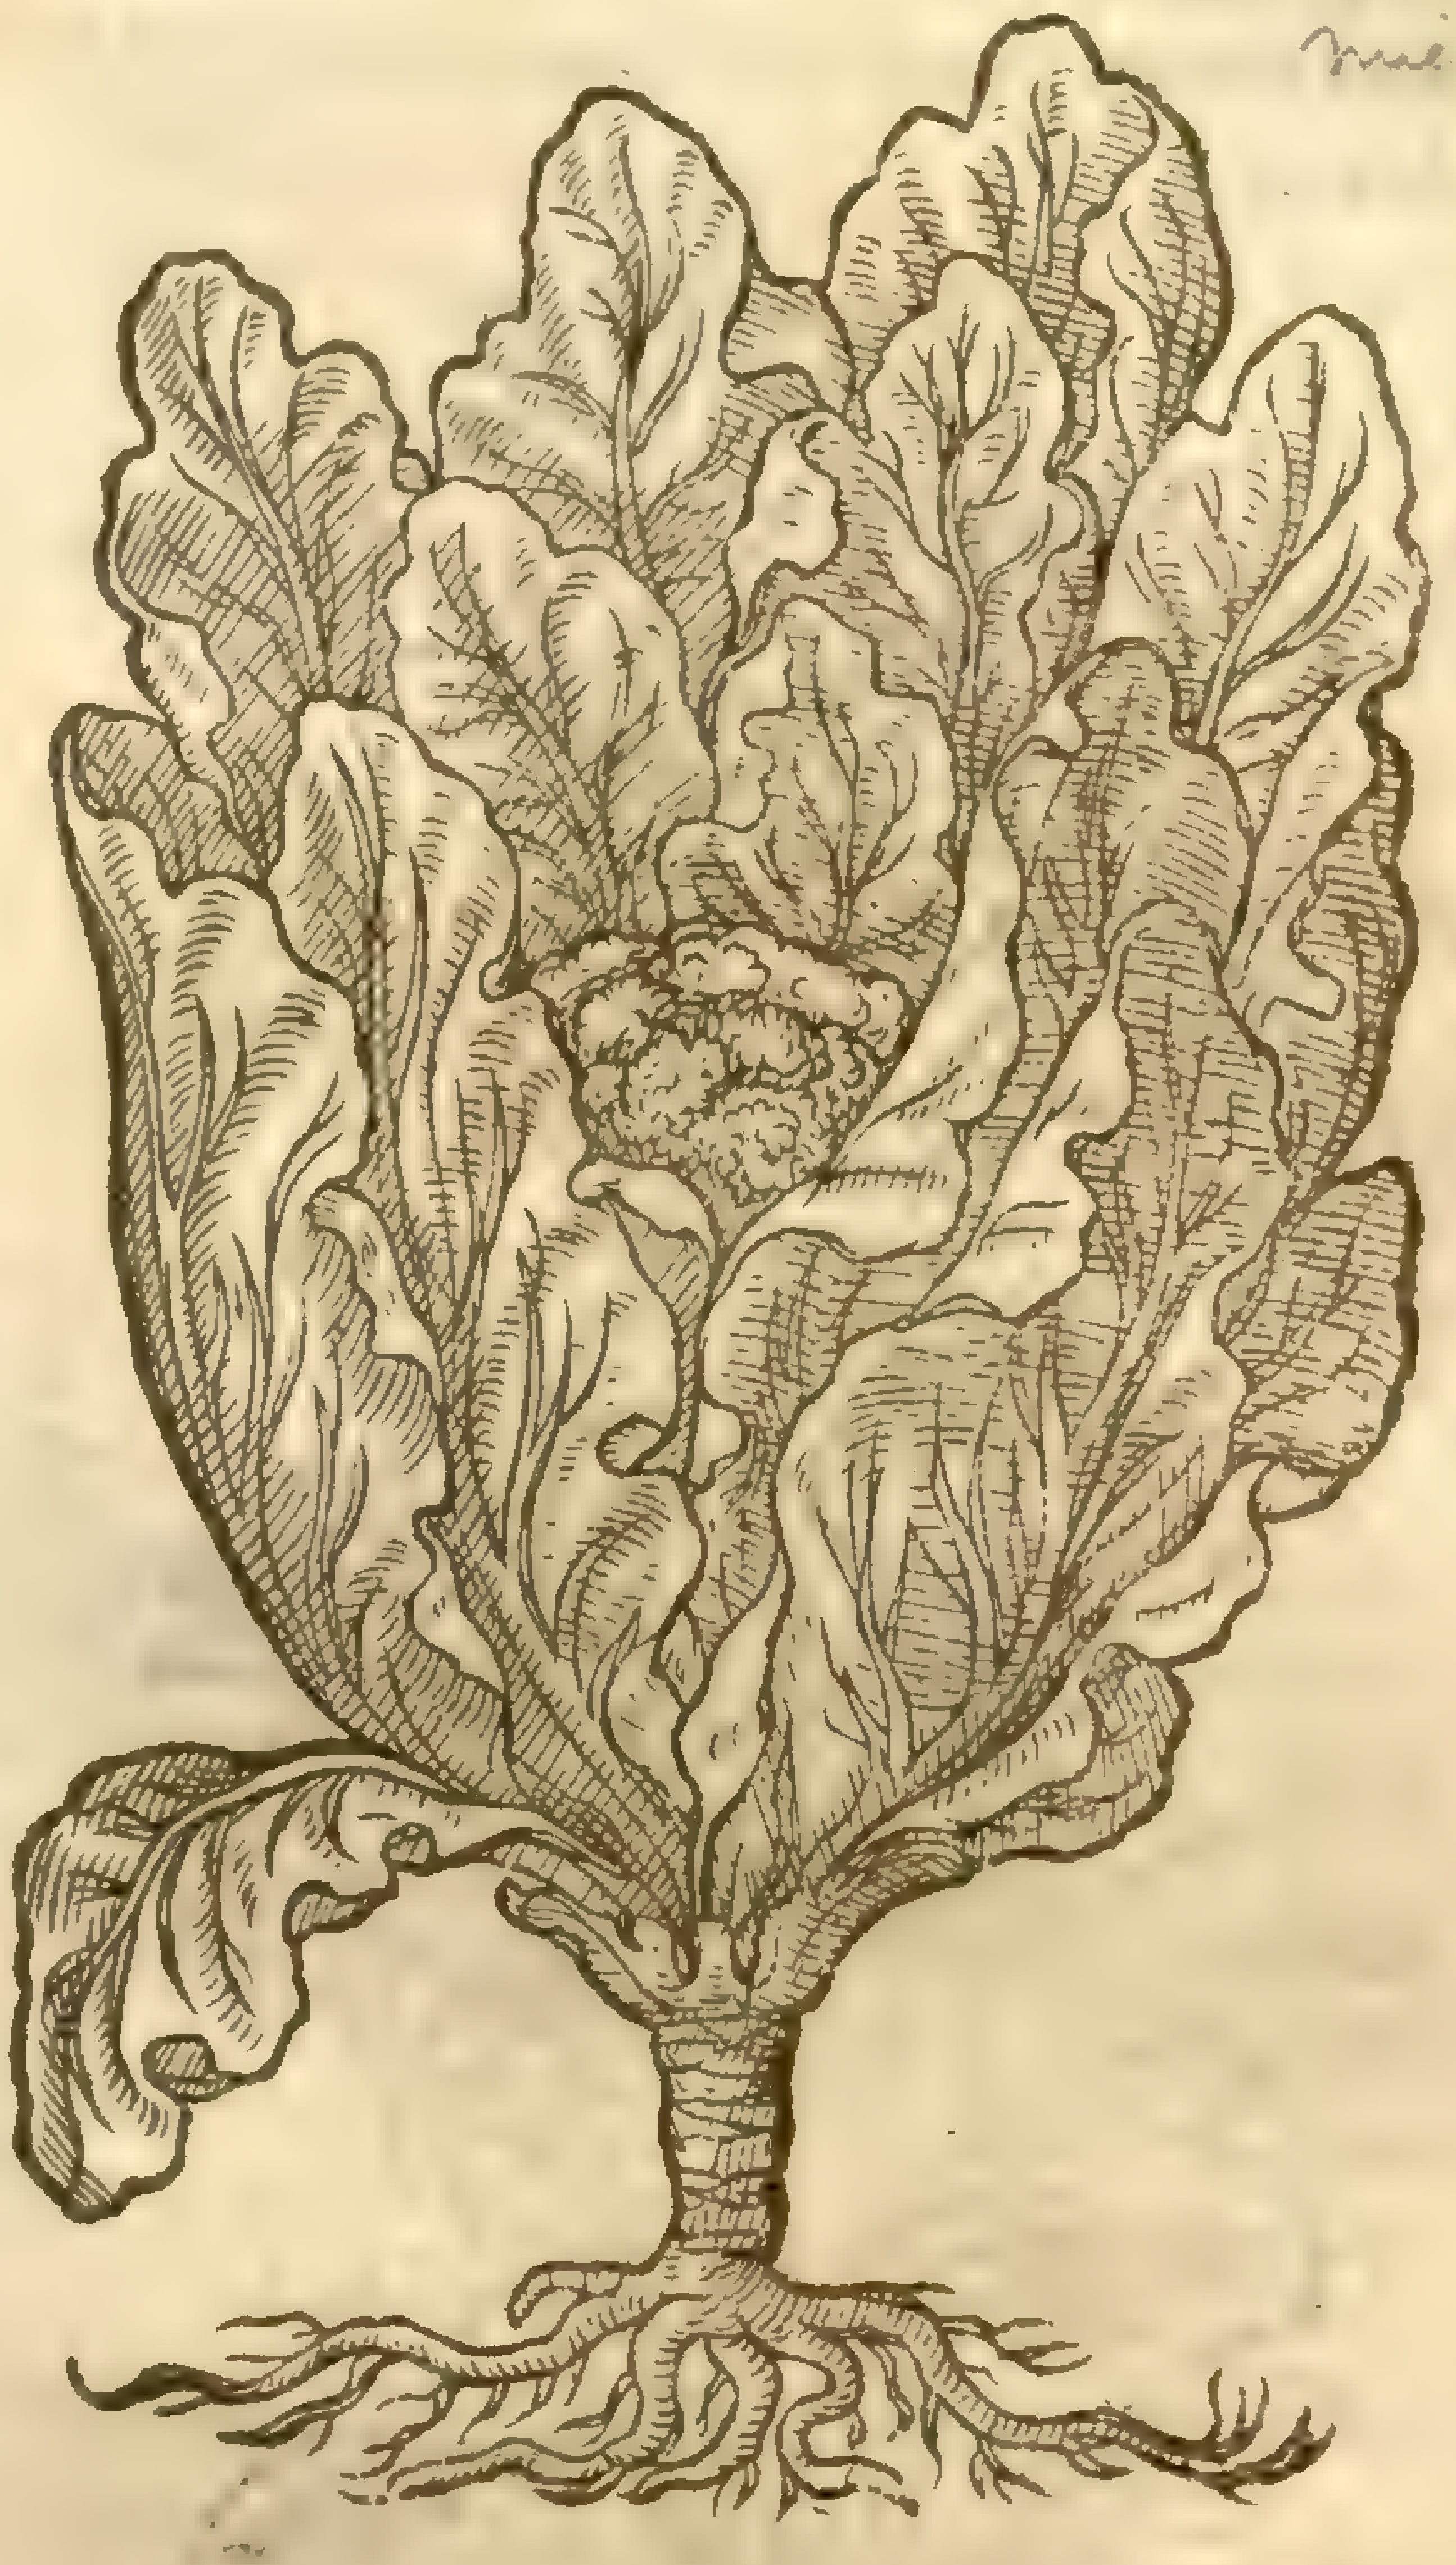
13 This kinde of Colewoort hath very large leaues deeply jagged euen to the middle rib, in face reſembling great and ranke parſley. It hath a great and thicke ſtalke of three cubits high, whereupon doe grow floures, cods, and ſeed like the other Cole-woorts.

11 *Braßica Sabauda.*
Sauoy Cole.



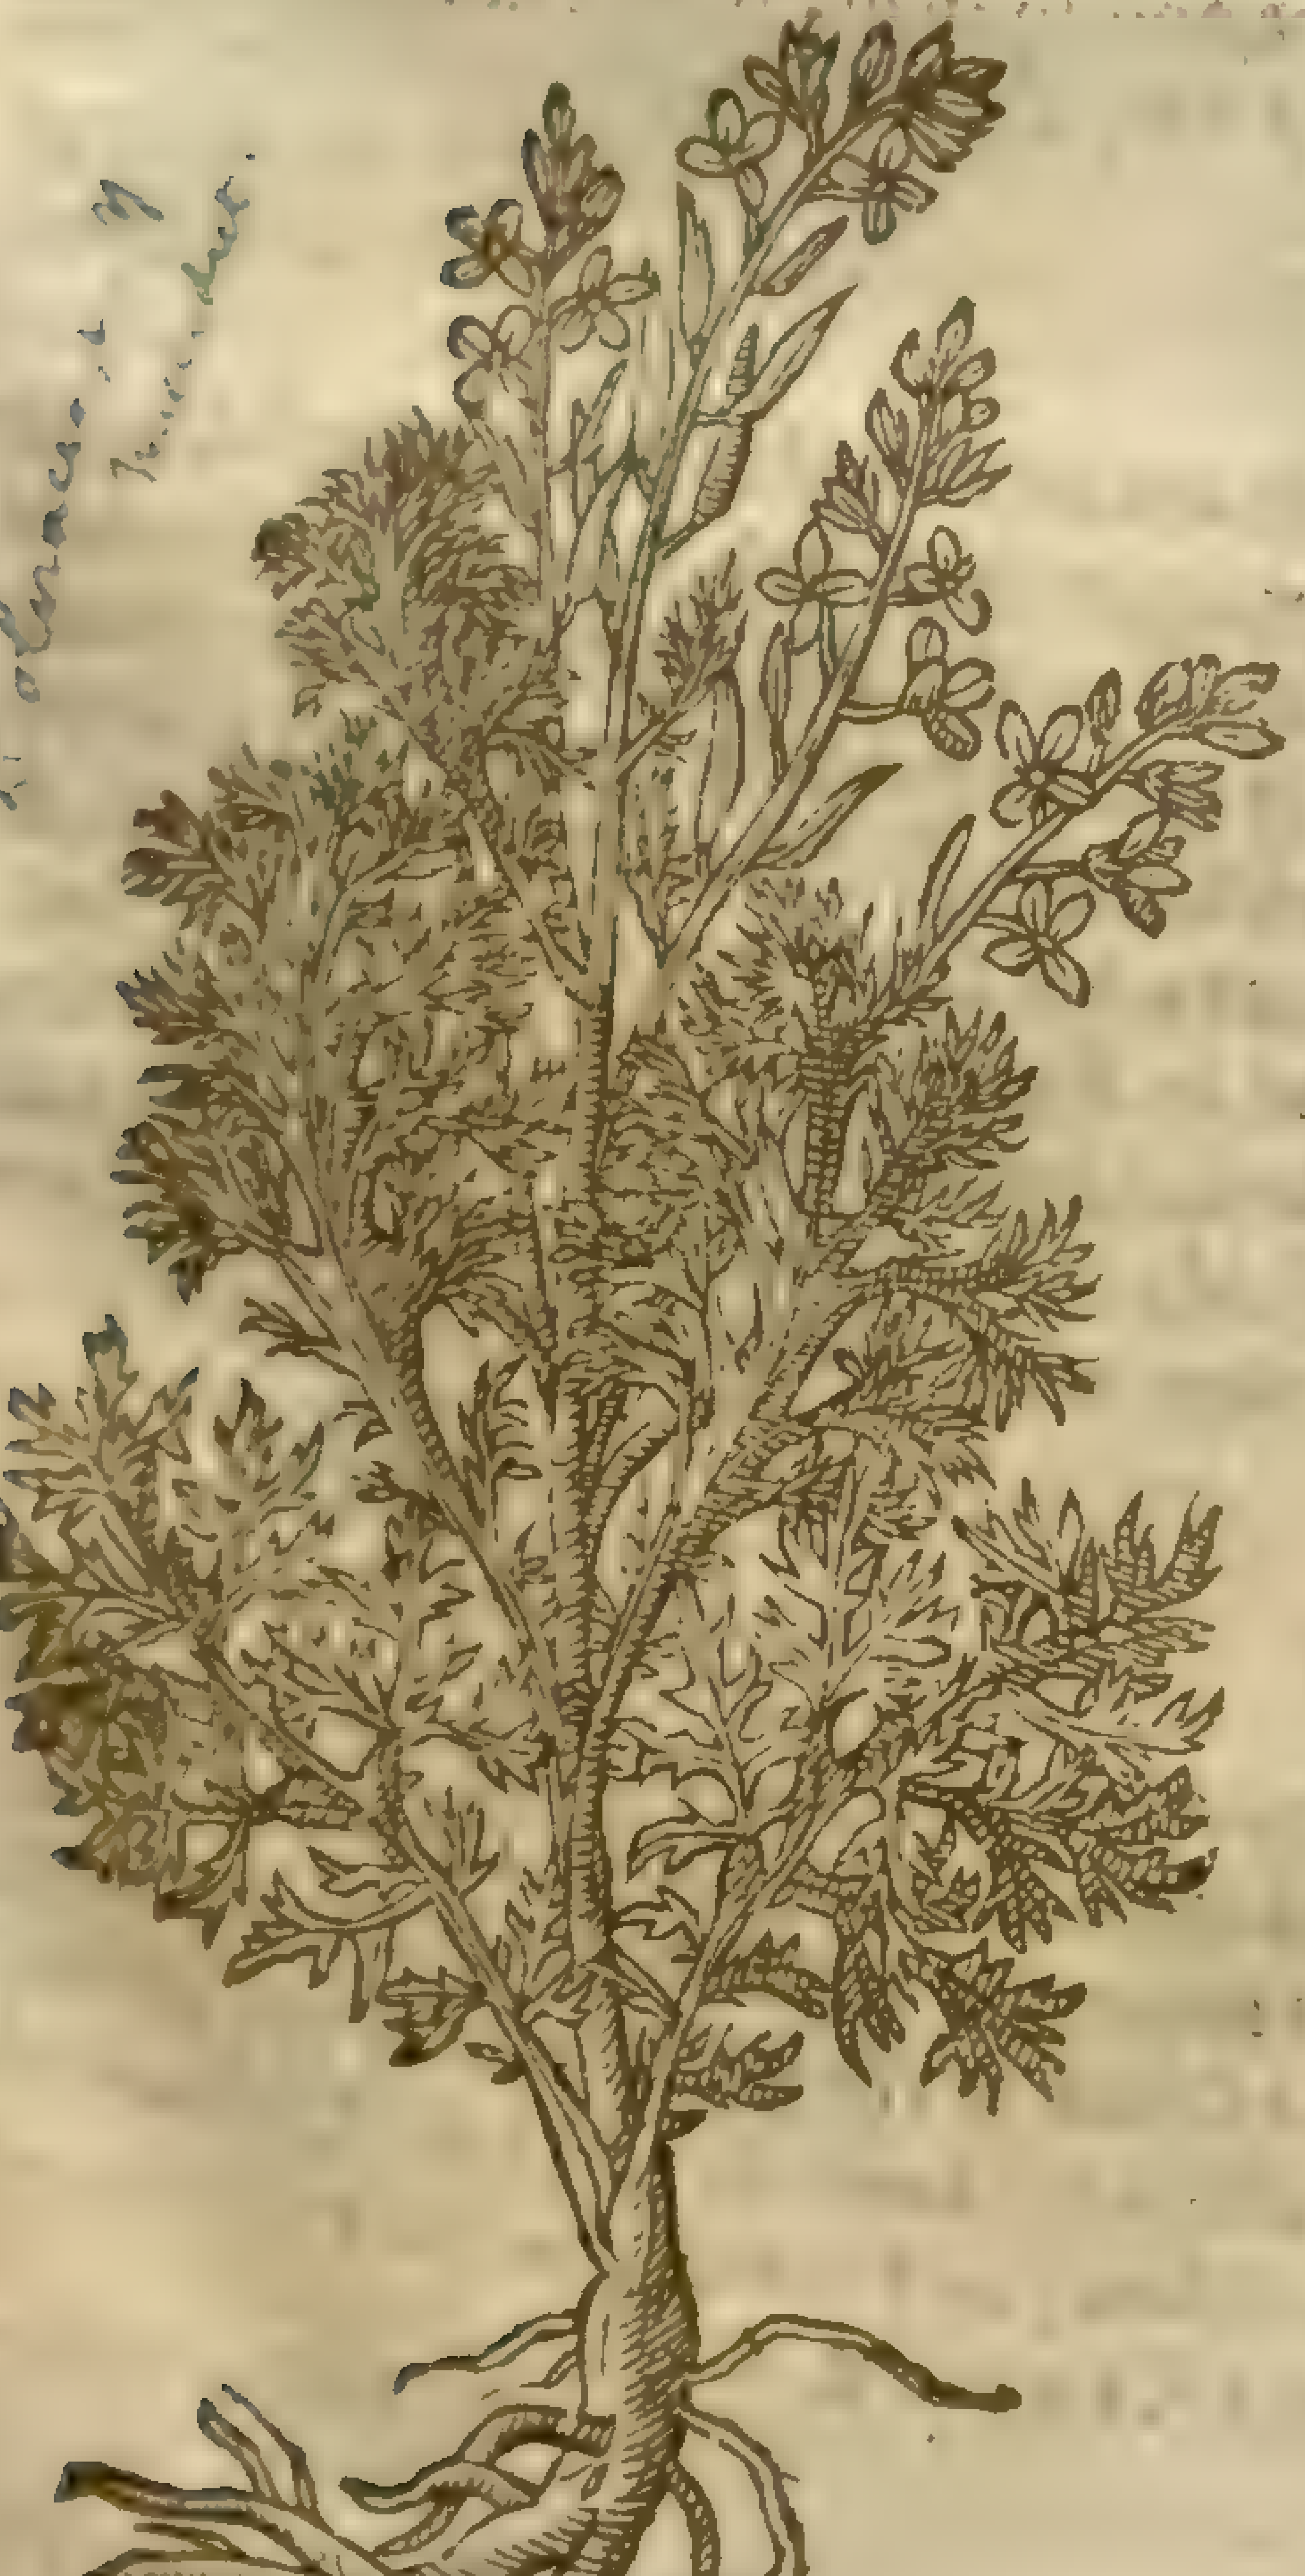
12 *Braßica Sabauda criſpa.*
Curled Sauoy Cole.

B. oleracea, L. E
Mill. dict.



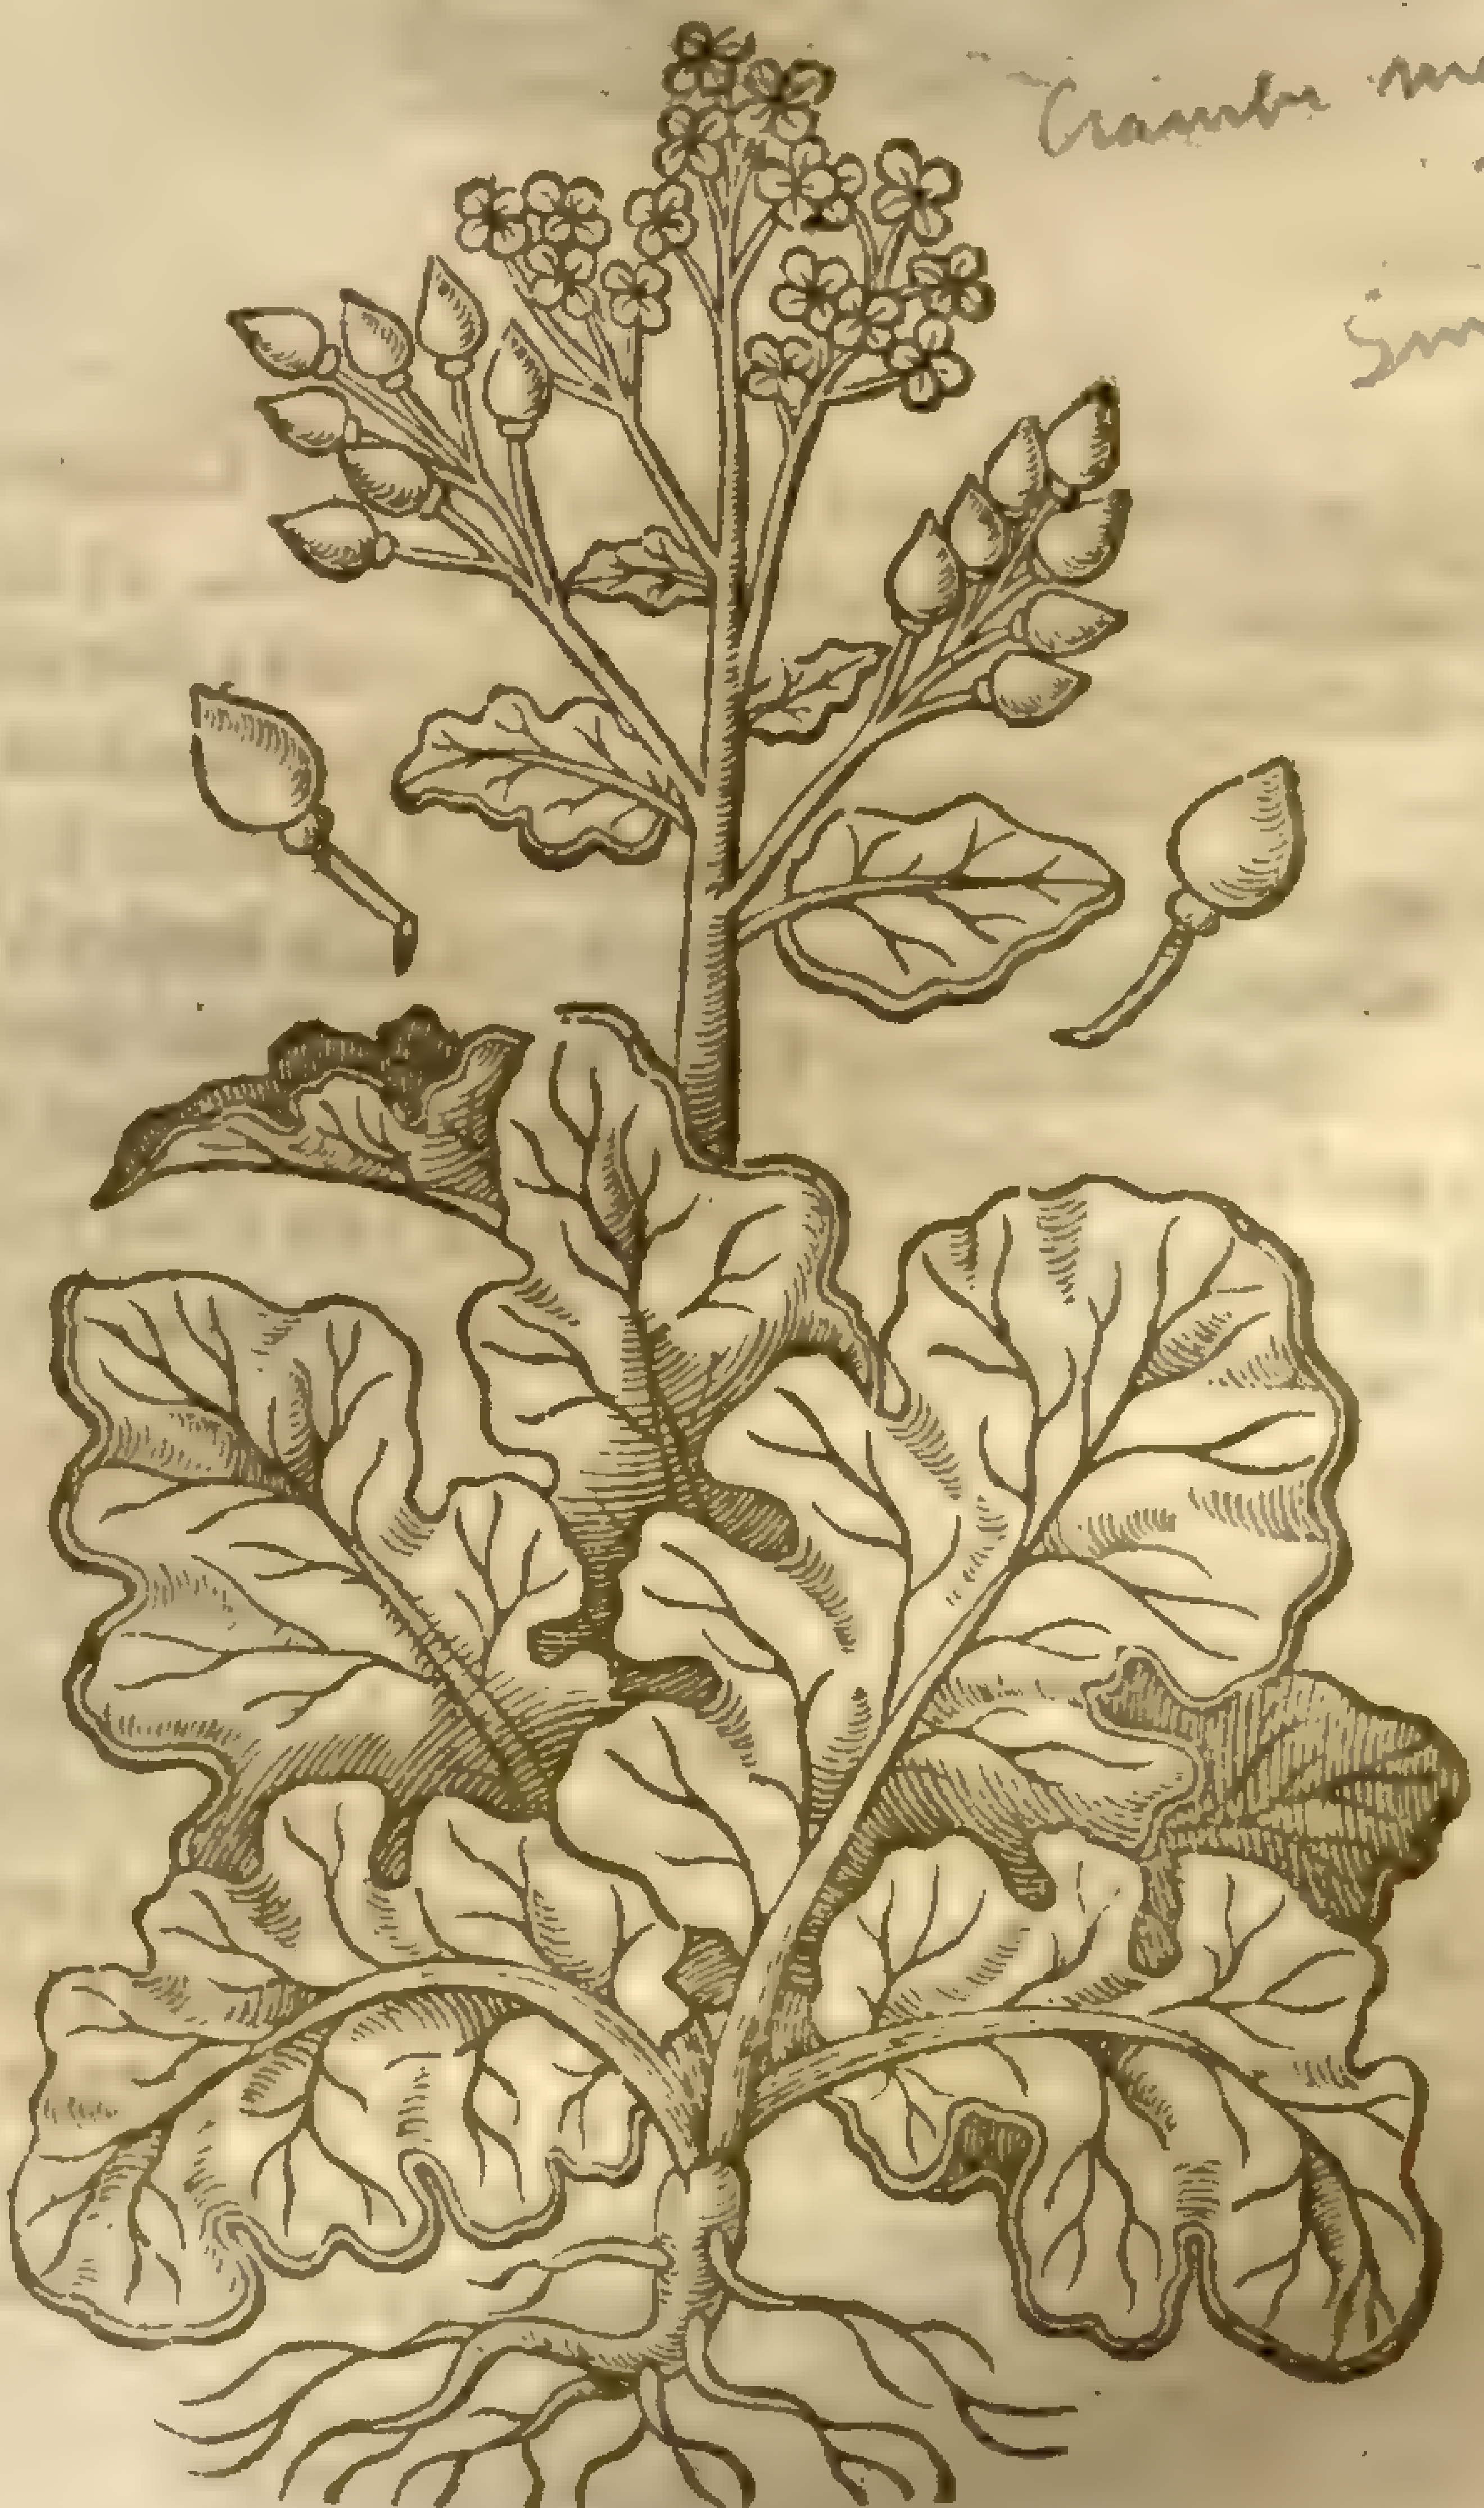
13 *Braßica Selinoides.*
Parſley Colewort.

B. oleracea, γ
Mill. dict.



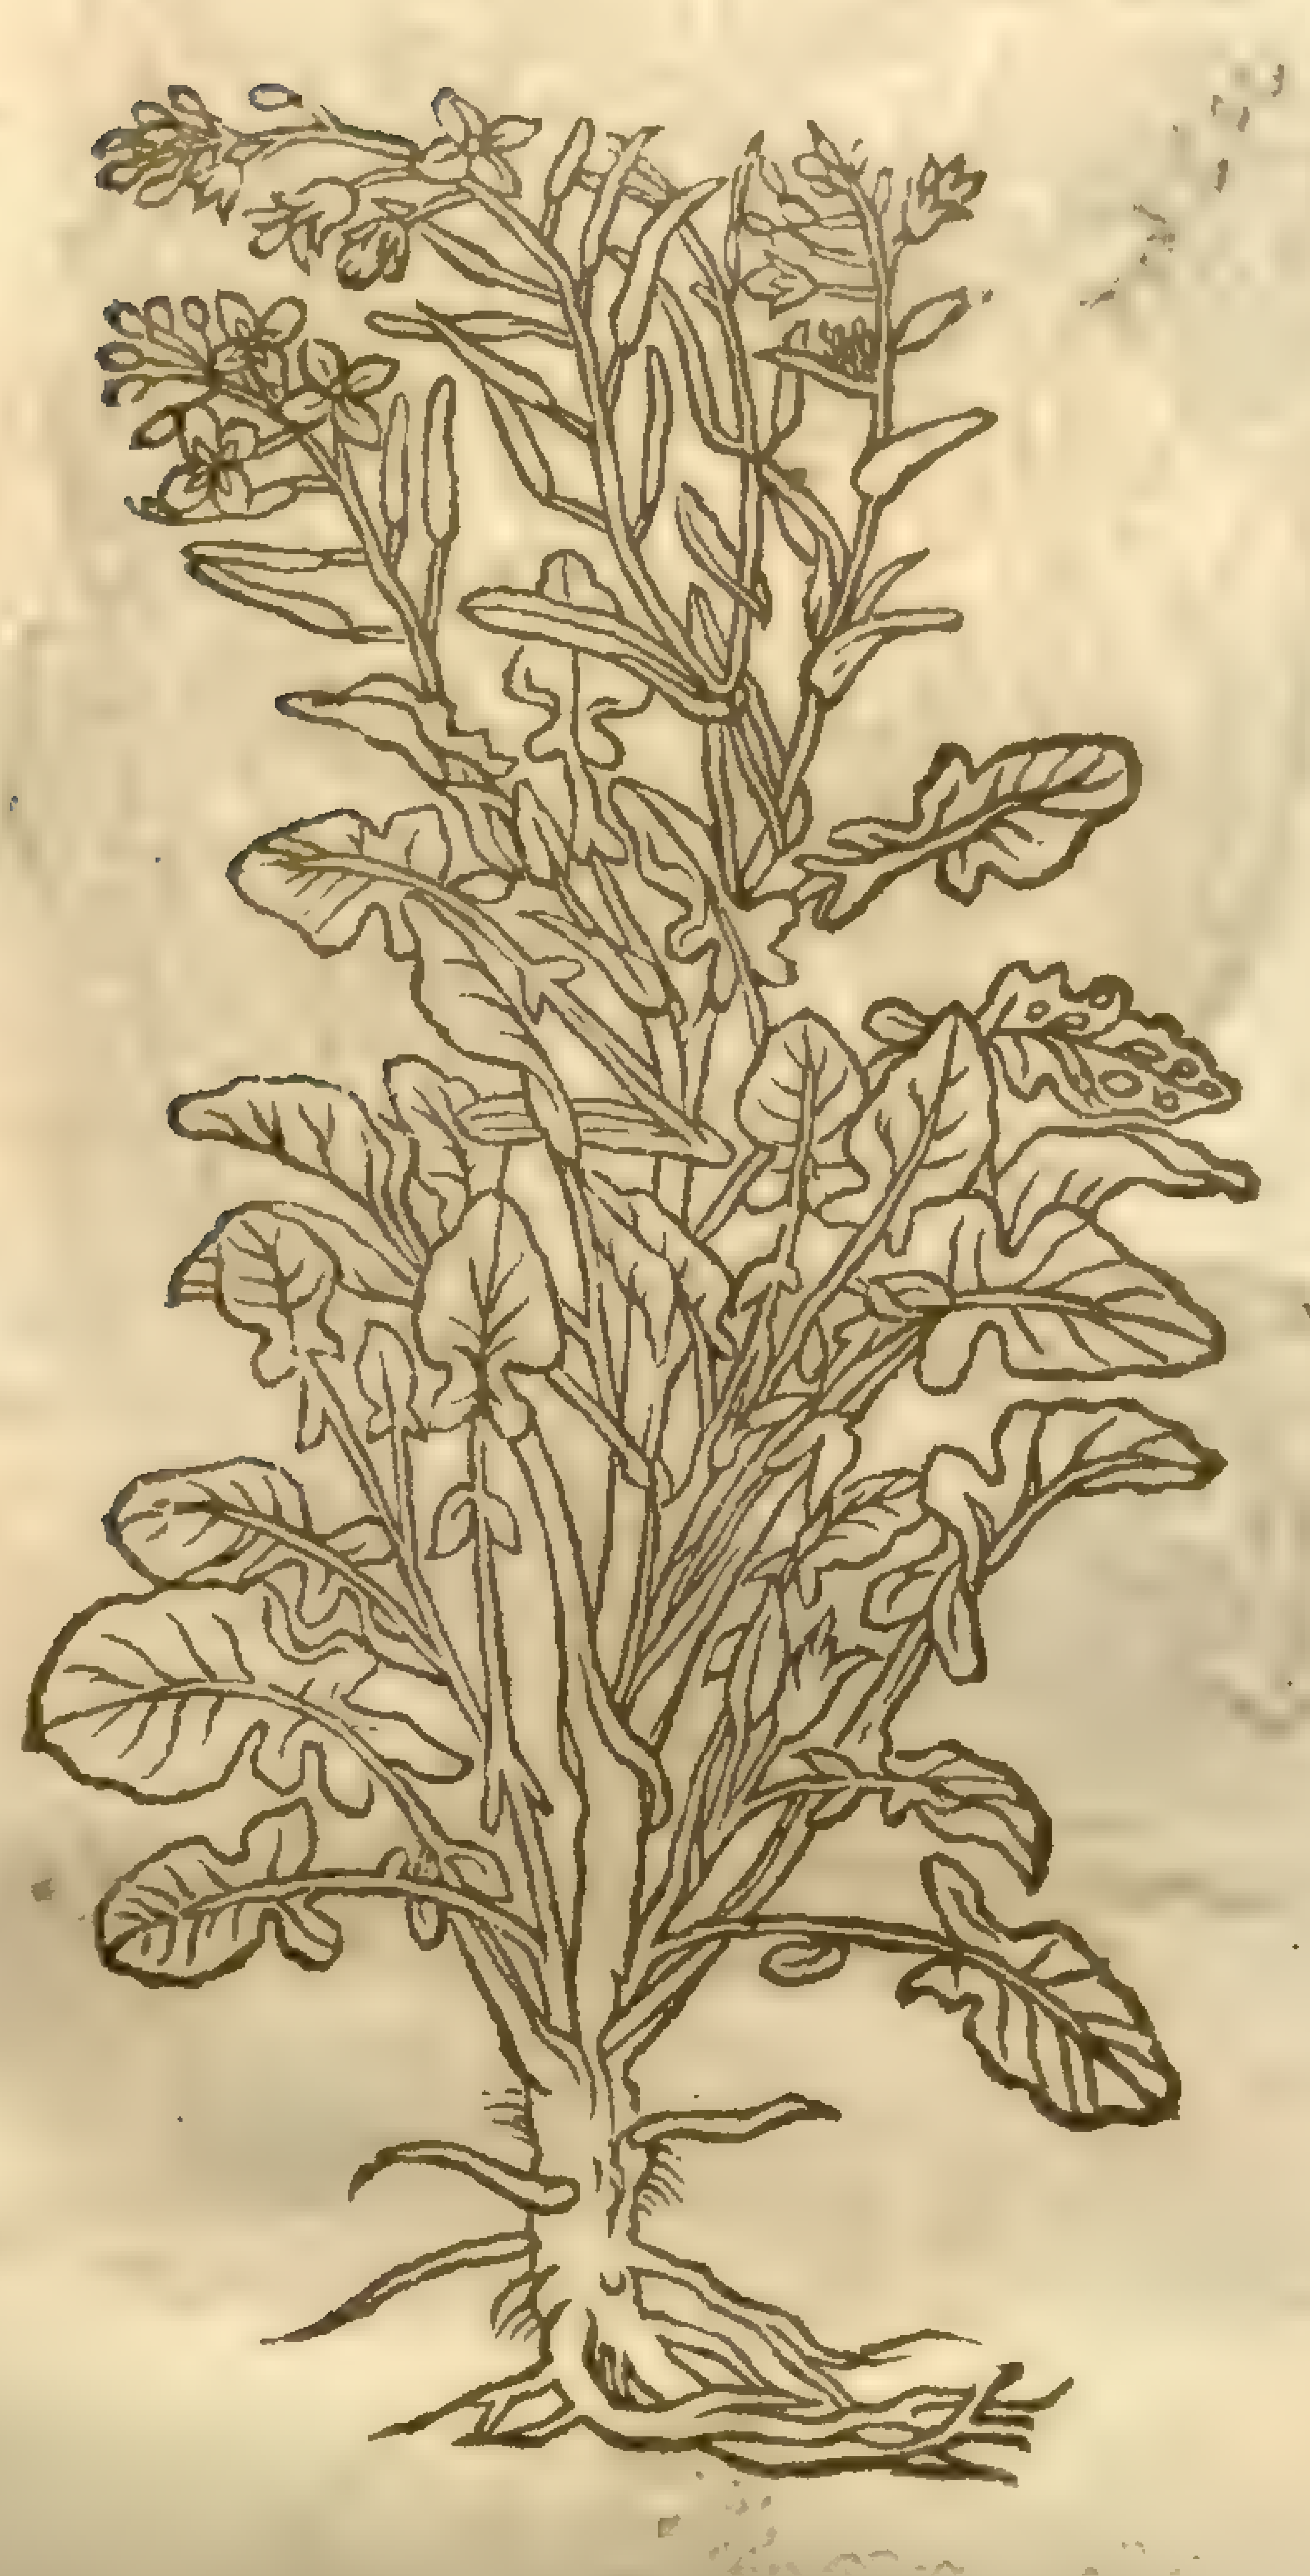
† 15 *Braßica marina Anglica.*
Engliſh ſea Colewort.

Crambe maritima, L.
Mill. dict.
Sm. fl. 3. 184



14 The ſmall cut Colewort hath very large leaues,wonderfully cut,hackt, and hewen euen to the middle rib,reſembling a kind of curled Parſly that ſhal be deſcribed in his place(which is not common,nor hath bin knowne or deſcribed vntill this time) very wel agreeing with the laſt before mentioned,but differeth in the curious cutting and iagging of the leaues : in ſtalke,floure & ſeed not vnlike.

† 16 *Braſsica ſylveſtris.*
Wilde Coleworts.



2 B. [illegible]

15 Sea Colewort hath large and broad leaues very thick and curled, and ſo brittle that they cannot be handled without breaking, of an ouerworne green colour tending to grayneſſe : among which riſe vp ſtalks two cubits high,bearing ſmall pale floures at the top; which being paſt,there follow round knobs wherein is contained one round ſeed and no more , blacke of colour, of the bigneſſe of a tare or vetch. ‡ And therefore *Pena* and *Lobel* call it *Braſsica marina monoſpermos.* ‡

16 The wilde Colewort hath long broad leaues not vnlike to the tame Colewort, but leſſer, as is all the reſt of the plant, and is of his owne nature wilde, and therefore not ſought after as a meat, but is ſowne and husbanded vpon ditch banks and ſuch like places, for the ſeeds ſake, by which oftentimes great gaine is gotten.

¶ *The Place.*

The greateſt ſort of Colewoorts grow in gardens, and do loue a ſoile which is fat, being throughly dunged and manured : they doe beſt proſper being remoued, and euery of them grow in our Engliſh gardens, except the wilde, which growes in fields and new digged ditch banks.

The ſea Colewort grows naturally vpon the baych and brims of the ſea,where there is no earth to be ſeen, but ſand and rolling pibble ſtones , which thoſe that dwell neere the ſea do call Bayche.I found it growing between Whitſtable and the Iſle of Tenet neere the brinke of the ſea,and in many places neere to Colcheſter,and elſewhere by the ſea ſide.

¶ *The Time.*

Petrus Creſcentius ſaith,That the Colewort may be ſowne and remoued at any time of the yeare; whoſe opinion I altogether miſlike. It is ſowne in the Spring,as in March,Aprill,and oftentimes in May, and ſometimes in Auguſt ; but the ſpeciall time is about the beginning of September.

The Colewort,ſaith *Columella,* muſt be remoued when it attaineth to ſix leaues after it is come vp from ſeed ; the which muſt be done in Aprill or May,eſpecially thoſe which were ſowne in Autumne,which afterwards flouriſh in the Winter moneths,at what time they are fitteſt for meat.

But the Sauoy Cole and the Cole florey muſt be ſowne in Aprill, in a bed of hot horſe-dung and couered with ſtraw or ſuch like , to keepe it from the cold and froſty mornings ; and hauing gotten ſix leaues in ſuch ſort,you ſhall remoue it as aforeſaid ; otherwiſe if you tarry for temperat weather before you ſow,the yeare will be ſpent before it come to ripeneſſe.

¶ *The Names.*

Euery of the Colewoorts is called in Greeke by *Dioſcorides* and *Galen,* κράμβη : it is alſo called ἀμέθυστος : ſo named not onely becauſe it driueth away drunkenneſſe, but alſo for that it is like in colour to the pretious ſtone called the Amethyſt ; which is meant by the firſt and garden Colewort. The Apothecaries and the common Herbariſts do call it *Caulis,*of the goodneſſe of the ſtalke. In the Germane Tongue it is called **Koole kraut** : in French, *Des Choux* : in Engliſh, Coleworts.

Cole-florey is called in Latine *Craſsica Cypria* and *Cauliflora* : in Italian, *Caulifiore* : it ſeemes to agree with *Braſsica Pompeiana* of *Pliny,*whereof he writeth,*lib.* 19.*cap.* 8.

¶ Th

¶ *The Temperature.*

All the Coleworts haue a drying and binding facultie, with a certaine nitrous or ſalt quality, wherby they mightily clenſe, either in iuice or in broth. The whole ſubſtance or body of the Colewort is of a binding and drying faculty, becauſe it leaueth in the decoction his ſalt quality; which lieth in the iuice and watry part thereof: the water wherein it is firſt boiled, draweth to it ſelfe all the quality; for which cauſe the decoction thereof looſeth the belly, as doth alſo the iuice of it, if it be drunke: but if the firſt broth in which it was boiled be caſt away, then doth the Colewort dry and bind the belly. But it yeeldeth to the body ſmal nouriſhment, and doth not ingender good, but a groſſe and melancholicke bloud. The white Cabbage is beſt next vnto the Cole-florey; yet *Cato* doth chiefely commend the ruſſet Cole: but he knew neither the white ones, nor the Cole-florey; for if he had, his cenſure had bin otherwiſe.

¶ *The Vertues.*

Dioſcorides teacheth, that the Colewoort beeing eaten is good for them that haue dim eies, and A
that are troubled with the ſhaking palſie.

The ſame Author affirmeth, that if it be boiled and eaten with vineger, it is a remedy for thoſe B
that be troubled with the ſpleene.

It is reported, that the raw Colewort beeing eaten before meate, doth preſerue a man from C
drunkenneſſe: the reaſon is yeelded, for that there is a naturall enmitie betweene it and the vine, which is ſuch, as if it grow neere vnto it, forthwith the vine periſheth and withereth away: yea, if wine be poured vnto it while it is in boiling, it will not be any more boiled, and the colour thereof quite altered, as *Caſſius* and *Dionyſius Vticenſis* do write in their bookes of tillage: yet doth not *Athenæus* aſcribe that vertue of driuing away drunkenneſſe to the leaues, but to the ſeeds of Colewort.

Moreouer, the leaues of Coleworts are good againſt all inflammations, and hot ſwellings; bee- D
ing ſtamped with barley meale, and laied vpon them with ſalt: and alſo to breake carbuncles.

The iuyce of Coleworts, as *Dioſcorides* writeth, beeing taken with Floure-de-lys and nitre, doth E
make the body ſoluble: and being drunke with wine, it is a remedy againſt the bitings of venomous beaſts.

The ſame being applied with the pouder of Fennugreeke, taketh away the paine of the gout, and F
alſo cureth old and foule vlcers.

Being conueied into the noſthrils, it purgeth the head: being put vp with barley meale it brin- G
geth downe the floures.

Pliny writeth, that the iuice mixed with wine, and dropped into the eares, is a remedy againſt H
deafeneſſe.

The ſeed, as *Galen* ſaith, driueth forth wormes, taketh away freckles of the face, ſun-burning, and I
what thing ſoeuer that need to be gently ſcoured or clenſed away.

They ſay that the broth wherein the herbe hath bin ſodden is maruellous good for the ſinewes K
and ioints, and likewiſe for cankers in the eies, called in Greeke *Carcinomata*, which cannot be healed by any other meanes, if they be waſhed therewith.

‡ The fifteenth and ſixteenth figures were formerly tranſpoſed.

CHAP. 41. *Of Rape-Cole.*

¶ *The Deſcription.*

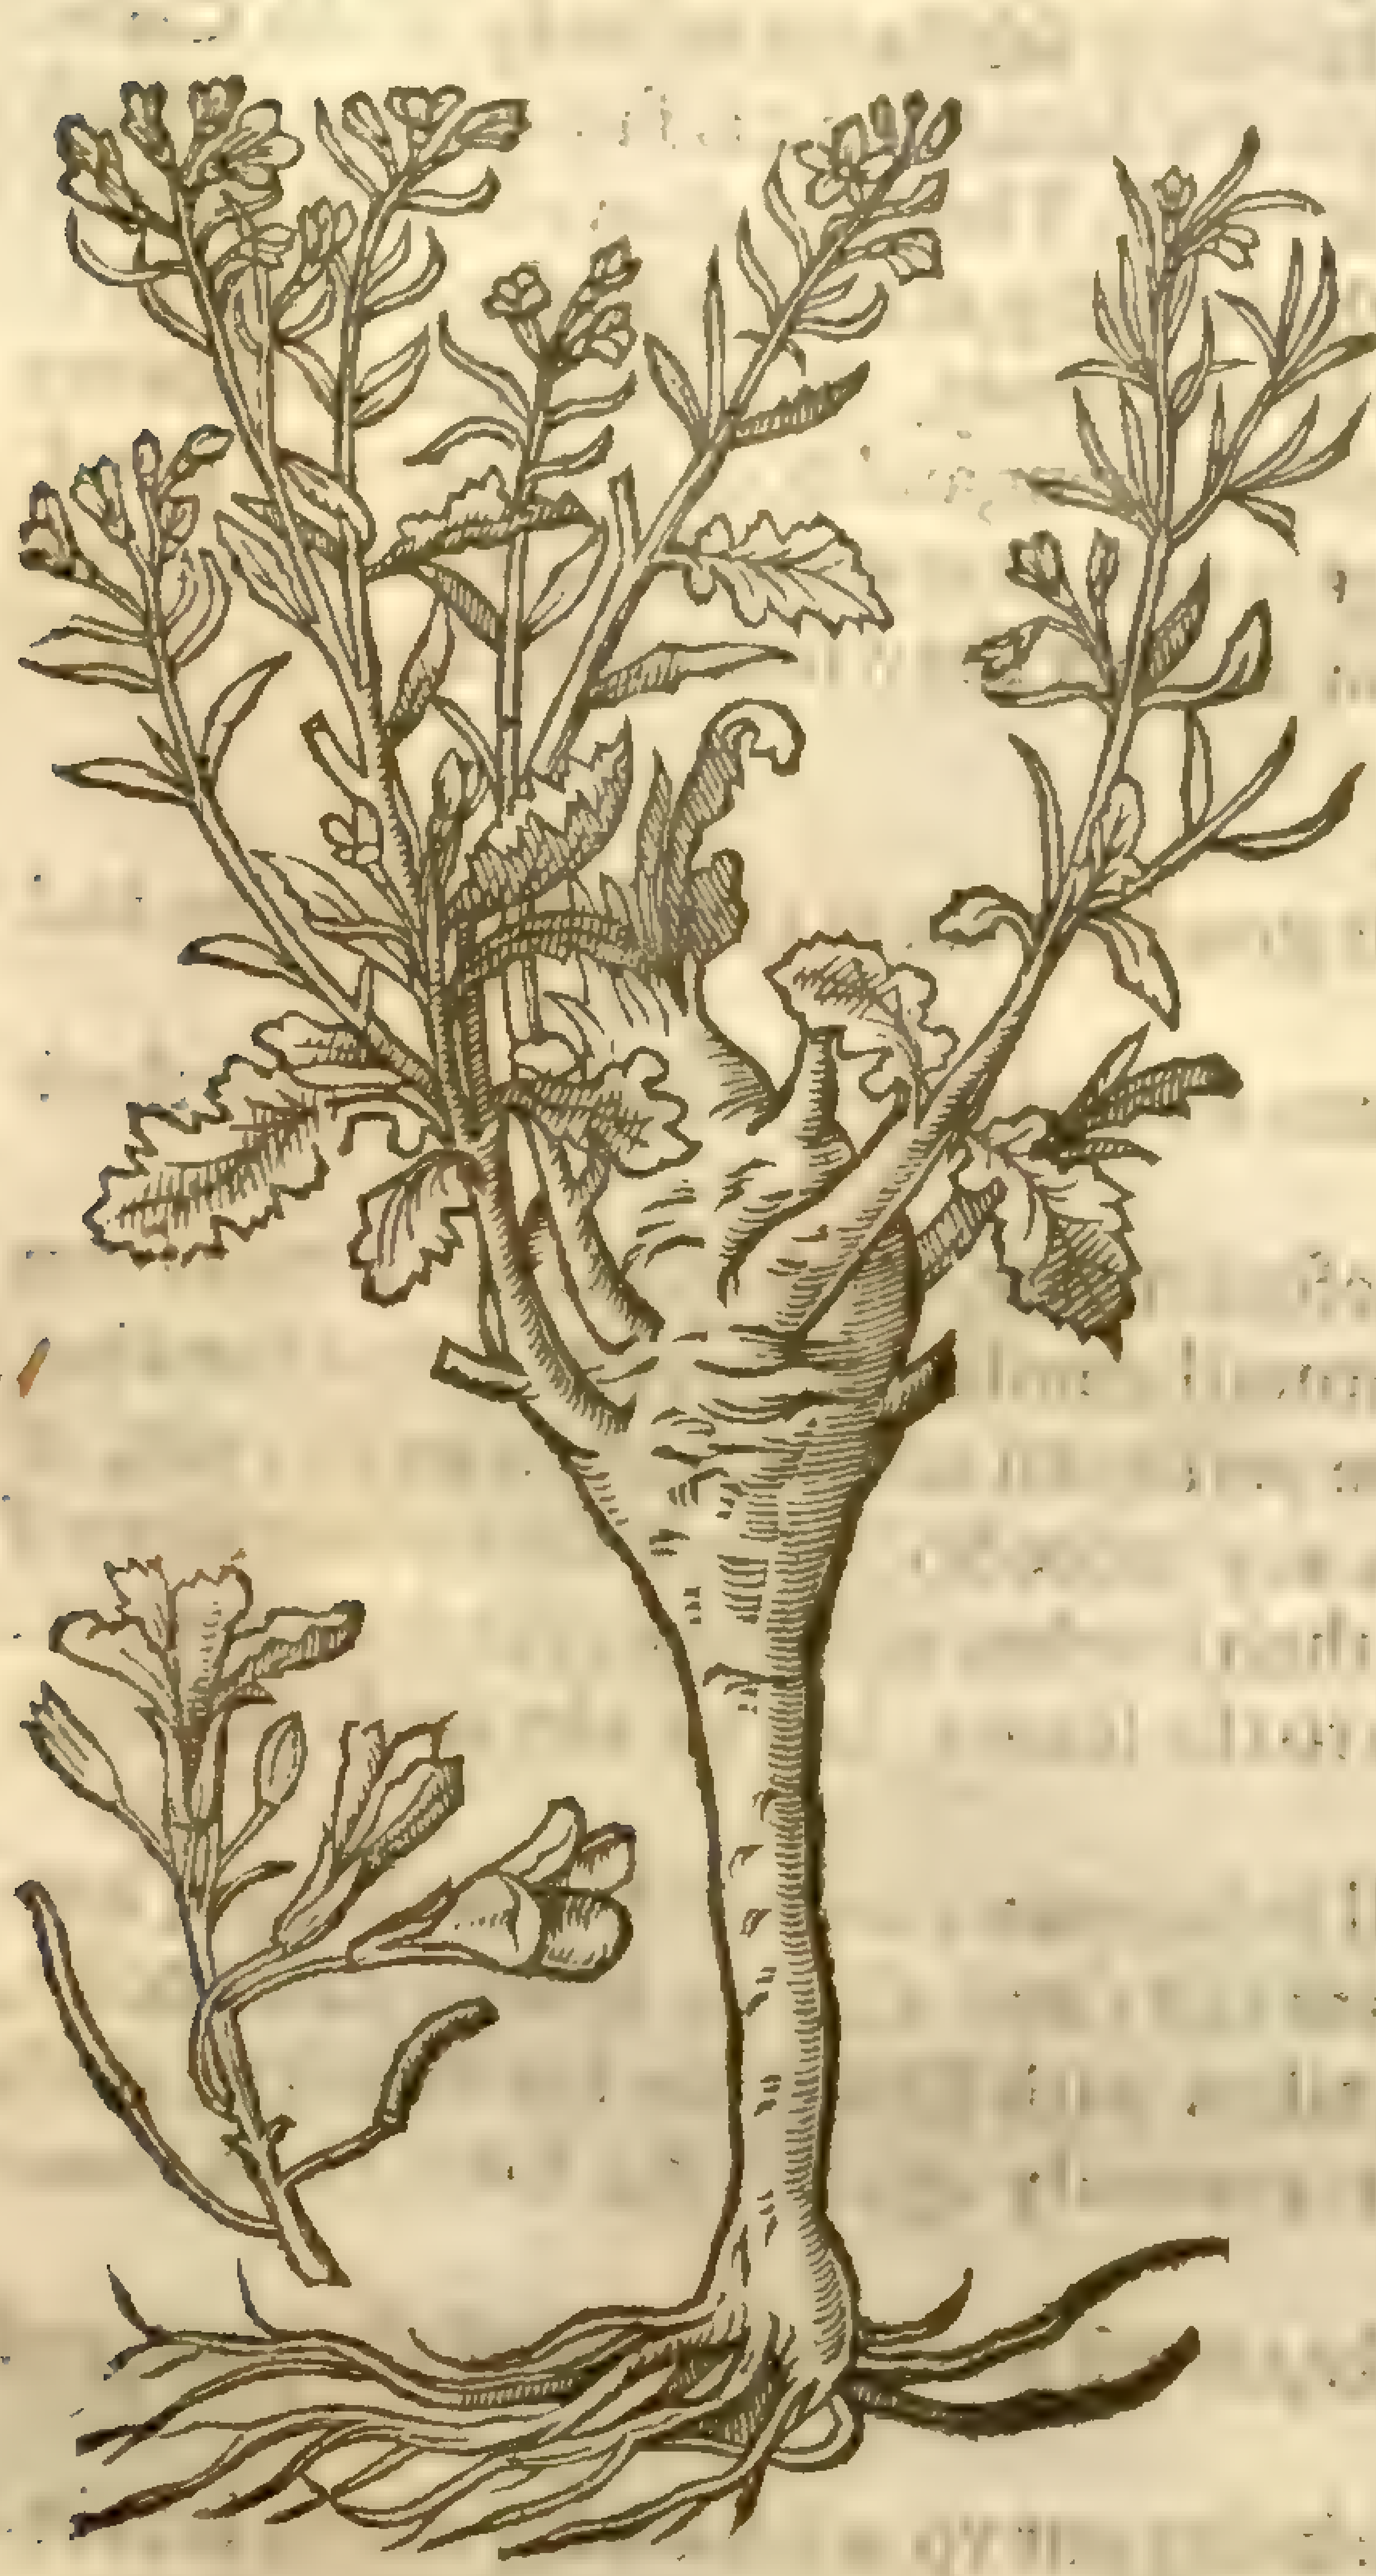
1 The firſt kinde of Rape Cole hath one ſingle long root, garniſhed with many threddy ſtrings: from which riſeth vp a great thick ſtalk, bigger than a great Cucumber or great Turnep: at the top whereof ſhooteth forth great broad leaues, like vnto thoſe of Cabbage Cole. The floures grow at the top on ſlender ſtalkes, compact of foure ſmall yellow floures: which being paſt, the ſeed followeth incloſed in little long cods, like the ſeed of Muſtard.

2 The ſecond hath a long fibrous root like vnto the precedent; the tuberous ſtalk is very great and long, thruſting forth in ſome few places here and there, ſome foot-ſtalks, whereupon doe grow ſmooth leaues, ſleightly indented about the edges: on the top of the long Turnep ſtalke grow leane ſtalks and floures like the former. ‡ This ſecond differs from the former onely in the length of the ſwolne ſtalke, whence they call it *Caulorapum longum*, or long Rape Cole. ‡

¶ *The Place.*

They grow in Italy, Spaine, and ſome places of Germanie, from whence I haue receiued ſeeds for my garden, as alſo from an honeſt and curious friend of mine called maſter *Goodman*, at the Minories neere London.

1 *Caulerapum rotundum.*
Round rape Cole.



¶ *The Time.*

They floure and flouriſh when the other Coleworts do, whereof no doubt they are kinds, and muſt be carefully ſet and ſowen, as Muske Melons and Cucumbers are.

¶ *The Names.*

They are called in Latine, *Caulorapum*, and *Rapocaulis*, bearing for their ſtalkes, as it were Rapes and Turneps, participating of two plants, the Colewort and Turnep, whereof they tooke their names.

¶ *The Temperature and Vertues.*

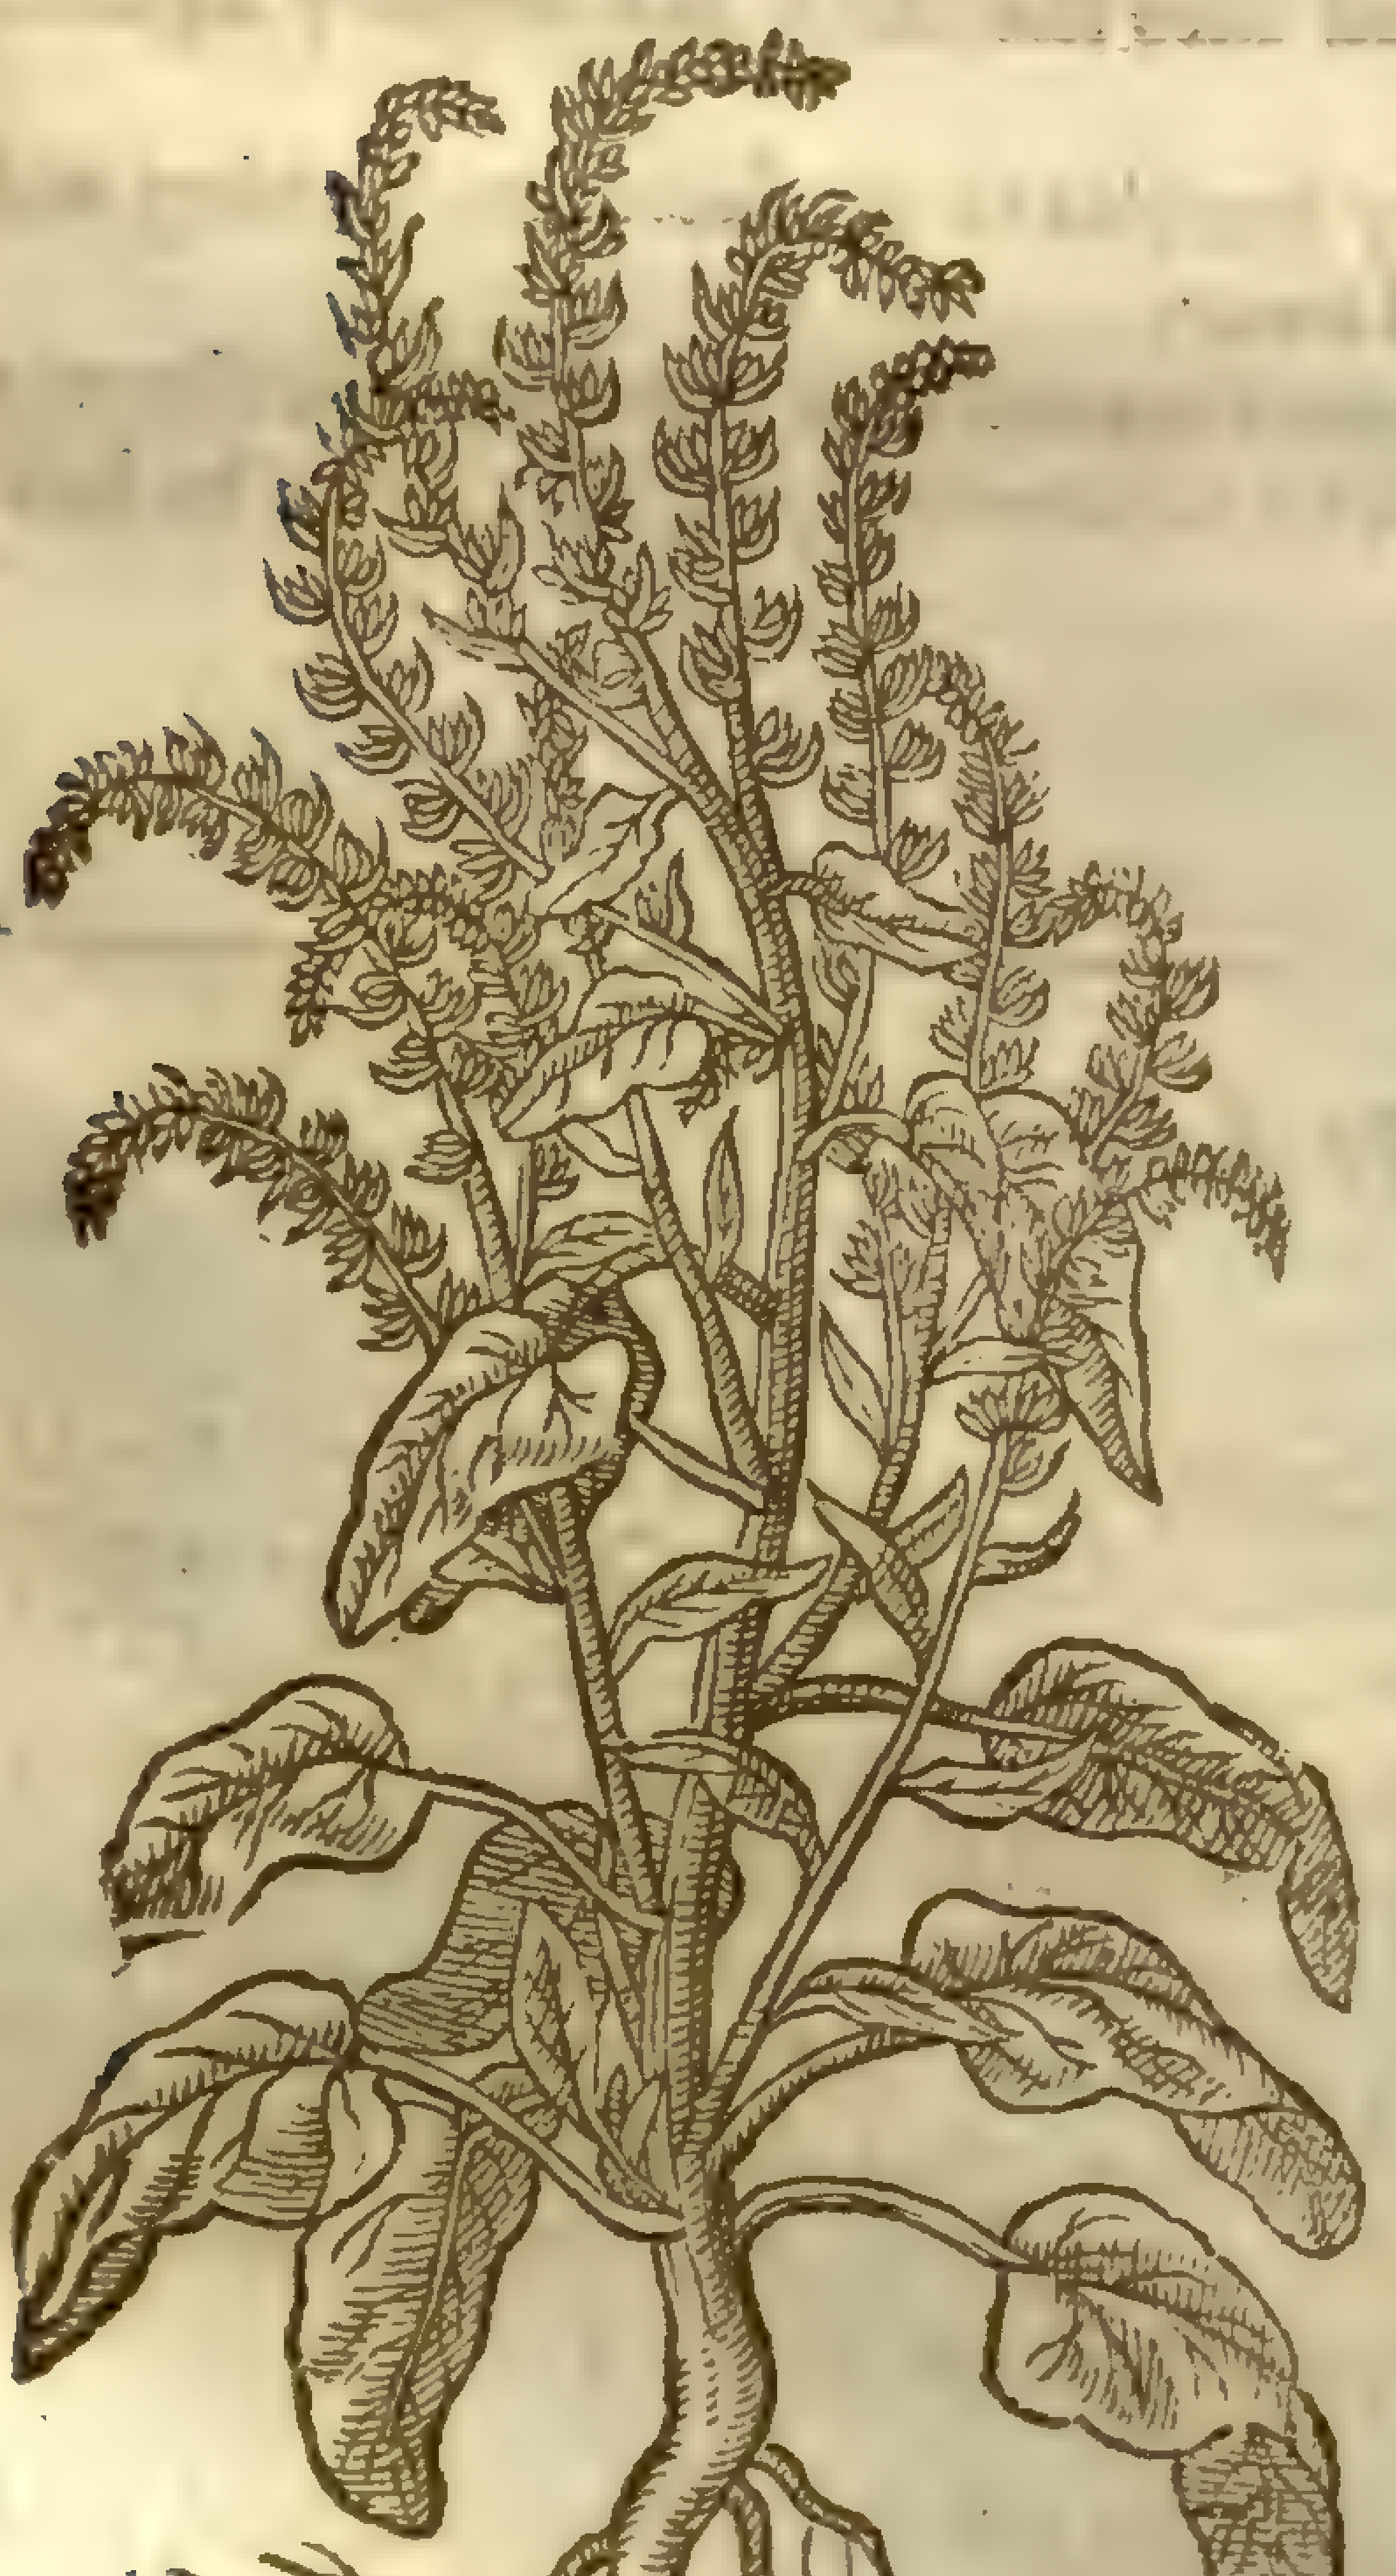
There is nothing ſet downe of the faculties of theſe plants, but are accounted for daintie meate, contending with the Cabbage Cole in goodneſſe and pleaſant taſte.

Chap. 42. *Of Beets.*

¶ *The Deſcription.*

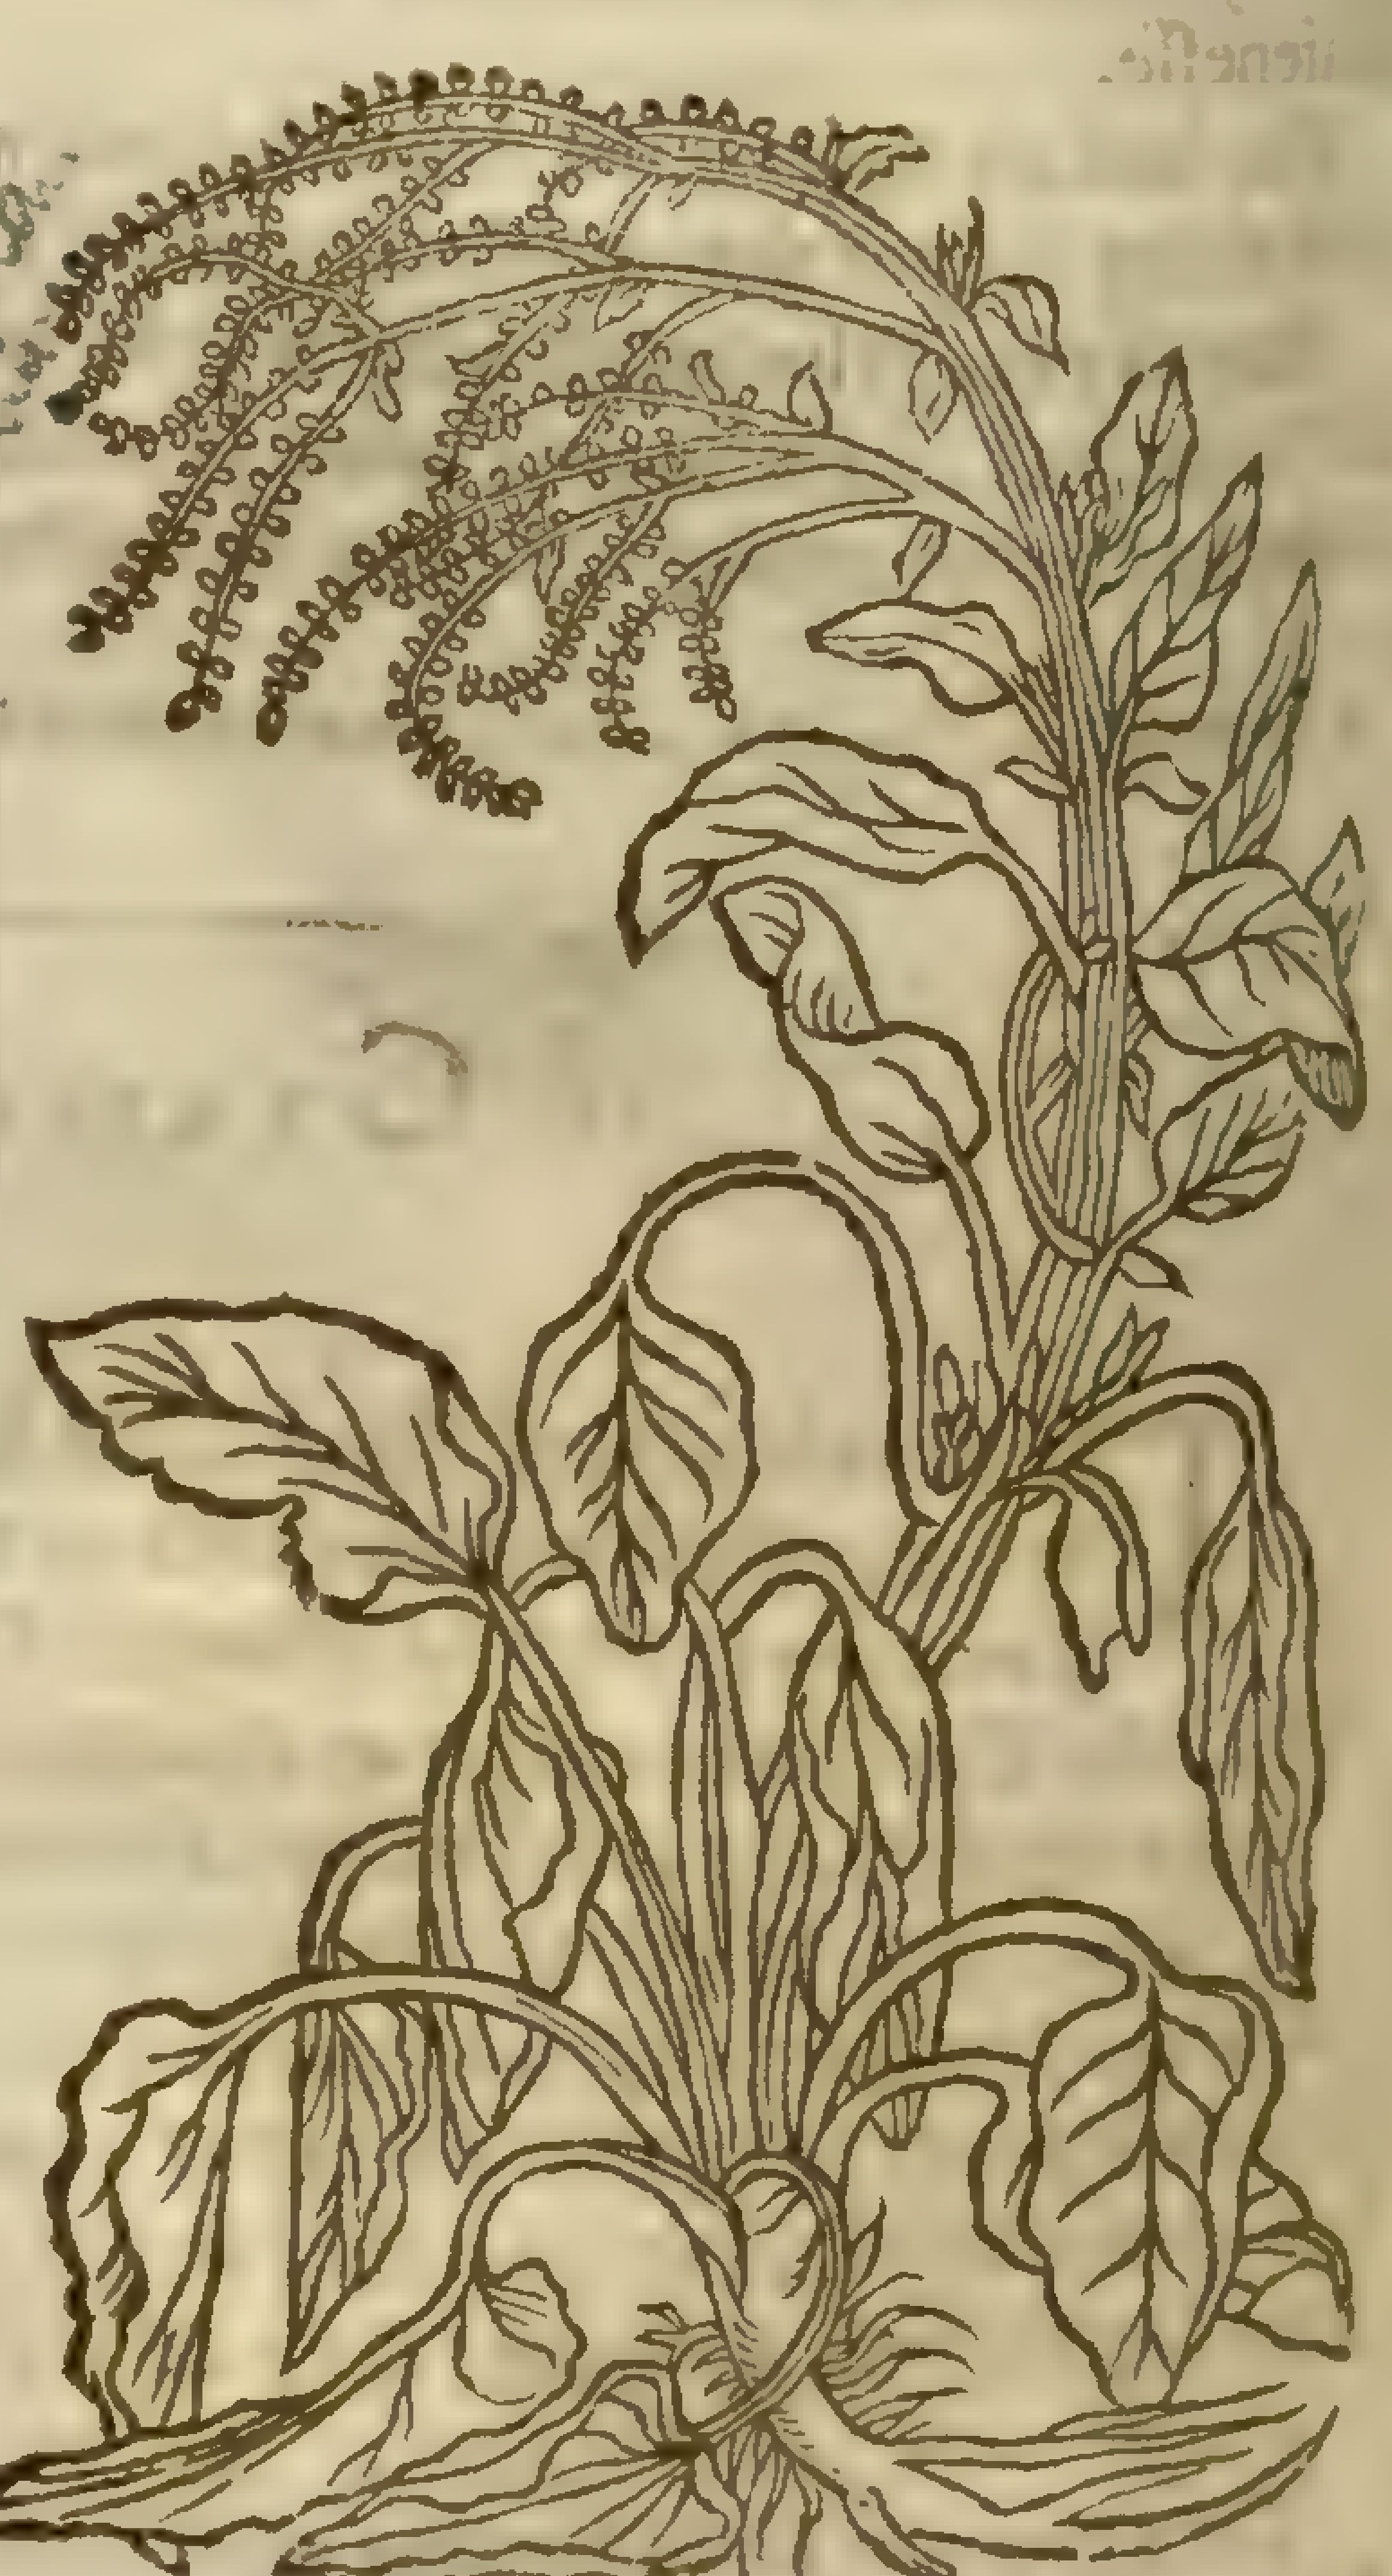
1 The common white Beet hath great broad leaues, ſmooth, and plain: from which riſe thicke creſted or chamfered ſtalks: the floures grow along the ſtalks cluſtering together, in ſhape like little ſtars, which being paſt, there ſucceed round & vneuen prickly ſeed. The root is thicke, hard, and great.

1 *Beta alba.* White Beets.



Beta Cicla L. Mill. dict.

2 *Beta rubra.* Red Beets.



B. maritima L. acc. to [illegible] [illegible] Miller [illegible]

Beta vulgaris, L. Mill. dict.

‡ 3 *Beta rubra Romana.*
Red Roman Beet.

2 There is another ſort like in ſhape and proportion to the former ſauing that the leaues of this be ſtreaked with red here and there confuſedly, which ſetteth forth the difference.

3 There is likewiſe another ſort hereof, that was brought vnto me from beyond the ſeas, by that courteous Merchant maſter *Lete*, before remembred, the which hath leaues very great, and red of colour, as is all the reſt of the plant, as well root, as ſtalke, and floures full of a perfect purple juyce tending to redneſſe: the middle rib of which leaues are for the moſt part very broad and thicke, like the middle part of the Cabbage leafe, which is equall in goodneſſe with the leaues of Cabbage being boyled. It grew with me 1596. to the height of eight cubits, and did bring forth his rough and vneuen ſeed very plentifully: with which plant nature doth ſeeme to play and ſport herſelfe: for the the ſeeds taken from that plant, which was altogether of one colour and ſowen, doth bring forth plants of many and variable colours, as the worſhipfull Gentleman maſter *Iohn Norden* can very well teſtifie: vnto whom I gaue ſome of the ſeeds aforeſaid, which in his garden brought forth many other of beautifull colours.

¶ *The Place.*

The Beete is ſowne in gardens: it loueth to grow in a moiſt and fertile ground. ‡ The ordinary white Beet growes wilde vpon the ſea-coaſt of Tenet and diuers others places by the Sea, for this is not a different kind as ſome would haue it. ‡

¶ *The Time.*

The fitteſt time to ſow it is in the ſpring: it flouriſheth and is green all Summer long, and likewiſe in Winter, and bringeth forth his ſeed the next yeare following.

¶ *The Names.*

The Grecians haue named it Σεῦτλον τεῦτλον: the Latines, *Beta*: the Germanes, **Maugolt**: the Spaniards, *Aſelgas*: the French, *de la Porée, des Iotes*, and *Beets*: *Theophraſtus* ſaith, that the white Beete is ſurnamed σικελική, that is to ſay, *Sicula*, or of Sicilia: hereof commeth the name *Sicla*, by which the Barbarians, and ſome Apothecaries did call the Beet; the which word we in England doe vſe, taken for the ſame.

¶ *The Nature.*

The white Beets are in moiſture and heate temperate, but the other kindes are dry, and all of them abſterſiue: ſo that the white Beet is a cold and moiſt pot-herbe, which hath joyned with it a certaine ſalt and nitrous quality, by reaſon whereof it cleanſeth and draweth flegme out of the noſthrils.

¶ *The Vertues.*

A Being eaten when it is boyled, it quickly deſcendeth, looſeth the belly, and prouoketh to the ſtoole, eſpecially being taken with the broth wherein it is ſodden: it nouriſheth little or nothing, and is not ſo wholeſome as Lettuce.

B The juyce conueighed vp into the noſthrils doth gently draw forth flegme, and purgeth the head.

C The great and beautifull Beet laſt deſcribed may be vſed in Winter for a ſallad herb, with vinegre, oyle, and ſalt, and is not only pleaſant to the taſte, but alſo delightfull to the eie.

D The greater red Beet or Roman Beet, boyled and eaten with oyle, vinegre and pepper, is a moſt excellent and delicat ſallad: but what might be made of the red and beautifull root (which is to be preferred before the leaues, as well in beautie as in goodneſſe) I refer vnto the curious and cunning cooke, who no doubt when hee had the view thereof, and is aſſured that it is both good and wholeſome, will make thereof many and diuers diſhes, both faire and good.

Chap. 43. Of Blites.

¶ *The Deſcription.*

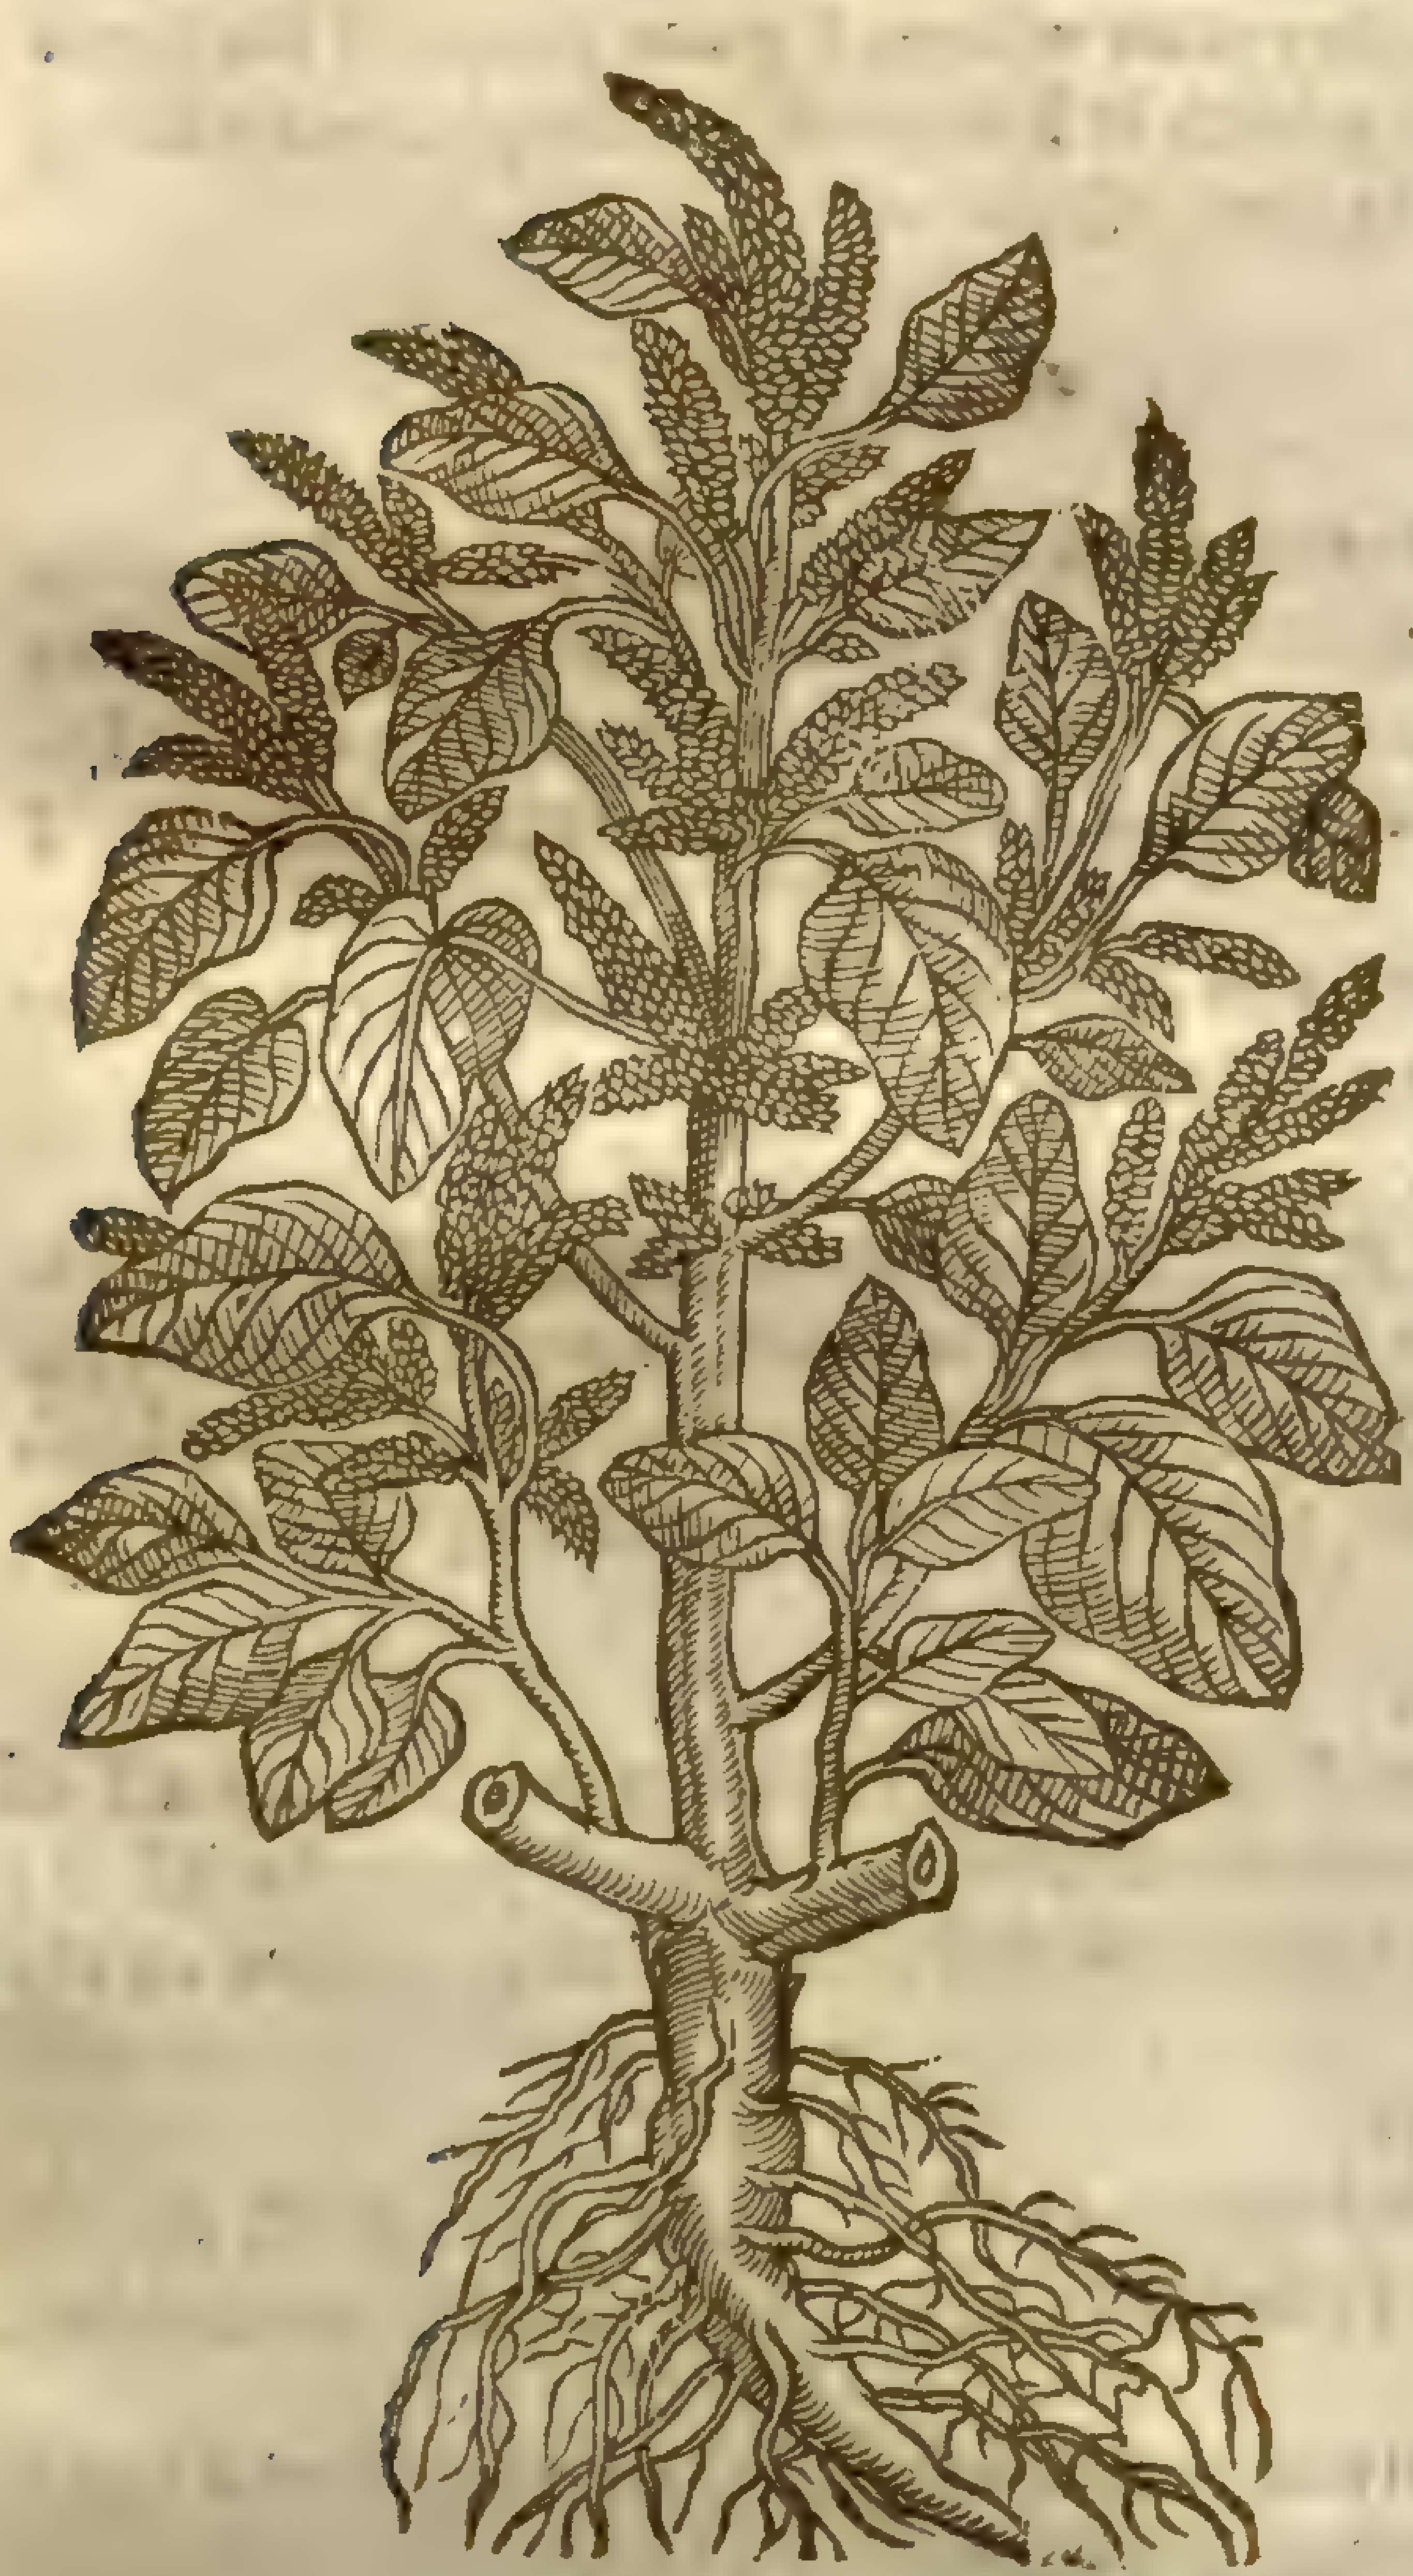
1 THe great white Blite groweth three or foure foot high, with grayiſh or white round ſtalkes: the leaues are plaine and ſmooth, almoſt like to thoſe of the white Orach, but not ſo ſoft nor mealy: the floures grow thruſt together like thoſe of Orach: after that commeth the ſeed incloſed in little round flat husky skinnes.

2 There is likewiſe another ſort of Blites very ſmooth and flexible like the former, ſauing that the leaues are reddiſh, mixed with a darke greene colour, as is the ſtalke and alſo the reſt of the plant.

3 There is likewiſe found a third ſort very like vnto the other, ſauing that the ſtalkes, branches, leaues, and the plant is altogether of a greene colour. But this growes vpright, and creepes not at all.

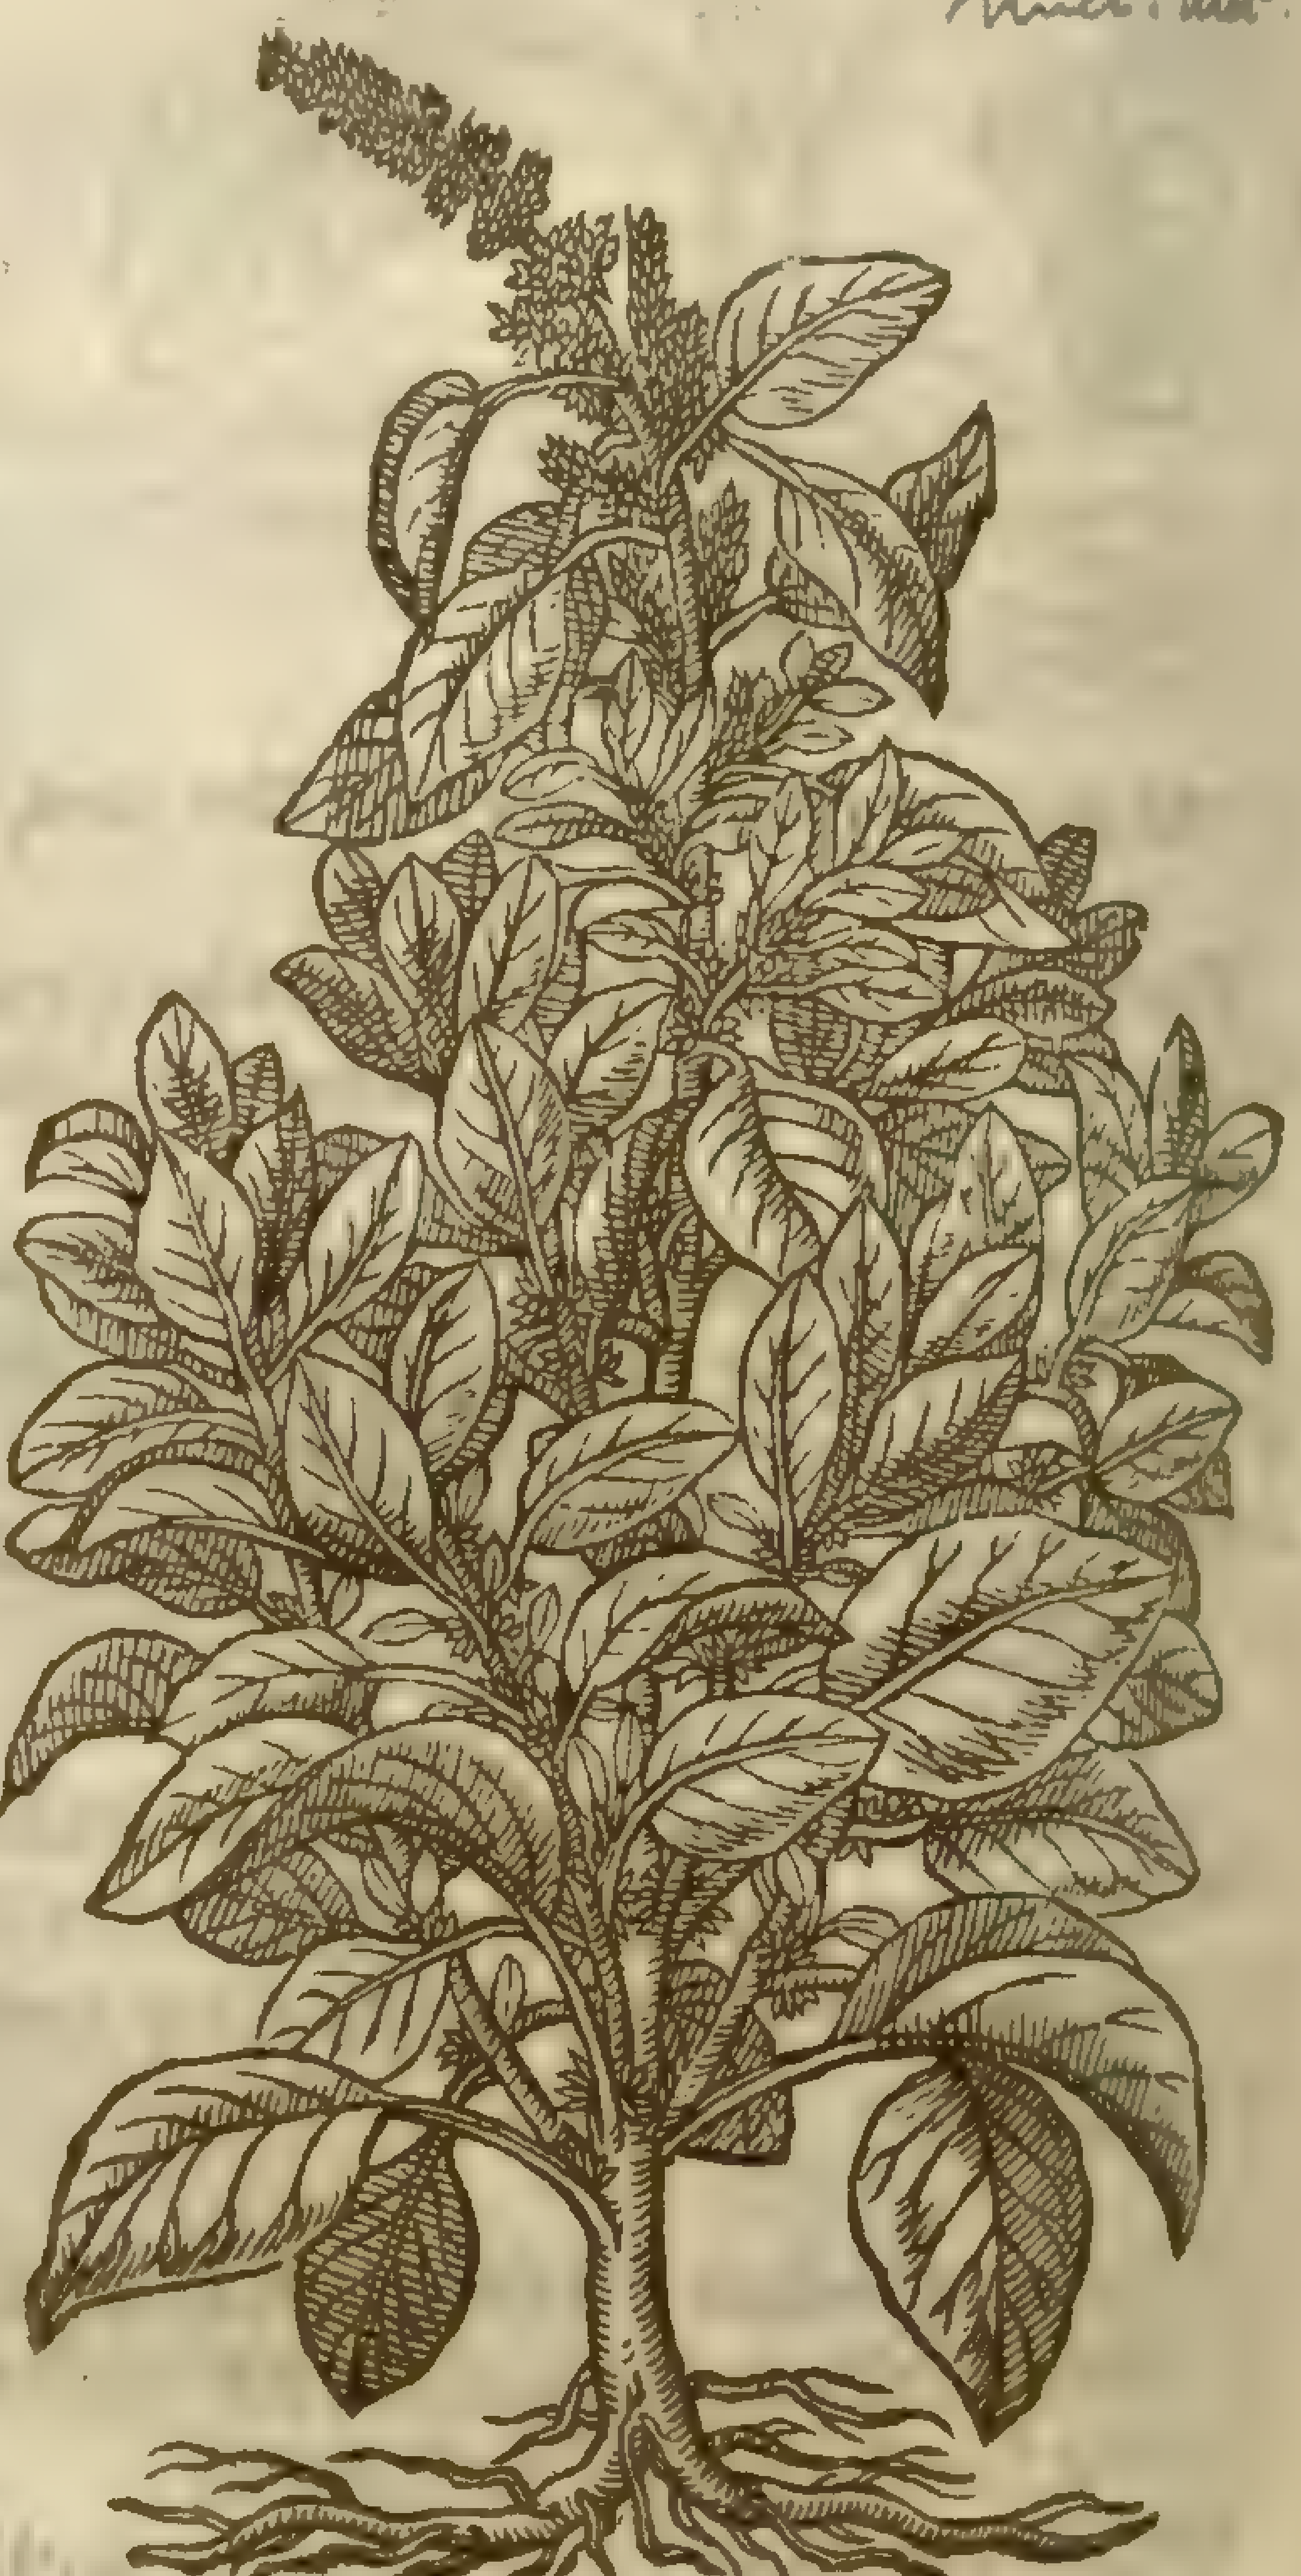
4 There is likewiſe another in our gardens very like the former, ſauing that the whole Plant traileth vpon the ground: the ſtalkes, branches, and leaues are reddiſh: the ſeed is ſmall, and cluſtering together, greene of colour, and like vnto thoſe of *Ruellius* his *Coronopus*, or Bucks-horne.

‡ 1 *Blitum majus album.*
The great white Blite.



2 *Blitum majus rubrum.*
The great red Blite.

Amaranthus blitum, L.
mei. det.



¶ *The Place.*

The Blites grow in Gardens for the moſt part, although there be found of them wilde many times.

¶ *The Time.*

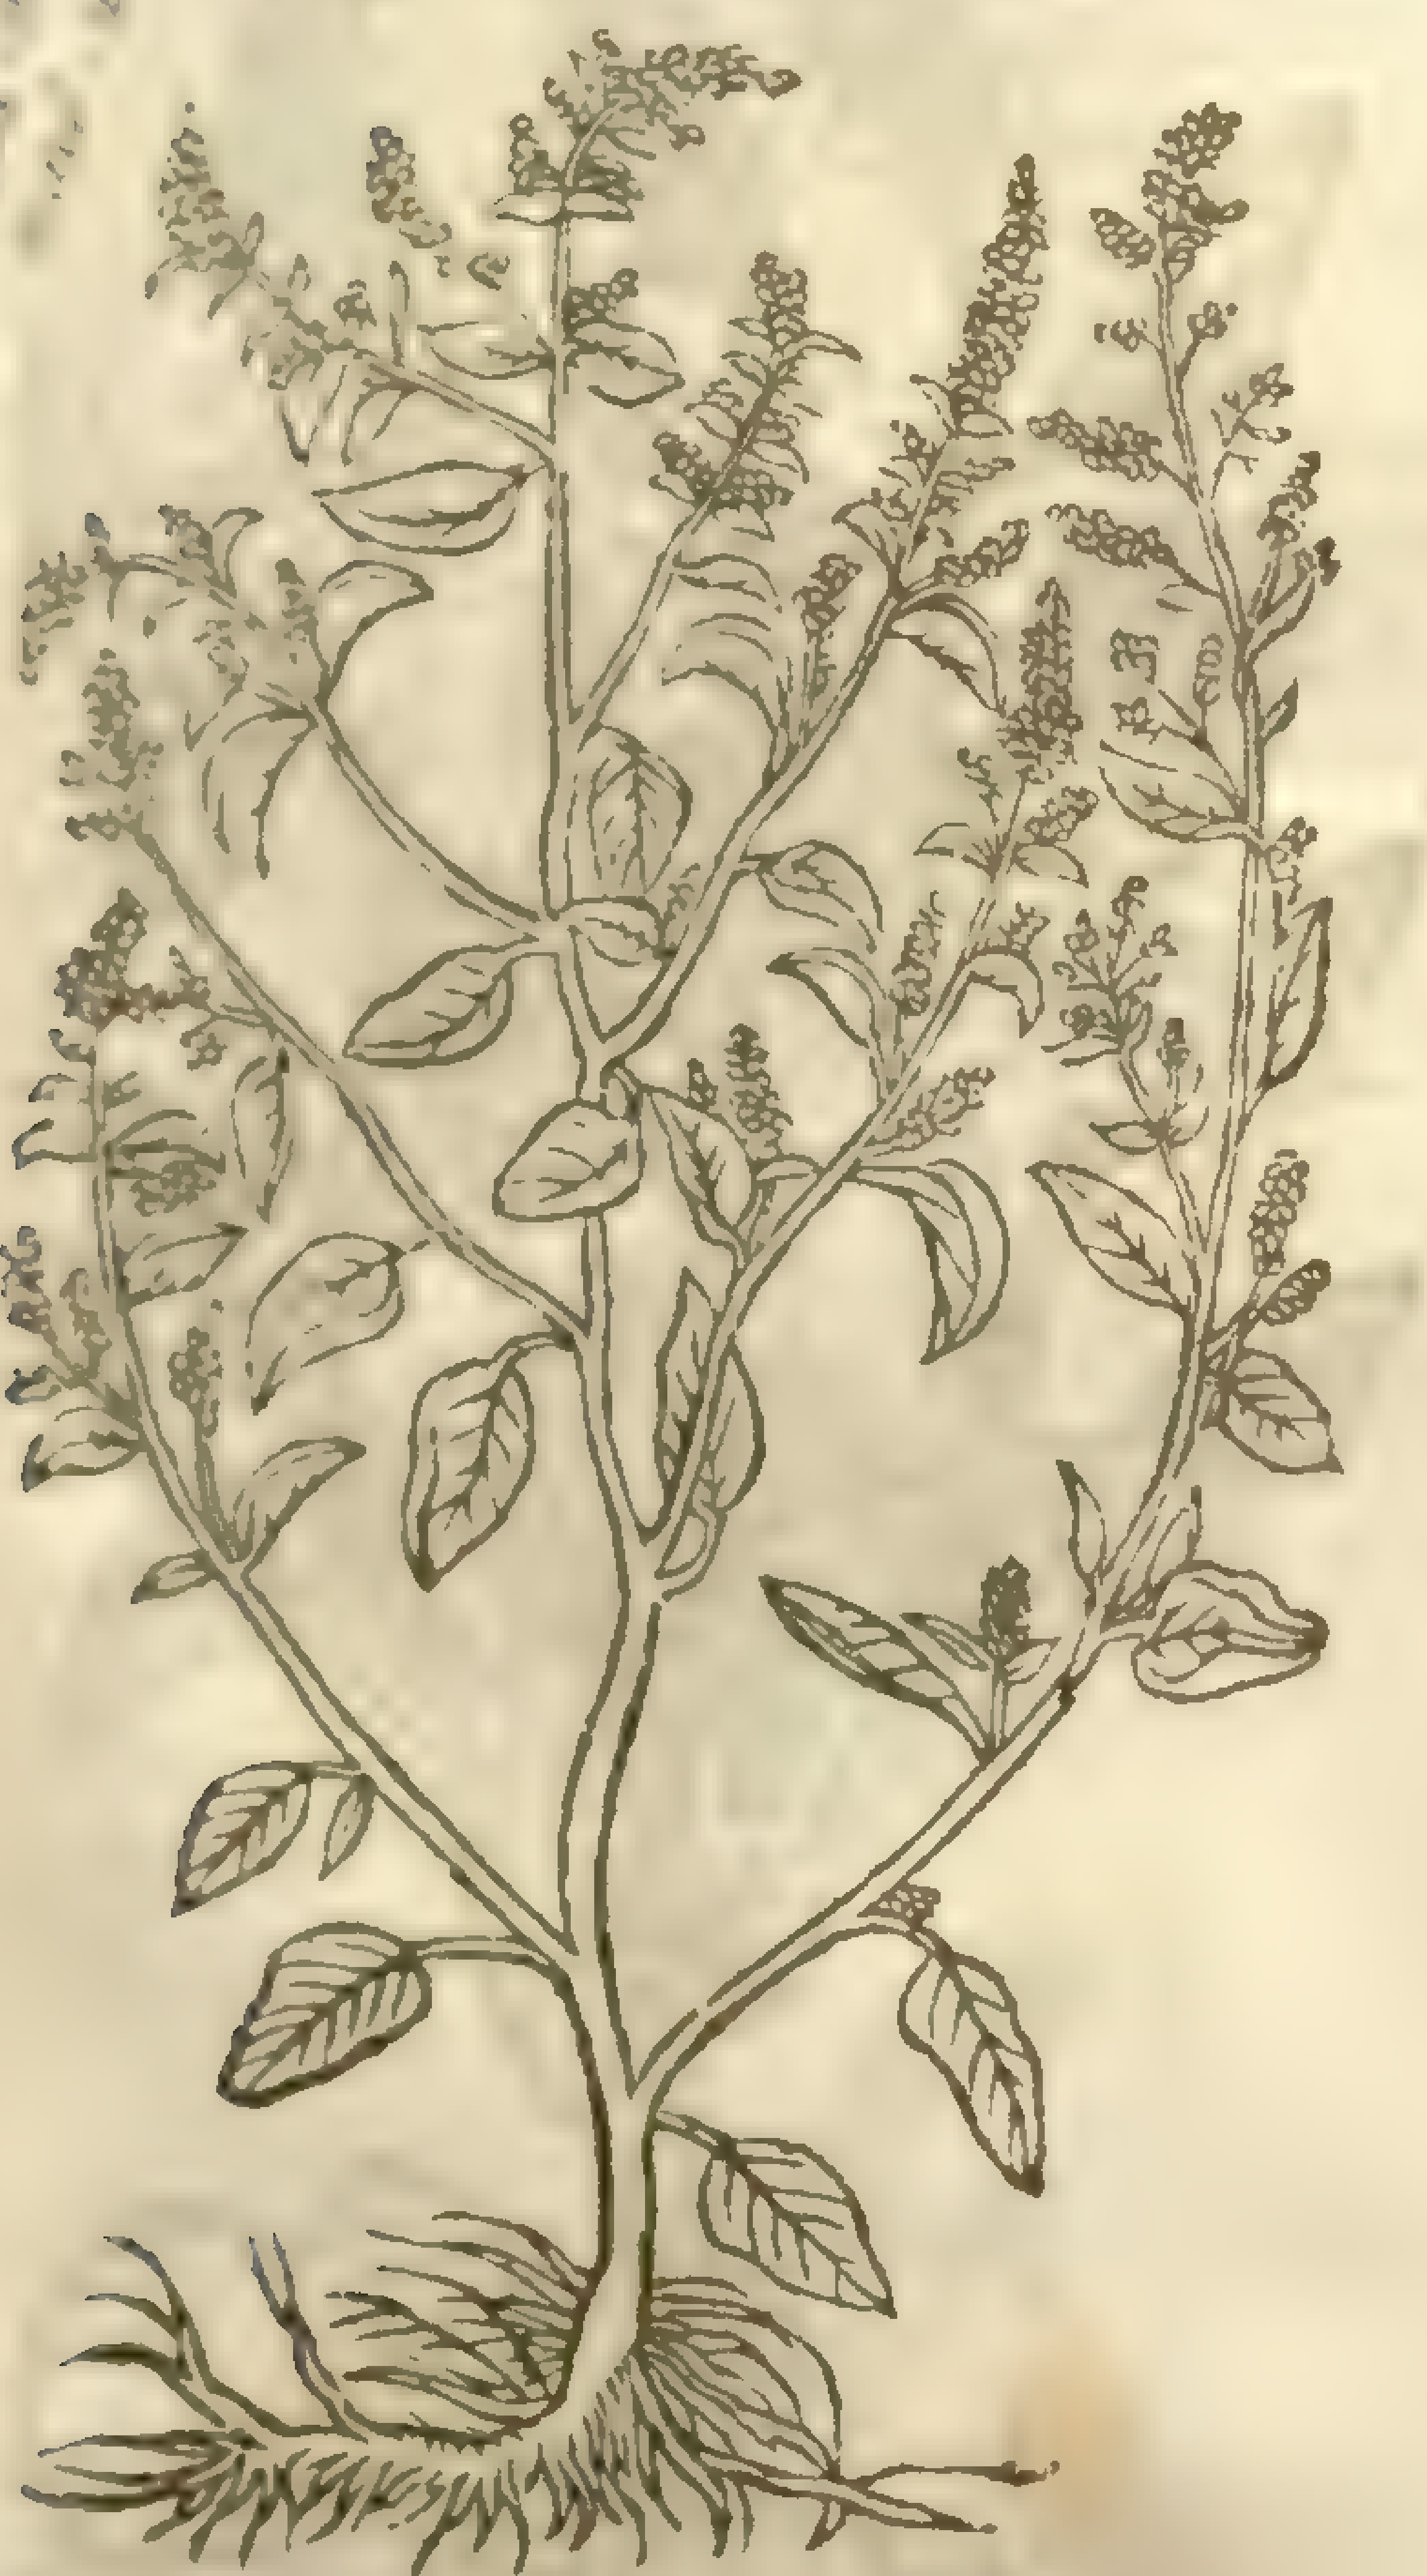
They flouriſh all the Summer long, and grow very greene in Winter likewiſe.

¶ *The Names.*

It is called in Greeke, Βλίτον: in Latine, *Blitum*: in Engliſh, Blite, and Blites: in French, *Blites*, or *Blitres*.

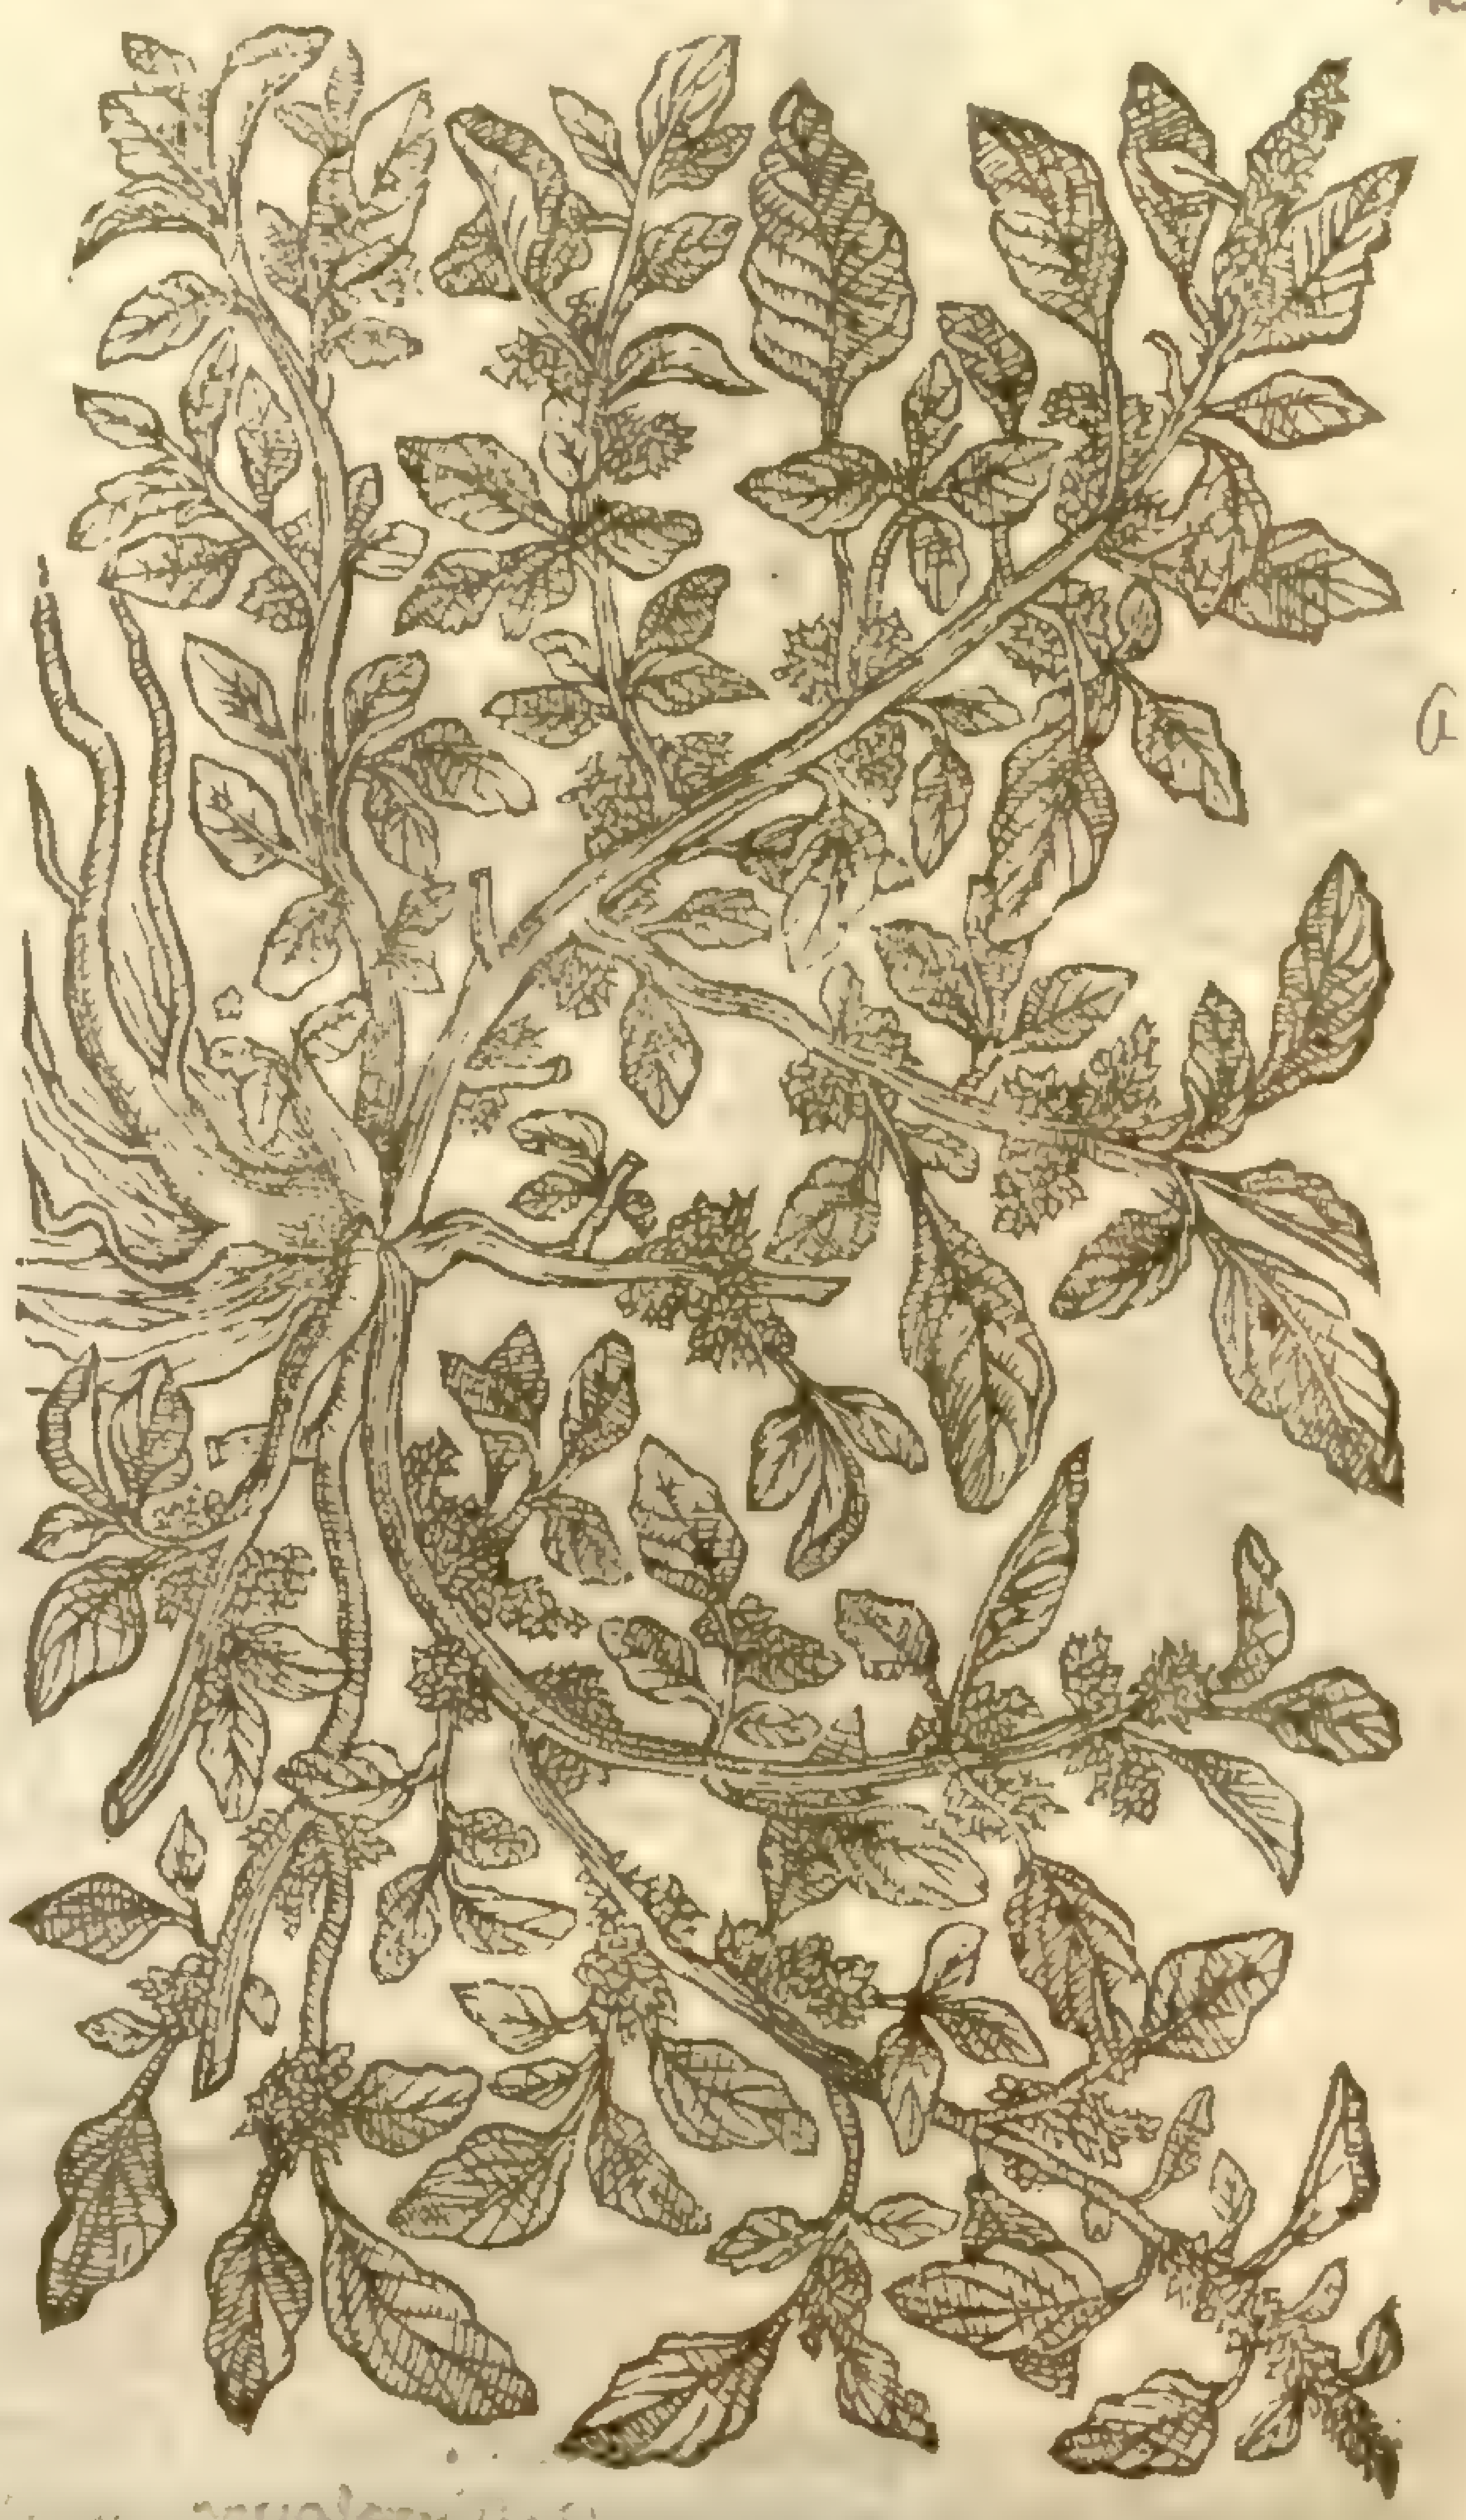
¶ The

‡ 3 *Blitum minus album.*
The ſmall white Blite.



‡ 4 *Blitum minus rubrum.*
The ſmall red Blite.

[illegible] blitum, [illegible]



A. blitum L.
See [illegible]

¶ *The Temperature.*

The Blite (ſaith *Galen* in his ſixth booke of the faculties of ſimple medicines) is a pot-herbe ſeruing for meat, being of a cold moiſt temperature, and that chiefely in the ſecond degree. It yeelds to the body ſmall nouriſhment, as in his ſecond booke of the faculties of nouriſhments he plainly ſhewes: for it is one of the pot-herbes that be vnſauorie or without taſte, whoſe ſubſtance is wateriſh.

¶ *The Vertues.*

The Blite doth nouriſh little, and yet is fit to make the belly ſoluble, though not vehemently; ſeeing it hath no nitrous or ſharpe qualitie whereby the belly ſhould be prouoked. I haue heard many old wiues ſay to their ſeruants, Gather no Blites to put into my pottage, for they are not good for the eie-ſight. Whence they had thoſe words I know not, it may be of ſome Doctor that neuer went to ſchoole; for that I can find no ſuch thing vpon record, either among the old or later writers.

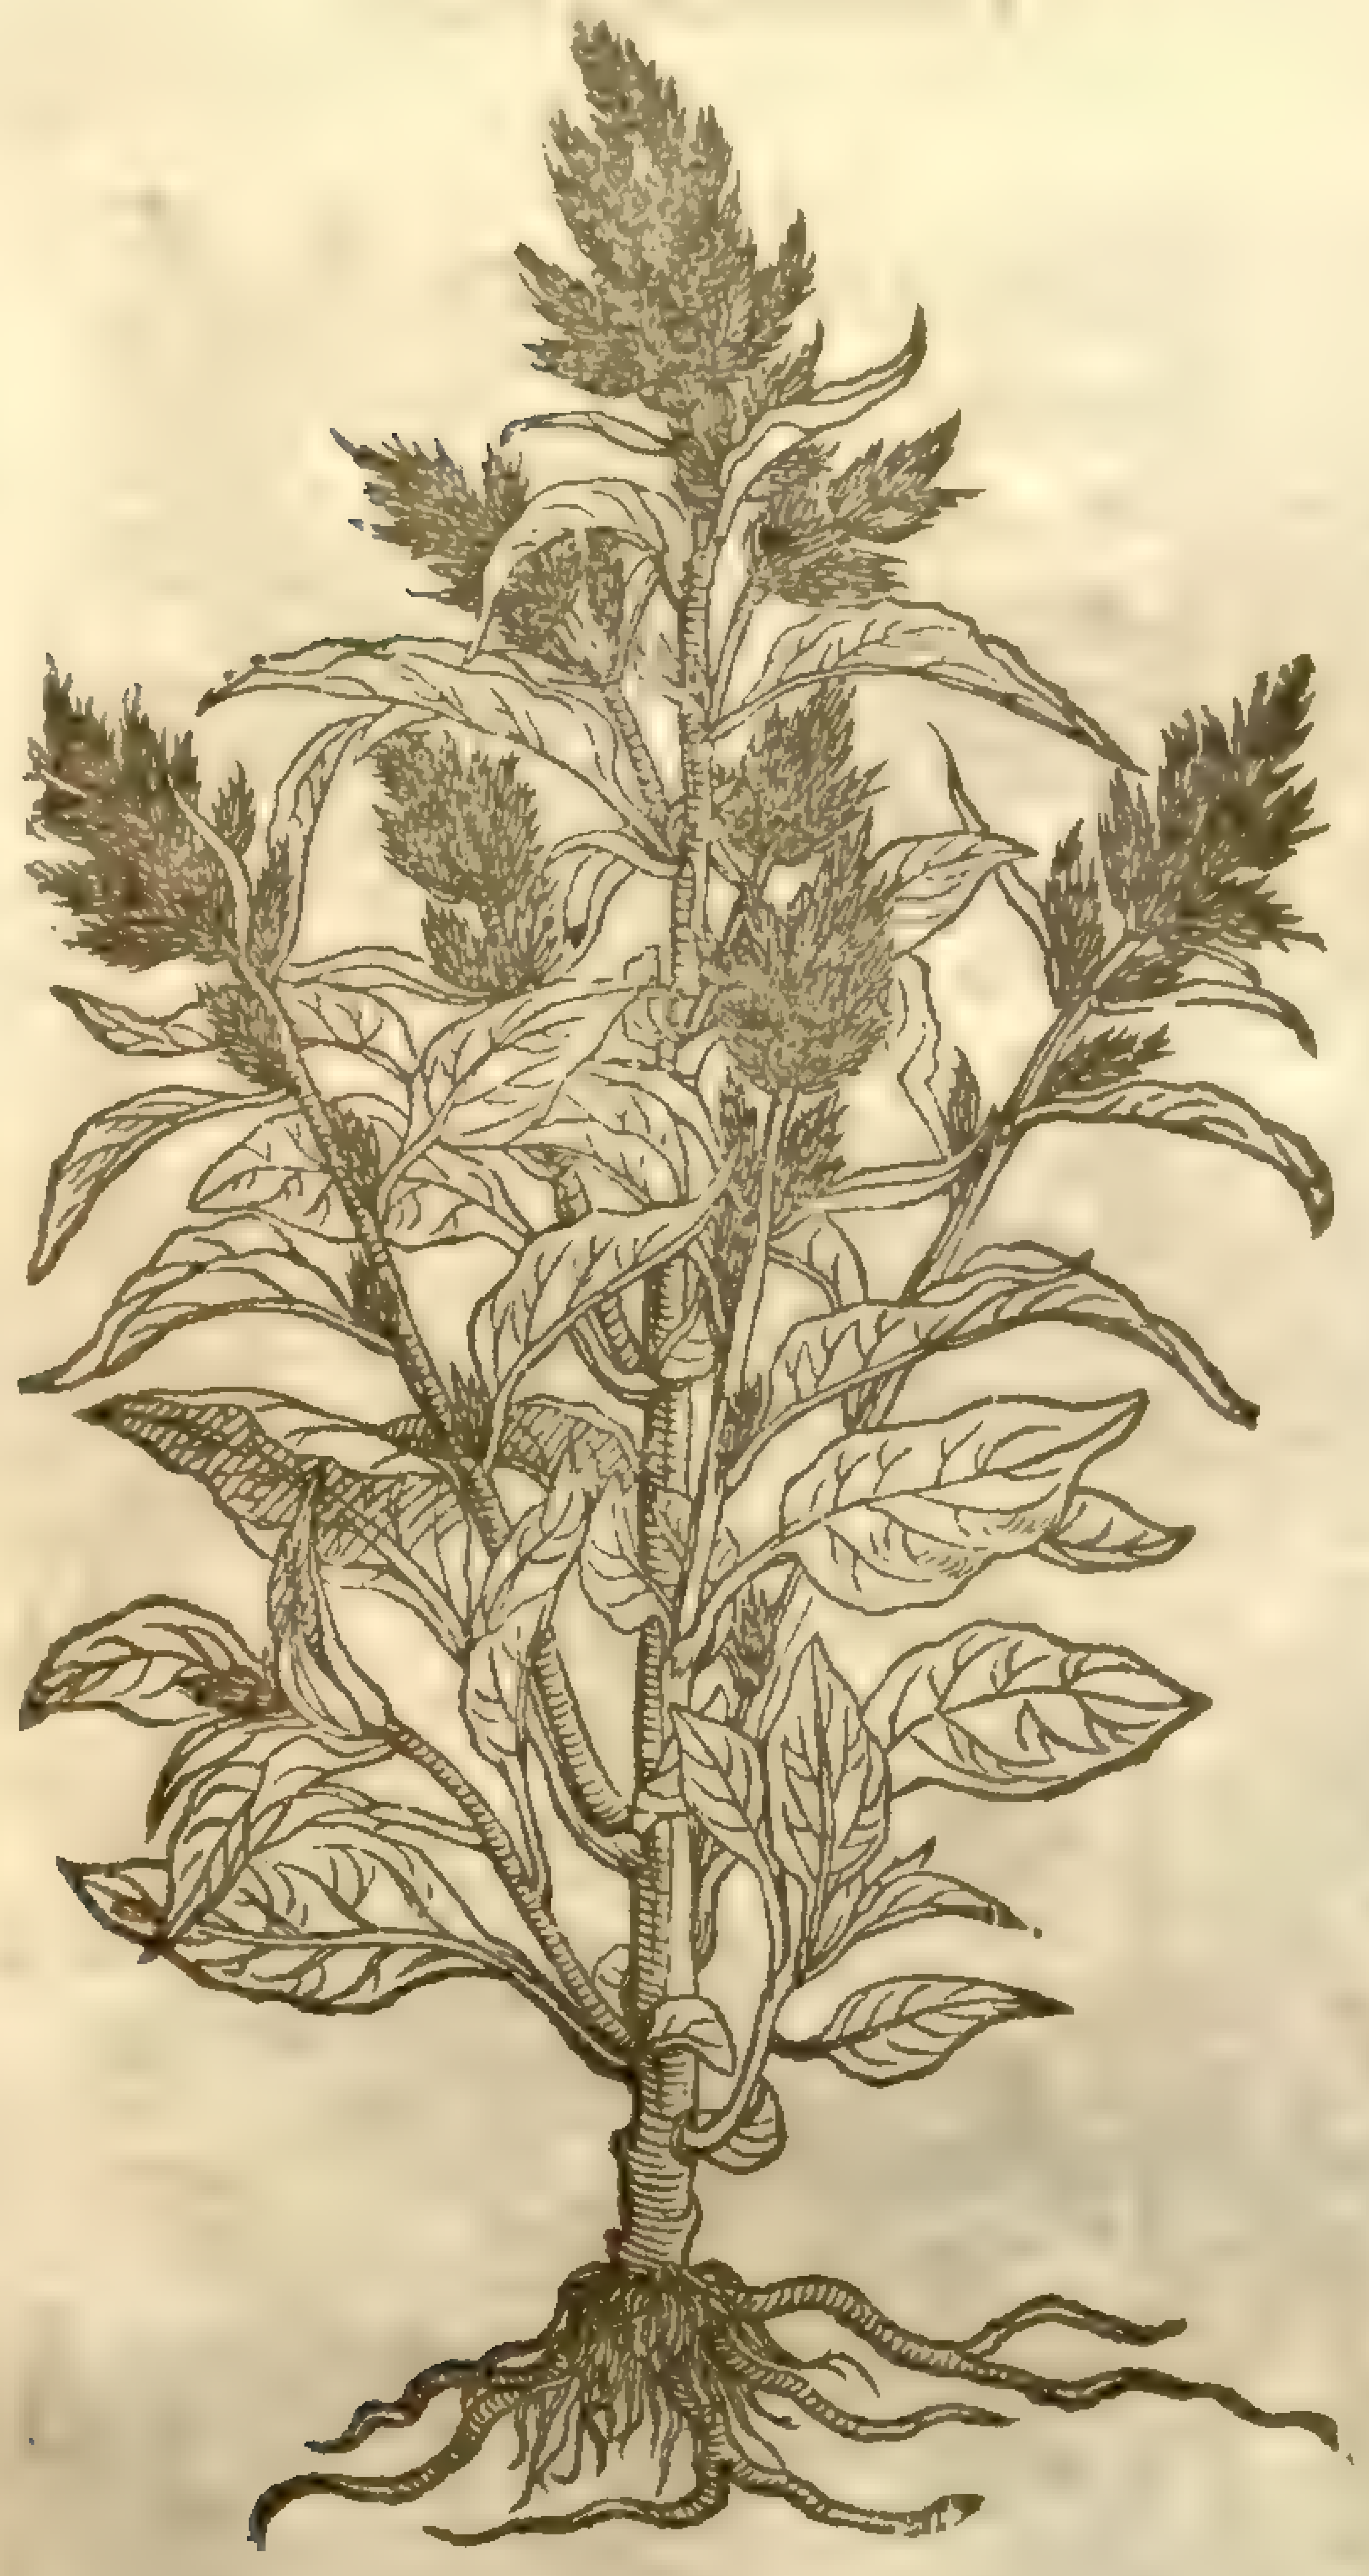
CHAP. 44. *Of Floure-Gentle.*

¶ *The Kindes.*

THere be diuers ſorts of Floure-gentle, differing in many points very notably, as in greatneſſe and ſmalneſſe; ſome purple, and others of a skarlet colour; and one aboue the reſt wherewith Nature hath ſeemed to delight her ſelfe, eſpecially in the leaues, which in variable colours ſtriues with the Parrats feathers for beauty.

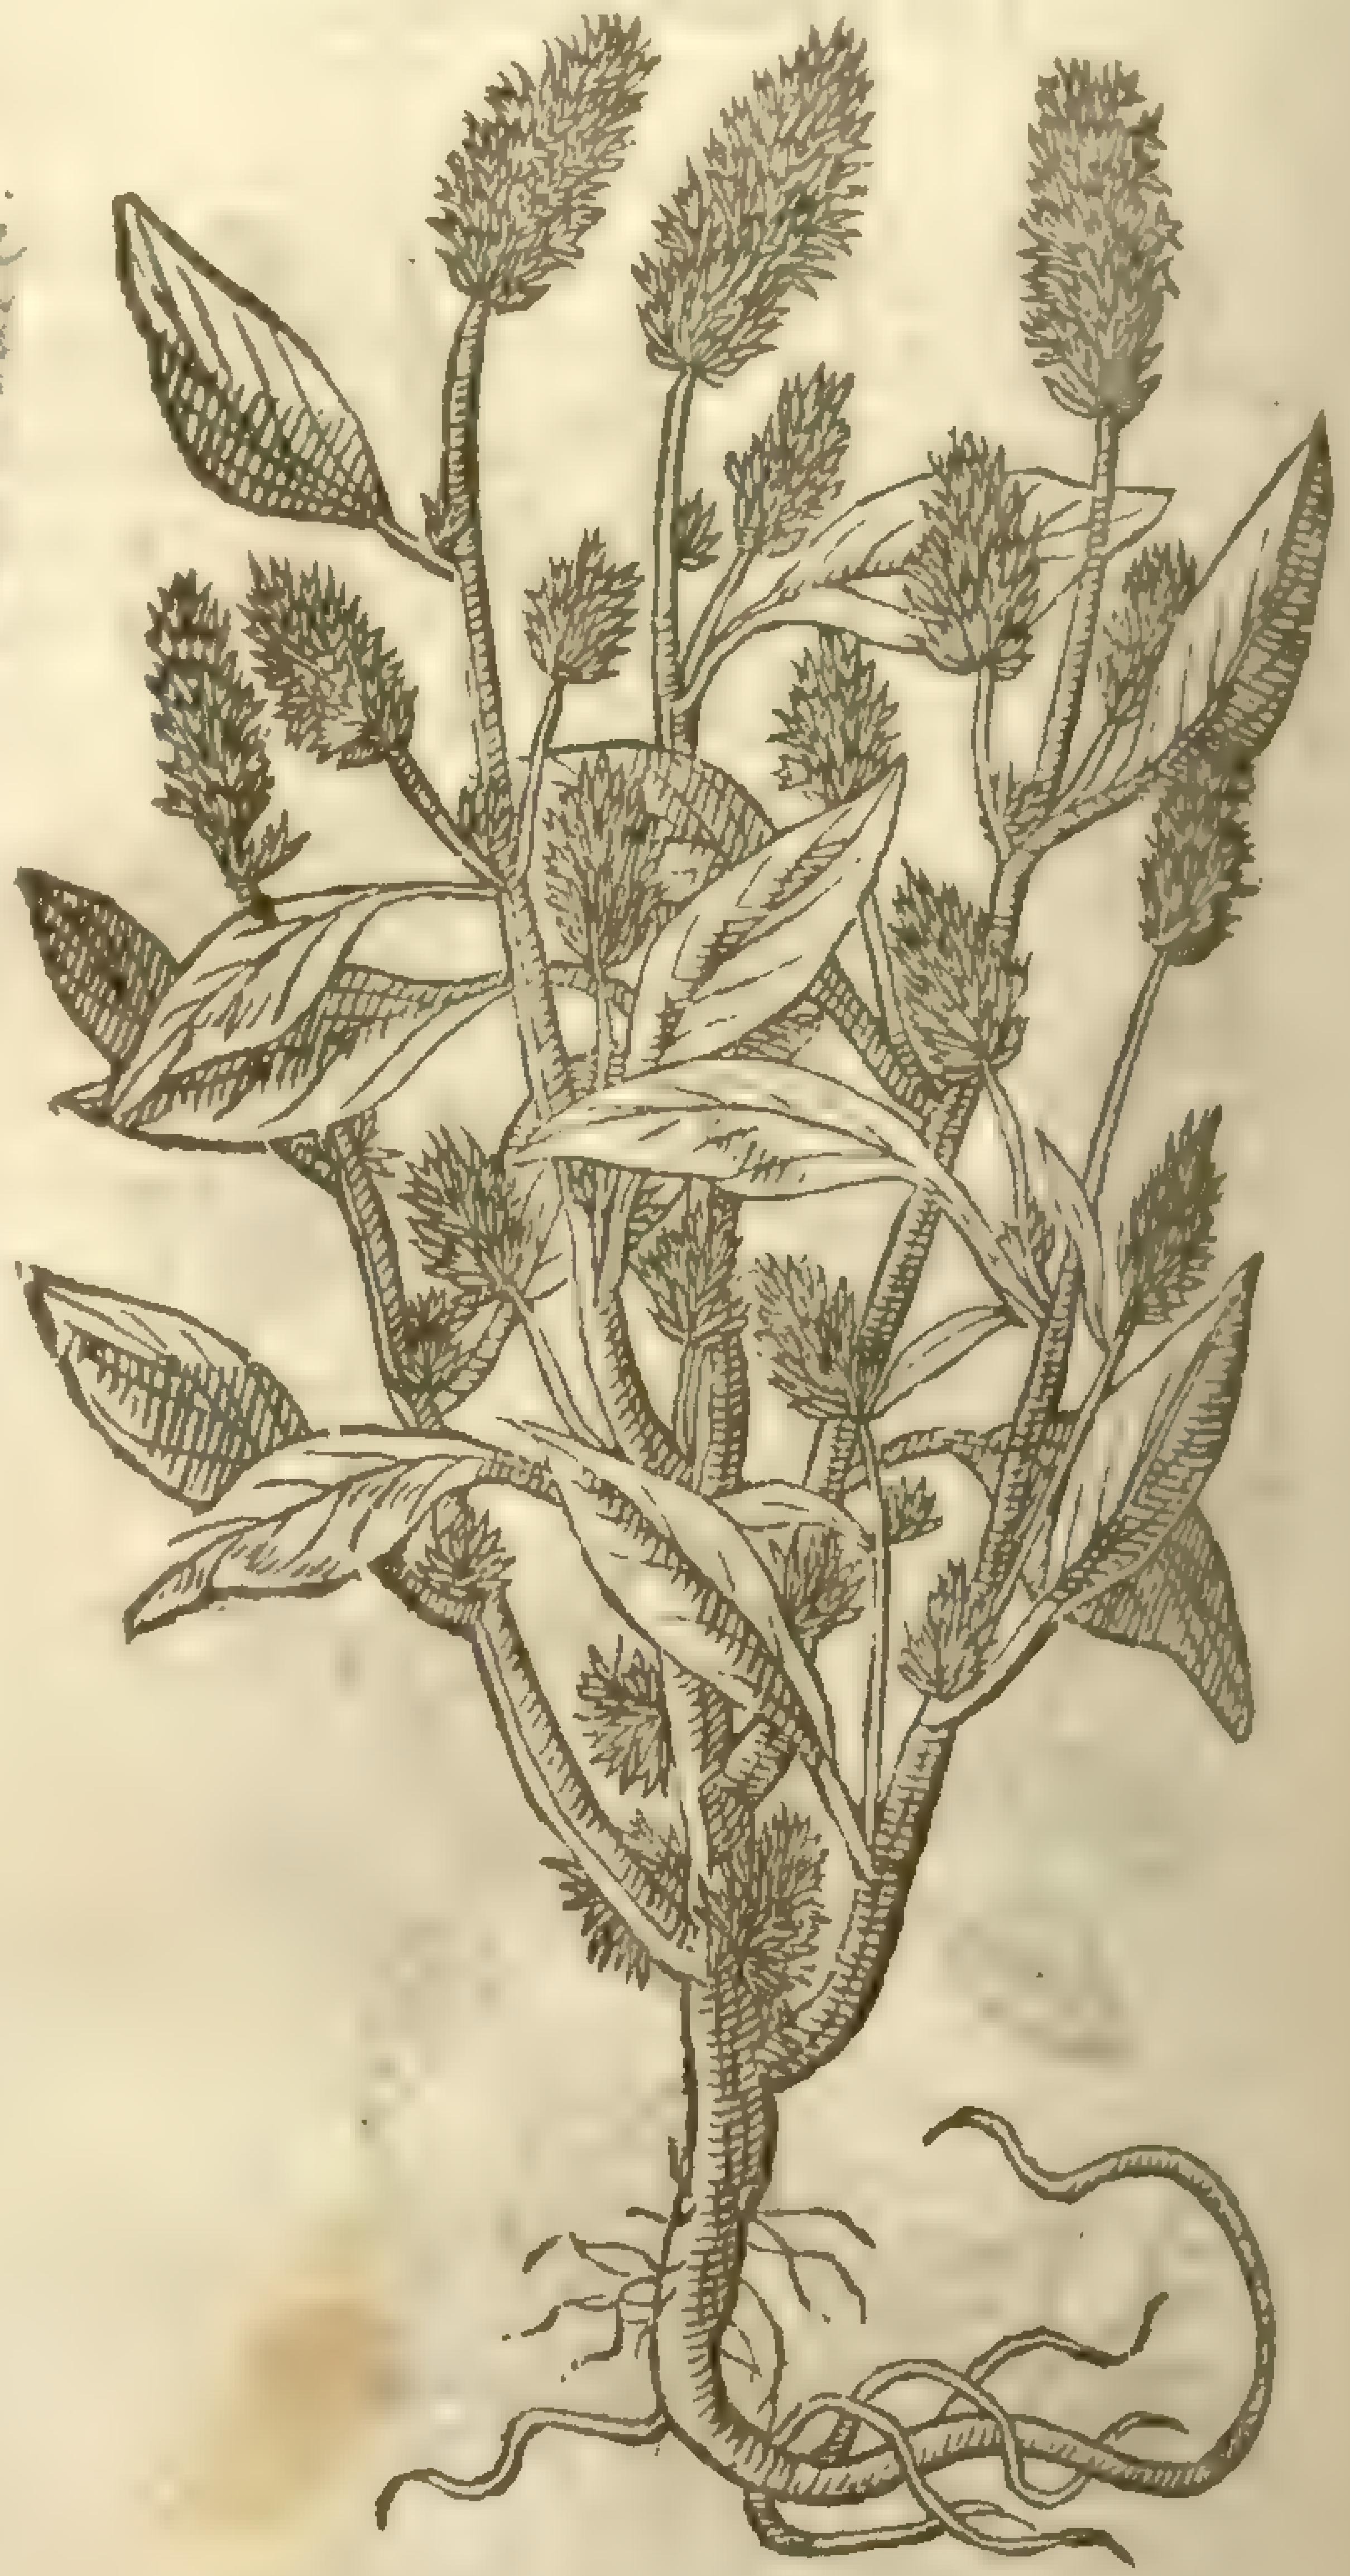
1 *Amaranthus purpureus.*
Purple Floure-Gentle.

Celosia castrensis, L.
[illegible]

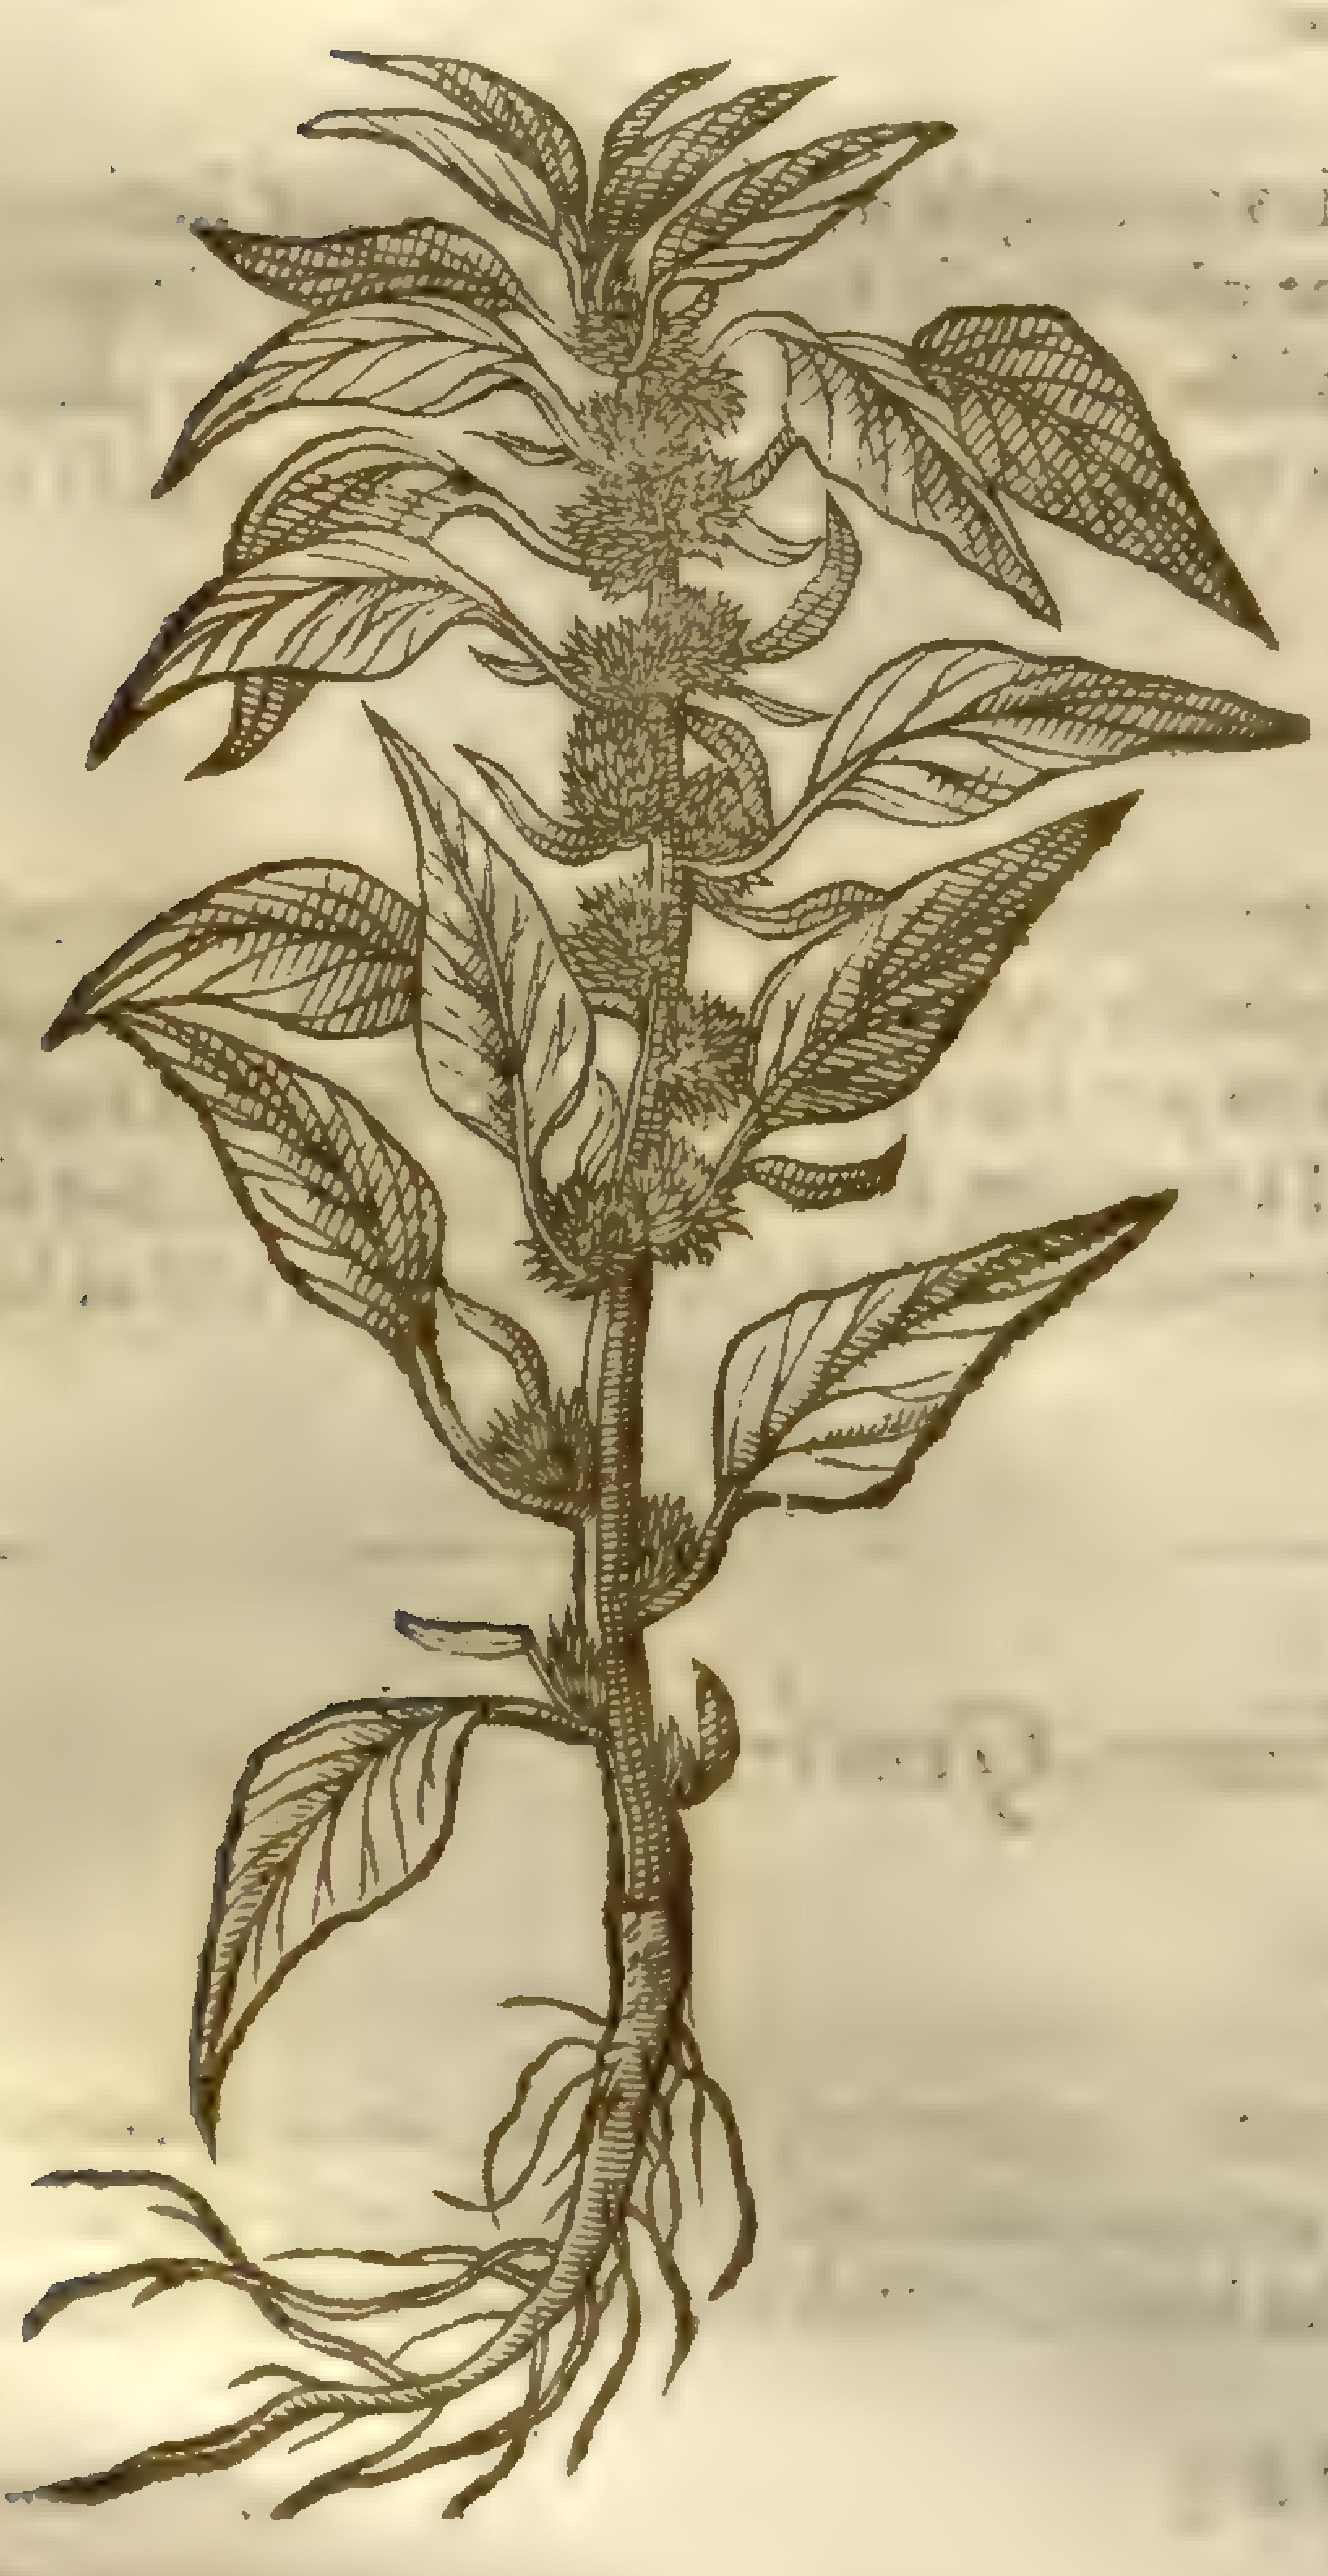


2 *Amaranthus Coccineus.*
Scarlet Floure-gentle.

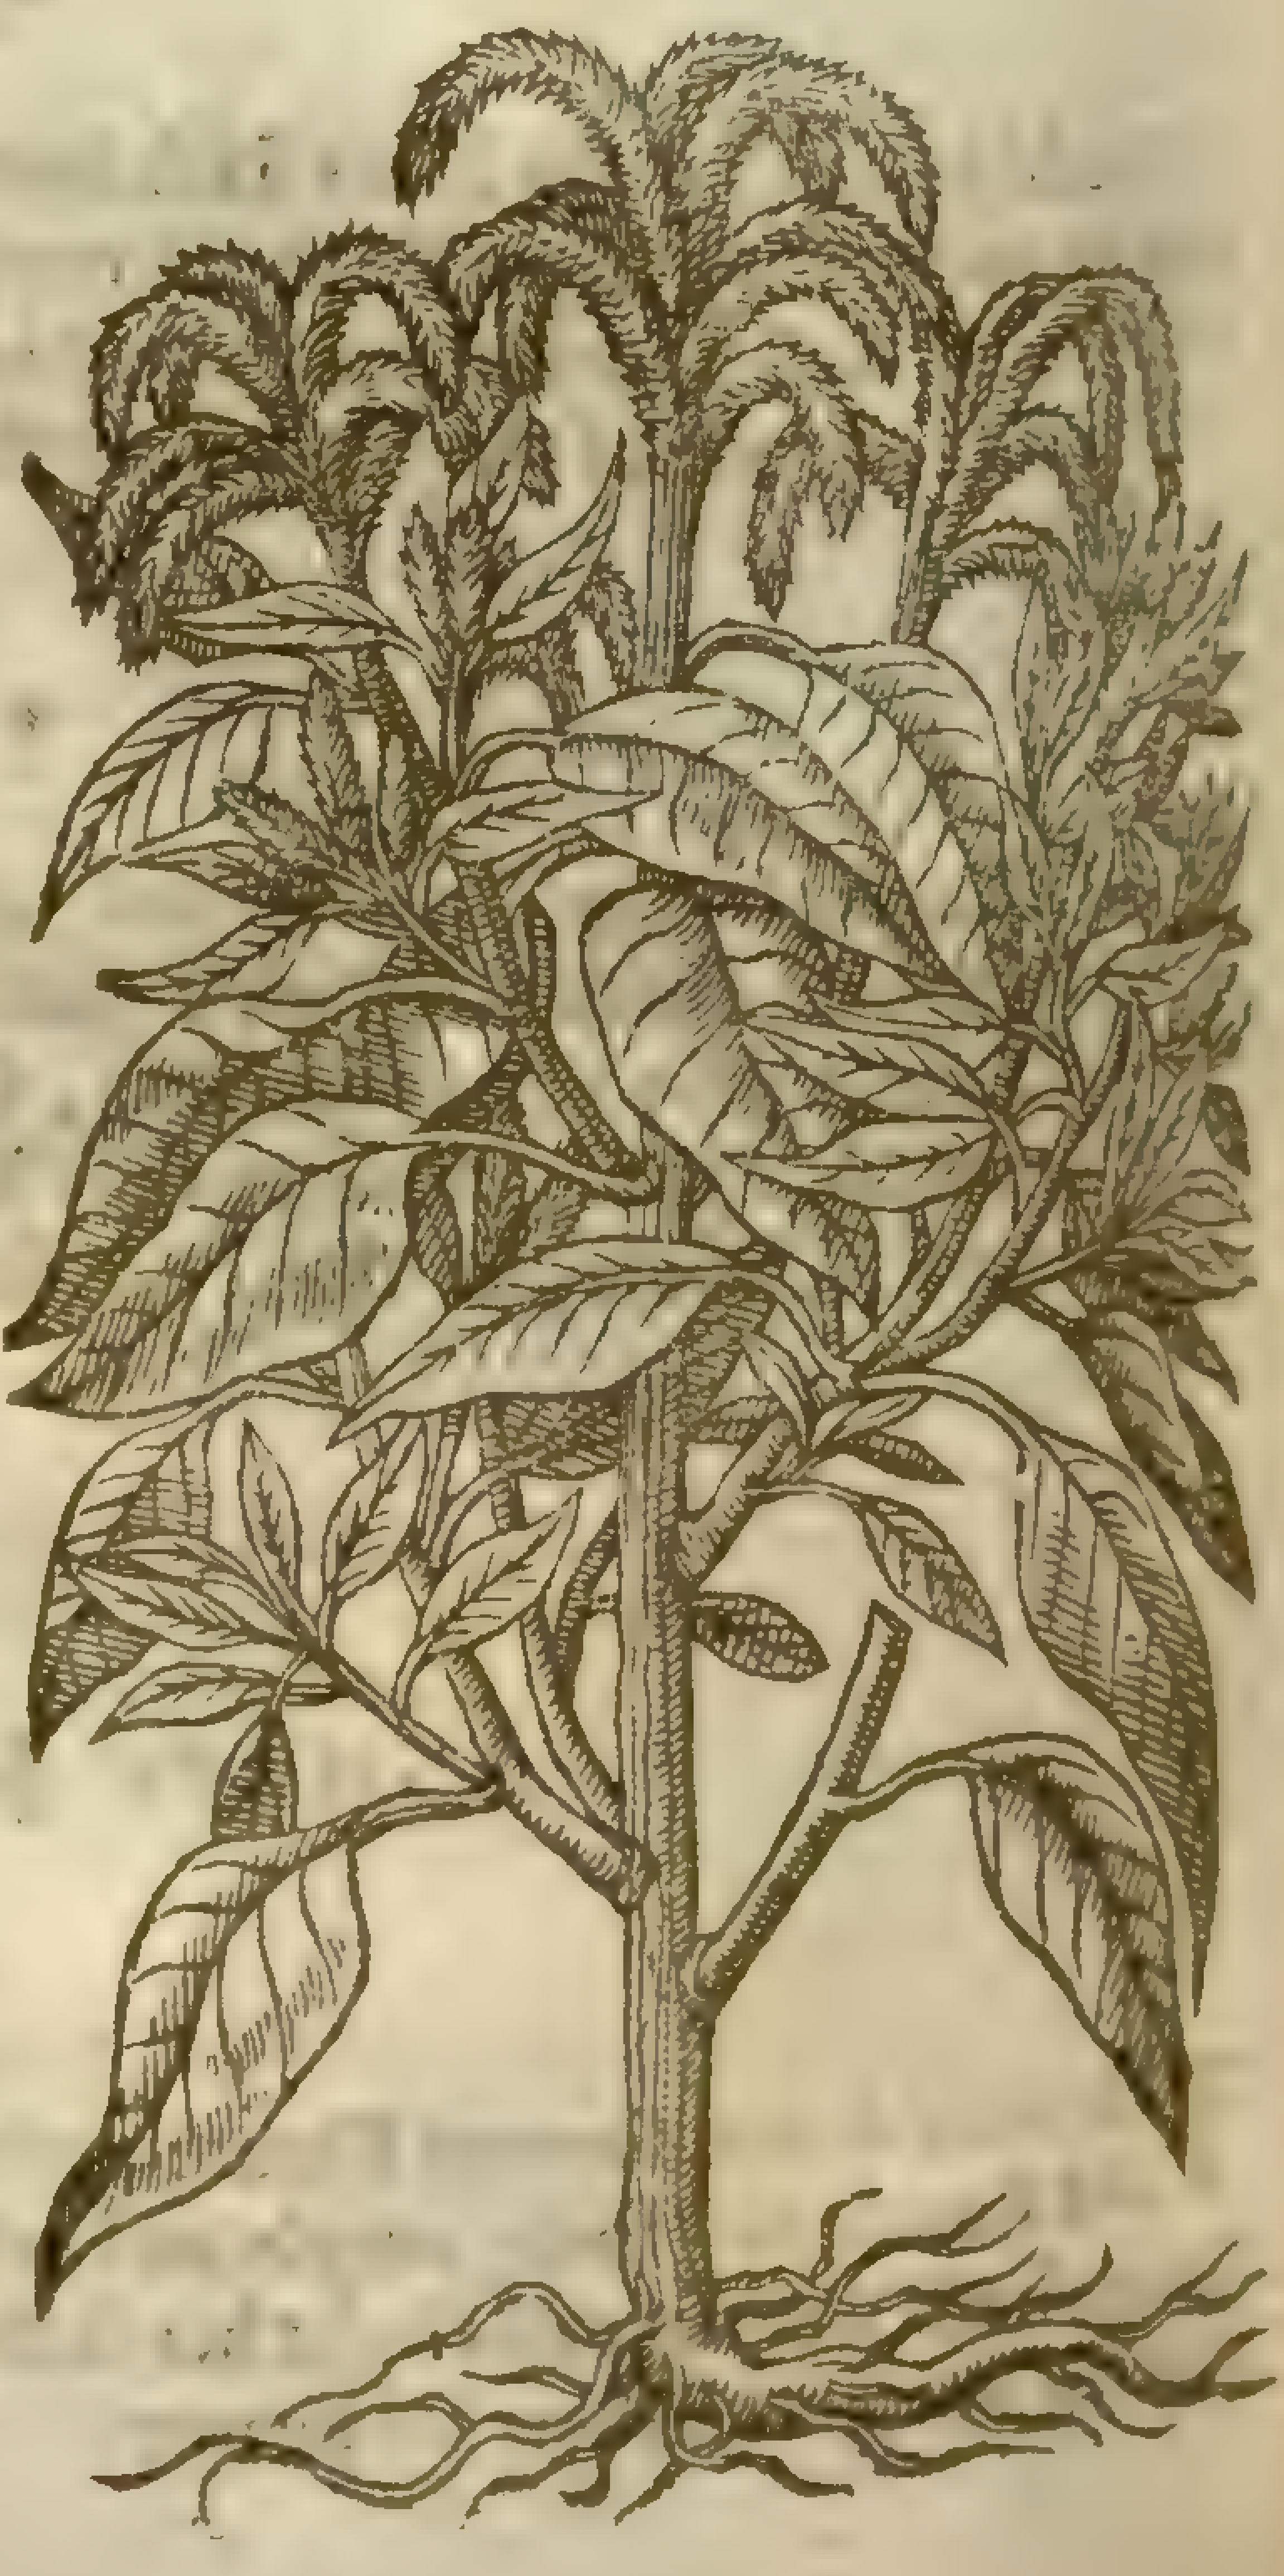
Celosia coccinea, L.
[illegible]



3 *Amaranthus tricolor.*
Floramor, and Paſſeuelours.



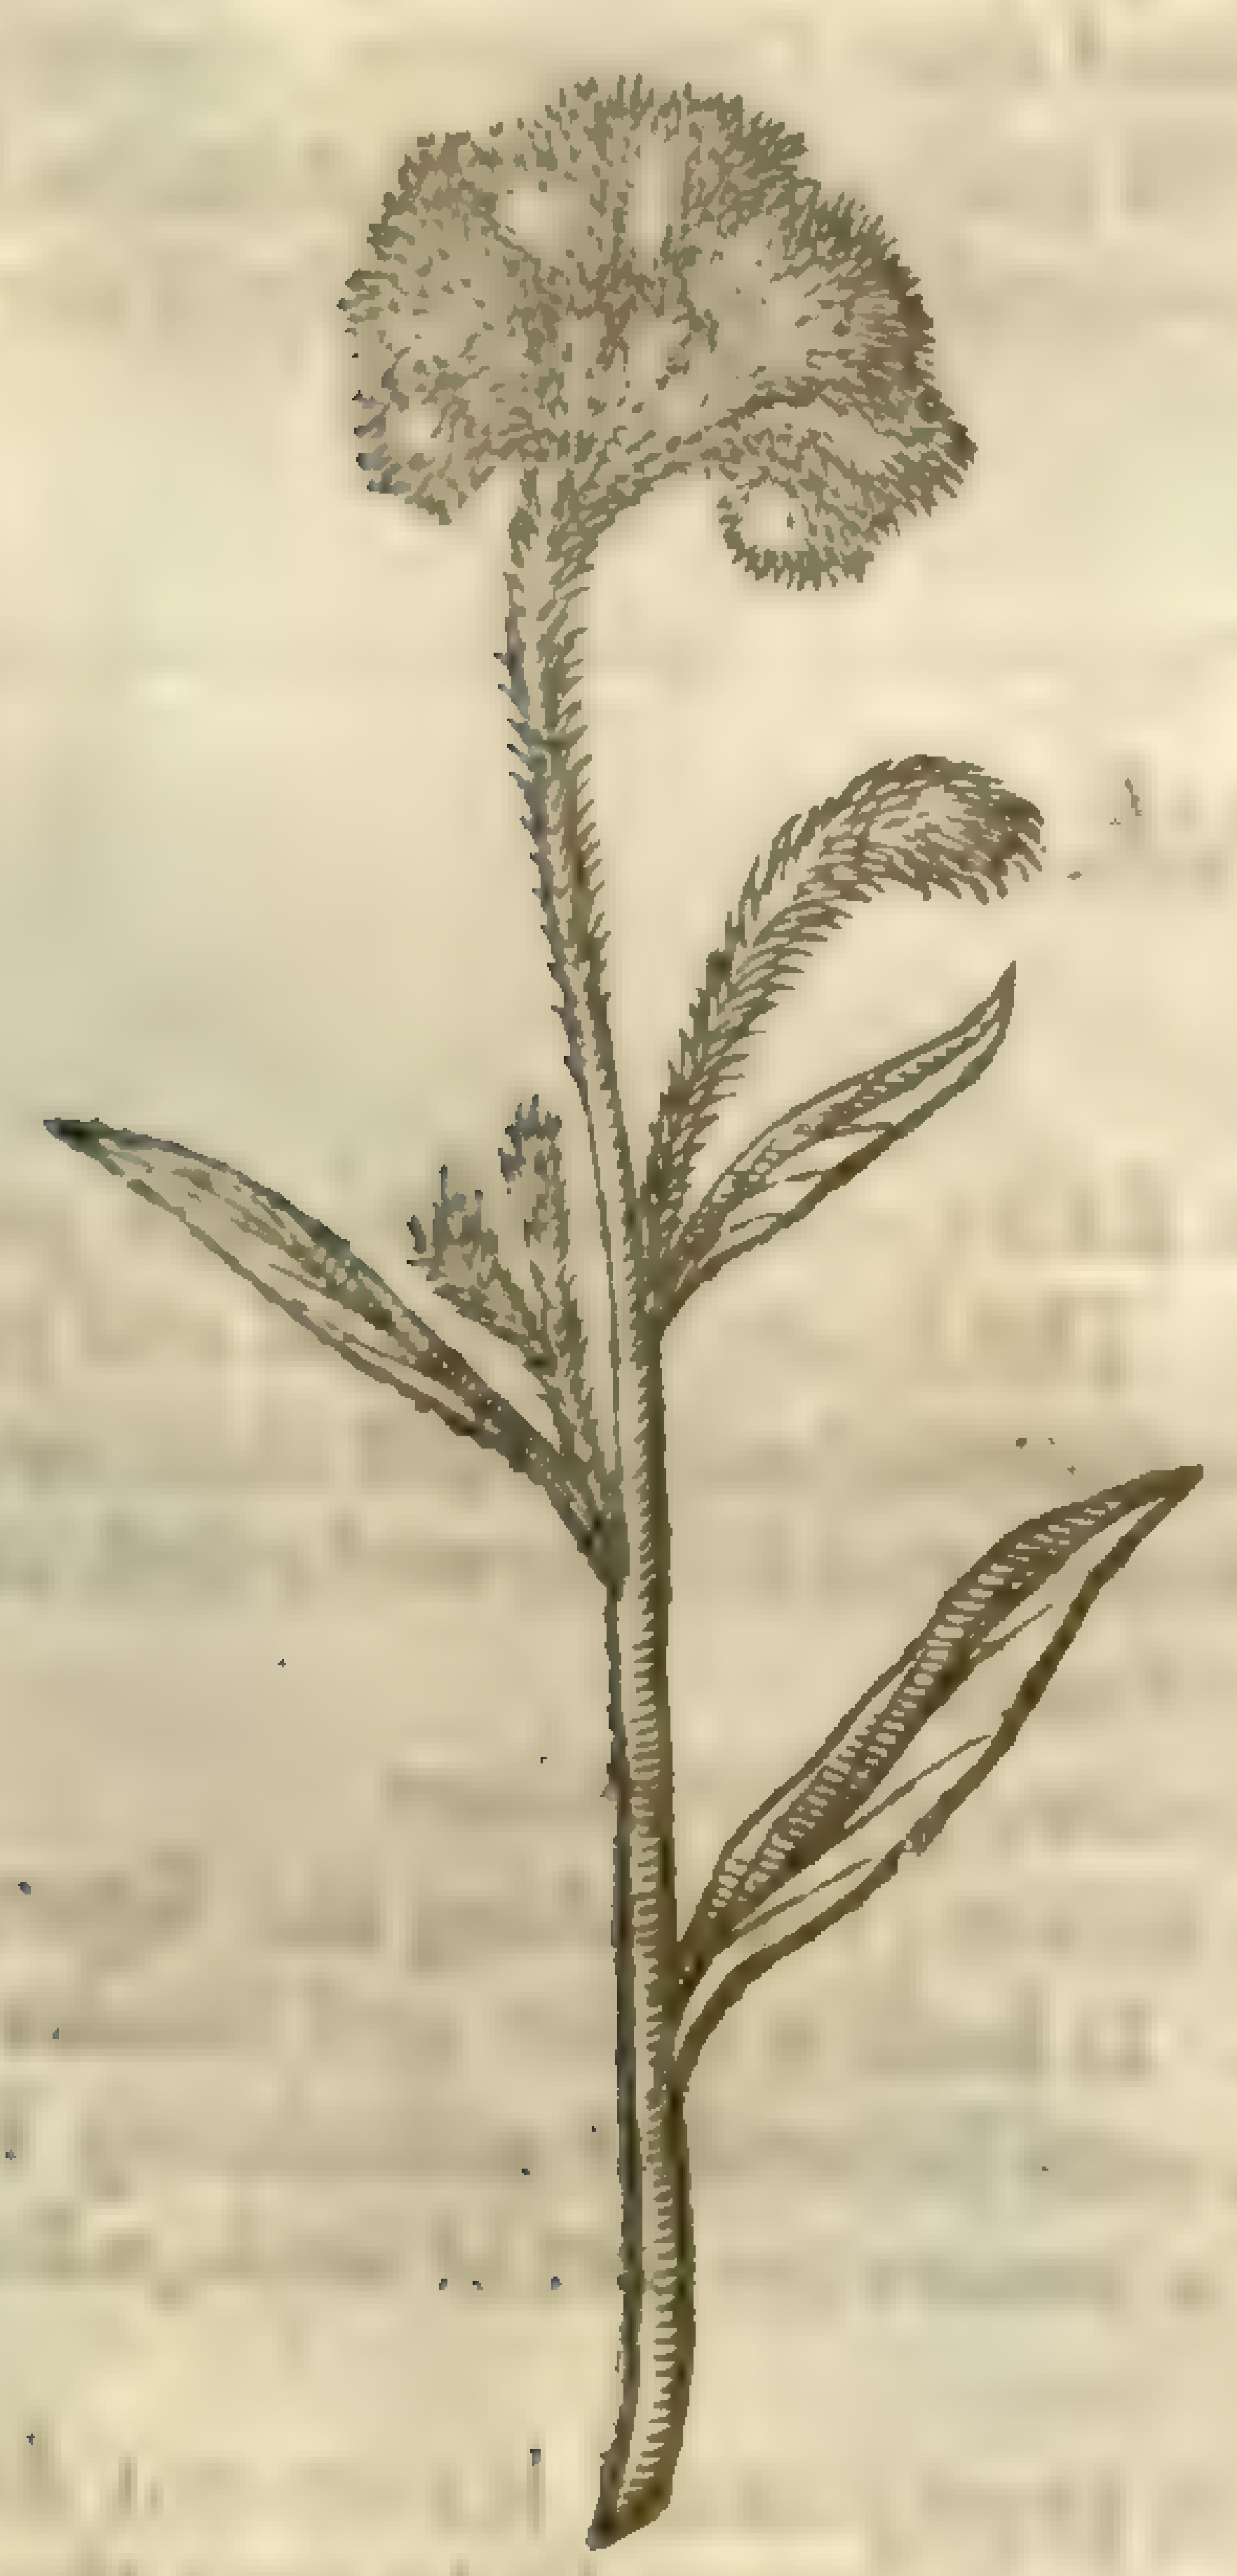
4 *Amaranthus Panniculaſparſa.*
Branched Floure-gentle.



¶ *The Deſcription.*

1 Purple Floure-gentle riſeth vp with a ſtalke a cubit high, and ſomtimes higher, ſtreaked or chamfered alongſt the ſame, often reddiſh toward the root, and very ſmooth; which diuides it ſelf toward the top into ſmal branches, about which ſtand long leaues, broad, ſharpe pointed, ſoft, ſlipperie, of a greene colour, and ſometimes tending to a reddiſh: in ſtead of floures come vp eares or ſpoky tufts, very braue to look vpon, but without ſmel, of a ſhining light purple, with a gloſſe like Veluet, but far paſſing it: which when they are bruiſed doe yeeld a juice almoſt of the ſame colour, and being gathered, doe keep their beauty a long time after; inſomuch that being ſet in water, it will reuiue again as at the time of his gathering, and remaineth ſo, many yeares; whereupon likewiſe it hath taken it's name. The ſeed ſtandeth in the ripe eares, of colour blacke, and much glittering: the root is ſhort and full of ſtrings.

‡ 5 *Amaranthus panicula incurva holoſerica.*
Veluet Floure-gentle.



2 The ſecond ſort of Floure-gentle hath leaues like vnto the former: the ſtalke is vpright, with a few ſmall ſlender leaues ſet vpon it: among which do grow ſmall cluſters of ſcaly floures, of an ouerworne ſcarlet colour: the ſeed is like the former.

3 It farre exceedeth my skill to deſcribe the beauty and excellencie of this rare plant called *Floramor*; and I thinke the penſil of the moſt curious painter will be at a ſtay, when he ſhall come to ſet it downe in his liuely colours. But to colour it after my beſt manner, this I ſay, *Floramor* hath a thicke knobby root, whereon do grow many thred-die ſtrings; from which riſeth a thicke ſtalke, but tender and ſoft, which beginneth to diuide it ſelfe into ſundry branches at the ground and ſo vpward, whereupon doth grow many leaues, wherein doth conſiſt his beauty: for in few words, euerie leafe reſembleth in colour the moſt faire and beautifull feather of a Parat eſpecially thoſe feathers that are mixed with moſt ſundry colours, as a ſtripe of red, and a line of yellow, a daſh of white, and a rib of green colour, which I cannot with words ſet forth; ſuch are the ſundry mixtures of colours that Nature hath beſtowed in her greateſt jolitie, vpon this floure. The floure doth grow betweene the footſtalks of thoſe leaues, and the body of the ſtalke or trunke, baſe, and of no moment in reſpect of the leaues, being as it were little chaffie husks of an onerworne tawny colour: the ſeed is black, and ſhining like burniſhed horne.

‡ I haue not ſeene this thus variegated as our Author mentions: but the leaues are commonly of three colours; the lower part or that next the ſtalke is greene; the middle red, and the end yellow; or elſe the end red, the middle yellow, & the bottom green. ‡

4 This plant hath a great many threds or ſtrings, of which his roots do conſiſt. From which riſe vp very thicke fat ſtalks creſted and ſtreaked, exceeding ſmooth, and of a ſhining red colour; which begin at the ground to diuide themſelues into branches, whereupon grow many great large leaues of a darke green colour tending to redneſſe, in ſhew like thoſe of the red Beet, ſtreaked and daſht here and there with red mixed with green. The flours grow alongſt the ſtalks, from the midſt thereof euen to the top in ſhape like *Panicum*, that is, a great number of chaffie confuſed ears thruſt hard together, of a deep purple colour. I can compare the ſhape thereof to nothing ſo fitly as to the veluet head of a ſtag, compact of ſuch ſoft matter as is the ſame: wherein is the ſeed, in colour white, round, and bored through the middle.

‡ 5 This in ſtalks and leaues is much like the purple Floure-gentle, but the heads are larger, bended round, and laced, or as it were wouen one with another, looking very beautifully like Crimſon veluet: this is ſeldome to be found with vs, but for the beauties ſake is kept in the *Gardens* of Italy, whereas the women eſteemed it not only for the comelineſſe and beautious *aſpect*,

but alſo for the efficacie thereof againſt the bloudy iſſues,and ſanious vlcers of the wombe and kidneyes, as the Authors of the *Aduerſaria* affirme. ‡

¶ *The Place and Time.*

Theſe pleaſant floures are ſowne in gardens, eſpecially for their great beautie.

They floure in Auguſt,and continue flouriſhing till the froſt ouertake them, at what time they periſh. But the Floramor would be ſowne in a bed of hot horſe-dung, with ſome earth ſtrewed thereon in the end of March, and ordered as we doe muske Melons, and the like.

¶ *The Names.*

This plant is called in Greeke Ἀμάραντος, becauſe it doth not wither and wax old : in Latine *Amaranthus purpureus* : in Dutch, **Samatbluomen** : in Italian, *Fior velluto* : in French, *Paſſe velours* : in Engliſh, floure Gentle,purple Veluet floure,Floramor ; and of ſome, floure Velure.

¶ *The Temperature and Vertues.*

Moſt attribute to floure Gentle a binding faculty, with a cold and dry temperature.

A It is reported they ſtop all kindes of bleeding ; which is not manifeſt by any apparant quality in them, except peraduenture by the colour onely that the red eares haue : for ſome are of opinion, that all red things ſtanch bleeding in any part of the body : becauſe ſome things,as *Bole armoniacke, ſanguis Draconis,terra Sigillata,* and ſuch like of red colour doe ſtop bloud : But *Galen, lib.* 2.& 4. *de ſimp. facult.* plainly ſheweth,that there can be no certainty gathered from the colours, touching the vertues of ſimple and compound medicines:wherefore they are ill perſuaded,that thinke the floure Gentle to ſtanch bleeding, to ſtop the laske or bloody flix, becauſe of the colour onely, if they had no other reaſon to induce them thereto.

Chap. 45. *Of Orach.*

¶ *The Deſcription.*

1 The Garden white Orach hath an high and vpright ſtalke, with broad ſharpe pointed leaues like thoſe of Blite, yet ſmoother and ſofter. The floures are ſmall and yellow, growing in cluſters:the ſeed round, and like a leafe couered with a thin skin, or filme, and groweth in cluſters.The root is wooddy and fibrous : the leaues and ſtalkes at the firſt are of a glittering gray colour,and ſprinkled as it were with a meale or floure.

2 This differs from the former,only in that it is of an ouerworne purple colour.

‡ 3 This might more fitly haue beene placed amongſt the Blites ; yet finding the figure here (though a contrary deſcription) I haue let it injoy the place. It hath a white and ſlender root, and it is ſomewhat like, yet leſſe than the Blite, with narrow leaues ſomewhat reſembling Baſill: it hath abundance of ſmall floures, which are ſucceeded by a numerous ſort of ſeeds, which are blacke and ſhining. ‡

4 There is a wilde kinde growing neere the ſea, which hath pretty broad leaues, cut deepely about the edges, ſharpe pointed, and couered ouer with a certaine mealineſſe, ſo that the whole plant as well leaues, as ſtalkes and floures, looke of an hoary or gray colour. The ſtalkes lye ſpred on the ſhore or Beach,whereas it vſually growes.

‡ 5 The common wilde Orach hath leaues vnequally ſinuated, or cut in ſomewhat after the manner of an oaken leafe, and commonly of an ouerworne grayiſh colour : the floures and ſeeds are much like thoſe of the garden but much leſſe.

6 This is like the laſt deſcribed, but the leaues are leſſer and not ſo much diuided, the ſeeds grow alſo in the ſame manner as thoſe of the precedent.

7 This alſo in the face and manner of growing is like thoſe already deſcribed, but the leaues are long and narrow, ſometimes a little notched : and from the ſhape of the leafe *Lobel* called it, *Atriplex Syluestris polygoni, aut Helxines folia.*

8 This elegant Orach hath a ſingle and ſmall root, putting forth a few fibres, the ſtalkes are ſome foot high, diuided into many branches, and lying along vpon the ground ; and vpon theſe grow leaues at certaine ſpaces whitiſh and vnequally diuided, ſomewhat after the manner of the wilde Orach ; about the ſtalke or ſetting on of the leaues grow as it were little berries, ſomewhat like a little mulberry,and when theſe come to ripeneſſe,they are of an elegant red colour,and make a fine ſhew. The ſeed is ſmall, round, and aſhcoloured. ‡

¶ *The Place.*

The Garden Oraches grow in moſt gardens. The wilde Oraches grow neere path-wayes and ditch ſides ; but moſt commonly about dung-hils and ſuch fat places. Sea Orach I haue found at Queeneborough, as alſo at Margate in the Iſle of Thanet : and in moſt places about the ſea ſide. ‡The eighth groweth only in ſome choiſe gardens: I haue ſeen it diuers times with Mr *Parkinſon.* ‡

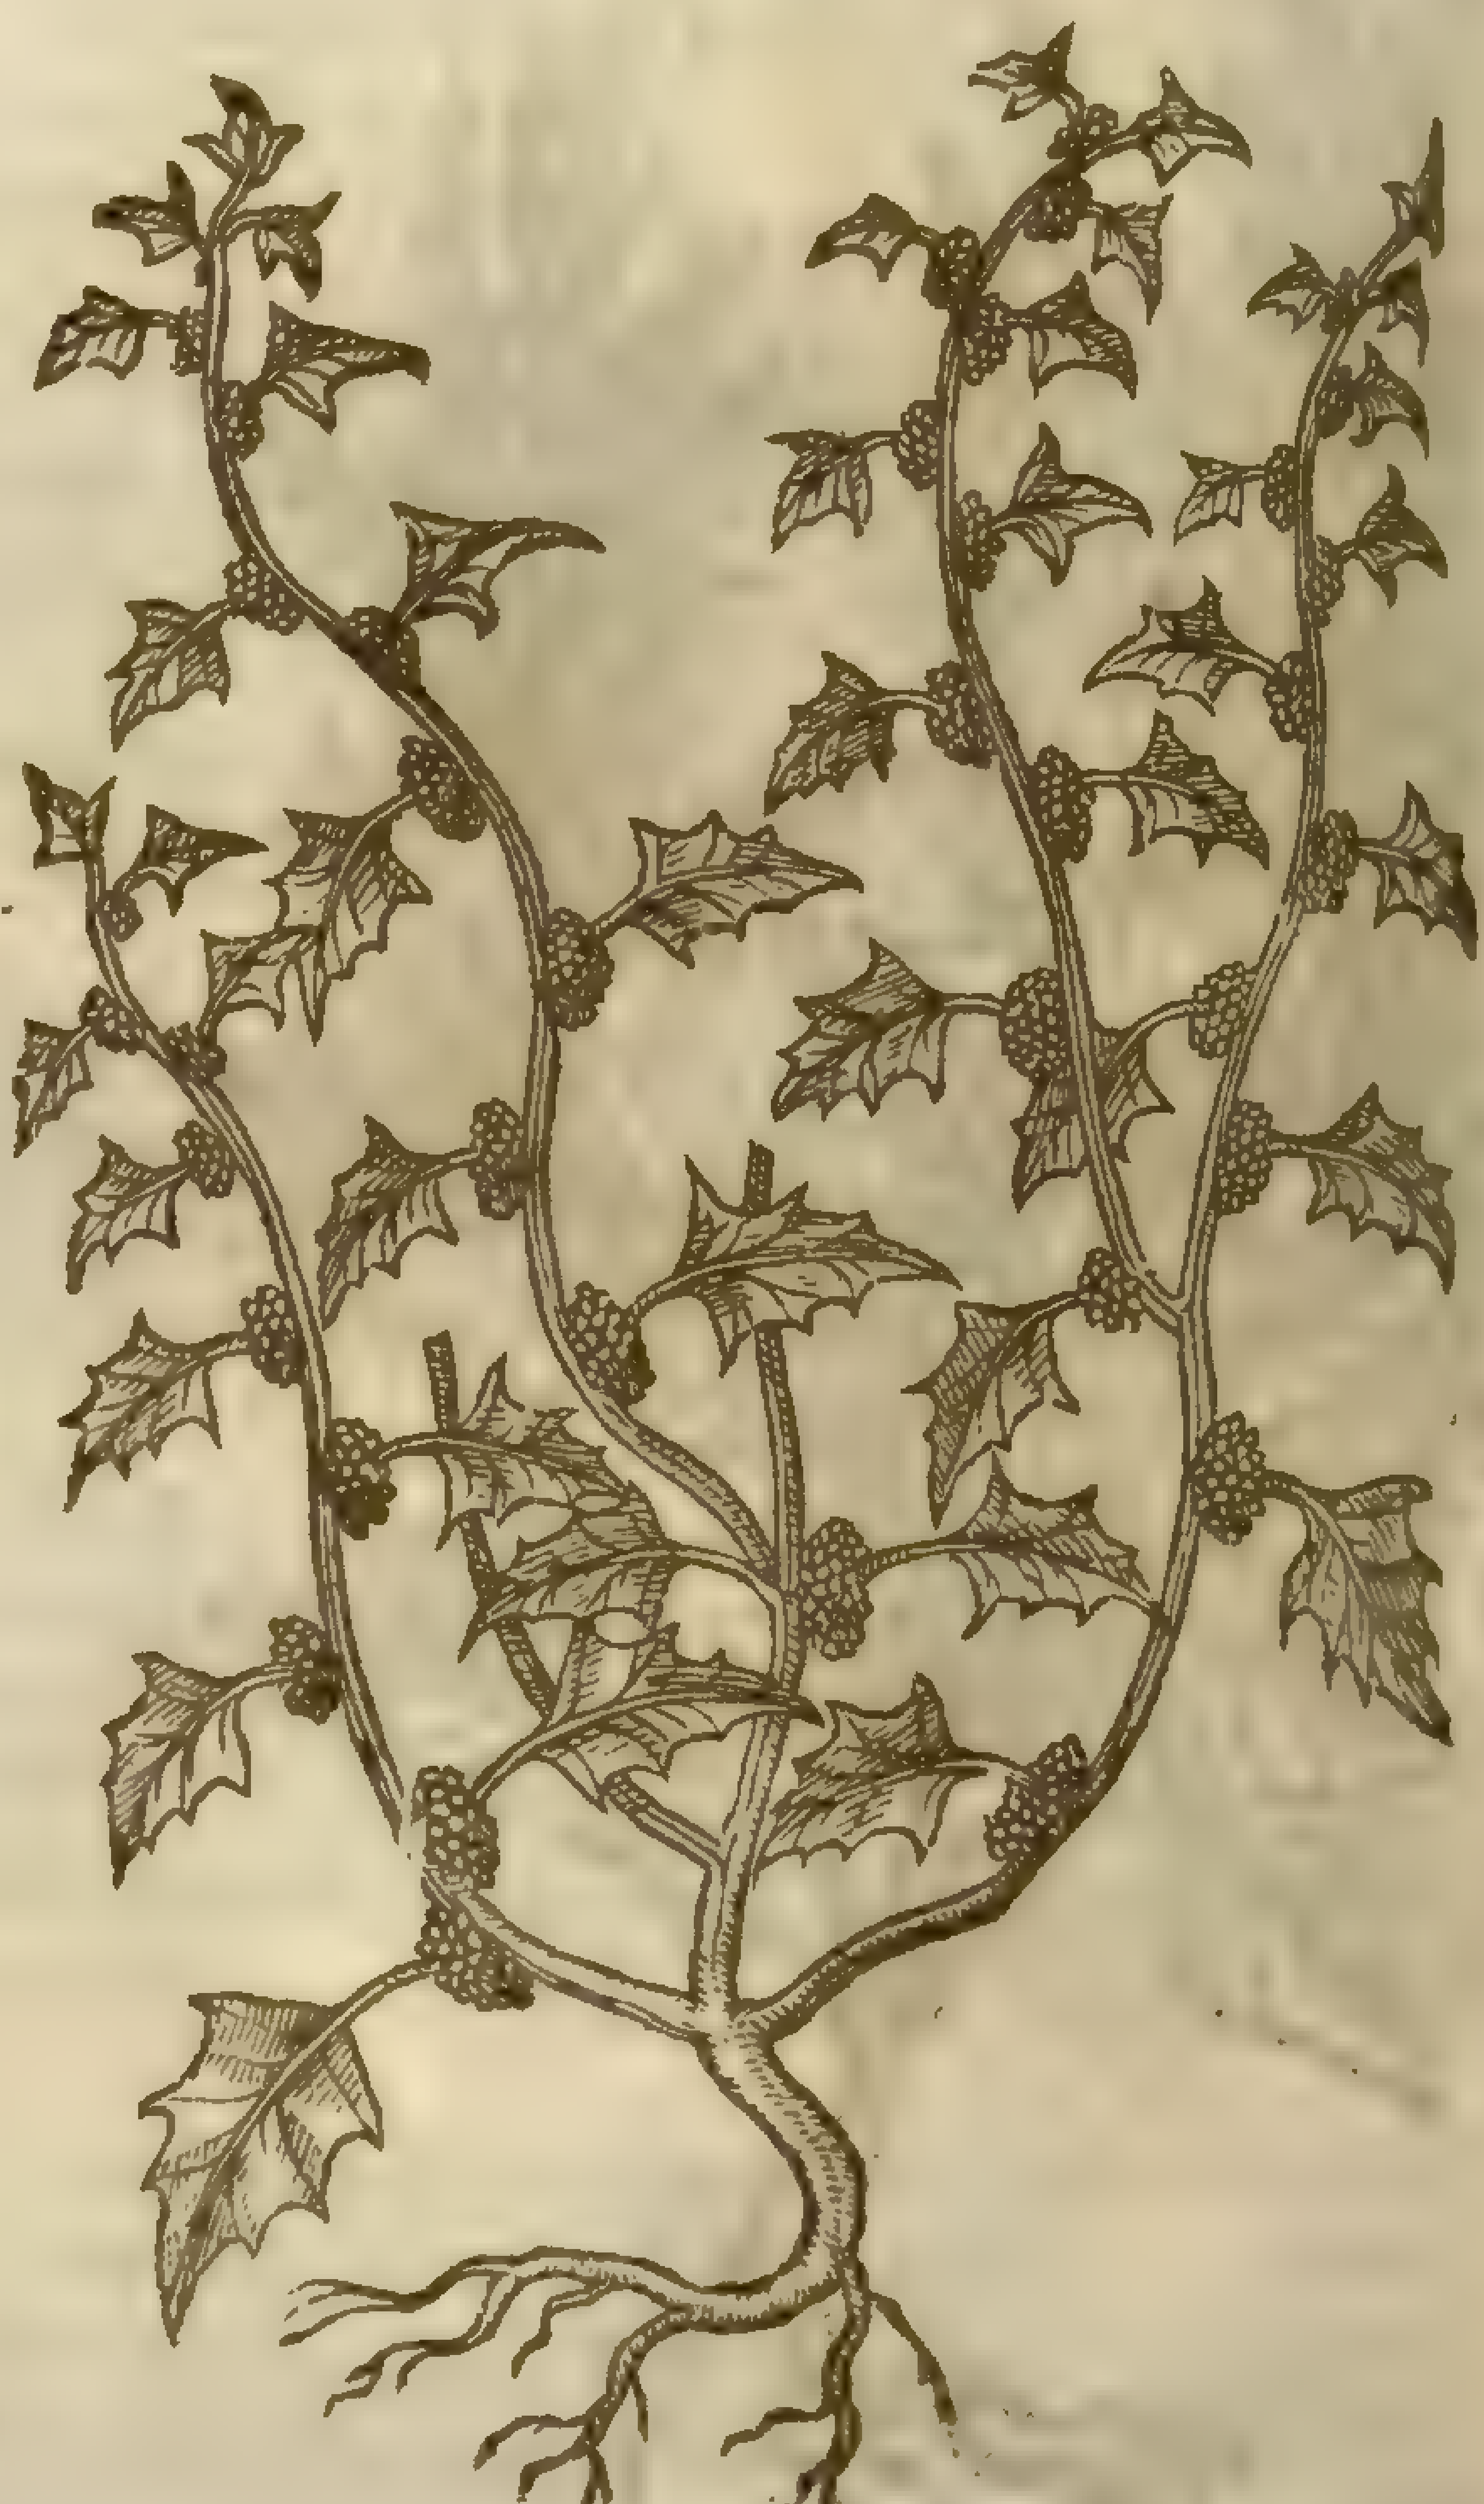
Berry-bearing Orach.



Blitum capitatum, L.

¶ The Time.

They floure and ſeed from Iune to the end of Auguſt.

¶ The Names.

Garden Orach is called in Greeke, ἀτράφαξυς: in Latine, *Atriplex*, and *Aureum Olus*: in Dutch, **Melde**: in French, *Arrouches ou bonnes dames*: in Engliſh, Orach, and Orage: in the Bohemian tongue, *Leboda*: *Pliny* hath made ſome difference between *Atriplex* and *Chryſolachanum* as though they differed one from another; for of *Atriplex* he writeth in his twentieth booke; and of *Chryſolachanum* in his twenty eighth booke, and 8. chapter: where he writeth thus, *Chryſolachanum*, ſaith he, groweth in Pinetum like Lettuce: it healeth cut ſinewes if it be forthwith applied.

3 This wilde Orach hath been called of *Lobel*, *Polyſpermon Caſſani Baſſi*, or All ſeed.

¶ The Temperature.

Orach, ſaith *Galen*, is of temperature moiſt in the ſecond degree, and cold in the firſt.

¶ The Vertues.

Dioſcorides writeth, That the garden Orach is both moiſt and cold, and that it is eaten boiled as other ſallad herbes are, and that it ſofteneth and looſeth the belly. A

It conſumeth away the ſwellings of the throat, whether it be laid on raw or ſodden. B

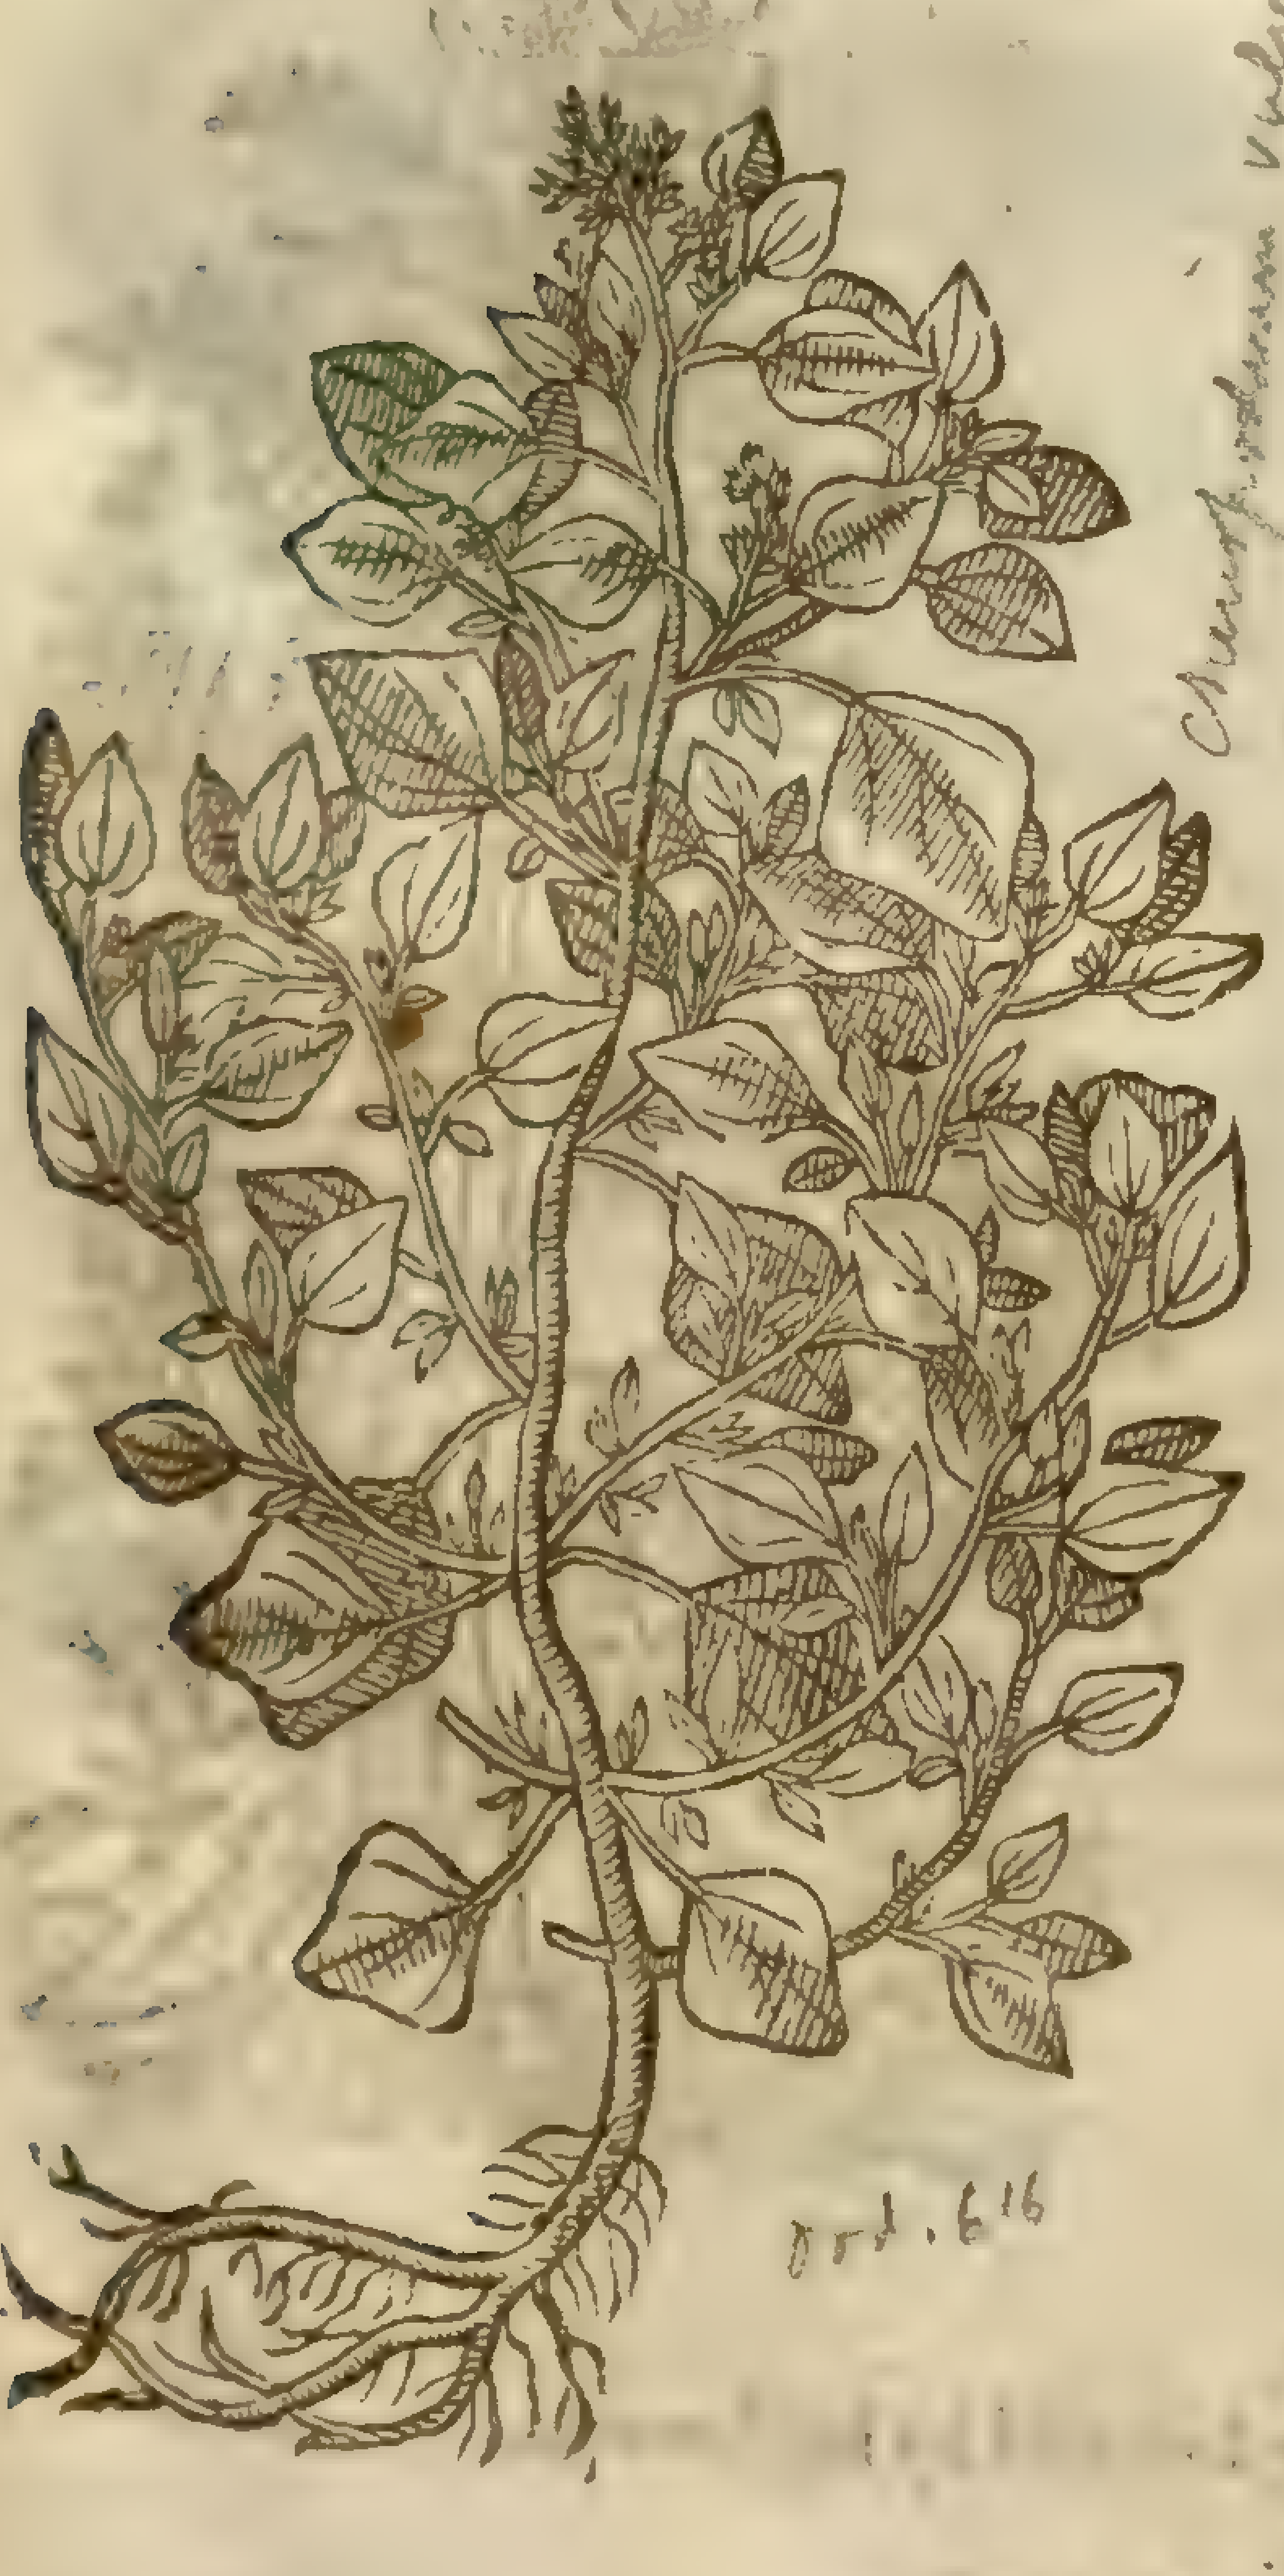
The ſeed being drunken with mead or honied water, is a remedy againſt the yellow jaundiſe. C

Galen thinketh, that for that cauſe it hath a clenſing quality, and may open the ſtoppings of the liuer. D

† The figure which was in the ſecond place was of *Pes Anſerinus*. 2. of *Taber*. The figure in the fourth place was of the wilde Orach, that I haue deſcribed in the 6th place.

Chap. 46. *Of ſtinking Orach.*

Atriplex olida.
Stinking Orach.



Chenopodium Vulvaria
Mill. dict.
Sm. fl. 2. 14

Erl. 616

¶ The Deſcription.

Stinking Orach growes flat vpon the ground and is a baſe and low plant with many weake and feeble branches, whereupon doe grow ſmall leaues of a grayiſh colour, ſprinckled ouer with a certaine kind of duſty mealineſſe, in ſhape like the leaues of Baſill: amongſt which leaues here and there confuſedly be the ſeeds diſperſed, as it were nothing but duſt and aſhes. The whole plant is of a moſt loathſome ſauour or ſmell; vpon which plant if any ſhould chance to reſt and ſleepe, hee might very well report to his friends, that he had repoſed himſelfe among the chiefe of *Scoggins* heires.

¶ The Place.

It groweth vpon dunghils, and in the moſt filthy places that may bee found, as alſo about the common piſſing places of great princes and Noblemens houſes. Sometime it is found in places neere Bricke kilns and old walls, which doth ſomwhat alter his ſmell, which is like toſted cheeſe: but that which groweth in his natural place ſmels like ſtinking ſalt-fiſh, whereof it tooke his name *Garoſmus*.

¶ The Time.

It is an hearbe for a yeare, which ſpringeth vp, and when the ſeed is ripe it periſheth, and recouereth it ſelfe againe of his owne ſeed; ſo that if it be gotten into a ground, it cannot bee deſtroyed.

¶ The Names.

Stinking Orach is called of *Cordus*, *Garoſmus*, becauſe it ſmelleth like ſtinking fiſh: it is likewiſe called *Tragium Germanicum*, and *Atriplex fœtida garum olens*, by *Pena* and *Lobel*: for it ſmelleth more ſtinking than the rammiſh male Goat: whereupon ſome by a figure haue called it *Vulvaria*: and it may be called in Engliſh, ſtinking Mother-wort.

¶ *The Nature and Vertues.*

There hath bin nothing ſet downe by the Antients, either of his nature or vertues, notwithſtanding it is thought profitable, by reaſon of his ſtinking ſmell, for ſuch as are troubled with the mother: for as *Hippocrates* ſaith, when the mother doth ſtifle or ſtrangle, ſuch things are to be applied vnto the noſe as haue a ranke and ſtinking ſmell.

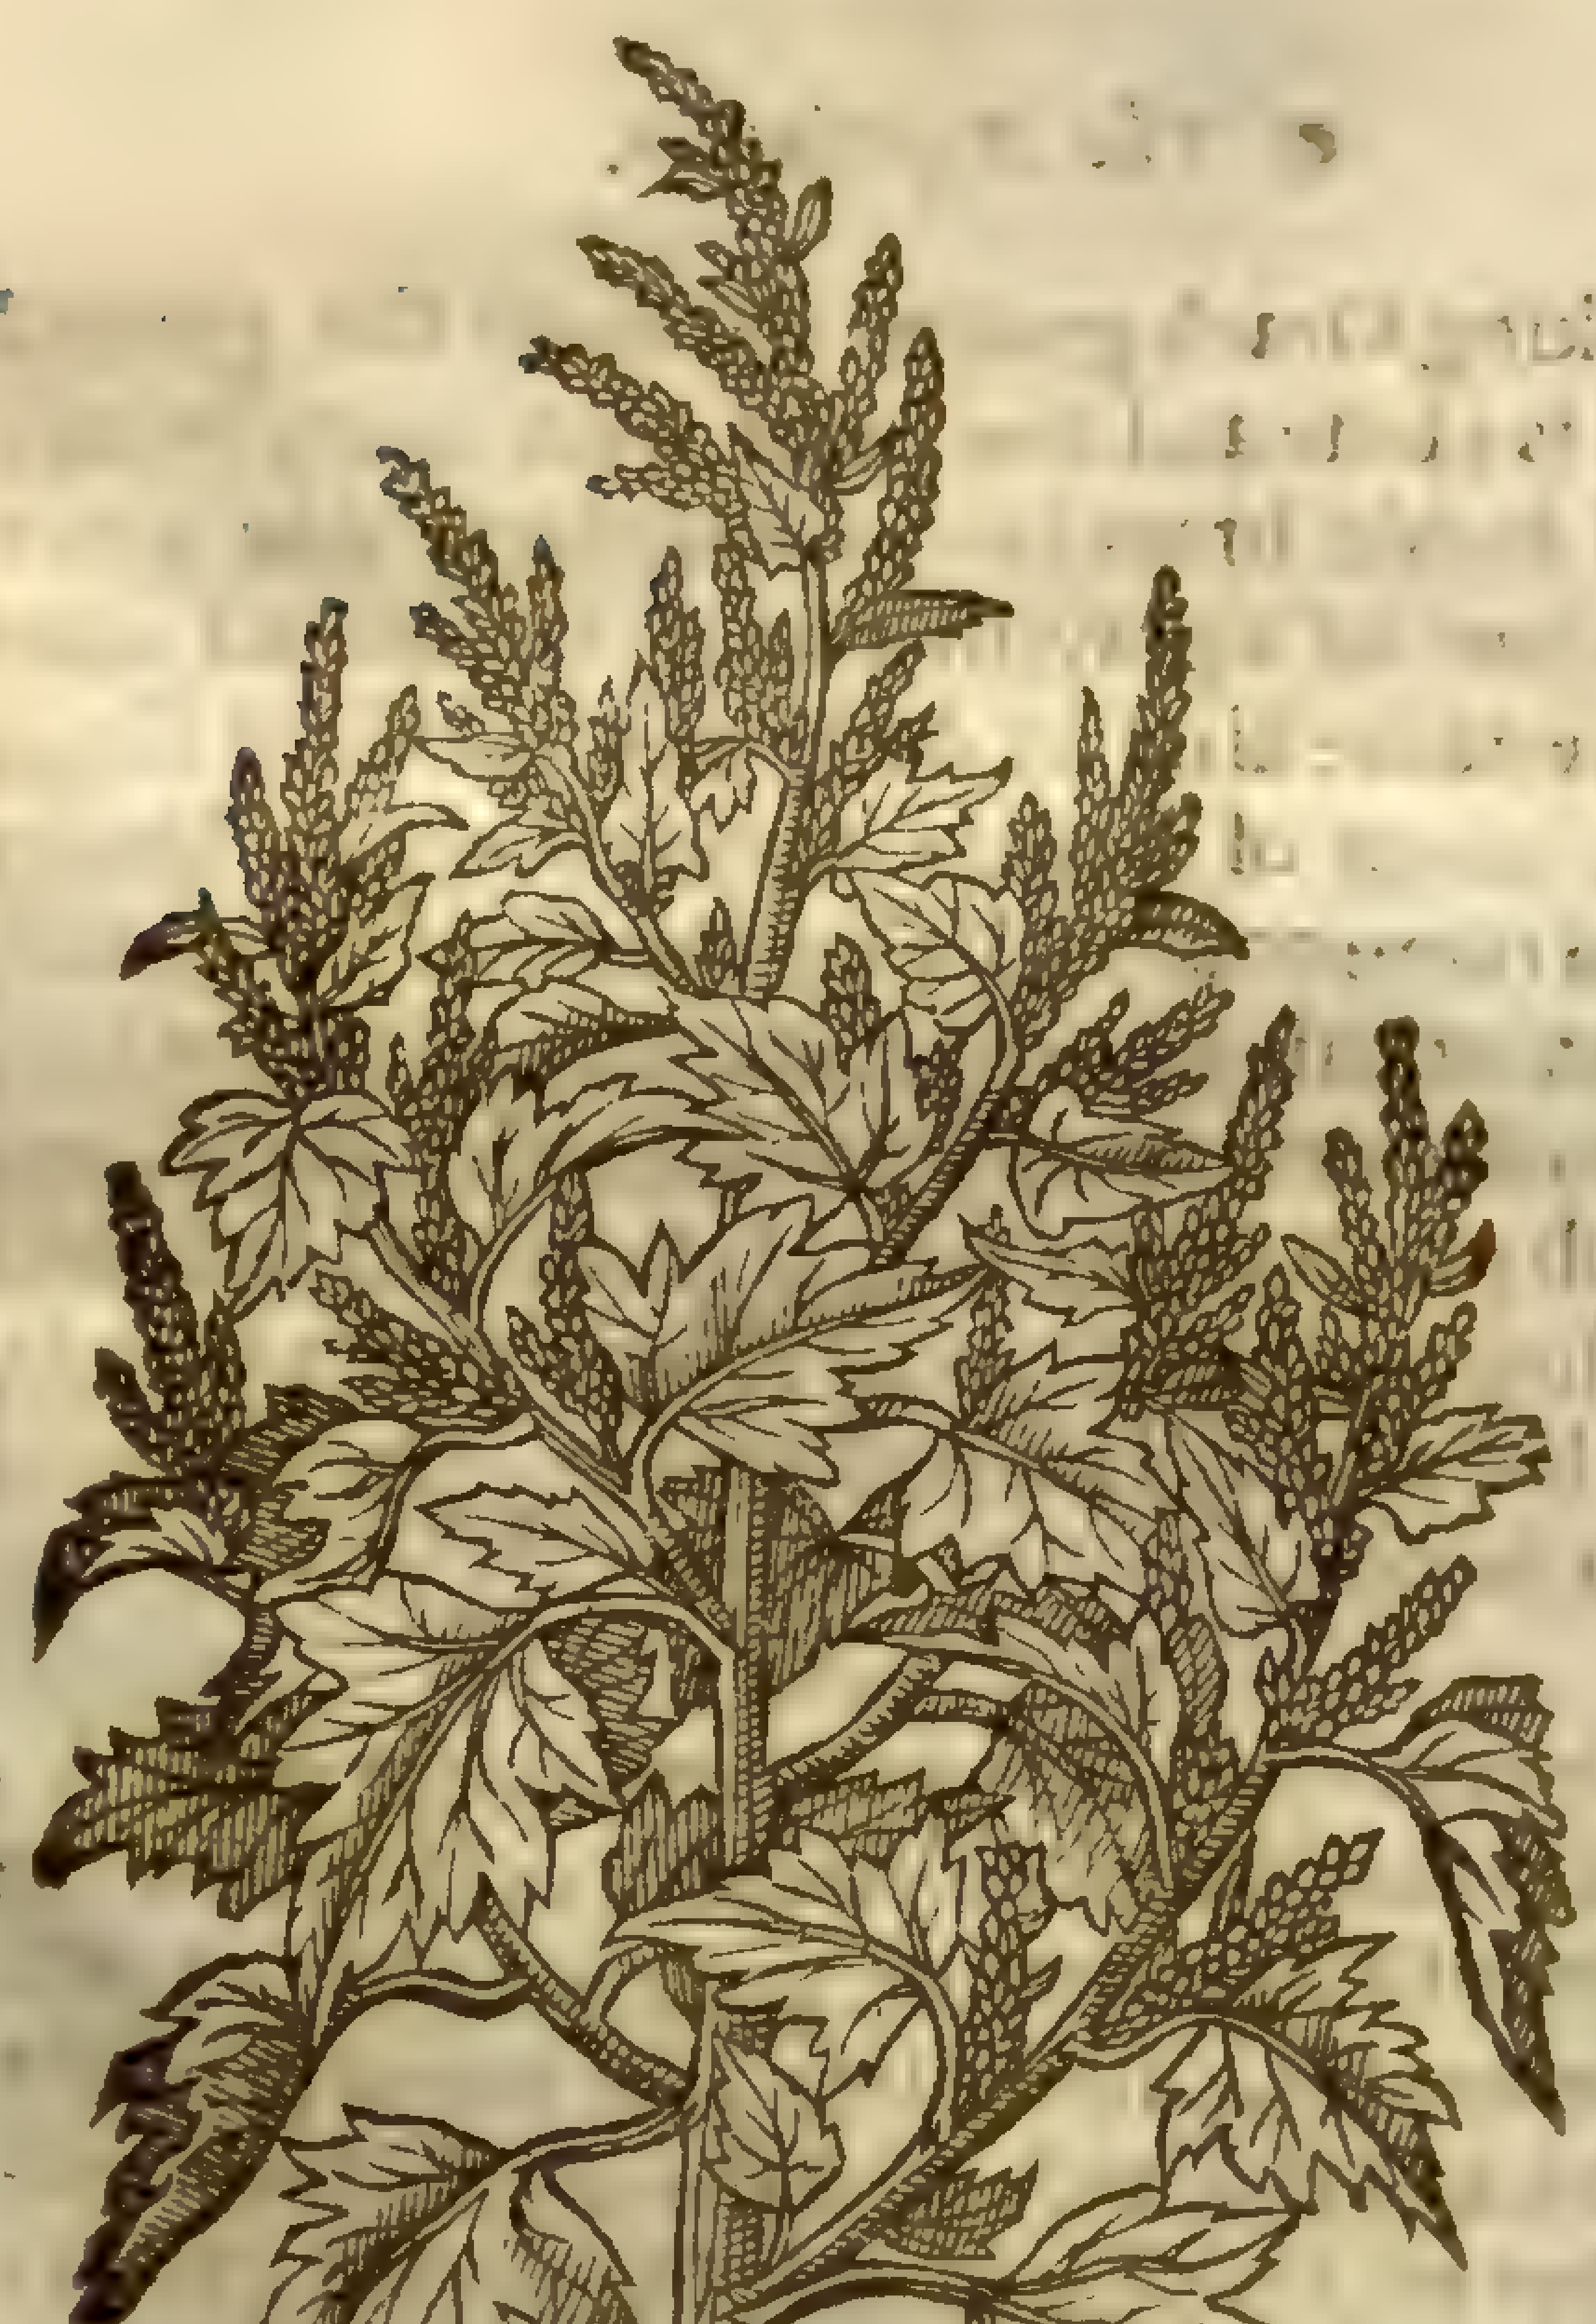
CHAP. 47. *Of Gooſe-foot.*

¶ *The Deſcription.*

1 GOoſe-foot is a common herbe, and thought to be a kinde of Orach: it riſeth vp with a ſtalke a cubit high or higher, ſomewhat chamfered and branched: the leaues be broad, ſmooth, ſharpe pointed, ſhining, hauing certaine deepe cuts about the edges, reſembling the foot of a gooſe: the floures be ſmall, ſomething red: the ſeed ſtandeth in cluſters vpon the top of the branches, being very like the ſeed of wild Orach, and the root is diuided into ſundry ſtrings.

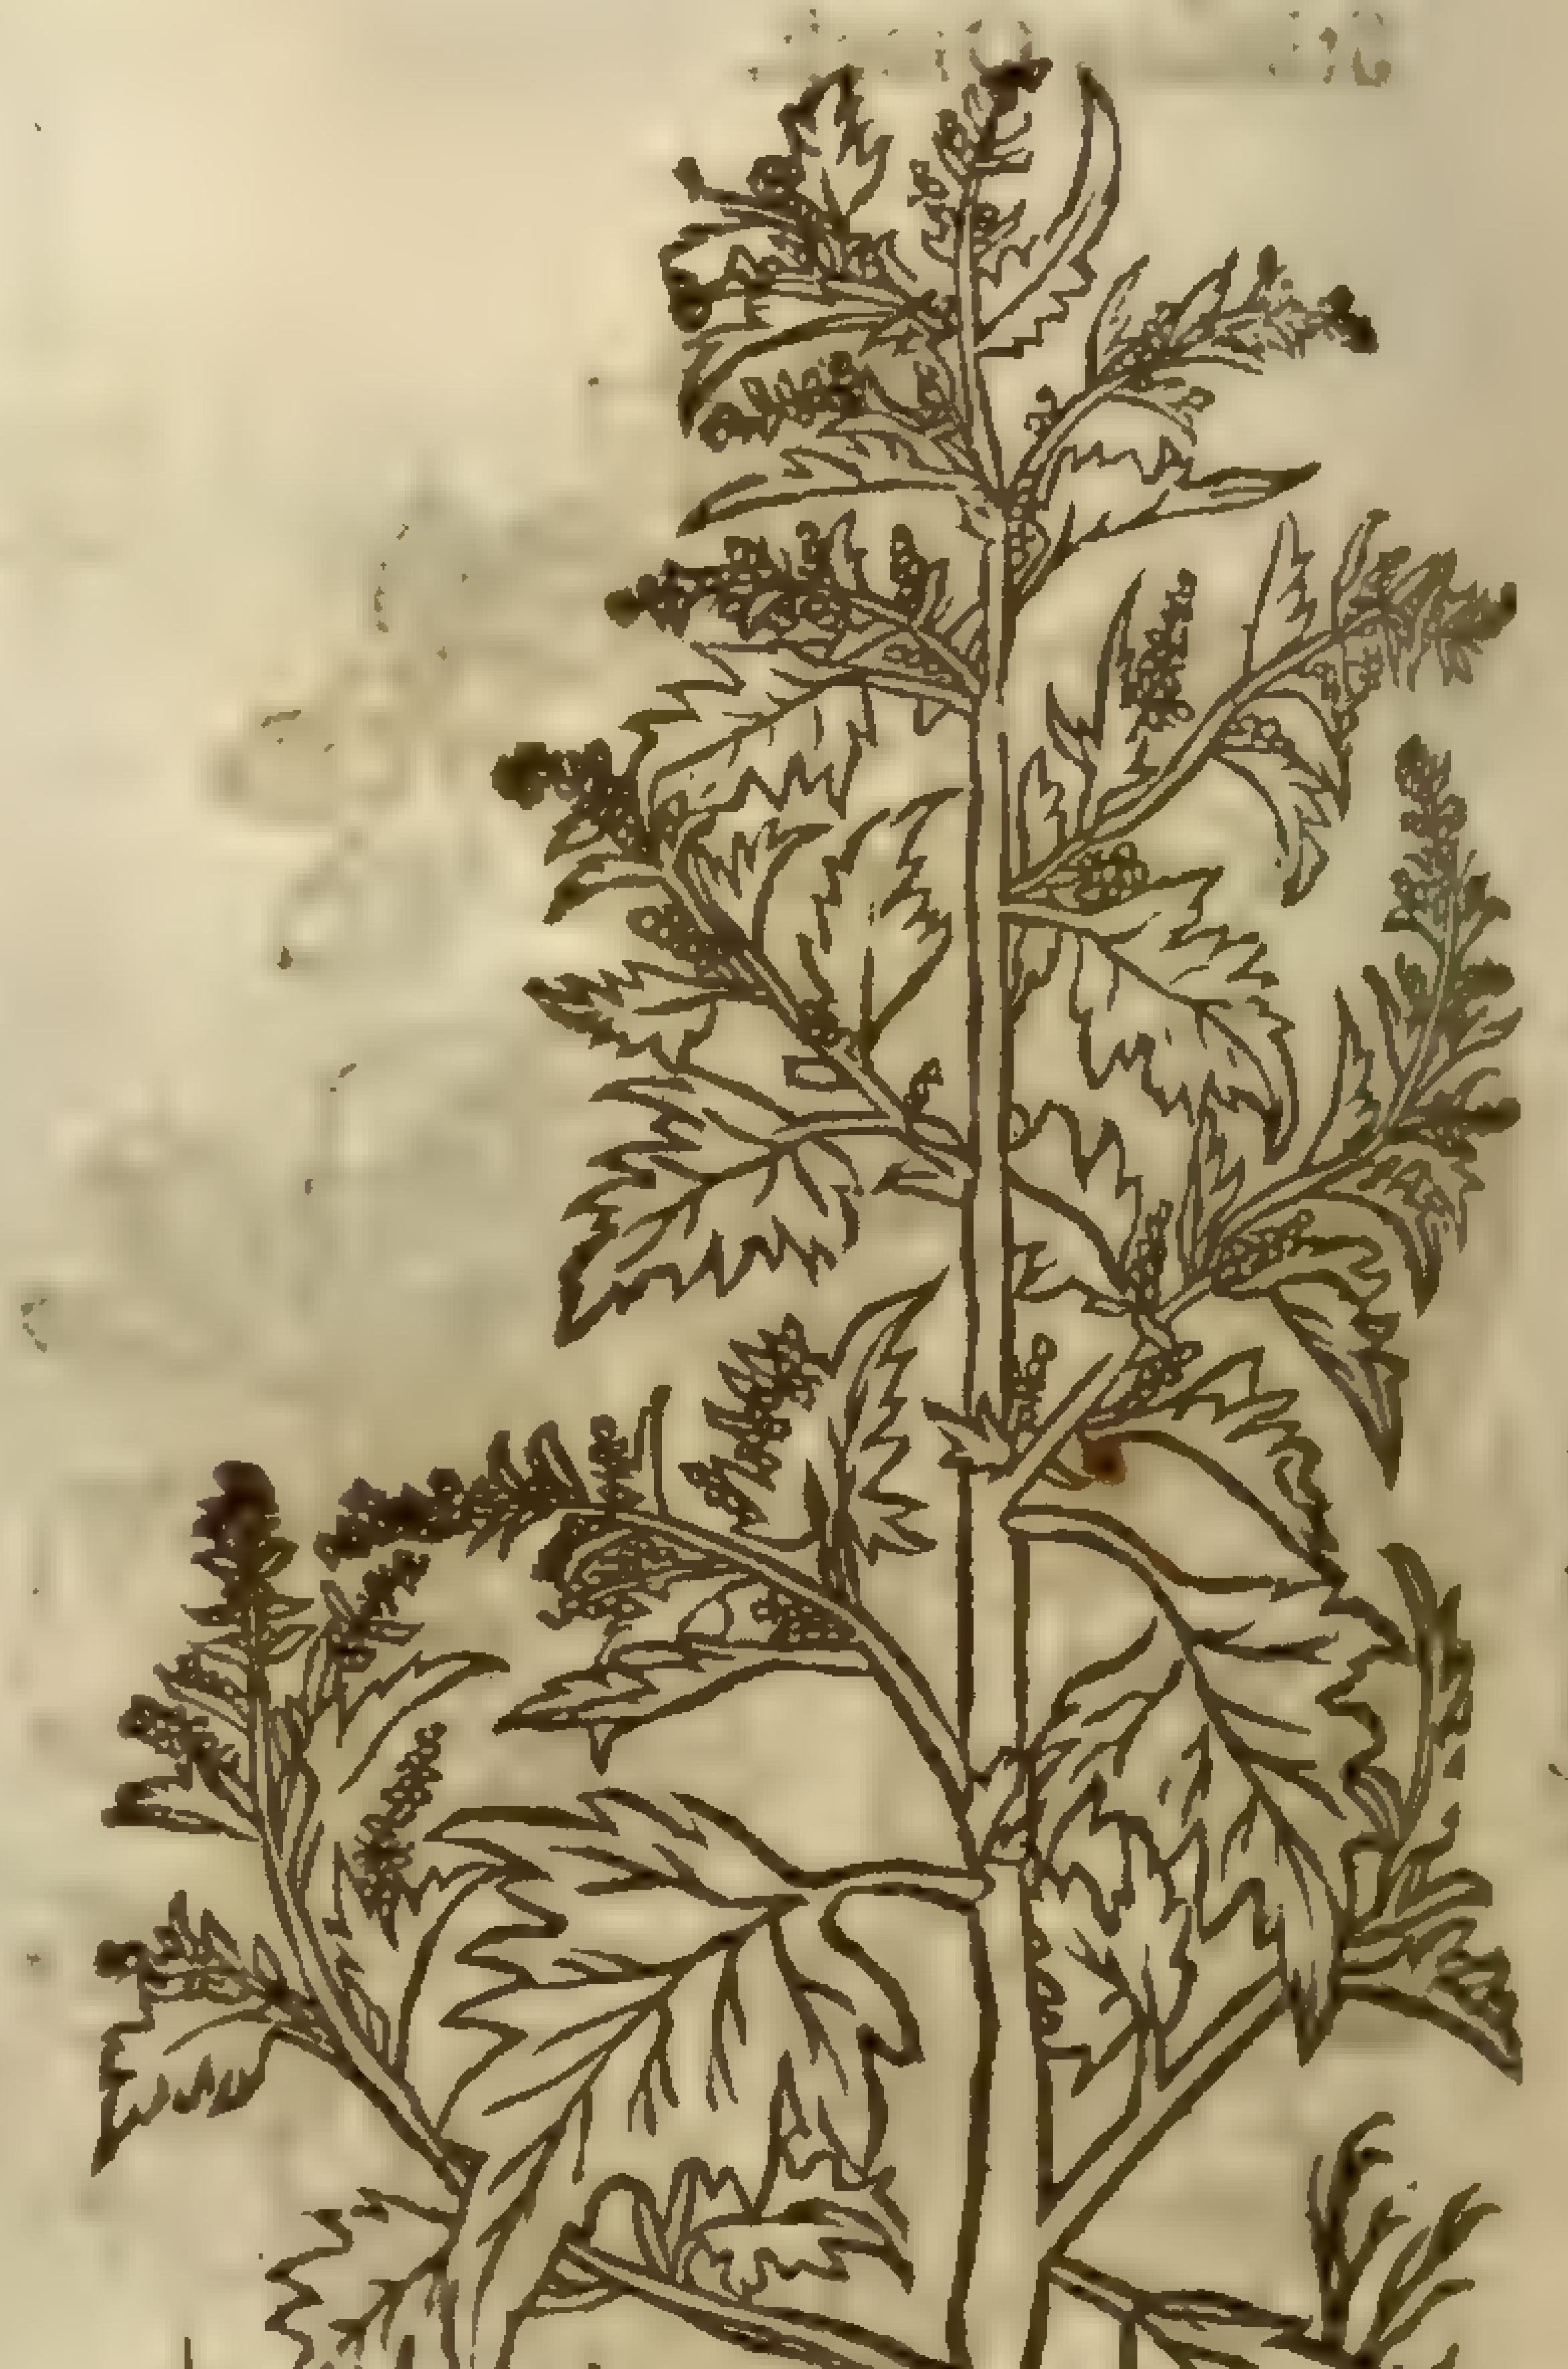
‡ 2 This differs from the laſt deſcribed, in that the leaues are ſharper cut, and more diuided, the ſeed ſomewhat ſmaller, and the colour of the whole plant is a deeper or darker greene. ‡

‡ 1 *Atriplex ſylueſtris latifolia, ſiue Pes Anſerinus.*
Gooſe-foot.



Chenopodium rubrum, L. [illegible] both.

‡ 2 *Atriplex ſylueſtris latifolia altera.*
The other Gooſe-foot.



2 Chenopodium urbicum, L
Sm. p. 2.10

¶ *The Place.*

It growes plentifully in fat moiſt places, as vpon dung-hils and by high waies.

¶ *The Time.*

It flouriſheth when the Orach doth, whereof this is a wilde kinde.

¶ *The Names.*

The later Herbariſts haue called it *Pes anſerinus*, and *Chenopodium*, of the likeneſſe that the leaues haue with the foot of a Gooſe: in Engliſh, Gooſe-foot, and wilde Orach.

¶ The

¶ *The Temperature.*

This herb is cold and moiſt,and that no leſſe than Orach,but as it appeareth more cold.

¶ *The Vertues.*

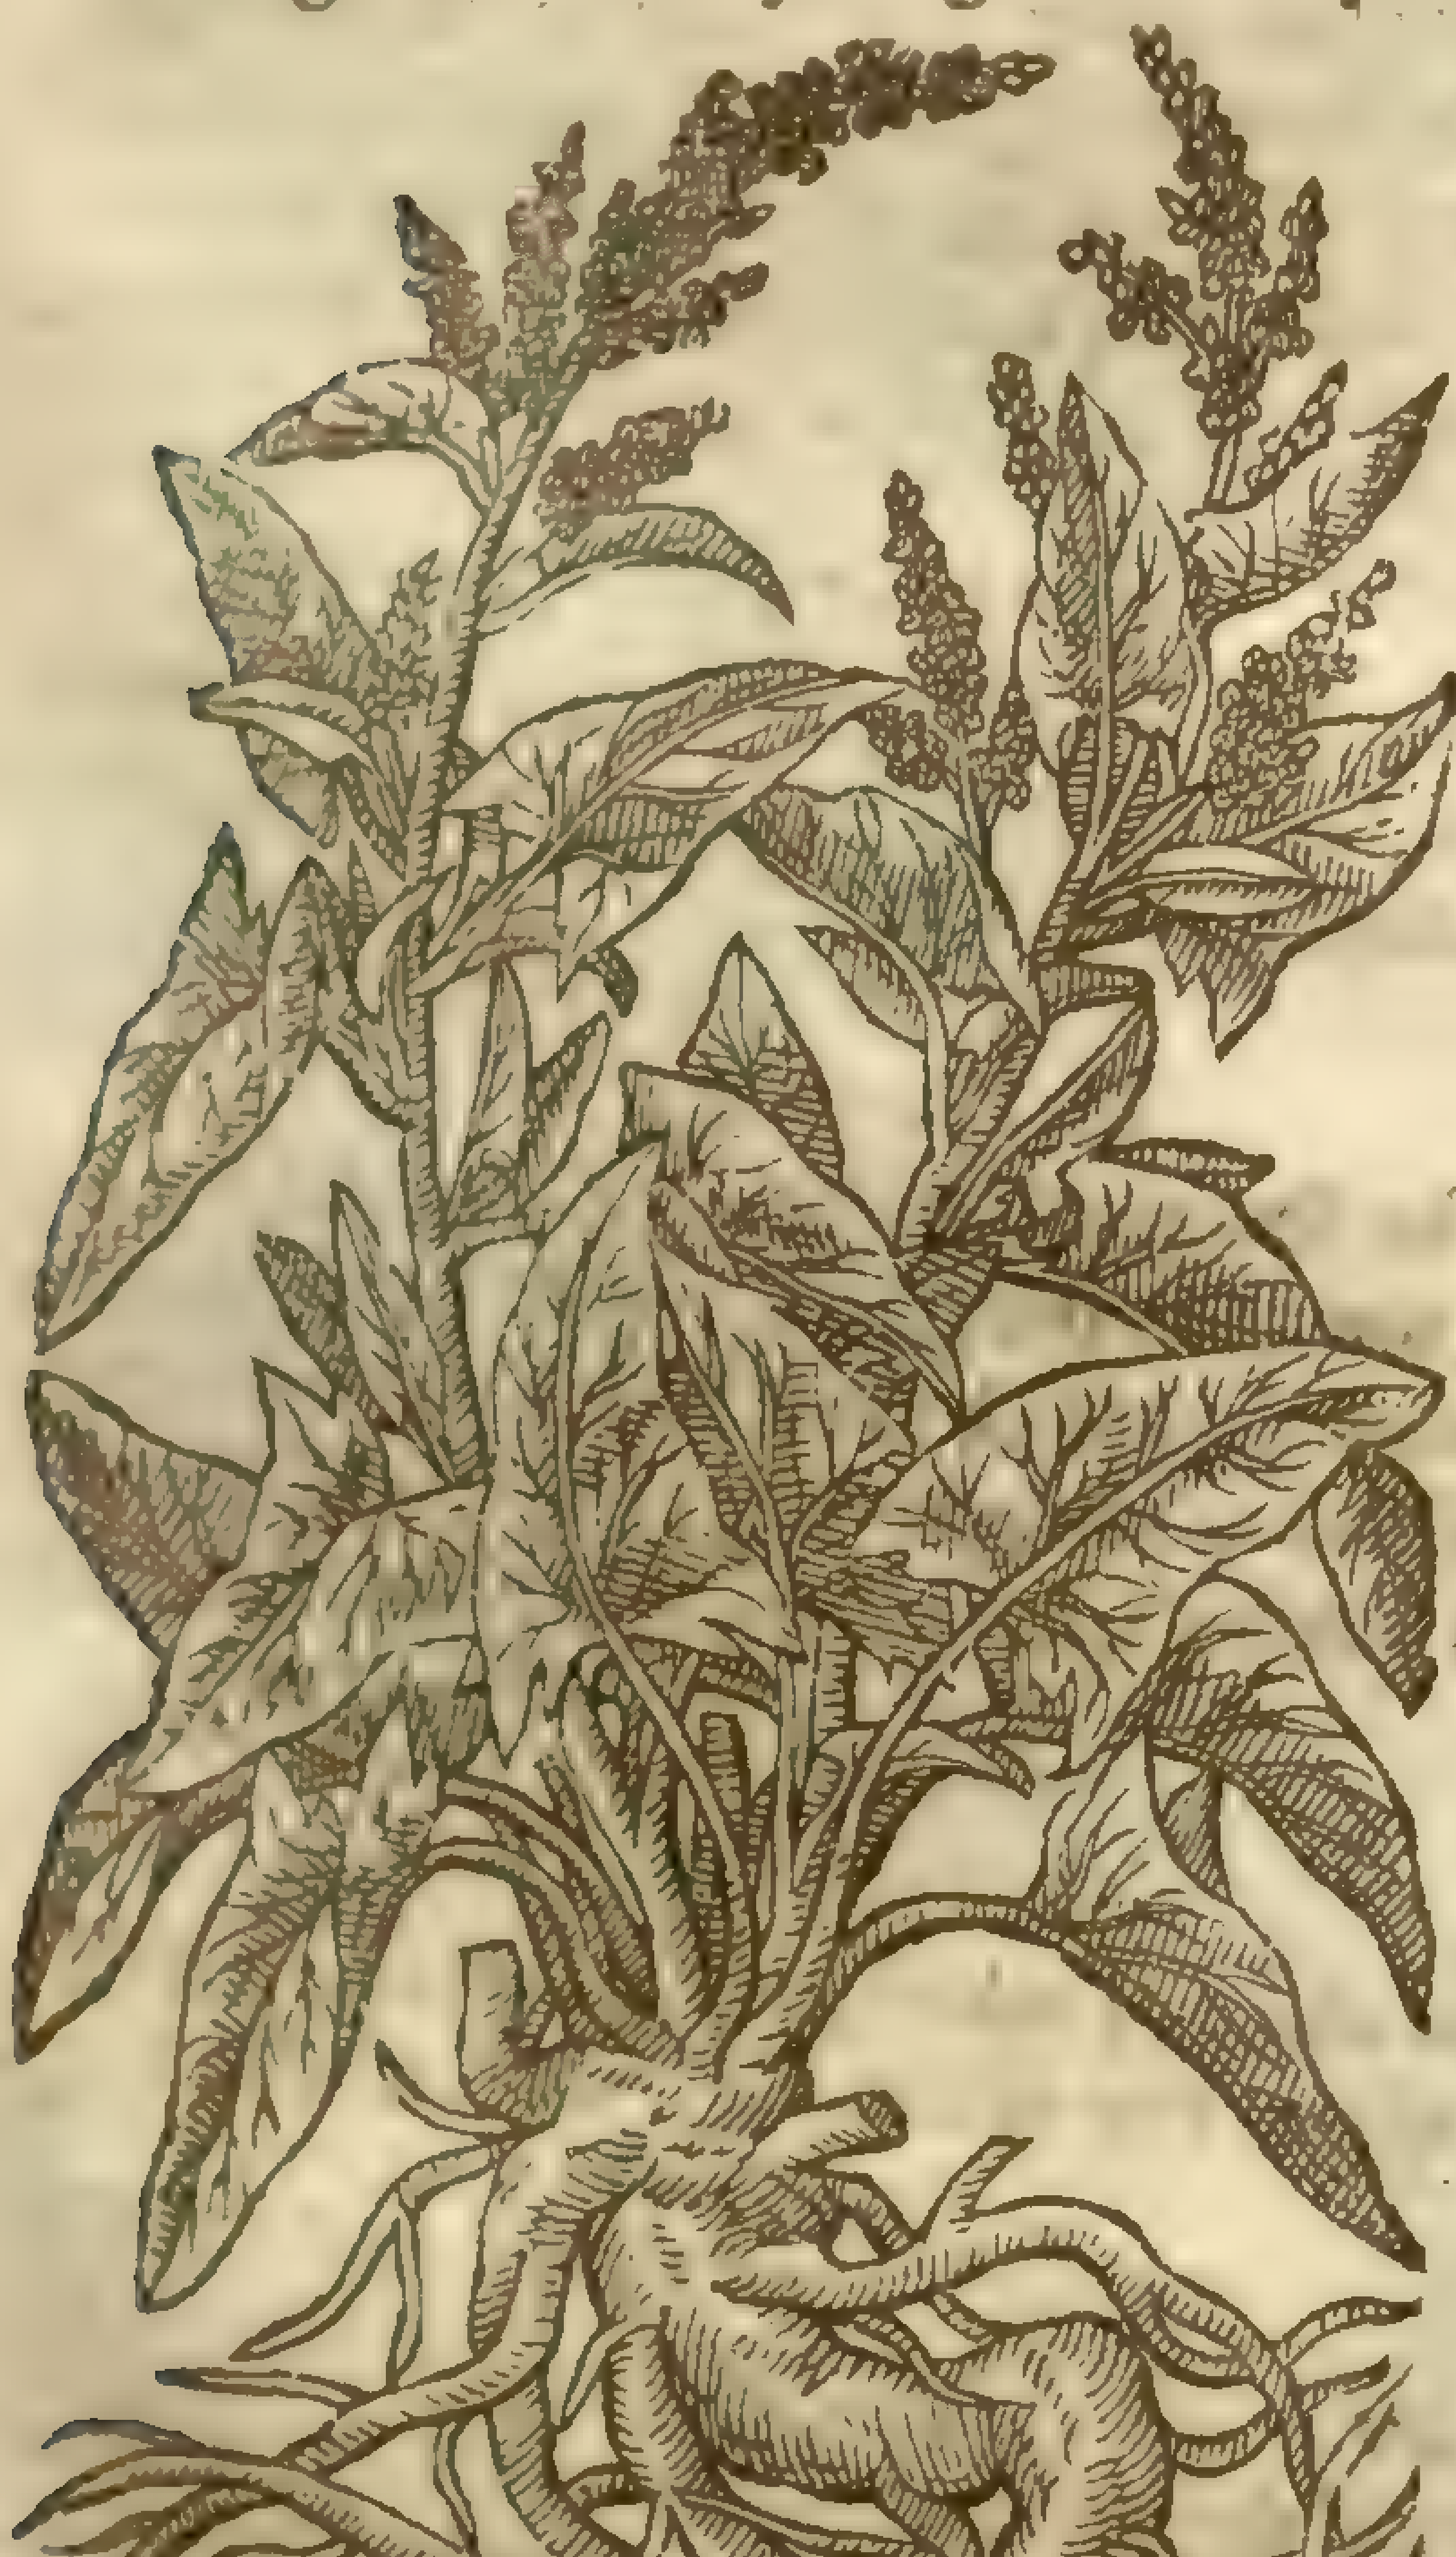
It is reported that it killeth ſwine,if they do eat thereof: it is not vſed in phyſick, & much leſſe as a ſallad herbe.

Chenopodium bonus henricus [illegible]

CHAP. 48.

Of Engliſh Mercury.

Bonus Henricus.
Engliſh Mercury, or good Henry.



¶ *The Deſcription.*

GOod Henry,called *Tota bona*, ſo named of the later Herbariſts,is accounted of them to be one of the Docks,but not properly. This bringeth forth very many thick ſtalks ſet with leaues two foot high; on the branches whereof toward the top ſtand greene floures in cluſters thicke thruſt together. The ſeed is flat like that of the Orach, whereof this is a kinde. The leaues be faſtned to long footſtalks, broad behind and ſharpe pointed, faſhioned like the leaues of Aron or Wake-robin, white or grayiſh of colour,and as it were couered ouer with a fine meale: in handling it is ſoft and oleous, with a very thick root,and parted into many diuiſions,of a yellow colour within,like the ſharp pointed Docke.

¶ *The Place.*

It is commonly found in vntilled places,and among rubbiſh neere common waies, old wals, and by hedges in fields.

¶ *The Time.*

It floureth in Iune and Iuly eſpecially.

¶ *The Names.*

It is called of ſome, *Pes Anſerinus*, and *Tota Bona*: in Engliſh, All-good,and Good Henrie: in Cambridge ſhire it is called Good King Harry: the Germans call it **Guter Heinrich**, of a certaine good qualitie it hath. As they alſo name another pernicious herb, *Malus Henricus*, or bad Henry. It is taken for a kinde of Mercurie, but vnproperly, for that it hath no participation with Mercurie either in forme or qualitie, except yee will call euery herbe Mercury that hath power to looſe the belly.

¶ *The Temperature.*

This plant is moderatly hot and dry,clenſing and ſcouring withall.

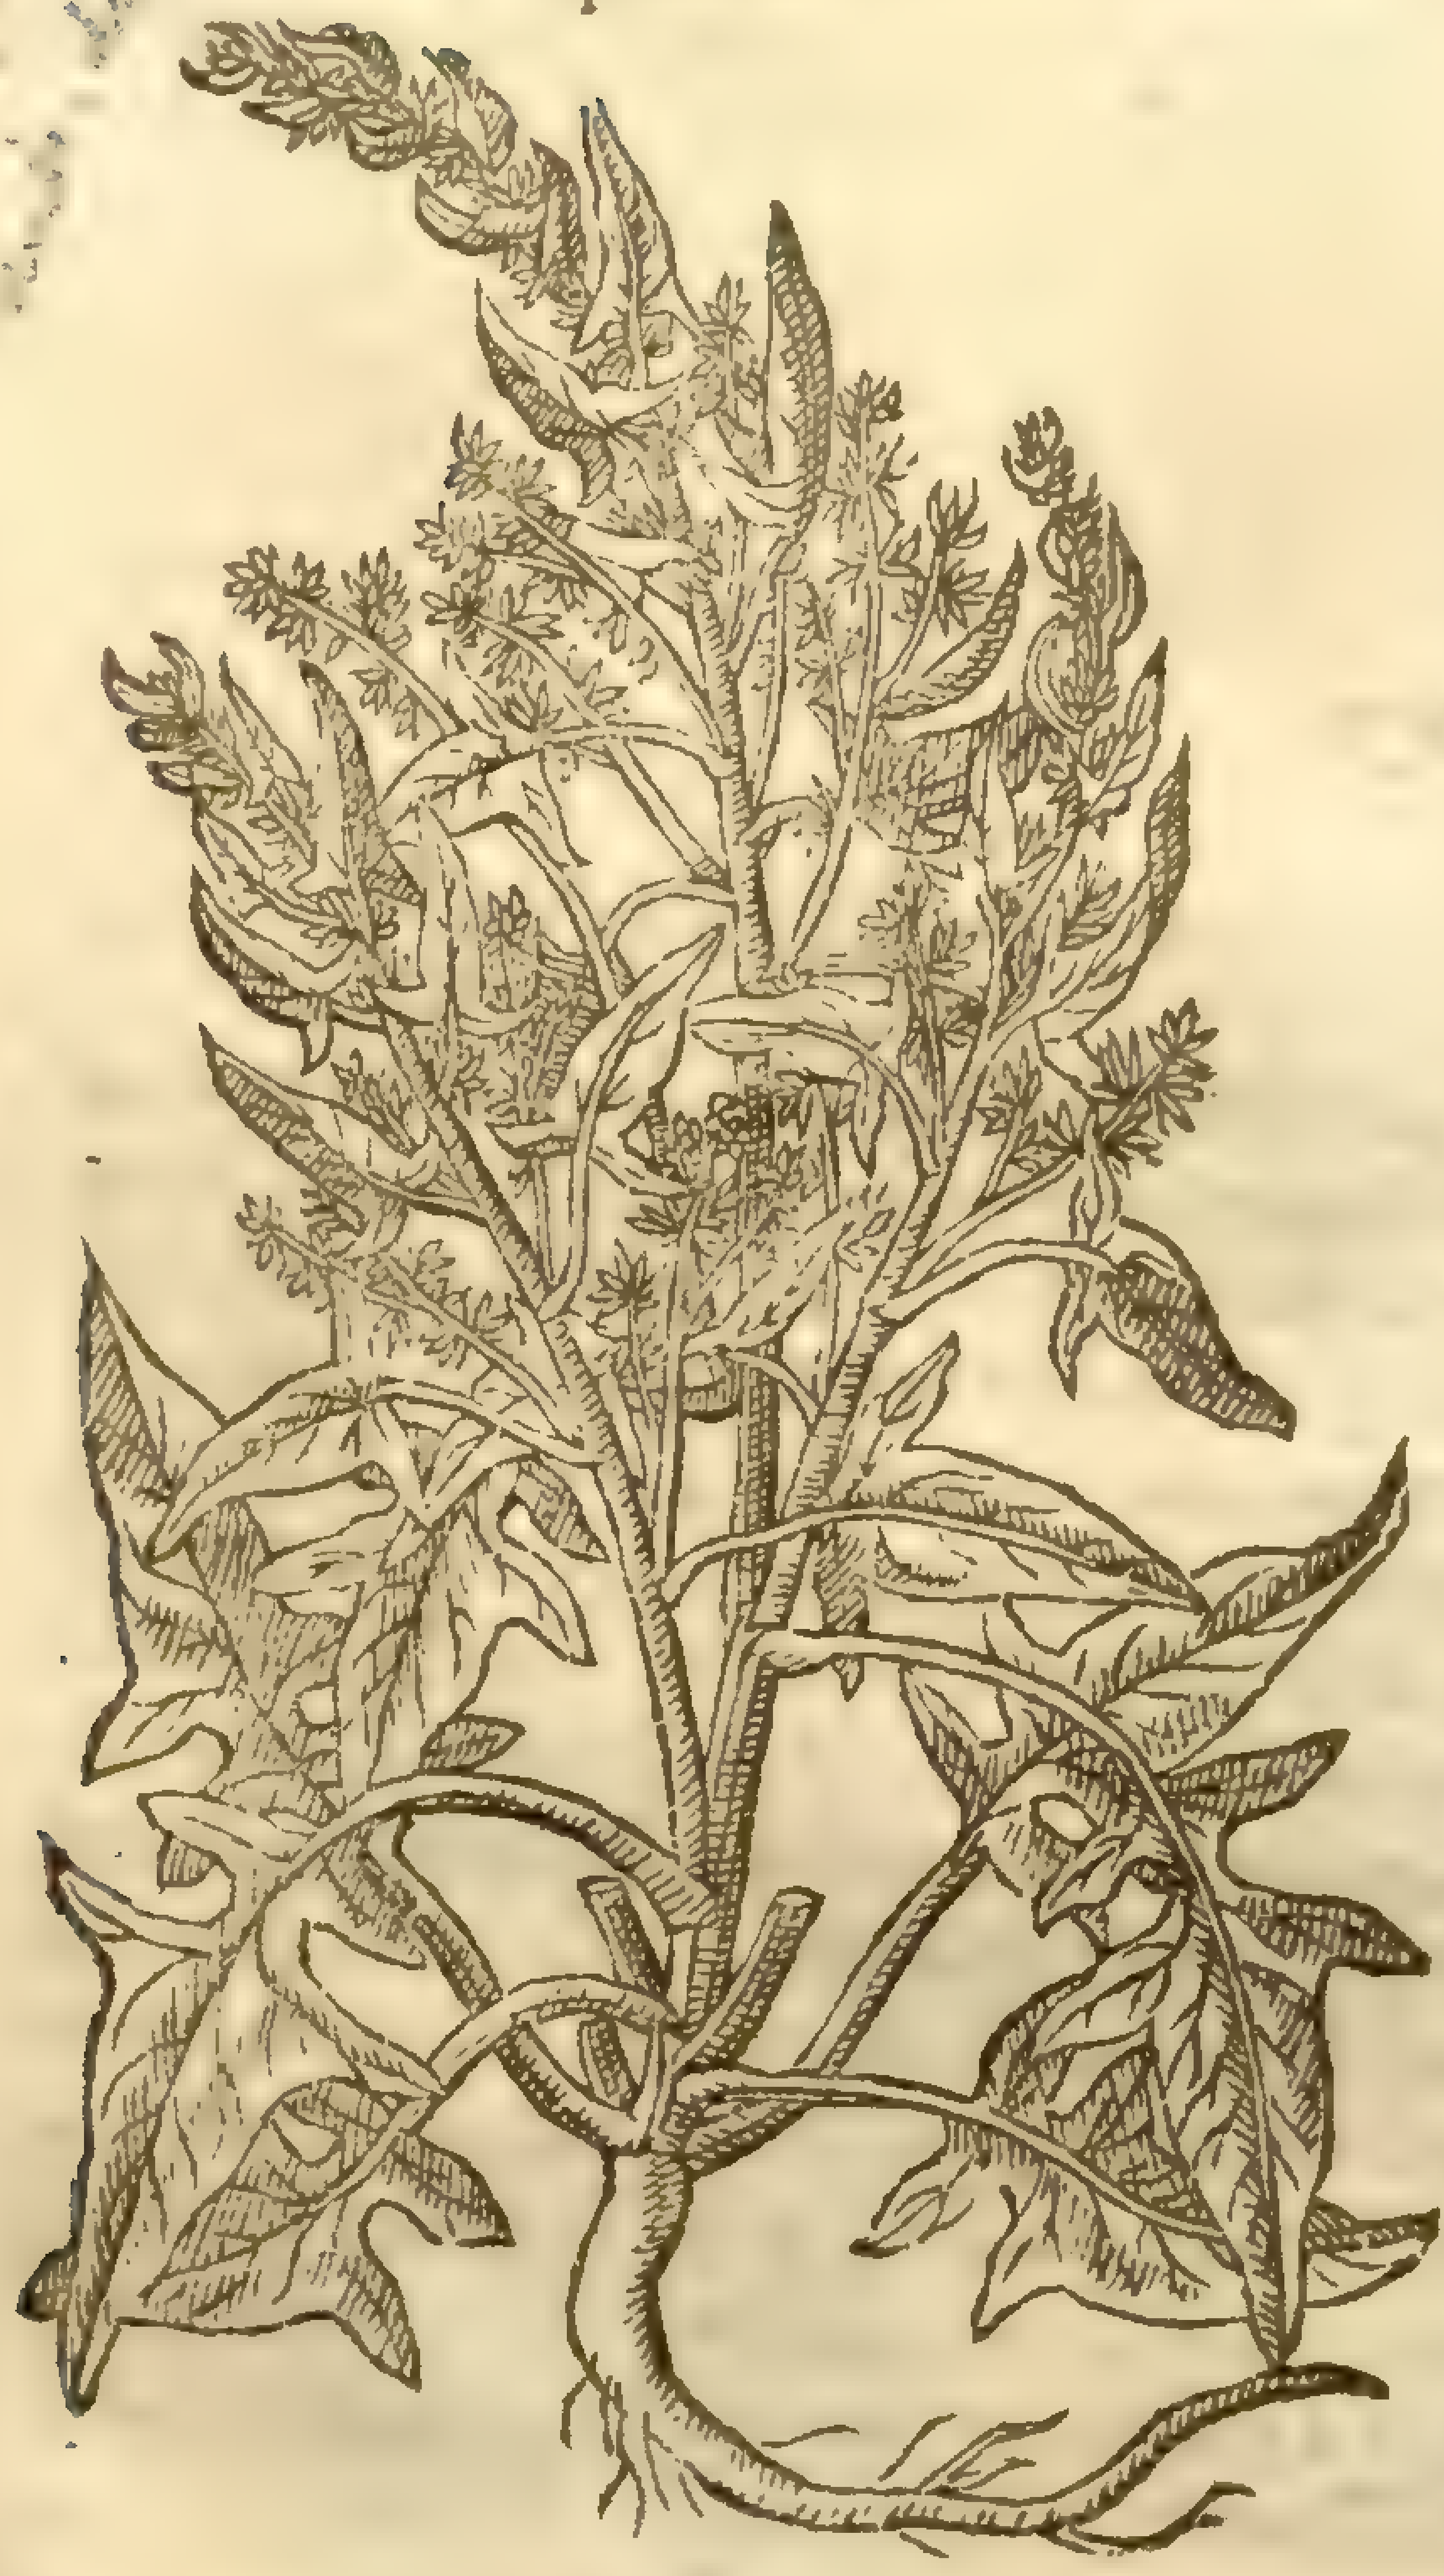
¶ *The Vertues.*

The leaues boiled with other pot-herbs and eaten,make the body ſoluble. A

The ſame bruiſed and layd vpon green wounds or foule and old vlcers,doe ſcoure,mundifie, and heale them. B

Chap. 49. *Of Spinach.*

Spinachia.
Spinach.



¶ *The Deſcription.*

1 SPinach is a kind of Blite, after ſome, notwithſtanding I rather take it for a kinde of Orach. It bringeth forth ſoft and tender leaues of a dark green colour, ful of juice, ſharp pointed, & in the largeſt part or nether end ſquare; parted oftentimes with a deepe gaſh on either ſide next to the ſtem or footſtalke: the ſtalke is round, a foot high, hollow within; on the tops of the branches ſtand little floures in cluſters, in whoſe places doth grow a prickely ſeed. The root conſiſteth of many ſmall threds.

2 There is another ſort found in our gardens, like vnto the former in goodneſſe, as alſo in ſhape, ſauing that the leaues are not ſo great, nor ſo deeply gaſht or indented; and the ſeed hath no prickes at all, wherefore it is called wilde Spinach.

¶ *The Place.*

It is ſowne in gardens without any great labour or induſtrie, and forſaketh not any ground, beeing but indifferent fertill.

¶ *The Time.*

It may be ſowne almoſt at any time of the yere, but being ſowne in the ſpring, it quickely groweth vp and comes to perfecton within two moneths: but that which is ſown in the fall of the leaf groweth not ſo ſoone to perfection, yet continueth all the winter, and ſeedeth preſently vpon the firſt ſpring.

¶ *The Names.*

It is called in theſe daies *Spinachia*: of ſome, *Spinacheum olus*: of others, *Hiſpanicum olus*: *Fuchſius* nameth it *Spinachia*: the Arabians and *Serapio* call it *Hiſpane*: the Germanes, **Spinet**: in Engliſh, Spinage and Spinach: in French, *Eſpinas*.

¶ *The Temperature.*

Spinach is euidently cold and moiſt almoſt in the ſecond degree, but rather moiſt. It is one of the pot-herbs whoſe ſubſtance is waterie and almoſt without taſte, and therefore quickely deſcendeth and looſeth the belly.

¶ *The Vertues.*

A It is eaten boiled, but it yeeldeth little or no nouriſhment at all: it is ſomething windie, & eaſily cauſeth a deſire to vomit. It is vſed in ſallads when it is yong and tender.

B This herb of all other pot-herbs and ſallad-herbes maketh the greateſt diuerſitie of meats and ſallads.

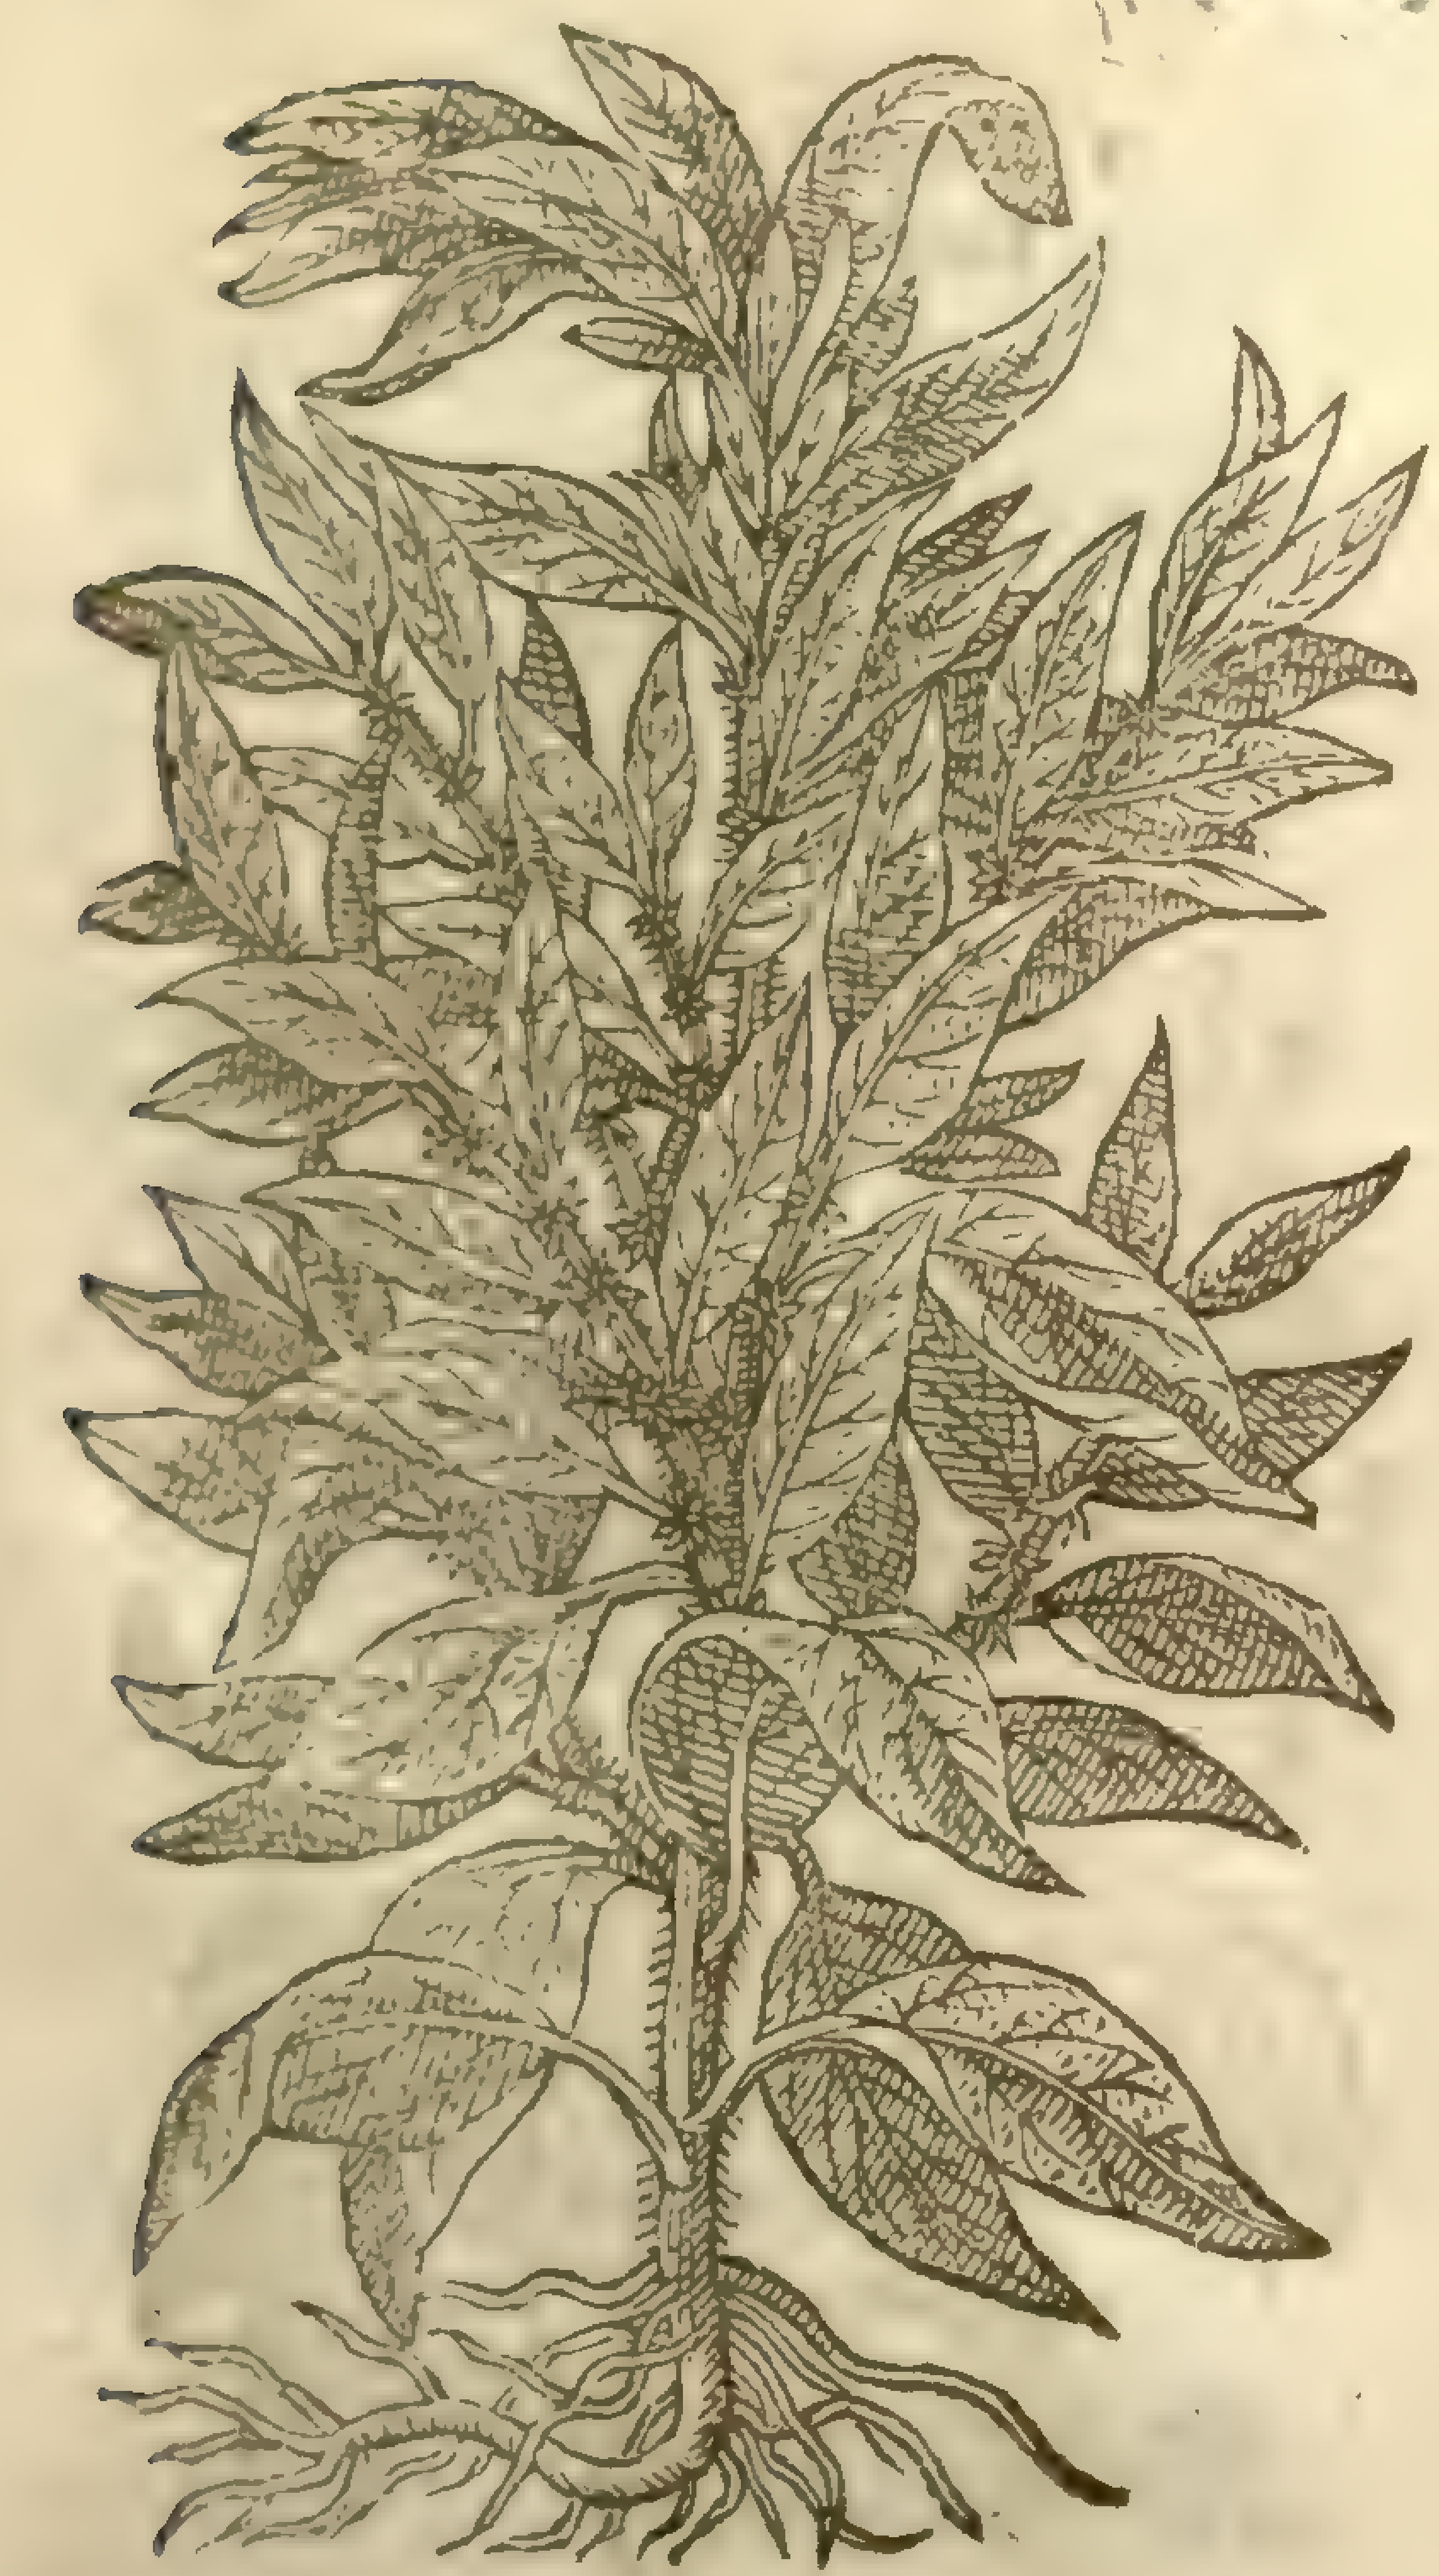
Chap. 50. *Of Pellitorie of the wall.*

¶ *The Deſcription.*

PEllitorie of the wall hath round tender ſtalks ſomwhat brown and reddiſh of colour, and ſomwhat ſhining: the leaues be rough like to the leaues of Mercury, nothing ſnipt about the edges: the floures be ſmall, growing cloſe to the ſtems: the ſeed is black and very ſmall, couered with a rough huske which hangeth faſt vpon garments: the root is ſomewhat reddiſh.

¶ *The*

Parietaria.
Pellitorie of the wall.



¶ *The Place.*

It groweth neere to old wals in the moiſt corners of Churches and ſtone buildings, amongſt rubbiſh and ſuch like places.

¶ *The Time.*

It commeth vp in May: it ſeedeth in Iuly and Auguſt: the root onely continueth and is to bee found in Winter.

¶ *The Names.*

It is commonly called *Parietaria*, or by a corrupt word *Paritaria*, becauſe it groweth neere to walls: and for the ſame cauſe it is named of diuers *Muralis*: alſo *Muralium* of *Pliny* and *Celſus*: of the Grecians ἑλξίνη: There is alſo another *Helxine* ſyrnamed *Ciſſampelos*: ſome call it *Perdicium*, of Partridges which ſometimes feed hereon: ſome *Vrceolaris*, and *Vitraria*, becauſe it ſerueth to ſcoure Glaſſes, Pipkins, and ſuch like: it is called in high-Dutch, **Tagvndnacht**: in Spaniſh, *Yerva del muro*: in Engliſh, Pellitorie of the Wall: in French, *Parietaire*.

¶ *The Temperature.*

Pellitorie of the Wall (as *Galen* ſaith) hath force to ſcoure, and is ſomething cold and moiſt.

¶ *The Vertues.*

Pellitory of the wall boiled, and the decoction of it drunken, helpeth ſuch as are vexed with an old cough, the grauell and ſtone, and is good againſt the difficultie of making water, and ſtopping of the ſame, not onely inwardly, but alſo outwardly applied vpon the region of the bladder, in manner of a fomentation or warme bathing, with ſpunges or double clouts, or ſuch like. A

Dioſcorides ſaith, That the juice tempered with Ceruſe or white leade maketh a good ointment againſt S. *Anthonies* fire and the ſhingles: and mixed with the Cerot of Alcanna, or with the male Goats tallow, it helpeth the gout in the feet: which *Pliny* alſo affirmeth, *Lib. 22. cap. 17.* B

It is applied (ſaith he) to paines of the feet with Goats ſuet and wax of Cyprus; where in ſtead of wax of Cyprus there muſt be put the cerot of Alcanna. C

Dioſcorides addeth, That the juice hereof is a remedy for old coughs, and taketh away hot ſwellings of the almonds in the throat, if it be vſed in a gargariſme, or otherwiſe applied: it mitigateth alſo the paines of the eares, being poured in with oile of Roſes mixed therewith. D

It is affirmed, That if three ounces of the juice be drunke it procureth vrine out of hand. E

The leaues tempered with oile of ſweet almonds in manner of a pulteſſe, and laid to the pained parts, are a remedy for them that be troubled with the ſtone, and that can hardly make water. F

Chap. 51. *Of French Mercurie.*

¶ *The Kindes.*

There be two kinds of Mercury reckoned for good, and yet both ſometimes wilde; beſides two wilde neuer found in gardens, vnleſſe they be brought thither.

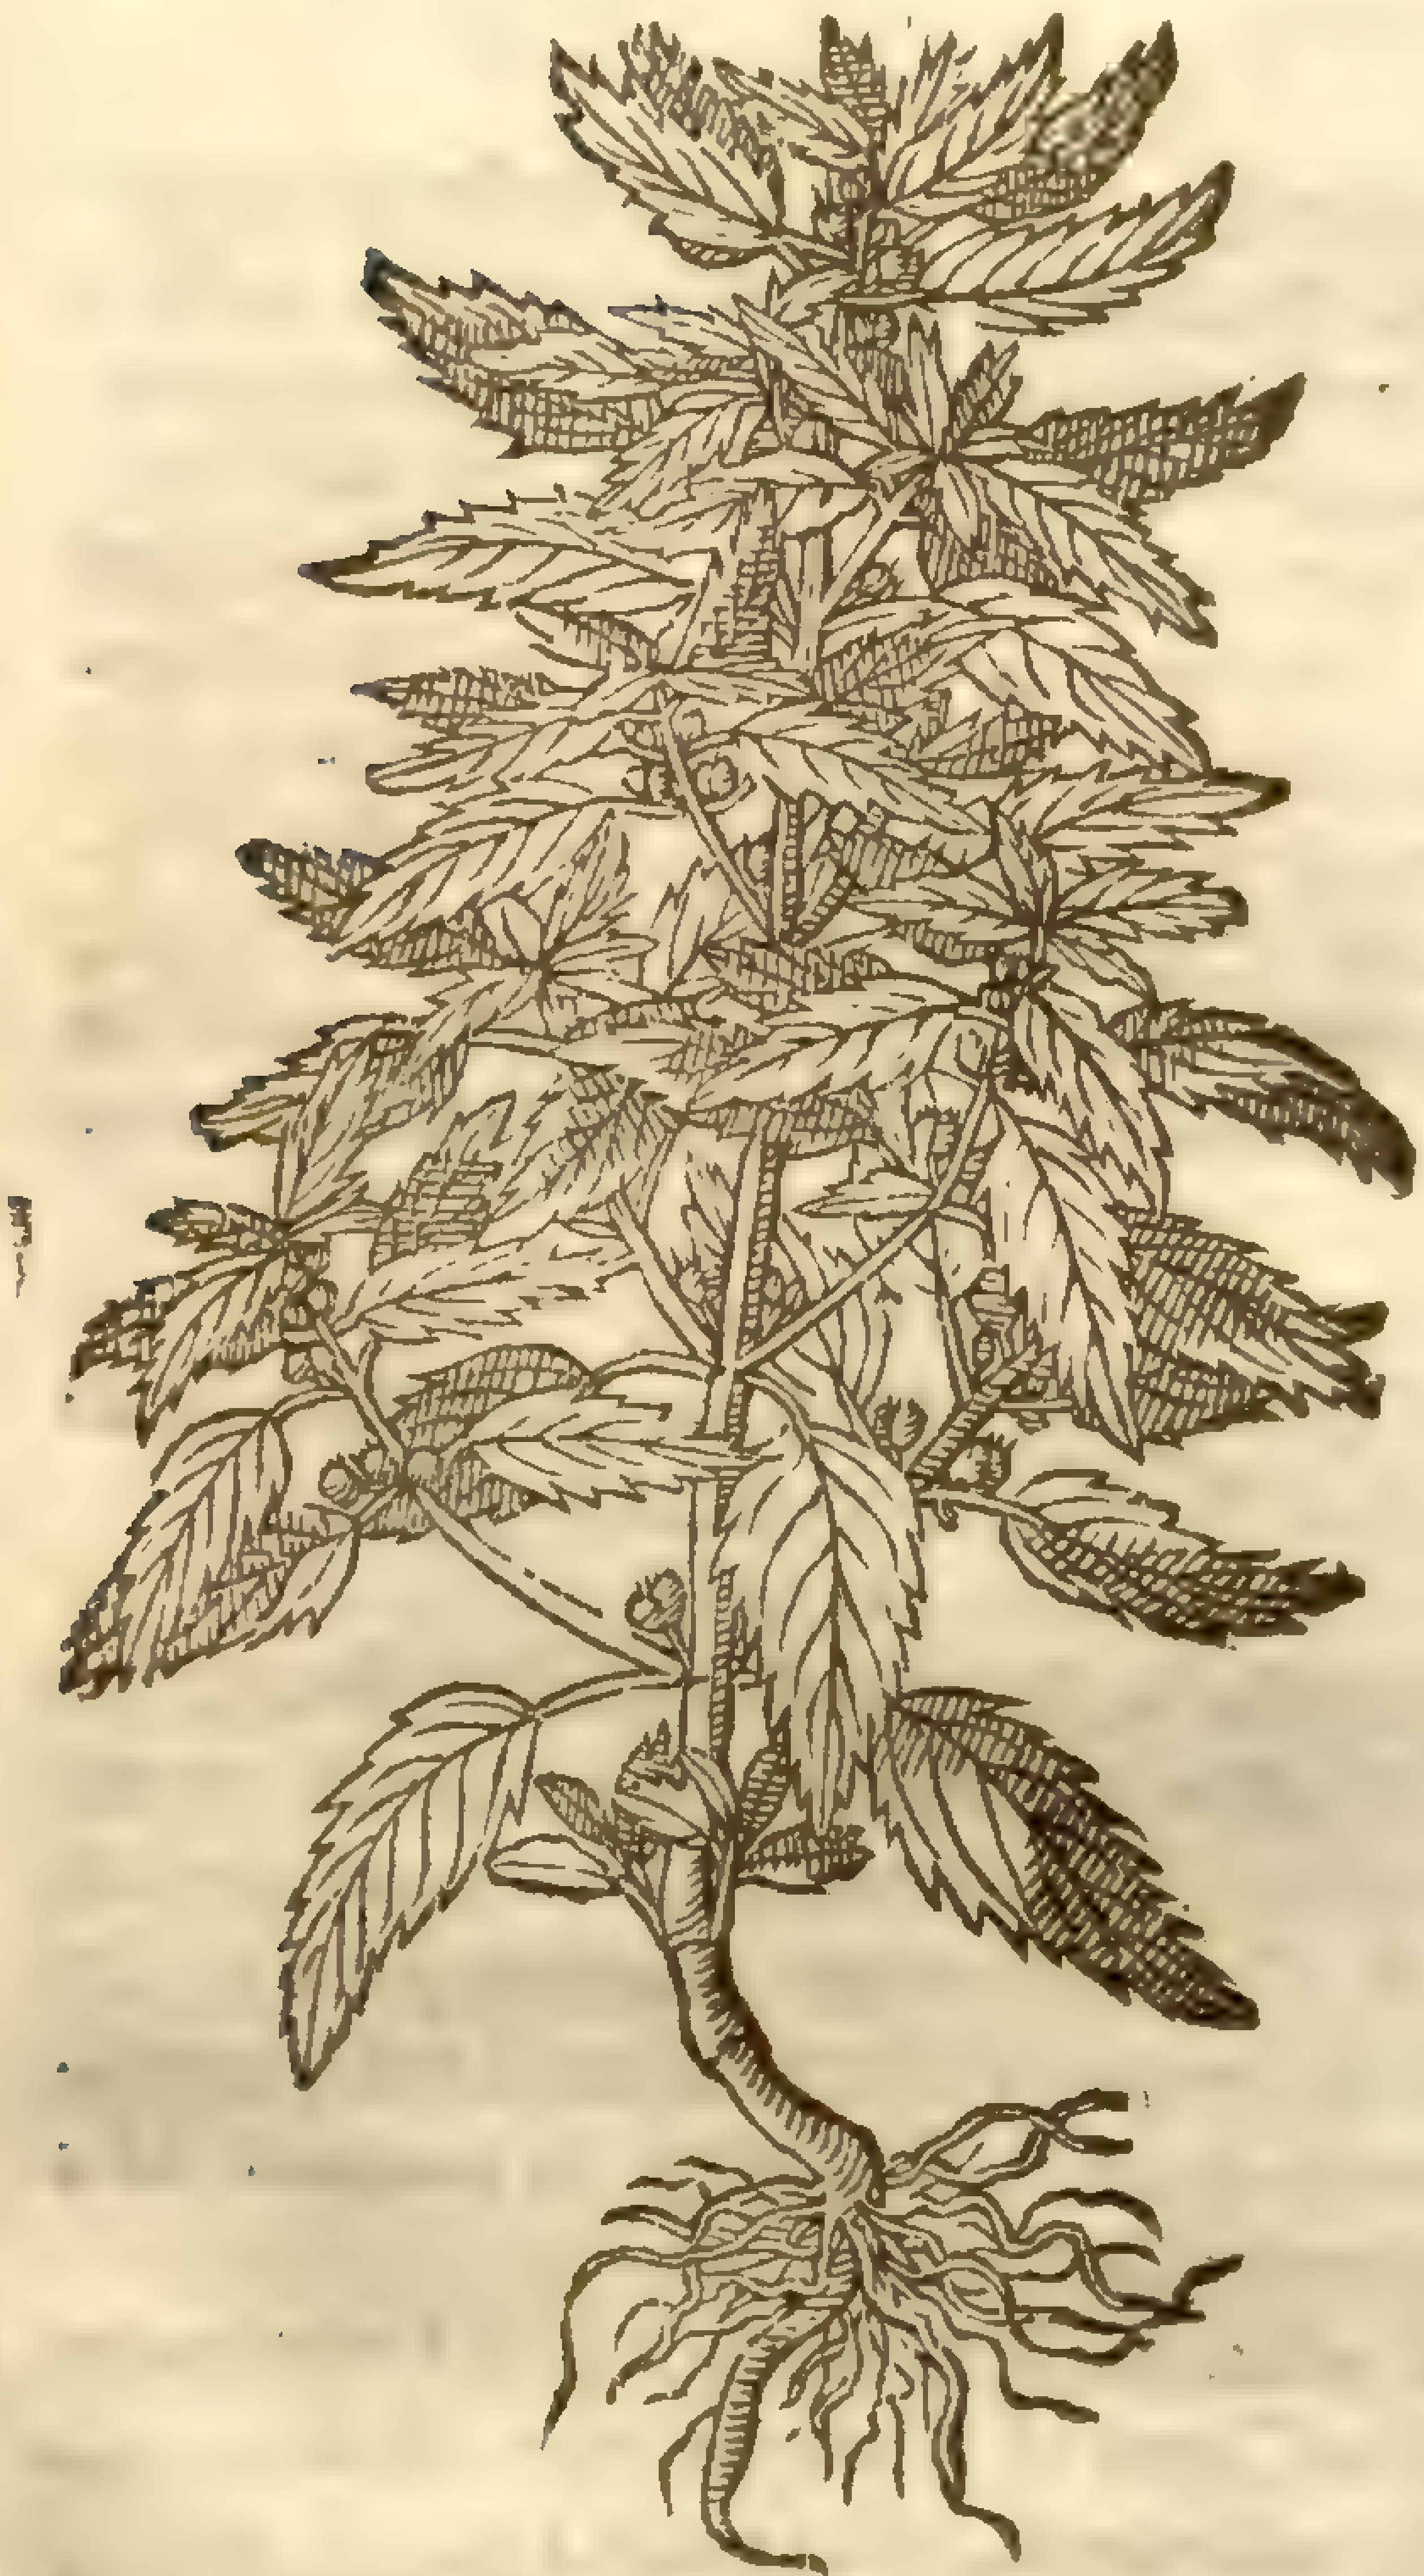
¶ *The Deſcription.*

1 The male garden Mercury hath tender ſtalks full of joints and branches, whereupon doe grow greene leaues like Pellitorie of the wall, but ſnipt about the edges: among which come forth two hairie bullets round, and ioined together like thoſe of Gooſe-graſſe or Cleuers, each containing in it ſelfe one ſmall round ſeed: the root is tender, and full of white hairy ſtrings.

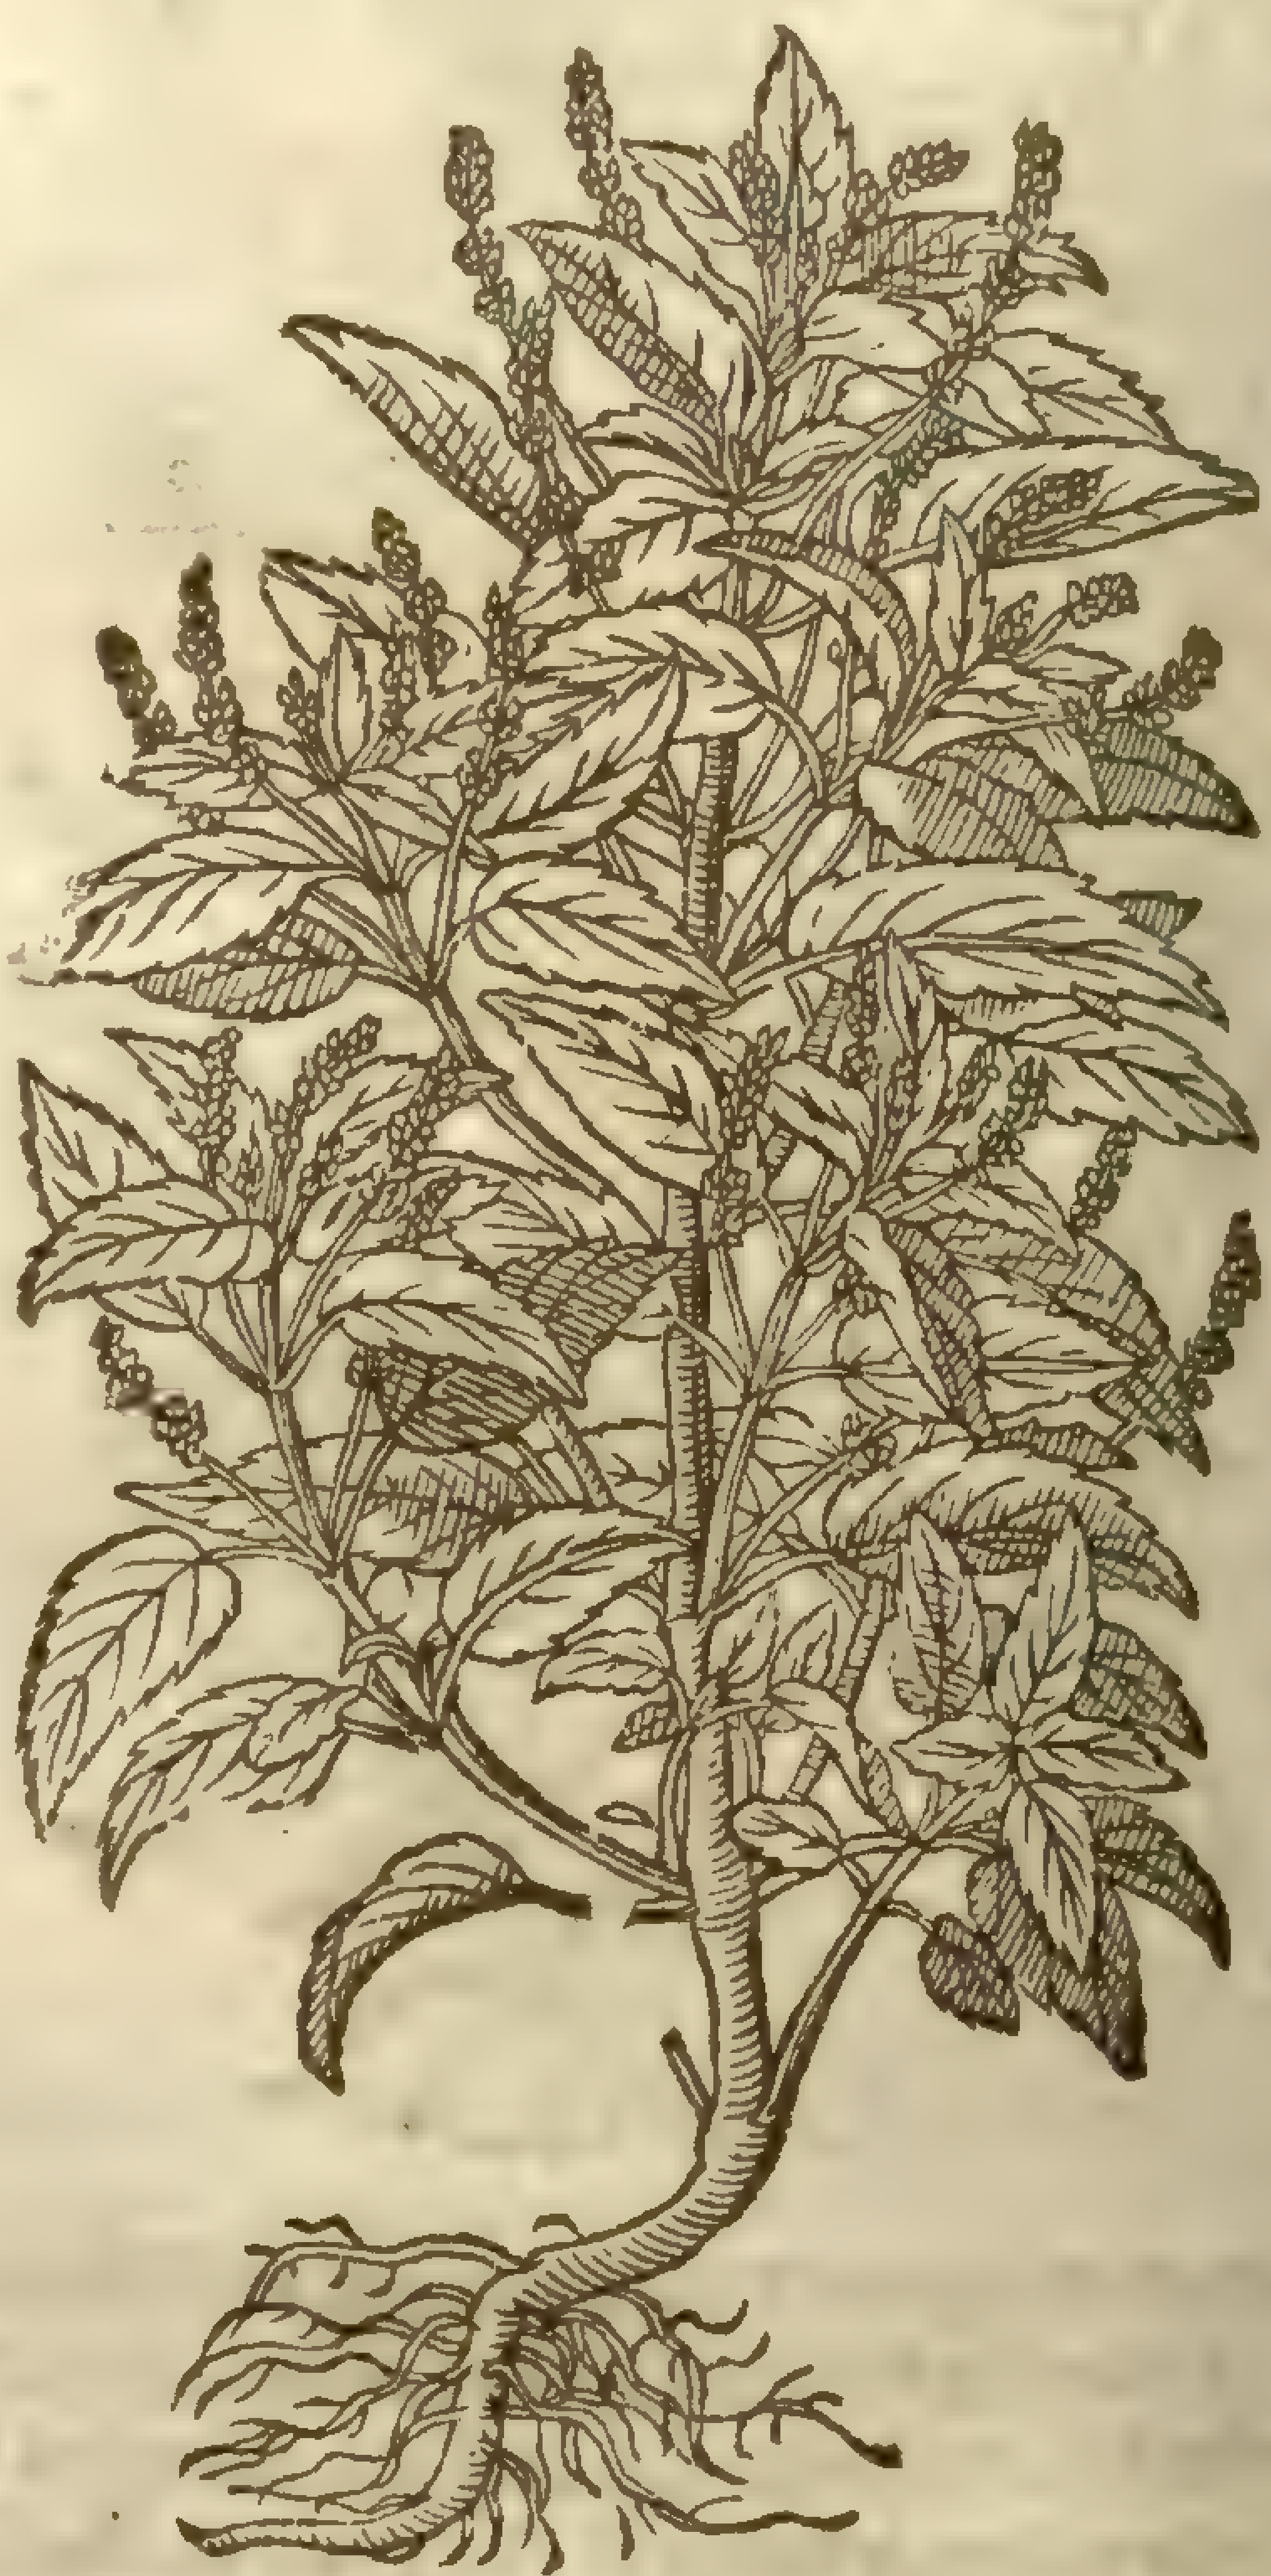
2 The female is like vnto the former in leaues, ſtalkes, and manner of growing, differing but in

the floures and ſeed: for this kinde hath a greater quantitie of floures and ſeed growing together like little cluſters of grapes, of a yellowiſh colour. The ſeed for the moſt part is loſt before it can be gathered.

1 *Mercurialis mas.*
Male Mercurie.



2 *Mercurialis fœmina.*
Female Mercury.



¶ *The Place.*

French Mercurie is ſowen in Kitchen gardens among pot-herbes; in Vineyards, and in moiſt ſhadowie places: I found it vnder the dropping of the Biſhops houſe at Rocheſter; from whence I brought a plant or two into my garden, ſince which time I cannot rid my garden from it.

¶ *The Time.*

They floure and flouriſh all the Summer long.

¶ *The Names.*

It is called in Greeke, λινόζωστις, and ἑρμοῦ βοτάνιον, or Mercurie his herbe; whereupon the Latines call it *Mercurialis*: it is called in Italian, *Mercorella*: in Engliſh, French Mercurie: in French, *Mercuriale, Vignoble*, and *Foirelle, quia Fluidam laxamve alvum reddit, Gallobelgæ enim foize & foizeus, ventris Fluorem vocant.*

¶ *The Temperature.*

Mercury is hot and drie, yet not aboue the ſecond degree: it hath a cleanſing faculty, and (as *Galen* writeth) a digeſting quality alſo.

¶ *The Vertues.*

A It is vſed in our age in cliſters, and thought very good to clenſe and ſcour away the excrements and other filth contained in the guts. It ſerueth to purge the belly, being eaten or otherwiſe taken, voiding out of the belly not only the excrements, but alſo flegme and choler. *Dioſcorides* reporteth, that the decoction hereof purgeth wateriſh humors.

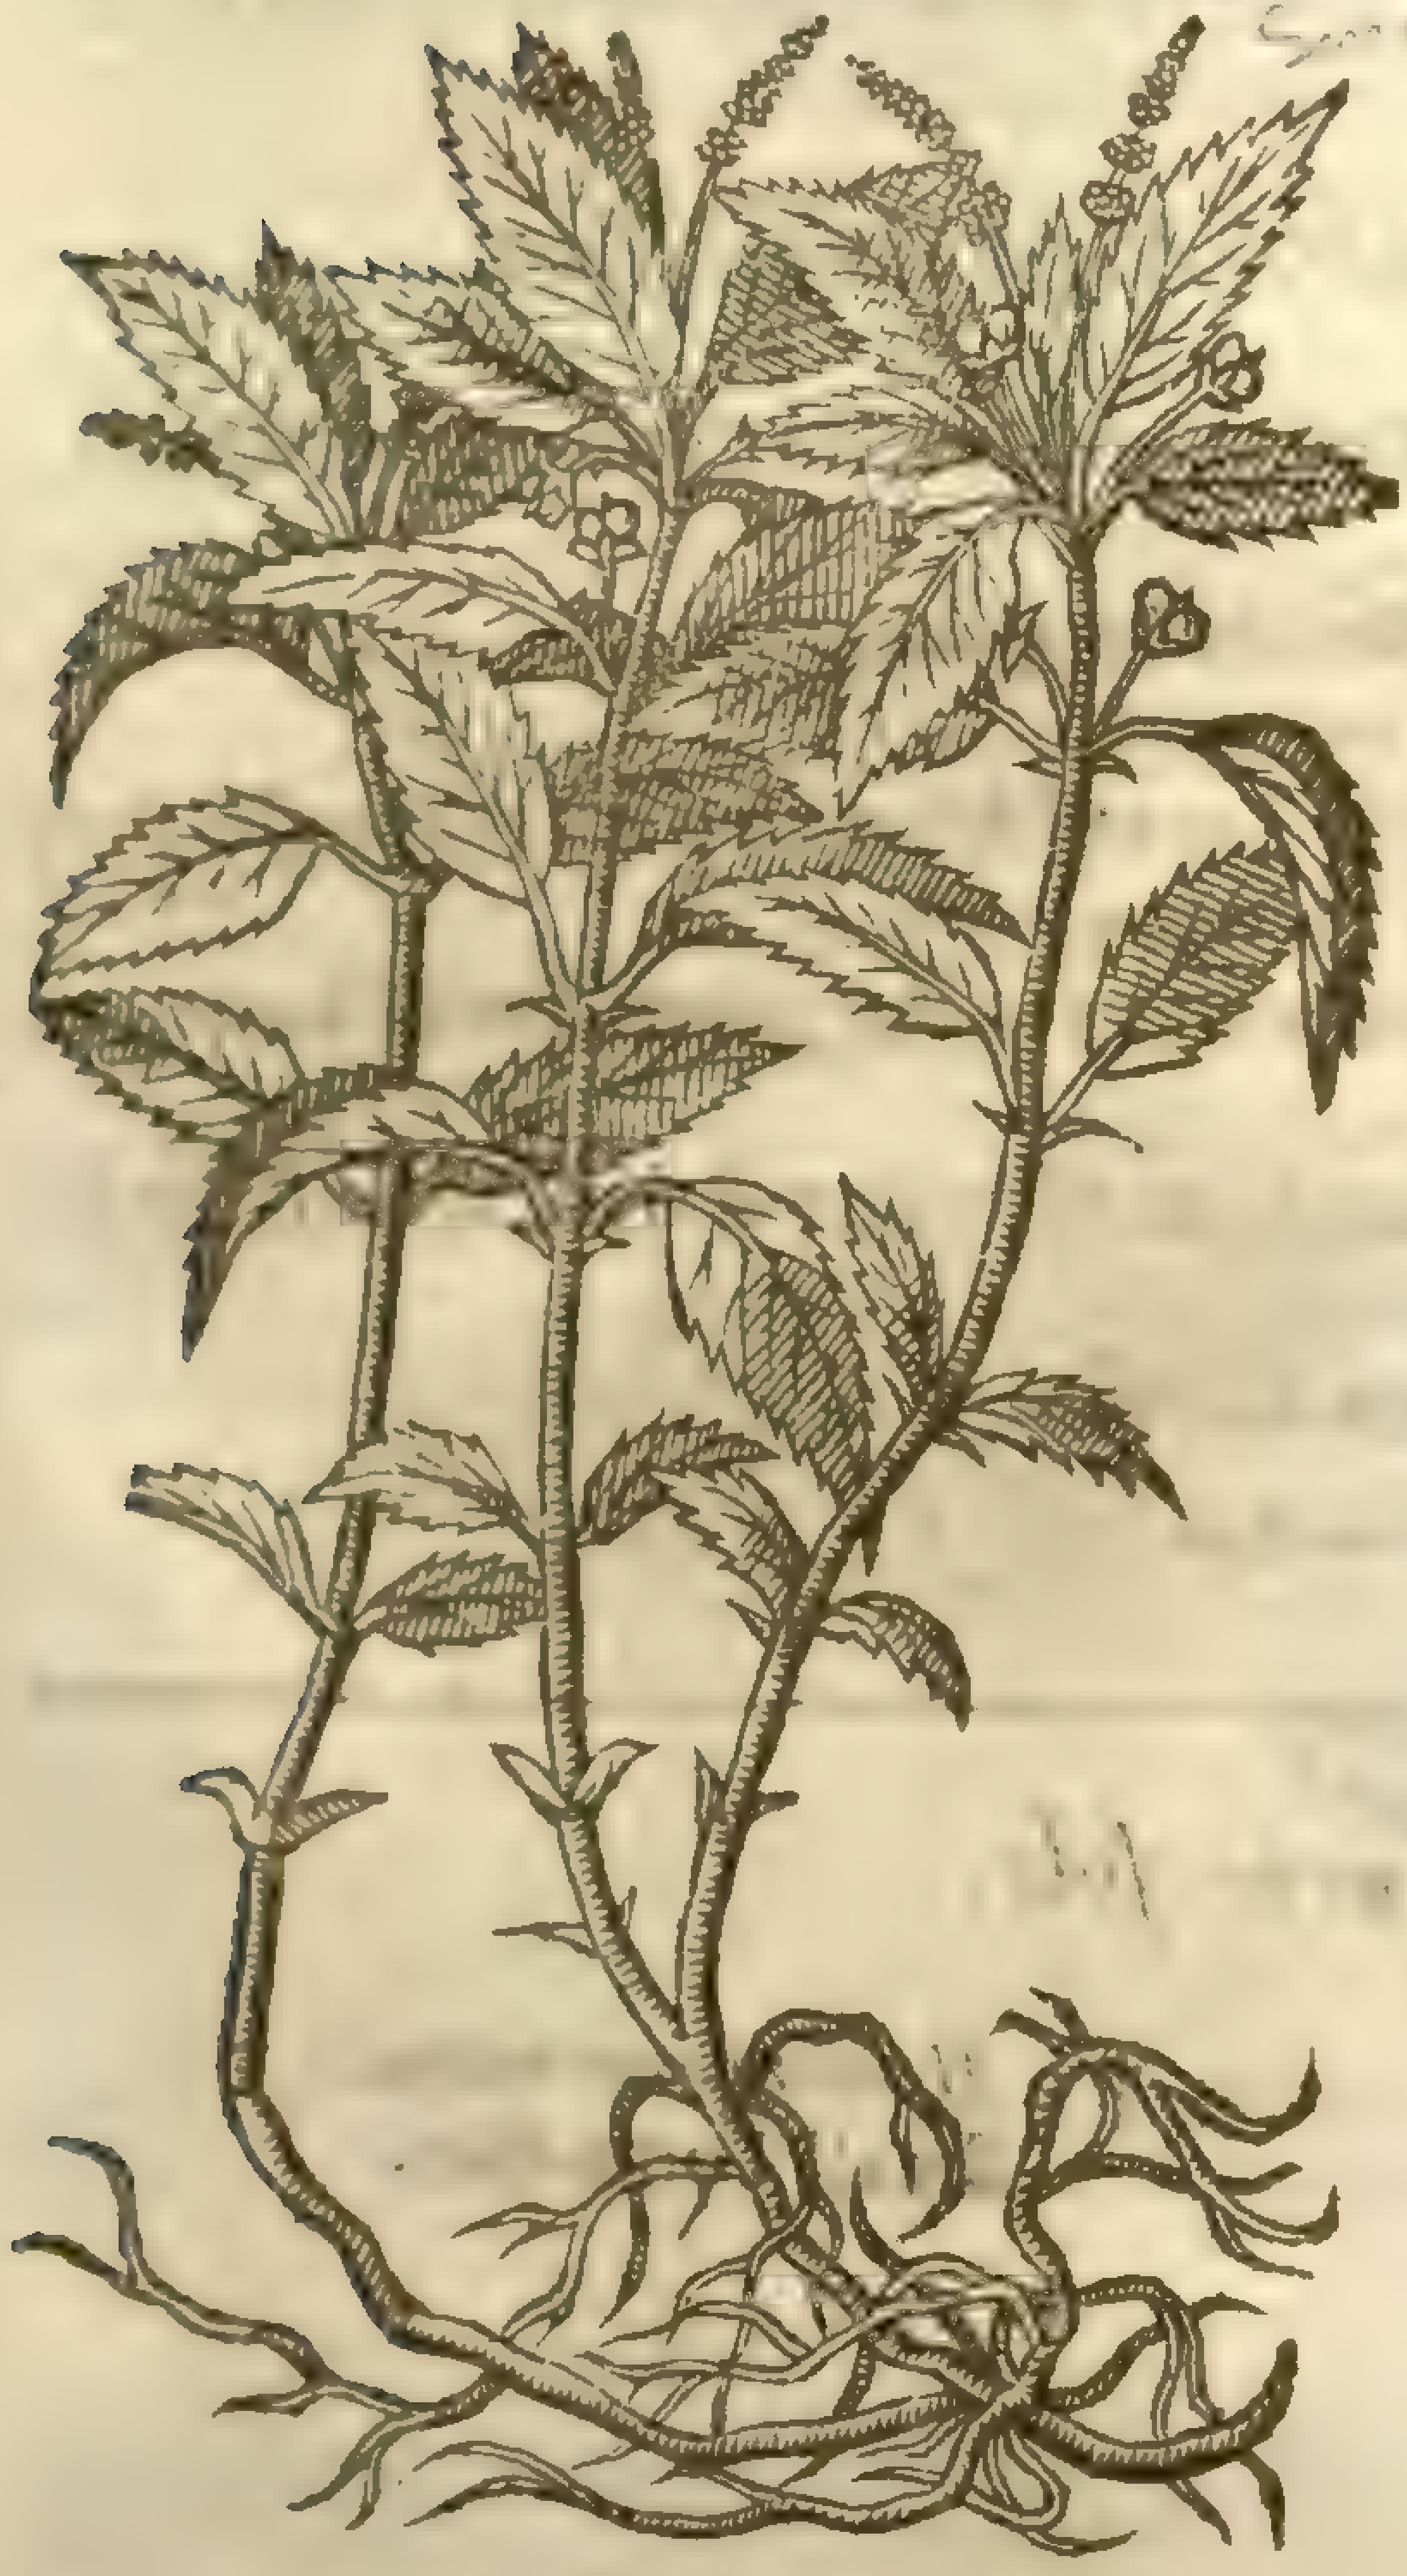
B The leaues ſtamped with butter, and applied to the fundament, prouoke to the ſtoole; and the herbe bruiſed and made vp in manner of a peſſary, cleanſeth the mother, and helpeth conception.

C *Coſtæus* in his booke of the nature of plants ſaith, that the juice of Mercury, Hollihocks, & purſlane mixed together, and the hands bathed therein, defendeth them from burning, if they be thruſt into boyling lead.

CHAP. 52. *Of Wilde Mercurie.*

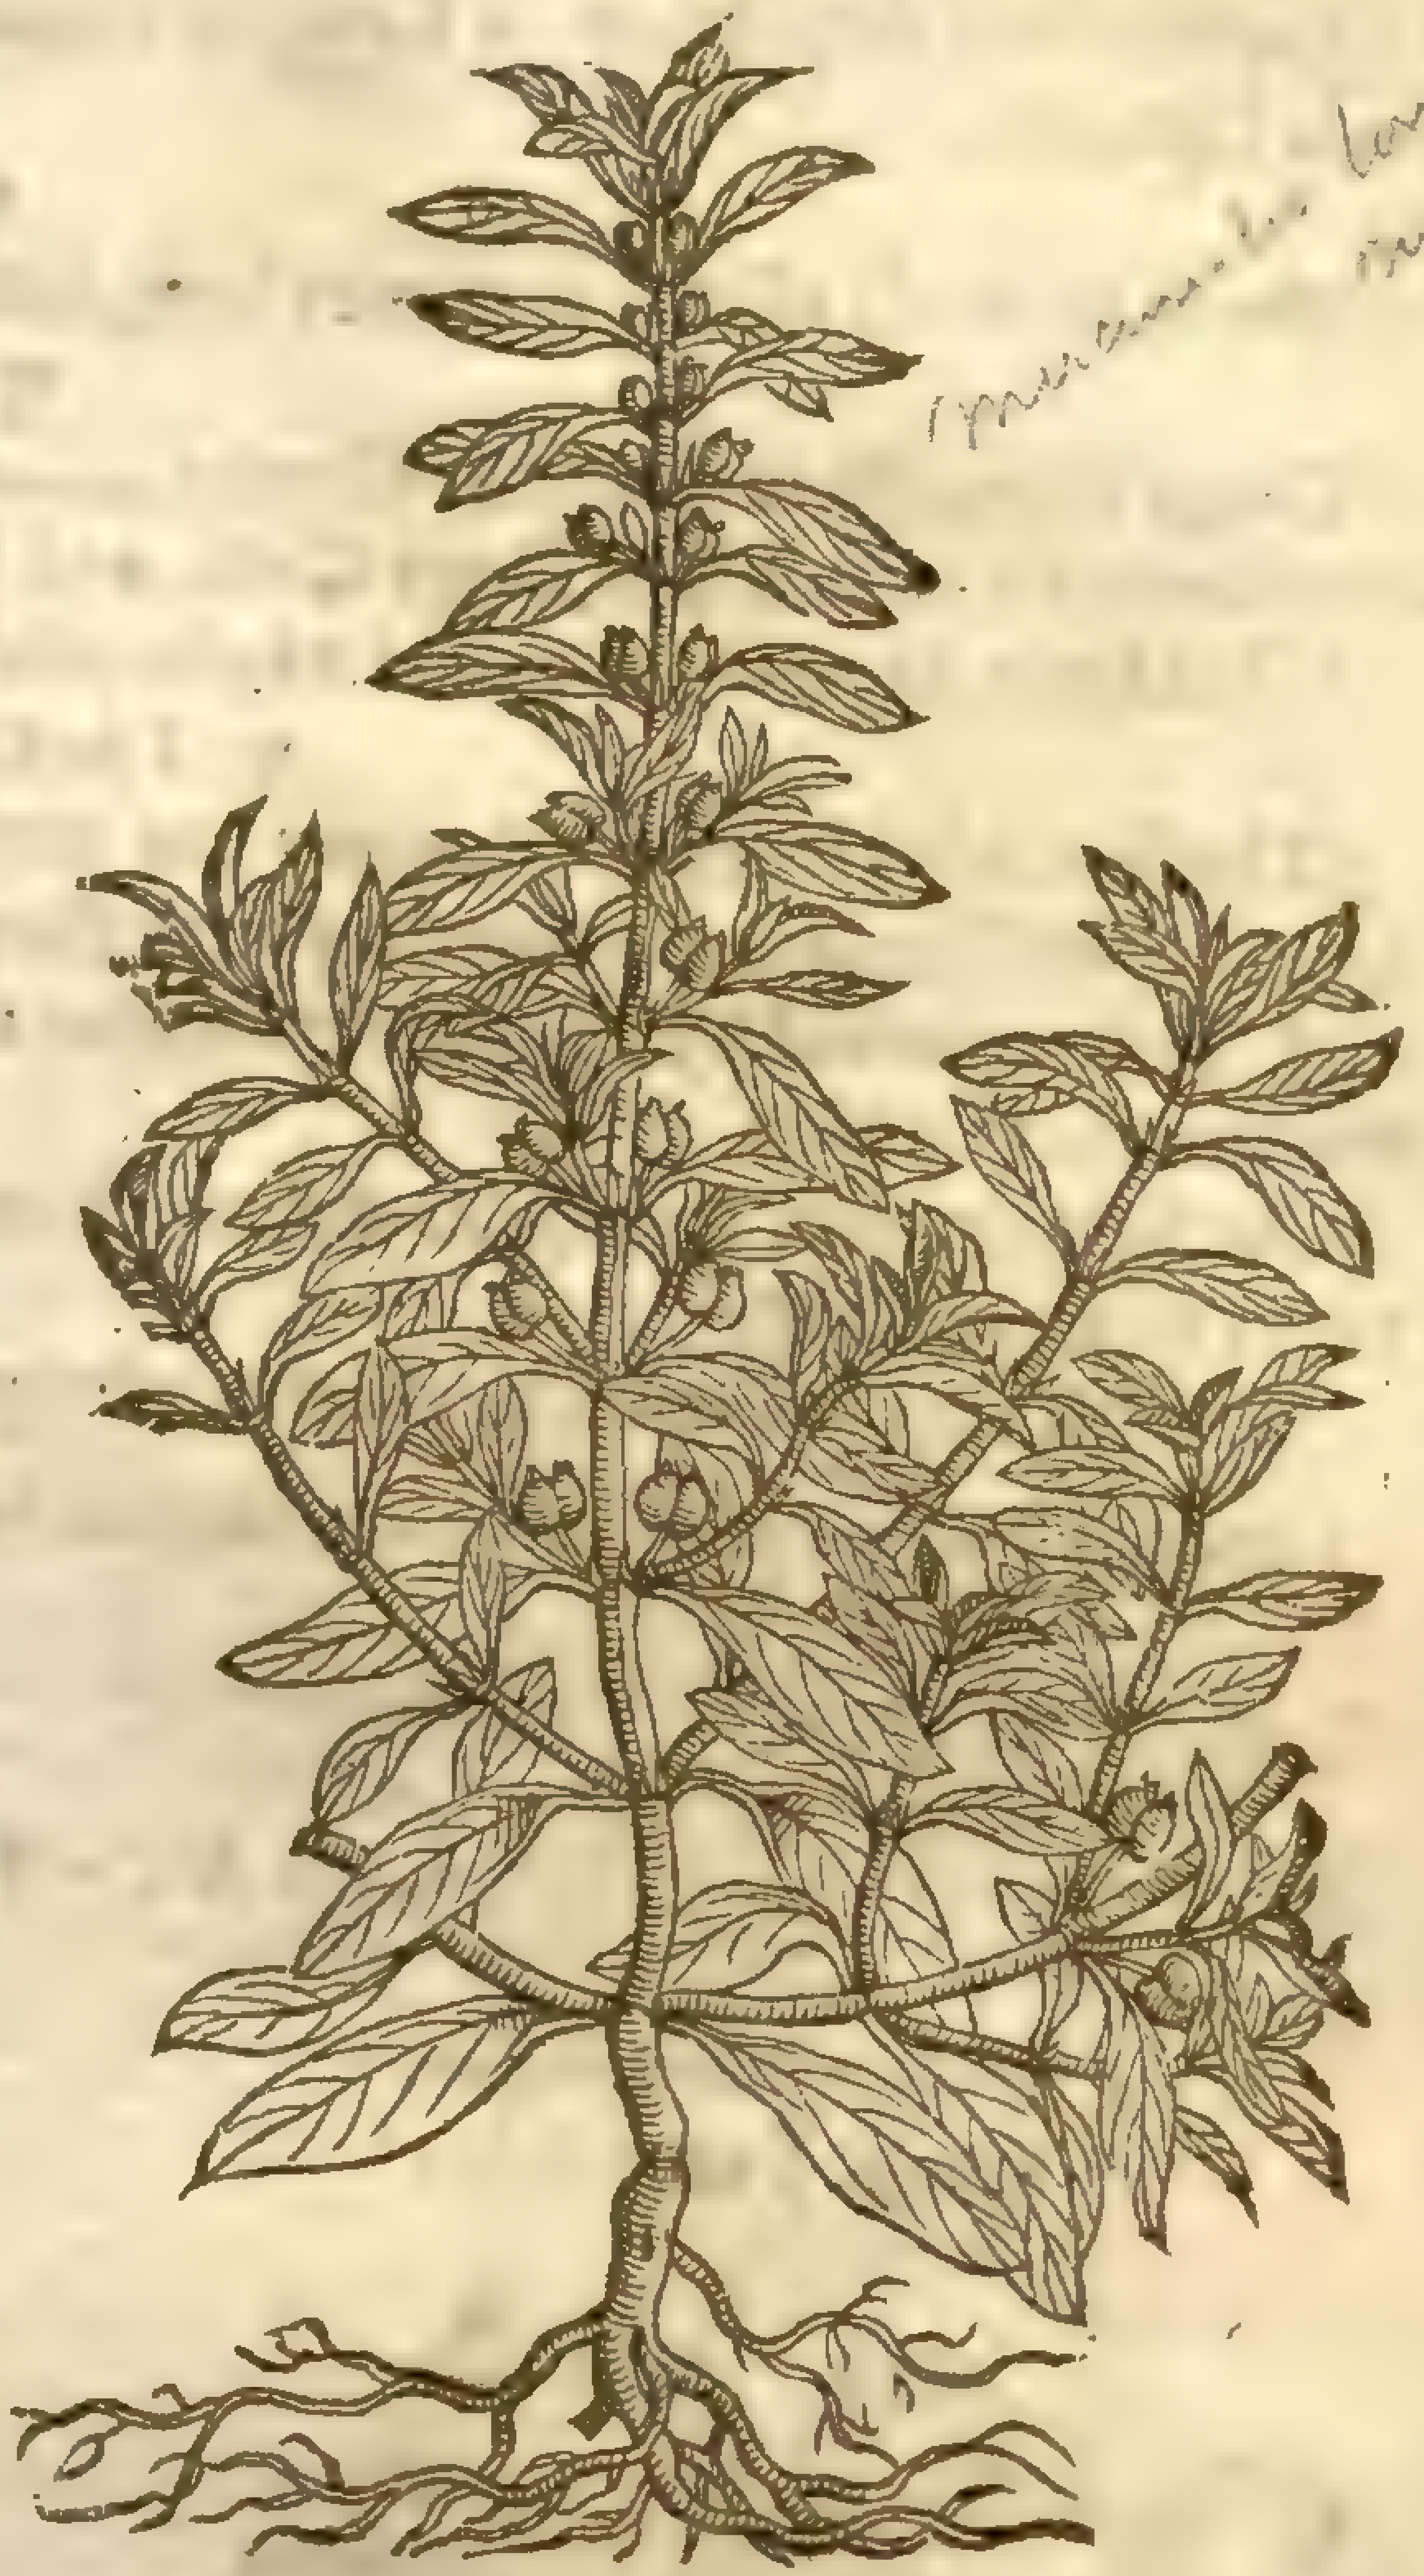
‡ 1 *Cynocrambe.*
Dogs Mercury.

[illegible] Simplic. 248



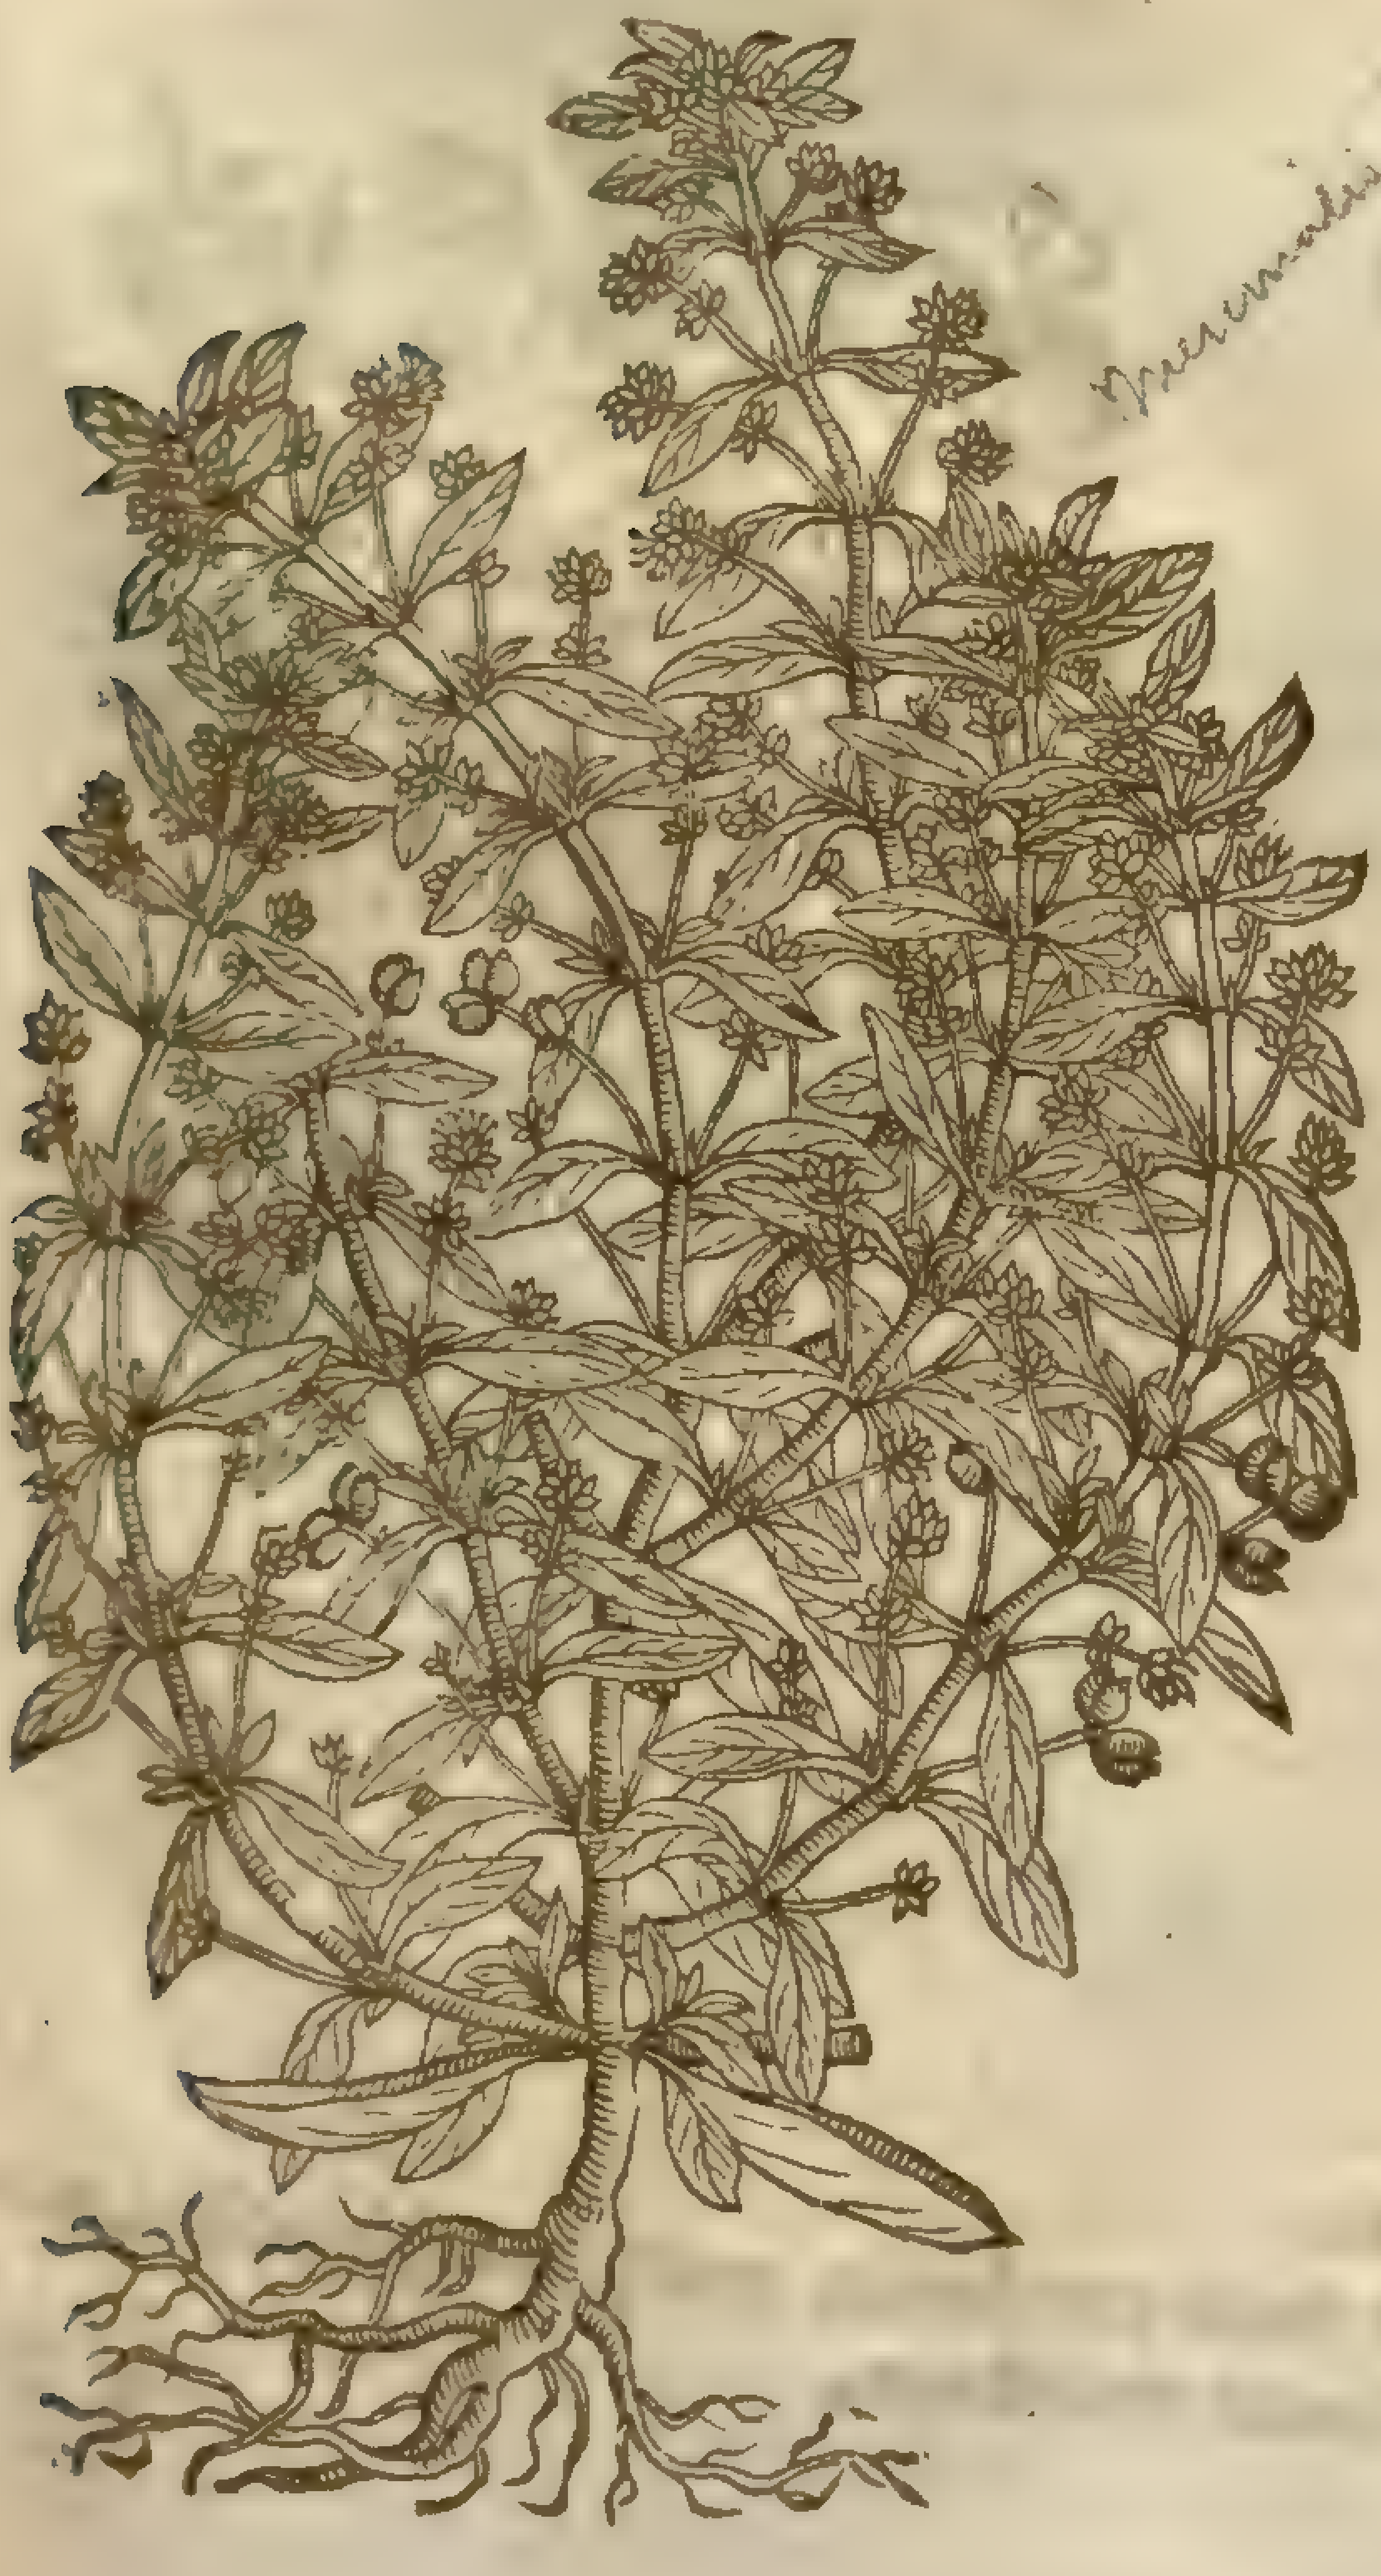
† 2 *Phyllon arrhenogonon, ſiue mariſicum.*
Male childrens Mercury.

Mercurialis [illegible]



3 *Phyllon Thelygonon, ſiue Fæminiſicum.*
Childrens Mercury the female.

Mercurialis [illegible]



¶ *The Deſcription.*

1 DOgs Mercurie is ſomewhat like vnto the garden Mercury, ſauing the leaues hereof are greater, and the ſtalke not ſo tender, and yet very brittle, growing to the height of a cubit, without any branches at all, with ſmall yellow floures. The ſeed is like the female Mercurie. ‡ It is alſo found like the male Mercurie, as you ſee them both expreſt in the figure; and ſo there is both male and ſemale of this Mercury alſo. ‡

2 Male childrens Mercury hath three or foure ſtalkes, or moe: the leaues be ſomewhat long, not much vnlike the leaues of the Oliue tree, couered ouer with a ſoft downe or wooll gray of colour; and the ſeed alſo like thoſe of Spurge, growing two together, being firſt of an aſh-colour, but after turne to a blew.

‡ 3 This is much in ſhape like to the laſt deſcribed, but the ſtalkes are weaker, and haue more leaues vpon them; the floures alſo are ſmall and moſſy, and they grow vpon long ſtalkes, whereas the ſeeds of the other are faſtned to very ſhort ones: the ſeed is contained in round little heads, being ſometimes two, otherwhiles three or more in a cluſter. ‡

¶ *The Place.*

They grow in woods and copſes, in the borders of fields, and among buſhes and hedges. ‡ But the two laſt deſcribed are not in England, for any thing that I know. ‡

The Dogs Mercury I haue found in many places about Greene-hithe, Swaineſ-combe village, Graueſend, and Southfleet in Kent; in Hampſted wood, and all the villages thereabout, foure miles from London.

¶ *The Time.*

Theſe flouriſh all the Summer long, vntill the extreame froſt do pull them downe.

¶ *The Names.*

Dogs Mercury is called in Greeke, κυνοκράμβη: in Latine, *Canina*, and *Braßica Canina*, and *Mercurialis ſylueſtris*: in Engliſh, Dogs Cole, and Dogs Mercury.

Childrens Mercury is called *Phyllon thelygonon*, and *Phyllon Arrhenogonon*.

¶ *The Temperature and Vertues.*

Theſe wilde kindes of Mercury are not vſed in Phyſicke; notwithſtanding it is thought they agree as well in nature as quality with the other kindes of Mercury.

A ‡ It is reported by the Antients, that the male *Phyllon* conduces to the generation of boies, and the female to girles.

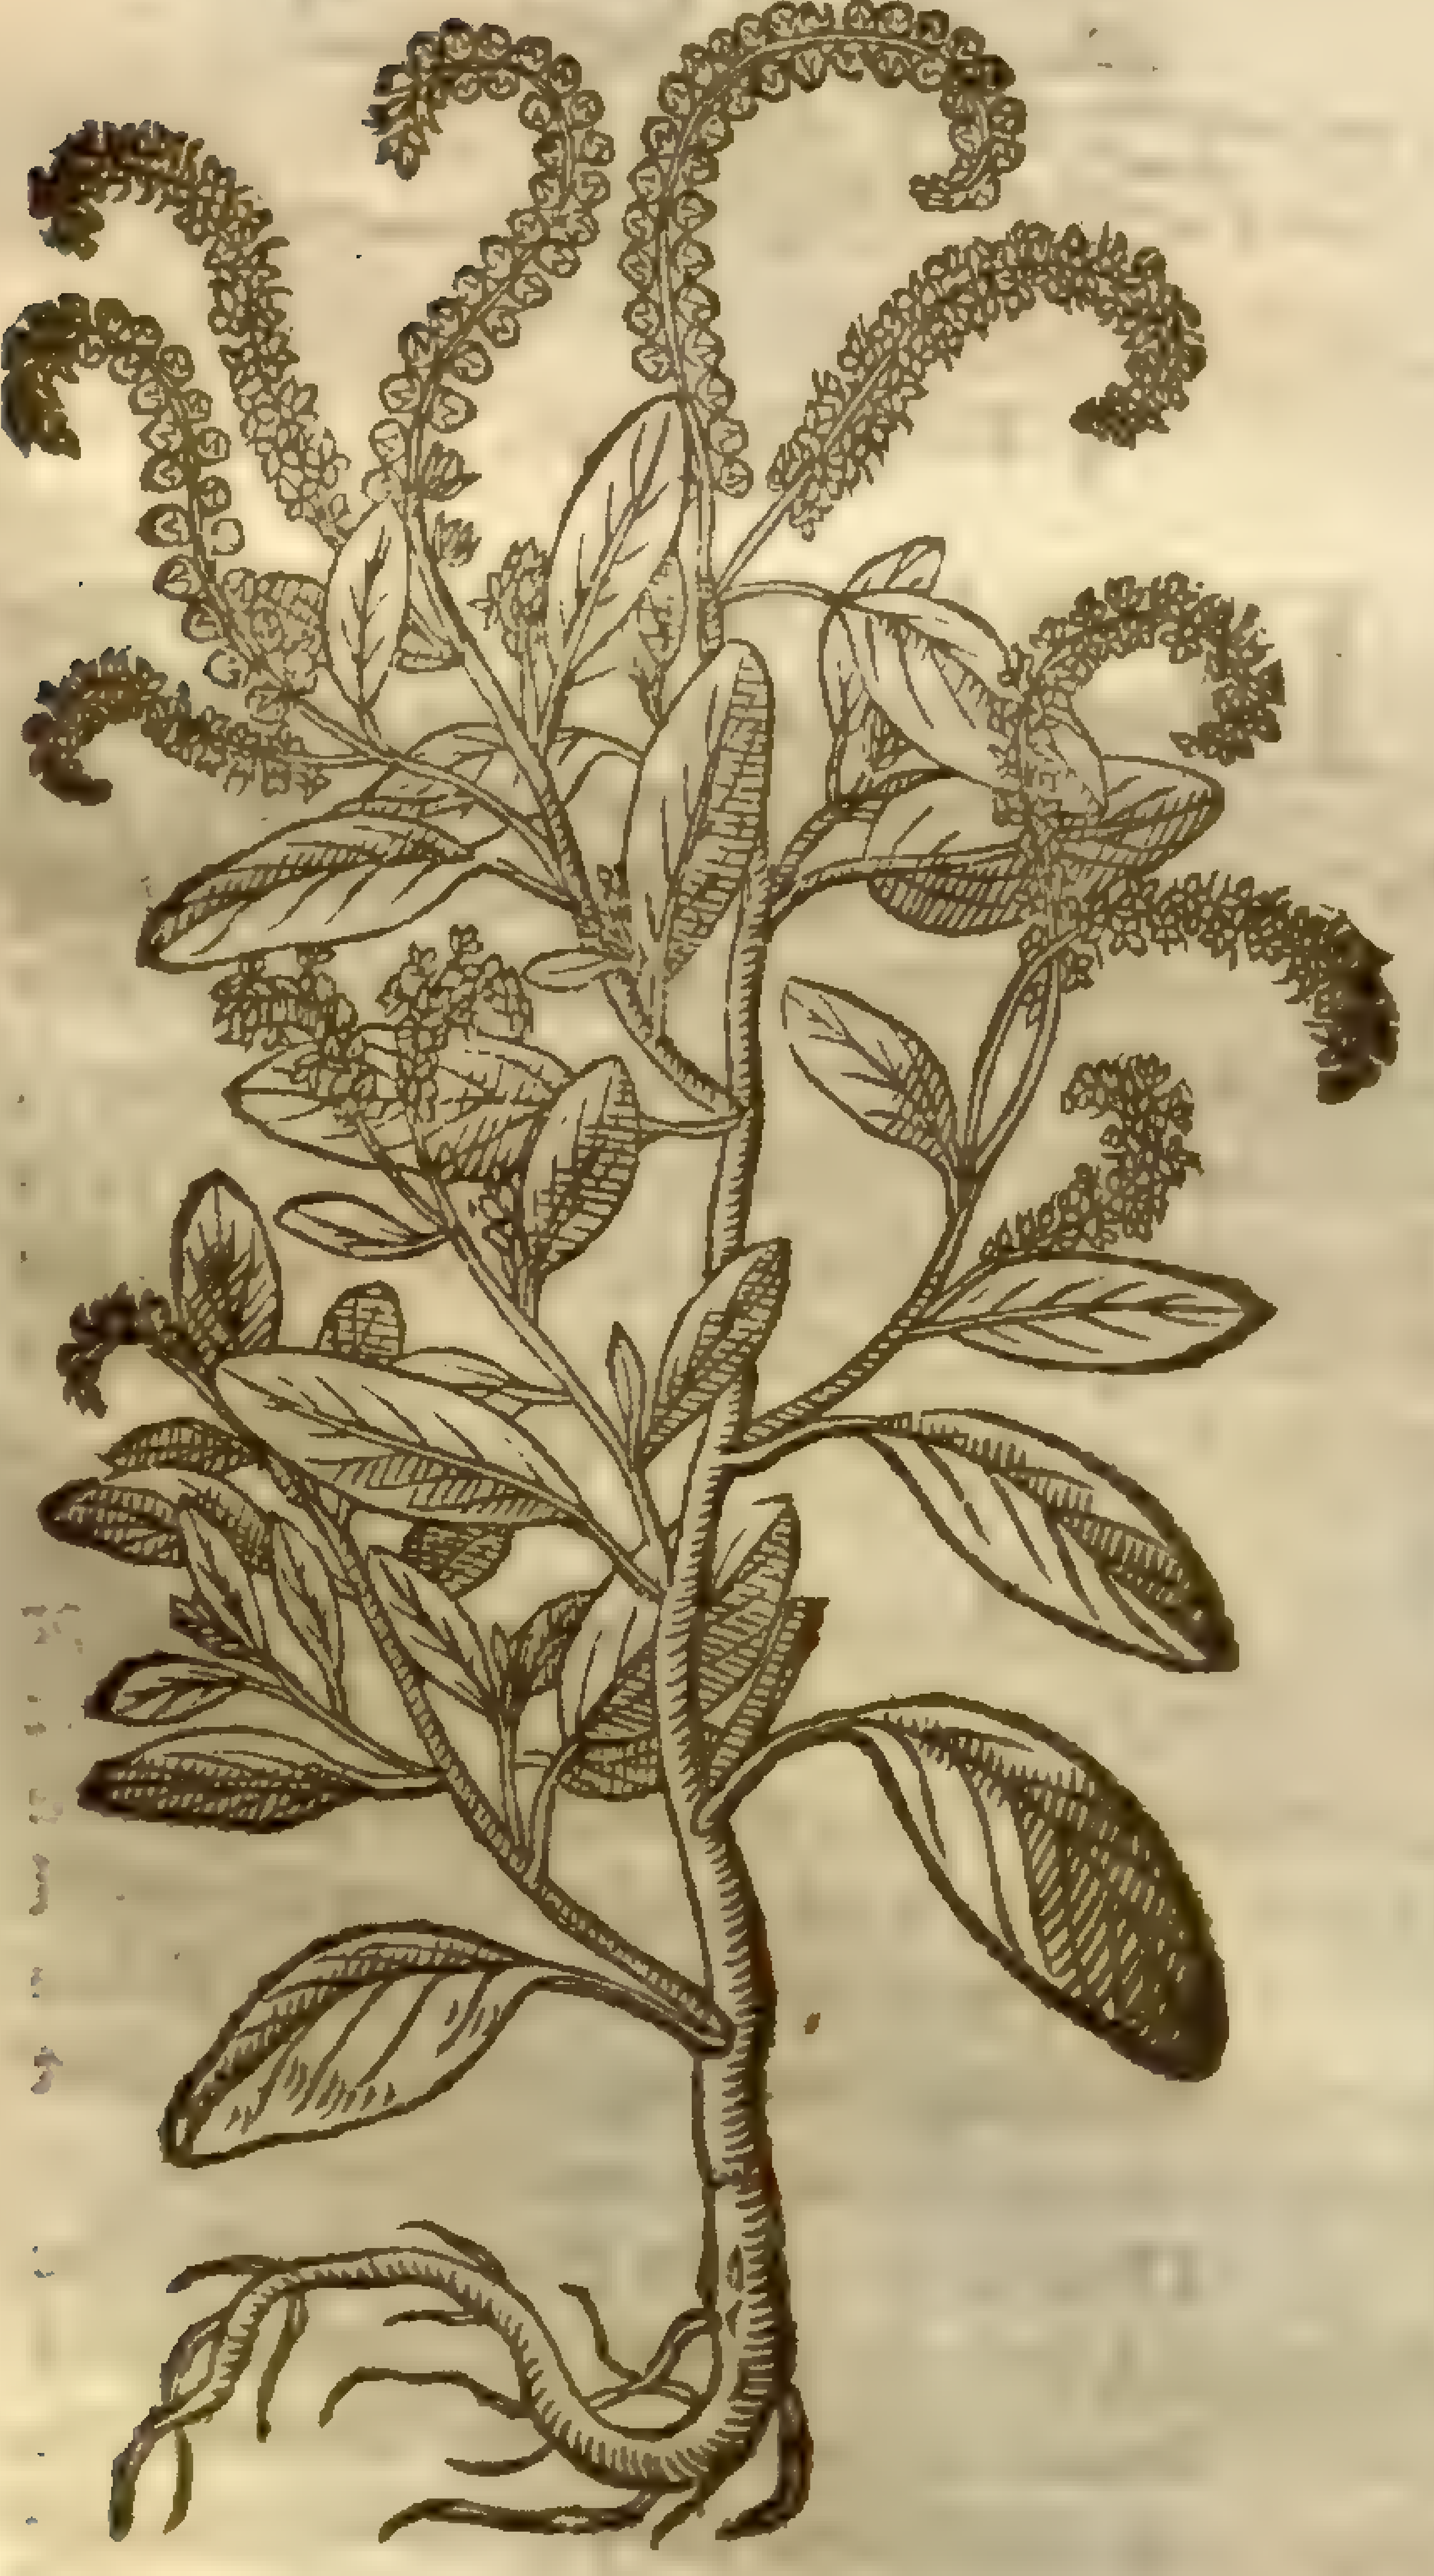
B At Salamantica they giue and much commend the decoction of either of theſe againſt the bitings of a mad dog.

C The Moores at Granado vſe them frequently in womens diſeaſes. ‡

† The figure of the *Cynocrambe* was omitted, and in ſtead thereof was put the figure of *Phyllon mariſcum*.

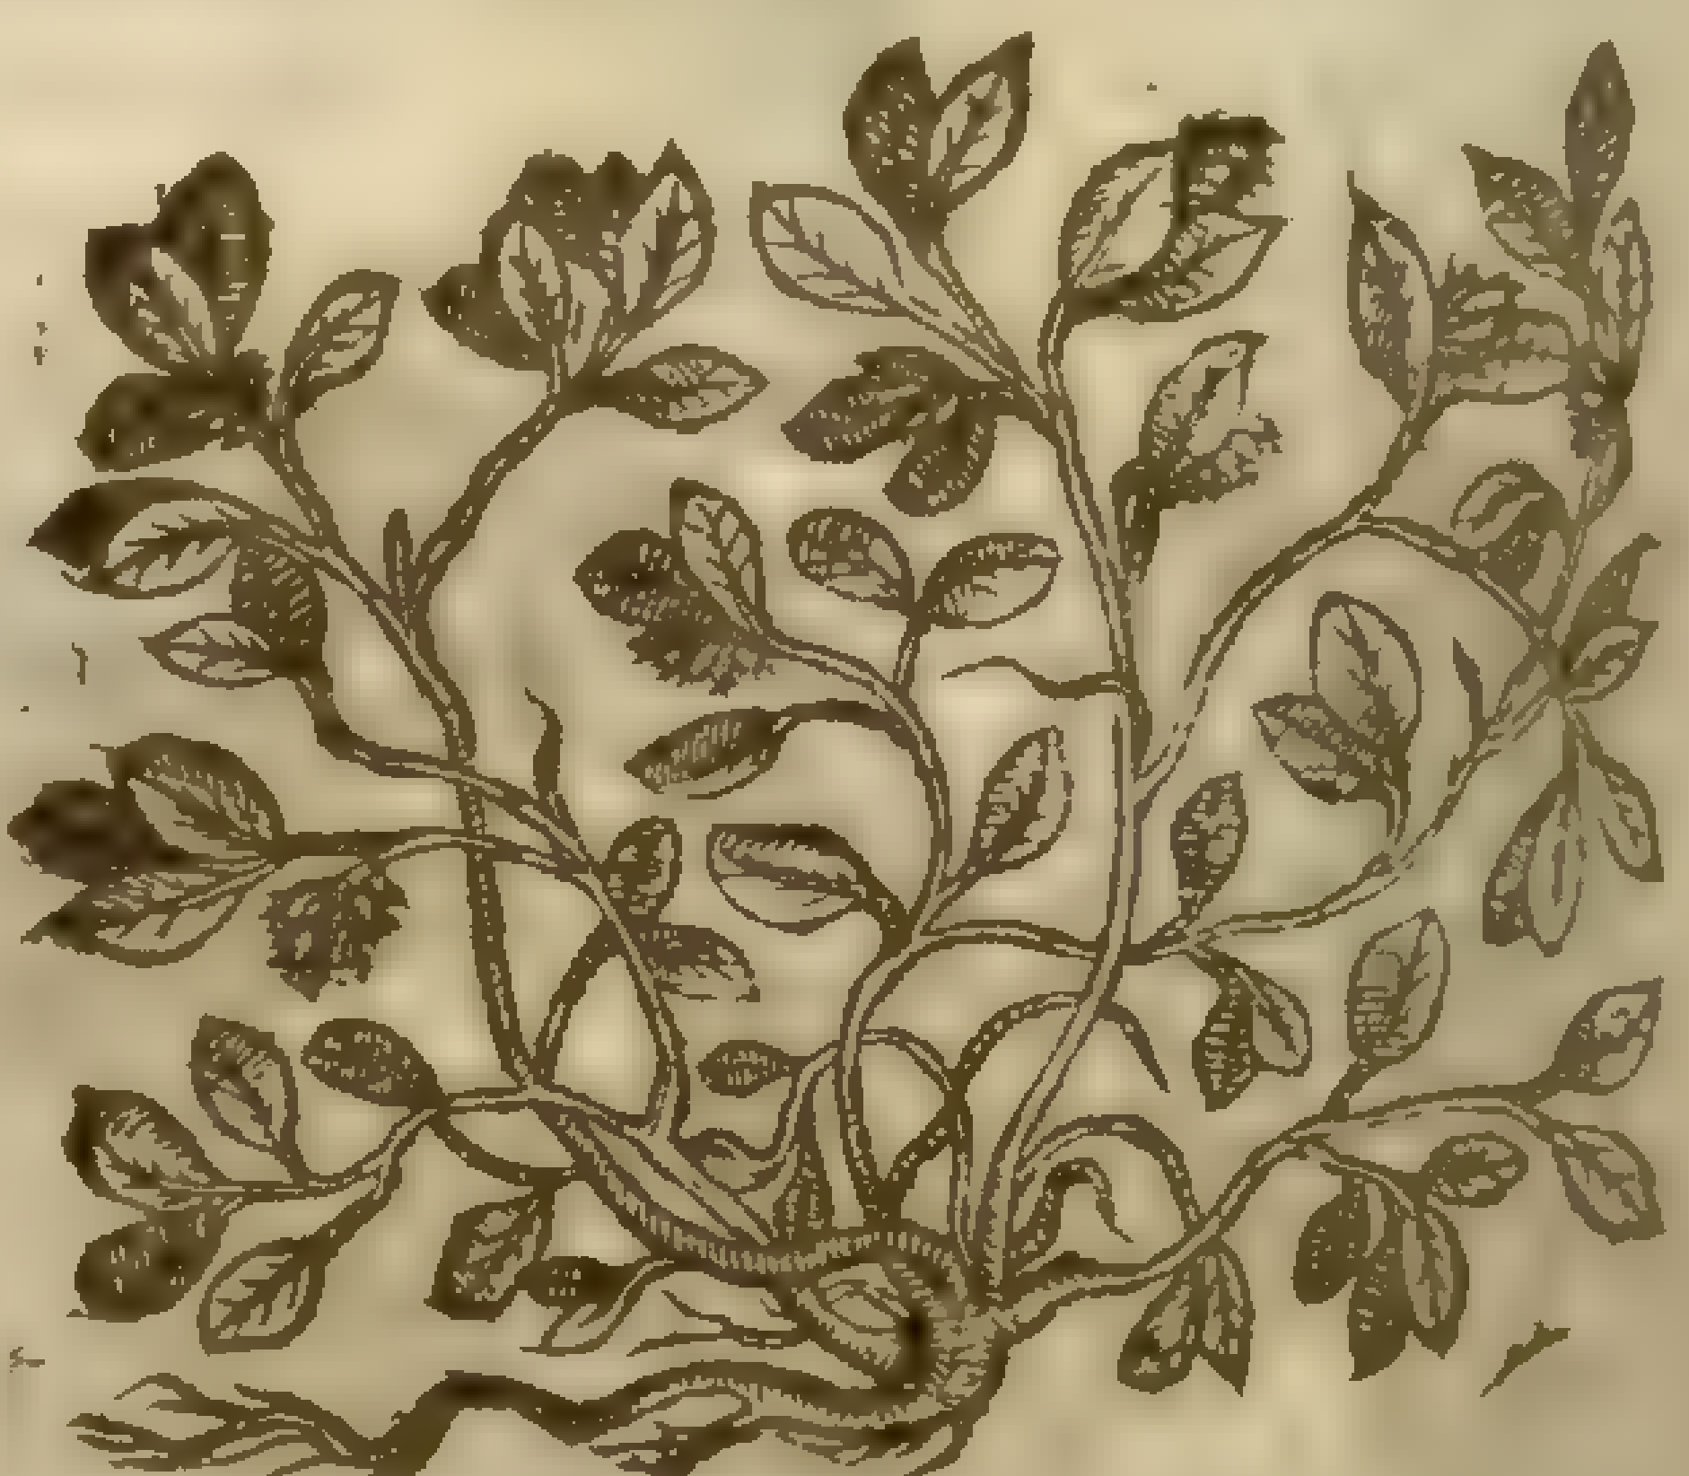
Chap. 53. *Of Torne-ſole.*

1 *Heliotropium majus.*
Great Torne-ſole.



H. Europæum, L. [illegible]

† 2 *Heliotropium minus.*
Small Torne-ſole.



¶ *The Kindes.*

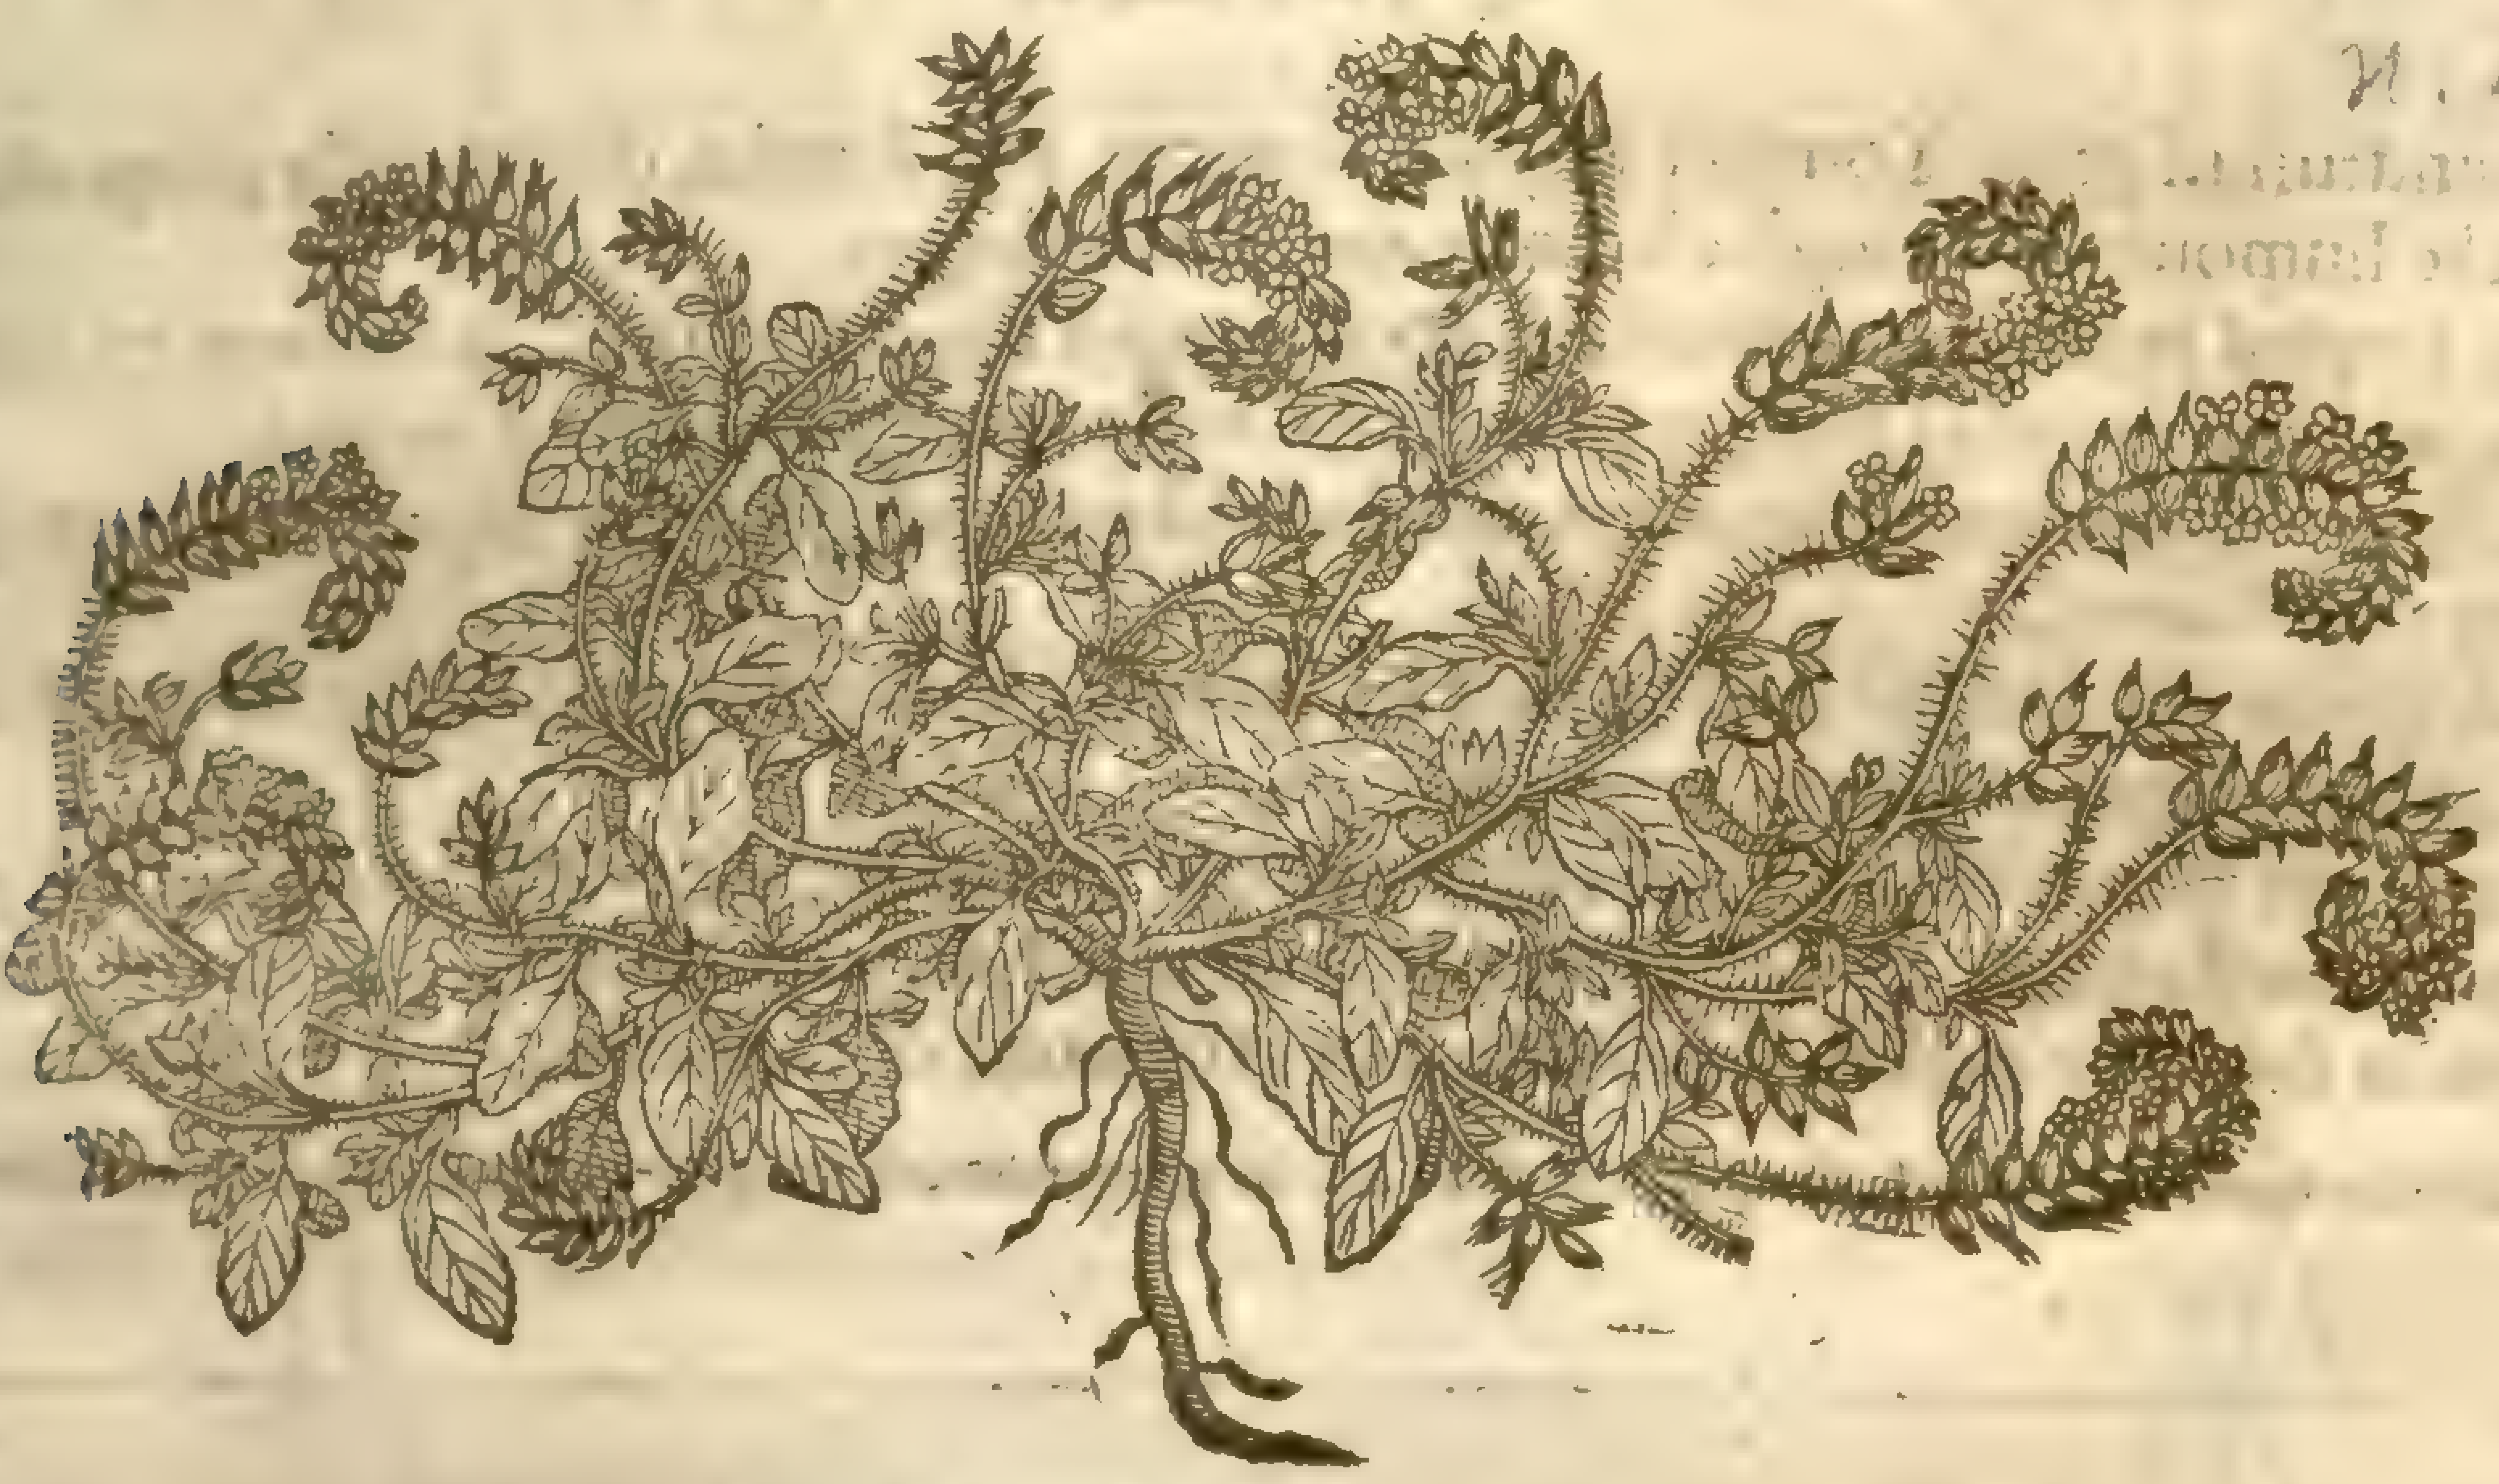
There bee foure ſorts of Torne-ſole, differing one from another in many notable points, as in greatneſſe and ſmallneſſe, in colour of floures, in forme and ſhape.

¶ *The Deſcription.*

1 The great Torneſole hath great ſtraight ſtalks couered with a white hairy cotton, eſpecially about the top; the leaues are ſoft and hairy in handling, in ſhape like the leaues of Baſill: the floures grow at the top of the branches, in colour white, thicke together in rowes vpon one ſide of the ſtalke, which ſtalke doth bend to turne backeward like the taile of a ſcorpion: the root is ſmall and threddy.

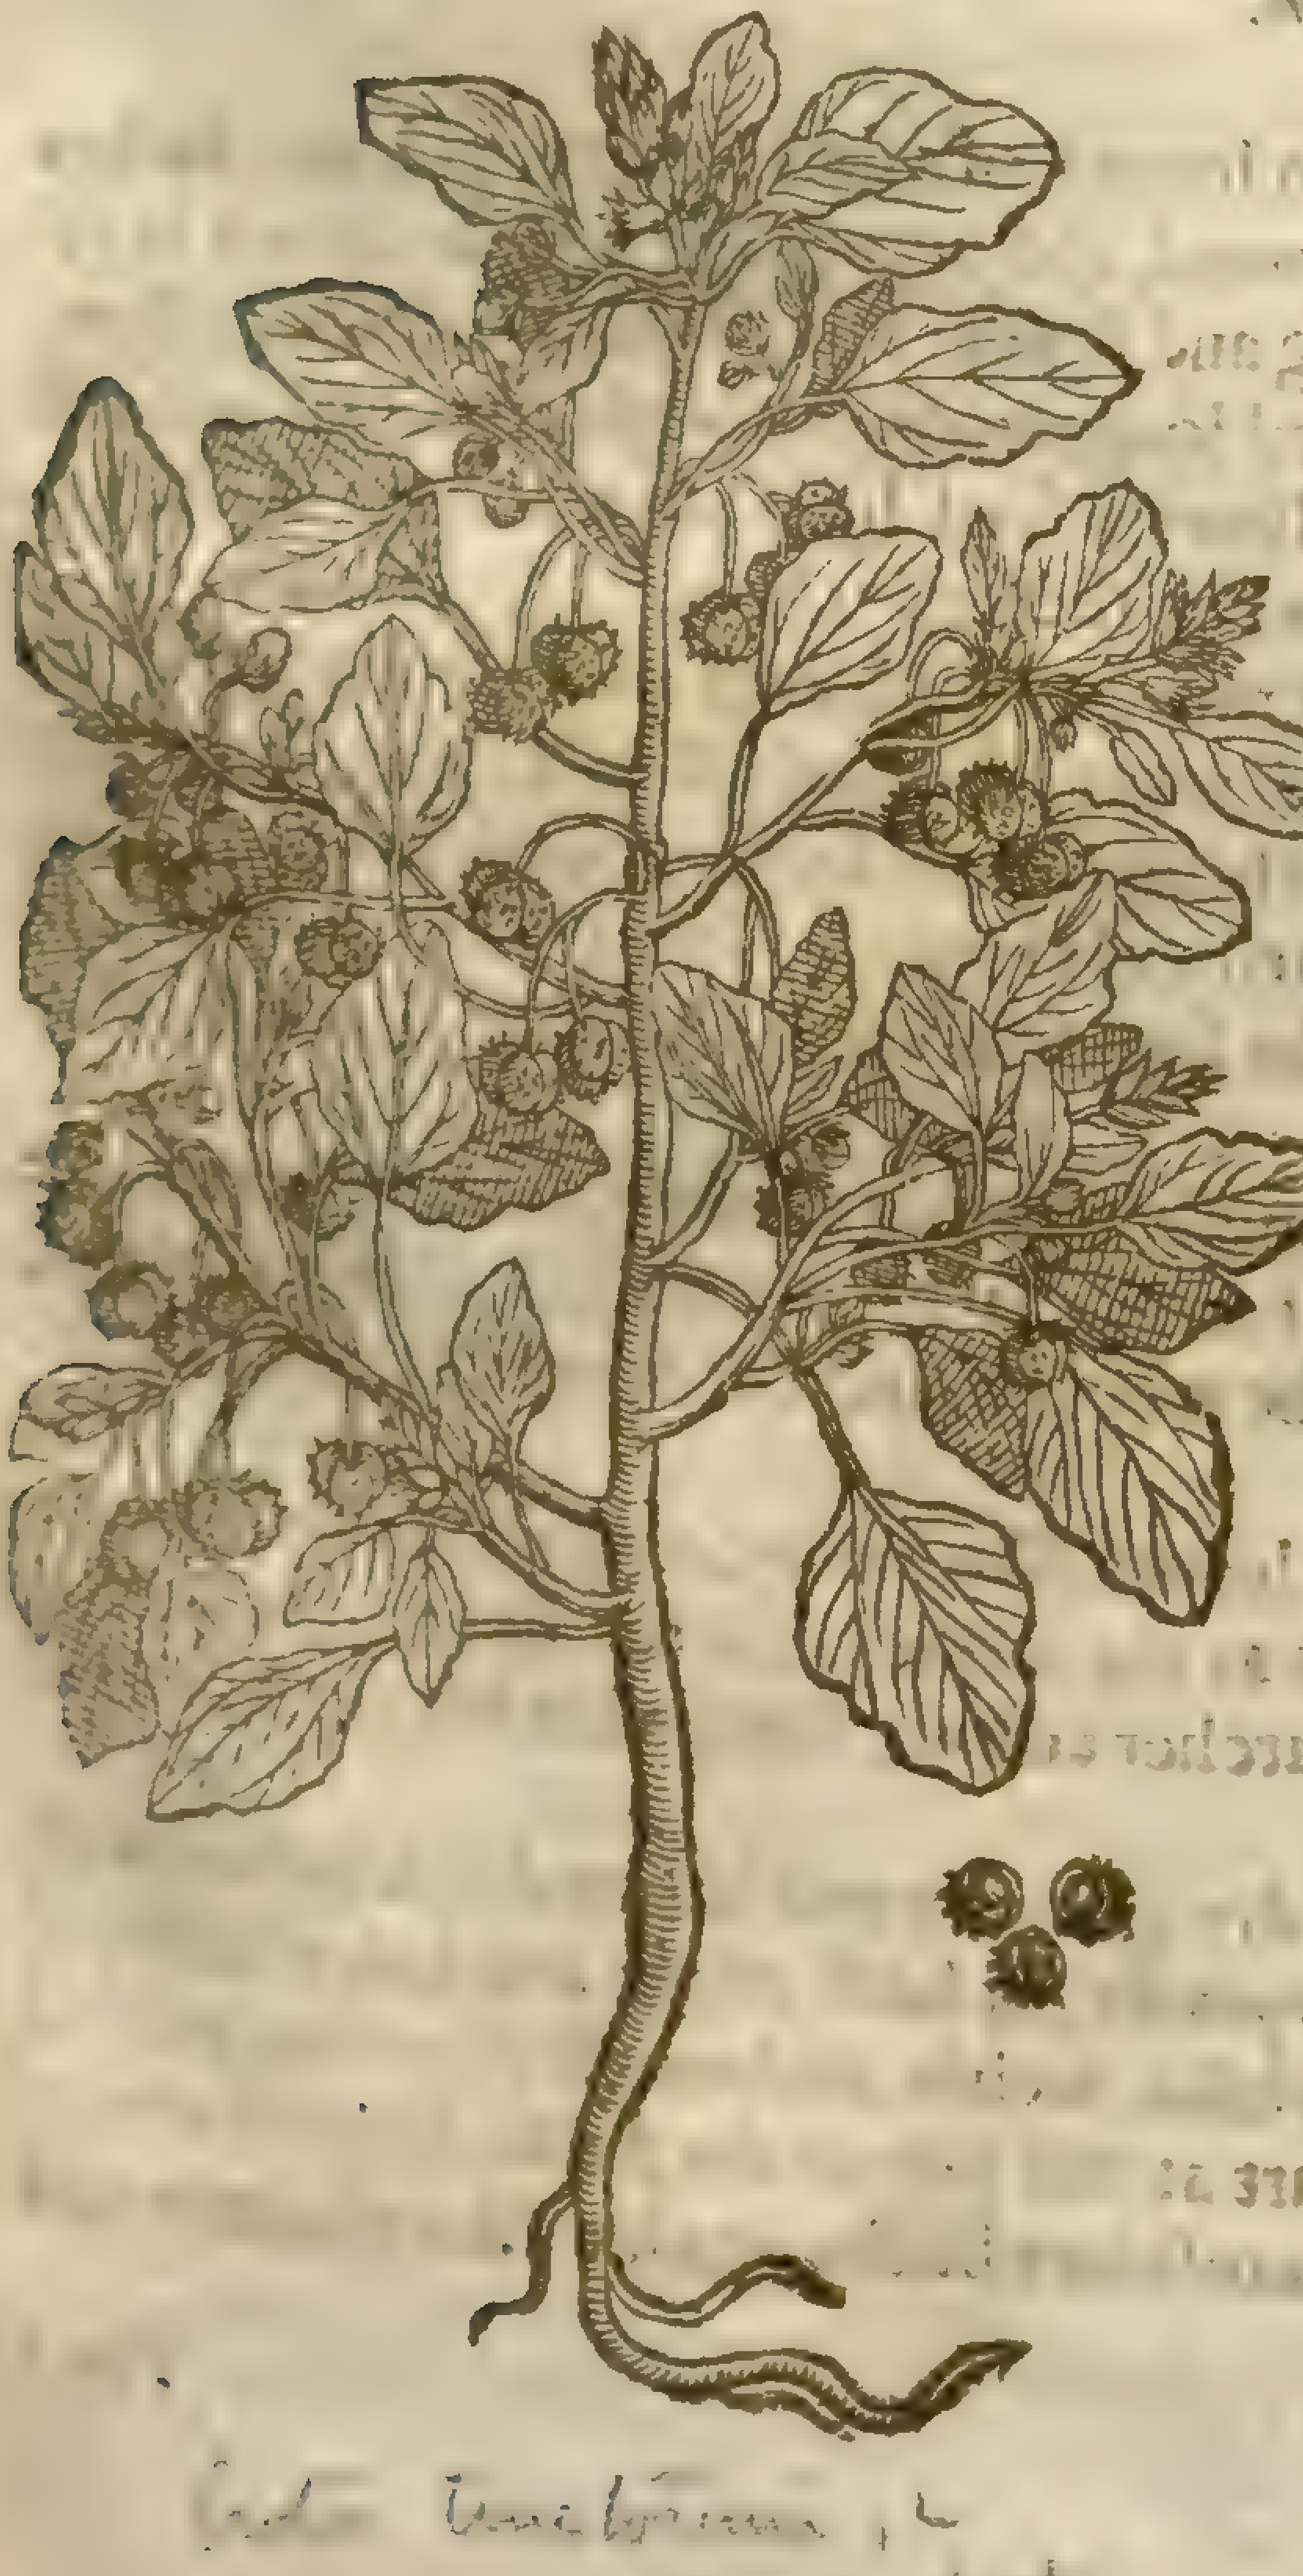
2 The ſmall Torneſole hath many little and weake branches trailing vpon the ground, whereupon do grow ſmall leaues, like thoſe of the leſſer Baſill. The floures do grow without any certaine order, amongſt the leaues and tender branches, gray of colour, with a little ſpot of yellow in the middeſt, the which turne into crooked tailes like thoſe of the precedent, but not altogether ſo much.

† 3 *Heliotropium ſupinum Cluſij & Lobelij.* Hairie Torneſole.



H. sup[illegible]
[illegible] . 20
[illegible]

4 *Heliotropium Tricoccum.*
Widow-waile Tornſole.



Croton tinctorium, L.
[illegible]

3 Hairy Torneſole hath many feeble and weake branches trailing vpon the ground, ſet with ſmall leaues, leſſer than the great Tornſole, of which it is a kinde, hauing the ſeed in ſmall chaffie husks, which do turne backe like the taile of a ſcorpion, iuſt after the manner of the firſt deſcribed.

4 This kinde of Torneſole hath leaues very like to thoſe of the great Torneſole, but of a blacker greene colour: the floures be yellow, and vnprofitable; for they are not ſucceeded by the fruit, but after them commeth out the fruit hanging vpon ſmall foot-ſtalkes three ſquare, and in euery corner there is a ſmall ſeed like to thoſe of the Tythimales; the root is ſmall and threddy.

¶ *The Place.*

Torneſole, as *Dioſcorides* ſaith, doth grow in fennie grounds and neere vnto pooles and lakes. They are ſtrangers in England as yet: It doth grow about Montpelier in Languedock, where it is had in great vſe to ſtaine and die clouts withall, wherewith through Europe meat is coloured.

¶ *The Time.*

They flouriſh eſpecially in the Summer ſolſtice, or about the time when the ſun entreth into Cancer.

¶ *The Names.*

The Græcians call it *Heliotropium*: the Latines keepe theſe names, *Heliotropium magnum,* and *Scorpiurum*: of *Ruellius*, *Herba Cancri*: it is named *Heliotropium*, not becauſe it is turned about at the daily motion of the Sun, but by reaſon it floureth in the former ſolſtice, at which time the Sun being fartheſt gone from the Equinoctiall circle, returneth to the ſame: and *Scorpiurum* of the twiggie tops, that bow backeward like a ſcorpions taile: of the Italians, *Torneſole bobo*; in French, *Tournſol*: ſome thinke it to be *Herba Clytiæ*, into which the Poëts feigne *Clytia* to be metamorphoſed; whence one hath theſe verſes:

Herba velut Clytiæ ſemper petit obuia ſolem,
Sic pia mens Chriſtum, quo prece ſpectet, habet.

¶ *The Temperature.*

Tornſole, as *Paulus Ægineta* writeth, is hot and dry, and of a binding faculty.

¶ *The Vertues.*

A A good handfull of great Tornſole boyled in water, and drunke, doth gently purge the body of hot cholericke humours and tough clammie and ſlimie flegme.

B The ſame boyled in wine and drunke is good againſt the ſtinging of Scorpions, or other venomous beaſts, and is very good to be applied outwardly vpon the grieſe or wound.

C The ſeed ſtamped and laid vpon warts and ſuch like excreſcences, or ſuperfluous out-growings, cauſeth them to fall away.

D The ſmall Torneſole and his ſeed boyled with Hyſſope, Creſſes, and ſalt-peter and drunke, driueth forth flat and round wormes.

E With the ſmall Torneſole they in France doe die linnen rags or clouts into a perfect purple colour, wherewith cookes and confectioners do colour jellies, wines, meats, and ſundry confectures: which clouts in ſhops be called Torneſole, after the name of the herbe.

† The ſecond and third figures were formerly tranſpoſed: the fourth was the figure of the hairy Scorpion-graſſe deſcribed in the fourth place, in the following Chapter.

Chap. 54. *Of Scorpion Graſſe.*

¶ *The Deſcription.*

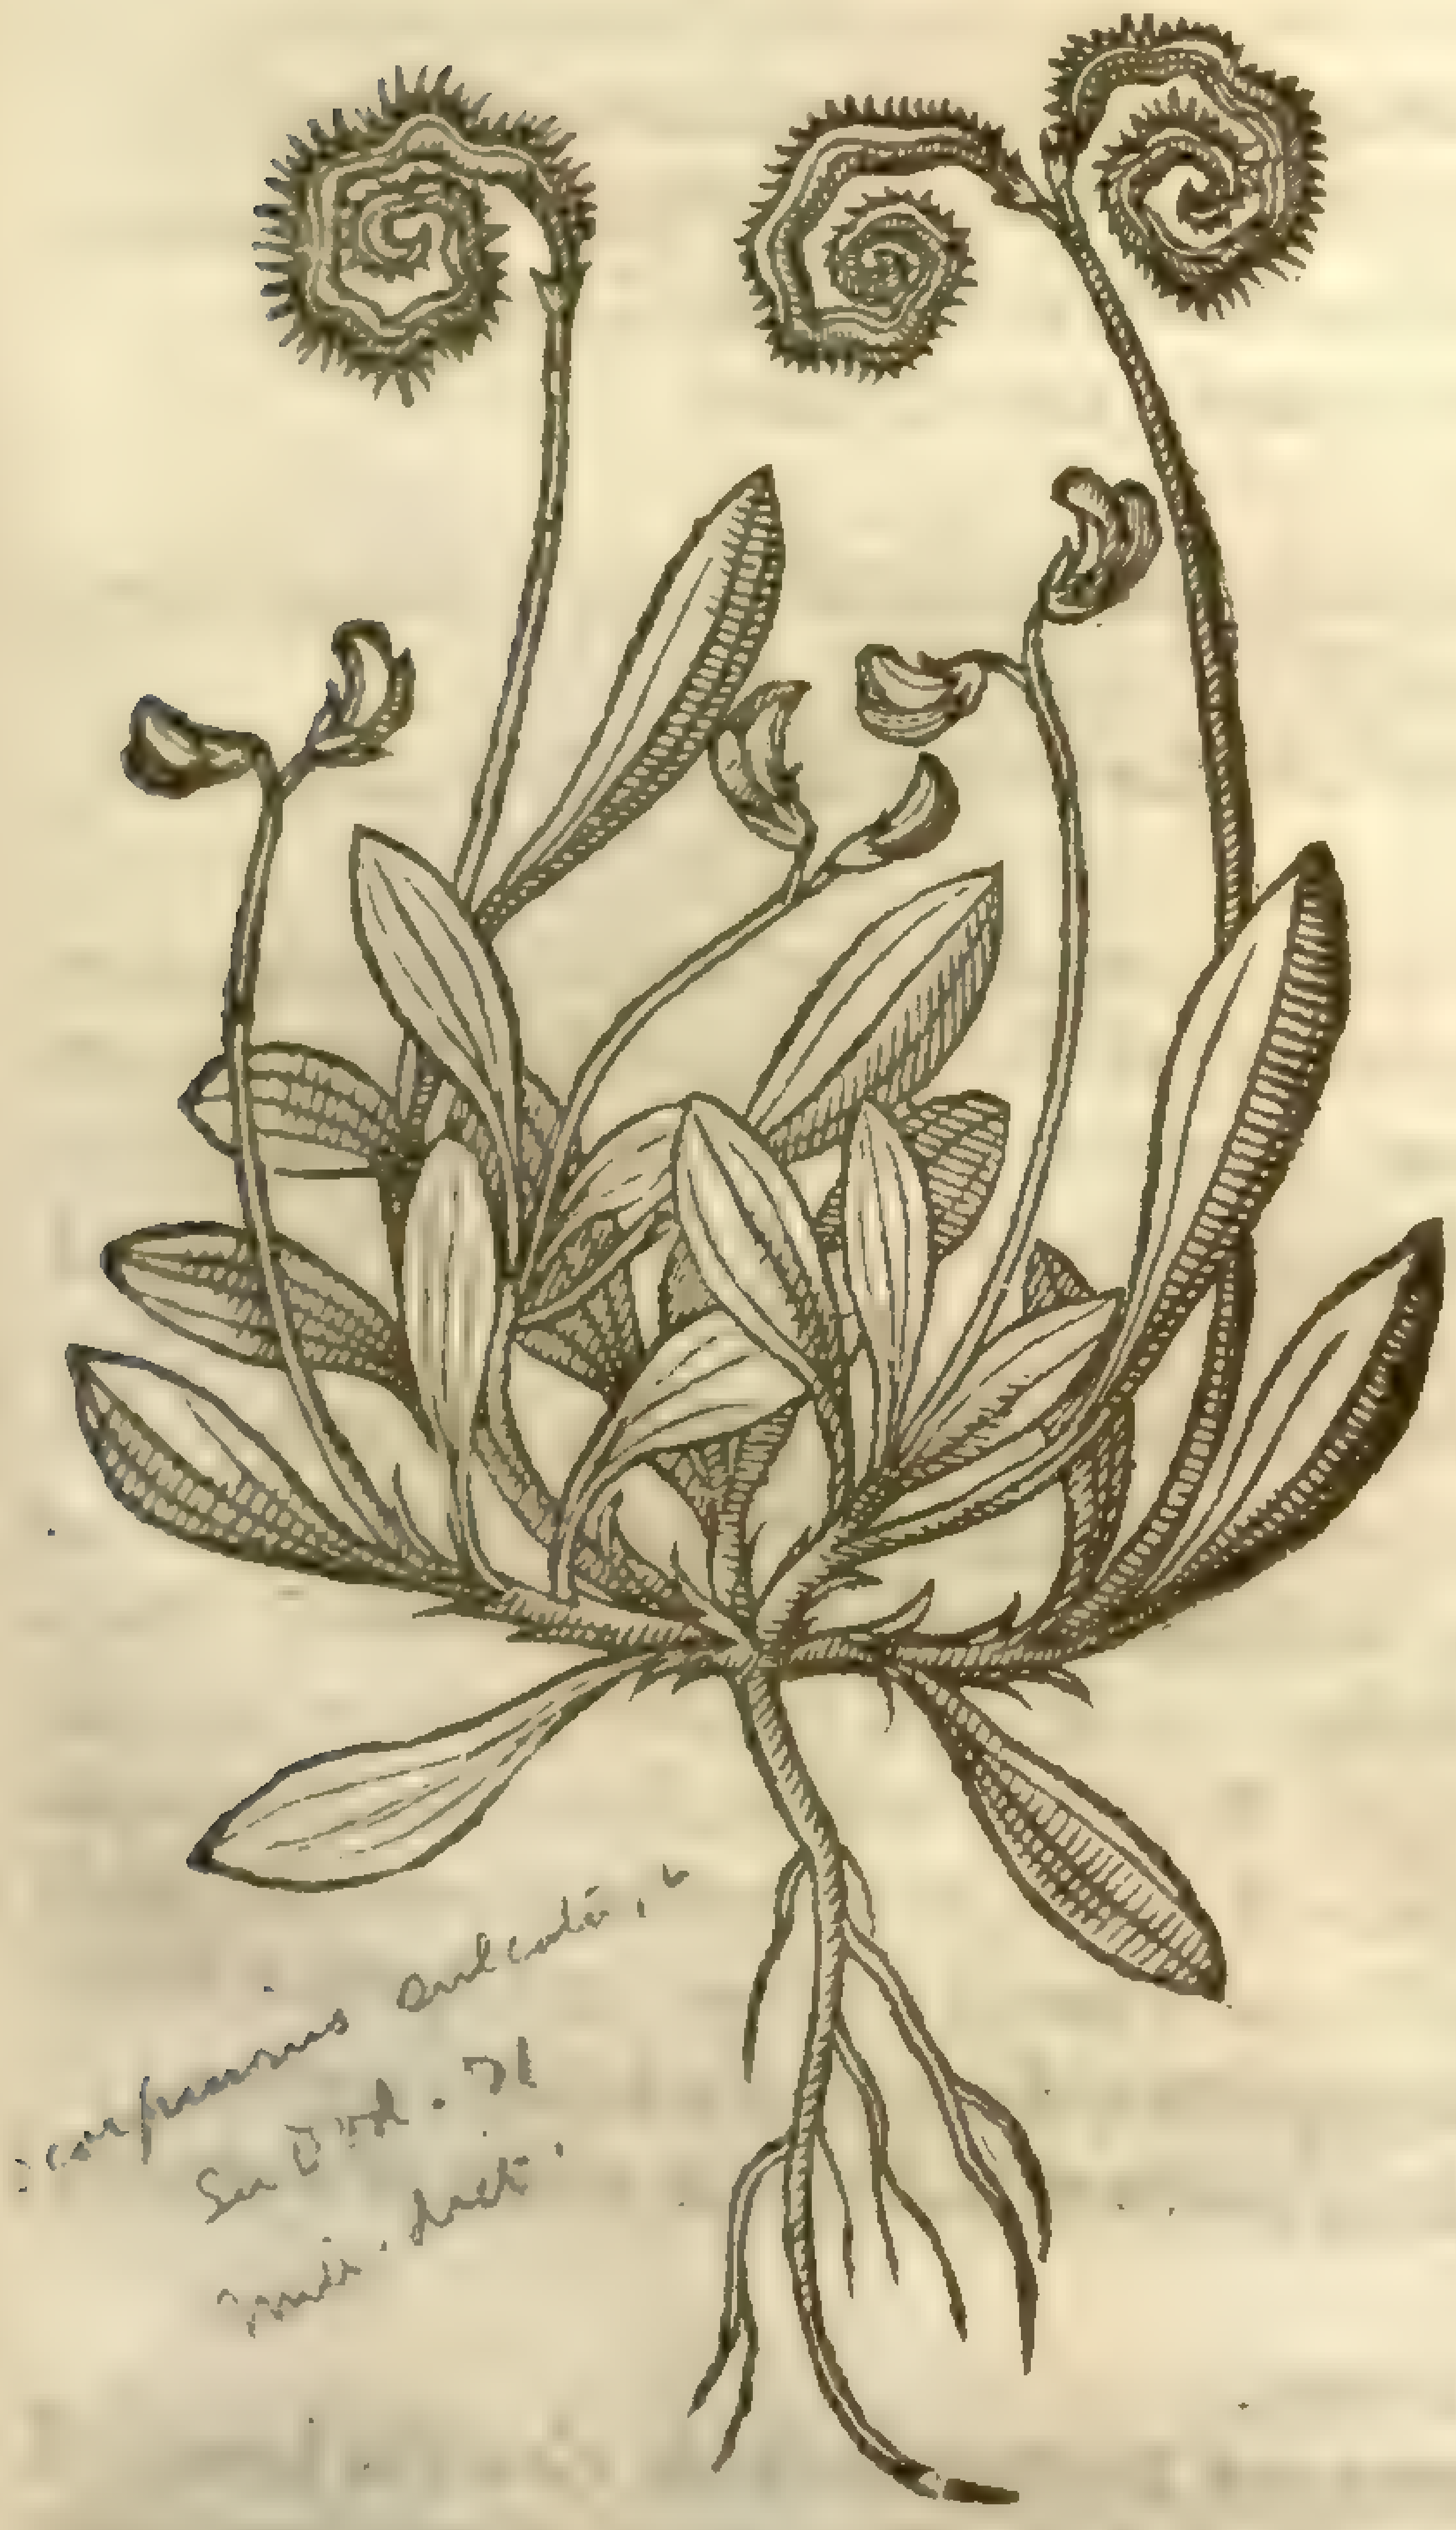
1 Scorpion graſſe hath many ſmooth, plaine, euen leaues, of a darke greene colour; ſtalkes ſmall, feeble and weake, trailing vpon the ground, and occupying a great circuit in reſpect of the plant. The floures grow vpon long and ſlender foot-ſtalks, of colour yellow, in ſhape like to the floures of broome; after which ſucceed long, crooked, rough cods, in ſhape and colour like vnto a Caterpiller; wherein is contained yellowiſh ſeed like vnto a kidney in ſhape. The root is ſmall and tender: the whole plant periſheth when the ſeed is ripe.

2 There is another Scorpion graſſe, found among (or rather reſembling) peaſe, and thereupon called *Scorpioides Leguminoſa*, which hath ſmall and tender roots like ſmall threds: branches many, weake and tender, trailing vpon the ground, if there be nothing to take hold vpon with his claſping and crooked ſeed veſſels; otherwiſe it rampeth vpon whatſoeuer is neere vnto it. The leaues be few and ſmall: the floures very little and yellow of colour: the ſeed followeth, little and blackiſh, conteined in little cods, like vnto the taile Scorpion.

3 There is another ſort almoſt in euery ſhallow grauelly running ſtreame, hauing leaues like to *Becabunga* or Brooklime. The floures grow at the top of tender fat greene ſtalkes, blew of colour, and ſometimes with a ſpot of yellow among the blew; the whole branch of floures do turne themſelues likewiſe round like the ſcorpions taile.

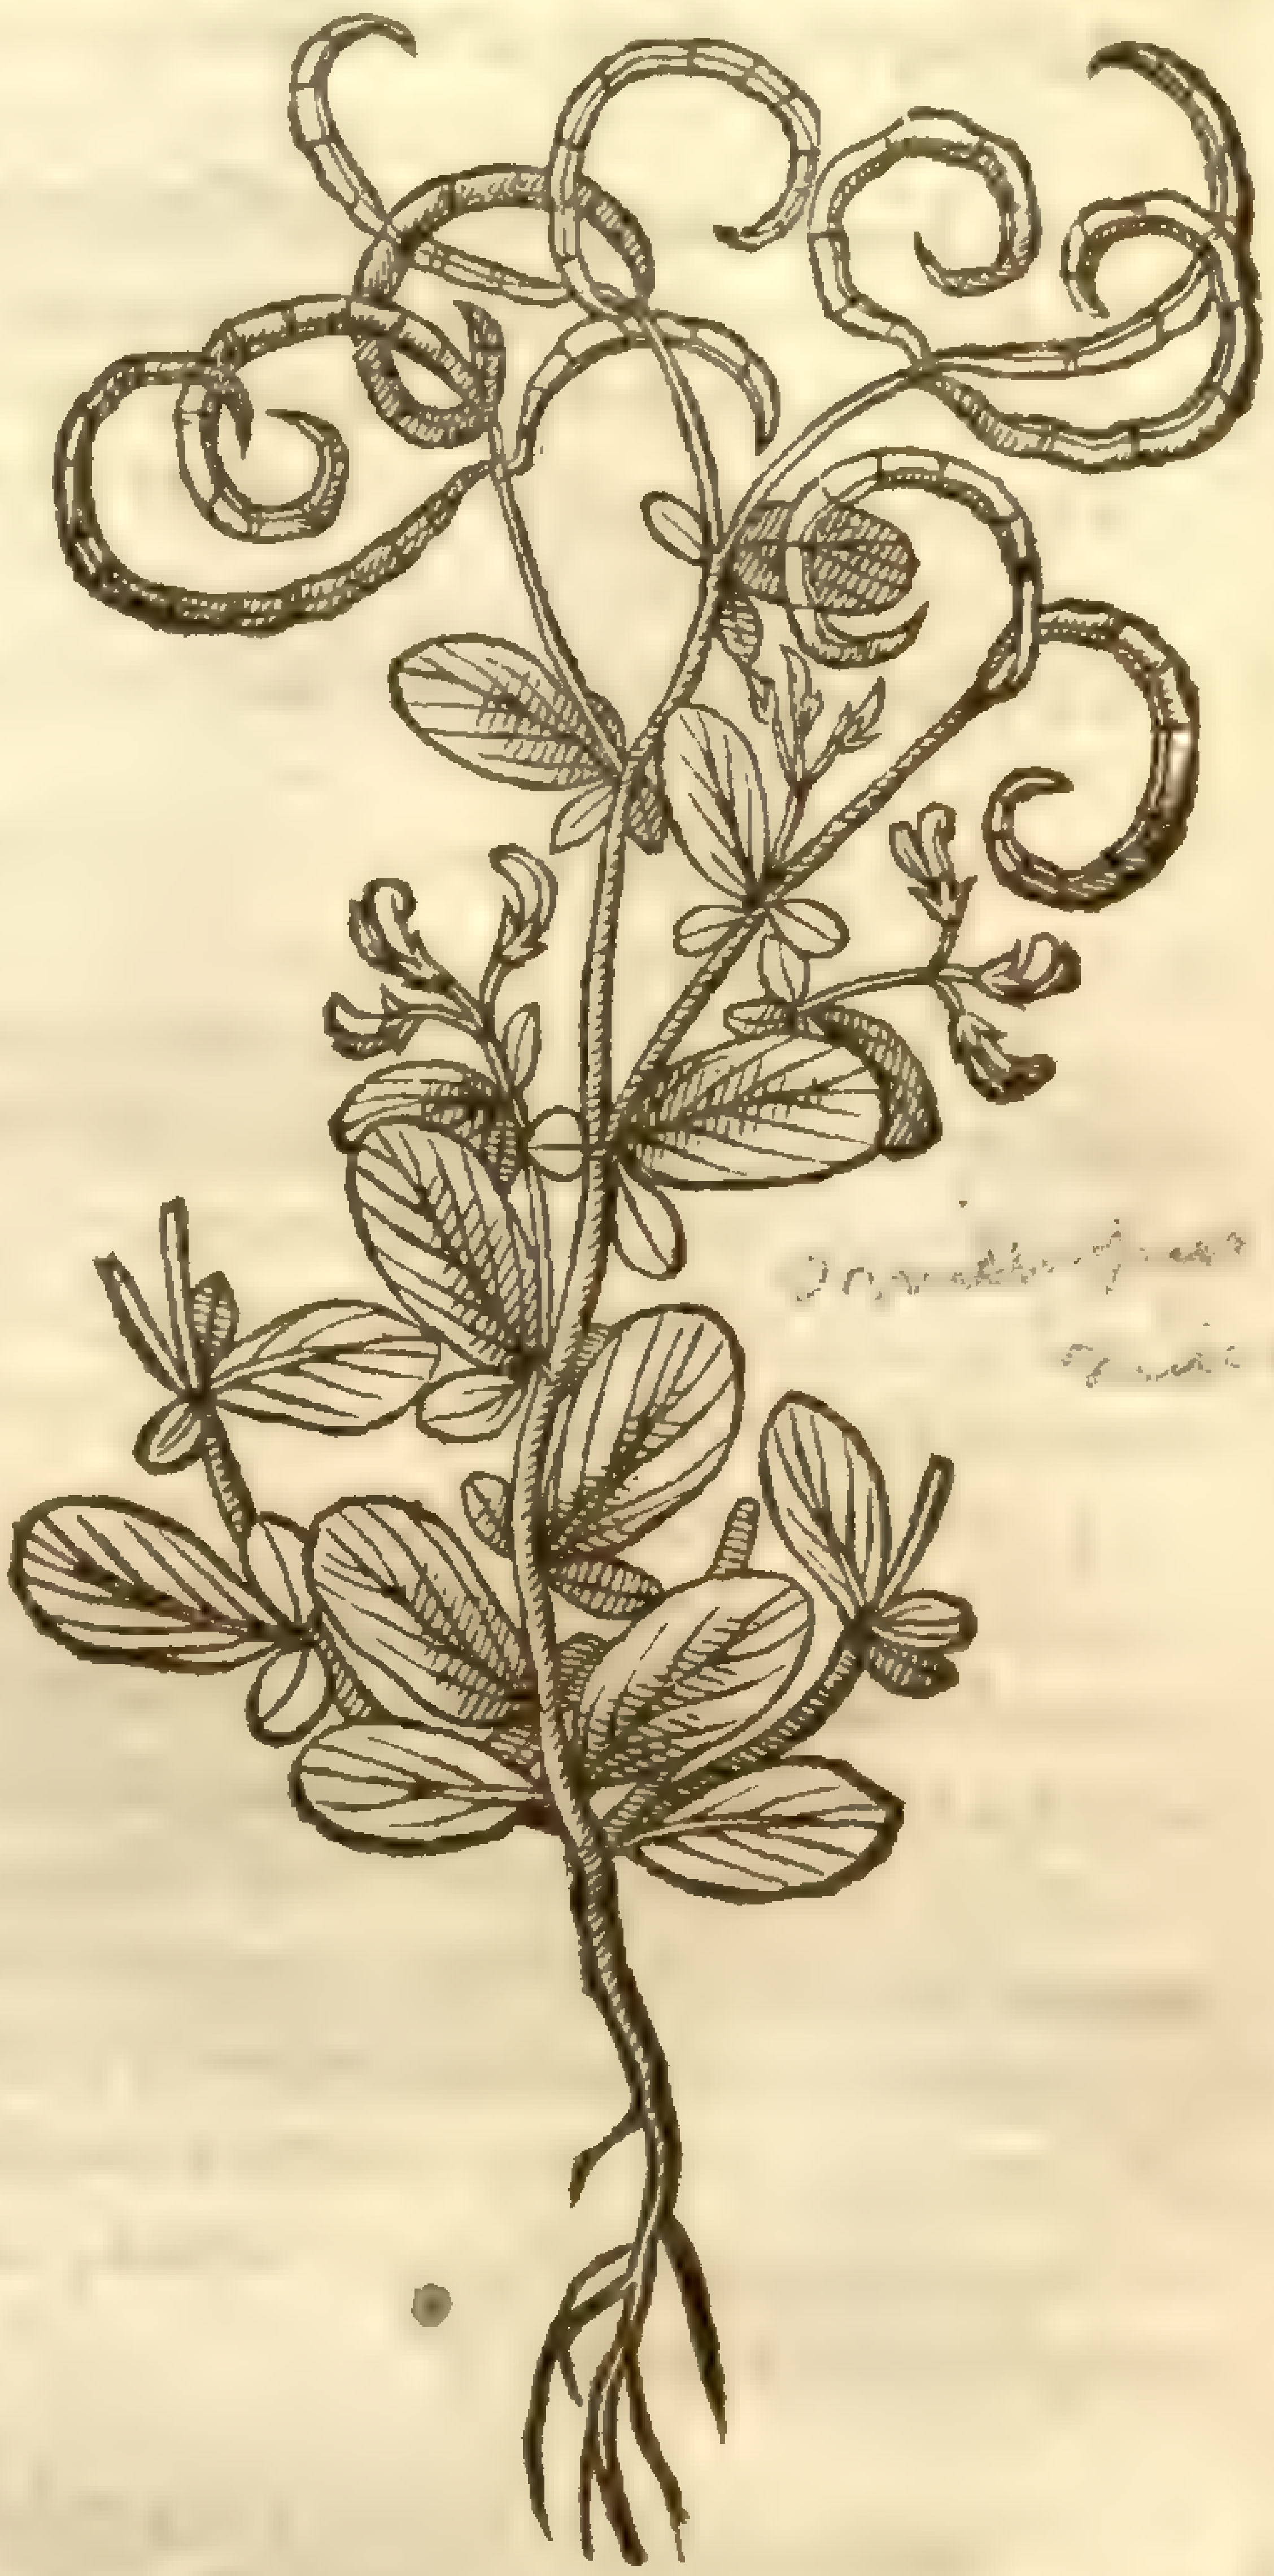
There is alſo another growing in watery places, with leaues like vnto *Anagallis aquatica* or water Checkweed, hauing like ſlender ſtalkes and branches as the former, and the floures not vnlike, ſauing that the floures of this are of a light blew or watchet colour, ſomewhat bigger, and layd more open, whereby the yellow ſpot is ſeene.

4 There is likewiſe another ſort growing vpon moſt dry grauelly and barren ditch bankes, with leaues like thoſe of Mouſe-eare: this is called *Myoſotes ſcorpioides*; it hath rough and hairy leaues, of an ouerworne ruſſet colour: the floures doe grow vpon weake, feeble, and rough branches, as is all the reſt of the plant. They likewiſe grow for the moſt part at one ſide of the ſtalke, blew of colour, with a like little ſpot of yellow as the others, turning themſelues backe againe like the taile of a Scorpion.



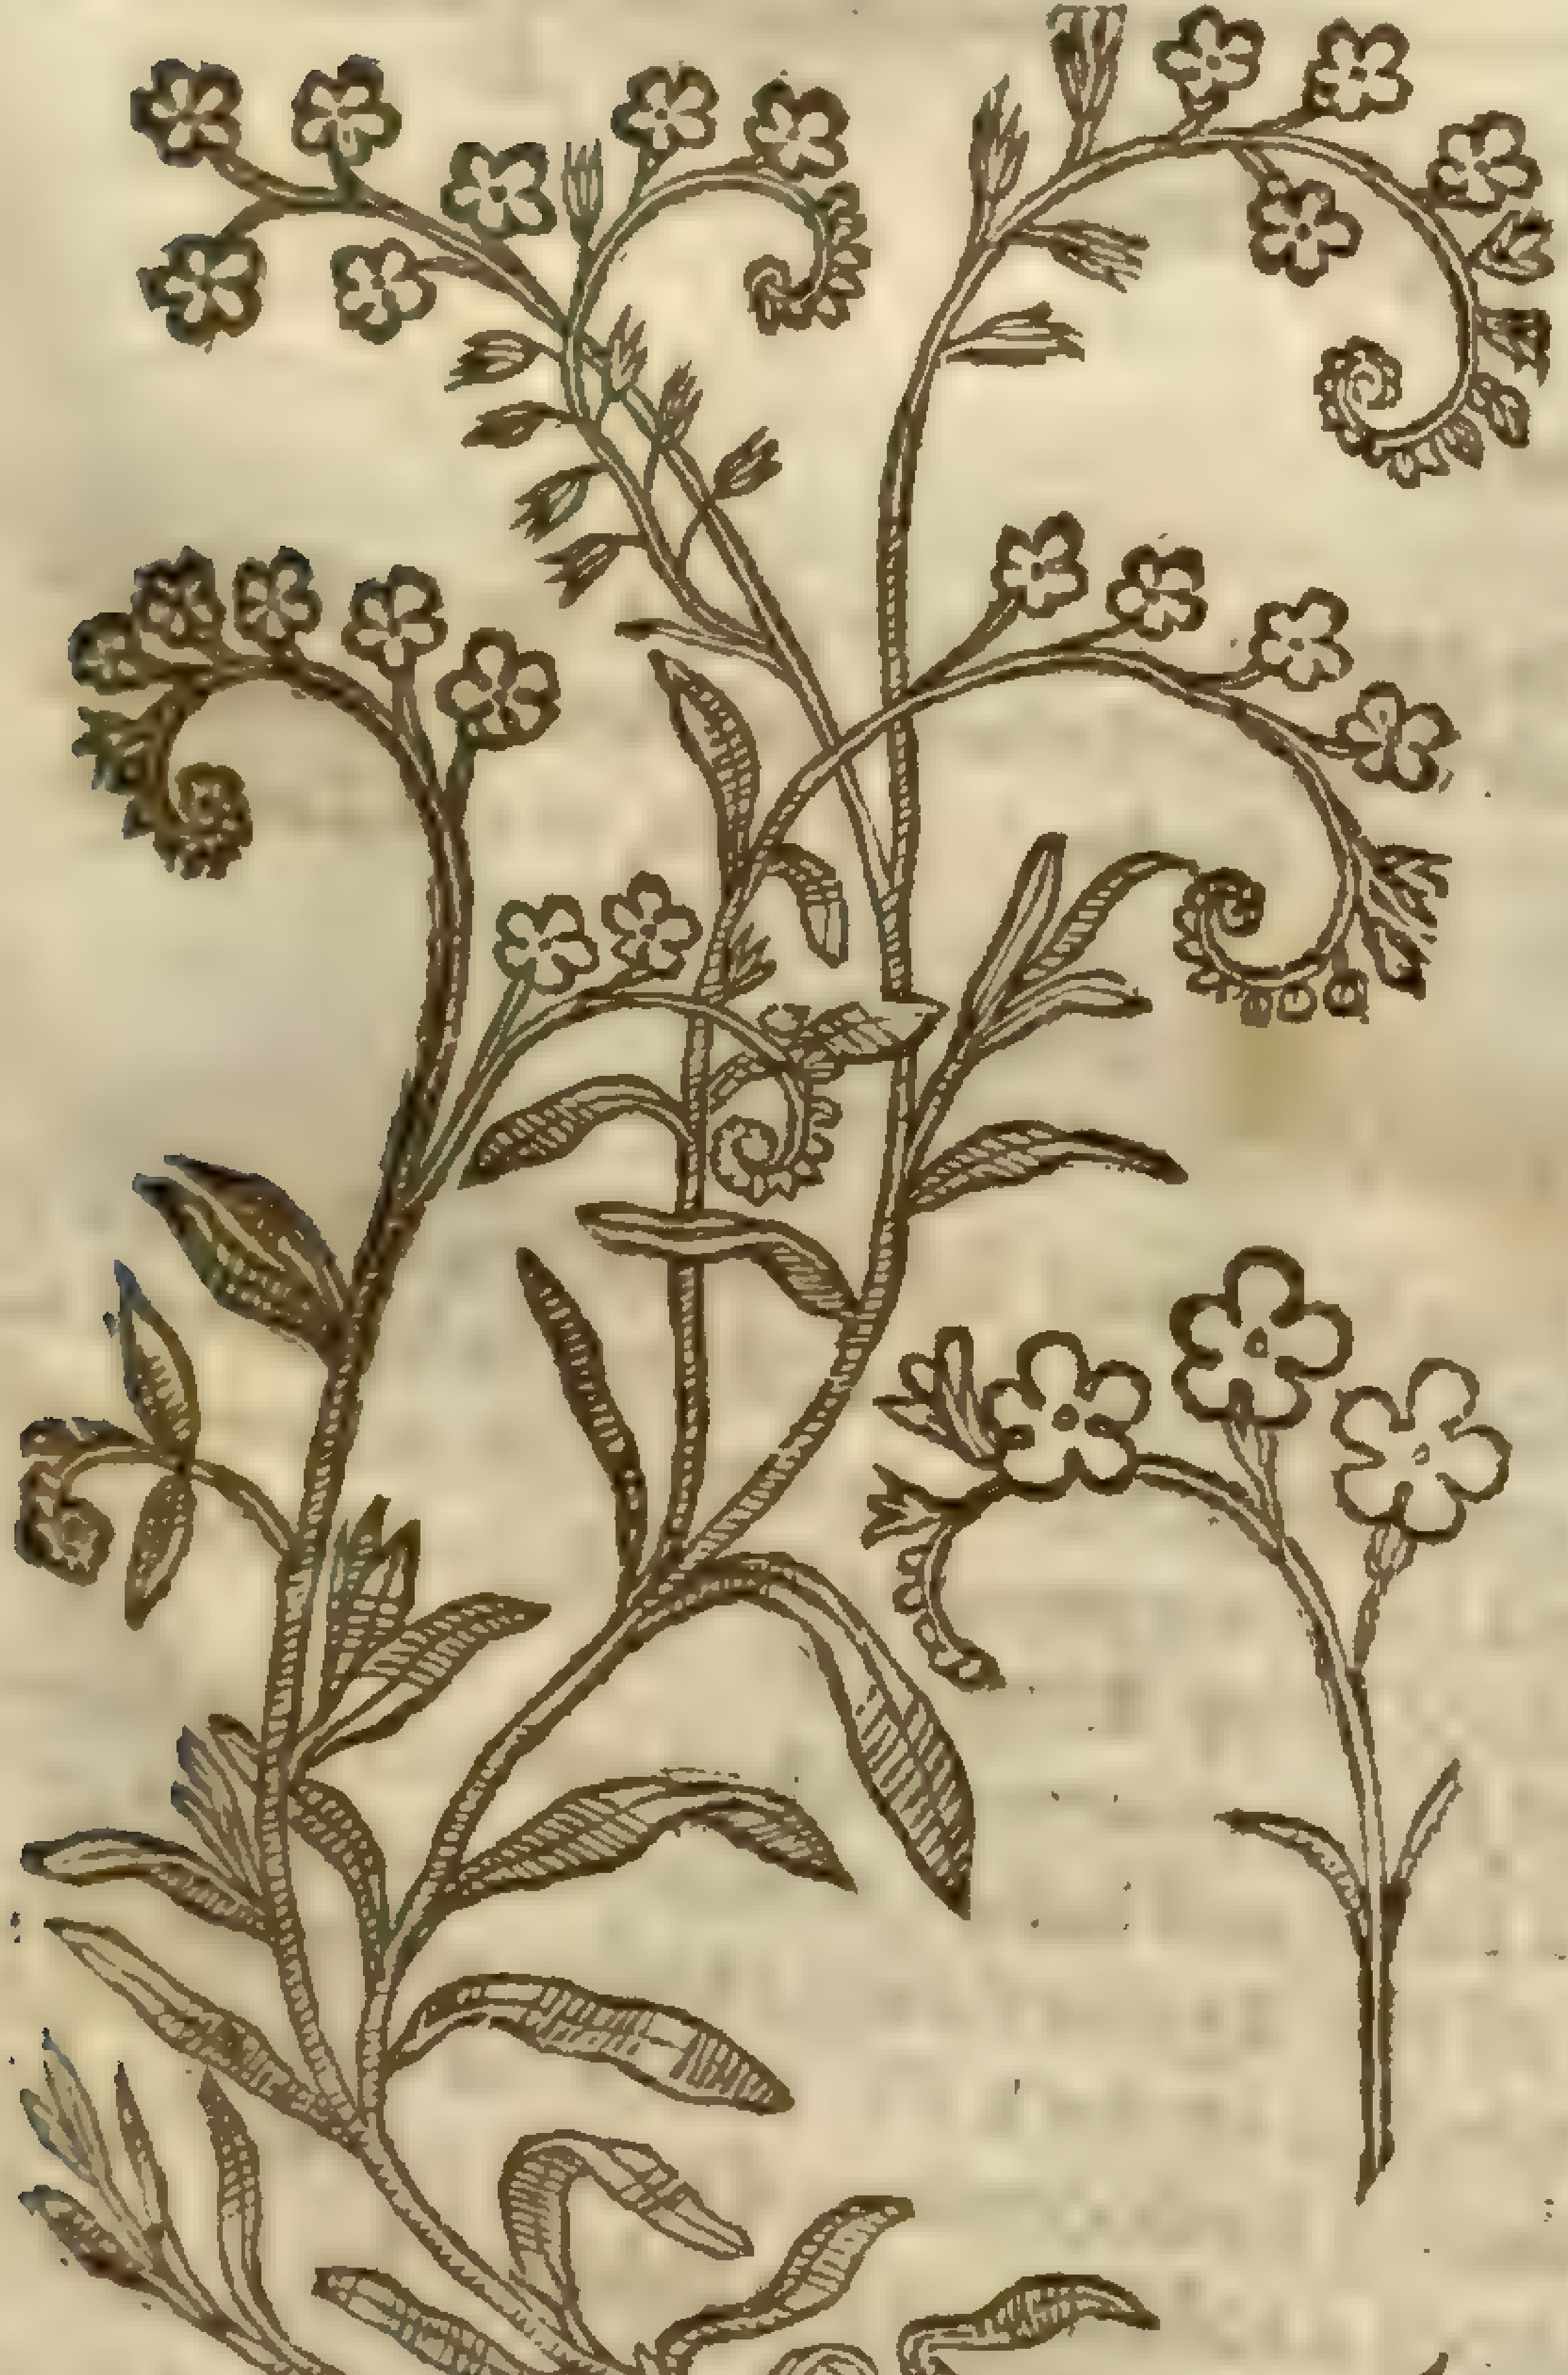
1 *Scorpioides Bupleuri folio, Penæ & L'Obelij.*
Scorpion graſſe, or Caterpillers.

Scorpiurus sulcata, L.
See Dod. 71
Mill. dict.



‡ 2 *Scorpioides Matthioli.*
Matthiolus his Scorpion graſſe.

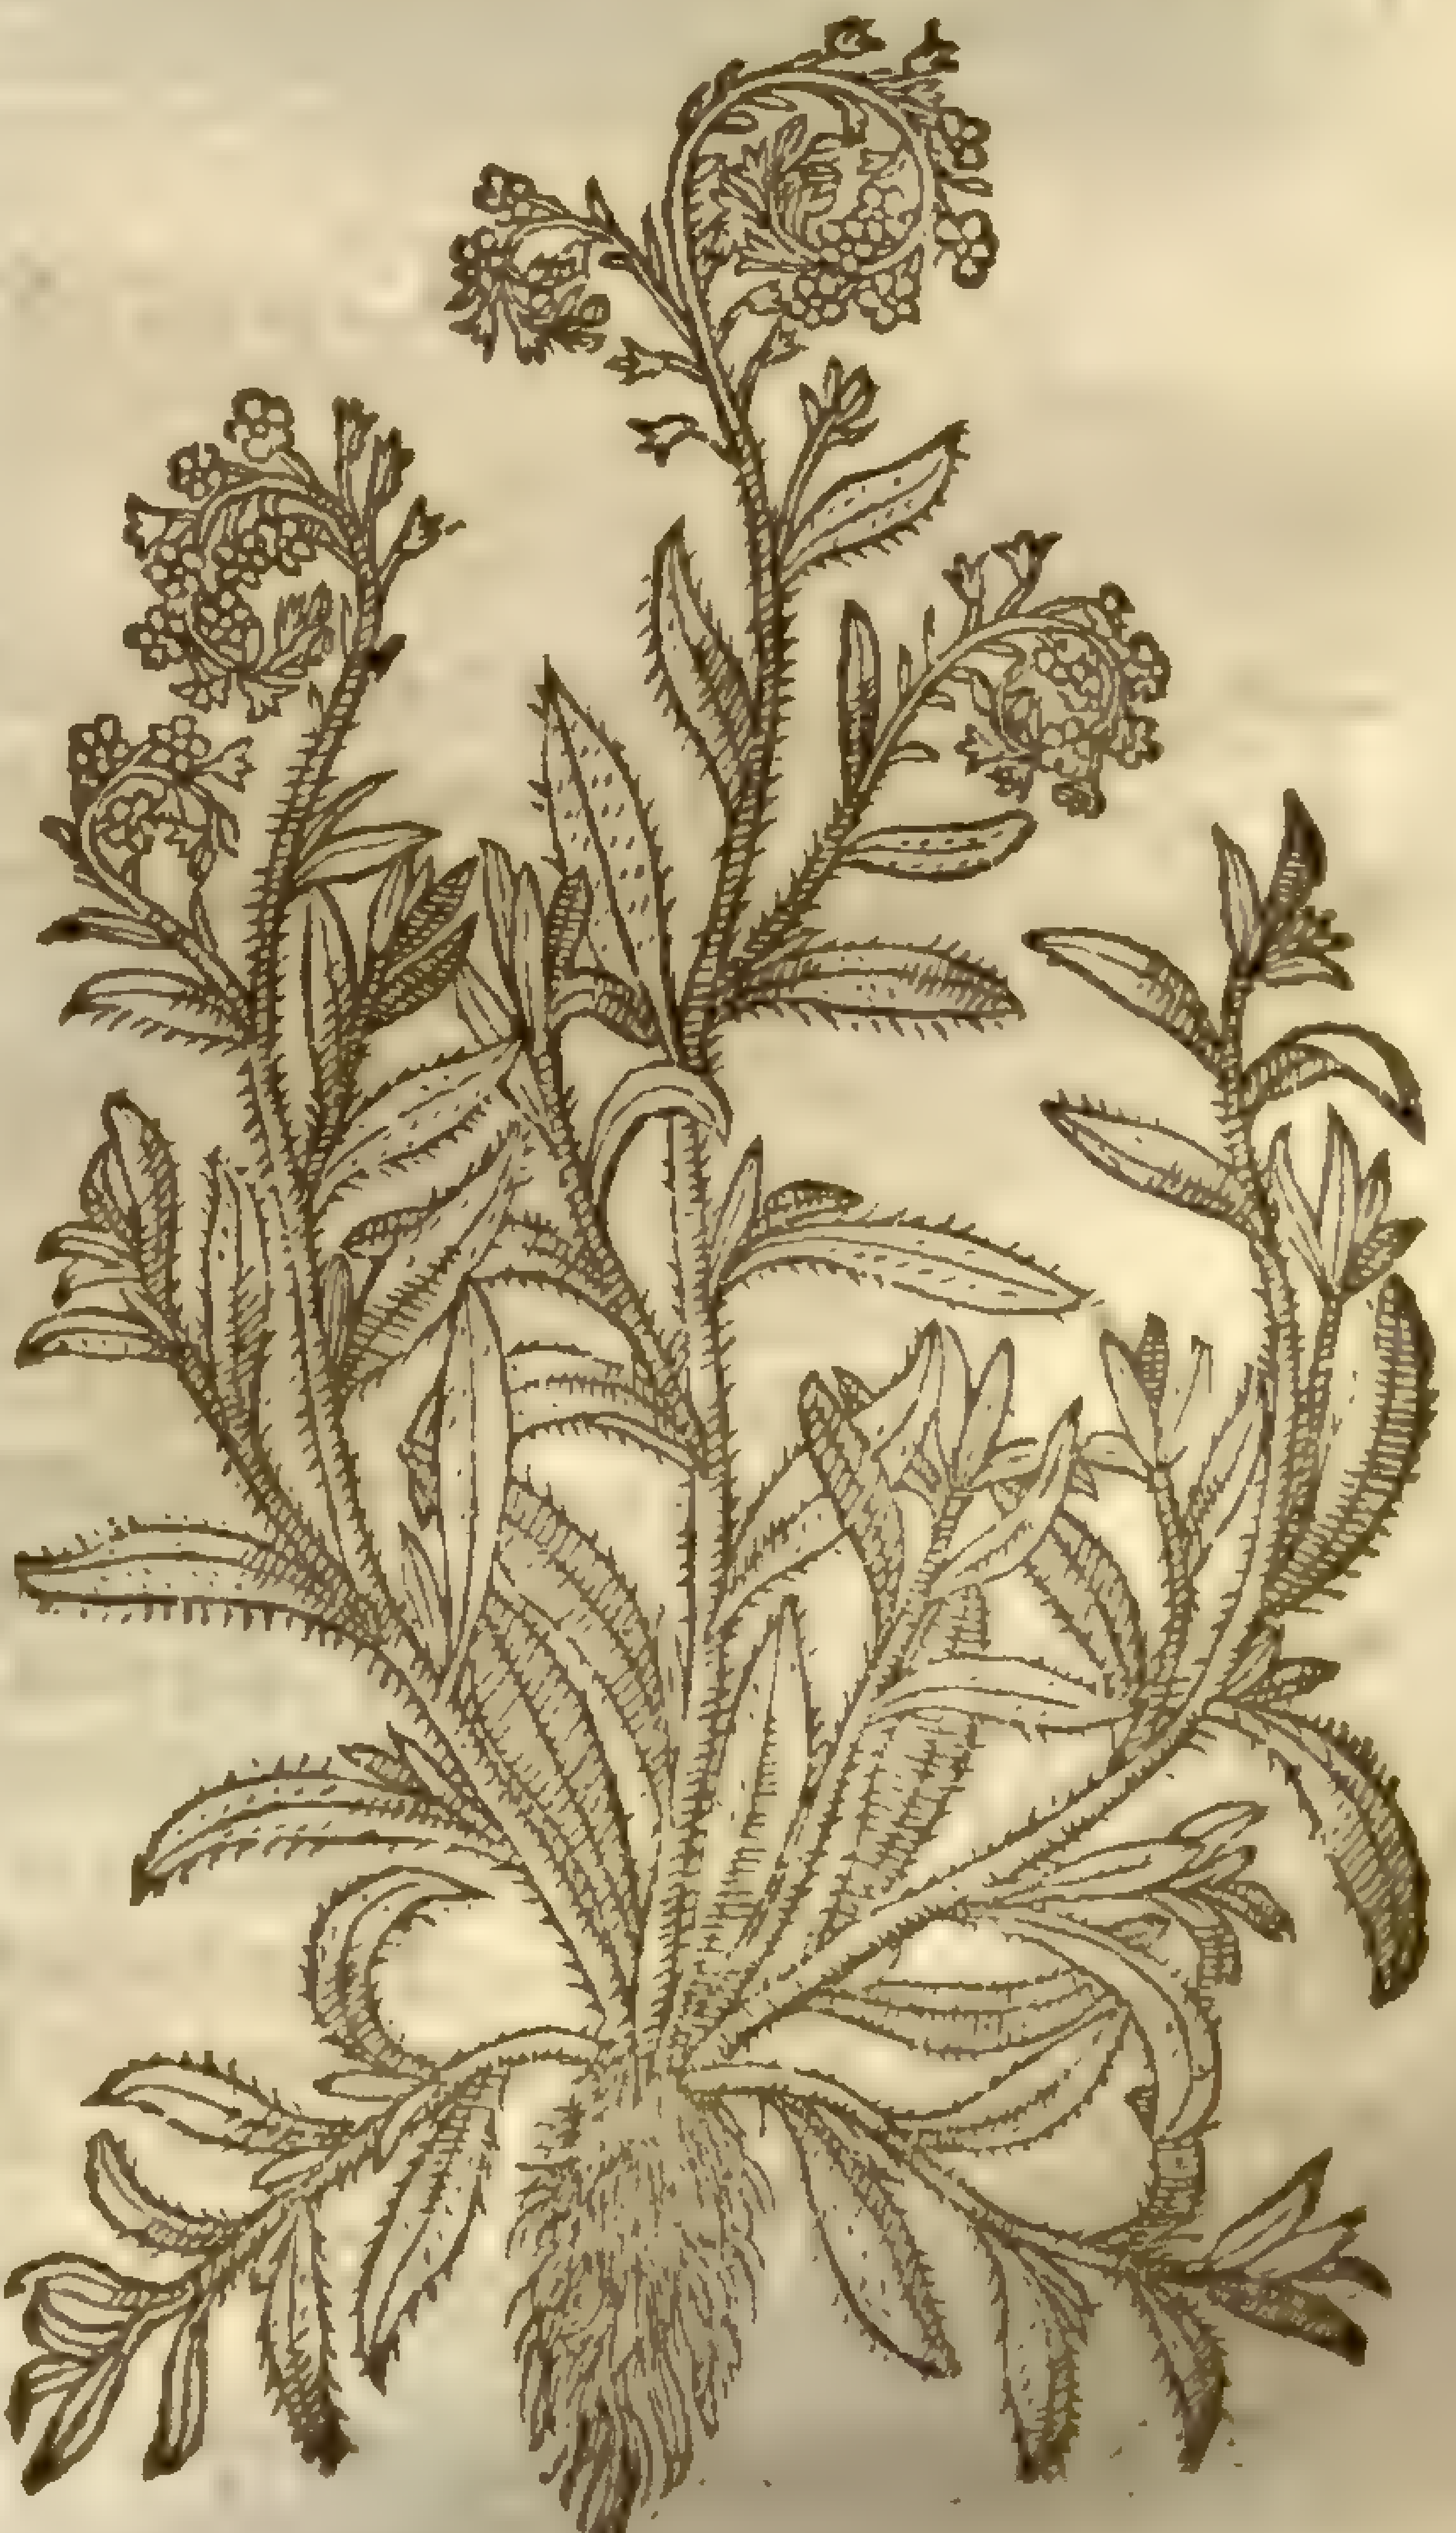
Ornithopus scorpioides, L
Mill. dict.



‡ 3 *Myoſotis ſcorpioides paluſtris.*
Water Scorpion graſſe.

M. palustris, Sm
Sm. fl. 1.249

M. scorpioides, L. β
Mill. dict.



‡ 4 *Myoſotis ſcorpioides arvenſis hirſuta.*
Mouſe-eare Scorpion graſſe.

Myosotis scorpioides, L
Mill. dict.

There is another of the land called *Myoſotis Scorpioides repens*, like the former: but the floures are thicker thruſt together, and do not grow all vpon one ſide as the other, and part of the floures are blew, and part purple, confuſedly mixt together.

¶ *The Place.*

1, 2 Theſe Scorpion graſſes grow not wilde in England, notwithſtanding I haue receiued ſeed of the firſt from beyond the ſeas, and haue diſperſed them through England, which are eſteemed of gentlewomen for the beautie and ſtrangneſſe of the crooked cods reſembling Caterpillers.

The others do grow in waters and ſtreames, as alſo on dry and barren bankes.

¶ *The Time.*

The firſt floureth from May to the end of Auguſt: the others I haue found all the Summer long.

¶ *The Names.*

‡ 1 *Fabius Columna* iudges this to be the *Clymenon* of *Dioſcorides*: others call it *Scorpioides*, and *Scorpioides Bupleuri folio*.

2 This is the *Scorpioides* of *Matthiolus*, *Dod.* *Lobel*, and others; and I iudge it was this plant our Author in this place intended, and not the *Scorpioides Leguminoſa* of the *Aduerſaria*, for that hath not a few leaues, but many vpon one rib; and beſides, *Dodonæus*, whom in deſcriptions and hiſtory our Author chiefely followes, deſcribes this immediately after the other: *Guillandinus*, *Cæſalpinus*, and *Bauhine* iudge it to be the *Telephium* of *Dioſcorides*.

3 This and the next want no names, for almoſt euery writer hath giuen them ſeuerall ones: *Brunfelſius* called it *Cynogloſſa minor*: *Tragus*, *Tabernamontanus*, and our Author (*page* 537. of the former edition) haue it vnder the name of *Euphraſia Cærulea*: *Dodonæus* cals it *Scorpioides fœmina*: *Lonicerus*, *Leontopodium*; *Cæſalpinus*, *Heliotropium minus in paluſtribus*: *Cordus* and *Thalius*, *Echium paluſtre*.

4 This is *Auricula muris minor tertia*, *Euphraſia quarta*, and *Piloſella ſylueſtris* of *Tragus*: *Scorpioides mas* of *Dodonæus*; *Alſine Myoſotis*: and *Myoſotis hirſuta repens* of *Lobel*; *Heliotropium minus alterum* of *Cæſalpinus*; *Echium minimum* of *Columna*; and *Echium paluſtre alterum* of *Thalius*: our Author had it thrice: firſt in the precedent chapter, by the name of *Heliotropium rectum*, with a figure: ſecondly in this preſent chapter, without a figure: and thirdly, *pag.* 514. alſo with a figure vnder the name of *Piloſella flore cæruleo*. ‡

¶ *The Nature and Vertues.*

A There is not any thing remembred of the temperature: yet *Dioſcorides* ſaith, that the leaues of Scorpion graſſe applyed to the place, are a preſent remedy againſt the ſtinging of Scorpions: and likewiſe boyled in wine and drunke, preuaile againſt the ſaid bitings, as alſo of addars, ſnakes, and ſuch venomous beaſts: being made in an vnguent with oile, wax, and a little gum *Elemni*, they are profitable againſt ſuch hurts as require an healing medicine.

Chap. 55. *Of Nightſhade.*

¶ *The Kindes.*

There be diuers Nightſhades, whereof ſome are of the garden; and ſome that loue the fields, and yet euery of them found wilde; whereof ſome cauſe ſleepineſſe euen vnto death: others cauſe ſleepineſſe, and yet Phyſicall: and others very profitable vnto the health of man, as ſhall be declared in their ſeuerall vertues.

¶ *The Deſcription.*

1 Garden Nightſhade hath round ſtalkes a foot high, and full of branches, whereon are ſet leaues of a blackiſh colour, ſoft and full of iuice, in ſhape like to the leaues of Baſill, but much greater: among which do grow ſmall white floures with yellow pointals in the middle; which being paſt, there ſucceed round berries, greene at the firſt, and blacke when they be ripe, like thoſe of Iuy: the root is white and full of hairy ſtrings.

‡ 2 The root of this is long, pretty thicke and hard, being couered with a browniſh skin; from this root grow vp many ſmall ſtalkes of the height of a cubit and better, ſomewhat thicke withall: the leaues that grow alongſt the ſtalkes are like thoſe of the Quince-tree, thicke, white, ſoft and downie. The floures grow about the ſtalke at the ſetting on of the leafe, ſomewhat long, and of a pale colour, diuided into foure parts, which are ſucceeded by ſeeds contained in hairy or woolly receptacles: which when they come to ripeneſſe are red, or of a reddiſh ſaffron colour. ‡

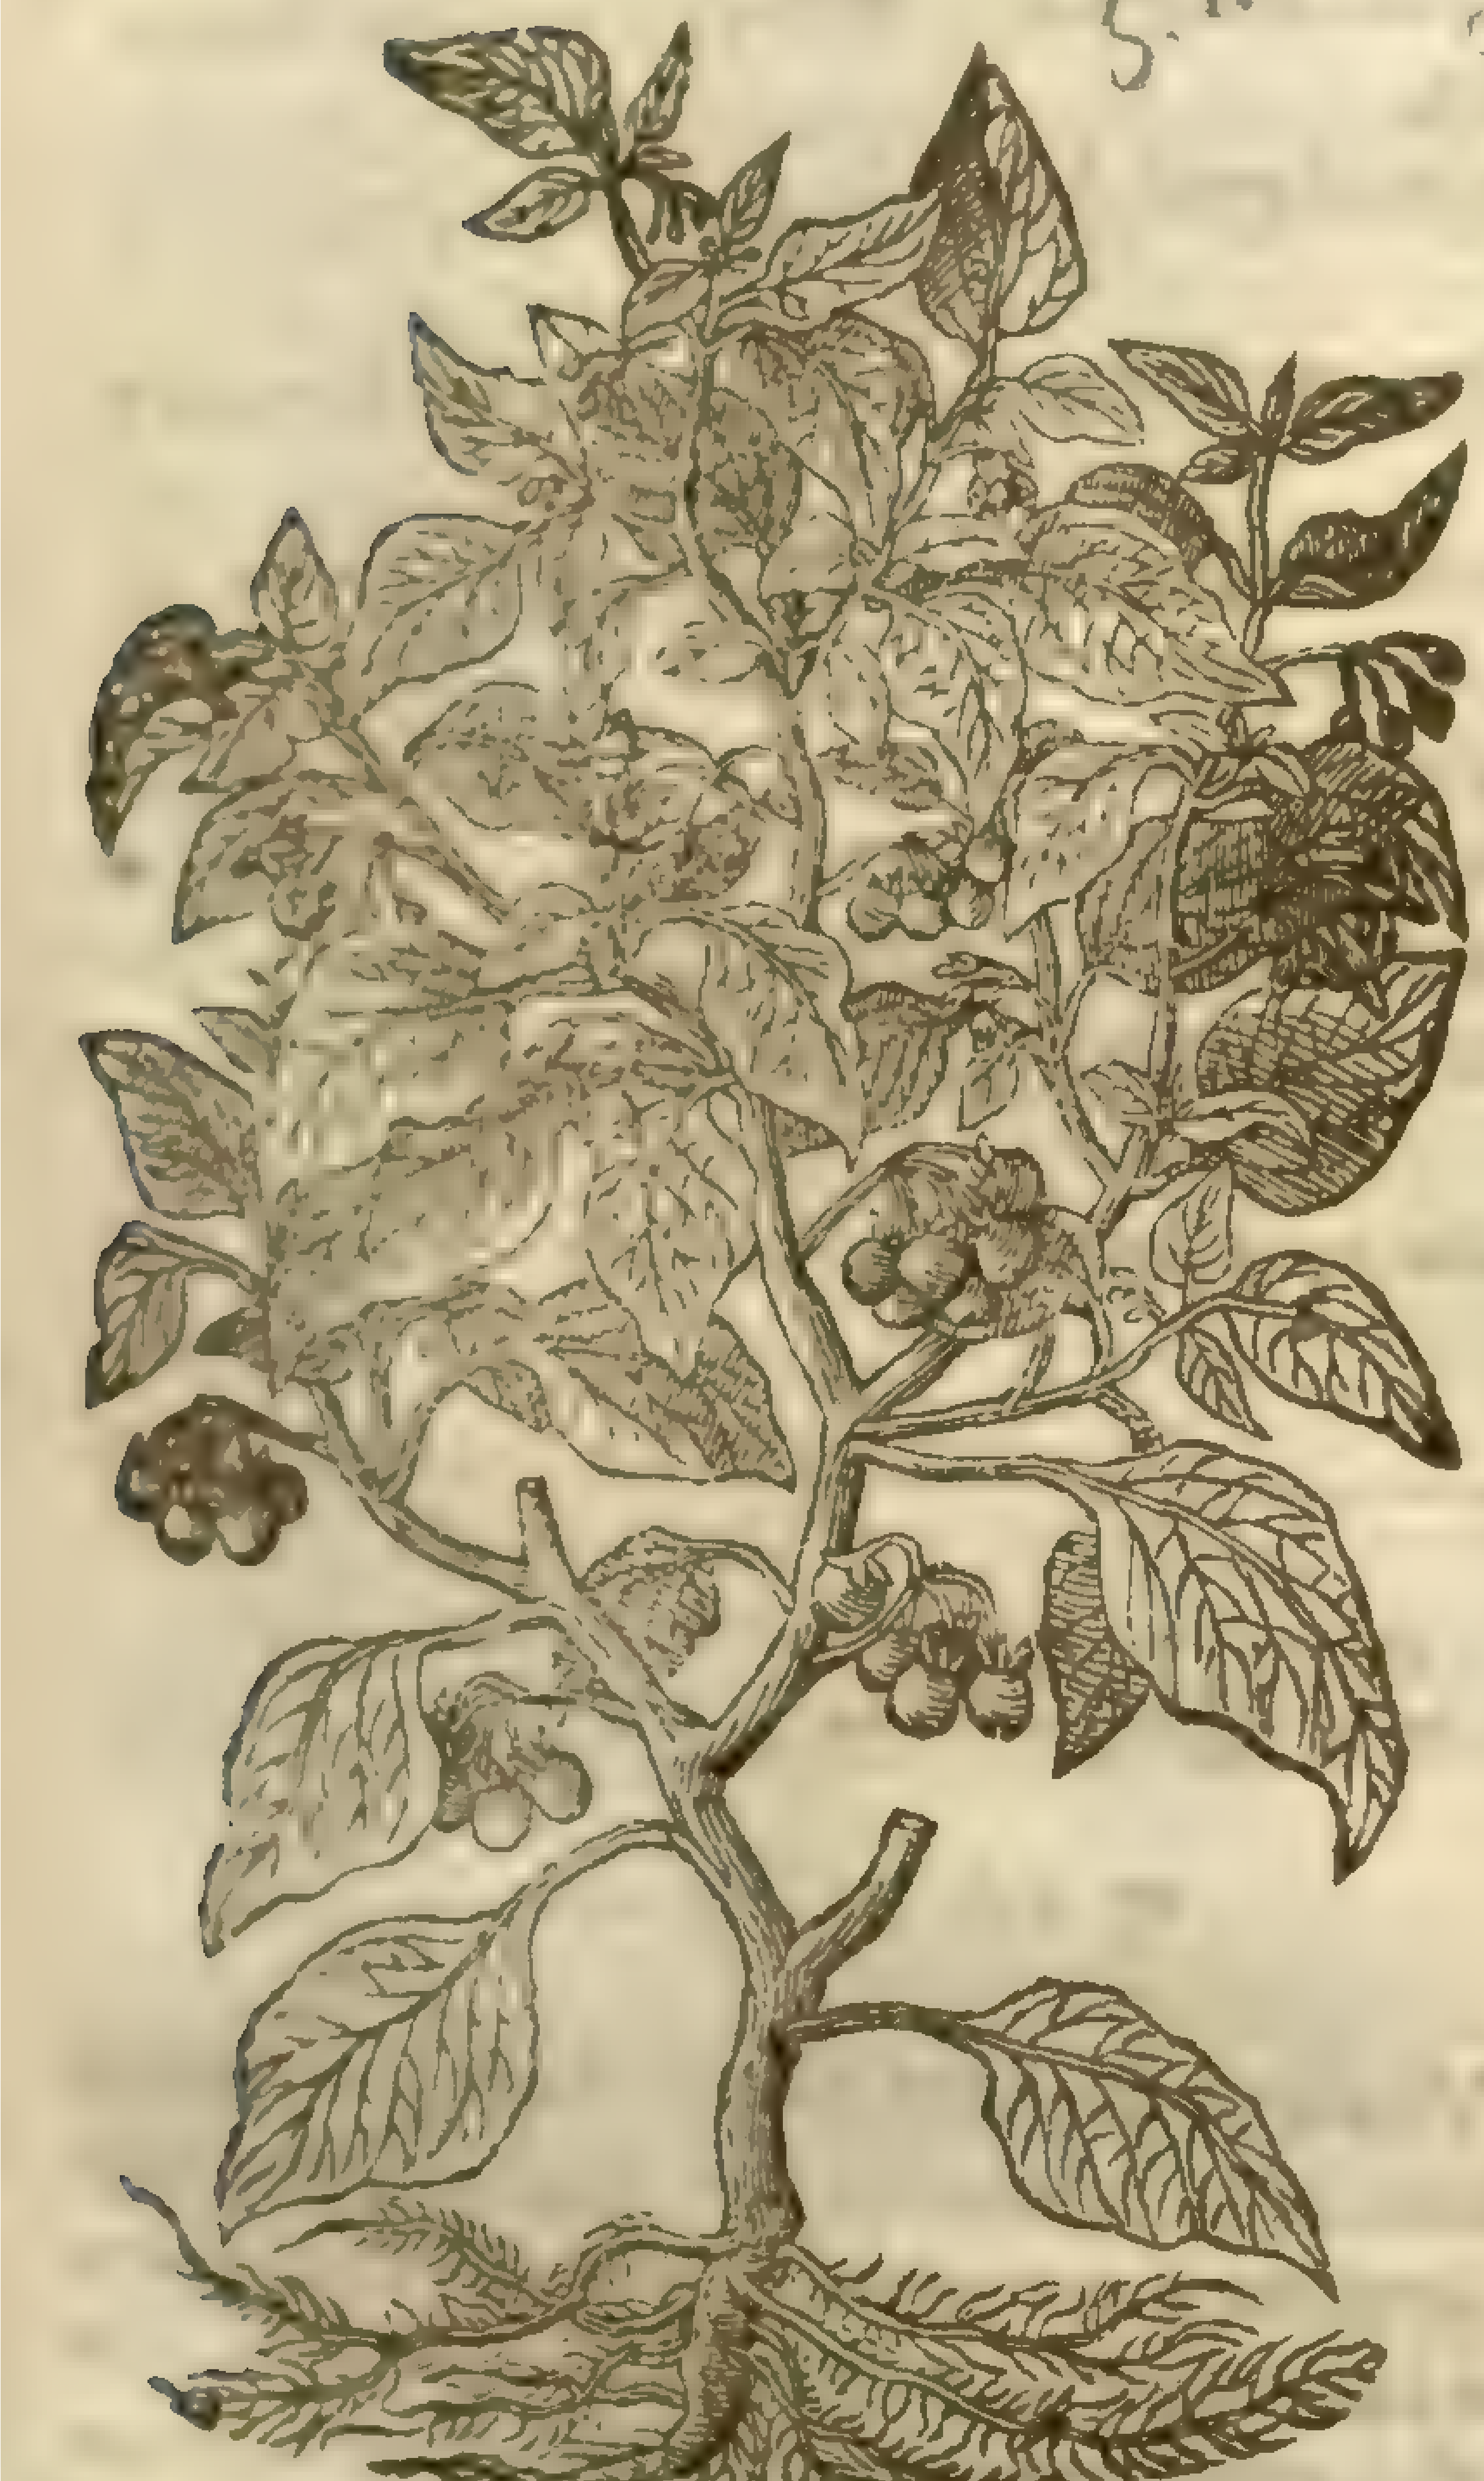
¶ *The Place,*

This Nightſhade commeth vp in many places, and not onely in gardens, of which notwithſtanding it hath taken his ſyrname, and in which it is often found growing among other herbs; but alſo neere common highwaies, the borders of fields, by old walls and ruinous places.

‡ 2 This growes not with vs, but in hotter countries. *Cluſius* found it growing among rubbiſh at Malago in Spaine. ‡

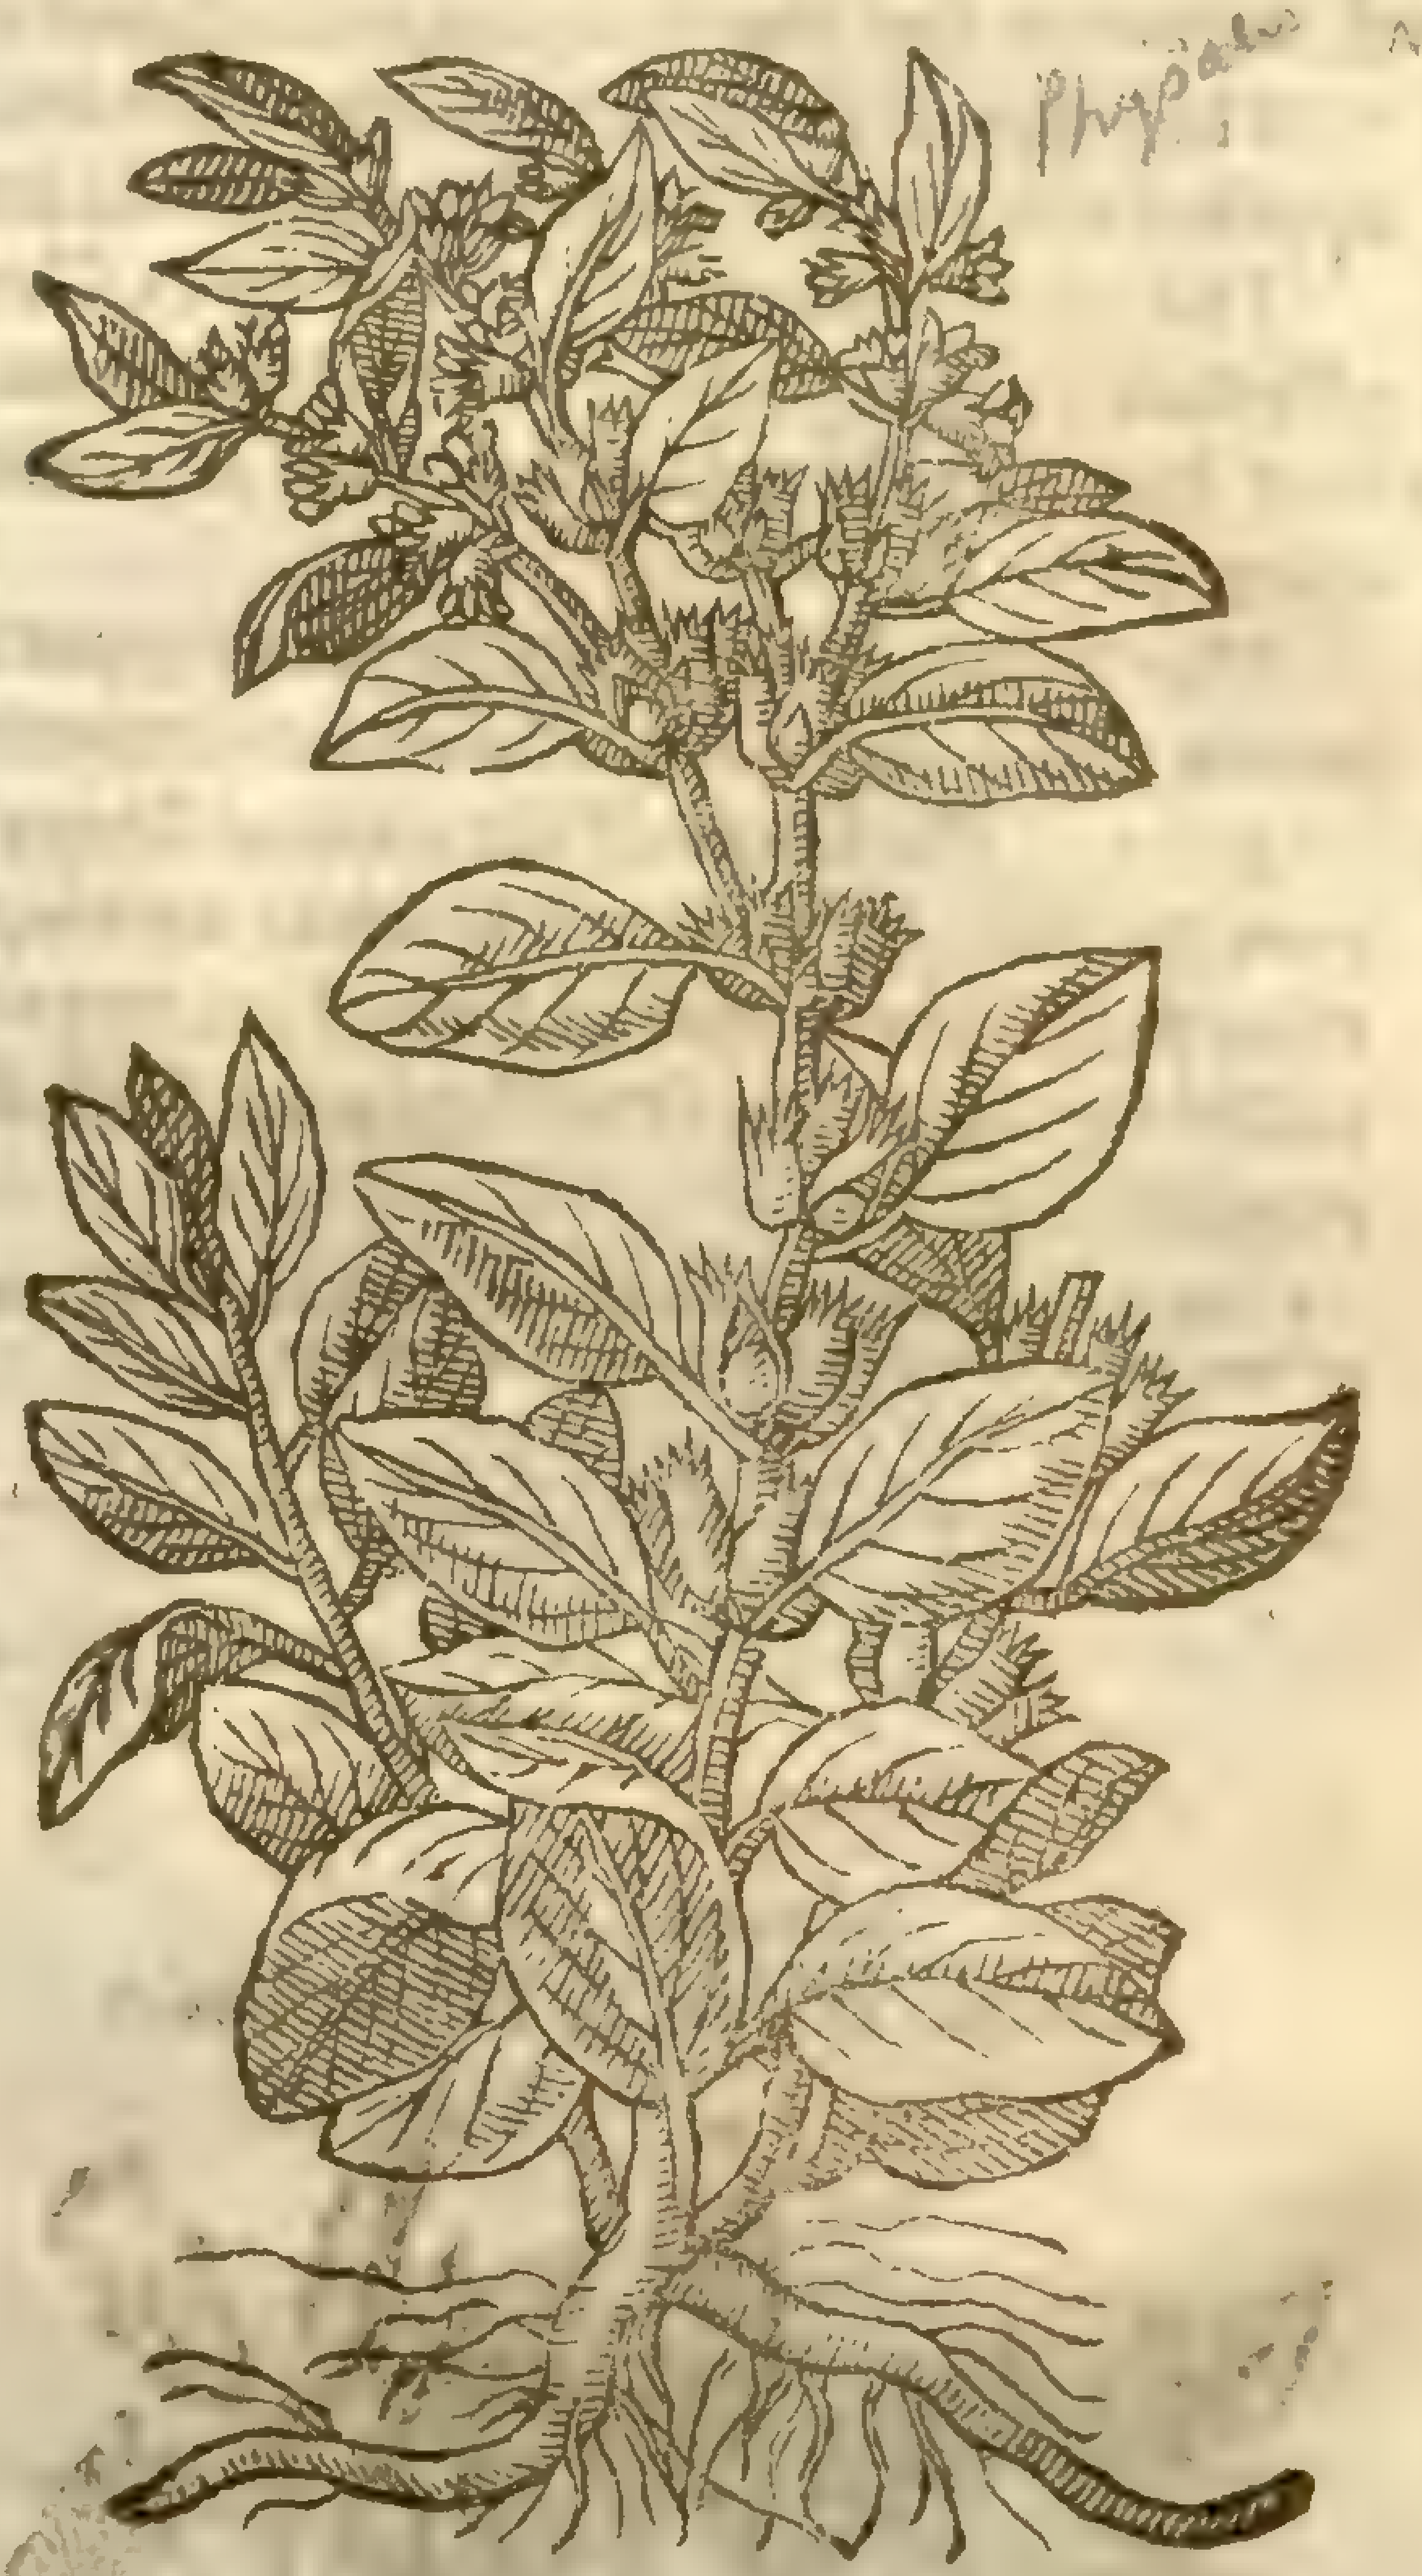
1 *Solanum hortenſe.*
Garden Nightſhade.

S. nigrum [illegible]



‡ 2 *Solanum ſomniferum.*
Sleepie Nightſhade.

Physalis somnifera [illegible]



¶ *The Time.*

It floureth in Summer, and oftentimes till Autumne be wel ſpent; and then the fruit commeth to ripeneſſe.

‡ 2 This *Cluſius* found in floure and with the ſeed ripe in Februarie: for it liues many yeats in hot countries, but in cold it is but an annual. ‡

¶ *The Names.*

It is called of the Grecians στρύχνον: of the Latines, *Solanum*, and *Solanum hortenſe*: in ſhops, *Sola- rum*: of ſome, *Morella*, *Vua Lupina*, and *Vua Vulpis*: in Spaniſh likewiſe *Morella*, and *Yerva Mora*: *Marcellus* an old phyſick writer, and diuers others of his time called it *Strumum*: *Pliny*, *lib*. 27. *ca*. 8. ſheweth that it is called *Cucubalus*: both theſe words are likewiſe extant in *Apuleius*, amongſt the confuſed names of Nightſhade; who comprehending all the kinds of Nightſhade together in one chapter, being ſo many, hath ſtrangely & abſurdly confounded their names. In Engliſh it is called garden Nightſhade, Morel, and petty Morel: in French, *Morelle*, *Gallobelgis*: *ſeu ardent, quia medetur igni ſacro.*

¶ *The Nature and Vertues.*

Nightſhade (as *Galen* ſaith, *Lib. de Facult. Simp.*) is vſed for thoſe infirmities that haue need of cooling and binding; for theſe two qualities it hath in the ſecond degree: which thing alſo he affirmeth in his booke of the faculties of nouriſhments, where he ſaith, that there is no pot-herb wee vſe to eat, that hath ſo great aſtriction or binding as Nightſhade hath; and therefore Phyſitians do worthily vſe it, and that ſeldome as a nouriſhment, but alwaies as a medicine.

1 *Dioſcorides* writeth, that Nightſhade is good againſt S. Anthonies fire, the ſhingles, paine of the head, the heart-burning or heate of the ſtomacke, and other like accidents proceeding of ſharp and biting humors. But although it hath theſe vertues, yet it is not alwaies good that it ſhould be applied vnto thoſe infirmities, for that many times there hapneth more dangers by applying theſe remedies, than by the diſeaſe it ſelf: for as *Hippocrates* writes, *Lib. 6. de Aphoriſm. the* 25 Particular,

It is not good that S. Anthonies fire ſhould be driuen from the outward parts to the inward. And likewiſe in his Prognoſticks he ſaith, It is neceſſarie that S. Anthonies fire ſhould break forth, and that it is death to haue it driuen in: which is to be vnderſtood not only of S. *Anthonies* fire, but alſo of other like burſtings out procured by nature. For by vſing theſe kindes of cooling and repelling medicines, the bad, corrupt, and ſharpe humors are driuen backe inwardly to the chiefe and principall parts, which cannot be done without great danger and hazard of life. And therefore wee muſt not vnaduiſedly, lightly, or raſhly adminiſter ſuch kinde of medicines, vpon the comming out of S. *Anthonies* fire, the ſhingles, or ſuch hot inflammations.

B The juice of the green leaues of garden Nightſhade mixed with Barly meale, is very profitably applied vnto S. *Anthonies* fire, and to all hot inflammations.

C The juice mixed with oile of roſes, Ceruſe, and Litharge of gold, & applied, is more proper and effectuall to the purpoſes afore ſet downe.

D † Neither the juice hereof nor any other part is vſually giuen inwardly, yet it may without any danger.

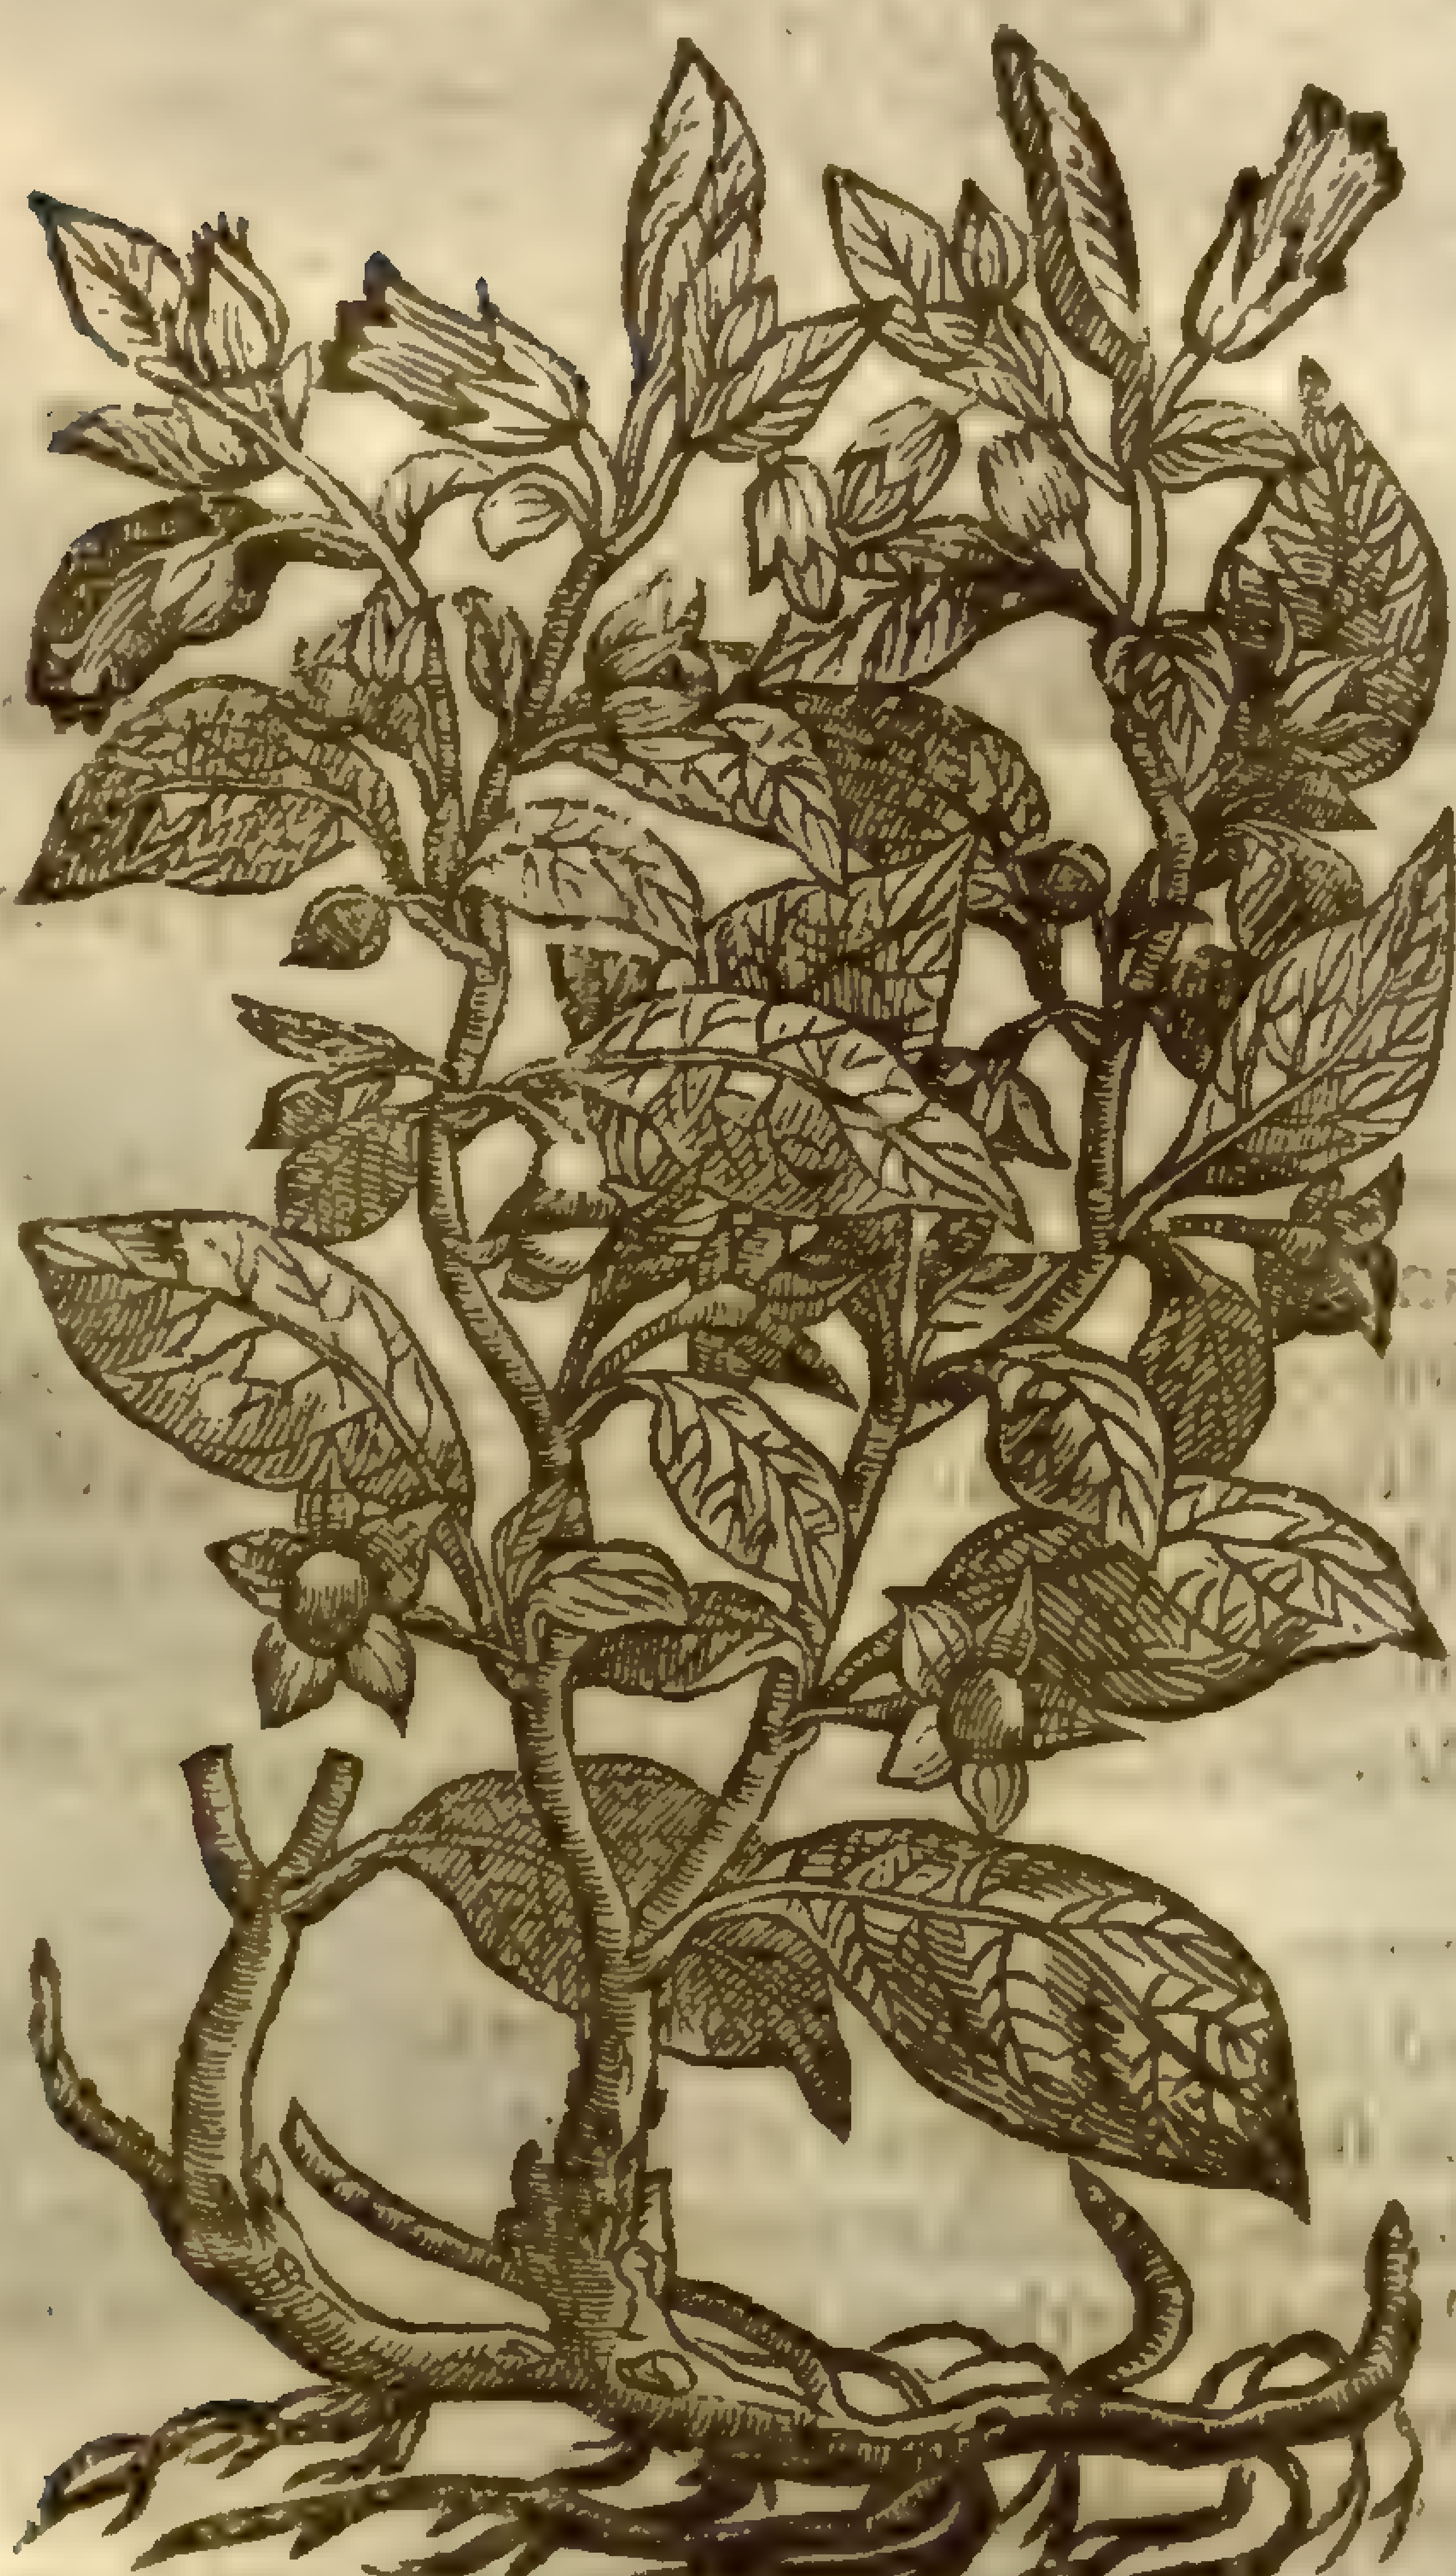
E The leaues ſtamped are profitably put into the ointments of Poplar buds called *Vnguentum Populeon*, and it is good in all other ointments made for the ſame purpoſe.

F ‡ 2 The barke of the root of ſleepy Nightſhade taken in the weight of ℥ 1. hath a ſomniferous qualitie, yet is it milder than *Opium*, and the fruit thereof vehemently prouokes vrine. But (as *Pliny* ſaith) the remedies hereof are not of ſuch eſteem that we ſhould long inſiſt vpon them, eſpecially ſeeing we are furniſhed with ſuch ſtore of medicines leſſe harmfull, yet ſeruing for the ſame purpoſe. ‡

† The figure in the ſecond place was of the *Solanum Pomiferum*, or *Mala Æthiopica*, treated of at large in the 61 Chap. of this booke, and therefore it is omitted here, and in ſtead thereof another put in the place.

Chap. 56. *Of ſleepy Nightſhade.*

Solanum Lethale.
Dwale, or deadly Nightſhade.



¶ *The Deſcription.*

Dwale or ſleeping Nightſhade hath round blackiſh ſtalkes ſix foot high, whereupon do grow great broad leaues of a dark green colour: among which grow ſmal hollow floures bel-faſhion, of an ouerworn purple colour; in the place whereof come forth great round berries of the bigneſſe of the black chery, green at the firſt, but when they be ripe of the colour of black jet or burniſhed horne, ſoft, and ful of purple juice; among which juice lie the ſeeds, like the berries of Ivy: the root is very great, thick, and long laſting.

¶ *The Place.*

It growes in vntoiled places neere highwaies and the ſea mariſhes, and in ſuch like places.

It groweth very plentifully in Holland in Lincolneſhire, and in the Iſle of Ely at a place called Walſoken, neere vnto Wisbitch.

I found it growing without Highgate, neere vnto a pound or pinfold on the left hand.

¶ *The Time.*

This flouriſheth all the Spring and Summer, bearing his ſeed and floure in Iuly and Auguſt.

¶ *The Names.*

It is called of *Dioſcorides*, στρύχνος ὑπνωτικός: of *Theophraſtus*, στρύχνος ὑπνωτικός: of the Latines, *Solanum ſomniferum*,

ſomniferum, or ſleeping Nightſhade; and *Solanum læthale*, or deadly Nightſhade; and *Solanum manicum*, raging Nightſhade: of ſome, *Apollinaris minor vlticana*, and *Herba Opſago*: in Engliſh, Dwale, or ſleeping Nightſhade: the Venetians and Italians call it *Bella dona*: the Germanes, **Dollwurtz**: the low Dutch, **Dulle beſien**: in French, *Morelle mortelle*: it commeth very neere vnto *Theophraſtus* his *Mandragoras*, (which differeth from *Dioſcorides* his *Mandragoras*.)

¶ *The Nature.*

It is cold euen in the fourth degree.

¶ *The Vertues.*

A This kinde of Nightſhade cauſeth ſleep, troubleth the mind, bringeth madneſſe if a few of the berries be inwardly taken, but if moe be giuen they alſo kill and bring preſent death. *Theophraſtus* in his ſixth booke doth likewiſe write of Mandrake in this manner; Mandrake cauſeth ſleepe, and if alſo much of it be taken it bringeth death.

B The greene leaues of deadly Nightſhade may with great aduice be vſed in ſuch caſes as Pettimorell: but if you will follow my counſell, deale not with the ſame in any caſe, and baniſh it from your gardens and the vſe of it alſo, being a plant ſo furious and deadly: for it bringeth ſuch as haue eaten thereof into a dead ſleepe wherein many haue died, as hath beene often ſeene and proued by experience both in England and elſewhere. But to giue you an example hereof it ſhall not be amiſſe: It came to paſſe that three boies of Wisbich in the Iſle of Ely did eate of the pleaſant and beautifull fruit hereof, two whereof died in leſſe than eight houres after that they had eaten of them. The third child had a quantitie of honey and water mixed together giuen him to drinke, cauſing him to vomit often: God bleſſed this meanes and the child recouered. Baniſh therefore theſe pernitious plants out of your gardens, and all places neere to your houſes, where children or women with child do reſort, which do oftentimes long and luſt after things moſt vile and filthie; and much more after a berry of a bright ſhining blacke colour, and of ſuch great beautie, as it were able to allure any ſuch to eate thereof.

C The leaues hereof laid vnto the temples cauſe ſleepe, eſpecially if they be imbibed or moiſtened in wine vinegre. It eaſeth the intollerable paines of the head-ache proceeding of heat in furious agues, cauſing reſt being applied as aforeſaid.

CHAP. 57. *Of Winter Cherries.*

¶ *The Description.*

1 THe red Winter Cherrie bringeth forth ſtalkes a cubit long, round, ſlender, ſmooth and ſomewhat reddiſh, reeling this way and that way by reaſon of his weakeneſſe, not able to ſtand vpright without a ſupporter: whereupon do grow leaues not vnlike to thoſe of common Nightſhade, but greater; among which leaues come forth white floures, conſiſting of fiue ſmall leaues: in the middle of which leaues ſtandeth out a berry, green at the firſt, and red when it is ripe, in colour of our common Cherry and of the ſame bigneſſe, incloſed in a thin huske or little bladder, it is of a pale reddiſh colour, in which berry is conteined many ſmall flat ſeeds of a pale colour. The roots be long, not vnlike to the roots of Couch-graſſe, ramping and creeping within the vpper cruſt of the earth farre abroad, whereby it encreaſeth greatly.

2 The blacke Winter Cherry hath weake and ſlender ſtalkes ſomewhat creſted, and like vnto the tendrels of the vine, caſting it ſelfe all about, and taking hold of ſuch things as are next vnto it: whereupon are ſet jagged leaues deepely indented or cut about the edges almoſt to the middle ribbe. The floures be very ſmall and white ſtanding vpon long footſtalkes or ſtemmes. The skinnie bladders ſucceed the floures, parted into three ſells or chambers, euery of the which conteineth one ſeed and no more, of the bigneſſe of a ſmall peaſe, and blacke of colour, hauing a mark of white colour vpon each berry, in proportion of an heart. The root is very ſmall and threddy.

¶ *The Place.*

1 The red Winter Cherry groweth vpon old broken walls, about the borders of fields, and in moiſt ſhadowie places, and in moſt gardens, where ſome cherriſh it for the beautie of the berries, and others for the great and worthy vertues thereof.

2 The blacke Winter Cherrie is brought out of Spaine and Italy, or other hot regions, from whence I haue had of thoſe blacke ſeeds marked with the ſhape of a mans heart, white, as aforeſaid: and haue planted them in my garden where they haue borne floures, but haue periſhed before the fruit could grow to maturitie, by reaſon of thoſe vnſeaſonable yeares, 1594. 95. 96.

¶ *The Time.*

The red winter Cherrie beareth his floures and fruit in Auguſt.

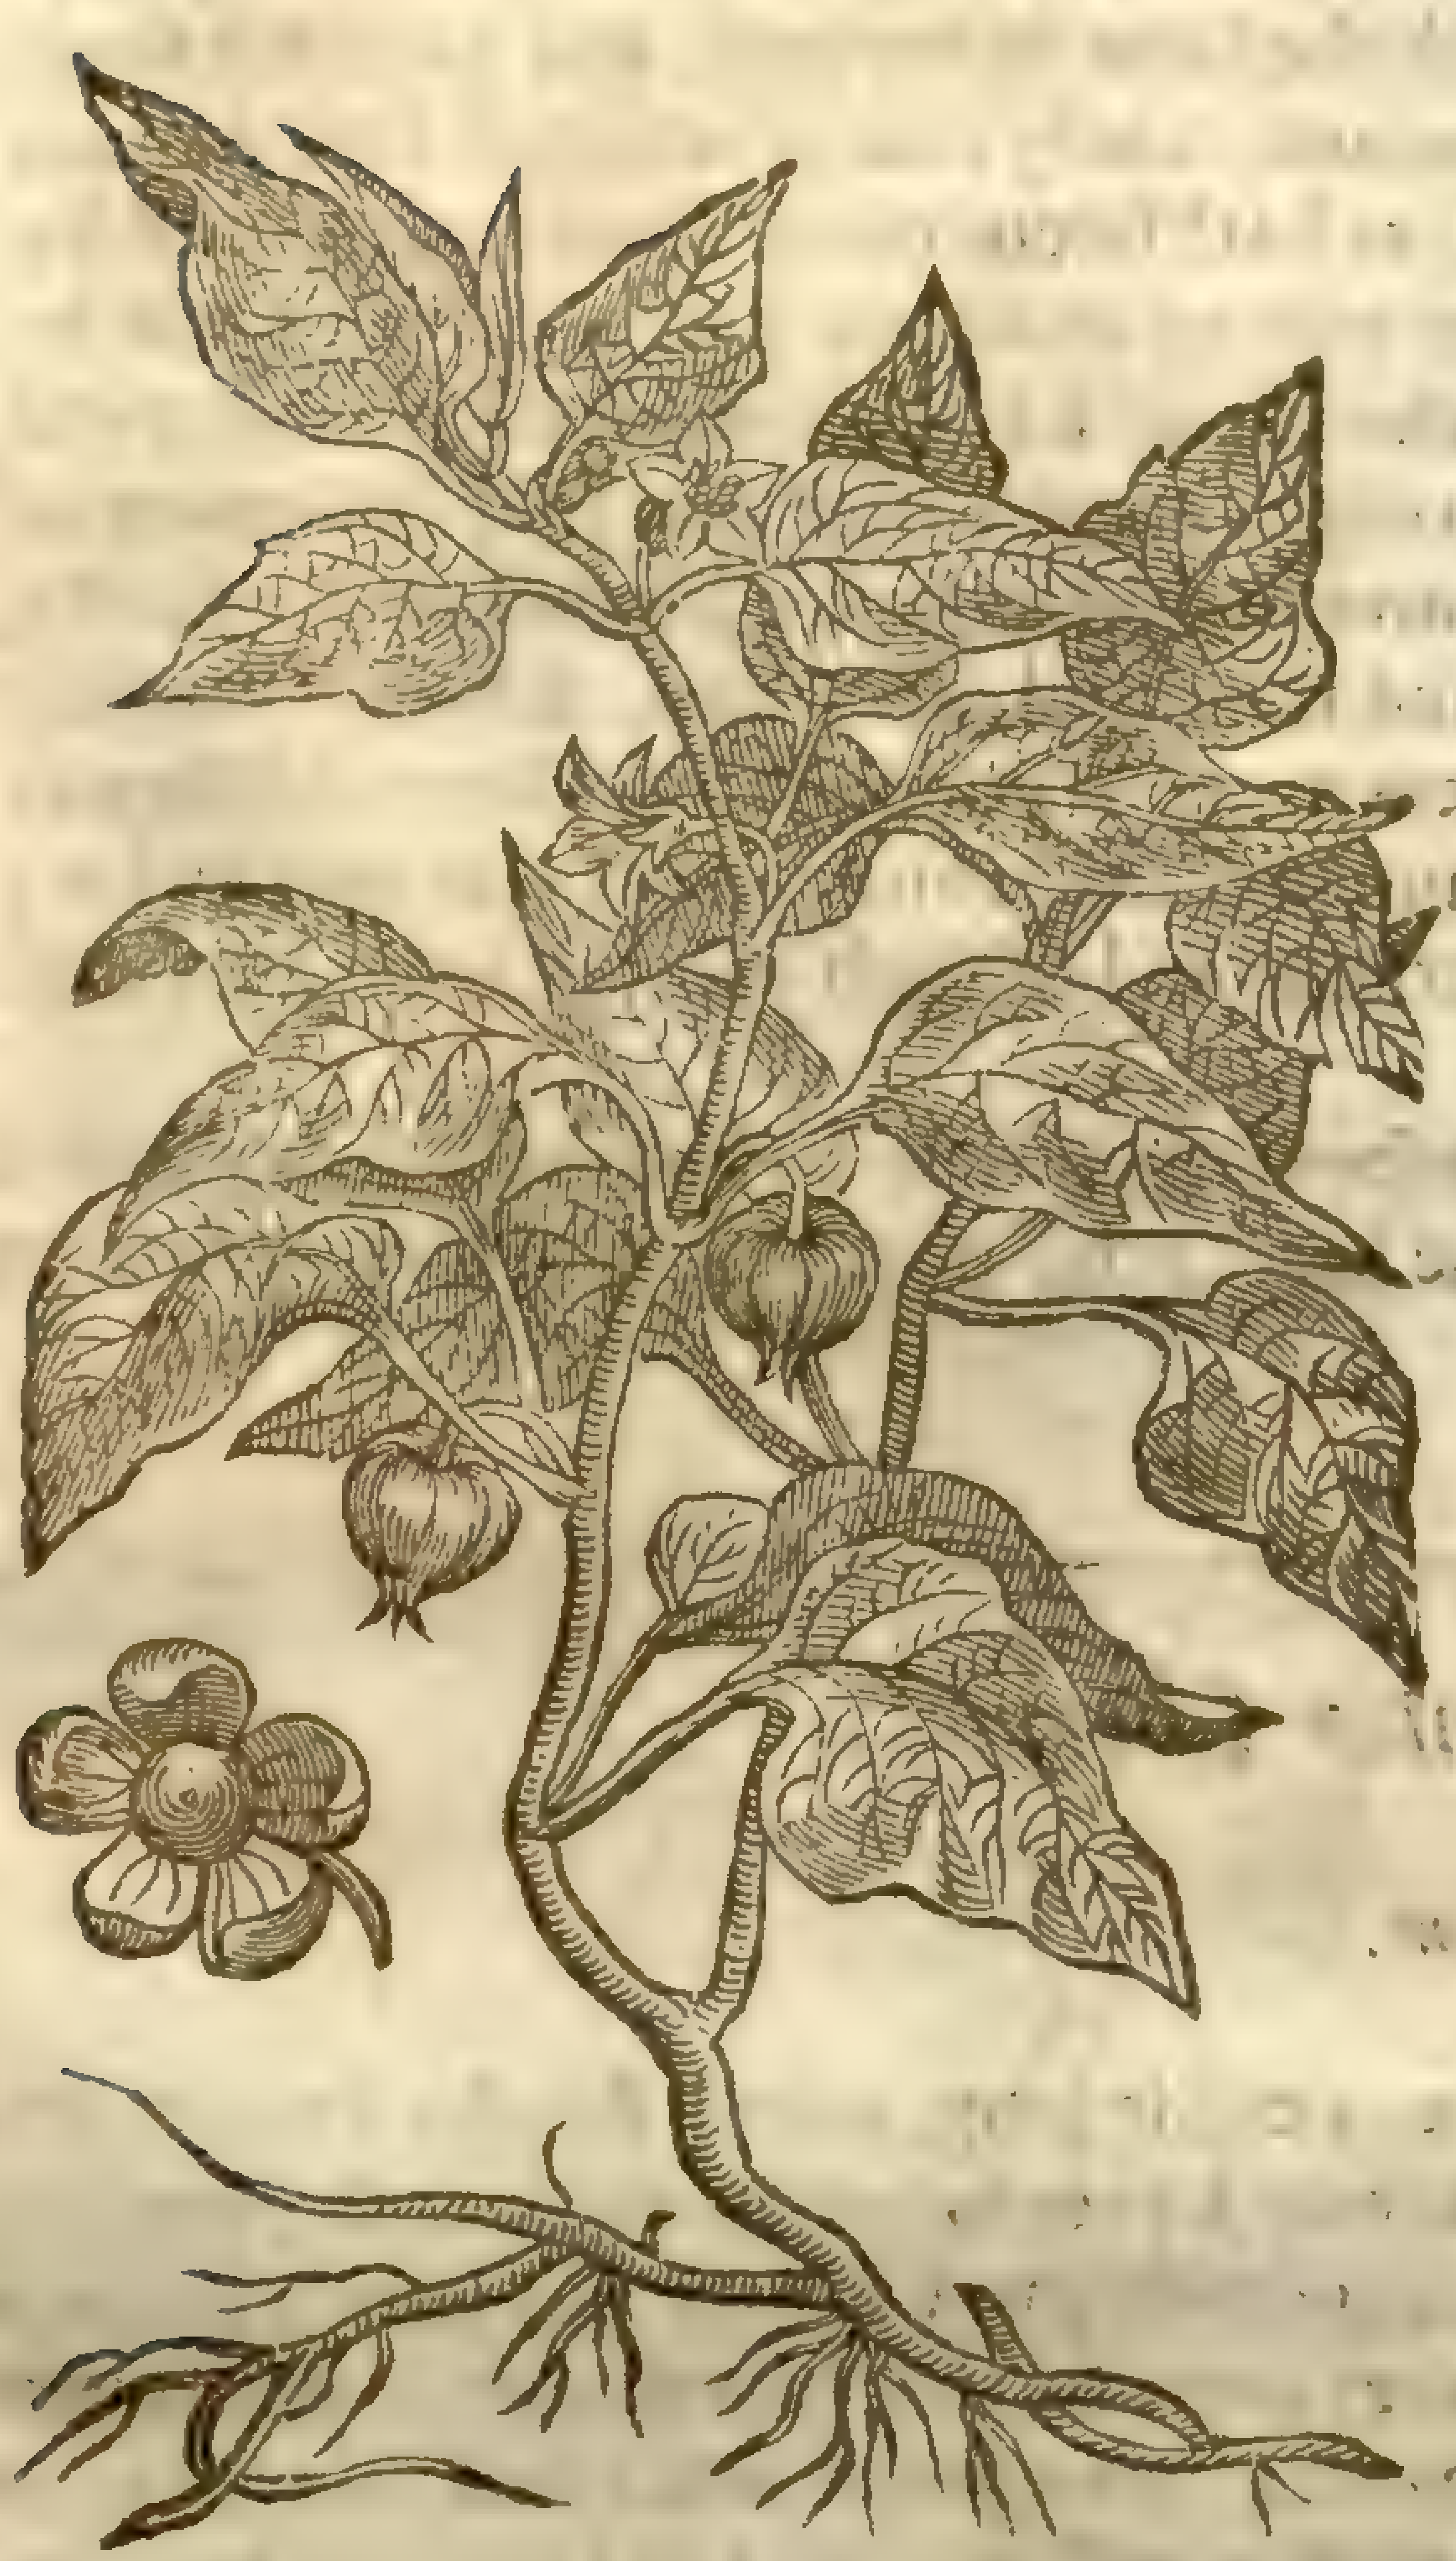
The blacke beareth them at the ſame time, where it doth naturally grow.

¶ *The Names.*

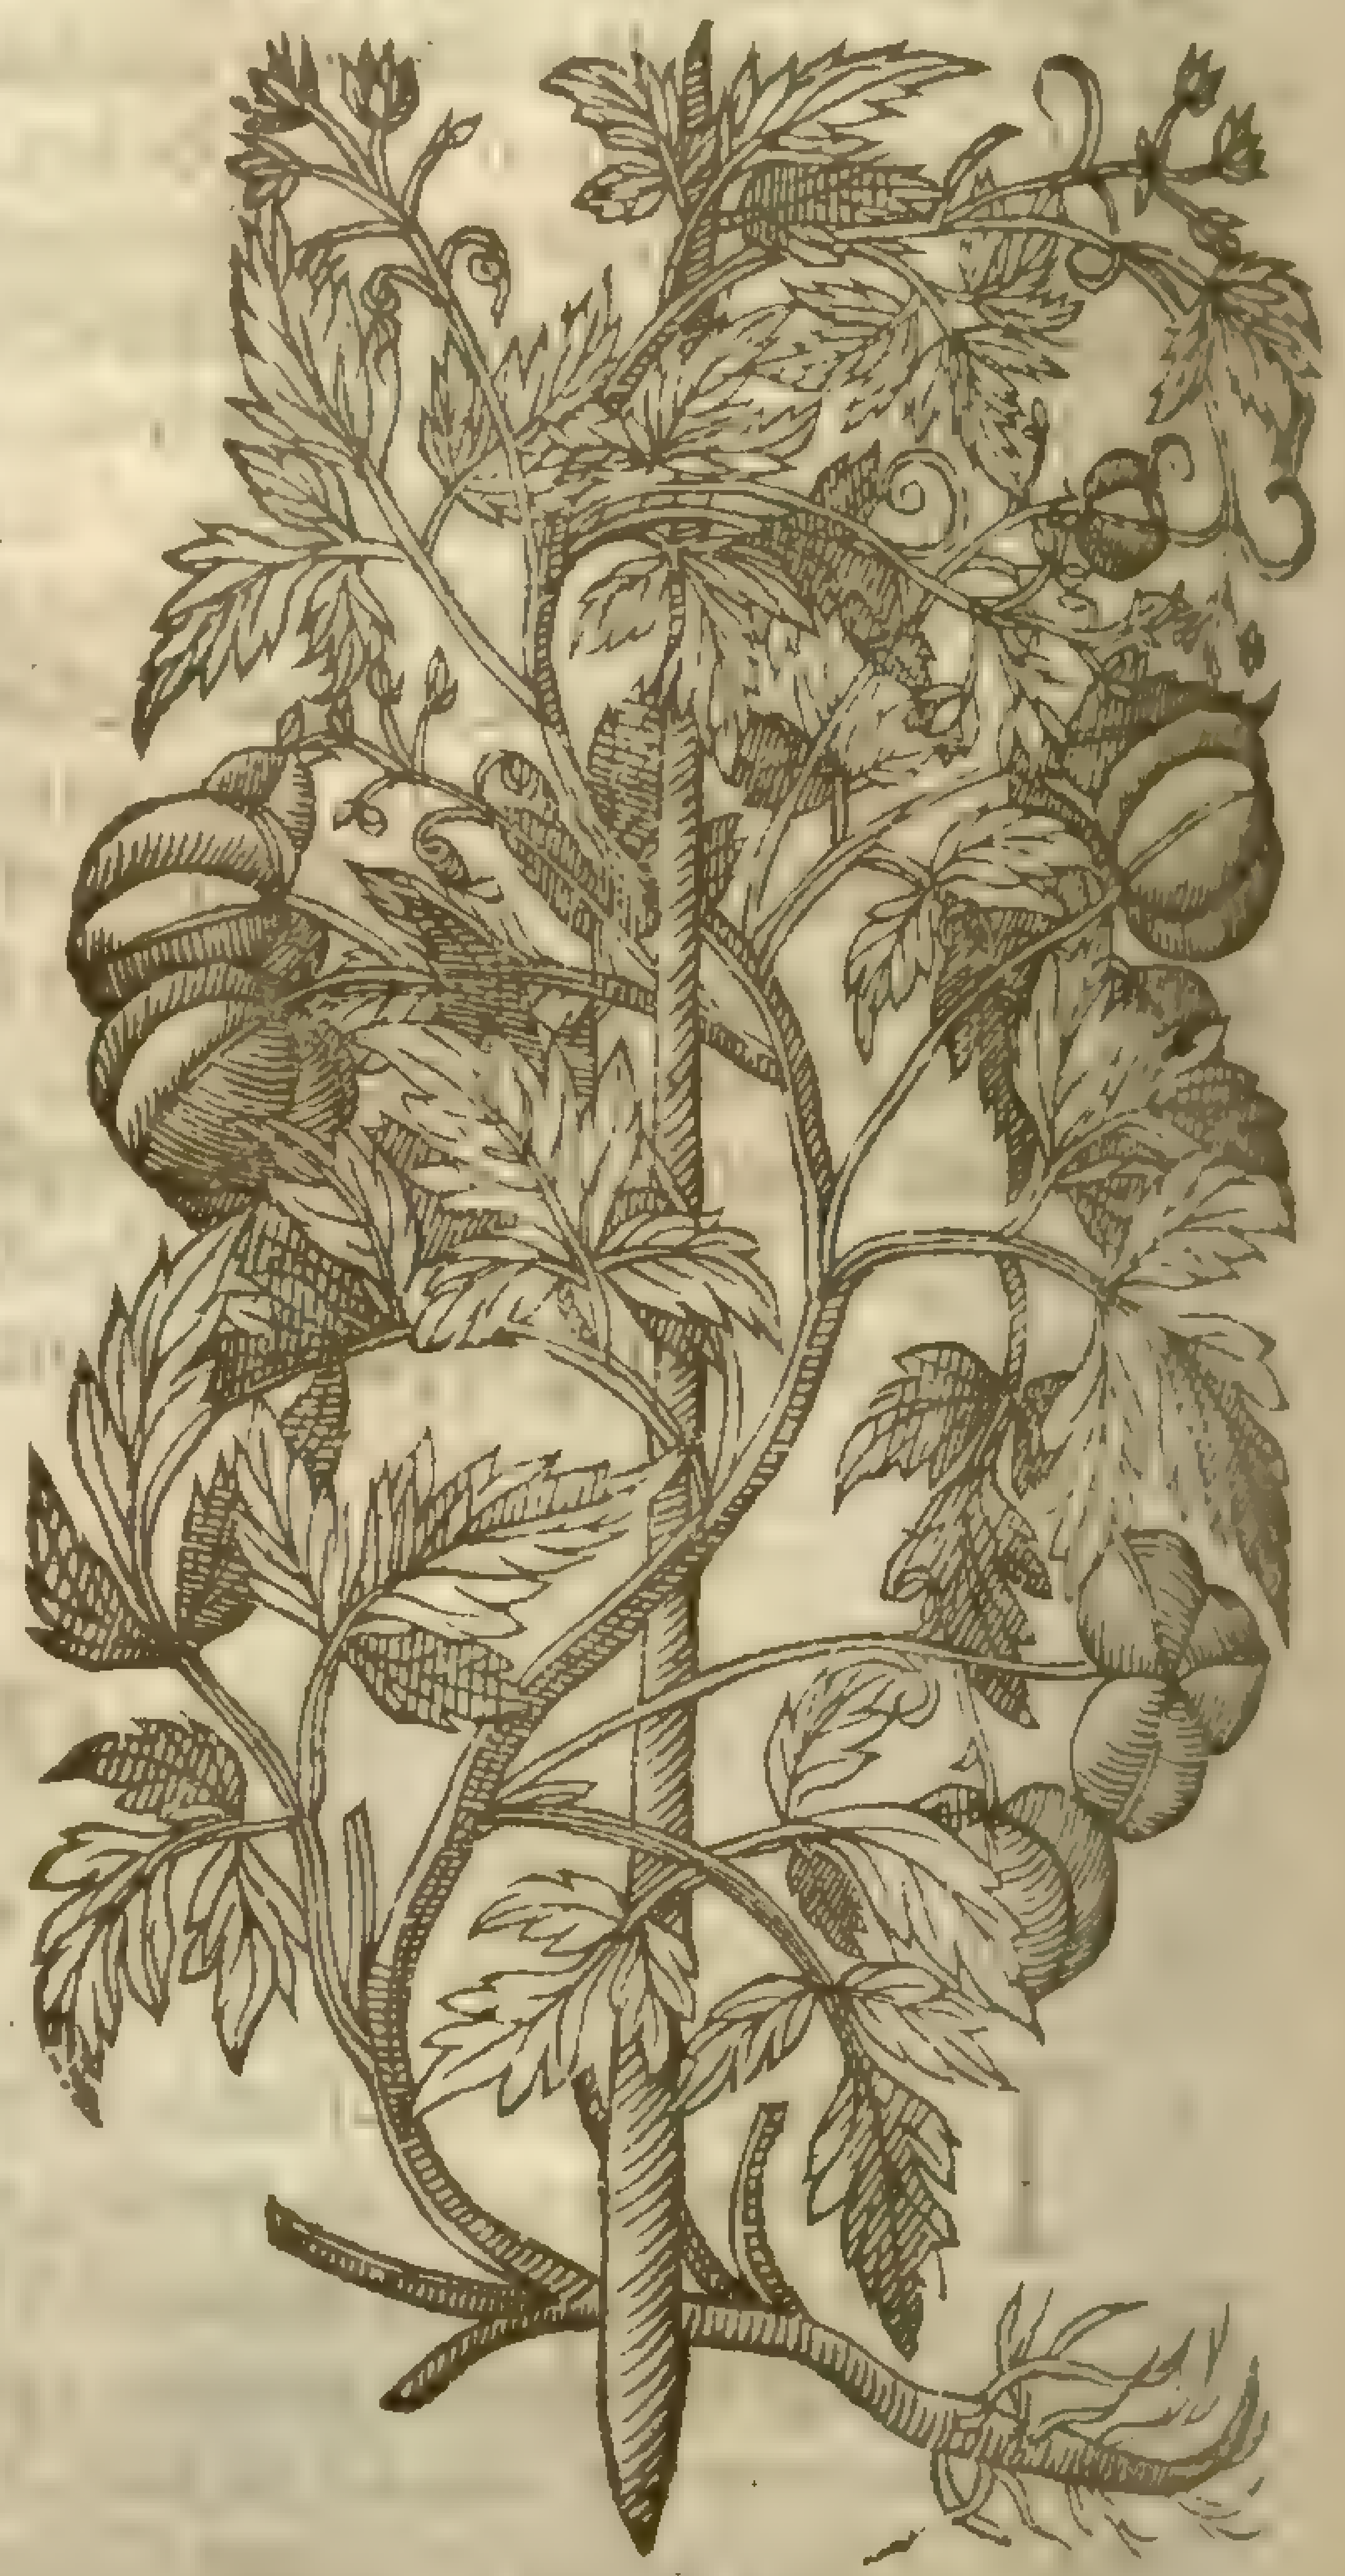
The red winter Cherrie is called in Greeke, στρύχνος: in Latine, *Veſicaria*, and *Solanum Veſicarium*: in ſhops, *Alkekengi*: *Plinie* in his 21. booke nameth it *Halicacabus*, and *Veſicaria*, of the little bladders: or as the ſame Authour writeth, becauſe it is good for the bladder and the ſtone: it is called in Spaniſh, *Vexiga de Porro*: in French, *Alquequenges*, *Bagenauldes*, and *Ceriſes d'outre mer*: in Engliſh, red Nightſhade, Winter Cherries, and Alkakengie.

Physalis alkekengi L. [illegible]

1 *Solanum Halicacabum.*
Red Winter Cherries.



2 *Halicacabum Peregrinum.*
Blacke Winter Cherries.



The Blacke Winter Cherrie is called *Halicacabum Peregrinum*, *Veſicaria Peregrina*, or ſtrange winter Cherrie: of *Pena* and *Lobel* it is called, *Cor Indum*, *Cor Indicum*: of others, *Piſum Cordatum*: in Engliſh, the Indian heart, or heart peaſe: ſome haue taken it to be *Dorycnion*, but they are greatly deceiued, being in truth not any of the Nightſhades; it rather ſeemeth to agree with the graine named of *Serapio*, *Abrong*, or *Abrugi*, of which he writeth in his 153. chapter in theſe words: It is a little graine ſpotted with blacke and white, round, and like the graine Maiz, with which notes this doth agree.

¶ *The Temperature.*

The red Winter Cherrie is thought to be cold and dry, and of ſubtile parts.

The leaues differ not from the temperature of the garden Night ſhade, as *Galen* ſaith.

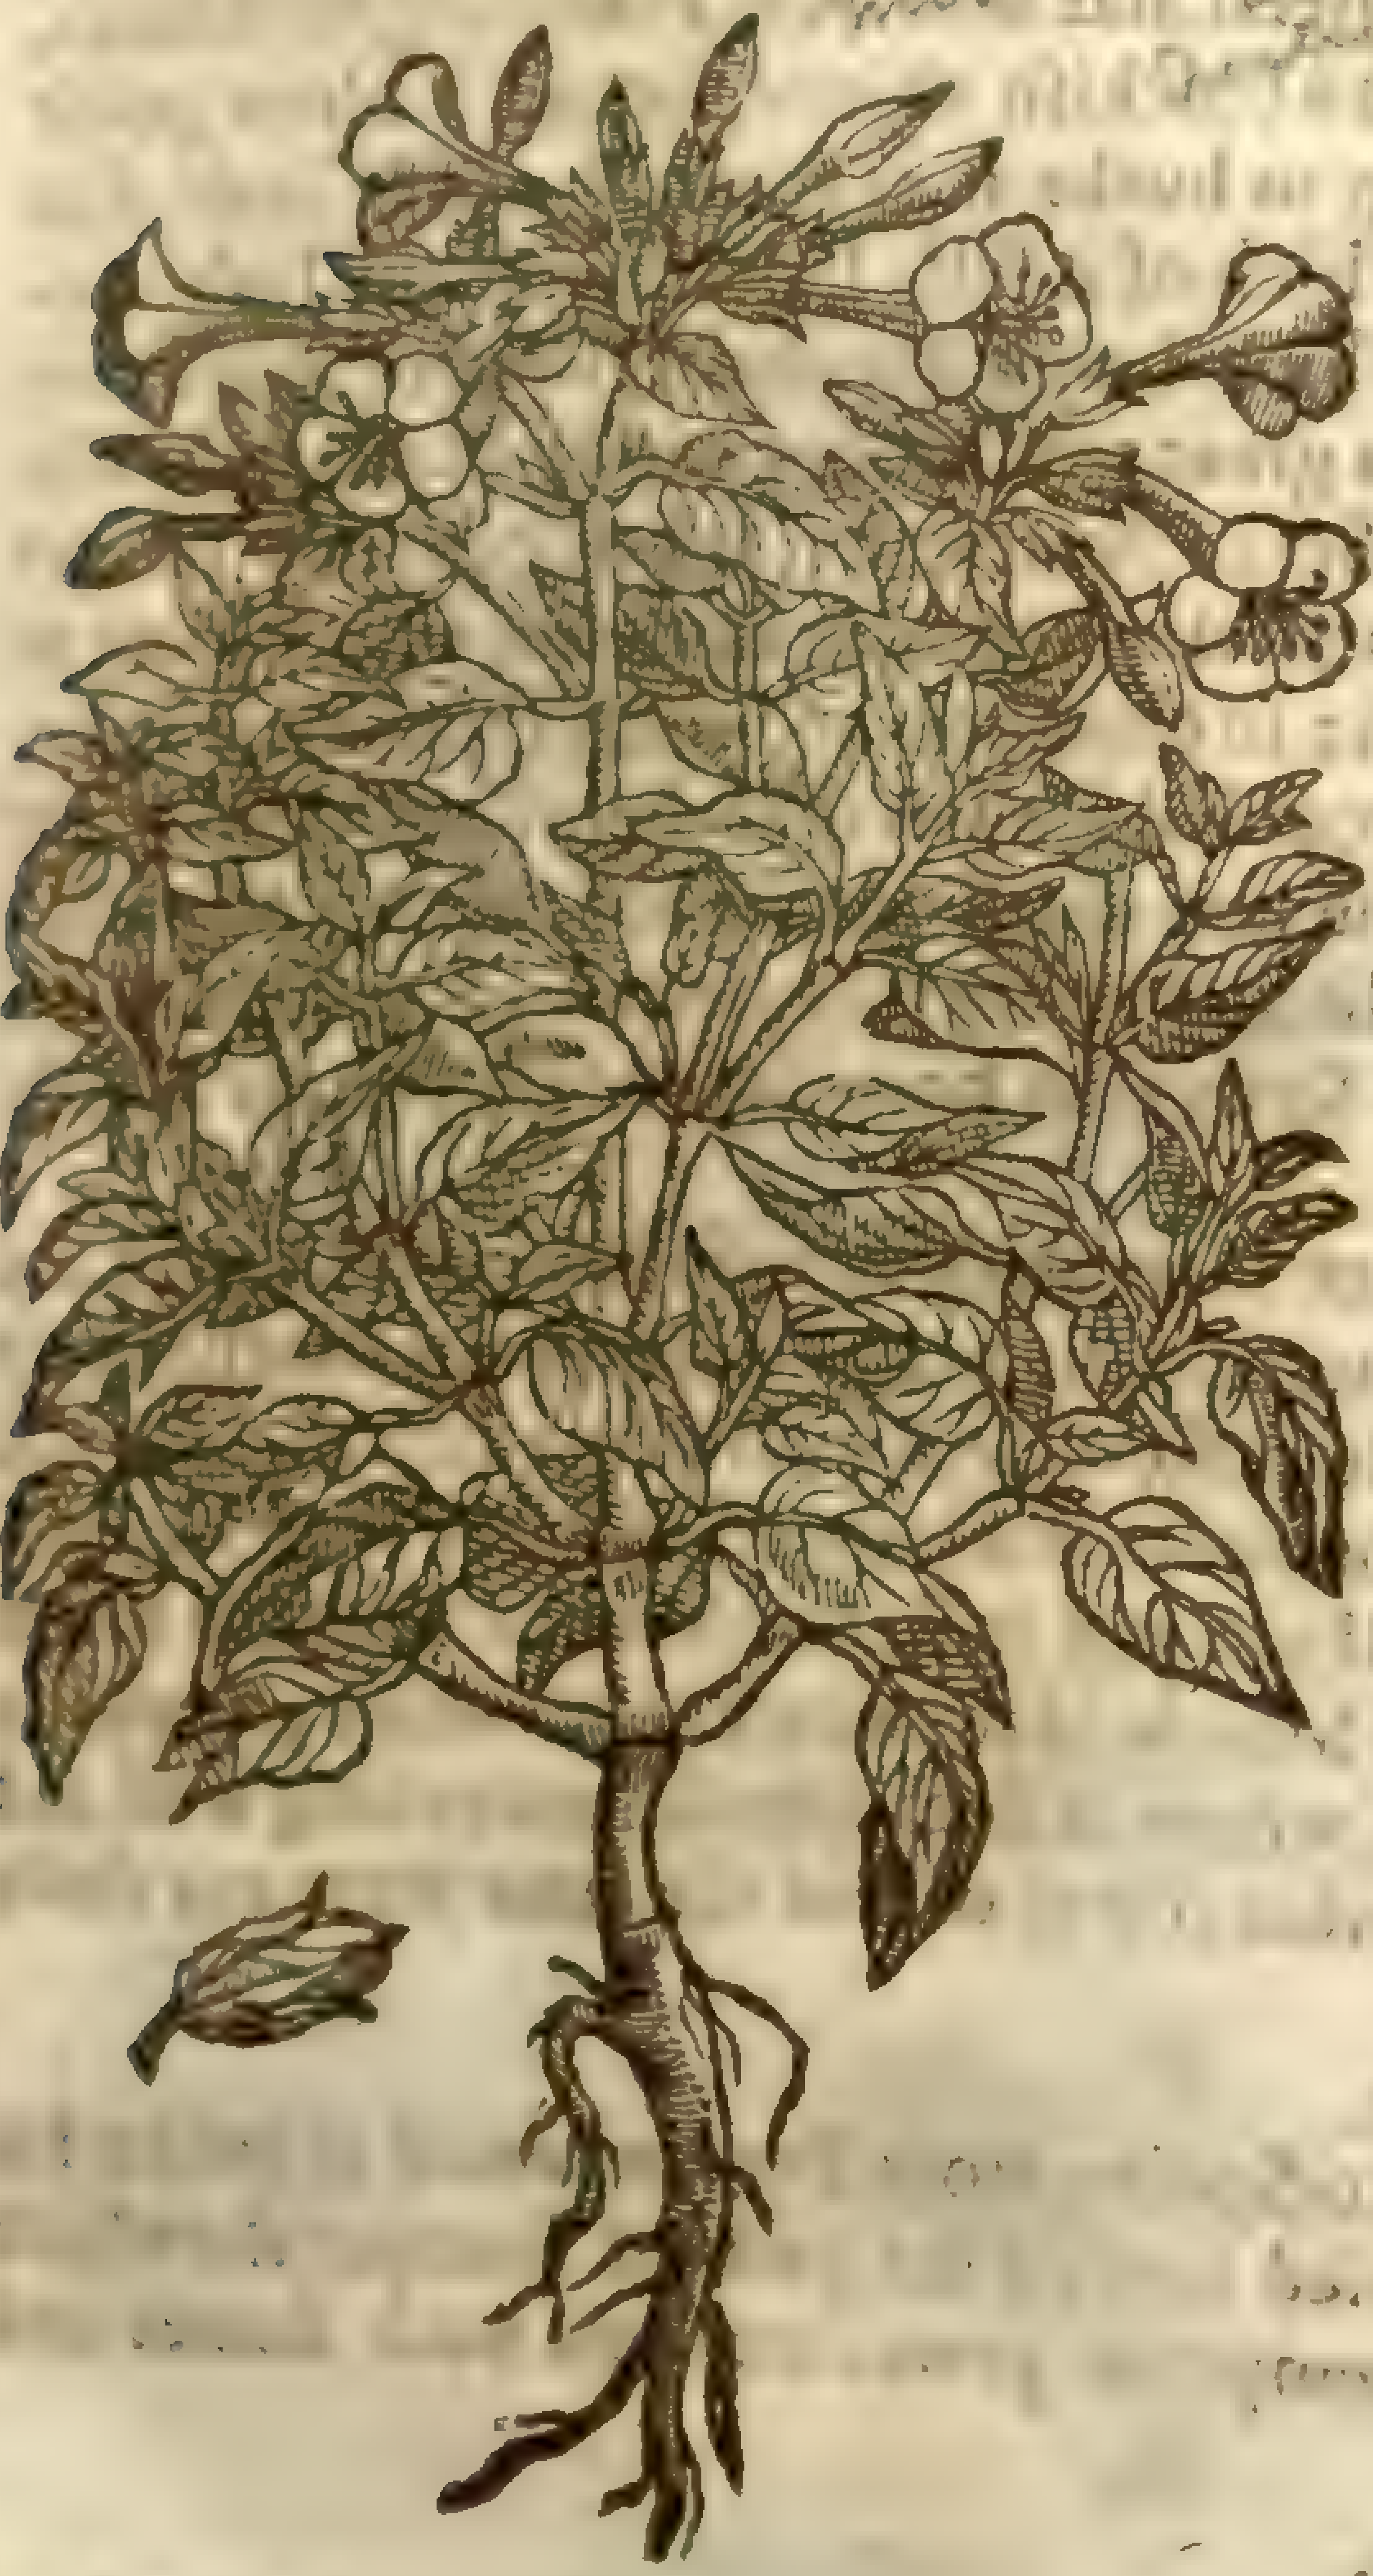
¶ *The Vertues.*

A The fruit bruſed and put to infuſe or ſteepe in white wine two or three houres, and after boiled two or three bublings, ſtraining it, and putting to the decoction a little ſugar and cinnamon, and drunke, prauaileth very mightily againſt the ſtopping of vrine, the ſtone and grauell, the difficultie and ſharpeneſſe of making water, and ſuch like diſeaſes: if the griefe be old, the greater quantity muſt be taken; if new and not great, the leſſe: it ſcoureth away the yellow jaundiſe alſo, as ſome write.

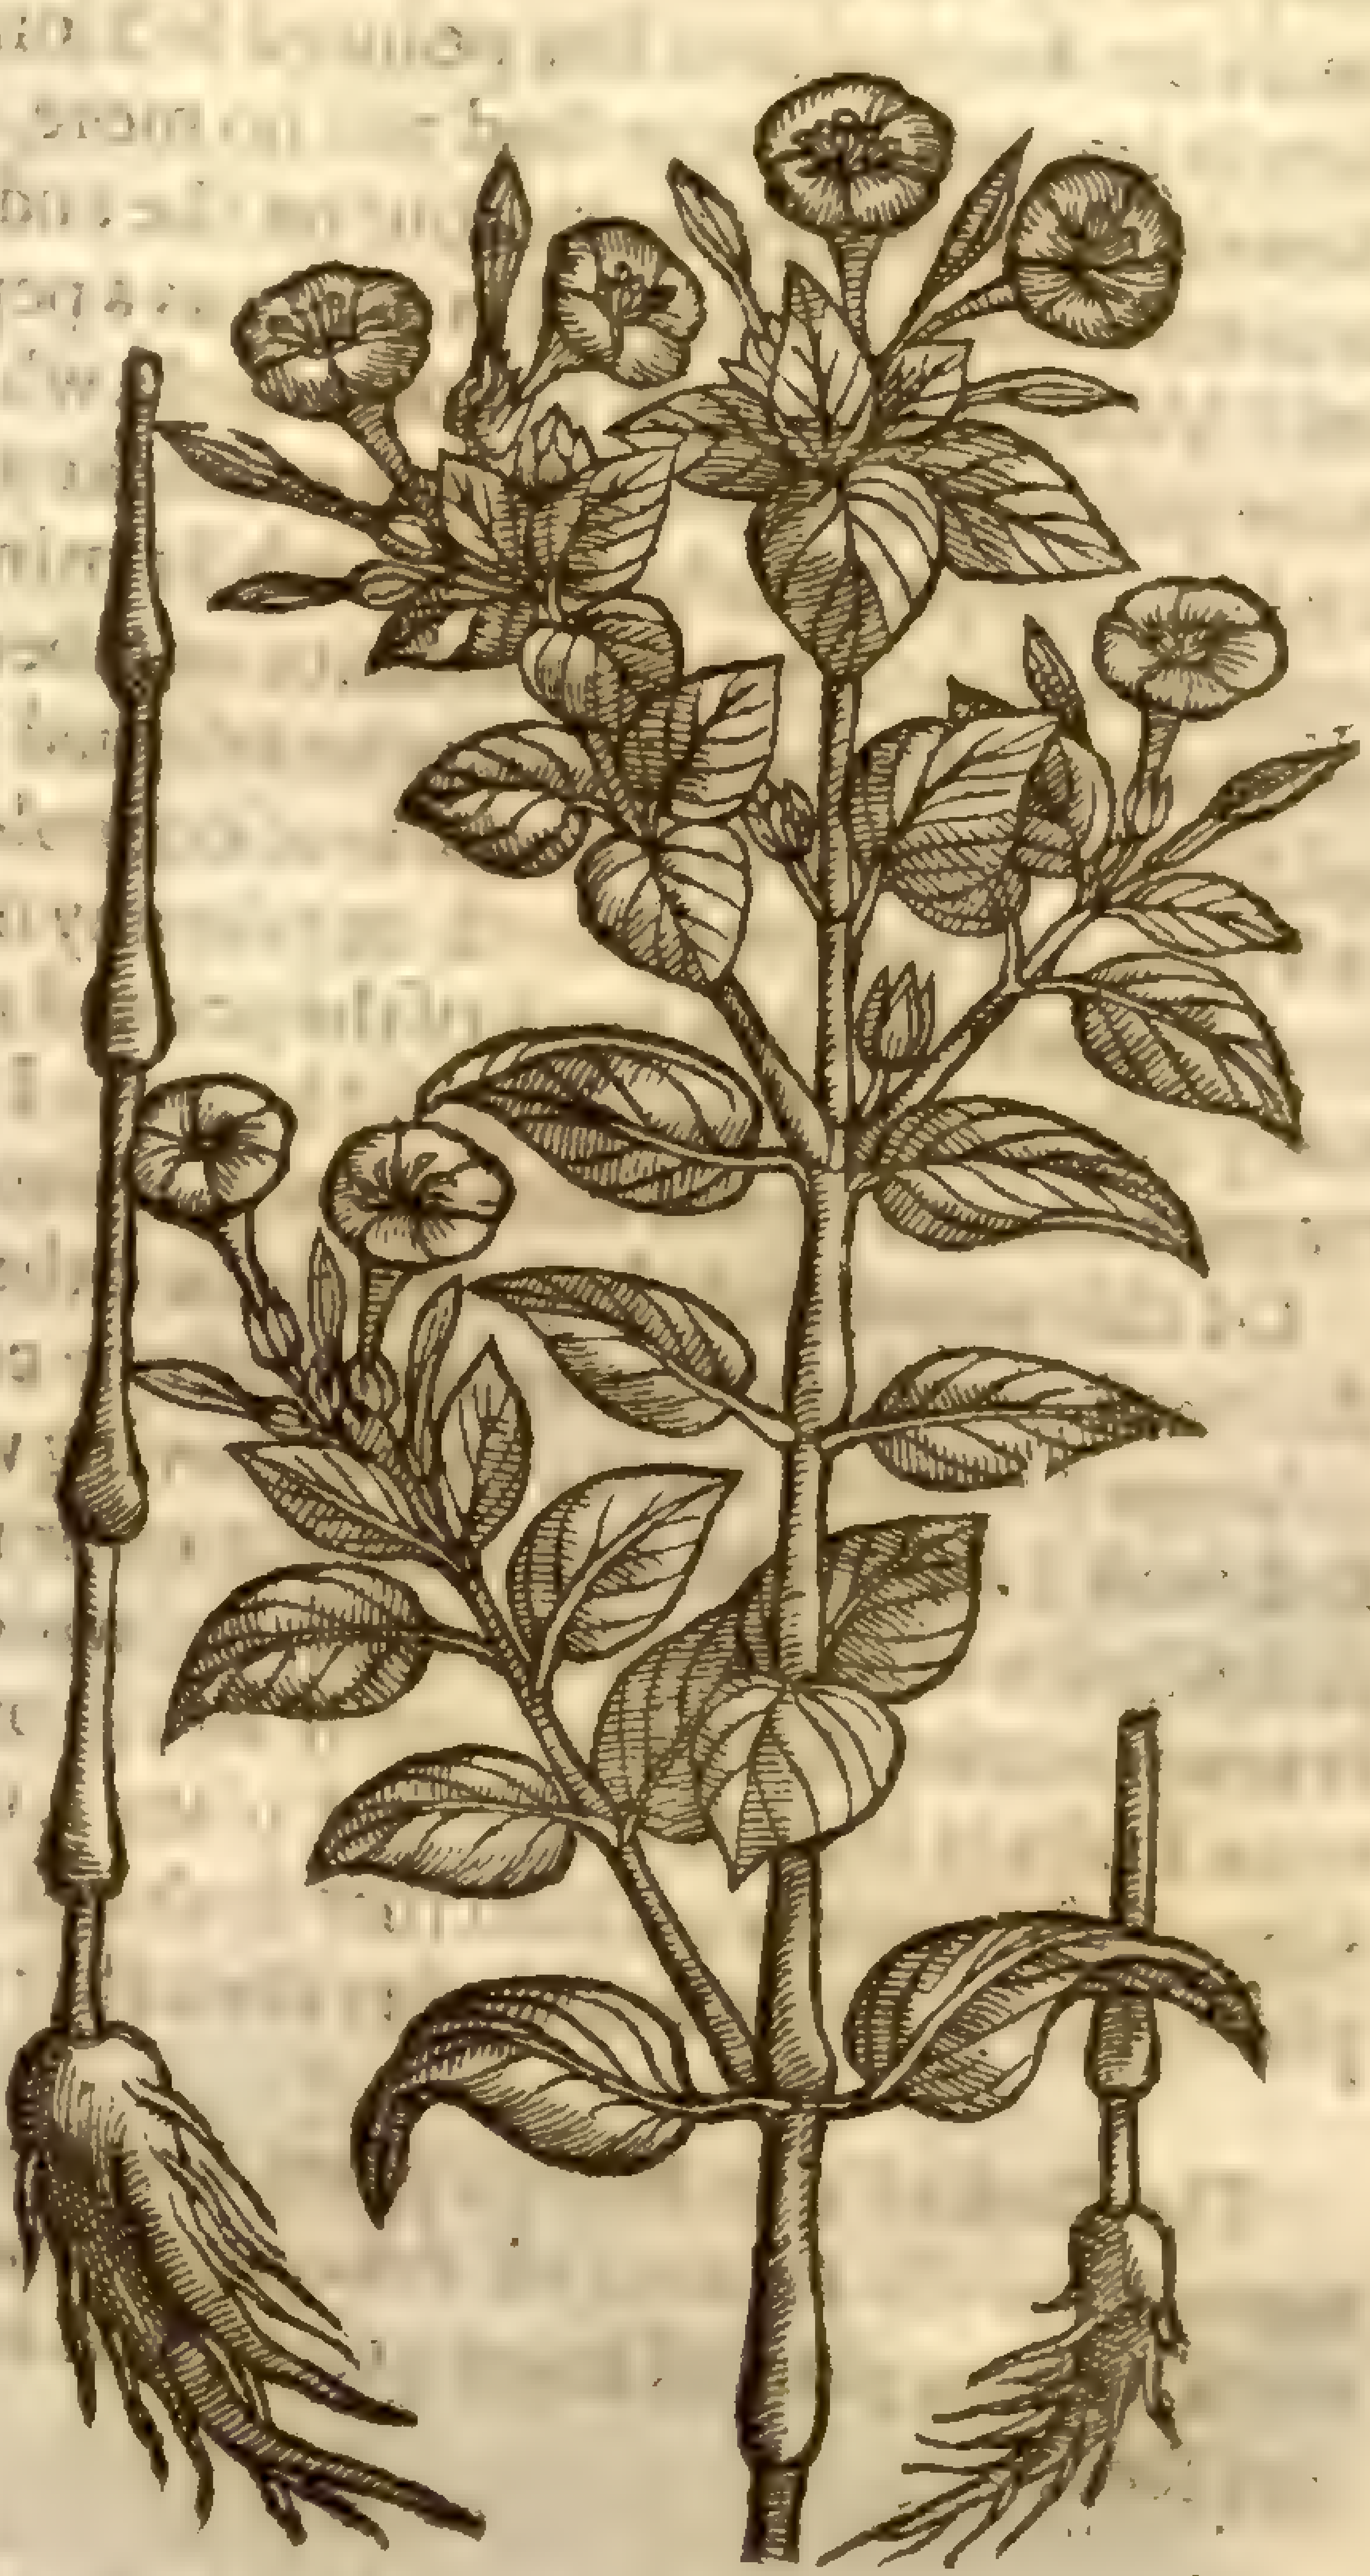
Chap.

CHAP. 58. *Of the Maruell of the World.*

Mirabilia Peruviana flore luteo.
The Maruell of Peru with yellowiſh floures.



‡ *Mirabilia Peruviana flore albo.*
The Maruell of Peru with white floures.



¶ *The Deſcription.*

THis admirable Plant, called the Maruell of Peru, or the Maruell of the World, ſprings forth of the ground like vnto Baſil in leaues; among which it ſendeth out a ſtalke two cubits and a halfe high, of the thickneſſe of a finger, full of juice, very firme, and of a yellowiſh green colour, knotted or kneed with joints ſomewhat bunching forth, of purpliſh colour, as in the female Balſamina: which ſtalke diuideth it ſelfe into ſundry branches or boughes, and thoſe alſo knottie like the ſtalke. His branches are decked with leaues growing by couples at the joints like the leaues of wilde Peaſcods, greene, fleſhy, and full of joints; which being rubbed doe yeeld the like vnpleaſant ſmell as wilde Peaſcods do, and are in taſte alſo very vnſauory, yet in the later end they leaue a taſt and ſharp ſmack of Tabaco. The ſtalks toward the top are garniſhed with long hollow ſingle floures, folded as it were into fiue parts before they be opened; but being fully blown, do reſemble the floures of Tabaco, not ending in ſharp corners, but blunt & round as the flours of Bindweed, and larger than the floures of Tabaco, glittering oft times with a fine purple or crimſon colour, many times of an horſe-fleſh, ſometimes yellow, ſometimes pale, and ſomtime reſembling an old red or yellow colour; ſometime whitiſh, and moſt commonly two colours occupying half the floure, or intercourſing the whole floure with ſtreaks or orderly ſtreames, now yellow, now purple, diuided through the whole, hauing ſometime great, ſomtime little ſpots of a purple colour, ſprinkled and ſcattered in a moſt variable order and braue mixture. The ground or field of the whole floure is either pale, red, yellow, or white, containing in the middle of the hollowneſſe a pricke or pointal ſet round about with ſix ſmall ſtrings or chiues. The floures are very ſweet and pleaſant, reſembling the Narciſſe or white Daffodill, and are very ſuddenly fading; for at night they are floured wide open, and ſo continue vntill eight of the clocke the next morning, at which time they begin to cloſe (after the maner of Bindweed, eſpecially if the weather be very hot: but the aire being temperat, they remain open the whole day, and are cloſed only at night, and ſo periſh, one floure laſting but onely one day, like the true Ephemerum or Hemerocallis. This maruellous variety doth not without cauſe bring admiration to all that obſerue it. For if the floures be gathered and reſerued in ſeuerall papers, and compared with thoſe floures that will ſpring and flouriſh the next day, you ſhall eaſily perceiue that one is not like another in colour, though you ſhall compare one hundred which floure one day, and another hundred which you gather the next day, and ſo from day to day during the time of their flouring. The cups and huskes which containe and embrace the floures are diuided into fiue pointed ſections, which are green, and as it were, conſiſting of skinnes, wherein is conteined one ſeed and no more, couered with a blackiſh skinne, hauing a blunt point whereon the floure groweth; but on the end next the cup or huske it is adorned with a little fiue cornered crowne. The ſeed is as big as a pepper corne, which of it ſelfe fadeth with any light motion. Within this ſeed is contained a white kernell, which being bruiſed, reſolueth into a very white pulpe like ſtarch. The root is thicke and like vnto a great raddiſh, outwardly black, and within white, ſharpe in taſte, wherewith is mingled a ſuperficiall ſweetneſſe. It bringeth new floures from Iuly vnto October in infinite number, yea euen vntill the froſts doe cauſe the whole plant to periſh: notwithſtanding it may be reſerued in pots, and ſet in chambers and cellars that are warme, and ſo defended from the iniurie of our cold climate; prouided alwaies that there be not any water caſt vpon the pot, or ſet forth to take any moiſture in the aire vntill March following; at which time it muſt be taken forth of the pot and replanted in the garden. By this meanes I haue preſerued many (though to ſmall purpoſe) becauſe I haue ſowne ſeeds that haue borne floures in as ample manner and in as good time as thoſe reſerued plants.

Of this wonderfull herbe there be other ſorts, but not ſo amiable or ſo full of varietie, and for the moſt part their floures are all of one color. But I haue ſince by practiſe found out another way to keepe the roots for the yere following with very little difficultie, which neuer faileth. At the firſt froſt I dig vp the roots and put vp or rather hide the roots in a butter ferkin, or ſuch like veſſell, filled with the ſand of a riuer, the which I ſuffer ſtill to ſtand in ſome corner of an houſe where it neuer receiueth moiſture vntill Aprill or the midſt of March, if the weather be warme; at which time I take it from the ſand and plant it in the garden, where it doth flouriſh exceeding well and increaſeth by roots; which that doth not which was either ſowne of ſeed the ſame yeere, nor thoſe plants that were preſerued after the other manner.

¶ *The Place,*

The ſeed of this ſtrange plant was brought firſt into Spaine, from Peru, whereof it tooke his name *Mirabilia Peruana*, or *Peruviana*: and ſince diſperſed into all the parts of Europe: the which my ſelfe haue planted many yeeres, and haue in ſome temperate yeeres receiued both floures and ripe ſeed.

¶ *The Time.*

It is ſowne in the midſt of Aprill, and bringeth forth his variable floures in September, and periſheth with the firſt froſt, except it be kept as aforeſaid.

¶ *The Names.*

It is called in Peru of thoſe Indians there, *Hachal*. Of others after their name *Hachal Indi*: of the high and low Dutch, *Solanum Odoriferum*: of ſome, *Iaſminum Mexicanum*: and of *Carolus Clusius*, *Admirabilia Peruviana*: in Engliſh rather the Maruell of the World, than of Peru alone.

¶ *The Nature and Vertues.*

We haue not as yet any inſtructions from the people of India, concerning the nature or vertues of this plant: the which is eſteemed as yet rather for his rareneſſe, beautie, and ſweetneſſe of his floures, than for any vertues knowne; but it is a pleaſant plant to decke the gardens of the curious. Howbeit *Iacobus Antonius Cortuſus* of Padua hath by experience found out, that two drams of the root thereof taken inwardly doth very notably purge wateriſh humours.

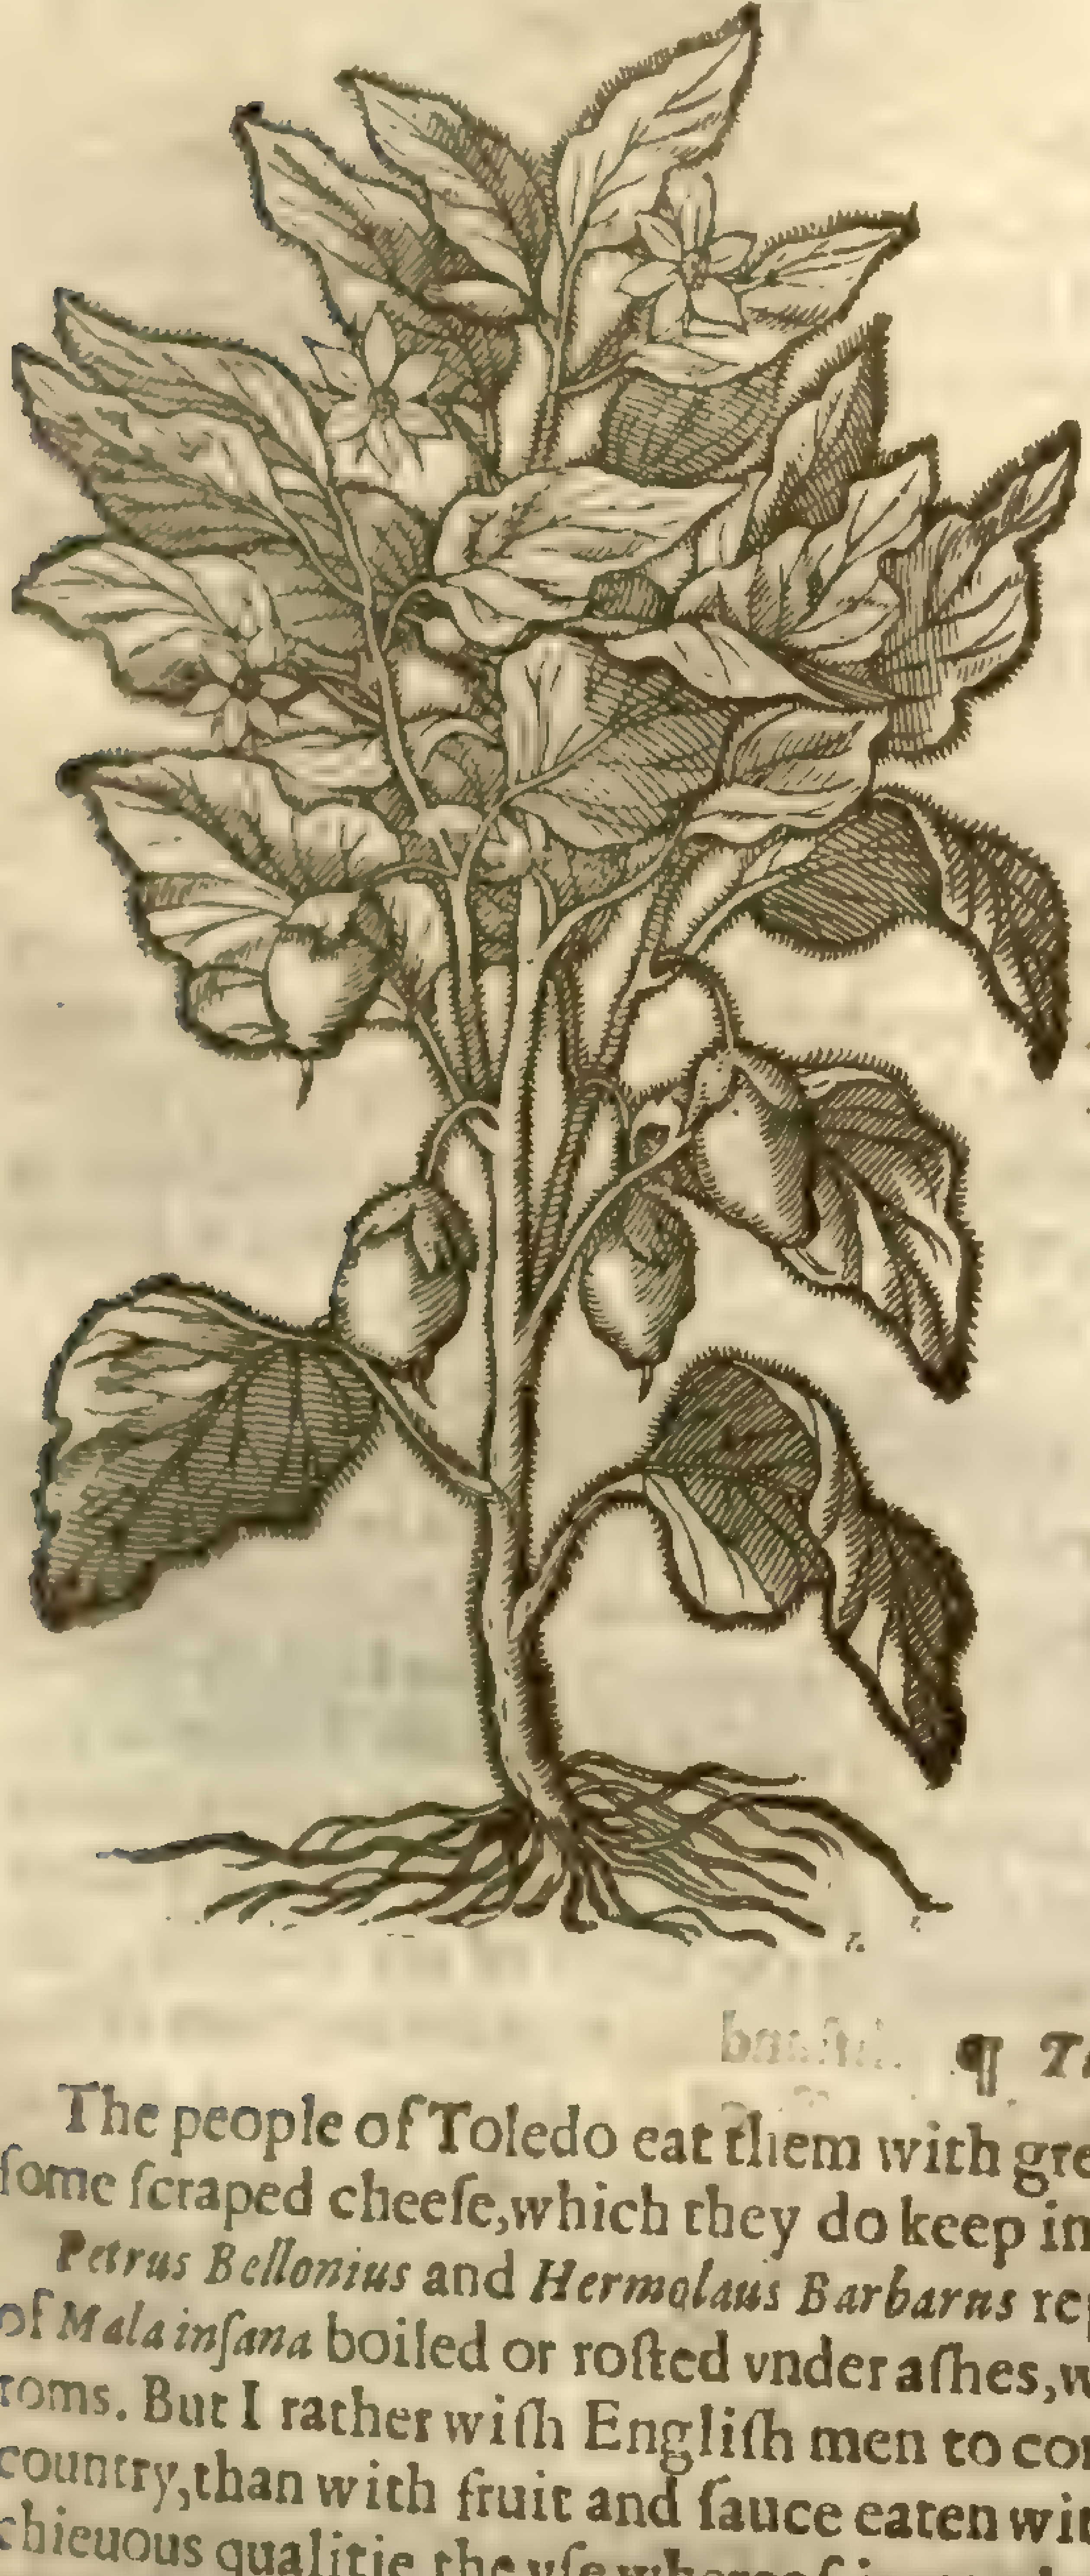
Chap. 59. *Of Madde Apples.*

¶ *The Deſcription.*

Raging Apples hath a round ſtalke of two foot high, diuided into ſundry branches, ſet with broad leaues ſomewhat indented about the edges, not vnlike the leaues of white Henbane, of a darke browne greene colour, ſomewhat rough. Among the which come the floures of a white colour, and ſomtimes changing into purple, made of ſix parts wide open like a ſtar, with certain yellow chiues or thrums in the middle: which being paſt, the fruit comes in place, ſet in a cornered cup or huske after the manner of great Nightſhade, great and ſomewhat long, of the bigneſſe of a Swans egge, and ſometimes much greater, of a white colour, ſomtimes yellow, and often brown, wherein is contained ſmall flat ſeed of a yellow colour. The root is thick, with many threds faſtned thereto.

Mala Inſana.
Mad or raging Apples.

Solanum melongena
[illegible]



¶ *The Place.*

This Plant growes in Egypt almoſt euery where in ſandy fields euen of it ſelfe, bringing forth fruit of the bigneſſe of a great Cucumber, as *Petrus Bellonius* writeth, *lib.* 2. of his ſingular obſeruations.

We had the ſame in our London gardens, where it hath borne floures; but Winter approching before the time of ripening, it periſhed: neuertheleſſe it came to beare fruit of the bignes of a gooſe egg one extraordinarie temperate yeare, as I did ſee in the garden of a worſhipfull merchant M^r^ *Harvy* in Limeſtreet; but neuer to the full ripeneſſe.

¶ *The Time.*

This herb muſt be ſowne in Aprill in a bed of horſe-doung, as Muske-melons are, and floureth in Auguſt.

¶ *The Names.*

Petrus Bellonius hath iudged it to be *Malinathalla Theophraſti*. In the dukedome of Millain it is called *Melongena*; and of ſome, *Melanzana*: in Latine, *Mala inſana*: and in Engliſh, Mad Apples. In the Germane tongue, **Dollopffell**: in Spaniſh, *Verangenes*.

¶ *The Nature.*

The herb is cold almoſt in the fourth degree.

¶ *The Vſe, and Danger.*

The people of Toledo eat them with great deuotion, being boiled with fat fleſh, putting to it ſome ſcraped cheeſe, which they do keep in vineger, hony, or ſalt pickle all winter, to procure luſt.

Petrus Bellonius and *Hermolaus Barbarus* report, That in Egypt & Barbary they vſe to eat the fruit of *Mala inſana* boiled or roſted vnder aſhes, with oile, vineger, and pepper, as people vſe to eat Muſhroms. But I rather wiſh Engliſh men to content themſelues with the meat and ſauce of our owne country, than with fruit and ſauce eaten with ſuch perill; for doubtleſſe theſe Apples haue a miſchieuous qualitie, the vſe whereof is vtterly to bee forſaken. As wee ſee and know many haue eaten and do eat Muſhroms more for wantonneſſe than for need; for there are two kinds therof deadly, which being dreſſed by an vnskilfull cooke may procure vntimely death: it is therefore better to eſteem this plant and haue it in the garden for your pleaſure and the rareneſſe thereof, than for any vertue or good qualities yet knowne.

Chap. 60. *Of Apples of Loue.*

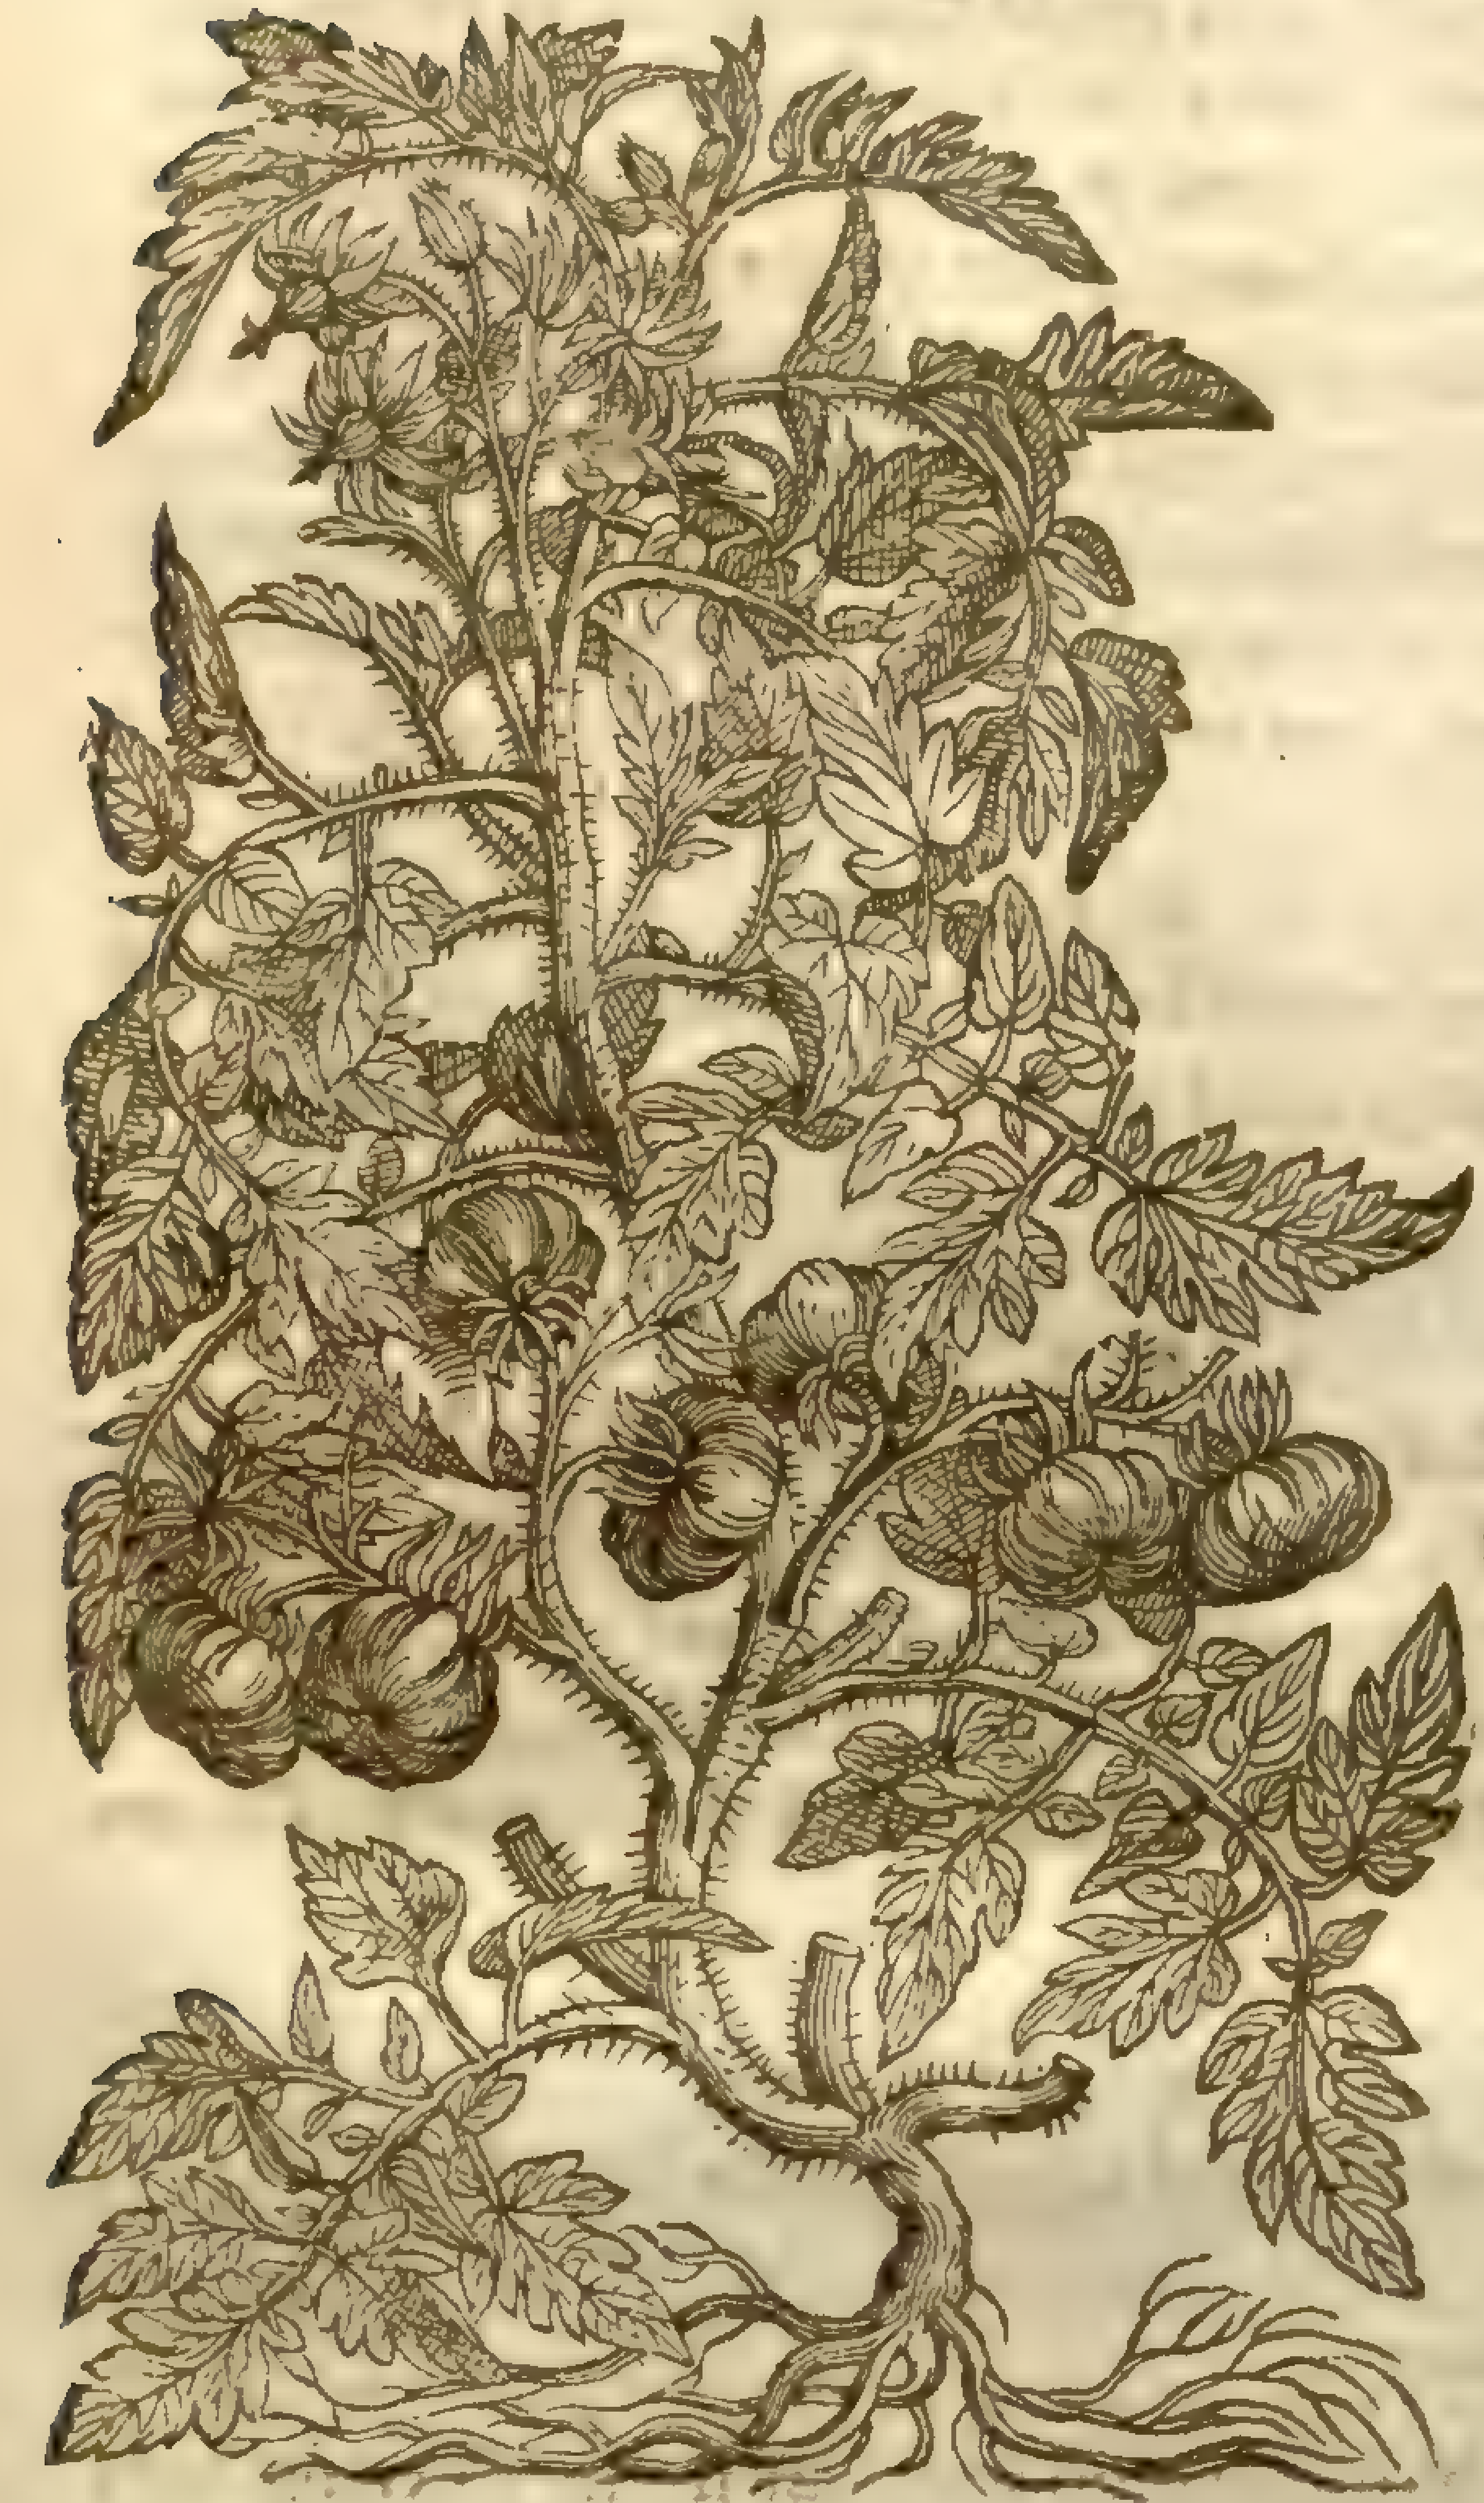
¶ *The Deſcription.*

The Apple of Loue bringeth forth very long round ſtalkes or branches, fat and full of juice, trailing vpon the ground, not able to ſuſtain himſelfe vpright by reaſon of the tenderneſſe of the ſtalkes, and alſo the great weight of the leaues and fruit wherewith it is ſurcharged. The leaues are great, and deeply cut or jagged about the edges, not vnlike to the leaues of Agrimonie, but greater, and of a whiter greene colour: Amongſt which come forth yellow floures growing vpon ſhort ſtems or footſtalkes,cluſtering together in bunches : which being fallen there doe come in place faire and goodly apples, chamfered, vneuen, and bunched out in many places ; of a bright ſhining red colour, and the bigneſſe of a gooſe egge or a large pippin. The pulpe or meat is very full of moiſture, ſoft, reddiſh, and of the ſubſtance of a wheat plumme. The ſeed is ſmall, flat and rough : the root ſmall and threddy : the whole plant is of a ranke and ſtinking ſauour.

There hath happened vnto my hands another ſort,agreeing very notably with the former,as well in leaues and ſtalkes as alſo in floures and roots,onely the fruit hereof,was yellow of colour,wherein conſiſteth the difference.

Poma amoris.
Apples of loue.

Solanum Lycopersicum L.
[illegible]



¶ The Place.

Apples of Loue grow in Spaine, Italie, and ſuch hot Countries, from whence my ſelfe haue receiued ſeeds for my garden, where they doe increaſe and proſper.

¶ The Time.

It is ſowne in the beginning of Aprill in a bed of hot horſe-dung, after the maner of muske Melons and ſuch like cold fruits.

¶ The Names.

The Apple of Loue is called in Latine *Pomum Aureum*, *Poma Amoris*, and *Lycoperſicum* : of ſome, *Glaucium*: in Engliſh, Apples of Loue, and Golden Apples: in French, *Pommes d'amours*. Howbeit there be other golden Apples whereof the Poëts doe fable, growing in the Gardens of the daughters of *Heſperus*, which a Dragon was appointed to keepe, who, as they fable, was killed by *Hercules*.

¶ The Temperature.

The Golden Apple, with the whole herbe it ſelfe is cold, yet not fully ſo cold as Mandrake, after the opinion of *Dodonæus*. But in my iudgement it is very cold, yea perhaps in the higheſt degree of coldneſſe : my reaſon is, becauſe I haue in the hotteſt time of Summer cut away the ſuperfluous branches from the mother root, and caſt them away careleſly in the allies of my Garden, the which (notwithſtanding the extreme heate of the Sun, the hardneſſe of the trodden allies, and at that time when no rain at all did fal) haue growne as freſh where I caſt them, as before I did cut them off ; which argueth the great coldneſſe contained therein. True it is, that it doth argue alſo a great moiſture wherewith the plant is poſſeſſed, but as I haue ſaid, not without great cold, which I leaue to euery mans cenſure.

¶ The Vertues.

A In Spaine and thoſe hot Regions they vſe to eate the Apples prepared and boiled with pepper, ſalt, and oyle : but they yeeld very little nouriſhment to the body, and the ſame naught and corrupt.

B Likewiſe they doe eate the Apples with oile, vinegre and pepper mixed together for ſauce to their meat, euen as we in theſe cold countries doe Muſtard.

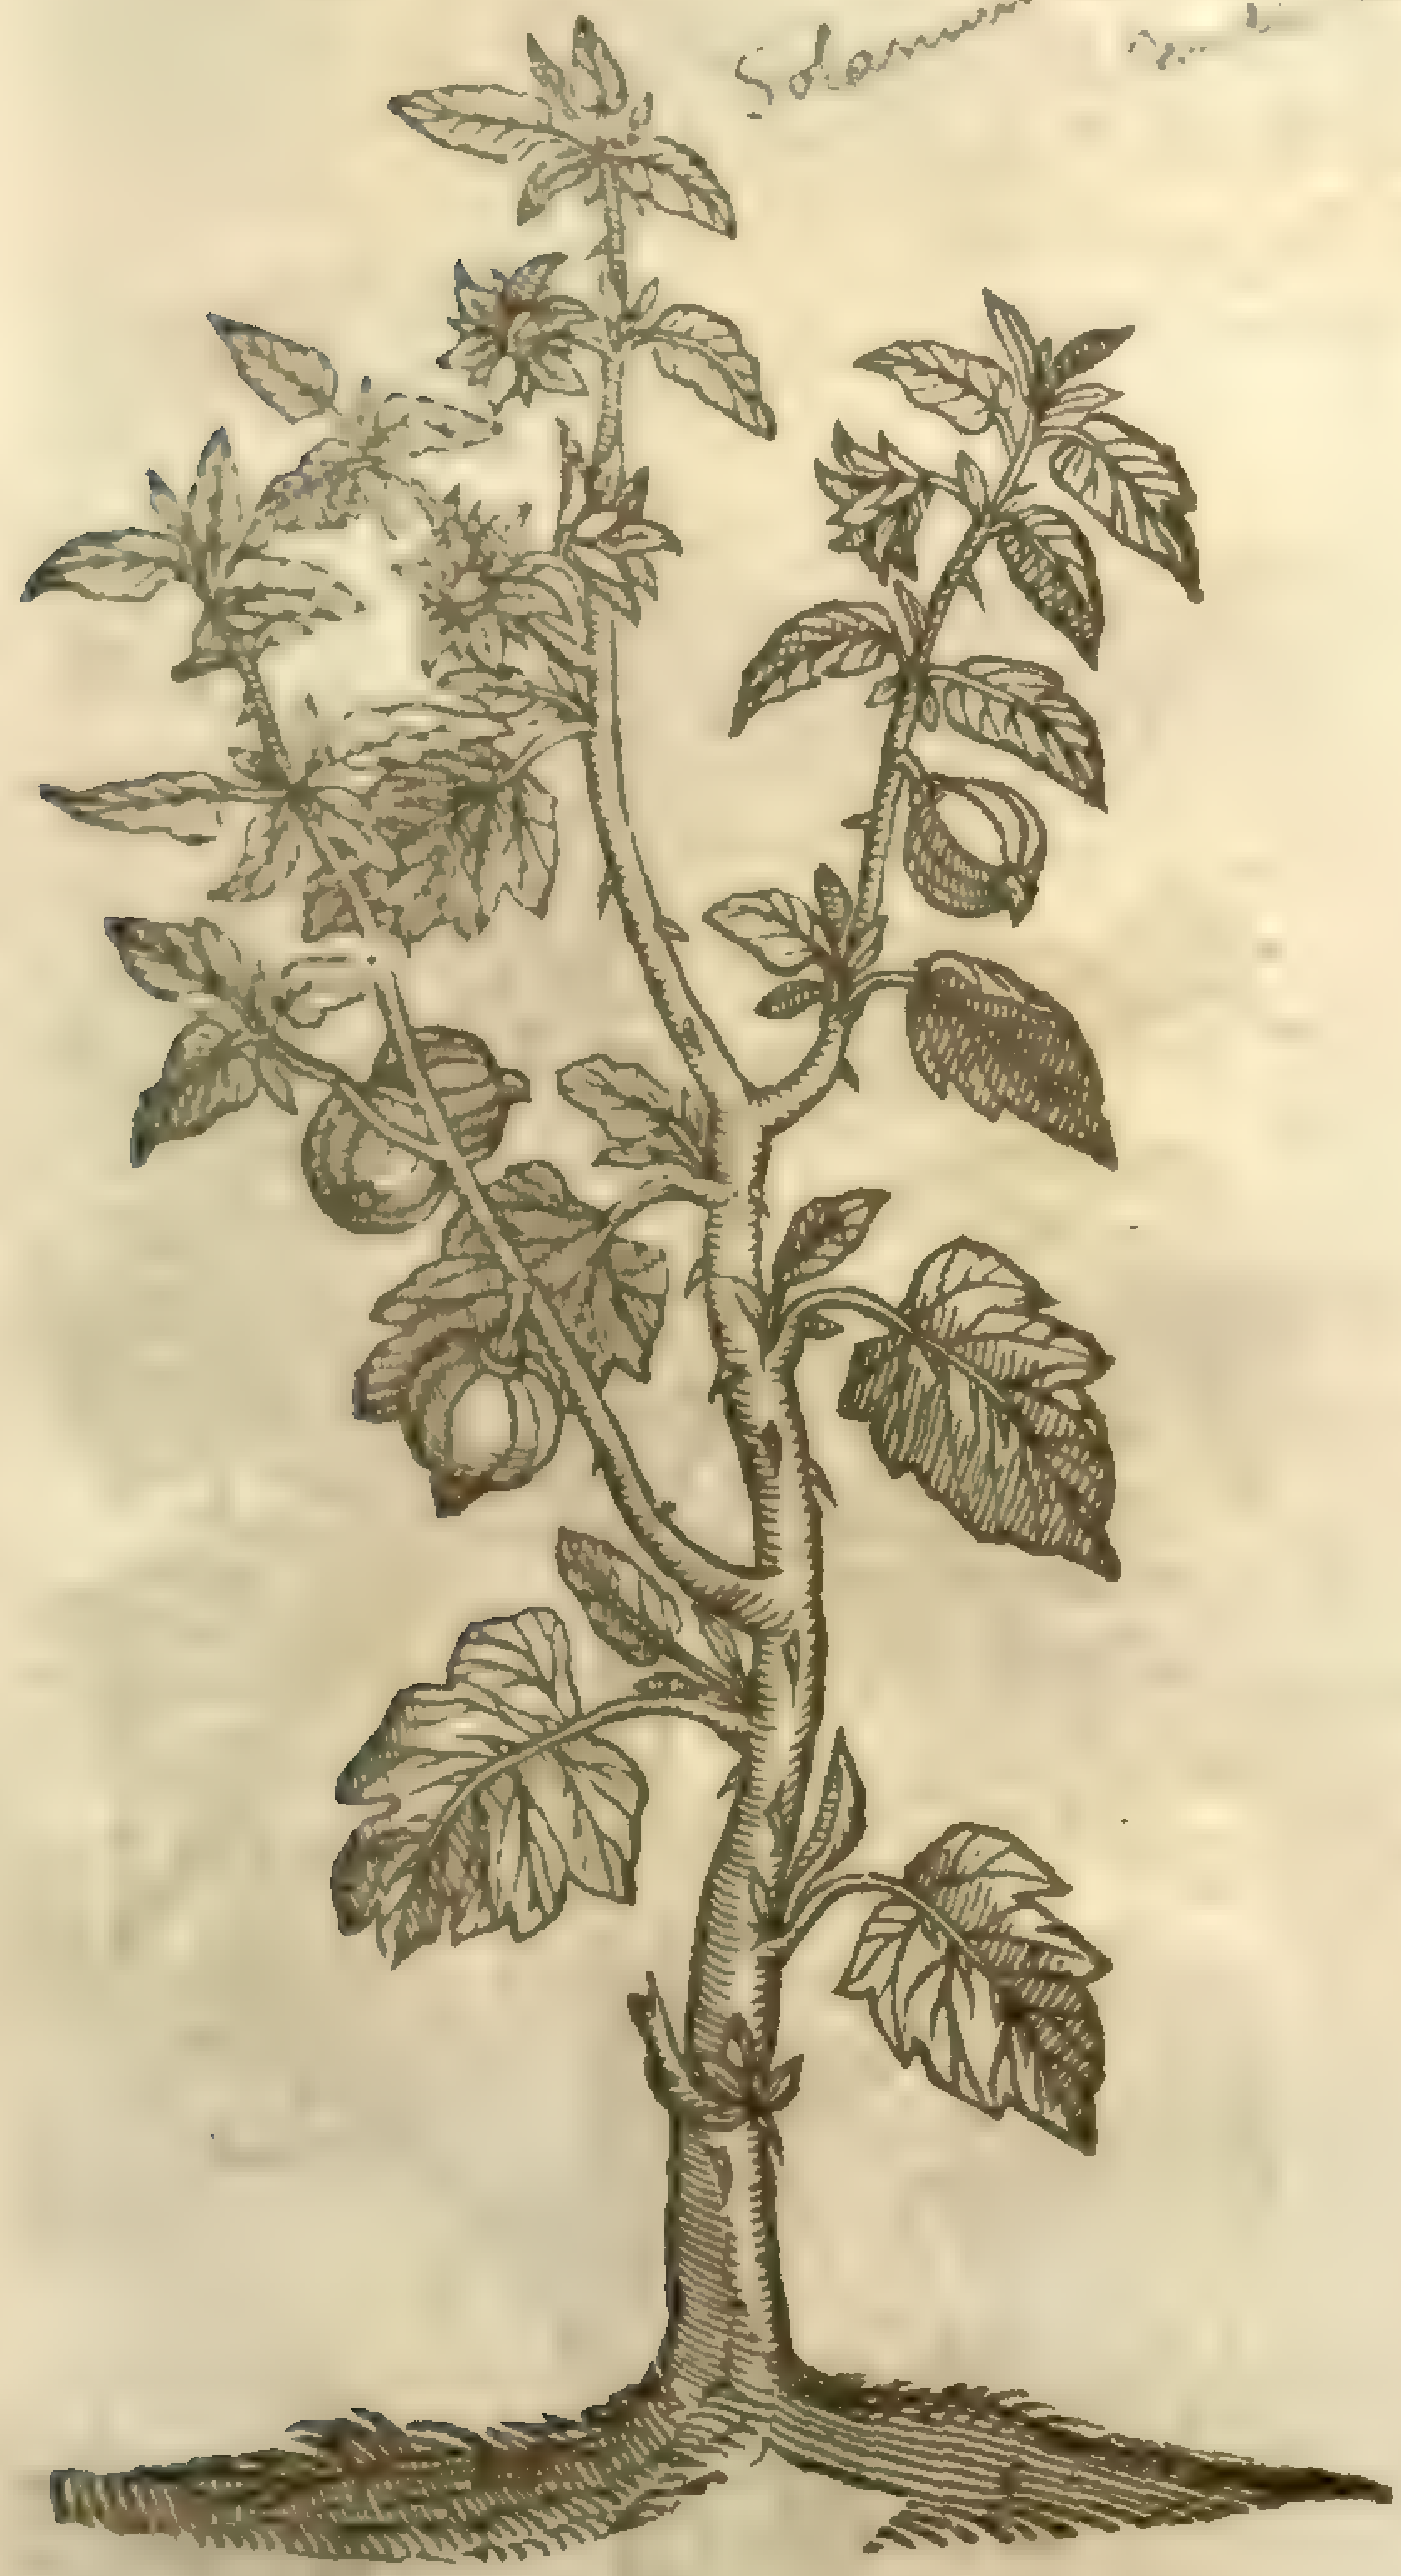
Chap. 61. *Of the Æthiopian Apple.*

¶ The Deſcription.

The Apple of Æthiopia hath large leaues of a whitiſh greene colour, deepely indented about the edges, almoſt to the middle rib; the which middle rib is armed with a few ſharpe prickles. The floures be white, conſiſting of ſix ſmall leaues, with a certain yellow pointel in the midſt. The

Mala Æthiopica.
Apples of Æthiopia.

Solanum [illegible]



The fruit is round, and bunched with vneuen lobes or bankes leſſer than the golden Apple, of colour red, and of a firme and ſollid ſubſtance; wherein are contained ſmall flat ſeeds. The root is ſmall and threddy.

¶ *The Place.*

The ſeeds of this plant haue beene brought vnto vs out of Spaine, and alſo ſent into France and Flaunders: but to what perfection it hath come vnto in thoſe parts I am ignorant; but mine periſhed at the firſt approach of Winter. His firſt originall was from Æthiopia, whereof it tooke his name.

¶ *The Time.*

This plant muſt be ſowne as Muske-melons, and at the ſame time. They floure in Iuly, and the fruit is ripe in September.

¶ *The Names.*

In Engliſh we haue thought good to call it the Æthiopian Apple, for the reaſon before alledged: in Latine, *Mala Æthiopica*: of ſome it hath been thought to be *Malinathalla*. ‡ This is the *Solanum Pomiferum* of *Lobel* and others; by which name our Author alſo formerly had it; in the fiftieth chapter of the former edition. ‡

¶ *The Nature.*

The temperature agreeth with the Apple of Loue.

¶ *The Vertues.*

Theſe Apples are not vſed in Phyſicke that I can reade of; onely they are vſed for a ſauce and ſeruice vnto rich mens tables to be eaten, being firſt boiled in the broth of fat fleſh with pepper and ſalt, and haue a leſſe hurtfull juyce than either mad Apples or golden Apples.

CHAP. 47. *Of Thornie Apples.*

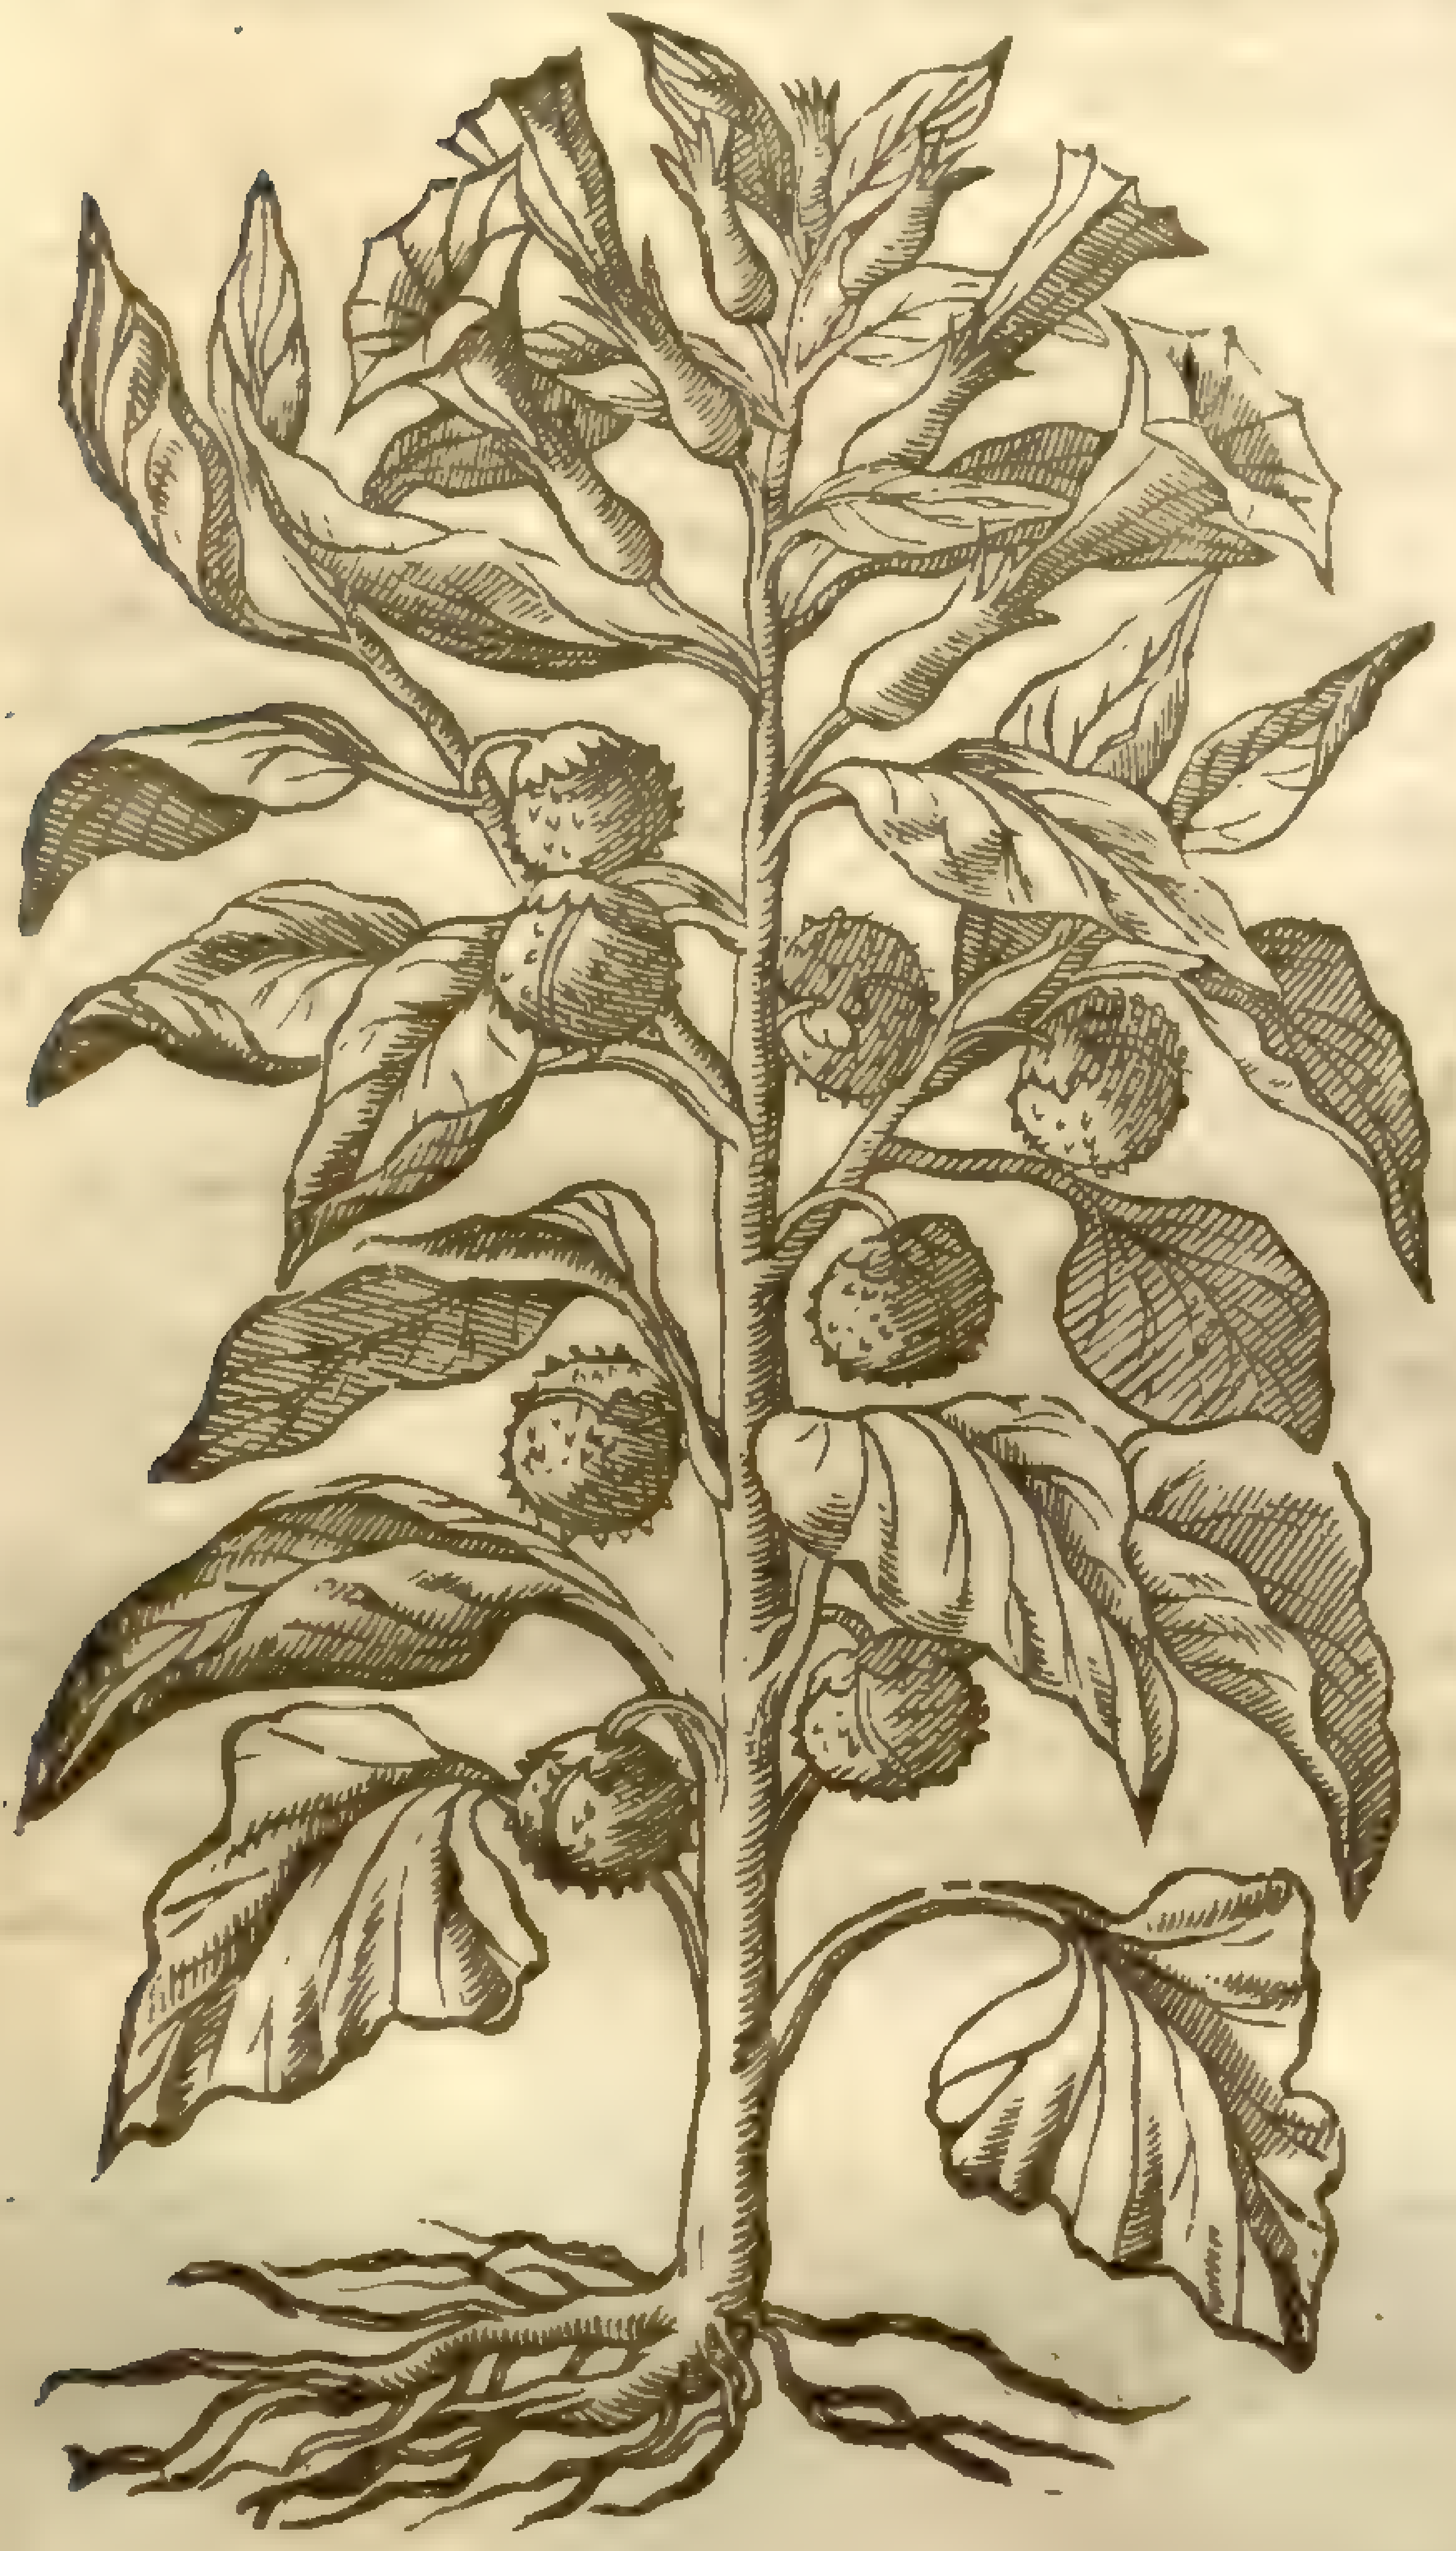
¶ *The Deſcription.*

1 THe ſtalkes of Thorny-apples are oftentimes aboue a cubit and a halfe high, ſeldome higher, an inch thicke, vpright and ſtraight, hauing very few branches, ſometimes none at all, but one vpright ſtemme; whereupon doe grow leaues ſmooth and euen, little or nothing indented about the edges, longer and broader than the leaues of Nightſhade, or of the mad Apples. The floures come forth of long toothed cups, great, white, of the forme of a bell, or like the floures of the great Withwinde that rampeth in hedges; but altogether greater and wider in the mouth, ſharpe cornered at the brimmes, with certaine white chiues or threds in the middeſt, of a ſtrong ponticke ſauour, offending the head when it is ſmelled vnto: in the place of the floure commeth vp round fruit full of ſhort and blunt prickles of the bigneſſe of a green Wallnut when it is at the biggeſt, in which are the ſeeds of the bigneſſe of tares or of the ſeed of Mandrakes, and of the ſame forme. The herbe it ſelfe is of a ſtrong ſauor, and doth ſtuffe the head, and cauſeth drowſineſſe. The root is ſmall and threddy.

2 There is another kinde hereof altogether greater than the former, whoſe ſeeds I receiued of the right honourable the Lord *Edward Zouch*; which he brought from Conſtantinople, and of his liberalitie did beſtow them vpon me, as alſo many other rare and ſtrange ſeeds; and it is that Thorn-apple that I haue diſperſed through this land, whereof at this preſent I haue great vſe in Surgery; as well in burnings and ſcaldings, as alſo in virulent and maligne vlcers, apoſtumes, and ſuch like. The which plant hath a very great ſtalke in fertile ground, bigger then a mans arme, ſmooth and greene of colour, which a little aboue the ground diuideth it ſelfe into ſundry branches or armes in manner of an hedge tree; whereupon are placed many great leaues cut and indented deepely

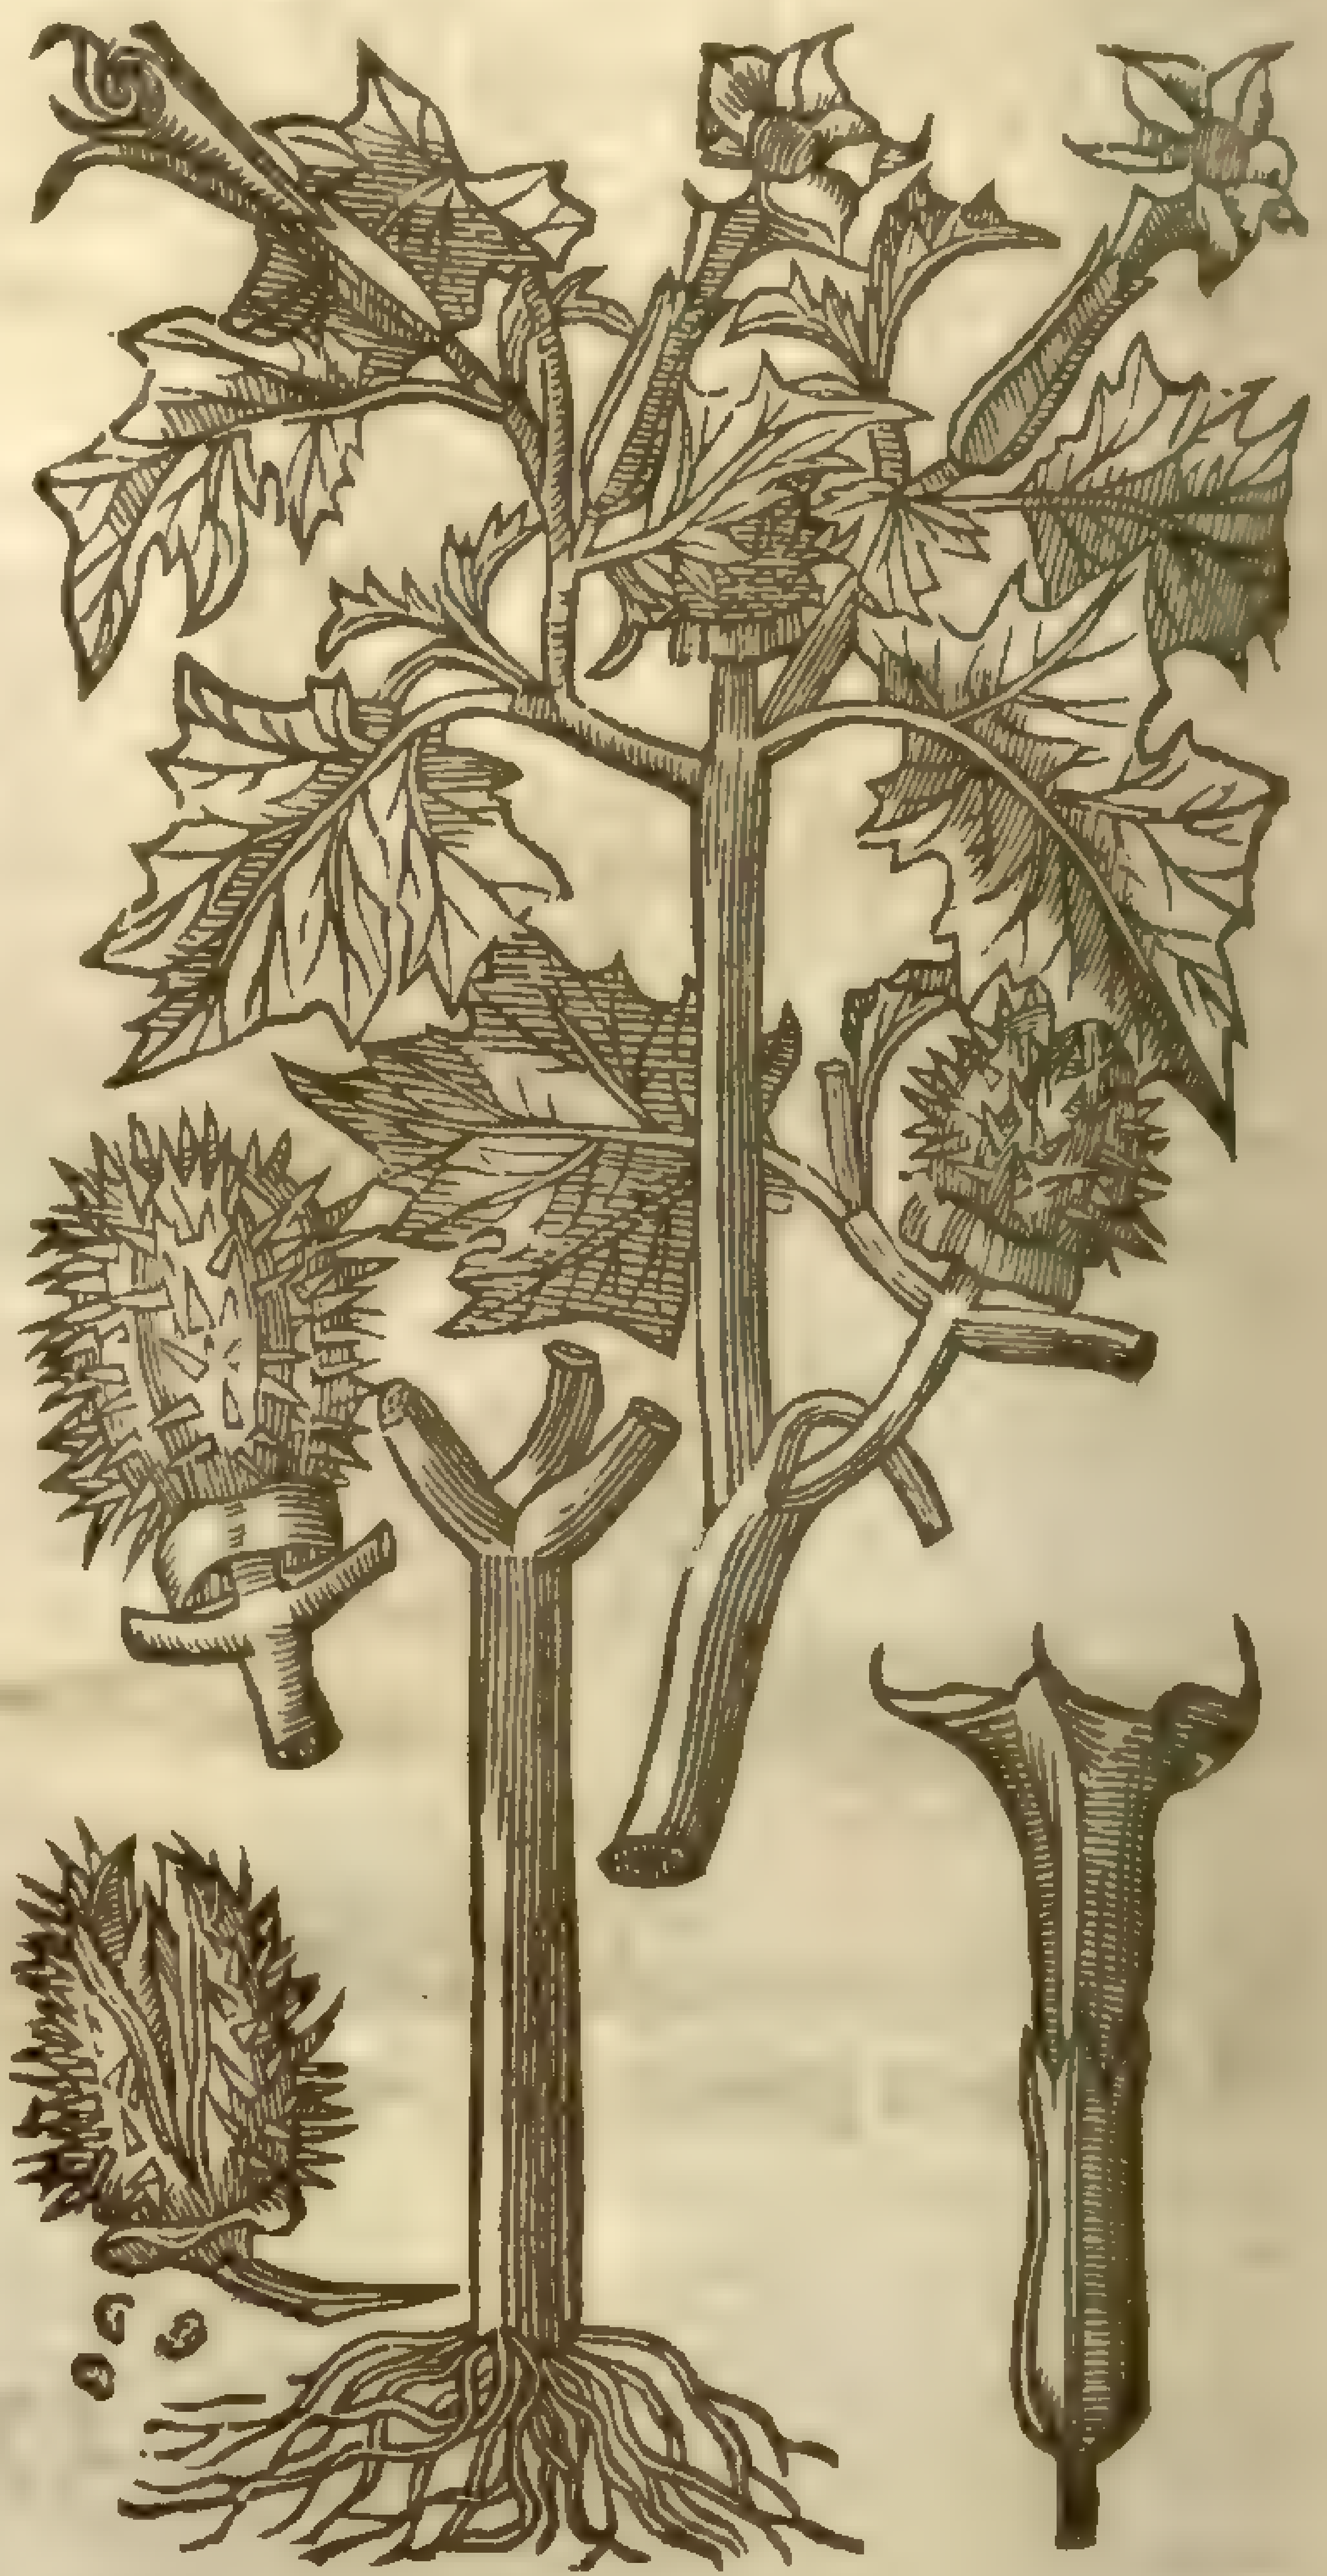
about the edges, with many vneuen ſharpe corners: among theſe leaues come white round floures made of one piece in manner of a bell, ſhutting it ſelfe vp cloſe toward night, as doe the floures of the great Binde-weed, whereunto it is very like, of a ſweet ſmell, but ſo ſtrong, that it offends the ſences. The fruit followeth round, ſometimes of the faſhion of an egge, ſet about on euery part with moſt ſharpe prickles; wherein is contained very much ſeed of the bigneſſe of tares, and of the ſame faſhion. The root is thicke, made of great and ſmall ſtrings: this plant is ſowen, beareth his fruit, and periſheth the ſame yeare. ‡ There are ſome varieties of this plant, in the colour and doubleneſſe of the floures. ‡

1 *Stramonium Peregrinum.*
The Apple of Peru.



Datura Stramonium [illegible] Mill. dict.
Sm. fl. 1. 314

2 *Stramonium ſpinoſum.*
Thorny apples of Peru.



¶ *The Place.*

1 This plant is rare and ſtrange as yet in England: I receiued ſeeds thereof from *Iohn Robin* of Paris, an excellent Herbariſt; which do grow and bare floures, but periſhed before the fruit came to ripeneſſe.

2 The Thorne-apple was brought in ſeed from Conſtantinople by the right honourable the Lord *Edward Zouch*, and giuen vnto me, and beareth fruit and ripe ſeed.

¶ *The Time.*

The firſt is to be ſowne in a bed of dorſe-dung, as we do Cucumbers and Muske-melons.

The other may be ſowne in March and Aprill, as other ſeeds are.

¶ *The Names.*

The firſt of theſe Thorne-apples may be called in Latine, *Stramonia*, and *Pomum*, or *Malum ſpinoſum*: of ſome, *Corona regia*, and *Meloſpinum*: The Grecians of our time name it περχονκάρυον, or rather ϲαρυοκάρυον; as though they ſhould ſay, a nut ſtuffing, and cauſing drowſineſſe and diſquiet ſleepe: the Italians, *Paracoculi*: it ſeemeth to *Valerius Cordus* to be *Hyoſcyamus Peruvianus*, or Henbane of Peru: *Cardanus* doubteth whether it ſhould be inſerted among the Night-ſhades as a kinde thereof: of *Matthiolus* and others it is thought to be *Nux methel*: *Serapio, cap.* 375. ſaith, That *Nux methel* is like vnto *Nux vomica*; the ſeed whereof is like that of Mandrake: the huske is rough or full of prickles; the taſte pleaſing and ſtrong: the qualitie thereof is cold in the fourth degree. Which deſcription agreeth therewith, except in the forme or ſhape it ſhould haue with *Nux vomica*: *Anguillara* ſuſpected it to be *Hippomanes* which *Theocritus* mentioned, wherewith in his ſecond *Eclog* he ſheweth that horſes are made mad: for *Cratevas*, whom *Theocritus* his Scholiaſt doth cite, writeth, That the plant of *Hippomanes* hath a fruit full of prickles, as hath the fruit of wild Cucumber. In Engliſh it may be called Thorn-Apple, or the Apple of Peru.

‡ The words of *Theocritus, Eidyl* 2. are theſe:

Ἱππομανὲς φυτόν ἐστι παρ' Ἀρκάσι, &c.

Which is thus in Engliſh:

Hippomanes 'mongſt th' Arcadians ſprings, by which ev'n all
The Colts and agile Mares in mountaines mad do fall.

Now in the Greeke *Scholia* amongſt the Expoſitions there is this, Κρατεύας φησί, &c. That is, *Cratevas* ſaith, that the plant hath a fruit like the wild Cucumber, but blacker; the leaues are like a poppy, but thorny or prickly. Thus I expound theſe words of the Greeke Scholiaſt, being *pag.* 51. of the edition ſet forth by *Dan. Heinſius, An. Dom.* 1603. *Iulius Scaliger* blames *Theocritus*, becauſe he cals *Hippomanes*, φυτόν, a Plant: but *Heinſius*, as you may ſee in his notes vpon *Theocritus, pag.* 120. probably iudges, that φυτόν in this place ſignifies nothing but χρῆμα, a thing [*growing.*] Such as are curious may haue recourſe to the places quoted, where they may finde it more largely handled than is fit for me in this place to inſiſt vpon. There is no plant at this day known, in mine opinion, whereunto *Cratevas* his deſcription may more fitly be referred, than to the *Papaver ſpinoſum*, or *Ficus infernalis*, which we ſhall hereafter deſcribe. ‡

¶ *The Temperature.*

The whole plant is cold in the fourth degree, and of a drowſie and numming qualitie, not inferior to Mandrake.

¶ *The Vertues.*

A The juice of Thorn-apples boiled with hogs greaſe to the form of an vnguent or ſalue, cures all inflammations whatſoeuer, all manner of burnings or ſcaldings, as well of fire, water, boiling lead, gun-pouder, as that which comes by lightning, and that in very ſhort time, as my ſelfe haue found by my daily practiſe, to my great credit and profit. The firſt experience came from Colcheſter, where Miſtreſſe *Lobel* a merchants wife there being moſt grieuouſly burned by lightning, and not finding eaſe or cure in any other thing, by this found helpe and was perfectly cured when all hope was paſt, by the report of Mʳ *William Ram* publique Notarie of the ſaid towne.

B The leaues ſtamped ſmall and boiled with oile Oliue vntill the herbs be as it were burnt, then ſtrained and ſet to the fire again, with ſome wax, roſin, and a little turpentine, and made into a ſalue, doth moſt ſpeedily cure old vlcers, new and freſh wounds, vlcers vpon the glandulous part of the yard, and other ſores of hard curation.

CHAP. 63.

Of Bitter-ſweet, or wooddy Nightſhade.

¶ *The Deſcription.*

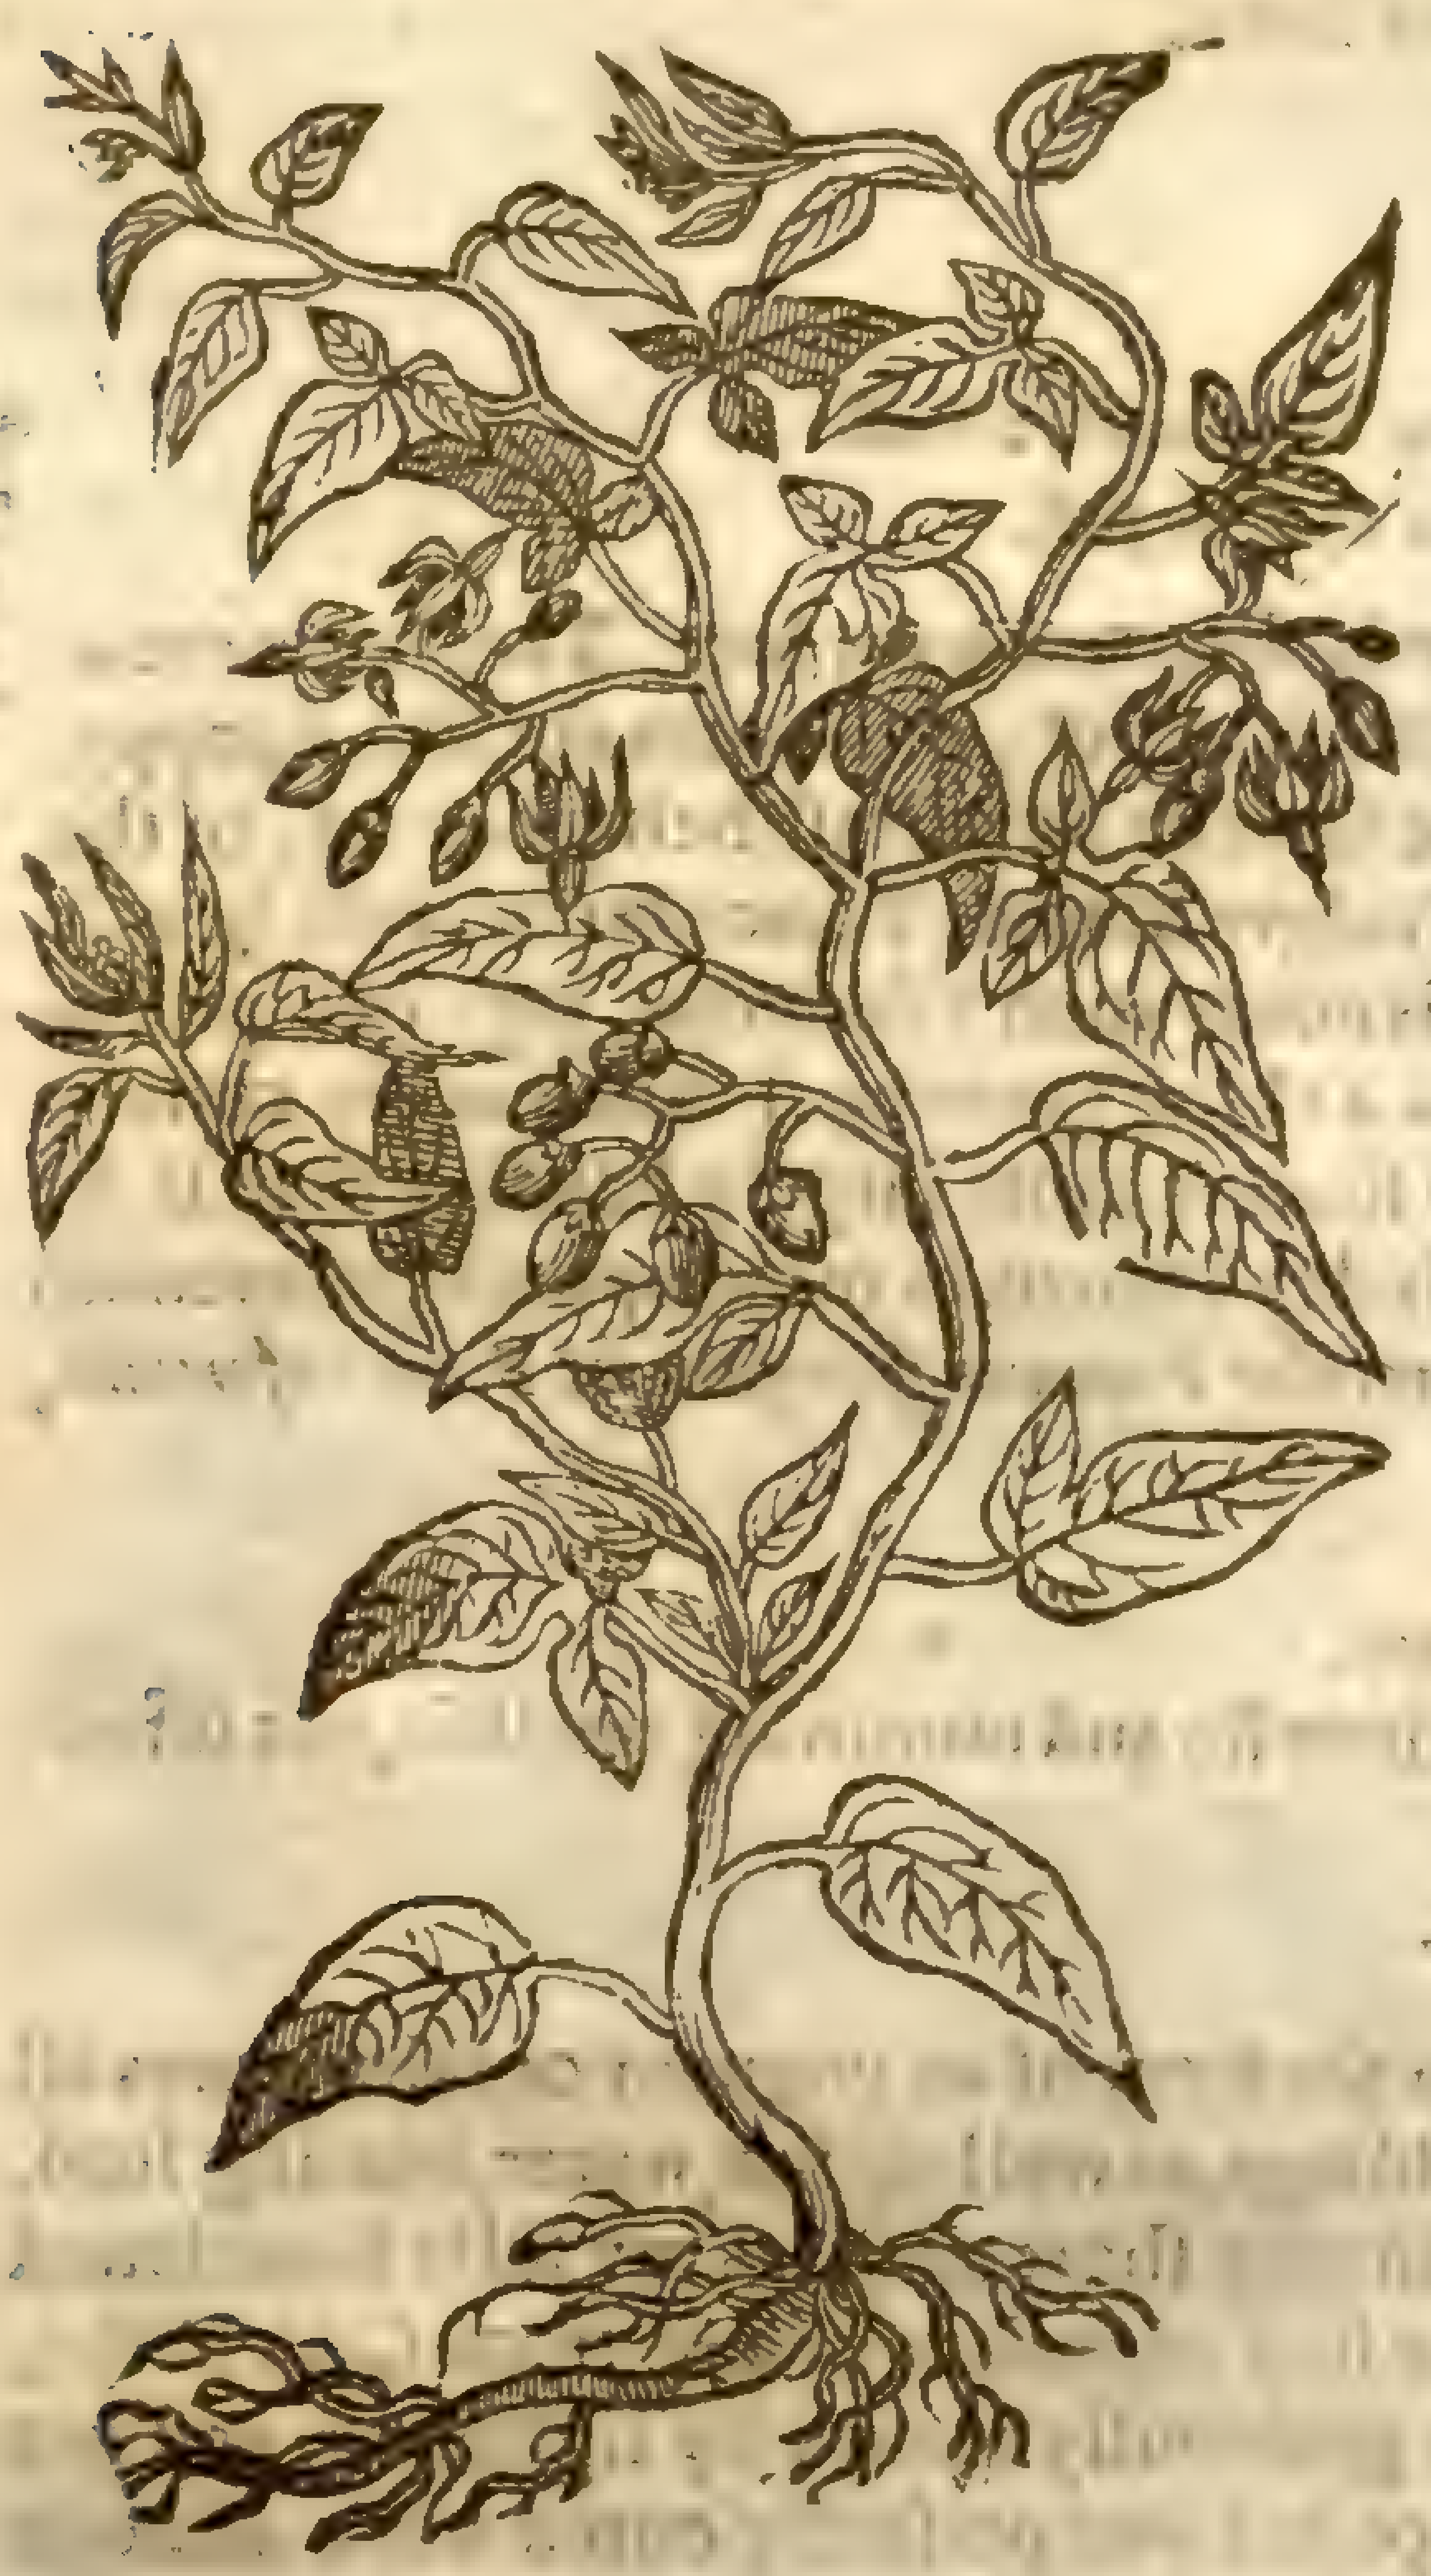
Bitter-ſweet bringeth forth wooddy ſtalks as doth the Vine, parted into many ſlender creeping branches, by which it climeth and taketh hold of hedges and ſhrubs next vnto it. The barke of the oldeſt ſtalks are rough and whitiſh, of the colour of aſhes, with the outward rind of a bright green colour, but the yonger branches are green as are the leaues: the wood brittle, hauing in it a ſpongie pith: it is clad with long leaues, ſmooth, ſharp pointed, leſſer than thoſe of the Bindweed. At the lower part of the ſame leaues doth grow on either ſide one ſmal or leſſer leafe like vnto two eares. The floures be ſmall, and ſomewhat cluſtered together, conſiſting of fiue little leaues apiece of a perfect blew colour, with a certain pricke or yellow pointal in the middle: which being paſt, there do come in place faire berries more long than round, at the firſt green, but very red when they be ripe; of a ſweet taſte at the firſt, but after very vnpleaſant, of a ſtrong ſauor, growing together in cluſters like burniſhed coral. The root is of a mean bigneſſe, and full of ſtrings.

I haue found another ſort which bringeth forth moſt pleaſant white flours, with yellow pointals in the middle: in other reſpects agreeing with the former.

¶ *The Place.*

Bitter-ſweet growes in moiſt places about ditches, riuers, and hedges, almoſt euerie where.

Amara-dulcis.
Bitter-ſweet.



The other ſort with the white floures I found in a ditch ſide, againſt the right honourable the Earle of Suſſex his garden wall, at his houſe in Bermondſey ſtreet by London, as you go from the court which is full of trees, vnto a ferm houſe neere thereunto.

¶ *The Time.*

The leaues come forth in the ſpring, the flours in Iuly, the berries are ripe in Auguſt.

¶ *The Names.*

The later Herbariſts haue named this plant *Dulcamara, Amarodulcis,* & *Amaradulcis*; that is in Greek, γλυκύπικρον: they call it alſo *Solanum lignoſum* and *Siliquaſtrum*: *Pliny* calleth it *Melortum*: *Theophraſtus, Vitis ſylveſtris*: in Engliſh we call it Bitter-ſweet, and wooddy Nightſhade. But euery Author muſt for his credit ſay ſomething, although but to ſmal purpoſe; for *Vitis ſylveſtris* is that which wee call our Ladies Seale, which is no kinde of Nightſhade: for *Tamus* and *Vitis ſylveſtris* are both one; as likewiſe *Solanum lignoſum* or *fruticoſum*, and alſo *Solanum rubrum*: whereas indeed it is no ſuch plant, nor any of the Nightſhades, although I haue followed others in placing it here. Therefore thoſe that vſe to mix the berries of it in compoſitions of diuers cooling ointments, in ſted of the berries of Nightſhade, haue committed the greater errour; for the fruit of this is not cold at all, but hot, as forthwith ſhal be ſhewed. *Dioſcorides* ſaith it is *Cyclaminus altera,* deſcribing it by the deſcription of thoſe with white floures aforeſaid, whereunto it doth very well agree.

‡ *Dioſcorides* deſcribes his *Muſcoſo flore* with a moſſy floure, that is, ſuch an one as conſiſts of ſmall chiues or threads, which can by no meanes be agreeable to the floure of this plant. ‡

¶ *The Temperature.*

The leaues and fruit of Bitter-ſweet are in temperature hot and dry, clenſing and waſting away.

¶ *The Vertues.*

A The decoction of the leaues is reported to remoue the ſtoppings of the liuer and gall, and to be drunke with good ſucceſſe againſt the yellow jaundiſe.

B The juice is good for thoſe that haue fallen from high places, and haue been thereby bruiſed, or dry-beaten: for it is thought to diſſolue bloud congealed or cluttered any where in the intrals, and to heale the hurt places.

C *Tragus* teacheth to make a decoction of wine, with the wood finely ſliced and cut into ſmal pieces: which he reporteth to purge gently both by vrine and ſiege, thoſe that haue the Dropſie or jaundice.

D *Dioſcorides* aſcribeth vnto *Cyclaminus altera,* or Bitter-ſweet with white floures, as I ſuppoſe, the like faculties.

E The fruit (ſaith he) being drunke in the weight of one dram, with three ounces of white wine for forty daies together, helpeth the ſpleen.

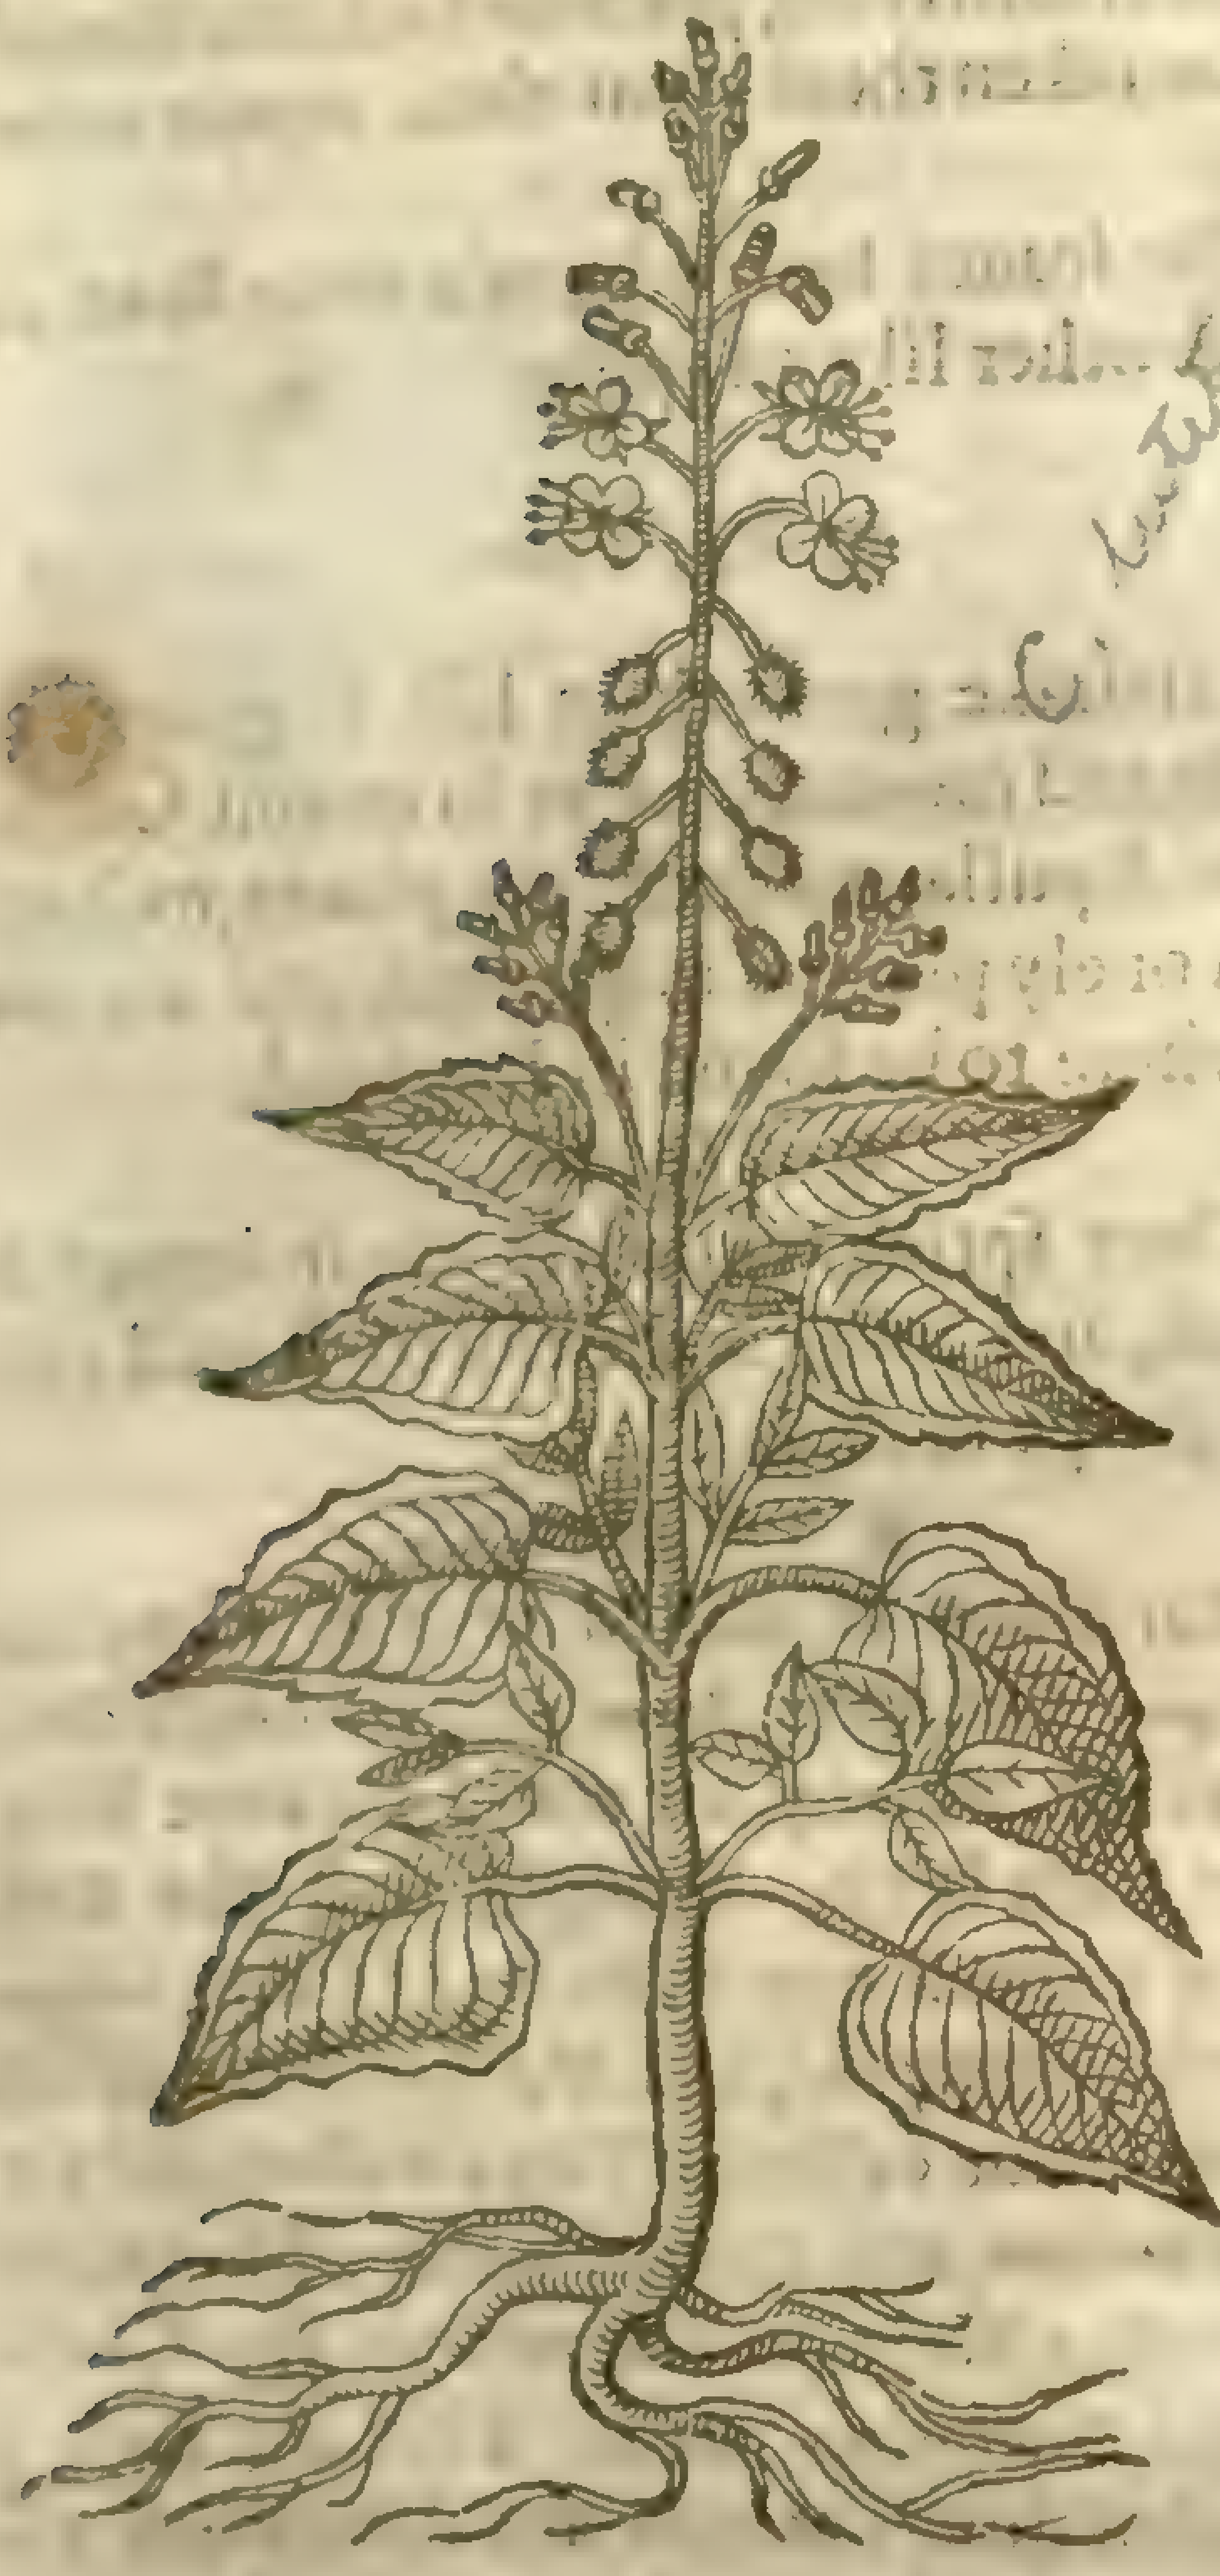
F It is drunk againſt difficultie of breathing: it throughly clenſeth women newly brought a bed.

Chap. 64. *Of Bindeweed Nightſhade.*

¶ *The Deſcription.*

INchanters Night-ſhade hath leaues like to petty Morell, ſharp at the point like vnto Spinage: the ſtalke is ſtreight and vpright, very brittle, two foot high: The floures are white tending to Carnation, with certaine ſmall browne chiues in the midſt: the ſeed is contained in ſmal round bullets

Circæa Lutetiana.
Inchanters Night-ſhade.



bullets, rough and very hairy. The roots are tough, and many in number, thruſting themſelues deep into the ground, and diſperſing far abroad; whereby it doth greatly encreaſe, inſomuch that when it hath once taken faſt rooting, it can hardly with great labour be rooted out or deſtroied.

¶ *The Place.*

It groweth in obſcure and darke places, about dung-hills, and in vntoiled grounds, by path-waies and ſuch like.

¶ *The Time.*

It flouriſheth from Iune to the end of September.

¶ *The Names.*

It is called of *Lobel*, *Circæa Lutetiana*: in Engliſh, Inchanters Night-ſhade, or Binde-weed Nightſhade.

¶ *The Nature and Vertues.*

There is no vſe of this herbe either in Phyſicke or Surgerie, that I can reade of; which hath happened by the corruption of time, and the errour of ſome who haue taken *Mandragoras* for *Circæa*; in which errour they haue ſtill perſiſted vnto this day, attributing vnto *Circæa* the vertues of *Mandragoras*; by which meanes there hath not any thing beene ſaid of the true *Circæa*, by reaſon, as I haue ſaid, that *Mandragoras* hath beene called *Circæa*: but doubtleſſe it hath the vertue of Garden Night-ſhade, and may ſerue in ſtead thereof without error.

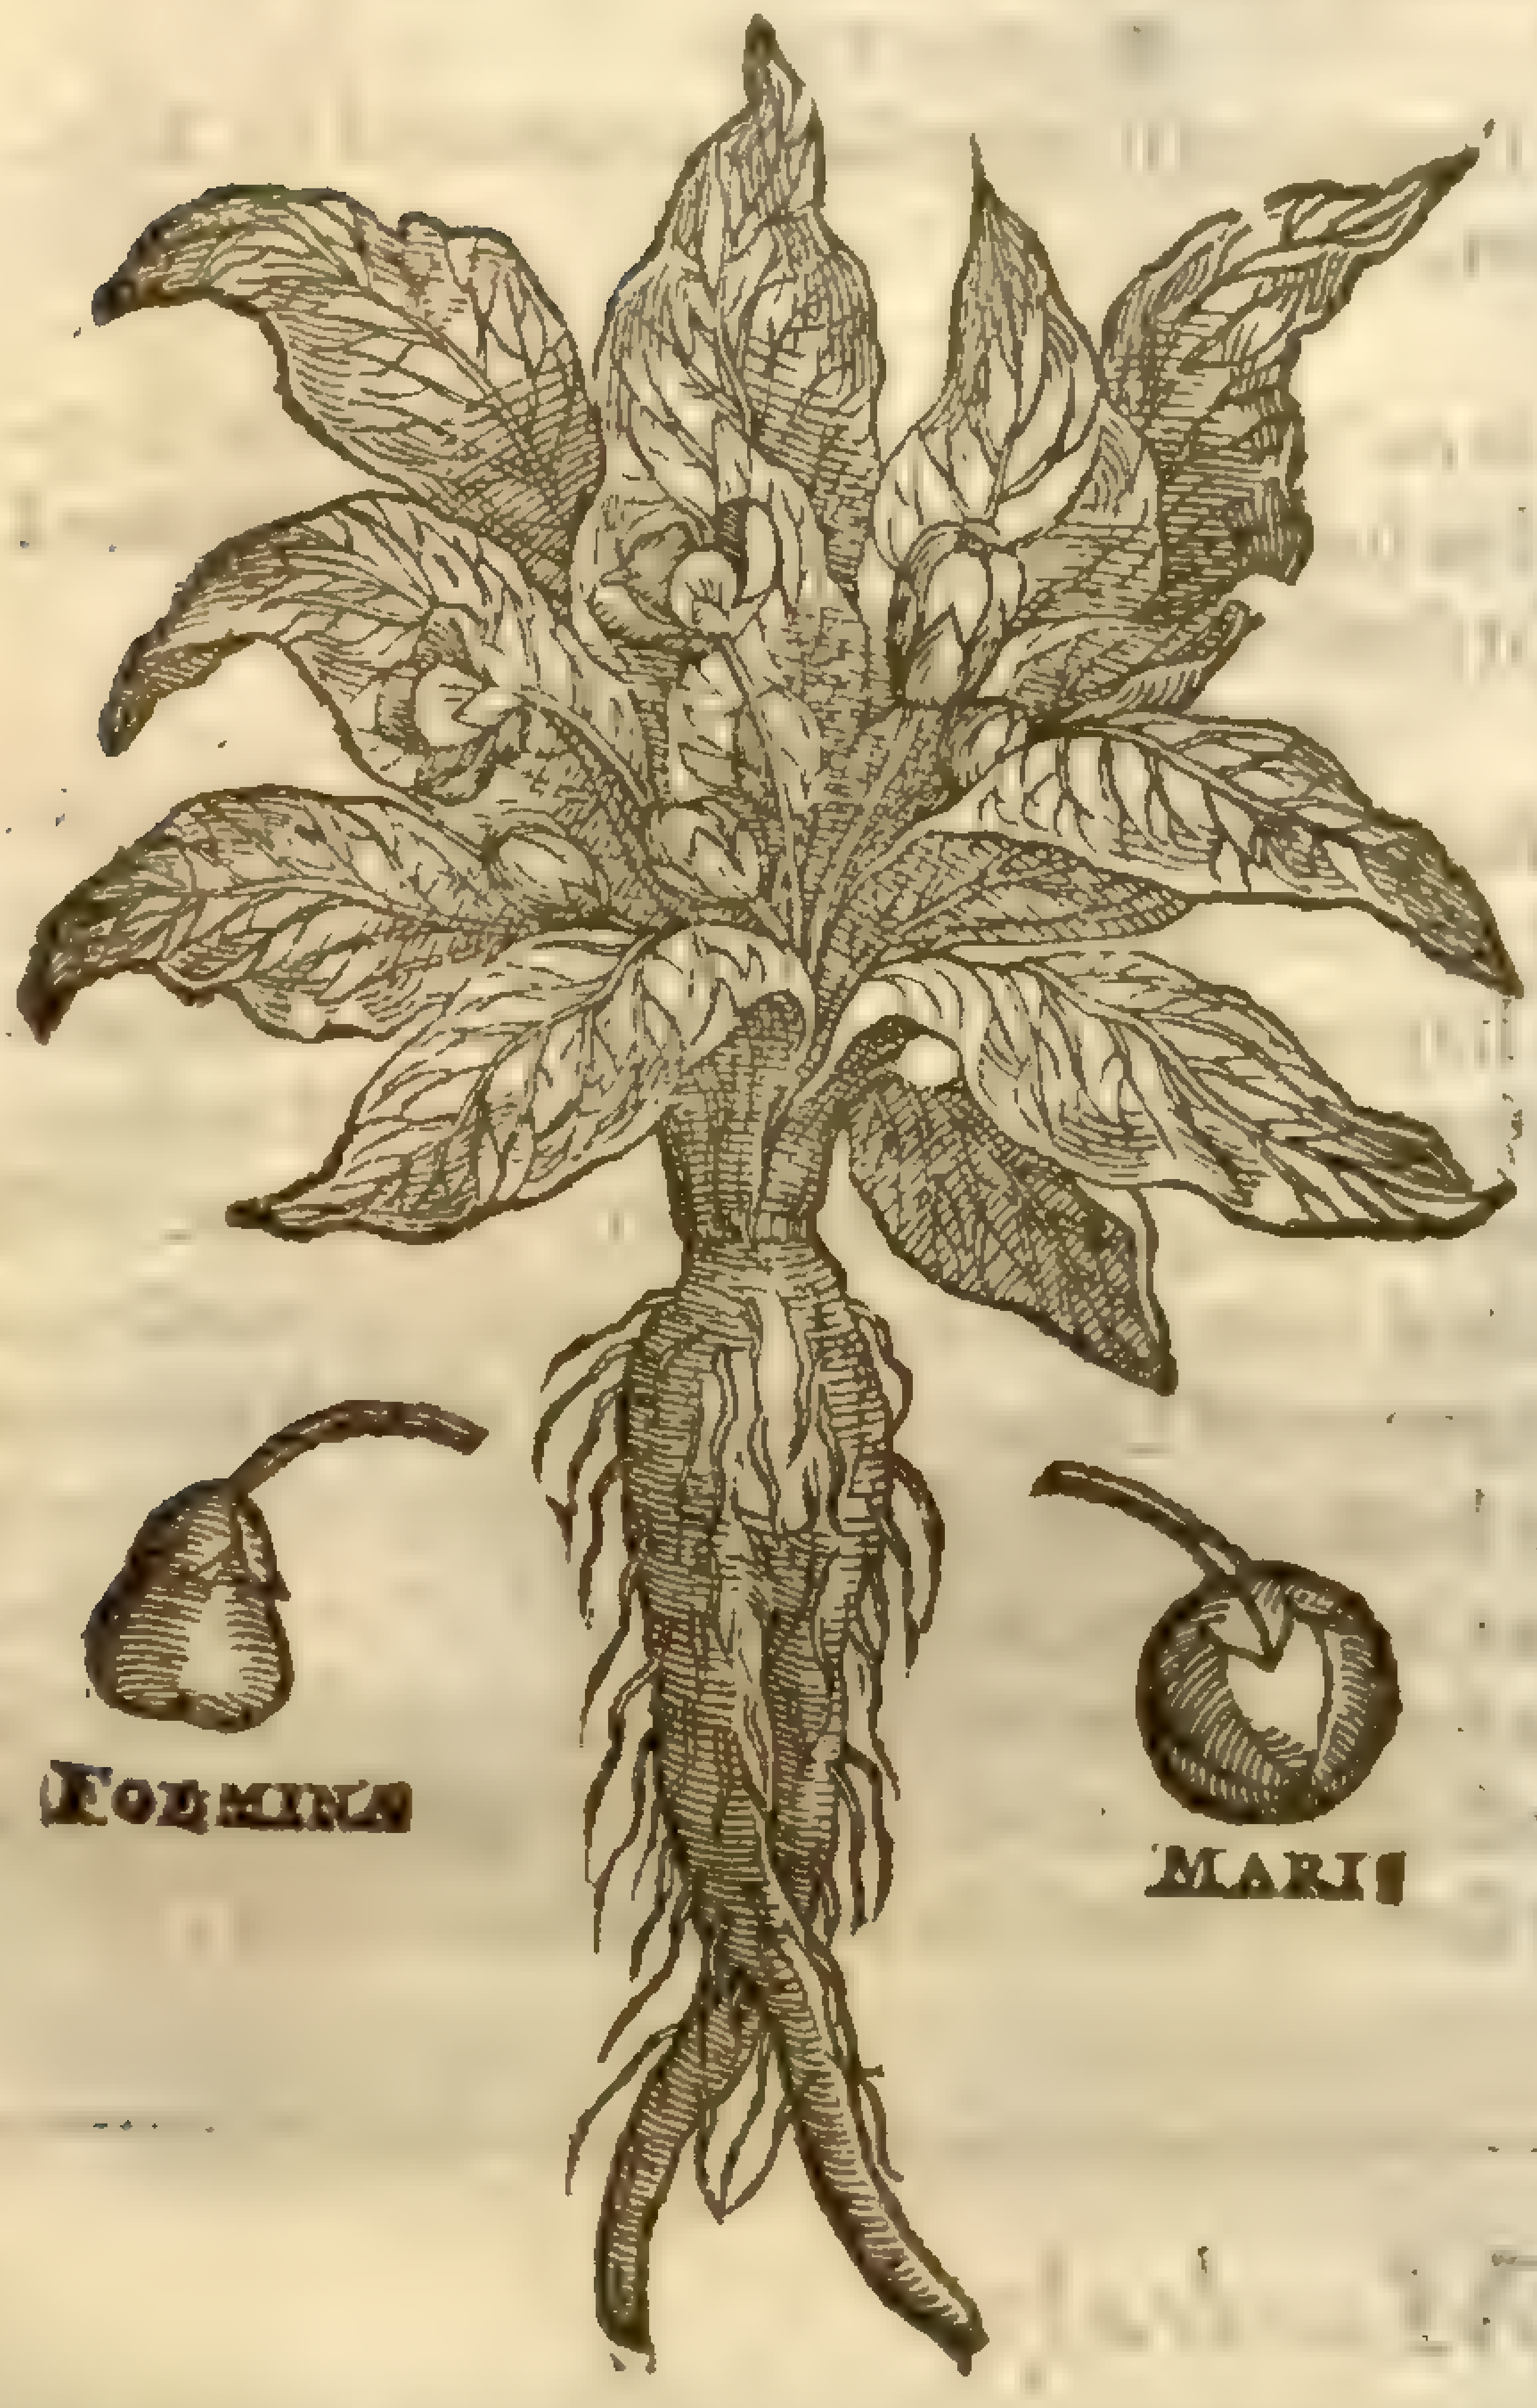
CHAP. 65. *Of Mandrake.*

¶ *The Deſcription.*

THe male Mandrake hath great broad long ſmooth leaues of a darke greene colour, flat ſpred vpon the ground: among which come vp the floures of a pale whitiſh colour, ſtanding euery one vpon a ſingle ſmall and weake foot-ſtalke of a whitiſh greene colour: in their places grow round Apples of a yellowiſh colour, ſmooth, ſoft, and glittering, of a ſtrong ſmell: in which are contained flat and ſmooth ſeeds in faſhion of a little kidney, like thoſe of the Thorne-apple. The root is long, thicke, whitiſh, diuided many times into two or three parts reſembling the legs of a man, with other parts of the body adjoyning thereto, as the priuie part, as it hath been reported; whereas in truth it is no otherwiſe than in the roots of carrots, parſeneps, and ſuch like, forked or diuided into two or more parts, which Nature taketh no account of. There hath beene many ridiculous tales brought vp of this plant, whether of old wiues, or ſome runnagate Surgeons or Phyſicke-mongers I know not, (a title bad enough for them) but ſure ſome one or moe that ſought to make themſelues famous and skilfull aboue others, were the firſt brochers of that errour I ſpeake of. They adde further, That it is neuer or very ſeldome to be found growing naturally but vnder a gallowes, where the matter that hath fallen from the dead body hath giuen it the ſhape of a man; and the matter of a woman, the ſubſtace of a female plant; with many other ſuch doltiſh dreames. They fable further and affirme, That he who would take up a plant thereof muſt tie a dog therunto to pull it vp, which will giue a great ſhreeke at the digging vp; otherwiſe if a man ſhould do it, he ſhould ſurely die in ſhort ſpace after. Beſides many fables of louing matters, too full of ſcurrilitie to ſet forth in print, which I forbeare to ſpeake of. All which dreames and old wiues tales you ſhall from henceforth caſt out of your bookes and memory; knowing this, that they are all and euerie part of them falſe and moſt vntrue: for I my ſelfe and my ſeruants alſo haue digged vp, planted, and replanted very many, and yet neuer could either perceiue ſhape of man or woman, but ſometimes one ſtreight root, ſometimes two, and often ſix or ſeuen branches comming from the maine great root, euen as Nature liſt to beſtow vpon it, as to other plants. But the idle drones that haue little or nothing to do but eate and drinke, haue beſtowed ſome of their time in caruing the roots of Brionie, forming them to the ſhape of men and women: which falſifying practiſe hath confirmed the errour amongſt the ſimple and vnlearned people, who haue taken them vpon their report to be the true Mandrakes.

The female Mandrake is like vnto the male, ſauing that the leaues hereof be of a more ſwart or darke greene colour: and the fruit is long like a peare, and the other like an apple.

Mandragoras mas & fœmina.
The male and female Mandrake.



¶ *The Place.*

Mandrake groweth in hot Regions, in woods and mountaines, as in mount Garganus in Apulia, and ſuch like places; we haue them onely planted in gardens, and are not elſewhere to be found in England.

¶ *The Time.*

They ſpring vp with their leaues in March, and floure in the end of Aprill: the fruit is ripe in Auguſt.

¶ *The Names.*

Mandrake is called of the Grecians Μανδραγόρας: of diuers, Κιρκαία, and *Circæa*, of *Circe* the witch, who by art could procure loue: for it hath beene thought that the Root hereof serueth to win loue: of ſome, ἀντίμηλον, *Anthropomorphos*, and *Morion*: ſome of the Latines haue called it *Terræ malum*, and *Terreſtre malum*, and *Canina malus*: Shops, and alſo other Nations doe receiue the Greeke name. *Dioſcorides* ſaith, That the male is called of diuers *Morion*: and deſcribeth alſo another Mandrake by the name of *Morion*, which, as much as can be gathered by the deſcription, is like the male, but leſſe in all parts: in Engliſh we call it Mandrake, Mandrage, and Mandragon.

¶ *The Temperature.*

Mandrake hath a predominate cold facultie, as *Galen* ſaith, that is to ſay, cold in the third degree: but the root is cold in the fourth degree.

¶ *The Vertues.*

A *Dioſcorides* doth particularly ſet downe many faculties hereof; of which notwithſtanding there be none proper vnto it, ſauing thoſe that depend vpon the drowſie and ſleepie power thereof which qualitie conſiſteth more in the root than in any other part.

B The Apples are milder, and are reported that they may be eaten, being boyled with pepper and other hot ſpices.

C *Galen* ſaith that the Apples are ſomething cold and moiſt, and that the barke of the root is of greateſt ſtrength, and doth not onely coole, but alſo dry.

D The juice of the leaues is very profitably put into the ointment called *Populeon*, and all cooling ointments.

E The juyce drawne forth of the roots dried, and taken in ſmall quantitie, purgeth the belly exceedingly from flegme and melancholike humors.

F It is good to be put into medicines and collyries that doe mitigate the paine of the eies; and put vp as a peſſarie it draweth forth the dead childe and ſecondine.

G The greene leaues ſtamped with barrowes greaſe and barley meale, coole all hot ſwellings and inflammations; and they haue vertue to conſume apoſtumes and hot vlcers, being bruiſed and applied thereon.

H A ſuppoſitorie made with the ſame juyce, and put into the fundament cauſeth ſleepe.

I The wine wherein the root hath been boyled or infuſed prouoketh ſleepe and aſſwageth paine.

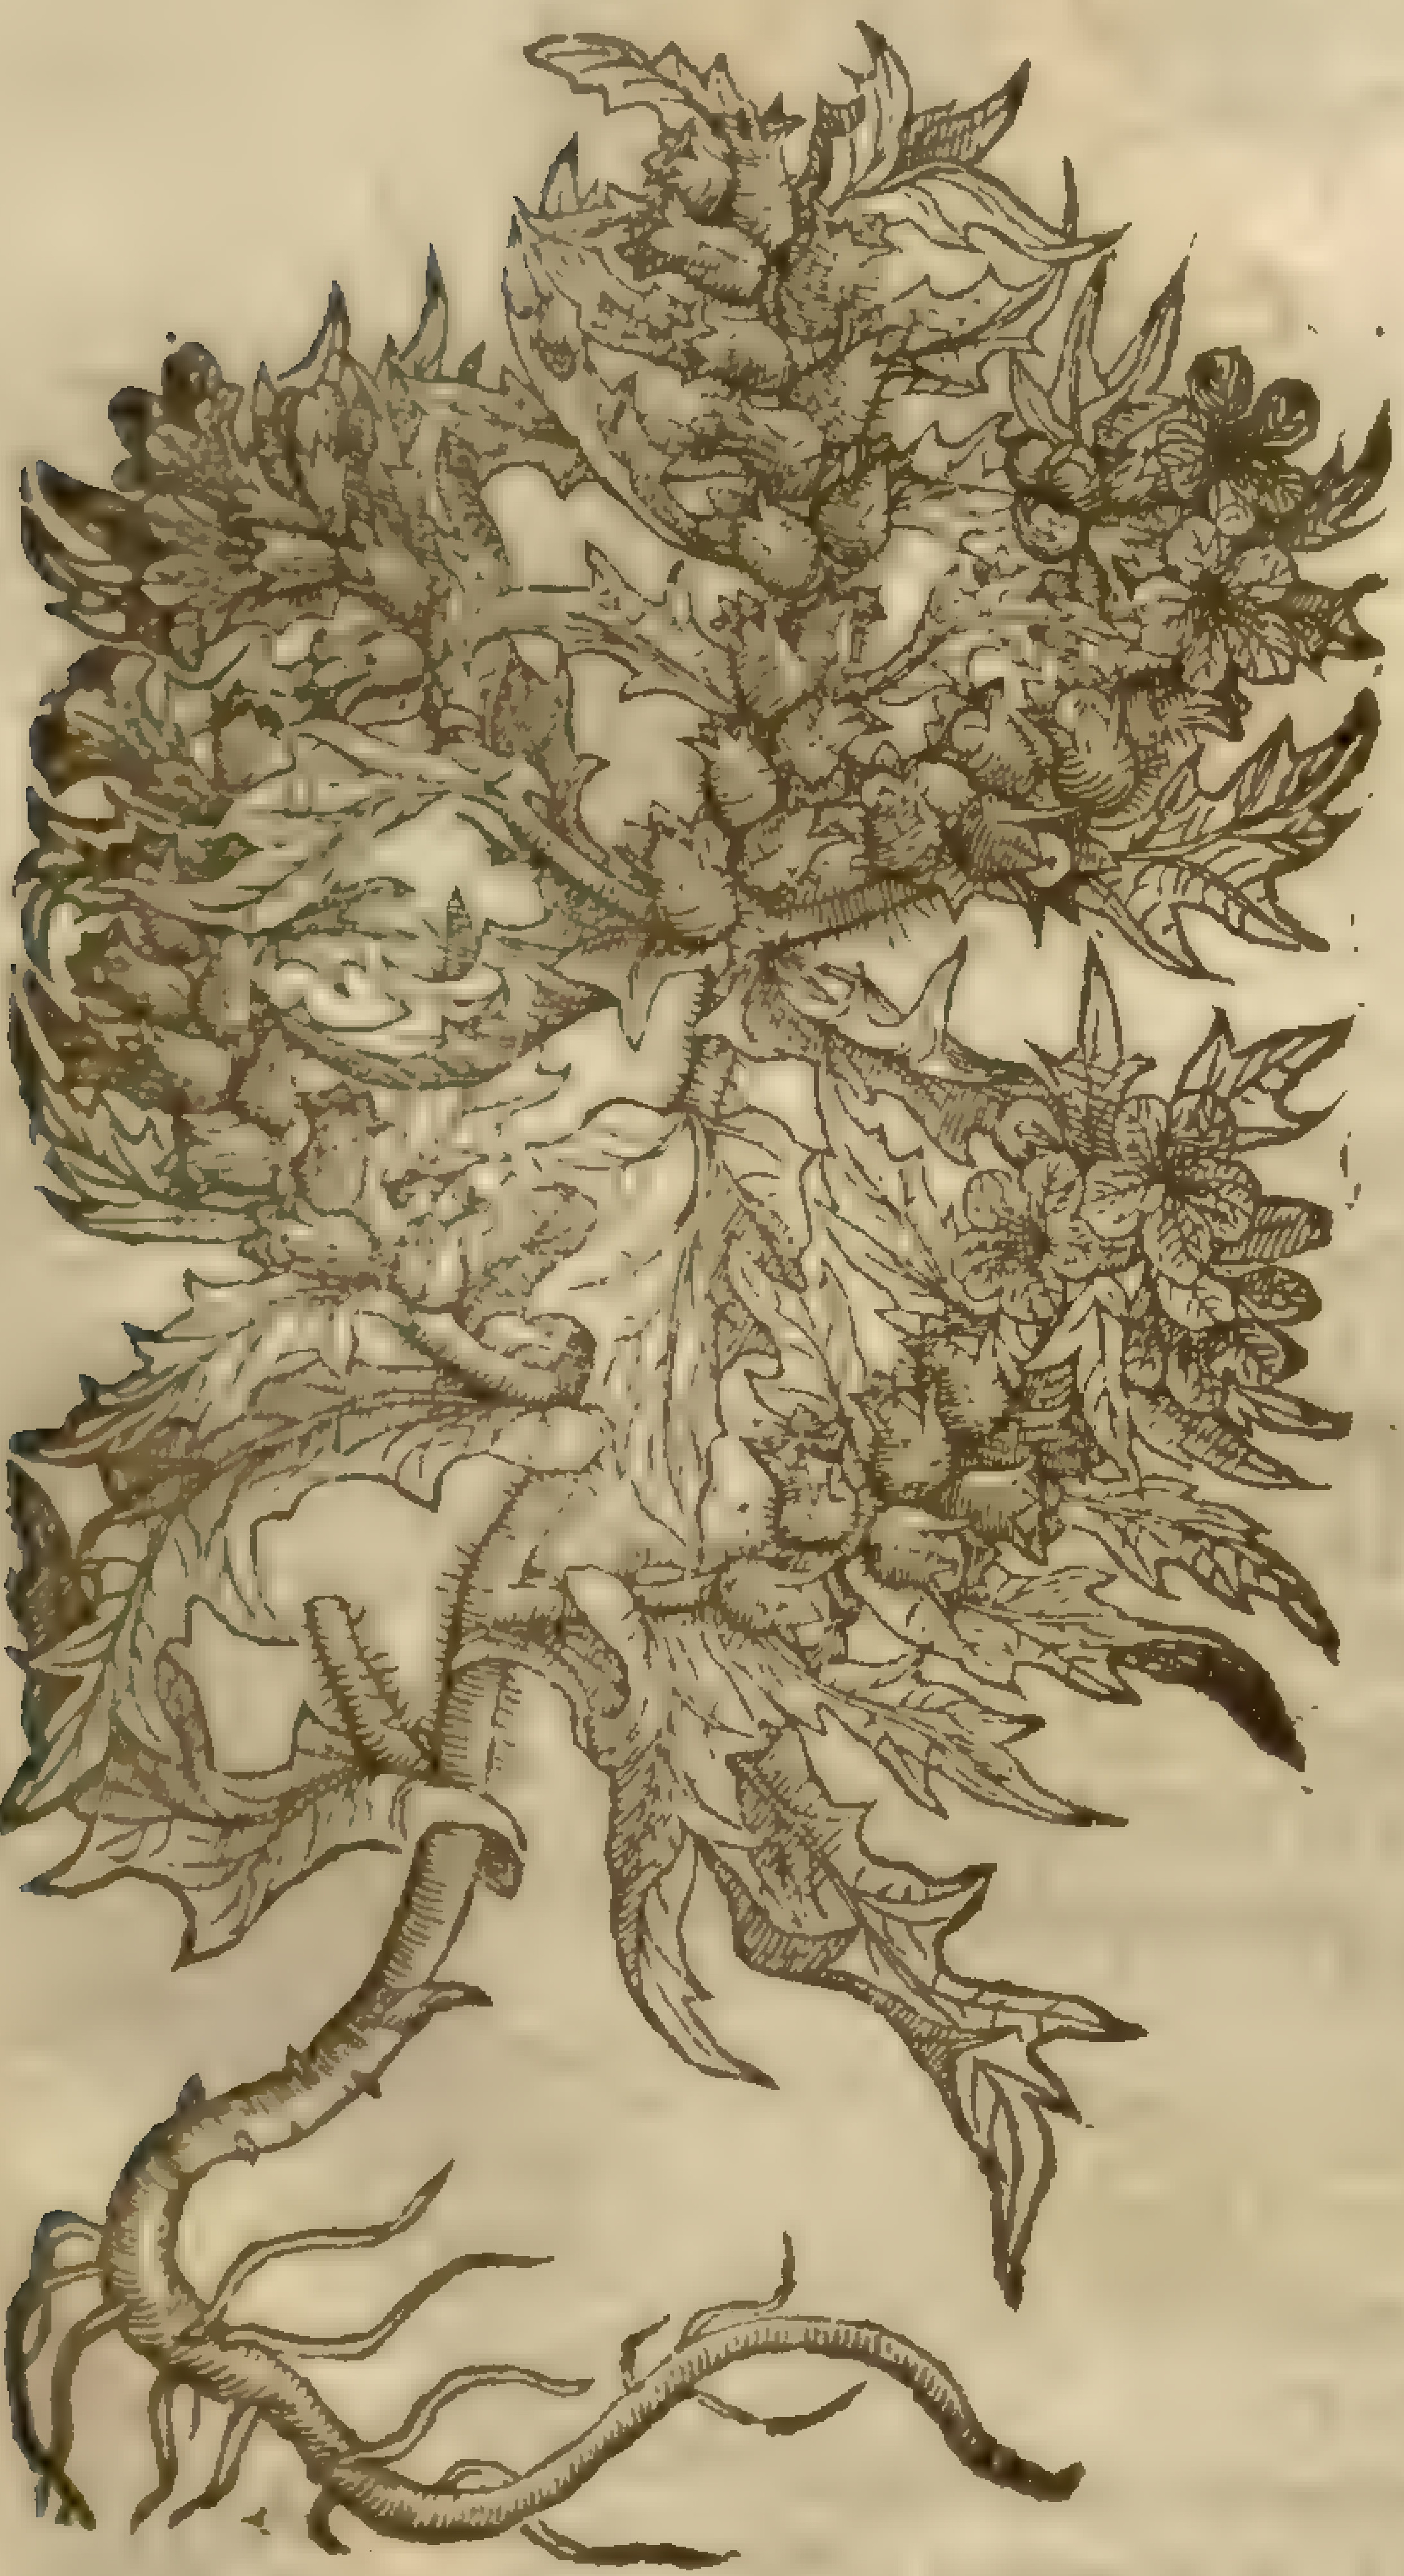
K The ſmell of the Apples moueth to ſleepe likewiſe; but the juice worketh more effectually if you take it in ſmall quantitie.

Great and ſtrange effects are ſuppoſed to bee in Mandrakes, to cauſe women to be fruitfull and L beare children, if they ſhall but carry the ſame neere to their bodies. Some do from hence ground it, for that *Rahel* deſired to haue her ſiſters Mandrakes (as the text is tranſlated) but if we look well into the circumſtances which there we ſhall finde, we may rather deem it otherwiſe. Yong *Ruben* brought home amiable and ſweet-ſmelling floures, (for ſo ſignifieth the Hebrew word, vſed *Cantic.*7.13. in the ſame ſence) rather for their beauty and ſmell, than for their vertue. Now in the floures of Mandrake there is no ſuch delectable or amiable ſmell as was in theſe amiable floures which *Ruben* brought home. Beſides, we reade not that *Rahel* conceiued hereupon, for *Leah Iacobs* wife had foure children before God granted that bleſſing of fruitfulneſſe vnto *Rahel*. And laſt of all, (which is my chiefeſt reaſon) *Iacob* was angry with *Rahel* when ſhee ſaid, Giue mee children or els I die; and demanded of her, whether he were in the ſtead of God or no, who had withheld from her the fruit of her body. And we know the Prophet *Dauid* ſaith, Children & the fruit of the womb are the inheritance that commeth of the Lord, *Pſal.*127.

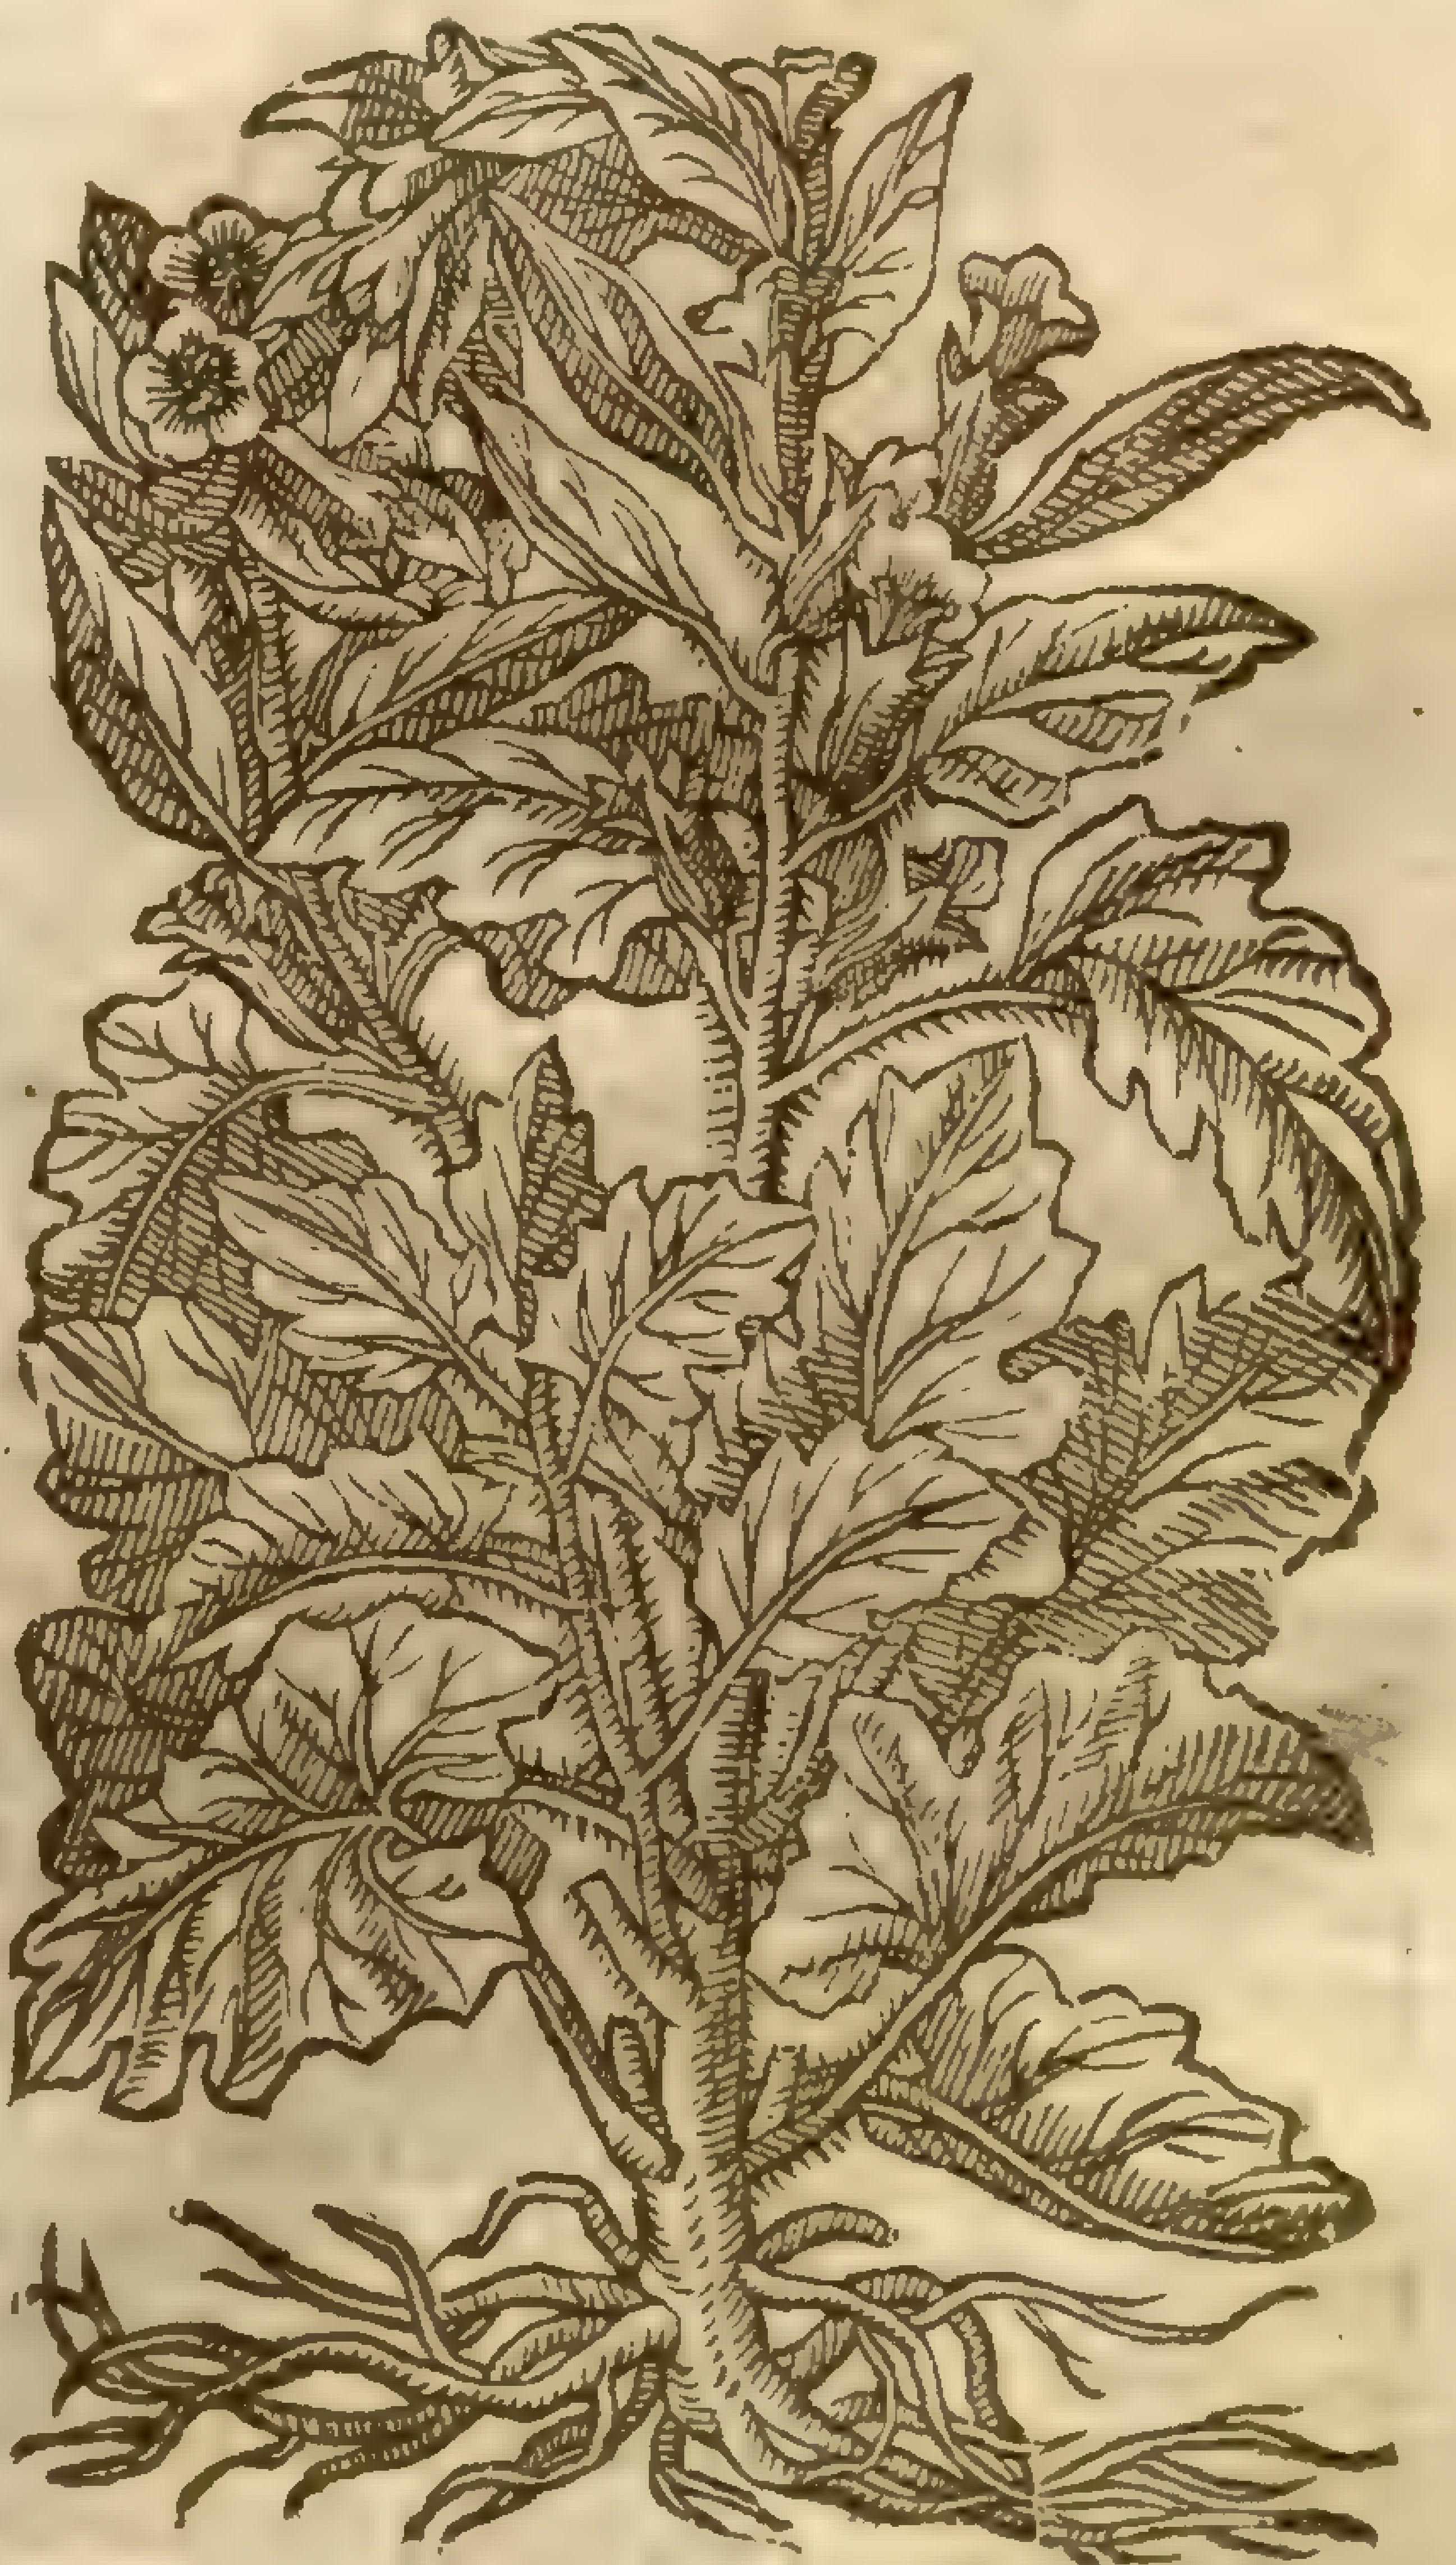
Serapio, *Avicen*, and *Paulus Ægineta* write, That the ſeed and fruit of *Mandragoras* taken in drinke, M do clenſe the matrix or mother: and *Dioſcorides* wrot the ſame long before them.

He that would know more hereof, may reade that chapter of Dr *Turners* booke concerning this N matter, where he hath written largely and learnedly of this Simple.

Chap. 66. *Of Henbane.*



1 *Hyoſcyamus niger.*
Blacke Henbane.



2 *Hyoſcyamus albus.*
White Henbane.

¶ *The Deſcription.*

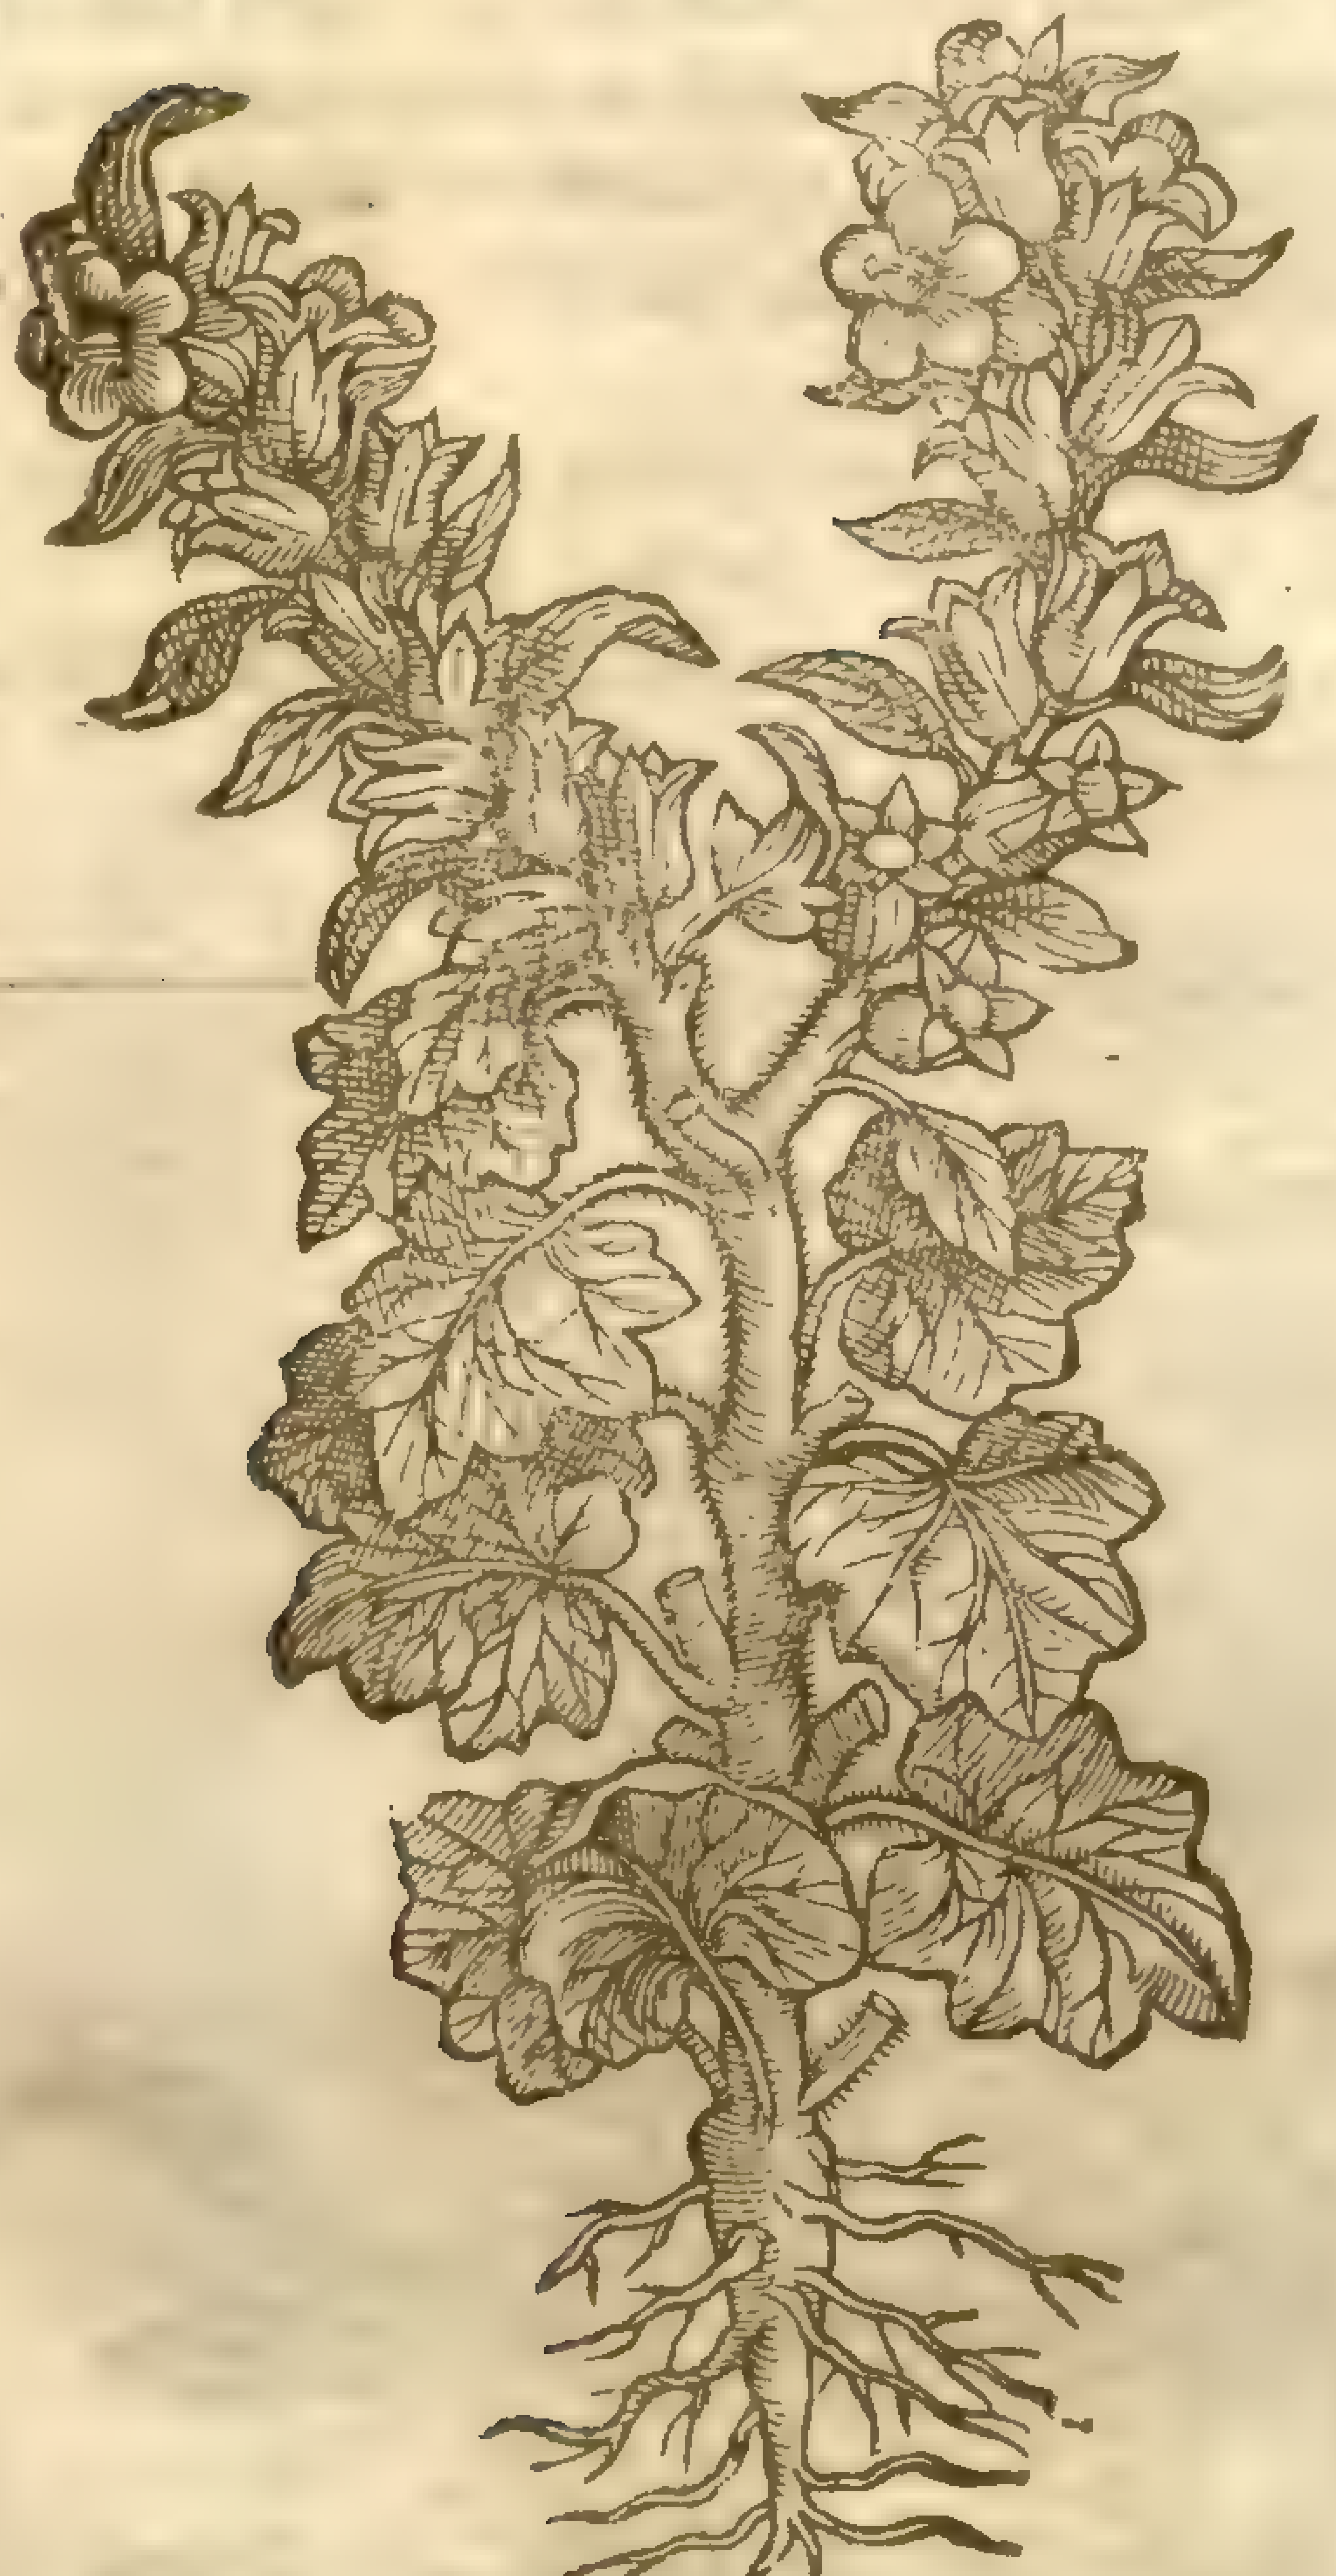
1 The common blacke Henbane hath great and ſoft ſtalkes, leaues very broad, ſoft, and woolly, ſomewhat jagged, eſpecially thoſe that grow neere to the ground, and thoſe that grow vpon the ſtalke, narrower, ſmaller, and ſharper, the floures are bell-faſhion, of a feint yellowiſh white, and browne within towards the bottome: when the floures are gone,

there come hard knobby husks like ſmall cups or boxes, wherein are ſmall brown ſeeds.

2 The white Henbane is not much vnlike the blacke, ſauing that his leaues are ſmaller, whiter, and more woolly, and the floures alſo whiter: the cods are like the other, but without pricks. It dieth in winter, and muſt likewiſe be ſowne again the next yeare.

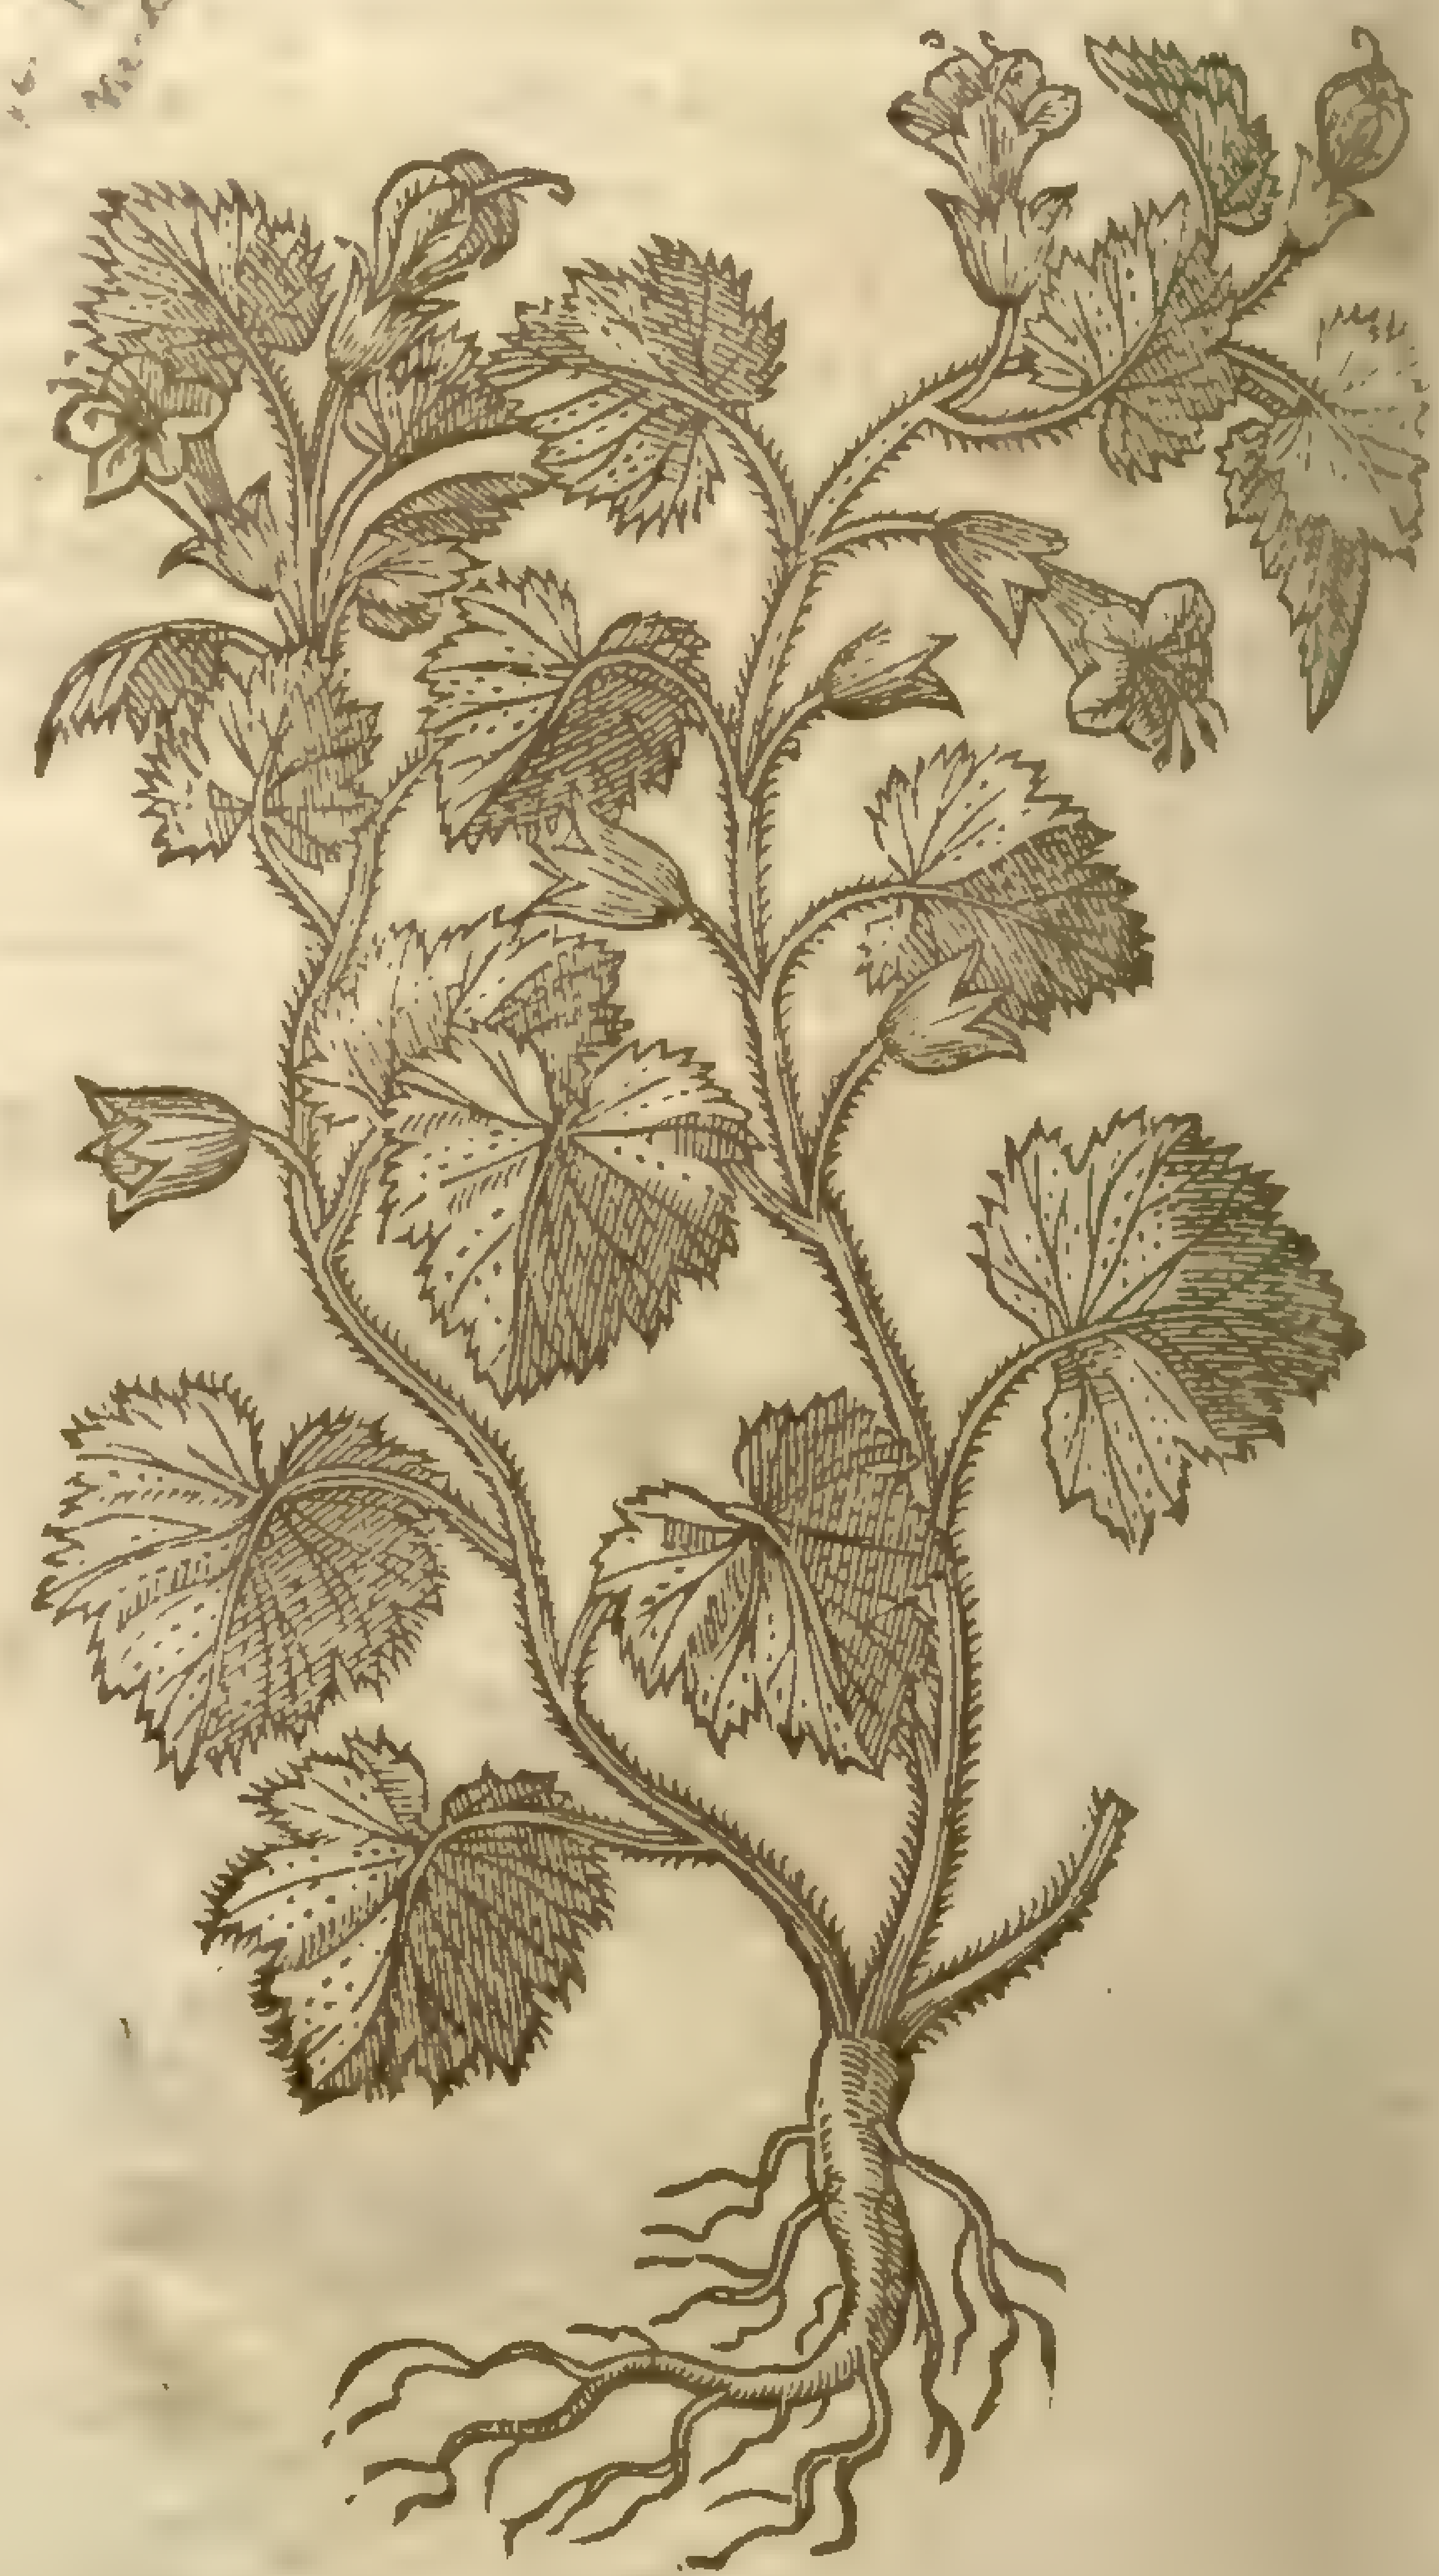
‡ 3 *Hyoſcyamus albus minor.*
The leſſer white Hembane.

H. albus, [illegible]



‡ 4 *Hyoſcyamus albus Creticus.*
White Henbane of Candy.

H. aureus [illegible]



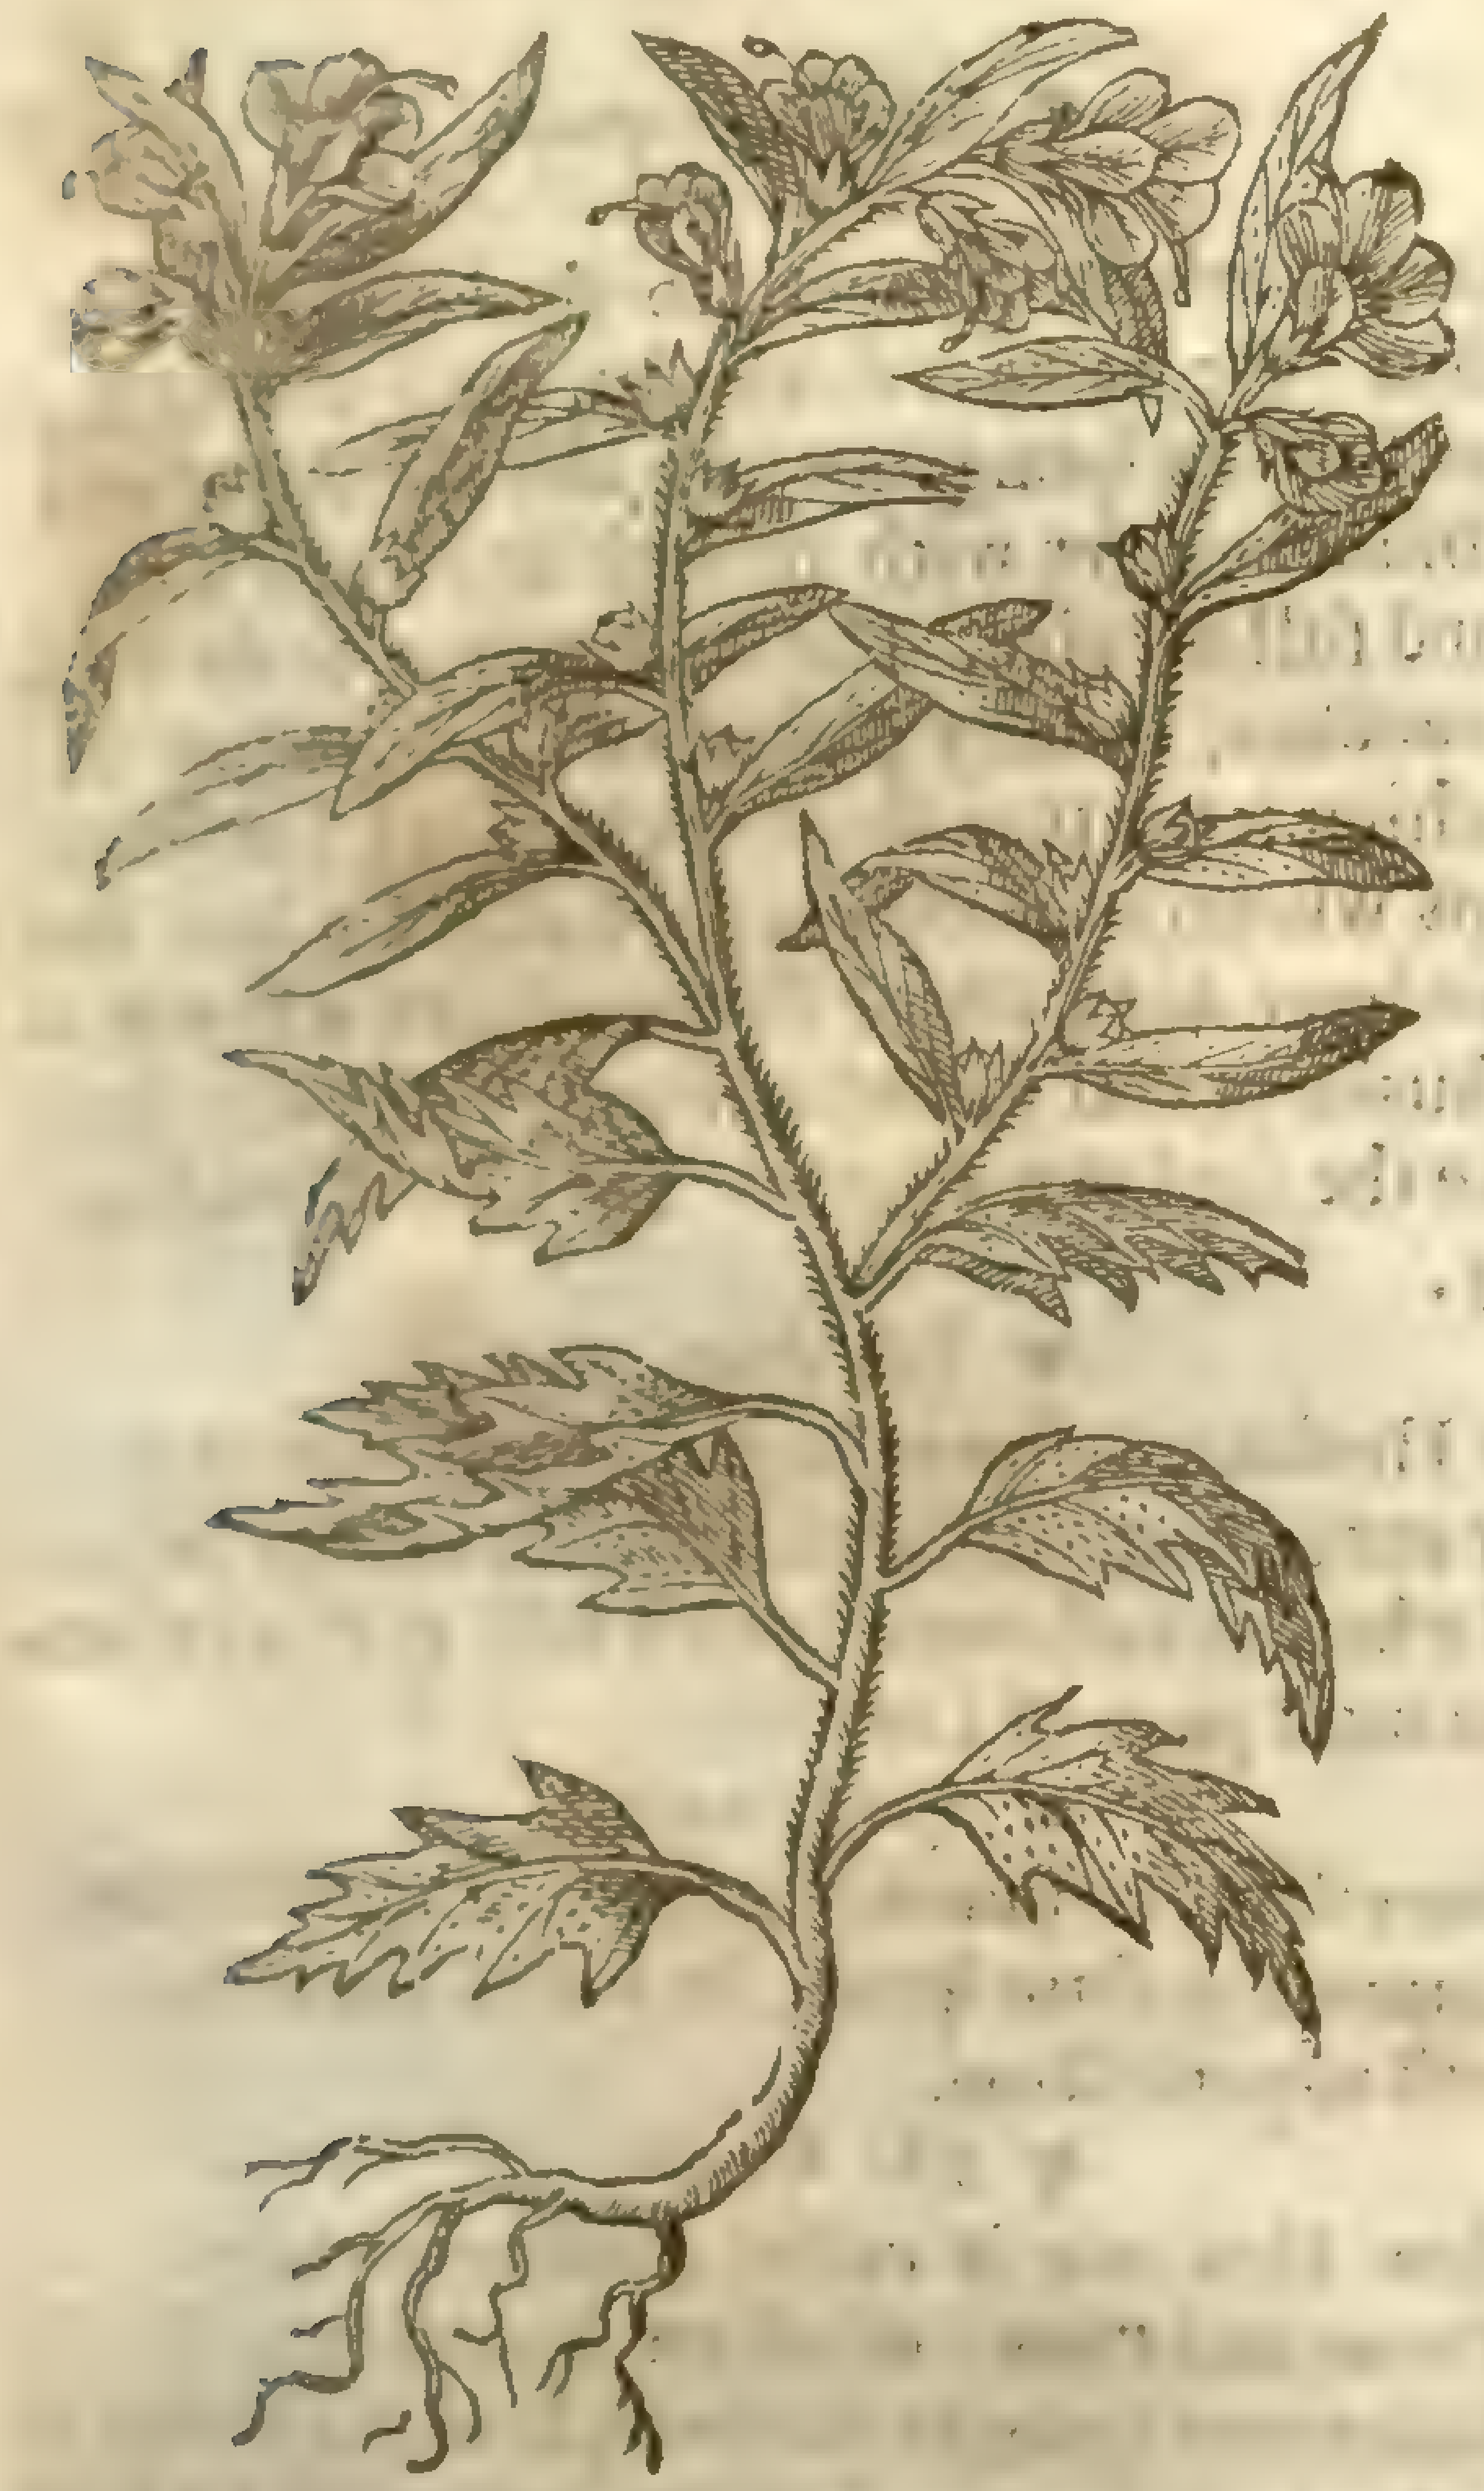
‡ 3 This other white Henbane is much like the laſt deſcribed, but that it is leſſe, the leaues ſmaller and rounder, hanging vpon pretty long ſtalks: the floures and ſeed-veſſels are like thoſe of the laſt mentioned.

4 This is ſofter and tenderer than the laſt deſcribed; the leaues alſo hang vpon long footſtalks and are couered ouer with a ſoft downineſſe; and they are ſomewhat broader, yet thinner & more ſinuated than thoſe of the white, and ſomewhat reſemble the forme of a Vine leafe beeing ſnipped about the edges; the ſtalks are alſo couered with a white colour: the floures are of a gold yellow, with a veluet-coloured circle in their middles; the root is ſufficiently thicke and large. *Cluſius* had the figure and deſcription of this from his friend *Iaques Plateau*, who had the Plant growing of ſeed receiued from Candy.

5 The ſtalke of this growes ſome cubit high, being pretty ſtiffe, about the thickneſſe of ones little finger, and couered ouer with a ſoft & white downe: the leaues grow diſperſt vpon the ſtalk, not much vnlike thoſe of the common kind, but leſſer, and more diuided, and white (while they are yong) couered with a ſlender and long downineſſe: the top of the ſtalke is diuided into certaine branches that bend or hang down their heads, which alternatly among narrower, leſſer, and vndiuided leaues carry cups like as the common one, ending in fiue pretty ſtiffe points, in which are contained floures at firſt ſomewhat like the common kinde, but afterwards as they grow bigger, they change into an elegant red purpliſh colour, with deep colored veins: neither is the ring or middle part purple as in the common kind, but whitiſh, hauing a purpliſh pointall, and fiue threds in the middle: the ſeeds and ſeed-veſſels are like thoſe of the common kinde. *Cluſius* receiued the ſeed hereof from *Paludanus*, returning from his trauels into Syria and Egypt; wherefore he calls it *Hyoſcyamus Ægyptius*, Egyptian Henbane. ‡

¶ The

‡ 5 *Hyoſcyamus flore rubello.*
Henbane with a reddiſh floure.



¶ *The Place.*

Blacke Henbane grows almoſt euery where by highways, in the borders of fields about dunghils and vntoiled places: the white Henbane is not found but in the gardens of thoſe that loue phyſicall plants: the which groweth in my garden, and doth ſow it ſelfe from yeare to yeare.

¶ *The Time.*

They ſpring out of the ground in May, bring forth their floures in Auguſt, and the ſeed is ripe in October.

¶ *The Names.*

Henbane is called of the Grecians, ὑοσκύαμος: of the Latines, *Apollinaris*, and *Faba ſuilla*: of the Arabians, as *Pliny* ſaith, *Altercum*: of ſome, *Faba Iovis*, or *Iupiters* bean: of *Pythagorus*, *Zoroaſtes*, and *Apuleius*, *Inſana*, *Alterculum*, *Symphoniaca*, and *Calicularis*: of the Tuſcanes, *Fabulonia*, and *Faba lupina*: of *Matthæus ſylvaticus*, *Dens Caballinus*, *Milimandrum*, *Caſsilago*: of *Iacobus à Manlijs*, *Herba pinnula*: in ſhops it is called *Iuſquiamus*, and *Hyoſcyamus*: in Engliſh, Henbane: in Italian, *Hyoſquiamo* in Spaniſh, *Velenno*: in high-Dutch, **Bilſen kraut**: in French, *Hannebane*, *Endormie*: the other is called *Hyoſcyamus albus*, or white Henbane.

¶ *The Nature.*

Theſe kinds of Henbane are cold in the fourth degree.

¶ *The Vertues.*

A Henbane cauſeth drowſineſſe, and mitigateth all kinde of paine: it is good againſt hot & ſharp diſtillations of the eyes and other parts: it ſtaieth bleeding and the diſeaſe in women: it is applied to inflammations of the ſtones and other ſecret parts.

B The leaues ſtamped with the ointment *Populeon*, made of Poplar buds, aſſwageth the pain of the gout, the ſwelling of the ſtones, and the tumors of womens breſts, and are good to be put into the ſame ointment, but in ſmall quantity.

C To waſh the feet in the decoction of Henbane cauſeth ſleepe; or giuen in a clyſter it doth the ſame, and alſo the often ſmelling to the floures.

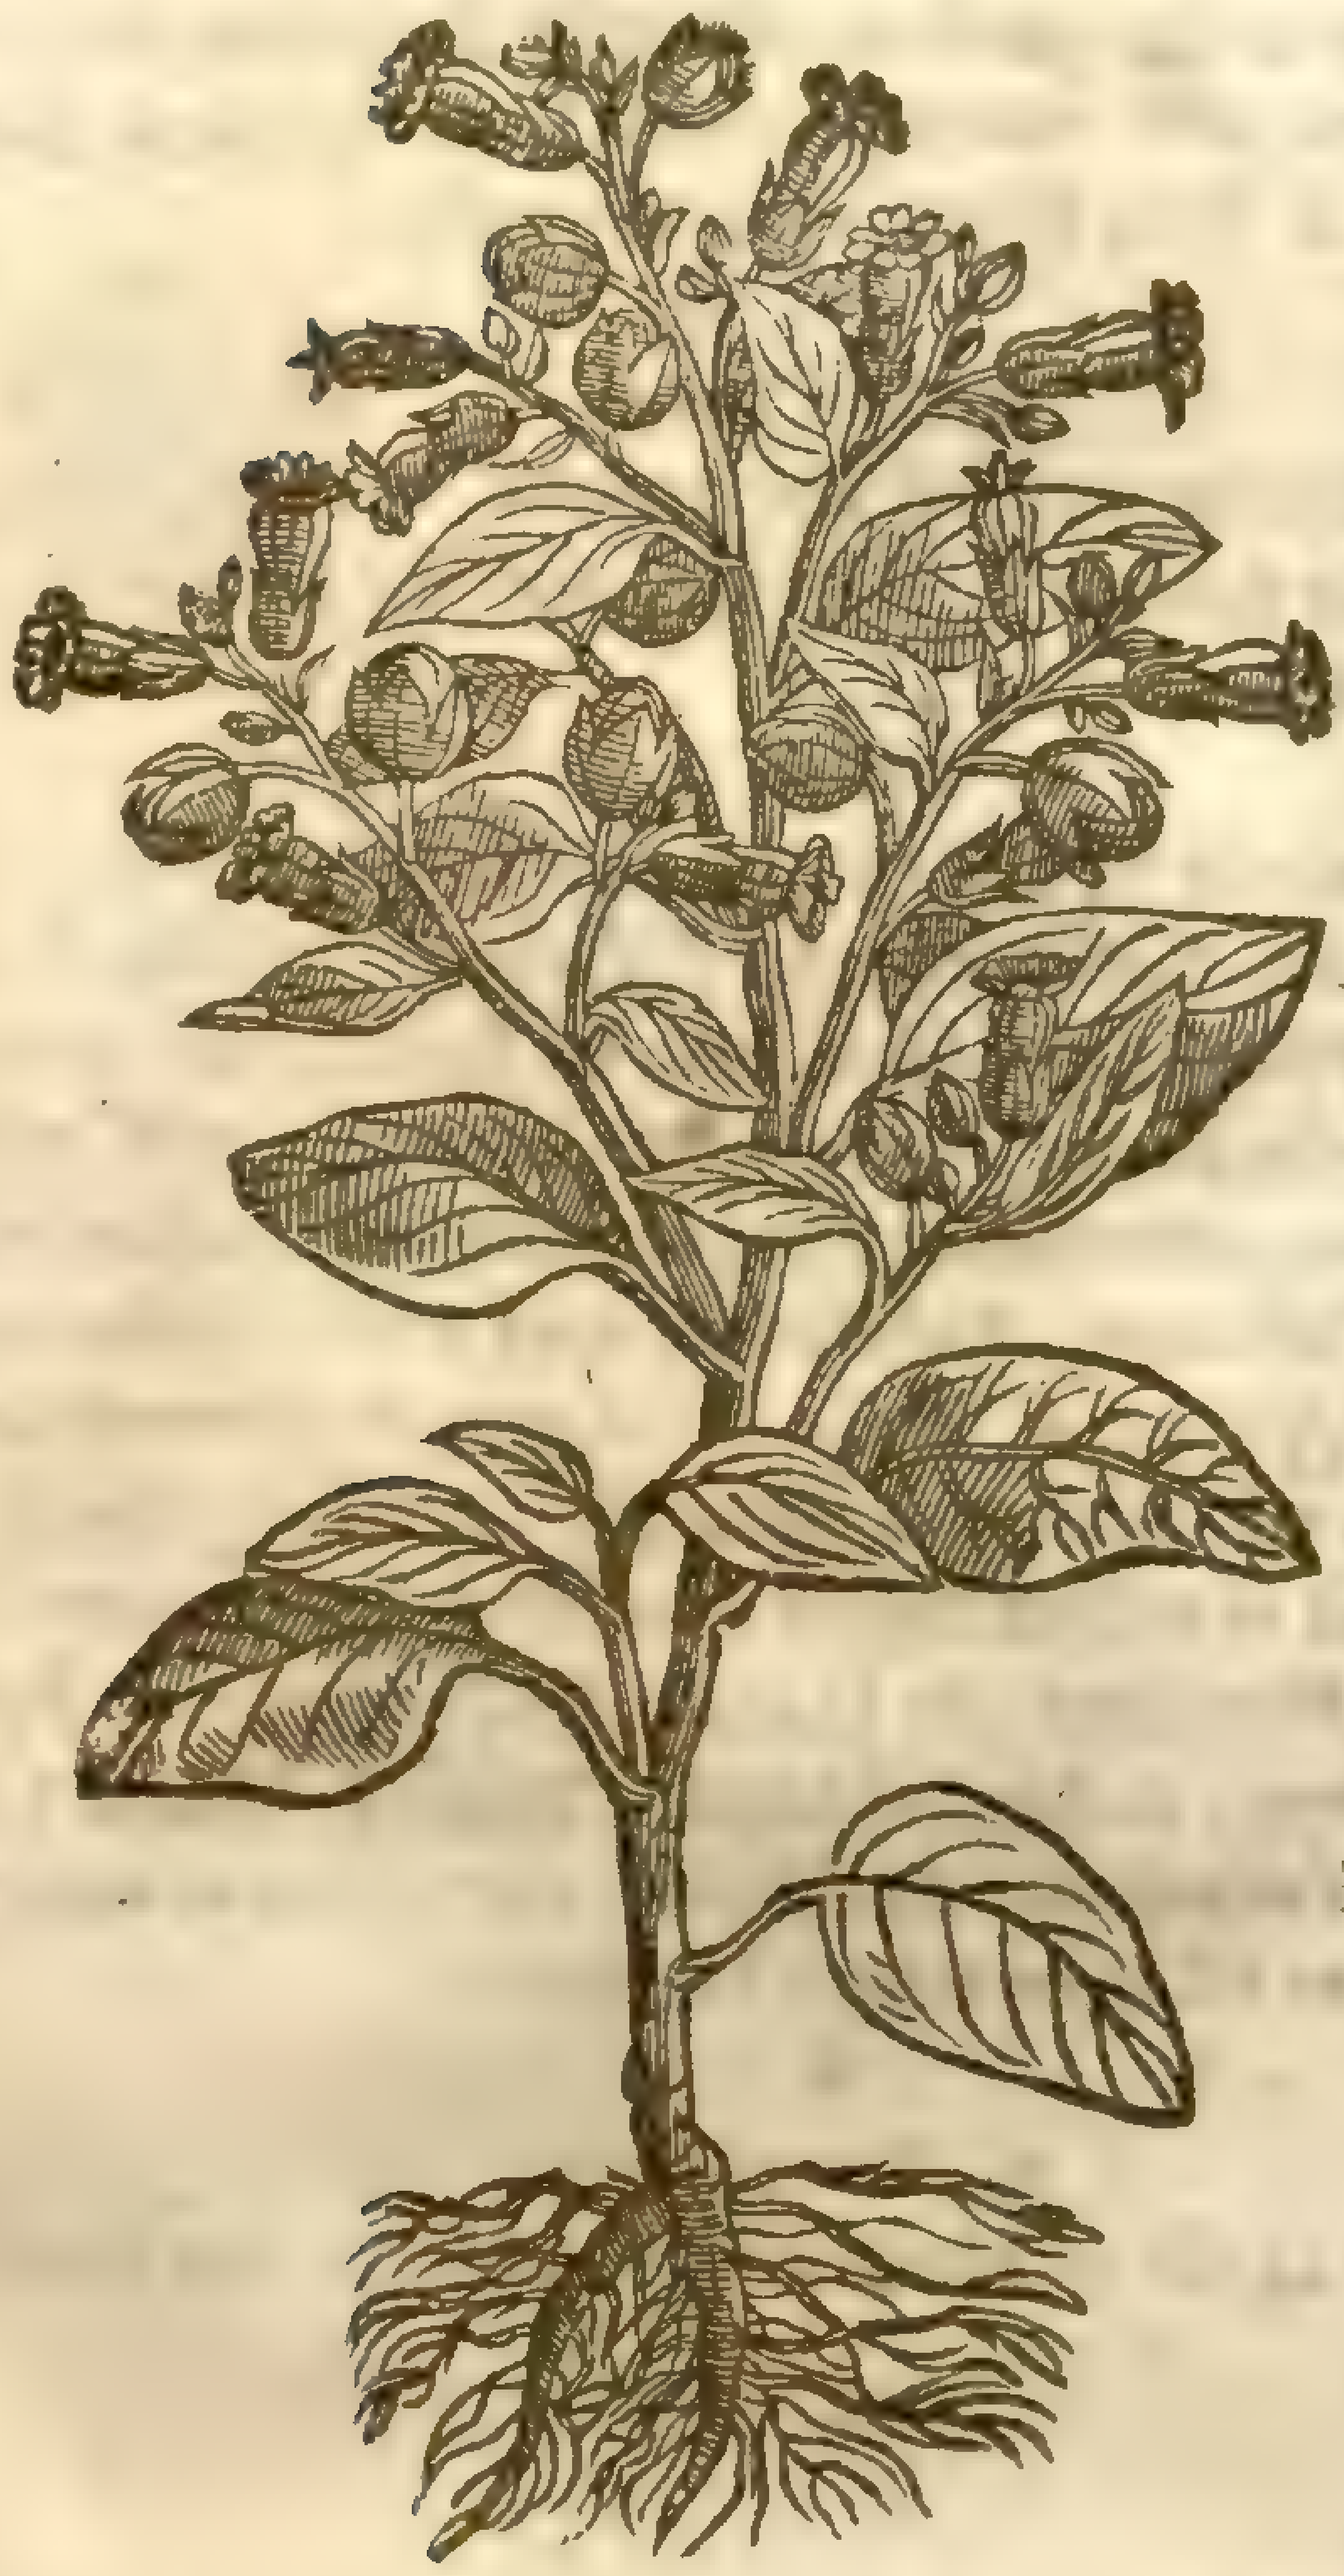
D The leaues, ſeed, and juice taken inwardly cauſe an vnquiet ſleep like vnto the ſleepe of drunkenneſſe, which continueth long, and is deadly to the party.

E The ſeed of white Henbane is good againſt the cough, the falling of watrie humors into the eys or breſt, againſt the inordinat flux of womens iſſues, & all other iſſues of bloud, taken in the weight of ten grains, with water wherein hony hath bin ſodden.

F The root boiled with vinegre, & the ſame holden hot in the mouth, eaſeth the pain of the teeth. The ſeed is vſed by Mountibank tooth-drawers which run about the country, to cauſe worms come forth of the teeth, by burning it in a chafing diſh of coles, the party holding his mouth ouer the fume thereof: but ſome crafty companions to gain mony conuey ſmall lute-ſtrings into the water, perſuading the patient, that thoſe ſmall creepers came out of his mouth or other parts which he intended to eaſe.

Chap. 67. *Of yellow Henbane, or Engliſh Tabaco.*

Hyoſcyamus luteus.
Yellow Henbane.



Nicotiana rustica L. [illegible]

¶ *The Deſcription.*

Yellow Henbane groweth to the height of two cubits: the ſtalke is thicke, fat, and green of colour, ful of a ſpongeous pith, and is diuided into ſundry branches, ſet with ſmooth and euen leaues, thicke and full of juice. The floures grow at the tops of the branches, orderly placed, of a pale yellow color, ſomthing leſſer than thoſe of the black Henbane. The cups wherein the floures do ſtand, are like, but leſſer, tenderer, and without ſharpe points, wherein is ſet the huske or cod ſomwhat round, full of very ſmal ſeed like the ſeed of marjerom. The root is ſmall and threddy.

¶ *The Place.*

Yellow Henbane is ſowne in gardens, where it doth proſper exceedingly, inſomuch that it cannot be deſtroied where it hath once ſown it ſelf, & it is diſperſed into moſt parts of London.

¶ *The Time.*

It floureth in the ſummer moneths, and oftentimes till Autumne be farre ſpent, in which time the ſeed commeth to perfection.

¶ *The Names.*

Yellow Henbane is called *Hyoſcyamus luteus*: of ſome, *Petum*, and *Petun*: of others, *Nicotiana*, of *Nicot* a Frenchman that brought the ſeeds from the Indies, as alſo the ſeeds of the true Tabaco, whereof this hath bin taken for a kind; inſomuch that *Lobel* hath called it *Dubius Hyoſcyamus*, or doubtfull Henbane, as a plant participating of Henbane and Tabaco: and it is vſed of diuers in ſtead of Tabaco, and called by the ſame name, for that it hath bin brought from Trinidada, a place ſo called in the Indies, as alſo from Virginia and other places, for Tabaco; and doubtleſſe, taken in ſmoke it worketh the ſame kind of drunkenneſſe that the right Tabaco doth.

‡ Some vſe to call this Nicotian in Engliſh, being a name taken from the Latine. ‡

¶ *The Temperature.*

This kinde of Henbane is thought of ſome to be cold and moiſt; but after *Lobel* it rather heats than cooles at all, becauſe of the biting taſt, as alſo that roſenninеſſe or gummineſſe it is poſſeſſed of; which is euidently perceiued both in handling and chewing it in the mouth.

¶ *The Vertues.*

A This herb auaileth againſt all apoſtumes, tumors, inueterat vlcers, botches, and ſuch like, beeing made into an vnguent or ſalue as followeth: Take of the greene leaues three pounds and an halfe, ſtampe them very ſmal in a ſtone mortar; of oile Oliue one quart: ſet them to boile in a braſſe pan or ſuch like, vpon a gentle fire, continually ſtirring it vntill the herbs ſeem blacke, and wil not boile or bubble any more: then ſhall you haue an excellent green oile; which beeing ſtrained from the feces or droſſe, put the cleare and ſtrained oile to the fire again, adding therto of wax half a pound, of roſen foure ounces, and of good turpentine two ounces: melt them all together, and keepe it in pots for your vſe, to cure inueterat vlcers, apoſtumes, burnings, green wounds, and all cuts or hurts in the head; wherewith I haue gotten both crownes and credit.

B It is vſed of ſome in ſtead of Tabaco, but to ſmall purpoſe or profit, although it doth ſtupifie or dull the ſences, and cauſe that kind of giddines that Tabaco doth, and likewiſe ſpitting, which any other herb of hot temperature will do, as Roſemary, Time, Winter-Sauorie, ſweet Marjerome, and uch like: any of the which I like better to be taken in ſmoke, than this kind of doubtful Henbane.

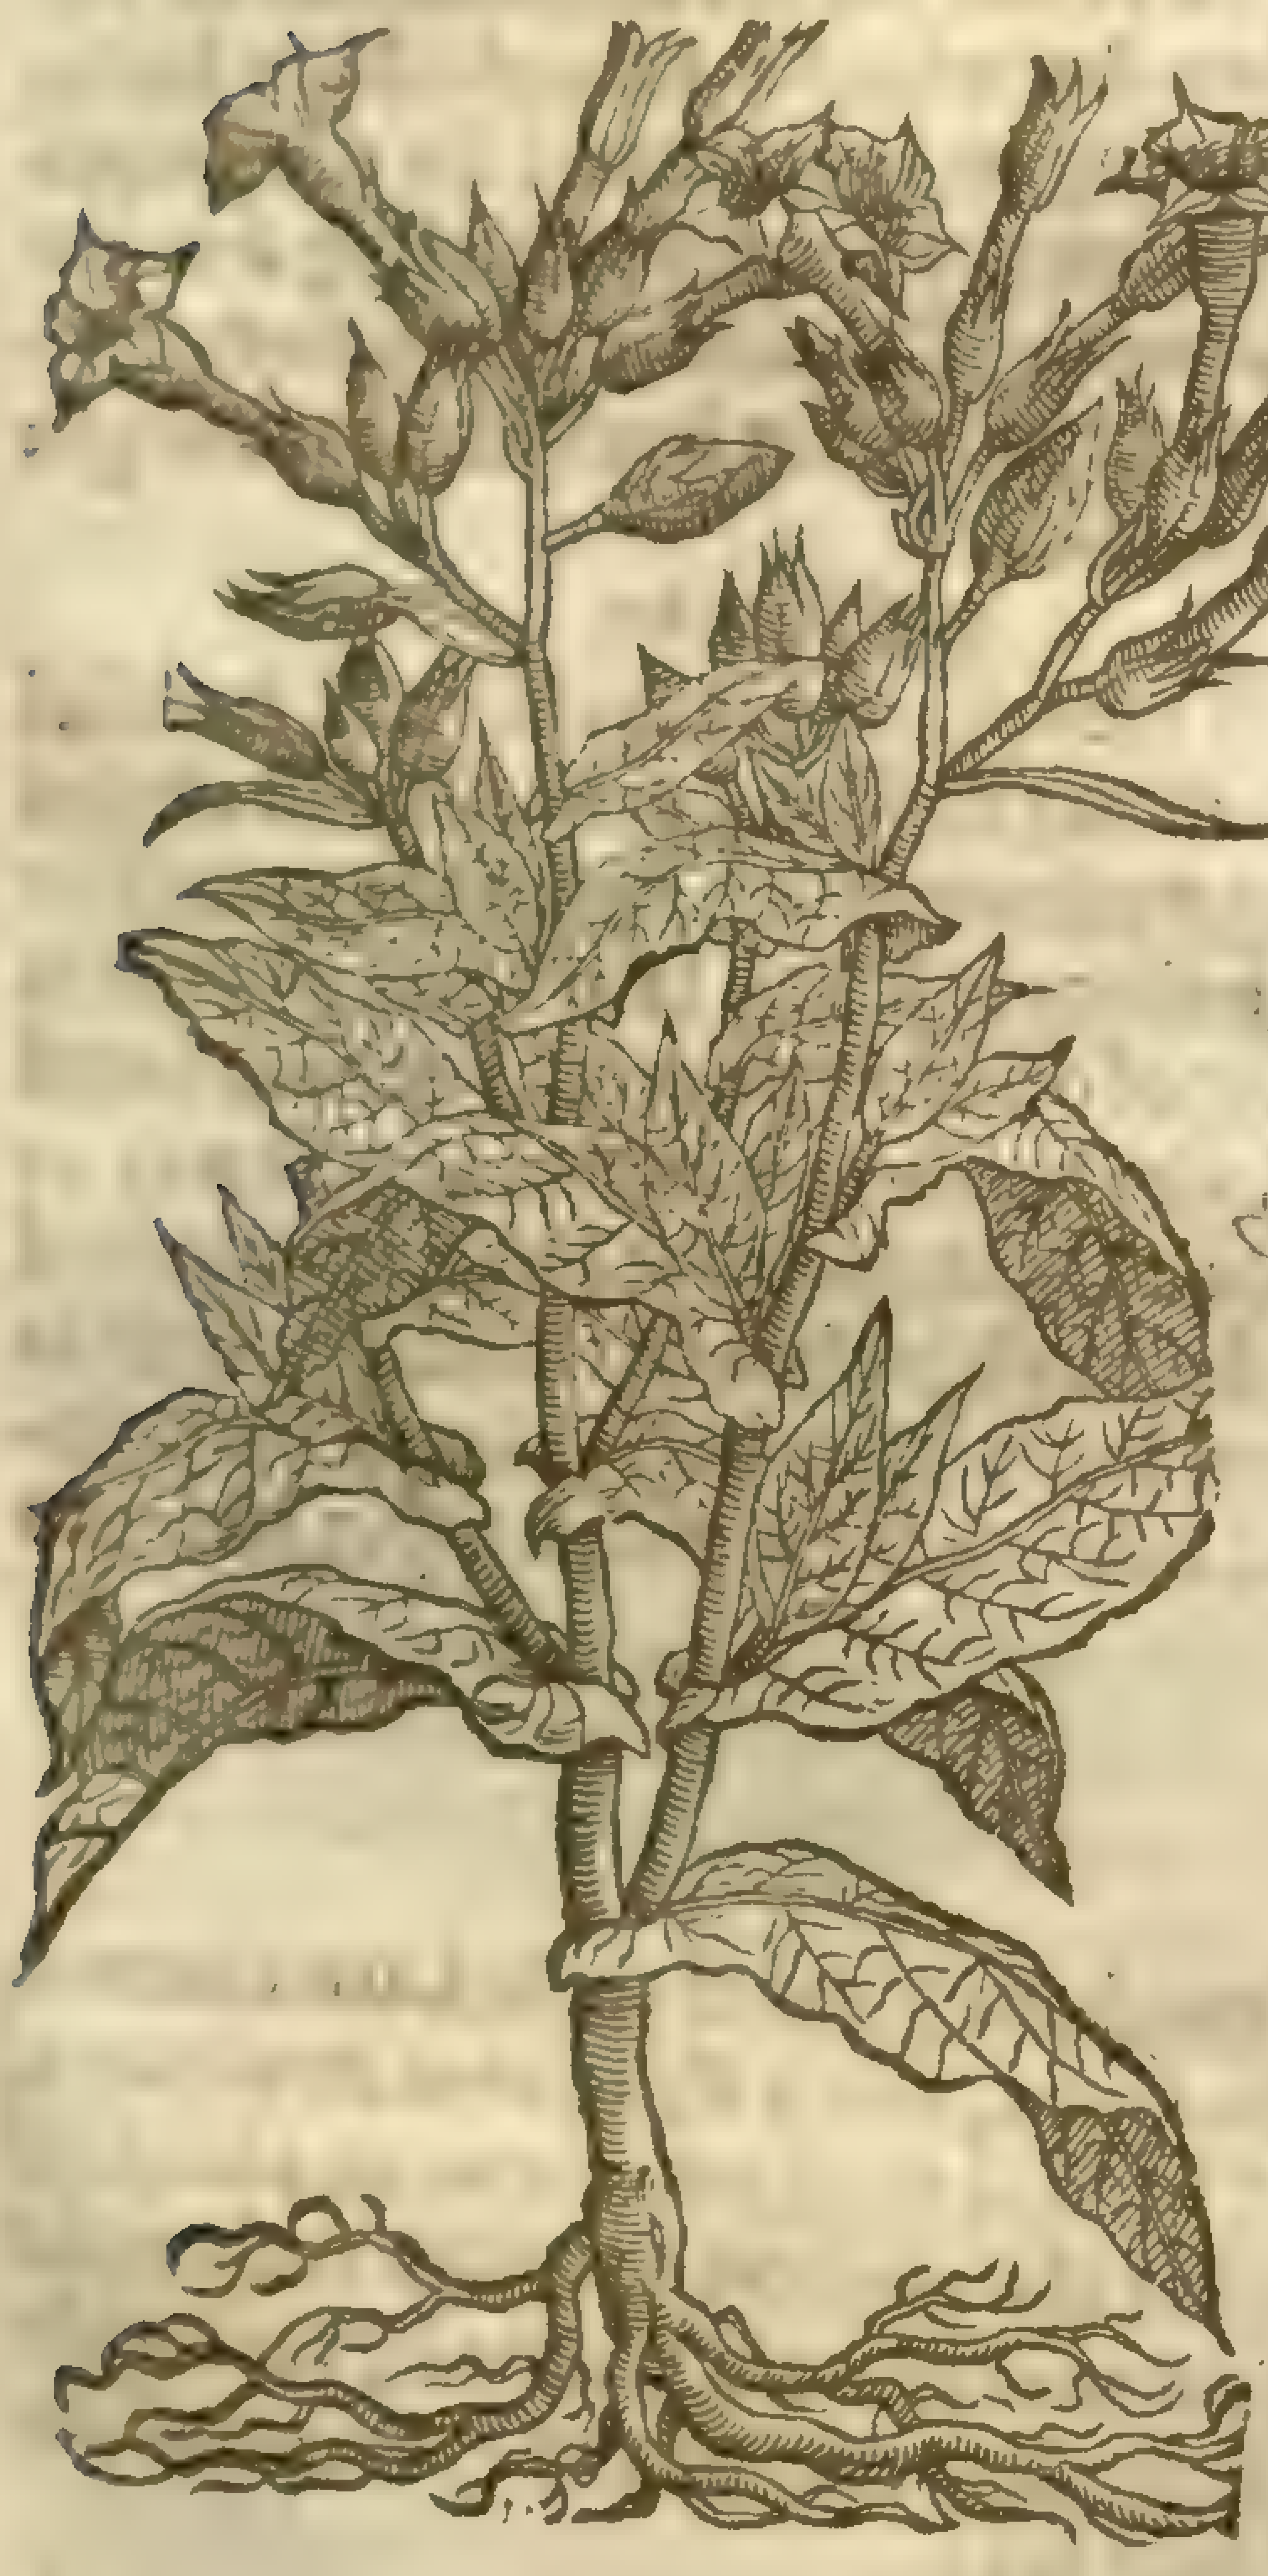
Chap. 68.

Of Tabaco, or Henbane of Peru.

¶ *The Kindes.*

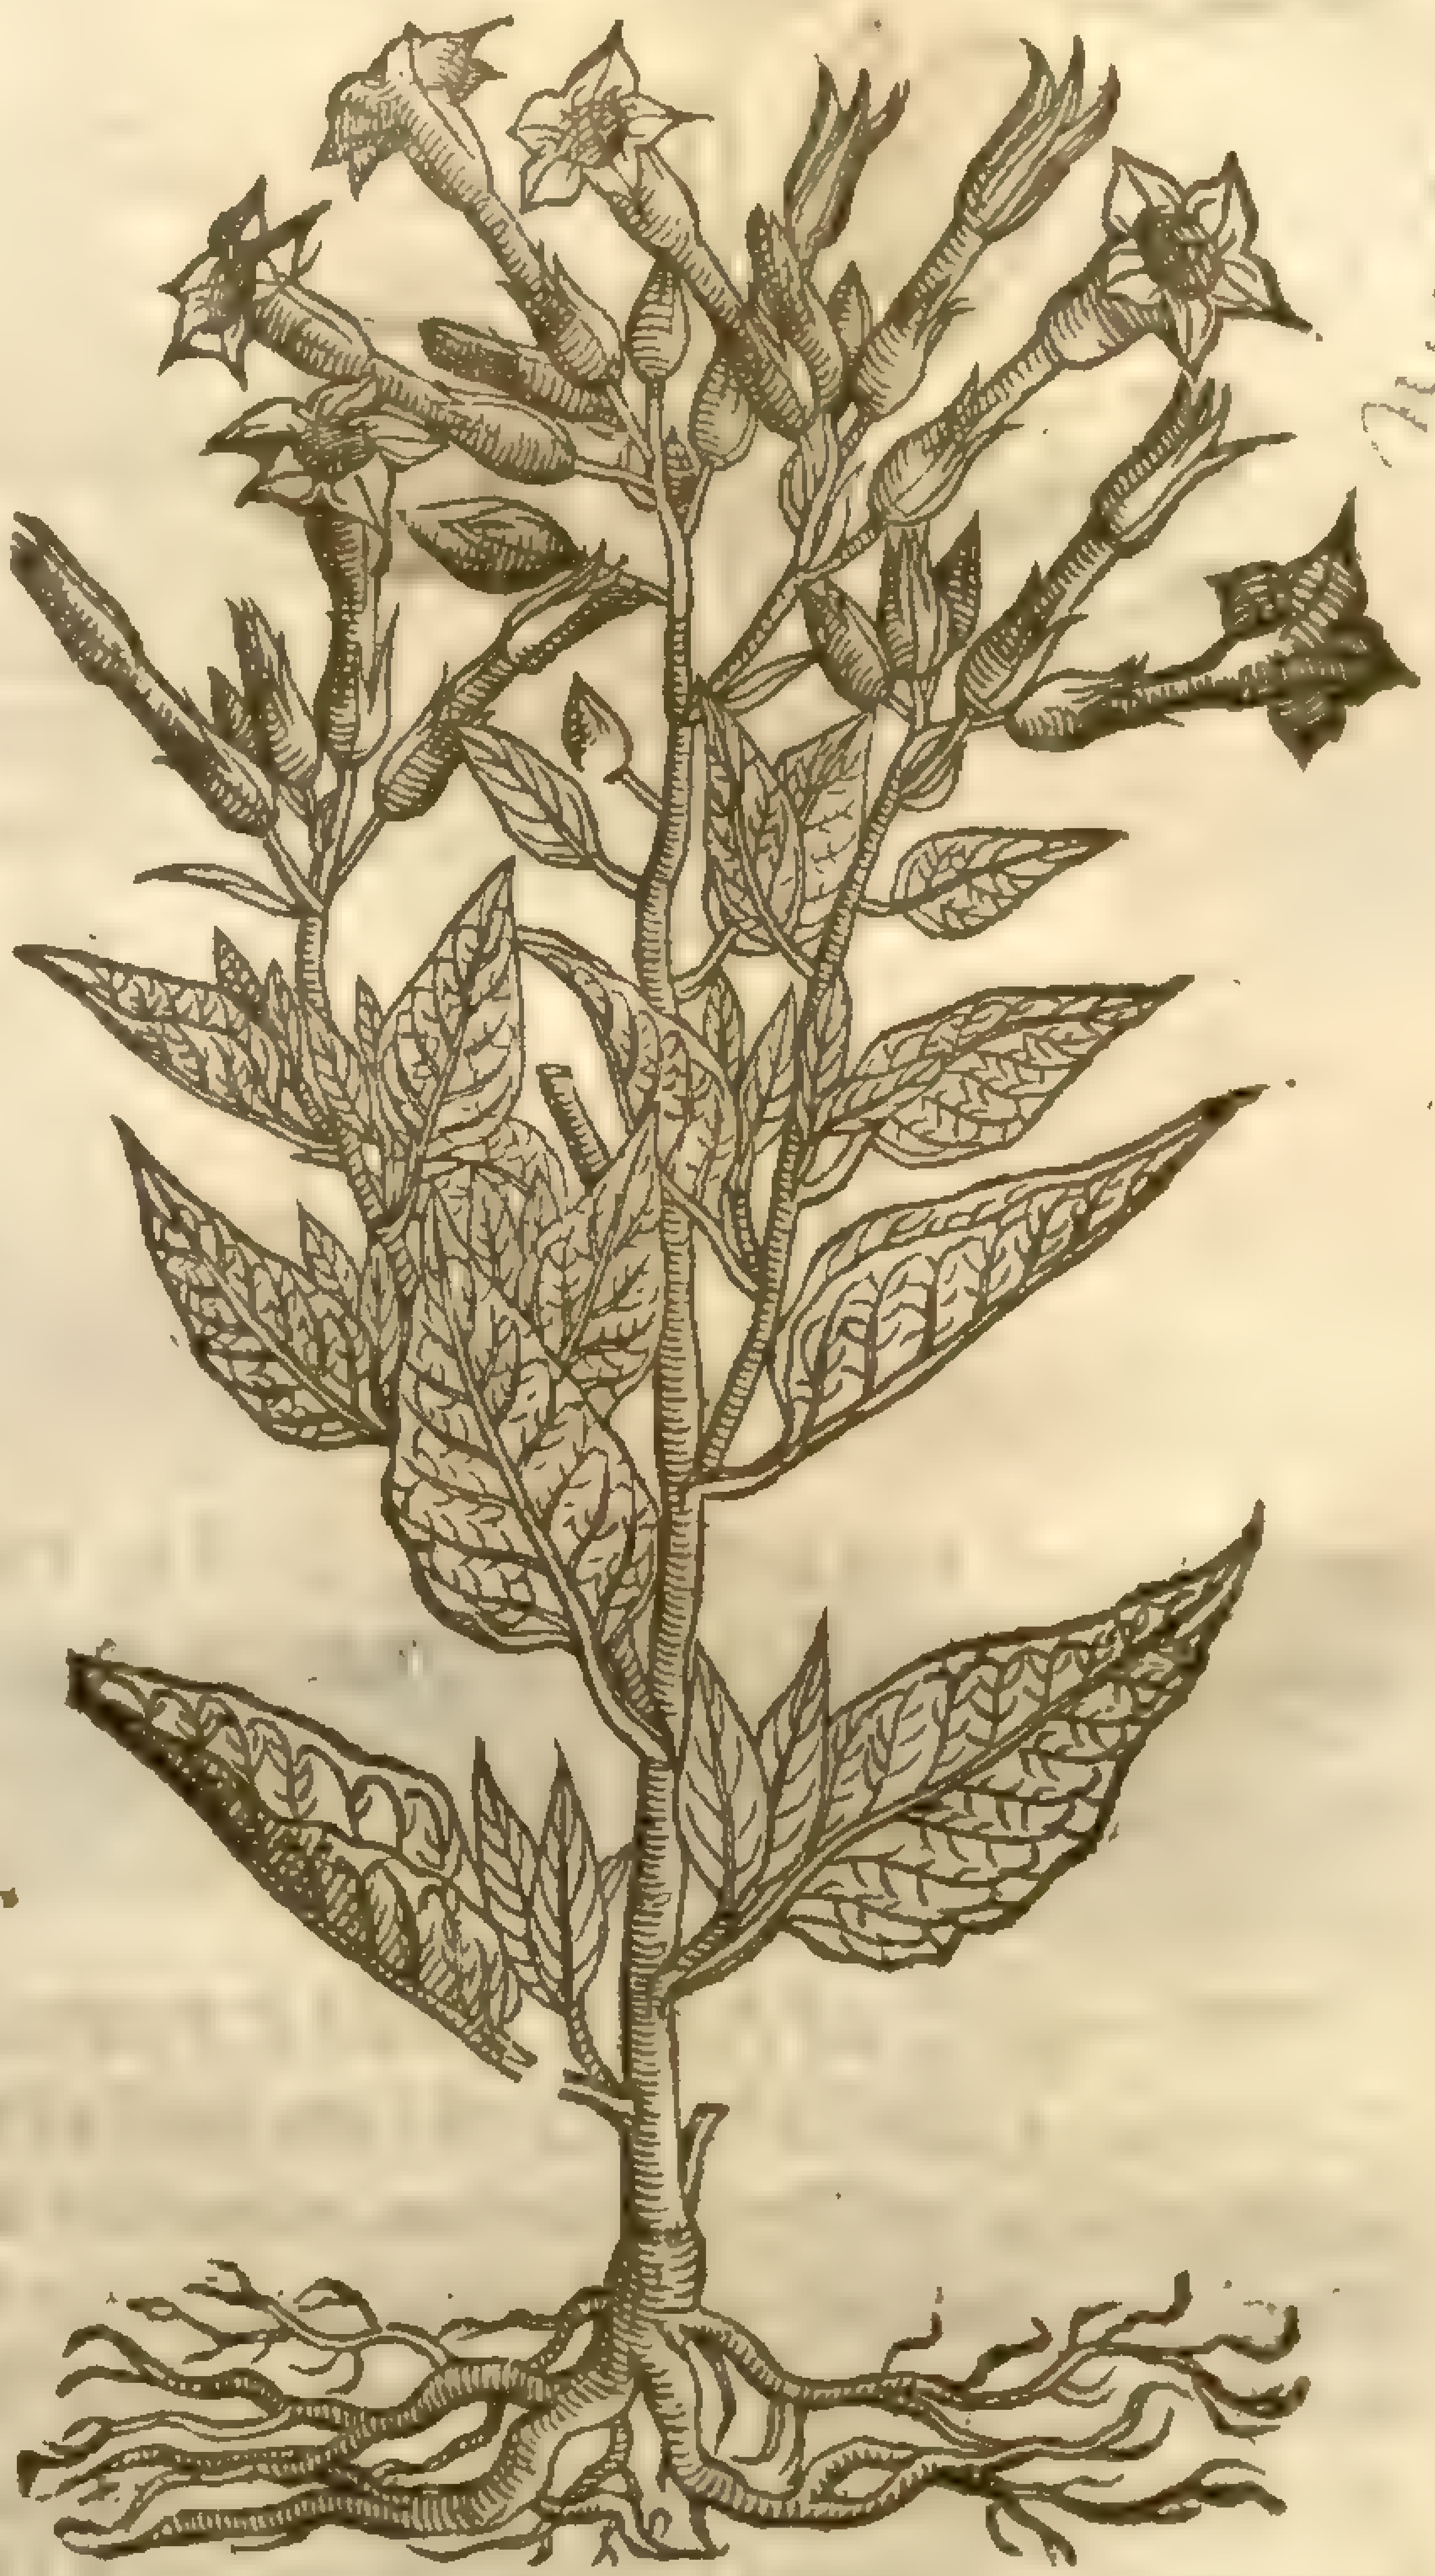
There be two ſorts or kinds of Tabaco, one greater, the other leſſer; the greater was brought into Europe out of the prouinces of America, which we call the Weſt Indies; the other from Trinidada, an Iſland neere vnto the continent of the ſame Indies. Some haue added a third ſort, and others make the yellow Henbane a kind thereof.

† 1 *Hyoſcyamus Peruvianus.*
Tabaco, or Henbane of Peru.



Nicotiana Tabacum L. [illegible]

† 2 *Sana ſancta Indorum.*
Tabaco of Trinidada.



Nicotiana Tabacum L. [illegible]

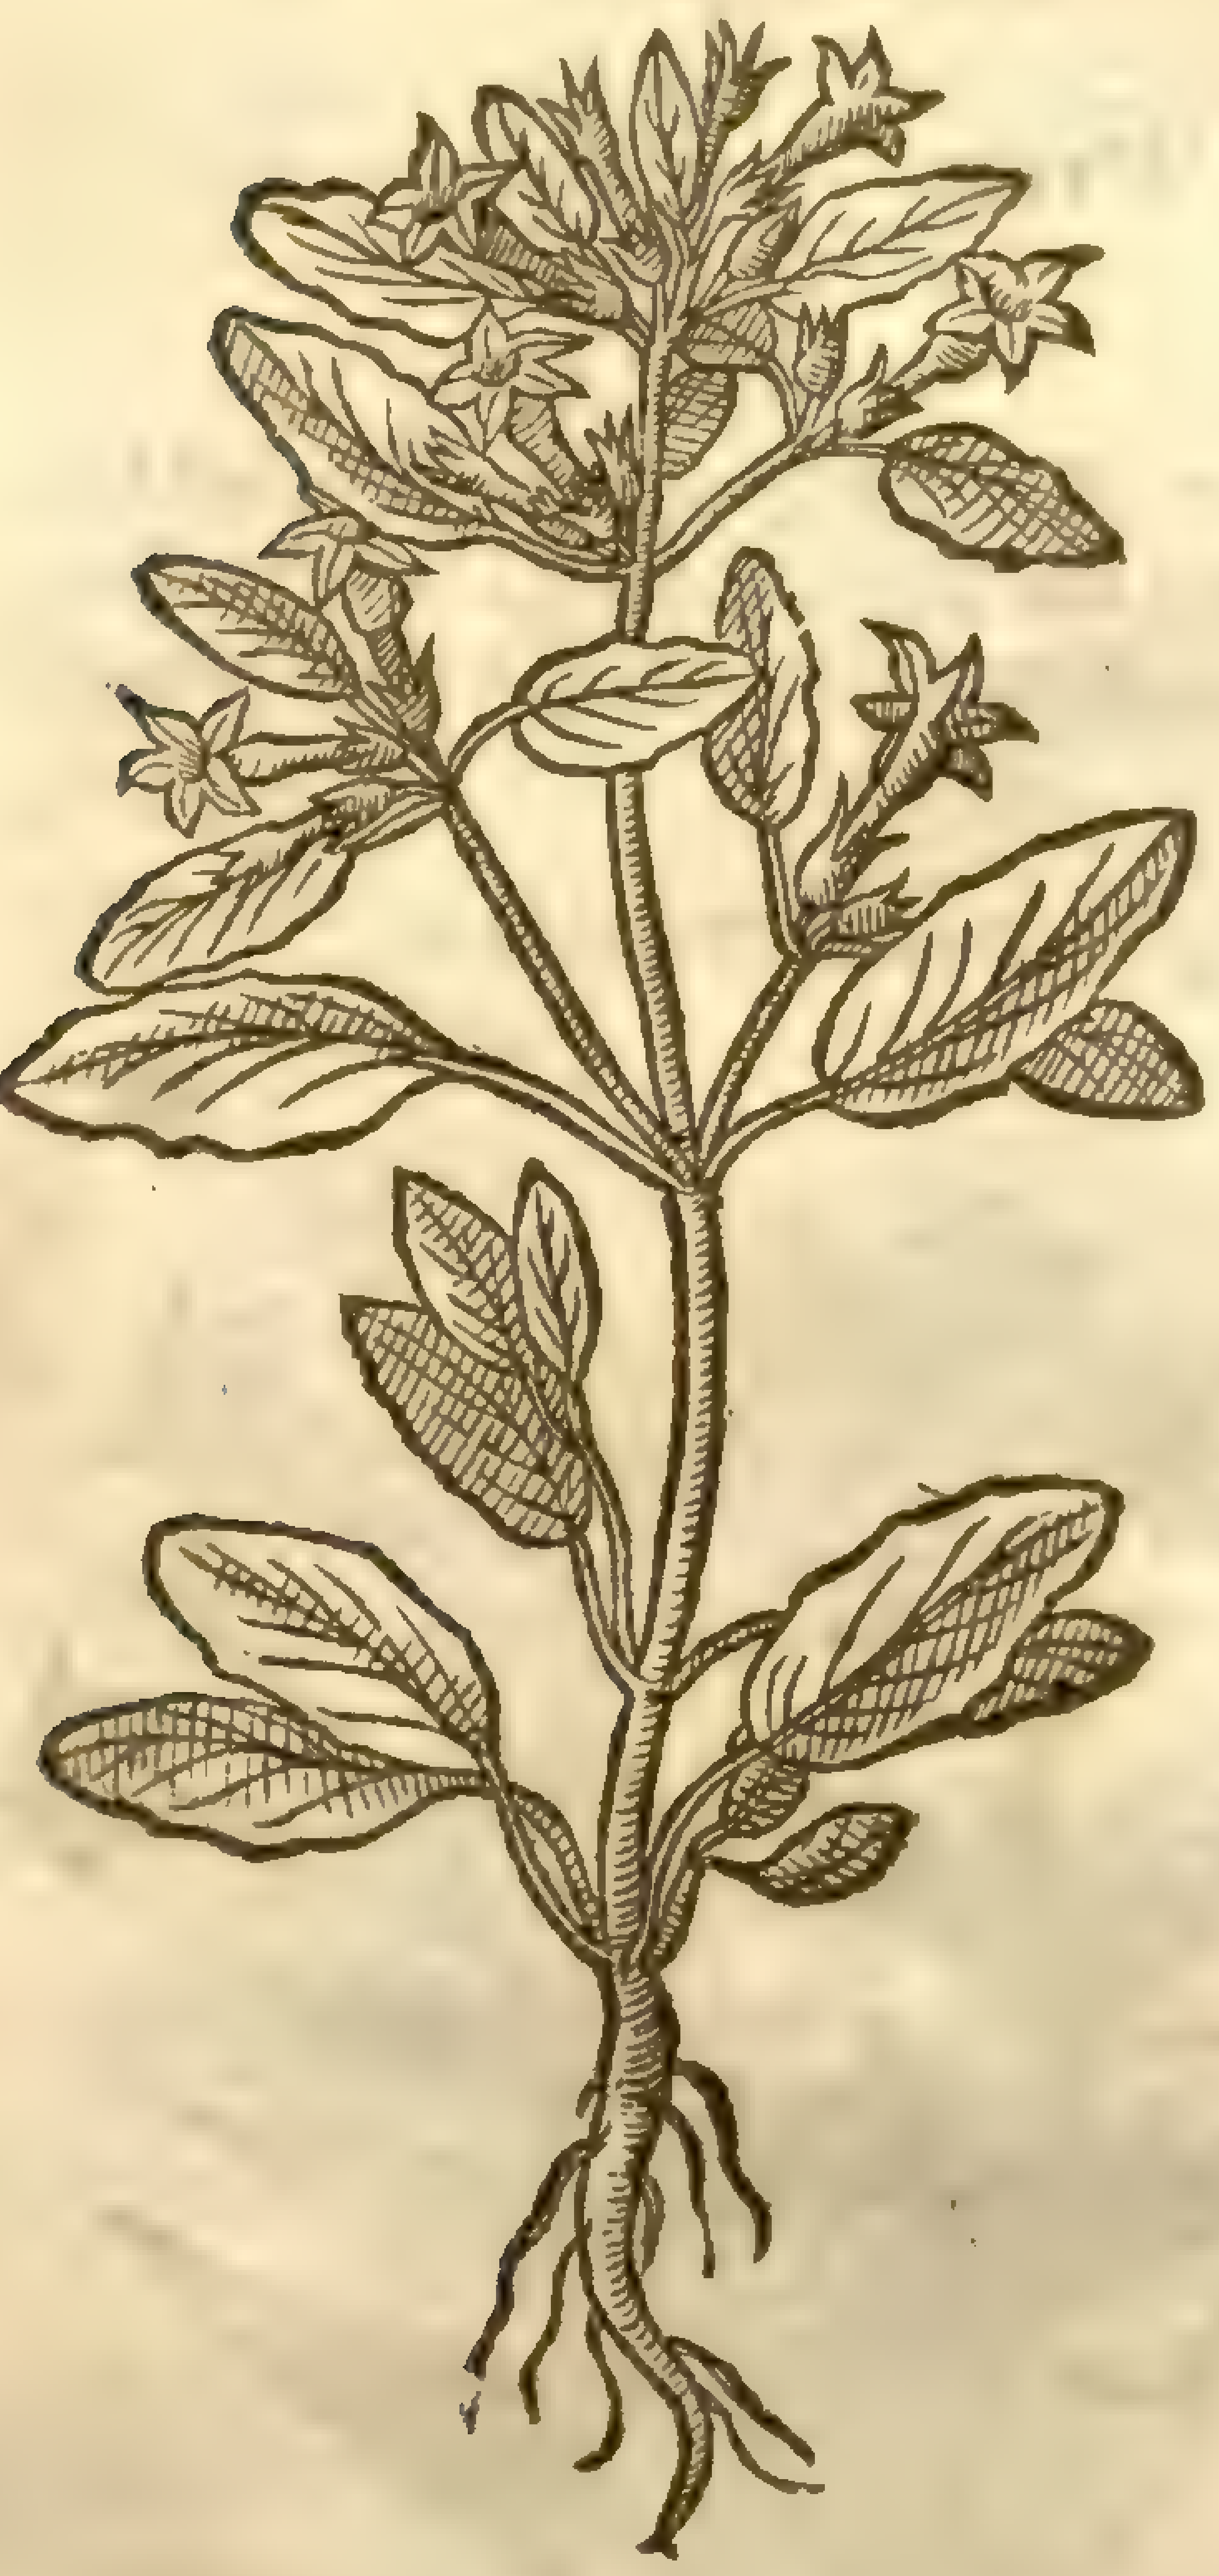
¶ *The Deſcription.*

1 Tabaco, or Henbane of Peru hath very great ſtalkes of the bigneſſe of a childes arme, growing in fertile and well dunged ground of ſeuen or eight foot high, diuiding it ſelfe into ſundry branches of great length; whereon are placed in moſt comly order very faire long leaues, broad, ſmooth, and ſharp pointed, ſoft, and of a light green colour, ſo faſtned about the ſtalke, that they ſeeme to embrace and compaſſe it about. The floures grow at the top of the ſtalks, in ſhape like a bell-floure, ſomewhat long and cornered, hollow within, of a light carnation colour, tending to whiteneſſe toward the brims. The ſeed is contained in long ſharpe pointed cods or ſeed-veſſels like vnto the ſeed of yellow Henbane, but ſomewhat ſmaller, and browner of colour. The root is great, thicke, and of a wooddy ſubſtance, with ſome threddy ſtrings annexed thereunto.

2 Trinidada Tabaco hath a thicke tough and fibrous root, from which immediately riſe vp long broad leaues and ſmooth, of a greeniſh colour, leſſe than thoſe of Peru: among which riſes vp a ſtalk diuiding it ſelf at the ground into diuers branches, wheron are ſet confuſedly the like leaues but leſſer. At the top of the ſtalks ſtand vp long necked hollow floures of a pale purple tending to a bluſh colour: after which ſucceed the cods or ſeed-veſſels, including many ſmall ſeeds like vnto the ſeed of Marjerom. The whole plant periſheth at the firſt approch of winter.

‡ 3 This

‡ 3 *Tabacum minimum.*
Dwarfe Tabaco.



‡ 3 This third is an herb ſom ſpan or better long, not in face vnlike the precedent, neither defectiue in the hot and burning taſt. The floures are much leſſe than thoſe of the yellow Henbane, and of a greeniſh yellow. The leaues are ſmall, and narrower than thoſe of Sage of Ieruſalem. The root is ſmall and fibrous. ‡

¶ *The Place.*

Theſe were firſt brought into Europe out of America, which is called the Weſt Indies, in which is the prouince or countrey of Peru: but being now planted in the gardens of Europe it proſpers very well, and comes from ſeed in one yeare to beare both floures and ſeed. The which I take to be better for the conſtitution of our bodies, than that which is brought from India; & that growing in India better for the people of the ſame country: notwithſtanding it is not ſo thought of our Tabaconiſts; for acording to the Engliſh prouerb, Far fetcht & dear bought is beſt for Ladies.

¶ *The Time.*

Tabaco muſt be ſowne in the moſt fruitfull ground that may be found, careleſly caſt abroad in ſowing, without raking it into the ground, or any ſuch pain or induſtry taken as is requiſit in the ſowing of other ſeeds, as my ſelf haue found by proof, who haue experimented euery way to cauſe it quickly to grow: for I haue committed ſome to the earth in the end of March, ſome in Aprill, and ſome in the beginning of May, becauſe I durſt not haſard all my ſeed at one time, leſt ſome vnkindely blaſt ſhould happen after the ſowing, which might be a great enemie thereunto.

¶ *The Names.*

The people of America call it *Petun*. Some, as *Lobel* and *Pena*, haue giuen it theſe Latine names, *Sacra herba*, *Sancta herba*, and *Sana ſancta Indorum*. Others, as *Dodonæus*, call it *Hyoſcyamus Peruvianus*, or Henbane of Peru. *Nicolaus Monardus* names it *Tabacum*. That it is *Hyoſcyami ſpecies*, or a kinde of Henbane, not only the forme being like to yellow Henbane, but the qualitie alſo doth declare; for it bringeth drowſineſſe, troubleth the ſences, and maketh a man as it were drunke by taking the fume only; as *Andrew Theuet* teſtifieth, and common experience ſheweth: of ſome it is called *Nicotiana*, the which I refer to the yellow Henbane for diſtinctions ſake.

¶ *The Temperature.*

It is hot and dry, and that in the ſecond degree, as *Monardis* thinketh, and is withall of power to diſcuſſe or reſolue, and to clenſe away filthy humors, hauing alſo a ſmall aſtriction, and a ſtupifying or benumming qualitie, and it purgeth by the ſtoole: and *Monardis* writeth, that it hath a certain power to reſiſt poiſon. And to proue it to be of an hot temperature, the biting quality of the leaues do ſhew, which is eaſily perceiued by taſte: alſo the green leaues laid vpon vlcers in ſinewie parts may ſerue for a proofe of heate in this plant; becauſe they doe draw out filth and corrupted mattar, which a cold Simple would neuer do. The leaues likewiſe being chewed draw forth flegm and water, as doth alſo the fume taken when the leaues are dried: which things declare that this is not a little hot; for what things ſoeuer, that being chewed or held in the mouth bring forth flegm and water, the ſame be all accounted hot; as the root of Pellitorie of Spaine, of Saxifrage, & other things of like power. Moreouer, the benumming qualitie hereof is not hard to be perceiued, for vpon the taking of the fume at the mouth there followeth an infirmitie like vnto drunkenneſſe, and many times ſleepe, as after the taking of *Opium*: which alſo ſheweth in the taſte a biting qualitie, and therefore is not without heate; which when it is chewed and inwardly taken, it doth forthwith ſhew, cauſing a certain heate in the cheſt, and yet withall troubling the wits, as *Petrus Bellonius* in his third booke of Singularities doth declare: where alſo he ſheweth, That the Turks oftentimes vſe *Opium*, and take one dram and a halfe thereof at one time, without any other hurt following, ſauing that they are thereupon as it were taken with a certain light drunkenneſſe. So alſo this Tabaco, being in taſt biting, and in temperature hot, hath notwithſtanding a benumming quality. Hereupon it ſeemeth to follow, that not only this Henbane of Peru, but alſo the juice of Poppie otherwiſe called *Opium*, conſiſteth of diuers parts, ſome biting and hot, others extreame cold, that is to ſay, ſtupifying, or benumming. If ſo be that this benumming qualitie proceed of extreame cold, as *Galen* and all the old Phyſitions do hold opinion; then ſhould this be cold: but if the benumming facultie doth not depend of an extreme cold qualitie, but proceedeth of the eſſence of the ſubſtance, then Tabaco is not cold and benumming, but hot and benumming, and the later not ſo much by reaſon of his temperature, as through the propertie of his ſubſtance; no otherwiſe than a purging medicine, which hath his force not from the temperature, but from the eſſence of the whole ſubſtance.

¶ *The Vertues.*

Nicolaus Monardis ſaith, that the leaues hereof are a remedie for the paine of head called the Megram or Migram, that hath bin of long continuance; and alſo for a cold ſtomack, eſpecially in children; and that it is good againſt the pains in the kidnies. A

It is a preſent remedie for the fits of the mother, it mitigateth the paine of the gout, if it be roſted in hot embers, and applied to the grieued part. B

It is likewiſe a remedy for the tooth-ache, if the teeth and gumbs be rubbed with a linnen cloth dipped in the juice, and afterward a round ball of the leaues laid vnto the place. C

The juice boiled in ſugar in form of a ſyrrup, and inwardly taken, driueth forth wormes of the belly, if withall a leafe be layd to the nauell. D

The ſame doth likewiſe ſcoure and clenſe old & rotten vlcers, and bringeth them to perfect digeſtion, as the ſame Author affirmeth. E

In the Low-countries it is vſed againſt ſcabs and filthineſſe of the skin, and to cure wounds: but ſome hold opinion it is to be vſed only to hot and ſtrong bodies; for they ſay, the vſe is not ſafe in weak and old folks; and for this cauſe (as it ſeemeth) the women in America (ſaith *Theuet*) abſtain from the herb *Petun* or Tabaco, and do in no wiſe vſe it. F

The weight of foure ounces of the juice hereof drunke doth purge both vpwards and downewards, and procureth afterward a long and ſound ſleepe, as wee haue learned of a friend by obſeruation, who affirmed, That a ſtrong countreyman of a middle age hauing a dropſie, took it, and being wakened out of his ſleepe called for meat and drinke, and after that became perfectly cured. G

Moreouer, the ſame man reported, That he had cured many countreymen of agues, with the diſtilled water of the leaues drunke a little while before the fit. H

Likewiſe there is an oile to be taken out of the leaues that healeth merri-galls, kibed heeles, and ſuch like. I

It is good againſt poyſon, and taketh away the malignitie therof, if the juice be giuen to drink, or the wounds made by venomous beaſts be waſhed therewith. K

The dry leaues are vſed to be taken in a pipe ſet on fire and ſuckt into the ſtomacke, and thruſt forth againe at the noſthrils, againſt the paines in the head, rheumes, aches in any part of the bodie, whereof ſoeuer the originall proceed, whether from France, Italy, Spaine, Indies, or from our familiar and beſt knowne diſeaſes. Thoſe leaues do palliate or eaſe for a time, but neuer perform any cure abſolutely: for although they empty the body of humors, yet the cauſe of the griefe cannot be ſo taken away. But ſome haue learned this principle, That repletion doth require euacuation; that is to ſay, That fulneſſe craueth emptineſſe; and by euacuation doe aſſure themſelues of health. But this doth not take away ſo much with it this day, but the next bringeth with it more. As for example, a Well doth neuer yeeld ſuch ſtore of water as when it is moſt drawn and emptied. My ſelfe ſpeake by proofe; who haue cured of that infectious diſeaſe a great many, diuers of which had couered or kept vnder the ſickeneſſe by the helpe of Tabaco as they thought, yet in the end haue bin conſtrained to haue vnto ſuch an hard knot, a crabbed wedge, or elſe had vtterly periſhed. L

Some vſe to drink it (as it is termed) for wantonneſſe, or rather cuſtome, and cannot forbeare it, no not in the midſt of their dinner; which kinde of taking is vnwholſome and very dangerous: although to take it ſeldom, and that phyſically, is to be tolerated, and may do ſome good: but I commend the ſyrrup aboue this fume or ſmoky medicine. M

N It is taken of ſome phyſically in a pipe for that purpoſe once in a day at the moſt, and that in the morning faſting, againſt paines in the head, ſtomack, and griefe in the breſt and lungs: againſt catarrhs and rheums, and ſuch as haue gotten cold and hoarſeneſſe.

O Some haue reported, That it doth little preuaile againſt an hot diſeaſe, and that it profiteth an hot complexion nothing at all. But experience hath not ſhewed as yet that it is injurious vnto either.

P They that haue ſeene the proofe hereof, haue credibly reported, That when the Moores and Indians haue fainted either for want of food or reſt, this hath bin a preſent remedie vnto them, to ſupply the one, and to help them to the other.

Q The prieſts and Inchanters of the hot countries do take the fume thereof vntil they be drunke, that after they haue lien for dead three or foure houres, they may tell the people what wonders, viſions, or illuſions they haue ſeen, and ſo giue them a prophetical direction or foretelling (if we may truſt the Diuell) of the ſucceſſe of their buſineſſe.

R The iuyce or diſtilled water of the firſt kind is very good againſt catarrhs, the dizzineſſe of the head, and rheums that fall downe the eies, againſt the pain called the megram, if either you apply it vnto the temples, or take one or two green leaues, or a dry leafe moiſtned in wine, and dried cunningly vpon the embers, and laid thereto.

S It cleeres the ſight, and taketh away the webs and ſpots thereof, being annointed with the juyce bloud-warme.

T The oile or iuyce dropped into the eares is good againſt deafneſſe; a cloth dipped in the ſame and layd vpon the face, taketh away the lentils, redneſſe, and ſpots thereof.

V Many notable medicines are made hereof againſt the old and inueterat cough, againſt aſthmaticall or pectorall griefes, all which if I ſhould ſet downe at large, would require a peculiar volume.

X It is alſo giuen vnto ſuch as are accuſtomed to ſwoune, and that are troubled with the Colicke and windineſſe: and likewiſe againſt the Dropſie, the Wormes in children, the Piles, and the Sciatica.

Y It is vſed in outward medicines, either the herbe boiled with oile, wax, roſin, and turpentine, as before is ſet downe in yellow Henbane, or the extraction thereof with ſalt, oile, balſam, the diſtilled water, and ſuch like, againſt tumours, apoſtumes, old vlcers of hard curation, botches, ſcabbes, ſtinging with nettles, carbuncles, poiſoned arrowes, and wounds made with gunnes or any other weapons.

Z It is excellent good in burnings and ſcaldings with fire, water, oile, lightning, or ſuch like, boiled with hogges greaſe into the forme of an ointment, as I haue often prooued, and found moſt true; adding a little of the juice of Thorne-Apple leaues, ſpreading it vpon a cloth and ſo applying it.

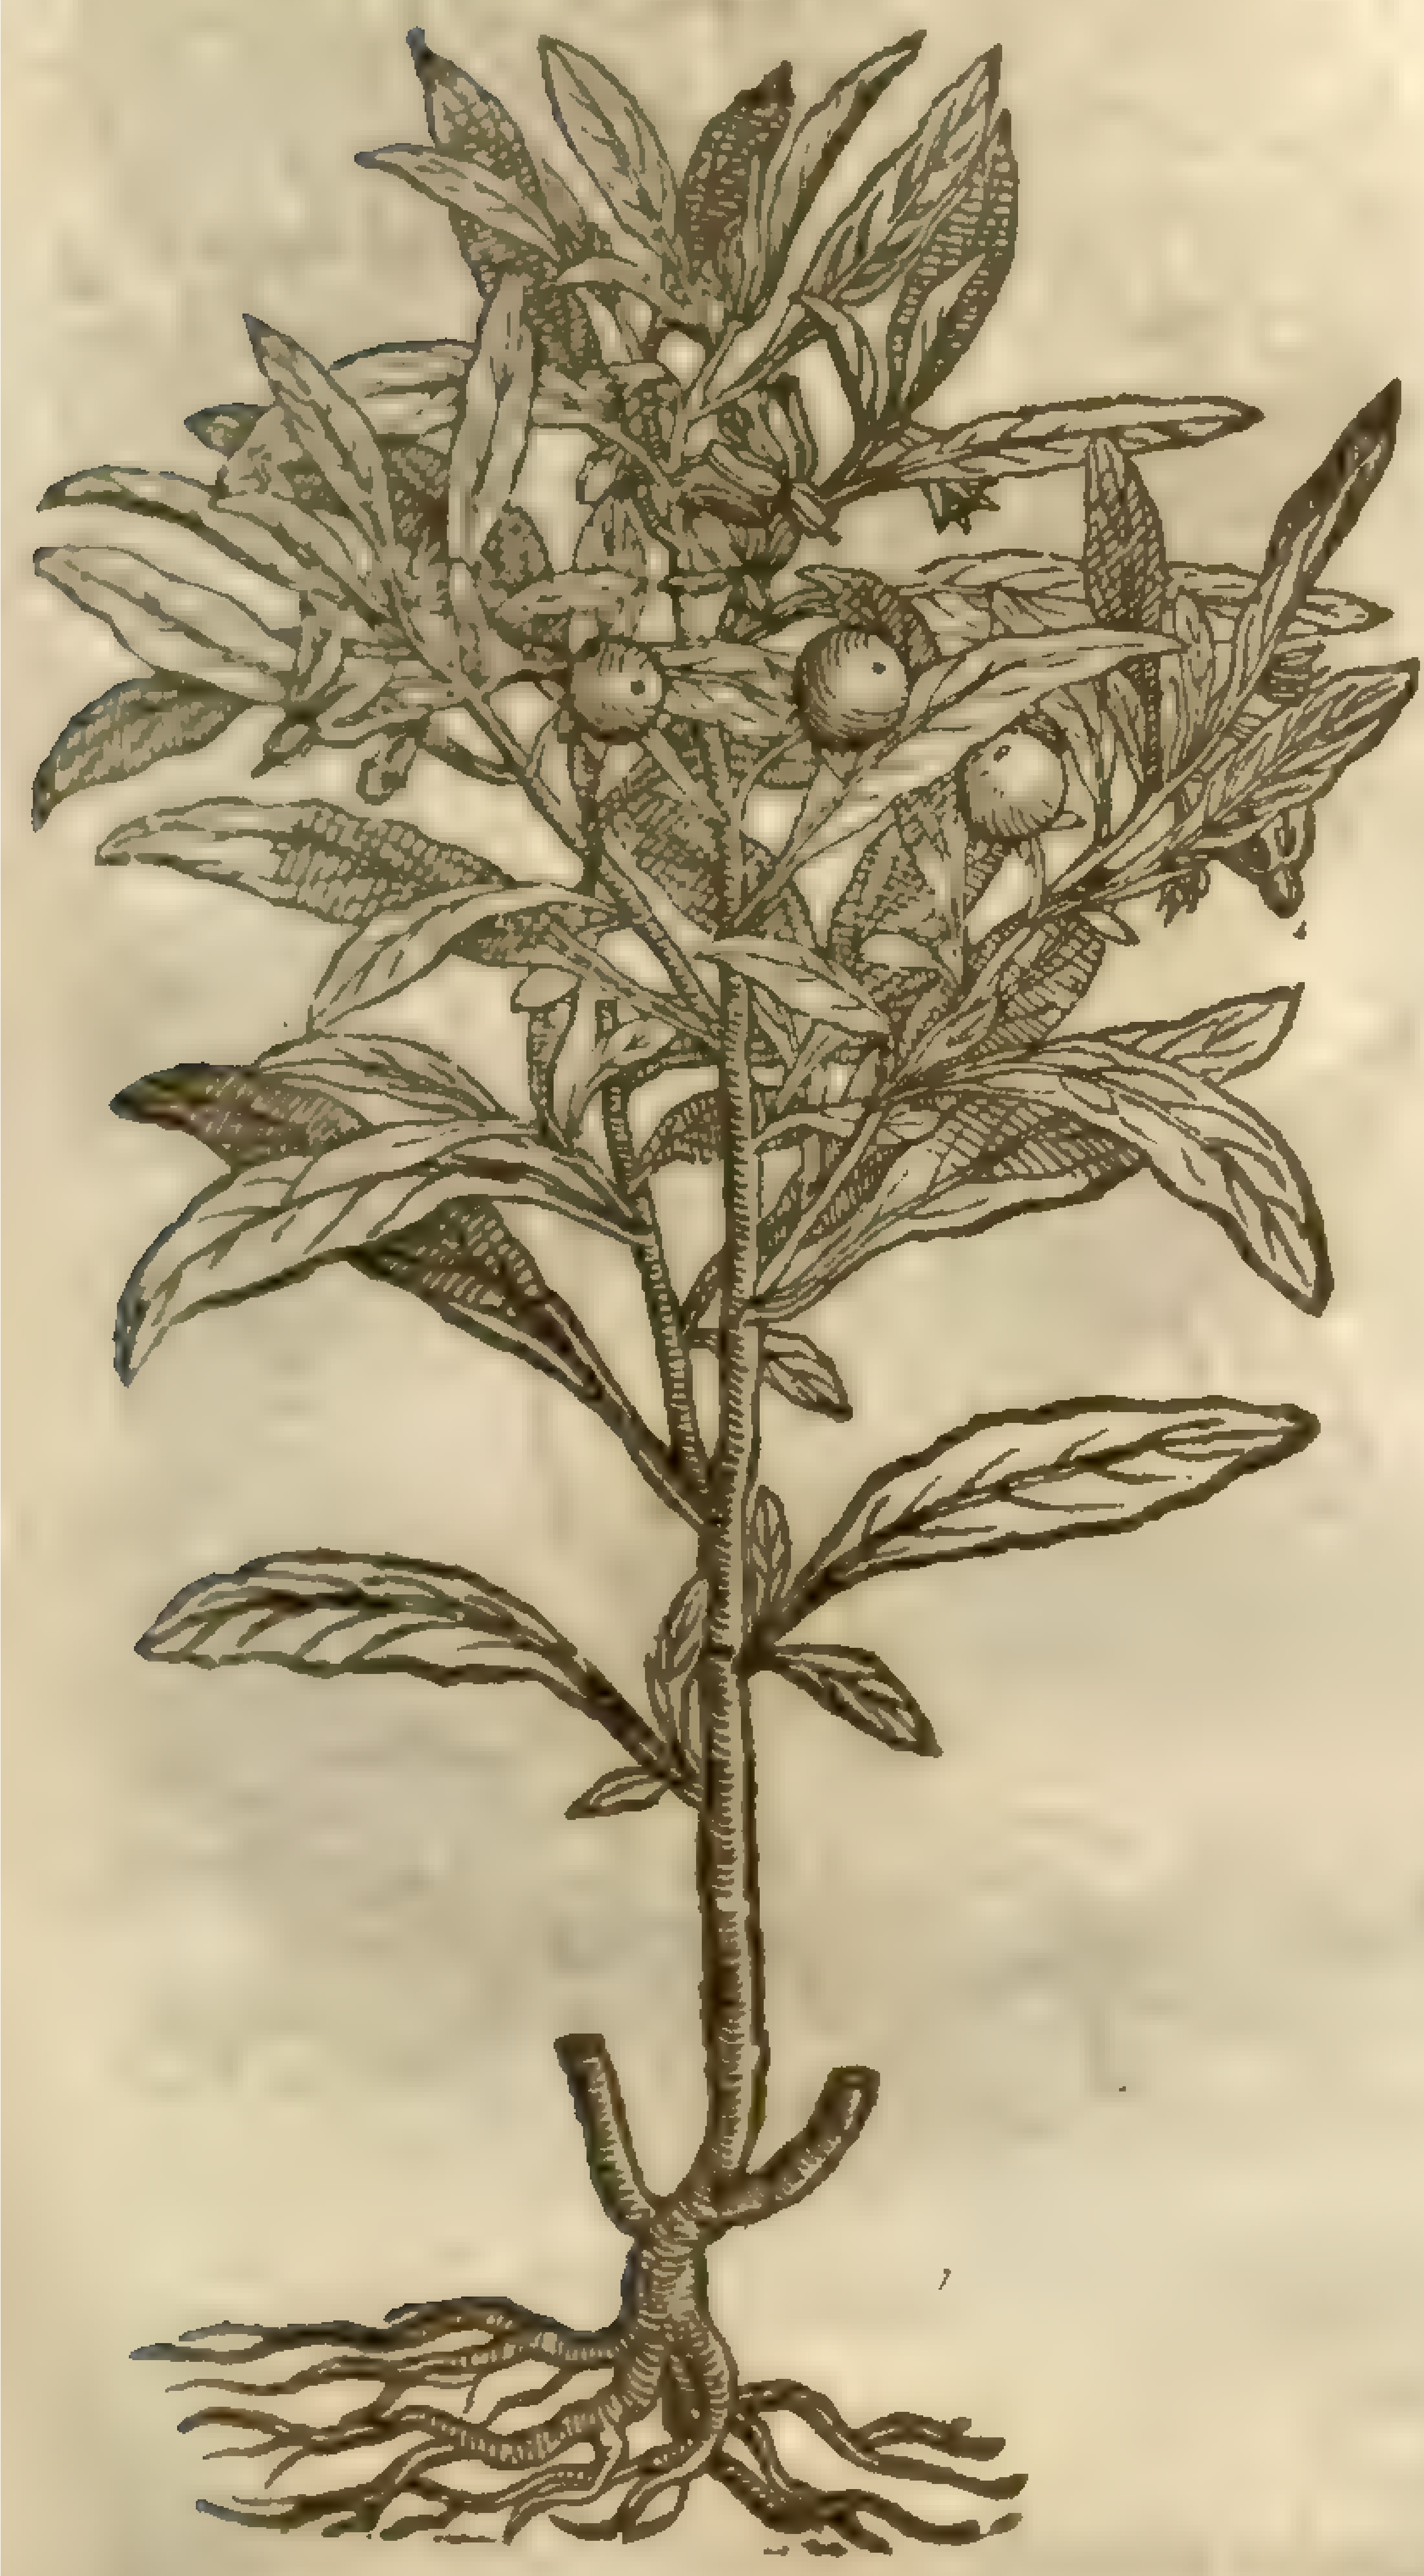
A I doe make hereof an excellent Balme to cure deep wounds and punctures made by ſome narrow ſharpe pointed weapon. Which Balſame doth bring vp the fleſh from the bottome verie ſpeedily, and alſo heale ſimple cuts in the fleſh according to the firſt intention, that is, to glew or ſoder the lips of the wound together, not procuring matter or corruption to it, as is commonly ſeene in the healing of wounds. The Receit is this: Take Oile of Roſes, Oile of S. Iohns Wort, of either one pinte, the leaues of Tabaco ſtamped ſmall in a ſtone mortar two pounds; boile them together to the conſumption of the juice, ſtraine it and put it to the fire againe, adding thereunto of Venice Turpentine two ounces, of Olibanum and Maſticke of either halfe an ounce, in moſt fine and ſubtil pouder: the which you may at all times make an vnguent or ſalue, by putting thereto wax and roſin to giue vnto it a ſtiffe body, which worketh exceeding well in malignant and virulent vlcers, as in wounds and punctures. I ſend this jewell vnto you women of all ſorts, eſpecially ſuch as cure and helpe the poore and impotent of your countrey without reward. But vnto the beggarly rabble of witches, charmers, and ſuch like couſeners, that regard more to get money, than to helpe for charitie, I wiſh theſe few medicines far from their vnderſtanding, and from thoſe deceiuers, whom I wiſh to be ignorant herein. But courteous gentlewomen, I may not for the malice that I doe beare vnto ſuch, hide any thing from you of ſuch importance: and therefore take one more that followeth, wherewith I haue done many and good cures, although of ſmall coſt; but regard it not the leſſe for that cauſe. Take the leaues of Tabaco two pounds, Hogs greaſe one pound, ſtampe the herbe ſmall in a ſtone morter, putting thereto a ſmall cup full of red or claret wine, ſtirre them well together, couer the morter from filth, and ſo let it reſt vntill morning; then put it to the fire and let it boile gently, continually ſtirring it vntill the conſumption of the wine: ſtraine it and ſet it to the fire againe, putting thereto the iuyce of the herbe one pound, of Venice turpentine foure ounces; boile them together to the conſumption of the iuice, then adde therto of the roots of round *Ariſtolochia* or Birthworth in moſt fine pouder two ounces, ſufficient wax to giue it a body; the which keep for thy wounded poore neighbor, as alſo the old and filthy vlcers of the legs and other parts of ſuch as haue need of help.

† The figures were formerly tranſpoſed.

Chap. 69. *Of Tree Nightſhade.*

Amomum Plinij.
Tree Nightſhade.

Solanum pseudo capsicum, & mali. dict



¶ *The Deſcription.*

This rare and pleaſant plant, called tree Nightſhade, is taken of ſome to bee a kinde of Ginny pepper, but not rightly: of others, for a kind of Nightſhade, whoſe iudgement and cenſure I gladly admit; for that it doth more fitly anſwer it both in the form and nature. It groweth vp like vnto a ſmall ſhrub or wooddy hedge-buſh, two or three cubits high, couered with a greeniſh barke ſet with many ſmal twiggy branches, and garniſhed with many long leaues verie green, like vnto thoſe of the Peach tree. The floures are white, with a certaine yellow pricke or pointall in the middle, like to the floures of garden Nightſhade. After which ſucceed ſmall round berries very red of colour, and of the ſame ſubſtance with winter Cherries; wherein are contained little flat yellow ſeeds. The root is compact of many ſmall hairy yellow ſtrings.

¶ *The Place.*

It groweth not wild in theſe cold regions, but wee haue them in our gardens, rather for pleaſure than profit, or any good qualitie as yet knowne.

¶ *The Time.*

It is kept in pots and tubs with earth & ſuch like, in houſes during the extremitie of Winter, and is ſet abroad in the garden in March or Aprill, becauſe it cannot endure the coldneſſe of our climat: it floures in May, and the fruit is ripe in September.

¶ *The Names.*

Tree Nightſhade is called in Latine *Solanum arboreſcens*: of ſome, *Strychnodendron*; and ſome do iudge it to be *Amomum* of *Pliny*: it is *Pſeudocapſicum* of *Dodonæus*.

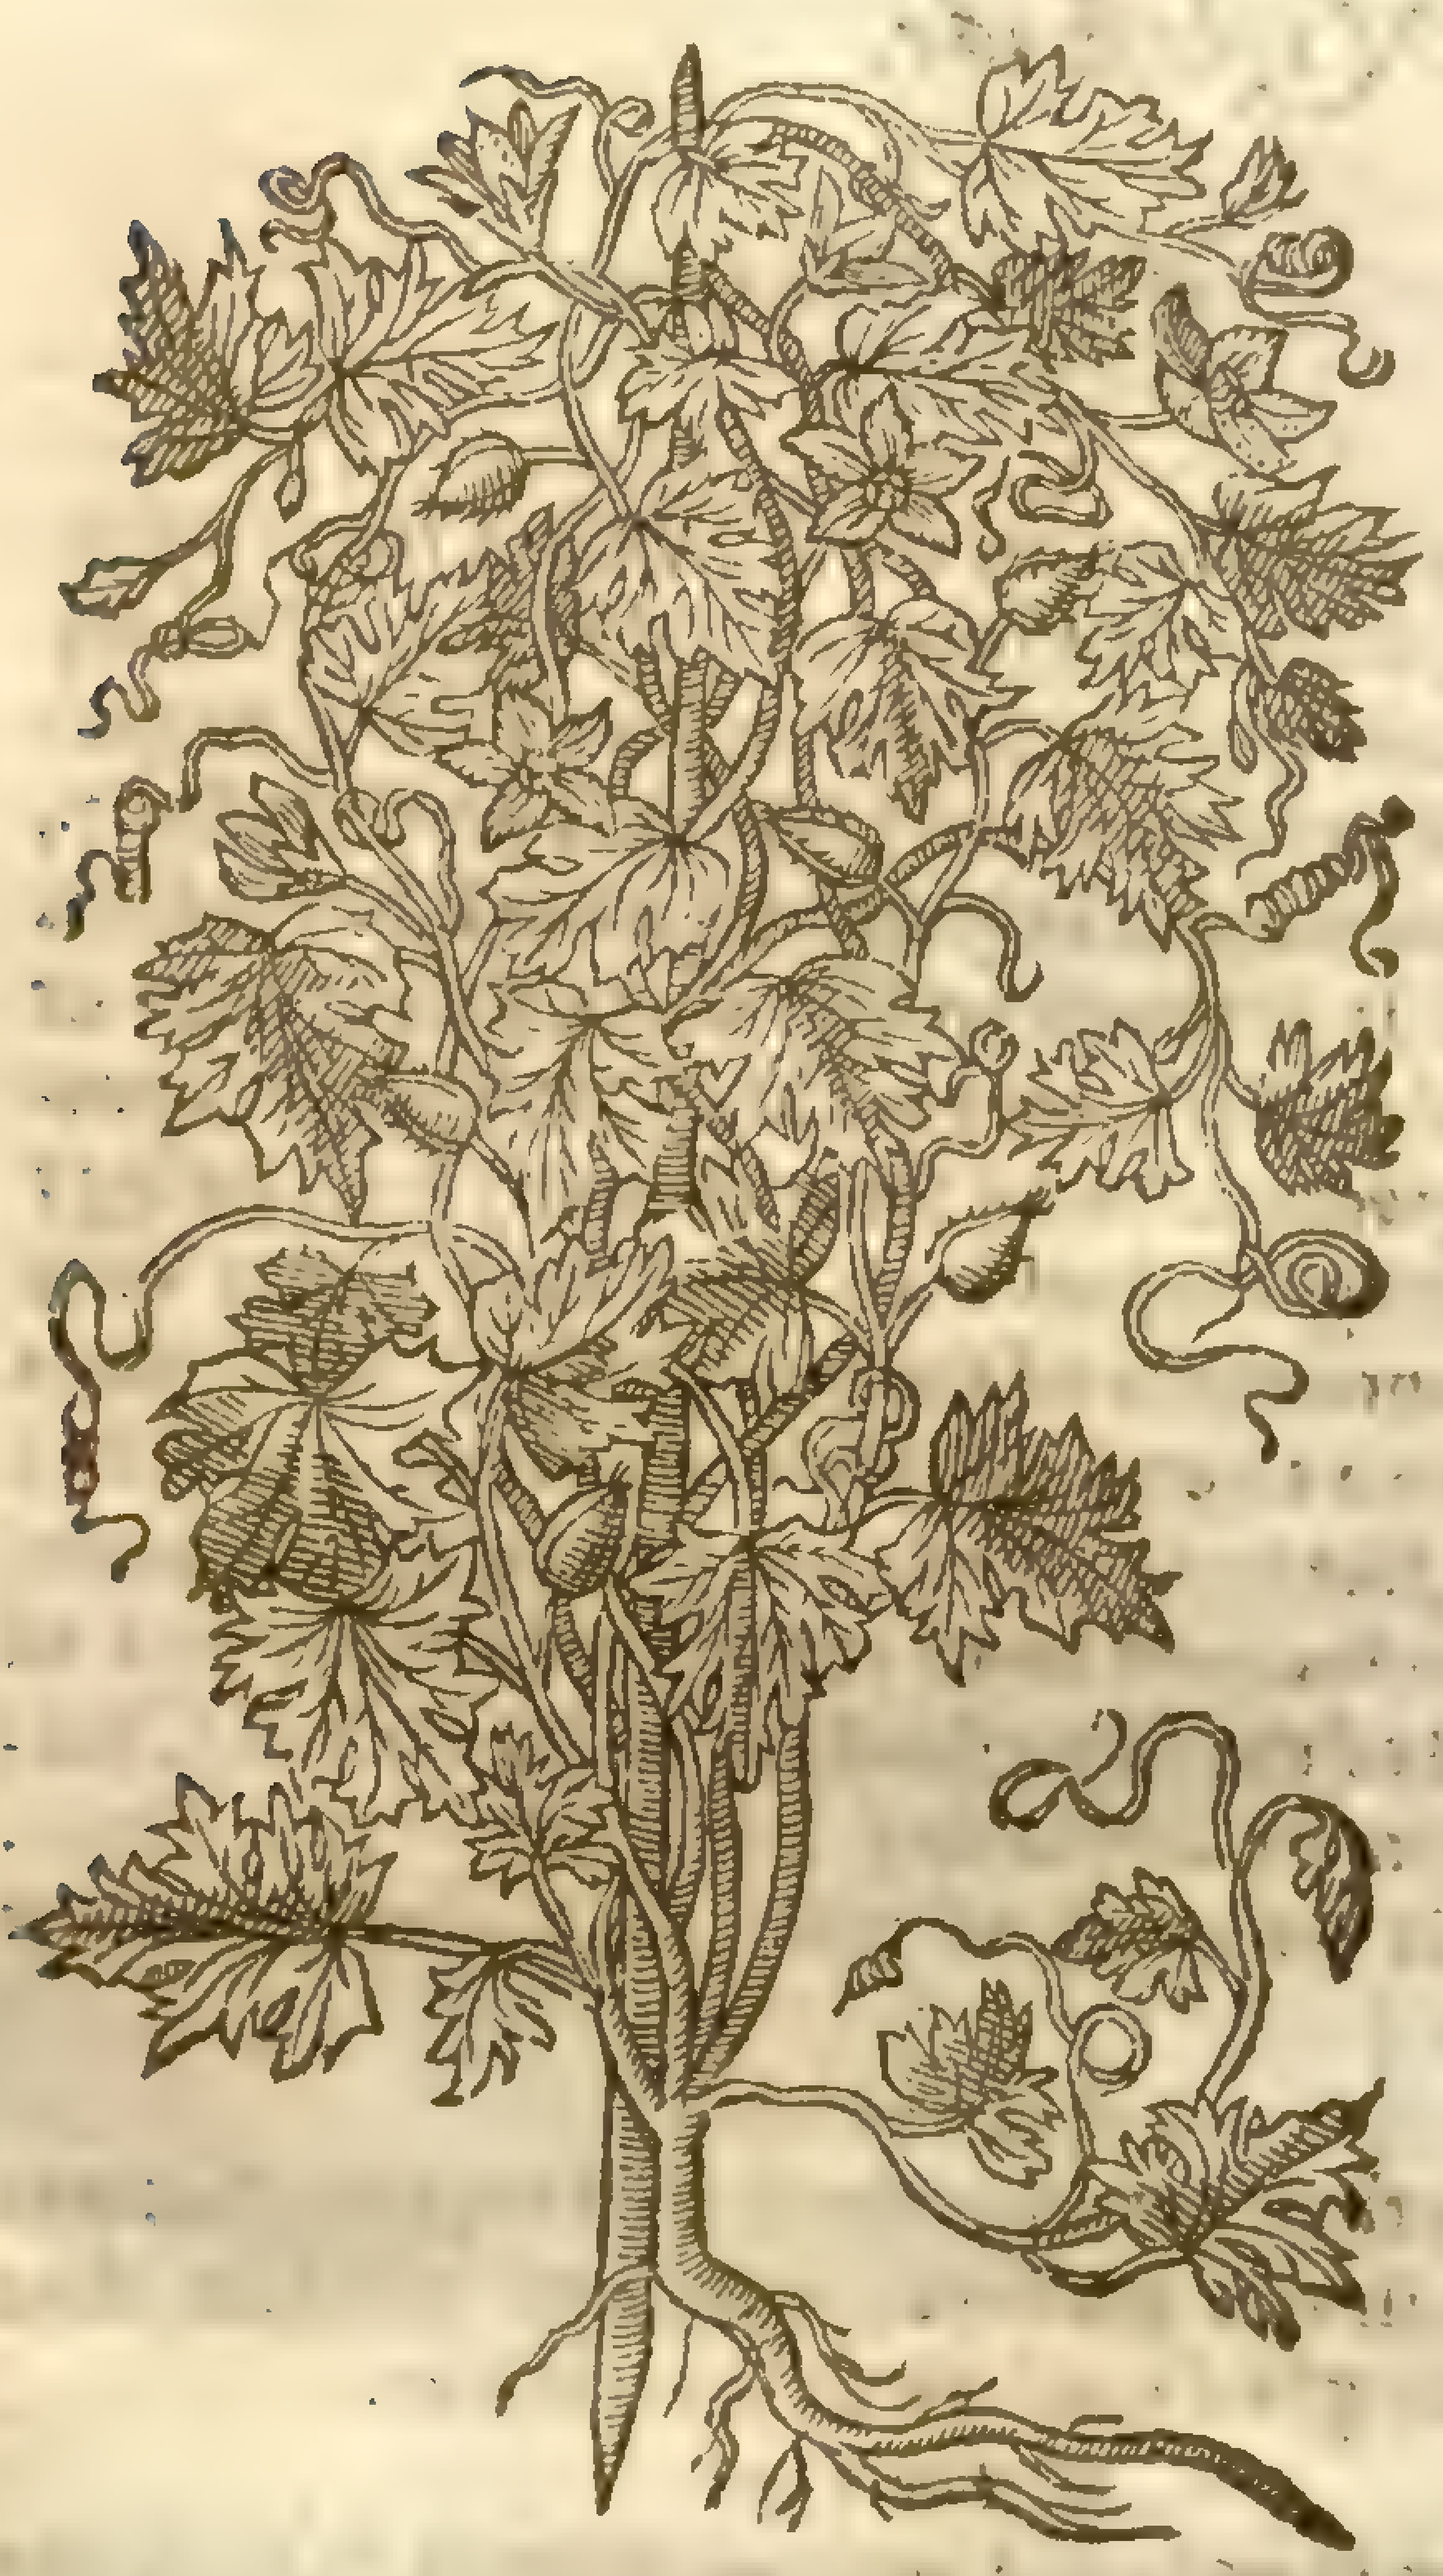
¶ *The Nature and Vertues.*

We haue not as yet any thing ſet down as touching the temperature or vertues of this plant, but it is referred of ſome to the kinds of Ginny pepper, but without any reaſon at all; for Ginny pepper though it bring forth fruit very like in ſhape vnto this plant, yet in taſte moſt vnlike, for that *Capſicum* or Ginny pepper is more ſharpe in taſte than our common pepper, and the other hath no taſte of biting at all, but is like vnto the berries of garden Nightſhade in taſt, although they differ in colour: which hath moued ſome to call this plant red Nightſhade, of the colour of the berries; and tree Nightſhade, of the wooddy ſubſtance which doth continue and grow from yeare to yeare: and Ginny Pepper dieth at the firſt approch of winter.

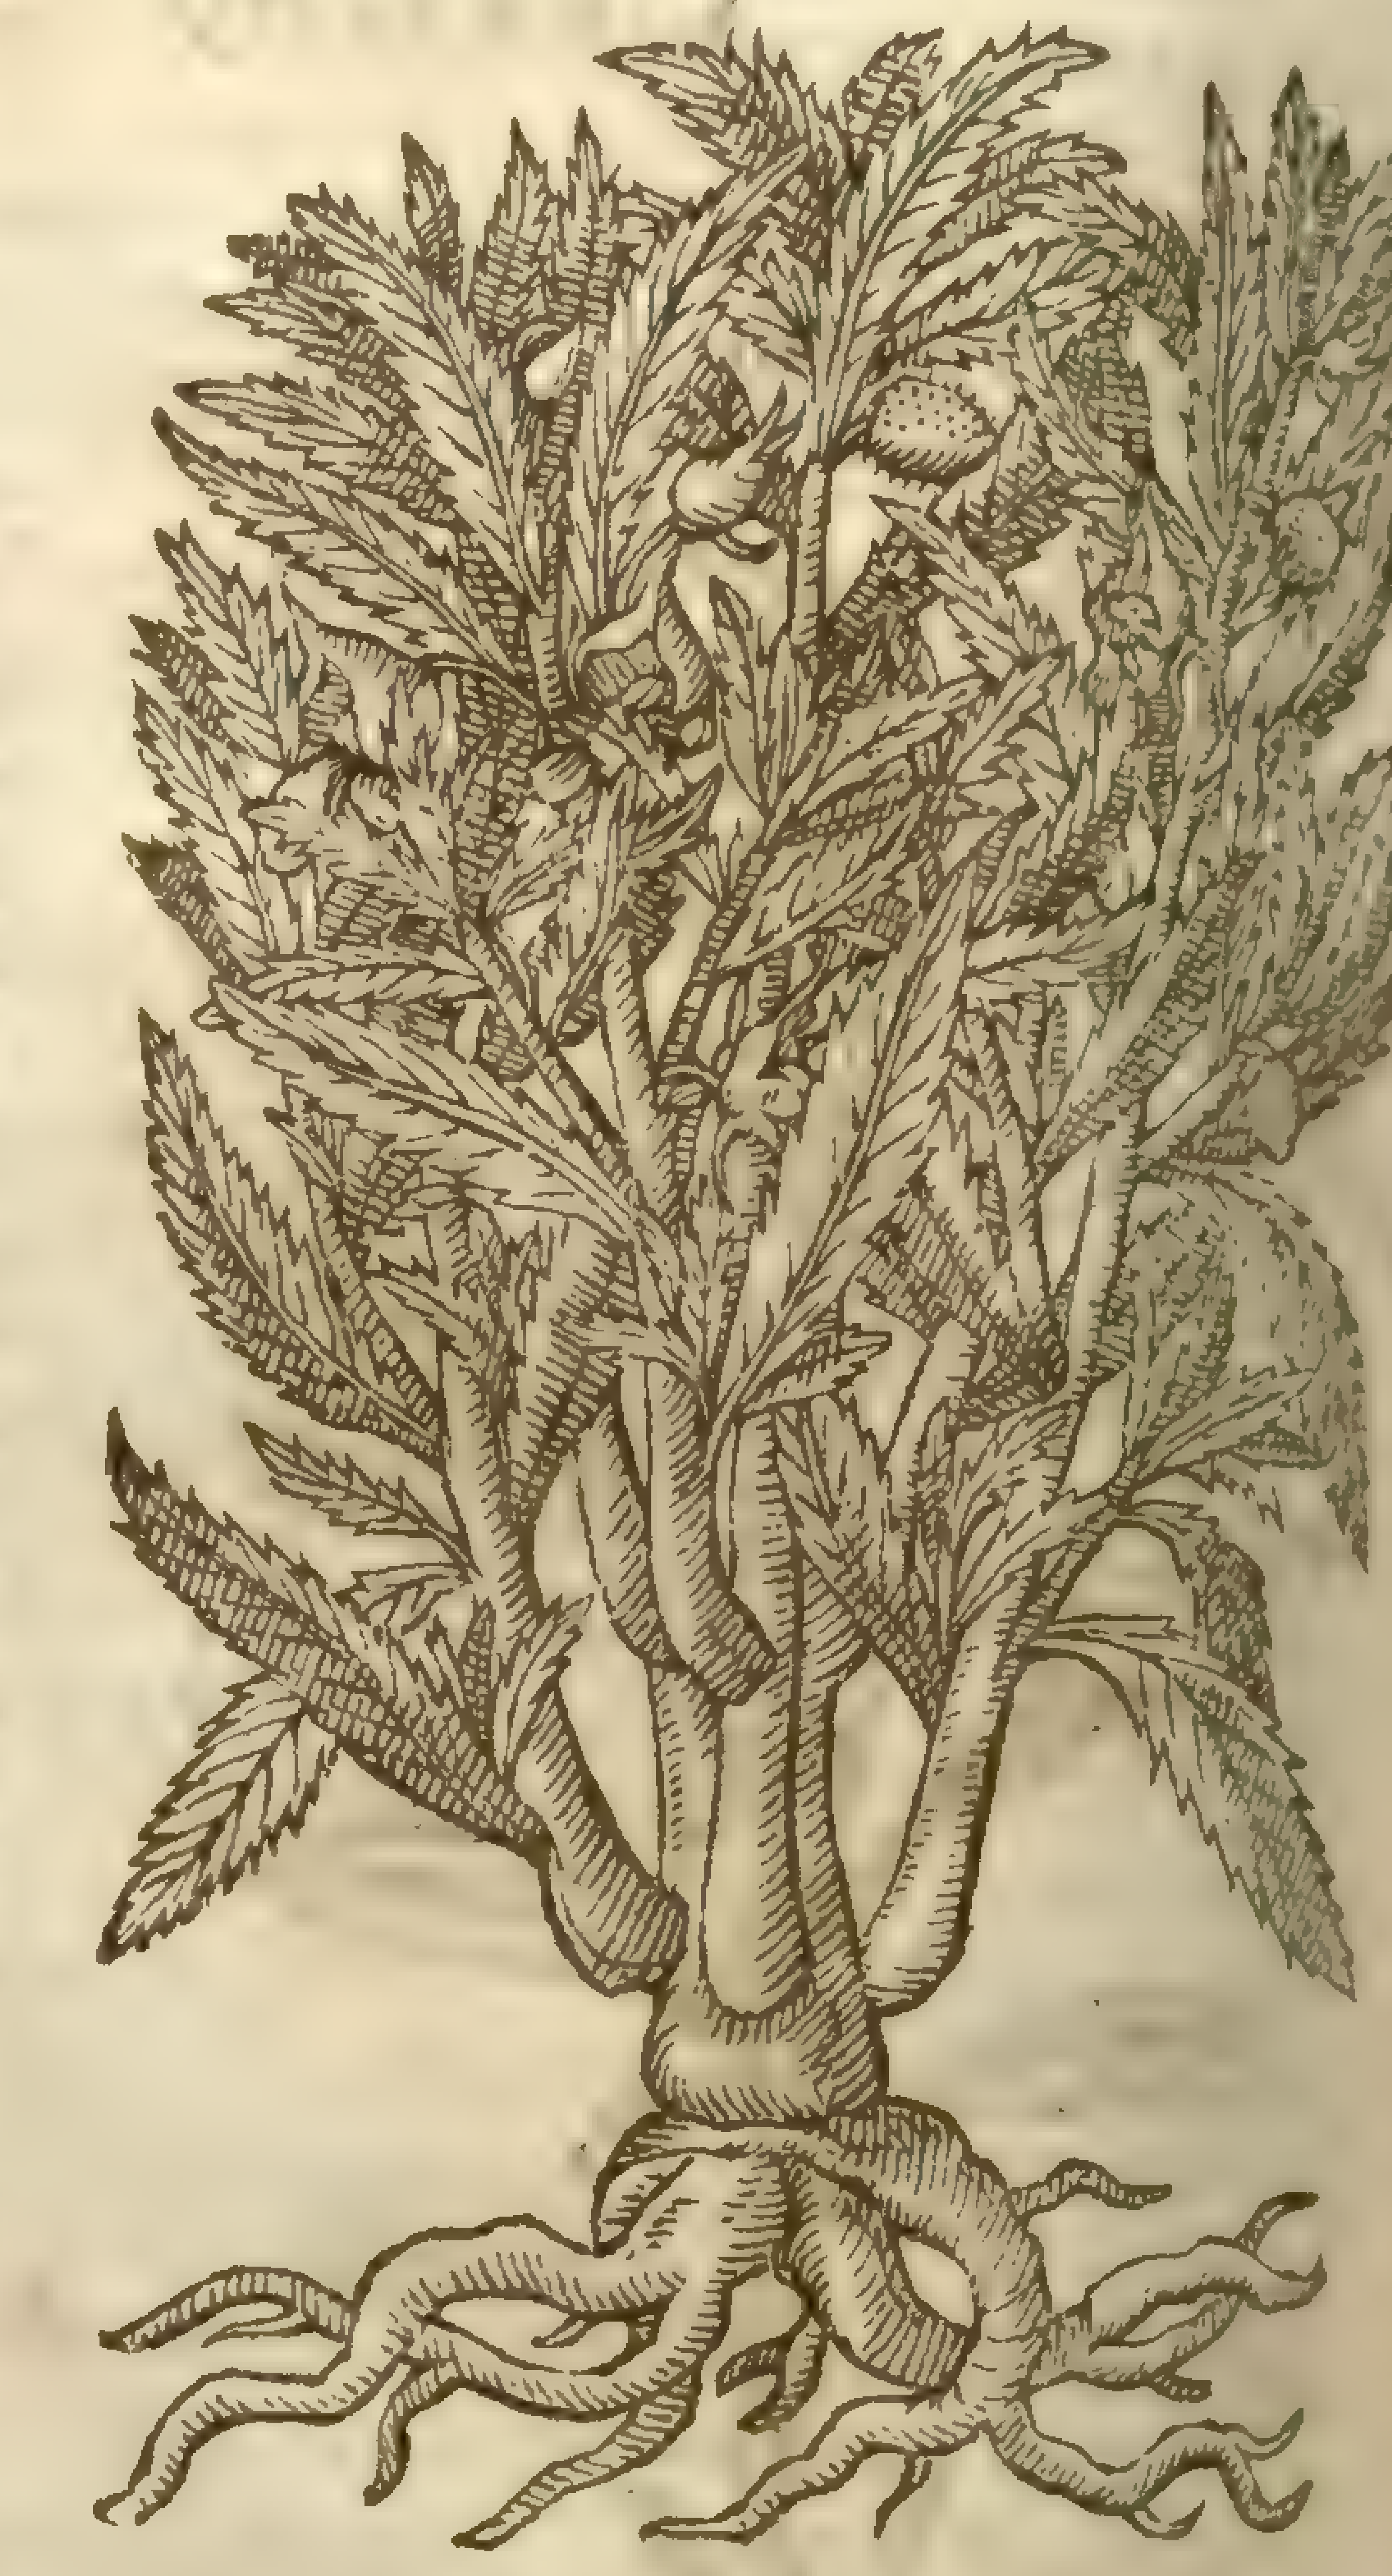
CHAP. 70 *Of Balme-Apple, or Apple of Ieruſalem.*

Impatiens [illegible] Balsamina [illegible] Mill. dict

1 *Balſamina mas.*
The male Balſam Apple.



2 *Balſamina fæmina.*
The female Balſam Apple.



¶ *The Deſcription.*

1 THe male Balme Apple hath long ſmall and tender branches, ſet with leaues like thoſe of the Vine, and the like ſmall claſping tendrels wherewith it catcheth hold of ſuch things as grow neere it, not able by reaſon of his weakeneſſe to ſtand vpright without ſome pole or other thing to ſupport it. The floures conſiſt of fiue ſmall leaues of mean bignes, and are of a feint yellow colour: which being paſt, there come in place long Apples, ſomething ſharpe toward the point, almoſt like an egge, rough all ouer, as it were with ſmall harmeleſſe prickles, red both within and without when they be ripe, and cleaueth in ſunder of themſelues: in the Apple lieth great broad flat ſeed, like thoſe of Pompion or Citrull, but ſomthing blacke when they be withered. The root is threddy, and diſperſeth it ſelfe far abroad in the ground.

2 The female Balm-Apple doth not a little differ from the former: it brings forth ſtalks not running or climing like the other, but a moſt thick and fat trunk or ſtock full of juice, in ſubſtance like the ſtalks of Purſlane, of a reddiſh colour, and ſomwhat ſhining. The leaues be long & narrow in ſhape like thoſe of Willow or the Peach tree, ſomewhat toothed or notched about the edges: among which grow the floures, of an incarnat colour tending to blewneſſe, hauing a ſmall ſpurre or taile anexed thereto as hath the Larks heele, of a faire light crimſon colour: in their places come vp the fruit or apples rough and hairy, but leſſer than thoſe of the former, yellow when they be ripe; which likewiſe cleaue aſunder of themſelues, and caſt abroad their ſeeds much like vnto Lentiles, ſaith mine Author. But thoſe which I haue from yeare to yere in my garden bring forth ſeed like the Cole-flory or Muſtard ſeed; whether they be of two kinds, or the climat doth alter the ſhape, it reſteth diſputable.

¶ *The Place.*

Theſe plants proſper beſt in hot regions : they are ſtrangers in England,and do with great labor and induſtrie grow in theſe cold countries.

¶ *The Time.*

They muſt be ſowne in the beginning of Aprill in a bed of hot horſe-dung,euen as Muske-melons, Cucumbers, and ſuch like cold fruits are ; and replanted abroad from the ſaid bed, into the moſt hot and fertile place of the garden,at ſuch time as they haue gotten three leaues apiece.

¶ *The Names.*

Diuerſly hath this plant been named ; ſome calling it by one name,and ſome by another,euery one as it ſeemed good to his fancie. *Baptiſta Sardus* calls it *Balſamina Cucumerina* : others,*Viticella*, & *Charantia*,as alſo *Pomum Hieroſolymitanum*,or Apples of Ieruſalem : in Engliſh,Balm Apple:in Italian,*Caranza* : in the German tongue,**Balſam opffel** : in French,*Merueille* : ſome of the Latins haue called it *Pomum mirabile*,or Maruellous Apples.It is thought to be *Balſamina*,becauſe the oile wherein the ripe Apples be ſteeped or infuſed, is thought profitable for many things, as is *Opobalſamum*,or the liquor of the plant *Balſamum*.

The female Balſam Apple is likewiſe called *Balſamina*,and oftentimes in the Neuter gender *Balſaminum* : *Geſner* chuſeth rather to name it *Balſamina amygdaloides* : *Valerius Cordus*,*Balſamella*:others, *Balſamina fœmina* : in Engliſh,the female Balme Apples.

¶ *The Temperature.*

The fruit or Apples hereof,as alſo the leaues, do notably dry, hauing withall a certaine moderate coldneſſe very neere to a mean temperature,that is after ſome,hot in the firſt,and dry in the ſecond degree.

¶ *The Vertues.*

The leaues are reported to heale greene wounds,if they be bruiſed and laid thereon ; and taken A with wine they are ſaid to be a remedy for the colique,and an effectual medicine for burſtings and convulſions or crampes.

The leaues of the male *Balſamina* dried in the ſhadow , and beaten into pouder and giuen in B wine vnto thoſe that are mortally wounded in the body,cureth them inwardly,and helpeth alſo the Collicke.

The oile which is drawne forth of the fruit cureth all greene and freſh wounds as the true natu- C rall Balſam : it helpeth the cramps and convulſions,and the ſhrinking of ſinewes,being annointed therewith.

It profiteth women that are in great extremitie of childe-birth,in taking away the paine of the D matrix, cauſing eaſie deliuerance beeing applied to the place,and annointed vpon their bellies,or caſt into the matrix with a ſyring,and eaſeth the dolour of the inward parts.

It cureth the Hemorrhoides and all other paines of the fundament, being thereto applied with E lint of old clouts.

The leaues drunken in wine, heale ruptures. F

I finde little or nothing written of the property or vertues of the female kinde, but that it is G thought to draw neere vnto the firſt in temperament and vertue.

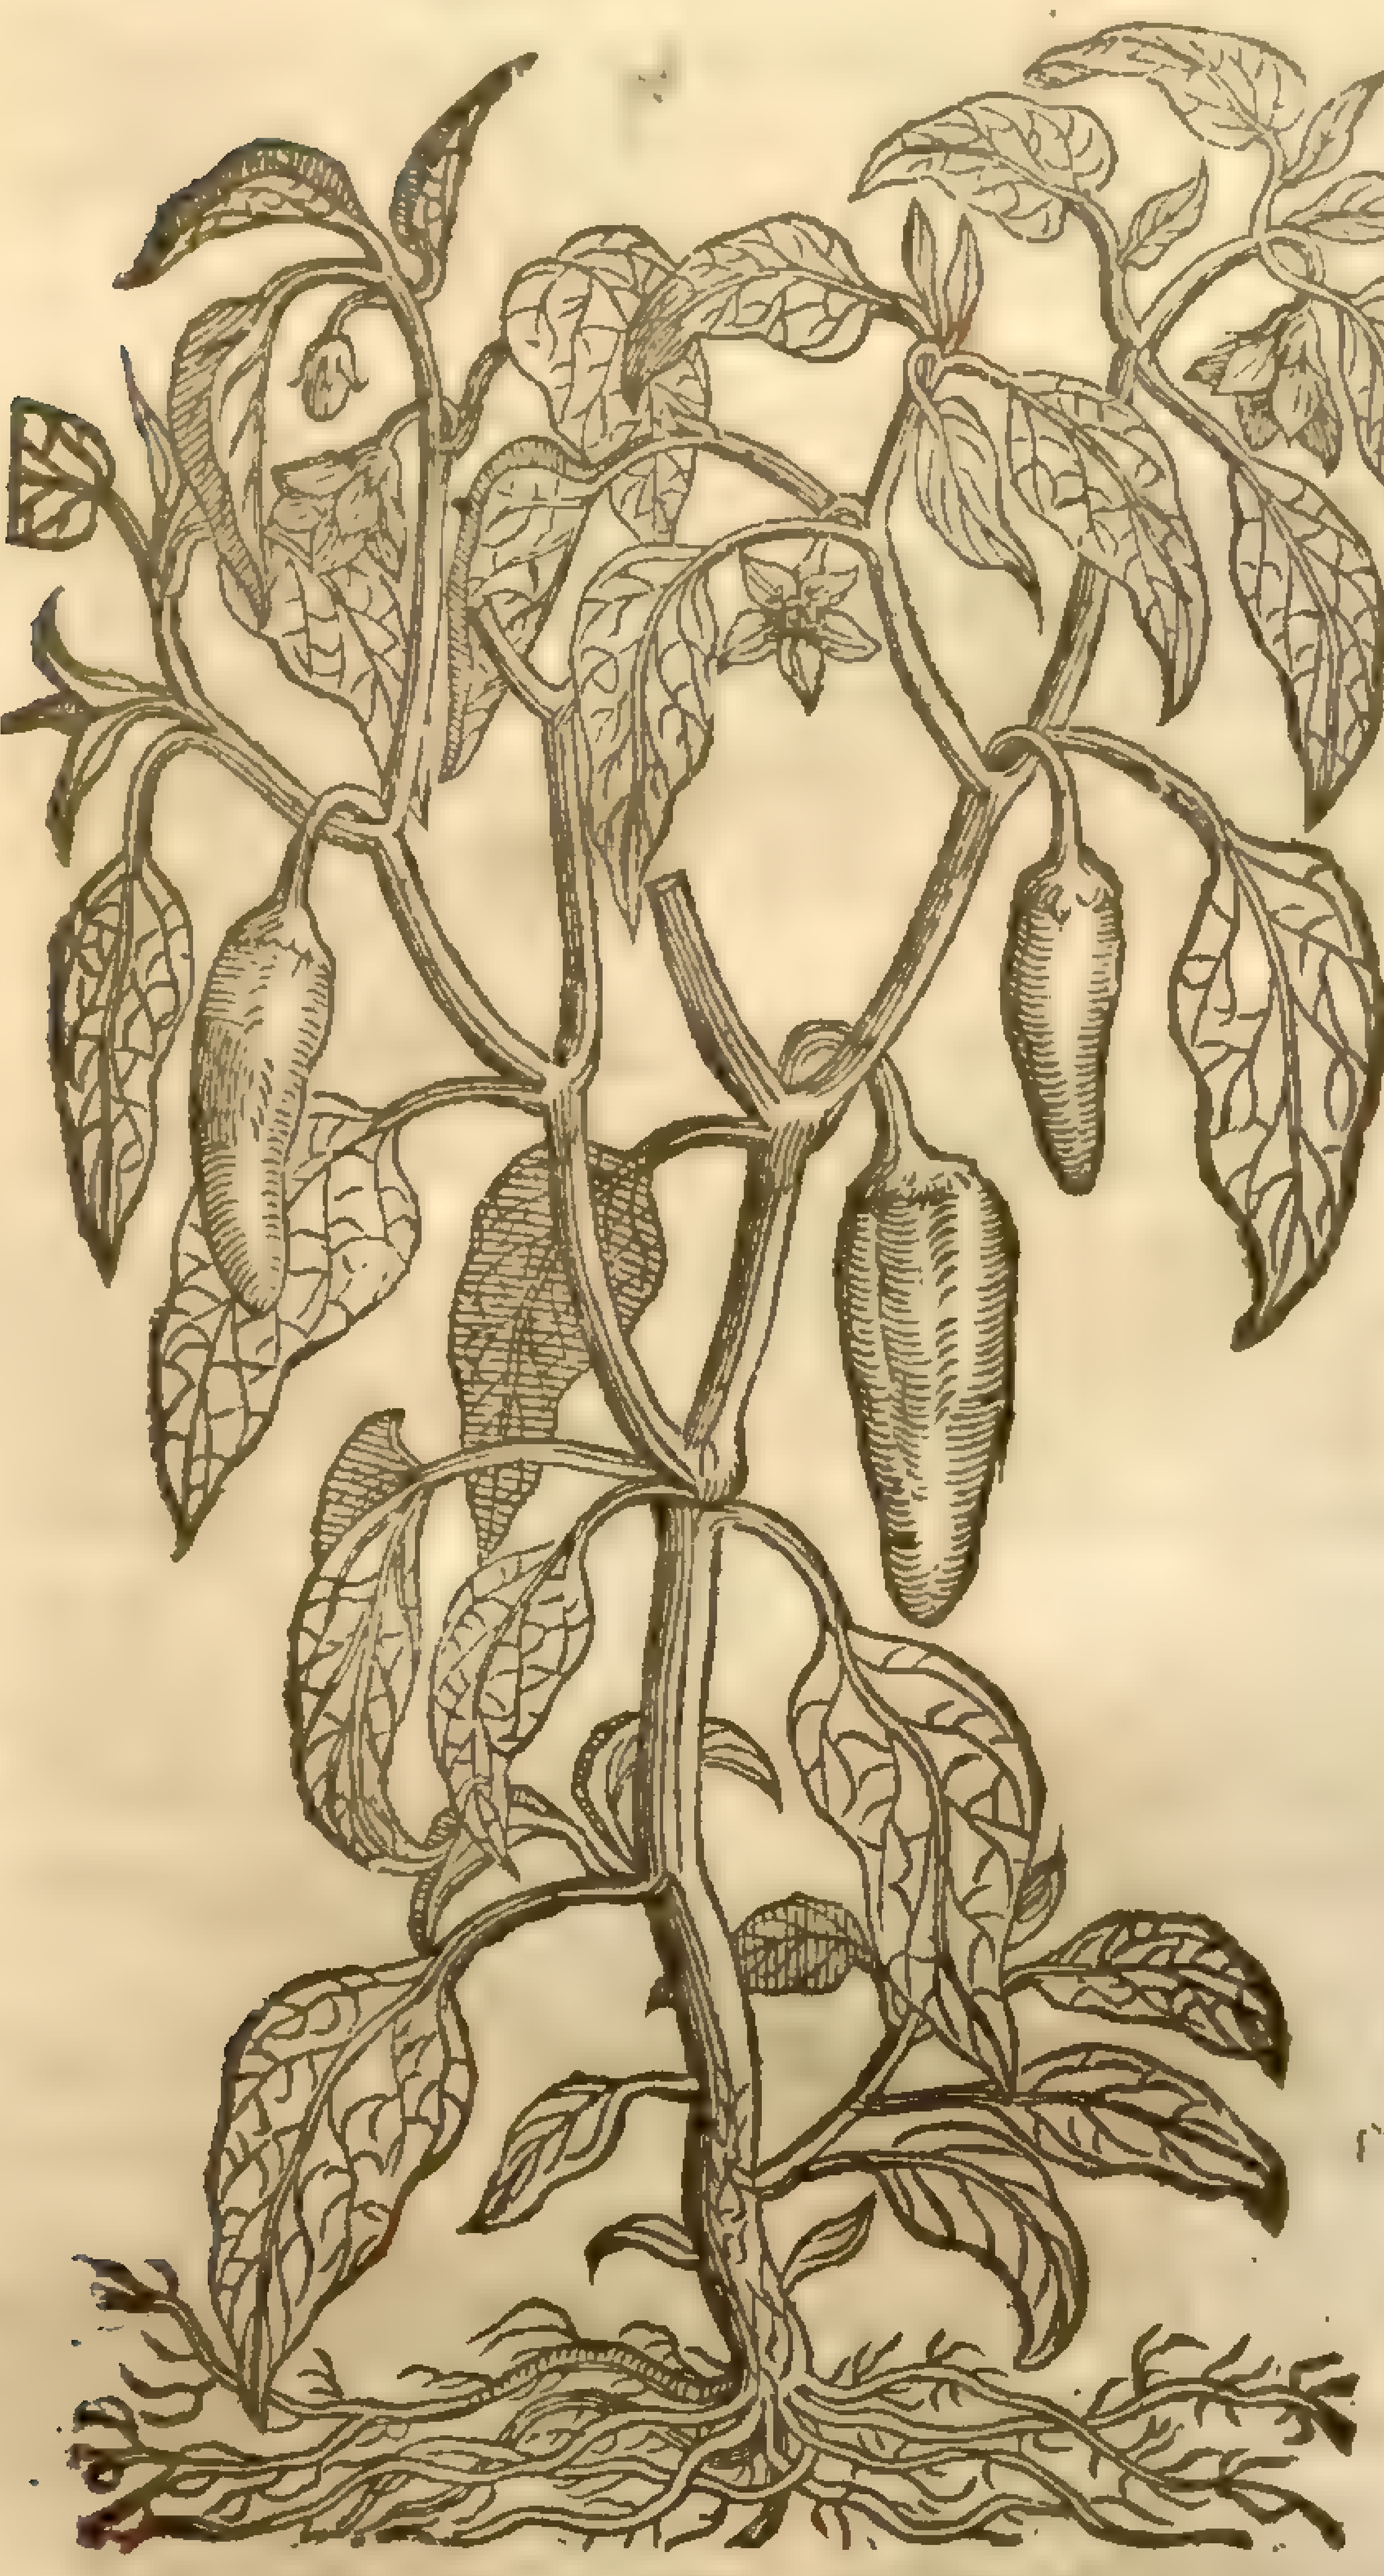
Oile oliue in which the fruit (the ſeed taken forth) is either ſet in the Sun, as we do when wee H make oile of roſes,or boiled in a double glaſſe ſet in hot water,or elſe buried in hot horſe dung,taketh away inflammations that are in wounds. It doth alſo eaſily and in ſhort time conſolidate or glew them together, and perfectly cure them.

It cureth the vlcers of the dugs or paps, the head of the yard or matrix, as alſo the inflammati- I on thereof being injected or conueied into the place, with a ſyringe or mother peſſarie.

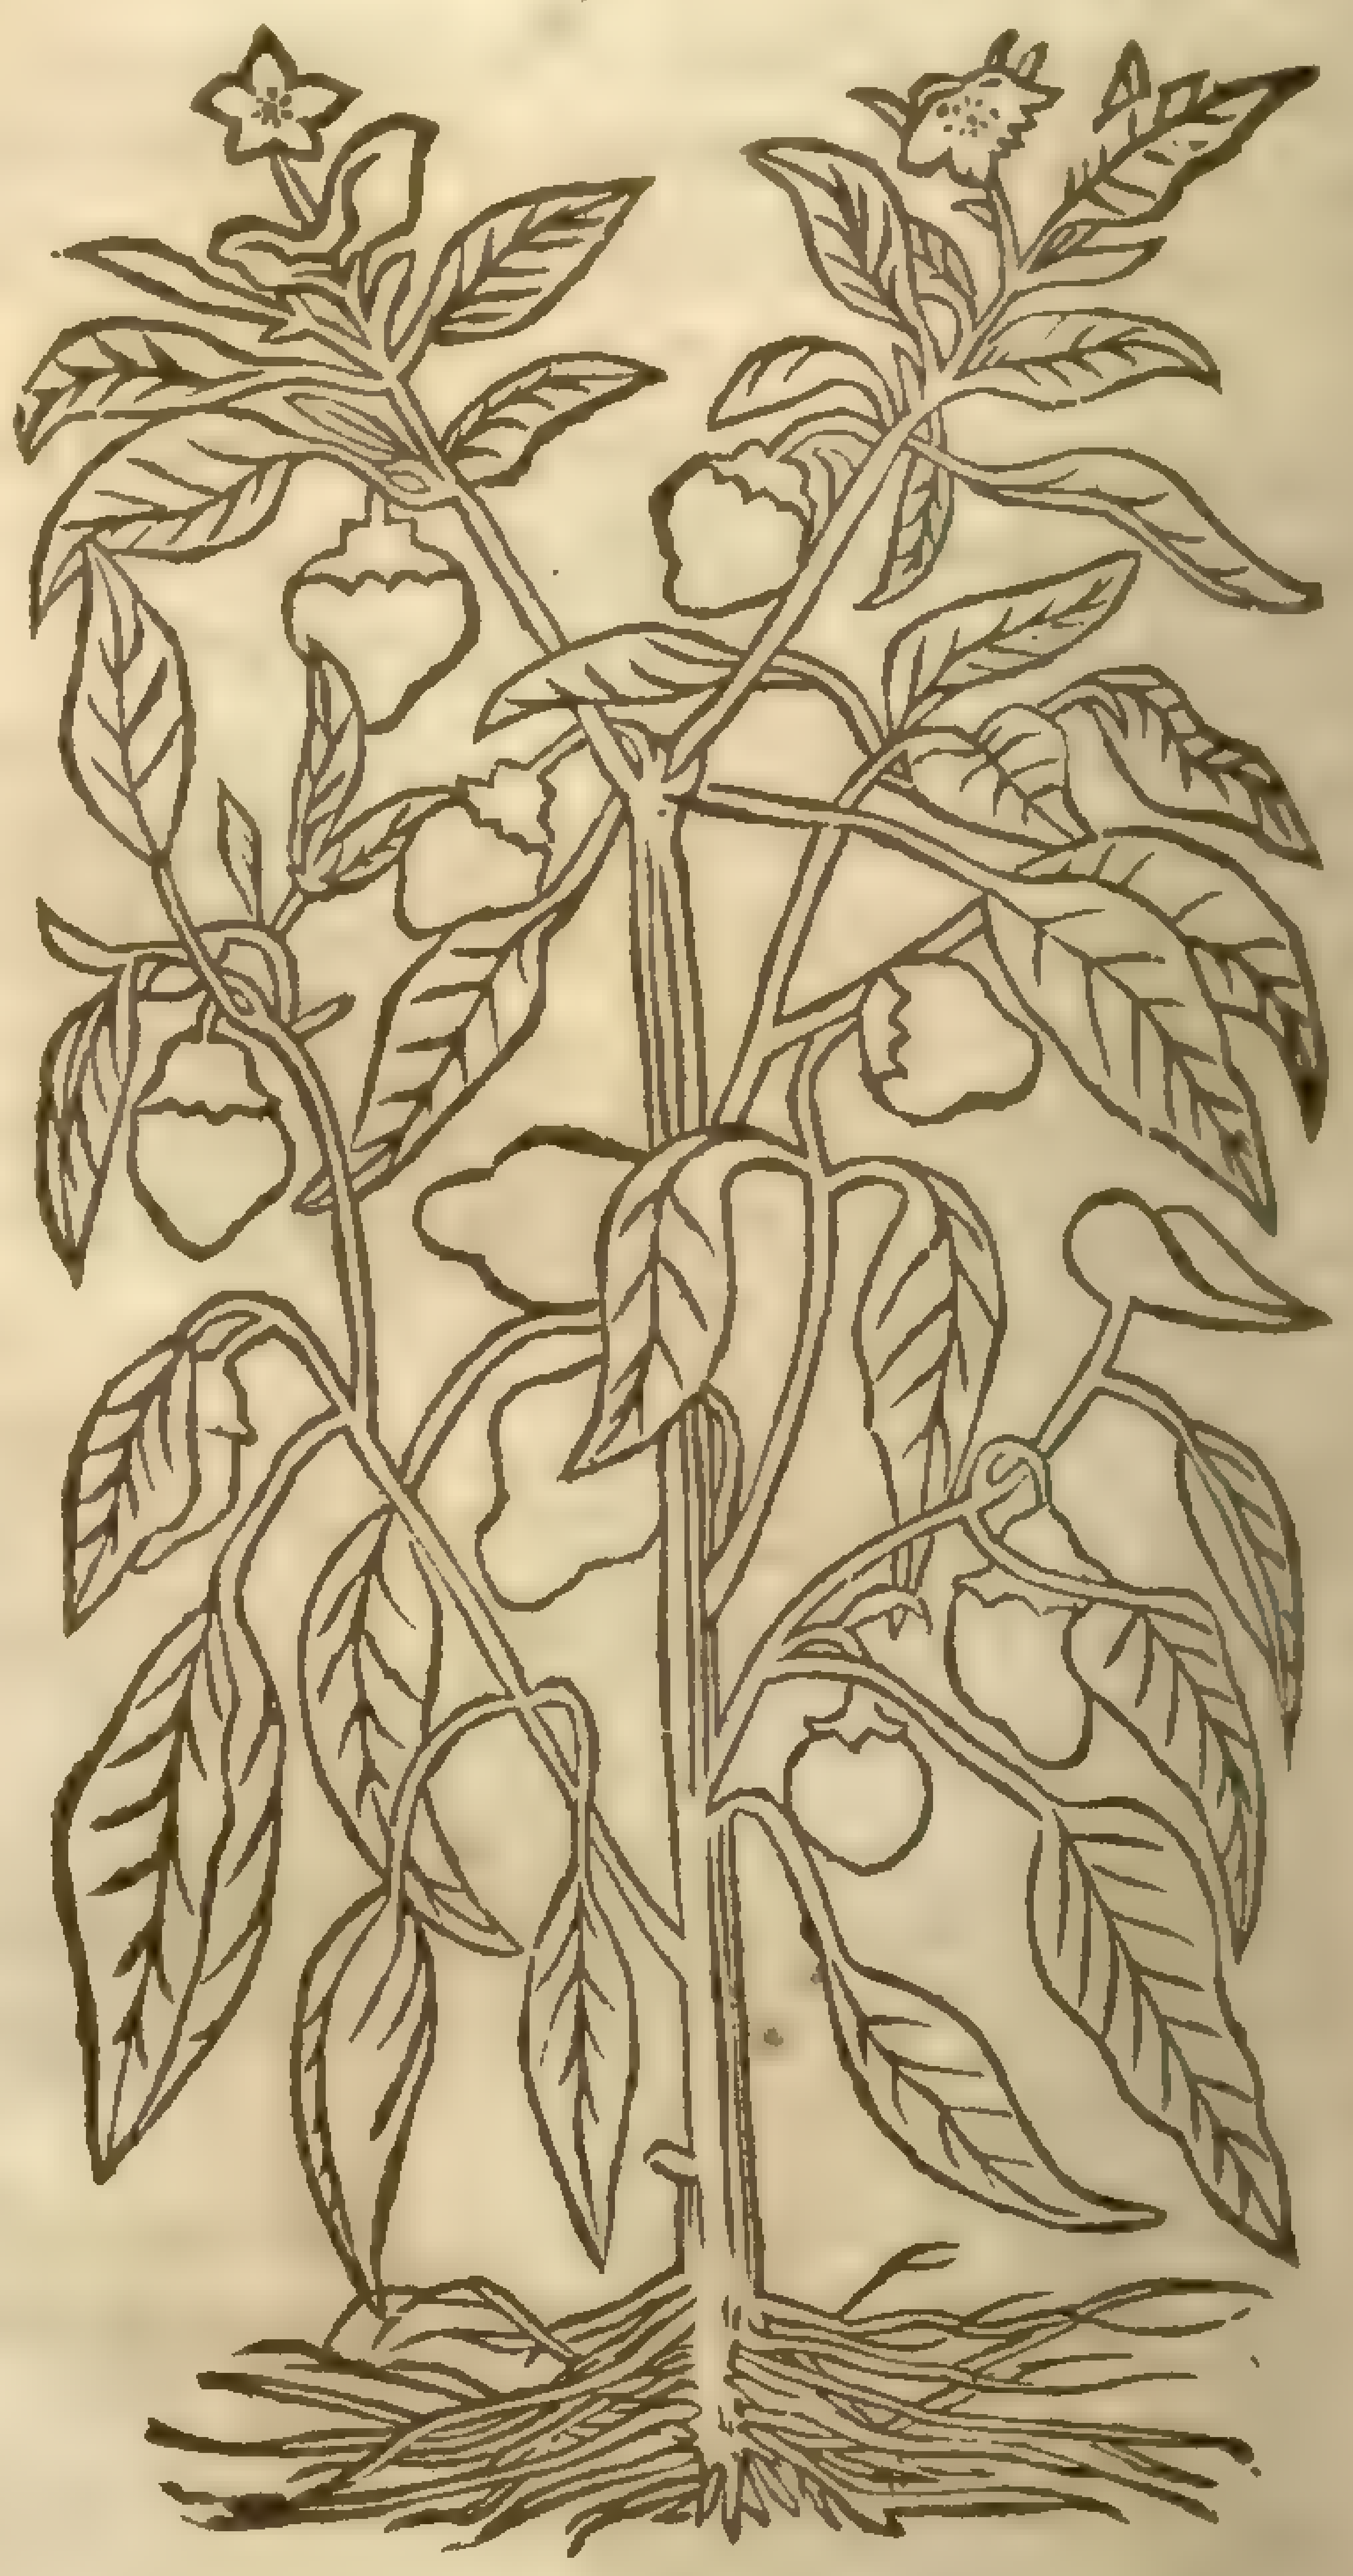
This apple is with good ſucceſſe applied vnto wounds,prickes and hurts of the ſinewes. It hath K great force to cure ſcaldings and burnings : it taketh away ſcarres and blemiſhes, if in the meane time the pouder of the leaues be taken for certaine daies together.

It is reported that ſuch as be barren are made fruitfull herewith, if the woman firſt be bathed in L a fit and conuenient bath for the purpoſe,and the parts about the ſhare and matrix annointed herewith,and the woman preſently haue the company of her husband.

Chap. 71. *Of Ginny or Indian Pepper.*

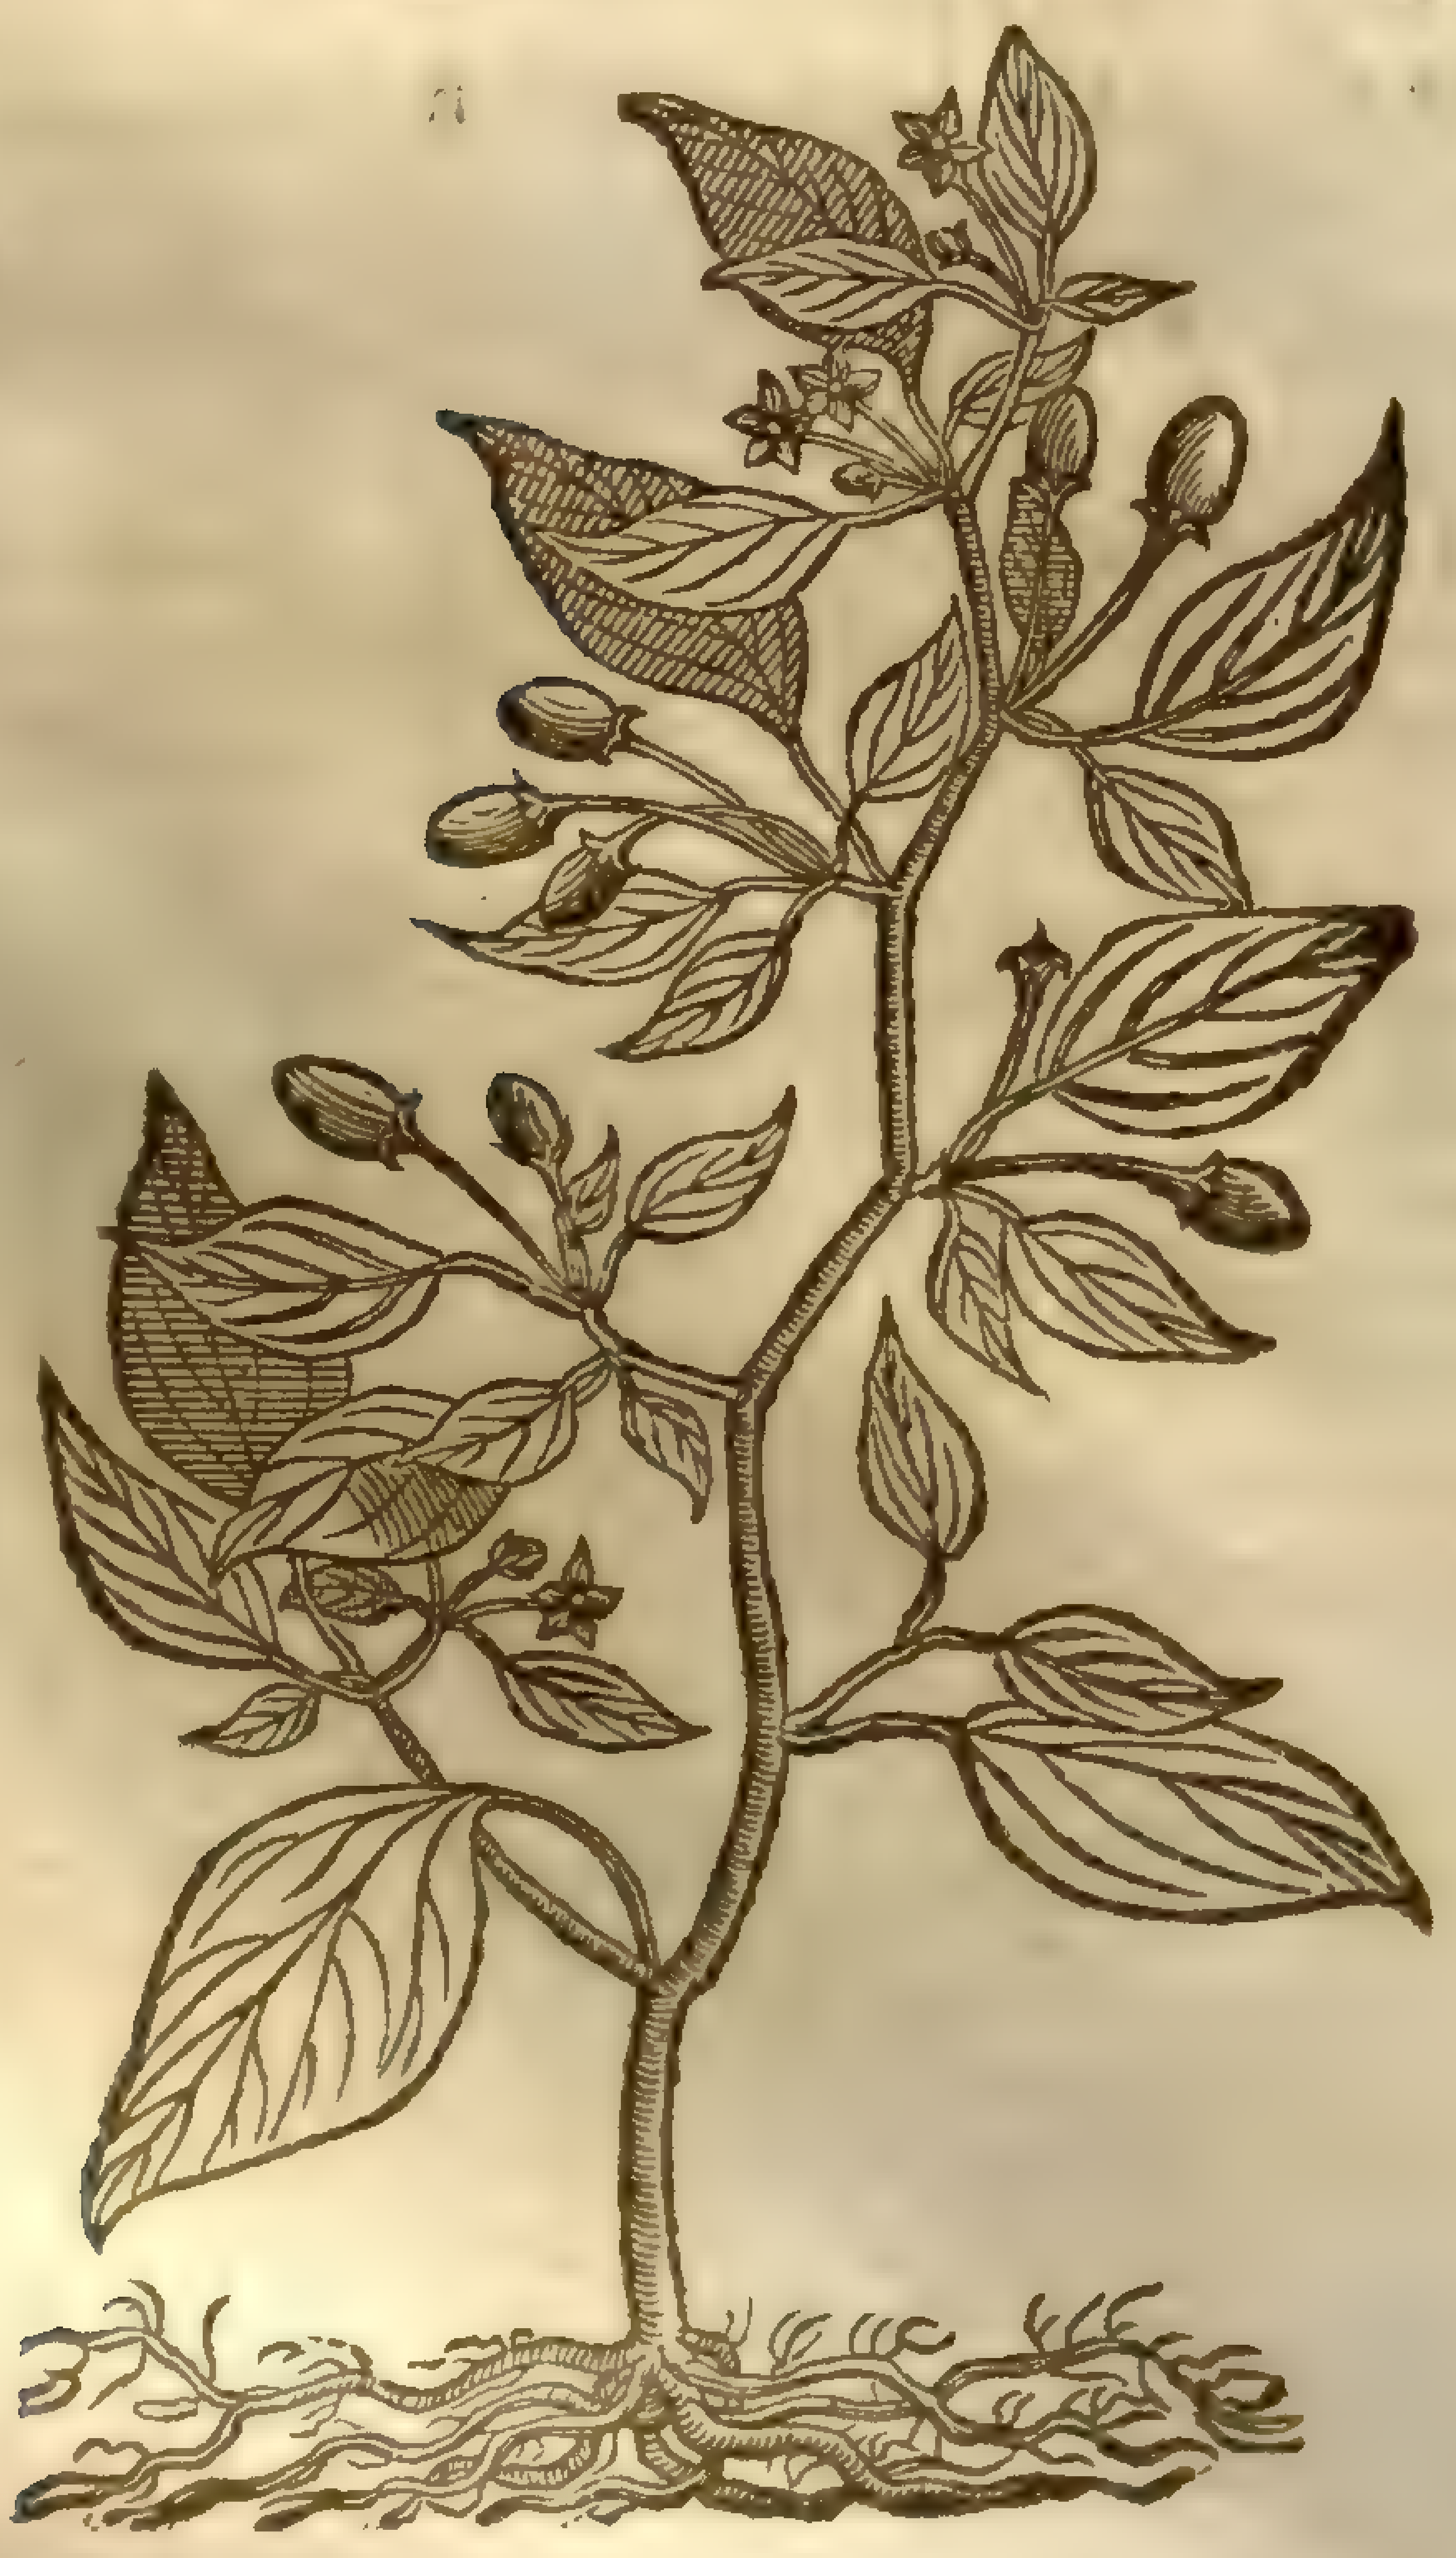


X 1 *Capſicum longioribus ſiliquis.*
Long codded Ginny Pepper.

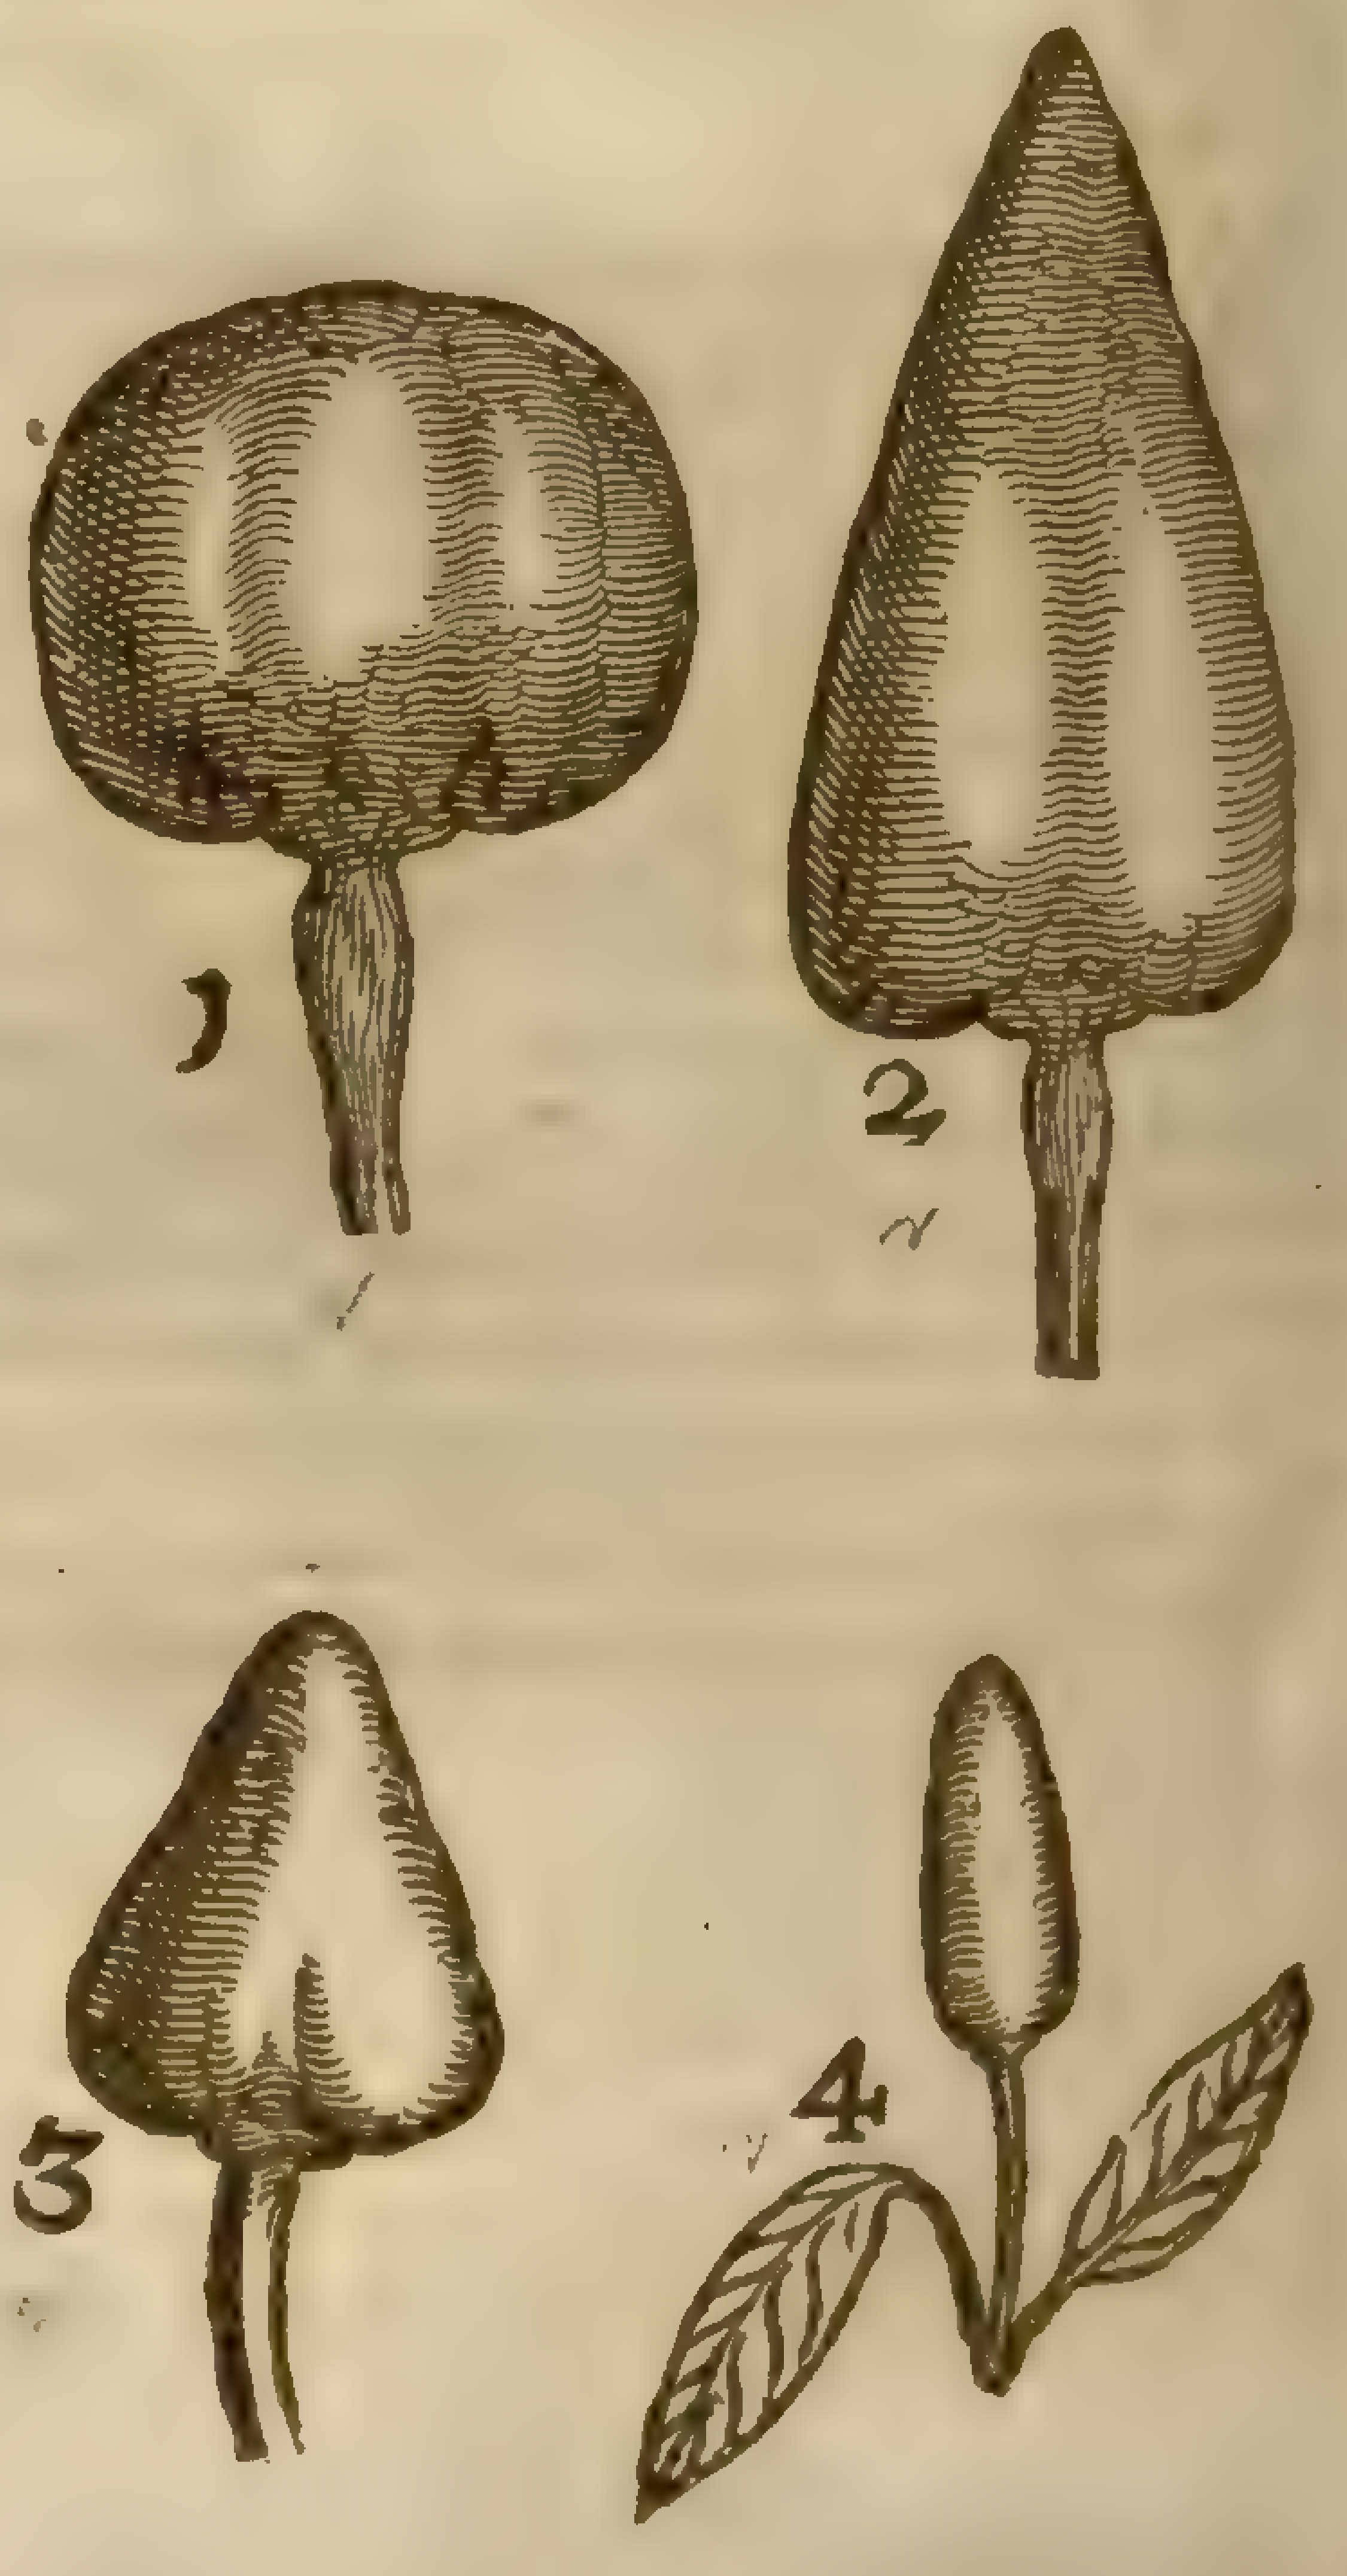


O ‡ 2 *Capſicum rotundioribus ſiliquis.*
Round codded Ginny Pepper.

[illegible]



D 3 *Capſicum minimis ſiliquis.*
Small codded Ginny Pepper.



‡ *Capſici ſiliquæ variæ.*
Varieties of the cods of Ginny pepper.

[illegible]

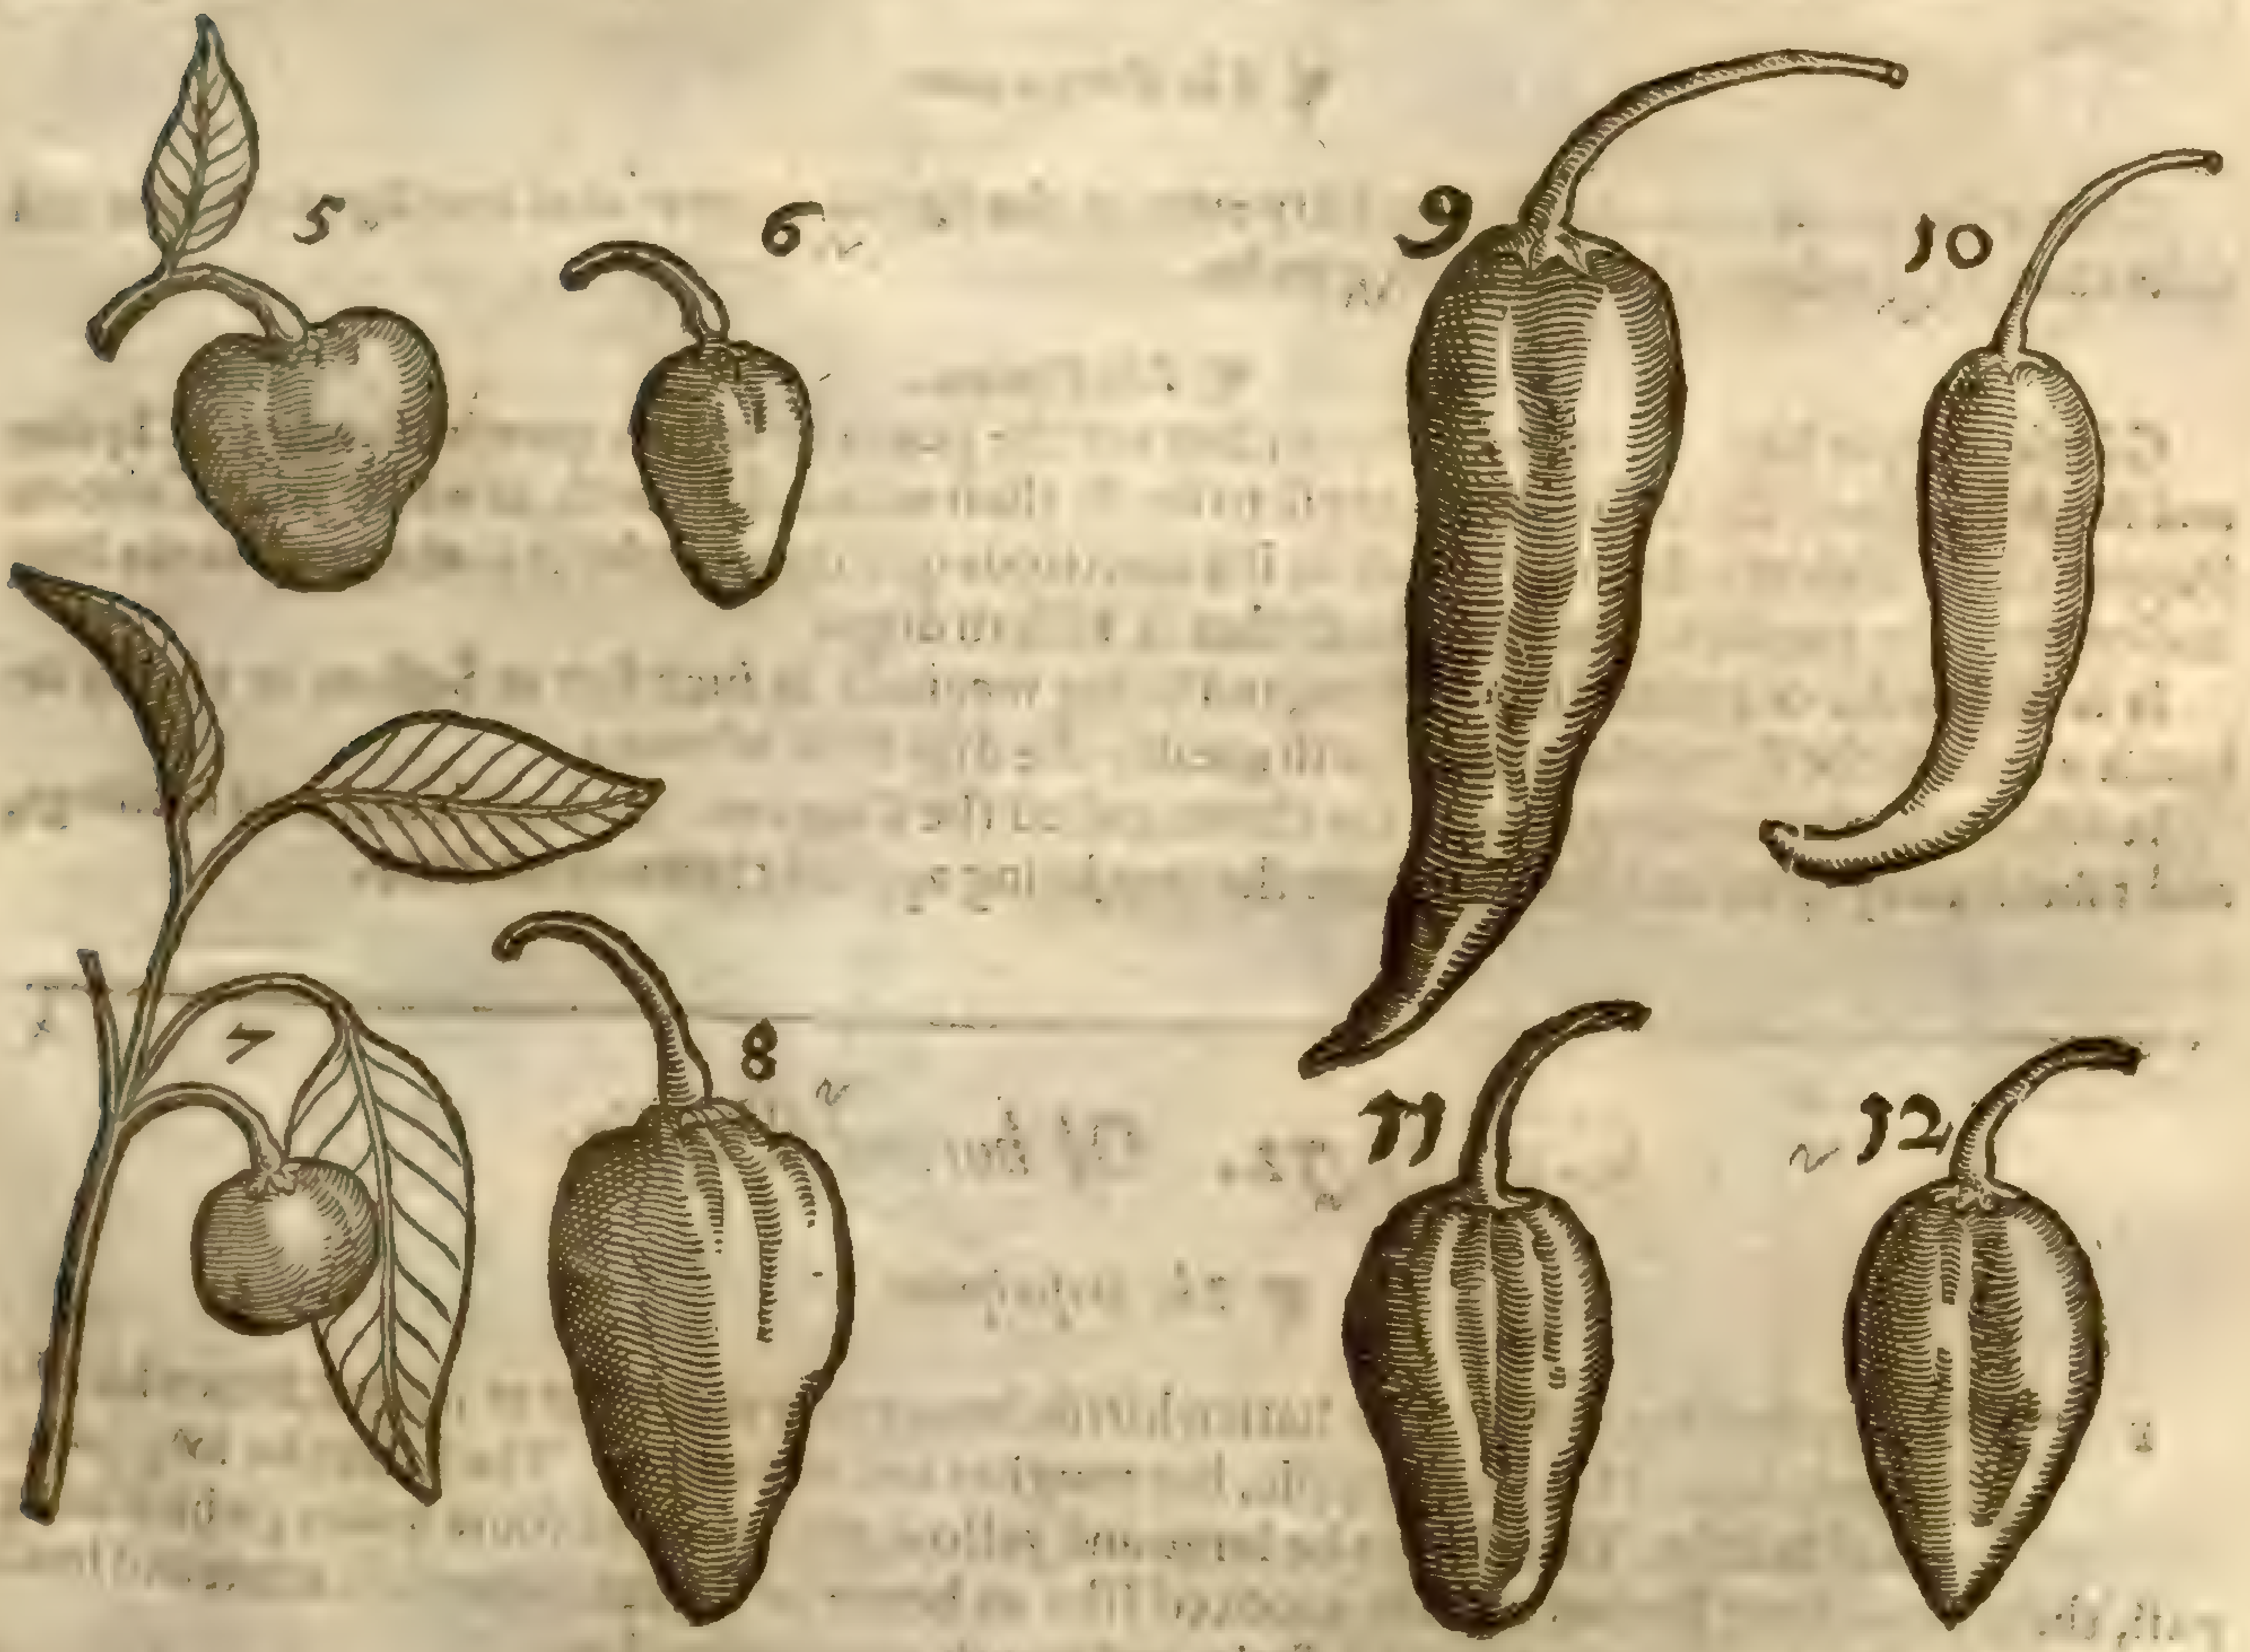
¶ *The Deſcription.*

1 THe firſt of theſe plants hath ſquare ſtalkes a foot high or ſomewhat more, ſet with many thicke and fat leaues, not vnlike to thoſe of garden Nightſhade, but narrower and ſharper pointed, of a darke greene colour. The floures grow alongſt the ſtalkes, out of the wings of the leaues, of a white colour, hauing for the moſt part fiue ſmall leaues blaſing out like a ſtar, with a greene button in the middle. After them grow the cods, greene at the firſt, and when they be ripe of a braue colour glittering like red corall, in which is contained little flat ſeeds, of a light yellow colour, of a hot biting taſte like common pepper, as is alſo the cod it ſelfe: which is long, and as big as a finger, and ſharpe pointed.

‡ 2 The difference that is betweene this and the laſt deſcribed is ſmall, for it conſiſts in nothing but that the cods are pretty large and round, after the faſhion of cherries, and not ſo long as thoſe of the former. ‡

3 The third kinde of Ginnie pepper is like vnto the precedent in leaues, floures, and ſtalkes. The cods hereof are ſmall, round, and red, very like to the berries of *Dulcamara* or wooddy Nightſhade, both in bigneſſe, colour, and ſubſtance, wherein conſiſteth the difference: notwithſtanding the ſeed and cods are very ſharpe and biting, as thoſe of the firſt kinde.

‡ *Capſici ſiliquæ variæ.*
Varieties of the cods of Ginnie Pepper.



‡ There are many other varieties of Ginnie Pepper, which chiefly conſiſt in the ſhape and colour of the cods: wherefore I thought good (and that chiefly becauſe it is a plant that will hardly brooke our climate) only to preſent you with the figures of their ſeuerall ſhapes, whereof the cods of ſome ſtand or grow vpright, and otherſome hang downe: ſuch as deſire further information of this plant, may be aboundantly ſatisfied in *Cluſius* his *Curæ poſter.* from *pag.* 95. to *pag.* 108. where they ſhall find theſe treated of at large in a treatiſe written in Italian by *Gregory de Regio*, a Capuchine Fryer, and ſent to *Cluſius*, who tranſlating it into Engliſh, left it to be ſet forth with other his obſeruations, which was performed two yeares after his death, to wit *Anno Domini* 1611. The figures we here giue are the ſame which are in that tractat. ‡

¶ *The Place.*

Theſe plants are brought from forrein countries, as Ginnie, India, and thoſe parts, into Spaine and Italy : from whence we haue receiued ſeed for our Engliſh gardens, where they come to fruitbearing : but the cod doth not come to that bright red colour which naturally it is poſſeſſed with, which hath happened by reaſon of theſe vnindely yeeres that are paſt : but we expect better when God ſhall ſend vs a hot and temperate yeere.

¶ *The Time.*

The ſeeds hereof muſt be ſowne in a bed of hot horſe-dung,as muske-Melons are,and remooued into a pot when they haue gotten three or foure leaues, that it may the more conueniently be caried from place to place to receiue the heate of the Sunne : and are toward Autumne to be caried into ſome houſe,to auoid the iniurie of the cold nights of that time of the yere, when it is to beare his fruit.

¶ *The Names.*

Actuarius calleth it in Greeke καψικὸν : in Latine,*Capſicum*:and it is thought to be that which *Auicen* nameth *Zinziber caninum*,or dogs Ginger : and *Pliny*,*Siliquaſtrum*, which is more like in taſte to pepper than is *Panax*,and it is therefore called *Piperitis*,as he hath written in his 19.booke,12.chapter. *Panax* (ſaith he) hath the taſte of Pepper and *Siliquaſtrum*, for which cauſe it is called *Piperitis*. The later Herbariſts doe oftentimes call it *Piper Indianum*, or *Indicum*,ſometimes *Piper Calicuthium*,or *Piper Hiſpanicum* : In Engliſh it is called, Ginnie Pepper, and Indian Pepper : in the Germane Tongue, **Indianiſchar Pfeffer**: in low Dutch, **Breſilie Peper** : in French, *Poiure d'Inde*, very well knowne in the ſhops at Billingſgate by the name of Ginnie Pepper, where it is vſually to be bought.

¶ *The Temperature.*

Ginnie Pepper is extreame hot and dry euen in the fourth degree : that is to ſay, far hotter and drier than *Auicen* ſheweth dogs Ginger to be.

¶ *The Vertues.*

A Ginnie Pepper hath the taſte of Pepper,but not the power or vertue, notwithſtanding in Spaine and ſundry parts of the Indies they do vſe to dreſſe their meate therewith, as we do with Calecute Pepper : but(ſaith my Author)it hath in it a malitious quality,whereby it is an enemy to the liuer and other of the entrails. *Auicen* writeth that it killeth dogs.

B It is ſaid to die or colour like Saffron;and being receiued in ſuch ſort as Saffron is vſually taken,it warmeth the ſtomacke,and helpeth greatly the digeſtion of meats.

C It diſſolueth the ſwellings about the throat,called the Kings euill,as kernels and cold ſwellings; and taketh away ſpots and lentiles from the face,being applied thereto with hony.

Chap. 72. *Of horned Poppie.*

¶ *The Deſcription.*

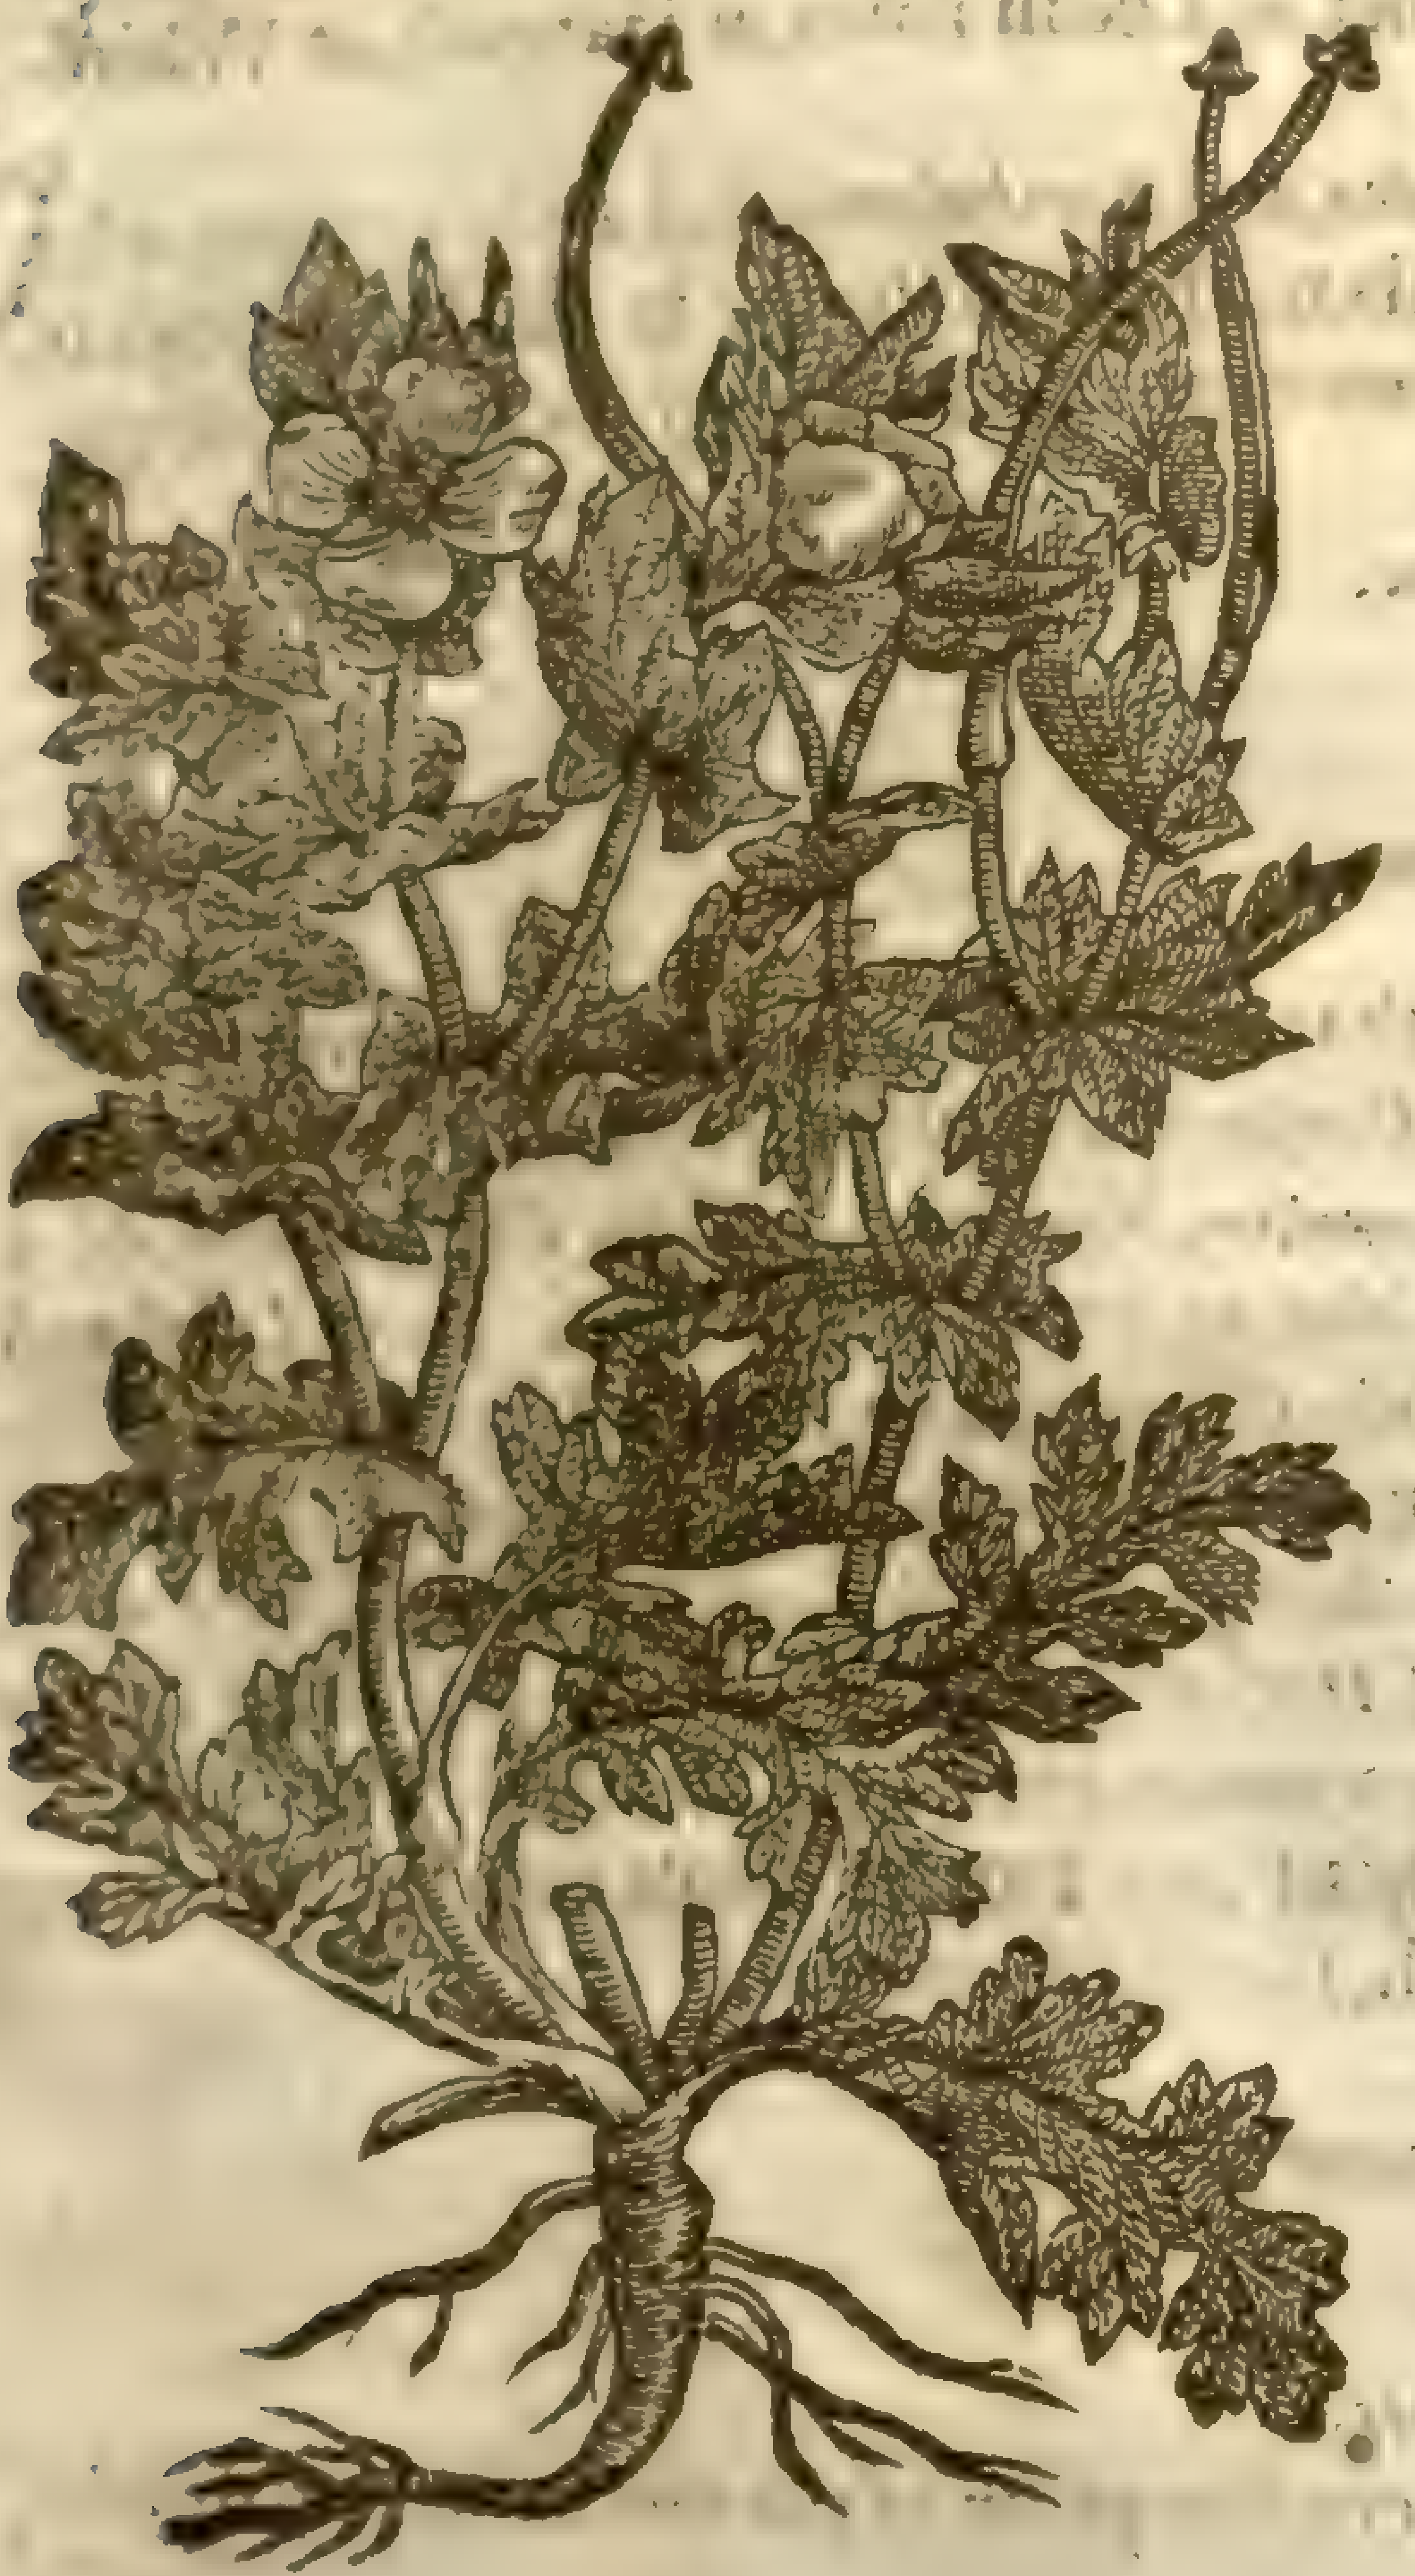
1 The yellow horned Poppie hath whitiſh leaues very much cut or jagged,ſomewhat like the leaues of Garden Poppie, but rougher and more hairy. The ſtalkes be long,round, and brittle. The floures be large and yellow,conſiſting of foure leaues ; which being paſt, there come long huskes or cods, crooked like an horne or cornet, wherein is conteined ſmall blacke ſeed. The root is great,thicke, ſcaly, and rough, continuing long.

2 The ſecond kinde of horned Poppie is much ſlenderer and leſſer than the precedent, and hath leaues with like deepe cuts as Rocket hath, and ſomething hairy.The ſtalkes be very ſlender, brittle,and branched into diuers armes or wings ; the floures ſmall, made of foure little leaues, of a red colour, with a ſmall ſtrake of blacke toward the bottome ; after which commeth the ſeed, incloſed in ſlender,long,crooked cods full of blackiſh ſeed. The root is ſmall and ſingle,and dieth euery yeere.

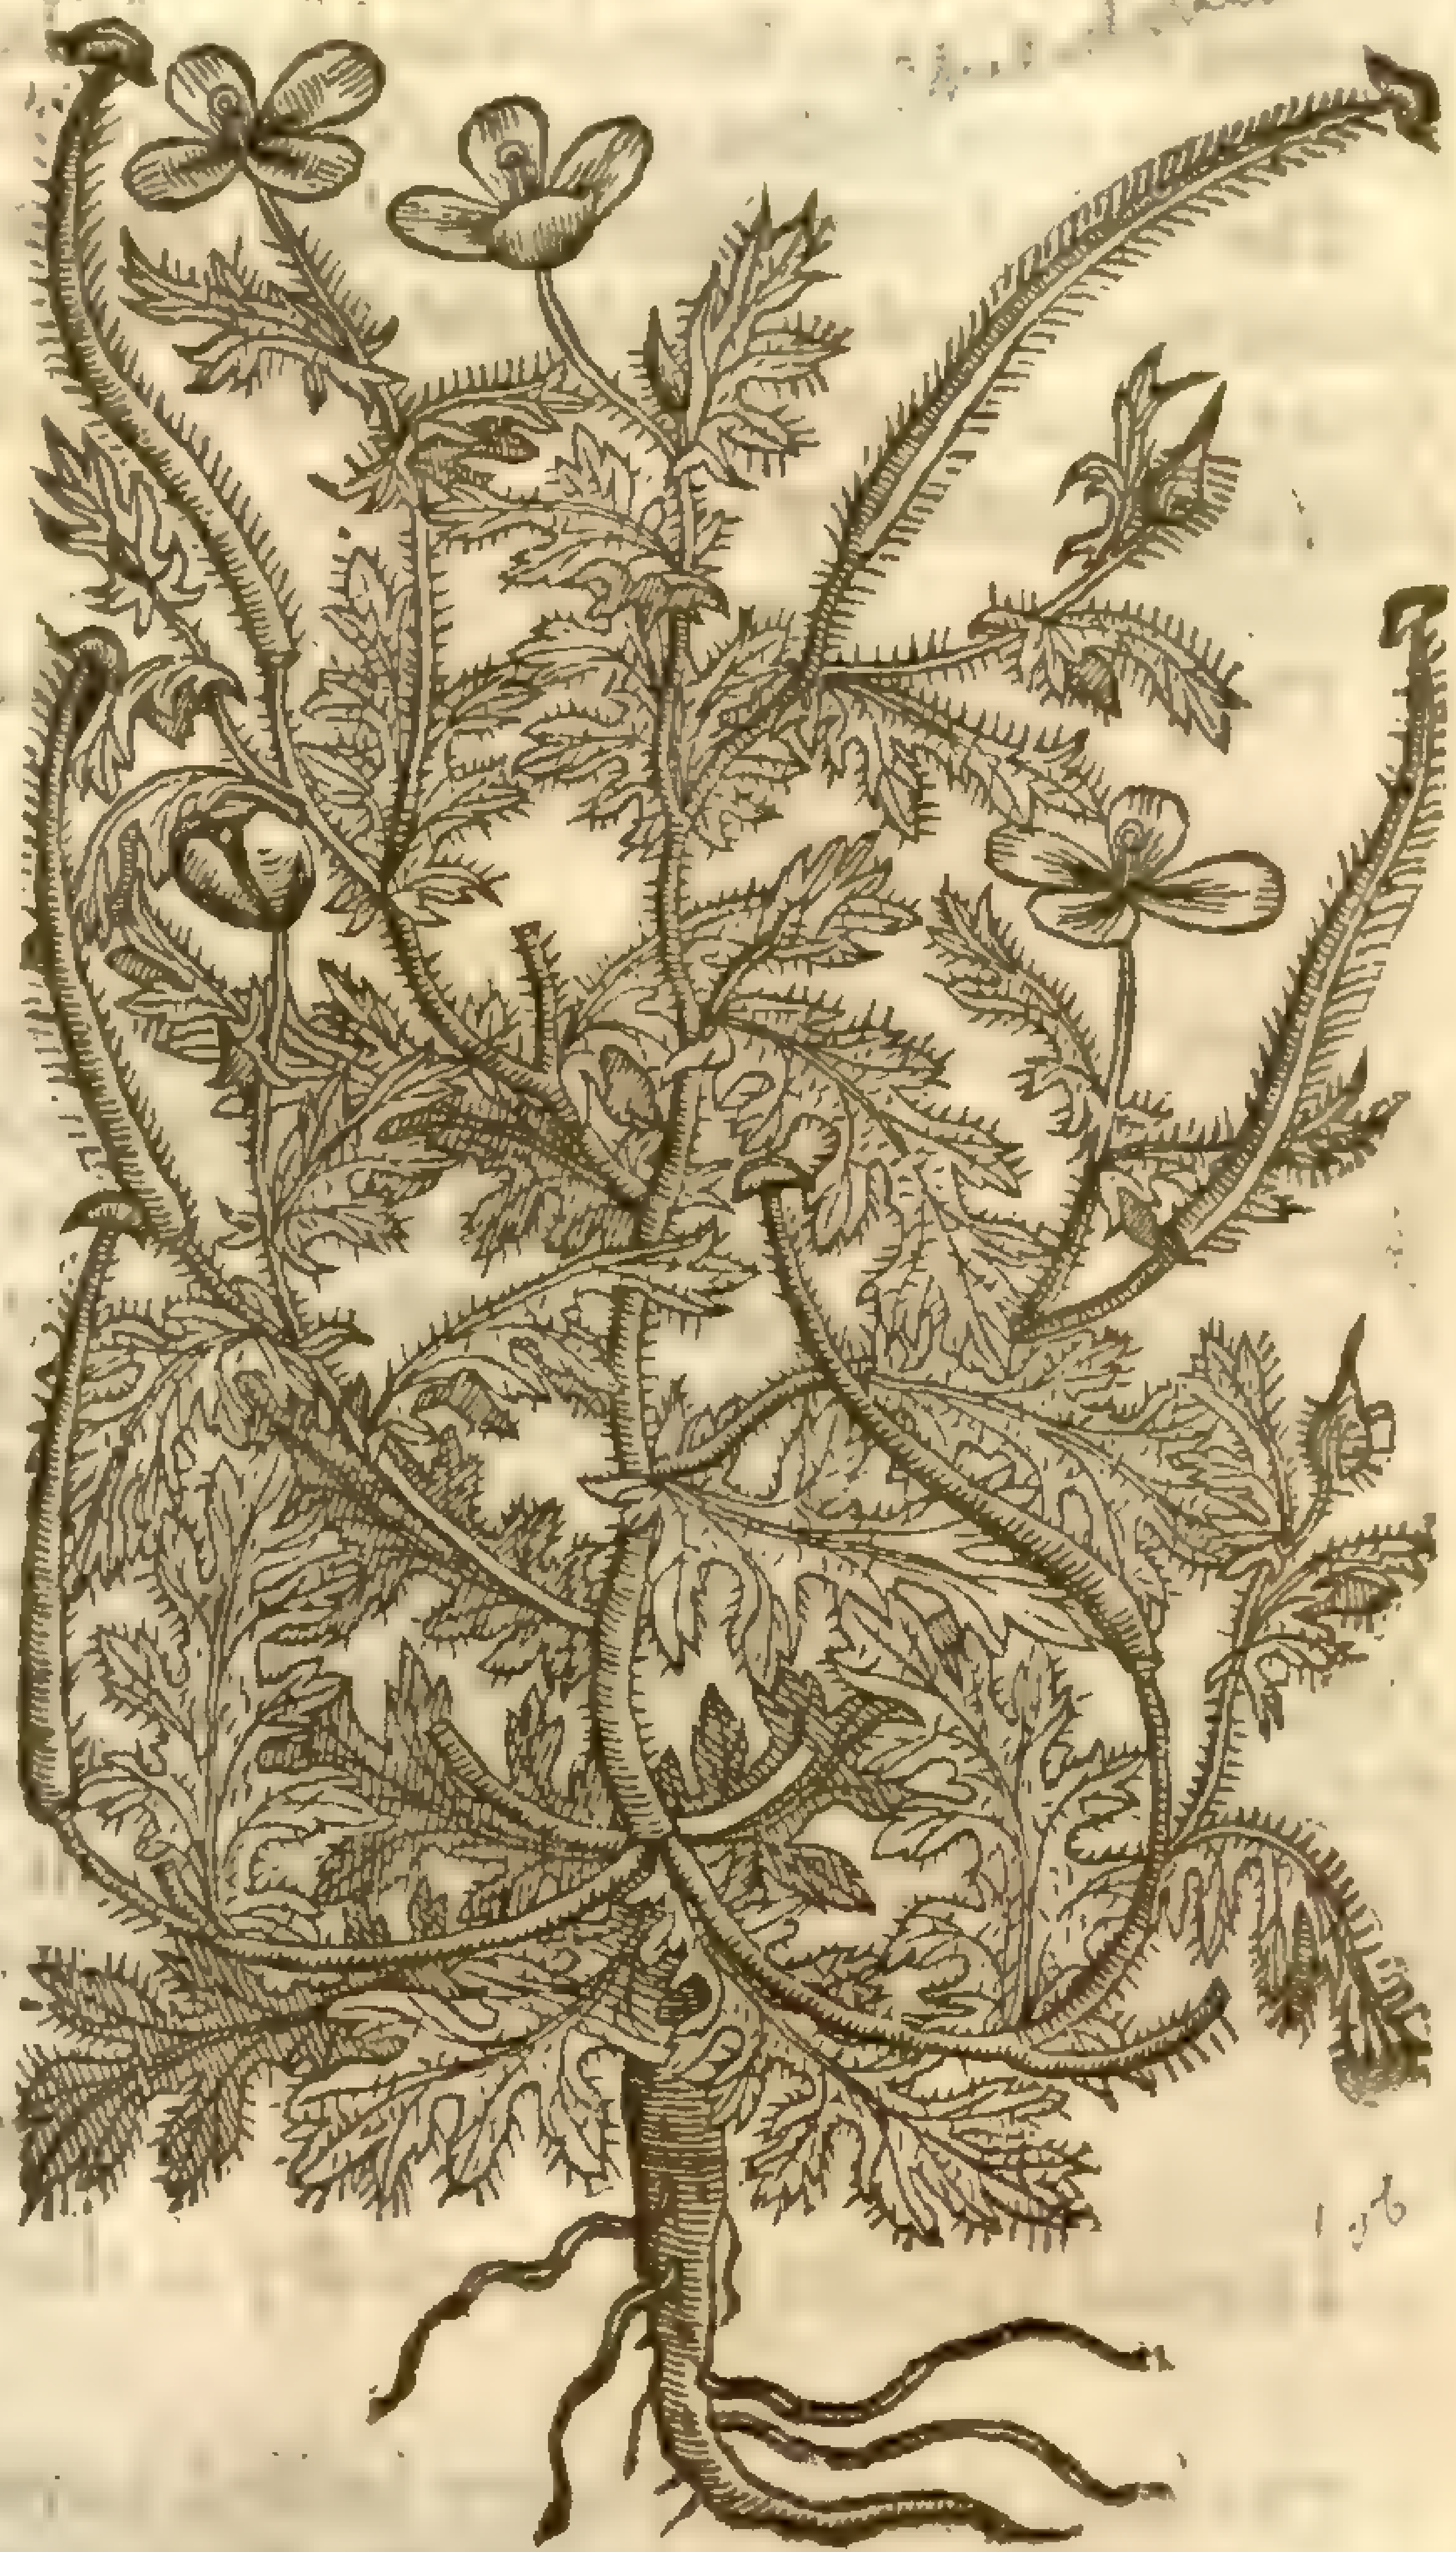
‡ 3 This is much like the laſt deſcribed,and according to *Cluſius*,rather a variety than different. It is diſtinguiſhed from the laſt mentioned by the ſmoothneſſe of the leaues, and the colour of the floures, which are of a pale yellowiſh red, both which accidents *Cluſius* affirmes happen to the former,toward the later end of Summer.

4 There is another ſort of horned Poppie altogether leſſer than the laſt deſcribed, hauing tenderer leaues,cut into fine little parcels : the floure is likewiſe leſſer, of a blew purple colour like the double Violets.

1 *Papauer cornutum flore luteo.*
Yellow horned Poppie.

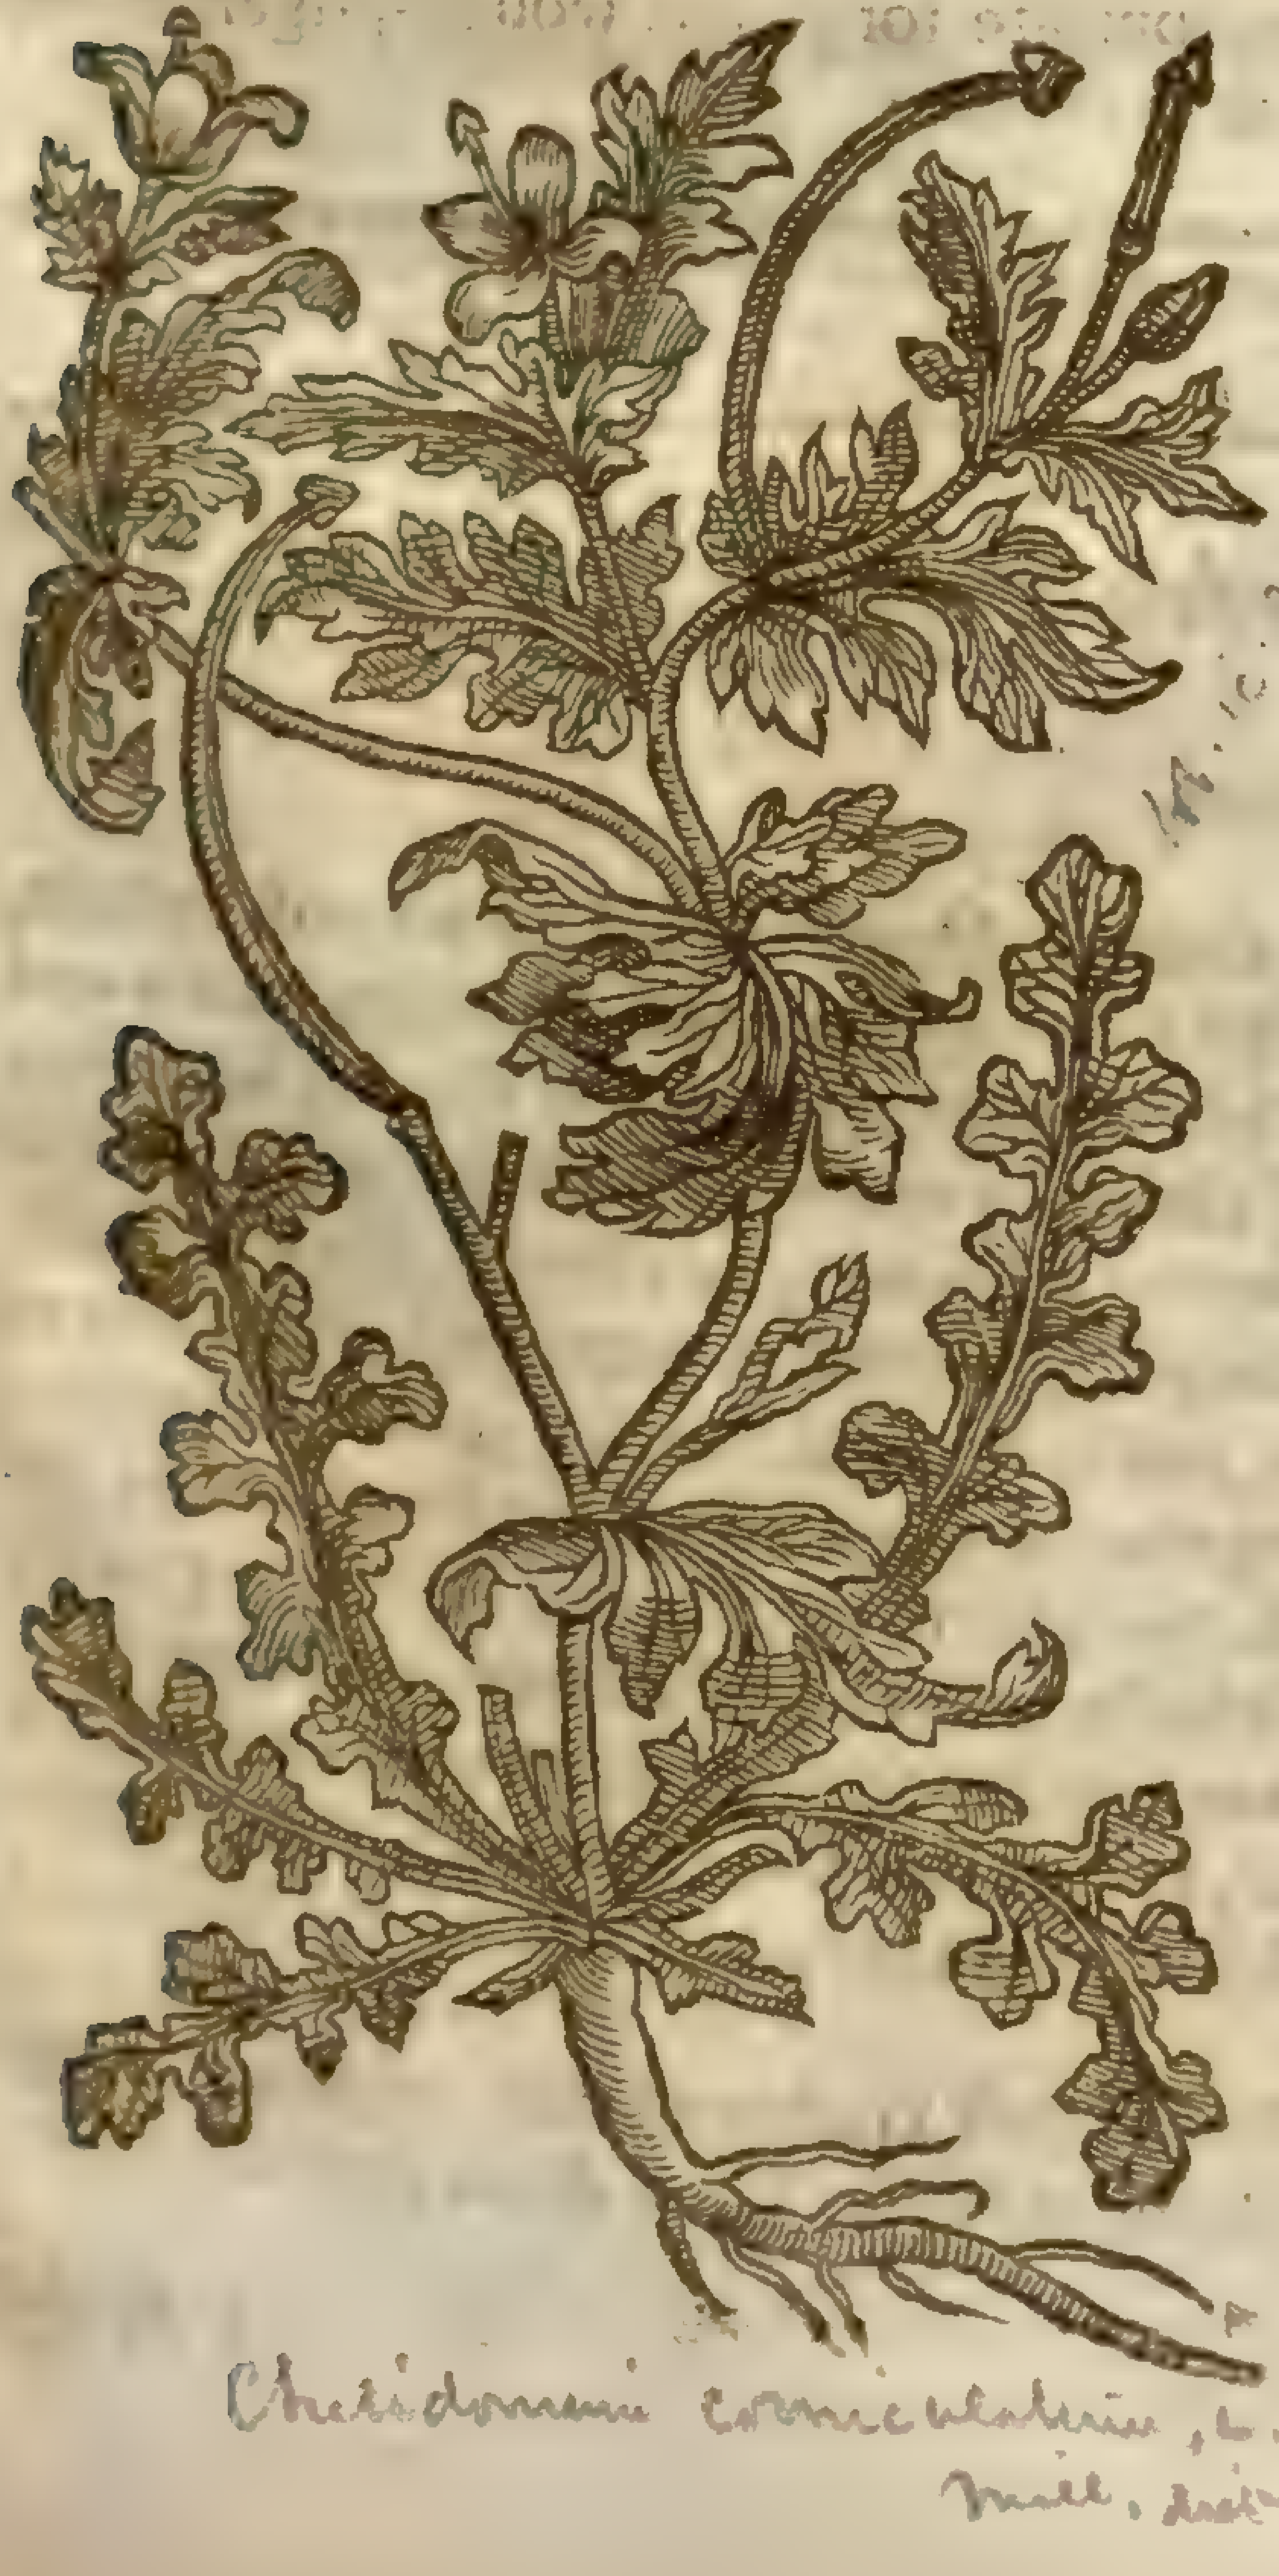


2 *Papauer cornutum flore rubro.*
Red horned Poppie.



Lob. ic. 271

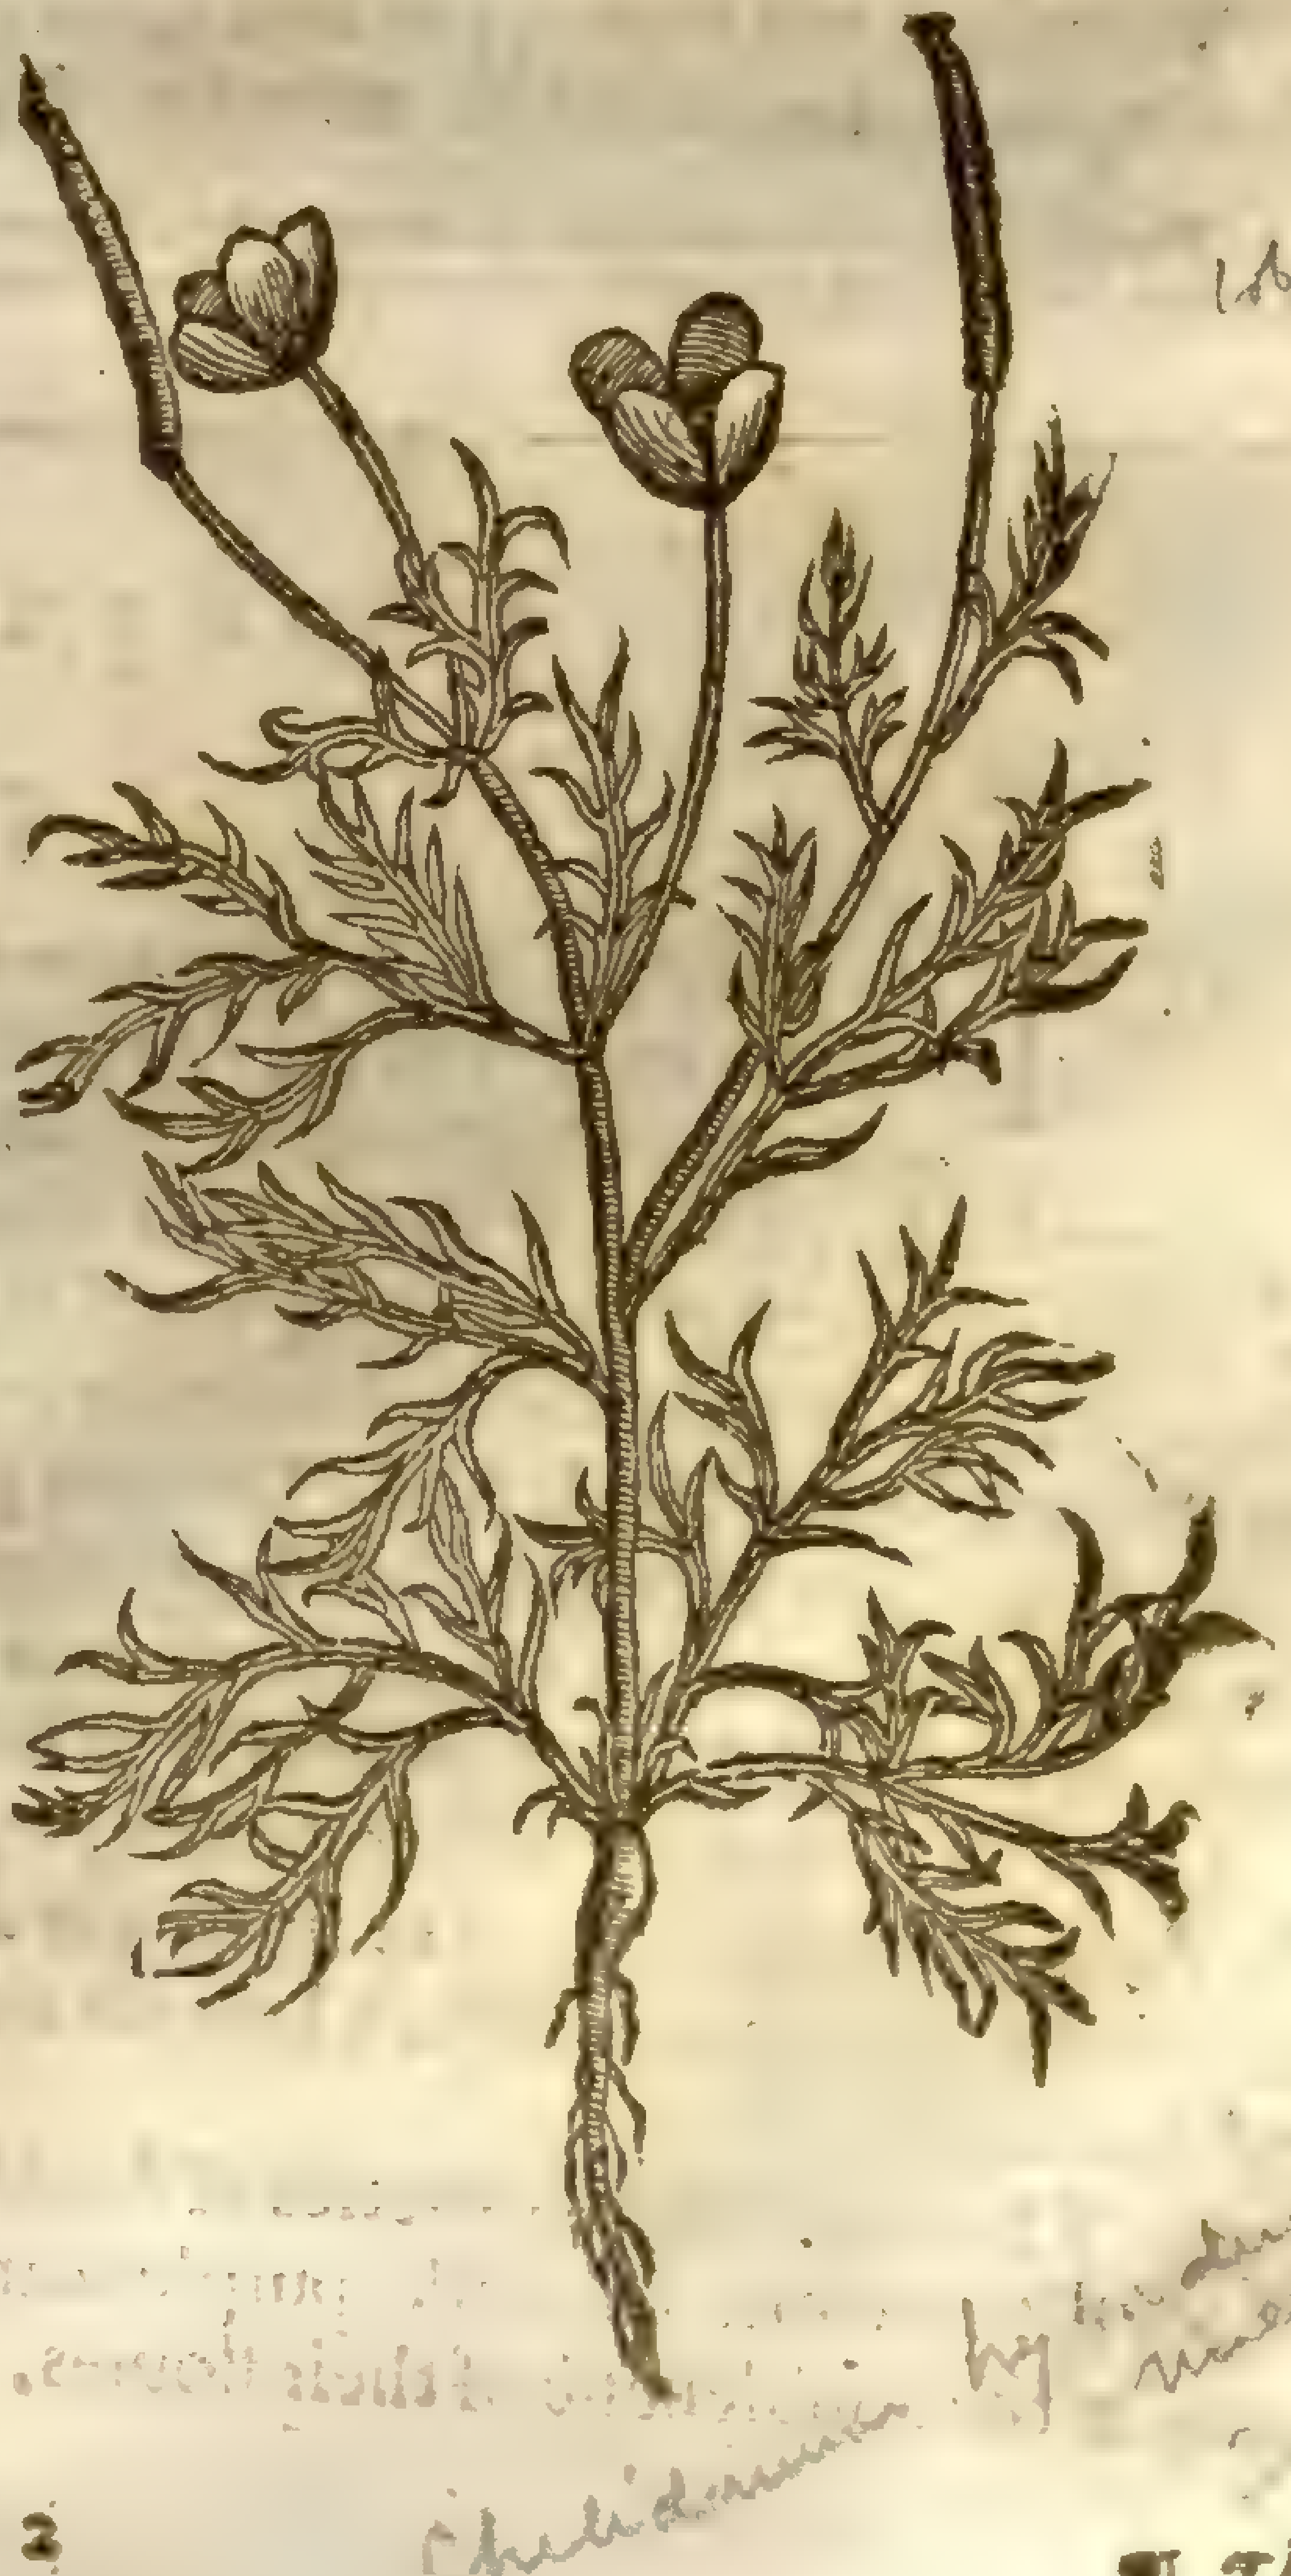
‡ 3 *Papauer corniculatum phœniceum glabrum.*
Red horned Poppie with ſmooth leaues.



Lob. ic. 271

Chelidonium corniculatum, C. B. Mill. dict.

4 *Papauer cornutum flore violaceo.*
Violet coloured horned Poppie.



Lob. ic. 272

Chelidonium hybridum, Mill. dict.

¶ *The Place.*

The yellow horned Poppy groweth vpon the ſands and banks of the ſea: I haue found it growing neer vnto Rie in Kent, in the Iſles of Shepey and Thanet, at Lee in Eſſex, at Harwich, at Whiteſtable, and many other places alongſt the Engliſh coaſt.

The ſecond groweth not wilde in England. *Angelus Palea*, and *Bartholomæus ab Vrbe-veterum*, who haue commented vpon *Meſue*, write that they found this red horned Poppy in the kingdomes of Arragon and Caſtile in Spaine, and the fields neere vnto common paths. They do grow in my garden very plentifully.

¶ *The Time.*

They floure from May to the end of Auguſt.

¶ *The Names.*

Moſt Writers haue taken horned Poppy, eſpecially that with red floures to be *Glaucium*: neither is this their opinion altogether vnprobable; for as *Dioſcorides* ſaith, *Glaucium* hath leaues like thoſe of horned Poppy, but λιπαρώτερα, that is to ſay fatter, χαμαίζηλα, low, or lying on the ground, of a ſtrong ſmell and of a bitter taſte, the iuice alſo is much like in colour to Saffron. Now *Lobel* and *Pena* witneſſe, that this horned Poppie hath the ſame kinde of iuice, as my ſelfe likewiſe can teſtifie. *Dioſcorides* ſaith that *Glaucium* groweth about Hierapolis, a citie in Syria; but what hindereth that it ſhould not be found alſo ſomewhere elſe? Theſe things ſhew it hath a great affinity with *Glaucium*, if it be not the true and legitimate *Glaucium* of *Dioſcorides*. Howbeit the firſt is the *Mecon Ceratites*, or *Papauer corniculatum* of the Antients, by the common conſent of all late writers: in Engliſh, Sea Poppy, and Horned Poppy: in Dutch, **Geelheul** and **Hoꝛne Heule**: in the Germane Tongue, **Gelbomag**: in French, *Pauot Cornu*: in Spaniſh, *Dormidera marina*.

¶ *The Temperature.*

Horned Poppies are hot and dry in the third degree.

¶ *The Vertues.*

A The root of horned Poppy boiled in water vnto the conſumption of the one halfe, and drunke, prouoketh vrine, and openeth the ſtopping of the liuer.

B The ſeed taken in the quantitie of a ſpoonefull looſeth the belly gently.

C The iuice mixed with meale and hony, mundifieth old rotten and filthy vlcers.

D The leaues and floures put into vnguents or ſalues appropriate for greene wounds, digeſt them, that is, bring them to white matter, with perfect quitture or ſanies.

† The figure that formerly was in the fourth place of this chap. vnder the title of *Papauer cornutum luteum minus*, was of a Bindeweed called by *Cluſius*, *Conuolulus Althea*. You ſhall finde it hereafter in the due place. The deſcription as far as I can iudge was of the *Cuminum Corniculatum* which was pag. 909.

Chap. 37. *Of Garden Poppies.*

¶ *The Deſcription.*

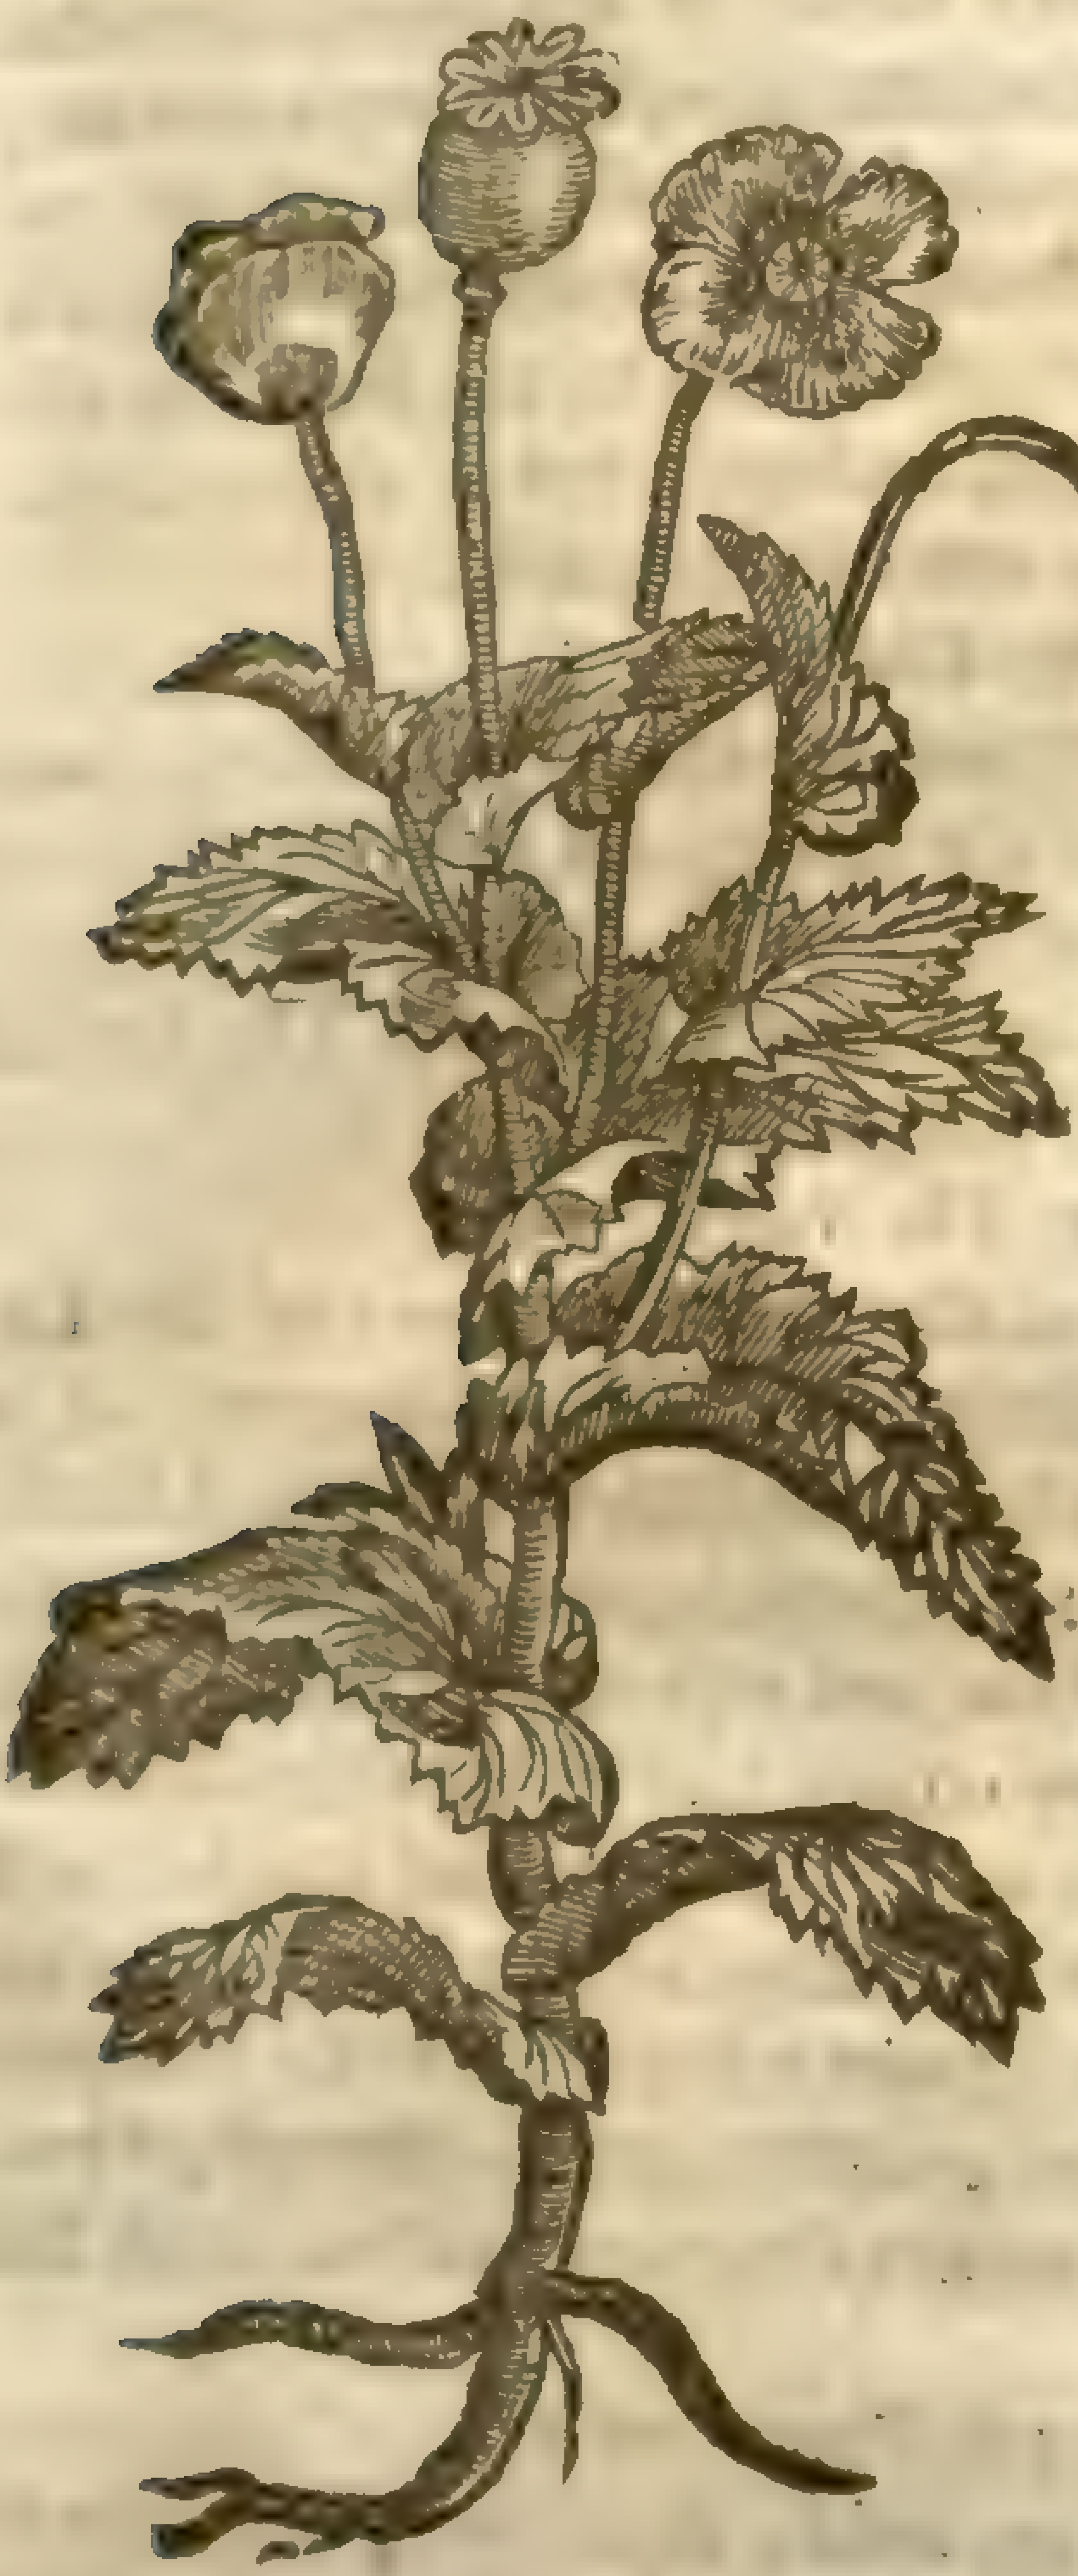
1 The leaues of white Poppie are long, broad, ſmooth, longer then the leaues of Lettuce, whiter, and cut in the edges: the ſtem or ſtalke is ſtraight and brittle, oftentimes a yard and a halfe high: on the top whereof grow white floures, in which at the very beginning appeareth a ſmall head, accompanied with a number of threds or chiues, which being full growne is round, and yet ſomething long withall, and hath a couer or crownet vpon the top; it is with many filmes or thin skin diuided into coffers or ſeuerall partitions, in which is contained abundance of ſmall round and whitiſh ſeed. The root groweth deepe, and is of no eſtimation nor continuance.

2 Like vnto this is the blacke garden Poppy, ſauing that the floures are not ſo white and ſhining, but vſually red, or at leaſt ſpotted or ſtraked with ſome lines of purple. The leaues are greater, more iagged, and ſharper pointed. The ſeed is likewiſe blacker, which maketh the difference.

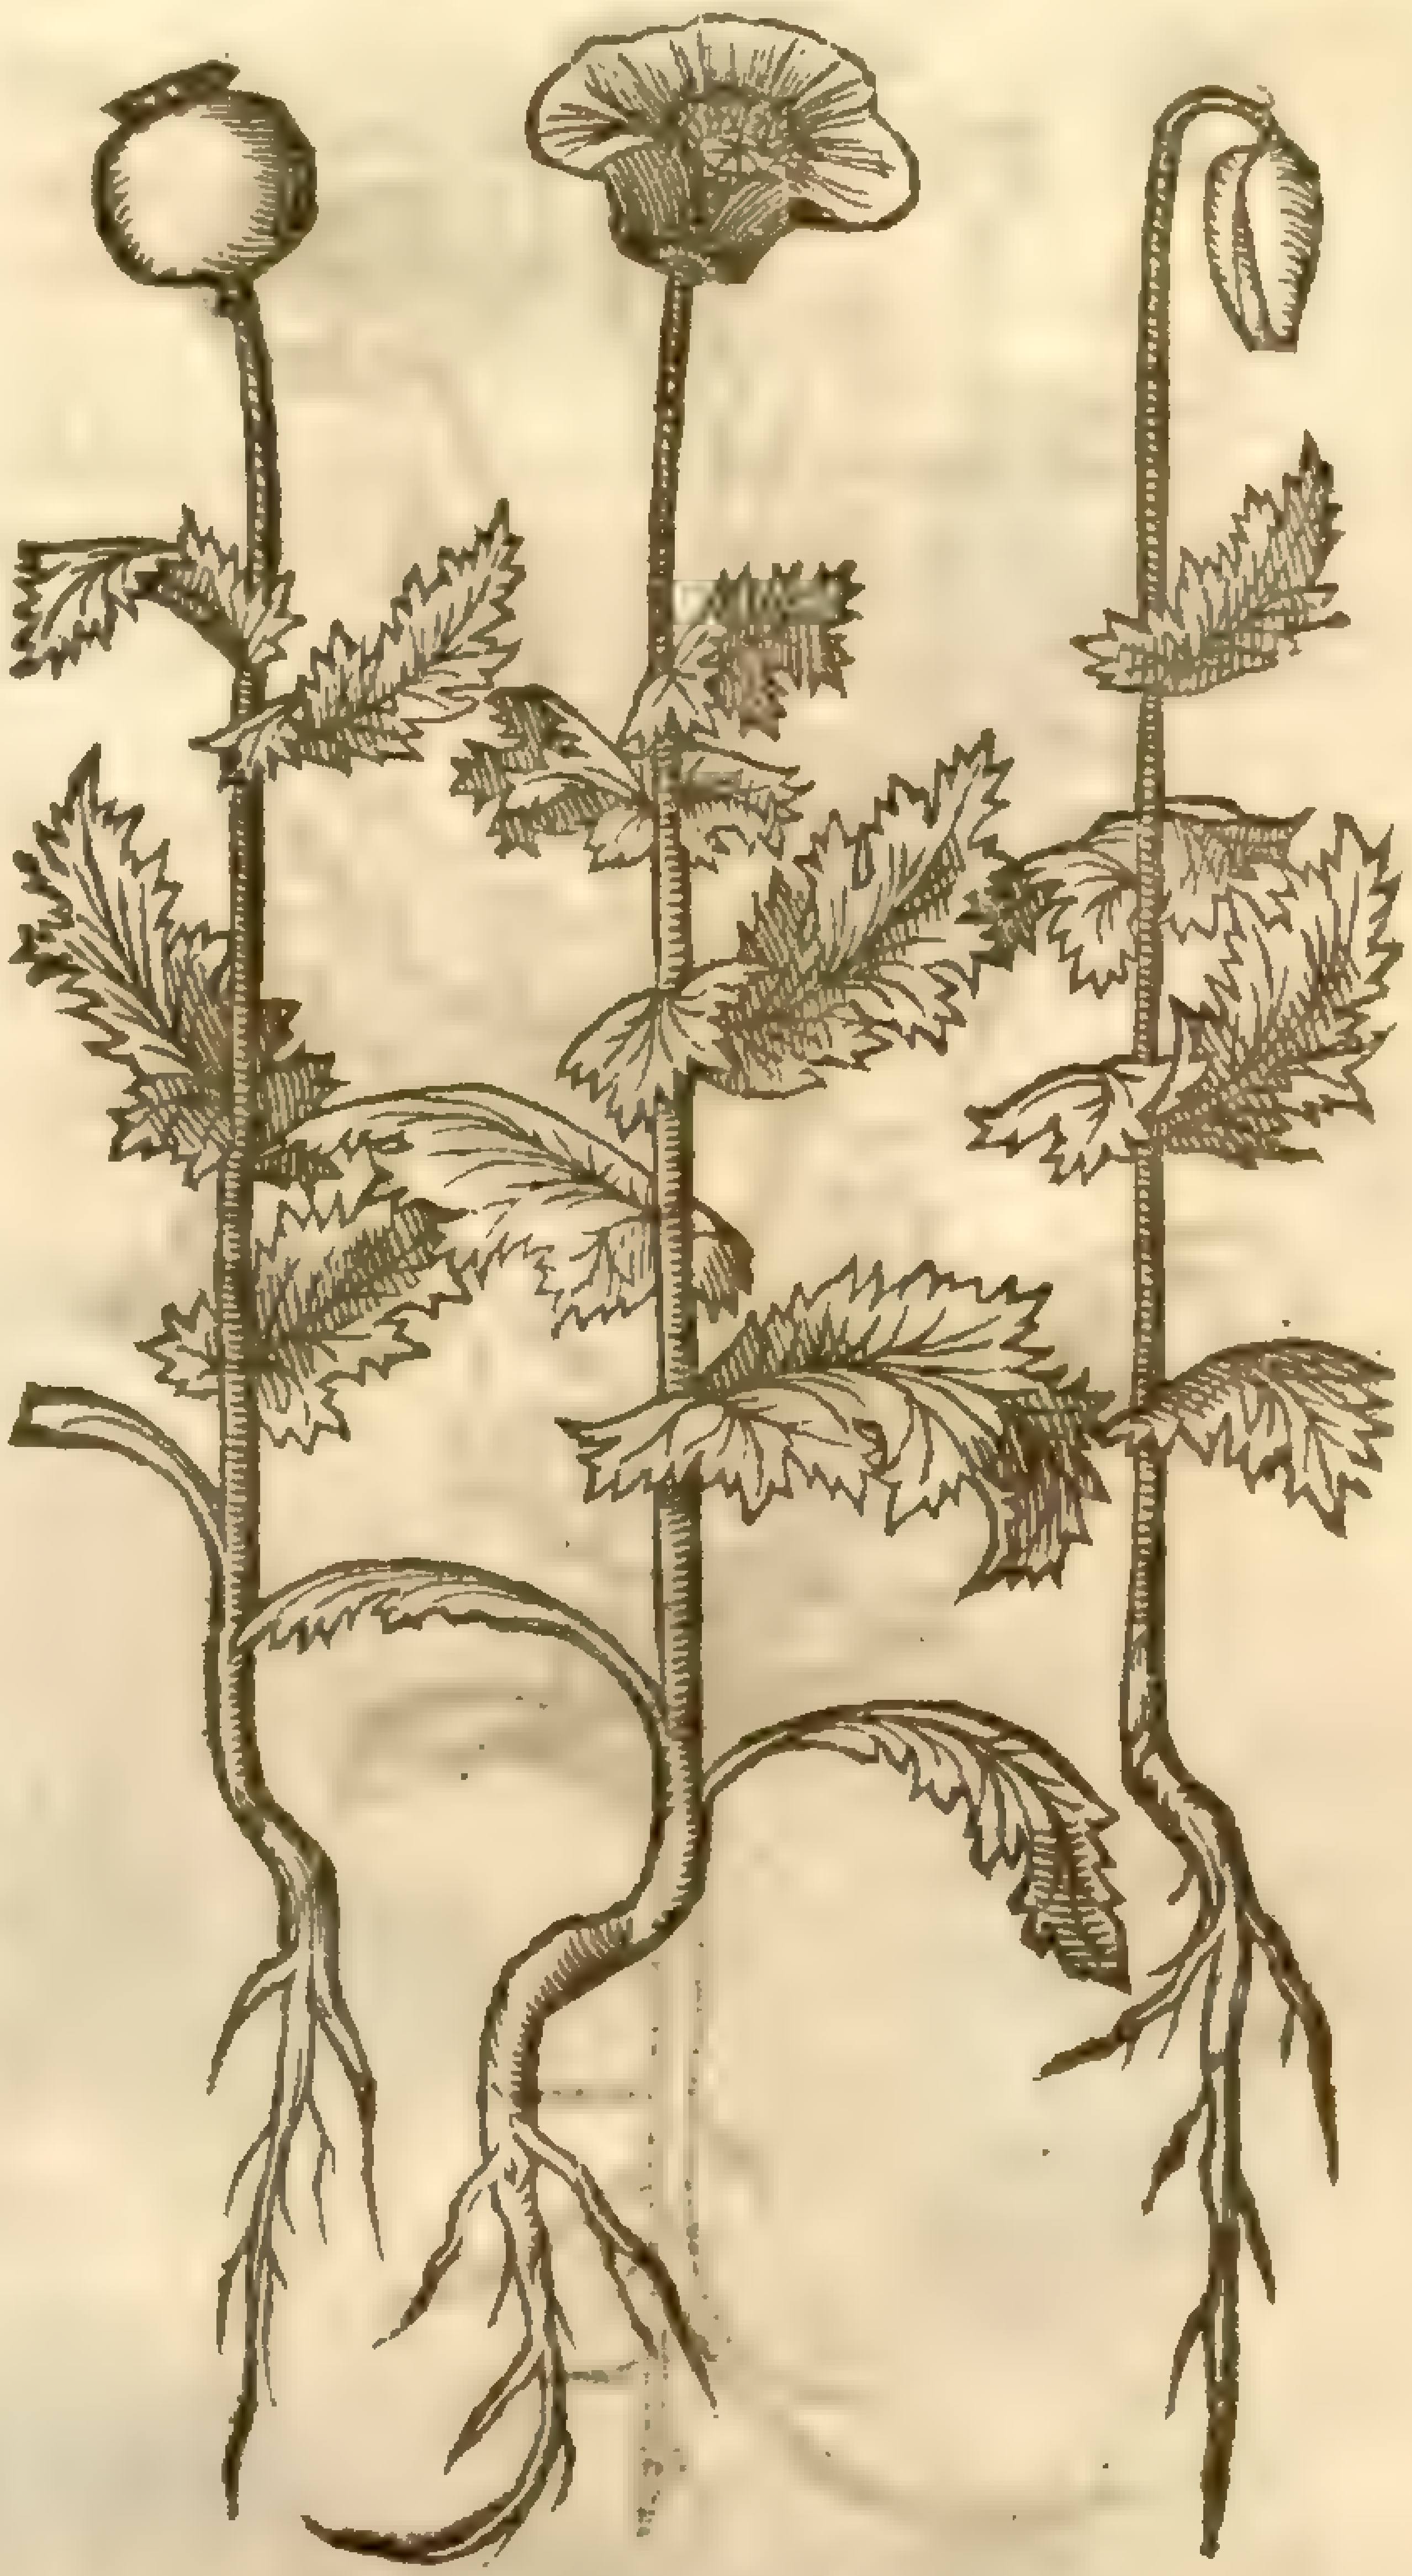
‡ 3 There alſo another garden Poppie whoſe leaues are much more ſinuated, or creſted, and the floure alſo is all iagged or finely cut about the edges, and of this ſort there is alſo both blacke and white. The floures of the black are red, and the ſeed blacke; and the other hath both the floures and ſeed white.

4 There are diuers varieties of double Poppies of both theſe kinds, and their colours are commonly either white, red, darke purple, ſcarlet, or mixt of ſome of theſe. They differ from the former onely in the doubleneſſe of their floures.

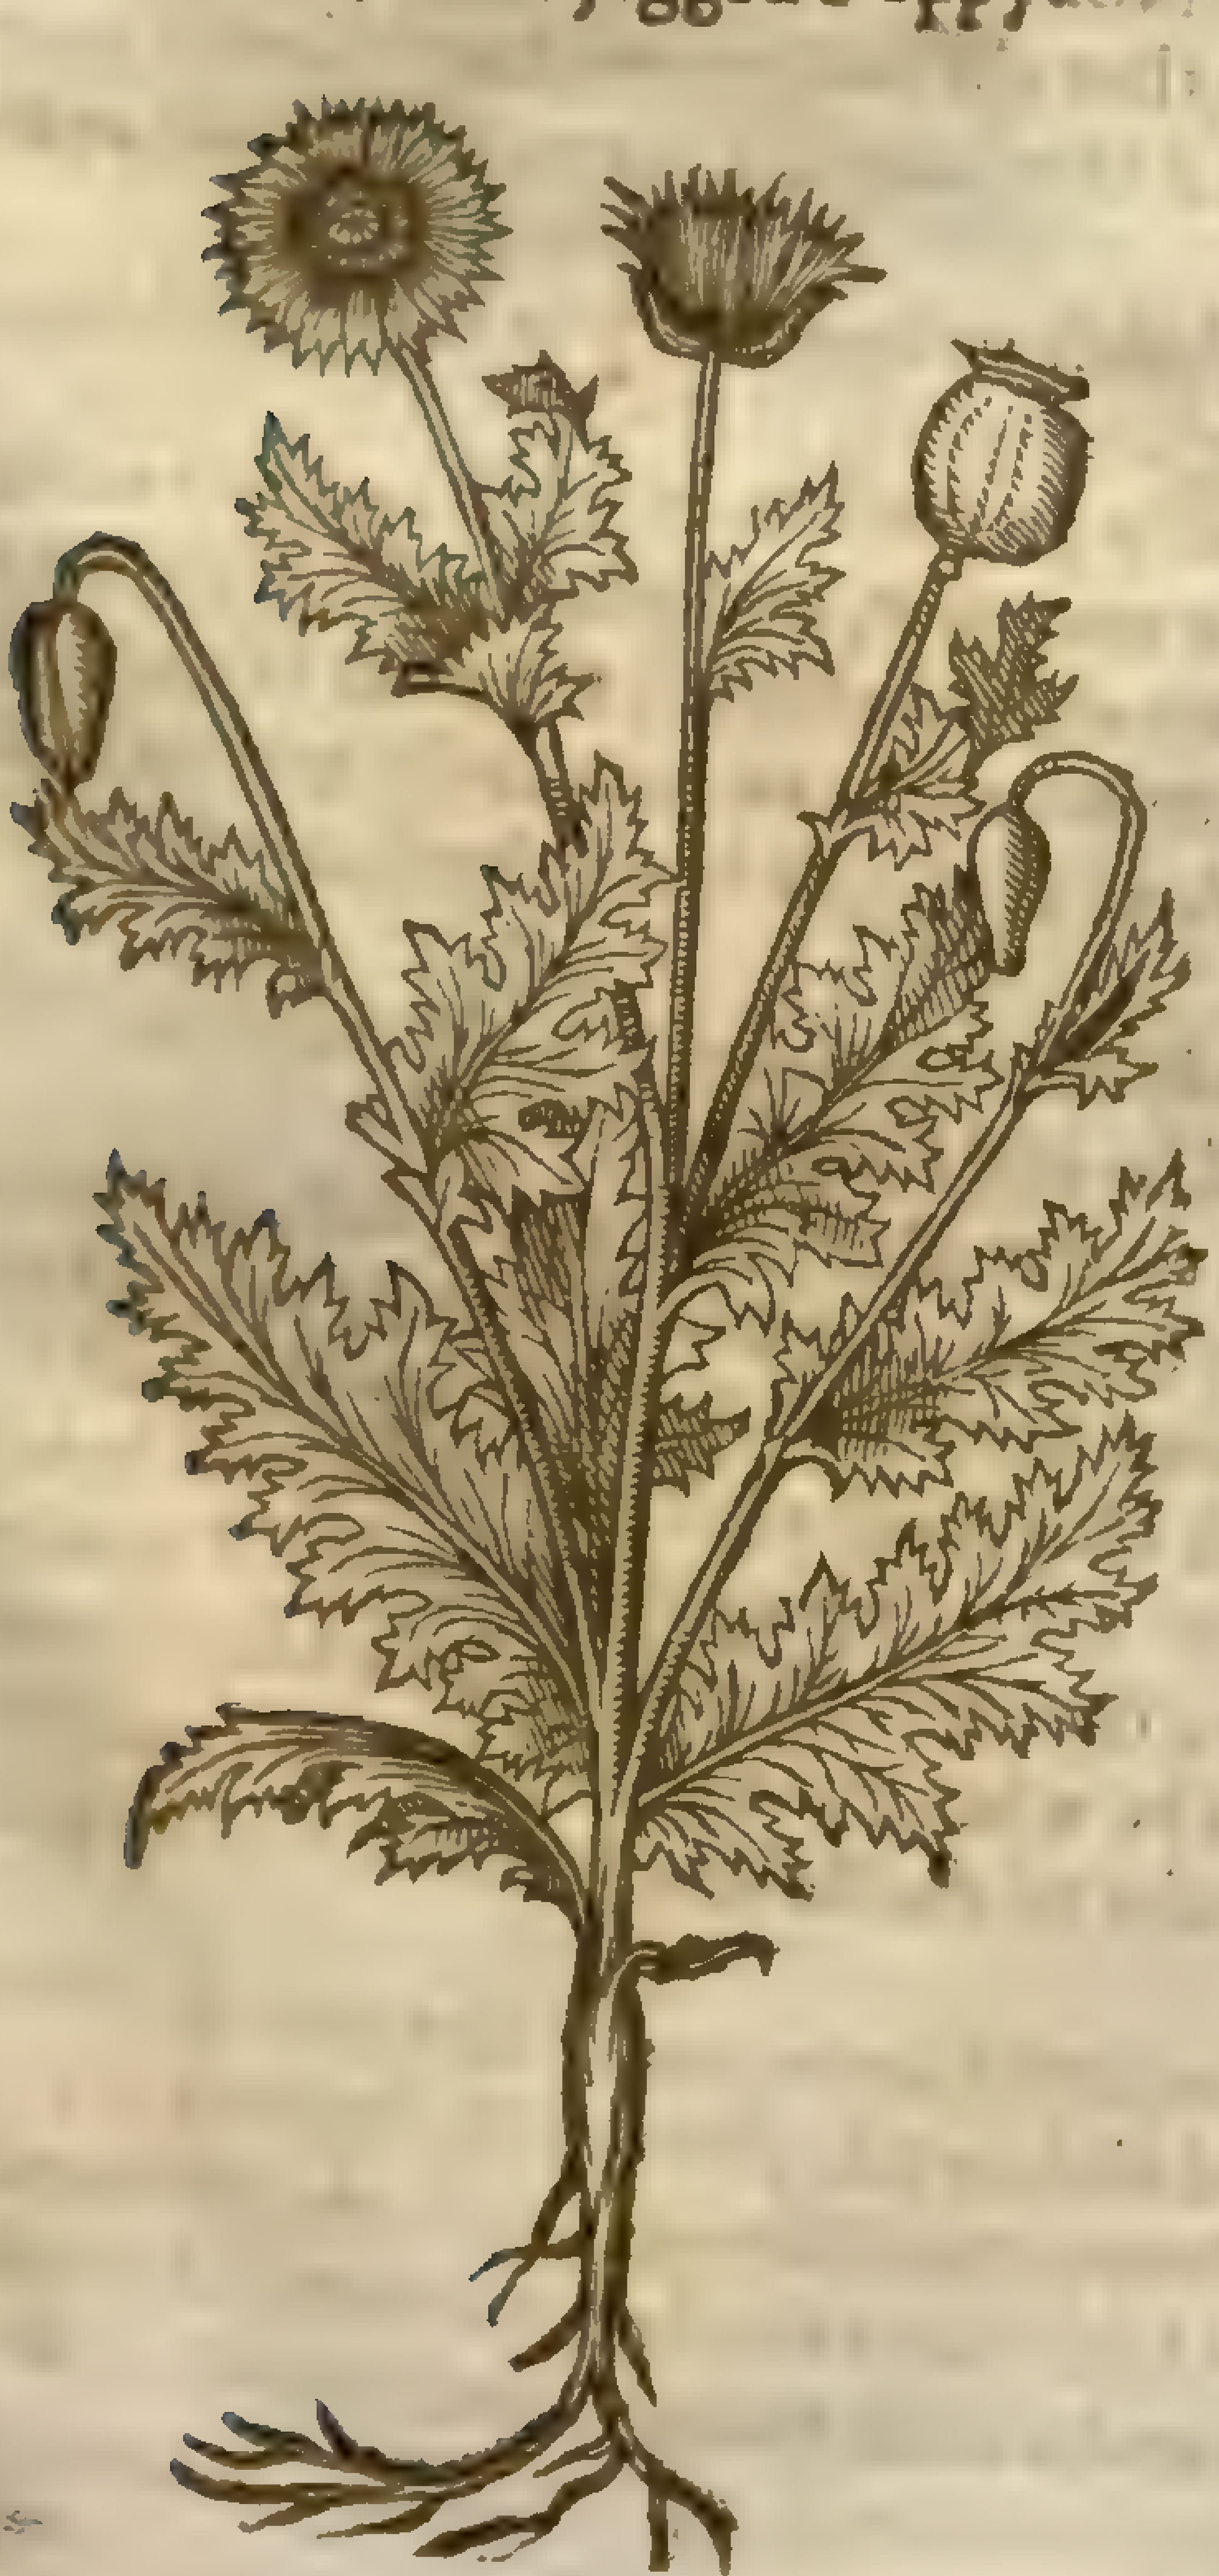
1 *Papauer ſatiuum album.*
White garden Poppy.



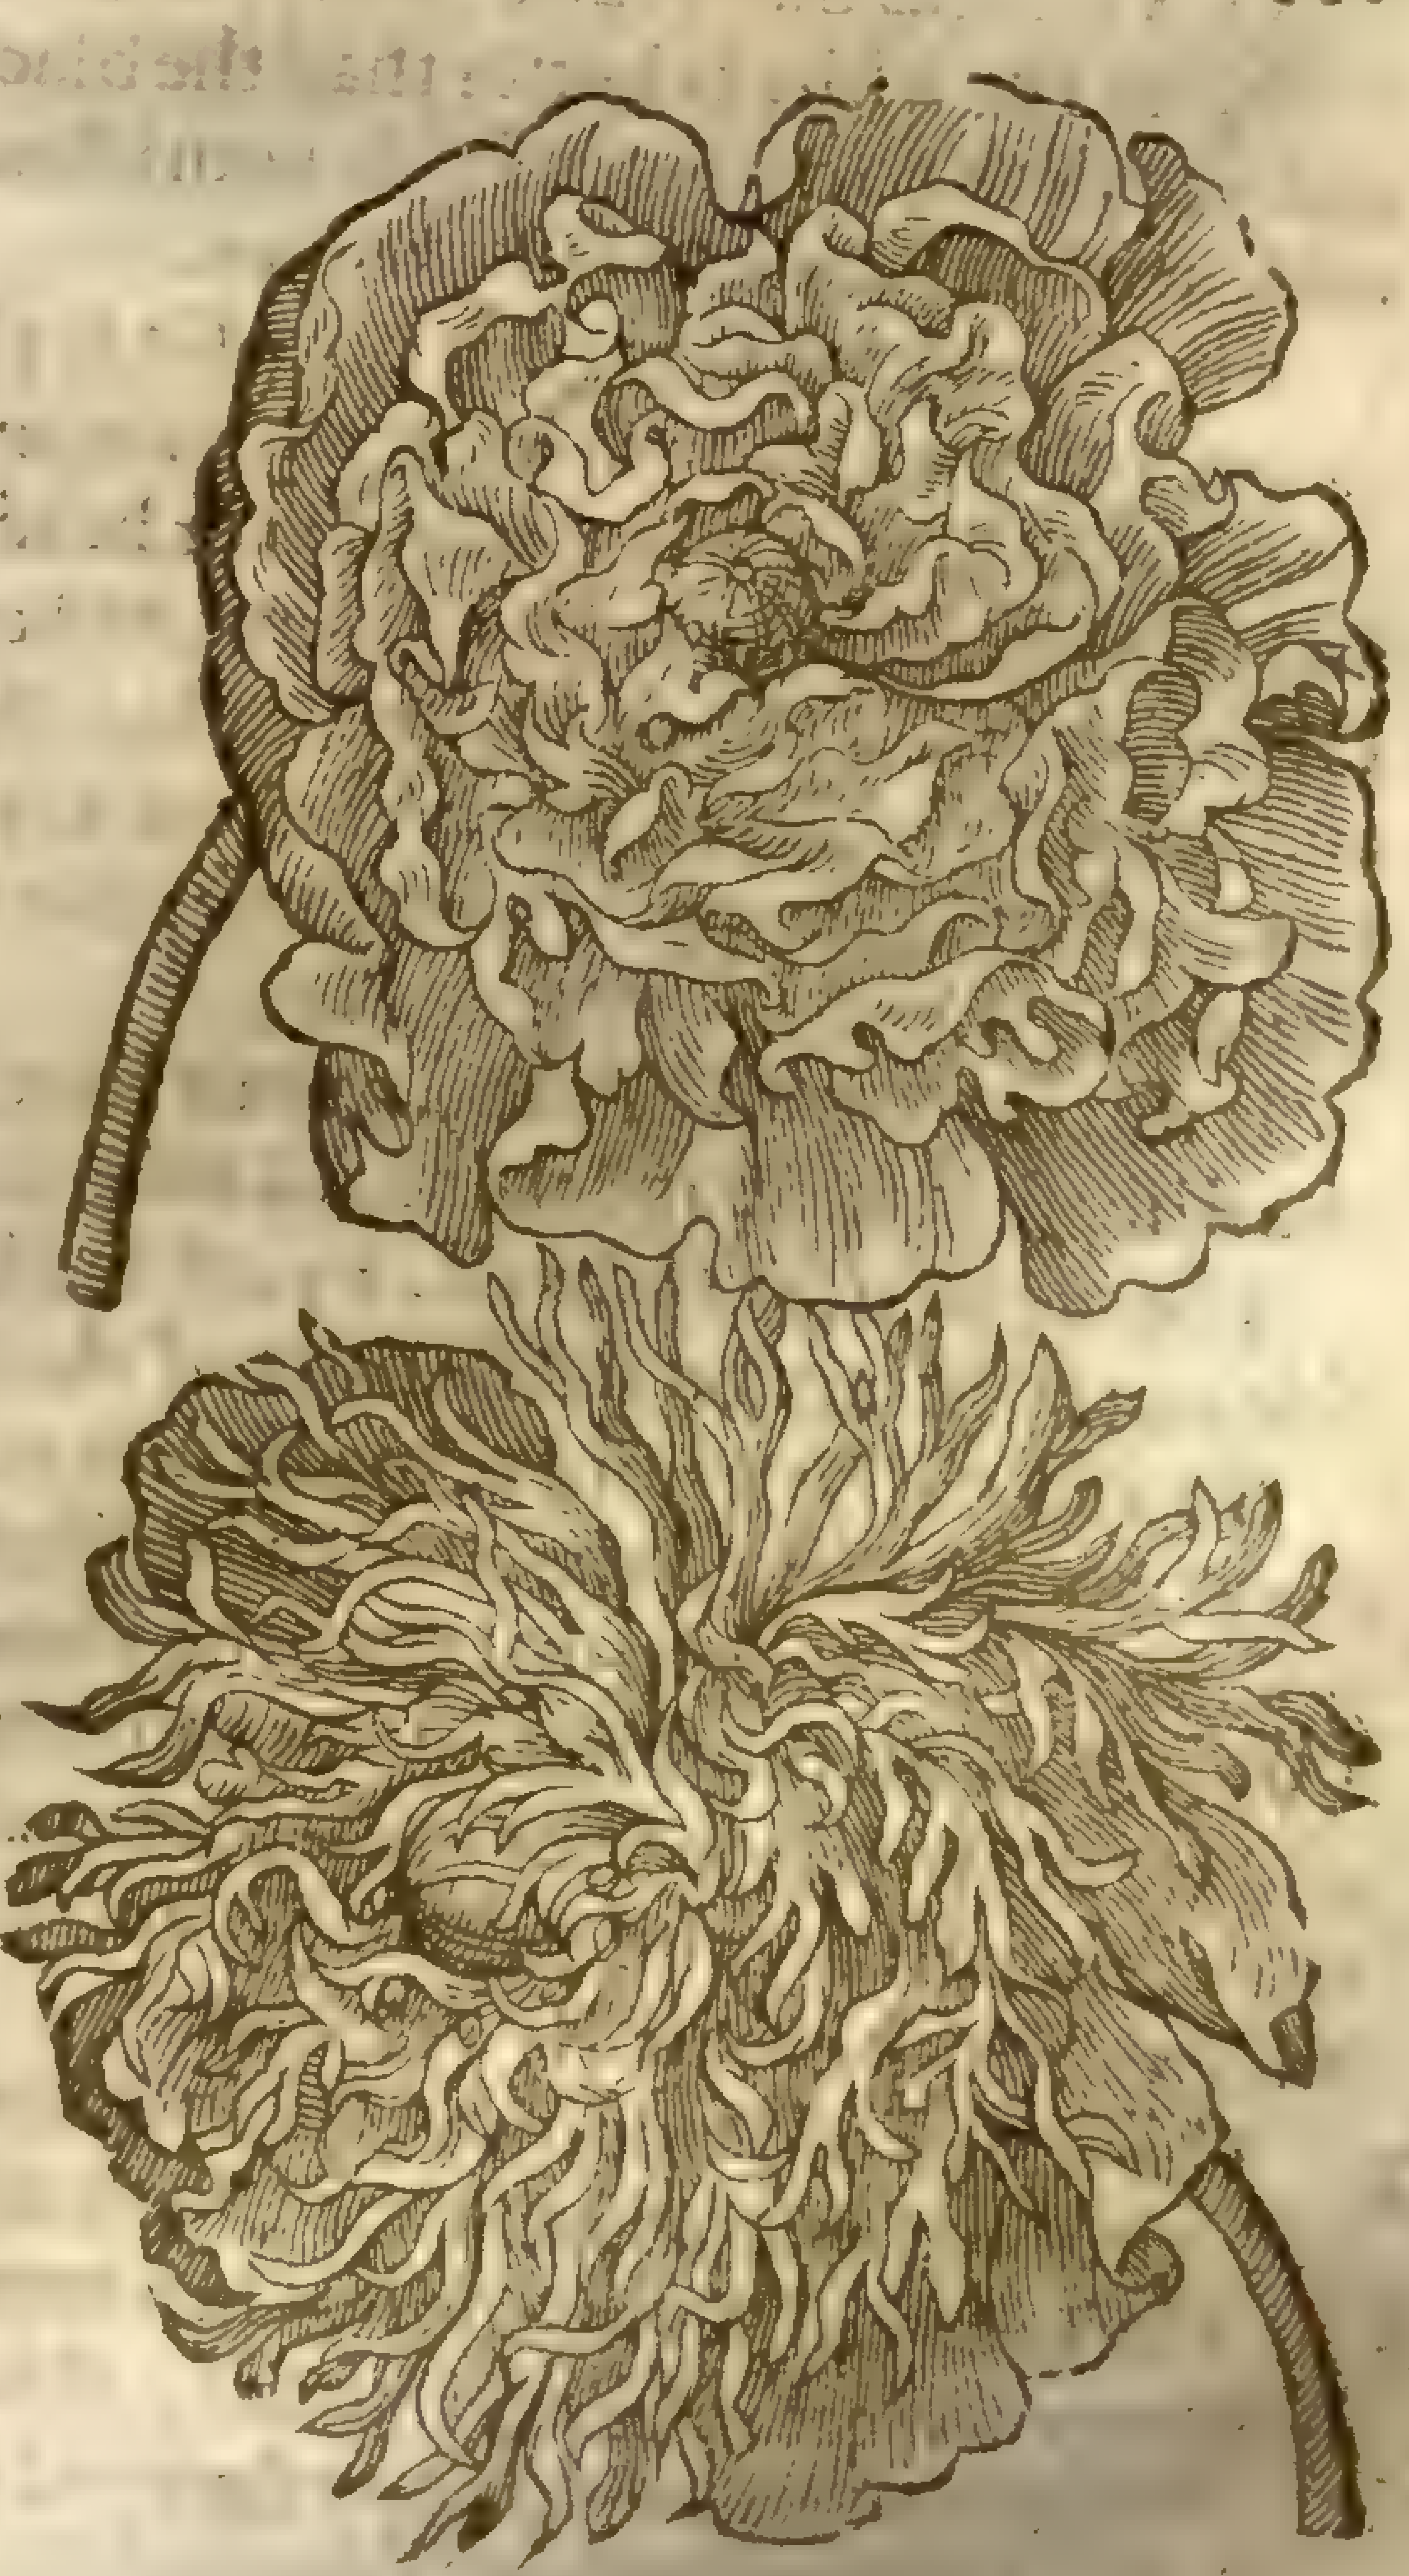
2 *Papauer ſatiuum nigrum.*
Blacke garden Poppy.



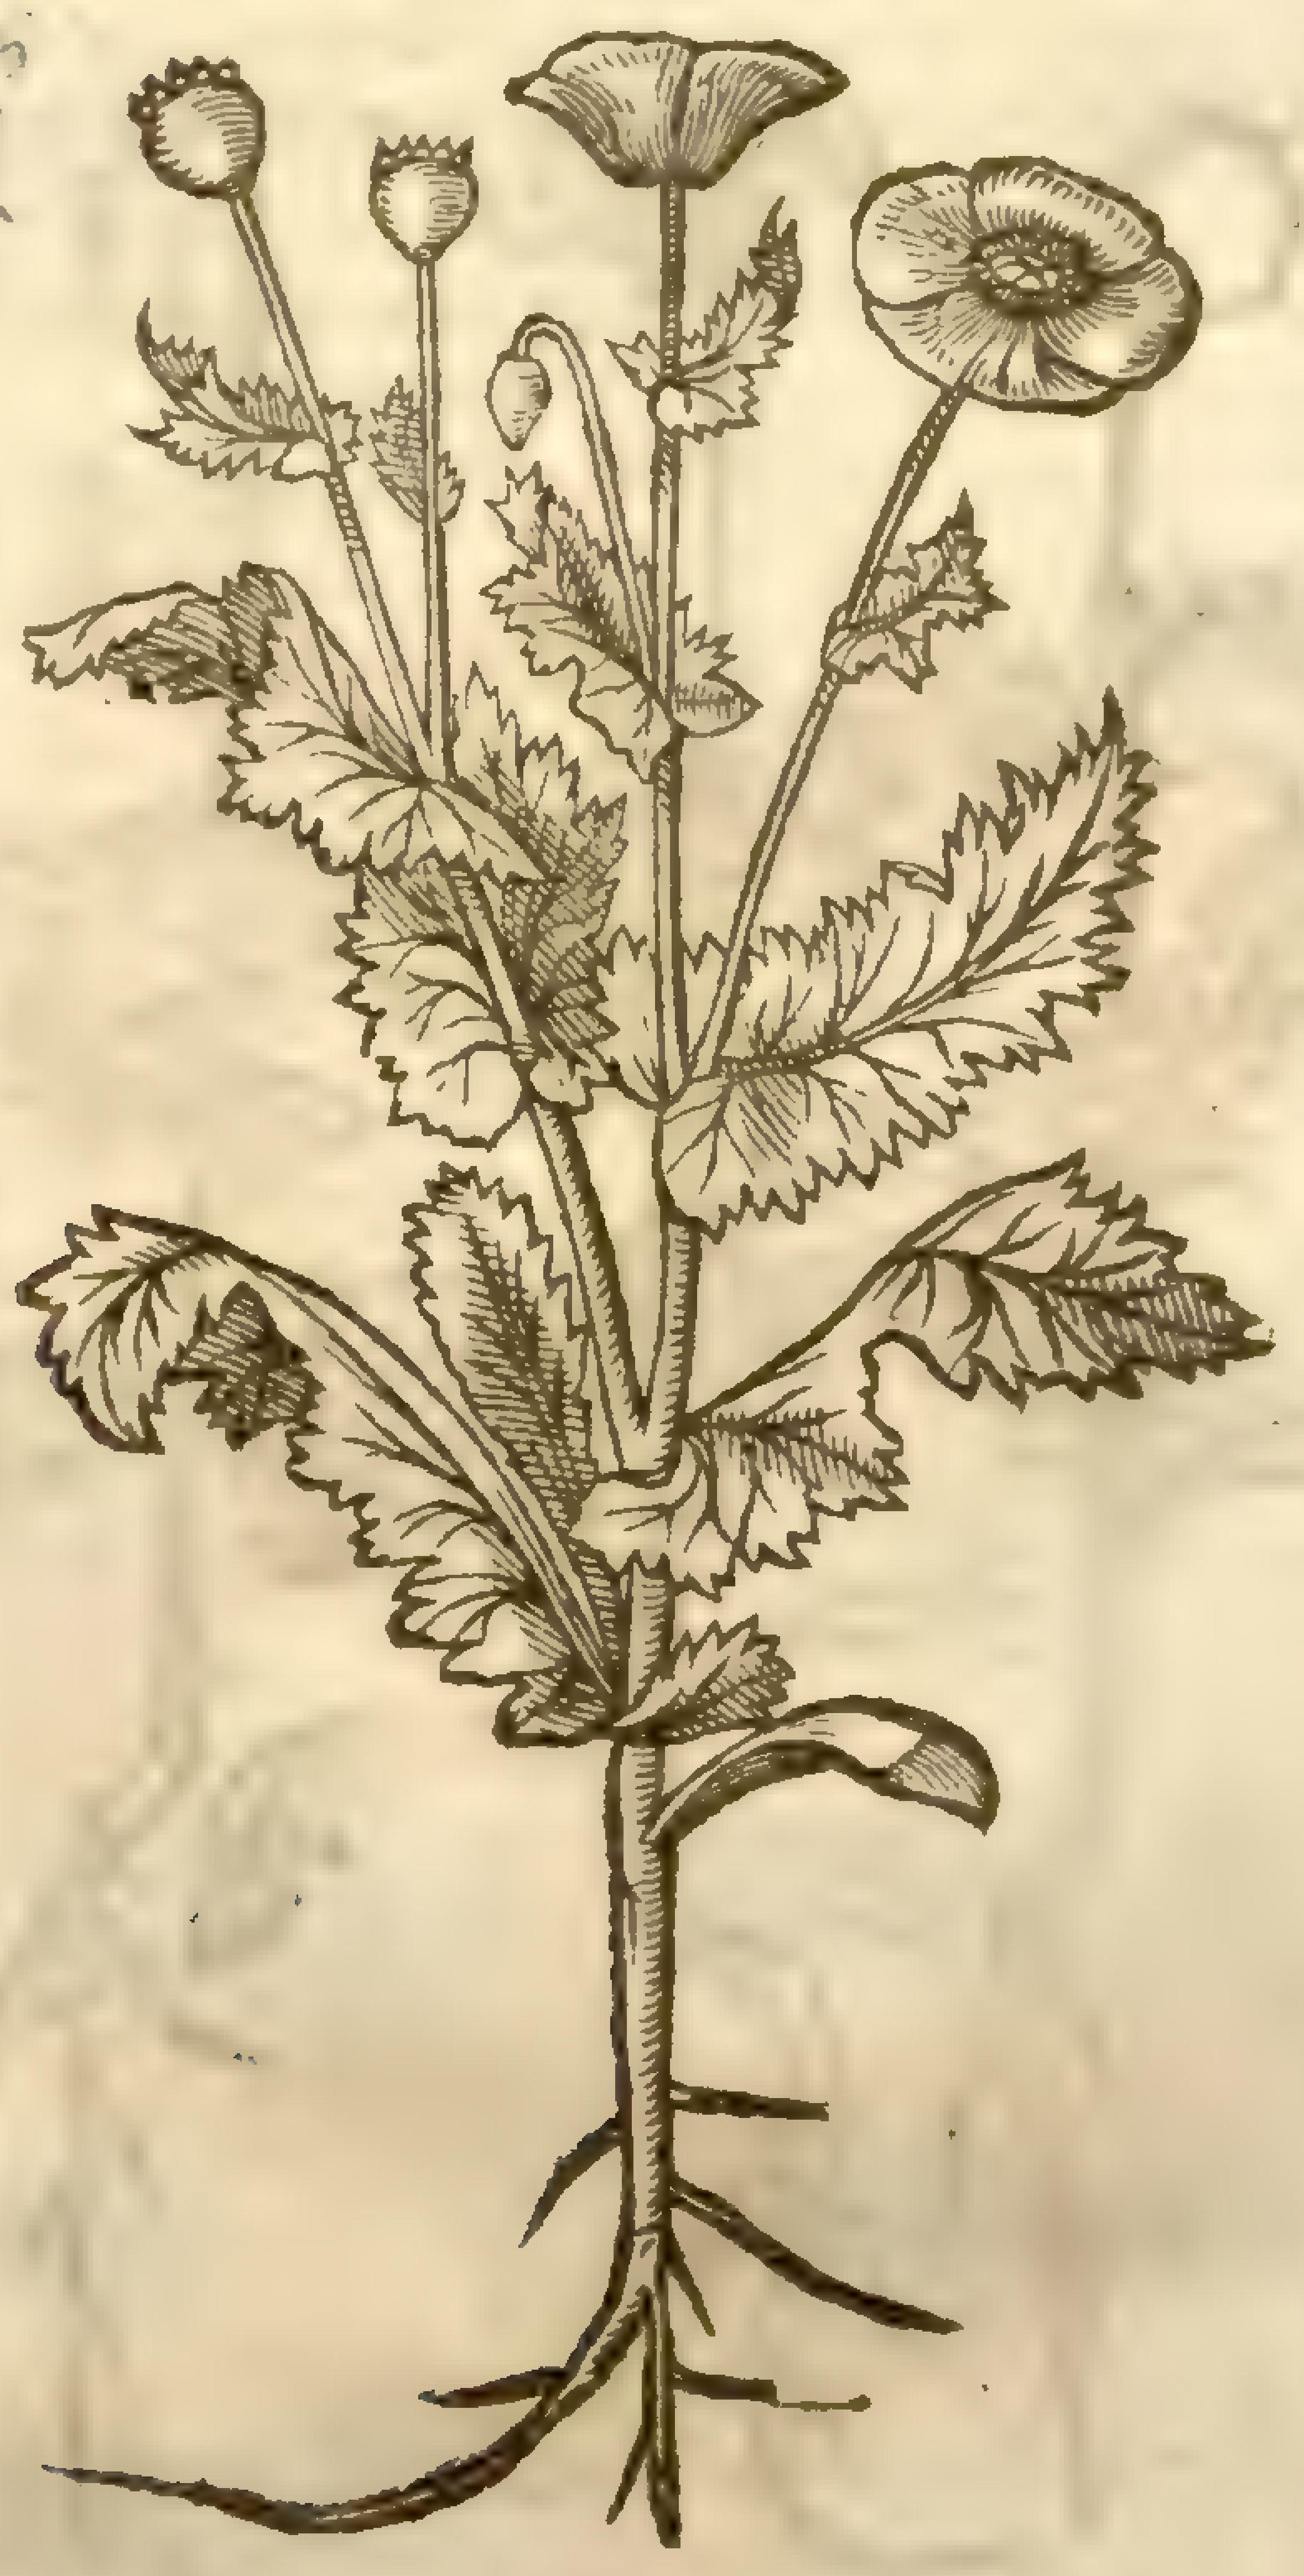
‡ 3 *Papauer fimbriatum album.*
White jagged Poppy.



4 *Papauer flo. multipl. albo & nigro.*
The double white and black Poppy.



‡ 5 *Papauer ſylveſtre.*
Wild Poppy.



P. ſomniferum, b
[illegible]
in p. 3.

5 There is alſo another kind of Poppy which oft times is found wild: the ſtalks, leaues, flours & heads are like, but leſſe than thoſe of the precedent: the floures are of an ouerworne blewiſh purple colour; after which follow heads ſhort and round, which vnder their couer or crowne haue little holes by which the ſeed may fall out; contrarie to the heads of the former, which are cloſe, and open not of themſelues: there is alſo a double one of this kinde.

¶ *The Place.*

Theſe kinds of Poppies are ſowne in gardens, and do afterward come of the fallings of their ſeed.

¶ *The Time.*

They floure moſt commonly in Iune. The ſeed is perfected in Iuly and Auguſt.

¶ *The Names.*

Poppy is called of the Grecians μήκων: of the Latines, *Papauer*: the ſhops keep the Latine name: it is called in high-Dutch, **Magſamen**: in low-Dutch, **Huel** and **Mancop**: in Engliſh, Poppy, and Cheeſebowles: in French, *Pauot*, and *Oliette*, by the Wallons.

The garden Poppy which hath blacke ſeeds, is ſurnamed of *Dioſcorides*, ἄγριον, or wilde; and is as he ſaith called ῥοιὰς, becauſe *Opium* flowes from it: of *Pliny* and the Latines, *Papauer nigrum*, wherof there be many variable colours, and of great beauty, although of euill ſmell, whereupon our gentlewomen call it Ioan Siluer pin.

¶ *The Temperature.*

All the Poppies are cold, as *Galen* teſtifieth in his booke of the faculties of ſimple medicines.

¶ *The Vertues.*

A This ſeed, as *Galen* ſaith in his booke of the faculties of Nouriſhments, is good to ſeaſon bread with, but the white is better than the black. He alſo addeth, that the ſame is cold and cauſeth ſleep, and yeeldeth no commendable nouriſhment to the body: it is often vſed in comfits, ſerued at the table with other junketting diſhes.

B The oile which is preſſed out of it is pleaſant and delightfull to be eaten, & is taken with bread or any other waies with meat, without any ſence of cooling.

C A greater force is in the knobs or heads, which do ſpecially preuaile to moue ſleepe, and to ſtay and repreſſe diſtillations or rheums, and come neere in force to *Opium*, but more gentle. *Opium*, or the condenſed juice of Poppy heads, is ſtrongeſt of all; *Meconium* (which is the juice of the heads and leaues) is weaker. Both of them any waies taken either inwardly, or outwardly applied to the head, prouoke ſleepe. *Opium* ſomewhat too plentifully taken doth alſo bring death, as *Pliny* truly writeth.

D It mitigateth all kind of paines: but it leaueth behinde it oftentimes a miſchiefe worſe than the diſeaſe it ſelfe, and that hard to be cured, as a dead palſie and ſuch like.

E The vſe of it, as *Galen lib.* 11. of medicines according to the places affected, ſaith, is ſo offenſiue to the firme and ſolide parts of the body, as that they had need afterwards to be reſtored.

F So alſo collyries or eye medicines made with *Opium* haue bin hurtfull to many; inſomuch that they haue weakened the eies and dulled the ſight of thoſe that haue vſed it: whatſoeuer is compounded of *Opium* to mitigate the extreame paines of the eares, bringeth hardneſſe of hearing. Wherefore all thoſe medicines and compounds are to bee ſhunned that are to be made of *Opium*, and are not to be vſed but in extreame neceſſitie; and that is, when no other mitigater or aſſwager of paine doth any thing preuaile, as *Galen* in his third booke of medicines, according to the places affected, doth euidently declare.

G The leaues of Poppie boiled in water with a little ſugar and drunke, cauſe ſleep: or if it be boiled without ſugar, and the head, feet, and temples bathed therewith, it doth effect the ſame.

H The heads of Poppie boiled in water with ſugar to a ſyrrup cauſe ſleepe, and are good againſt rheumes and catarrhes that diſtil and fall down from the brain into the lungs, and eaſe the cough.

I The green knops of Poppy ſtamped with barly meale and a little barrows greaſe, help S. *Anthonies* fire, called *Ignis ſacer.*

The leaues, knops, and ſeed ſtamped with vineger, womans milke, and ſaffron, cure an *Eryſipelas*, (another kind of S. *Anthonies* fire) and eaſe the gout mightily, and put in the fundament as a Cliſter, cauſe ſleepe. K

The ſeed of blacke Poppy drunk in wine, ſtoppeth the flux of the belly, and the ouermuch flowing of womens ſickneſſe. L

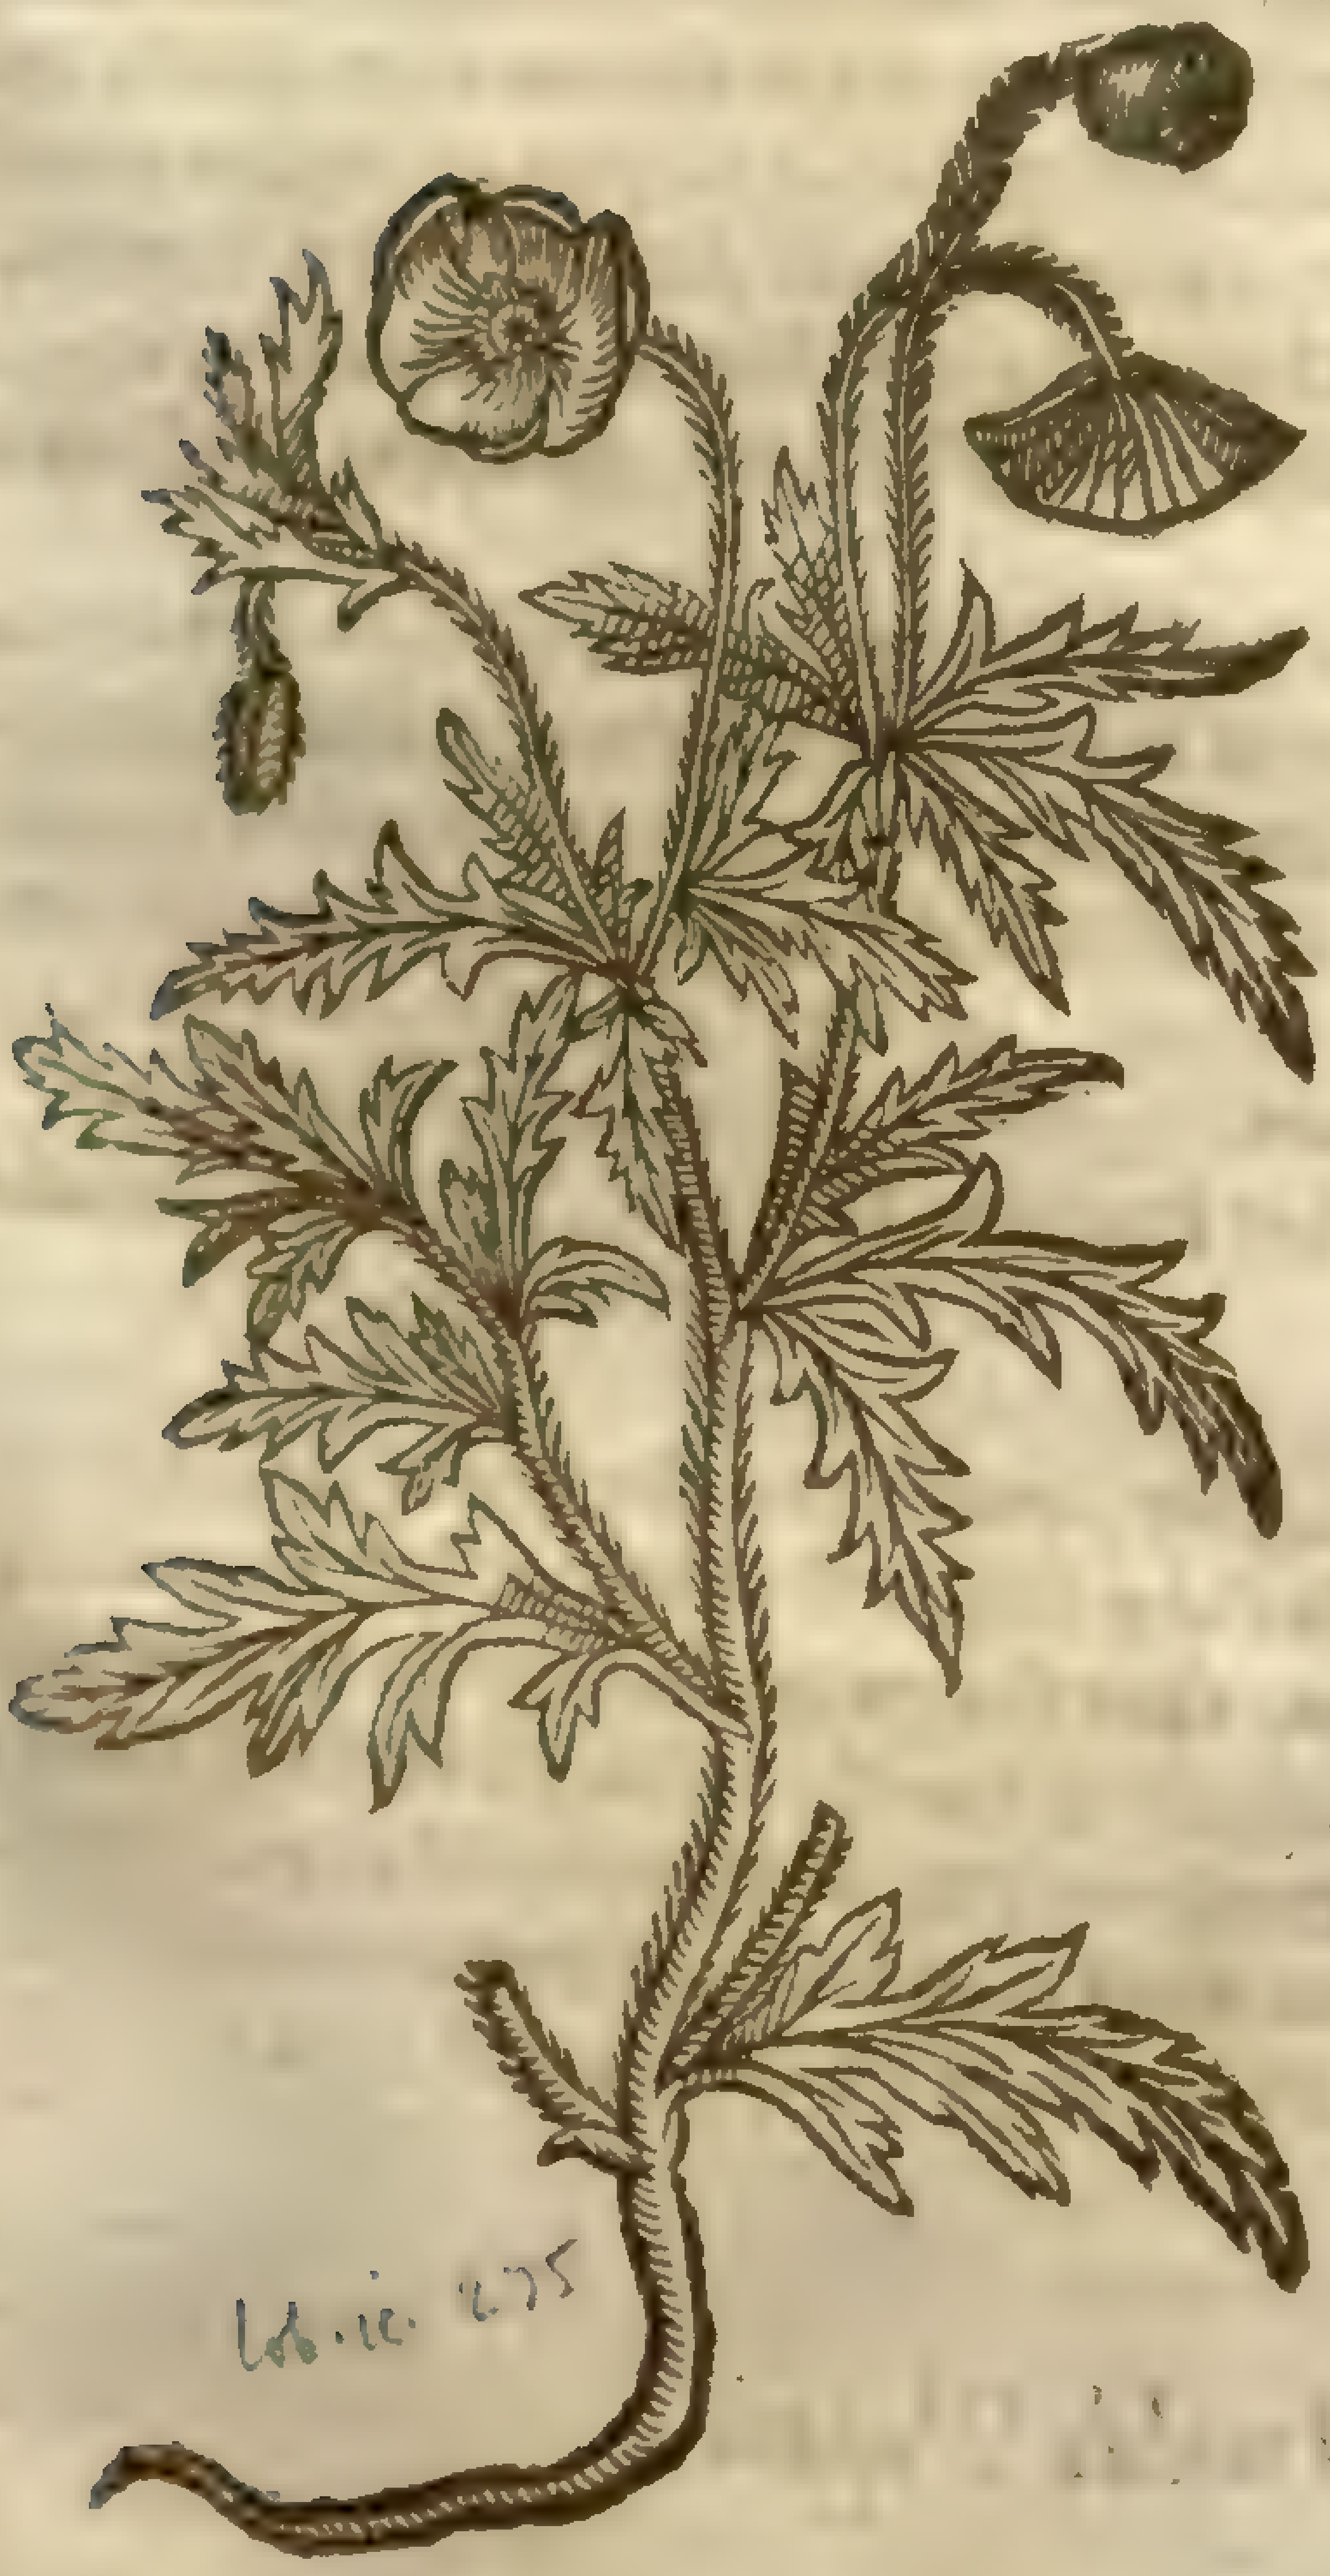
A Caudle made of the ſeeds of white Poppy, or made into Almond milk, and ſo giuen, cauſeth ſleepe. M

† It is manifeſt that this wilde Poppy (which I haue deſcribed in the fift place) is that wherof the compoſition *Diacodium* is to be made; as *Galen* hath at large treated in his ſeuenth book of Medicines according to the places affected. *Crito* alſo, and after him *Them ſon* and *Democritus* doe appoint Ἄγριον or the wilde Poppy to be in the ſame compoſition; and euen the ſame *Democritus* addeth, that it ſhould be that which is not ſowne: and ſuch an one is this, which grows without ſowing. *Ded.* N

CHAP. 74. *Of Corne-Roſe or wilde Poppy.*

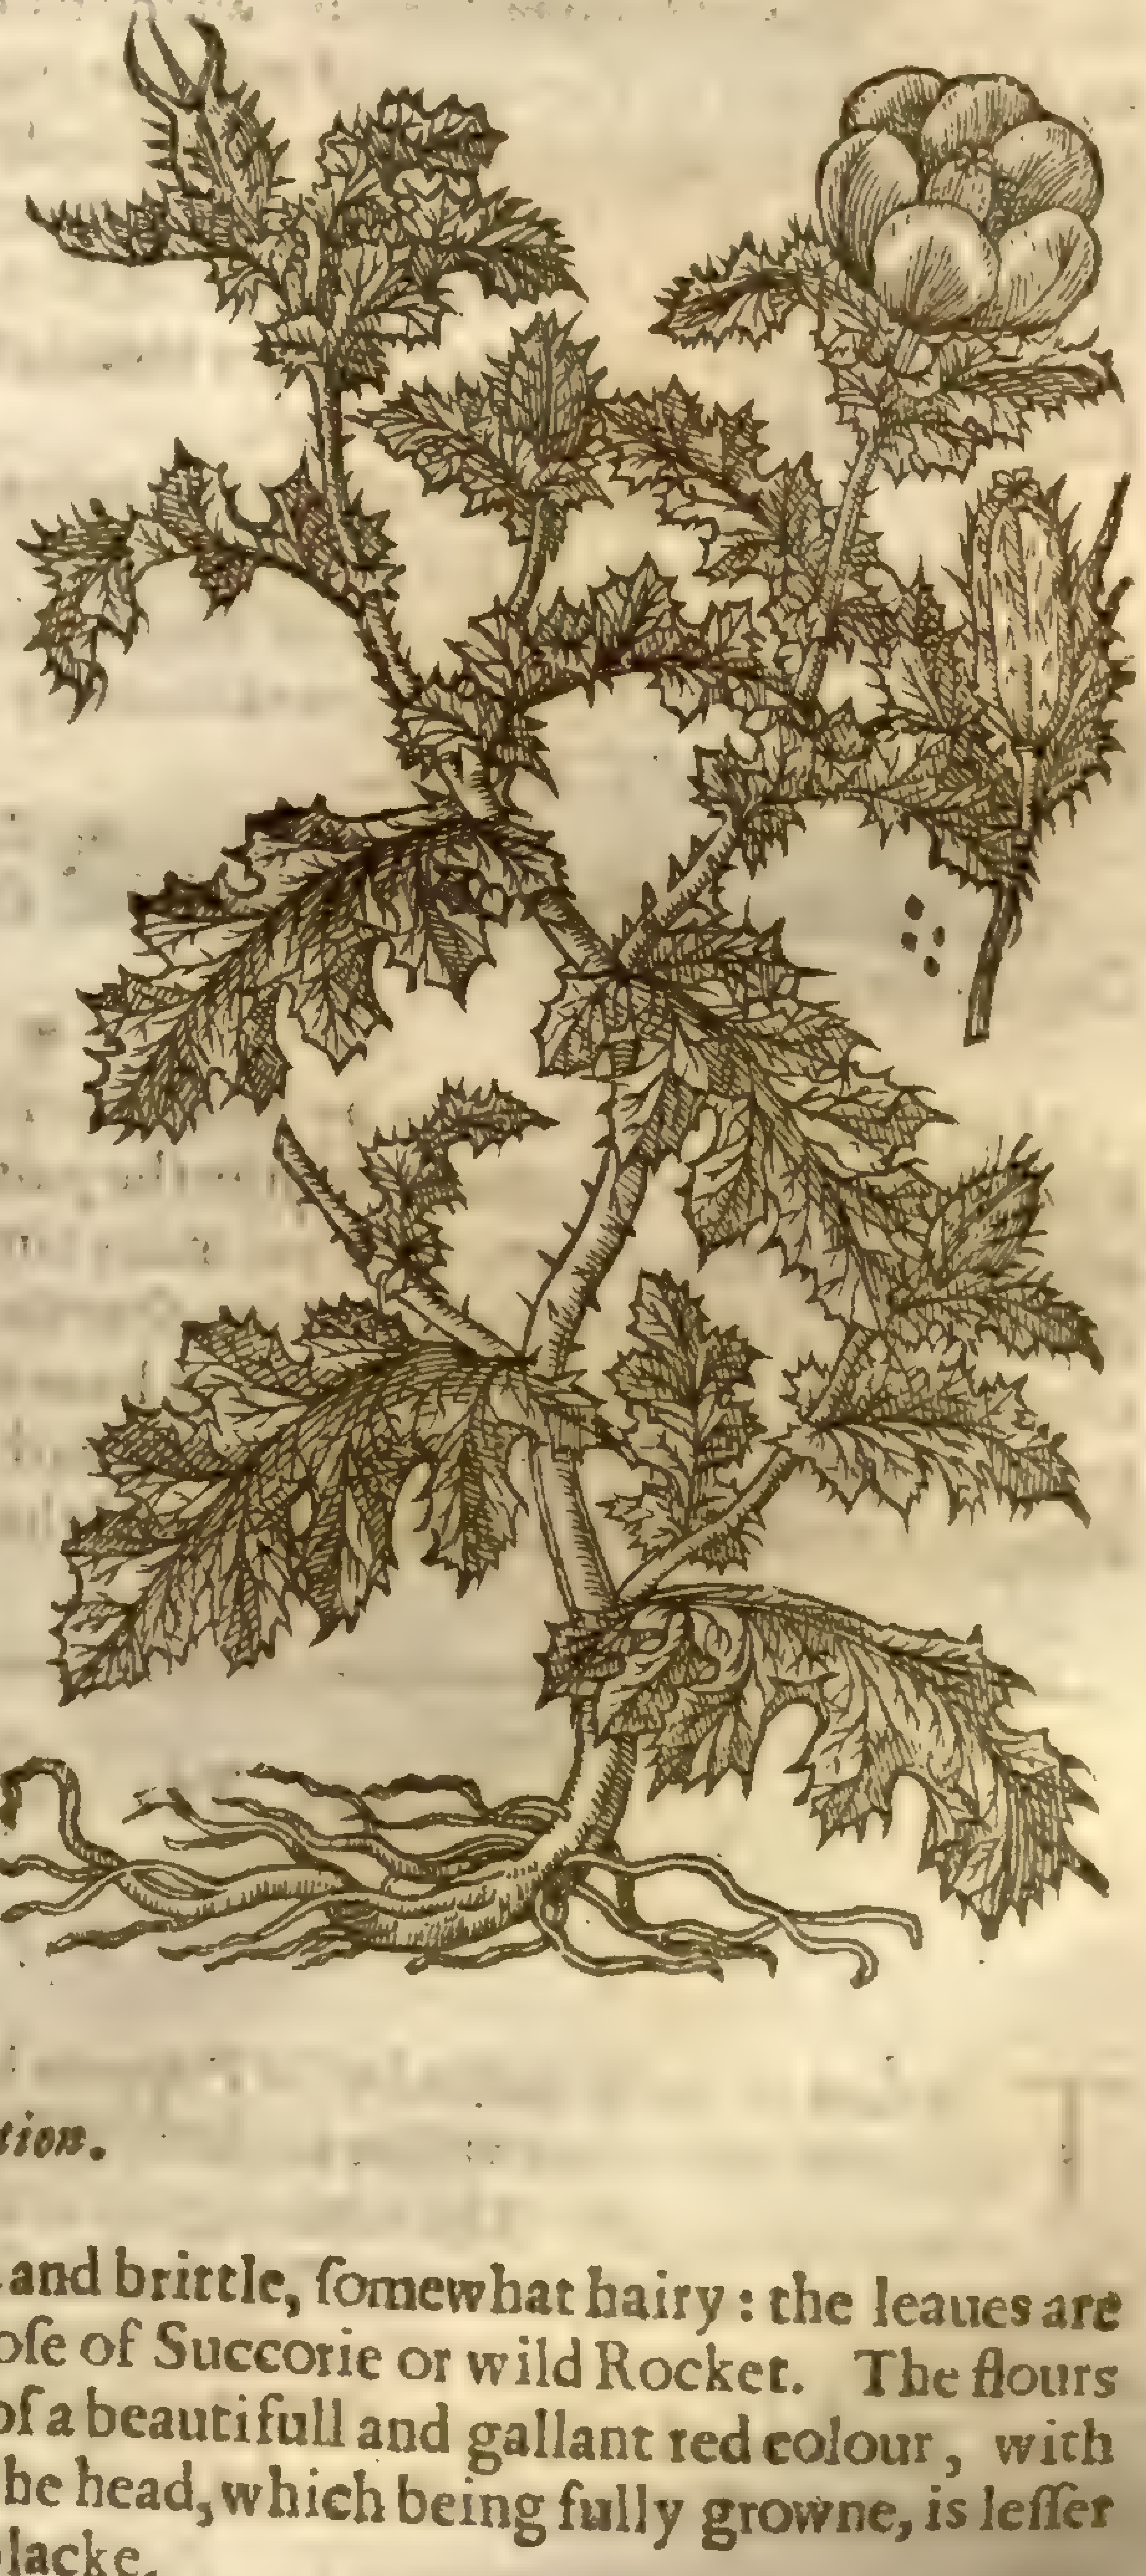
1 *Papauer Rhœas.*
Red Poppy, or Corn-Roſe.

P. Rhœas. Mei. diet p. 3. ll



Lob. ic. 275

2 *Papauer ſpinoſum.*
Prickly Poppy.



¶ *The Deſcription.*

1 THe ſtalks of red Poppy be blacke, tender, and brittle, ſomewhat hairy: the leaues are cut round about with deepe gaſhes like thoſe of Succorie or wild Rocket. The flours grow forth at the tops of the ſtalks, being of a beautifull and gallant red colour, with blackiſh threds compaſſing about the middle part of the head, which being fully growne, is leſſer than that of the garden Poppy: the ſeed is ſmall and blacke.

† 2 There is alſo a kind hereof in all points agreeing with the former, ſauing that the flours of this are very double and beautifull, and therein only conſiſts the difference. †

‡ 3

‡ 3 There is a ſmall kinde of red Poppy growing commonly wilde together with the firſt deſcribed, which is leſſe in all parts, and the floures are of a fainter or ouerworn red, inclining ſomwhat to orange.

4 Beſides theſe there is another rare plant, which all men, and that very fitly, haue referred to the kinds of Poppy. This hath a ſlender long and fibrous root, from which ariſes a ſtalk ſome cubit high, diuided into ſundry branches, round, creſted, prickly, and full of a white pith. The leaues are diuided after the manner of horned Poppy, ſmooth, with white veines and prickly edges. The floure is yellow, and conſiſts of foure or fiue leaues; after which ſucceeds a longiſh head, being either foure, fiue, or ſix cornered, hauing many yellow threds incompaſſing it: the head whileſt it is tender, is reddiſh at the top, but being ripe it is blacke, and is ſet with many and ſtiffe pricks. The ſeed is round, blacke, and pointed, being ſix times as big as that of the ordinarie Poppy. ‡

¶ *The Place.*

They grow in earable lands, among wheat, ſpelt, rie, barley, oats, and other graine, and in the borders of fields. ‡ The double red and prickly Poppy are not to be found in this kingdome, vnleſſe in the gardens of ſome prime Herbariſts.

¶ *The Time.*

The fields are garniſhed and ouerſpred with theſe wilde Poppies in Iune and Auguſt.

¶ *The Names.*

† Wilde Poppy is called in Greeke of *Dioſcorides*, Μήκων ῥοιάς: in Latine, *Papauer erraticum*: *Gaza*, according to the Greeke, nameth it *Papauer fluidum*: as alſo *Lobel*, who calls it *Pap. Rhœas*, becauſe the floure thereof ſoon falls away: which name *Rhœas* may for the ſame cauſe be common not only to theſe, but alſo to the others, if it be ſo called of the ſpeedy falling of the floures: but if it be ſyrnamed *Rhœas*, of the falling away of the ſeed (as it appeareth) then ſhall it be proper to that which is deſcribed in the fift place in the foregoing chapter, out of whoſe heads the ſeed eaſily & quickly falls; as it doth alſo out of this, yet leſſe manifeſtly. They name it in French *Cocquelicot*, *Conſanons*, *Pauot ſauvage*: in Dutch, **Collen bloemen**, **Coren roſen**: in high-Dutch, **Klapper Roſen**: in Engliſh, red Poppy, and Corn-roſe.

‡ 4 Some haue called this *Ficus infernalis*, from the Italian name *Figo del inferno*. But *Cluſius* and *Bauhine* haue termed it *Papauer ſpinoſum*: and the later of them would haue it, & that not without good reaſon, to be *Glaucium* of *Dioſcorides, lib.* 3. *cap.* 100. And I alſo probably coniecture it to be the *Hippomanes* of *Crateuas*, mentioned by the Greeke Scholiaſt of *Theocritus*, as I haue formerly briefly declared, Chap. *62*.

¶ *The Temperature.*

The facultie of the wild Poppies is like that of the other Poppies, that is to ſay, cold, and cauſing ſleepe.

¶ *The Vertues.*

Moſt men being led rather by falſe experiments than reaſon, commend the floures againſt the Pleuriſie, giuing to drinke as ſoon as the pain comes, either the diſtilled water, or ſyrrup made by often infuſing the leaues. And yet many times it happens, that the paine ceaſeth by that meanes, though hardly ſometimes, by reaſon that the ſpittle commeth vp hardly and with more difficulty, eſpecially in thoſe that are weake and haue not a ſtrong conſtitution of body. *Baptiſta Sardus* might be counted the author of this error, who hath written, That moſt men haue giuen the floures of this Poppy againſt the pain of the ſides; and that it is good alſo againſt the ſpitting of bloud.

Chap. 75. *Of baſtard wilde Poppie.*

¶ *The Deſcription.*

The firſt of theſe baſtard wild Poppies hath ſlender weake ſtems a foot high, rough and hairie, ſet with leaues not vnlike to thoſe of Rocket, made of many ſmal leaues deeply cut or jagged about the edges. The floures grow at the top of the ſtalkes, of a red colour, with ſome ſmall blackneſſe toward the bottom. The ſeed is ſmall, contained in little round knobs. The root is ſmal and threddy.

2 The ſecond is like the firſt, ſauing that the cods hereof be long, and the other more round, wherein the difference doth conſiſt.

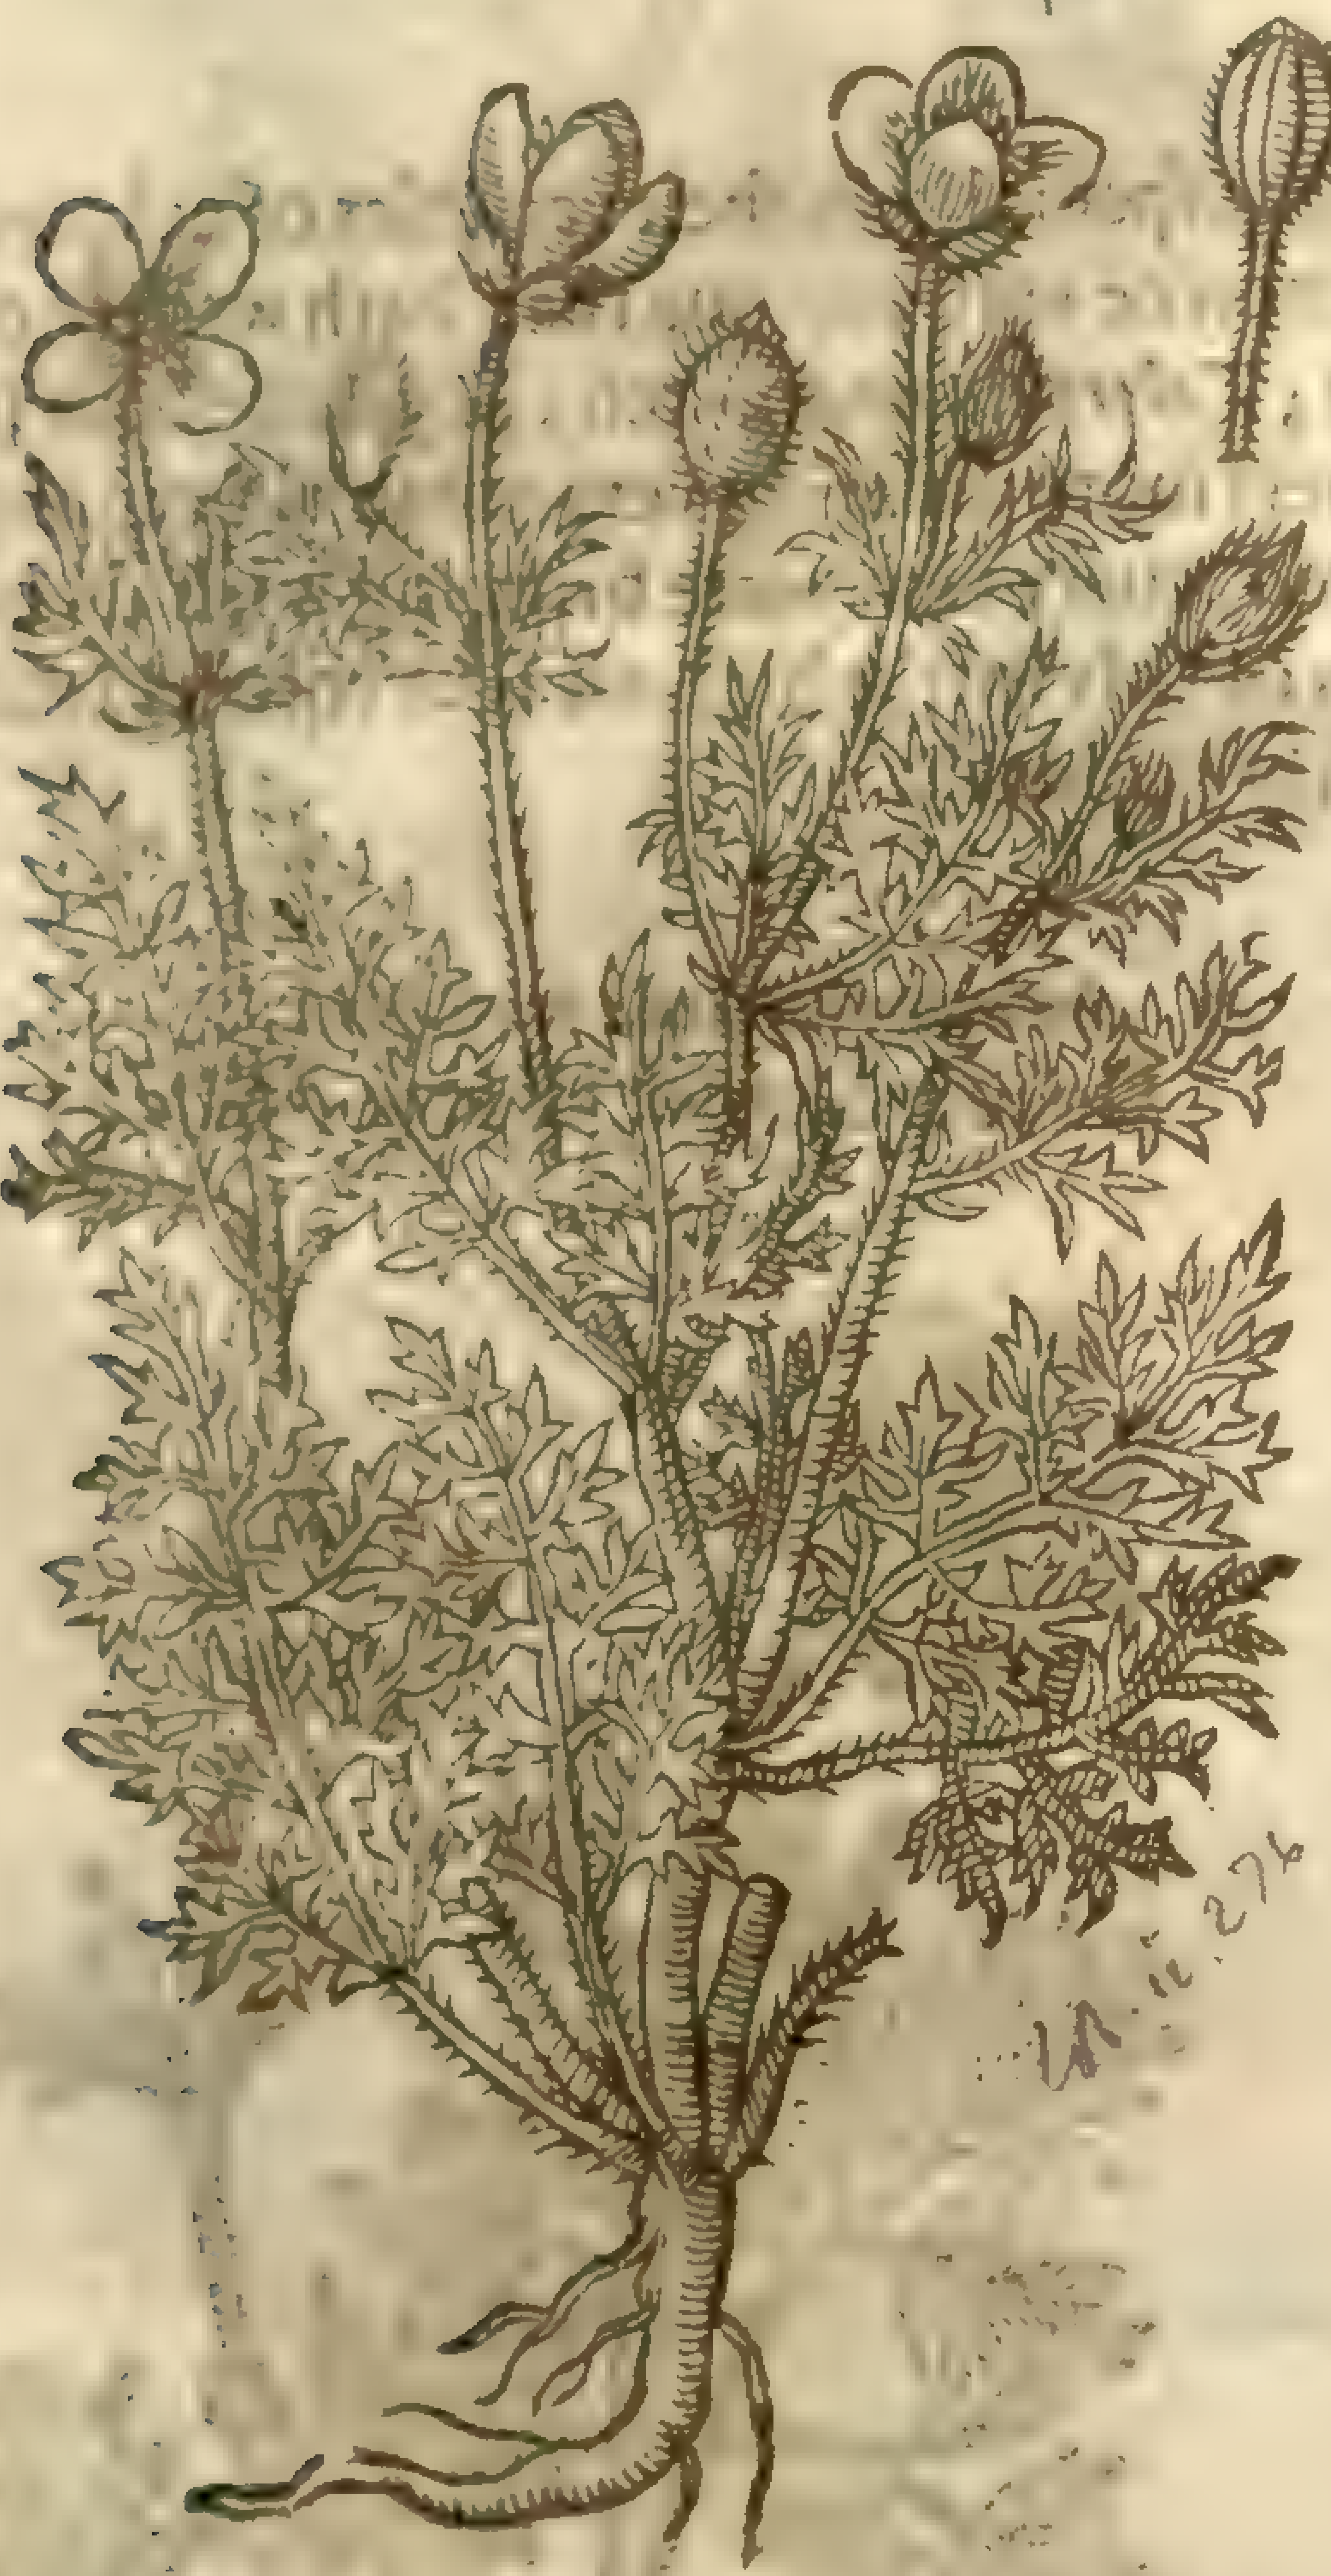
¶ *The Place.*

Theſe plants grow in the Corne fields in Sommerſet ſhire, and by the hedges and high-wayes, as ye trauell from London to Bathe. *Lobel* found it growing in the next field vnto a village in Kent called Southfleet, my ſelfe being in his company, of purpoſe to diſcouer ſome ſtrange plants not hitherto written of.

‡ Mr *Robert Lorkin* and I found both theſe growing in Chelſey fields, as alſo in thoſe belonging to Hamerſmith: but the ſhorter headed one is a floure of a more elegant colour, and not ſo plentifull as the other.

1 *Argemone capitulo torulo.*
Baſtard wilde Poppy.

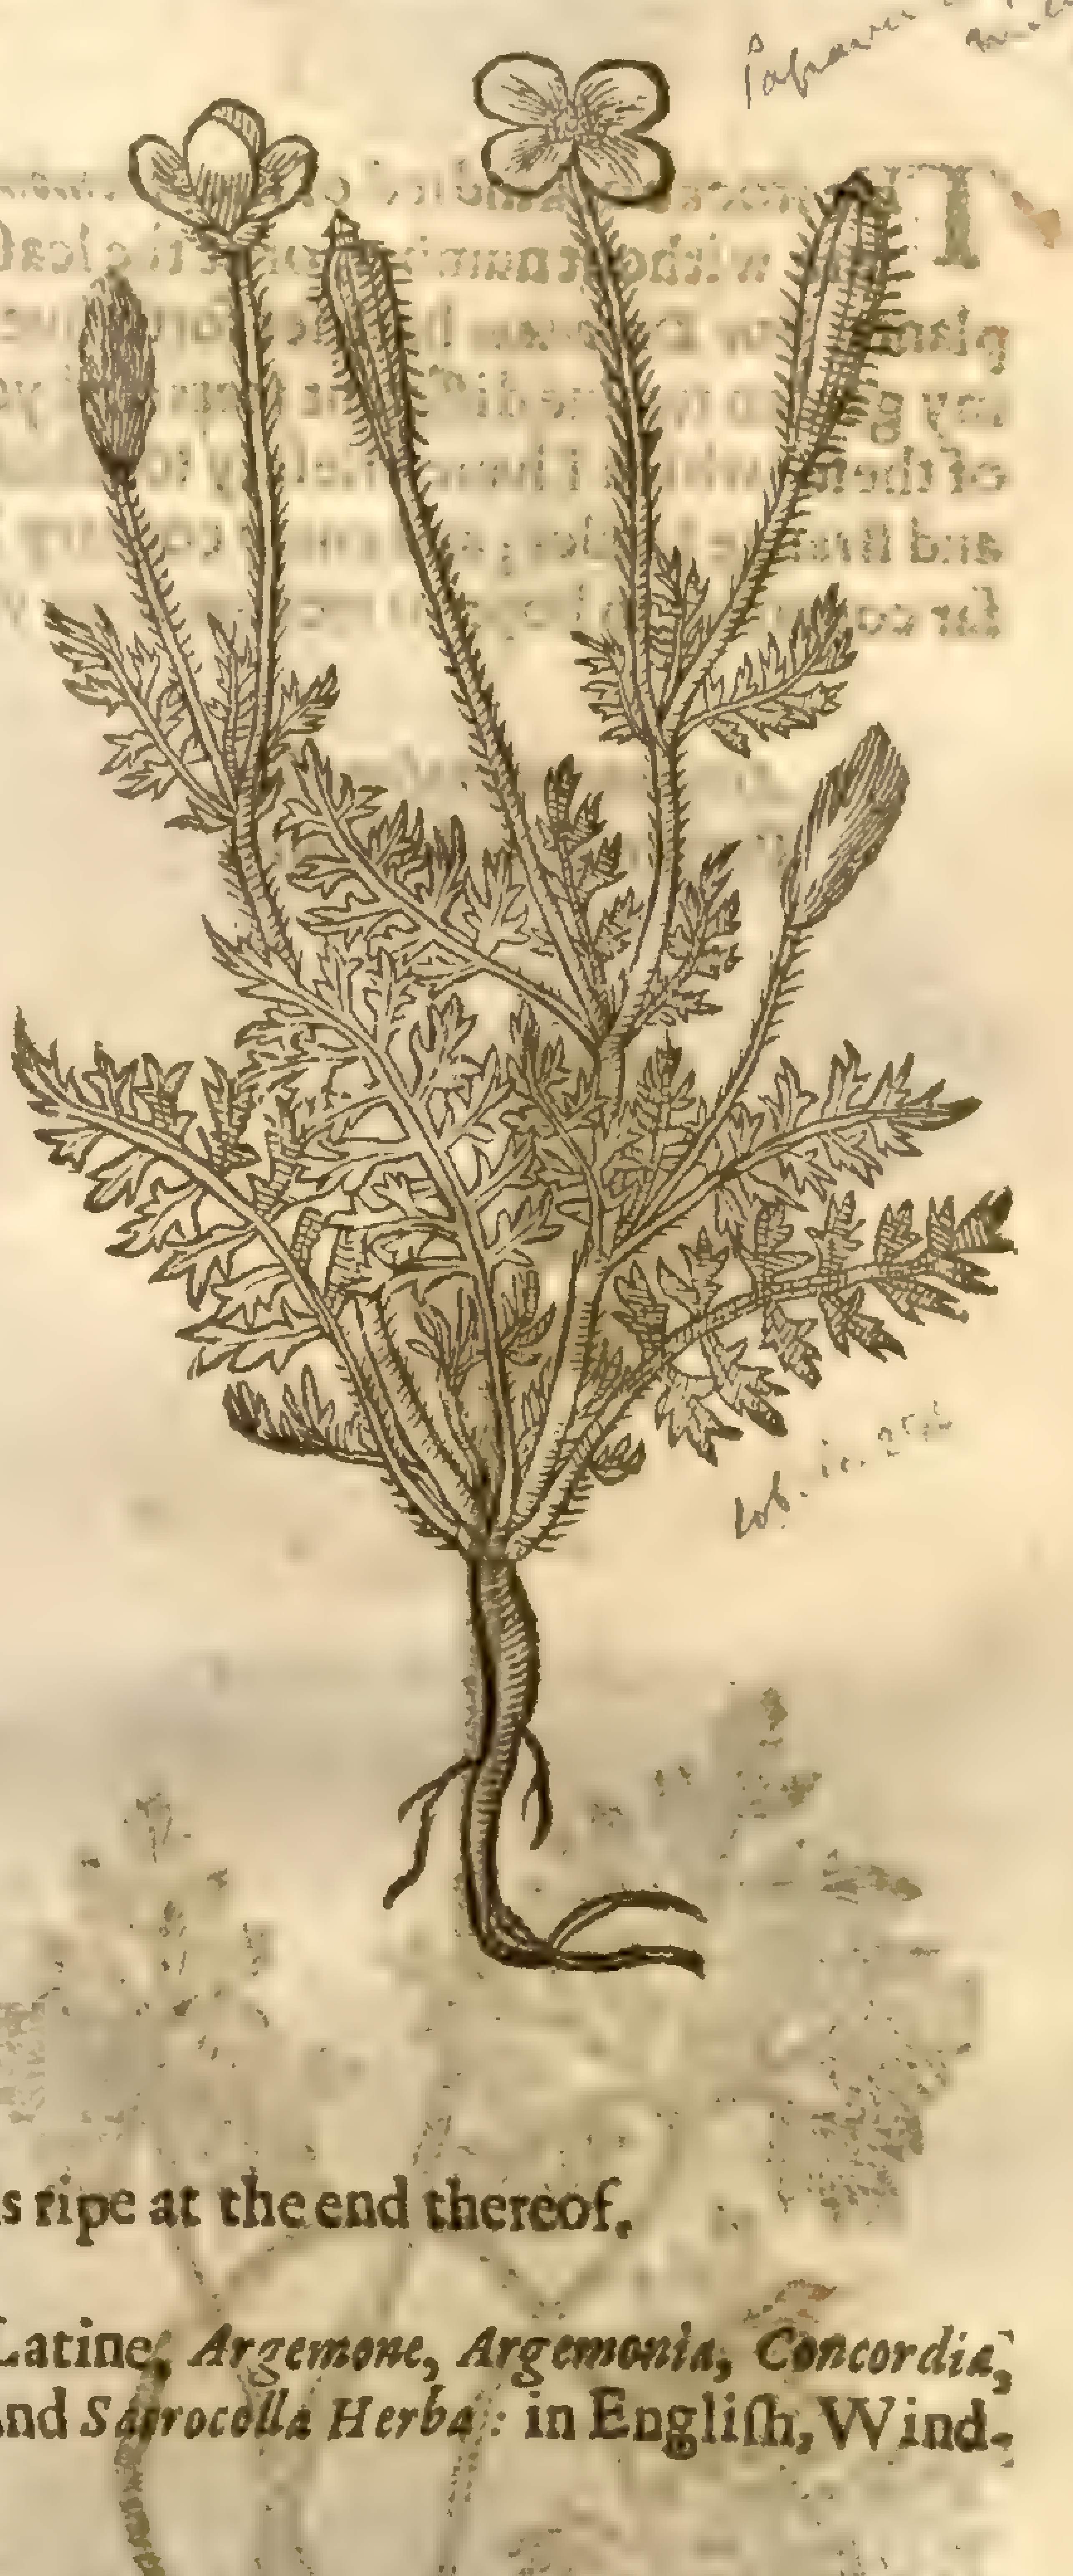
Papaver hybridum



Lob. ic. 276

2 *Argemone capitulo longiore.*
Long codded wilde Poppy.

Papaver argemone



Lob. ic. 276

¶ *The Time.*

They floure in the beginning of Auguſt, and their ſeed is ripe at the end thereof.

¶ *The Names.*

The Baſtard wilde Poppy is called in Greeke, Ἀργεμώνη: in Latine, *Argemone, Argemonia, Concordia, Concordalis*, and *Herba liburnica*: of ſome, *Pergalium, Arſela*, and *Sarrocolla Herba*: in Engliſh, Windroſe, and baſtard wilde Poppy.

¶ *The Temperature.*

They are hot and dry in the third degree.

¶ *The Vertues.*

A The leaues ſtamped, and the juyce dropped into the eies eaſe the inflammation thereof; and cure the diſeaſe of the eye called *Argema*, whereof it tooke his name: which diſeaſe when it happeneth on the blacke of the eye it appeares white; and contrariwiſe when it is in the white then it appeareth blacke of colour.

B The leaues ſtamped and bound vnto the eies or face that are blacke or blew by meanes of ſome blow or ſtripe, do perfectly take it away. The dry herbe ſteeped in warme water worketh the like effect.

C The leaues and roots ſtamped, and the juice giuen in drinke, helpe the wringings or gripings of the belly. The dry herbe infuſed in warme water doth the ſame effectually.

D The herbe ſtamped cureth any wound, vlcer, canker, or fiſtula, being made vp into an vnguent or ſalue, with oyle, wax, and a little turpentine.

E The juyce taken in the weight of two drammes, with wine, mightily expelleth poyſon or venome.

The

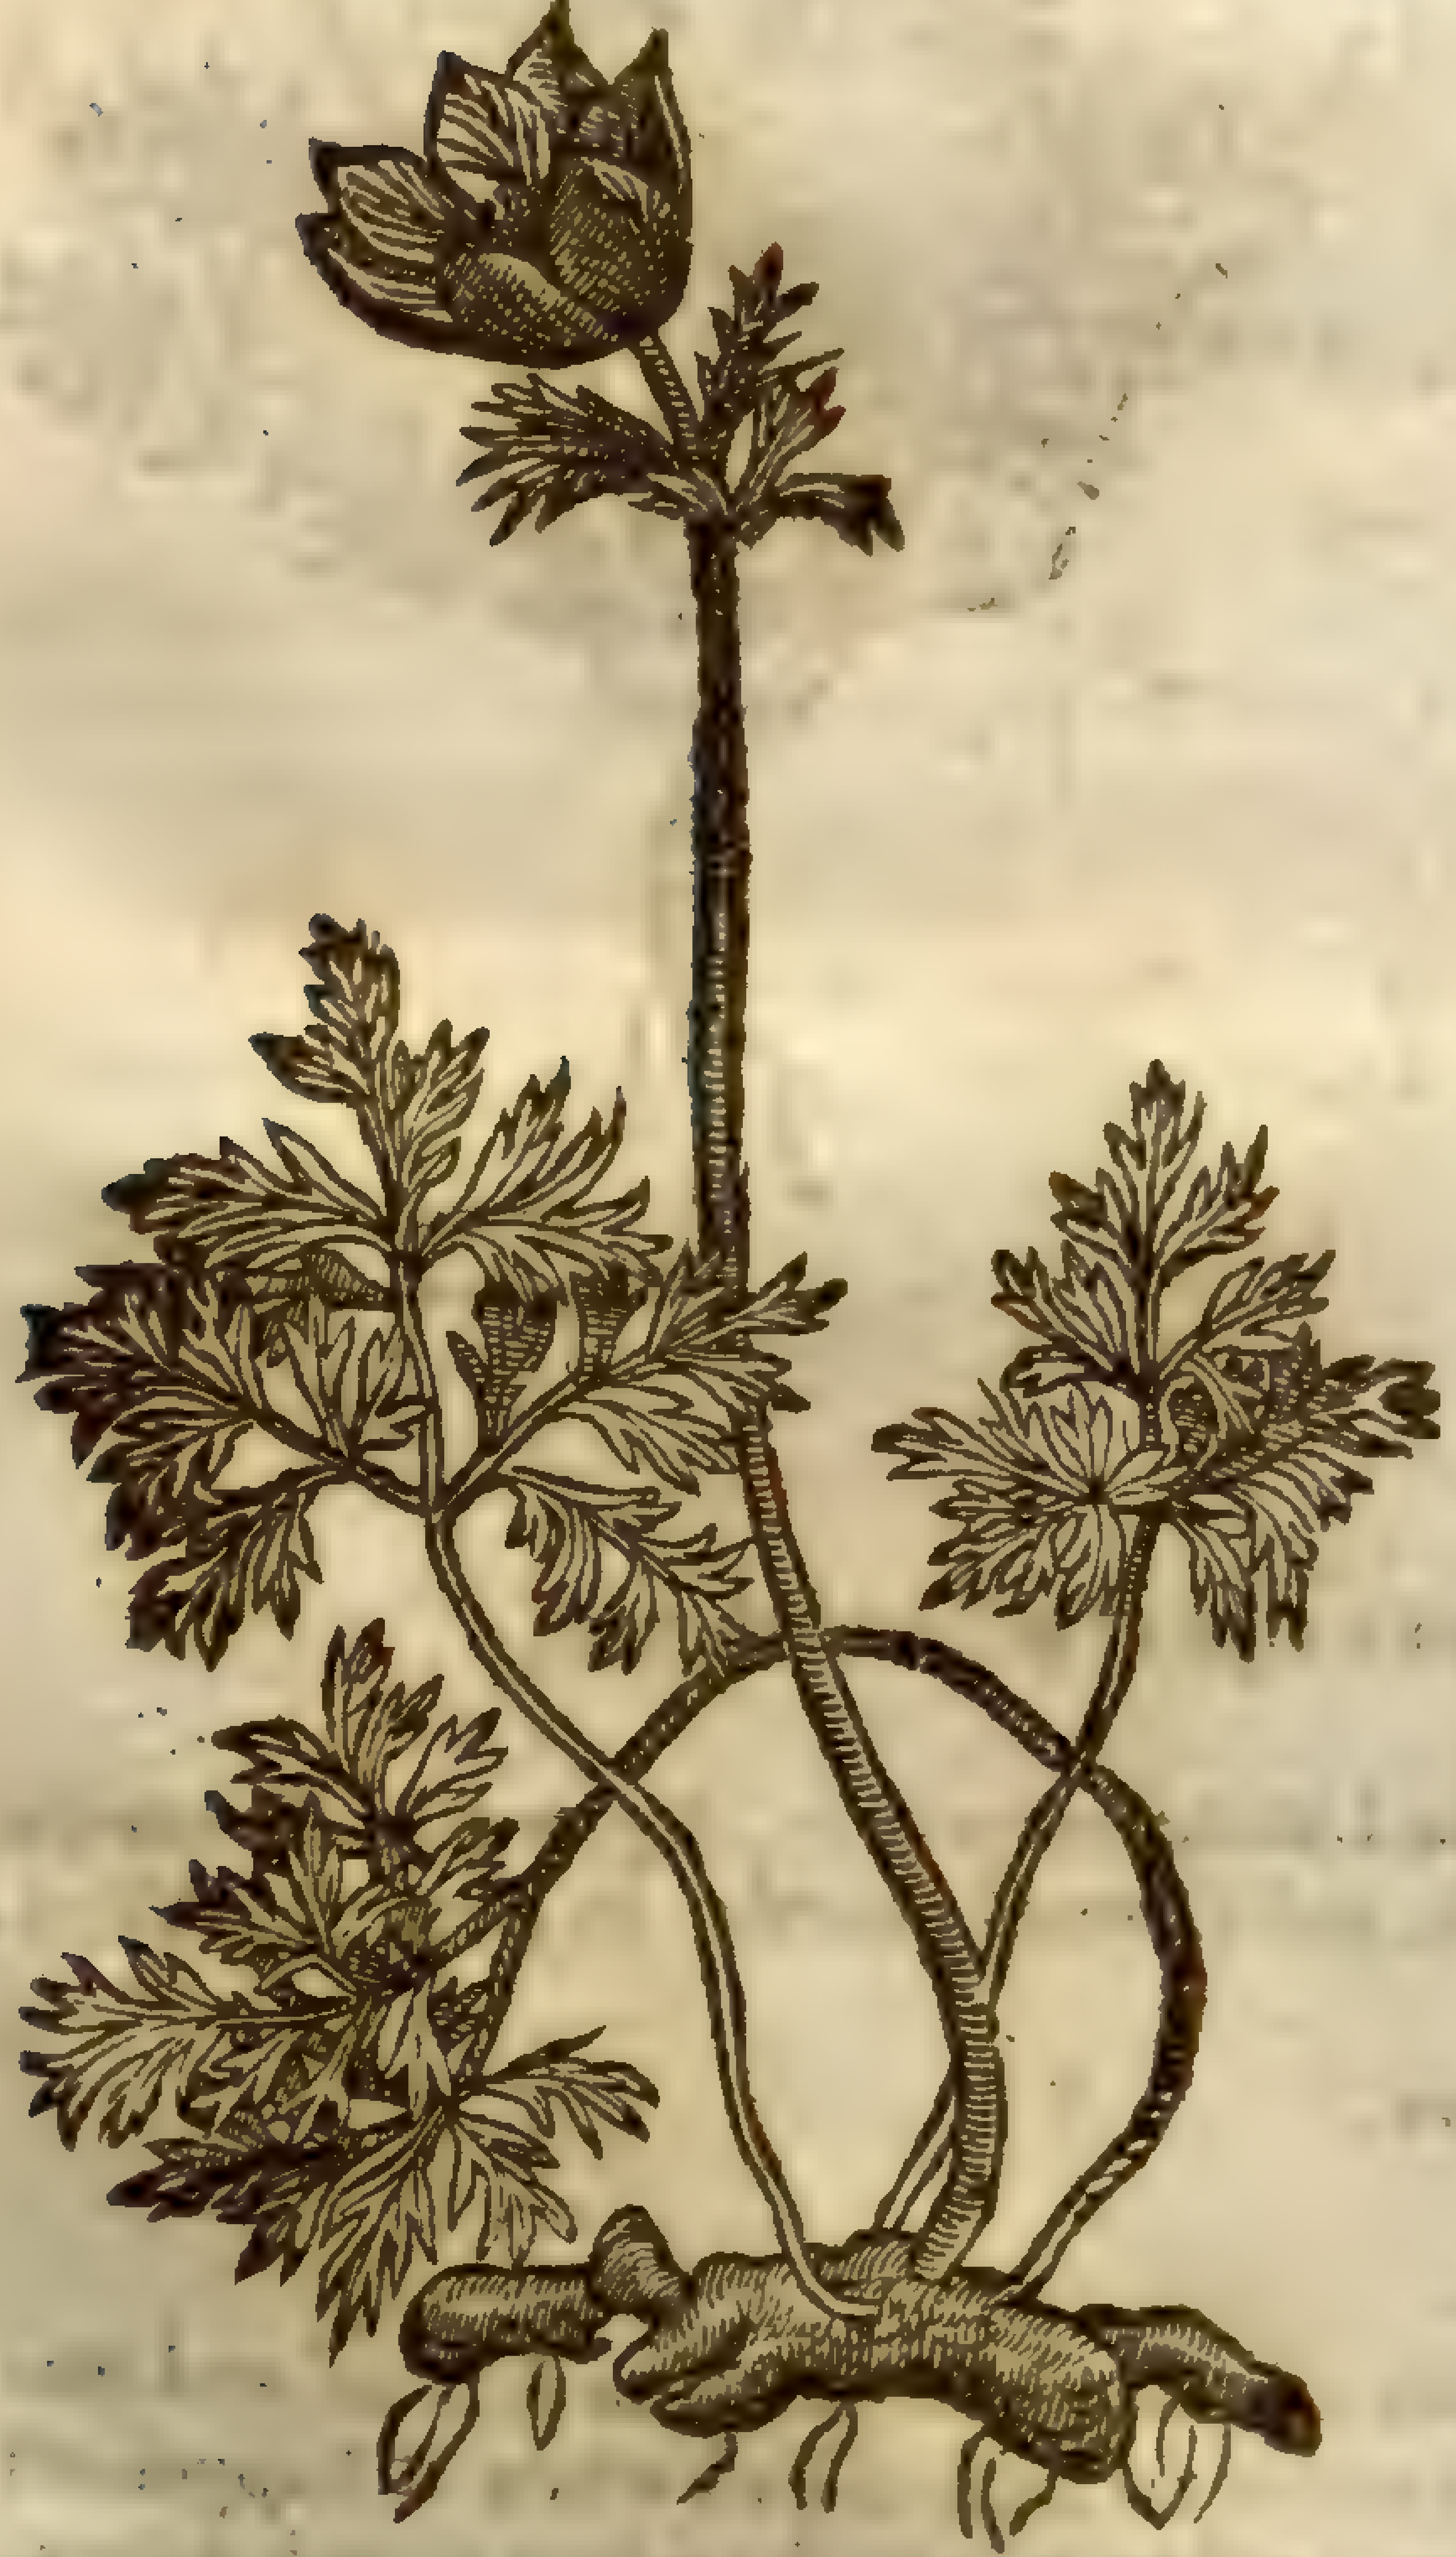
F The juyce taketh away warts if they be rubbed therewith; and being taken in meate it helpes the milt or ſpleene if it be waſted.

Chap. 76.
Of Winde-floures.

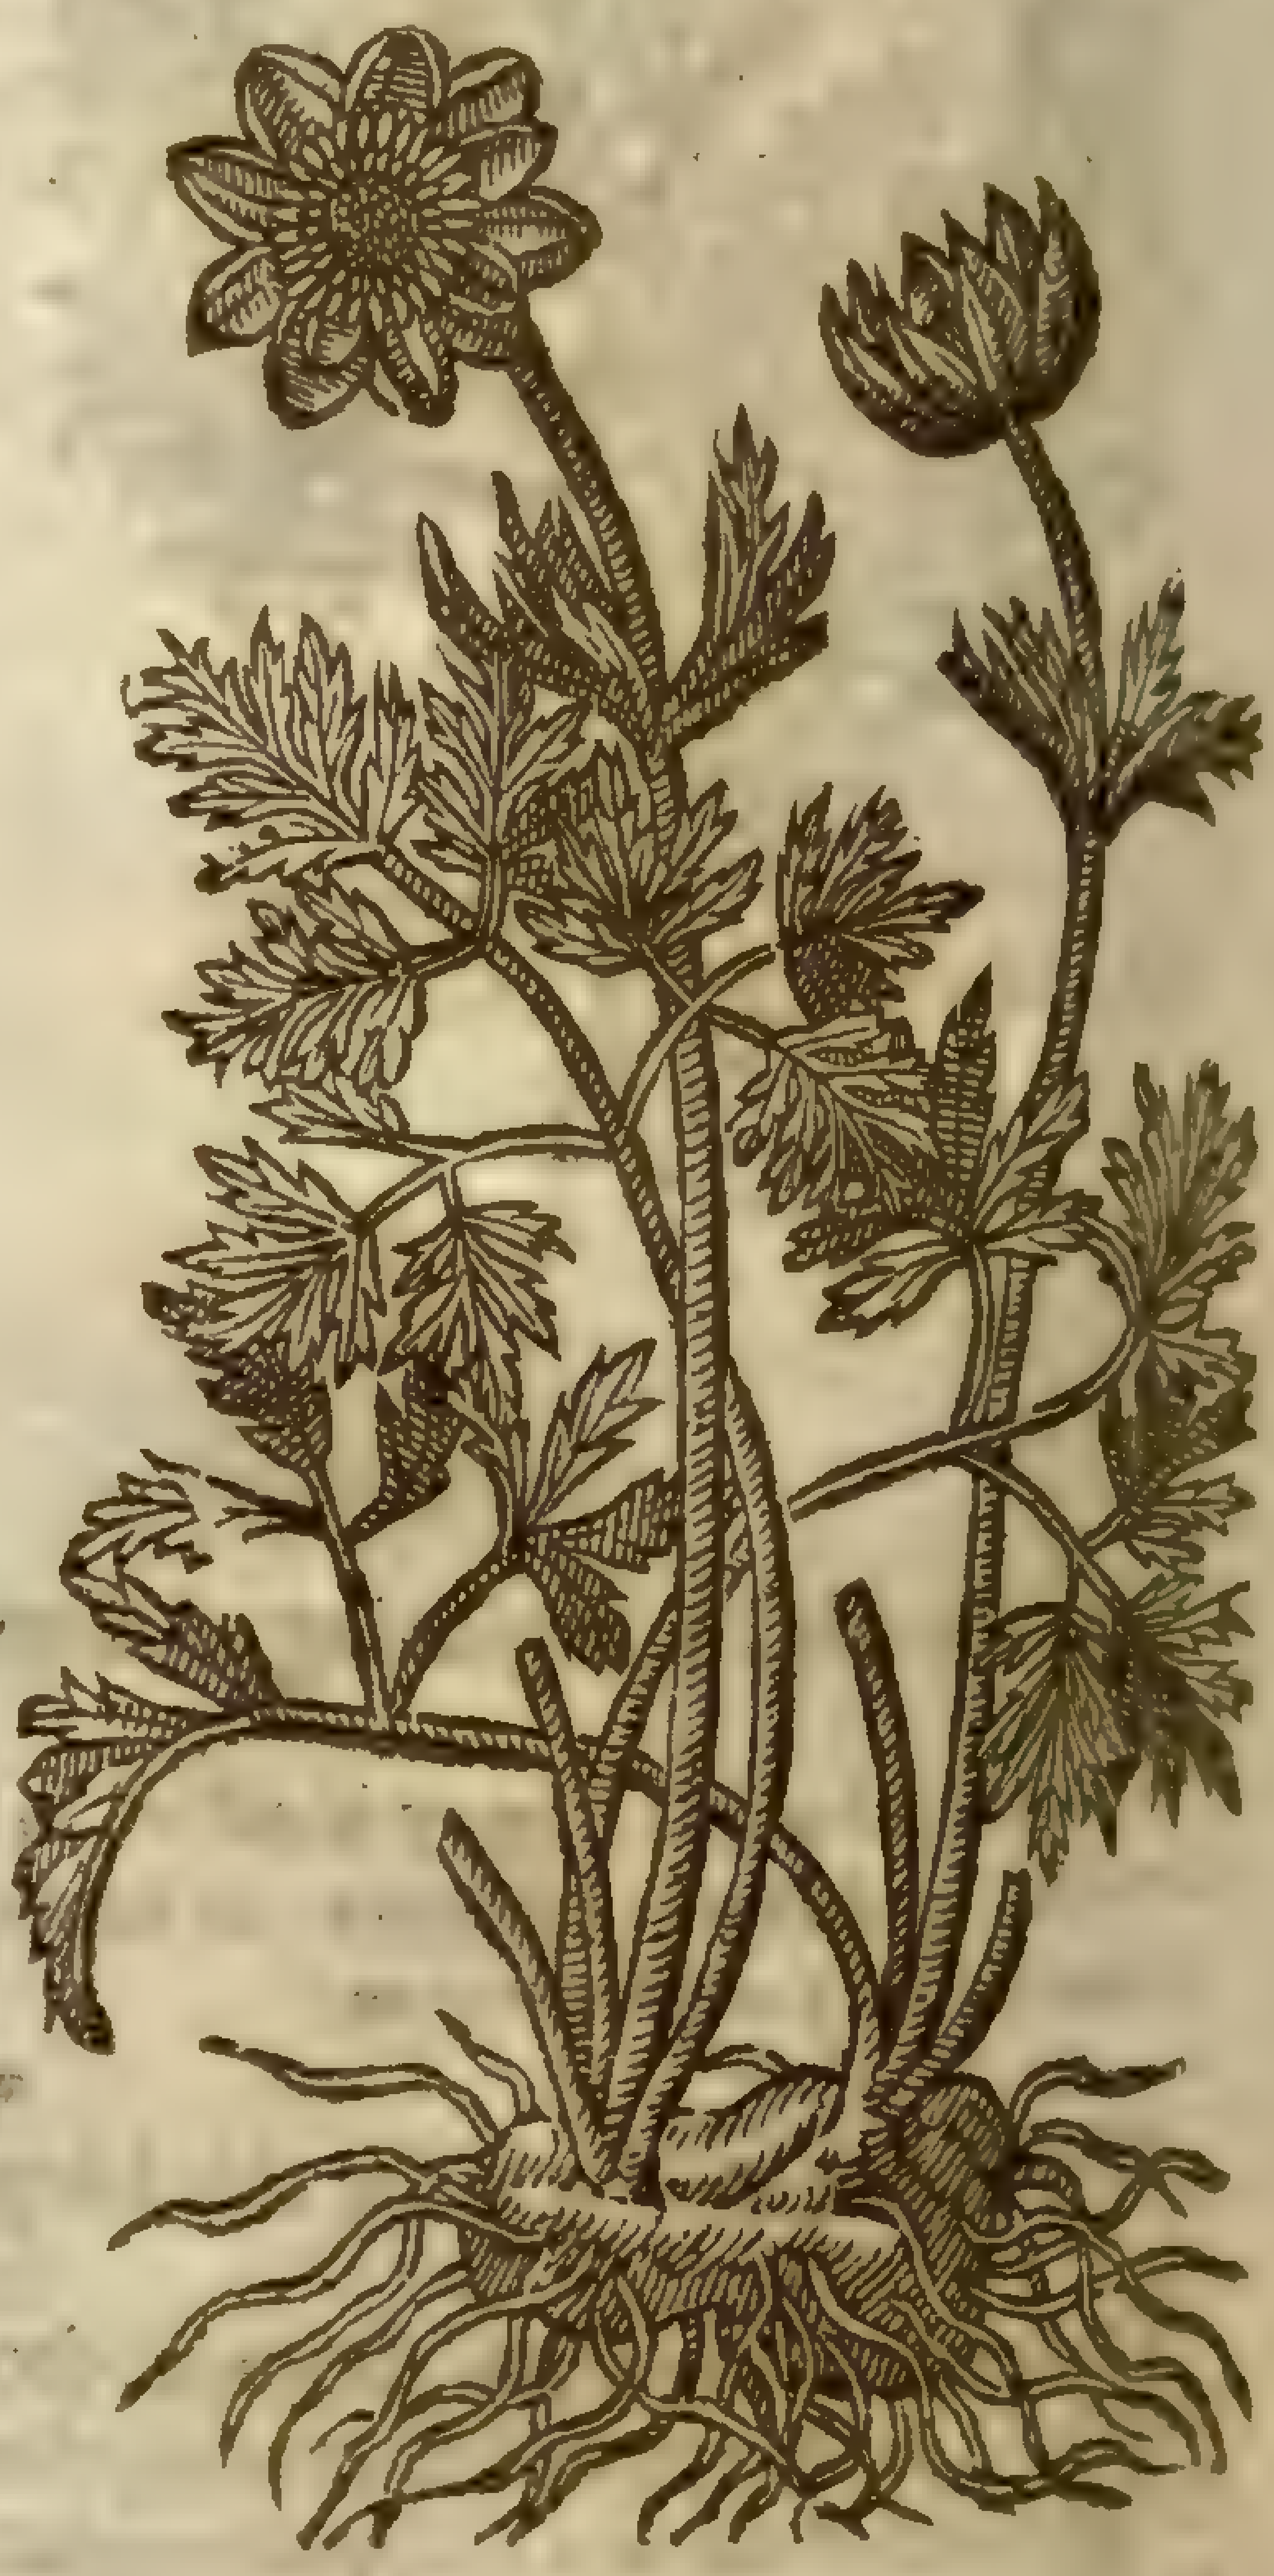
¶ *The Kindes.*

THe ſtocke or kindred of the *Anemones* or Winde-floures, eſpecially in their varieties of colours, are without number, or at the leaſt not ſufficiently knowne vnto any one that hath written of plants. For *Dodonæus* hath ſet forth fiue ſorts; *Lobel* eight; *Tabernamontanus* ten: My ſelfe haue in my garden twelue different ſorts: and yet I do heare of diuers more differing very notably from any of theſe: which I haue briefely touched, though not figured, euery new yeare bringing with it new and ſtrange kindes; and euery country his peculiar plants of this ſort, which are ſent vnto vs from far countries, in hope to receiue from vs ſuch as our country yeeldeth.

1 *Anemone tuberoſa radice.*
Purple Winde-floure.



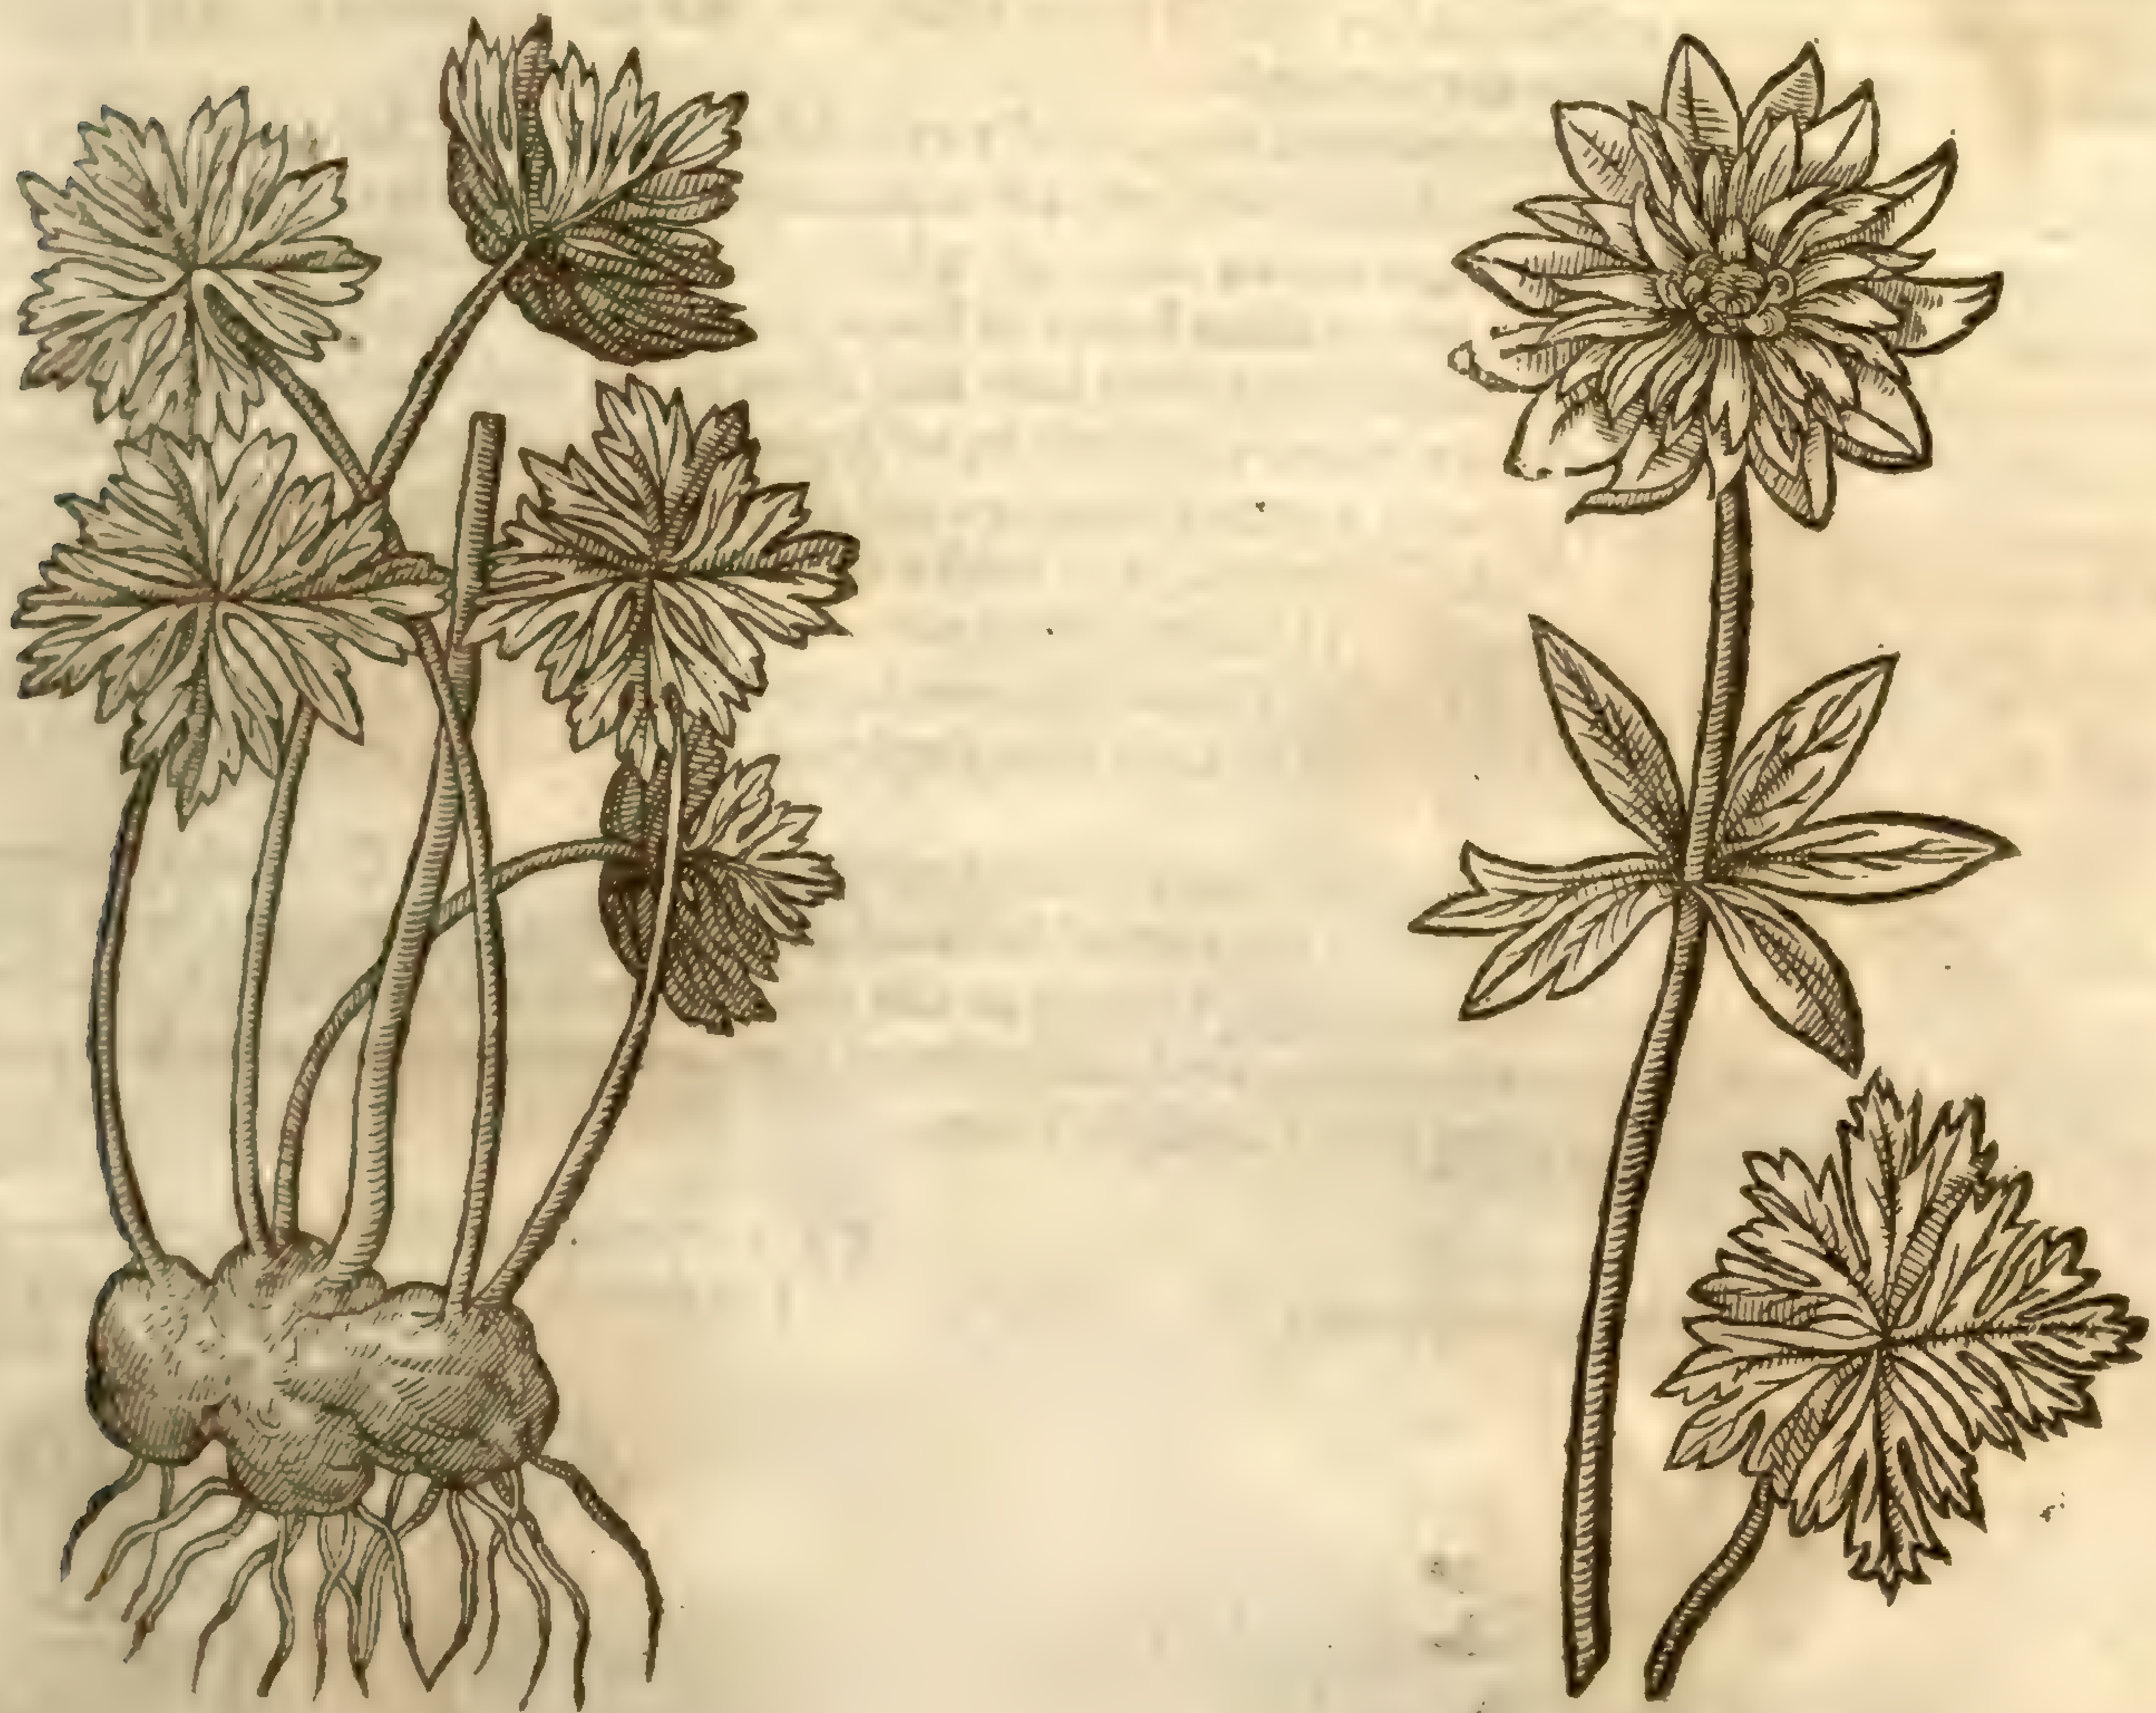
2 *Anemone coccinea multiplex.*
Double Skarlet Winde-floure.



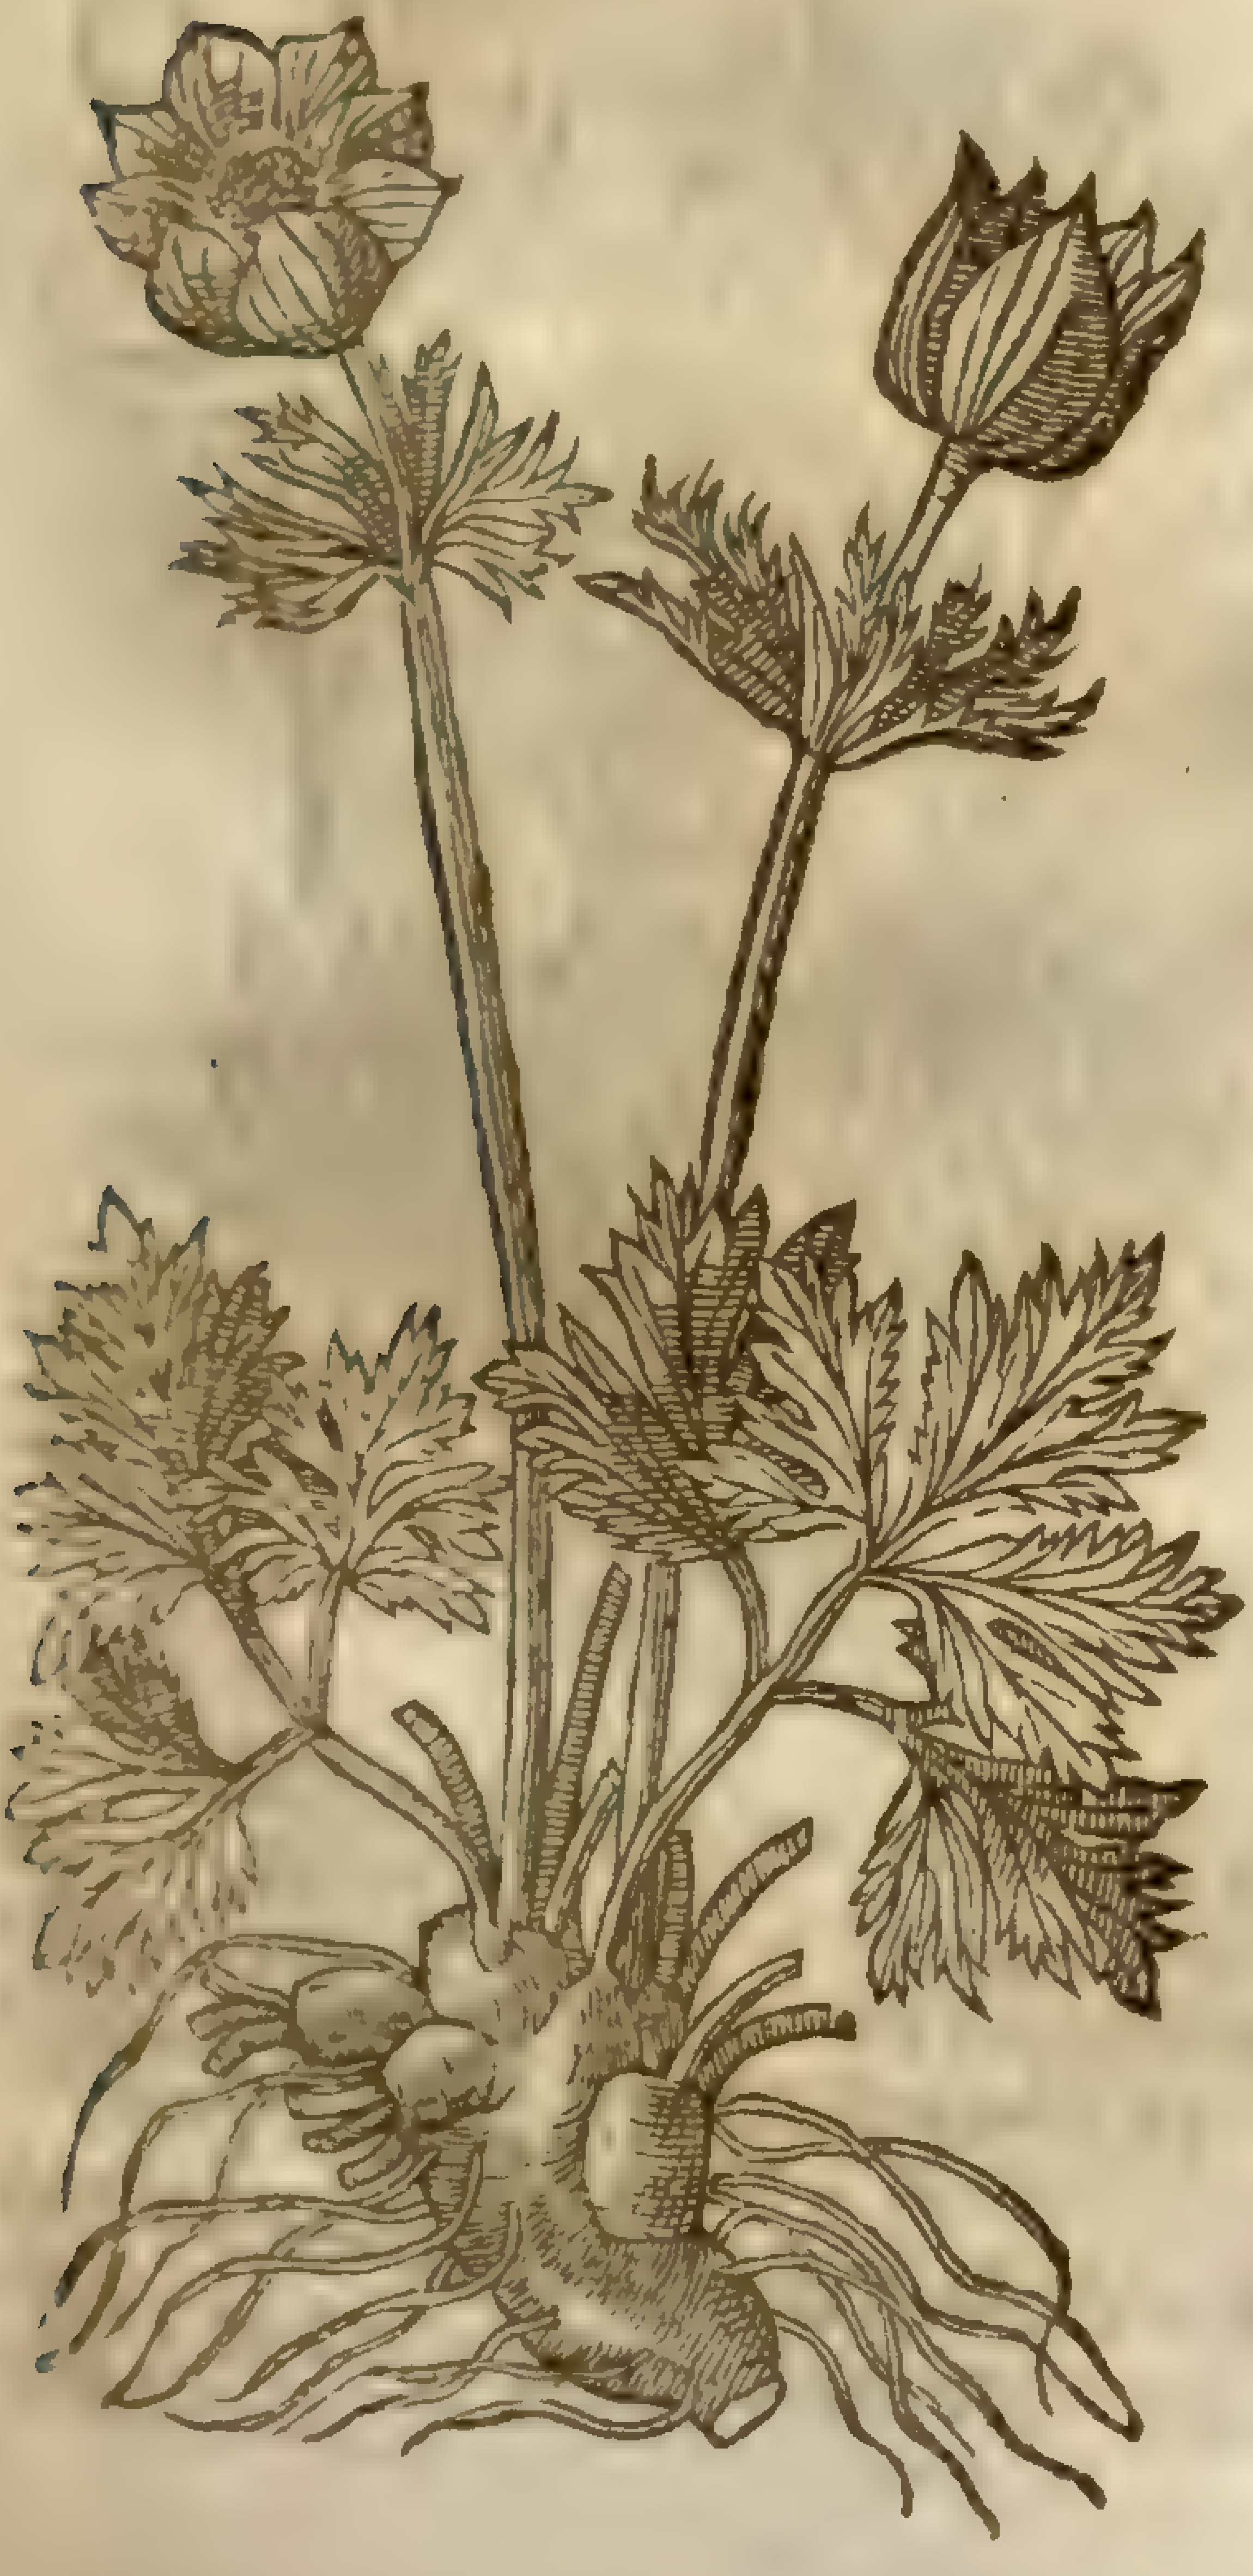
¶ *The Deſcription.*

1 THe firſt kinde of *Anemone* or Winde-floure hath ſmall leaues very much ſnipt or jagged almoſt like vnto Camomile, or Adonis floure: among which riſeth vp a ſtalke bare or naked almoſt vnto the top; at which place is ſet two or three leaues like the other: and at the top of the ſtalke commeth forth a faire and beautifull floure compact of ſeuen leaues, and ſometimes eight, of a violet colour tending to purple. It is impoſſible to deſcribe the colour in his full perfection, conſidering the variable mixtures. The root is tuberous or knobby, and very brittle.

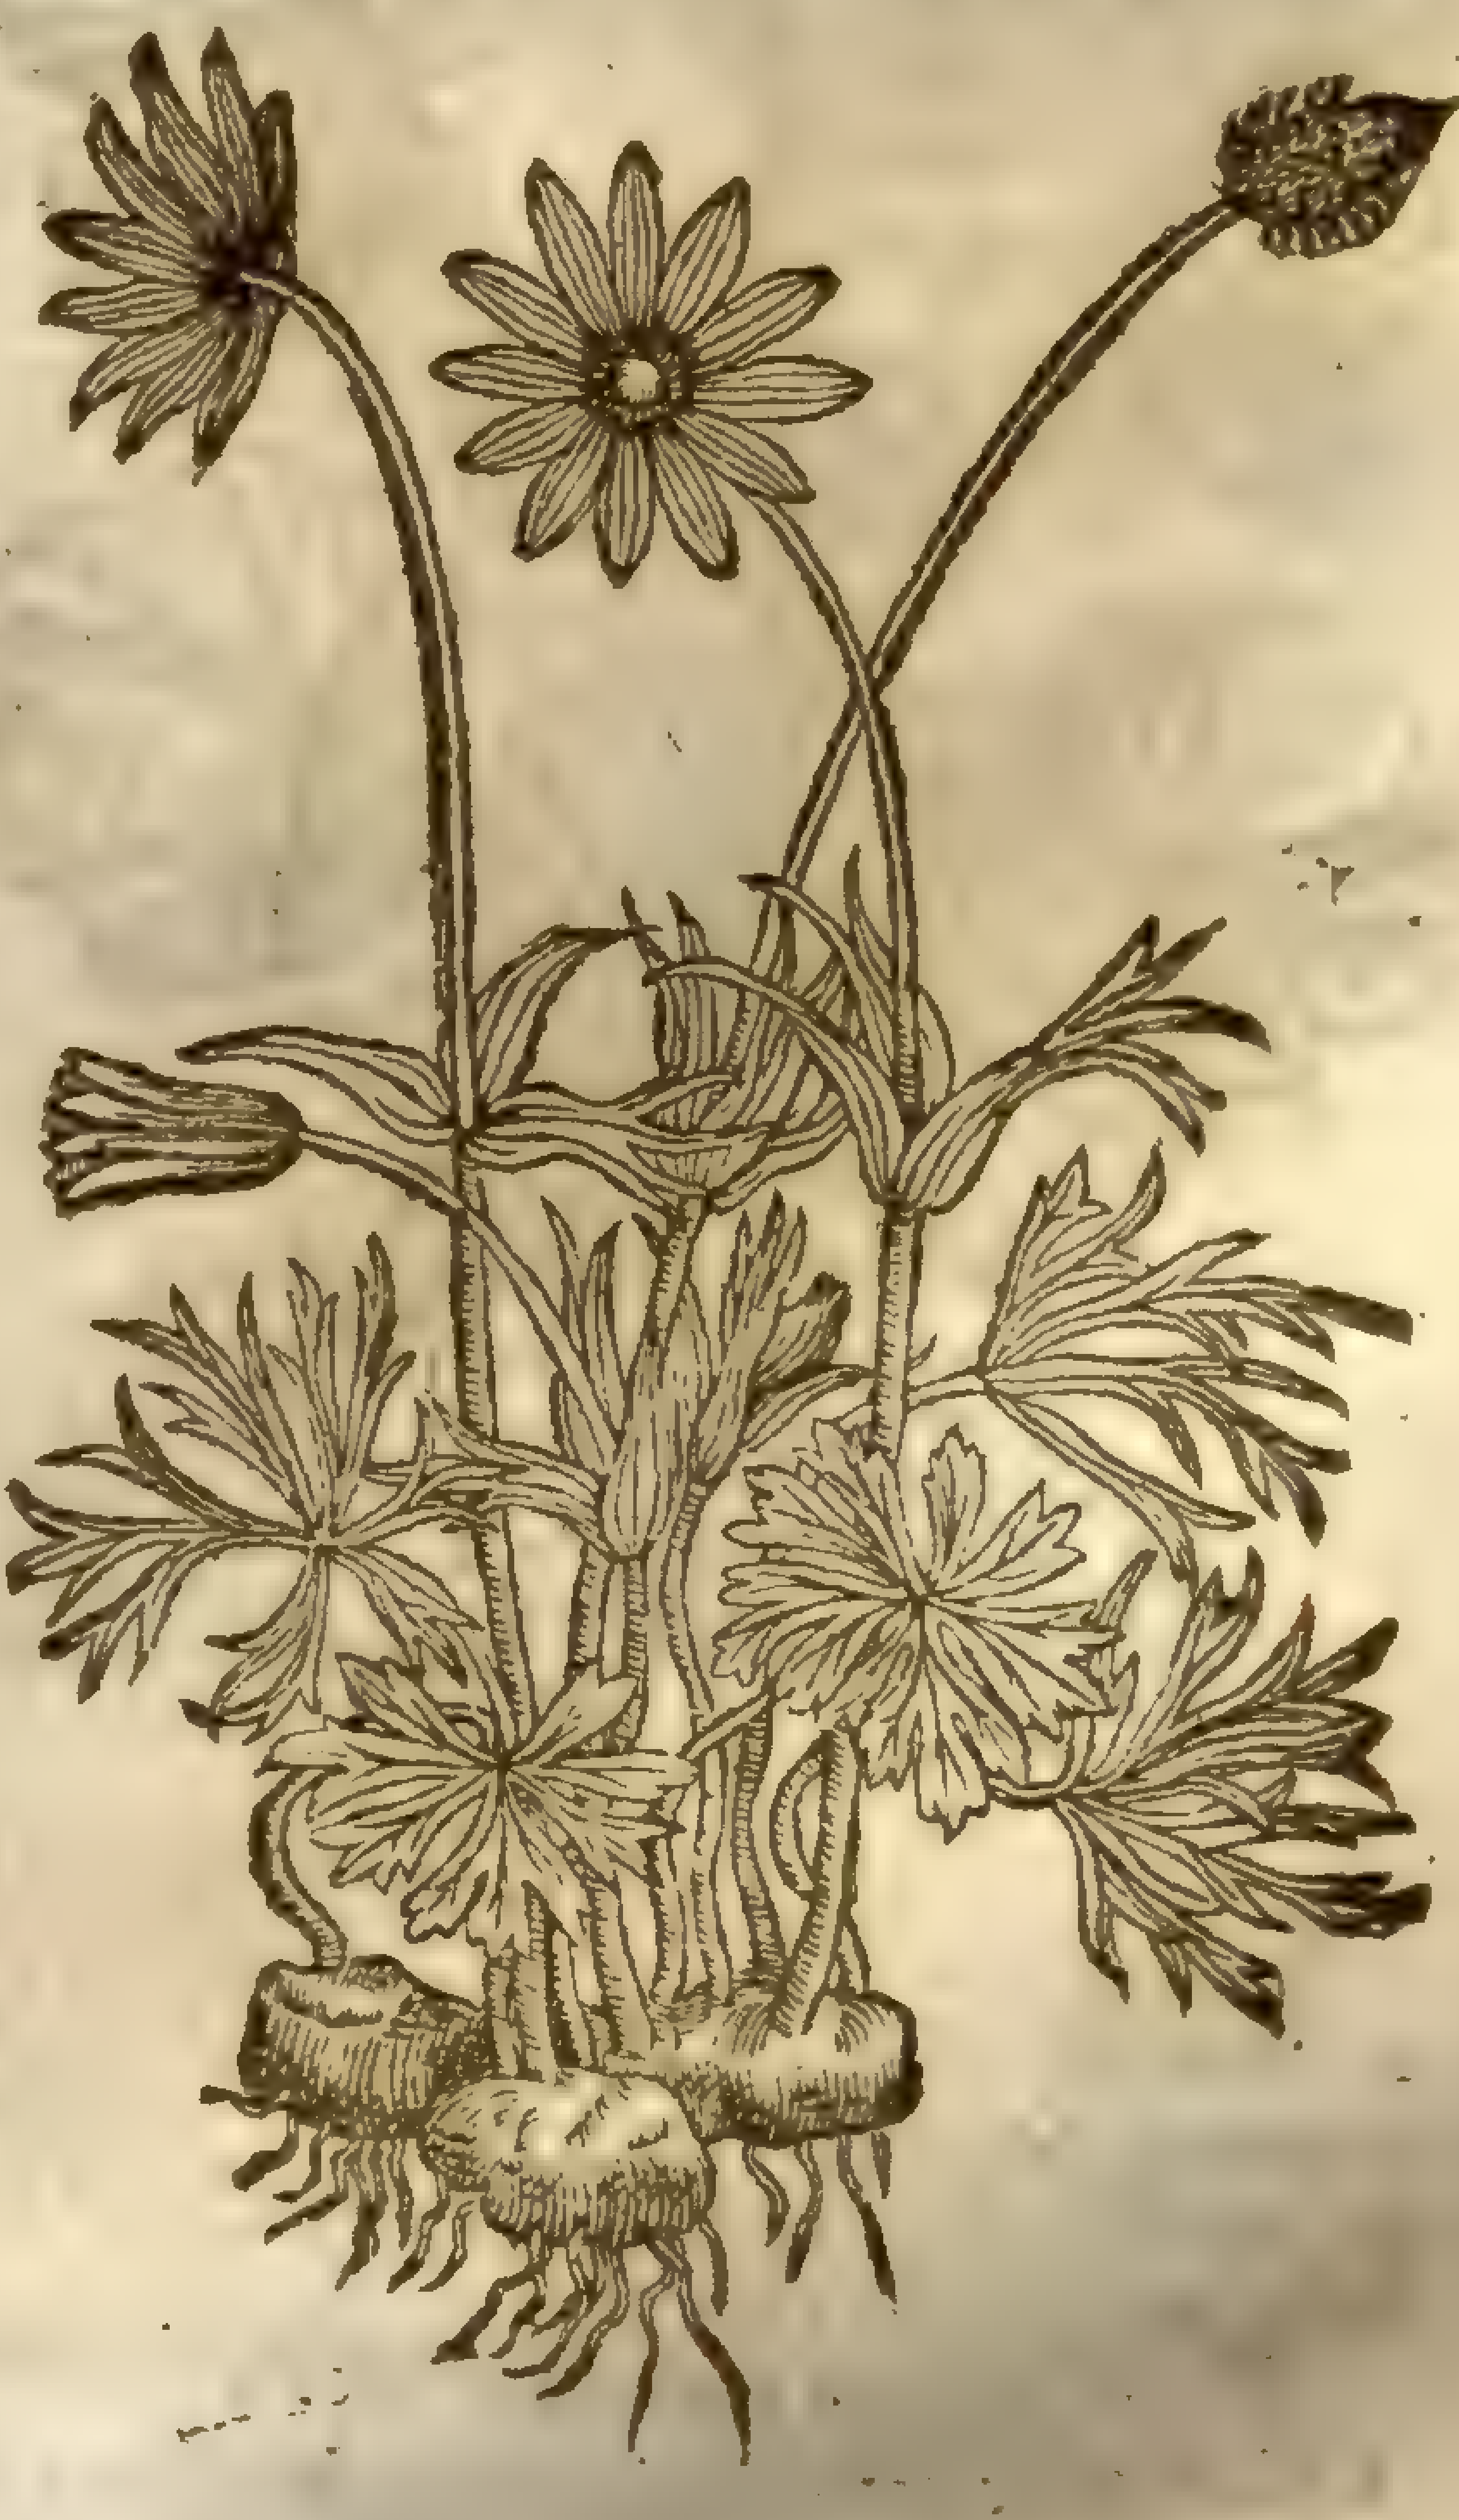
3 *Anemone maxima Chalcedonia Polyanthos.*
The great double Winde-floure of Bithynia.



4 *Anemone Chalcedonica ſimplici flore.*
The ſingle Winde-floure of Bithynia.



5 *Anemone Bulbocaſtani radice.*
Cheſnut Winde-floure.



6 *Anemone*

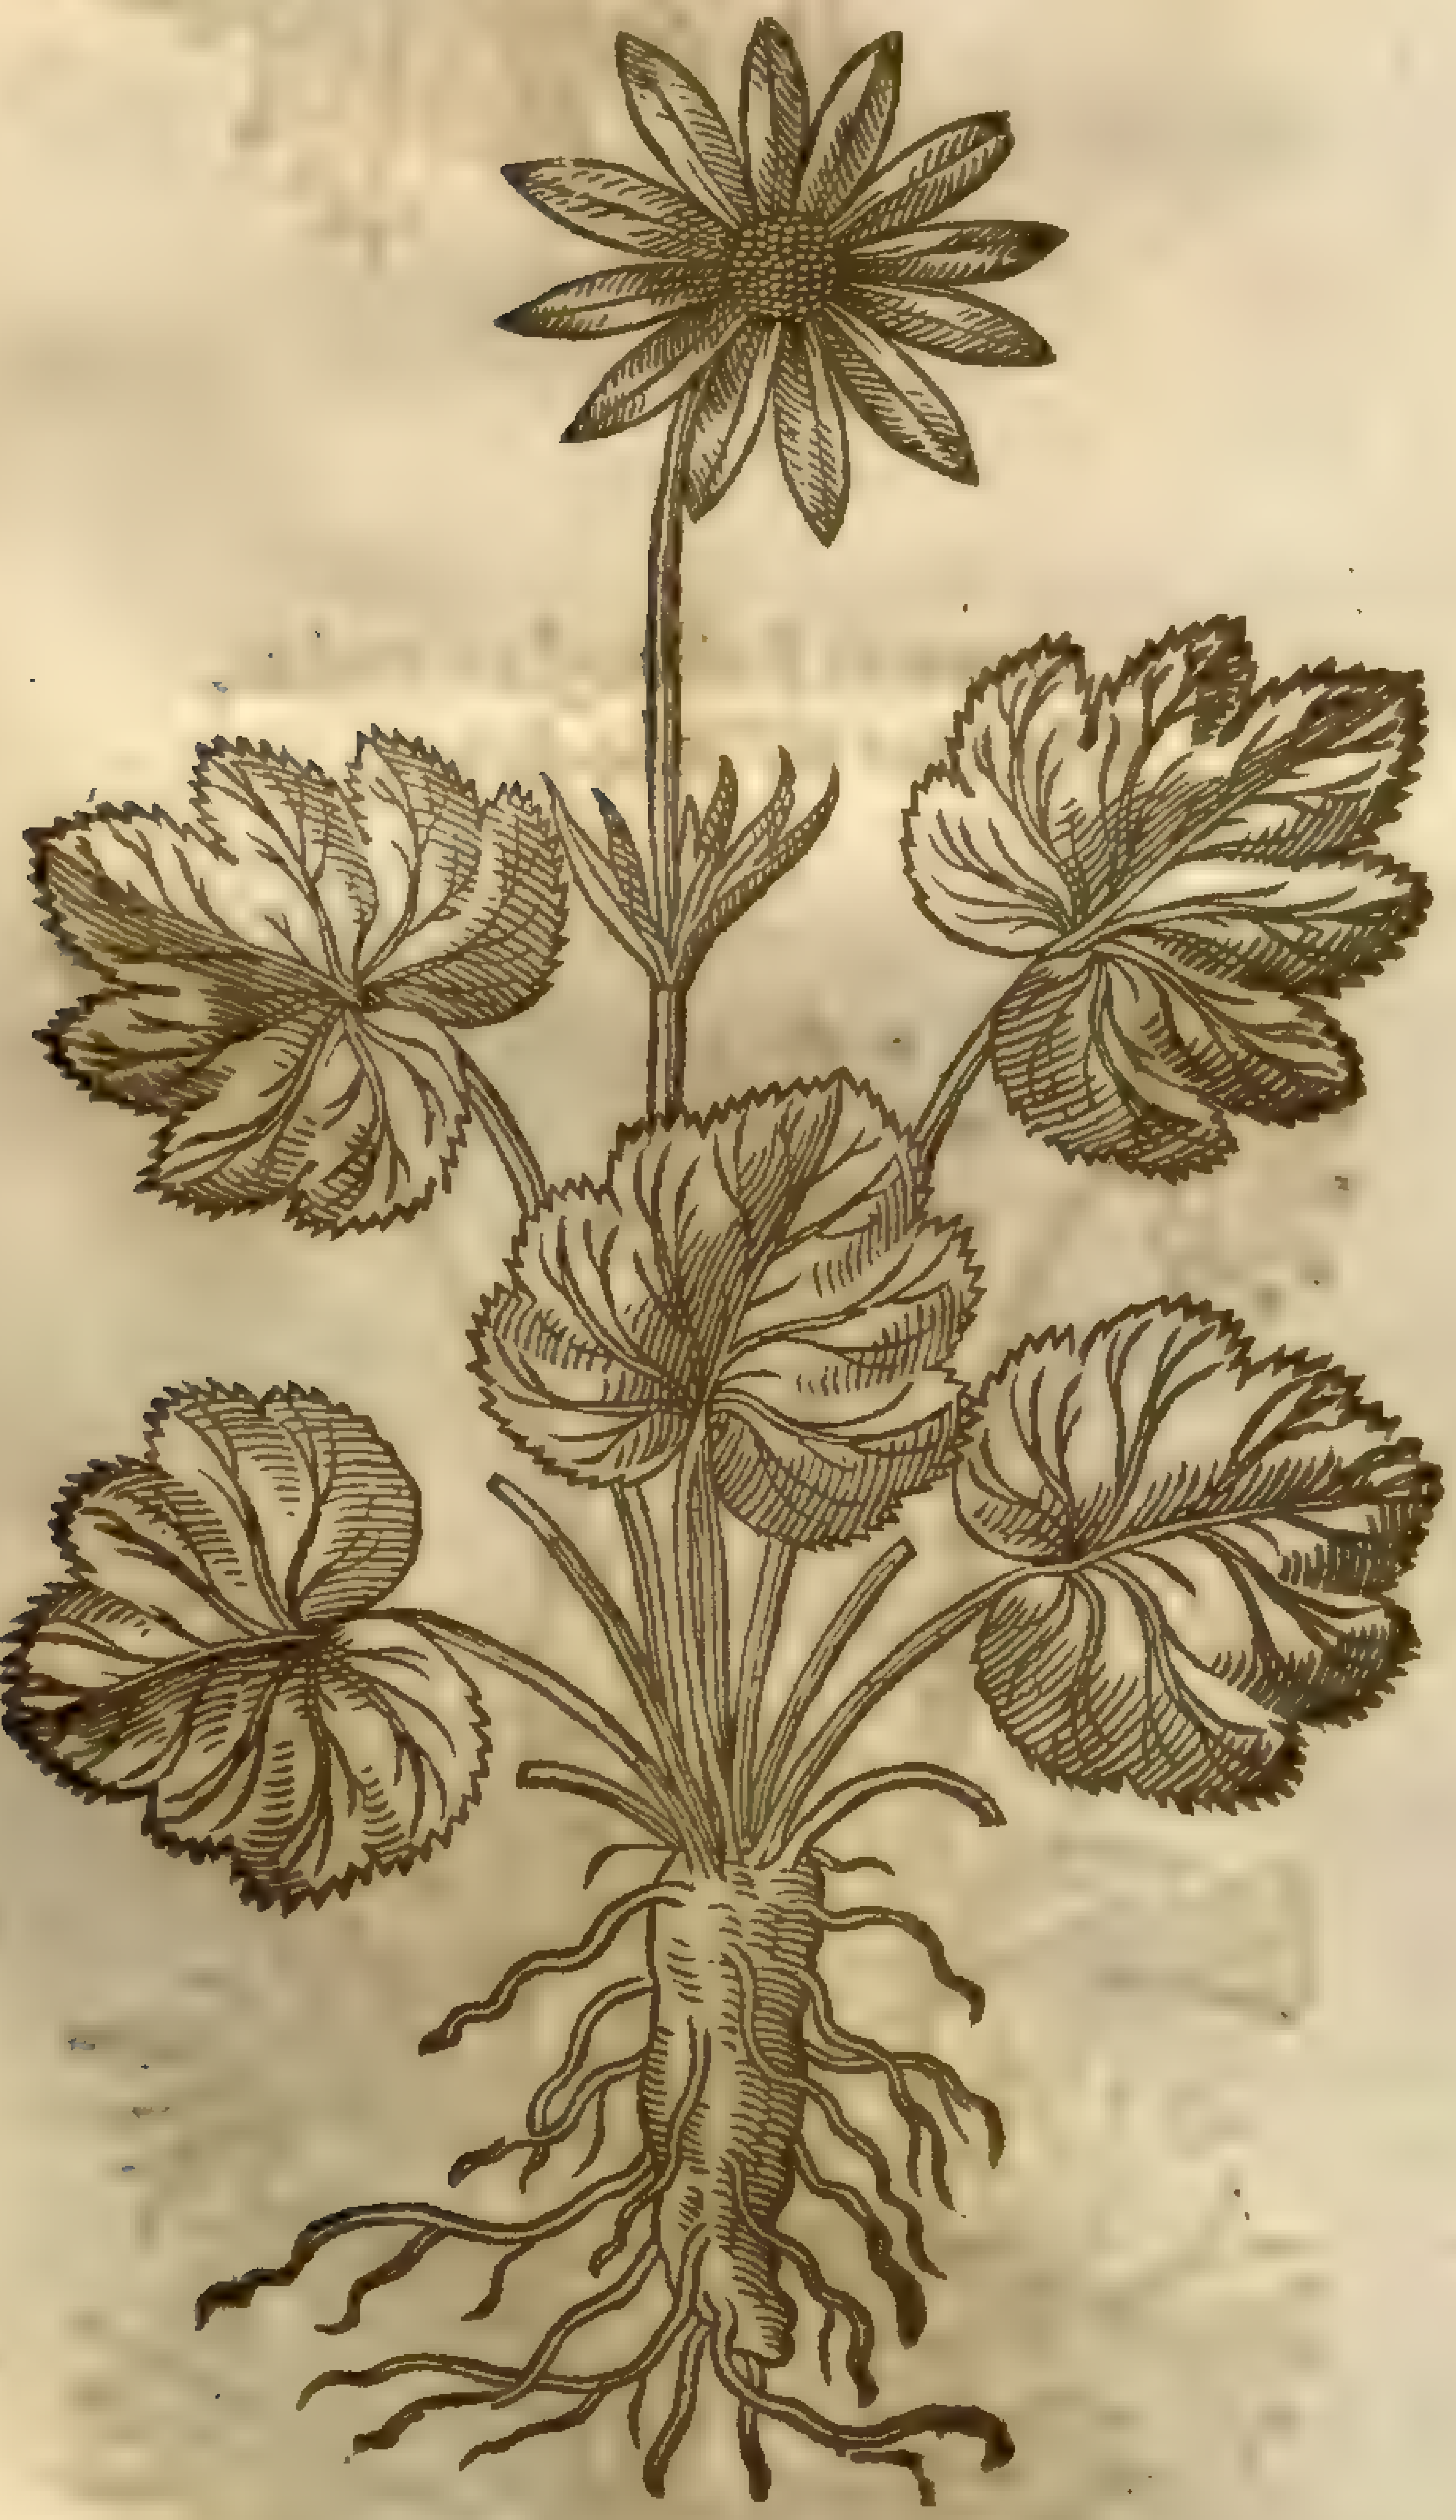
2 The ſecond kind of *Anemone* hath leaues like to the precedent, inſomuch that it is hard to diſtinguiſh the one from the other but by the floures onely: for thoſe of this plant are of a moſt bright and faire skarlet colour, and as double as the Marigold; and the other not ſo. The root is knobby and very brittle, as is the former.

3 The great *Anemone* hath double floures, vſually called the *Anemone* of Chalcedon (which is a city in Bithynia) and great broad leaues deepely cut in the edges, not vnlike to thoſe of the field Crow-foot, of an ouerworne greene colour: amongſt which riſeth vp a naked bare ſtalke almoſt vnto the top, where there ſtand two or three leaues in ſhape like the others, but leſſer; ſometimes changed into reddiſh ſtripes, confuſedly mixed here and there in the ſaid leaues. On the top of the ſtalke ſtandeth a moſt gallant floure very double, of a perfect red colour, the which is ſometimes ſtriped amongſt the red with a little line or two of yellow in the middle; from which middle commeth forth many blackiſh thrums. The ſeed is not to be found that I could euer obſerue, but is carried away with the wind. The root is thicke and knobby.

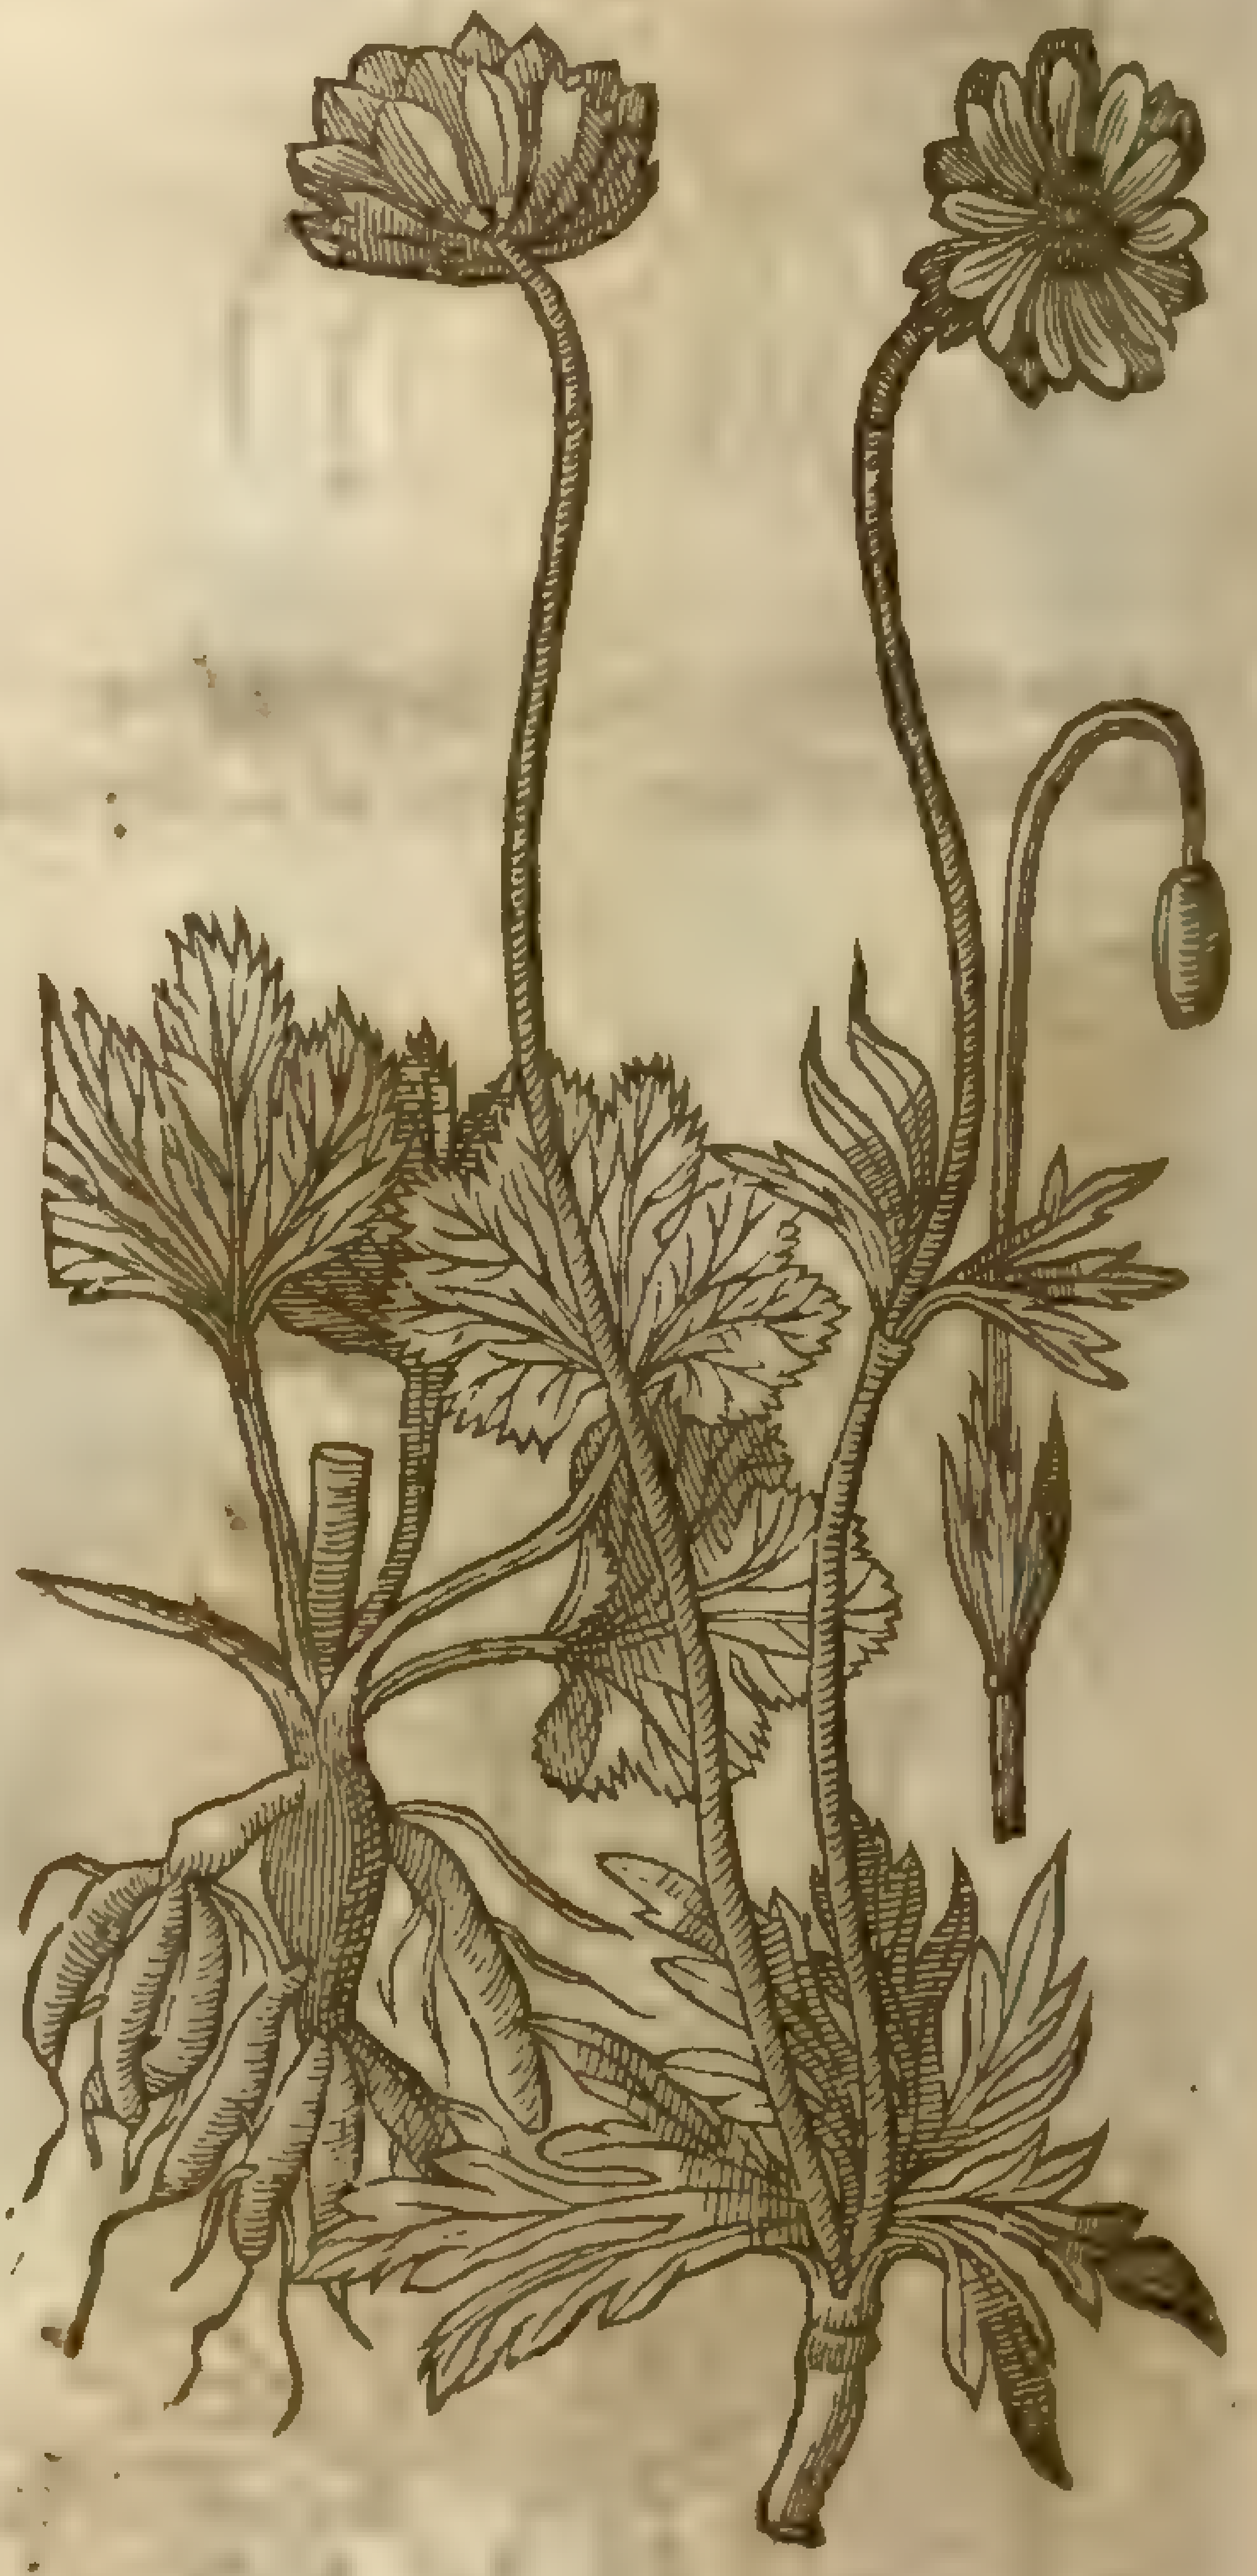
4 The fourth agreeth with the firſt kind of *Anemone*, in roots, leaues, ſtalkes, and ſhape of floures; differing in that, that this plant bringeth forth faire ſingle red floures, and the other of a violet colour, as is aforeſaid.

5 The fifth ſort of *Anemone* hath many ſmall jagged leaues like thoſe of Coriander, proceeding from a knobby root reſembling the root of *Bulbocaſtanum* or earth Cheſnut. The ſtalke riſes vp among the leaues, of two hands high, bearing at the top a ſingle floure, conſiſting of a pale or border of little purple leaues, ſometimes red, and often of a white colour ſet about a blackiſh pointall, thrummed ouer with many ſmall blackiſh haires.

6 *Anemone latifolia Cluſij.*
Broad leaued Winde-floure.



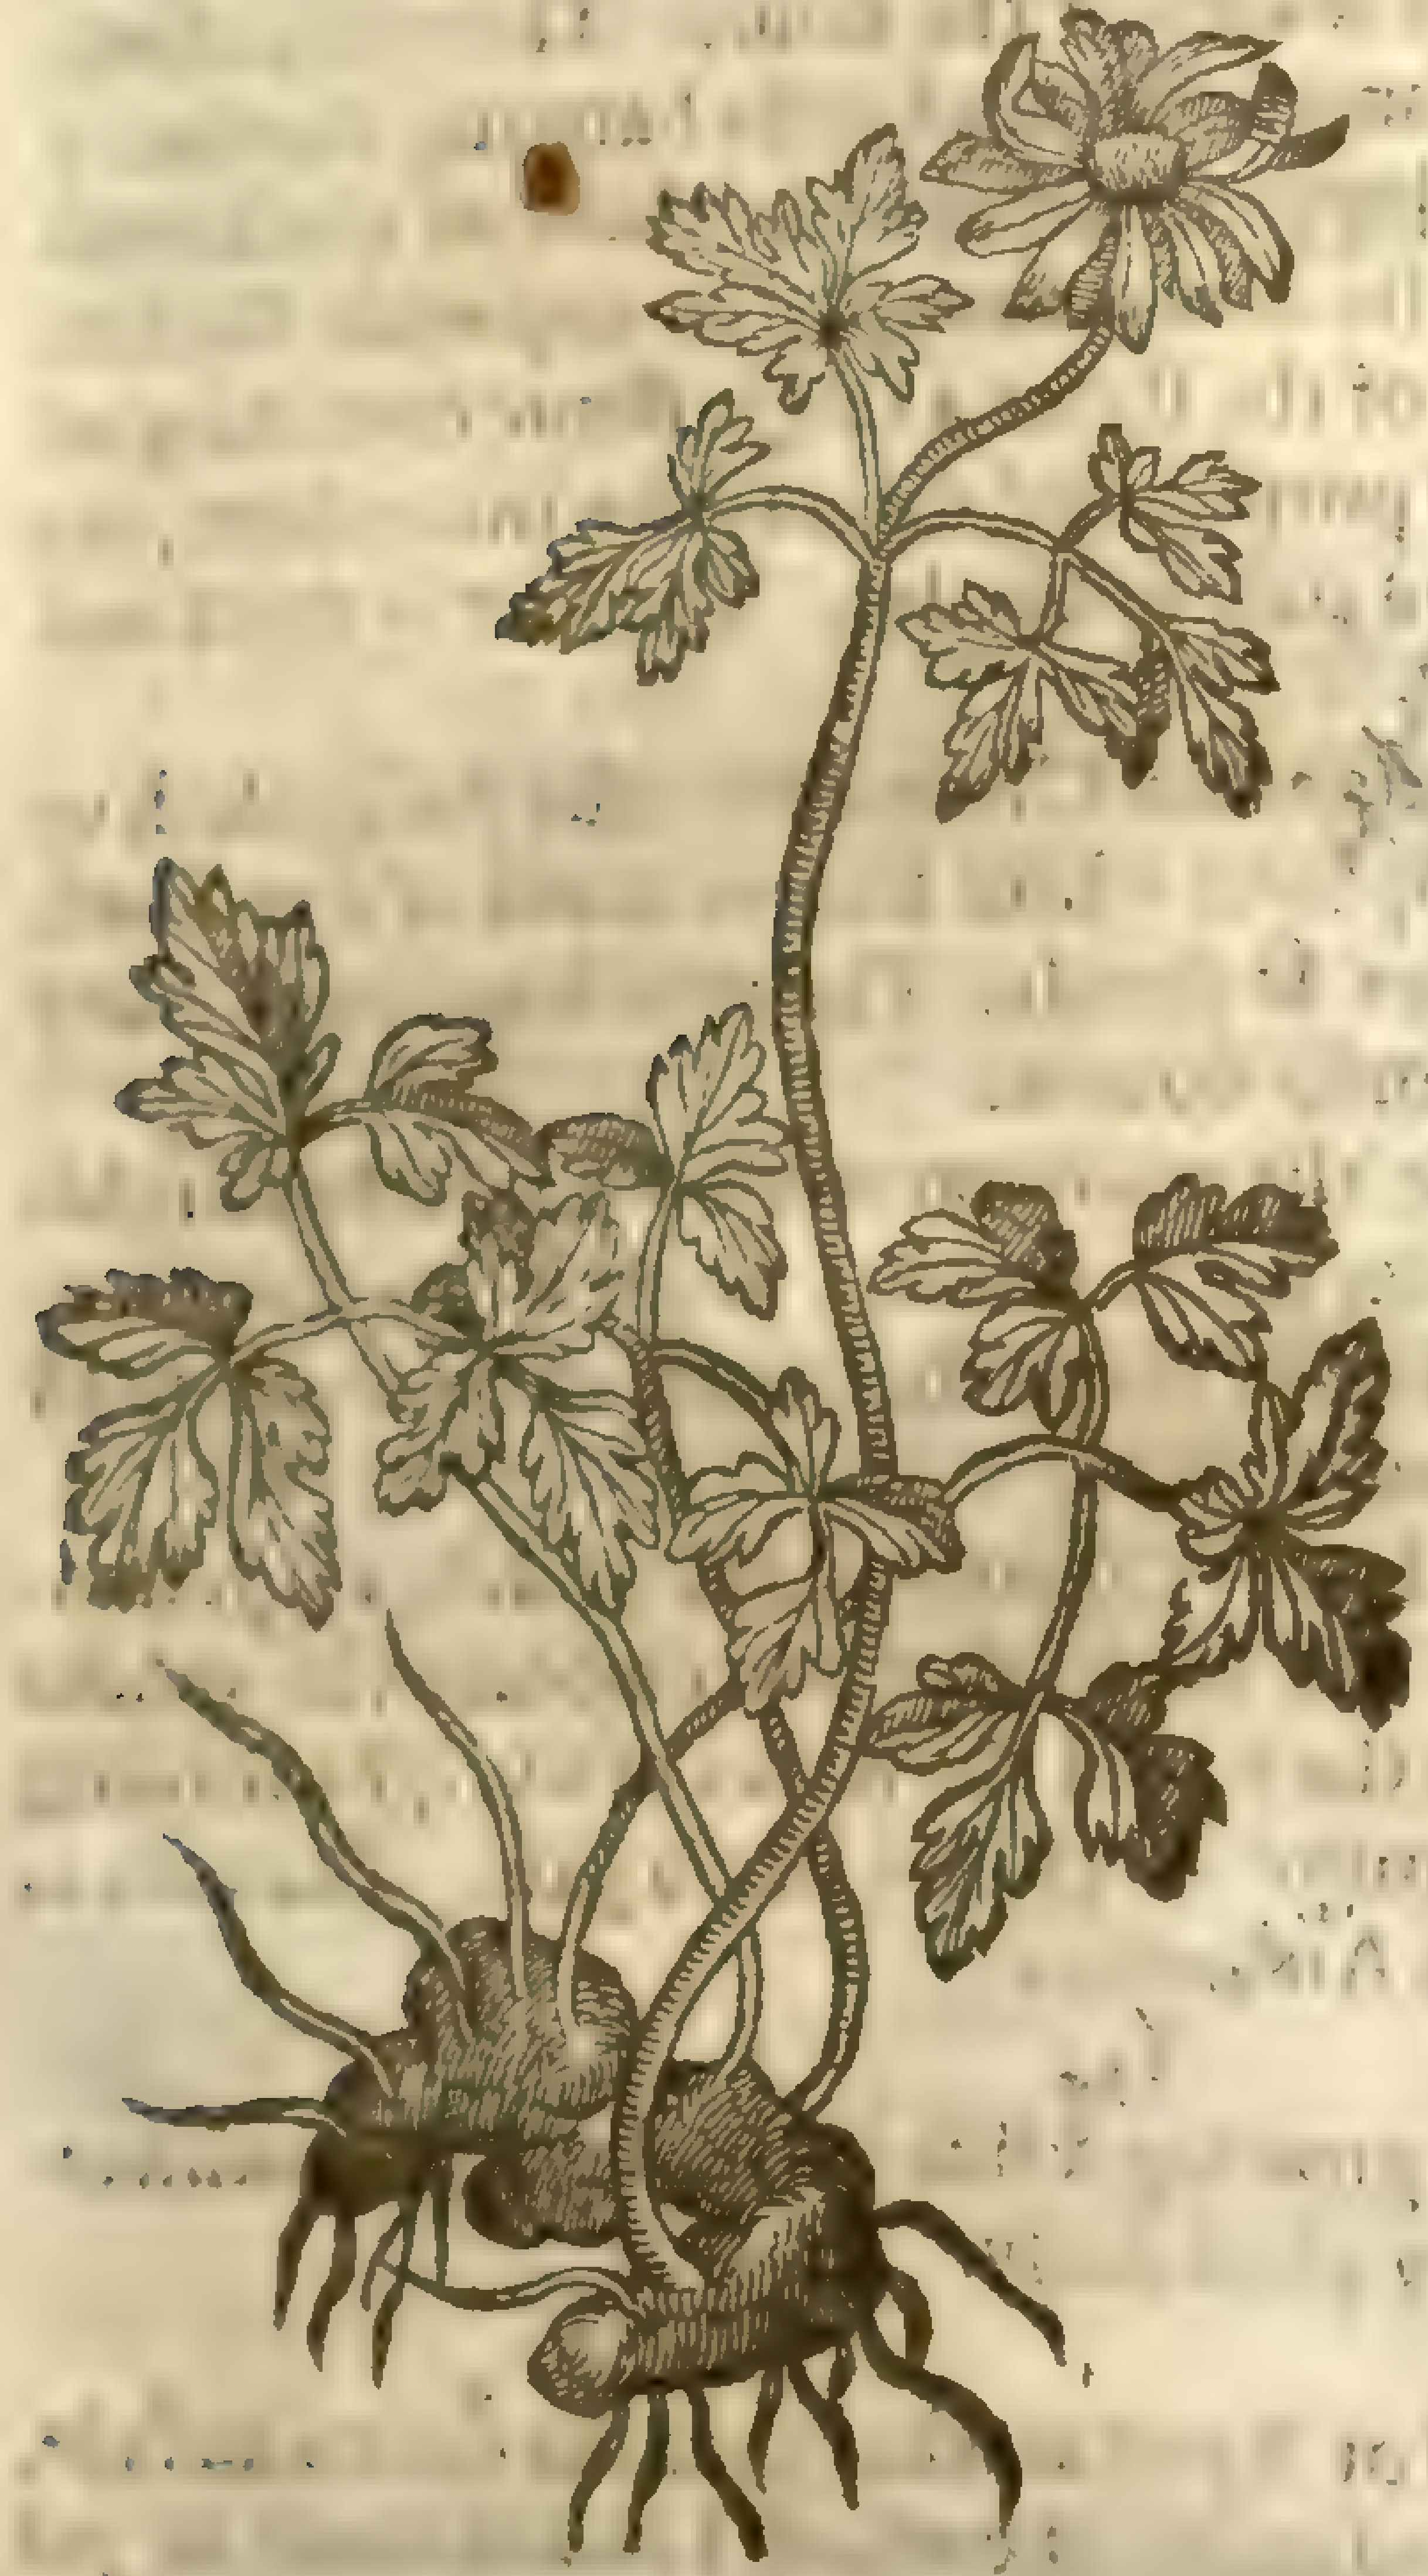
‡ 7 *Anemone latifolia duplo flauo flore.*
The double yellow Winde-floure.



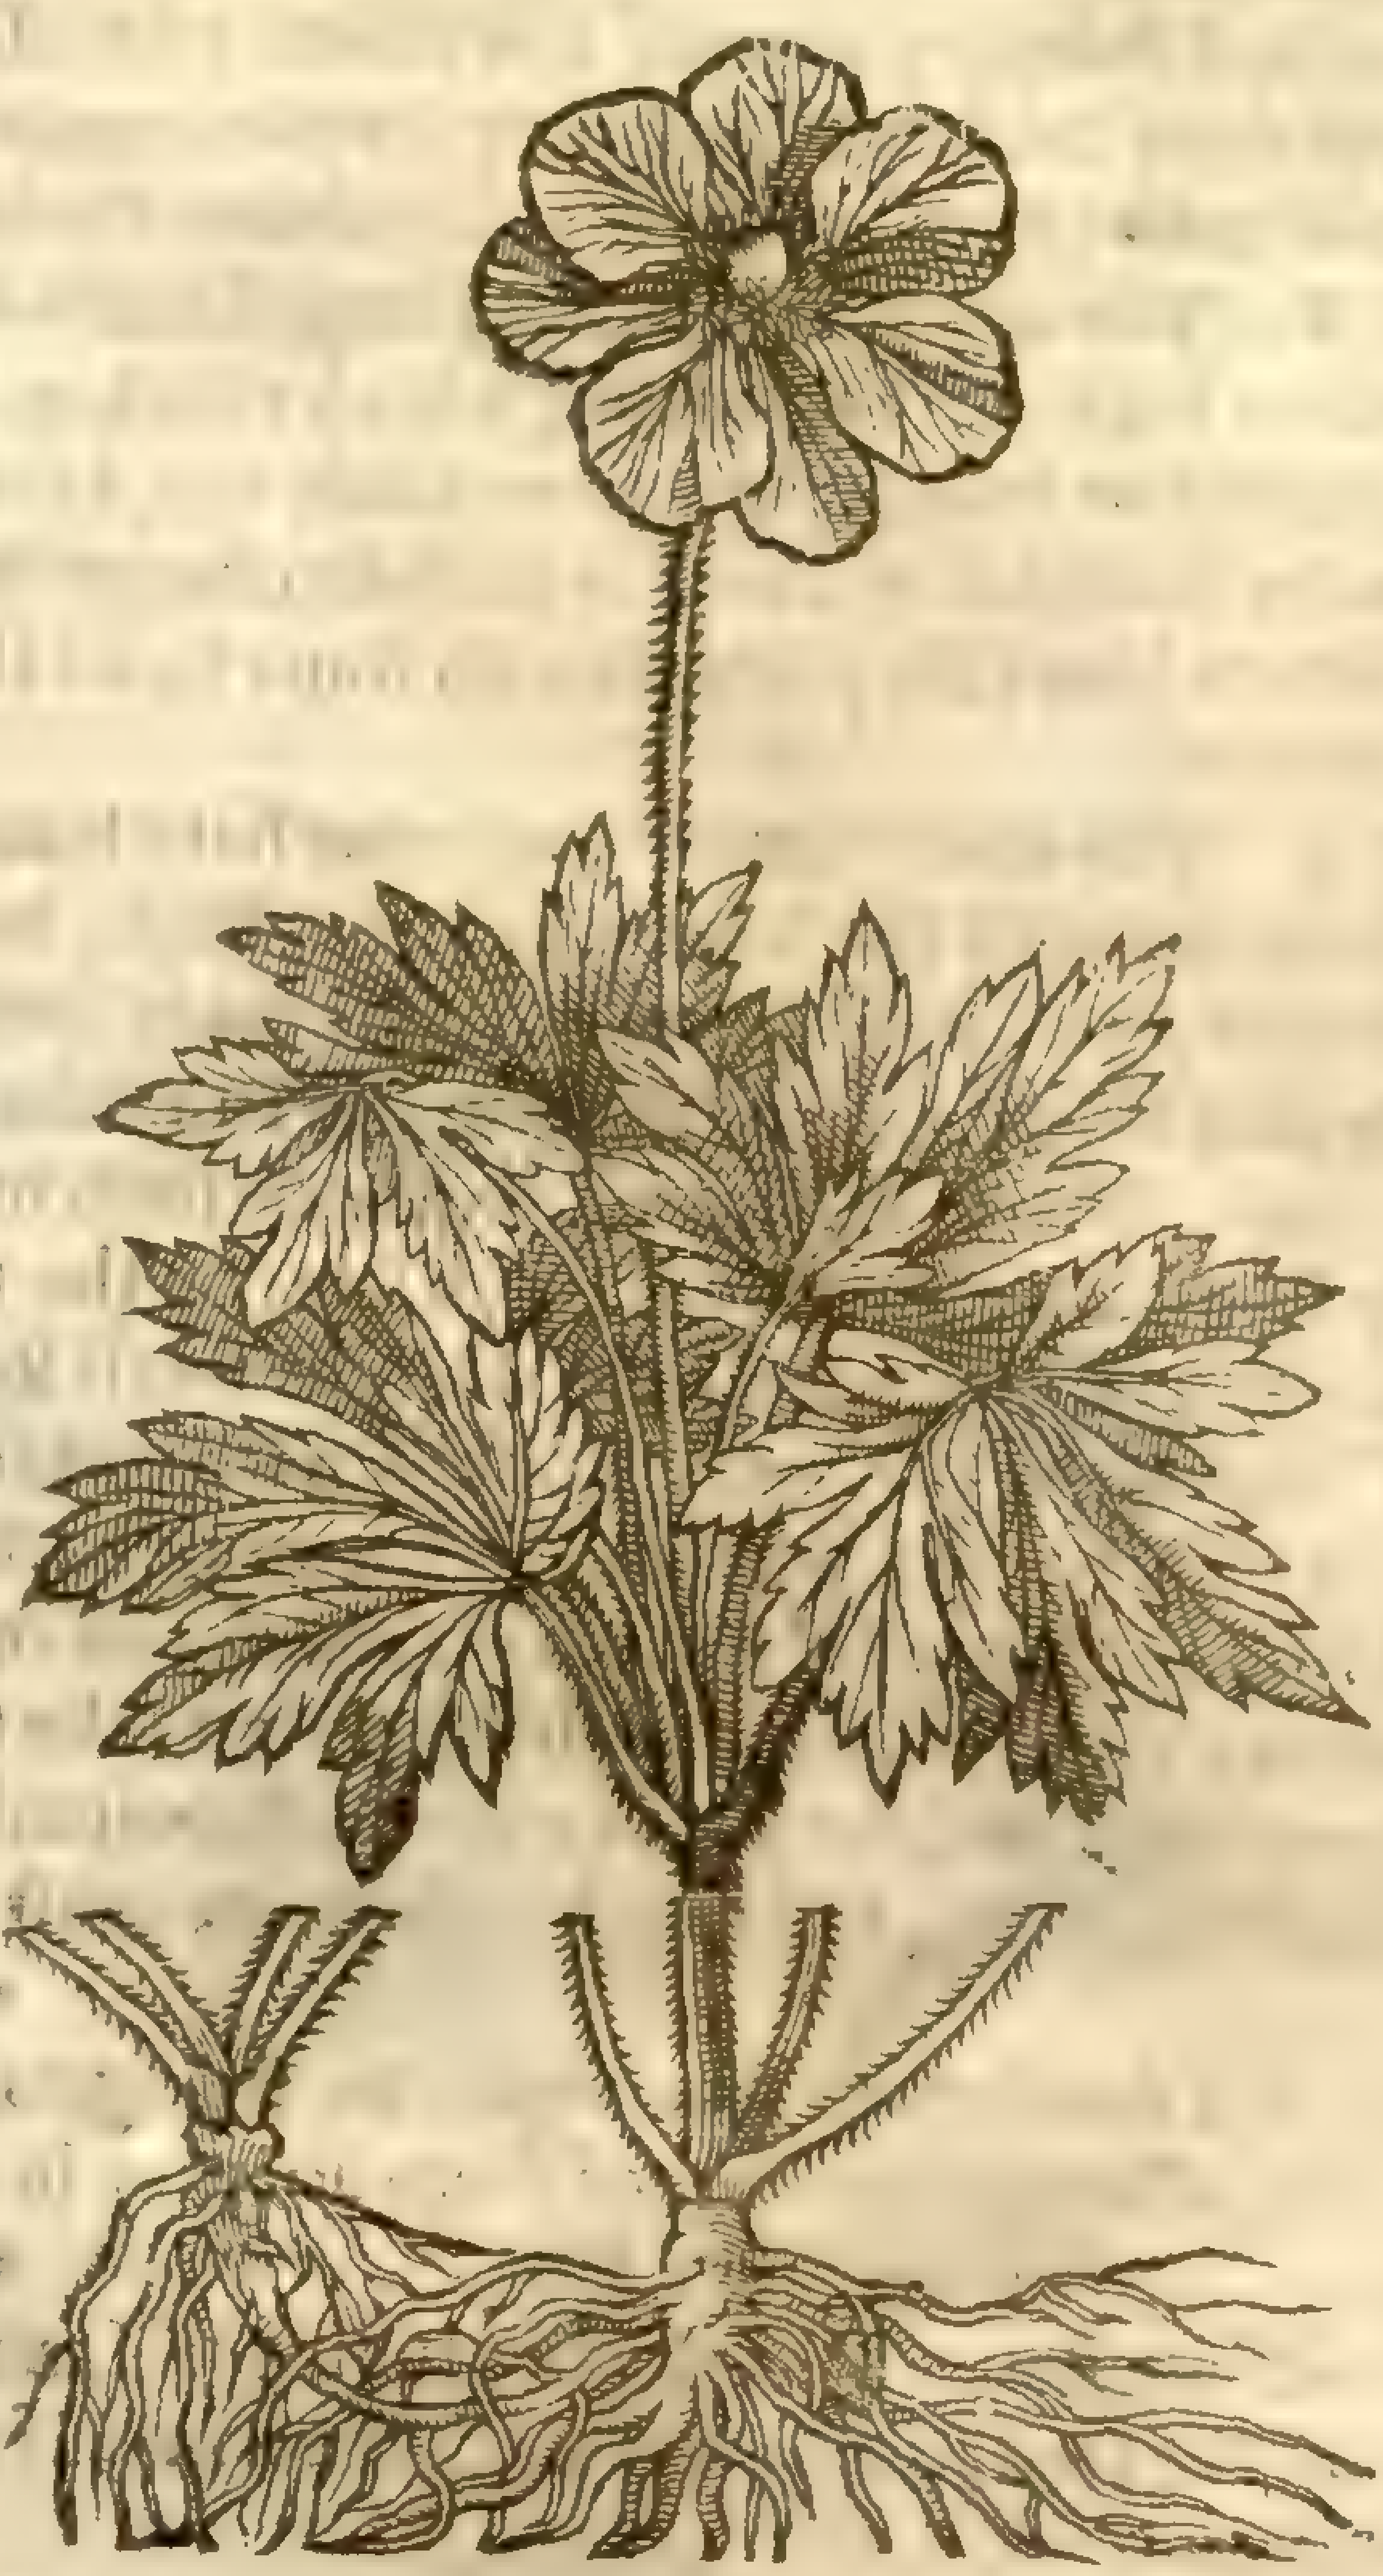
6 The ſixth hath very broad leaues in reſpect of all the reſt of the *Anemones*, not vnlike to thoſe of the common Mallow, but greene on the vpper part, and tending to redneſſe vnderneath, like the leaues of Sow-bread. The ſtalke is like that of the laſt deſcribed, on the top whereof growes a faire yellow ſtar-floure, with a head ingirt with yellow thrums. The root (ſaith my Author) is a finger long, thicke and knobby.

‡ 7 There is alſo another whoſe lower leaues reſemble thoſe of the laſt deſcribed, yet thoſe which grow next aboue them are more diuided or cut in: amongſt theſe leaues riſeth vp a ſtalke

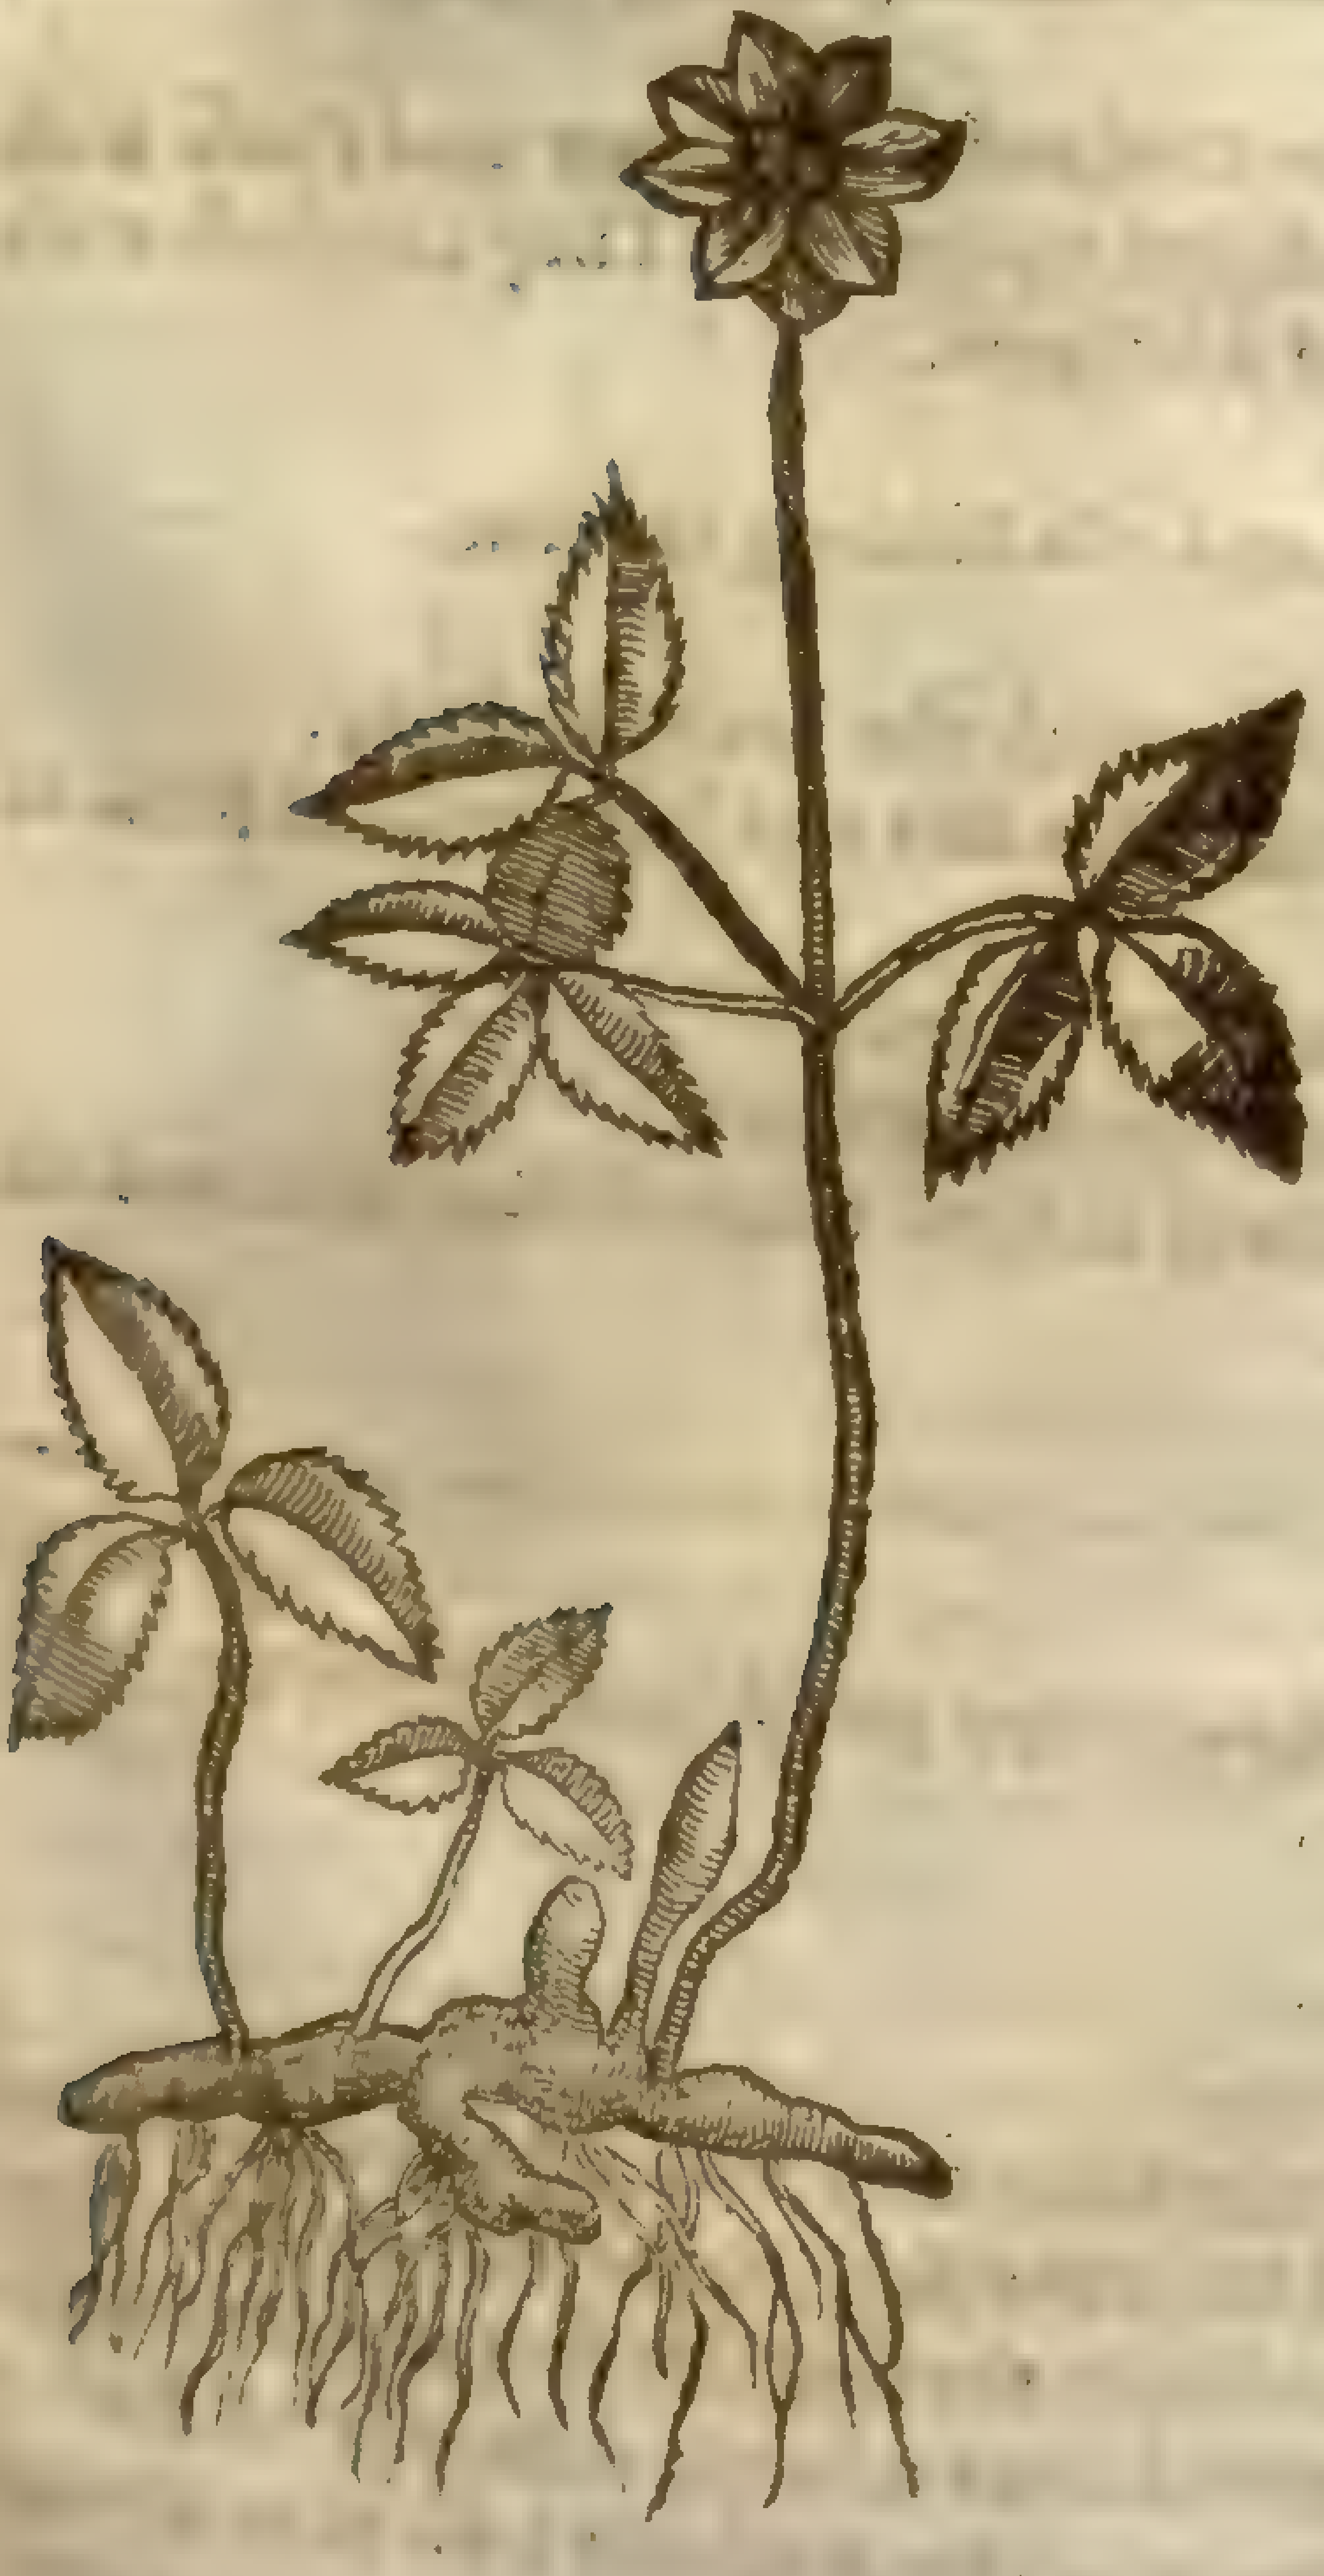
ſome



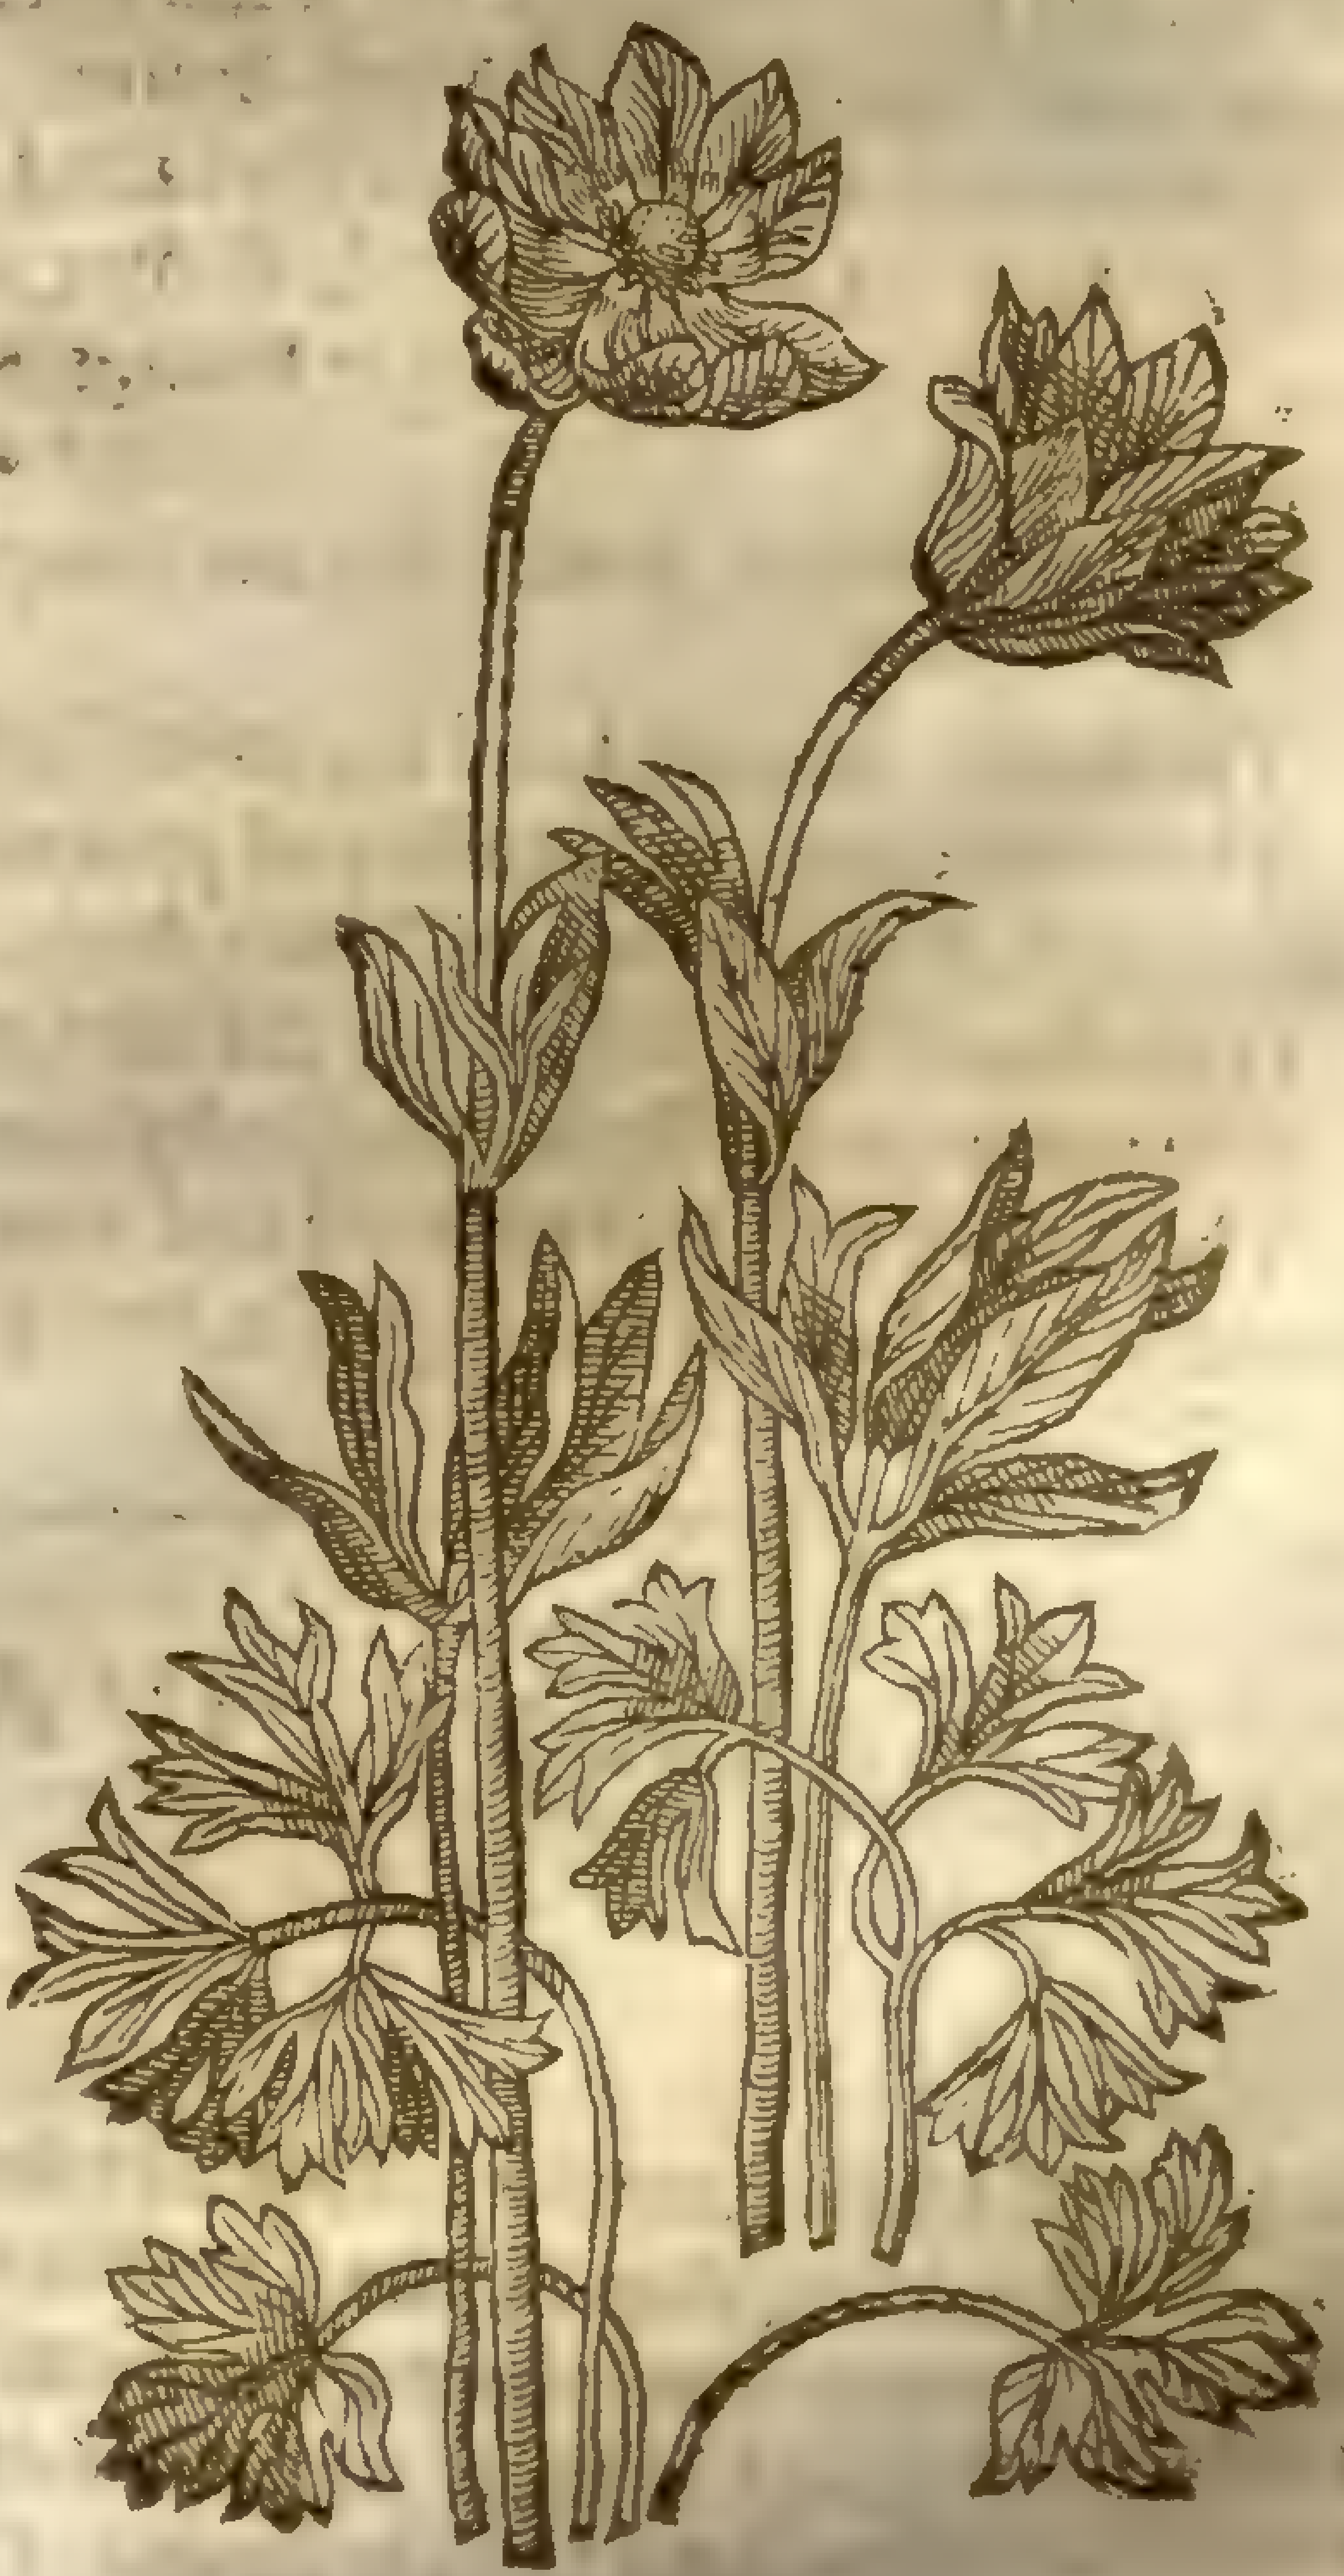
8 *Anemone Geranifolia.*
Storks bill Wind-floure.



9 *Anemone Matthioli.*
Matthiolus white Winde-floure.



10 *Anemone trifolia.*
Three leaued Wind-floure.



11 *Anemone Papaueracea.*
Poppy Winde-floure.

ſome foot high, the top whereof is adorned with a floure conſiſting of two ranks of leaues, whereof thoſe on the out ſide are larger, rounder pointed, and ſometimes ſnipt in a little; the reſt are narrower and ſharper pointed. The colour of theſe leaues is yellow, deeper on the inſide, and on the outſide there are ſome ſmall purple veins running alongſt theſe leaues of the floure. The root is ſome two inches long, the thickneſſe of ones little finger, with ſome tuberous knobs hanging thereat. ‡

8 The eighth hath many large leaues deeply cut and jagged, in ſhape like thoſe of the Storks bill or Pink-needle: among which riſeth vp a naked ſtalke ſet about toward the top with the like leaues, but ſmaller and more finely cut, bearing at the top of the ſtalke a ſingle floure conſiſting of many ſmall blew leaues, which do change ſometimes into purple, and oftentimes into white, ſet about a blackiſh pointall with ſome ſmall threds like vnto a pale or border. The root is thick and knobby.

9 The ninth ſort of Anemone hath leaues like vnto the garden Crow-foot: the ſtalk riſeth vp from amongſt the leaues, of a foot high, bearing at the top faire white floures made of fiue ſmall leaues; in the middle whereof are many little yellow chiues or threds. The root is made of many ſlender threds or ſtrings, contrarie to all the reſt of the Winde-floures.

10 The tenth ſort of Anemone hath many leaues like the common medow Trefoile, ſleightly ſnipt about the edges like a ſaw: on the top of the ſlender ſtalks ſtands a ſingle white flour tending to purple, conſiſting of eight ſmall leaues, reſembling in ſhape the floures of common field Crow-foot. The root is knobby, with certain ſtrings faſtned thereto.

11 The eleuenth kind of Anemone hath many jagged leaues cut euen to the middle rib, reſembling the leaues of *Geranium Columbinum* or Doues foot. The leaues that doe embrace the tender weake ſtalks are flat and ſleightly cut: the floures grow at the top of the ſtalks, of a bright ſhining purple colour, ſet about a blackiſh pointall with ſmall thrums or chiues like a pale. The root is knobby, thicke, and very brittle, as are moſt of thoſe of the Anemones.

¶ *The Place.*

All the ſorts of Anemones are ſtrangers, and not found growing wilde in England; notwithſtanding all and euery ſort of them do grow in my garden very plentifully.

¶ *The Time.*

They floure from the beginning of Ianuarie to the end of April, at what time the flours do fade, and the ſeed flieth away with the wind, if there be any ſeed at all; the which I could neuer as yet obſerue.

¶ *The Names.*

Anemone, or Wind-floure, is ſo called, ἀπὸ τοῦ ἀνέμου; that is to ſay, of the wind: for the floure doth neuer open it ſelfe but when the wind doth blow, as *Pliny* writeth: whereupon it is named of diuers, *Herba venti*: in Engliſh, Wind-floure.

Thoſe with double floures are called in the Turky tongue, *Giul*, and *Gul Catamer*: and thoſe with ſmall jagged leaues and double floures are called *Lalé benzede*, and *Galipoli lalé*. They cal thoſe with ſmall jagged leaues and ſingle floures; *Binizate*, *Binizade*, and *Binizante*.

¶ *The Temperature.*

All the kinds of Anemones are ſharp, biting the tongue, and of a binding facultie.

¶ *The Vertues.*

A The leaues ſtamped, and the juice ſniffed vp into the noſe, purgeth the head mightily.

B The root champed or chewed procureth ſpitting, and cauſeth water and flegme to run forth of the mouth, as Pellitorie of Spain doth.

C It profiteth in collyries for the eies, to ceaſe the inflammation thereof.

D The juice mundifieth and clenſeth malignant, virulent, and corroſiue vlcers.

E The leaues and ſtalks boiled and eaten of nurſes, cauſe them to haue much milke: it prouoketh the terms, and eaſeth the leproſie, being bathed therewith.

‡ Chap. 77. *Of diuers other Anemones or Winde-floures.*

¶ *The Kindes.*

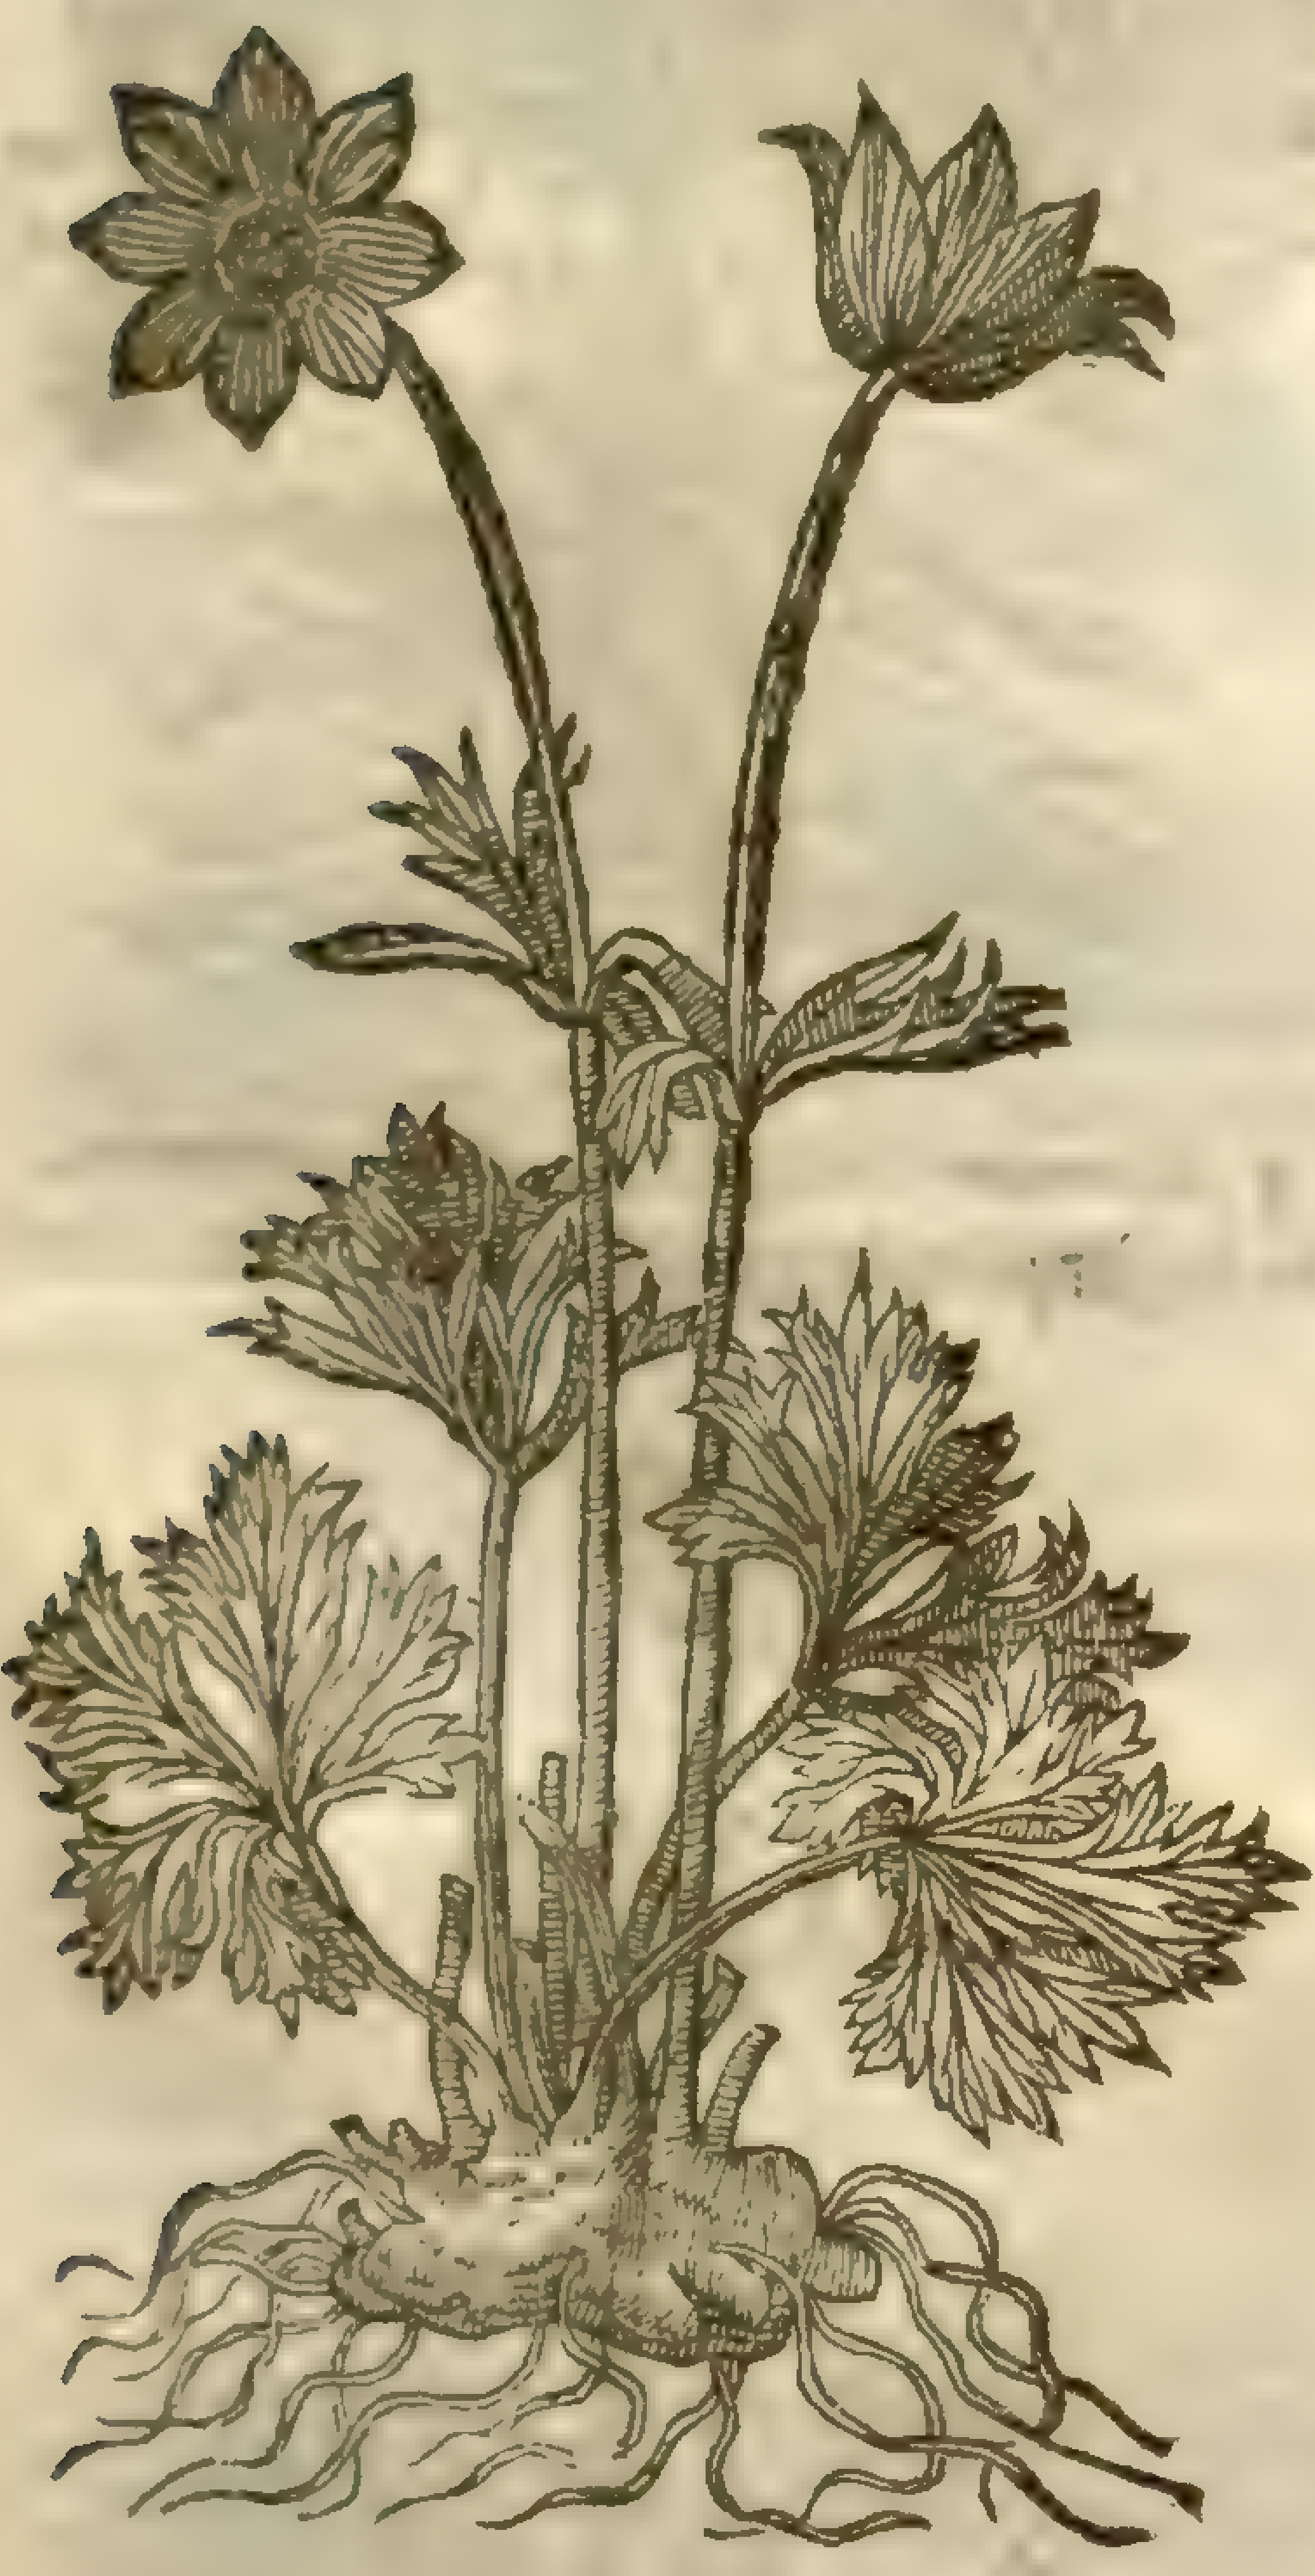
‡ These floures which are in ſuch eſteeme for their beautie may well be diuided into two ſorts, that is, the *Latifolia* or broad leaued, and the *Tenuifolia*, or narrow leaues. Now of each of theſe ſorts there are infinite varieties, which conſiſt in the ſingleneſſe and doubleneſſe of the floures, and in their diuerſitie of colours, which would aske a large diſcourſe to handle exactly. Wherefore I onely intend (beſides thoſe ſet downe by our Authour) to giue you the

figures of ſome few others, with their deſcription, briefly taken out of the Workes of the learned and diligent Herbariſt *Carolus Cluſius*; where ſuch as deſire further diſcourſe vpon this ſubiect may be abundantly ſatisfied: and ſuch as do not vnderſtand Latine may finde as large ſatisfaction in the late worke of Mr *Iohn Parkinſon*; whereas they ſhall not onely haue their hiſtory at large, but alſo learne the way to raiſe them of ſeed, which hath beene a thing not long knowne (except to ſome few;) and thence hath riſen this great varietie of theſe floures, wherewith ſome Gardens ſo much abound.

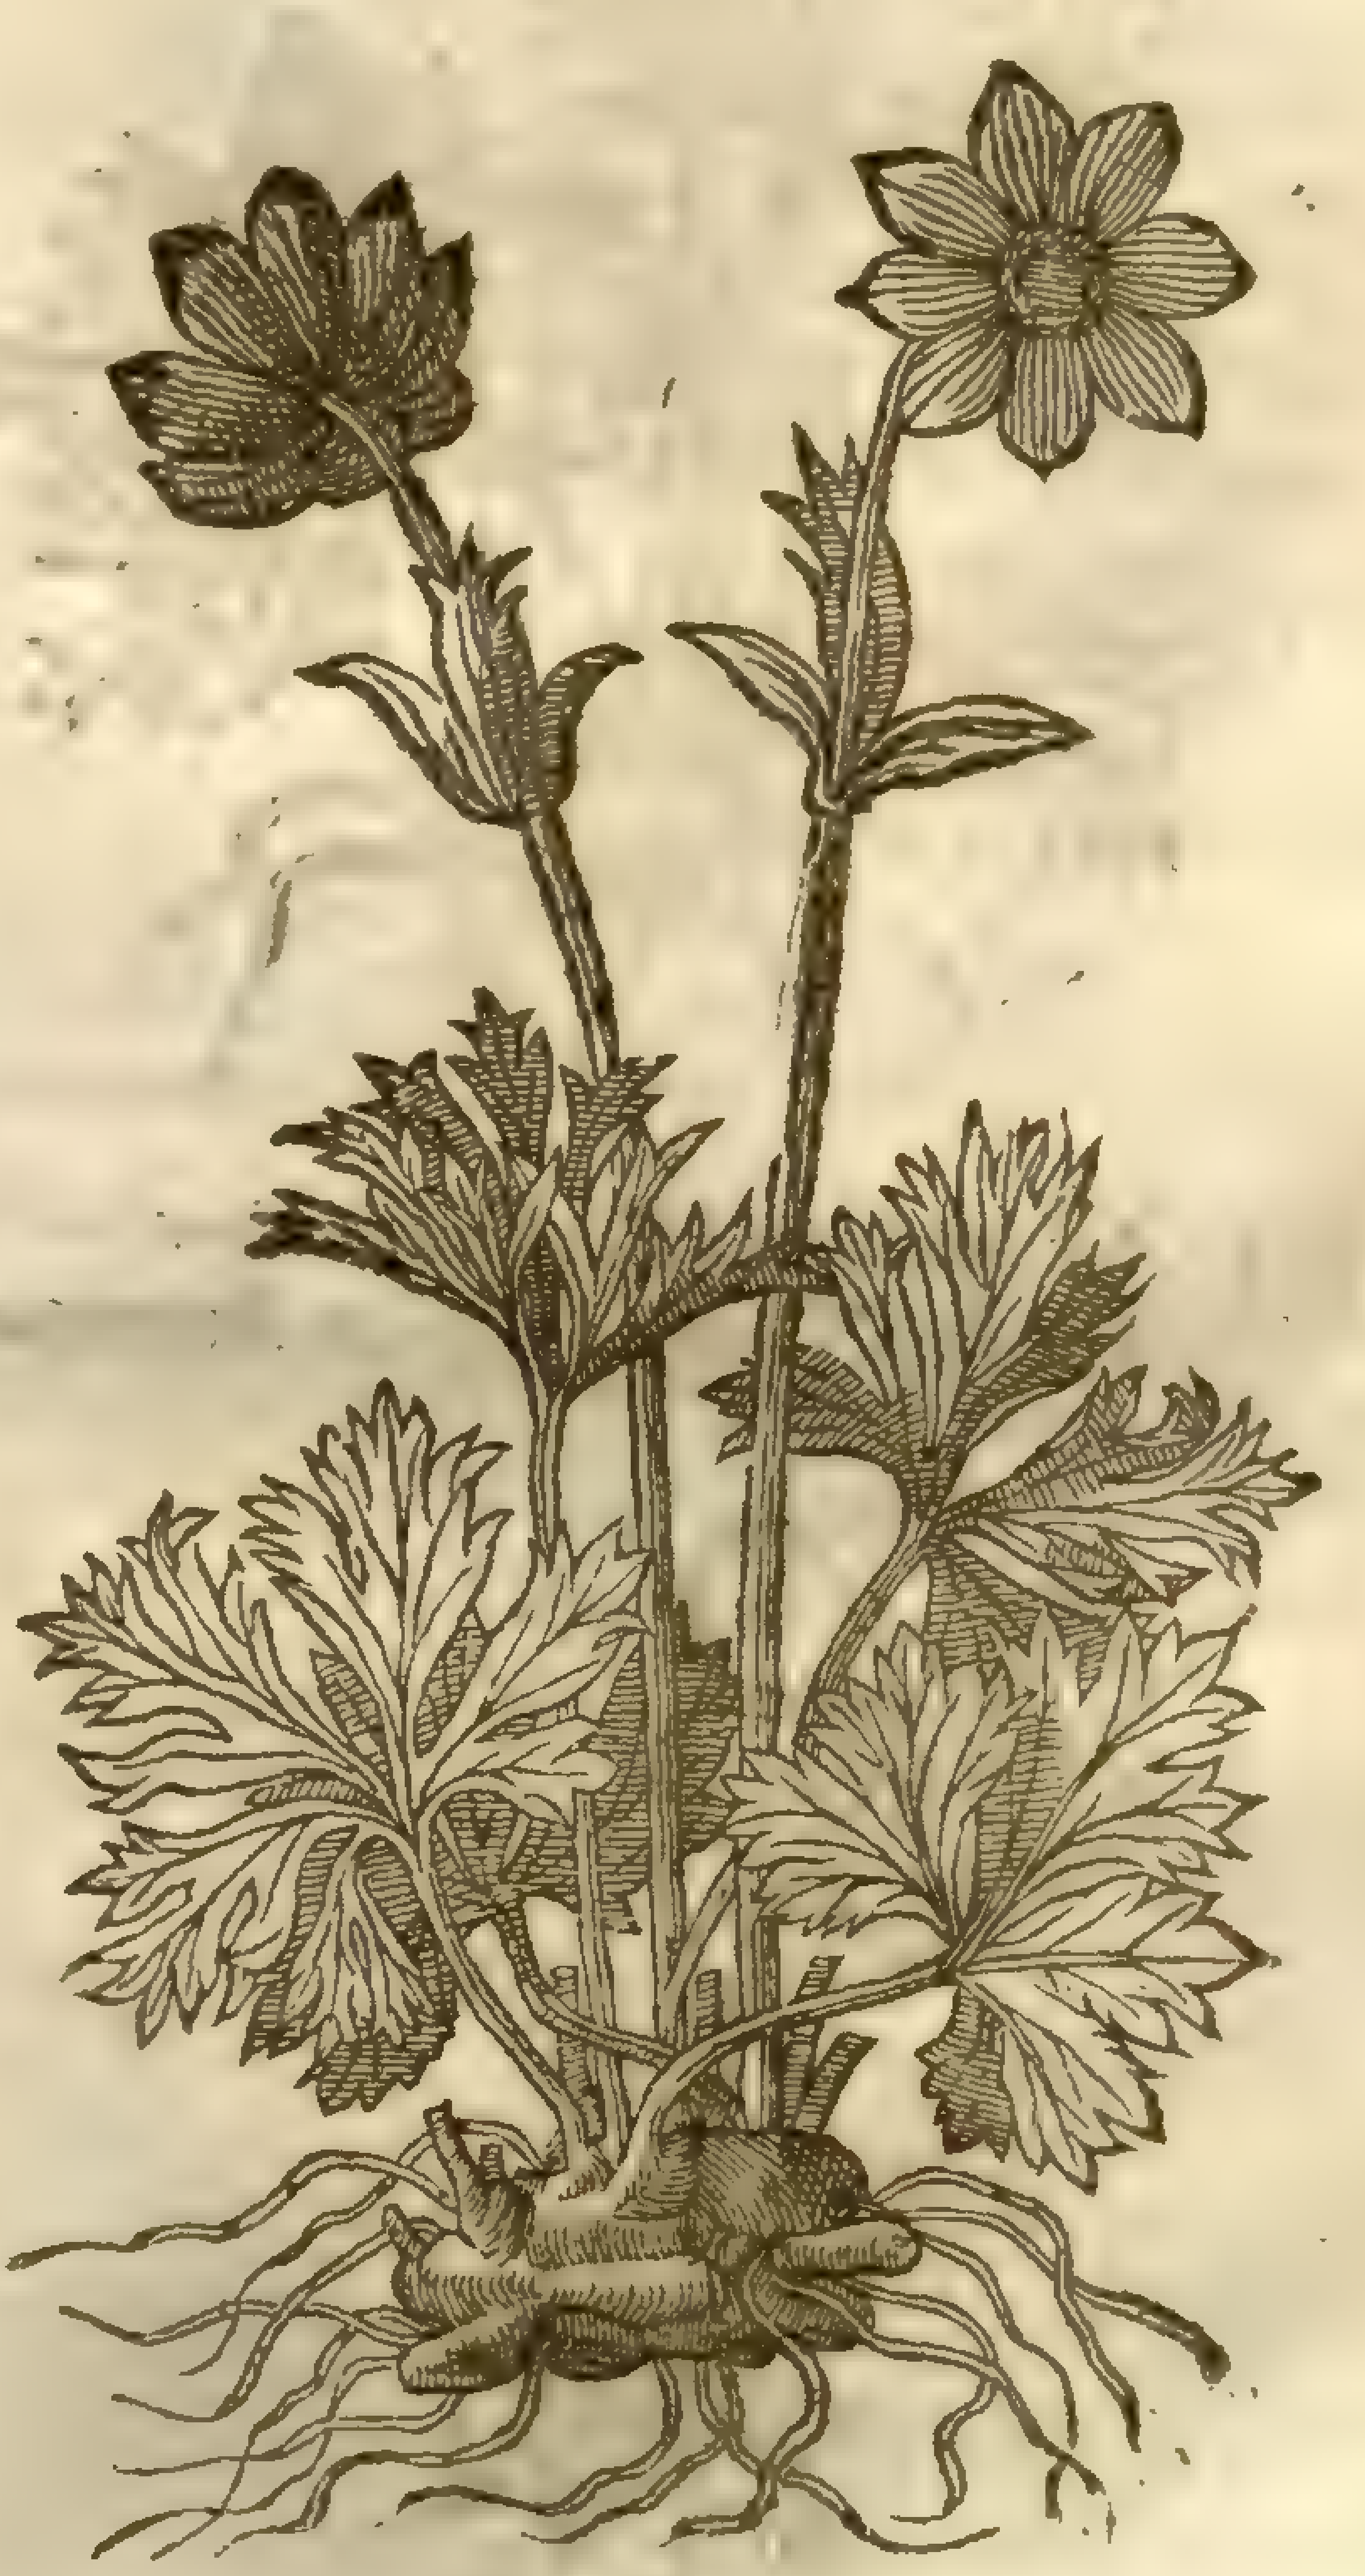
¶ *The Deſcription.*

1 The root of this is like that of the great double red *Anemone* deſcribed in the third place of the precedent chapter; and the leaues alſo are like, but leſſer and deeper coloured. The ſtalke growes ſome foot high, ſlender and greene, at the top whereof groweth a ſingle floure, conſiſting of eight leaues of a bright ſhining skarlet colour on the inſide, with a paler coloured ring incompaſſing a hairy head ſet about with purple thrums: the outſide of the floure is hairy or downie. This is *Anem.latifol.ſimpl.flo.*16.of *Cluſius*.

‡ 1 *Anemone latifolia flore coccineo.*
The broad leaued skarlet Anemone.



‡ 2 *Anemone latifolia flore magno coccineo.*
The skarlet Anemone with the large floure.

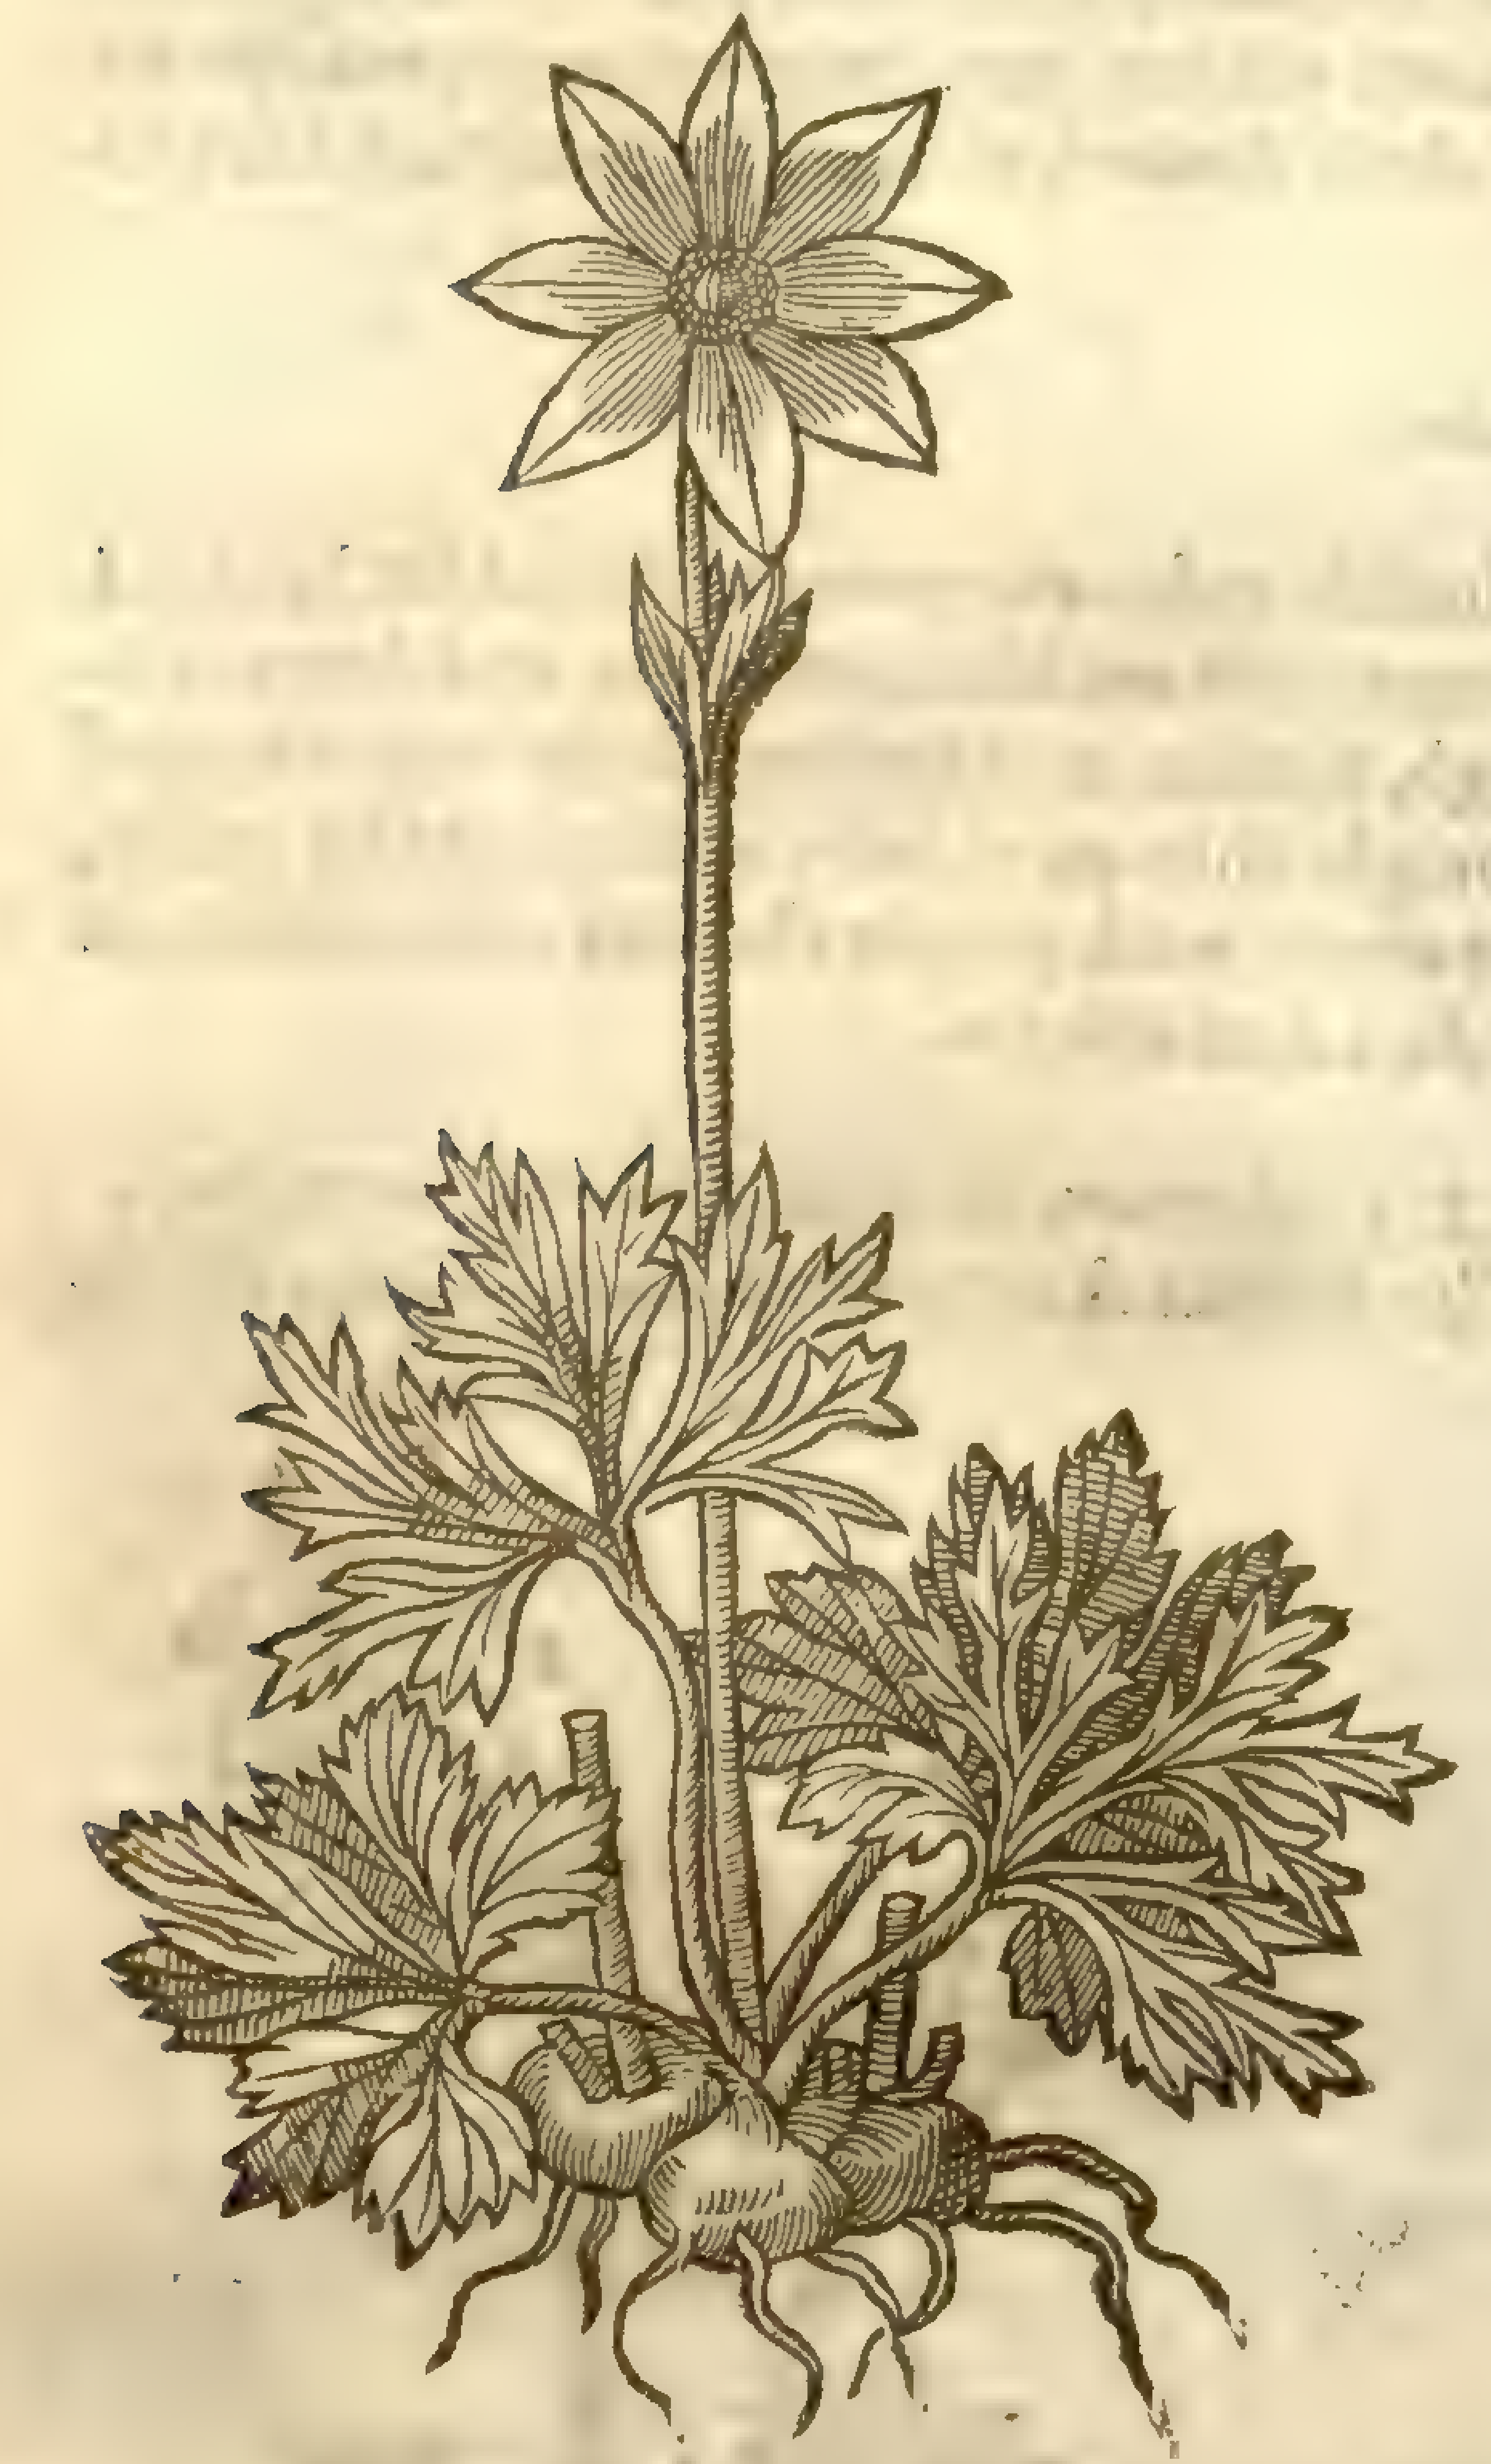


2 This in ſhape of roots & leaues is like the former, but the leaues are blacker, and more ſhining on their vpper ſides: the ſtalke alſo is like to others of this kinde, and at the top carrieth a large floure conſiſting of eight broad leaues, being at the inſide of a bright skarlet colour, without any circle; and the thrums that ingirt the hairy head are of a ſanguine colour. This head (as in others of this kindred) growes larger after the falling of the floure, and at length turns into a downie ſubſtance, wherein a ſmooth blacke ſeed is incloſed like as in other Anemones; which ſowne as ſoone as it is ripe vſually comes vp before Winter. This is *Anem.latifol.ſimpl.flore* 17.of *Cluſius*.

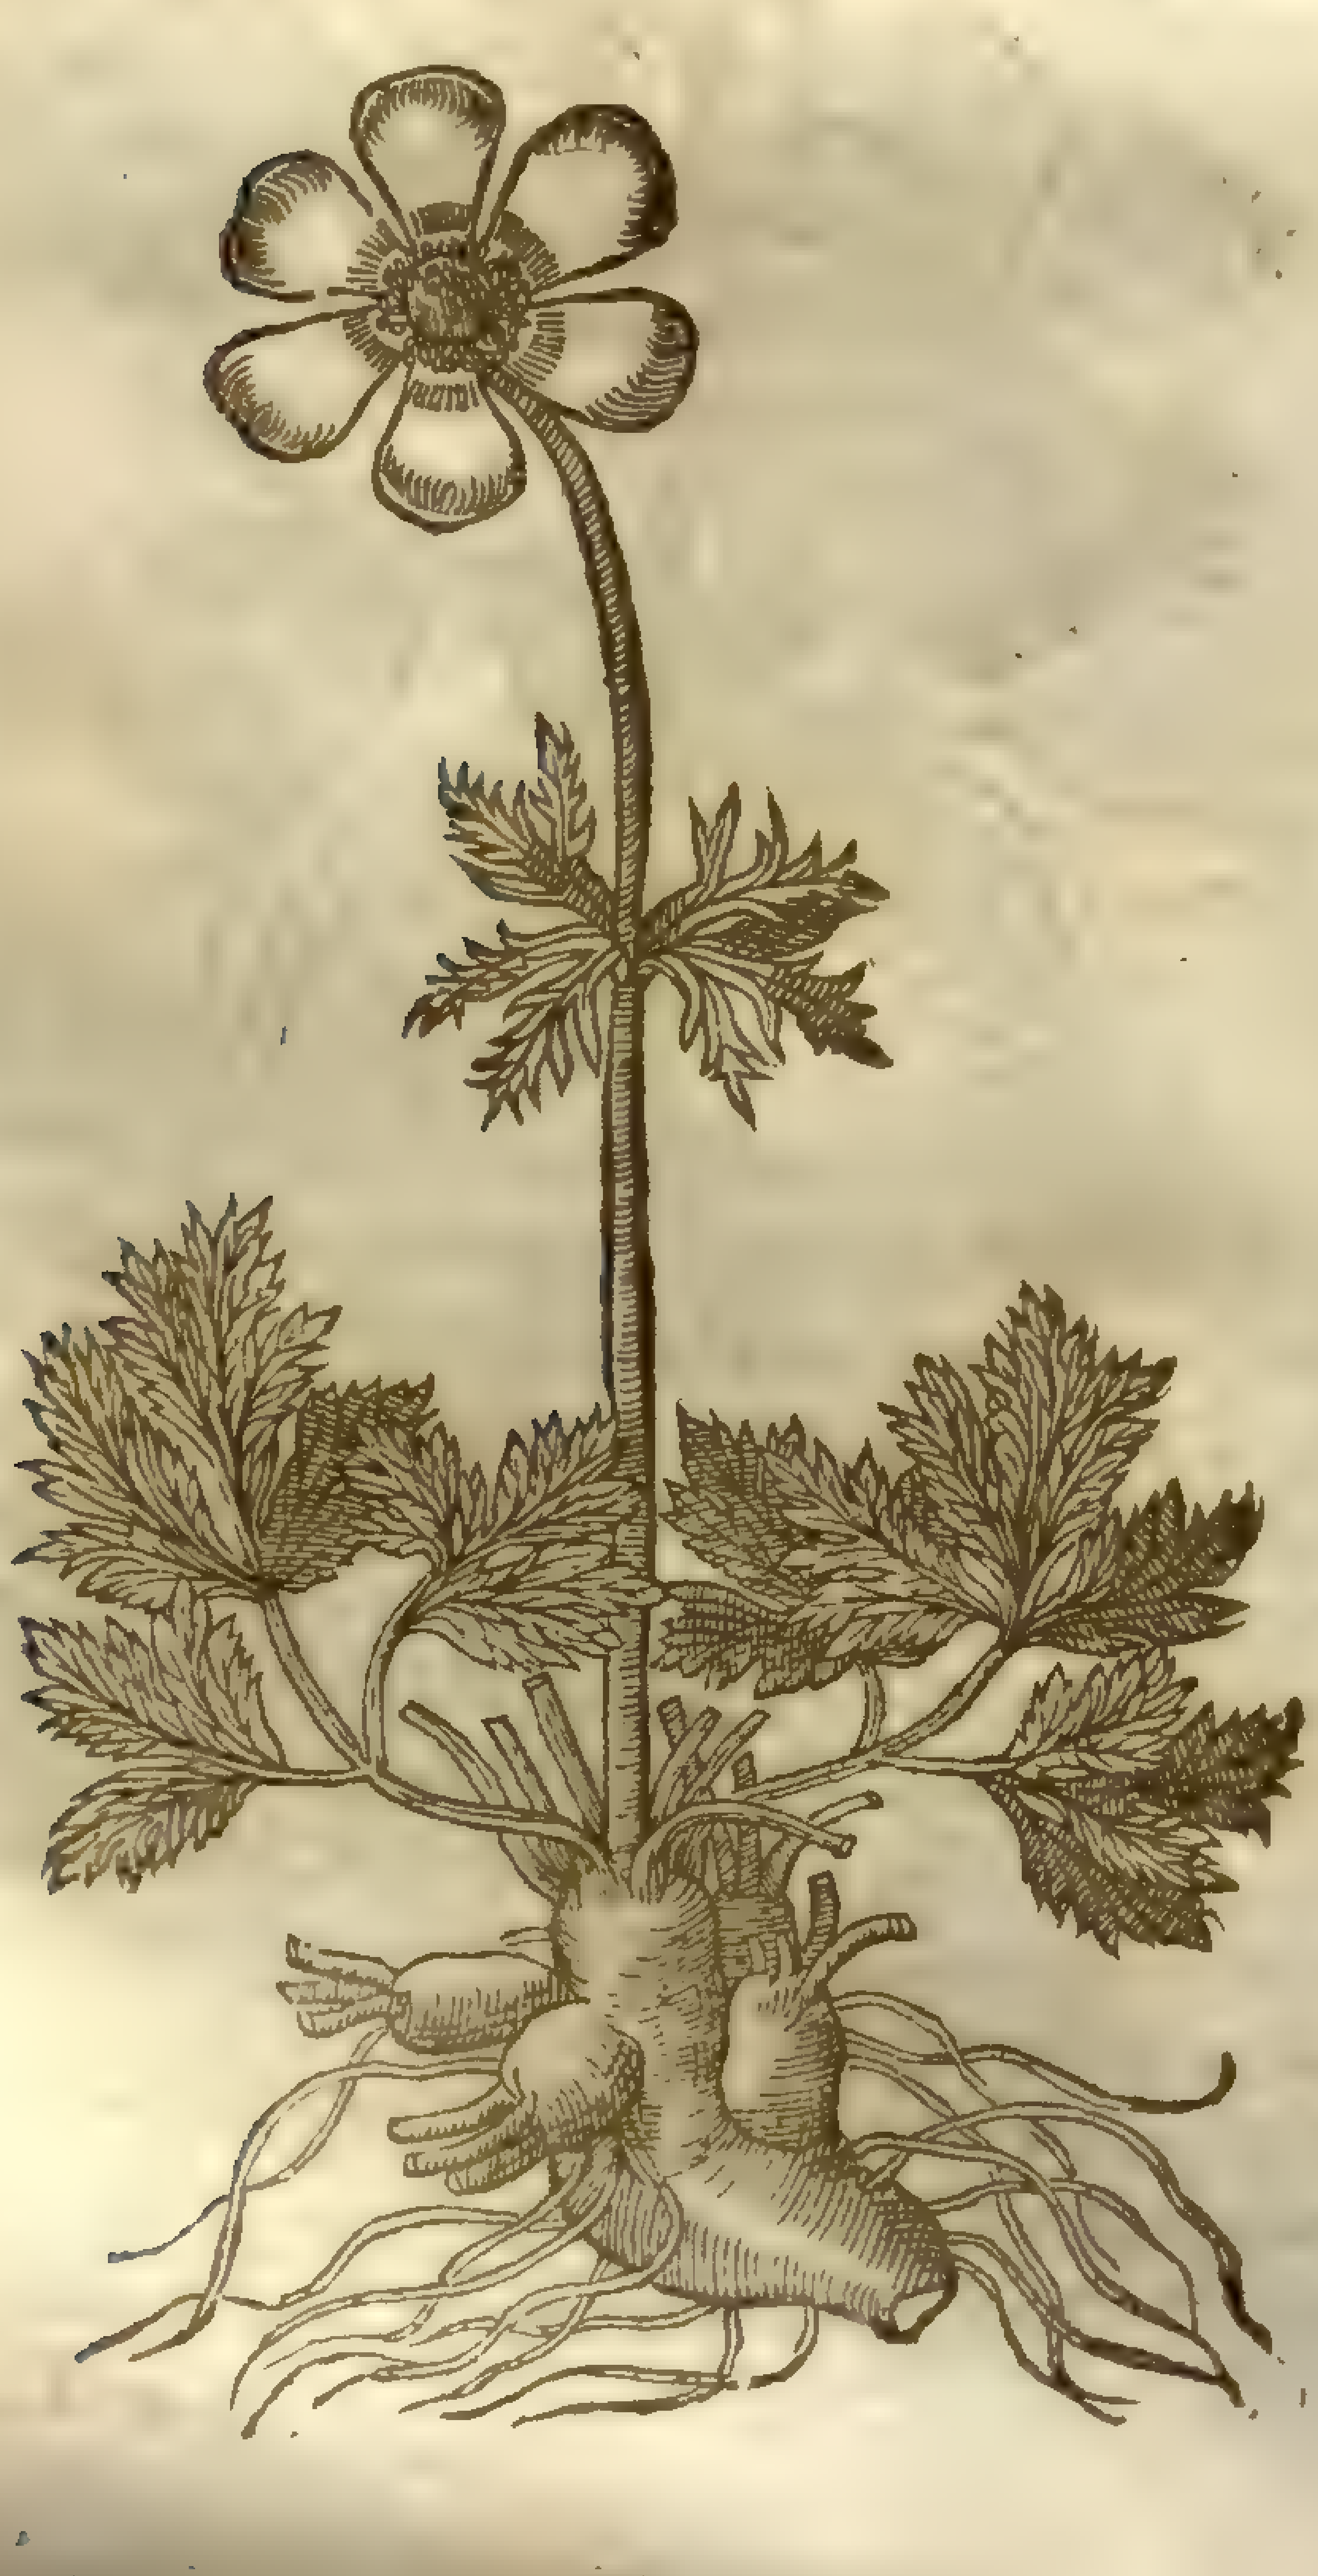
3 This differs not from the former but in floures, which are of an orange-tawny colour, like that of Corne-roſe, or red Poppy; and the bottomes of the leaues of the floures are of a paler colour, which make a ring or circle about the hairy head. This is the eighteenth of *Cluſius*.

Beſides theſe varieties here mentioned, there are many others, which in the colour of the leaues of the floure, or the nailes which make a circle at the bottome thereof, doe differ each from other. Now let vs come to the narrow leaued ones, which alſo differ little but in colour of their floures.

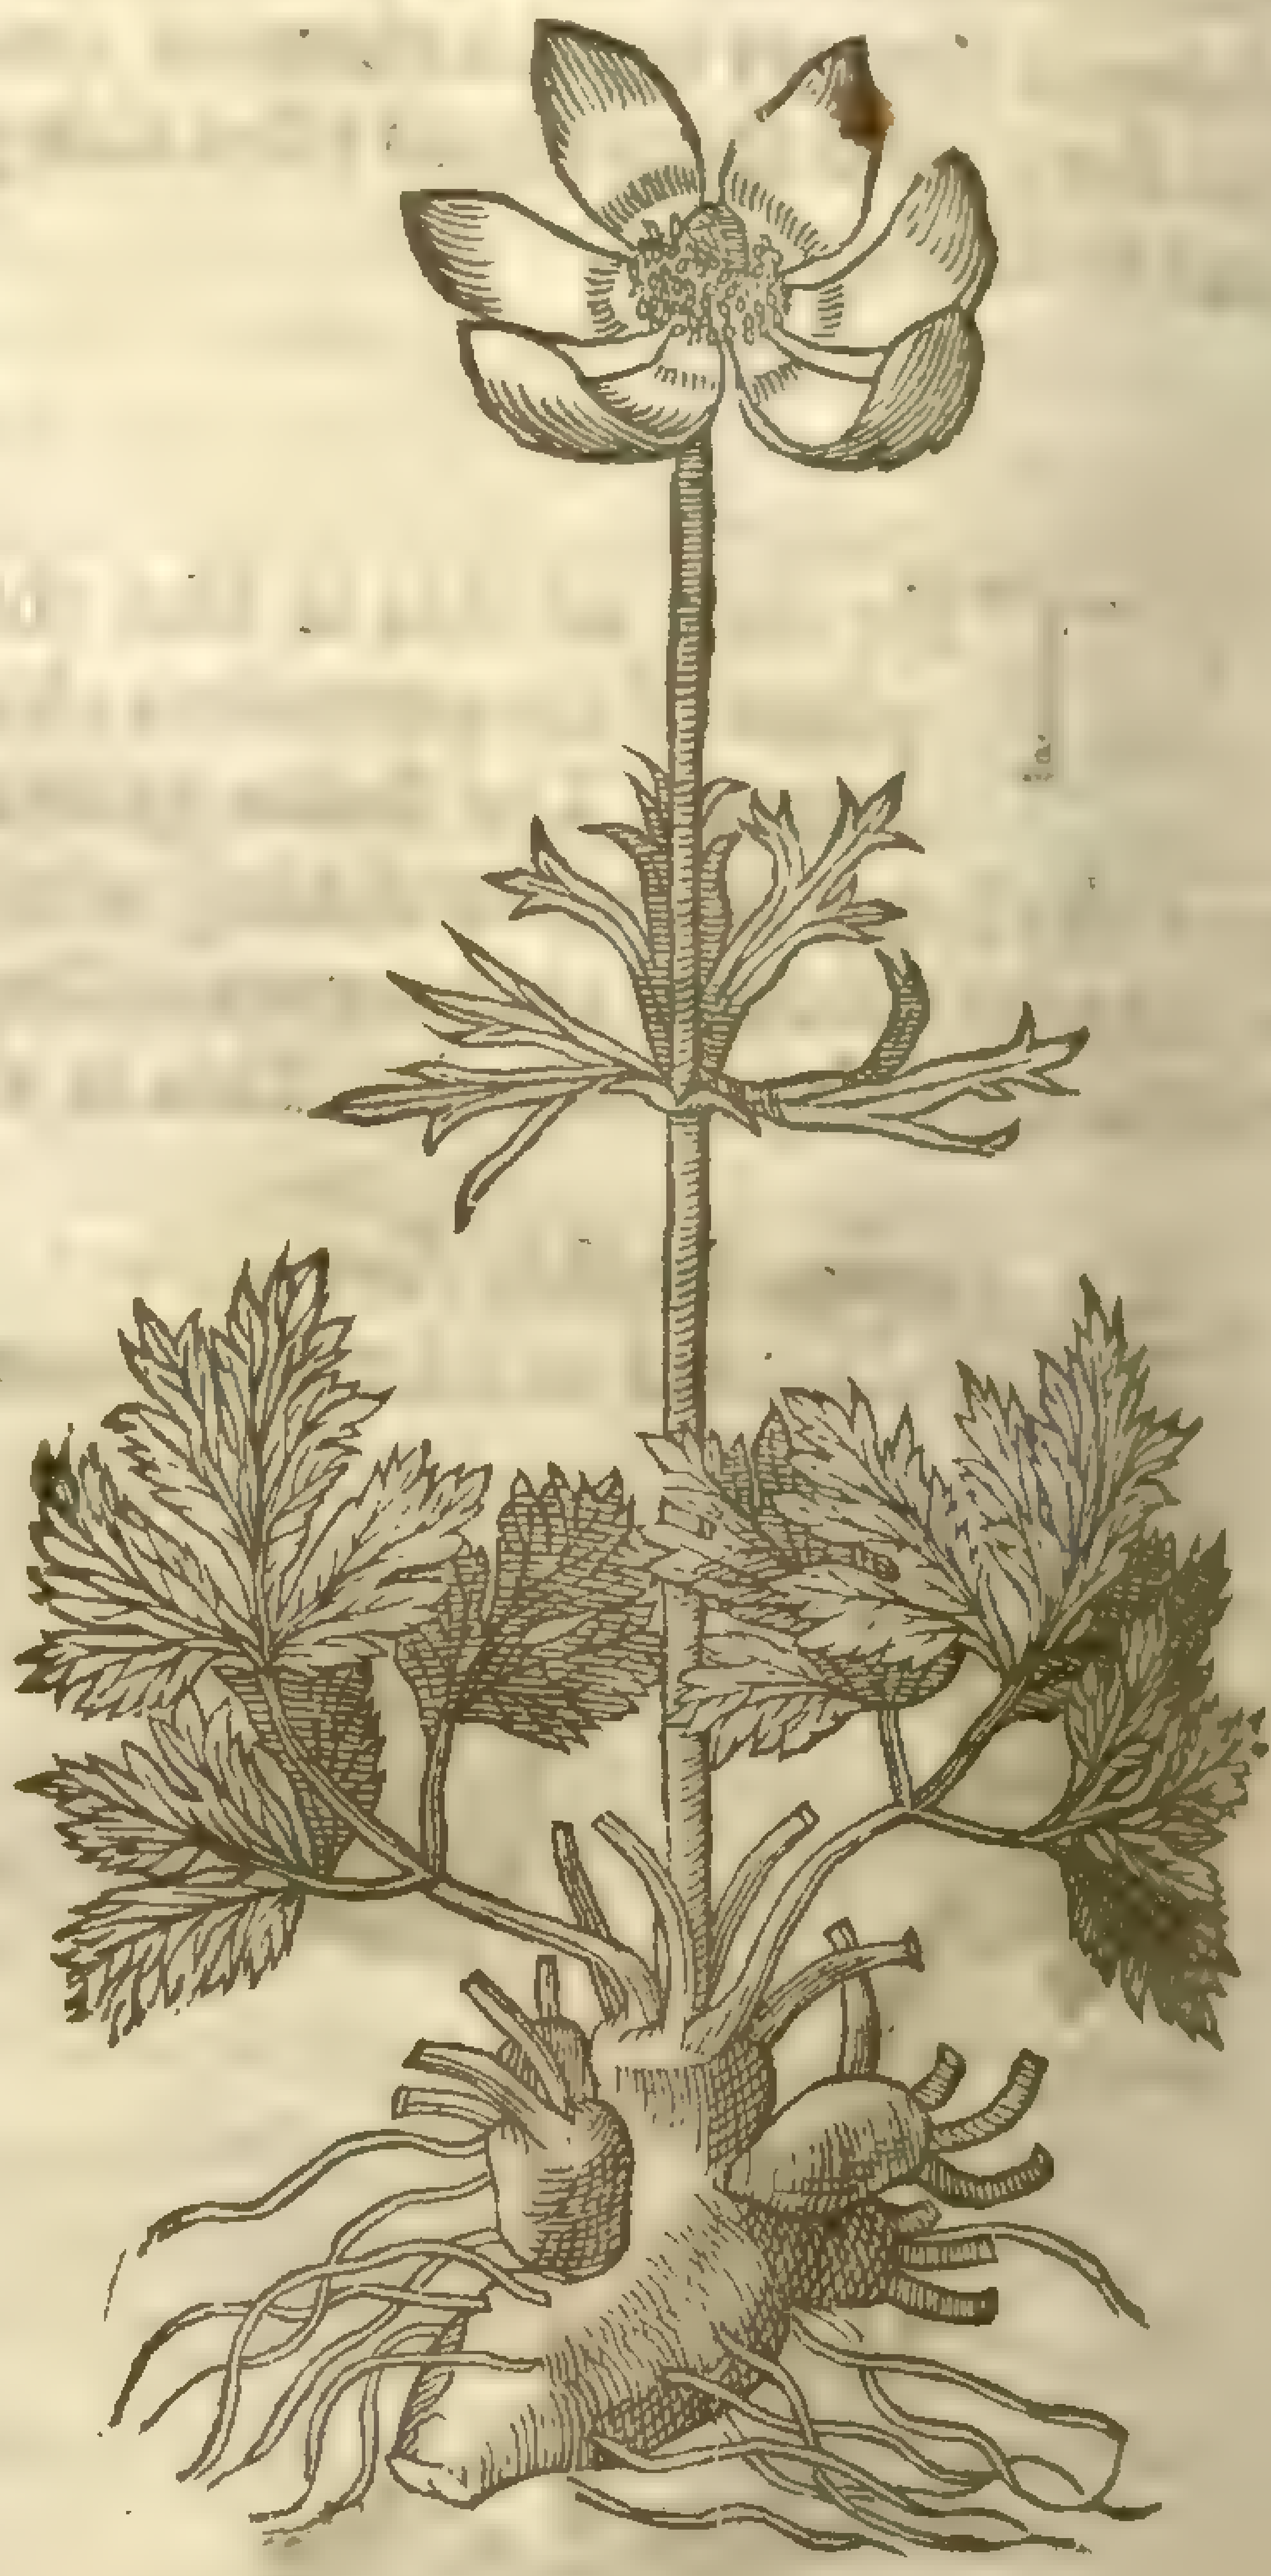
‡ 3 *Anemone latifolia Byzantina.*
The broad leaued Anemone of Conſtantinople.



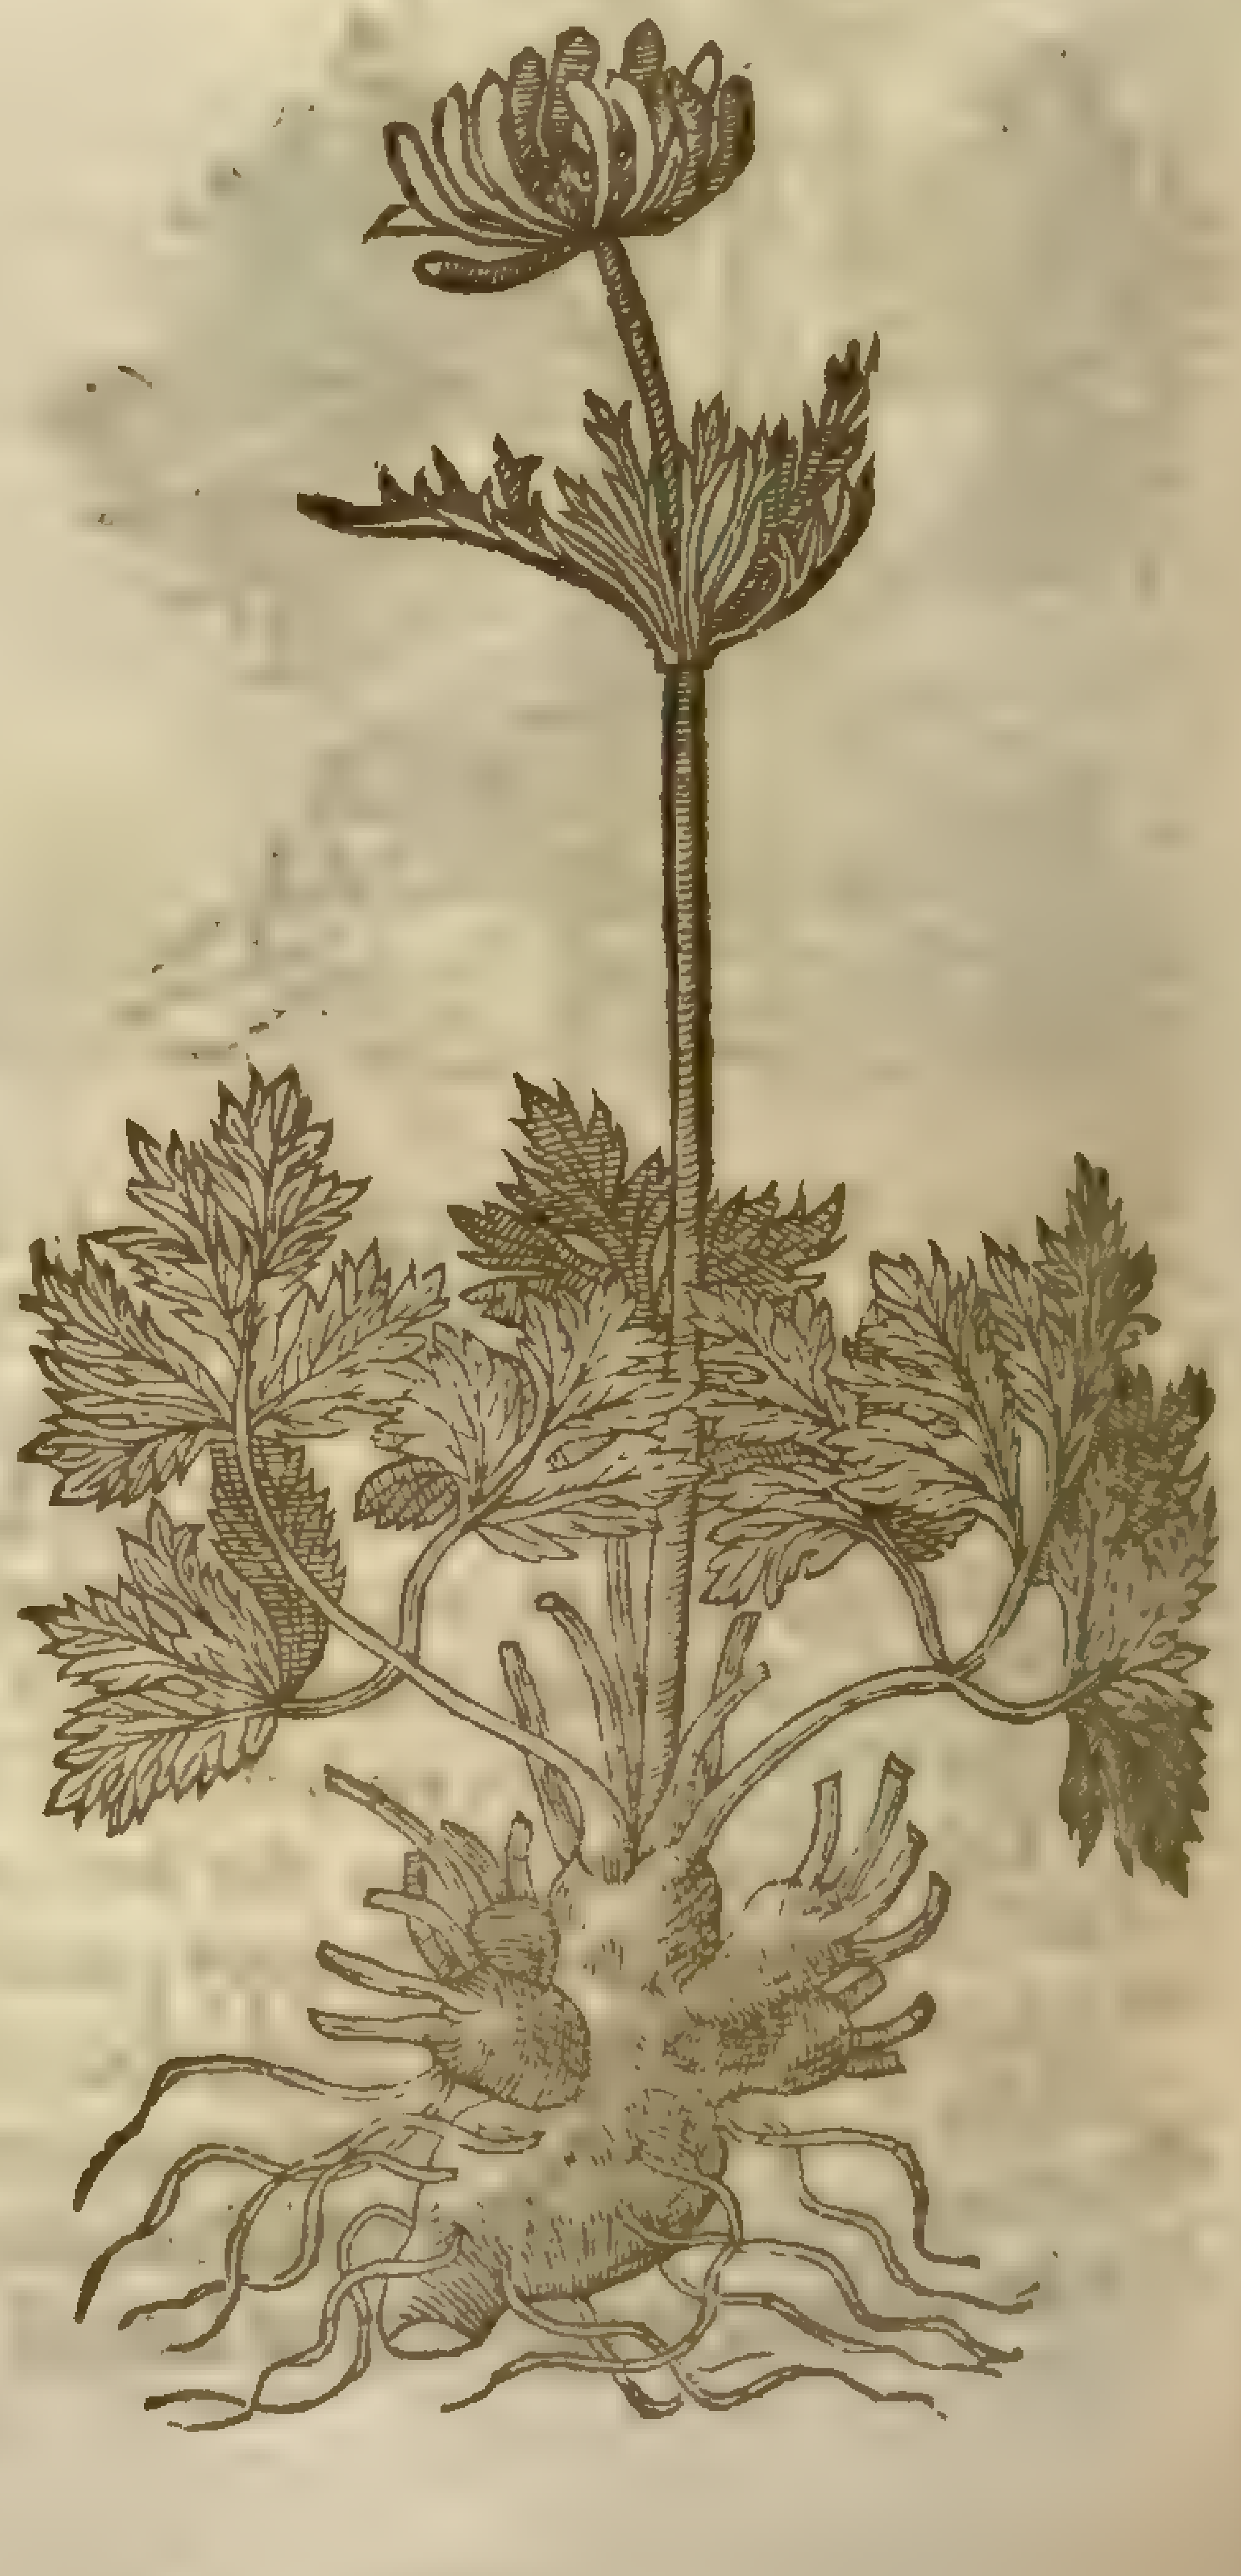
‡ 5 *Anemone tenuifolia flore coccineo.*
The ſmall leaued ſkarlet Anemone.



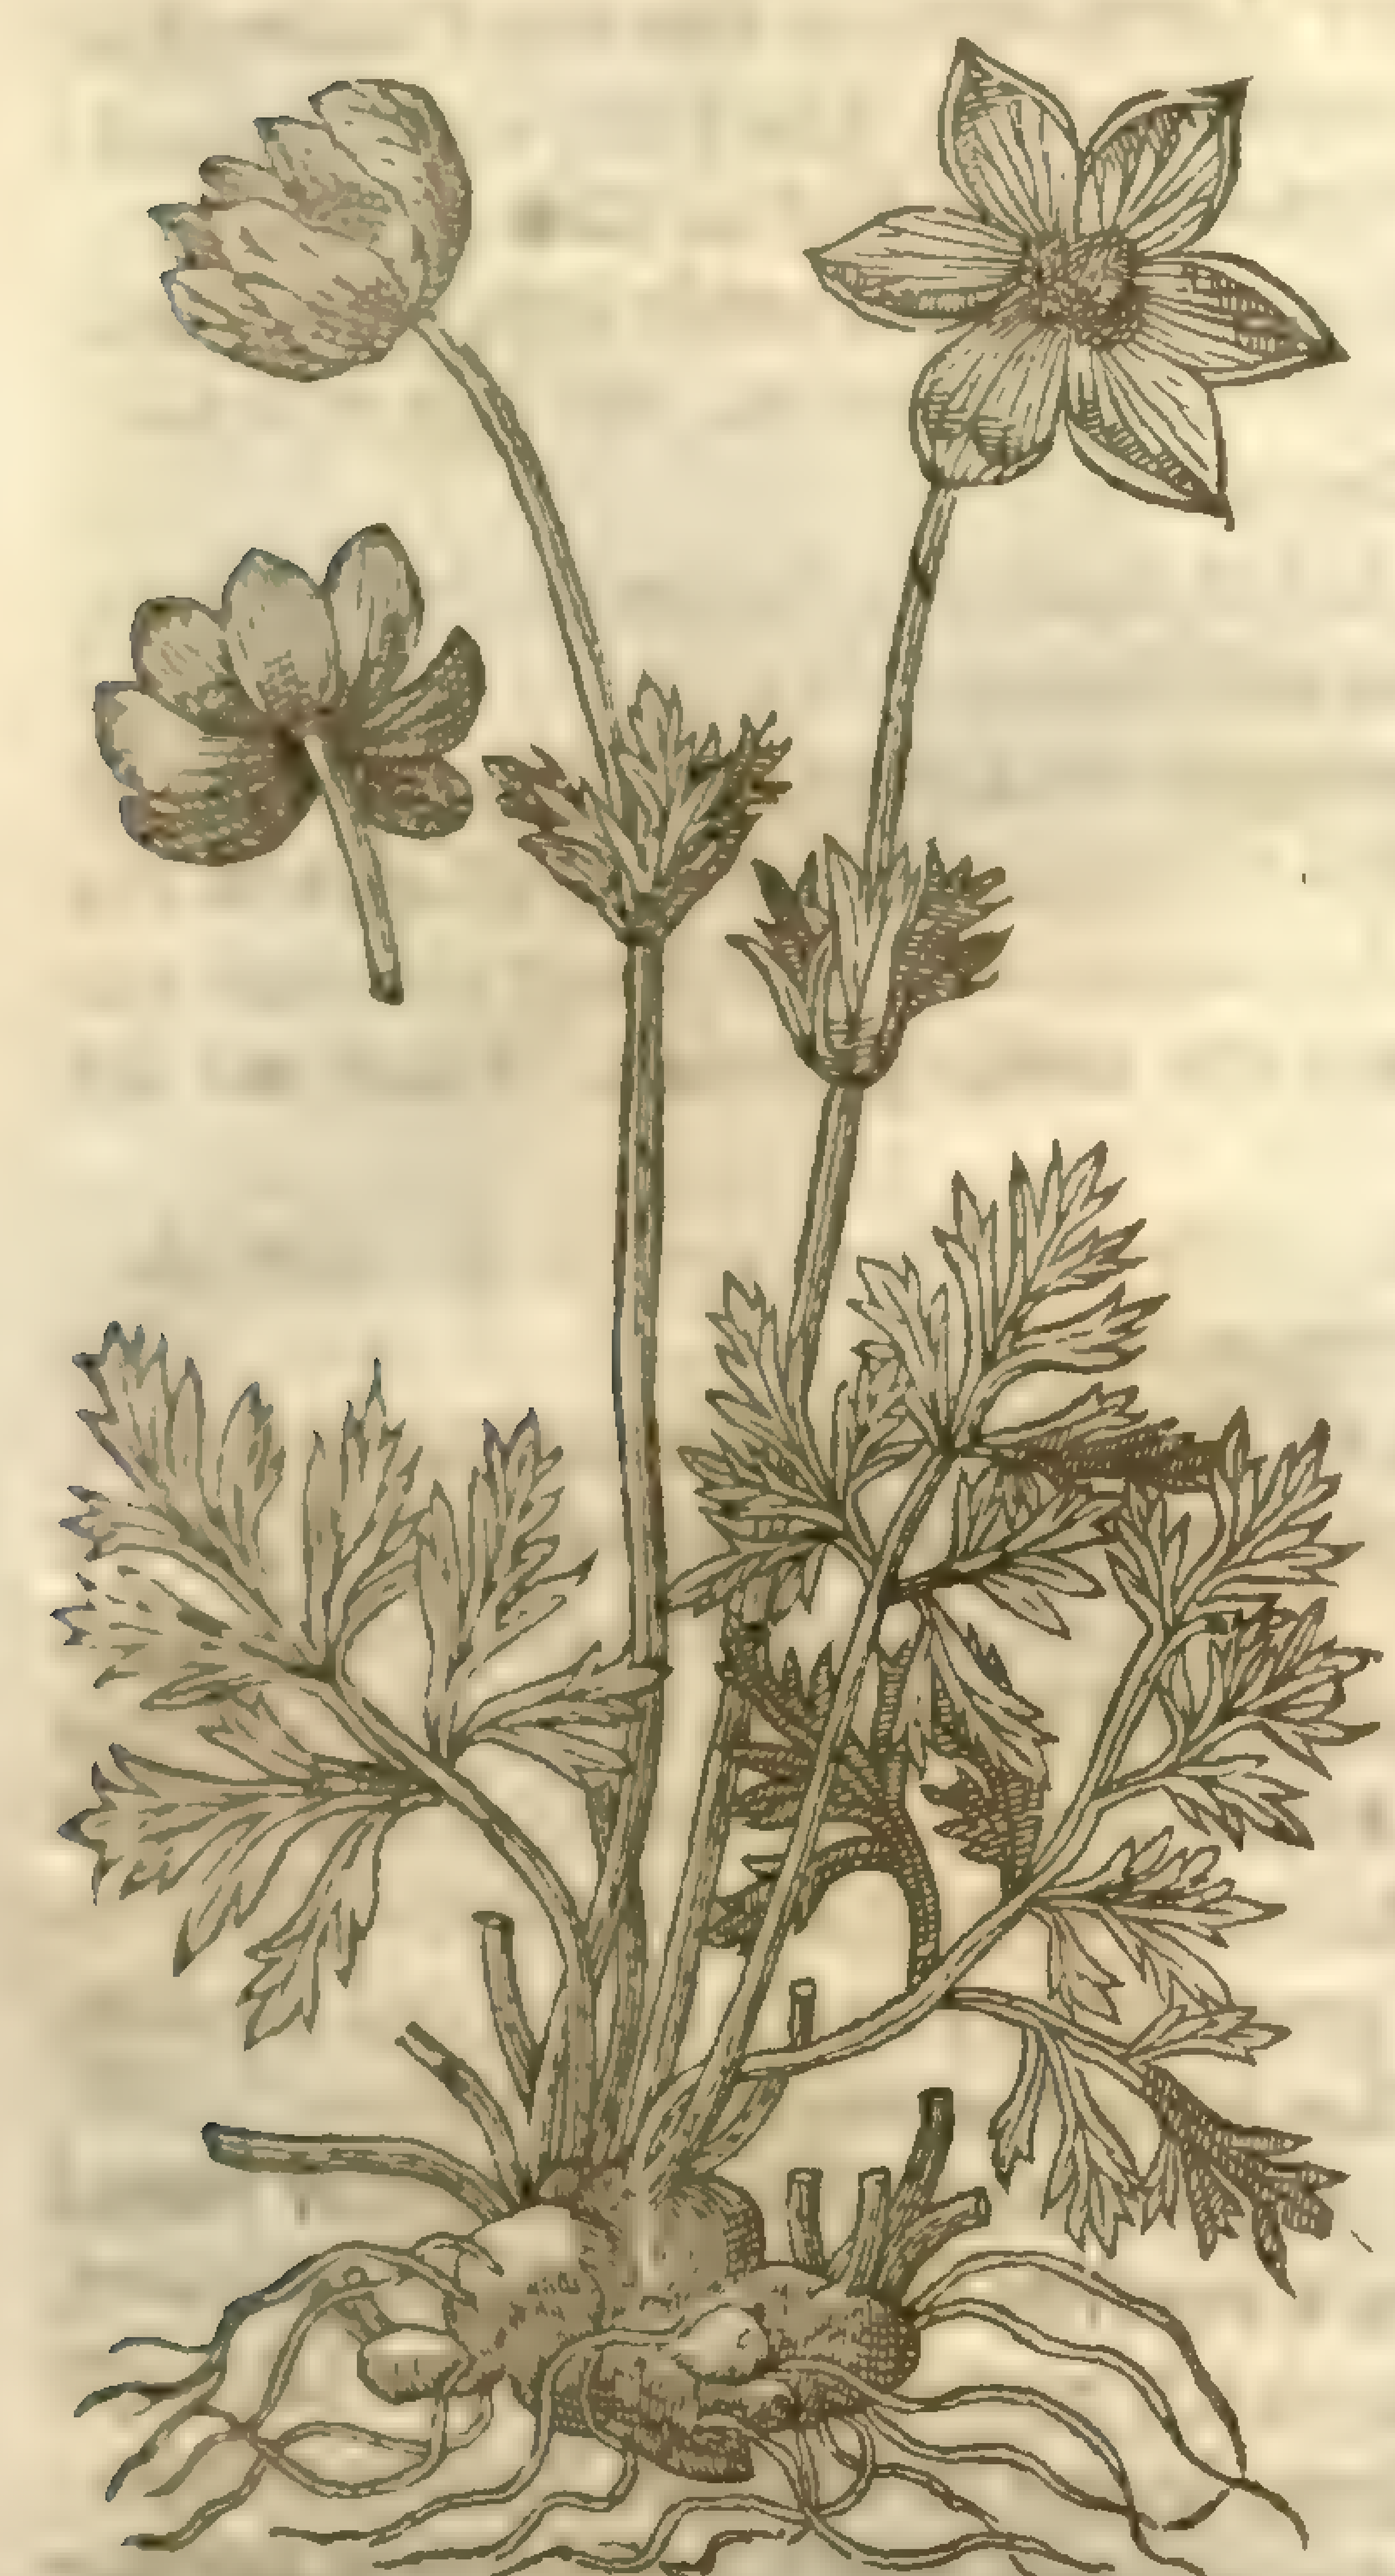
‡ 4 *Anemone tenuifolia flore amplo ſanguineo.*
Small leaued Anemone with the ſanguine floure.



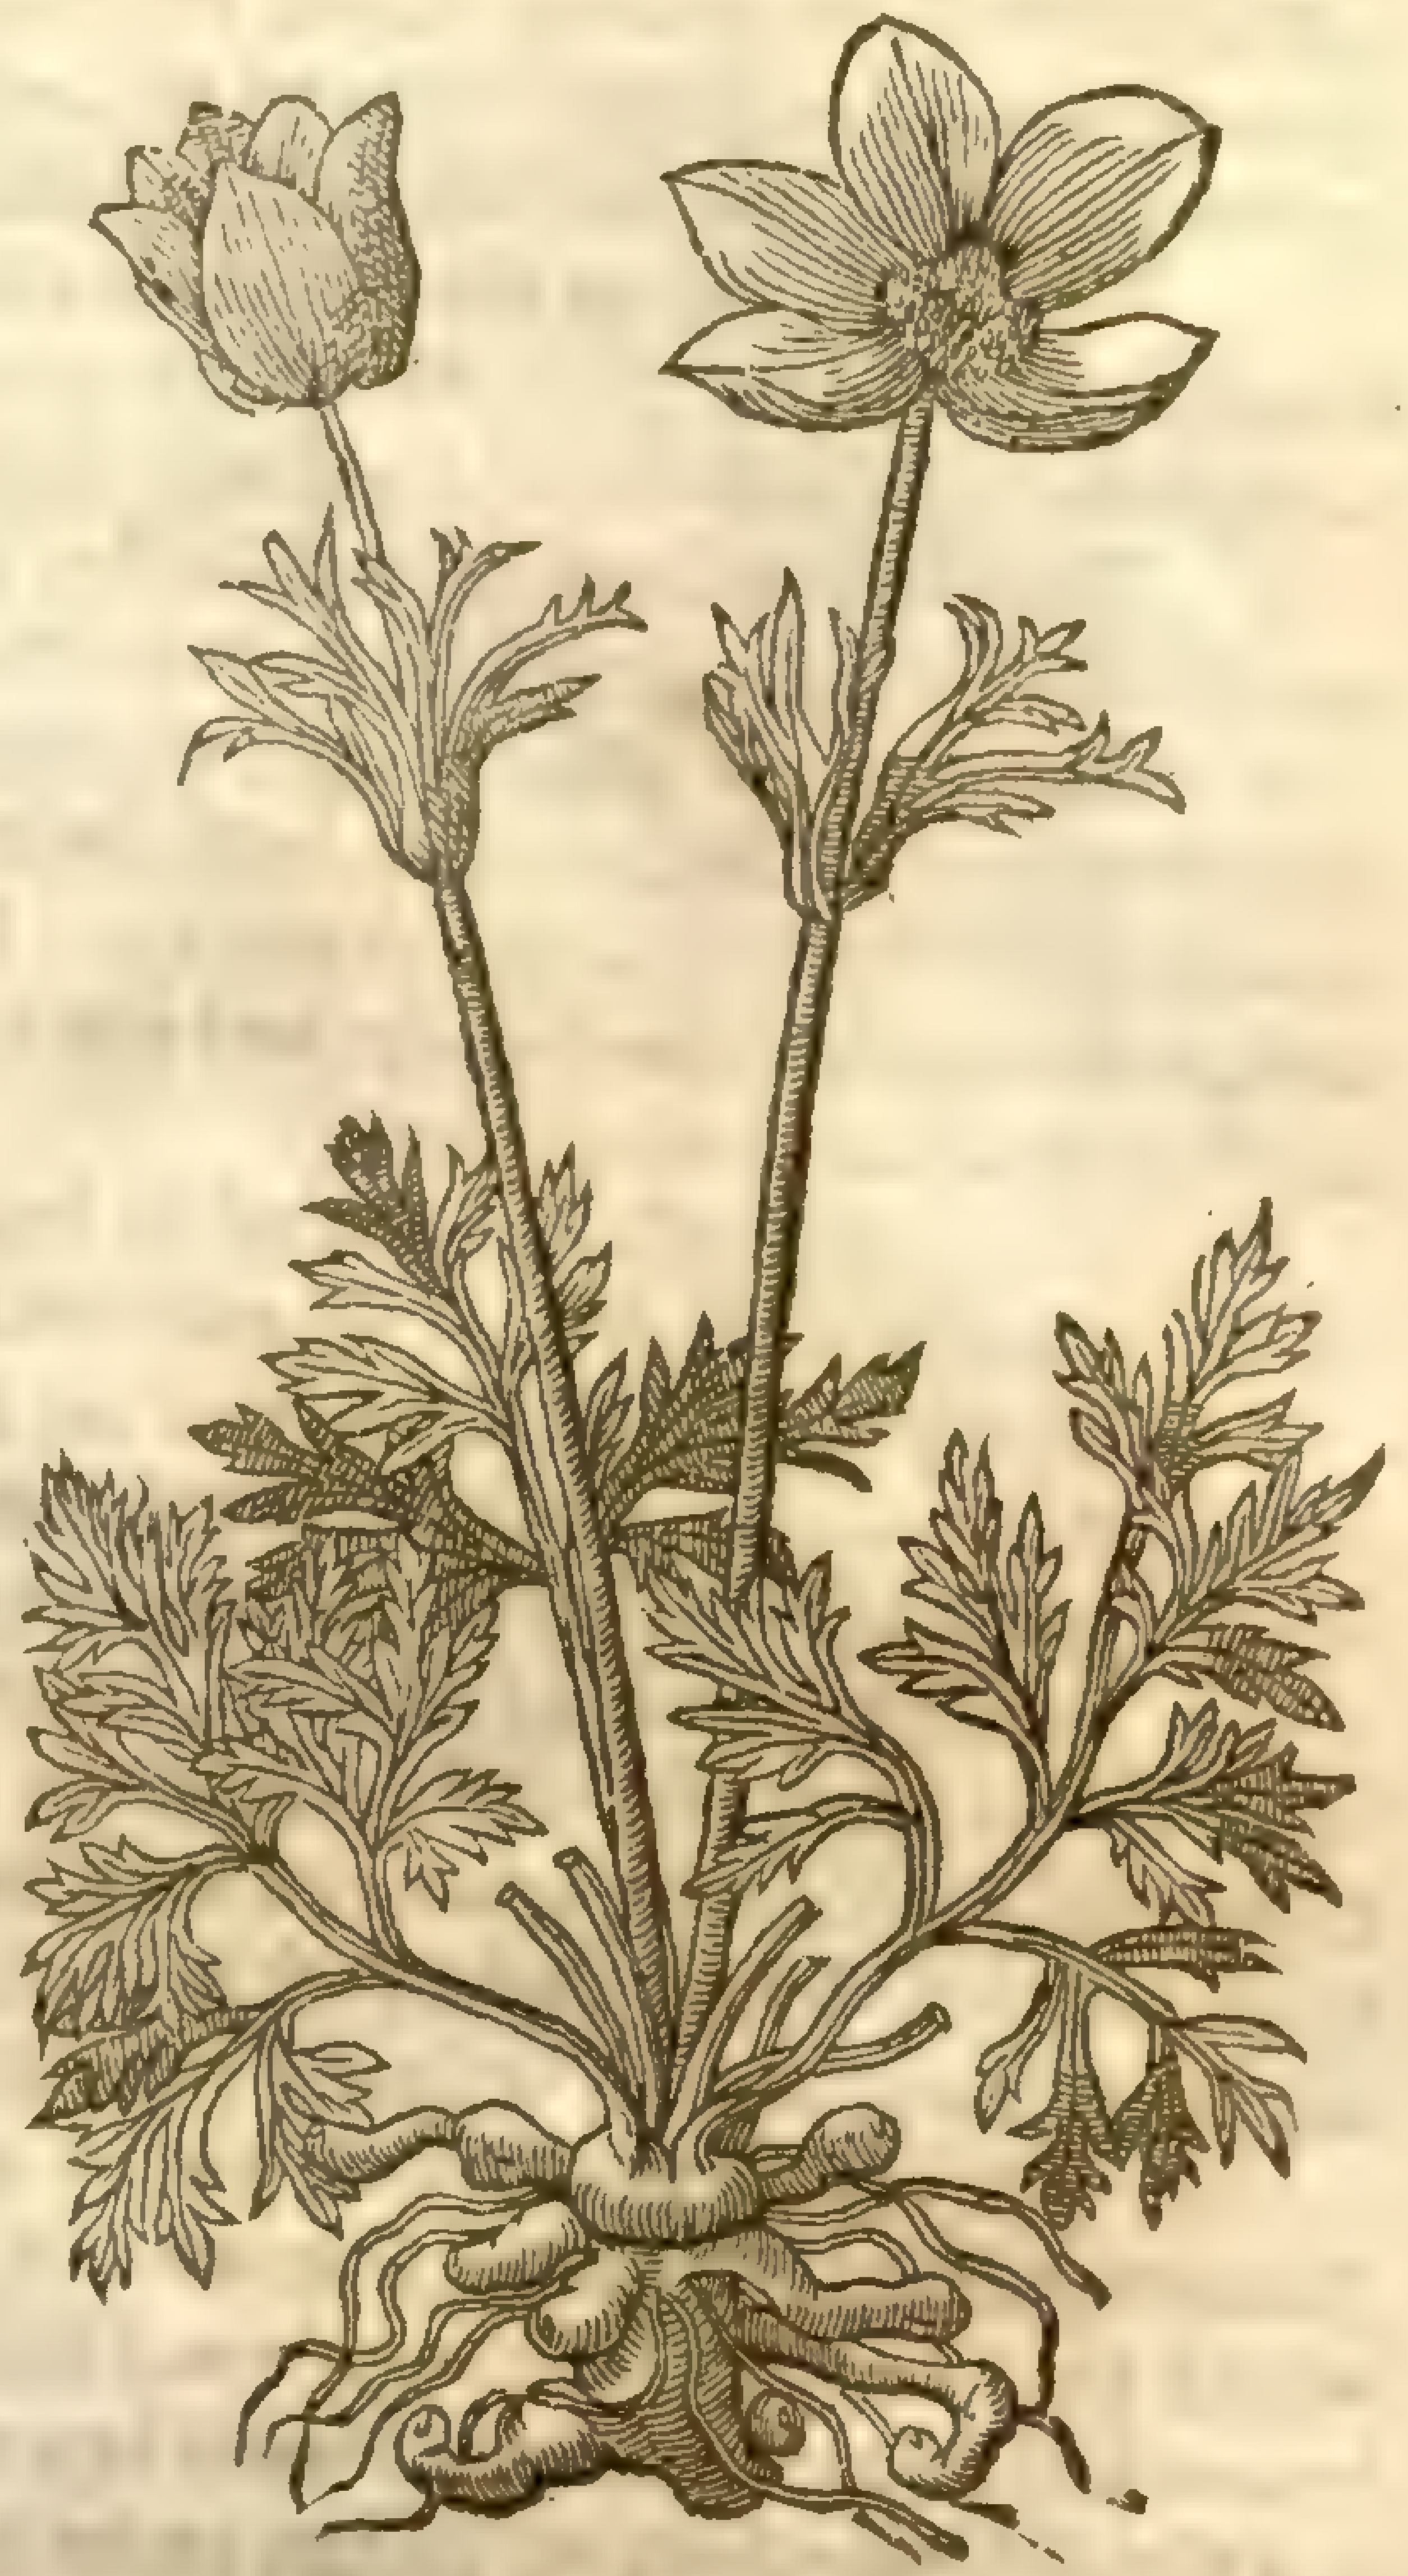
‡ 5 *Anemone tenuifol. flo. dilute purpureo.*
The light purple ſmall leaued Anemone.



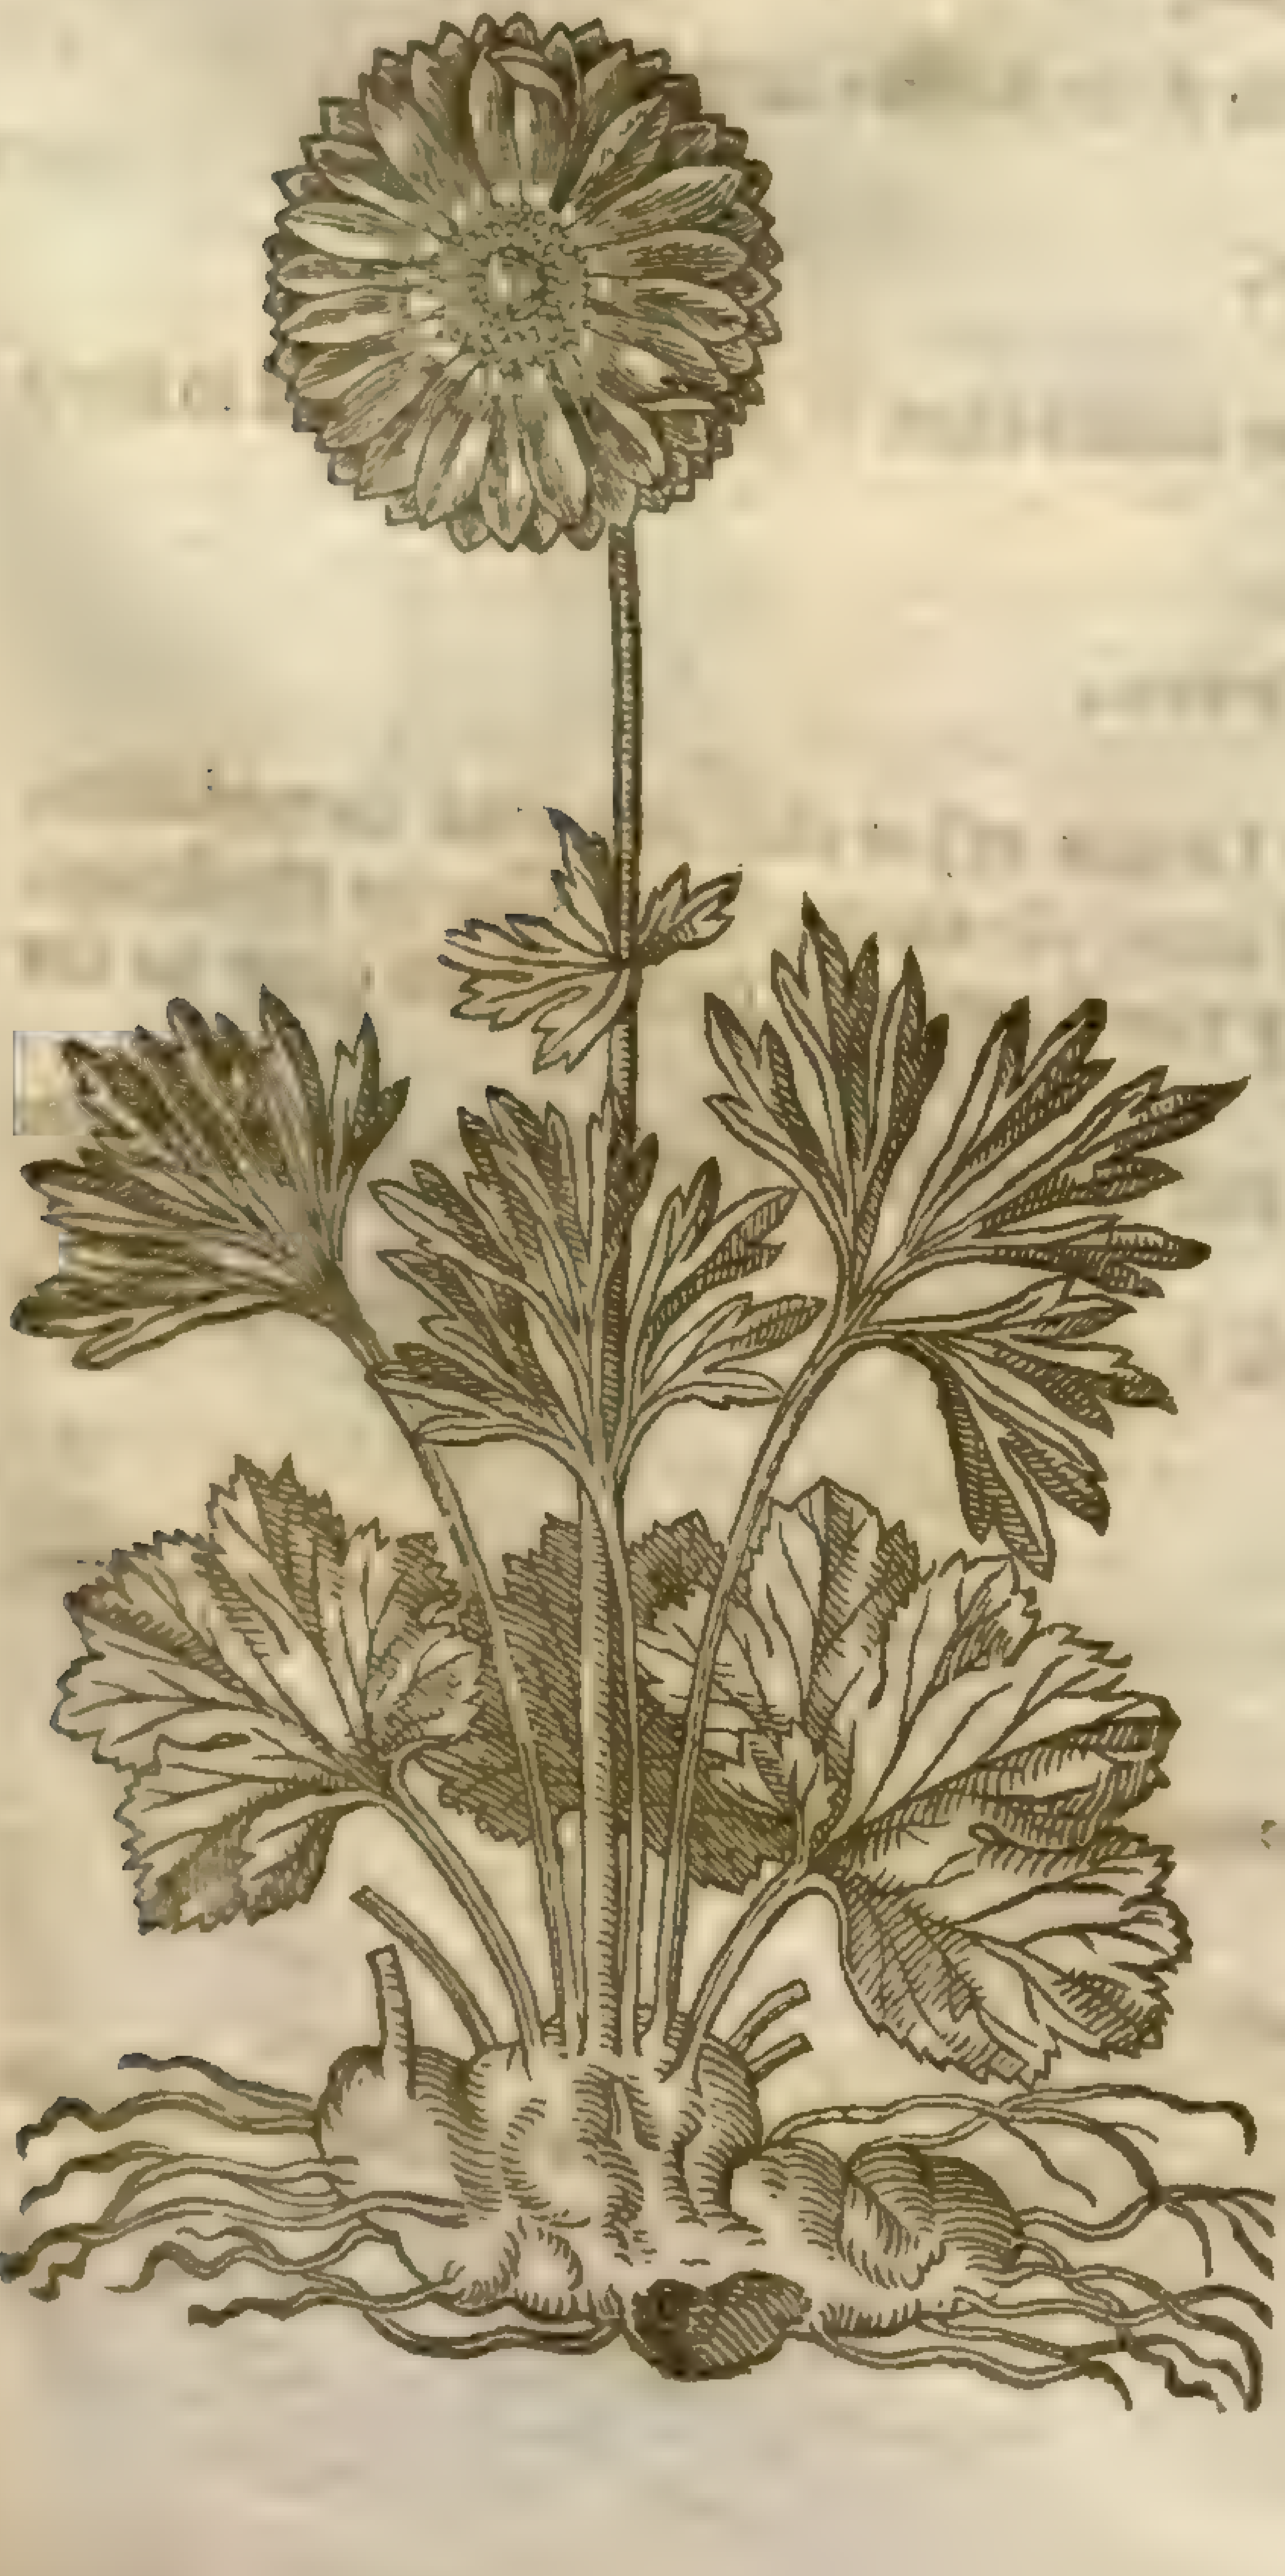
‡ 7 *Anemone tenuifol. flo. exalbido.*
The whitiſh ſmall leaued Anemone.



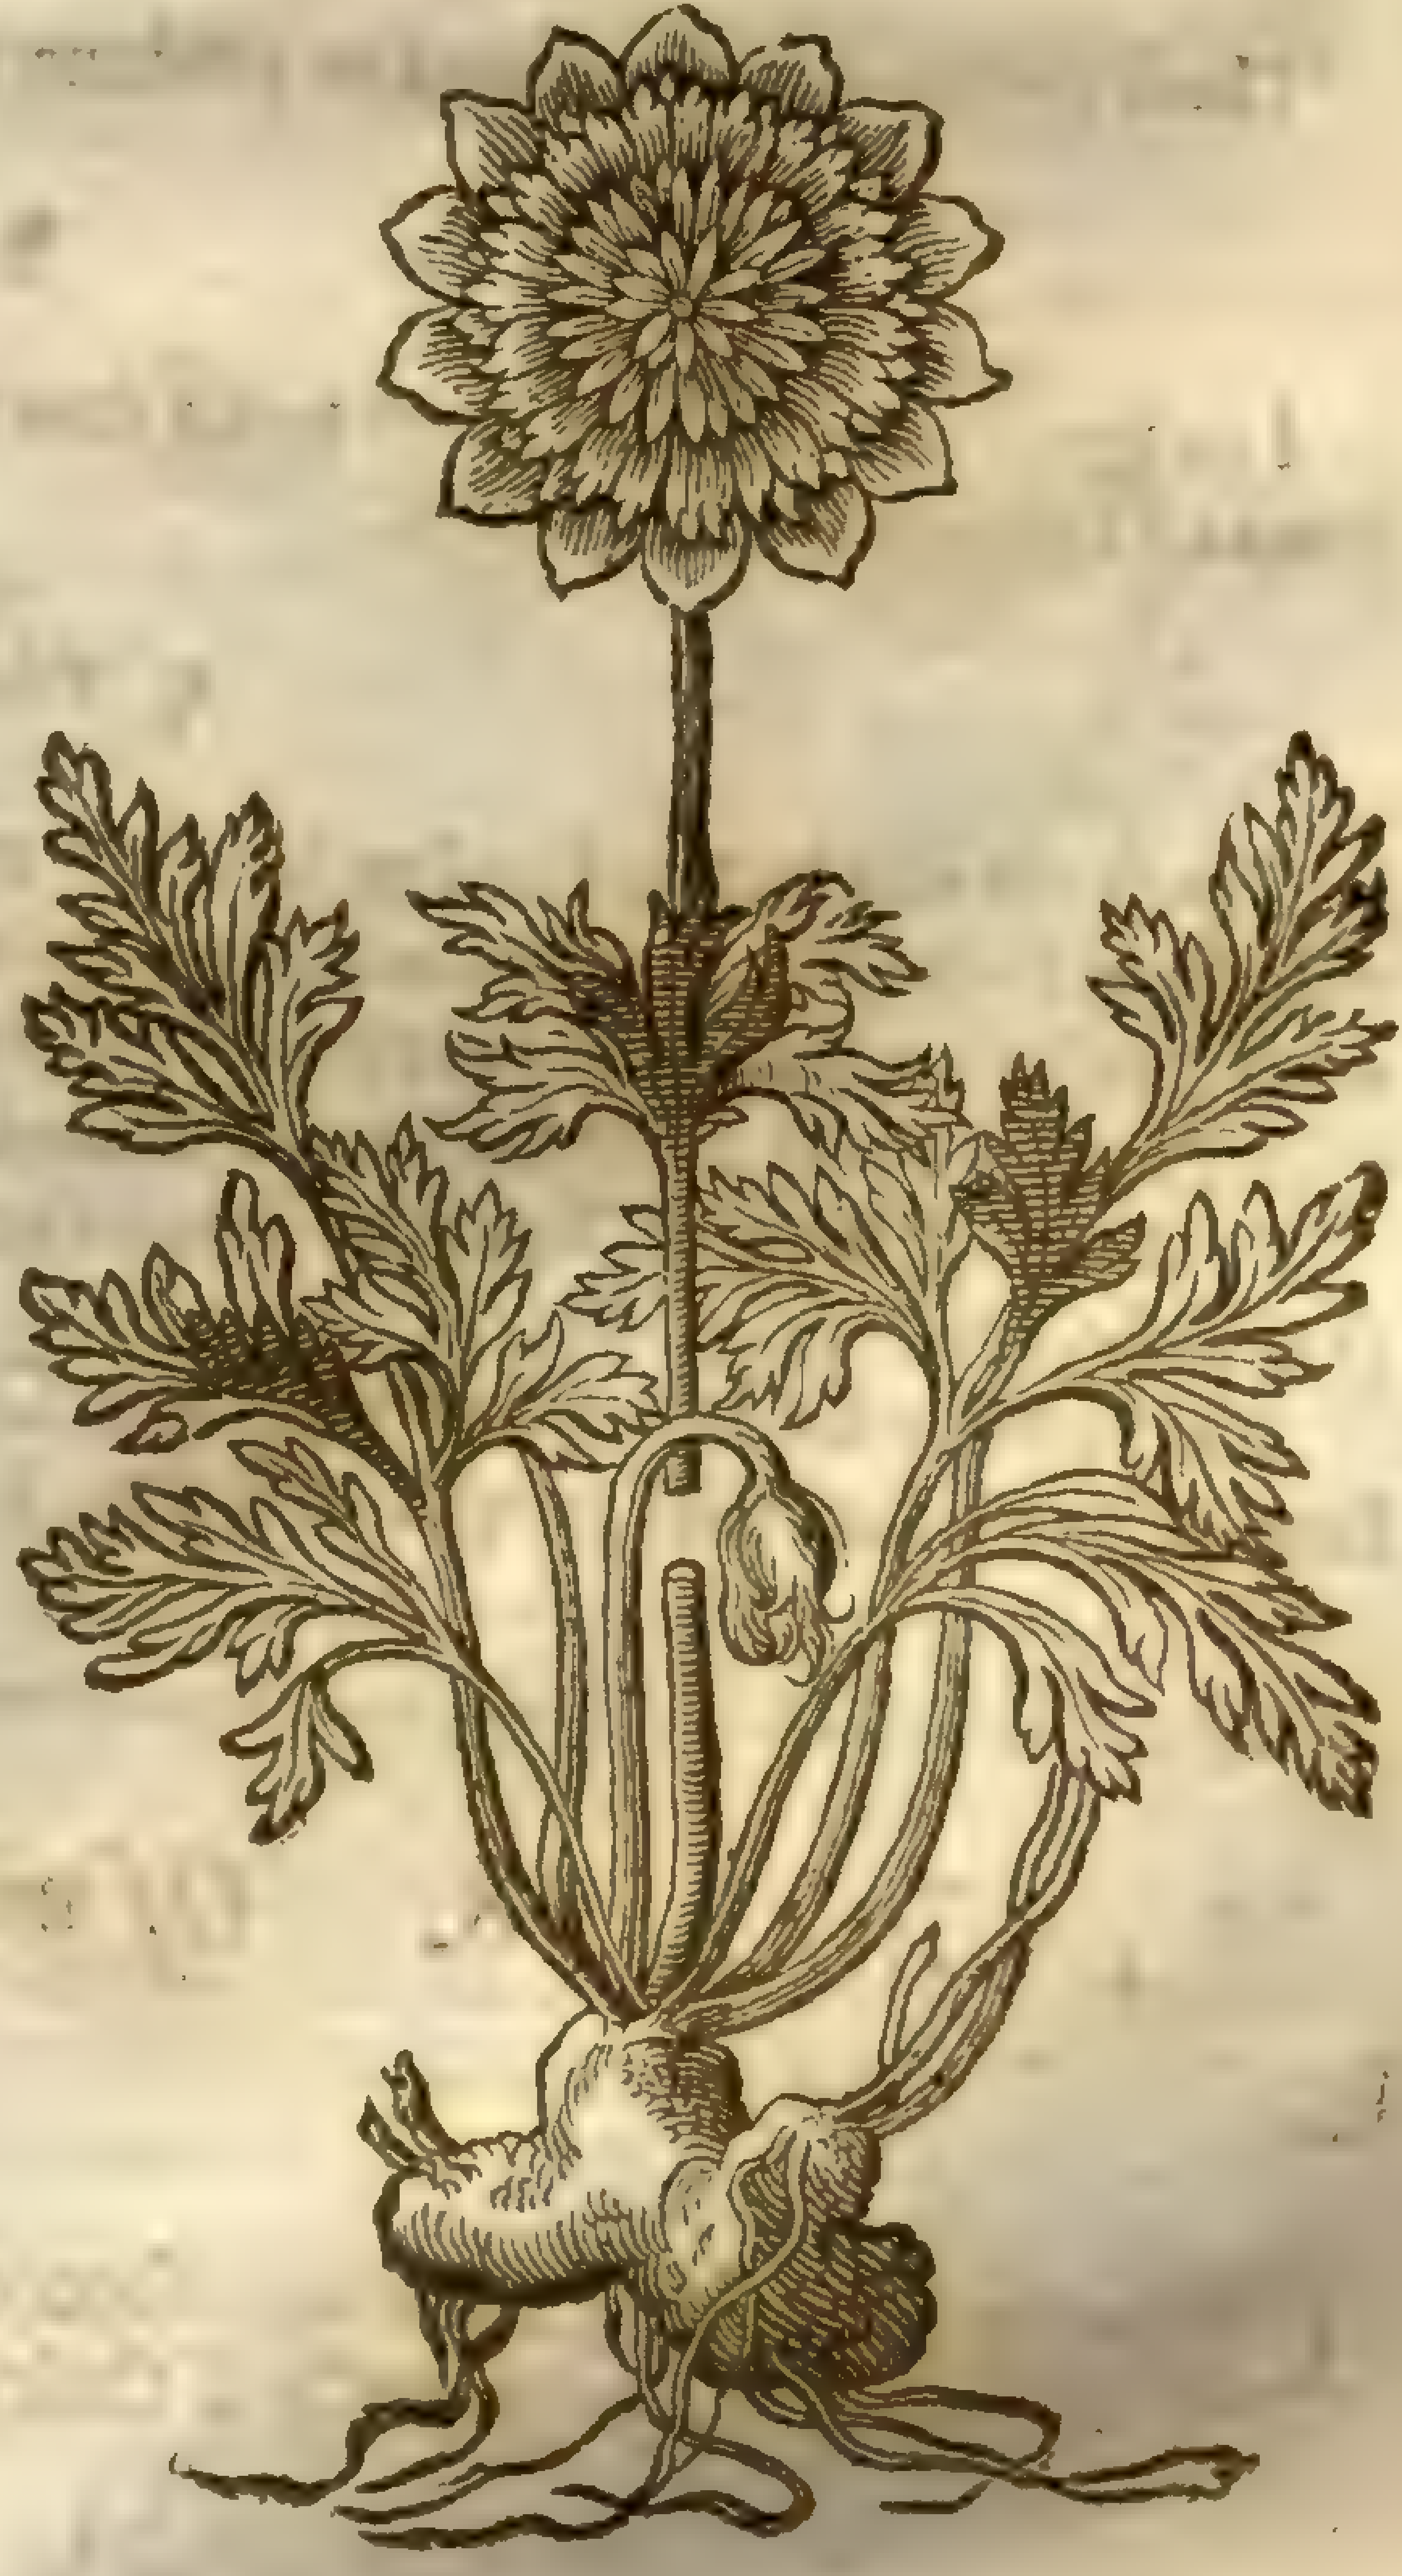
‡ 8 *Anemone tenuifolia flo. carneo ſtriato.*
The ſtriped fleſh-coloured Anemone.



‡ 9 *Anemone tenuifol. flo. pleno coccin.*
The ſmall leaued double crimſon Anemone.



‡ 10 *Anemone tenuifol. flo. pleno atropurpuraceſcente.*
The double darke purple Anemone.



4 The root of this is knotty and tuberous like thoſe of other Anemones, and the leaues are much diuided and cut in like to thoſe of the firſt deſcribed in the former Chapter: the ſtalke (which hath three or foure leaues ingirting it, as in all other Anemones) at the top ſuſtaineth a faire ſanguine floure conſiſting of ſix large leaues with great white nailes. The ſeeds are contained in downie heads like as thoſe of the former. This is *Anem. Tenuifol. ſimpl. flo. 6.* of *Cluſius*.

5 This differs from the former in the floure, which conſiſts of ſix leaues made ſomewhat rounder than thoſe of the precedent: their colour is betweene a ſkarlet and ſanguine. And there is a varietie hereof alſo of a bricke colour. This is the eighth of *Cluſius*.

6 This differs from the reſt, in that the floure is compoſed of ſome foureteene or more leaues, and thoſe of a light purple, or fleſh-colour. This is the ninth of *Cluſius*.

7 The floure of this is large, conſiſting of ſix leaues, being at the firſt of a whitiſh greene, and then tending to a fleſh colour, with their nailes greene on the outſide, and white within, and the threds in the middle of a fleſh colour. There is a leſſer of this kinde, with the floure of a fleſh colour, and white on the outſide, and wholly white within, with the nailes greeniſh. Theſe are the tenth and eleuenth of *Cluſius*.

8 This floure alſo conſiſts of ſix leaues of a fleſh colour, with whitiſh edges on the outſide; the inſide is whitiſh, with fleſh-coloured veines running to the middeſt thereof.

Beſides theſe ſingle kindes, there are diuers double both of the broad and narrow leaued Anemones, whereof I will onely deſcribe and figure two, and refer you to the forementioned Authors for the reſt, which differ from theſe onely in colour.

9 This broad leaued double Anemone hath roots, ſtalkes, and leaues like thoſe of the ſingle ones of this kinde, and at the top of the ſtalke there ſtands a faire large floure compoſed of two or three rankes of leaues, ſmall and long, being of a kinde of ſkarlet or orange-tawny colour; the bottomes of theſe leaues make a whitiſh circle, which giues a great beauty to the floure; and the downie head is ingirt with ſanguine threds tipt with blew. This is the *Pauo major* 1. of *Cluſius*.

10 This in ſhape of roots, leaues, and ſtalkes reſemble the formerly deſcribed narrow leaued Anemones, but the floure is much different from them; for it conſiſts firſt of diuers broad leaues, which incompaſſe a great number of ſmaller narrow leaues, which together make a very faire and beautifull floure: the outer leaues hereof are red, and the inner leaues of a purple Veluet colour.

Of this kinde there are diuers varieties, as the double white, crimſon, bluſh, purple, blew, carnation, roſe-coloured, &c.

¶ *The Place and Time.*

Theſe are onely to be found in gardens, and bring forth their floures in the Spring.

¶ *Their Names.*

I iudge it nowaies pertinent to ſet downe more of the names than is already deliuered in their ſeuerall title and deſcriptions.

¶ *The Nature and Vertues.*

A These are of a hot and biting facultie, and not (that I know of) at this day vſed in medicines, vnleſſe in ſome one or two ointments: yet they were of more vſe amongſt the Greeke Phyſitions, who much commend the juyce of them for taking away the ſcares and ſcales which grow on the eyes; and by them are called ἕλκη, and λευκώματα.

B *Trallianus* alſo ſaith, That the floures beaten in oyle, and ſo anointed, cauſe haire to grow where it is deficient.

C The vertues ſet downe in the former Chapter doe alſo belong to theſe here treated of, as theſe here deliuered are alſo proper to them. ‡

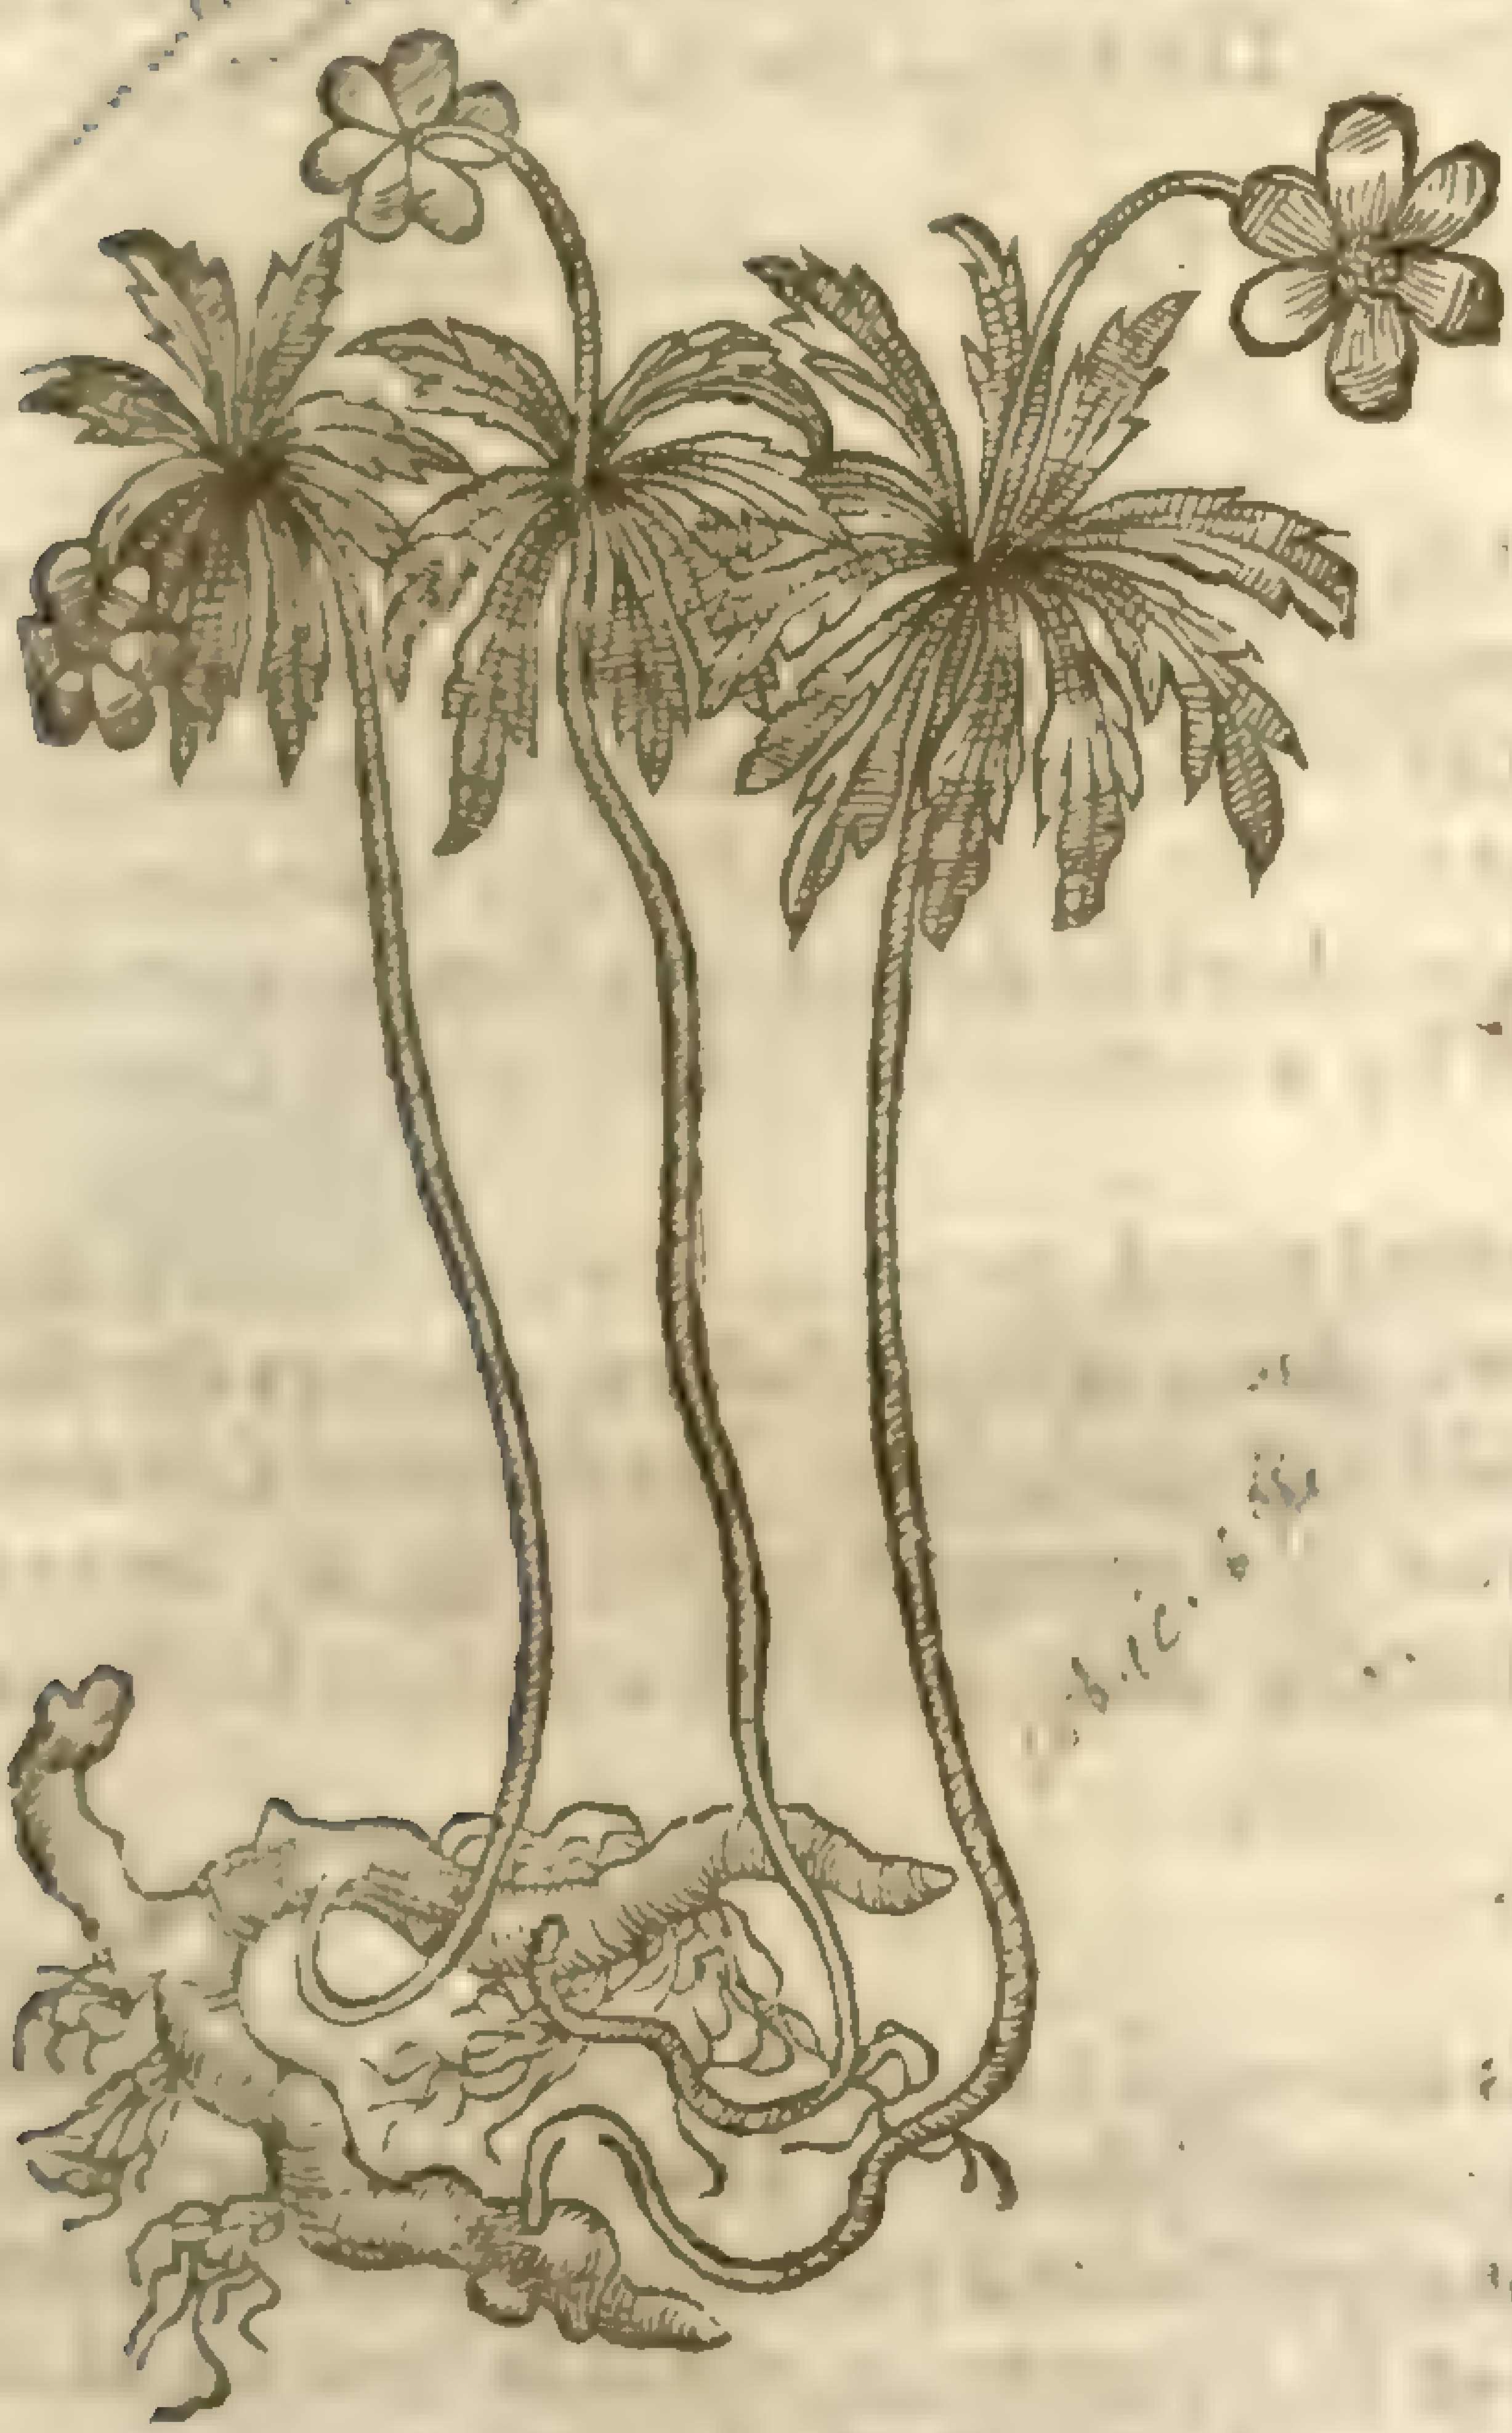
Chap. 78. *Of wilde Anemones, or Winde-floures.*

¶ *The Kindes.*

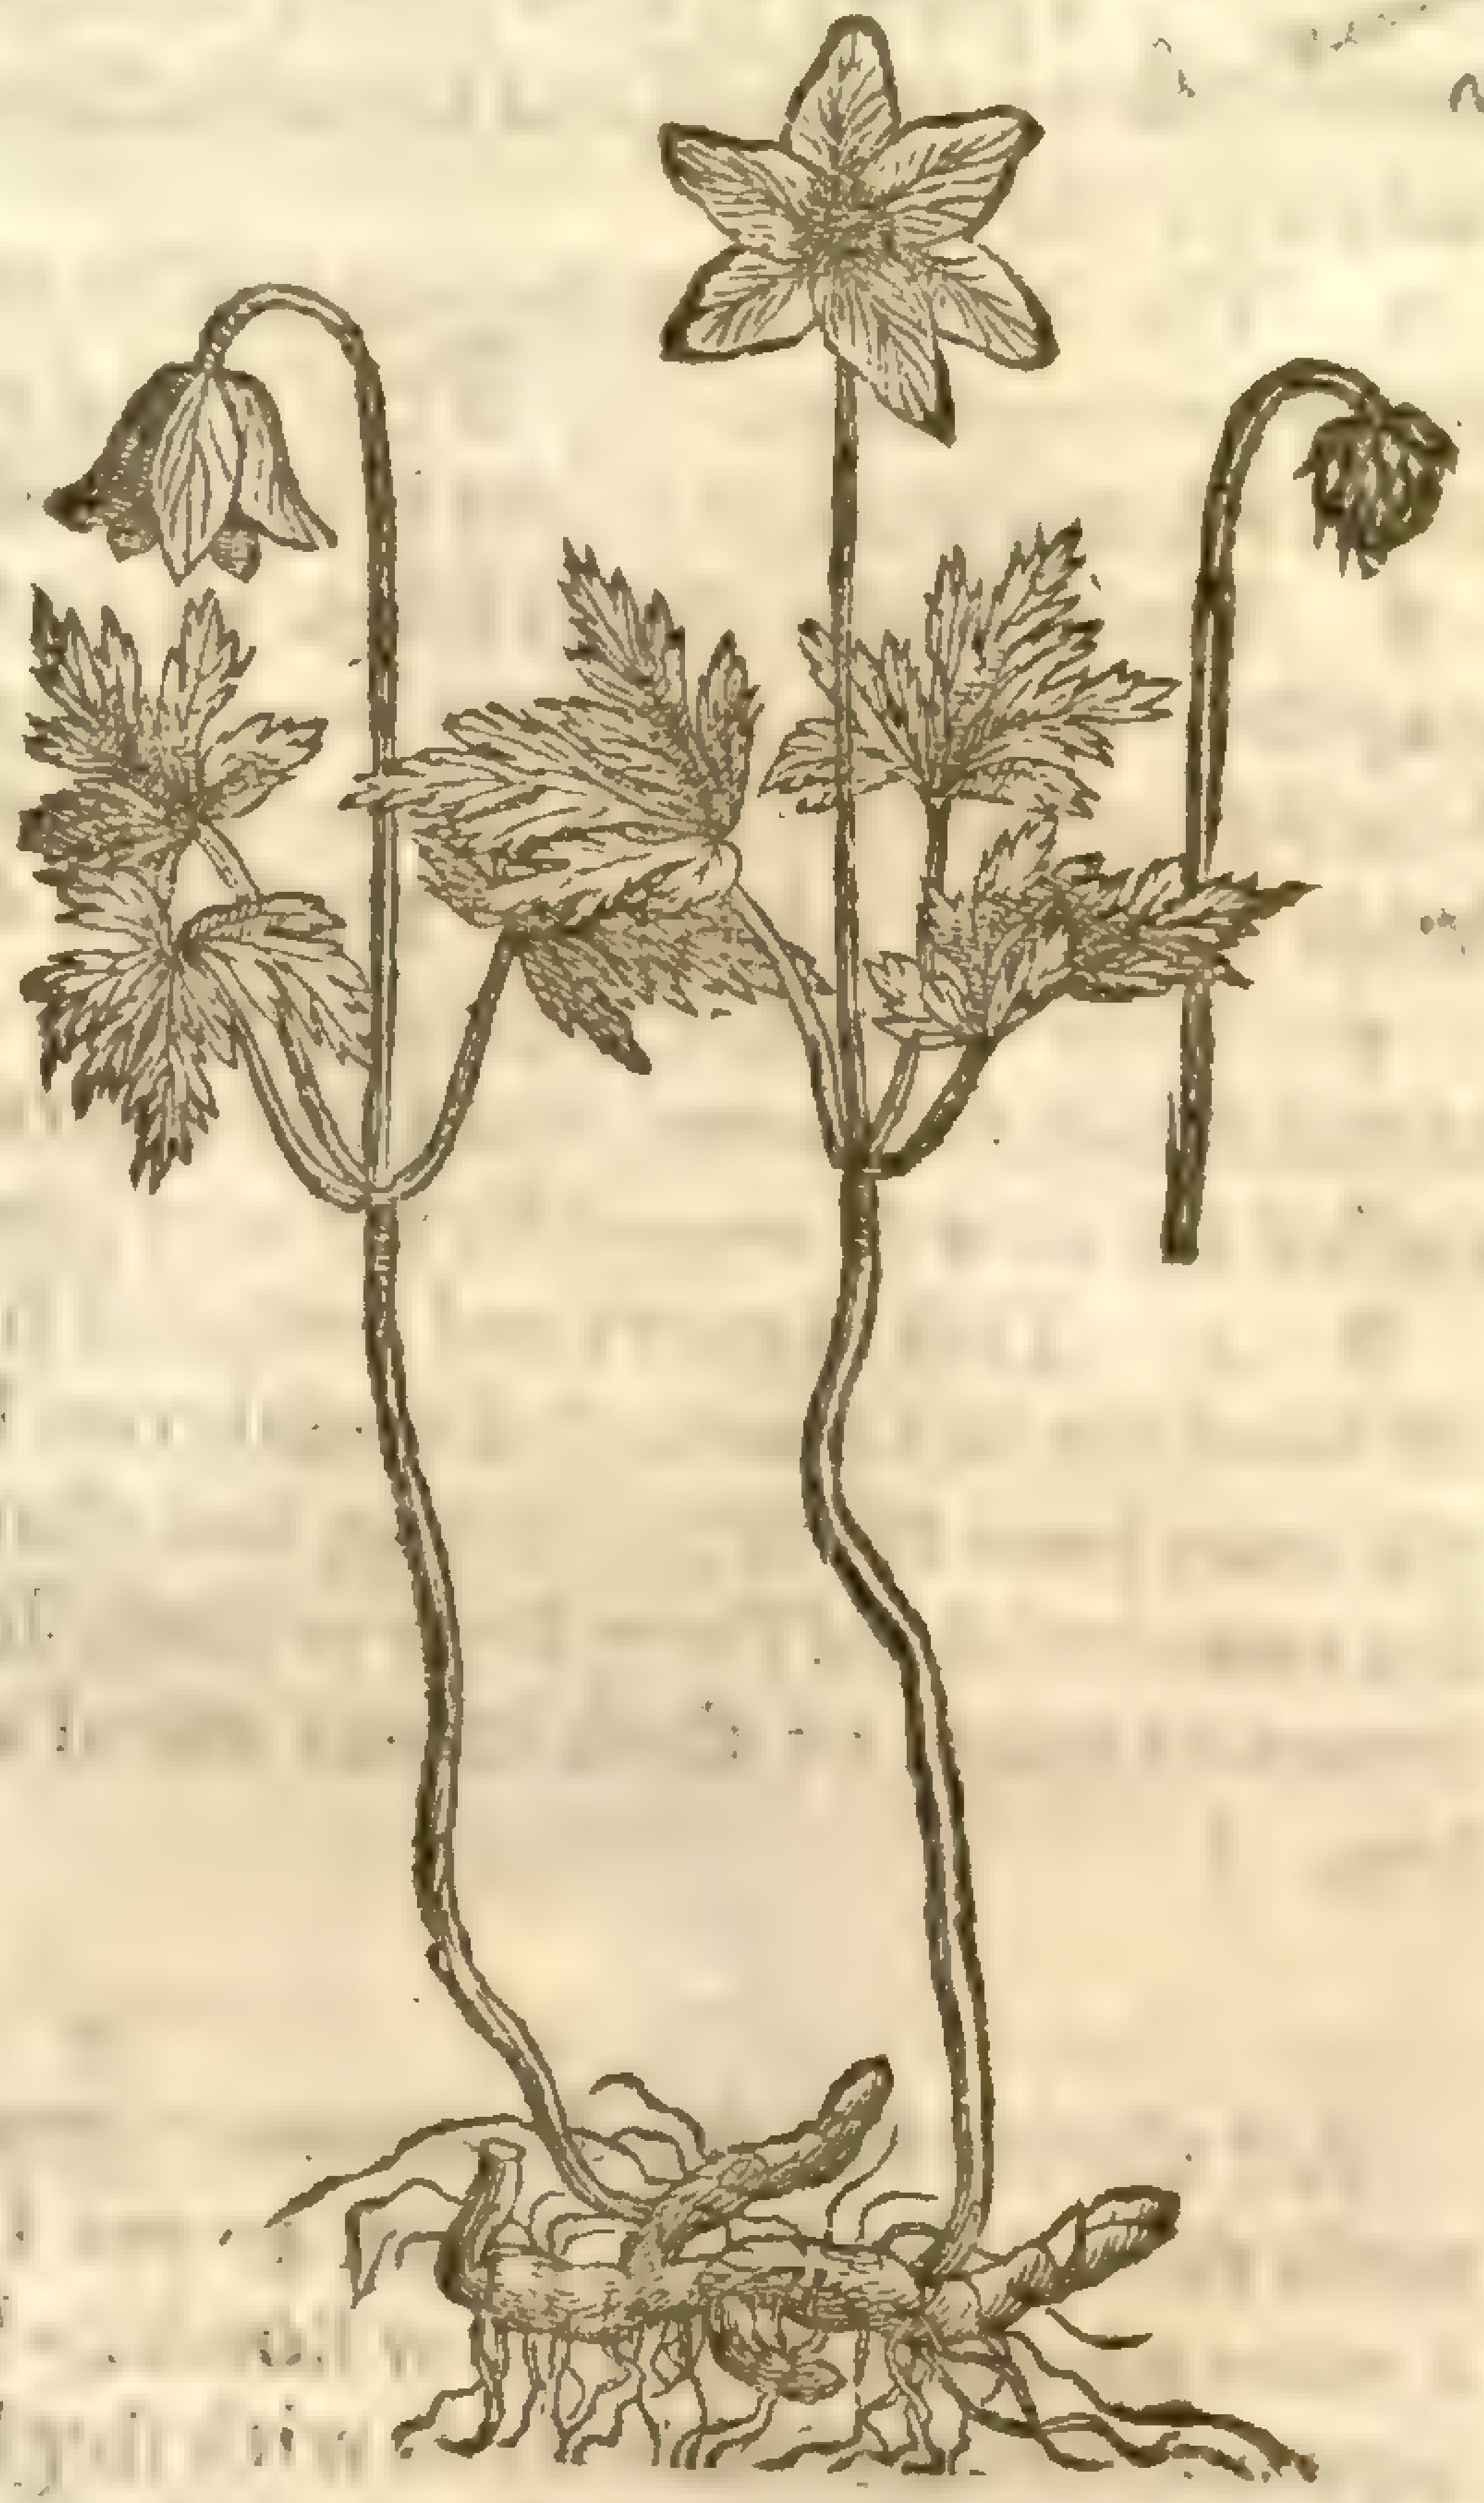
Like as there by many and diuers ſorts of the garden Anemones, ſo are there of the wilde kindes alſo, which do vary eſpecially in their floures.

¶ *The*

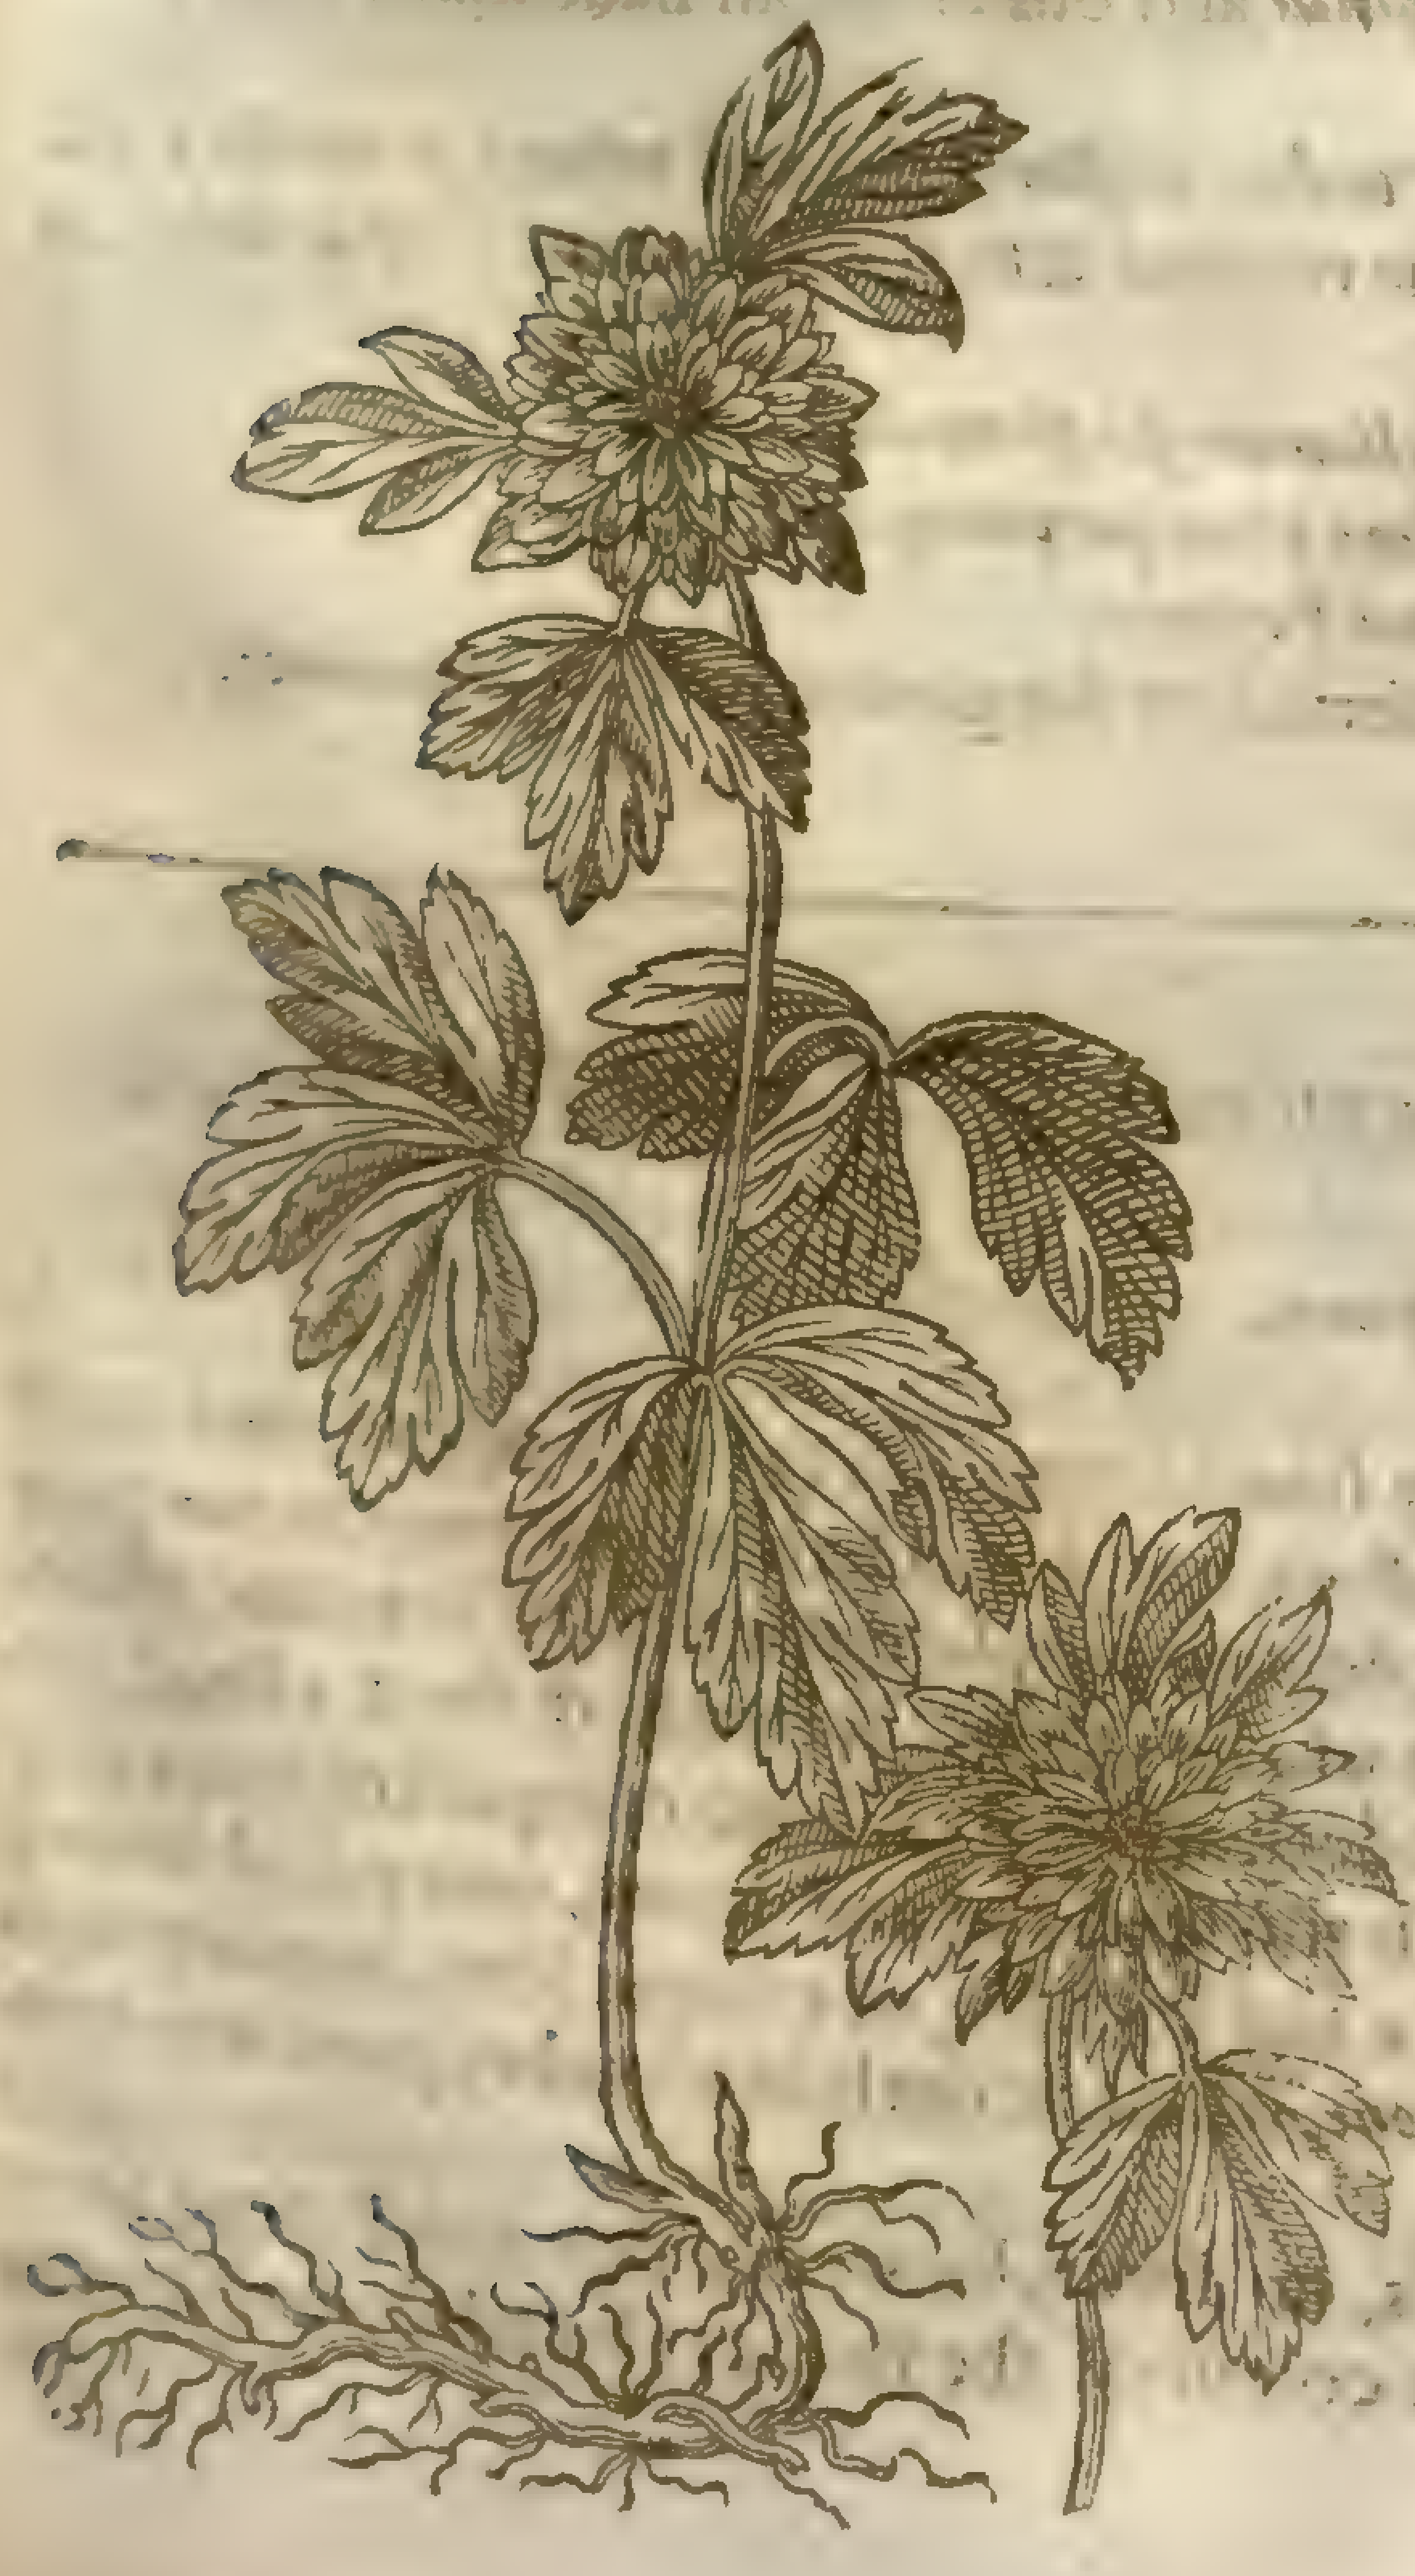
1 *Anemone nemorum lutea.*
Yellow wilde Winde-floure.



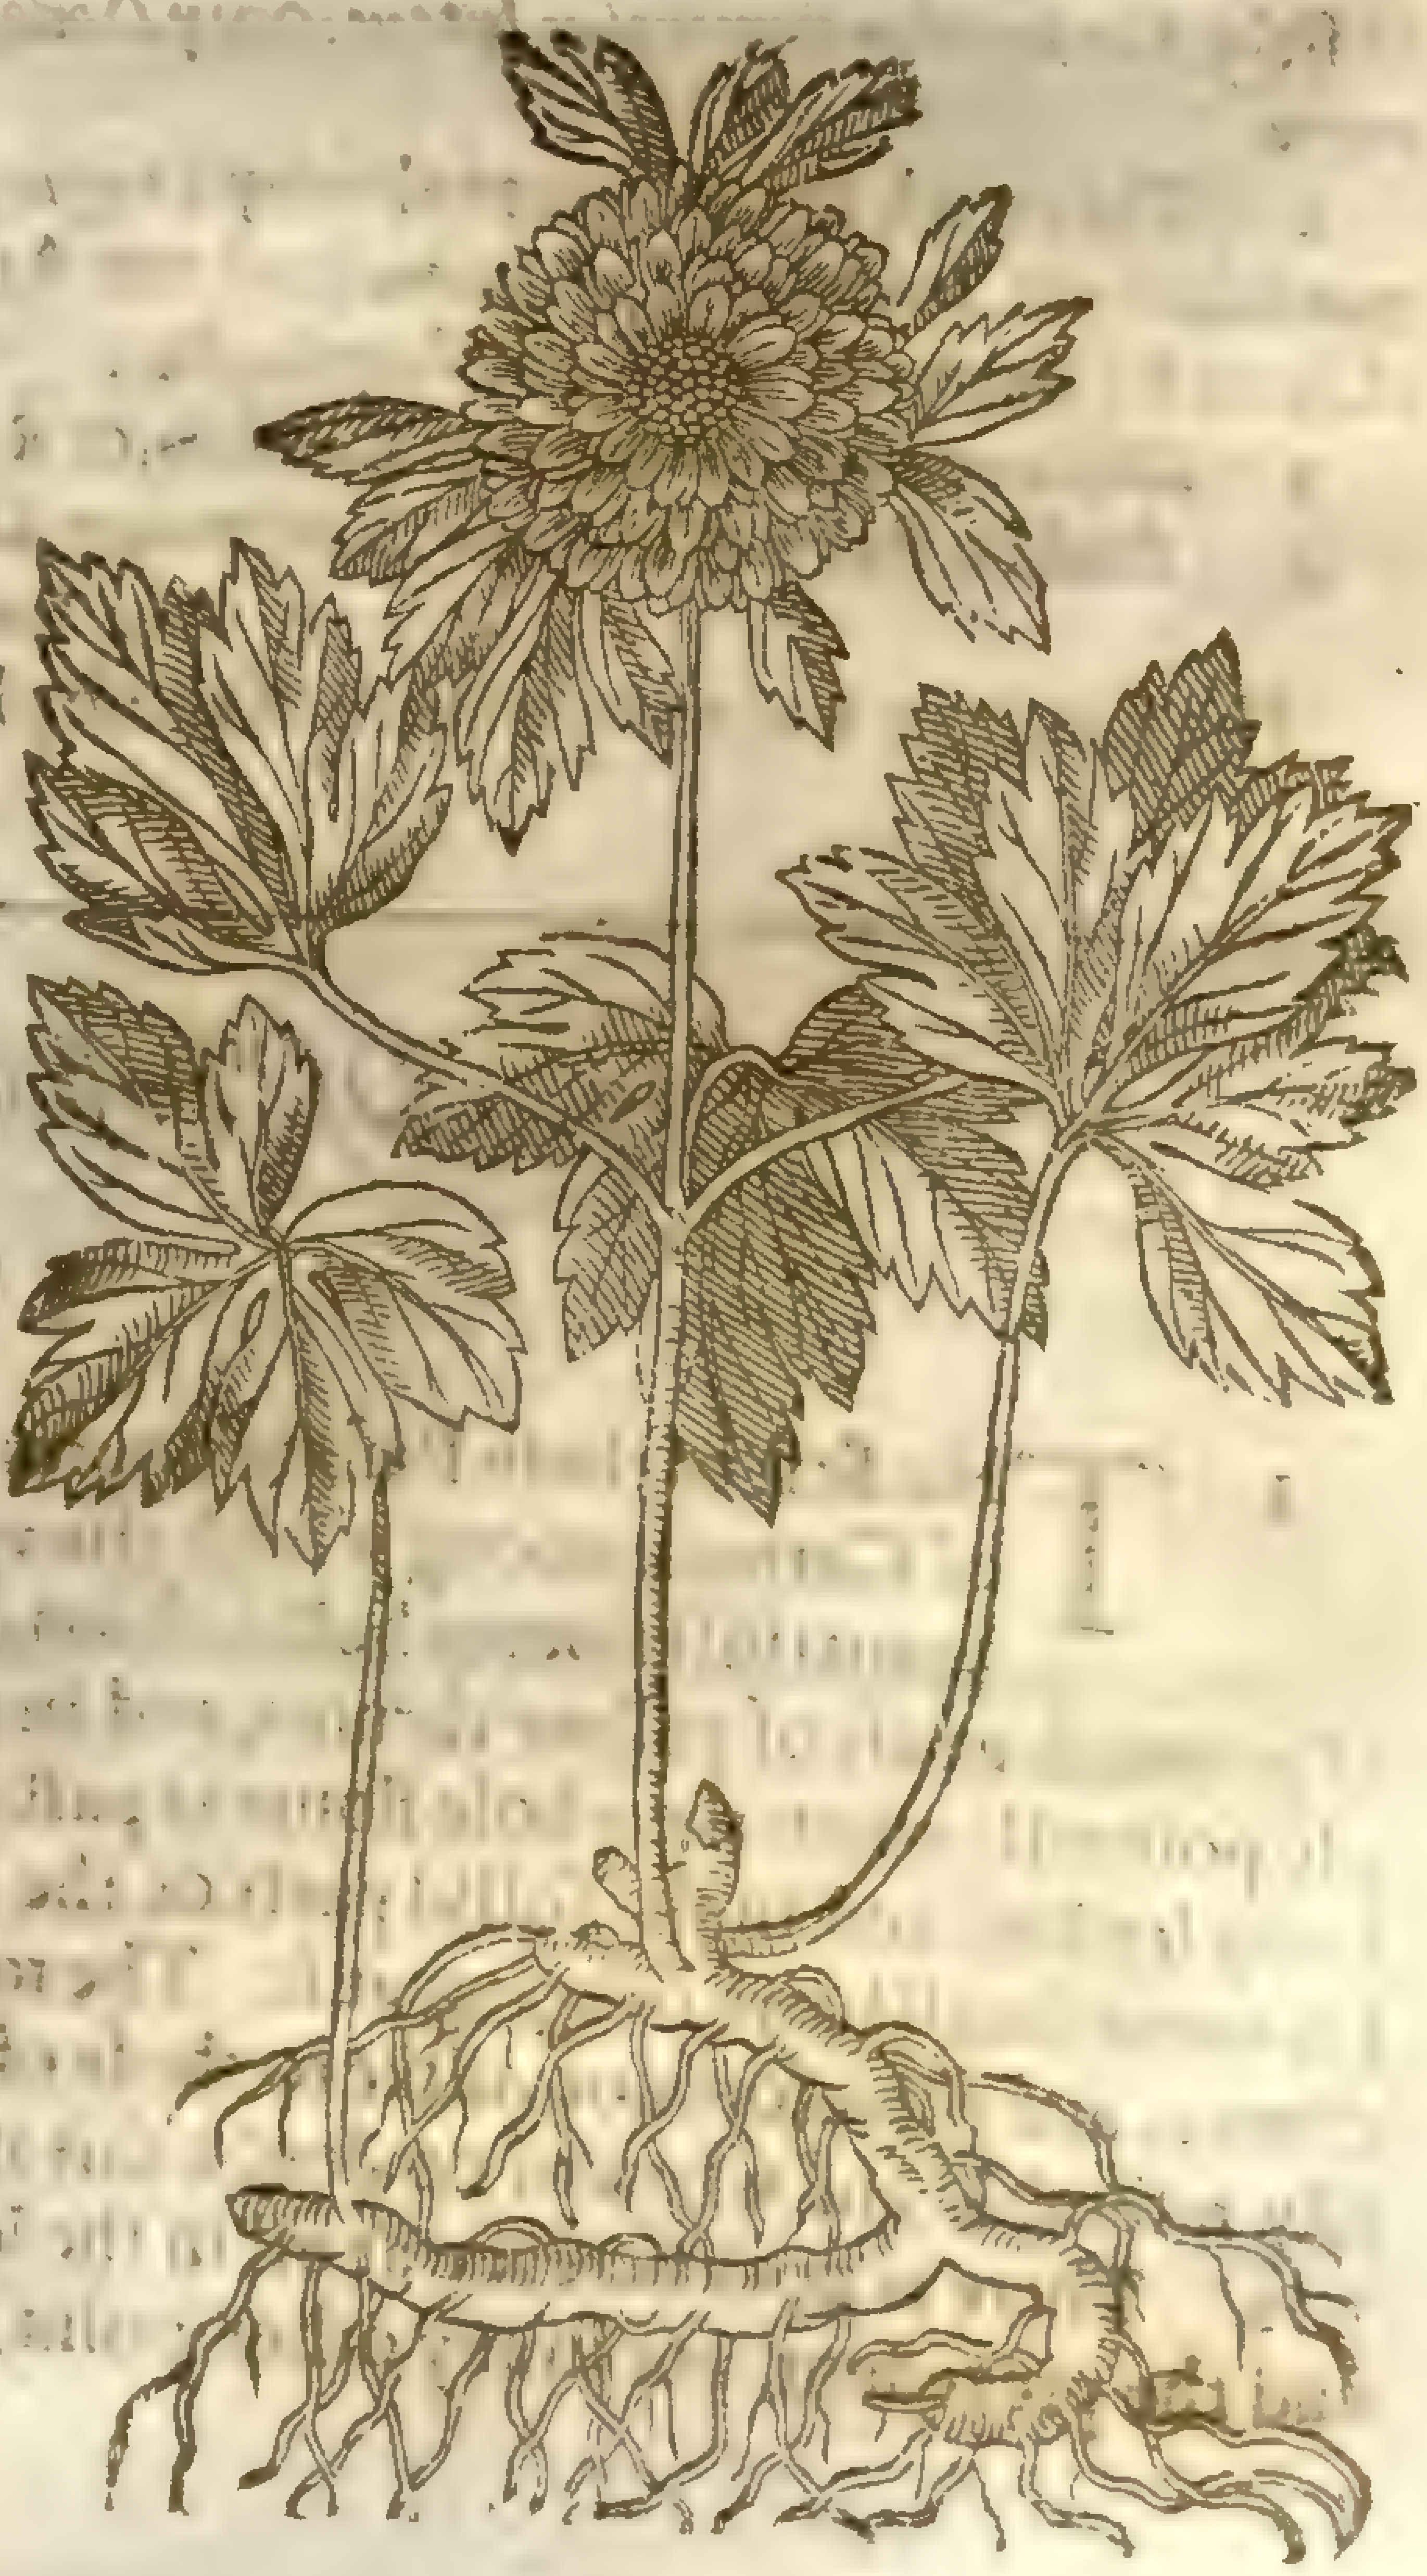
2 *Anemone nemorum alba.*
White Winde-floure.



‡ 3 *Anemone nemorum flo. pleno albo.*
The double white wood Anemone.



‡ 4 *Anemone nemorum flo. pleno purpuraſcente.*
The double purpliſh wood Anemone.



¶ *The Deſcription.*

1 The firſt of theſe wilde *Anemones* hath jagged leaues deepely cut or indented, which do grow vpon the middle part of a weake and tender ſtalke: at the top whereof doth ſtand a pretty yellow floure made of ſix ſmall leaues, and in the middle of the floure there is a little blackiſh pointell, and certaine ſlender chiues or threds. The root is ſmall, ſomewhat knottie and very brittle.

2 The ſecond hath jagged leaues, not vnlike to water Crowfoot or mountaine Crowfoot. The floure groweth at the top of the ſtalke not vnlike to the precedent in ſhape, ſauing that this is of a milke white colour, the root is like the other.

‡ There is alſo of this ſingle kinde two other varieties, the one with a purple floure, which we may therefore call *Anemone nemorum purpurea*, the wilde purple Winde-floure. And the other with a Scarlet (or rather a bluſh) coloured floure, which wee may terme *Anemone nemorum coccinia*, The wilde Scarlet winde-floure. Theſe two differ not in other reſpects from the white Winde-floure. ‡

3 There is in ſome choiſe gardens one of this kinde with white floures very double, as is that of the Scarlet *Anemone*, and I had one of them giuen me by a worſhipfull Merchant of London, called M^r *Iohn Franqueuille*, my very good friend.

‡ 4 This in roots and ſtalkes is like the laſt deſcribed wood *Anemones*, or winde-floures. But this and the laſt mentioned double one haue leaues on two places of their ſtalkes; whereas the ſingle ones haue them but in one, and that is about the middle of the ſtalkes. The floure of this double one conſiſts of ſome forty or more little leaues, whereof the outermoſt are the biggeſt; the bottomes or nailes of theſe leaues are of a deepe purple, but the other parts of a lighter bluſh colour. ‡

¶ *The Place.*

A All theſe wilde ſingle *Anemones* grow in moſt woods and copſes through England, except that with the yellow floure, which as yet I haue not ſeene: notwithſtanding I haue one of the greater kindes which beareth yellow floures, whoſe figure is not expreſſed nor yet deſcribed, for that it doth very notably reſemble thoſe with ſingle floures, but is of ſmall moment, either in beautie of the floure, or otherwiſe. ‡ The double ones grow onely in ſome few gardens. ‡

¶ *The Time.*

B They floure from the middeſt of Februarie vnto the end of Aprill, or the midſt of May.

¶ *The Names.*

C ‡ The firſt of theſe by moſt Writers is referred to the *Ranunculi*, or Crowfeet; and *Lobel* calls it fitly *Ranunculus nemoroſus luteus*: only *Dodonæus*, *Cæſalpinus*, and our Authour haue made it an *Anemone*.

2 This with the varieties alſo, by *Tragus*, *Fuchſius*, *Cordus*, *Geſner*, *Lobel*, and others, is made a *Ranunculus*: yet *Dodonæus*, *Cæſalpinus*, and our Authour haue referred it to the *Anemones*. *Cluſius* thinkes this to be *Anemone*, Ἀνεμώνη of *Theophraſtus*.

3 *Cluſius* cals this *Anemone Limonia*, or *Ranunculus ſyluarum flo. pleno albo*.

4 And he ſtiles this *Anem. Limonia*, or *Ranunc. ſyl. flore pleno purpuraſcente*. ‡

¶ *The Temperature and Vertues.*

The faculties and temperature of theſe plants are referred to the garden ſorts of *Anemones*.

Chap. 79. *Of Baſtard Anemones, or Paſque floures.*

¶ *The Deſcription.*

1 The firſt of theſe Paſque floures hath many ſmall leaues finely cut or jagged, like thoſe of Carrots: among which riſe vp naked ſtalkes, rough and hairie; whereupon doe grow beautifull floures bell faſhion, of a bright delaied purple colour: in the bottome whereof groweth a tuft of yellow thrums, and in the middle of the thrums it thruſteth forth a ſmall purple pointell: when the whole floure is paſt there ſuccedeth an head or knob compact of many gray hairy lockes, and in the ſollid parts of the knobs lieth the ſeed flat and hoary, euery ſeed hauing his owne ſmall haire hanging at it. The root is thicke and knobby, of a finger long, running right downe, and therefore not vnlike to thoſe of the *Anemone*, which it doth in all other parts very notably reſemble, and whereof no doubt this is a kinde.

2 There is no difference at all in the leaues, roots, or ſeeds, betweene this red Paſque floure and the precedent, nor in any other point, but in the colour of the floures; for whereas the other

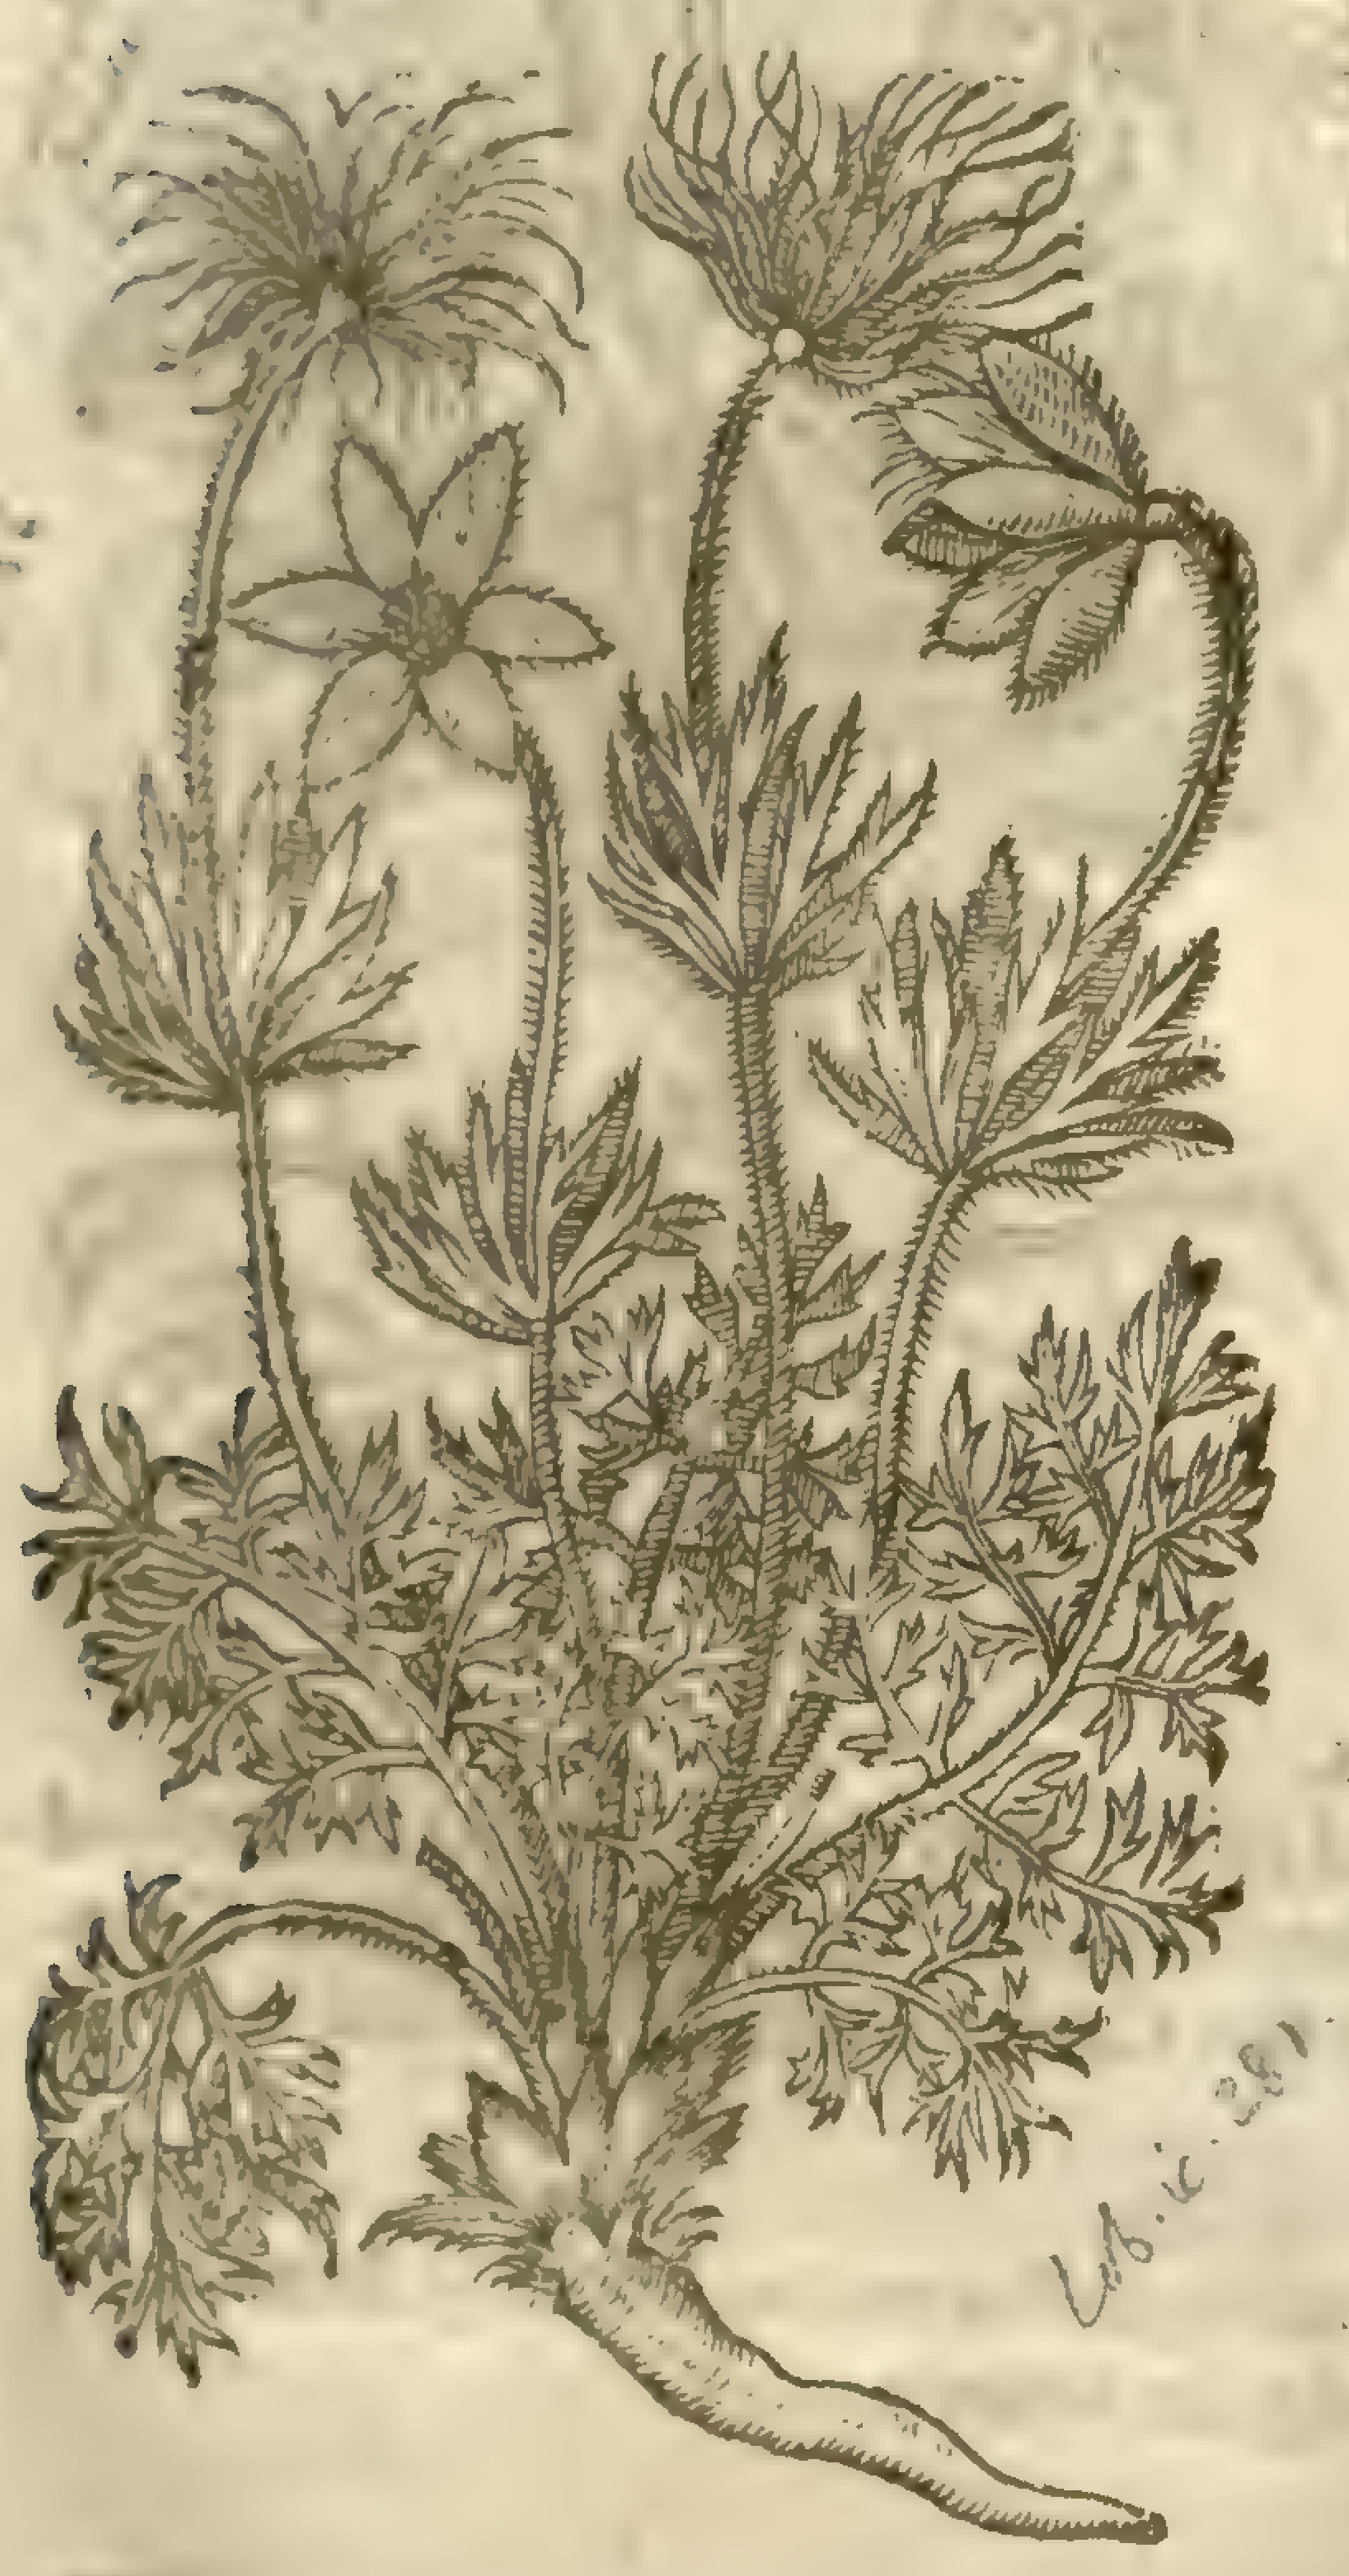
are of a purple colour, theſe are of a bright red, which ſetteth forth the difference.

3 The white Paſſe-floure hath many fine jagged leaues, cloſely couched or thruſt together, which reſemble an Holy-water ſprinckle, agreeing with the others in roots, ſeeds, and ſhape of floures, ſauing that theſe are of a white colour, wherein chiefely conſiſteth the difference.

‡ 4 This alſo in ſhape of roots and leaues little differs from the precedent, but the floures are leſſer, of a darker purple colour, and ſeldome open or ſhew themſelues ſo much abroad as the other of the firſt deſcribed, to which in all other reſpects it is very like.

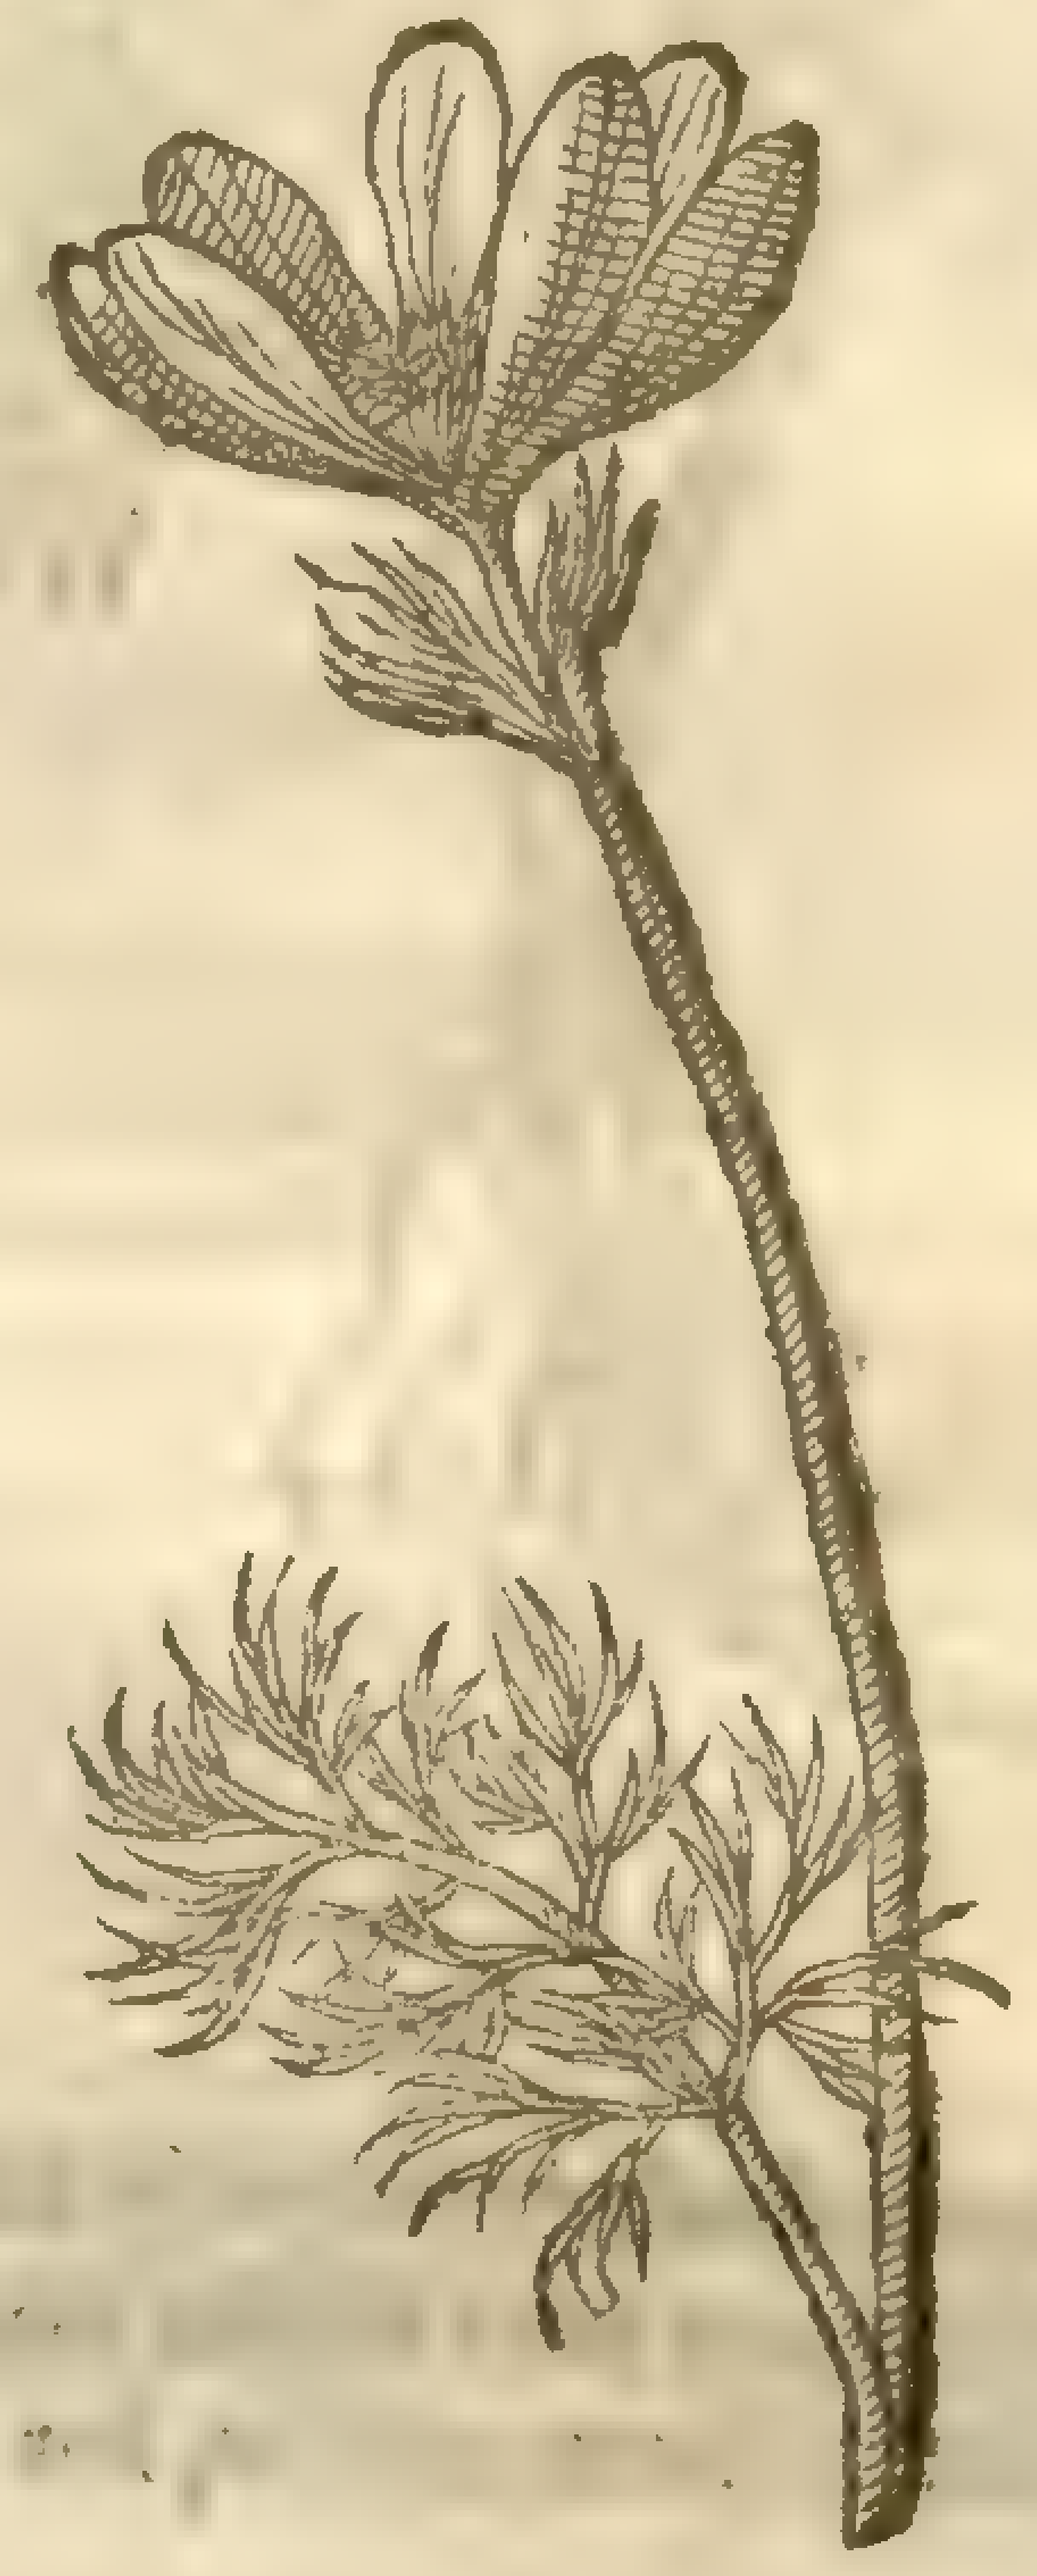
5 There is alſo another kinde with leaues leſſe diuided, but in other parts like thoſe alreadie deſcribed, ſauing that the floure is of a yellow colour ſomething inclining to red. ‡

1 *Pulſatilla vulgaris.*
Purple Paſſe-floure.



Lib. ic. 281

2 *Pulſatilla rubra.*
Red Paſſe-floure.



¶ *The Place.*

Ruellius writeth, that the Paſſe-floure groweth in France in vntoiled places: in Germany they grow in rough and ſtony places, and oftentimes on rockes.

Thoſe with purple floures do grow very plentifully in the paſture or cloſe belonging to the parſonage houſe of a ſmall village ſix miles from Cambrige, called Hilderſham: the Parſons name that liued at the impreſſion hereof was M^r^ *Fuller*, a very kind and louing man, and willing to ſhew vnto any man the ſaid cloſe, who deſired the ſame.

¶ *The Time.*

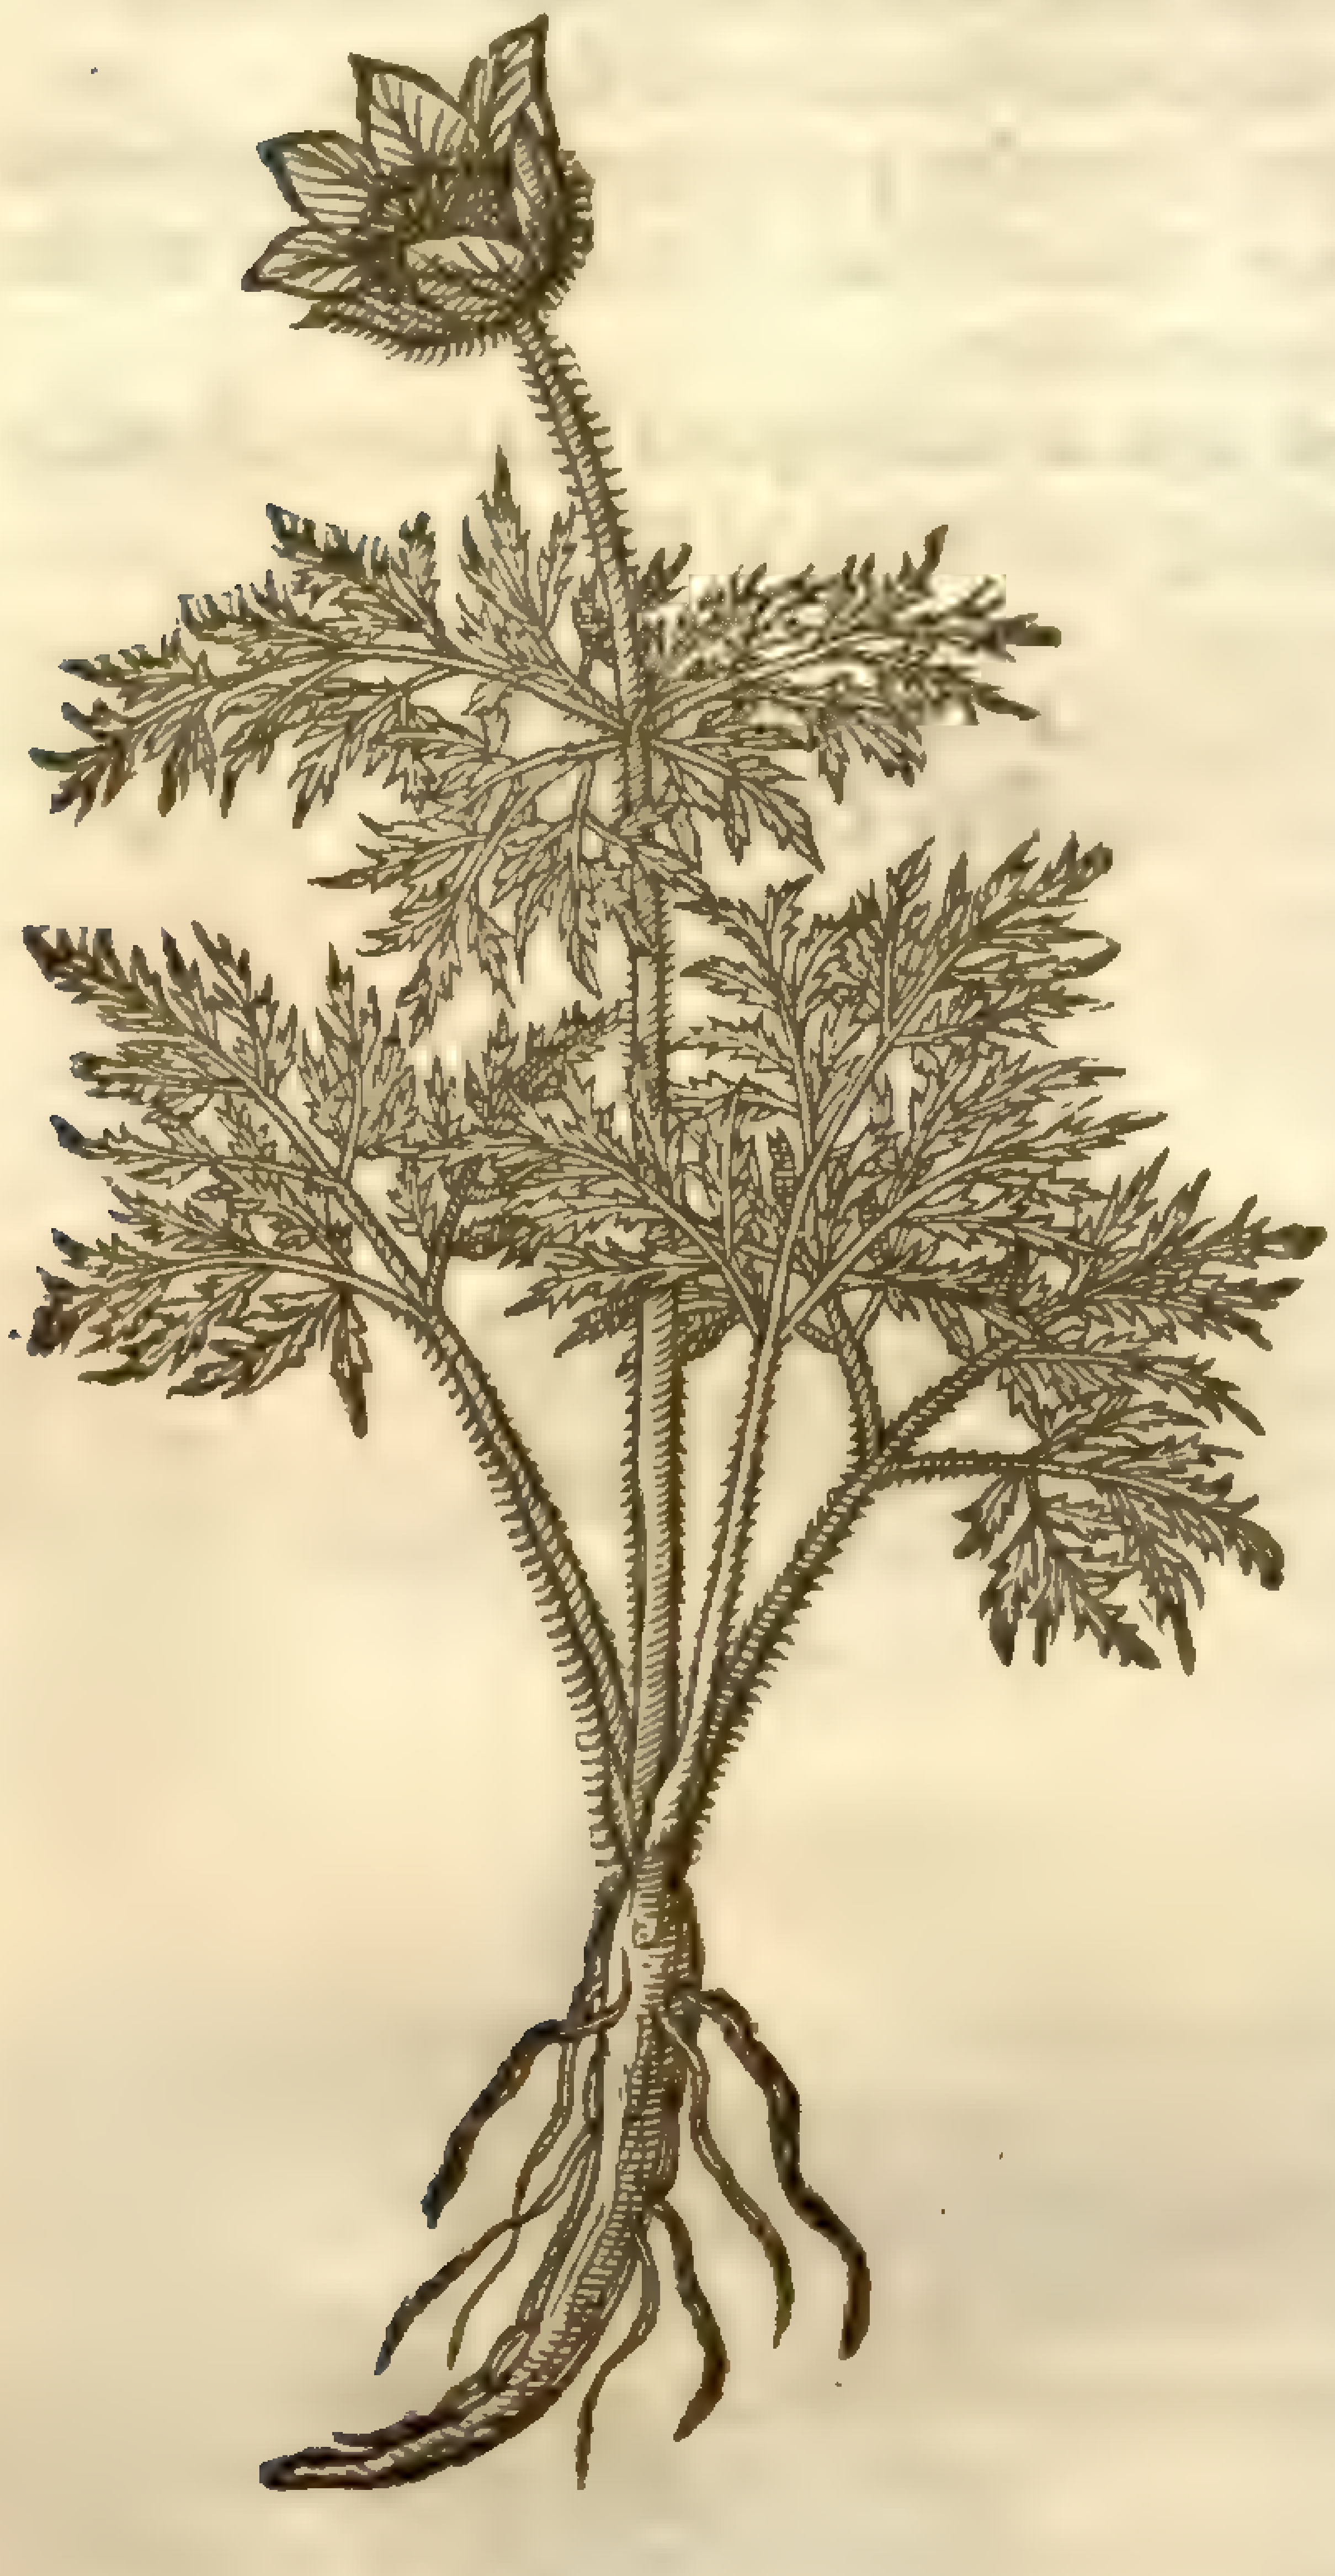
They floure for the moſt part about Eaſter, which hath mooued mee to name it *Paſque-Floure*, or Eaſter floure: and often they doe floure againe in September. ‡ The yellow kinde floures in May. ‡

¶ *The Names.*

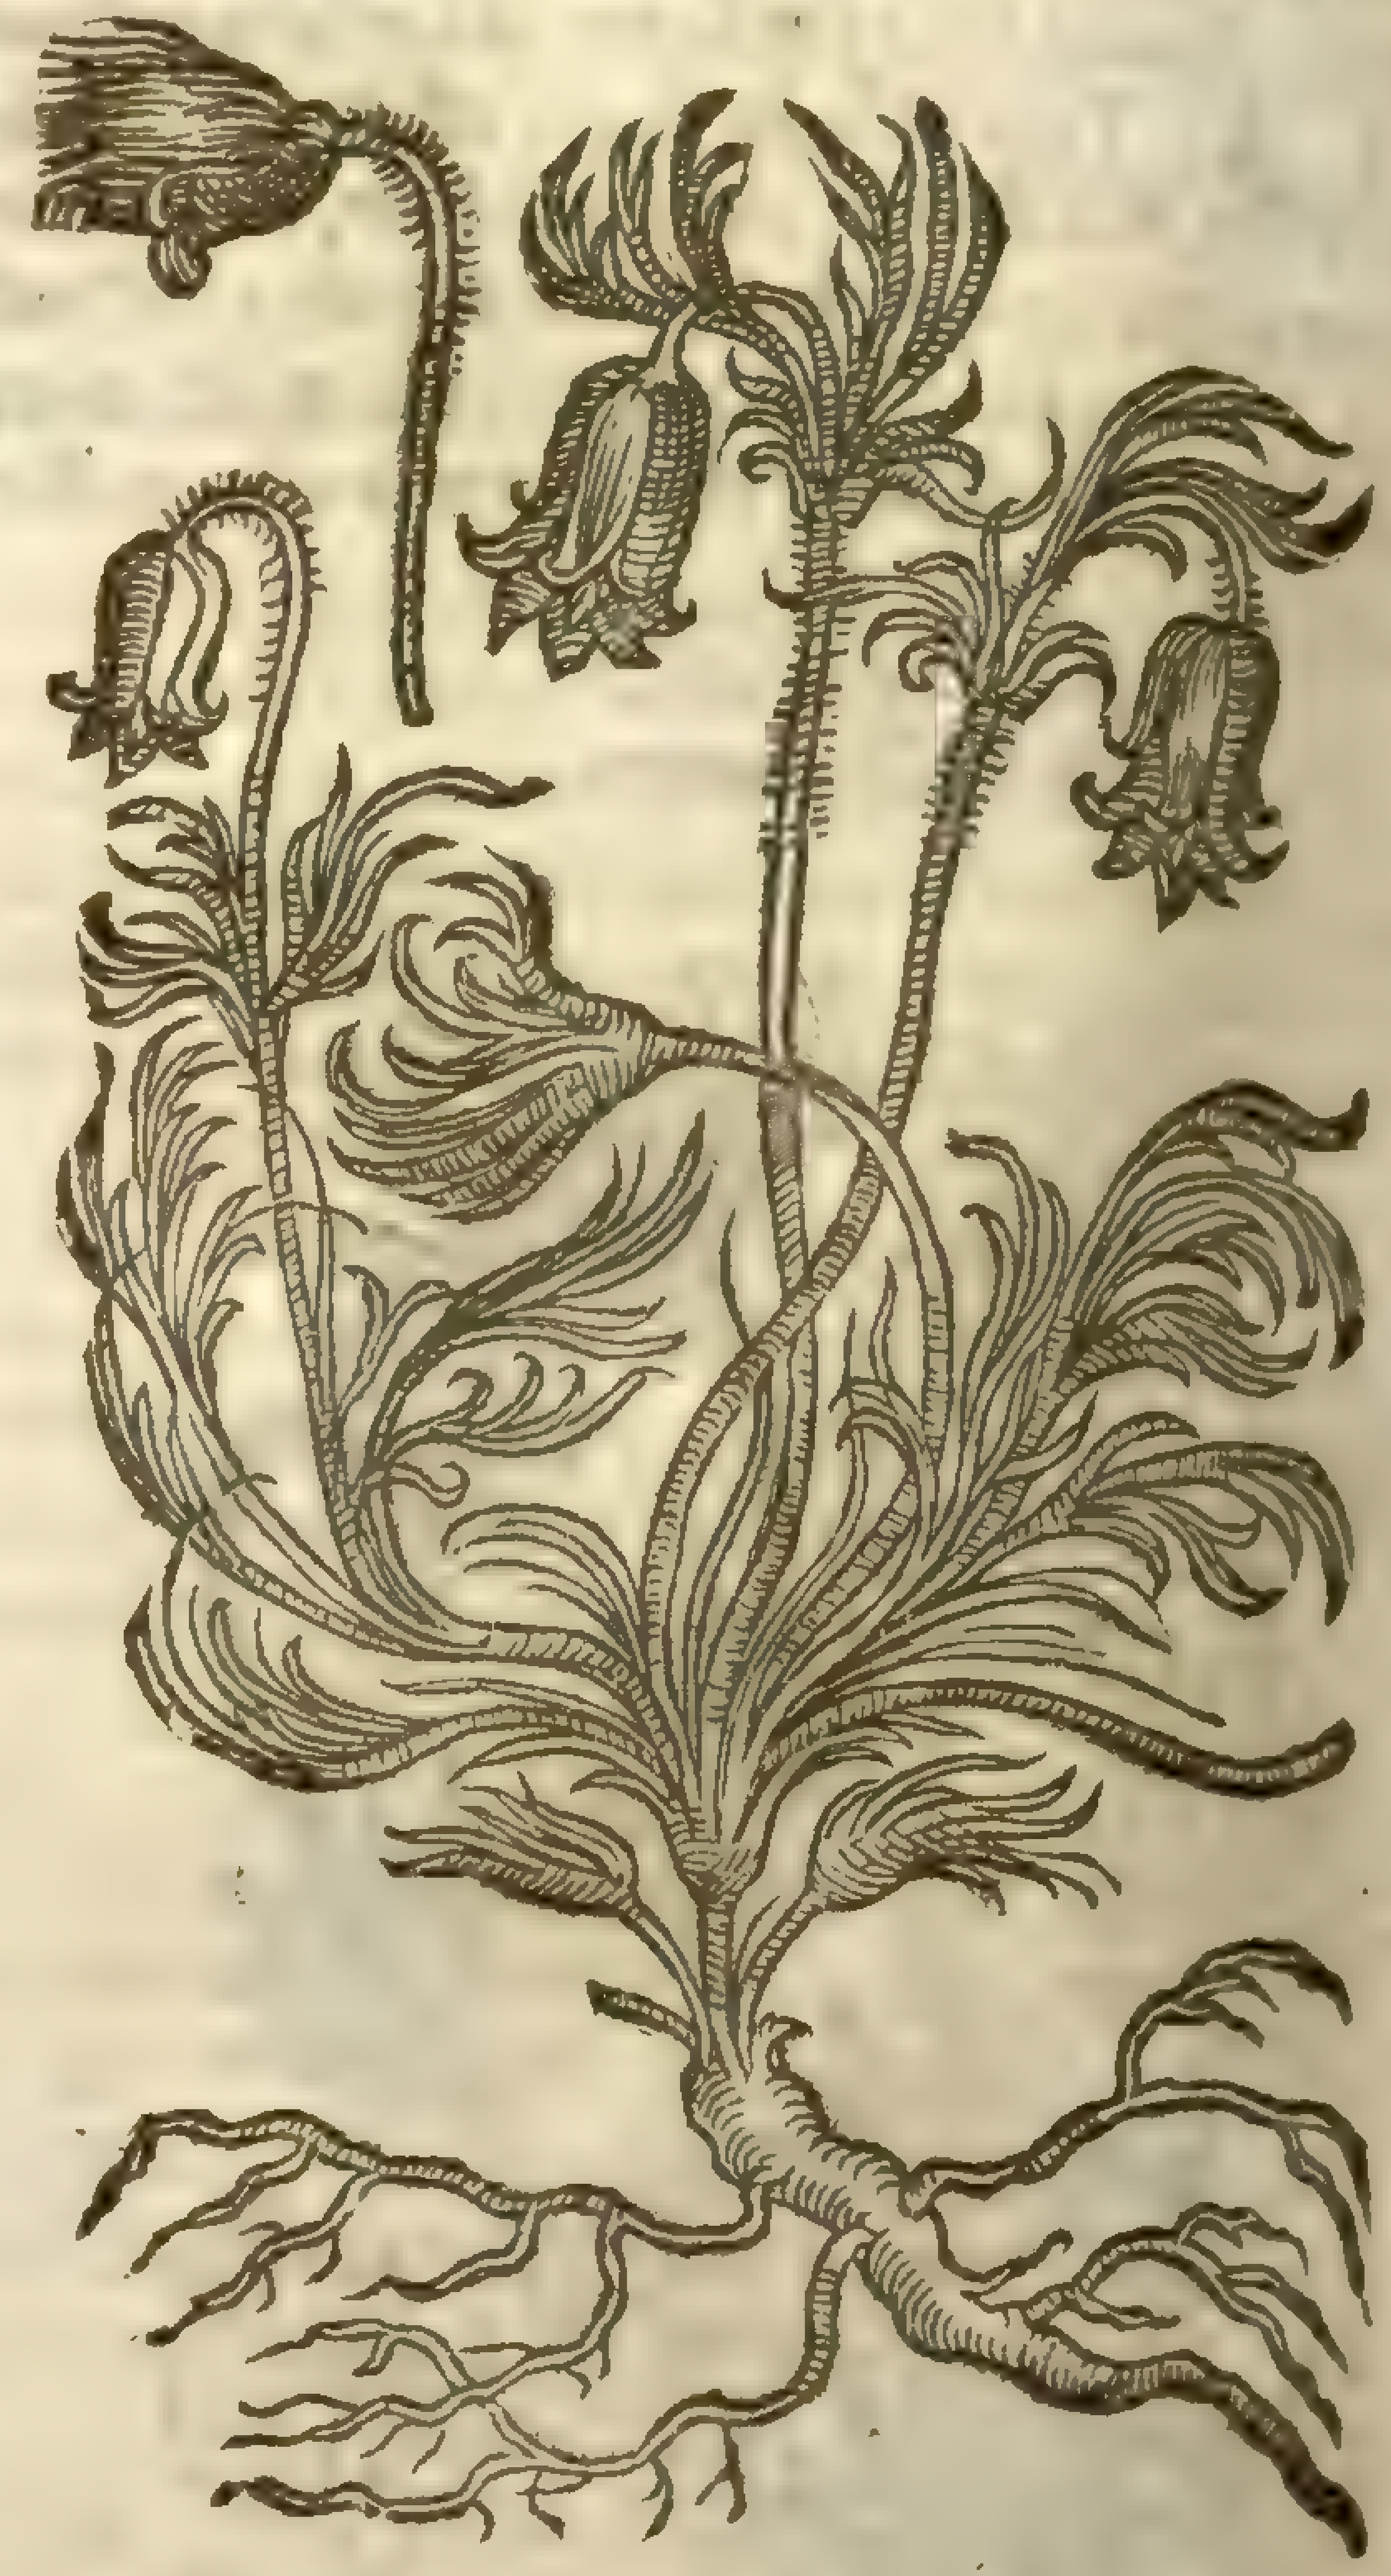
† Paſſe floure is called commonly in Latine, *Pulſatilla*: and of ſome, *Apium riſus*, & *herba venti*. *Daleſchampius* would haue it to be *Anemone Limonia* and *Samolus* of *Pliny*: in French, *Coquelourdes*: in Dutch, **Keckenſchell**: in Engliſh, Paſque floure, or Paſſe-floure, and after the Latine name *Pulſatilla*, or Flaw floure: in Cambridge-ſhire where they grow, they are named Couentrie bels.

¶ *The*

3 *Pulſatilla flore albo.*
White Paſſe-floure.



‡ 4 *Pulſatilla flore minore.*
The leſſer purple Paſſe-floure.



¶ *The Temperature.*

Paſſe-floure doth extremely bite, and exulcerateth and eateth into the skinne if it be ſtamped and applied to any part of the body; whereupon it hath beene taken of ſome to be a kinde of Crowfoot, and not without reaſon, for that it is not inferiour to the Crowfoots: and therefore it is hot and drie.

¶ *The Vertues.*

There is nothing extant in writing among Authors of any peculiar vertue, but they ſerue onely for the adorning of gardens and garlands, being floures of great beautie.

Chap. 80. *Of Adonis floure.*

¶ *The Deſcription.*

1 The firſt hath very many ſlender weake ſtalkes, trailing or leaning to the ground, ſet on euery part with fine jagged leaues very deepely cut like thoſe of Camomill, or rather thoſe of May-weed: vpon which ſtalkes doe grow ſmall red floures, in ſhape like the field Crow-foot, with a blackiſh greene pointell in the middle, which being growne to maturity turneth into a ſmall greeniſh bunch of ſeeds, in ſhape like a little bunch of grapes. The root is ſmal and threddy.

2 The ſecond differeth not from the precedent in any one point, but in the color of the floures, which are of a perfect yellow colour, wherein conſiſteth the difference.

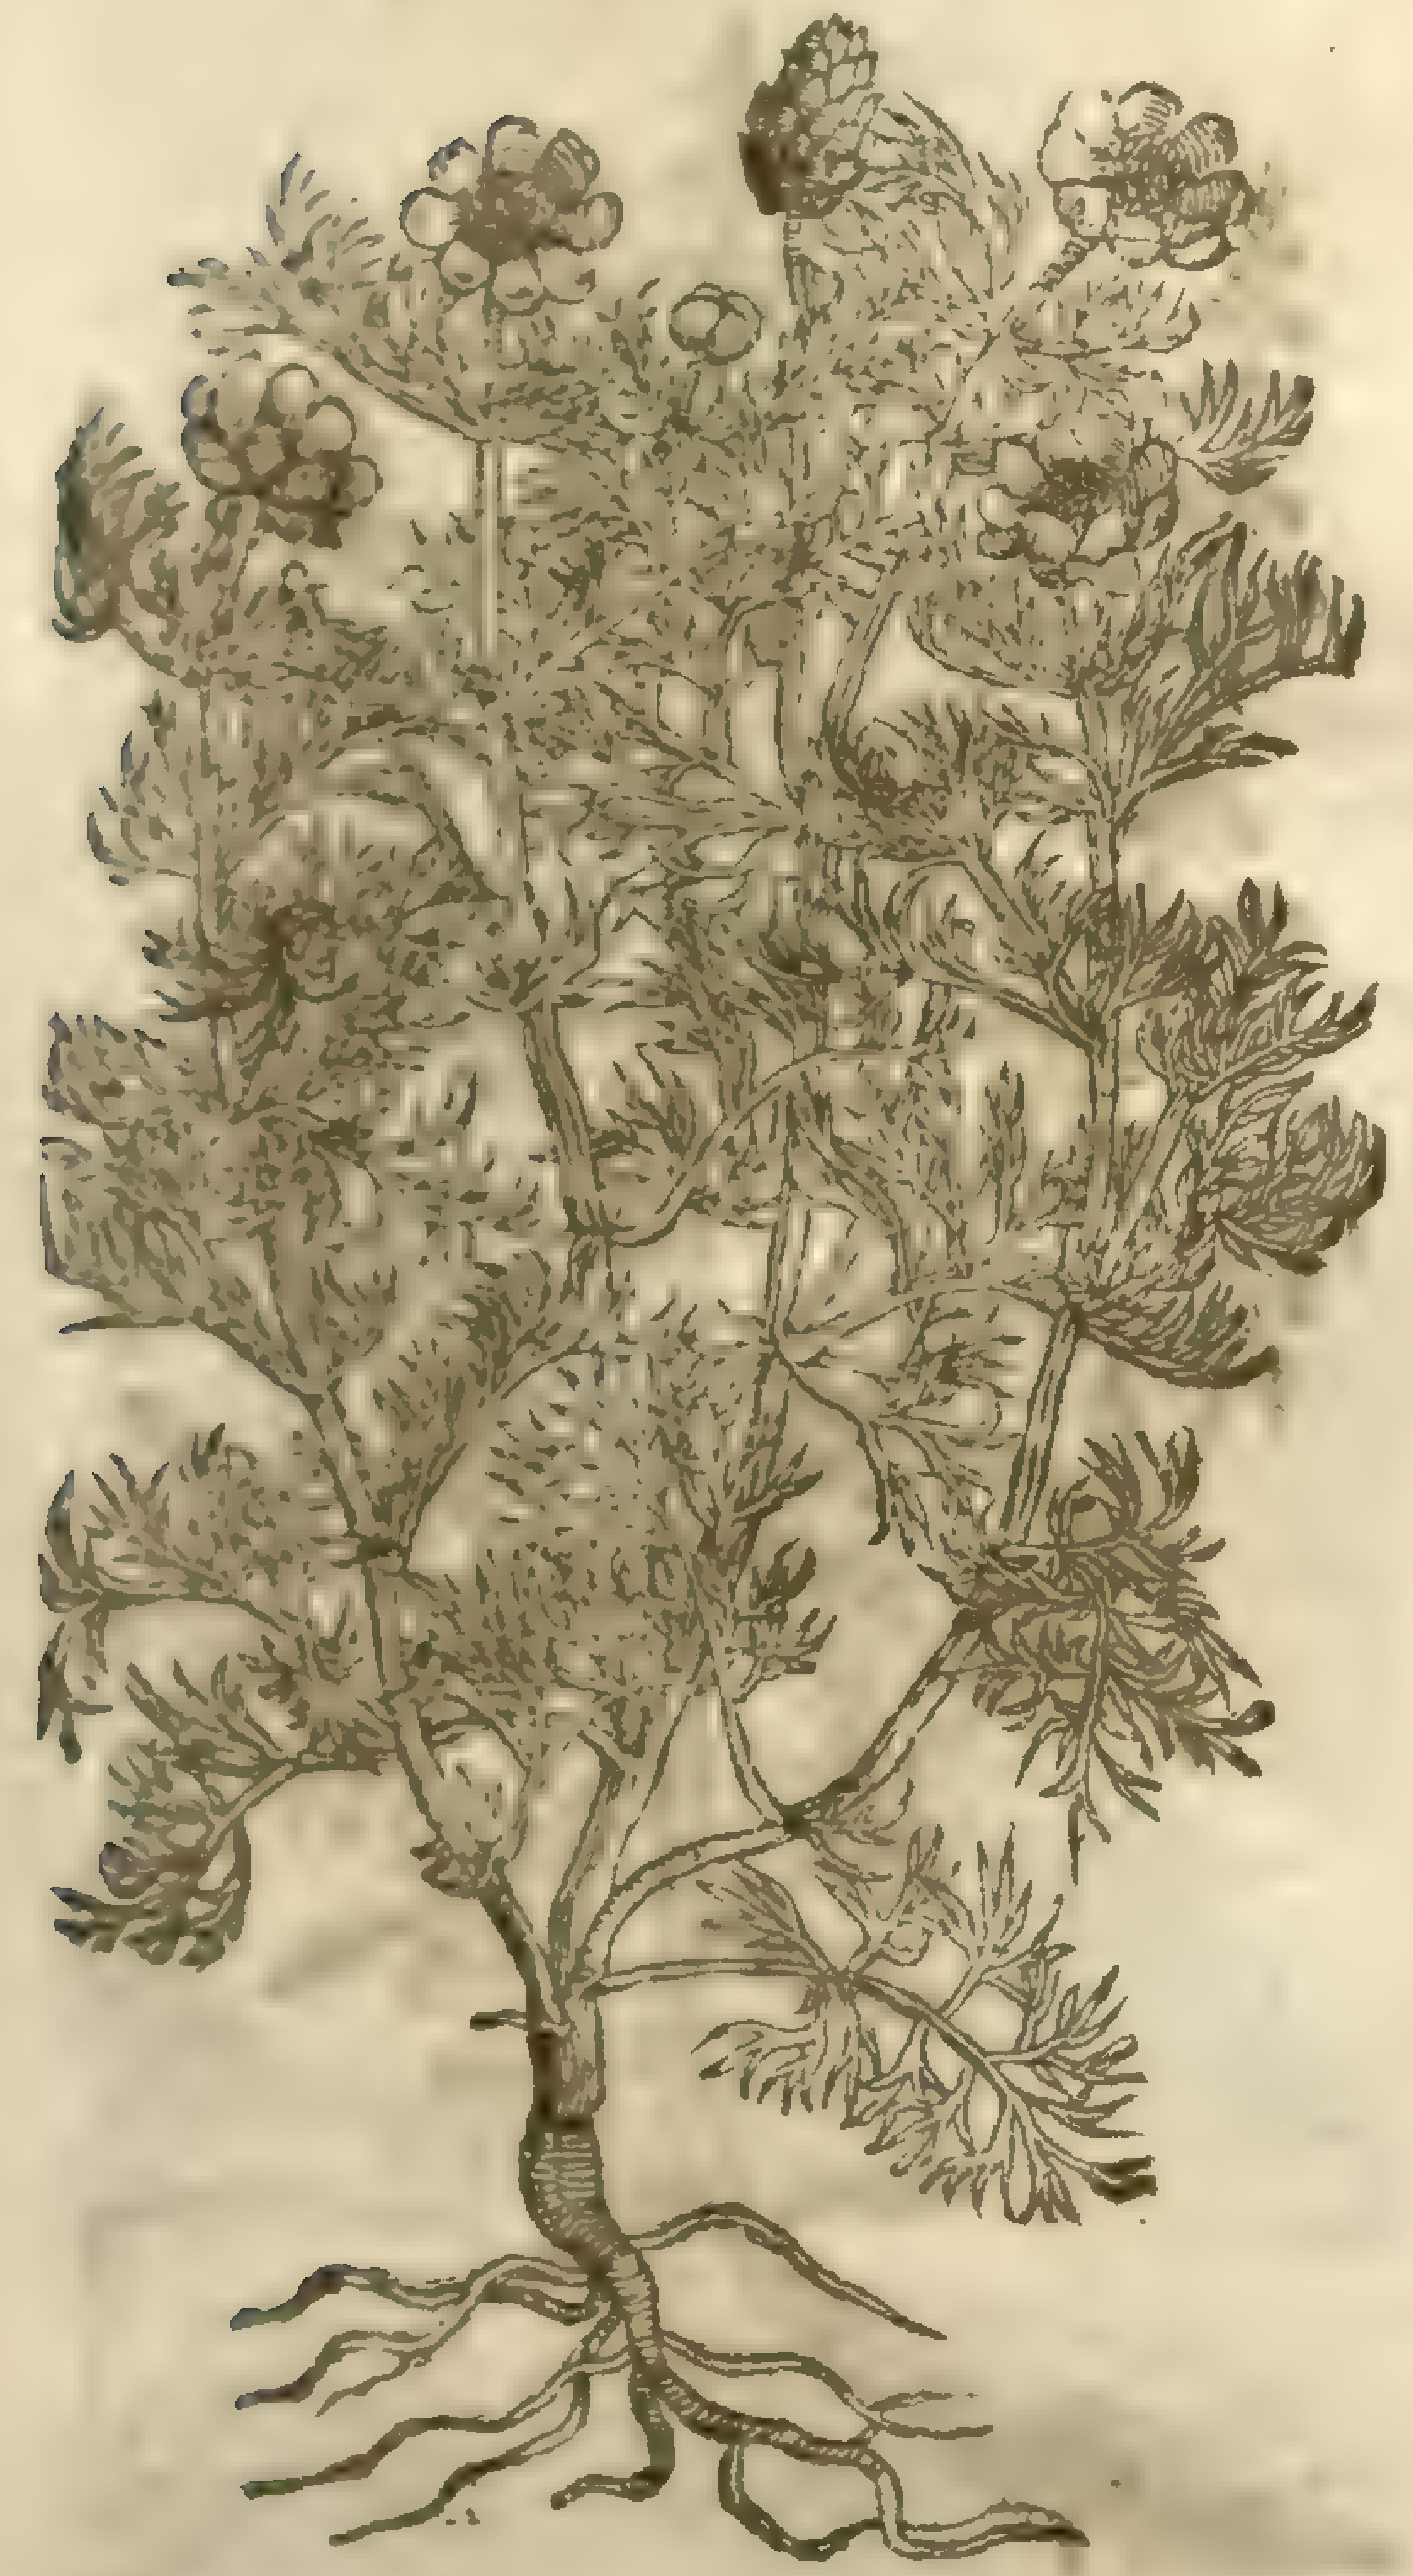
¶ *The Place.*

The red floure of Adonis groweth wilde in the Weſt parts of England among their corne, euen as May-weed doth in other parts, and is likewiſe an enemy to corne as May-weed is: from thence I brought the ſeed, and haue ſowne it in my garden for the beautie of the floures ſake. That with the yellow floure is a ſtranger in England.

¶ *The*

1 *Flos Adonis flore rubro.*
Adonis with red floures.

Adonis autumnalis



¶ *The Time.*

They floure in the Summer moneths, May, Iune, and Iuly, and ſometimes later.

¶ *The Names.*

Adonis floure is called in Latine, *Flos Adonis* and *Adonidis*: of the Dutchmen, **Feldroſzlin**: in Engliſh we may cal it red Mayths, by which name it is called of them that dwell where it groweth naturally, and generally red Camomil: in Greeke, ἐρανθεμον: and *Eranthemum*: our London women do call it Roſe-a-rubie.

¶ *The Nature.*

There hath not bin any that hath written of the temperature hereof; notwithſtanding, ſo far as the taſte thereof ſheweth, it is ſomthing hot; but not much.

¶ *The Vertues.*

The ſeed of Adonis floure is thought to bee good againſt the ſtone: amongſt the Antients it was not knowne to haue any other faculty; albeit experience hath of late taught vs, That the ſeed ſtamped, and the pouder giuen in wine, ale, or beere to drinke, doth wonderfully and with great effect helpe the colique.

CHAP. 81. Of Docks.

¶ *The Kindes.*

Dioſcorides ſetteth forth foure kinds of Docks; wilde or ſharpe pointed Docke, garden Docke, round leafed Docke, and the ſoure Dock called Sorrel: beſides theſe, the later Herbariſts haue added certain other Docks alſo, which I purpoſe to make mention of.

¶ *The Deſcription.*

1 THat which among the Latines ſignifies to ſoften, eaſe, or purge the belly, the ſame ſignification hath λαπάσσειν, among the Grecians; whereof *Lapathum* and λάπαθον (as ſome do reade) tooke their names for herbs which are vſed in pottage and medicine, very wel knowne to haue the power of clenſing: of theſe there be many kindes and differences, great ſtore euerie where now growing; among whom is that which is now called ſharp pointed Dock or ſharp leafed Dock. It growes in moſt medowes and by running ſtreams, hauing long narrow leaues ſharp and hard pointed: among which come vp round hollow ſtalks of a brown colour, hauing joints like knees, garniſhed with ſuch like leaues, but ſmaller: at the end whereof grow many floures of a pale colour, one aboue another; and after them comes a browniſh three ſquare ſeed, lapped in browne chaffie husks like Patience. The root is great, long, and yellow within.

‡ There is a varietie of this with criſped or curled leaues, whoſe figure was by our Author giuen in the ſecond place in the following chapter, vnder the title of *Hydrolapathum minus*. ‡

2 The ſecond kind of ſharp pointed Dock is like the firſt, but much ſmaller, and doth bear his ſeed in rundles about his branches, in chaffie husks like Sorrell; not ſo much in vſe as the former, called alſo ſharp pointed Dock.

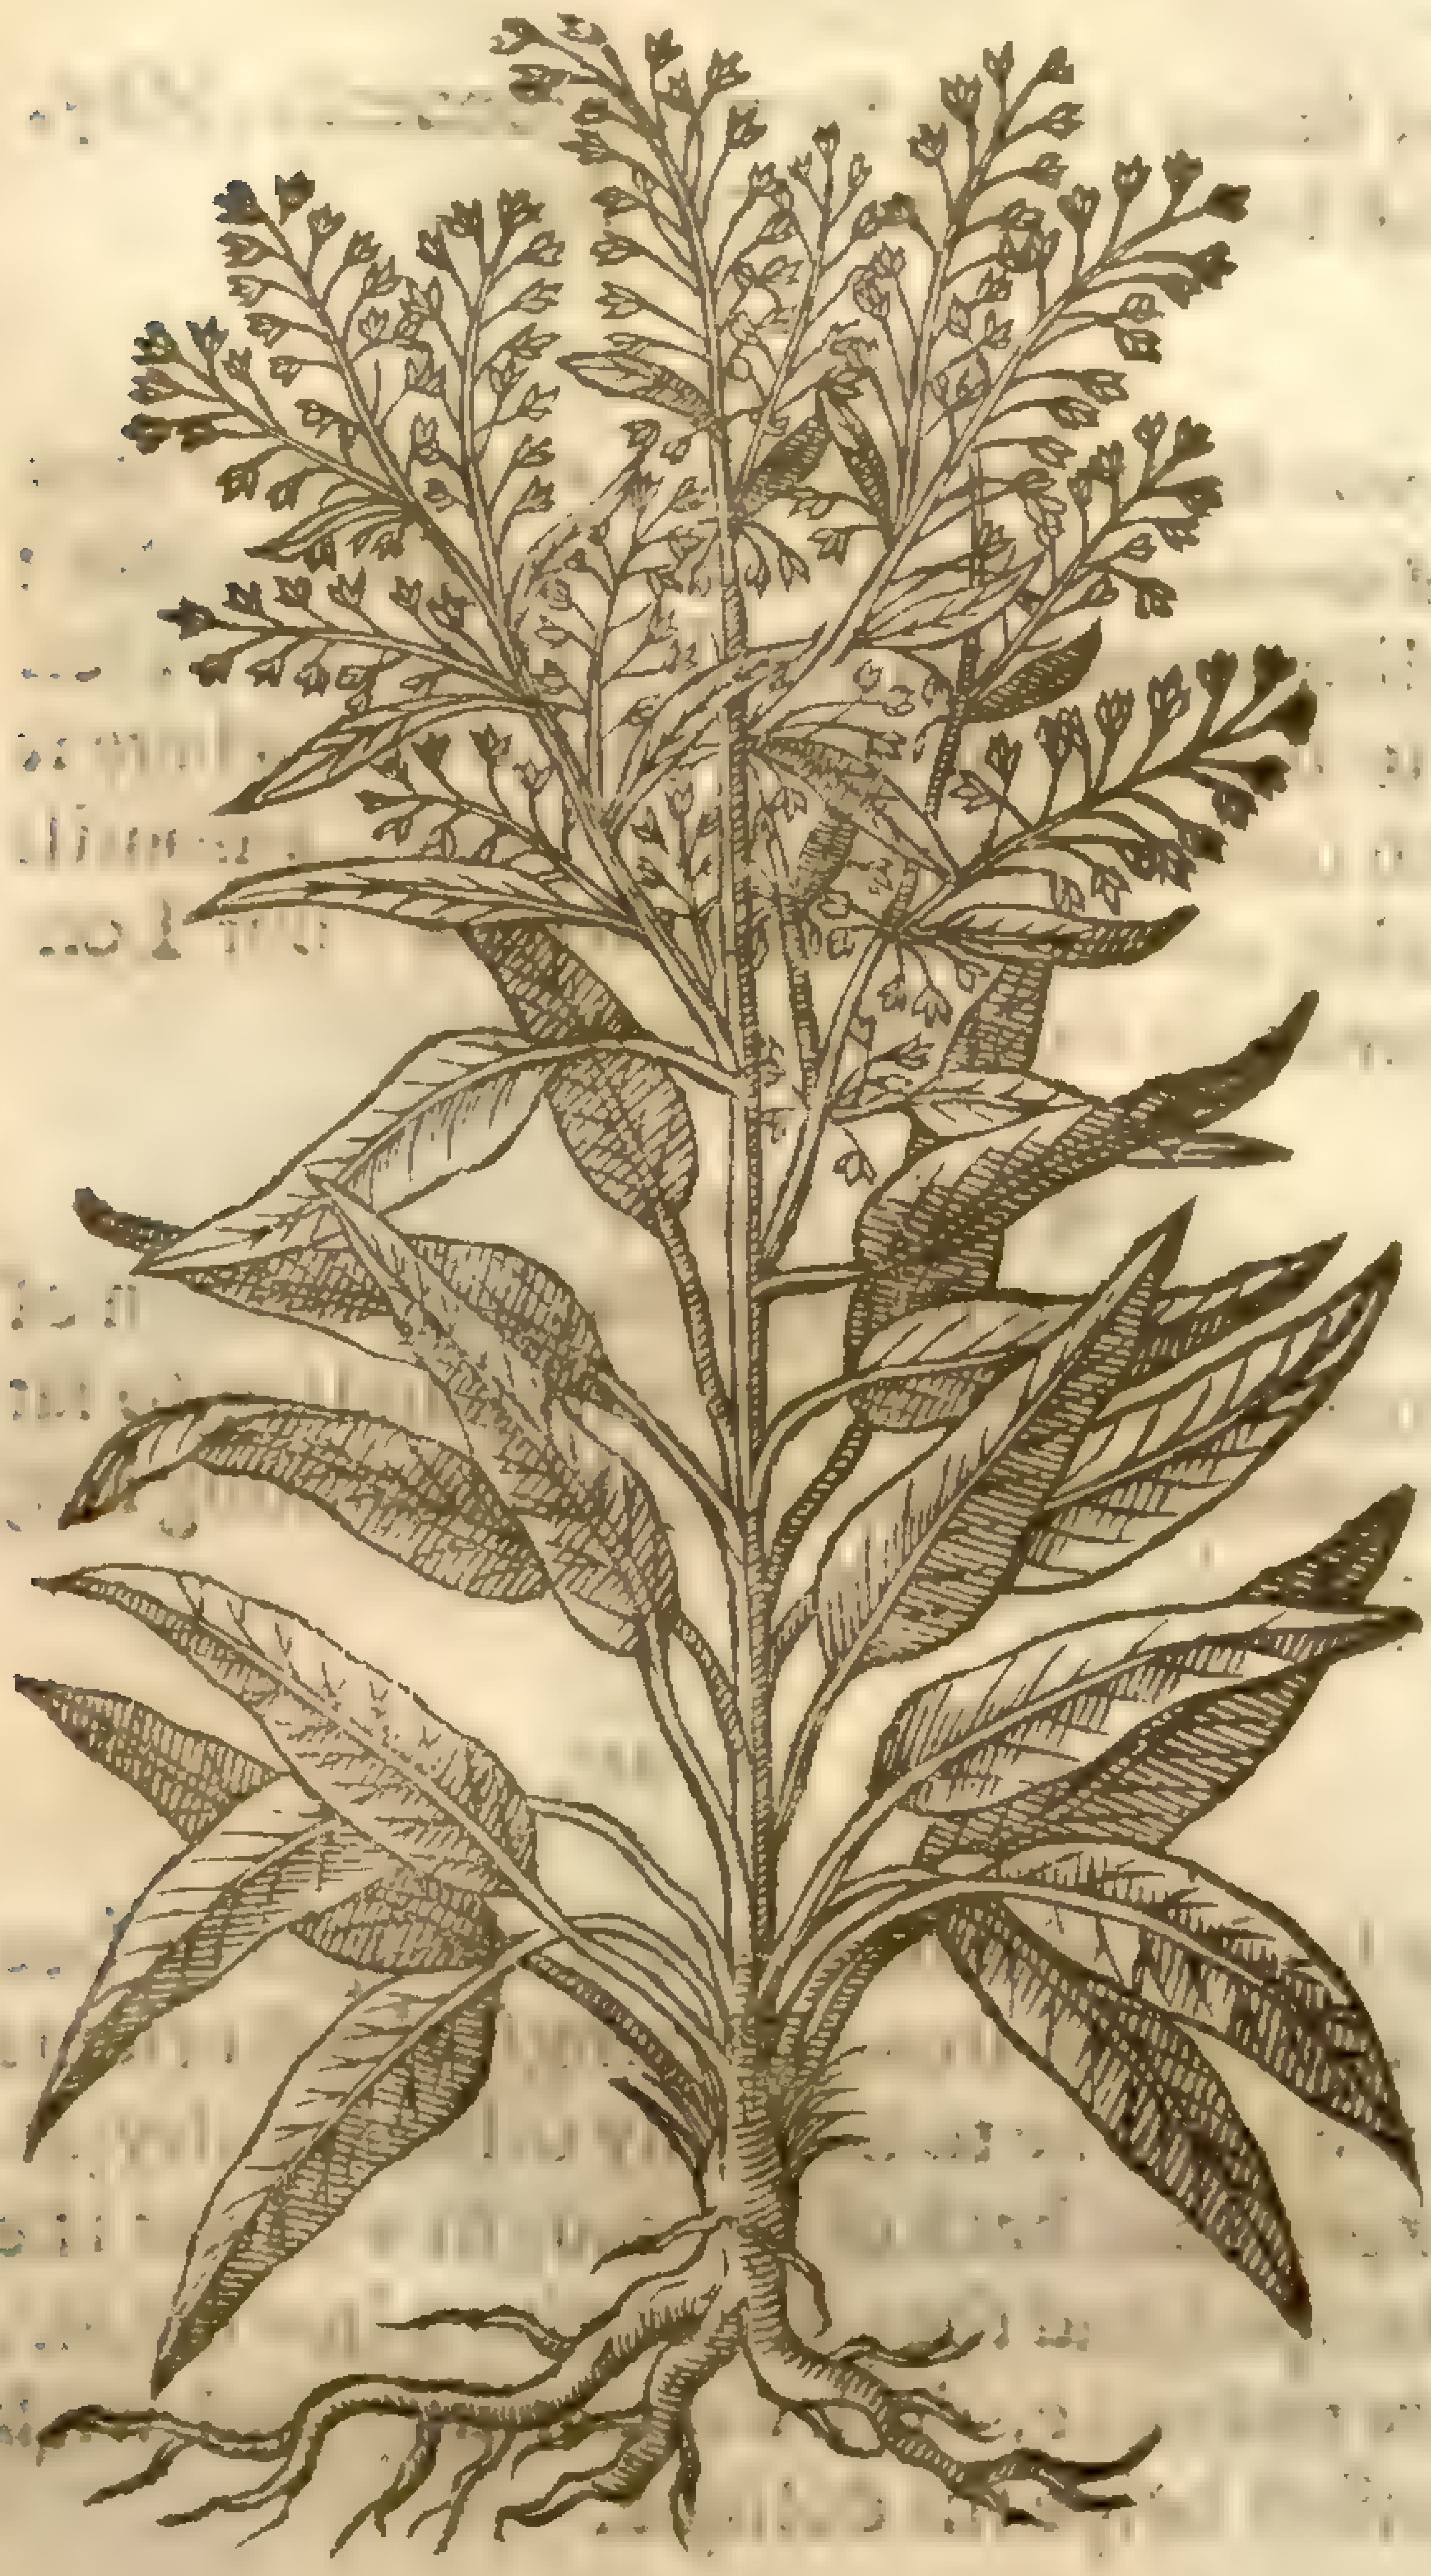
‡ 3 This in roots, ſtalks, and ſeeds is like to the precedent, but the leaues are ſhorter & rounder than thoſe of the firſt deſcribed, wherein conſiſts the chiefe difference betwixt this and it. ‡

¶ *The Place.*

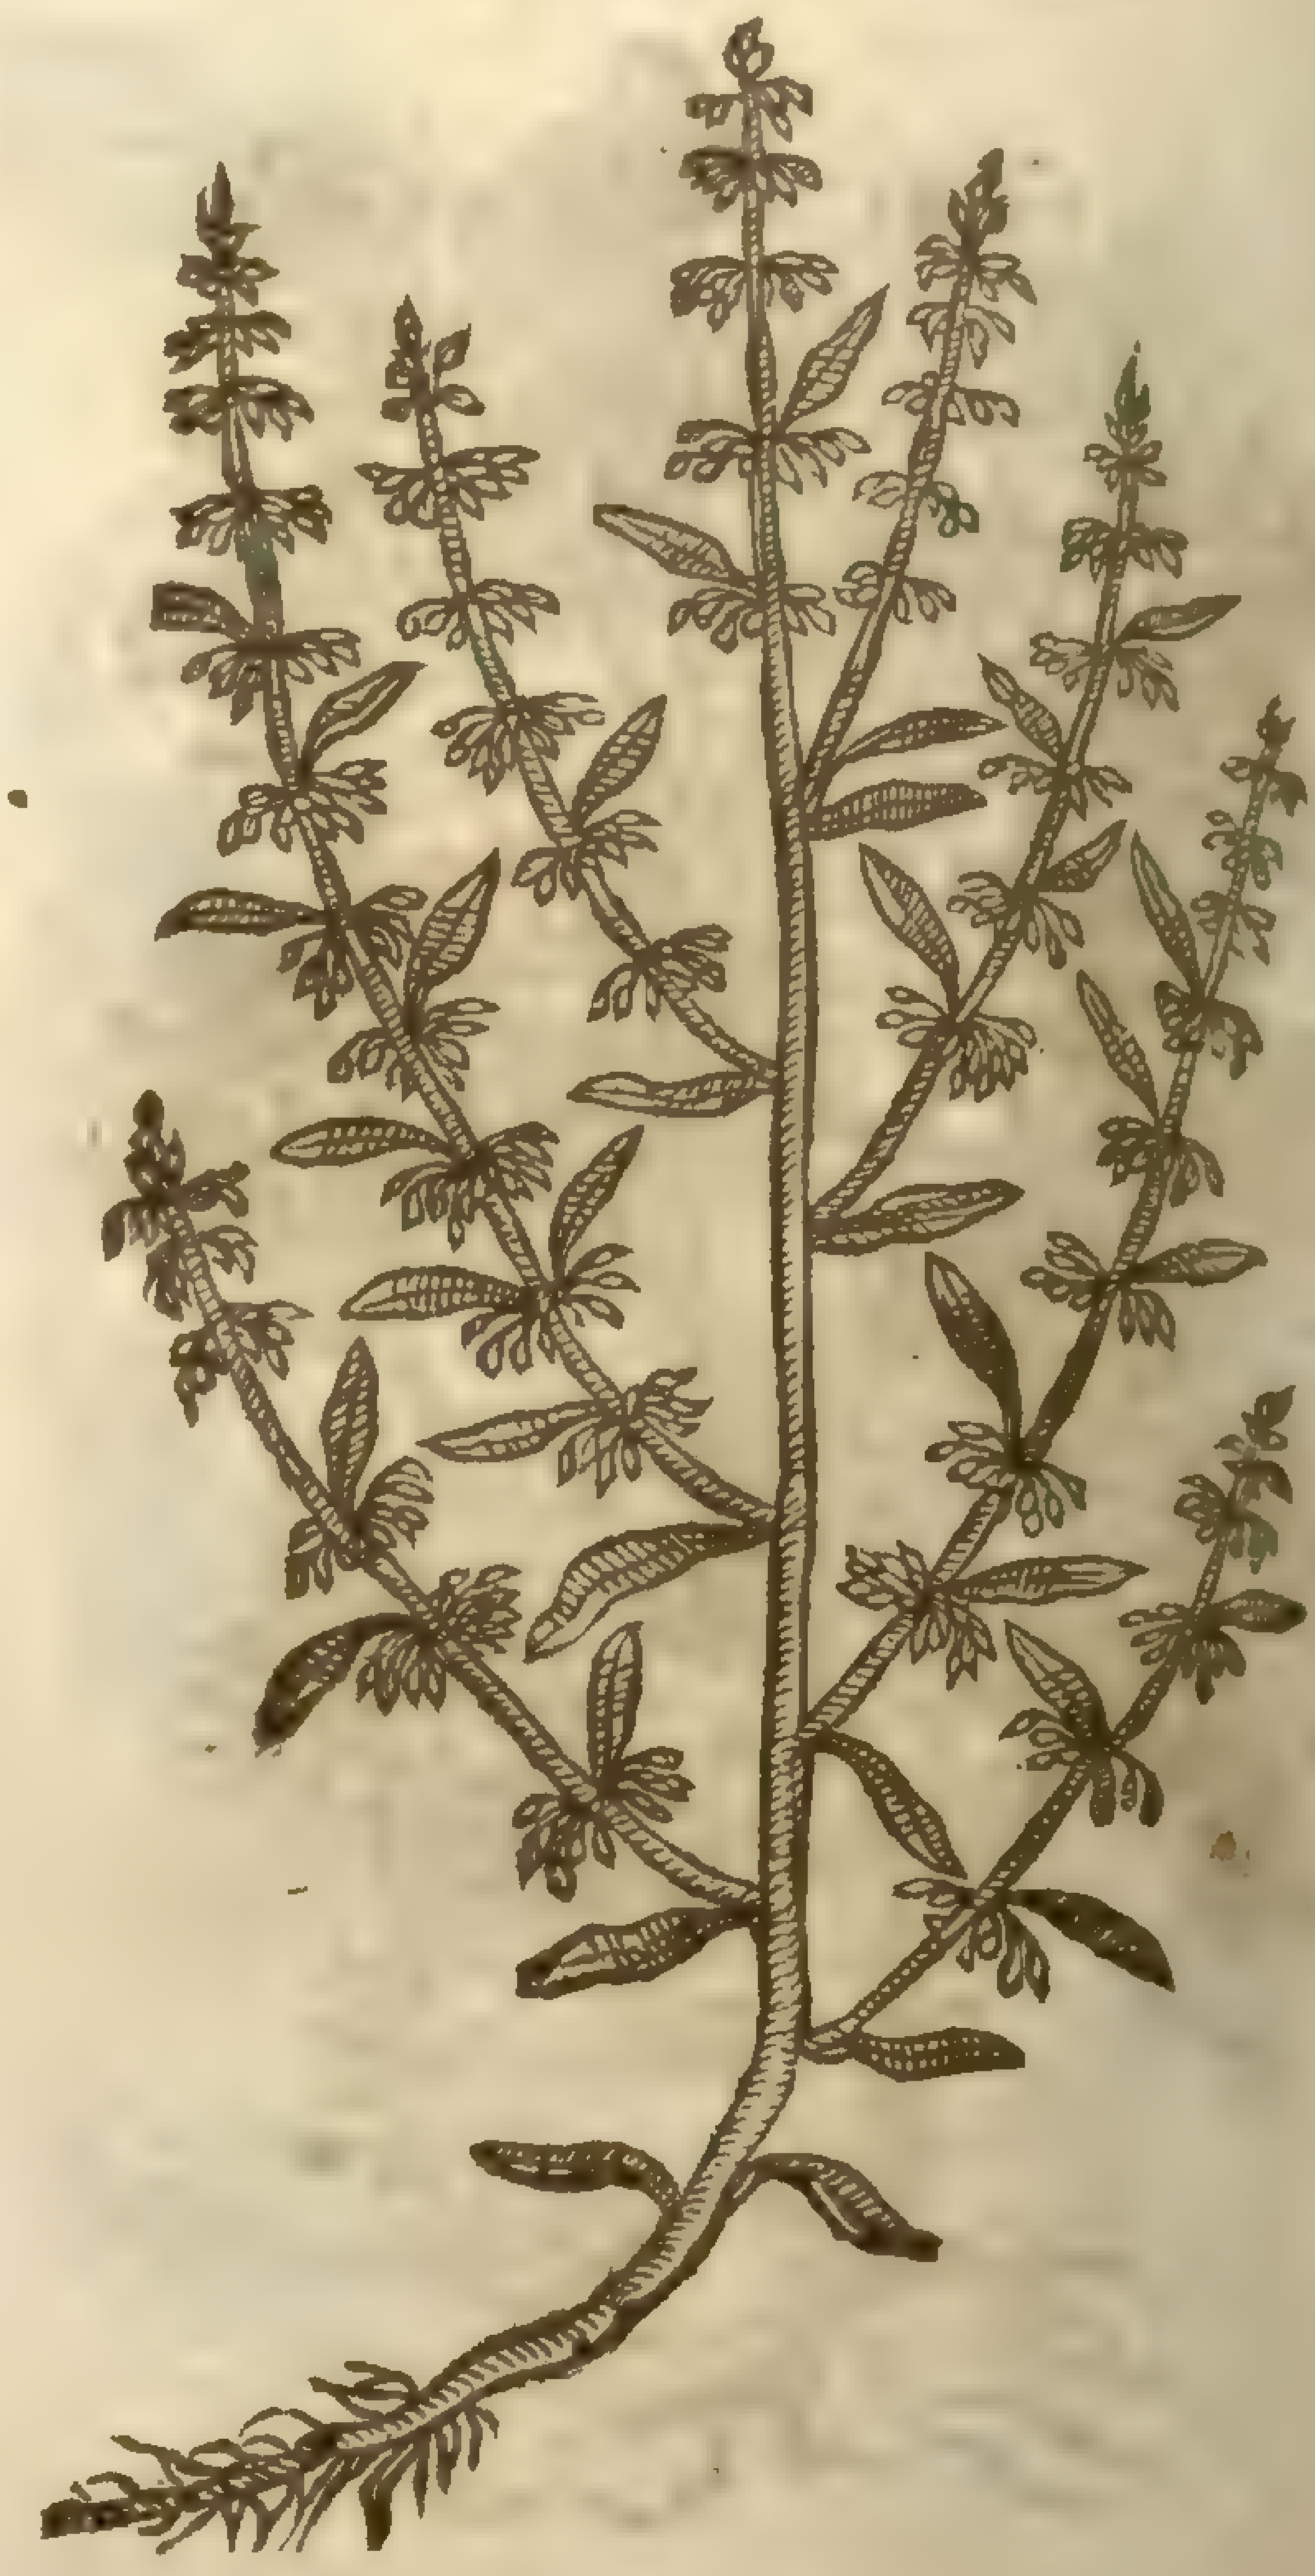
Theſe kinds of Docks grow, as is beforeſaid, in medowes and by riuers ſides.

¶ The

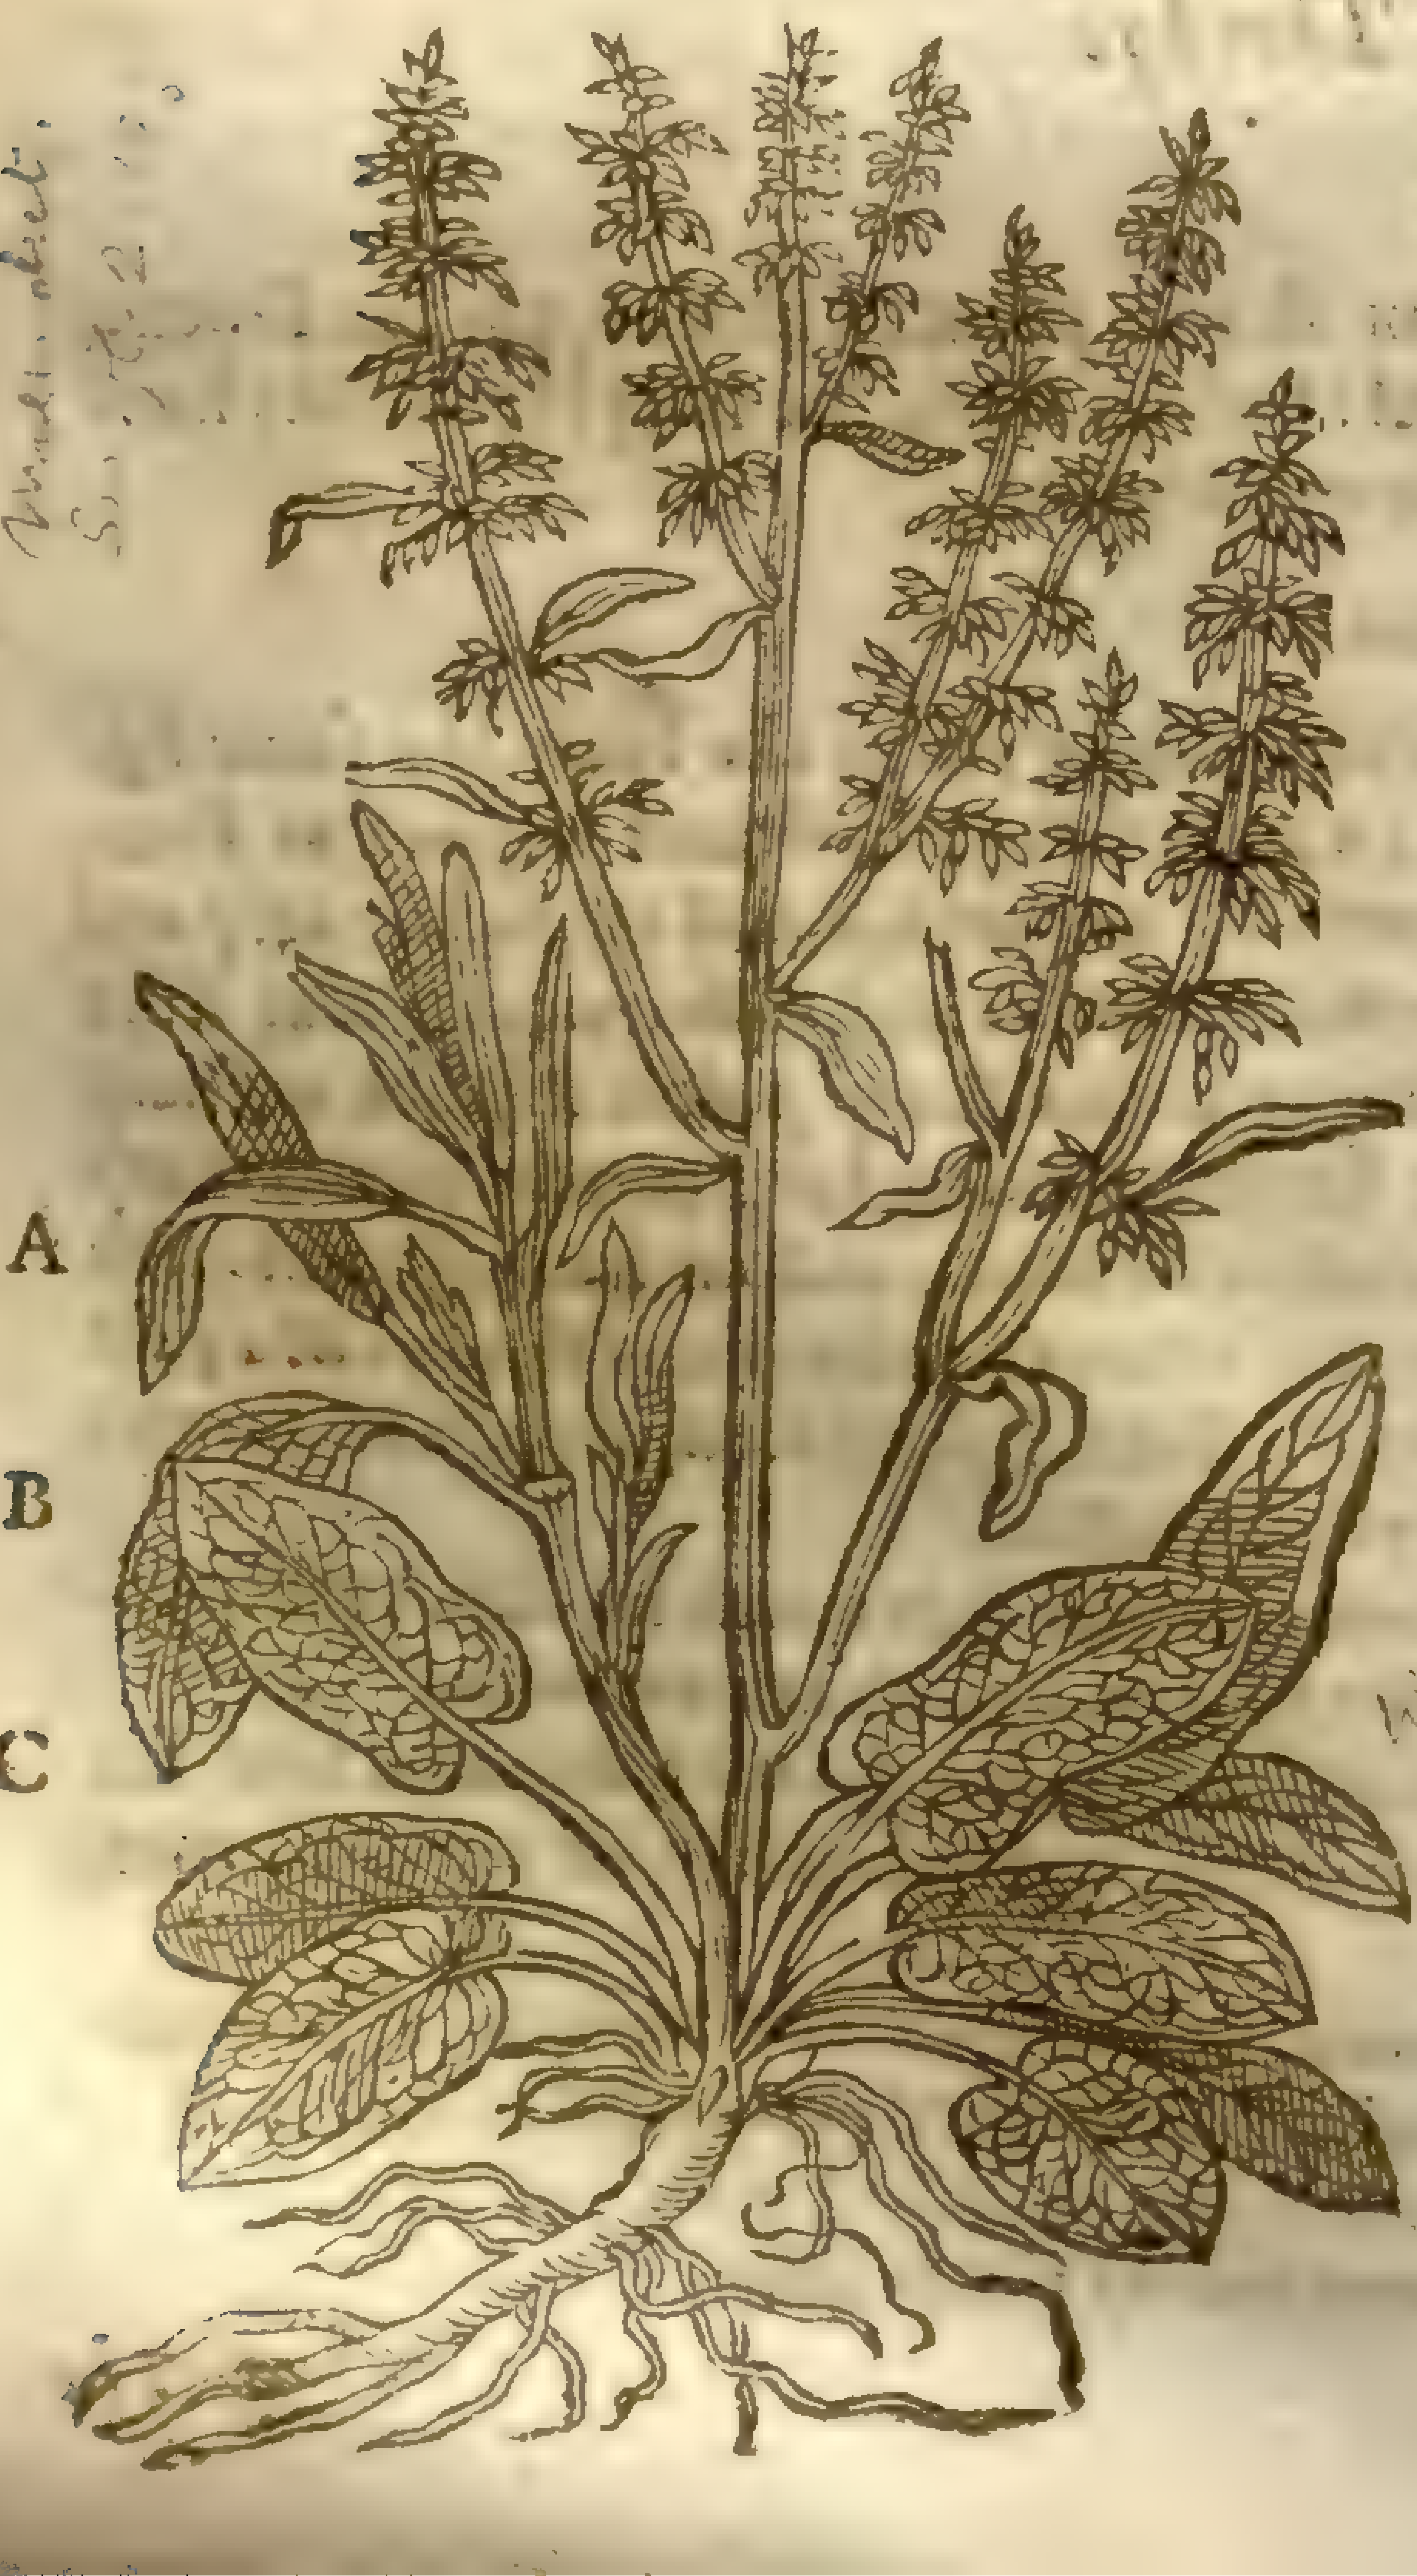
† 1 *Lapathum acutum.*
Sharpe pointed Docke.



2 *Lapathum acutum minimum.*
Small ſharpe Docke.



‡ ~~3~~ *Lapathum ſylueſtre fol. minus acuto.*
The roundiſh leaued wilde Docke.



Rumex obtusifolius L.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

They are called in Latine, *Lapathum acutum, Rumex, Lapatium*, and *Lapathium*: of ſome, *Oxylapathum*: in Engliſh, Dock, and ſharp pointed dock, the greater and the leſſer: of the Greeks, [illegible]: in high Dutch, **Mengelwurtz, Streiſſwurtz**: in Italian, *Rombice*: in Spaniſh, *Romaza, Paradella*: in low-Dutch, **Patich** (which word is deriued of *Lapathum*) and alſo **Peerdick**: in French, *Pareille*.

‡ The third is *Lapathum folio retuſo*, or *minus acuto* of *Lobel*; and *Hippolapathum ſylueſt*, of *Taber*. ‡

¶ *The Nature and Vertues.*

Theſe herbs are of a mixture between cold and heate, and almoſt dry in the third degree, eſpecially the ſeed, which is very aſtringent.

The pouder of any of the kinds of docks drunk in wine, ſtoppeth the lask and bloudy flix, and eaſeth the pain of the ſtomacke.

The roots boiled til they be very ſoft, & ſtamped with barrowes greaſe, and made into an ointment, helps the itch and all ſcuruy ſcabs & manginesse: and for the ſame purpoſe it ſhall be neceſſarie to boile them in water as aforeſaid, and the party to be rubbed and bathed therewith.

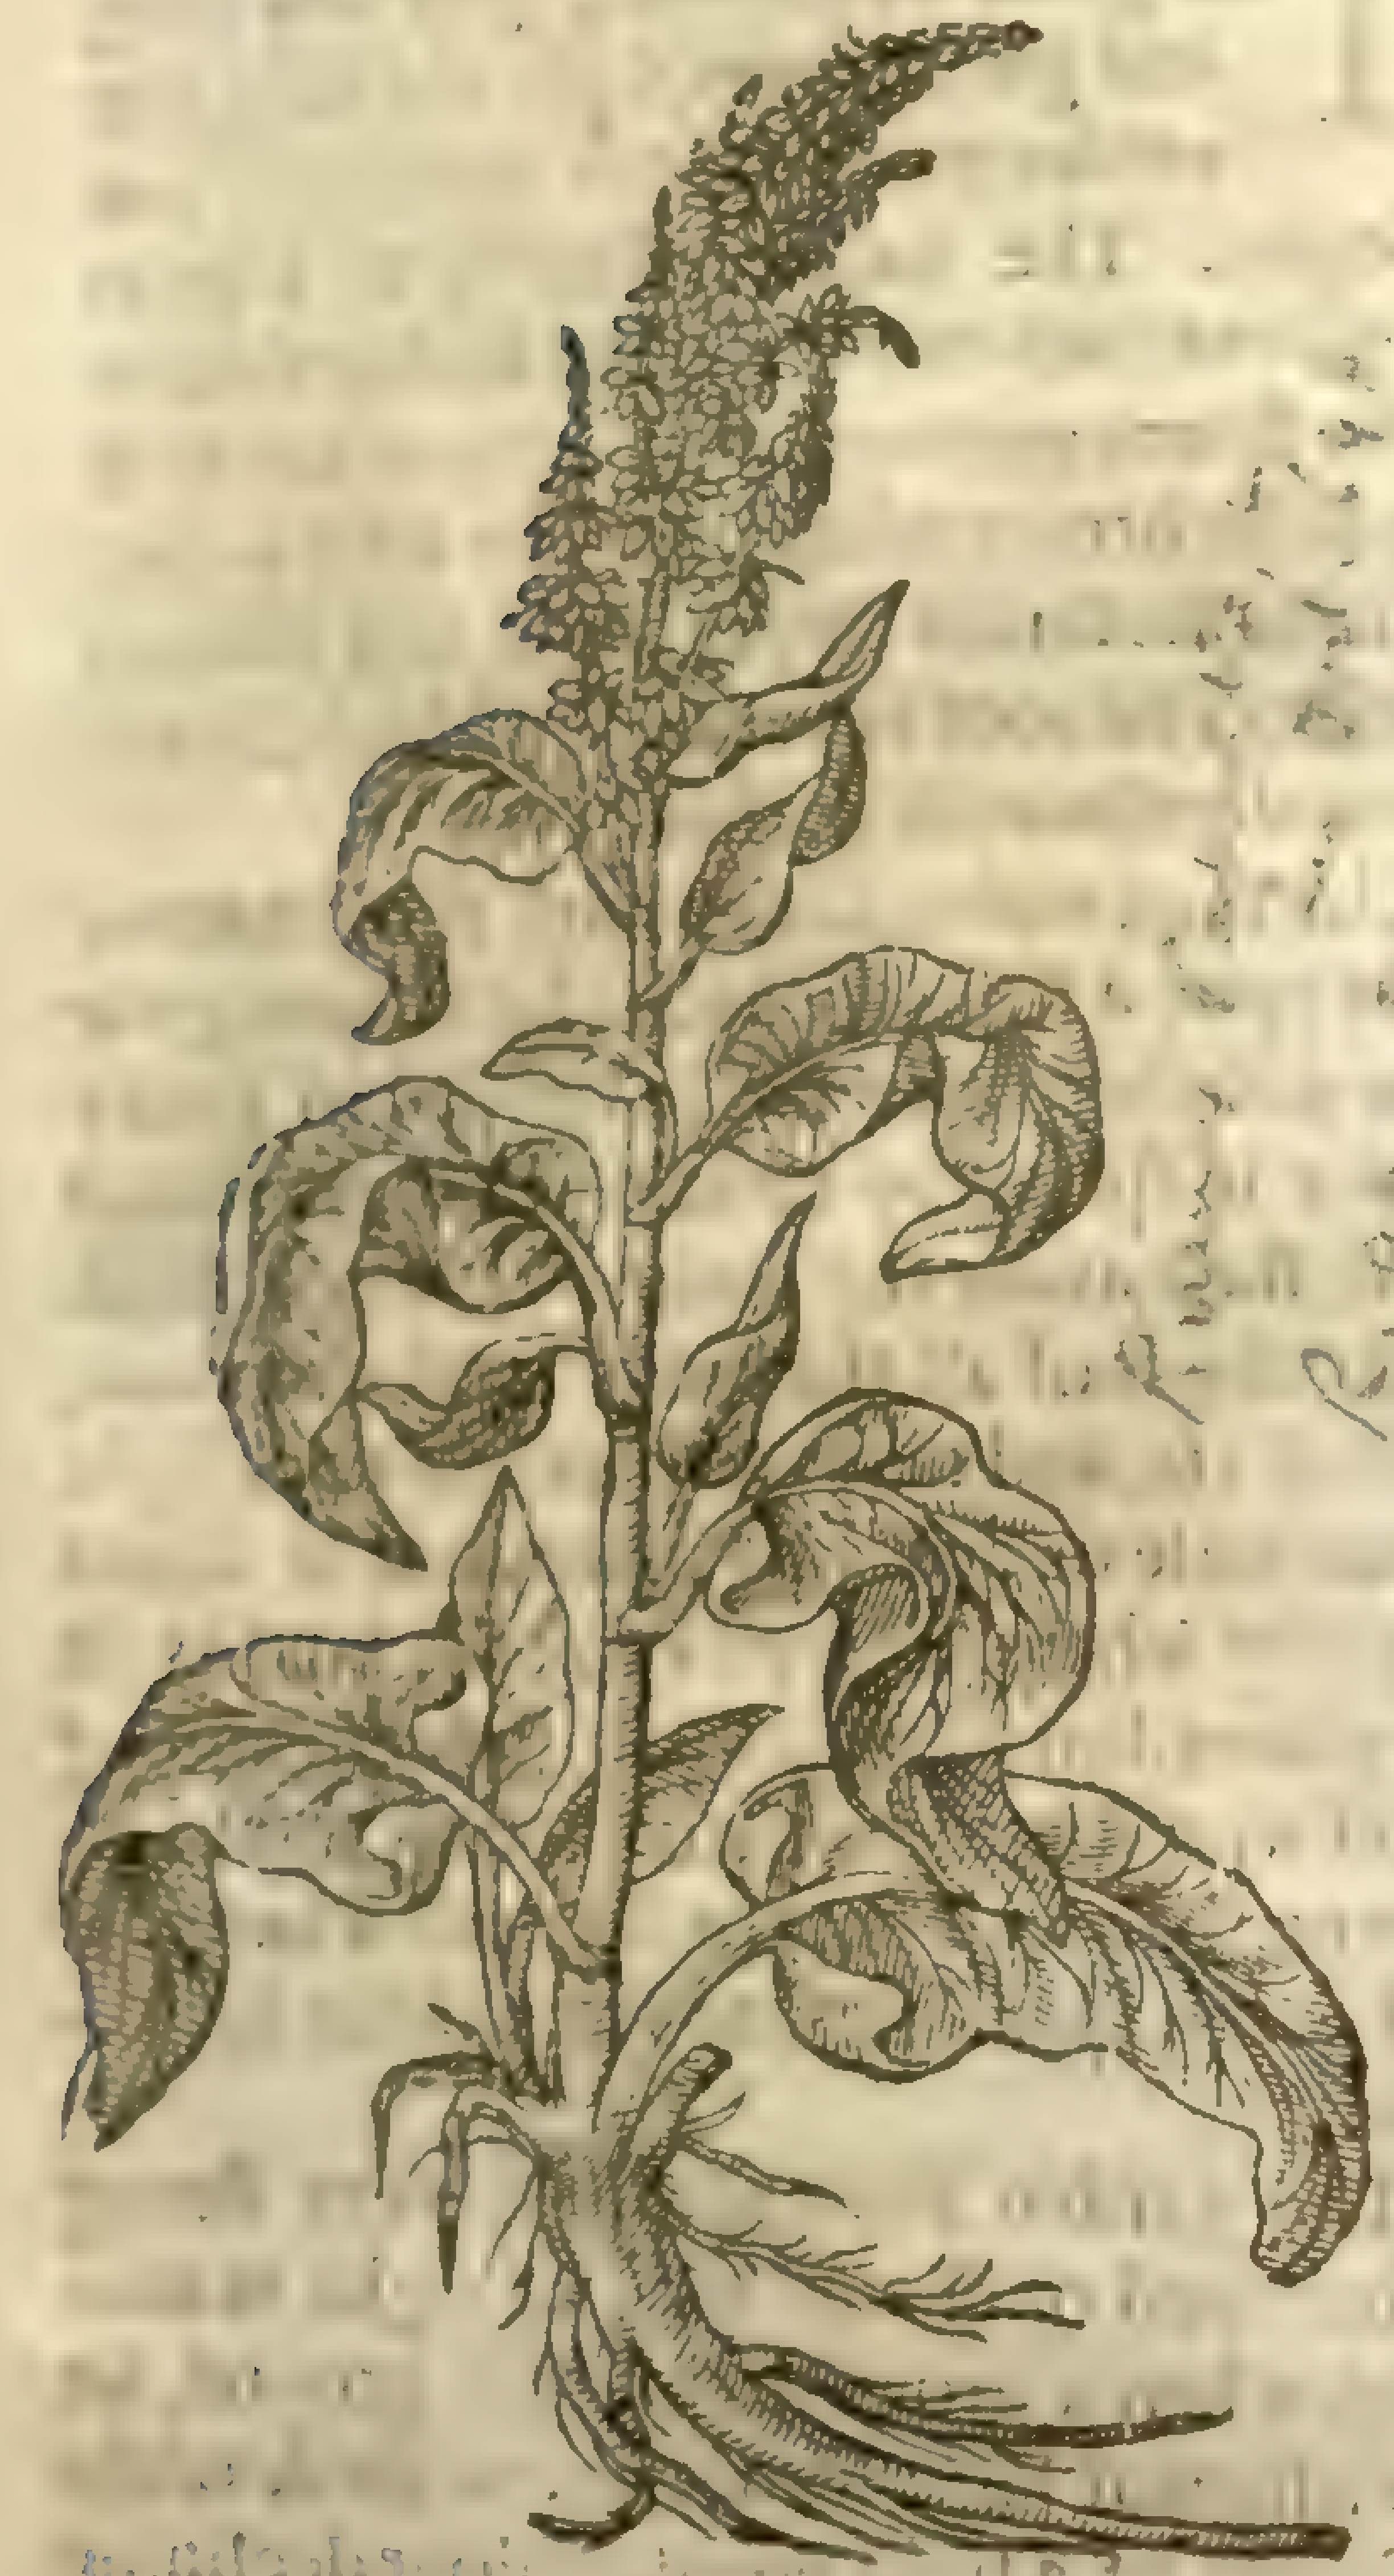
---

† The firſt figure in the former edition was of *Hydrolapathum magnum*, being the firſt in the next chapter; and the figure of that wee giue you in the third place of this chapter, was that in the firſt place of the former Chap. vnder the forementioned title.

CHAP.

CHAP. 82. *Of water-Docke.*

† 1 *Hydrolapathum magnum.*
Great water-Docke.



† 2 *Hydrolapathum minus.*
Small water-Docke.

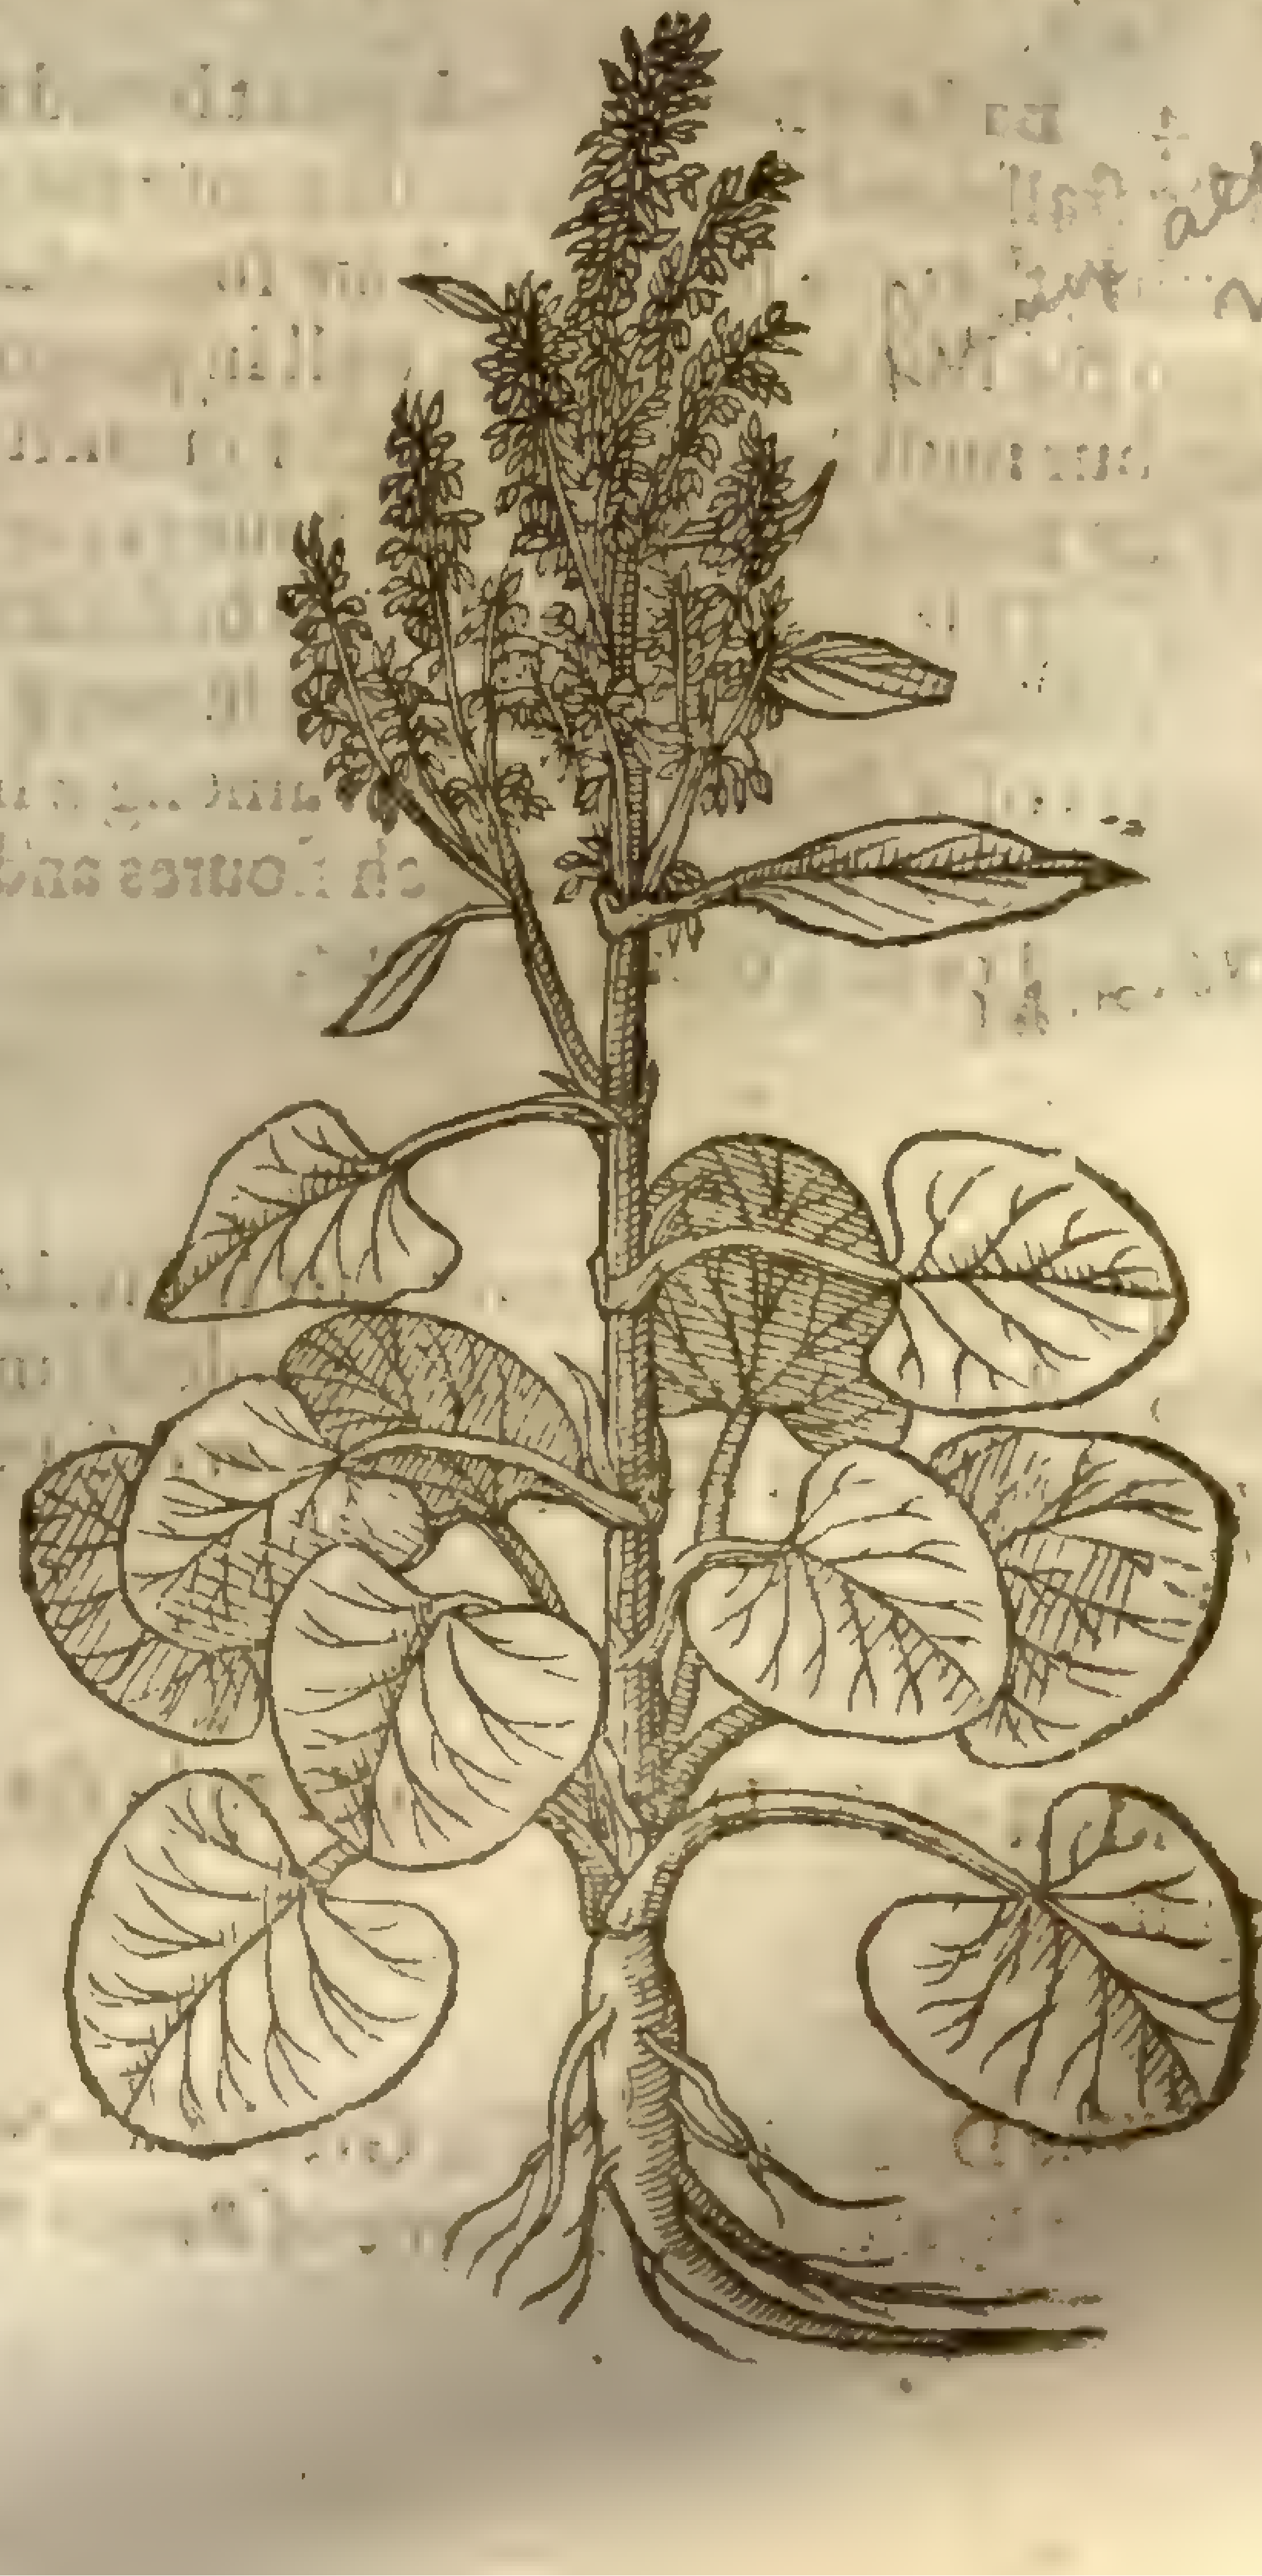
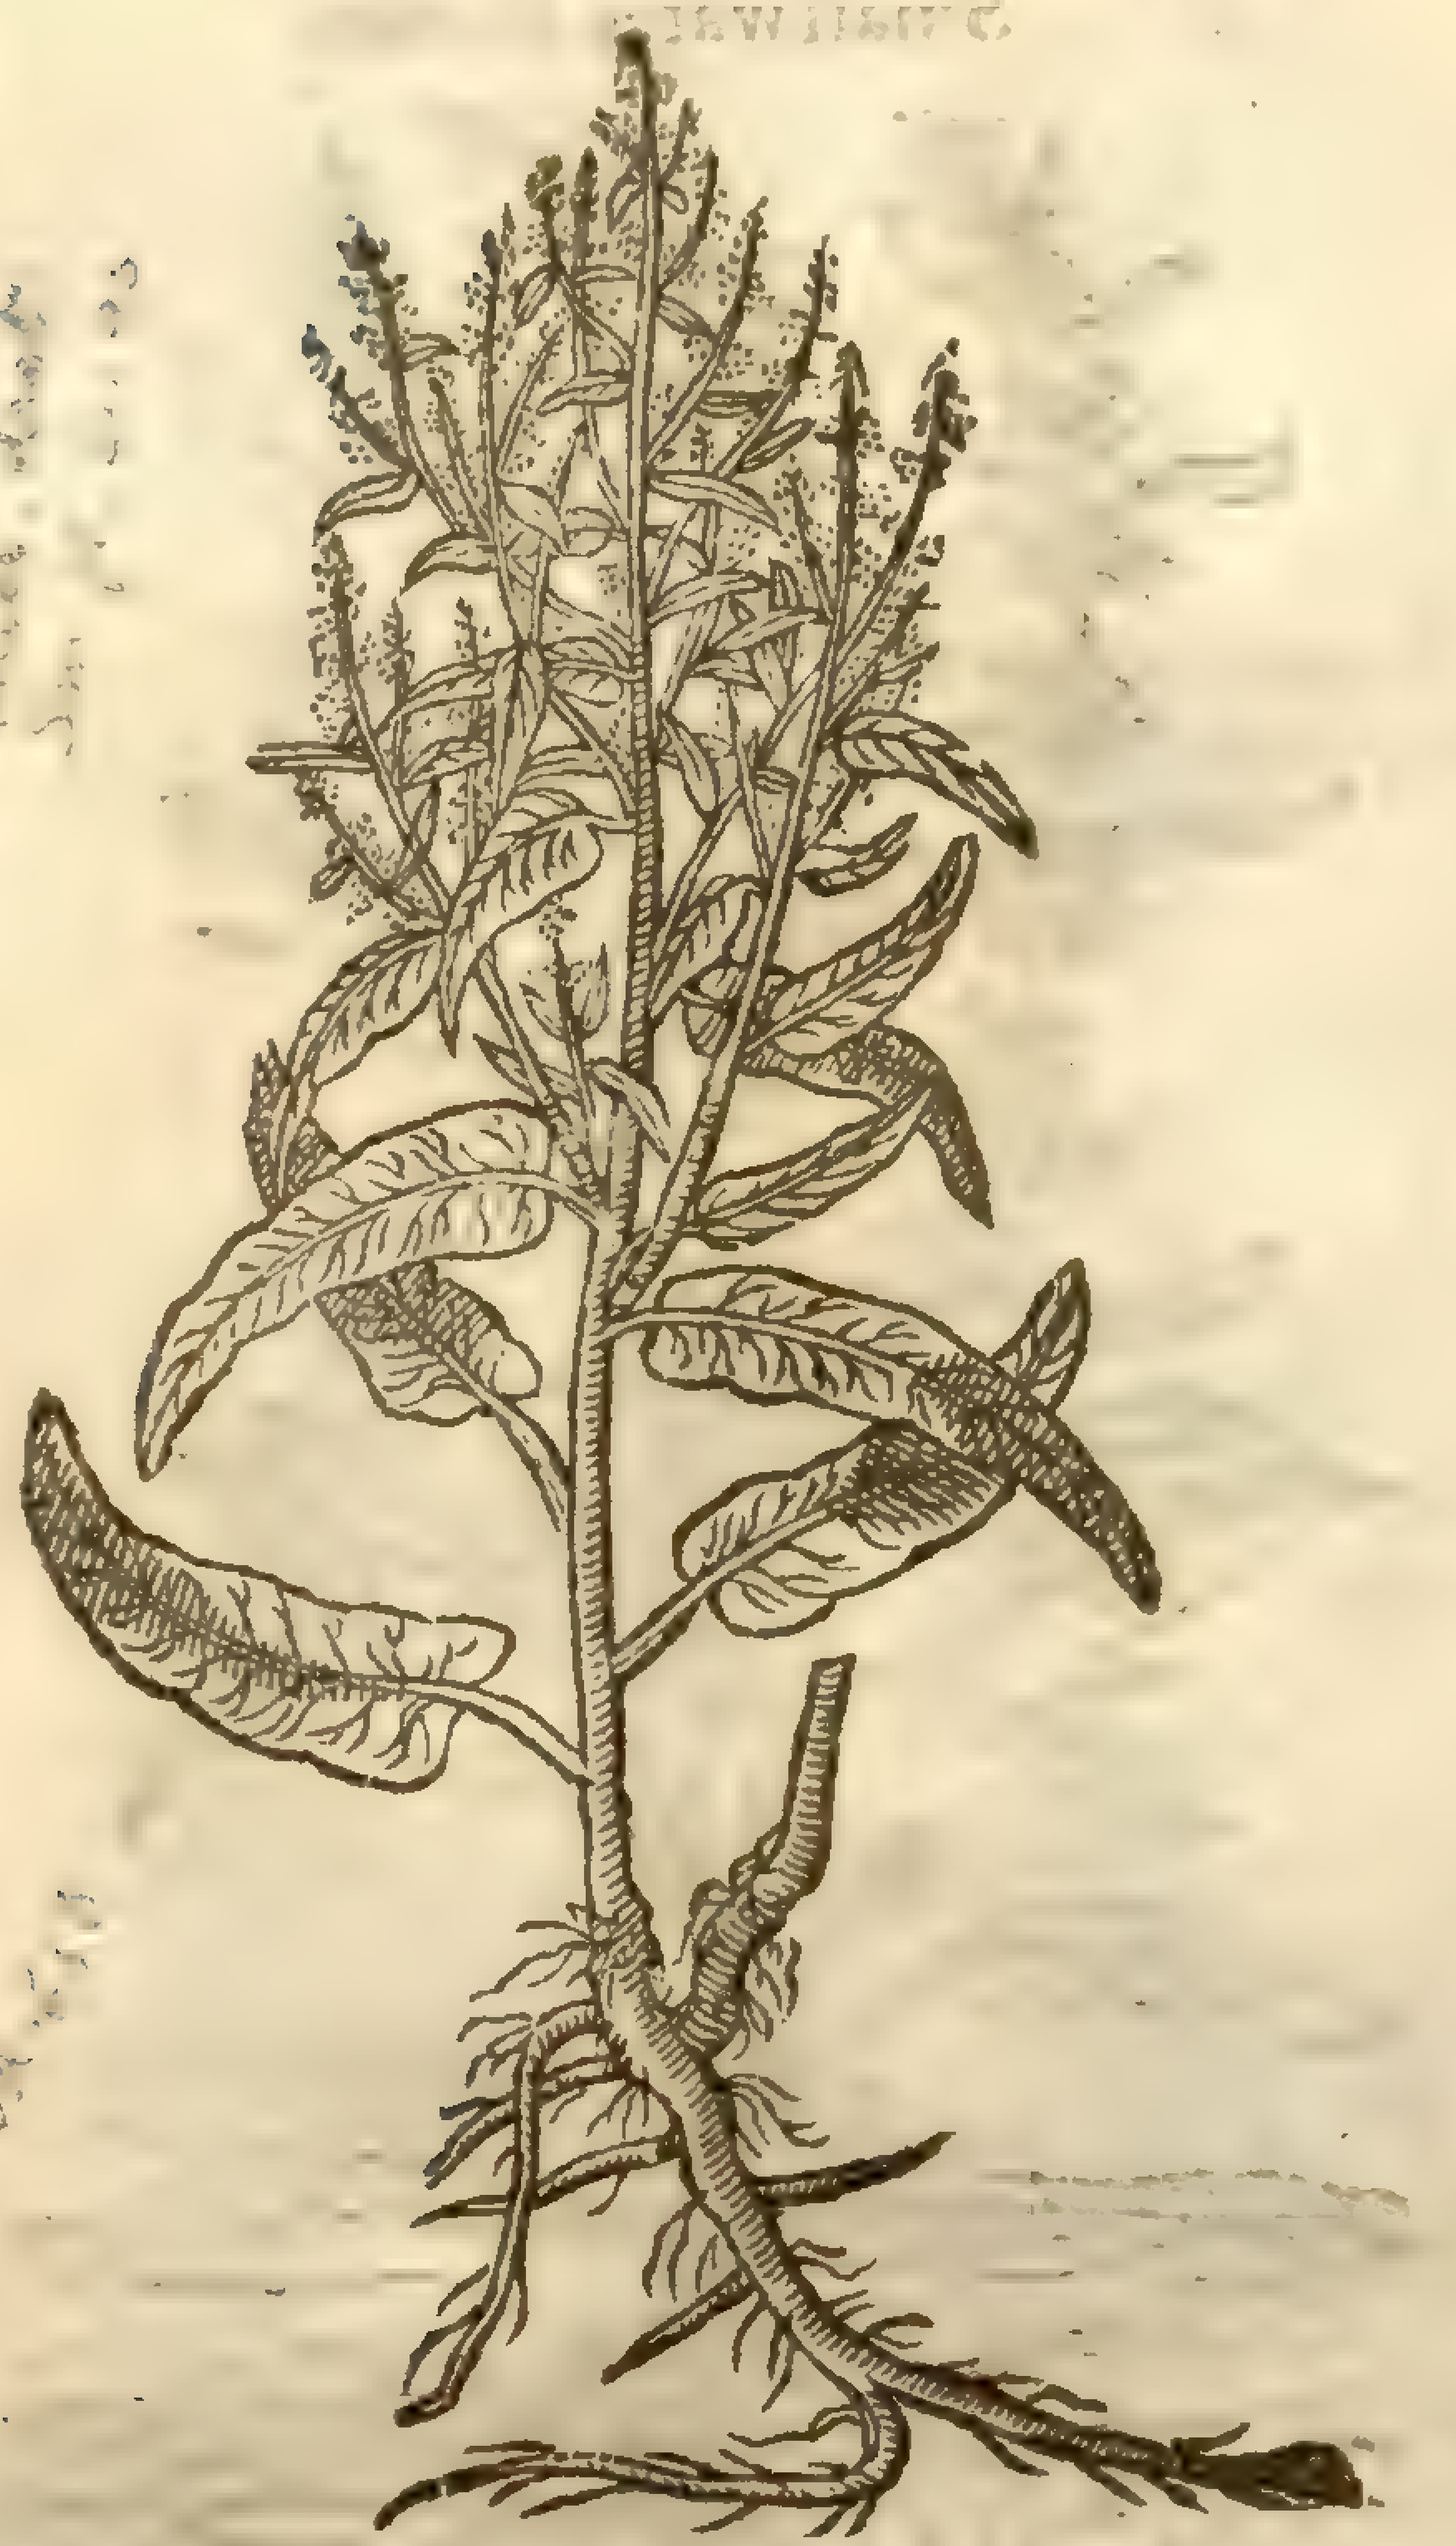
Baſtard Rubarb.

alpinus, vulg. dict.



‡ 5 *Lapathum ſativum ſanguineum.*
Bloudwort.



Rumex sanguineum, [illegible]

¶ *The Deſcription.*

1 The great water-dock hath very long and great leaues, ſtiffe and hard, not vnlike to the garden Patience, but much longer. The ſtalke riſeth vp to a great height, oftentimes to the height of fiue foot or more. The floure groweth at the top of the ſtalk in ſpoky tufts, brown of colour. The ſeed is contained in chaffie husks three ſquare, of a ſhining pale colour. The root is very great, thick, brown without and yellowiſh within.

2 The ſmal water-Dock hath ſhort narrow leaues ſet vpon a ſtiffe ſtalke. The floures grow from the middle of the ſtalke vpward in ſpoky rundles, ſet in ſpaces by certain diſtances round about the ſtalk, as are the floures of Horehound: which Docke is of all the kinds moſt common, and of leaſt vſe, and takes no pleaſure or delight in any one ſoile or dwelling place, but is found almoſt euery where, as well vpon the land as in waterie places, but eſpecially in gardens among good and wholſome pot-herbs, being there better knowne, than welcome or deſired: wherefore I intend not to ſpend farther time about his deſcription.

3 The garden Patience hath very ſtrong ſtalks furrowed or chamfered, of eight or nine foot high when it groweth in fertile ground, ſet about with great large leaues like to thoſe of the water-Docke, hauing alongſt the ſtalkes toward the top floures of a light purple colour declining to brownneſſe. The ſeed is three ſquare, contained in thin chaffie husks like thoſe of the common Docke. The root is very great, browne without and yellow within, in colour and taſte like the true Rubarb.

4 Baſtard Rubarb hath great broad round leaues in ſhape like thoſe of the garden Bur-docke. The ſtalke and ſeeds are ſo like vnto the precedent that the one cannot be knowne from the other, ſauing that the ſeeds of this are ſomewhat leſſe. The root is exceeding great and thicke, very like vnto the Rha of Barbary, as well in proportion as colour and taſte, and purgeth after the ſame manner, but muſt be taken in greater quantity, as witneſſeth that famous learned phyſition now liuing, M^r^ D^r^ *Bright*, and others who haue experimented the ſame.

5 This fift kind of Dock is beſt knowne vnto all of the ſtocke or kindred of Dockes: it hath long thin leaues ſometimes red in euery part thereof, and often ſtriped here & there with lines and ſtrakes of a darke red colour: among which riſe vp ſtiffe brittle ſtalkes of the ſame colour: on the top whereof come forth ſuch floures and ſeed as the common wild Docke hath. The root is likewiſe red, or of a bloudy colour.

¶ *The Place.*

They grow for the moſt part in ditches and water-courſes, very common thorow England. The two laſt ſaue one do grow in gardens: my ſelfe and others in London and elſewhere haue them growing for our vſe in phyſicke and Surgerie. The laſt is ſown for a pot-herb in moſt gardens.

¶ *The Time.*

Moſt of the Docks doe riſe vp in the Spring of the yeare, and their ſeed is ripe in Iune and Auguſt.

¶ *The Names.*

The Docke is called in Greeke λάπαθον: in Latine, *Rumex*, and *Lapathum*: yet *Pliny, lib.* 19. *ca.* 12. ſeems to attribute the name of *Rumex* only to the garden Docke.

The Monks Rubarb is called in Latine, *Rumex ſativus*, and *Patientia*, or Patience, which word is borrowed of the French, who call this herb *Patience*: after whom the Dutchmen alſo name this pot herb **Patientie**: of ſome, *Rhabarbarum Monachorum*, or Monks Rubarb, becauſe as it ſeemes ſome Monke or other hath vſed the root hereof in ſtead of Rubarb.

Bloudwort or bloudy Patience is called in Latine *Lapathum ſanguineum*: of ſome, *Sanguis Draconis*, of the bloudy colour wherewith the whole plant is poſſeſt: it is of pot-herbs the chiefe or principall, hauing the propertie of the baſtard Rubarb, but of leſſe force in his purging qualitie.

¶ *The Temperature.*

Generally all the Docks are cold, ſome little and moderatly, and ſome more: they do all of them dry, but not all after one manner; yet ſome are of opinion, that they are dry almoſt in the third degree.

¶ *The Vertues.*

A The leaues of the garden Dock or Patience may be eaten, and are ſomwhat cold but more moiſt, and haue withall a certain clammineſſe, by reaſon whereof they eaſily and quickely paſſe through the belly when they be eaten: and *Dioſcorides* writeth, That all the Docks being boiled, do mollifie the belly: which thing alſo *Horace* hath noted in his ſecond booke of Sermons, *Satyr* 4. writing thus:

> ——— *Si dura morabitur alvus*
> *Mugilus, & viles pellent obſtantia conchæ,*
> *Et Lapathi brevis herba.* ——

B He calleth it a ſhort herb, being gathered before the ſtalke be growne vp, at which time it is fitteſt to be eaten.

C And being ſodden, it is not ſo pleaſant to be eaten as either Beets or Spinach: it ingenders moiſt bloud of a mean thickneſſe, and nouriſheth little.

D The leaues of the ſharp pointed Docks are cold and dry, but the ſeed of Patience and the water Docke do coole, with a certain thinneſſe of ſubſtance.

E The decoction of the roots of Monks Rubarb is drunk againſt the bloudy flix, the lask, the wambling of the ſtomack comming of choler, and alſo againſt the ſtinging of ſerpents, as *Dioſcorides* writeth.

F It is alſo good againſt the ſpitting of bloud, being taken with *Acacia* (or his *ſuccedaneum* the dried juice of ſloes) as *Pliny* ſaith.

G Monks Rubarb or Patience is an excellent wholſome pot-herb, for being put into the pottage in ſome reaſonable quantitie, it looſens the belly, helps the jaundice, the timpanie, and ſuch like diſeaſes proceeding of cold cauſes.

H If you take the roots of Monks Rubarb and red Madder of each halfe a pound, Sena foure ounces, Aniſe ſeed and Licorice of each two ounces, Scabious and Agrimonie of each one handfull; ſlice the roots of the Rubarb, bruiſe the Aniſe ſeed and Licorice, breake the herbs with your hands and put them into a ſtone pot called a ſtean, with foure gallons of ſtrong ale, to ſteep or infuſe the ſpace of three daies, and then drinke this liquor as your ordinary drink for three weeks together at the leaſt, though the longer you take it, ſo much the better; prouiding in a readineſſe another ſtean ſo prepared, that you may haue one vnder another, being alwaies carefull to keep a good diet: it cureth the dropſie, the yellow jaundice, all manner of itch, ſcabs, breaking out and mangineſſe of the whole body: it purifieth the bloud from all corruption, preuaileth againſt the greene ſicknes very greatly, and all oppilations or ſtoppings, makes yong wenches look faire and cherry-like, bringing downe their terms, the ſtopping whereof hath cauſed the ſame.

I The ſeed of Baſtard Rubarb is manifeſtly aſtringent, inſomuch that it cures the bloudy flix, mixed with the ſeed of Sorrell, and giuen to drink in red wine.

K There haue not bin any other faculties attributed to this plant, either of the antient or later writers, but generally of all it hath bin referred to the other Docks or Monks Rubard: of which number I aſſure my ſelfe this is the beſt, and doth approch neereſt vnto the true Rubarb. Many reaſons induce me ſo to thinke and ſay; firſt, this hath the ſhape and proportion of Rubarb, the ſame color both within and without, without any difference, they agree as well in taſte as ſmell; it coloureth the ſpittle of a yellow colour when it is chewed, as Rubarb doth; and laſtly, it purgeth the belly after the ſame gentle manner as the right Rubarb doth; only herein it differeth, that this muſt be giuen in three times the quantitie of the other. Other diſtinctions and differences, with the temperature and other circumſtances, I leaue to the learned Phyſitions of our London colledge, who are very well able to ſearch this matter, as a thing far aboue my reach, being no Graduat, but a Country Scholler, as the whole frame of this hiſtorie doth well declare: but I hope my good meaning will be well taken, conſidering I do my beſt: and I doubt not but ſome of greater learning wil perfect that which I haue begun according to my ſmall skill, eſpecially the ice being broken to him, and the wood rough-hewn to his hand. Notwithſtanding I thinke it good to ſay thus much more in my own defence, That although there be many wants and defects in mee, that were requiſite to performe ſuch a worke; yet may my long experience by chance happen vpon ſome one thing or other that may do the Learned good: conſidering what a notable experiment I learned of one *Iohn Benet* a Surgeon of Maidſtone in Kent, (a man as ſlenderly learned as my ſelfe) which he practiſed vpon a butchers boy of the ſaid towne, as himſelfe reported vnto me. His practiſe was this: Being deſired to cure the foreſaid Lad of an ague which did grieuouſly vex him, hee promiſed him a medicine; and for want of one for the preſent (for a ſhift, as himſelfe confeſſed vnto me) he tooke out of his garden three or four leaues of this plant of Rubarb, which my ſelfe had among other ſimples giuen him, which he ſtamped and ſtrained with a draught of ale, and gaue it the lad in the morning to drinke: it wrought extreamely downeward and vpward within one houre after, and neuer ceaſed vntil night: in the end, the ſtrength of the boy ouercame the force of the phyſick, it gaue ouer working, and the Lad loſt his Ague; ſince which time (as he ſaith) he hath cured with the ſame medicine many of the like maladie, hauing euer great regard to the quantitie, which was the cauſe of the violent working in the firſt cure. By reaſon of which accident, that thing hath bin reuealed to poſteritie, which heretofore was not ſo much as dreamed of. Whoſe blunt attempt may incourage ſome ſharper Wit and greater Iudgement in the faculties of plants, to ſeeke farther into their nature than any of the Antients haue done; and none fitter than the learned Phyſitions of the Colledge of London, where are many ſingularly well learned and experienced in naturall things.

L The roots ſliced and boiled in the water of *Carduus benedictus*, to the conſumption of the third part, adding thereto a little hony, and eight or nine ſpoonfulls of the decoction thereof drunke before the fit, cure the ague in two or three times ſo taking it at the moſt: vnto robuſtious or ſtrong bodies twelue ſpoonfuls may be giuen. This experiment was practiſed by a worſhipfull Gentlewoman Miſtreſſe *Anne Wylbraham* vpon diuers of her poore neighbours with good ſucceſſe.

† The figure that was in the firſt place was of *Lapathum fol. minus acuto*, deſcribed by me in the third place of the preceding chapter. The ſecond was of *Lapathum acutum criſpum* of Tabern. The third was of *Hydrolapathum minus*.

Chap. 83. *Of Rubarb.*

‡ IT hath hapned in this as in many other forrein medicines or Simples; which though they be of great and frequent vſe, as Hermodactyls, Muske, Turbith, &c. yet haue we no certain knowledge of the very place which produces them, nor of their exact manner of growing: which hath giuen occaſion to diuers to think diuerſly, and ſome haue bin ſo bold as to counterfeit figures out of their own fancies, as *Matthiolus*. So that this ſaying of *Ruellius* is found very true, *Nulla medicinæ pars magis incerta, quam quæ ab alio quam noſtro orbe petitur*. But we will endeauor to ſhew you more certaintie of this here treated, than was known vntill of very late years.

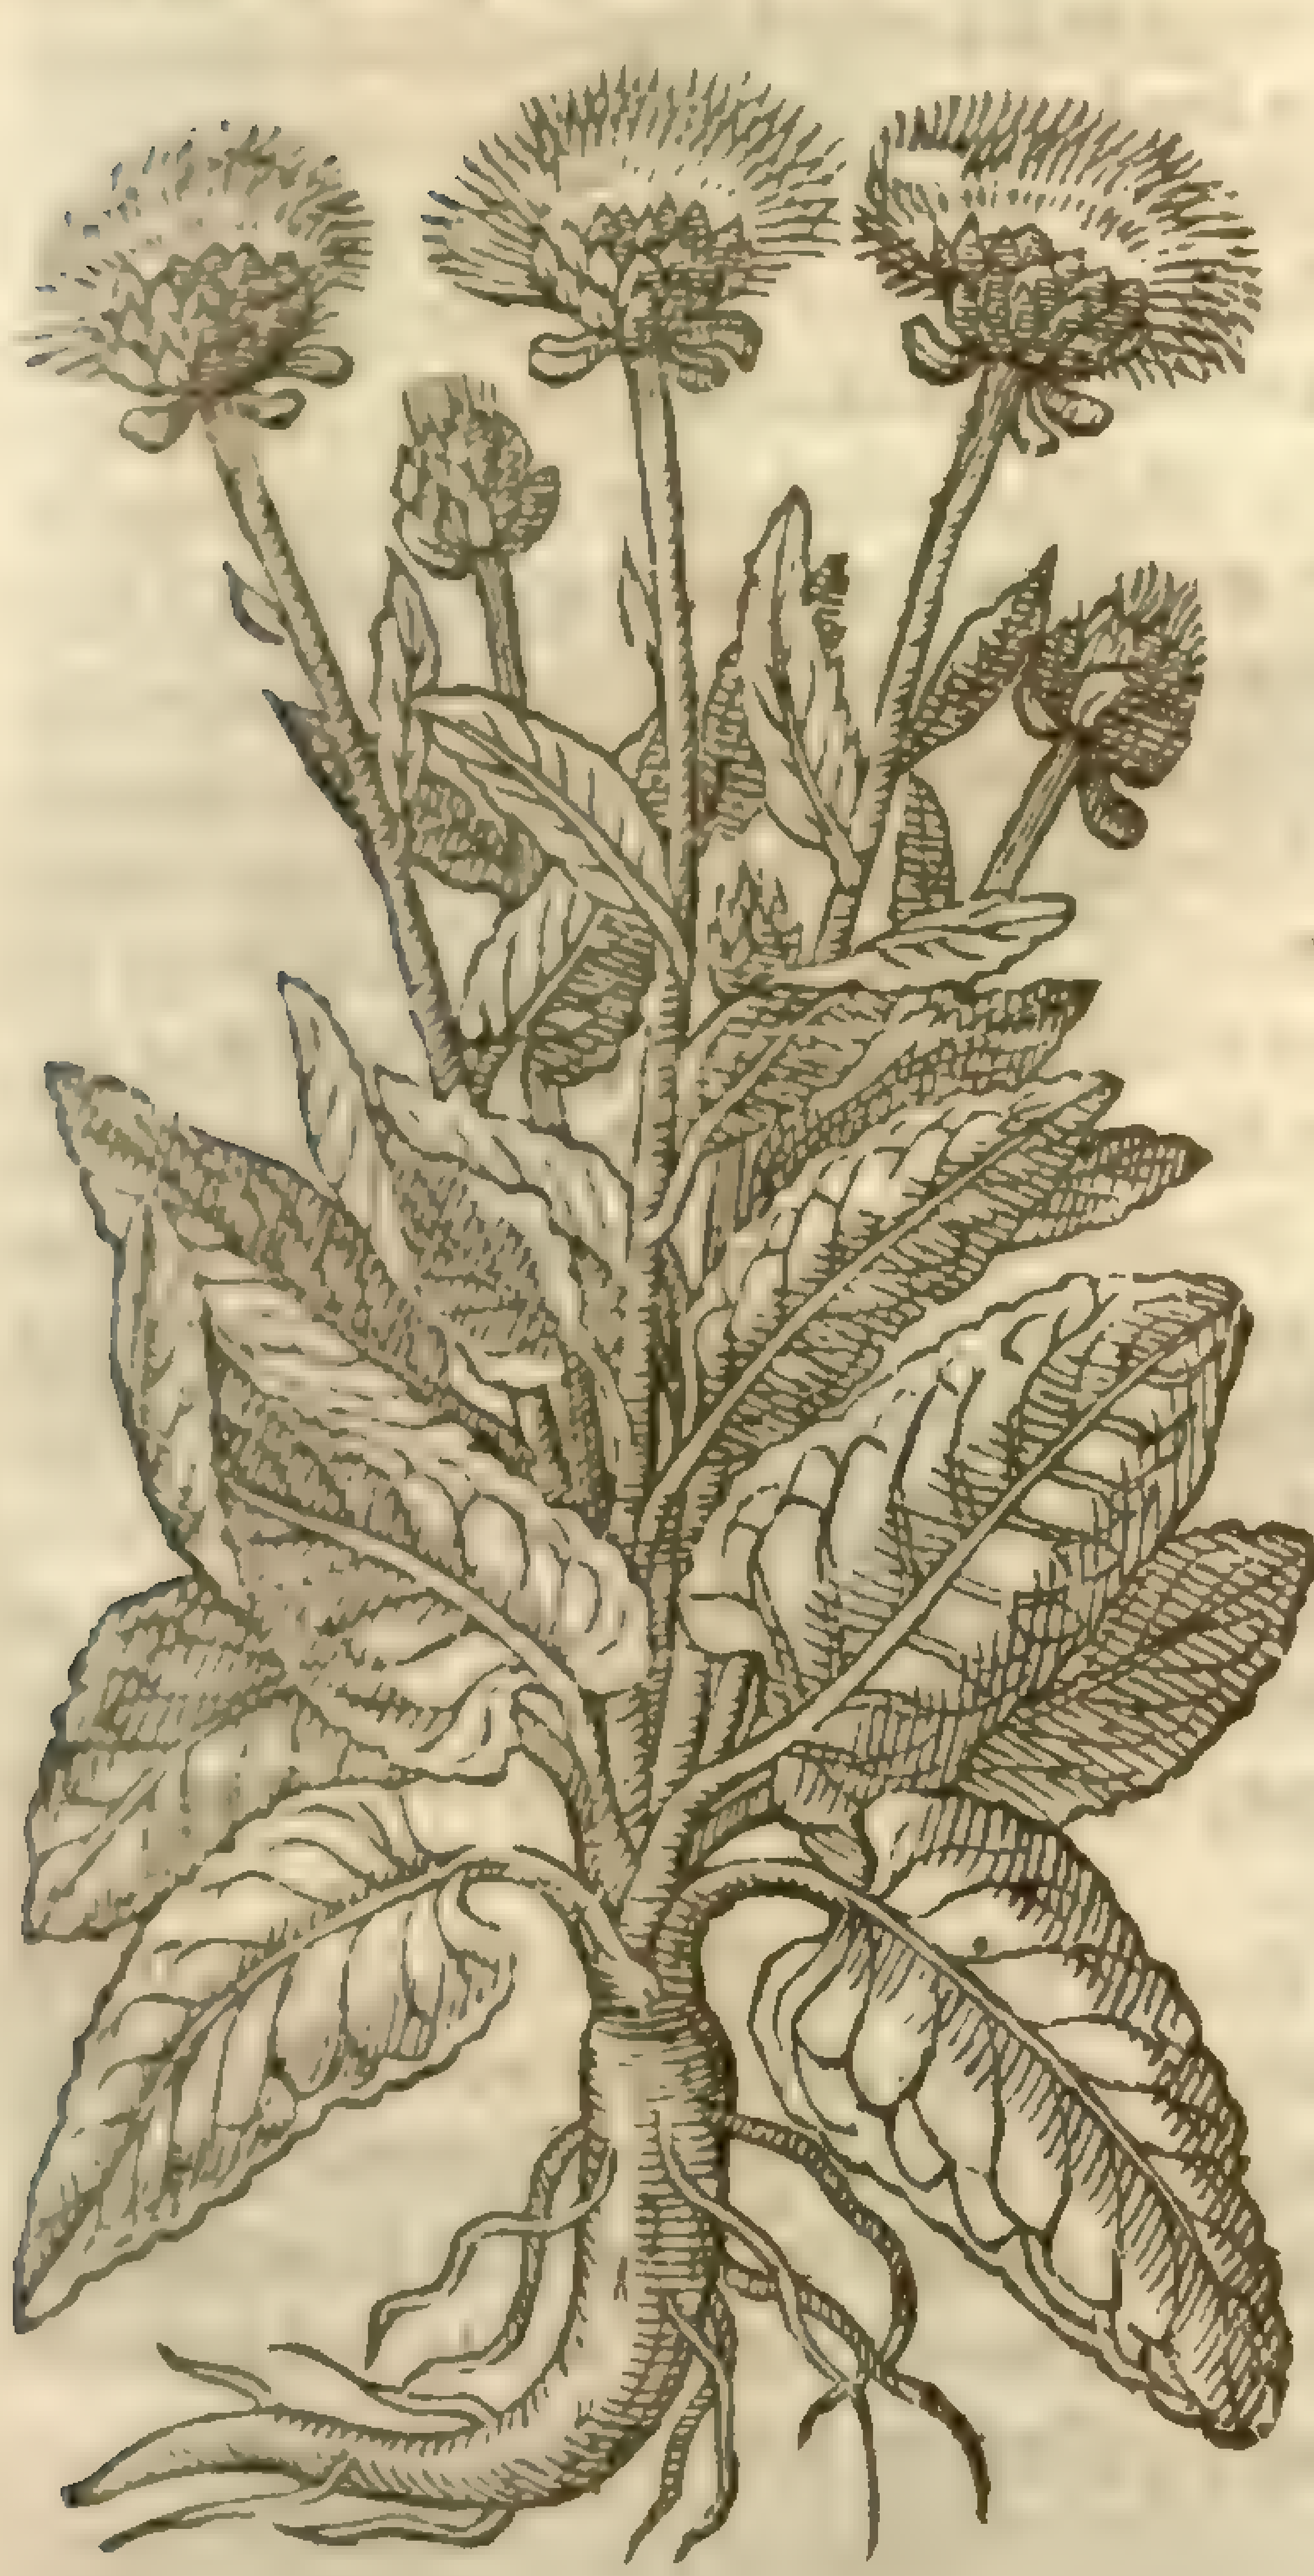
¶ *The Deſcription.*

1 THis kind of Rubarb hath very great leaues ſomewhat ſnipt or indented about the edges like the teeth of a Saw, not vnlike the leaues of *Enula campana*, called by the vulgar ſort Elecampane, but greater: amongſt which riſeth vp a ſtraight ſtalke of two cubits high, bearing at the top a ſcaly head like thoſe of Knap-weed or *Iacea major*: in the midſt of which knap or head thruſteth forth a faire floure conſiſting of many purple threds like thoſe of the Artichoke: which being paſt, there followeth a great quantitie of down, wherein is wrapped long ſeed like vnto the great Centorie, which the whole plant doth very well reſemble: the root is long and thicke, blackiſh without, and of a pale colour within; which being chewed makes the ſpittle verie yellow, as doth the Rubarb of Barbarie.

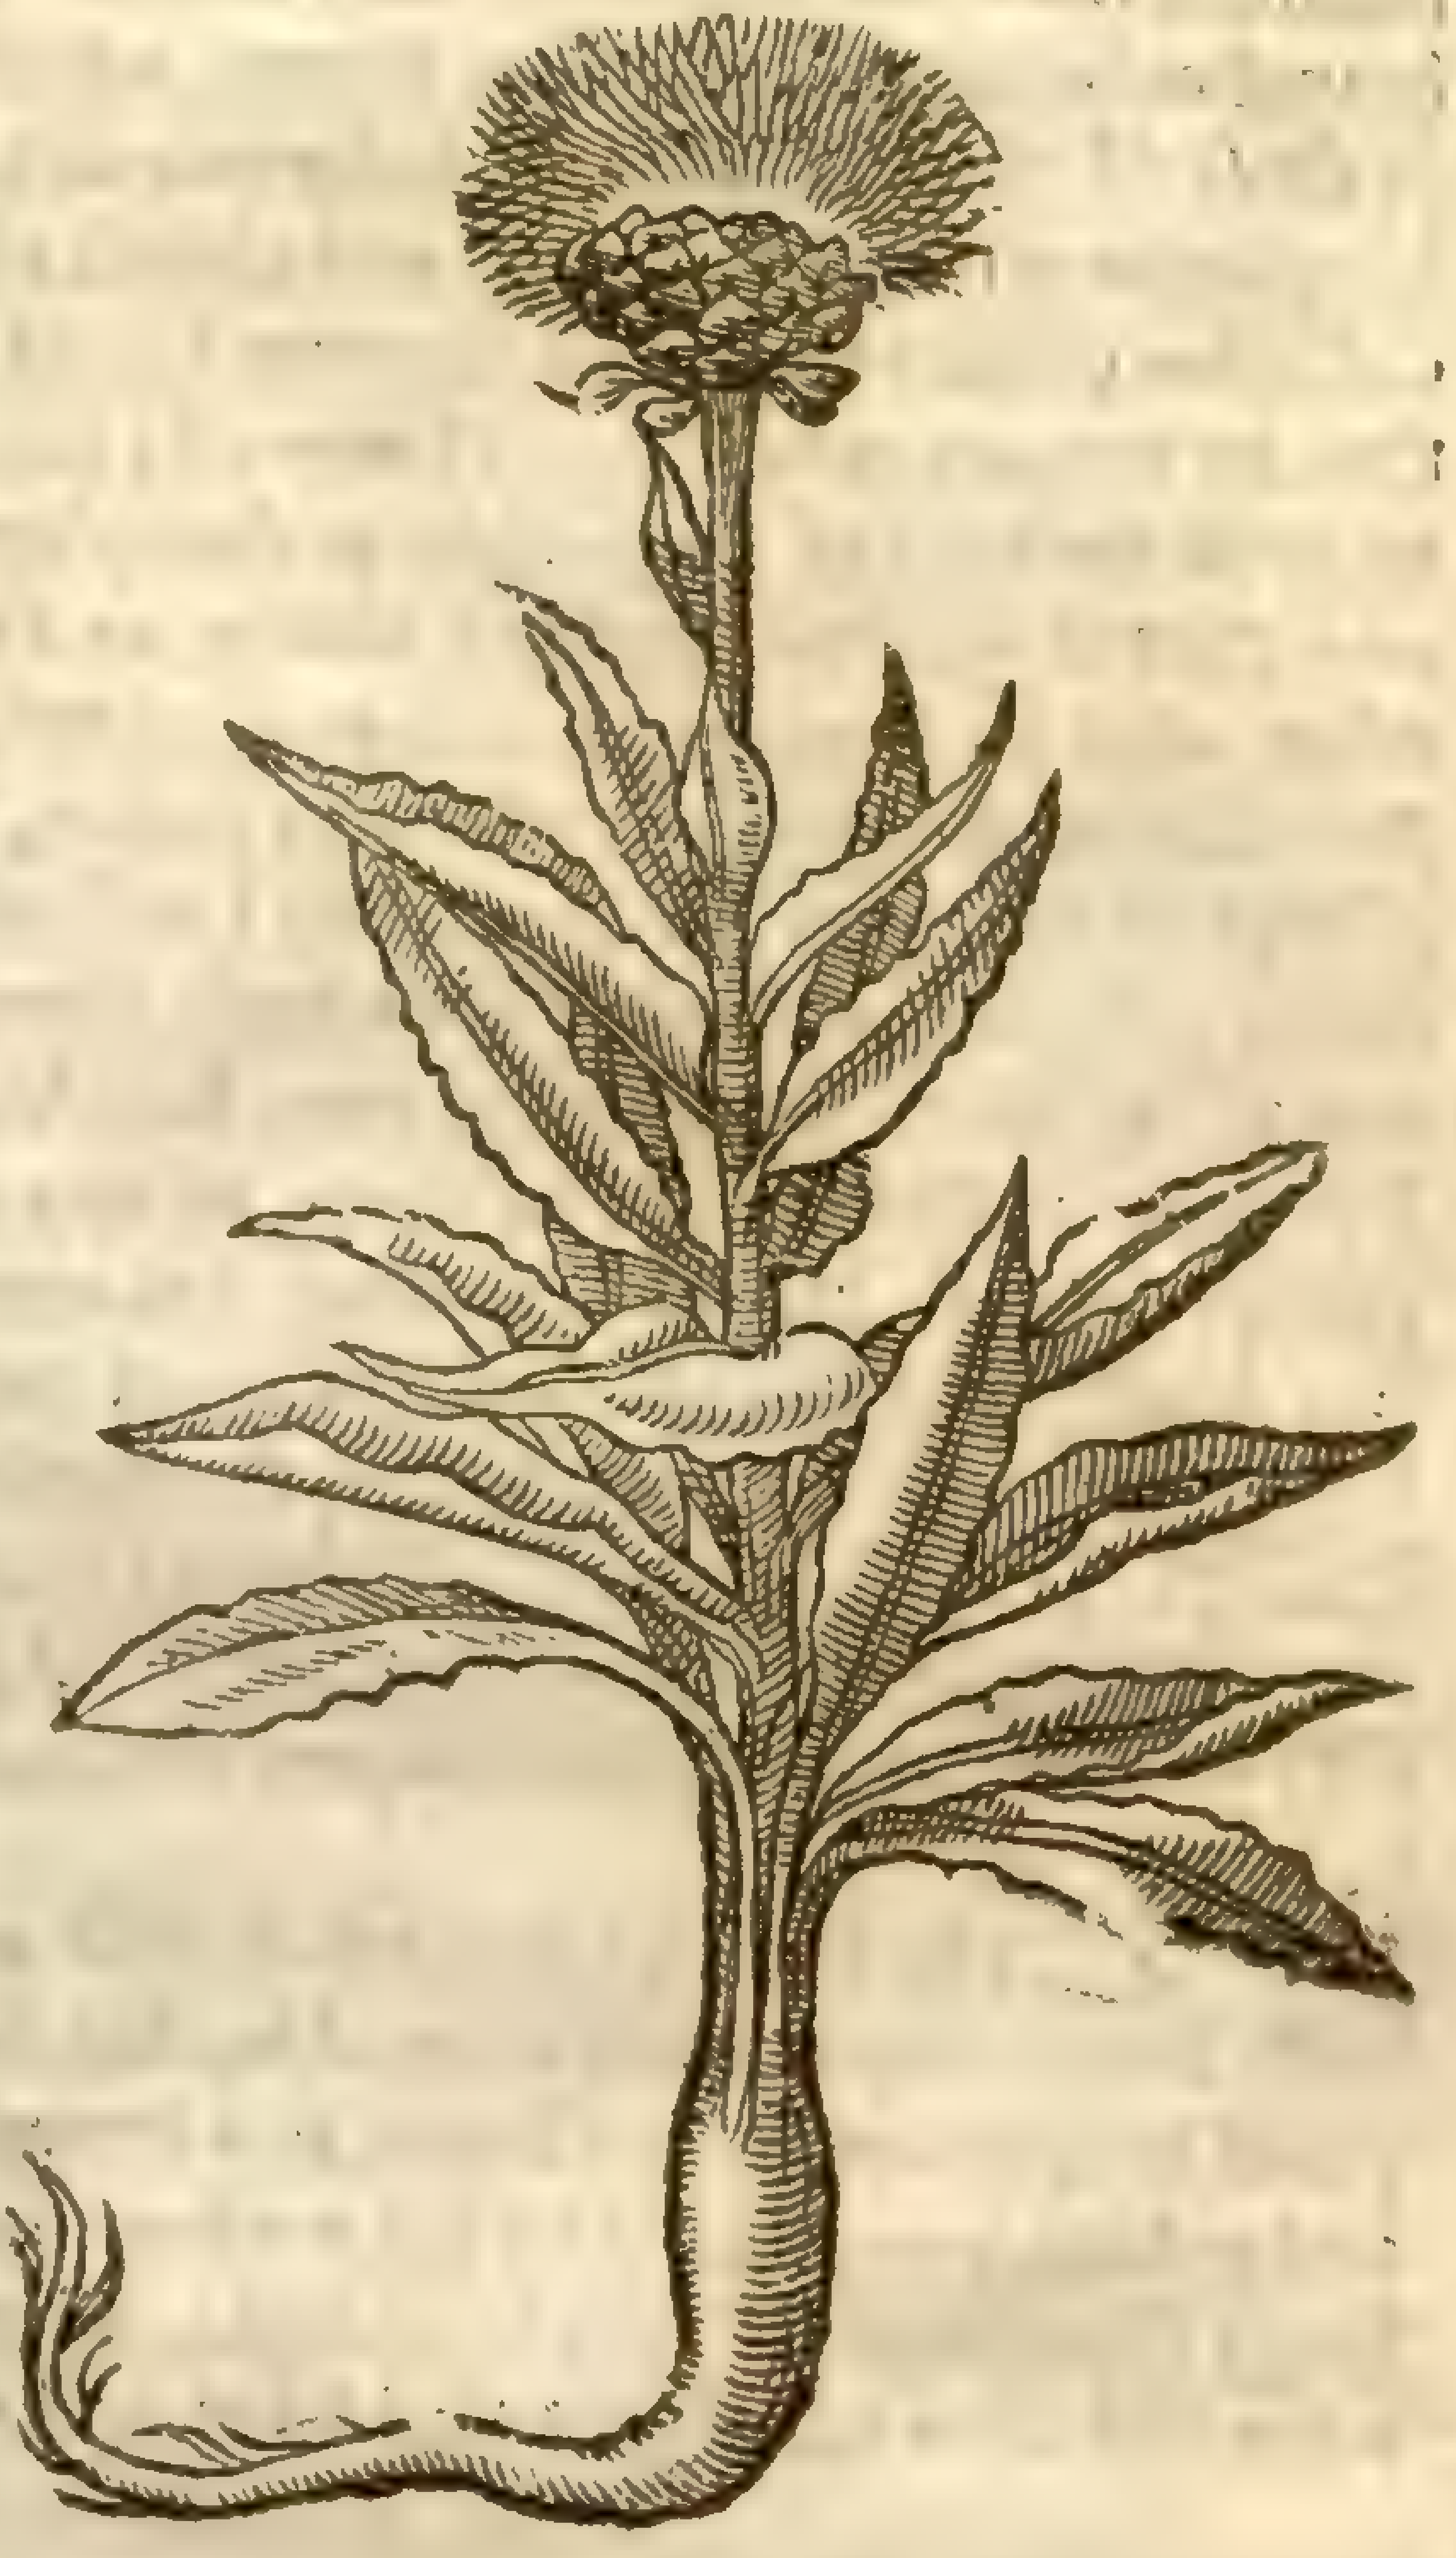
‡ 2 This other baſtard Rha, which is alſo of *Lobels* deſcription, hath a root like that of the laſt deſcribed; but the leaues are narrower, almoſt like thoſe of the common Dock, but hoarie on the other ſide: the ſtalk growes vp ſtraight, and beares ſuch heads and floures as the precedent.

‡ 3 I haue thought good here to omit the counterfeit figure of *Matthiolus*, giuen vs in this place by our Author, as alſo the hiſtorie, which was not much pertinent, and in lieu of them to preſent you with a perfect figure and deſcription of the true *Rha Ponticum* of the Antients, which was firſt of late diſcouered by the learned *Proſper Alpinus*, who writ a pecular tract thereof, and it is alſo again figured and deſcribed in his Worke *de Plantis exoticis*. Our countreyman Mr *Iohn Parkinſon* hath alſo ſet forth very well both the figure and deſcription hereof in his *Paradiſus terreſtris*. This

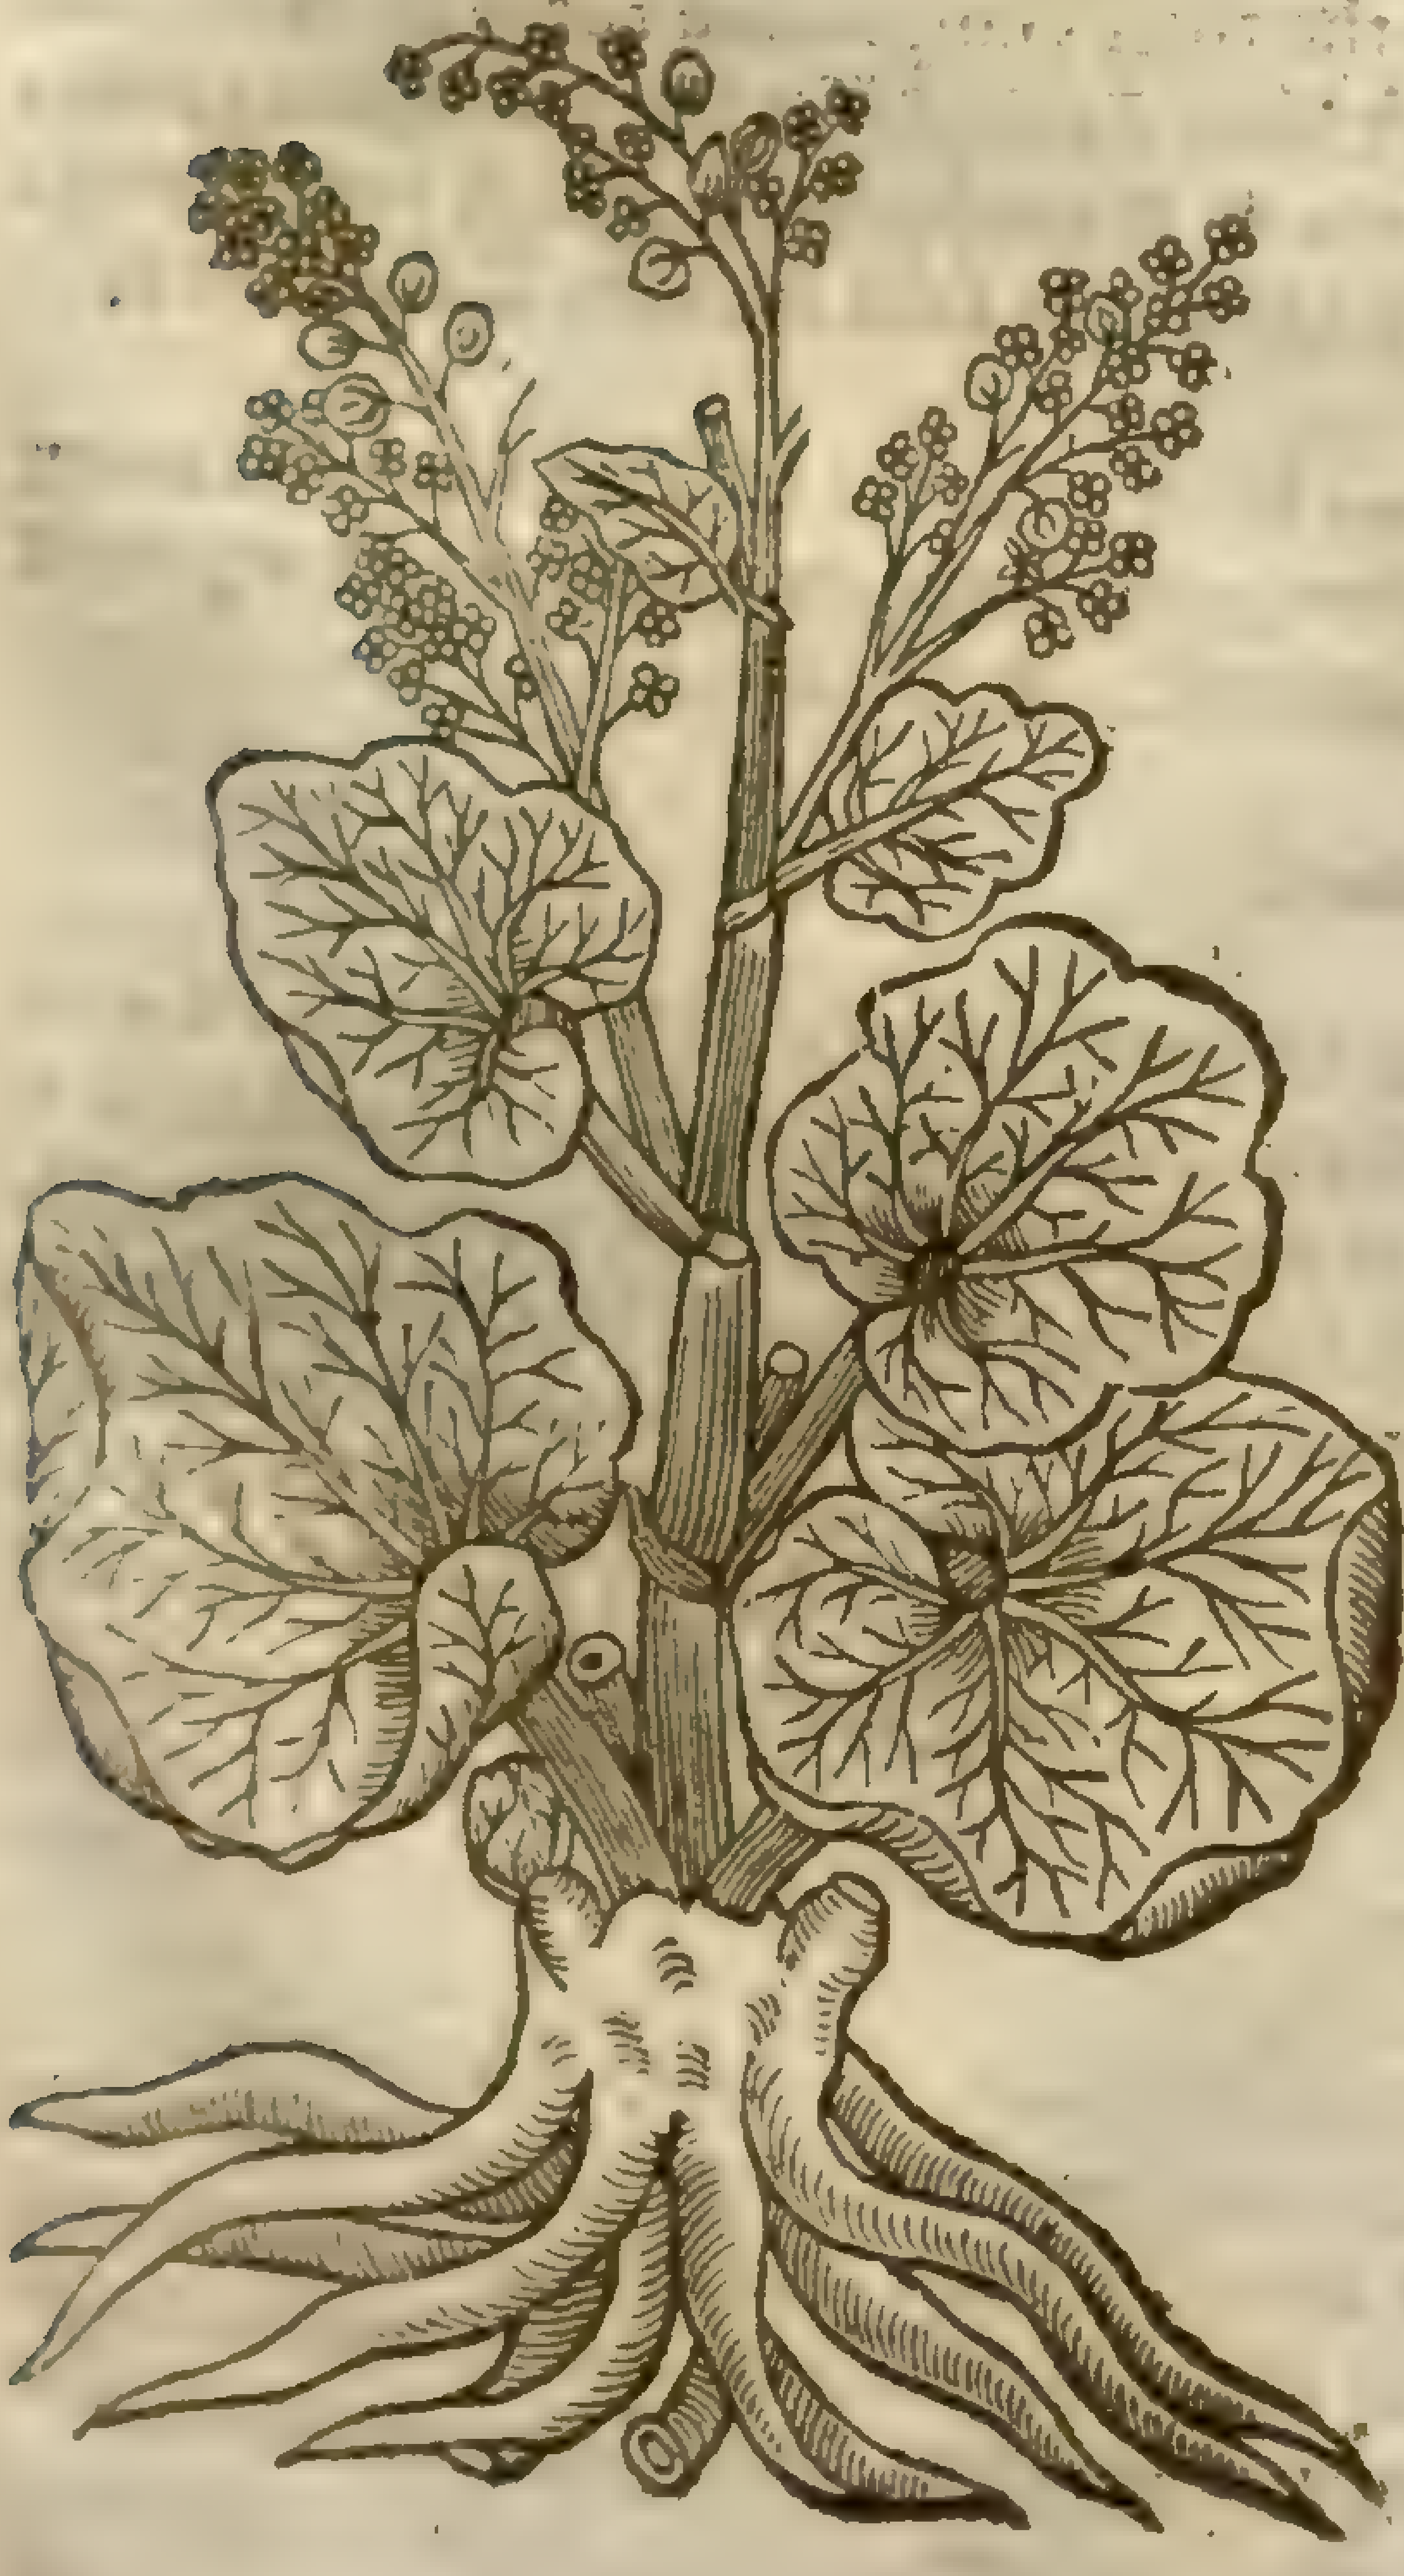
1 *Rha Capitatum Lobelij.*
Turky Rubarb.



2 *Rha Capitatum anguſtifolium.*
The other baſtard Rubarb.



‡ 3 *Rha verum antiquorum.*
The true Rubarb of the Antients.



Rhabarbarum ſiccatum.
The dry roots of Rubarb.

plant hath many large roots diuerſly ſpreading in the ground,of a yellow colour,from which grow vp many very great leaues like thoſe of the Butter-burre,but of a freſh green colour,with great and manifeſt red veins diſperſed ouer them. The ſtalke alſo is large and creſted,ſending forth ſundrie branches bearing ſmal white floures,which are ſucceeded by ſeeds three ſquare and browniſh, like as thoſe of other Docks. Dr *Liſter* one of his Majeſties Phyſitions, was the firſt that enriched this kingdome with this elegant and vſefull plant,by ſending the ſeeds thereof to Mr *Parkinſon*. *Proſper Alpinus* proues this to be the true *Rha* of the Antients,deſcribed by *Dioſcorides,lib.*3.*ca.*2. yet neither he nor any other(that I know of) haue obſerued a fault, which I more than probably ſuſpect to be in the text of *Dioſcorides* in that place, namely in the word μελαίνα, which I iudge ſhould bee μήλινα, that is, yellow, and not blacke, as *Ruellius* and others haue tranſlated it: now μήλινος is a word often vſed by *Dioſcorides*, as may appeare by the chapters of *Hieracium magnum & parvum, Conyza, Peucedanum, Ranunculus*,and diuers others, and I ſuſpect the like fault may be found in ſome other places of the ſame Author. But I will no further inſiſt vpon this, ſeeing the thing it ſelfe in all other reſpects,as alſo in yellowneſſe,ſhews it ſelfe to be that deſcribed by *Dioſcorides*,and that my conjecture muſt therefore be true. Beſides,the root whereto he compares it is ὑπόπυρρος, that is, *Rubeſcens*,or rather *ex flavo rubeſcens*, as any verſed in reading *Dioſcorides* may eaſily gather by diuers places in him. Now I here omit his words, becauſe they are in the next deſcription alledged by our Author, as alſo the deſcription of our ordinarily vſed Rubarb, for that it is ſufficiently deſcribed vnder the following title of the choice thereof. Mr *Parkinſon* is of opinion, that this is the true Rubarb vſed in ſhops,only leſſe heauy,bitter,and ſtrong in working, by reaſon of the diuerſitie of our Clymat,from that whereas the dried Rubarb brought vs vſually growes. This his opinion is very probable,and if you compare the roots together you may eaſily be enduced to be of the ſame beleefe. ‡

† 4 The Pontick Rubarb is leſſe and ſlenderer than that of Barbary. Touching Pontick Rubarb *Dioſcorides* writeth thus: *Rha*,that diuers call *Rheon*,which growes in thoſe places that are beyond Boſphorus,from whence it is brought,hath yellow roots like to the great Centorie,but leſſe and redder, ἄοσμος, that is to ſay,without ſmell (*Dodonæus* thinks it ſhould be εὔοσμος, that is,well ſmelling) ſpongie,and ſomething light. That is the beſt which is not worm-eaten, and taſted is ſomewhat viſcide with a light aſtriction,and ſhewed becomes of a yellow or Saffron colour.

¶ *The Place.*

It is brought out of the country of Sina (commonly called China)which is toward the Eaſt in the vpper part of India,and that India which is without the riuer Ganges,and not at all *ex Scenitarum prouincia*,as many do vnaduiſedly think,which is in Arabia *Fœlix*,& far from China:it growes on the ſides of the riuer Rha, now called Volga, as *Ammianus Marcellus* ſaith, which riuer ſprings out of the Hyperborean mountains,and running through Muſcouia,falls into the Caſpian or Hircan ſea.

‡ The Rha of the Antients growes naturally,as *Alpinus* ſaith,vpon the hil Rhodope in Thrace, now called Romania. It growes alſo,as I haue bin informed,vpon ſome mountains in Hungary. It is likewiſe to be ſound growing in ſome of our choice gardens. ‡

¶ *The choice of Rubarb.*

The beſt Rubarb is that which is brought from China freſh & new,of a light purpliſh red,with certain veins and branches of an vncertain varietie of colour, commonly whitiſh; but when it is old the colour becomes ilfauored by turning yellowiſh or pale,but more if it be worme-eaten: being chewed in the mouth it is ſomthing gluie or clammy,and of a Saffron colour,which being rubbed vpon paper or ſome white thing ſheweth the colour more plainly: the ſubſtance thereof is neither hard or cloſely compact,nor yet heauy,but ſomthing light,and as it were in a middle betwixt hard and looſe,and ſomthing ſpongie: it hath alſo a pleaſing ſmell. The ſecond in goodnes is that which comes from Barbary. The laſt and worſt from Boſphorus and Pontus,

¶ *The Names.*

It is commonly called in Latine *Rha Barbarum*,or *Rha Barbaricum*: of diuers,*Rheu Barbarum*: the Moors and Arabians do more truly name it *Raued Seni,à Senenſi prouincia*,from whence it is brought into Perſia and Arabia,and afterward into Europe: and likewiſe from Tanguth through the land of Cataia into the Sophy of Perſia his country,and from thence into Egypt,and ſo into Europ. It is called of the Arabians and the people of China & the parts adiacent,*Rauend Cini, Raved Seni*,and *Raued Sceni*: in ſhops,*Rhabarbarum*: in Engliſh,Rubarb,and Rewbarb.

4 *Rha Ponticum Siccatum.*
Rubarb of Pontus dried.

¶ *The Nature.*

Rubarb is of a mixt ſubſtance, temperature, and faculties: ſome of the parts thereof are earthy, binding and drying: others thin, airous, hot, and purging.

¶ *The Vertues.*

A Rubarb is commended by *Dioſcorides*, againſt windineſſe, weakneſſe of the ſtomack, and all griefes thereof, Convulſions, diſeaſes of the ſpleen, liuer, and kidnies, gripings, and inward gnawings of the guts, infirmities of the bladder and cheſt, ſwellings about the heart, diſeaſes in the matrix, pain in the huckle bones, ſpitting of bloud, ſhortneſſe of breath, yexing, or the hicket, the bloudy flix, the laske proceeding of raw humors, fits in agues, and againſt the bitings of venomous beaſts.

B Moreouer hee ſaith, that it taketh away blacke and blew ſpots, and Tettars or Ringwormes, if it be mixed with vineger, and the place anointed therewith.

C *Galen* affirmes it to be good for burſtings, cramps, and convulſions, & for thoſe that are ſhort winded and ſpit bloud.

D But touching the purging faculty neither *Dioſcorides* nor *Galen* haue written any thing, becauſe it was not vſed in thoſe days to purge with. *Galen* held opinion, That the thin airous parts do make the binding qualitie of more force, not becauſe it doth reſiſt the cold and earthy ſubſtance, but becauſe it carrieth the ſame, and maketh it deeply to pierce, and therby to work the greater effect; the dry and thin eſſence containing in it ſelfe a purging force & quality to open obſtructions, but helped and made more facile by the ſubtill and airous parts. *Paulus Ægineta* ſeemeth to be the firſt that made triall of the purging facultie of Rubarb; for in his firſt book, *cap*. 43 he makes mention thereof, where he reckons vp Turpentine among thoſe medicines which make the bodies of ſuch as are in health ſoluble: But when we purpoſe (ſaith he) to make the turpentine more ſtrong, we adjvnto it a little Rubarb. The Arabians that followed him brought it to a farther vſe in phyſick, as chiefly purging downward choler, and oftentimes flegme.

E The purgation which is made with Rubarb is profitable and fit for all ſuch as be troubled with choler, and for thoſe that are ſicke of ſharpe and tertian feuers, or haue the yellow jaundice, or bad liuers.

F It is a good medicine againſt the pleuriſie, inflammation of the lungs, the ſqinancy or Squincy, madneſſe, frenſie, inflammation of the kidnies, bladder, and all the inward parts, and eſpecially againſt S. *Anthonies* fire, as well outwardly as inwardly taken.

G Rubarb is vndoubtedly an eſpeciall good medicine for the liuer and infirmities of the gall; for beſides that it purgeth forth cholericke and naughty humors, it remooueth ſtoppings out of the conduits.

H It alſo mightily ſtrengthneth the intrals themſelues, inſomuch that Rubarb is iuſtly termed of diuers, the life of the liuer: for *Galen, lib*. 11. of the method or manner of curing, affirmeth, that ſuch kinds of medicines are moſt fit and profitable for the liuer, as haue ioyned with a purging and opening qualitie an aſtringent or binding power. The quantitie that is to be giuen is from one dram to two; and the infuſion from one and a halfe to three.

I It is giuen or ſteeped, and that in hot diſeaſes, with the infuſion or diſtilled water of Succory, Endiue, or ſome other of the like nature, and likewiſe in Whay; and if there be no heat it may be giuen in wine.

K It is alſo oftentimes giuen beeing dried at the fire, but ſo, that the leaſt or no part thereof at all be burned; and beeing ſo vſed, it is a remedie for the bloudy Flix, and for all kinds of Laskes: for

it

[illegible] → [illegible]

it both purgeth away naughty and corrupt humors, and likewiſe withall ſtoppeth the belly.

K The ſame being dried after the ſame manner, doth alſo ſtay the ouermuch flowing of the Monethly Sickeneſſe, and ſtoppeth bloud in any part of the body, eſpecially that which commeth thorow the bladder; but it ſhould bee giuen in a little quantitie, and mixed with ſome other binding thing.

L *Meſues* ſaith, That Rubarb is an harmleſſe medicine, and good at all times, and for all ages, and likewiſe for children and women with childe.

M ‡ My friend Mr *Sampſon Iohnſon* Fellow of *Magdalen* Colledge in Oxford aſſures me, That the Phyſitions of Vienna in Auſtria vſe ſcarce any other at this day than the Rubarb of the Antients, which growes in Hungary not far from thence: and they prefer it before the dried Rubarb brought out of Perſia and the Eaſt Indies, becauſe it hath not ſo ſtrong a binding facultie as it, neither doth it heate ſo much, only it muſt be vſed in ſomewhat a larger quantitie. ‡

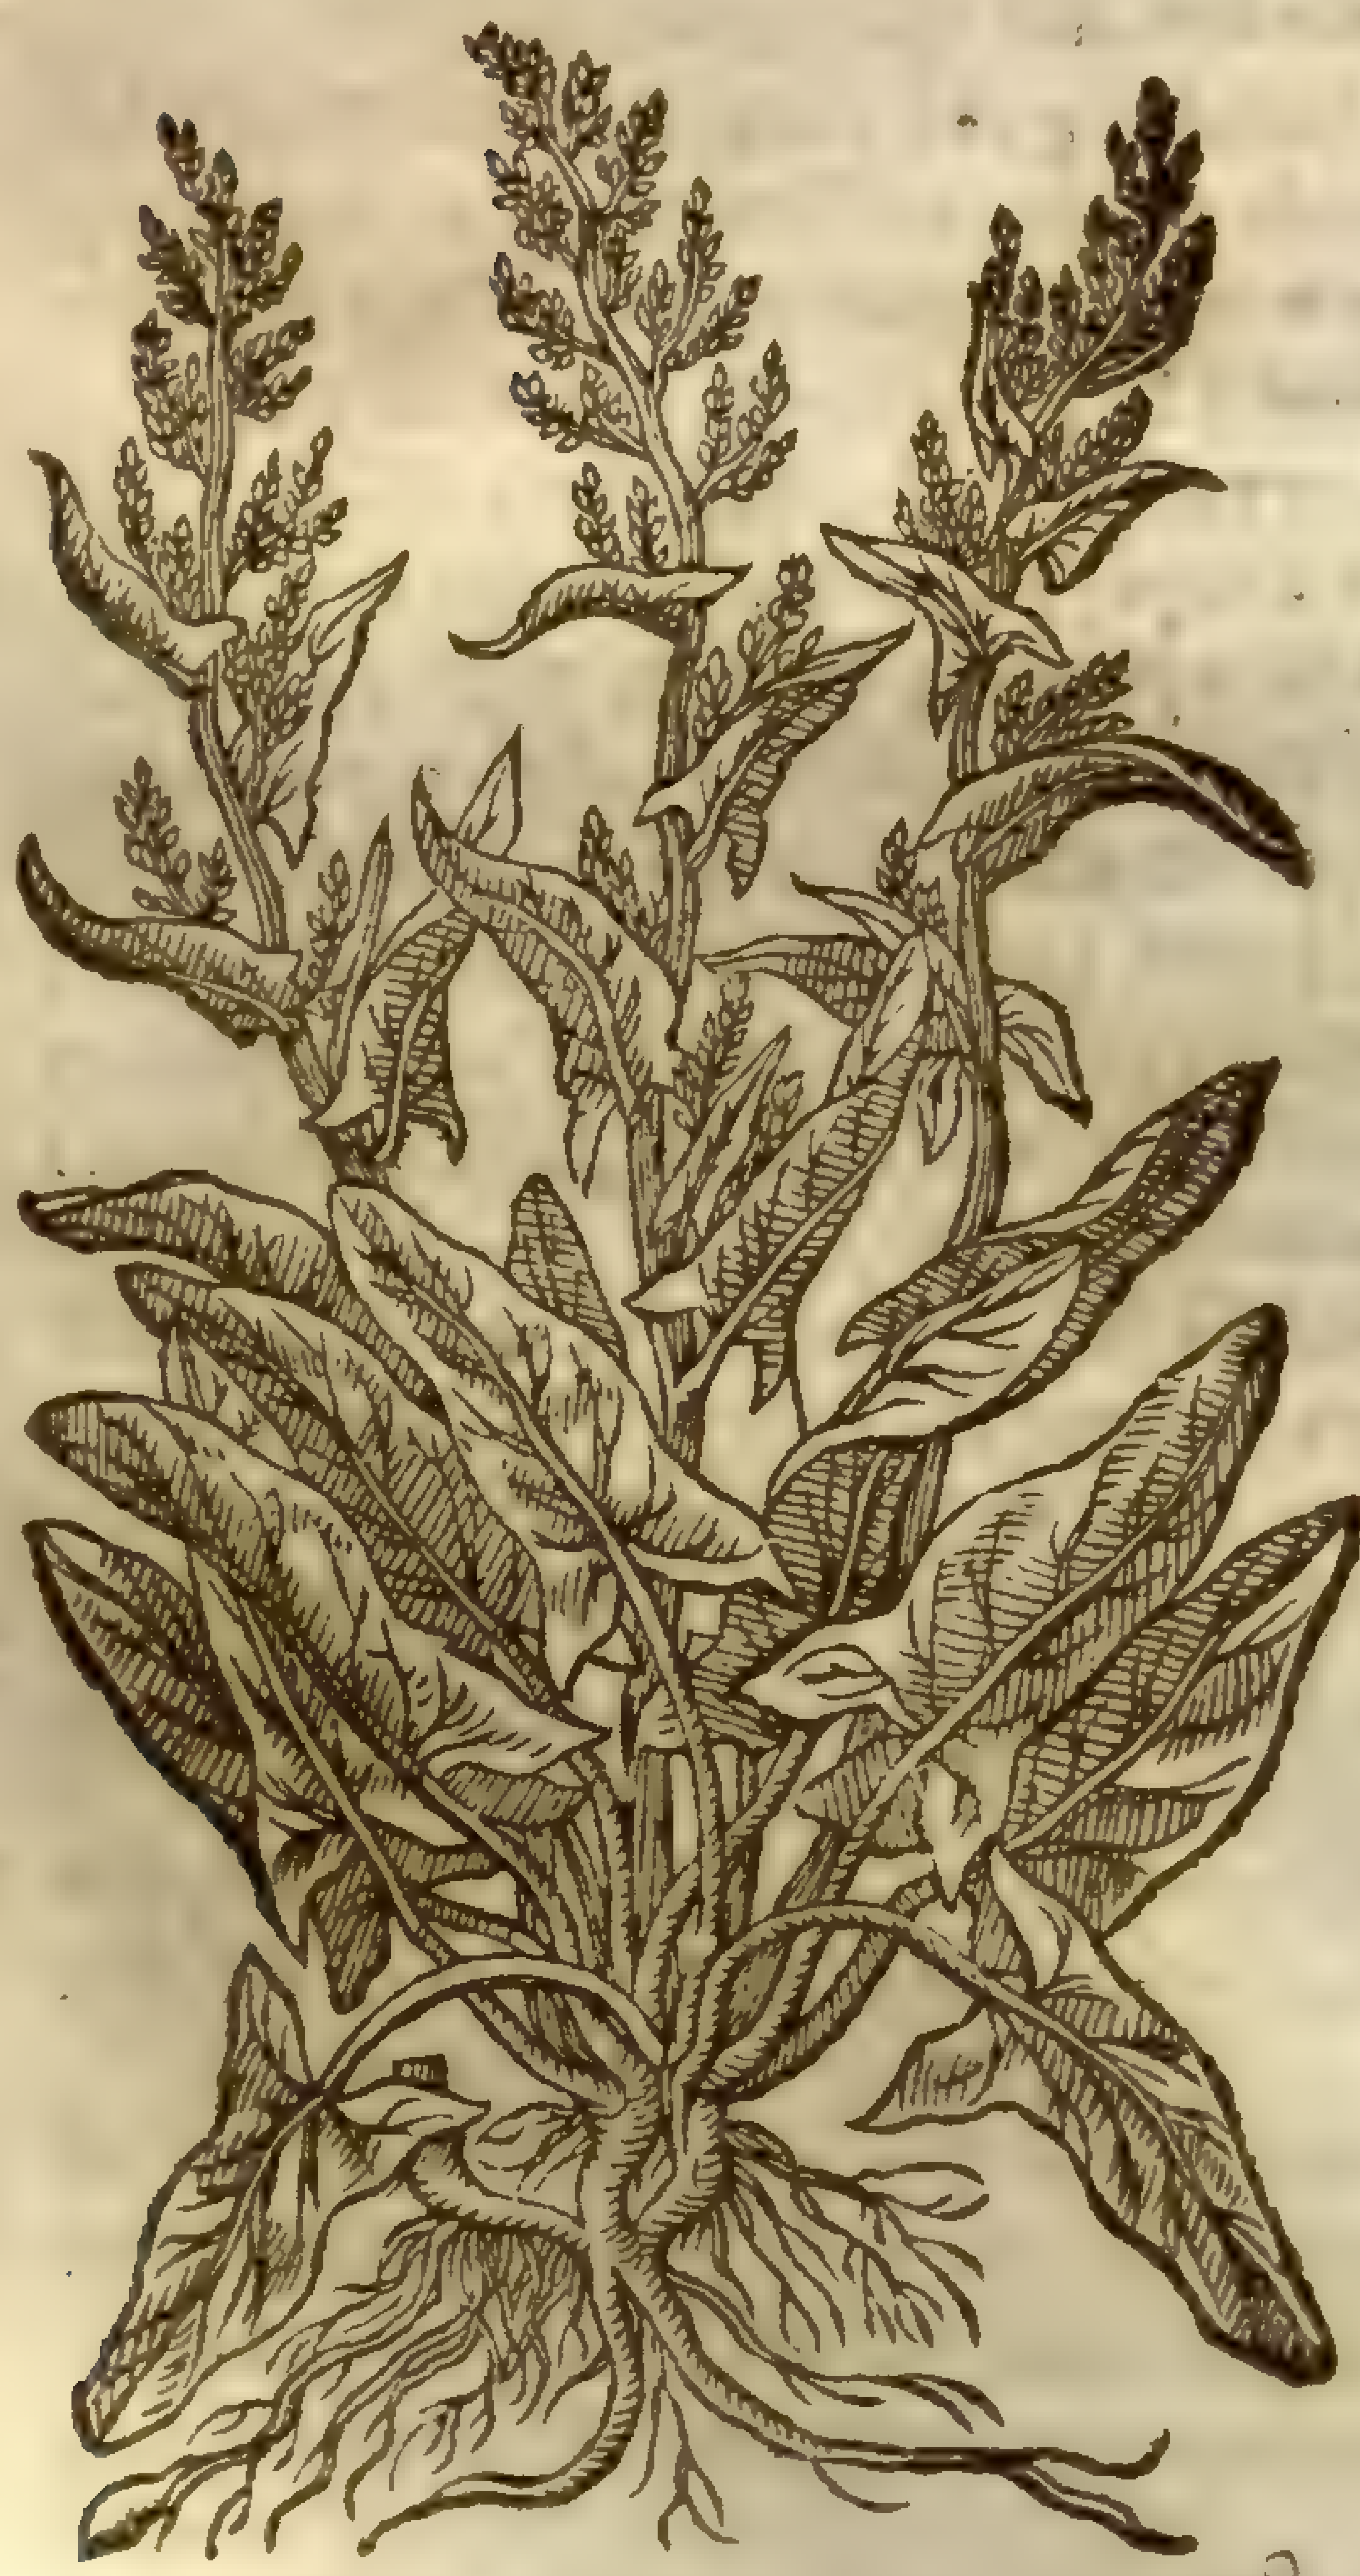
Chap. 84.

Of Sorrell.

¶ The Kindes.

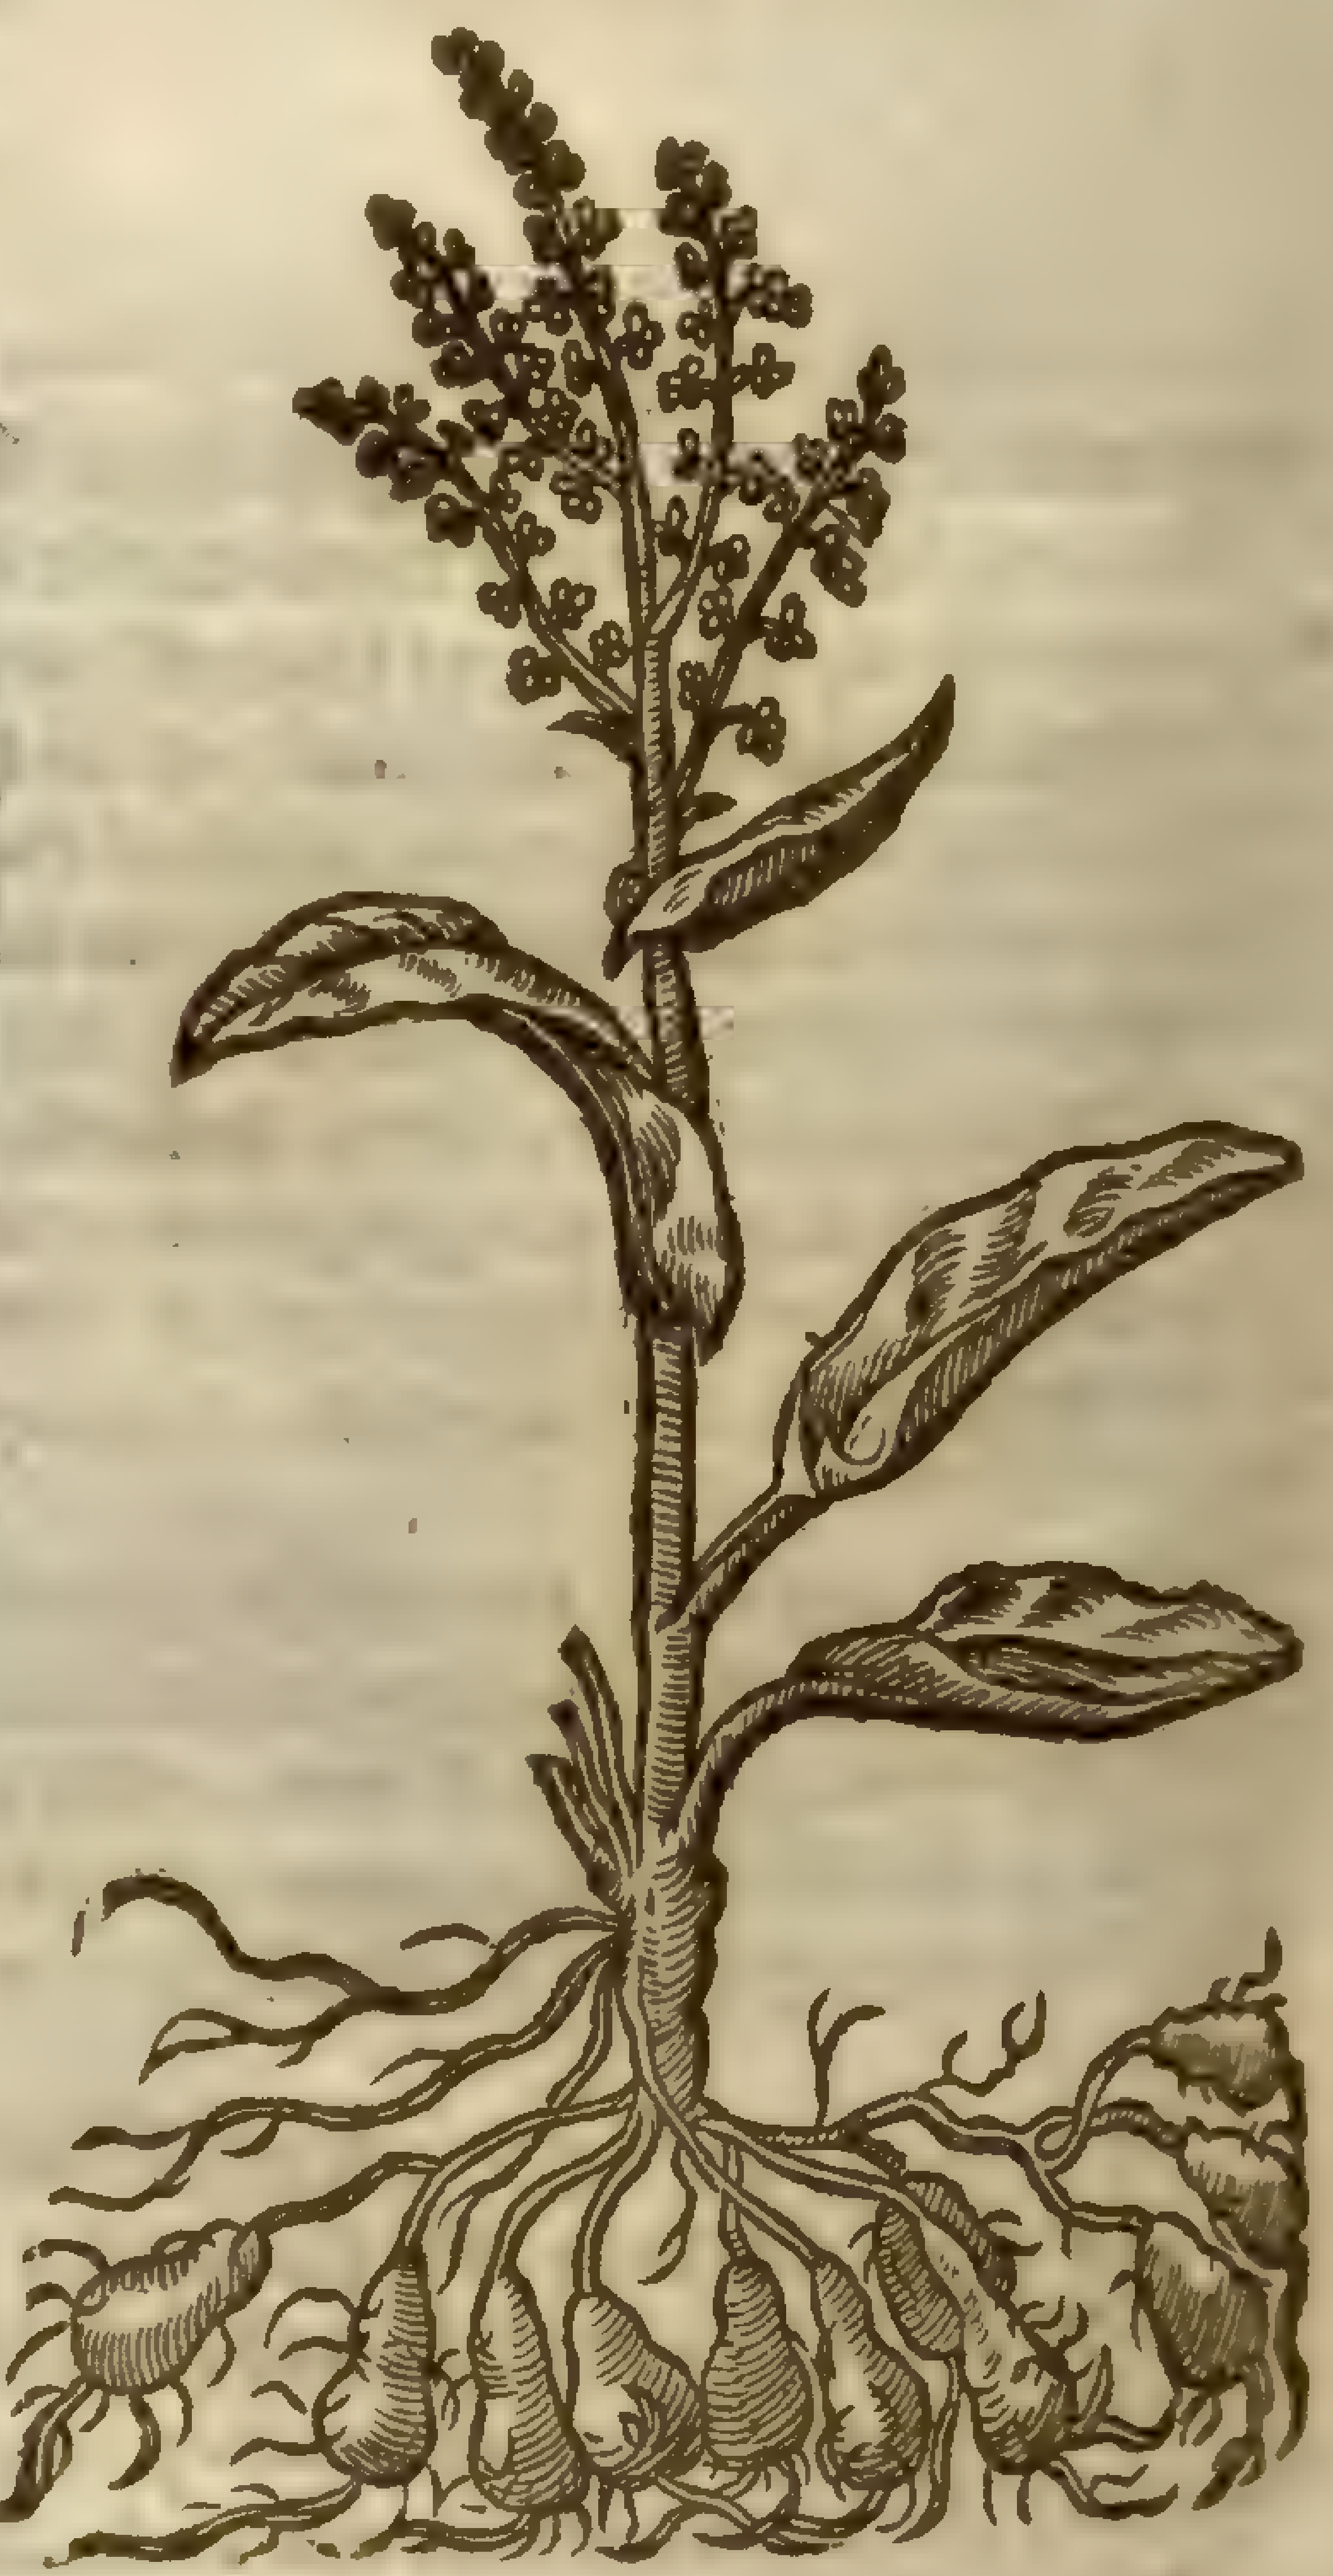
There be diuers kinds of Sorrell, differing in many points, ſome of the garden, others wild; ſome great, and ſome leſſer.

1 *Oxalis, ſiue Acetoſa.*
Sorrell.



Rumex acetosa, [illegible]

2 *Oxalis tuberoſa.*
Knobbed Sorrell.



Rumex Tuberosus [illegible]

¶ The Deſcription.

Though *Dioſcorides* hath not expreſſed the *Oxalides* by that name, yet none ought to doubt but that they were taken and accounted as the fourth kinde of *Lapathum*: for although ſome like it not wel that the ſeed ſhould be ſaid to be *Drimus*; yet that is to bee vnderſtood according to the common phraſe, when acride things are confounded with thoſe that be ſharp and ſoure: elſe we might accuſe him of ſuch ignorance as is not amongſt the ſimpleſt women. Moreouer, the word *Oxys* doth not only ſignifie the leafe, but the ſauor and tartneſſe, which by a figure drawn from the ſharpneſſe of kniues edges, is therefore called ſharpe: for ὀξὺς χυμὸς ſignifieth a ſharpe or ſoure juyce which pierceth the tongue like a ſharp knife: whereupon alſo *Lapathum* may be called *Oxalis*, as it is indeed. The leaues of this are thinner, tenderer, and more vnctuous than thoſe of *Lapathum acutum*, broader next to the ſtem, horned and creſted like Spinach & *Atriplex*. The ſtalk is much ſtreaked, reddiſh, and full of juice: the root is yellow and fibrous, the ſeed ſharp, cornered and ſhining, growing in chaffie husks like the other Docks.

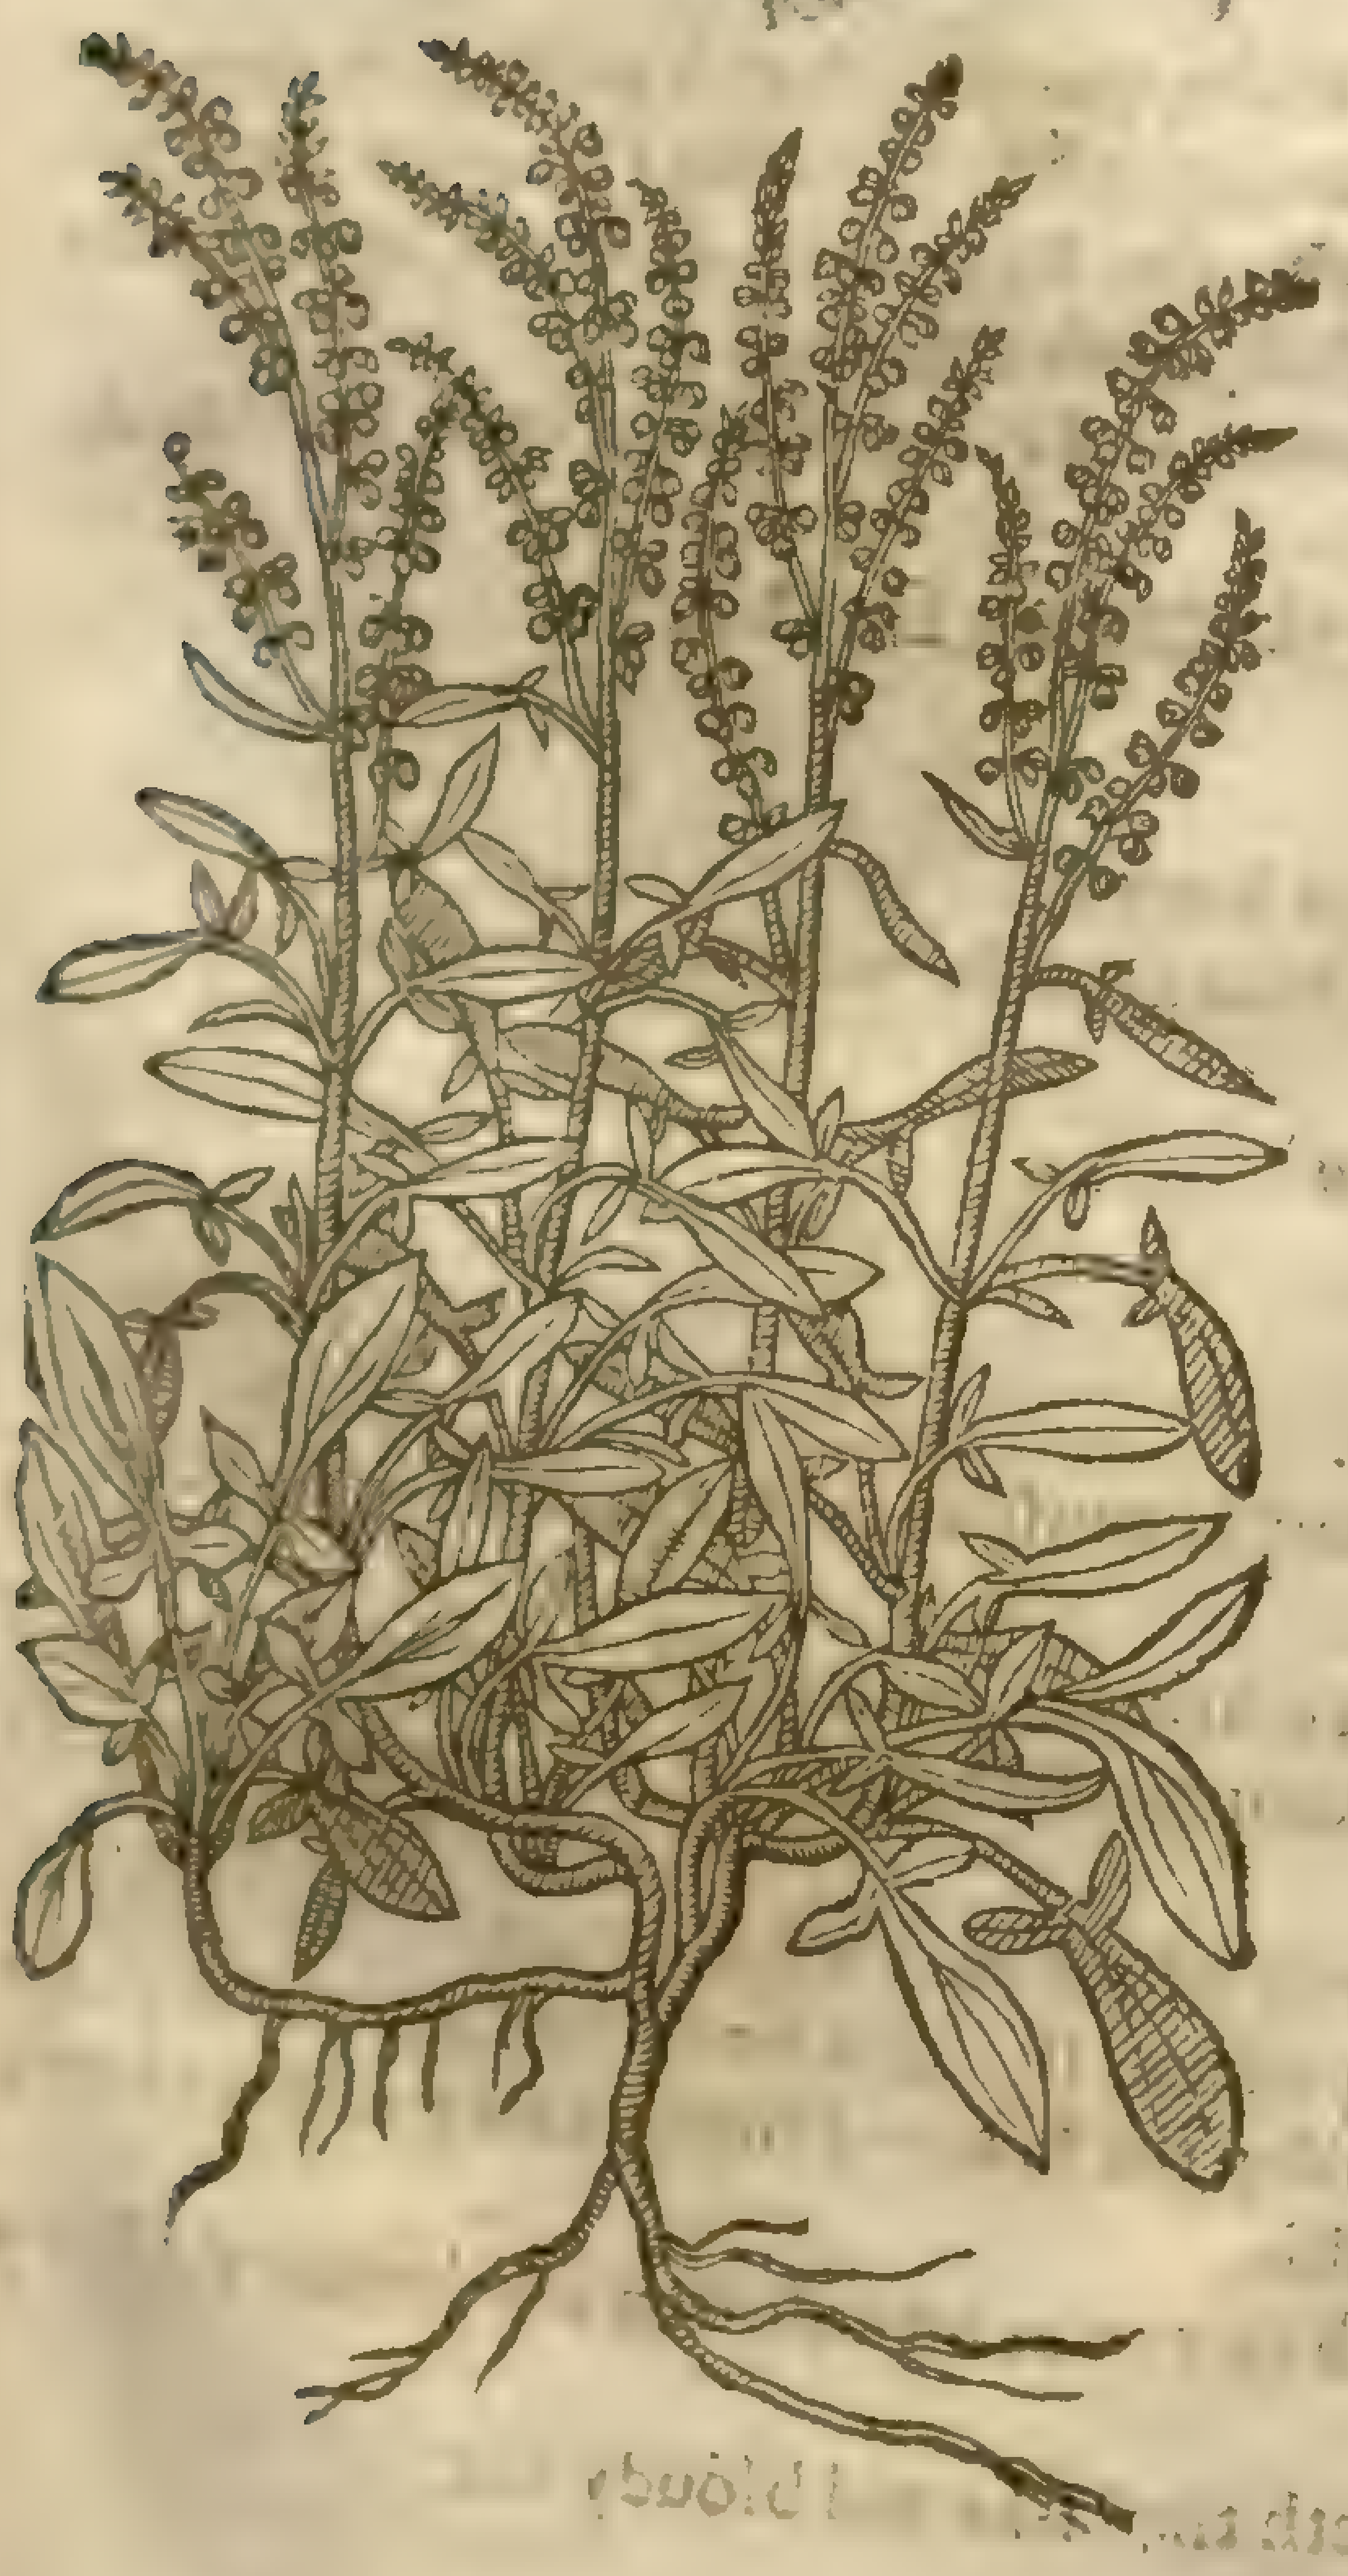
2 The ſecond kind of *Oxalis* or Sorrel hath large leaues like Patience, confuſedly growing together vpon a great tall ſtalke, at the top whereof grow tufts of a chaffie ſubſtance. The root is tuberous, much like the Peonie or rather Filipendula, faſtned to the lower part of the ſtem with ſmal long ſtrings or laces.

3 The third kind of Sorrell groweth very ſmall, branching hither and thither, taking hold (by new ſhoots) of the ground where it groweth, whereby it diſperſeth it ſelfe farre abroad: the leaues are little and thin, hauing two ſmall leaues like eares faſtned thereto, in ſhew like the herb *Sagittaria*: the ſeed in taſte is like the other of his kinde.

4 The fourth kinde of Sorrell hath leaues ſomwhat round and cornered, of a whiter color than the ordinarie, and hauing two ſhort eares anexed vnto the ſame. The ſeed and root in taſte is like the other Sorrels.

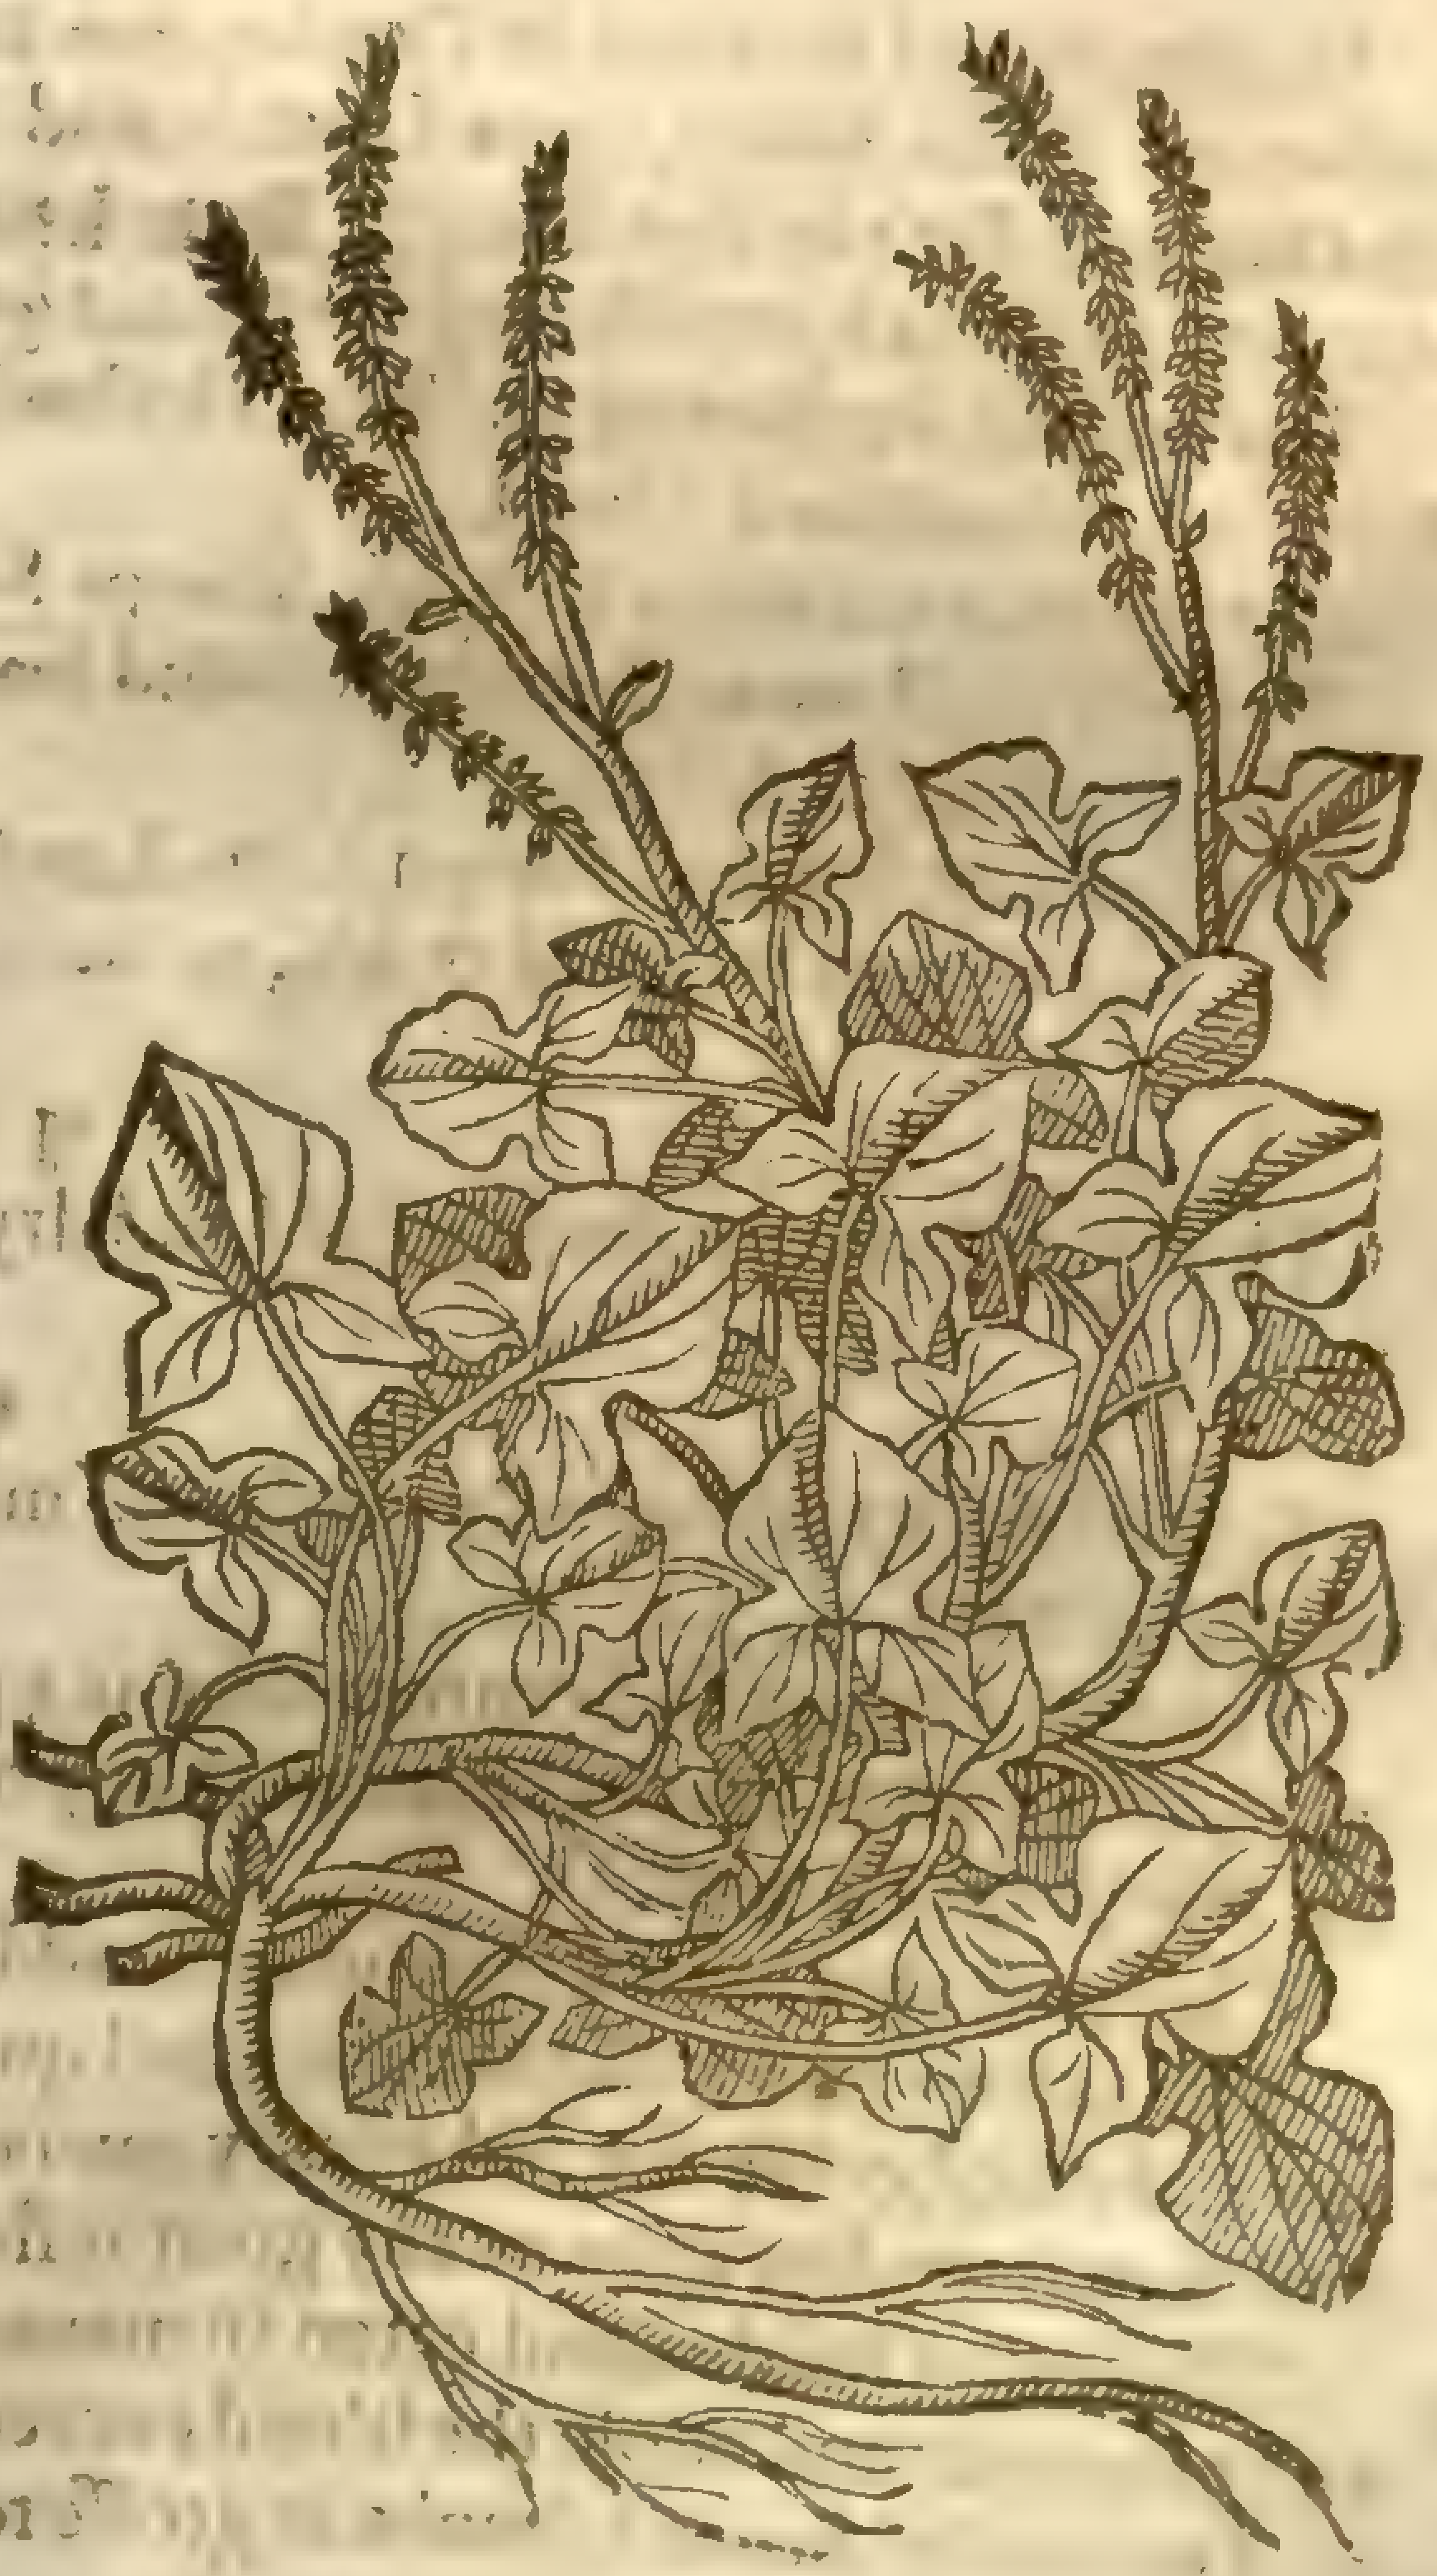
3 *Oxalis tenuifolia.*
Sheeps Sorrel.

Rumex acetosella
[illegible]
[illegible]



Rumex scutatus L.
[illegible]
Lam. 5. 66

4 *Oxalis Franca ſeu Romana.*
Round leaued or French Sorrel.

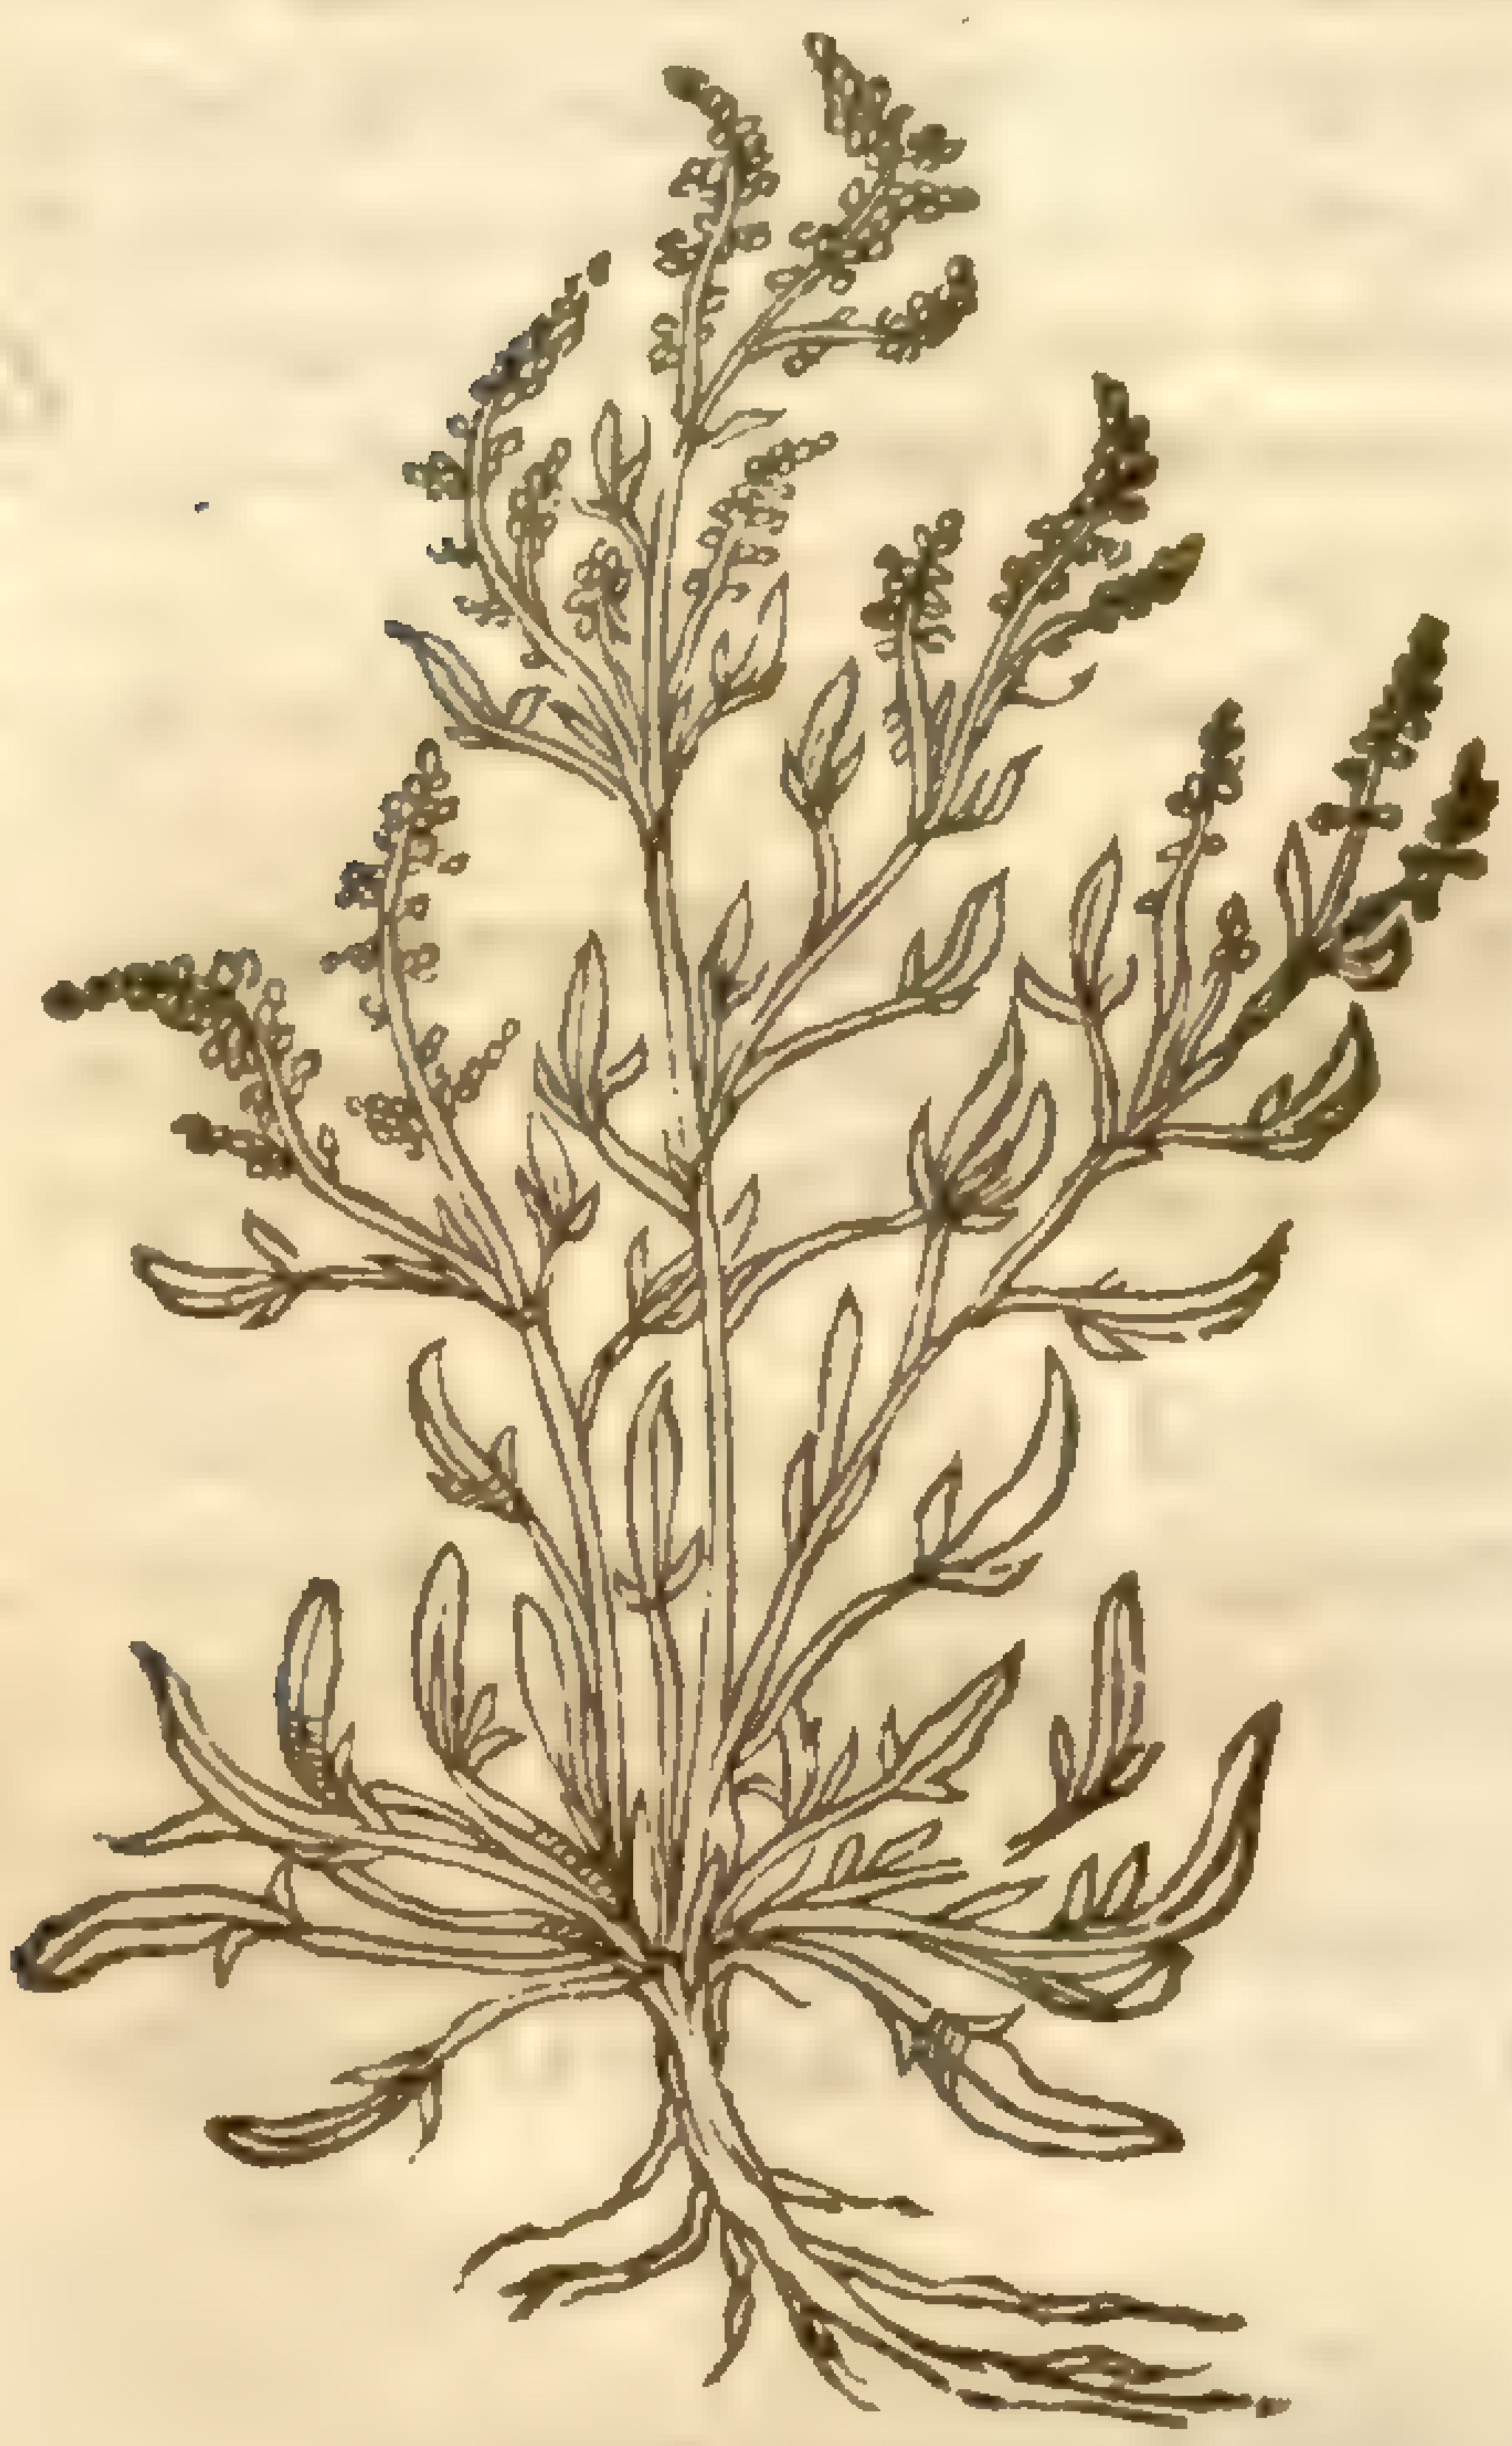


5 This kind of curled Sorrell is a ſtranger in England, and hath very long leaues in ſhape like garden Sorrell, but curled and crumpled about the edges as is the curled Colewort. The ſtalke riſeth vp among the leaues, ſet here and there with the like leaues, but leſſer. The floures, ſeeds, and roots are like the common Sorrell or ſoure Docke.

6 The ſmall Sorrell that groweth vpon dry barren ſandy ditch banks, hath ſmall graſſy leaues ſomewhat forked or croſſed ouer like the croſſe hilt of a Rapier. The ſtalks riſe vp amongſt the

leaues,

6 *Oxalis minor.*
Small Sorrell.



leaues, ſmall, weake, and tender, of the ſame ſoure taſte that the leaues are of. The floure, ſeed, and root is like the other Sorrels, but altogether leſſer.

7 The ſmalleſt ſort of Sorrel is like vnto the precedent, ſauing that the loweſt leaues that lie vpon the ground be ſomewhat round, and without the little ears that the other hath, which ſetteth forth the difference.

‡ 8 There is alſo kept in ſome gardens a verie large Sorrel, hauing leaues thicke, whitiſh, and as large as an ordinarie Docke, yet ſhaped like Sorrell, and of the ſame acide taſte. The ſtalks and ſeed are like thoſe of the ordinarie, yet whiter coloured. ‡

¶ *The Place.*

† The common Sorrel groweth for the moſt part in moiſt medowes and gardens. The ſecond by waters ſides, but not in this kingdome that I know of. The fourth and fift alſo are garden plants with vs; but the third and ſixth grow vpon grauelly and ſandy barren ground and ditch banks.

¶ *The Time.*

They flouriſh at that time when as the other kindes of Docks do floure.

¶ *The Names.*

Garden Sorrel is called in Greeke, ὀξαλὶς, and ἀναξυρὶς: of *Galen*, ὀξυλάπαθον: that is to ſay, *Acidum Lapathum*; or *Acidus rumex*, ſoure Docke; and in ſhops commonly *Acetoſa*: in the Germane Tongue, **Sawr ampffer**: in low-Dutch, **Surckele**, and **Surinck**: the Spaniards, *Azederas*, *Agrelles*, and *Azedas*: in French, *Ozeille*, and *Surelle*, *Aigrette*: in Engliſh, garden Sorrell.

The ſecond is called of the later Herbariſts, *Tuberoſa acetoſa*, and *Tuberoſum lapathum*: in Engliſh, Bunched or knobbed Sorrel.

The third is called in Engliſh, Sheeps Sorrell: in Dutch, **Schap Surkel.**

The fourth, Roman Sorrell, or round leaued Sorrell.

The fift, Curled Sorrell.

The ſixt and ſeuenth, Barren Sorrell, and dwarfe Sheeps Sorrell.

‡ The eighth is called *Oxalis*, or *Acetoſa maxima latifolia*, great broad leaued Sorrell. ‡

¶ *The Temperature.*

The Sorrels are moderatly cold and dry.

¶ *The Vertues.*

A Sorrell doth vndoubtedly coole and mightily dry; but becauſe it is ſoure, it likewiſe cutteth tough humors.

B The juice hereof in Sommer time is a profitable ſauce in many meats, and pleaſant to the taſte: it cooleth an hot ſtomacke, moueth appetite to meat, tempereth the heat of the liuer, and openeth the ſtoppings thereof.

C The leaues are with good ſucceſſe added to decoctions which are vſed in agues.

D The leaues of Sorrel taken in good quantitie, ſtamped and ſtrained into ſome ale, and a poſſet made thereof, coole the ſicke body, quench thirſt, and allay the heate of ſuch as are troubled with a peſtilent feuer, hot ague, or any great inflammation within.

E The leaues ſodden, and eaten in manner of a Spinach tart, or as meat, ſoften and looſen the belly and attemper and coole the bloud exceedingly.

F The ſeed of Sorrell drunke in groſſe red wine ſtoppeth the laske and bloudy flix.

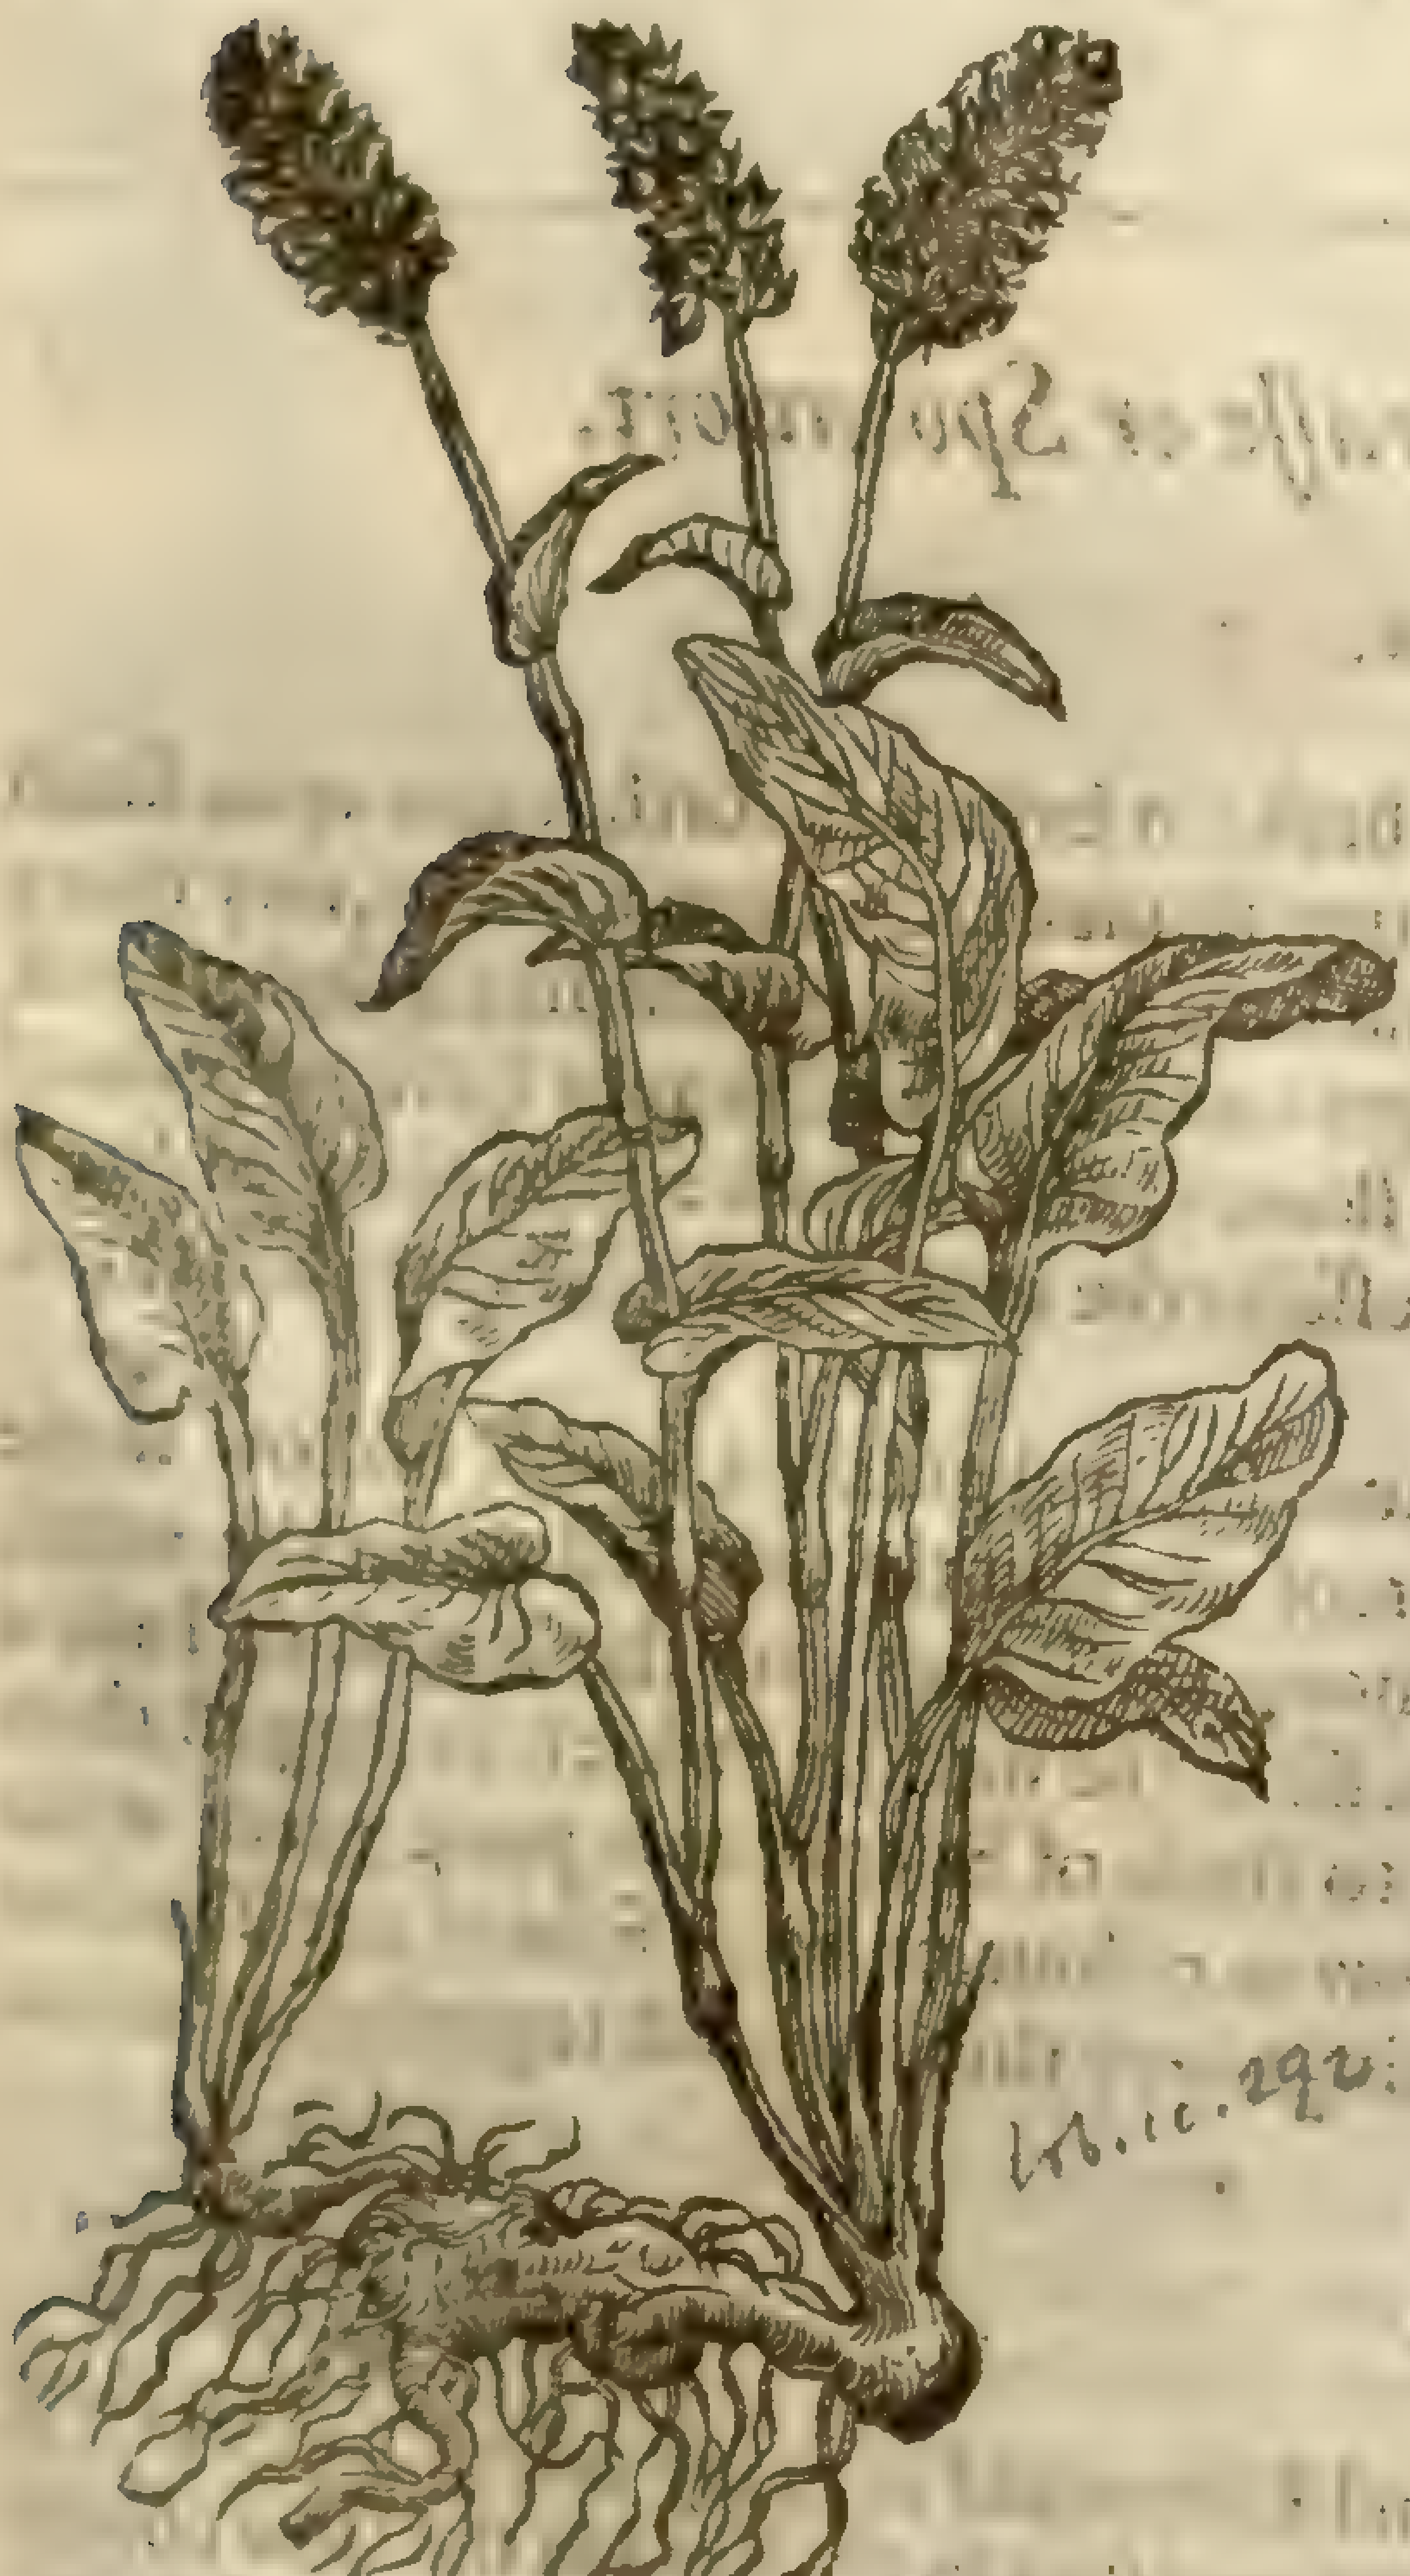
CHAP. 85. *Of Biſtort or Snake-weed.*

¶ *The Deſcription.*

1 THe great Biſtort hath long leaues much like Patience,but ſmaller,and more wrinkled or crumpled,on the vpper ſide of a darke green,and vnderneath of a blewiſh greene colour much like Woad. The ſtalke is long, ſmooth, and tender, hauing at the top a ſpiked knap or eare ſet full of ſmal whitiſh floures declining to carnation. The root is all in a lumpe, without faſhion; within of a reddiſh colour like vnto fleſh, in taſte like the kernell of an acorne.

2 The ſmall Biſtort hath leaues about three inches long,and of the bredth of a mans nail; the vpper ſide is of a green colour, and vnderneath of an ouerworne greeniſh colour: amongſt which riſeth vp a ſtalke of the height of a ſpan, full of joints or knees, bearing at the top ſuch floures as the great Biſtort beareth; which being fallen, the ſeeds appeare of the bigneſſe of a tare, reddiſh of colour, euery ſeed hauing one ſmall green leafe faſtned thereto, with many ſuch leaues thruſt in among the whole bunch of floures and ſeed. The root is tuberous like the other, but ſmaller, and not ſo much crooked.

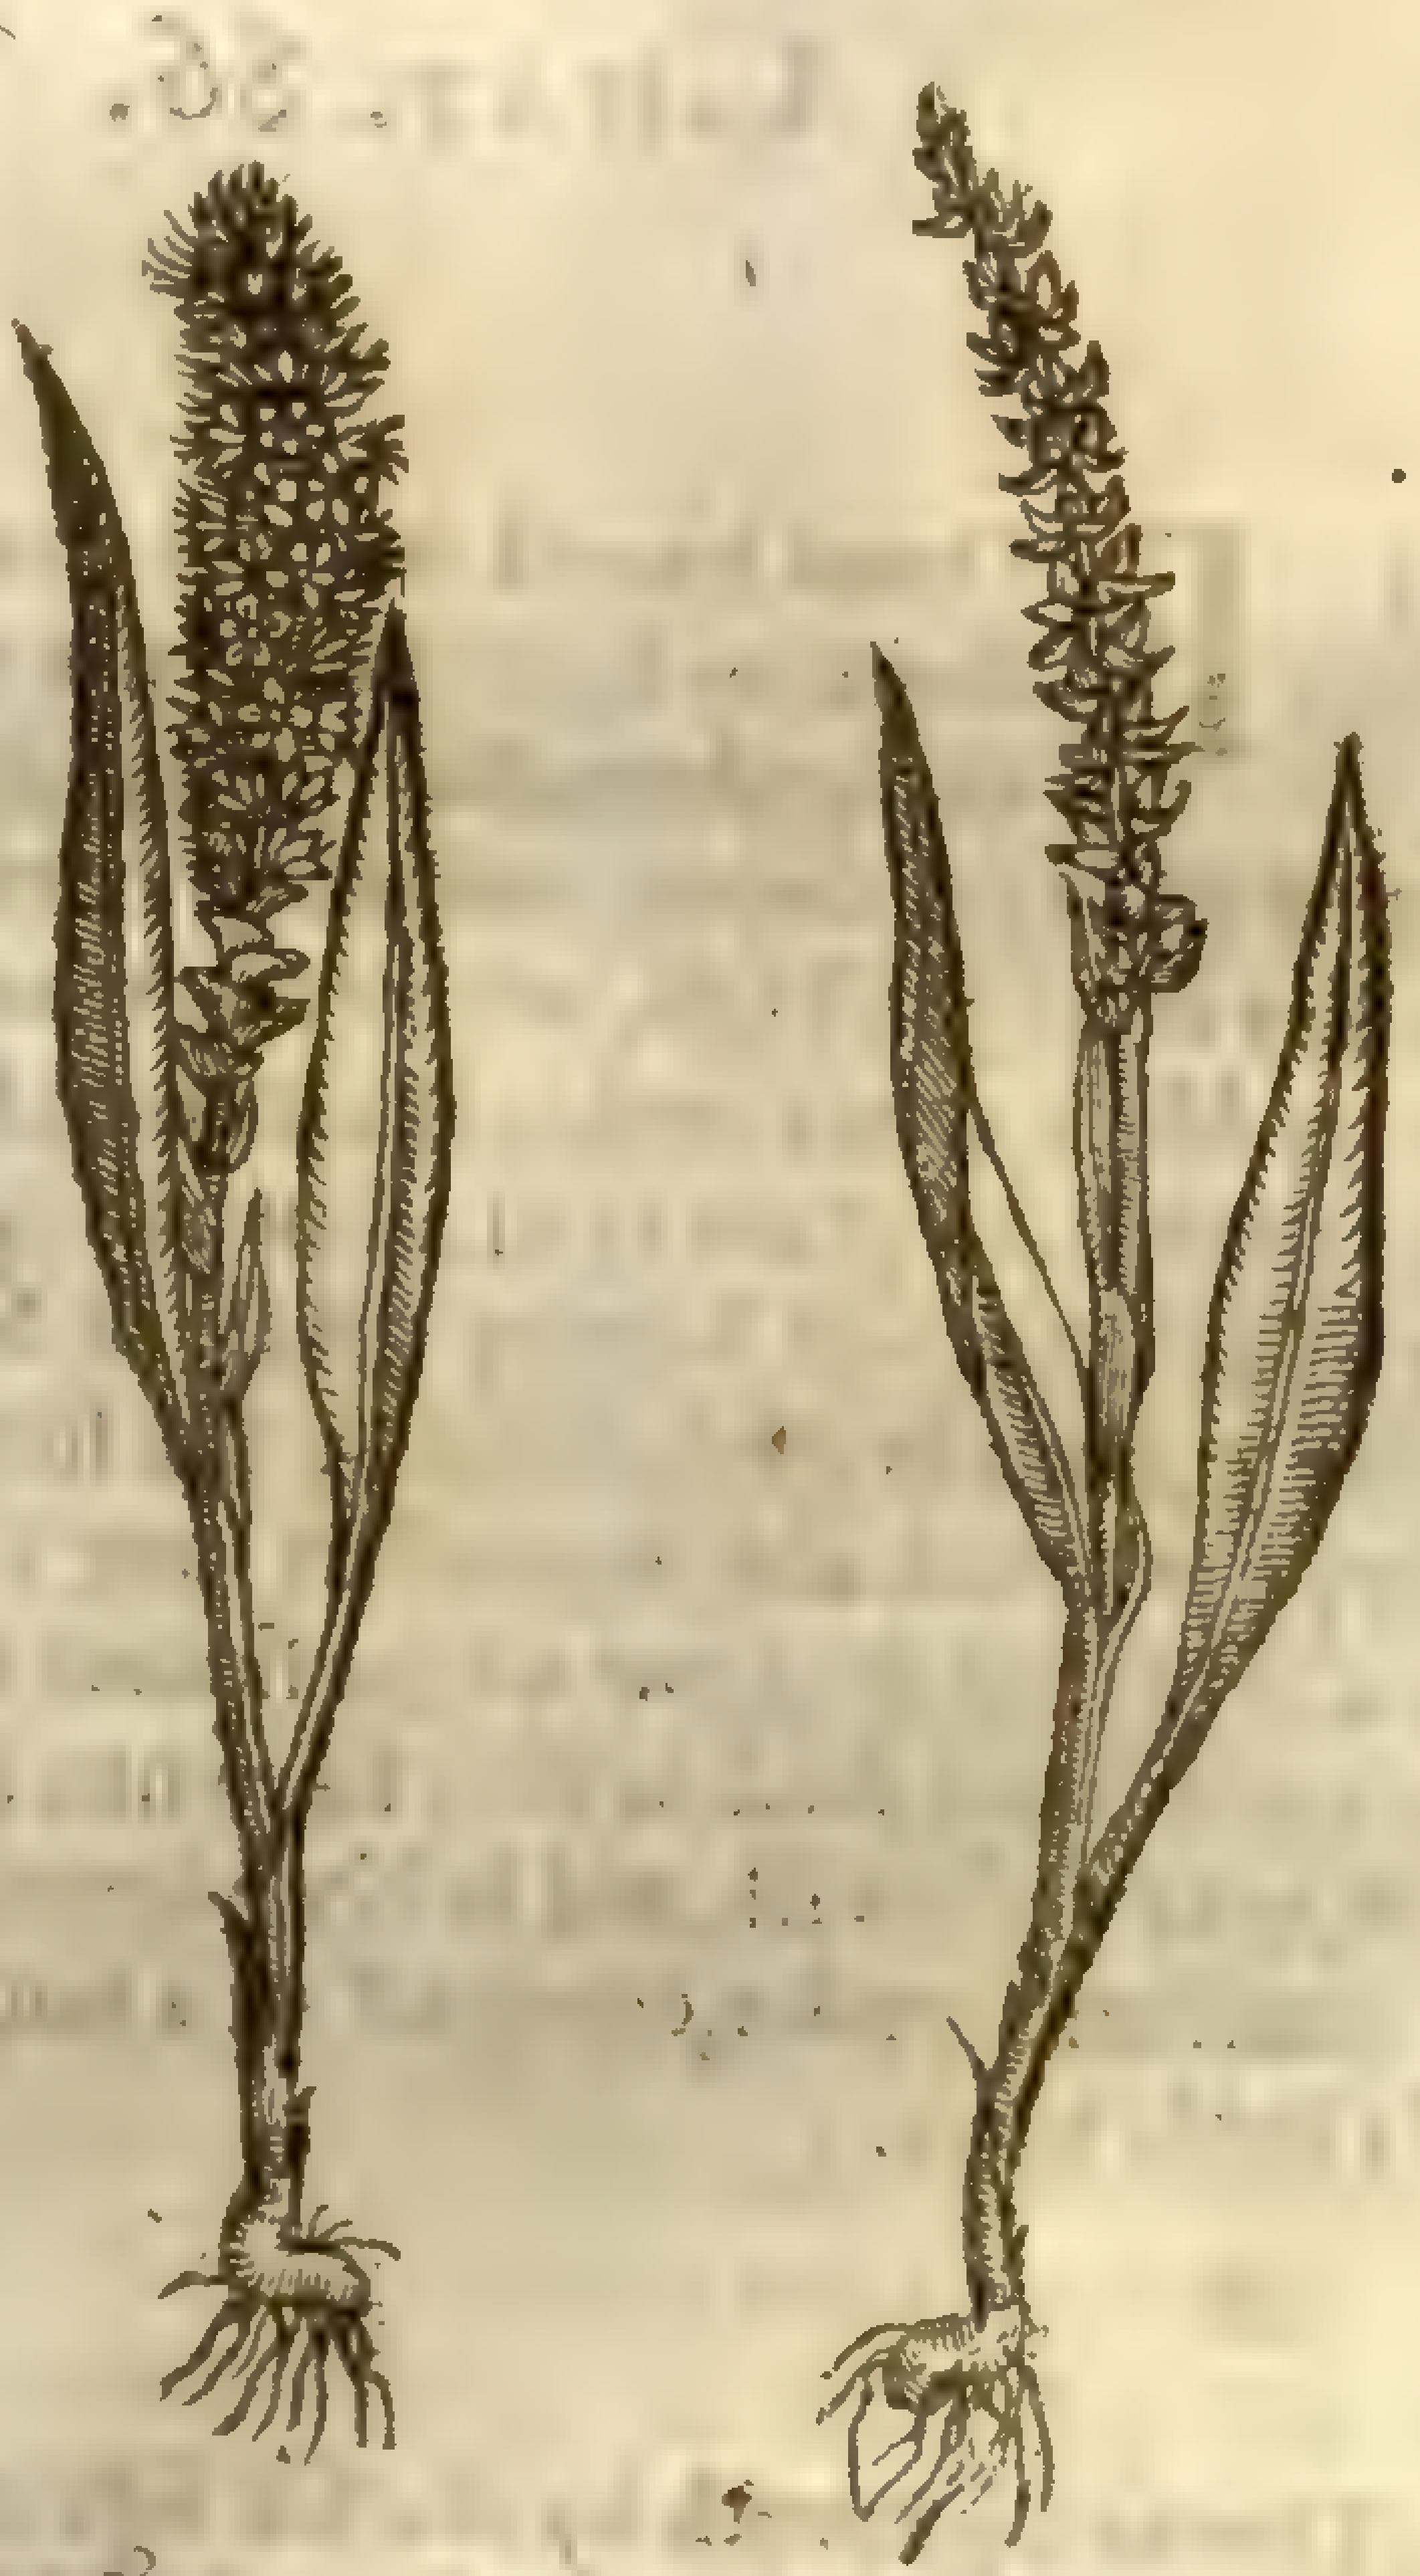
1 *Biſtorta major.*
Snake-weed.



Lob. ic. 290

Polygonum bistorta, L.
Moris. dict. Sm. fl. br. 426

2 *Biſtorta minor.*
Small Snake-weed.



Polygonum viviparum, L.
Trance. dict.
Sm. fl. b. 427)

3 Broad leaued Snake-weed hath many large vneuen leaues, ſmooth and very greene; among which riſe vp ſmall brittle ſtalks of two hands high, bearing at the top a faire ſpike of floures like to the white Biſtort. The root is knobby or bunched, crookedly turned or writhed this way & that way; whereof it tooke his name *Biſtorta.* ‡ It differs from the firſt only in that the root is more twined in, and the leaues broader and more crumpled. ‡

¶ *The Place.*

1 The great Biſtort growes in moiſt and waterie places, and in the darke ſhadowie woods, being very common in moſt gardens.

2 The ſmall Biſtort groweth in great aboundance in Weſtmerland, at Croſby Rauenſwaith, at the head of a Parke belonging to one Mr *Pickering*; from whence it hath bin diſperſed into many gardens, and alſo ſent vnto me for my garden.

¶ *The Time.*

They floure in May, and the ſeed is ripe in Iune.

¶ *The Names.*

Biſtorta is called in Engliſh, Snake-weed: in ſome places, Oiſterloit: in Cheſhire, Paſſions, and Snakeweed, and there vſed for an excellent pot-herbe. It is called *Biſtorta* of his writhed roots, and alſo *Colubrina, Serpentaria, Brittanica, Dracontion Plinij, Dracunculus Dodonæi*, and *Limonium Geſneri.*

¶ *The Temperature.*

Biſtort doth coole and dry in the third degree.

¶ *The Vertues.*

A The iuice of Biſtort put into the noſe preuaileth much againſt the diſeaſe called *Polypus*, & the biting of ſerpents or any other venomous beaſt, being drunke in wine or the water of Angelica.

B The root boiled in wine and drunke ſtoppeth the laſk and bloudy flix; it ſtayeth alſo the ouermuch flowing of womens monethly ſickneſſes.

C The root taken as aforeſaid ſtaieth vomiting, and healeth the inflammation and ſoreneſſe of the mouth and throat: it likewiſe faſtneth looſe teeth, being holden in the mouth for a certaine ſpace, and at ſundry times.

Chap. 86. *Of Scuruy-graſſe or Spoonwort.*

¶ *The Deſcription.*

1 Round leaued Scuruy-graſſe is a low or baſe herb: it bringeth forth leaues vpon ſmall ſtems or foot-ſtalks of a mean length, comming immediatly from the root, very many in number, of a ſhining green colour, ſomwhat broad, thicke, hollow like a little ſpoon, but of no great depth, vneuen or cornered about the edges: among which leaues ſpring vp ſmall ſtalkes of a ſpan high, whereon grow many little white floures; after which comes the ſeed, ſmall and reddiſh, contained in little round pouches or ſeed-veſſels: the roots be ſmall, white, and threddie: the whole plant is of a hot and ſpicy taſte.

2 The common Scuruy-graſſe or Spoonwort hath leaues ſomewhat like a ſpoon, hollow in the middle, but altogether vnlike the former: the leaues hereof are bluntly toothed about the edges, ſharpe pointed and ſomewhat long: the ſtalks riſe vp among the leaues, of the length of halfe a foot, whereon do grow white floures with ſome yellowneſſe in the middle: which being paſt, there ſucceed ſmall ſeed-veſſels like vnto a pouch, not vnlike to thoſe of Shepheards purſe, green at the firſt, next yellowiſh, and laſtly when they be ripe of a browne colour, or like a filberd nut. The root is ſmall and tender, compact of a number of threddy ſtrings very thicke thruſt together in manner of a little turfe.

¶ *The Place.*

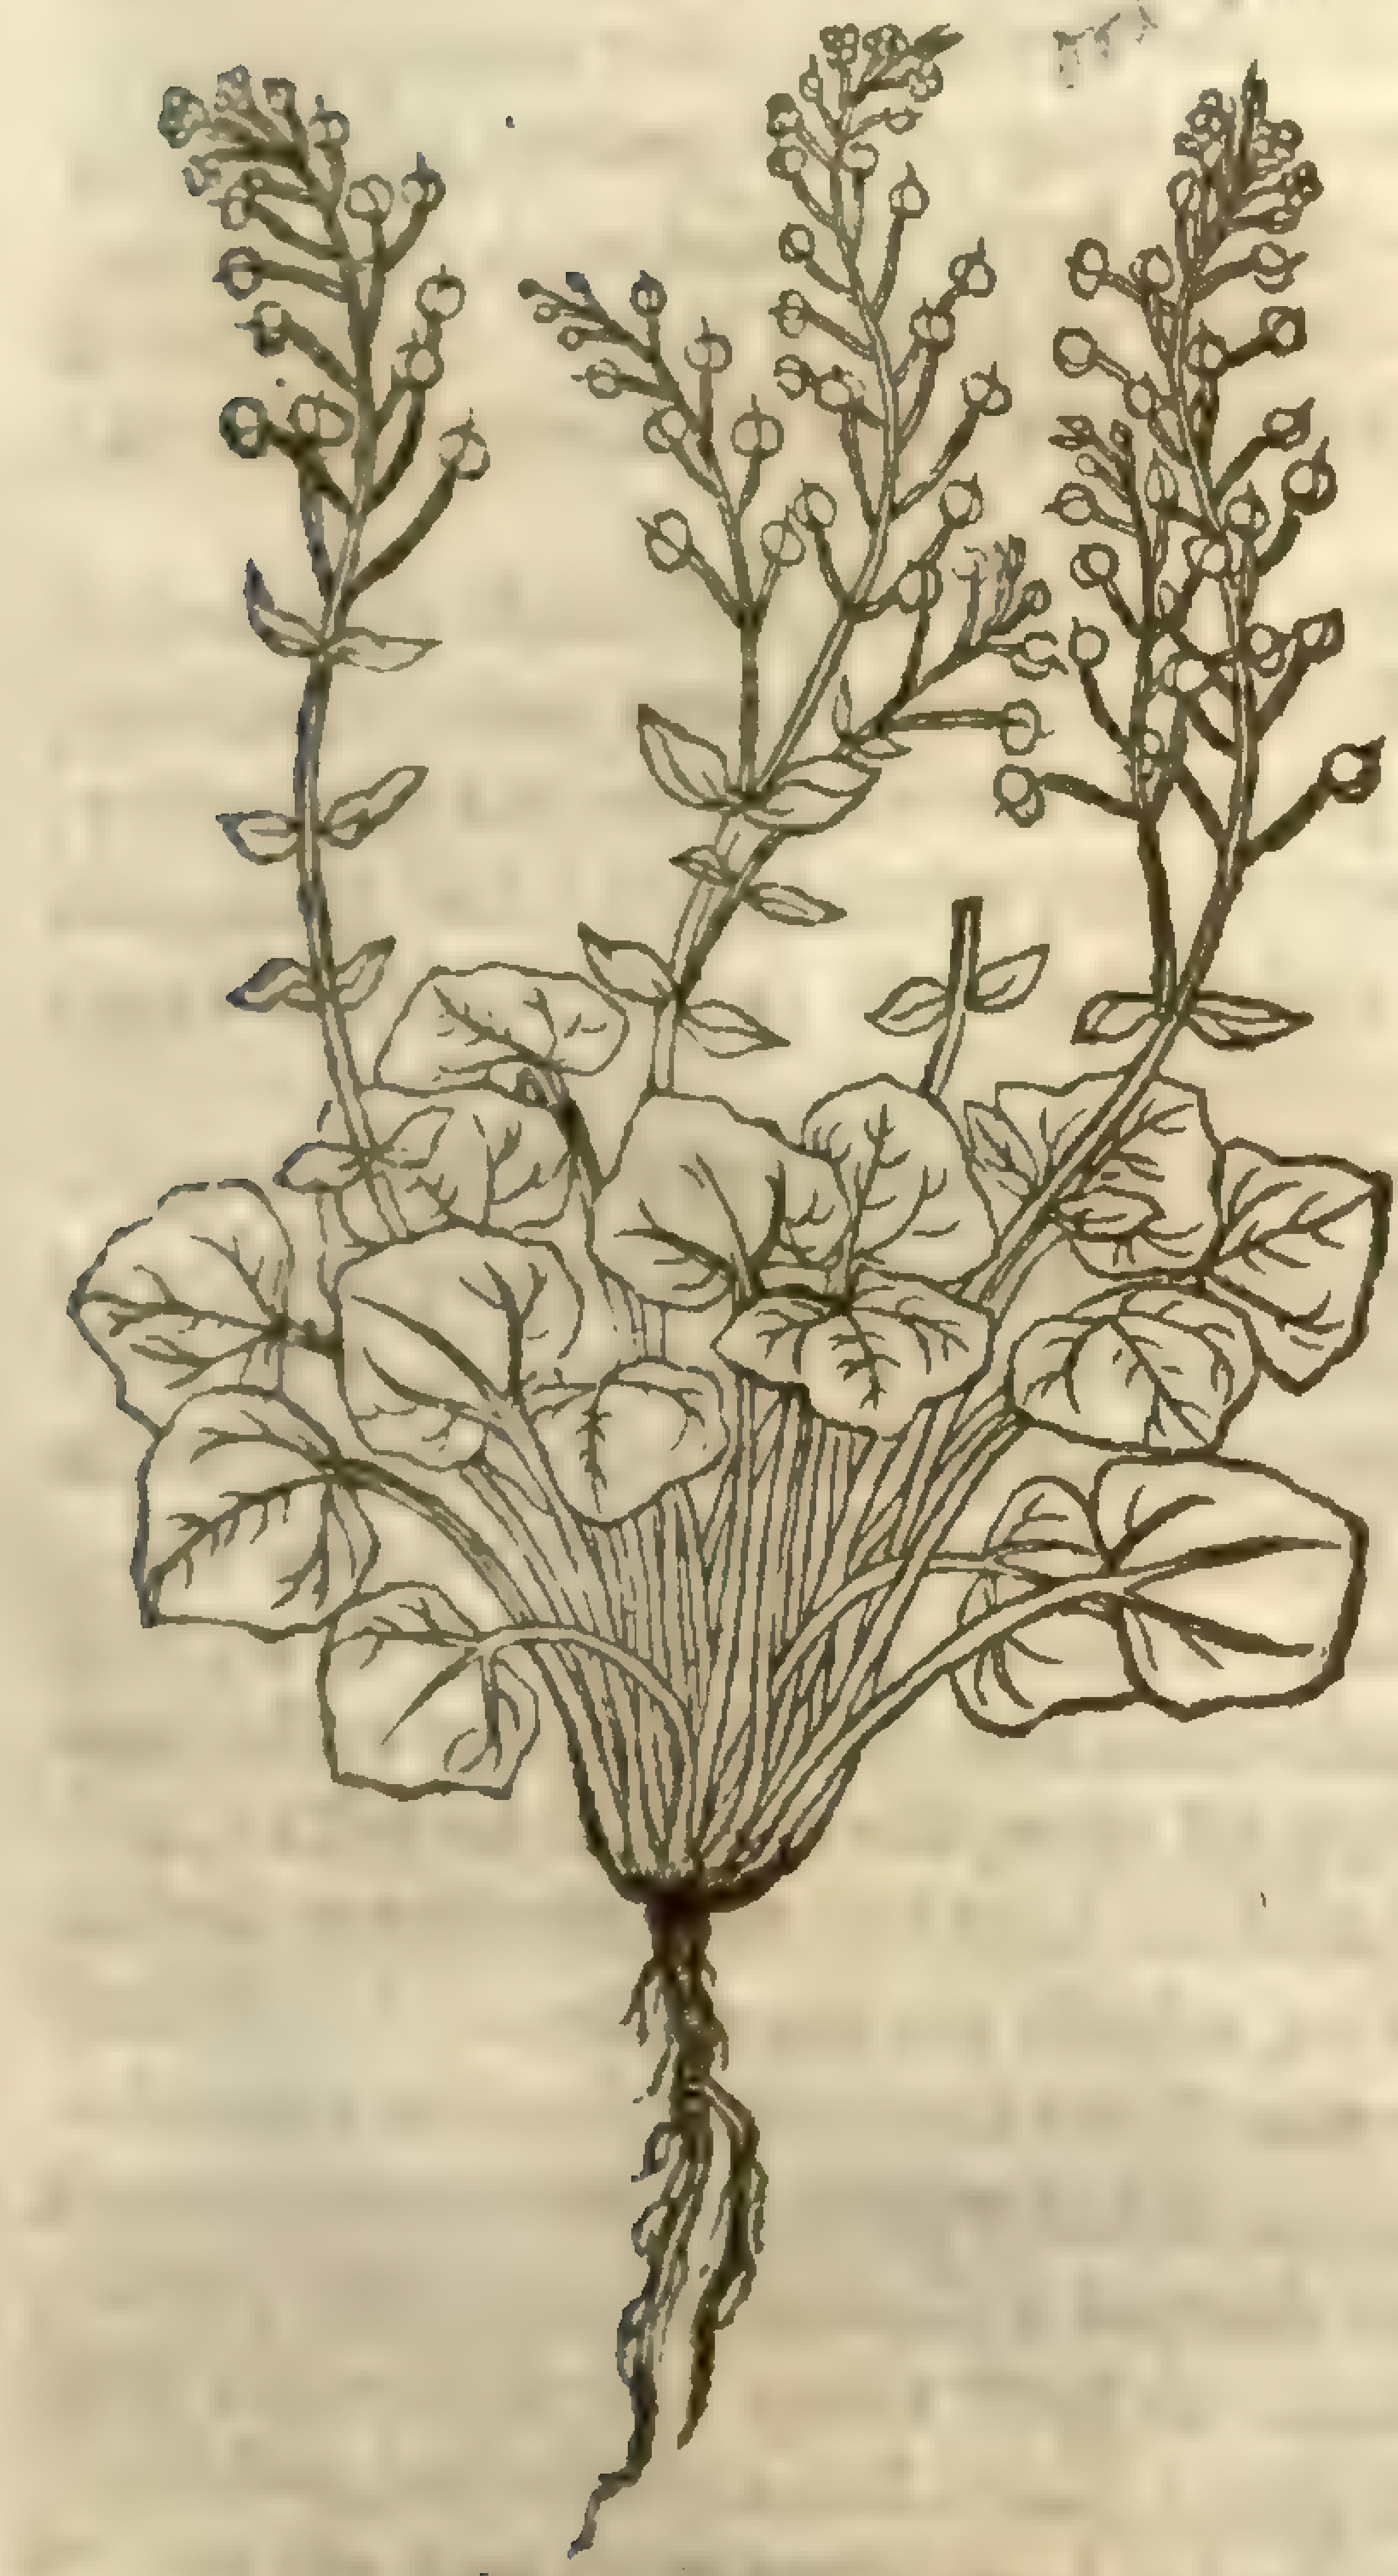
The firſt groweth by the ſea ſide at Hull, at Boſton, and Lynne, and in many other places of Lincolnſhire neere vnto the ſea, as in Whapload and Holbeck marſhes in Holland in the ſame county. It hath bin found of late growing many miles from the ſea ſide, vpon a great hil in Lancaſhire called Ingleborough hill; which may ſeem ſtrange to thoſe that do not know that it will bee content with any ſoile, place, or clyme whatſoeuer. For proofe whereof, my ſelfe haue ſowne the ſeeds of it in my garden, and giuen them vnto others, with whom they floure, flouriſh, and bring forth their ſeed as naturally as by the ſea ſide, and likewiſe retain the ſame hot ſpicy taſt: which proueth that they refuſe no culture, contrary to many other ſea plants.

The ſecond, which is our common Scuruy-graſſe, groweth in diuers places vpon the brimmes of the famous riuer Thames, as at Woolwich, Erith, Greenhithe, Grauesend, as wel on the Eſſex ſhore as the Kentiſh; at Portſmouth, Briſtow, and many other places alongſt the Weſtern coaſt: but toward the North I haue not heard that any of this kind hath growne.

¶ *The Time.*

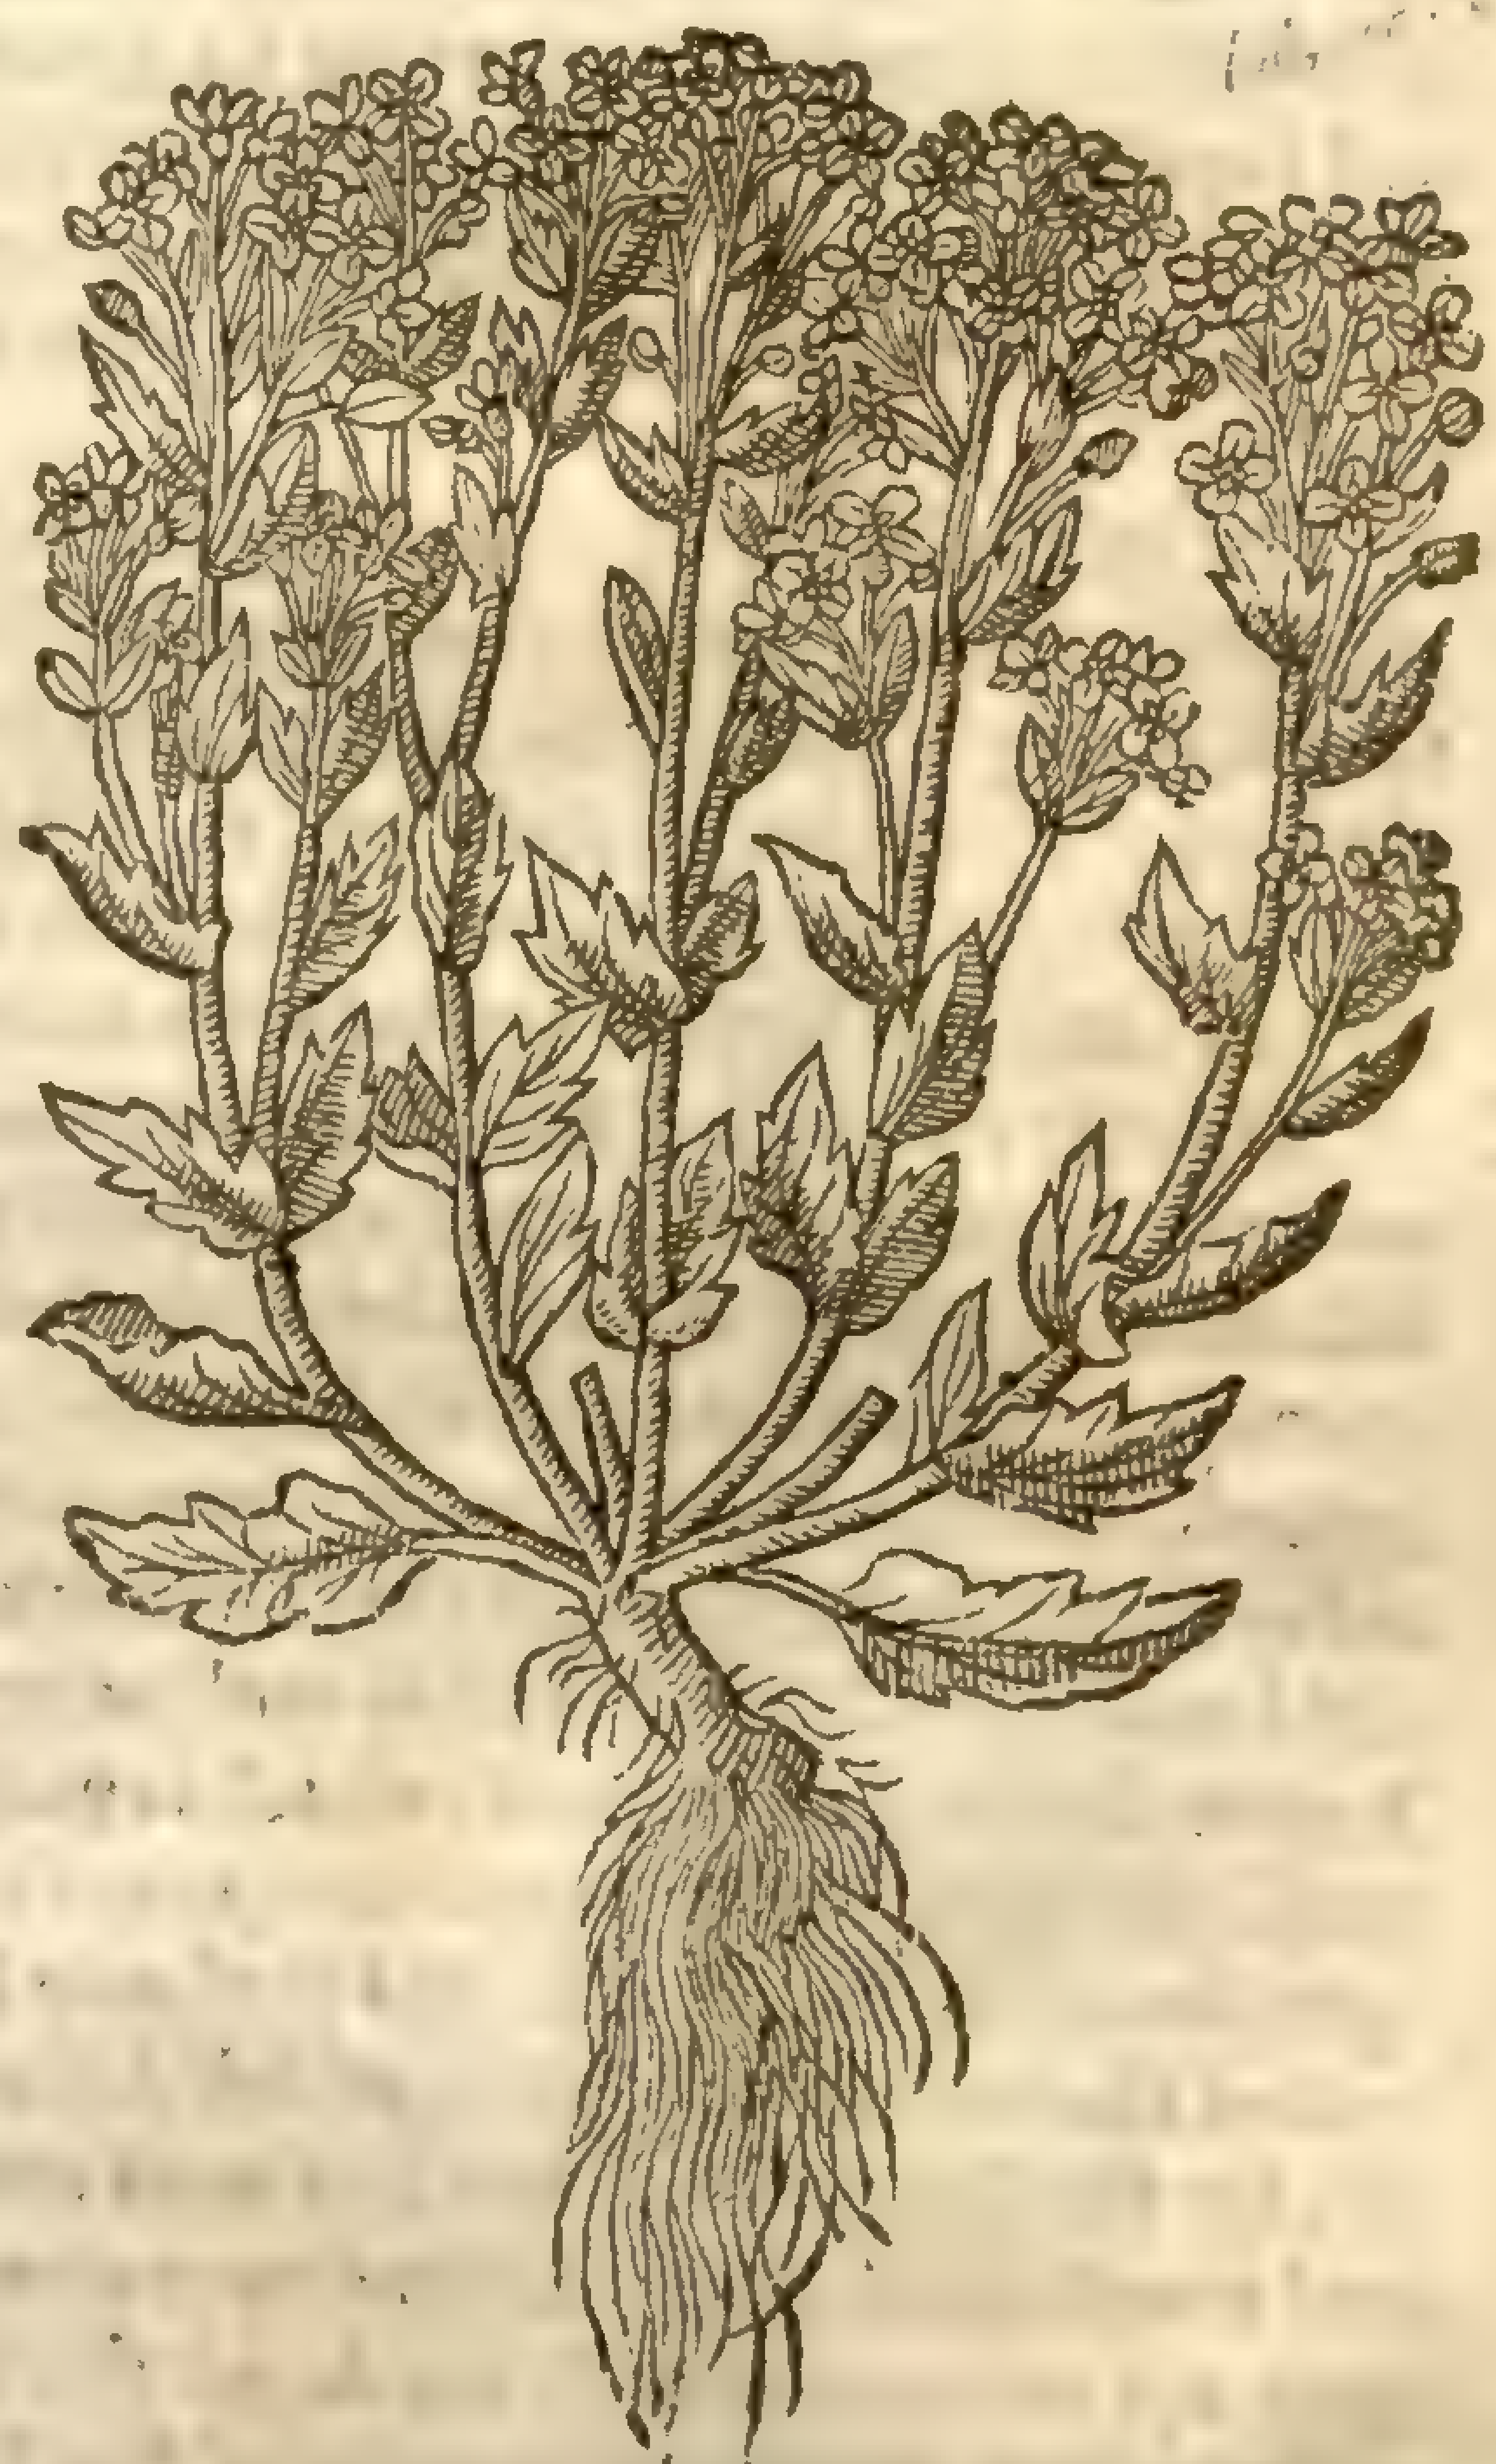
It floureth and flouriſheth in May. The ſeed is ripe in Iune.

1 *Cochlearia rotundifolia.*
Round leafed Scuruie-graſſe.



[illegible] Smith [illegible] 3375

2 *Cochlearia Britannica.*
Common Engliſh Scuruie-graſſe.



C. anglica, L.
[illegible] Smith [illegible]

¶ *The Names.*

† We are not ignorant that in low Germany, this hath ſeemed to ſome of the beſt learned to be the true *Britannica*, and namely to thoſe next the Ocean in Frieſland and Holland. The Germanes call it **Leffelkraut**: that is, *Cochlearia* or Spoonewort, by reaſon of the compaſſed roundnes and hallowneſſe of the leaues, like a ſpoone; and haue thought it to be *Plinies Britannica*, becauſe they finde it in the ſame place growing, and endued with the ſame qualities. Which excellent plant *Cæſars* ſoldiers (when they remooued their camps beyond the Rhene) found to preuaile (as the Friſians had taught it them) againſt that plague and hurtfull diſeaſe of the teeth, gums, and ſinewes, called the Scuruie, being a depriuation of all good bloud and moiſture, in the whole body, called *Scorbutum*; in Engliſh, the Scuruie, and Skyrby, a diſeaſe happening at the ſea among Fiſhermen, and freſh-water ſouldiers, and ſuch as delight to ſit ſtill without labour and exerciſe of their bodies; and eſpecially aboue the reſt of the cauſes, when they make not cleane their biſket bread from the floure or mealineſſe that is vpon the ſame, which doth ſpoile many. But ſith this agrees not with *Plinies* deſcription, and that there be many other water plants, as *Naſturtium*, *Sium*, *Cardamine*, and ſuch others, like in taſte, and not vnlike in proportion and vertues, which are remedies againſt the diſeaſes aforeſaid, there can be no certaine argument drawne therefrom to prooue it to be *Britannica*. For their leaues at their firſt comming forth are ſomewhat long like *Pyrola* or Adders tongue, ſoone after ſomewhat thicker, and hollow like a nauell, after the manner of Sundew, but in greatneſſe like *Soldanella*, in the compaſſe ſomewhat cornered, in faſhion ſomewhat like a ſpoone: the floures white, and in ſhape like the Cuckow floures: the ſeed reddiſh, like the ſeed of *Thlaſpi*, which is not to be ſeene in *Britannica*, which is rather holden to be Biſtort or Garden Patience, than Scuruie graſſe. In Engliſh it is called, Spoonewort, Scruby graſſe and Scuruie graſſe.

¶ *The Temperature.*

Scuruie graſſe is euidently hot and dry, very like in taſte and quality to the garden Creſſes of an aromaticke or ſpicie taſte.

¶ *The Vertues.*

A The juice of Spoonewort giuen to drinke in Ale or Beere, is a ſingular medicine againſt the corrupt and rotten vlcers, and ſtench of the mouth: it perfectly cureth the diſeaſe called of *Hippocrates, Volvulus Hematites*: of *Pliny, Stomacace*: of *Marcellus, Oſcedo*: and of the later writers, *Scorbutum*: of the Hollanders and Friſians, Scuerbuyck: in Engliſh, the Scuruie: either giuing the juice in drinke as aforeſaid, or putting ſix great handfuls to ſteepe, with long pepper, graines, anniſe-ſeed, and liquorice, of each one ounce, the ſpices being braied, and the herbe bruiſed with your hands, and ſo put into a pot, ſuch as is before mentioned in the chapter of baſtard Rubarbe, and vſed in like manner; or boiled in milke or wine and drunke for certaine daies together it worketh the like effect.

B The juice drunke once in a day faſting with any liquor, ale, beere, or wine, doth cauſe the foreſaid medicine more ſpeedily to worke his effect in curing this filthy, lothſome, heauy, and dull diſeaſe, which is very troubleſome, and of long continuance. The gums are looſed, ſwolne, and exulcerate; the mouth greeuouſly ſtinking; the thighes and legs are withall very often full of blew ſpots, not much vnlike thoſe that come of bruiſes: the face and the reſt of the body is oftentimes of a pale colour: and the feet are ſwolne as in a dropſie.

C There is a diſeaſe (ſaith *Olaus magnus* in his hiſtorie of the Northerne regions) haunting the campes, which vexes them that are beſieged and pinned vp: and it ſeemeth to come by eating of ſalt meates, which is increaſed and cheriſhed with the cold vapors of the ſtone walls. The Germanes call this diſeaſe (as we haue ſaid) Scorbuck; the ſymptome or paſſion which hapneth to the mouth, is called of *Pliny* στομακάκη: *Stomacace*: and that which belongeth to the thighes σκελοτύρβη: *Marcellus* an old writer nameth the infirmitie of the mouth *Oſcedo*: which diſeaſe commeth of a groſſe cold and tough bloud, ſuch as melancholy juice is, not by aduſtion, but of ſuch bloud as is the feculent or droſſie part thereof: which is gathered in the body by ill diet, ſlothfulneſſe to worke, laiſineſſe (as we terme it) much ſleepe and reſt on ſhip-boord, and not looking to make cleane the biſquet from the mealineſſe, and vncleane keeping their bodies, which are the cauſes of this diſeaſe called the ſcuruie or ſcyrby; which diſeaſe doth not onely touch the outer parts, but the inward alſo: for the liuer oftentimes, but moſt commonly the ſpleene, is filled with this kinde of thicke, cold and tough juice, and is ſwolne by reaſon that the ſubſtance thereof is ſlacke, ſpungie and porous, very apt to receiue ſuch kinde of thicke and cold humors. Which thing alſo *Hippocrates* hath written of in the ſecond booke of his Prorrhetikes: their gums (ſaith he) are infected, and their mouthes ſtinke that haue great ſpleenes or milts: and whoſoeuer haue great milts and vſe not to bleed, can hardly be cured of this maladie, eſpecially of the vlcers in the legs, and blacke ſpots. The ſame is affirmed by *Paulus Ægineta* in his third booke, 49. chapter, where you may eaſily ſee the difference betweene this diſeaſe and the blacke jaunders, which many times are ſo confounded together, that the diſtinction or difference is hard to be knowne, but by the expert chirurgion: who oftentimes ſeruing in the ſhips, as well her Majeſties as merchants, are greatly peſtered with the curing thereof: it ſhall be requiſite to carry with them the herbe dried: the water diſtilled, and the juice put into a bottle with a narrow mouth, full almoſt to the necke, and the reſt filled vp with oile oliue, to keep it from putrifaction: the which preparations diſcreetly vſed, will ſtand them in great ſtead for the diſeaſe aforeſaid.

D The herbe ſtamped and laid vpon ſpots and blemiſhes of the face, will take them away within ſix houres, but the place muſt be waſhed after with water wherein bran hath been ſodden.

Chap. 87. *Of Twayblade, or herbe Biſoile.*

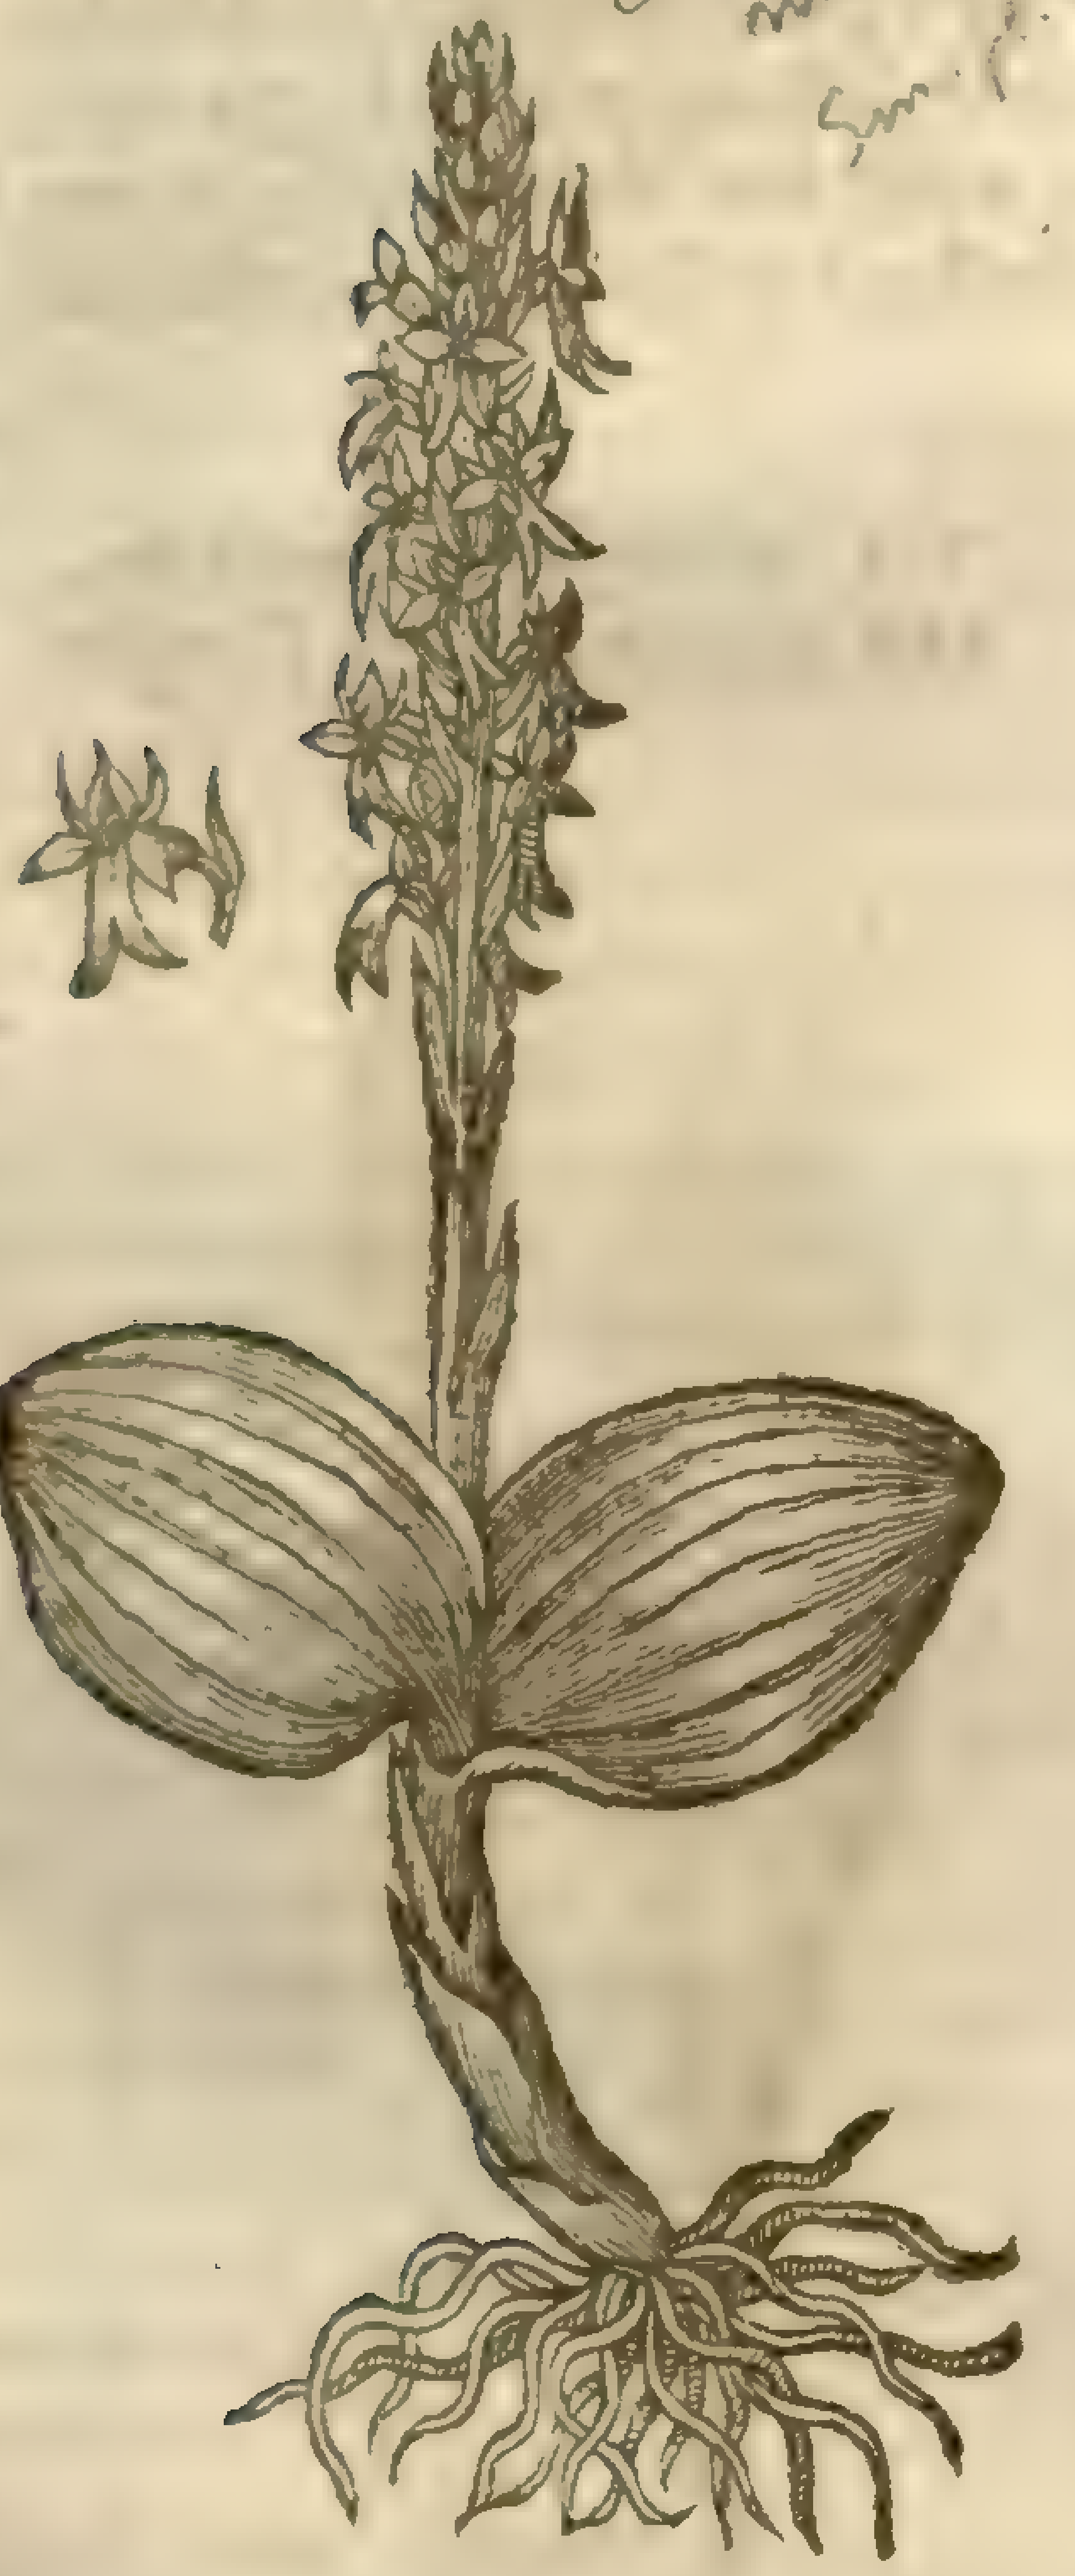
¶ *The Deſcription.*

1 Herbe Byſoile hath many ſmall fibres or threddy ſtrings, faſtened vnto a ſmall knot or root, from which riſeth vp a ſlender ſtem or ſtalke, tender, fat, and full of juice; in the middle whereof are placed in comely order two broad leaues, ribbed and chamfered, in ſhape like the leaues of Plantaine: vpon the top of the ſtalke groweth a ſlender greeniſh ſpike made of many ſmall floures, each little floure reſembling a gnat, or little goſling newly hatched, very like thoſe of the third ſort of Serapias ſtones.

2 *Ophris Trifolia*, or Trefoile Twaiblade, hath roots, tender ſtalkes, and a buſh of floures like the precedent; but differeth in that, that this plant hath three leaues which doe clip or embrace the

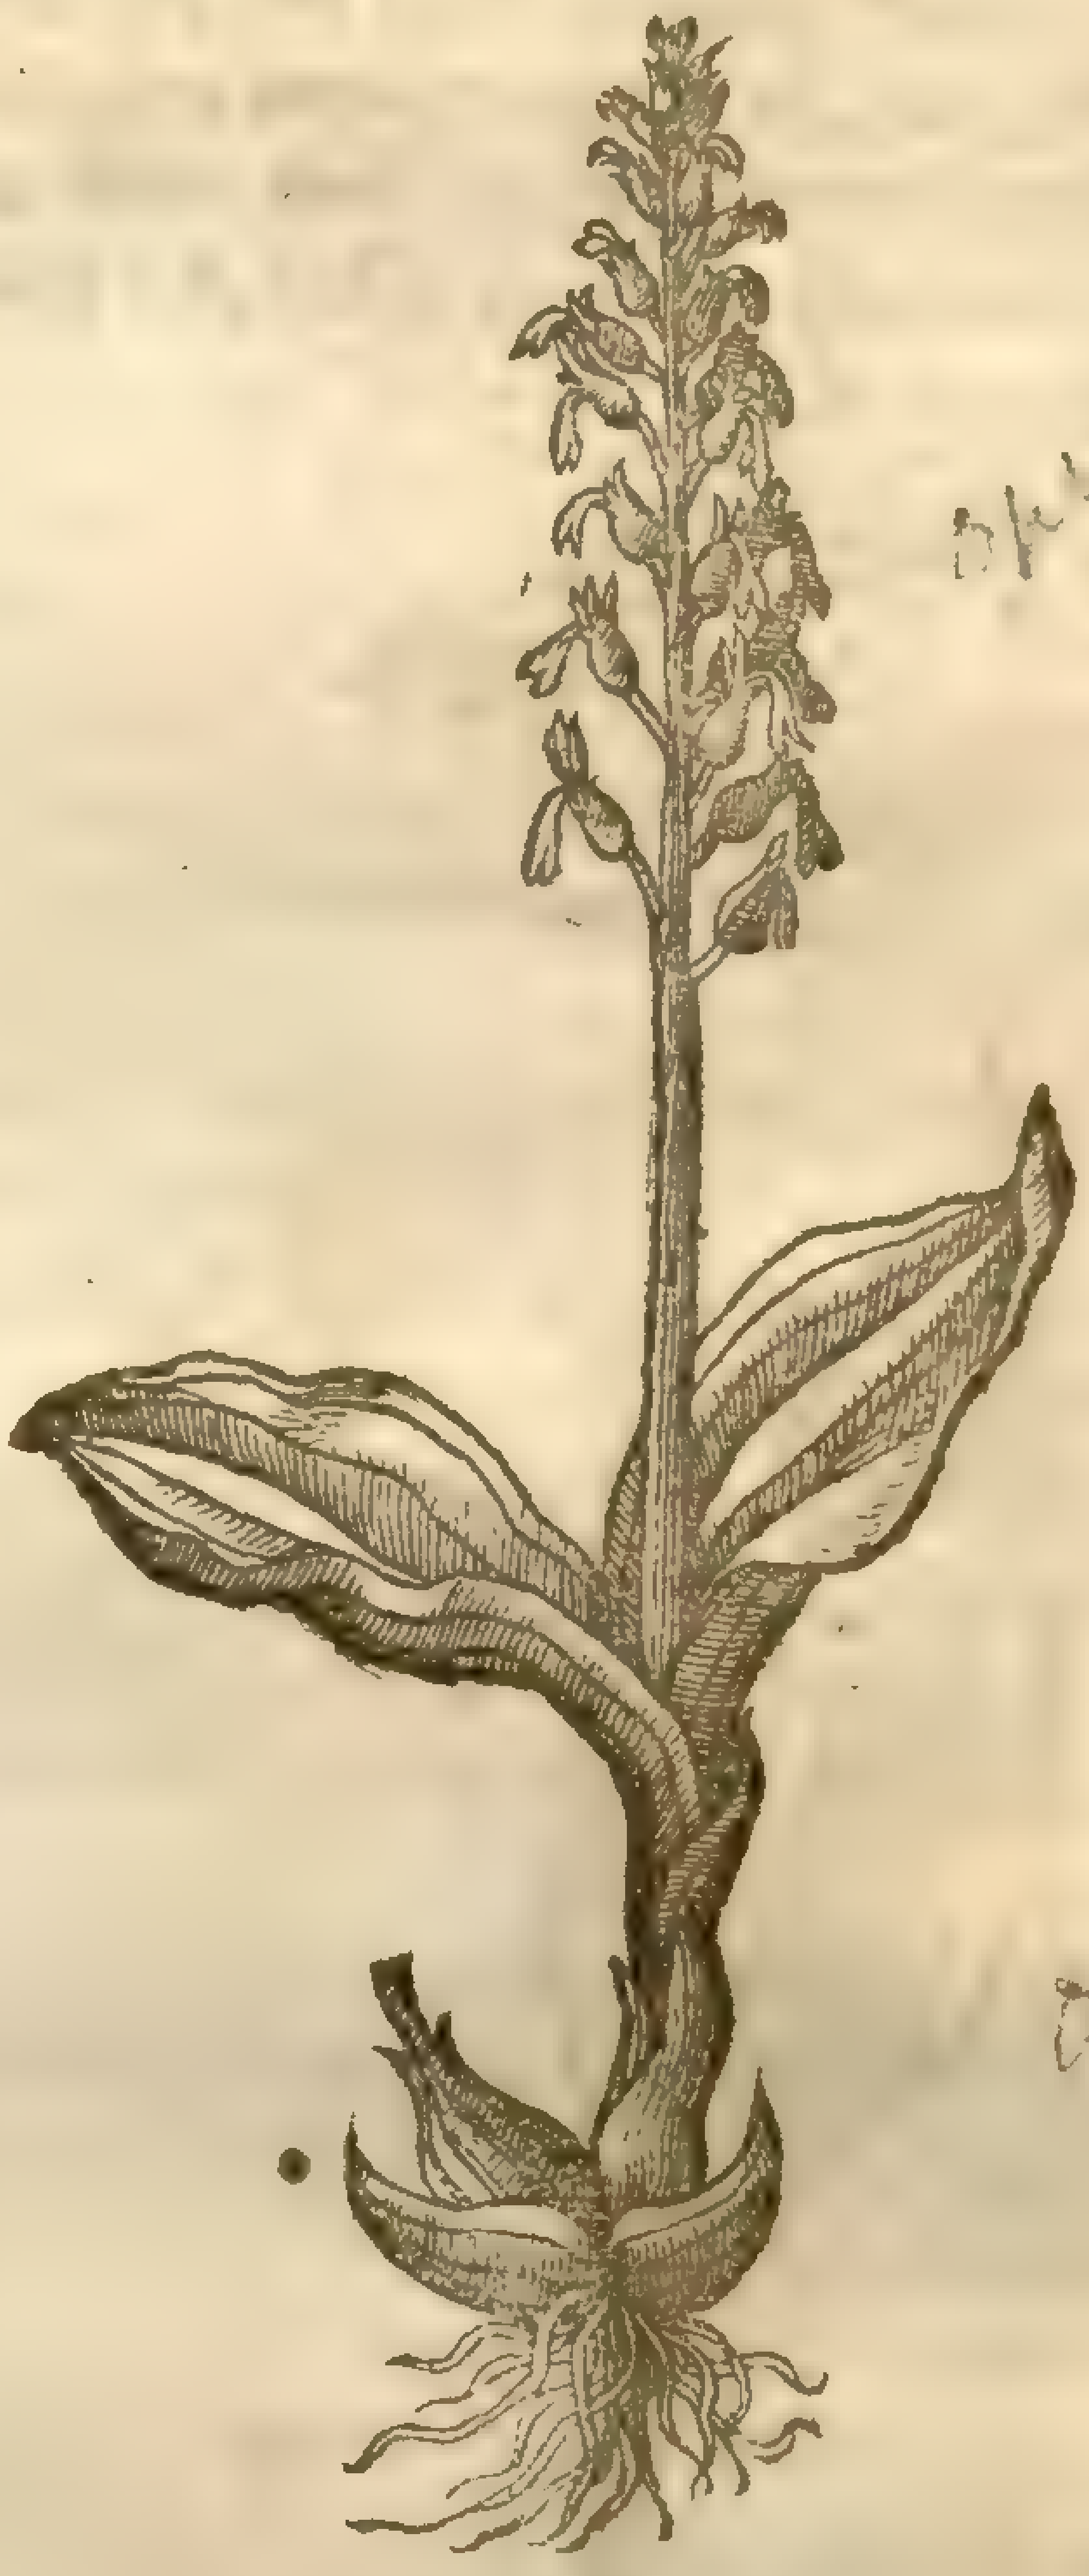
ſtalke about; and the other hath but two, and neuer more, wherein eſpecially conſiſteth the difference: although in truth I thinke it a degenerate kinde, and hath gotten a third leafe *per accidens*, as doth ſometimes chance vnto the Adders Tongue, as ſhall be declared in the Chapter that followeth.

‡ 3 This kinde of Twaiblade, firſt deſcribed in the laſt edition of *Dodonæus*, hath leaues, floures, and ſtalkes like to the ordinary; but at the bottome of the ſtalke aboue the fibrous roots it hath a bulbe greeniſh within, and couered with two or three skins: it groweth in moiſt and wet low places of Holland. ‡



1 *Ophris bifolia.*
Twaiblade.

O. ovata [illegible]



‡ 3 *Ophris bifolia bulboſa.*
Bulbous Twaiblade.

Ophrys Loeselii [illegible]

Dod. 242

¶ *The Place.*

The firſt groweth in moiſt medowes, fenny grounds, and ſhadowie places. I haue found it in many places, as at South-fleet in Kent, in a Wood of Maſter *Sidleys* by Long-field Downes, in a Wood by London called Hampſtead Wood, in the fields by High-gate, in the Woods by Ouenden neere to Clare in Eſſex, and in the Woods by Dunmow in Eſſex. The ſecond ſort is ſeldome ſeene.

¶ *The Time.*

They floure in May and Iune.

¶ *The Names.*

It is called of the later Herbariſts, *Bifolium*, and *Ophris*.

¶ *The Nature and Vertues.*

These are reported of the Herbariſts of our time to be good for greene wounds, burſtings, and ruptures, whereof I haue in my vnguents and balſams for greene wounds had great experience, and good ſucceſſe. A

Chap. 88. *Of Adders-Tongue.*

¶ *The Deſcription.*

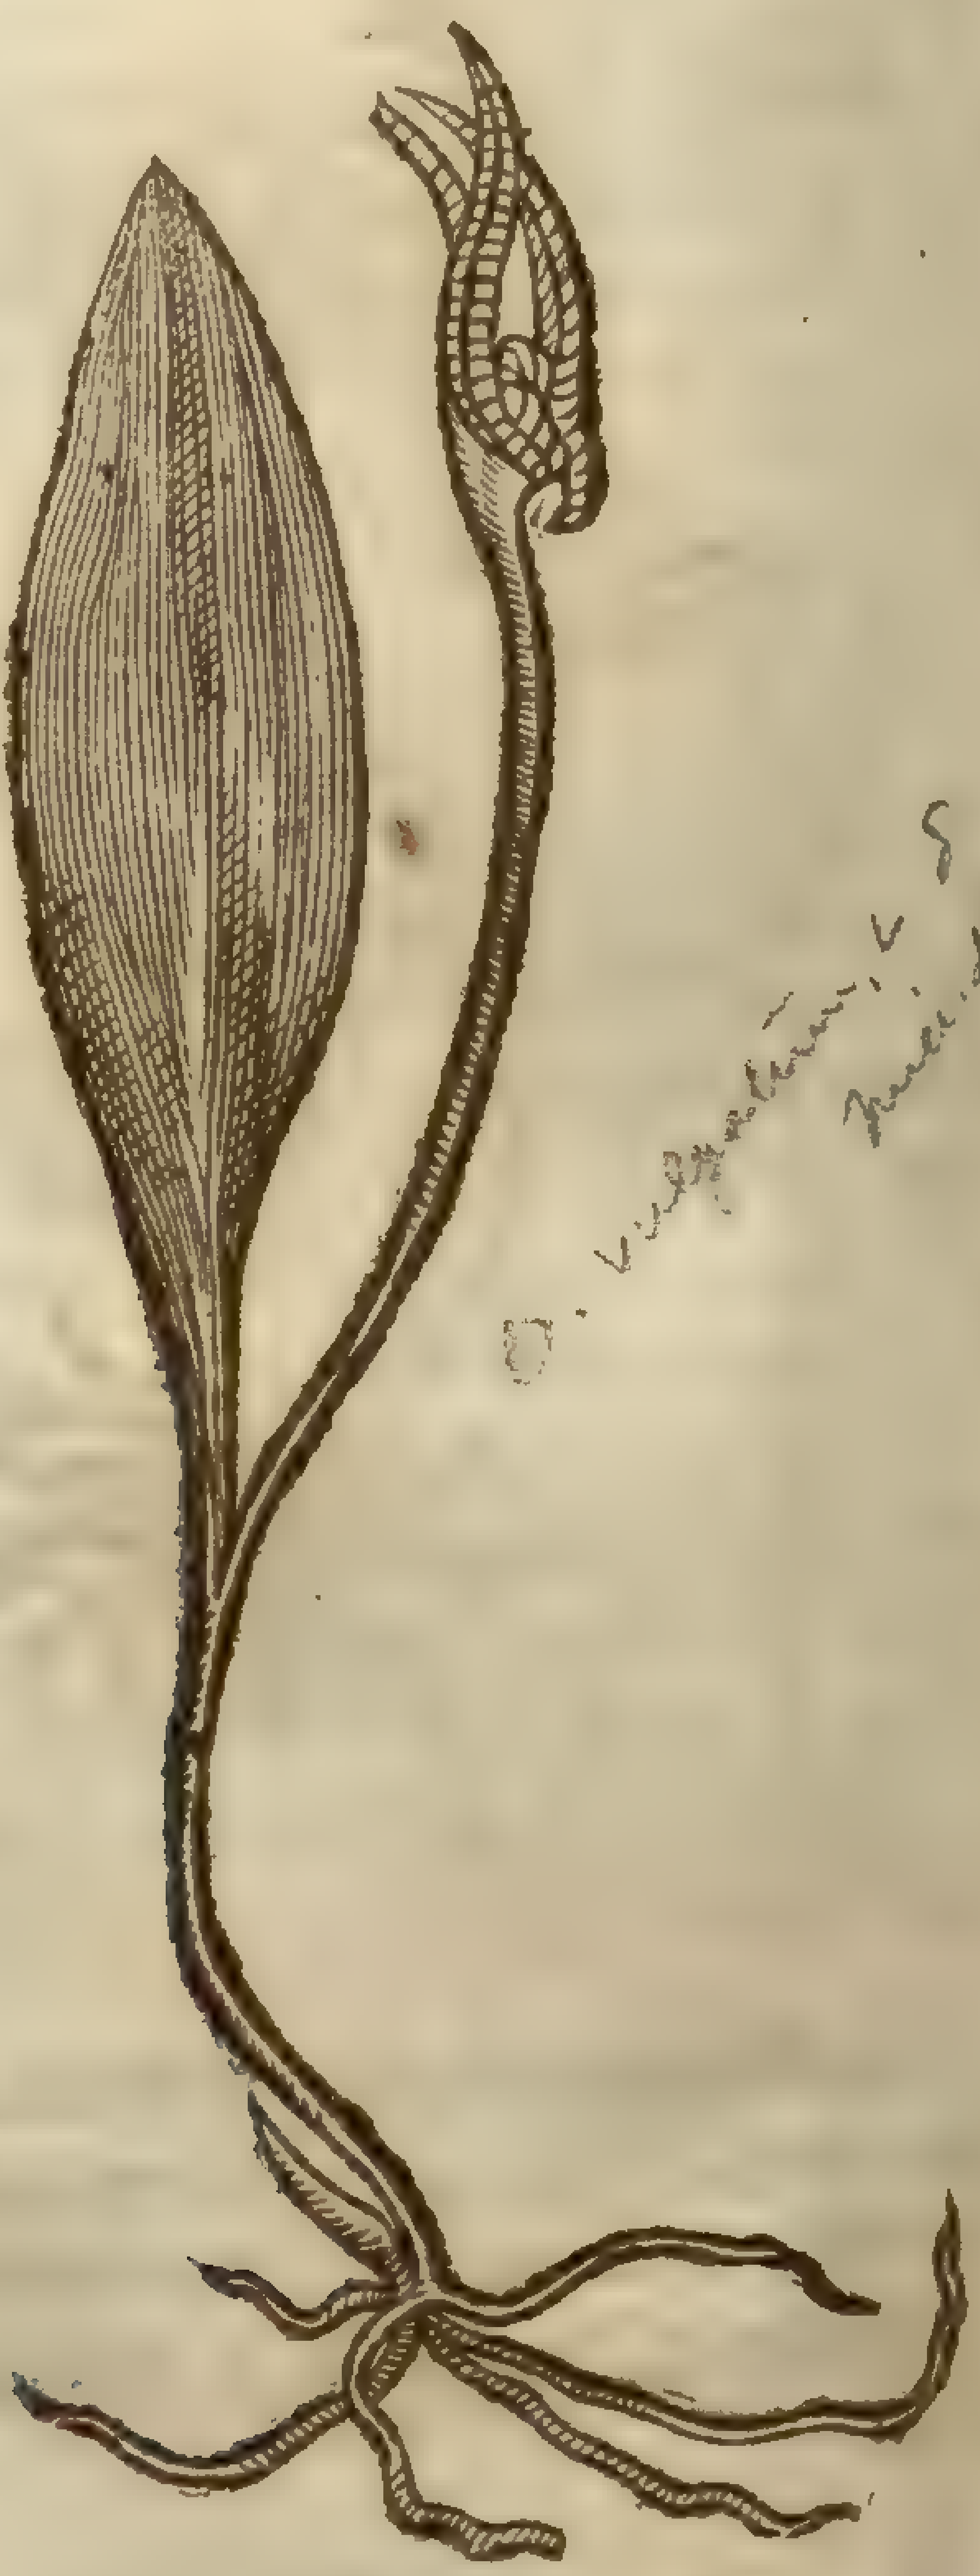
1 O*Phiogloſſon*, or *Lingua ſerpentis* (called in Engliſh Adders-Tongue; of ſome Adders-Graſſe,though vnproperly)riſeth forth of the ground, hauing one leafe and no more, fat or oleous in ſubſtance,of a finger long, and very like the young and tender leaues of Marigolds: from the bottome of which leafe ſpringeth out a ſmall and tender ſtalke one finger and a halfe long,on the end whereof doth grow a long ſmall tongue not vnlike the tongue of a ſerpent,whereof it tooke the name.

2 I haue ſeene another like the former in root,ſtalke,and leafe; and differeth,in that this plant hath two, and ſometimes more crooked tongues, yet of the ſame faſhion,which if my iudgement faile not chanceth *per accidens*, euen as we ſee children borne with two thumbes vpon one hand: which moueth me ſo to think, for that in gathering twentie buſhels of the leaues a man ſhall hardly finde one of this faſhion.

1 *Ophiogloſſon.*
Adders-Tongue.

O. vulgatum, L. Mill. dict.
Sm. fl. p. 330

‡ 2 *Ophiogloſſon abortivum.*
Miſ-ſhapen Adders Tongue.



O. vulgatum, L. δ Mill. dict.

¶ *The Place.*

Adders-Tongue groweth in moiſt medowes throughout moſt parts of England,as in a Meadow neere the preaching Spittle adjoyning to London; in the Mantels by London,in the medowes by Cole-brooke,in the fields in Waltham Forreſt,and many other places.

¶ *The Time.*

They are to be found in Aprill and May; but in Iune they are quite vaniſhed and gone.

¶ *The Names.*

Ophiogloſſum is called in ſhops *Lingua ſerpentis*,*Linquace*, and *Lingualace*: it is alſo called *Lancea Chriſti Enephyllon*,and *Lingua vulneraria*: in Engliſh,Adders tongue, or Serpents tongue: in Dutch, **Natertonguen**: of the Germanes, **Nater zungelin.**

¶ *The Nature.*

Adders-tongue is dry in the third degree.

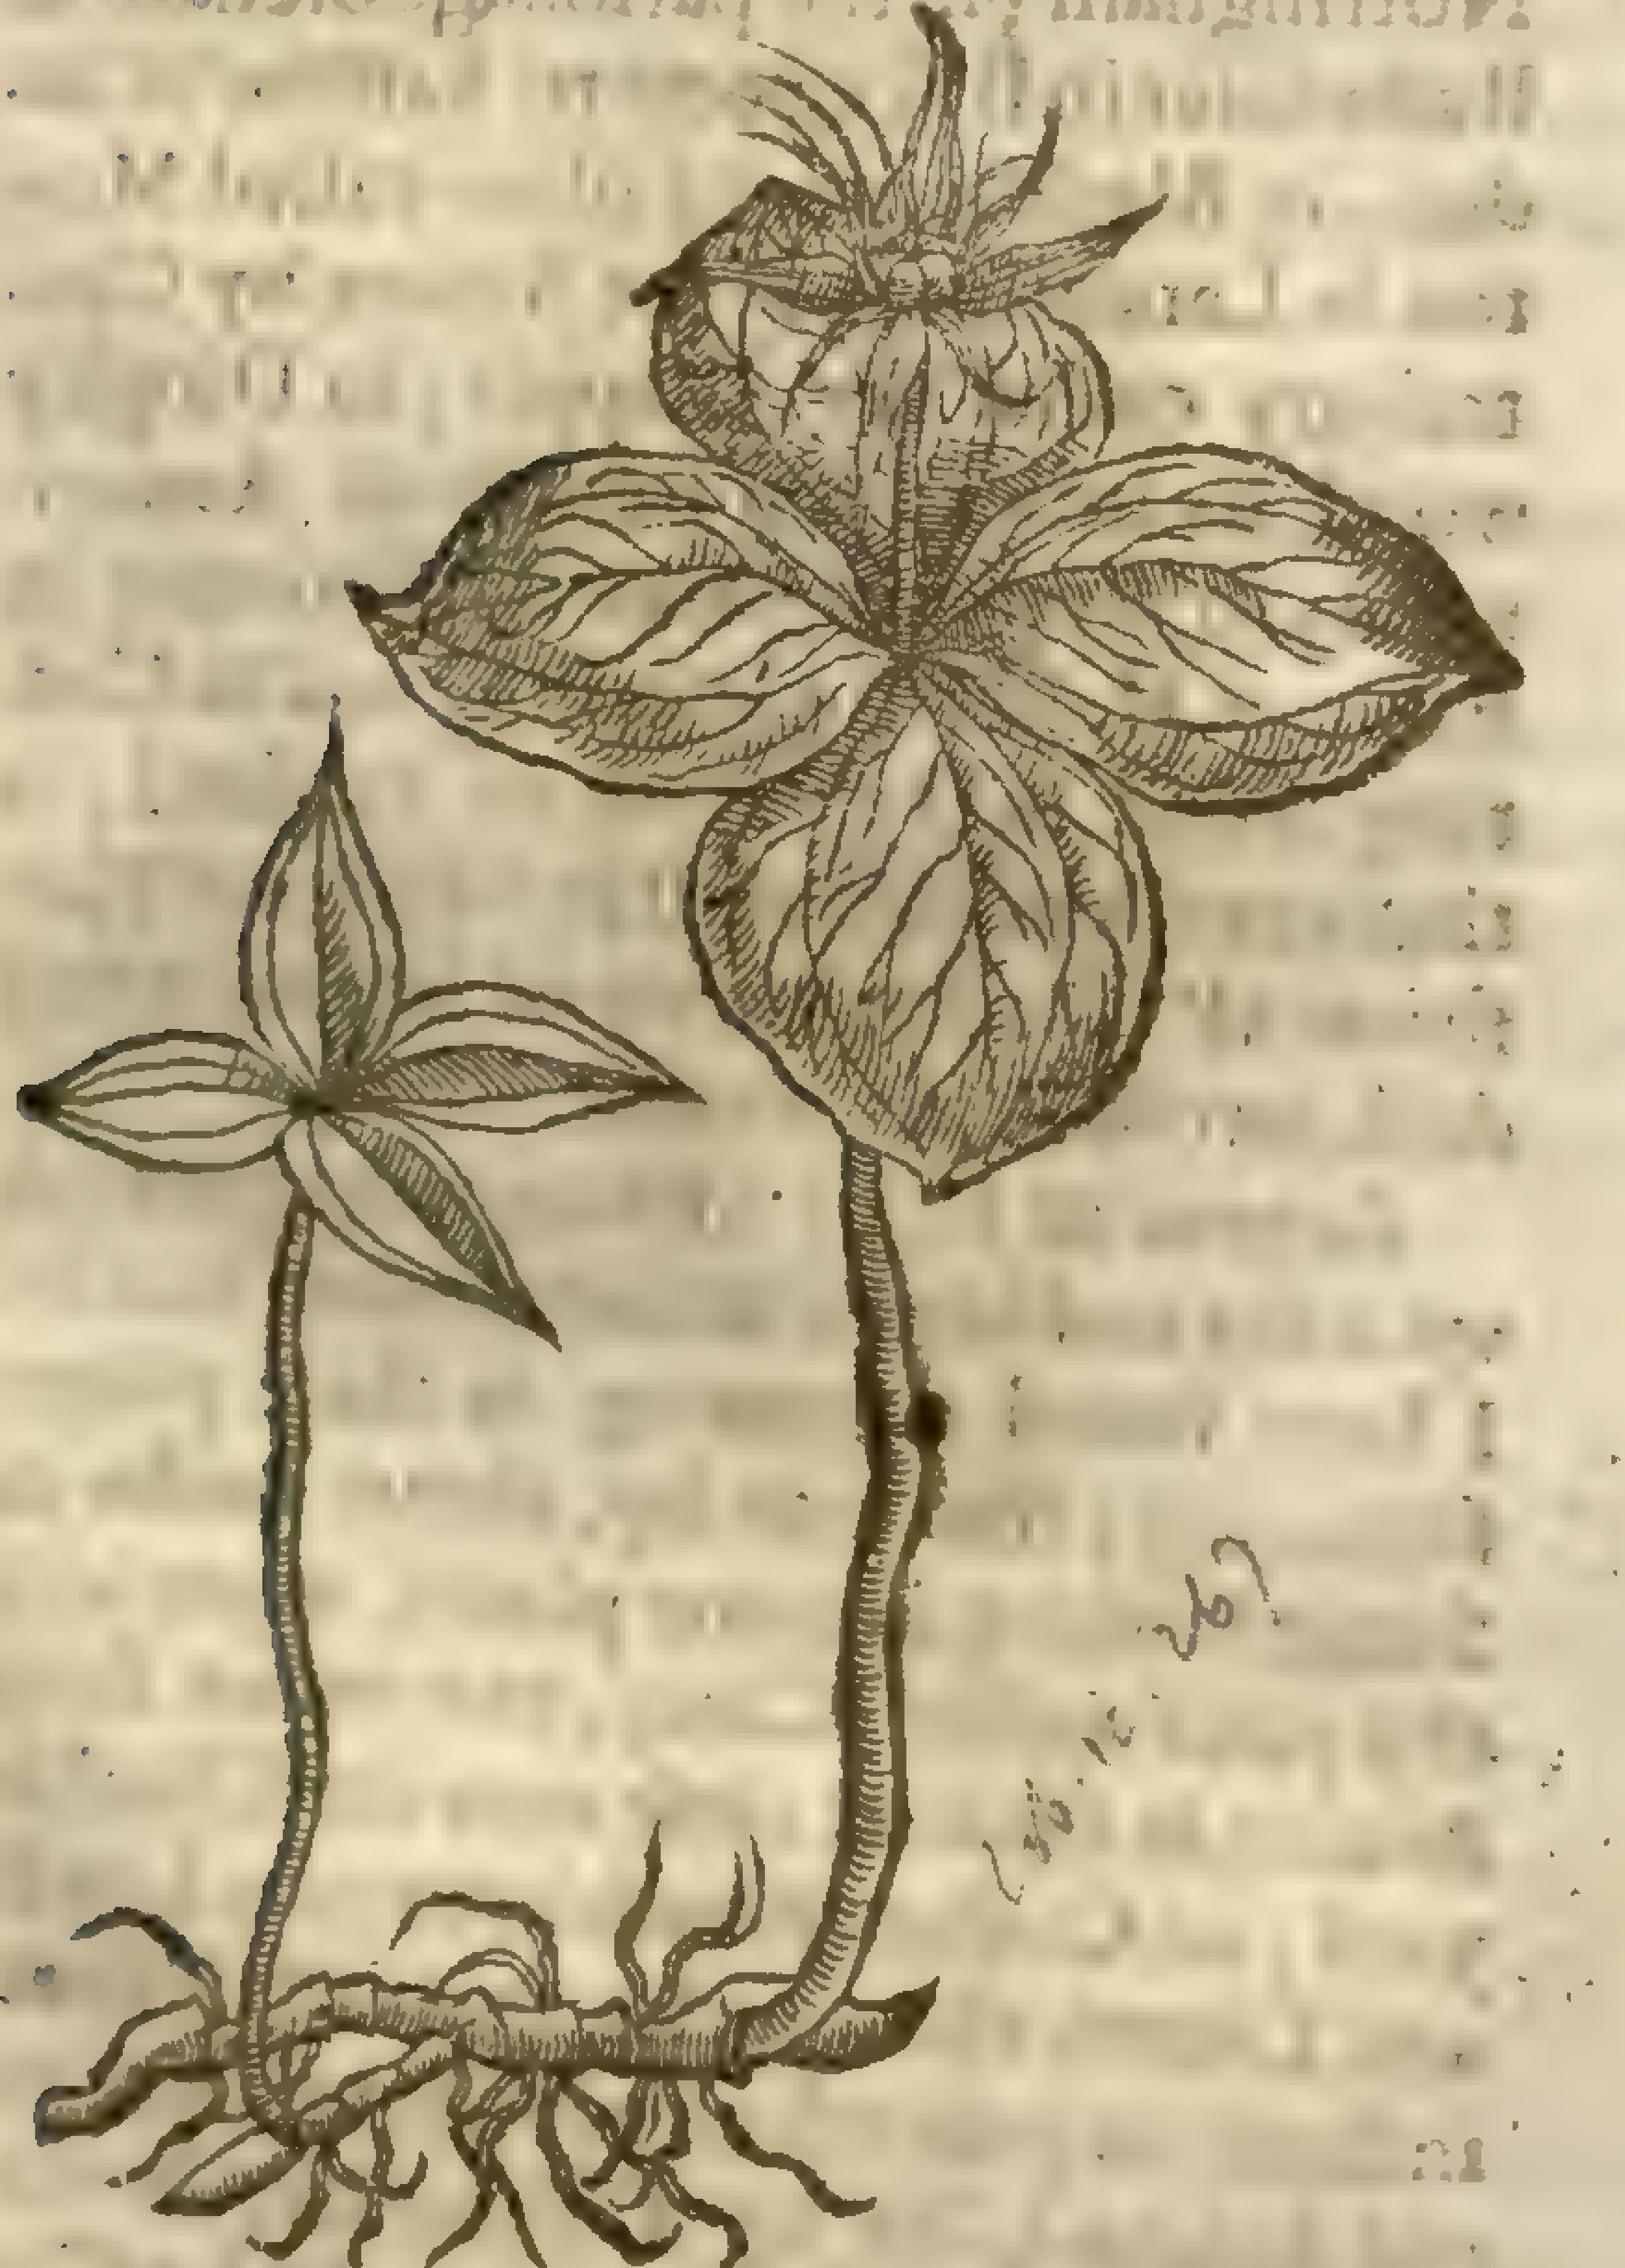
¶ *The Vertues.*

A The leaues of Adders tongue ſtamped in a ſtone morter, and boyled in Oile Oliue vnto the conſumption of the juyce, and vntill the herbes be dry and parched, and then ſtrained, will yeeld a moſt excellent greene oyle, or rather a balſame for greene wounds, comparable to oile of S. *Iohns* wort, if it do not farre ſurpaſſe it by many degrees: whoſe beautie is ſuch that very many Artiſts haue thought the ſame to be mixed with Verdigreaſe.

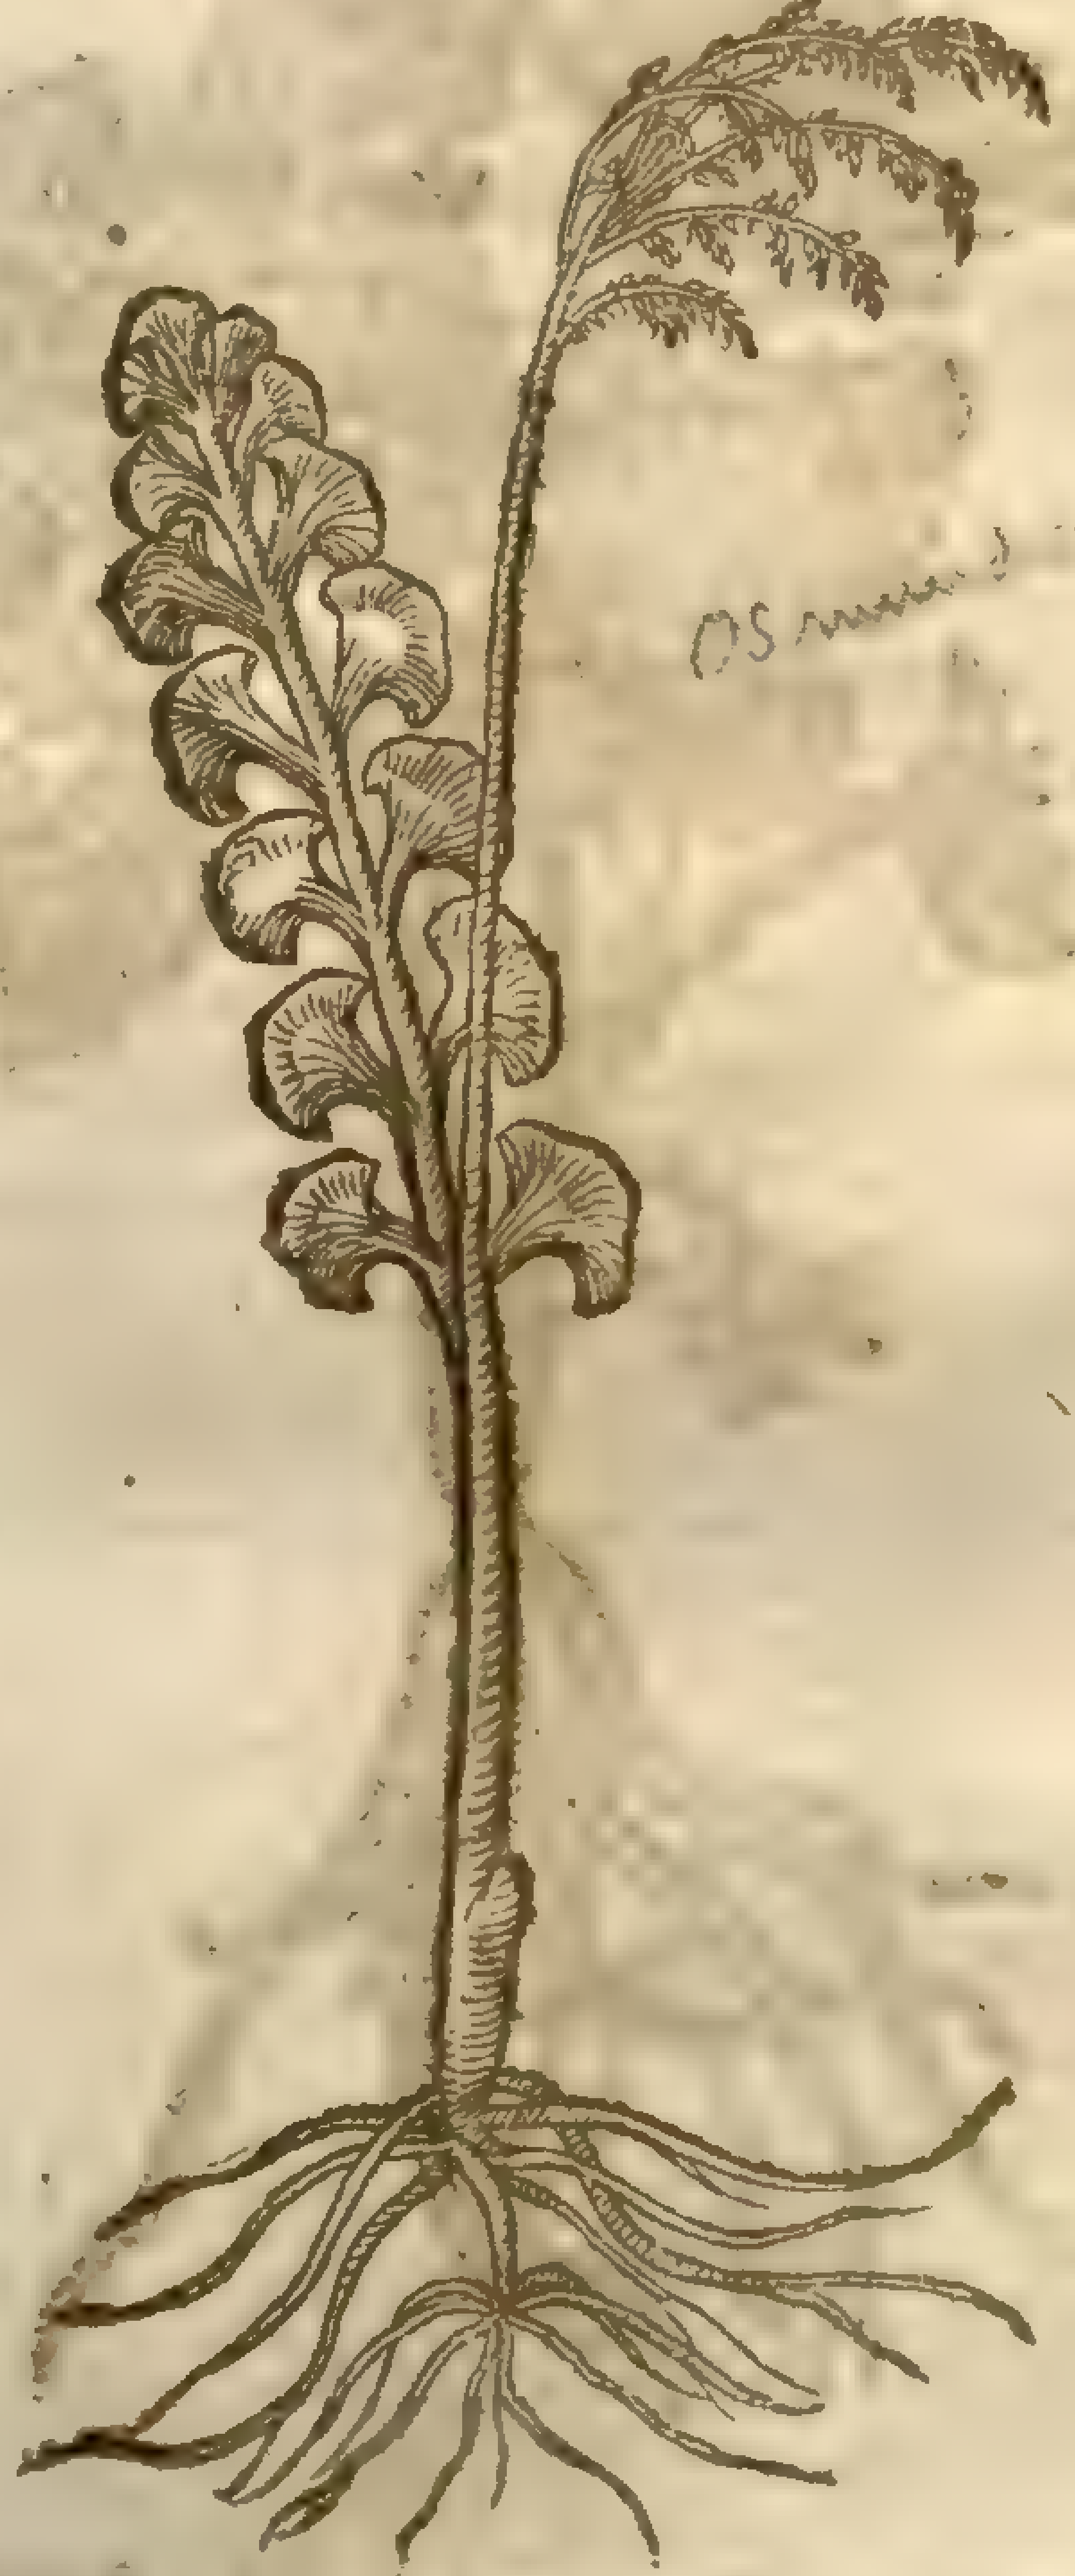
CHAP. 89.

Of One-berry, or Herbe True-loue, and Moone-wort.

1 *Herba Paris.*
One-berry, or Herbe True-loue.



2 *Lunaria minor.*
Small Moone-wort.



Osmunda Lunaria [illegible]
See p. 4. 338

¶ *The Deſcription.*

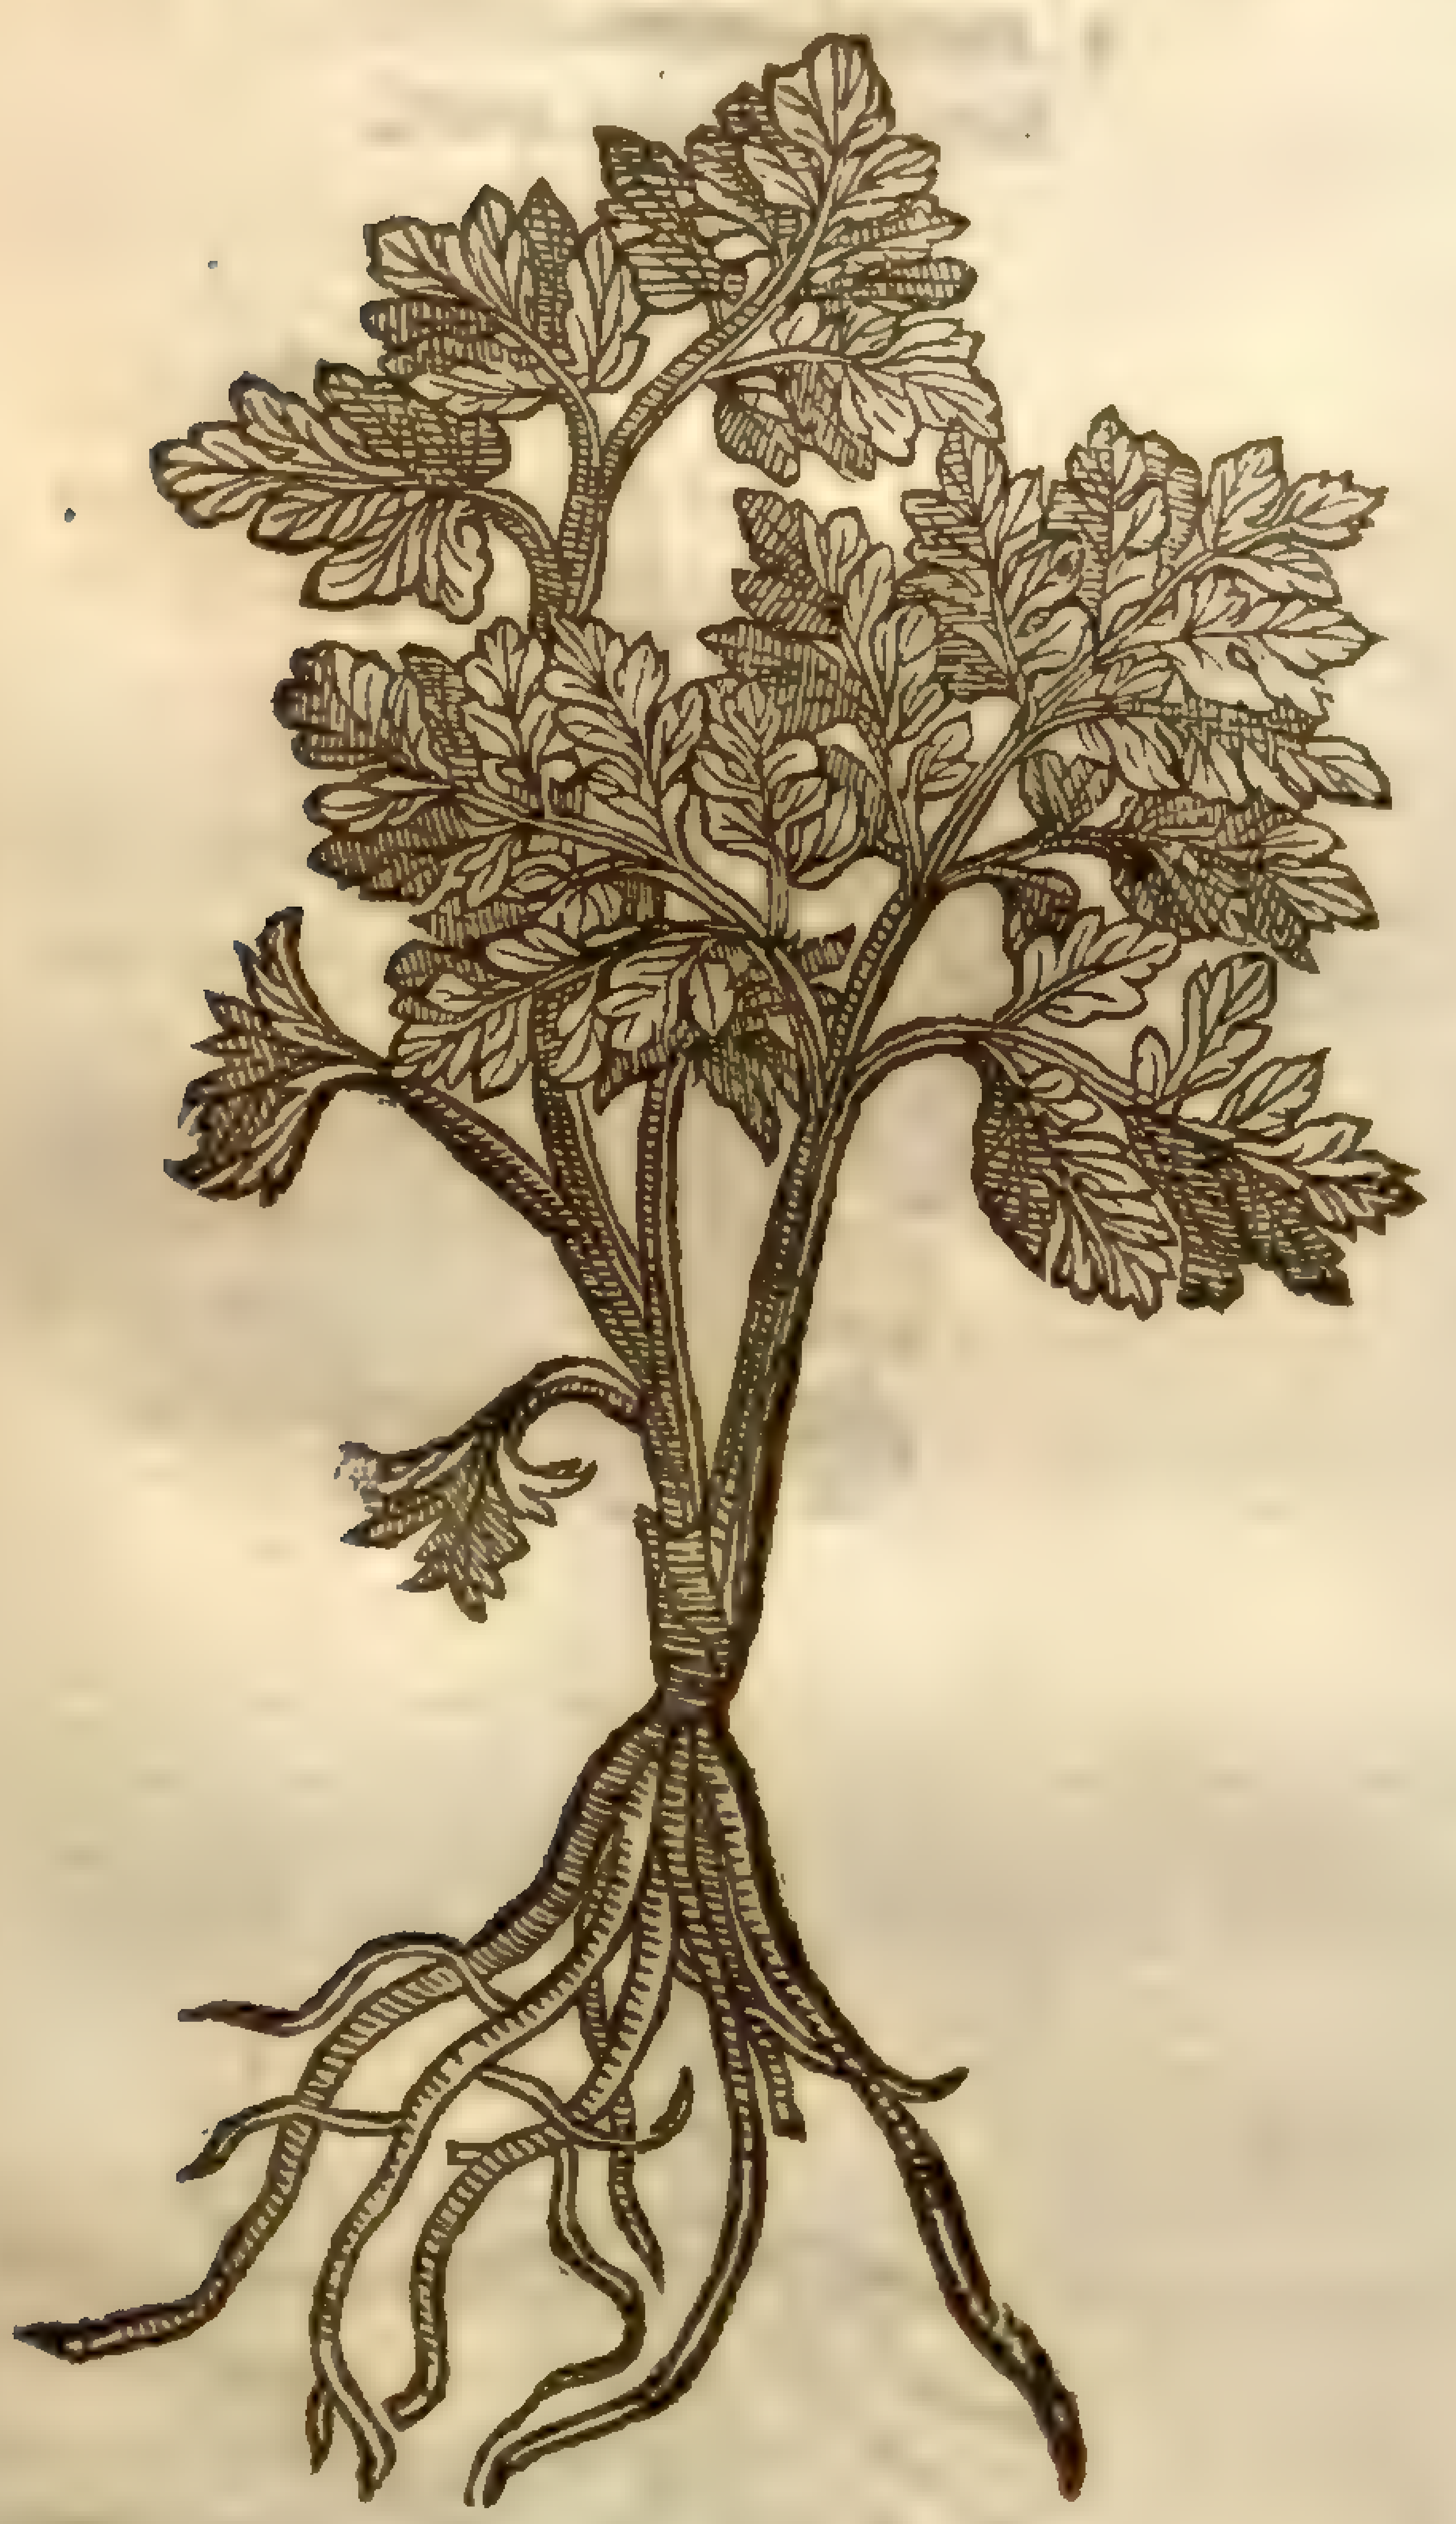
1 HErbe Paris riſeth vp with one ſmal tender ſtalke two hands high; at the very top whereof come forth foure leaues directly ſet one againſt another in manner of a Burgundian Croſſe or True-loue knot: for which cauſe among the Antients it hath been called Herbe True-loue. In the midſt of the ſaid leafe comes forth a ſtarre-like floure of an herby or graſſie colour; out of the middeſt whereof there ariſeth vp a blackiſh browne berry: the root is long and tender, creeping vnder the earth, and diſperſing it ſelfe hither and thither.

2 The ſmall Lunary ſpringeth forth of the ground with one leafe like Adders-tongue, jagged or cut on both ſides into fiue or ſix deepe cuts or notches, not much vnlike the leaues of *Scolopendria*, or *Ceterach*, of a greene colour; whereupon doth grow a ſmall naked ſtem of a finger long, bearing at the top many little ſeeds cluſtering together; which being gathered and laid in a platter or ſuch like thing for the ſpace of three weekes, there will fall from the ſame a fine duſt or meale of a whitiſh colour, which is the ſeed if it bring forth any. The root is ſlender, and compact of many ſmall threddy ſtrings.

‡ In England (ſaith *Camerarius*) there growes a certaine kinde of *Lunaria*, which hath many leaues, and ſometimes alſo ſundry branches; which therefore I haue cauſed to be delineated, that other Herbariſts might alſo take notice hereof. Thus much *Camerarius*, *Epit. Mat. p.* 644. where he giues an elegant figure of a variety hauing more leaues and branches than the ordinary, otherwiſe not differing from it.

3 Beſides this varietie there is another kinde ſet forth by *Cluſius*; whoſe figure and deſcription I thinke good here to ſet downe. This hath a root conſiſting of many fibres ſomewhat thicker than thoſe of the common kinde: from which ariſe one or two winged leaues, that is, many leaues ſet to one ſtalke; and theſe are like the leaues of the other *Lunaria*, but that they are longer, thicker, and more diuided, and of a yellowiſh greene colour. Amongſt theſe leaues there comes vp a ſtalke fat and juycie, bearing a greater tuft of floures or ſeeds (for I know not whether to call them) than the ordinary, but otherwiſe very like thereto. It groweth in the mountaines of Sileſia, and in ſome places of Auſtria. ‡

‡ 3 *Lunaria minor Ramoſa.*
Small branched Moon-wort.



¶ *The Place.*

Herba Paris groweth plentifully in all theſe places following; that is to ſay, in Chalkney wood neere to wakes Coulne, ſeuen miles from Colcheſter in Eſſex, and in the wood by Robinhoods well, neere to Nottingham; in the parſonage orchard at Radwinter in Eſſex, neere to Saffron Walden; in Blackburne at a place called Merton in Lancaſhire; in the Moore by Canterbury called the Clapper; in Dingley wood, ſix miles from Preſton in Aunderneſſe; in Bocking parke by Braintree in Eſſex; at Heſſet in Lancaſhire, and in Cotting wood in the North of England; as that excellent painefull and diligent Phyſition Mr Doctor *Turner* of late memorie doth record in his Herbal.

Lunaria or ſmall Moone-wort groweth vpon dry and barren mountains and heaths. I haue found it growing in theſe places following; that is to ſay, about Bathe in Somerſetſhire in many places, eſpecially at a place called Carey, two miles from Bruton, in the next cloſe vnto the Church-yard; on Cockes Heath betweene Lowſe and Linton, three miles from Maidſtone in Kent: it groweth alſo in the ruines of an old bricke-kilne by Colcheſter, in the ground of Mr *George Sayer*, called Miles end: it groweth likewiſe vpon the ſide of Blacke-heath, neere vnto the ſtile that leadeth vnto Eltham houſe, about an hundred paces from the ſtile: alſo in Lancaſhire neere vnto a Wood called Faireſt, by Latham: moreouer, in Nottinghamſhire by the Weſtwood at Gringley, and at Weſton in the Ley field by the Weſt ſide of the towne; and in the Biſhops field at Yorke, neere vnto Wakefield, in the cloſe where Sir *George Sauill* his houſe ſtandeth, called the Heath Hall, by the relation of a learned Doctor in Phyſicke called Maſter *Iohn Merſhe* of Cambridge, and many other places.

¶ *The Time.*

Herba Paris floureth in Aprill, and the berry is ripe in the end of May.

Lunaria or ſmall Moone wort is to be ſeene in the moneth of May.

¶ *The Names.*

One-berry is alſo called Herbe True-loue, and Herbe Paris: in Latine, *Herba Paris*, and *Solanum tetraphyllum* by *Geſner* and *Lobel*.

Lunaria minor is called in Engliſh, Small Lunarie, and Moone-wort.

¶ *The Temperature.*

Herbe Paris is exceeding cold; whereby it repreſſeth the rage and force of poyſon.

Lunaria minor is cold and dry of temperature.

¶ *The Vertues.*

A The berries of Herbe Paris giuen by the ſpace of twentie daies, are excellent good againſt poyſon, or the pouder of the herbe drunke in like manner halfe a ſpoonefull at a time in the morning faſting.

B The ſame is miniſtred with great ſucceſſe vnto ſuch as are become peeuiſh, or without vnderſtanding, being miniſtred as is aforeſaid, euery morning by the ſpace of twenty daies, as *Baptiſta Sardus*, and *Matthiolus* haue recorded. Since which time there hath been further experience made therof againſt poyſon, & put in practiſe in the citie of Paris, in Louaine, and at the baths in Heluetia, by the right excellent Herbariſts *Matthias de Lobel*, and *Petrus Pena*, who hauing often read, that it was one of the Aconites, called *Pardalianches*, and ſo by conſequence of a poyſoning quality, they gaue it vnto dogs and lambes, who receiued no hurt by the ſame: wherefore they further proſecuted the experience thereof, and gaue vnto two dogs faſt bound or coupled together, a dram of Arſenicke, and one dram of Mercury ſublimate mixed with fleſh (‡ in the *Aduerſaria* it is but of each halfe a dram, and there *pag.* 105. you may finde this Hiſtory more largely ſet downe. ‡) which the dogs would not willingly eate, and therefore they had it crammed downe their throats: vnto one of theſe dogs they gaue this Antidote following in a little red wine, whereby he recouered his former health againe within a few houres: but the other dog which had none of the medicine, died incontinently.

This is the Receit.

R. *vtriuſque Angelicæ (innuit) domeſticam, & ſylueſtrem, Vicetoxici, valerianæ domeſticæ, Polipodij querni, radicum Altheæ, & Vrticæ, ana* ʒ.iiij, *Corticis Mezerei Germanici,* ʒ.ij, *granorum herbæ Paridis, N.* 24. *foliorum ejuſdem cam toto, Num.* 36. *Ex maceratis in aceto radicibus & ſiccatis fit omnium pulvis.*

C The people in Germany doe vſe the leaues of Herbe Paris in greene wounds, for the which it is very good, as *Ioachimus Camerarius* reporteth; who likewiſe ſaith, that the pouder of the roots giuen to drinke, doth ſpeedily ceaſe the gripings and paine of the Collicke.

D Small Moone-woort is ſingular to heale greene and freſh wounds: it ſtaieth the bloudy flix. It hath beene vſed among the Alchymiſts and witches to doe wonders withall, who ſay, that it will looſe lockes, and make them to fall from the feet of horſes that graſe where it doth grow, and hath beene called of them *Martagon*, whereas in truth they are all but drowſie dreames and illuſions; but it is ſingular for wounds as aforeſaid.

CHAP. 90. *Of Winter-Greene.*

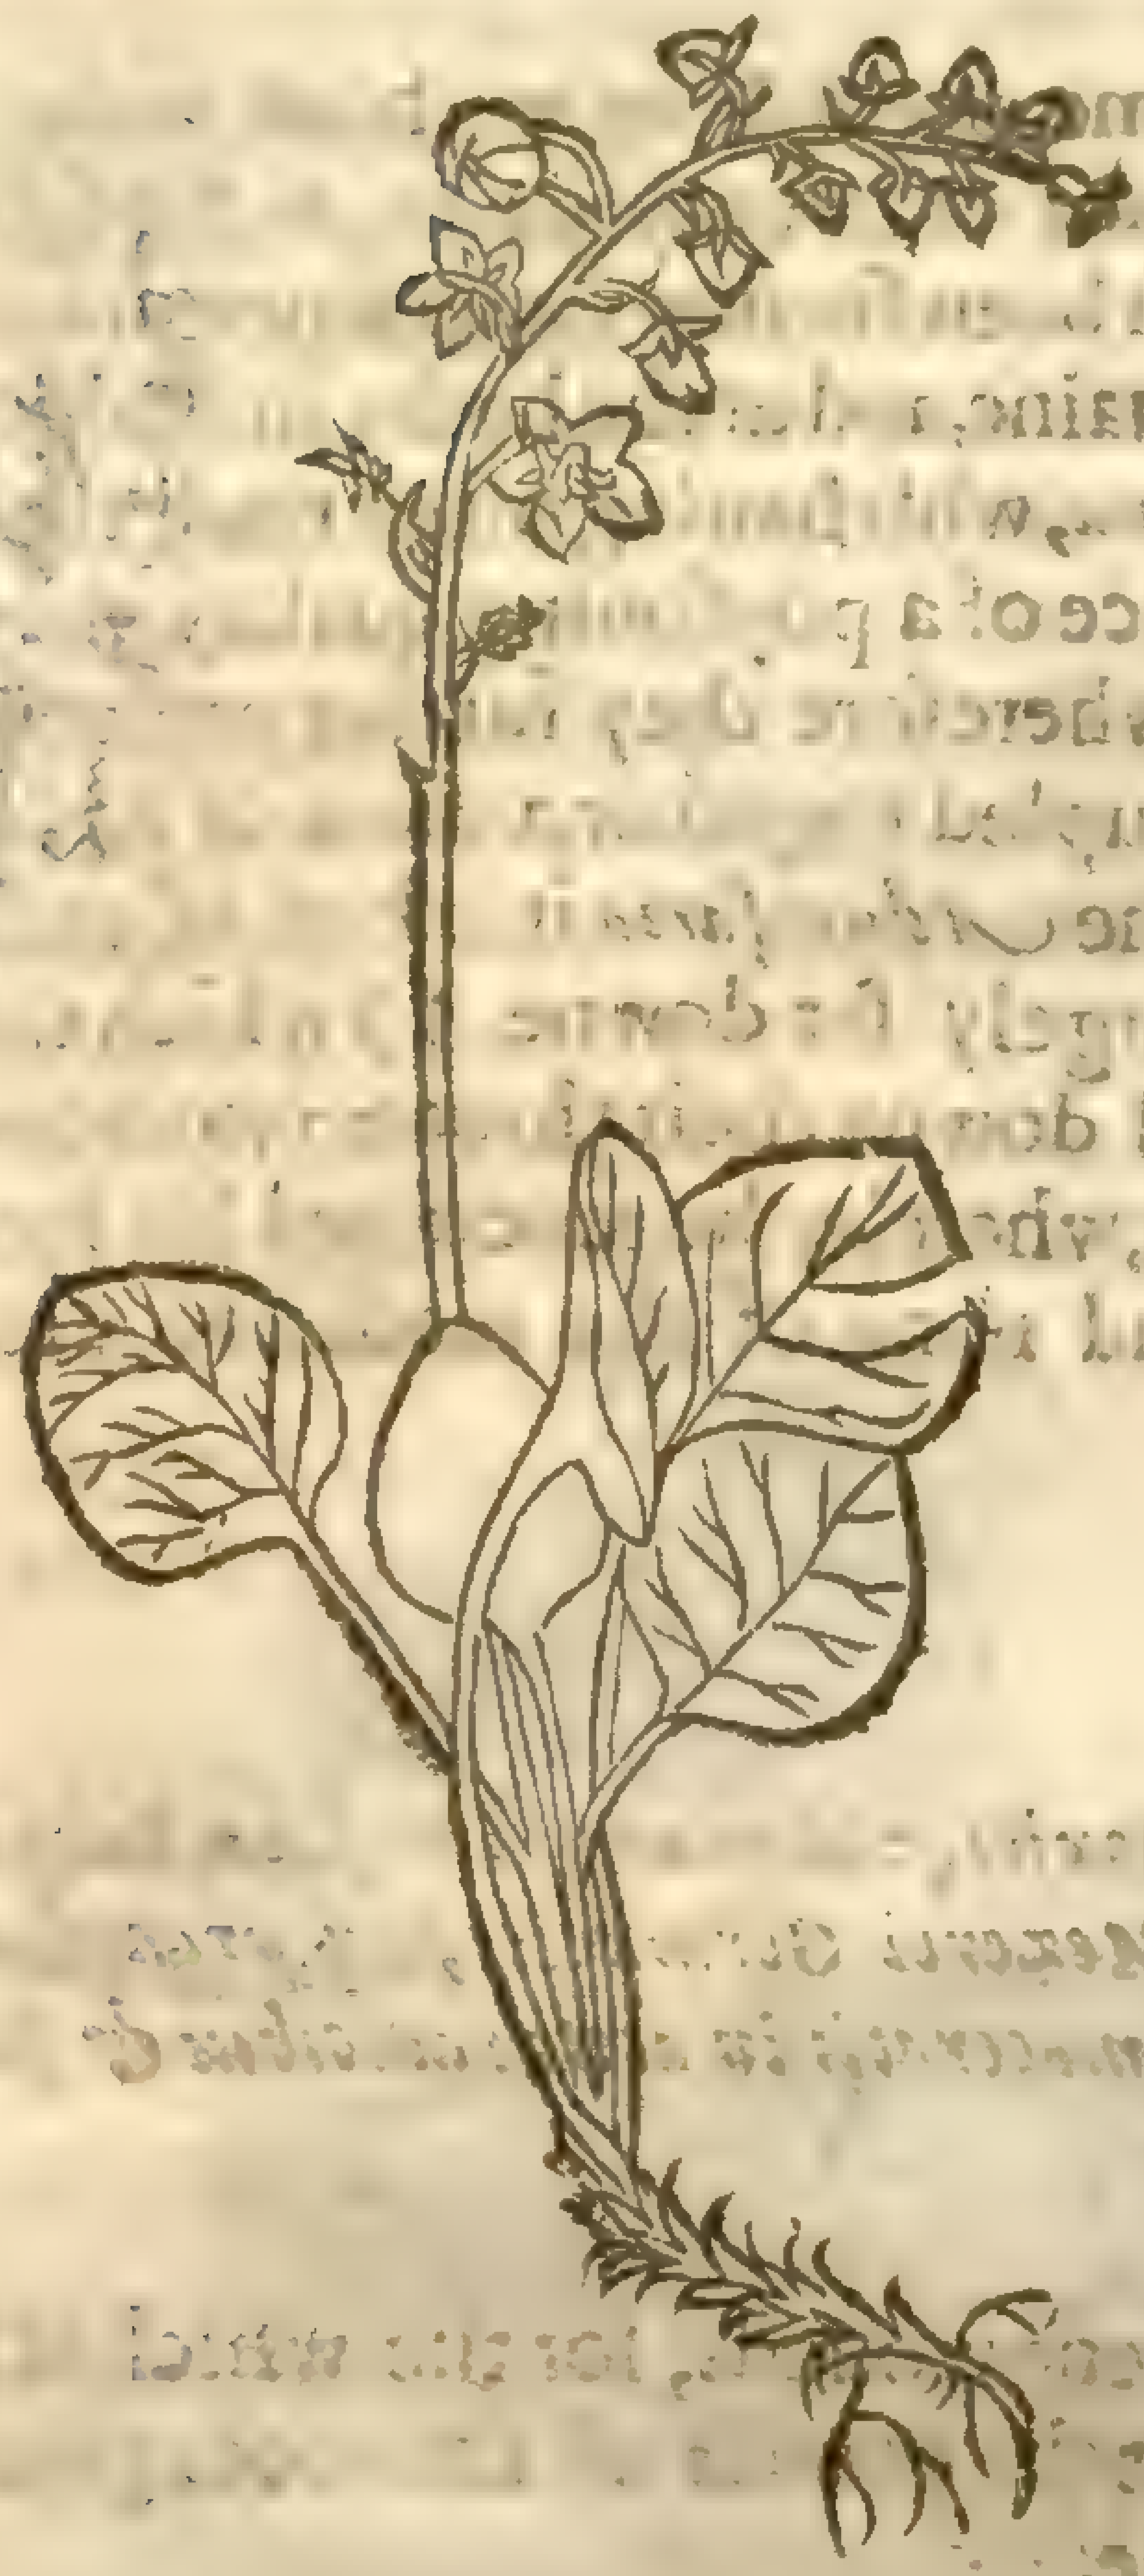
¶ *The Deſcription.*

1 PYrola hath many tender and very greene leaues, almoſt like the leaues of Beet, but rather in my opinion like to the leaues of a Peare-tree, whereof it tooke his name *Pyrola*, for that it is *Pyriformis*. Among theſe leaues commeth vp a ſtalke garniſhed with prettie white floures, of a very pleaſant ſweet ſmell, like *Lillium Conuallium*, or the Lillie of the Valley. The root is ſmall and threddy, creeping far abroad vnder the ground.

‡ 2 This differs from the laſt deſcribed in the ſlenderneſſe of the ſtalkes, and ſmalneſſe of the leaues and floures: for the leaues of this are not ſo thicke, and ſubſtantiall, but very thinne, ſharpe pointed, and very finely ſnipt about the edges, blacker, and reſembling a Peare-tree leafe. The floures are like thoſe of the former, yet ſmaller and more in number: to which ſucceed fiue cornered ſeed veſſels with a long pointell as in the precedent: the root alſo creepes no leſſe than that of the former, and here and there puts vp new ſtalkes vnder the moſſe. It growes vpon the Auſtrian and Styrian Alpes, and floures in Iune and Iuly.

3 This is an elegant plant, and ſometimes becomes ſhrubby, for the new and ſhort branches growing vp each yeere, doe remaine firme and greene for ſome yeeres, and grow ſtreight vp, vntill at length borne downe by their owne weight they fall downe and hide themſelues in the moſſe. It hath commonly at each place where new branches grow forth, two, three, or foure thicke, very greene and ſhining leaues, almoſt in forme and magnitude like to the leaues of *Laureola*, yet ſnipt about the edges, of a very drying taſte, and then bitteriſh. From among theſe leaues at the *Spring* of the yeere new branches ſhoot vp, hauing ſmall leaues like ſcailes vpon them, and at their tops

1 *Pyrola.*
Winter-Greene.



Pyrola rotundifolia

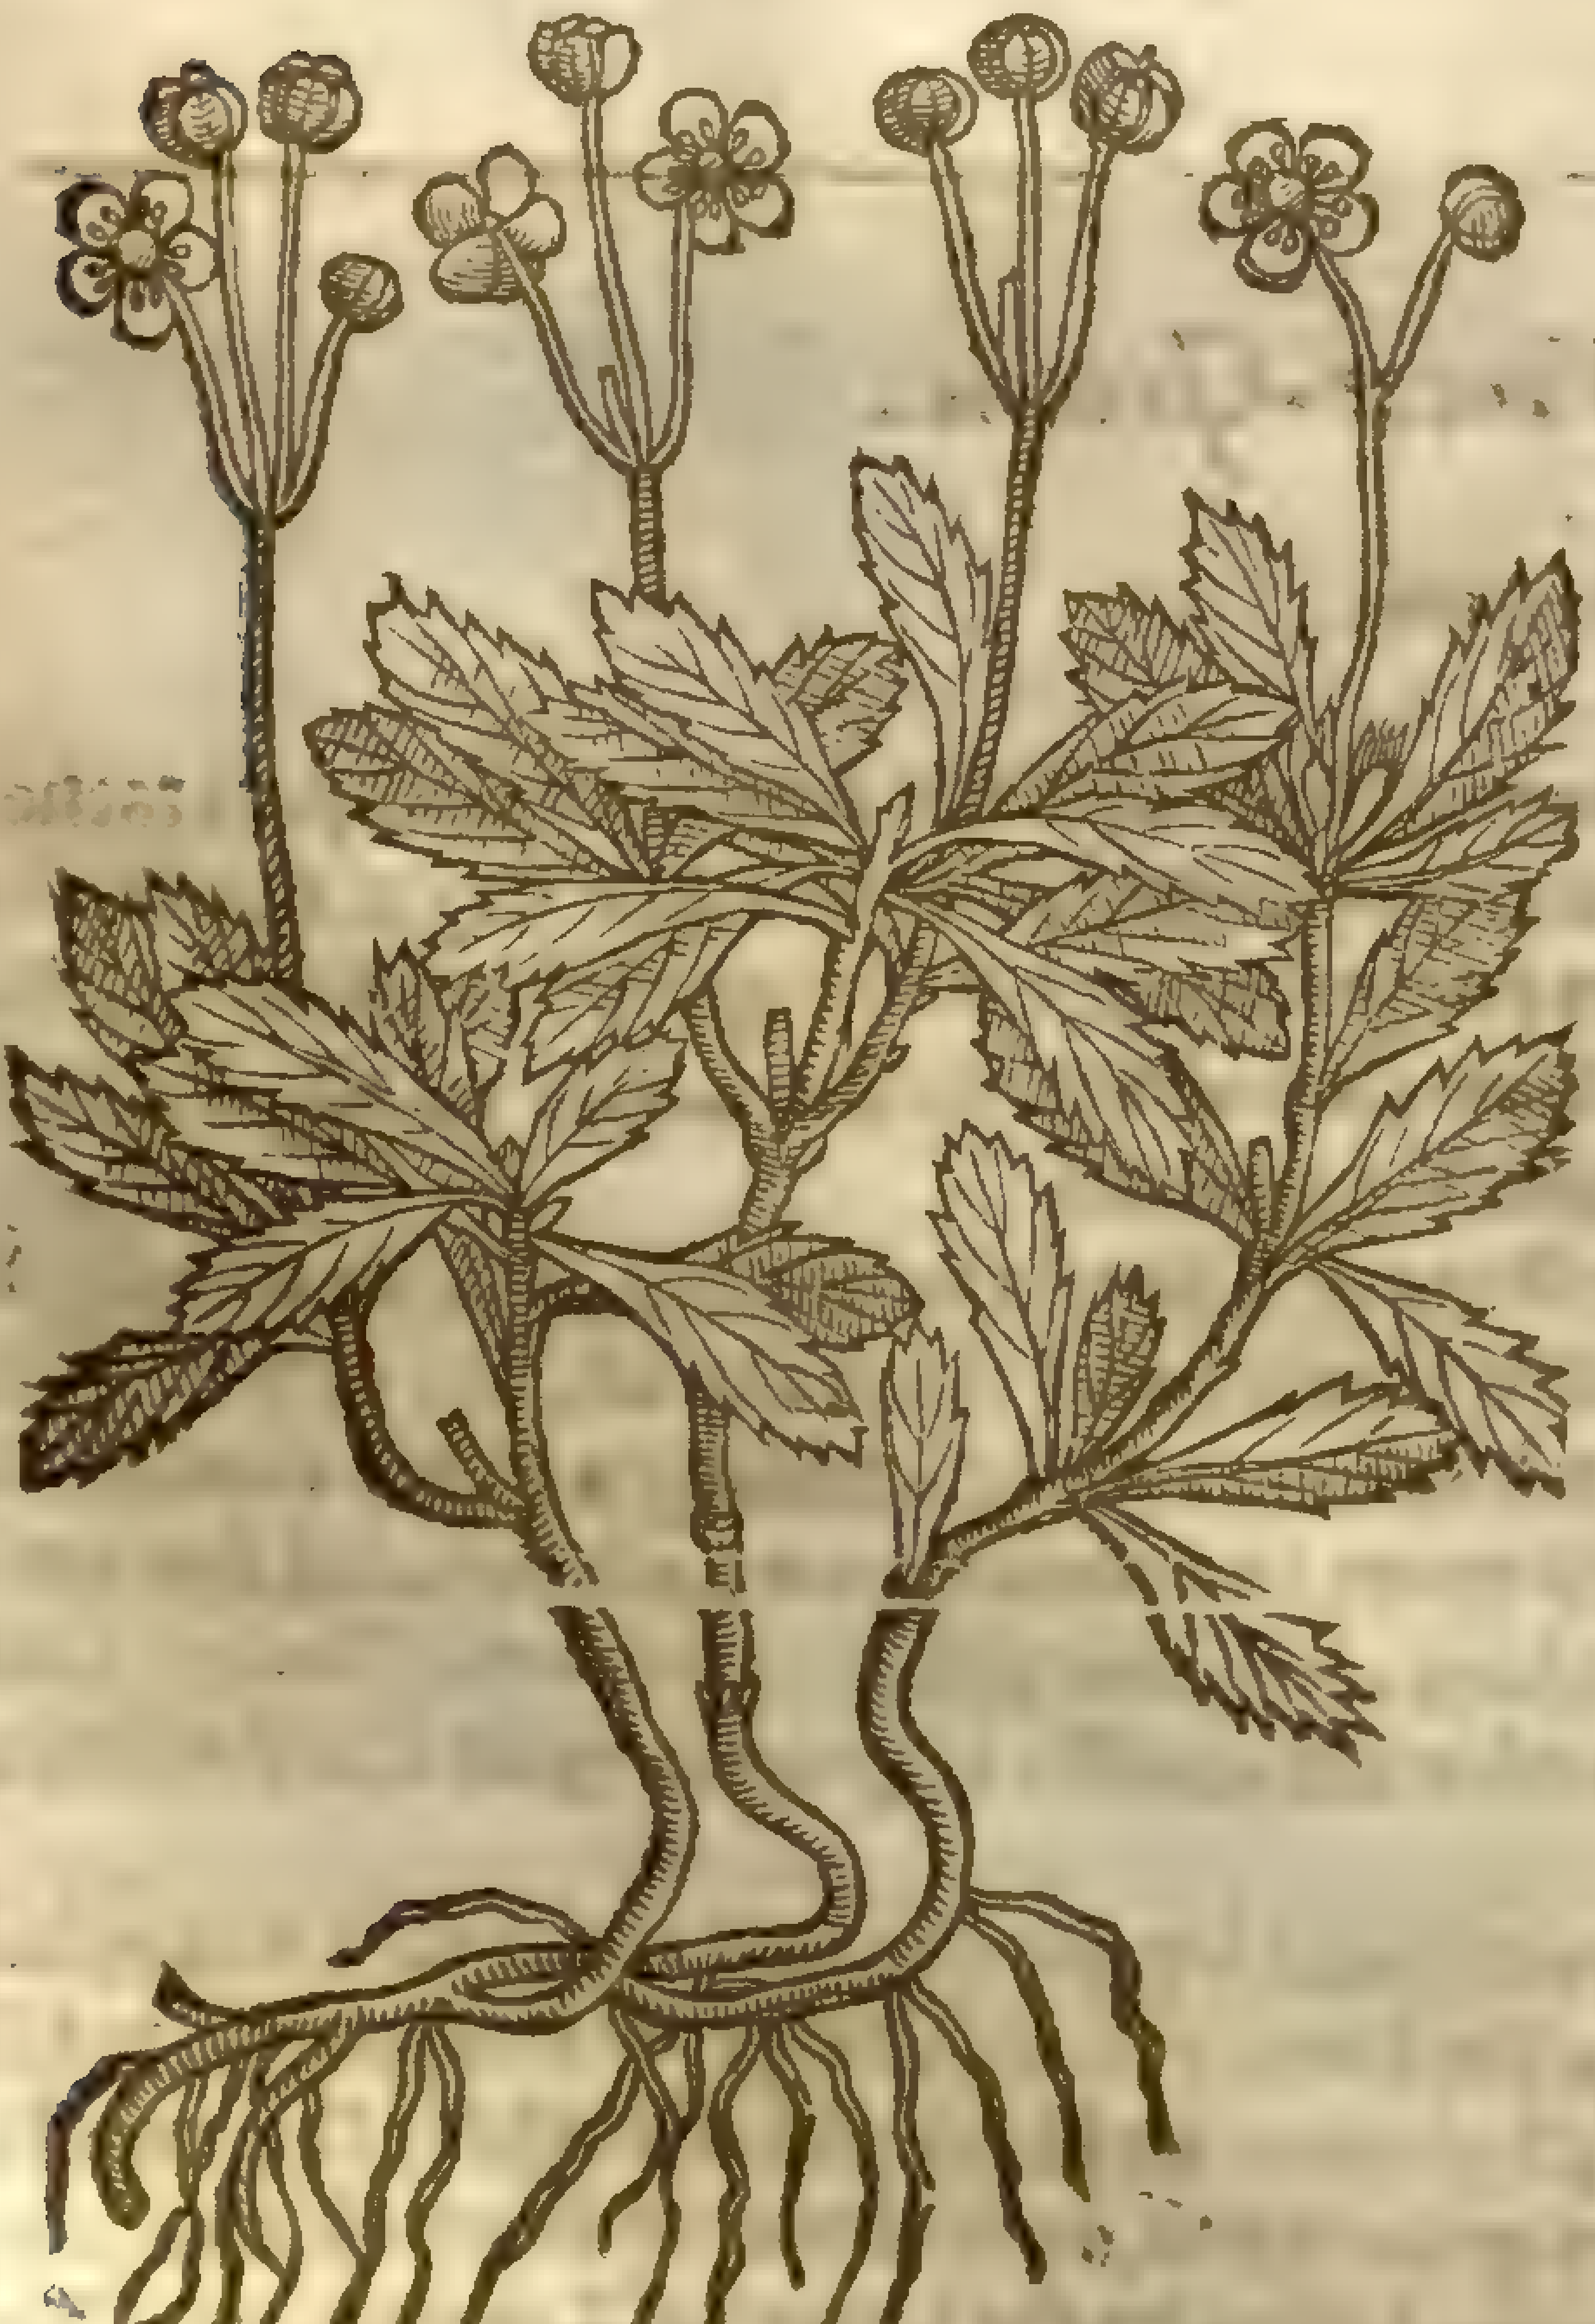
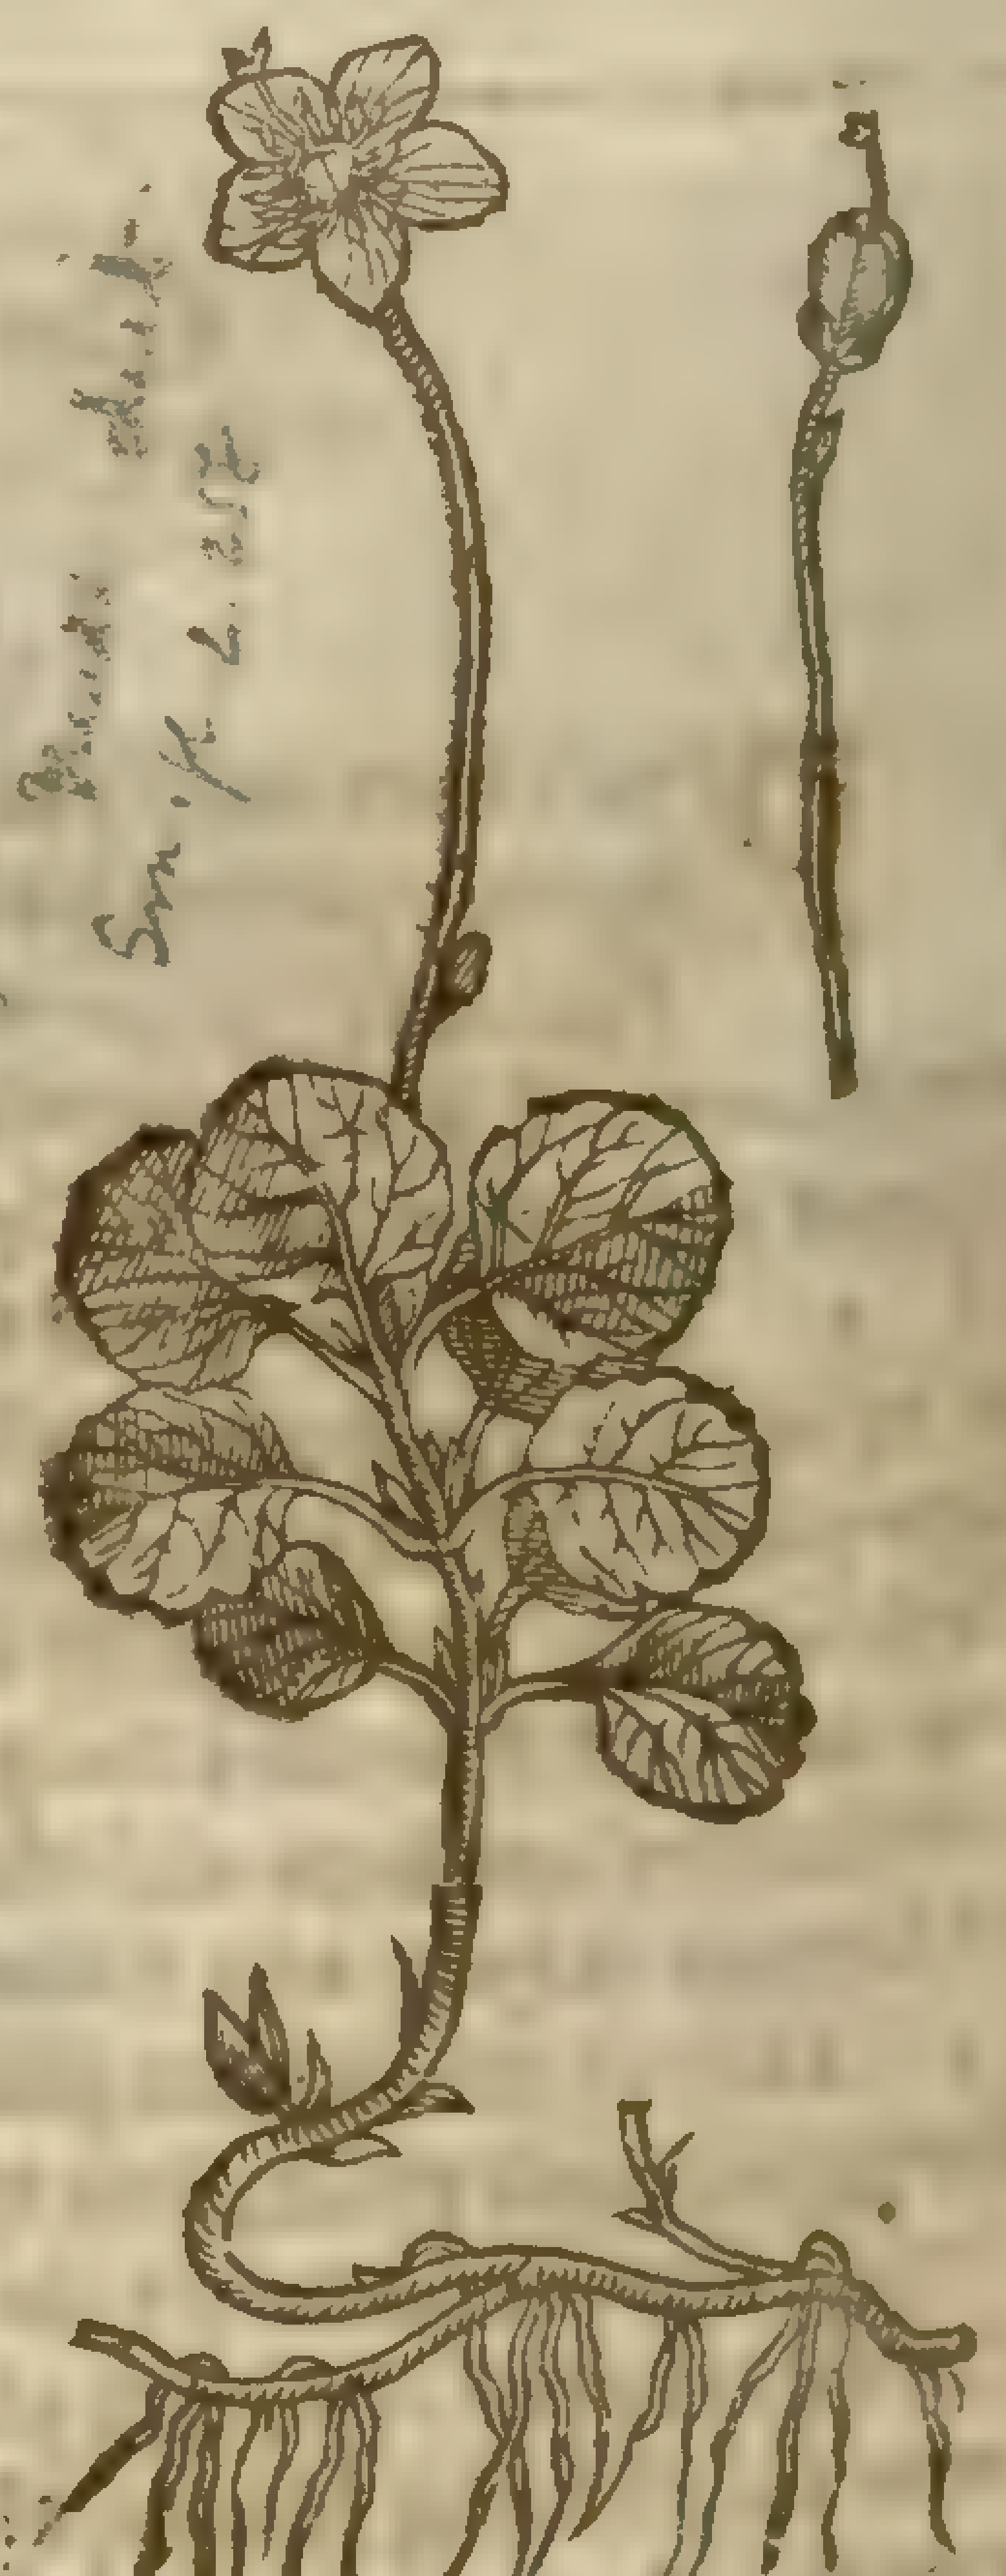
‡ 3 *Pyrola 3 fruticans Cluſ.*
Shrubby Winter-Greene.



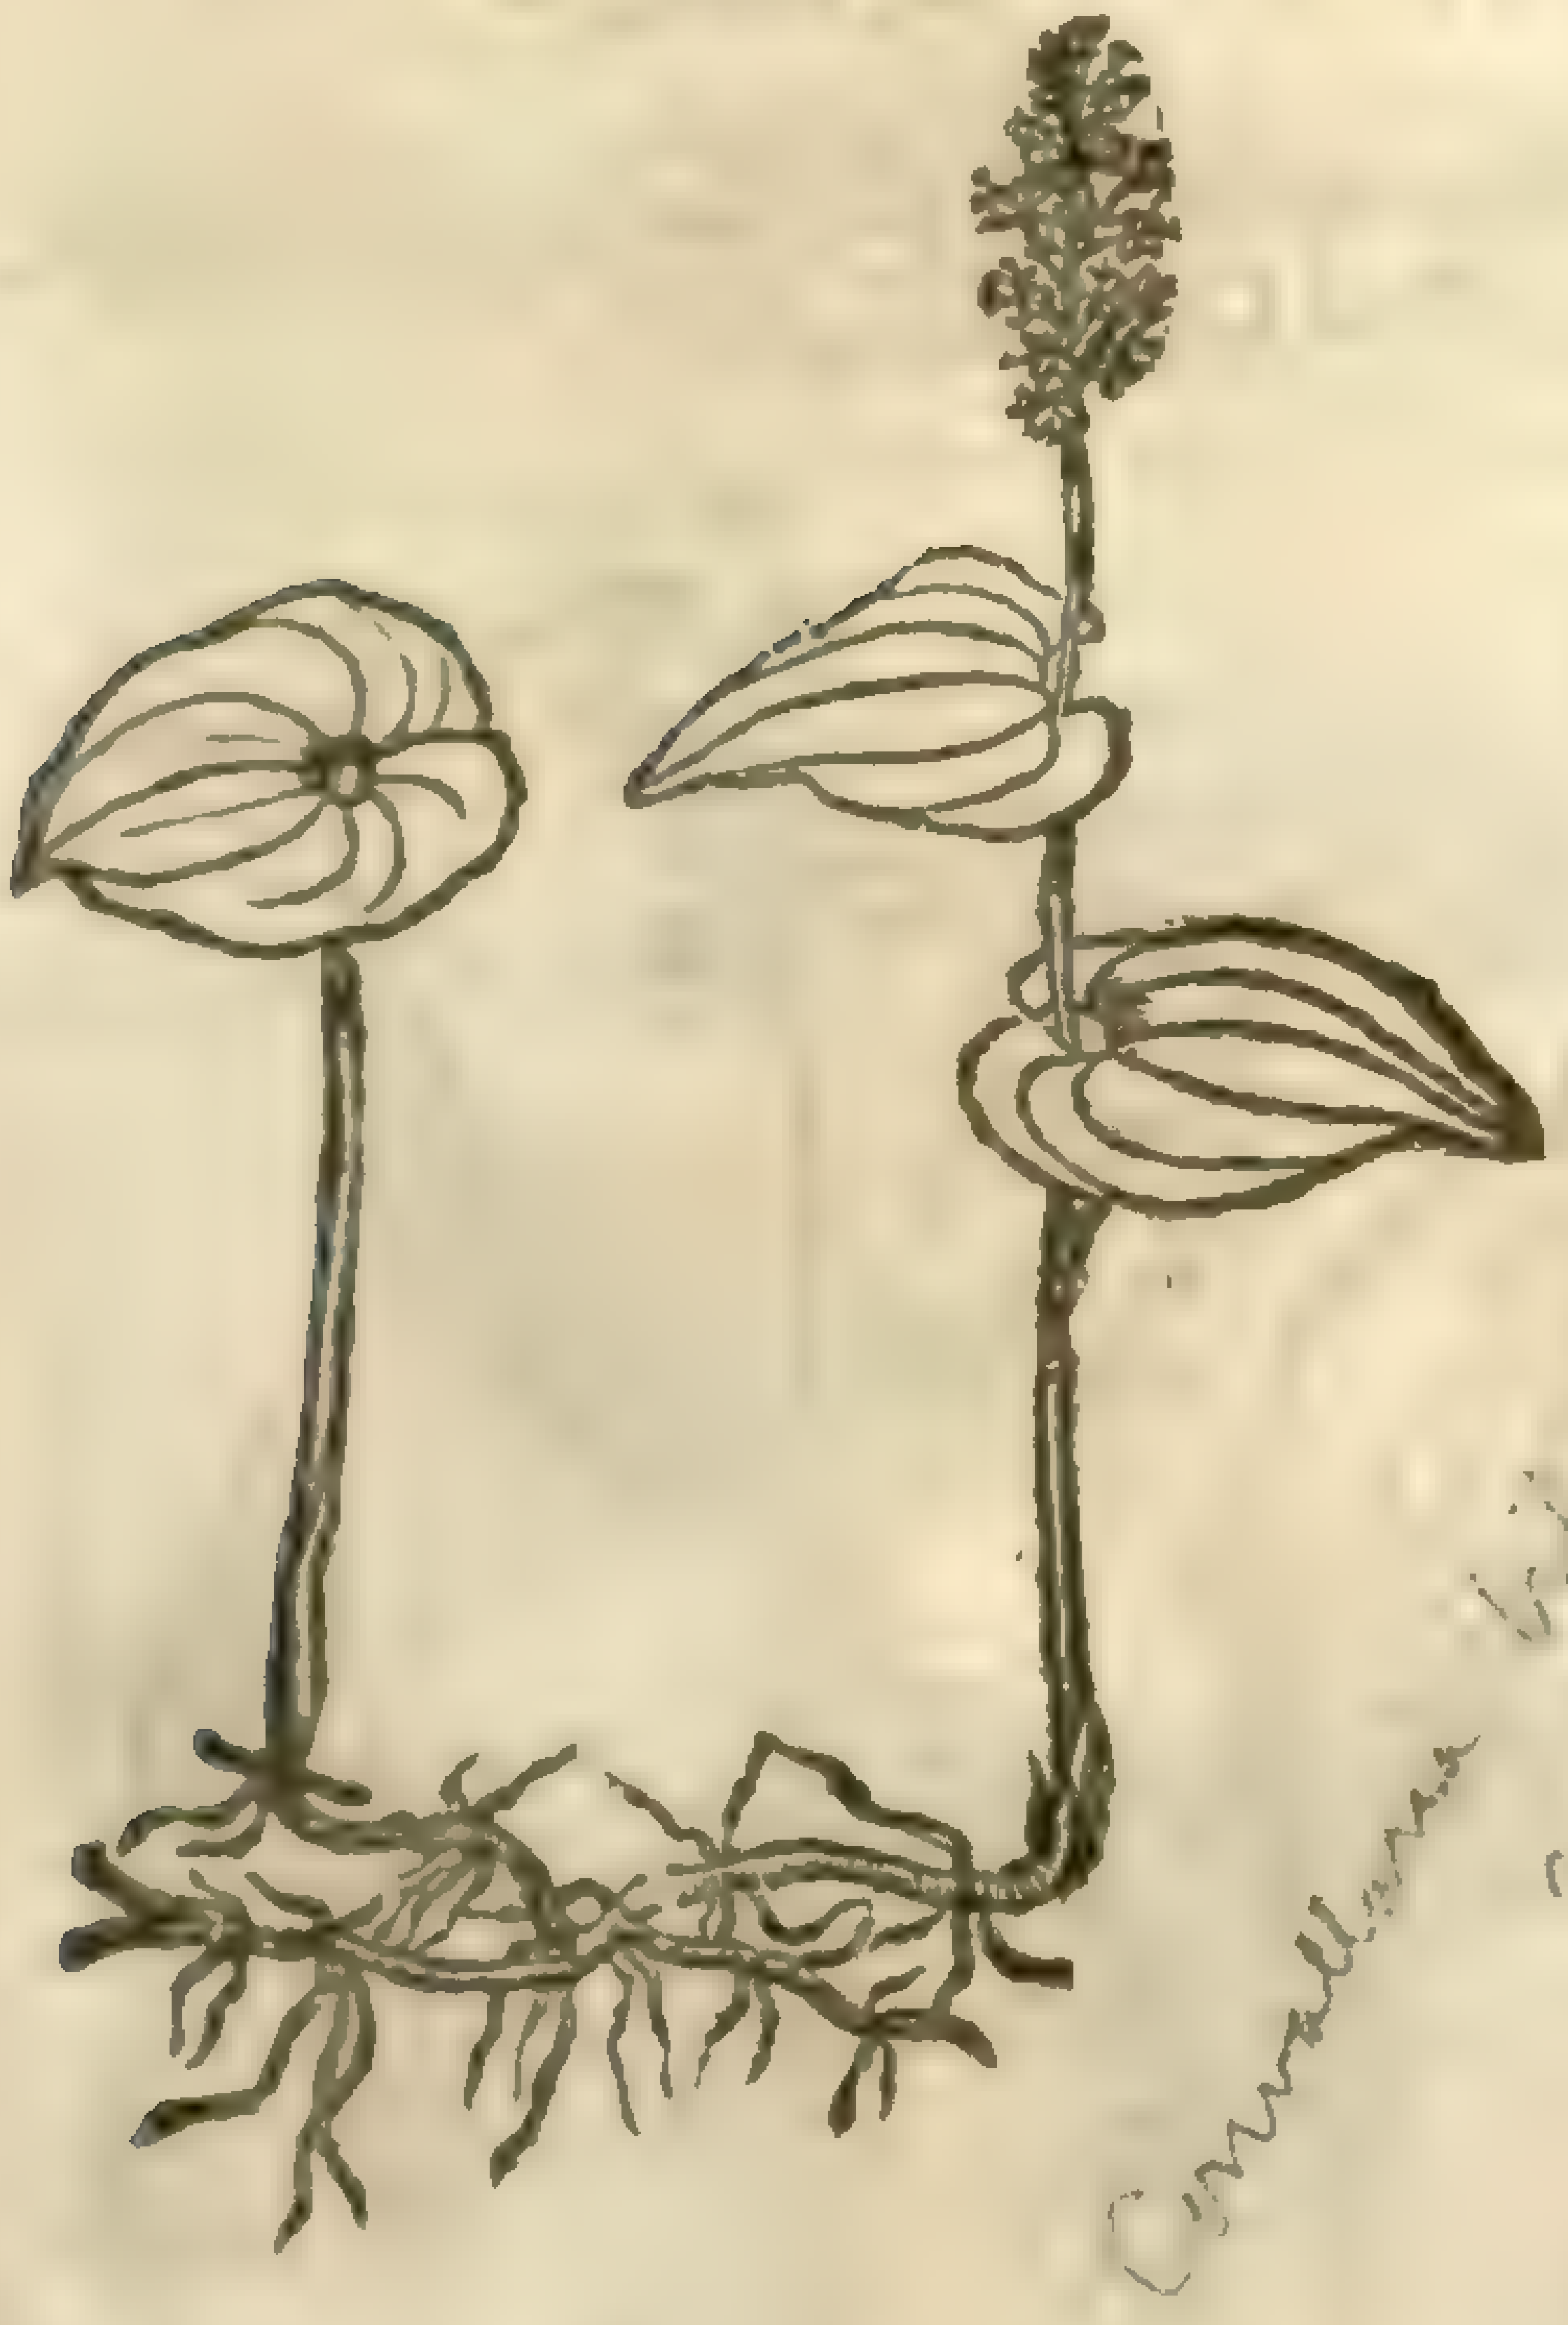
Pyrola umbellata, b.
Su Clus. 2.117

‡ 4 *Pyrola 4 minima Cluſ.*
Round leaued Winter-Greene.



Pyrola uniflora, b.
[illegible]
Sm. [illegible] 2.252

5 *Monophyllon.*
One Blade.



Convallaria bifolia [illegible]

grow floures like to thoſe of the firſt deſcribed, yet ſomewhat larger, of a whitiſh purple colour; which fading, are ſucceeded by fiue cornered ſeed veſſels containing a very ſmall ſeed; the roots are long and creeping. It growes a little from Vienna in Auſtria in the woods of Entzeſtorf, and in diuers places of Bohemia and Sileſia.

4 This from creeping roots ſends vp ſhort ſtalkes, ſet at certaine ſpaces with ſmall, round, and thinne leaues, alſo ſnipt about the edges, amongſt which vpon a naked ſtem, growes a floure of pretty bignes, conſiſting of fiue white ſharpiſh pointed leaues with ten threds, and a long pointell in the midſt. The ſeed is contained in ſuch heads as the former, and it is very ſmall. This growes in the ſhadowie places of the Alpes of Sneberge, Hochbergerin, Durrenſtaine, towards the roots of theſe great mountaines. *Cluſ.* ‡

5 *Monophyllon*, or *Vnifolium*, hath a leafe not much vnlike the greateſt leafe of Iuie, with many ribs or ſinewes like the Plantaine leafe; which ſingle leafe doth alwaies ſpring forth of the earth alone, but when the ſtalke riſeth vp, it bringeth vpon his ſides two leaues, in faſhion like the former; at the top of which ſlender ſtalke come forth fiue ſmall floures like *Pyrola*; which being vaded, there ſucceed ſmall red berries. The root is ſmall, tender, and creeping farre abroad vnder the vpper face of the earth.

¶ *The Place.*

1 *Pyrola* groweth in Lanſdale, and Crauen, in the North part of England, eſpecially in a cloſe called Crag-cloſe.

2 *Monophyllon* groweth in Lancaſhire in Dingley wood, ſix miles from Preſton in Aunderneſſe; and in Harwood neere to Blackeburne likewiſe.

¶ *The Time.*

1 *Pyrola* floureth in Iune and Iuly, and groweth Winter and Summer.

2 *Monophyllon* floureth in May, and the fruit is ripe in September.

¶ *The Names.*

1 *Pyrola* is called in Engliſh Winter-greene: it hath beene called *Limonium* of diuers, but vntruly.

2 *Monophyllon*, according to the etymologie of the word, is called in Latine *Vnifolium*: in Engliſh, One-blade, or One-leafe.

¶ *The Nature.*

1 *Pyrola* is cold in the ſecond degree, and dry in the third.

2 *Monophyllon* is hot and dry of complexion.

¶ *The Vertues.*

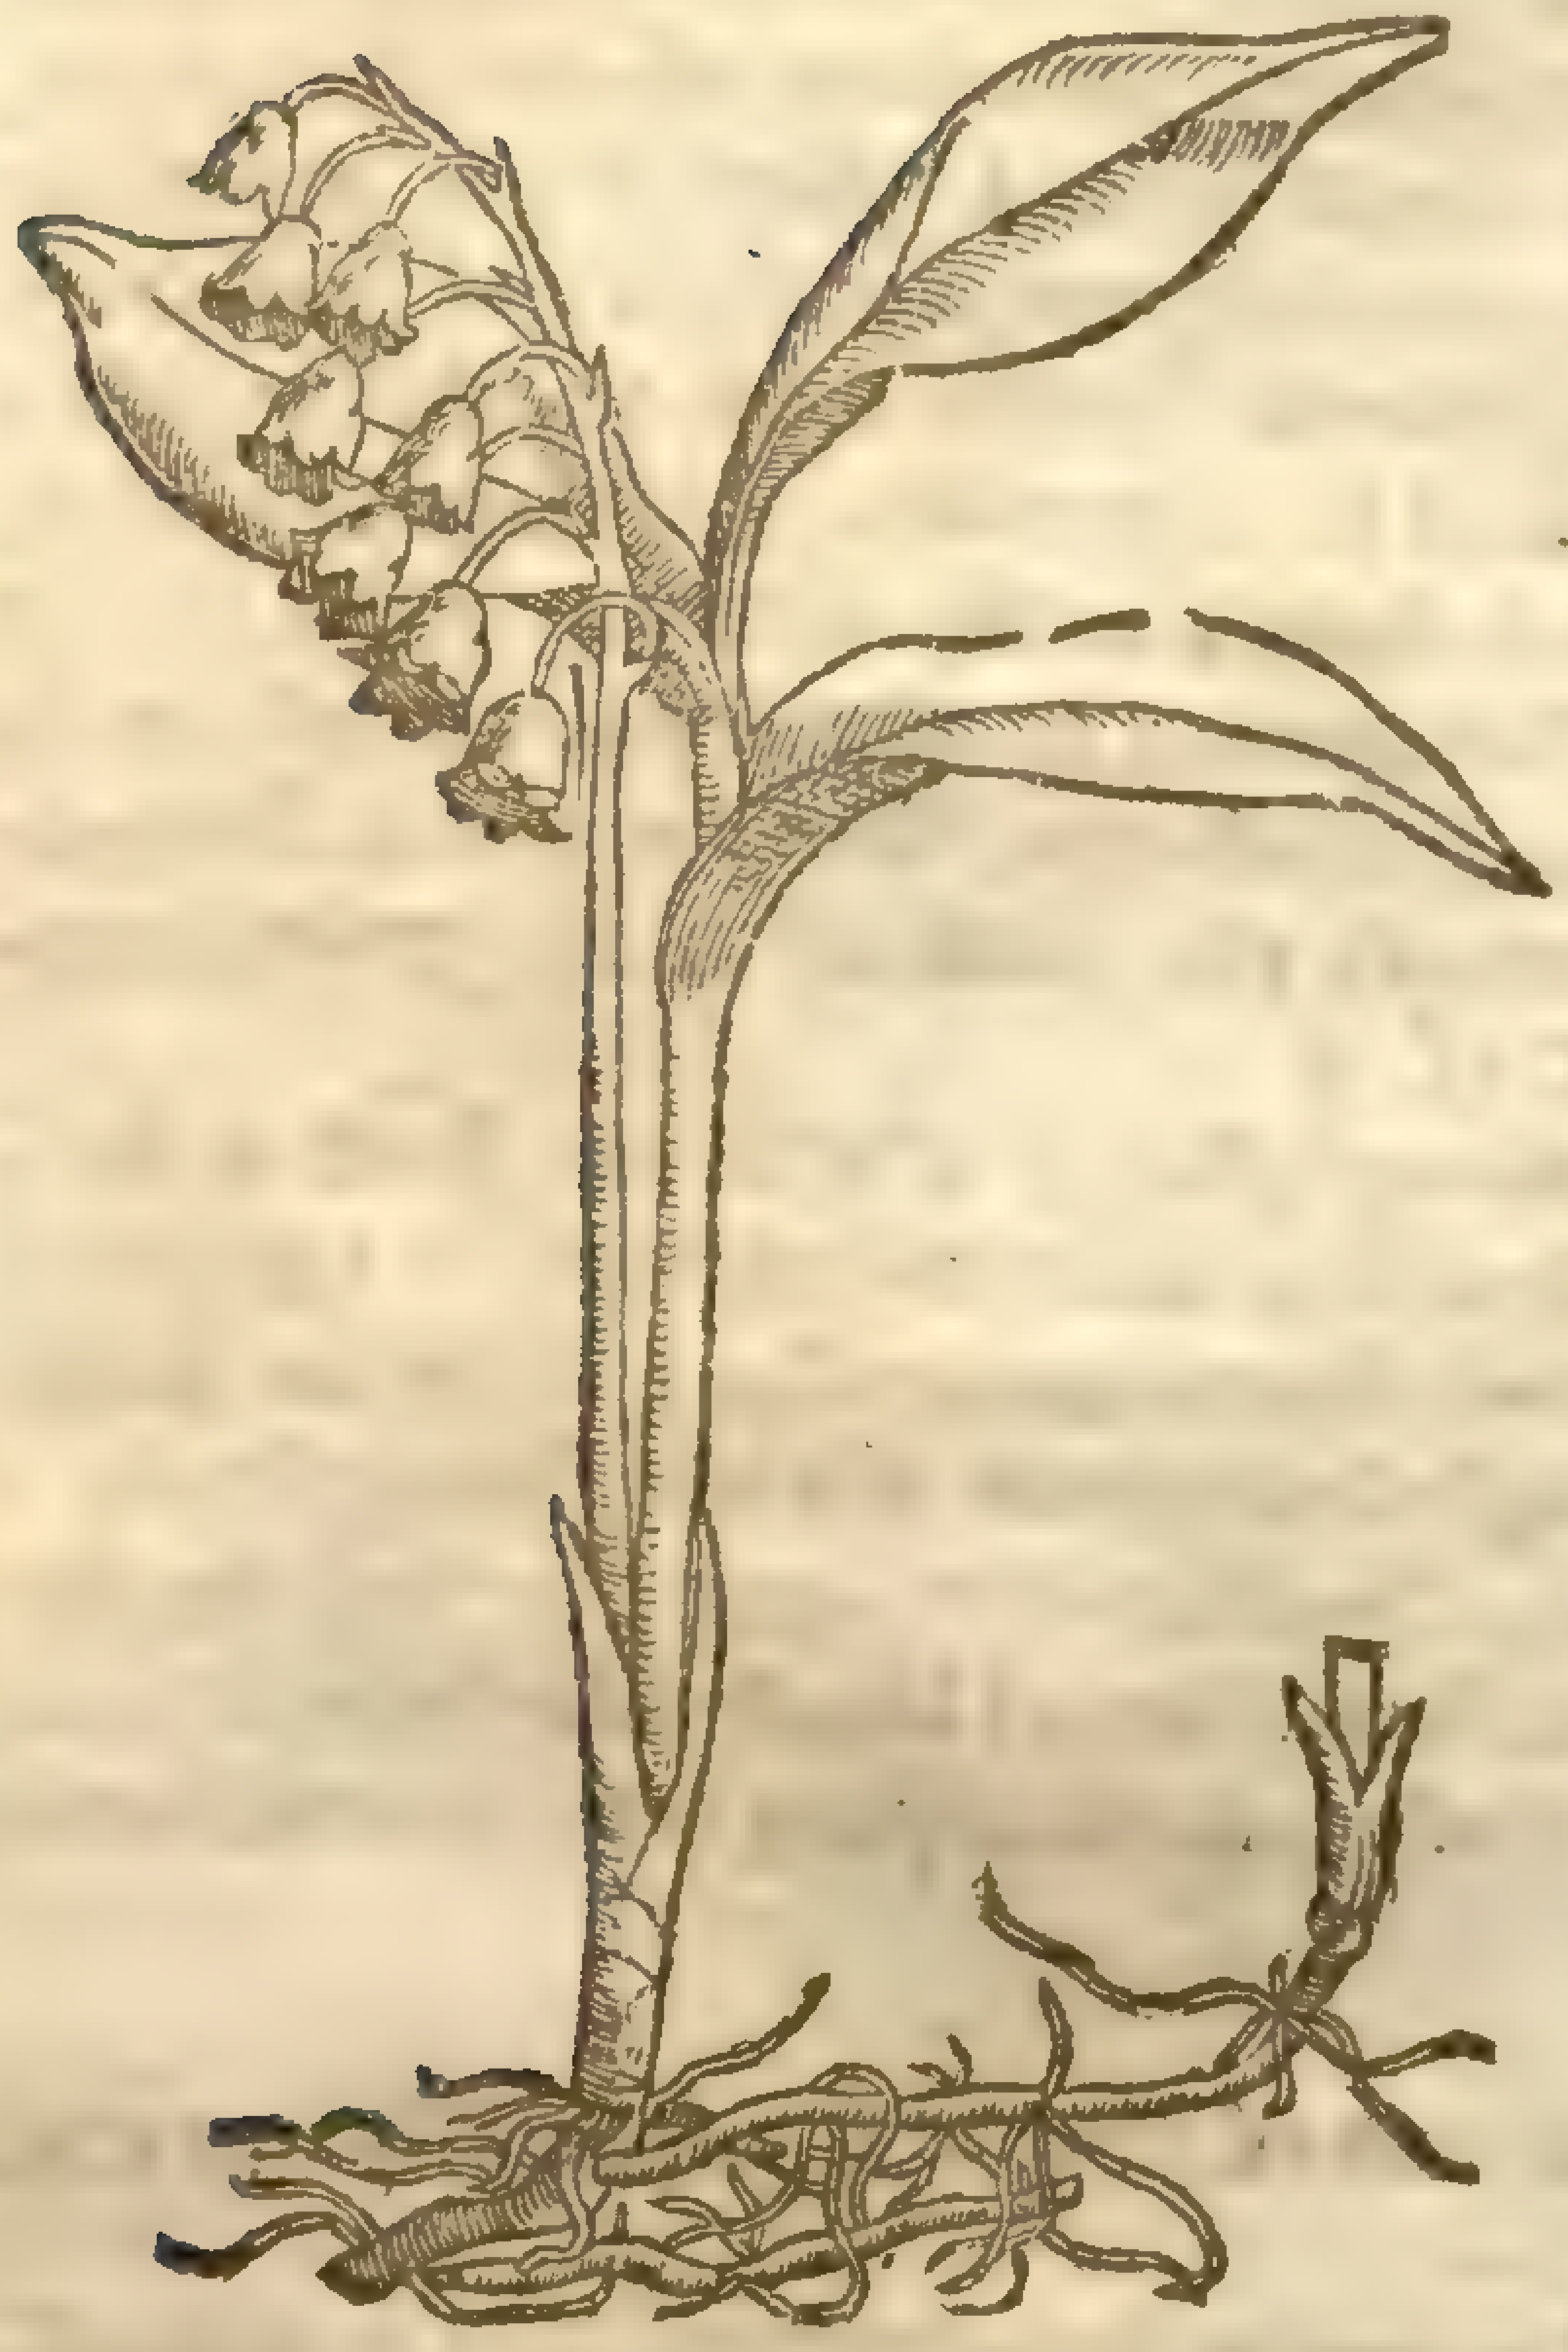
A *Pyrola* is a moſt ſingular wound-herbe, either giuen inwardly, or applied outwardly: the leaues whereof ſtamped and ſtrained, and the juice made vnto an vnguent, or healing ſalue, with wax, oyle, and turpentine, doe cure wounds, vlcers and fiſtulaes, that are mundified from the callous and tough matter, which keepeth the ſame from healing.

B The decoction hereof made with wine, is commended to cloſe vp and heale wounds of the entrailes, and inward parts: it is alſo good for vlcers of the kidneies, eſpecially made with water and the roots of Comfrey added thereto.

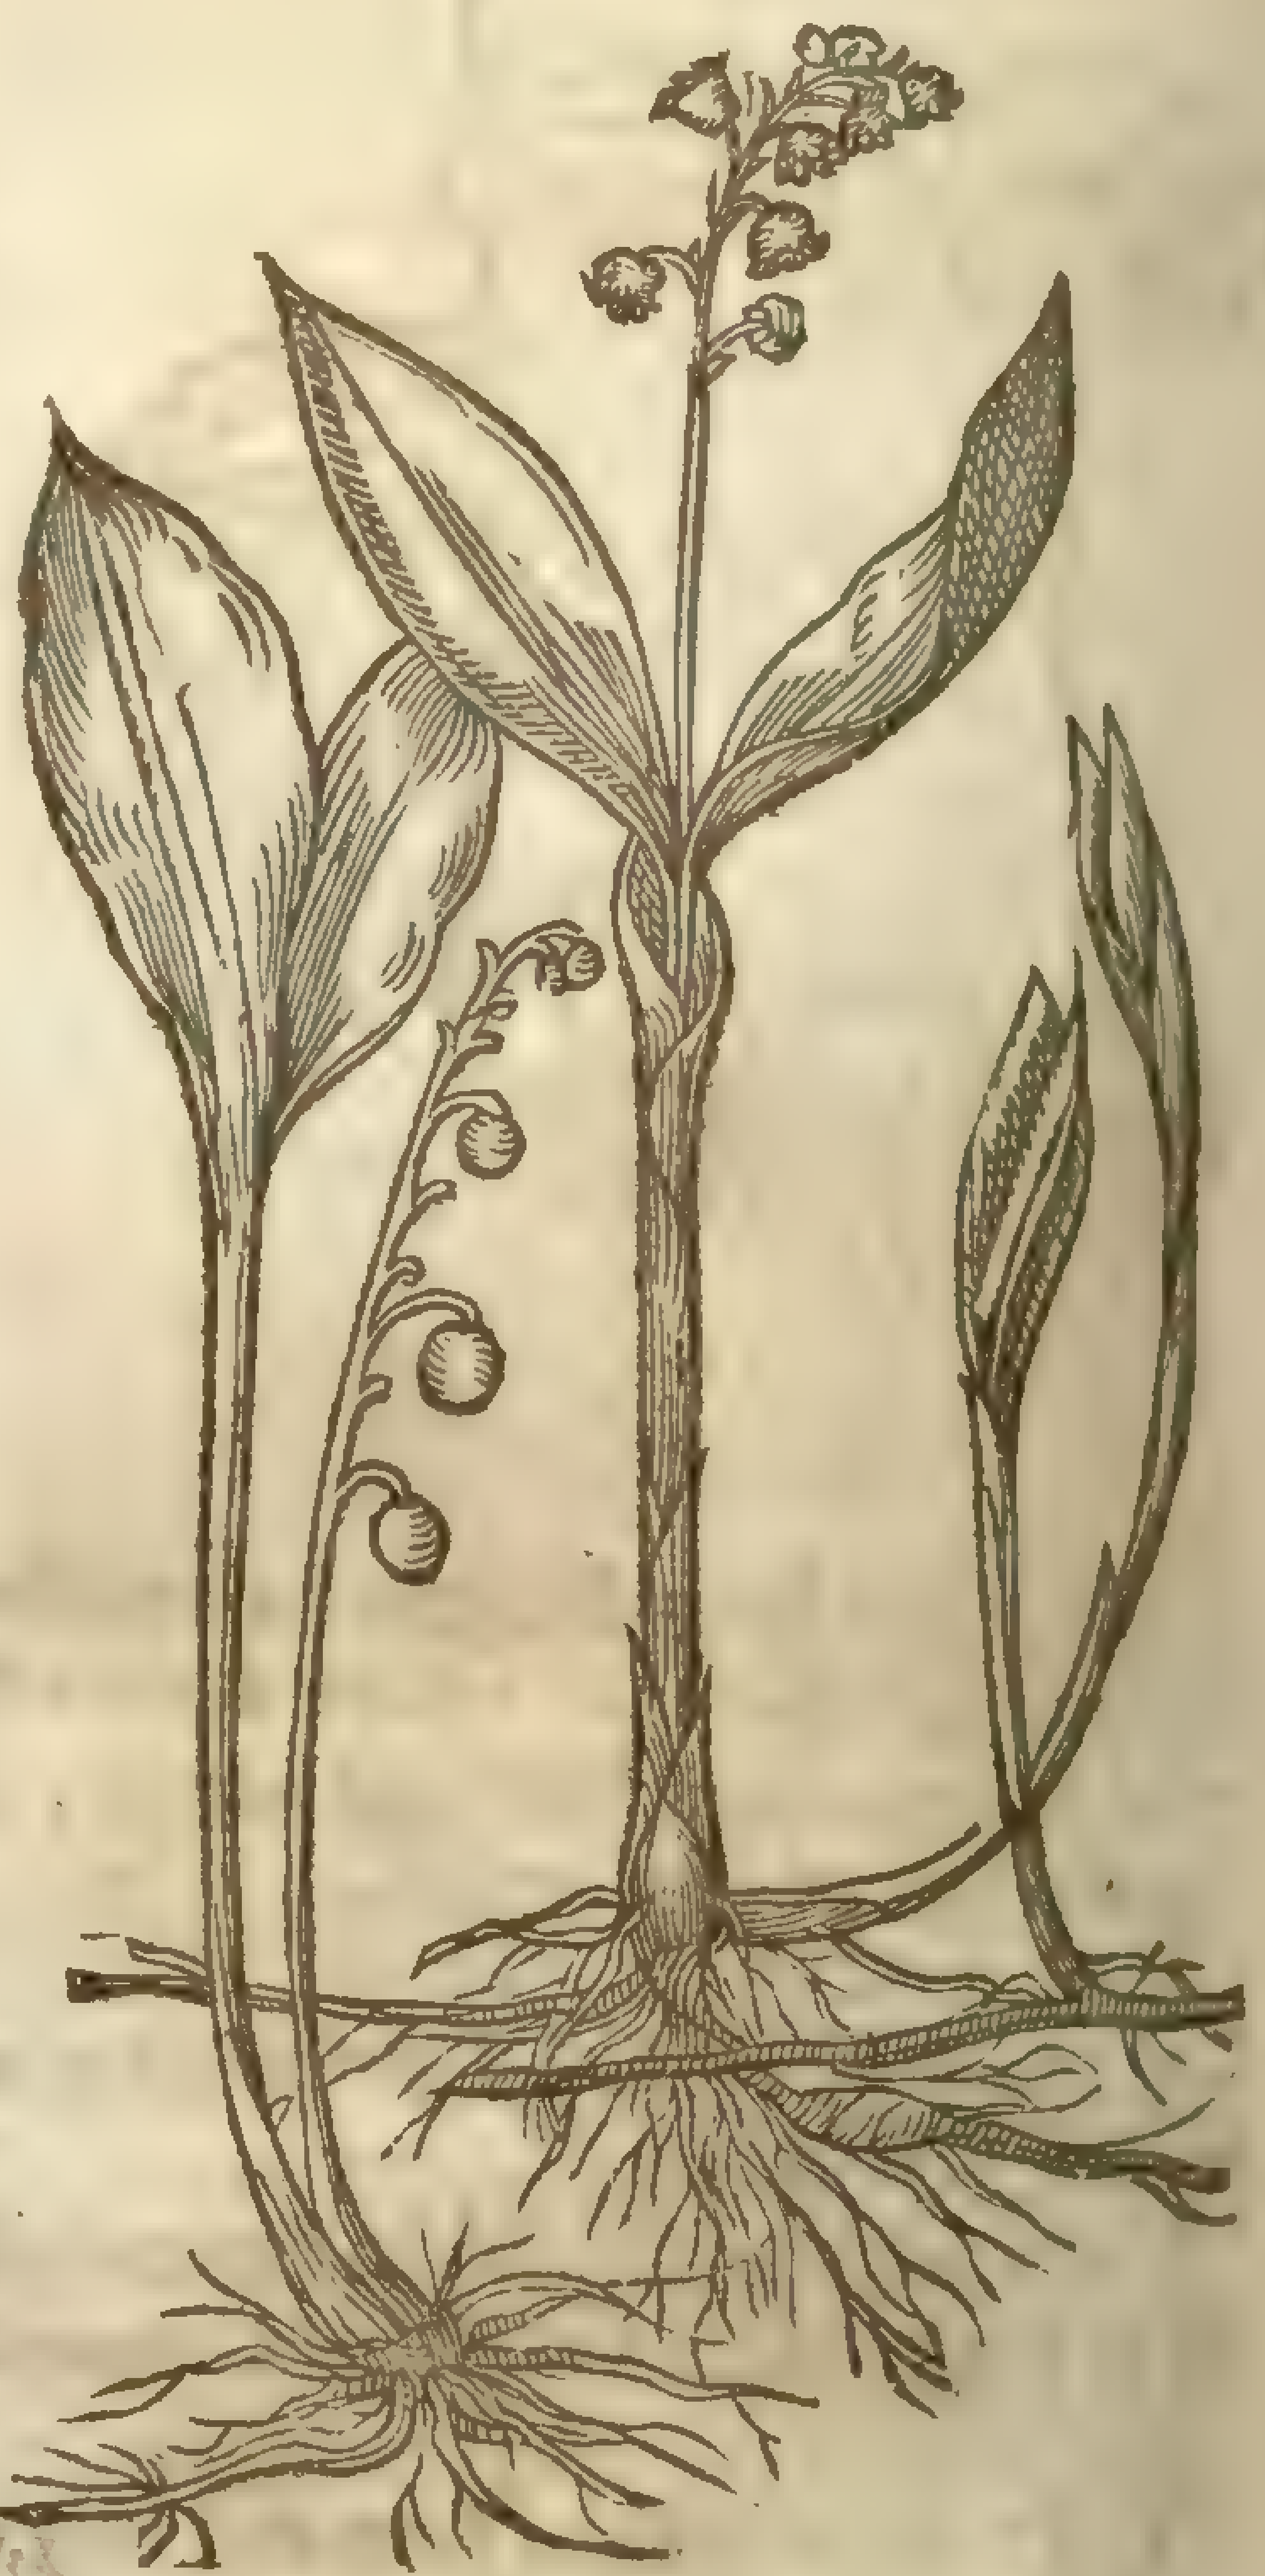
C The leaues of *Monophyllon* or *Vnifolium*, are of the ſame force in wounds with *Pyrola*, eſpecially in wounds among the nerues and ſinewes. Moreouer, it is eſteemed of ſome late writers a moſt perfect medicine againſt the peſtilence, and all poyſons, if a dram of the root be giuen in vinegre mixed with wine or water, and the ſicke go to bed and ſweat vpon it.

Chap. 91. *Of Lilly in the valley, or May Lilly.*

1 *Lilium convallium.*
Conuall Lillies.



2 *Lilium convallium floribus ſuaue-rubentibus.*
Red Conuall Lillies.



¶ *The Deſcription.*

1 THe Conuall Lilly, or Lilly of the Vally, hath many leaues like the ſmalleſt leaues of Water Plantaine; among which riſeth vp a naked ſtalke halfe a foot high, garniſhed with many white floures like little bels, with blunt and turned edges, of a ſtrong ſauour, yet pleaſant enough; which being paſt, there come ſmall red berries, much like the berries of *Aſparagus*, wherein the ſeed is contained. The root is ſmall and ſlender, creeping far abroad in the ground.

2 The ſecond kinde of May Lillies is like the former in euery reſpect; and herein varieth or differeth, in that this kinde hath reddiſh floures, and is thought to haue the ſweeter ſmell.

¶ *The Place.*

1 The firſt groweth on Hampſted heath, foure miles from London, in great abundance: neere to Lee in Eſſex, and vpon Buſhie heath, thirteene miles from London, and many other places.

2 The other kinde with the red floure is a ſtranger in England: howbeit I haue the ſame growing in my garden.

¶ *The Time.*

They floure in May, and their fruit is ripe in September.

¶ *The Names.*

The Latines haue named it *Lilium Conuallium*: *Geſner* doth thinke it to be *Callionymum*: in the Germane tongue, **Meyen blumlen**: the low Dutch, **Meyen bloemkens**: in French, *Muguet*: yet there is likewiſe another herbe which they call *Muguet*, commonly named in Engliſh, Woodroof. It is called in Engliſh, Lilly of the Valley, or the Conuall Lillie, and May Lillies, and in ſome places Liriconfancie.

¶ *The Nature.*

They are hot and dry of complexion.

¶ The

¶ *The Vertues.*

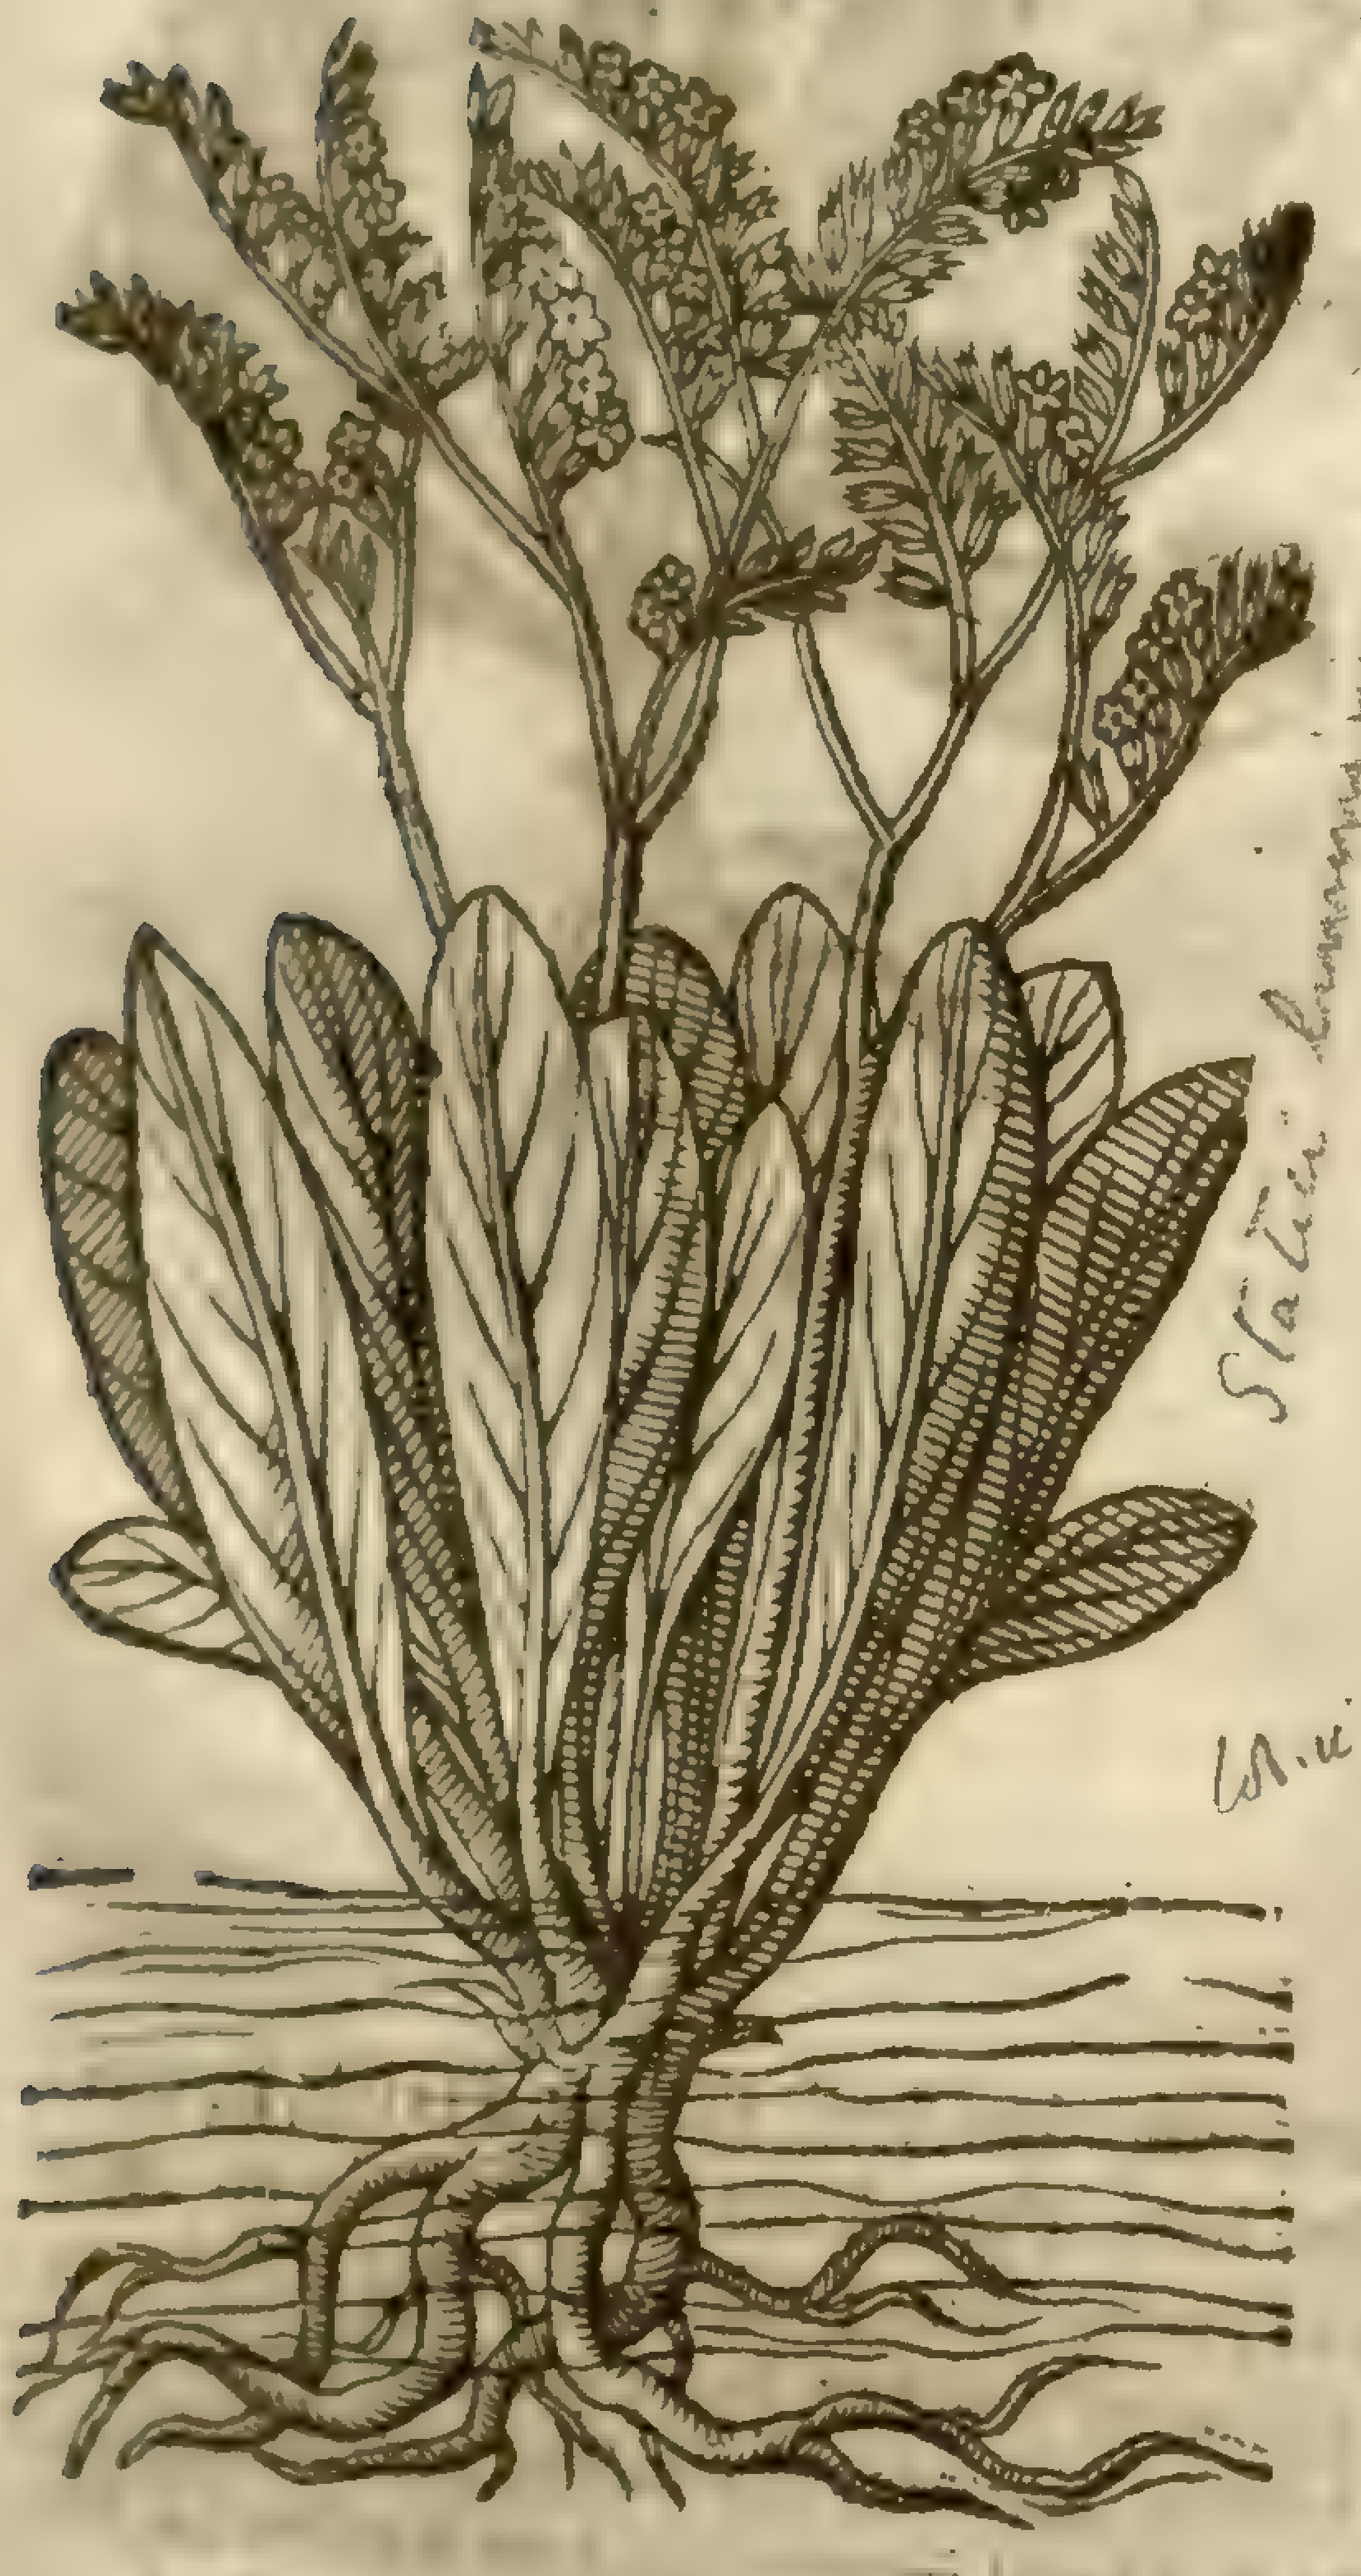
A The floures of the Valley Lillie diſtilled with wine,and drunke the quantitie of a ſpoonefull,reſtore ſpeech vnto thoſe that haue the dumb palſie and that are falne into the Apoplexie, and are good againſt the gout, and comfort the heart.

B The water aforeſaid doth ſtrengthen the memory that is weakened and diminiſhed; it helpeth alſo the inflammations of the eies,being dropped thereinto.

C The floures of May Lillies put into a glaſſe, and ſet in a hill of ants,cloſe ſtopped for the ſpace of a moneth,and then taken out,therein you ſhall finde a liquor that appeaſeth the paine and griefe of the gout, being outwardly applied; which is commended to be moſt excellent.

CHAP. 92. *Of Sea Lauander.*

1 *Limonium.*
Sea Lauander.



Statice limonium α mill. dict. Sm. fl. 2.116

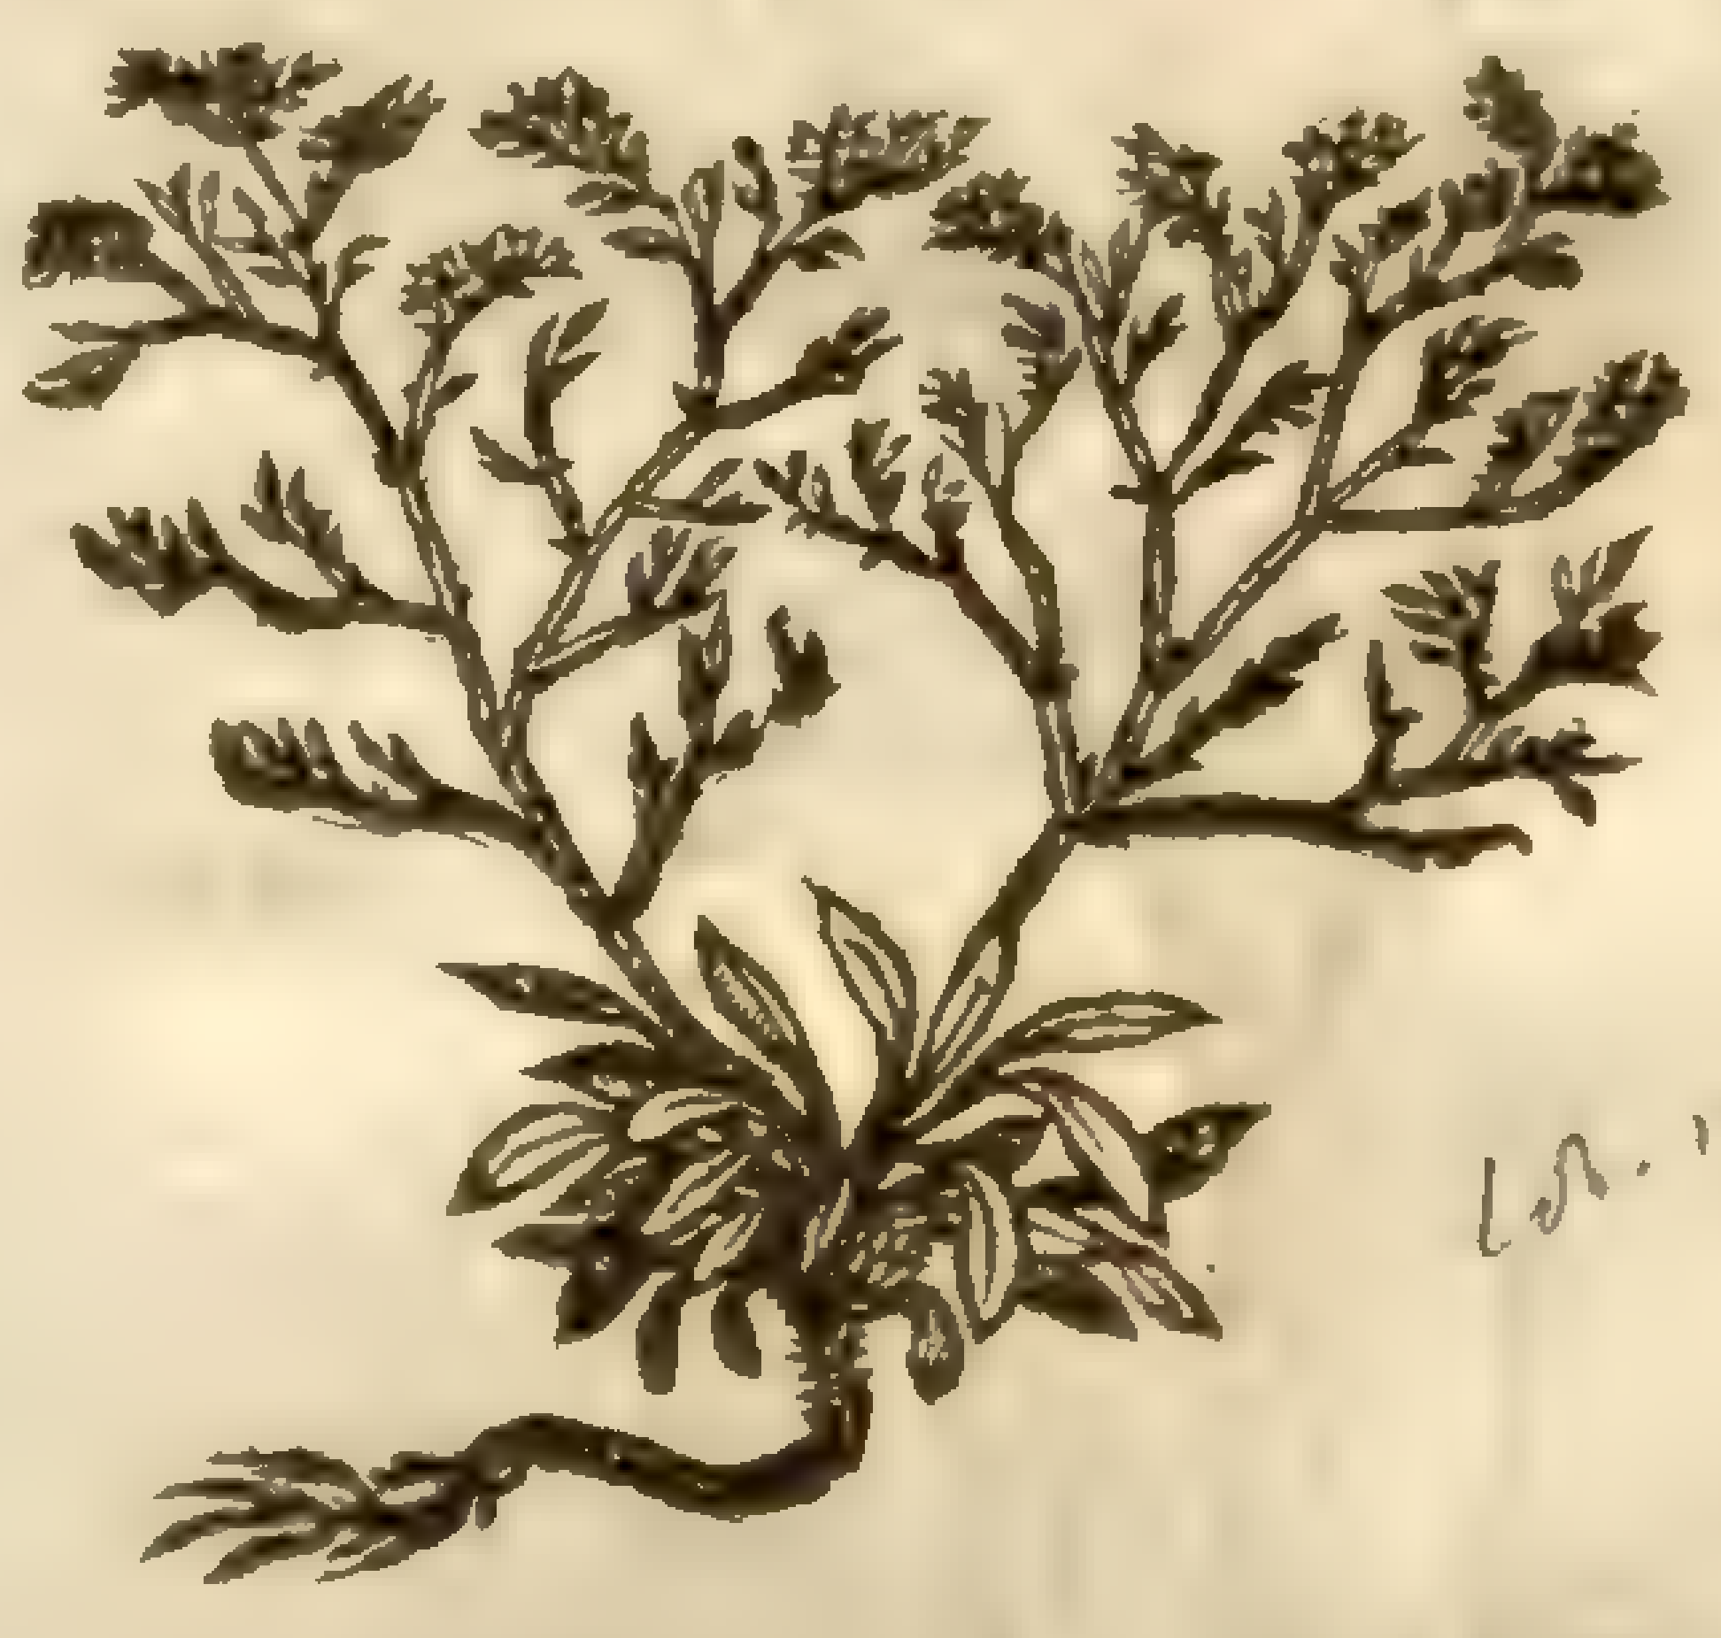
2 *Limonium parvum.*
Rocke Lauander.

Statice limonium β mill. dict. Sm. fl. 2.116



Lob. ic. 295

¶ *The Deſcription.*

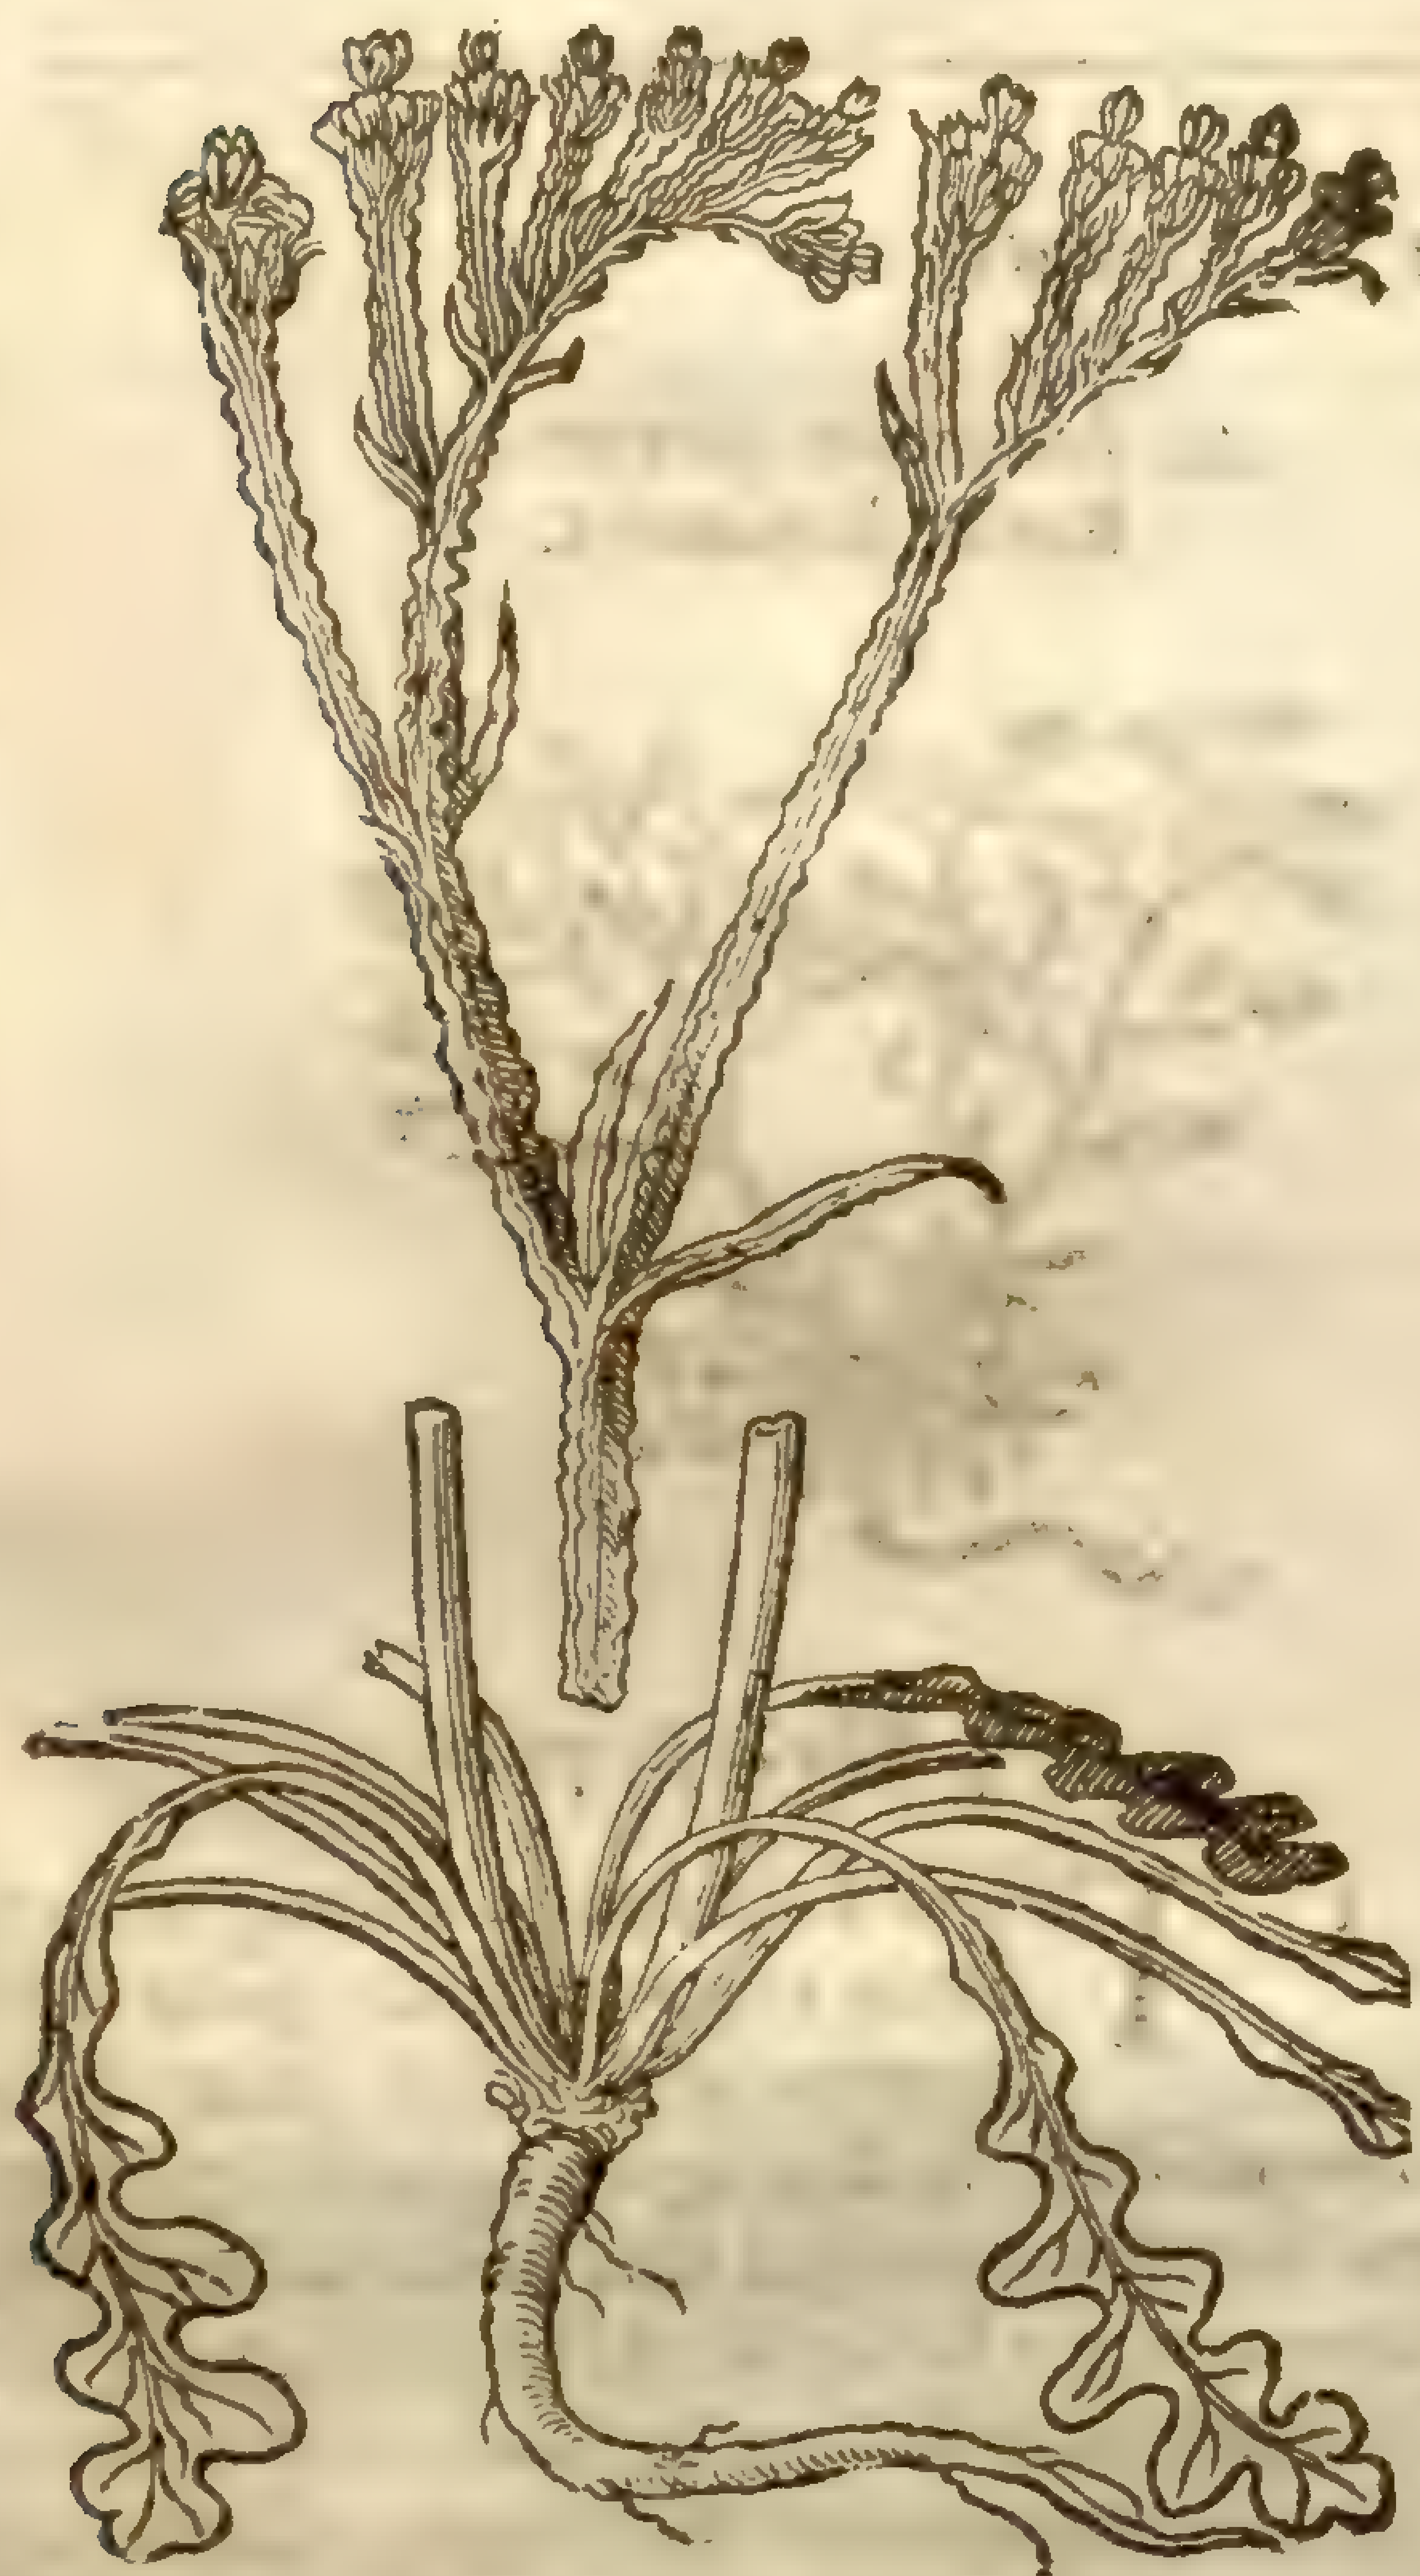
1 There hath beene among writers from time to time great contention about this plant *Limonium*,no one Author agreeing with another: for ſome haue called this herbe *Limonium*; ſome another herbe by this name; and ſome in remoouing the rocke, haue mired themſelues in the mud, as *Matthiolus*, who deſcribed two kindes, but made no diſtinction of them, nor yet expreſſed which was the true *Limonium*; but as a man herein ignorant, he ſpeakes not a word of them. Now then to leaue controuerſies and cauilling, the true *Limonium* is that which hath faire leaues, like the Limon or Orenge tree,but of a darke greene colour, ſomewhat fatter, and a little crumpled: amongſt which leaues riſeth vp an hard and brittle naked ſtalke of a foot high, diuided at the top into ſundry other ſmall branches, which grow for the moſt part vpon one ſide, full of little blewiſh floures, in ſhew like Lauander, with long red ſeed, and a thicke root like vnto the ſmall Docke.

2 There is a kinde of *Limonium* like the firſt in each reſpect, but leſſer, which groweth vpon rockes and chalkie cliffes.

‡ 3 Beſides theſe two here deſcribed, there is another elegant plant by *Cluſius* and others referred to this kindred: the deſcription thereof is thus; from a long ſlender root come forth long greene leaues lying ſpread vpon the ground, being alſo deepely ſinuated on both ſides, and ſomewhat roughiſh. Amongſt theſe leaues grow vp the ſtalkes welted with ſlender indented ſkinnes, and towards their tops they are diuided into ſundry branches after the manner of the ordinarie one; but theſe branches are alſo winged, and at the tops they carry floures ſome foure or fiue

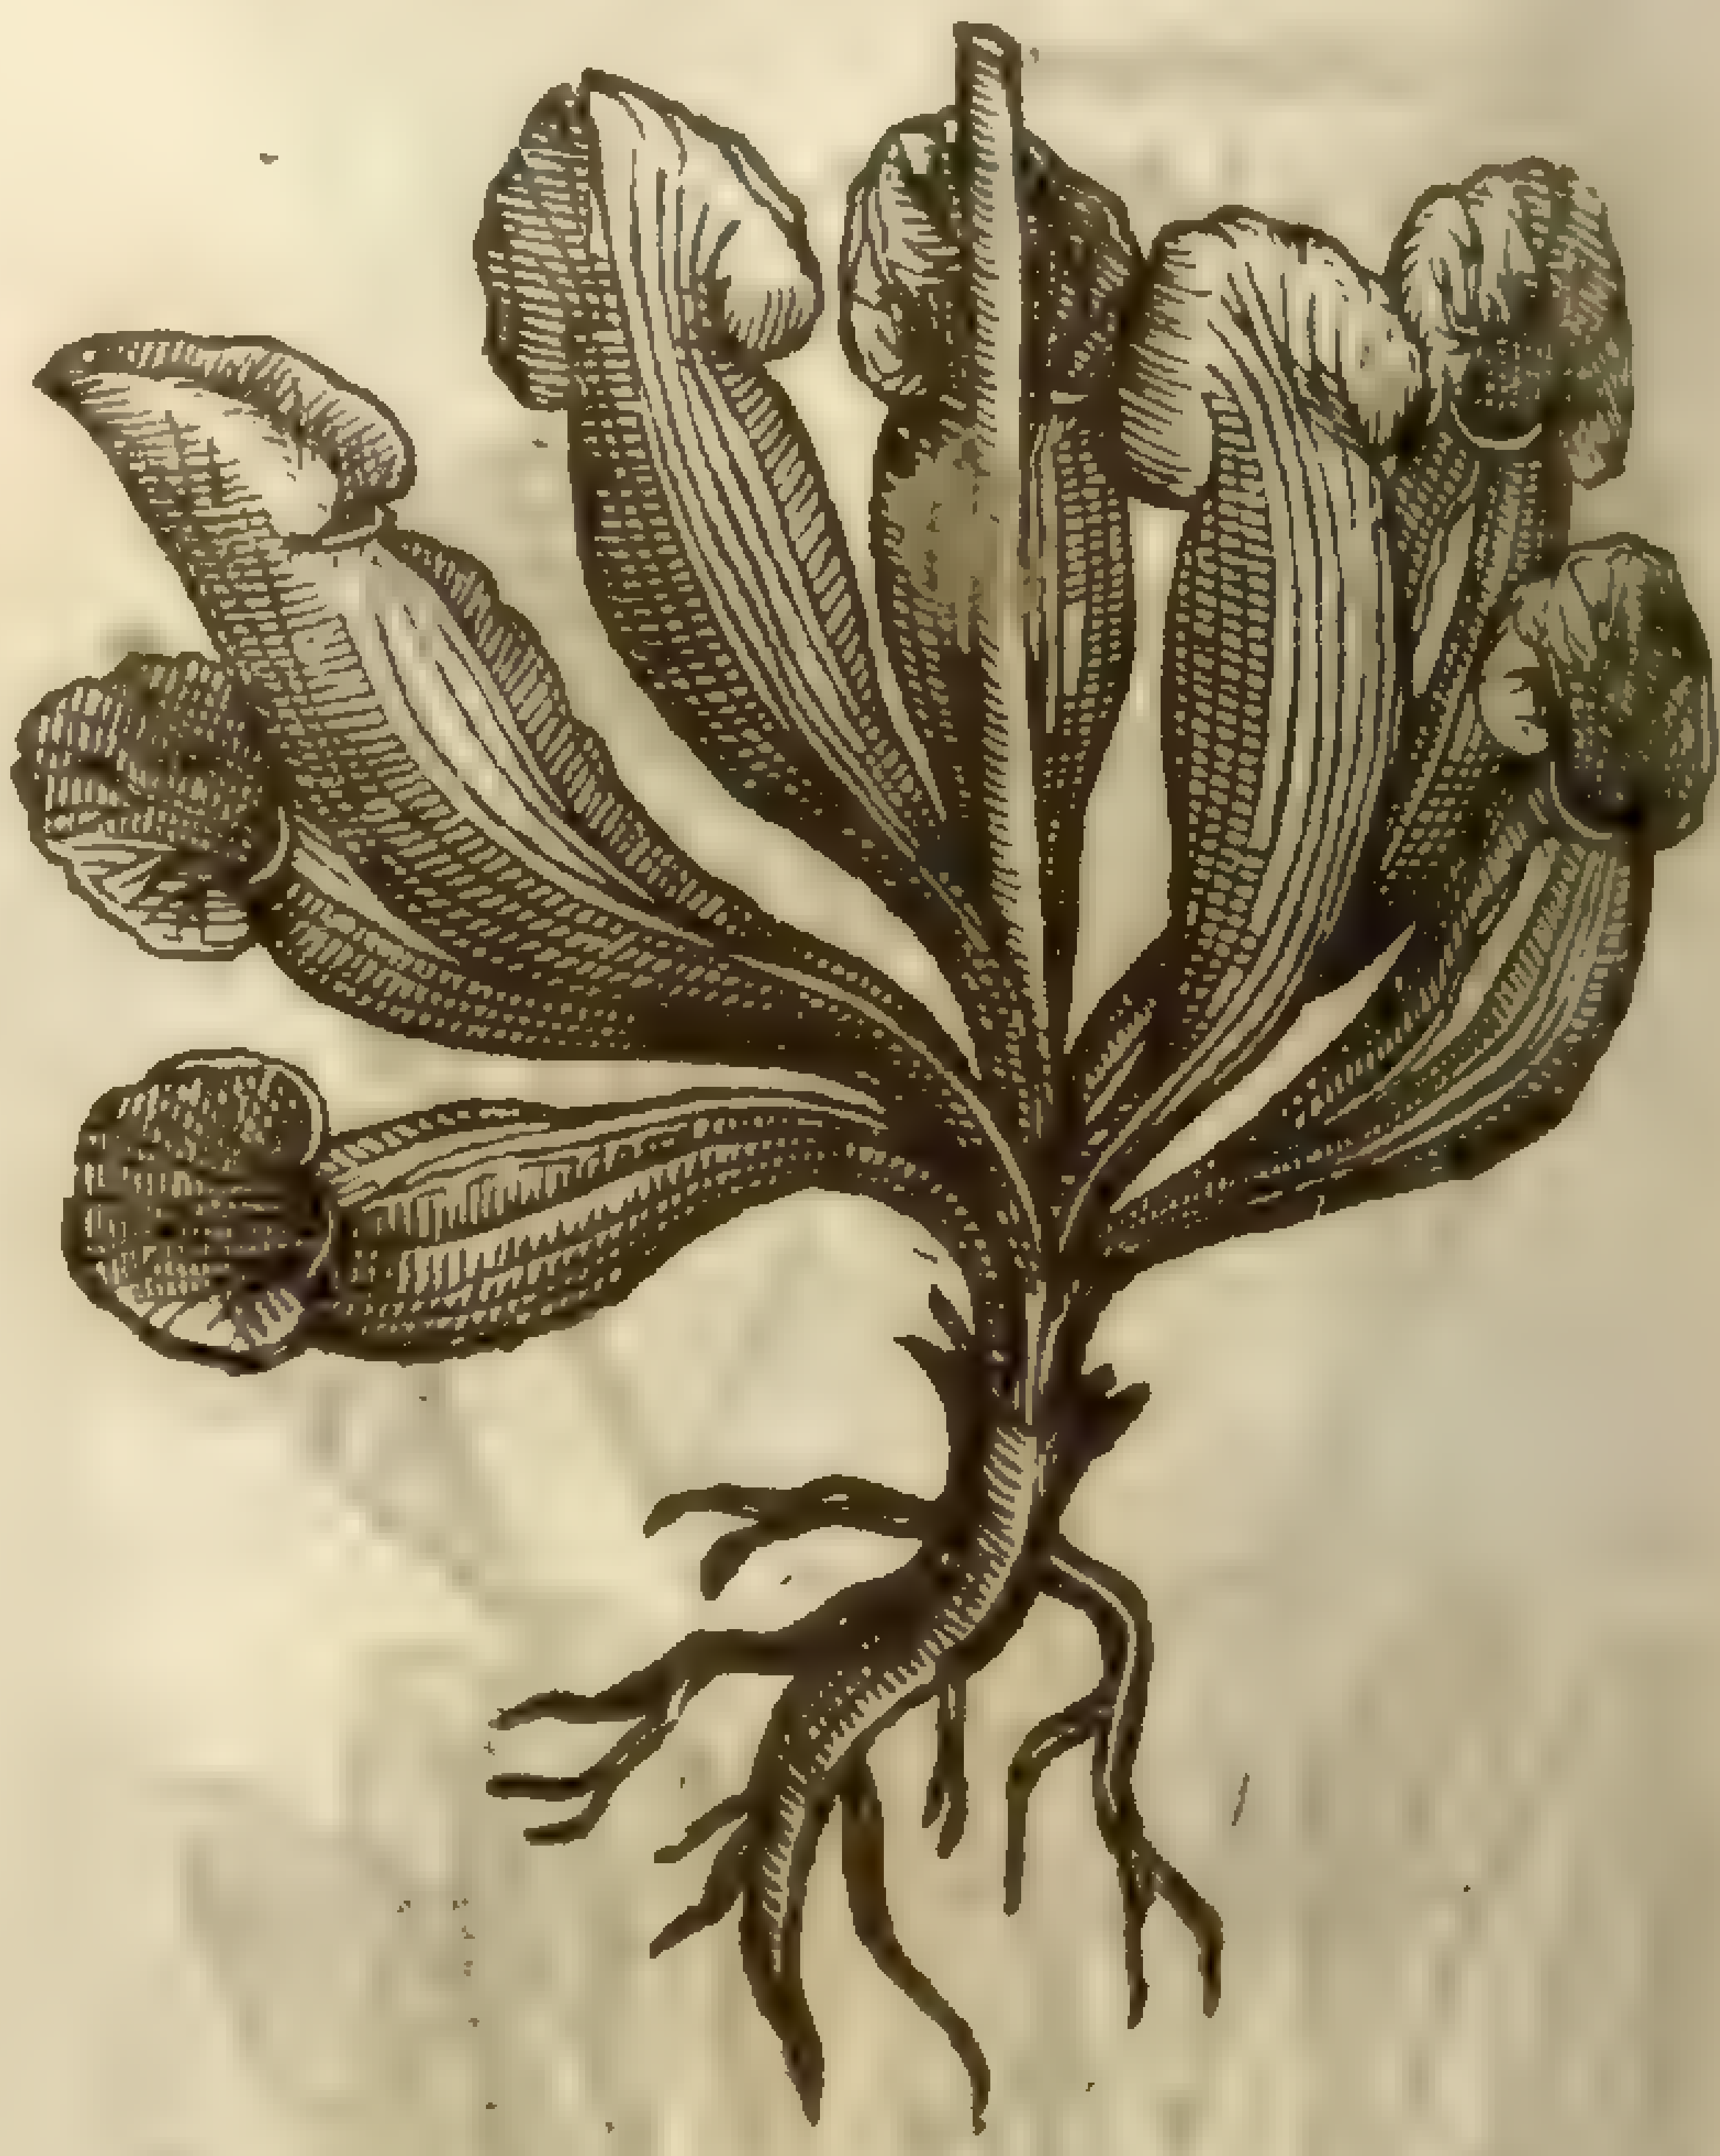
cluſtering together, conſiſting of one thin criſpe or crumpled leafe of a light blew colour (which continues long, if you gather them in their perfect vigour, and ſo dry them) and in the middeſt of this blew comes vp little white floures, conſiſting of fiue little round leaues with ſome white threds in their middles. This plant was firſt obſerued by *Rouwolfius* at Ioppa in Syria: but it growes alſo vpon the coaſts of Barbarie, and at Malacca and Cadiz in Spaine: I haue ſeene it growing with many other rare plants, in the Garden of my kinde friend Maſter *Iohn Tradeſcant* at South-Lambeth.

‡ 3 *Limonium folio ſinuato.*
Sea-Lauander with the indented leafe.



Statice sinuata L. Mill. dict.

‡ 4 *Limonio congener, Cluſ.*
Hollow leaued Sea-Lauander.



Sarracenia purpurea L. Mill. dict.

4 *Cluſius* in the end of his fourth Booke *Hiſtoria Plantarum*, ſets forth this, and ſaith, he receiued this figure with one dried leafe of the plant ſent him from Paris from *Claude Gonier* an Apothecarie of that citie, who receiued it (as you ſee it here expreſt) from Lisbone. Now *Cluſius* deſcribes the leafe, that it was hard, and as if it had been a piece of leather, open on the vpper ſide, and diſtinguiſhed with many large purple veines on the inſide, &c. for the reſt of his deſcription was onely taken from the figure (as he himſelfe ſaith) which I hold impertinent to ſet downe, ſeeing I here giue you the ſame figure, which by no meanes I could omit, for the ſtrangeneſſe thereof, but hope that ſome or other that trauell into forraine parts may finde this elegant plant, and know it by this ſmall expreſſion, and bring it home with them, that ſo we may come to a perfecter knowledge thereof. ‡

¶ *The Place.*

1 The firſt groweth in great plenty vpon the walls of the fort againſt Graueſend: but abundantly on the bankes of the Riuer below the ſame towne, as alſo below the Kings Store-houſe at Chattam: and faſt by the Kings Ferrey going into the Iſle of Shepey: in the ſalt marſhes by Lee in Eſſex: in the Marſh by Harwich, and many other places.

The ſmall kind I could neuer find in any other place but vpon the chalky cliffe going from the towne of Margate downe to the ſea ſide, vpon the left hand.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

It ſhall be needleſſe to trouble you with any other Latine name than is expreſt in their titles: The people neere the ſea ſide where it growes do call it Marſh Lauander, and ſea Lauander.

‡ This cannot be the *Limonium* of *Dioſcorides*, for the leaues are not longer than a Beet, nor the ſtalke ſo tall as that of a Lilly; but you ſhall find more hereafter concerning this, in the chapter of water Plantain. I cannot better refer this to any plant deſcribed by the Antients, than to *Britannica* deſcribed by *Dioſcorides, lib.* 4. *cap.* 2. ‡

¶ *The Temperature.*

The ſeed of *Limonium* is very aſtringent or binding.

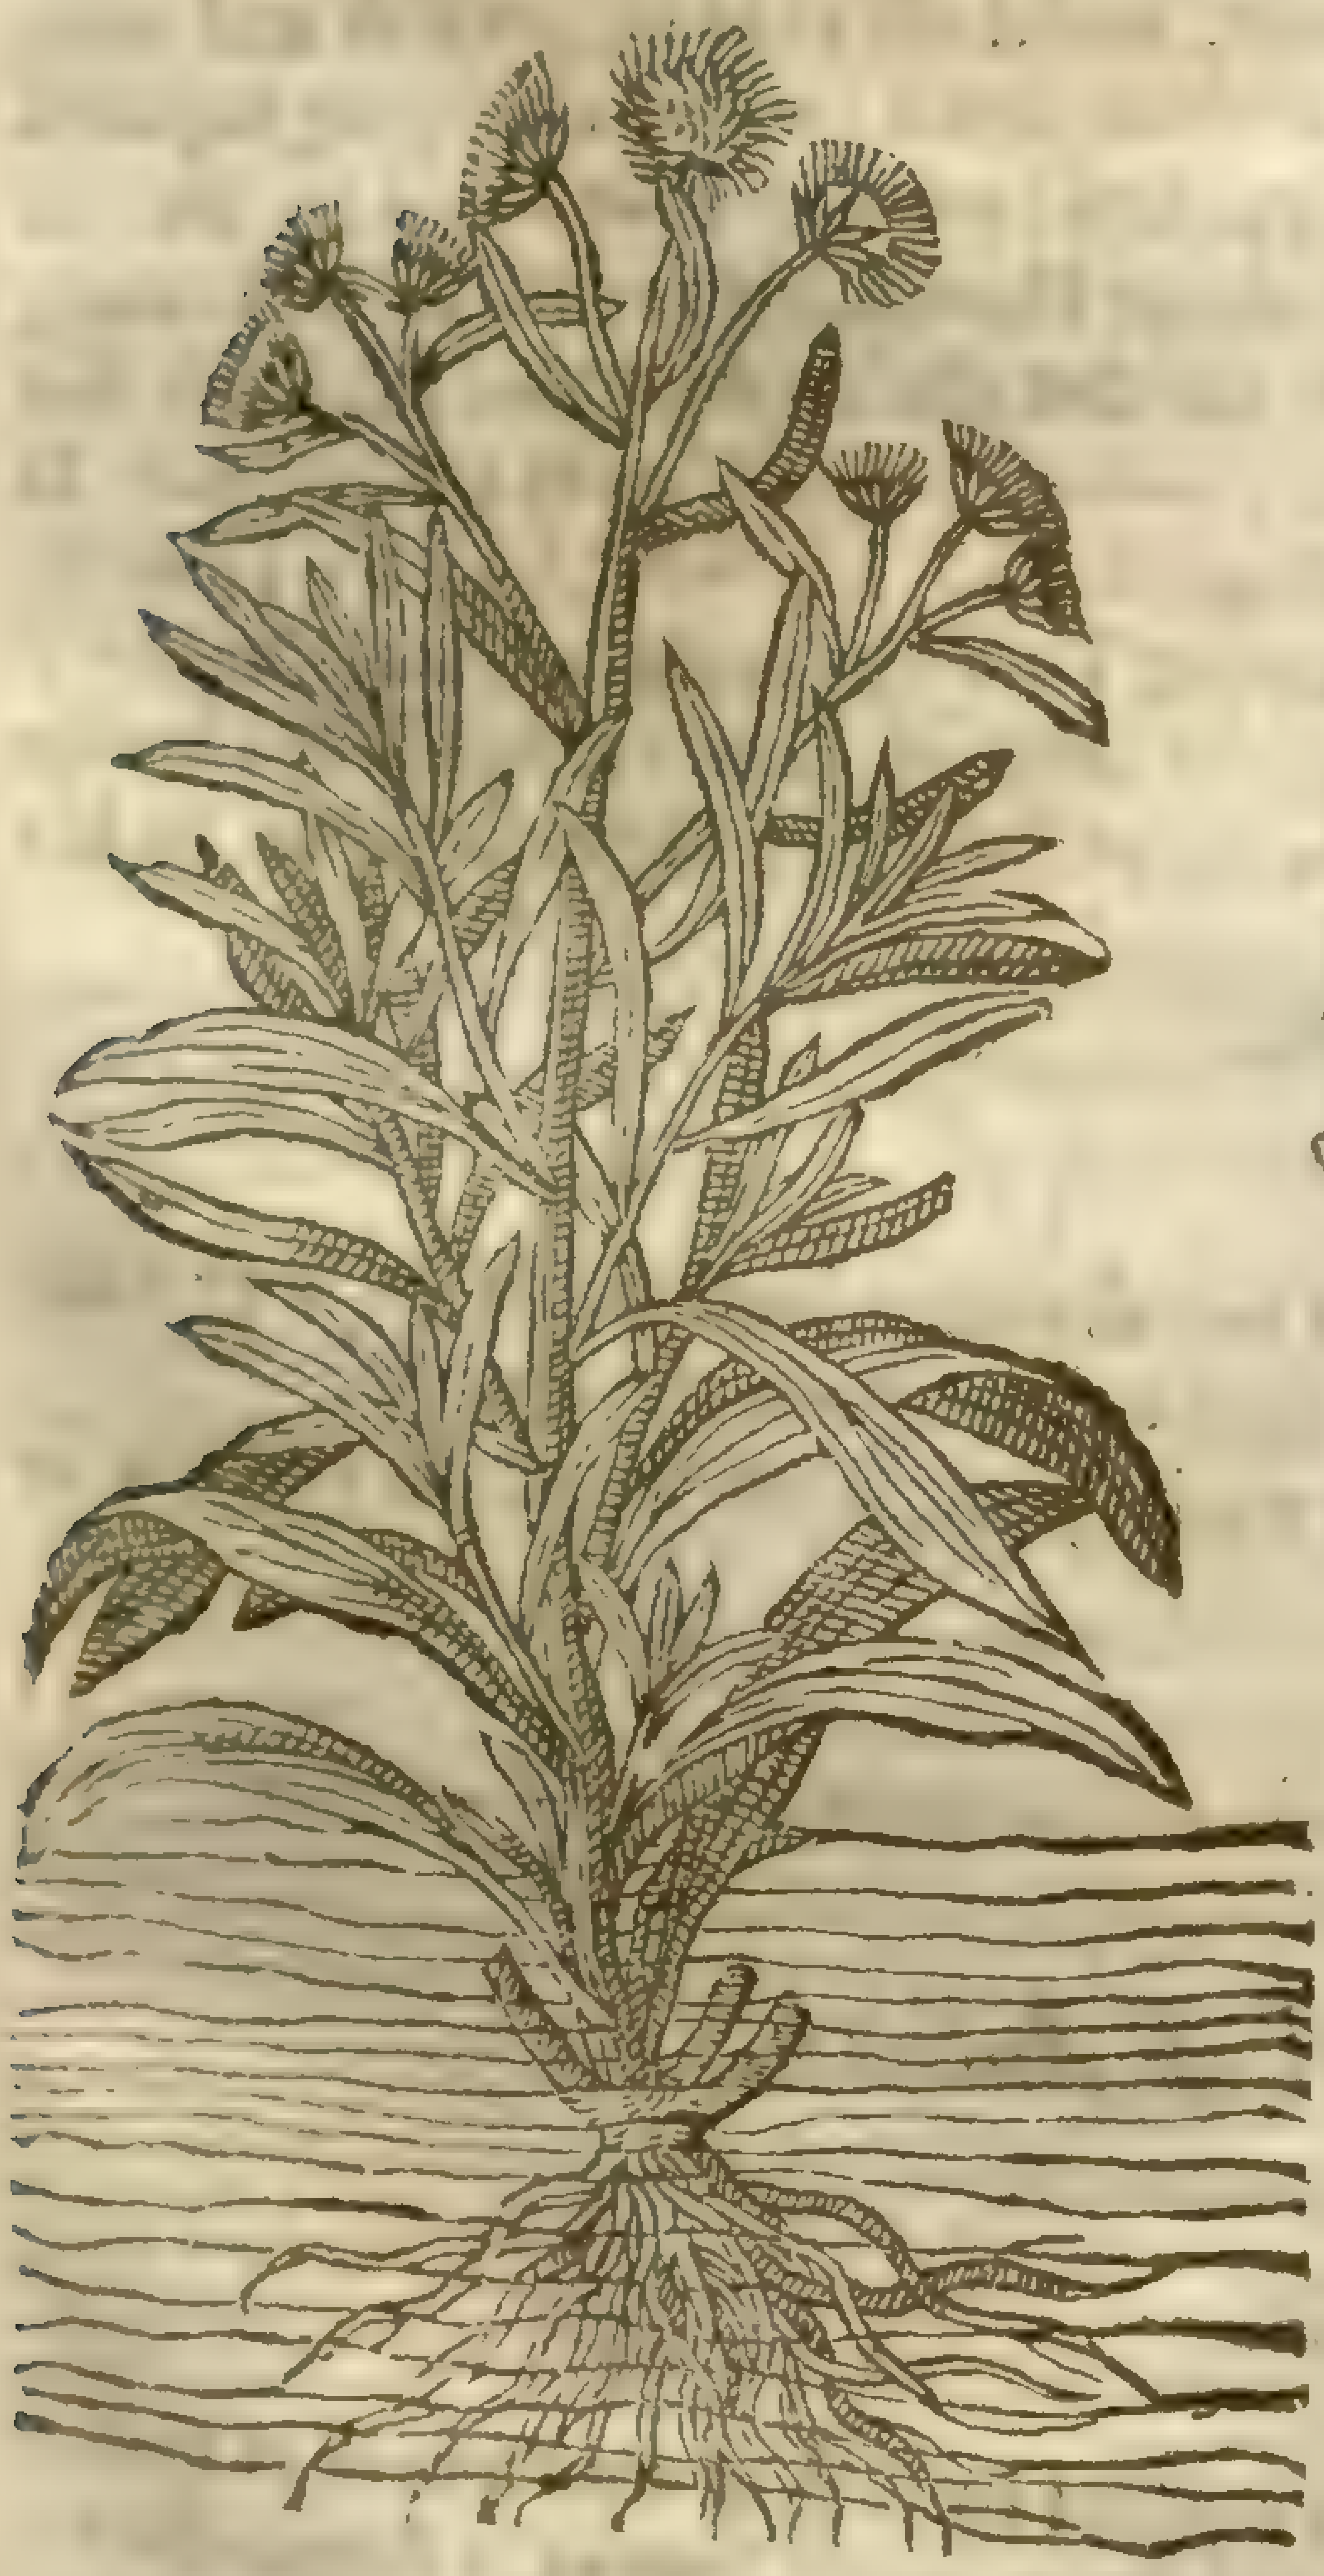
¶ *The Vertues.*

The ſeed beaten into pouder and drunk in Wine, helpeth the Collique, Strangurie, and Dyſenterie. A

The ſeed taken as aforeſaid, ſtaieth the ouermuch flowing of womens terms, and all other fluxes of bloud. B

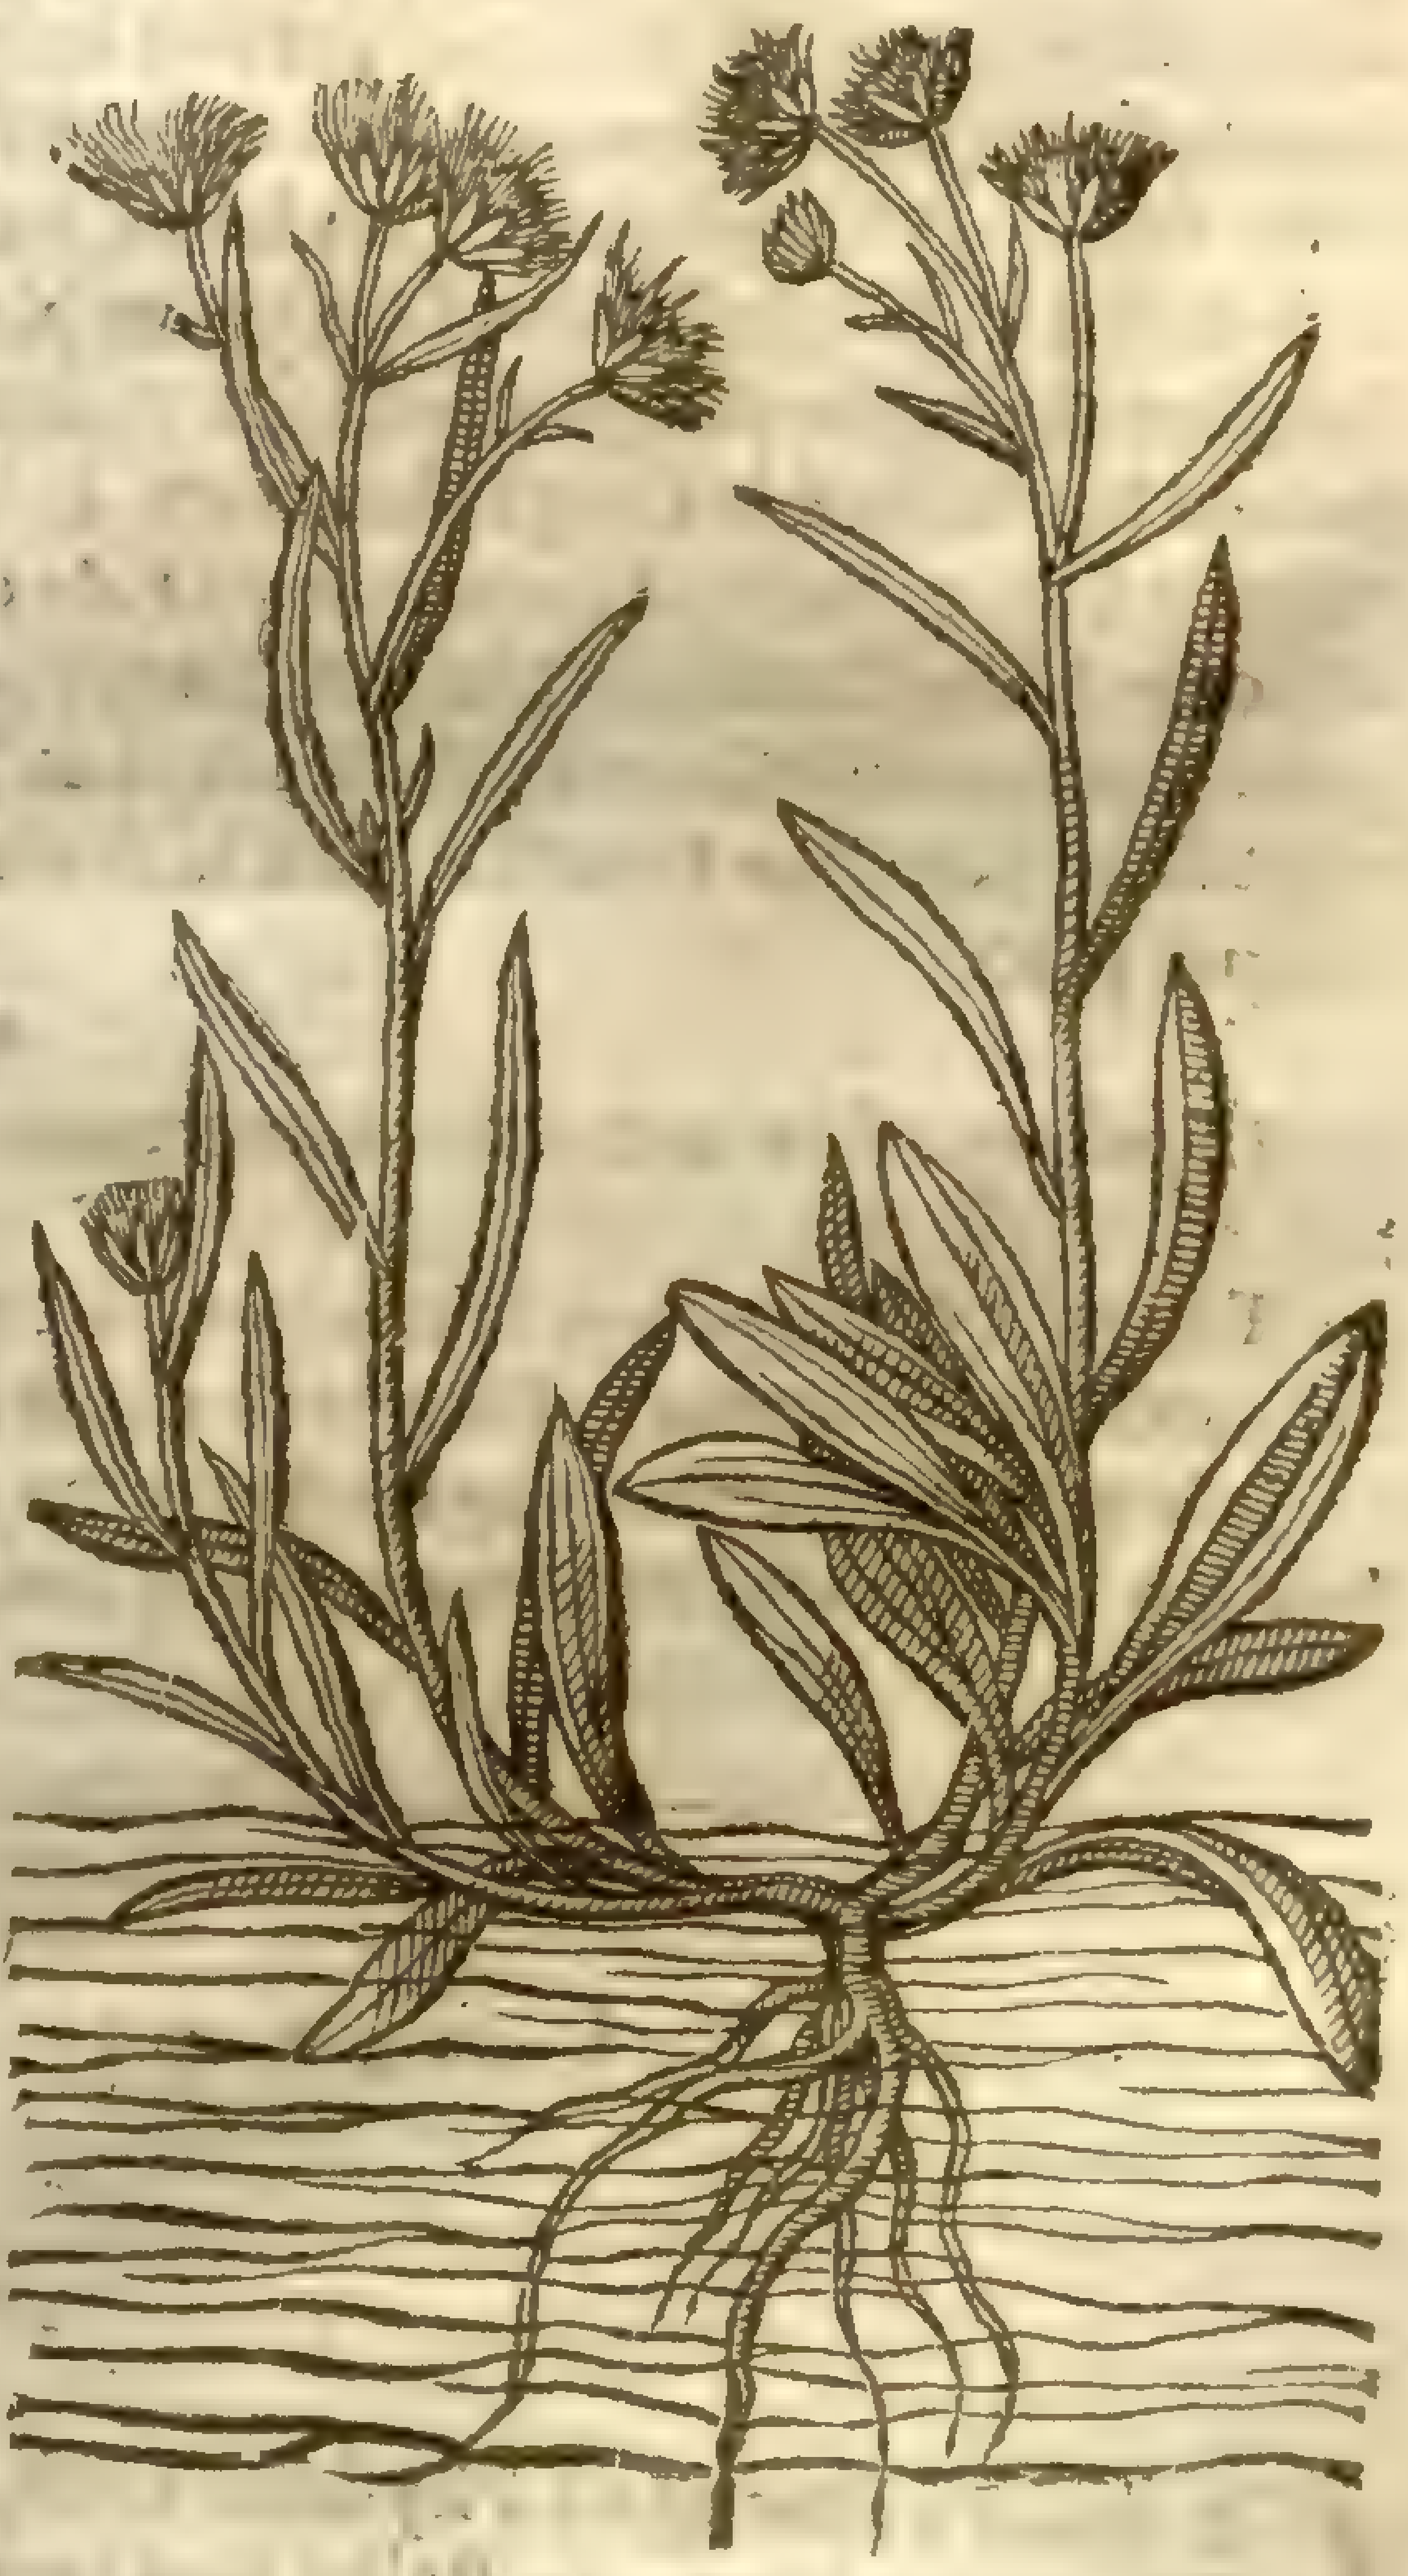
CHAP. 93. *Of Serapia's Turbith, or ſea Star-wort.*

1 *Tripolium vulgare majus.*
Great ſea Star-wort.



Aster Tripolium L.
[illegible]
[illegible] p. 3[illegible]

‡ 2 *Tripolium vulgare minus.*
Small ſea Star-wort.



¶ *The Deſcription.*

1 THe firſt kind of *Tripolium* hath long and large leaues ſomewhat hollow or furrowed, of a ſhining green colour declining to blewneſſe, like the leaues of Woad: among which riſeth vp a ſtalke of two cubits high and more, which toward the top is diuided into many ſmall branches garniſhed with many floures like Camomill, yellow in the middle, ſet about

or bordered with ſmall blewiſh leaues like a pale, as in the floures of Camomill; which grow into a whitiſh, rough downe that flieth away with the wind. The root is long and threddy.

2 There is another kinde of *Tripolium* like the firſt, but much ſmaller, wherein conſiſteth the difference.

¶ *The Place.*

Theſe herbs grow plentifully alongſt the Engliſh coaſts in many places, as by the fort againſt Grauesend, in the Iſle of Shepey in ſundry places, in a marſh which is vnder the town wals of Harwich, in the marſh by Lee in Eſſex, in a marſh which is between the Iſle of Shepey and Sandwich, eſpecially where it ebbeth and floweth: being brought into gardens it flouriſheth a long time, but there it waxeth huge, great, and ranke, and changeth the great roots into ſtrings.

¶ *The Time.*

Theſe herbs do floure in May and Iune.

¶ *The Names.*

It is reported by men of great fame and learning, That this plant was called *Tripolium* becauſe it doth change the colour of his floures thrice in a day. This rumor we may beleeue as true, for that we ſee and perceiue things of as great or greater wonder to proceed out of the earth. This herbe I planted in my garden, whither in his ſeaſon I did repaire to finde out the truth hereof, but I could not eſpy any ſuch variableneſſe herein: yet thus much I may ſay, that as the heate of the ſun doth change the colour of diuers floures, ſo it fell out with this, which in the morning was very faire, but afterward of a pale or wan colour. Which proueth that to be but a fable which *Dioſcorides* ſaith is reported by ſome, that in one day it changeth the colour of his floures thrice; that is to ſay, in the morning it is white, at noone purple, and in the euening, φοινικοῦν, or crimſon. But it is not vntrue, that there may be found three colours of the floures in one day, by reaſon that the floures are not all perfected together, (as before I partly touched) but one after another by little and little. And there may eaſily be obſerued three colours in them, which is to be vnderſtood of them that are beginning to floure, that are perfectly floured, and thoſe that are falling away. For they that are blowing and be not wide open and perfect are of a purpliſh colour, and thoſe that are perfect and wide open of a whitiſh blew, and ſuch as haue fallen away haue a white down: which changing hapneth vnto ſundry other plants. This herbe is called of *Serapio*, *Turbith*: women that dwell by the ſea ſide call it in Engliſh, blew Daiſies, or blew Camomill; & about Harwich it is called Hogs beans, for that the ſwine do greatly deſire to feed thereon, as alſo for that the knobs about the roots doe ſomewhat reſemble the garden bean. It is called in Greeke, τριπόλιον: and of diuers others, [illegible]. It may be fitly called *Aſter marinus* or *Amellus marinus*: in Engliſh, Sea Starwort, *Serapio's* Turbith: of ſome, blew Daiſies. The Arabian *Serapio* calls Sea Starwort, Turbith; and after him, *Auicen*: yet *Actuarius* the Grecian thinketh, that Turbith is the root of *Alypum*. *Meſues* iudged it to be the root of an herb like Fenell. The hiſtorie of Turbith of the ſhops ſhall be diſcourſed vpon in his proper place.

¶ *The Temperature.*

Tripolium is hot in the third degree, as *Galen* ſaith.

¶ *The Vertues.*

A The root of *Tripolium* taken in wine by the quantitie of two drams driueth forth by ſiege wateriſh and groſſe humors; for which cauſe it is often giuen to them that haue the dropſie.

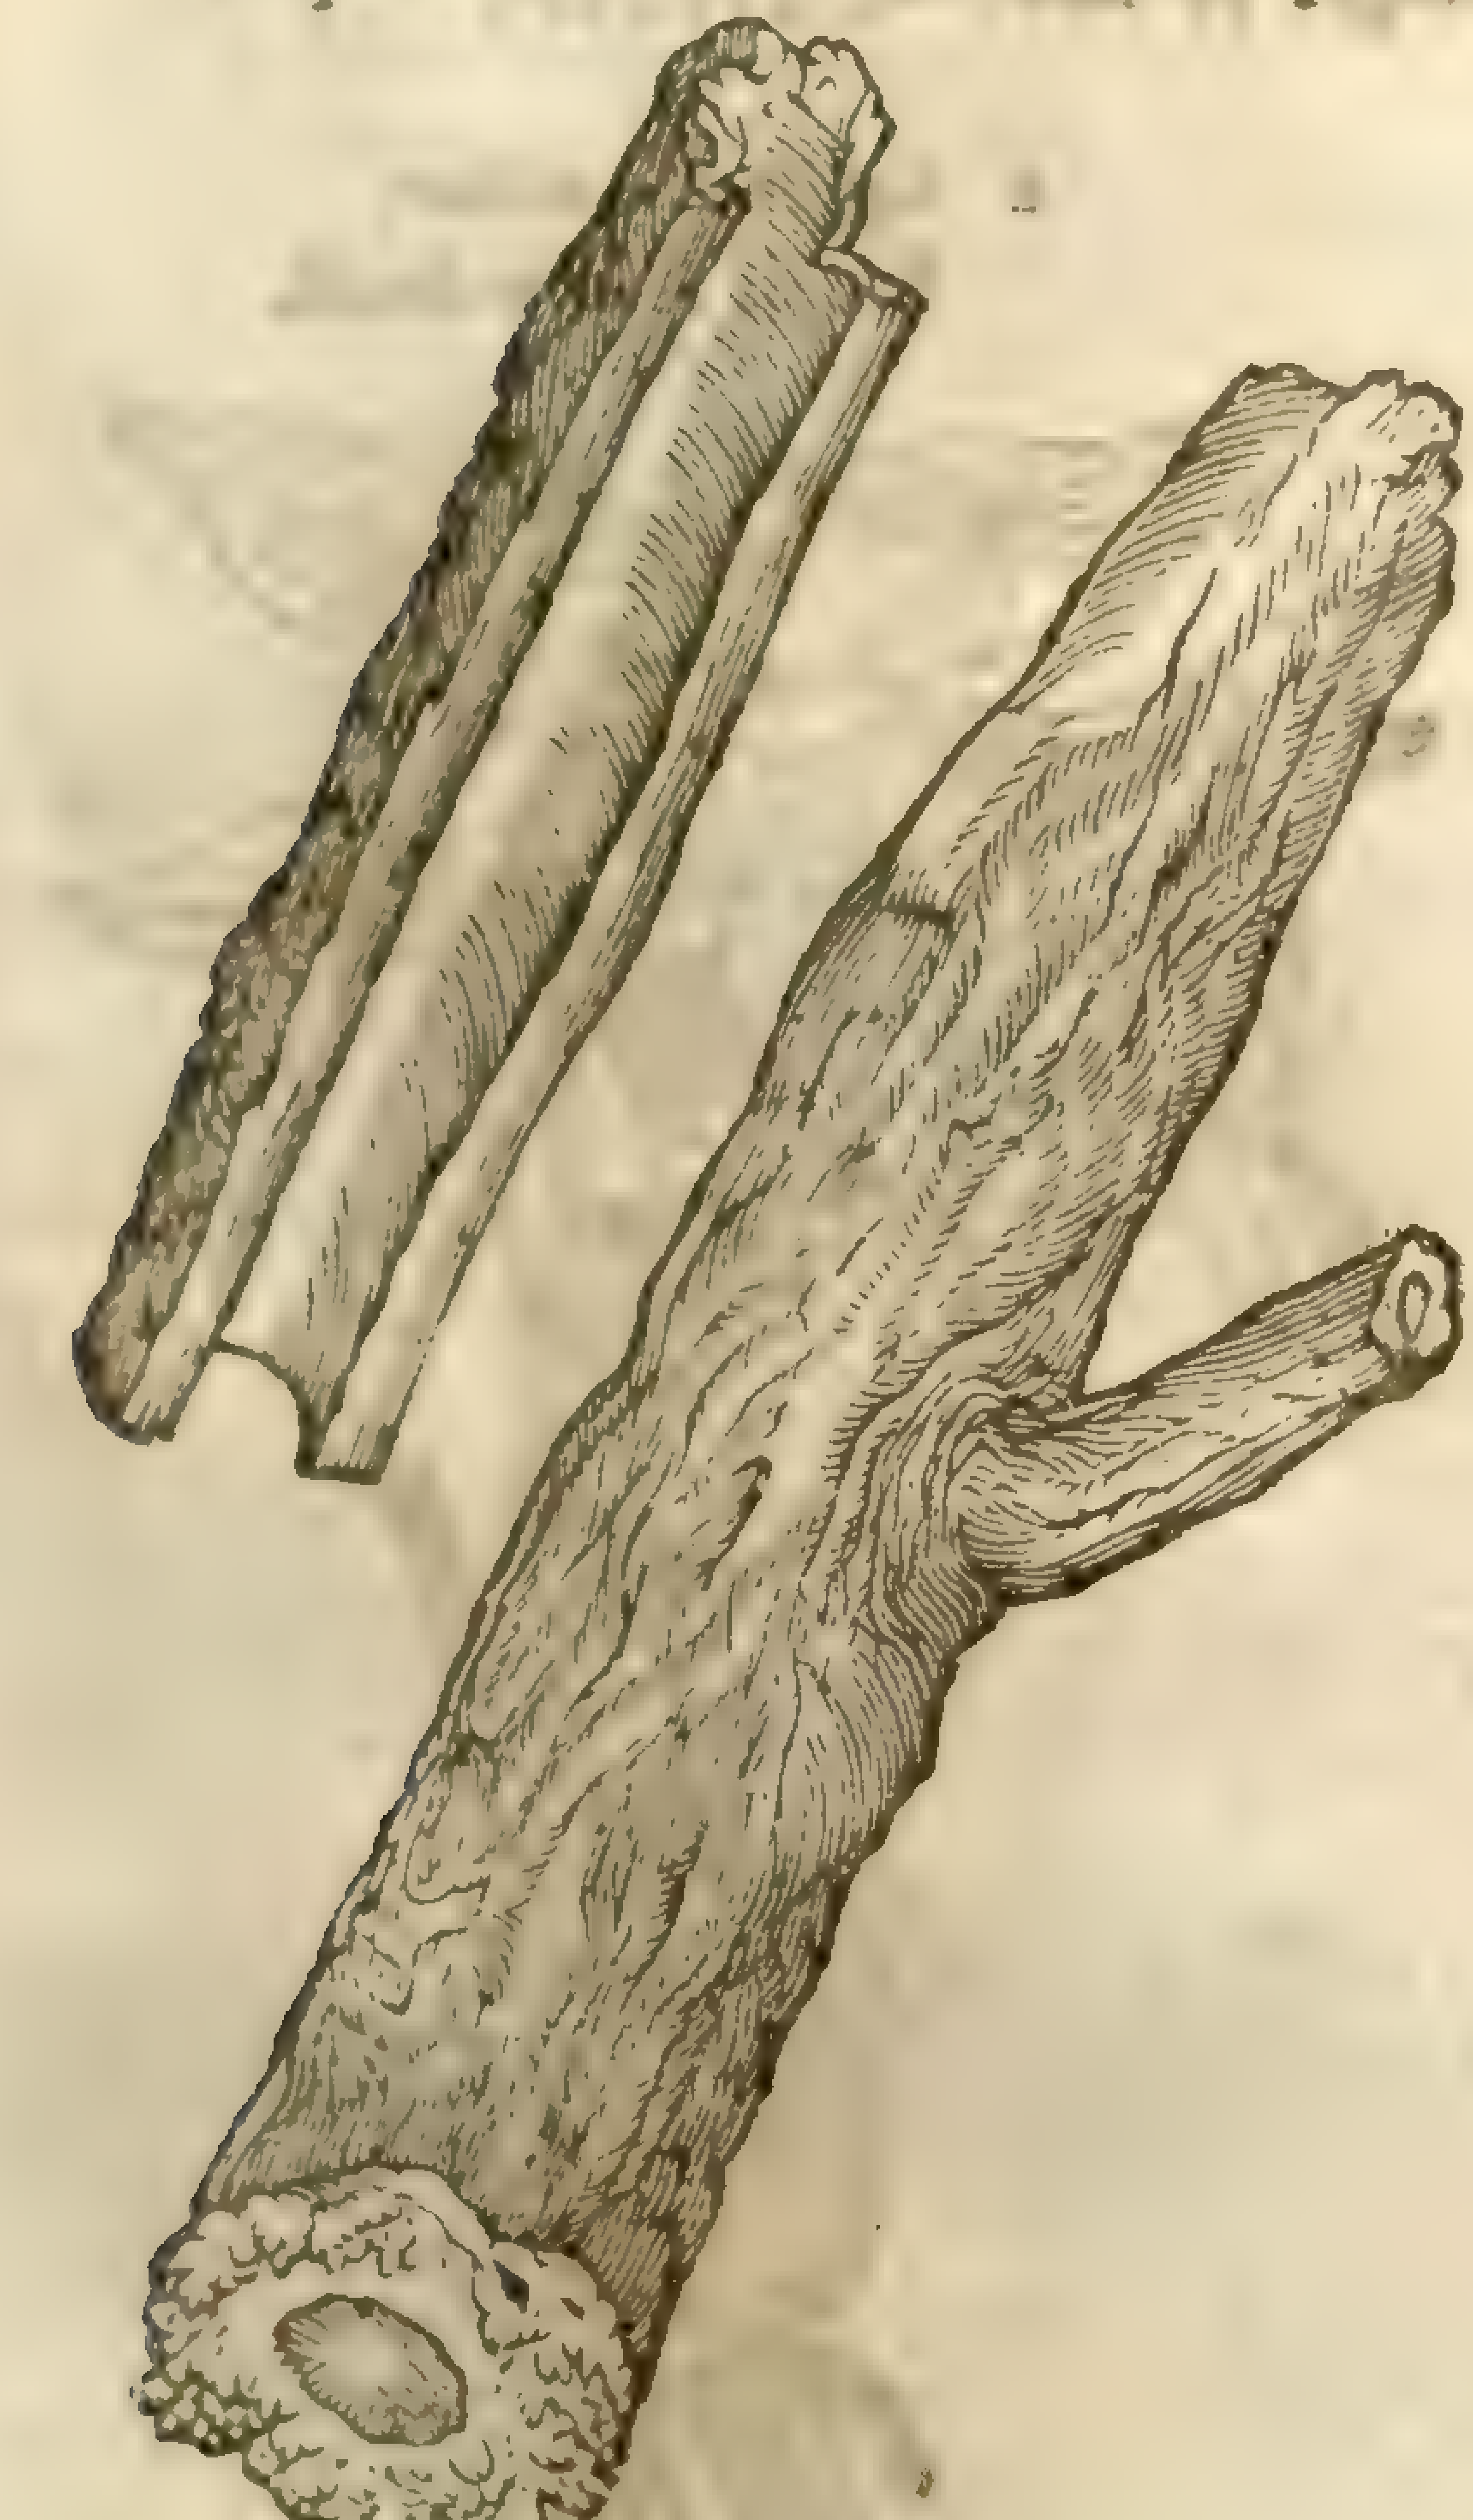
B It is an excellent herb againſt poyſon, and comparable with *Pyrola*, if not of greater efficacie in healing of wounds either outward or inward.

Chap. 94 *Of Turbith of Antioch.*

¶ *The Deſcription.*

Garcias a Portugall Phyſition ſaith, That Turbith is a plant hauing a root which is neither great nor long: the ſtalke is of two ſpannes long, ſometimes much longer, a finger thicke, which creepeth in the ground like Ivye, and bringeth forth leaues like thoſe of the Mariſh Mallow. The floures be alſo like thoſe of the Mallow, of a reddiſh white colour. The lower part of the ſtalke only, which is next vnto the root and gummy, is that which is profitable in medicine, and is the ſame that is vſed in ſhops: they chuſe that for the beſt which is hollow, and round like a reed, brittle, and with a ſmooth bark, as alſo that whereunto doth cleaue a congealed gum, which is ſaid to be *gummoſum*, or gummy, and ſomewhat white. But as *Garcias* ſaith, it is not alwayes gummy of his own nature; but the Indians becauſe they ſee that our merchants note the beſt Turbith by the gummineſſe, are wont before they gather the ſame, either to wryth or els lightly bruiſe them, that the ſap or liquor may iſſue out; which root being once hardned, they picke out from the reſt to ſell at a greater price. It is likewiſe made white, as the ſame Author ſheweth, being dried in the Sun; for if it be dried in the ſhadow it waxeth blacke, which notwithſtanding may be as good as the white which is dried in the Sun.

Turbith Alexandrinum officinarum.
Turpetum, or Turbith of the ſhops.



¶ *The Place.*

It groweth by the ſea ſide, but yet not ſo neere that the waſh or water of the ſea may come to it, but neere about, and that for two or three miles in vntilled grounds, rather moiſt than dry. It is found in Cambaya, Surrate, in the Iſle Dion, Bazaim, and the places neere adioyning; alſo in Guzarate, where it groweth plentifully, from whence great aboundance of it is brought into Perſia, Arabia, Aſia the leſſe, and alſo into Portingall and other parts of Europe; but that is preferred which groweth in Cambaia.

¶ *The Names.*

It is called of the Arabians, Perſians, & Turks, *Turbith:* and in Guzarata, *Barcaman:* in the Prouince Canara, in which is the city Goa, *Tiguar:* likewiſe in Europe the Learned call it diuerſly, according to their ſeuerall fancies, which hath bred ſundry controuerſies, as it hath fallen out as well in Hermodactyls as in Turbith; the vſe and poſſeſſion of which we cannot ſeem to want: but which plant is the true Turbith wee haue great cauſe to doubt. Some haue thought our *Tripolium marinum,* deſcribed in the former chapter, to bee the true Turbith: others haue ſuppoſed it to bee one of the Tithymales, but which kind they know not. *Guillandinus* ſaith, that the root of *Tithymalus myrſinitis* is the true Turbith: which cauſed *Lobel* and *Pena* to plucke vp by the roots all the kinds of Tithymales and dry them very curiouſly; which when they had beheld and throughly tried, they found it nothing ſo. The Arabians and halfe-Moores that dwell in the Eaſt parts haue giuen diuers names to this plant; and as their words are diuers, ſo haue they diuers ſignifications: but this name Turbith they ſeem to interpret to be any milky root which doth ſtrongly purge flegme, as this root doth. So that as men haue thought good, pleaſing themſelues, they haue many and diuers conſtructions, which hath troubled many excellent learned men to know what root is the true Turbith. But briefly to ſet downe mine opinion, not varying from the iudgement of men of great experience; I thinke aſſuredly, that the root of Scammonie of Antioch is the true and vndoubted Turbith: one reaſon eſpecially that moueth me ſo to thinke is, for that I haue taken vp the roots of Scammony which grew in my garden, and compared them with the roots of Turbith, betweene which I found little or no difference at all.

‡ Through all Spain (as *Cluſius* in his notes vpon *Garcias* teſtifies) they vſe the roots of *Thapſia* for Turbith, which alſo hath bin brought hither, and I keep ſome of them by me, but they purge little or nothing at all being dry, though it may be the green root or iuyce may haue ſome purging facultie. ‡

¶ *The Temperature and Vertues.*

A The Indian Phyſitions vſe it to purge flegme, to which if there be no feuer they adde Ginger; otherwiſe they giue it without in the broth of a chicken, and ſometimes in faire water.

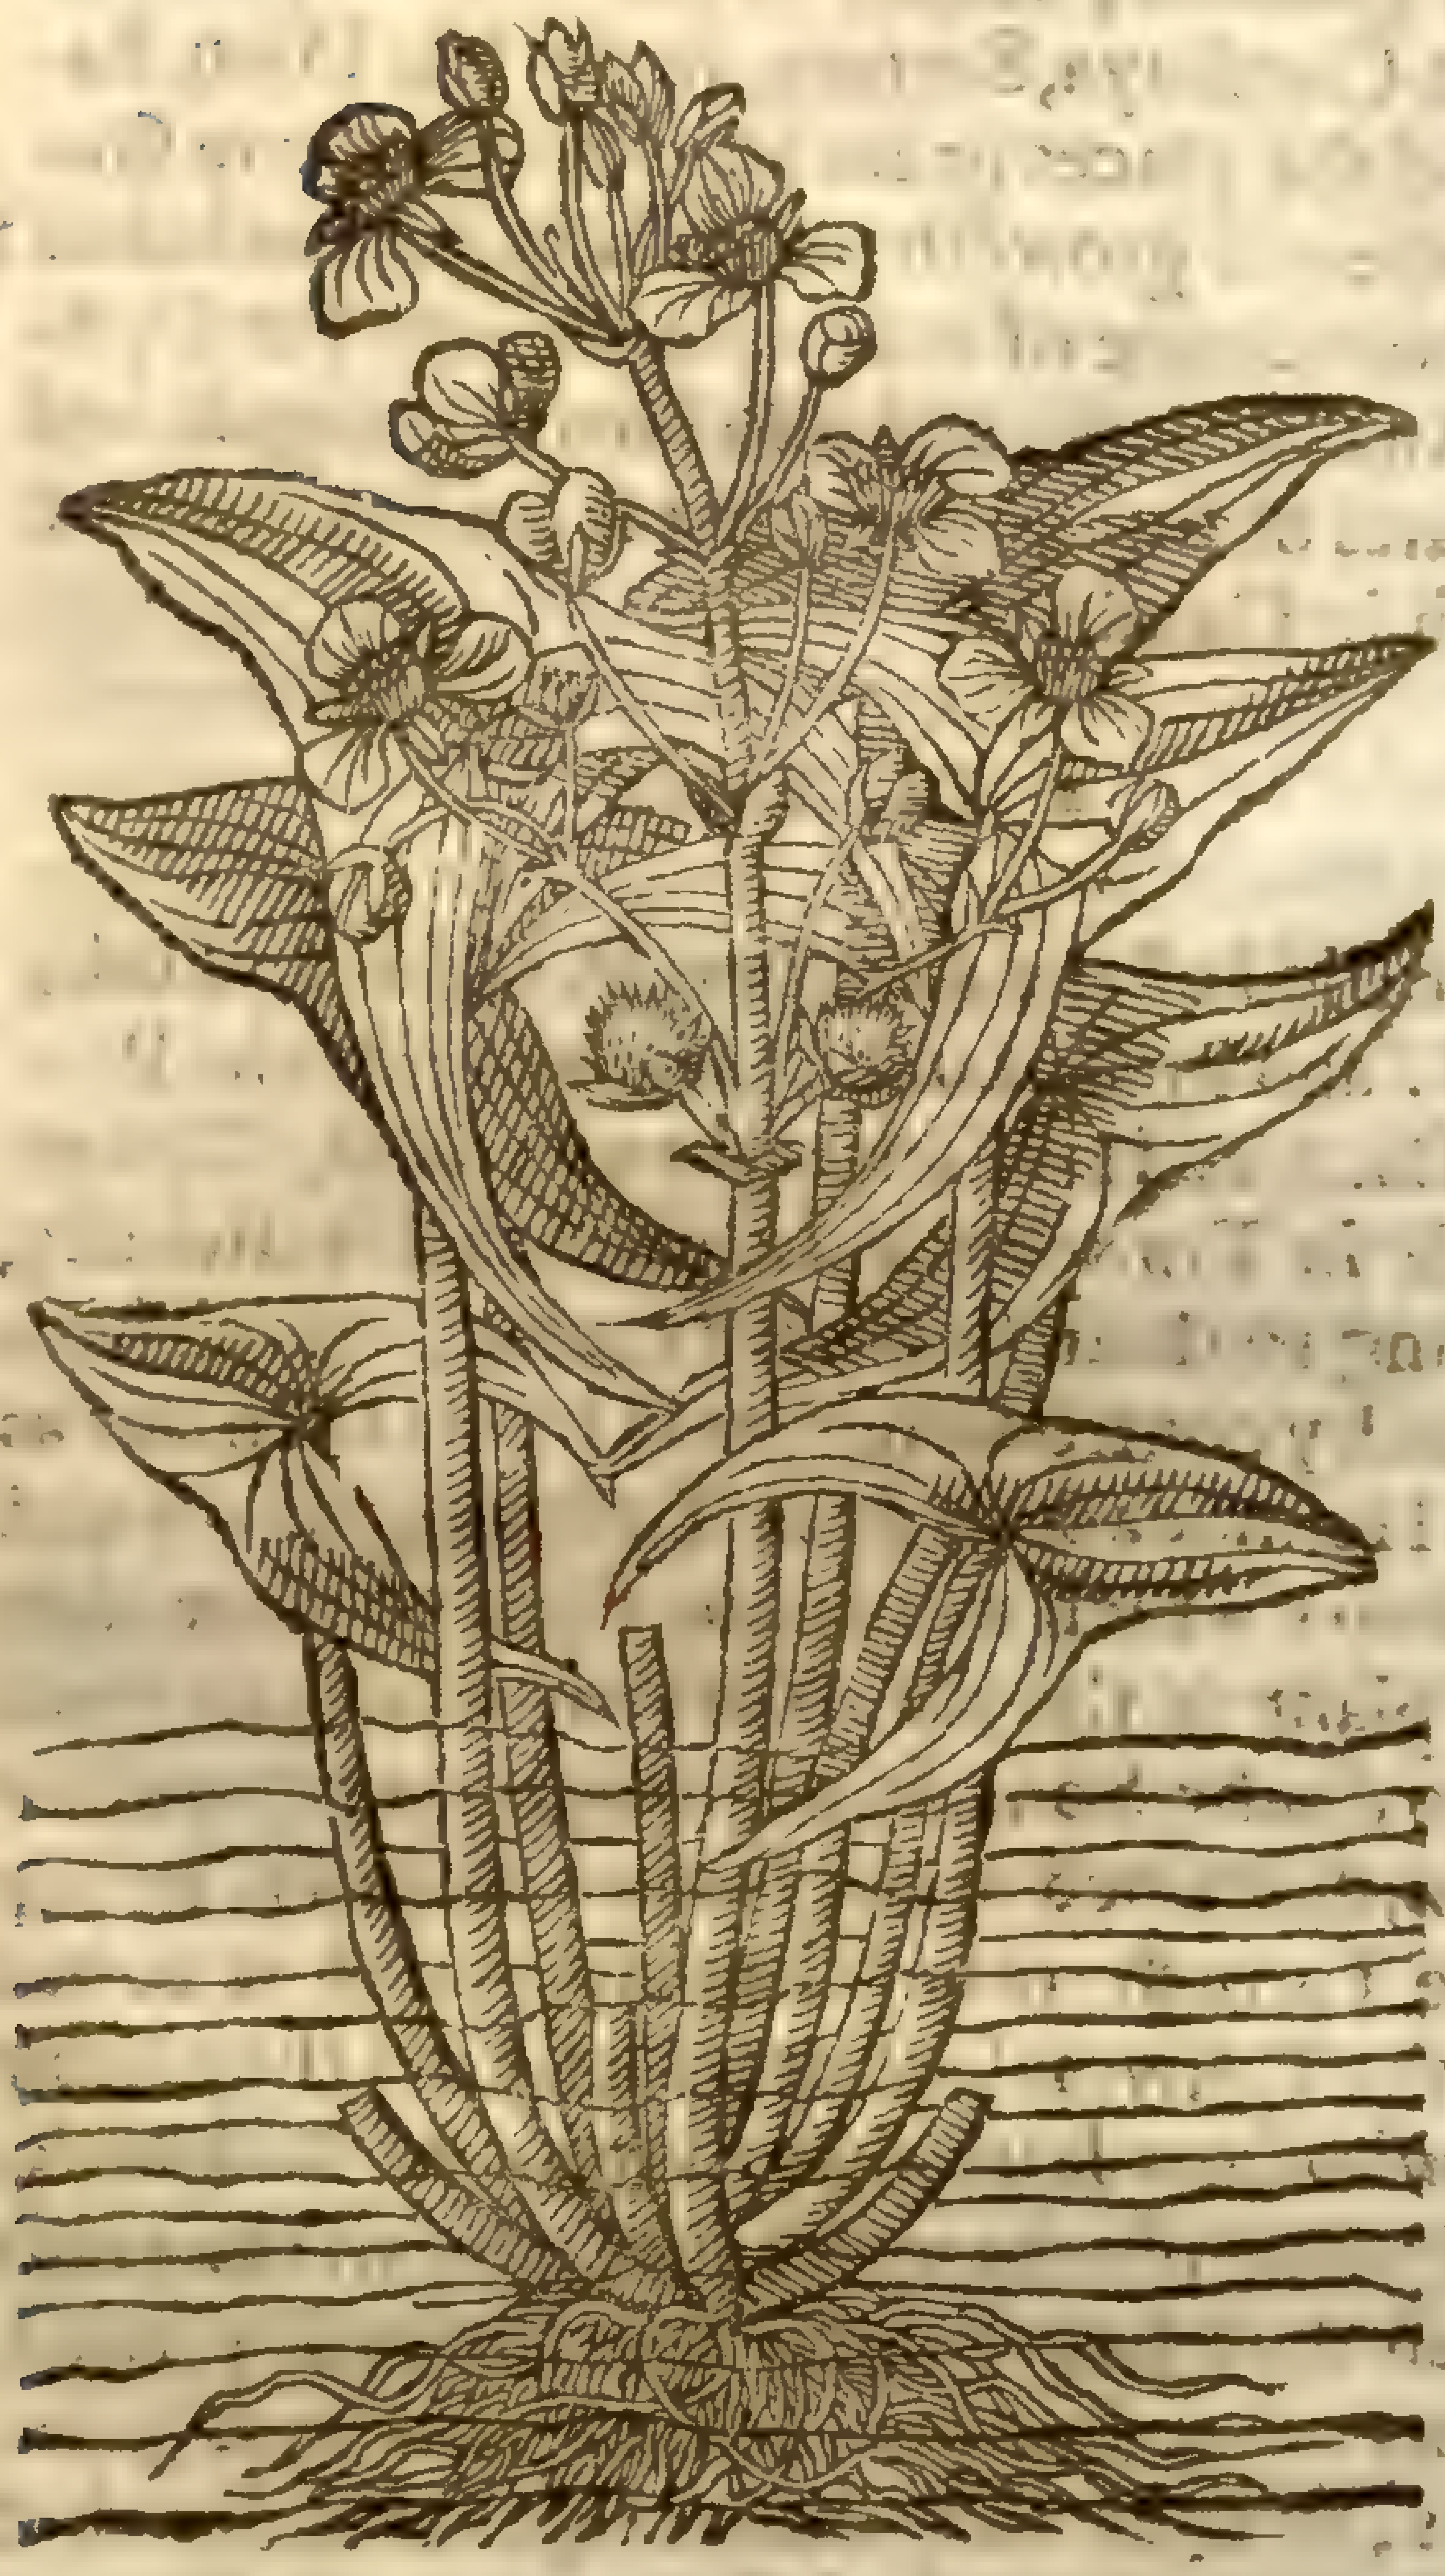
B *Meſues* writeth, that Turbith is hot in the third degree, and that it voideth thicke tough flegme out of the ſtomack, cheſt, ſinues, and out of the furthermoſt parts of the body; but (as he ſaith) it is ſlow in working, and troubleth and ouerturneth the ſtomacke, and therefore Ginger, Maſtick, and other ſpices are to be mixed with it; alſo oile of ſweet Almonds, or Almonds themſelues, or ſugar, leſt the body with the vſe hereof ſhould pine and fall away. Others temper it with Dates, ſweet

Almonds and certaine other things,making thereof a compoſition that the Apothecaries call an Electuarie) which is named Διαφοινικῶν : common in ſhops, and in continual vſe among expert Phyſitions.

C There is giuen at one time of this Turbith one dram (more or leſſe) two at the moſt : but in the decoction or in the infuſion three or foure.

Chap. 95. *Of Arrow-head, or Water-Archer.*

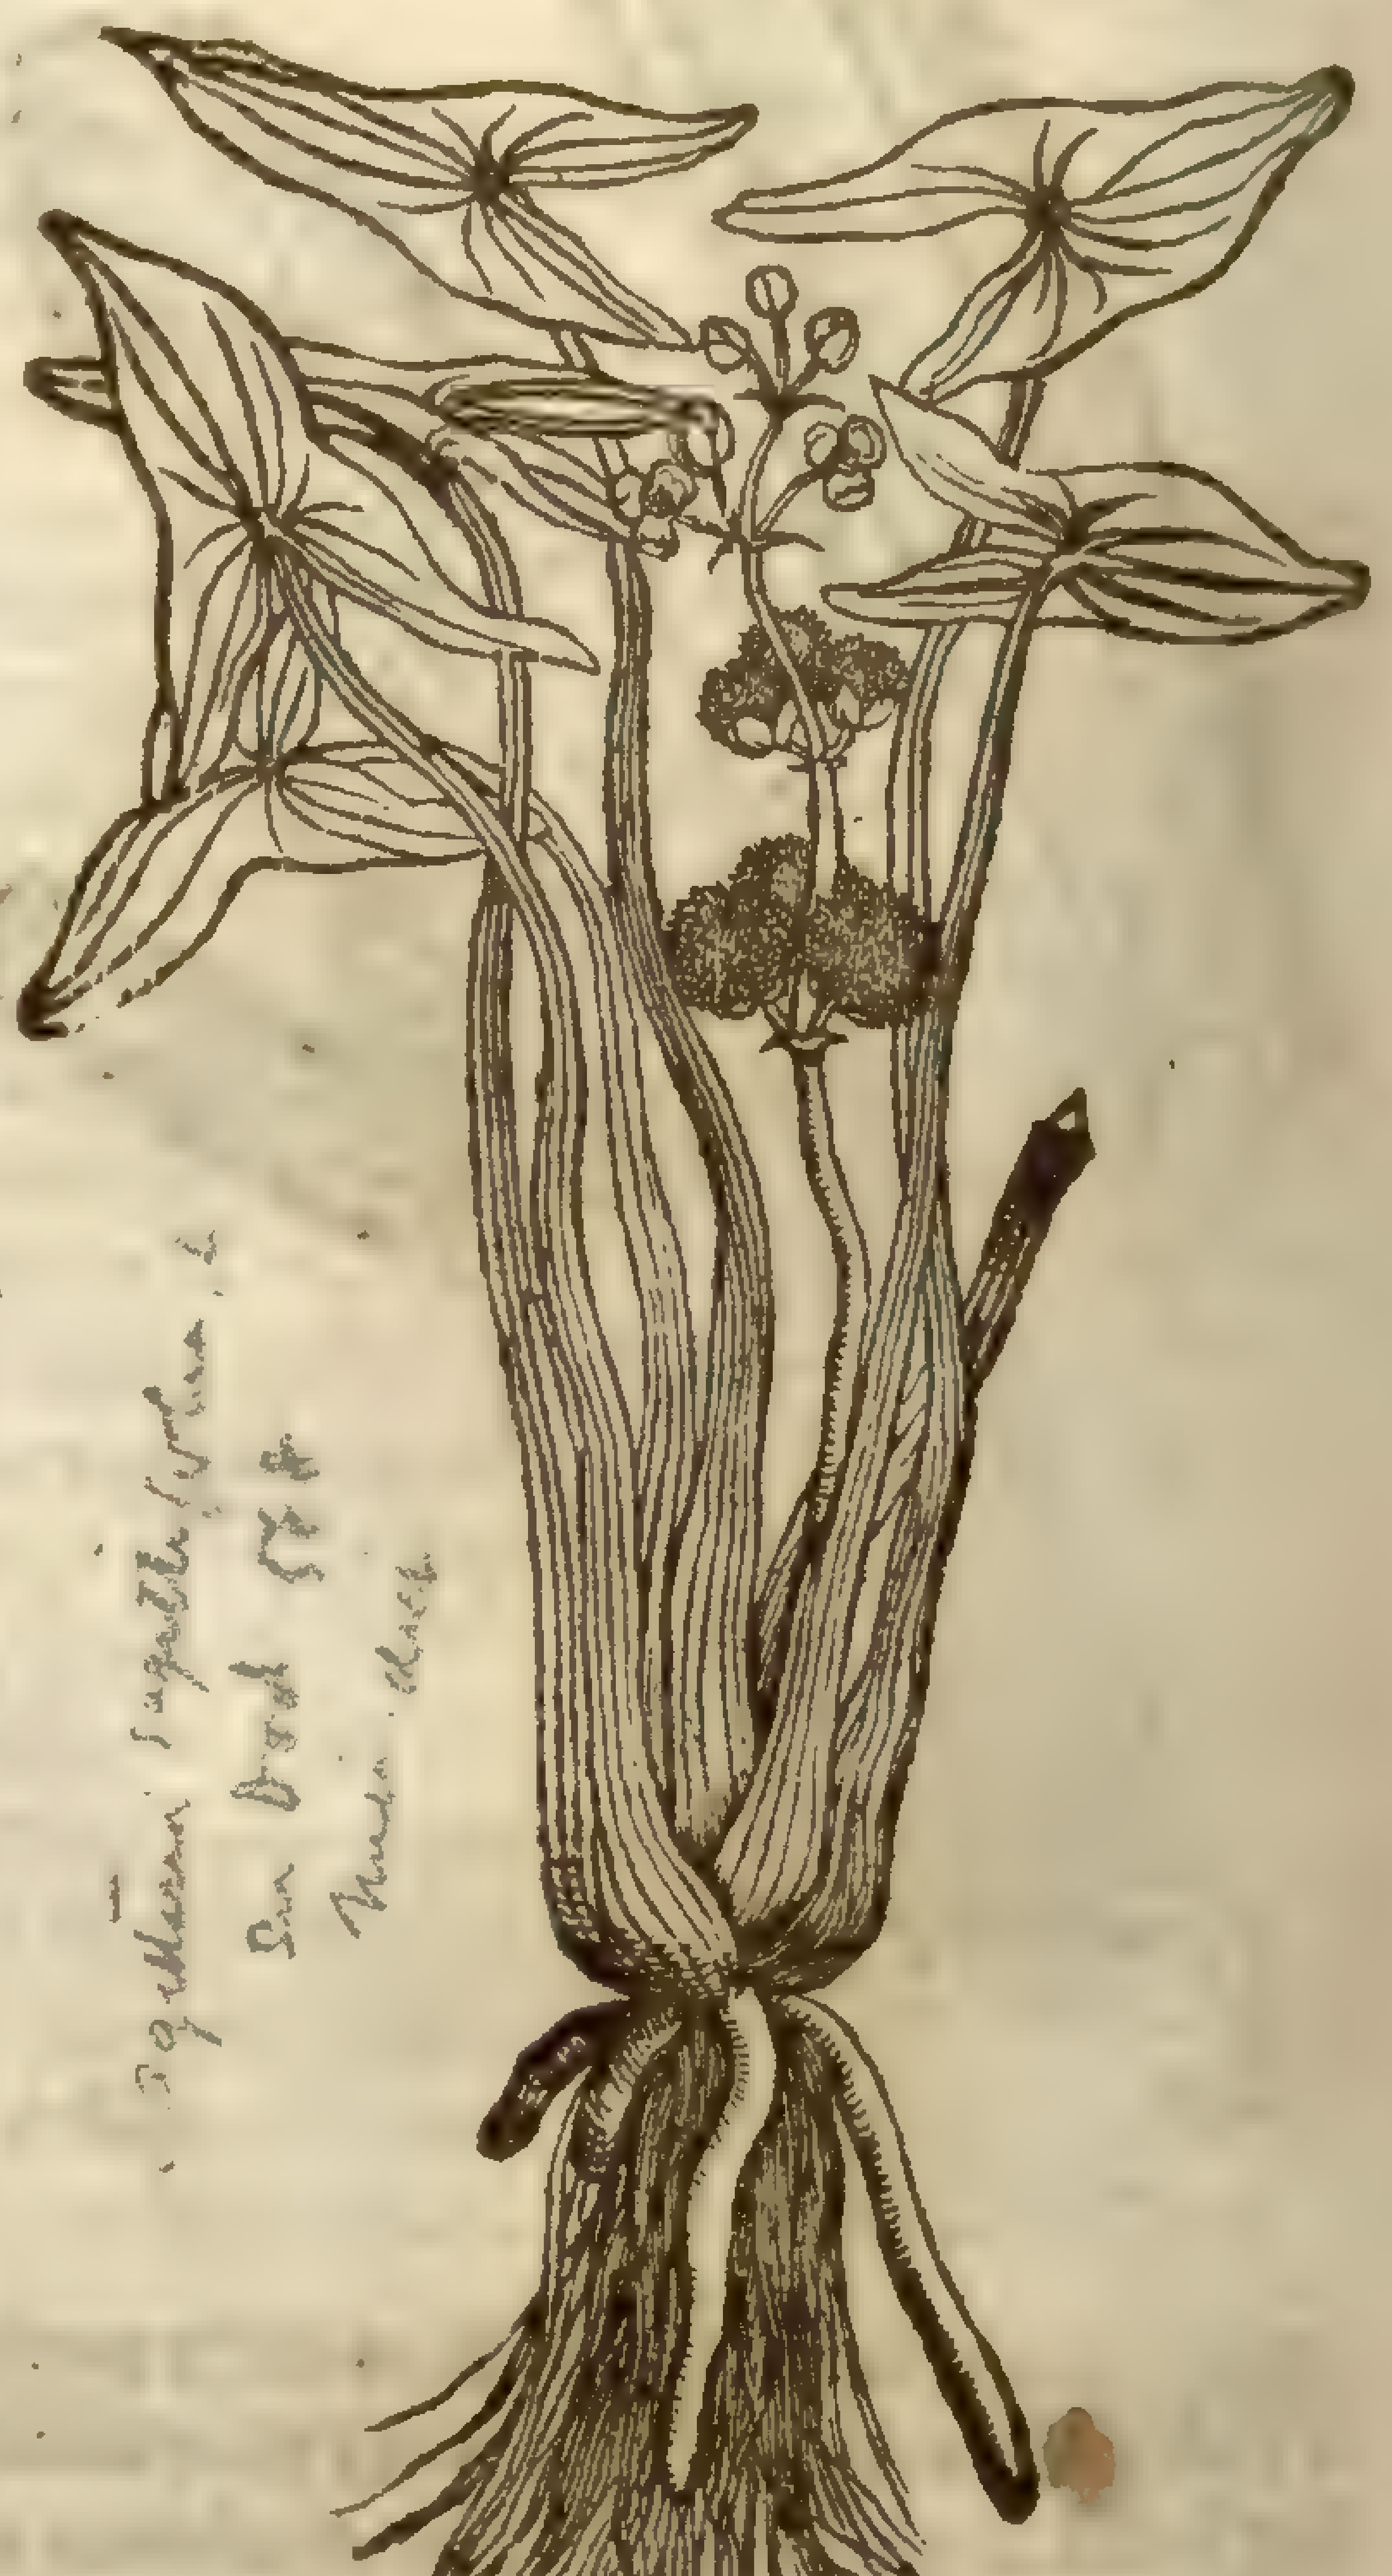
1 *Sagittaria maior.*
Great Arrow-head.



Sagittaria Sagittifolia, Lin. Sp.
maior. Ger.

Sagittifolia

2 *Sagittaria minor.*
Small Arrow-head.



Sagittaria Sagittifolia L.
Eng. Bot. 84
Minor. Ger.

¶ *The Deſcription.*

1 THe firſt kinde of water-Archer or Arrow-head hath large and long leaues in ſhape like a bearded broad Arrow-head. Among which riſeth vp a fat and thicke ſtalke two or three foot long,hauing at the top many pretty white floures declining to a light carnation,compact of three ſmall leaues : which being paſt , there come after great rough knops or burres wherein is the ſeed. The root conſiſteth of many ſtrings.

2 The ſecond is like the firſt,and differs in that this kinde hath ſmaller leaues and floures, and greater burres and roots.

3 The third kinde of Arrow-head hath leaues in ſhape like the broad Arrow-head, ſtanding vpon the ends of tender foot-ſtalks a cubit long : among which riſeth long naked ſmooth ſtalks of a greeniſh colour,from the middle whereof to the top grow floures like to the precedent. The root is ſmall and threddy.

¶ *The Place.*

Theſe herbs grow in the waterie ditches by S. *Georges* field neere London,in the tower ditch at London,in the ditches neere the walls of Oxford,by Chelmsford in Eſſex, and in many other places, as namely in the ditch neere the place of execution called S. *Thomas Waterings*,not farre from London.

¶ *The Time.*

They floure in May and Iune.

¶ *The Names.*

Sagittaria may be called in Engliſh, water Archer, or Arrow-head. ‡ Some would haue it the *Phleum* of *Theophraſtus*; and it is the *Piſtana Magonis*, and *Sagitta* of *Pliny, lib.* 21. *cap.* 17. ‡

¶ *The Nature and Vertues.*

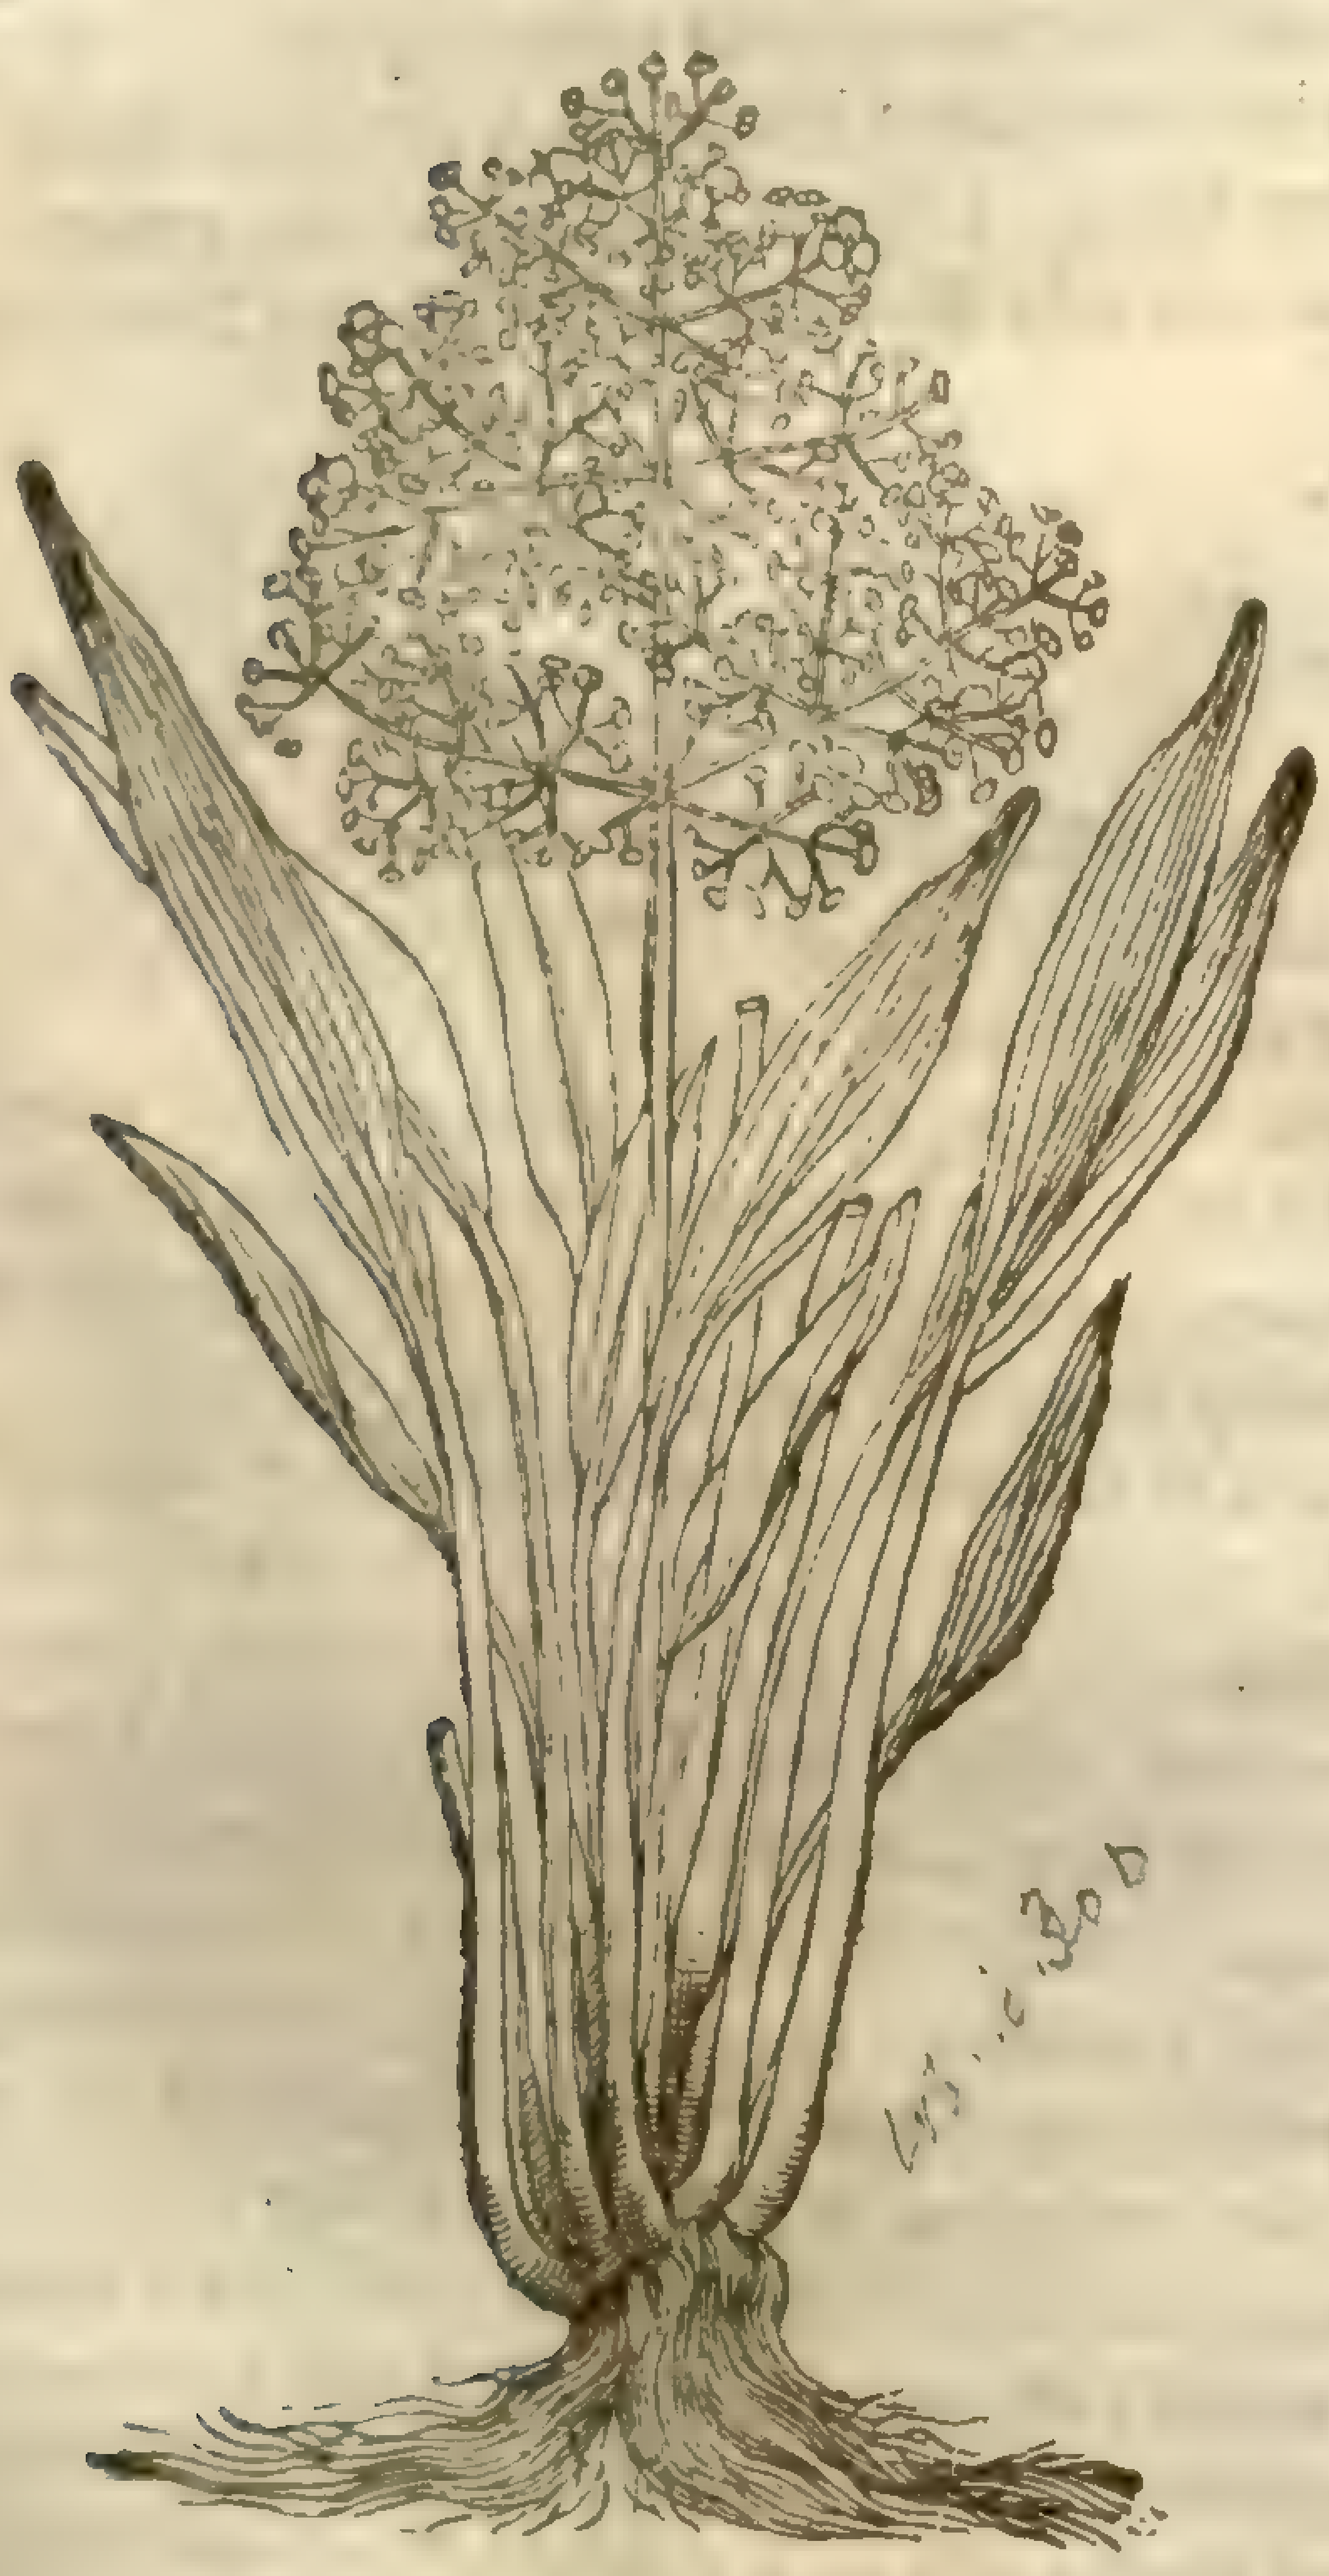
I find nothing extant in writing either concerning their vertues or temperament, but doubtles they are cold and dry in qualitie, and are like Plantain in facultie and temperament.

Alisma plantago, L. Spec. dist. Sm. fl. 2. 203

CHAP. 96. *Of water Plantaine.*

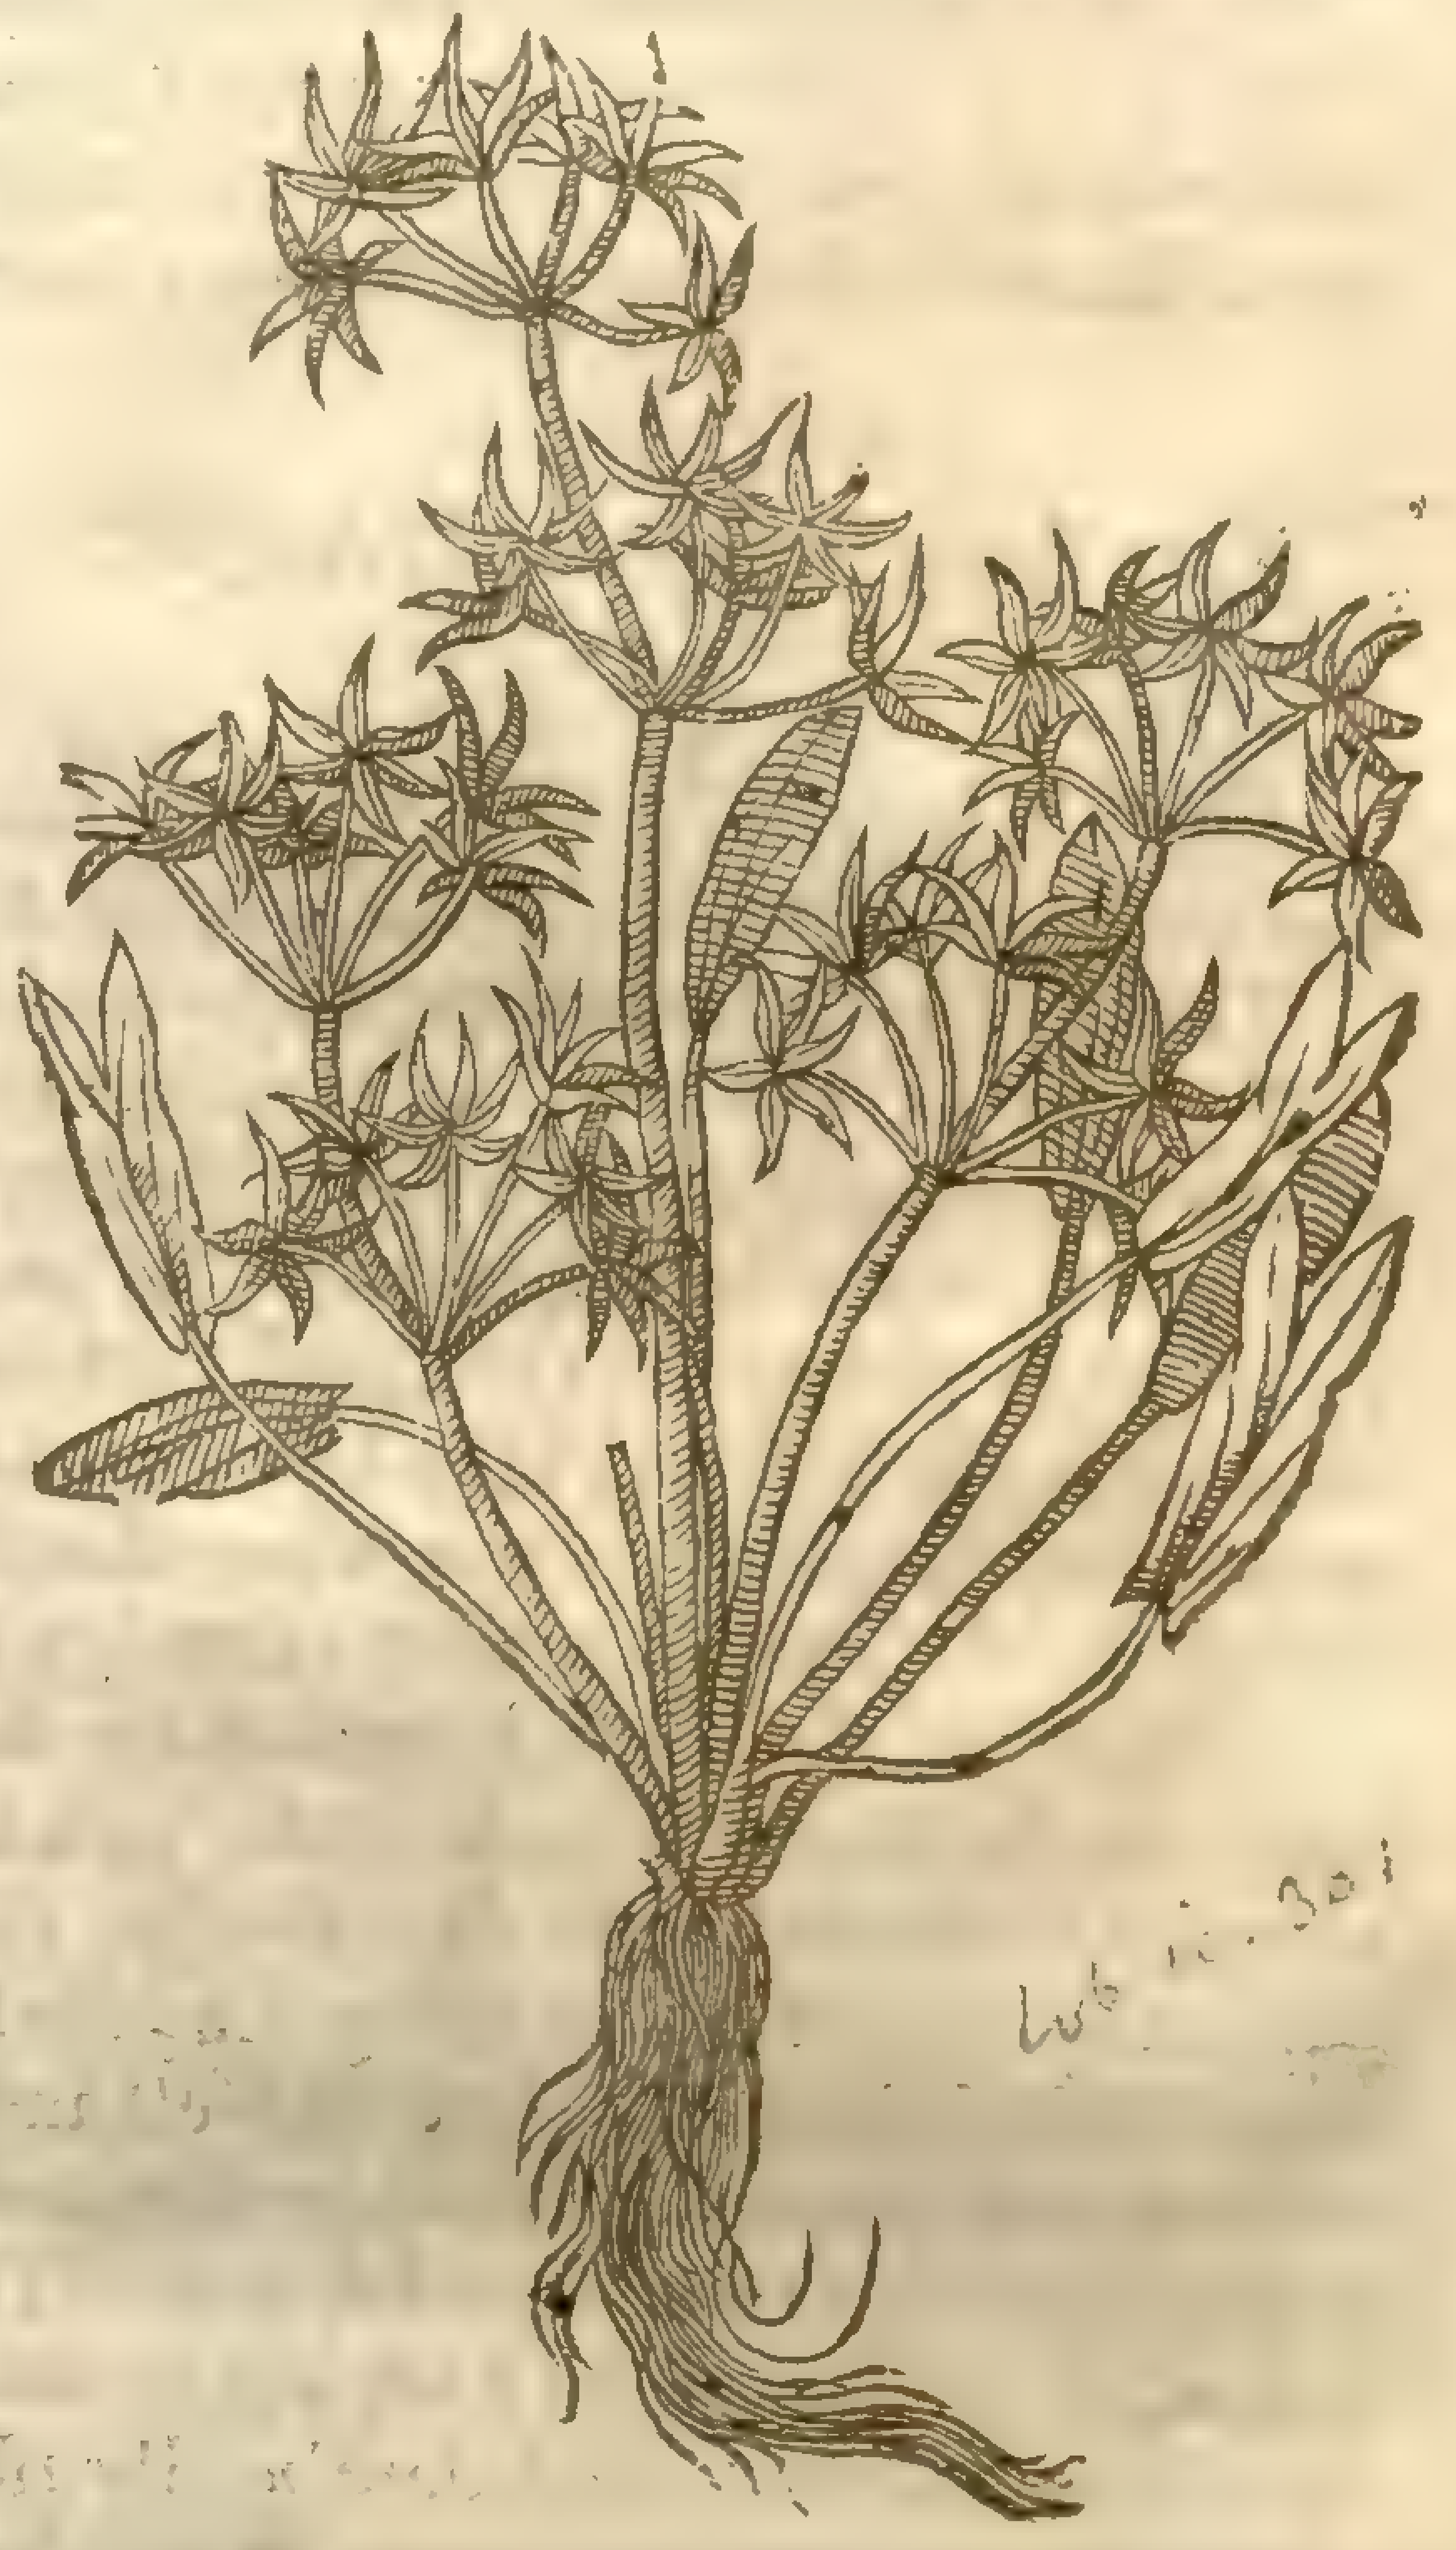
Alisma damasonium, L. mult. dist. Sm. fl. 2. 204

1 *Plantago aquatica maior.*
Great Water Plantain.



Lob. ic. 300

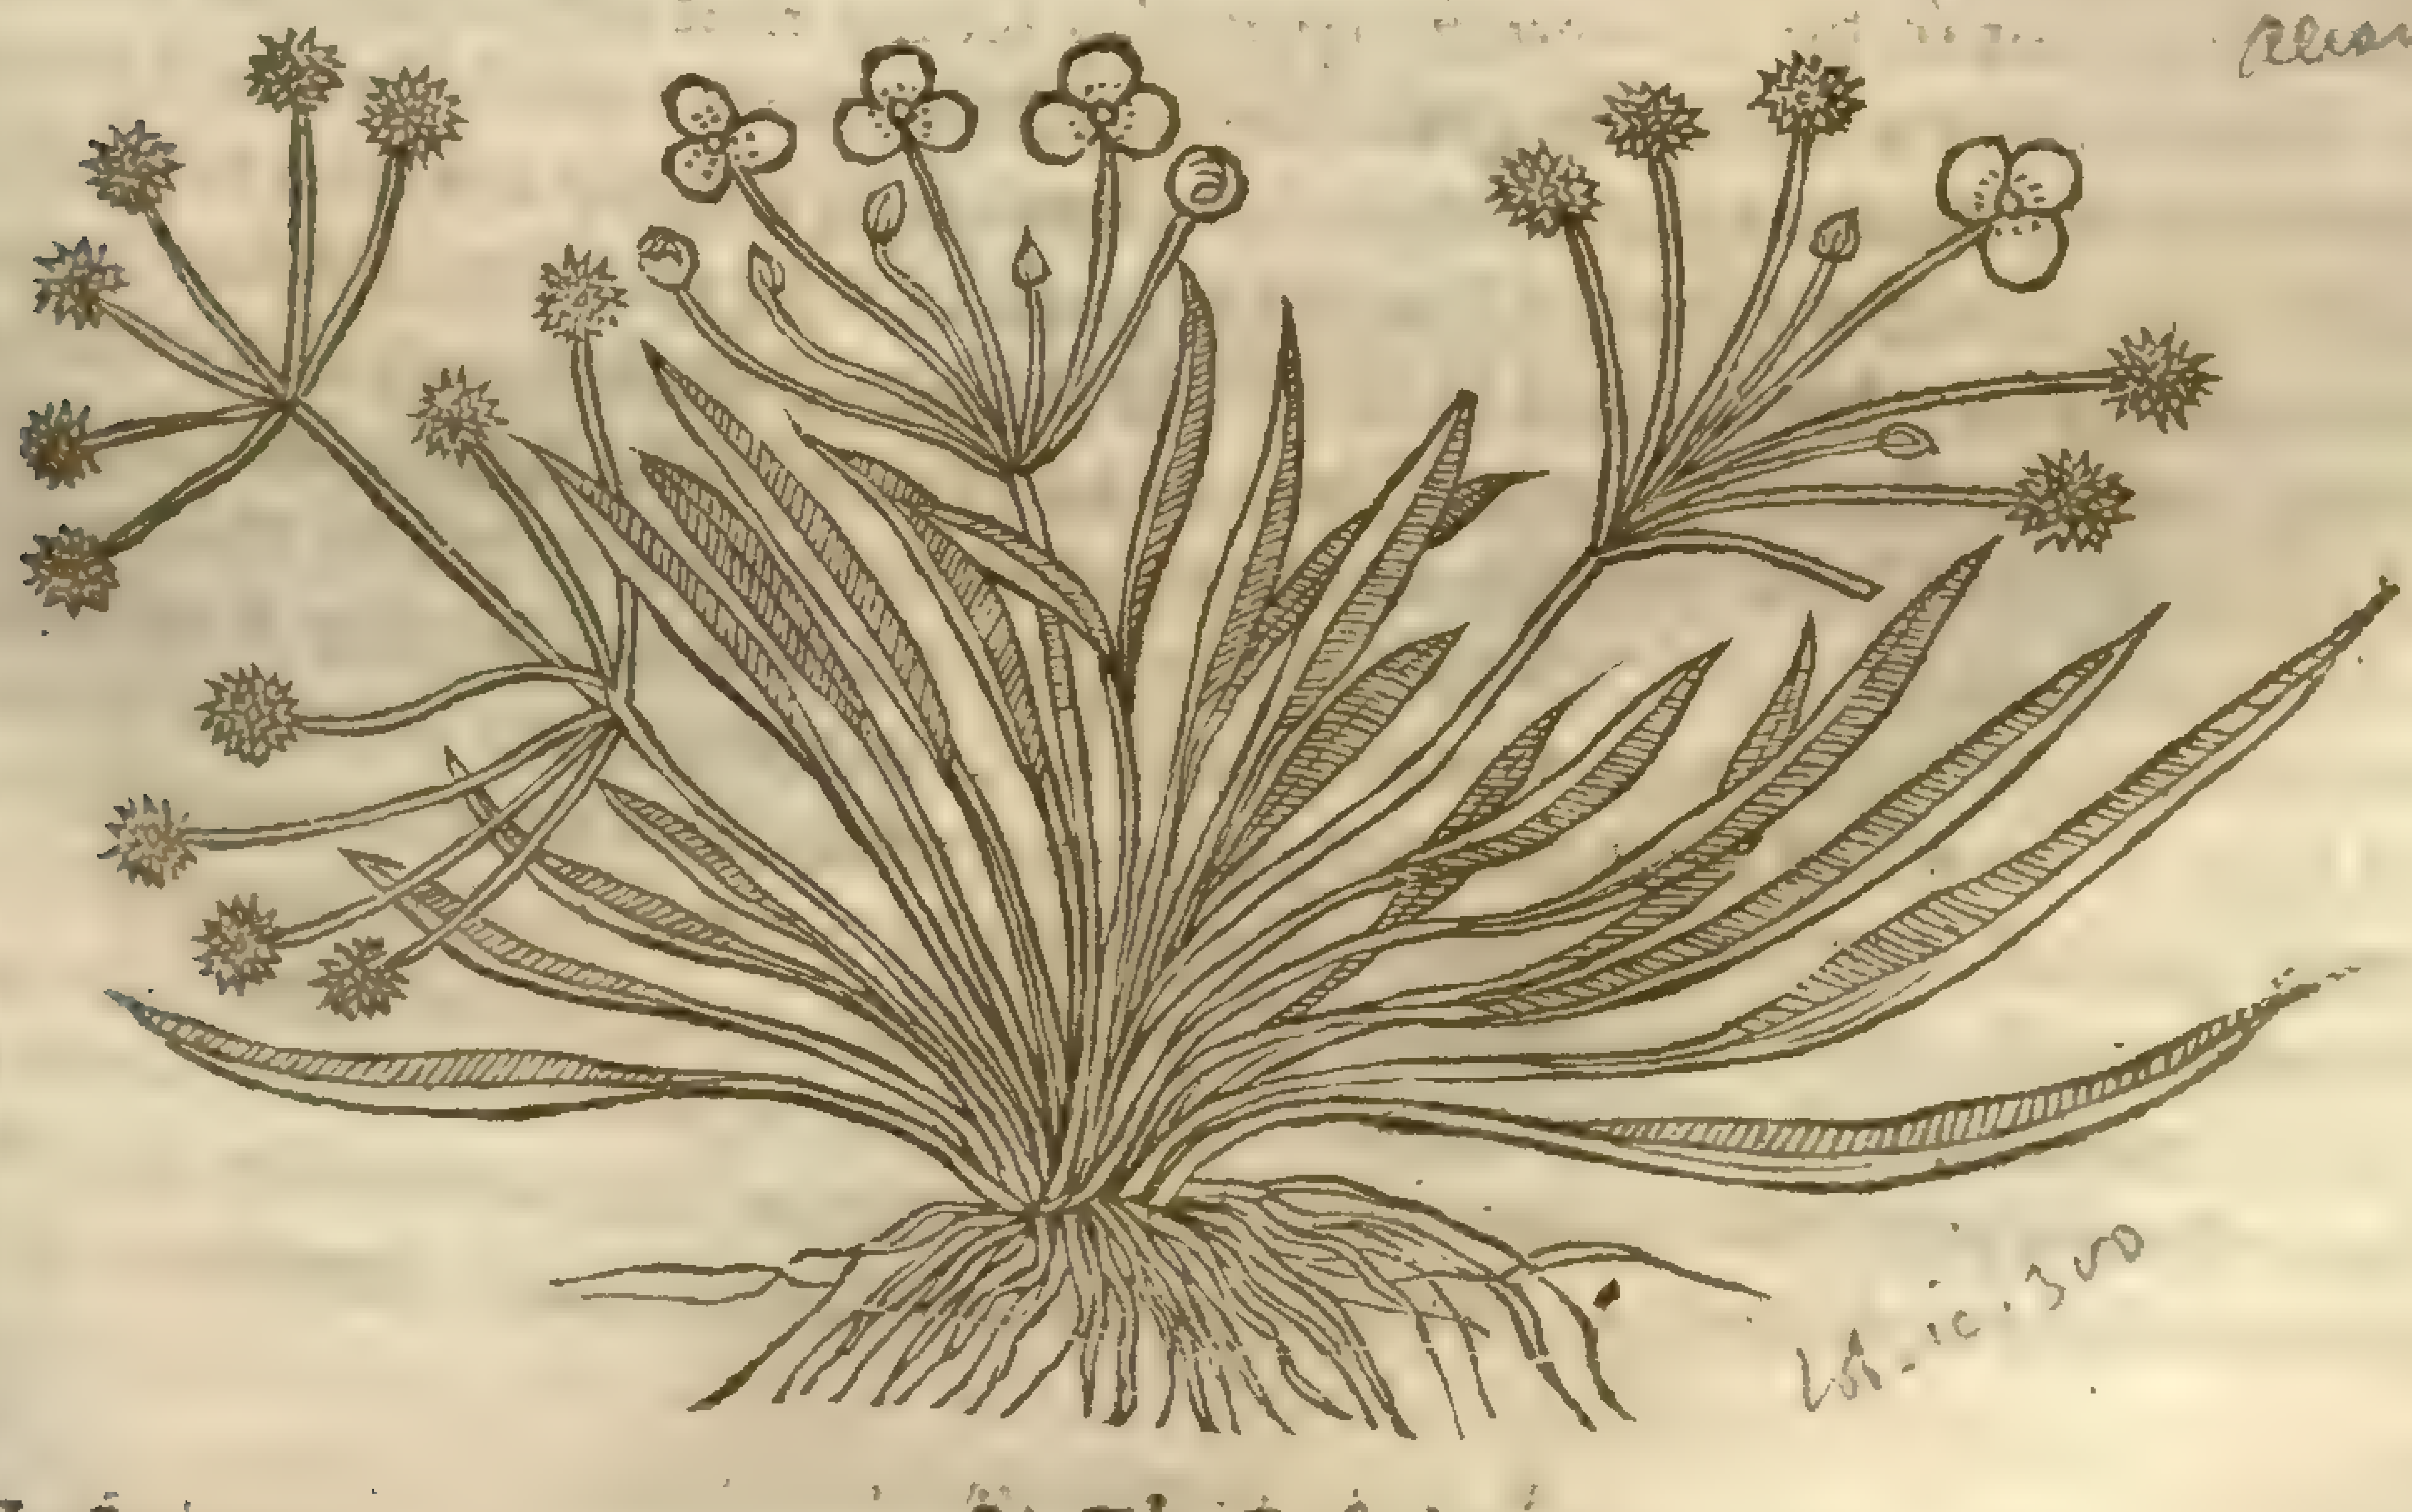
‡ 2 *Plantago aquatica minor ſtellata.*
Starry headed ſmall water Plantaine.



Lob. ic. 301

3 *Plantago aquatica humilis.* Dwarfe water Plantain.

Alisma ranunculoides, L. mult. dist. Sm. fl. 2. 205



Lob. ic. 300

¶ *The Deſcription.*

1 THe firſt kinde of Water Plantaine hath faire great large leaues like the land Plantaine, but ſmoother, and full of ribs or ſinewes: amongſt which riſeth vp a tall ſtemme foure foot high, diuiding it ſelfe into many ſlender branches, garniſhed with infinite ſmal white floures,

which being paſt, there appeare triangle huskes or buttons wherein is the ſeed. The root is as it were a great tuft of threds or thrums.

‡ 2 This plant in his roots and leaues is like the laſt deſcribed, as alſo in the ſtalk, but much leſſe in each of them, the ſtalk being about ſome foot high; at the top whereof ſtand many pretty ſtar-like skinny ſeed-veſſels, containing a yellowiſh ſeed. ‡

3 The third kinde hath long little narrow leaues much like the Plantaine called Ribwort: among which riſe vp ſmall and feeble ſtalkes branched at the top, whereon are placed white floures conſiſting of three ſlender leaues; which being fallen, there come to your view round knobs or rough burs: the root is threddy.

¶ *The Place.*

1 This herb growes about the brinks of riuers, ponds, and ditches almoſt euery where.

‡ 2 3 Theſe are more rare. I found the ſecond a little beyond Ilford, in the way to Rumford, and Mr *Goodyer* found it alſo growing vpon Hounſlow heath. I found the third in the companie of Mr *Will. Broad* and Mr *Leonard Buckner*, in a ditch on this ſide Margate in the Iſle of Tenet. ‡

¶ *The Time.*

They floure from Iune till Auguſt.

¶ *The Names.*

The firſt is called *Plantago aquatica*, that is, water Plantain. ‡ The ſecond *Lobel* calls *Aliſma puſillum anguſtifolium muricatum*: and in the *Hiſt. Lugd.* it is called *Damaſonium ſtellatum*. ‡

The third is named *Plantago aquatica humilis*, the low water Plantaine.

‡ I thinke it fit here to reſtore this plant to his antient dignitie, that is, his names and titles wherewith he was antiently dignified by ***Dioſcorides*** and ***Pliny***. The former whereof cals it by ſundry names, and al very ſignificant and proper, as λειμώνιον, ποταμογείτων, νευρωειδὴς, λογχῖτις: thus many are Greek and therefore ought not to be reiected, as they haue been by ſome without either reaſon or authoritie. For the barbarous names we can ſay nothing: now it is ſaid to be called *Limonium*, becauſe ἐν λειμῶσι φύεται: it growes in wet or ouerflown medowes: it is called *Neuroides*, becauſe the leaf is compoſed of diuers ſtrings or fibers running from one end thereof to the other, as in Plantaine; which therfore by ***Dioſcorides*** it is termed for the ſame reaſon πολύνευρον. Alſo it may be as fitly termed *Lonchitis*, for the ſimilitude which the leafe hath to the top or head of a lance, which λόγχη properly ſignifies, as that other plant deſcribed by ***Dioſcorides***, *lib.* 3. *cap.* 161. for that the ſeed (a leſſe eminent part) reſembles the ſame thing. And for ***Potamogeiton***, which ſignifies a neighbor to the riuer or water, I thinke it loues the water as well, and is as neere a neighbour to it as that which takes its name from thence, and is deſcribed by ***Dioſcorides***, *lib.* 4. 101. Now to come to *Pliny*, *lib.* 20. *cap.* 8. he cals it *Beta ſylueſtris*, *Limonion*, and *Neuroides*: the two later names are out of *Dioſcorides*, and I ſhall ſhew you where alſo you ſhall finde the former in him. Thus much I thinke might ſerue for the vindication of my aſſertion, for I dare boldly affirm, that no late writer can fit all theſe names to any other plant; and that makes me more to wonder, that all our late Herbariſts, as *Matthiolus*, *Dodonæus*, *Fuchſius*, *Cæſalpinus*, *Daleſchampius*, but aboue all, *Pena* and *Lobel* (who, *Aduerſ. pag.* 126. cal it to queſtion) ſhould not allow this plant to be ***Limonium***, eſpecially ſeeing that *Anguillara* had before or in their time aſſerted it ſo to be: but whether he gaue any reaſons or no for his Aſſertion, I cannot tell, becauſe I could neuer by any meanes get his opinions, but onely find by *Bauhines Pinax*, that ſuch was his opinion hereof. But to return from whence I digreſt: I will giue you ***Dioſcorides*** his deſcription, with a briefe explanation thereof, and ſo deſiſt. It is thus; It hath leaues like a Beet, thinner and larger, ten or more; a ſtalke ſlender, ſtraight, and as tall as that of a Lilly, and full of ſeeds of an aſtringent taſte. The leaues of this you ſee are larger than thoſe of a Beet, and thin, and as I formerly told you in the names, neruous; which to be ſo may be plainly gathered by ***Dioſcorides*** his words in the deſcription of white Hellebore, whoſe leaues he compares to the leaues of Plantain and the wild Beet: now there is no wilde Beet mentioned by any of the Antients, but only this by *Pliny*, in the place formerly quoted; nor no leafe more fit to compare thoſe of Hellebore to than thoſe of water Plantaine, eſpecially for the nerues and fibers that run alongſt the leaues: the ſtalke alſo of this is but ſlender, conſidering the height, and it grows ſtraight, and as high as that of a Lilly, with the top plentifully ſtored with aſtringent ſeed: So that no one note is wanting in this, nor ſcarce any to be found in the other plants that many haue of late ſet forth for *Limonium*. ‡

¶ *The Temperature.*

Water Plantain is cold and dry of temperature.

¶ *The Vertues.*

The leaues of water Plantain, as ſome Authors report, are good to be laid vpon the legs of ſuch as are troubled with the dropſie, and hath the ſame propertie that the land Plantain hath. A

‡ *Dioſcorides* and *Galen* commend the ſeed hereof giuen in wine, againſt fluxes, dyſenteries, the ſpitting of bloud, and ouermuch flowing of womens terms. B

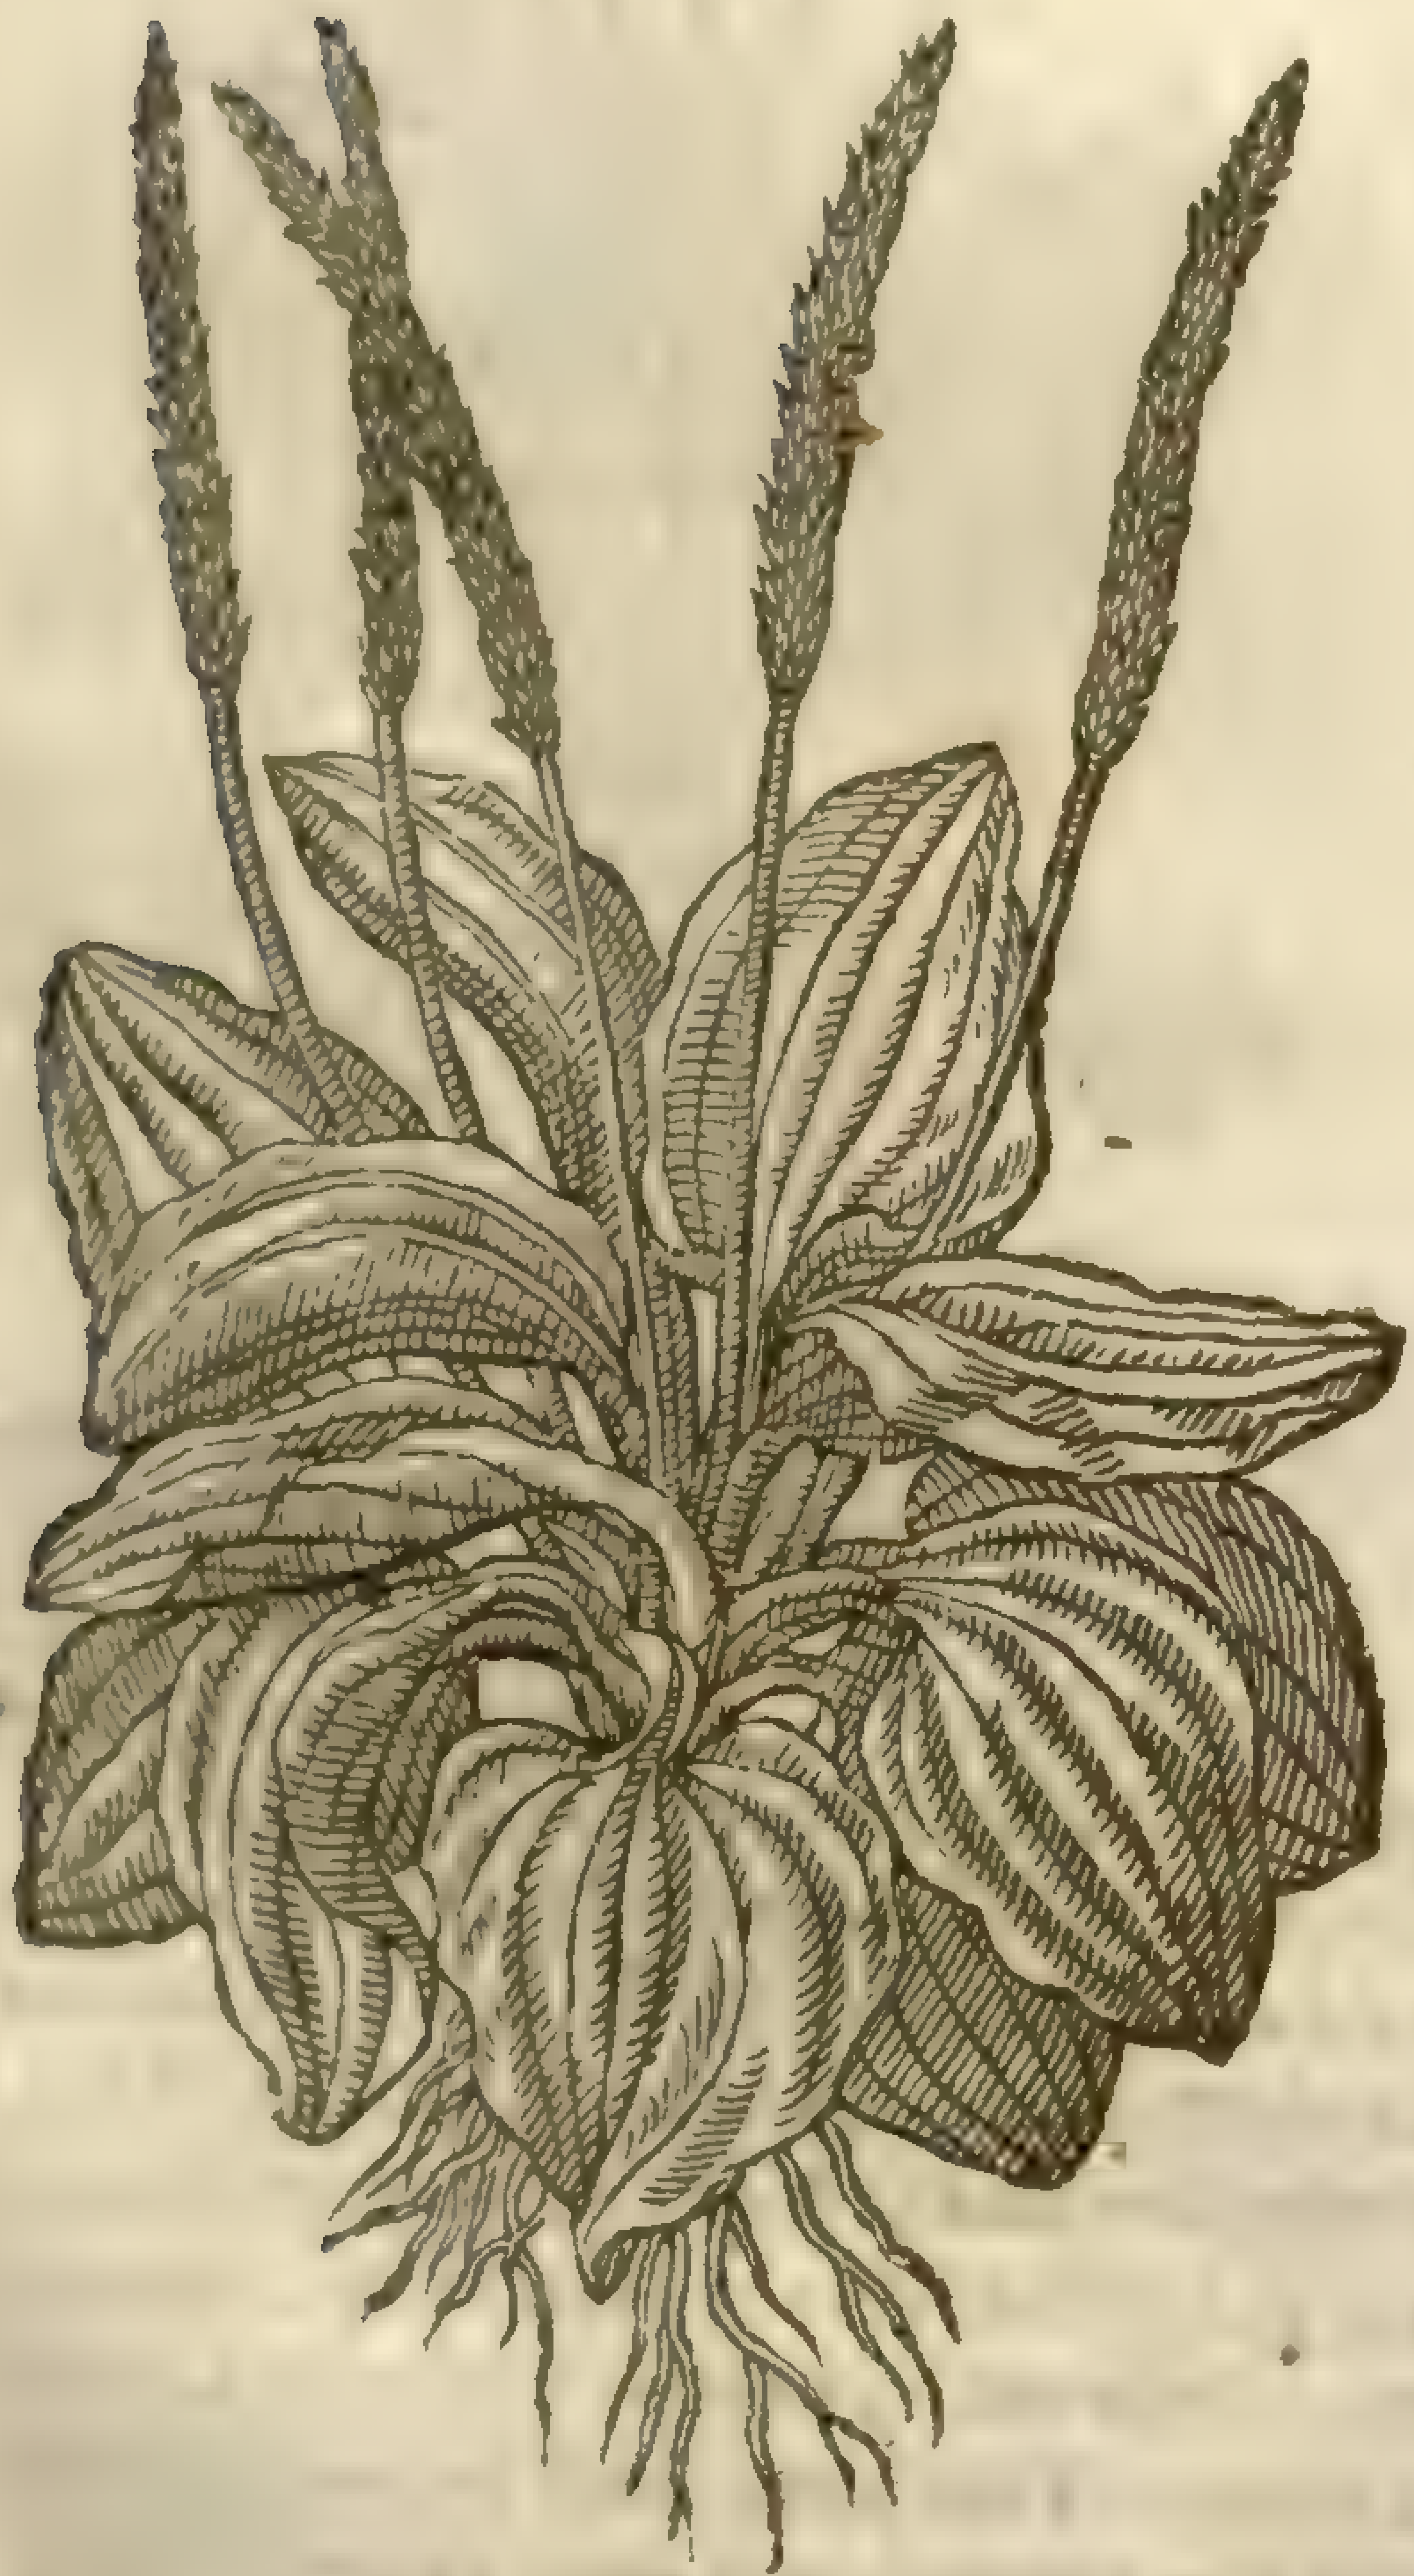
Pliny ſaith, the leaues are good againſt burns. ‡ C

[illegible]

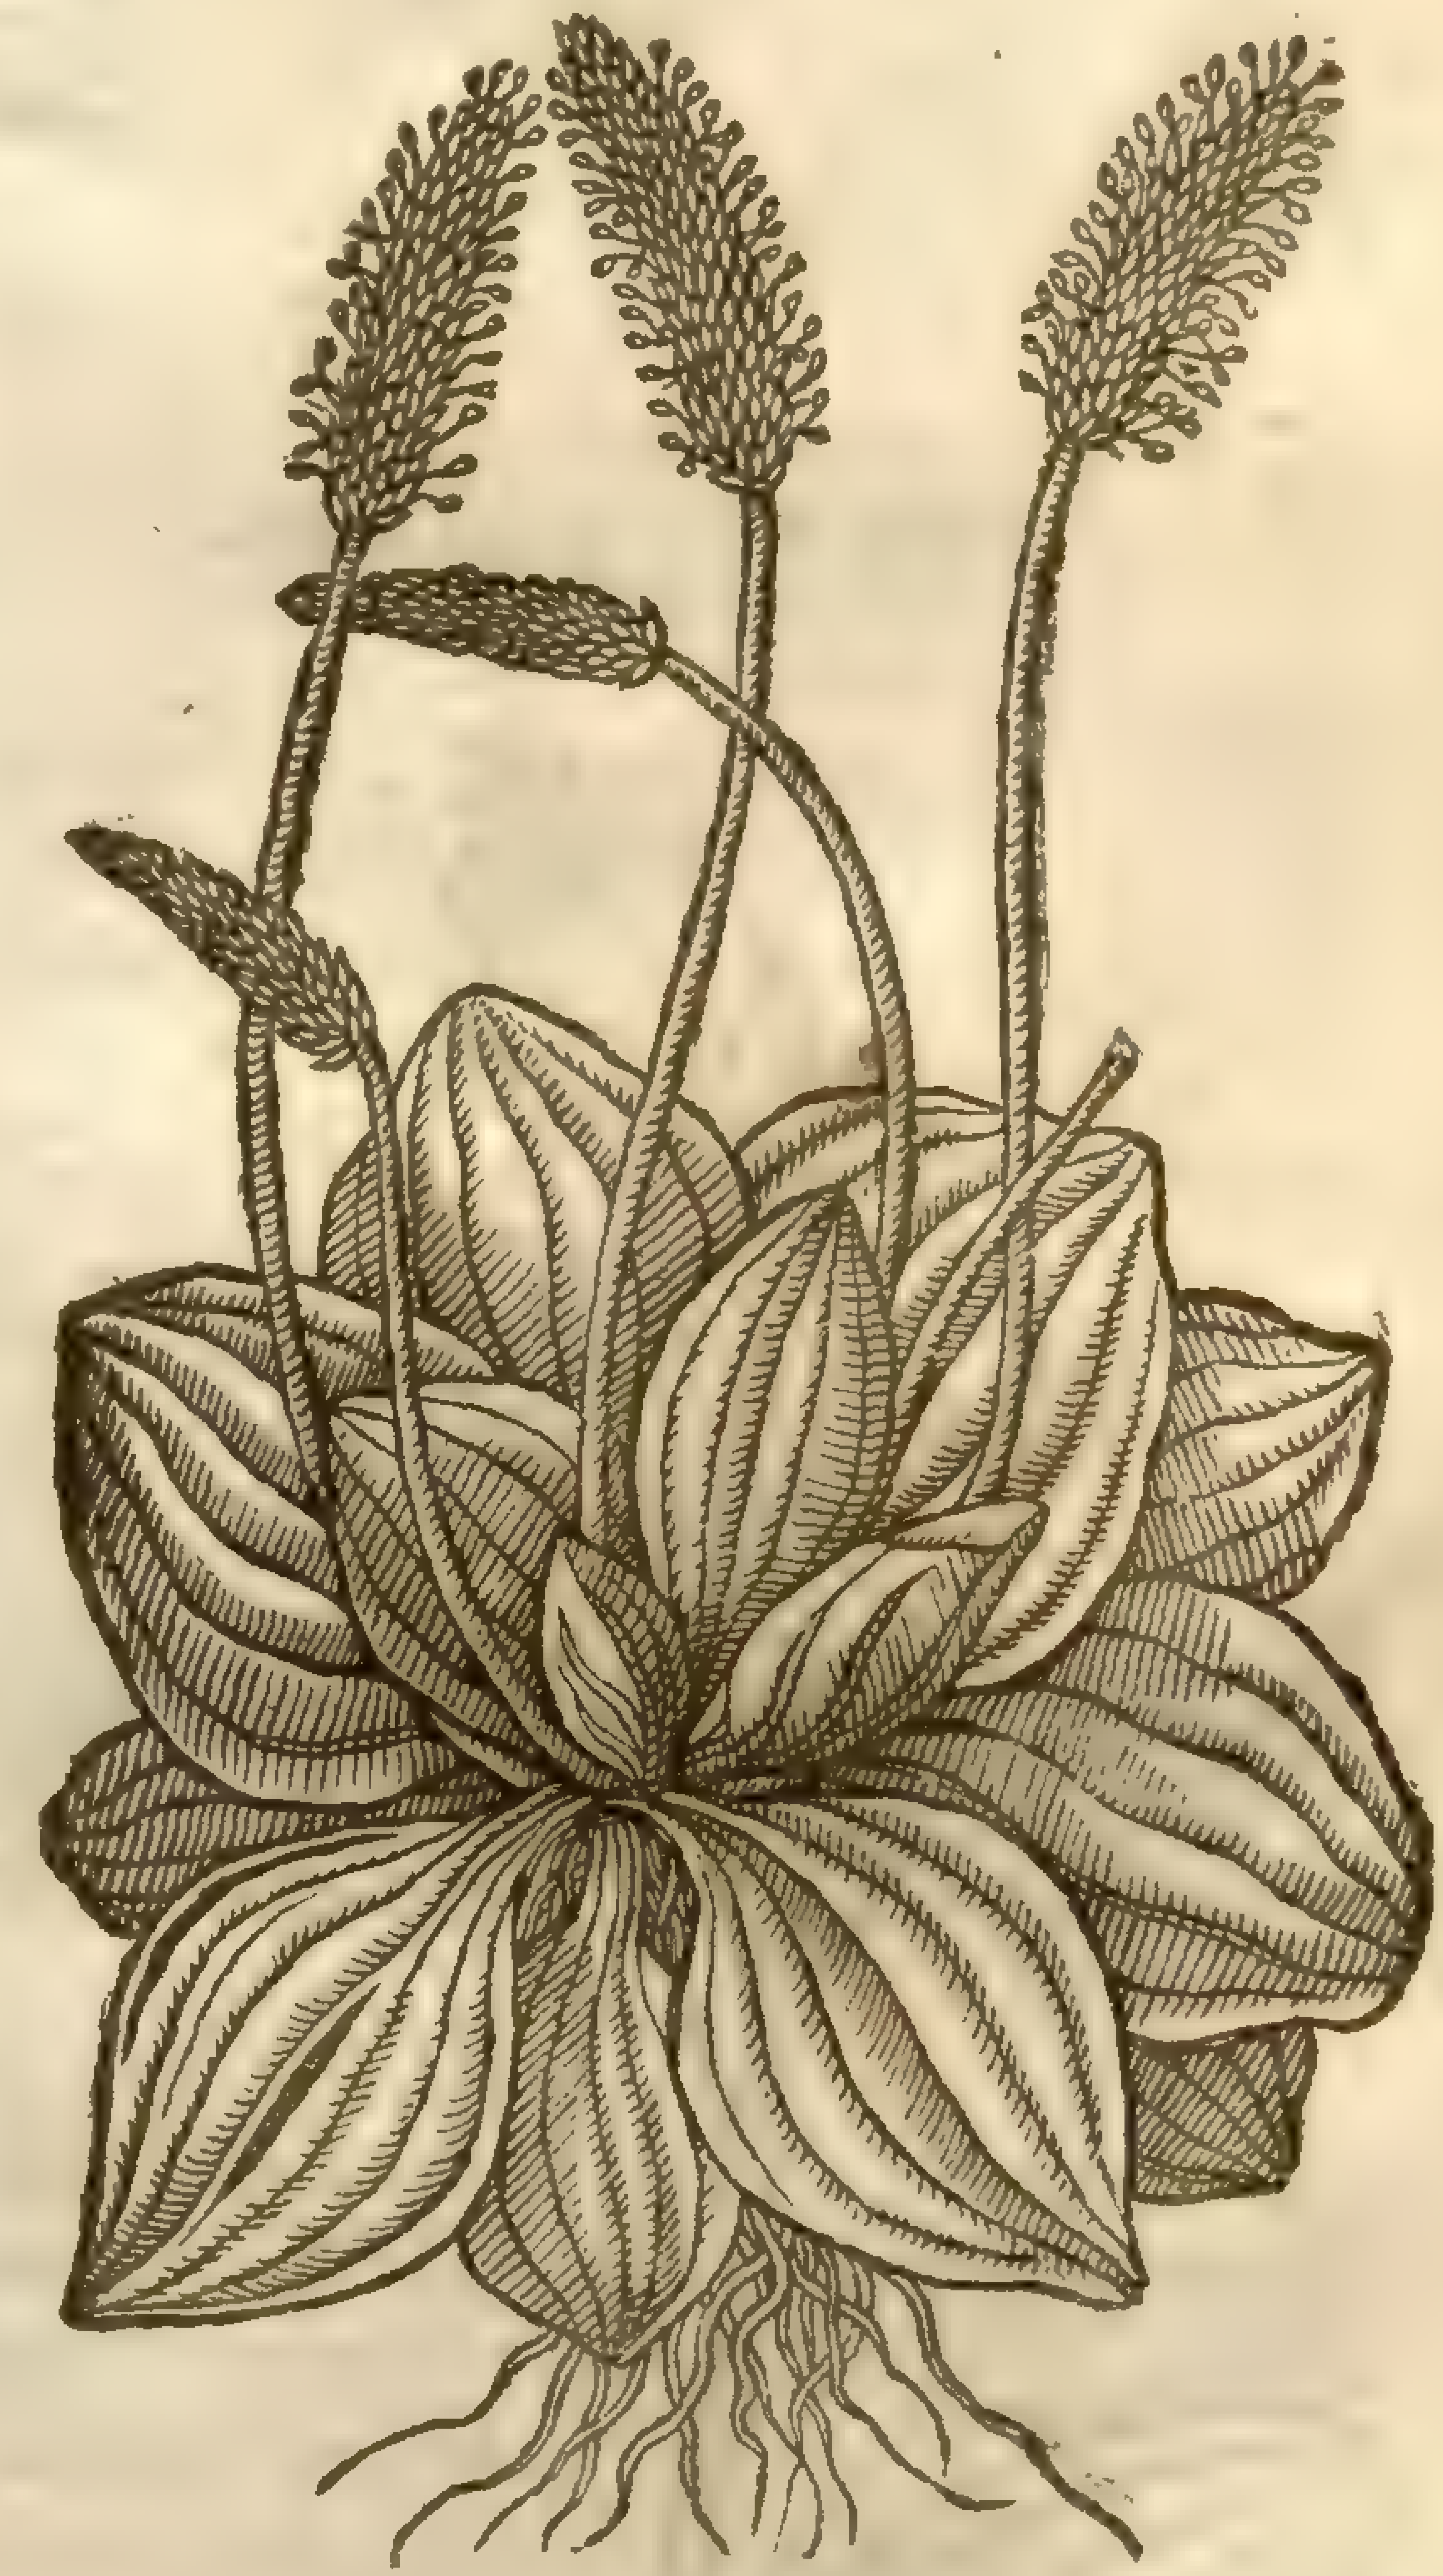
CHAP. 97. *Of land Plantaine.*

[illegible]

1 *Plantago latifolium.*
Broad leaued Plantaine.



2 *Plantago incana.*
Hoary Plantaine.



¶ *The Deſcription.*

1 AS the Greeks haue called ſome kinds of herbs Serpents tongue, Dogs tongue, and Ox tongue; ſo haue they termed a kinde of Plantain *Arnogloſſon*, which is as if you ſhould ſay Lambs tongue, well known to all, by reaſon of the great commoditie and plenty of it growing euery where; and therefore it is needleſſe to ſpend time about them. The greatnes and faſhion of the leaues hath been the cauſe of the varieties and diuerſities of their names.

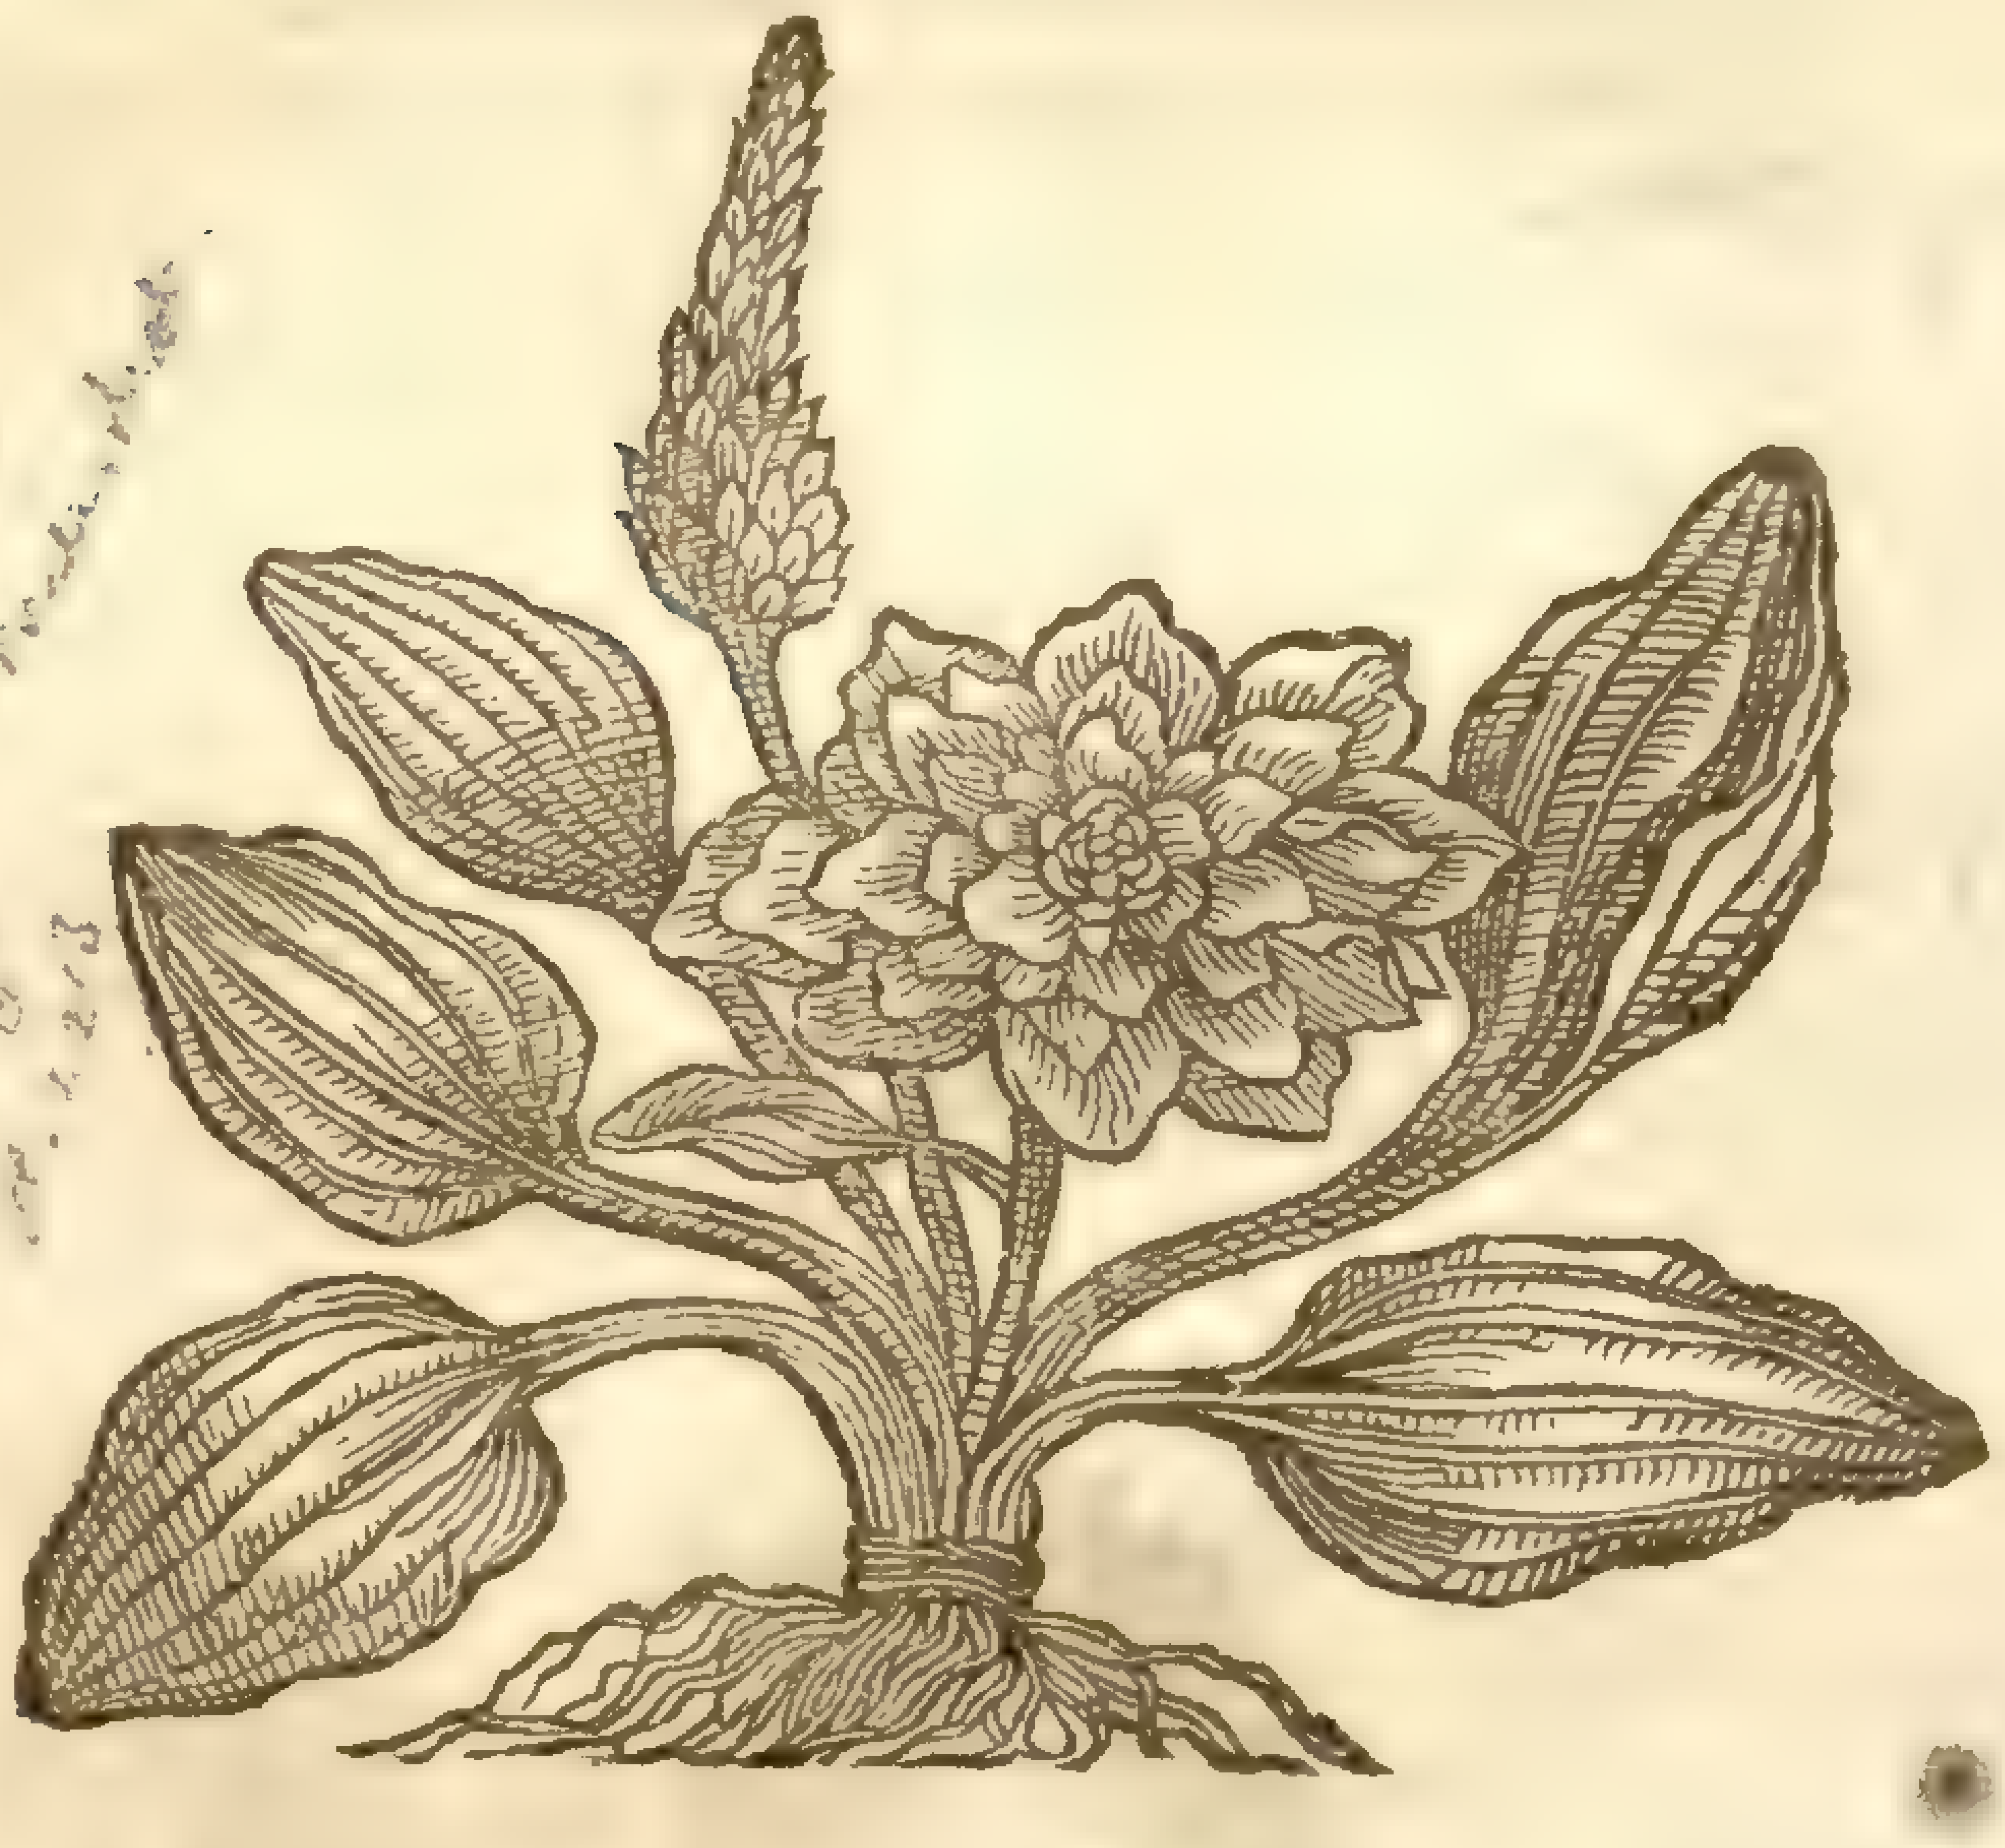
2 The ſecond is like the firſt, and differeth in that, that this Plantaine hath greater but ſhorter ſpikes or knaps; and the leaues are of an hoary or ouerworne green colour: the ſtalks are likewiſe hoary and hairy.

3 The ſmall Plantain hath many tender leaues ribbed like vnto the great Plantain, and is very like in each reſpect vnto it, ſauing that it is altogether leſſer.

4 The ſpiked roſe Plantaine hath very few leaues, narrower than thoſe of the ſecond kinde of Plantain, ſharper at the ends, and further growing one from another. It beareth a very double floure vpon a ſhort ſtem like a roſe, of a greeniſh colour tending to yellowneſſe. The ſeed groweth vpon a ſpiky tuft aboue the higheſt part of the plant; notwithſtanding it is but very low in reſpect of the other Plantains aboue mentioned.

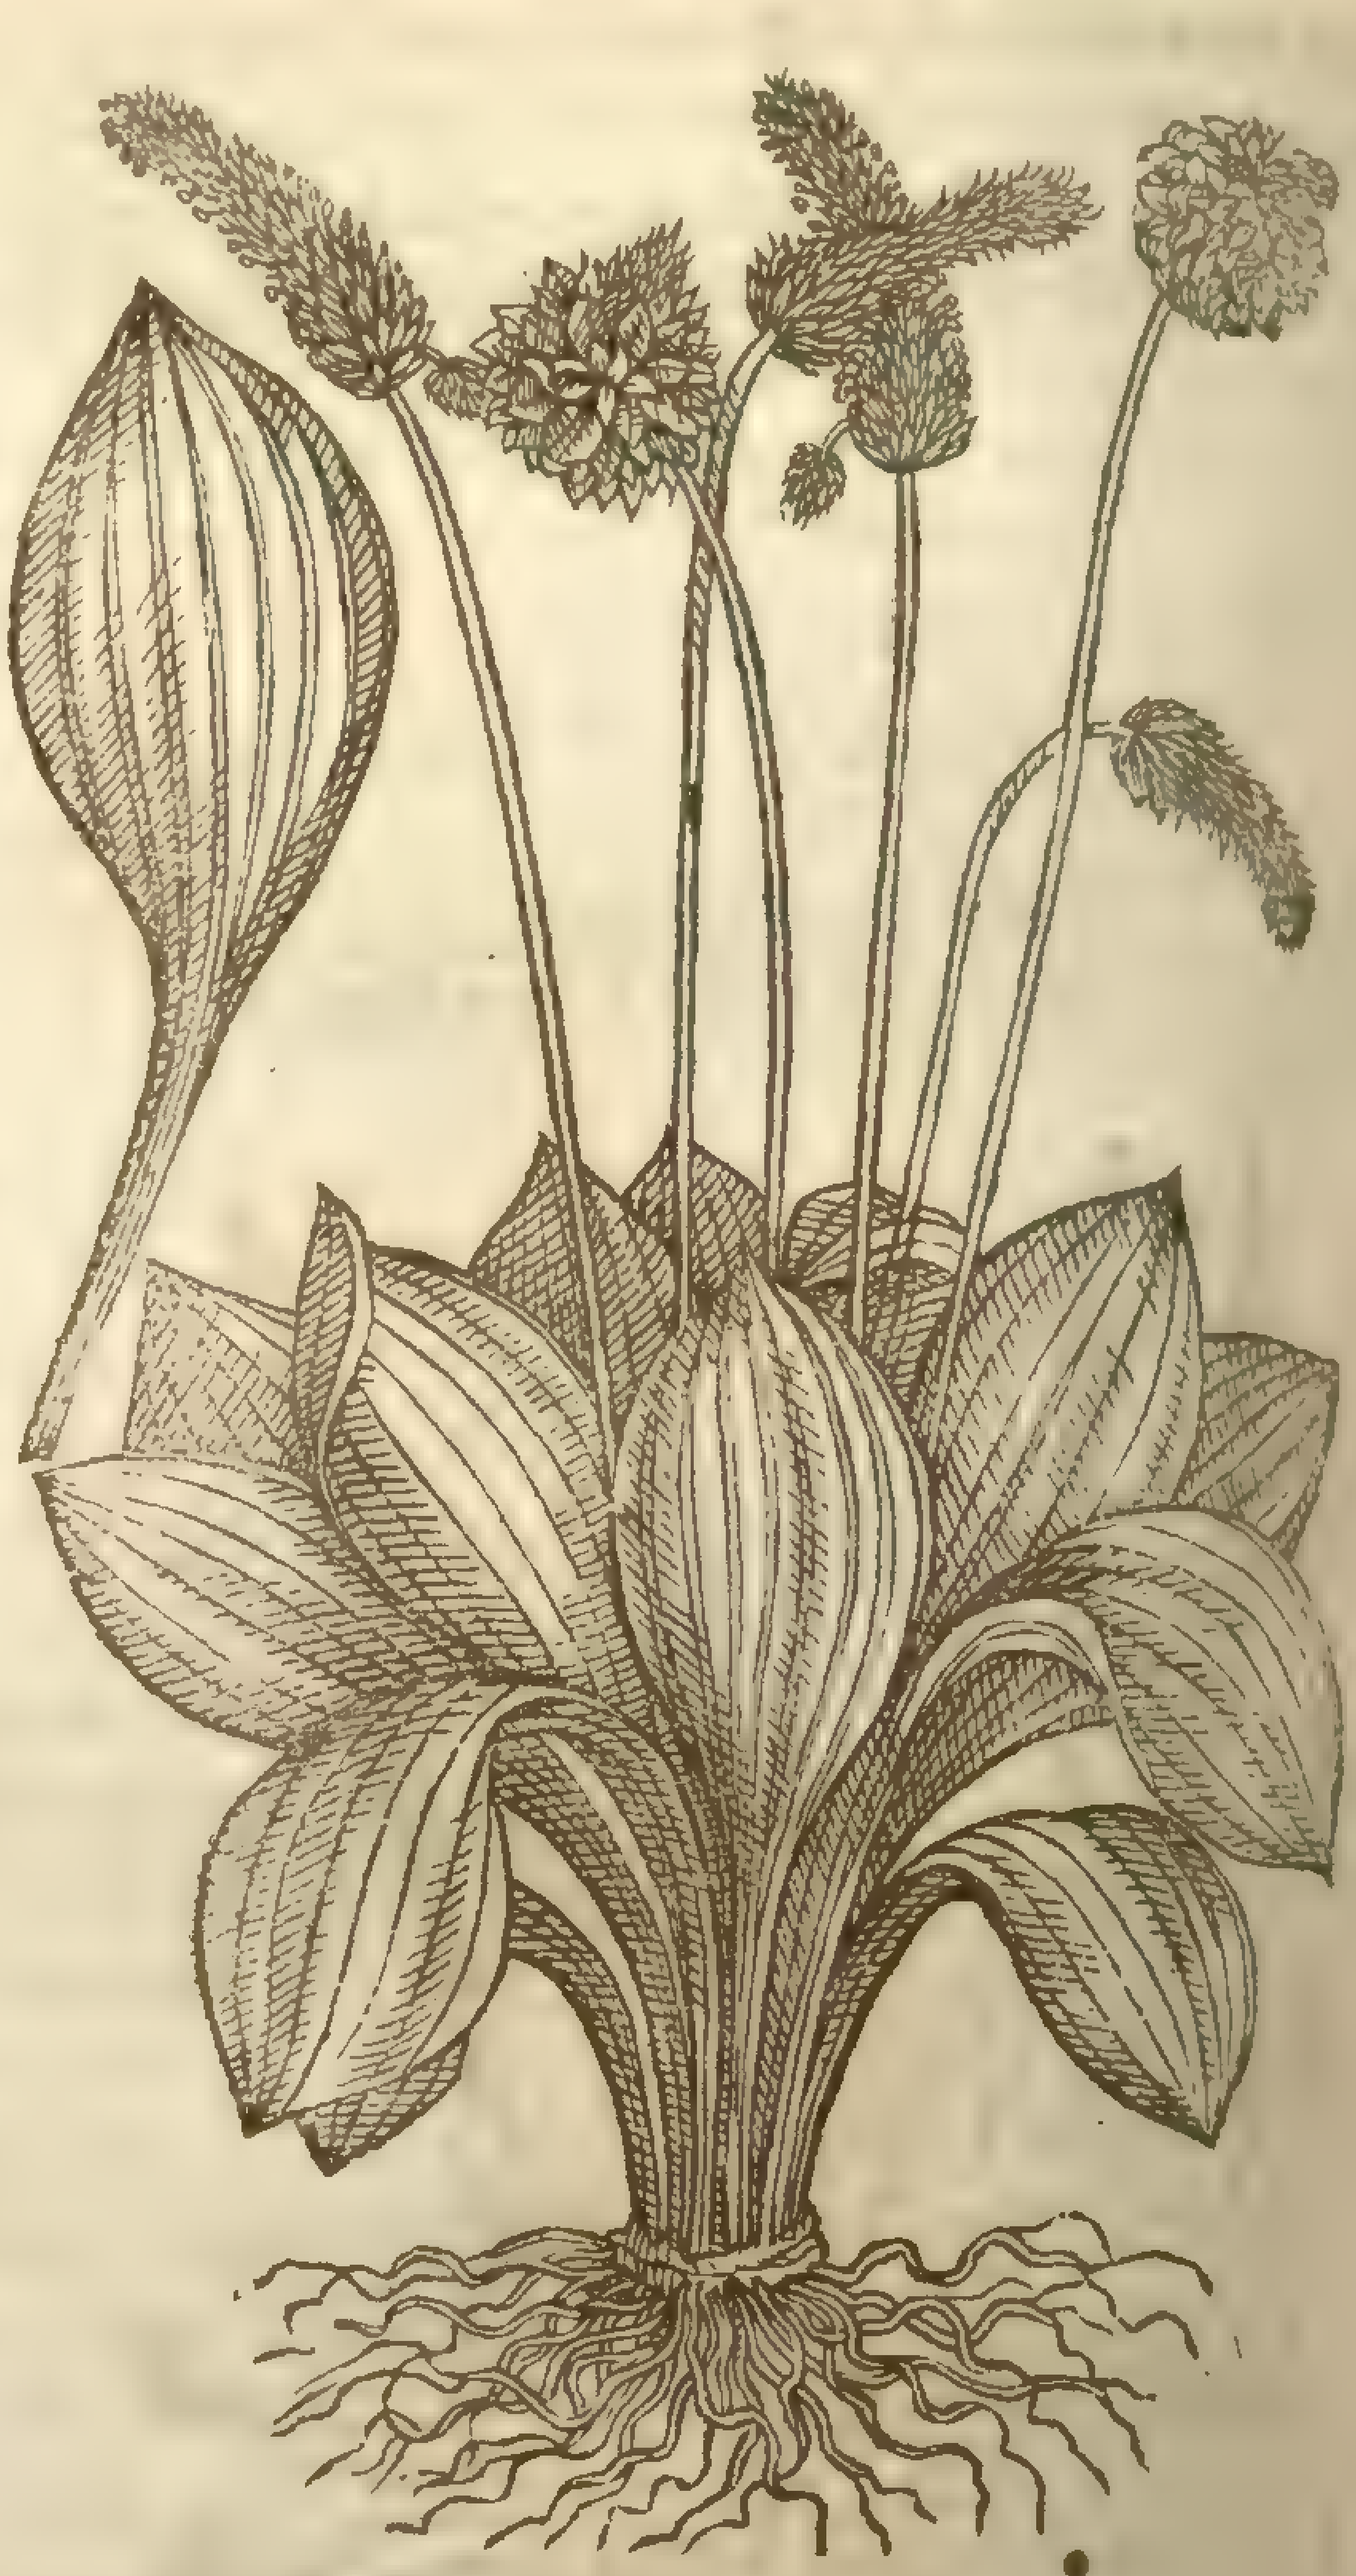
5 The

4 *Plantago Roſea ſpicata.*
Spiked Roſe Plantaine.

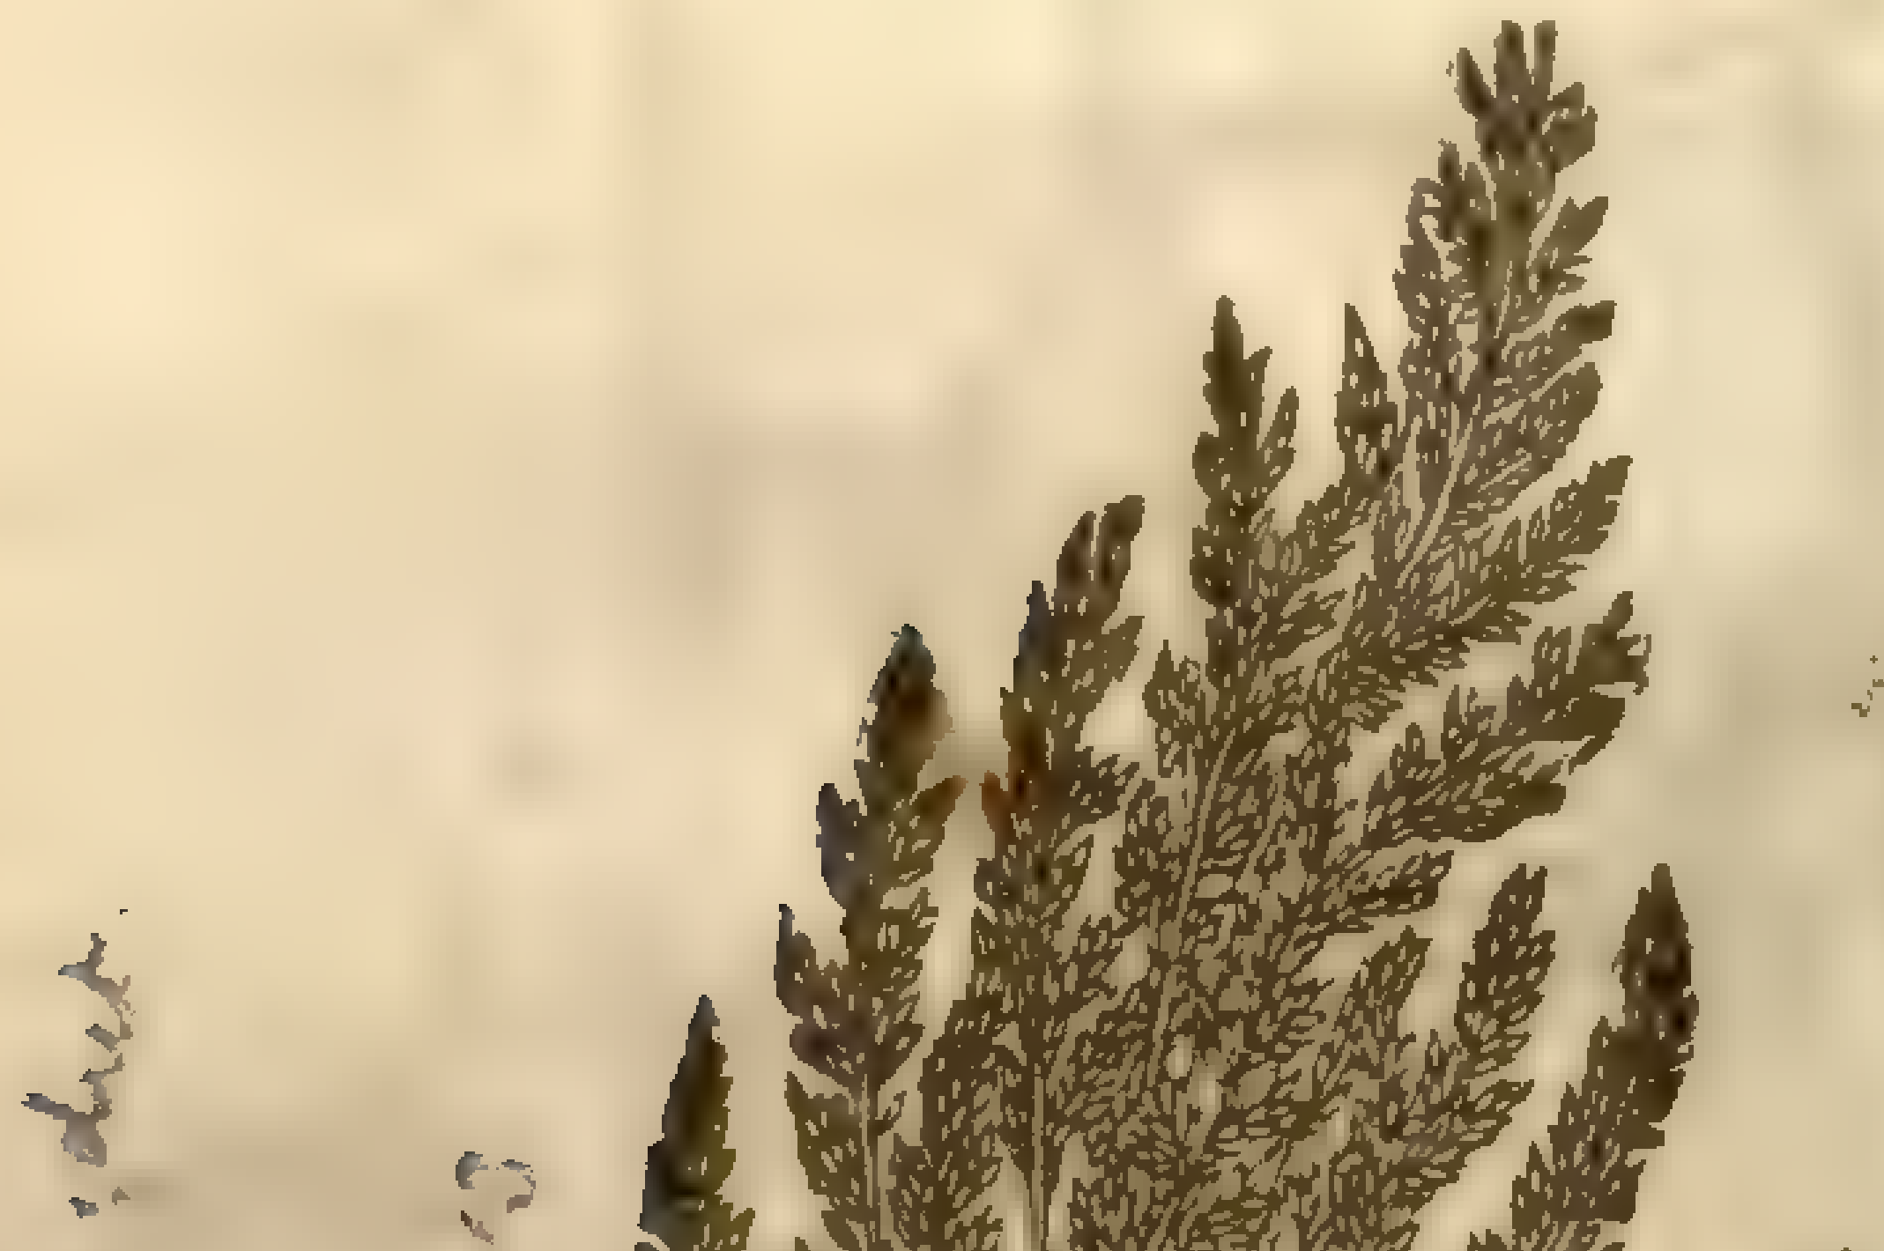


P. major v. S. [illegible]
P. major v. [illegible] p. 1. 213

5 *Plantago Roſea exotica.*
Strange Roſe Plantaine.



‡ 6 *Plantago panniculis ſparſis.*
Plantain with ſpoky tufts.



P. major v. S. [illegible]
P. major v. [illegible] p. 1. 213

5 The fift kinde of Plantain hath beene a ſtranger in England and elſwhere vntil the impreſſion hereof. The cauſe why I ſay ſo is, the want of conſideration of the beauty which is in this plant, wherein it excelleth all the other. Moreouer, becauſe it hath not been written of or recorded before this preſent time, though plants of leſſer moment haue bin very curiouſly ſet forth. This plant hath leaues like vnto them of the former, and more orderly ſpread vpon the ground like a Roſe: amongſt which riſe vp many ſmall ſtalkes like the other Plantains, hauing at the top of euery one a fine double roſe altogether vnlike the former, of an hoarie or ruſty green colour.

‡ I take this ſet forth by our Author to be the ſame with that which *Cluſius* receiued from *Iames Garret* the yonger of London; and therefore I giue you the figure thereof in this place, together with this addition to the hiſtorie out of *Cluſius*: That ſome of the heads are like thoſe of the former Roſe Plantaine; other ſome are ſpike-faſhion, and ſome haue a ſpike growing as it were out of the midſt of the Roſe, and ſome heads are otherwiſe ſhaped; alſo the whole plant is more hoary than the common Roſe Plantaine.

6 This Plantain muſt not here be forgot, though it be ſomwhat hard to be found: his leaues, roots, and ſtalkes are like thoſe of the ordinarie, but in ſtead of a compact ſpike it hath one much diuided after the manner as you ſee it heere expreſſed in the figure, and the colour thereof is greeniſh. ‡

¶ *The Place.*

The greater Plantains grow almoſt euery where.

The leſſer Plantain is found on the ſea coaſts and banks of great riuers, which are ſomtimes waſhed with brackiſh water.

‡ The Roſe-Plantaines grow with vs in gardens; and the ſixt with ſpoky tufts grows in ſome places in the Iſle of Tenet, where I firſt found it, being in company with Mr *Tho. Hicks*, Mr *Leonard Buckner*, and other London Apothecaries, *Anno 1632*. ‡

¶ *The Time.*

They are to be ſeen from Aprill vnto the end of September.

¶ *The Names.*

Plantain is called in Latine *Plantago*; and in Greek, ἀρνόγλωσσος, and *Arnogloſſa*, that is to ſay, Lambs tongue: the Apothecaries keep the Latine name: in Italian, *Piantagine*, and *Plantagine*: in Spaniſh, *Lhantem*: the Germanes, **Wegrich**: in low-Dutch, **Weechbre**: in Engliſh, Plantain, and Weybred: in French, *Plantain*.

¶ *The Temperature.*

Plantain (as *Galen* ſaith) is of a mixt temperature; for it hath in it a certaine waterie coldneſſe, with a little harſhneſſe, earthy, dry and cold; therefore they are cold and dry in the ſecond degree. To be briefe, they are dry without biting, and cold without benumming. The root is of like temperature, but drier, and not ſo cold. The ſeed is of ſubtill parts, and of temperature leſſe cold.

¶ *The Vertues.*

Plantain is good for vlcers that are of hard curation, for fluxes, iſſues, rheumes, and rottenneſſe, and for the bloudy flix: it ſtayeth bleeding, it heales vp hollow ſores and vlcers as well old as new. Of all the Plantains the greateſt is the beſt, and excelleth the reſt in facultie and vertue. A

The juice or decoction of Plantain drunken ſtoppeth the bloudy flix and all other fluxes of the belly, ſtoppeth the piſſing of bloud, ſpitting of bloud, and all other iſſues of bloud in man or woman, and the deſire to vomit. B

Plantain leaues ſtamped and made into a tanſie, with the yelks of egges, ſtayeth the inordinate flux of the terms, although it haue continued many yeares. C

The root of Plantaine with the ſeed boiled in white wine and drunke, openeth the conduits or paſſages of the liuer and kidnies, cures the jaundice, and vlceration of the kidnies and bladder. D

The juice dropped in the eies cooles the heate and inflammation thereof. I find in antient writers many good-morrowes, which I thinke not meet to bring into your memorie againe; as, That three roots will cure one griefe, foure another diſeaſe, ſix hanged about the necke are good for another malady, &c. all which are but ridiculous toyes. E

The leaues are ſingular good to make a water to waſh a ſore throat or mouth, or the priuy parts of a man or woman. F

The leaues of Plantaine ſtamped and put into oile oliue, and ſet in the hot ſun for a moneth together, and after boiled in a kettle of ſeething water (which we call *Balneum Mariæ*) and then ſtrained, preuaile againſt the pains in the eares, the yard, or matrix, (being dropped into the eares, or caſt with a ſyringe into the other parts before rehearſed) or the paines of the fundament; prooued by a learned gentleman Mr *Godowrus* Sergeant Surgeon to the Queens Majeſtie. G

Chap. 98. *Of Ribwort.*

¶ *The Deſcription.*

1 Ribwort or ſmall Plantaine hath many leaues flat ſpred vpon the ground, narrow, ſharpe pointed, and ribbed for the moſt part with fiue nerues or ſinues, and therefore it was called *Quinque-neruia*: in the middle of which leaues riſeth vp a nerued or creſted ſtalk bearing at the top a darke or duskiſh knap, ſet with a few ſuch white floures as are the floures of wheat. The root and other parts are like the other Plantains.

‡ There is another kind of this Ribwort, which differs not from the laſt mentioned in any thing but the ſmalneſſe thereof. ‡

2 Roſe Rib-wort hath many broad and long leaues of a darke greene colour, ſharpe pointed, and ribbed with fiue nerues or ſinewes like the common Rib-wort: amongſt which riſe vp naked ſtalkes, furrowed, chamfered, or creſted with certaine ſharpe edges: at the top whereof groweth a great and large tuft of ſuch leaues as thoſe are that grow next the ground, making one entire tuft

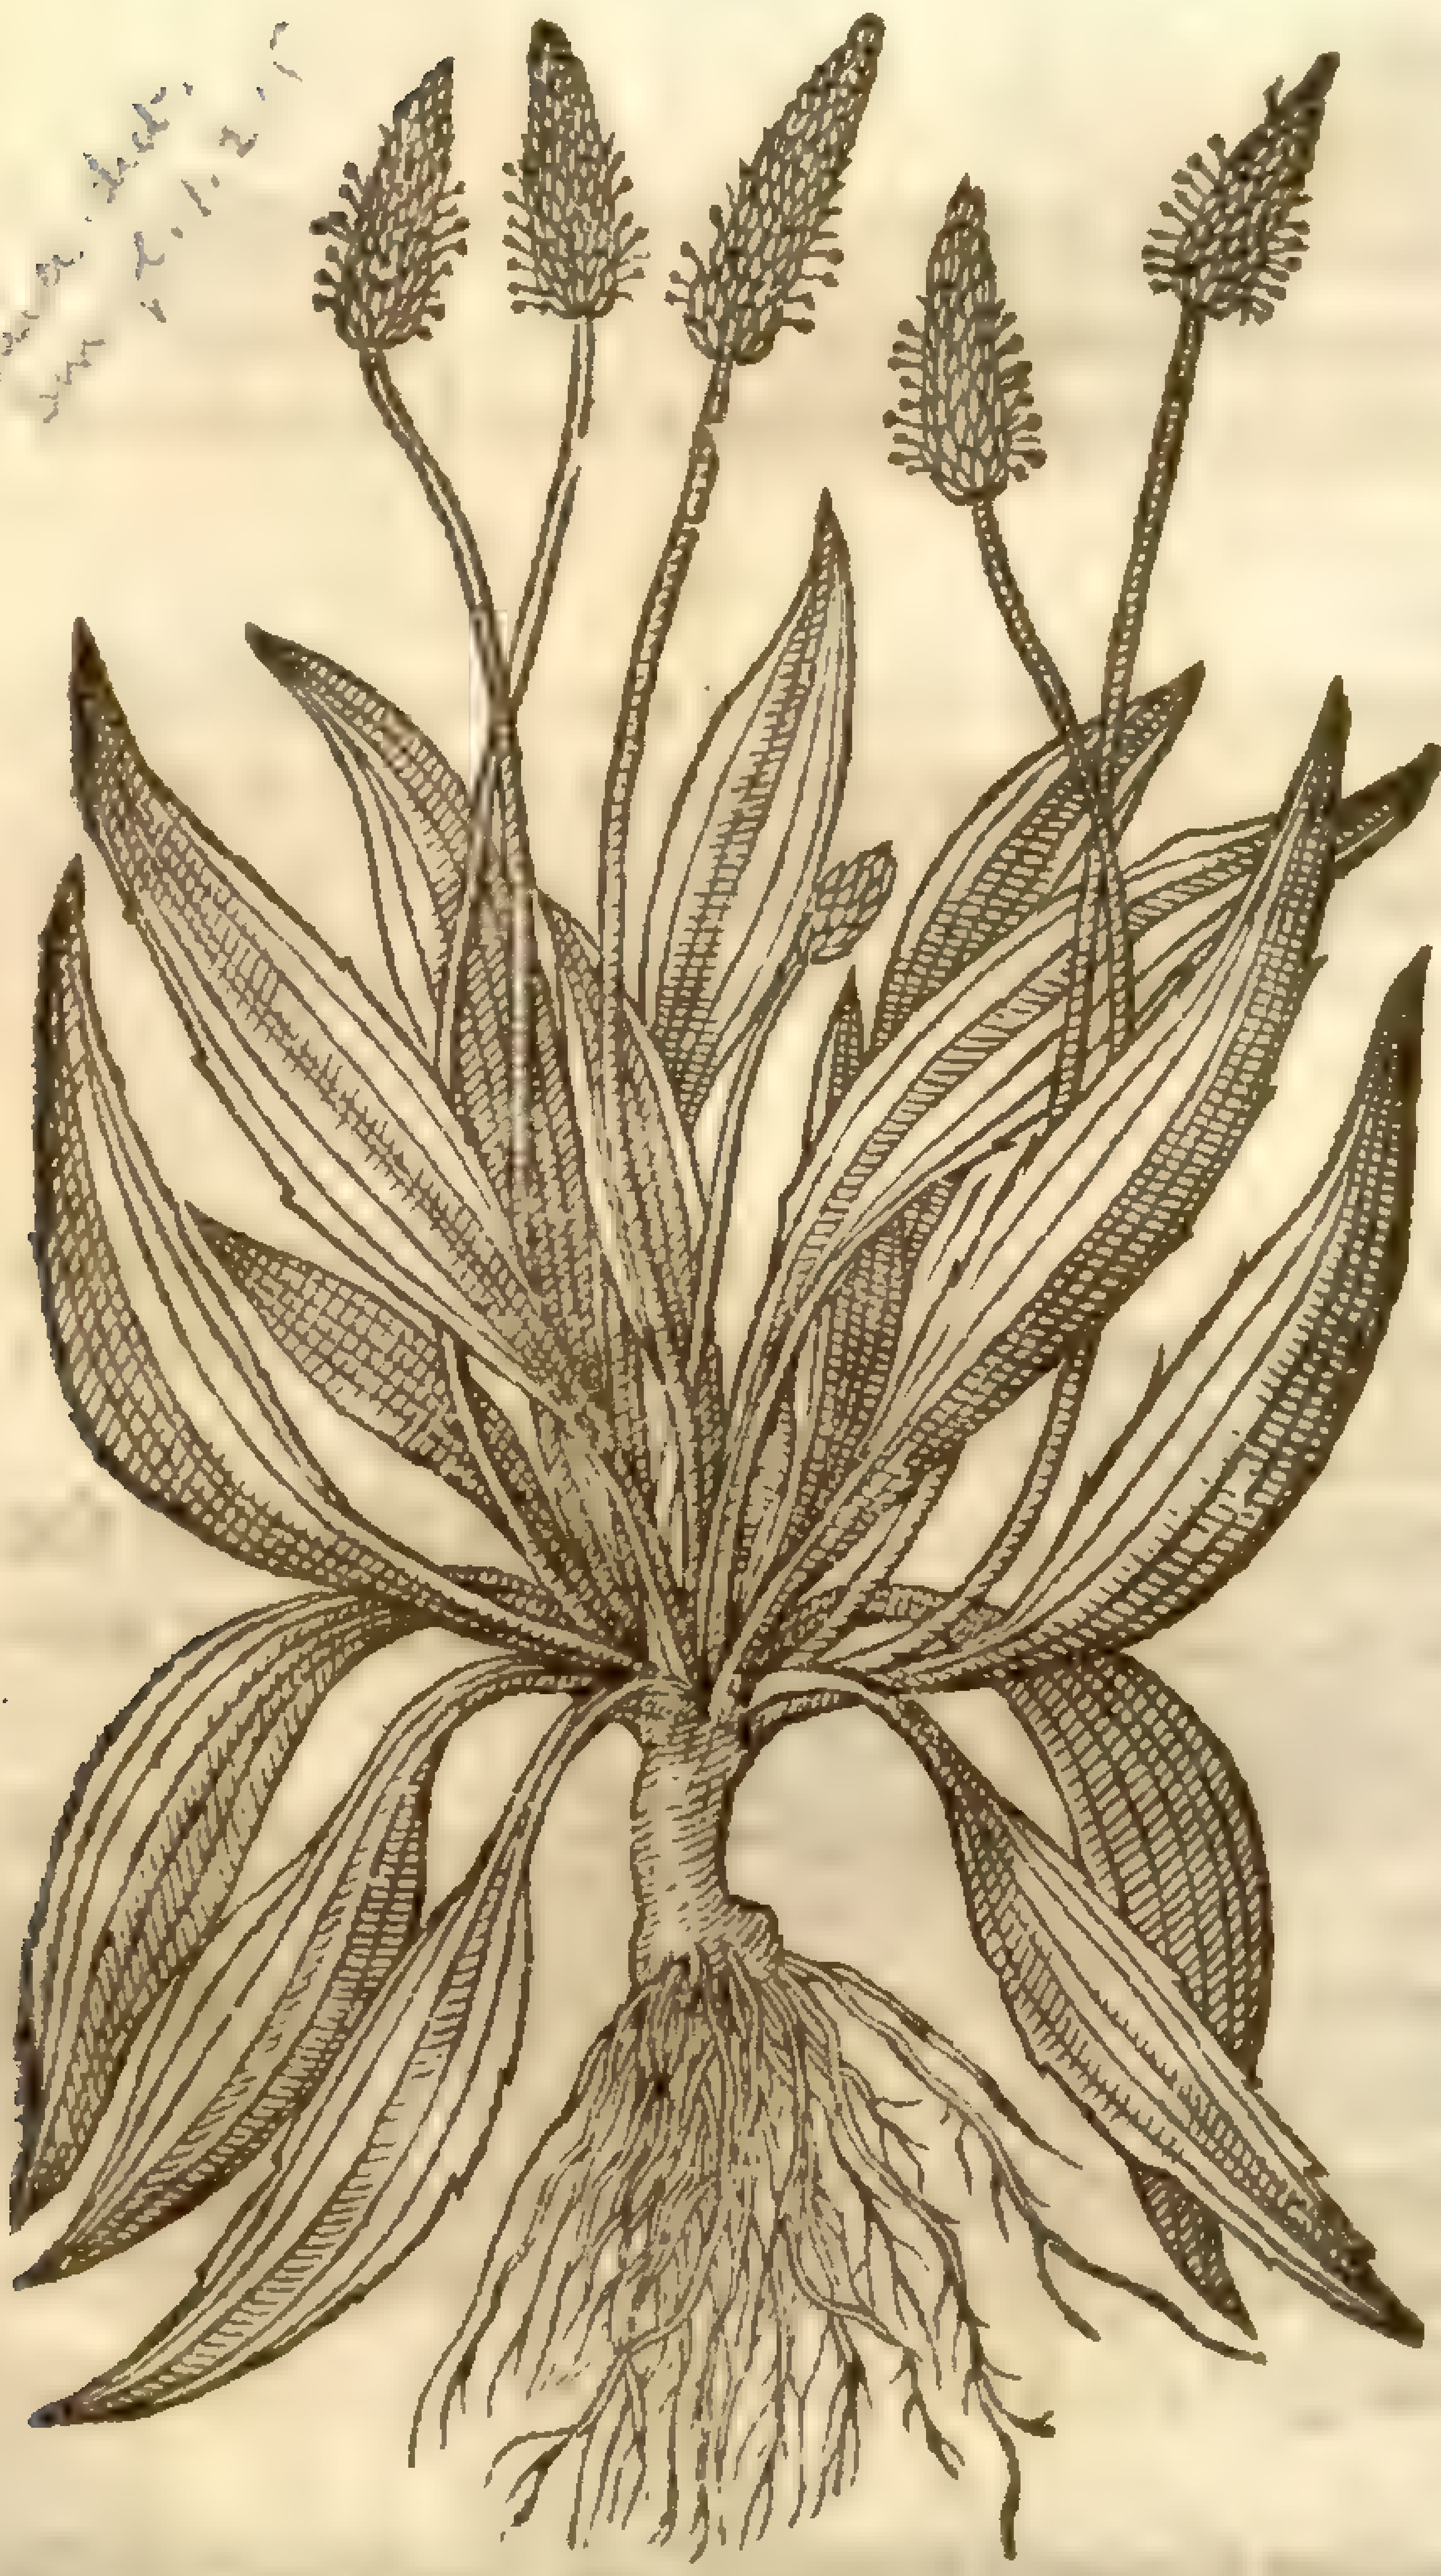
of

or vmbel, in ſhape reſembling a Roſe (whereof I thought good to giue it his ſirname Roſe) which is from his floure.

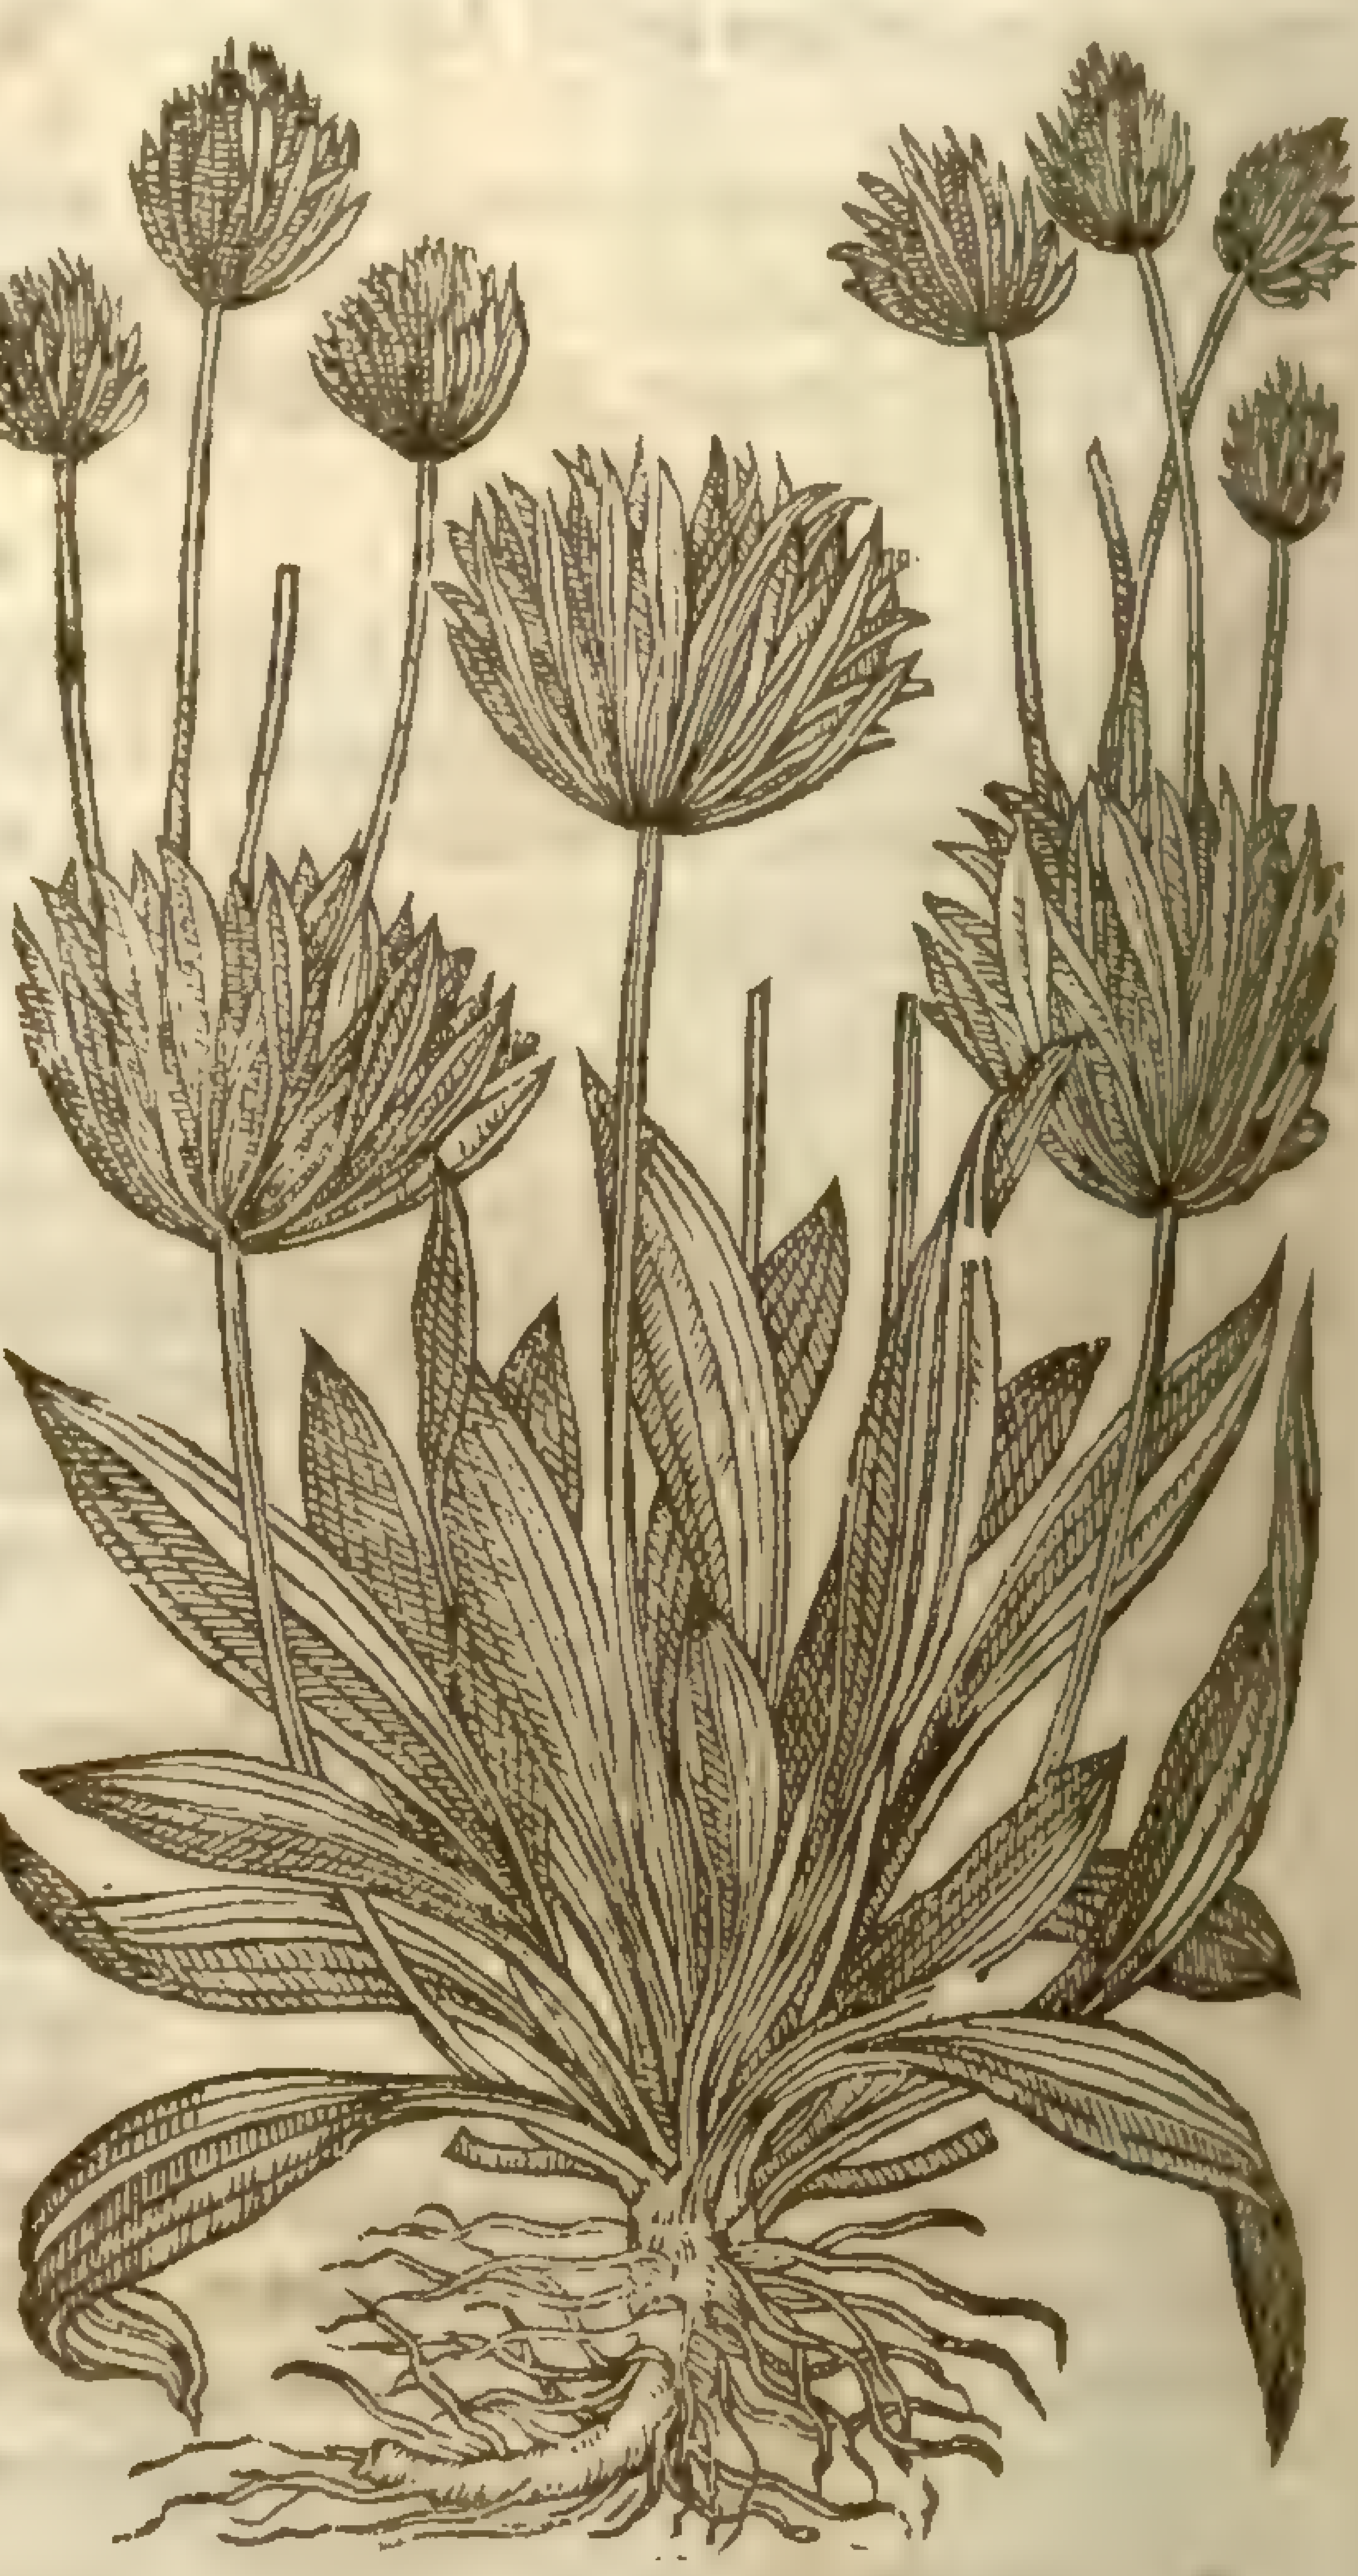
‡ This alſo I thinke differs not from that of *Cluſius*, wherefore I giue his figure in the place of that ſet forth by our Author. ‡

1 *Plantago quinquenernia.*
Ribwort Plantaine.

P. lanceolata [illegible]



2 *Plantago quinquenernia roſea.*
Roſe Ribwort.



¶ *The Place.*

Ribwort groweth almoſt euerie where in the borders of path-wayes and fertile fields.

Roſe Ribwort is not very common in any place, notwithſtanding it groweth in my garden, and wilde alſo in the North parts of England, as alſo in a field neere London by a village called Hogſdon, found by a learned merchant of London Mr *Iames Cole*, a louer of plants, and very skilfull in the knowledge of them.

¶ *The Time.*

They floure and flouriſh when the other Plantains do.

¶ *The Names.*

Ribwort is called in Greeke, ἀρνόγλωσσον μικρὸν : and of ſome, πεντάνευρος : in Latine, *Plantago minor, Quinquenervia*, and *Lanceola*, or *Lanceolata* : in high-Dutch, **Spitziger wegrich**: in French, *Lanceole* : in low-Dutch, **Hondts ribbe** ; that is to ſay in Latine, *Coſta Canina*, or Dogs rib : in Engliſh, Ribwort, or Rib Plantaine.

The ſecond I haue thought meet to call Roſe Ribwort in Engliſh, and *Quinquenervia roſea* in Latine.

¶ *The Temperature.*

Ribwort is cold and dry in the ſecond degree, as are the Plantaines.

¶ *The Vertues.*

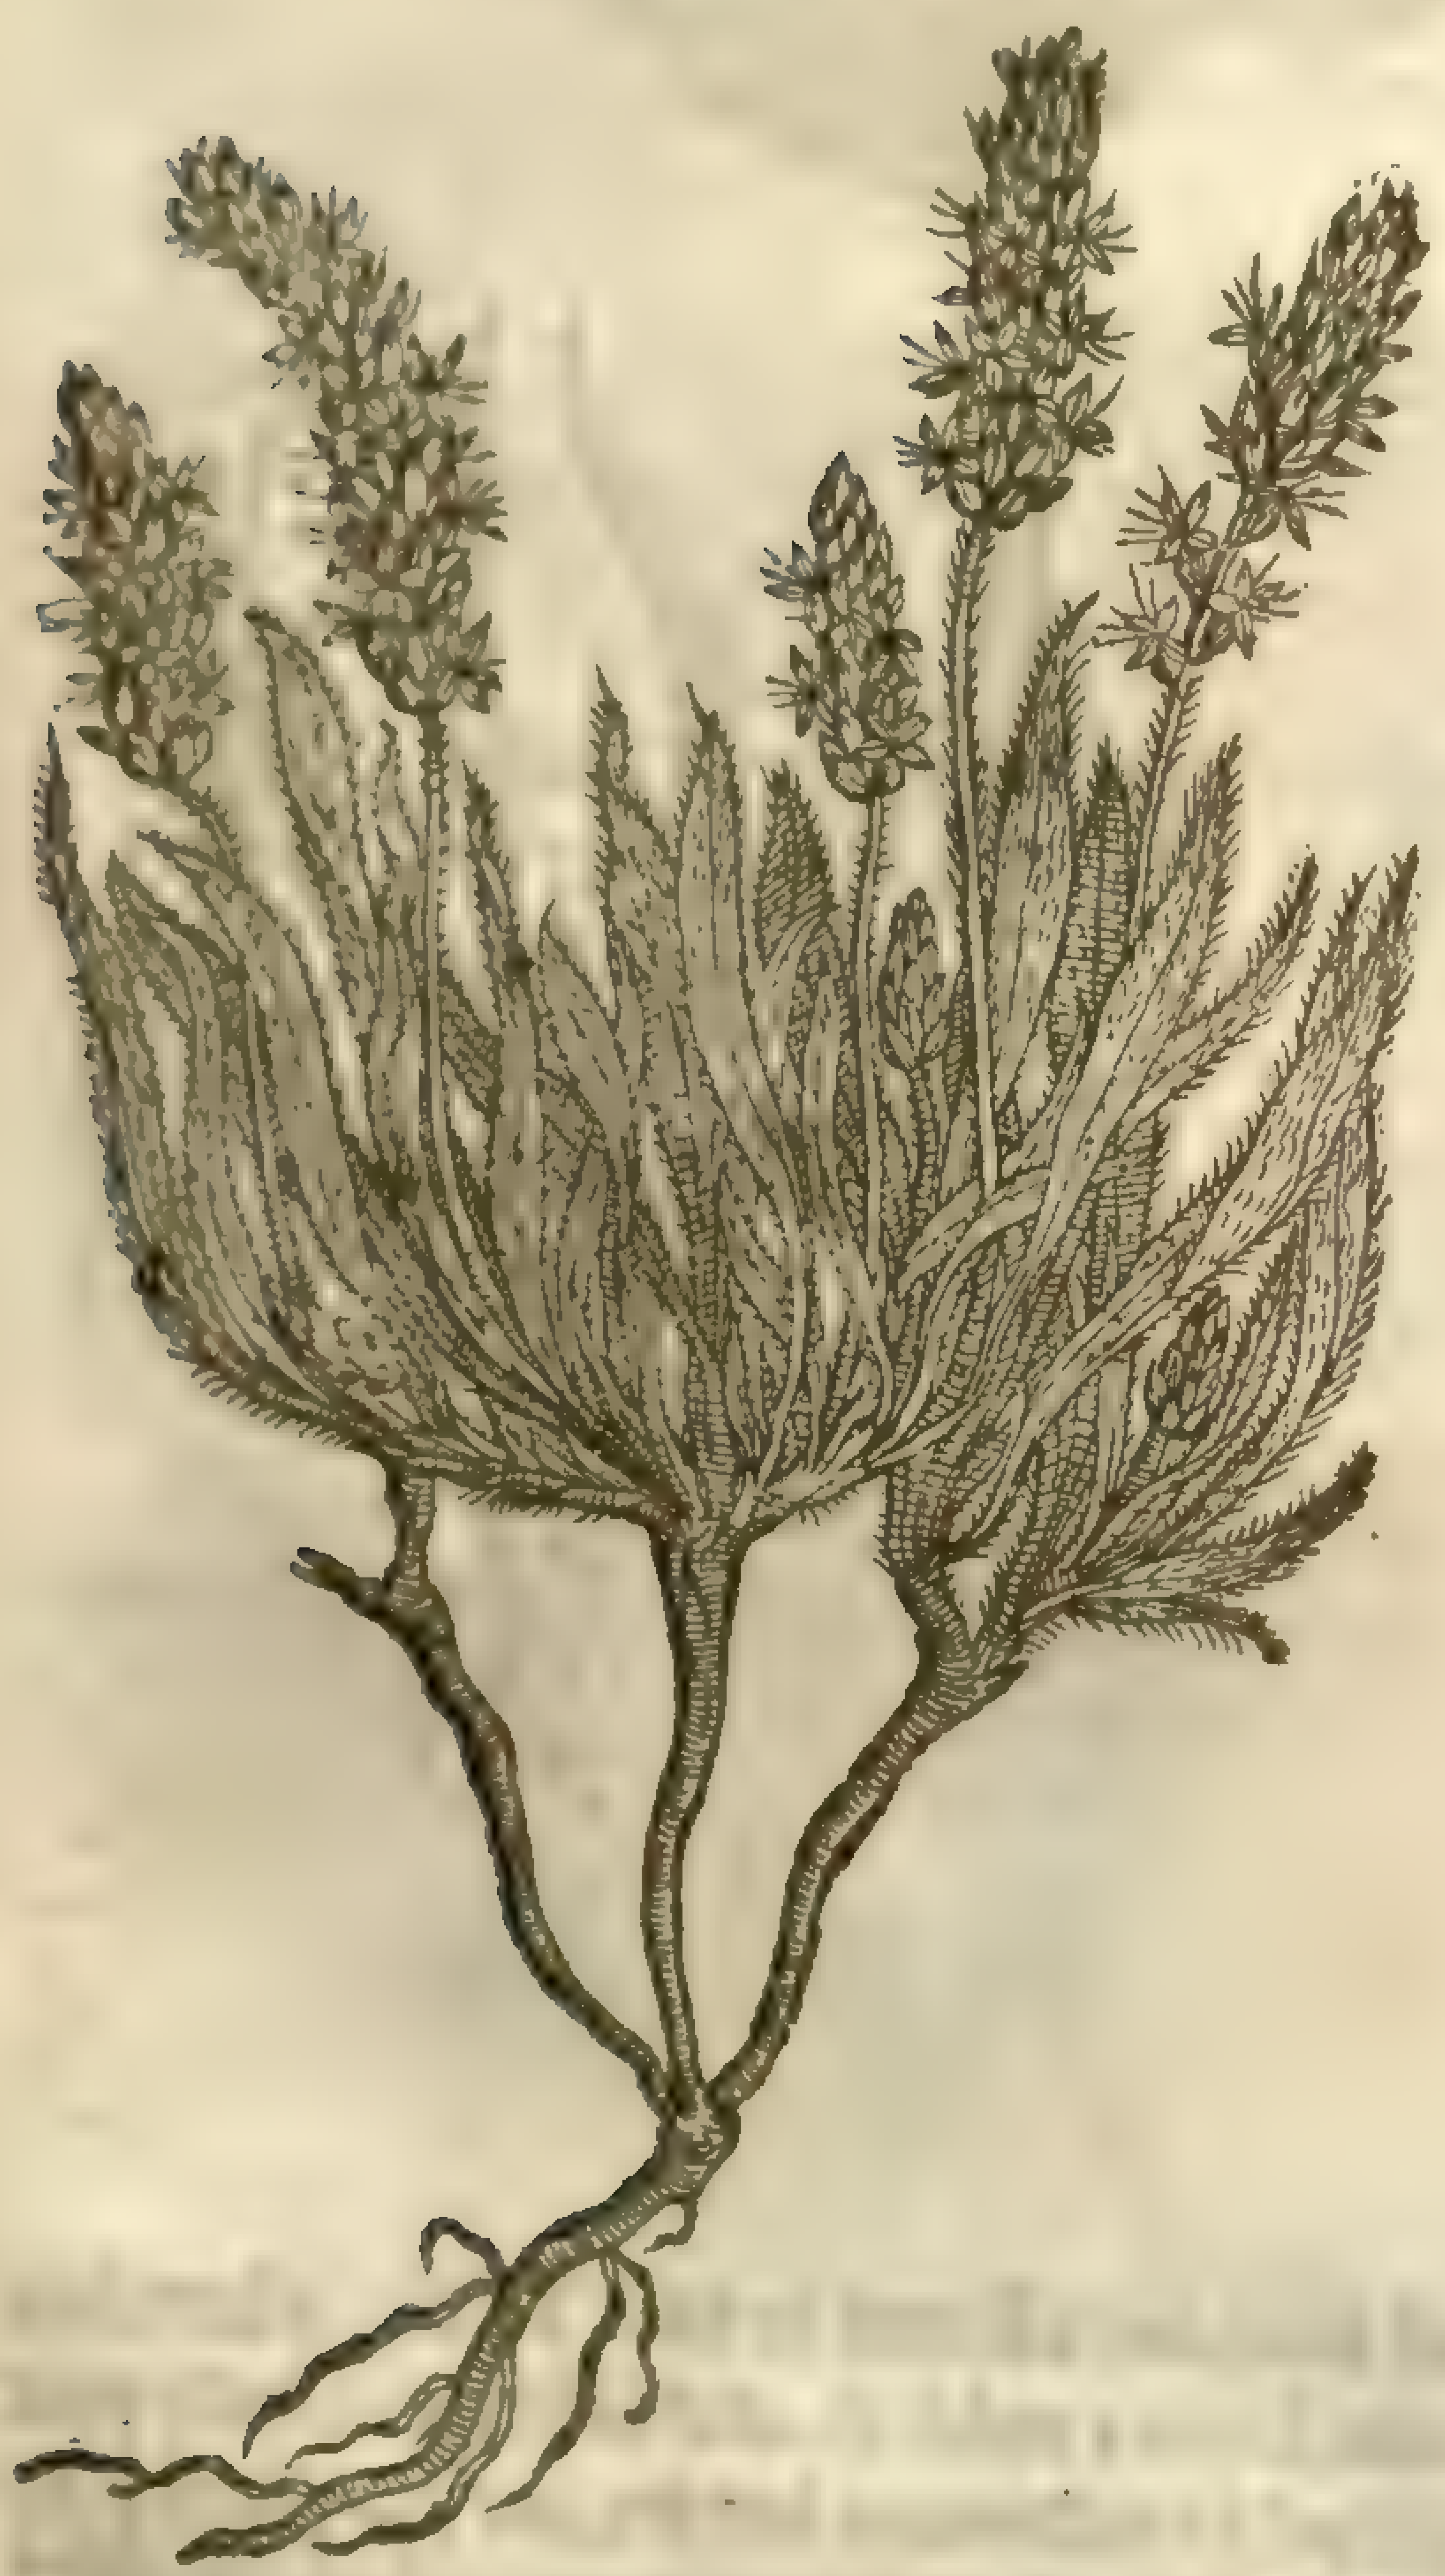
The vertues are referred to the kinds of Plantains.

Chap.

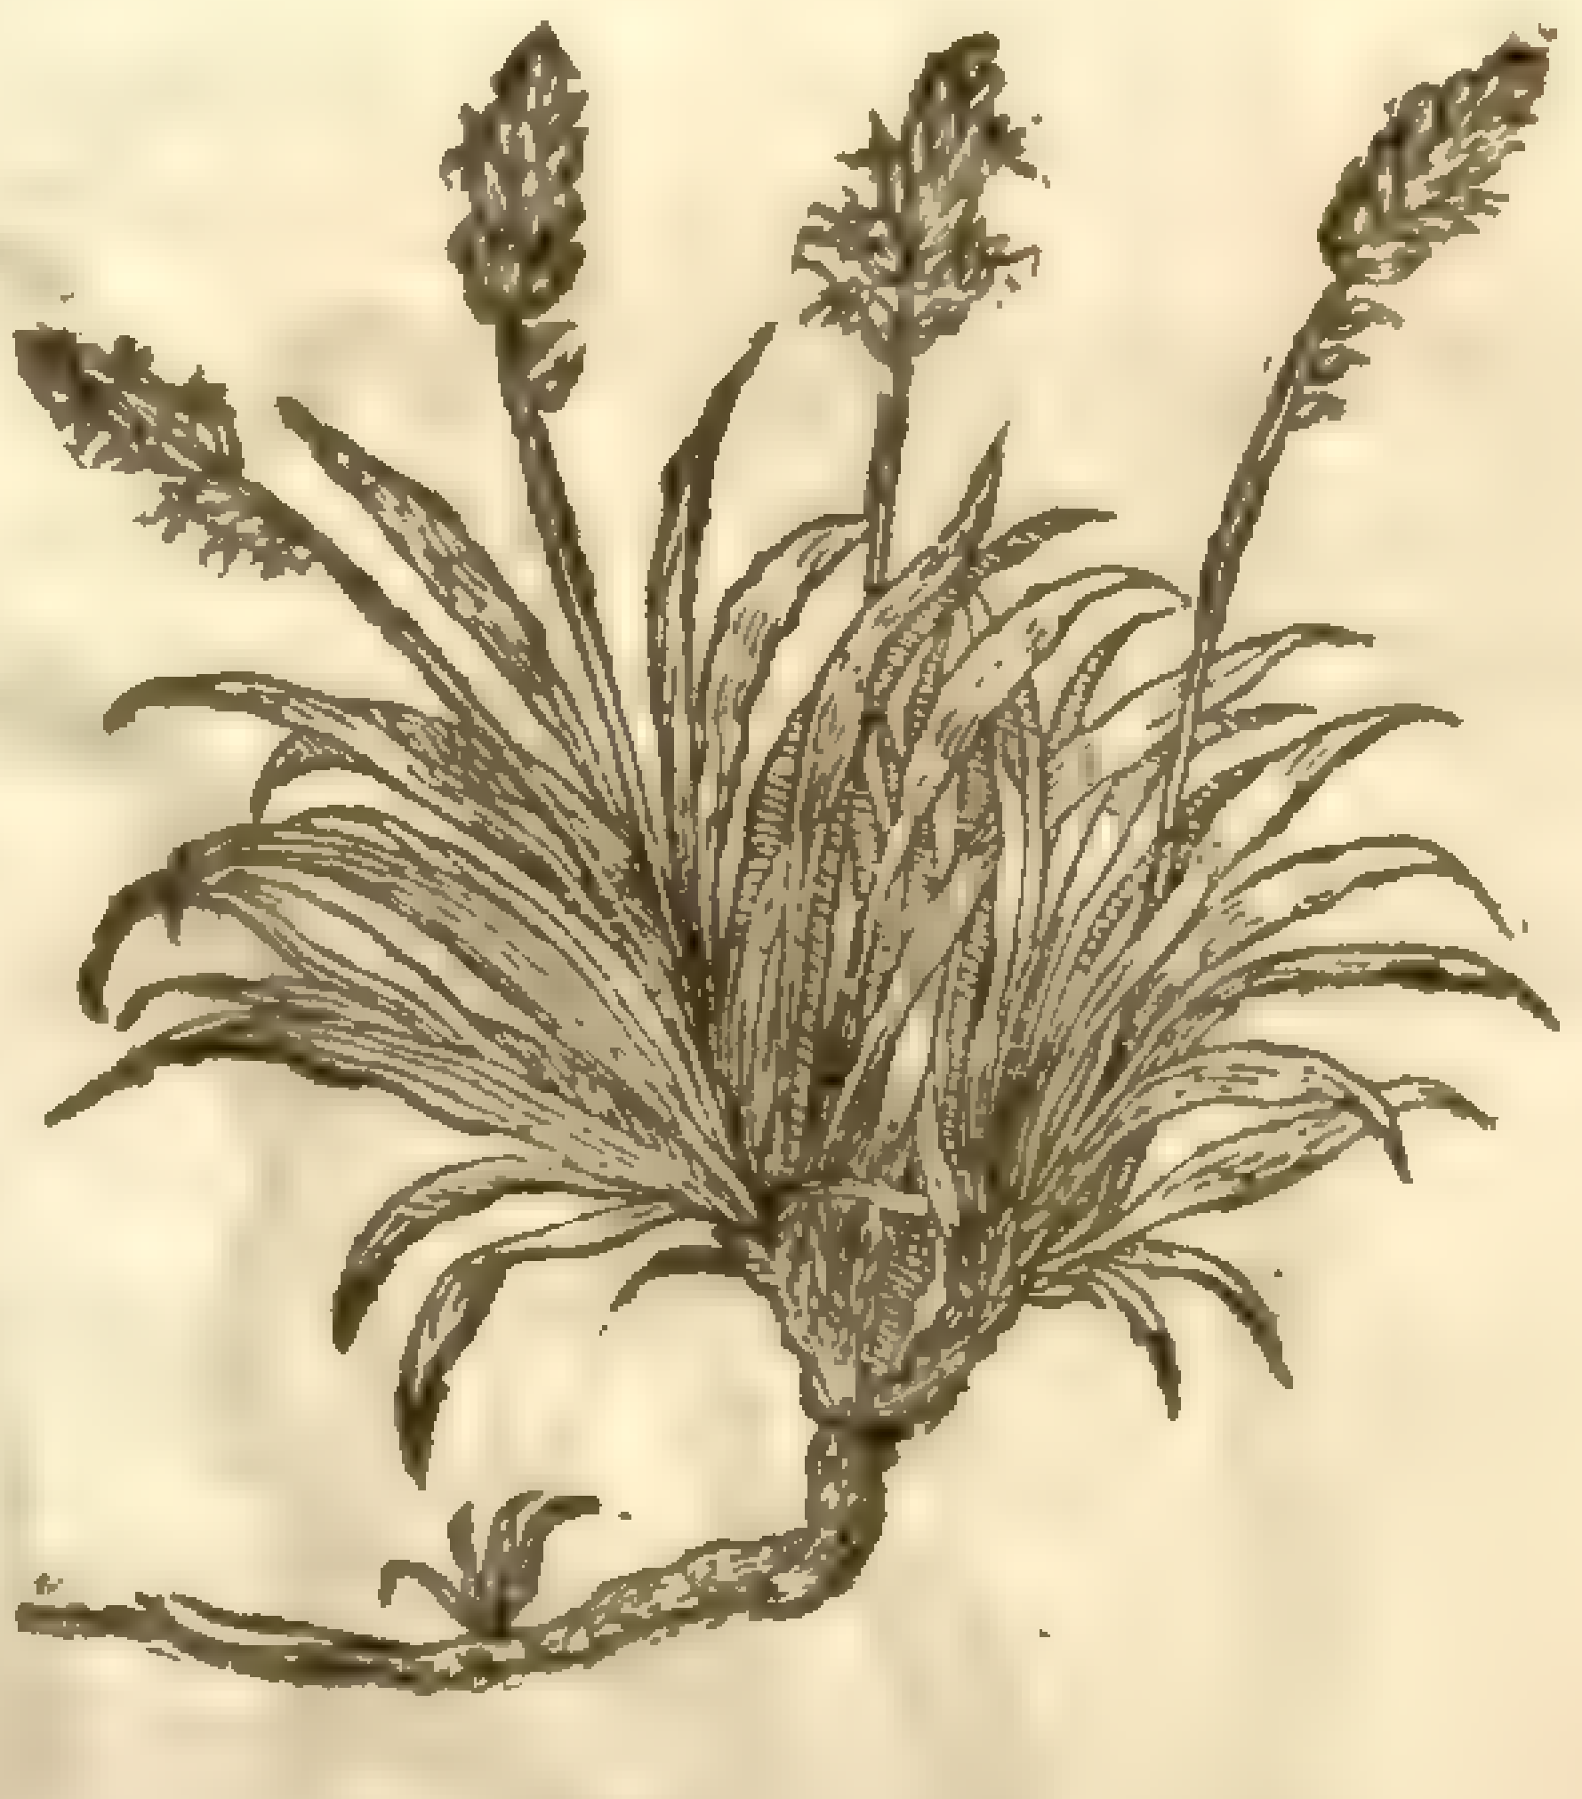
CHAP. 99. *Of Sea Plantaines.*

1 *Holoſteum Salamanticum,*
Flouring ſea Plantaine.

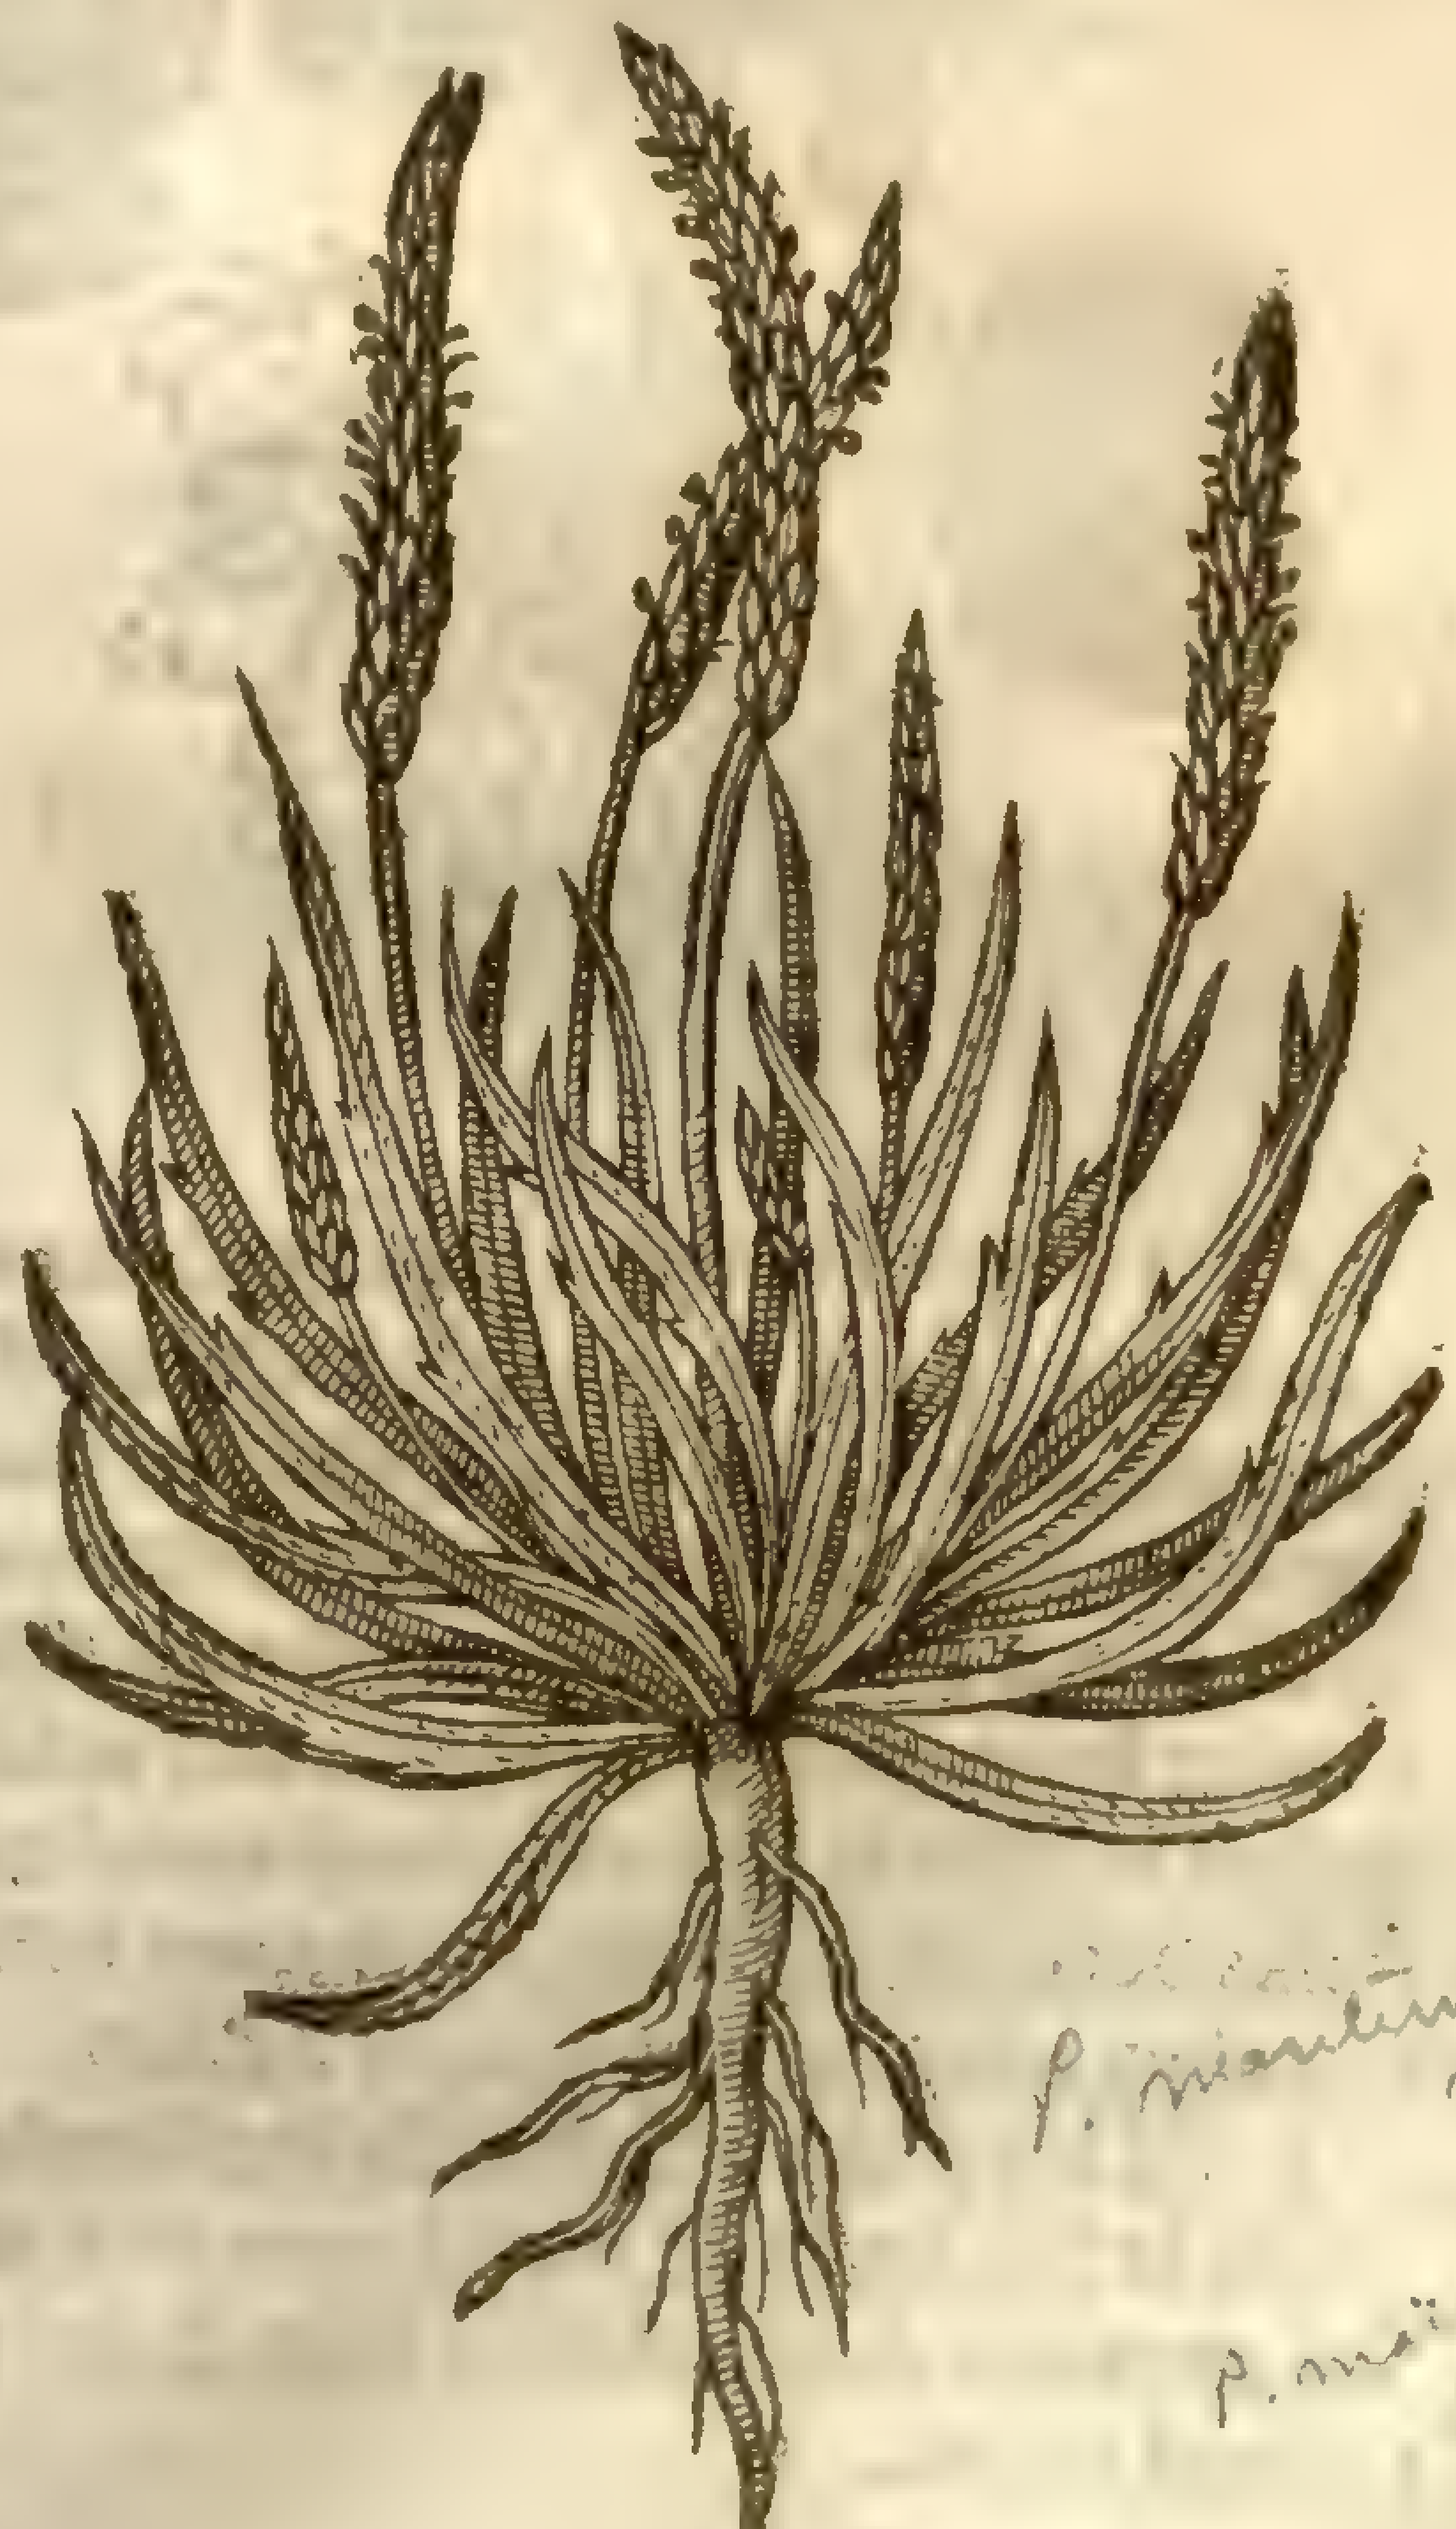
Plantago albicans, L.
mea. dut



2 *Holoſteum paruum.*
Small Sea Plantaine.



3 *Plantago marina.*
Sea Plantaine.



P. maritima, L. β
mea. dut

P. maritima, L.
Sm. Fl. Br.

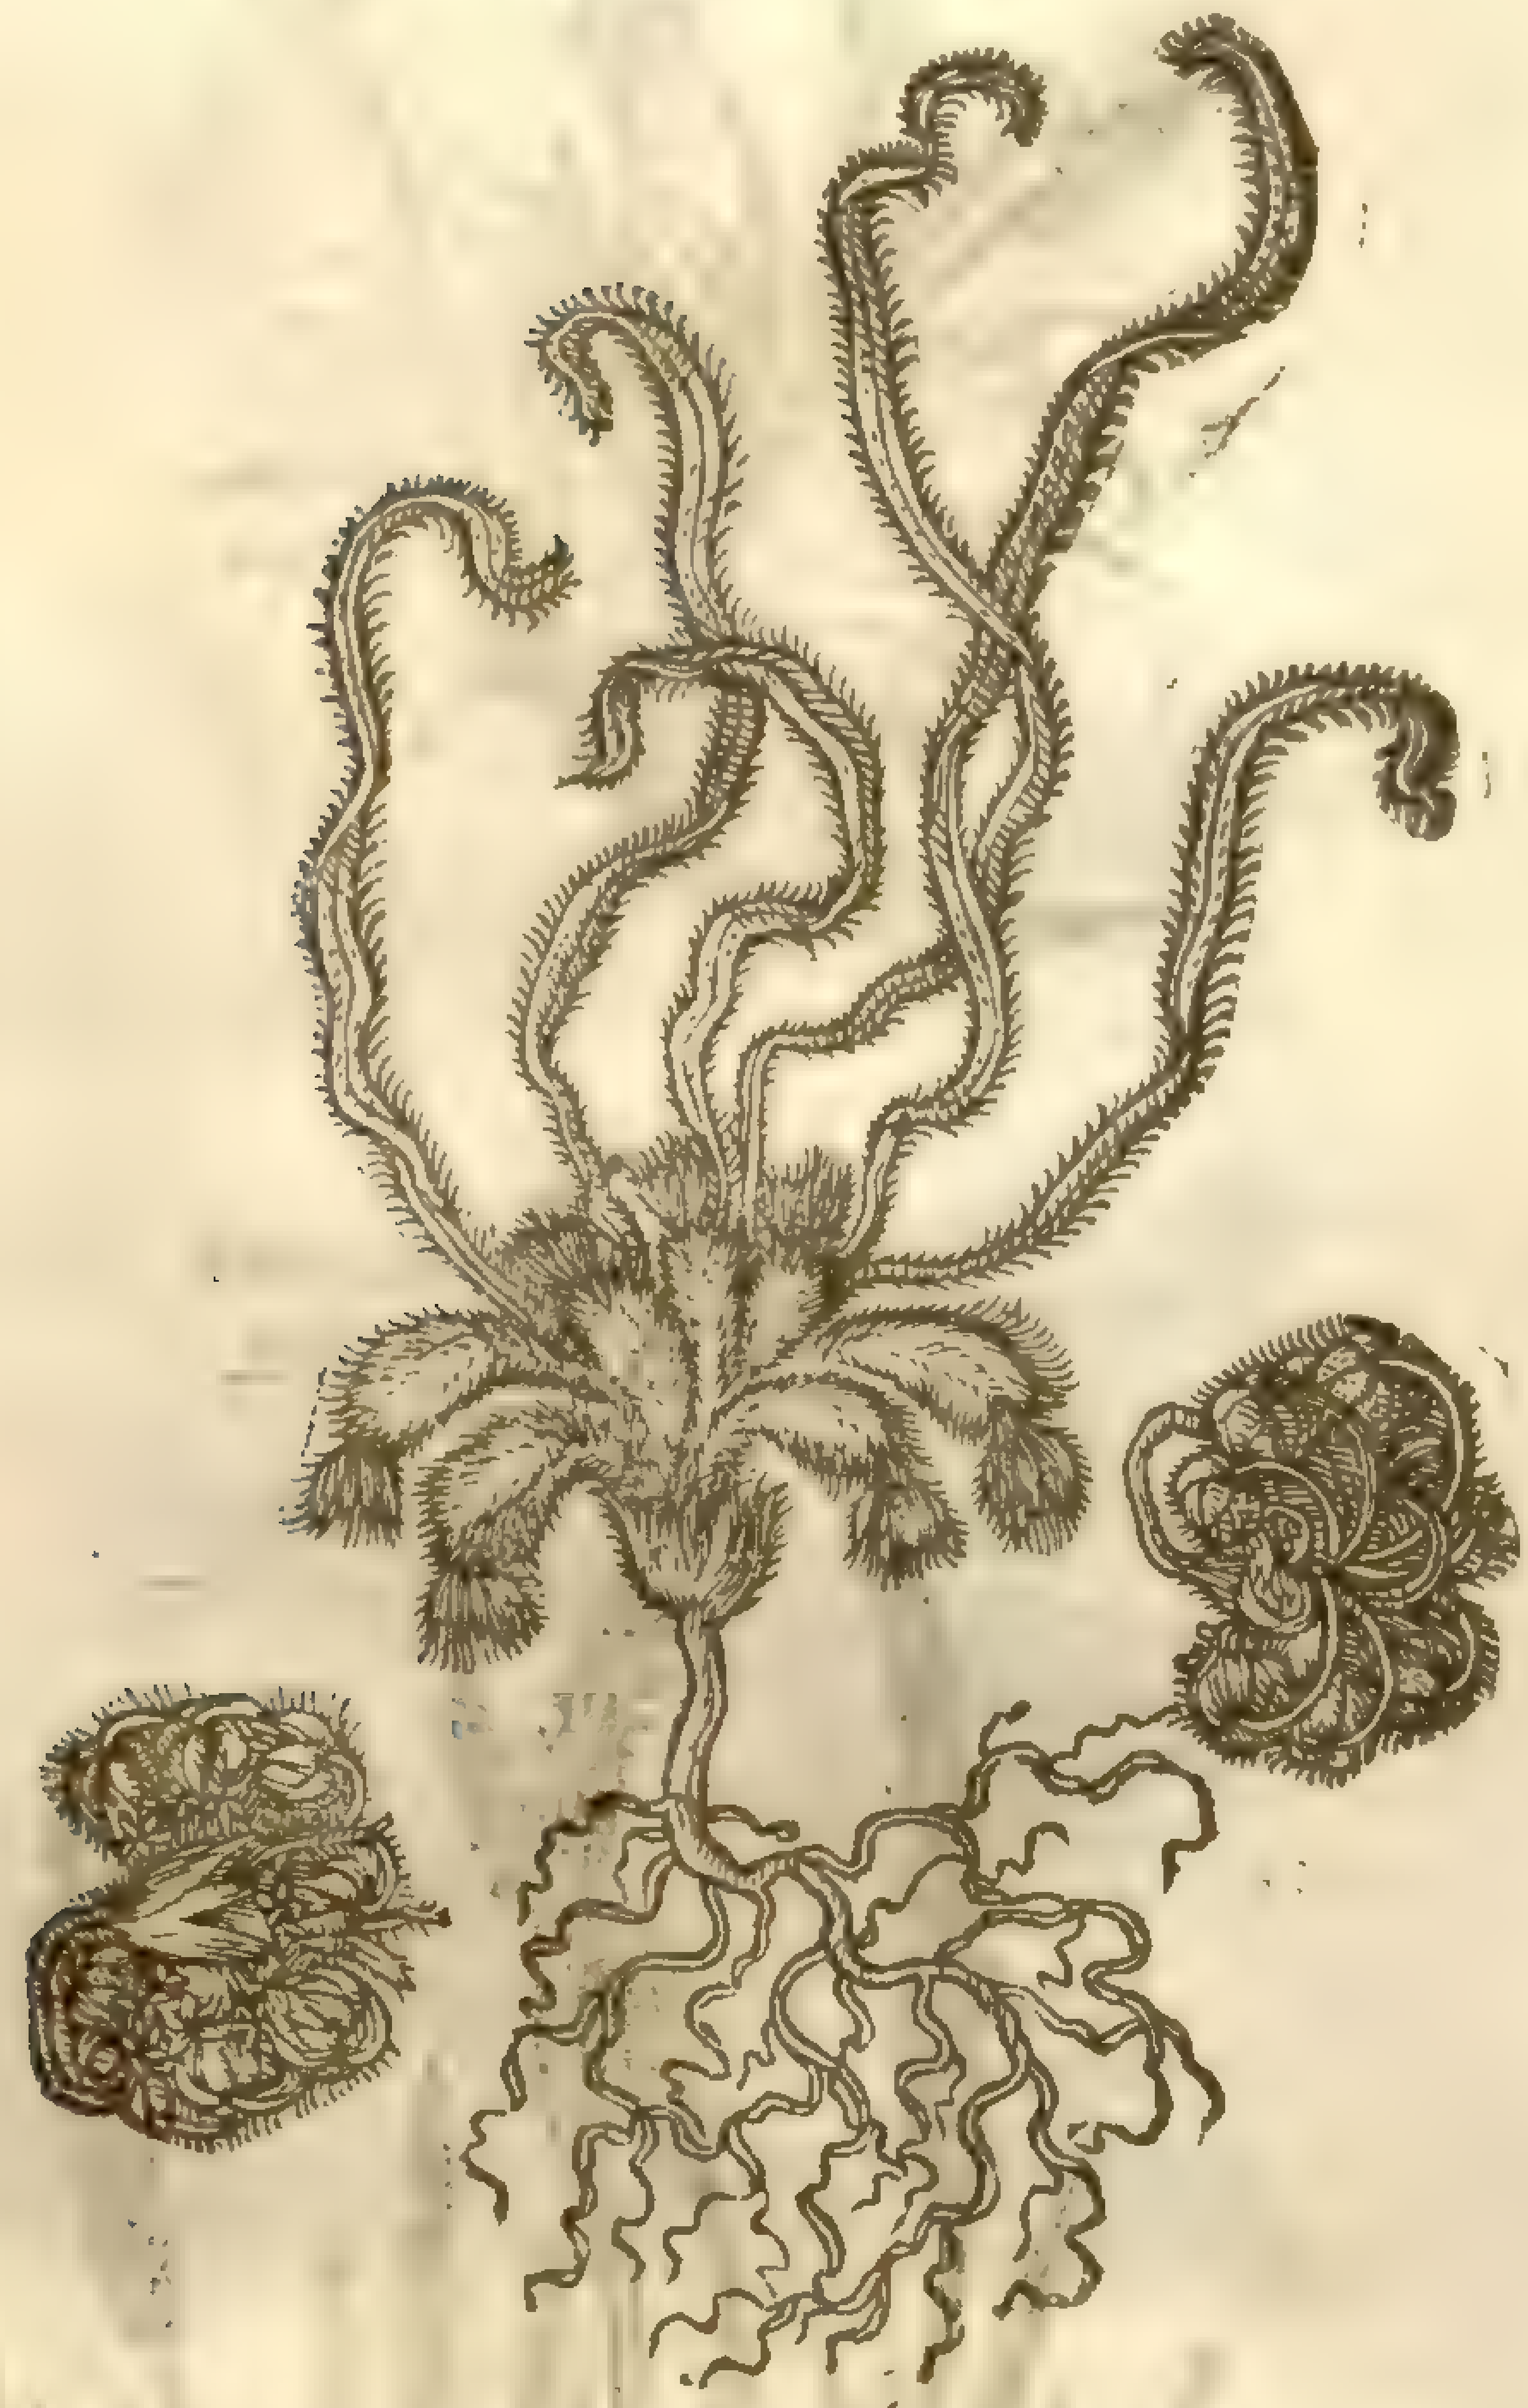
¶ *The Deſcription.*

1 CArolus Cluſius that excellent Herbariſt hath referred theſe two ſorts of *Holoſteum* to the kindes of Sea Plantain. The firſt hath long leaues like the common Rib wort, but narrower, couered with ſome hairineſſe or woollineſſe: among which there riſeth vp a ſtalk bearing at the top a ſpike like the kindes of Plantaine: the root is long and wooddy. This flours in Aprill or May.

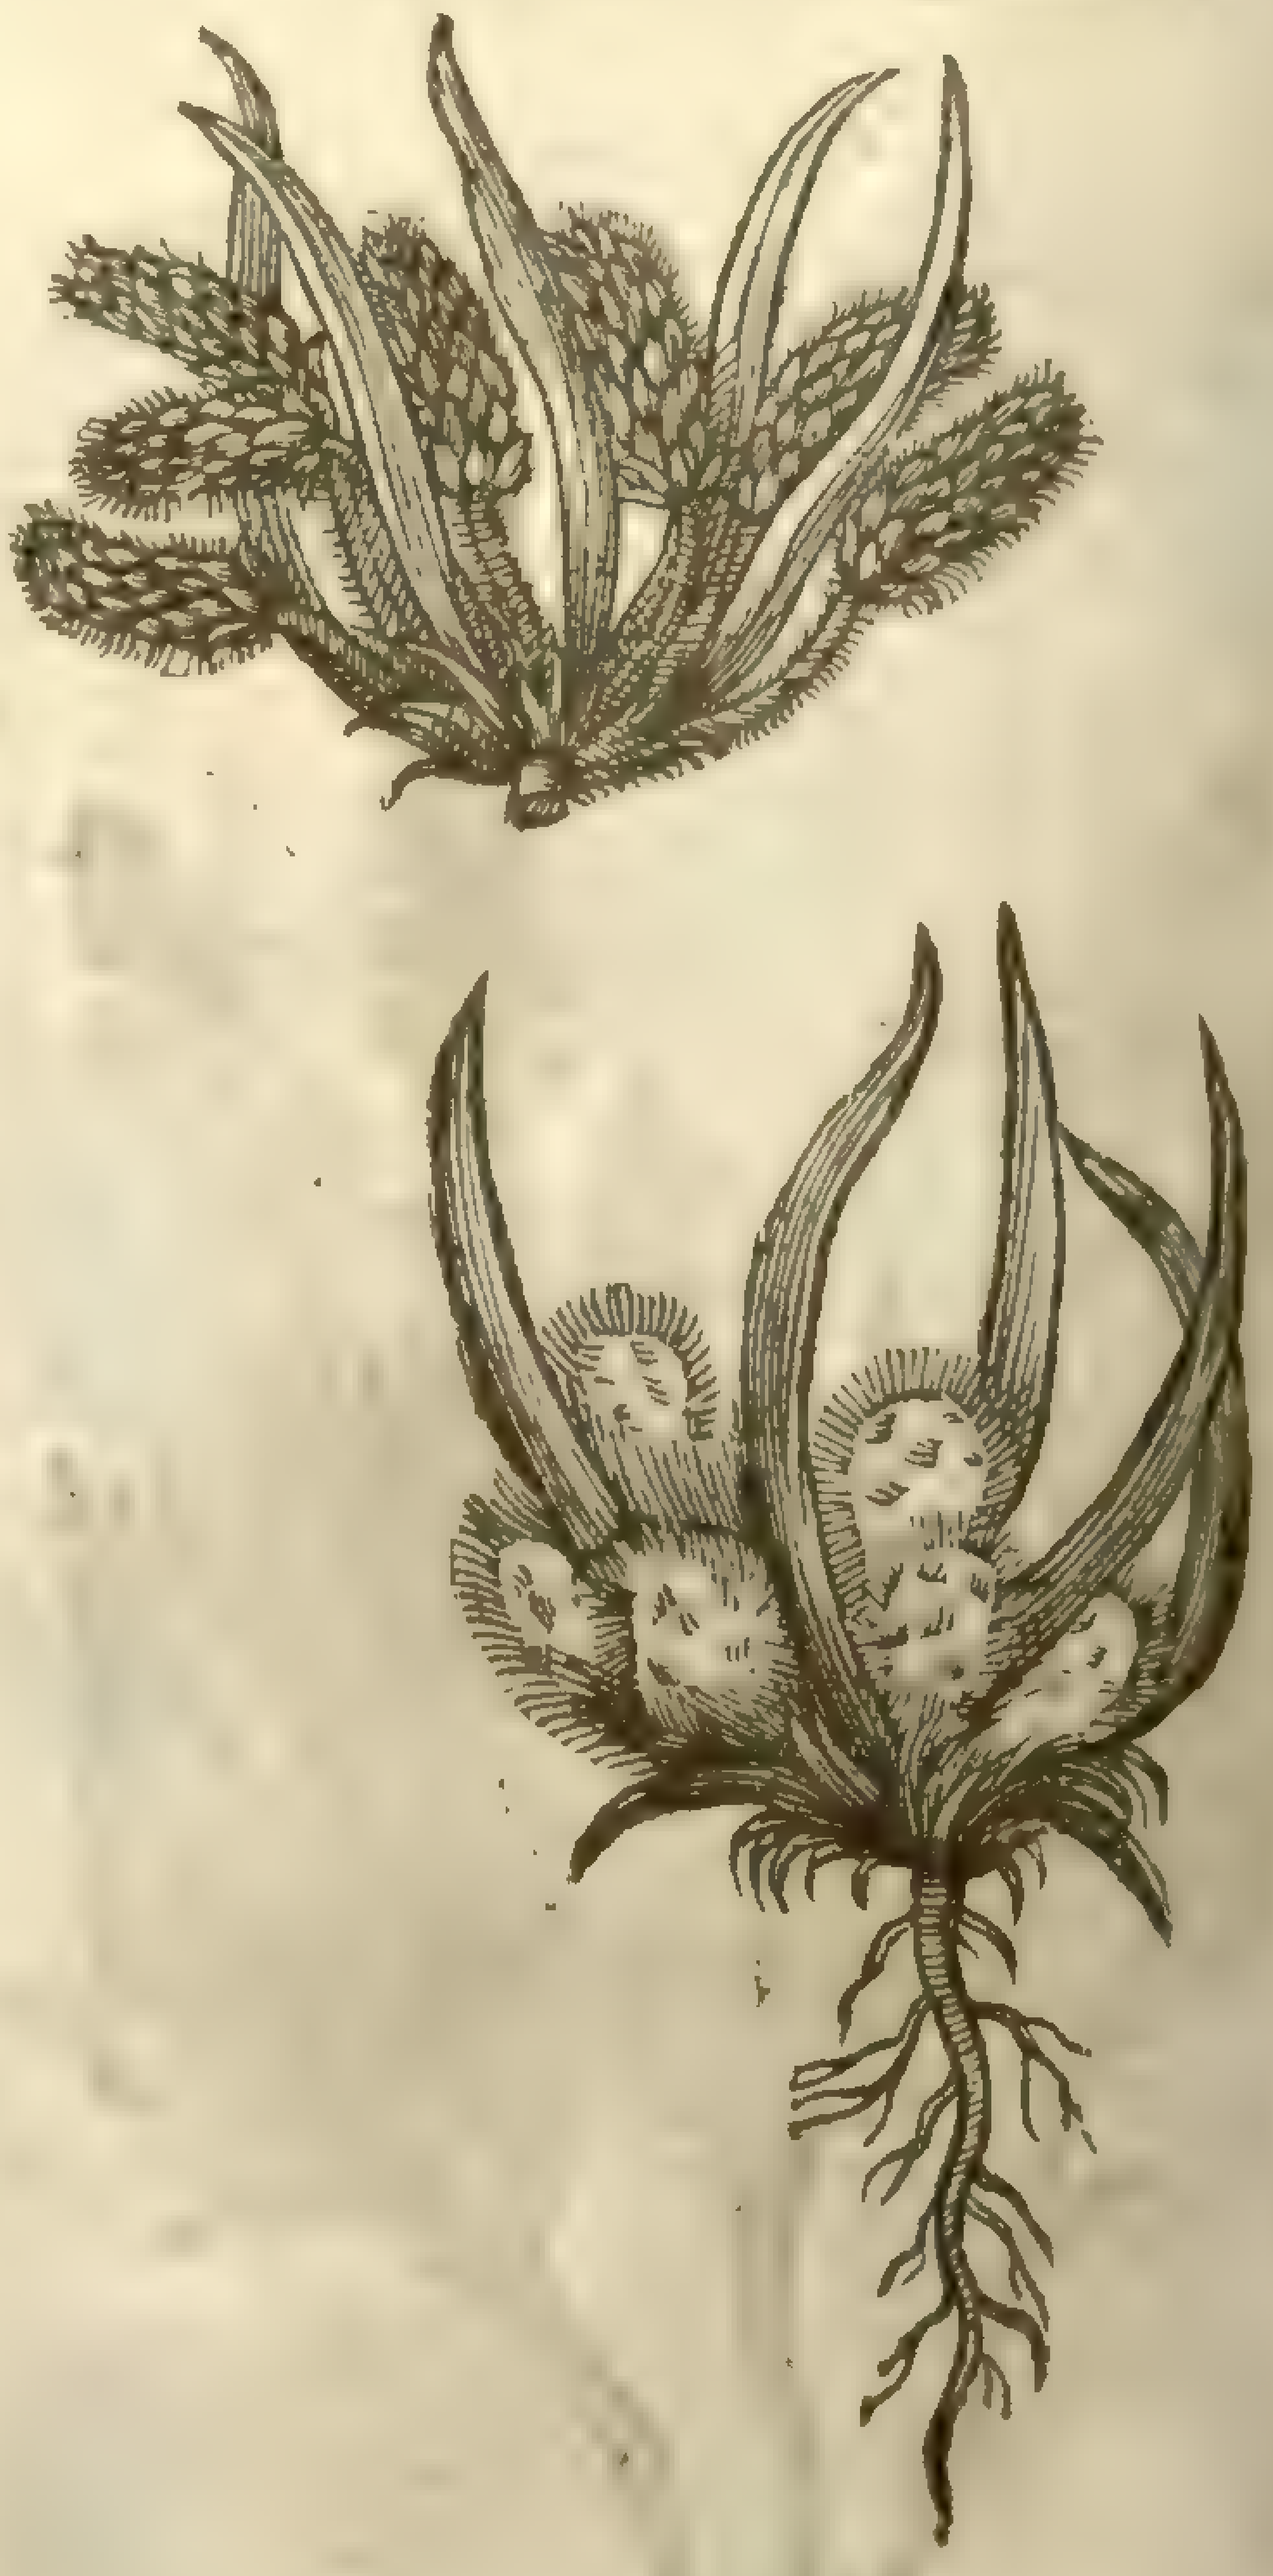
2 The ſecond is like the former, but ſmaller, and not ſo gray or hoary: the flours are like to *Coronopus* or the leſſer Ribwort. This floures at the ſame time as the former.

3 The third kinde, which is the ſea Plantaine, hath ſmall narrow leaues like Bucks-horne, but without any manifeſt inciſure, cuttings, or notches vpon the one ſide: among which riſeth vp a ſpikie ſtalke like the common kinde, but ſmaller.

‡ 4 *Holoſteum, ſiue Leontopodium Creticum.*
Candy Lions foot.



‡ 5 *Holoſteum, ſiue Leontopod. Cret. alterum.*
The other Candy Lions foot.



‡ 4 Theſe two following plants are by *Cluſius* and *Bauhine* referred to this Tribe; wherefore I thinke it fitting to place them here. The former of them, from a reddiſh and as it were ſcaly root growing leſſe by little and little, and diuided into fibers, ſends forth many leaues, narrow, hoary, an handfull long, and hauing three nerues or ribs running alongſt each of them: amongſt theſe come forth diuers footſtalks couered with a ſoft reddiſh down, and being ſome two or three inches long, hauing heads ſomewhat thicke and reddiſh: the floures are whitiſh, with a blackiſh middle, which makes it ſeem as if it were perforated or holed. Now when the plant growes old and withers, the ſtalks becomming more thicke and ſtiffe bend downe their heads toward the root, ſo that in ſome ſort they reſemble the foot of a Lion.

5 This plant which is figured in the vpper place (for I take the lower to be an exacter figure of the laſt deſcribed) hath leaues like to the ſmall ſea Plantain, but tenderer, and ſtanding vpright; and amongſt theſe on little foot-ſtalks grow heads like thoſe of *Pſyllium*, but prettier, and of a whitiſh red colour. ‡

¶ *The Place.*

The two firſt grow in moſt of the Spaniſh dominions. *Carolus Cluſius* writeth, that he neuer ſaw greater or whiter than neere to Valentia a city of Spain, by the highwaies. Since they haue beene found at Baſtable in the Iſle of Wight, and in the Iſles of Gernſey and Iarſey.

The third growes neere vnto the ſea in all places of England where I haue trauelled, eſpecially by the forts on both ſides the water at Graueſend, at Erith neere London, at Lee in Eſſex, at Rie in Kent, at Weſt-Cheſter, and at Briſtow.

‡ The fourth and fifth grow in Candy, from whence they haue beene ſent to Padua and many other places. ‡

¶ *The Names.*

Holoſteum, is alſo called by *Dodonæus*, *Plantago anguſtifolia albida*, or *Plantago Hiſpanienſis*: in Engliſh, Spaniſh hairy ſmall Plantaine, or flouring ſea Plantaine.

‡ The fourth is called by *Cluſius*, *Leontopodium Creticum*: by ſome it hath beene thought to be *Catanance* of *Dioſcorides*: the which *Honorius Bellus* will not allow of: *Bauhine* calls it *Holoſteum, ſiue Leontopodium Creticum.*

The fifth is *Leontopodium Creticum alterum* of *Cluſius*; the *Habbures* of *Camerarius*; and the *Holoſteum Creticum alterum* of *Bauhine*. ‡

¶ *The Temperature and Vertues.*

Galen ſaith, That *Holoſteum* is of a binding and drying facultie.

A Galen, *Dioſcorides*, and *Pliny* haue prooued it to be ſuch an excellent wound herbe, that it preſently cloſeth or ſhutteth vp a wound, though it be very great and large: and by the ſame authority I ſpeake it, that if it be put into a pot where many pieces of fleſh are boyling, it will ſoder them together.

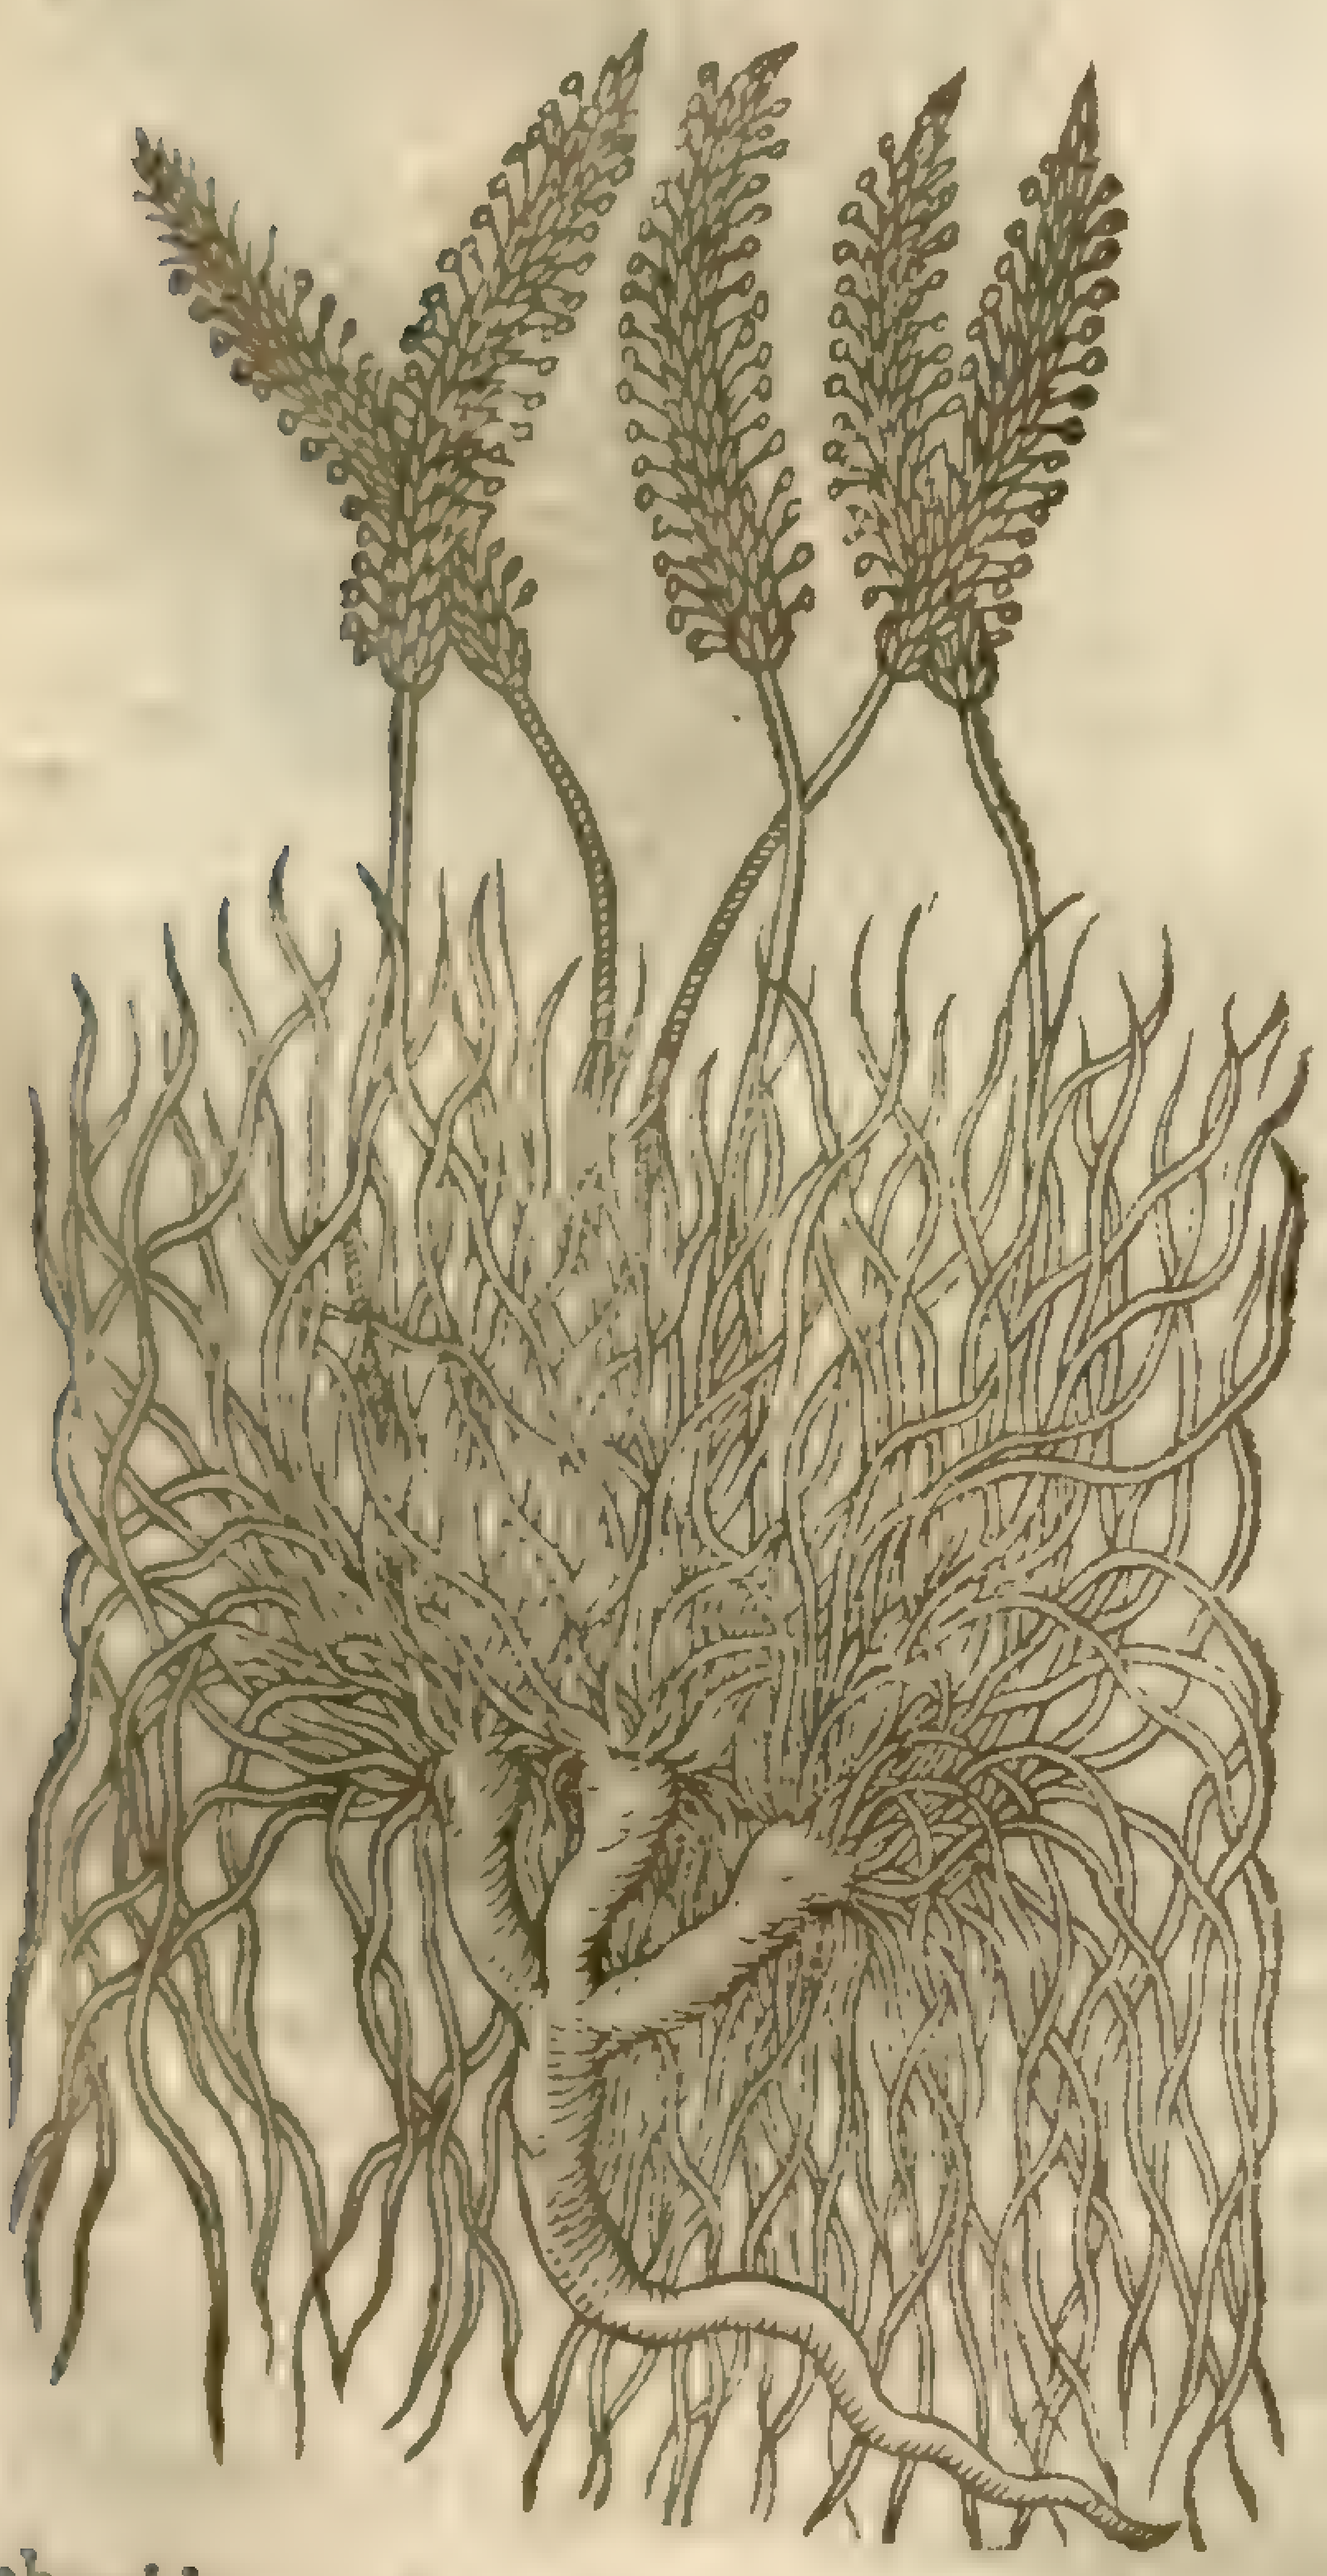
B Theſe herbes haue the ſame faculties and vertues that the other Plantains haue, and are thought to be the beſt of all the kindes.

† That which was formerly in the fourth place of this chapter, vnder the name of *Holoſteum Petræum*, you ſhall finde hereafter vnder the title of *Muſcus Corniculatus*, for vnder that name our Author alſo gaue another figure thereof, with a deſcription; and I iudge it more fitly placed there than here amongſt the Plantaines.

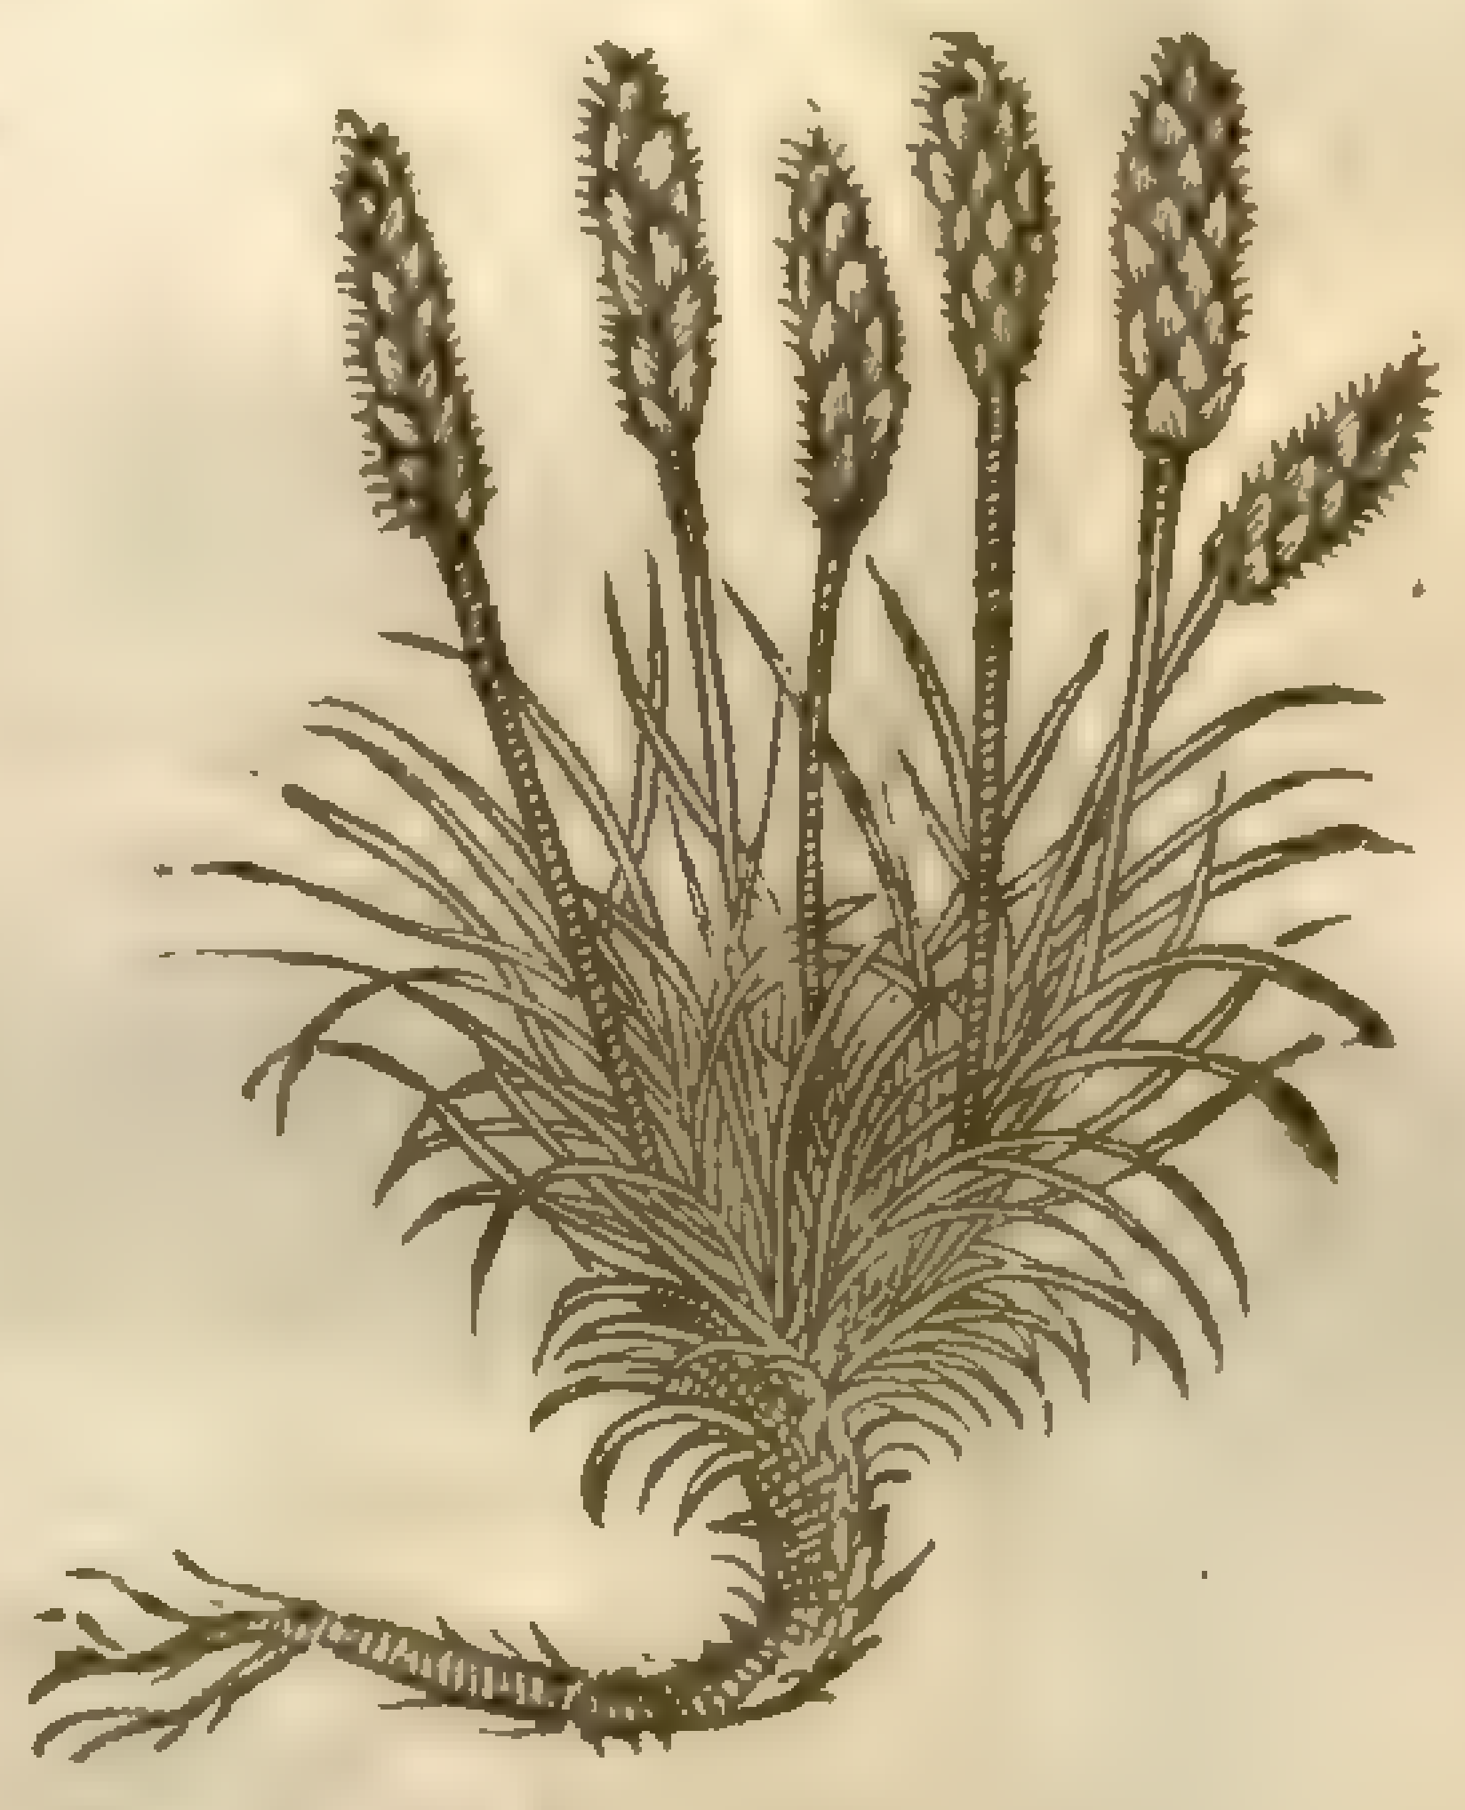
Chap. 100. *Of Sea Buck-horne Plantaines.*

Sm. Rh. 1. 25

1 *Coronopus.*
Sea Buck-horne.



2 *Coronopus, ſiue Serpentina minor.*
Small Sea Buck-horne.



¶ *The Deſcription.*

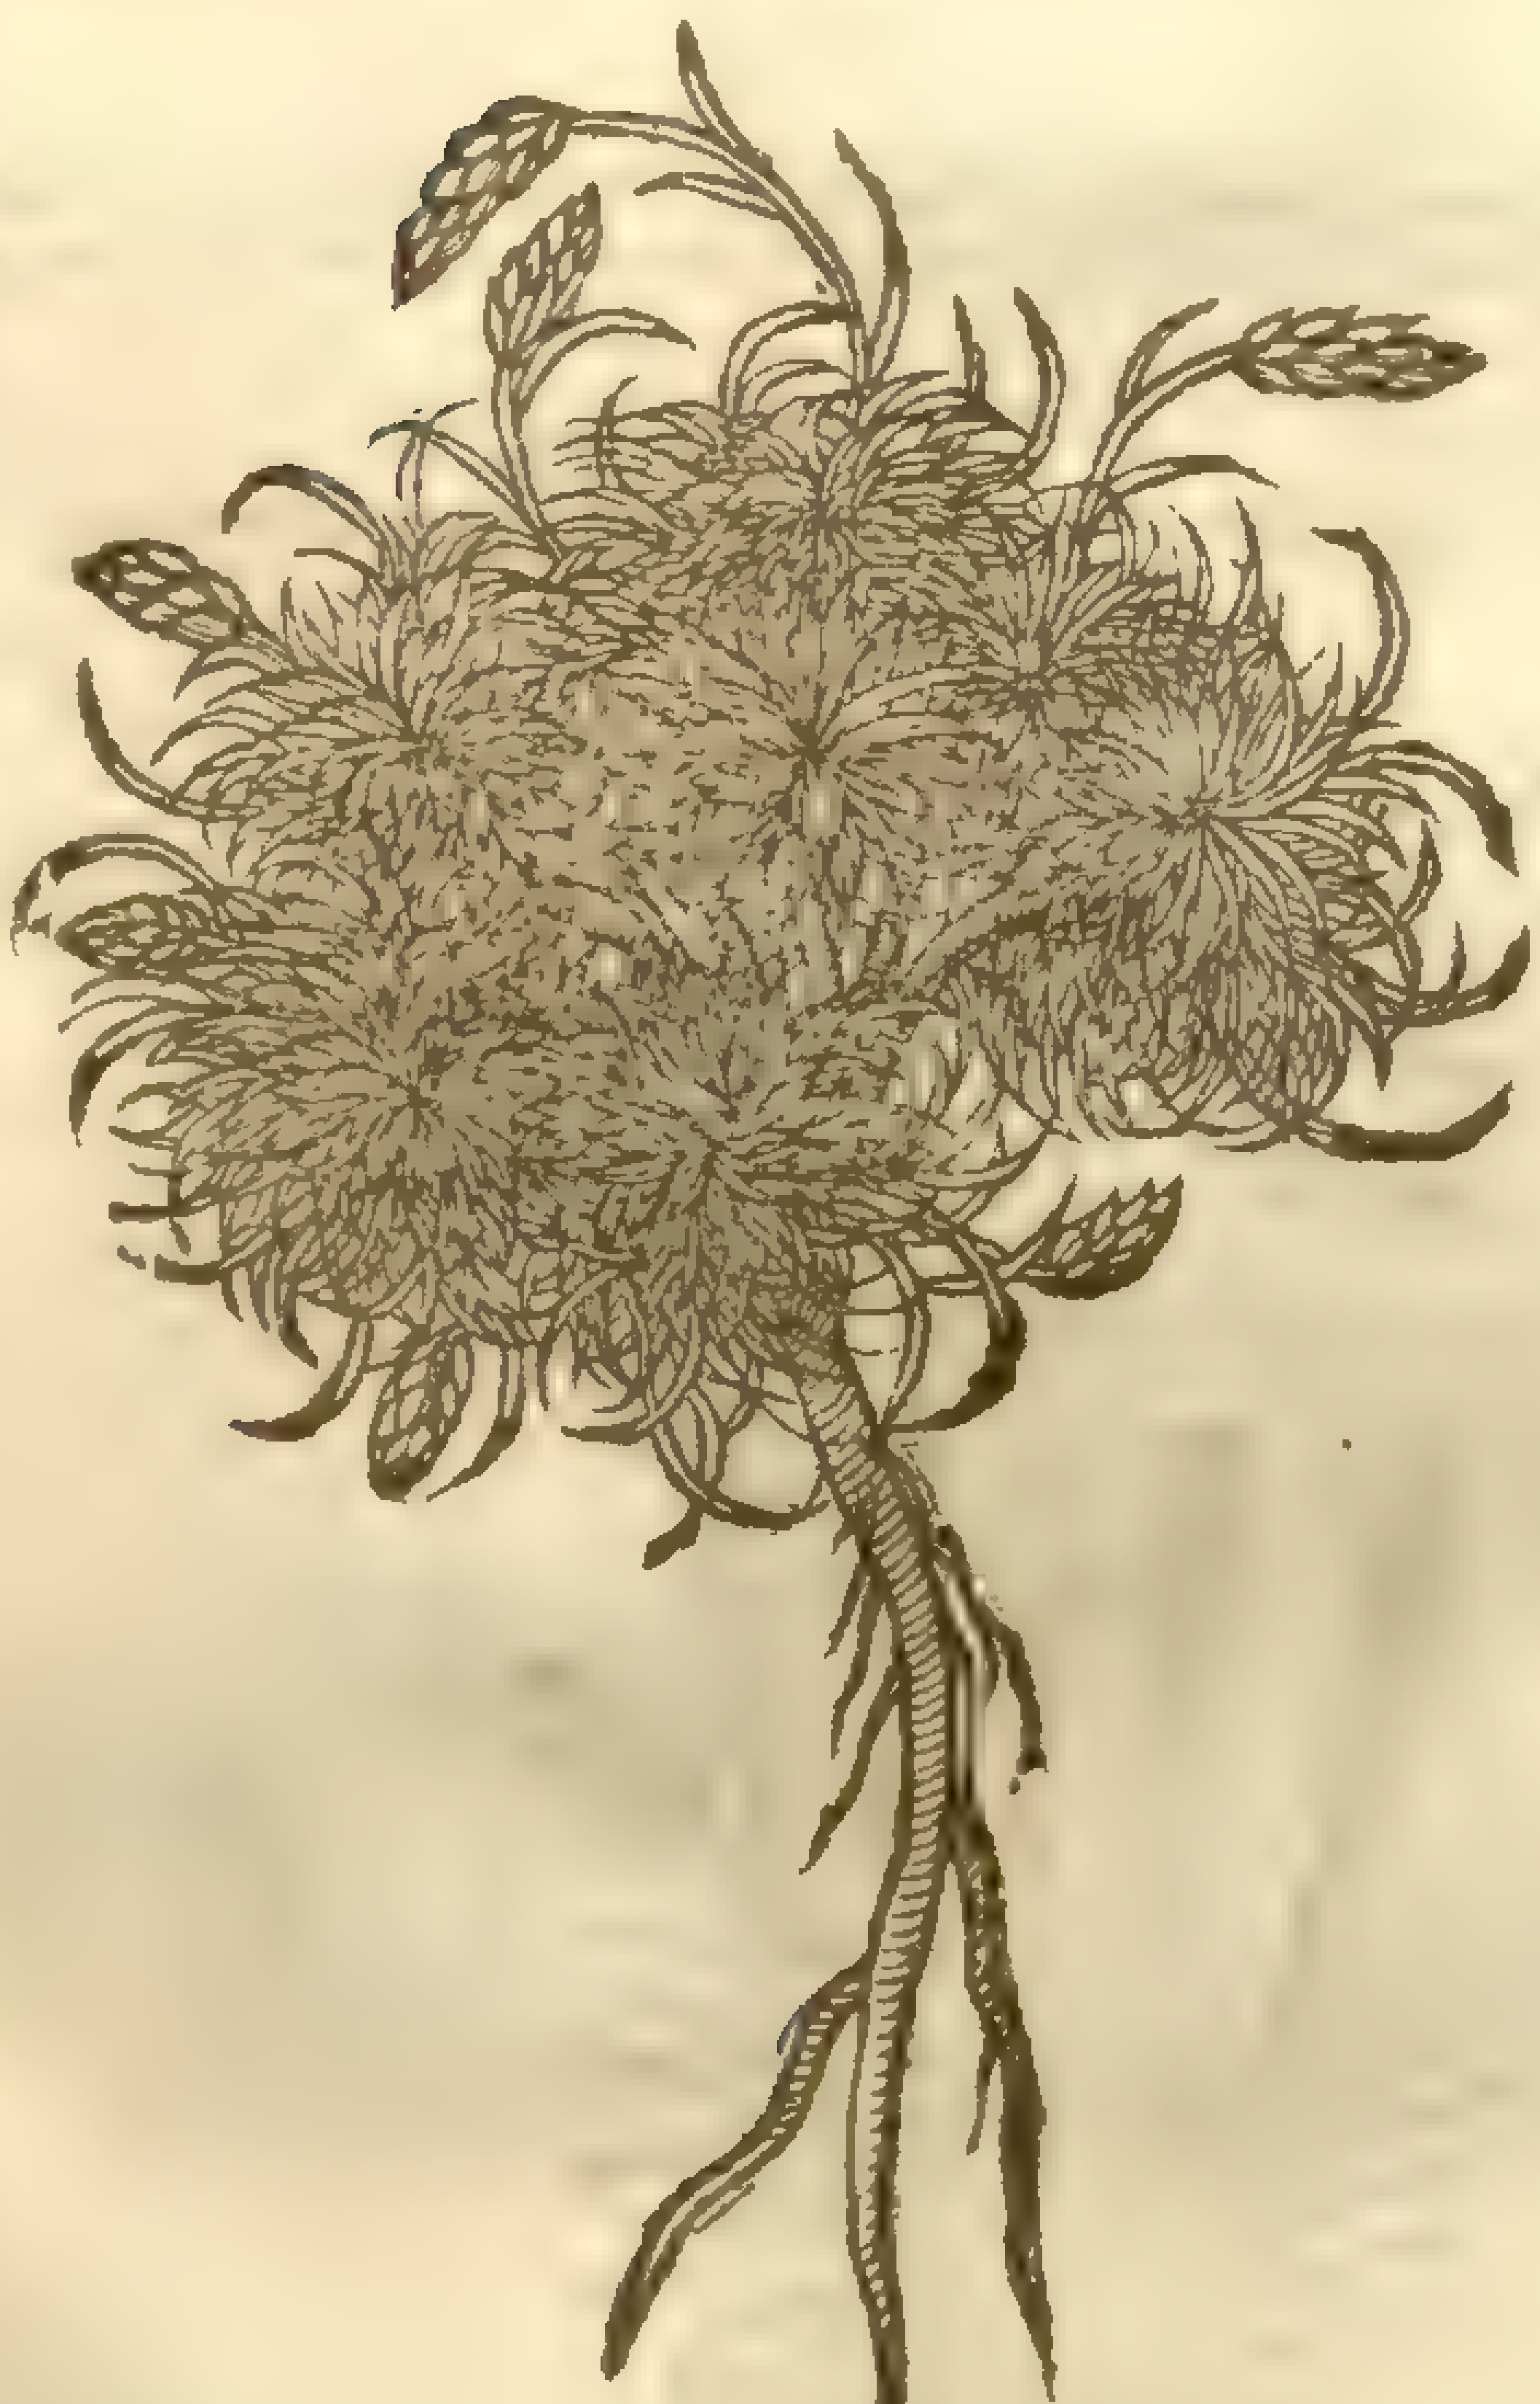
1 The new Writers following as it were by tradition thoſe that haue written long agone, haue been content to heare themſelues ſpeake and ſet downe certainties by vncertain ſpeeches; which haue wrought ſuch confuſion and corruption of writings, that ſo many Writers, ſo many ſeueral opinions; as may moſt euidently appeare in theſe plants and in others: And my ſelfe am content rather to ſuffer this ſcar to paſſe, than by correcting the error, to renew the old wound. But for mine owne opinion thus I thinke, the plant which is reckoned for a kind of *Coronopus* is doubtleſſe a kinde of *Holoſteum*: my reaſon is, becauſe it hath graſſie leaues, or rather leaues like *Vetonica ſylueſtris* or wilde Pinks, a root like thoſe of *Garyophyllata* or Auens, and the ſpikie eare of *Holoſteum* or Sea Plantaine: which are certaine arguments that theſe writers haue neuer ſeene the Plant, but only the picture thereof, and ſo haue ſet downe their opinions by heare-ſay.

This plant likewiſe hath beene altogether vnknowne vnto the old Writers. It groweth moſt plentifully vpon the cliffes and rocks and the tops of the barren mountaines of Auergne in France, and in many places of Italy.

2 The ſecond ſort of wilde ſea Plantaine or *Serpentina* differeth not from the former but onely in quantitie and ſlenderneſſe of his ſtalkes, and the ſmallneſſe of his leaues, which exceed not the height of two inches. It groweth on the hills and rockes neere the waſhings of the ſea at Maſſilia in great plenty almoſt euery where among the *Tragacanthum*, hauing a moſt thicke and ſpreading cluſter of leaues after the manner of *Sedum minimum ſaxeum montanum*, ſomwhat like *Pinaſter*, or the wilde Pine, as well in manner of growing, as ſtiffeneſſe, and great increaſe of his ſlender branches. It hath the ſmall ſeed of Plantaine, or *Serpentina vulgaris*, contained within his ſpikie eares. The root is ſomewhat long, wooddy, and thicke, in taſte ſomewhat hot and aromaticall.

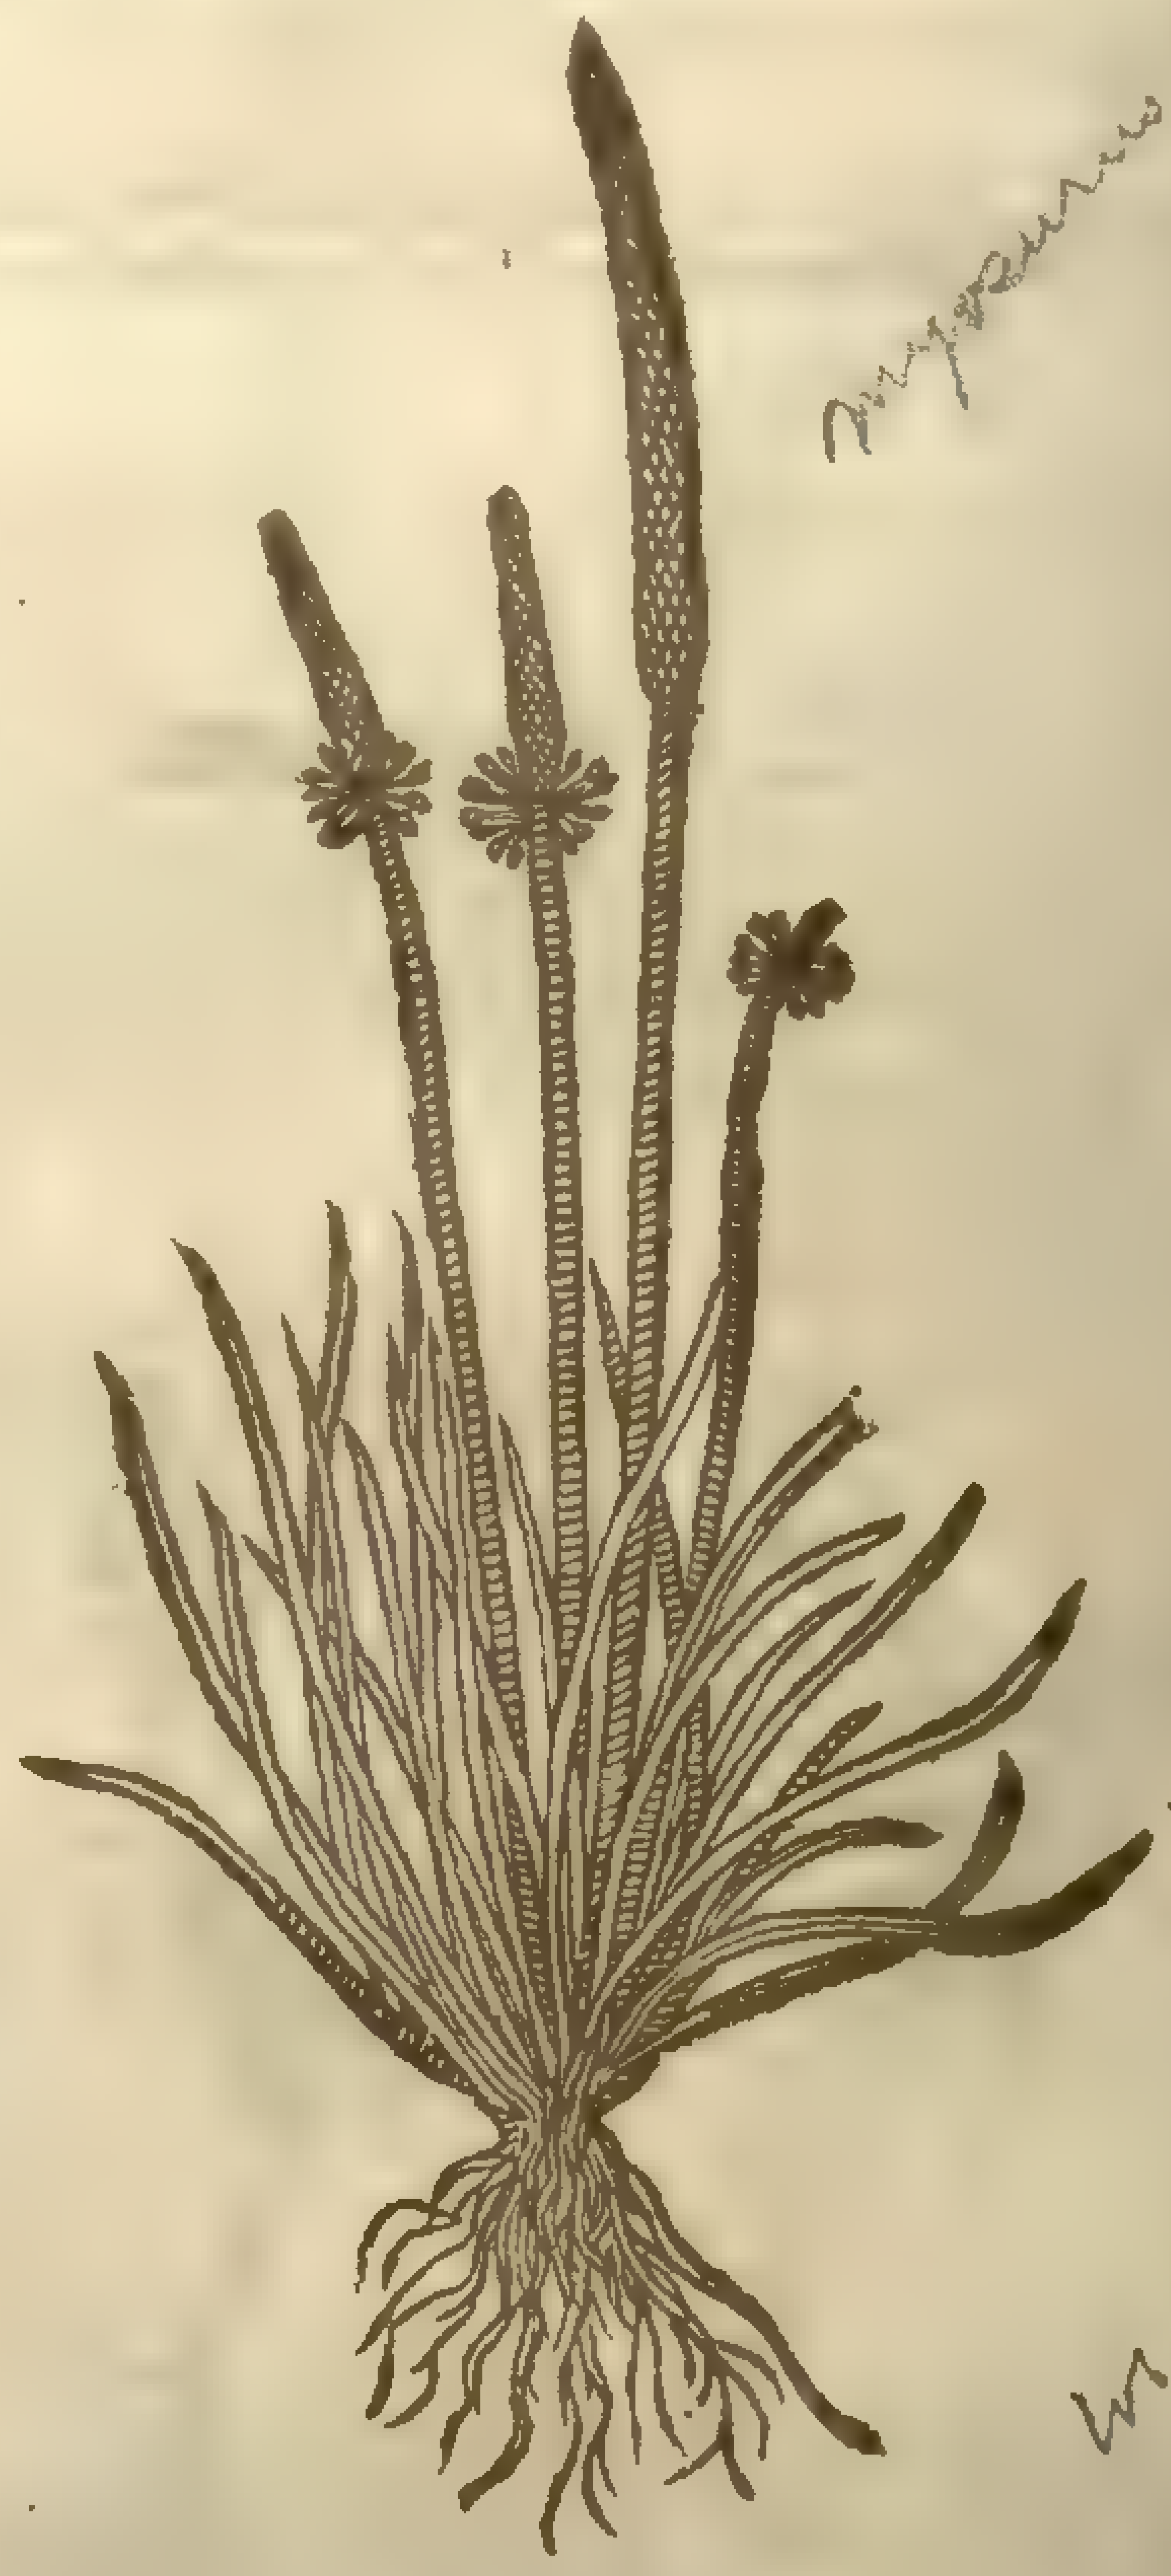
3 *Coronopus, ſiue Serpentina minima.*
Small Buck-horne Plantaine.

Plantago [illegible]



4 *Cauda Muris.*
Mouſe-taile.

Myosurus minimus



3 This ſmall ſea plant is likewiſe one of the kindes of ſea Plantaine, participating as well of Buck-horne as of *Holoſtium*, being as it were a degenerate kinde of ſea Plantaine. It hath many graſſie leaues very like vnto the herbe Thrift, but much ſmaller; among which come forth little tender foot-ſtalkes, whereon doe grow ſmall ſpikie knobs like thoſe of ſea Plantaine. The root is tough and threddy.

4 Mouſe-taile or *Cauda muris* reſembleth the laſt kinde of wilde *Coronopus* or ſea Plantaine, in ſmall ſpikie knobs, leaues, and ſtalkes, that I know no reaſon to the contrary, but that I may as well place this ſmall herbe among the kindes of *Coronopus* or Bucks-horne, as other writers haue placed kindes of *Holoſtium* in the ſame ſection: and if that be pardonable in them, I truſt this may be tolerable in me, conſidering that without controuerſie this little and baſe herbe is a kinde of *Holoſtium*, hauing many ſmall graſſie leaues ſpred on the ground, an inch long or ſomewhat more: among which doe riſe ſmall tender naked ſtalkes of two inches long, bearing at the top a little blackiſh torch or ſpikie knob in ſhape like that of the Plantains, reſembling very notably the taile of a Mouſe, whereof it tooke his name. The root is ſmall and threddy.

¶ *The Place.*

The firſt and ſecond of theſe plants are ſtrangers in England; notwithſtanding I haue heard ſay that they grow vpon the rocks in Silley, Garnſey, and the Iſle of man.

Mouſe-taile groweth vpon a barren ditch banke neere vnto a gate leading into a paſture on the right hand of the way, as ye go from London to a Village called Hampſtead; in a field as you goe from Edmonton (a village neer London) vnto a houſe thereby called Pims, by the foot-paths ſides; in Woodford Row in Waltham Forreſt, and in the Orchard belonging to Mr *Francis Whetſtone* in Eſſex, and in other places.

¶ *The Time.*

They floure and flouriſh in May and Iune.

¶ *The Names.*

Matthiolus writeth, That the people of Goritia doe commonly call theſe two former plants *Serpentaria* and *Serpentina*; but vnproperly, for that there be other plants which may better be called *Serpentina* than theſe two: we may call them in Engliſh, wild ſea Plantaine, whereof doubtleſſe they are kindes.

Mouſe-taile is called in Latine, *Cauda muris*, and *Cauda murina*: in Greeke, μύουρος, or μυὸς οὐρά. *Myoſuros* is called of the French-men, *Queue de ſouris*: in Engliſh, Bloud-ſtrange, and Mouſe-taile.

¶ *The Temperature.*

Coronopus is cold and dry much like vnto the Plantaine. Mouſe-taile is cold and ſomething drying, with a kinde of aſtriction or binding quality.

¶ *The Vertues.*

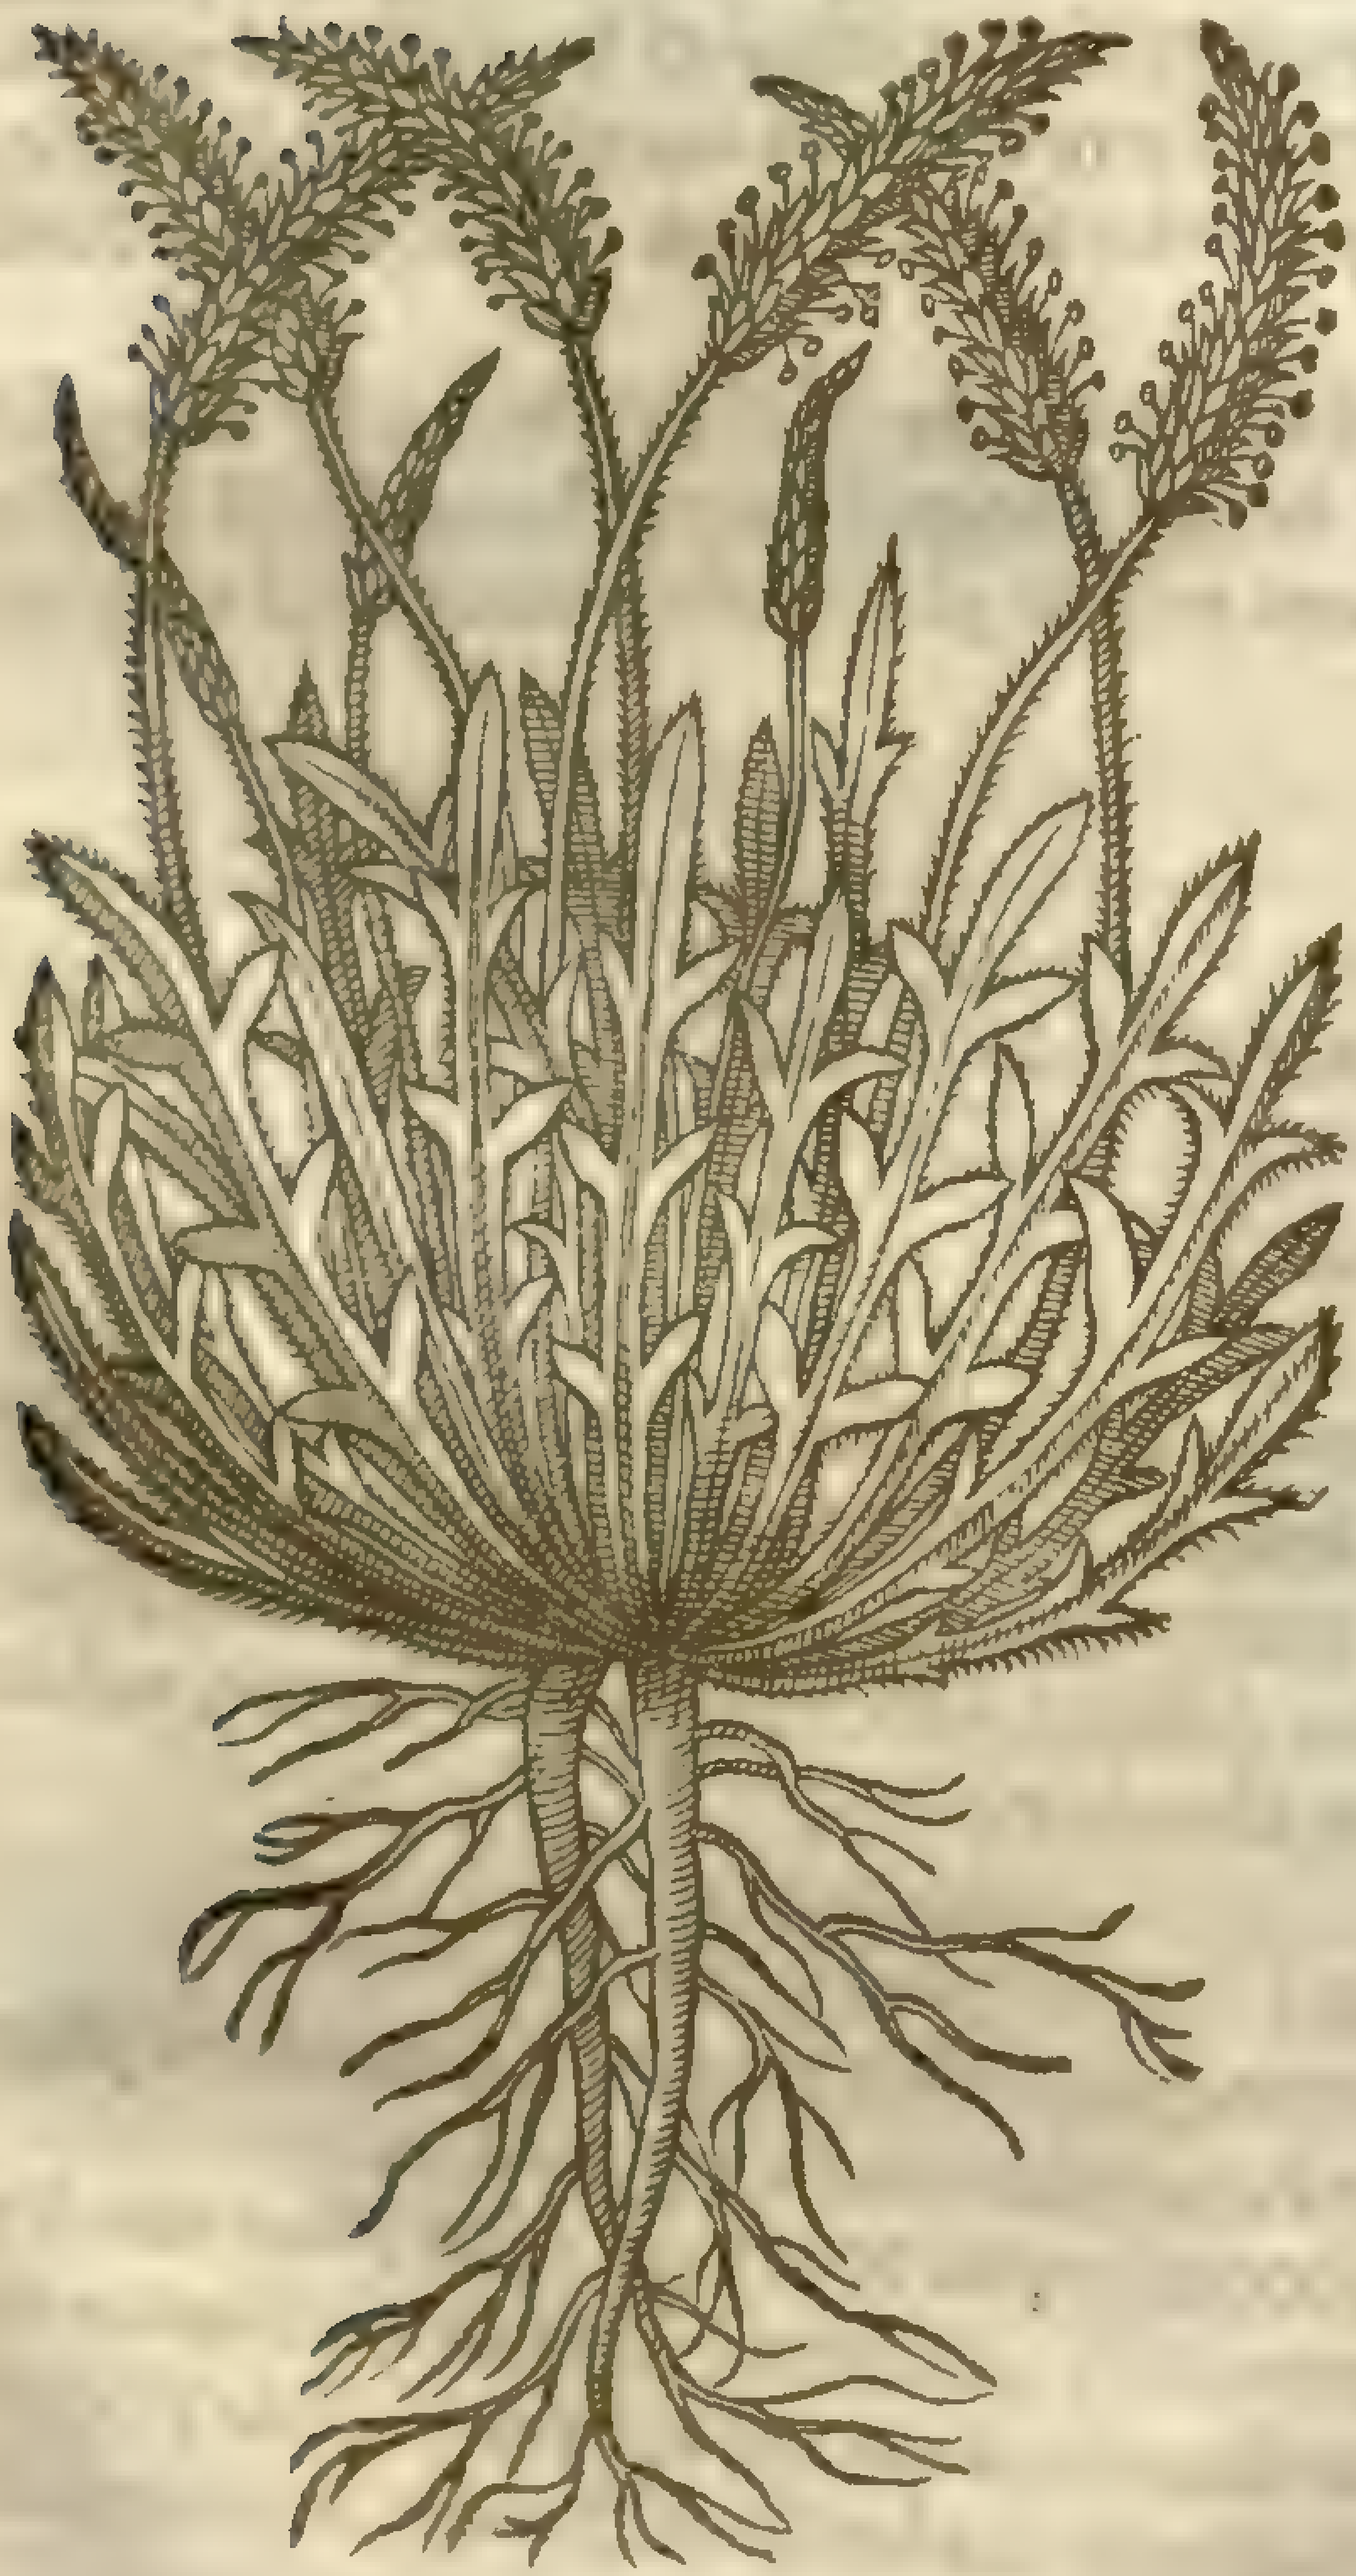
Their faculties in working are referred vnto the Plantaines and Harts-horne.

CHAP. 101.

Of Bucke-horne Plantaines, or Harts-horne.

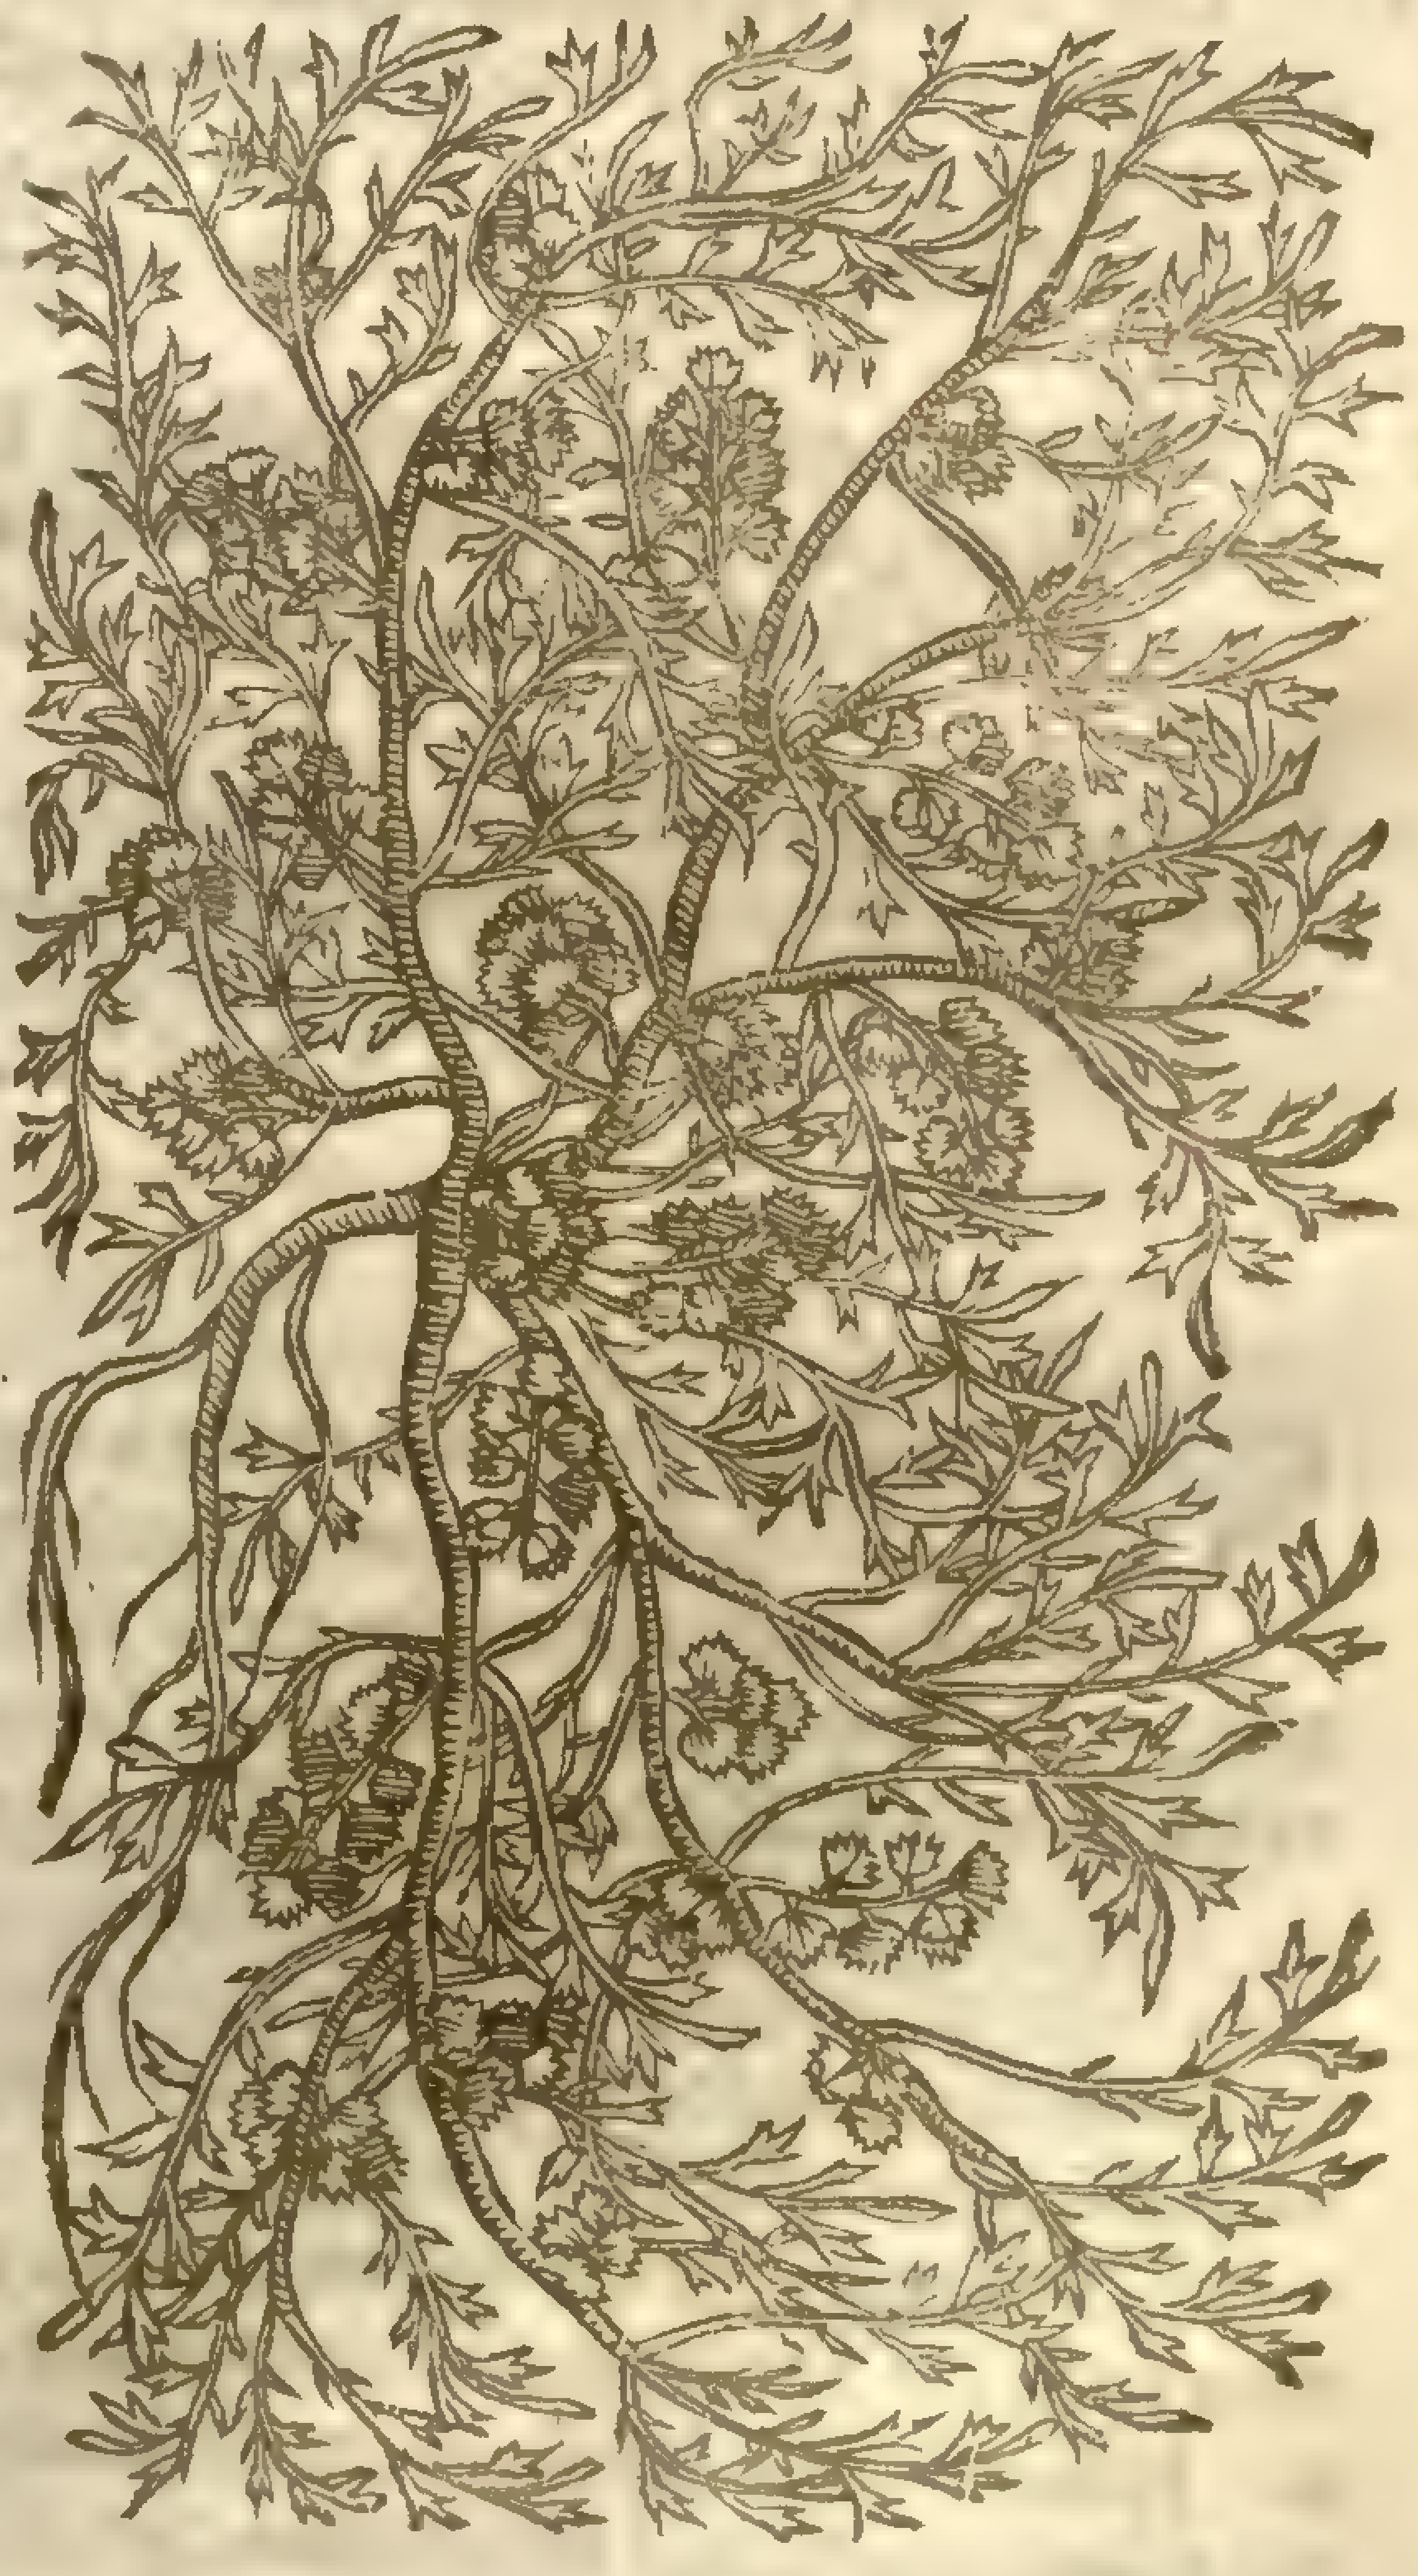
1 *Cornu Ceruinum.*
Harts-horne,

Plantago coronopus. Linn. dict. Sm. fl.



2 *Coronopus Ruellij.*
Swines Creſſes, or Bucks-horne.

Lob. ic. 438



Cochlearia coronopus. Linn. dict. Sm. fl. 3. [illegible]

¶ *The Deſcription.*

1 Bucks-horne or Harts-horne hath long narrow hoary leaues, cut on both the ſides with three or foure ſhort ſtarts or knags, reſembling the branches of an harts horne, ſpreading it ſelfe on the ground like a ſtar: from the middle whereof ſpring vp ſmall round naked hairy ſtalkes; at the top whereof do grow little knops or ſpikie torches like thoſe of the ſmall Plantaines. The root is ſlender and threddy.

2 *Ruellius* Bucks-horne or Swines Creſſes hath many ſmall and weake ſtragling branches, trailing here and there vpon the ground, ſet with many ſmall cut or jagged leaues, ſomewhat like the former, but ſmaller, and nothing at all hairy as is the other. The floures grow among the leaues, in ſmall rough cluſters, of a whitiſh colour: which being paſt, there come in place little flat pouches broad and rough, in which the ſeed is contained. The root is white, threddy, and in taſte like the garden Creſſes.

¶ *The Place.*

They grow in barren plaines, and vntilled places, and ſandy grounds; as in Touthill field neere vnto Weſtminſter, at Waltham twelue miles from London, and vpon Blackeheath alſo neere London.

¶ *The Time.*

They floure and flouriſh when the Plantaines doe, whereof theſe ſame haue beene taken to be kindes.

¶ *The Names.*

Bucks-horne is called in Latine *Cornu Ceruinum*, or Harts-horne: diuers name it *Herba ſtella*: or *Stellaria* although there be another herbe ſo called: in low Dutch, **Hertzhooren**: in Spaniſh, *Guiabella*: in French, *Corne de Cerf*: It is thought to be *Dioſcorides* his κορωνόπους, which doth ſignifie *cornicis pedem*, a Crowes foot. It is called alſo by certaine baſtard names, as *Harenaria*, *Sanguinaria*: and of many, Herbe Iuy, or herbe Eue.

¶ *The Temperature.*

Bucks-horne is like in temperature to the common Plantaine, in that it bindeth, cooleth, and drieth.

¶ *The Vertues.*

A The leaues of Buckes-horne boyled in drinke, and giuen morning and euening for certaine daies together, helpe moſt wonderfully thoſe that haue ſore eies, watery or blaſted, and moſt of the griefes that happen vnto the eyes; experimented by a learned Phyſition of Colcheſter called Maſter *Duke*; and the like by an excellent Apothecary of the ſame Towne called Maſter *Buckſtone*.

B The leaues and roots ſtamped with Bay ſalt, and tied to the wreſts of the armes, take away fits of the Ague: and it is reported to worke the like effect being hanged about the necke of the Patient in a certaine number; as vnto men nine plants, roots and all; and vnto women and children ſeuen.

CHAP. 102. *Of Saracens Conſound.*

¶ *The Deſcription.*

SAracens Conſound hath many long narrow leaues cut or ſlightly ſnipt about the edges: among which riſe vp faire browne hollow ſtalkes of the height of foure cubits; along which euen from the bottome to the top it is ſet with long and pretty large leaues like them of the Peach tree: at the top of the ſtalkes grow faire ſtarre-like yellow floures, which turne into downe, and are carried away with the winde. The root is very fibrous or threddy.

¶ *The Place.*

Saracens Conſound groweth by a wood as ye ride from great Dunmow in Eſſex, vnto a place called Clare in the ſaid country; from whence I brought ſome plants into my garden.

‡ I formerly in the twenty fourth Chapter of this ſecond booke told you what plant our Author took for Saracens Conſound, and (as I haue beene credibly informed) kept in his Garden for it. Now the true *Solidago* here deſcribed and figured was found *Anno* 1632, by my kinde Friends M^r^ *George Bowles* and M^r^ *William Coot*, in Shropſhire in Wales, in the hedge in the way as one goeth from Dudſon in the pariſh of Cherberry to Guarthlow. ‡

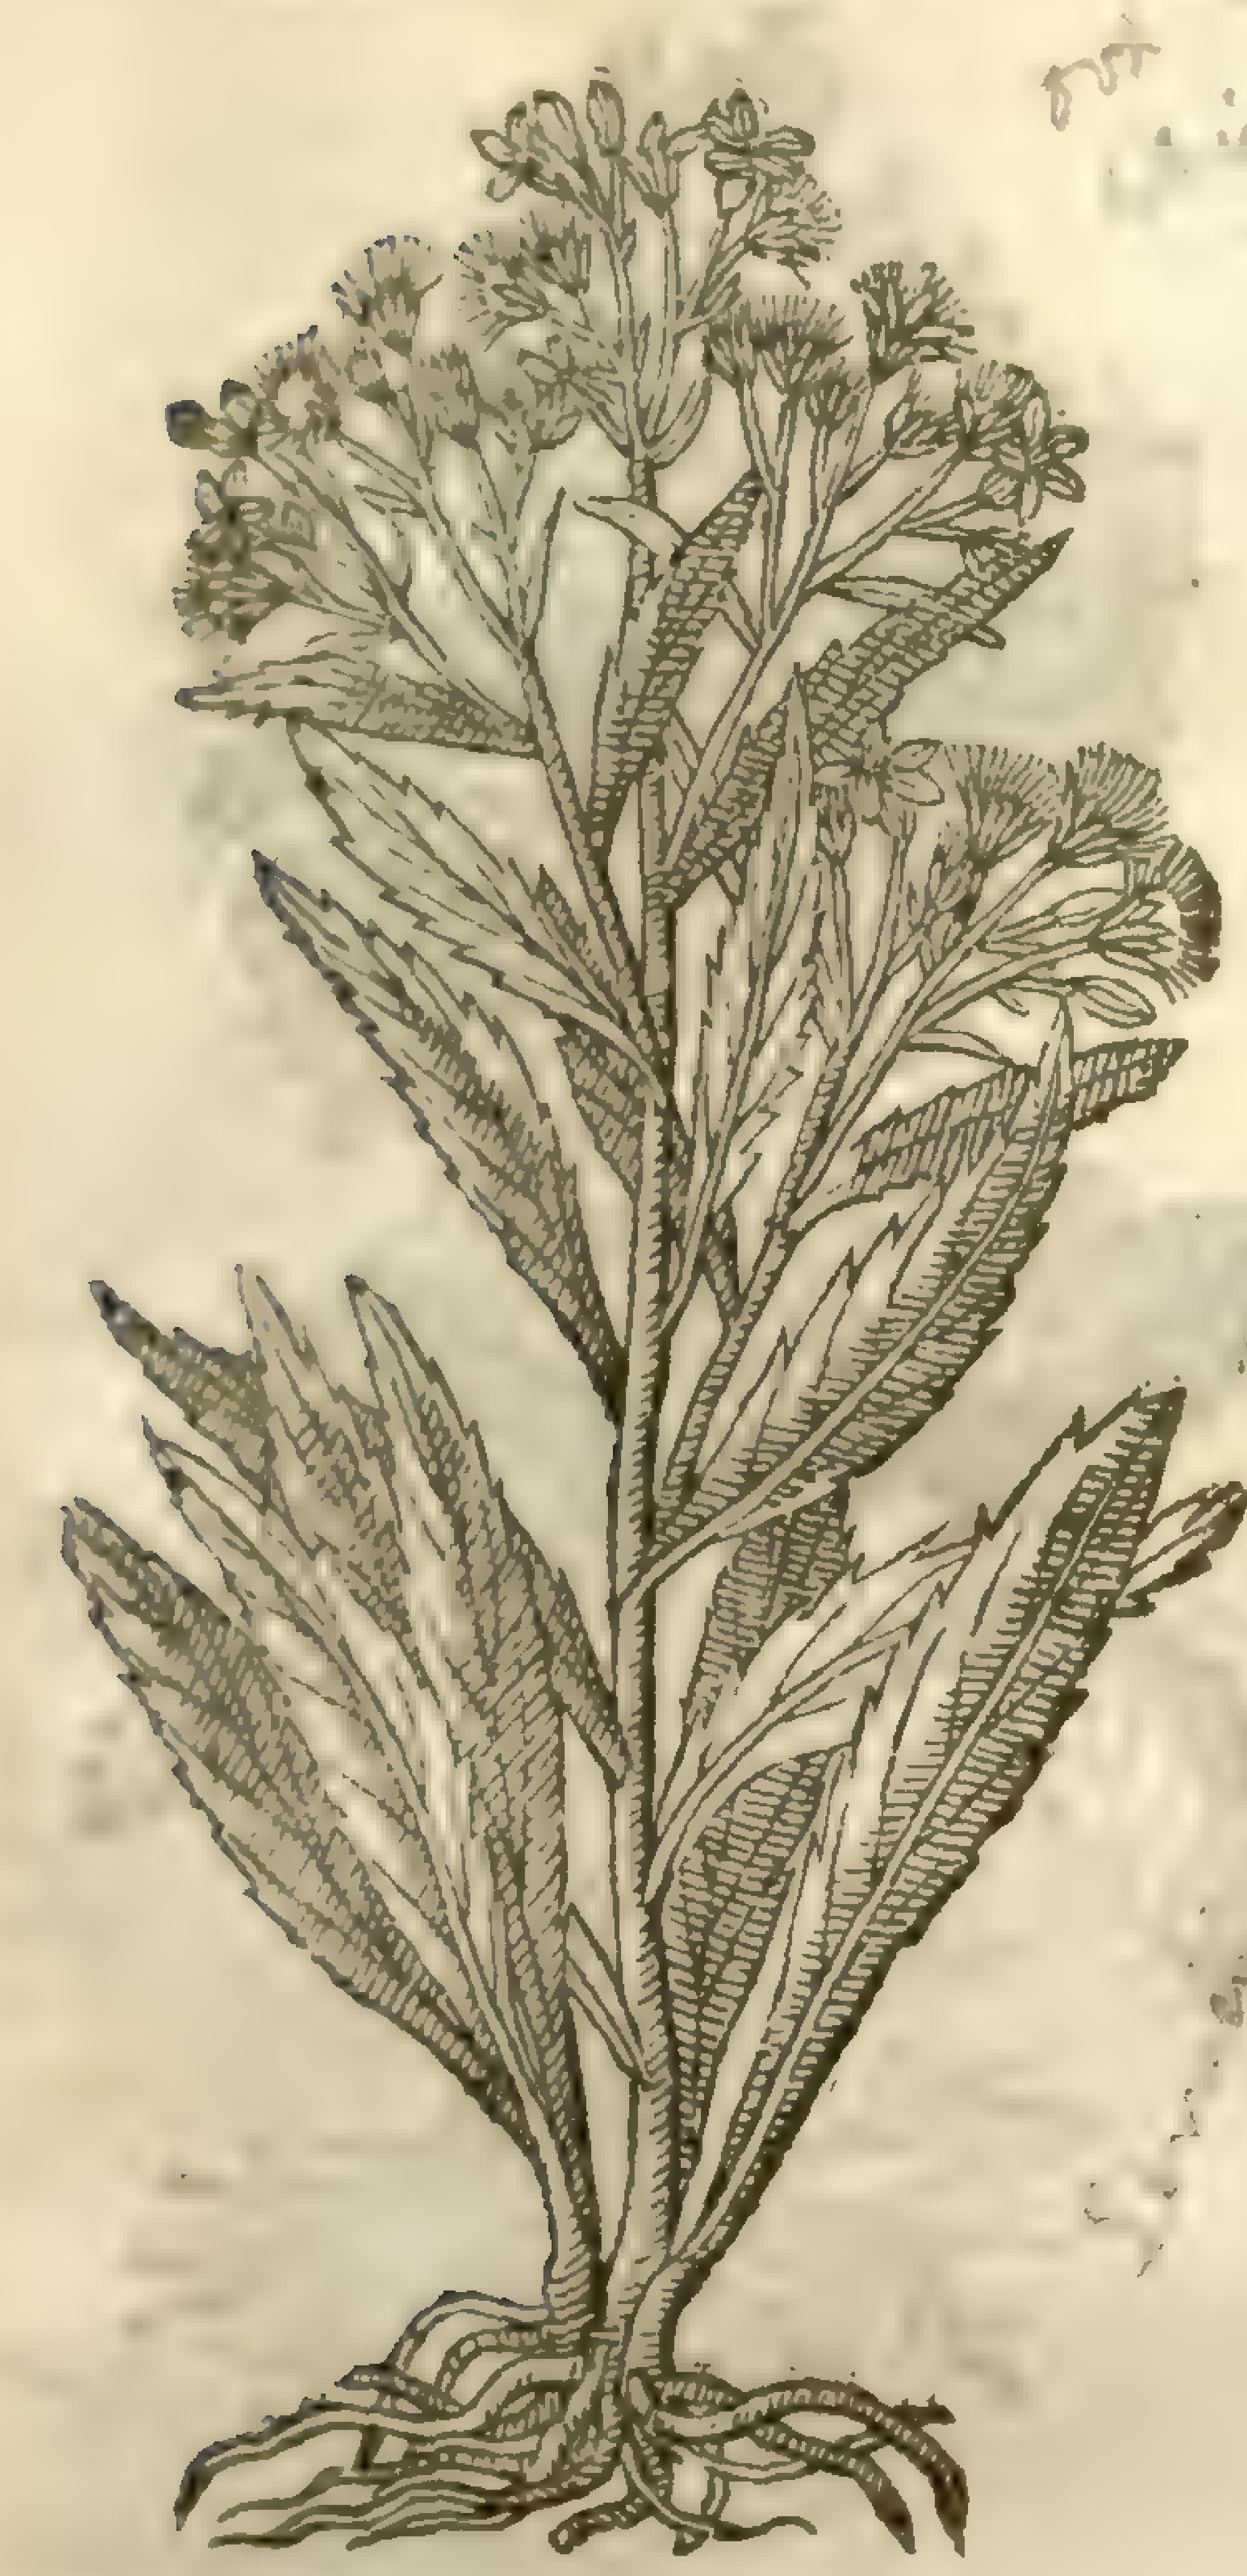
¶ *The Time.*

It floureth in Iuly, and the ſeed is ripe in Auguſt.

¶ *The Names.*

Saracens Conſound is called in Latine *Solidago Saracenica*, or Saracens Comfrey, and *Conſolida Saracenica* in Dutch, **Heidniſch wundtkraut**: of ſome, *Herba fortis*: in Engliſh, Saracens Conſound, or Saracens Wound-wort.

† *Solidago Saracenica.*
Saracens Conſound.



¶ *The Nature.*

Saracens Conſound is dry in the third degree, with ſome maniſeſt heate.

¶ *The Vertues.*

A Saracens Conſound is not inferiour to any of the wound-herbes whatſoeuer, being inwardly miniſtred, or outwardly applied in ointments or oyles. With it I cured Maſter *Cartwright* a Gentleman of Grayes Inne, who was grieuouſly wounded into the lungs, and that by Gods permiſſion in ſhort ſpace.

B The leaues boiled in water and drunke, reſtraine and ſtay the waſting of the liuer, take away the opilation and ſtopping of the ſame, and profit againſt the iaundice and Feuers of long continuace.

C The decoction of the leaues made in water is excellent againſt the ſoreneſſe of the throat, if it be therewith gargariſed: it increaſeth alſo the vertue and force of lotion or waſhing waters, appropriat for priuy maimes, ſore mouthes, and ſuch like, if it be mixed therewith.

† The figure that was formerly in this place was of *Conſolida paluſtris* of *Tabernamontanus*; and the true figure belonging to this hiſtory was in the next chapter ſaue one, vnder the title of *Herba Dorea Lobelii.*

CHAP. 103. *Of Golden Rod.*

¶ *The Deſcription.*

1 GOlden Rod hath long broad leaues ſomewhat hoary and ſharpe pointed; among which riſe vp browne ſtalkes two foot high, diuiding themſelues toward the top into ſundry branches, charged or loden with ſmall yellow floures; which when they be ripe turn into downe which is carried away with the winde. The root is threddy and browne of colour. † *Lobel* makes this with vnſnipt leaues to be that of *Arnoldus de villa noua.* ‡

2 The ſecond ſort of Golden Rod hath ſmall thin leaues broader than thoſe of the firſt deſcribed, ſmooth, with ſome few cuts or nickes about the edges, and ſharpe pointed, of a hot and harſh taſte in the throat being chewed; which leaues are ſet vpon a faire reddiſh ſtalke. It tooke his name from the floures which grow at the top of a gold yellow colour: which floures turne into Downe, which is carryed away with the winde as is the former. The root is ſmall, compact of many ſtrings or threds.

¶ *The Place.*

They both grow plentifully in Hampſtead Wood, neere vnto the gate that leadeth out of the wood vnto a Village called Kentiſh towne, not far from London; in a wood by Rayleigh in Eſſex, hard by a Gentlemans houſe called Mr *Leonard*, dwelling vpon Dawes heath; in Southfleet and in Swaineſcombe wood alſo, neere vnto Graueſend.

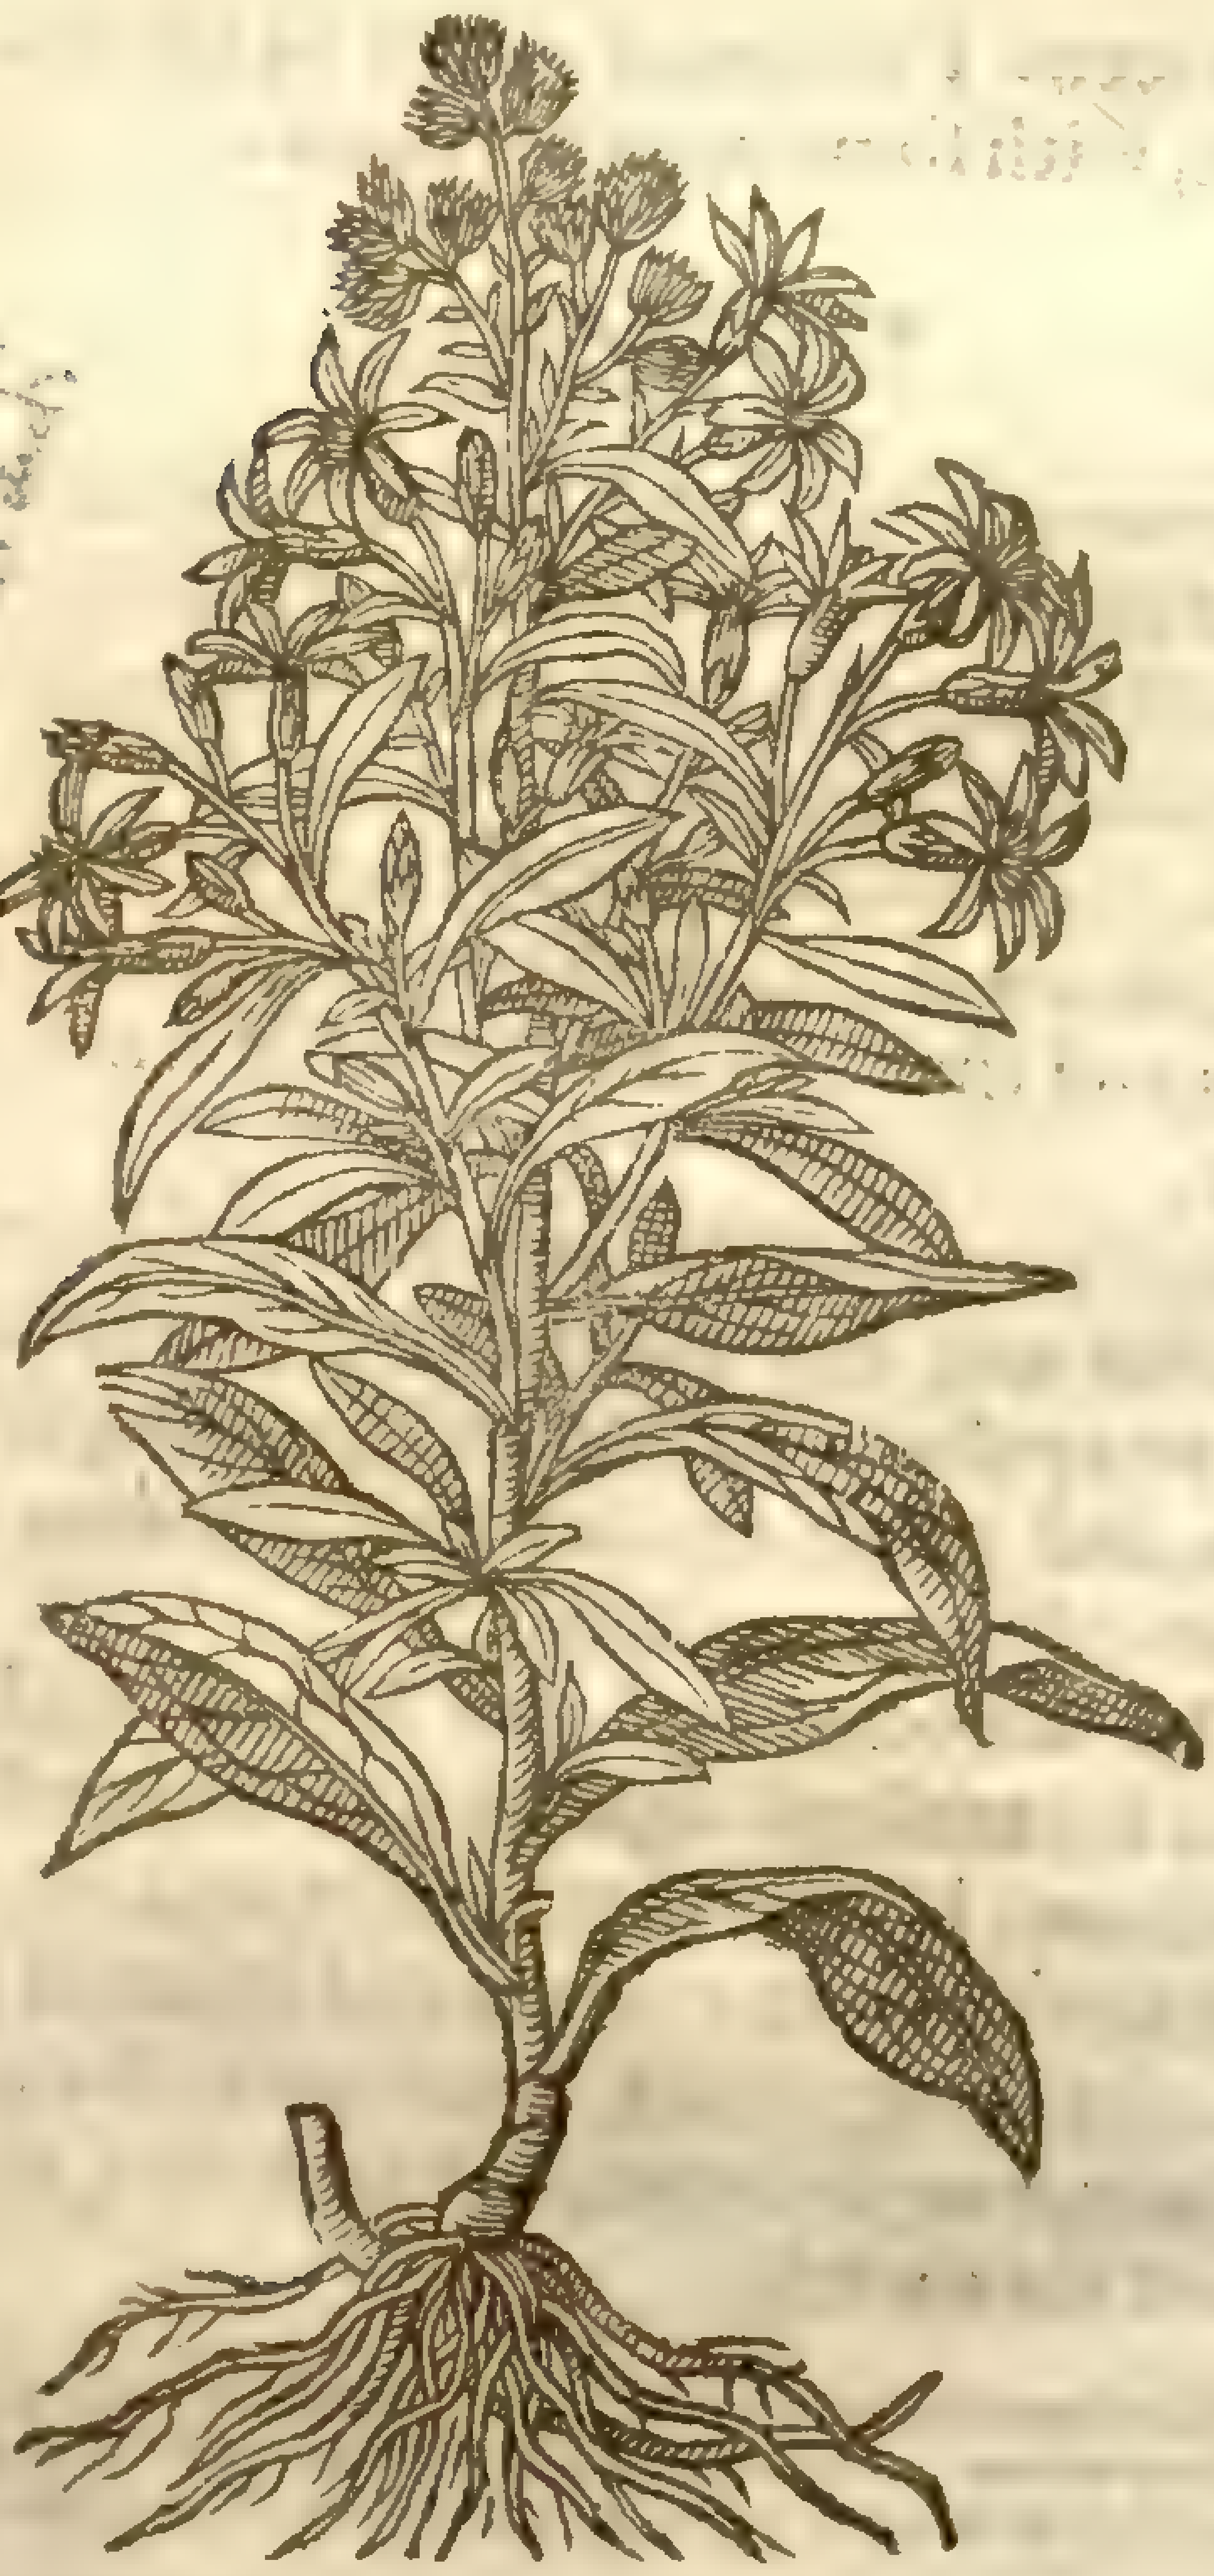
¶ *The Place.*

They floure and flouriſh in the end of Auguſt.

¶ *The Names.*

It is called in Engliſh, Golden Rod: in Latine, *Virga aurea*, becauſe the branches are like a Golden Rod: in Dutch, **Gulden roede**: in French, *Verge d'or.*

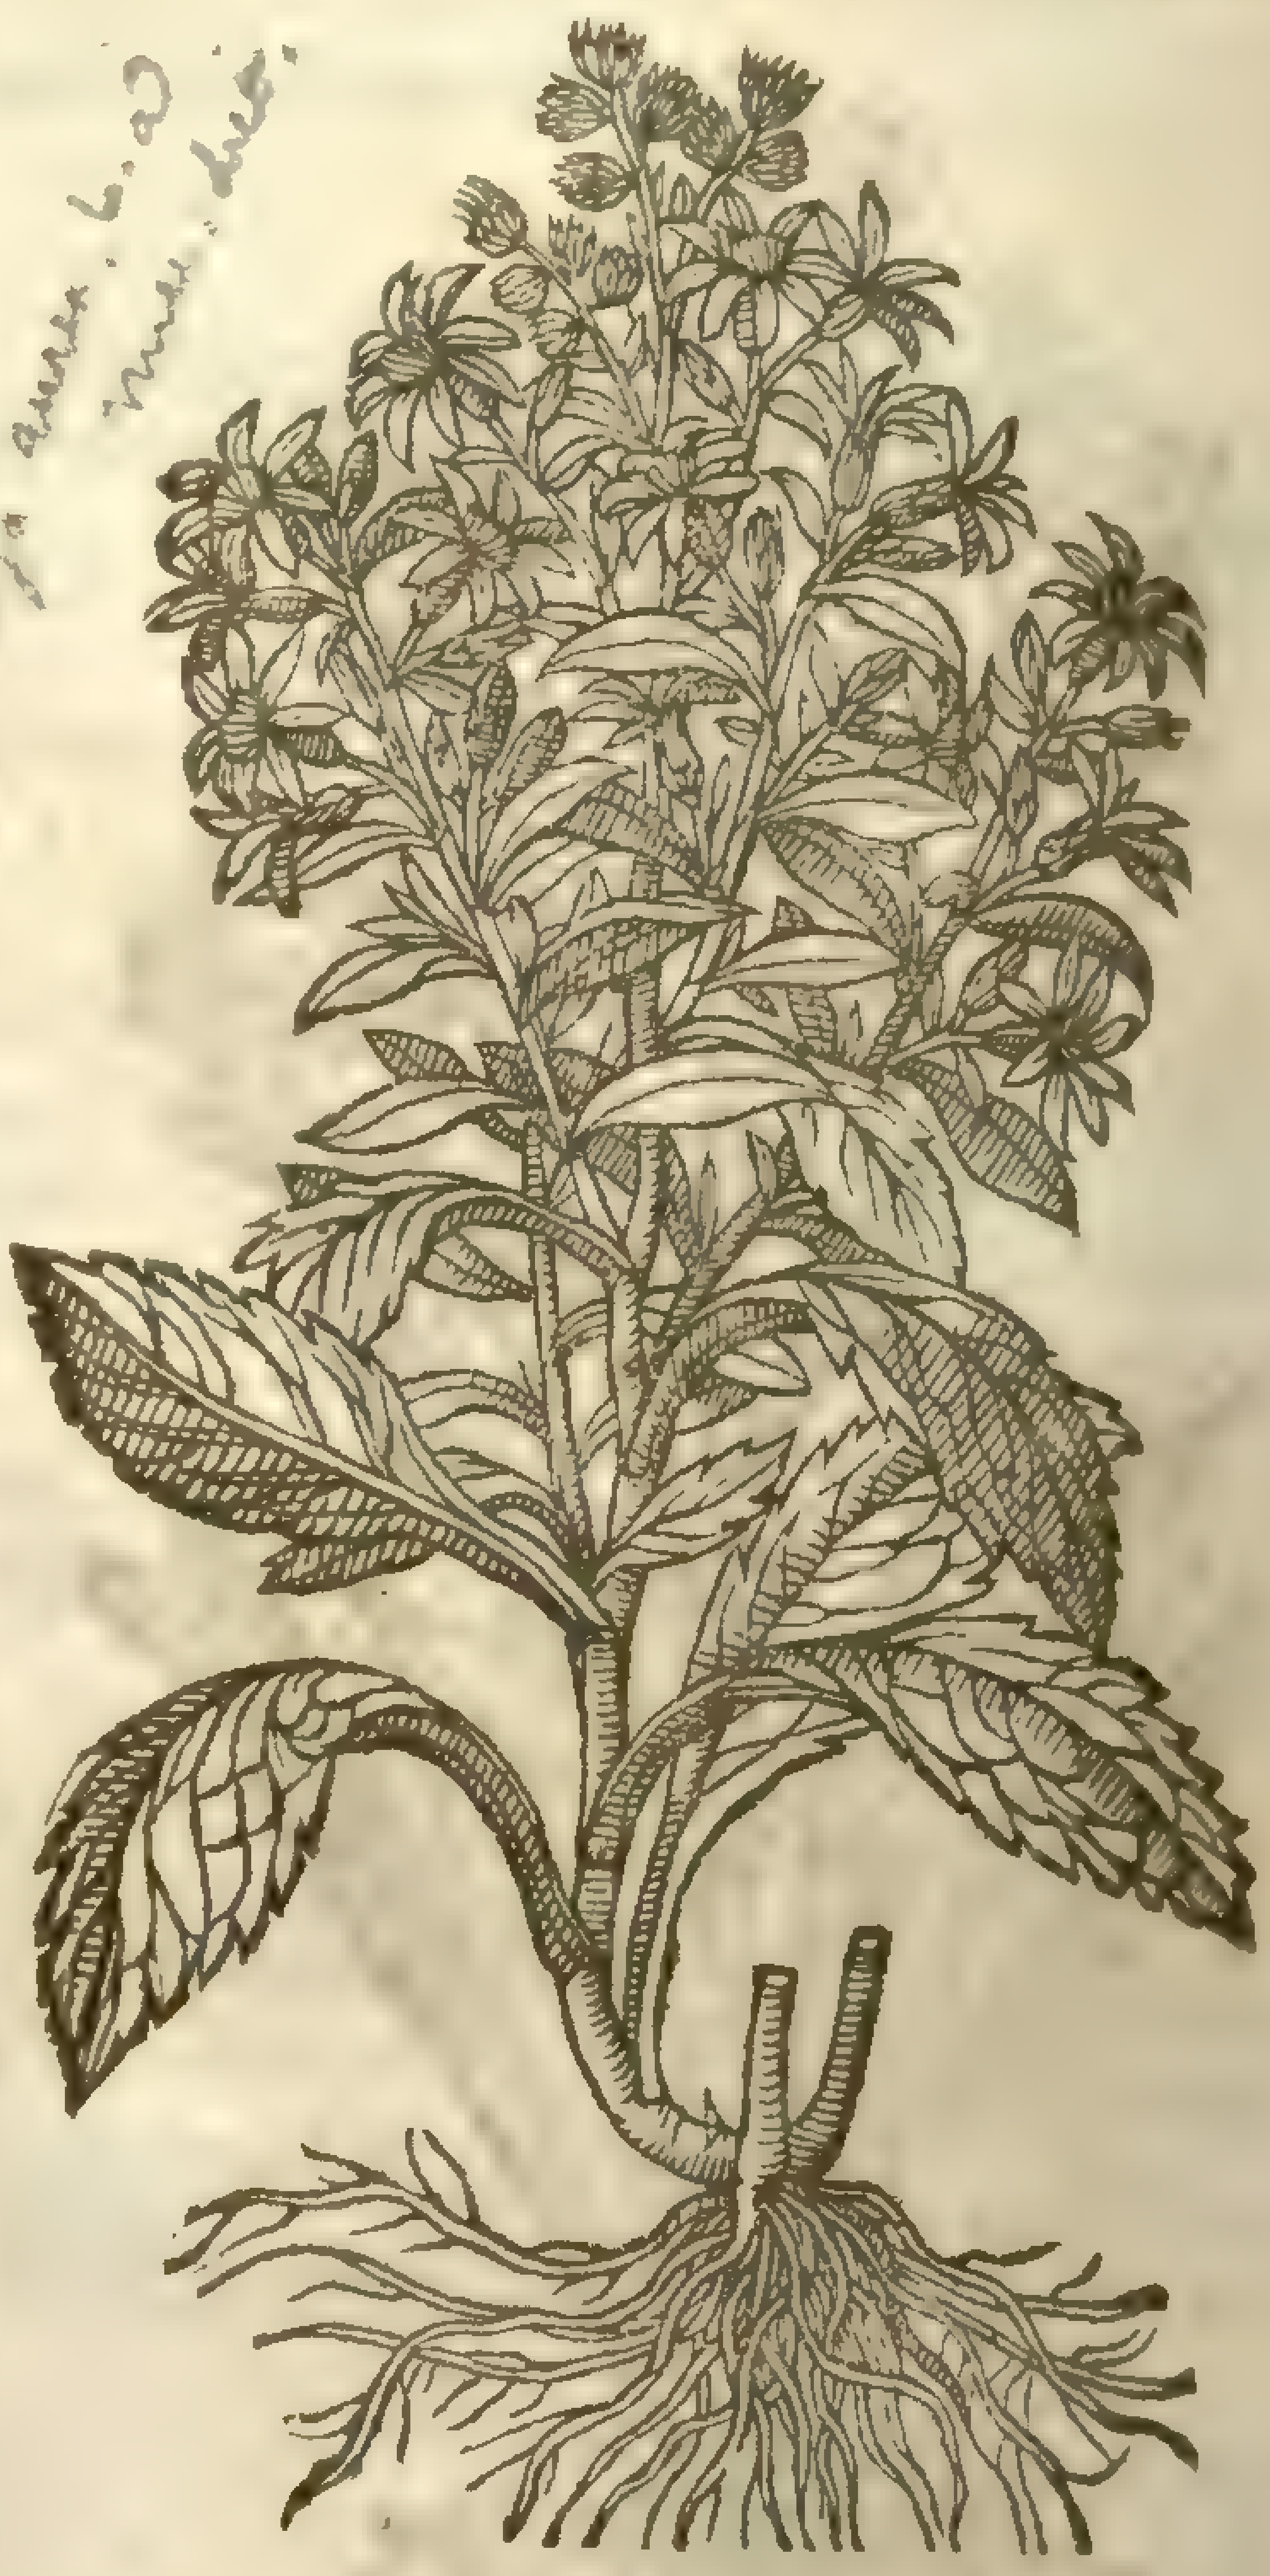
1 *Virga aurea.*
Golden Rod.



Solidago virga aurea [illegible]

S. virgaurea [illegible]

2 *Virga aurea Arnoldi Villanouani.*
Arnold of the new towne his Golden Rod



Solidago virga aurea [illegible]

¶ *The Temperature.*

Golden Rod is hot and dry in the ſecond degree: it clenſeth, with a certaine aſtriction or binding quality.

¶ *The Vertues.*

A Golden Rod prouoketh vrine, waſteth away the ſtones in the kidnies, and expelleth them, and withall bringeth downe tough and raw flegmatick humors ſticking in the vrine veſſels, which now and then do hinder the comming away of the ſtones, and cauſeth the grauell or ſand which is brittle to be gathered together into one ſtone. And therefore *Arnoldus Villanouanus* by good reaſon hath commended it againſt the ſtone and paine of the kidnies.

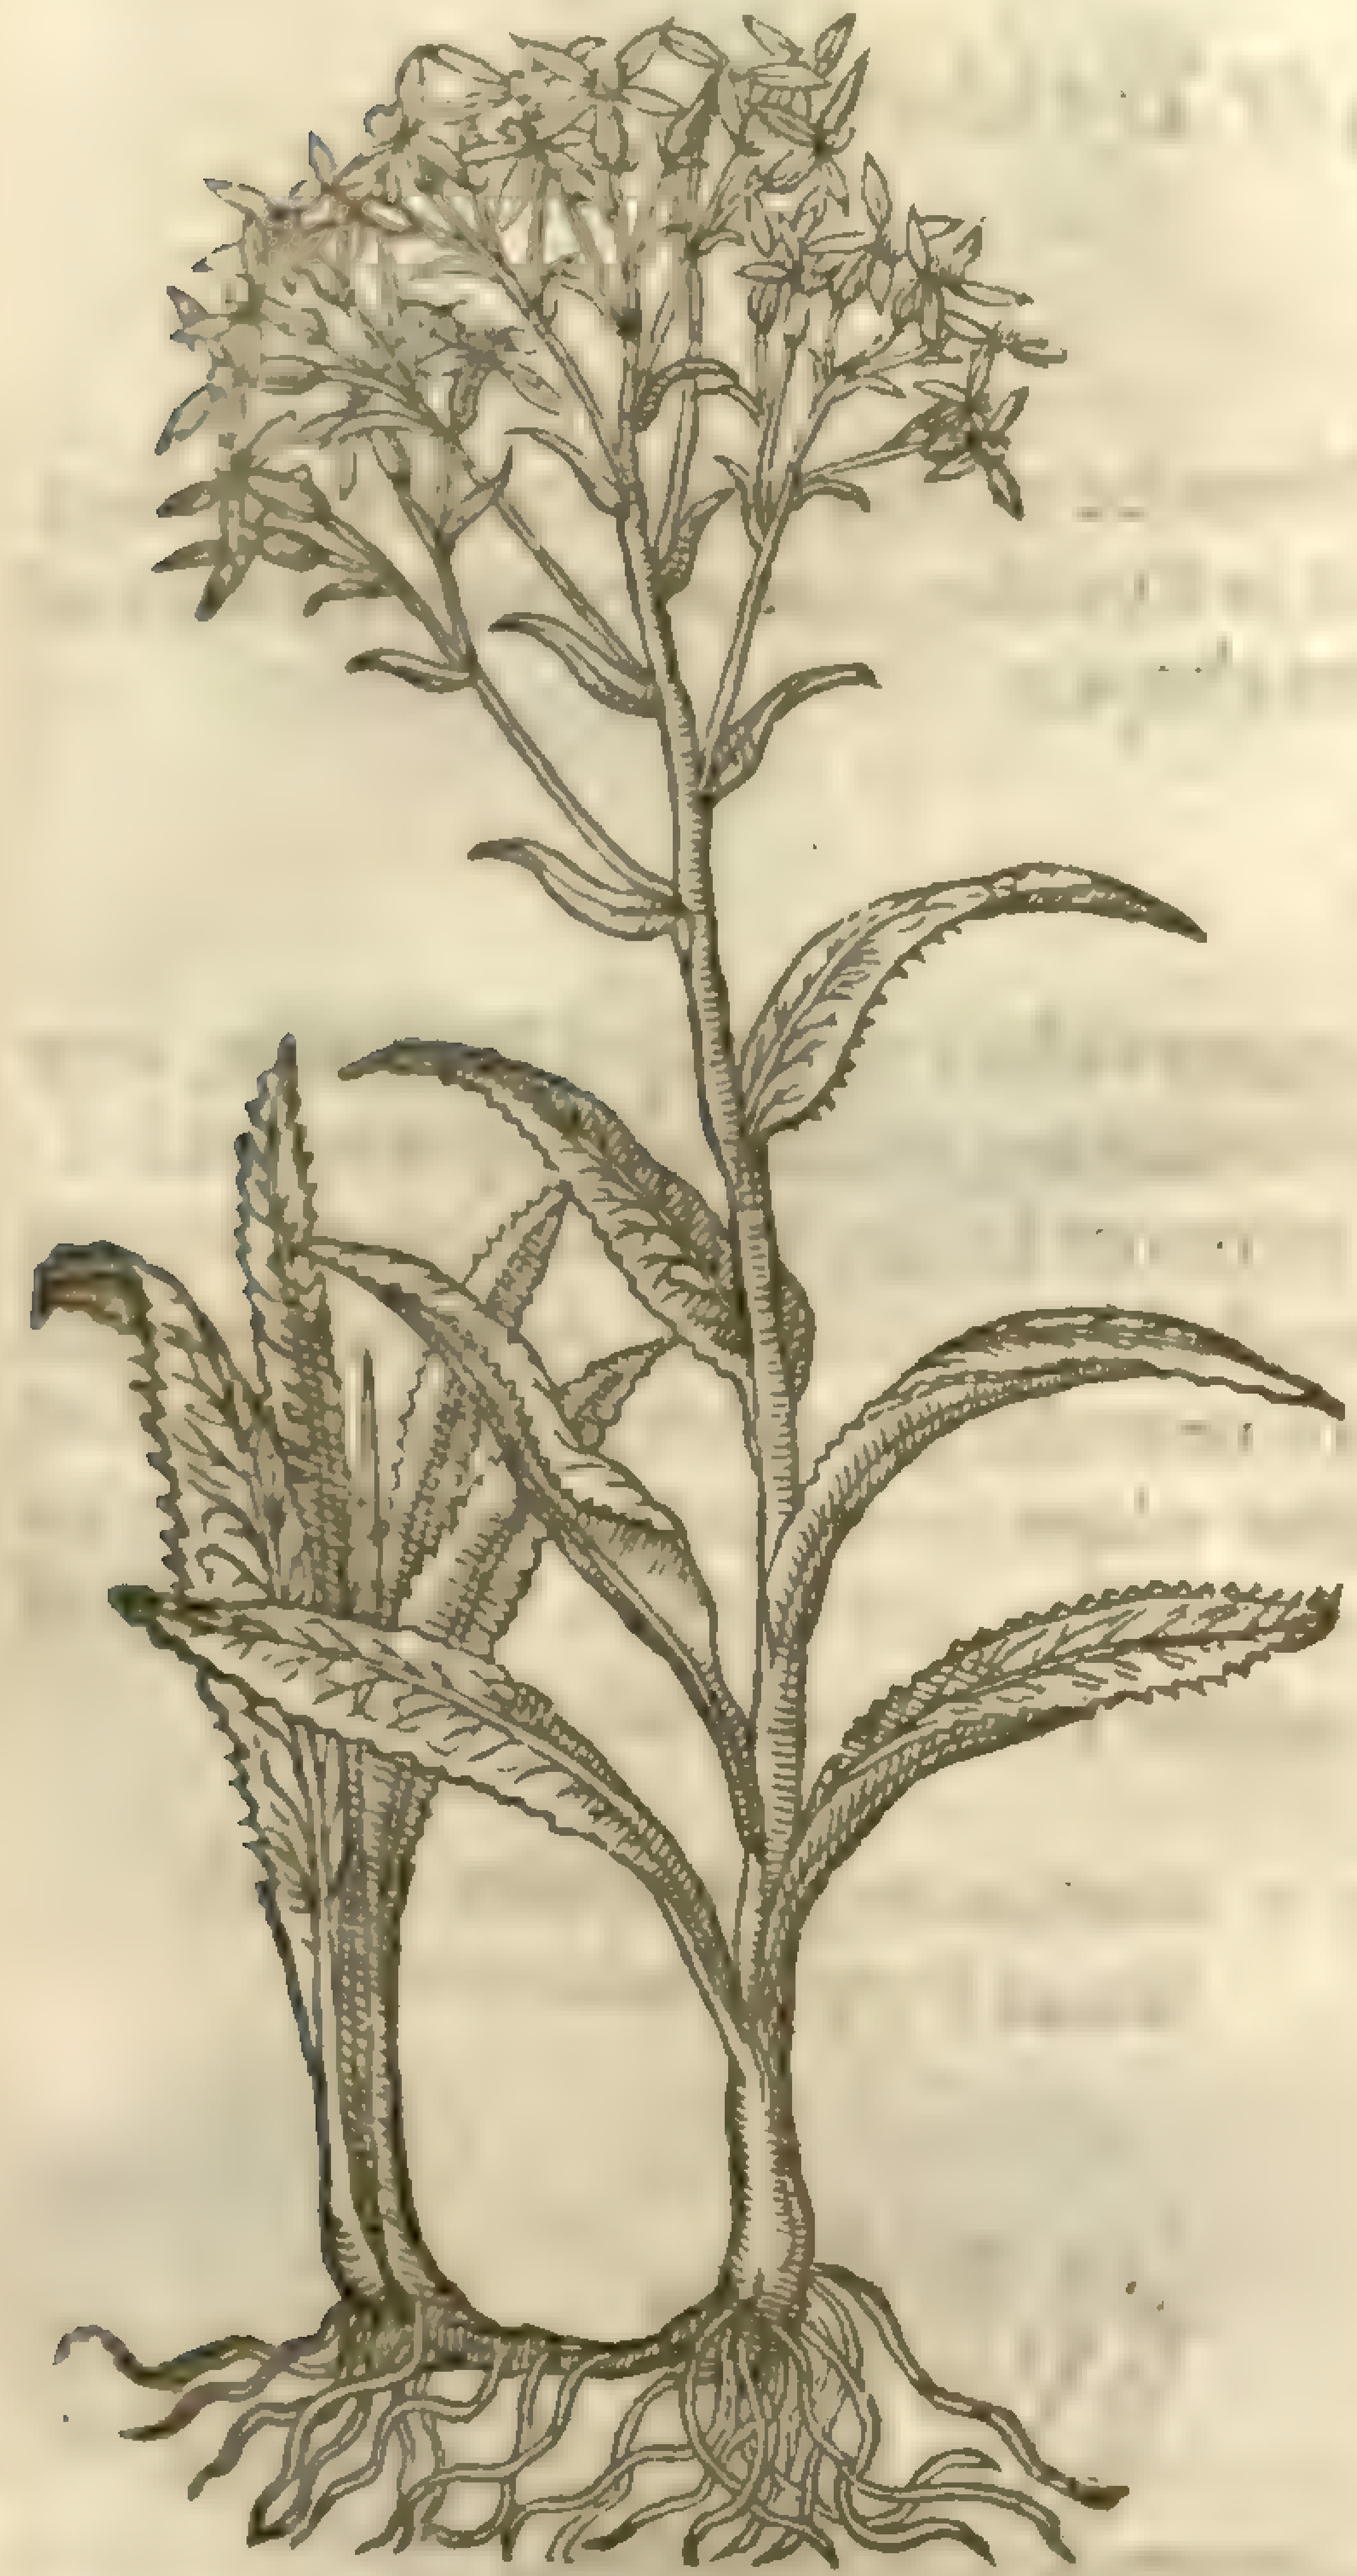
B It is of the number of thoſe plants that ſerue for wound-drinkes, and is reported that it can fully performe all thoſe things that Saracens conſound can; and in my practiſe ſhall be placed in the formoſt ranke.

C *Arnoldus* writeth, That the diſtilled water drunke with wine for ſome few daies together, worketh the ſame effect, that is, for the ſtone and grauell in the kidnies.

D It is extolled aboue all other herbes for the ſtopping of bloud in ſanguinolent vlcers and bleeding wounds; and hath in times paſt beene had in great eſtimation and regard than in theſe daies: for in my remembrance I haue known the dry herbe which came from beyond the ſea ſold in Bucklers bury in London for halfe a crowne an ounce. But ſince it was found in Hampſtead wood, euen as it were at our townes end, no man will giue halfe a crowne for an hundred weight of it: which plainely ſetteth forth our inconſtancie and ſudden mutabilitie, eſteeming no longer of any thing, how pretious ſoeuer it be, than whileſt it is ſtrange and rare. This verifieth our Engliſh prouerbe, Far fetcht and deare bought is beſt for Ladies. Yet it may be more truely ſaid of phantaſticall Phyſitions, who when they haue found an approued medicine and perfect remedy neere home againſt any diſeaſe; yet not content therewith, they will ſeeke for a new farther off, and by that meanes many times hurt more than they helpe. Thus much I haue ſpoken to bring theſe new fangled fellowes backe againe to eſteeme better of this admirable plant than they haue done, which no doubt haue the ſame vertue now that then it had, although it growes ſo neere our owne homes in neuer ſo great quantity.

CHAP. 104. *Of Captaine Andreas Dorias his Wound-woort.*

† *Herba Doria Lobelij.*
Dorias Wound-woort.



¶ *The Deſcription.*

This plant hath long and large thicke and fat leaues, ſharpe pointed, of a blewiſh greene like vnto Woad, which being broken with the hands hath a pretty ſpicie ſmell. Among theſe leaues riſeth vp a ſtalke of the height of a tall man, diuided at the top into many other branches, whereupon grow ſmall yellowiſh floures, which turneth into downe that flyeth away with the winde. The root is thicke almoſt like *Helleborus albus*.

Of which kinde there is another like the former, but that the leaues are rougher, ſomewhat bluntly indented at the edges, and not ſo fat and groſſe.

‡ *Herba Doria altera.*

This herbe growes vp with a greene round brittle ſtalke, very much chamfered, ſinewed, or furrowed, about foure or fiue foot high, full of white pith like that of Elder, and ſendeth forth ſmall branches: the leaues grow on the ſtalke out of order, and are ſmooth, ſharpe pointed, in ſhape like thoſe of *Herba Doria*, but much ſhorter and narrower, the broadeſt and longeſt ſeldome being aboue ten or eleuen inches long, and ſcarce two inches broad, and are more finely and ſmally nickt or indented about the edges; their ſmell being nothing pleaſant, but rather when together with the ſtalke they are broken and rubbed yeeld forth a ſmell hauing a ſmall touch of the ſmell of Hemlocke. Out of the boſomes of theſe leaues ſpring other ſmaller leaues or branches. The floures are many, and grow on ſmall branches at the tops of the ſtalkes like thoſe of *Herba Doria*, but more like thoſe of *Iacobæa*, of a yellow colour, as well the middle button, as the ſmall leaues that ſtand round about, euery floure hauing commonly eight of thoſe ſmall leaues. Which being paſt the button turneth into downe and containeth very ſmall long ſeeds which fly away with the wine. The root is nothing elſe but an infinite of ſmall ſtrings which moſt hurtfully ſpread in the ground, and by their infinite increaſing deſtroy and ſterue other herbes that grow neere it. Its naturall place of growing I know not; for I had it from M^{r} *Iohn Coys*, and yet keepe it growing in my garden. *Iohn Goodyer*. ‡

¶ *The Place.*

Theſe plants grow naturally about the borders or brinkes of riuers neere to Narbone in France, from whence they were brought into England, and are contented to be made denizons in my Garden, where they flouriſh to the height aforeſaid.

¶ *The Time.*

They floured in my Garden about the twelfth of Iune.

¶ *The Nature.*

The roots are ſweet in ſmell, and hot in the third degree.

¶ *The Vertues.*

Two drams of the roots of *Herba Doria* boiled in wine and giuen to drinke, draw downe wateriſh humors, and prouoke vrine. A

The ſame is with good ſucceſſe vſed in medicines that expell poyſon. B

‡ All theſe plants mentioned in the three laſt Chapters, to wit, *Solidago*, *Virga aurea* and this *Herba Dorea*, are by *Bauhine* fitly comprehended vnder the title of *Virga aurea*; becauſe they are much alike in ſhape, and for that they are all of the ſame facultie in medicine.

† The figure that was here was of *Solidago Saracenica*.

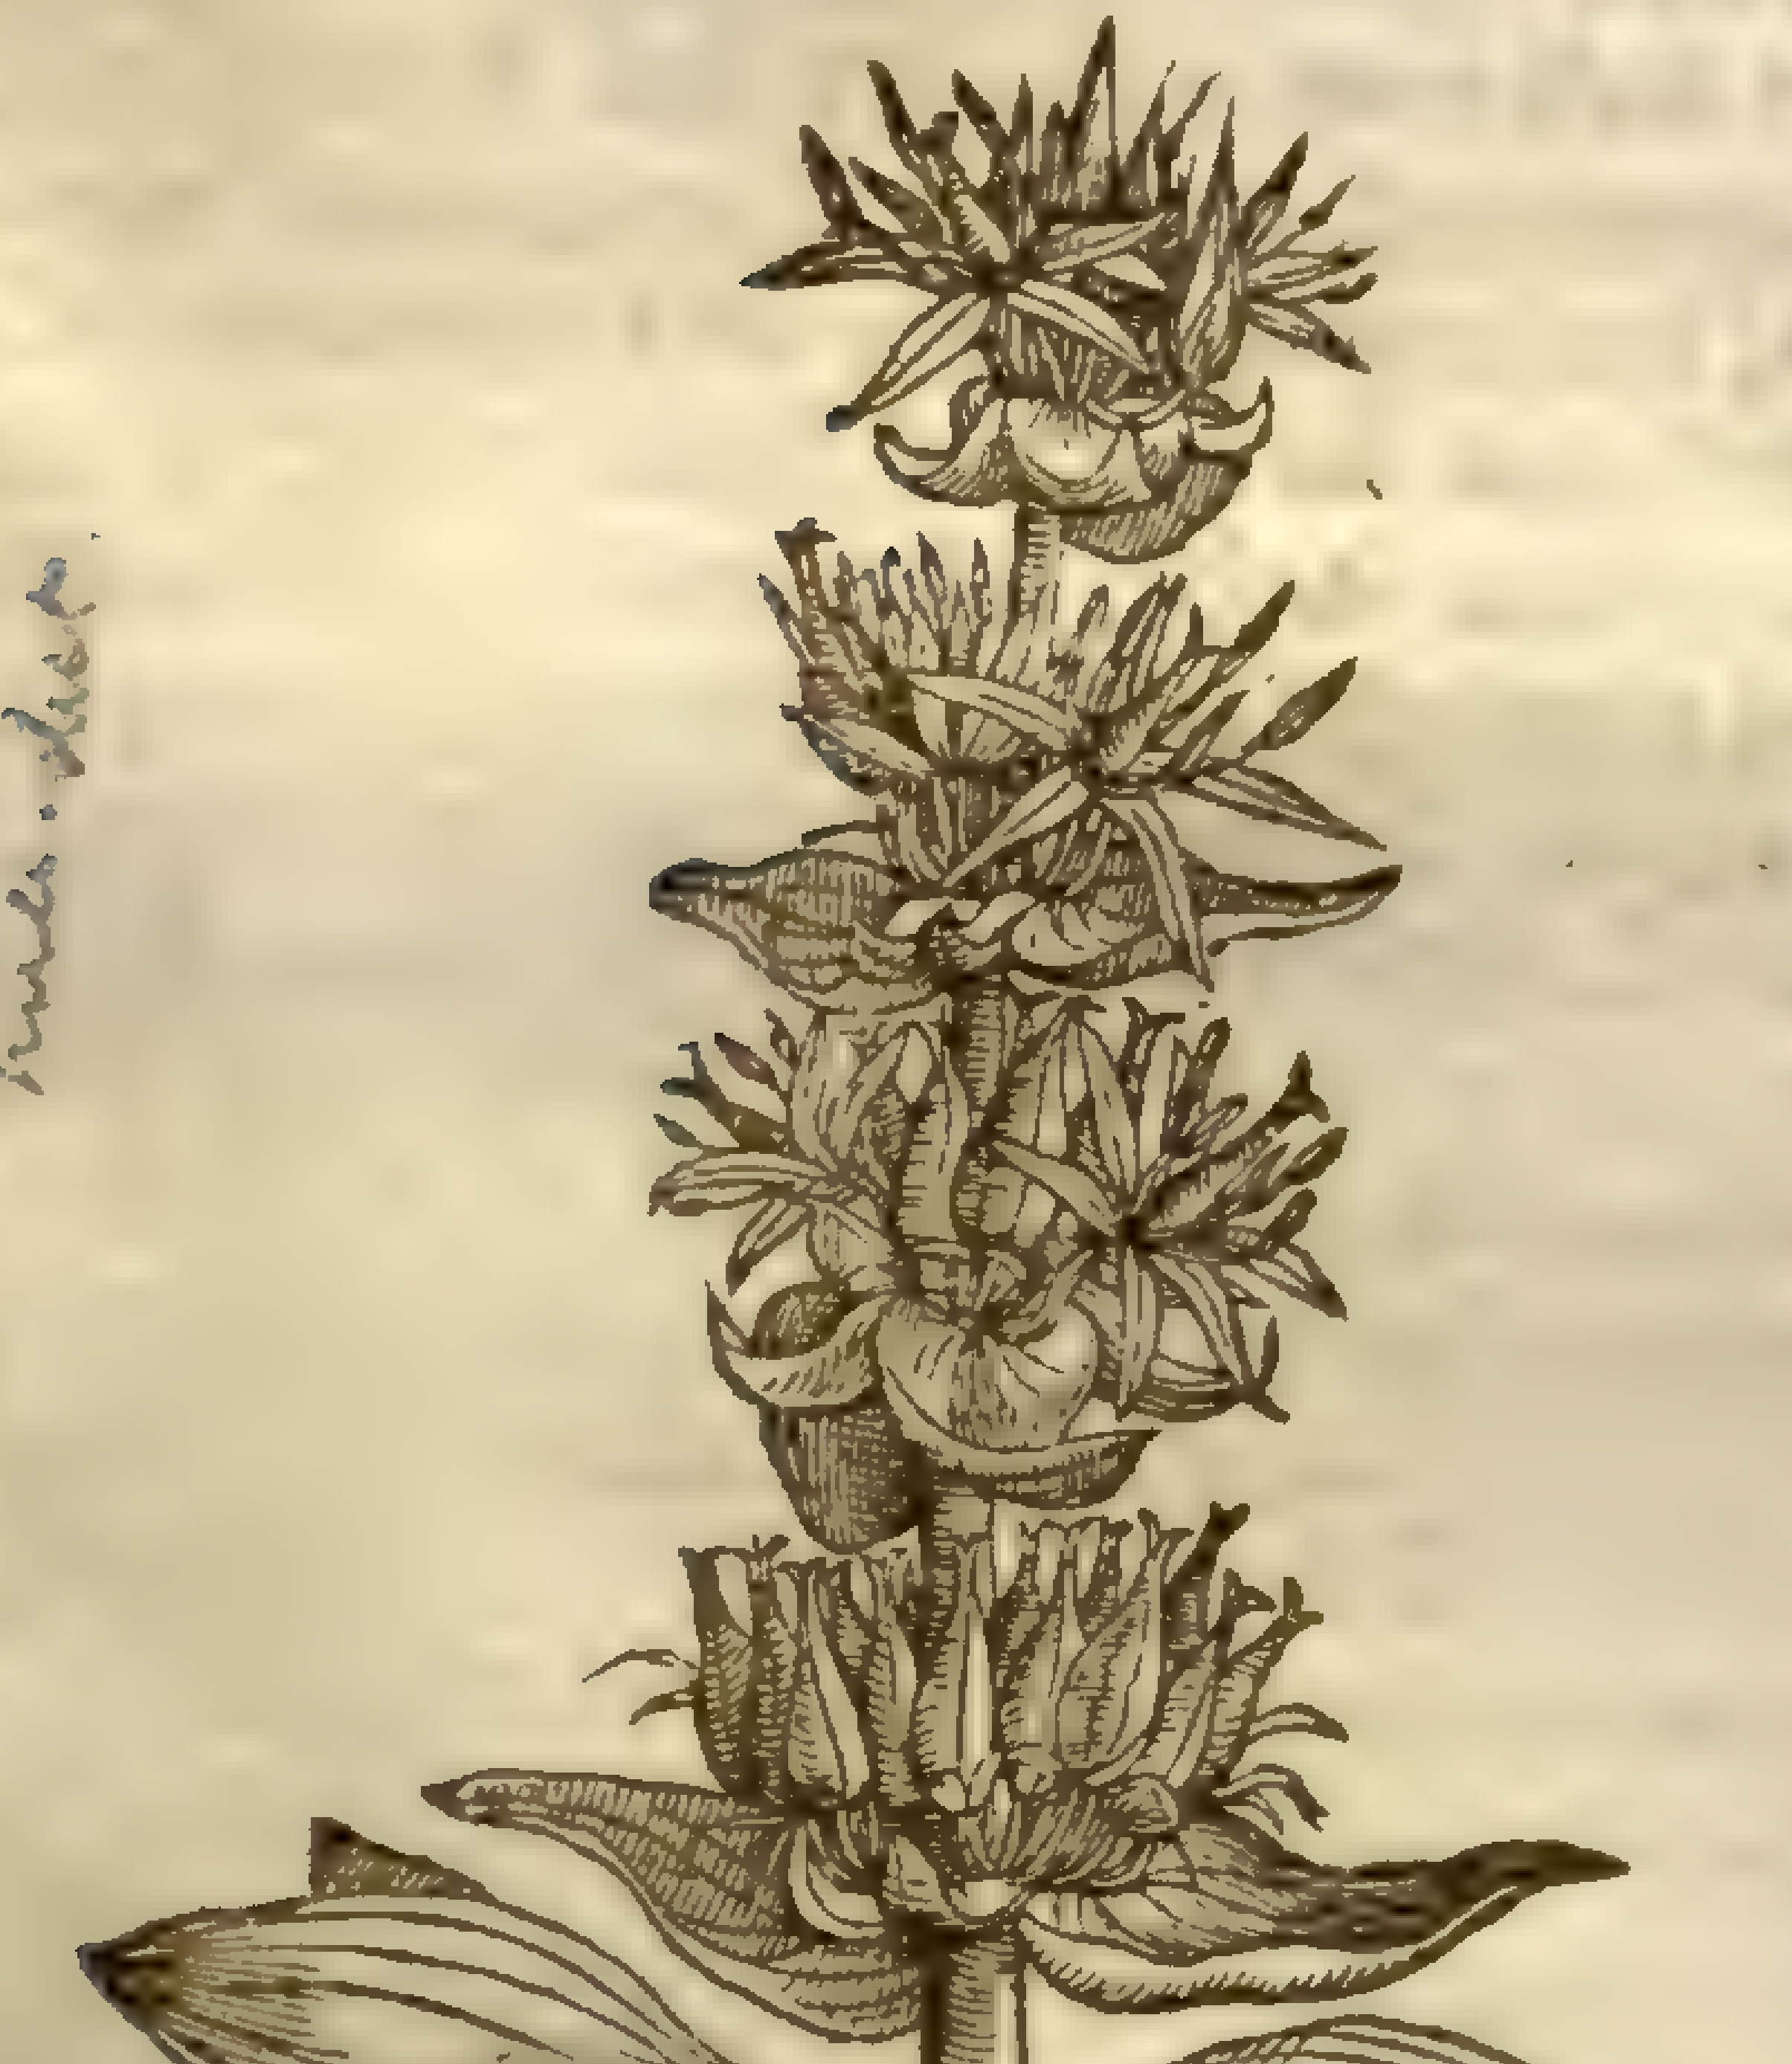
Chap. 105. *Of Felwoort, or Baldmoney.*

¶ *The Kindes.*

There be diuers ſorts of Gentians or Felwoorts, whereof ſome be of our owne countrey; others more ſtrange and brought further off: and alſo ſome not before this time remembred, either of the antient or later writers, as ſhall be ſet forth in this preſent chapter.

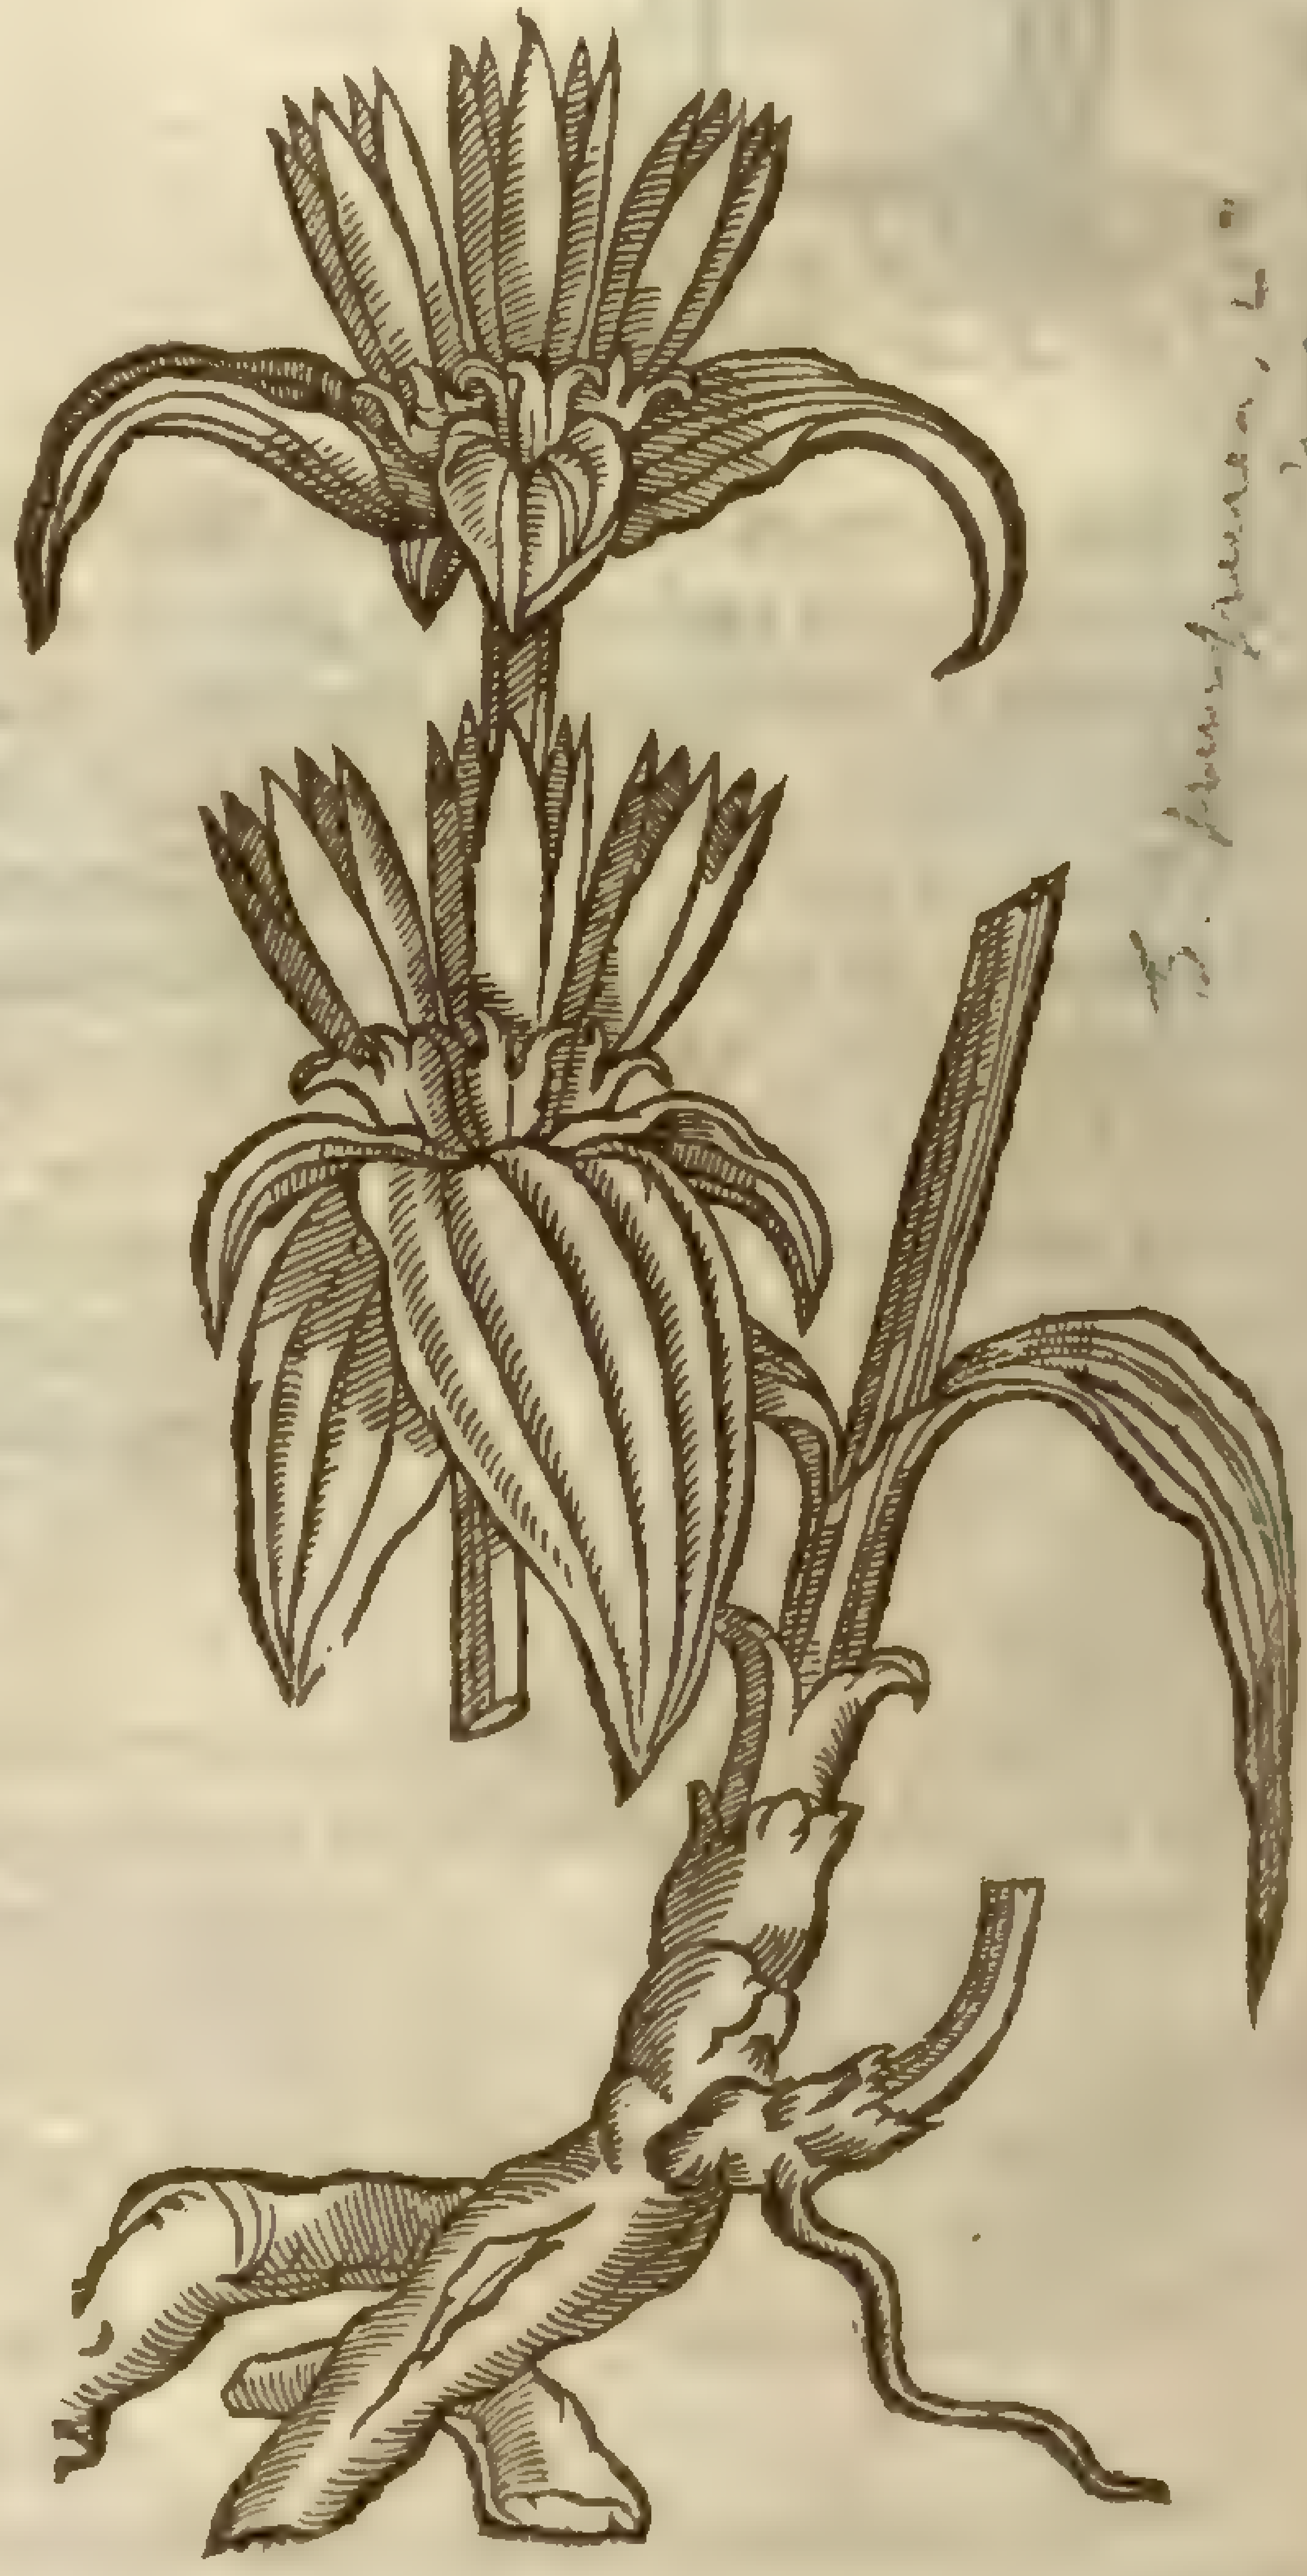
¶ *The Deſcription.*

1 The firſt kinde of Felwoot hath great large leaues, not vnlike to thoſe of Plantaine, very well reſembling the leaues of the white Hellebore: among which riſeth vp a round hollow ſtalke as thicke as a mans thumbe, full of joints or knees, with two leaues at each of them, and towards the top euery joynt or knot is ſet round about with ſmall yellow ſtarre-like floures, like a coronet or garland: at the bottome of the plant next the ground the leaues do ſpread themſelues abroad, embracing or clipping the ſtalke in that place round about, ſet together by couples one oppoſite againſt another. The ſeed is ſmall, browne, flat, and ſmooth like the ſeeds of the Stocke Gillo-floure. The root is a finger thicke. The whole Plant is of a bitter taſte.



1 *Gentiana major.*
Great Felwoort.

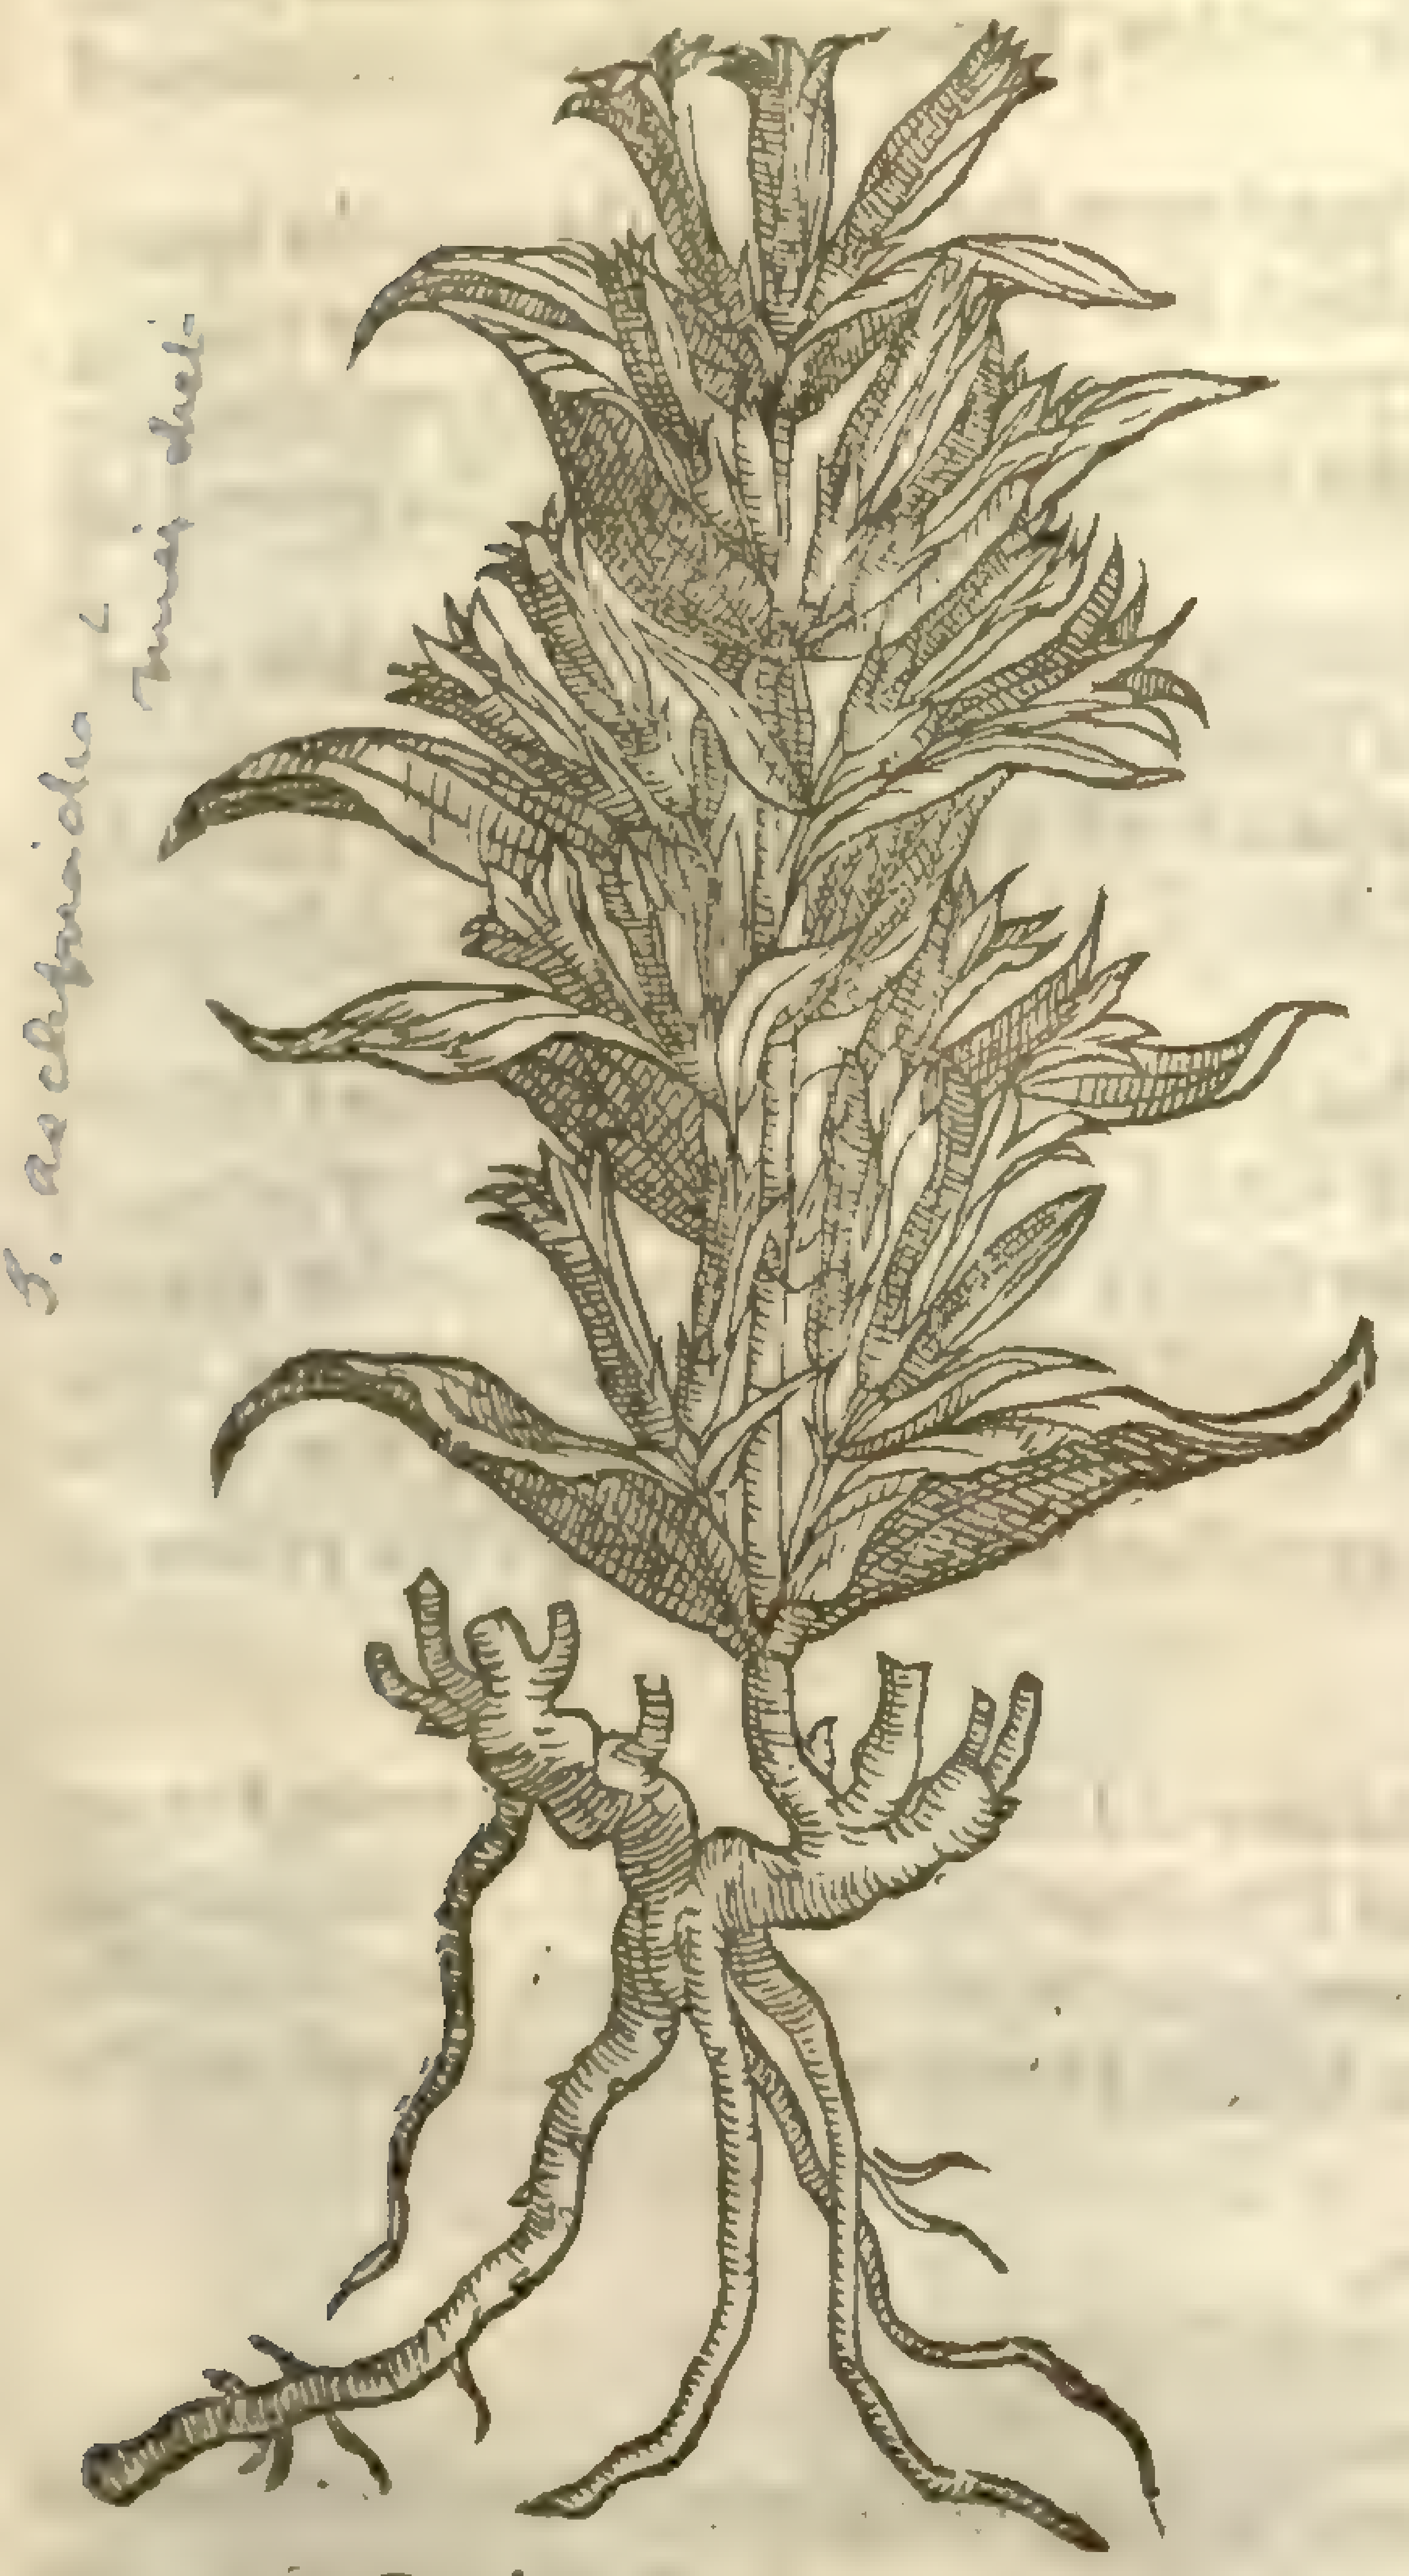
G. lutea — Linn. Sp.



‡ 2 *Gentiana major purpurea, 1. Cluſij.*
Great Purple Felwoort.

G. purpurea, L. — Linn. Sp.

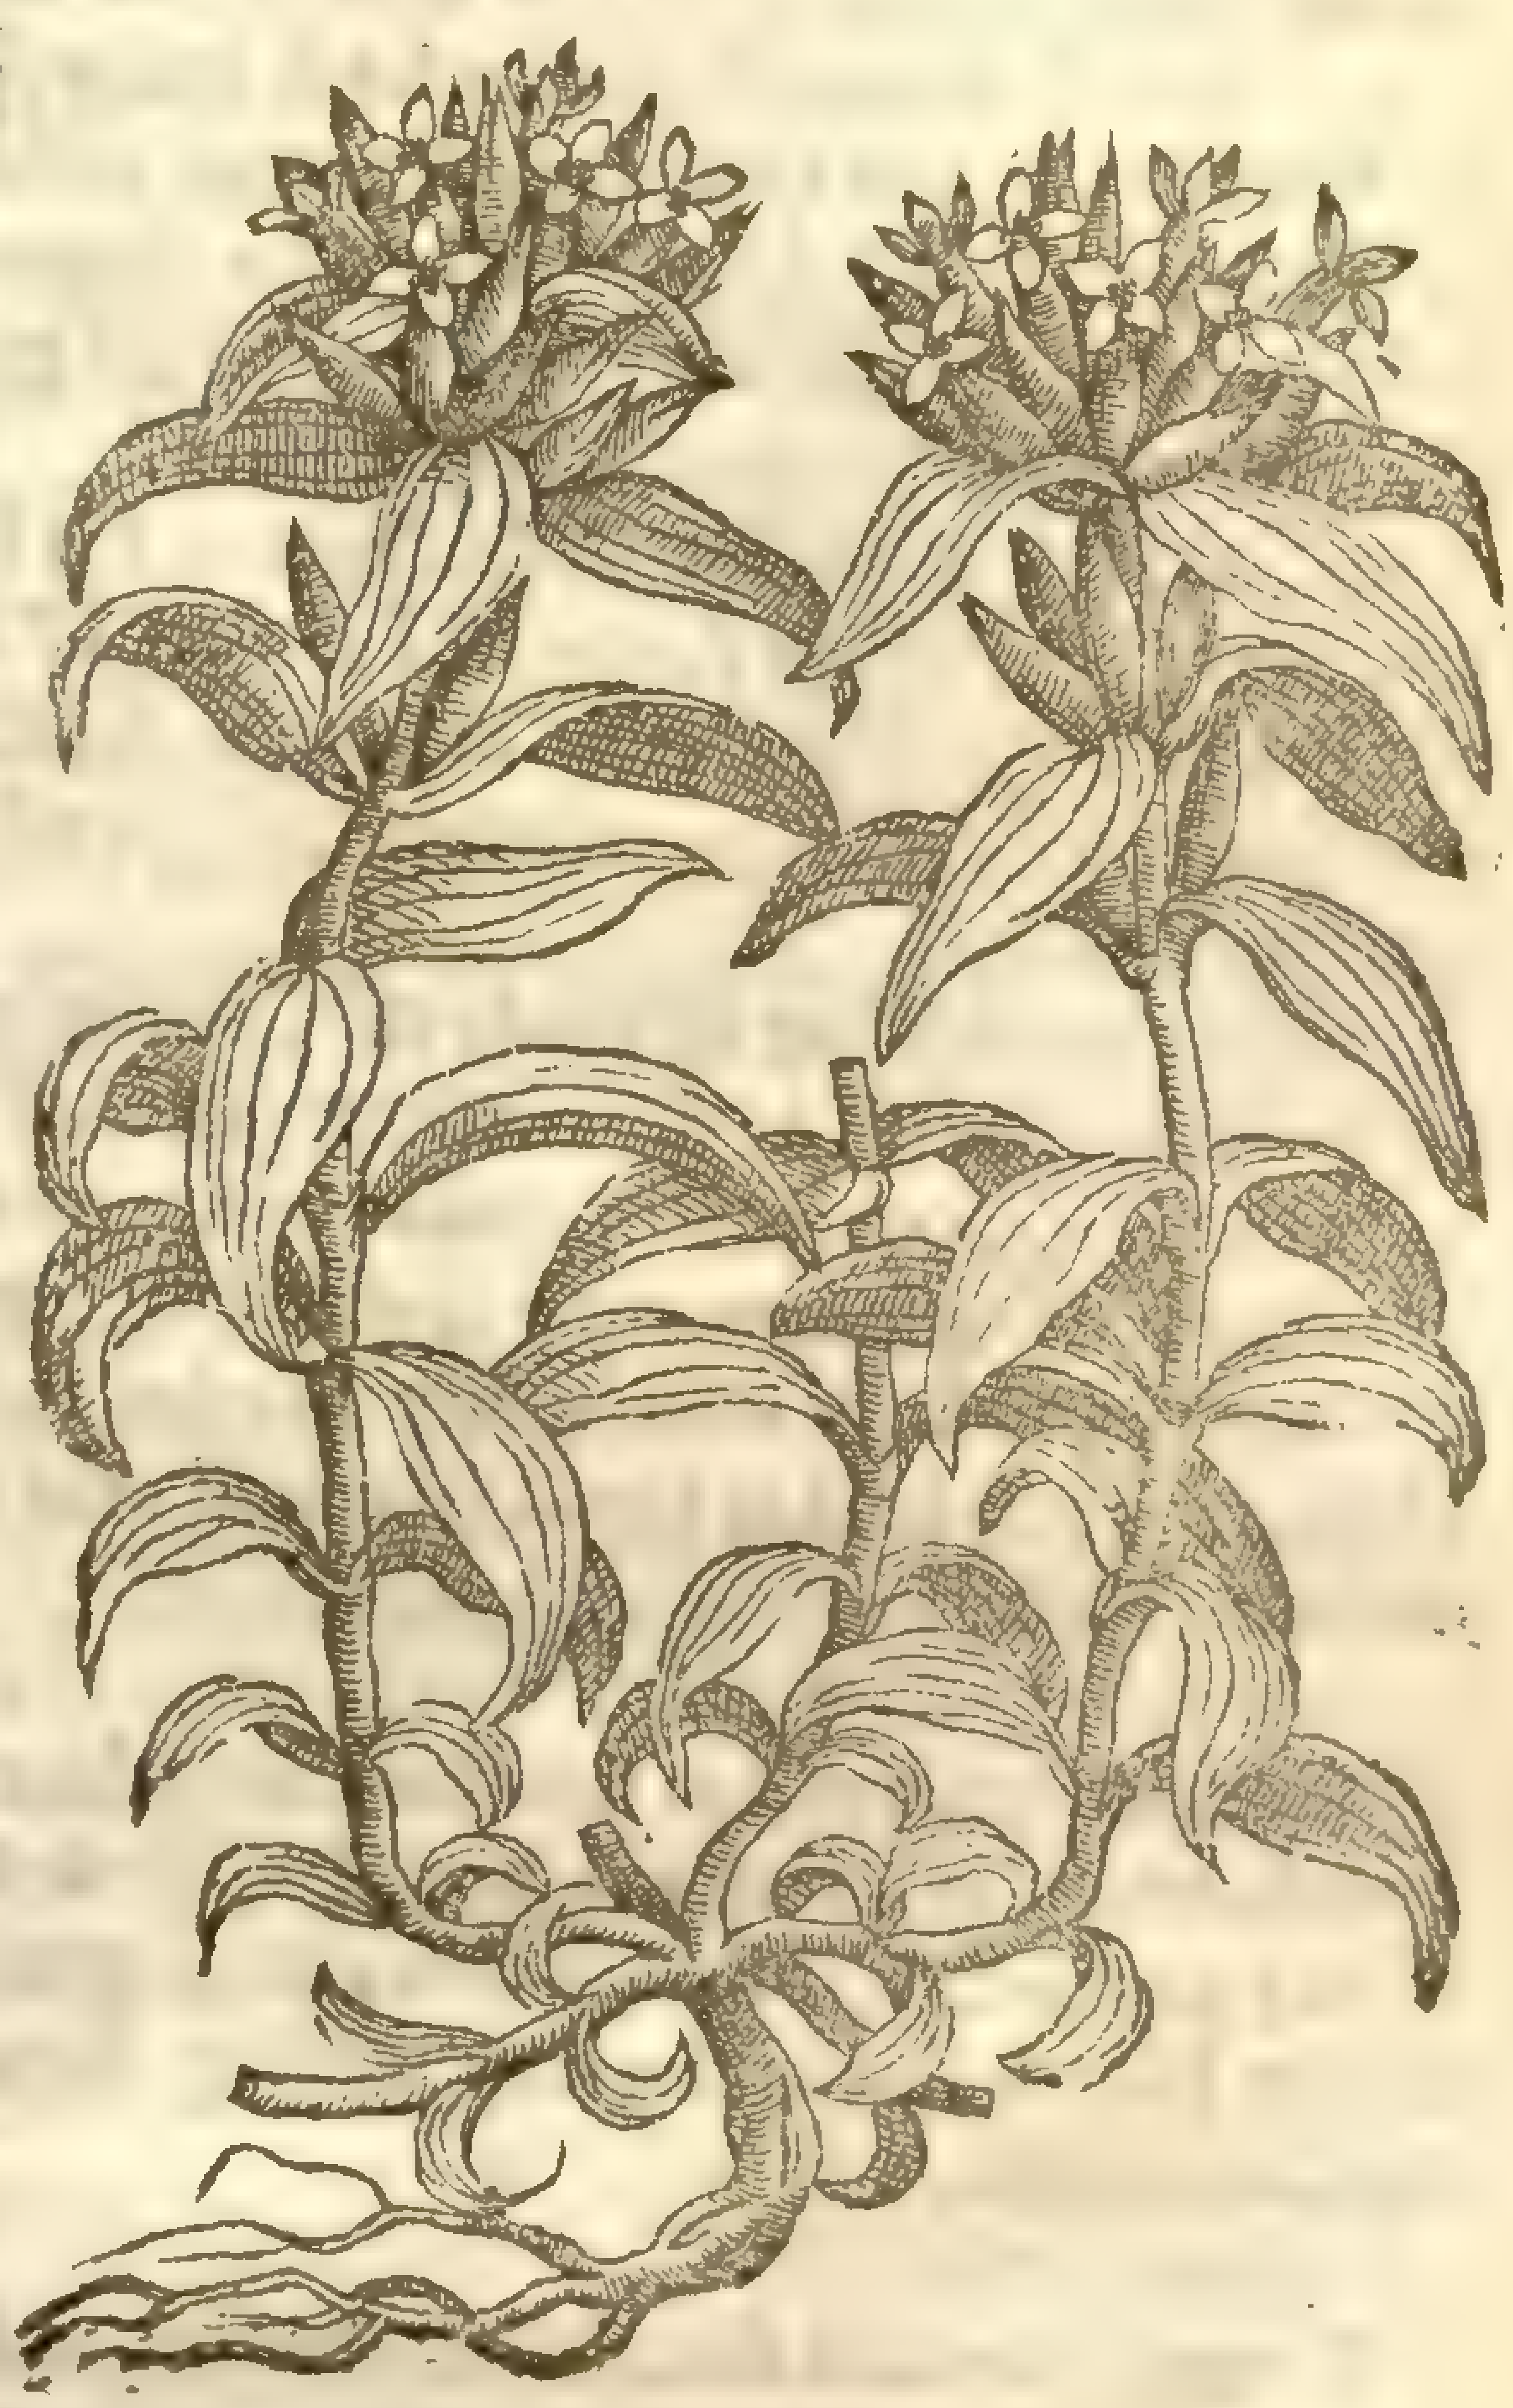
3 *Gentiana major ij. cæruleo flore Cluſij.*
Blew floured Felwoort.



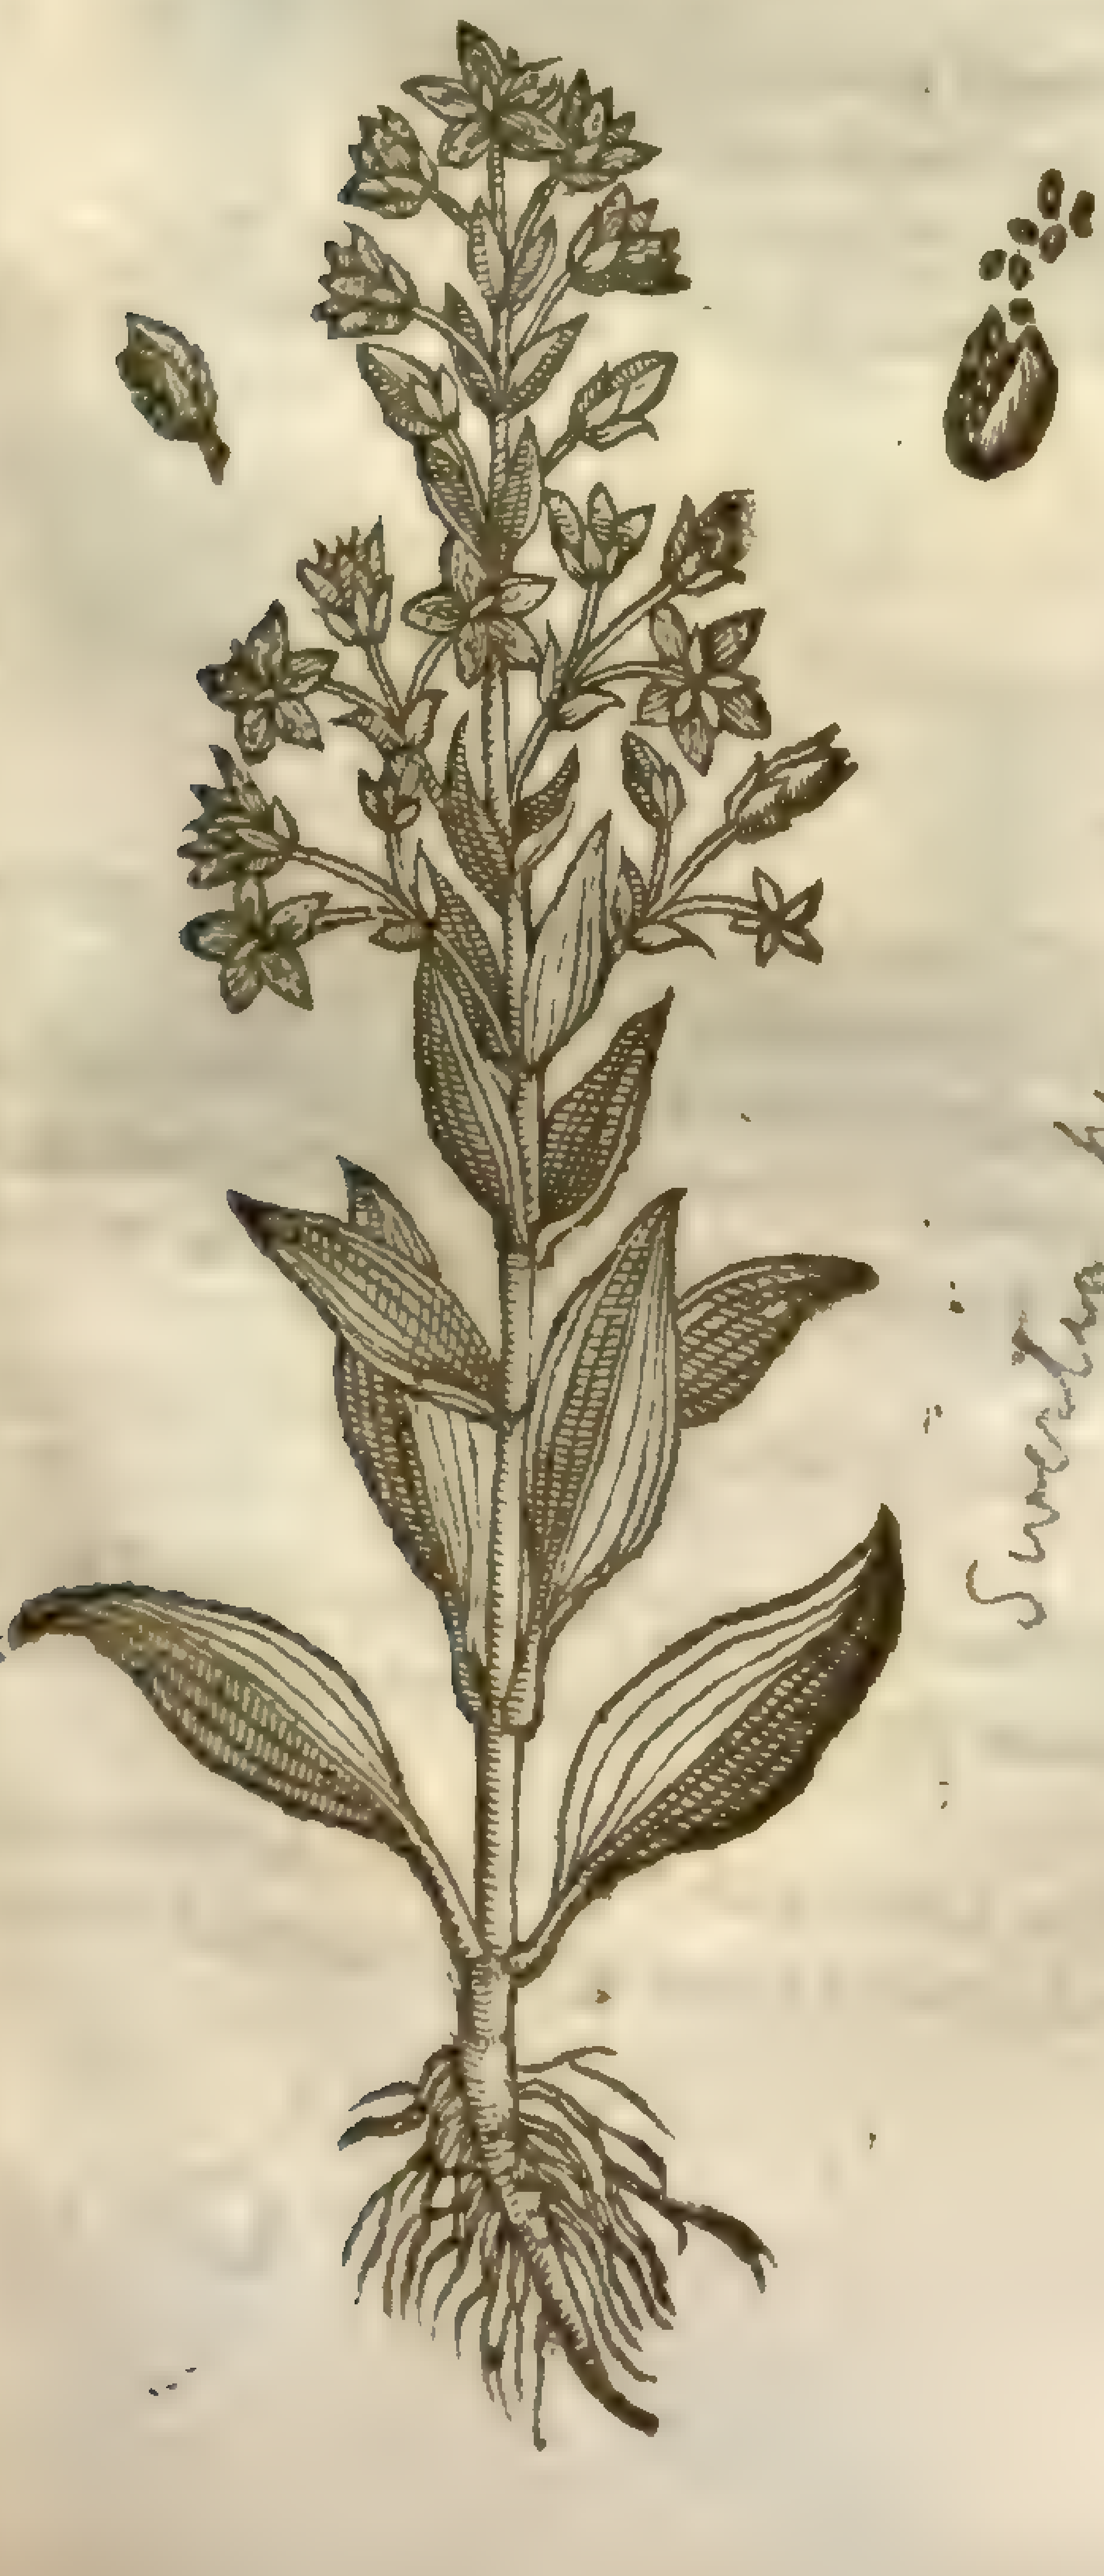
G. asclepiadea L. mihi dict.

4 *Gentiana minor Cruciata.*
Croſſewoort Gentian.

G. cruciata L. mihi dict.



5 *Gentiana Pennei minor.*
Spotted Gentian of Dr *Pennie.*



Swertia perennis L. mihi dict. Sm. p 2.26

‡ 2 This deſcribed by *Cluſius*, hath leaues and ſtalkes like the precedent; theſe ſtalkes are ſome cubit and halfe or two cubits high, and towards the toppes they are ingirt with two or three coronets of faire purple floures, which are not ſtarre-faſhioned, like thoſe of the former, but long and hollow, diuided as it were into ſome fiue or ſix parts or leaues, which towards the bottome on the inſide are ſpotted with deepe purple ſpots: theſe floures are without ſmell, and haue ſo many chiues as they haue jagges, and theſe chiues compaſſe the head, which is parted into two cells, and containes ſtore of a ſmooth, chaffie, reddiſh ſeed. The root is large, yellow on the outſide, and white within, very bitter, and it ſends forth euery yeare new ſhoots. It growes in diuers places of the Alps; it floures in Auguſt, and the ſeeds are ripe in September. ‡

3 *Carolus Cluſius* alſo ſetteth forth another ſort of a great Gentian, riſing forth of the ground with a ſtiffe firme or ſolide ſtalke, ſet with leaues like vnto *Aſclepias*, by couples one oppoſite againſt another, euen from the bottome to the top in certaine diſtances: from the boſome of the

leaues there ſhoot forth ſet vpon ſlender foot-ſtalkes certaine long hollow floures like bels, the mouth whereof endeth in fiue ſharpe corners. The whole floure changeth many times his colour according to the ſoile and climate; now and then purple or blew, ſometimes whitiſh, and often of an aſh colour. The root and ſeed is like the precedent.

4 Croſſe-woort Gentian hath many ribbed leaues ſpred vpon the ground, like vnto the leaues of Sopewoort, but of a blacker greene colour: among which riſe vp weake joynted ſtalkes trailing or leaning toward the ground. The floures grow at the top in bundles thicke thruſt together, like thoſe of ſweet Williams, of a light blew colour. The root is thicke, and creepeth in the ground far abroad, whereby it greatly increaſeth.

5 *Carolus Cluſius* hath ſet forth in his Pannonicke hiſtorie a kinde of Gentian, which he receiued from M^r *Thomas Pennie* of London, D^r in Phyſicke, of famous memory, and a ſecond *Dioſcorides* for his ſingular knowledge in Plants: which *Tabernamontanus* hath ſet forth in his Dutch booke for the ſeuenth of *Cluſius*, wherein he greatly deceiued himſelfe, and hath with a falſe deſcription wronged others.

This twelfth ſort or kinde of Gentian after *Cluſius*, hath a round ſtiffe ſtalke, firme and ſollide, ſomewhat reddiſh at the bottome, jointed or kneed like vnto Croſſewoort Gentian. The leaues are broad, ſmooth, full of ribbes or ſinewes, ſet about the ſtalkes by couples, one oppoſite againſt another. The floures grow vpon ſmall tender ſtalkes, compact of fiue ſlender blewiſh leaues, ſpotted very curiouſly with many blacke ſpots and little lines; hauing in the middle fiue yellow chiues. Thee ſeed is ſmall like ſand: the root is little, garniſhed with a few ſtrings of a yellowiſh colour.

¶ *The Place.*

Gentian groweth in ſhadowie woods, and the mountaines of Italy, Sclauonia, Germany, France, and Burgundie; from whence M^r *Iſaac de Laune* a learned Phyſitian ſent me plants for the increaſe of my garden. Croſſewoort Gentian groweth in a paſture at the Weſt end of little Rayne in Eſſex on the North ſide of the way leading from Braintree to Much-Dunmow; and in the horſe way by the ſame cloſe.

¶ *The Time.*

They floure and flouriſh in Auguſt, and the ſeed is ripe in September.

¶ *The Names.*

Gentius King of Illyria was the firſt finder of this herbe, and the firſt that vſed it in medicine, for which cauſe it was called Gentian after his owne name: in Greeke, γεντιανή: which name alſo the Apothecaries retaine vnto this day, and call it *Gentiana*: it is named in Engliſh, Felwoort Gentian; Bitterwoort; Baldmoyne, and Baldmoney.

1 This by moſt Writers is called *Gentiana*, and *Gentiana major Lutea*.

2 *Geſner* cals this *Gentiana punicea*; *Cluſius*, *Gentiana major flore purpureo*.

3 This is *Gentiana folijs hirundinariæ* of *Geſner*: and *Gentiana Aſclepiadis folio* of *Cluſius*.

4 This *Cruciata*, or *Gentiana Cruciata*, of *Tragus*, *Fuchſius*, *Dodonæus*, *Geſner* and others: it is the *Gentiana minor* of *Matthiolus*.

5 *Cluſius* calls this, *Gentiana major pallida punctis diſtincta*.

¶ *The Temperature.*

The root of Felwoort is hot, as *Dioſcorides* ſaith, clenſing or ſcouring: diuers copies haue, that it is likewiſe binding, and of a bitter taſte.

¶ *The Vertues.*

A It is excellent good as *Galen* ſaith, when there is need of attenuating, purging, clenſing, and remouing of obſtructions, which quality it taketh of his extreme bitterneſſe.

B It is reported to be good for thoſe that are troubled with crampes and conuulſions; for ſuch as are burſt, or haue fallen from ſome high place: for ſuch as haue euill liuers and bad ſtomackes. It is put into Counterpoyſons, as into the compoſition named *Theriaca diateſſaron*: which *Ætius* calleth *Myſterium*, a myſtery or hid ſecret.

C This is of ſuch force and vertue, ſaith *Pliny*, that it helpeth cattell which are not onely troubled with the cough, but are alſo broken winded.

D The root of Gentian giuen in pouder the quantitie of a dramme, with a little pepper and herbe Grace mixed therewith, is profitable for them that are bitten or ſtung with any manner of venomous beaſt or mad dog: or for any that hath taken poyſon.

E The decoction drunke is good againſt ehe ſtoppings of the liuer, and cruditie of the ſtomacke, helpeth digeſtion, diſſolueth and ſcattereth congealed bloud, and is good againſt all cold diſeaſes of the inward parts.

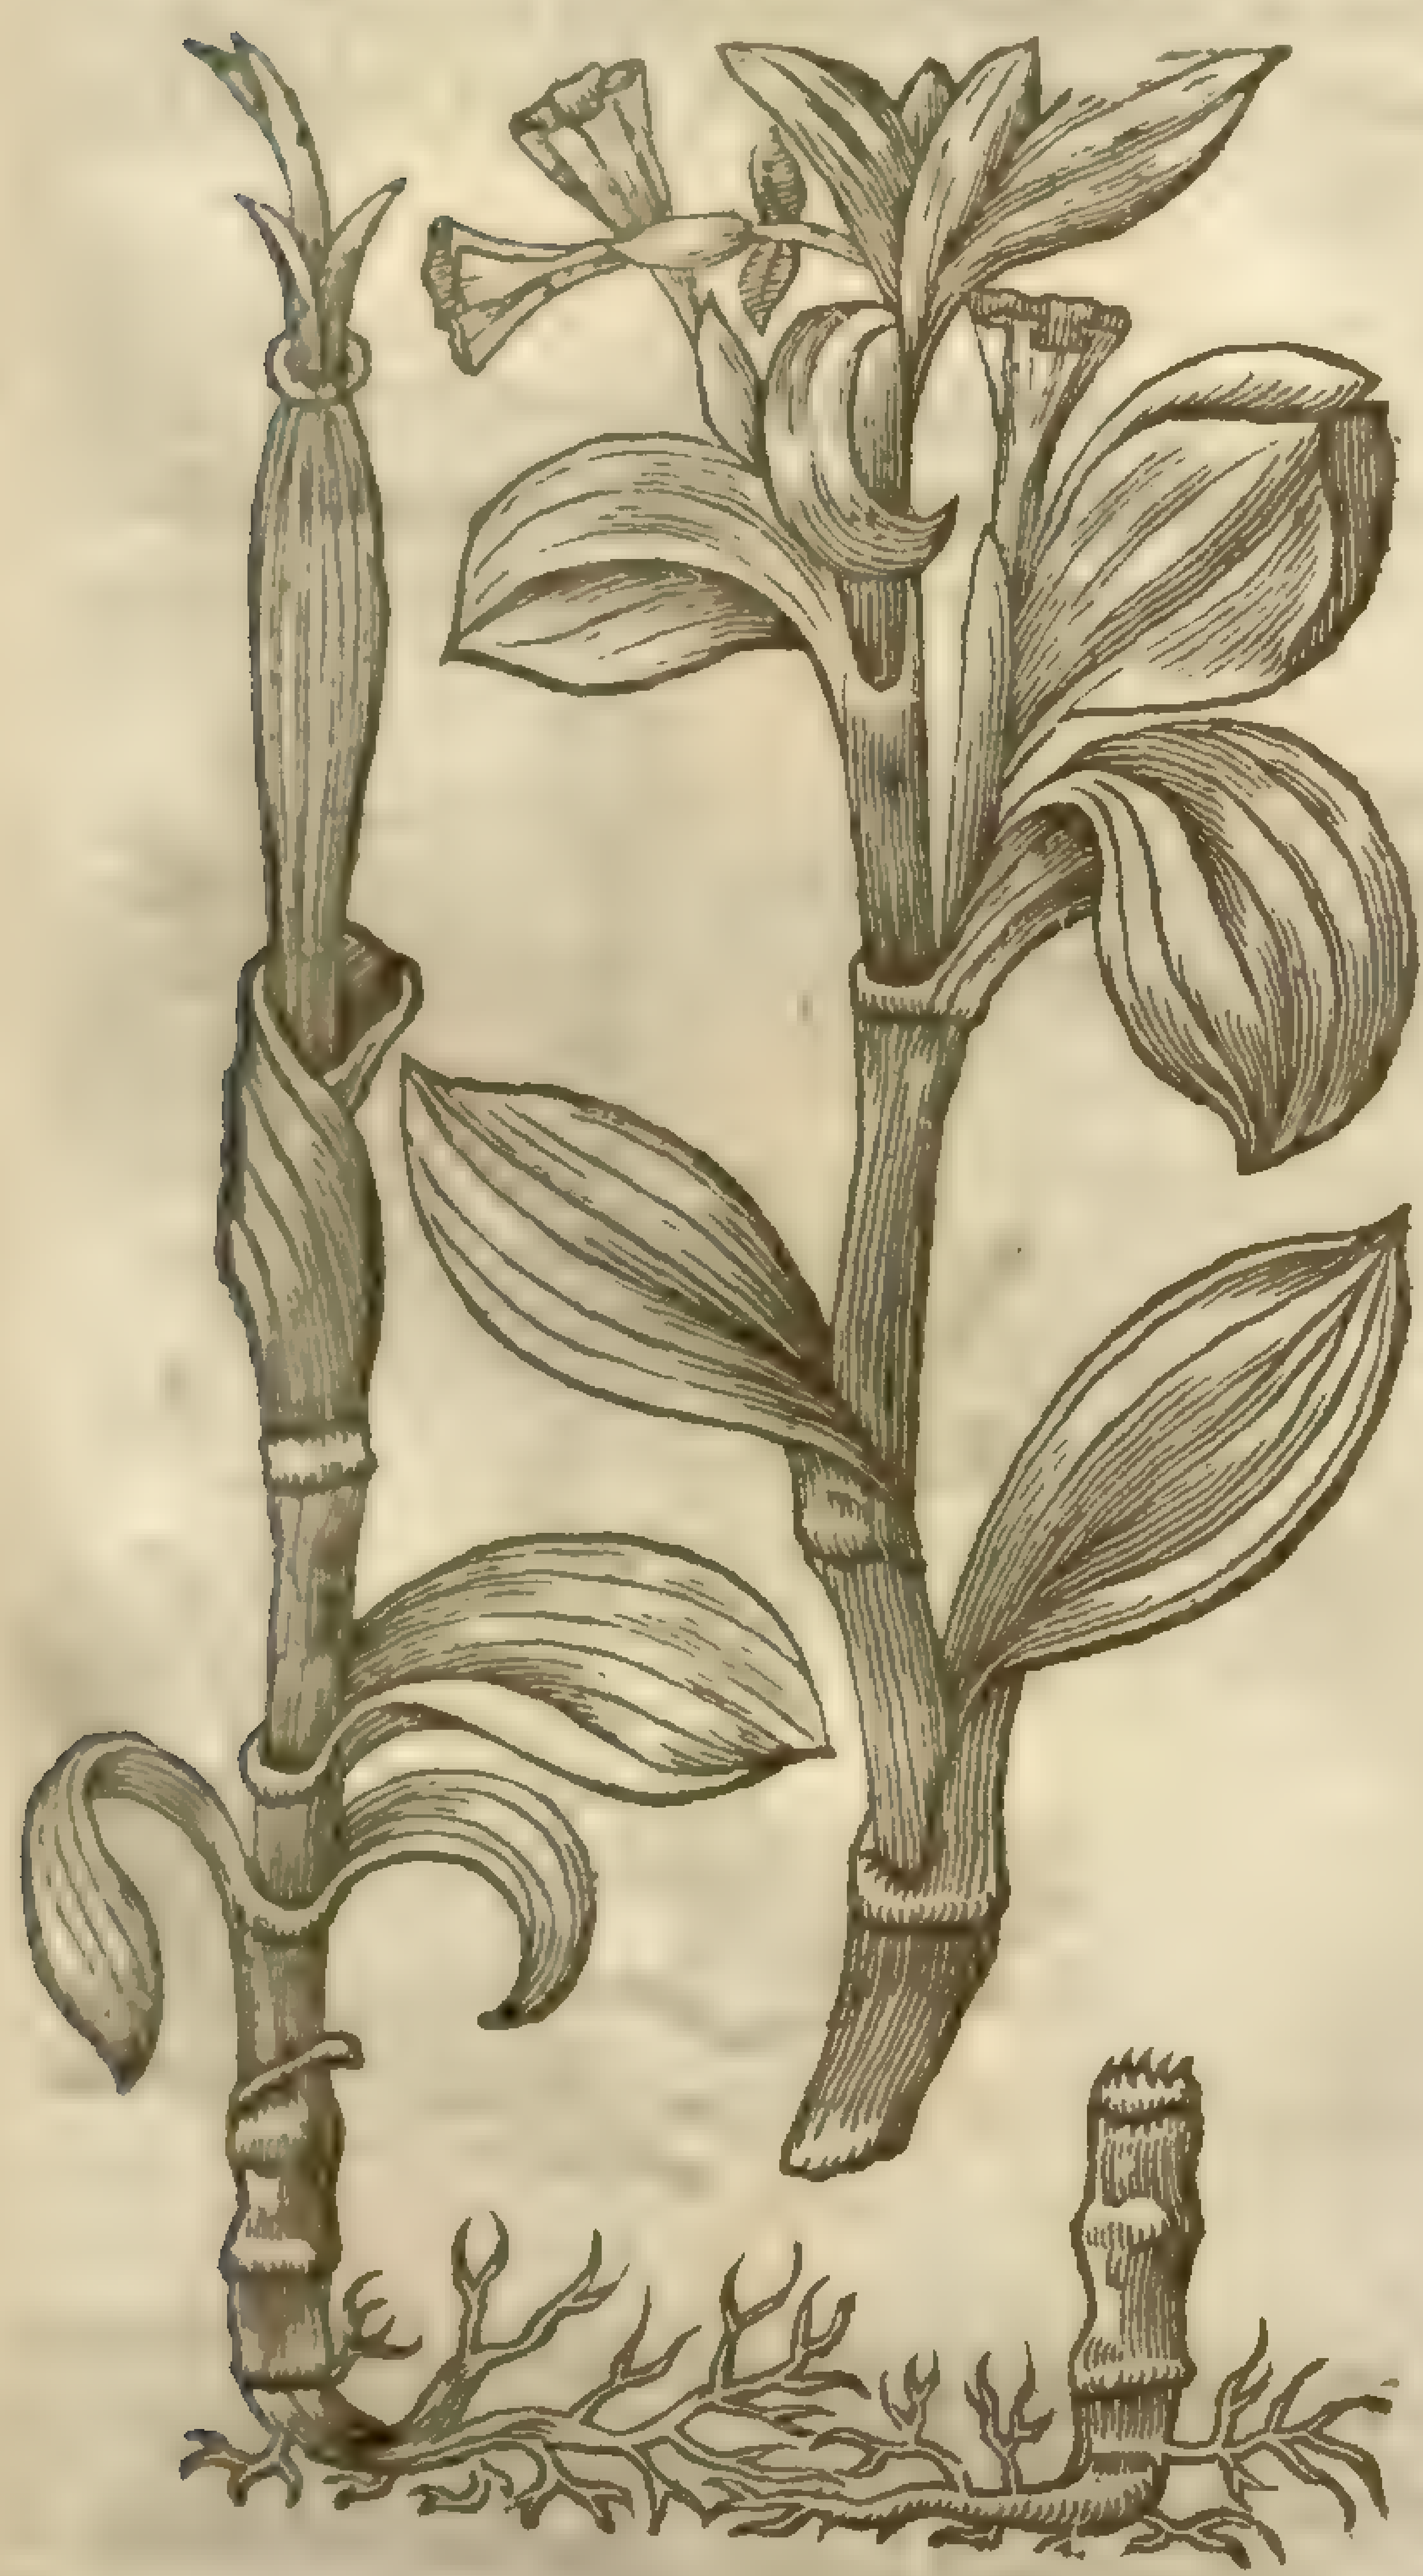
CHAP.

Chap. 87. *Of Engliſh Felwoort.*

¶ *The Deſcription.*

Hollow leaſed Felwoort or Engliſh Gentian hath many long tough roots, diſperſed hither and thither within the vpper cruſt of the earth; from which immediatly riſeth a fat thicke ſtalke, jointed or kneed by certaine diſtances, ſet at euery knot with one leafe, and ſometimes moe, keeping no certaine number: which leaues do at the firſt incloſe the ſtalkes round about, being one whole and entire leafe without any inciſure at all, as it were a hollow trunke; which after it is growne to his fulneſſe, breaketh in one ſide or other, and becommeth a flat ribbed leafe, like vnto the great Gentian or Plantaine. The floures come forth of the boſome of the vpper leaues, ſet vpon tender foot ſtalkes, in ſhape like thoſe of the ſmall Bindeweed, or rather the floures of Sopewoort, of a whitiſh colour, waſht about the brims with a little light carnation. Then followeth the ſeed, which as yet I haue not obſerued.

Gentiana concaua.
Hollow Felwoort. Saponaria [illegible]



¶ *The Place.*

I found this ſtrange kind of Gentian in a ſmall groue of a wood called the Spinie, neere vnto a ſmall village in Northampton ſhire called Lichbarrow: elſewhere I haue not heard of it.

¶ *The Time.*

It ſpringeth forth of the ground in Aprill, and bringeth forth his floures and ſeed in the end of Auguſt.

¶ *The Names.*

I haue thought good to giue vnto this plant, in Engliſh, the name Gentian, being doubtleſſe a kind thereof. The which hath not been ſet forth, nor remembred by any that haue written of plants vntil this time. In Latine we may call it *Gentiana concaua*, of the hollow leaues. It may be called alſo hollow leaued Felwoort.

¶ *The Temperature and Vertues.*

Of the faculties of this plant as yet I can ſay nothing, referring it vnto the other Gentians, vntill time ſhall diſcloſe that which yet is ſecret and vnknowne.

‡ *Bauhine* receiued this plant with the figure thereof from Doctor *Liſter* one of his Majeſties Phyſitions, and he referres it vnto *Saponaria*, calling it *Saponaria concaua Anglica*; and (as farre as I can conjecture) hath a good deſcription thereof in his *Prodrom. pag.* 103. Now both by our Authour and *Bauhines* deſcription, I gather, that the root in this Figure is not rightly expreſſed, for that it ſhould be long, thicke, and creeping, with few fibers adhering thereunto; when as this figure expreſſeth an annuall woody root. But not hauing as yet ſeene the plant, I can affirme nothing of certaintie. ‡

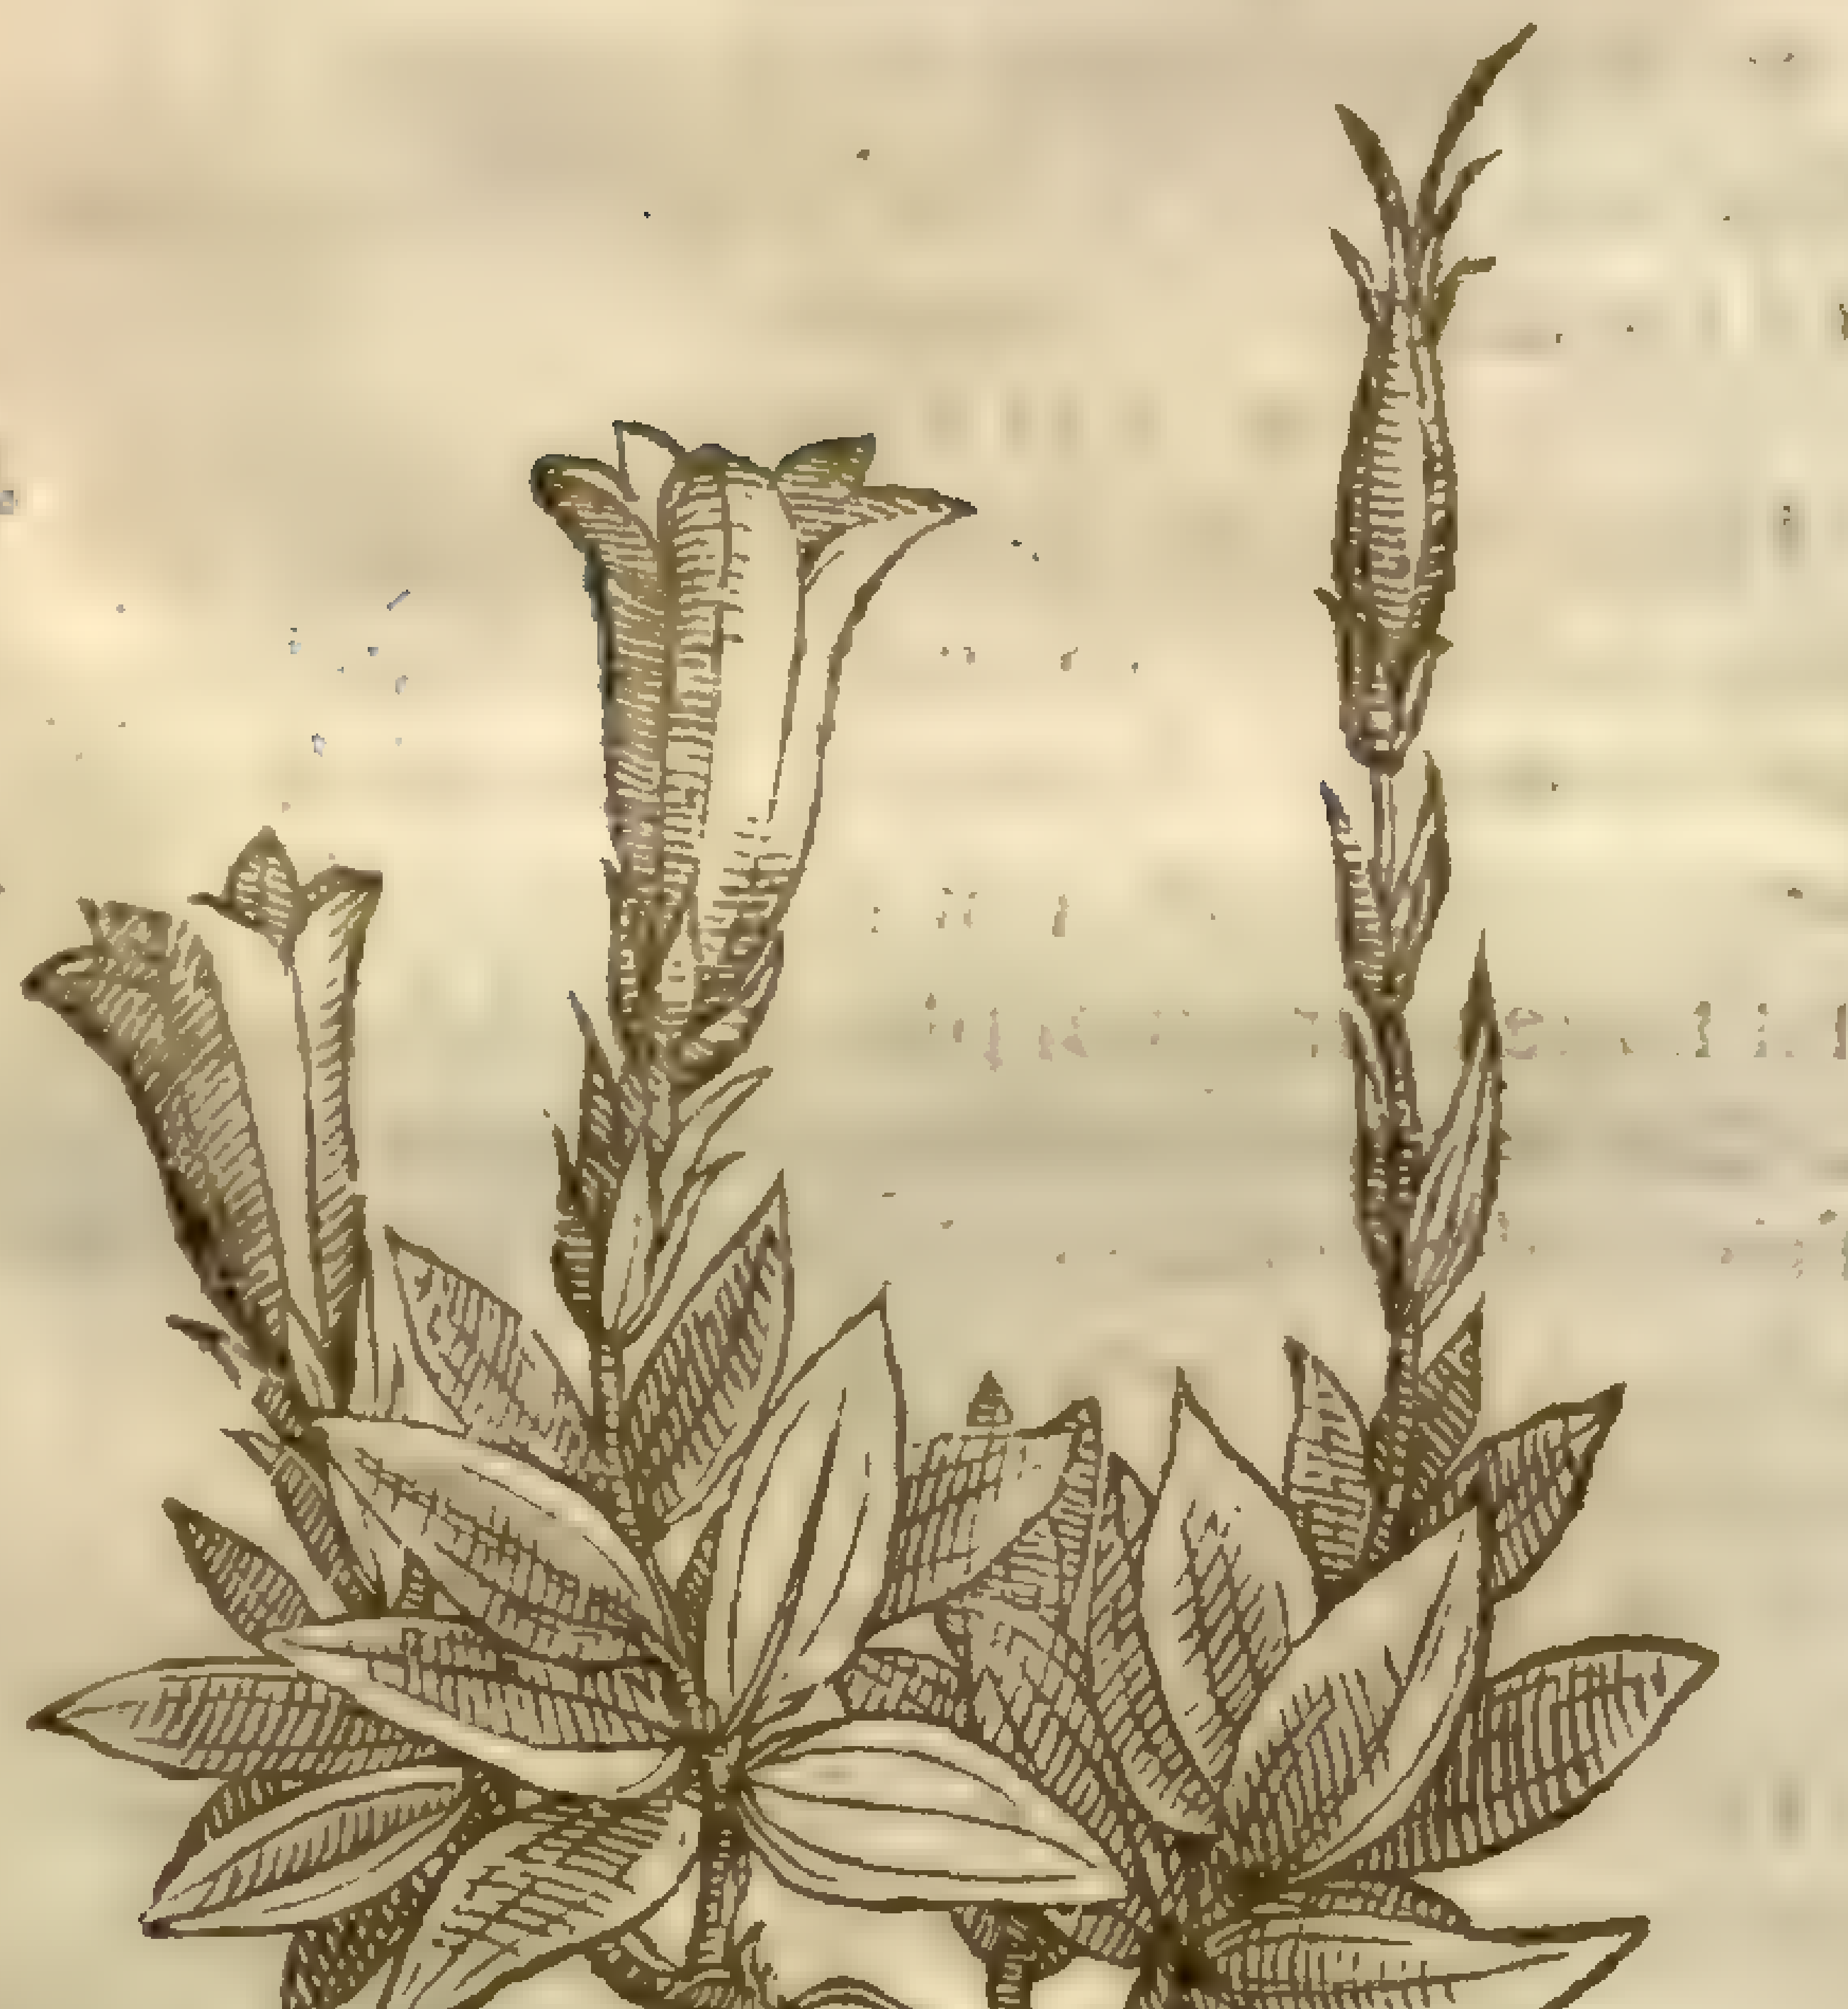
‡ Chap. 107 *Of Baſtard Felwoort.*

¶ *The Deſcription.*

‡ Our Authour in this Chapter ſo confounded all, that I knew not well how, handſomely to ſet all right; for his deſcriptions they were ſo barren, that little might be gathered by them, & the figures agreed with their titles, but the place contradicts al; for the firſt figured is found in England, and the ſecond is not that euer I could learne: alſo the ſecond floures in the ſpring, according to *Cluſius* and all others that haue written thereof, and alſo by our Authors owne title, truely put ouer the figure: yet he ſaid they both floure and flouriſh from Auguſt to the end of September, Theſe things conſidered, I thought it fitter both for the Readers benefit and my owne credit to giue you this chapter wholly new with additions, rather than mangled and confuſed, as otherwiſe of neceſſitie it muſt haue beene. ‡

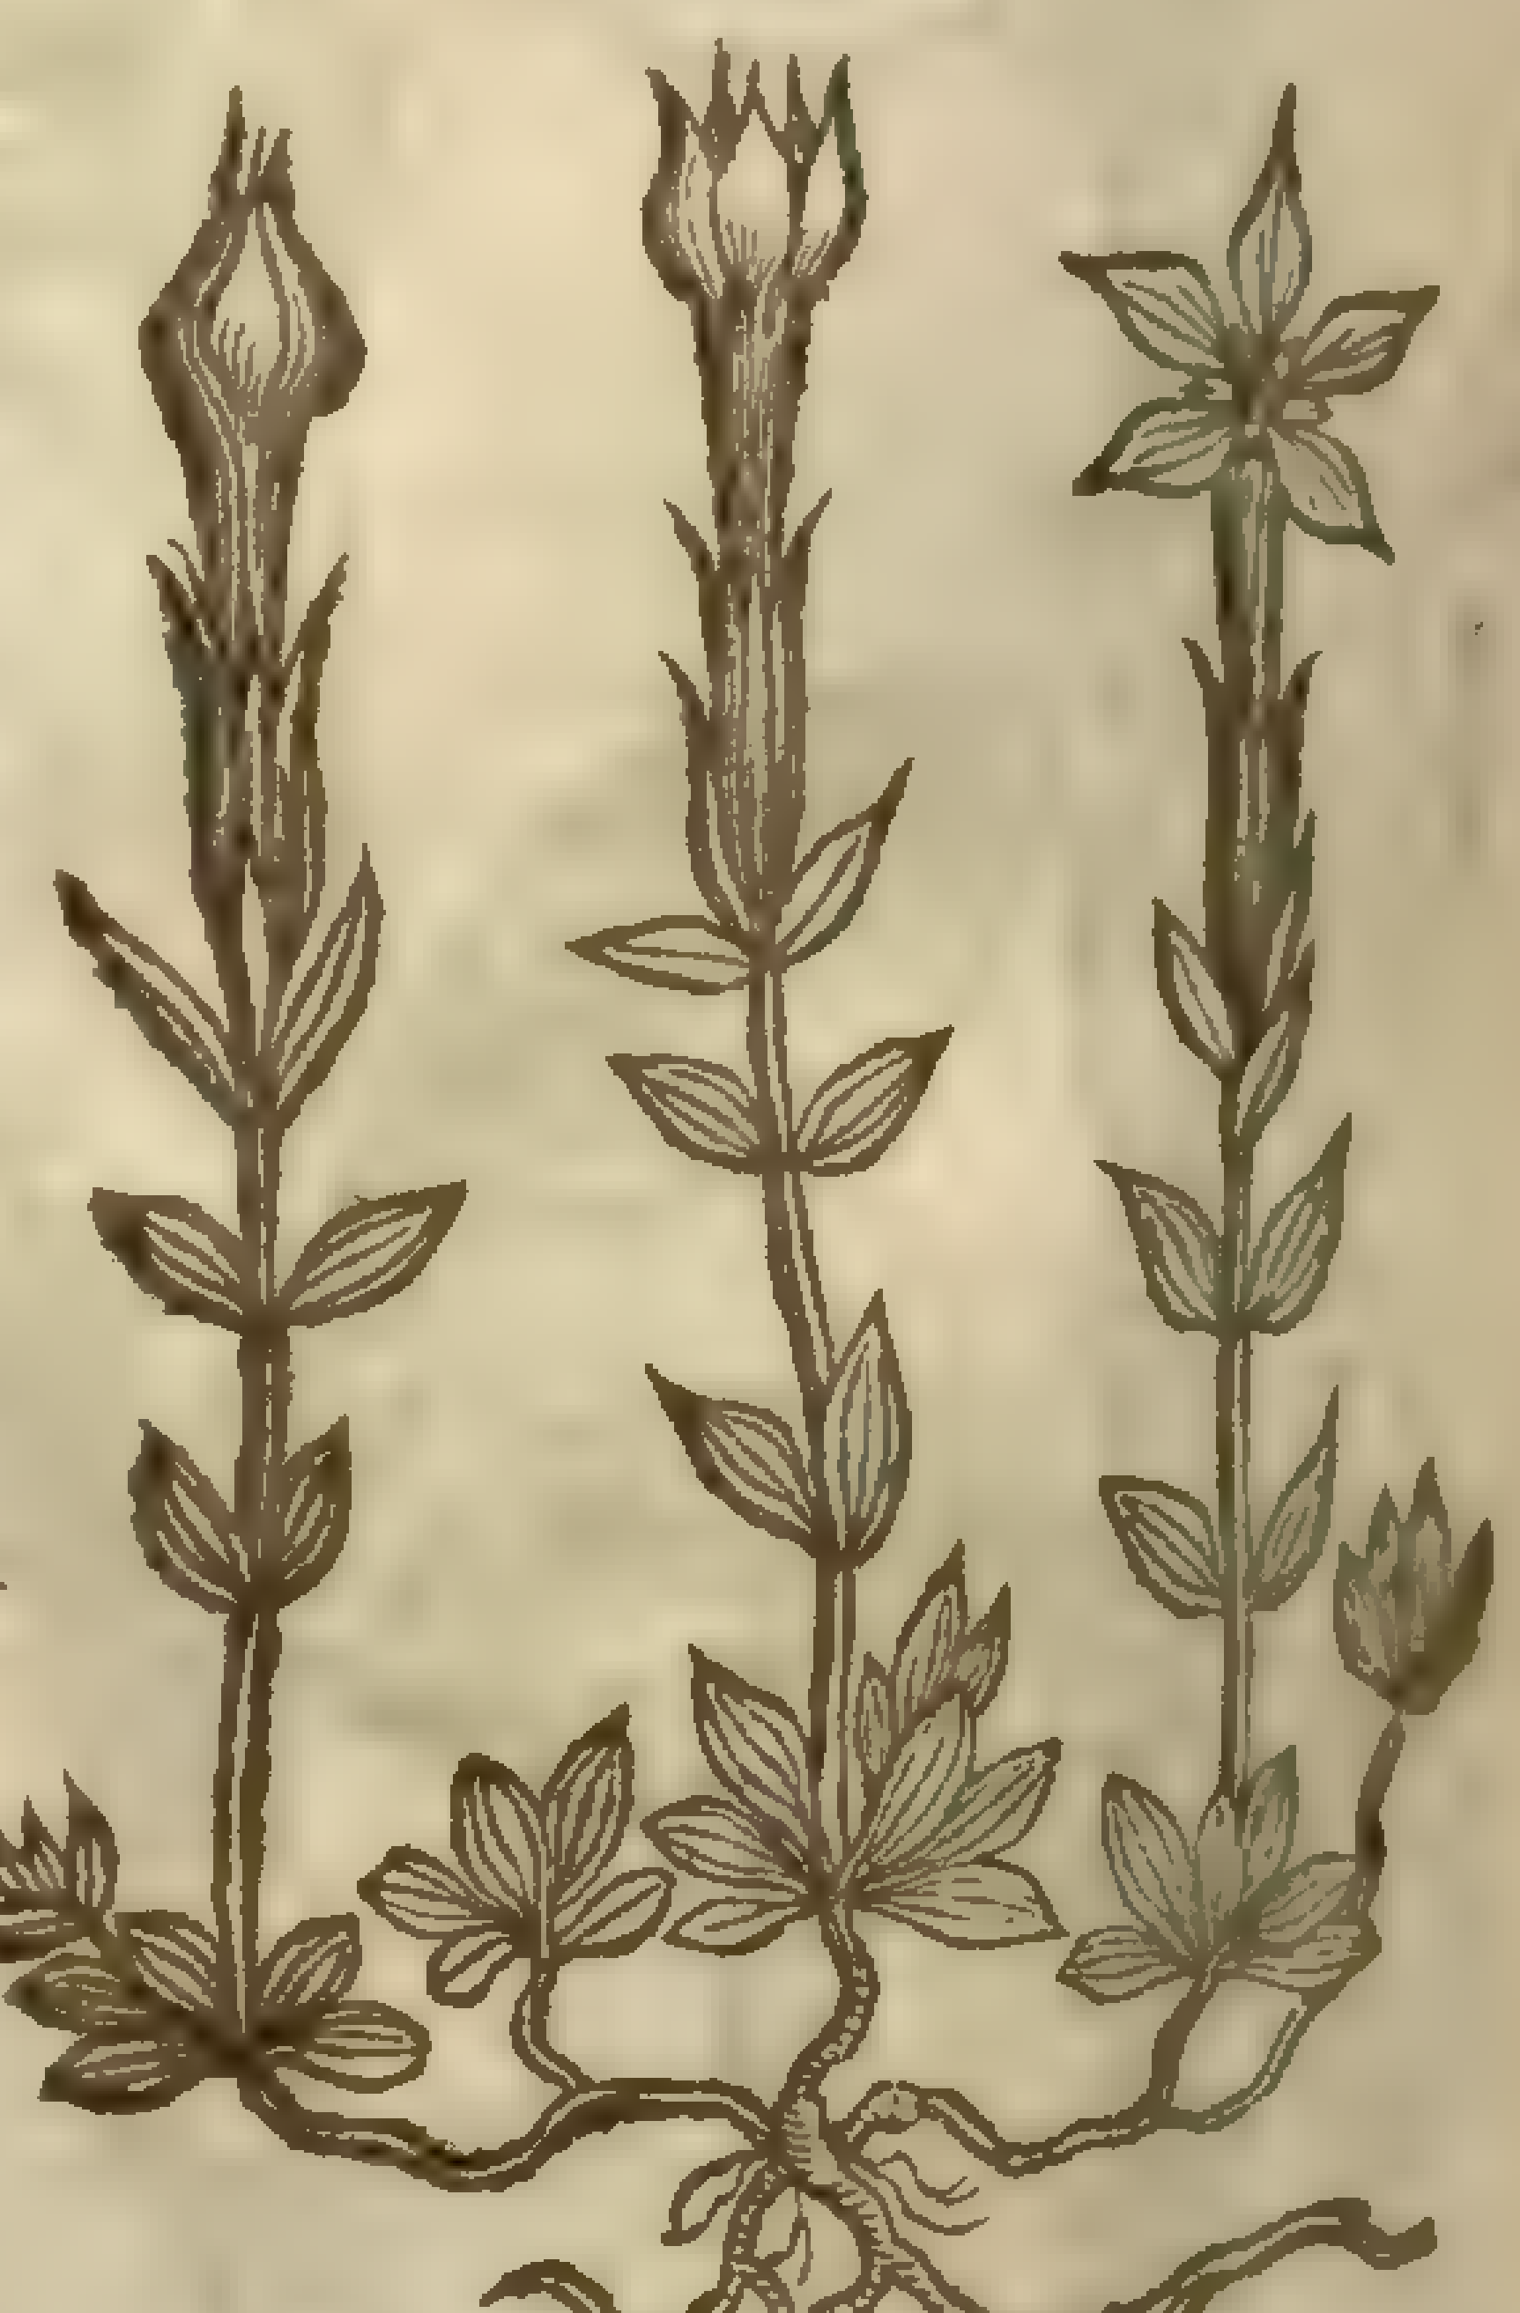
1 This elegant *Gentianella* hath a ſmall yellowiſh creeping root, from which ariſe many greene ſmooth thicke hard and ſharpe pointed leaues like thoſe of the broad leaued Myrtle, yet larger, and hauing the veines running alongſt the leaues as in Plantaine. Amongſt the leaues come vp ſhort ſtalkes, bearing very large floures one vpon a ſtalke; and theſe floures are hollow like a Bel-floure, and end in fiue ſharpe points with two little eares betweene each diuiſion, and their colour is an exquiſite blew. After the floure is paſt there followes a ſharpe pointed longiſh veſſell, which opening it ſelfe into two equall parts, ſhewes a ſmall creſted darke coloured ſeed.

‡ 1 *Gentianella verna major.*
Spring large floured Gentian.



Gentiana acaulis, L.
mill. dict.
Sm. pl. 2. 28

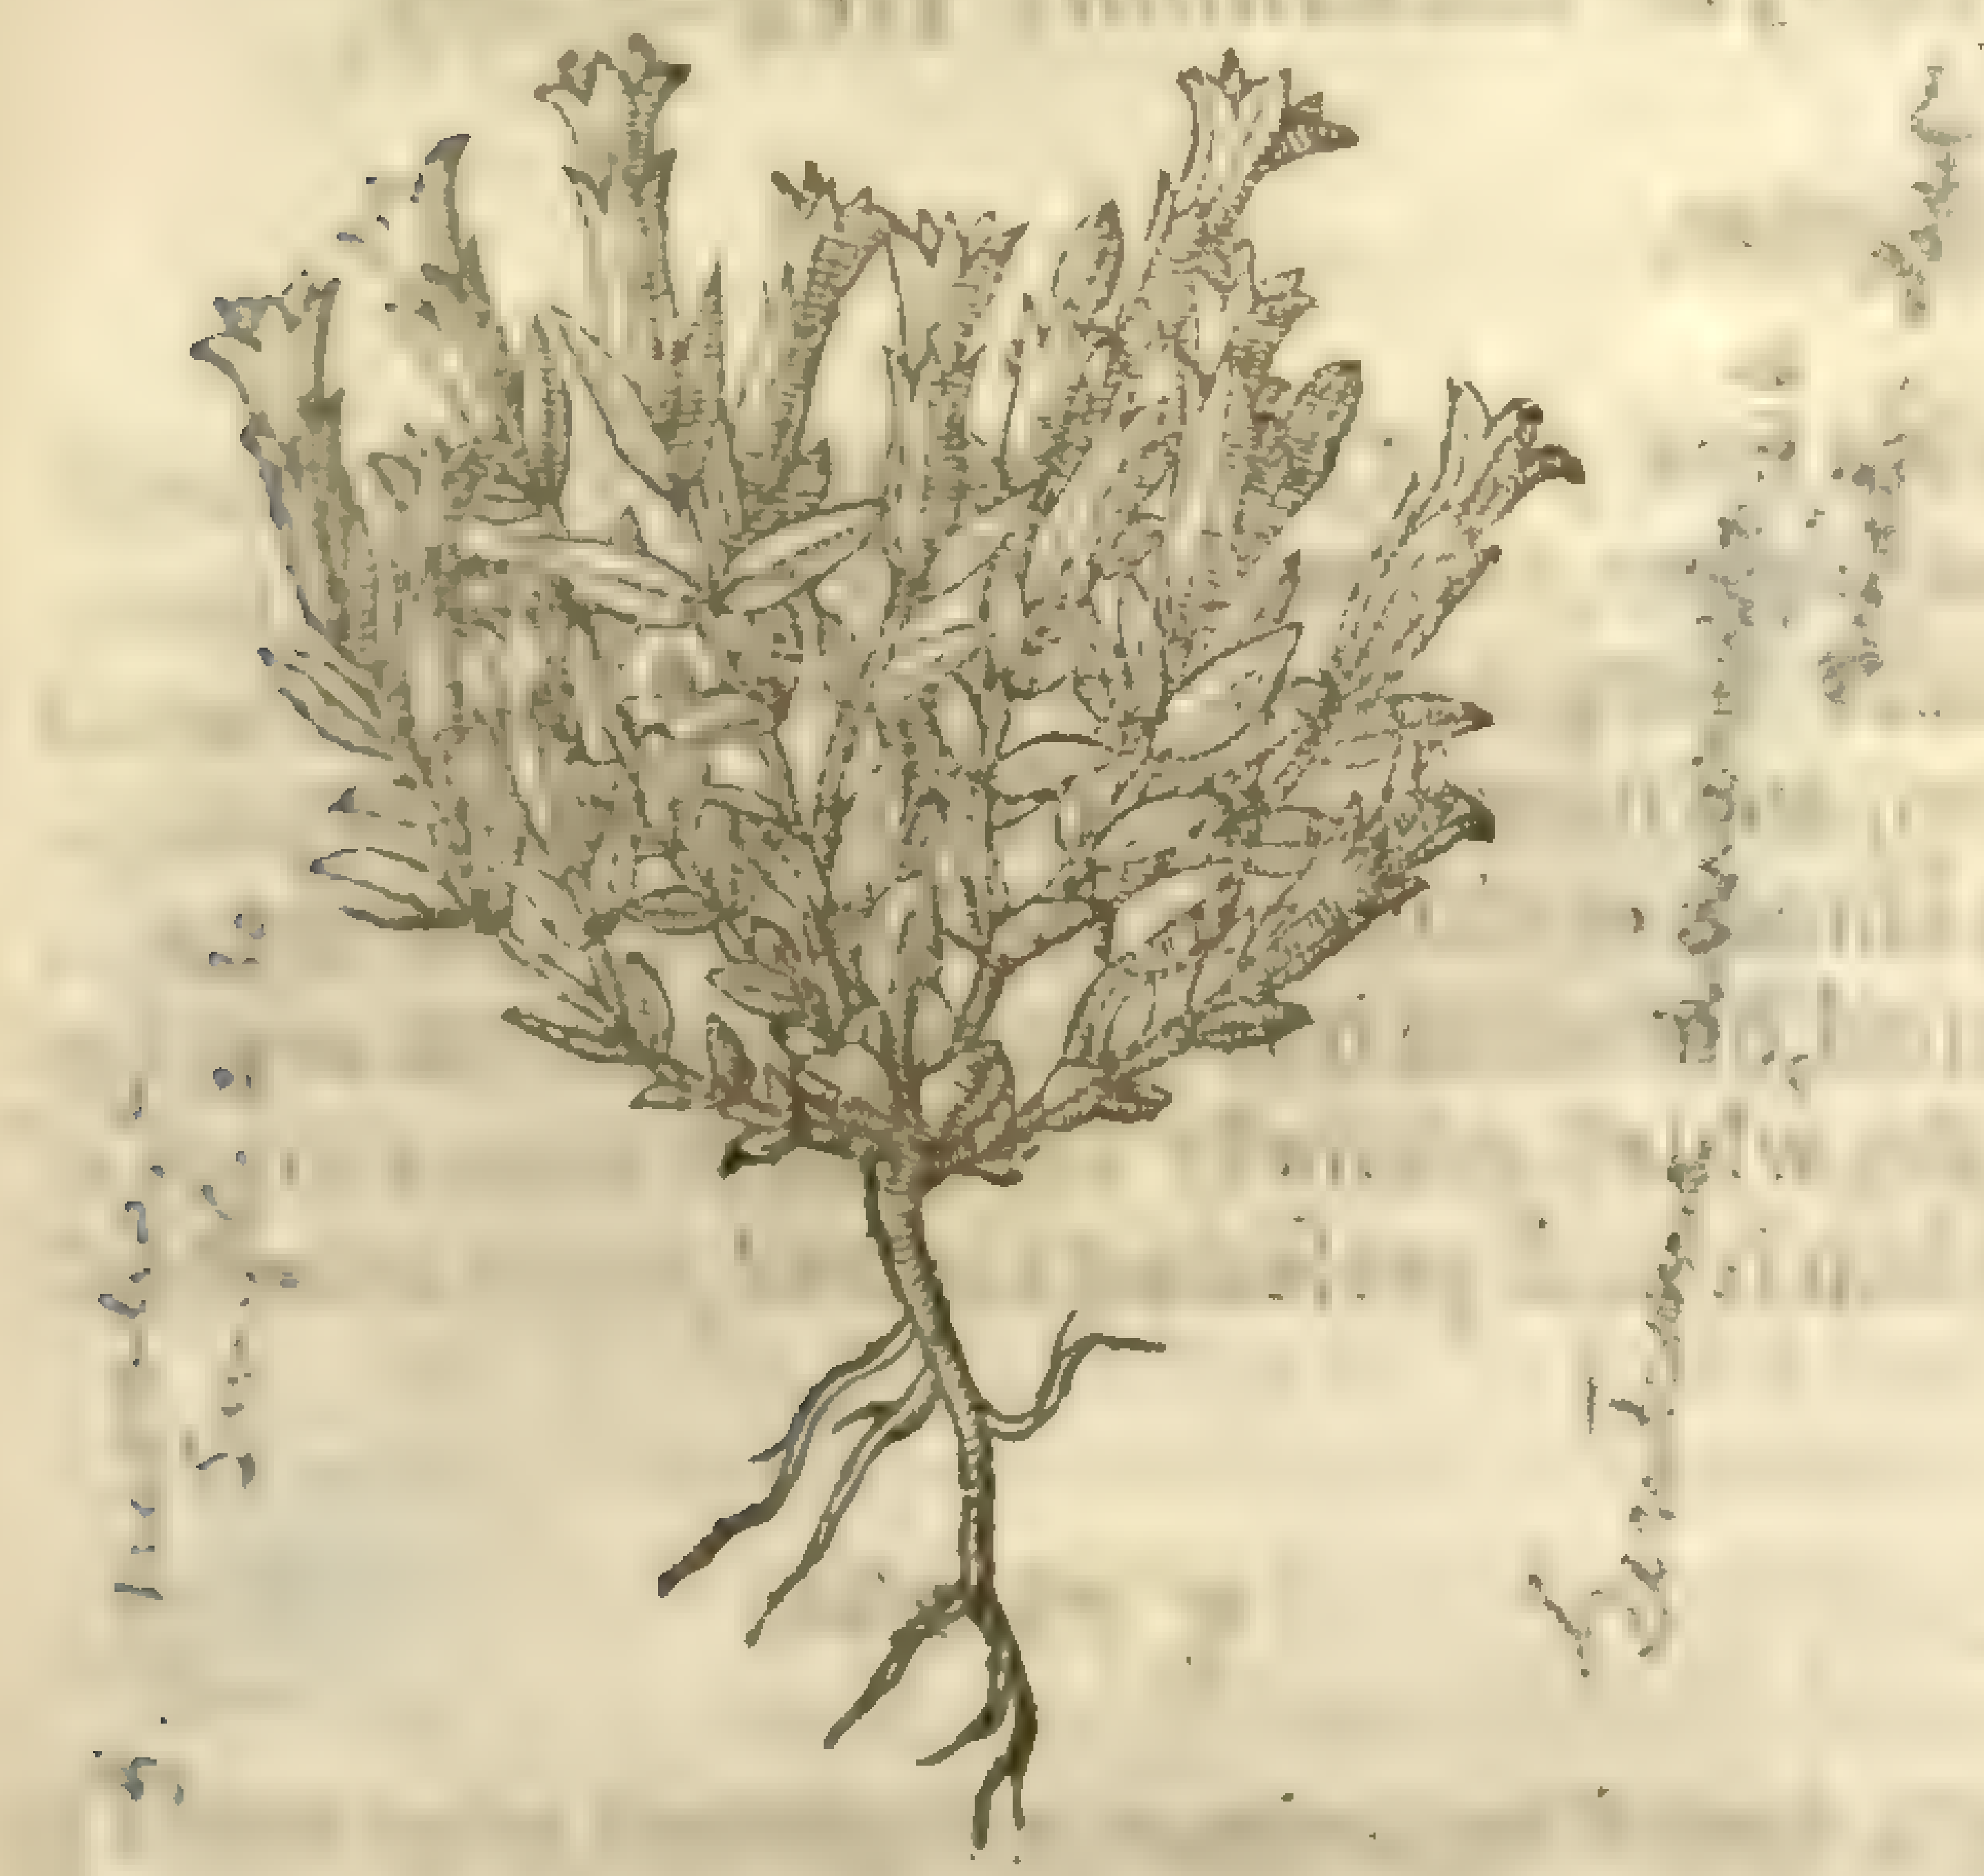
2 *Gentianella Alpina verna.*
Alpes Felwoort of the Spring time.



Gentiana Verna, L.
mill. dict.
Sm. pl. 2. 29

2 This ſecond riſes vp with a ſingle ſlender and purpliſh ſtalke, ſet at certaine ſpaces with ſix or eight little ribbed leaues, ſtanding by couples one againſt another. At the top ſtands a cup, out whereof comes one long floure without ſmell, and as it were diuided at the top into fiue parts; and it is of ſo elegant a colour, that it ſeemes to exceed blewneſſe it ſelfe; each of the foldes or little leaues of the floure hath a whitiſh line at the ſide, and other fiue as it were pointed leaues or appendices ſet between them: and in the middeſt of the floure are certaine pale coloured chiues: a longiſh ſharpe pointed veſſell ſucceeds the floure which containes a ſmall hard round ſeed. The root is ſmall, yellowiſh and creeping, putting vp here and there ſtalkes bearing floures, and in other places onely leaues lying orderly ſpread vpon the ground.

3 *Gentianella fugax minor.*
Baſtard or Dwarfe Felwoort.



3 Beſides theſe two whoſe roots laſt long and increaſe euery yeare, there are diuers other Dwarfe or baſtard Gentians which are annuall, and wholly periſh euery yeare aſſoone as they haue perfected their ſeed; and therefore by *Cluſius* they are fitly called *Gentianæ fugaces*. Of theſe I haue onely obſerued two kindes (or rather varieties) in this Kingdome, which I will here deſcribe vnto you. The firſt of theſe, which is the leſſer, and whoſe figure wee here giue you, is a proper plant ſome two or three inches high, diuided immediately from the root into three, foure, or more branches, ſet at certaine ſpaces with little longiſh leaues, being broadeſt at the ſetting on, and ſo growing narrower or ſharper pointed. The tops of theſe ſtalkes are beautified with long, hollow, and pretty large floures, conſidering the magnitude of the plant, and theſe floures are of a darke purpliſh colour, and at their tops diuided into fiue parts. The root is yellowiſh, ſmall, and wooddy. The ſeed which is ſmall and round is contained in longiſh veſſels. The ſtalkes and leaues are commonly of a darke greene, or elſe of a browniſh colour.

4 This from a root like, yet a little larger than the former, ſends vp a pretty ſtiffe round ſtalke of ſome ſpan high, which at certaine ſpaces is ſet with ſuch leaues as the laſt deſcribed, but larger: and out of the boſomes of theſe leaues from the bottome to the top of the ſtalke come forth little foot-ſtalkes, which vſually carry three floures a piece; two ſet one againſt another, and the third vpon a ſtalke ſomewhat higher; and ſometimes there comes forth a ſingle floure at the root of theſe foot-ſtalkes. The floures in their ſhape, magnitude and colour, are like thoſe of the laſt mentioned, and alſo the ſeed and ſeed veſſels. The manner of growing of this is very well preſented by the figure of the third Gentian, formerly deſcribed in the chapter laſt ſaue one aforegoing.

¶ *The Place.*

1 2 Theſe grow not wilde in England that I know of, but the former is to be found in moſt of our choiſe gardens. As with M^{r} *Parkinſon*, M^{r} *Tradeſcant*, and M^{r} *Tuggye*, &c.

3 4 Theſe are found in diuerſe places, as in the Chalke-dale at Dartford in Kent, and according to our Authour (for I know hee meant theſe) in Waterdowne Forreſt in Suſſex, in the way that leadeth from Charlewoods lodge, vnto the houſe of the Lord of Abergauenie, called Eridge houſe, by a brooke ſide there, eſpecially vpon a Heath by Colbrooke neere London: on the Plaine of Salisbury, hard by the turning from the ſaid Plain, vnto the right Honourable the Lord of Pembrooks houſe at Wilton, and vpon a Chalkie banke in the high way betweene Saint Albons and Goramberrie.

¶ *The Time.*

1 2 Theſe two floure in Aprill and May. The other from Auguſt vnto the end of October.

¶ *The Names.*

1 This is the *Gentiana* 4. of *Tragus*. The *Gentianella Alpina* of *Geſner*. *Gentianella campanulæ flore* and *Heluetica* of *Lobel*; the *Gentiana* 5. or *Gentianella major verna* of *Cluſius*.

2 *Geſner* called this *Calathiana verna*: *Lobel*, *Gentianella Alpina*: and *Cluſius*, *Gentiana* 6. and *Gentianella minor verna*.

3 This is the *Calathiana vera* of *Daleſchampius*: and the *Gentiana fugax* 5. or *Gentiana* 11. *minima* of *Cluſius*.

4 I take this to be *Cluſius* his *Gentiana fugax* 4. or *Gentiana* 10. We may call this in Engliſh, Small Autumne Gentian.

¶ *The Temperature and Vertues.*

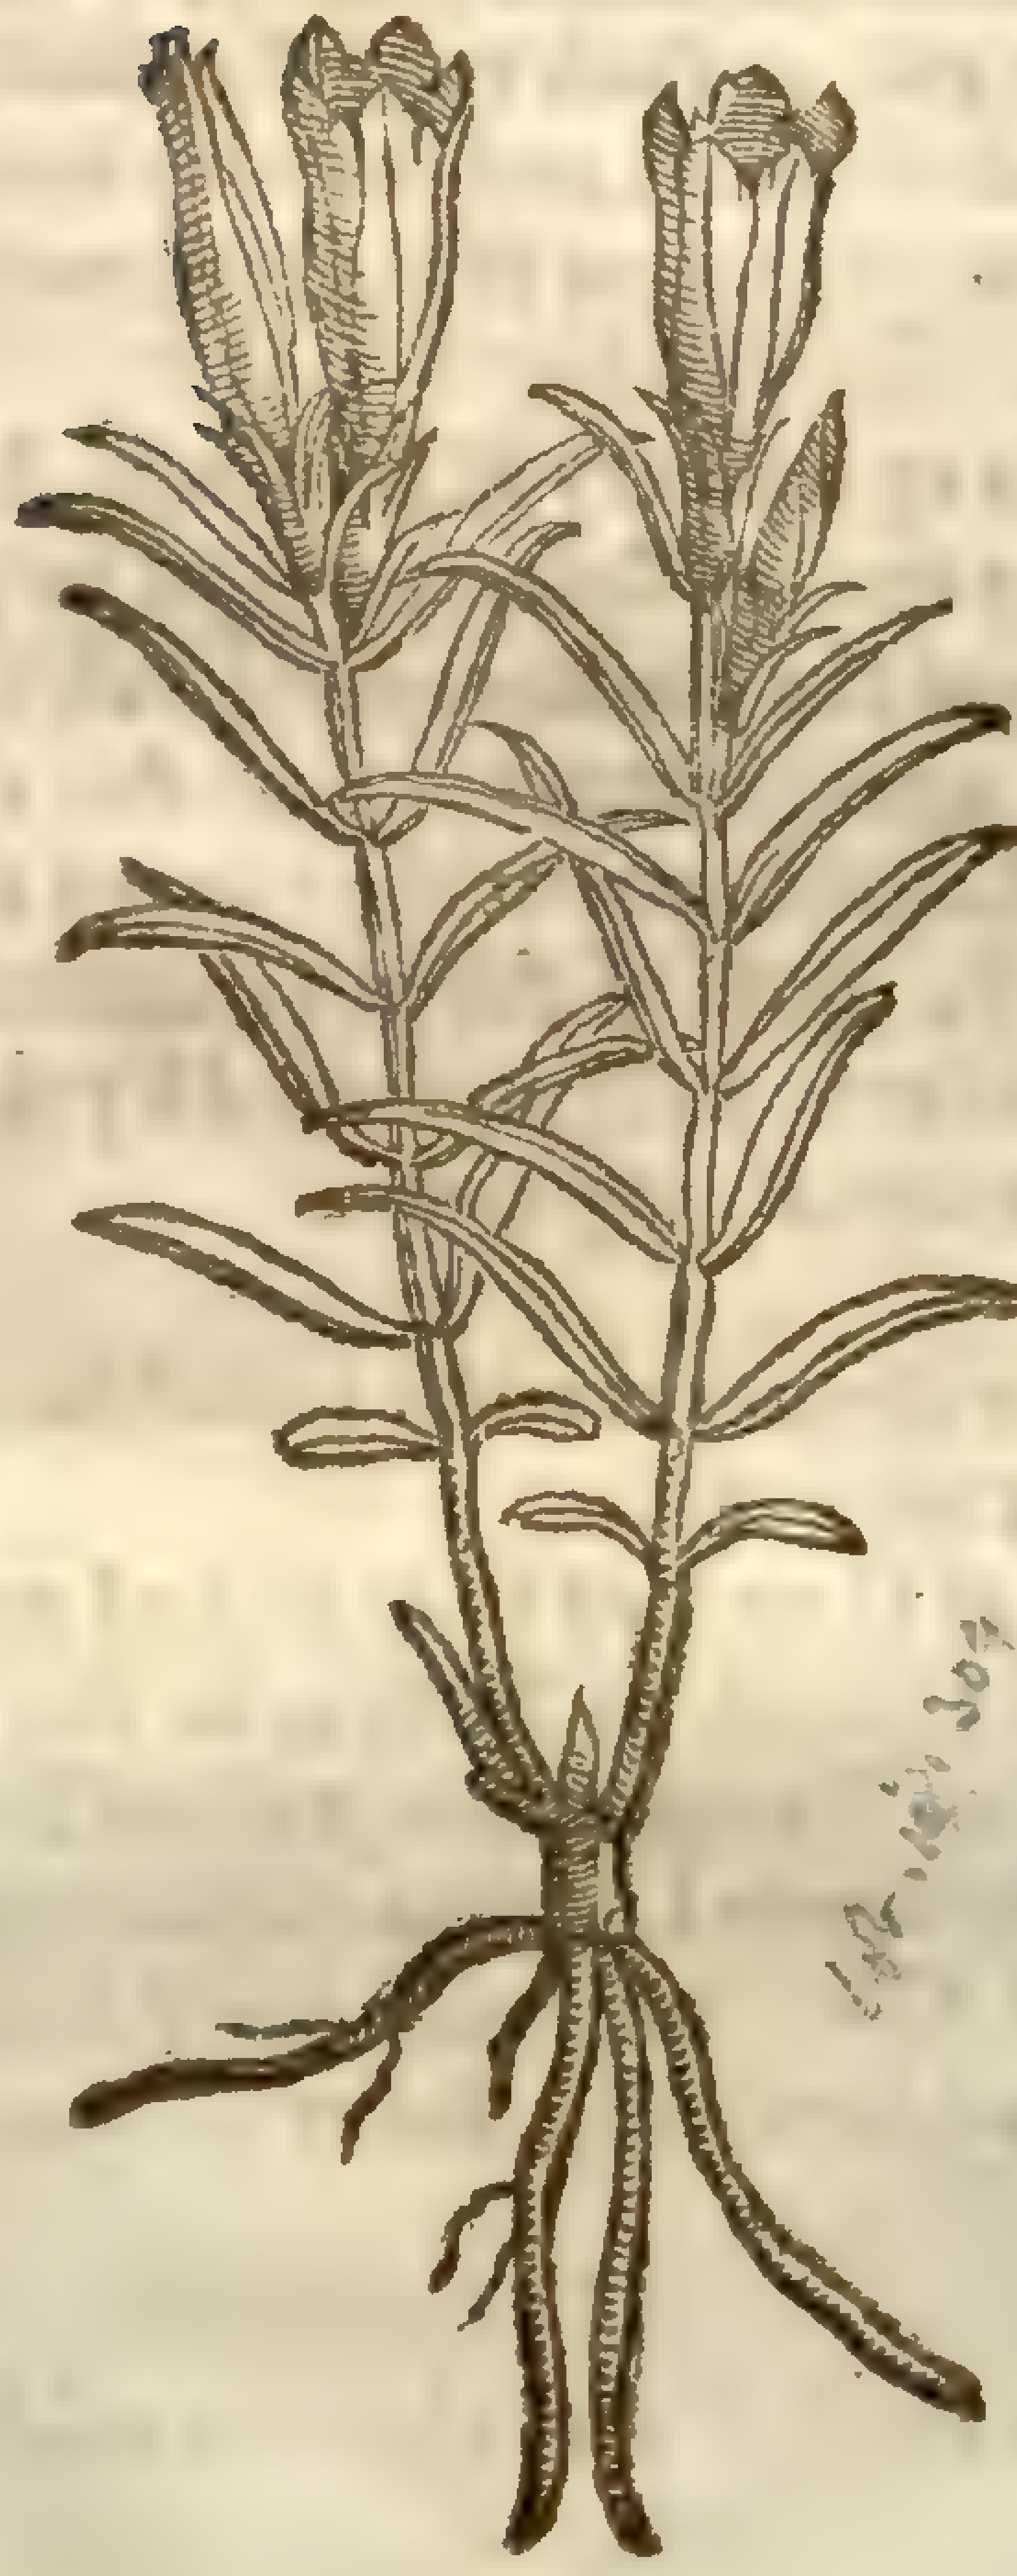
Theſe by their taſte and forme ſhould be much like to the greater Gentians in the operation and working, yet not altogether ſo effectuall.

Chap. 108. *Of Calathian Violet, or Autumne Bell-floure.*

¶ *The Deſcription.*

AMong the number of the baſe Gentians there is a ſmal plant, which is late before it commeth vp, hauing ſtalkes a ſpan high, and ſometimes higher, narrow leaues like vnto Time, ſet by couples about the ſtalkes by certaine diſtances: long narrow floures growing at the top of the ſtalkes, like a cup called a Beaker, wide at the top, and narrower toward the bottome, of a deepe blew colour tending to purple, with certaine white threds or chiues in the bottome: the floure at the mouth or brim is fiue cornered before it be opened, but when it is opened it appeareth with fiue clifts or pleats. The whole plant is of a bitter taſte, which plainely ſheweth it to be a kinde of wilde Gentian. The root is ſmall, and periſheth when it hath perfected his ſeed, and recouereth it ſelfe by falling of the ſame.

Pneumonanthe.
Calathian Violet.



Gentiana pneumonanthe, L. [illegible] Sm. Fl. [illegible]

¶ *The Place.*

It is found ſometimes in Medowes, oftentimes in vntilled places. It groweth vpon Long-field downes in Kent, neere vnto a village called Longfield by Graueſend, vpon the Chalkie cliffes neere Greene-Hythe and Cobham in Kent, and many other places. It likewiſe groweth as you ride from Sugar-loafe hil vnto Bathe, in the Weſt-country.

‡ This plant I neuer found but once, and that was on a wet Mooriſh ground in Lincolnſhire, two or three miles on this ſide Caſter, and as I remember, the place is called Netleton Moore. Now I ſuſpect that our Author knew it not; firſt, becauſe he deſcribes it with leaues like vnto Time, when as this hath long narrow leaues more like to Hyſſop or Roſemary. Secondly, for that hee ſaith the root is ſmall and periſheth when as it hath perfected the ſeed: whereas this hath a liuing, ſtringie and creeping root. Beſides, this ſeldome or neuer growes on chalkie cliffes, but on wet Mooriſh grounds and Heaths: wherefore I ſuſpect out Author tooke the ſmall Autumne Gentian (deſcribed by me in the fourth place of the laſt Chapter) for this here treated of. ‡

¶ *The Time.*

The gallant floures hereof bee in their brauery about the end of Auguſt, and in September.

¶ *The Names.*

‡ This is thought to be *Violo Calathiana* of *Ruellius*, yet not that of *Pliny*; and thoſe that deſire to know more of this may haue recourſe to the twelfth chapter of the firſt booke of the 2. *Pemp.* of *Dodon.* his Latine Herball, whence our Author tooke thoſe words that was formerly in this place, though he did not well vnderſtand nor expreſſe them ‡. it is called *Viola Autumnalis*, or Autumne Violet, and ſeemeth to be the ſame that *Valerius Cordus* doth call *Pneumonanthe*, which he ſaith is named in the Germane tongue, **Lungen blumen**, or Lung-floure: in Engliſh, Autumne Bel-floures, Calathian Violets, and of ſome, Harueſt-bels.

¶ *The Temperature.*

This wilde Felwoort or Violet is in Temperature hot, ſomewhat like in faculty to Gentian, whereof it is a kinde, but far weaker in operation.

¶ *The Vertues.*

The later Phyſitions hold it to be effectuall againſt peſtilent diſeaſes, and the bitings and ſtingings of venomous beaſts.

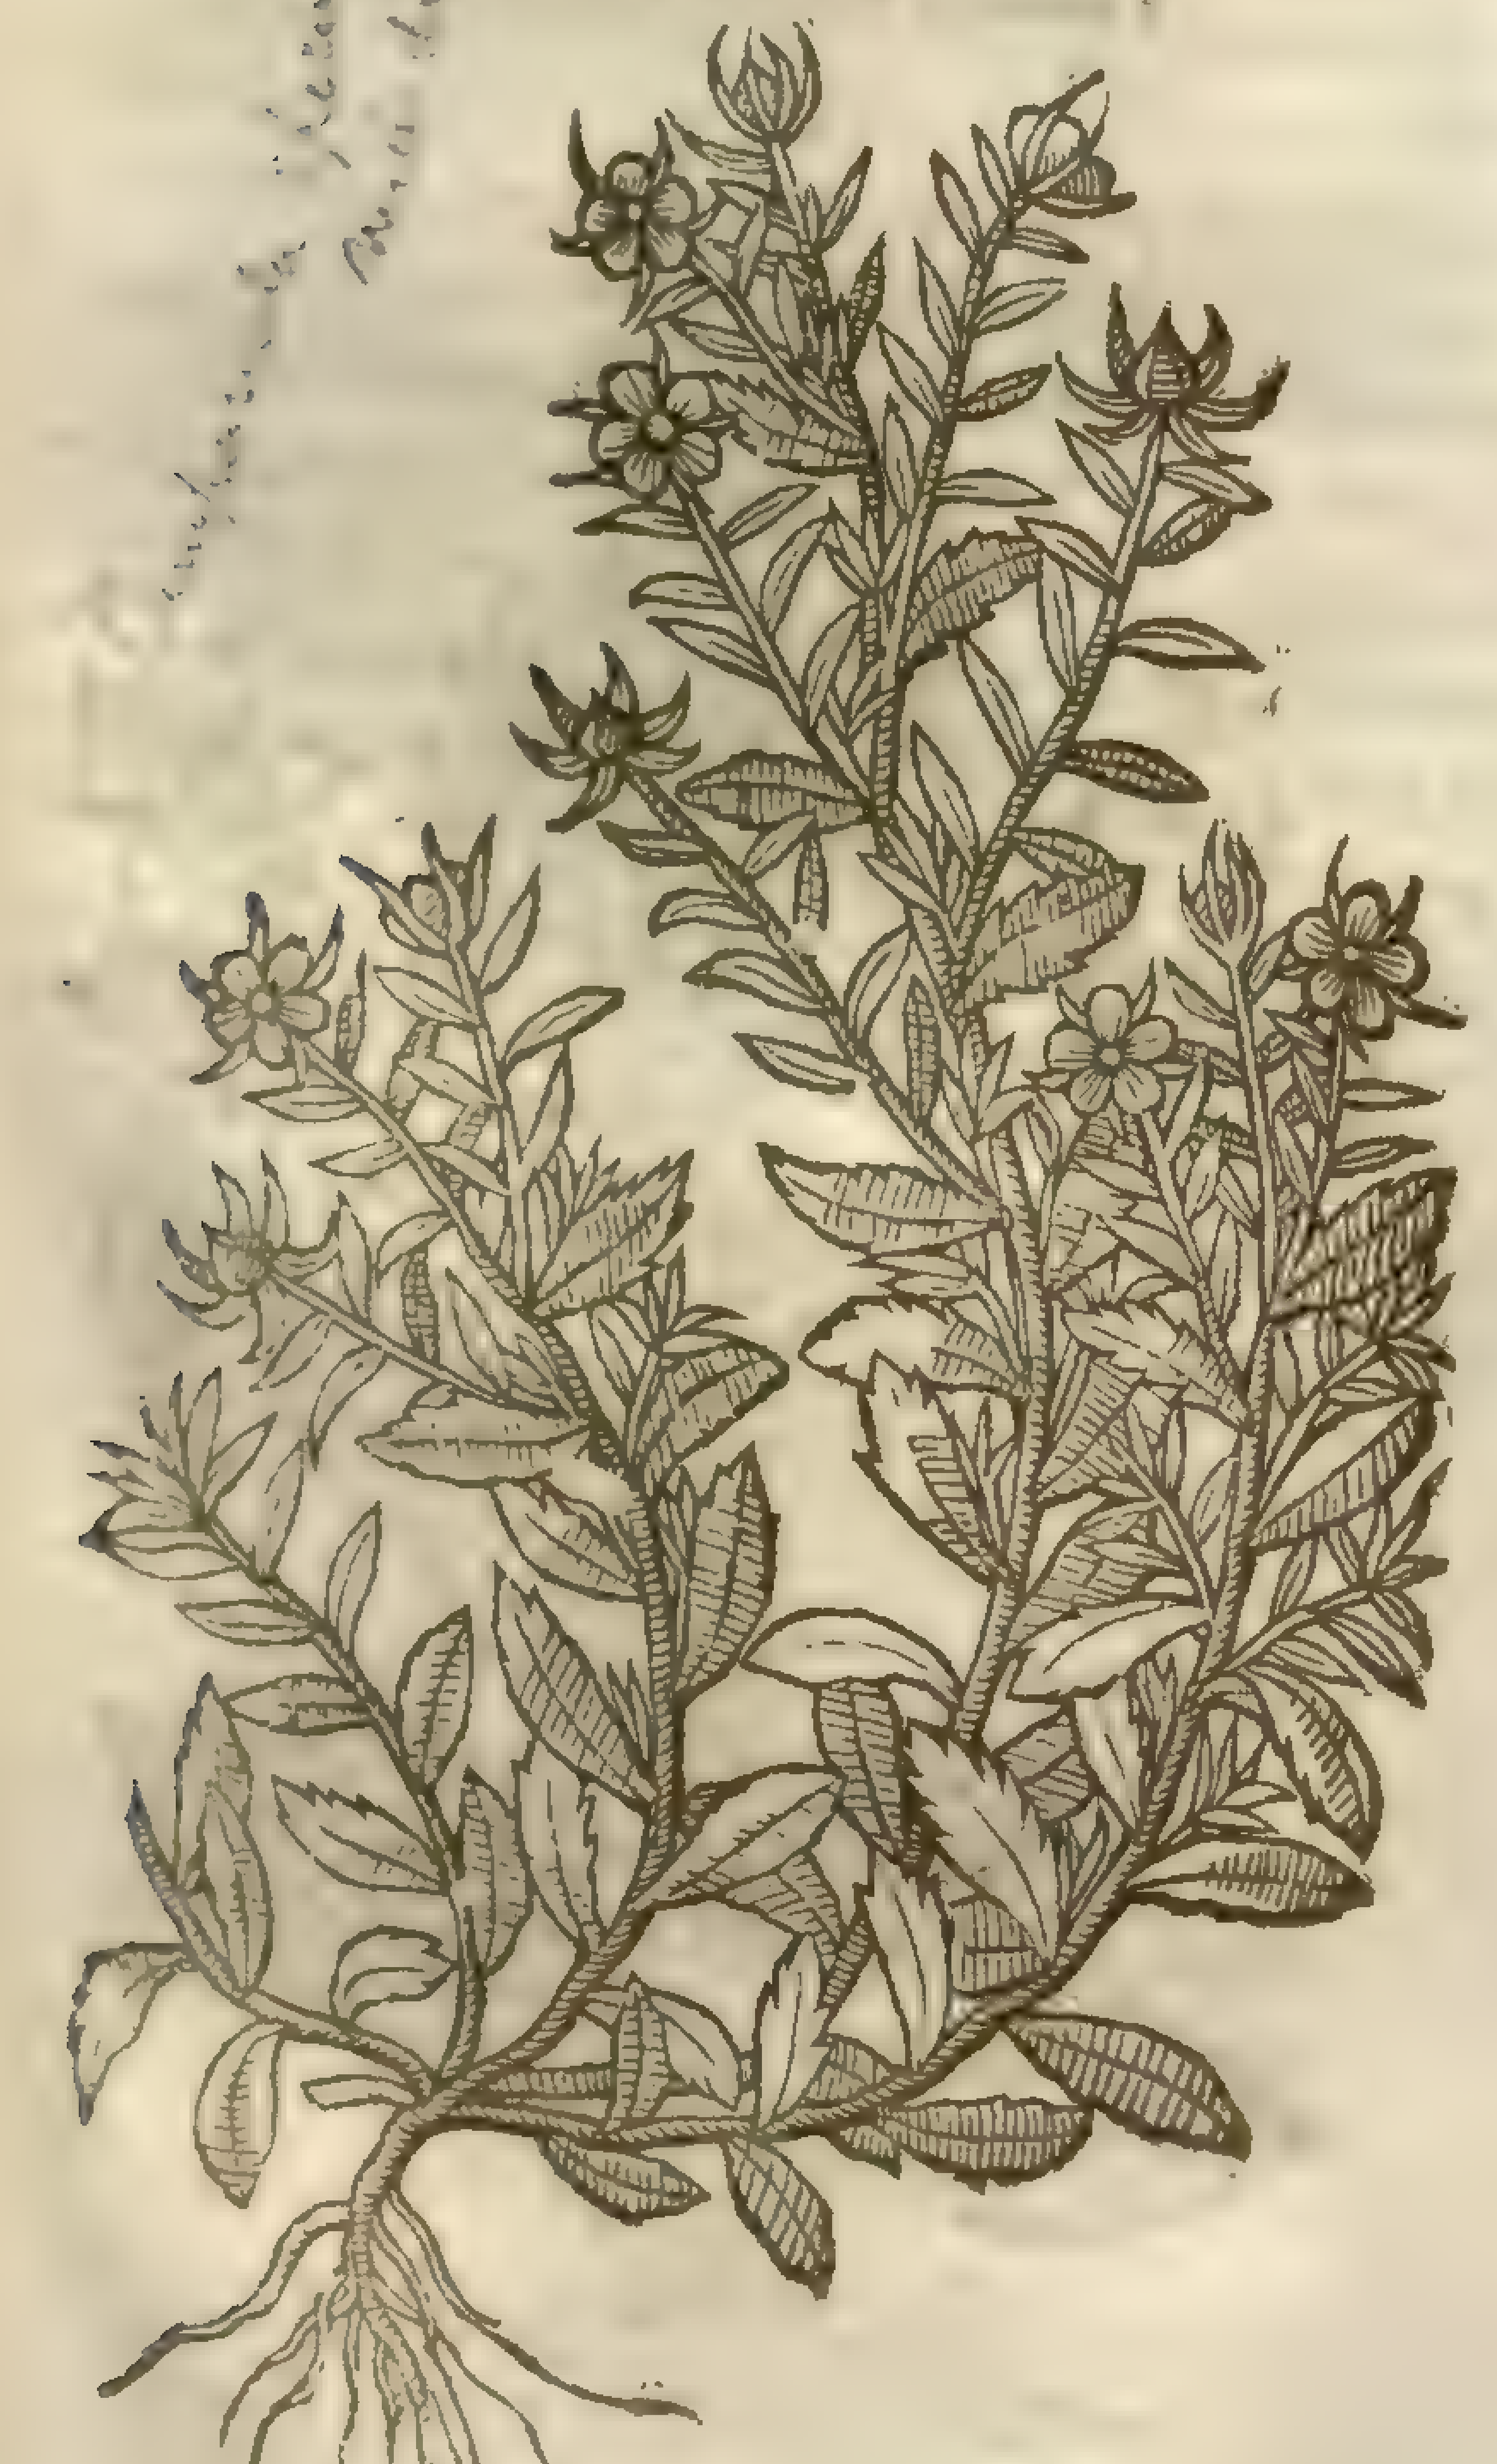
Chap. 109. *Of Venus Looking-glaſſe.*

¶ *The Deſcription.*

1 Beſides the former Bel-floures there is likewiſe a certaine other which is low and little; the ſtalks whereof are tender, two ſpannes long, diuided into many branches moſt commonly lying vpon the ground: the leaues about the ſtalks are little, ſleightly nicked in the edges: the floures are ſmall, of a bright purple colour tending to blewneſſe, very beautiful, with wide mouthes like broad bells, hauing a white chiue or thred in the middle. The flours in the day time are wide open, and about the ſetting of the ſun are ſhut vp and cloſed faſt together in fiue corners, as they are before their firſt opening, and as the other Bell-floures are. The roots be very ſlender, and periſh when they haue perfected their ſeed.

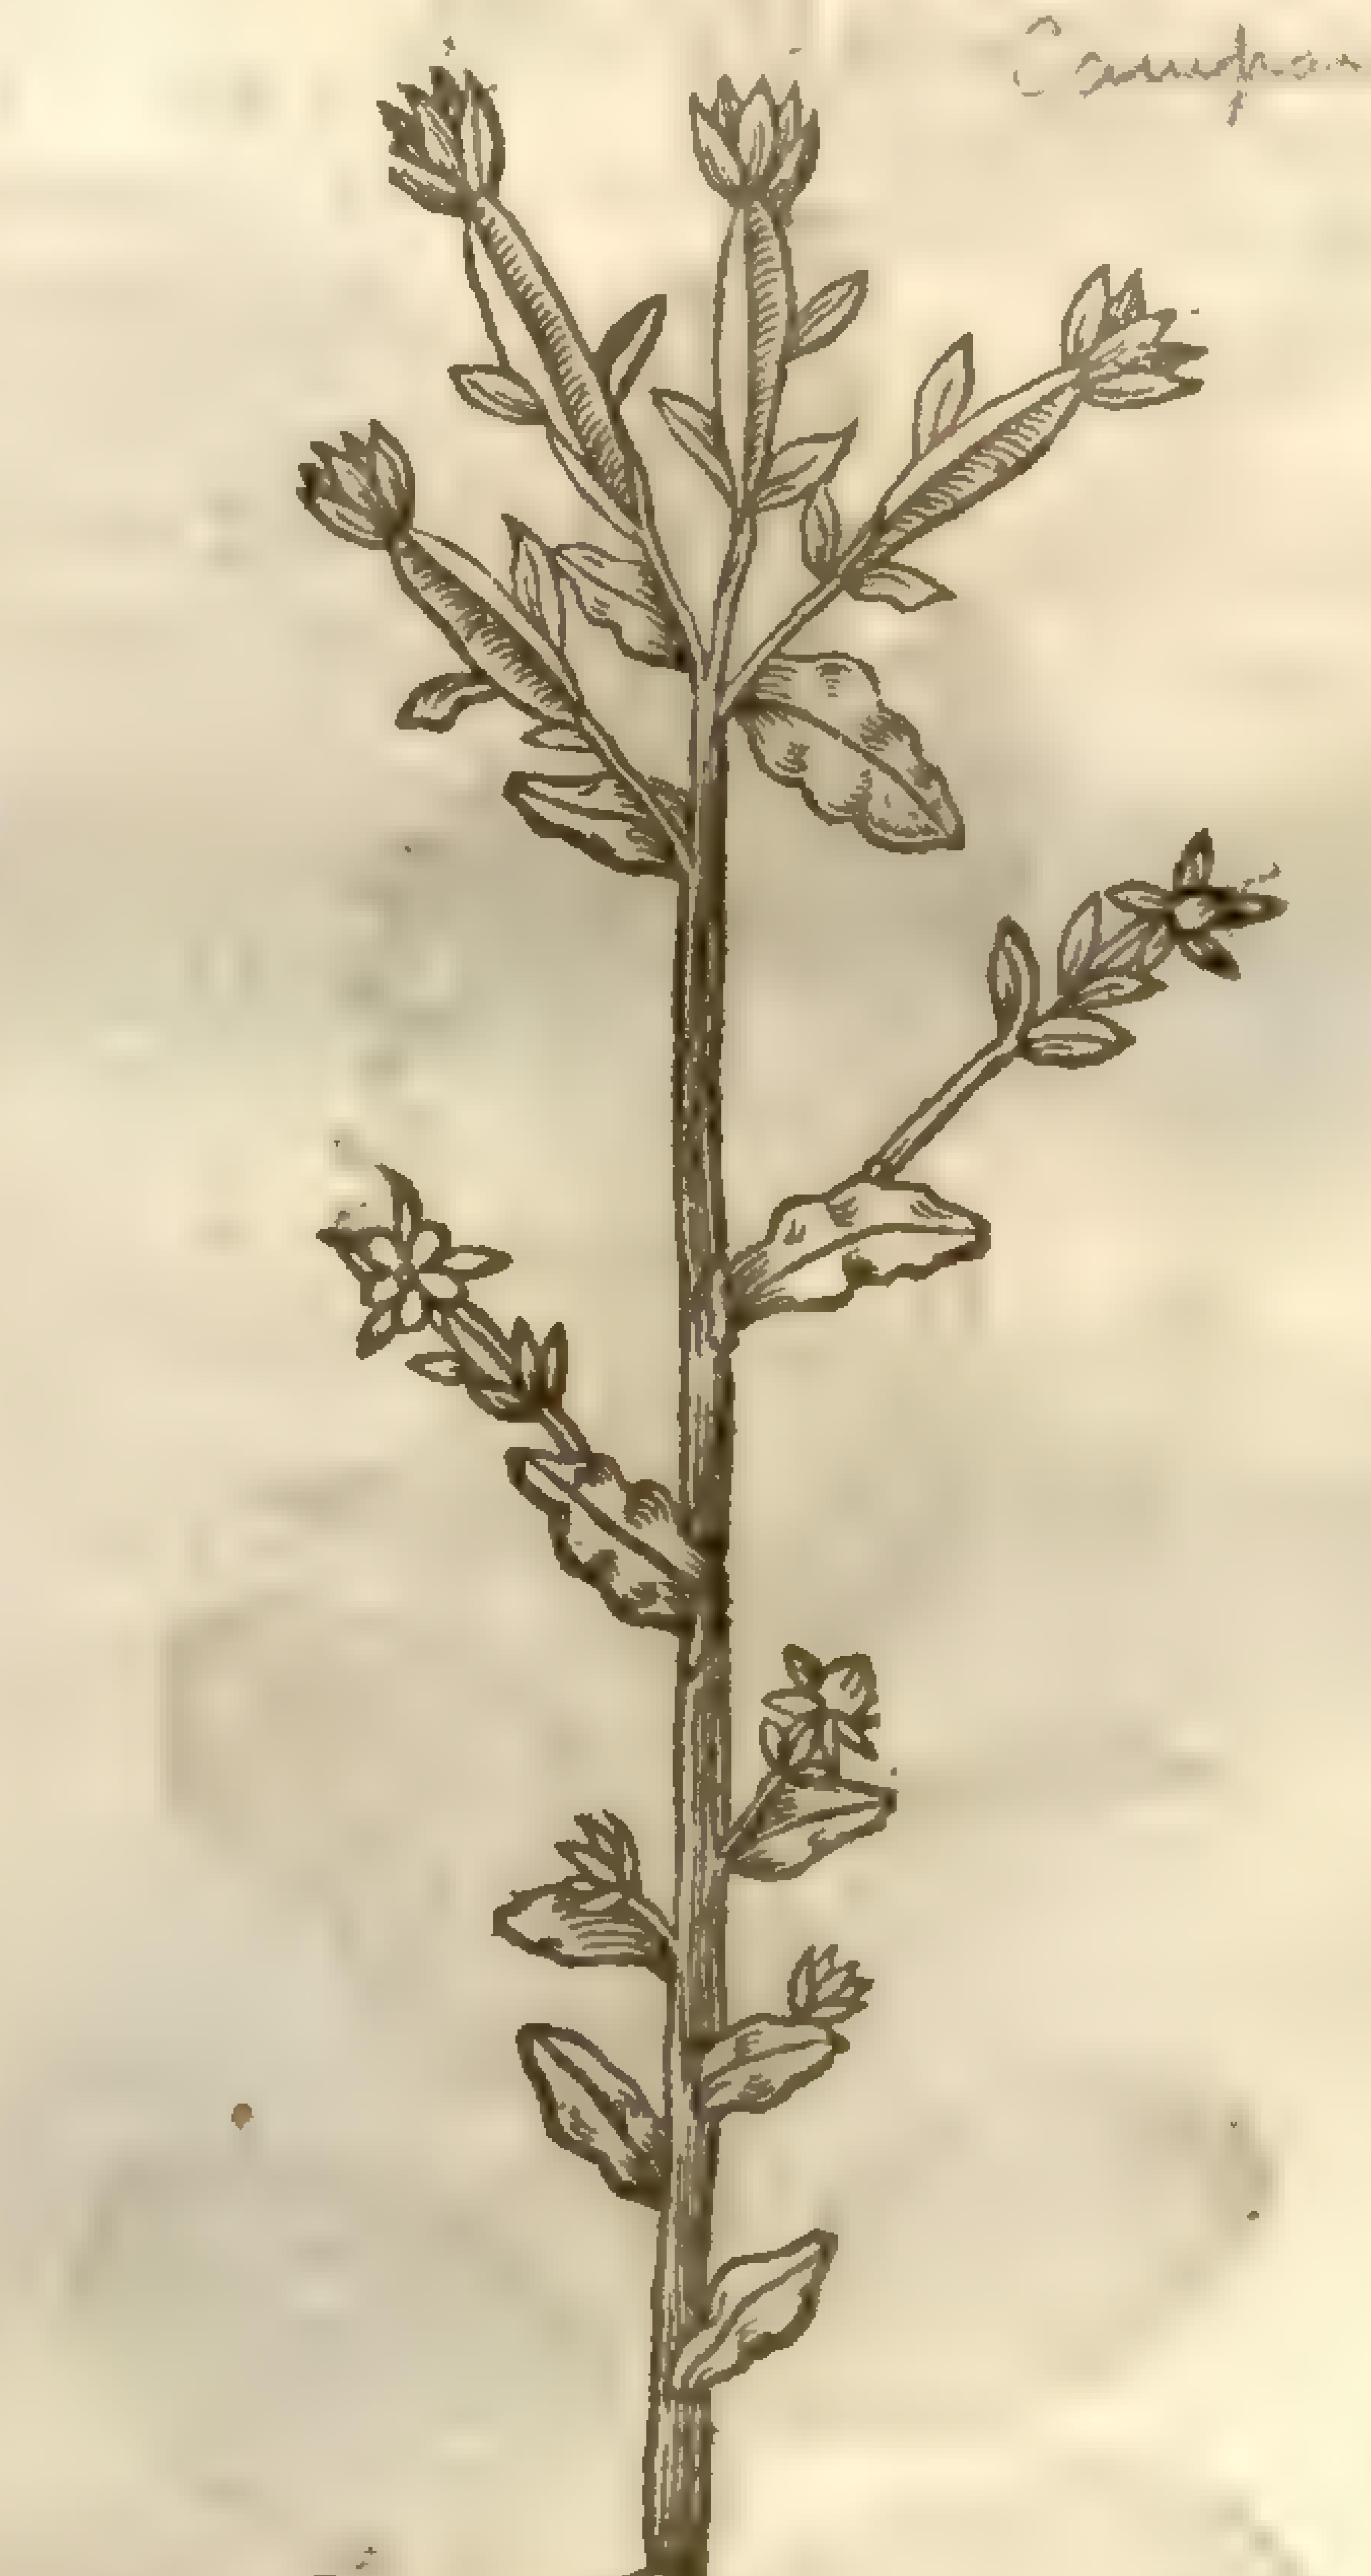
‡ 2 There is another, which from a ſmall and wooddy root ſendeth vp a ſtraight ſtalk, ſometimes but two or three inches, yet otherwhile a foot high, when as it lights into good ground. This ſtalke is creſted and hollow, hauing little longiſh leaues crumpled or ſinuated about the edges ſet thereon: and out of the boſome of thoſe leaues, towards the top of the ſtalke and ſomtimes lower, come little branches bearing little winged cods; at the tops of which in the midſt of fiue little greene leaues ſtand ſmall purple floures of little or no beauty: which being paſt, the cods become much larger, and containe in them a ſmall yellowiſh ſeed, and they ſtill retaine at their tops the fiue longiſh green leaues that incompaſſed the floure. The plant is an Annual like as the former. ‡

1 *Speculum Veneris.*
Venus Looking-glaſſe.



‡ 2 *Speculum Veneris minus.*
Codded Corn Violet.

Campanula [illegible]



¶ *The Place.*

It groweth in ploughed fields among the corne in a plentifull and fruitfull ſoile. I found it in a field among the corn by Greenhithe, as I went from thence toward Dartford in Kent, and in many other places thereabout, but not elſewhere; from whence I brought of the ſeeds for my garden, where they come vp of themſelues from yeare to yeare by falling of the ſeed.

‡ That which is here figured and deſcribed in the firſt place I neuer found growing in England,

land, I haue ſeene onely ſome branches of it brought from Leiden by my friend Mr *William Parker*. The other of my deſcription I haue diuers times found growing among the corne in Chelſey field, and alſo haue had it brought me from other places by Mr *George Bowles* and Mr *Leonard Buckner*. ‡

¶ *The Time.*

It floureth in Iune and Iuly, and the ſeed is ripe in the end of Auguſt.

¶ *The Names.*

It is called *Campanula Aruenſis*, and of ſome *Onobrychis*, but vnproperly: of other, *Caryophyllus Segetum*, or Corn Gillofloure, or Corn Pink, and *Speculum Veneris*, or Ladies Glaſſe: the Brabanders in their tongue call it **Urowen Spiegel.**

‡ *Tabernamontanus* hath two figures thereof, the one vnder the name of *Viola aruenſis*, and the other by the title of *Viola Pentagonia*, becauſe the floure hath fiue folds or corners. 2 This of my deſcription is not mentioned by any Author, wherefore I am content to follow that name which is giuen to the former, and terme it in Latine *Speculum Veneris minus*; and from the colour of the floure and codded ſeed-veſſell to call it Codded Corn Violet. ‡

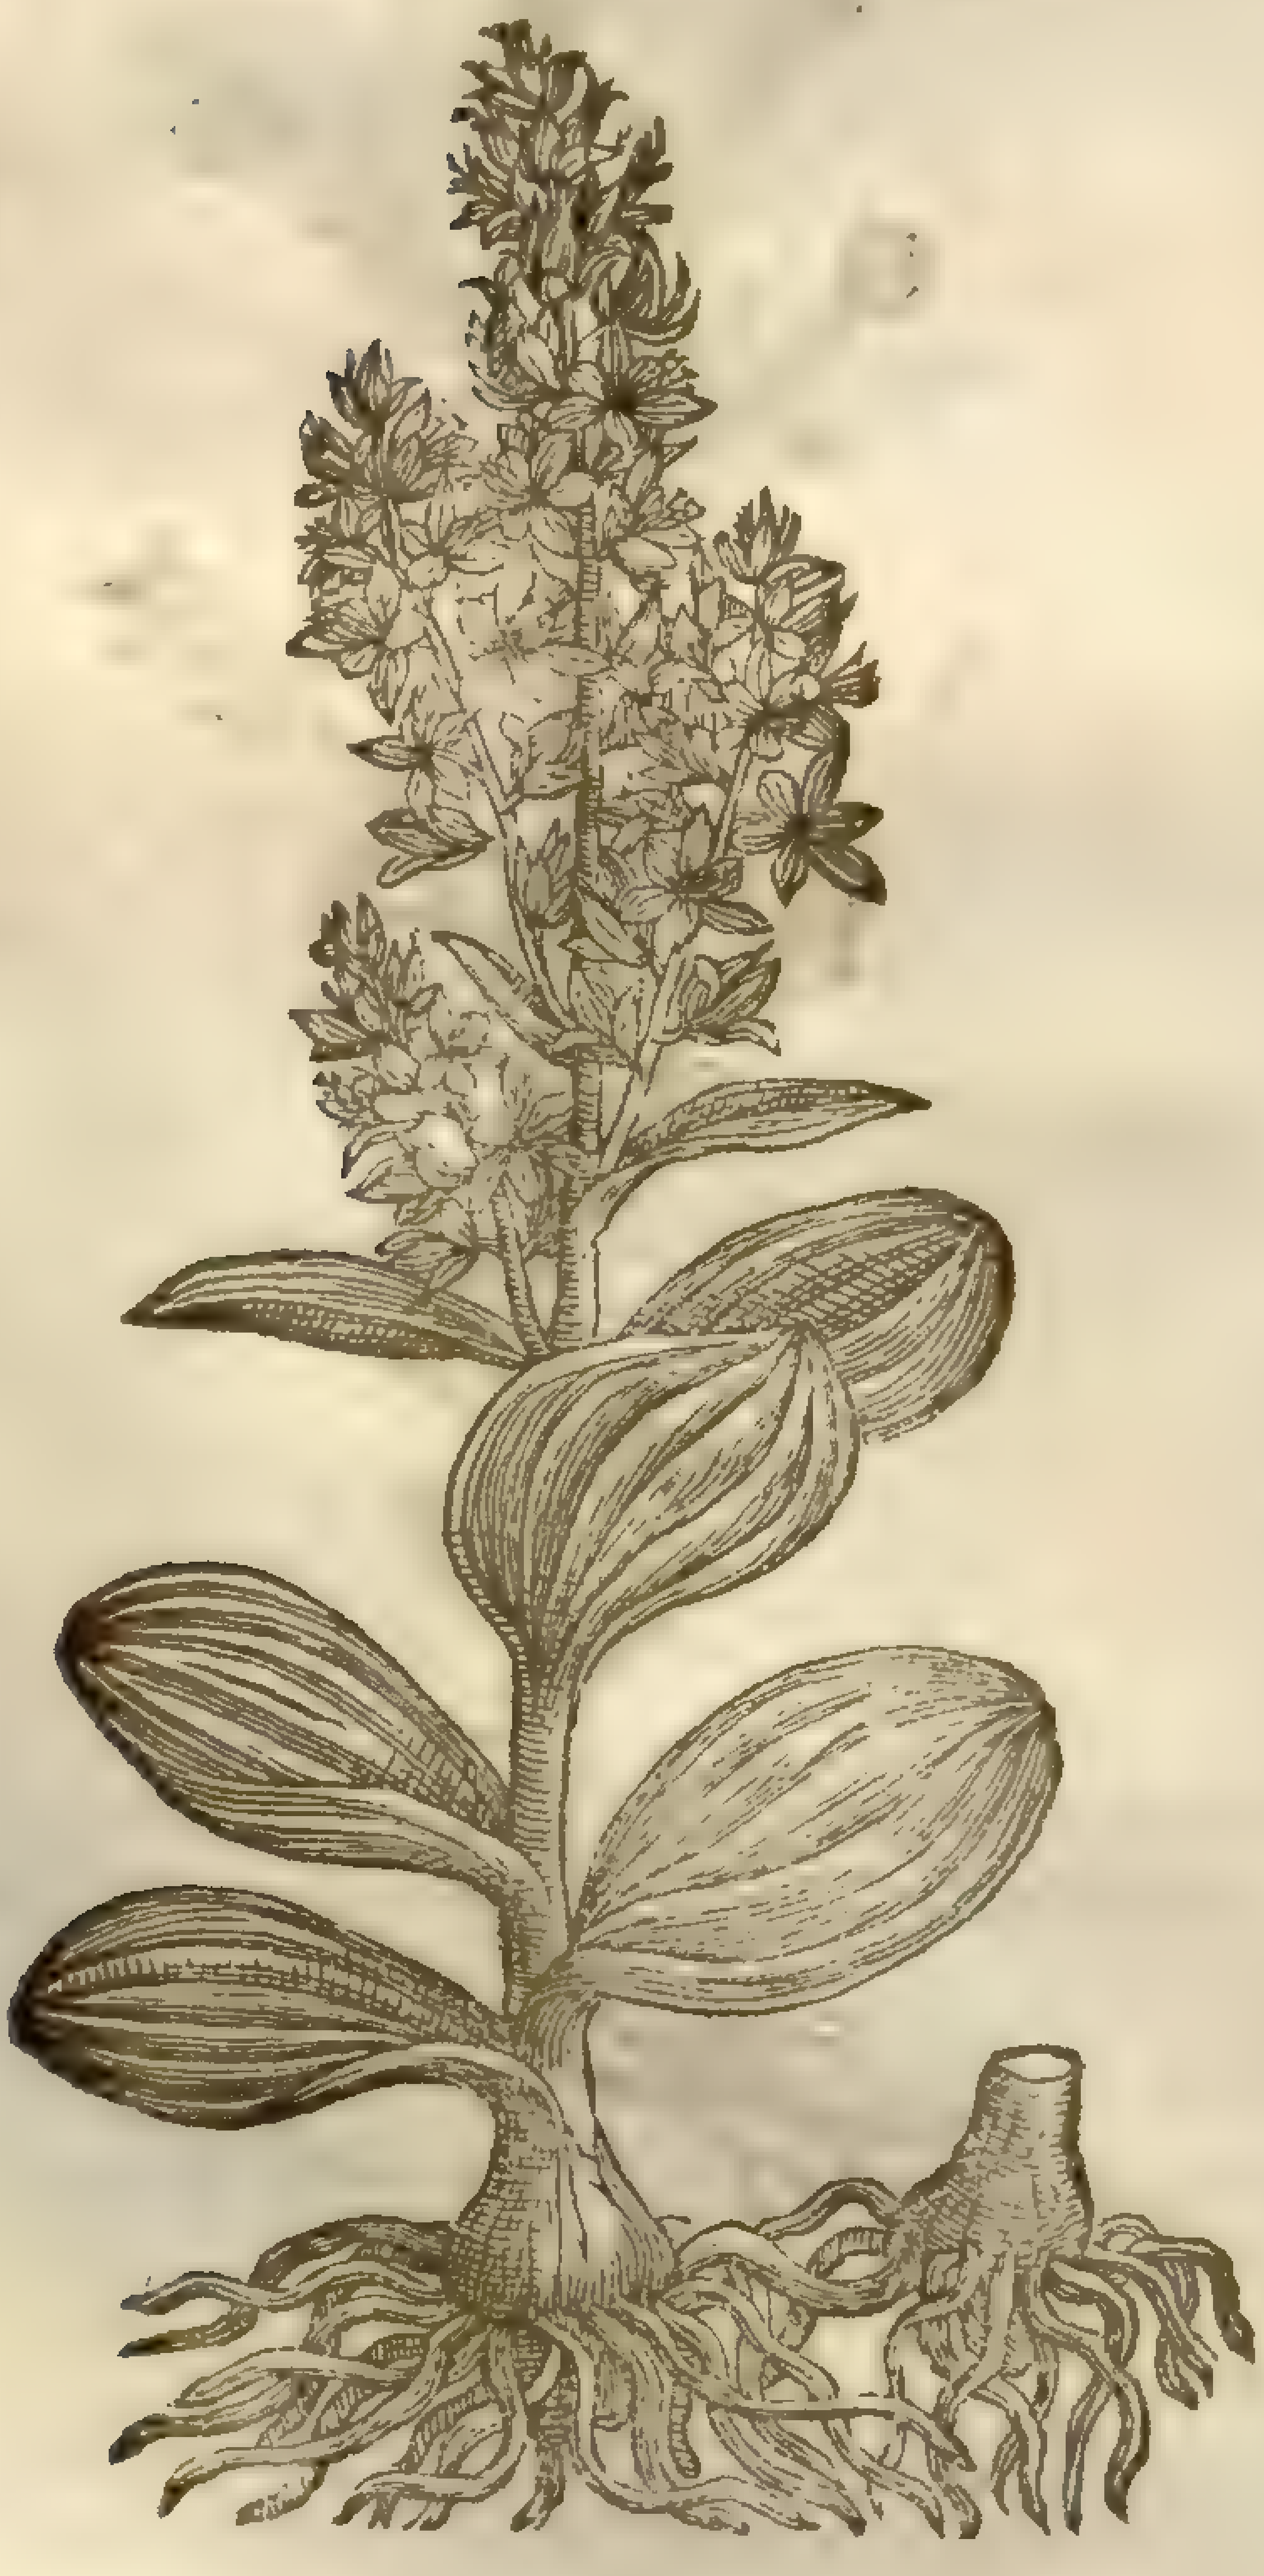
¶ *The Temperature and Vertues.*

We haue not found any thing written either of his vertue or temperature, of the antient or later Writers.

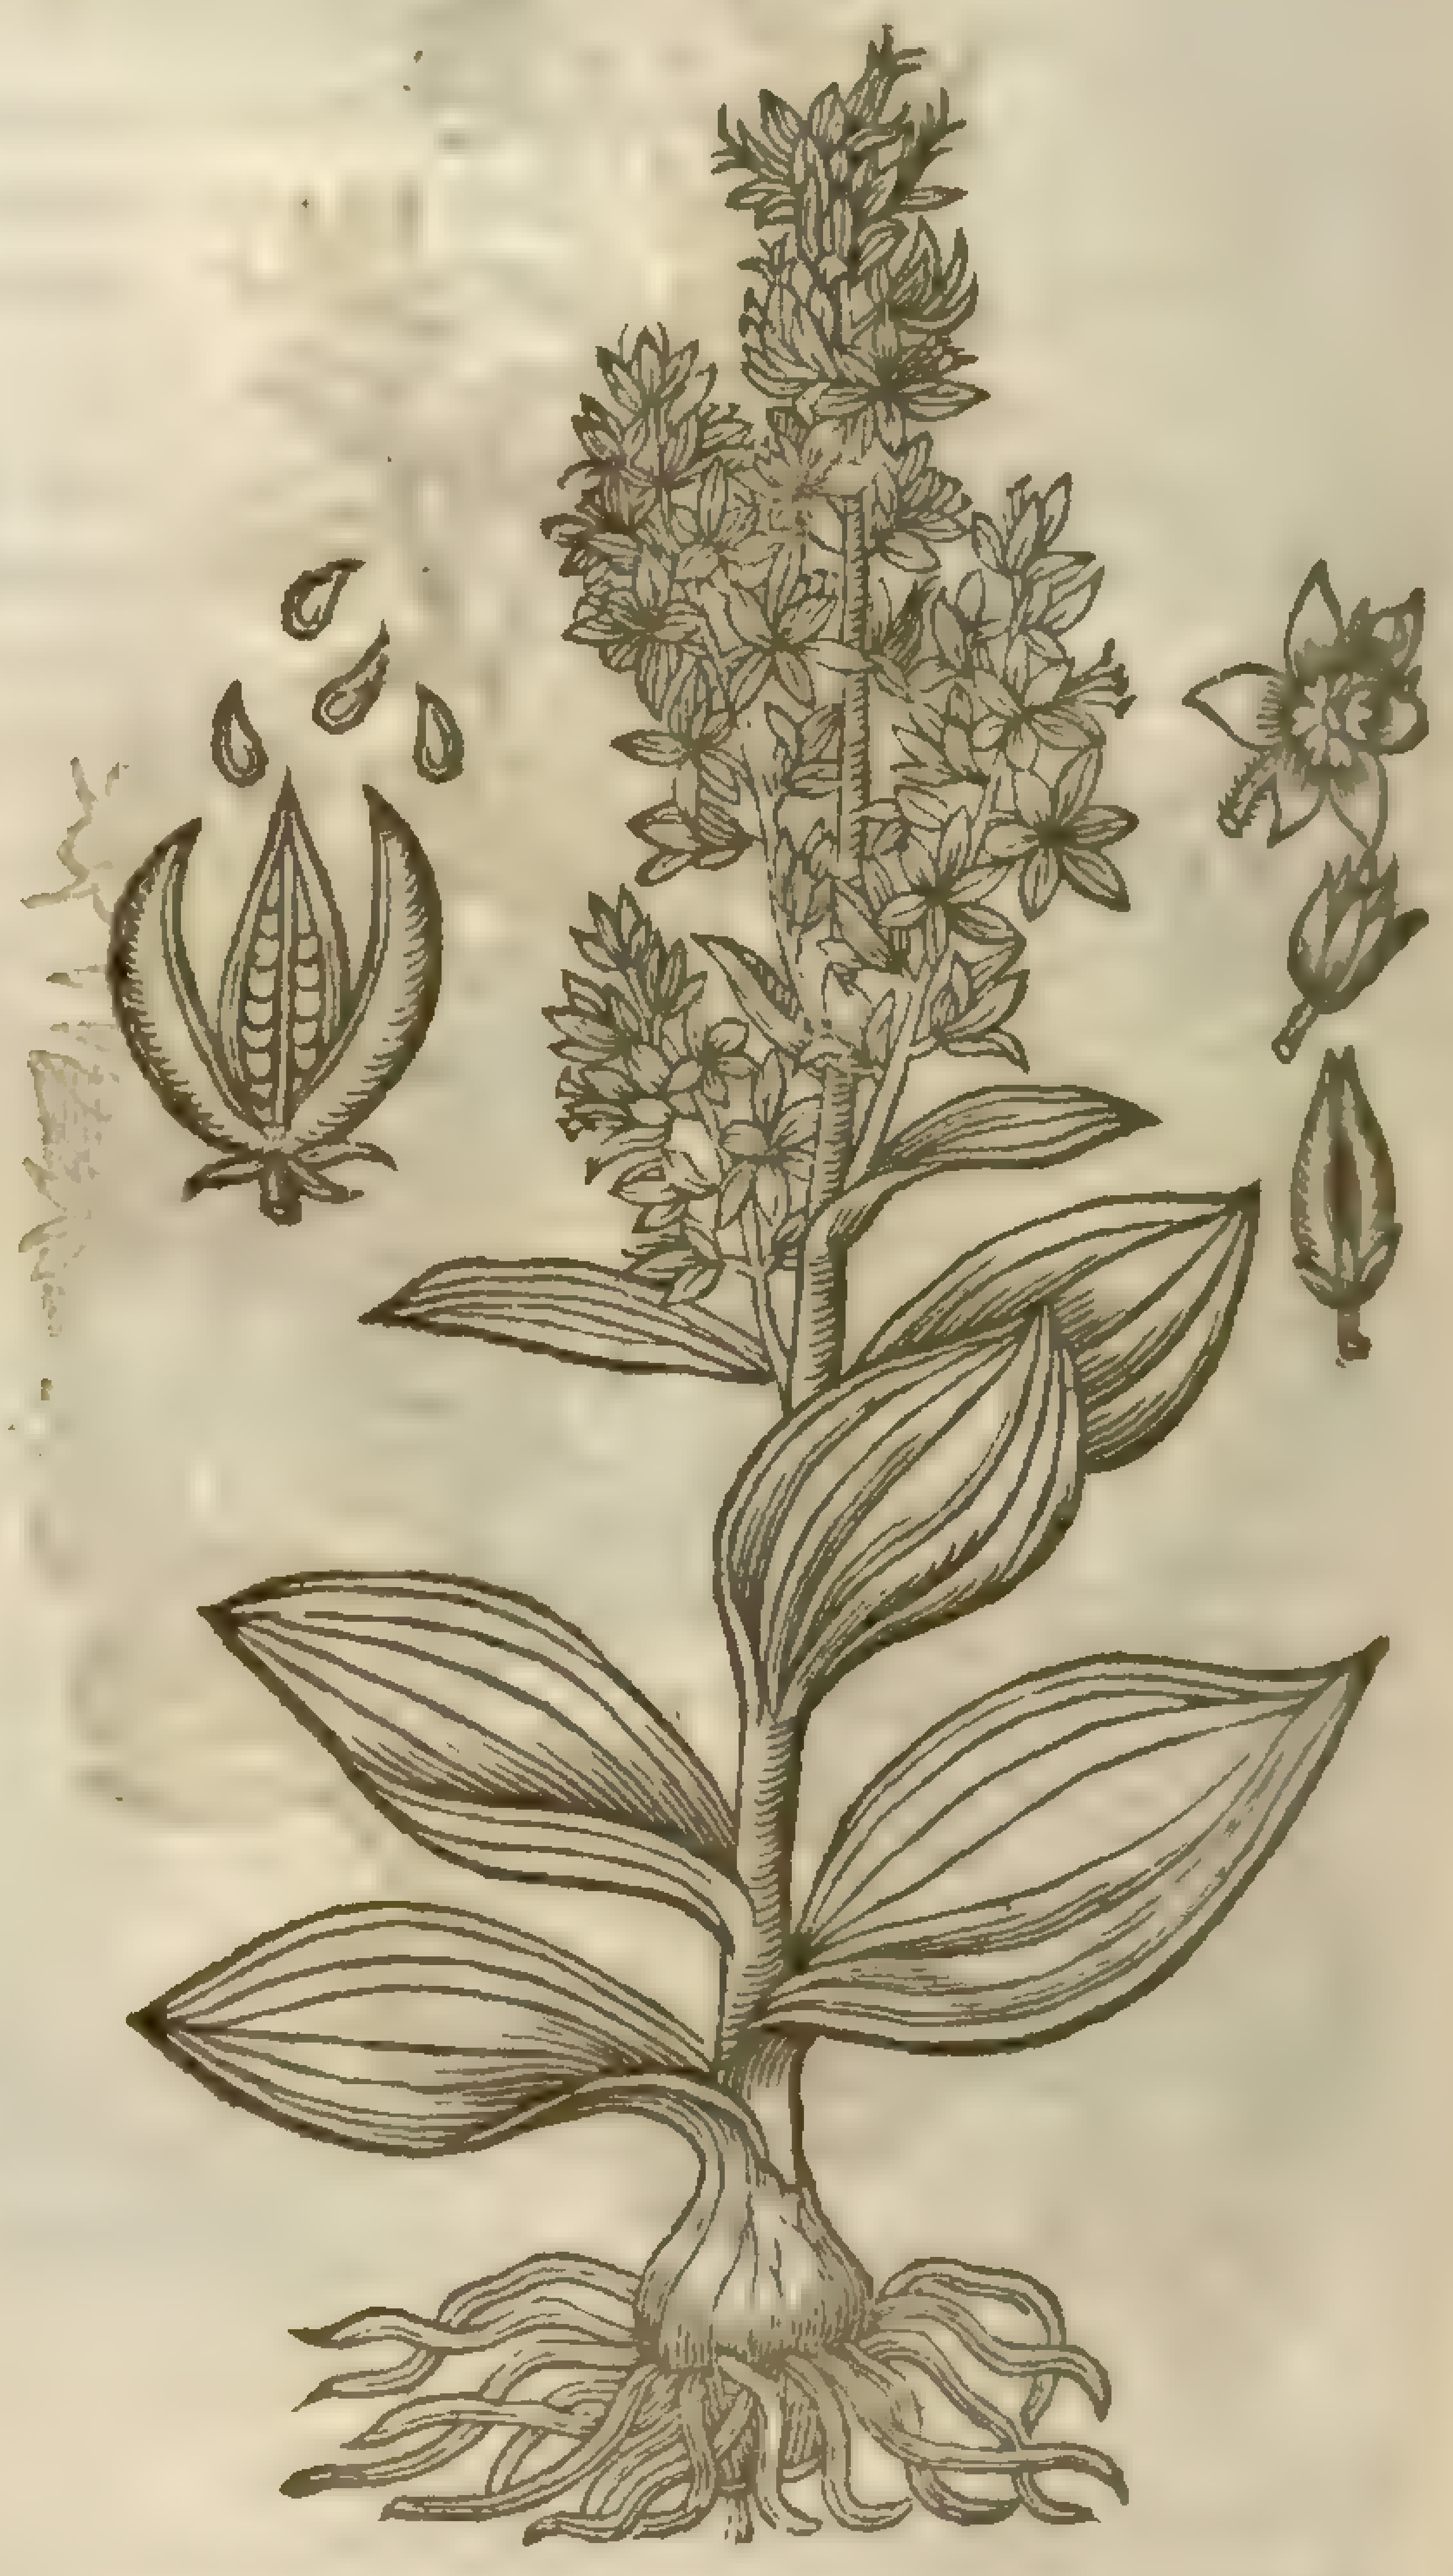
Chap. 110. *Of Neeſing root or Neeſewort.*

Veratrum [illegible]

[illegible]



1 *Helleborus præcox.*
White Hellebor.



2 *Helleborus albus præcox.*
Timely white Hellebor.

¶ *The Deſcription.*

1 The firſt kinde of white Hellebor hath leaues like vnto great Gentian, but much broader, and not vnlike the leaues of the great Plantaine, folded into pleits like a garment plaited to be laid vp in a cheſt: amongſt theſe leaues riſeth vp a ſtalke a cubit long, ſet toward

towards the top full of little ſtar-like floures of an herby green colour tending to whitenes: which being paſt, there come ſmall husks containing the ſeed. The root is great and thicke, with many ſmall threds hanging thereat.

2 The ſecond kind is very like the firſt, and differeth in that, that this hath blacke and reddiſh floures, and comes to flouring before the other kind, and ſeldom in my garden commeth to ſeed.

¶ *The Place.*

The white Hellebor groweth on the Alps and ſuch like mountains where Gentian growes. It was reported vnto me by the Biſhop of Norwich, That white Hellebor groweth in a wood of his owne neere to his houſe at Norwich. Some ſay likewiſe that it doth grow vpon the mountaines of Wales. I ſpeake this vpon report, yet I thinke it may be true. Howbeit I dare aſſure you that they grow in my garden at London, where the firſt kinde floureth and ſeedeth very well.

¶ *The Time.*

The firſt floureth in Iune, and the ſecond in May.

¶ *The Names.*

Neeſewort is called in Greeke, ἐλλέβορος λευκός: in Latine, *Veratrum album, Helleborus albus*, and *Sanguis Herculeus*. The Germans call it **Weiſz nieſwurt**: the low-Dutch, **Neiſwortel**: the Italians, *Elleboro bianco*: the Spaniards, *Verde gambre blanco*: the French, *Ellebore blanche*: and we of England call it white Hellebor, Neeſewort, Lingwort, and the root Neeſing pouder.

¶ *The Temperature.*

The root of white Hellebor is hot and dry in the third degree.

¶ *The Vertues.*

The root of white Hellebor procureth vomit mightily, wherein conſiſteth his chiefe vertue, and by that means voideth all ſuperfluous ſlime and naughty humors. It is good againſt the falling ſickneſſe, phrenſies, ſciatica, dropſies, poiſon, and againſt all cold diſeaſes that be of hard curation, and will not yeeld to any gentle medicine. A

This ſtrong medicine made of white Hellebor, ought not to bee giuen inwardly vnto delicate bodies without great correction; but it may be more ſafely giuen vnto countrey people which feed groſly, and haue hard tough and ſtrong bodies. B

The root of Hellebor cut in ſmall pieces, ſuch as may aptly and conueniently be conueyed into fiſtula's, doth mundifie them, and take away the callous matter which hinders curation: and after they may be healed vp with ſome incarnatiue vnguent fit for the purpoſe. ‡ This facultie by *Dioſcorides* is attributed to the blacke Hellebor, and not to this. ‡ C

The pouder drawne vp into the noſe cauſeth ſneeſing, and purgeth the brain from groſſe and ſlimie humors. D

The root giuen to drinke in the weight of two pence, taketh away the fits of agues, killeth mice and rats, being made vp with hony and floure of wheat. *Pliny* addeth, that it is a medicine againſt the Lowſie euill. E

CHAP. III. *Of Wilde white Hellebor.*

¶ *The Deſcription.*

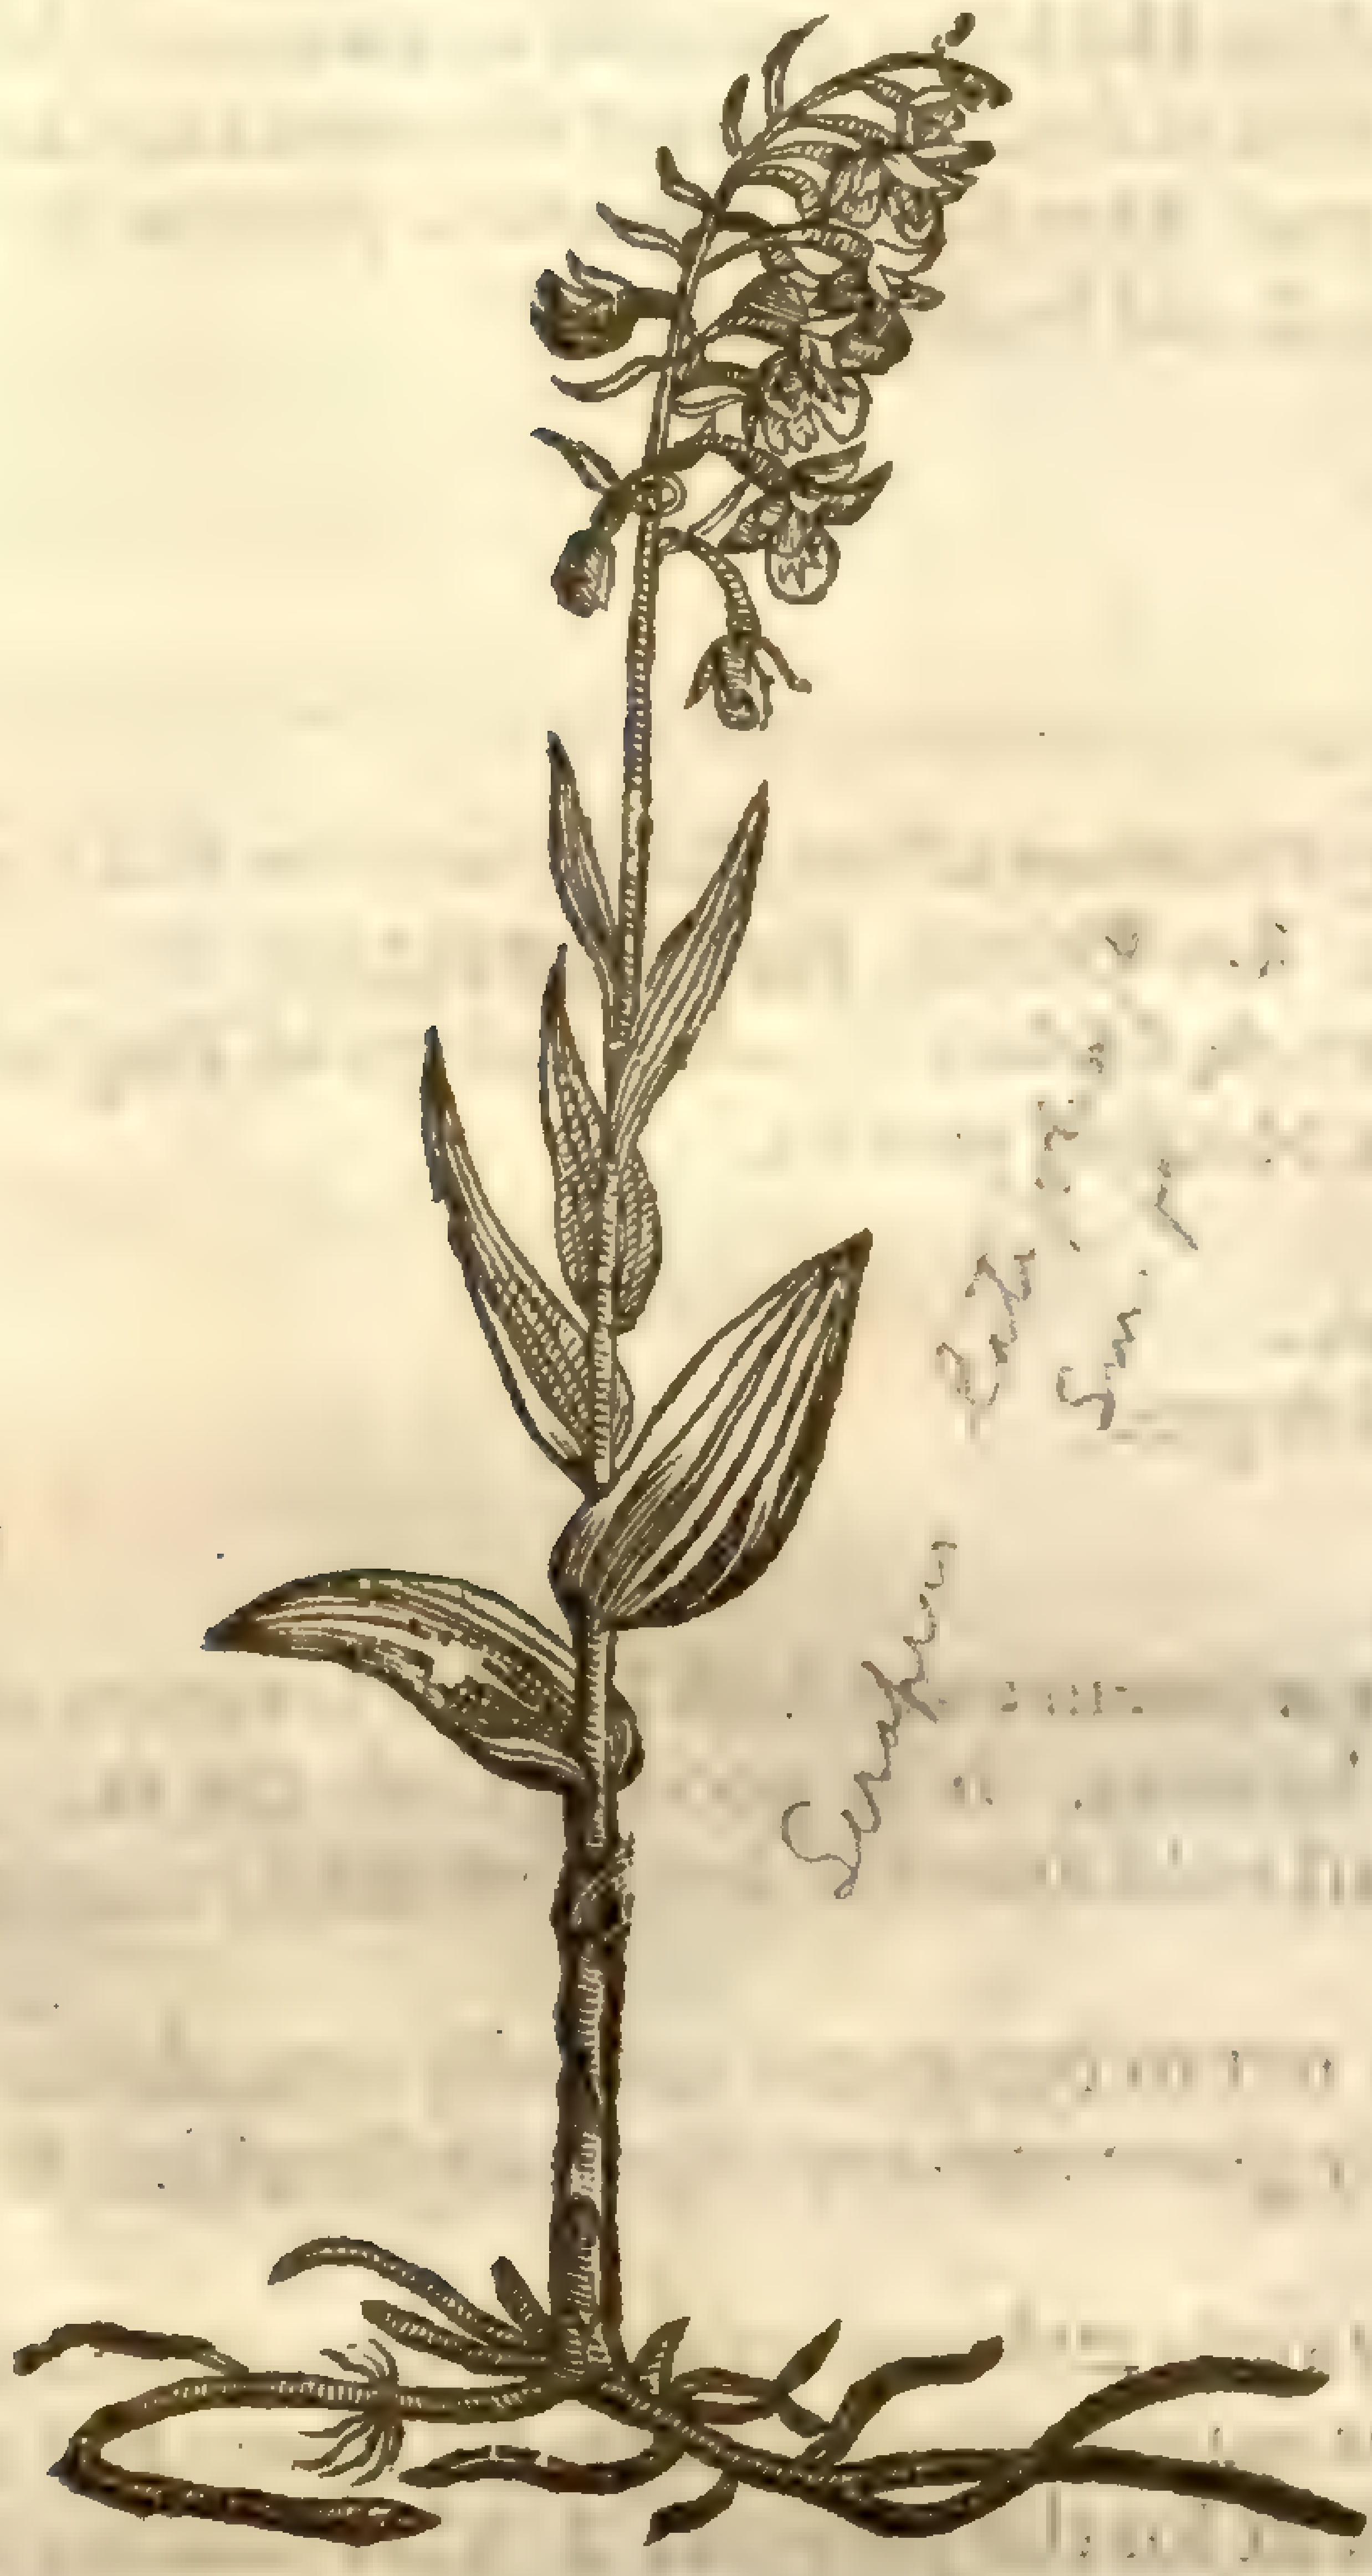
1 HElleborine is like vnto white Hellebor, and for that cauſe wee haue giuen it the name Helleborine. It hath a ſtraight ſtalke of a foot high, ſet from the bottome to the tuft of floures with faire leaues, ribbed and chamfered like thoſe of white Hellebor, but nothing neere ſo large, of a darke green colour. The floures be orderly placed from the middle to the top of the ſtalke, hollow within, and white of colour, ſtraked here and there with a daſh of purple, in ſhape like the floures of Satyrion. The ſeed is ſmall like duſt or motes in the ſun. The root is ſmall, full of juice, and bitter in taſte.

2 The ſecond is like vnto the firſt, but altogether greater: the floures white without any mixture at all, wherein conſiſteth the difference.

3 The third kinde of Helleborine, being the ſixt of *Cluſius*, hath leaues like the firſt deſcribed, but

ſmaller and narrower. The ſtalke riſeth vp to the height of two ſpans; at the top wherof grow faire ſhining purple colored flours, conſiſting of ſix little leaues, within or among which lies hid things like ſmall helmets. The plant in proportion is like the other of this kinde. The root is ſmall, and creepeth in the ground.

1 *Helleborine.*
Wilde white Hellebor.

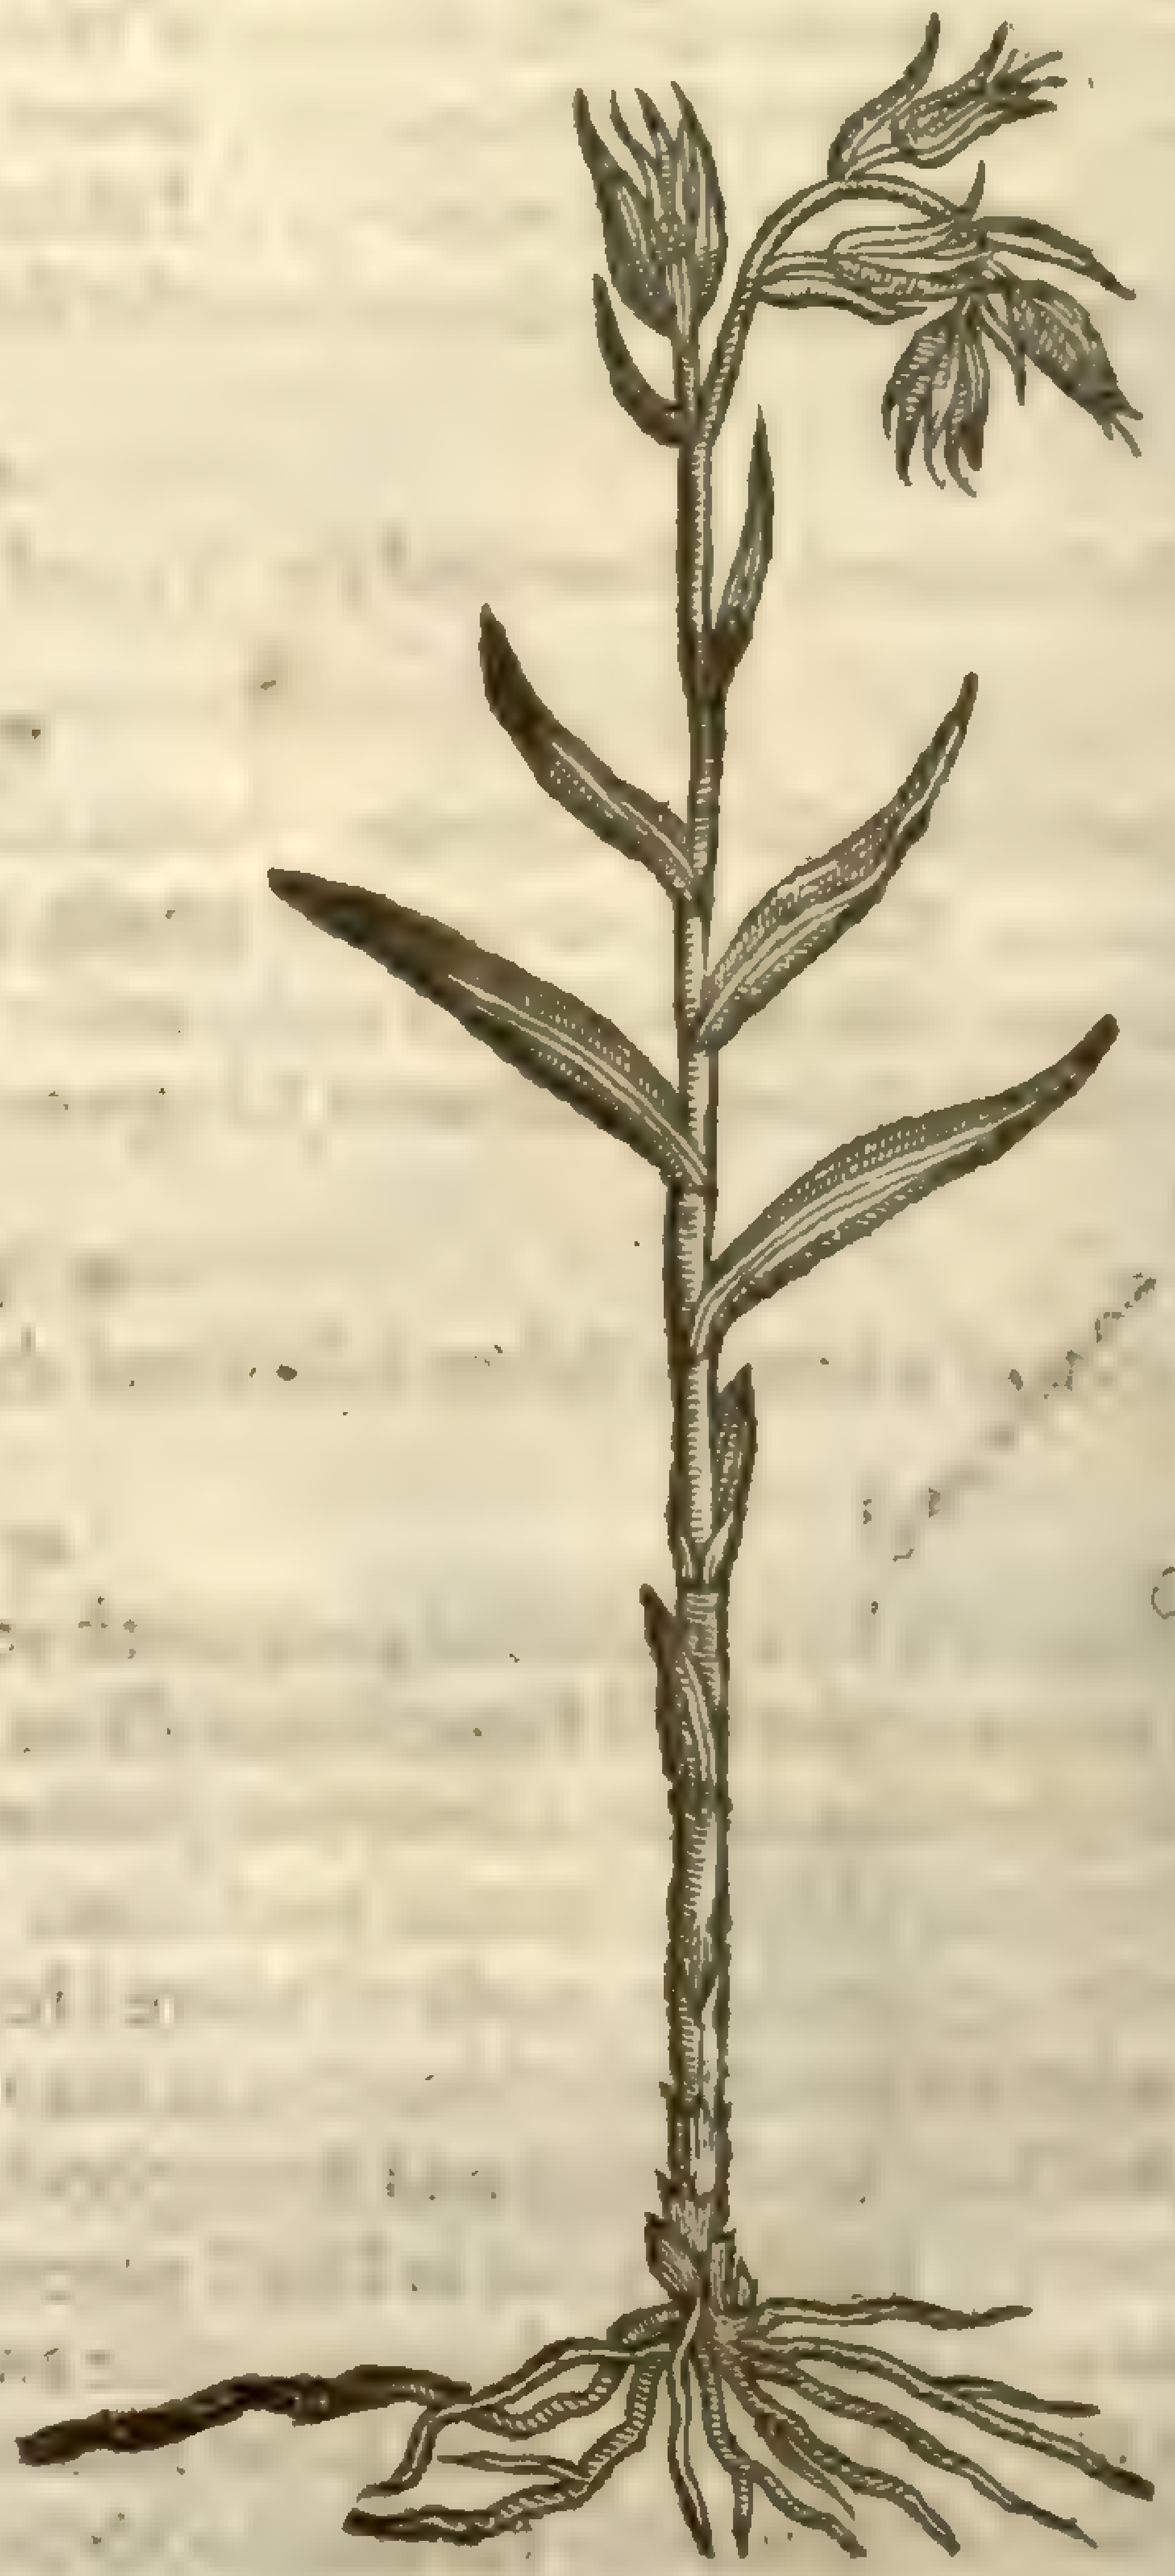


Lob. ic. 312

Serapias

[illegible]

2 *Helleborine anguſtifolia 6. Cluſij.*
Narrow leafed wilde Neeſewort.



[illegible]

¶ *The Place.*

They be found in dankiſh and ſhadowie places: the firſt was found growing in the Woods by Digs wel paſtures, half a mile from Welwen in Hartfordſhire: it grows in a wood fiue miles from London, neere a bridge called Lockbridge; by Robinhoods wel, where my friend Mr *Stephen Bredwel* a learned Phyſition found the ſame: in the woods by Dunmow in Eſſex, by Southfleet in Kent in a little groue of Iuniper, and in a wood by Clare in Eſſex.

¶ *The Time.*

They floure in May and Iune, and perfect their ſeed in Auguſt.

¶ *The Names.*

The likeneſſe it hath with white Hellebor, doth ſhew it may not vnproperly be named *Helleborine*, or white Hellebor: which is alſo called of *Dioſcorides* and *Pliny*, ἐπιπακτὶς, or *Epipactis*, but whence that name came it is not apparant: it is alſo named [illegible].

¶ *The Temperature.*

They are thought to be hot and dry of nature.

¶ *The Vertues.*

A The faculties of theſe wilde Hellebors are referred vnto the white Neeſewort, whereof they are kindes.

B It is reported, that the decoction of wilde Hellebor drunk, opens the ſtoppings of the liuer, and helpeth any imperfections of the ſame.

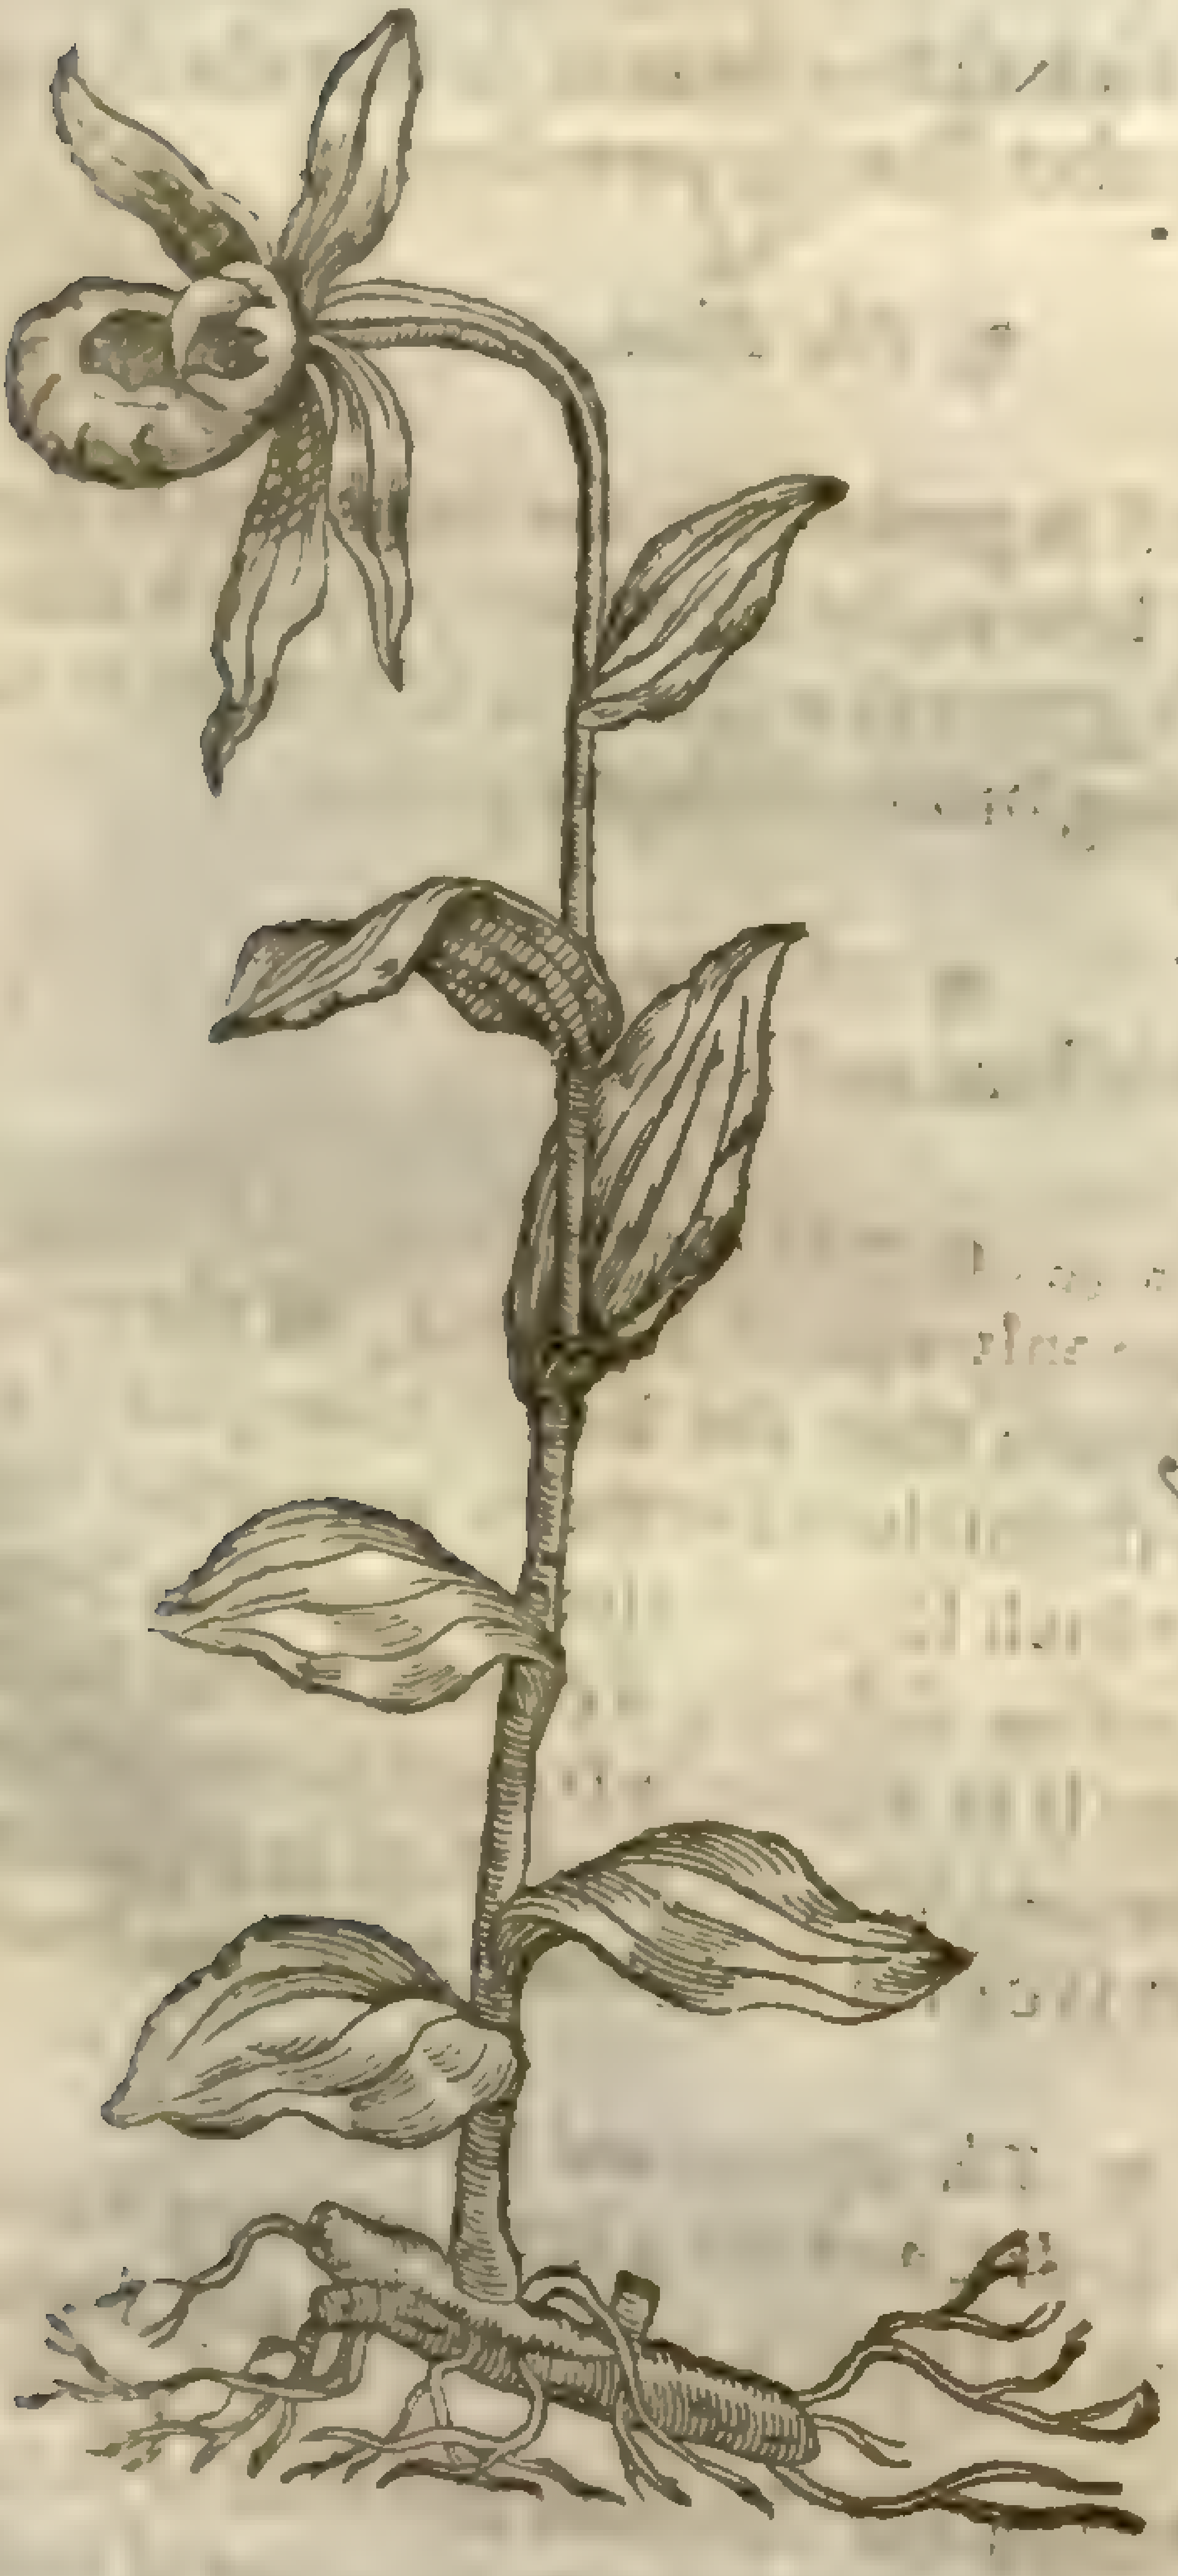
CHAP.

Chap. 112. *Of our Ladies Slipper.*

¶ *The Deſcription.*

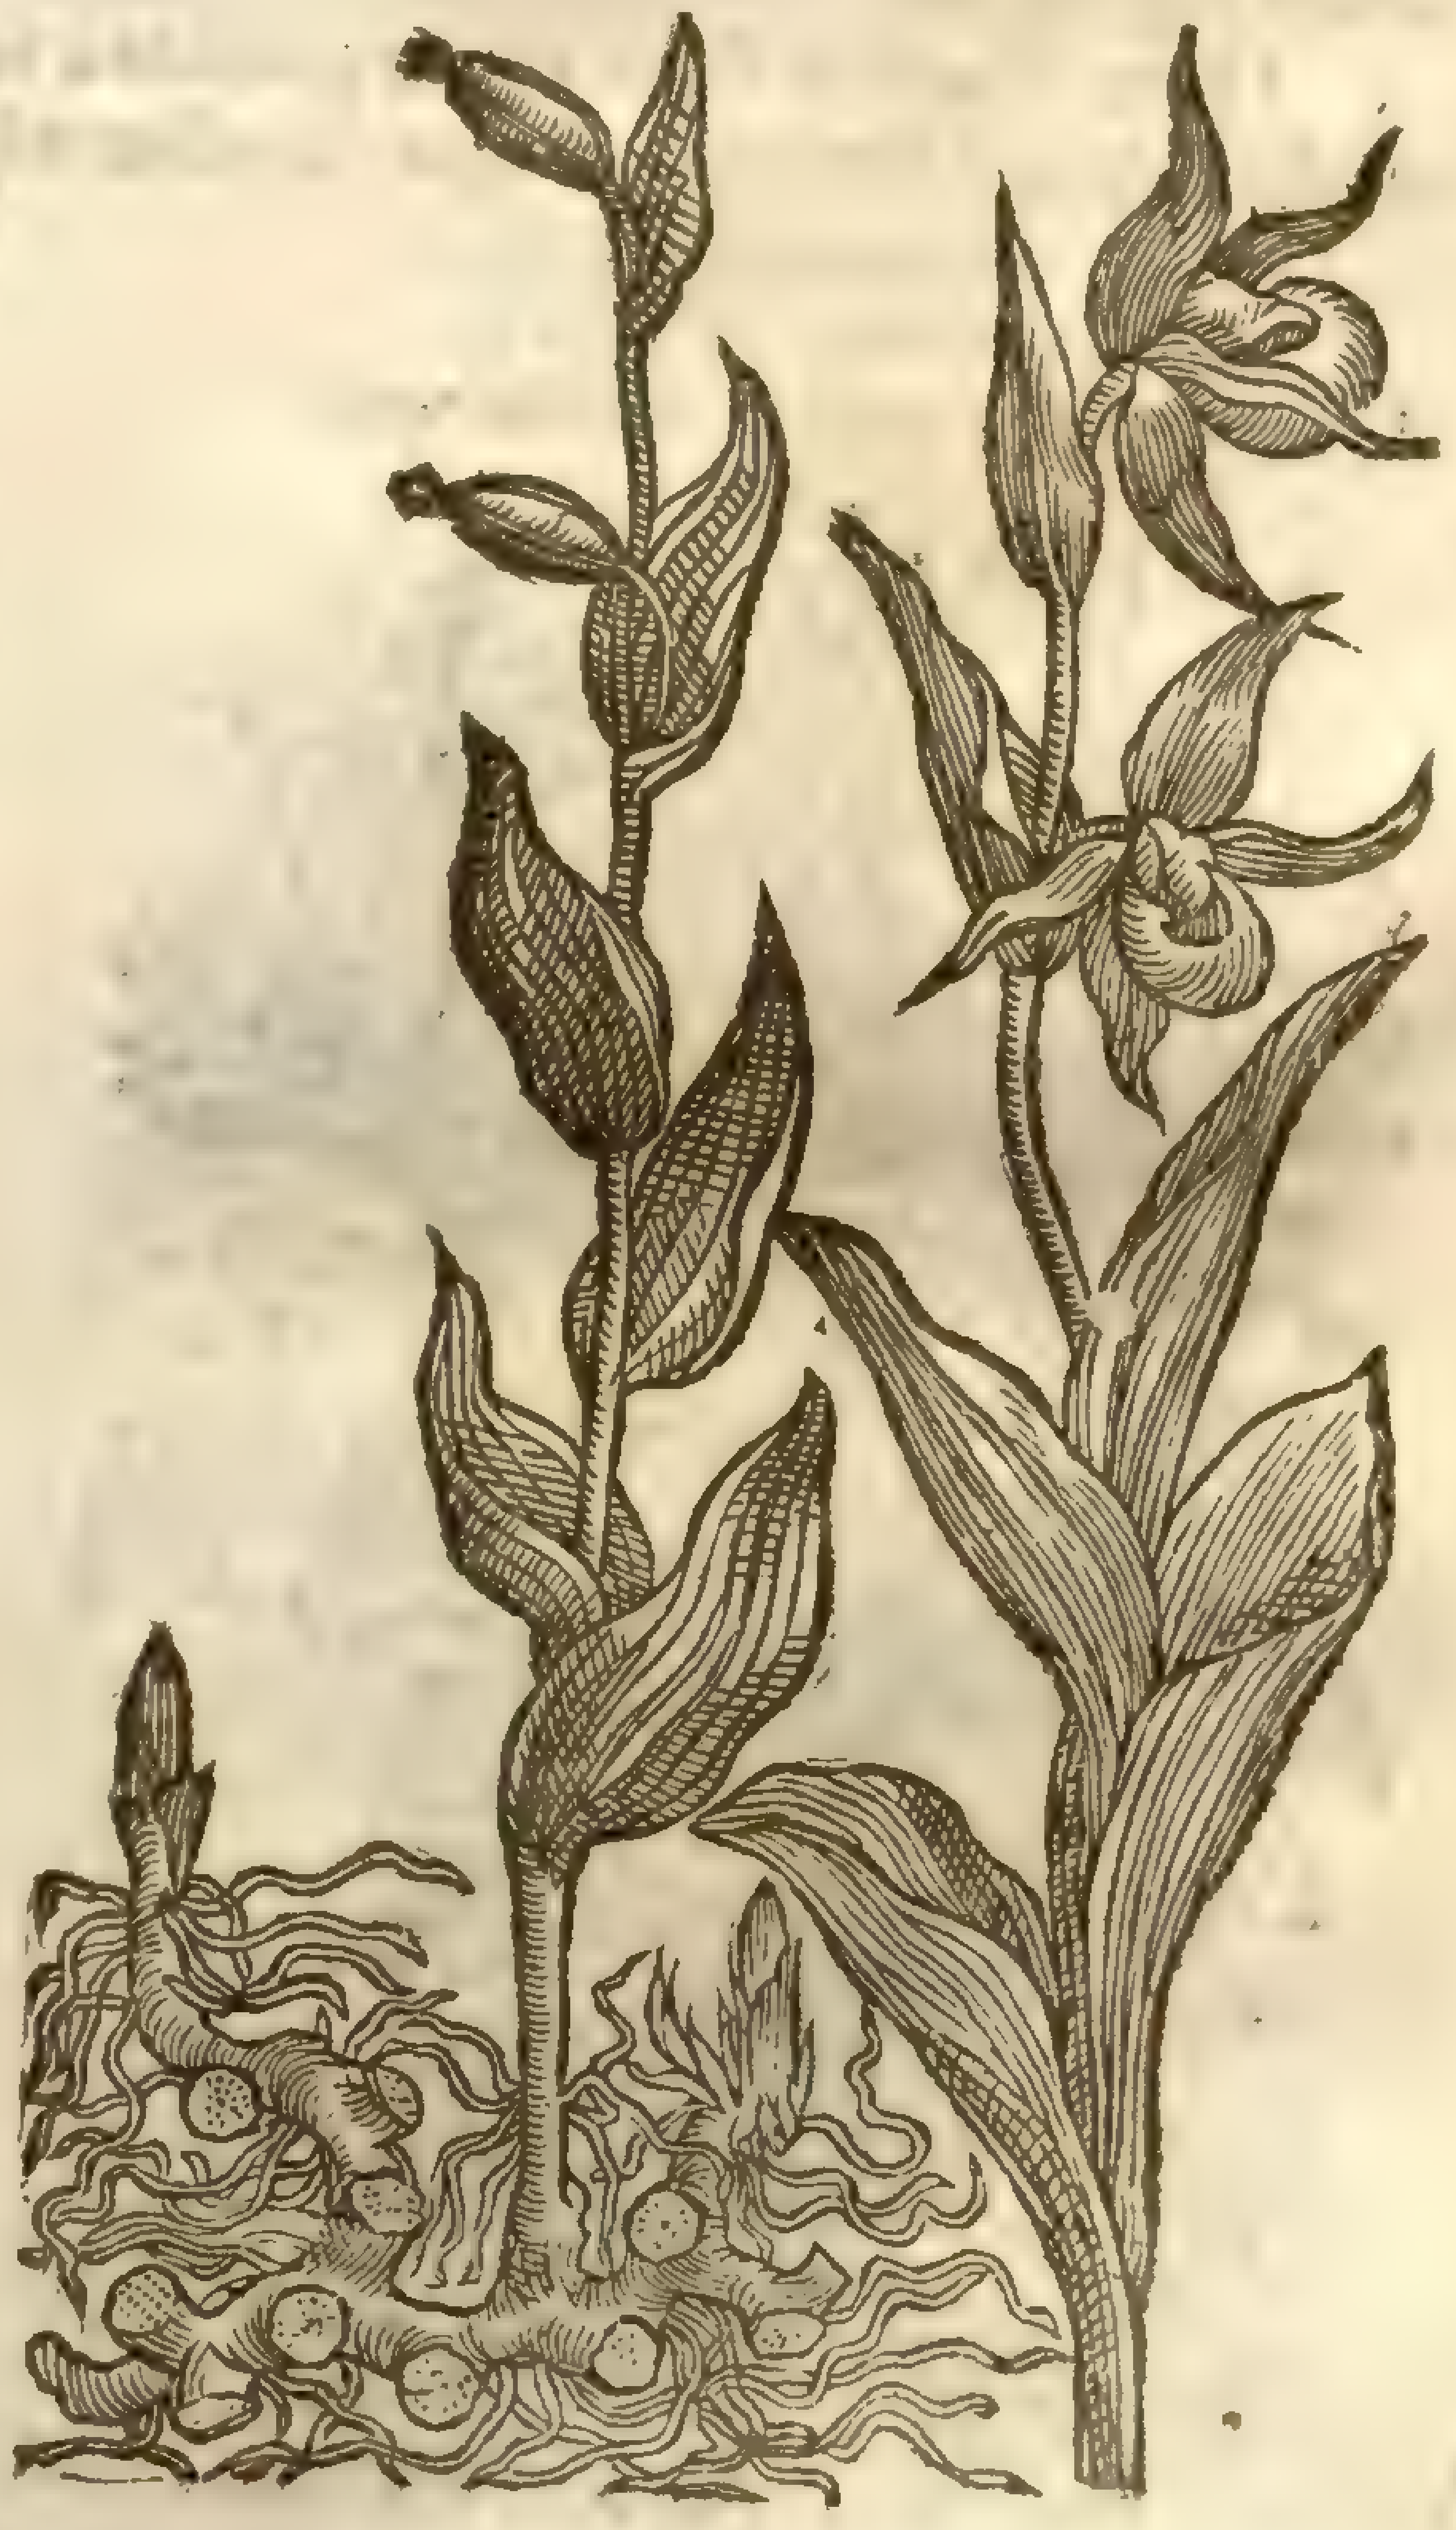
1 Ovr Ladies Shoo or Slipper hath a thicke knobbed root, with certain markes or notes vpon the ſame, ſuch as the roots of Solomons Seale haue, but much leſſer, creeping within the vpper cruſt of the earth; from which riſeth vp a ſtiffe and hairy ſtalke a foot high, ſet by certaine ſpaces with faire broad leaues, ribbed with the like ſinues or nerues as thoſe of the Plantain. At the top of the ſtalke groweth one ſingle floure, ſeldome two, faſhioned on the one ſide like an egge; on the other ſide it is open, empty, and hollow, and of the form of a ſhoo or ſlipper, whereof it tooke his name; of a yellow colour on the outſide, and of a ſhining deep yellow on the inſide. The middle part is compaſſed about with foure leaues of a bright purple colour, often of a light red or obſcure crimſon, and ſometimes yellow as in the middle part, which in ſhape is like an egge as aforeſaid.

‡ 2 This other differs not from the former vnleſſe in the colour of the floure, which in this hath the foure long leaues white, and the hollow leafe or ſlipper of a purple colour. ‡



1 *Calceolus Mariæ.*
Our Ladies Slipper.

Cypripedium Calceolus, L. [illegible]



‡ 2 *Calceolus Mariæ alter.*
The other Ladies Slipper.

¶ *The Place.*

Ladies Slipper groweth vpon the mountains of Germany, Hungary, and Poland. I haue a plant thereof in my garden, which I receiued from Mr *Garret* Apothecarie, my very good friend.

‡ It is alſo reported to grow in the North parts of this kingdome. I ſaw it in floure with Mr *Tradeſcant.*

¶ *The Time.*

It floureth about the midſt of Iune.

¶ *The Names.*

It is commonly called *Calceolus D. Mariæ*, and *Marianus*: of ſome, *Calceolus Sacerdotis*: of ſome, *Aliſma*, but vnproperly: in Engliſh, our Ladies ſhoo or ſlipper: in the Germane tongue, **Pfaffen Schueth, Papen ſcoen**: and of ſome, *Damaſonium nothum.*

¶ The

¶ *The Nature and Vertues.*

Touching the faculties of our Ladies ſhoo we haue nothing to write, it beeing not ſufficiently known to the old writers, no nor to the new.

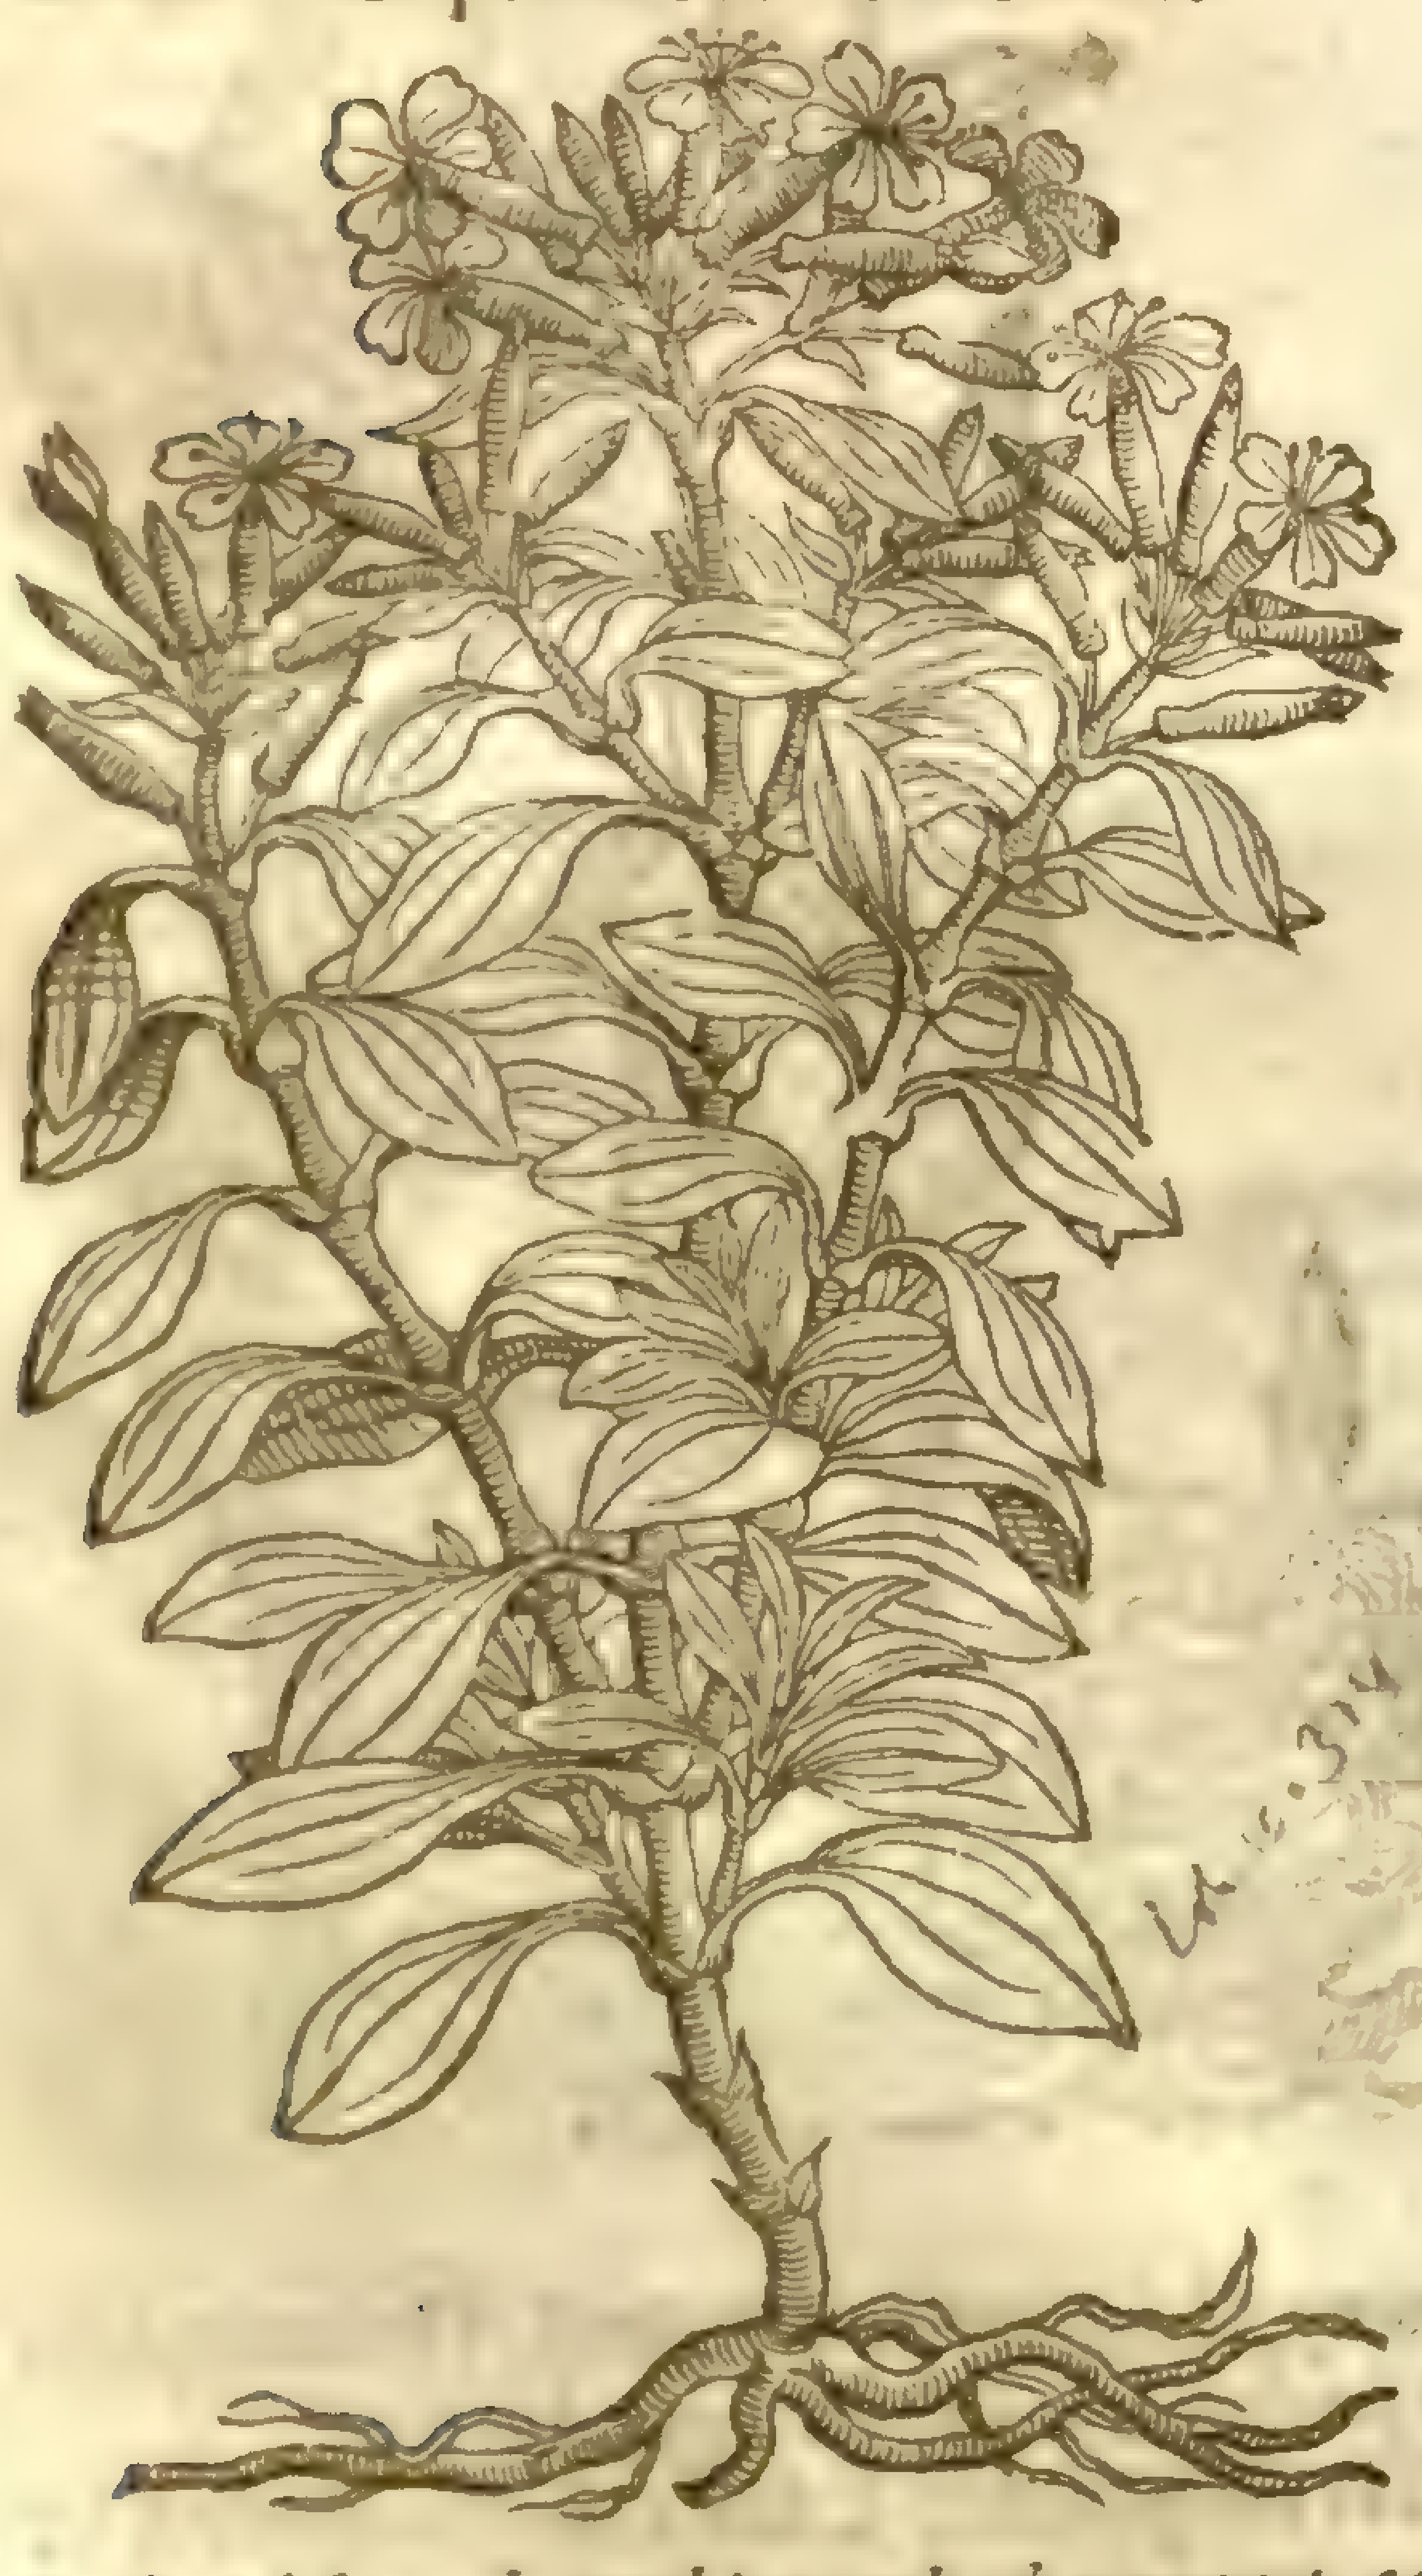
Chap. 113. *Of Sopewort.*

¶ *The Deſcription.*

THe ſtalks of Sopewort are ſlipperie, ſlender, round, jointed, a cubit high or higher: the leaues are broad, ſet with veins very like broad leaued Plantain, yet leſſer, ſtanding out of euery joint by couples for the moſt part, and eſpecially thoſe that are the neereſt the roots bowing backward. The floures in the top of the ſtalkes and about the vppermoſt joints are many, well ſmelling, ſometimes of a beautifull red colour like a roſe; otherwhile of a light purple or white, which grow out of long cups conſiſting of fiue leaues, in the middle of which are certaine little threds. The roots are thicke, long, creeping aſlope, hauing certain ſtrings hanging out of them like the roots of blacke Hellebor, and if they haue once taken good and ſure rooting in any ground, it is impoſſible to deſtroy them.

‡ There is kept in ſome of our gardens a varietie of this, which differs from it, in that the flours are double, and ſomewhat larger: in other reſpects it is altogether like the precedent. ‡

Saponaria.
Sopewort or Bruiſewort.



¶ *The Place.*

It is planted in gardens for the flours ſake, to the decking vp of houſes, for the which purpoſe it chiefly ſerueth. It groweth wilde of it ſelfe neere to riuers and running brooks in ſunny places.

¶ *The Time.*

It floureth in Iune and Iuly.

¶ *The Names.*

It is commonly called *Saponaria*, of the great ſcouring qualitie that the leaues haue; for they yeeld out of themſelues a certaine juice when they are bruiſed, which ſcoureth almoſt as well as Sope, although *Ruellius* deſcribe a certaine other Sopewort. Of ſome it is *Aliſma*, or *Damaſonium*: of others *Saponaria Gentiana*, whereof doubtleſſe it is a kinde: in Engliſh it is called Sopewort, & of ſome, Bruiſewort.

¶ *The Nature and Vertues.*

It is hot & dry, and not a little ſcouring withall, hauing no vſe in phyſick ſet downe by any Authour of credit.

A ‡ Although our Authour and ſuch as before him haue written of plants, were ignorant of the facultie of this herbe, yet hath the induſtry of ſome later writers found out the vertue thereof: and Septalius reports, that it was one *Zapata* a Spaniſh Emperick. Since whoſe time it hath bin written of by *Rudius, lib.5. de morbis occult. & venenat. cap.18.* And by *Cæſar Claudinus, de ingreſſu ad infirmos,* num. 214. wh 411. & *pag.417.* But principally by *Ludouicus Septalius, Animaduerſ. med. lib.7. num.* 214. where treating of decoctions in vſe againſt the French poxes, he mentions the ſingular effect of this herbe againſt that filthy diſeaſe. His words are theſe: I muſt not in this place omit the vſe of another Alexipharmicall decoction, being very effectuall and vſefull for the poorer ſort; namely that which is made of Sopewort, an herbe common and knowne to all. Moreouer, I haue ſometimes vſed it with happy ſucceſſe in the moſt contumacious diſeaſe: but it is of ſomewhat an vngratefull taſte, and therefore it muſt be reſerued for the poorer ſort. The decoction is thus made: R. *Saponariæ virid. M. 2. infundantur per noctem in lib. viij. aquæ mox excoquantur ad cocturam Saponariæ: deinde libra vna cum dimidia aquæ cum herba iam cocta excoletur cum expreſſione, quæ reſeruetur pro potione matutina ad ſudores proliciendos ſumendo ℥ vij. aut viij. quod vero ſupereſt dulcoretur cum paſſulis aut ſaccaro pro potu cum cibis: æſtate & biliosis naturis addi poterit aut Sonchi, aut Cymbalariæ M. j. Valet & pro mulieribus ad menſtrua alba abſumenda cum M. ſſ. Cymbalariæ, & addito tantundem Philipendulæ.* Thus much *Septalius*, who ſaith he had vſed it *ſæpè ac ſæpius*, often and often againe. B

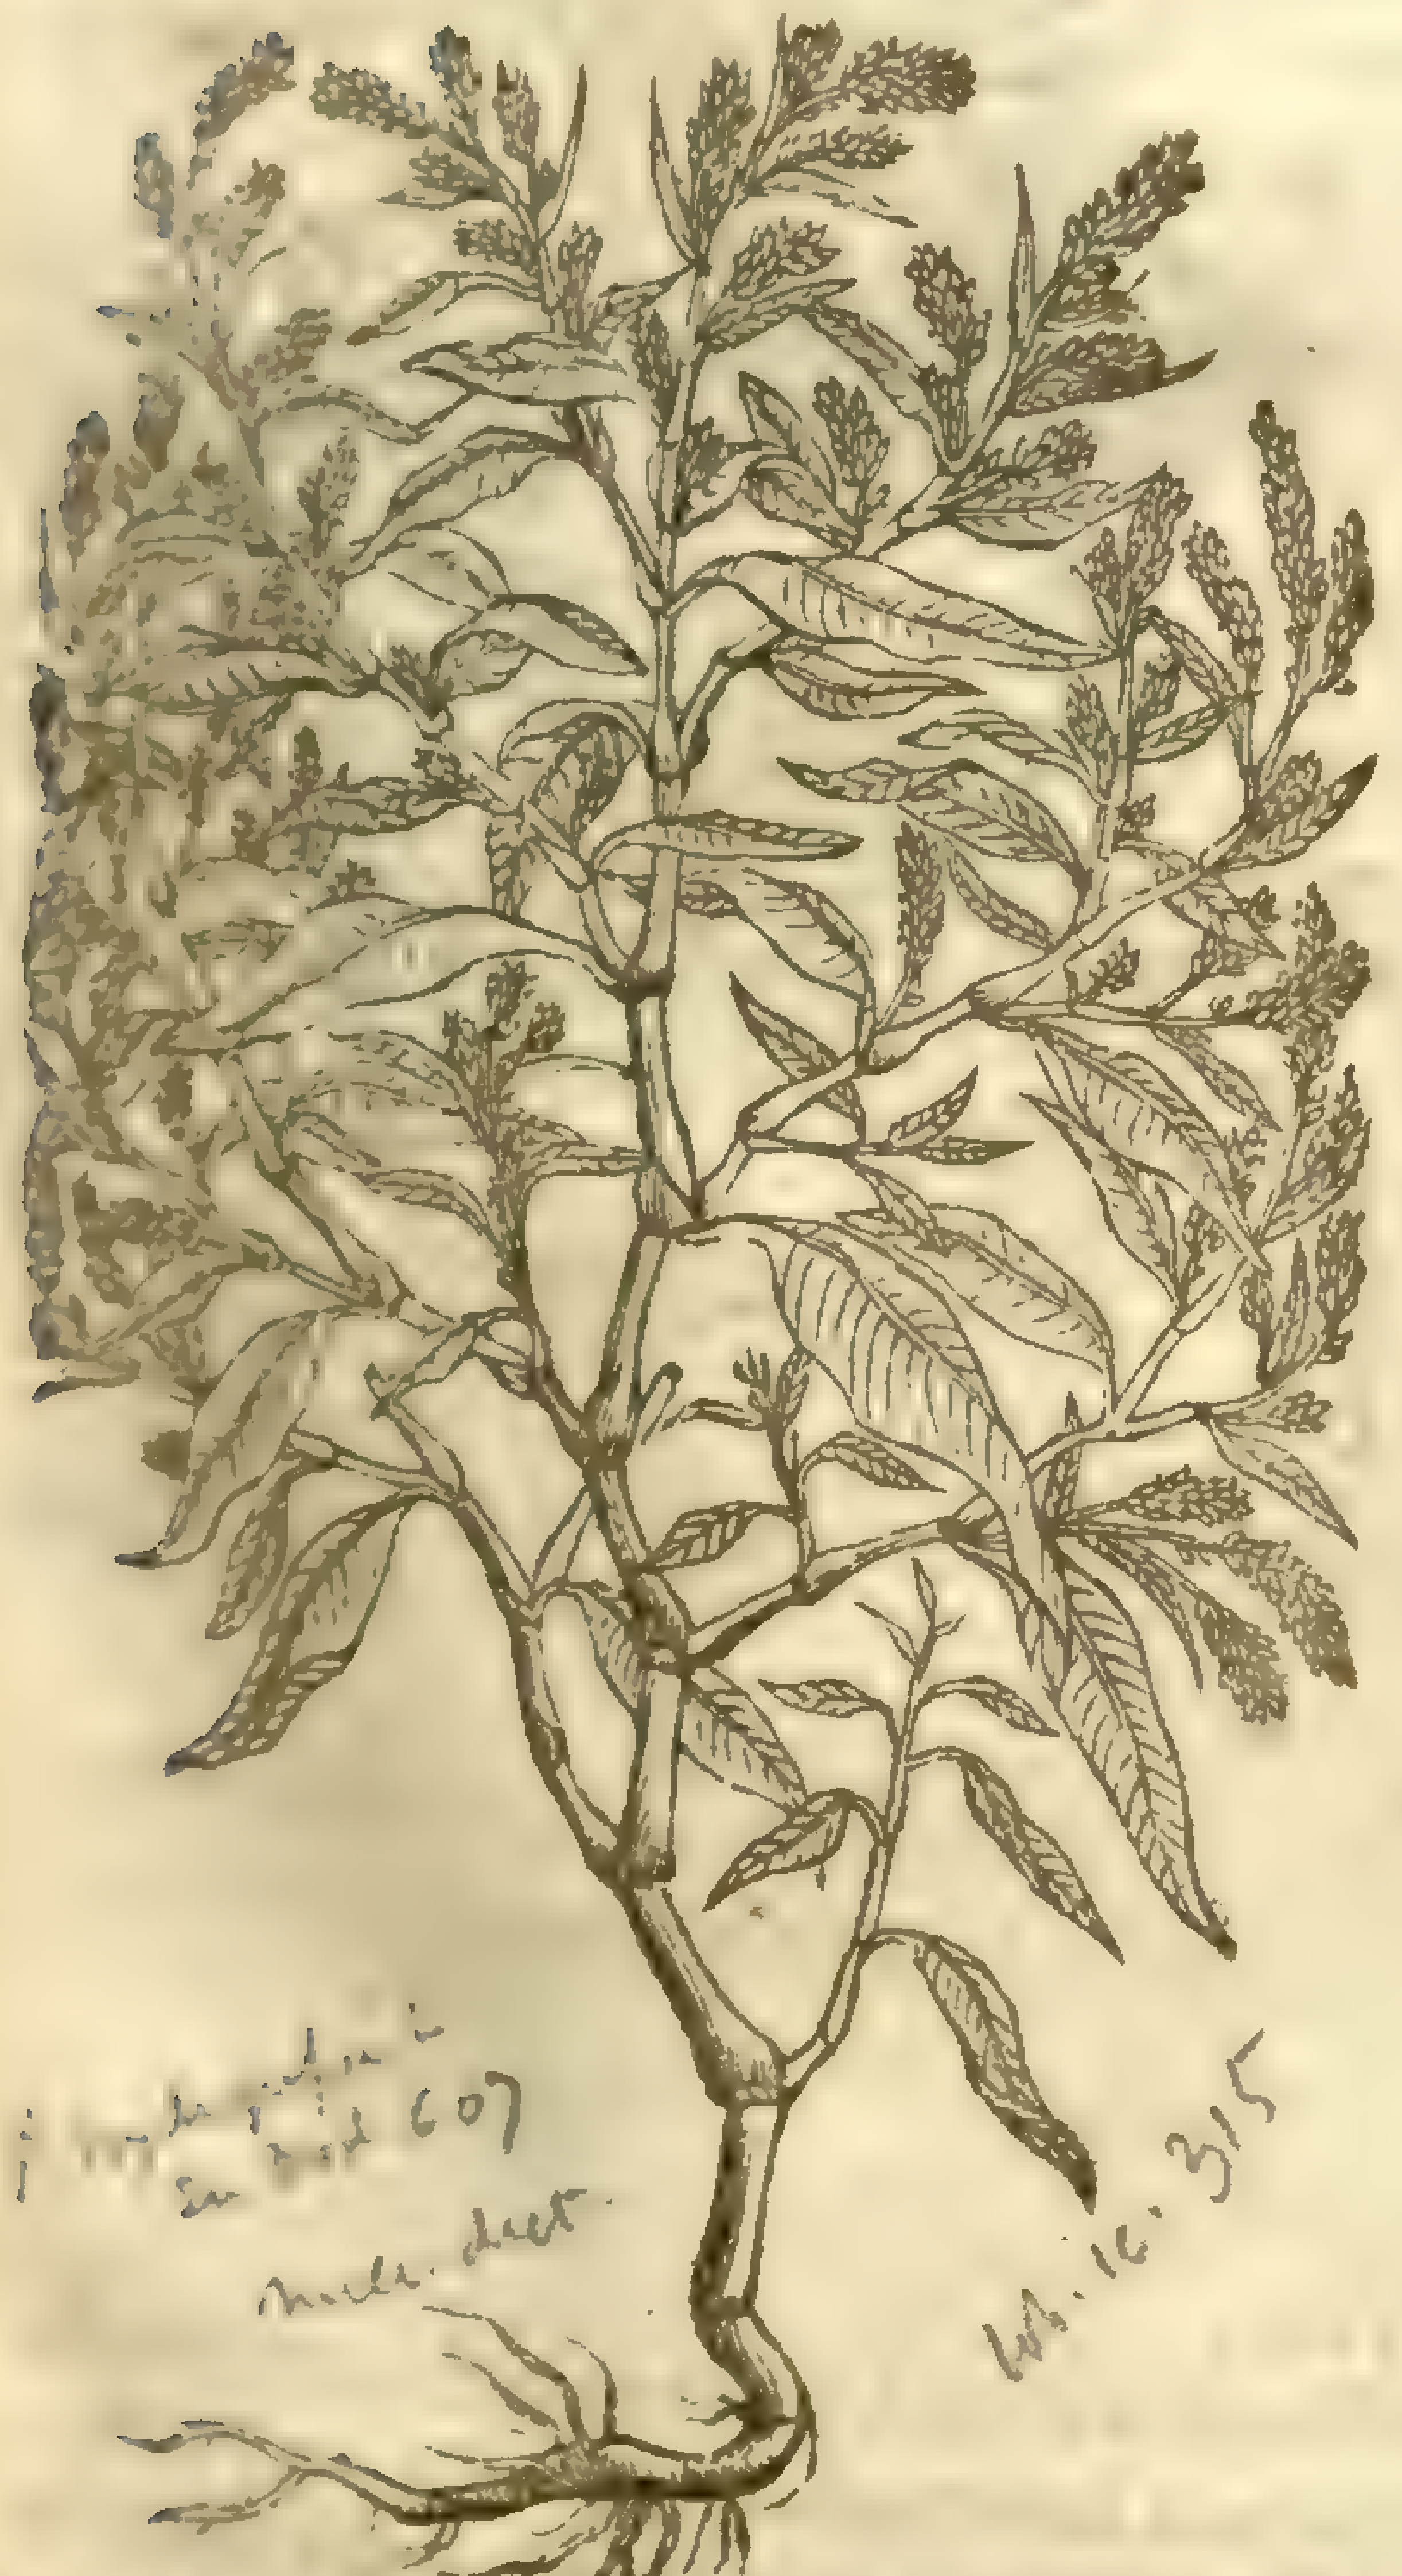
Some haue commended it to be very good to be applied to greene wounds, to hinder inflammation, and ſpeedily to heale them.

CHAP. 114. *Of Arſmart or water Pepper.*

¶ *The Deſcription.*

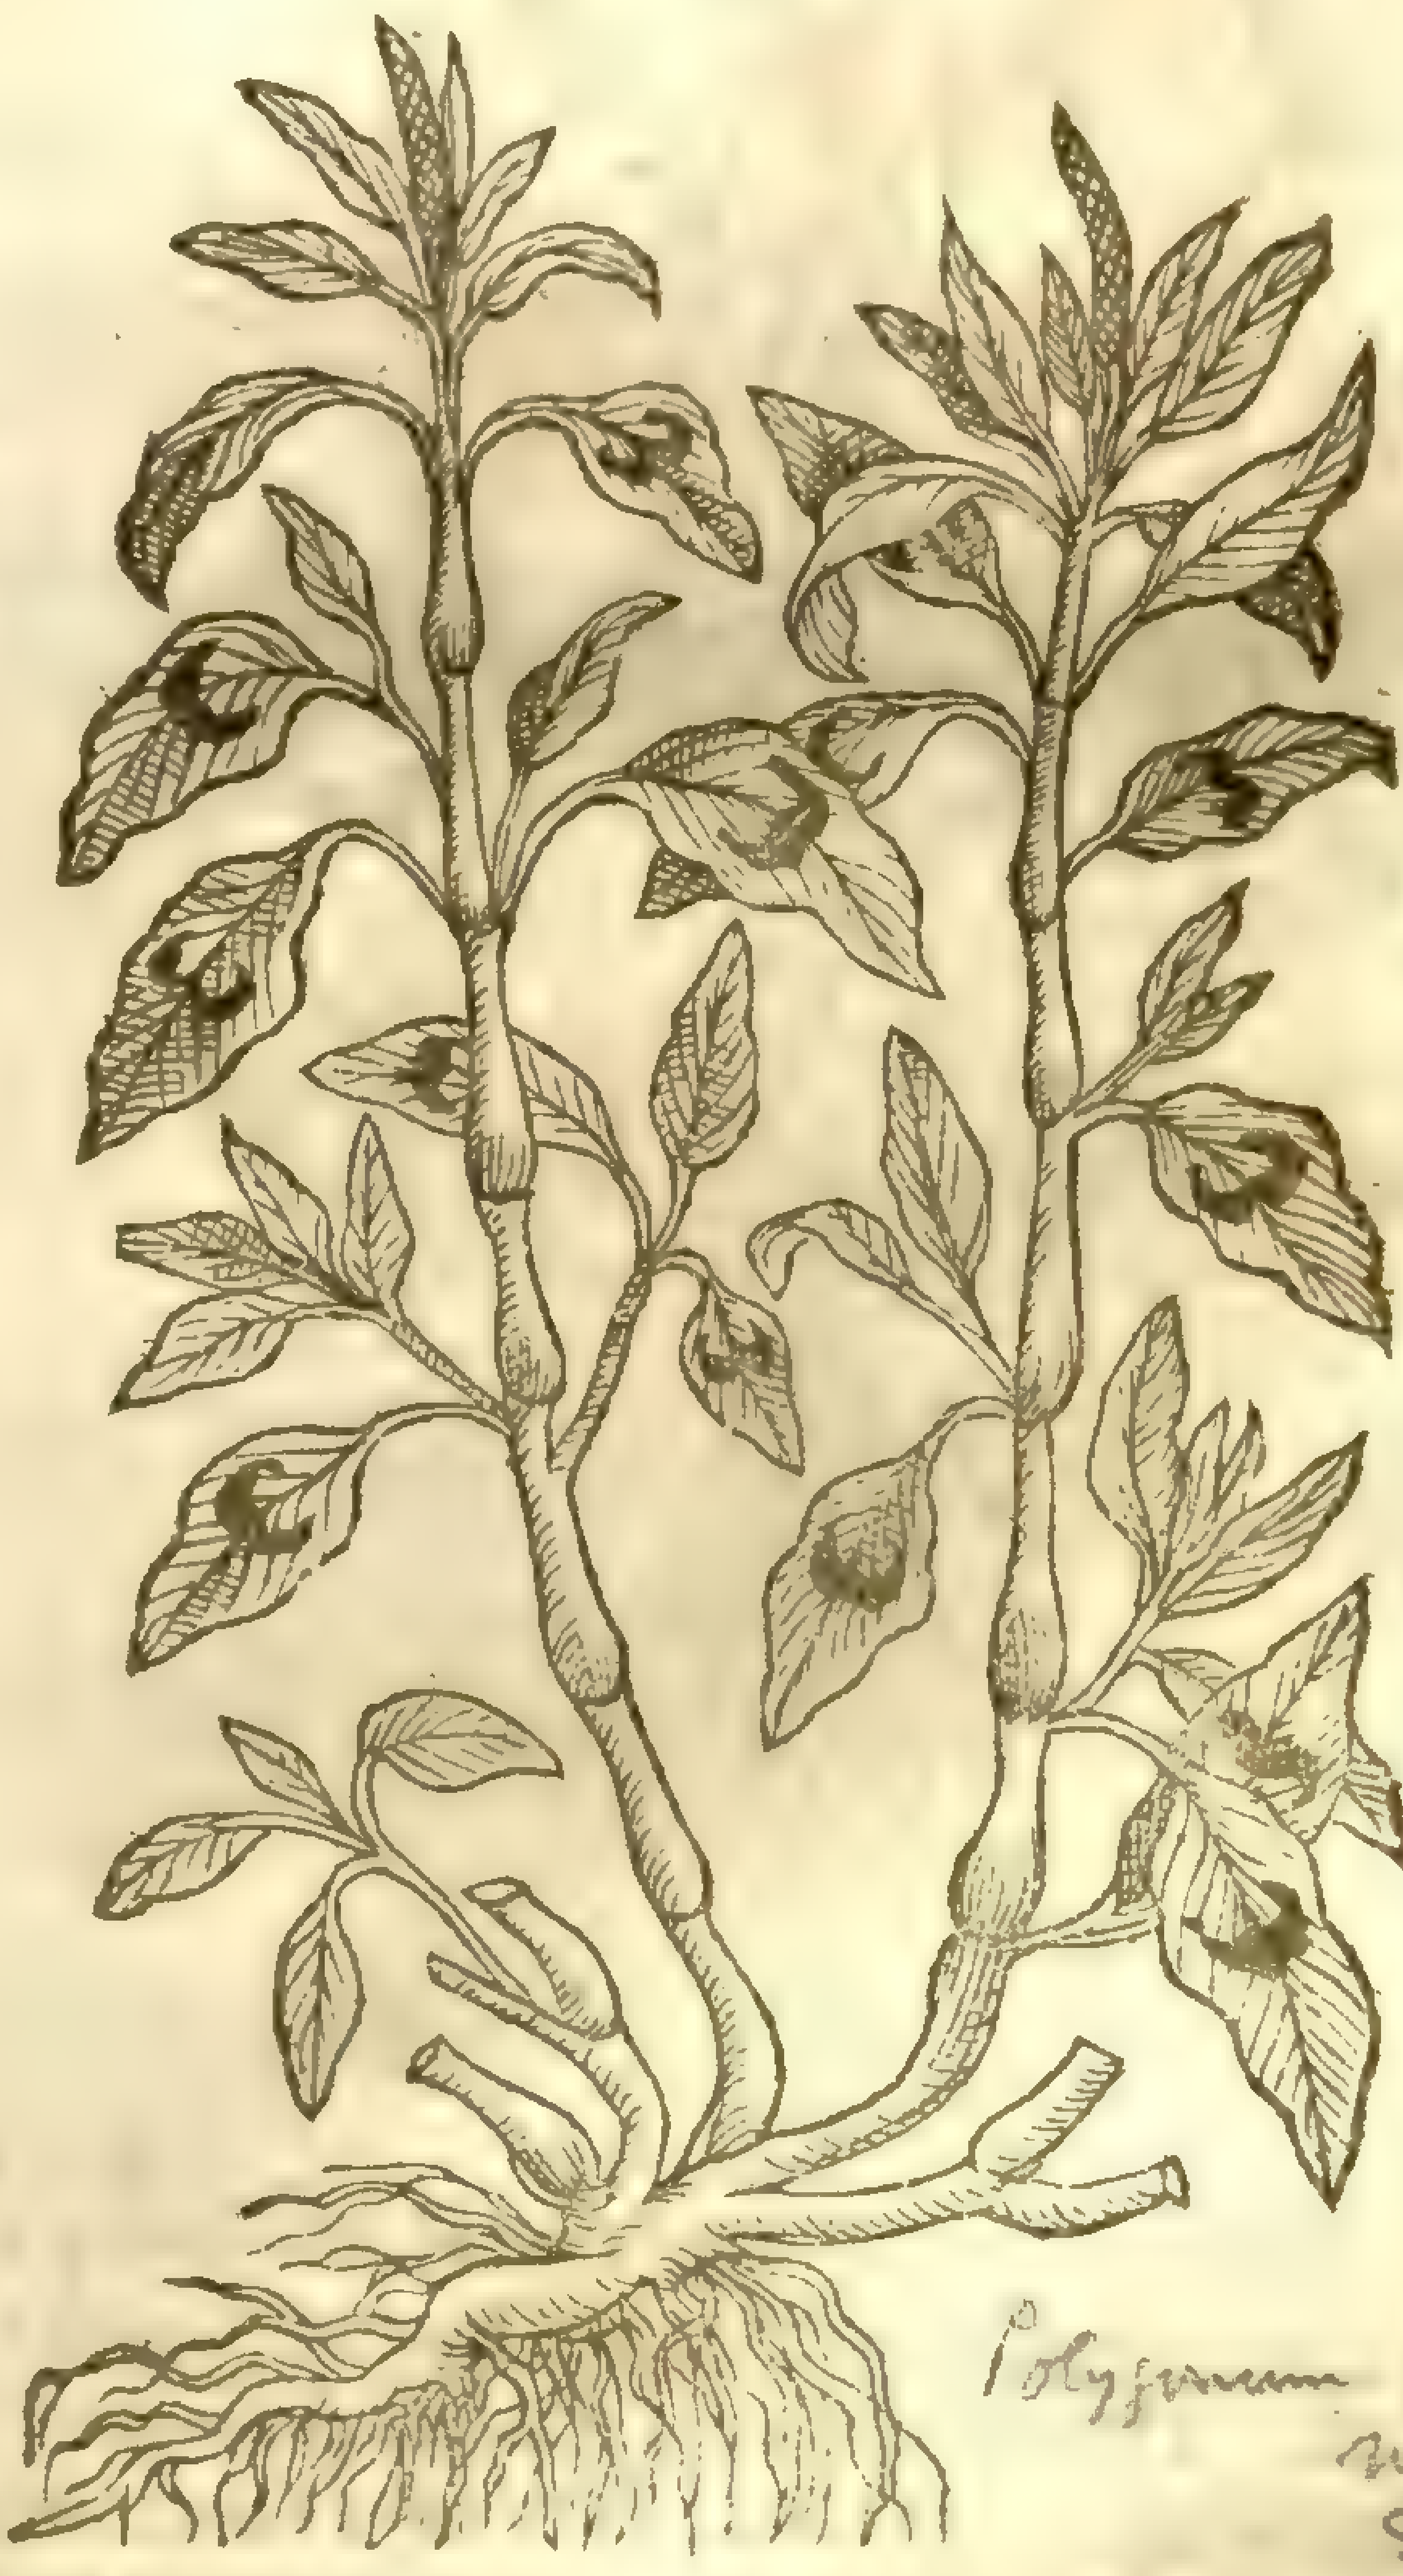
1 ARſmart bringeth forth ſtalks a cubit high, round, ſmooth, jointed or kneed, diuiding themſelues into ſundry branches, whereon grow leaues like thoſe of the Peach or of the Sallow tree. The floures grow in cluſters vpon long ſtems, out of the boſom of the branches and leaues, and likewiſe vpon the ſtalks themſelues, of a white colour tending to a bright purple: after which come forth little ſeeds ſomwhat broad, of a reddiſh yellow, and ſomtime blackiſh, of an hot and biting taſte, as is all the reſt of the Plant, and like vnto pepper, whereof it tooke his name, yet hath it no ſmell at all.

1 *Hydropiper.*
Arſmart.



i. hydropiper Syn. ed. 607
mile. dist.
Lob. ic. 315
Polygonum lapathifolium, L.
mile. dist.
Syn. fl. 2. 234

2 *Perſicaria maculoſa.*
Dead or ſpotted Arſmart.



Lob. ic. 315
Polygonum persicaria, L.
mile. dist.
Sm. fl. 2. 233

2 Dead Arſmart is like vnto the precedent in ſtalks, cluſtering floures, roots and ſeed, & differeth in that, that this plant hath certain ſpots or marks vpon the leaues, in faſhion of a halfe moon, of a dark blackiſh colour. The whole plant hath no ſharp or biting taſte, as the other hath but as it were a little ſoure ſmacke vpon the tongue. The root is likewiſe full of ſtrings or threds, creeping vp and downe in the ground.

‡ 3

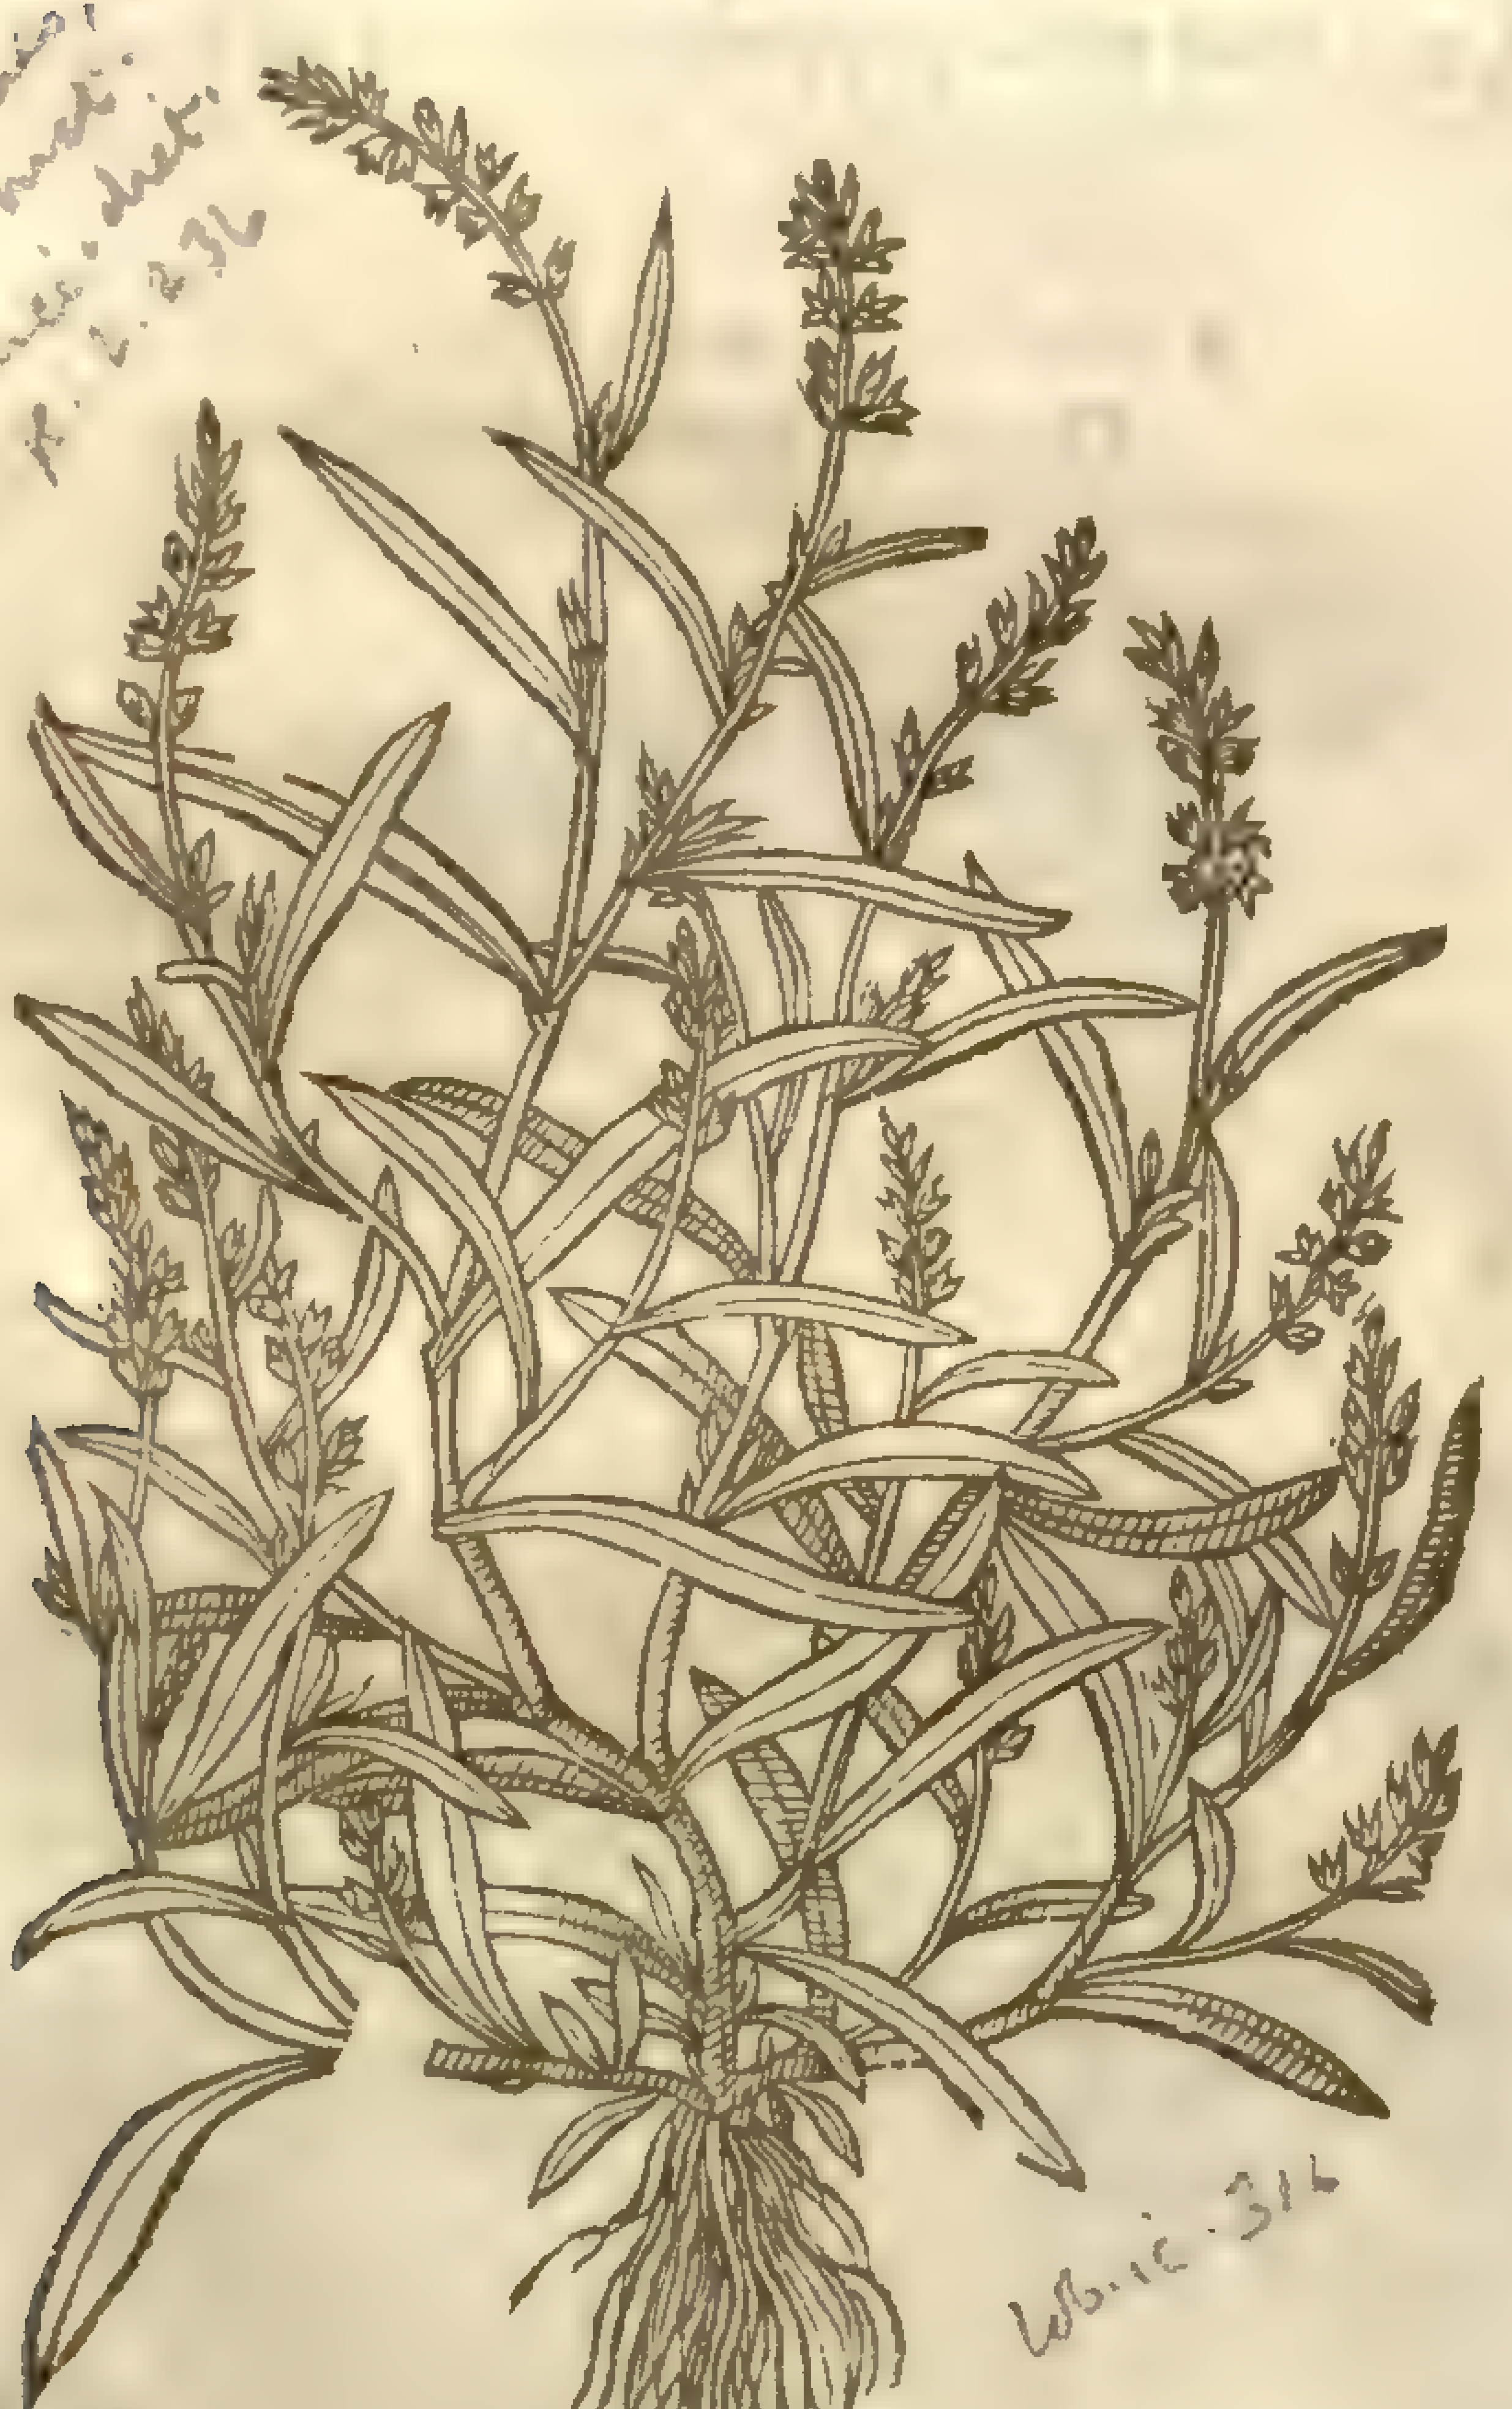
‡ 3 This in roots, leaues, and manner of growing is very like the firſt deſcribed, but leſſer by much in all theſe parts: the floures alſo are of a whitiſh and ſometimes of a purpliſh colour: it growes in barren grauelly and wet places.

4 I haue thought good to omit the impertinent deſcription of our Author fitted to this plant, and to giue one ſomewhat more to the purpoſe: the ſtalkes of this are ſome two foot high, tender, green, and ſometimes purpliſh, hollow, ſmooth, ſucculent and tranſparent, with large and eminent joints, from whence proceed leaues like thoſe of French Mercurie, a little bigger, and broader toward their ſtalkes, and thereabout alſo cut in with deeper notches: from the boſomes of each of theſe leaues come forth long ſtalks hanging downward, and diuided into three or foure branches; vpon which hang floures yellow, and much gaping, with crooked ſpurs or heeles, and ſpotted alſo with red or ſanguine ſpots: after theſe are paſt ſucceed the cods, which contain the ſeed, and they are commonly two inches long, ſlender, knotted, and of a whitiſh greene colour, creſted with greeniſh lines; and as ſoon as the ſeed begins to be ripe, they are ſo impatient, that they wil by no means be touched, but preſently the ſeed will fly out of them into your face. And this is the cauſe that *Lobel* and others haue called this Plant *Noli me tangere*; as for the like reaſon ſome of late haue impoſed the ſame name vpon the *Sium minimum* of *Alpinus*, formerly deſcribed by me in the ſeuenth place of the eighteenth chapter of this booke, *pag*. 260. ‡

Impatiens noli tangere. Linn. dict. Syn. p. 1. 316

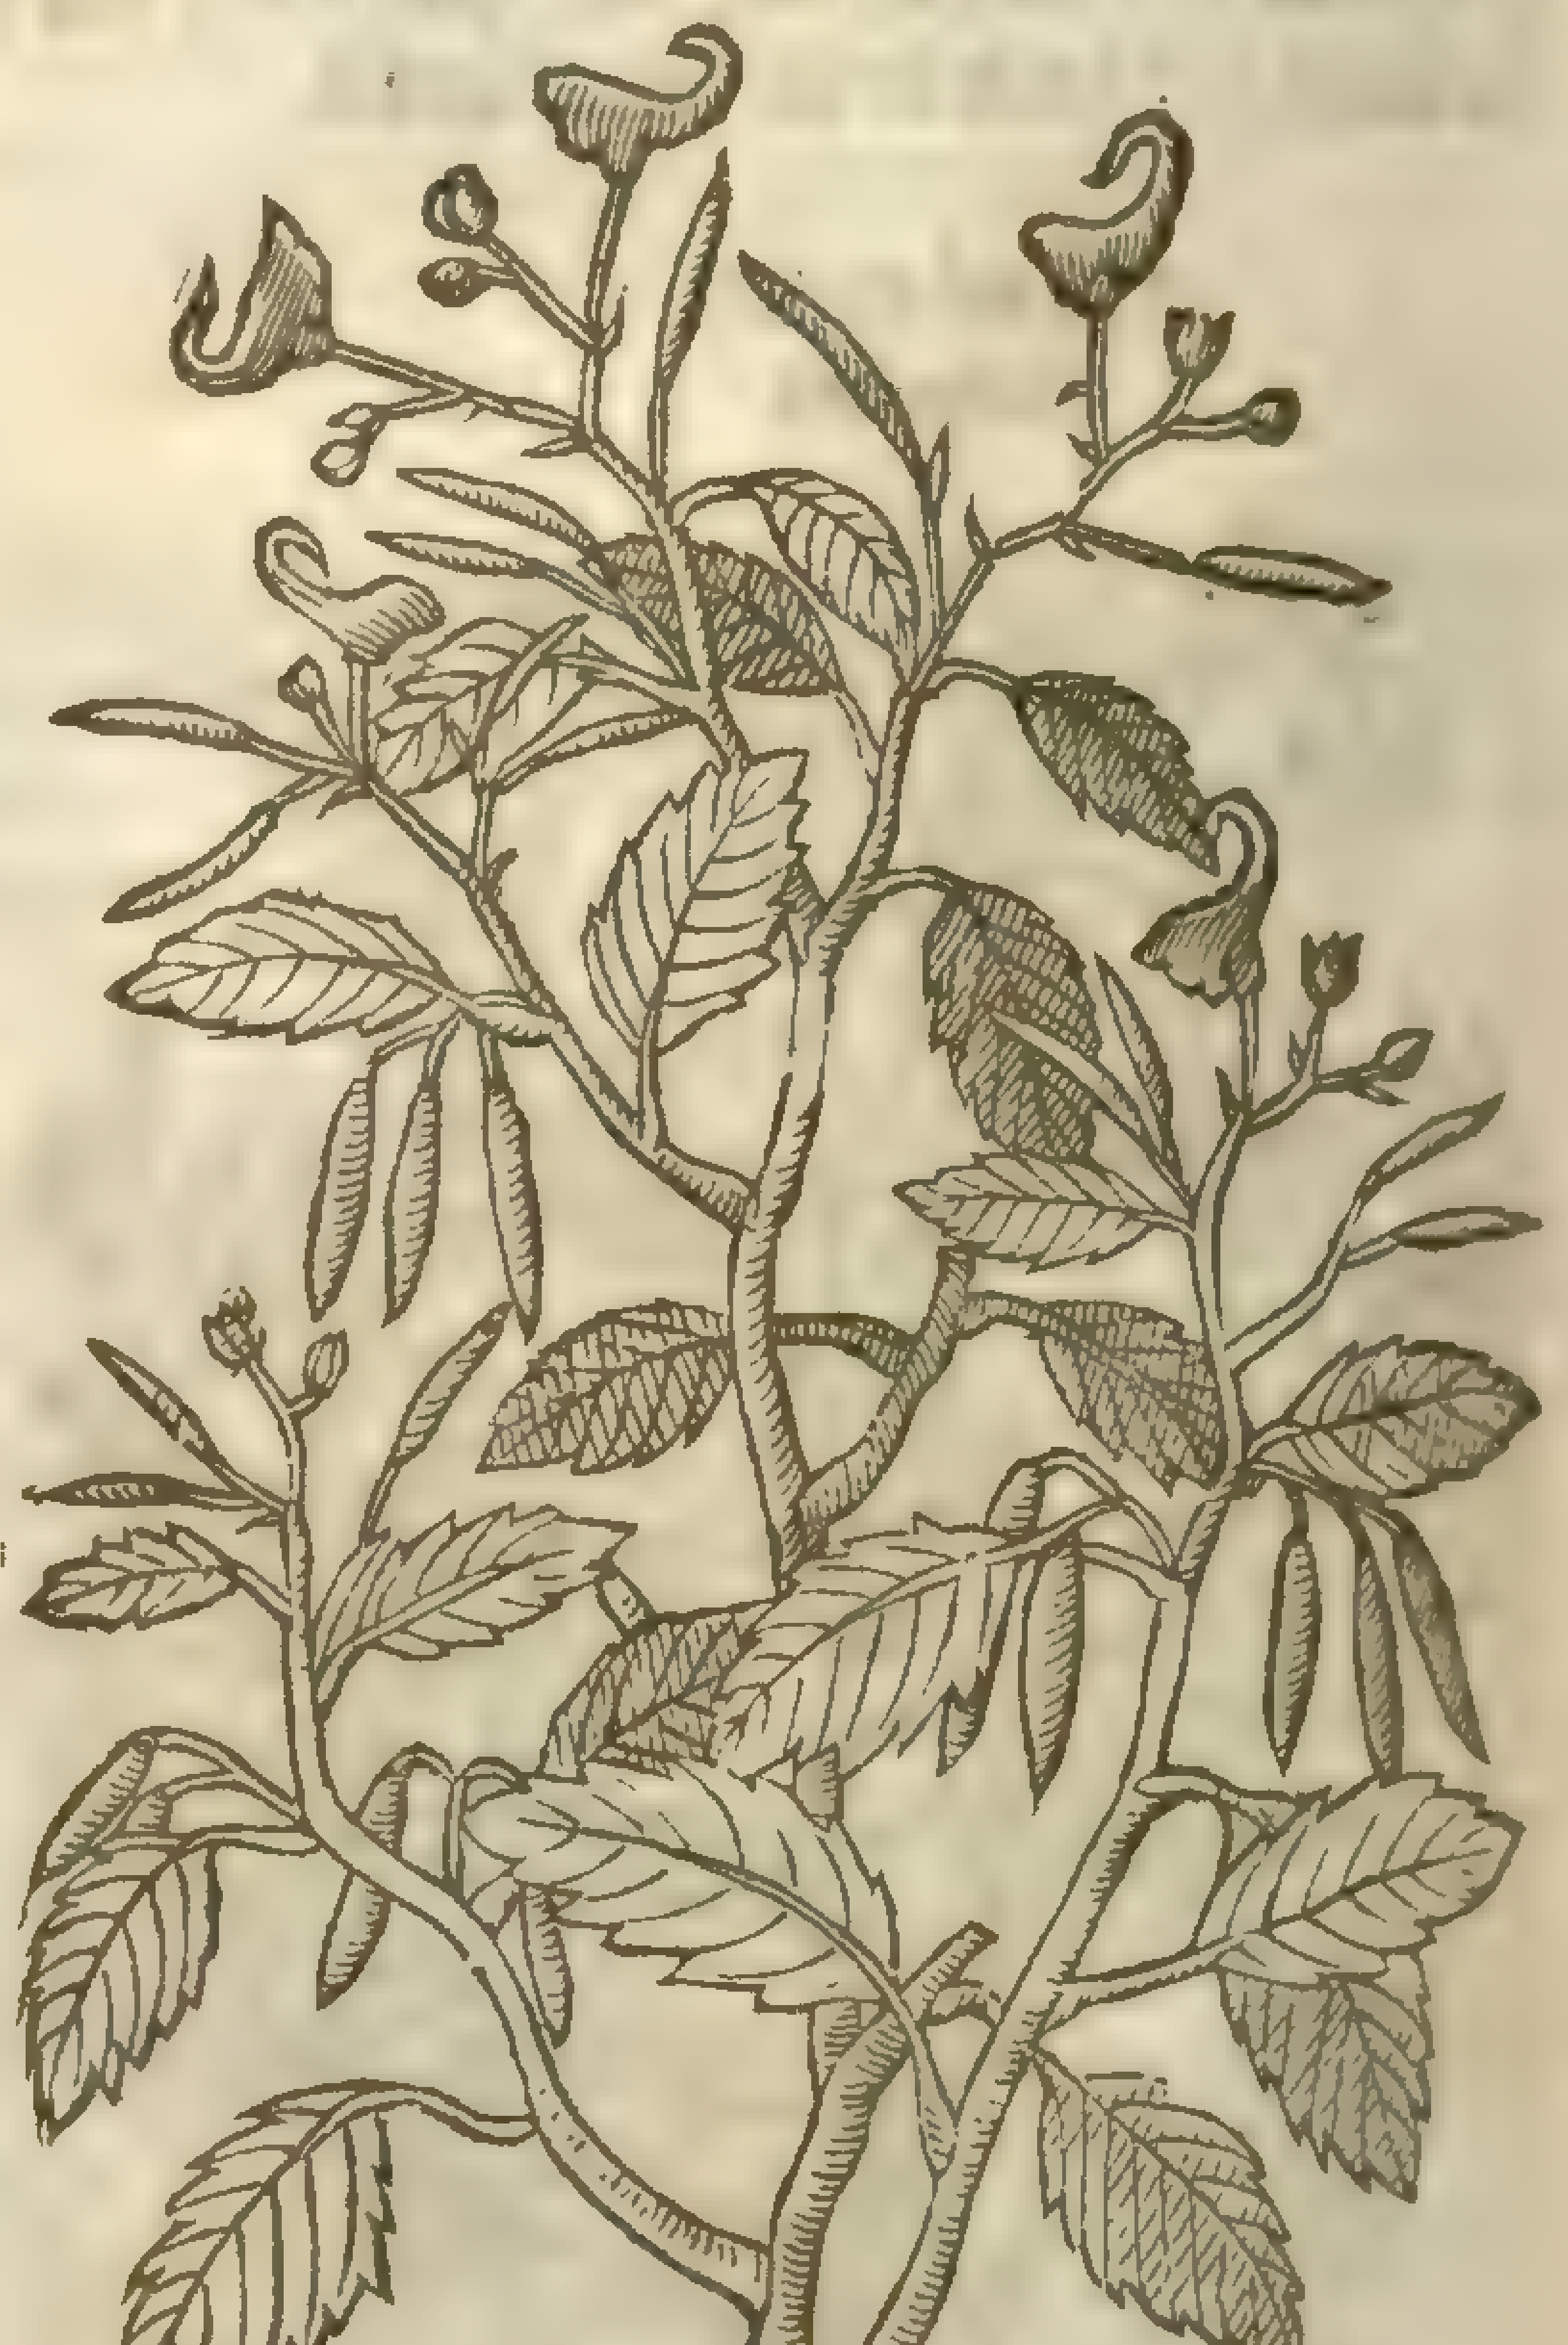
‡ 3 *Perſicaria puſilla repens.*
Small creeping Arſmart.

Polygonum minus, Huds. Spa. hast. Linn. dict. Syn. p. 2. 36



Wic. 316

4 *Perſicaria ſiliquoſa.*
Codded Arſmart.



¶ *The Place and Time.*

They grow very common almoſt euery where in moiſt and wateriſh plaſhes, and neere vnto the brims of riuers, ditches, and running brooks. They floure from Iune to Auguſt.

‡ The codded or impatient Arſmart was firſt found to grow in this kingdome by the induſtry of my good friend Mr *George Bowles*, who found it at theſe places; firſt in Shropſhire, on the banks of the riuer Kemlet at Marington in the pariſh of Cherberry, vnder a gentlemans houſe called Mr *LLoyd*: but eſpecially at Guerndee in the pariſh of Cherſtock, halfe a mile from the foreſaid riuer, amongſt great Alder trees in the highway.

¶ *The Names.*

1 Arſmart is called in Greeke ὑδροπίπερι: of the Latines, *Hydropiper*, or *Piper aquaticum*, or *Aquatile*, or water Pepper: in high-Dutch, **Waſſer Pfeffer**: in low-Dutch, **Water Peper**: in French, *Curage*,

Curage, or *Culrage*: in Spaniſh, *Pimenta aquatica*: in Engliſh, Water-Pepper, Culrage, and Arſeſmart, according to the operation and effect when it is vſed in the abſterſion of that part.

2 Dead Arſmart is called *Perſicaria*, or Peach-wort, of the likeneſſe that the leaues haue with thoſe of the Peach-tree. It hath beene called *Plumbago* of the leaden coloured markes which are ſeene vpon it: but *Pliny* would haue *Plumbago* not to be ſo called of the colour, but rather of the effect, by reaſon that it helpeth the infirmitie of the eies called *Plumbum*. Yet there is another *Plumbago* which is rather thought to be that of *Plinies* deſcription, as ſhal be ſhewed in his proper place. In Engliſh we may call it Peach-wort, and dead Arſmart, becauſe it doth not bite thoſe places as the other doth.

‡ 3 This is by *Lobel* ſet forth, and called *Perſicaria puſilla repens*: of *Tabernamontanus*, *Perſicaria pumila*.

4 No plant I thinke hath found more variety of names than this: for *Tragus* calls it *Mercurialis ſylueſtris altera*; and he alſo calls it *Eſula*: *Leonicerus* calls it *Tithymalus ſylueſtris*: *Geſner*, *Camerarius*, and others, *Noli me tangere*: *Dodonæus*, *Impatiens herba*: *Cæſalpinus*, *Catanance altera*: in the *Hiſt. Lugd.* (where it is ſome three times ouer) it is called beſides the names giuen it by others, *Chryſæa*: *Lobel*, *Thalius*, and others call it *Perſicaria ſiliquoſa*: yet none of theſe well pleaſing *Columna*, hee hath accurately deſcribed and figured it by the name of *Balſamita altera*: and ſince him *Bauhine* hath named it *Balſamina lutea*: yet both theſe and moſt of the other keepe the title of *Noli me tangere*. ‡

¶ *The Temperature.*

Arſmart is hot and dry, yet not ſo hot as Pepper, according to *Galen*.

Dead Arſmart is of temperature cold, and ſomething dry.

¶ *The Vertues.*

The leaues and ſeed of Arſmart doe waſte and conſume all cold ſwellings, diſſolue and ſcatter congealed bloud that commeth of bruiſings or ſtripes.

The ſame bruiſed and bound vpon an impoſtume in the ioints of the fingers (called among the vulgar ſort a fellon or vncome) for the ſpace of an houre, taketh away the paine: but (ſaith the Author) it muſt be firſt buried vnder a ſtone before it be applied; which doth ſomewhat diſcredit the medicine.

The leaues rubbed vpon a tyred Iades backe, and a good handfull or two laid vnder the ſaddle, and the ſame ſet on againe, wonderfully refreſh the wearied horſe, and cauſe him to trauell much the better.

It is reported that Dead Arſmart is good againſt inflammations and hot ſwellings, being applied in the beginning: and for greene wounds, if it be ſtamped and boyled with oyle Oliue, wax and Turpentine.

‡ The faculties of the fourth are not yet knowne. *Lobel* ſaith it hath a venenate quality: and *Tragus* ſaith a vomitorie: yet neither of them ſeems to affirme any thing of certainty, but rather by heare-ſay.

CHAP. 115. *Of Bell-floures.*

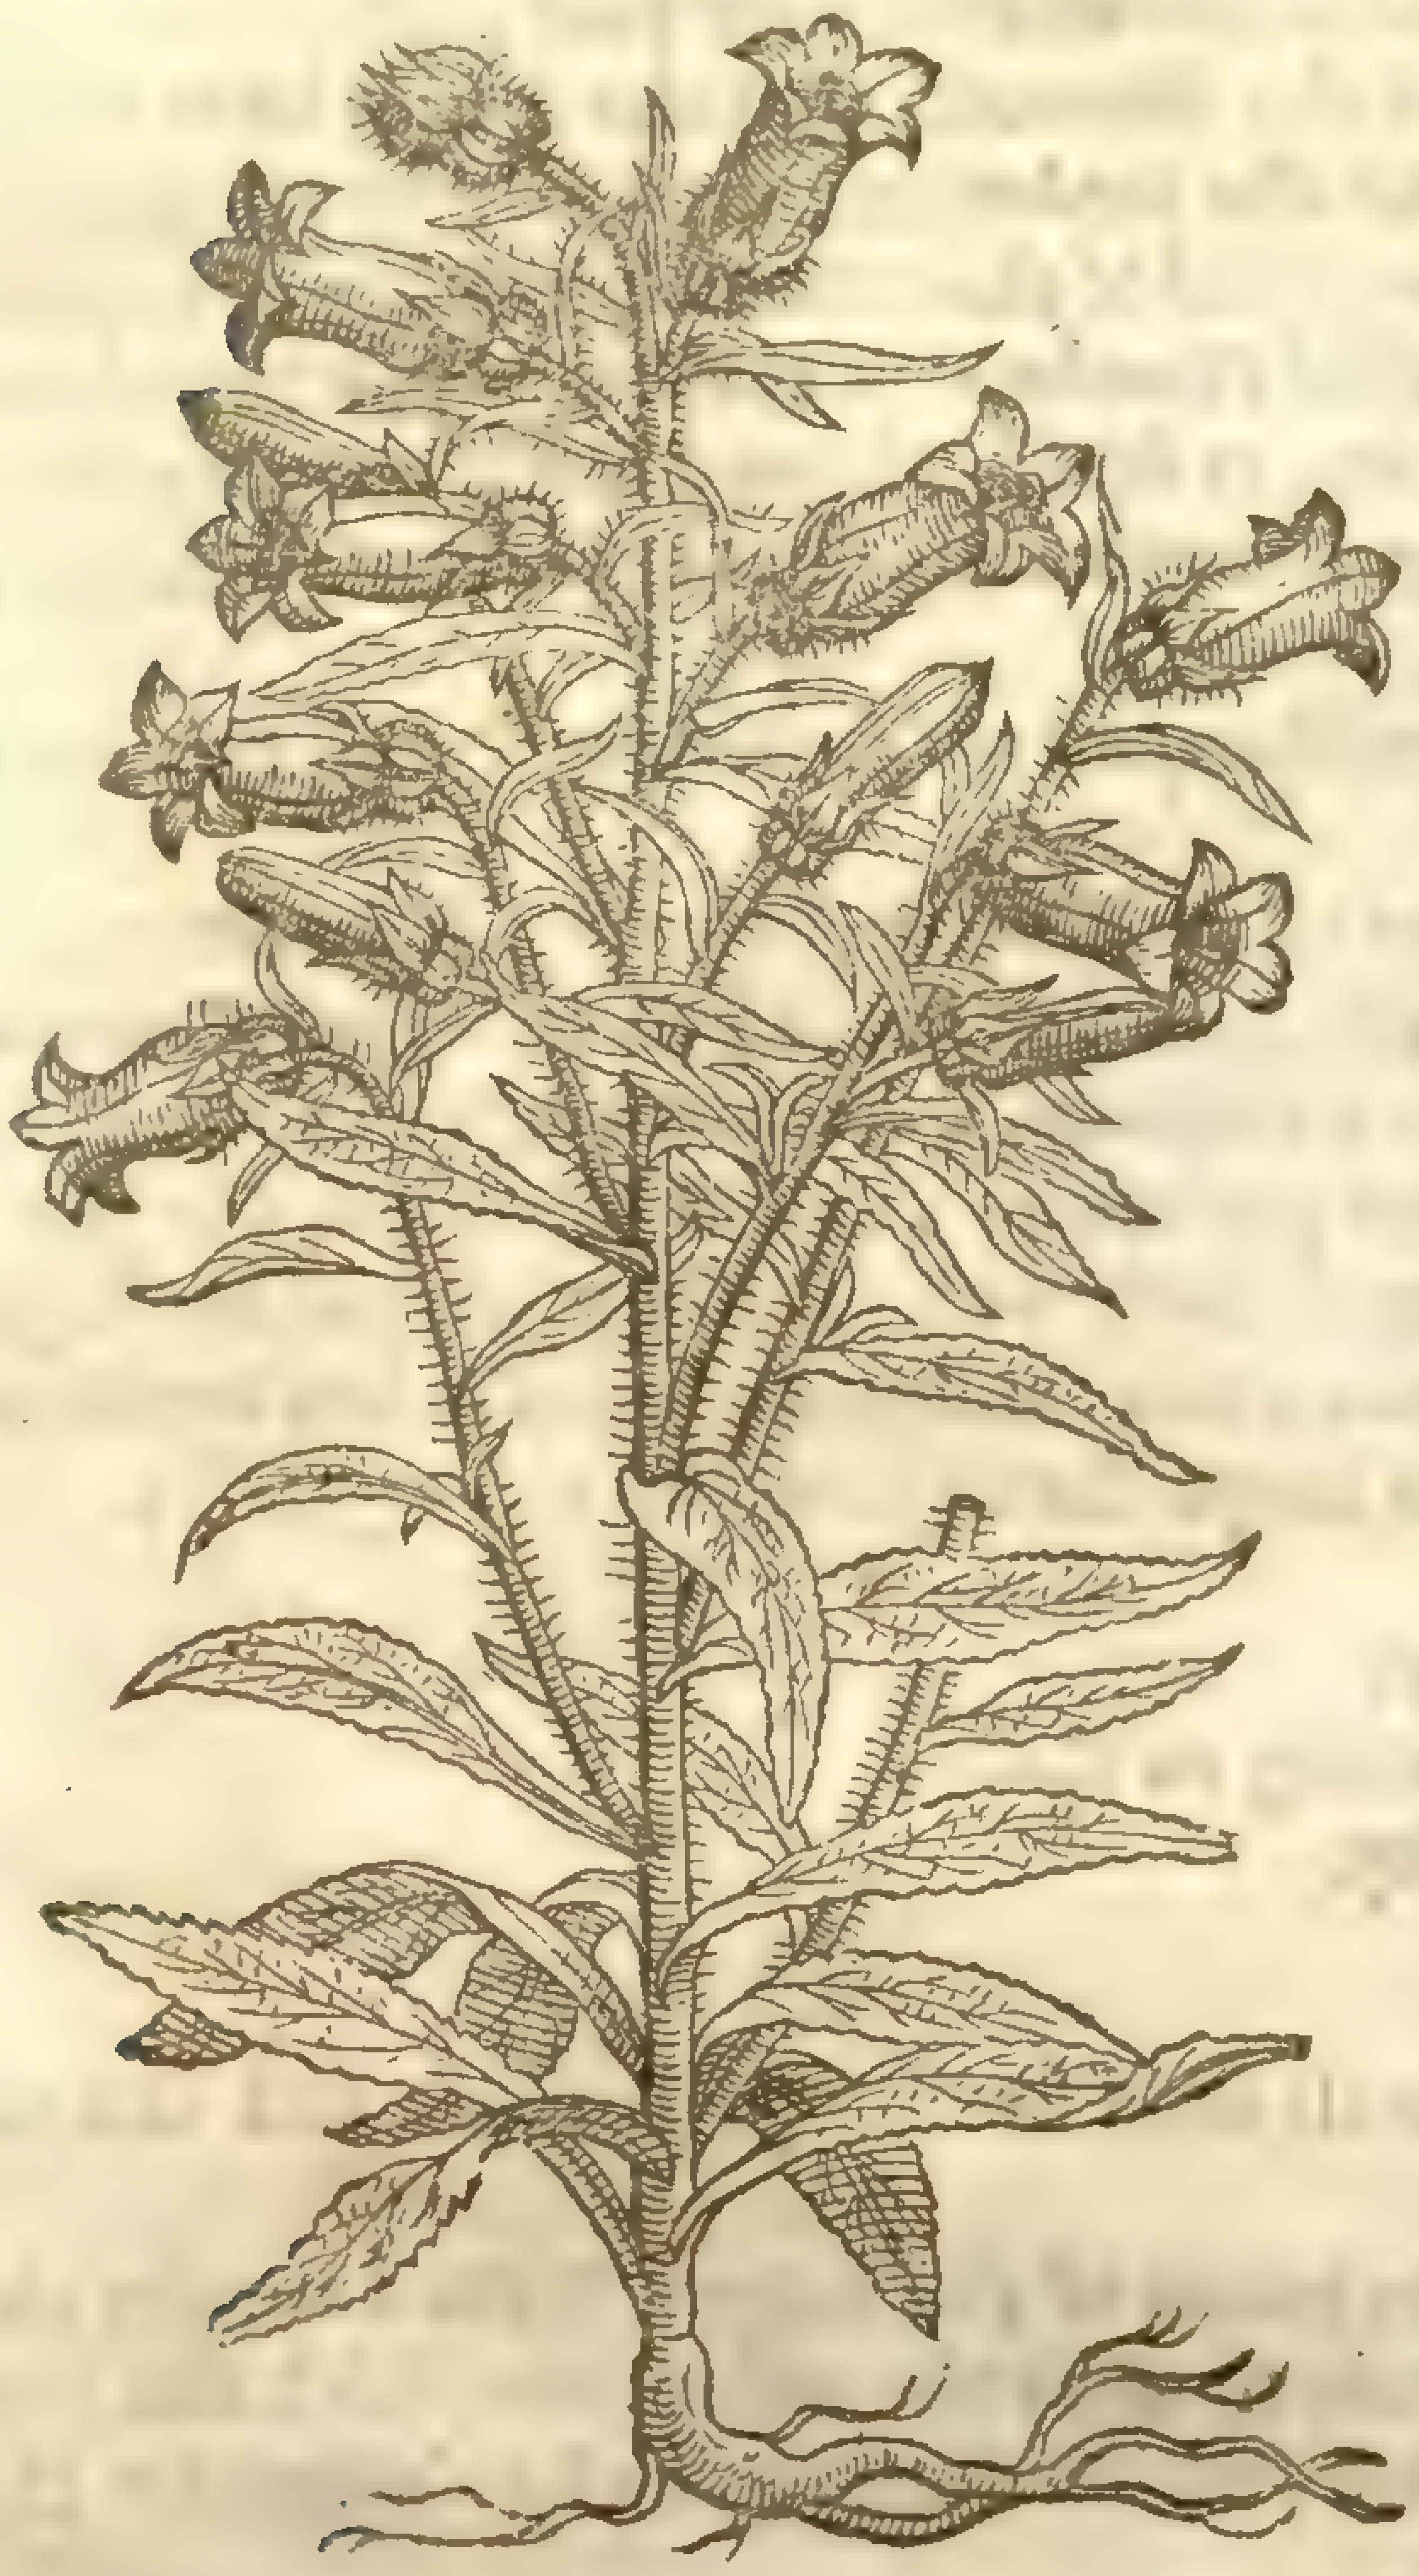
¶ *The Deſcription.*

1 Couentry-Bells haue broad leaues rough and hairy, not vnlike to thoſe of the Golden Bugloſſe, of a ſwart greene colour: among which do riſe vp ſtiffe hairie ſtalkes the ſecond yeare after the ſowing of the ſeed: which ſtalkes diuide themſelues into ſundry branches, whereupon grow many faire and pleaſant bell-floures, long, hollow, and cut on the brim with fiue ſleight gaſhes, ending in fiue corners toward night, when the floure ſhutteth it ſelfe vp, as doe moſt of the Bell-floures: in the middle of the floures be three or foure whitiſh chiues, as alſo much downie haire, ſuch as is in the eares of a Dog, or ſuch like beaſt. The whole floure is of a blew purple colour: which being paſt, there ſucceed great ſquare or cornered ſeed-veſſels, diuided on the inſide into diuers cels or chambers, wherein do lie ſcatteringly many ſmall browne flat ſeeds. The root is long and great like a Parſenep, garniſhed with many threddy ſtrings, which periſheth when it hath perfected his ſeed, which is in the ſecond yeare after his ſowing, and recouereth it ſelfe againe by the falling of the ſeed.

2 The ſecond agreeth with the firſt in each reſpect, as well in leaues, ſtalkes, or roots, and differeth in that, that this plant bringeth forth milke-white floures, and the other not ſo.

¶ The

Viola mariana. Blew Couentry Bells.



Campanula [illegible] [illegible]

¶ *The Place and Time.*

They grow in woods, mountaines, and dark vallies, and vnder hedges among the buſhes, eſpecially about Couentry, where they grow very plentifully abroad in the fields, and are there called Couentry bells, and of ſome about London, Canterbury bells; but vnproperly, for that there is another kinde of Bell-floure growing in Kent about Canterbury, which may more fitly be called Canterbury Bells, becauſe they grow there more plentifully than in any other countrey. Theſe pleaſant Bell-floures wee haue in our London gardens eſpecially for the beauty of their floure, although they be kinds of Rampions, and the roots eaten as Rampions are.

They floure in Iune, Iuly, and Auguſt; the ſeed waxeth ripe in the mean time; for theſe plants bring not forth their floures all at once, but when one floureth another ſeedeth.

¶ *The Names.*

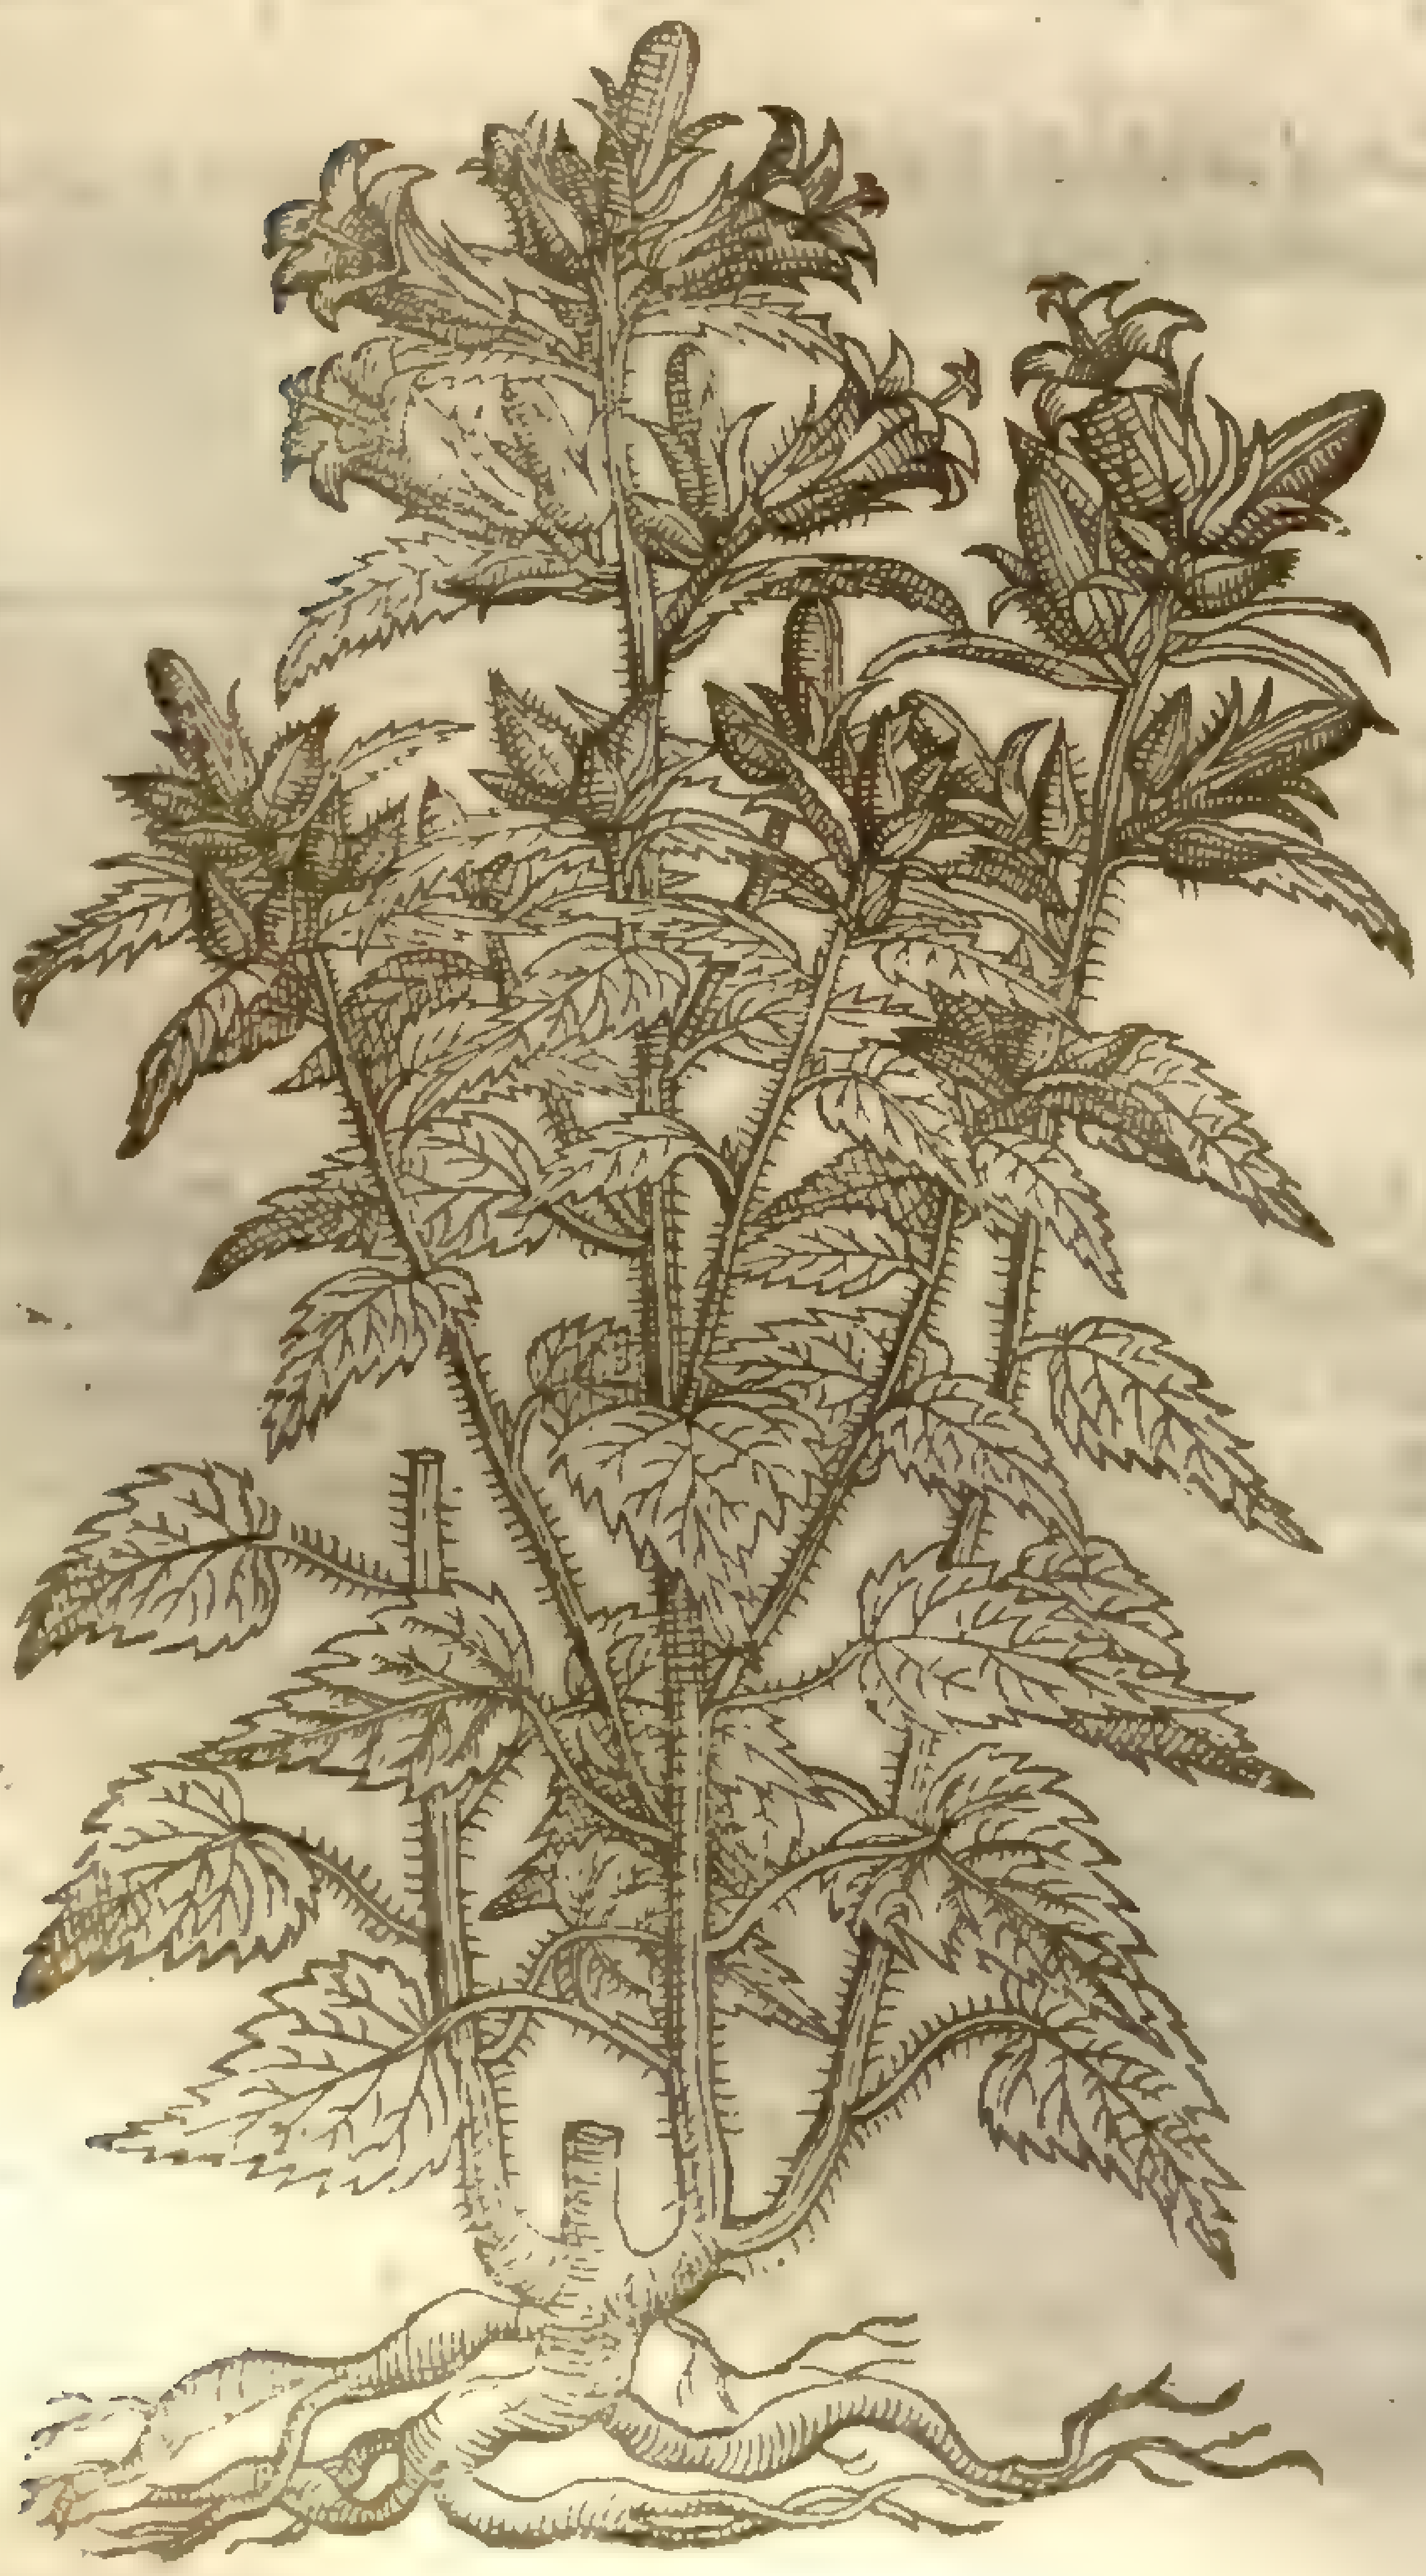
Couentry bels are called in Latine *Viola mariana*: in Engliſh, *Mercuries* Violets, or Couentry Rapes, and of ſome, Mariets. It hath bin taken to be *Medium*, but vnfitly: of ſome it is called *Rapum ſylveſtre*: which the Greeks call [illegible].

¶ *The Nature and Vertues.*

The root is cold and ſomewhat binding, and not vſed in phyſicke, but only for a ſallet root boiled and eaten, with oile, vineger, and pepper.

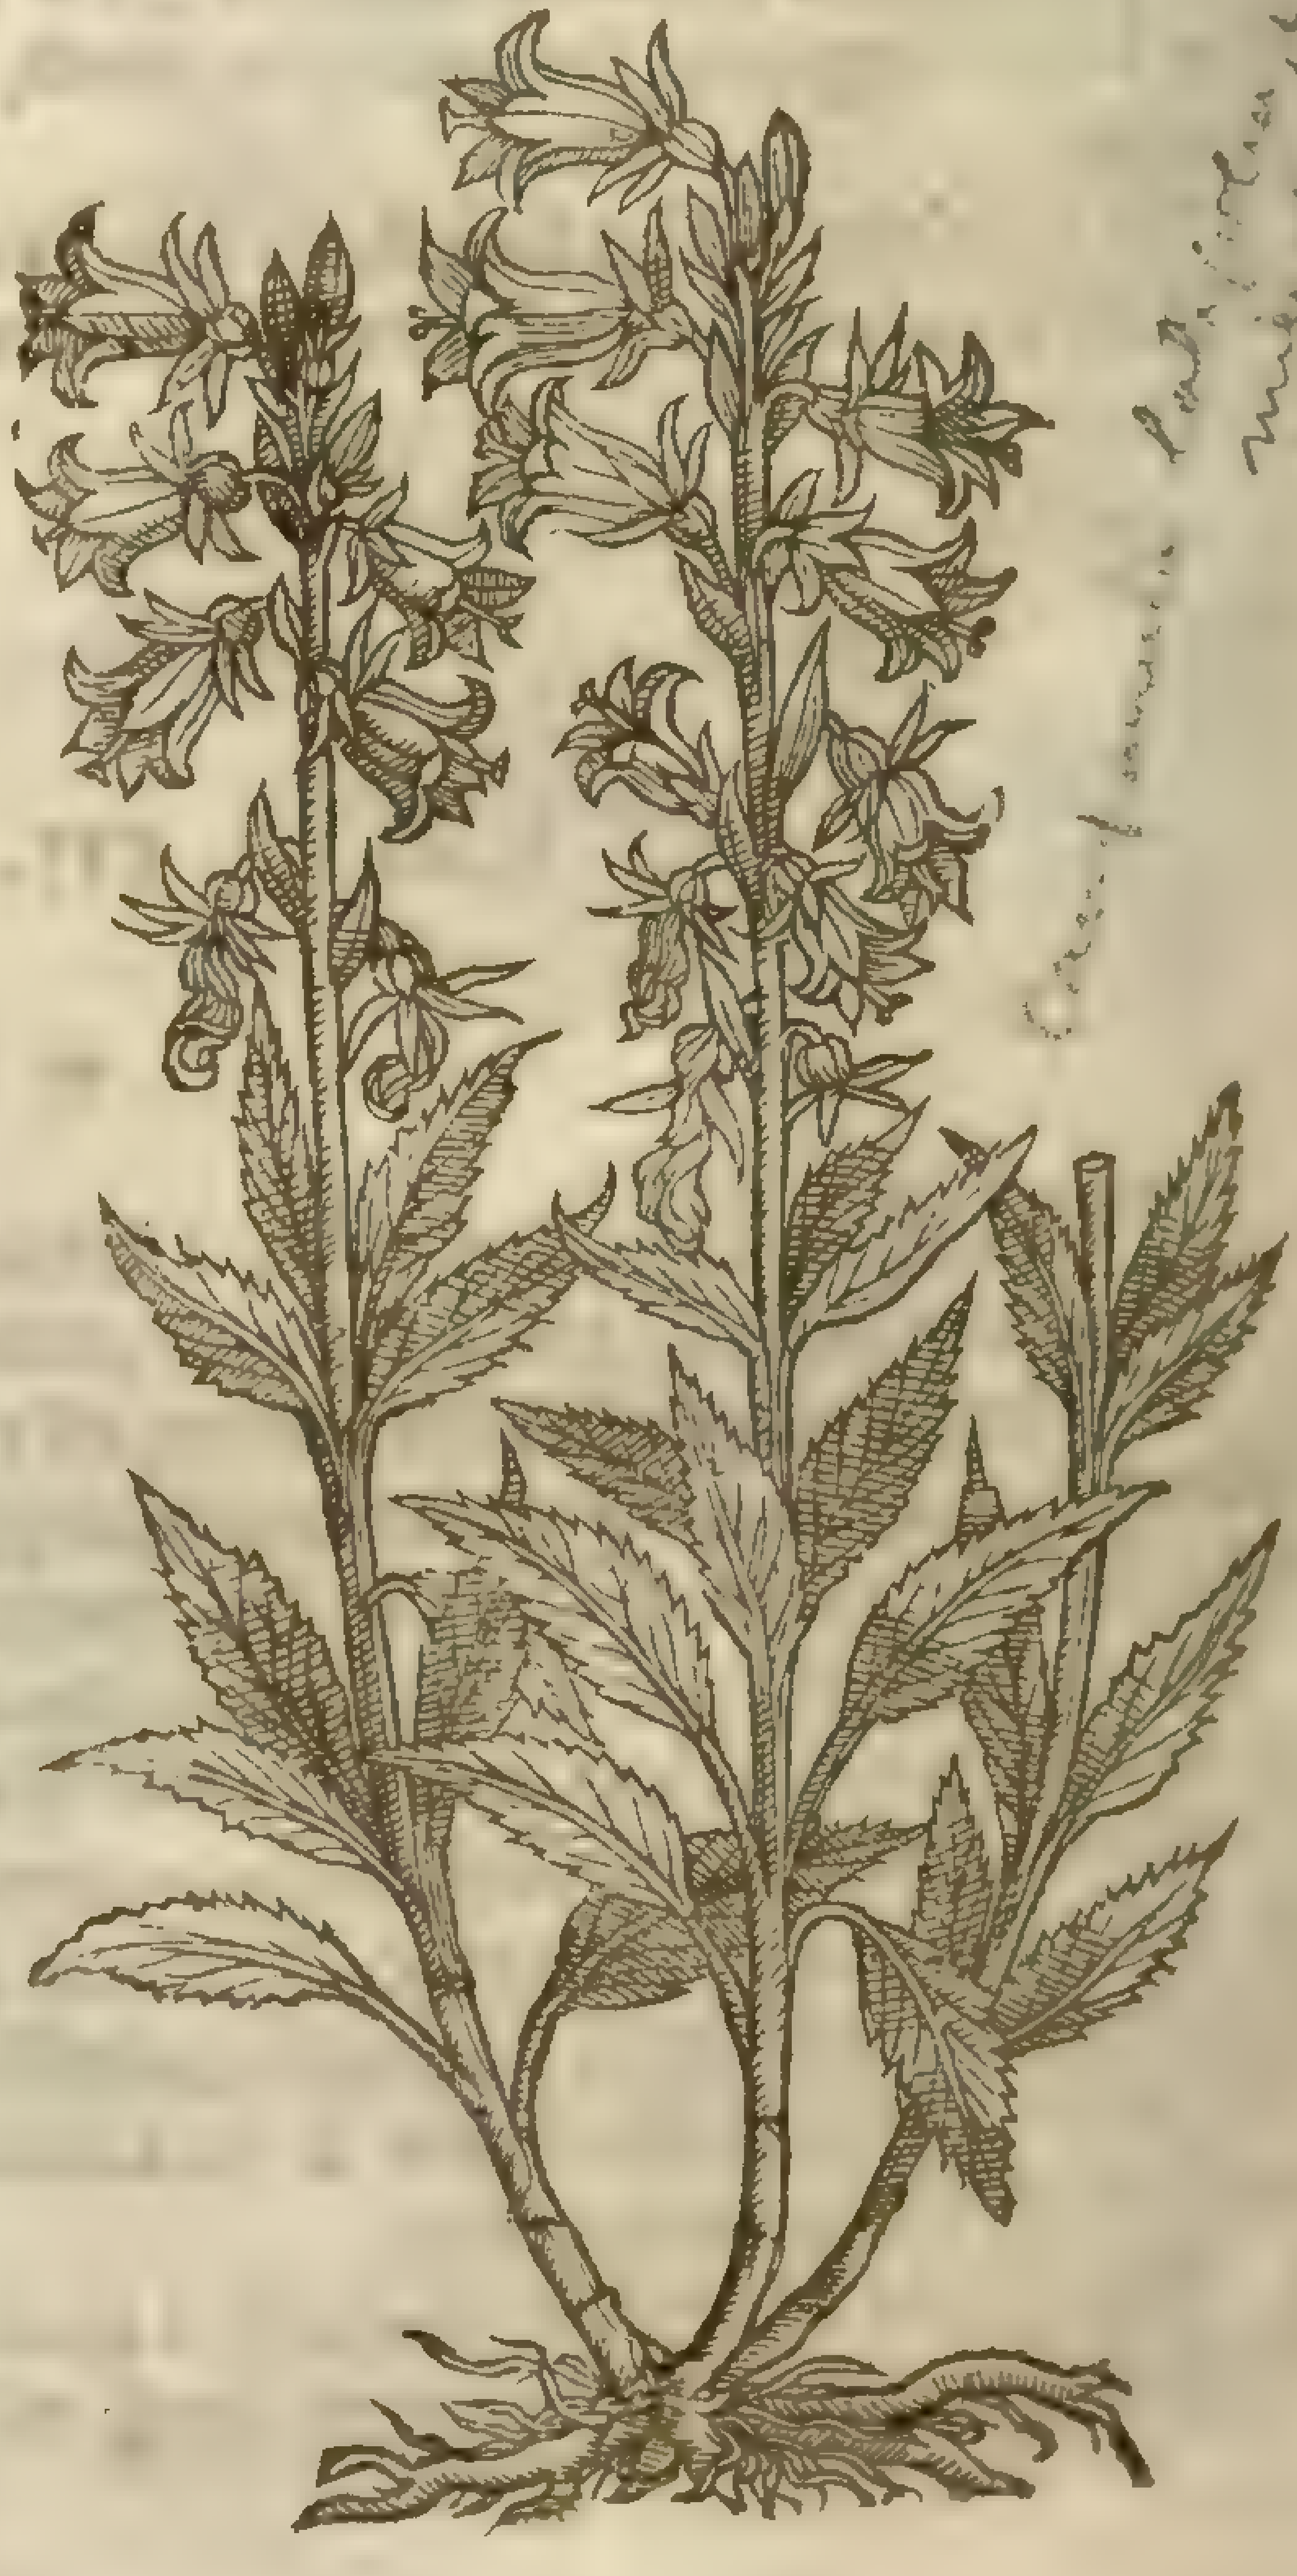
Chap. 116. *Of Throatwort, or Canterbury Bells.*

1 *Trachelium majus.*
Blew Canterbury Bells.



Campanula Trachelium, [illegible]
[illegible]
Sm. fl. 1, 292

3 *Trachel. majus Belg. ſiue Giganteum.* Gyant Throatwort.



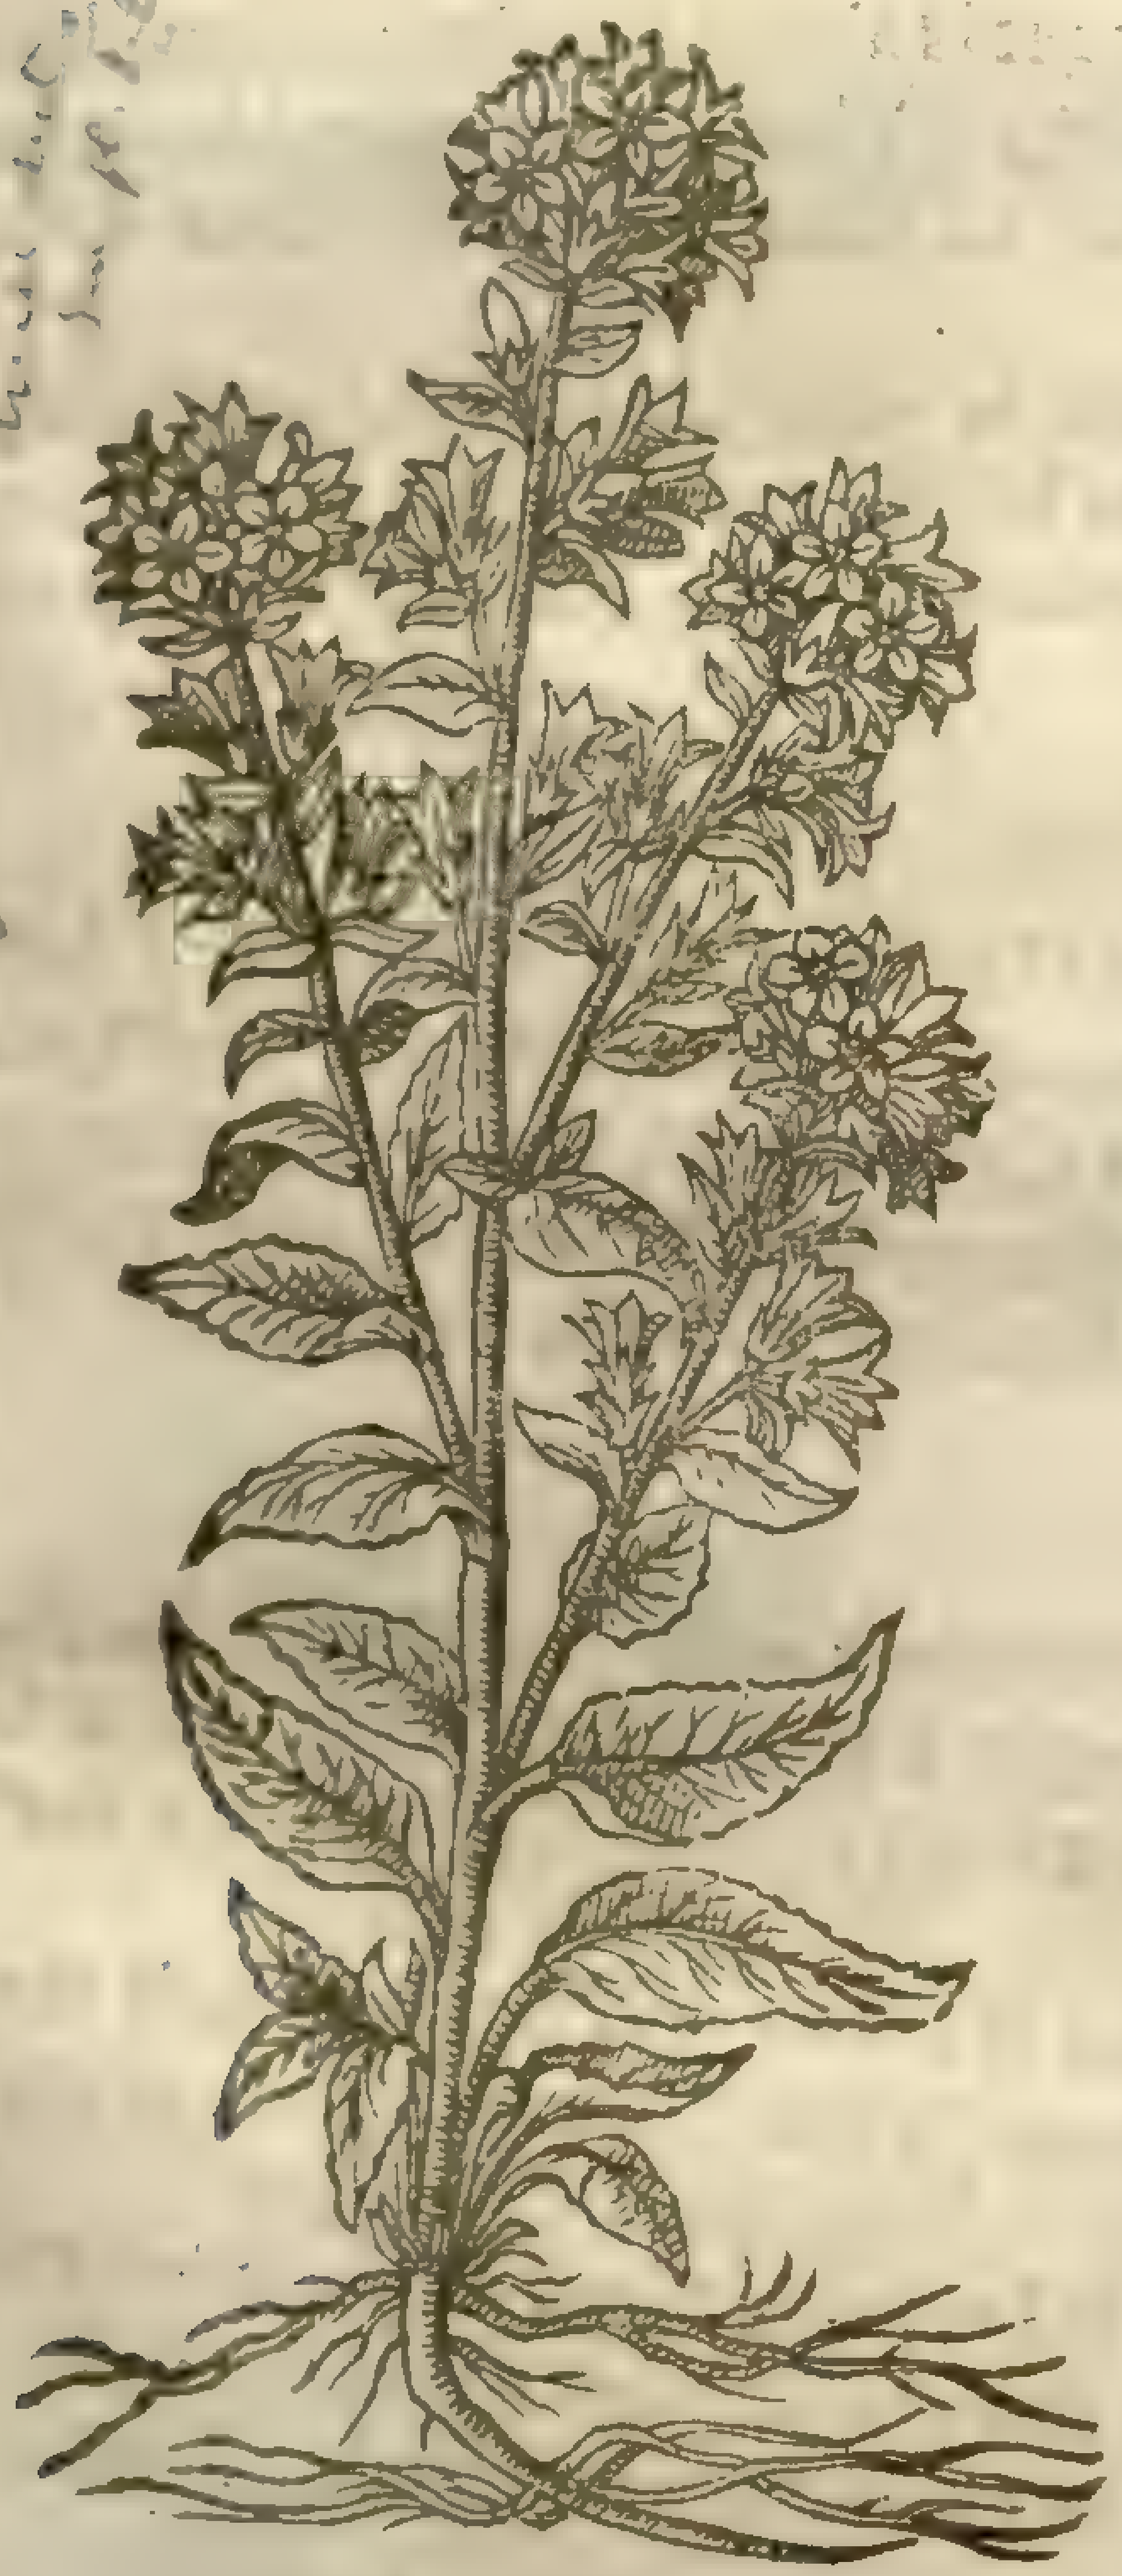
Campanula latifolia, [illegible]

¶ *The Deſcription.*

1 THe firſt of the Canterbury bells hath rough and hairy brittle ſtalkes, creſted into a certaine ſquareneſſe, diuiding themſelues into diuers branches, whereupon do grow very rough ſharpe pointed leaues, cut about the edges like the teeth of a ſawe; and ſo like the leaues of nettles, that it is hard to know the one from the other, but by touching them. The floures are hollow, hairy within, and of a perfect blew colour, bell faſhion, not vnlike to the Couentry bells. The root is white, thicke, and long laſting. ‡ There is alſo in ſome Gardens kept a variety hereof hauing double floures. ‡

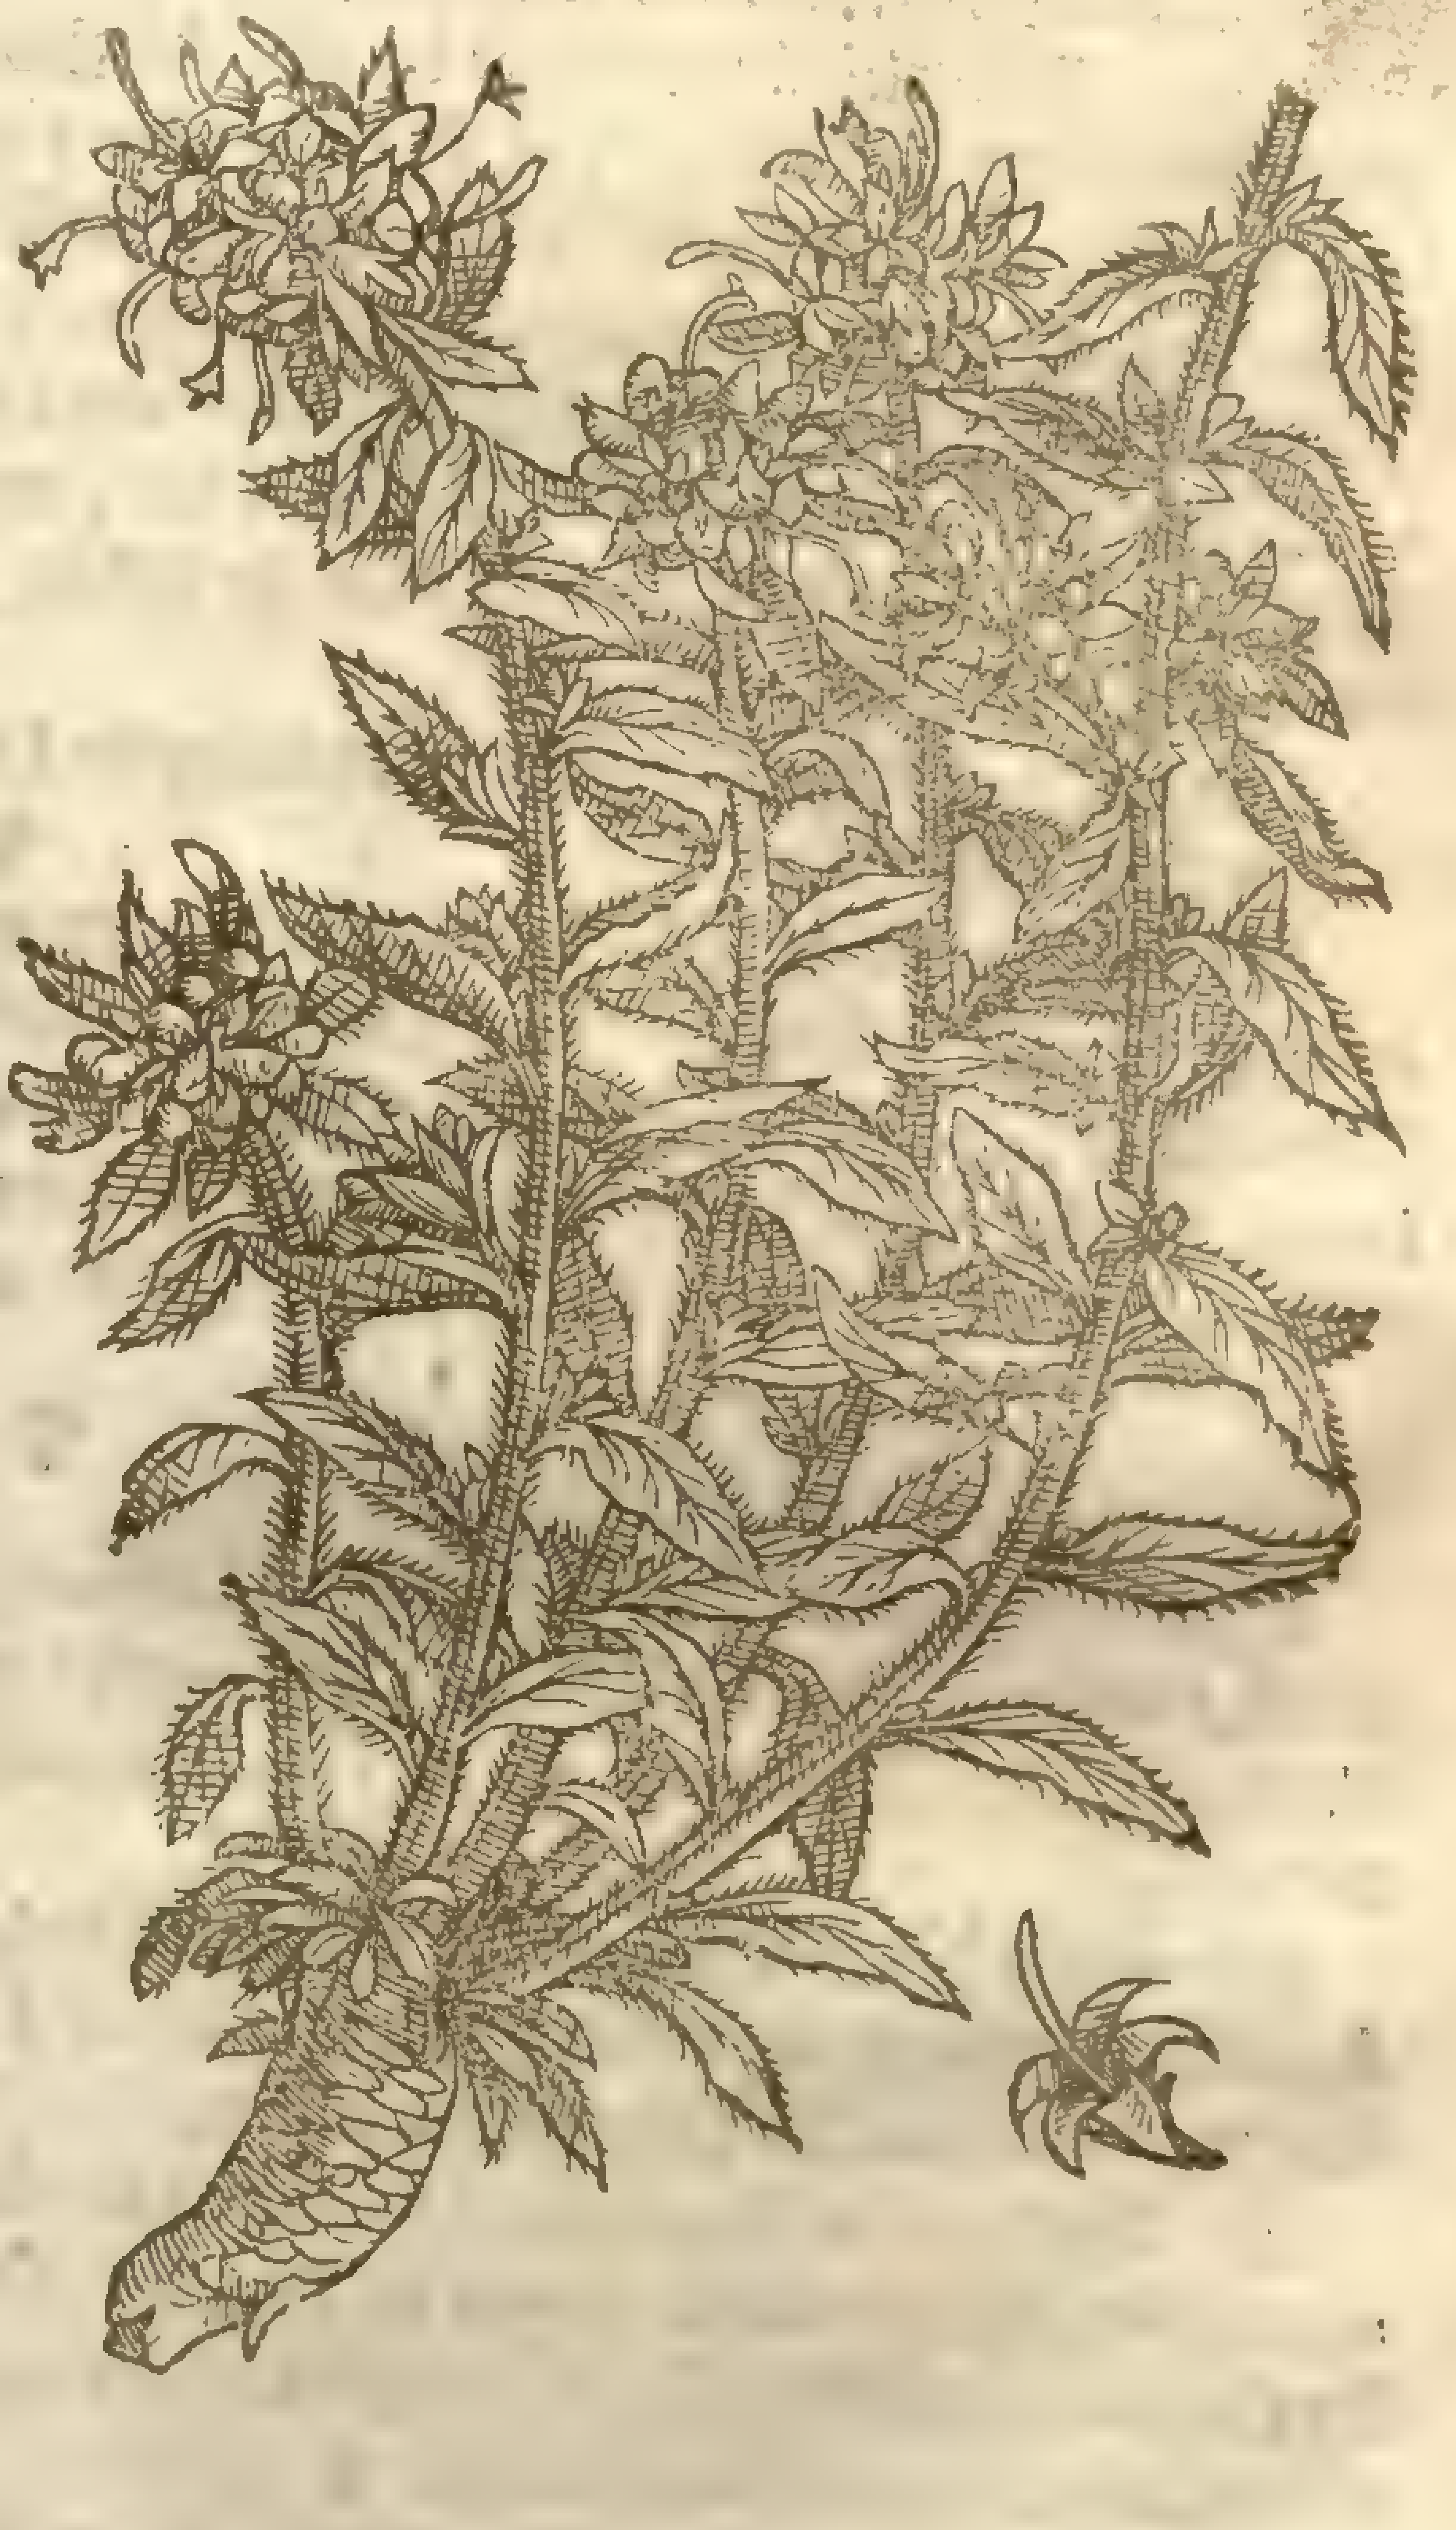
2 The white Canterbury bells are ſo like the precedent, that it is not poſſible to diſtinguiſh them, but by the colour of the floures; which of this plant is a milke white colour, and of the other a blew, which ſetteth forth the difference.

4 *Trachelium minus.*
Small Canterbury bells.



Campanula glomerata [illegible]

‡ 5 *Trachelium majus petræum.*
Great Stone Throtewort.



Campanula [illegible] petræa [illegible]

‡ Our Author much miſtaking in this place (as in many other) did againe figure and deſcribe the third and fourth, and of them made a fifth and ſixth, calling the firſt *Trachelium Giganteum*, and the next, *Viola Calathiana*; yet the figures were ſuch as *Bauhine* could not conjecture what was meant by them, and therefore in his *Pinax*, he ſaith, *Trachelium Giganteum, & viola Calathiana apud Gerardum, quid?* but the deſcriptions were better, wherefore I haue omitted the former deſcriptions, and here giuen you the later. ‡

3 Giants Throatwort hath very large leaues of an ouerworne greene colour, hollowed in the middle like the Moſcouites ſpoone, and very rough, ſlightly indented about the edges. The ſtalke is two cubits high, whereon thoſe leaues are ſet from the bottome to the top; from the boſome of each leafe commeth forth one ſlender footeſtalke, whereon doth grow a faire and large floure faſhioned like a bell, of a whitiſh colour tending to purple. The pointed corners of each floure turne themſelues backe like a ſcrole, or the Dalmatian cap; in the middle whereof commeth forth a ſharpe ſtile or clapper of a yellow colour. The root is thicke, with certaine ſtrings annexed thereto.

4 The ſmaller kinde of Throtewort hath ſtalkes and leaues very like vnto the great Throtewoort,

woort, but altogether leſſer, and not ſo hairy: from the boſome of which leaues ſhoot forth very beautifull floures bell faſhion, of a bright purple colour, with a ſmall peſtle or clapper in the middle, and in other reſpects it is like the precedent.

‡ 5 This from a wooddy and wrinkled root of a pale purple colour ſends forth many rough creſted ſtalks of ſome cubit high, which are vnorderly ſet with leaues, long, rough, and ſnipt lightly about their edges, being of a darke colour on the vpper ſide, and of a whitiſh on their vnder part. At the tops of the ſtalkes grow the floures, being many; and thicke thruſt together, white of colour, and diuided into fiue or ſeuen parts, each floure hauing yellowiſh threds, and a pointall in their middles. It floures in Auguſt, and was firſt ſet forth and deſcribed by *Pona* in his deſcription of Mount Baldus. ‡

¶ *The Place.*

The firſt deſcribed and ſometimes the ſecond growes very plentifully in the low Woods and Hedge-rowes of Kent, about Canterbury, Sittingborne, Grauesend, South-fleet, and Greenehyth, eſpecially vnder Cobham Parke-pale in the way leading from Southfleet to Rocheſter, at Eltham about the parke there not farre from Greenewich; in moſt of the paſtures about Watford and Buſhey, fifteene miles from London.

‡ 3 The third was kept by our Author in his Garden, as it is alſo at this day preſerued in the Garden of M^r^ *Parkinſon*: yet in the yeere 1626, I found it in great plenty growing wilde vpon the bankes of the Riuer Ouſe in Yorkeſhire, as I went from Yorke to viſite Selby the place whereas I was borne, being ten miles from thence. ‡

The fourth groweth in the Medow next vnto Ditton ferrie as you goe to Windſore, vpon the chalky hills about Greenehithe in Kent; and in a field by the high way as you goe from thence to Dartford; in Henningham Parke in Eſſex; and in Sion Medow neere to Brandford, eight miles from London.

The fifth groweth on mount Baldus in Italy.

¶ *The Time.*

All the kindes of bell floures doe floure and flouriſh from May vntill the beginning of Auguſt, except the laſt, which is the plant that hath beene taken generally for the Calathian Violet, which floureth in the later end of September; notwithſtanding the Calathian Violet or Autumne violet is of a moſt bright and pleaſant blew or Azure colour, as thoſe are of this kinde, although this plant ſometimes changeth his colour from blew to whiteneſſe by ſome one accident or other.

¶ *The Names.*

1 2 Throtewoort is called in Latine, *Ceruicaria*, and *Ceruicaria major*: in Greeke: τραχήλιον: of moſt, *Vvularia*: of *Fuchſius*, *Campanula*: in Dutch, **Halſcruyt**: in Engliſh, Canterburie bells, Haskewoort, Throtewoort, or *Vvula* woort, of the vertue it hath againſt the paine and ſwelling thereof.

‡ 3 This is the *Trachelium majus Belgarum* of *Lobel*, and the ſame (as I before noted) that our Author formerly ſet forth by the name of *Trachelium Giganteum*, ſo that I haue put them as you may ſee, together in the title of the plant.

4 This is the *Trachelium minus* of *Dodonæus*, *Lobel*, and others: the *Ceruicaria minor* of *Tabernmontanus*; and *Vvularia exigua* of *Tragus*: Our Author gaue this alſo another figure and deſcription by the name of *Viola Calathiana*, not knowing that it was the laſt ſaue one which he had deſcribed by the name of *Trachelium minus*. ‡

¶ *The Temperature.*

Theſe plants are cold and dry, as are moſt of the Bell-floures.

¶ *The Vertues.*

A The Antients for any thing that we know haue not mentioned, and therefore not ſet downe any thing concerning the vertues of theſe Bell-floures: notwithſtanding wee haue found in the later writers, as alſo of our owne experience, that they are excellent good againſt the inflammation of the throate and *Vvula* or Almonds, and all manner of cankers and vlcerations in the mouth, if the mouth and throat be gargariſed and waſhed with the decoction of them: and they are of all other herbes the chiefe and principall to be put into lotions, or waſhing waters, to inject into the priuie parts of man or woman, being boyled with hony and Allom in water, with ſome white wine.

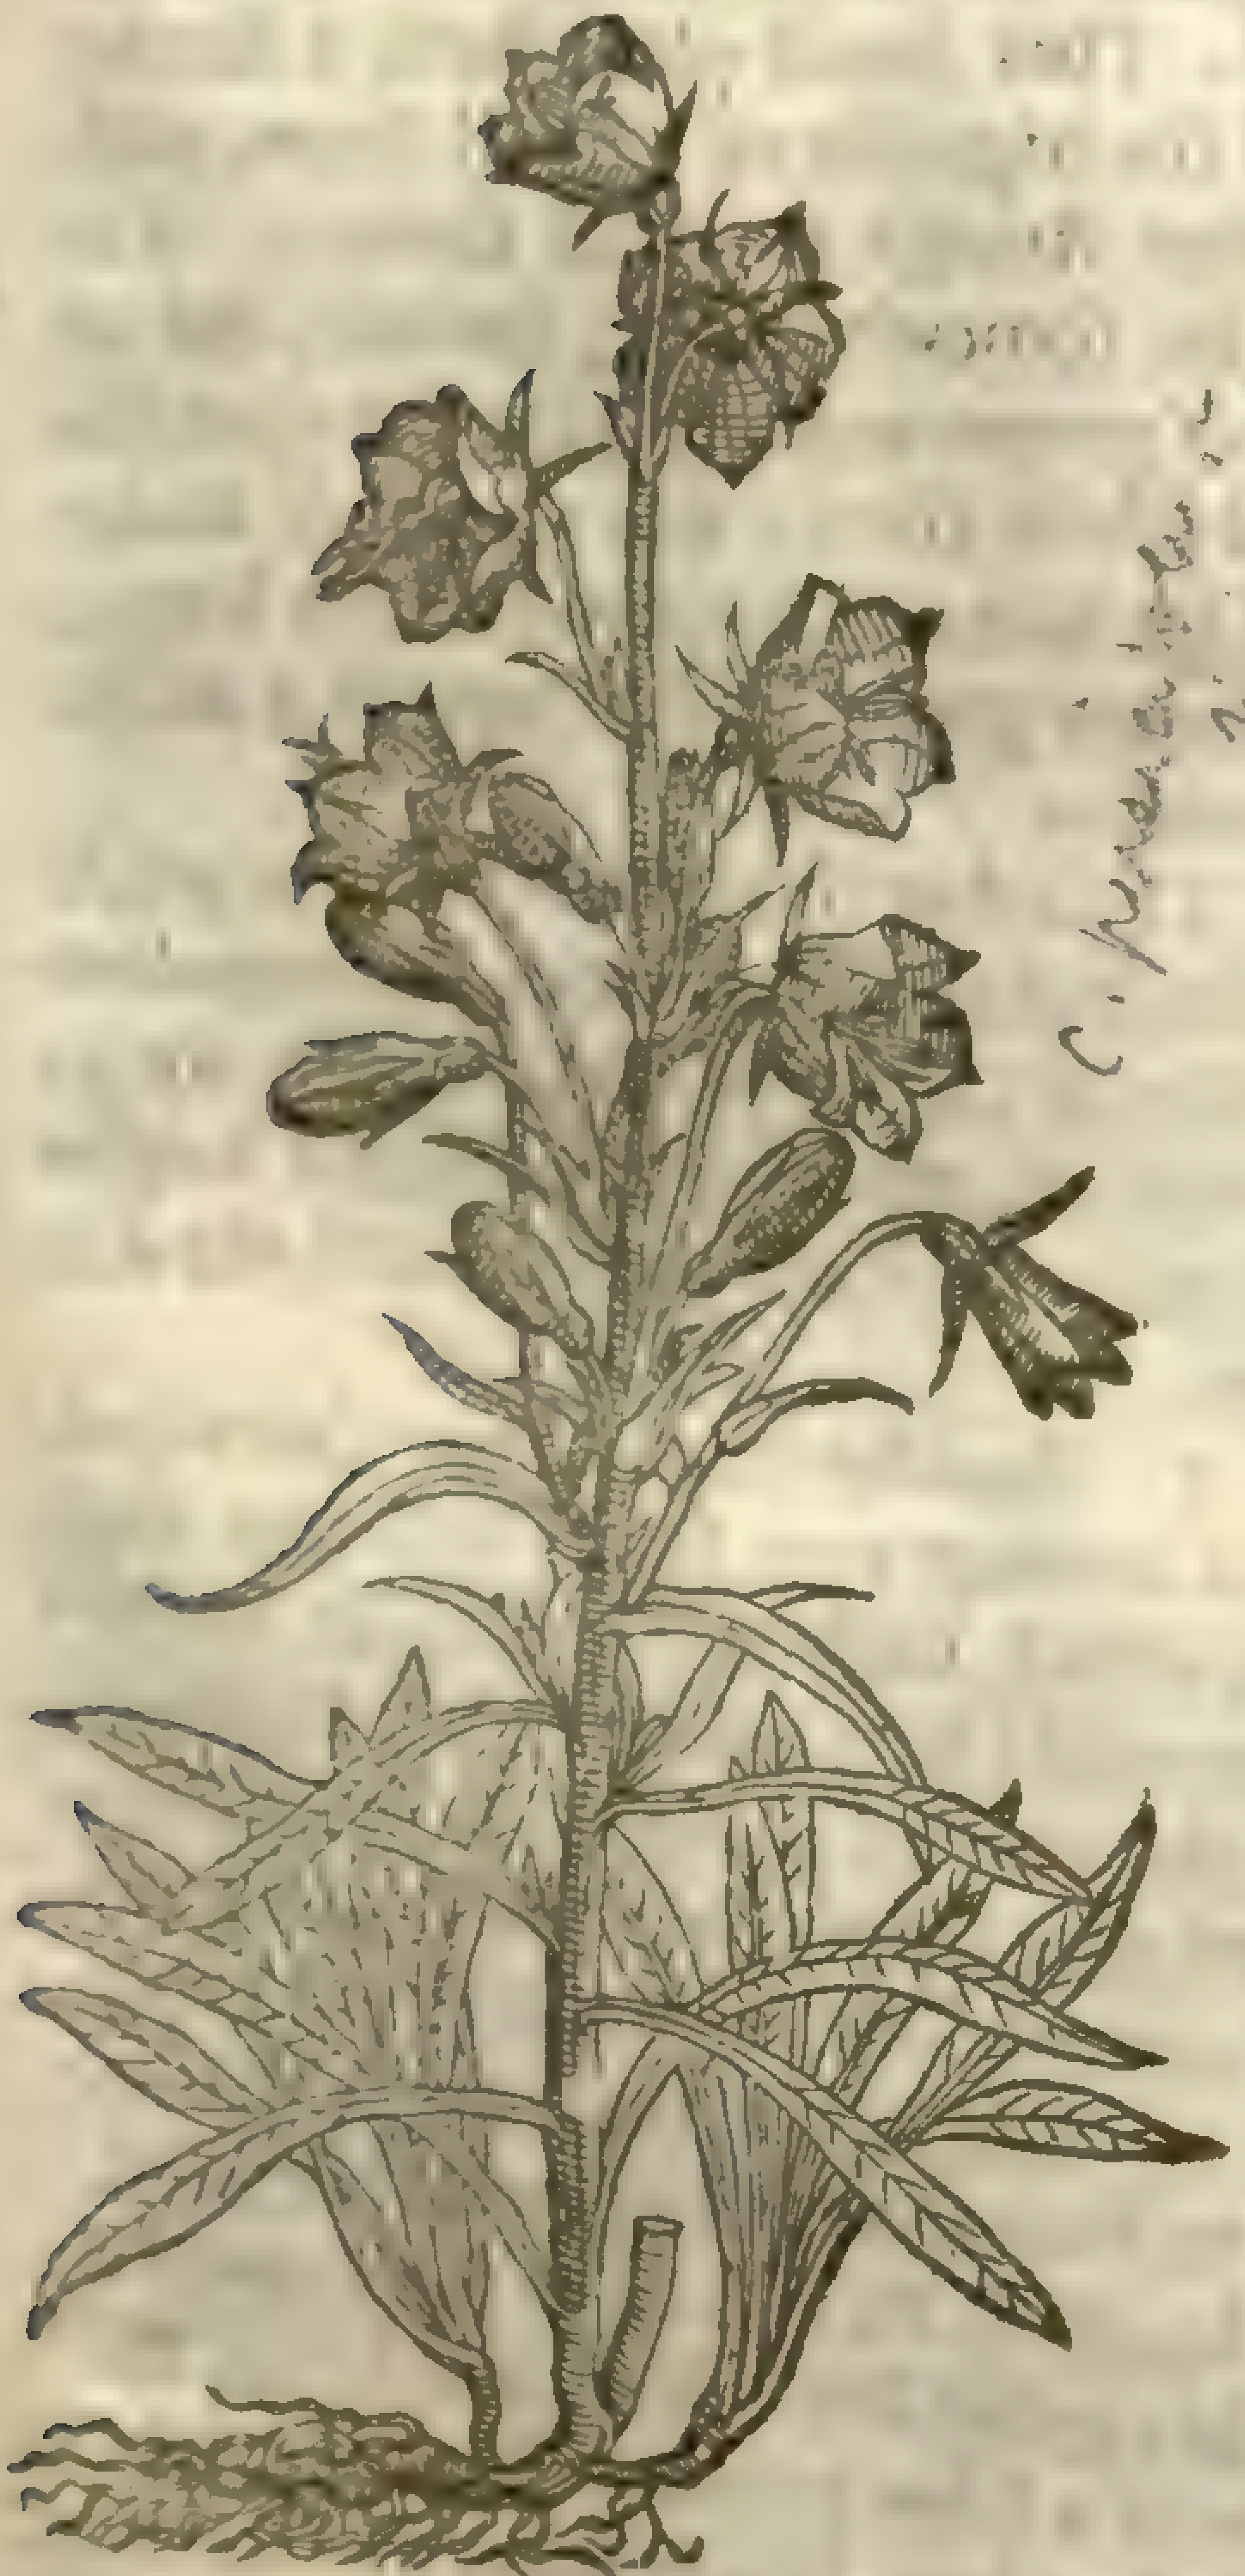
CHAP. 117. *Of Peach-bells and Steeple-bells.*

¶ *The Deſcription.*

1 THe Peach-leaued Bell-floure hath a great number of ſmall and long leaues, riſing in a great buſh out of the ground, like the leaues of the Peach-tree: among which riſeth vp a ſtalke two cubits high: alongſt the ſtalke grow many floures like bells, ſometime white, and for the moſt part of a faire blew colour; but the bells are nothing ſo deepe as they of the other kindes; and theſe are more dilated or ſpread abroad than any of the reſt. The ſeed is ſmall like Rampions, and the root a tuft of laces or ſmall ſtrings.

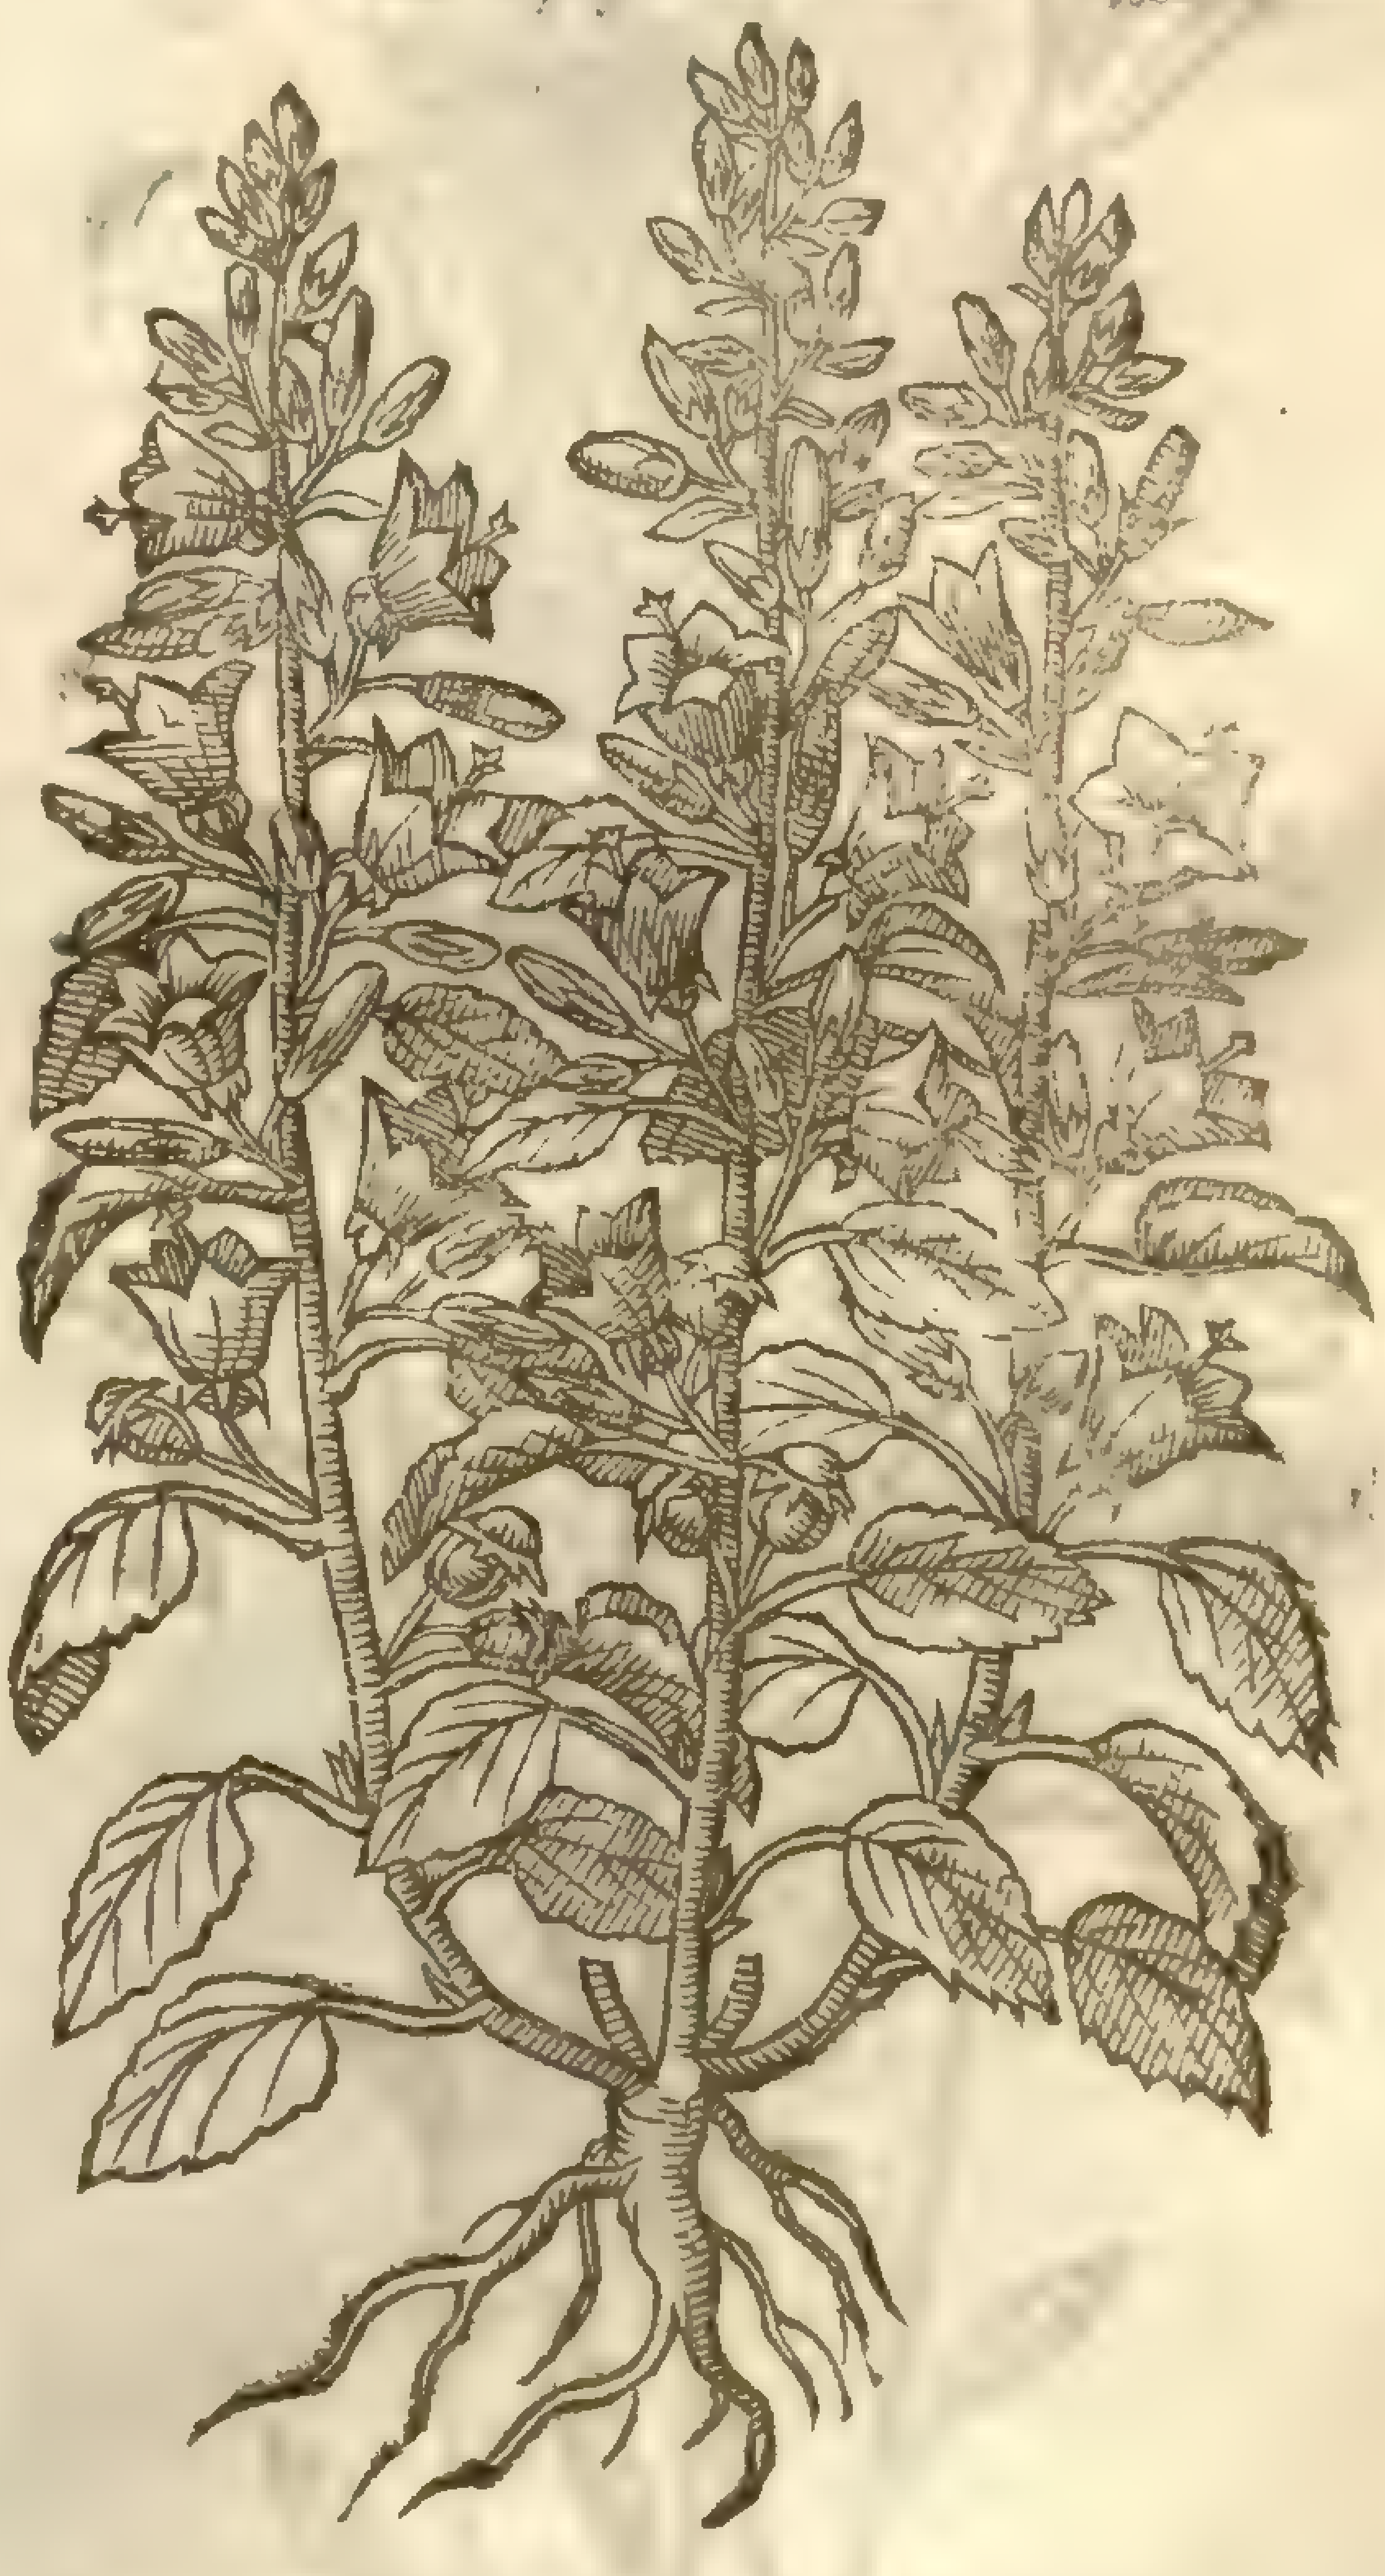
2 The ſecond kinde of Bell-floure hath a great number of faire Blewiſh or Watchet floures, like the other laſt before mentioned, growing vpon goodly tall ſtems two cubits and a halfe high, which are garniſhed from the top of the plant vnto the ground with leaues like Beets, diſorderly placed. This whole plant is exceeding full of milke, inſomuch as if you do but breake one leafe of the plant, many drops of a milky juice will fall vpon the ground. The root is very great, and full of milke alſo: likewiſe the knops wherein the ſeed ſhould be are empty and void of ſeed, ſo that the whole plant is altogether barren, and muſt be increaſed with ſlipping of his root.

1 *Campanula perſicifolia.*
Peach-leaued Bell-floure.



C. [illegible]

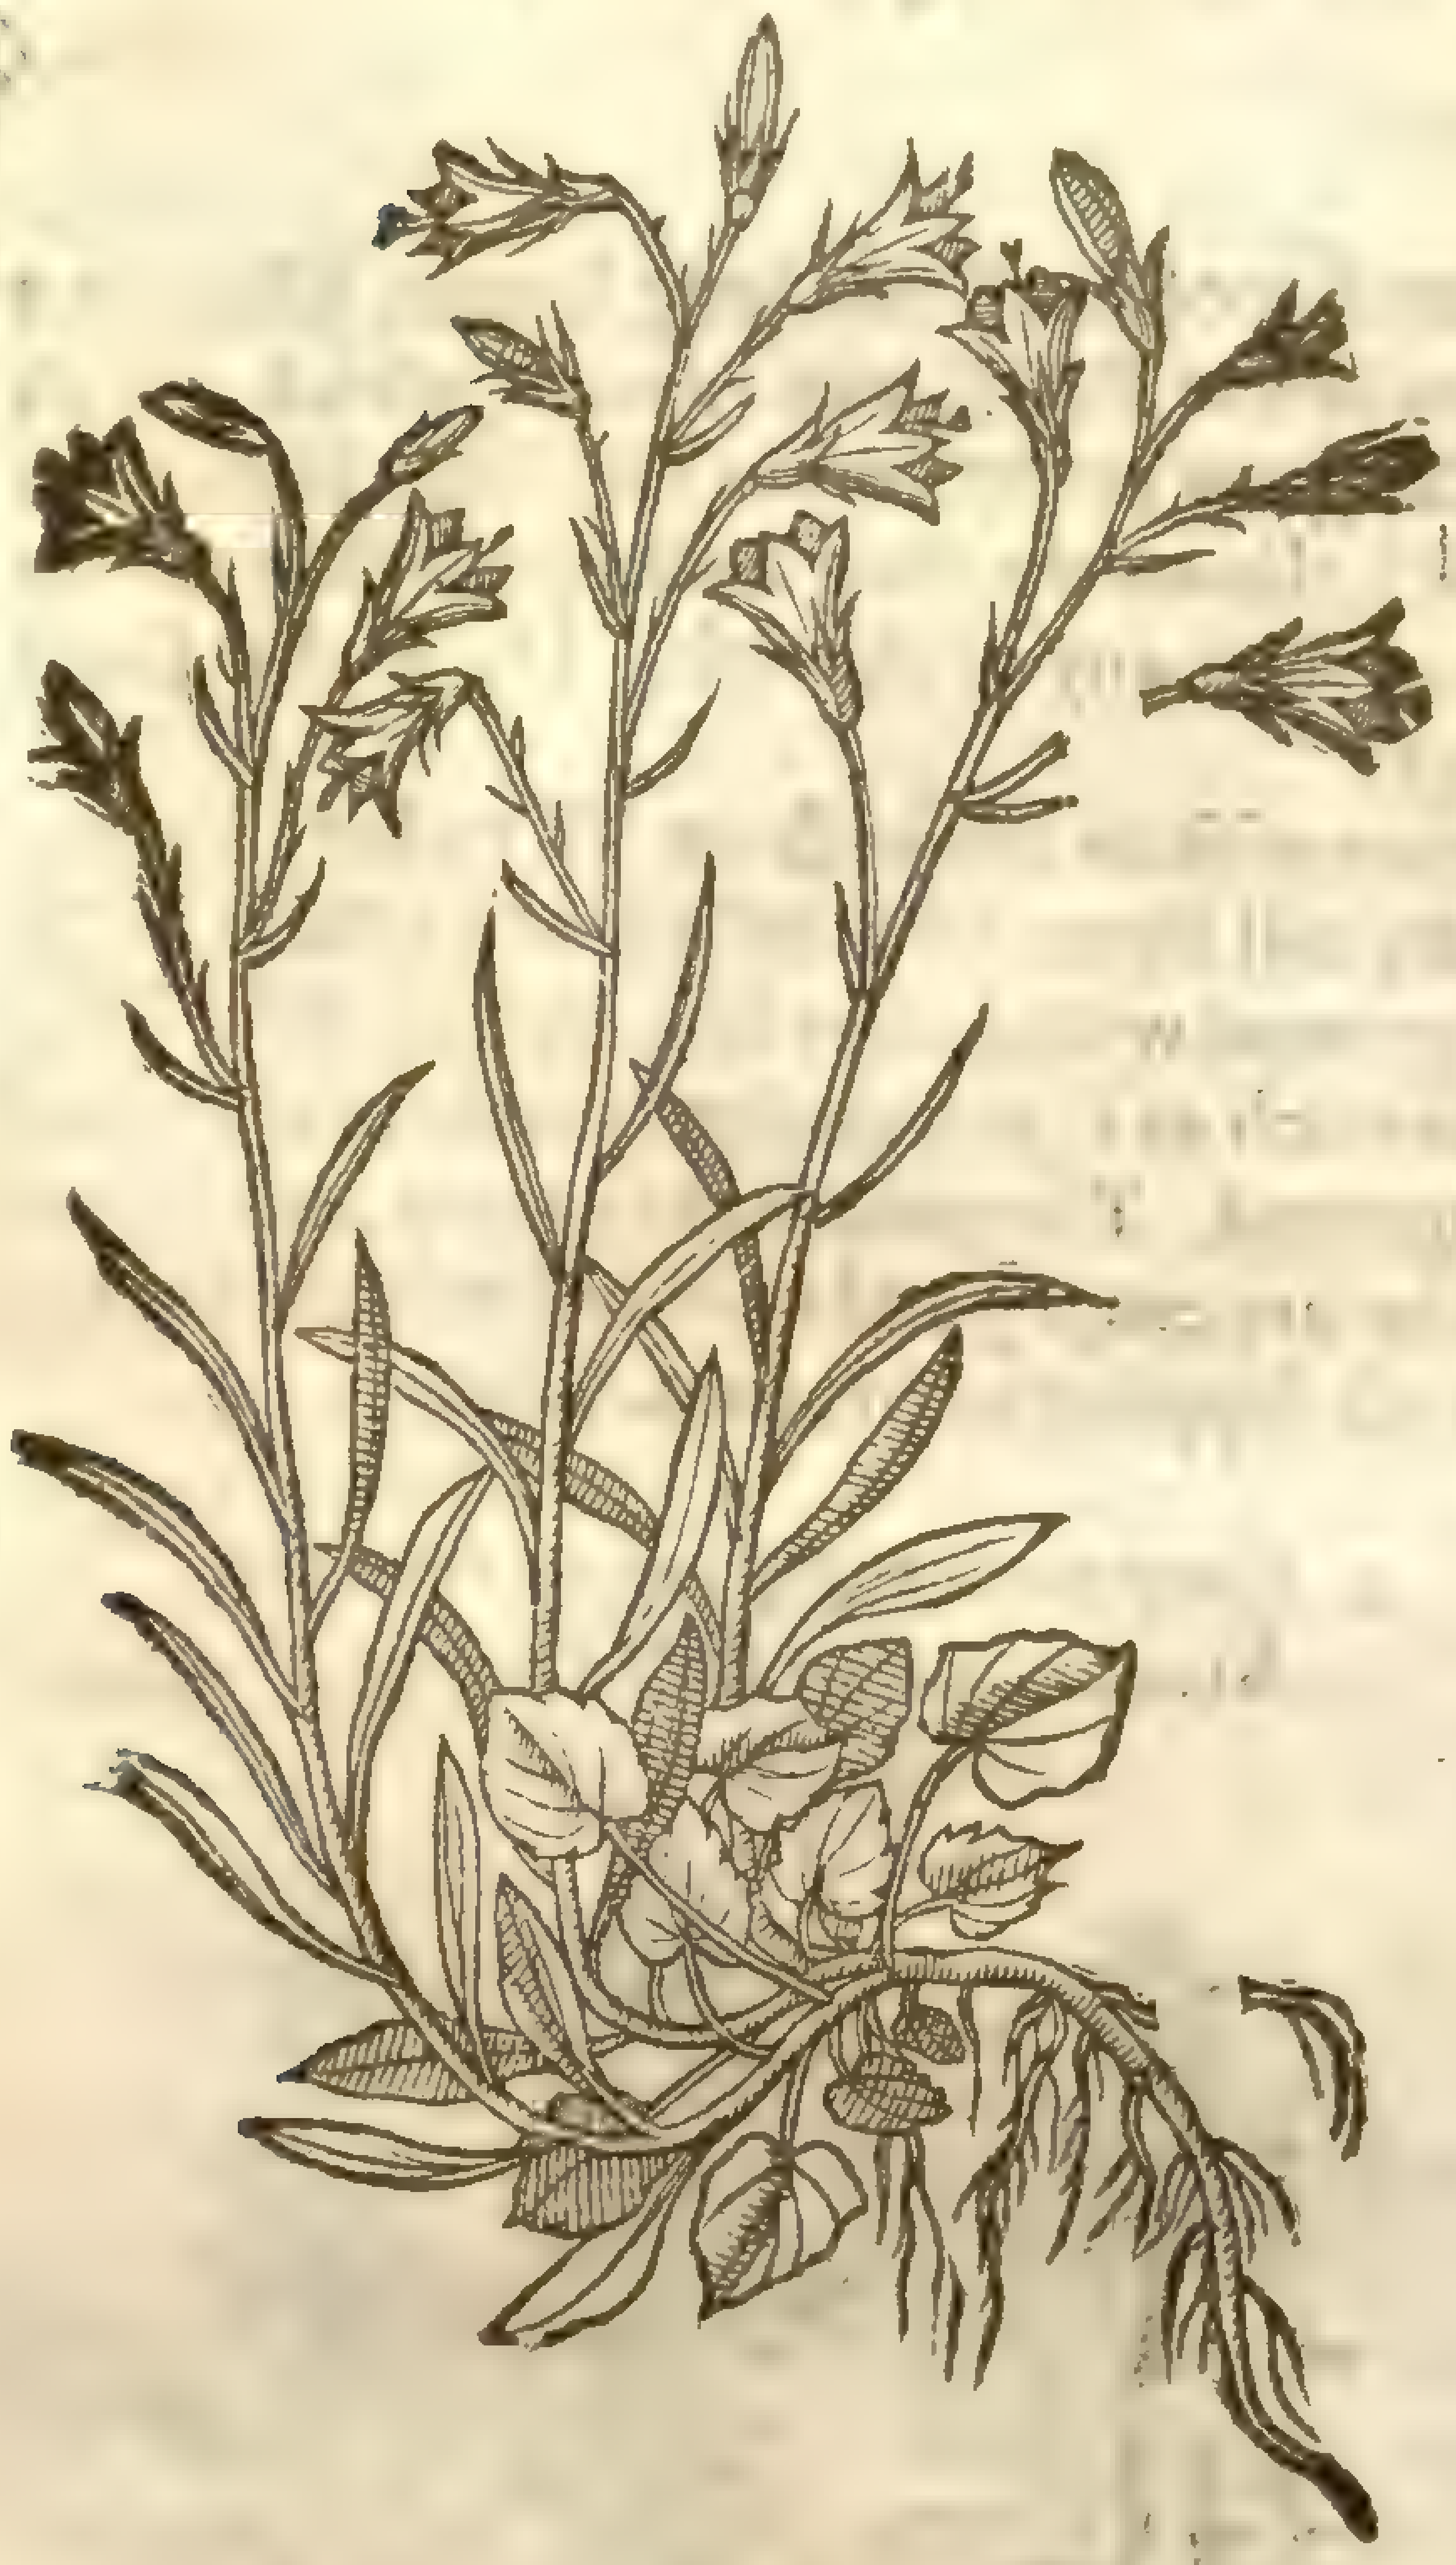
2 *Campanula lacteſcens pyramidalis.*
Steeple milky Bell-floure.



3 The ſmall Bell-floure hath many round leaues very like thoſe of the common field Violet, ſpred vpon the ground; among which riſe vp ſmall ſlender ſtems, diſorderly ſet with many graſſie narrow leaues like thoſe of flax. The ſmall ſtem is diuided at the top into ſundry little branches, whereon do grow pretty blew floures bell-faſhion. The root is ſmall and threddy.

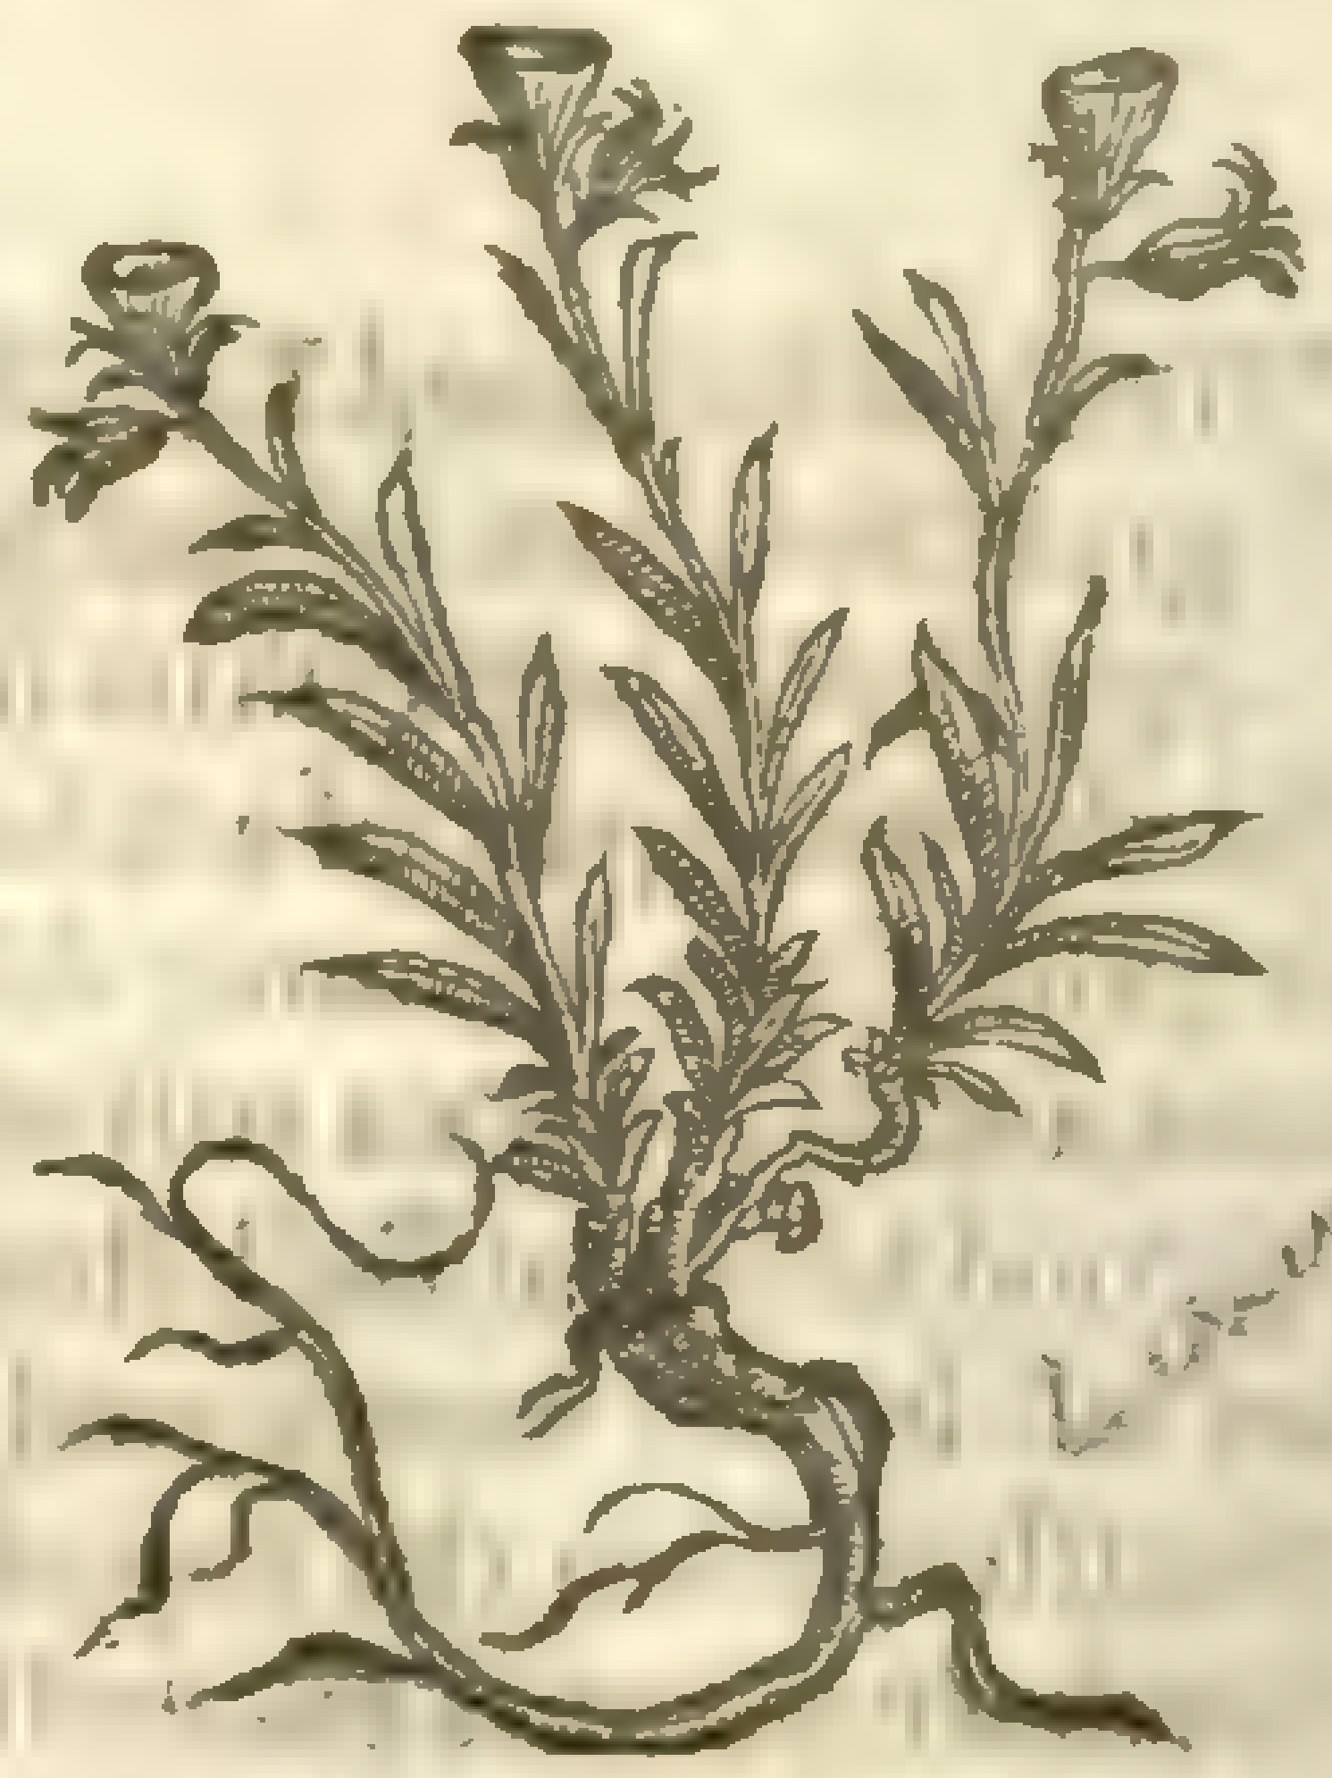
4 The yellow Bell-floure is a very beautifull plant of an handfull high, bearing at the top of his weake and tender ſtalkes moſt pleaſant floures Bel-faſhion, of a faire and bright yellow colour. The leaues and roots are like the precedent, ſauing that the leaues that grow next to the ground of this plant are not ſo round as the former. ‡ Certainly our Author in this place meant to ſet forth the *Campanula lutea linifolia flore volubilis,* deſcribed in the *Aduerſ. pag.* 177. and therefore I haue giuen you the figure thereof. ‡

3 *Campanula rotundifolia.*
Round leaued Bell-floure.



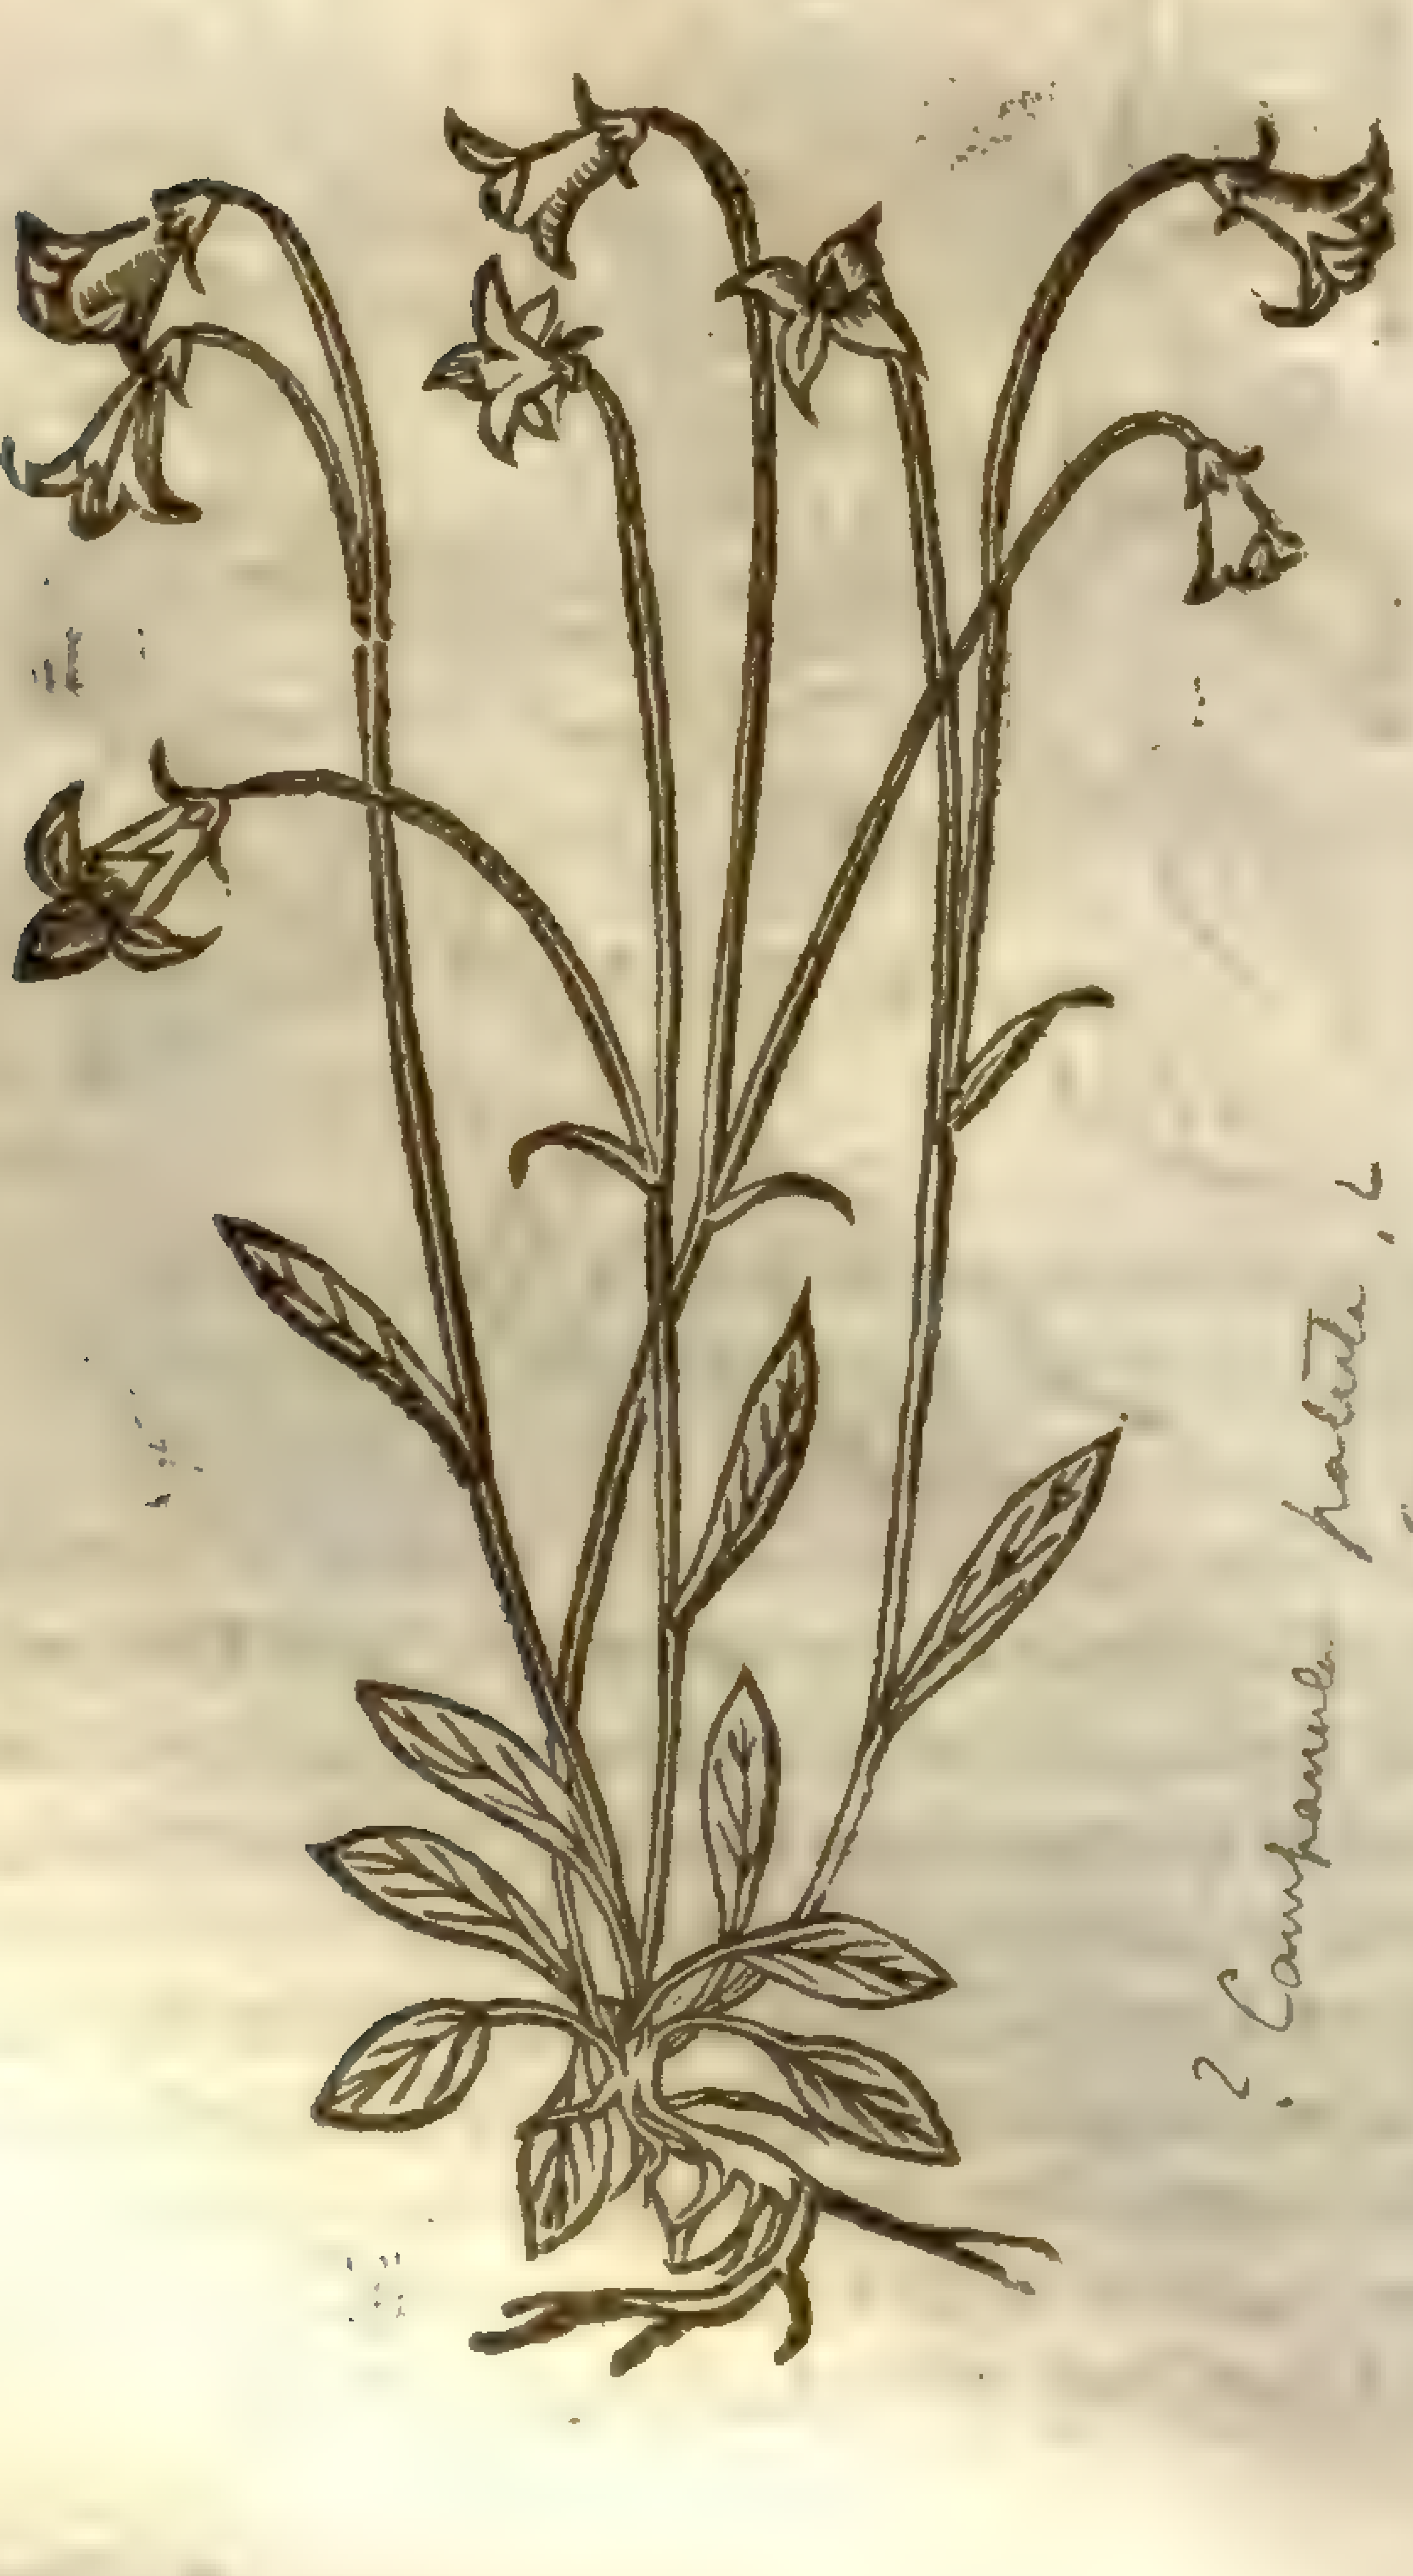
C. rotundifolia, Linn. [illegible]

† 4 *Campanula lutea linifoli.*
Yellow Bell-floure.



[illegible]

5 *Campanula minor alba, ſiue purpurea.*
Little white or purple Bell-floure.



? Campanula patula. L. Sm. Fl. 1. 269

5 The litle white Bell-floure is a kind of wilde Rampions, as is that which followeth, and alſo the laſt ſaue one before deſcribed. This ſmall plant hath a ſlender root of the bigneſſe of a ſmall ſtraw, with ſome few ſtrings annexed thereto. The leaues are ſomewhat long, ſmooth, and of a perfect greene colour, lying flat vpon the ground: from thence riſe vp ſmall tender ſtalkes, ſet here and there with a few leaues. The floures grow at the top, of a milke white colour.

6 The other ſmall Bel-floure or wilde Rampion differeth not from the precedent but onely in colour of the floures; for as the others are white, theſe are of a bright purple colour, which ſetteth forth the difference.

‡ 7 Beſides theſe here deſcribed, there is another very ſmall and rare Bell-floure, which hath not beene ſet forth by any but onely by *Bauhine*, in his *Prodromus*, vnder the title of *Campanula Cymbalariæ folijs*, and that fitly; for it hath thinne and ſmall cornered leaues much after the manner of *Cymbalaria*, and theſe are ſet without order on very ſmall weak and tender ſtalkes ſome handfull long; and at the tops of the branches grow little ſmall and tender Bell-floures of a blew colour. The root, like as the whole plant, is very ſmall and threddy. This pretty plant was firſt diſcouered to grow in England by Maſter *George Bowles*, *Anno* 1632. who found it in Montgomery ſhire, on the dry bankes in the high-way as one rideth from Dolgeogg a Worſhipfull Gentlemans houſe called Mr. *Francis Herbert*, vnto a market towne called Mahuntleth, and in all the way from thence to the ſea ſide. It may be called in Engliſh, The tender Bell-floure.

¶ The

¶ *The Place.*

The two firſt grow in our London Gardens, and not wilde in England.

The reſt, except that ſmall one with yellow floures, doe grow wilde in moſt places of England, eſpecially vpon barren ſandy heaths and ſuch like grounds.

¶ *The Time.*

Theſe Bell-floures do flouriſh from May vnto Auguſt.

¶ *The Names.*

Their ſeuerall titles ſet forth their names in Engliſh and Latine, which is as much as hath been ſaid of them.

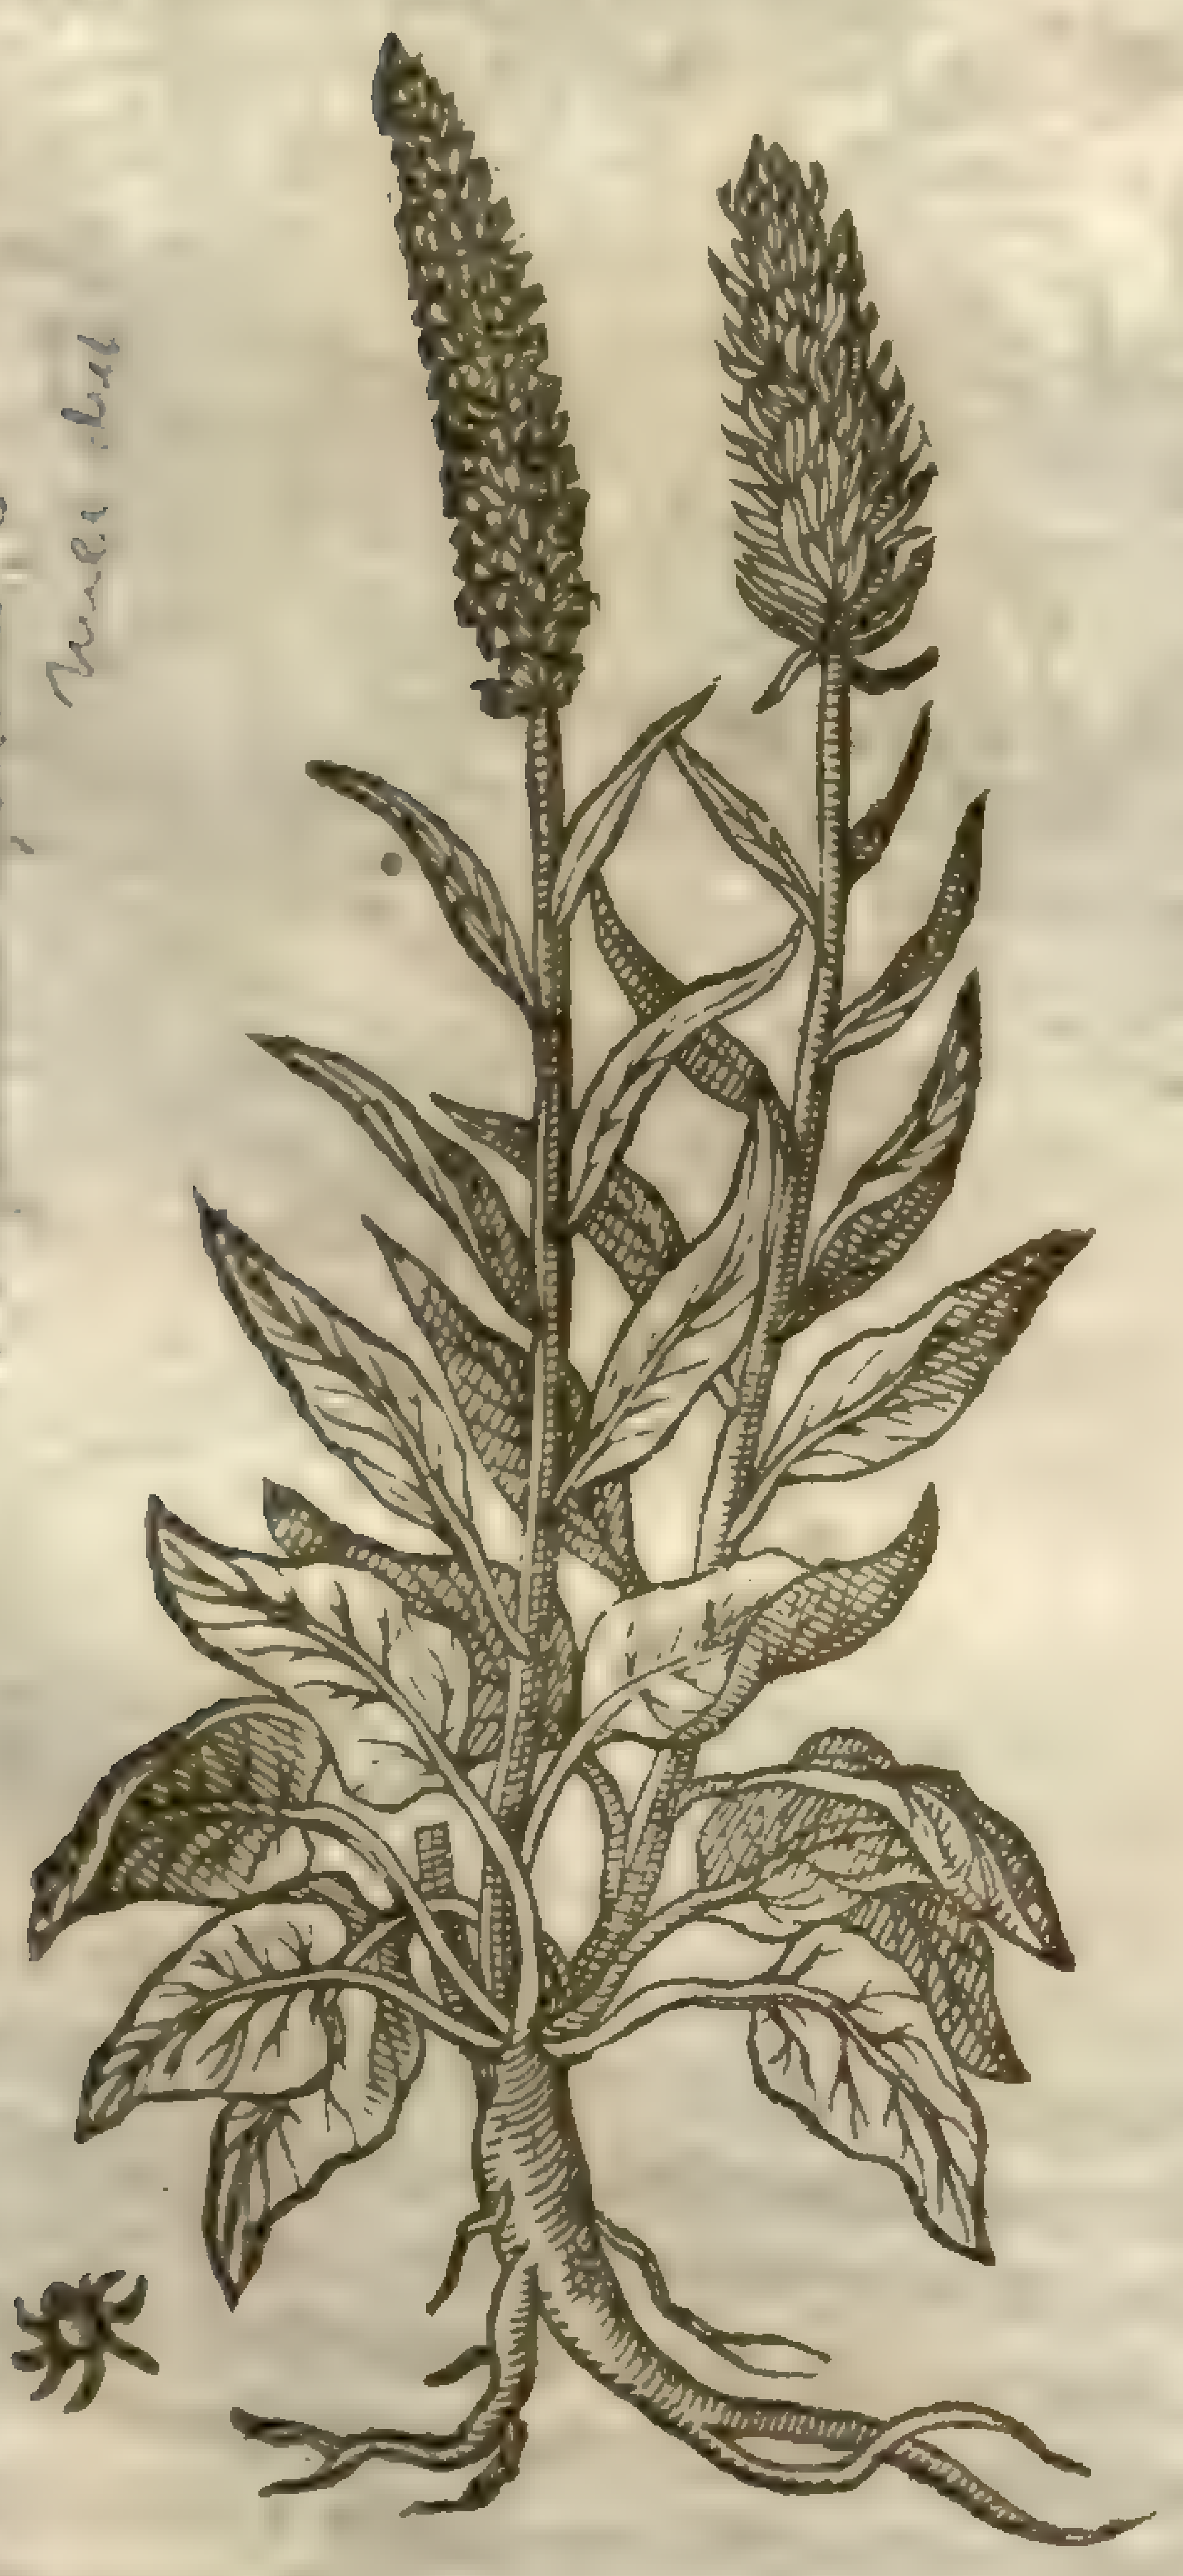
¶ *The Nature and Vertues.*

Theſe Bell-floures, eſpecially the foure laſt mentioned, are cold and dry, and of the Nature of Rampions, whereof they be kindes.

† The figure in the fourth place was of *Rapunculus nemoroſus* 3. of *Tabern.* whereof you ſhall finde mention in the following chapter.

CHAP. 118. *Of Rampions, or wilde Bell-floures.*

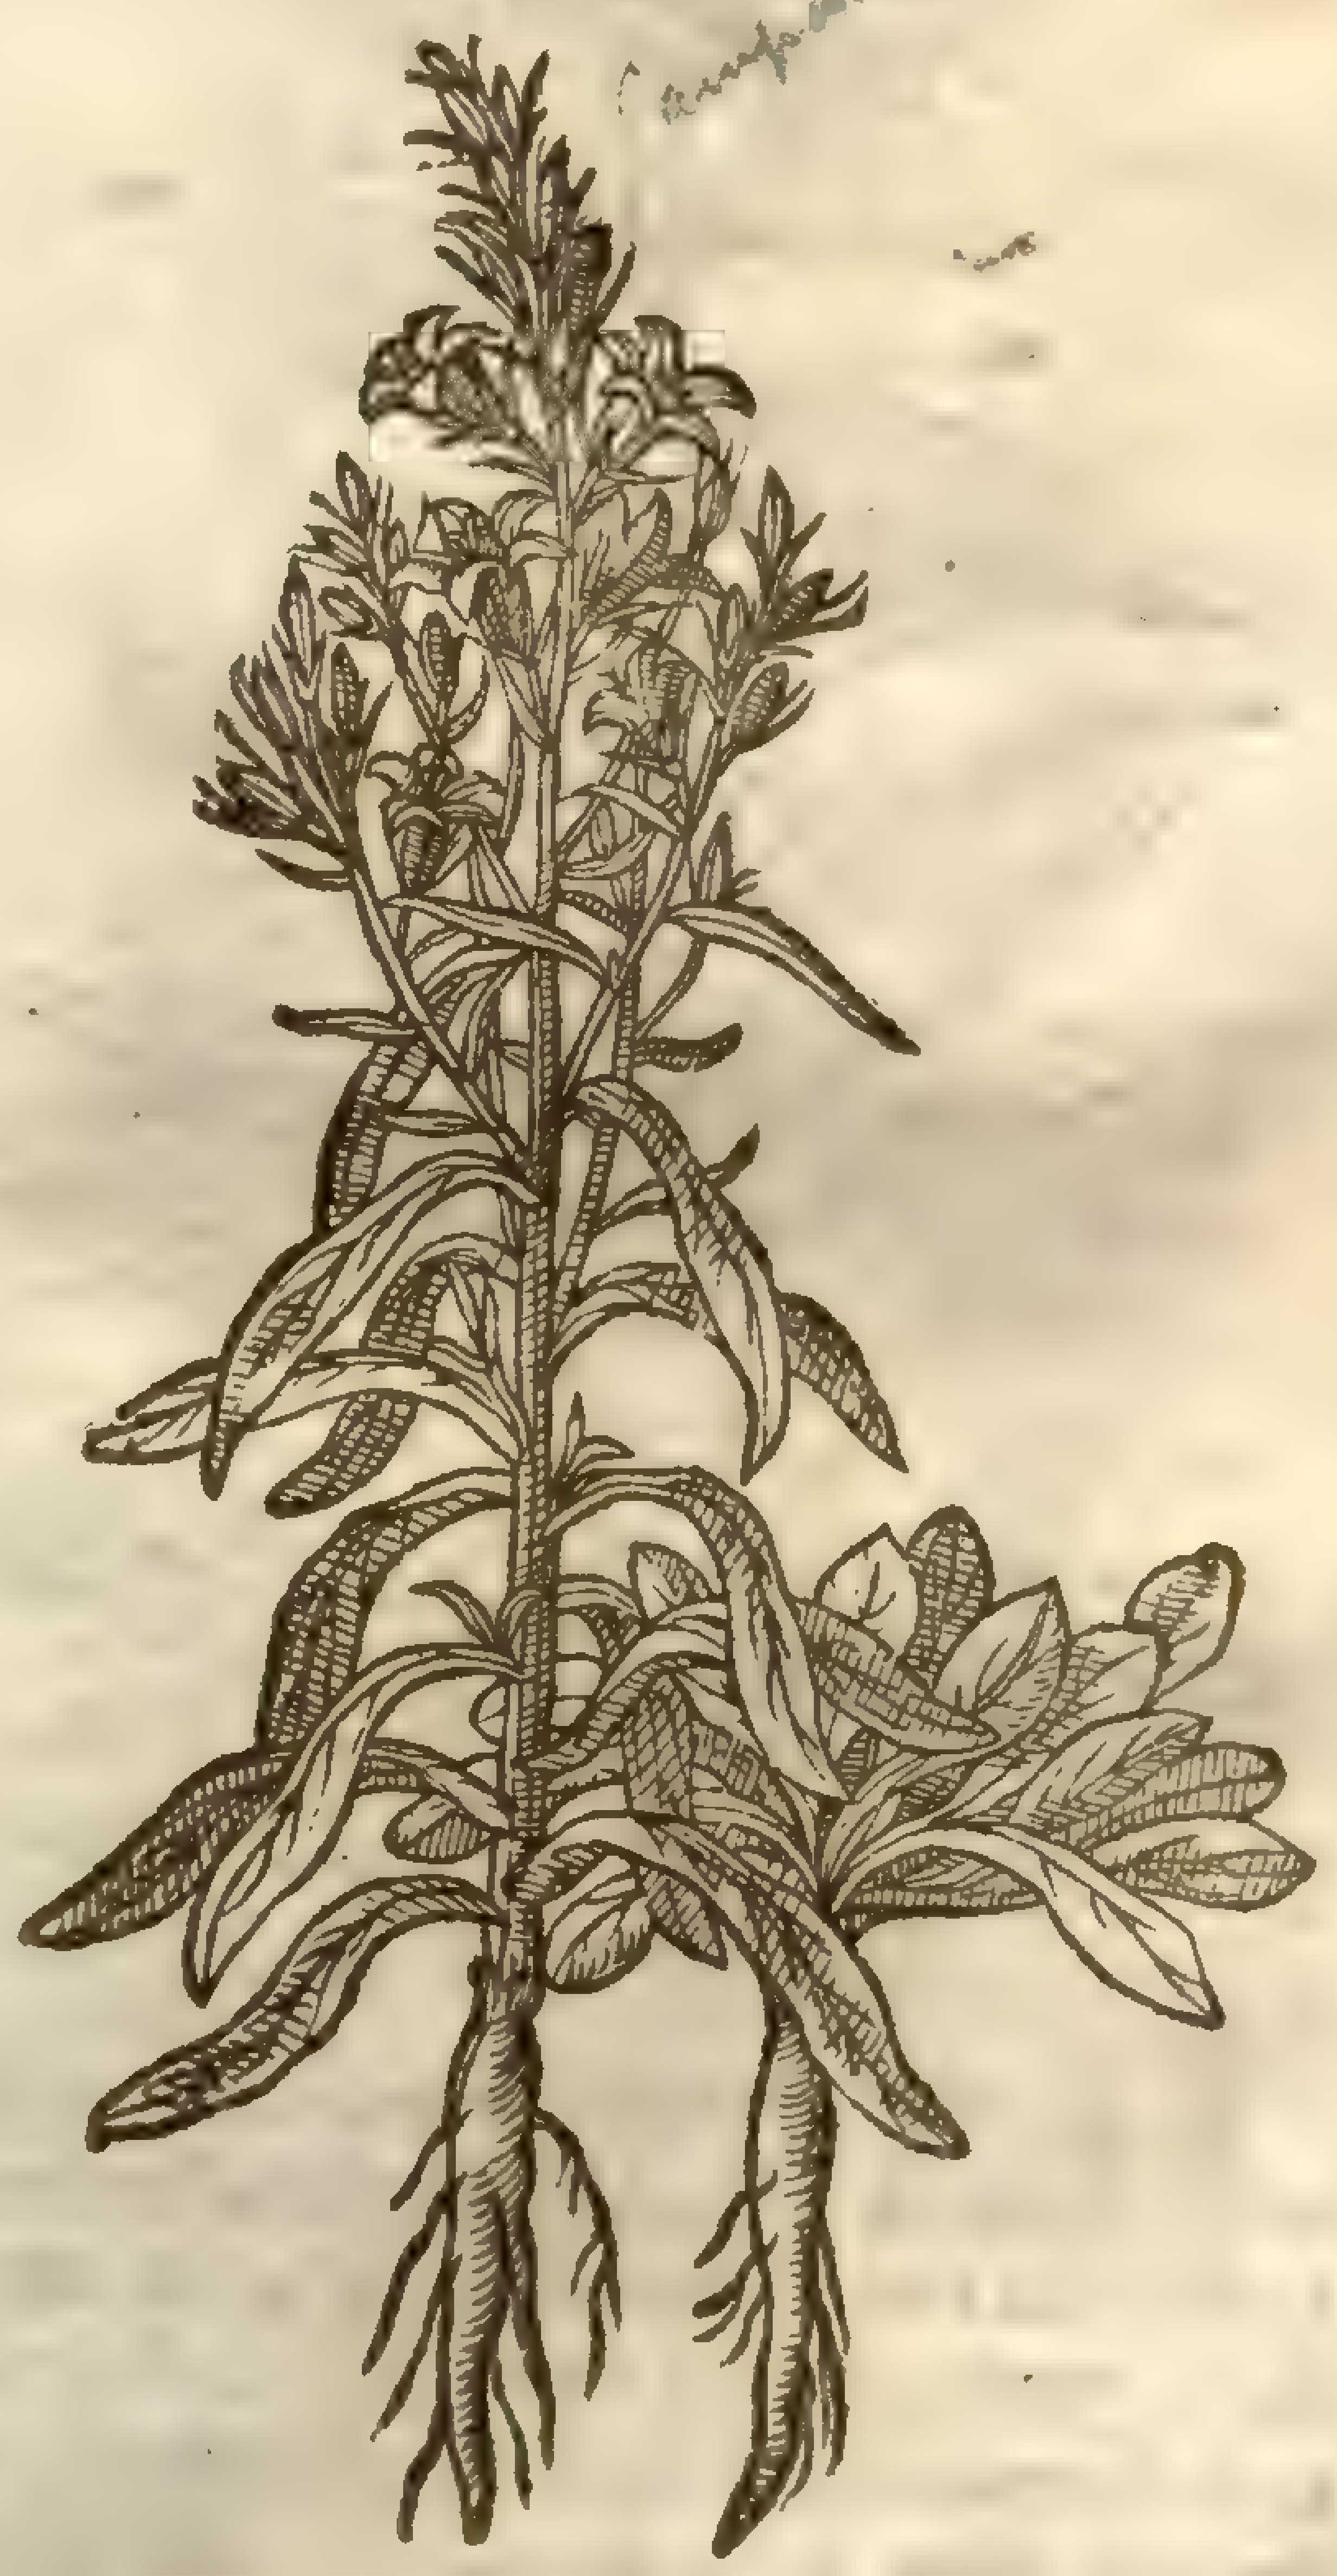
1 *Rapuntium majus.*
Great Rampion.



[illegible]

2 *Rapuntium parvum.*
Small Rampion.

Campanula [illegible] Sm. [illegible] 1. 259



¶ *The Deſcription.*

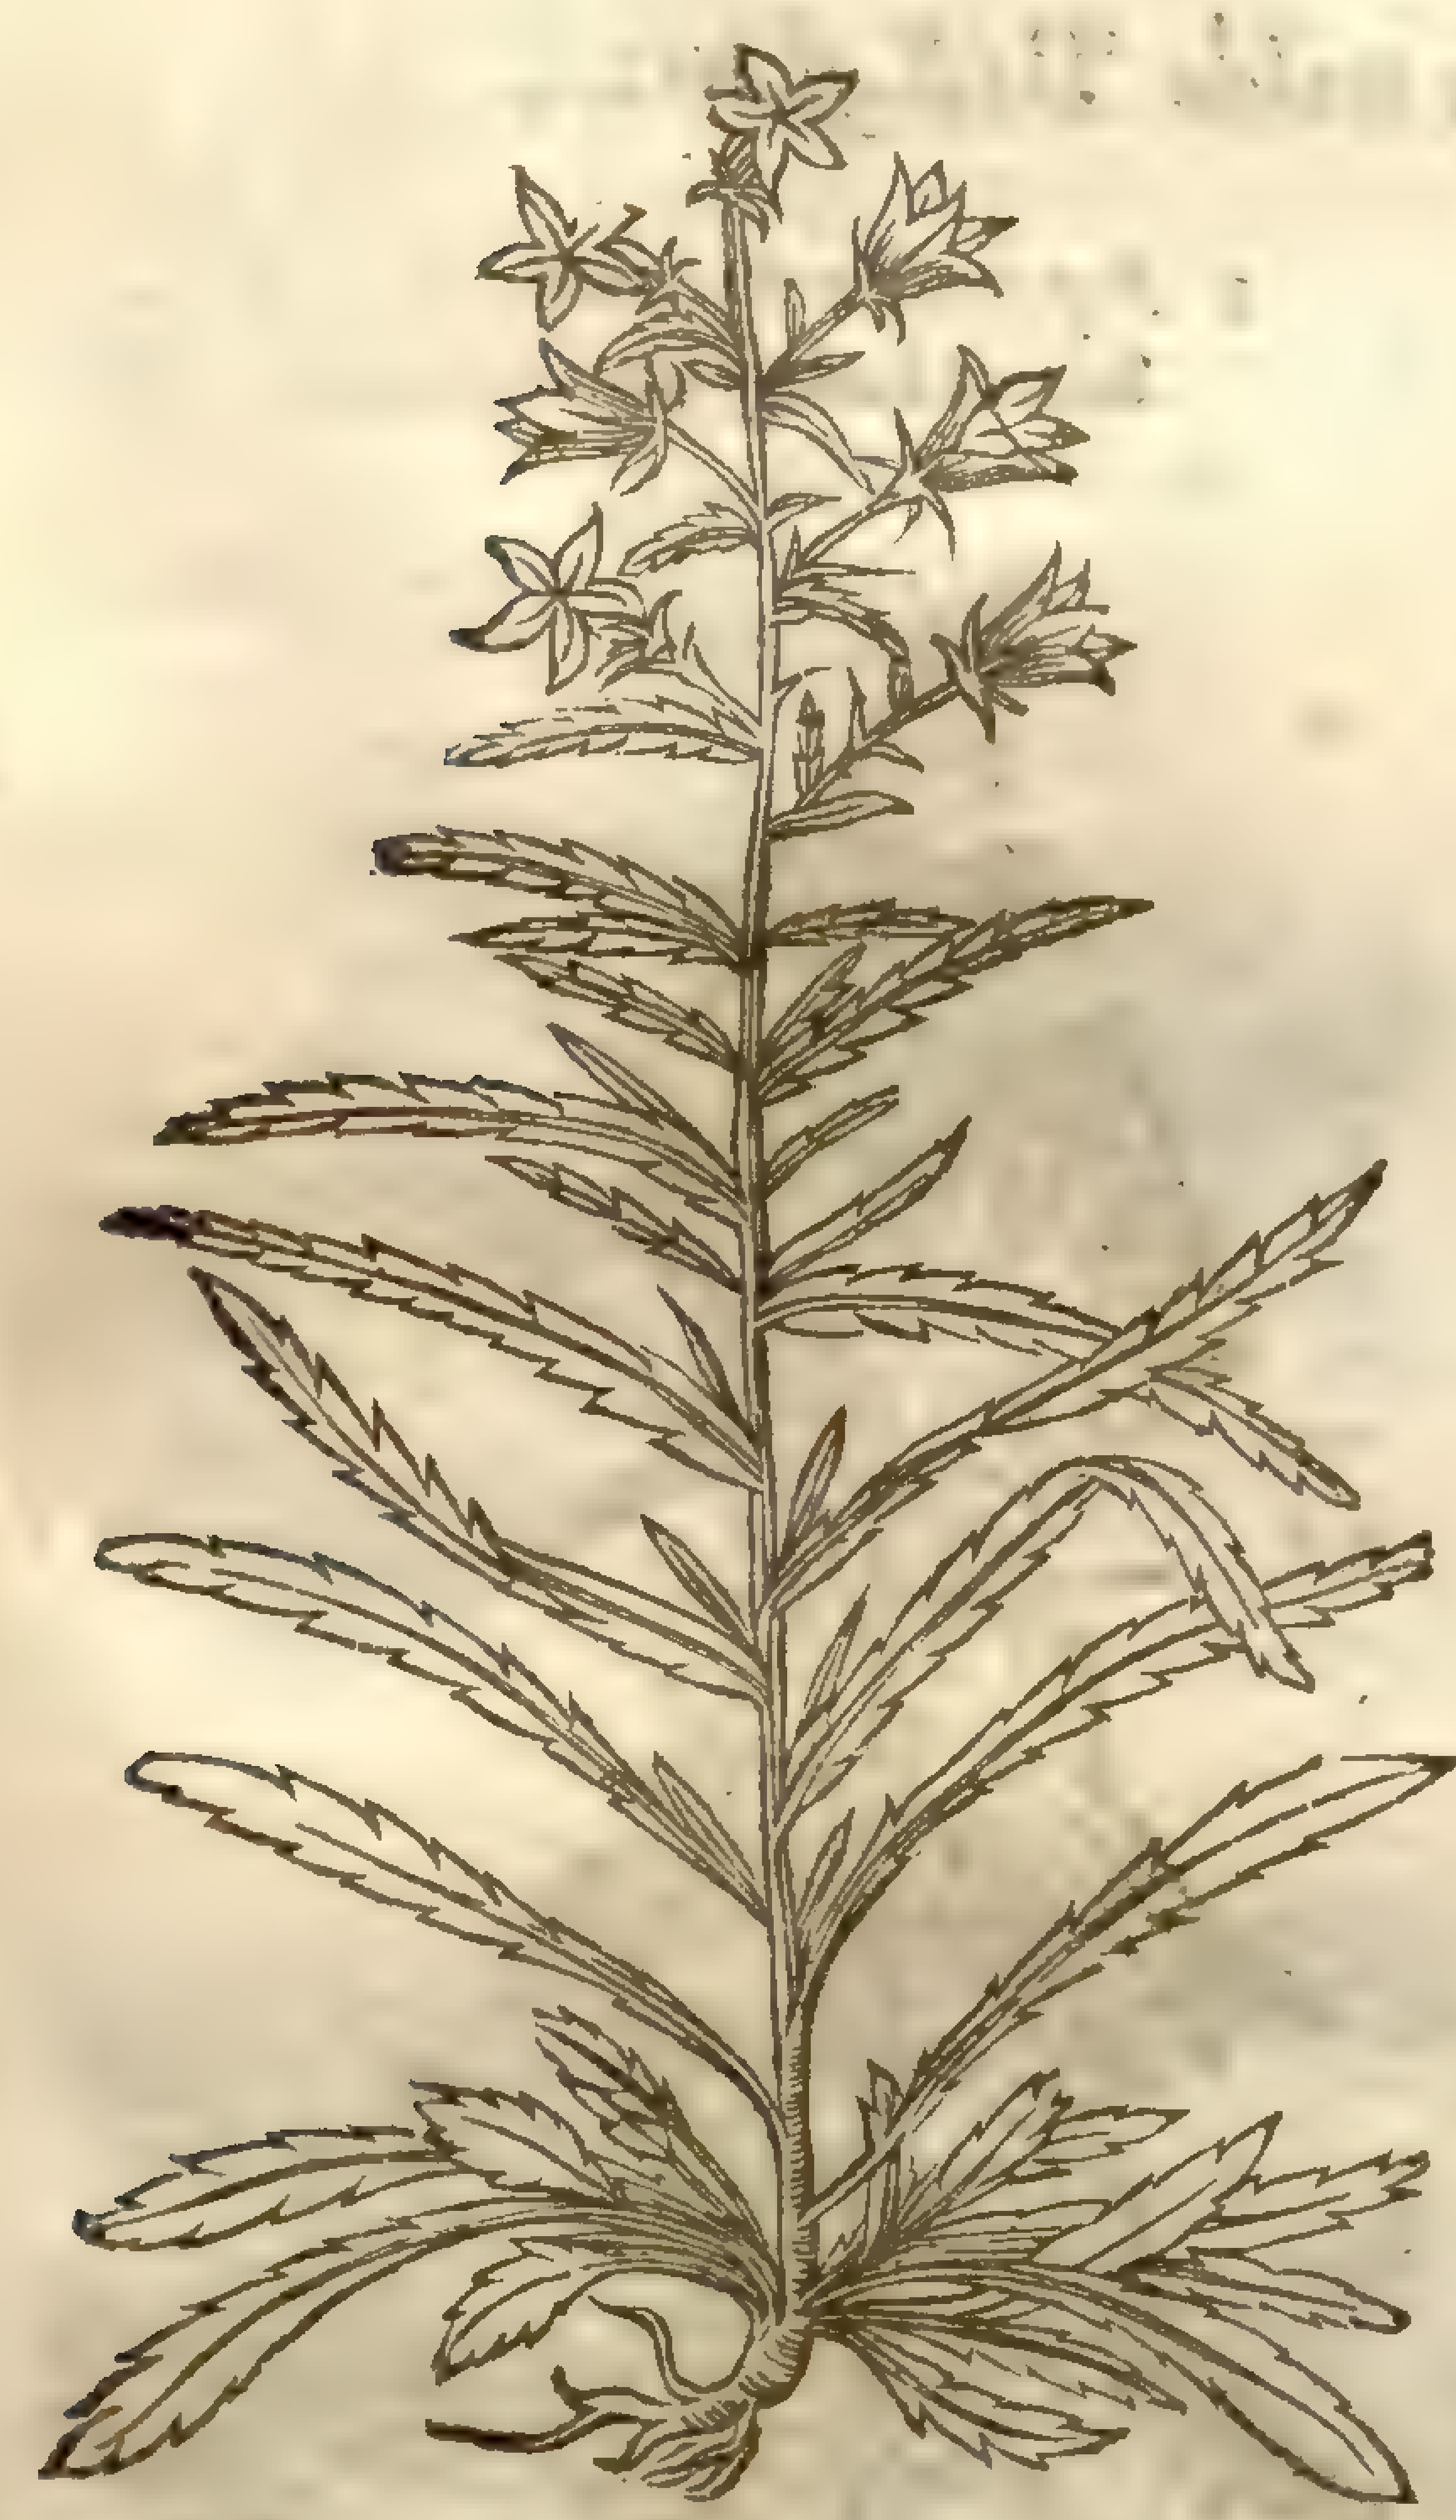
1 THe great Rampion being one of the Bell-floures, hath leaues which appeare or come forth at the beginning ſomewhat large and broad, ſmooth and plaine, not vnlike to the leaues of the ſmalleſt Beet. Among which riſe vp ſtemmes one cubit high, ſet with ſuch like leaues as thoſe are of the firſt ſpringing vp, but ſmaller, bearing at the top of the ſtalke a great thicke buſhie eare full of little long floures cloſely thruſt together like a Fox-taile: which ſmall floures before their opening are like little crooked hornes, and being wide opened they are ſmal blew-bells, ſometimes white, and ſometimes purple. The root is white, and as thicke as a mans thumbe.

2 The ſecond kind being likewiſe one of the bel-floures, and yet a wild kind of Rampion, hath leaues at his firſt comming vp like vnto the Garden Bell-floure. The leaues which ſpring vp afterward for the decking vp of the ſtalke are ſomewhat longer and narrower. The floures grow at the top of tender and brittle ſtalkes like vnto little bells, of a bright blew colour, ſometimes white or purple. The root is ſmall, long, and ſomewhat thicke.

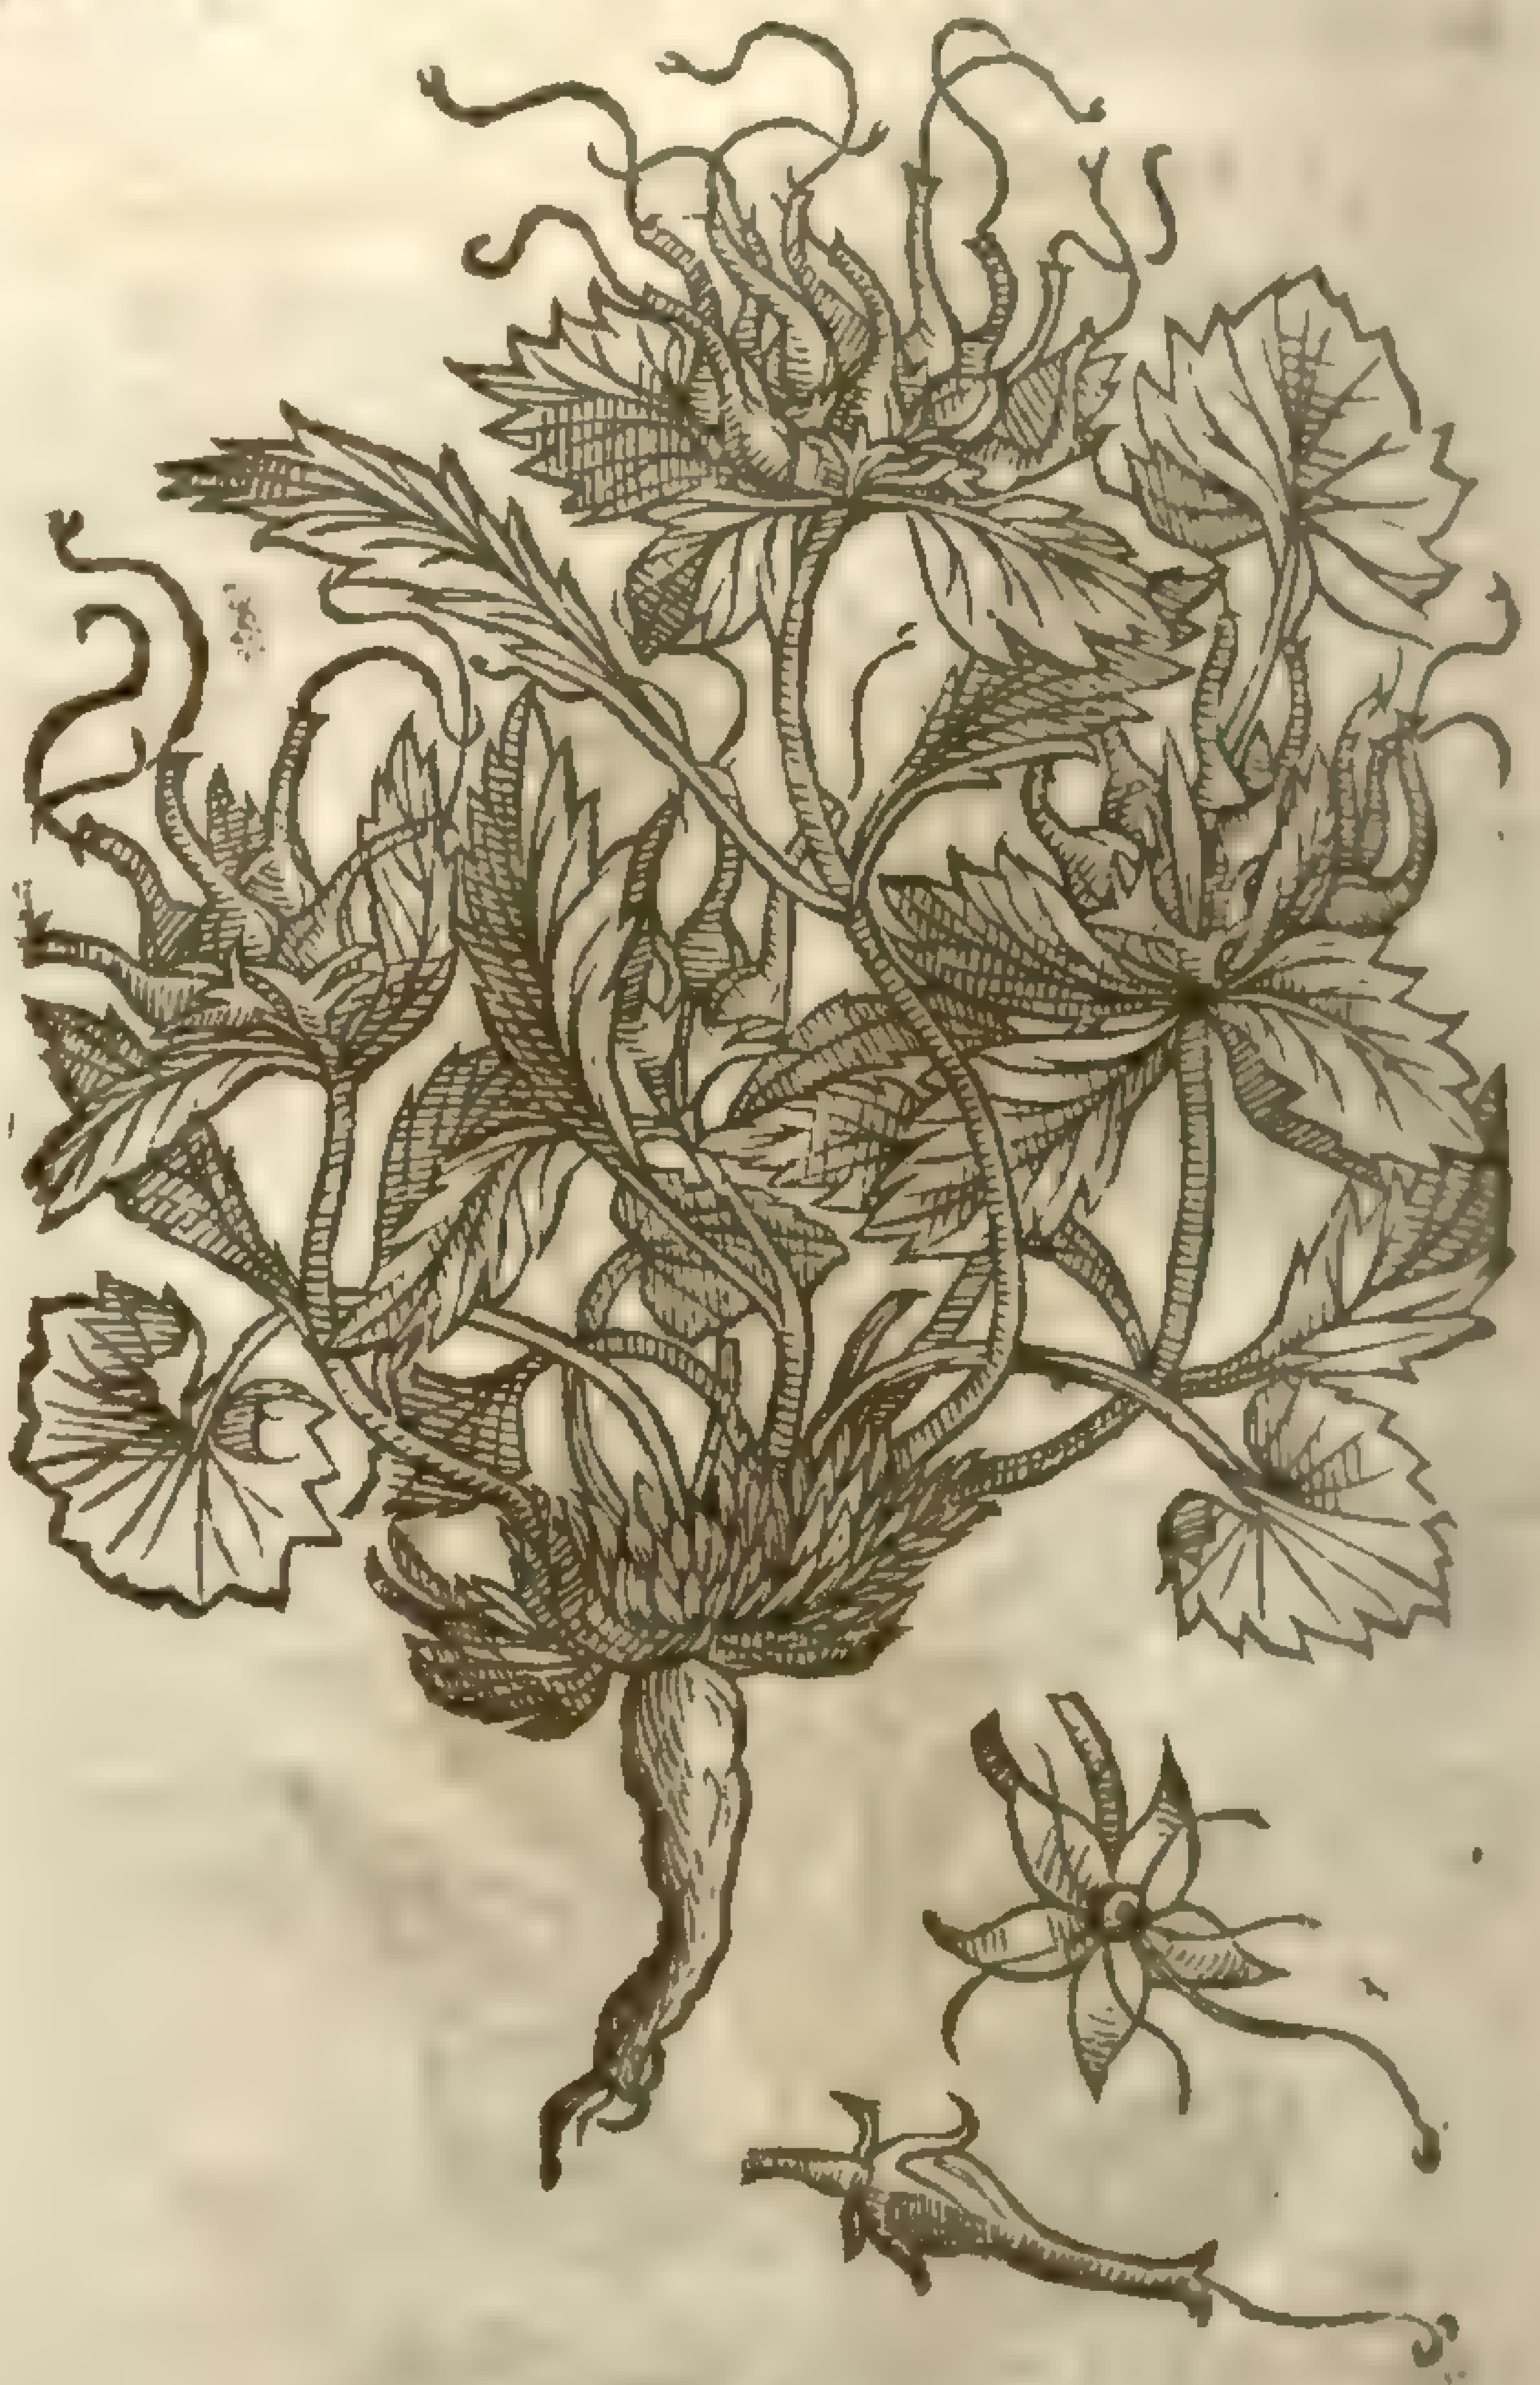
3 This is a wilde Rampion that growes in woods: it hath ſmall leaues ſpread vpon the ground, bluntly indented about the edges: among which riſeth vp a ſtraight ſtem of the height of a cubit, ſet from the bottome to the top with longer and narrower leaues than thoſe next the ground: at the top of the ſtalkes grow ſmall Bell-floures of a watchet blewiſh colour. The root is thicke and tough, with ſome few ſtrings anexed thereto.

‡ There is another variety of this, whoſe figure was formerly by our Author ſet forth in the fourth place of the laſt chapter: it differs from this laſt onely in that the floures and other parts of the plant are leſſer a little than thoſe of the laſt deſcribed. ‡

3 *Rapunculus nemoroſus.*
Wood Rampions.



‡ 4 *Rapunculus Alpinus Corniculatus.*
Horned Rampions of the Alpes.



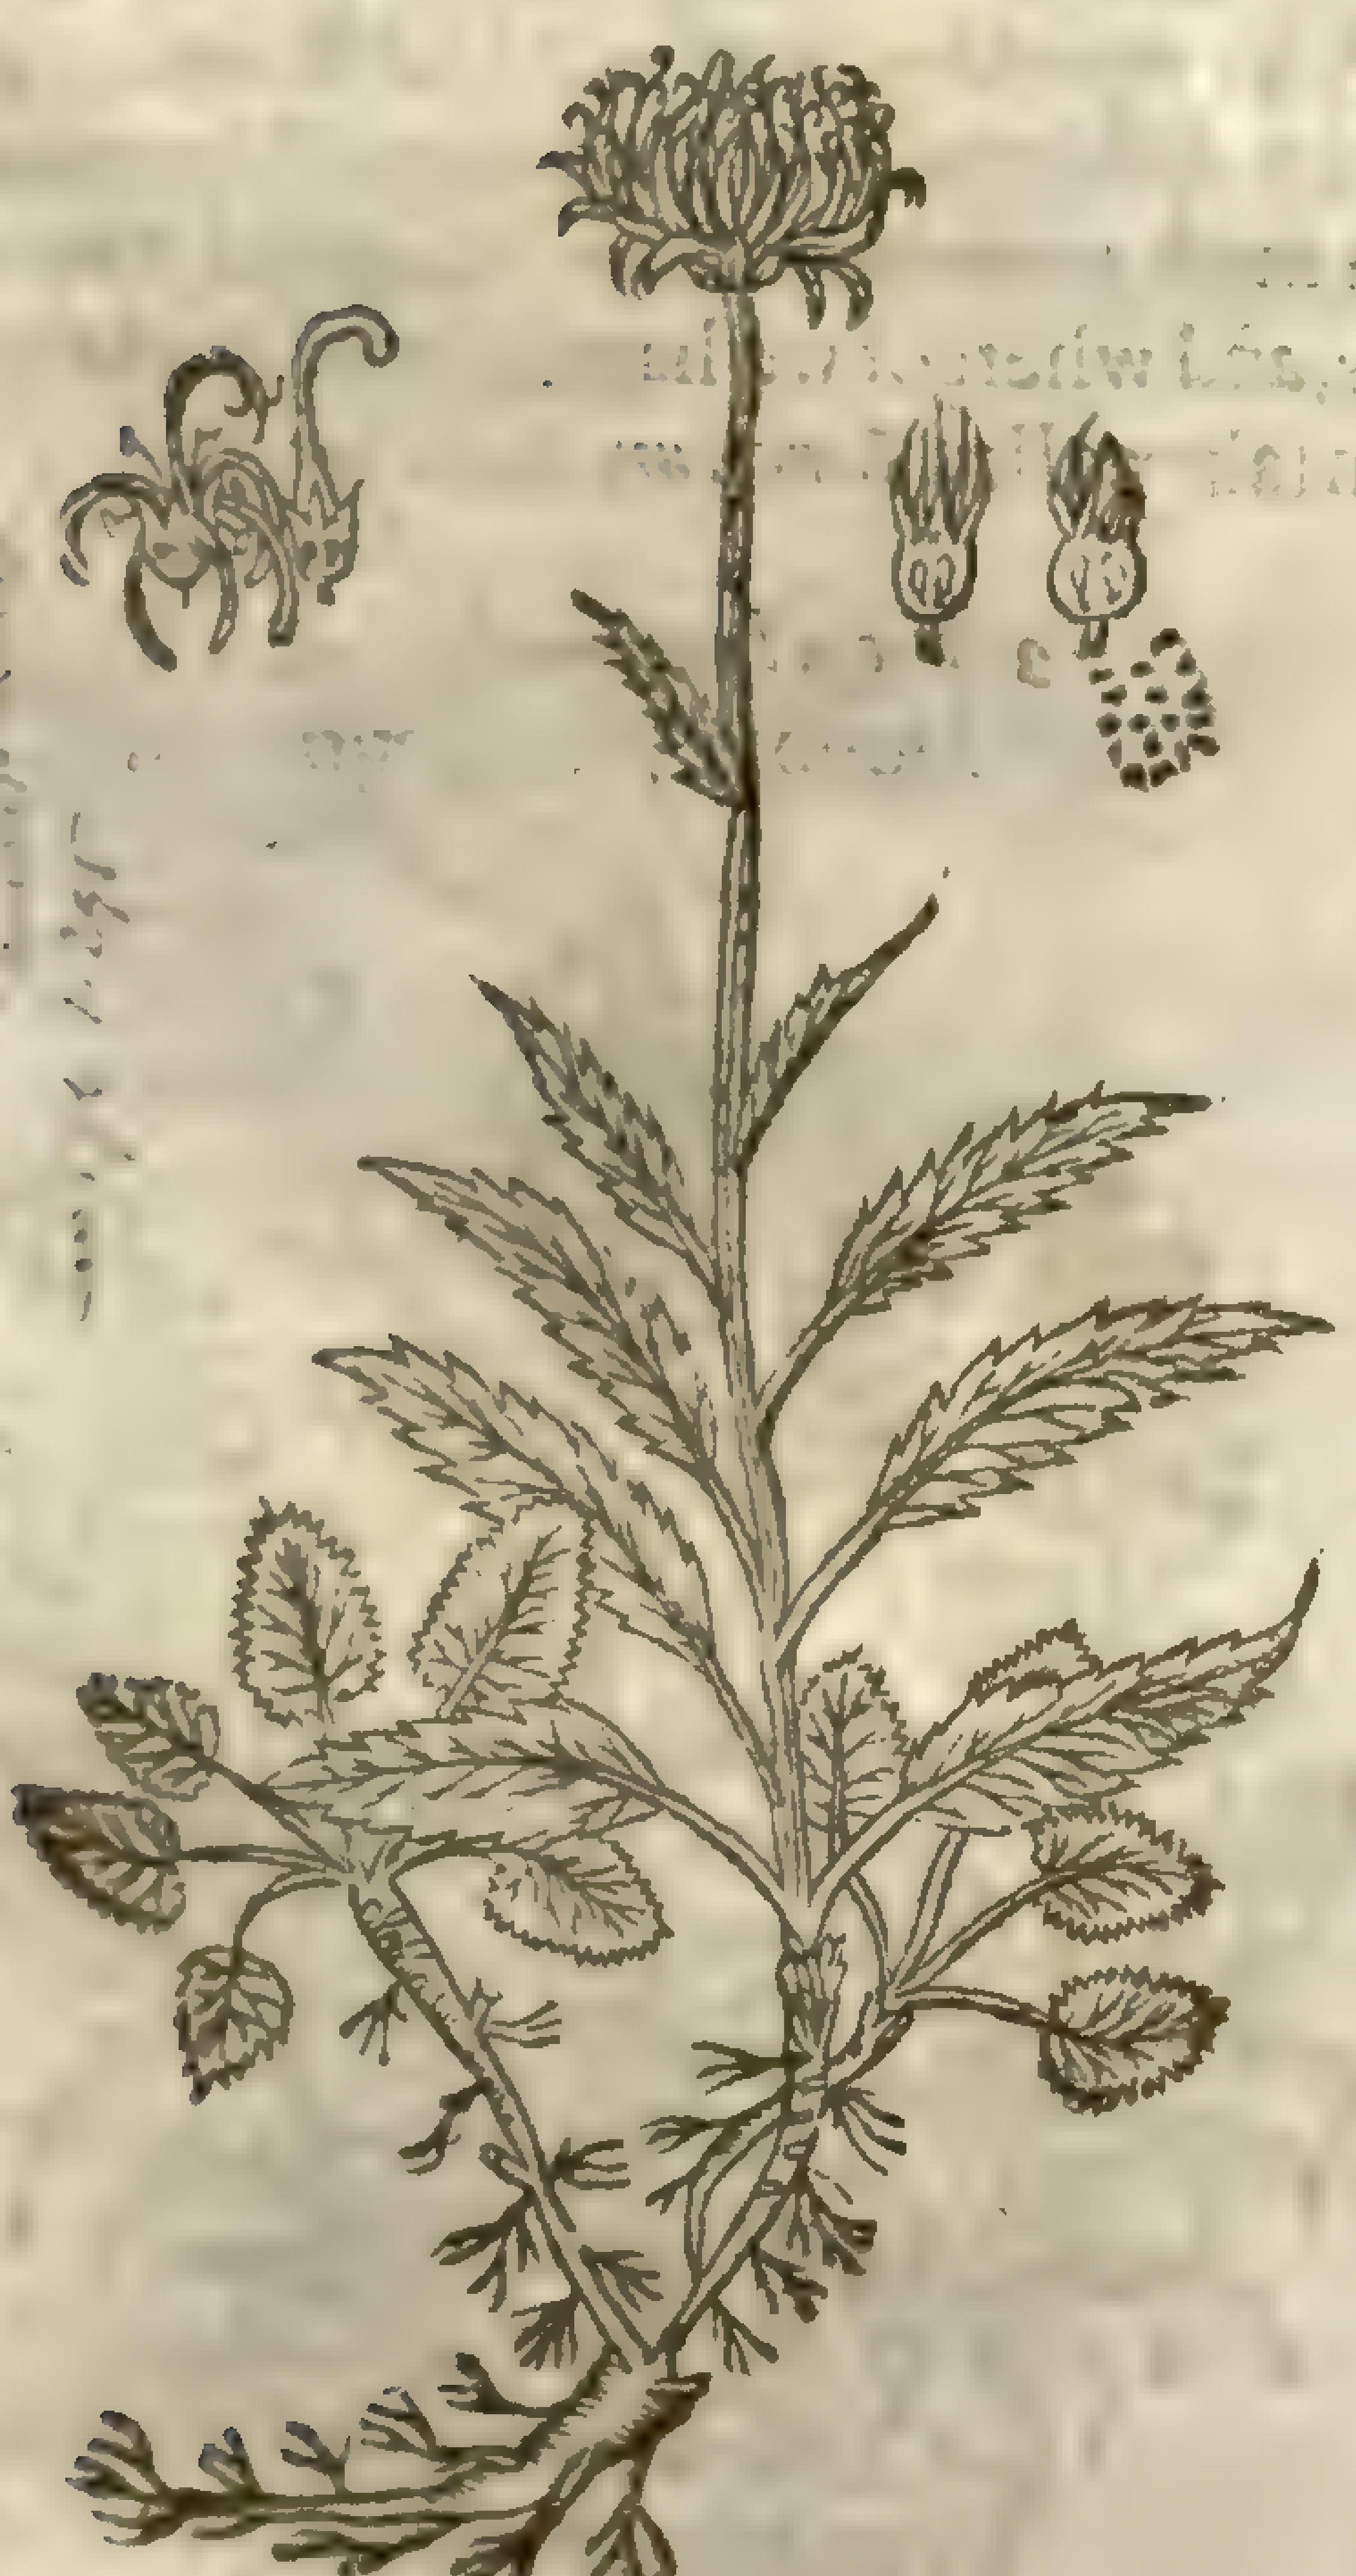
‡ 4 This which growes amongſt the rockes in the higheſt Alpes hath a wooddy and very wrinkled root an handfull and halfe long, from which ariſe many leaues ſet on pretty long ſtalkes, ſomewhat round, and diuided with reaſonable deepe gaſhes, hauing many veines, and being of a darke greene colour: amongſt theſe grow vp little ſtalkes, hauing one leafe about their middles, and three or foure ſet about the floure, being narrower and longer than the bottome leaues. The floures grow as in an vmbell, and are ſhped like that Chymicall veſſell we vſually call a Retort, being big at their bottomes, and ſo becomming ſmaller towards their tops, and hauing many threds in them, whereof one is longer than the reſt, and comes forth in the middle of the floure: it floures in Auguſt. *Pona* was the firſt that deſcribed this, vnder the name of *Trachelium petræum minus.*

5 The roots of this other kinde of horned Rampion grow after an vnuſuall manner; for firſt or lowermoſt is a root like to that of a Rampion, but ſlenderer, and from the top of that commeth forth as it were another root or two, being ſmalleſt about that place whereas they are faſtned to the vnder root; and all theſe haue ſmall fibres comming from them. The leaues which firſt grow vp are ſmooth, and almoſt like thoſe of a Rampion, yet rounder, and made ſomewhat after the manner of a violet leafe, but nothing ſo big: at the bottome of the ſtalke come forth ſeuen or eight long narrow

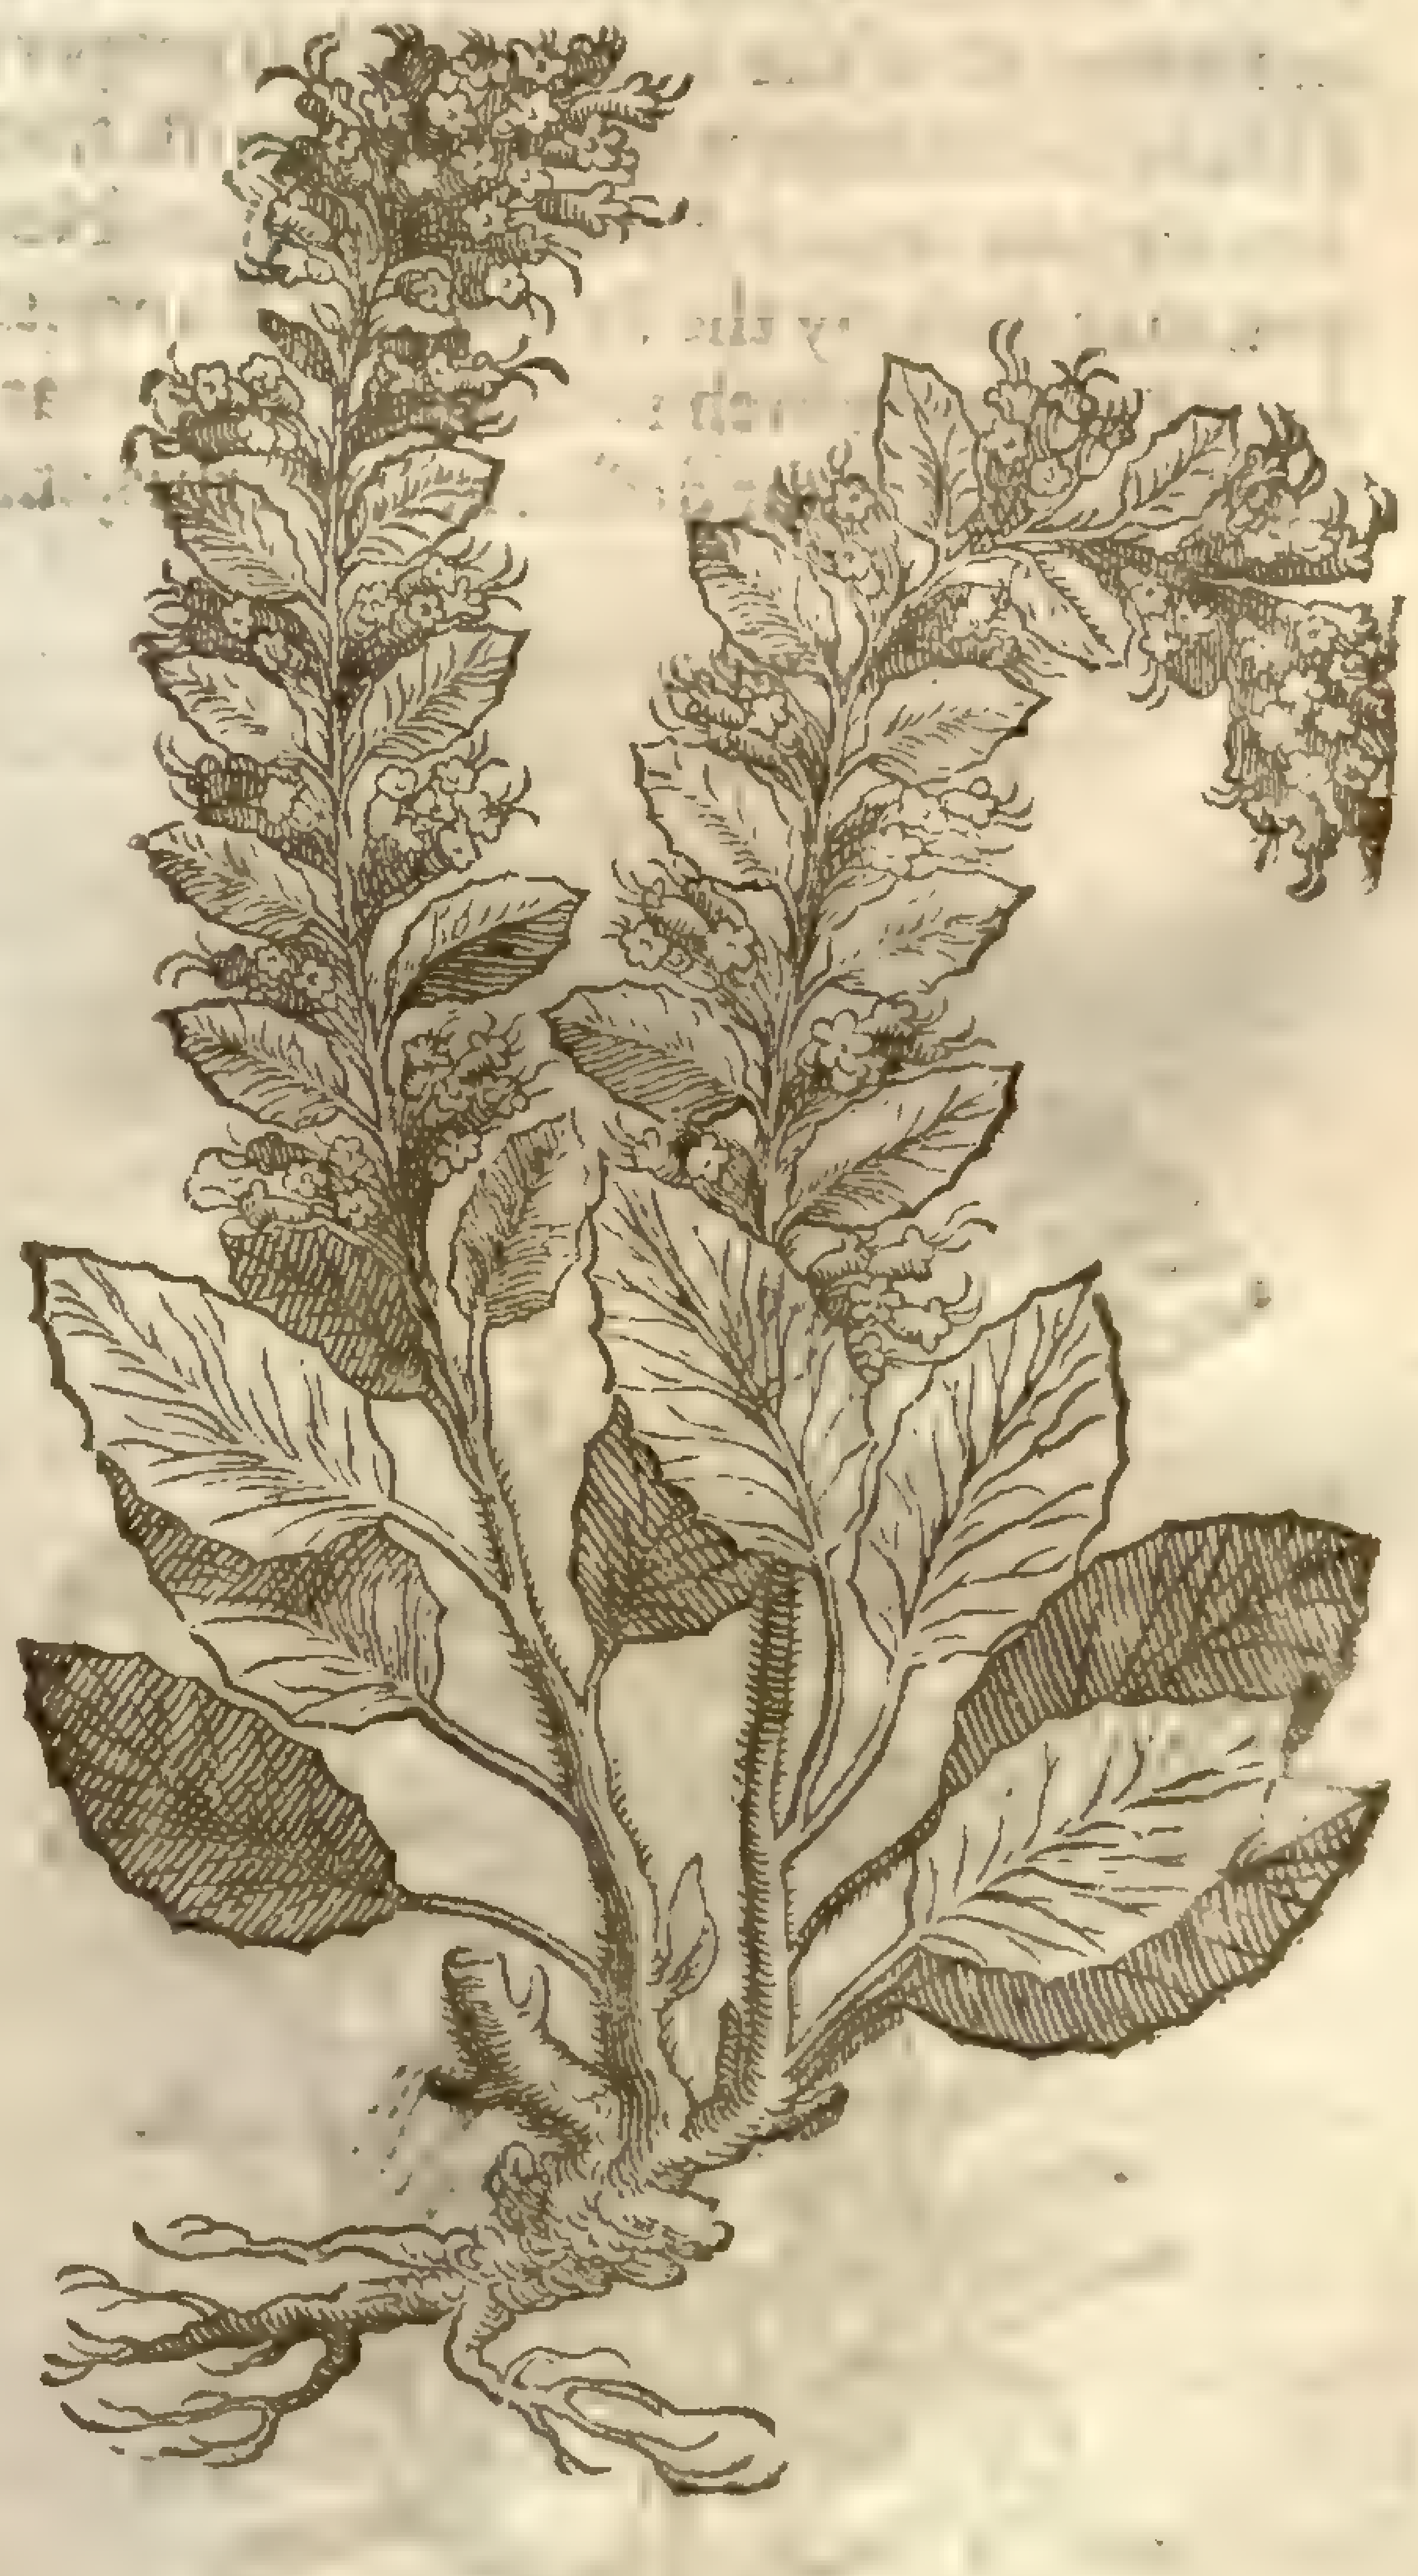
leaues ſnipt about the edges, and ſharpe pointed, and vpon the reſt of the ſtalke grow alſo three or foure narrow ſharpe pointed leaues. The floures which are of a purple colour, at firſt reſemble thoſe of the laſt deſcribed; but afterwards part themſelues into fiue ſlender ſtrings with threds in the middles; which decaying, they are ſucceeded by little cups ending in fiue little pointels, and containing a ſmall yellow ſeed. This is deſcribed by *Fabius Columna*, vnder the name of *Rapuntium Corniculatum montanum*: And I receiued ſeeds and roots hereof from Mr *Goodyer*, who found it growing plentifully wilde in the incloſed chalky hilly grounds by Maple-Durham neere Petersfield in Hampſhire. In gardens the floures become much longer and fairer.

6 This which is deſcribed in *Cluſius* his *Curæ poſter.* by the name of *Pyramidalis*, and was firſt found and ſent to him by *Gregory de Reggio*, a Capuchine Frier, is alſo of this kindred; wherefore I will giue you a briefe deſcription thereof. The root is white, and long laſting; from which come diuers round hairie and writhen ſtalkes, about a ſpan long more or leſſe. At the top of theſe ſtalkes and all amongſt the leaues, grow many elegant blew floures, which are ſucceeded by ſeed veſſels like thoſe of the leſſer *Trachelium*, being full of a ſmall ſeed. The whole plant yeelds milke like as the reſt of this kinde, and the leaues as well in ſhape as hoarineſſe on their vnder ſides, well reſemble thoſe of the ſecond French or Golden Lungwoort of my deſcription. It was firſt found growing in the chinkes of hard rockes about the mouthes of Caues, in the mountaines of Breſcia in Italy, by the foreſaid Frier.

‡ 5 *Rapunculus Corniculatus montanus.*
Mountaine horned Rampions.



‡ 6 *Rapunculus ſaxatilis, ſiue Pyramidalis alter.*
Rocke Rampion.



¶ *The Place.*

The firſt is ſowne and ſet in Gardens, eſpecially becauſe the roots are eaten in Sallads.
The ſecond groweth in woods and ſhadowie places, in fat and clayie ſoiles.

¶ *The Time.*

They floure in May, Iune, and Iuly.

¶ *The Names.*

‡ Rampions by a generall name are called *Rapuntium* and *Rapunculus*; and the firſt by reaſon of the long ſpokie tuft of floures is called *Rapuntium majus Alopecuri comoſo flore*, by *Lobel* and *Pena*: *Rapunculum ſylueſtre*, and *Rapunculus ſylueſtris ſpicatus* by others. The ſecond which is the

ordinary Rampion is called *Rapunculus*, and *Rapuntium minus*; *Lobel* thinkes it the *Pes Locuſtæ* of *Auicen*; and *Columna* iudges it to be *Erinus* of *Nicander* and *Dioſcorides*. The third is the *Rapunculus nemoroſus ſecundus* of *Tabernamontanus*; and the variety of it is *Rapunc.nemor.tertius*. The names of the reſt are ſhewne in their deſcriptions. ‡

¶ *The Temperature.*

The roots of theſe are of a cold temperature, and ſomething binding.

¶ *The Vertues.*

A The roots are eſpecially vſed in ſallads, being boiled and eaten with oile, vinegre, and pepper.

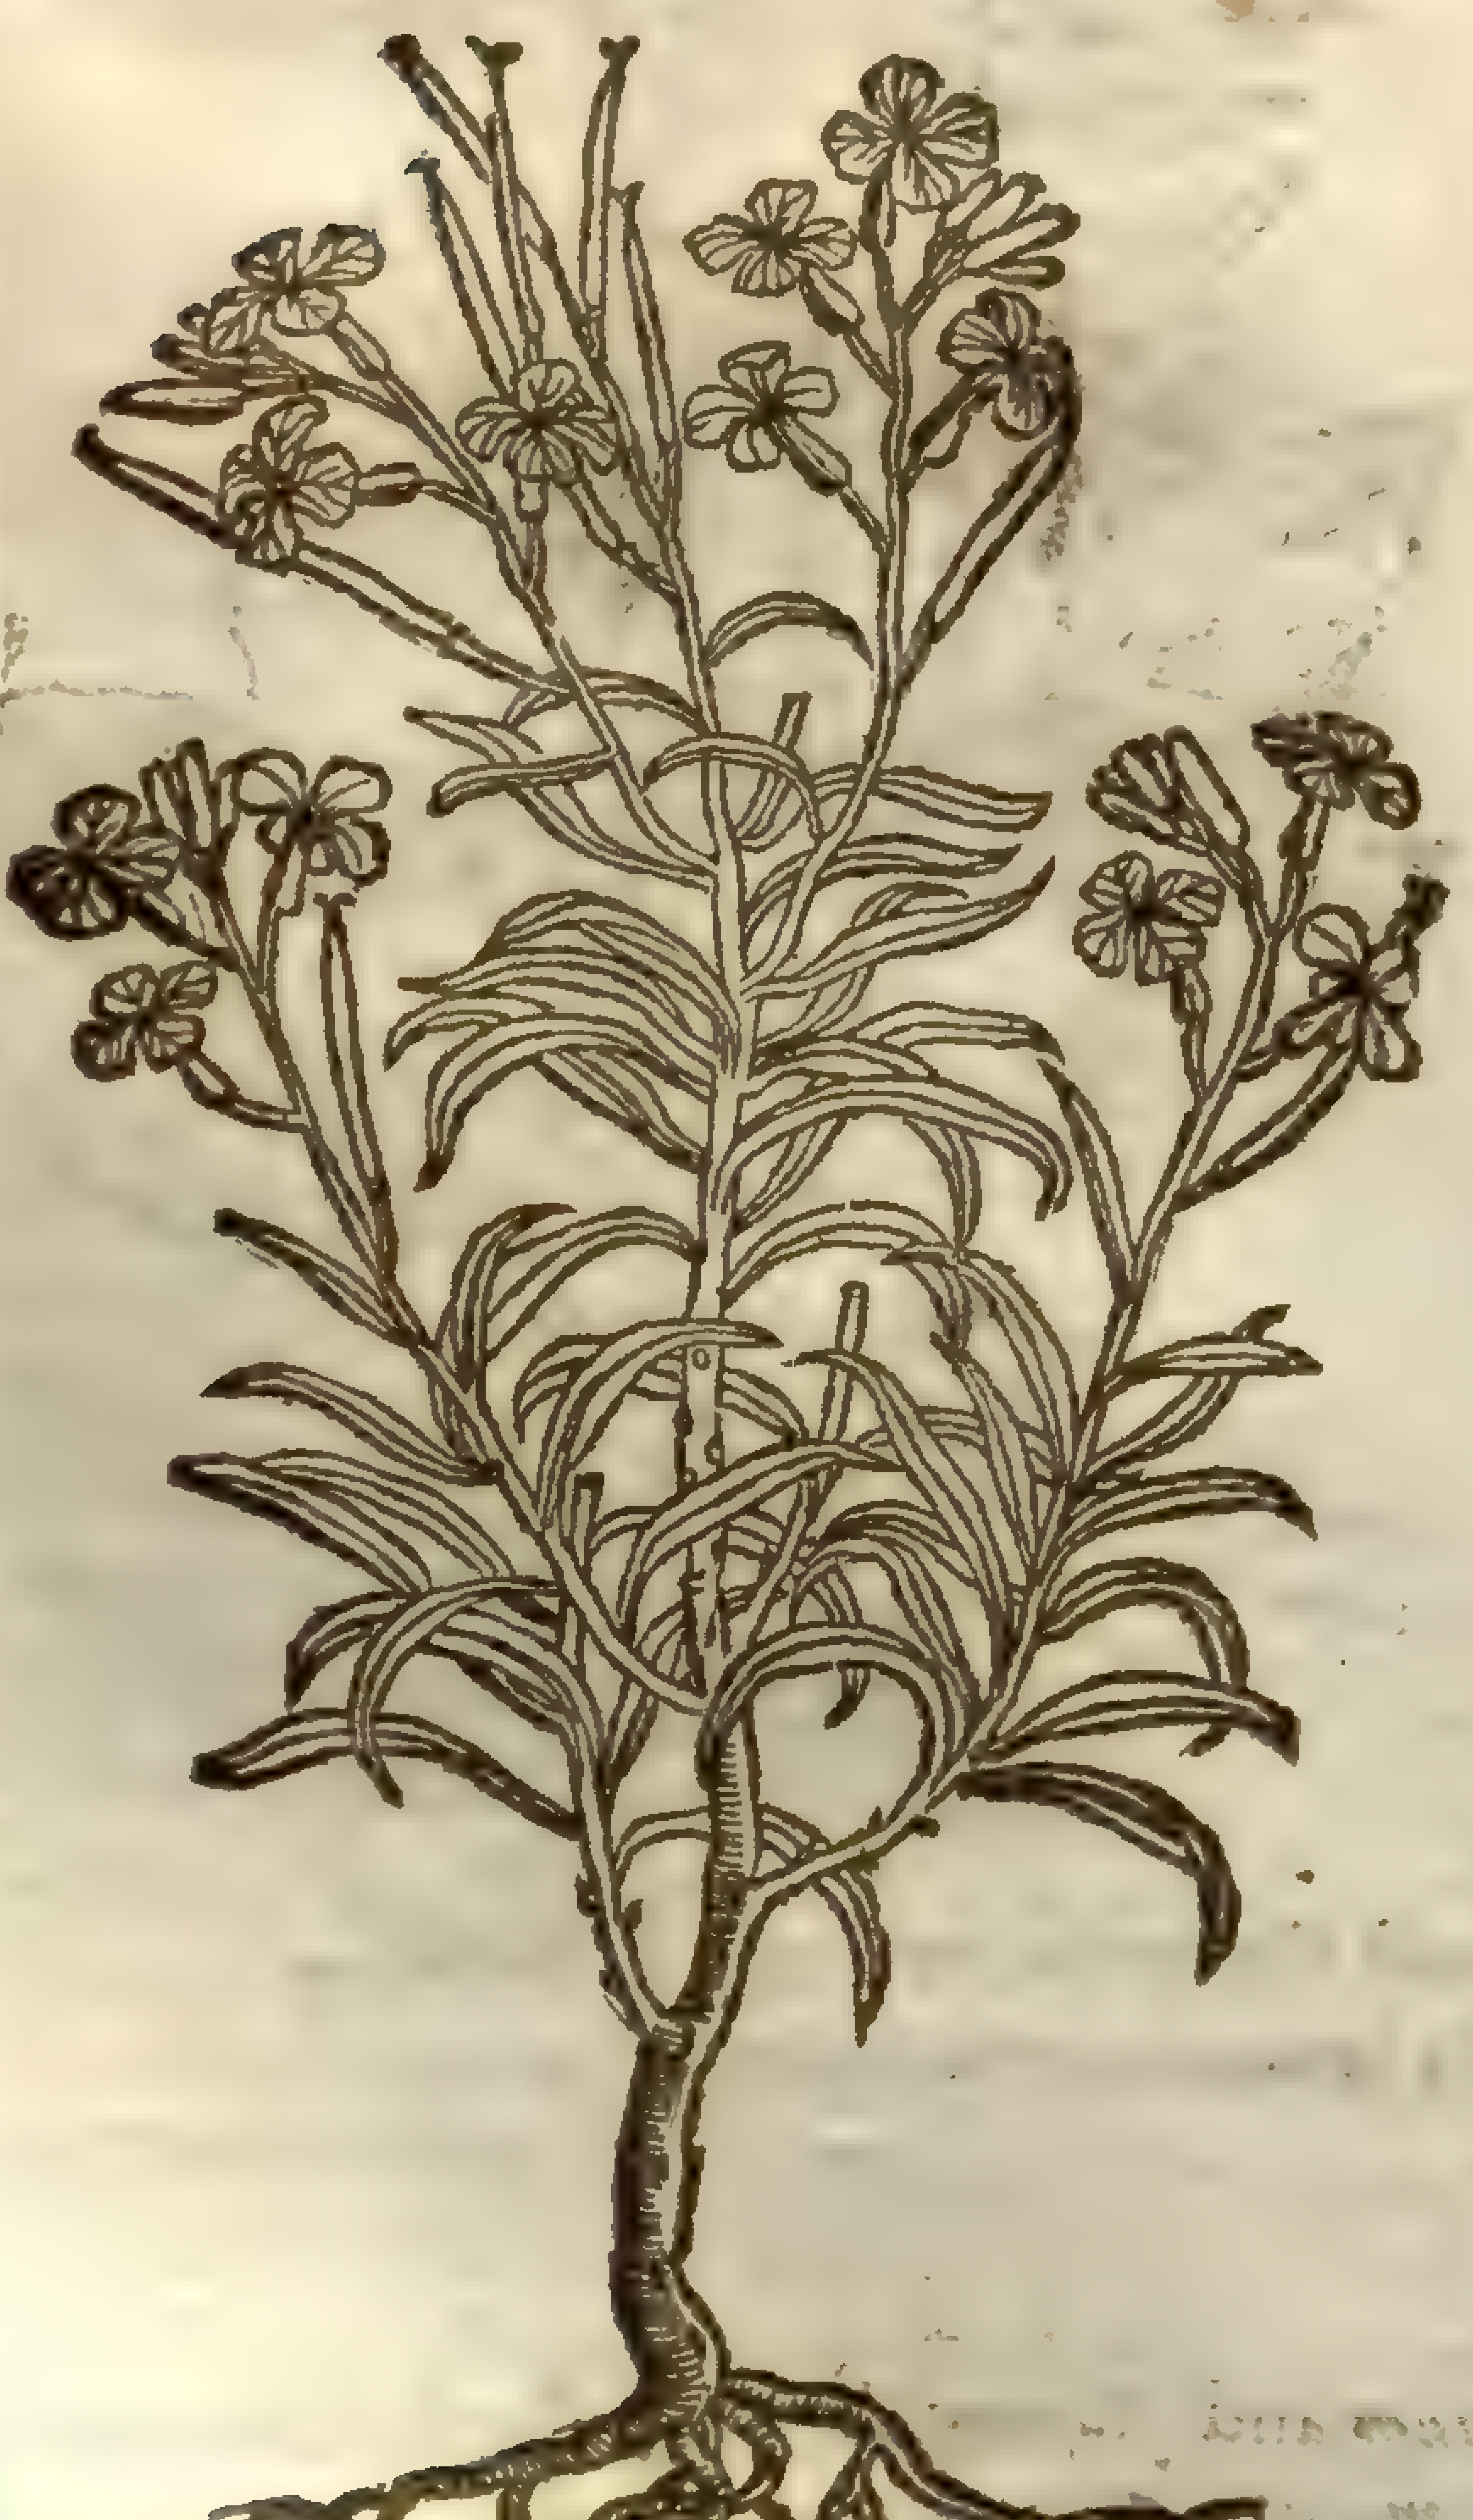
B Some affirme, that the decoction of the roots is good for all inflammations of the mouth, and Almonds of the throat, and other diſeaſes happening in the mouth and throte, as the other Throtewoorts.

Chap. 119. *Of Wall-floures, or yellow Stocke-Gillofloures.*

¶ *The Kindes.*

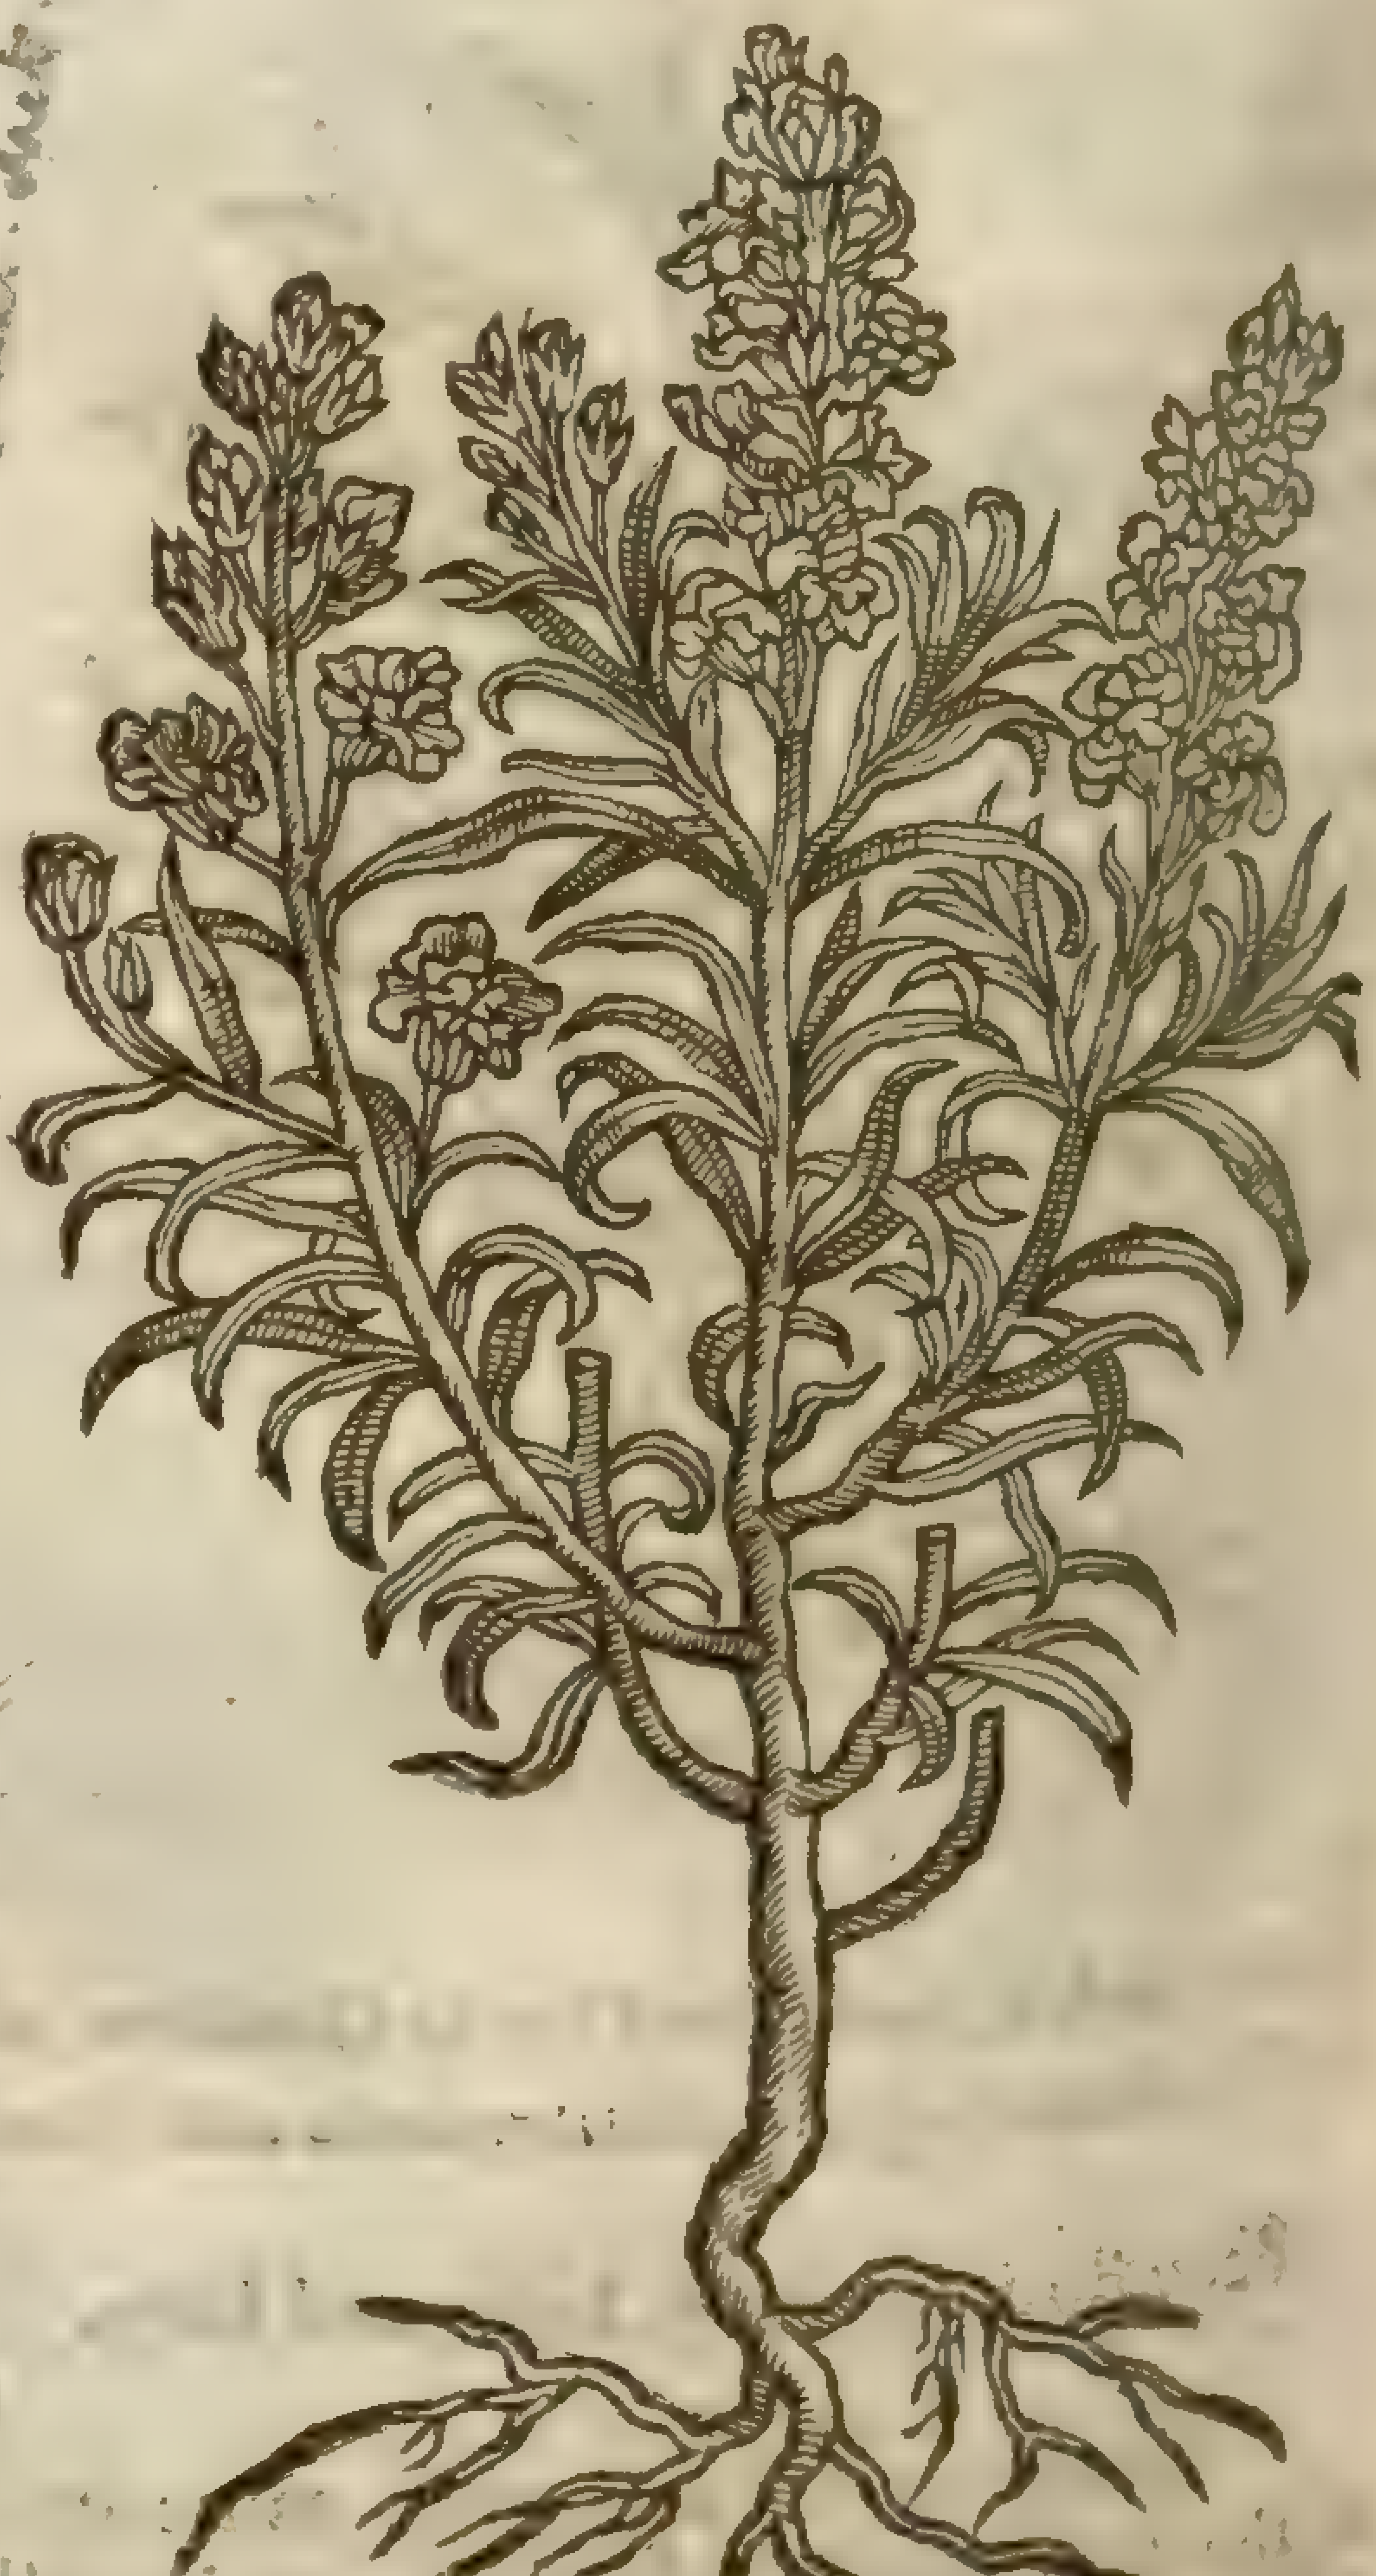
‡ These plants which wee terme commonly in Engliſh, Wal-floures and Stocke-Gillofloures are comprehended vnder one generall name of *Leucoion*, (i) *Viola alba*, White Violet, λευκὸς ſignifying white, and ἴον a Violet; which as ſome would haue it is not from the whiteneſſe of the floure, for that the moſt and moſt vſuall of them are of other colours, but from the whitenes or hoarineſſe of the leaues, which is proper rather to the Stocke Gillouers than to the Wal-floures: I therefore thinke it fit to diſtinguiſh them into *Leucoia folijs viridibus*, that is, Wal-floures; and *Leucoia folijs incanis*, Stocke-Gillouers. Now theſe againe are diſtinguiſhed into ſeuerall ſpecies, as you may finde by the following Chapters. Moreouer, you muſt remember there is another *Viola alba* or *Leucoion* (which is thought to be that of *Theophraſtus*, and whereof we haue treated in the firſt booke) which is far different from this, and for diſtinction ſake called *Leucoium bulboſum*. ‡

1 *Viola Lutea.*
Wal-floure.



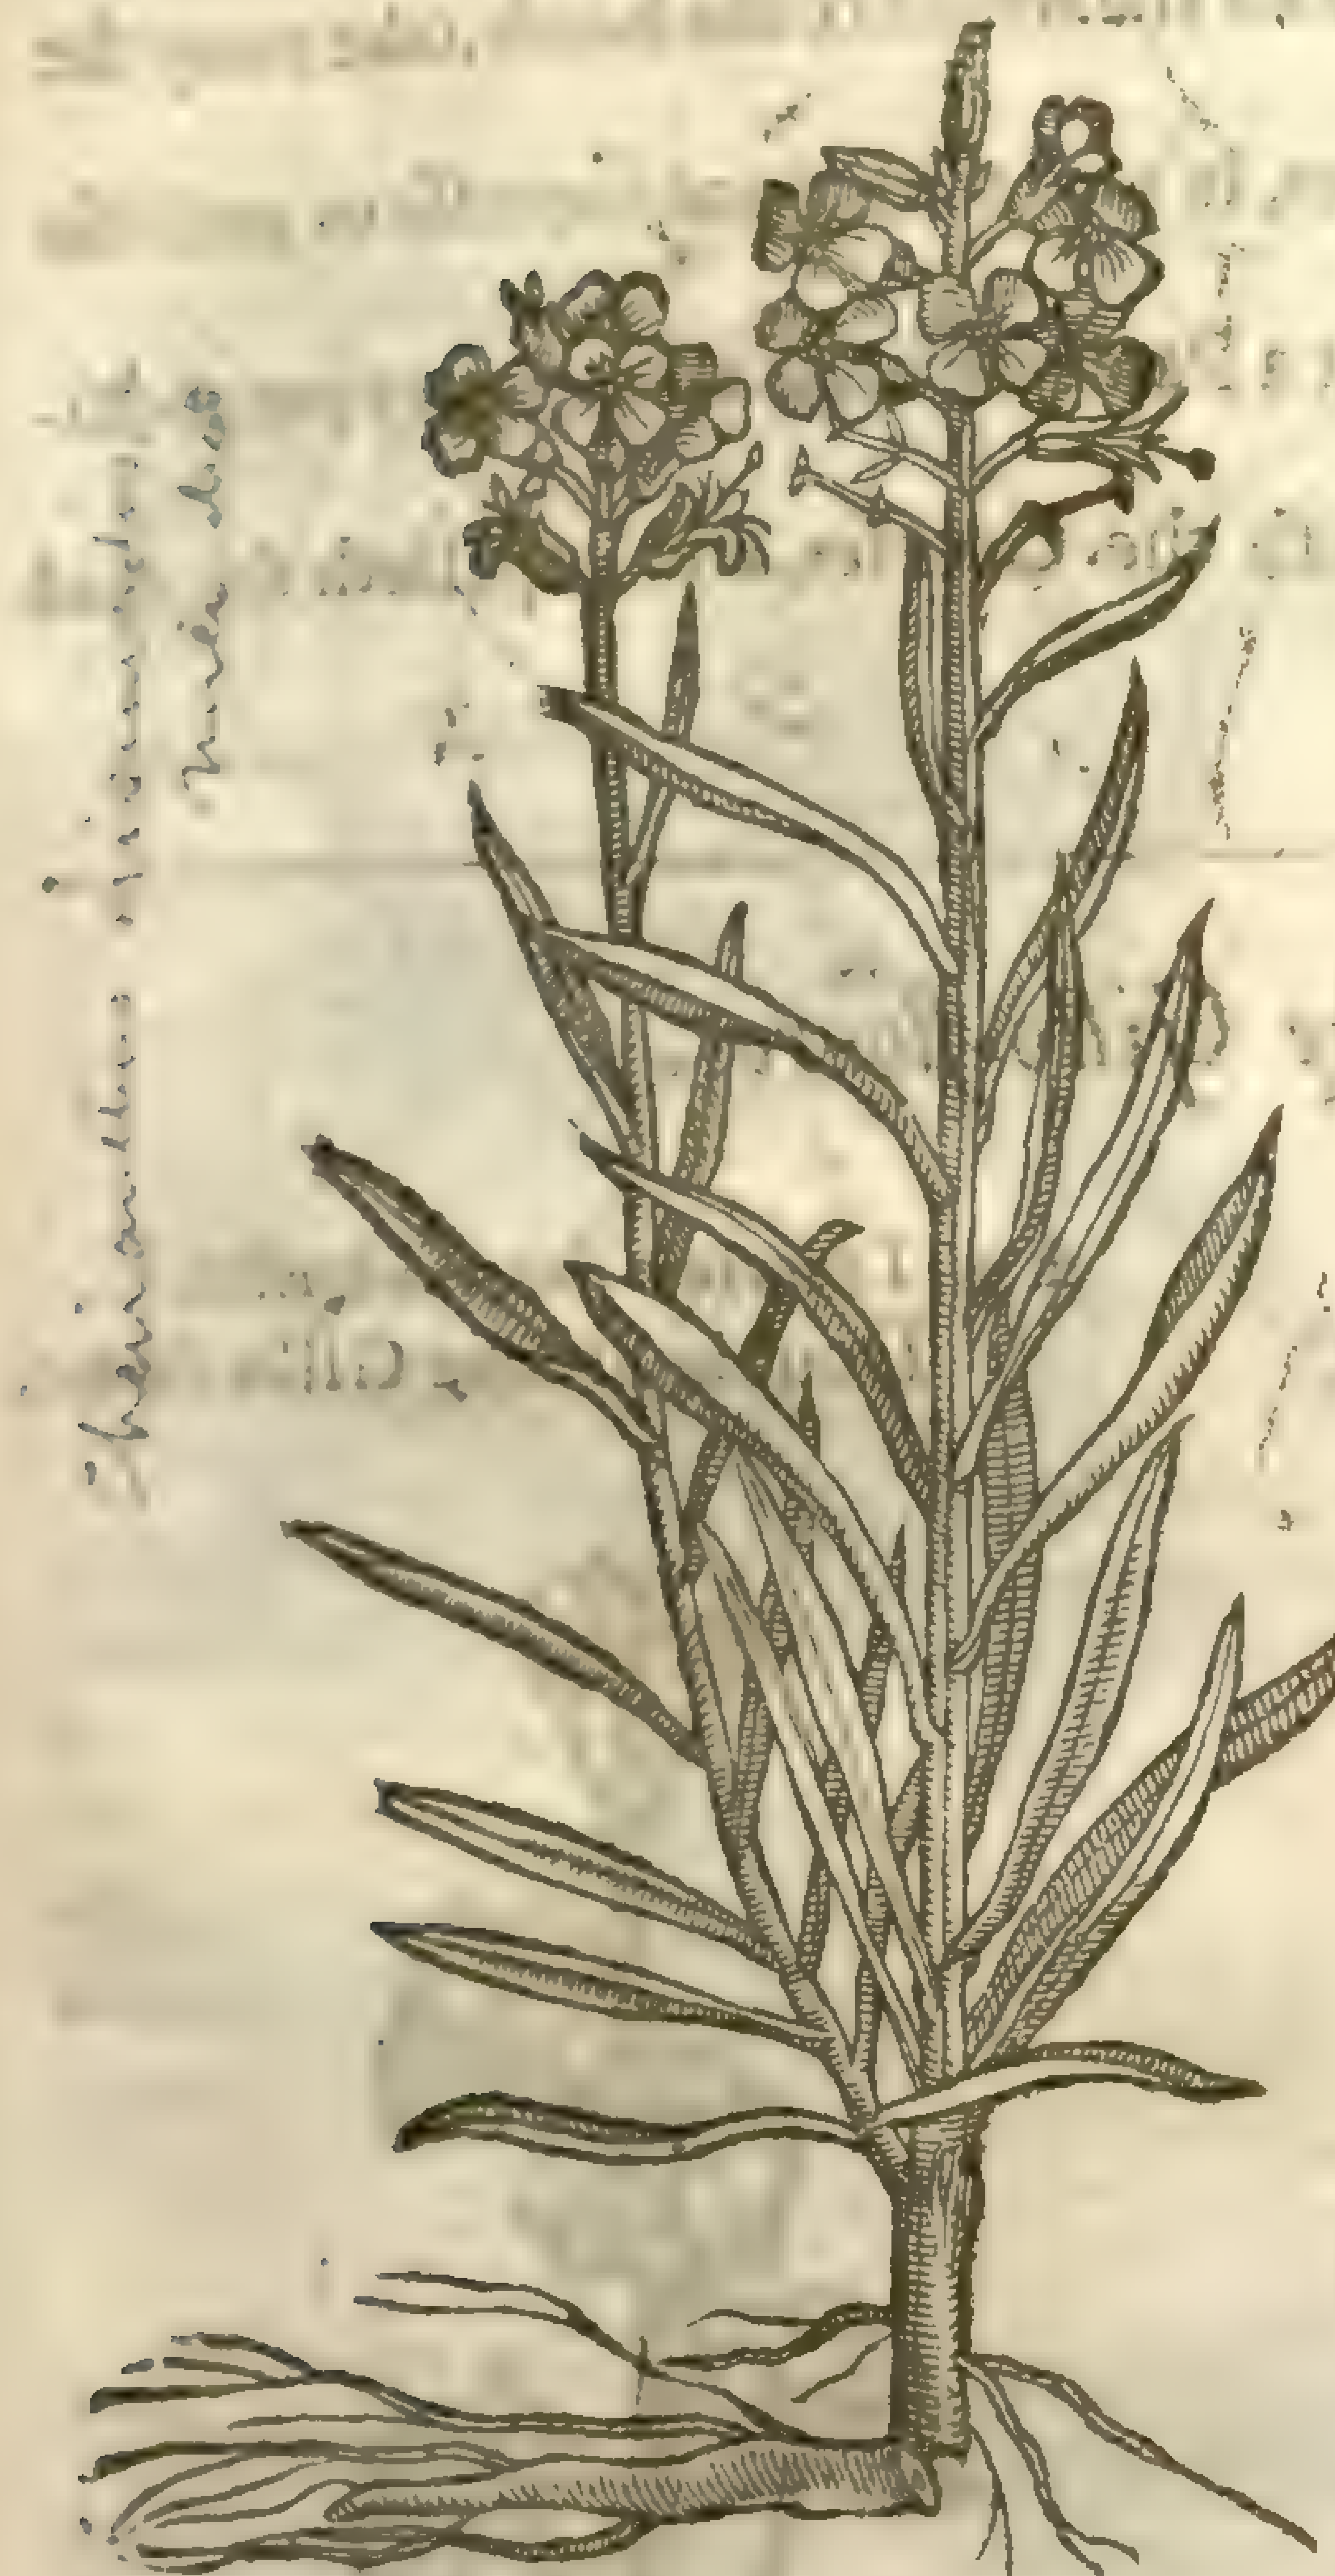
Cheiranthus cheiri, L.
mill. dict.

2 *Viola lutea multiplex.*
Double Wal-floure.



Cheiranthus cheiri, L. &
mill. dict.

¶ The



† 4 *Leucoium ſylueſtre.*
Wilde Wall-floure.

¶ *The Deſcription.*

1 THe ſtalks of the Wal-floure are ful of greene branches, the leaues are long, narrow, ſmooth, ſlippery, of a blackiſh green color, and leſſer than the leaues of ſtocke Gillofloures. The floures are ſmall, yellow, very ſweet of ſmell, and made of foure little leaues; which being paſt, their ſucceed long ſlender cods, in which is contained flat reddiſh ſeed. The whole plant is ſhrubby, of a wooddy ſubſtance, and can eaſily endure the cold of Winter.

2 The double Wal-floure hath long leaues greene and ſmooth, ſet vpon ſtiffe branches, of a wooddy ſubſtance: whereupon doe grow moſt pleaſant ſweet yellow flours very double, which plant is ſo well knowne to all, that it ſhall be needleſſe to ſpend much time about the deſcription.

3 Of this double kinde we haue another ſort that bringeth his floures open all at once, whereas the other doth floure by degrees, by meanes whereof it is long in flouring.

‡ 4 This plant which was formerly ſeated in the fourth place of the following chapter, I haue brought to enioy the ſame place in this, for that by reaſon of the greeneſſe of his leaues and other things hee comes neareſt to theſe here deſcribed; alſo I wil deſcribe it anew becauſe the former was almoſt wholly falſe: It hath many greene leaues at the top of the root like to thoſe of the Wall-floure, but narrower, and bitter of taſte; among which riſe vp one or more ſtalkes of a foot or more in height, creſted and ſet with carinated leaues. The floures grow at the tops of the ſtalkes many together, conſiſting of foure yellow leaues a piece, leſſer than thoſe of the ordinary wall-floures; theſe floures are ſucceeded by long cods containing a flat ſeed. The root is long and whitiſh, with many fibres.

5 Beſides theſe, there is in ſome Gardens kept another Wall-floure differing from the firſt in the bignes of the whole plant, but eſpecially of the floure, which is yellow and ſingle, yet very large and beautifull.

6 Alſo there is another with very greene leaues, and pure white and well ſmelling floures. ‡

¶ *The Place.*

The firſt groweth vpon bricke and ſtone walls, in the corners of churches euery where, as alſo among rubbiſh and other ſtony places.

The double Wall-floure groweth in moſt gardens of England.

¶ *The Time.*

They floure for the moſt part all the yeere long, but eſpecially in Winter, whereupon the people in Cheſhire do call them Winter-Gillofloures.

¶ *The Names.*

The Wall-floure is called in Greeke λευκόιον: in Latine, *Viola lutea*, and *Leucoium luteum*: in the Arabicke tongue, *Keyri*: in Spaniſh, *Violettas Amarillas*: in Dutch, **Violieren**: in French, *Girofflees iaulnes, Violieres des murailles*: in Engliſh, Wall-Gillofloure, Wall-floure, yellow ſtocke Gillofloure, and Winter-Gillofloure.

¶ *The Temperature.*

All the whole ſhrub of Wall-Gillofloures, as *Galen* ſaith, is of a cleanſing faculty, and of thinne parts.

¶ *The Vertues.*

A *Dioſcorides* writeth, that the yellow Wall-floure is moſt vſed in Phyſicke, and more than the reſt of ſtocke-Gillofloures, whereof this is holden to be a kinde: which hath moued me to preferre it vnto the firſt place. He ſaith, that the juyce mixed with ſome vnctious or oylie thing, and boiled to the forme of a lyniment, helpeth the chops or rifts of the fundament.

B The herbe boiled with white wine, hony, and a little allom, doth cure hot vlcers, and cankers of the mouth.

C The leaues ſtamped with a little bay ſalt, and bound about the wreſts of the hands, take away the ſhaking fits of the Ague.

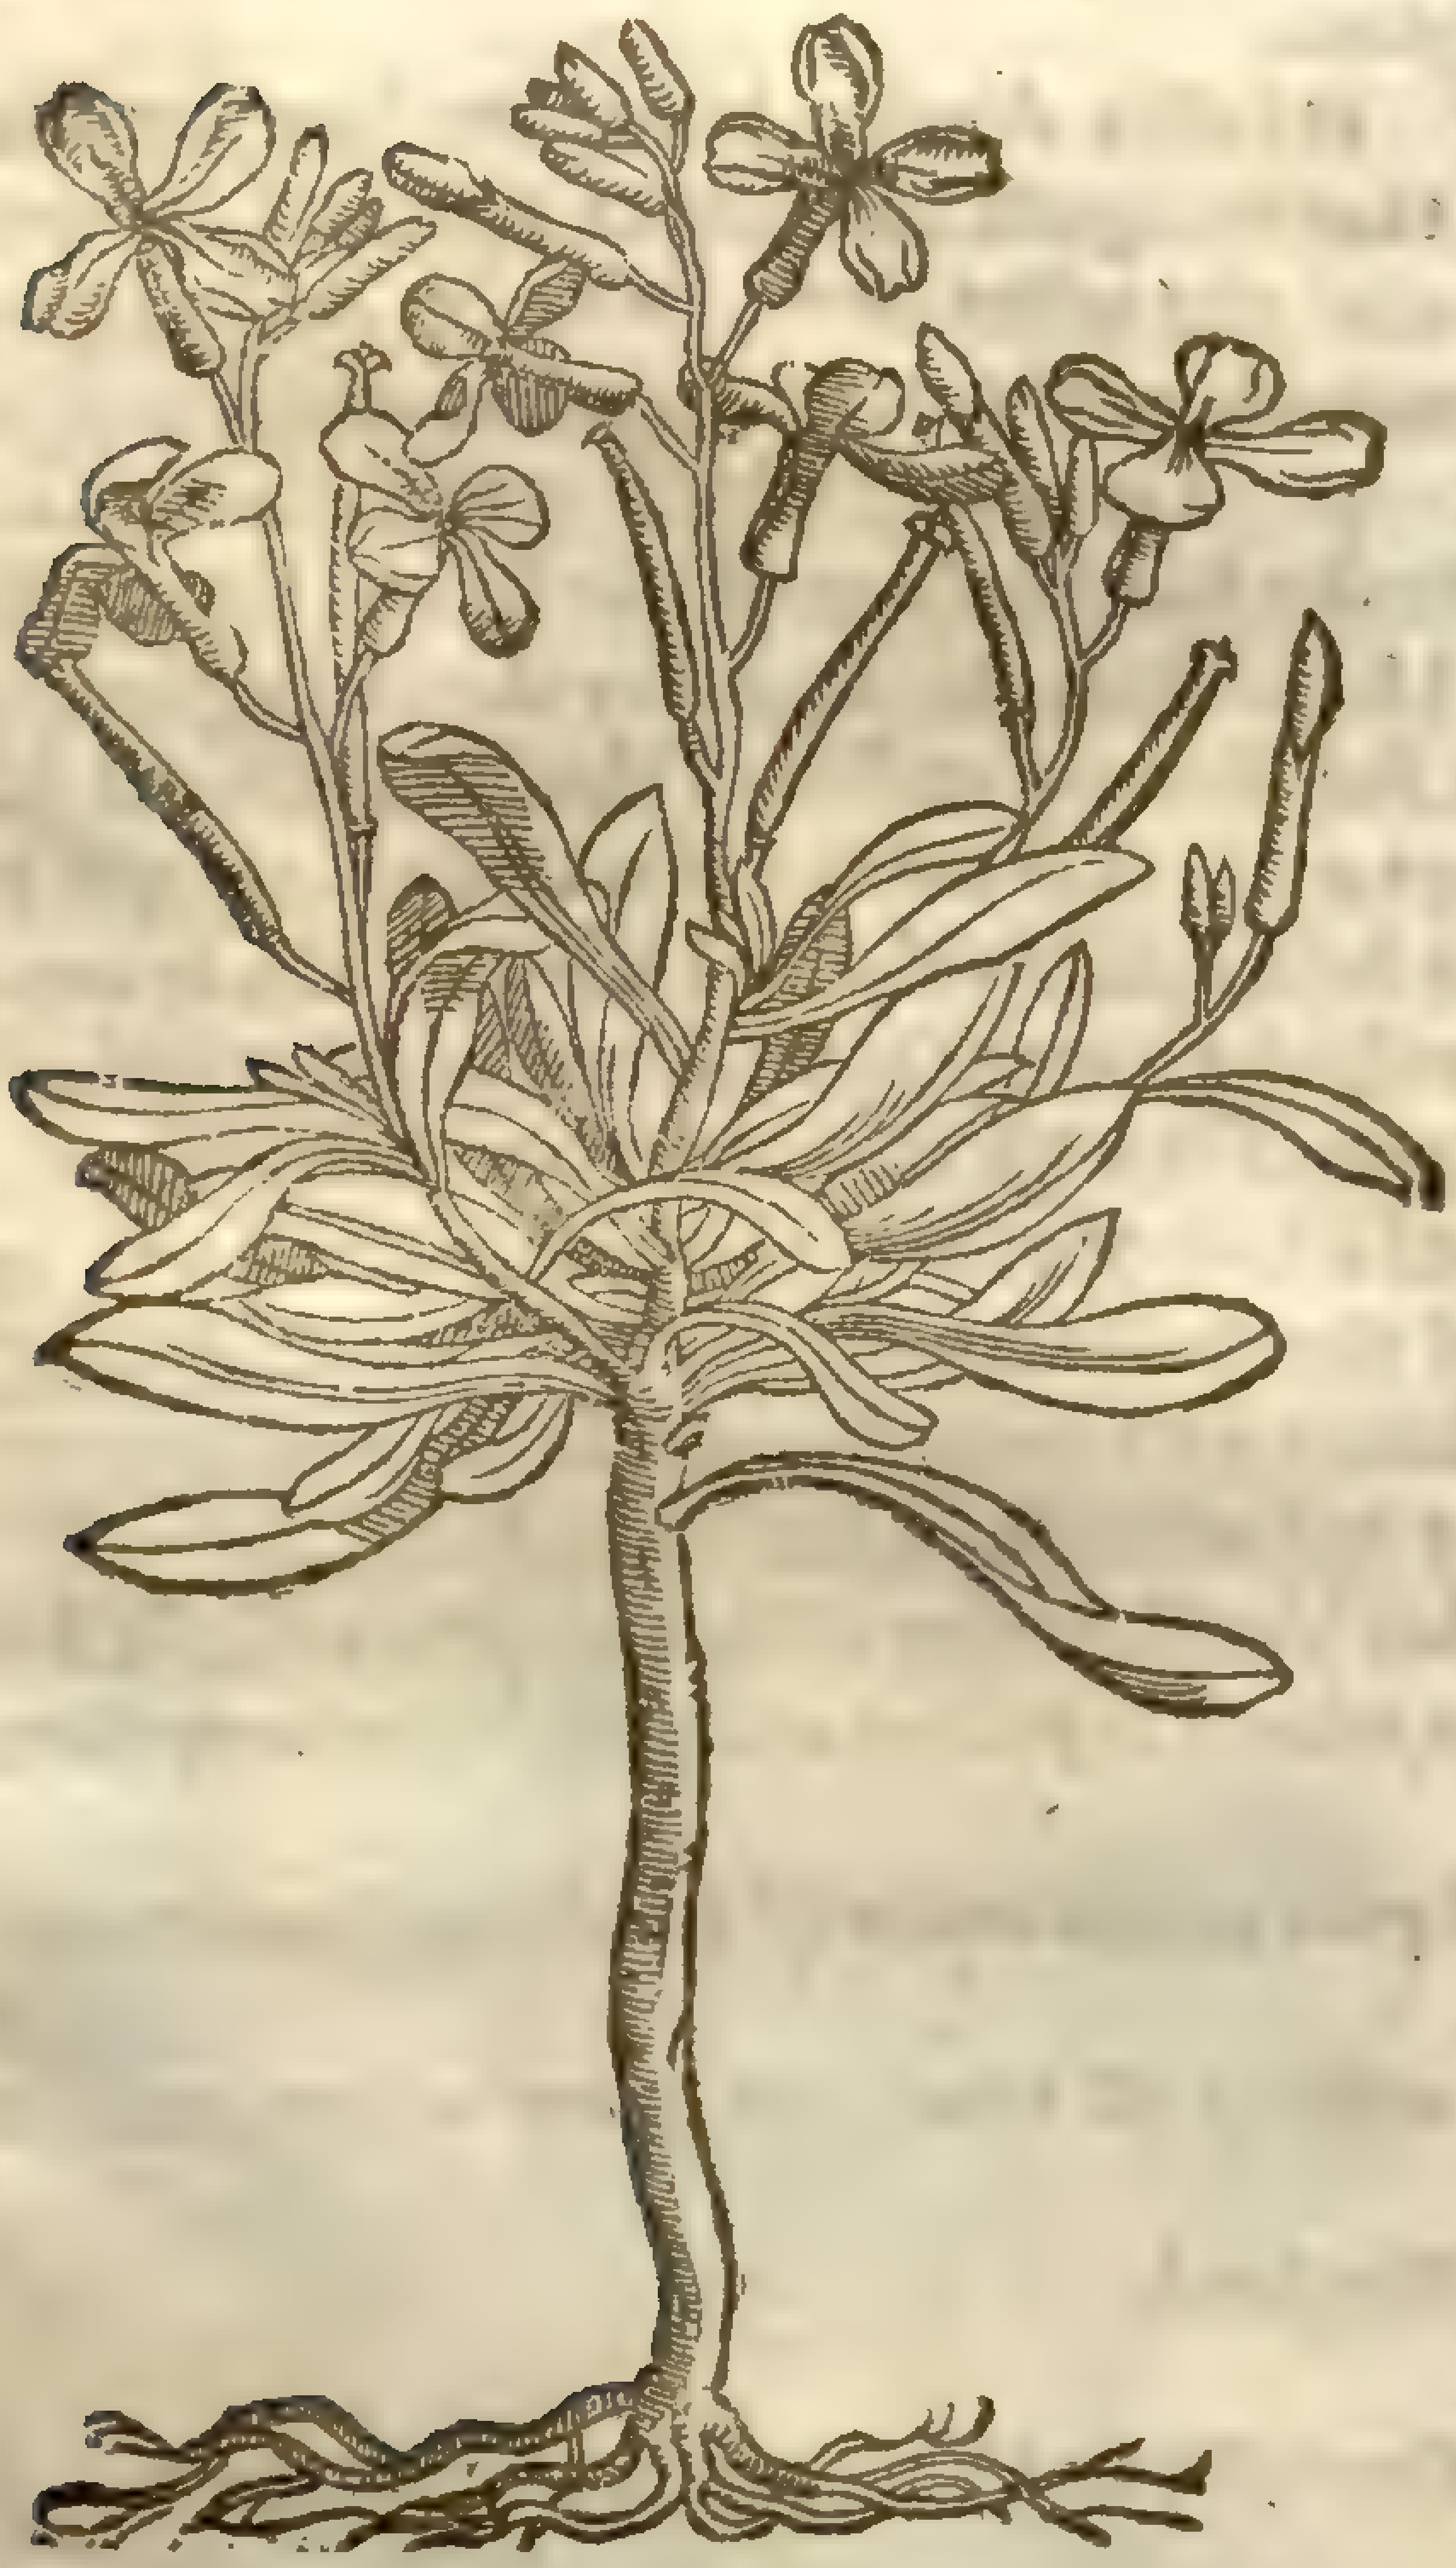
D ‡ A decoction of the floures together with the leaues, is vſed with good ſucceſſe to mollifie Schirrous tumors.

E The oyle made with theſe is good to be vſed to annoint a Paralyticke, as alſo a gouty part to mitigate paine.

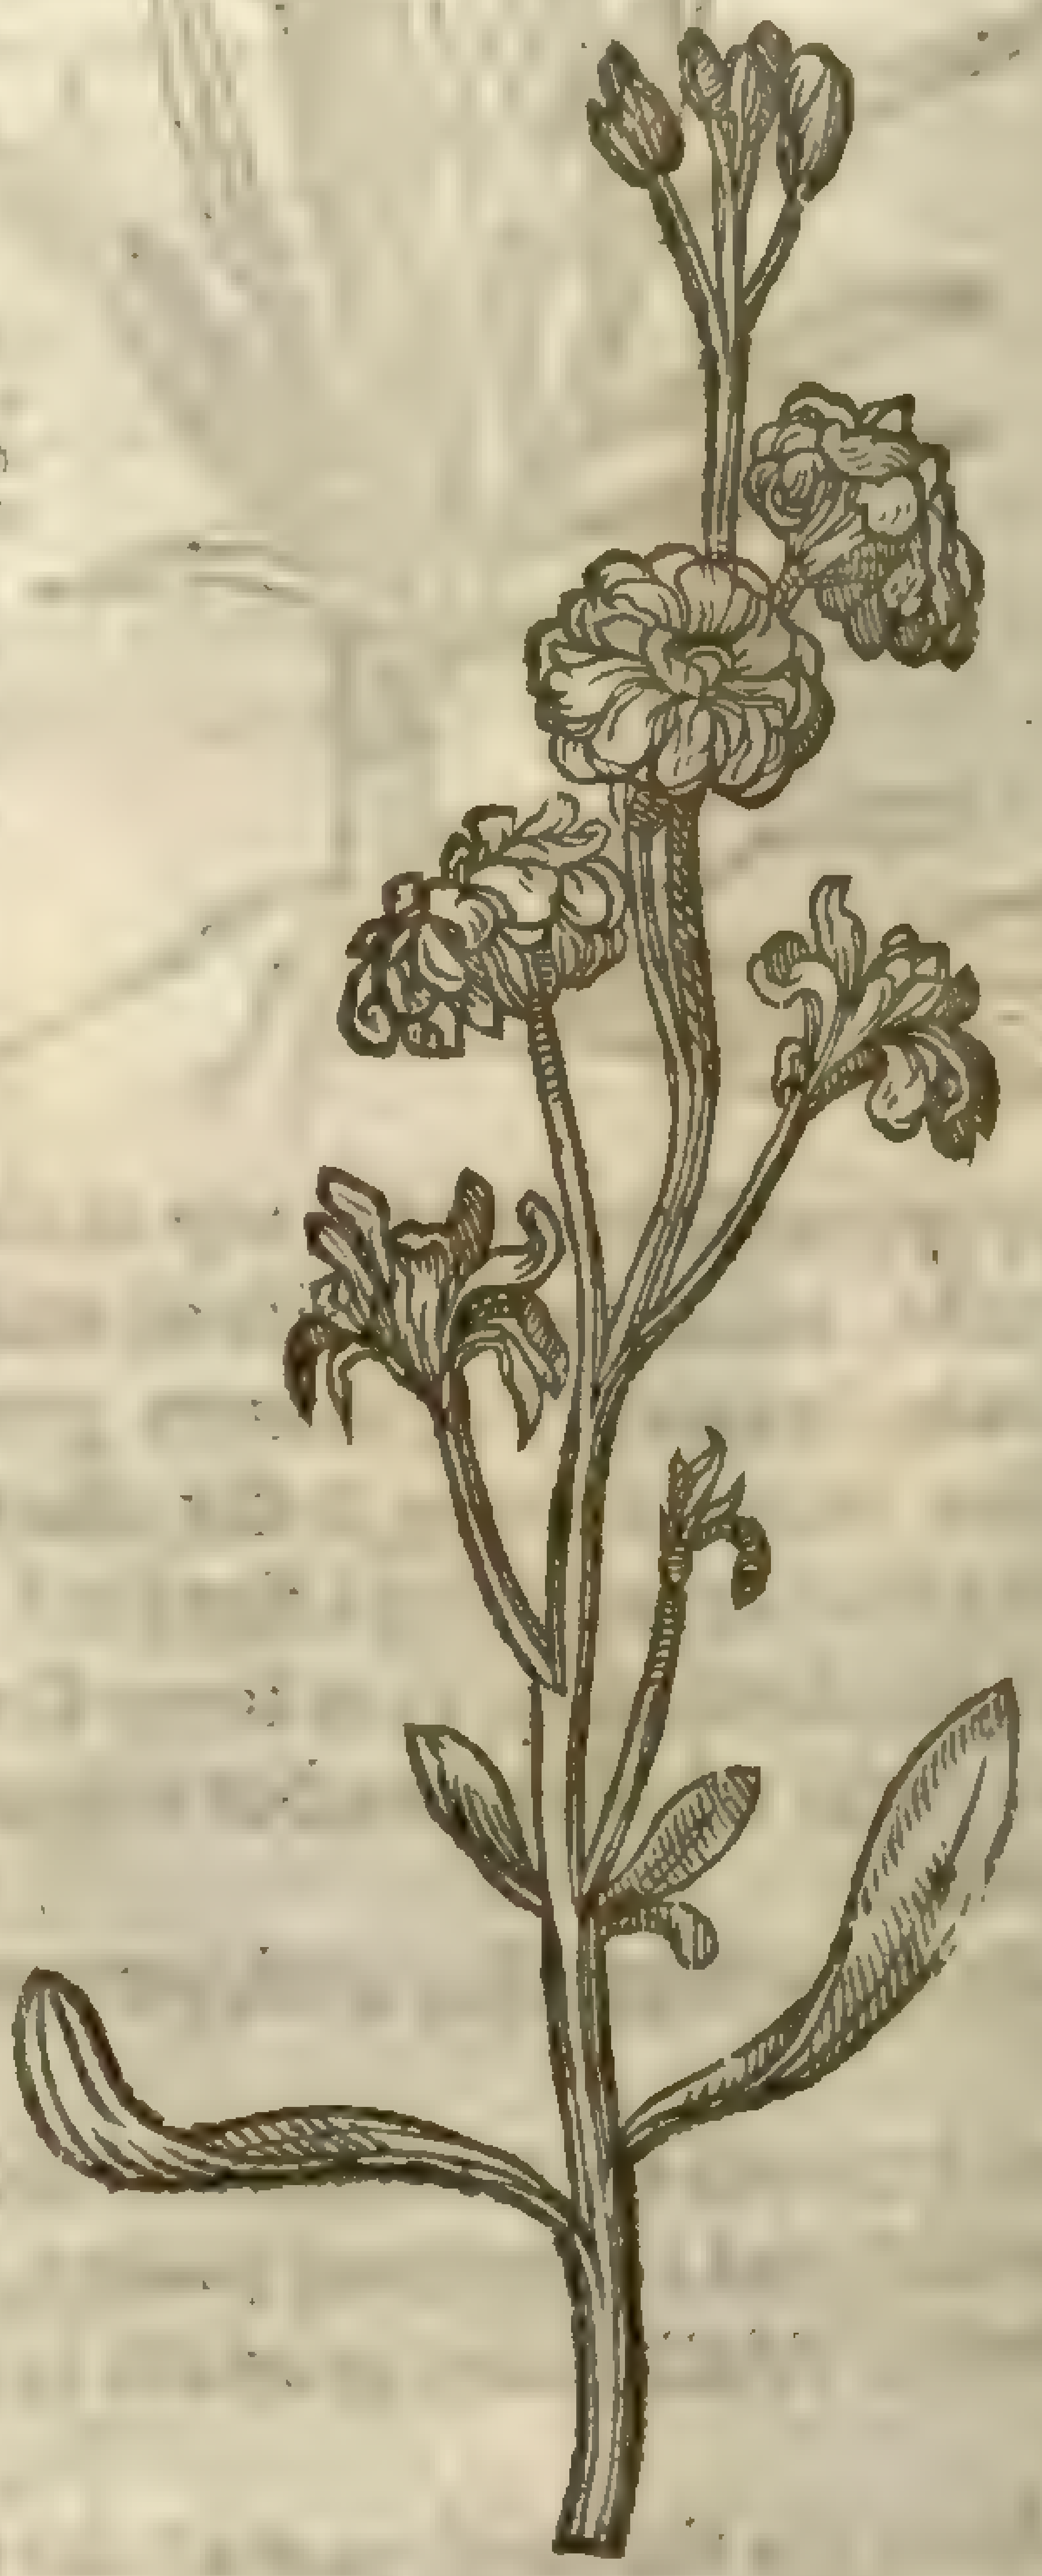
F Alſo a ſtrong decoction of the floures drunke, moueth the Courſes, and expelleth the dead childe. ‡

Chap. 120. *Of Stocke Gillo-floures.*

1 *Leucoium album, ſiue purpureum, ſiue violaceum.*
White, Purple, or Violet coloured Stocke Gillo-floure.



‡ 2 *Leucoium flore multiplici.*
Double Stocke Gillo-floure.



[illegible]

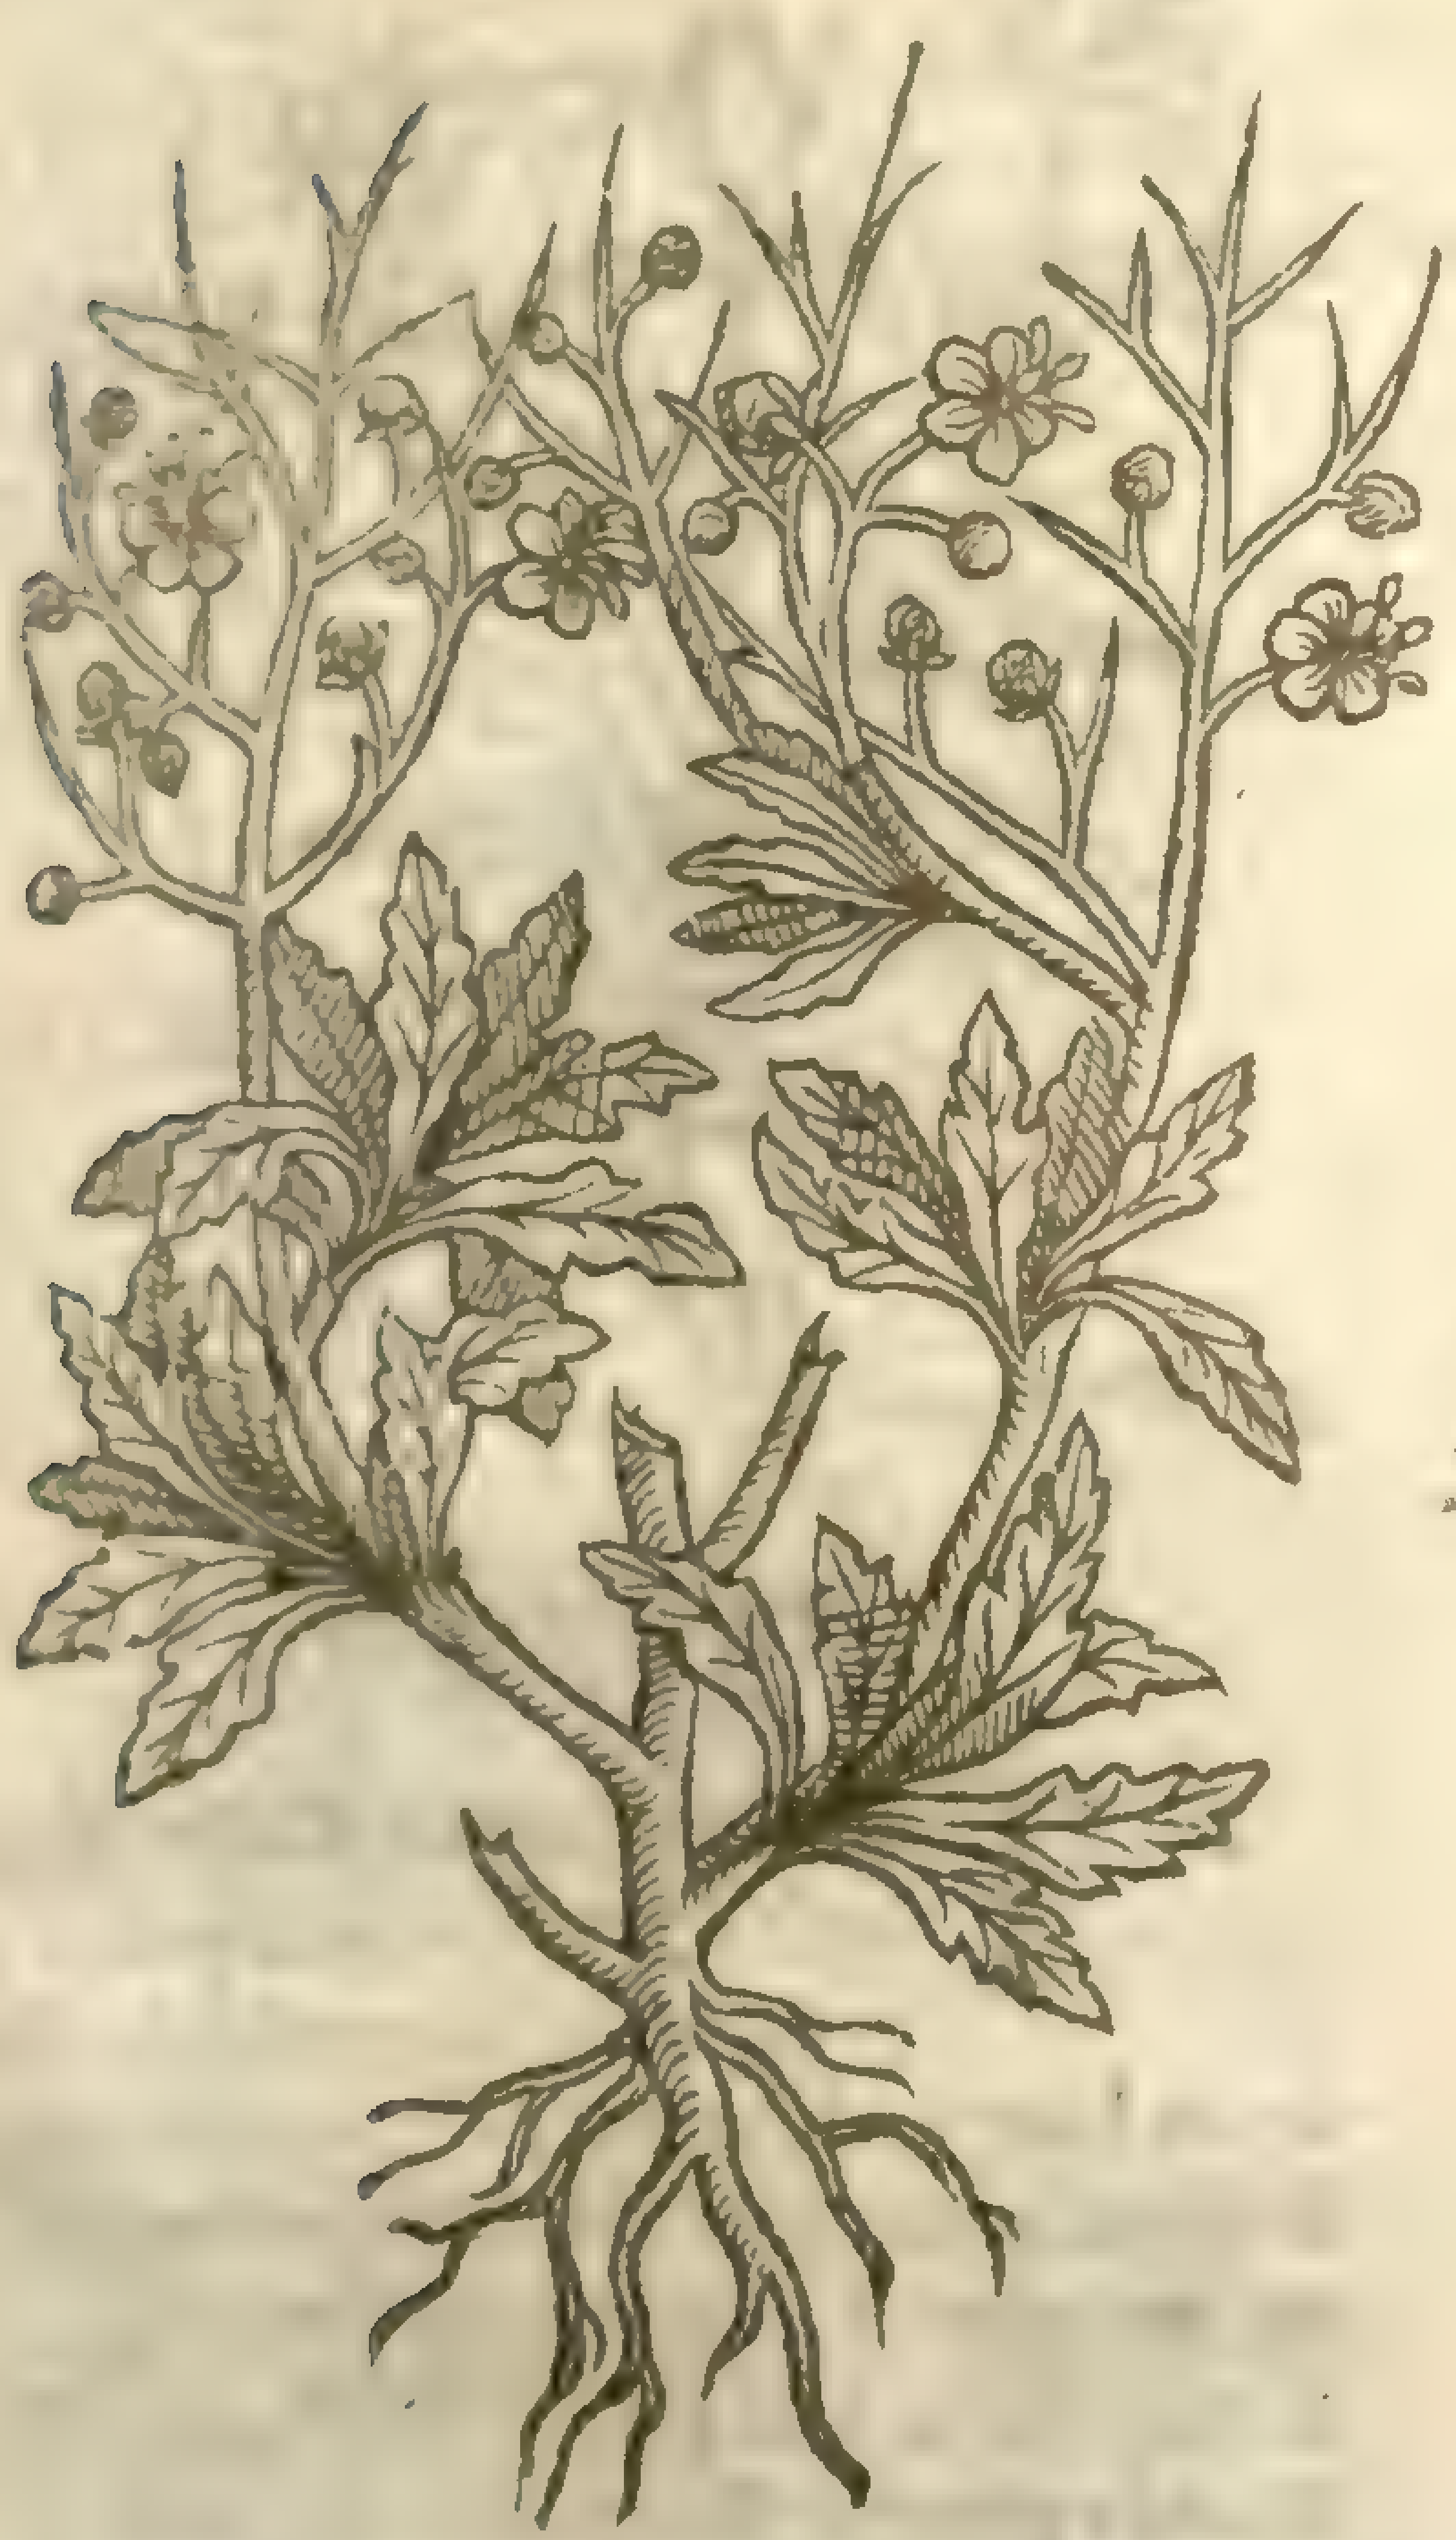
¶ *The Deſcription.*

1 The ſtalke of the great ſtocke Gillo-floure is two foot high or higher, round, and parted into diuers branches. The leaues are long, white, ſoft, and hauing vpon them as it were a downe like vnto the leaues of willow, but ſofter: the floures conſiſt of foure little leaues growing all along the vpper part of the branches, of a white colour, exceeding ſweet of ſmell: in their places come vp long and narrow cods, in which is contained broad, flat, and round ſeed. The root is of a wooddy ſubſtance, as is the ſtalke alſo.

The purple ſtocke Gillo-floure is like the precedent in each reſpect, ſauing that the floures of this plant are of a pleaſant purple colour, and the others white, which ſetteth forth the difference: of which kinde we haue ſome that beare double floures which are of diuers colours, greatly eſteemed for the beautie of the floures, and pleaſant ſweet ſmell.

This

3 *Leucoium ſpinoſum Creticum.*
Thorny Stocke Gillofloures.



This kinde of Stocke Gillo floure that beareth floures of the colour of a Violet, that is to ſay of a blew tending to a purple colour, which ſetteth forth the difference betweene this plant and the other ſtocke Gillofloures, in euery other reſpect is like the precedent.

‡ 2 There were formerly three figures of the ſingle Stockes, which differ in nothing but the colour of their floures; wherefore wee haue made them content with one, and haue giuen (which was formerly wanting) a figure of the double Stock, of which there are many and pretty varieties kept in the Garden of my kinde friend Maſter *Ralph Tuggye* at Weſtminſter, and ſet forth in the bookes of ſuch as purpoſely treat of floures and their varieties.

3 To theſe I thinke it not amiſſe to adde that plant which *Cluſius* hath ſet forth vnder the name of *Leucoium ſpinoſum Creticum*. It growes ſome foot or more high, bringing forth many ſtalkes which are of a grayiſh colour, and armed at the top with many and ſtrong thorny prickles: the leaues which adorne theſe ſtalkes are like thoſe of the ſtocke Gillouer, yet leſſe and ſomewhat hoary; the floures are like thoſe of Mulleine, of a whitiſh yellow colour, with ſome purple threds in their middles; the cods which ſucceed the floures are ſmall and round, containing a little ſeed in them. They vſe, ſaith *Honorius Bellus*, to heat ouens therewith in Candy, where it plentifully growes; and by reaſon of the ſimilitude which the prickles hereof haue with *Stœbe* and the white colour, they call it *Gala Stivida*, or *Galaſtividi*, and not becauſe it yeelds milke, which *Gala* ſignifies. ‡

¶ *The Place.*

1 2 Theſe kindes of Stocke Gillofloures do grow in moſt Gardens throughout England.

¶ *The Time.*

They floure in the beginning of the Spring, and continue flouring all the Summer long.

¶ *The Names.*

The Stocke Gillofloure is called in Greeke, λευκόιον: in Latine, *Viola alba*: in Italian, *Viola bianca*: in Spaniſh, *Violetta blanquas*: in Engliſh, Stocke Gillofloure, Garnſey Violet, and Caſtle Gillofloure.

¶ *The Temperature and Vertues.*

A They are referred vnto the Wal-floure, although in vertue much inferiour; yet are they not vſed in Phyſicke, except amongſt certaine Empericks and Quackſaluers, about loue and luſt matters, which for modeſtie I omit.

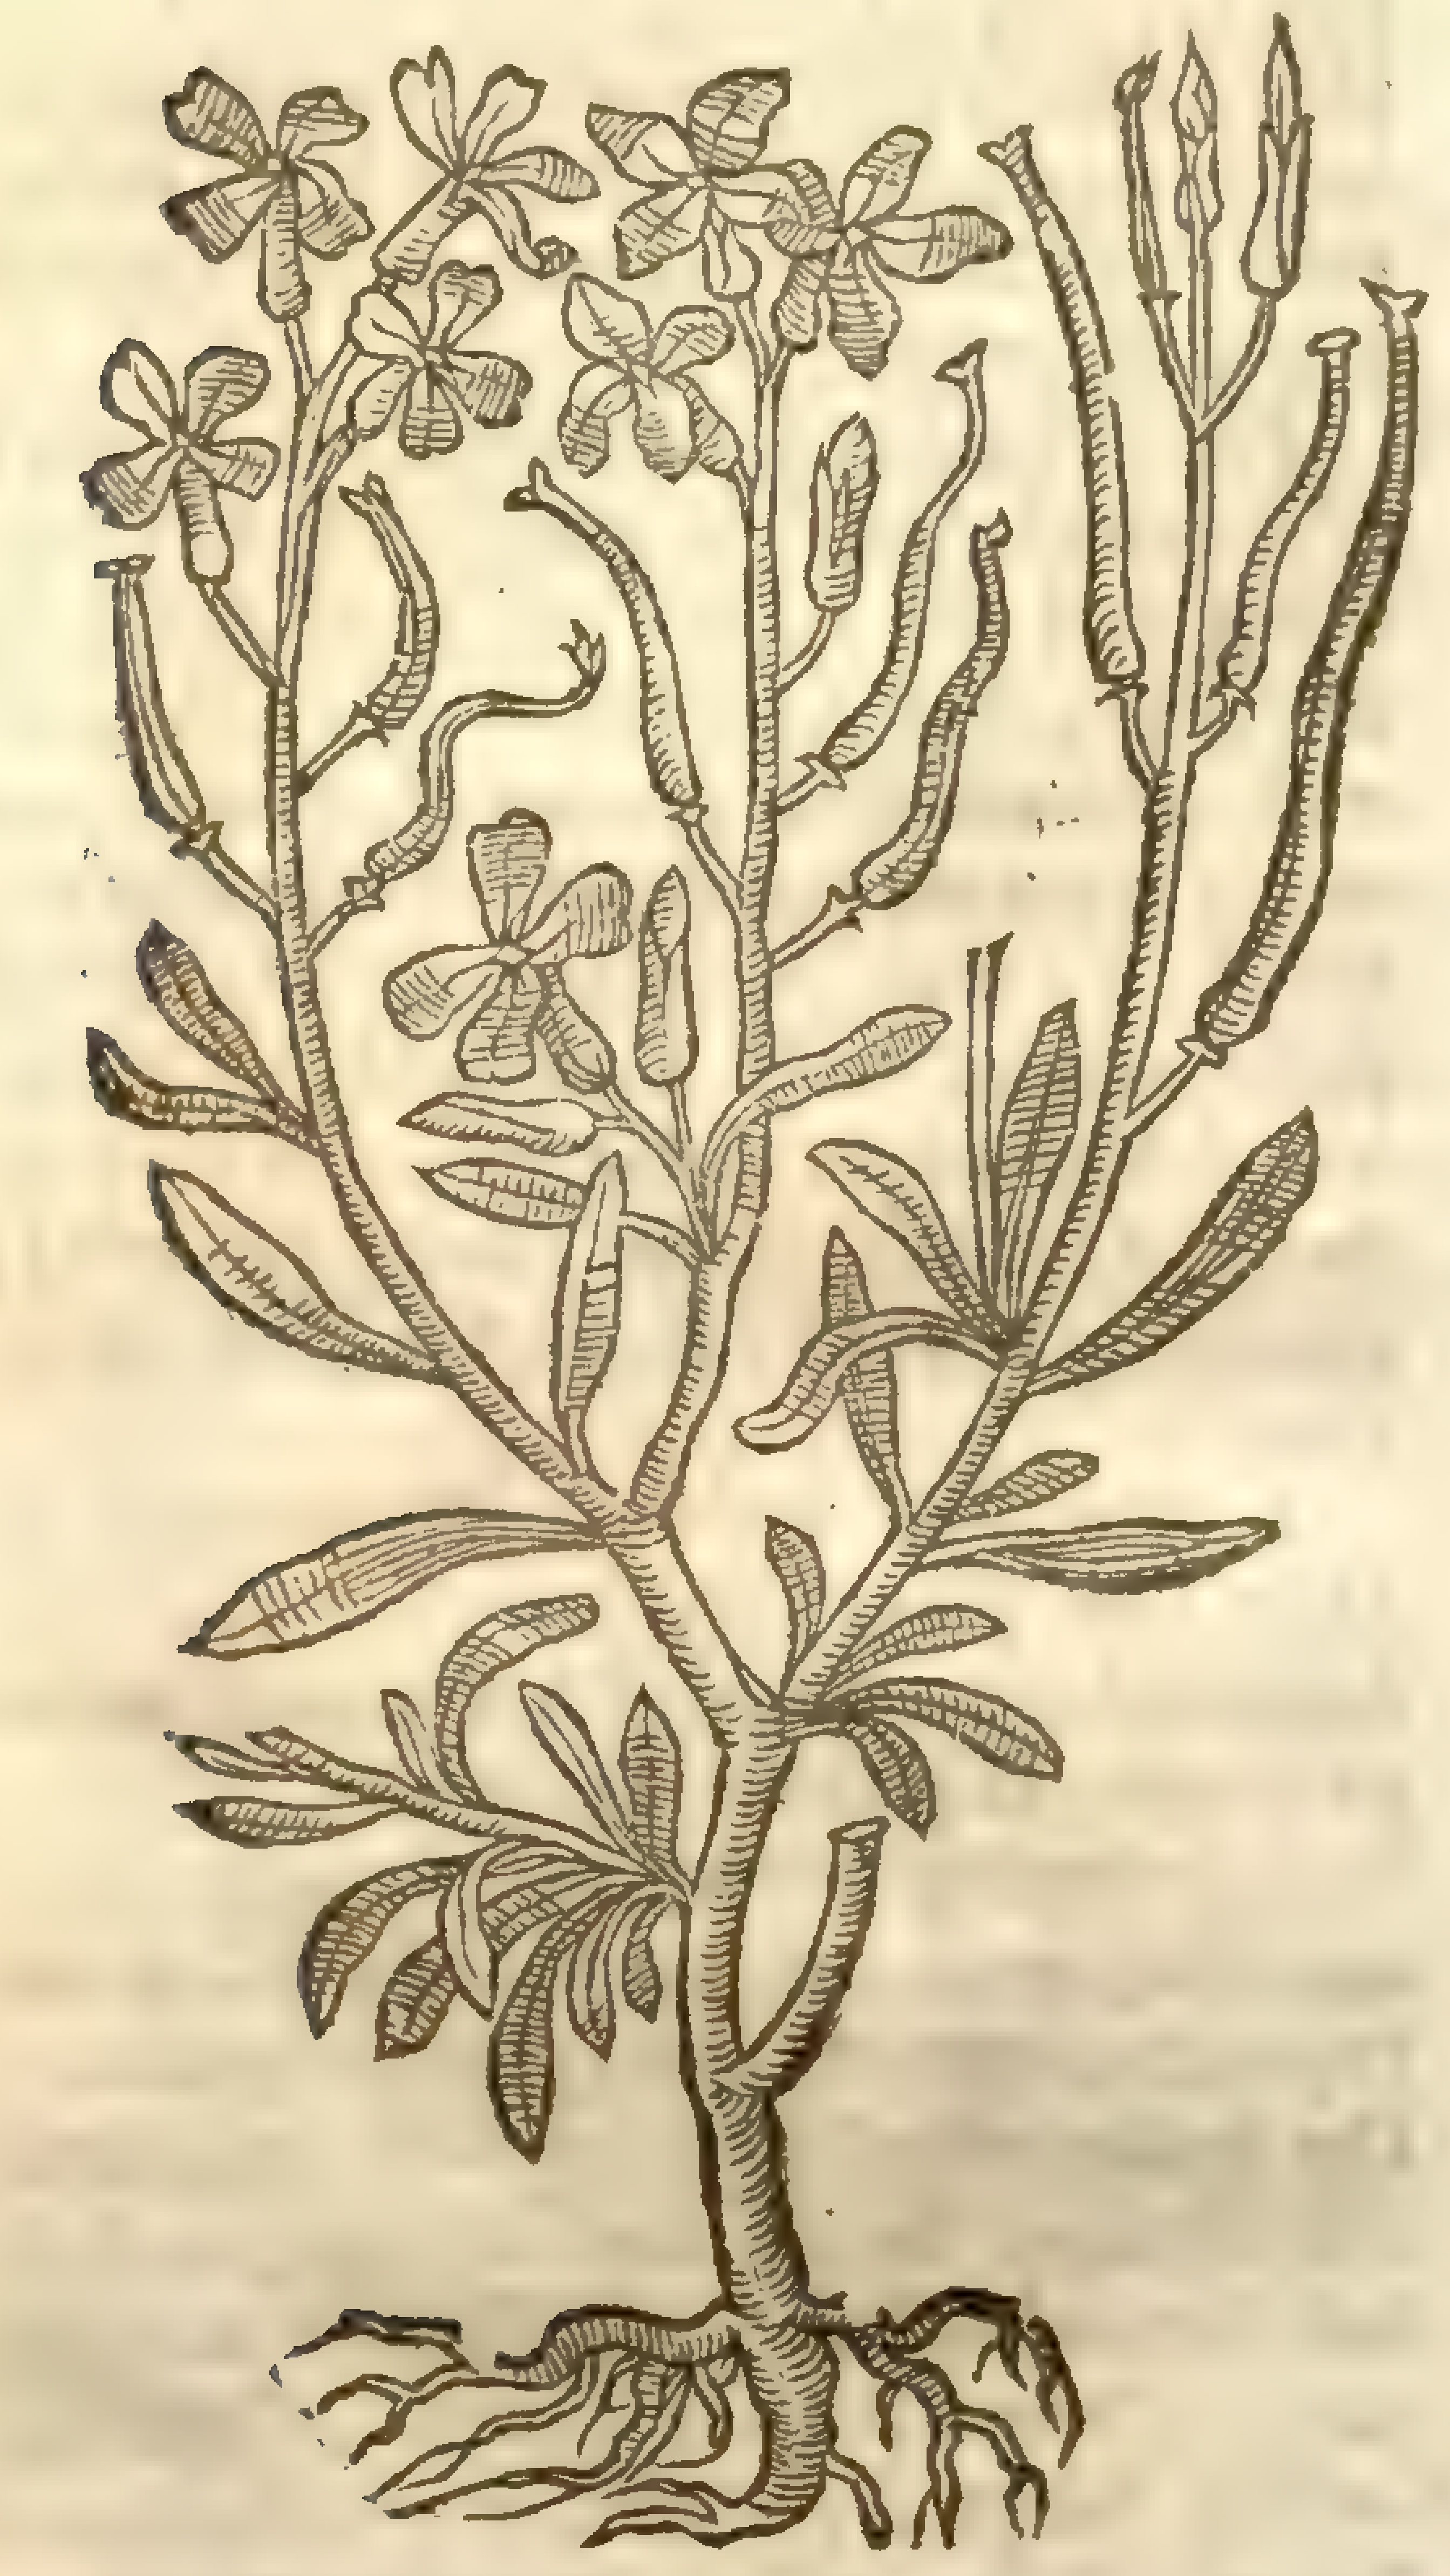
B *Ioachimus Camerarius* reporteth, that a conſerue made of the floures of Stocke Gillofloure, and often giuen with the diſtilled water thereof, preſerueth from the Apoplexie, and helpeth the palſie.

CHAP. 121. *Of Sea Stocke Gillo-floures.*

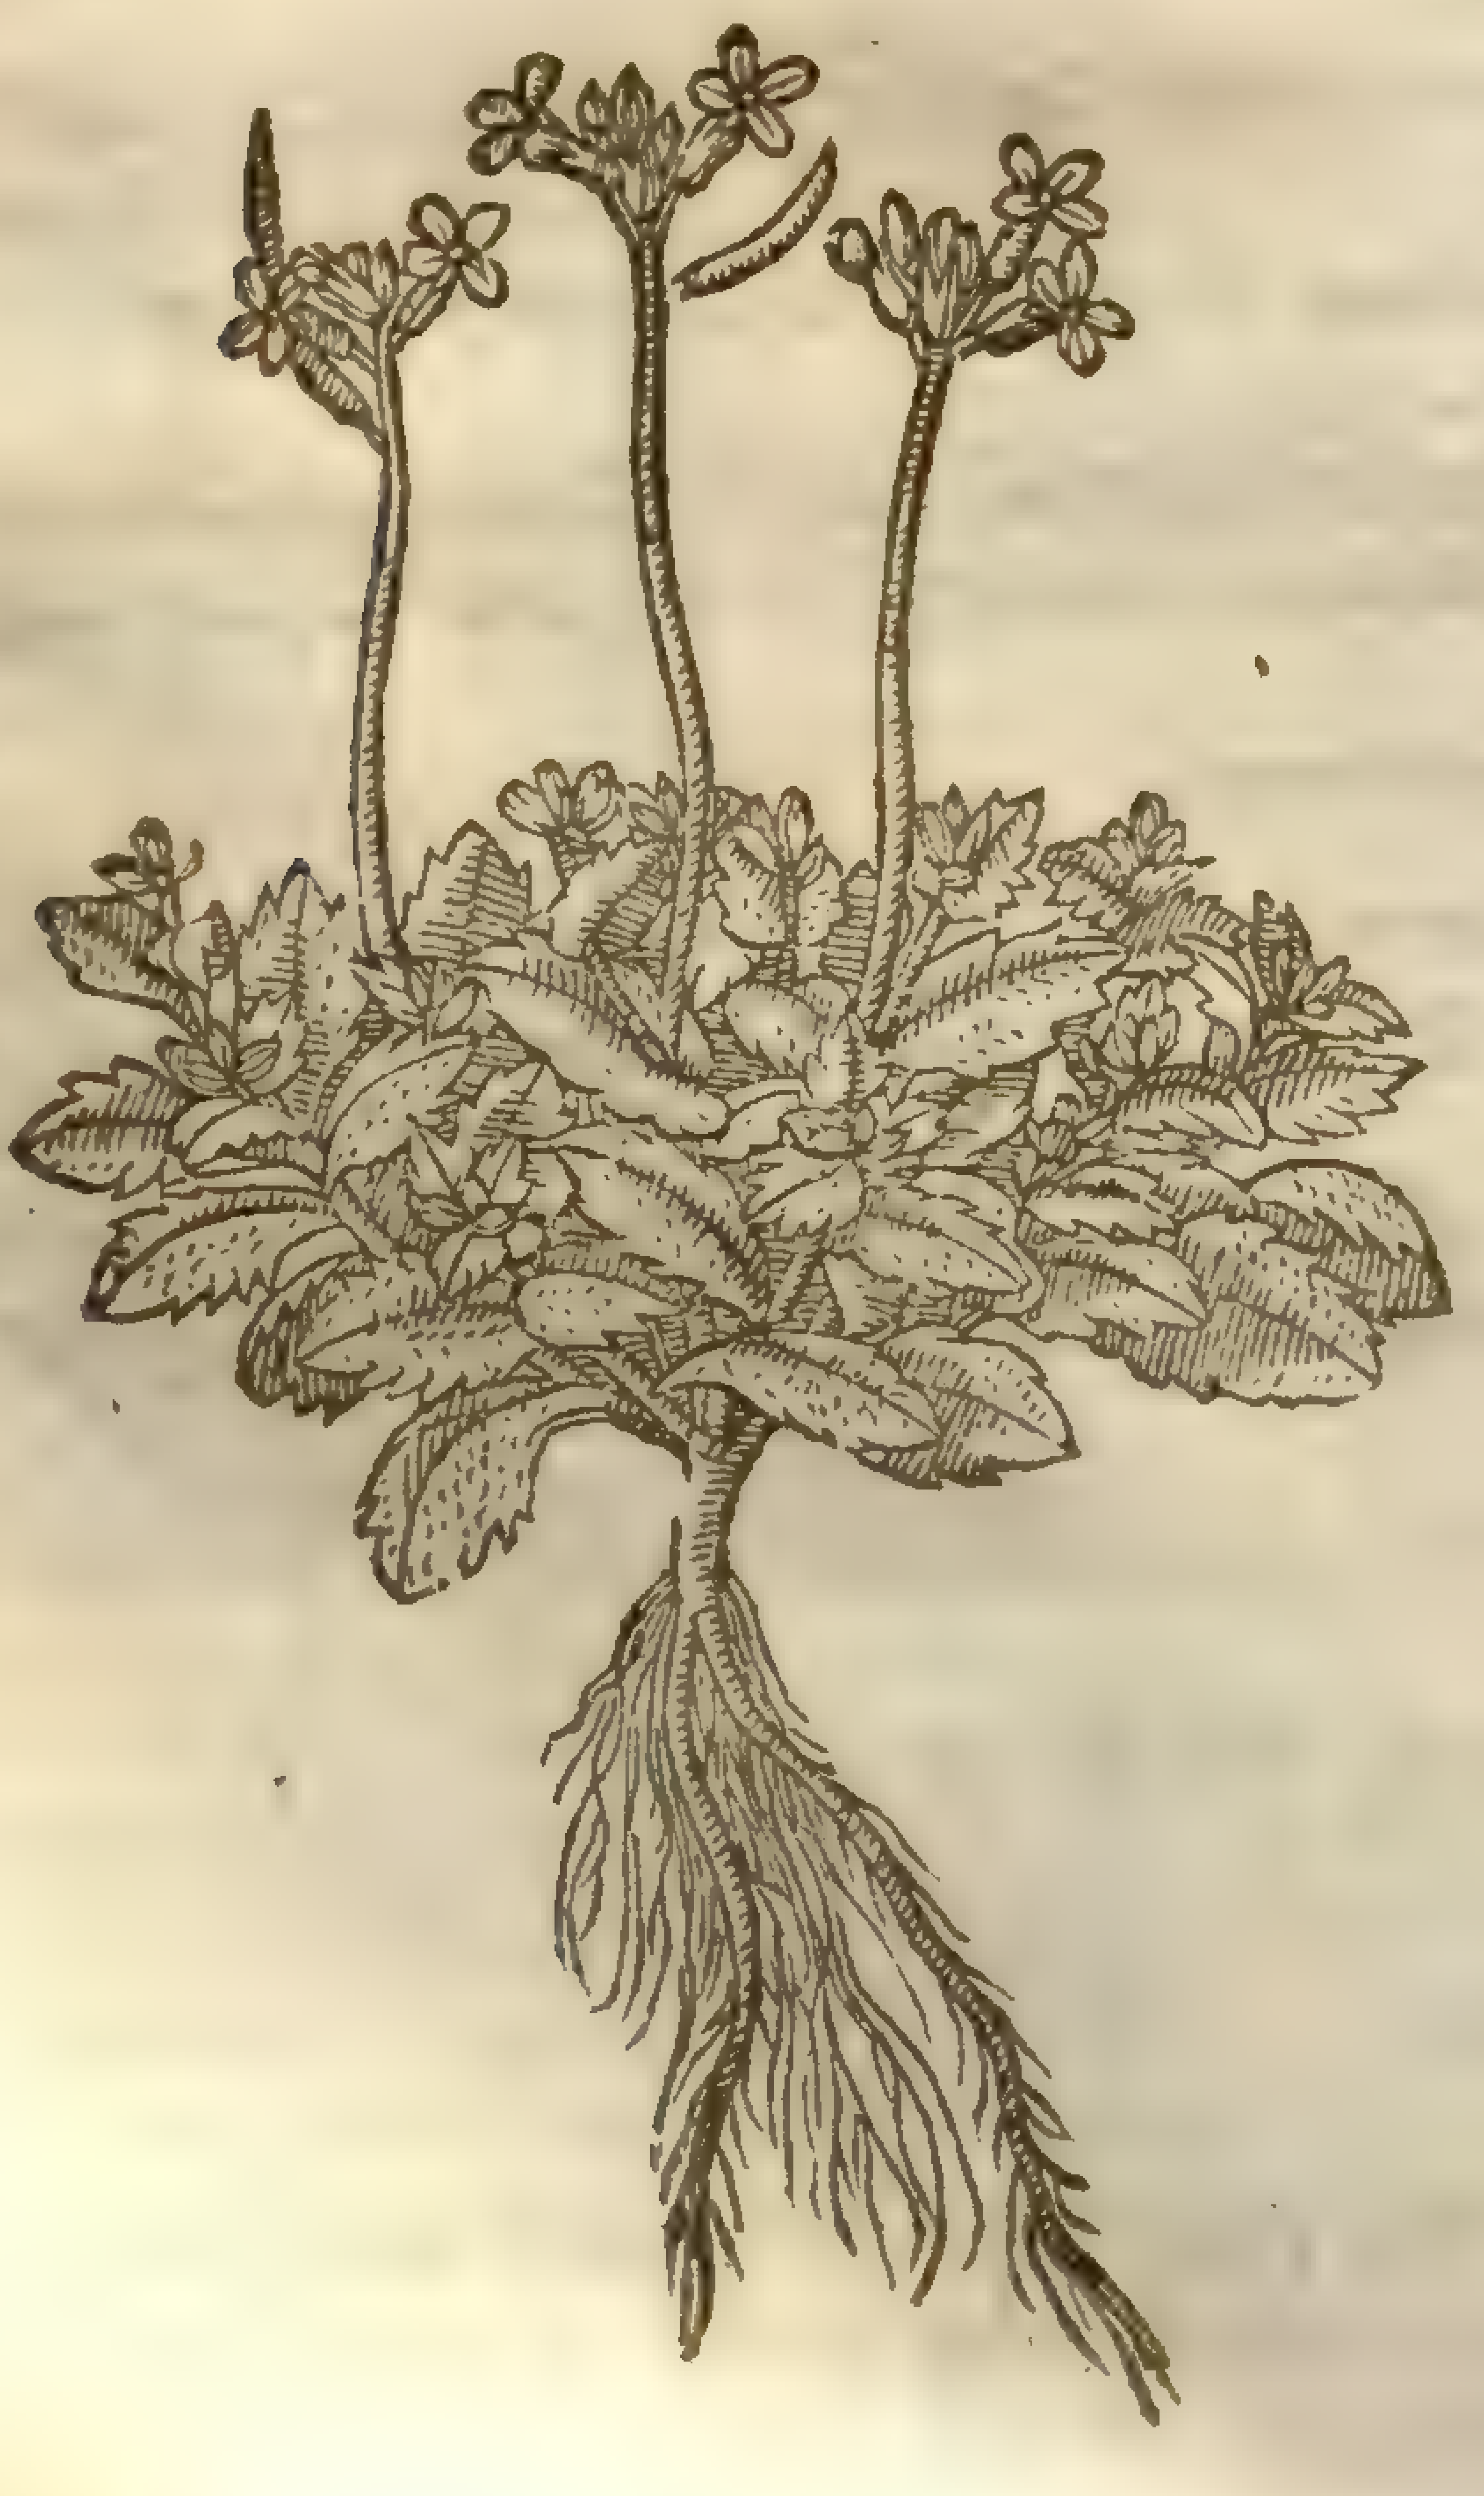
¶ *The Kindes.*

OF Stocke Gillo-floures that grow neere vnto the Sea there bee diuers and ſundry ſorts, differing as well in leaues as floures, which ſhall bee comprehended in this Chapter next following.

1 *Leucoium marinum flore candido Lobelij.*
White Sea Stocke Gillo-floures.

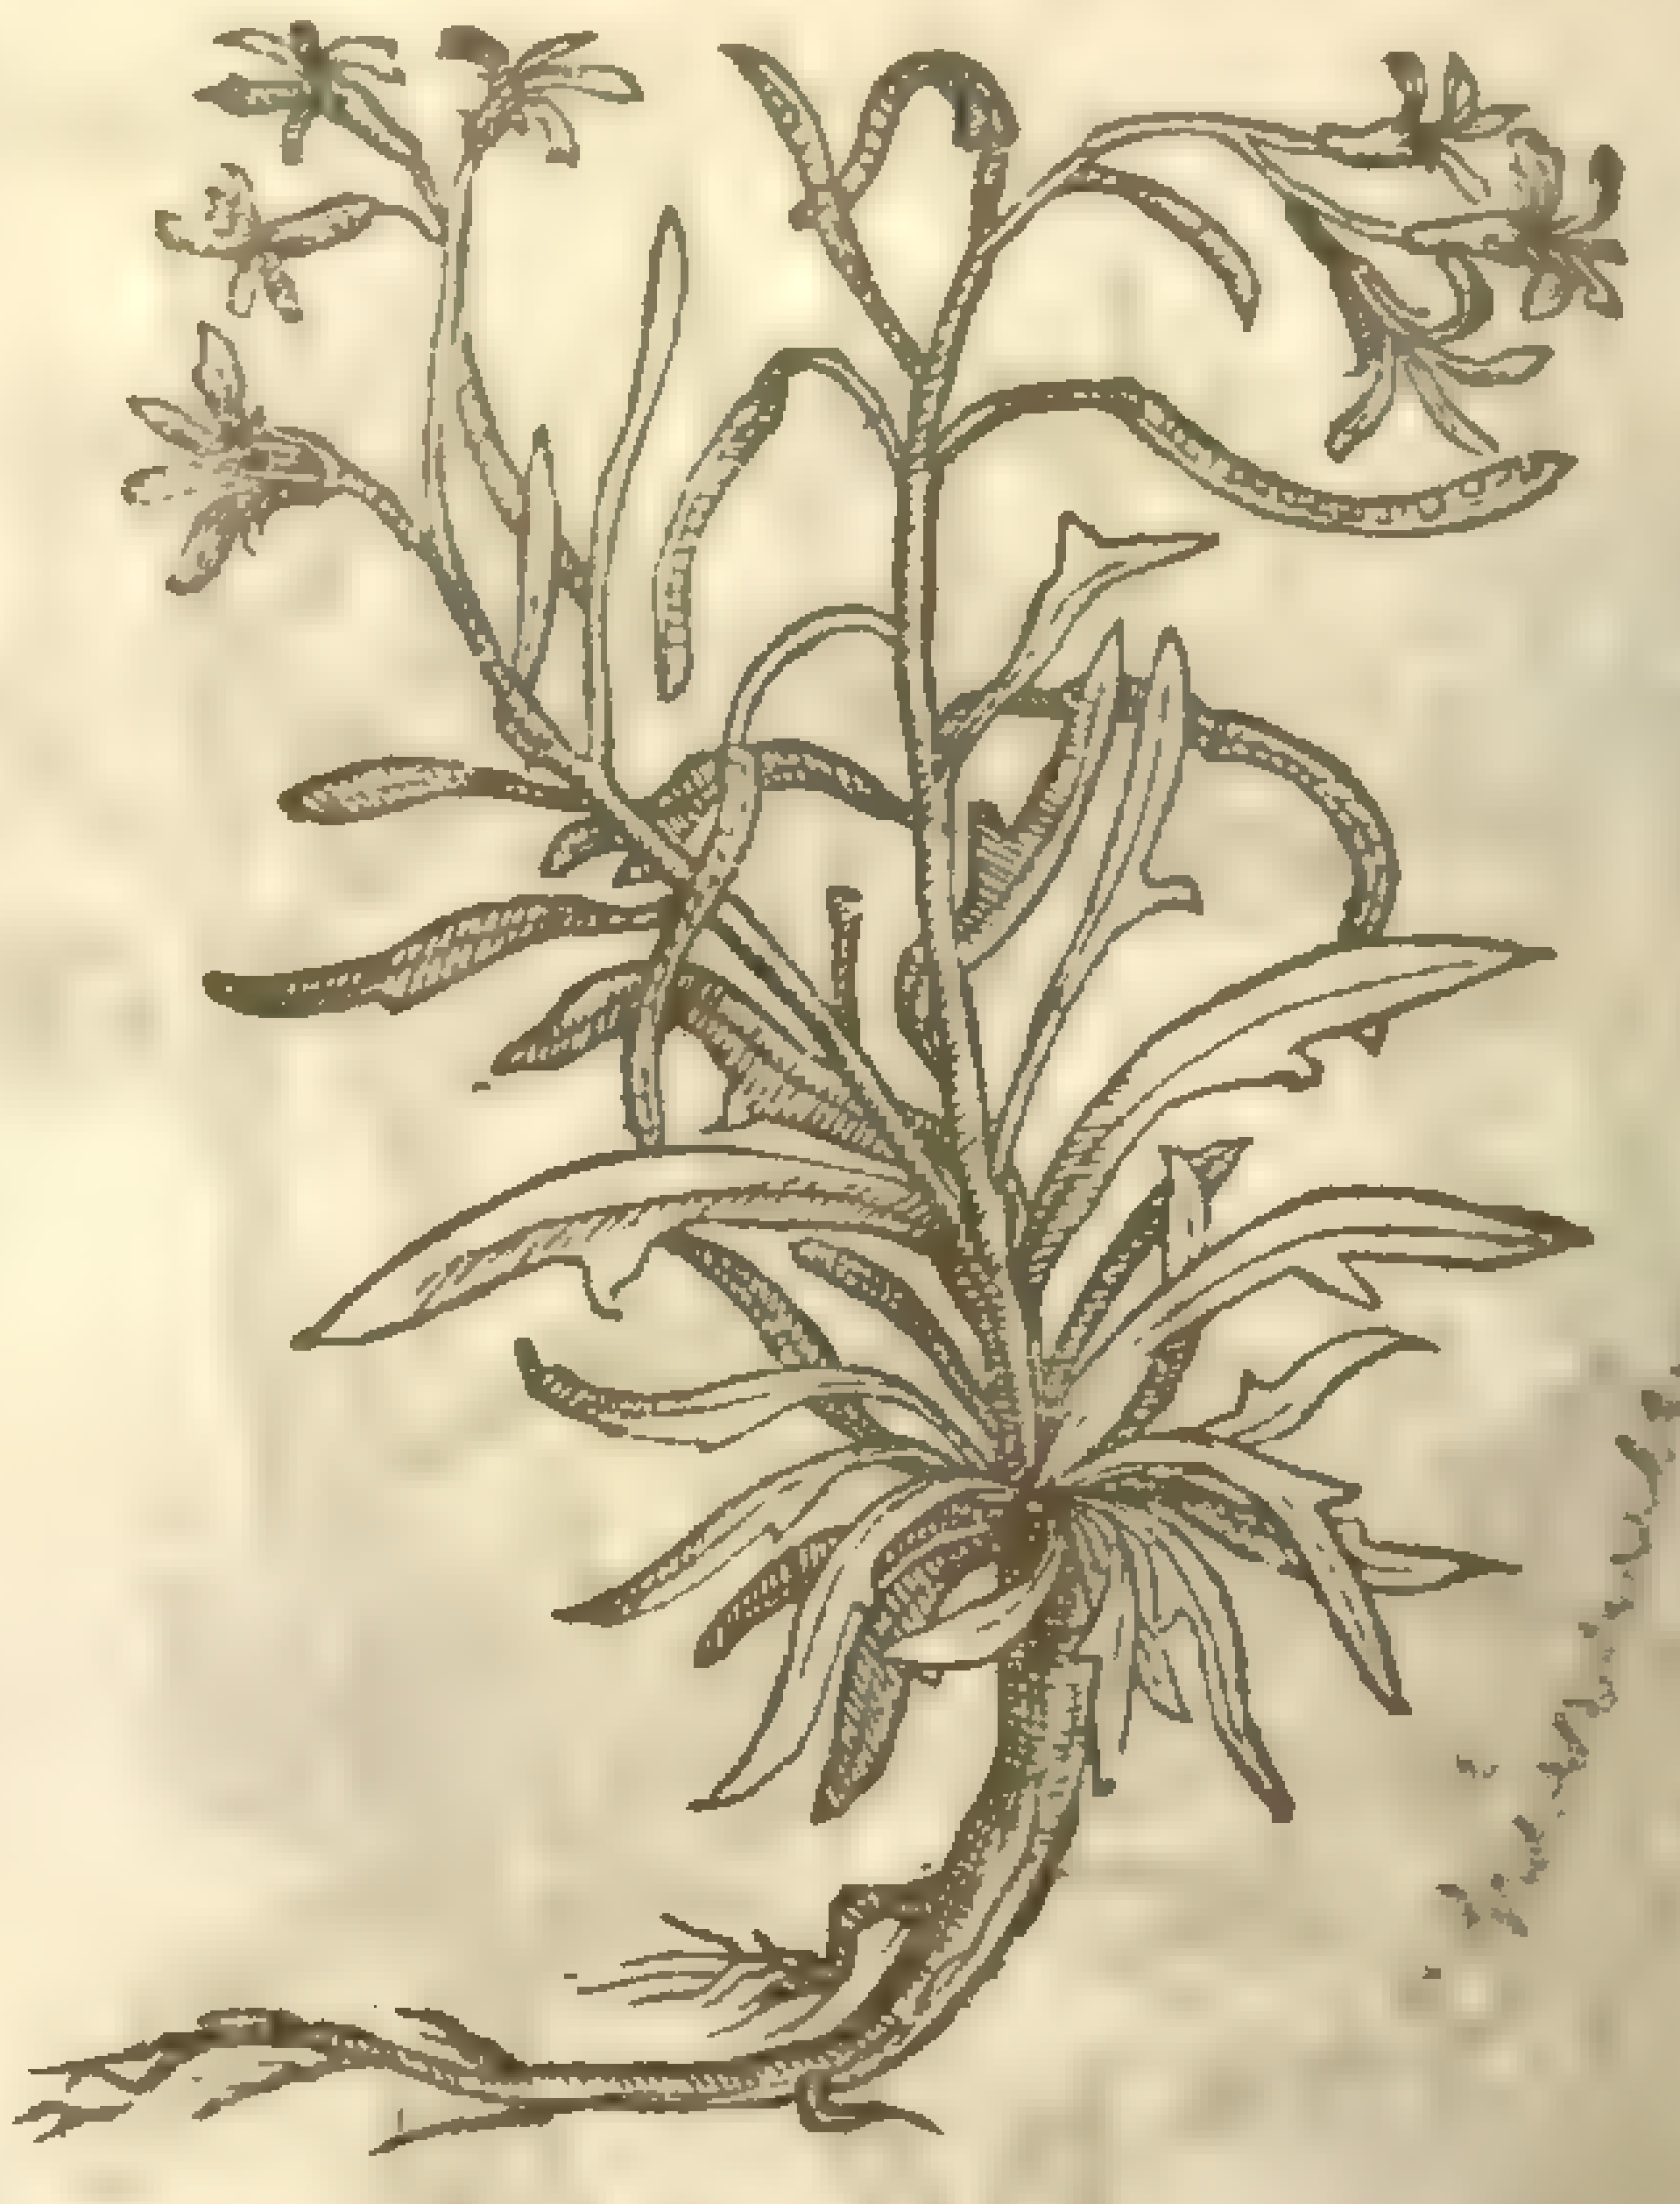


3 *Leucoium marinum latifolium.*
Broad leafed Sea Stocke Gillo-floure.



Heſperis verna, mihi, dub.

2 *Leucoium marinum purpureum Lobelij.*
Purple Sea Stocke Gillo-floures.



Heſperis Dunenſis mihi dub.

¶ *The Deſcription.*

1 The Sea Stocke Gillo-floure hath a ſmall wooddy root very threddy; from which riſeth vp an hoary white ſtalk of two foot high, diuided into diuers ſmall branches, wheron are placed confuſedly many narrow leaues of a ſoft hoary ſubſtance. The floures grow at the top of the branches, of a whitiſh colour, made of foure little leaues; which beeing paſt there follow long cods and ſeed, like vnto the Garden ſtocke Gillo-floure.

‡ 2 The purple ſtocke Gilloflowre hath a very long tough root, thruſting it ſelfe deepe into the ground; from which riſe vp thicke, fat, ſoft, and hoarie ſtalkes. The leaues come forth of the ſtalkes next the ground, long, ſoft, thicke, full of iuice, couered ouer with a certaine downy hoarineſſe, and ſinuated ſomewhat deepe on both ſides, after the manner you may ſee expreſt in the figure of the fourth deſcribed in this Chapter. The ſtalke is ſet here and there with the like leaues, but leſſer. The floures grow at the top of the ſtalkes, compact of foure ſmall leaues, of a light purple colour. The ſeed is contained in long crooked cods like the garden ſtocke Gillo-floure.

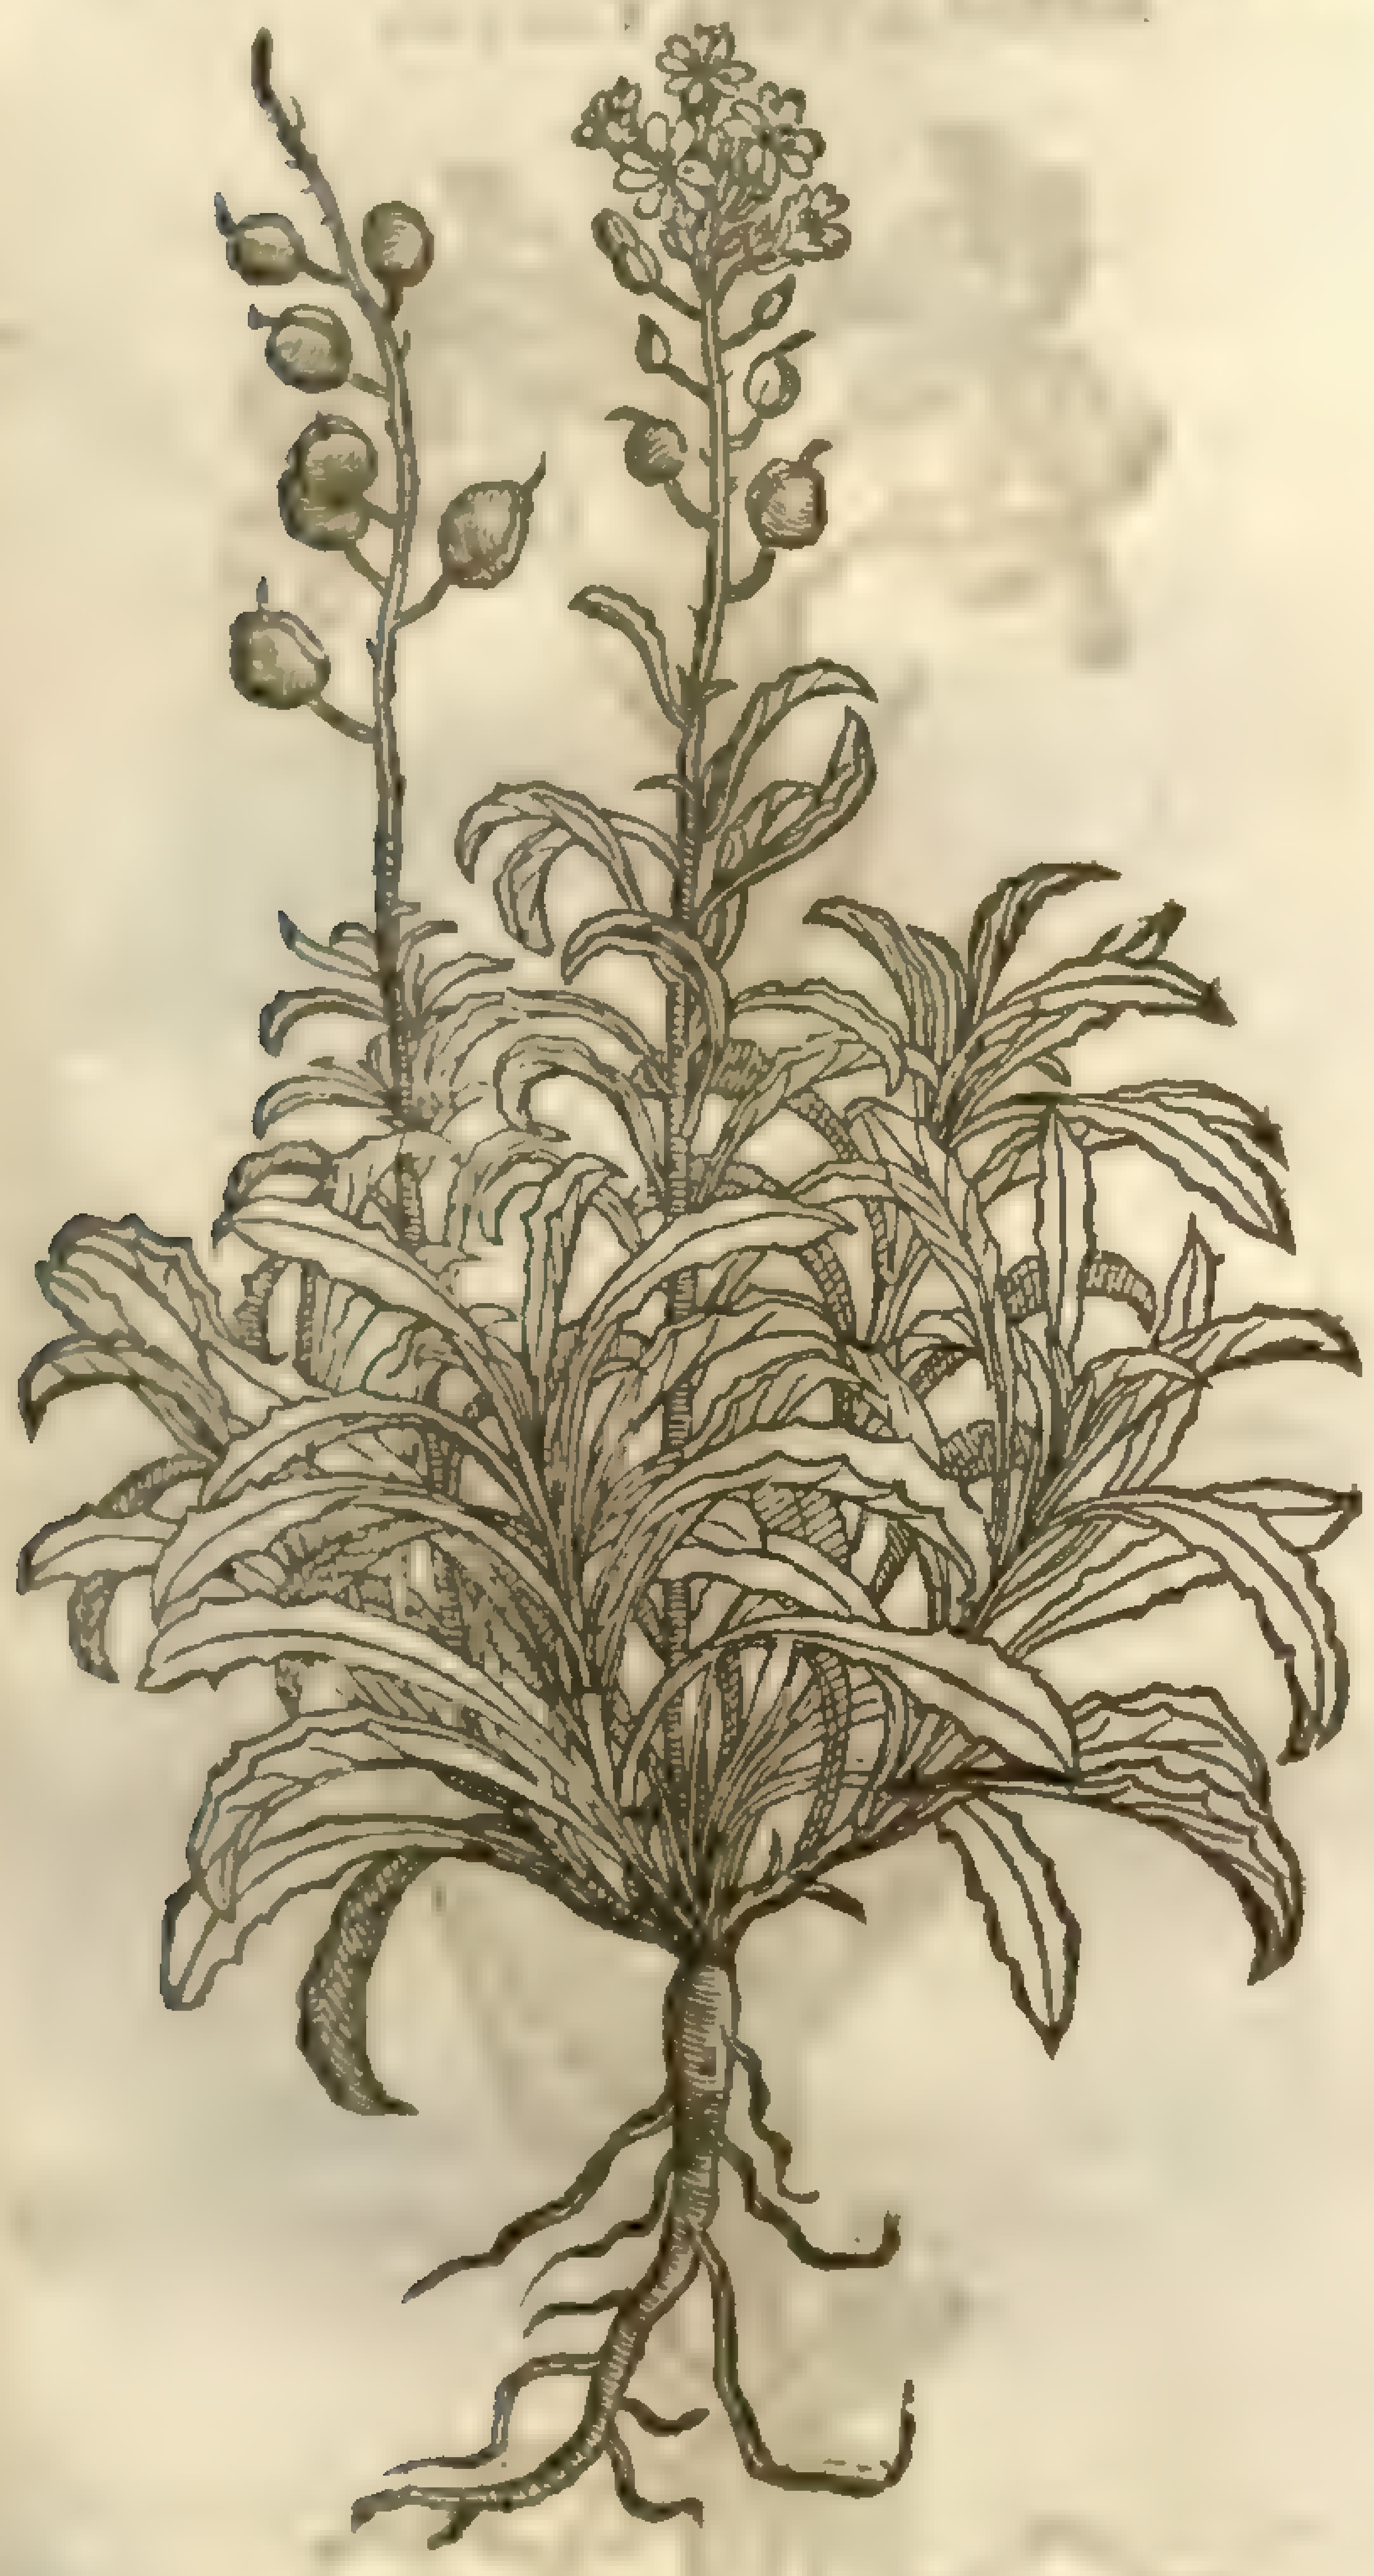
The figure of *Lobels* which here we giue you was taken of a dried plant, and therefore the leaues are not expreſt ſo ſinuate as they ſhould be. ‡

3 This ſea ſtock Gillofloure hath many broad leaues ſpred vpon the ground, ſomwhat ſnipt or cut on the edges; amongſt which riſe vp ſmal naked ſtalkes, bearing at the top many little floures of a blew colour tending to a purple. The ſeed is in long cods like the others of his kinde.

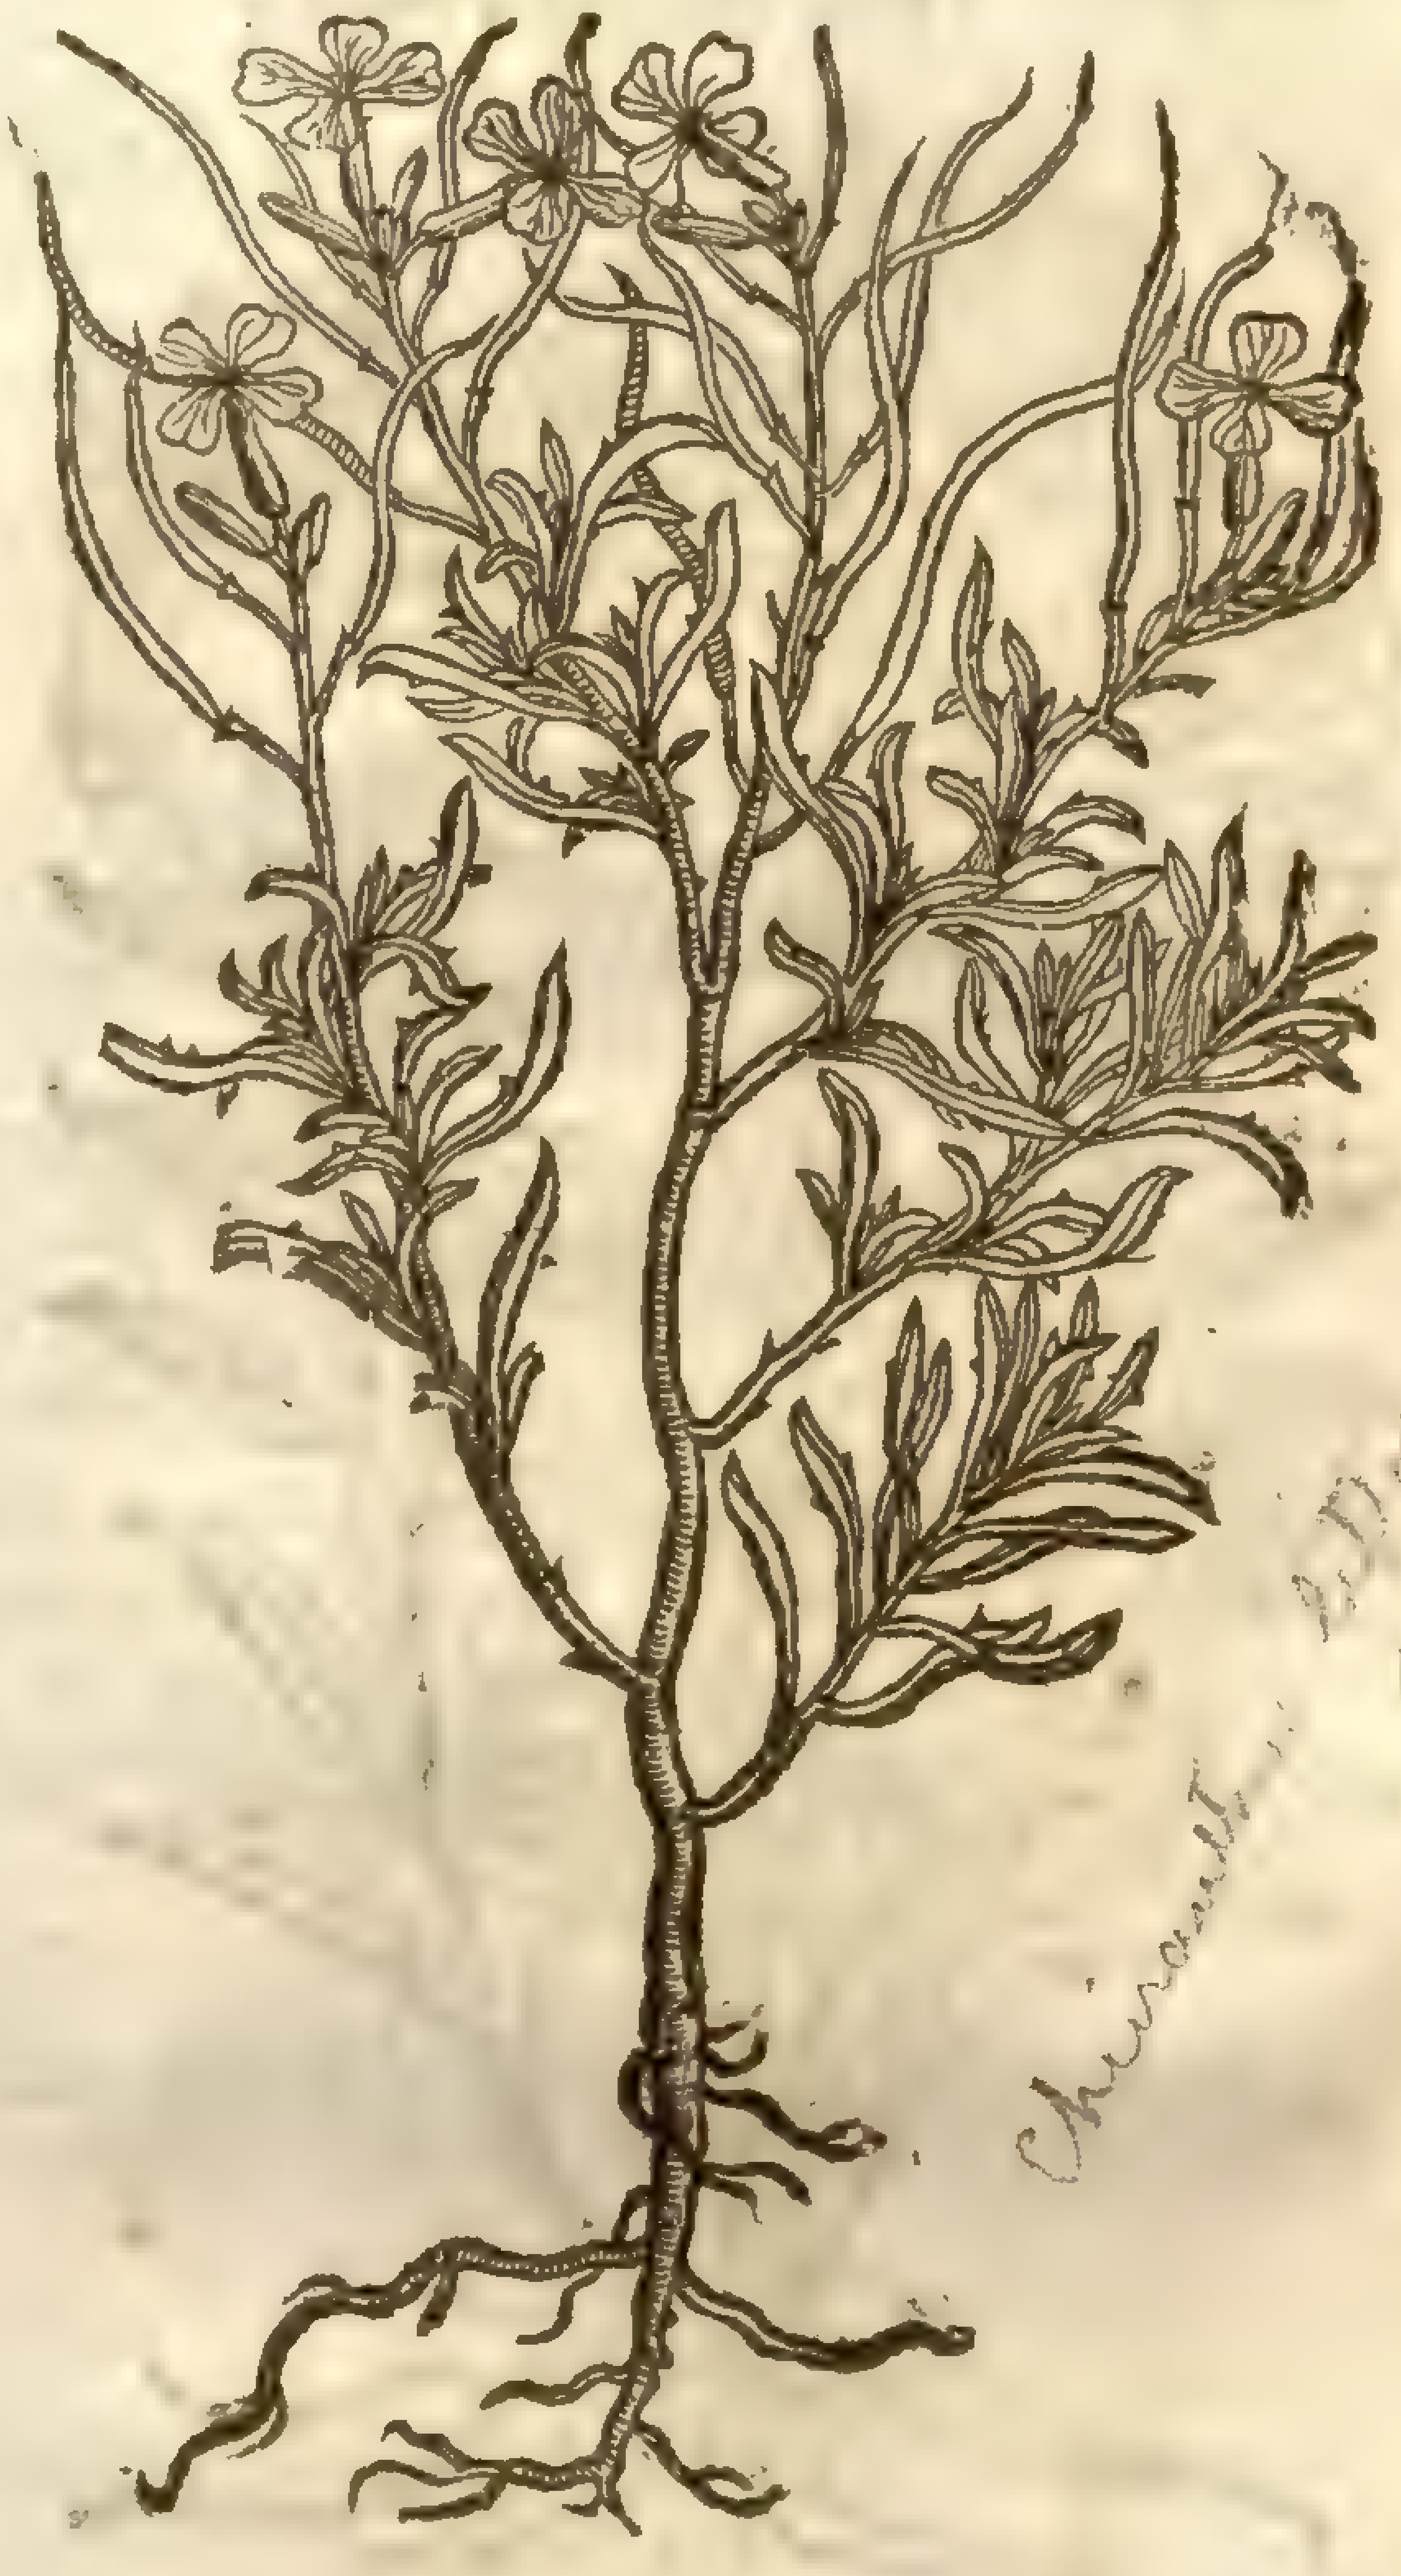
4 The great ſea ſtocke Gilloflouꝛe hath many broad leaues growing in a great tuft, ſleightly indented about the edges. The floures grow at the top of the ſtalks, of a gold yellow colour. The root is ſmall and ſingle.

5 The ſmall yellow ſea ſtock Gilloflouꝛe hath many ſmooth hoary and long leaues ſet vpon a branched ſtalk; on the top whereof grow pretty ſweet ſmelling yellow floures, bringing his ſeed in little long cods. The root is ſmall and threddy. ‡ The floures of this are ſometimes of a red or purpliſh colour.

4 *Leucoium marinum luteum maius Cluſij & Lobelij.*
The yellow ſea ſtock Gilloflouꝛe.



5 *Leucoium marinum minus Lobel. & Cluſ.*
Small yellow ſea ſtock Gilloflouꝛe.



Cheiranthus [illegible]

¶ *The Place.*

Theſe Plants grow neere vnto the ſea ſide about Colcheſter, in the Iſle of Man, neere Preſton in Aunderneſſe, and about Weſtcheſter.

‡ I haue not heard of any of theſe wild on our Coaſts but onely the ſecond, which it may be groweth in theſe places here ſet downe; for it was gathered by Mr *George Bowles* vpon the rocks at Aberdovye in Merioneth ſhire. ‡

¶ *The Time.*

They flouriſh from Aprill to the end of Auguſt.

¶ *The Names.*

There is little to be ſaid as touching the names, more than hath beene touched in their ſeuerall titles.

¶ *The Nature and Vertues.*

There is no vſe of theſe in phyſicke, but they are eſteemed for the beauty of their floures.

CHAP. 122. *Of Dames Violets or Queens Gilloflouꝛes.*

¶ *The Deſcription.*

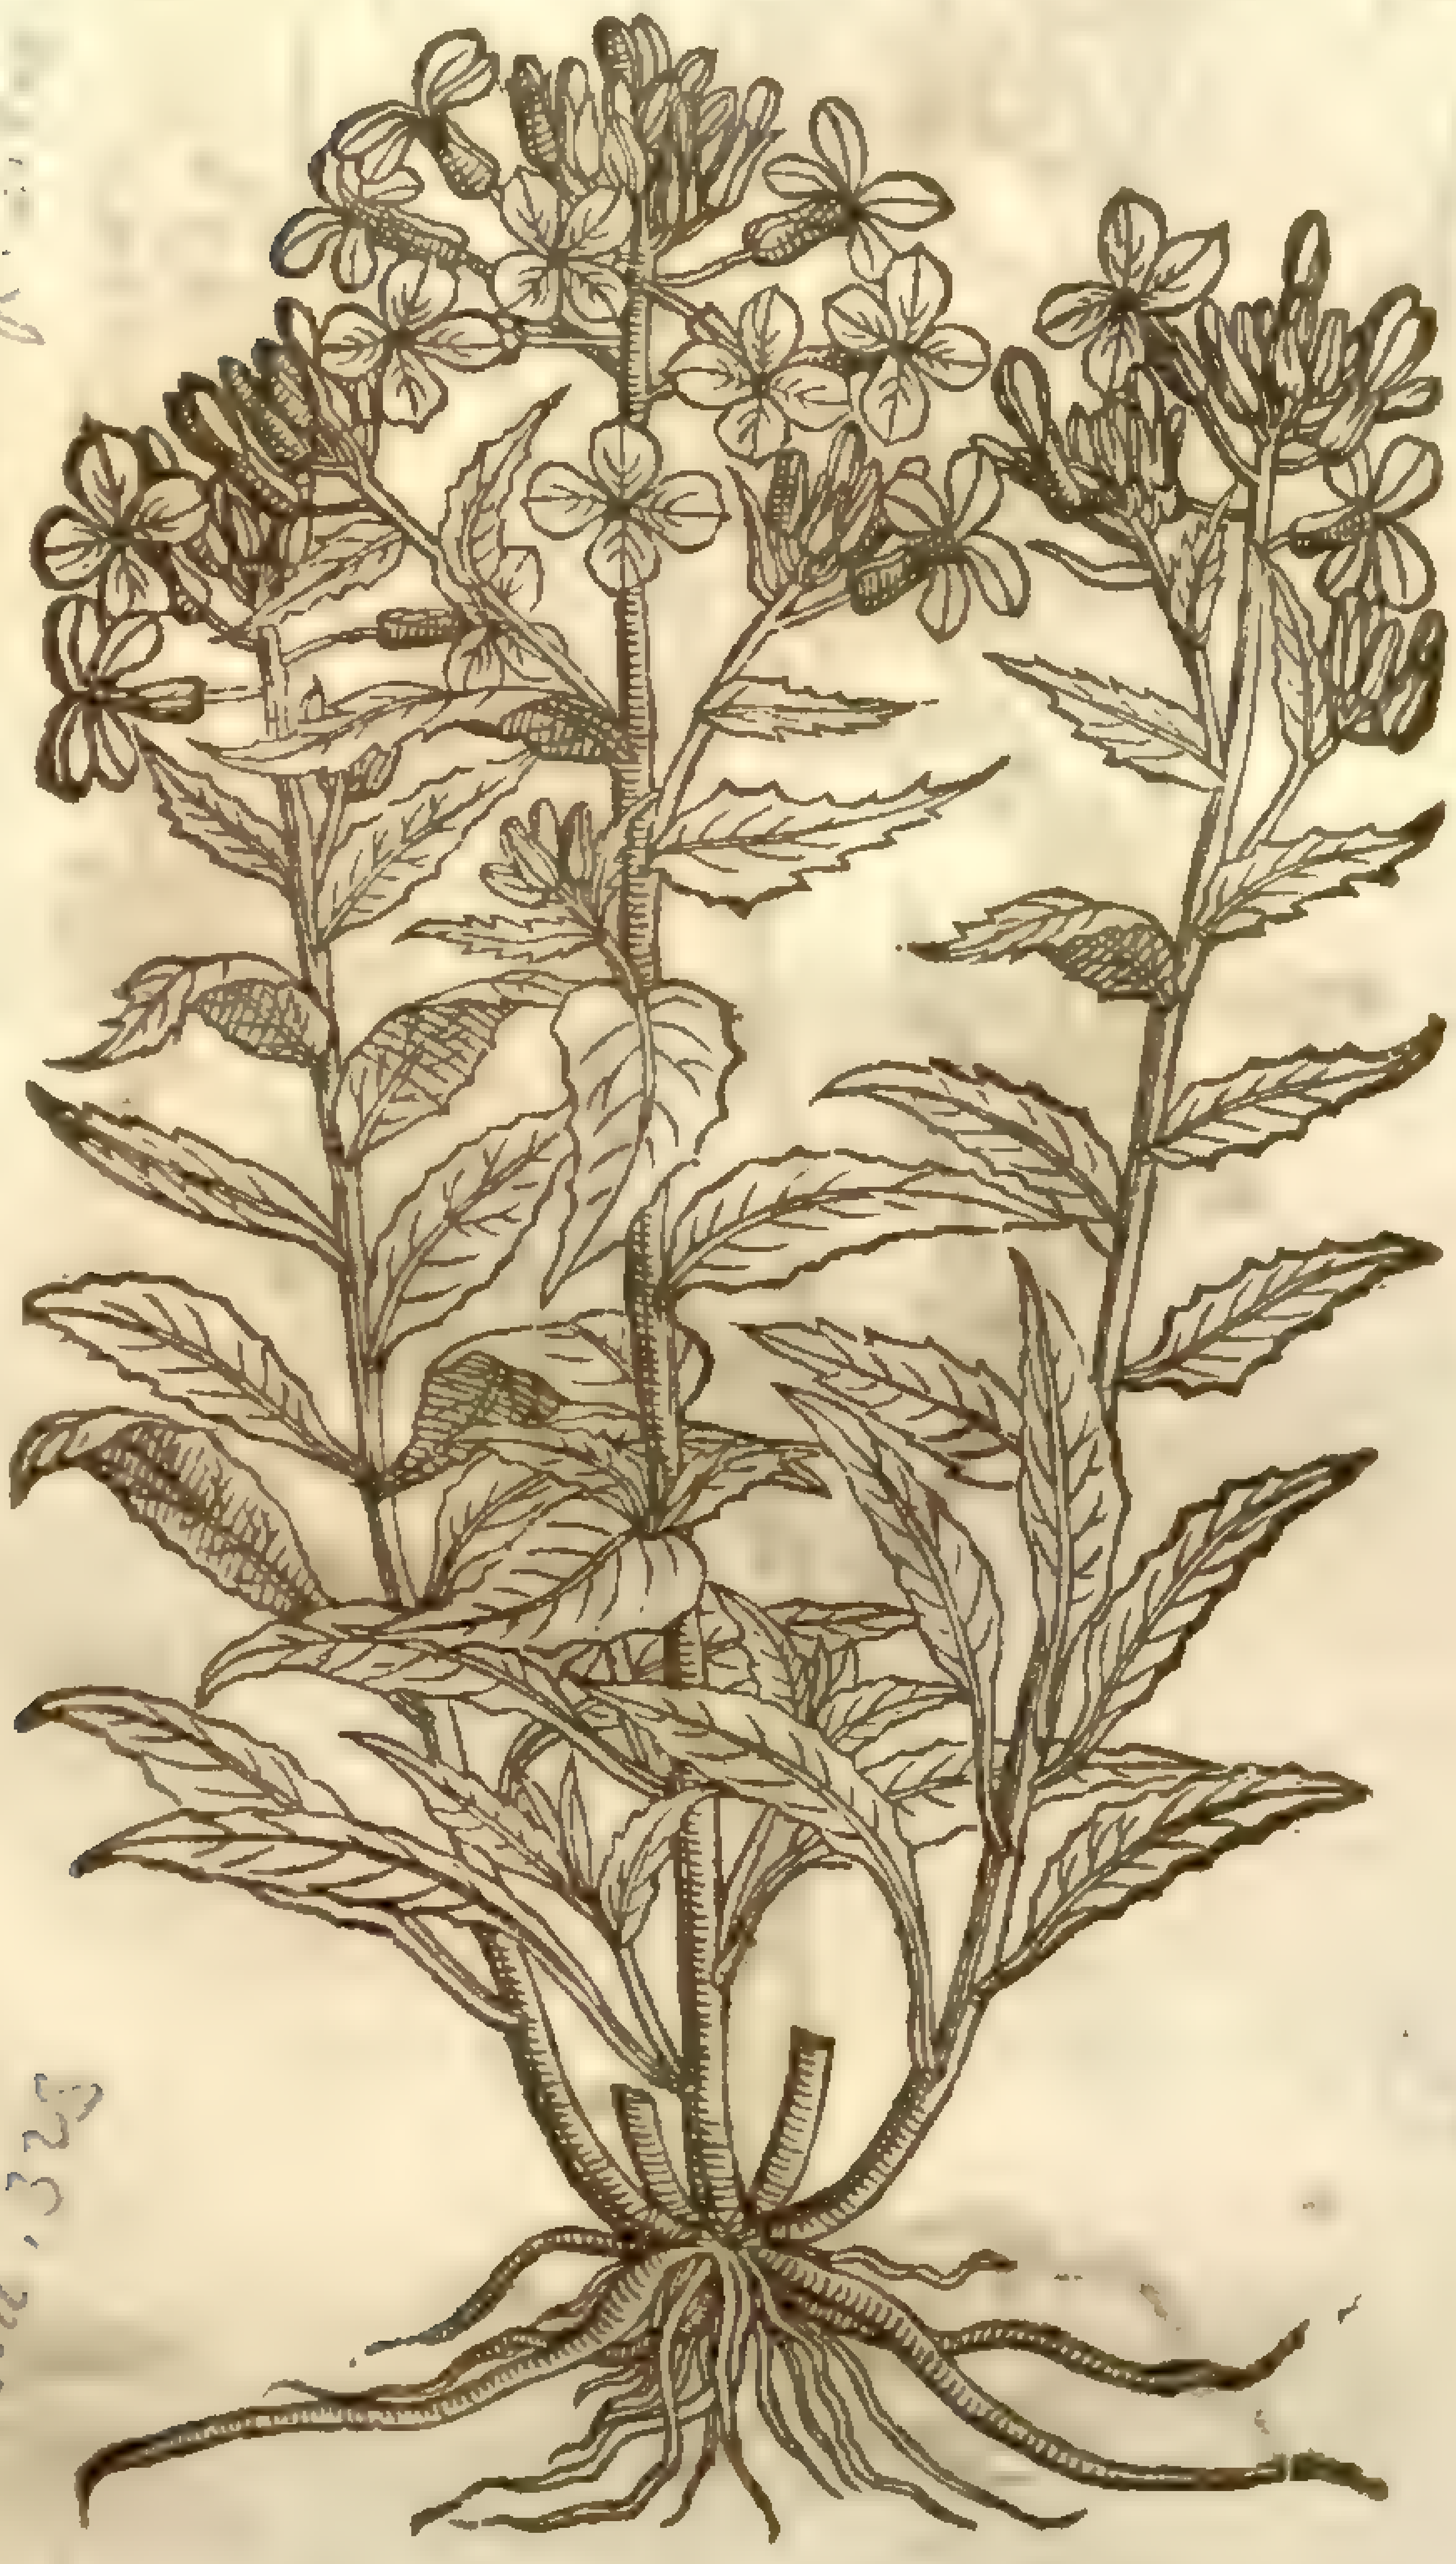
1 DAmes Violets or Queenes Gilloflouꝛes haue great large leaues of a darke green colour, ſomewhat ſnipt about the edges; among which ſpring vp ſtalks of the height of two

cubits, ſet with ſuch like leaues: the floures come forth at the tops of the branches, of a faire purple colour, very like thoſe of the ſtock Gillofloures, of a very ſweet ſmell; after which come vp long cods, wherein is contained ſmall long blackiſh ſeed. The root is ſlender and threddy.

The Queens white Gillofloures are like the laſt mentioned, ſauing that this plant brings forth faire white floures, and the other purple.

‡ 2 By the induſtry of ſome of our Floriſts, within theſe two or three years hath bin brought vnto our knowledge a very beautifull kind of theſe Dame Violets, hauing very faire double white floures: the leaues, ſtalks, and roots are like to the other plants before deſcribed. ‡

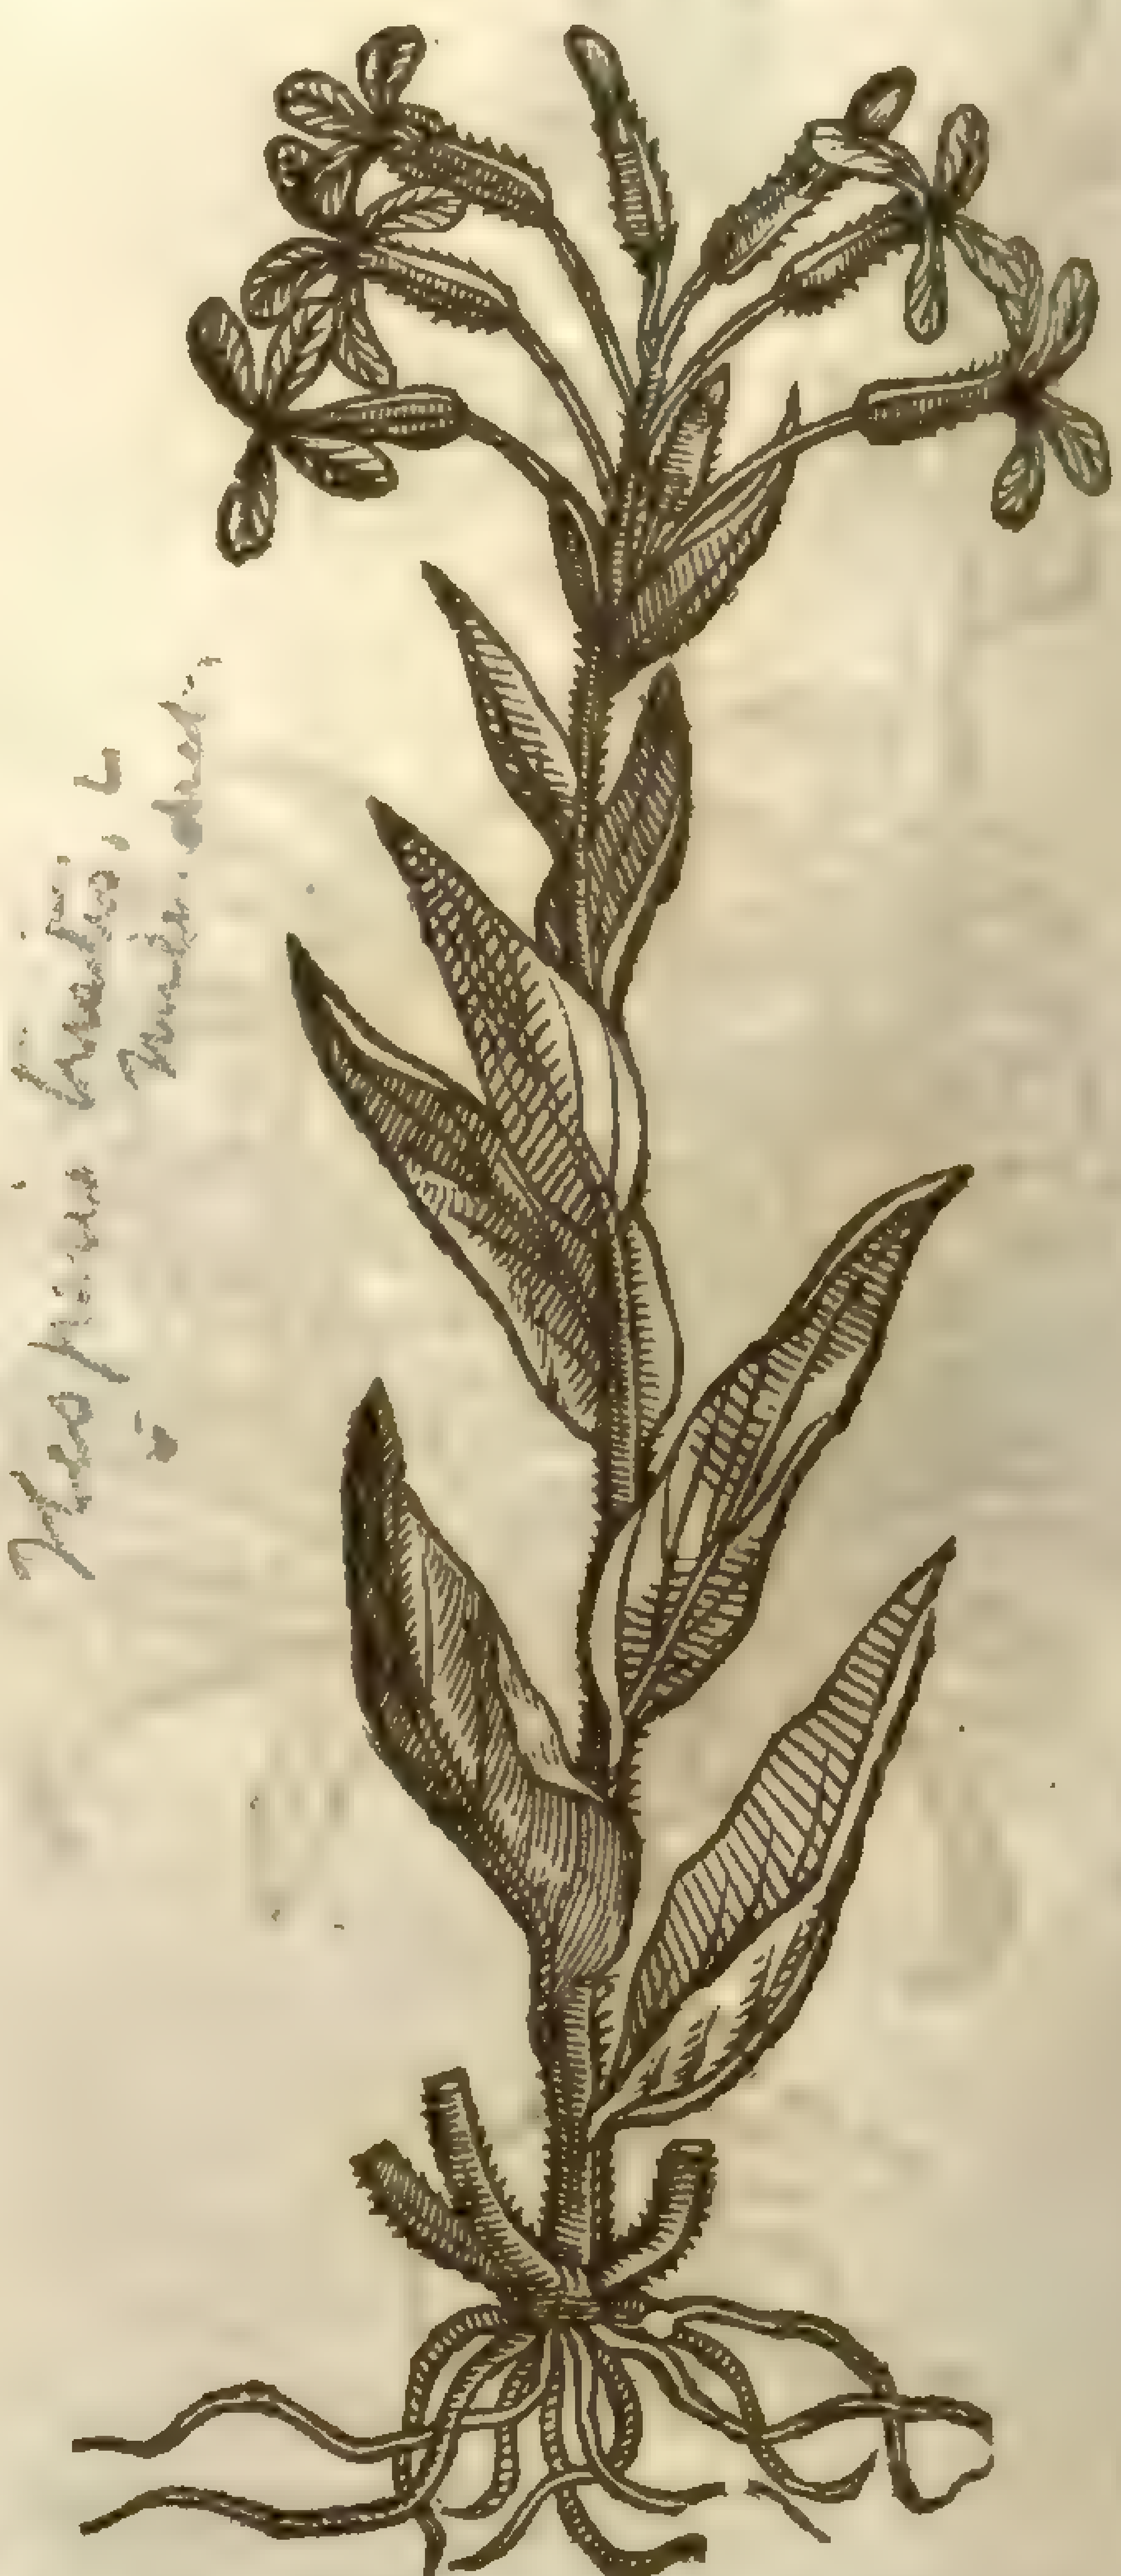
1 *Viola Matronalis flore purpureo, ſiue albo.*
Purple or white Dames Violets.



Hesperis matronalis, [illegible]

lob. ic. 325

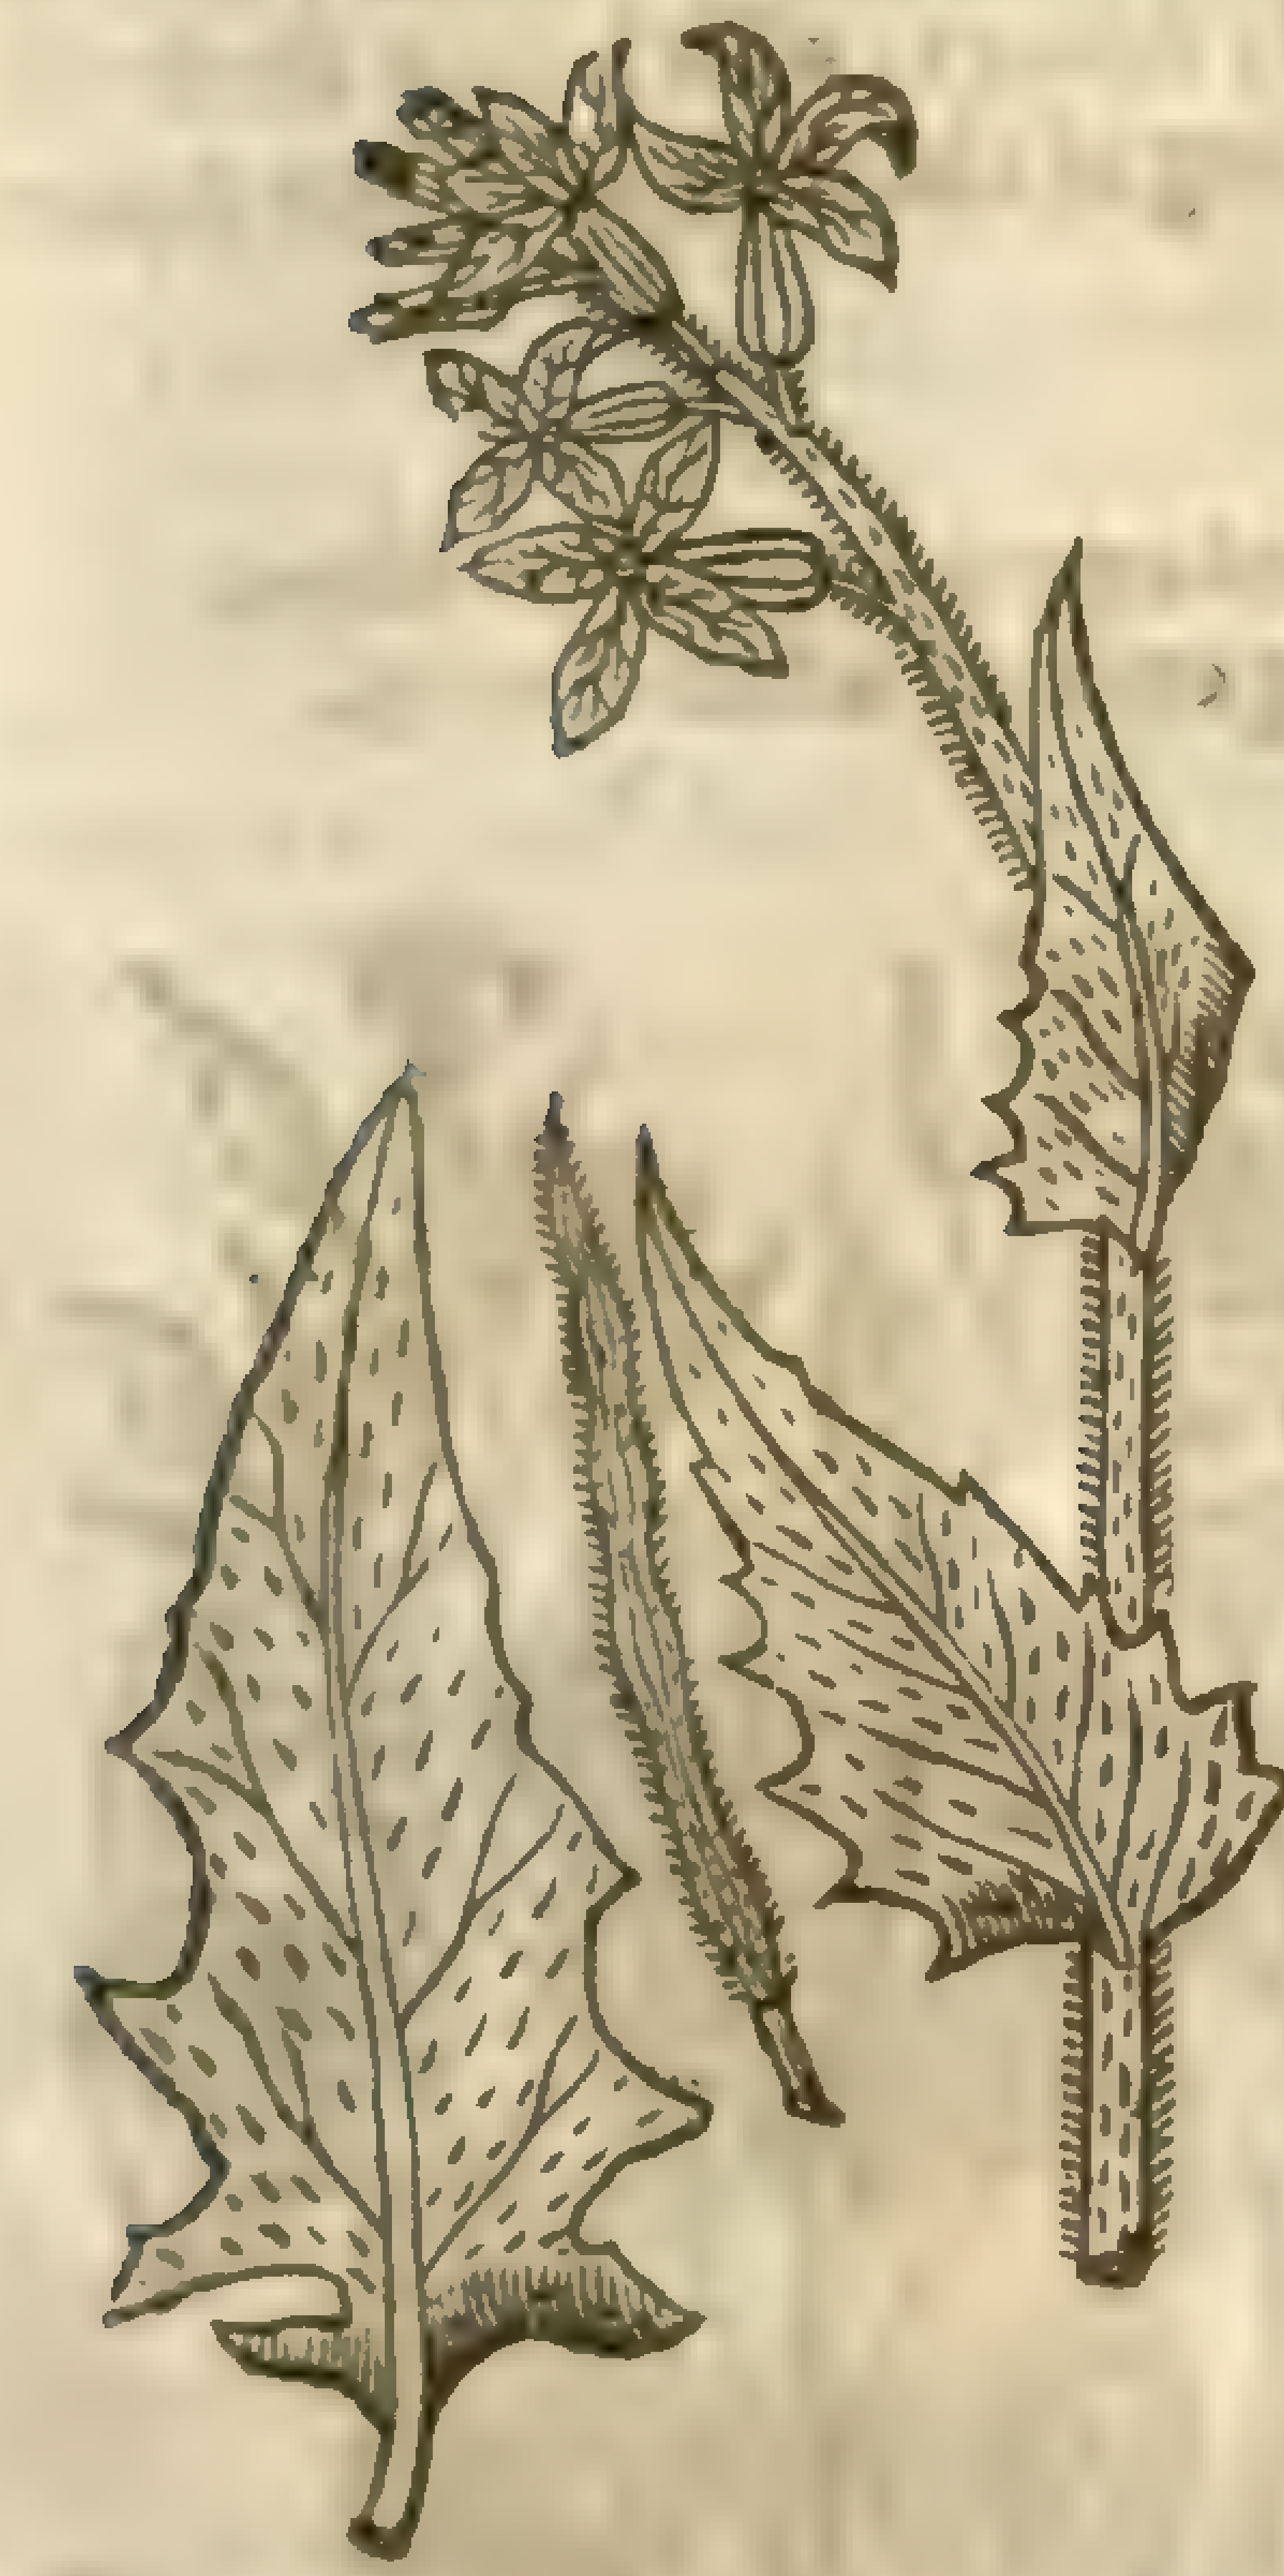
‡ 3 *Viola Matronalis flore obſoleto.*
Ruſſet Dames Violets.



Hesperis tristis, [illegible]

‡ 3 This plant hath a ſtalke a cubit high, and is diuided into many branches, vpon which in a confuſed order grow leaues like thoſe of the Dames violet, yet a little broader and thicker, being firſt of ſomewhat an acide, and afterwards of an acride taſte; at the tops of the branches in long cups grow floures like thoſe of the Dames violet, conſiſting of foure leaues, which ſtand not faire open, but are twined aſide, and are of an ouerworne ruſſet colour, compoſed as it were of a yellow and browne, with a number of blacke purple veins diuaricated ouer them. Their ſmell on the day time is little or none, but in the euening very pleaſing and ſweet. The floures are ſucceeded by long and here and there ſwolne cods, which are almoſt quadrangular, and containe a reddiſh ſeed like that of the common kinde. The root is fibrous, and vſually liues not aboue two yeares, for after it hath borne ſeed it dies; yet if you cut it downe and keepe it from ſeeding, it ſometimes puts forth ſhoots whereby it may be increaſed. I very much ſuſpect that this figure and Deſcription which I here giue you taken out of *Cluſius*, is no other plant than that which is kept in ſome of our gardens, and ſet forth in the *Hortus Eyſtettenſis* by the name of *Leucoium Melancholicum*: Now I iudge the occaſion of this error to haue come from the figure of *Cluſius* which we here preſent you with, for it is in many particulars different from the deſcription; firſt in that it expreſſes not many branches: ſecondly, in that the leaues are not ſnipt and diuided: thirdly, in that the floures are not expreſt wreſted or twined: fourthly, the veines are not rightly expreſt in the floure: and laſtly, the cods are omitted. Now the *Leucoium melancholicum* hath a hairy ſtalk diuided into ſundry branches of the height formerly mentioned, and the leaues about the middle of the ſtalke are ſomwhat ſinuated or deepely or vnequally cut in; The ſhape and colour of the floure is the ſame with that now deſcribed.

‡ 4 *Leucoium melancholicum.*
The melancoly Floure.



Hesperis [illegible]

deſcribed, and the ſeed-veſſels the ſame, as farre as I can remember: for I muſt confeſſe, I did not in writing take any particular note of them, neither did I euer compare them with this deſcription of *Cluſius*; onely I tooke ſome yeares agon an exact figure of a branch with the vpper leaues and floures, whereof one is expreſſed as they vſually grow twining backe, and the reſt faire open, the better to ſet forth the veins that are ſet ouer it. There are alſo expreſt a cod or ſeed-veſſell, and one of the leaues that grow about the middle of the ſtalke: all which are agreeable to *Cluſius* deſcription, in myne opinion; wherefore I only giue you the figure that I then drew, with the title I had it by. ‡

¶ *The Place.*

They are ſowne in gardens for the beauty of their floures.

¶ *The Time.*

They eſpecially floure in May and Iune, the ſecond yeare after they are ſowne.

¶ *The Names.*

Dames Violet is called in Latine, *Viola Matronalis*, and *Viola Hyemalis*, or winter Violets, and *Viola Damaſcena*: it is thought to be the *Heſperis* of *Pliny*, *lib.* 21. *cap.* 7. ſo called, for that it ſmels more, and more pleaſantly in the euening or night, than at any other time. They are called in French, *Violettes de dames, & de domas*, and *Girofflees des dames*, or *Matrones Violettes*: in Engliſh, Damaske Violets, winter Gillofloures, Rogues Gillofloure, and Cloſe Sciences.

¶ *The Temperature.*

The leaues of Dames Violets are ſharpe and hot, very like in taſte and facultie to *Eruca* or Rocket, and ſeemes to be a kinde thereof.

¶ *The Vertues.*

The diſtilled Water of the floures hereof is counted to bee a moſt effectuall thing to procure ſweat.

CHAP. 123.

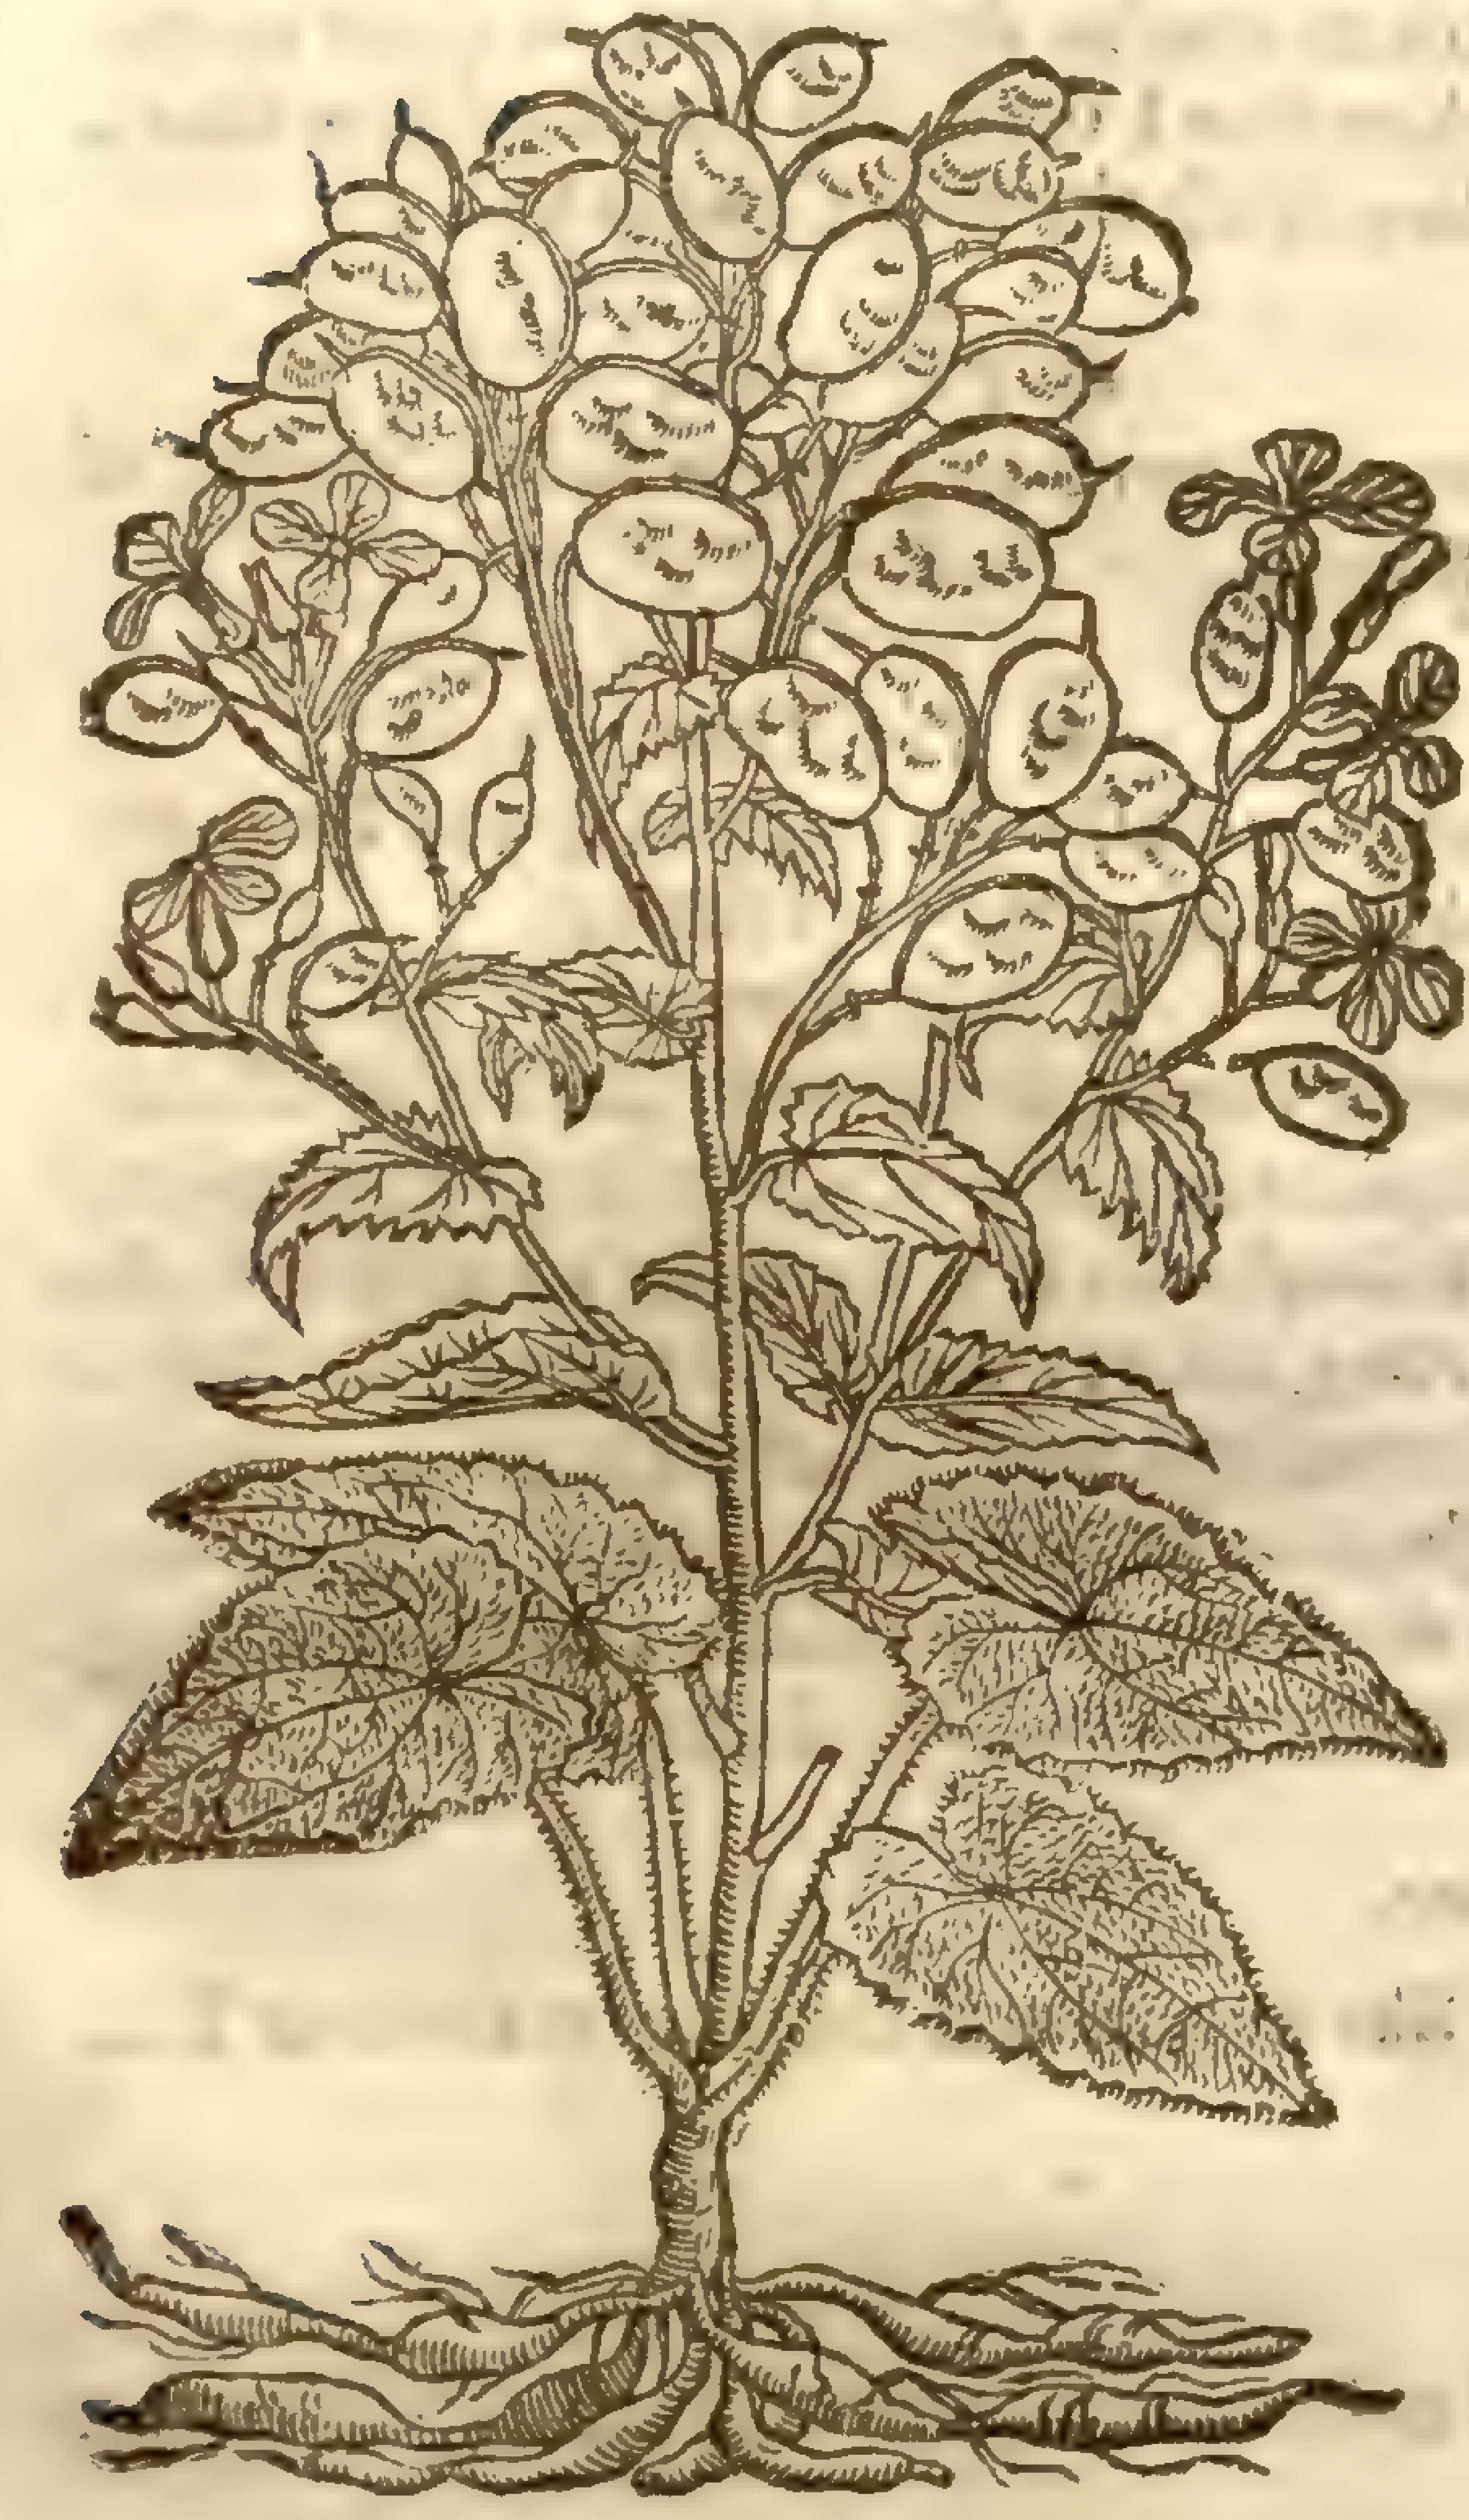
Of white Sattin floure.

¶ *The Deſcription.*

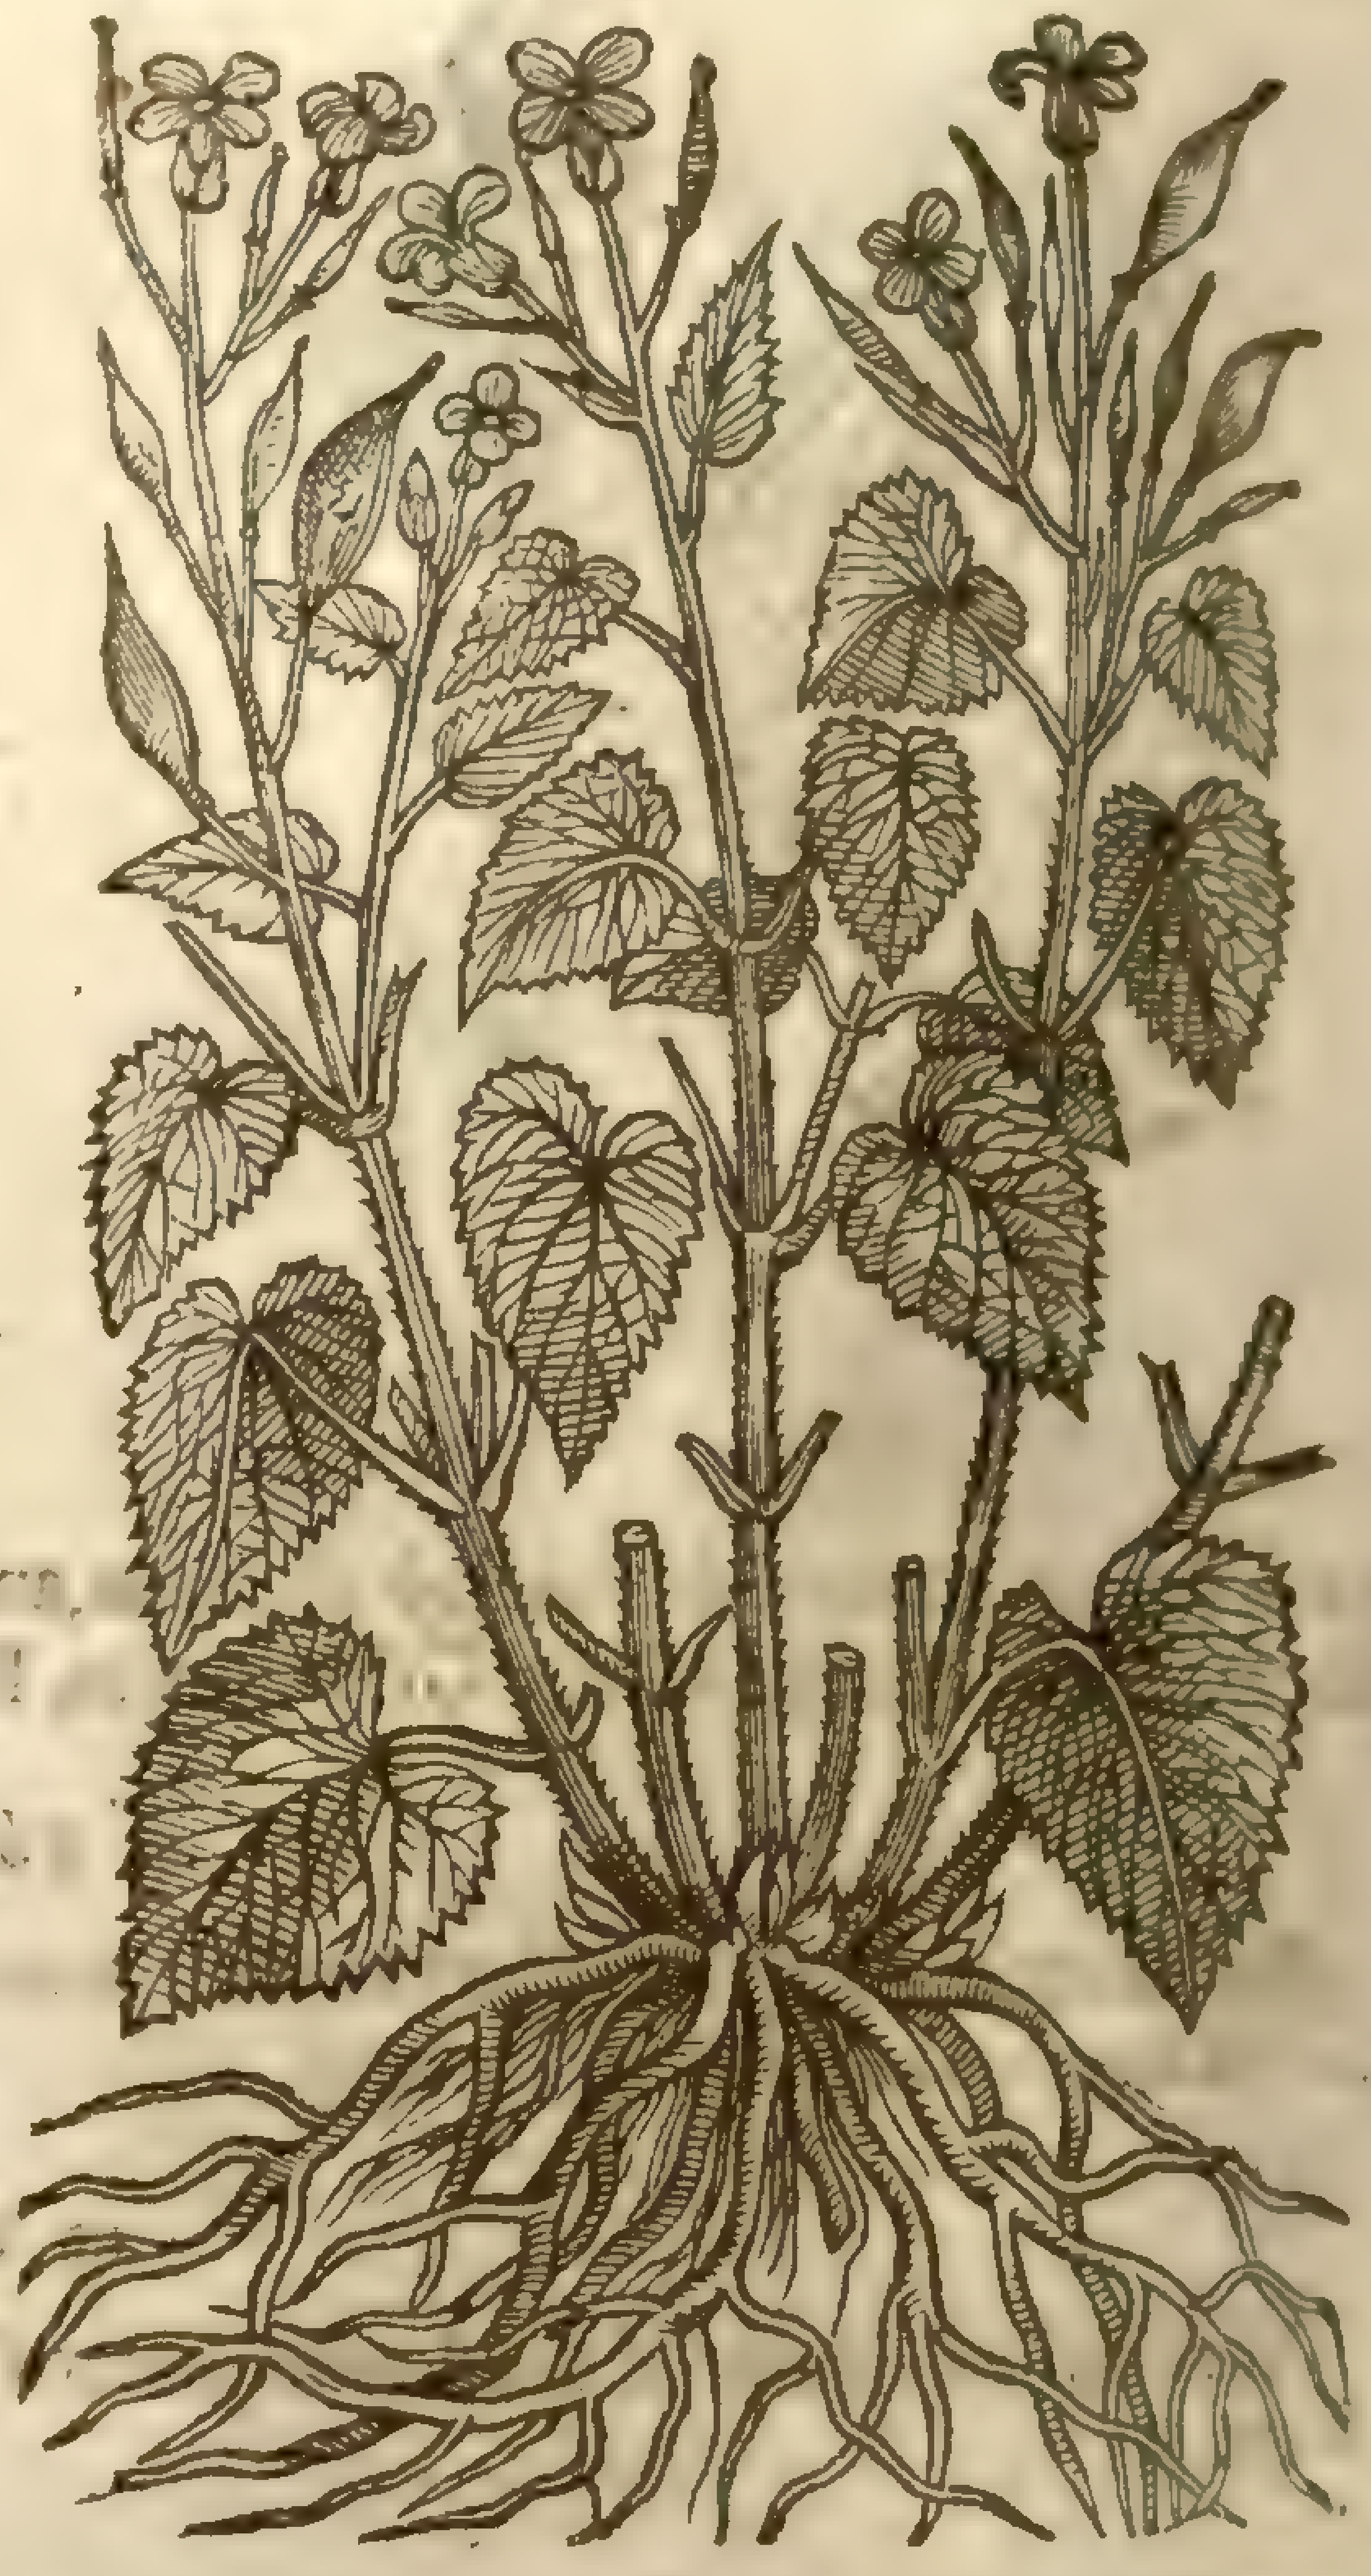
1 Bolbonac or the Sattin floure hath hard and round ſtalks, diuiding themſelues into many other ſmall branches, beſet with leaues like Dames Violets or Queenes Gillofloures, ſomewhat broad, and ſnipt about the edges, and in faſhion almoſt like Sauce alone, or Iacke by the hedge, but that they are longer and ſharper pointed. The ſtalks are charged or loden with many floures like the common ſtocke Gillofloure, of a purple colour: which being fallen, the ſeed comes forth, contained in a flat thin cod, with a ſharp point or pricke at one end, in faſhion of the Moon, but ſomewhat blackiſh. This cod is compoſed of three filmes or skins, whereof the two outmoſt are of an ouerworne aſh colour, and the innermoſt or that in the middle, wheron the ſeed doth hang or cleaue, is thinne and cleere ſhining, like a ſhred of white Sattin newly cut from the piece. The whole plant dieth the ſame yeare that it hath borne ſeed, and muſt be ſown yearly. The root is compact of many tuberous parts like Key clogs, or like the great Aſphodill.

2 The ſecond kinde of *Bolbonac* or white Sattin hath many great and broad leaues, almoſt like thoſe of the great Bur-Dock: among which riſeth vp a very tal ſtem of the height of foure cubits, ſtiffe, and of a whitiſh green colour, ſet with the like leaues, but ſmaller. The floures grow vpon the ſlender branches, of a purple colour, compact of foure ſmall leaues like thoſe of the ſtocke Gilloﬂoure; after which come thin long cods of the ſame ſubſtance and colour of the former. The root is thicke, whereunto are faſtned an infinite number of long threddy ſtrings: which root dieth not euery yere, as the other doth, but multiplieth it ſelfe as wel by falling of the ſeed, as by new ſhoots of the root.

1 *Viola Lunaris, ſive Bolbonac.*
White Sattin.



2 *Viola Lunaris longioribus ſiliquis.*
Long codded white Sattin.



¶ *The Place.*

Theſe Plants are ſet and ſowne in gardens, notwithſtanding the firſt hath bin found wild in the woods about Pinner and Harrow on the hill 12 miles from London, and in Eſſex likewiſe about Horn-church.

The ſecond groweth about Watford, fifteene miles from London.

¶ *The Time.*

They floure in Aprill the next yeare after they be ſowne.

¶ *The Names.*

They are commonly called *Bolbonac* by a barbarous name: wee had rather call it with *Dodonæus* and *Cluſius*, *Viola latifolia*, and *Viola lunaris*, or as it pleaſeth moſt Herbariſts, *Viola peregrina*: the Brabanders name it **Penninck bloemen**, of the faſhion of the cods, like after a ſort to a groat or Teſterne; and **Paeſch bloemen**, becauſe it alwayes floureth neere about the feaſt of Eaſter. Moſt of the later Herbariſts doe call it *Lunaria*: Others, *Lunaria Græca*, either of the faſhion of the ſeed, or of the ſiluer brightneſſe that it hath, or of the middle skinne of the cods, when the two outermoſt skins or husks and ſeeds likewiſe are fallen away. We call this herbe in Engliſh, Penny floure, or Mony-floure, Siluer Plate, Prickſong-wort; in Norfolke, Sattin, and white Sattin; and among our women it is called Honeſtie: it ſeemeth to be the old Herbariſts *Thlaſpi alterum*, or ſecond Treacle muſtard; and that which *Crateuas* deſcribeth, called of diuers, *Sinapi Perſicum*: for as *Dioſcorides* ſuch, *Crateuas* maketh mention of a certaine *Thlaſpi* or Treacle muſtard with broad leaues and big roots, and ſuch this Violet hath, which we ſirname *Latifolia* or broad leaued.: generally taken of all to be the great *Lunaria* or Moonwort.

¶ *The Temperature and Vertues.*

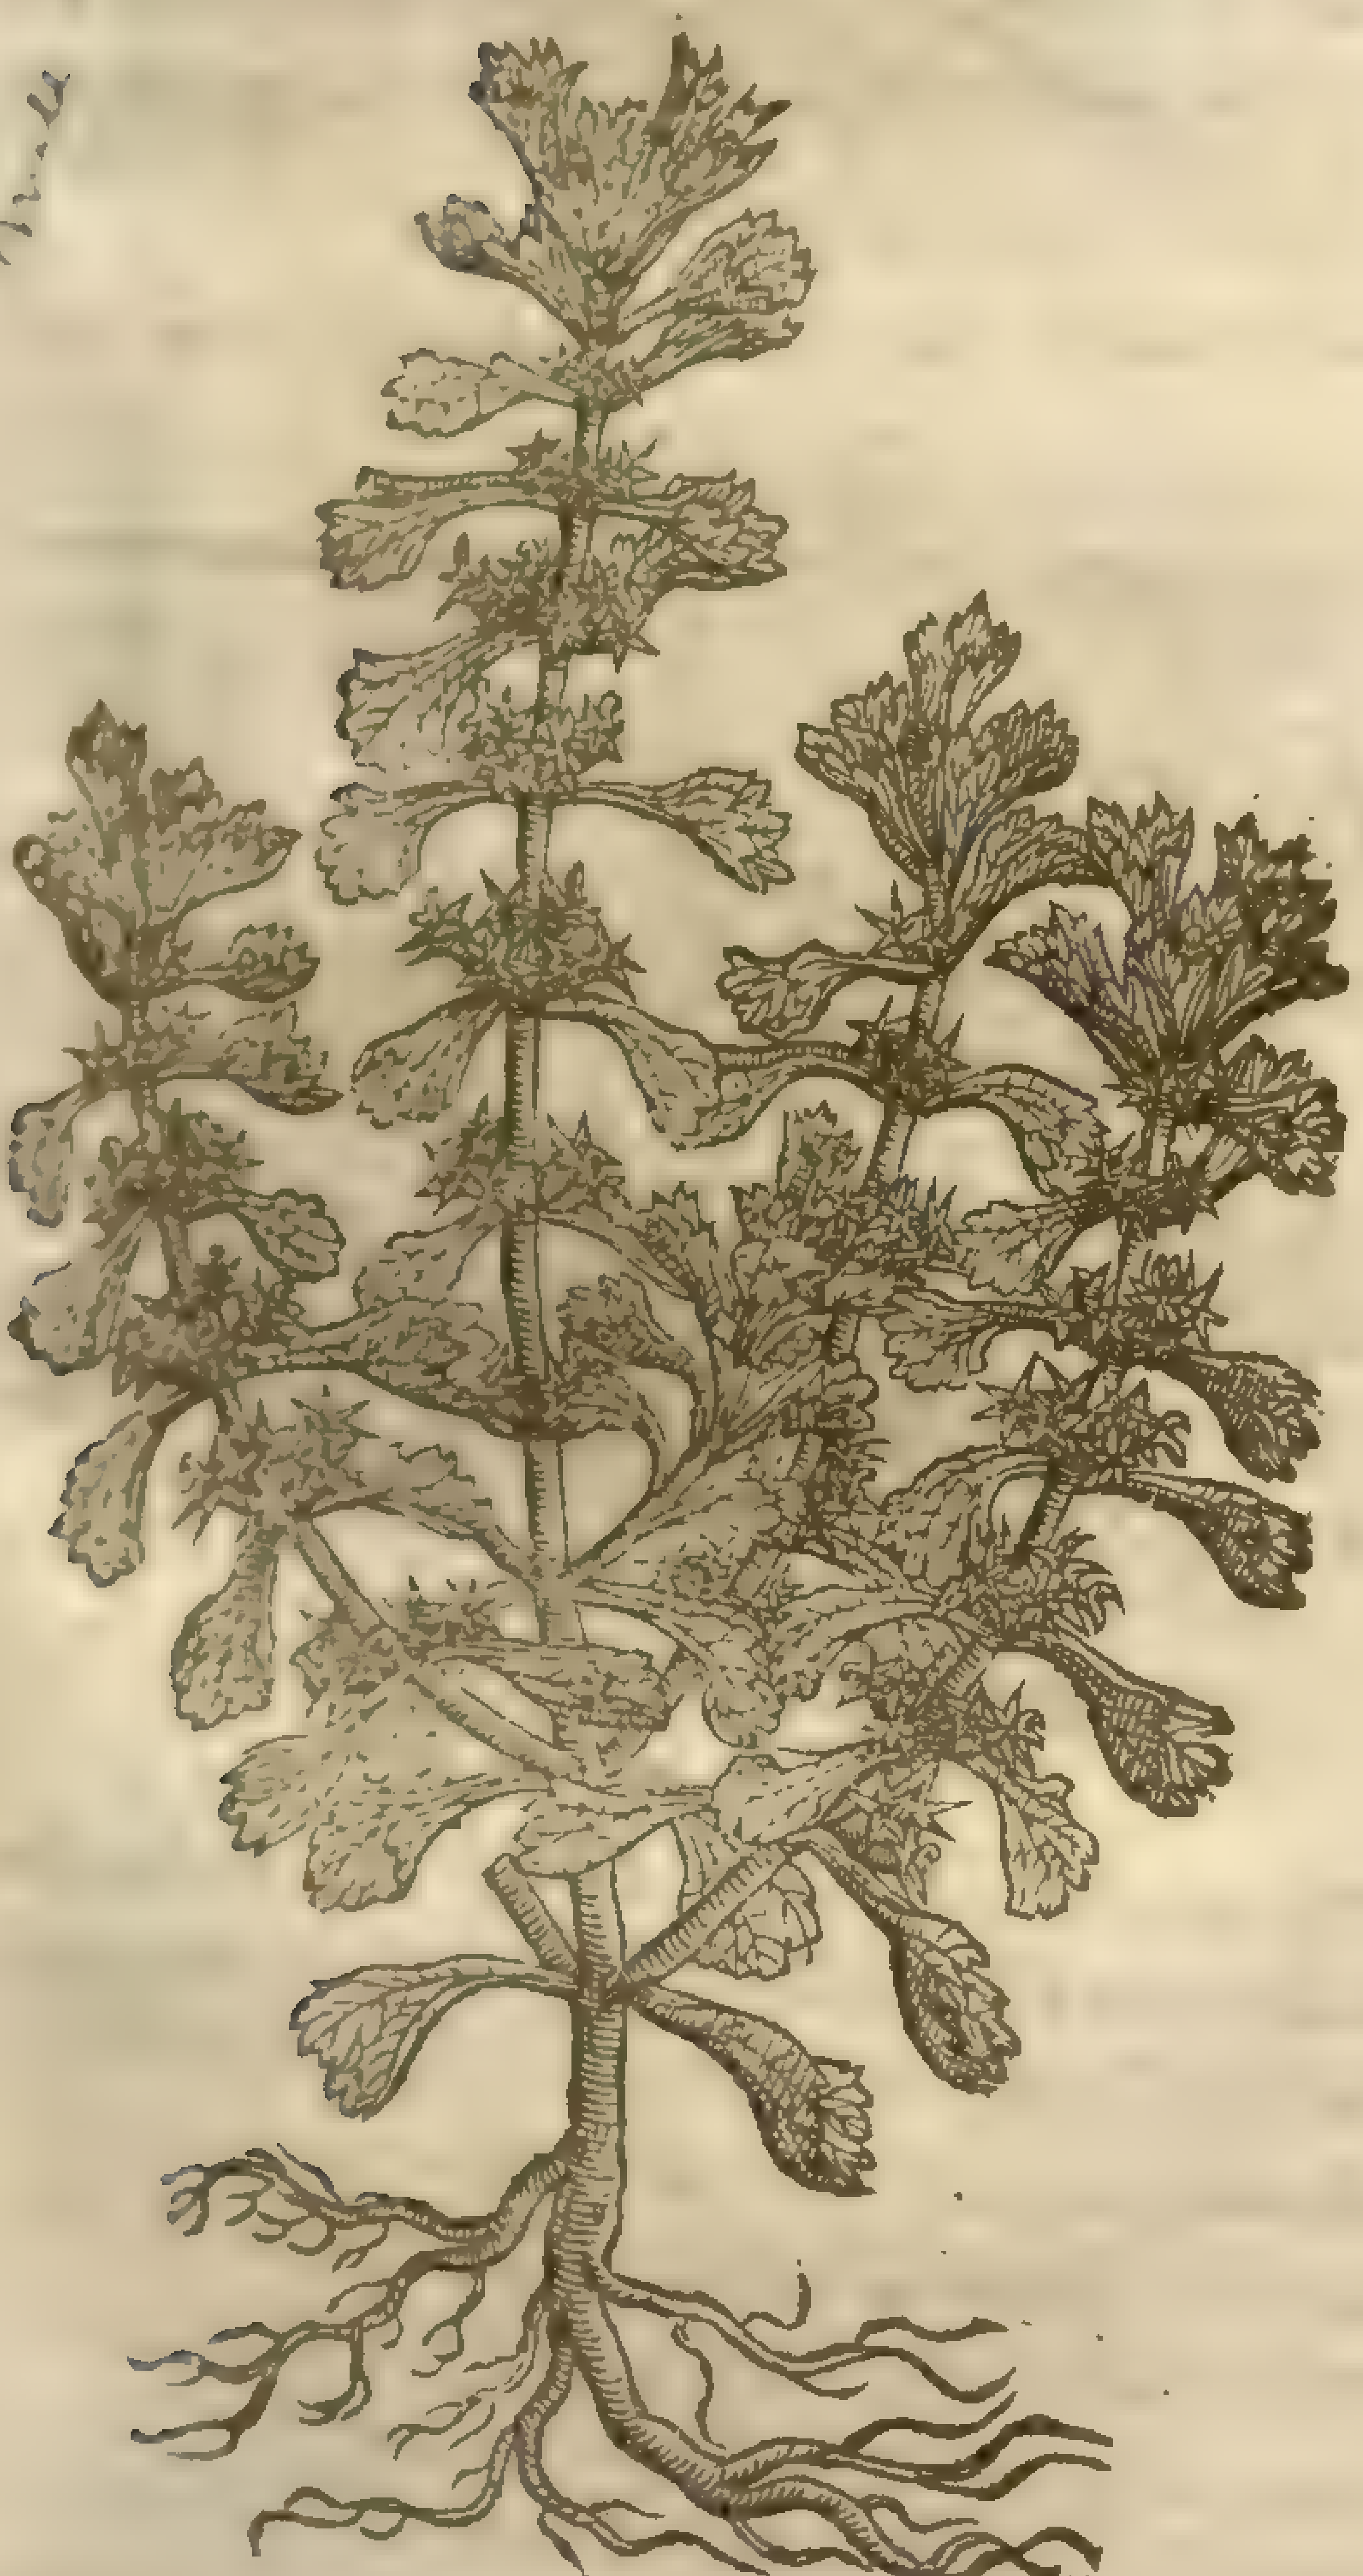
The ſeed of Bulbonac is of temperature hot and dry, and ſharpe of taſte, like in force to the ſeed of Treacle muſtard: the roots likewiſe are ſomewhat of a biting qualitie, but not much: they are eaten with ſallads as certaine other roots are. A

A certain Heluetian Surgeon compoſed a moſt ſingular vnguent for green wounds, of the leaues of Bolbonac and Sanicle ſtamped together, adding thereto oile and wax. The ſeed is greatly commended againſt the falling ſickneſſe. B

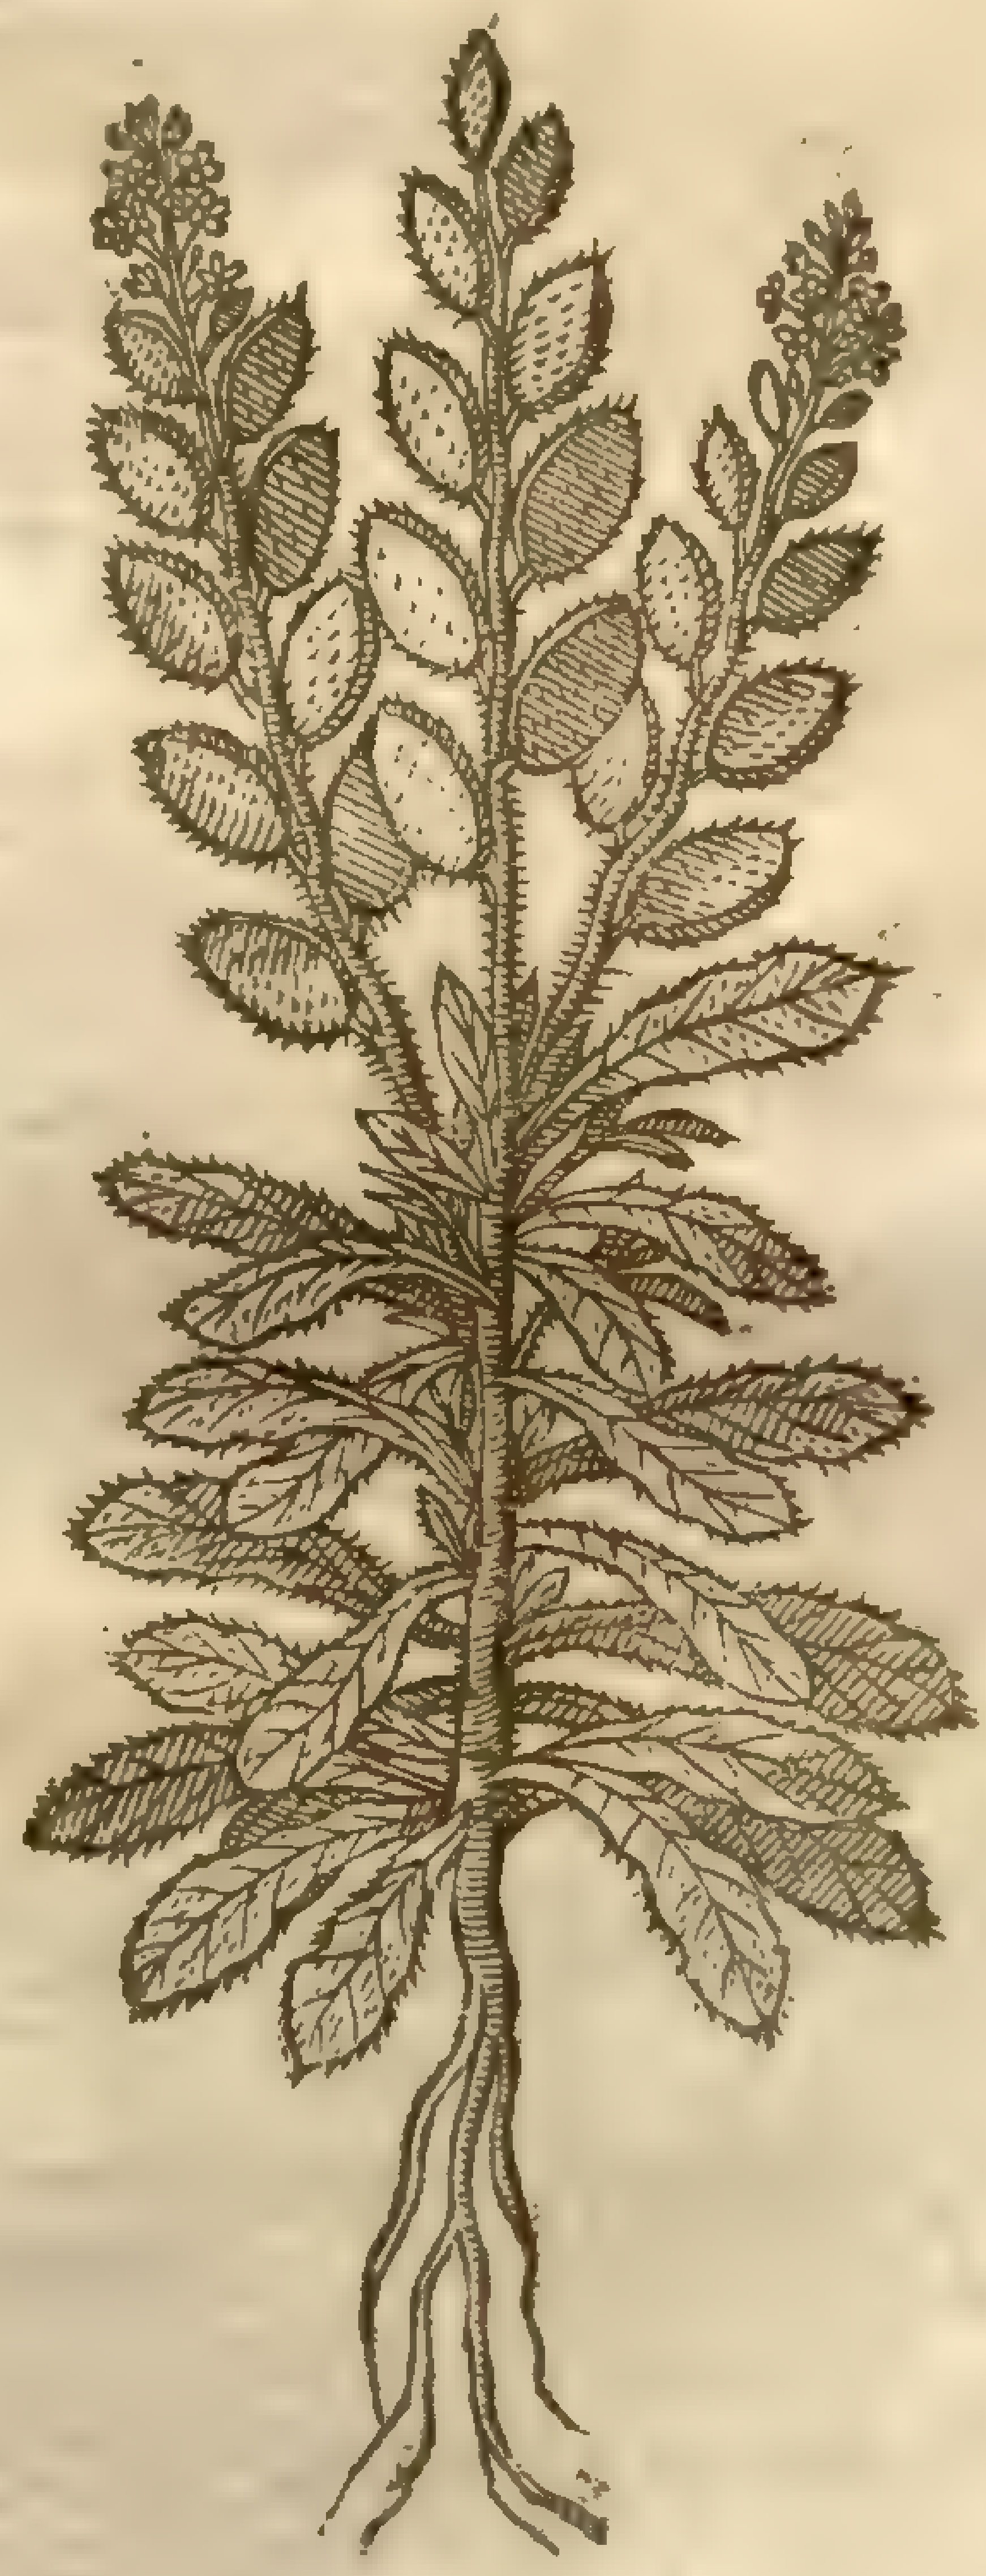
Chap. 124. *Of* Galen *and* Dioſcorides *Moonworts or Madworts.*

marrubium [illegible]

1 *Alyſſum Galeni.*
Galens Madwort.



† 2 *Alyſſum Dioſcoridis.*
Dioſcorides Moonwort or Madwort.



¶ *The Description.*

1 This might be one of the number of the Hore-hounds, but that *Galen* vſed it not for a kinde thereof, but for *Alyſſon* or Madwort: it is like in forme and ſhew to Hore-hound, and alſo in the number of the ſtalks, but the leaues thereof are leſſe, more curled, more hoary & whiter, without any manifeſt ſmell at all. The little coronets or ſpoky whurles that compaſſe the ſtalks round about are full of ſharp prickles, out of which grow floures of a blewiſh purple colour like thoſe of Horehound: the root is hard, wooddy, and diuerſly parted.

2 I haue one growing in my garden, which is thought to be the true and right Lunary or Moonwort of *Dioſcorides* deſcription; hauing his firſt leaues ſomewhat round, and afterward more long, whitiſh, and rough or ſomewhat woolliſh in handling: amongſt which riſe vp rough brittle ſtalkes ſome cubit high, diuided into many branches, whereupon grow many little yellow floures; which

being paſt, there follow flat and rough huskes of a whitiſh colour, in ſhape like little targuets or bucklers, wherein is contained flat ſeed like to the ſeeds of ſtocke Gillofloures, but bigger. The whole huske is of the ſame ſubſtance, faſhion, and colour that thoſe are of the white Satin.

¶ *The Place.*

Theſe plants are ſowne now and then in gardens, eſpecially for the rareneſſe of them; the ſeed being brought out of Spain and Italy, from whence I receiued ſome for my garden.

¶ *The Time.*

They floure and flouriſh in May, the ſeed is ripe in Auguſt the ſecond yeare after their ſowing.

¶ *The Names.*

Madwort or Moonwort is called of the Grecians ἄλυσσος or ἄλυσσον: of the Latines, *Alyſſum*: in Engliſh, *Galens* Madwort, and of ſome, Heale-dog: and it hath the name thereof, becauſe it is a preſent remedie for them that are bitten of a mad dog, as *Galen* writeth, *lib.2. de Antidotis*, in *Antonius Cous* his compoſition deſcribing it in theſe words; Madwort is an herbe very like to Horehound, but rougher, and more full of prickles about the floures; it beareth a floure tending to blew.

‡ 2 The ſecond by *Dodonæus*, *Lobel*, *Camerarius*, and others, is reputed to be the *Alyſſon* of *Dioſcoridis*; *Geſner* names it *Lunaria aſpera*; and *Columna*, *Leucoium montanum lunatum*. ‡

¶ *The Temperature and Vertues.*

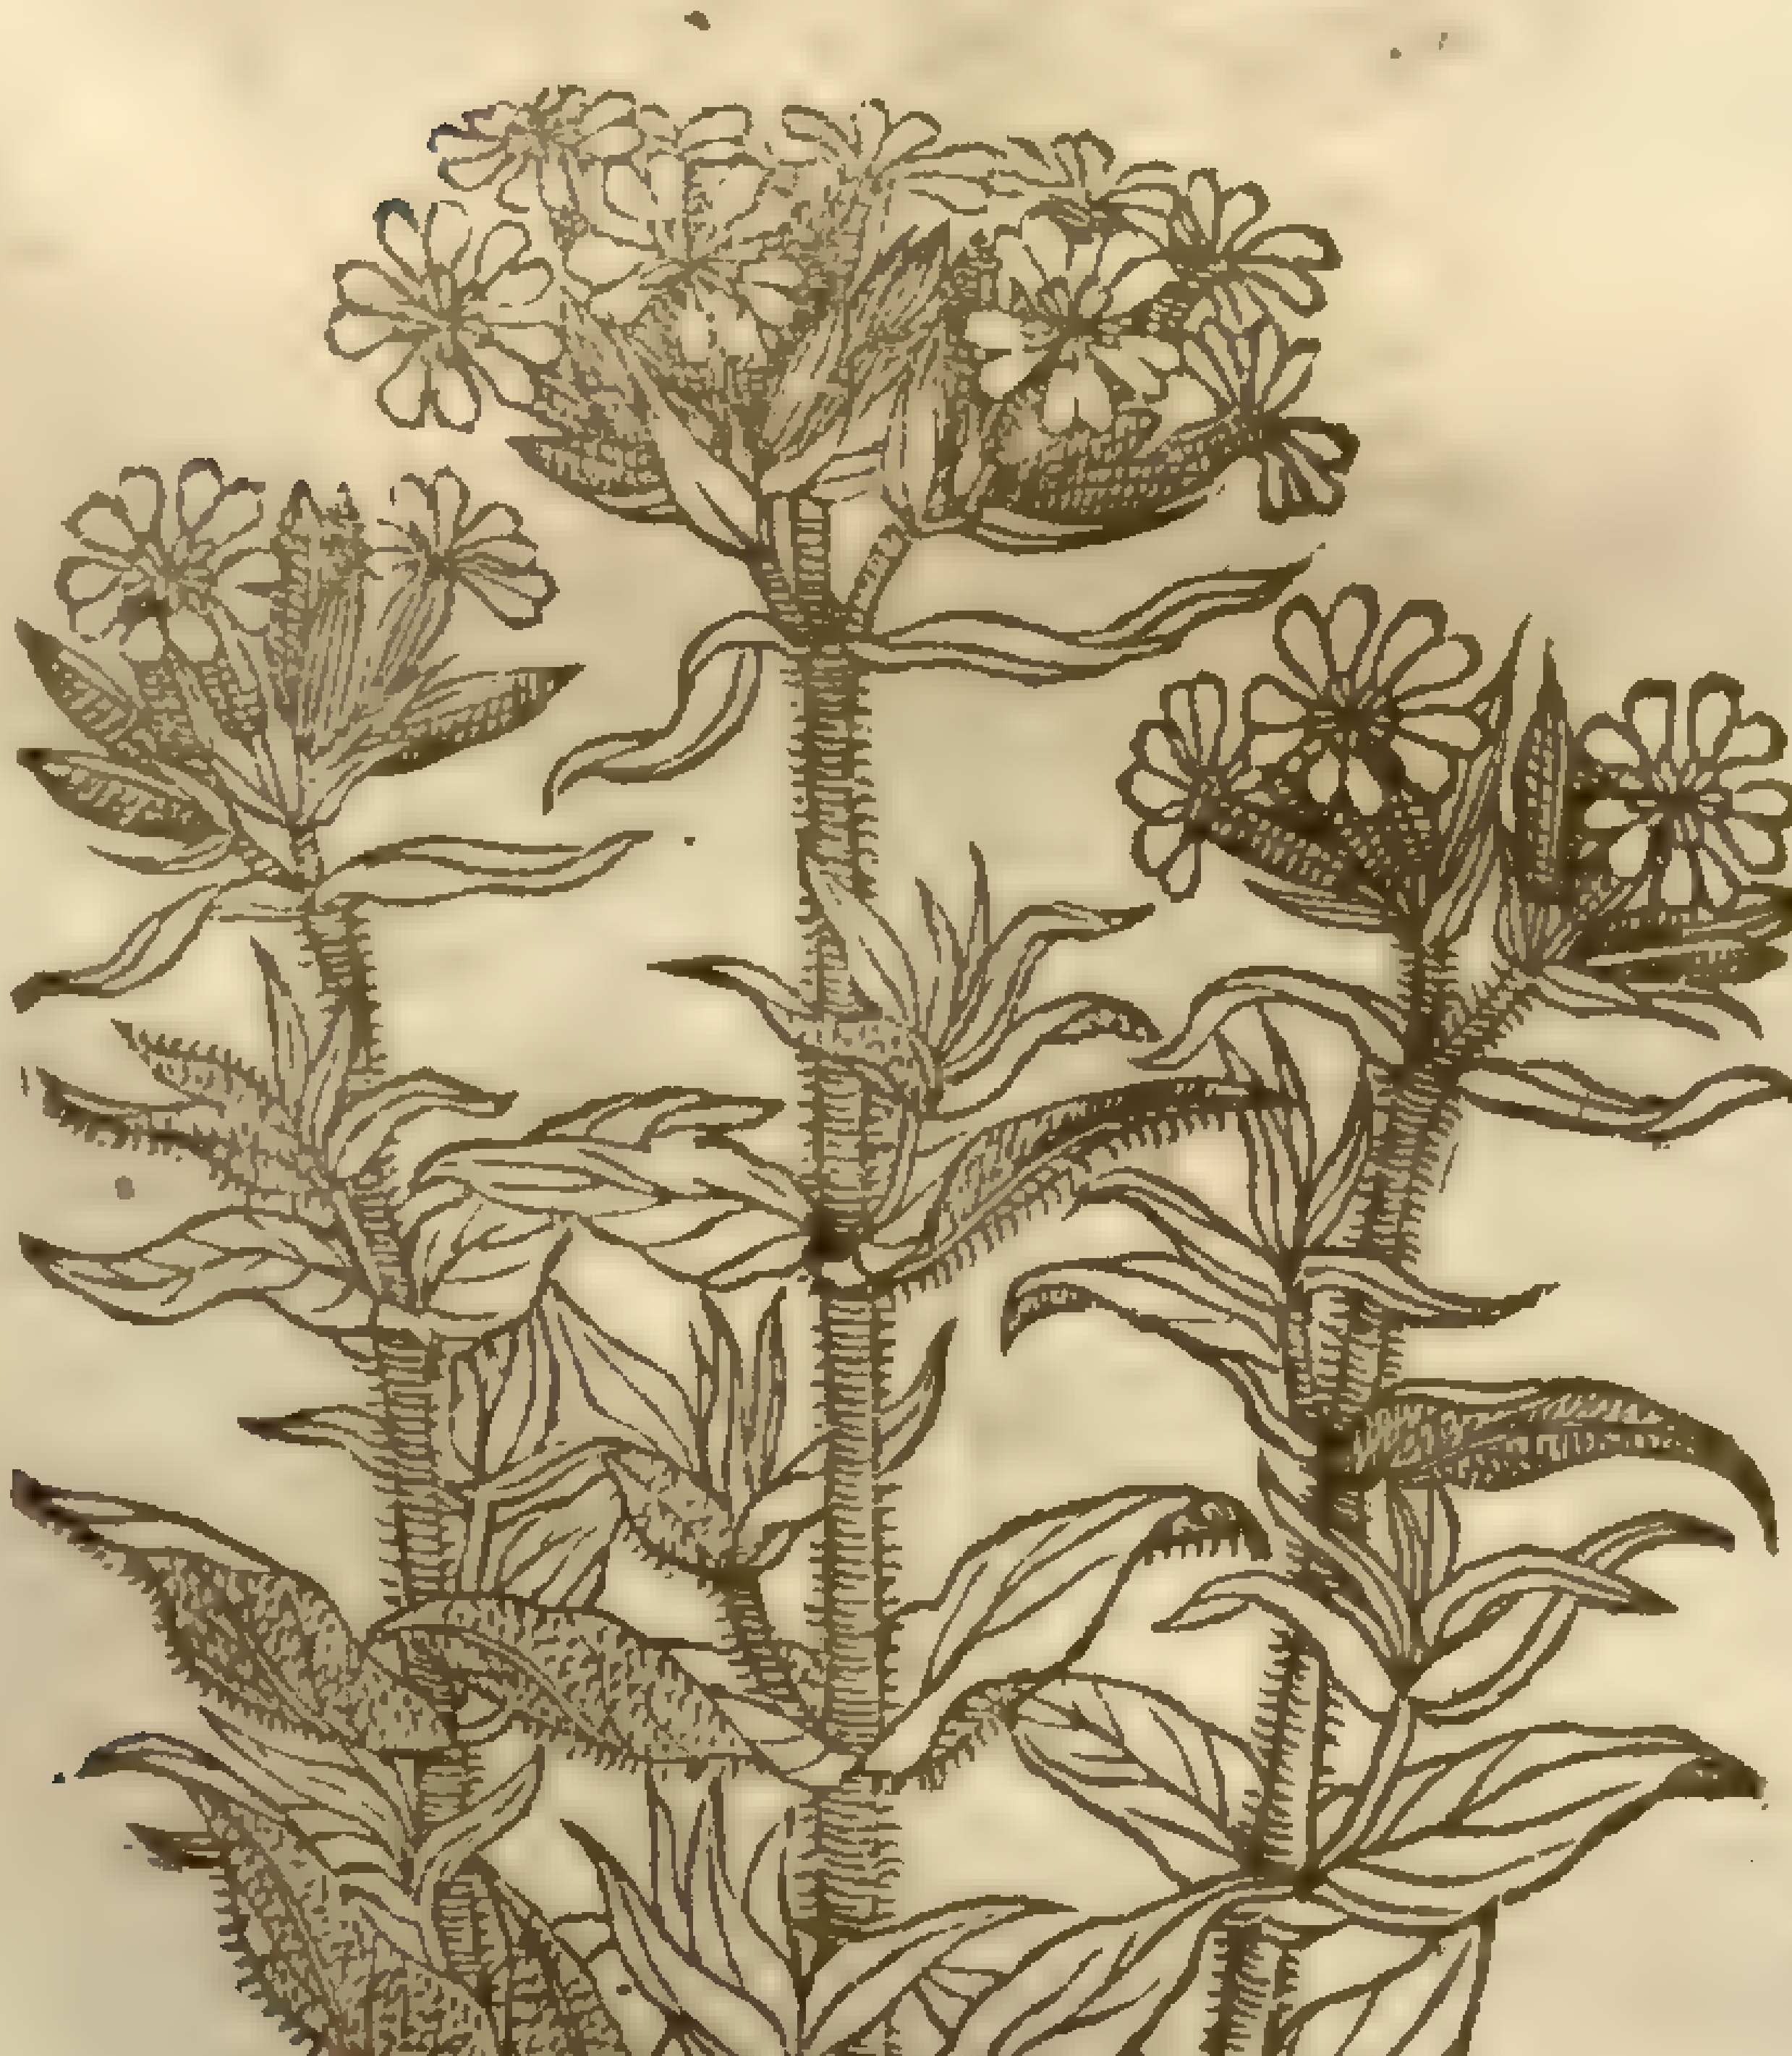
A *Galen* ſaith it is giuen vnto ſuch as are inraged by the biting of a mad dogge, which thereby are perfectly cured, as is knowne by experience, without any artificiall application or method at all. The which experiment if any ſhall proue, he ſhall find in the working thereof, it is of temperature meanly dry, digeſteth, and ſomthing ſcoureth withall: for this cauſe it taketh away the morphew and ſun-burning, as the ſame Author affirmes.

† That which was formerly figured in the ſecond place, being a kinde of *Sideritis*, I haue here omitted, that I may giue you it more fitly among the reſt of that name and kindred hereafter.

Chap. 125. *Of Roſe Campion.*

L. chalcedonica, 6
Mill., [illegible]

Lychnis Chalcedonica.
Floure of Conſtantinople.



¶ *The Kindes.*

There be diuers ſorts of Roſe Campions, ſome of the garden, and others of the field, the which ſhall be diuided into ſeueral chapters; and firſt of the Campion of Conſtantinople.

¶ *The Deſcription.*

The Campion of Conſtantinople hath ſundry vpright ſtalks two cubits high & full of joints, with a certain roughneſſe, and at euery joint two large leaues of a brown green colour. The flours grow at the top like ſweet-Williams or rather like dames Violet, of the colour of red lead or orenge-tawny. The root is ſomewhat ſharpe in taſte.

‡ There are diuers varieties of this, as with white and bluſh coloured floures, as alſo a double kinde with very large double and beautifull floures of a Vermilion colour like as the ſingle one here deſcribed. ‡

¶ *The Place.*

The floure of Conſtantinople is planted in gardens and is very common almoſt euery where.

‡ The white and bluſh ſingle and the double one are more rare, and not to be found but in the gardens of our prime Floriſts. ‡

¶ *The Time.*

It floureth in Iune ond Iuly, the ſecond yeare after it is planted, and many yeares after; for it conſteth of a root a root full of life, and endureth long, and can away with the cold of our clymat.

¶ *The Names.*

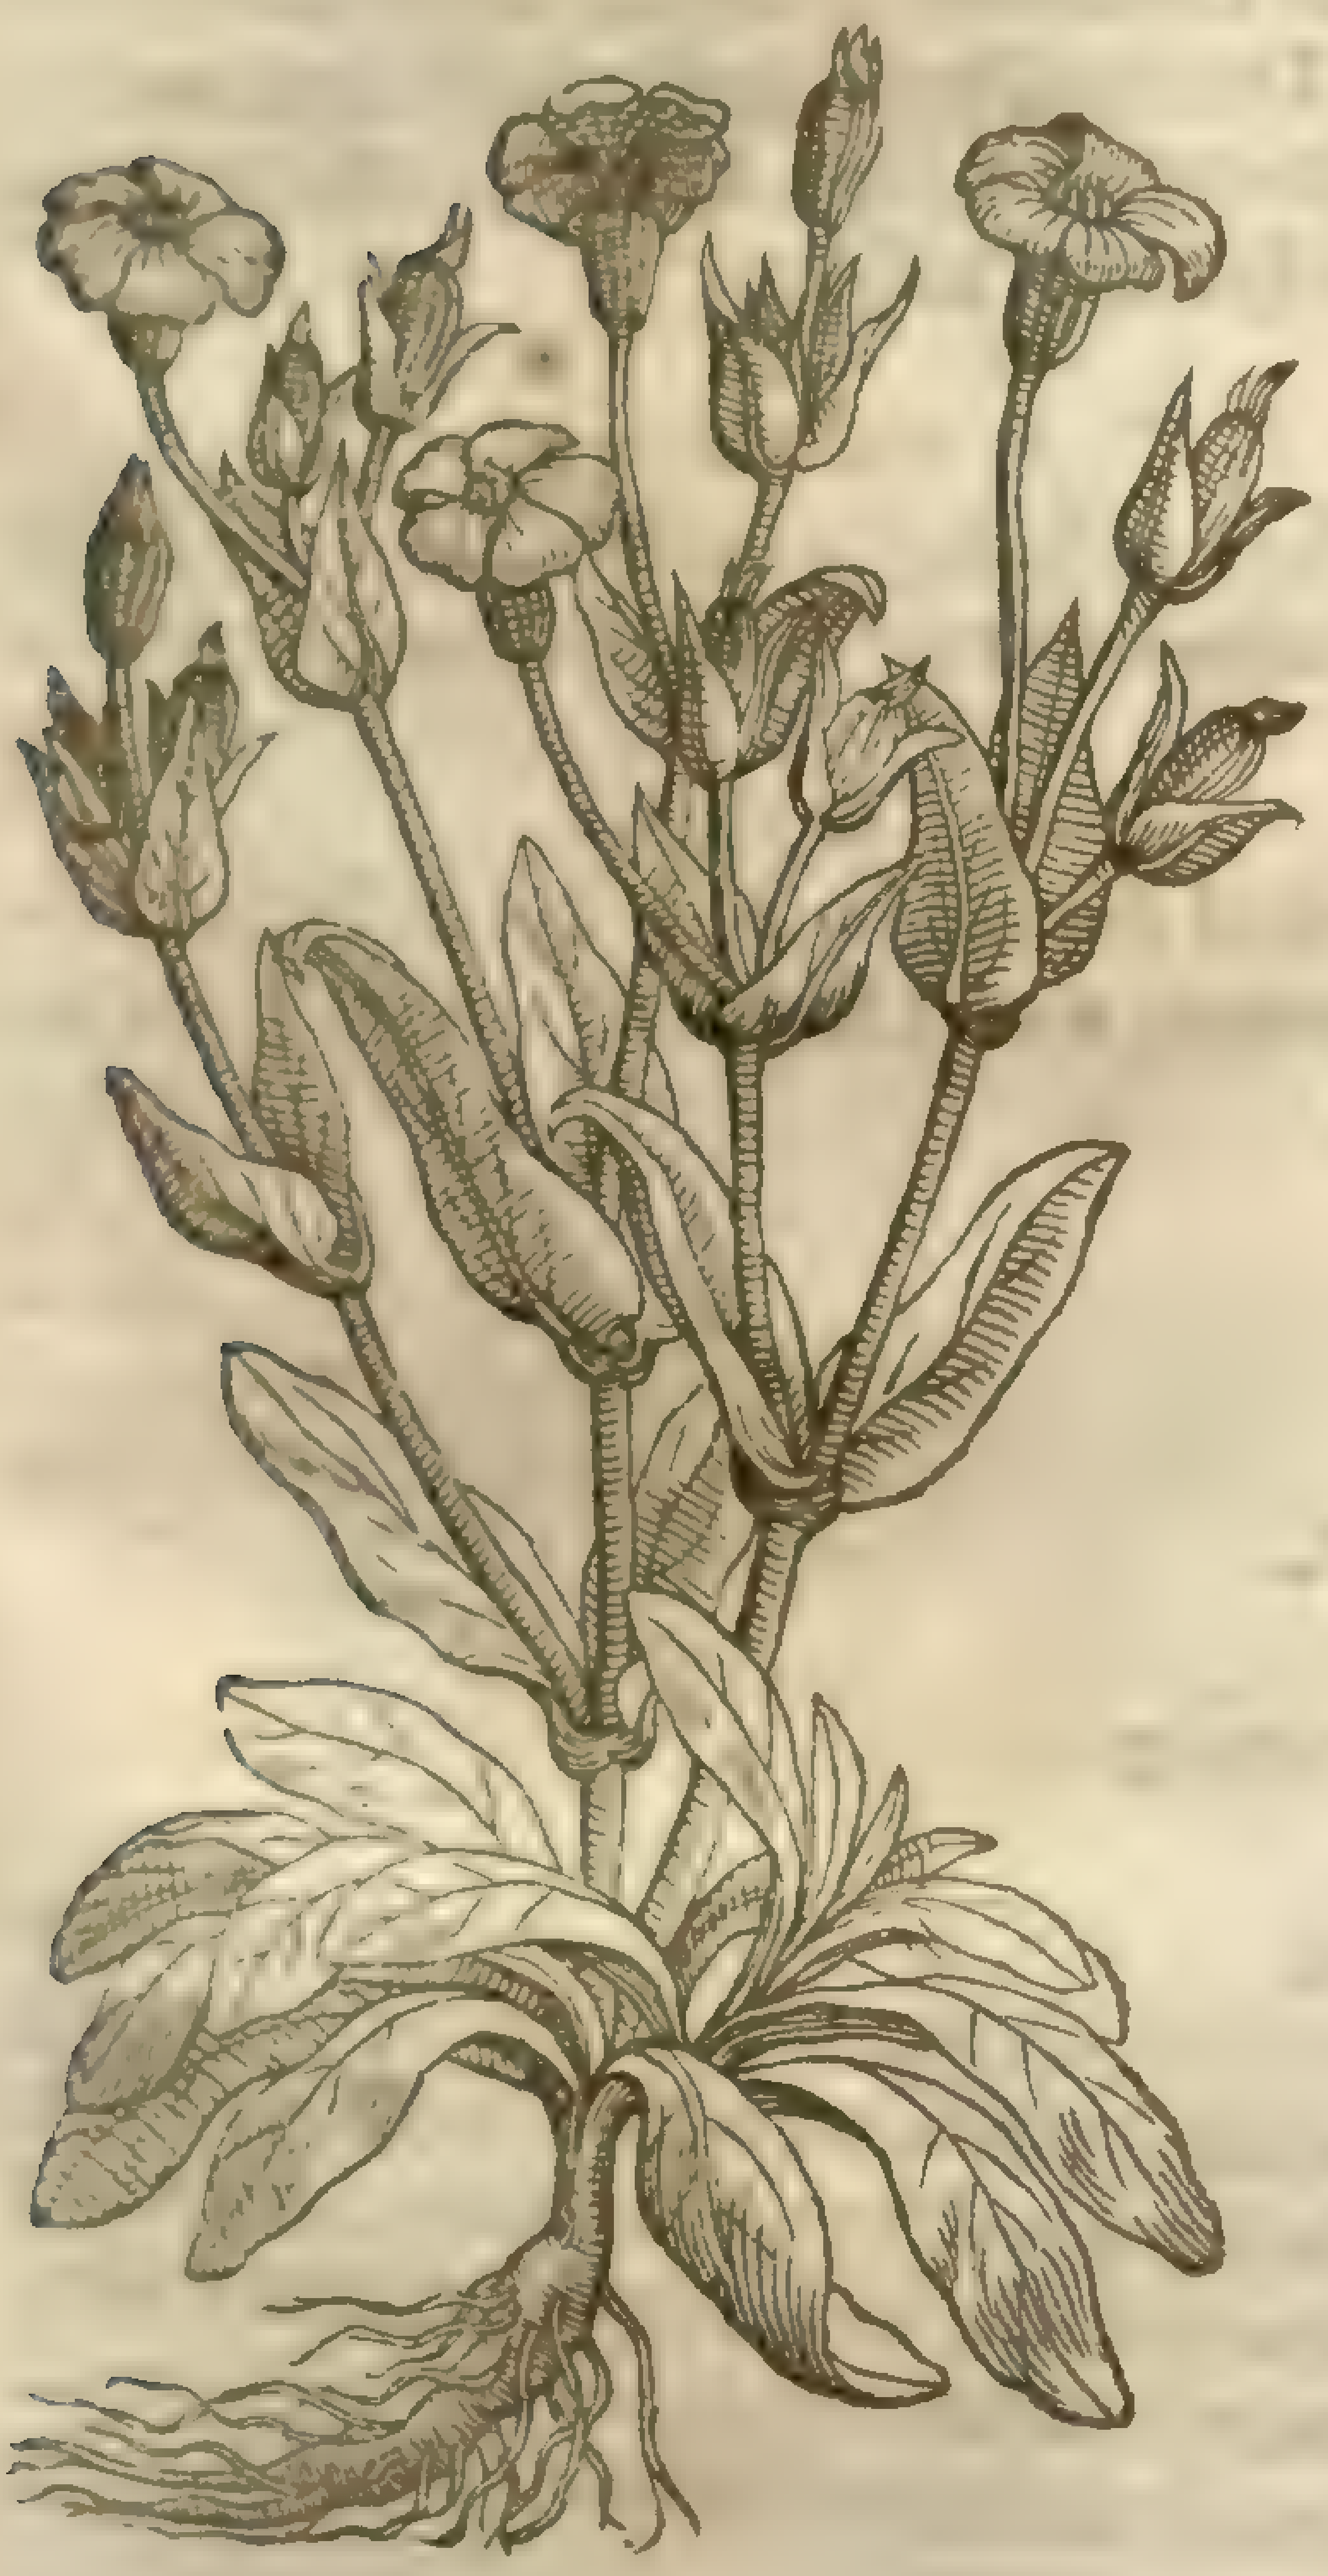
It is called *Conſtantinopolitanus flos*, & *Lychnis Chalcedonica*: of *Aldrouandus*, *Flos Creticus*, or Floure of Candy: of the Germanes, *Flos Hieroſolymitanus*, or Floure of Ieruſalem: in Engliſh, Floure of Conſtantinople: of ſome, Floure of Briſtow, or None-ſuch.

¶ *The Nature and Vertues.*

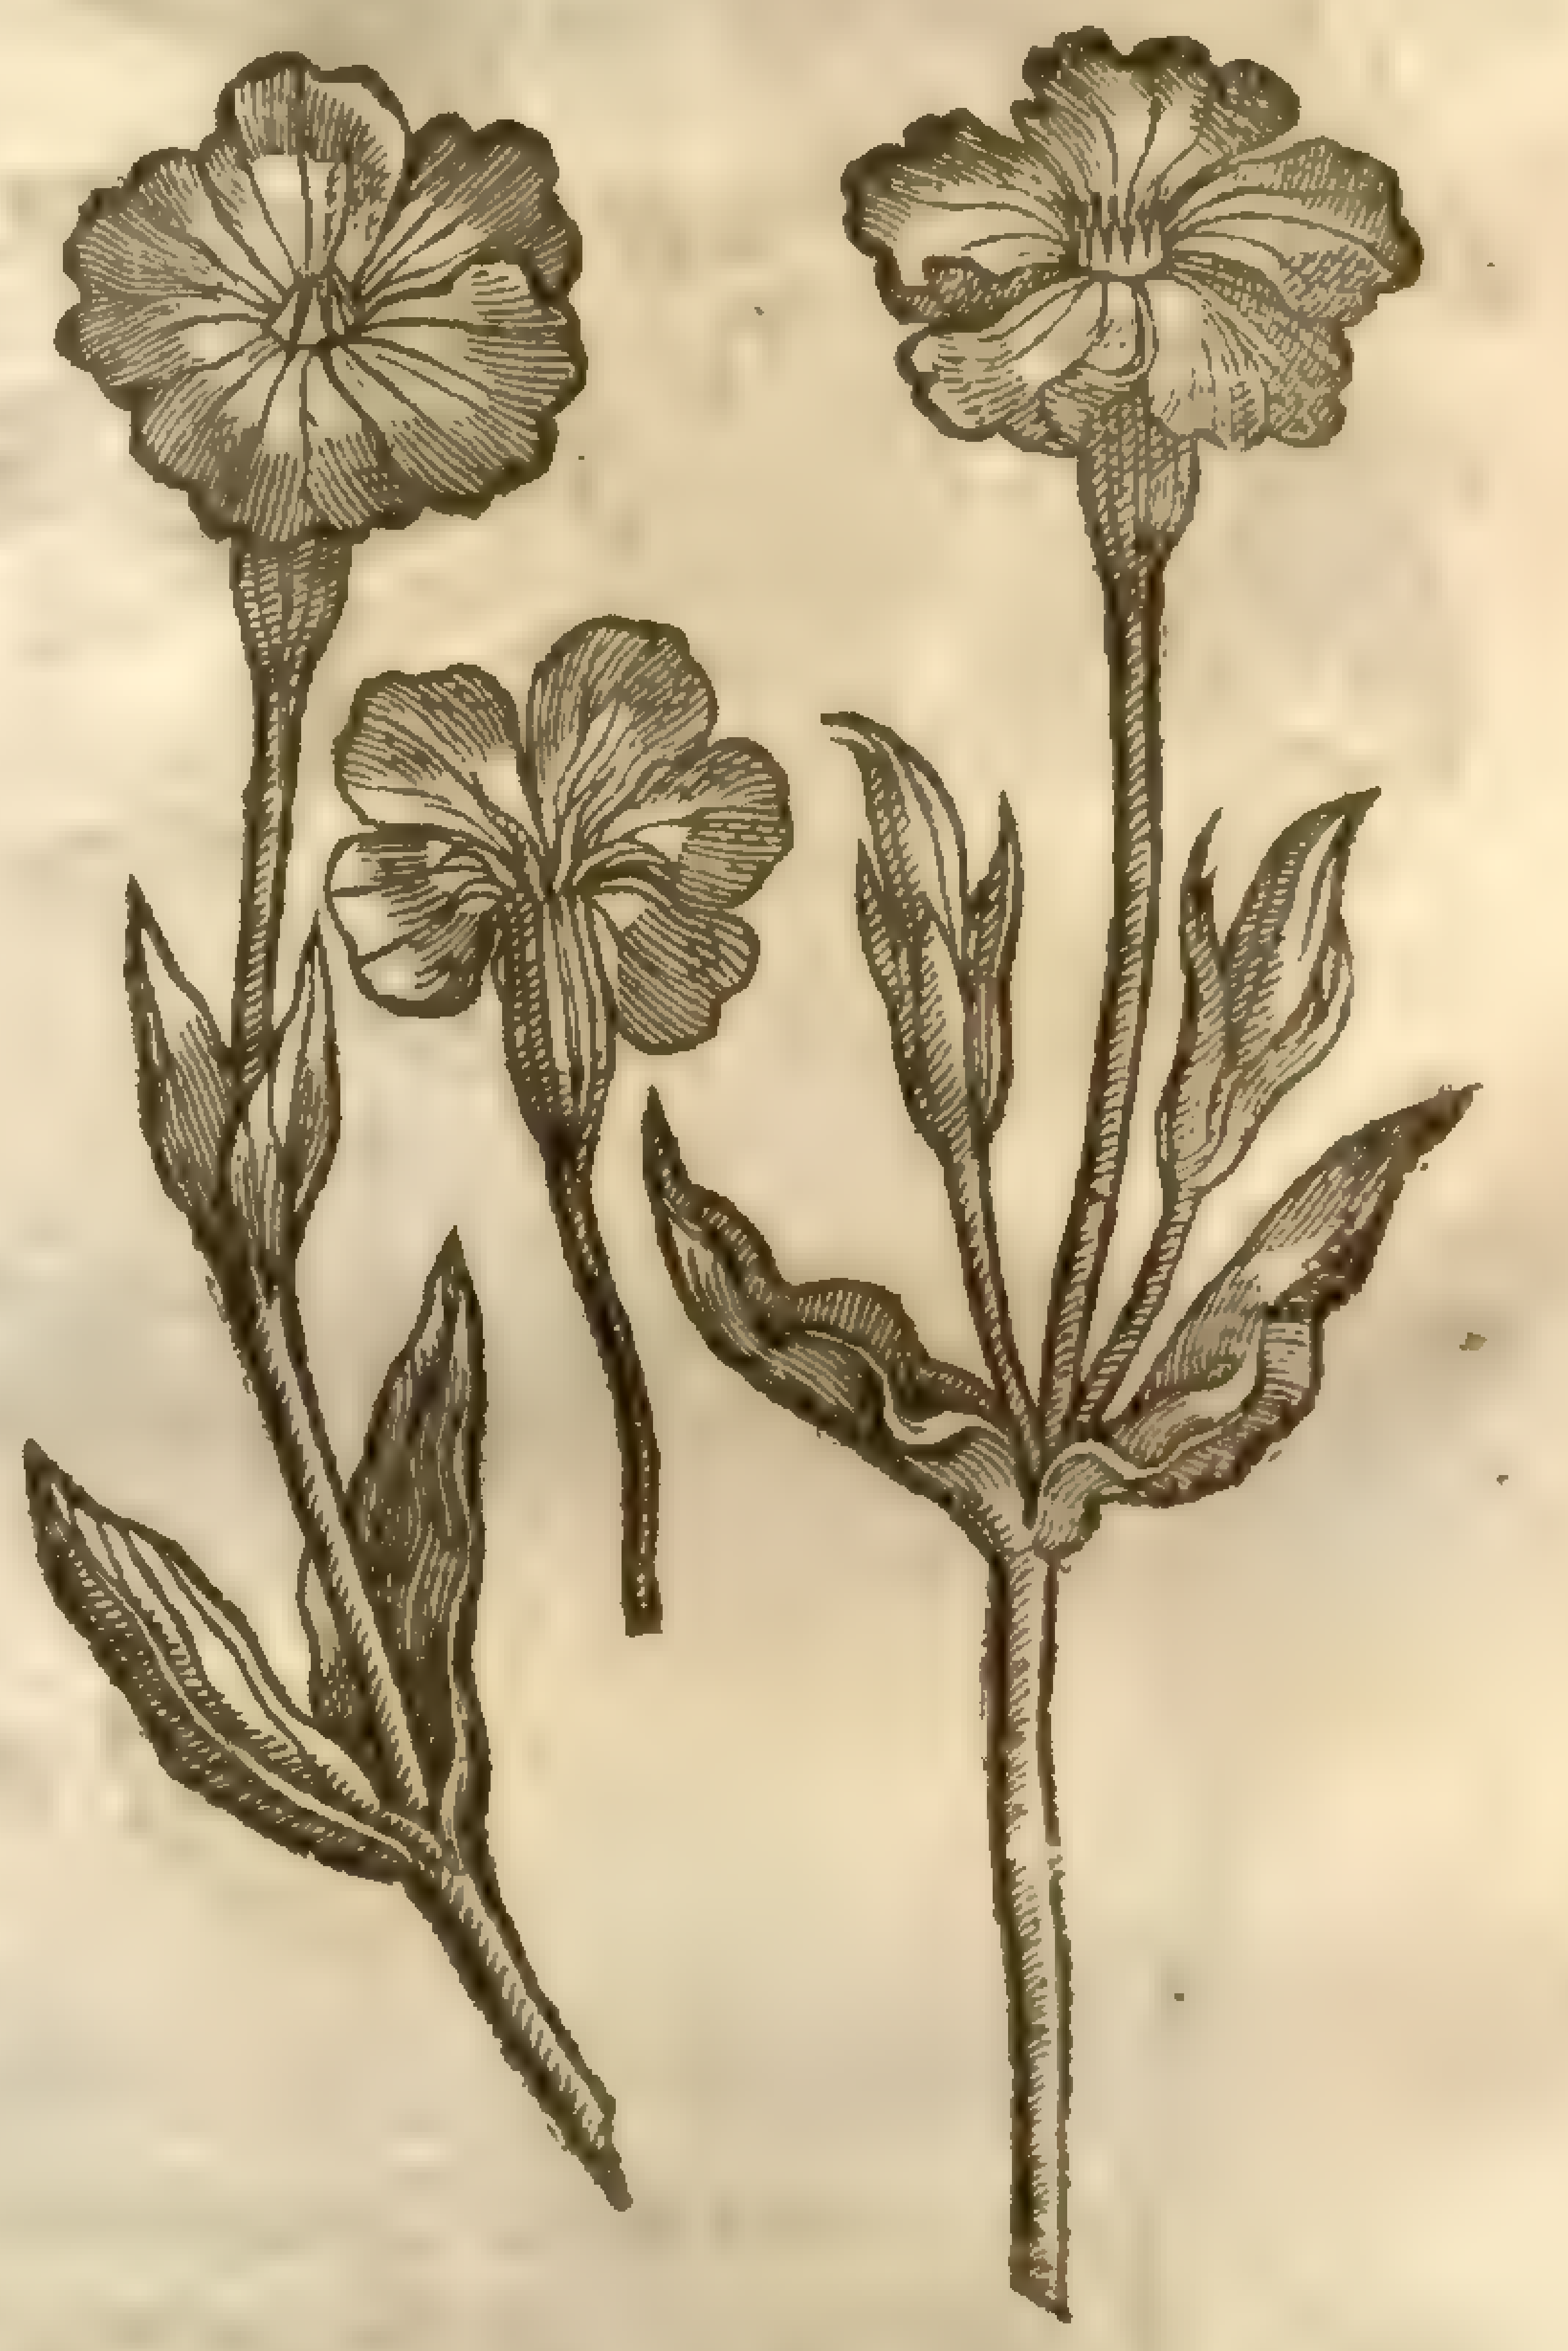
Floure of Conſtantinople, beſides that grace and beauty that it hath in gardens and garlands, is for ought we know of no vſe, the vertues thereof being not as yet found out.

Chap. 126. *Of Roſe Campion.*

1 *Lychnis Coronaria rubra.*
Red Roſe Campion.



2 *Lychnis Coronaria alba.*
White Roſe Campion.



¶ *The Deſcription.*

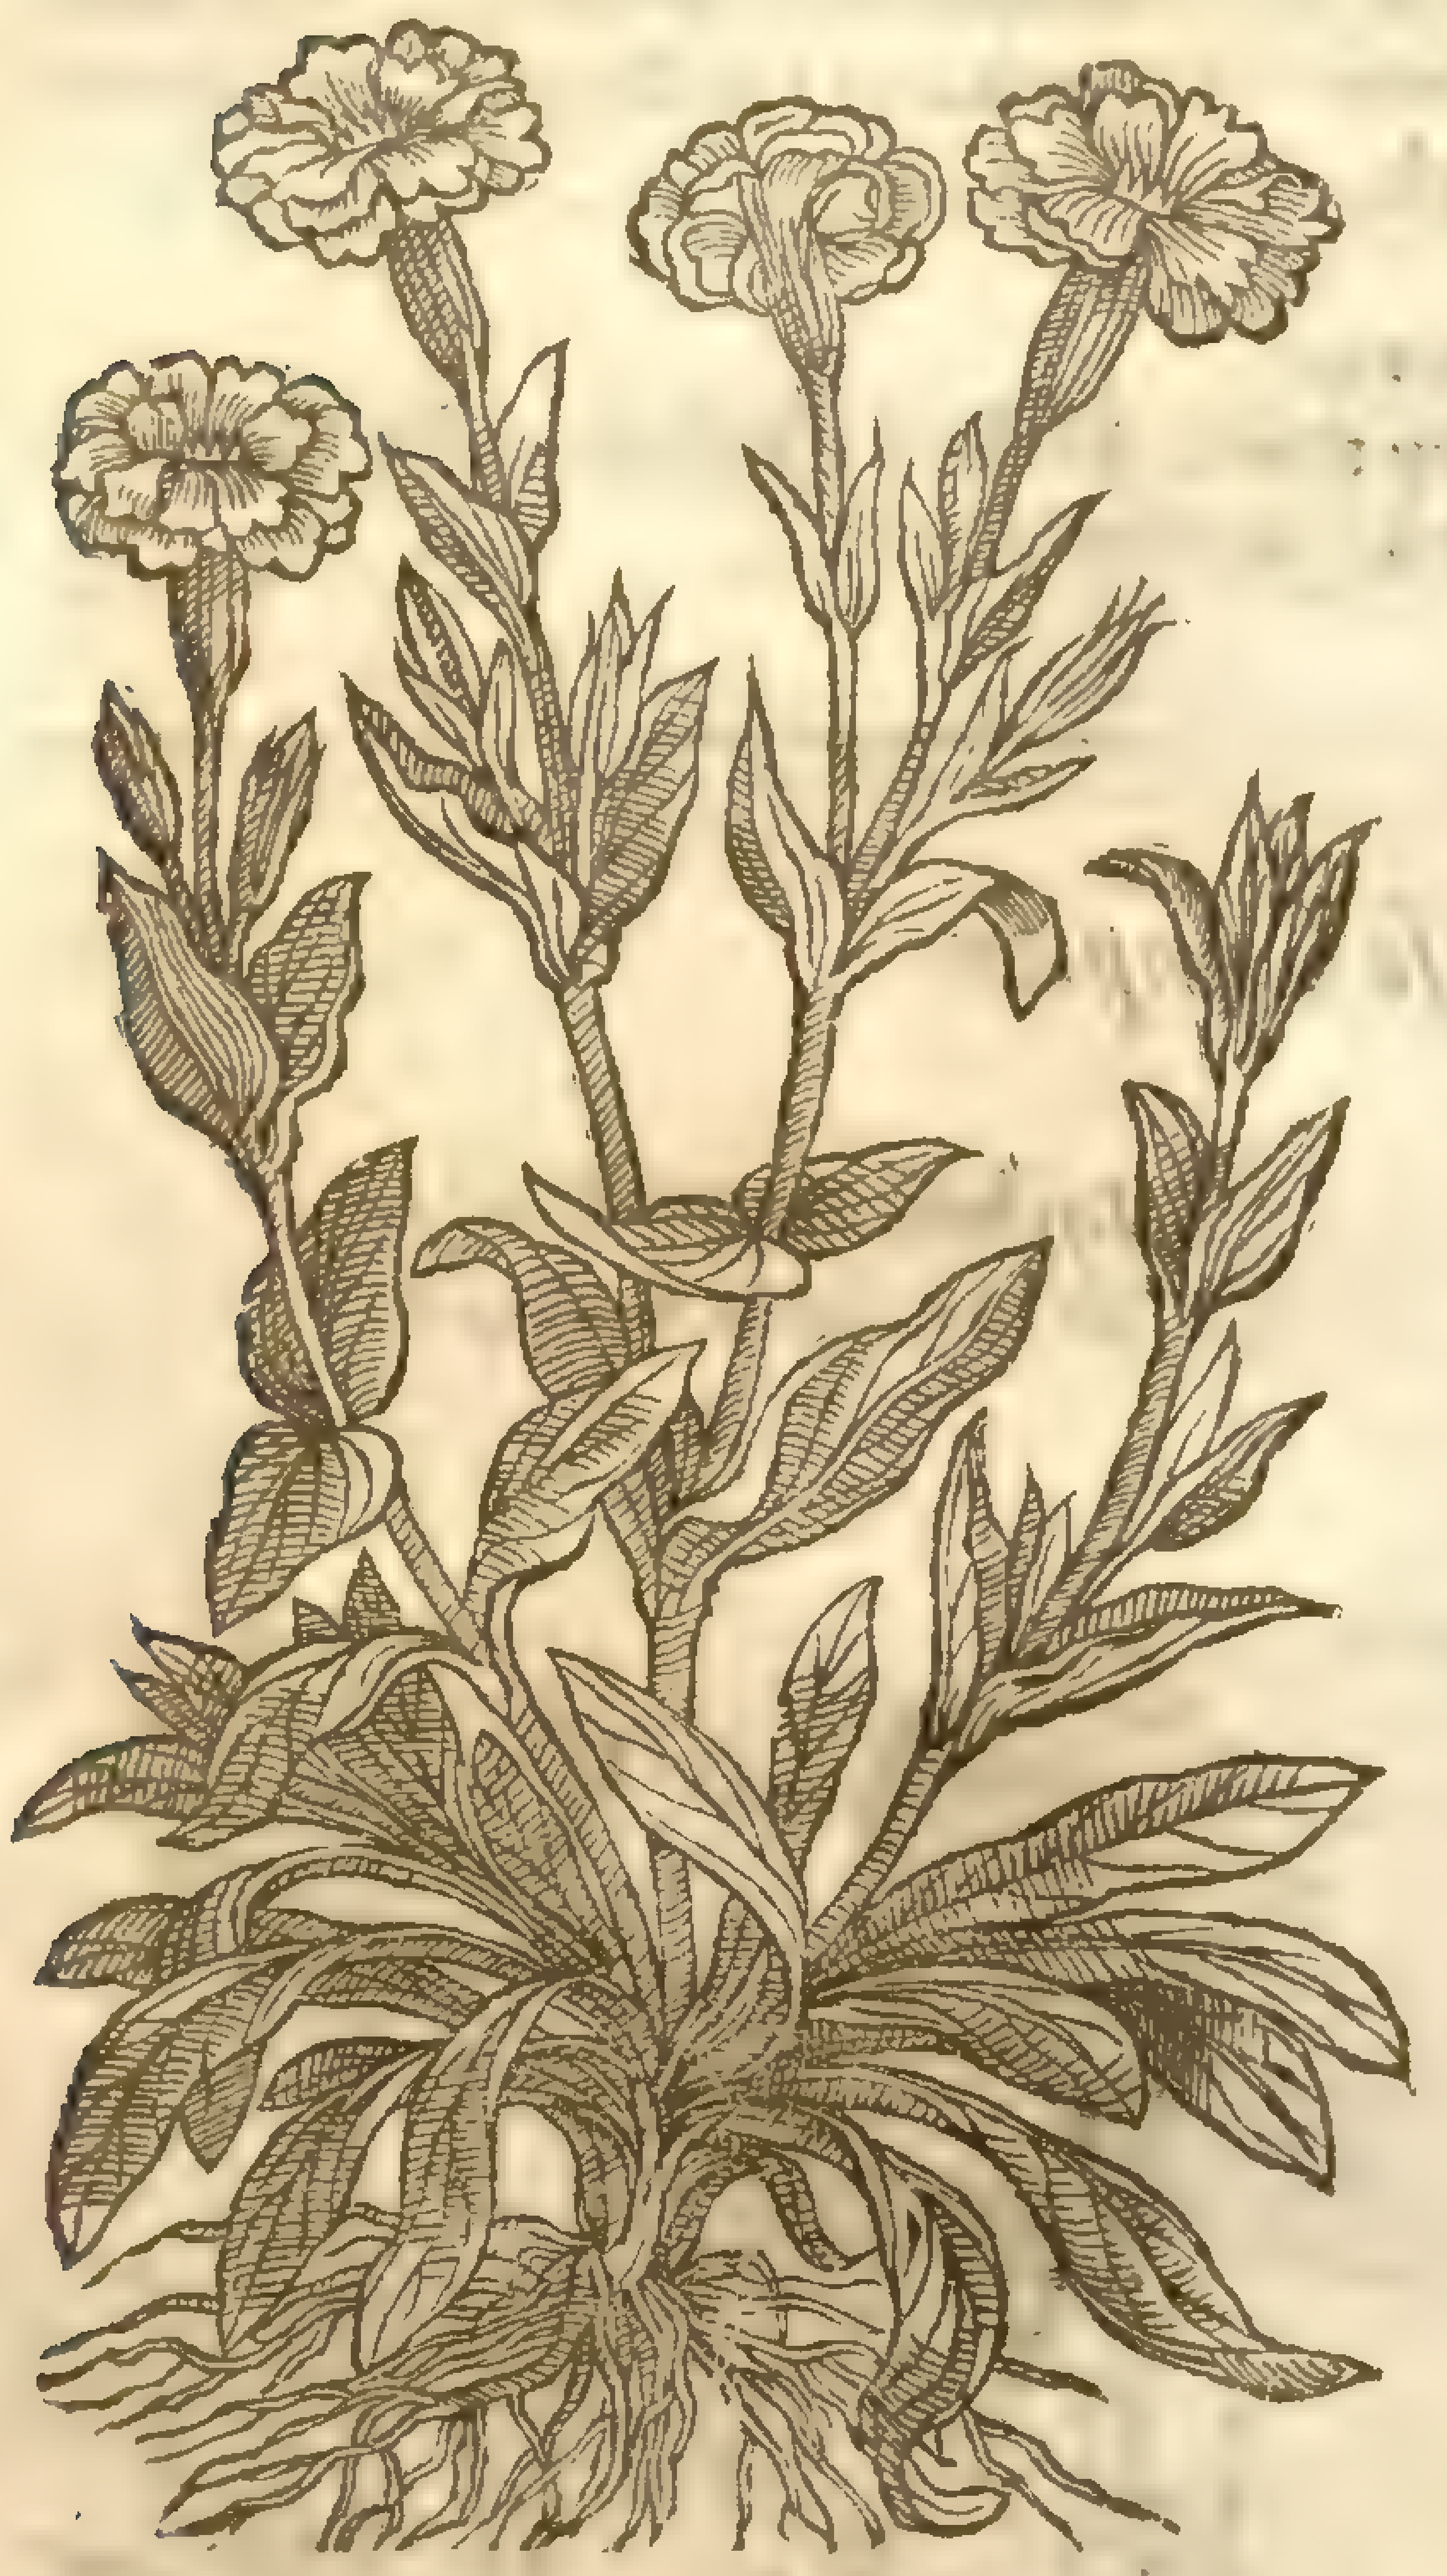
1 The firſt kind of Roſe Campion hath round ſtalks very knotty and woolly, and at euery knot or joint there do ſtand two woolly ſoft leaues like Mullein, but leſſer & much narrower: the floures grow at the top of the ſtalke, of a perfect red colour; which beeing paſt, there follow round cods full of blackiſh ſeed. The root is long and threddy.

2 The ſecond Roſe Campion differs not from the precedent in ſtalks, leaues, or faſhion of the floures; the only difference conſiſts in the colour, for the floures of this plant are of a milke white colour, and the other red.

‡ 3 This alſo in ſtalkes, roots, leaues, and manner of growing differs not from the former, but the floures are much more beautifull, beeing compoſed of ſome three or foure rankes or orders of leaues lying each aboue other. ‡

¶ The

‡ 3 *Lychnis Coronaria multiplex.*
Double Roſe Campion.



¶ *The Place.*

The Roſe Campion groweth plentifully in moſt gardens.

¶ *The Time.*

They floure from Iune to the end of Auguſt.

¶ *The Names.*

The Roſe Campion is called in Latine, ***Dominarum Roſa, Mariana Roſa, Cæli Roſa, Cæli flos*** : of *Dioſcorides*, λυχνὶς στεφανωματικὴ : that is, *Lychnis Coronaria* or *ſativa* : *Gaza* tranſlateth λυχνίδα, *Lucernula* ; becauſe the leaues thereof be ſoft, & fit to make weeks for candles, according to the teſtimony of *Dioſcorides*, it was called *Lychnis* or *Lychnides*, that is, a Torch or ſuch like light, according to the ſignification of the word, cleere, bright, and light-giuing floures : and therefore they were called the Gardeners Delight, or the Gardeners Eye : in Dutch, **Chriſtes eie** : in French, *Oeillets* and *Oeilets Dieu* : in high-Dutch, **Marien roſzlin**, and **Himmel roſzlin.**

¶ *The Nature.*

The ſeed of Roſe Campion, ſaith *Galen*, is hot and dry after a ſort in the ſecond degree.

¶ *The Vertues.*

The ſeed drunk in wine is a remedy for them that are ſtung with a ſcorpion, as *Dioſcorides* teſtifieth.

Chap. 127.

Of wilde Roſe Campion.

¶ *The Deſcription.*

1 THe wild Roſe Campion hath many rough broad leaues ſomewhat hoary and woolly; among which riſe vp long ſoft and hairy ſtalks branched into many armes, ſet with the like leaues, but leſſe. The floures grow at the top of the ſtalks, compact of fiue leaues of a reddiſh colour : the root is thicke and large, with ſome threds anexed thereto.

‡ There alſo growes commonly wilde with vs another of this kind with white floures, as alſo another that hath them of a light bluſh color. ‡

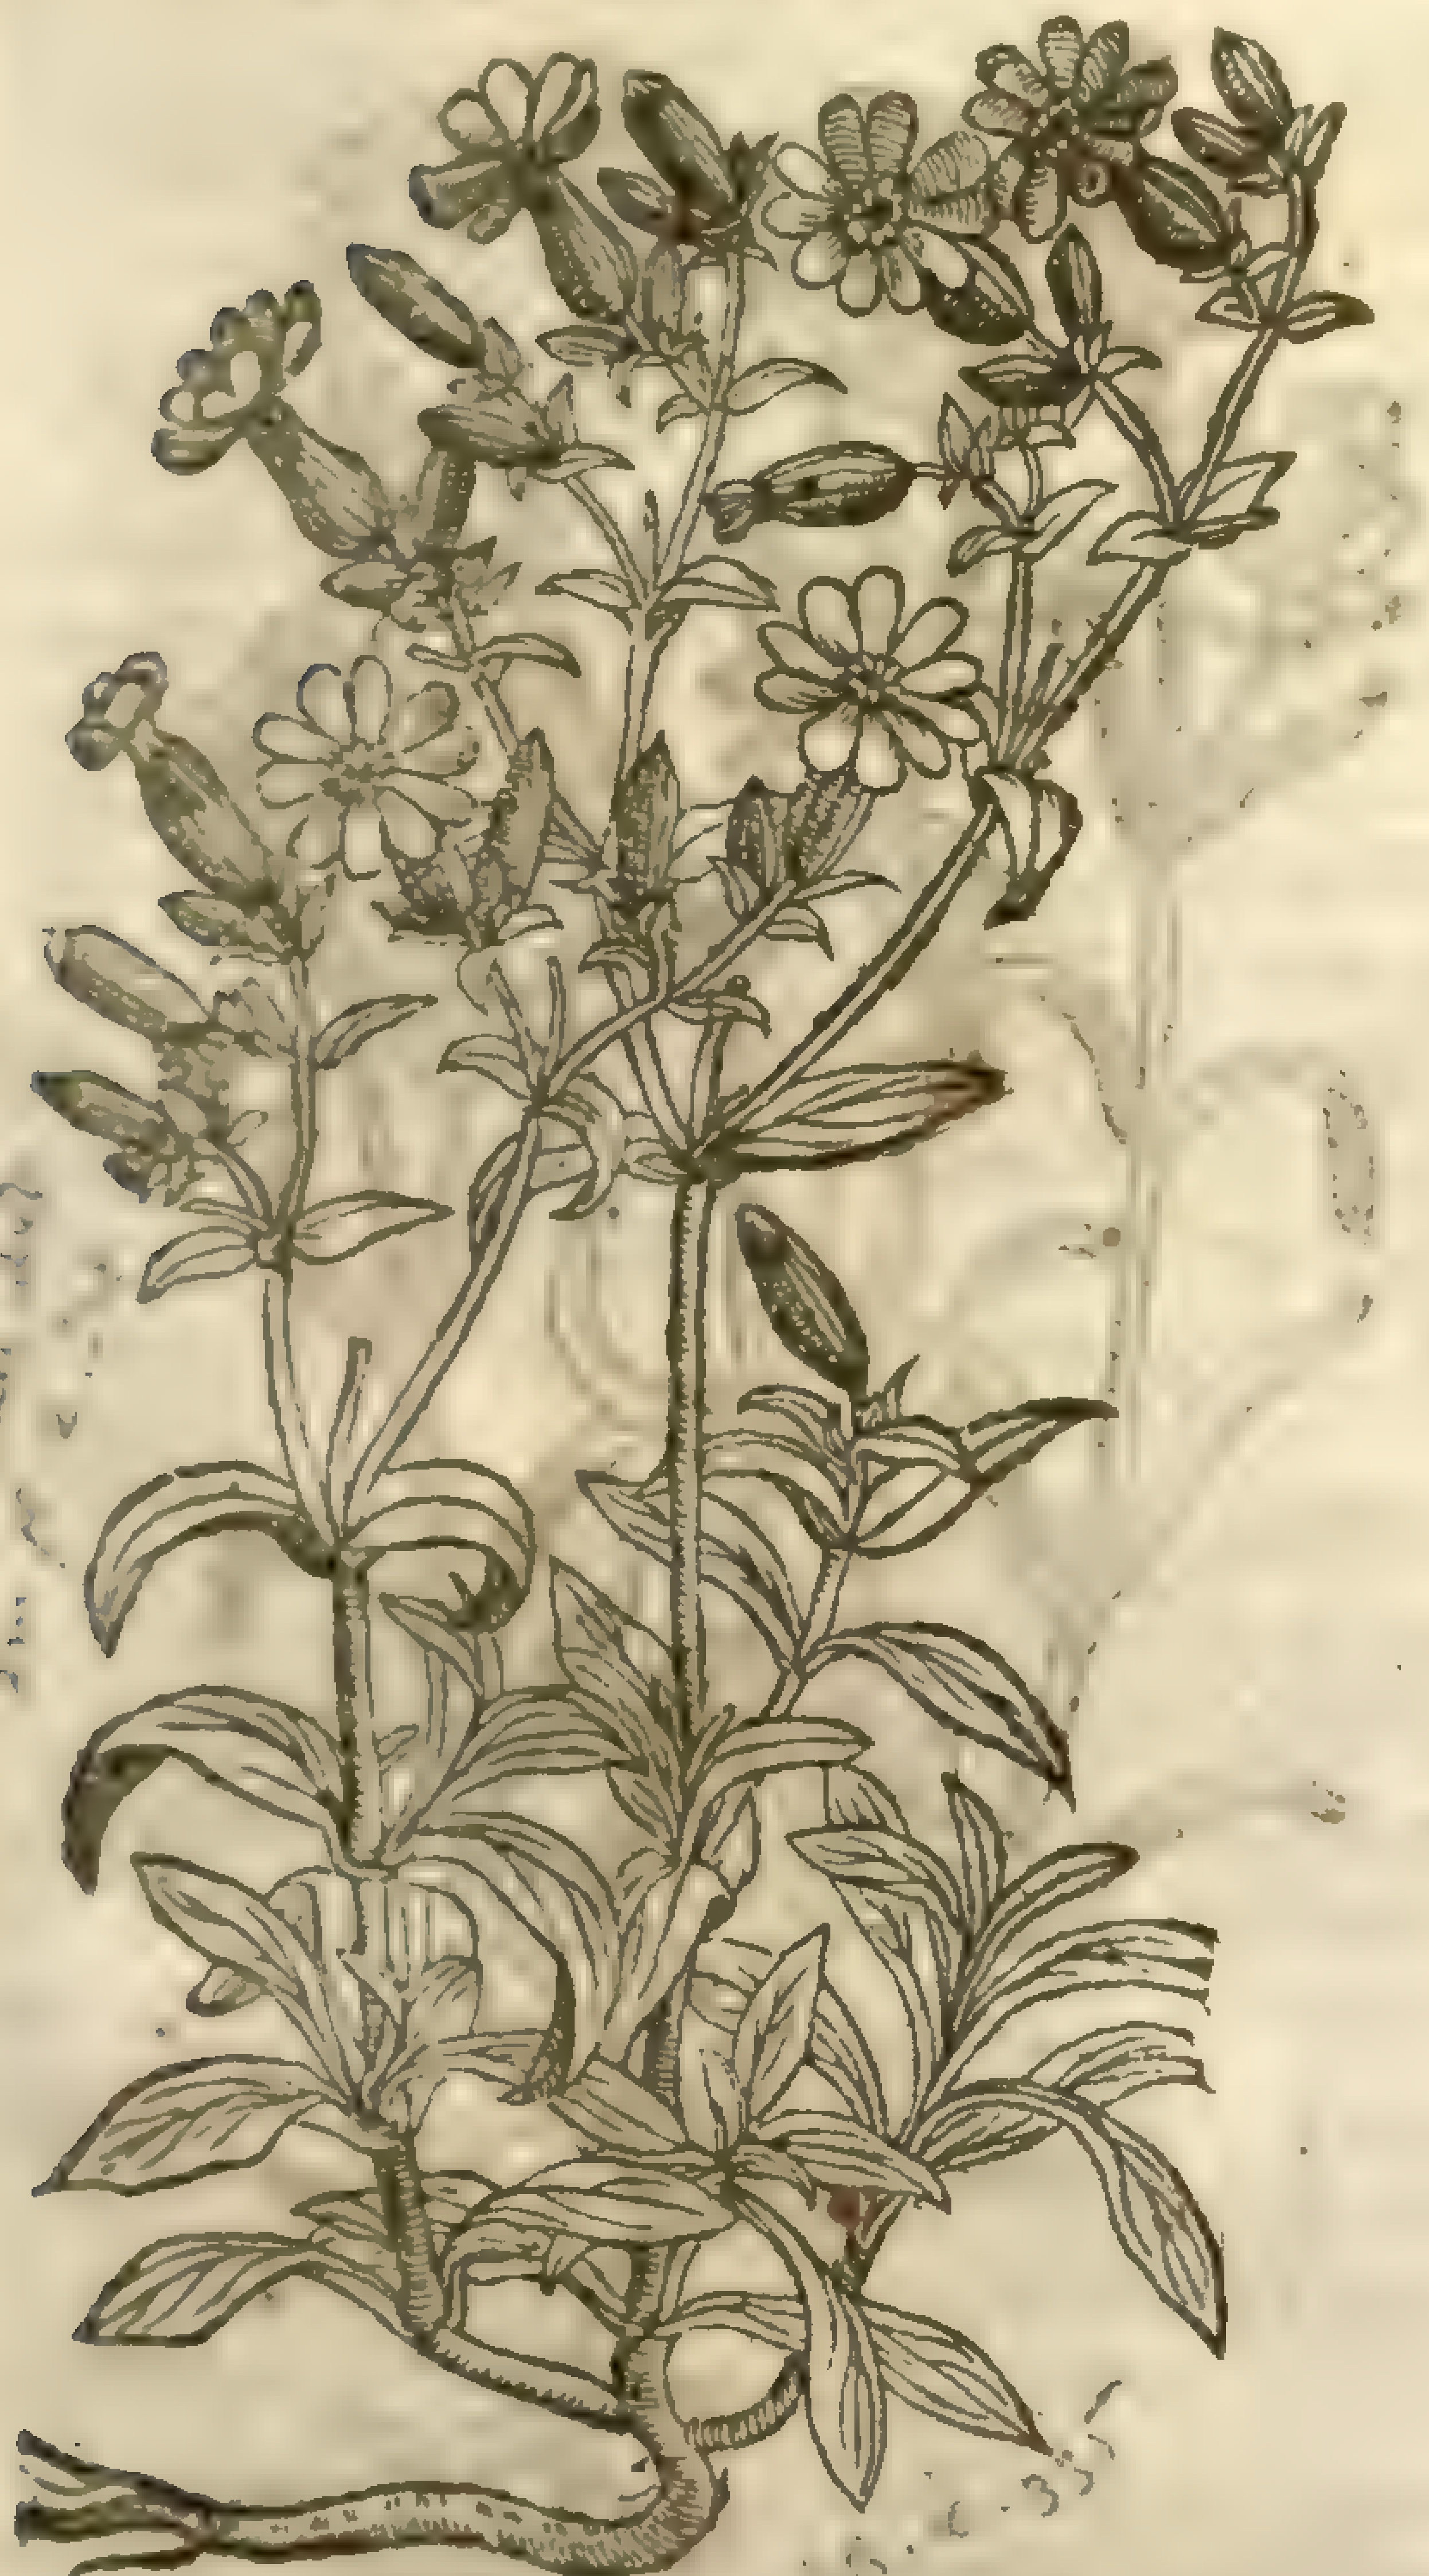
2 The ſea Roſe Campion is a ſmal herb, ſet about with many green leaues from the lower part vpward ; which leaues are thicke, ſomewhat leſſer and narrower than the leaues of ſea Purſlane. It hath many crooked ſtalks ſpred vpon the ground a foot long, in the vpper part whereof there is a ſmall white floure in faſhion and ſhape like a little cup or box, after the likeneſſe of *Behen album* or Spatling Poppy, hauing within the ſaid floure little threds of a blacke colour, in taſte ſalt, yet not vnpleaſant.

Mr *Tho. Hesket* reported vnto me, that by the ſea ſide in Lancaſhire from whence this plant came, there is another ſort hereof with red floures.

‡ 3 This brings many ſtalks from one root, round, long, and weaker than thoſe of the firſt deſcribed, lying vſually vpon the ground : the leaues grow by couples at each joint, long, ſoft, & hairy ; among which alternatly grow the floures, about the bigneſſe of thoſe of the firſt deſcribed, and of a bluſh colour ; and they are alſo ſucceeded by ſuch ſeed-veſſels, containing a reddiſh ſeed. The root is thicke and fibrous, yet commonly outliues not the ſecond yeare.

† 1 *Lychnis*

† 1 *Lychnis ſylveſtris rubello flore.*
Red wilde Campion.

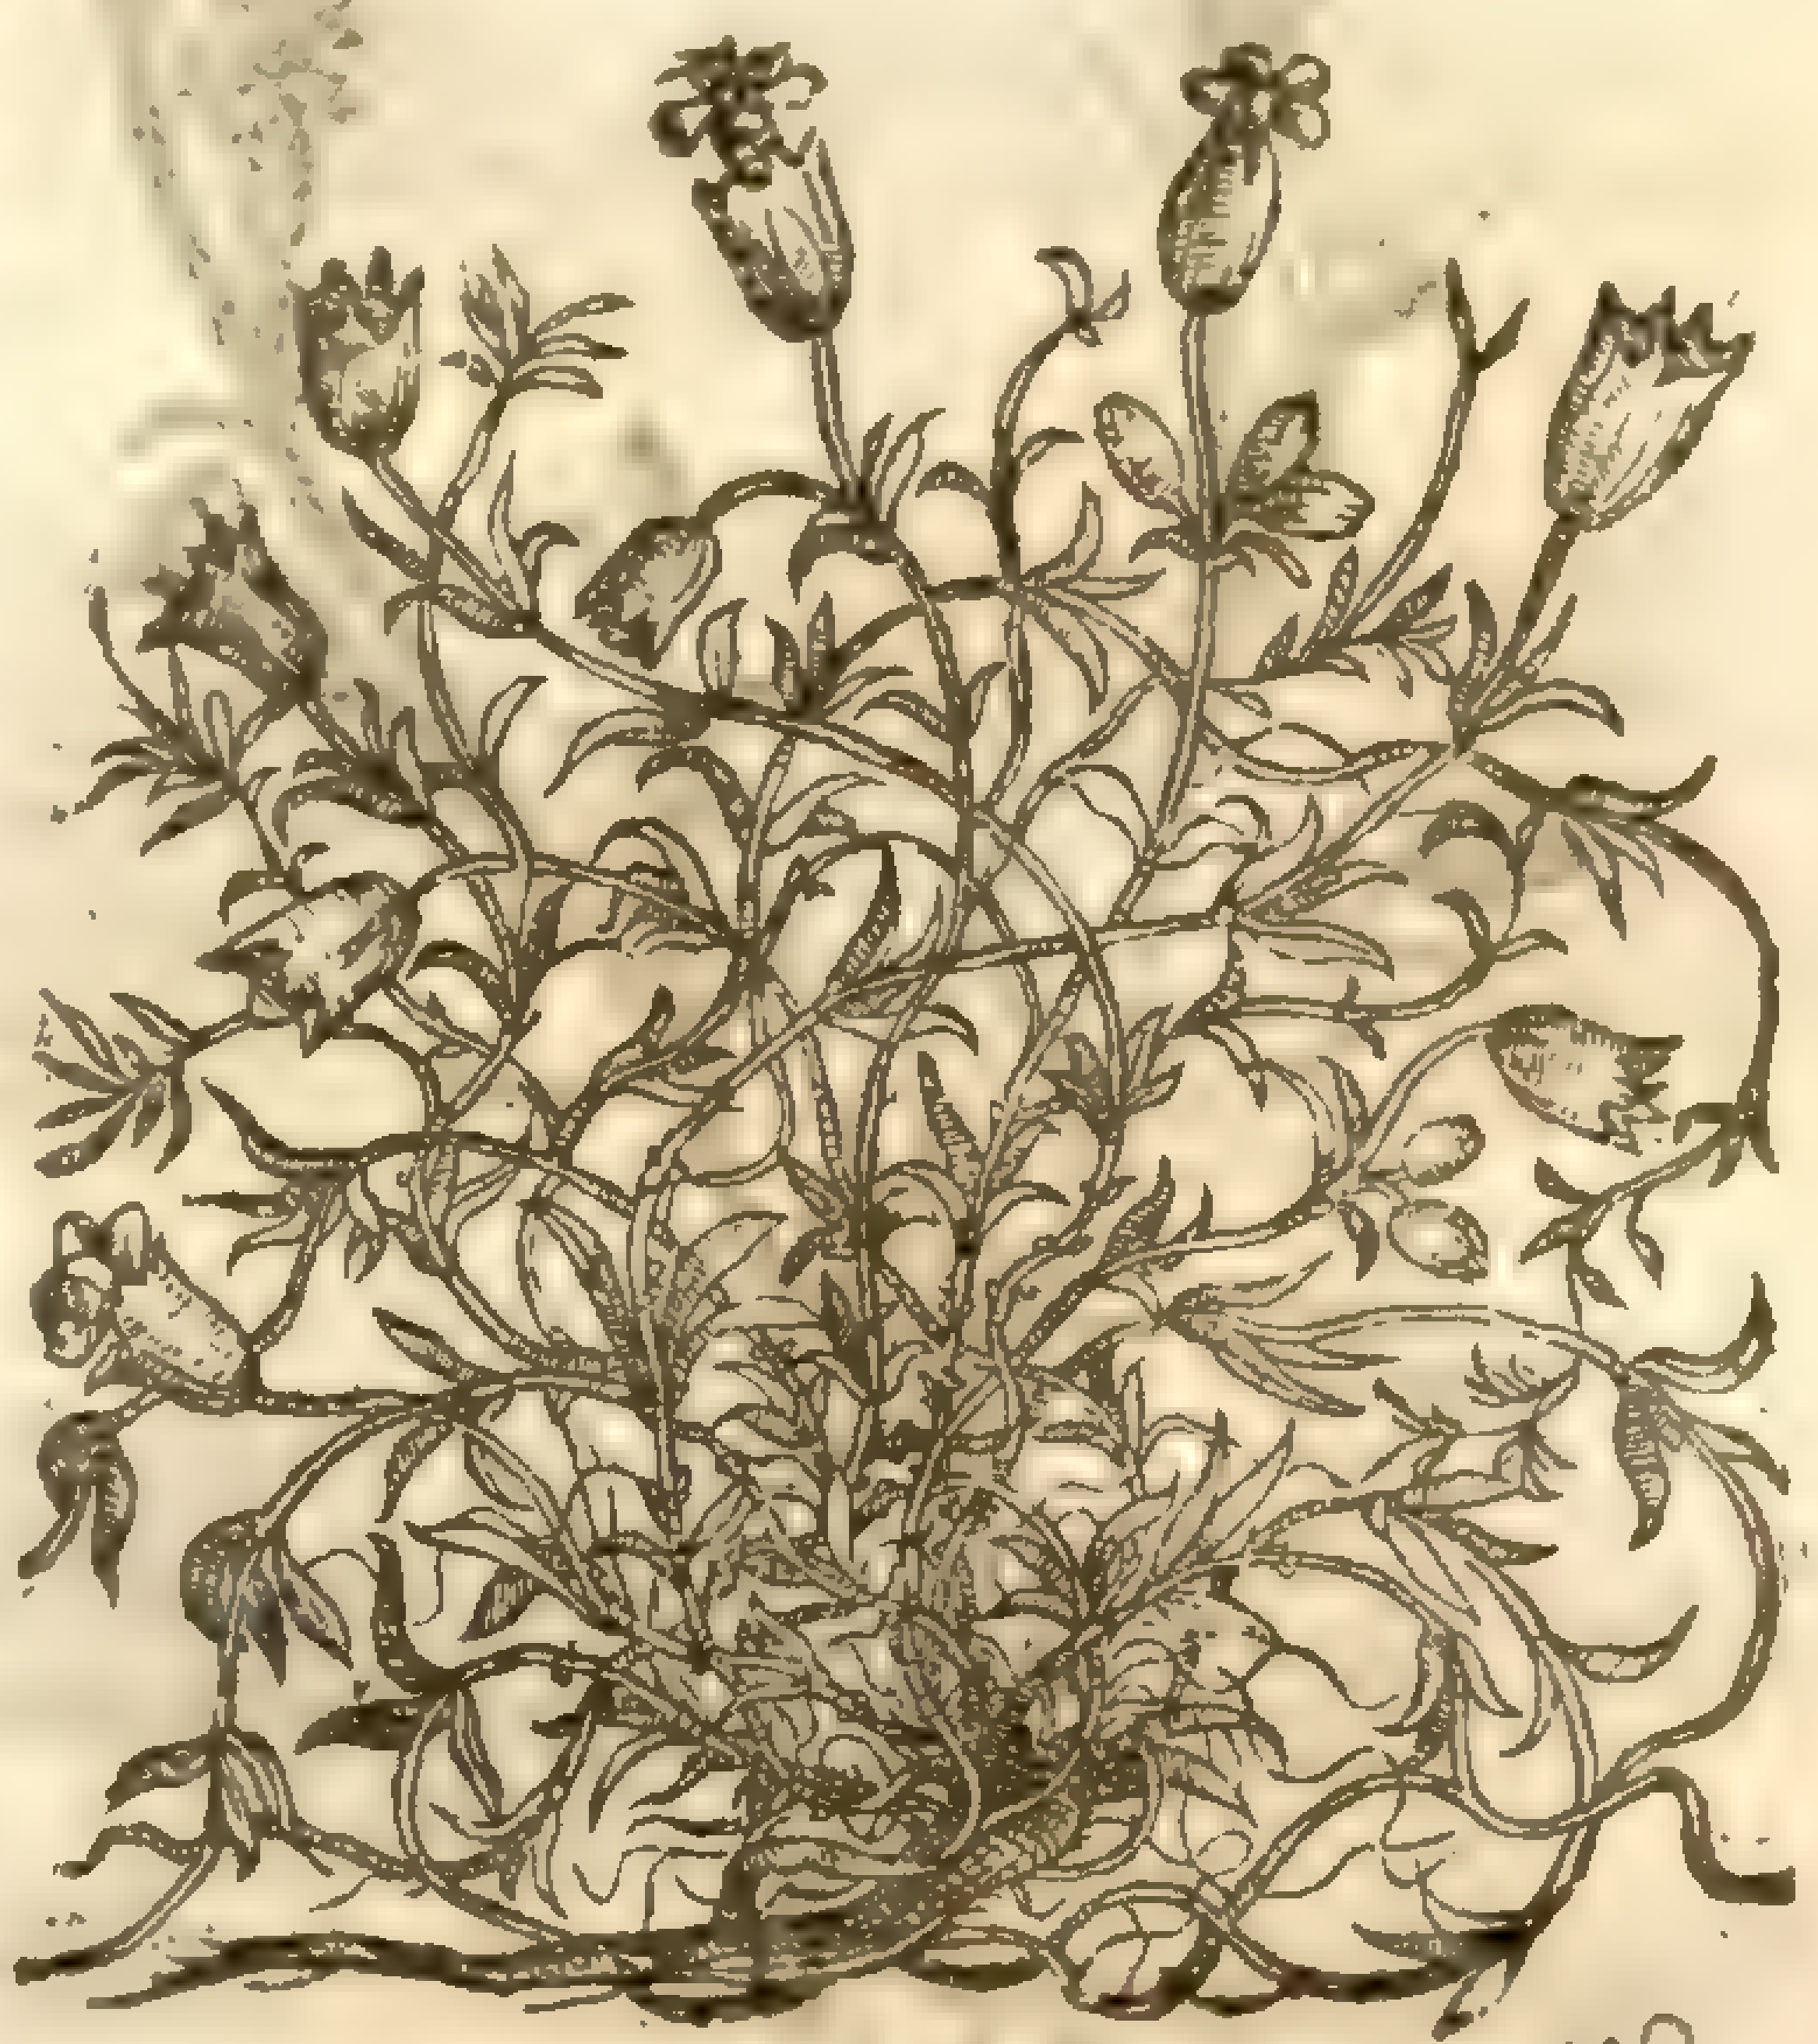


Ger. ic. 335

2 *Lychnis marina Anglica.*
English Sea Campion.

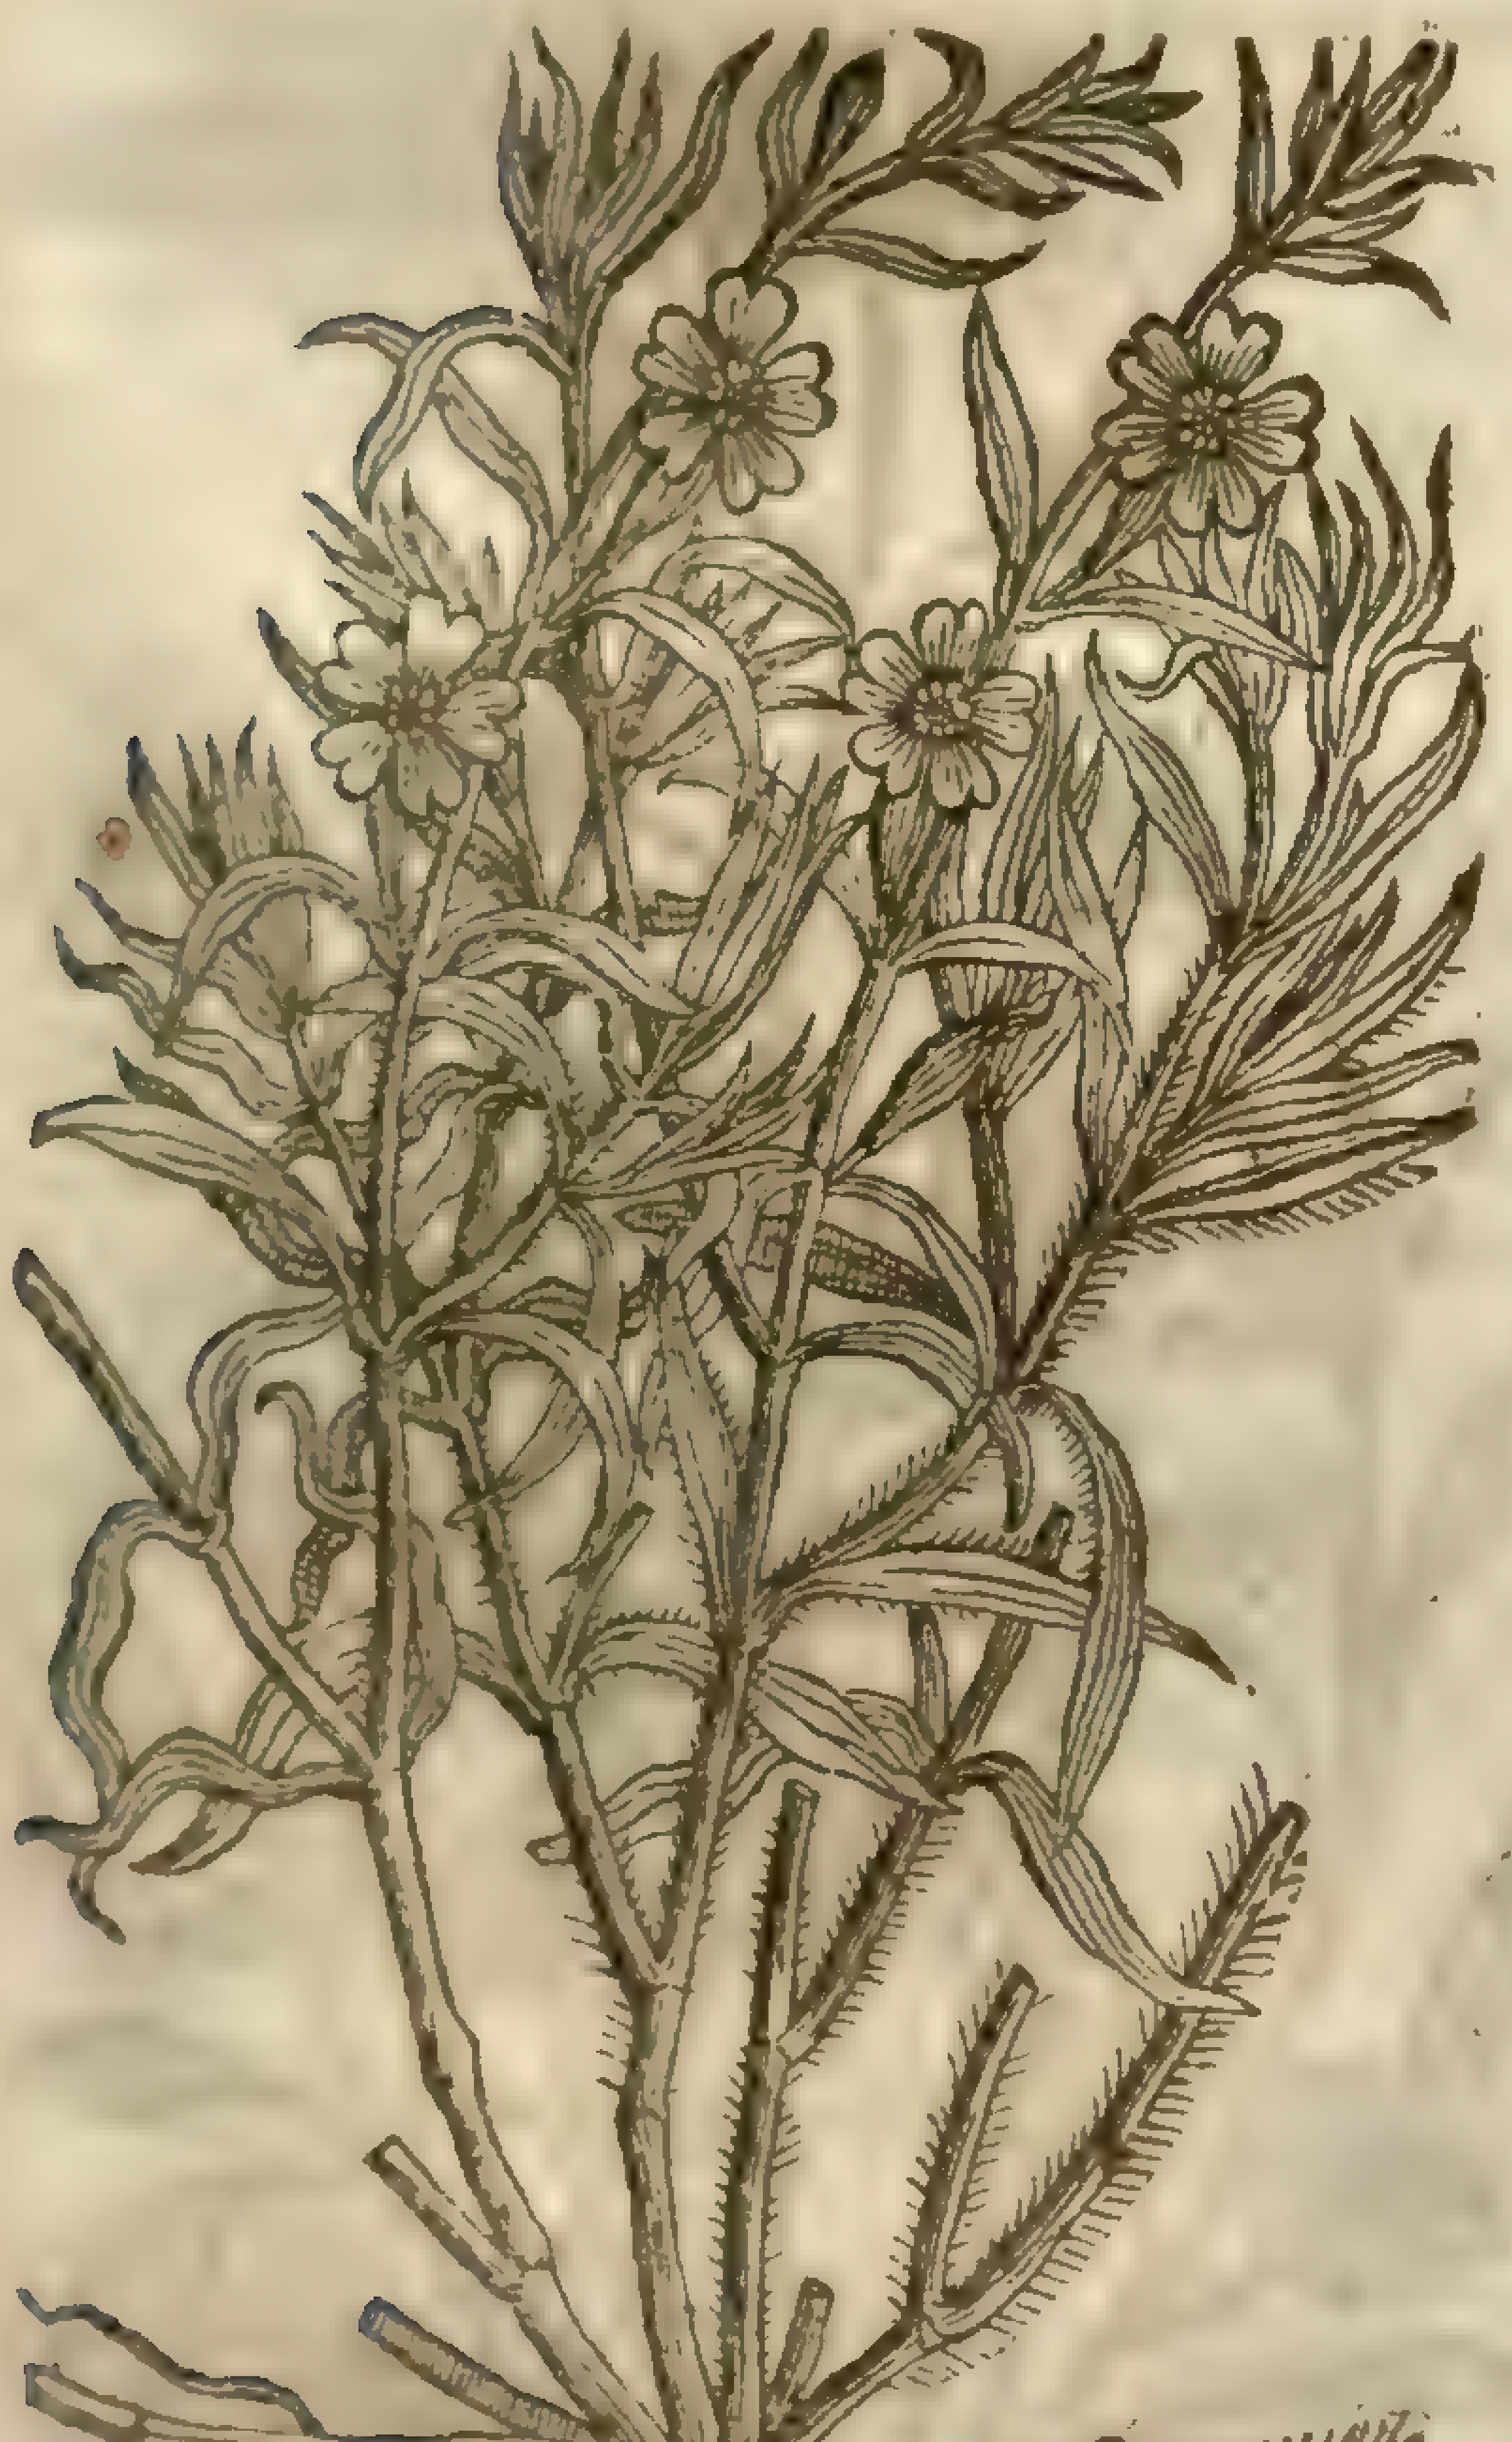
Silene maritima, With. Sm. p. 2. 293

Cucubalus behen b [illegible]

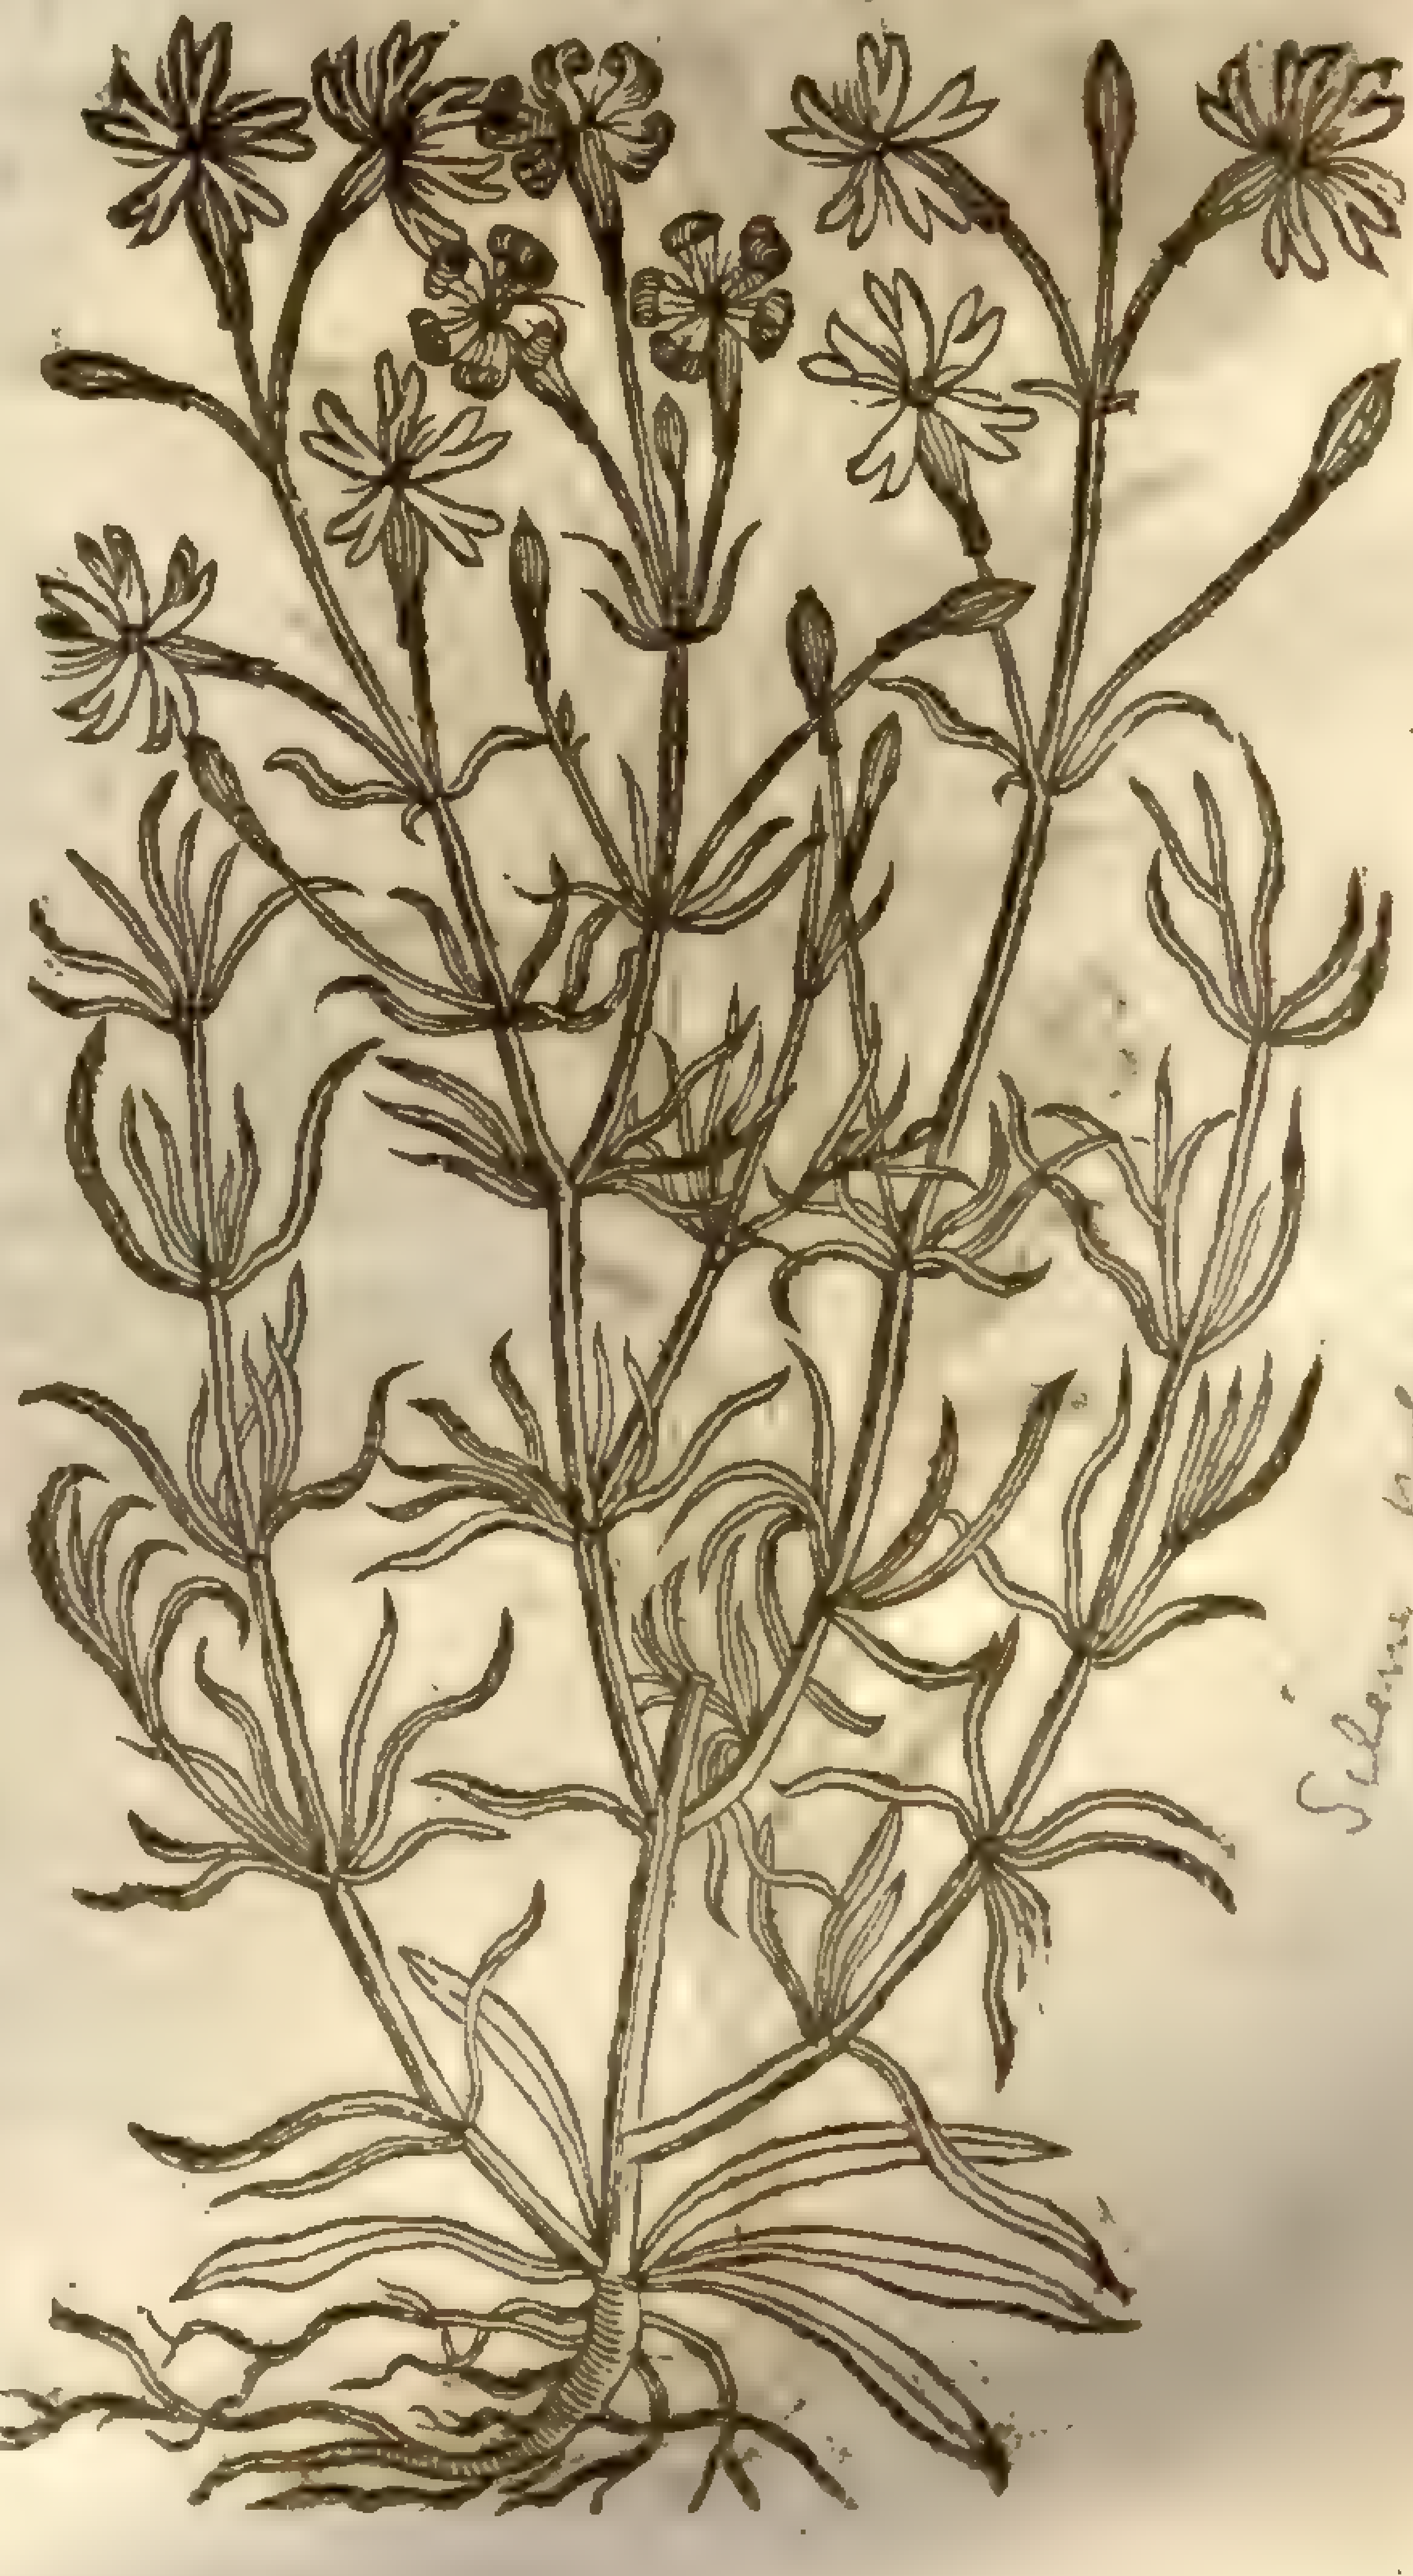


Ger. ic. 337

3 *Lychnis ſylveſtris hirta 5. Cluſij.*
Wilde hairy Campion.

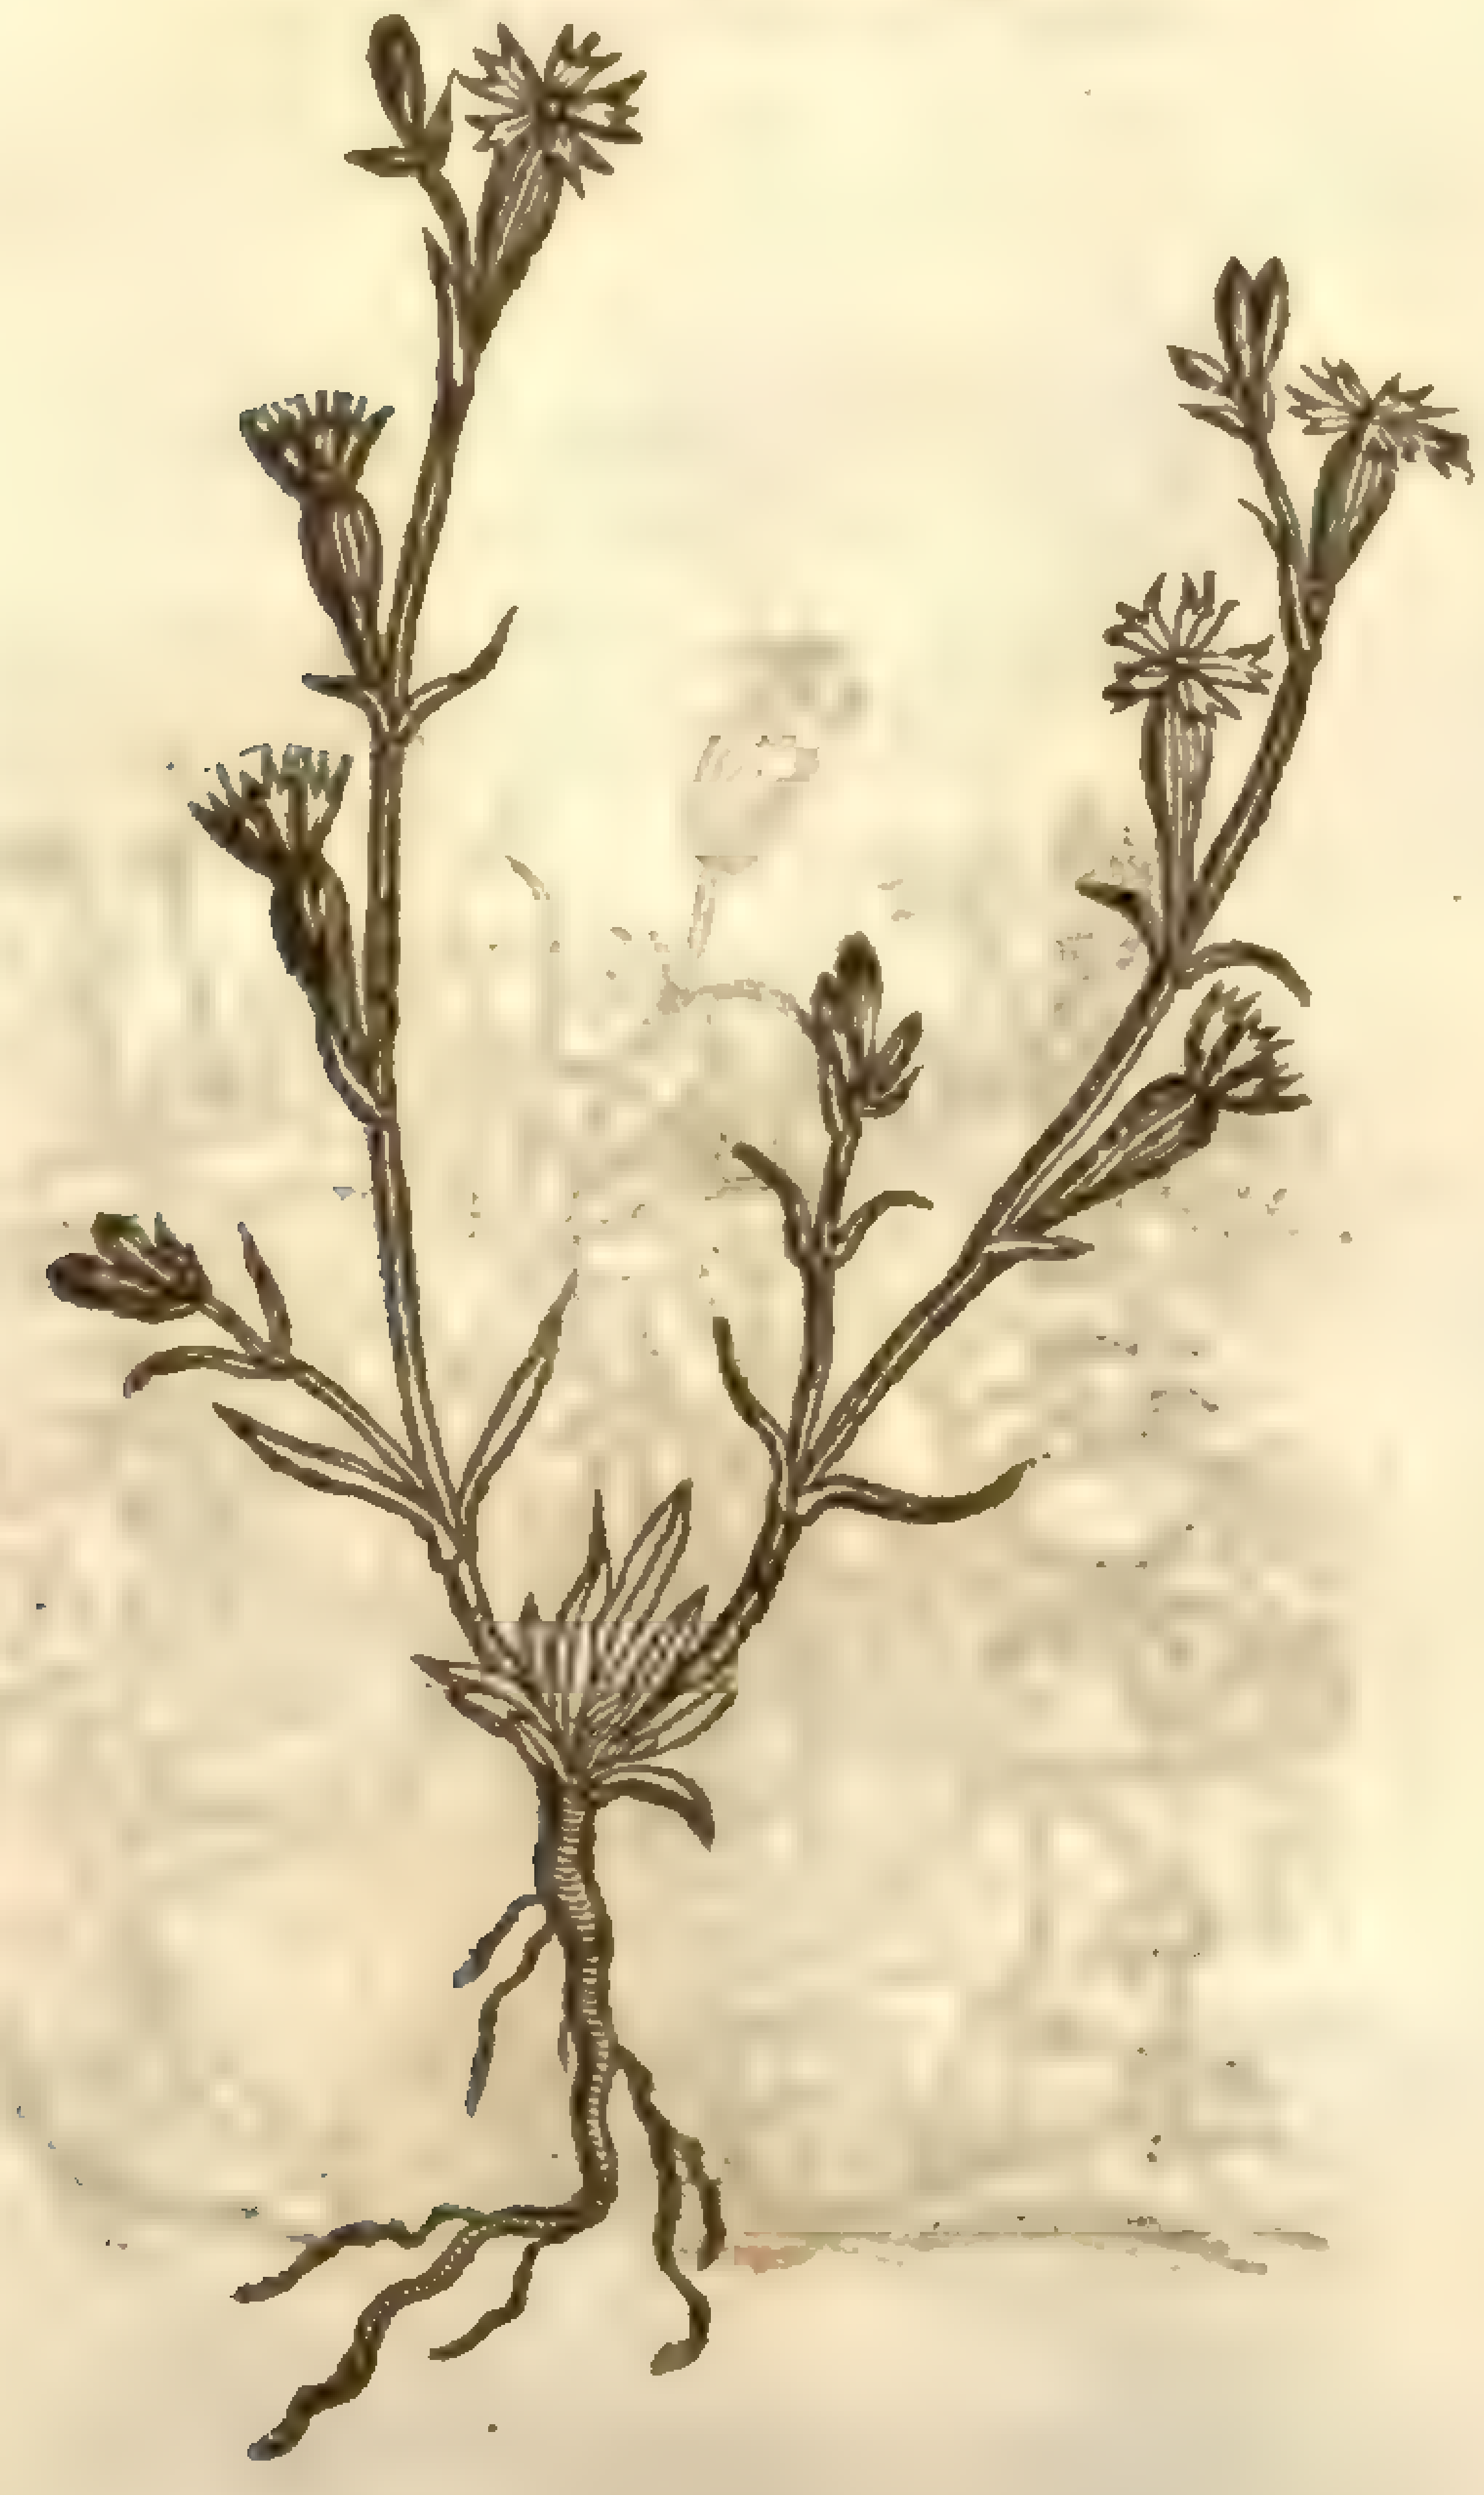


4 *Lychnis ſylveſtris 8. Cluſij.*
Hoary wilde Campion.

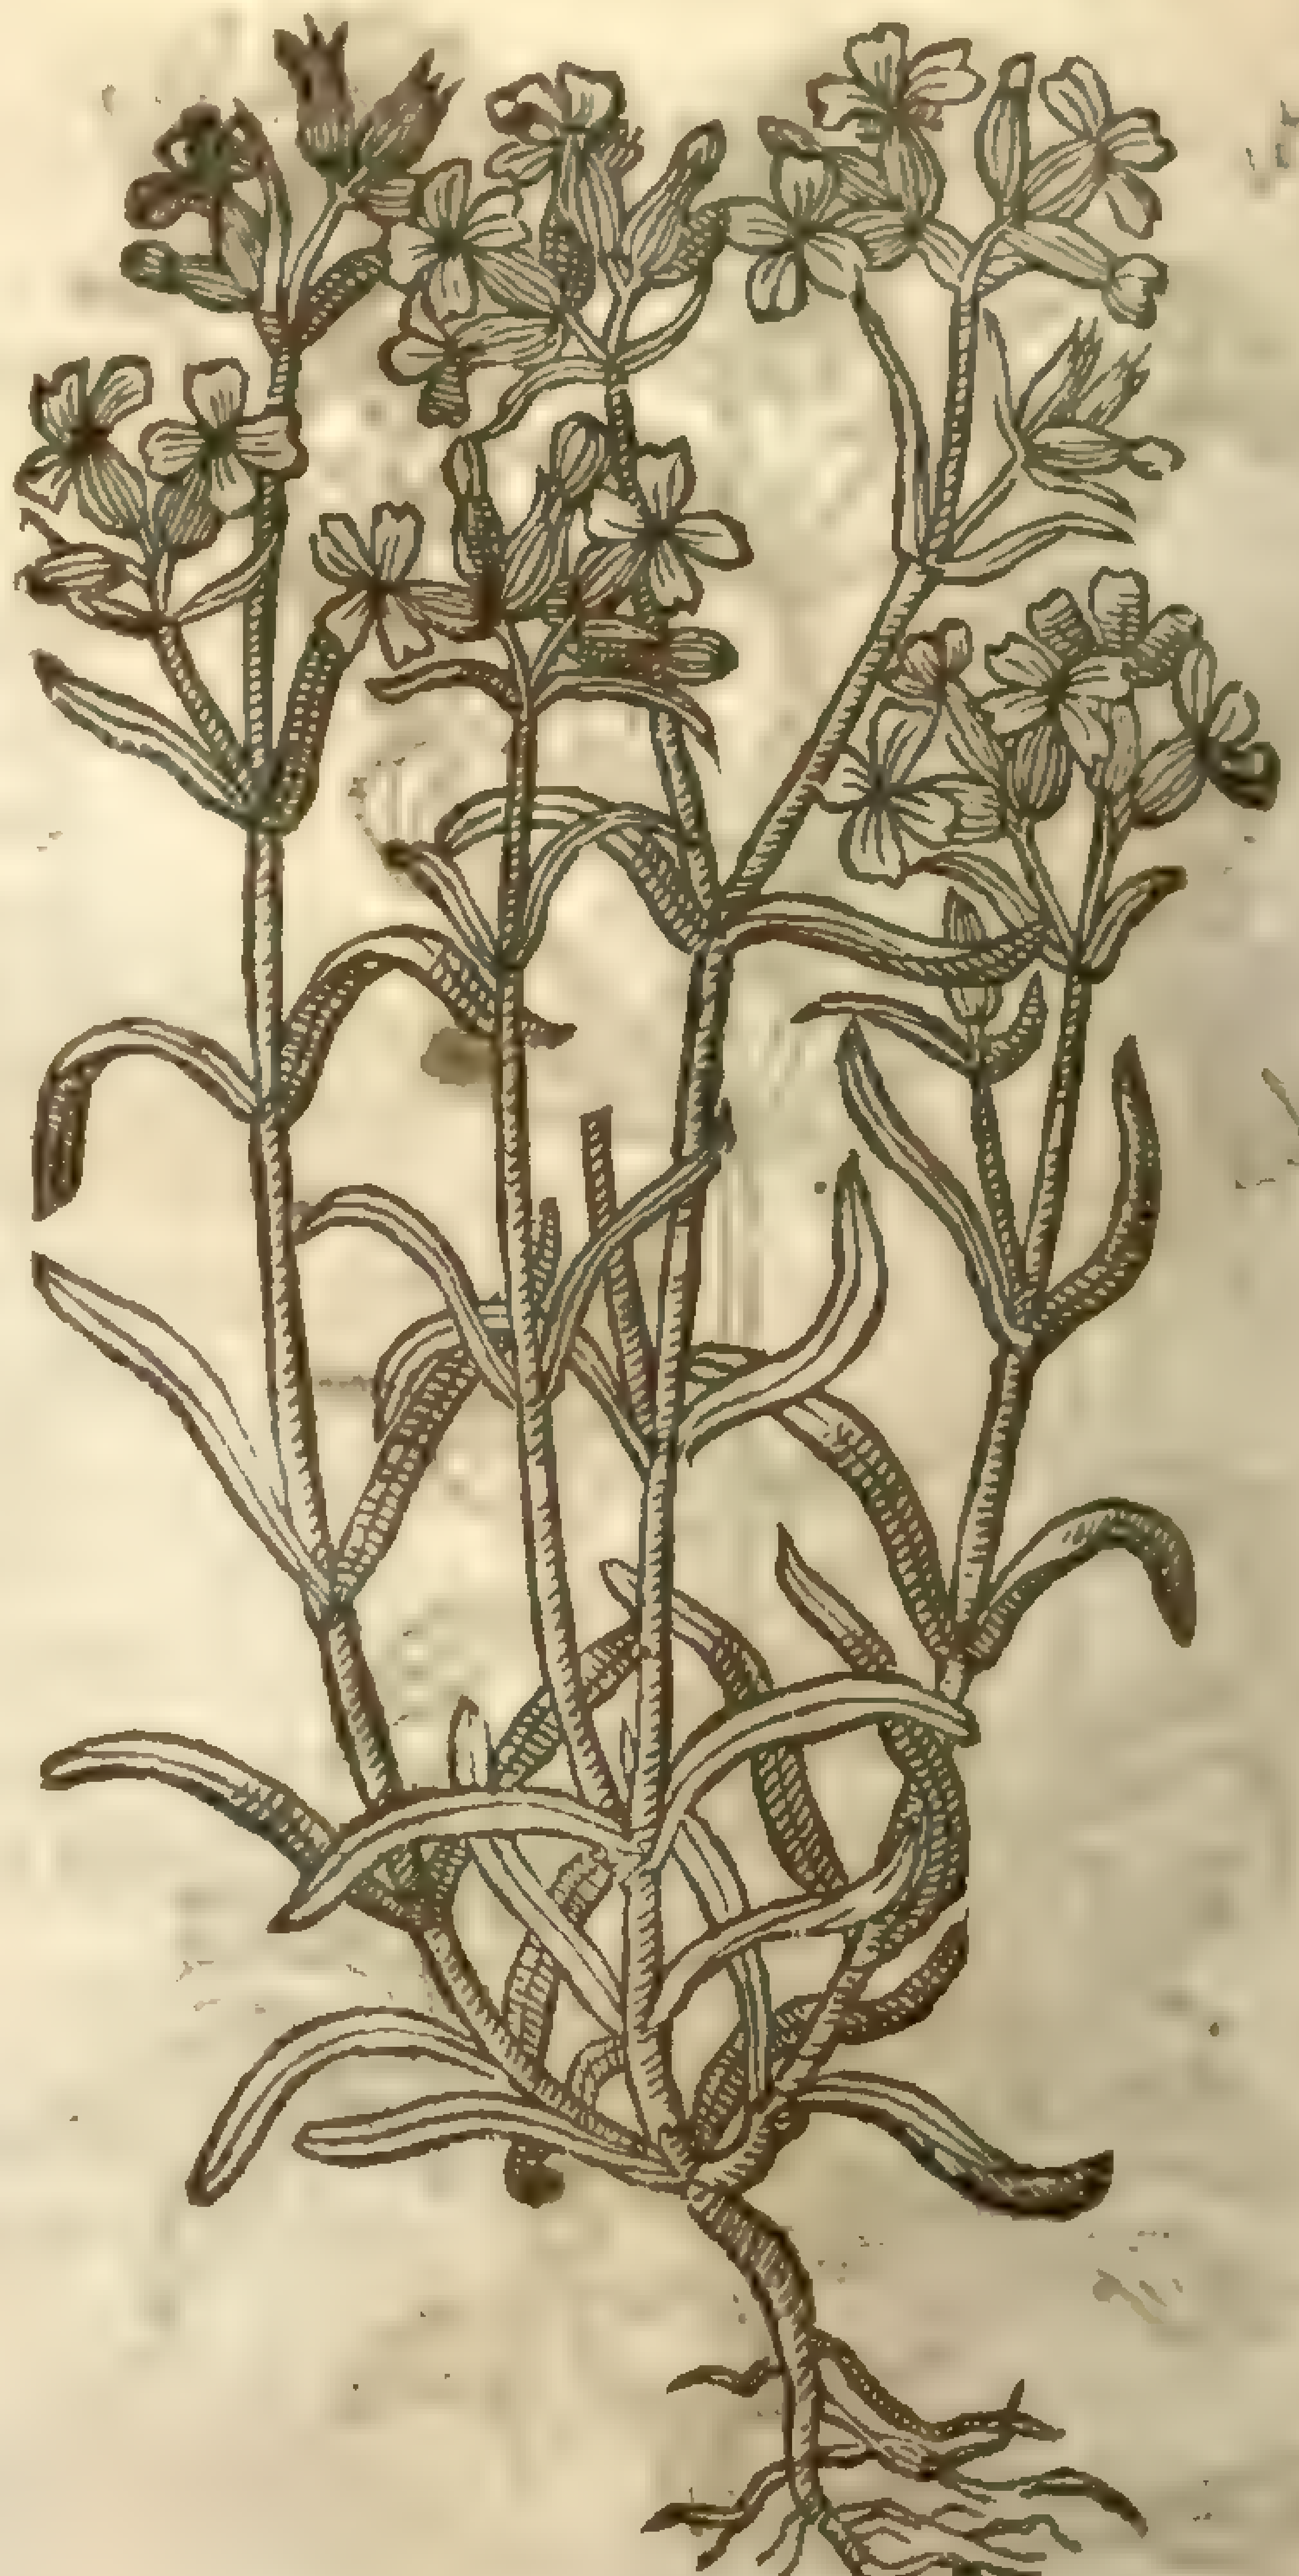


Silene polyphylla [illegible]

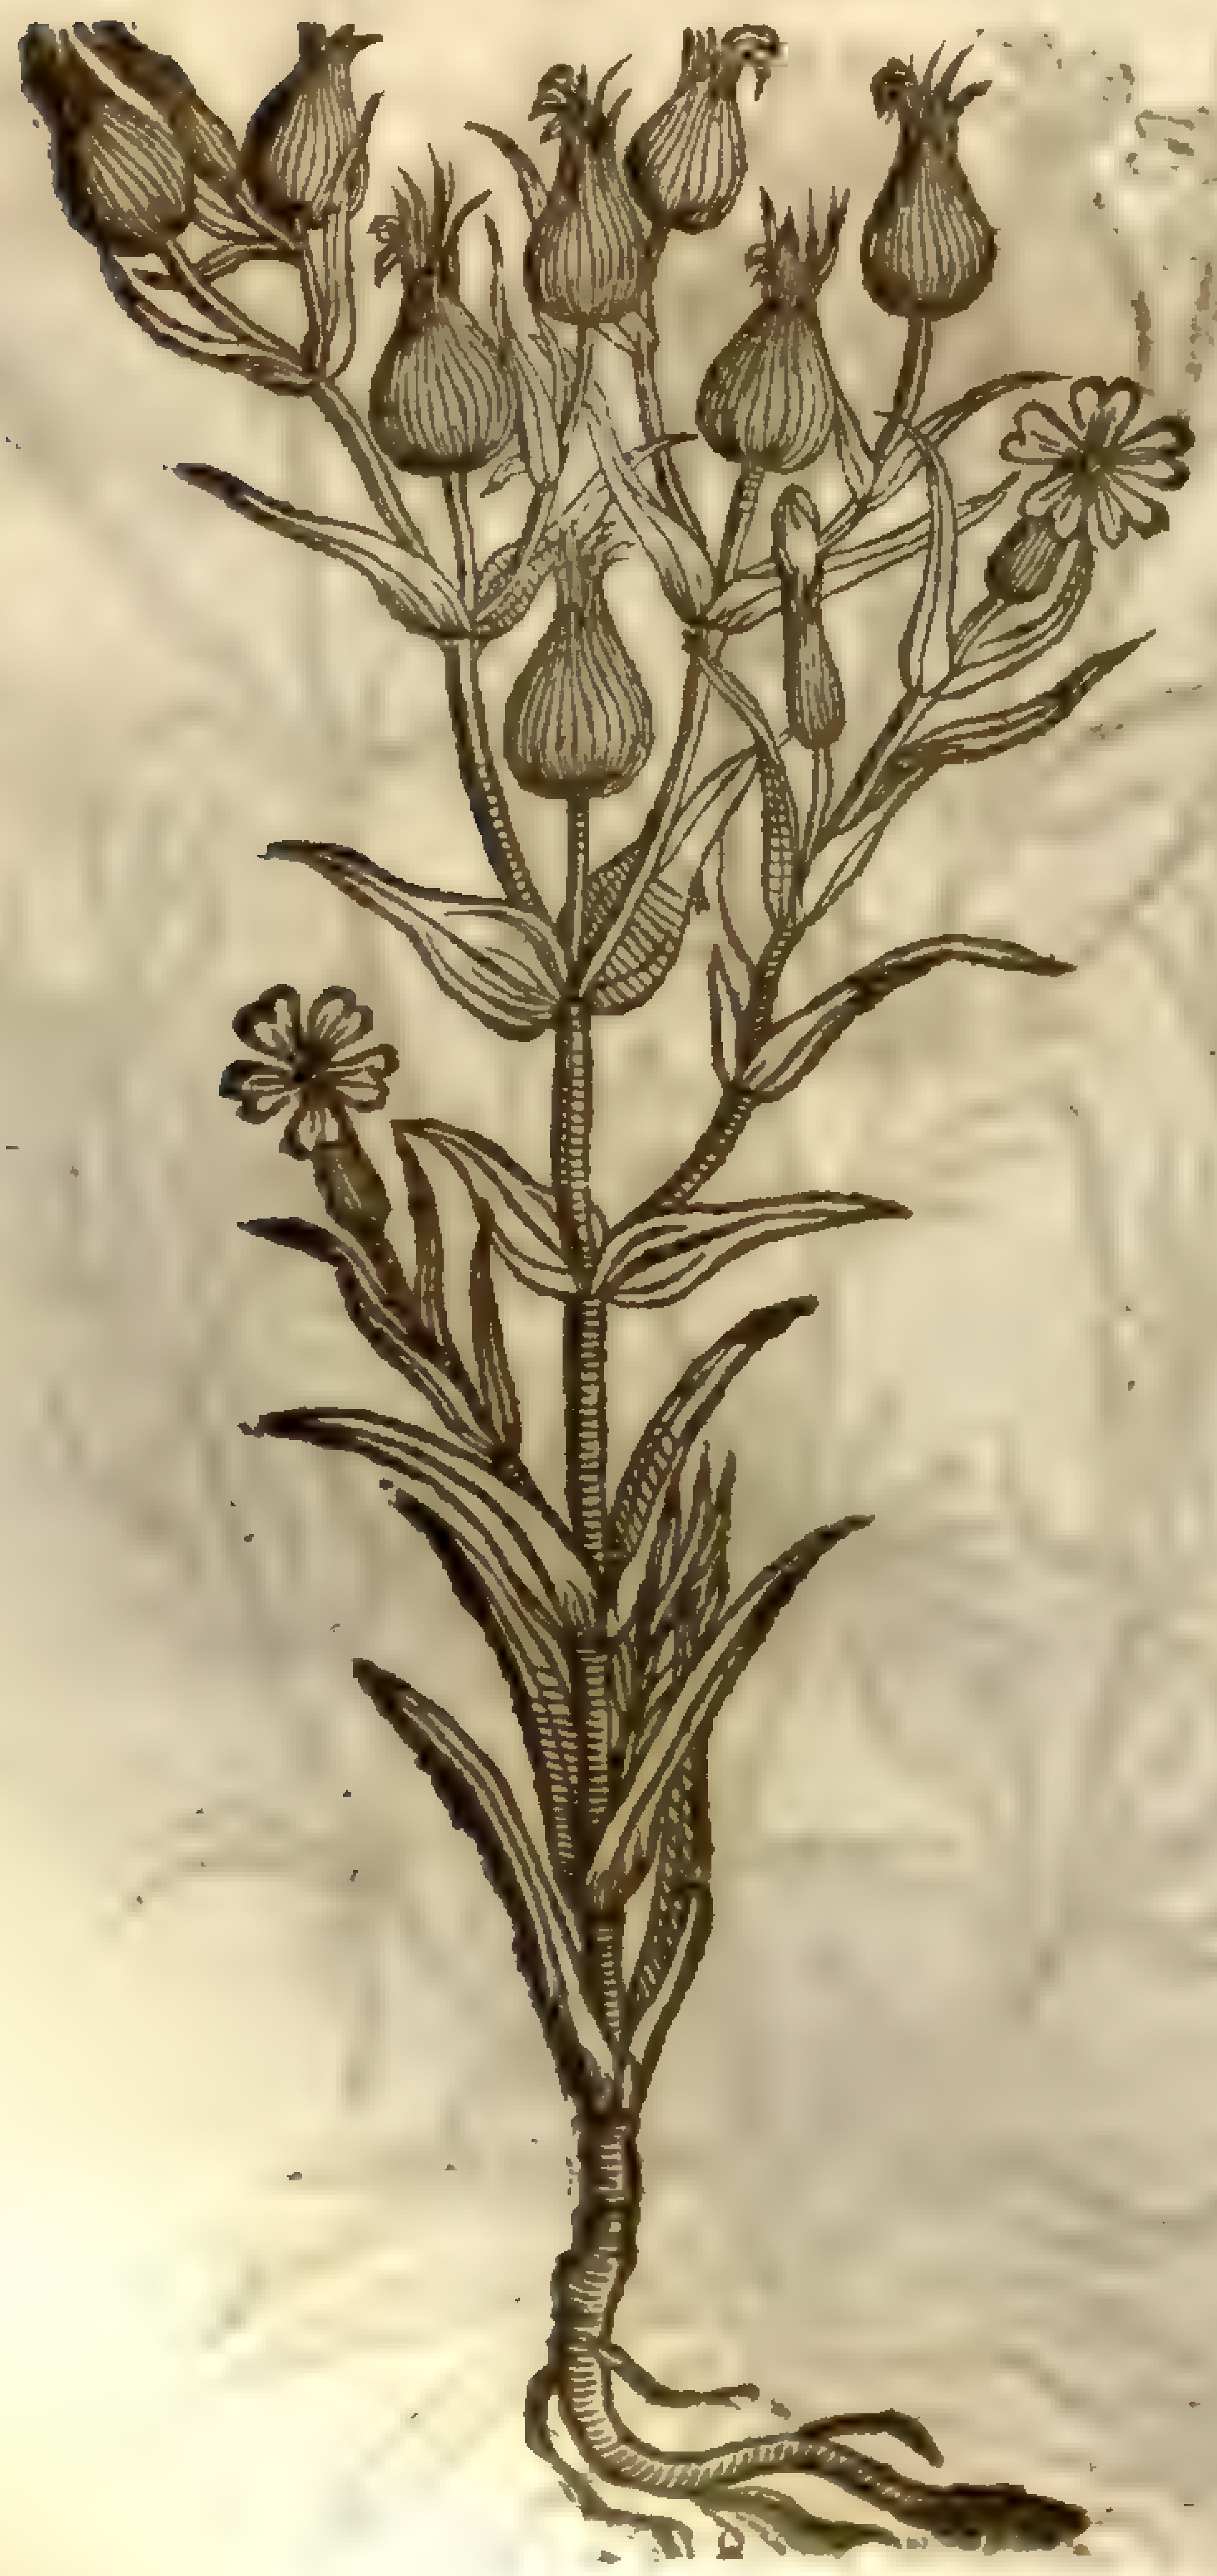
5 *Lychnis hirta minima 6. Cluſ.*
Small hairy Campion.



† 6 *Lychnis ſylueſtris incana Lob.*
Ouerworne Campion.

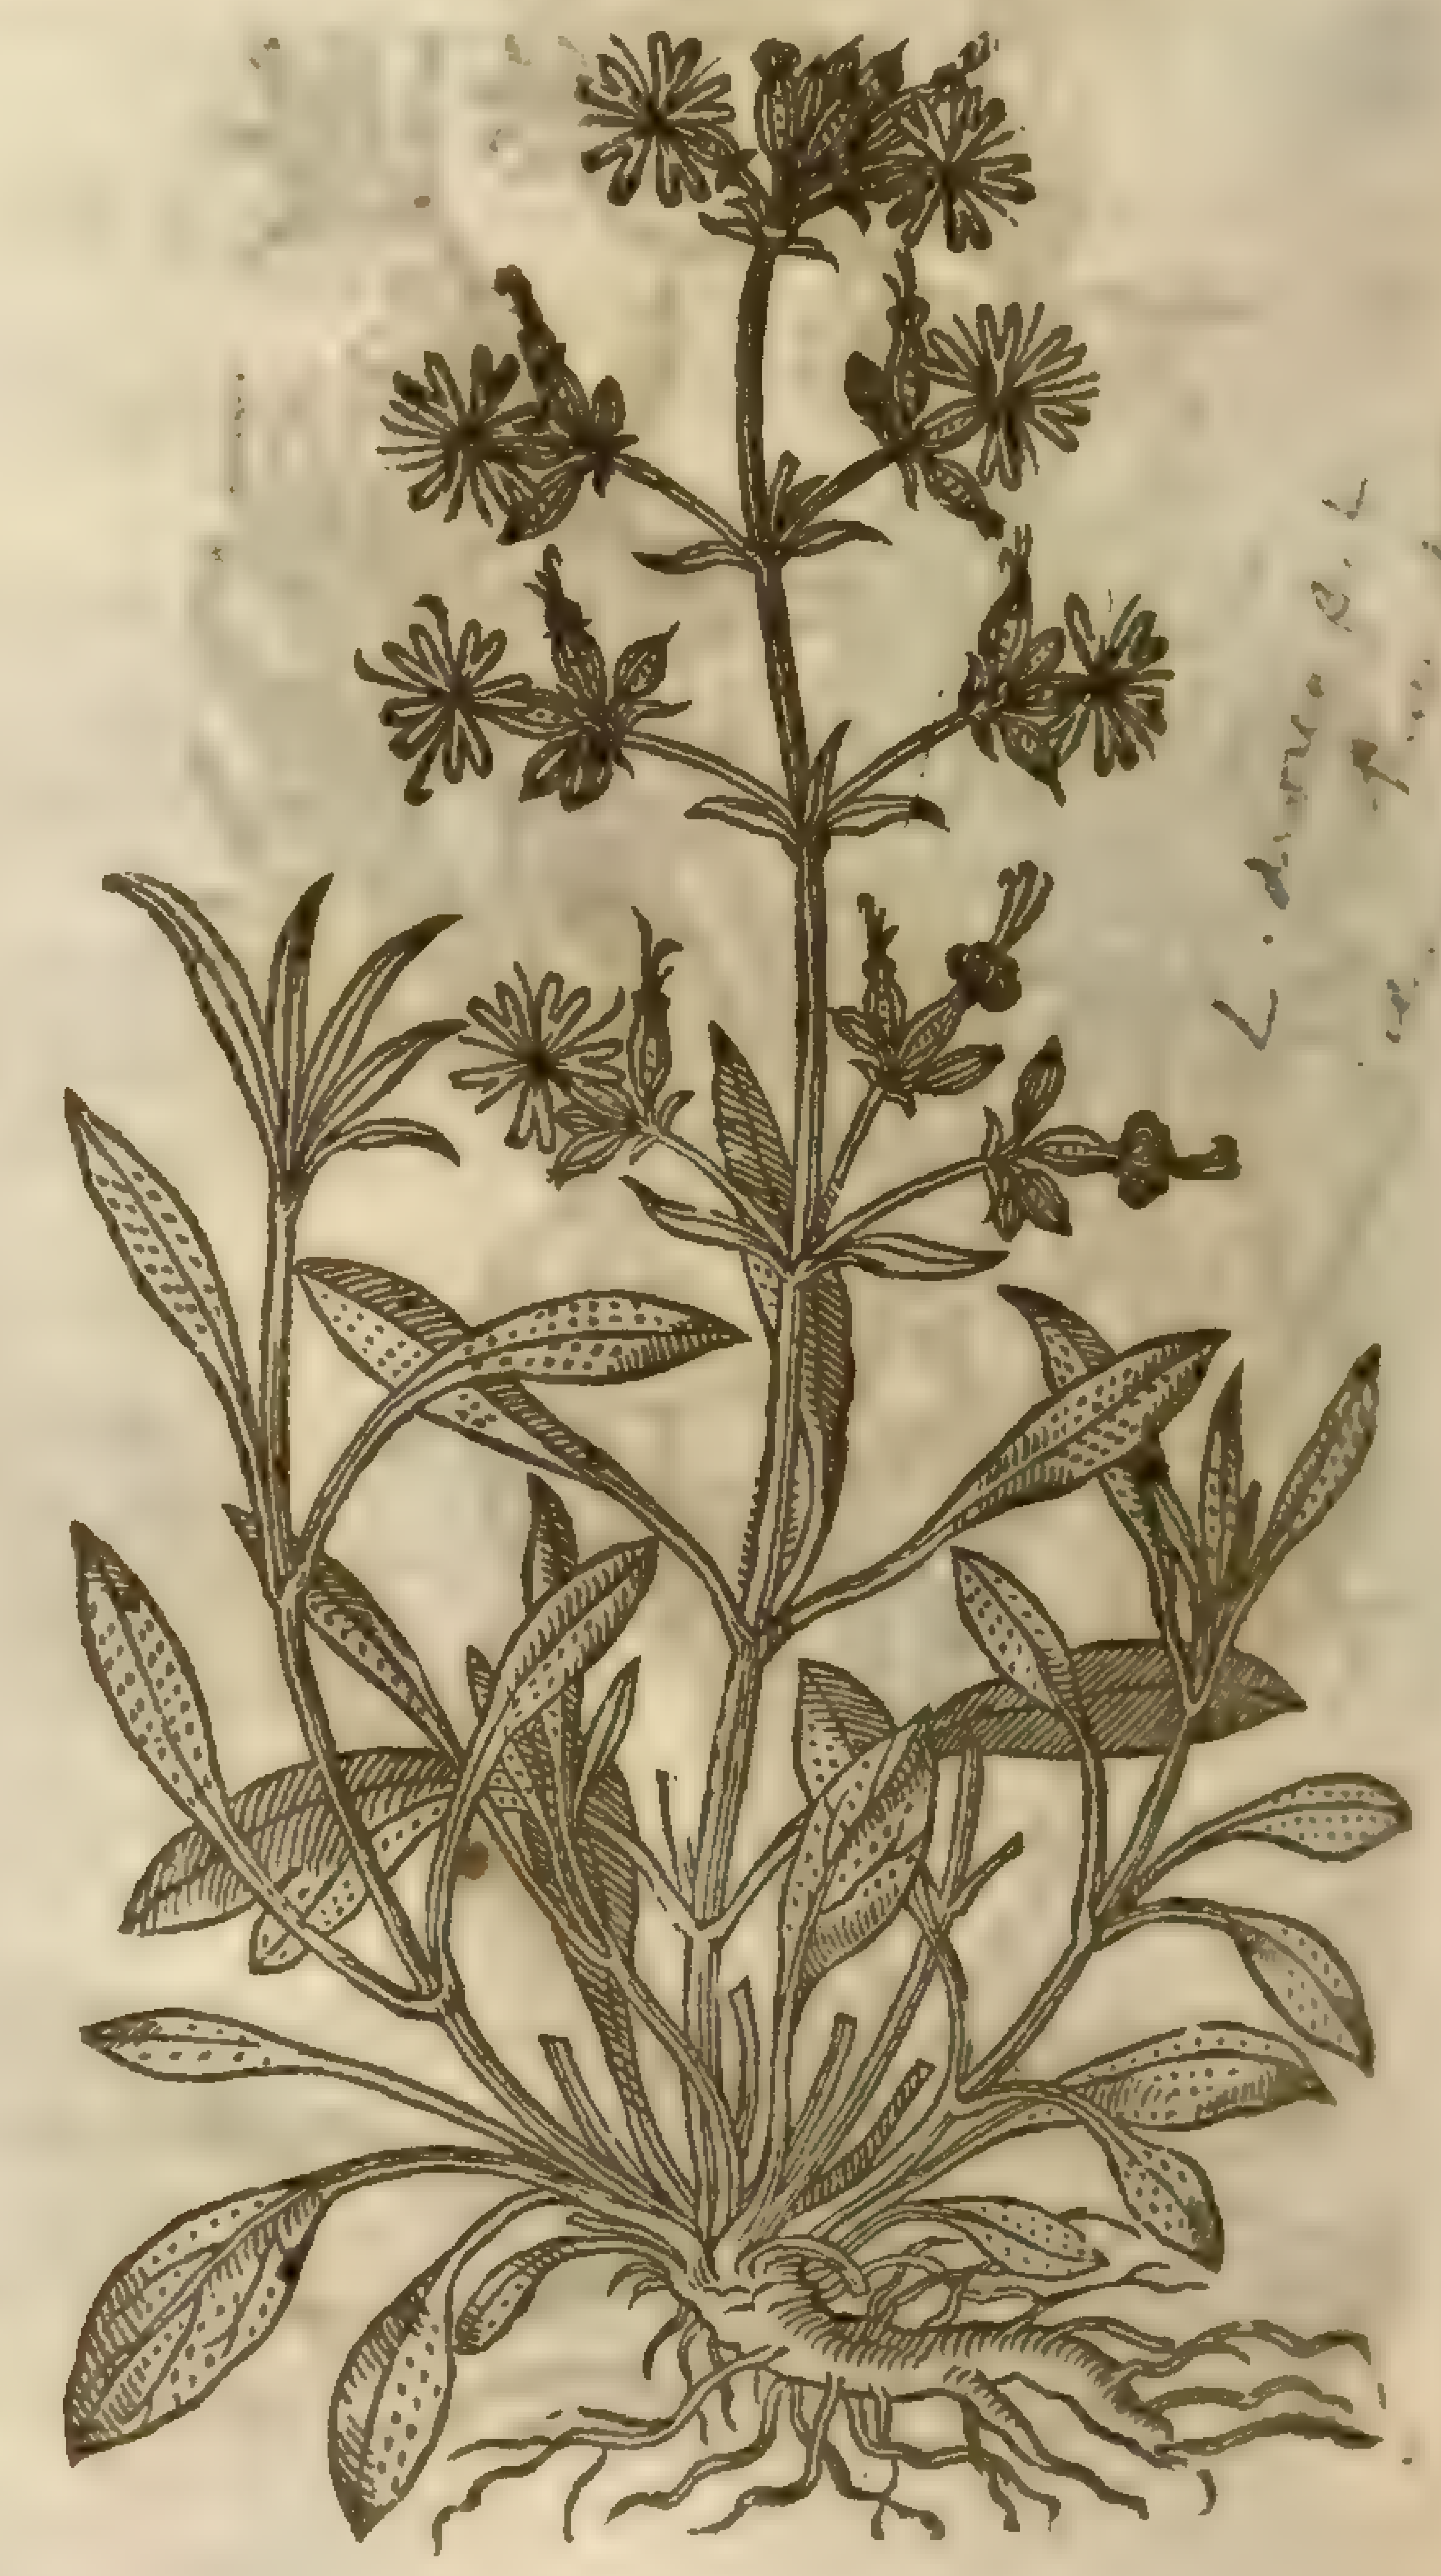


7 *Lychnis caliculis ſtriatis 2. Cluſij.*
Spatling Campion.



Silene conoidea, L. [illegible]

† 8 *Lychnis ſylueſtris alba 9. Cluſ.*
White wilde Campion.



Lychnis [illegible]

4 The fourth kinde of wild Campions hath long and ſlender ſtems, diuiding themſelues into ſundry other branches which are full of joints, hauing many ſmall and narrow leaues proceeding from the ſaid joints, and thoſe of a whitiſh green colour. The floures grow at the top of the ſtalke, of a whitiſh colour on the inner ſide, and purpliſh on the outer ſide, conſiſting of fiue ſmal leaues, euery leafe hauing a cut in the end, which maketh it ſhaped like a forke: the ſeed is like the wilde Poppy; the root ſomwhat groſſe and thicke, which alſo periſheth the ſecond yeare.

5 The fifth kind of wild Campion hath three or foure ſoft leaues ſomewhat downy, lying flat vpon the ground; among which riſeth vp an hairy aſh-coloured ſtalk diuided into diuers branches, whereupon grow at certain ſpaces, euen in the ſetting together of the ſtalke and branches, ſmal and graſſe-like leaues, hairy, and of an ouerworne dusky colour, as is all the reſt of the plant. The flours grow at the top of the branches, compoſed of fiue ſmall forked leaues of a bright ſhining red colour. The root is ſmall, and of a wooddy ſubſtance.

6 The ſixth kinde of wilde Campion hath many long thicke fat and hoary leaues ſpred vpon the ground, in ſhape & ſubſtance like thoſe of the garden Campion, but of a very duſty ouerworn colour: among which riſe vp ſmall and tender ſtalks ſet at certain diſtances by couples, with ſuch like leaues as the other, but ſmaller. The floures doe grow at the top of the ſtalks in little tufts like thoſe of ſweet-Williams, of a red colour. The root is ſmall, with many threddy ſtrings faſtned to it.

‡ 7 This growes ſome cubit high, with ſtalks diſtinguiſhed with ſundry joints, at each whereof are ſet two leaues, green, ſharp pointed, and ſomewhat ſtiffe: the floures grow at the top of the branches, like to thoſe of *Muſcipula* or Catch-fly, yet ſomewhat bigger, and of a darke red; which paſt, the ſeed (which is aſh-coloured and ſomewhat large) is contained in great cups or veſſels, couered with a hard and very much creſted skin or filme; whence it is called *Lychnis caliculis ſtriatis*, and not *cauliculis ſtriatis*, as it is falſly printed in *Lobels Icones*, which ſome as fooliſhly haue followed. The root is ſingle and not large, and dies euery yeare.

8 That which our Author figured in this place had great leaues and red floures, which no way ſorted with his deſcription: wherefore I haue in lieu thereof giuen you one out of *Cluſius*, which may fitly carry the title. This at the top of the large fibrous and liuing root ſendeth forth many leaues ſomewhat green, and of ſome fingers length, growing broader by degrees, and at laſt ending againe in a ſharpe point. The ſtalks are ſome cubit high, ſet at each joint with two leaues as it were embracing it with their foot-ſtalks; which leaues are leſſe and leſſe as they are higher vp, and more ſharp pointed. At the tops of the branches grow the floures, conſiſting of fiue white leaues deeply cut in almoſt to the middle of the floure, and haue two ſharp pointed appendices at the bottome of each of them, and fiue chiues or threds come forth of their middles: theſe when they fade contract and twine themſelues vp, and are ſucceeded by thick and ſharp pointed ſeed-veſſels, containing a ſmall round aſh-coloured ſeed. I coniecture that the figure of the *Lychnis plumaria*, which was formerly here in the ninth place, out of *Tabern.* might be of this plant as well as of that which *Bauhine* refers it to, and which you ſhall find mentioned in the end of the Chapter. ‡

¶ *The Place.*

They grow of themſelues neere the borders of plowed fields, medowes, and ditch bankes, common in many places. ‡ I haue obſerued none of theſe, the firſt and ſecond excepted, growing wild with vs. ‡

The ſea Campion growes by the ſea ſide in Lancaſhire, at a place called Lytham, fiue miles from Wygan, from whence I had ſeeds ſent me by Mr *Tho. Heſketh*, who had heard it reported, that in the ſaid place doth grow of the ſame kind ſome with red floures, which are very rare to be ſeen. ‡ This plant (in my laſt Kentiſh ſimpling voiage, 1632, with Mr *Tho. Hicks*, Mr *Broad*, &c.) I found growing in great plenty in the low mariſh ground in Tenet, that lieth directly oppoſit to the town of Sandwich. ‡

¶ *The Time.*

They floure and flouriſh moſt part of the Summer euen vnto Autumne.

¶ *The Names.*

The wilde Campion is called in Greeke Λυχνὶς ἀγρία: in Latine, *Lychnis ſylueſtris*: in Engliſh, wild Roſe Campion.

¶ *The Temperature.*

The temperature of theſe wilde Campions are referred vnto thoſe of the garden.

¶ *The Vertues.*

The weight of two drams of the ſeed of wilde Campion beaten to pouder and drunke, purgeth A choler by the ſtoole,and it is good for them that are ſtung or bitten of any venomous beaſt.

† The figure that was in the firſt place, and was intended for our ordinarie wilde Campion, is that which you ſee here in the eighth place; and thoſe that were in the ſixth and eighth places you ſhall hereafter finde with *Muſcipula* or Catch-fly, whereto they are of affinitie. That figure which was in the ninth place out of *Tabern.* vnder the title of *Lychnis plumaria*, as alſo the deſcription, I haue omitted as impertinent: for the figure of *Bauhine* himſelfe (who corrected & againe ſet forth the Works of *Tabernamontanus*) could not tell what to make thereof; but queſtions, *Quid ſit? an Muſcipula flore muſcoſo?* Which if it be, you ſhall find that plant hereafter deſcribed, vnder the title of *Seſamoides magnum Salmanticum*: for our Authors deſcription is not worth the ſpeaking of, being framed only from imagination.

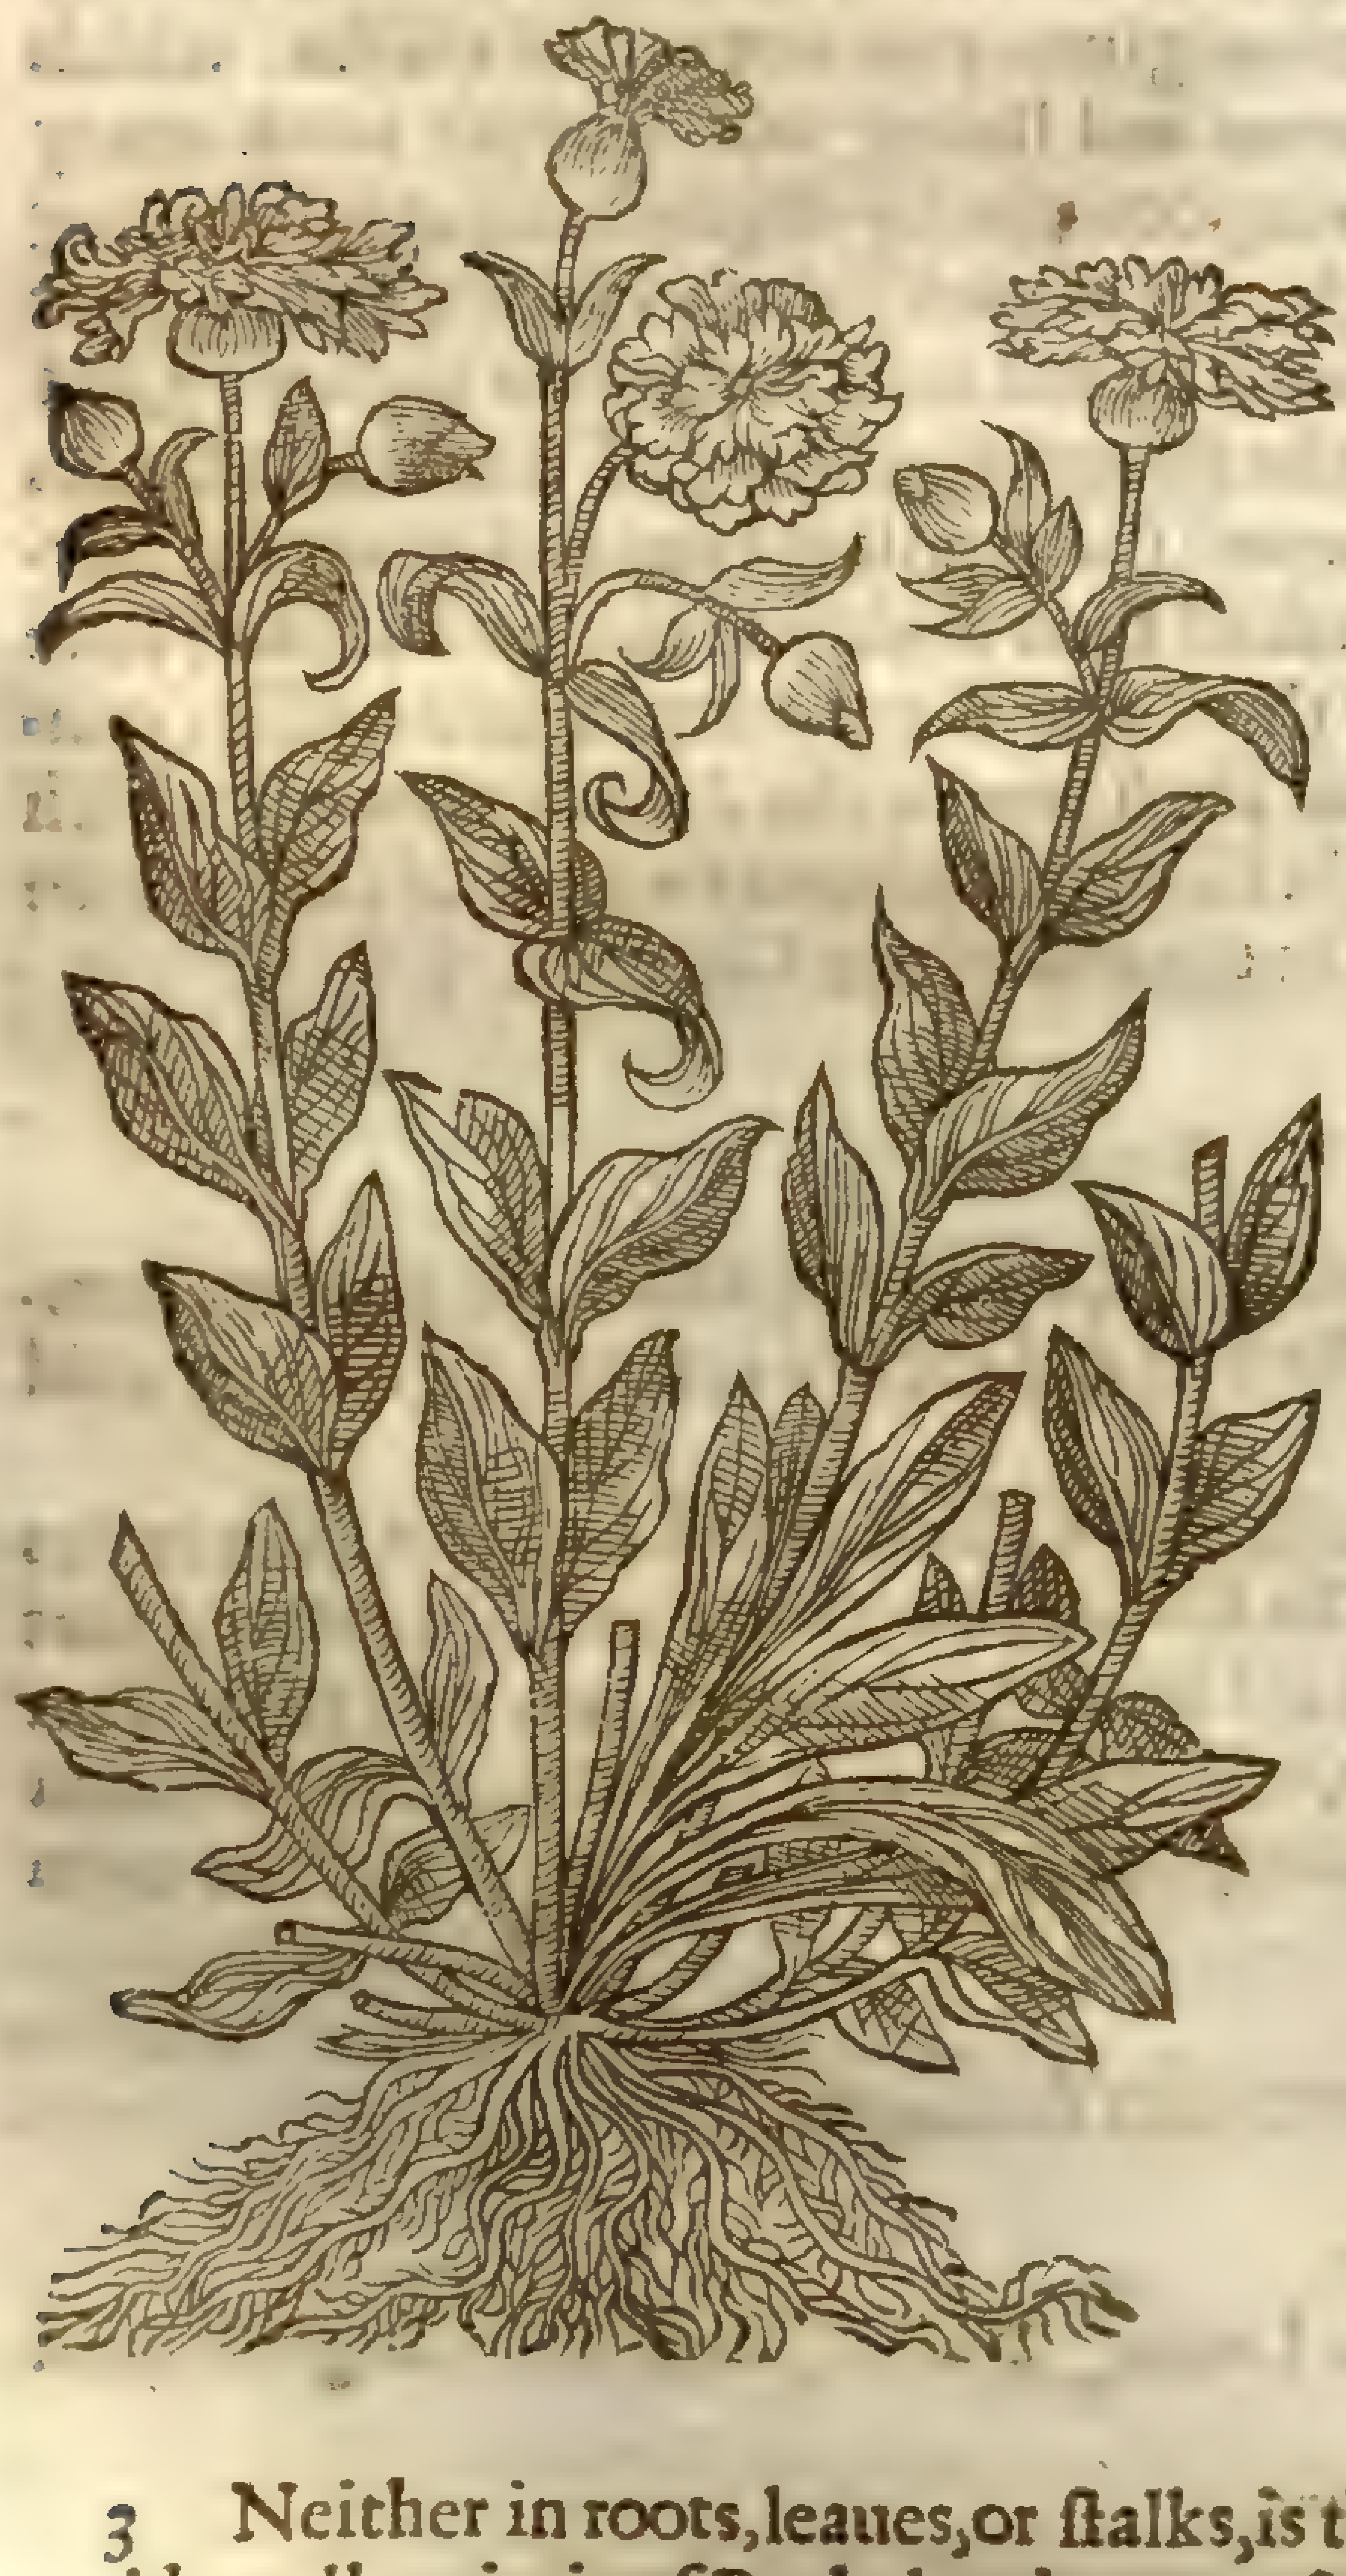
‡ Chap. 128. *Of diuers other wilde Campions.*

¶ *The Deſcription.*

‡ 1 The firſt of theſe which we here giue you is like in leaues, ſtalkes, roots, and manner of growing vnto the ordinarie wilde Campion deſcribed in the firſt place of the precedent Chapter; but the floures are very double, compoſed of a great many red leaues thick packt together, and they are commonly ſet in a ſhort and broken husk or cod. Now the ſimilitude that theſe floures haue to the jagged cloath buttons antiently worne in this Kingdome, gaue occaſion to our gentlewomen and other louers of floures in thoſe times, to call them Bachelors buttons.

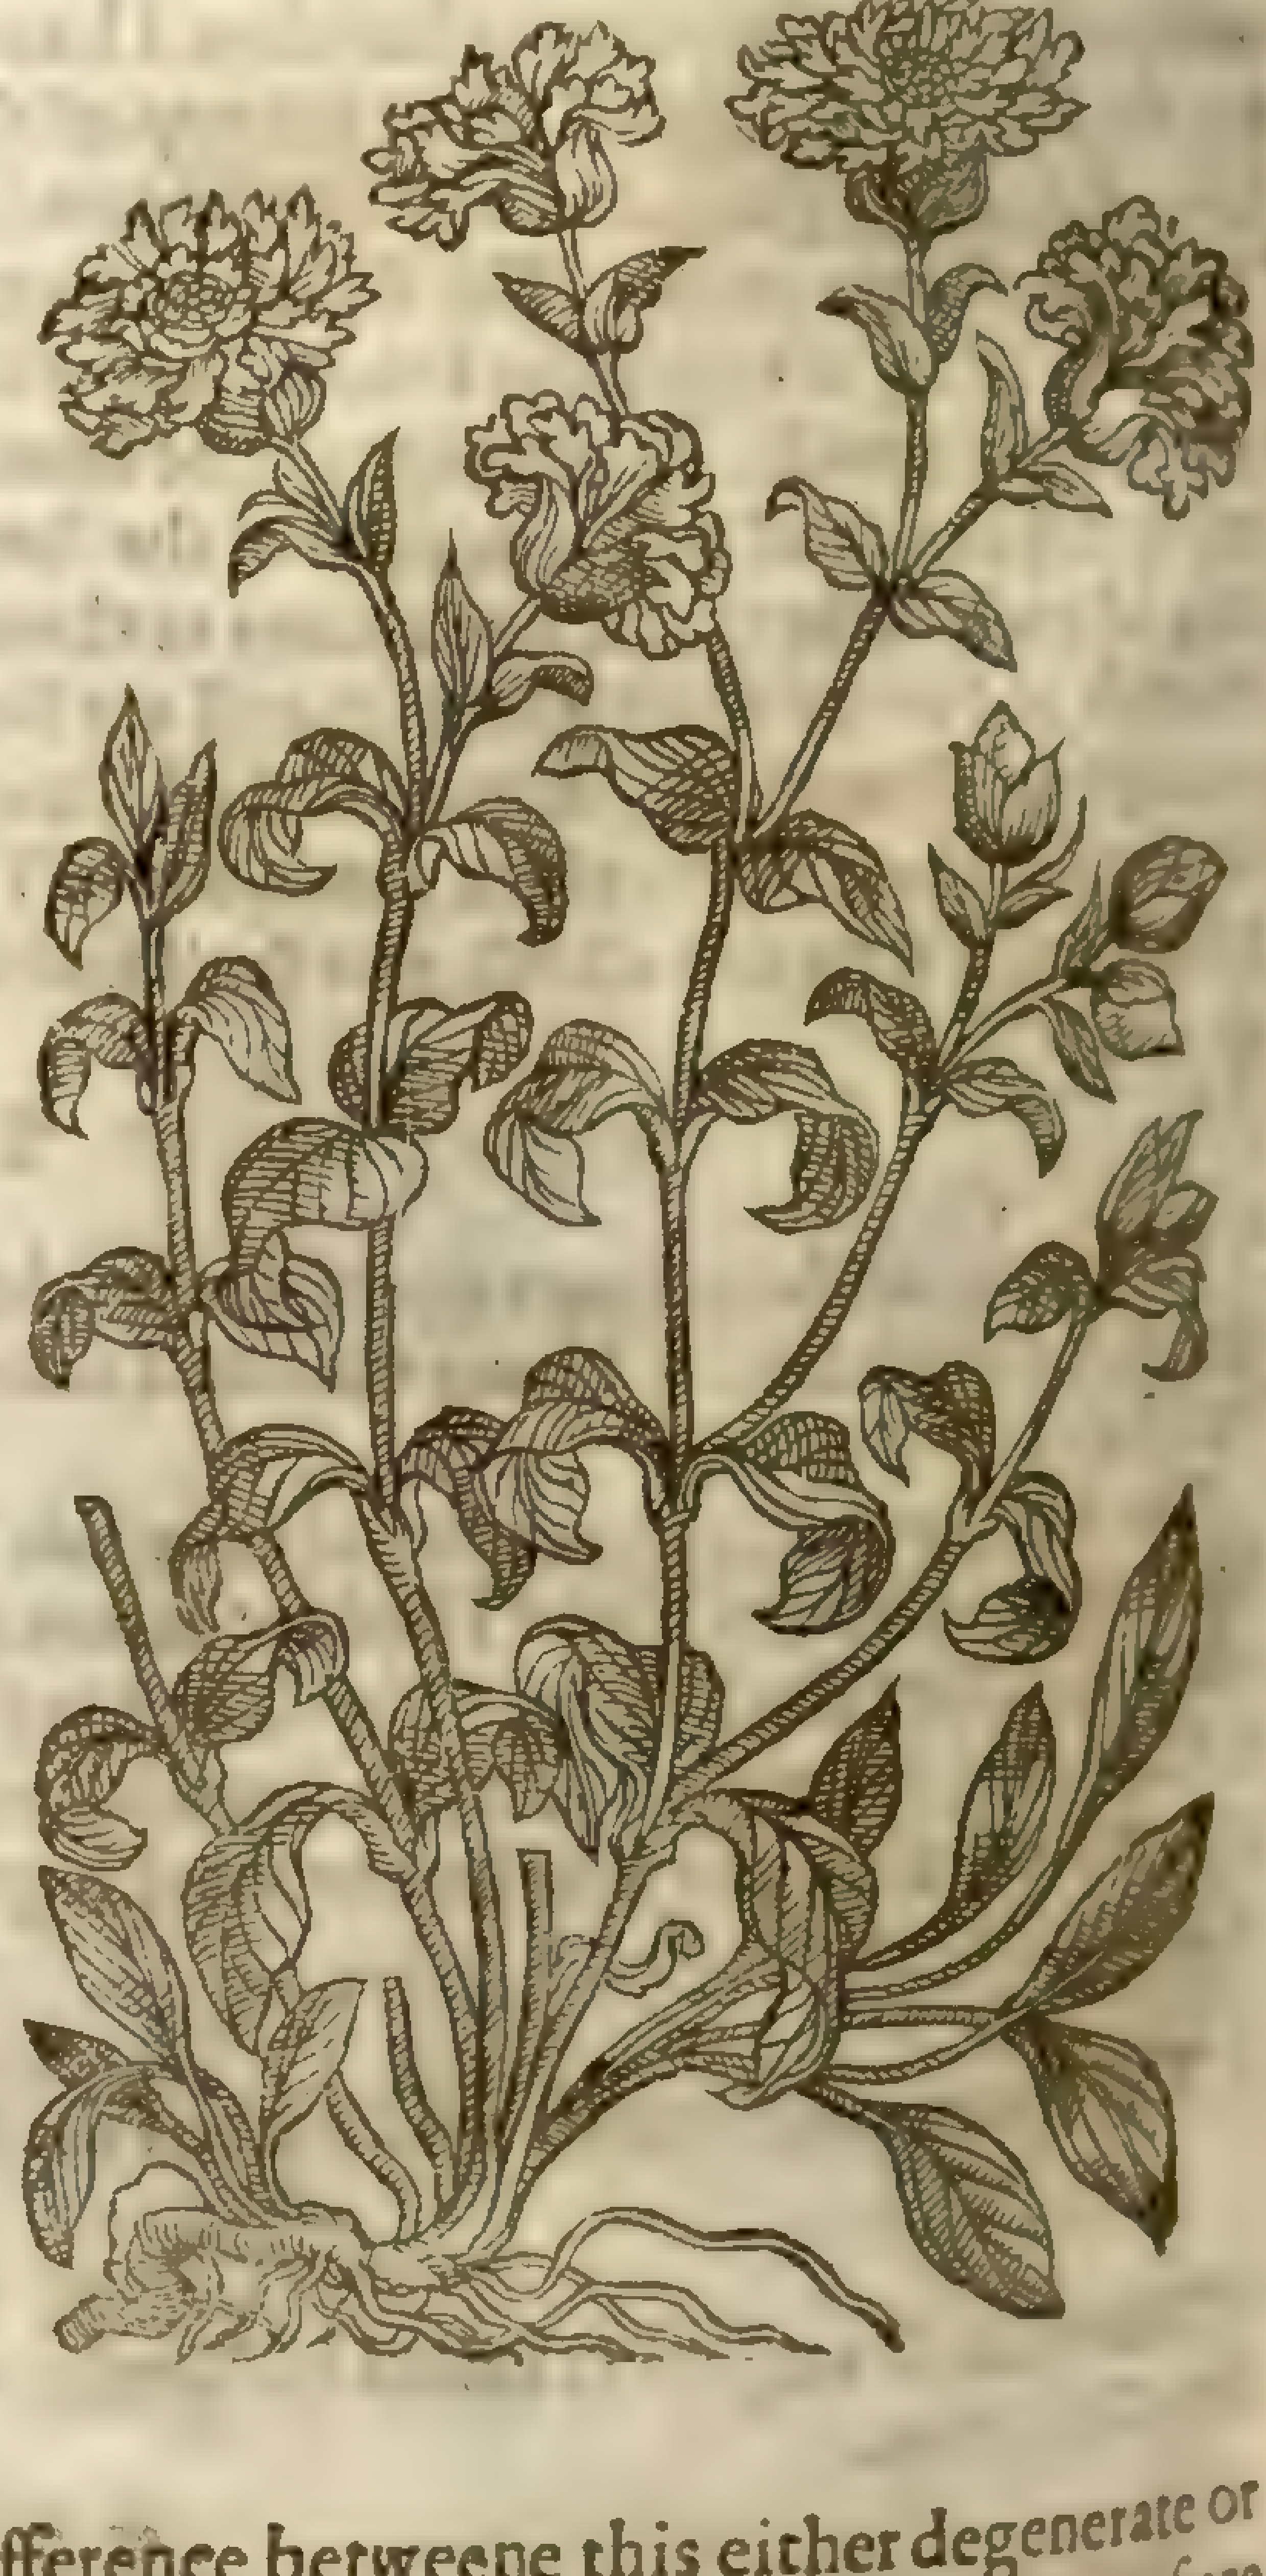
2 This differs not in ſhape from the laſt deſcribed, but only in the colour of the flours, which in this plant are white.

‡ 1 *Lychnis ſyl. multiplex purpurea.*
Red Bachelors buttons.



Lychnis dioica L. var.
multi. dupl.

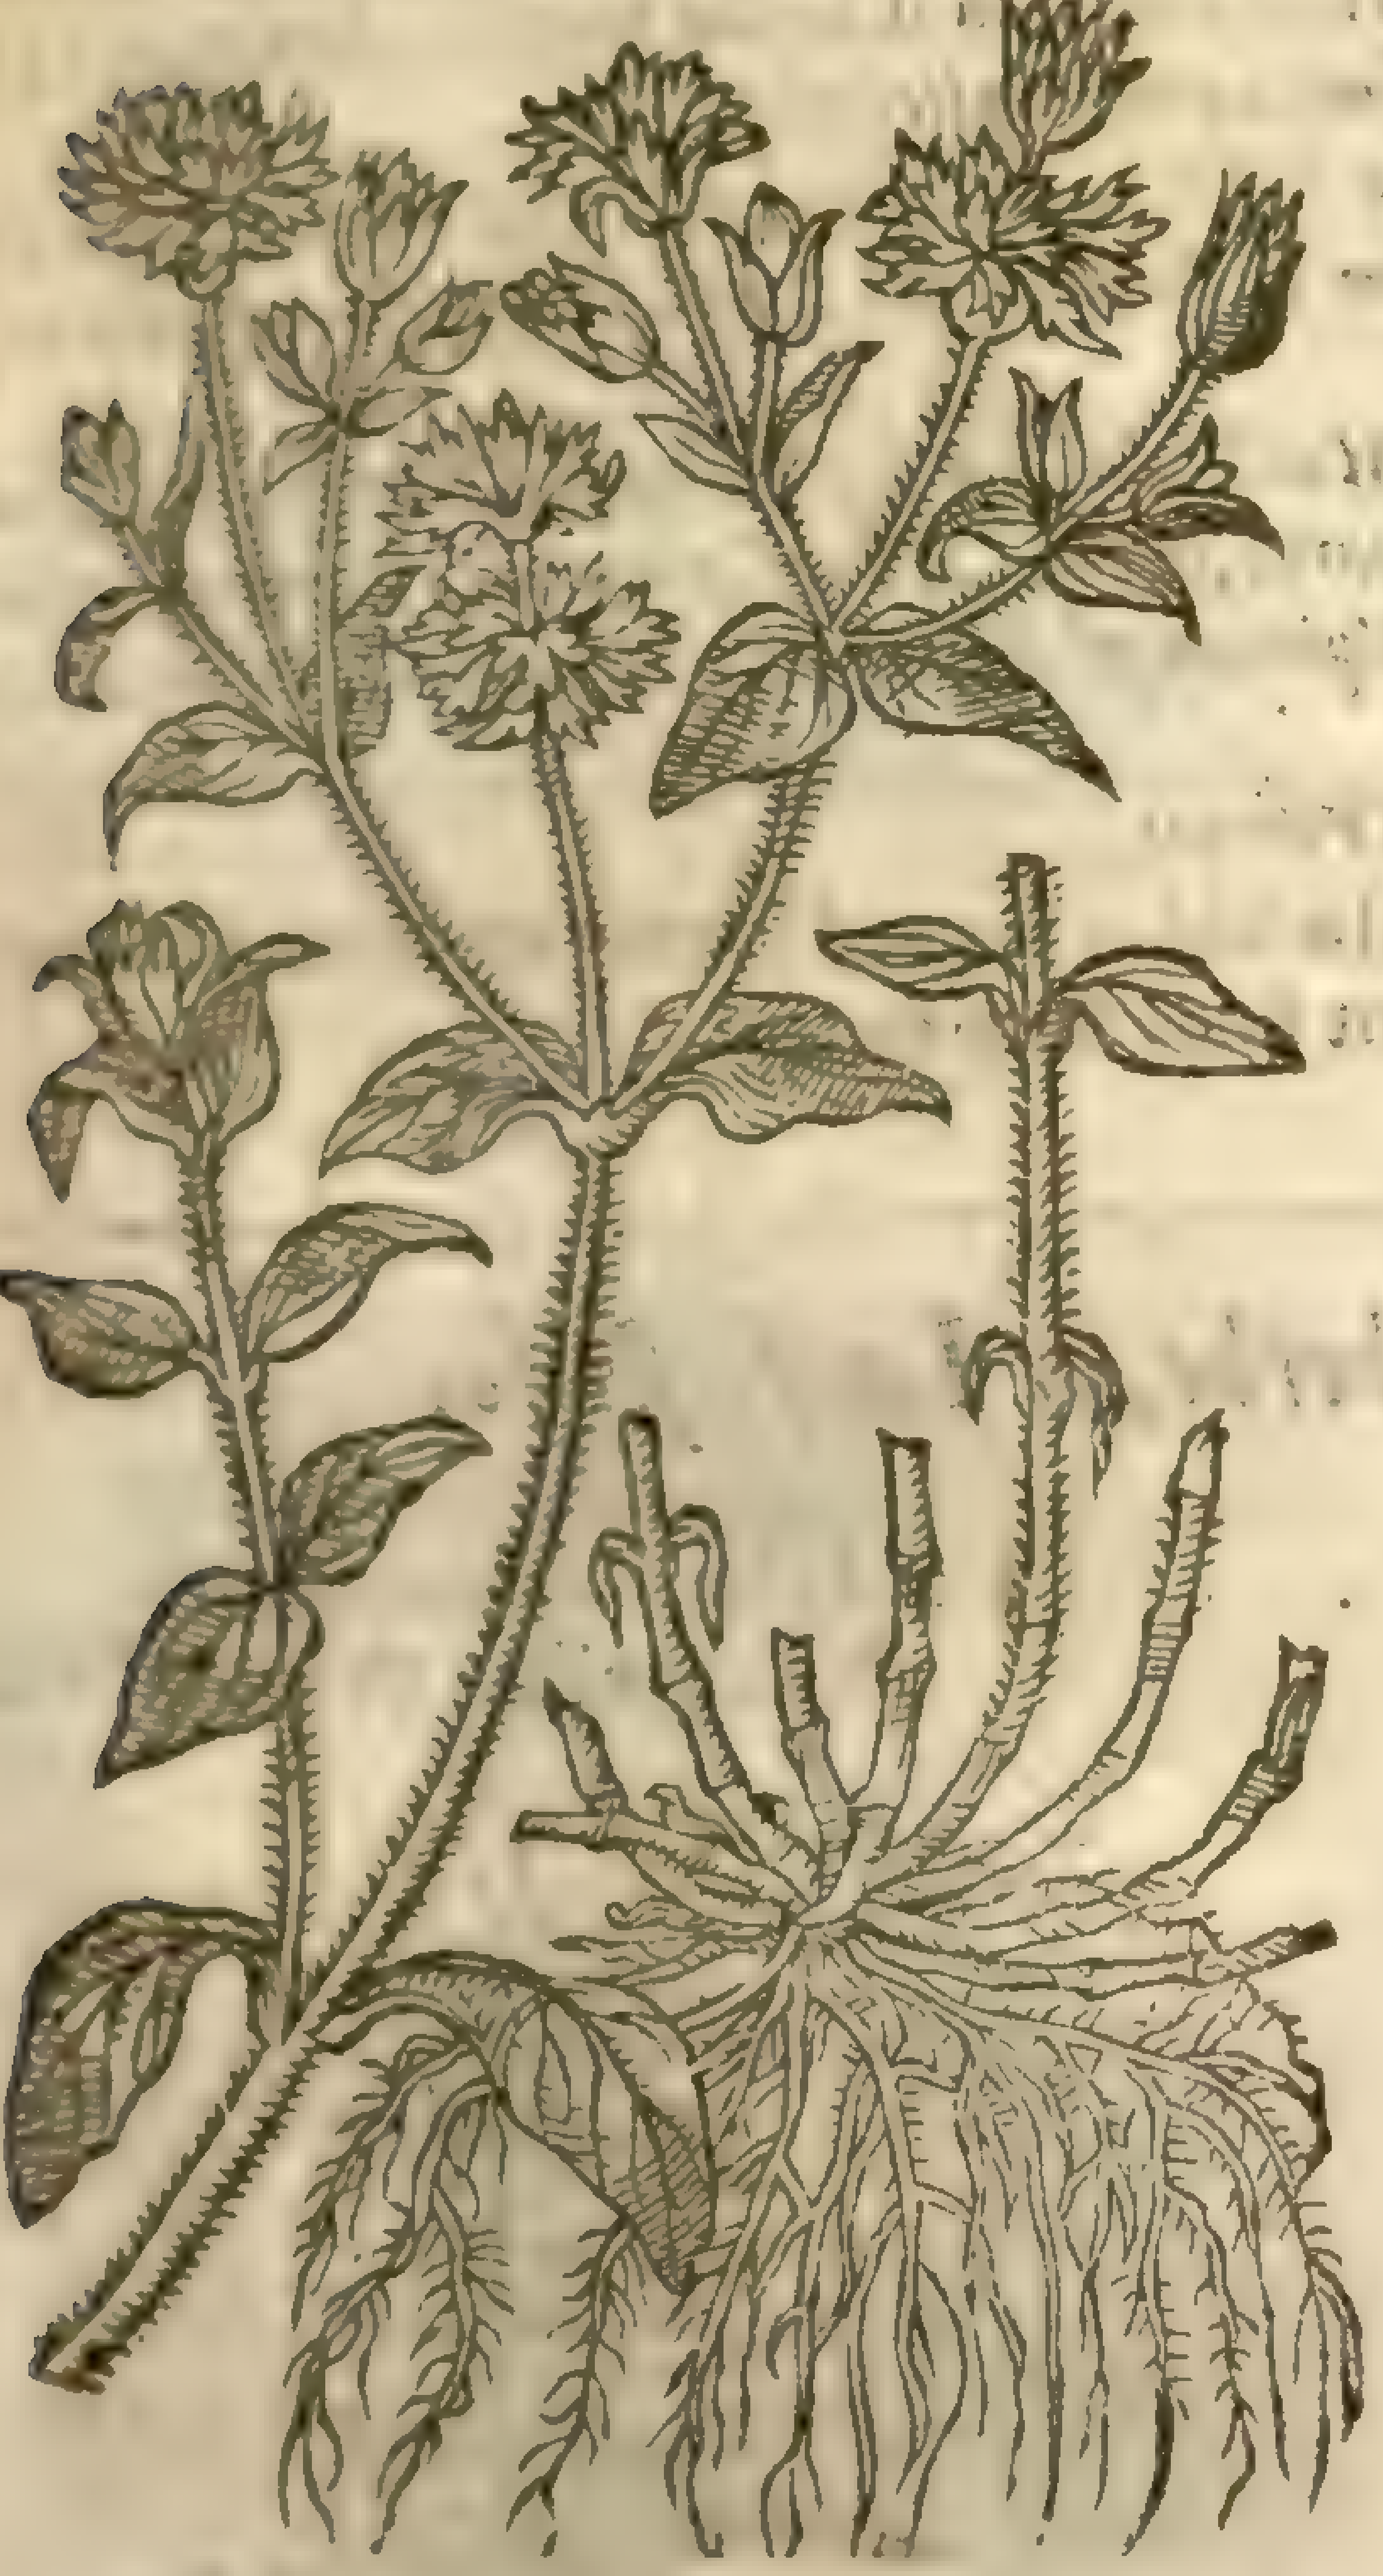
‡ 2 *Lychnis ſyl. alba multiplex.*
White Bachelors buttons.



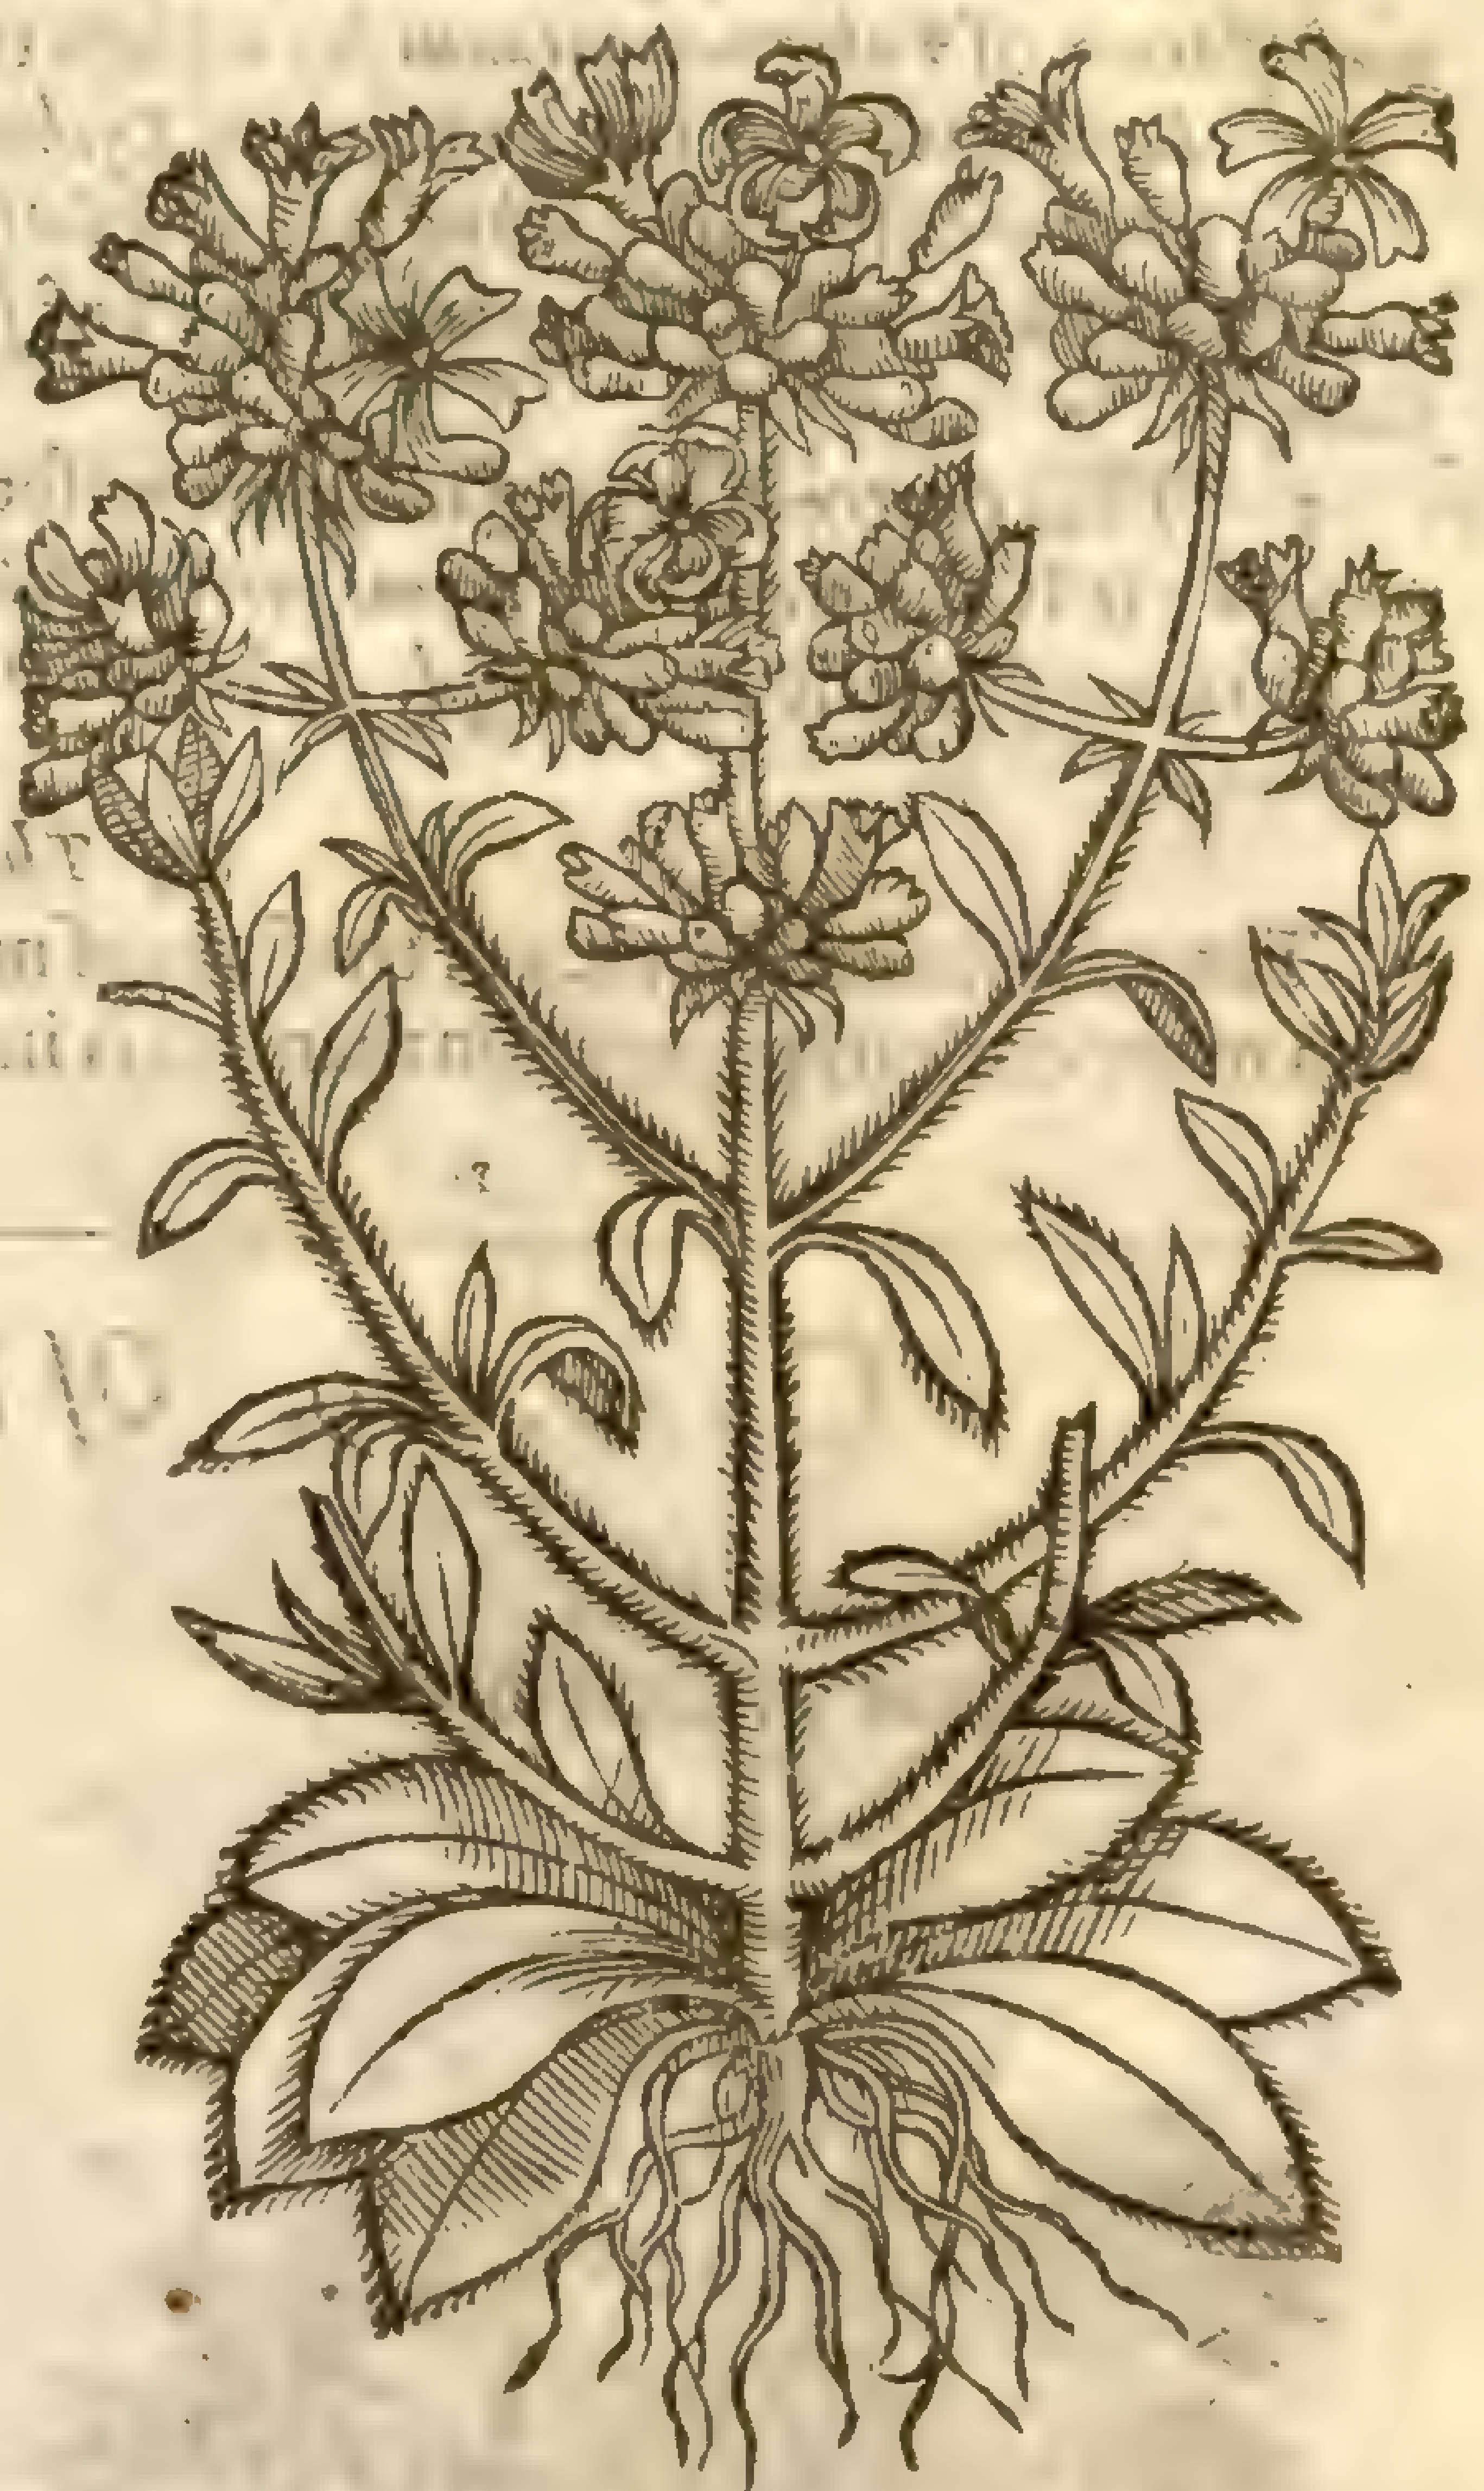
3 Neither in roots, leaues, or ſtalks, is there any difference betweene this either degenerate or accidentall varietie of Bachelors buttons, from the two laſt mentioned, onely the floures hereof are of a greeniſh colour, and ſometimes through the middeſt of them they ſend vp ſtalks, bearing alſo tufts of the like double floures.

4 This ſaith (*Cluſius*) hath fibrous roots like to thoſe of Primroſes; out of which come leaues of

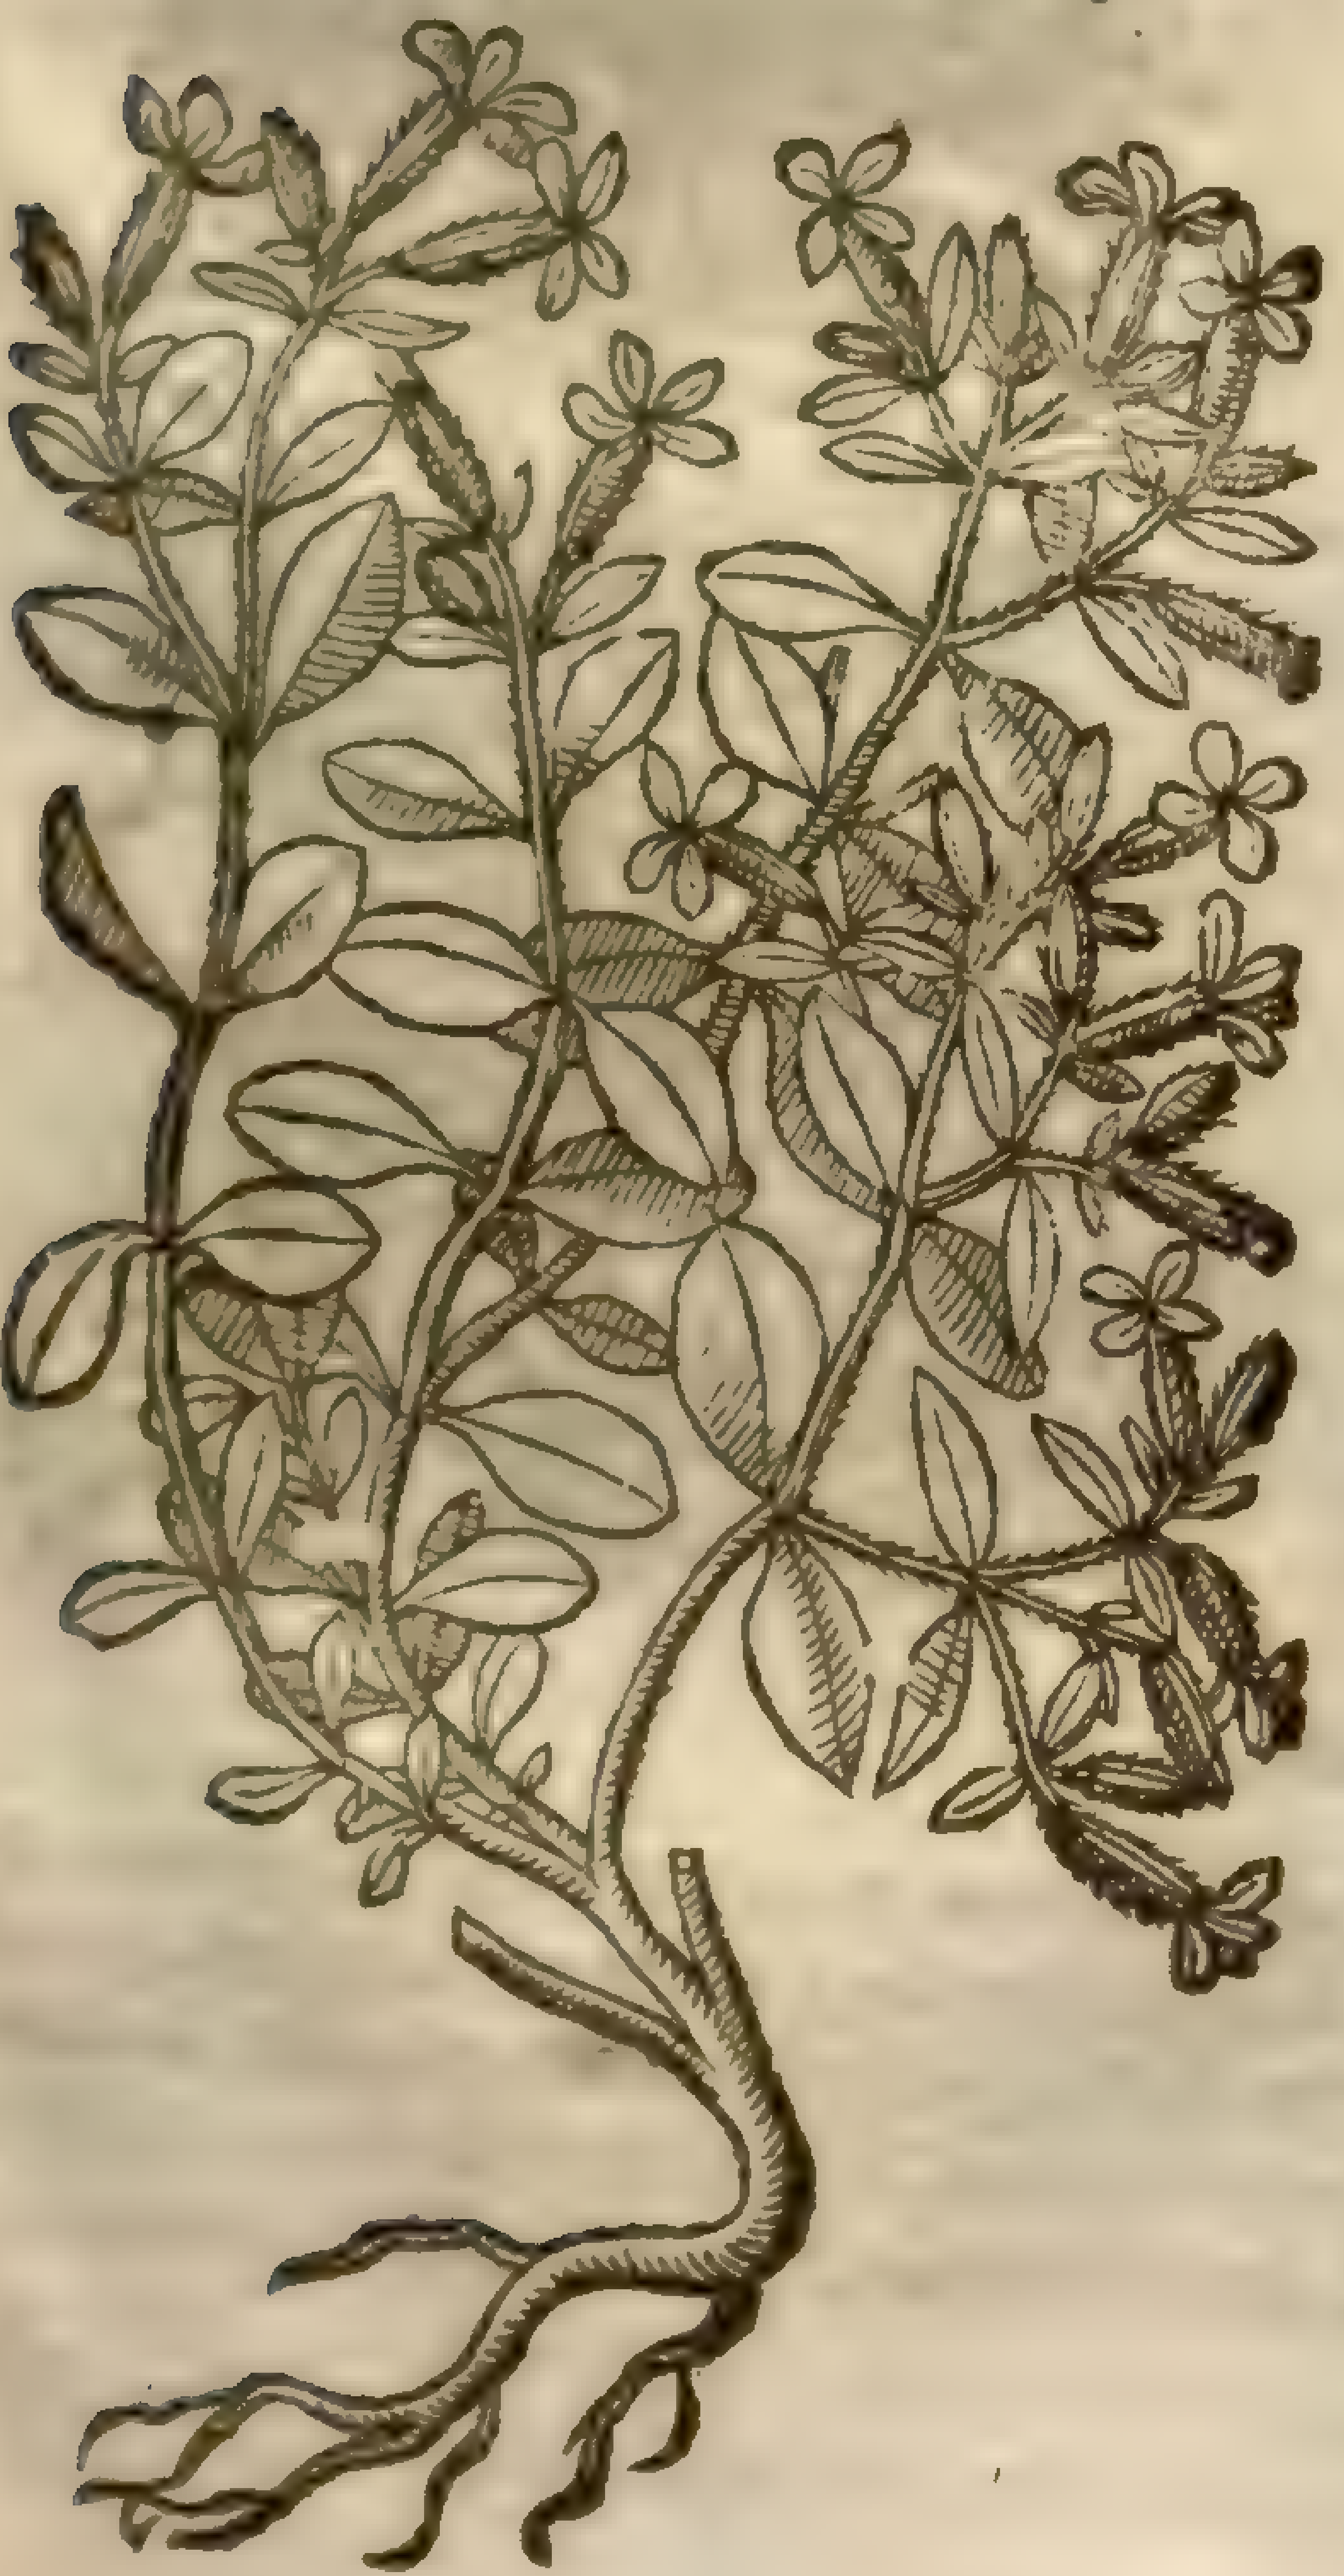
‡ 3 *Lychnis abortiua flore multiplici viridi.*
Degenerate Bachelors Buttons with greene floures.



‡ 4 *Lychnis ſyl. latifolia Cluſ.*
Broad leaued wilde Campion.



‡ 5 *Lychnis montana repens.*
Creeping mountaine Campion.



of a ſufficient magnitude, not much vnlike thoſe of the great yellow Beares-eare, yet whiter, more downy, thicke, and juycie. The next yeare after the ſowing thereof it ſends vp a ſtalke of two or three cubits high, here and there ſending forth a viſcous and glutinous juice, which detaines and holds faſt flies and ſuch inſects as do chance to light thereon. At the top of the branches it yeeldeth many floures ſet as it were in an vmbel, euen ſomtimes an hundred, yet ſufficiently ſmall, conſidering the magnitude of the plant; and each of theſe conſiſts of fiue little yellowiſh greene forked leaues.

5 The ſtalkes of this are ſlender, joynted and creeping like to thoſe of the greater Chickweed, and at each joynt grow two leaues like thoſe of the myrtle, or of Knot-graſſe, yet ſomewhat broader. The floures grow in long cups like as thoſe of *Saponaria*, and are much leſſe, yet of the ſame colour. The root is ſmall.

¶ *The Place.*

1 2 Theſe are kept in many Gardens of this Kingdome for their beautie, eſpecially the firſt, which is the more common.

4 This growes naturally in Candy; the fifth by riuelets in the mountainous places of Sauoy.

¶ *The Time.*

Theſe floure in Iune and Iuly with the other wild Campions.

Saponaria ocymoides
[illegible]

¶ *The Names.*

2 The firſt of theſe is *Lychnis agreſtis multiflora* of *Lobel*;and *Ocymoides flore pleno* of *Camerarius.*

2 The ſecond is by *Pena* and *Lobel* alſo called *Lychnis ſylueſtris multiflora*: it is the *Ocymaſtrum multiflorum* of *Tabernamontanus*;by which title our Author alſo had it in the former edition,*p.551.*

3 *Lobel* hath this by the name of *Lychnis agreſtis abortiua multiplici viride flore.*

4 *Cluſius* calls this *Lychnis ſylueſtris latifolia*; and he ſaith he had the ſeed from *Ioſeph de Caſa Bona*,by the name of *Muſcipula auriculæ vrſi facie*: *Bauhine* hath it by the name of *Lychnis auriculæ vrſi facie.*

5 This (according to *Bauhine*) was ſet forth by *Matthiolus*, by the name of *Cneoron aliud Theophraſti*: it is the *Ocimoides repens polygonifolia flore Saponariæ*,in the *Aduerſaria*: and *Saponaria minor Daleſchampij*, in the *Hiſt.Lugd.* It is alſo *Ocimoides Alpinum*,of *Geſner*; and *Ocymoides repens*,of *Camerarius.*

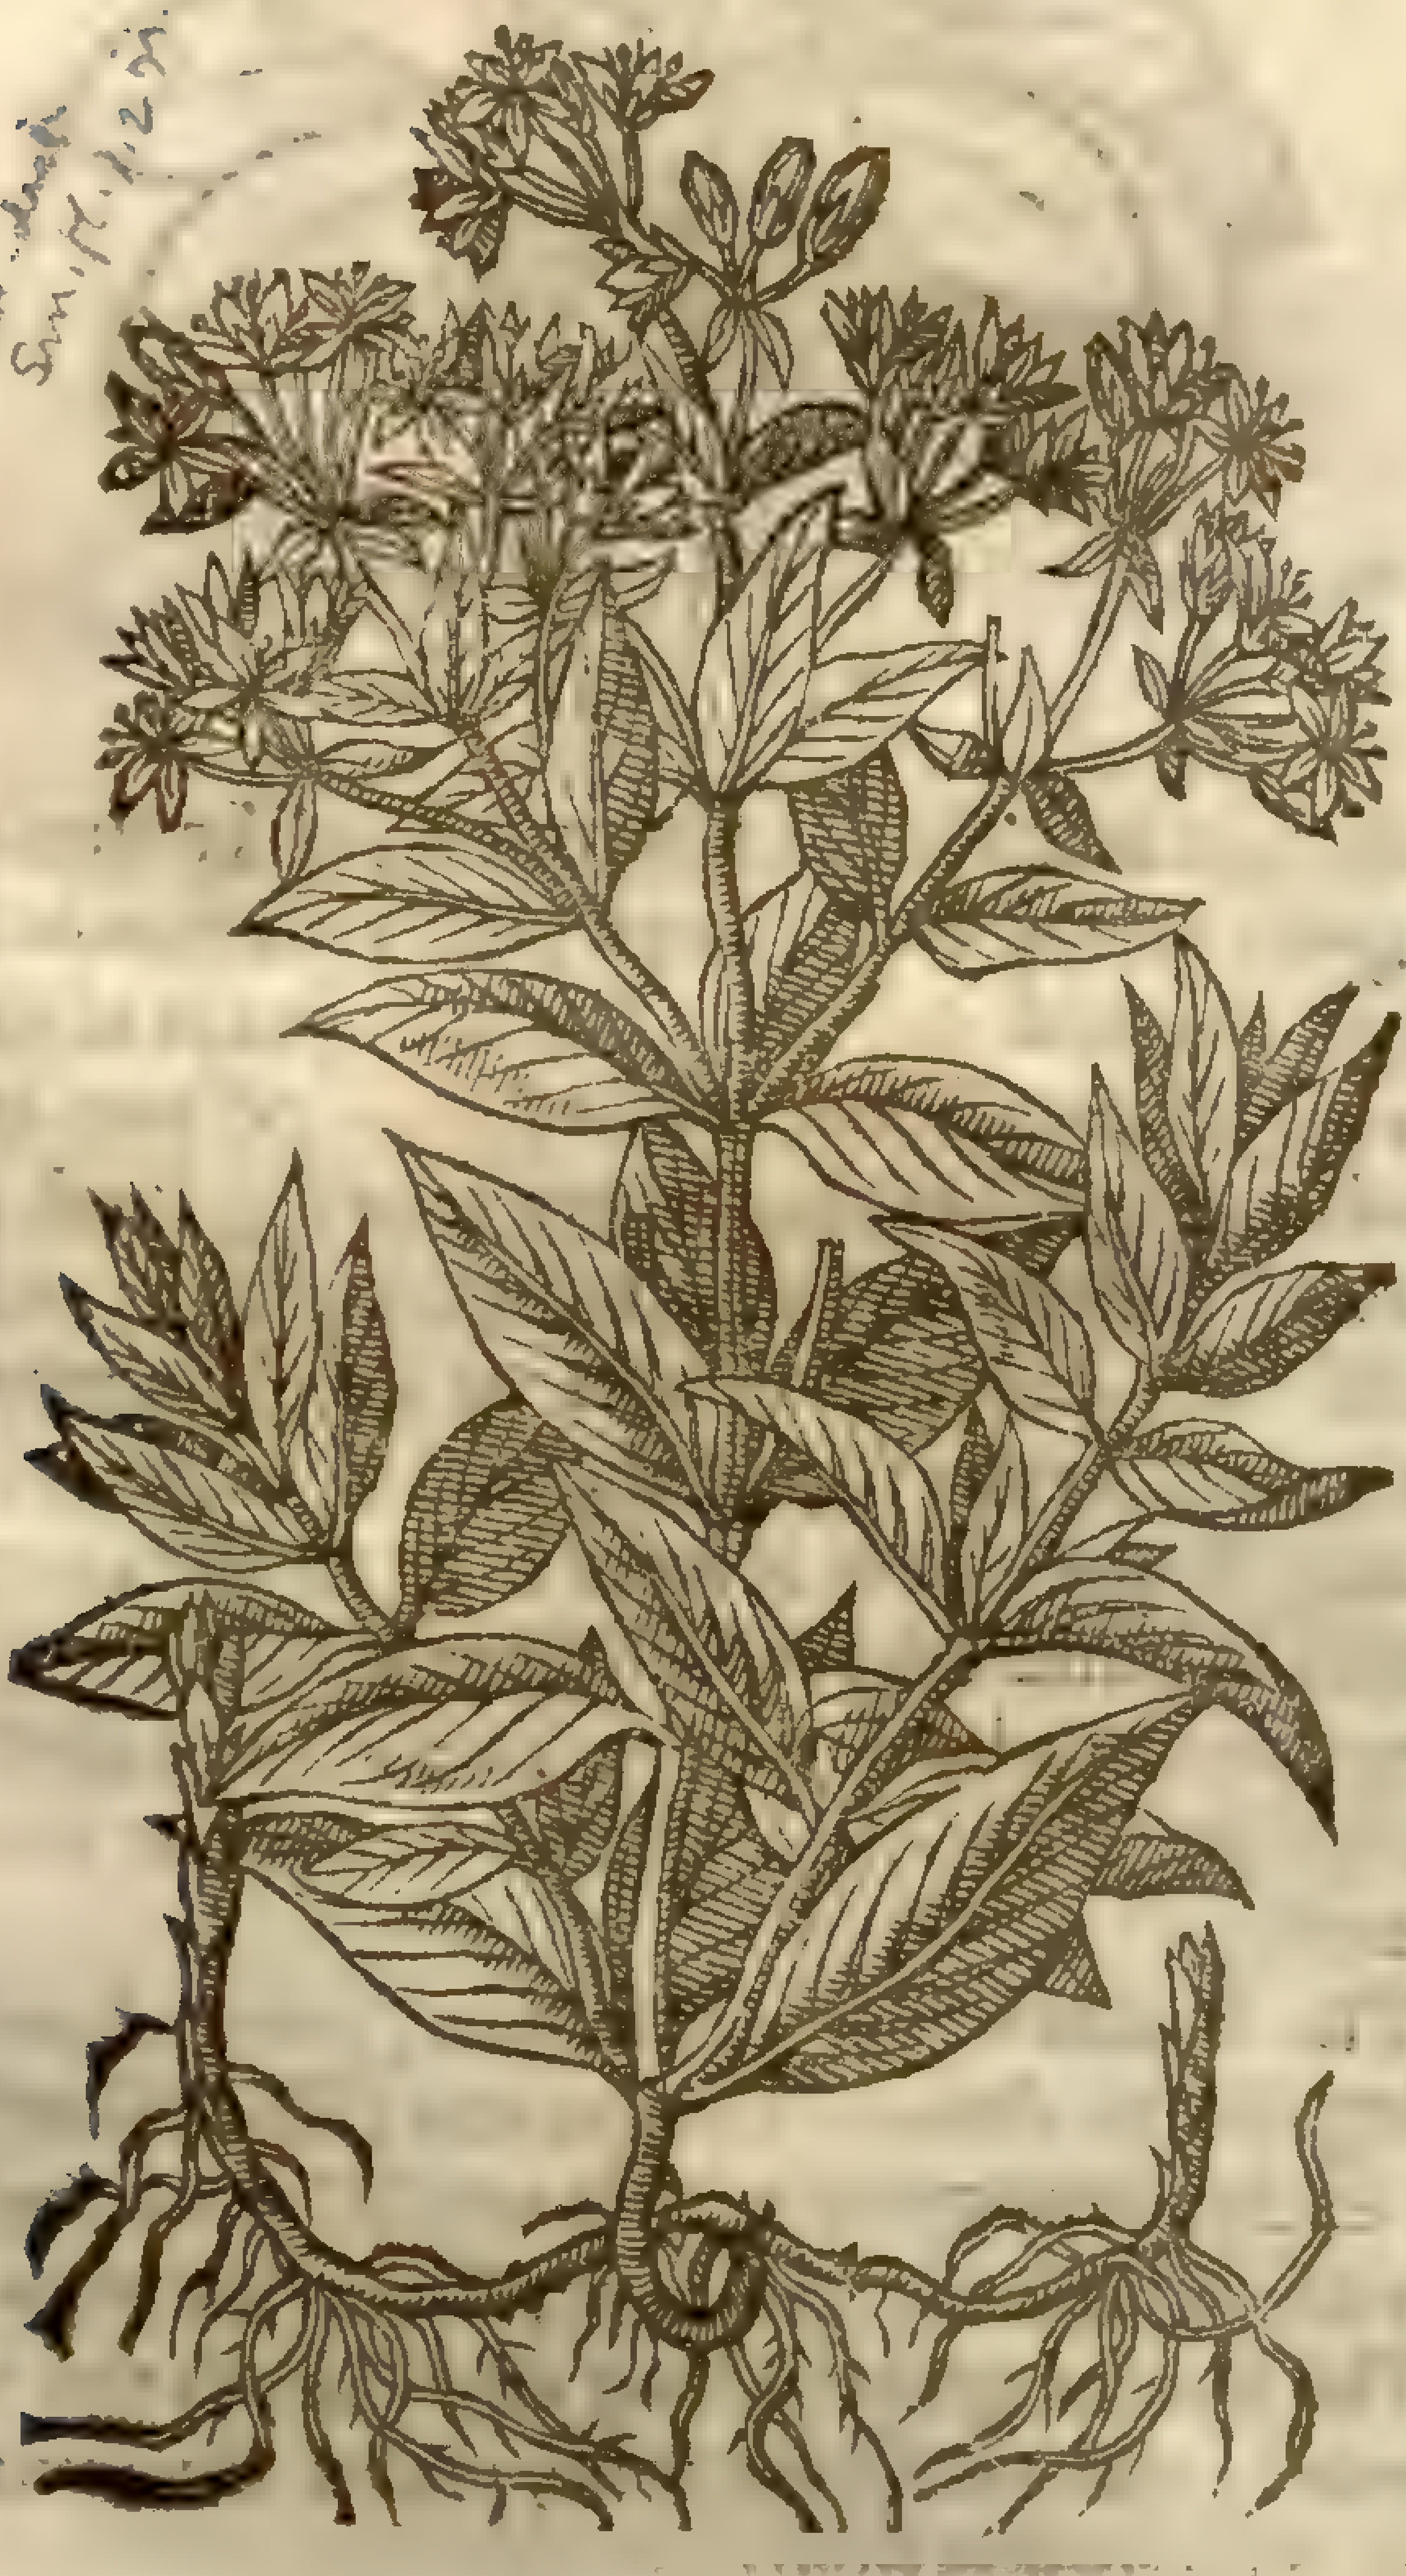
¶ *The Nature and Vertues.*

The natures and vertues of theſe,as of many others,lie hid as yet,and ſo may continue,if chance, or a more curious generation than yet is in being do not finde them out. ‡

Chap. 129. *Of Willow-herbe, or Looſe-ſtrife.*

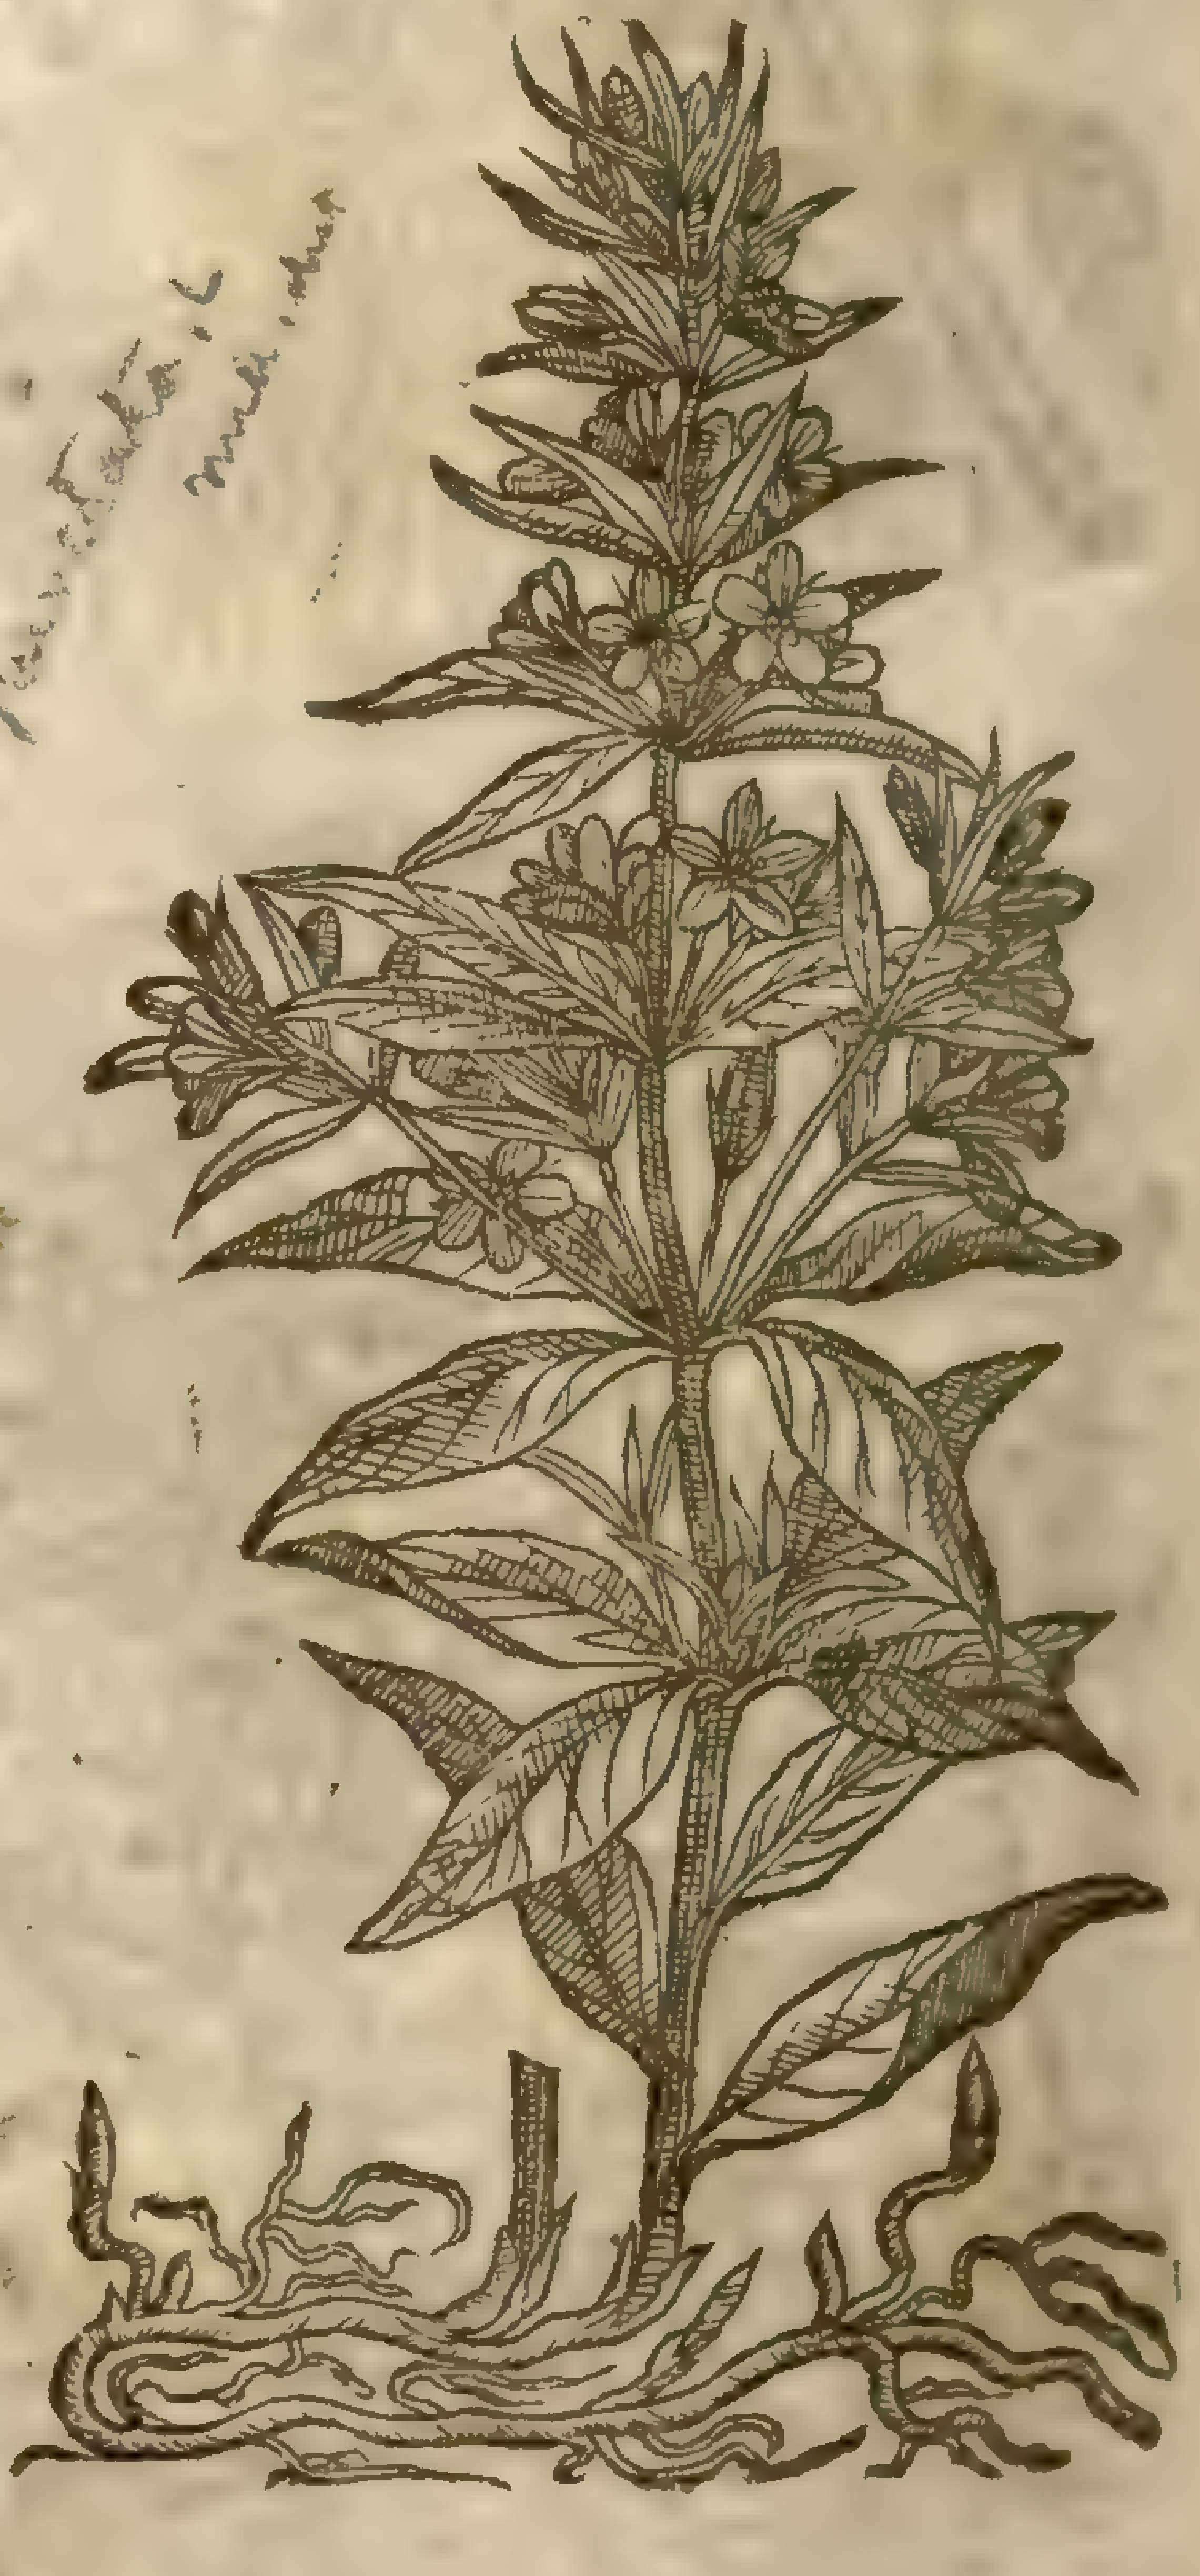
1 *Lyſimachia lutea.*
Yellow Willow-herbe.

L. vulgaris
mihi dub.
Sm. Fl. 1.27



‡ 2 *Lyſimachia lutea minor.*
Small yellow Willow-herbe.

L. punctata L.
mihi dub.

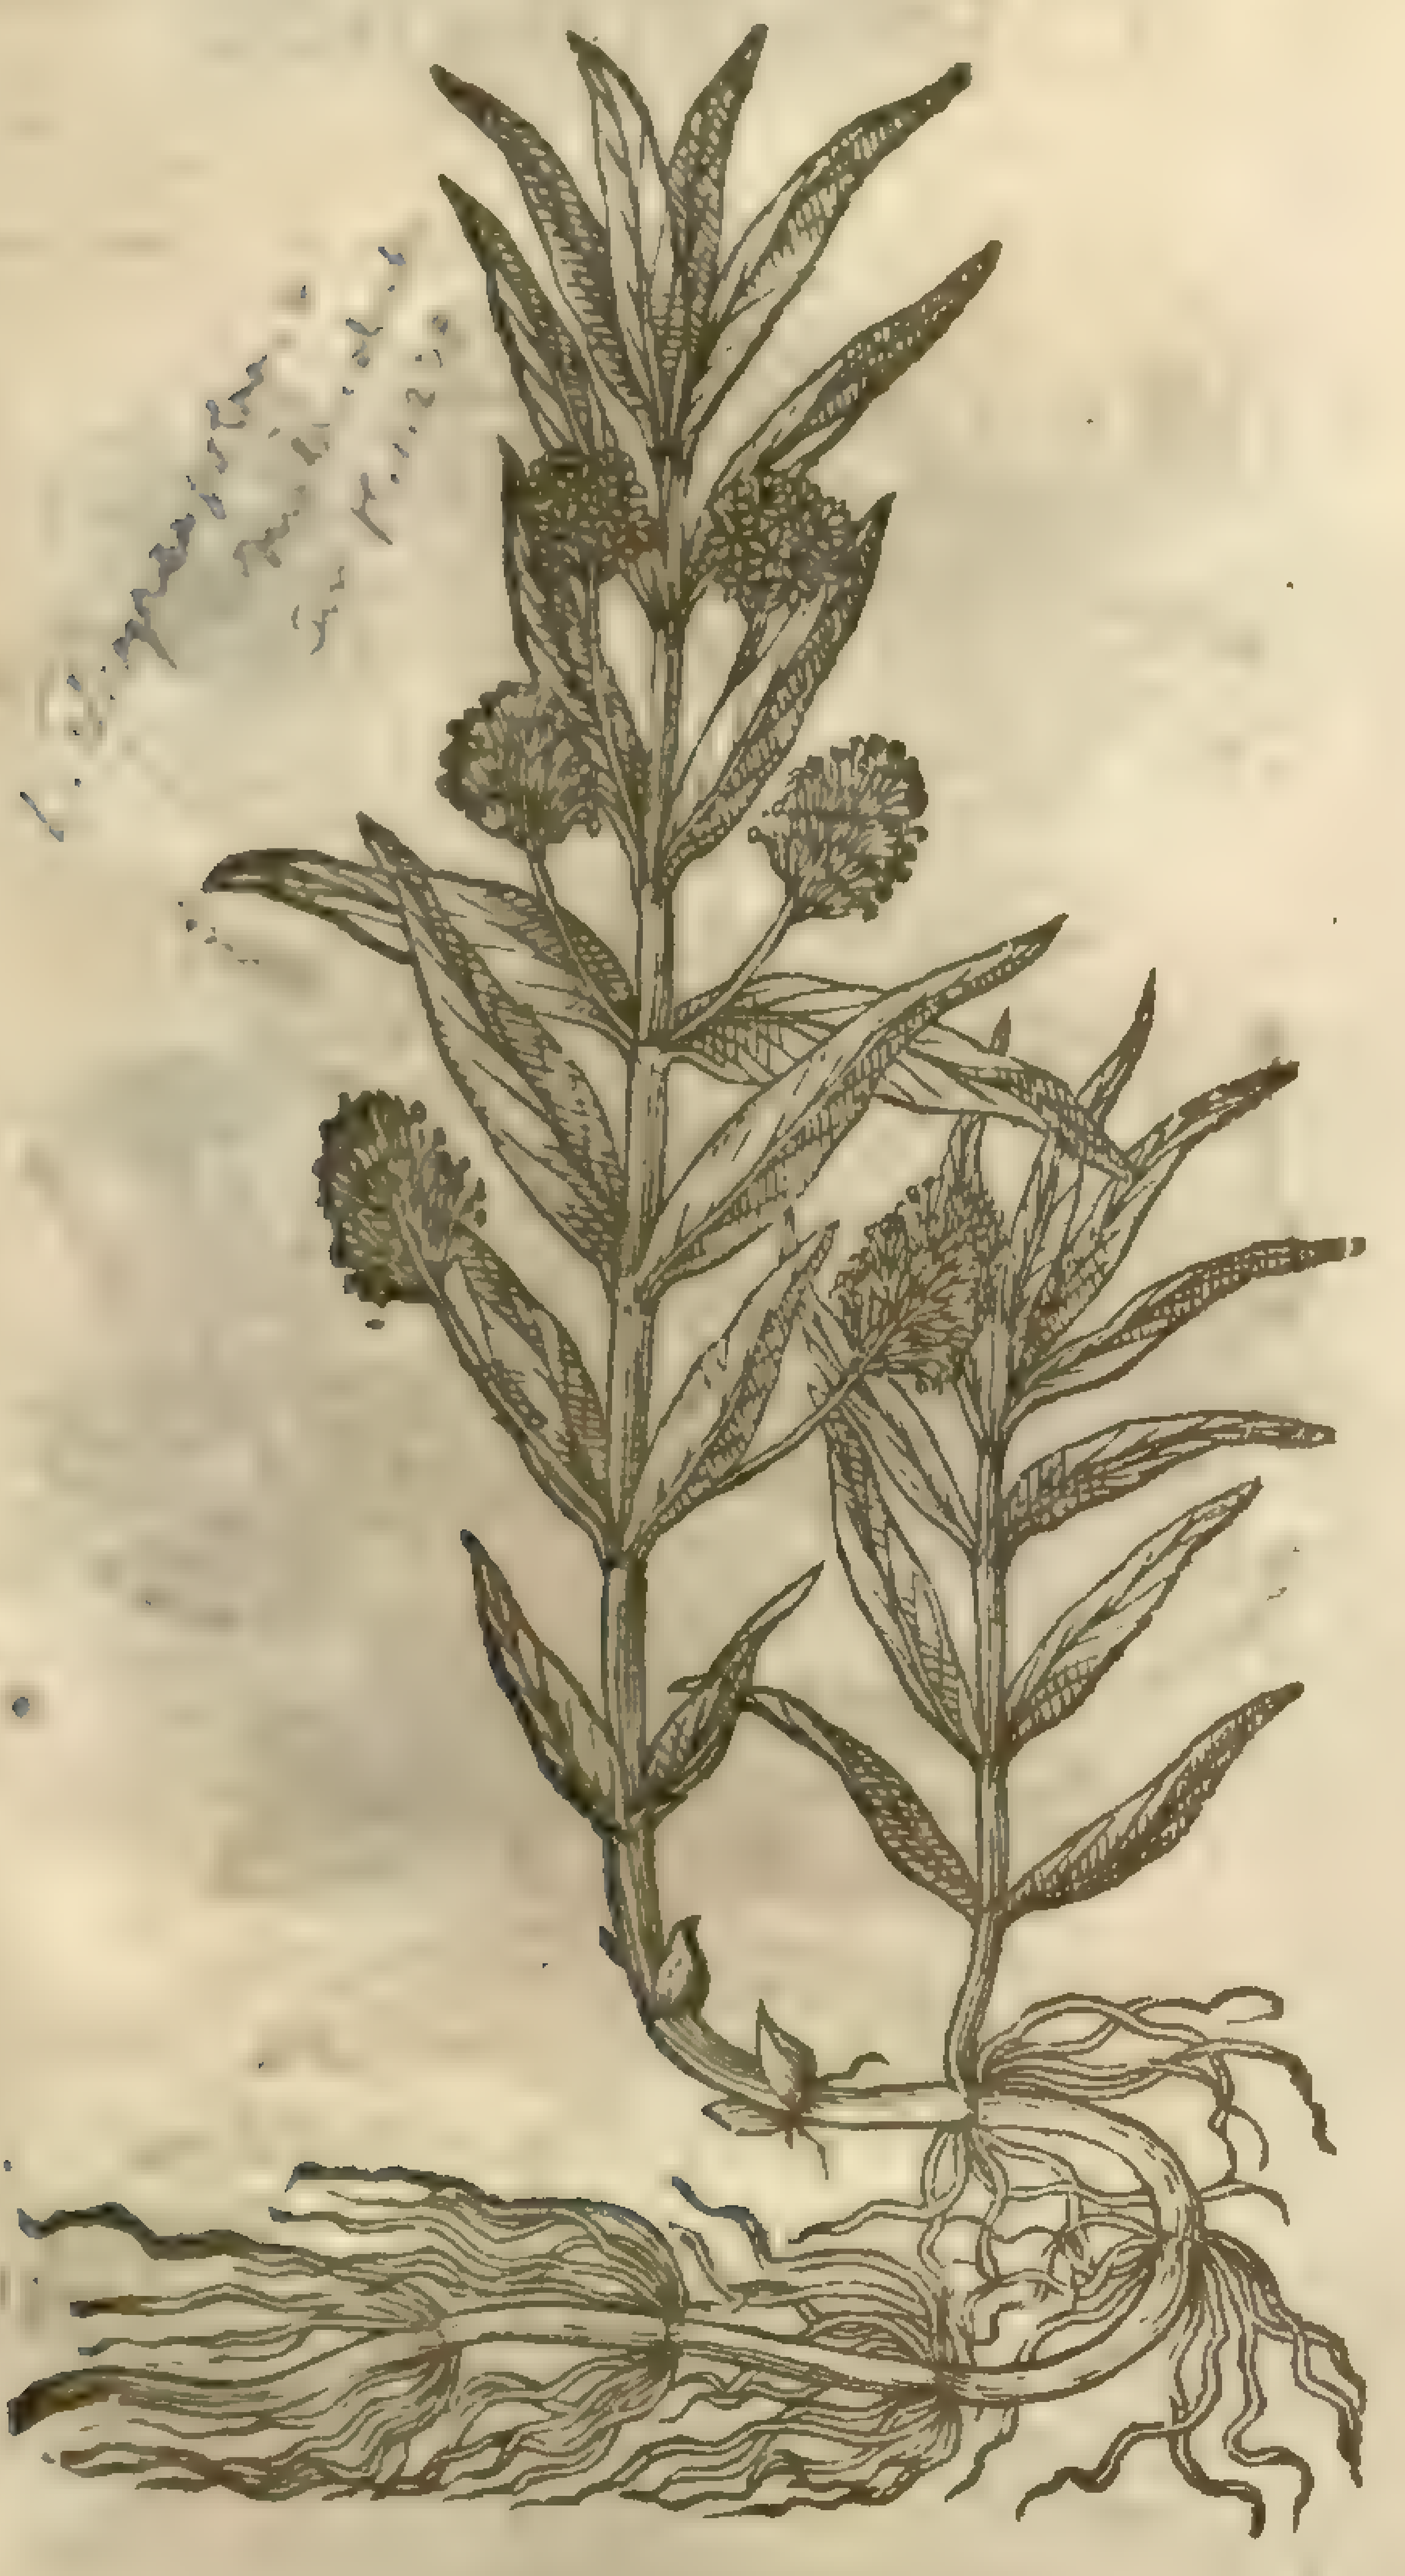


¶ *The Deſcription.*

1 THe firſt kinde of Willow-herbe hath long and narrow leaues of a grayiſh greene colour,in ſhape like the Willow or Sallow leaues, ſtanding three or foure one againſt another at ſeuerall diſtances round about the ſtalke; which toward the top diuideth it ſelfe into many other branches,on the tops whereof grow tufts of faire yellow floures, conſiſting of fiue leaues apiece, without ſmell: which being paſt, there commeth forth ſeed like Coriander. The root is long and ſlender.

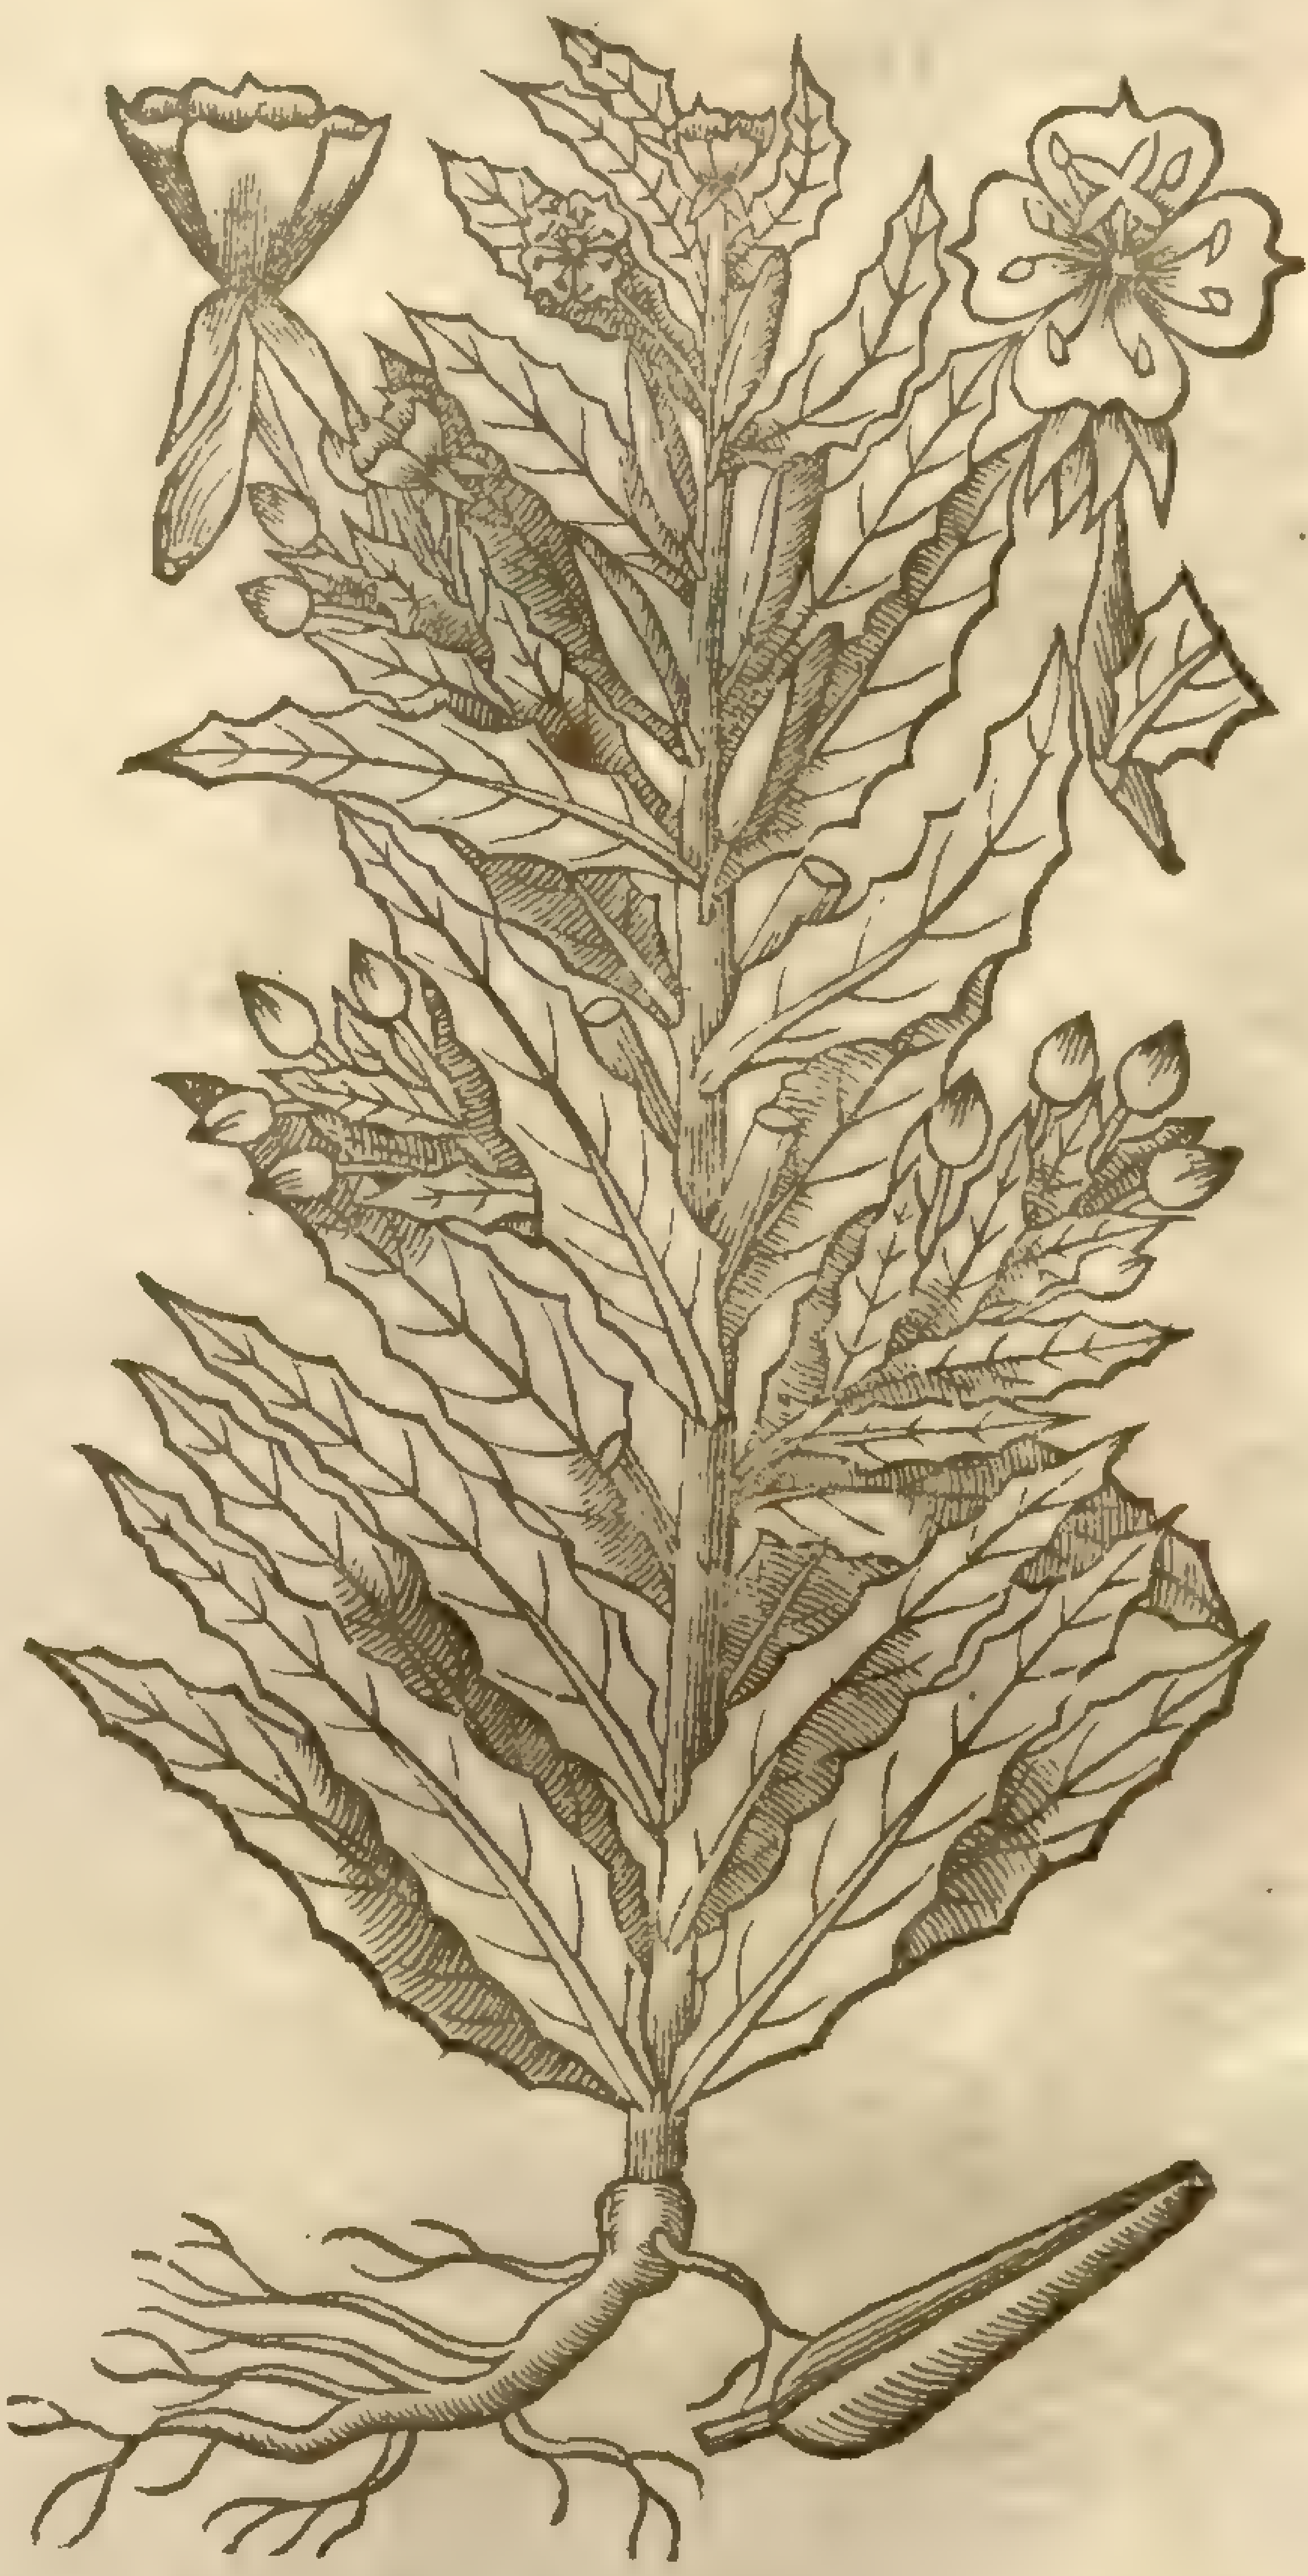
‡ 2 This leſſer of *Cluſius* his deſcription hath a ſtalke a cubit high, and ſometimes higher, firme, hard, and downy; about which at certaine diſtances grow commonly foure leaues together, yet ſometimes but three, and they are ſoft and ſomewhat downy, leſſer than thoſe of the former, being firſt of an acide taſte, and then of an acride; and they are vſually marked on their lower ſides with blacke ſpots. About the top of the ſtalke, out of the boſomes of each leafe come forth little branches bearing ſome few floures, or elſe foot-ſtalkes carying ſingle floures, which is more vſuall towards the top of the ſtalke. The floures are yellow, with ſomewhat a ſtrong ſmell, conſiſting of fiue ſharpe pointed yellow leaues, with ſo many yellow threds in their middle. The root is joynted, or creeping here and there, putting vp new ſhouts.

‡ 3 *Lyſimachia lutea flore globoſo.*
Yellow Willow-herb with bunched floures.



‡ 4 *Lyſimachia lutea Virginiana.*
Tree Primroſe.

Oenothera



3 This alſo may fitly be referred to the former. The ſtalke is a cubit high, ſtraight, and as it were jointed, naked oft times below by the falling away of the leaues; but from the middle to the top ſet with two leaues at a joynt, like thoſe of the former; and out of their boſoms on ſhort ſtalks grow round tufts of ſmall yellow floures as in bunches: the root which creeps ſends forth many ſmall fibres at each joynt. This was ſet forth by *Lobel* vnder the title of *Lyſimachia lutea altera*, or *Lyſimachia ſalicaria*: *Dodonaus* hath it by the name of *Lyſimachium aquatile*: and *Cluſius* calls it *Lyſimachia lutea tertia, ſiue minor.*

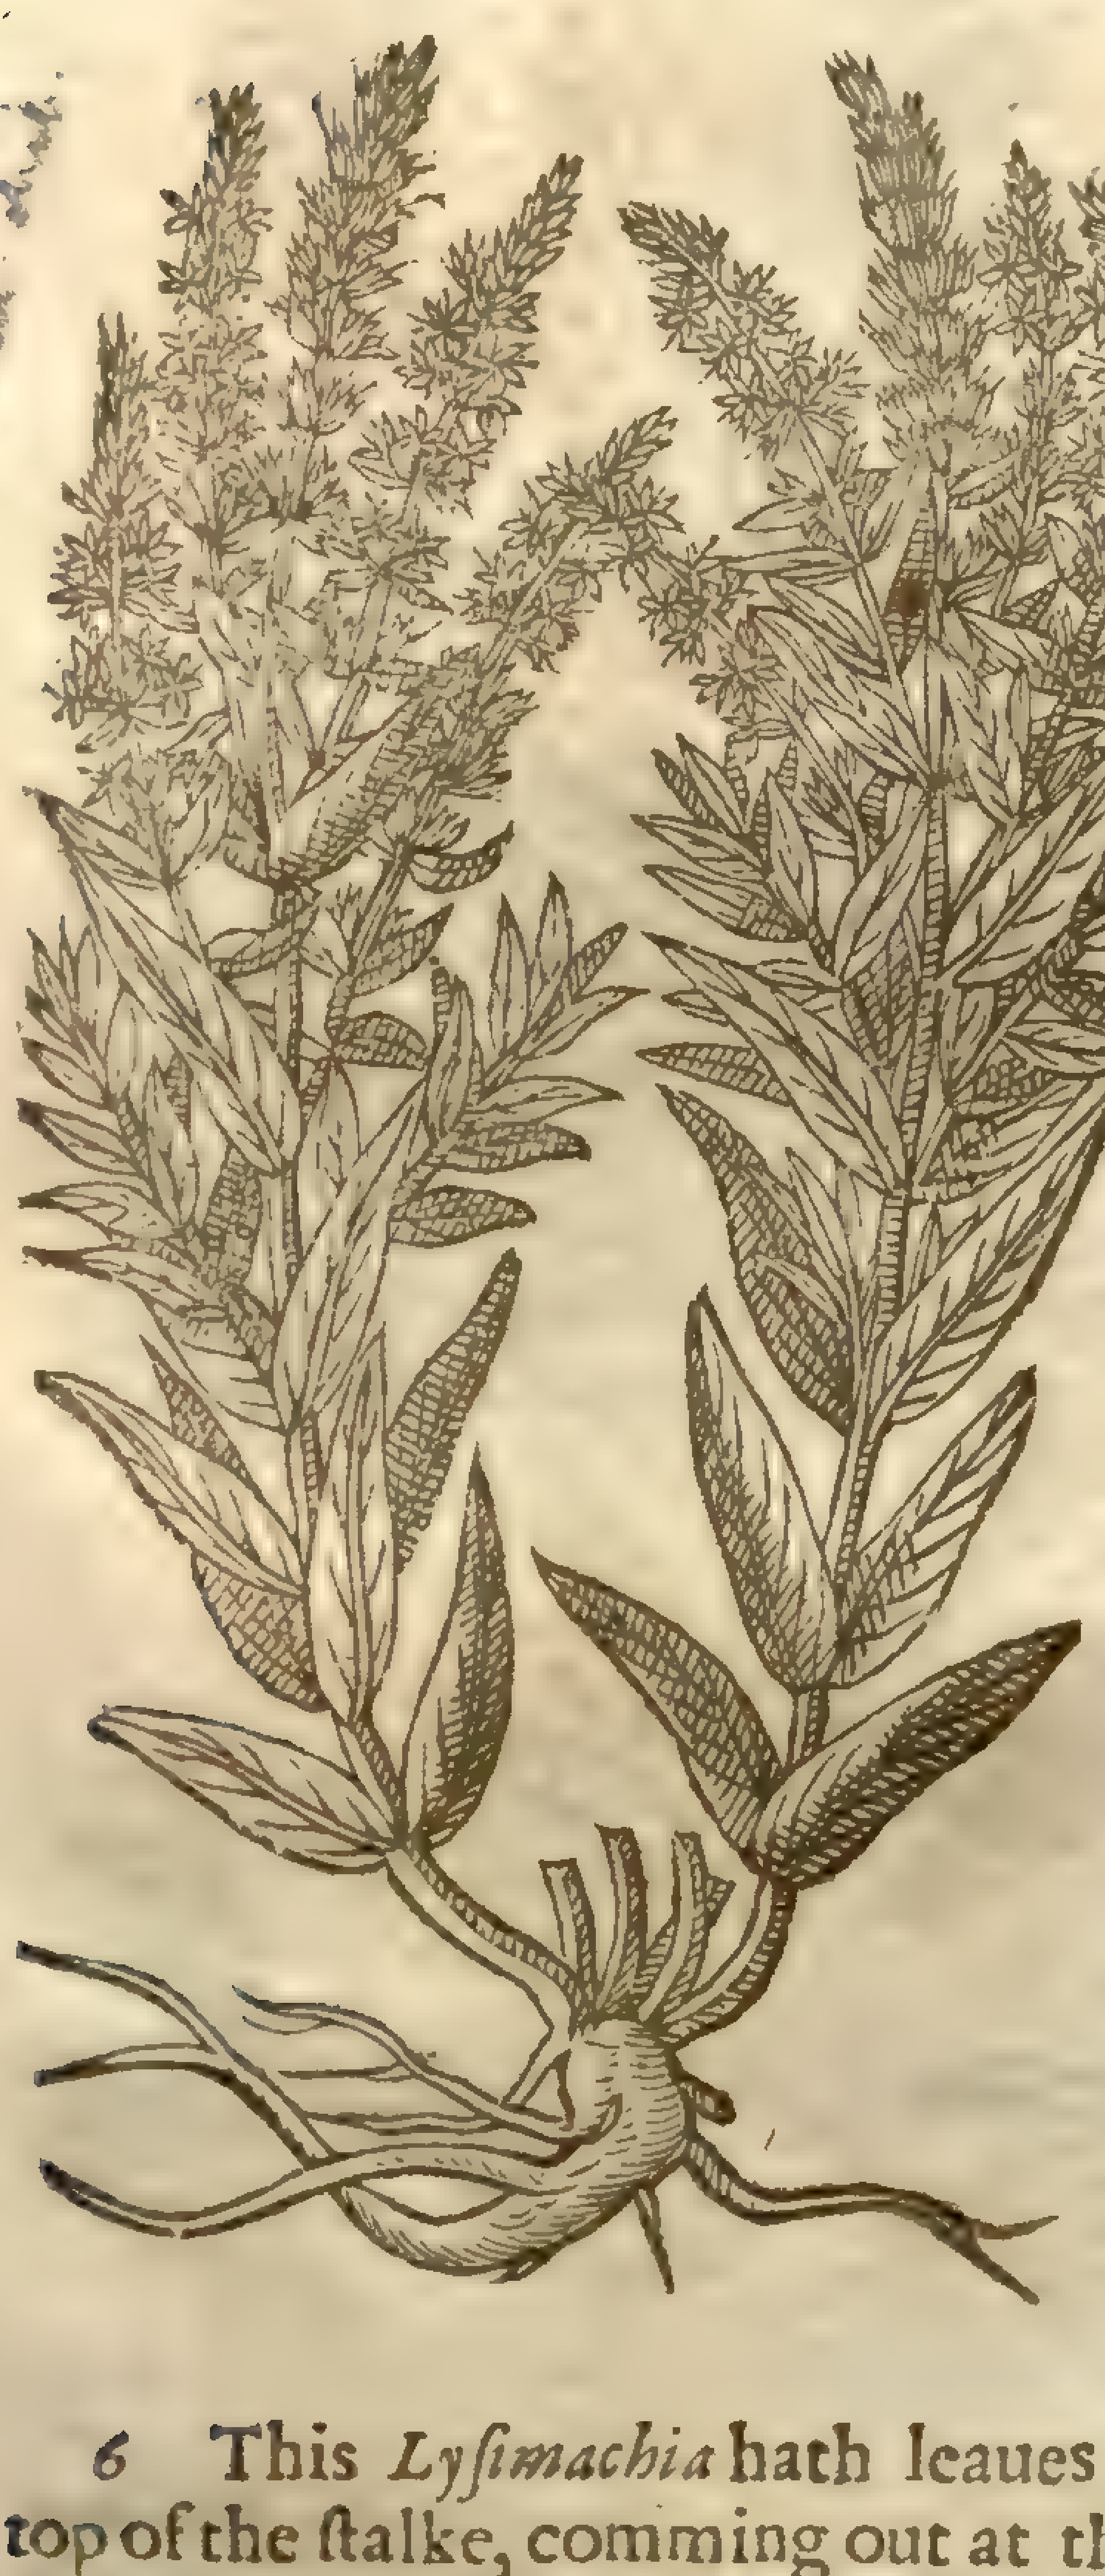
4 This Virginian hath beene deſcribed and figured onely by *Proſper Alpinus*, vnder the title of *Hyoſcyamus Virginianus*: and by M^r. *Parkinſon*, by the name of *Lyſimachia lutea ſiliquoſa Virginiana*: Alſo *Bauhine* in the Appendix of his *Pinax* hath a large deſcription thereof, by the name of *Lyſimachia lutea corniculata.* The root hereof is longiſh, white, about the thickeneſſe of ones thumbe, from whence growes vp a tall ſtalke diuided into many branches of an ouerworne colour, and a little hairie: the leaues are like thoſe of the former, but ſomewhat ſinuated alongſt their edges, and hauing their middle veine of a whitiſh colour: toward the tops of the branches amongſt the leaues come vp pretty thicke cods, which growing ſmaller on their tops ſuſtaine pretty large yellow floures conſiſting of foure leaues, with a peſtle in the middle, vpon which ſtand foure yellowiſh thrums

in faſhion of a croſſe; and there are alſo eight threds with their pointals in the middle of them. Theſe floures haue ſomewhat the ſmell of a Primroſe (whence Mr *Parkinſon* gaue it the Engliſh name, which I haue alſo here giuen you:) after the floures are fallen, the cods grow to be ſome two inches long, being thicker below, and ſharper at the top, and ſomewhat twined, which in fine open themſelues into foure parts to ſhatter their ſeed, which is blacke and ſmall; and ſowne, it growes not the firſt yeare into a ſtalke, but ſends vp many large leaues lying handſomely one vpon another Roſe-faſhion. It floures in Iune, and ripens the ſeed in Auguſt. ‡

5 The ſecond kinde of Willow-herbe in ſtalkes and leaues is like the firſt, but that the leaues are longer, narrower, and greener. The floures grow along the ſtalke toward the top, ſpike-faſhion, of a faire purple colour: which being withered turne into downe, which is carried away with the winde.

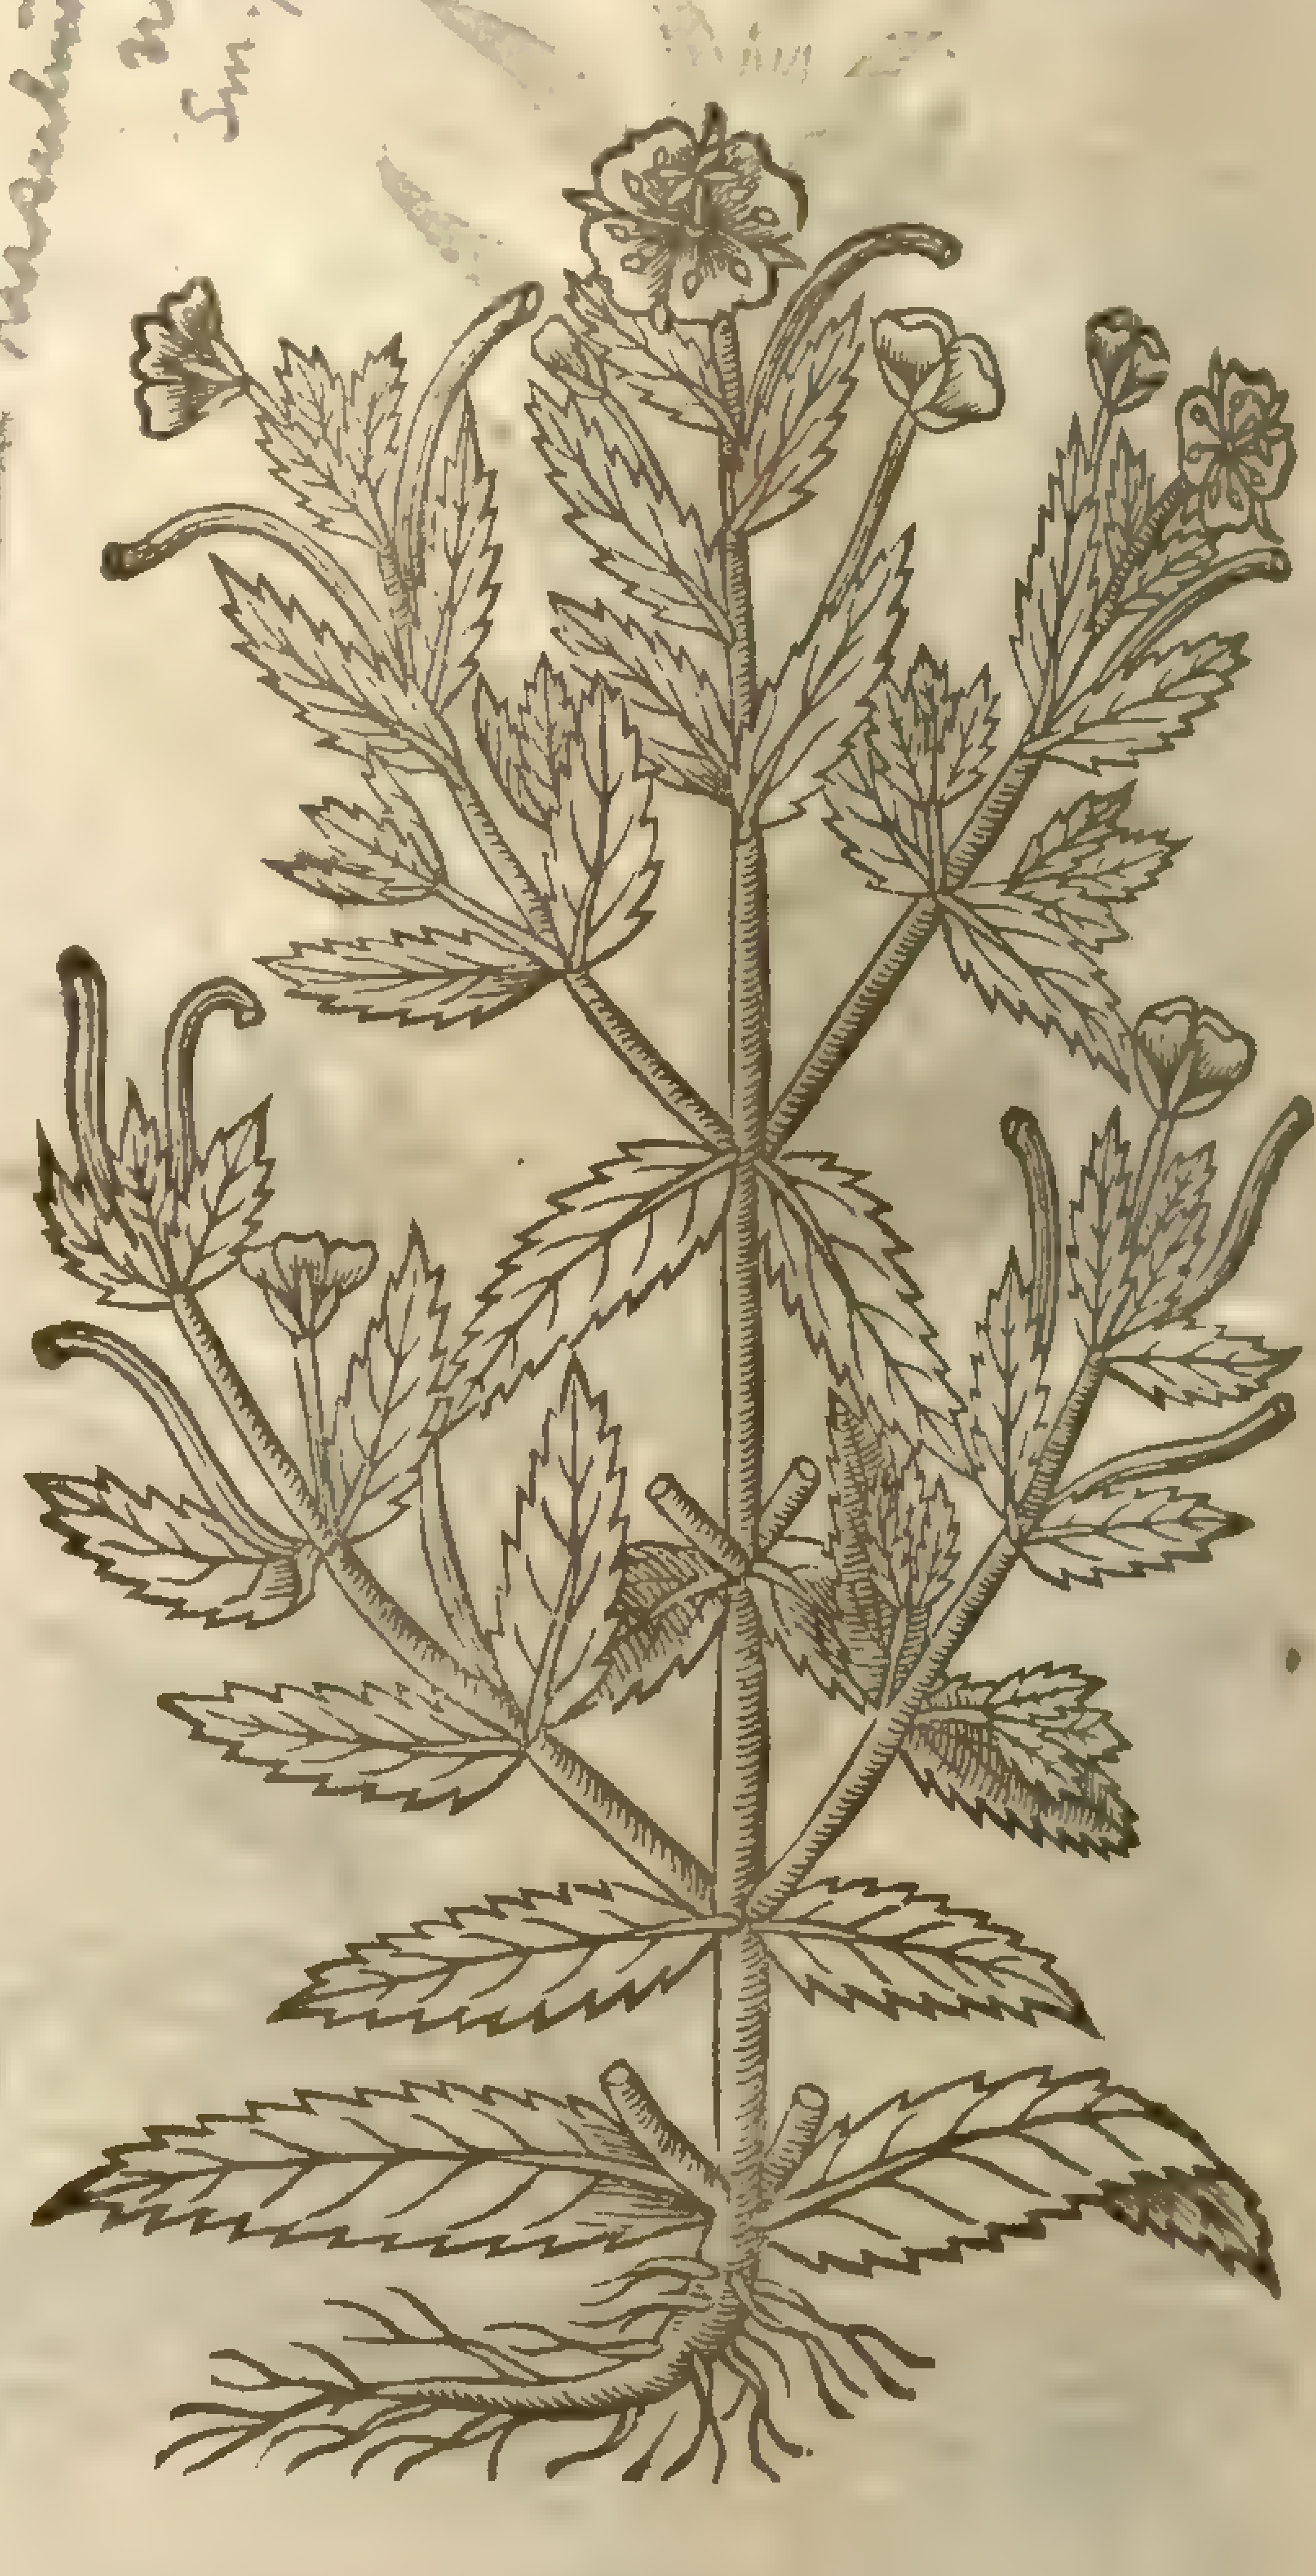
5 *Lyſimachia purpurea ſpicata.*
Spiked Willow-herbe.

Lythrum Salicaria [illegible]



6 *Lyſimachia ſiliquoſa.*
Codded Willow-herbe.

Epilobium hirsutum [illegible] Sm. [illegible]

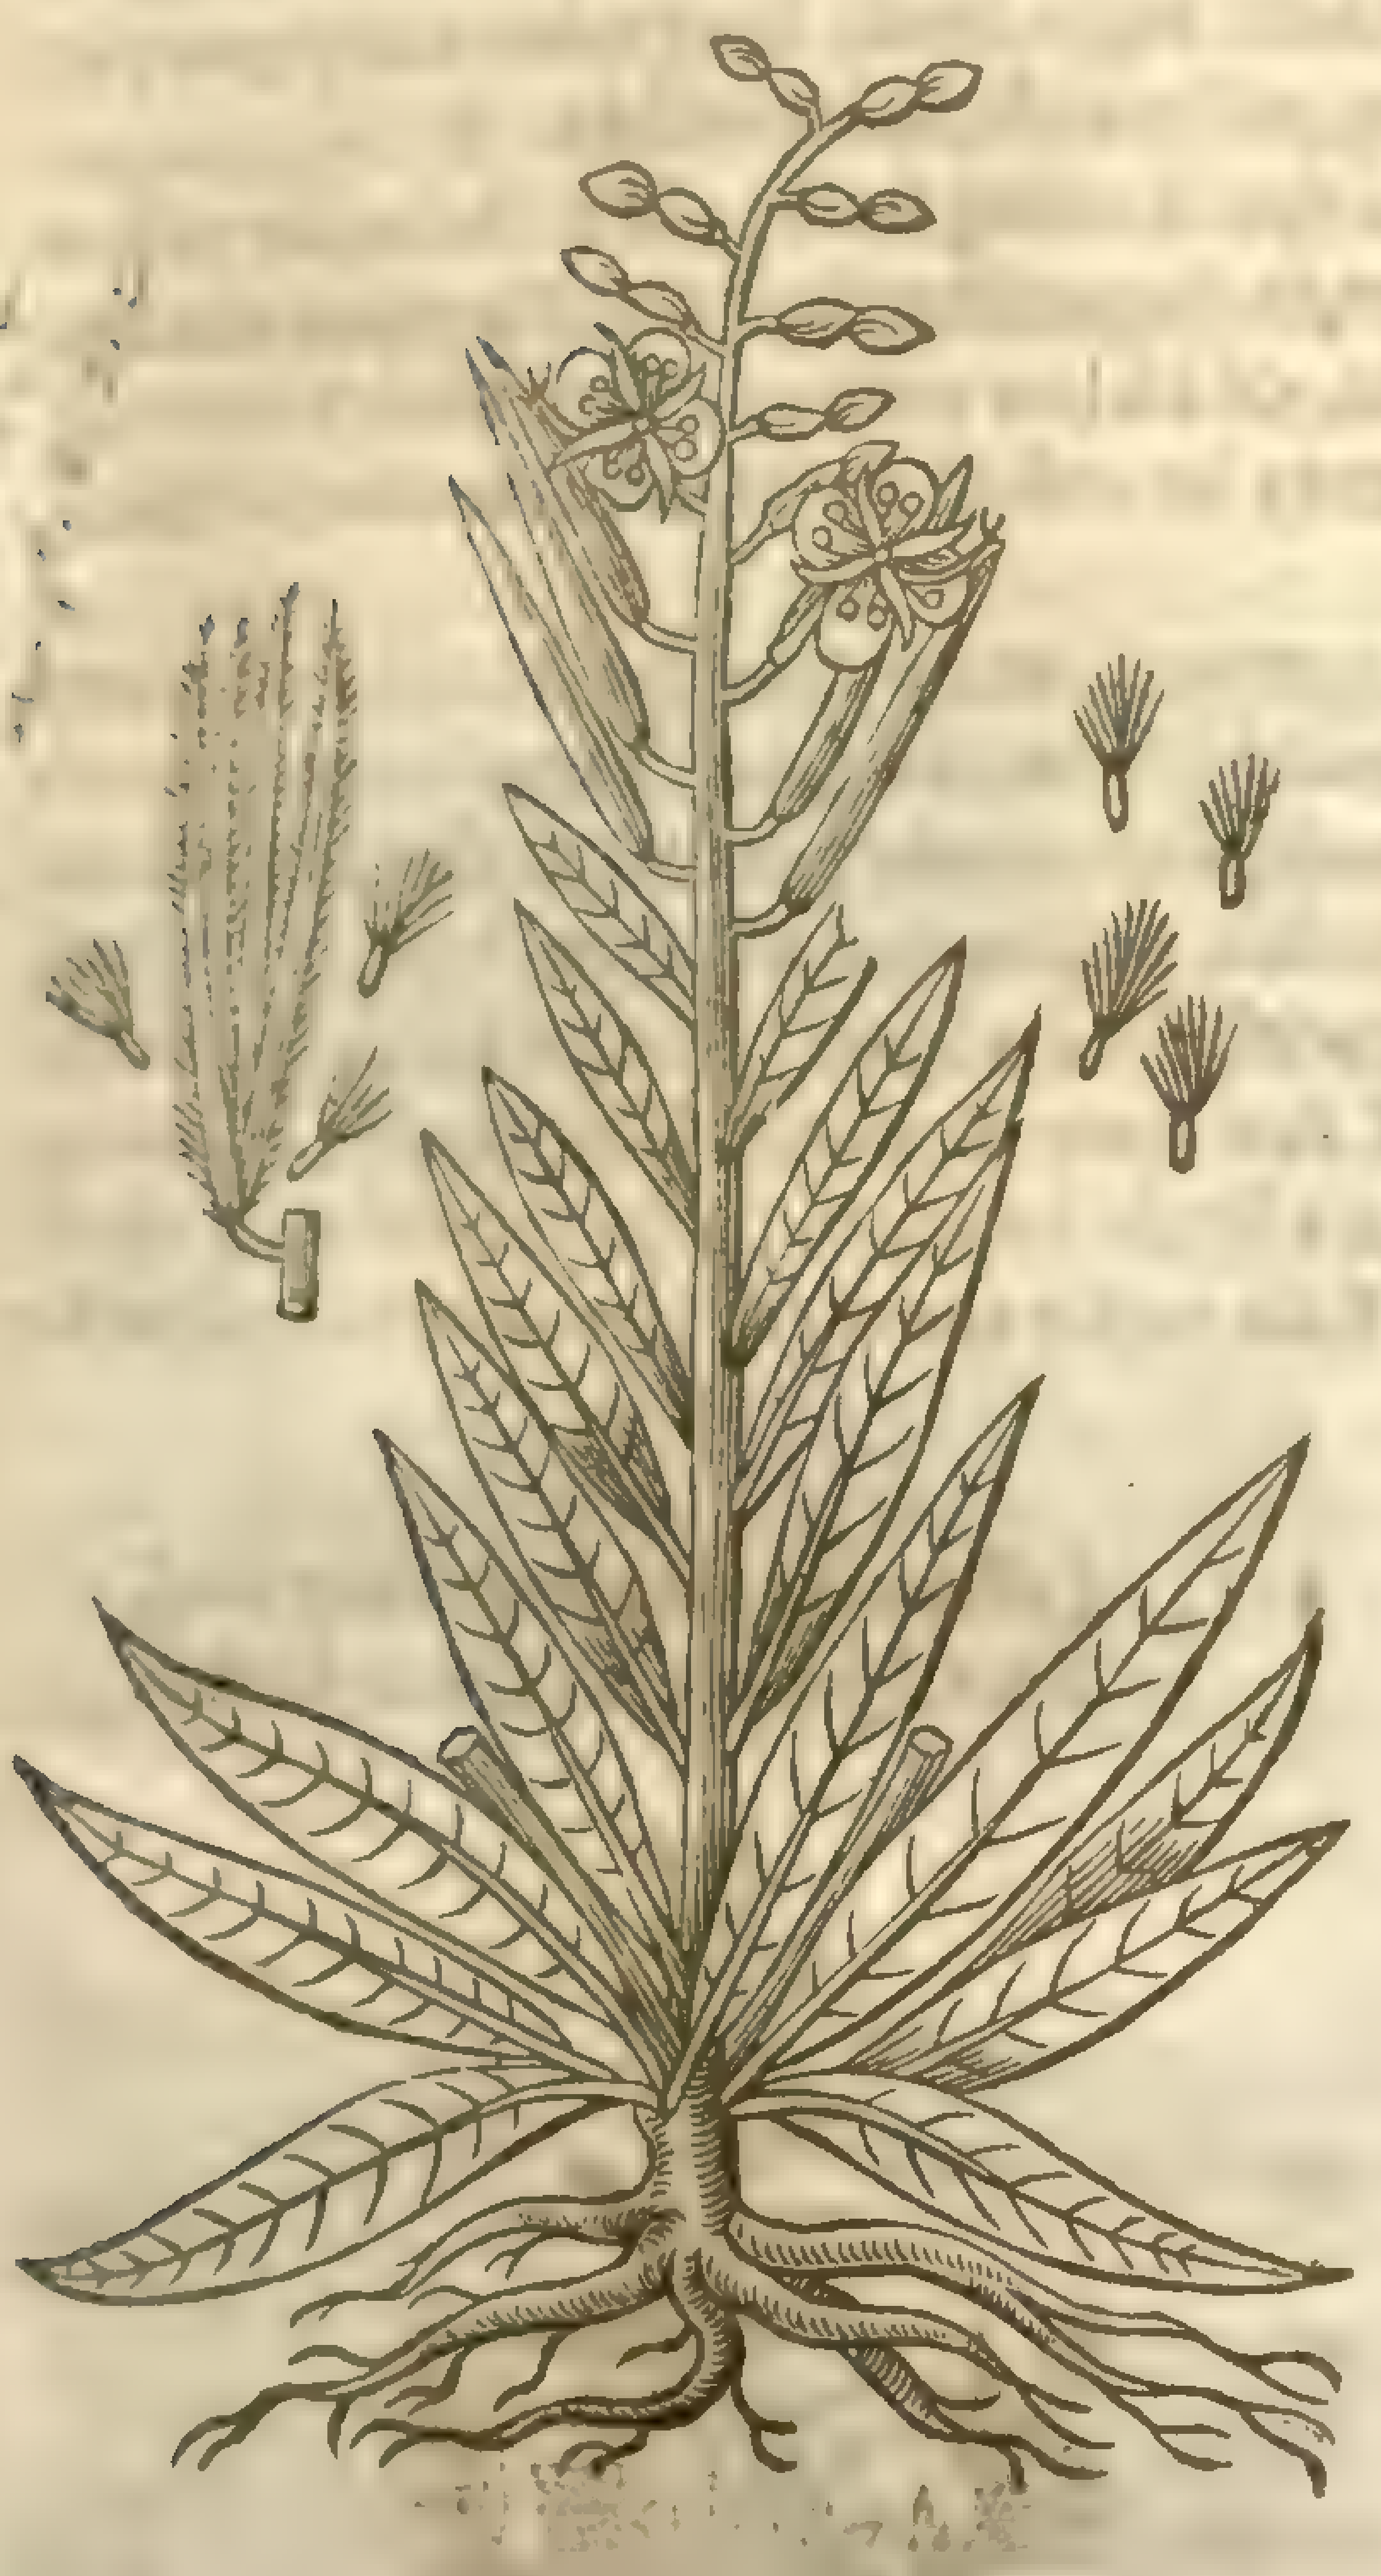


6 This *Lyſimachia* hath leaues and ſtalkes like vnto the former. The floure groweth at the top of the ſtalke, comming out at the end of a ſmall long cod, of a purple colour, in ſhape like a ſtocke Gillofloure, and is called of many *Filius ante Patrem* (that is, the Sonne before the Father) becauſe that the cod commeth forth firſt, hauing ſeeds therein, before the floure doth ſhew it ſelfe abroad. ‡ The leaues of this are more ſoft, large, and hairy than any of the former: they are alſo ſnipt about the edges, and the floure is large, wherein it differs from the twelfth, hereafter deſcribed; and from the eleuenth in the hairineſſe of the leaues, and largenſſe of the floures alſo, as you ſhall finde hereafter. ‡

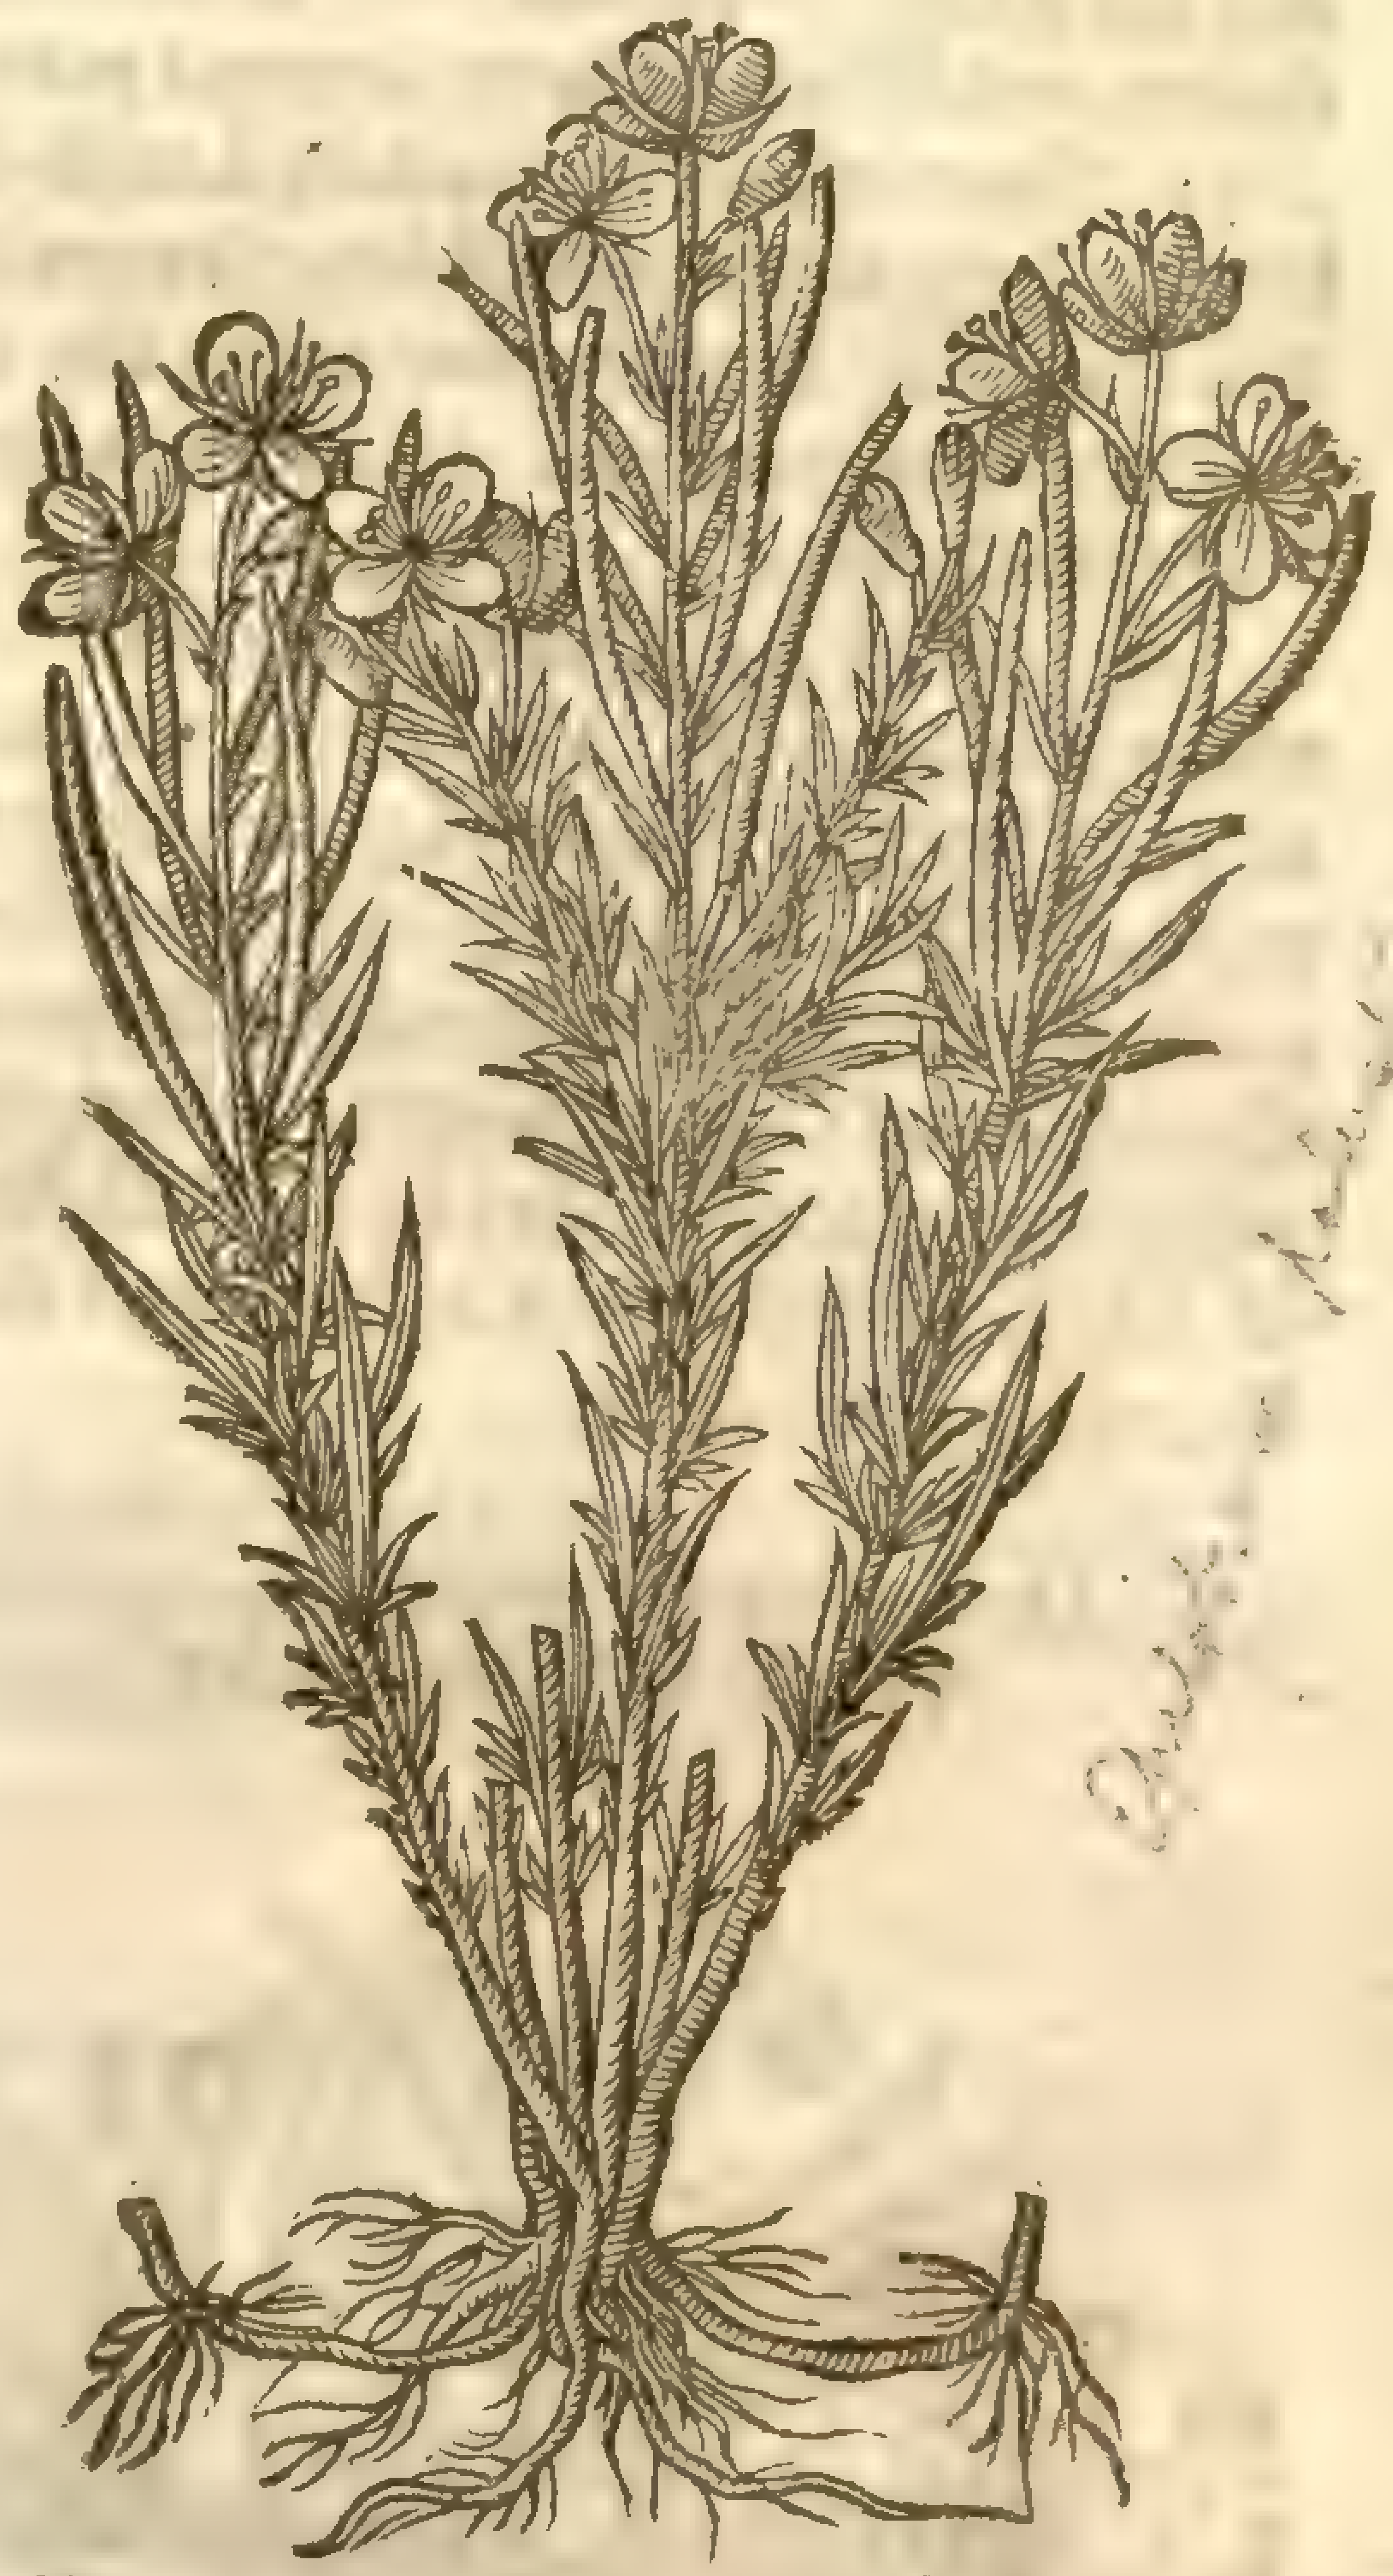
7 This being thought by ſome to be a baſtard kinde, is (as I do eſteeme it) of all the reſt moſt goodly and ſtately plant, hauing leaues like the greateſt Willow or Ozier. The branches come out of the ground in great numbers, growing to the height of ſix foot, garniſhed with braue floures of great beauty, conſiſting of foure leaues apiece, of an orient purple colour, hauing ſome threds in the middle of a yellow colour. The cod is long like the laſt ſpoken of, and full of downy matter, which flyeth away with the winde when the cod is opened.

‡ 8 This alſo, which is the *Chamænerion* of *Geſner*, as alſo his *Epilobion*, *quaſi* ἐπὶ λοβῷ ἴον, a Violet or floure vpon a cod, may iuſtly challenge the next place. *Dodonæus* calls it *Pſeudolyſimachium purpureum*

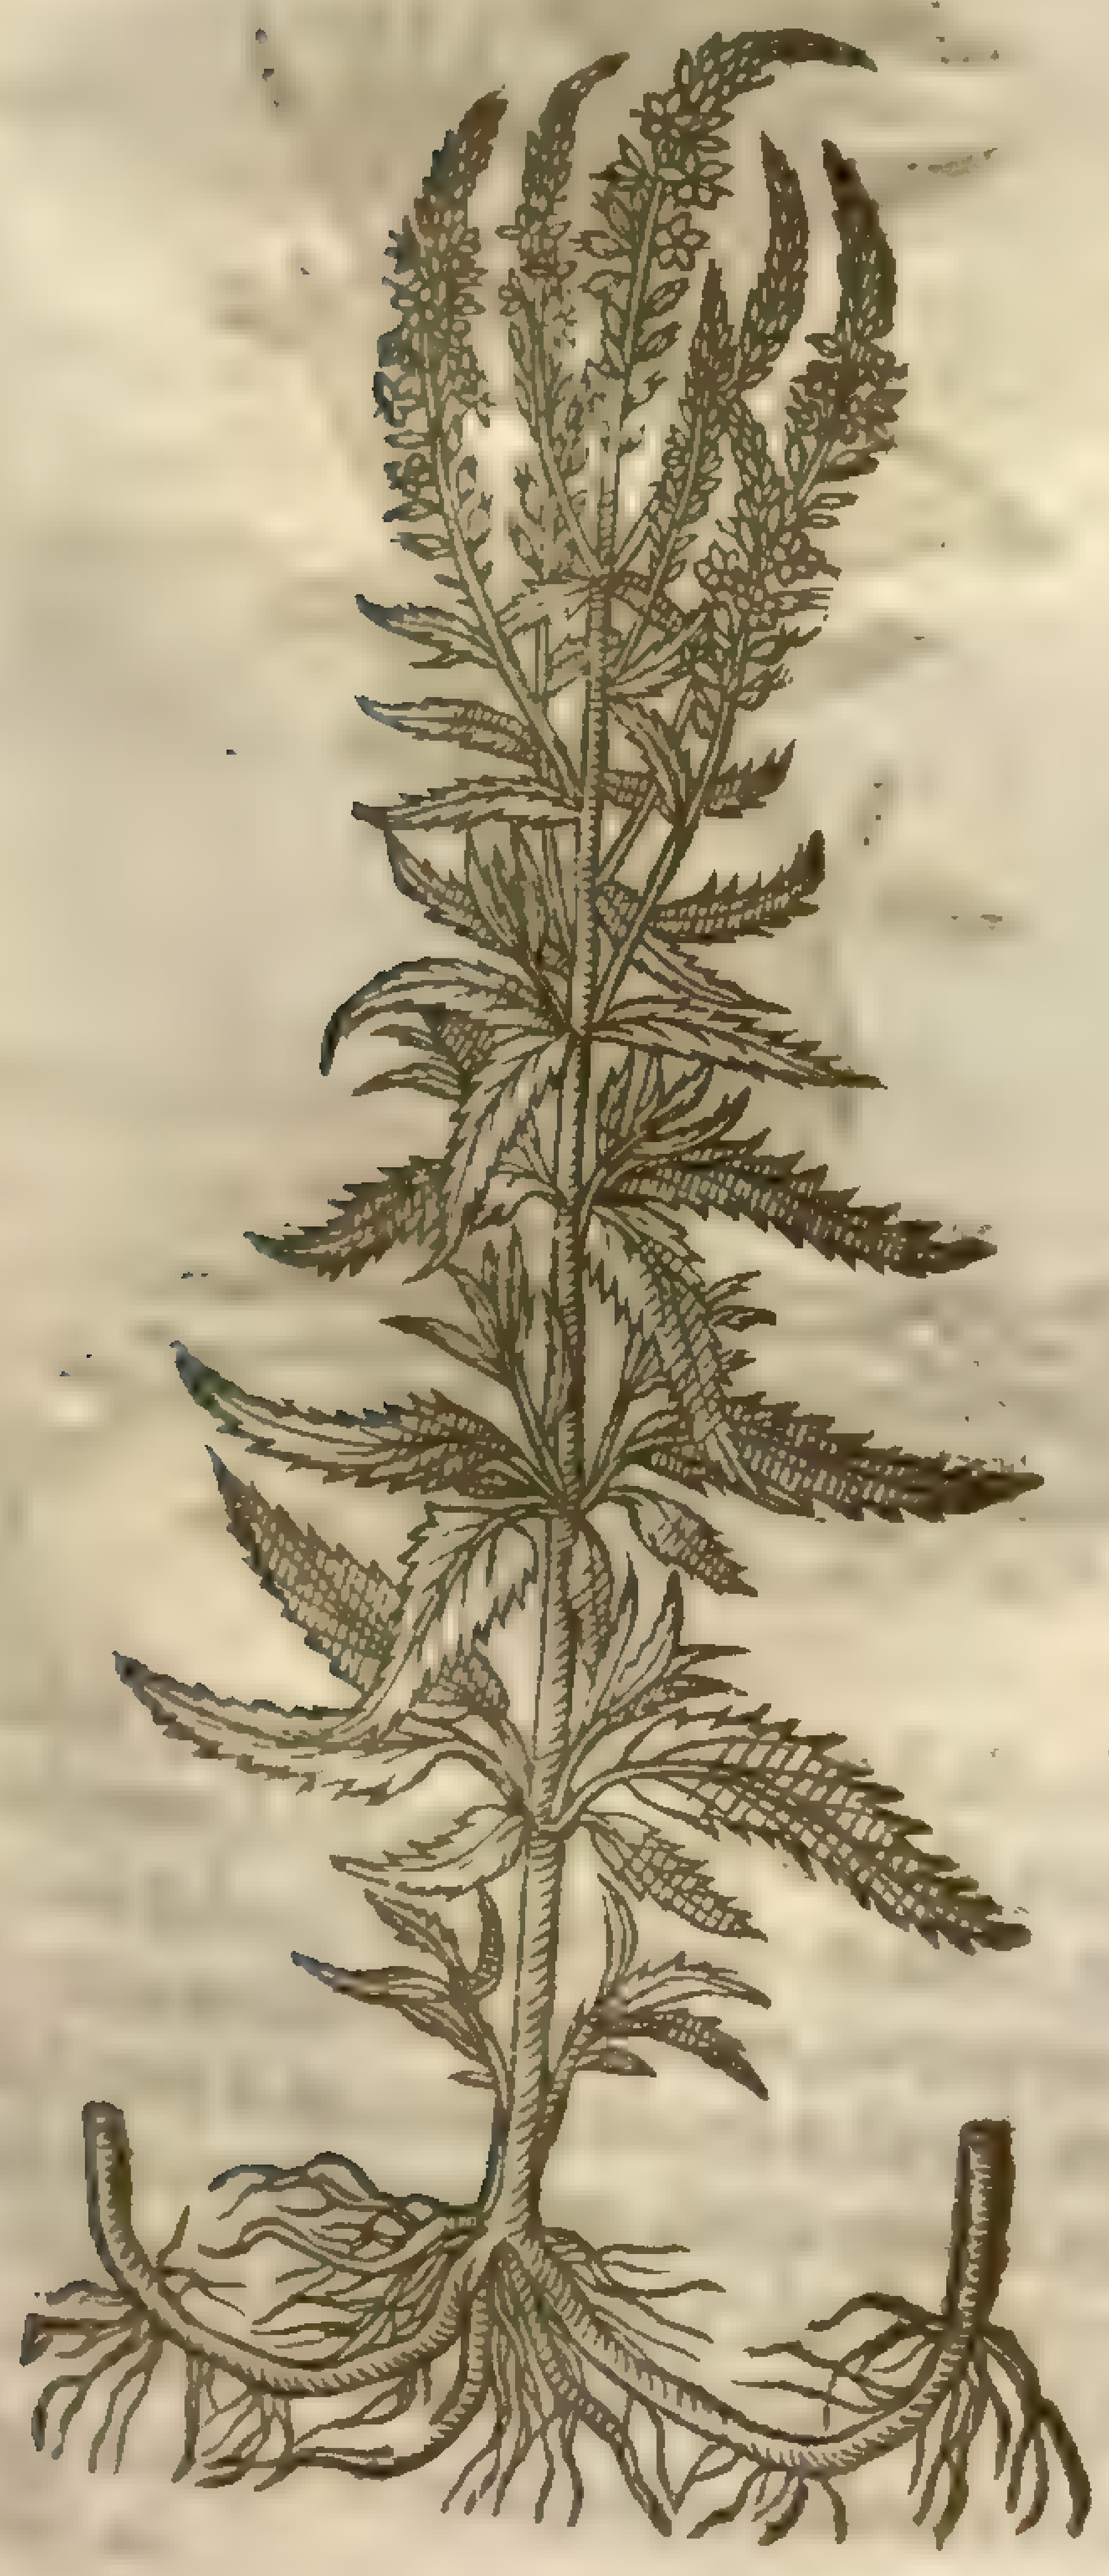
† 7 *Chamænerion.*
Roſe bay Willow-herbe.



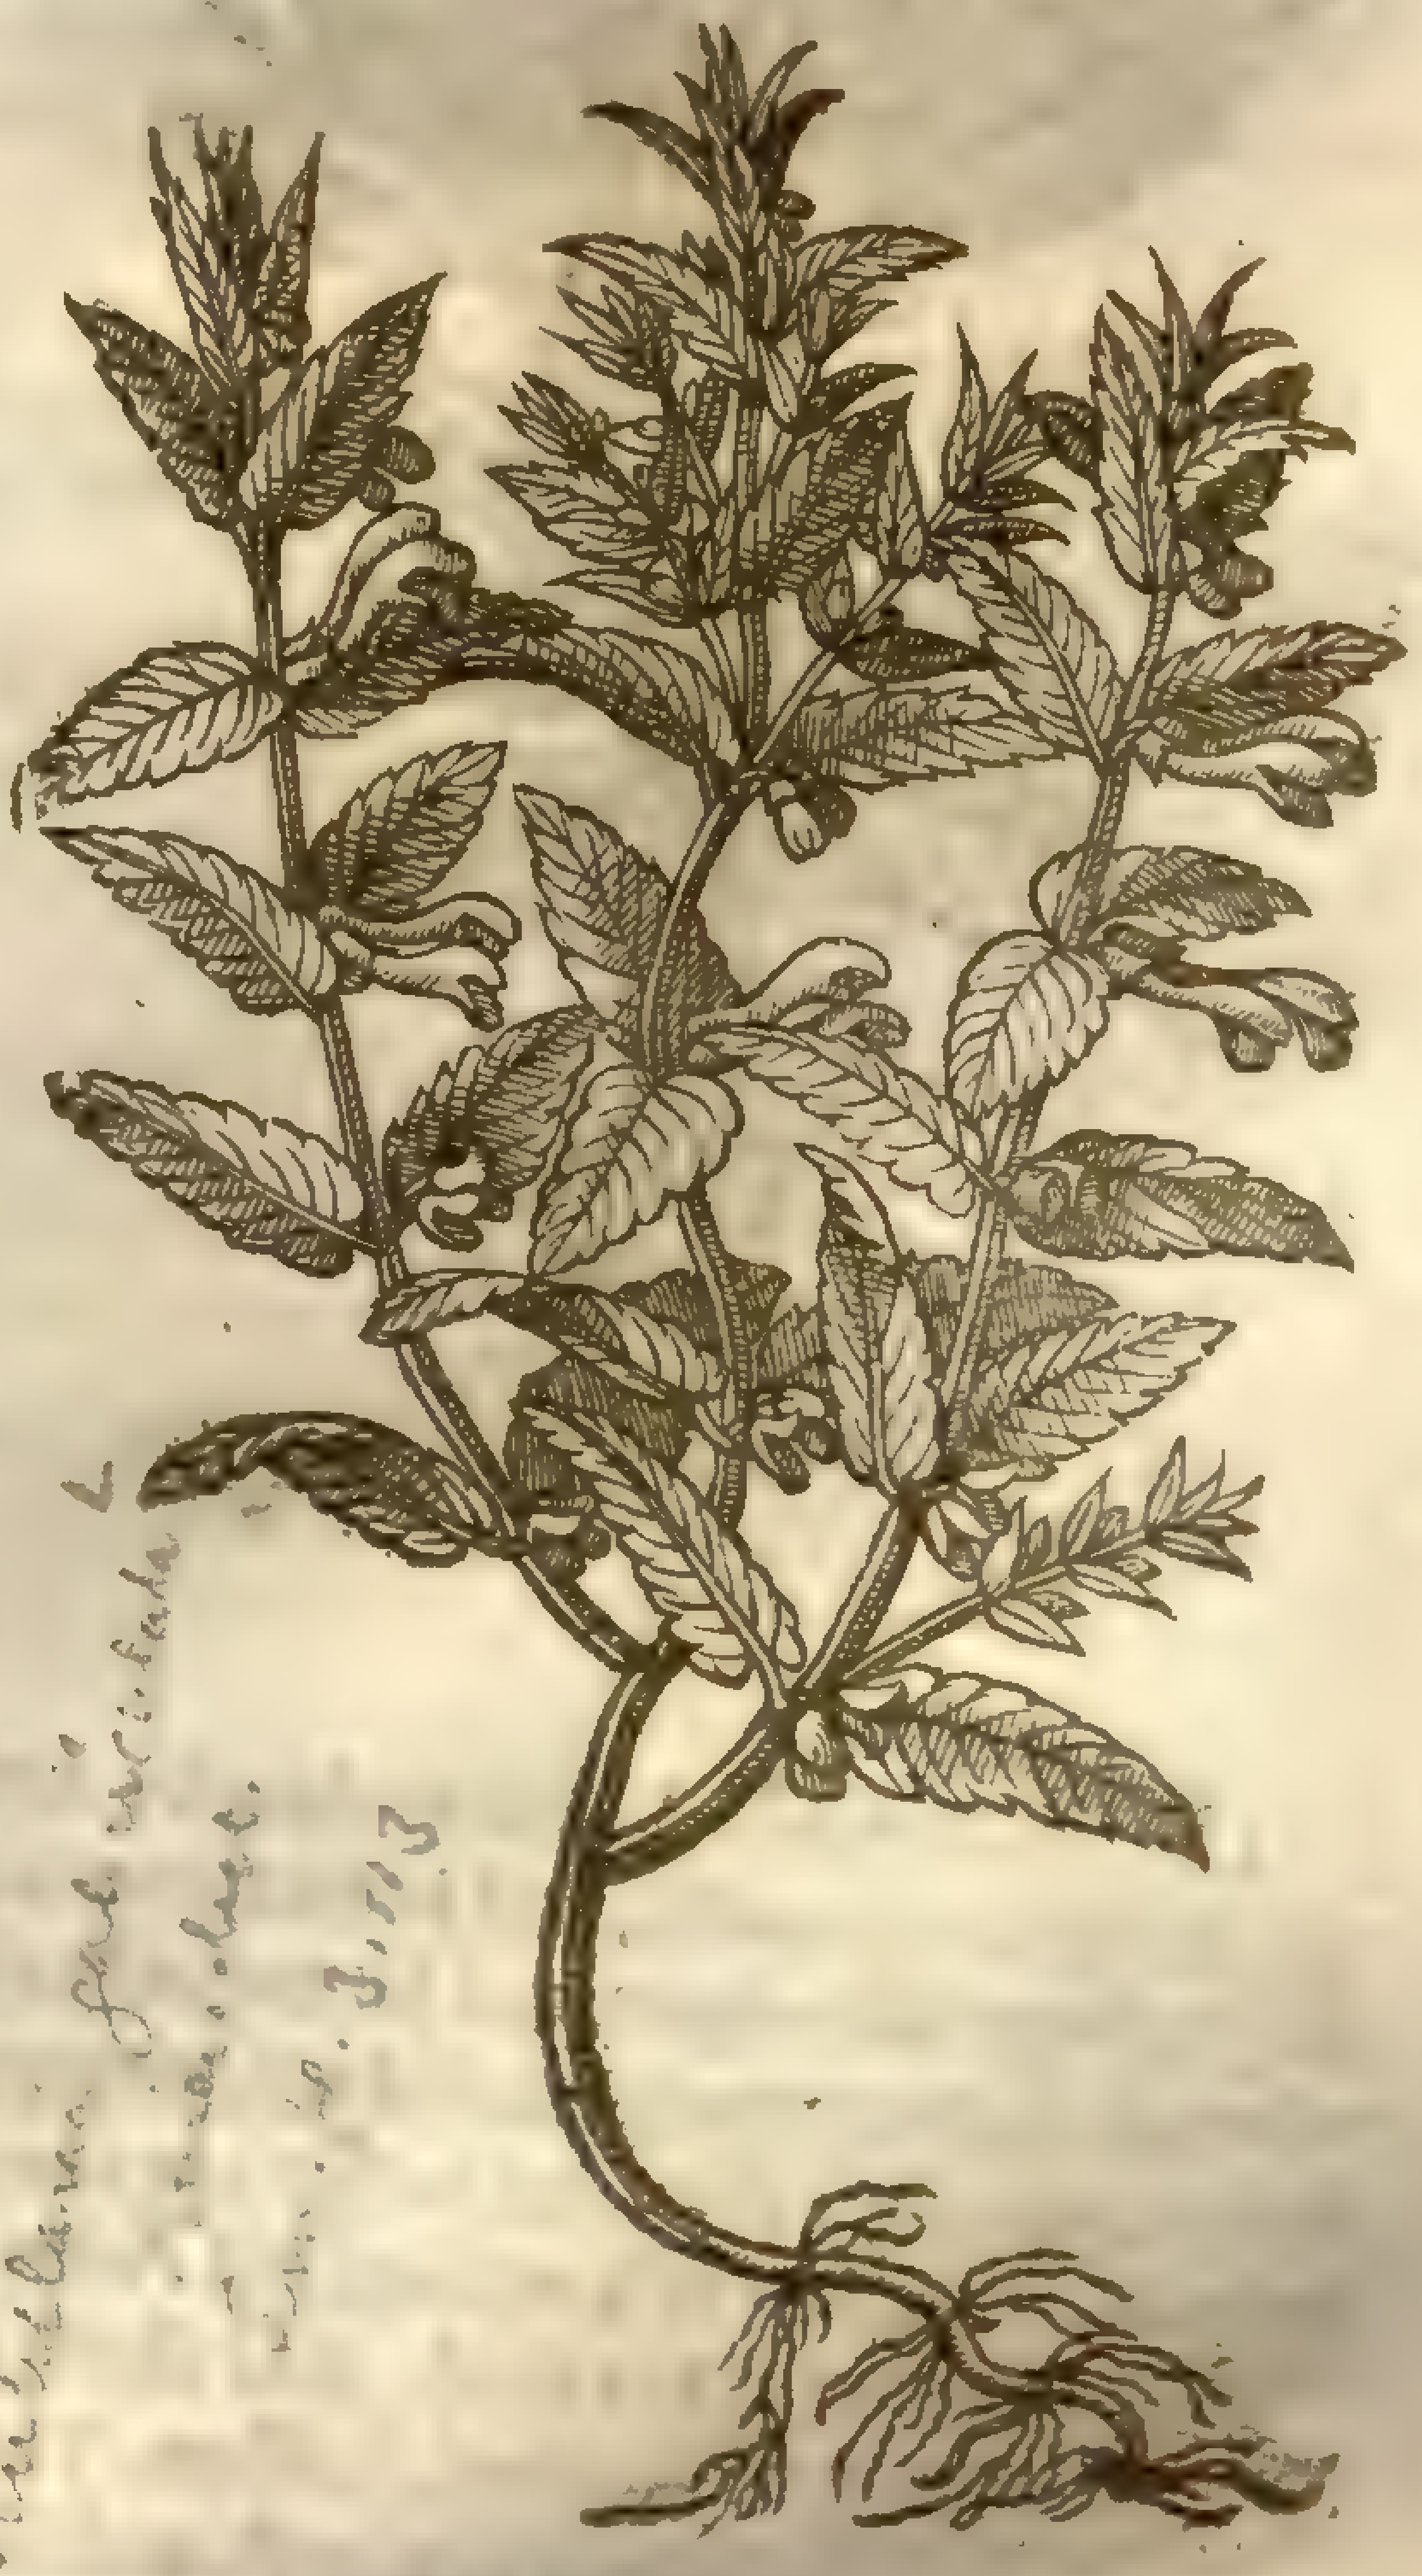
‡ 8 *Chamænerion alterum anguſtifolium.*
Narrow leaued Willow-floure.



‡ 9 *Lyſimachia cærulea.*
Blew Looſe-ſtrife.



‡ 10 *Lyſimachia galericulata.*
Hooded Looſe-ſtrife.



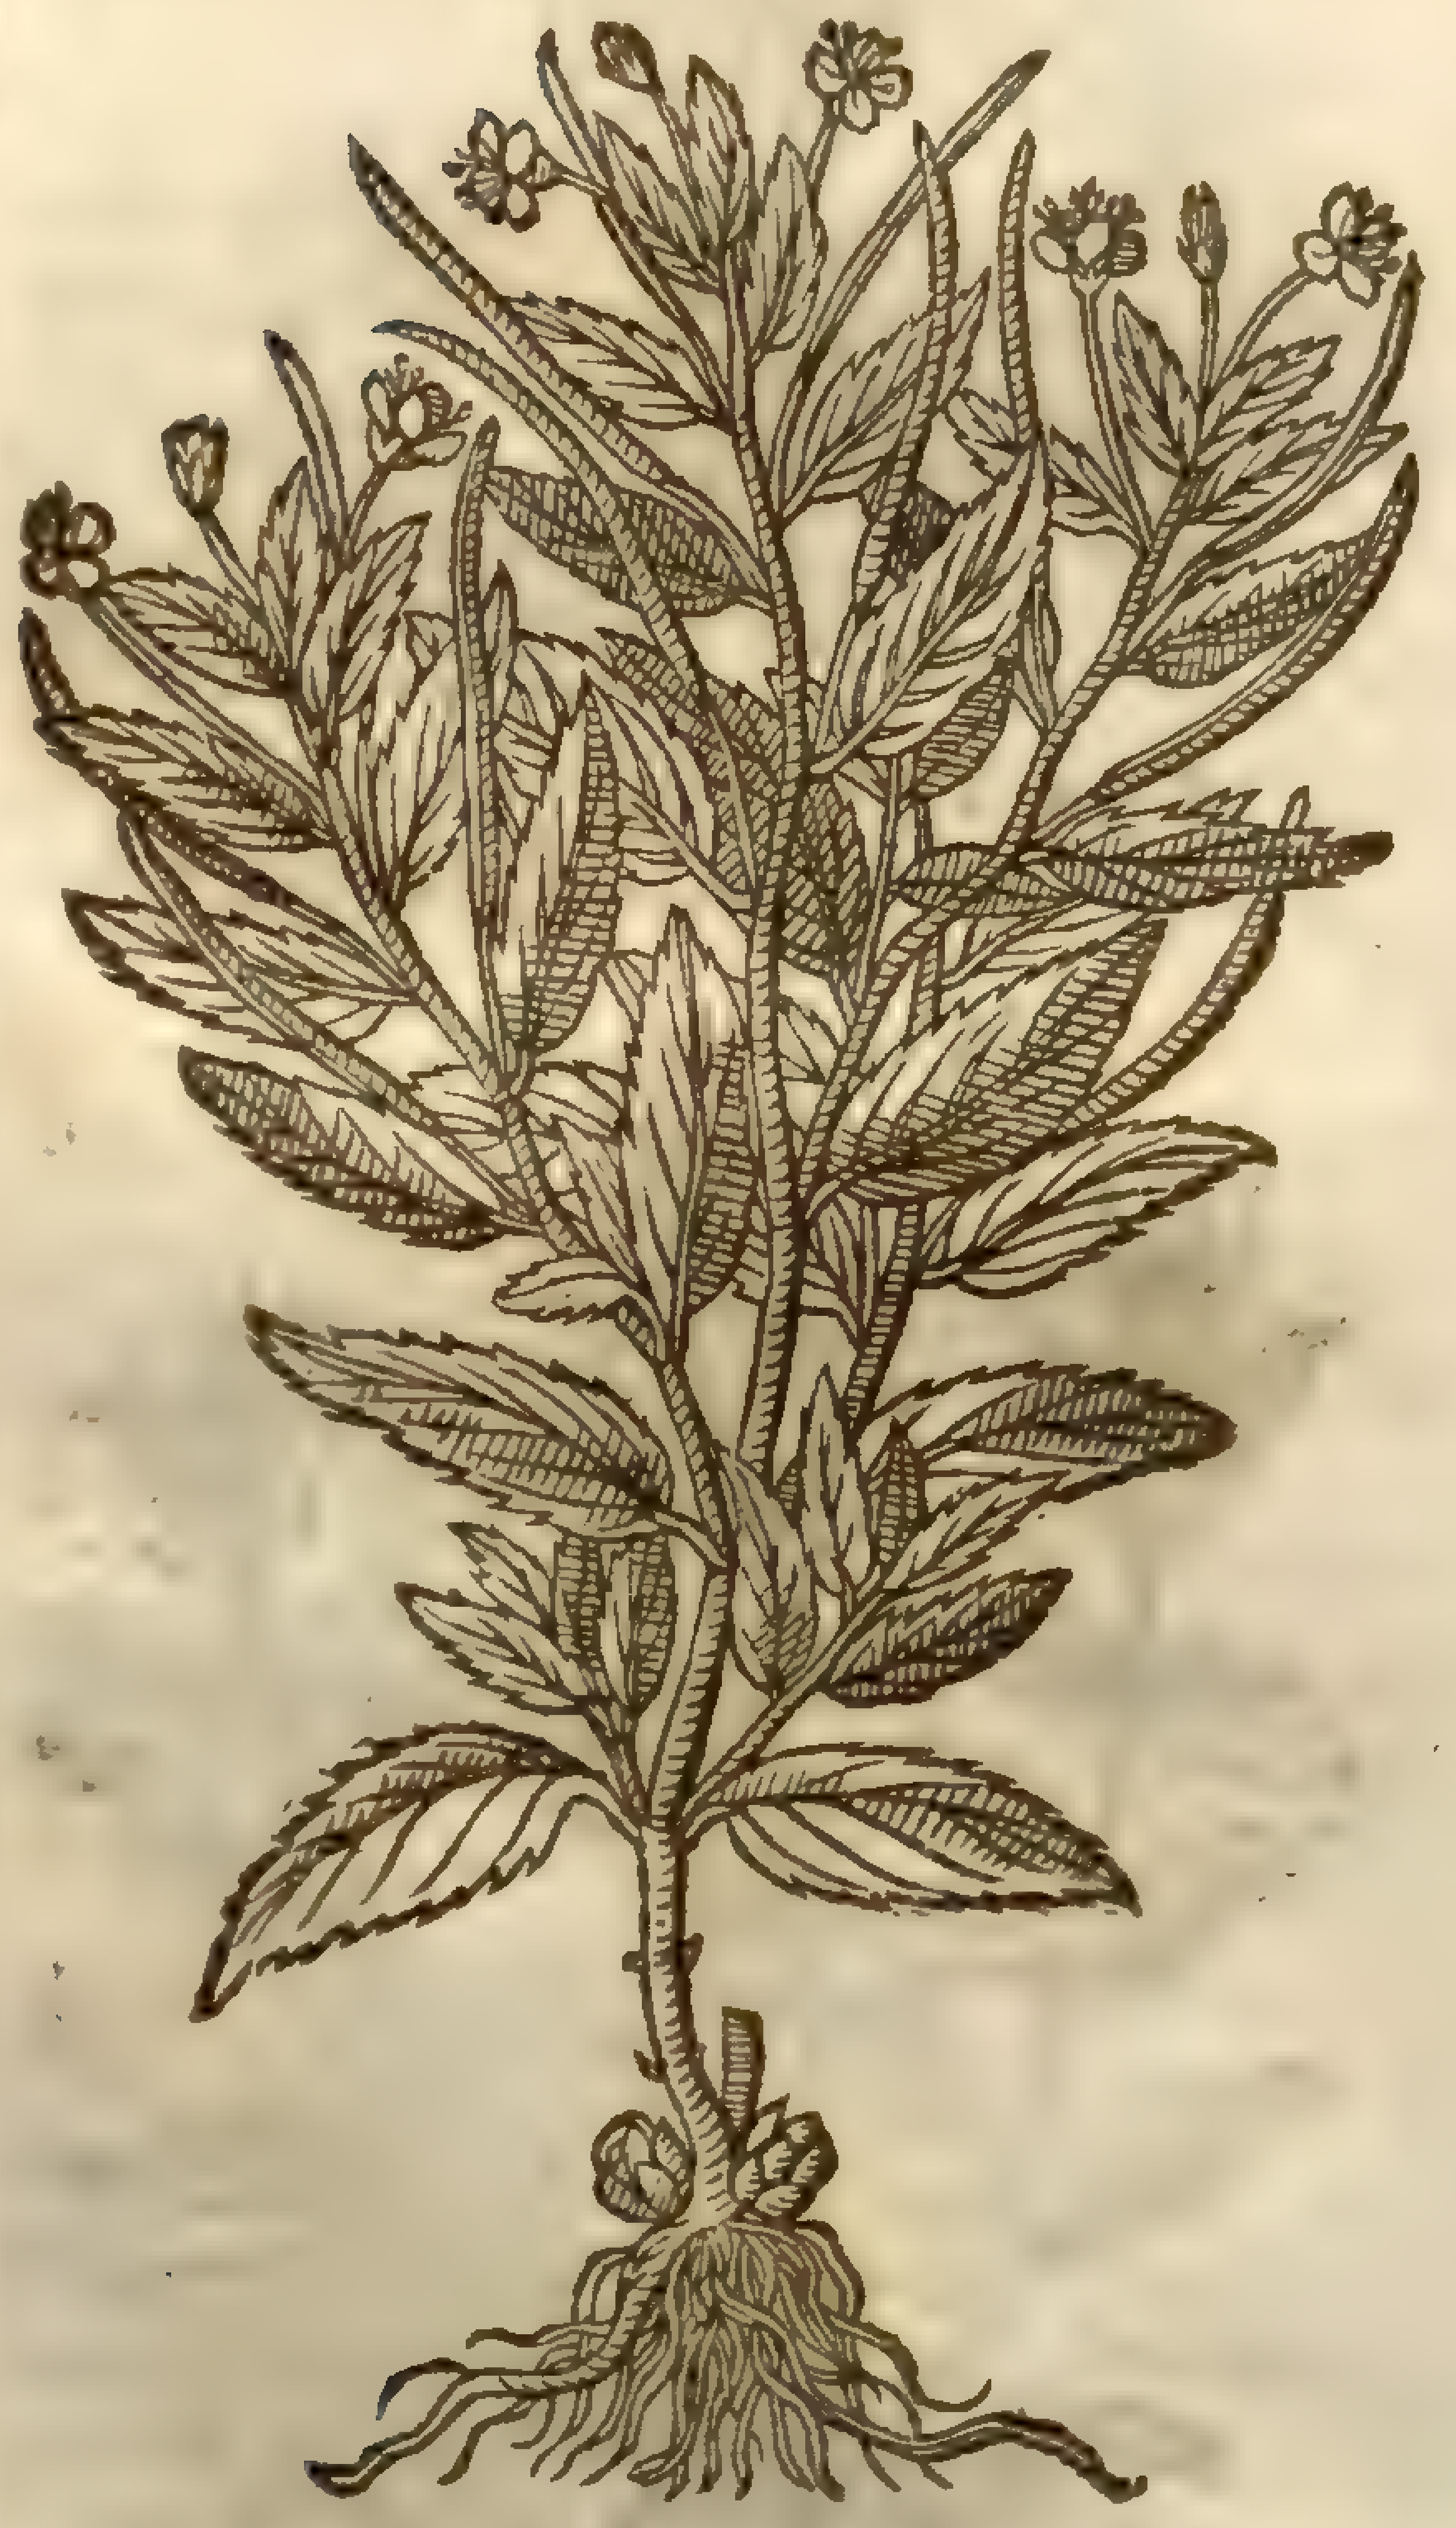
Scutellaria galericulata [illegible] 3.113

purpureum minus:and it is in the *Hiſtor. Lugdun.* vnder the name of *Linaria rubra*. It groweth vp with ſtalkes ſome foot high, ſet with many narrow leaues like thoſe of Toad-flax, of a grayiſh colour, and the ſtalke is parted into diuers branches, which at their tops vpon long cods carry purple floures conſiſting of foure leaues a piece. The root is long, yellowiſh, and wooddy. ‡

9 There is another baſtard Looſe-ſtrife or Willow herbe, hauing ſtalkes like the other of his kinde, whereon are placed long leaues ſnipt about the edges, in ſhape like the great *Veronica* or herbe *Fluellen*. The floures grow along the ſtalkes, ſpike-faſhion, of a blew colour; after which ſucceed ſmall cods or pouches. The root is ſmall and fibrous: it may be called *Lyſimachia cœrulea*, or blew Willow-herbe.

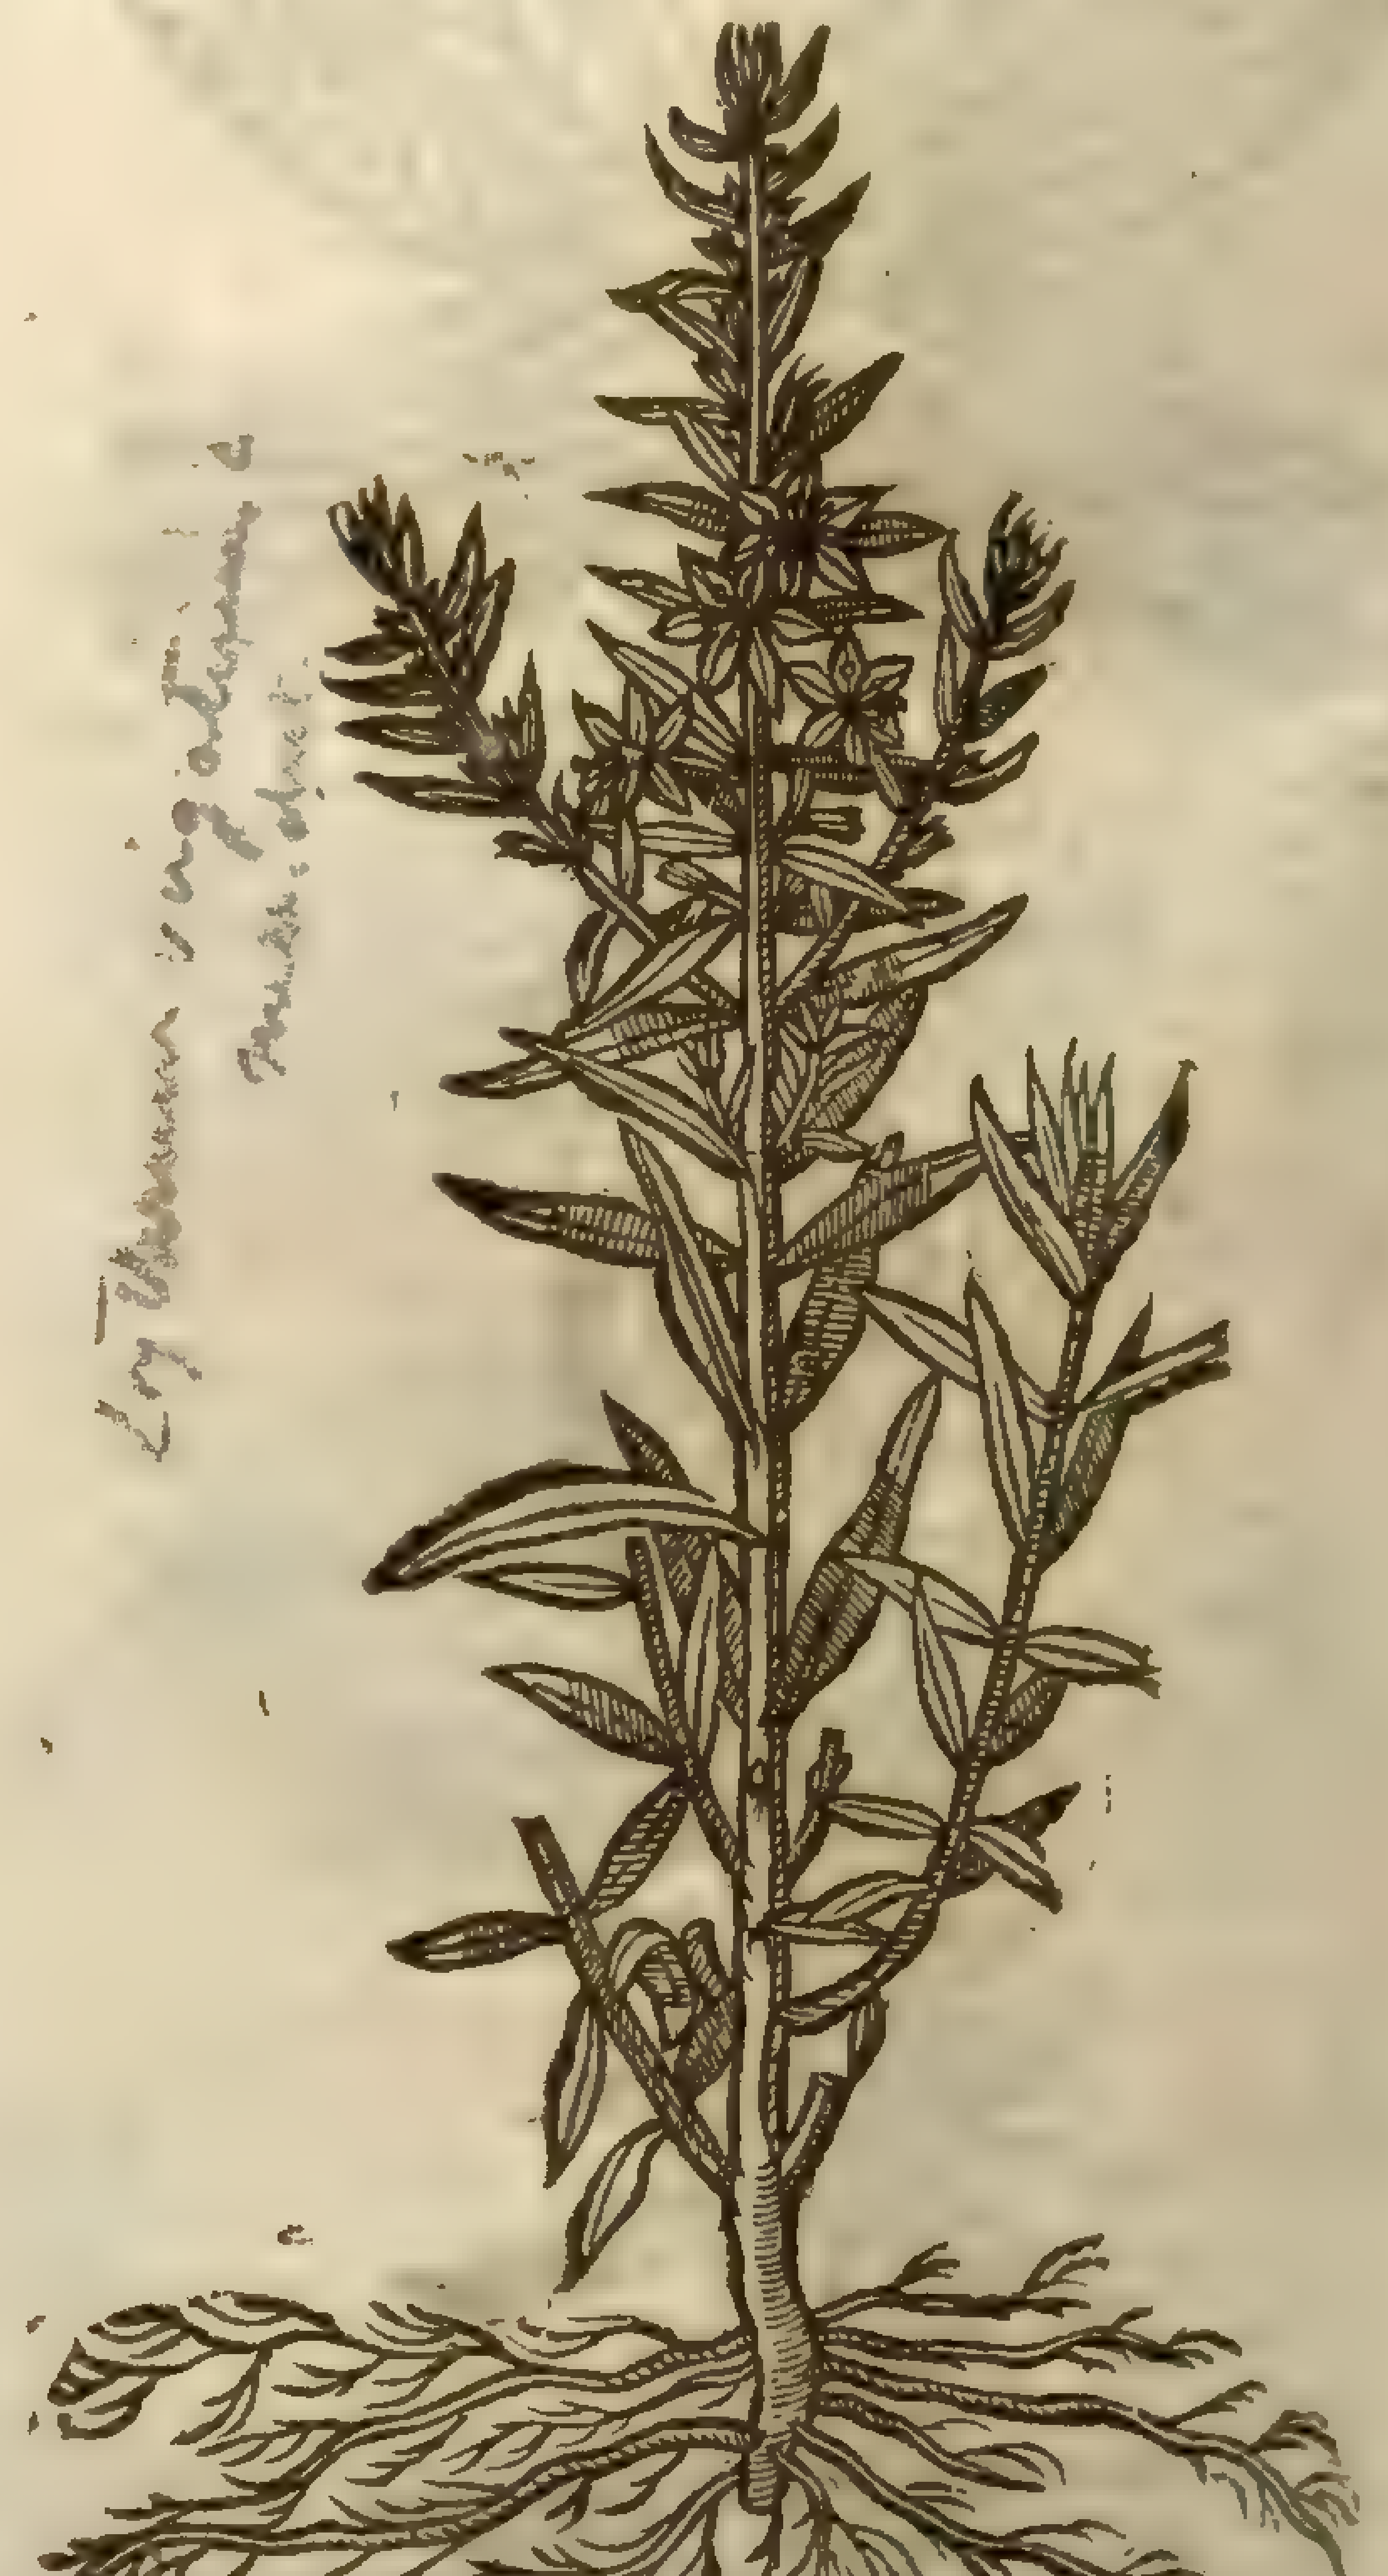
10 We haue likewiſe another Willow-herbe that groweth neere vnto the bankes of riuers and water-courſes. This I haue found in a watery lane leading from the Lord Treaſurer his houſe called Theobalds, vnto the backeſide of his ſlaughter-houſe, and in other places, as ſhall be declared hereafter. Which *Lobel* hath called *Lyſimachia galericulata*, or hooded Willow-herbe. It hath many ſmall tender ſtalkes trailing vpon the ground, beſet with diuers leaues ſomewhat ſnipt about the edges, of a deepe greene colour, like to the leaues of *Scordium* or water Germander: among which are placed ſundry ſmall Bell-floures faſhioned like a little hood, in ſhape reſembling thoſe of Ale-hoofe. The root is ſmall and fibrous, diſperſing it ſelfe vnder the earth farre abroad, whereby it greatly increaſeth.

11 *Lyſimachia campeſtris.*
Wilde Willow-herbe.



Epilobium montanum [illegible] Smith [illegible]

‡ 13 *Lyſimachia purpurea minor Cluſ.*
Small purple Willow-herbe.



Lythrum virgatum [illegible]

11 The wilde Willow-Herbe hath fraile and very brittle ſtalkes, ſlender, commonly about the height of a cubit, and ſometimes higher, whereupon do grow ſharpe pointed leaues ſomewhat ſnipt about the edges, and ſet together by couples. There come forth at the firſt long ſlender cods, wherein is contained ſmall ſeed, wrapped in a cottony or downy wooll, which is carried away with the winde when the ſeed is ripe: at the end of which commeth forth a ſmall floure of a purpliſh colour; whereupon it was called *Filius ante Patrem*, becauſe the floure doth not appeare vntill the cod be filled with his ſeed. But there is another Sonne before the Father, as hath beene declared in the Chapter of Medow-Saffron. The root is ſmall and threddy. ‡ This differeth from the ſixth onely in that the leaues are leſſe, and leſſe hairy, and the floure is ſmaller. ‡

12 The Wood Willow-Herbe hath a ſlender ſtalke diuided into other ſmaller branches, whereon are ſet long leaues rough and ſharpe pointed, of an ouerworne greene colour. The floures grow at the tops of the branches, conſiſting of foure or fiue ſmall leaues, of a pale purpliſh colour tending to whitenesse: after which come long cods, wherein are little ſeeds wrapped in a certaine white Downe that is carried away with the winde. The root is threddy. ‡ This differs from the ſixth in that it hath leſſer floures. There is alſo a leſſer ſort of this hairie *Lyſimachia* with ſmall floures.

[illegible]

There are two more varieties of theſe codded Willow-herbes; the one of which is of a middle growth, ſomewhat like to that which is deſcribed in the eleuenth place, but leſſe, with the leaues alſo ſnipped about the edges, ſmooth, and not hairy: and it may fitly be called *Lyſimachia ſiliquoſa glabra media*, or *minor*, The leſſe ſmooth-leaued Willow-herbe. The other is alſo ſmooth leaued, but they are leſſer and narrower: wherefore it may in Latine be termed, *Lyſimachia ſiliquoſa glabra minor anguſtifolia*: in Engliſh, The leſſer ſmooth and narrow leaued Willow-herbe.

‡ 13 This leſſer purple Looſe-ſtrife of *Cluſius*, hath ſtalkes ſeldome exceeding the height of a cubit, they are alſo ſlender, weake and quadrangular, towards the top, diuided into branches growing one againſt another, the leaues are leſſe and narrower than the common purple kinde, and growing by couples, vnleſſe at the top of the ſtalkes and branches, whereas they keepe no certaine order; and amongſt theſe come here and there cornered cups containing floures compoſed of ſix little red leaues with threds in their middles. The root is hard, wooddy, and not creeping, as in others of this kinde, yet it endures all the yeere, and ſends forth new ſhoots. It floures in Iune and Iuly, and was found by *Cluſius* in diuers wet medowes in Auſtria. ‡

¶ *The Place.*

The firſt yellow *Lyſimachia* groweth plentifully in moiſt Medowes, eſpecially along the Medowes as you goe from Lambeth to Batterſey neere London, and in many other places throughout England.

‡ The ſecond and third I haue not yet ſeene,

The fourth groweth in many Gardens. ‡

The fifth groweth in places of greater moiſture, yea almoſt in the running ſtreames and ſtanding waters, or hard by them. It groweth vnder the biſhops houſe wall at Lambeth, neere the water of Thames, and in moiſt ditches in moſt places of England.

The ſixth groweth neere the waters (and in the waters) in all places for the moſt part.

The ſeuenth groweth in Yorkeſhire in a place called the Hooke, neere vnto a cloſe called a Cow paſture, from whence I had theſe plants, which do grow in my Garden very goodly to behold, for the decking vp of Houſes and Gardens.

‡ The eighth I haue not yet found growing.

The ninth growes wilde in ſome places of this Kingdome, but I haue ſeene it only in Gardens.

The tenth growes by the ponds and waters ſides in Saint Iames his Parke, in Tuthill fields and many other places. ‡

The eleuenth groweth hard by the Thames, as you goe from a place called the Diuels Neckerchiefe to Redreſſe, neere vnto a ſtile that ſtandeth in your way vpon the Thames banke, among the plankes that do hold vp the ſame banke. It groweth alſo in a ditch ſide not farre from the place of execution, called Saint Thomas Waterings.

‡ The other varieties of this grow in wet places, about ditches, and in woods and ſuch like moiſt grounds. ‡

¶ *The Time.*

Theſe herbes floure in Iune and Iuly, and oftentimes vntill Auguſt.

¶ *The Names.*

Lyſimachia, as *Dioſcorides* and *Pliny* write, tooke his name of a ſpeciall vertue that it hath in appeaſing the ſtrife and vnrulineſſe which falleth out among oxen at the plough, if it be put about their yokes: but it rather retaineth and keepeth the name *Lyſimachia*, of King *Lyſimachus* the Sonne of *Agathocles*, the firſt finder out of the nature and vertues of this herbe, as *Pliny* ſaith in his 25. book chap. 7. which retaineth the name of him vnto this day; and was made famous by *Eraſiſtratus*. *Ruellius* writeth, that it is called in French, *Cornelle* and *Corneola*: in Greeke, λυσιμάχιον: of the Latines, *Lyſimachium*: of *Pliny*, *Liſimachia*: of the later Writers, *Salicaria*: in high Dutch, **Weiderich**: in Engliſh, Willow-herbe, and Looſe ſtrife.

Chamænerium is called of *Geſner*, *Epilobion*: in Engliſh, Bay Willow, or bay yellow herbe.

‡ The names of ſuch as I haue added haue beene ſufficiently ſet forth in their Titles and Hiſtories. ‡

¶ *The Nature.*

The yellow *Lyſimachia*, which is the chiefe and beſt for Phyſicke vſes, is cold and dry, and very aſtringent.

¶ *The Vertues.*

A The juyce, according to *Dioſcorides*, is good againſt the bloudy flix, being taken either by potion or Clyſter.

B It is excellent good for greene wounds, and ſtancheth the bloud: being alſo put into the noſthrils, it ſtoppeth the bleeding at the noſe.

C The ſmoke of the burned herbe driueth away ſerpents, and killeth flies and gnats in a houſe; which *Pliny* ſpeaketh of in his 23. booke, chap. 8. Snakes, ſaith he, craull away at the ſmell of Looſtrife. The ſame Author affirmeth in his 26. booke, laſt chap. that it dieth haire yellow, which is not very vnlike to be done by reaſon the floures are yellow.

D The others haue not beene experimented, wherefore vntill ſome matter worthy the noting doth offer it ſelfe to our conſideration, I will omit further to diſcourſe hereof.

E The iuyce of yellow *Lyſimachia* taken inwardly, ſtoppeth all flux of bloud, and the Dyſenteria or bloudy flix.

F The juyce put into the noſe, ſtoppeth the bleeding of the ſame, and the bleeding of wounds, and mightily cooleth and healeth them, being made into an vnguent or ſalue.

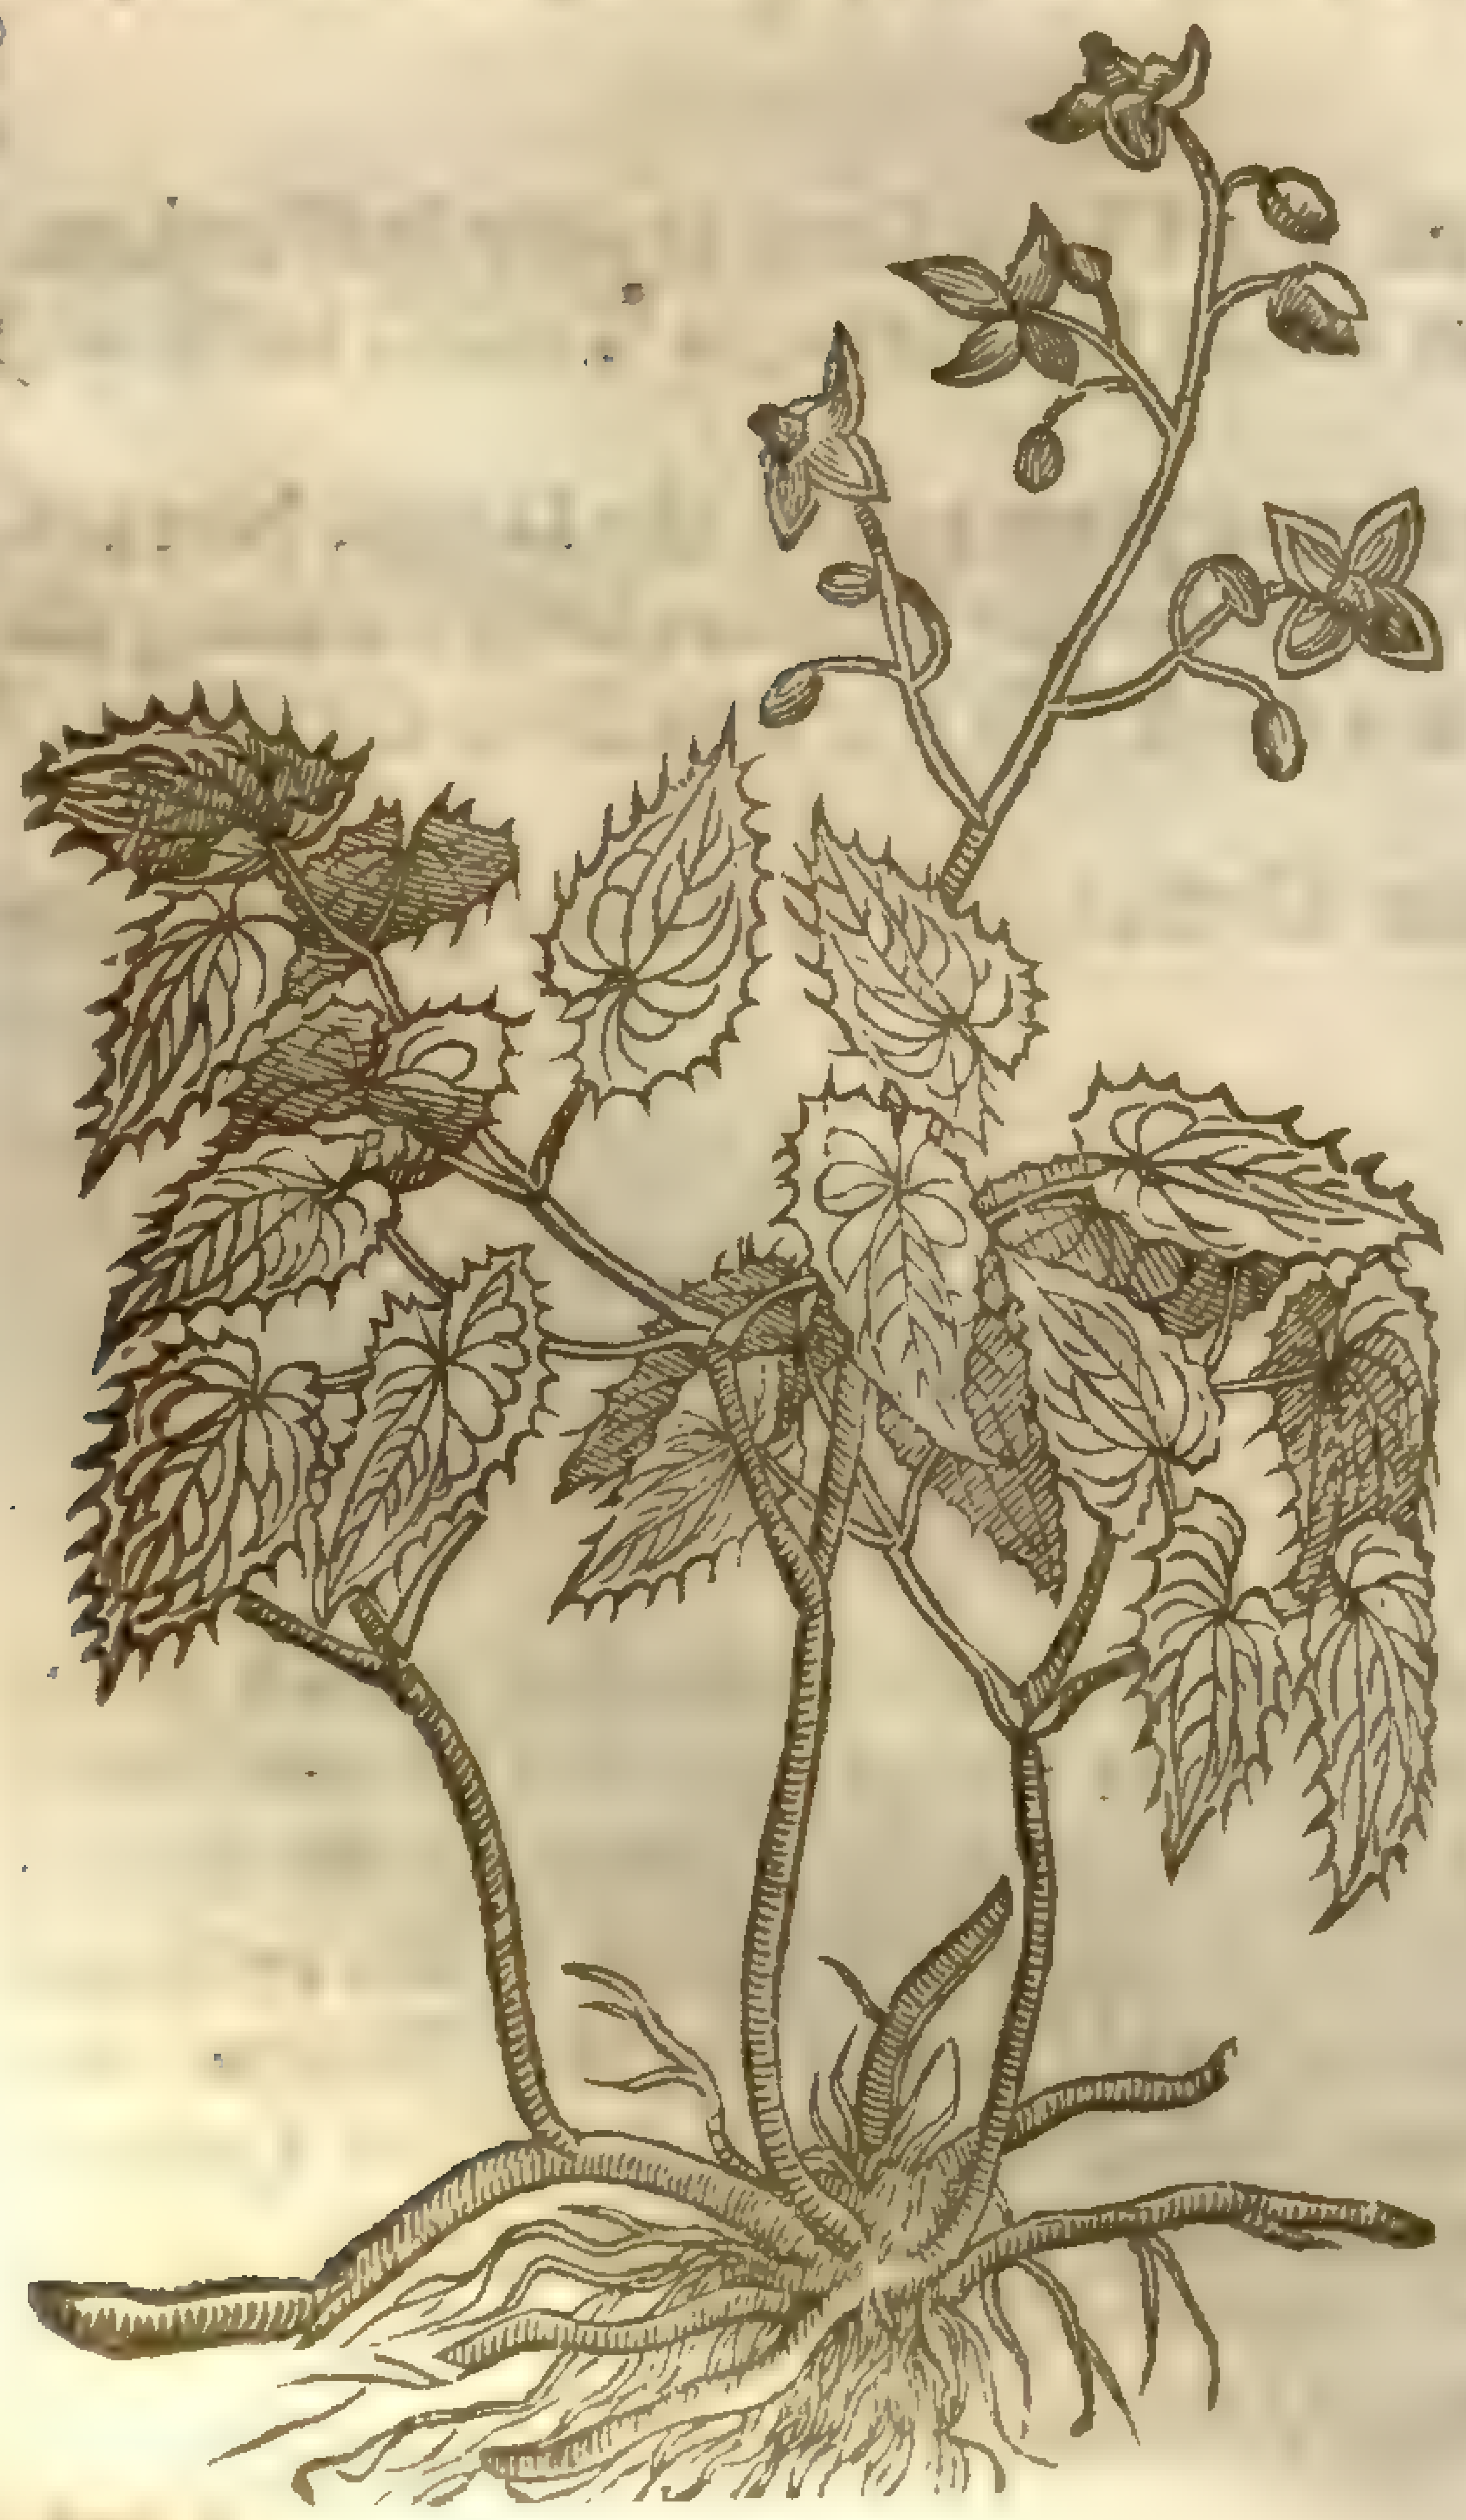
G The ſame taken in a mother ſuppoſitorie of wooll or cotton, bound vp with threds (as the manner thereof is, well knowne to women) ſtaieth the inordinate flux or ouermuch flowing of womens termes.

H It is reported, that the fume or ſmoke of the herbe burned, doth driue away flies and gnats, and all manner of venomous beaſts.

CHAP. 130. Of Barren-woort.

Epimedium.
Barren-Woort.

E. alpinum, L.
Mill. dict.
Sp. pl. 1. 120



¶ *The Deſcription.*

THis rare and ſtrange plant was ſent to me from the French Kings Herbariſt *Robinus*, dwelling in Paris at the ſigne of the blacke head, in the ſtreete called *Du bout du monde*, in Engliſh, The end of the world. This herbe I planted in my Garden, and in the beginning of May it came forth of the ground, with ſmall, hard, and woody crooked ſtalkes: wherupon grow rough and ſharpe pointed leaues, almoſt like *Alliaria*, that is to ſay, Sauce alone, or Iacke by the hedge. *Lobel* and *Dodon*. ſay, that the leaues are ſomewhat like Iuie; but in my iudgement they are rather like *Alliaria*, ſomwhat ſnipt about the edges, and turning themſelues flat vpright, as a man turneth his hand vpwards when hee receiueth money. Vpon the ſame ſtalkes come forth ſmall floures conſiſting of foure leaues, whoſe outſides are purple, the edges on the inner ſide red, the bottome yellow, & the middle part of a bright red colour, and the whole floure ſomewhat hollow. The root is ſmall, and creepeth almoſt vpon the vppermoſt face of the earth. It beareth his ſeed in very ſmall cods like Saracens Conſound, (‡ to wit that of our Authour formerly deſcribed, *pag.* 274. ‡) but ſhorter: which came not to ripeneſſe in my Garden, by reaſon that it was dried away with the extreme and vnaccuſtomed heat of the Sun, which happened in the yeare 1590. ſince which time from yeare to yeare it bringeth ſeed to perfection. Further *Dioſcorides* and *Pliny* do report, that it is without floure or ſeed.

¶ *The Place.*

† It groweth in the moiſt medowes of Italy about Bononia and Vincentia: it groweth in the Garden of my friend Mr *Iohn Milion* in Old-ſtreet, and ſome other Gardens about towne.

¶ *The Time.*

It floureth in Aprill and May, when it hath taken faſt hold and ſetled it ſelfe in the earth a yeare before.

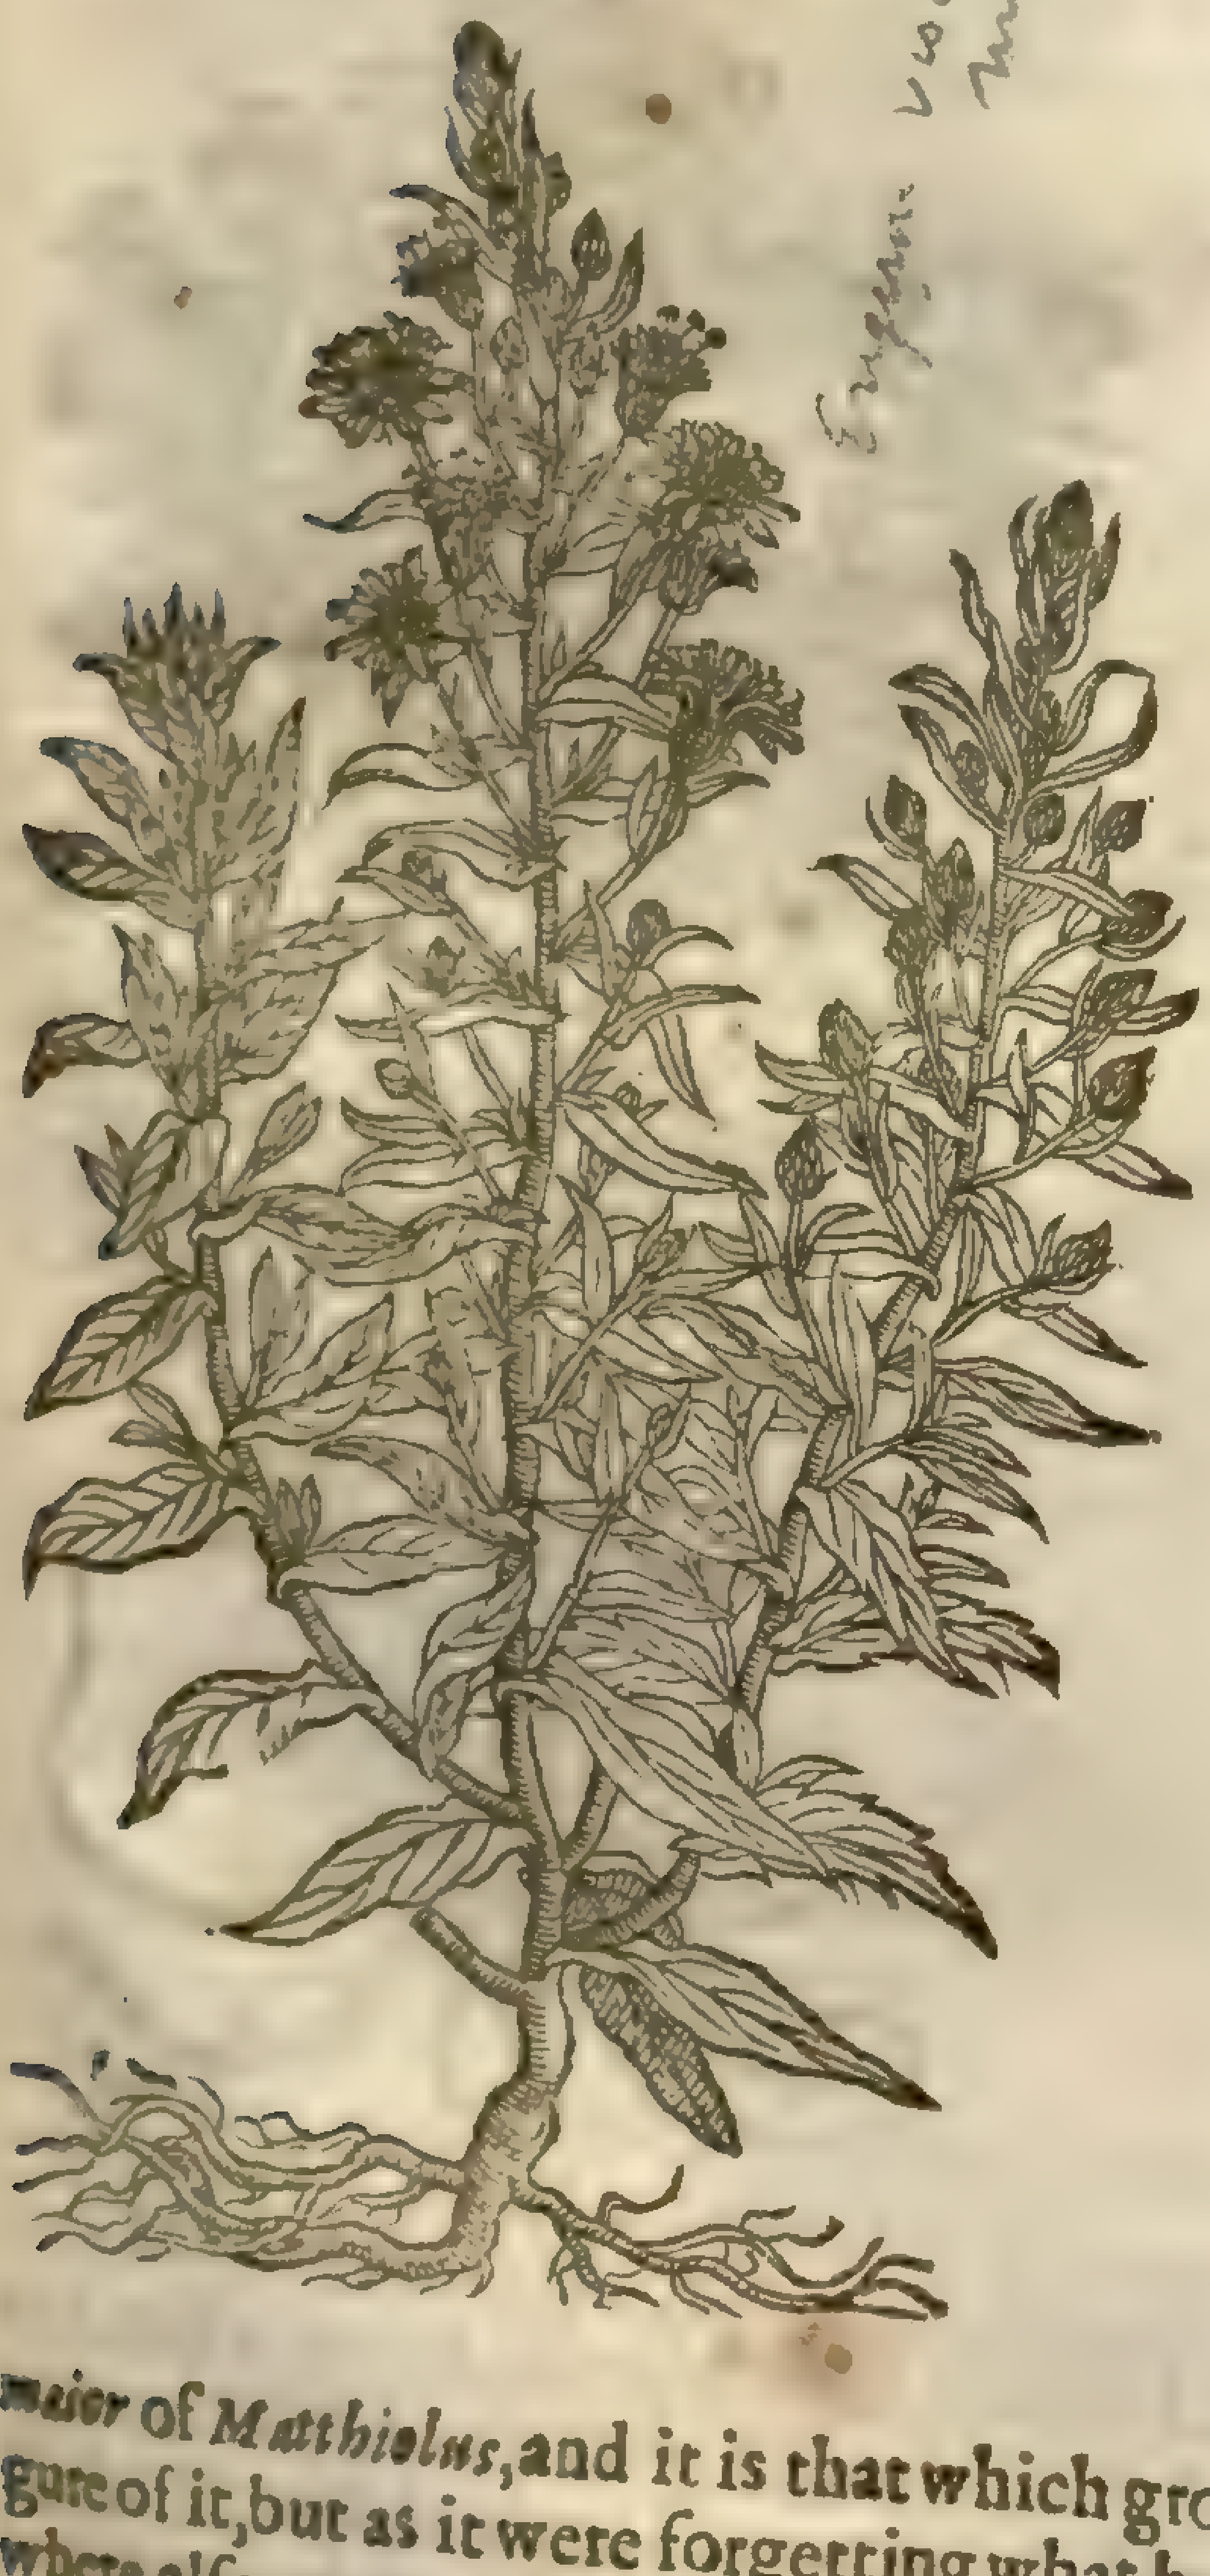
¶ *The Names.*

It is called *Epimedium*: I haue thought good to call it Barrenwoort in Engliſh; not becauſe that *Dioſcorides* ſaith it is barren both of floures and ſeeds, but becauſe (as ſome Authors affirme) being drunke it is an enemy to conception.

¶ *The Temperature and Vertues.*

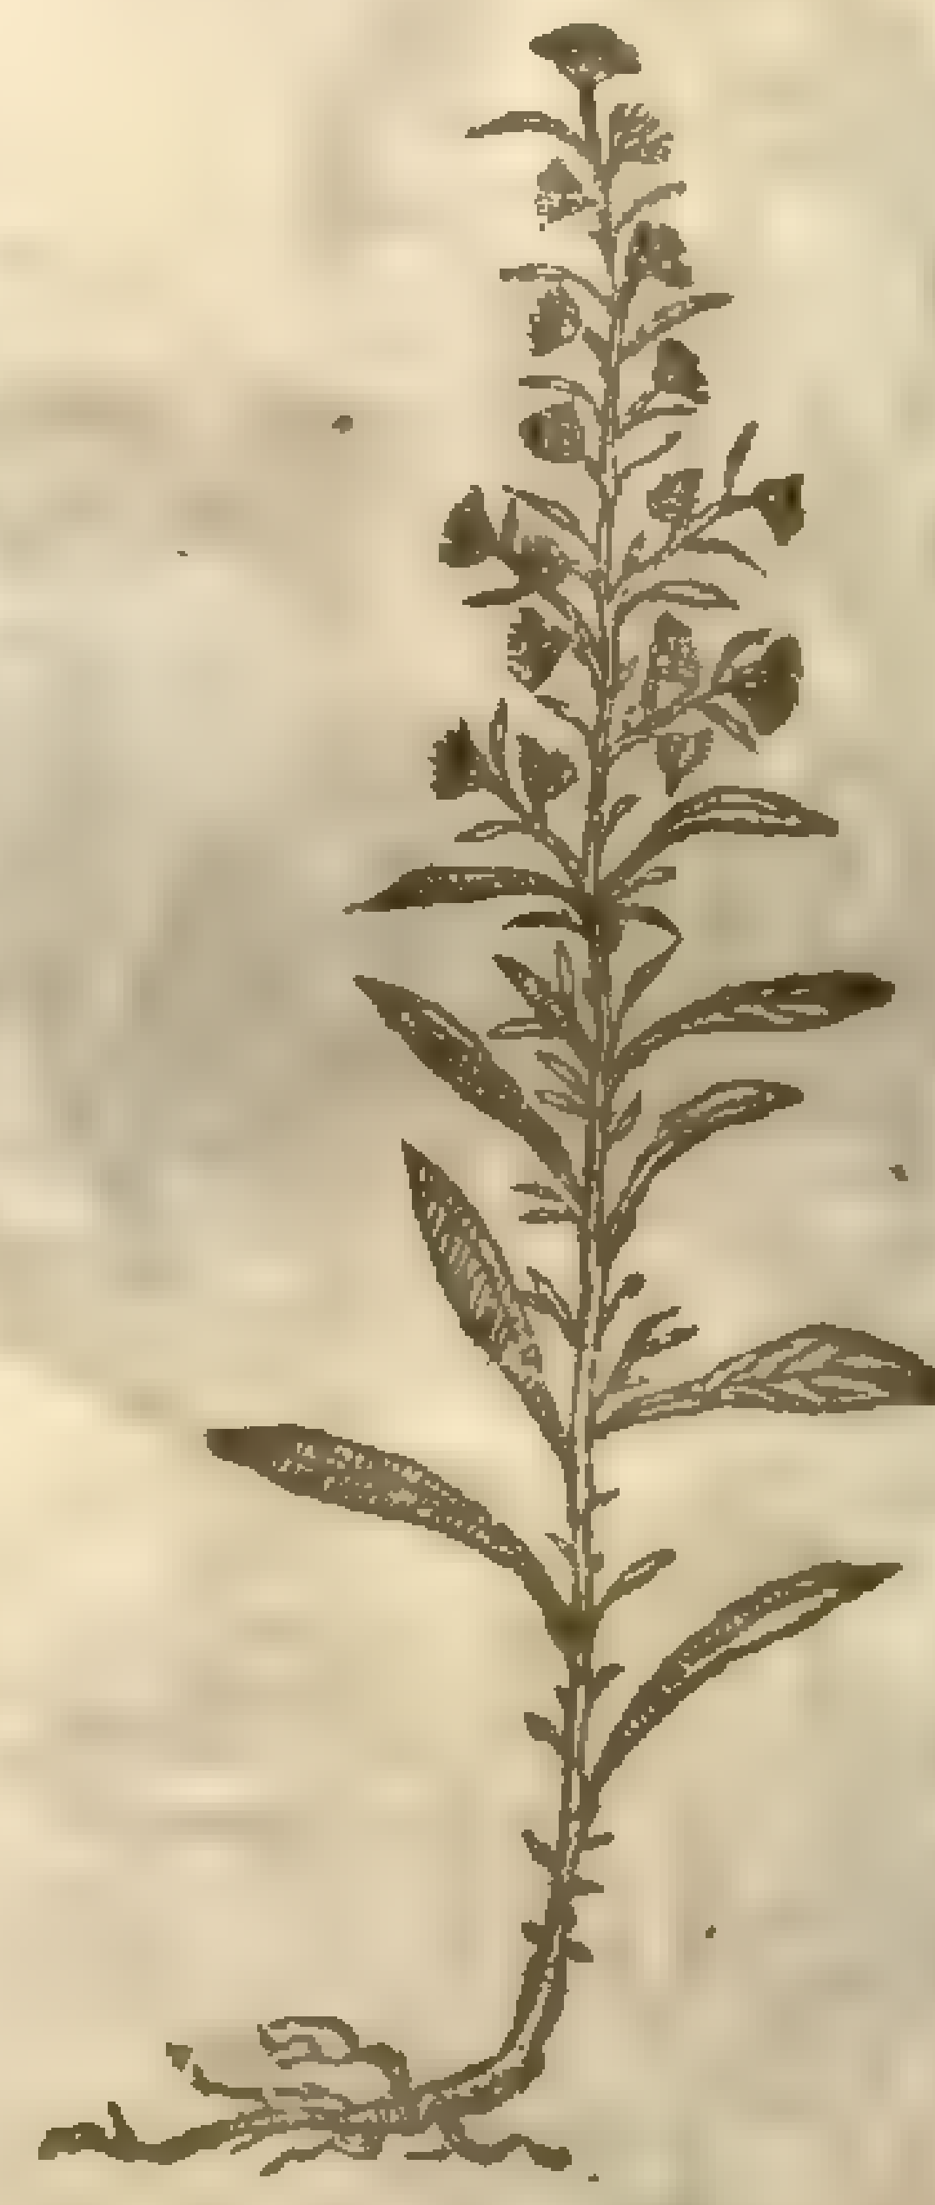
Galen affirmeth that it is moderately cold, with a watery moiſture: we haue as yet no vſe hereof in Phyſicke.

‡ CHAP. 131. *Of Fleabane.*



‡ 1 *Conyza maior.*
Great Fleawoort.

Erigeron viscosum L. Mill. dict.



‡ 2 *Conyza minor vera.*
Small Fleabane.

Erigeron graveolens L. Mill. dict.

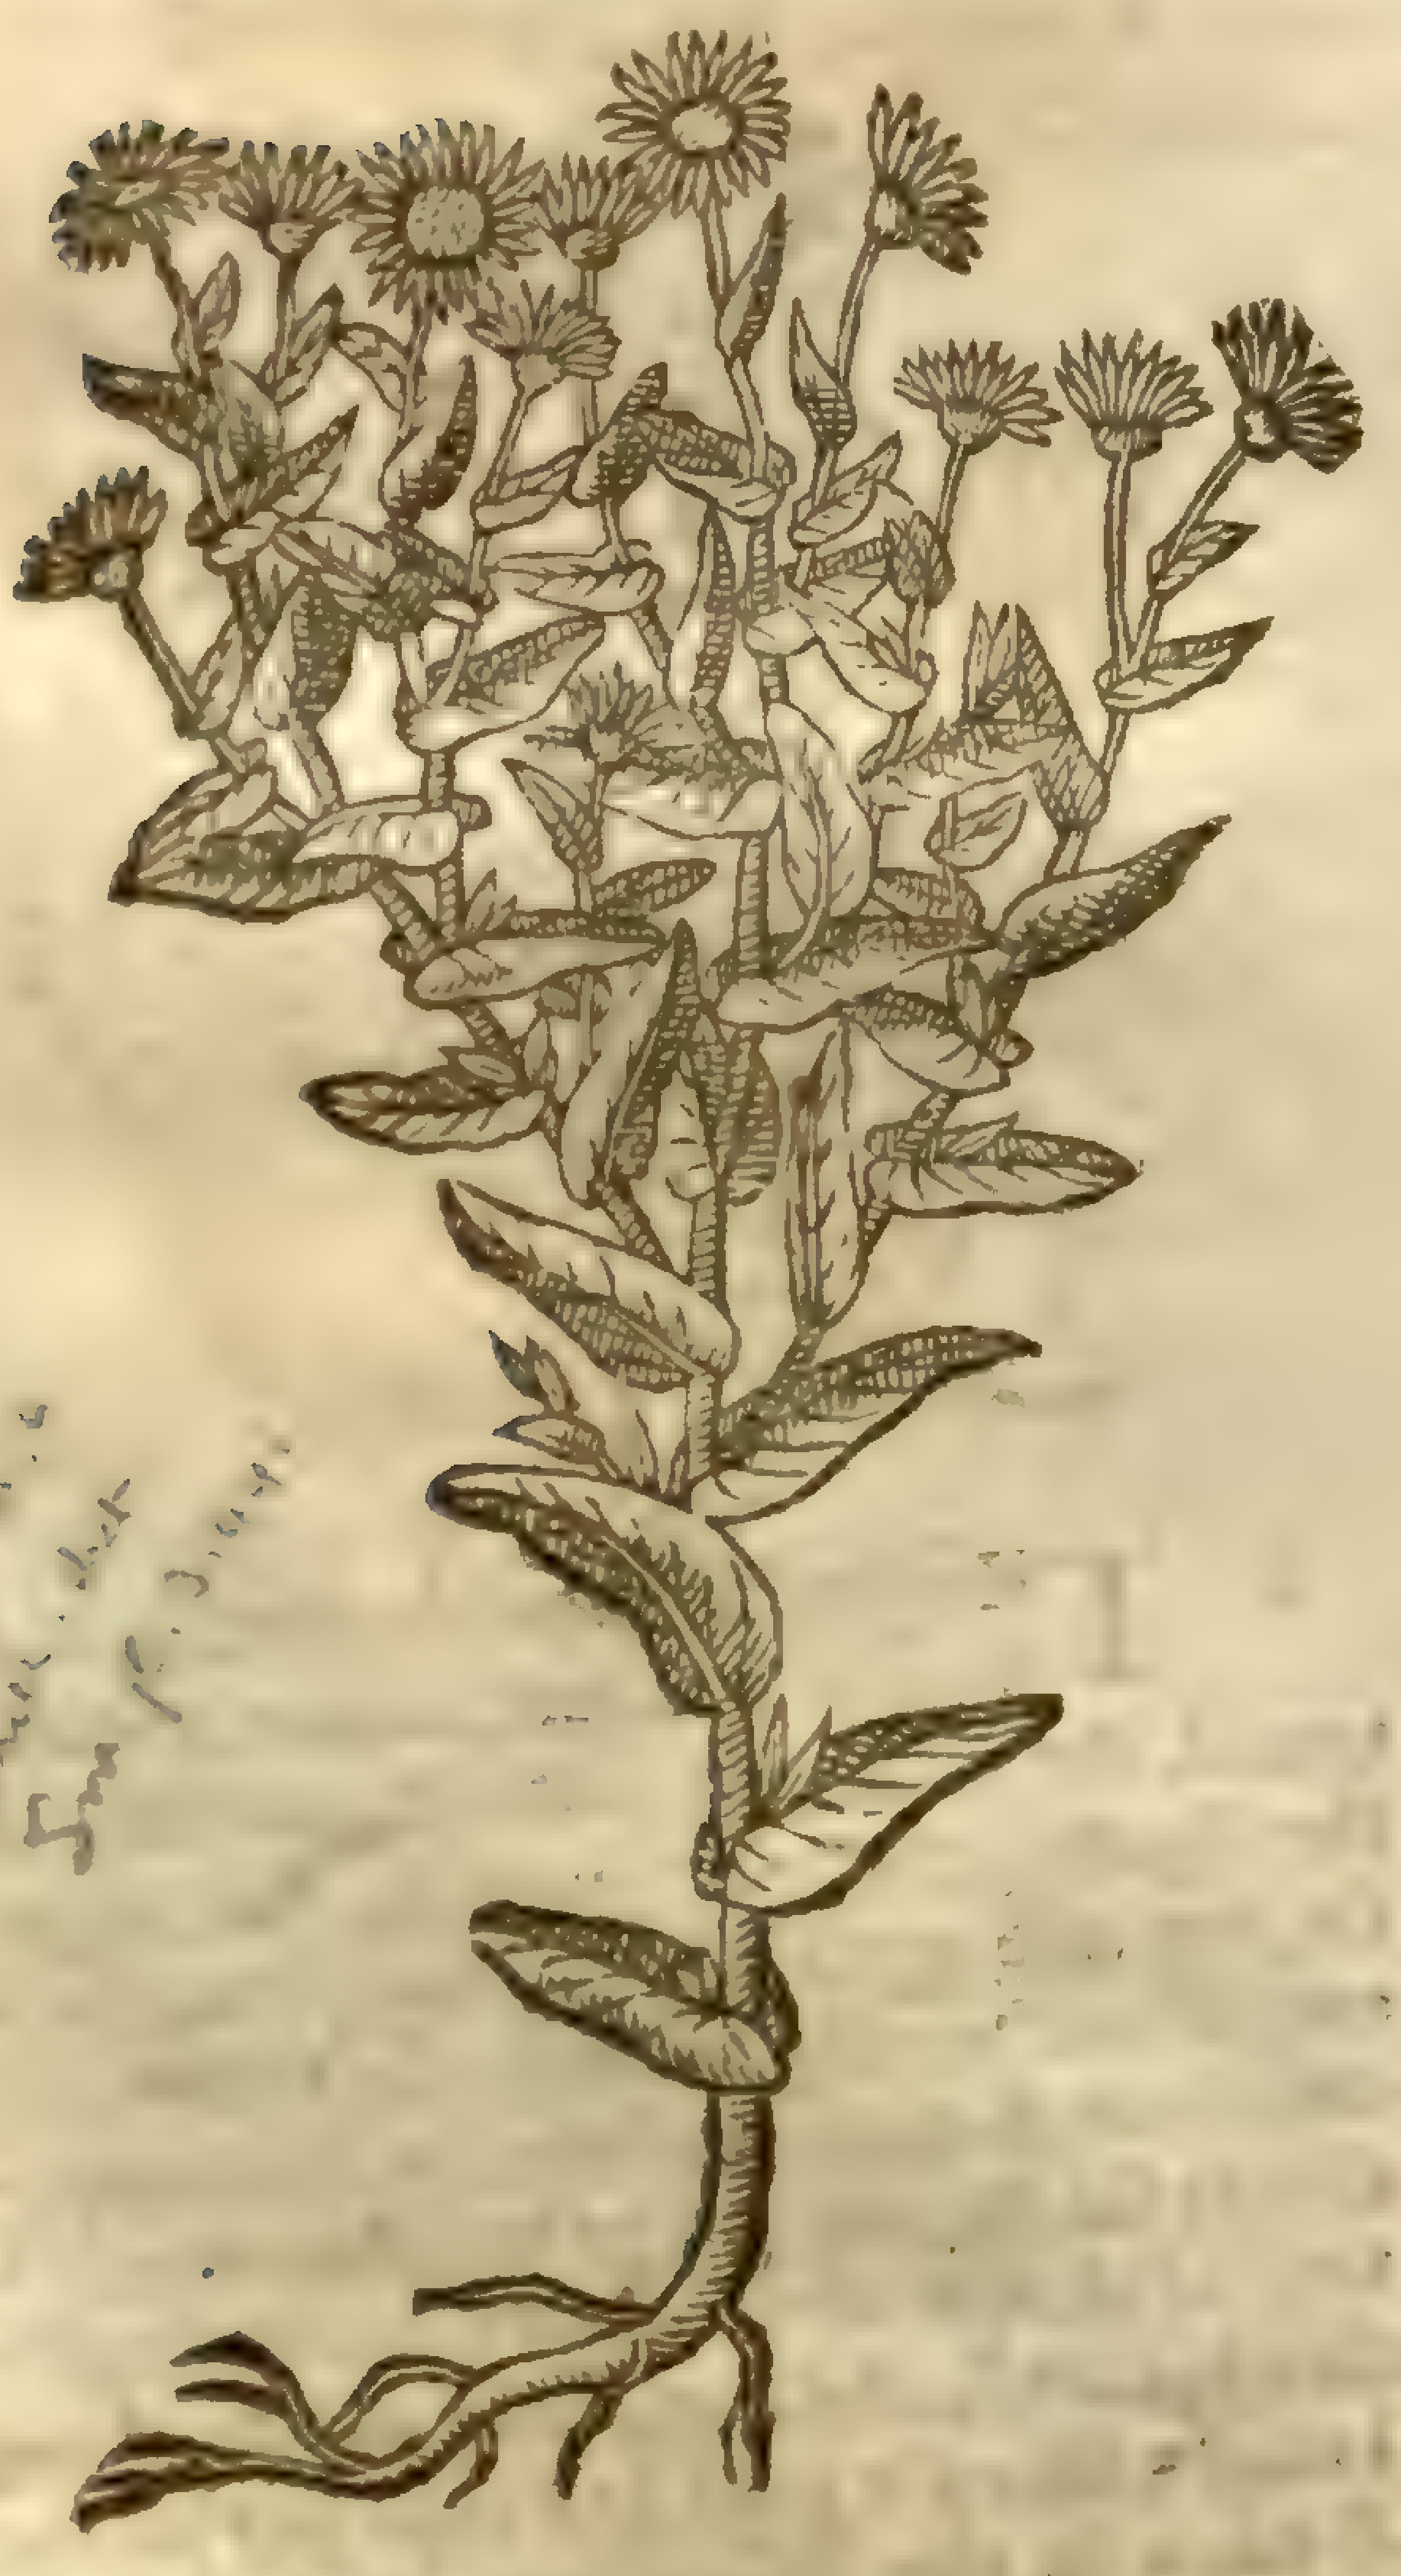
‡ THe ſmalneſſe of the number of theſe plants here formerly mentioned, the confuſion notwithſtanding in the figures, their nominations and hiſtorie, not one agreeing with another, hath cauſed mee wholly to omit the deſcriptions of our Author, and to giue new, agreeable to the figures; together with an addition of diuers other plants belonging to this kindred. Beſides, there is one thing I muſt aduertiſe you of, which is, that our Author in the firſt place deſcribed the *Baccharis Monſpelienſium* of *Lobel*, or *Conyza maior* of *Matthiolus*, and it is that which grows in Kent and Eſſex on chalkie hils; yet he gaue no figure of it, but as it were forgetting what he had done, allotted it in a particular chapter afterwards, where alſo another figure was put for it; but there you ſhall now finde it, though I muſt confeſſe that this is as fit or a fitter place for it, but I follow the courſe of my Author, whoſe matter, not method, I indeauour to amend.

¶ *The Deſcription.*

1 THis great Fleawoort or Fleabane, from a thick long liuing fibrous root ſends forth many ſtalkes of ſome yard high or more; hard, wooddy, rough, fat, and of an ouerworne colour: the leaues are many, without order, and alternately embrace the ſtalkes, twice as big as thoſe of the Oliue tree, rough and fat, being as it were beſmeared with a gummineſſe or fattineſſe, and of a yellowiſh greene colour: the floures grow after a ſort ſpoke faſhion, ſtanding at the ends of footſtalkes comming out of the boſomes of the leaues, and they are yellow and round almoſt like to Groundſwell, and fly away in downe like as they do; the ſeed is ſmall and aſh coloured. The whole plant is fatty and glutinous, with a ſtrong, yet not altogether vnpleaſant ſmell. This growes not that I know of in theſe cold Countries, vnleſſe ſowne in Gardens. *Cluſius* found it by Lisbone, and in diuers places of Spaine. He, as alſo *Dodonæus*, *Lobel*, and others, call this *Conyza maior*, and it is thought to be the *Conyza mas* of *Theophraſtus*, and *Conyza maior* of *Dioſcorides*.

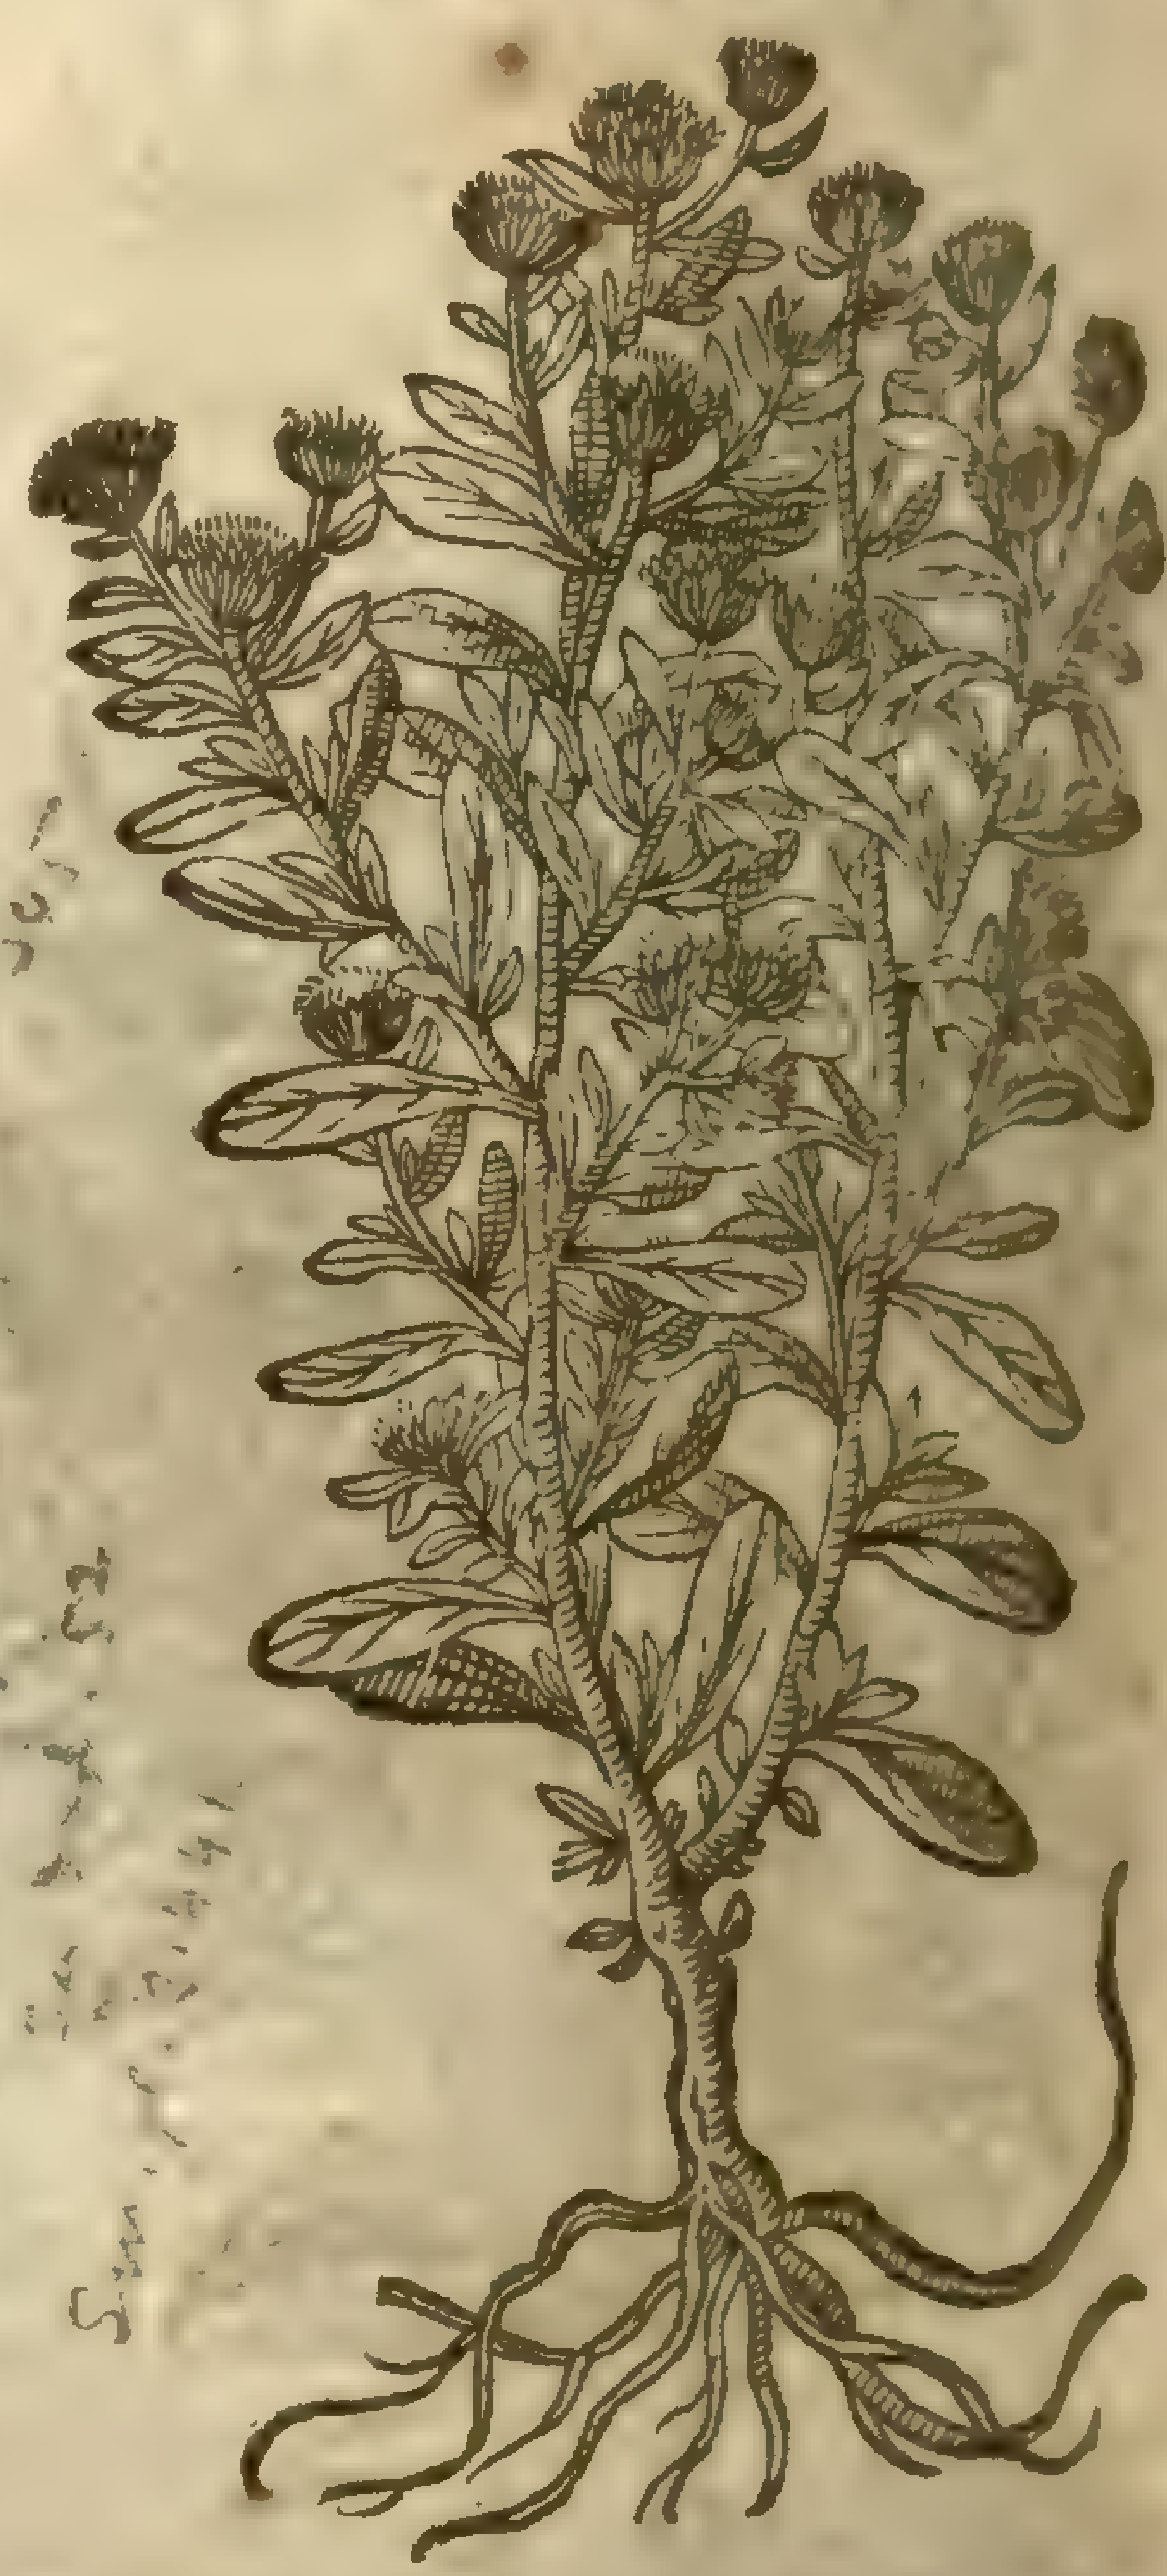
2 The leſſer ſeldome ſends vp more than one ſtalke, and that of a cubit high, yet vſually not ſo much: it is diuided into little branches, and alſo rough and glutinous as the precedent, but more greene. The leaues are three times leſſe than thoſe of the former, ſomewhat ſhaped like thoſe of Toad-flax, yet hairie and vnctious: the tops of the branches as in the bigger, carrie leſſe, and leſſe ſhining and ſightly floures, vaniſhing in like ſort into downe. The root is ſingle and annuall, and the whole plant more ſmelling than the former. This is iudged the *Conyza fœmina* of *Theophraſtus*; and *Con. minor* of *Dioſcorides*; it is the *Con. minor* of *Geſner*, *Lobel*, *Cluſius* and others. It growes in diuers parts of Spaine and Prouince in France, but not here, vnleſſe in Gardens.

† 3 *Conyza media.*
Middle Fleawoort.



Inula dysenterica [illegible]

† 4 *Conyza minima.*
Dwarfe Fleabane.



Inula pulicaria L.

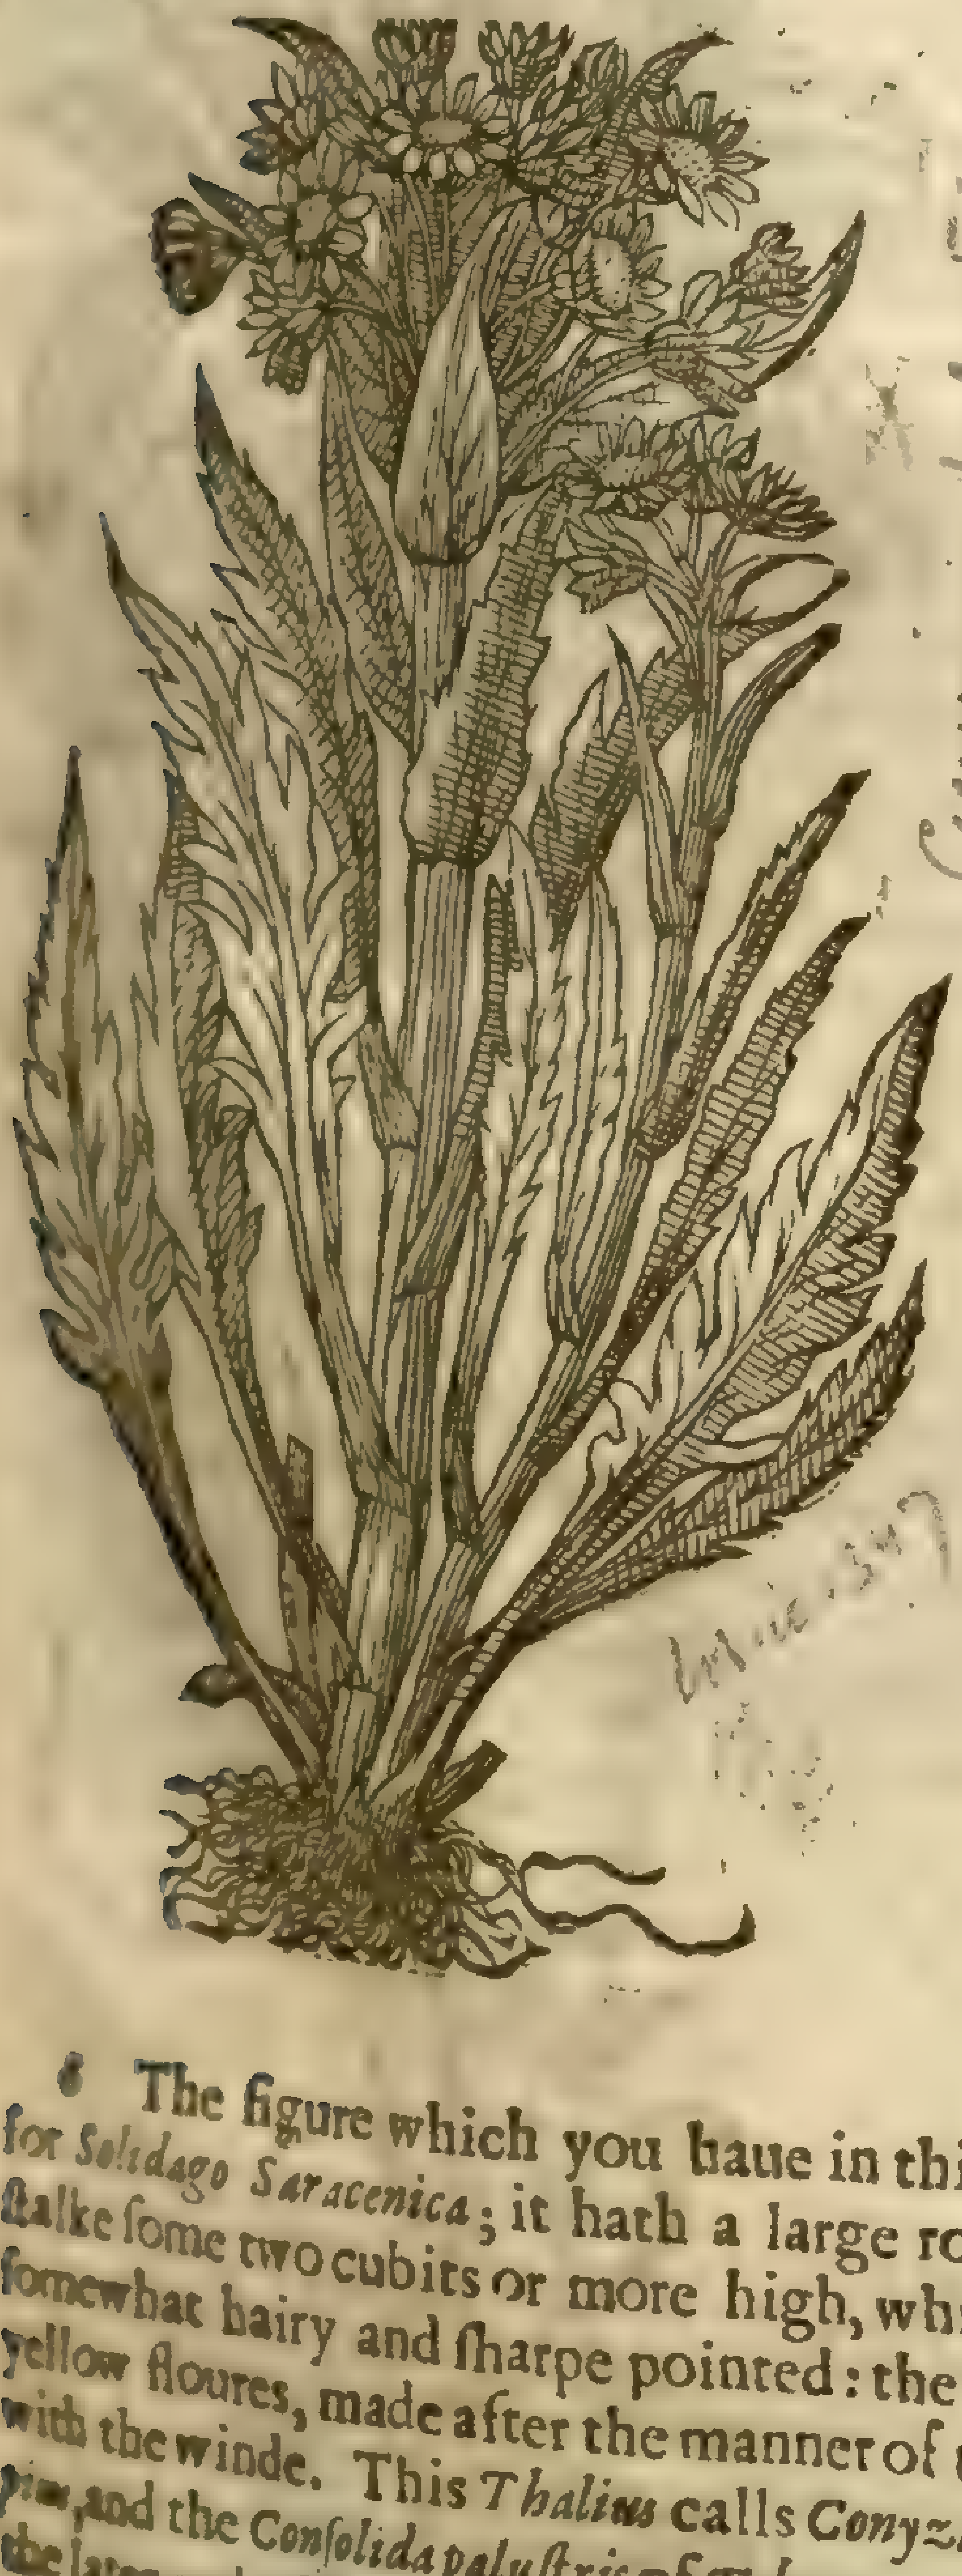
3 The root of this middle kinde is pretty large and fibrous, from whence ariſeth a branched ſtalke of ſome cubit high, engirt at certaine ſpaces with thicke, rough, grayiſh greene leaues: at the tops of the branches grow pretty faire yellow floures of the bignes of a little Marigold; which fading turne to downe, and are carried away with the winde. This floures in Iuly and Auguſt, and may be found growing in moſt places about riuers and pond ſides, as in S. Iames his Parke, Tuthill fields, &c. This is *Coniza media* of *Matthiolus*, *Dodonæus* and others. Some haue referred it vnto the

Mints,as *Fuchſius*, who makes it *Calamintha 3.genus*; and *Lonicerus*, who calls it *Mentha lutea*. In Cheape-ſide the herbe-women call it Herbe Chriſtopher,and ſell it to Empericks, who with it (as they ſay) make medicines for the eies,but againſt what affect of them,or with what ſucceſſe I know not.

4 In like places,or rather ſuch as are plaſhie in winter this may be plentifully found growing. The roots are ſmall and fibrous; from whence ariſeth a branched ſtalke ſome foot high, ſet with ſmall longiſh leaues ſomewhat roundiſh pointed,ſoft alſo and woolly, with a ſmell not altogether vnpleaſant,like as the laſt deſcribed: the floures are compaſſed with many yellowiſh threds like to the middle part of Camomill floures,or thoſe of Tanſey: and as the former, turne into downe, and are carried away with the winde; it floures in Iuly and Auguſt. This is the *Conyza minor* of *Tragus*, *Mathiolus*,and others: *Lobel* and *Dodon.* call it *Conyza minima*.

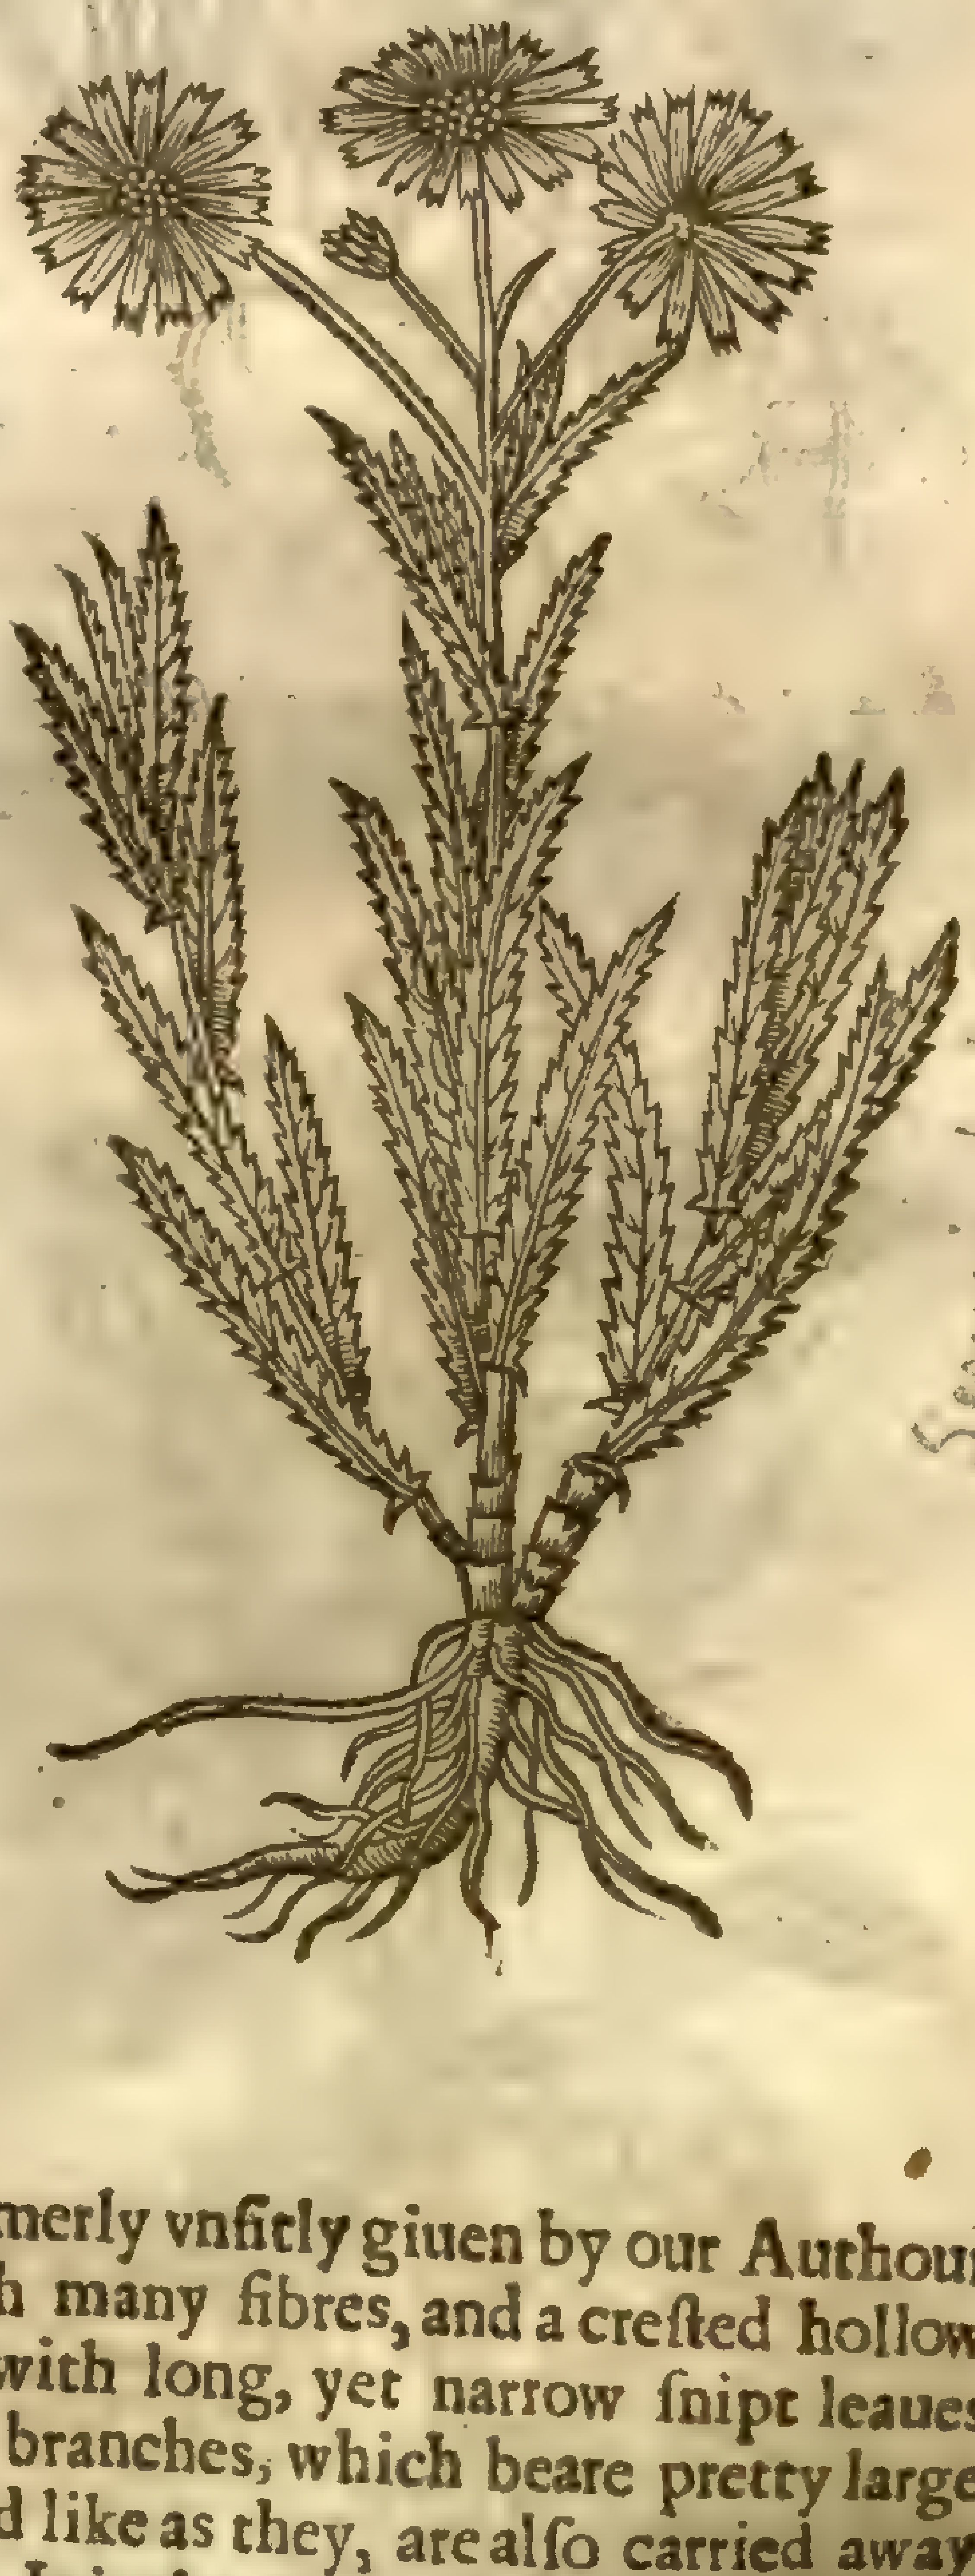
5 This cut leaued Fleabane hath ſmall fibrous roots,from which ariſe thicke, creſted,and hollow ſtalkes,diuided towards the tops into ſundry branches: the leaues that encompaſſe the ſtalke are gaſhed,or els deeply ſinuated on the edges:the floures are ſtarre faſhion and yellow,and alſo fly away in downe; the whole plant is couered ouer with a ſoft and tender downe, and hath ſomewhat the ſmell of hony. This is a variety of the third,and is called by *Dodon.Conyza mediæ ſpecies altera*. *Lobel* names it *Conyza helenitis folijs laciniatis*.

‡ 5 *Conyza folijs laciniatis*.
Great jagged leaued Fleabane.



Cineraria palustris, Mill. dict. Sm. fl. 2 [illegible]

‡ 6 *Conyza paluſtris ſerratifolia*.
Water ſnipt Fleabane.

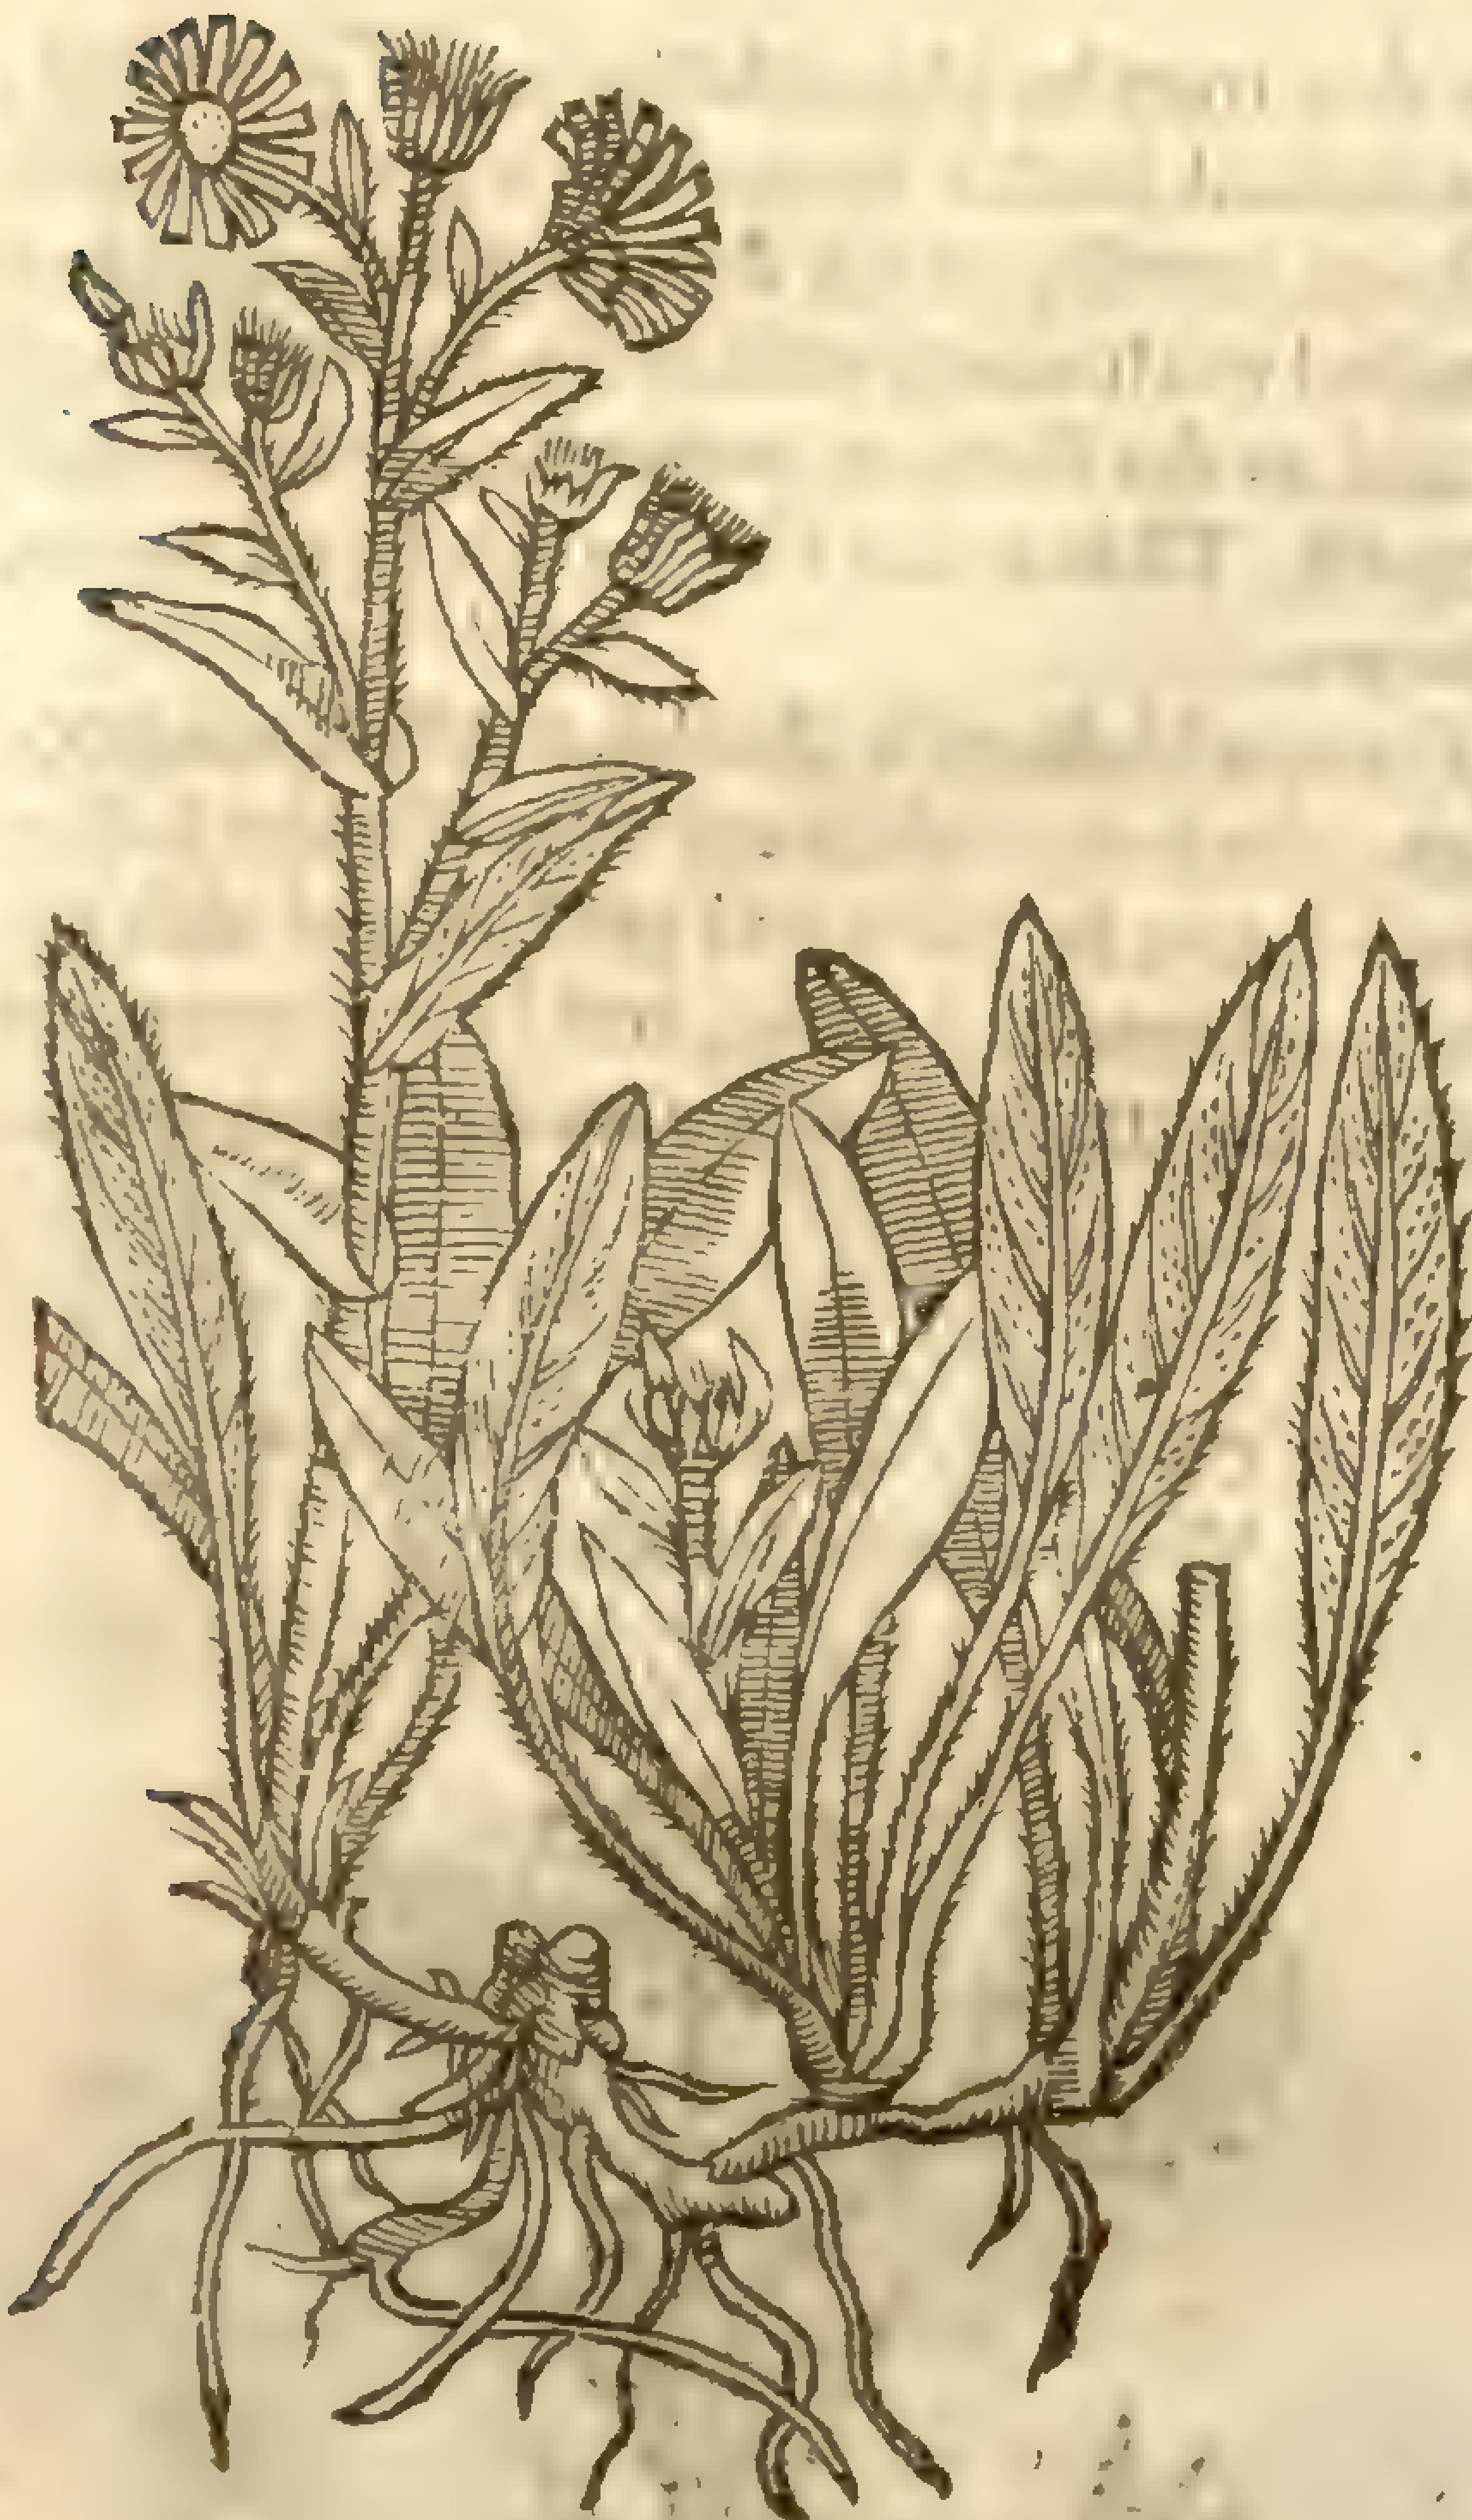


Senecio paludosus, Mill. dict. Sm. fl. 3 435

6 The figure which you haue in this ſixth place was formerly vnfitly giuen by our Authour for *Solidago Saracenica*; it hath a large root which ſends forth many fibres, and a creſted hollow ſtalke ſome two cubits or more high, which is vnorderly ſet, with long, yet narrow ſnipt leaues ſomewhat hairy and ſharpe pointed: the top is diuided into branches, which beare pretty large yellow floures, made after the manner of thoſe of Ragwort, and like as they, are alſo carried away with the winde. This *Thalius* calls *Conyza maxima ſerratifolia*. It is the *Lingua major* of *Daleſchampius*,and the *Conſolida paluſtris* of *Tabernamontanus*. It groweth neere water ſides,and floures towards the later end of Summer: I haue not yet heard that it doth grow wilde amongſt vs.

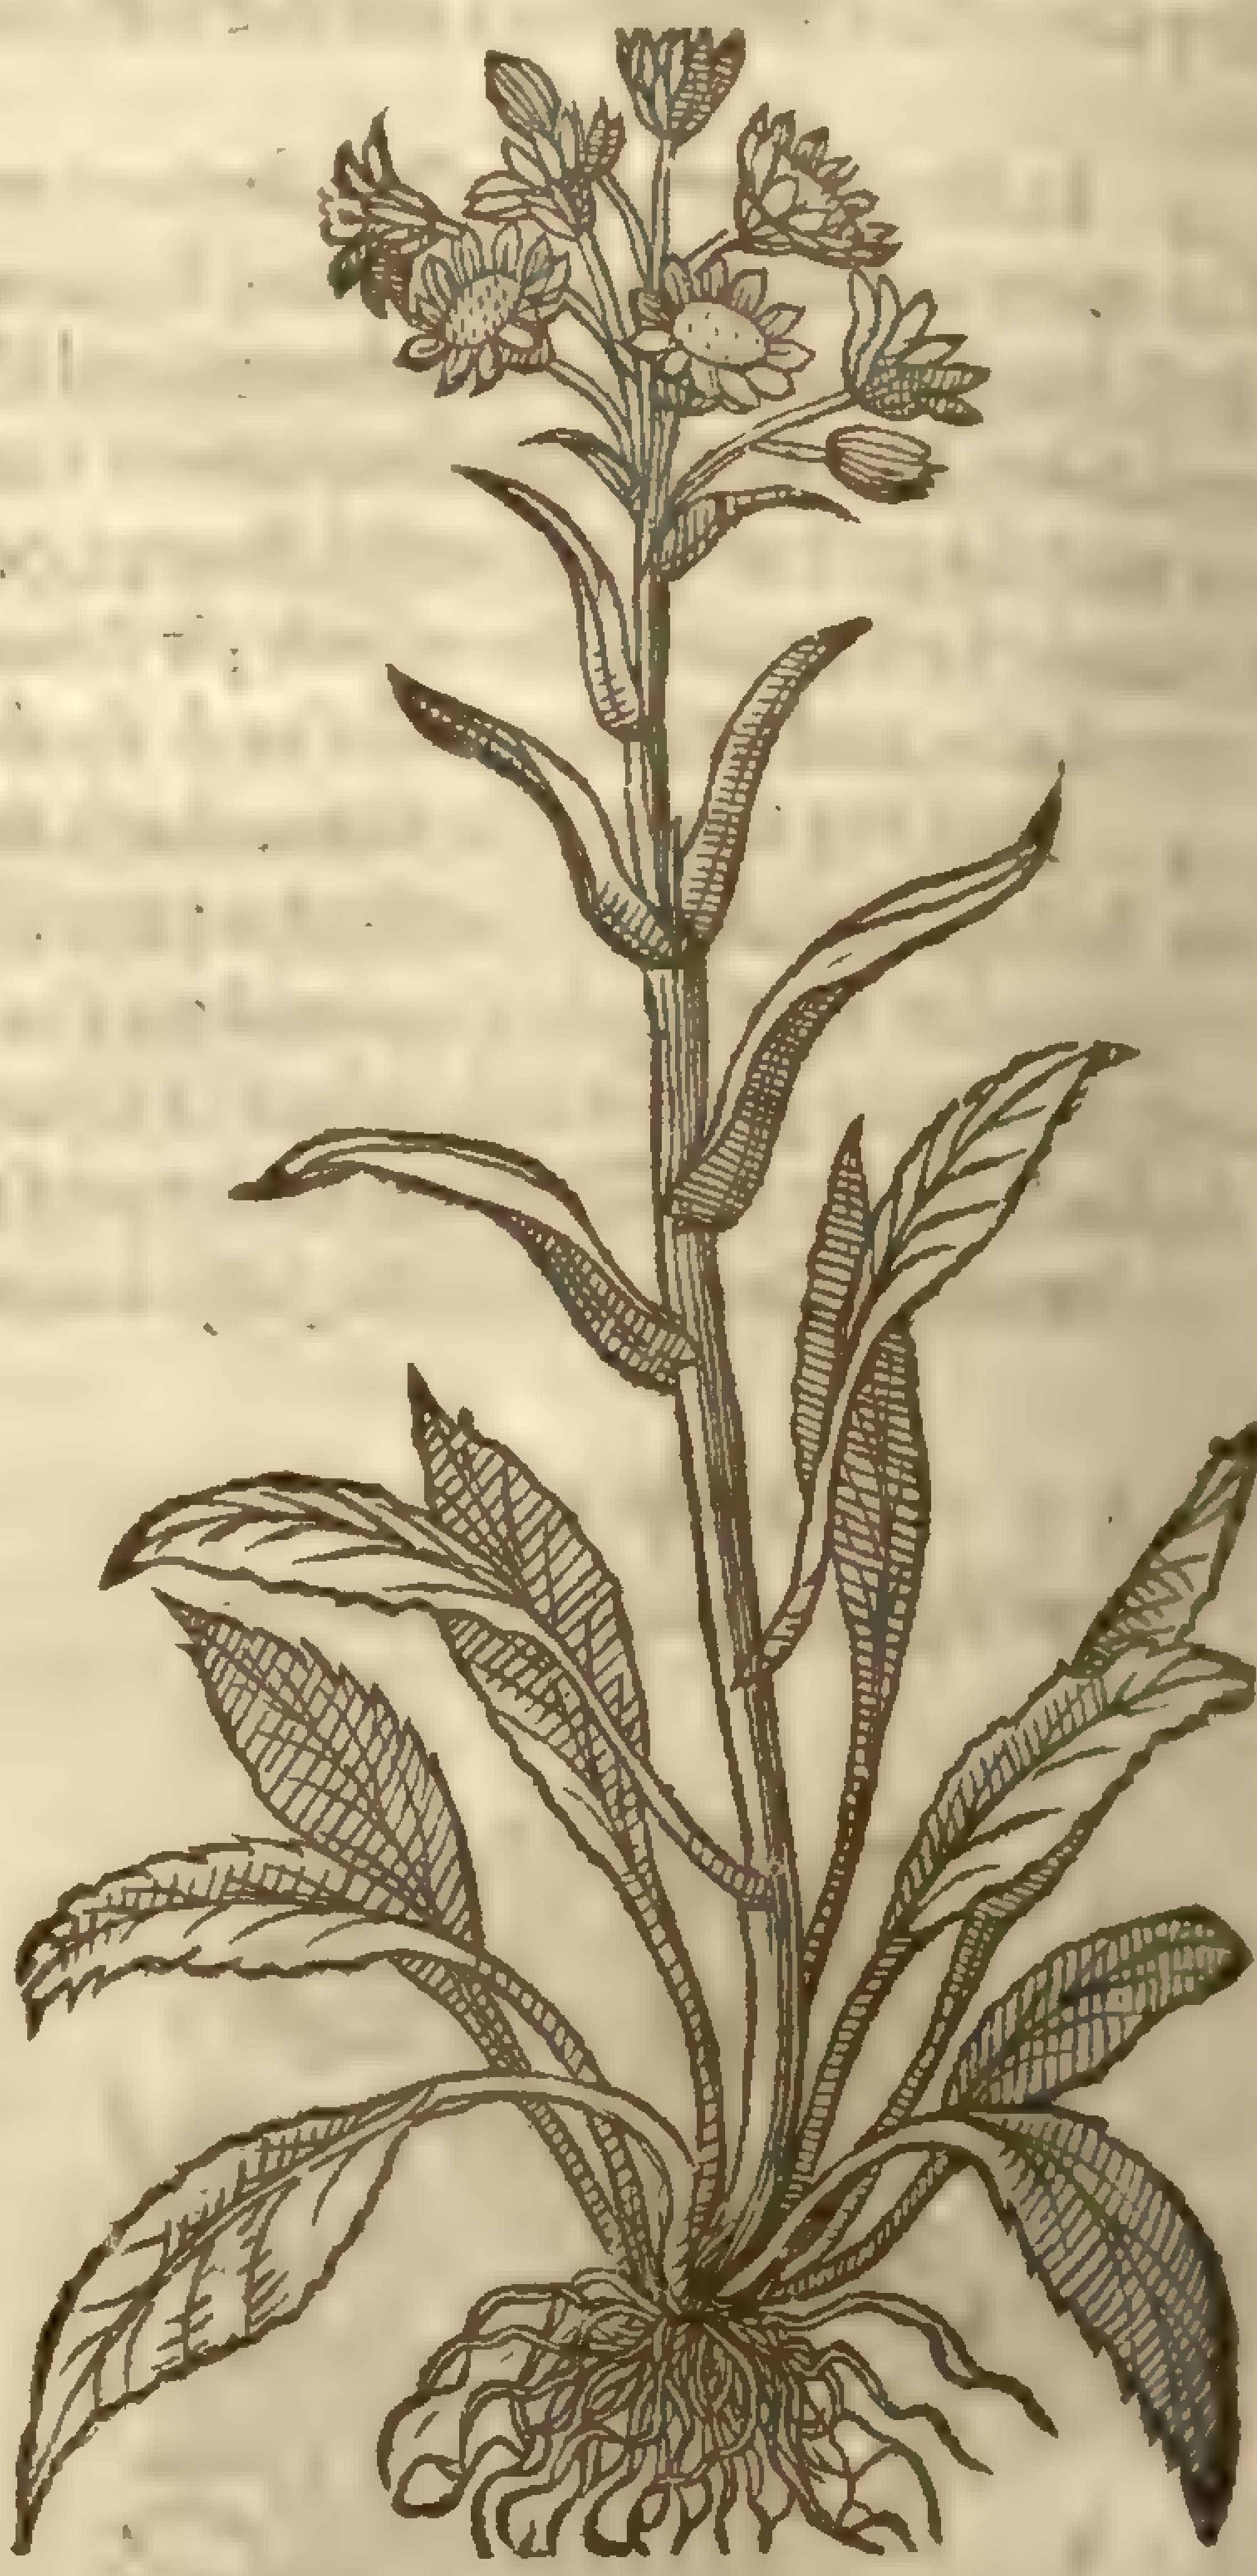
7 The

‡ 7 *Conyza Auſtriaca Cluſij.*
Auſtrian Fleabane.

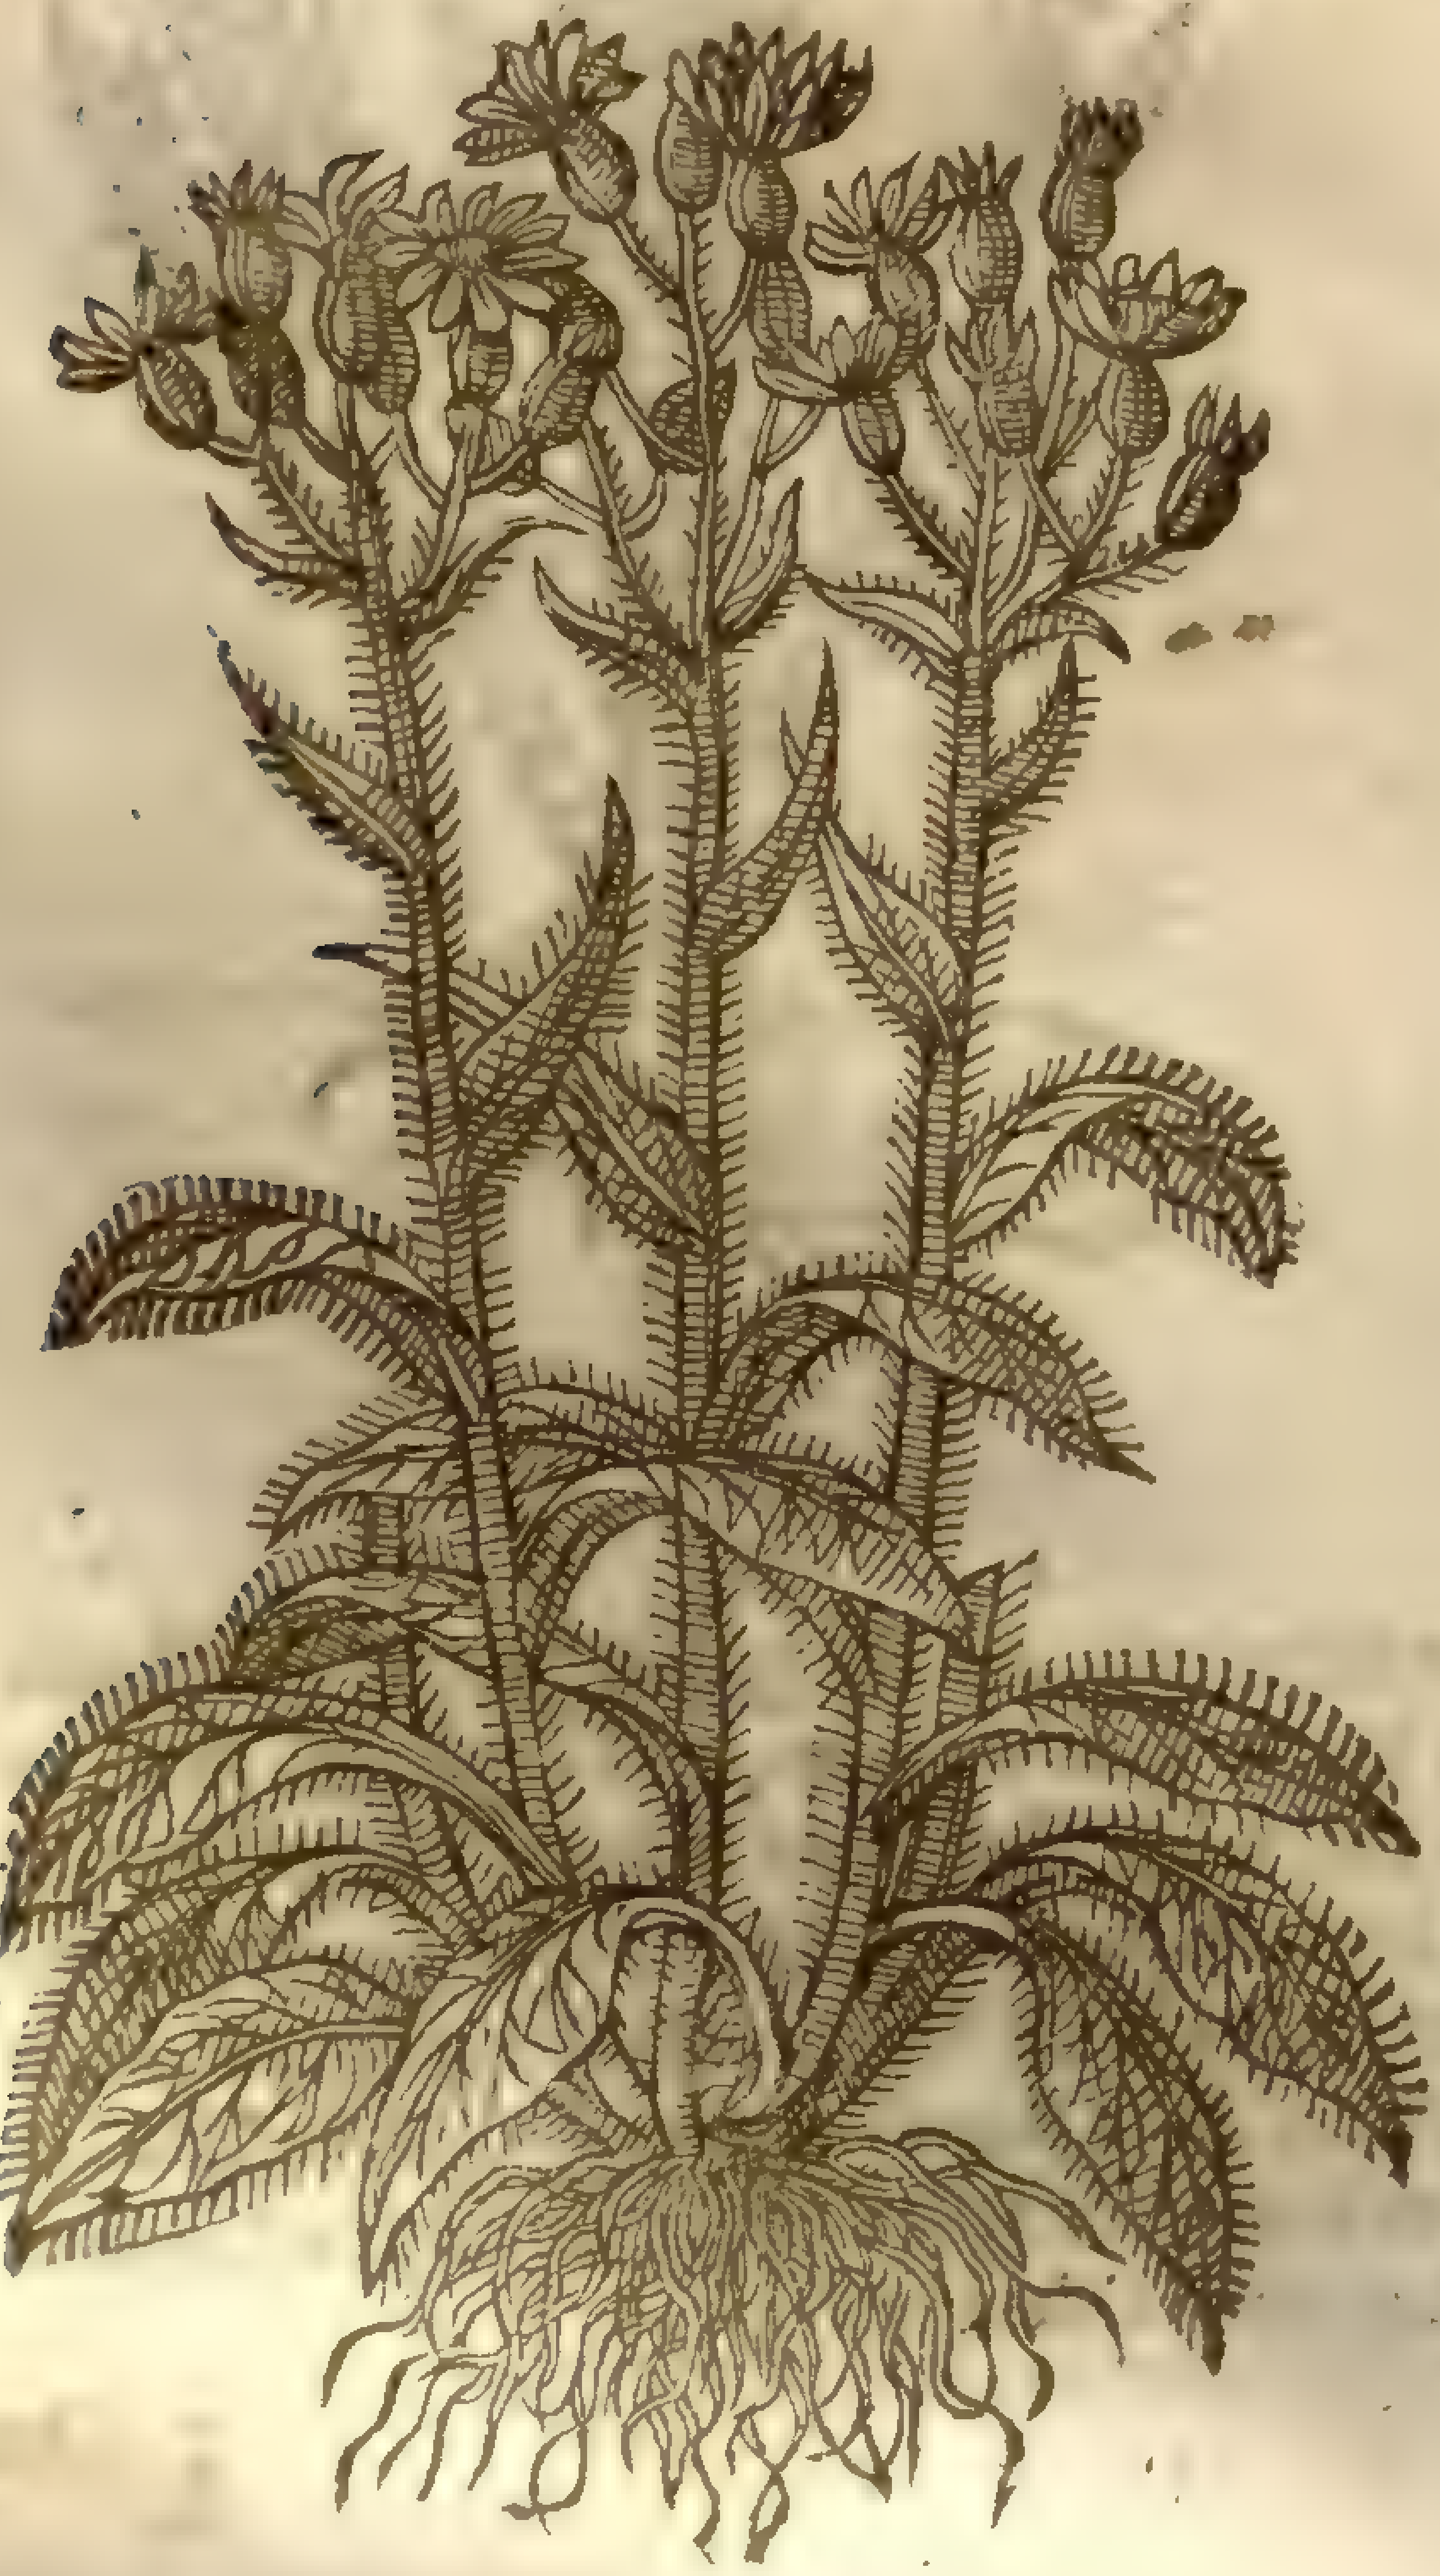


[illegible] oculus christi, L
[illegible]

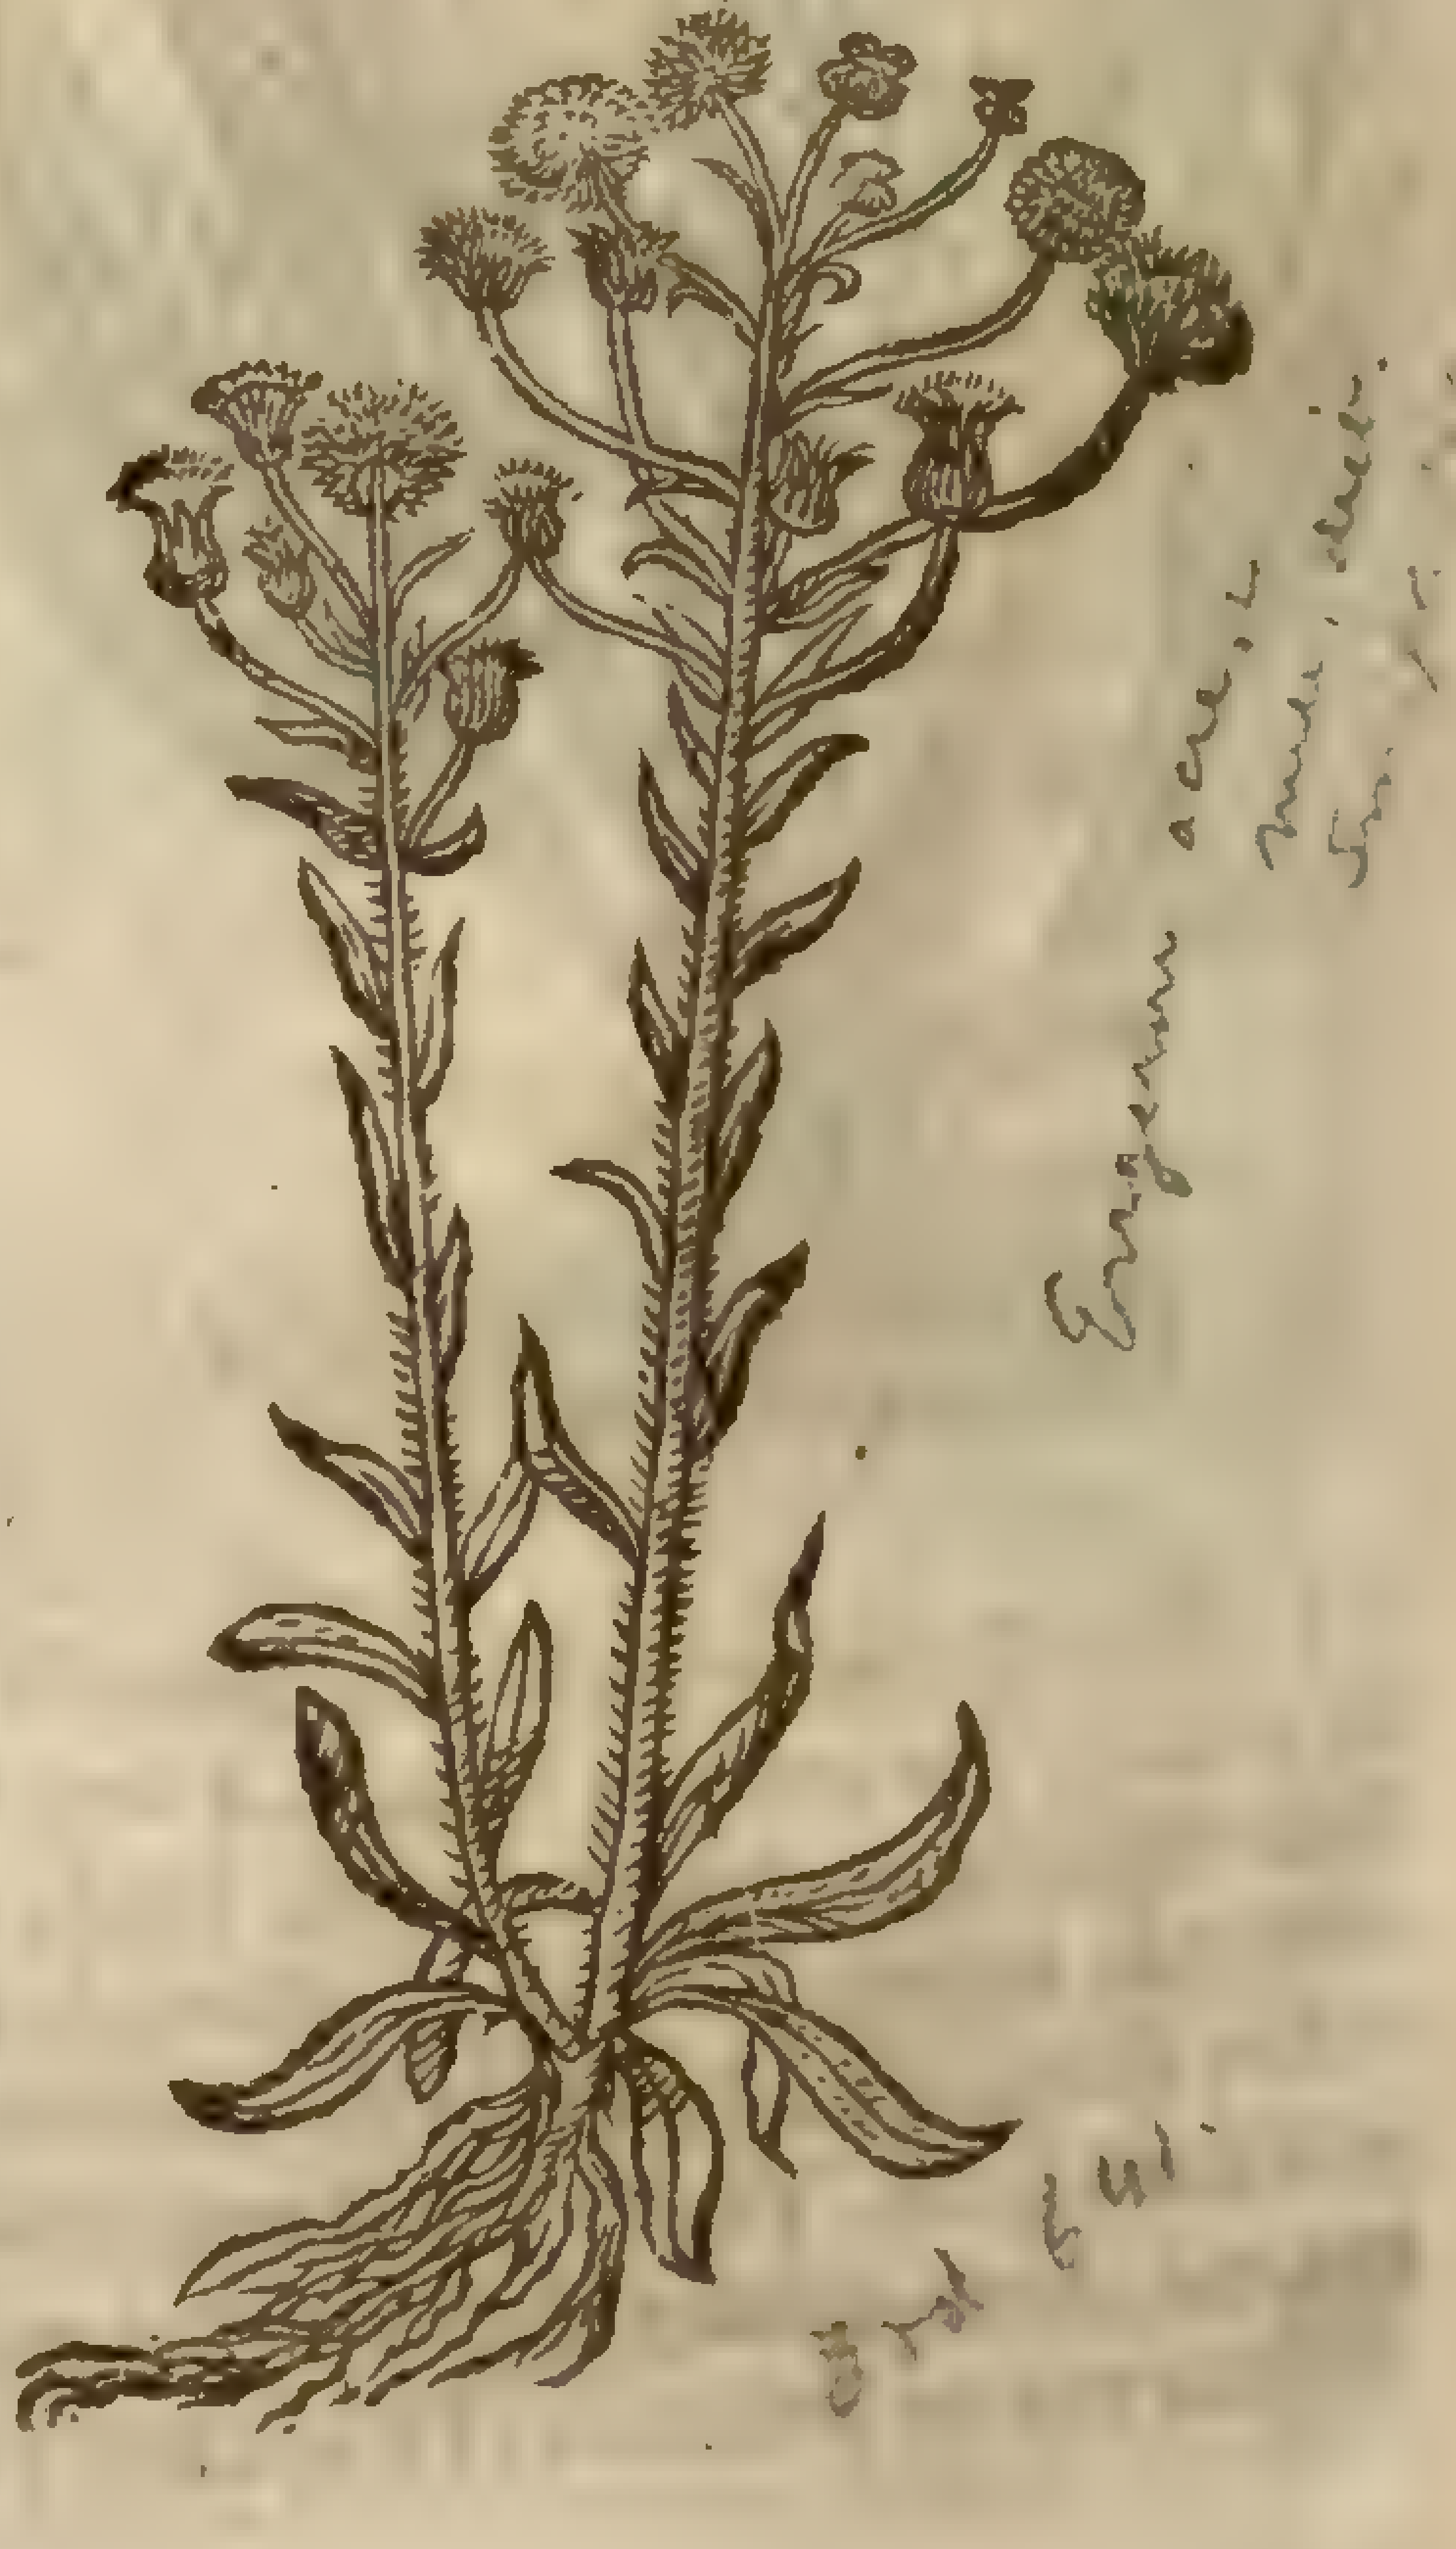
‡ 8 *Conyza incana.*
Hoary Fleabane.



‡ 9 *Conyza Alpina piloſiſſima.*
Hairie Fleabane of the Alpes.



† 10 *Conyza Cærulea acris.*
Blew floured Fleabane.



Erigeron acre, L
[illegible]
[illegible]

[illegible] 641

The ſtalkes of this are about a foot high, ſtraight, ſtiffe, hard, and couered with a whitiſh Downe: the leaues at the root grow vpon long ſtalks,and are ſoft and hairy; but thoſe which are higher vp haue a ſhort or elſe no ſtalke at all; rubbed,they yeeld no vnpleaſant ſmell, and taſted they are ſomwhat bitter and acride. The floures that grow vpon the tops of the branches are large, and faſhioned like thoſe of Elecampane,and are of the ſame yellow colour: the root is long, ſlender, and blackiſh, creeping,and putting vp new ſtalks; it hath many white fibres, and a reſinous ſmell. *Cluſius* found it growing on dry hilly places in Auſtria,and calls it *Conyza 3. Auſtriaca.*

8 This,which *Lobel* ſets forth vnder the title of *Conyza helenitis mellita incana*, I take to bee the ſame plant that I firſt figured and deſcribed out of *Cluſius*, only the root is better expreſt in *Cluſius* his figure; otherwiſe by the figures I cannot finde any difference, though *Bauhine* reckon it vp in his *Pinax* as differing therefrom. Hee calls it *Helenitis,* becauſe the floures and leaues haue ſome ſemblance of Elecampane; and *Mellita,* for that they ſmell ſomewhat like hony.

9 This alſo ſeems not much to differ from the laſt mentioned,but onely in the hairines of the leaues and ſtalks,and that the floures are ſmaller. *Lobel* calls it *Conyza Helenitis piloſa.* Theſe laſt grow vpon mountaines,but none of them with vs in England that I can yet heare of.

10 This hath a ſmall fibrous and yellow root of a very hot and biting taſte, which ſends vp diuers longiſh leaues about the head thereof: the ſtalke is ſome foot and halfe high, and ſet alternately with twined longiſh narrow and ſomewhat rough leaues of an ouerworne green colour: the top of the ſtalk and branches are adorned with floures ſet in longiſh ſcaly heads like thoſe of *Hieracium*; the outer little leaues are of a feint blew colour,and the inner threds are yellow. It floures in Auguſt,and the floures quickly turn into downe,and are carried away with the wind. It growes in many chalky hils,and I firſt obſerued it in the companie of Mr *George Bowles*, Mr *Iohn Bugs*, and others,cloſe by Farmingham in Kent; and the laſt yeare Mr *William Broad* found it growing at the Blockhouſe at Grauesend. *Tragus* calls it *Tinctorius flos alter*: *Dodonæus*, becauſe the floure quickly turnes to down,makes it *Erigeron quartum*: and *Geſner*,for that the root is hot,and drawes rheum like Pellitorie of Spain,which therefore is vſed againſt the tooth-ache,names it *Dentelaria*: he alſo calls it *Conyza muralis*,and *Conyzoides cærulea.* *Tabernamontanus* alſo calls it *Conyza cærulea* and laſtly, *Fabius Columna* hath it by the name of *Amellus montanus*, to which kinde it may in myne opinion bee as fitly referred as to theſe *Conyza's*. Our Authour had the figure hereof in the third place in this Chapter.

¶ *The Place, Time, and Names.*

All theſe haue bin ſufficiently ſhewne in their particular titles and deſcriptions. ‡

¶ *The Temperature.*

Conyza is hot and dry in the third degree.

¶ *The Vertues.*

The leaues and floures be good againſt the ſtrangurie,the jaundice,and the gnawing or griping of the belly. A

The ſame taken with Vineger help the Epilepſie or falling ſickneſſe. B

If women ſit ouer the decoction thereof it greatly eaſeth their paines of the Mother. C

The herb burned where flies,gnats,fleas,or any venomous things are,doth driue them away. D

† The firſt was formerly of *Conyza media*; the ſecond was of *Conyza minima*; and the third of *Conyza cærulea acris*.

CHAP. 132.

Of Starre-wort.

¶ *The Deſcription.*

1 THe firſt kind of *Aſter* or *Inguinalis* hath large broad leaues like *Verbaſcum Salvifolium* or the great *Conyza*; amongſt which riſeth vp a ſtalke foure or fiue handfulls high, hard, rough,and hairy,beſet with leaues like Roſe Campions, of a darke greene colour. At the top of the ſaid ſtalks come forth floures of a ſhining and gliſtering golden colour; and vnderneath about theſe floures grow fiue or ſix long leaues,ſharp pointed,and rough,not much in ſhape

vnlike the fiſh called *Stella marina* : the floures turn into down,and are carried away with the wind. The root is fibrous,of a biting and ſharp taſte.

‡ 2 The ſecond,called Italian Starwort, hath leaues not much vnlike Marigolds, but of a parke green colour,rough,and ſomwhat round at the vpper end : the ſtalks are many, & grow ſome cubit high, and at their tops are diuided into ſundry branches which beare faire blewiſh purple floures,yellow in their middles,& ſhaped like Marigolds, and almoſt of the ſame bignes,whence ſome haue called them blew Marigolds. ‡

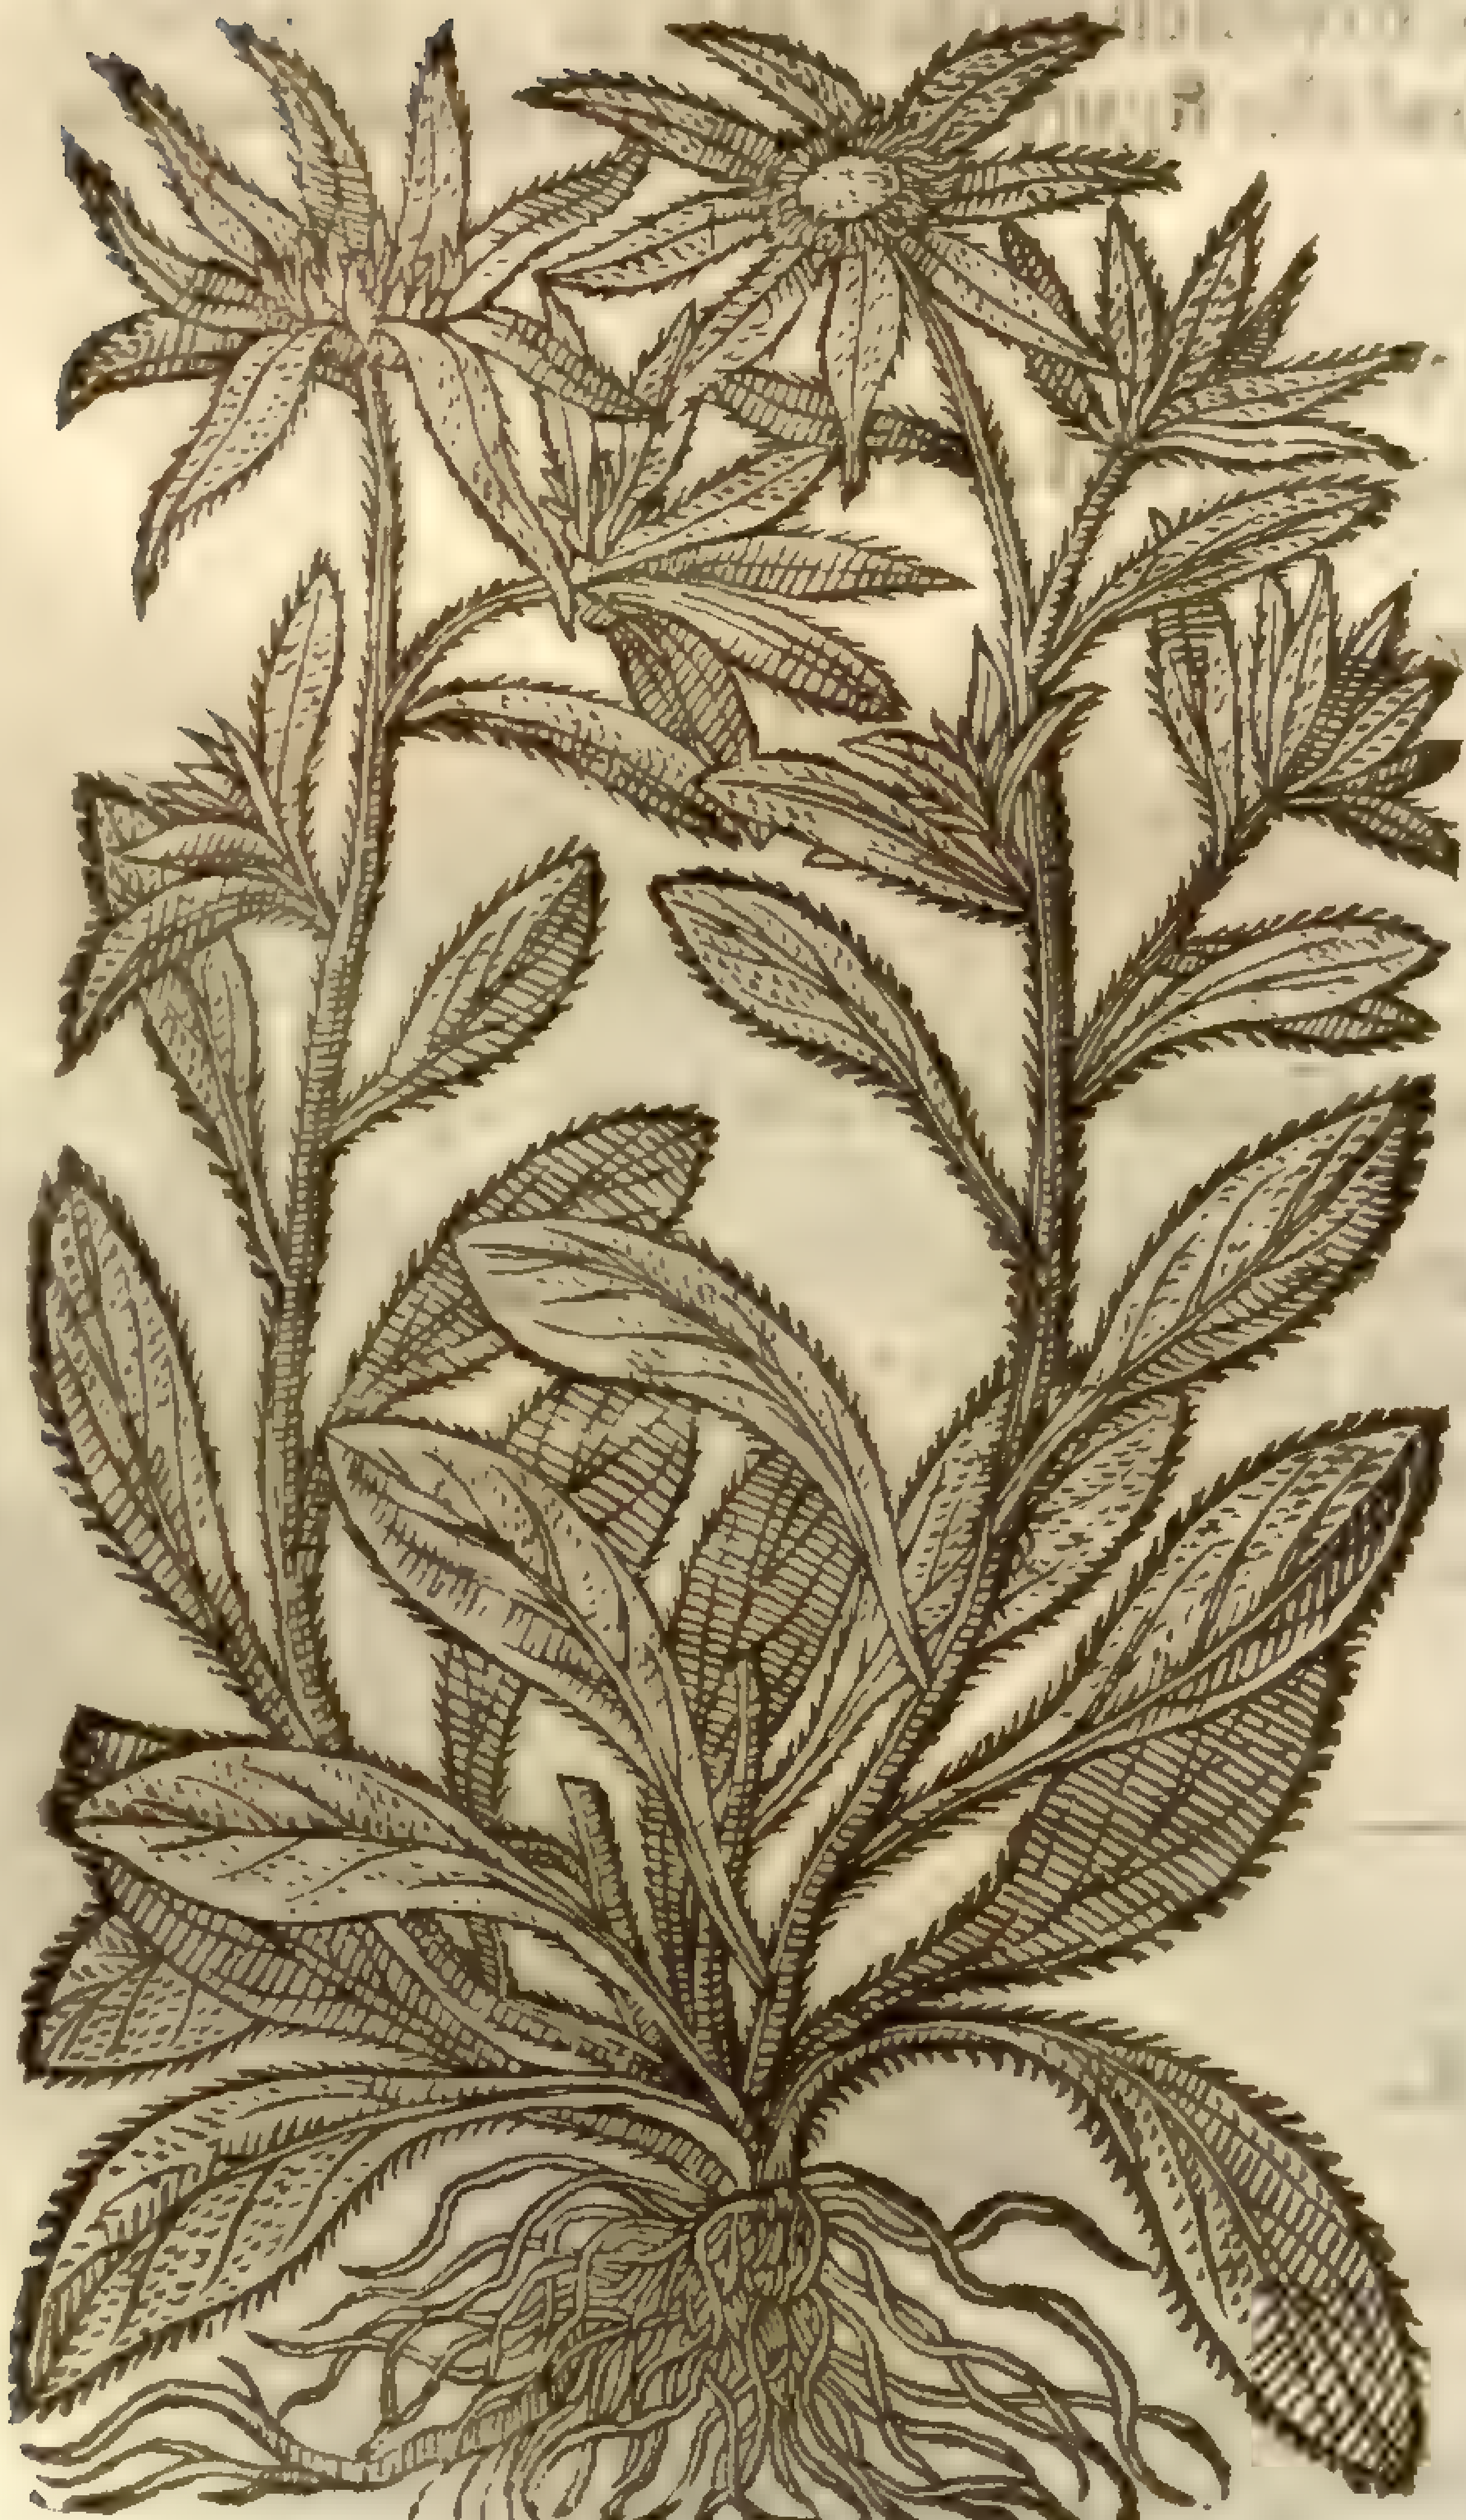
3 The third kind hath leaues ſo like the Italian Star-wort,that a man can ſcarcely at the ſudden diſtinguiſh the one from the other. The ſingle ſtalk is a cubit long,vpright and ſlender,on the top whereof grow faire yellow floures like thoſe of *Enula Campana*,and they fly away in down:the root is ſmall and threddy.

4 The fourth kinde in talneſſe and floure is not much vnlike that laſt before ſpecified, but in ſtalke and leaues more hairy,and longer, ſomewhat like our ſmall Hounds-tongue, and the roots are leſſe fibrous or threddy than the former.

5 There is another ſort that hath a browne ſtalke,with leaues like the ſmall *Conyza* : the flours are of a darke yellow,which turne into down that flieth away with the wind like *Conyza.* The root is full of threds or ſtrings.

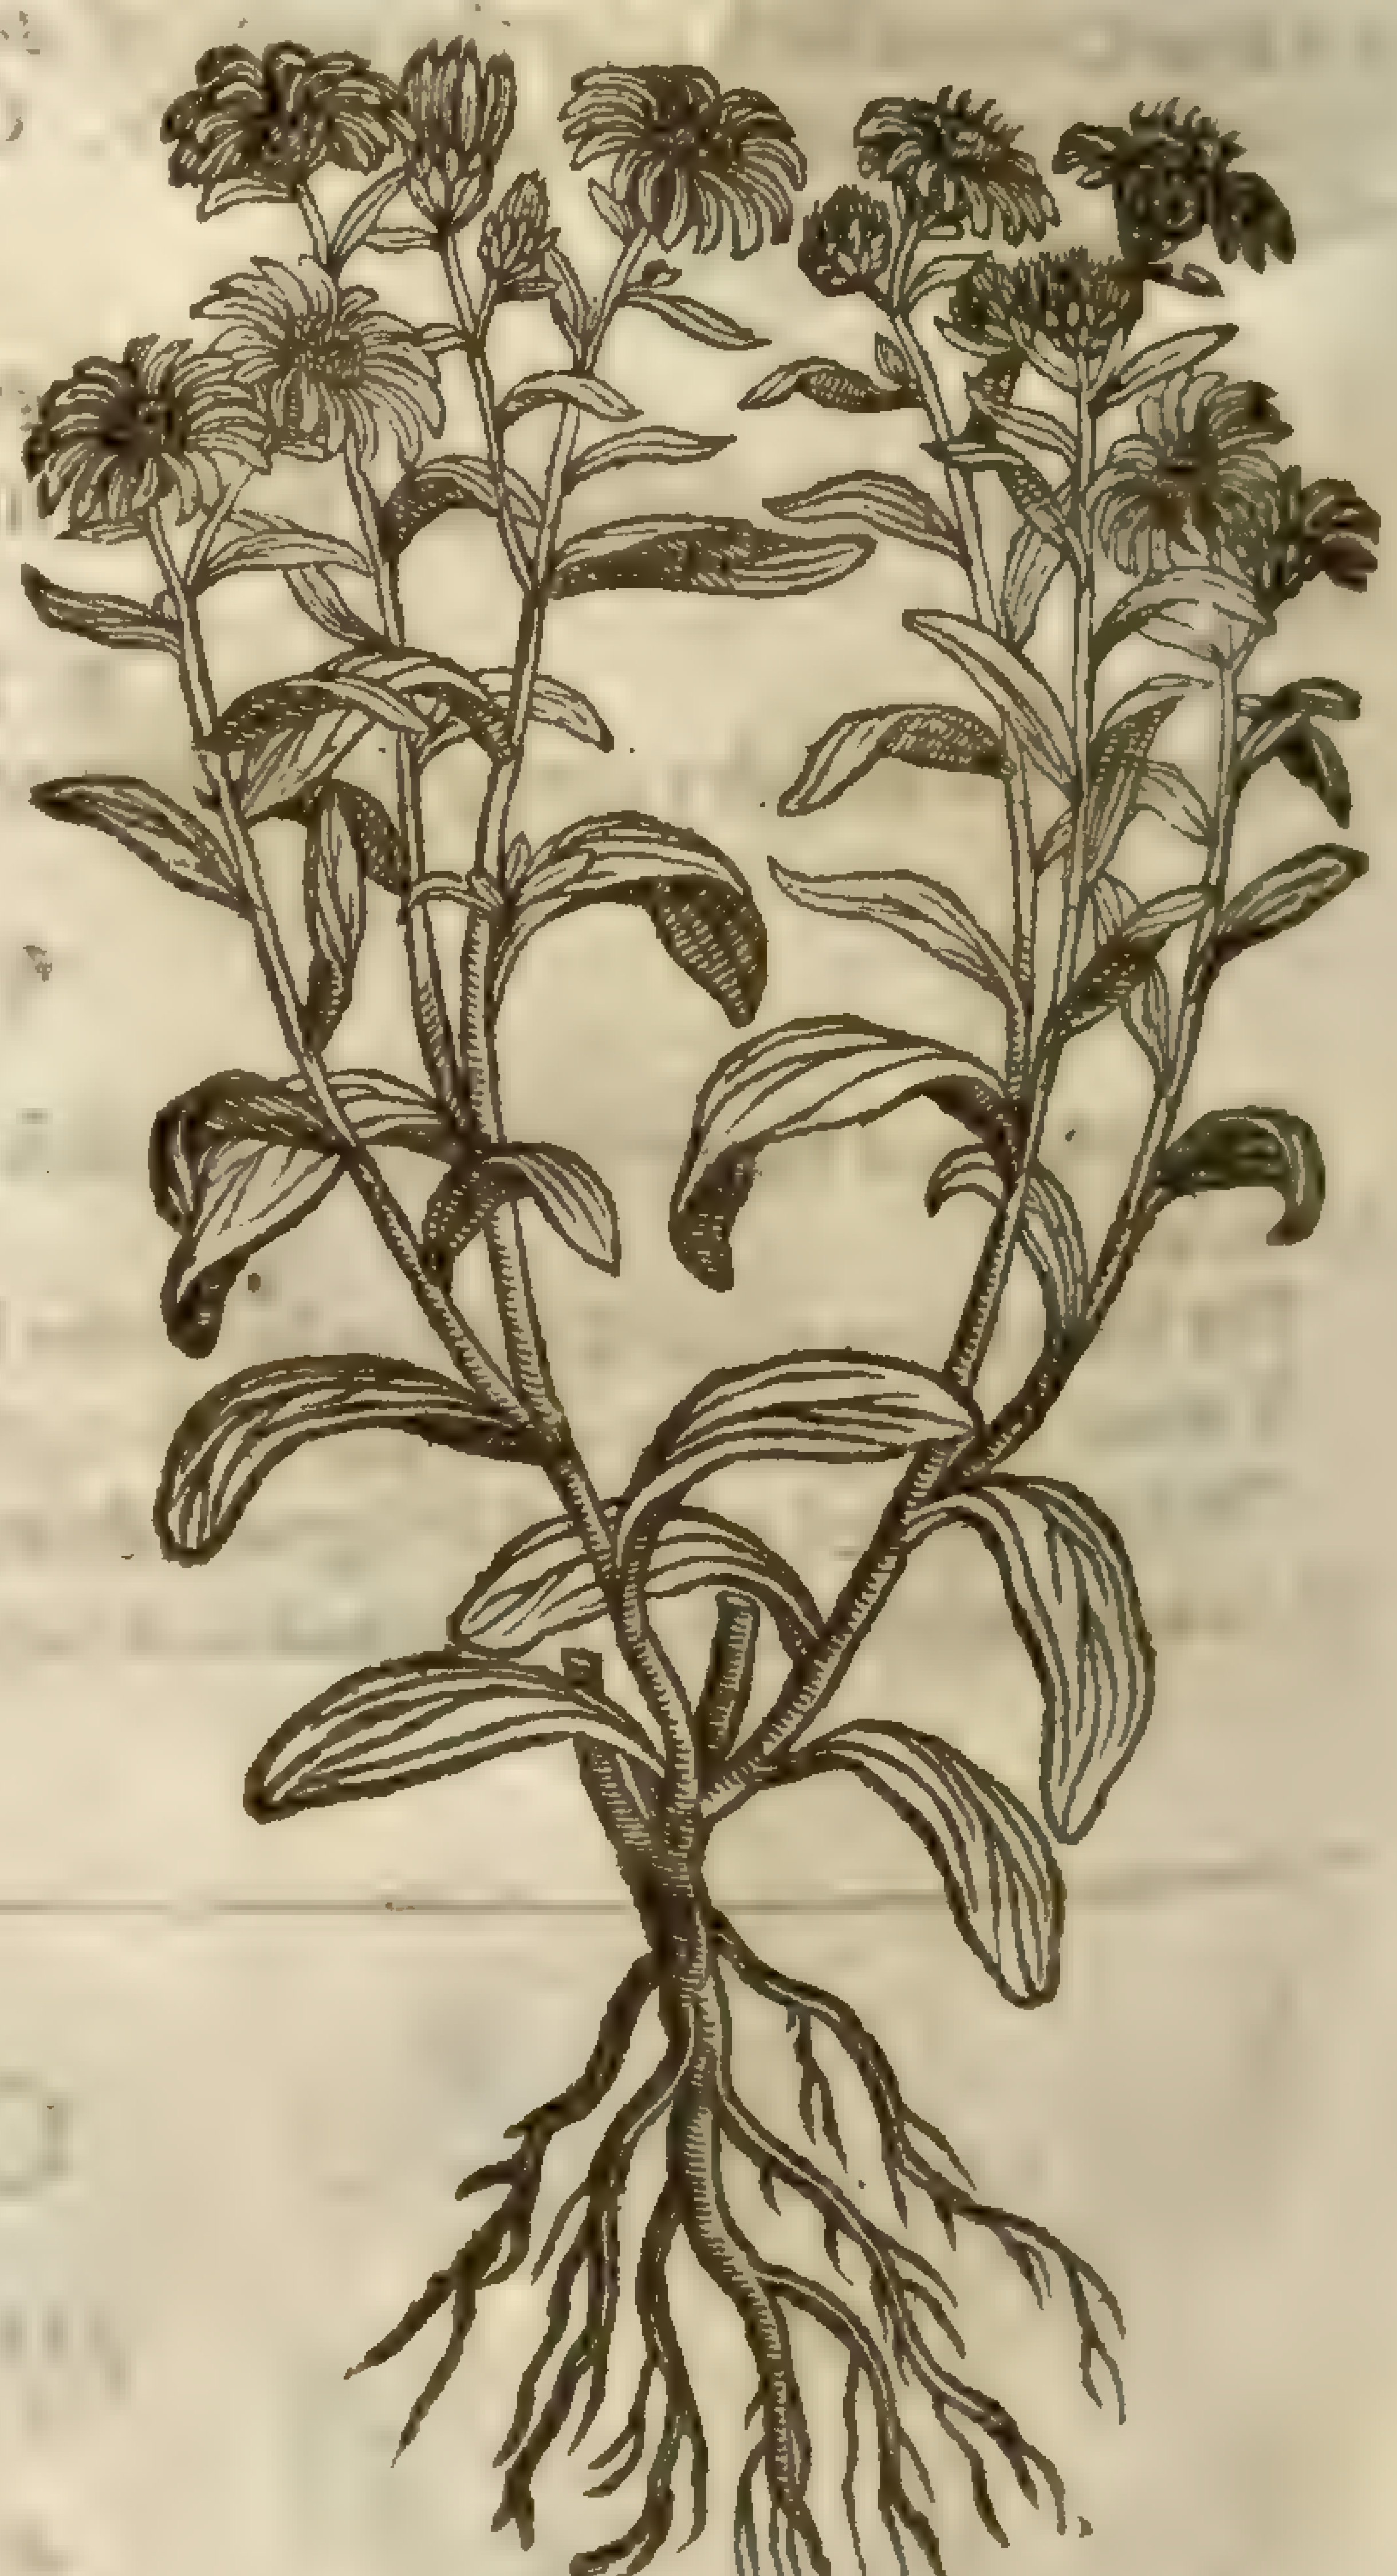
6 There is alſo another that hath leaues like the great Campion, ſomewhat hairie : amongſt which come vp crooked crambling ſtalks leaning lamely many wayes. Whereupon do grow faire yellow floures ſtar-faſhion; which paſt, the cups become ſo hard that they will ſcarce be broken with ones nails to take forth the ſeed:the root is long and ſtraight as a finger,with ſome few ſtrings anexed to the vppermoſt part thereof. It groweth wilde in ſome parts of Spain.

1 *Aſter Atticus.*
Starwort.



Buphthalmum spinosum, L.
[illegible]

‡ 2 *Aſter Italorum.*
Italian Starwort.



7 There groweth another kinde of Starre-woort which hath many leaues like Scabious, but thinner, and of a more greene colour, couered with a woolly hairineſſe, ſharpe and bitter in taſte; amongſt which ſpringeth vp a round ſtalke more than a cubit high; often growing vnto a red-

diſh colour, ſet with the like leaues, but ſmaller and ſharper pointed, diuiding it ſelfe toward the top into ſome few branches, whereon grow large yellow floures like *Doronicum* or *Sonchus*. The root is thicke and crooked. ‡ This is *Aſter Pannonicus maior, ſiue tertius* of *Cluſ.* and his *Auſtriacus primus*.

8 We haue ſeene growing vpon wild mountains another ſort, hauing leaues much leſſe than the former, ſomewhat like to the leaues of Willow, of a faire green colour, which doe adorne and deck vp the ſtalke euen to the top; whereupon do grow yellow floures ſtar-faſhion, like vnto the former. The root is ſmall and tender, creeping far abroad, whereby it mightily encreaſeth. ‡ This is *Aſter Pannonicus ſalignis folijs, ſiue Aſter* 4. *Auſtriacus* 2. of *Cluſius*. It is *Bubonium luteum* of *Tabern.* and our Author gaue the figure hereof for *Aſter Italorum*. ‡

9 *Cluſius* hath ſet forth a kinde that hath an vpright ſtalke ſomewhat hairy, two cubits high, beſet with leaues ſomewhat woolly, like to thoſe of the Sallow, hauing at the top of the ſtalke faire yellow floures like *Enula Campana*, which turn into down that is caried away with the winde. The root is thicke, with ſome haires or threds faſtned thereto. ‡ This is *Aſter lanuginoſo folio, ſiue* 3. of *Cluſius*. Our Author gaue the figure hereof vnder the title of *Aſter hirſutus*. It is *Aſter flore luteo* of *Taber.* ‡

10 He hath likewiſe deſcribed another ſort, that hath leaues, ſtalks, floures, and roots like the ninth, but neuer groweth to the height of one cubit. ‡ It bringeth forth many ſtalkes, and the leaues that grow diſorderly vpon them are narrower, blacker, harder and ſharper pointed than the former, not vnlike thoſe of the common *Ptarmica*, yet not ſnipt about the edges: The floures are yellow, and like thoſe of the laſt deſcribed, but leſſe. This is the *Aſter anguſtifolius ſiue ſextus* of *Cluſius*. ‡

11 There is likewiſe ſet forth in his Pannonicke Obſeruations, a kind of *Aſter* that hath many ſmall hairy leaues like the common great Daiſie; among which riſeth vp an hairy ſtalke of a foot high, hauing at the top faire blew floures inclining to purple, with their middle yellow, which turn in the time of ſeeding into a woolly down that flieth away with the wind. The whole plant hath a drying binding and bitter taſte. The root is threddy like the common Daiſie or that of the Scabious. ‡ This is *Aſter Alpinus cæruleo flore, ſiue* 7. of *Cluſius*. ‡

3 *Aſter mont. flore albo.*

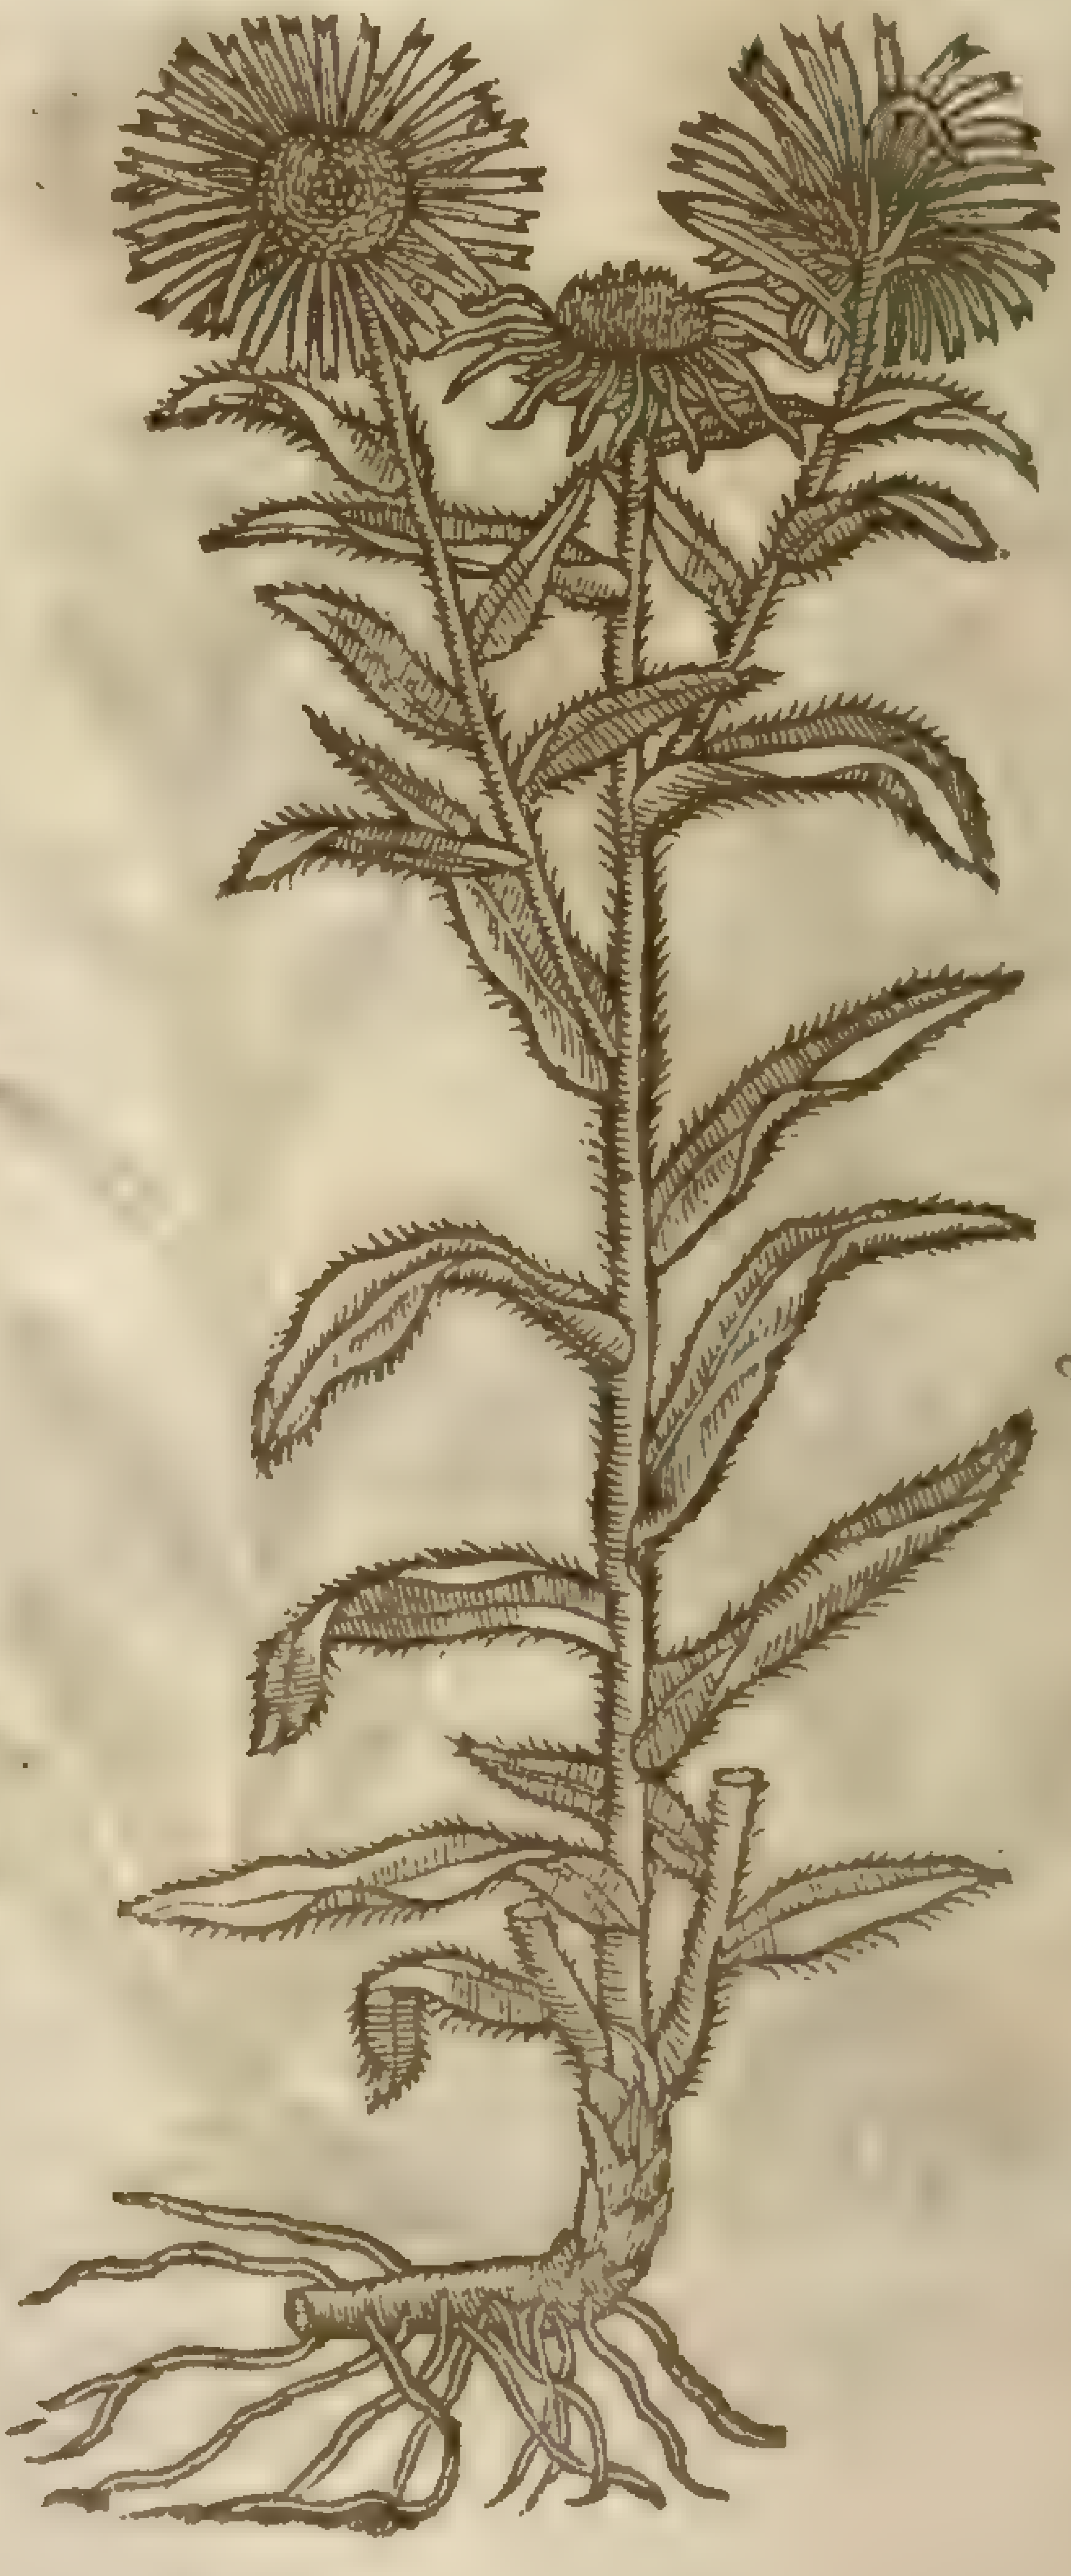
Sallow leaued Starwort.

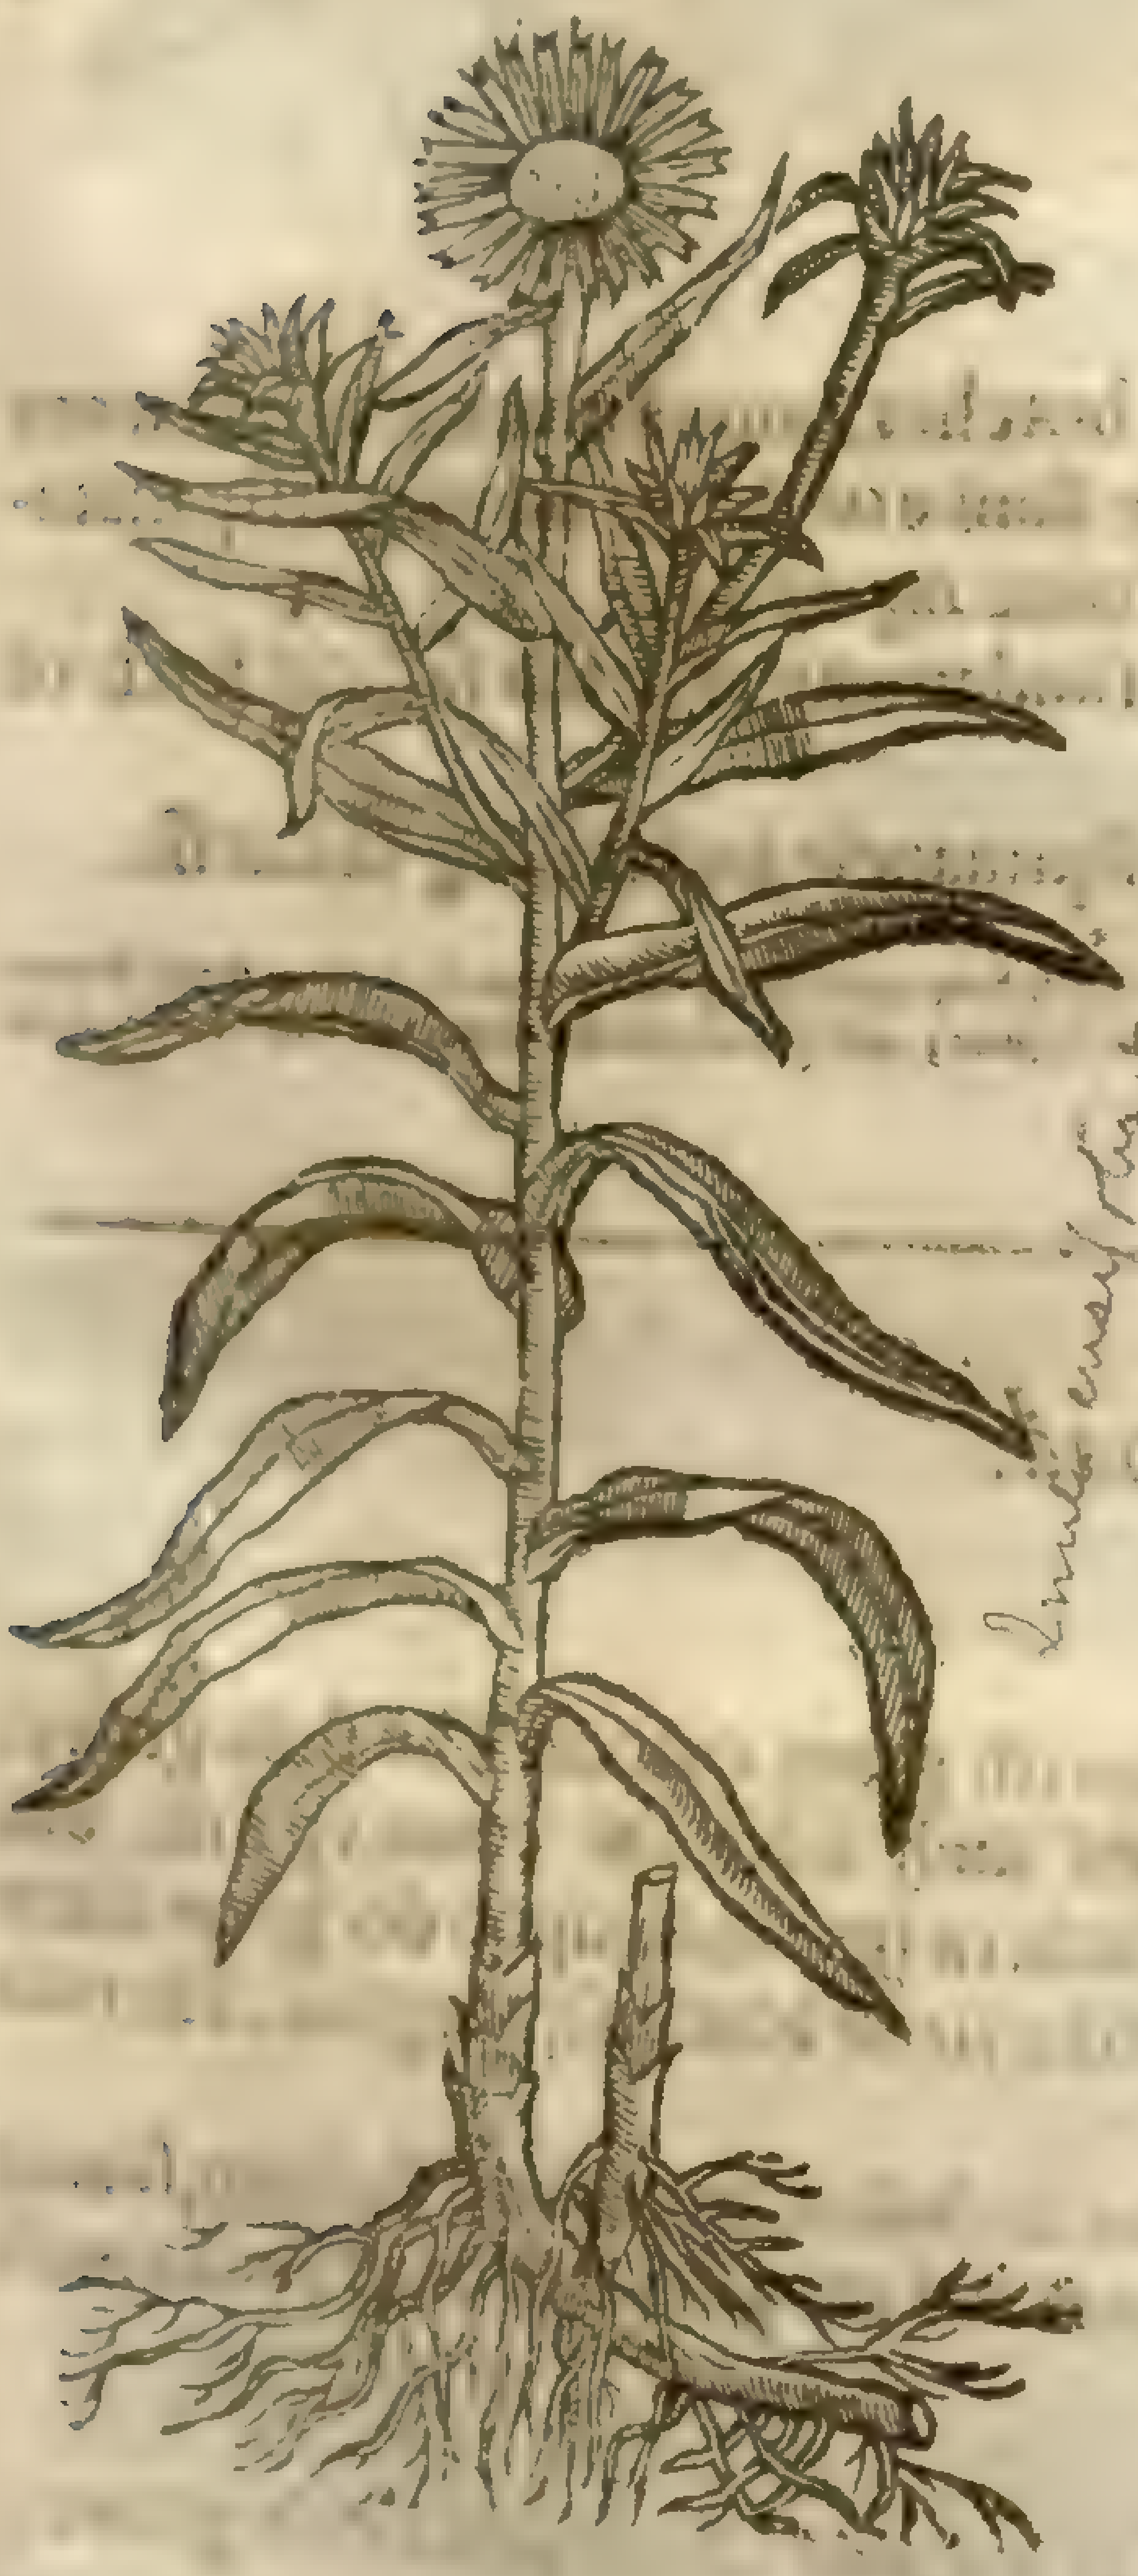


Inula hirta, mihi dict

‡ 12 There are kept in the gardens of Mr *Tradeſcant*, Mr *Tuggye*, and others, two Starworts differing much from all theſe formerly mentioned: the firſt of them is to be eſteemed for that it floures in October and Nouember, when as few other floures are to be found: the root is large and liuing, which ſends vp many ſmall ſtalks ſome two cubits high, wooddy, ſlender, and not hollow, and towards the top they are diuided into aboundance of ſmall twiggy branches: the leaues that grow alternatly vpon the ſtalks, are long, narrow, and ſharpe pointed, hauing foure or ſix ſcarce diſcernable nicks on their edges: the floures which plentifully grow on ſmal branches much after the manner of *Virga aurea*, conſiſt of twelue white leaues ſet in a ring, with many threds in their middles, which being yong are yellow, but becomming elder and larger they are of a reddiſh color, and at length turne into downe. I haue thought fit to call this plant, not yet deſcribed by any that I know of, being reported to be a Virginian, by the name of *Aſter Virginianus fruticoſus*, Shrubby ſtarwort.

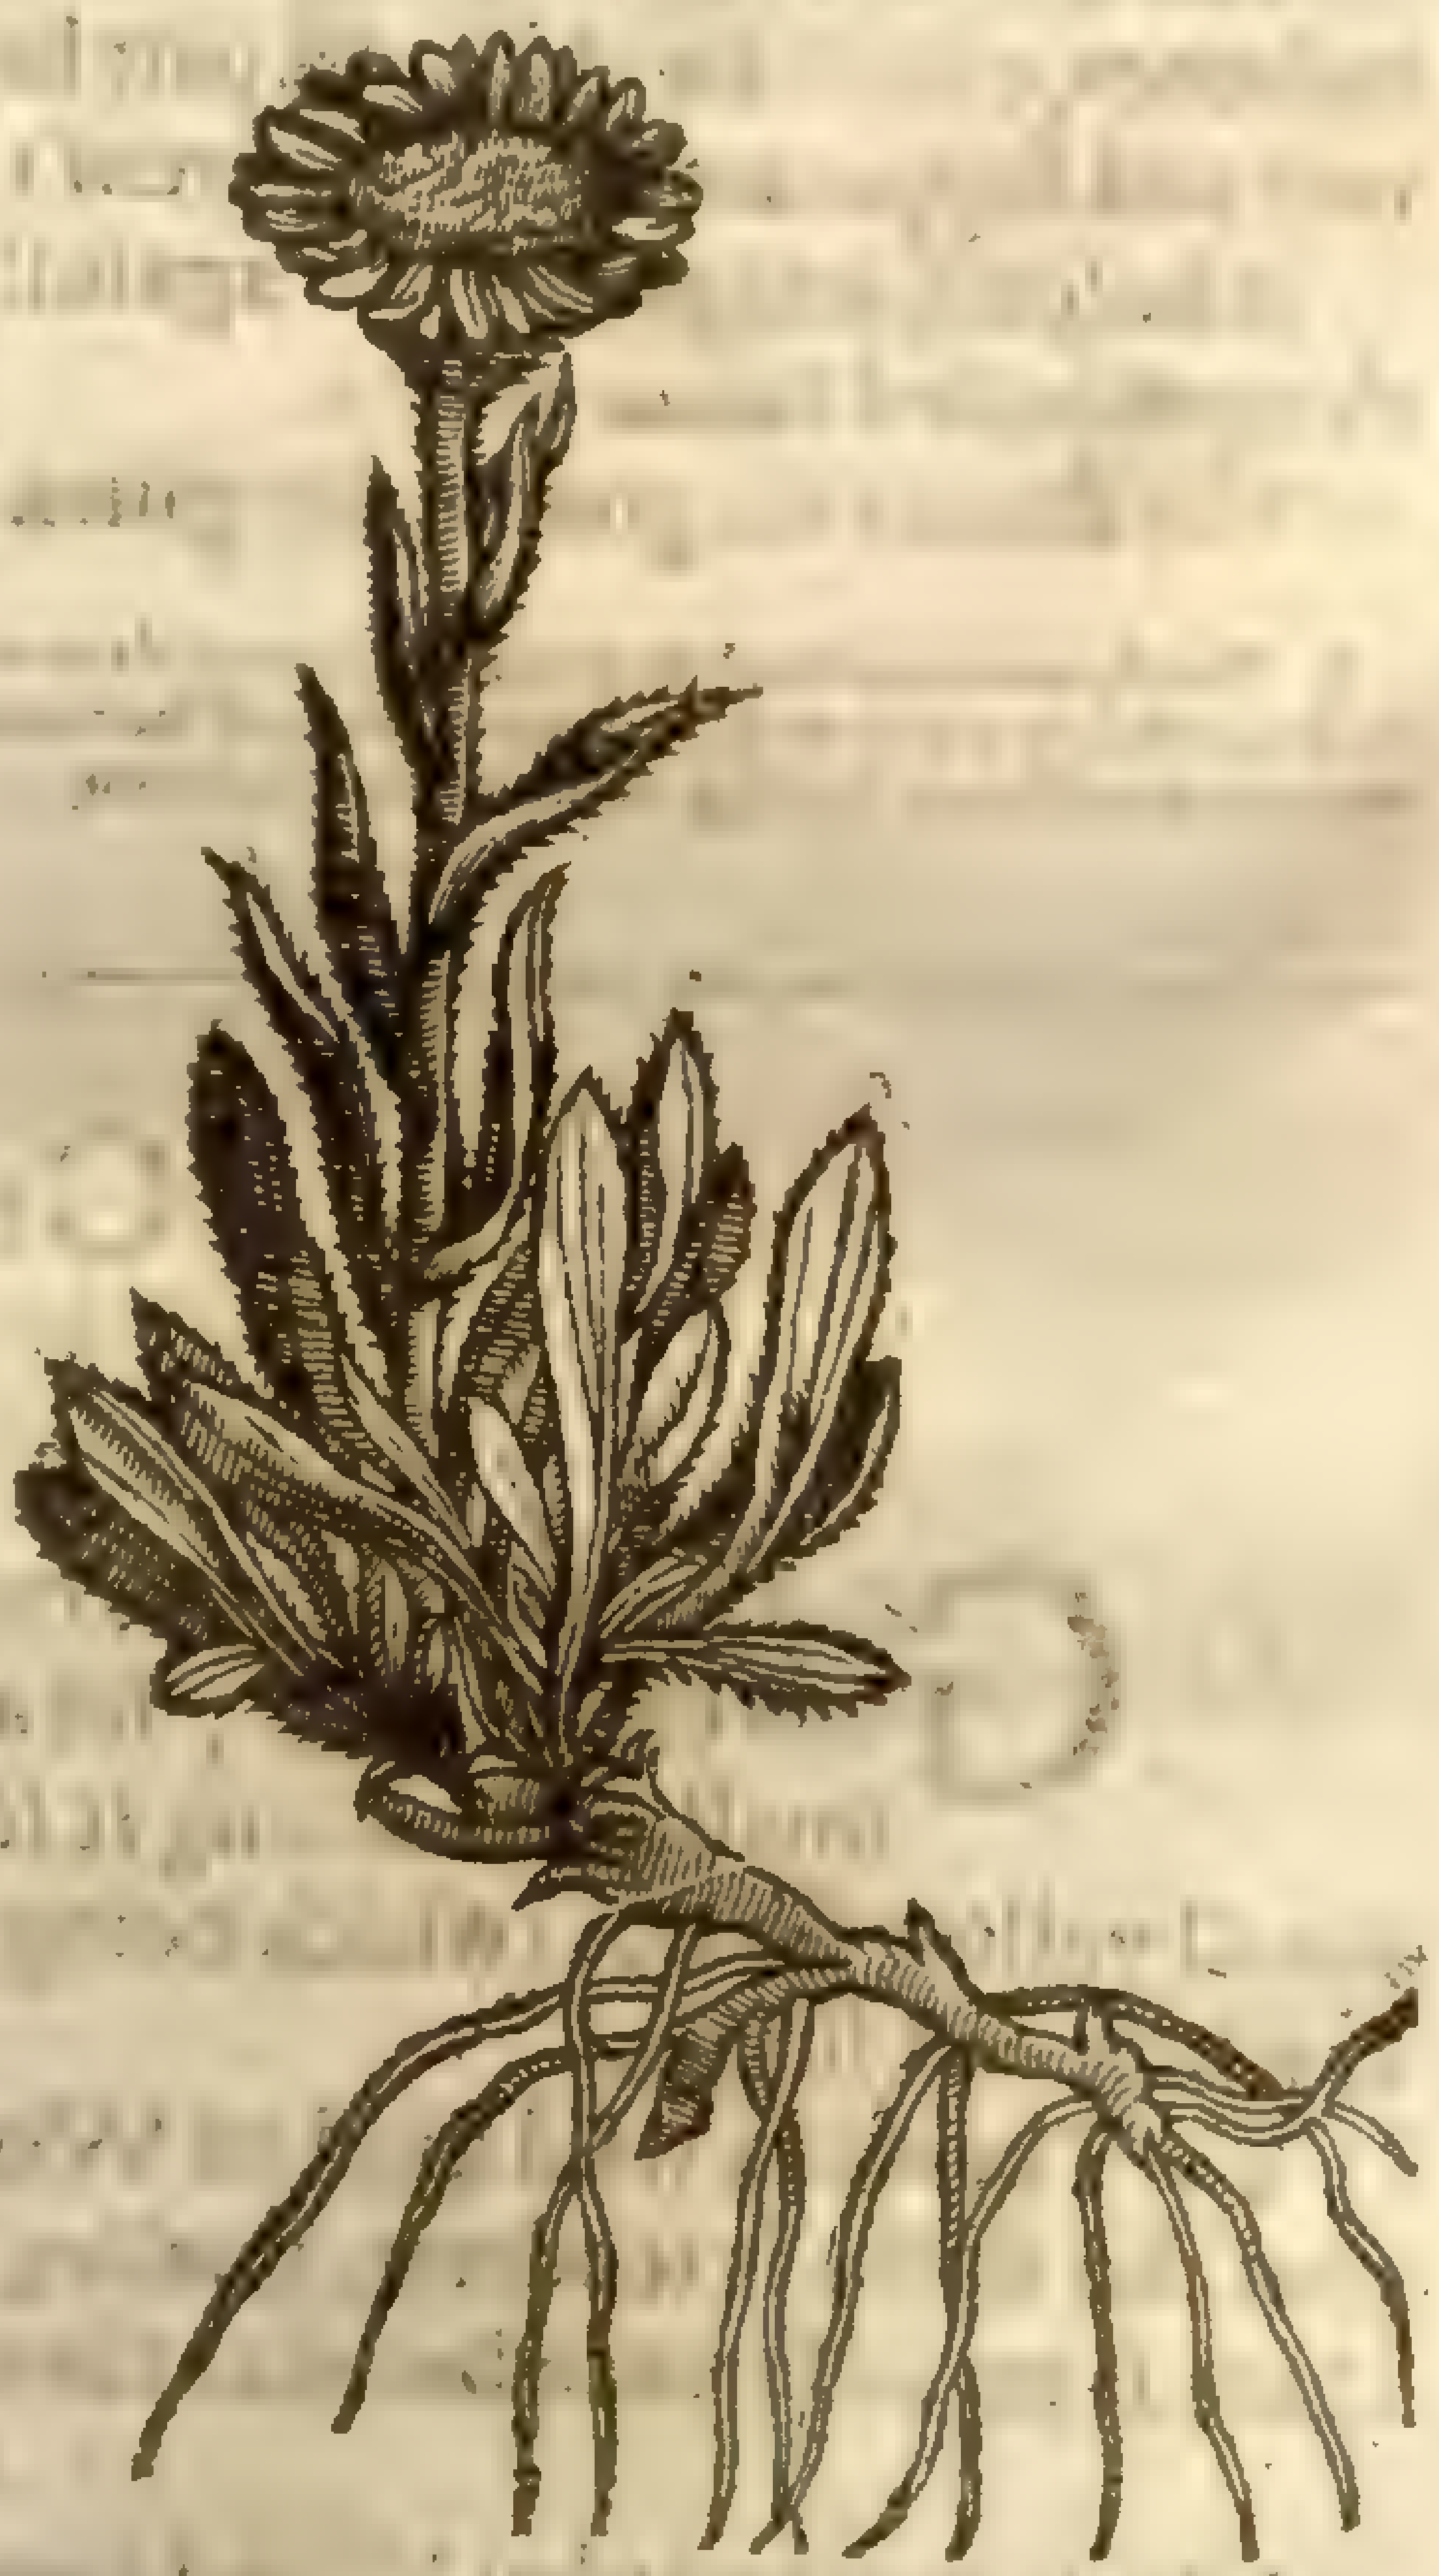
13 This which in gardens floures ſome moneth before the former, grows not ſo high, neither are the ſtalks ſo ſtraight, but often crooked, yet are they diuided into many branches which beare ſmall blewiſh floures like thoſe of the former: the leaues are longiſh and narrow. This alſo is ſaid to haue come from Canada or Virginia, and it may be called *Aſter fruticoſus minor*, Small ſhrubby Starwort. ‡

‡ 10 *Aſter 6. Cluſij.*
Narrow leaued Starwort.



Inula ensifolia L. [illegible]

‡ 11 *Aſter 7. Cluſij.*
Dwarfe Daiſie-leaued Starwort.



¶ *The Place.*

The kindes of Starwort grow vpon mountaines and hilly places, and ſomtimes in woods & medowes lying by riuers ſides.

The two firſt kinds grow vpon Hampſted heath foure miles from London, in Kent vpon Southfleet Downes, and in many other ſuch downy places.

‡ I could neuer yet find nor heare of any of theſe Star-floures to grow wilde in this kingdom, but haue often ſeen the Italian Starwort growing in gardens. Theſe two kindes that our Author mentions to grow on Hampſted heath and in Kent, are no other than two *Hieracia* or Hawkeweeds, which are much differing from theſe. ‡

¶ *The Time.*

They floure from Iuly to the end of Auguſt.

¶ *The Names.*

This herb is called in Greeke Ἀστὴρ ἀττικὸς, and alſo βουβώνιον: in Latine, *Aſter Atticus*, *Bubonium*, and *Inguinalis*: of ſome, *Aſterion*, *Aſteriſcon*, and *Hyophthalmon*: in high-Dutch, **Megerkraut**: in Spaniſh, *Bobas*: in French, *Eſtrille*, and *Aſper goutte menne*: in Engliſh, Starwort, and Sharewort.

¶ *The Temperature.*

It is of a mean temperature in cooling and drying. *Galen* ſaith it doth moderatly waſt and conſume, eſpecially while it is yet ſoft and new gathered.

That with the blew or purple floure is thought to be that which is of *Virgil* called *Flos Amellus*: of which he maketh mention, *lib.*4. of his Georgicks:

Eſt etiam flos in pratis, cui nomen Amello
Fecere agricolæ: facilis quærentibus herba;
Namque vno ingentem tollit de ceſpite ſylvam:
Aureus ipſe, ſed in folijs, quæ plurima circum
Funduntur, violæ ſublucet purpura nigræ.

In Engliſh thus:

In Medes there is a floure *Amello* nam'd,
By him that ſeeks it eaſie to be found,
For that it ſeems by many branches fram'd
Into a little wood: like gold the ground
Thereof appeares; but leaues that it beſet
Shine in the colour of the Violet.

¶ *The Vertues.*

A The leaues of *Aſter* or *Inguinalis* ſtamped, and applied vnto botches, impoſtumes, and venereous bubones, which for the moſt part happen in *Inguine*, that is, the flanke or ſhare) do mightily maturate and ſuppurate them, whereof this herb *Aſter* tooke the name *Inguinalis*.

B It helpeth and preuaileth againſt the inflammation of the fundament, and the falling forth of the gut called *Saccus ventris*.

C The floures are good to be giuen vnto children againſt the ſquinancie and falling ſickneſſe.

† The figure which formerly was in the ſecond place vnder the title of *Aſter Atticus*, was of the eighth here deſcribed; alſo in the third place formerly were theſe two figures which we here giue you, whereof the former is of *Aſter montanus*, and the later of *Aſter hirſutus*; and that which was vnder the title of *Aſter hirſutus* in the fouth place, belongs to the ninth deſcription,

Chap. 133. *Of Woad.*

¶ *The Deſcription.*

1 Glaſtum or garden Woad hath long leaues of a blewiſh green colour. The ſtalk growes two cubits high, ſet about with a great number of ſuch leaues as come vp firſt, but ſmaller, branching it ſelfe at the top into many little twigs, whereupon do grow many ſmall yellow floures: which being paſt, the ſeed comes forth like little blackiſh tongues. The root is white and ſingle.

2 There is a wild kind of Woad very like vnto the former in ſtalks, leaues, and faſhion, ſauing that the ſtalke is tenderer, ſmaller, and browner, and the leaues and tongues narrower; otherwiſe there is no difference betwixt them.

¶ *The Place.*

The tame or garden Woad growes in fertile fields where it is ſowne: the wilde kinde groweth where the tame hath bin ſowne.

¶ *The Time.*

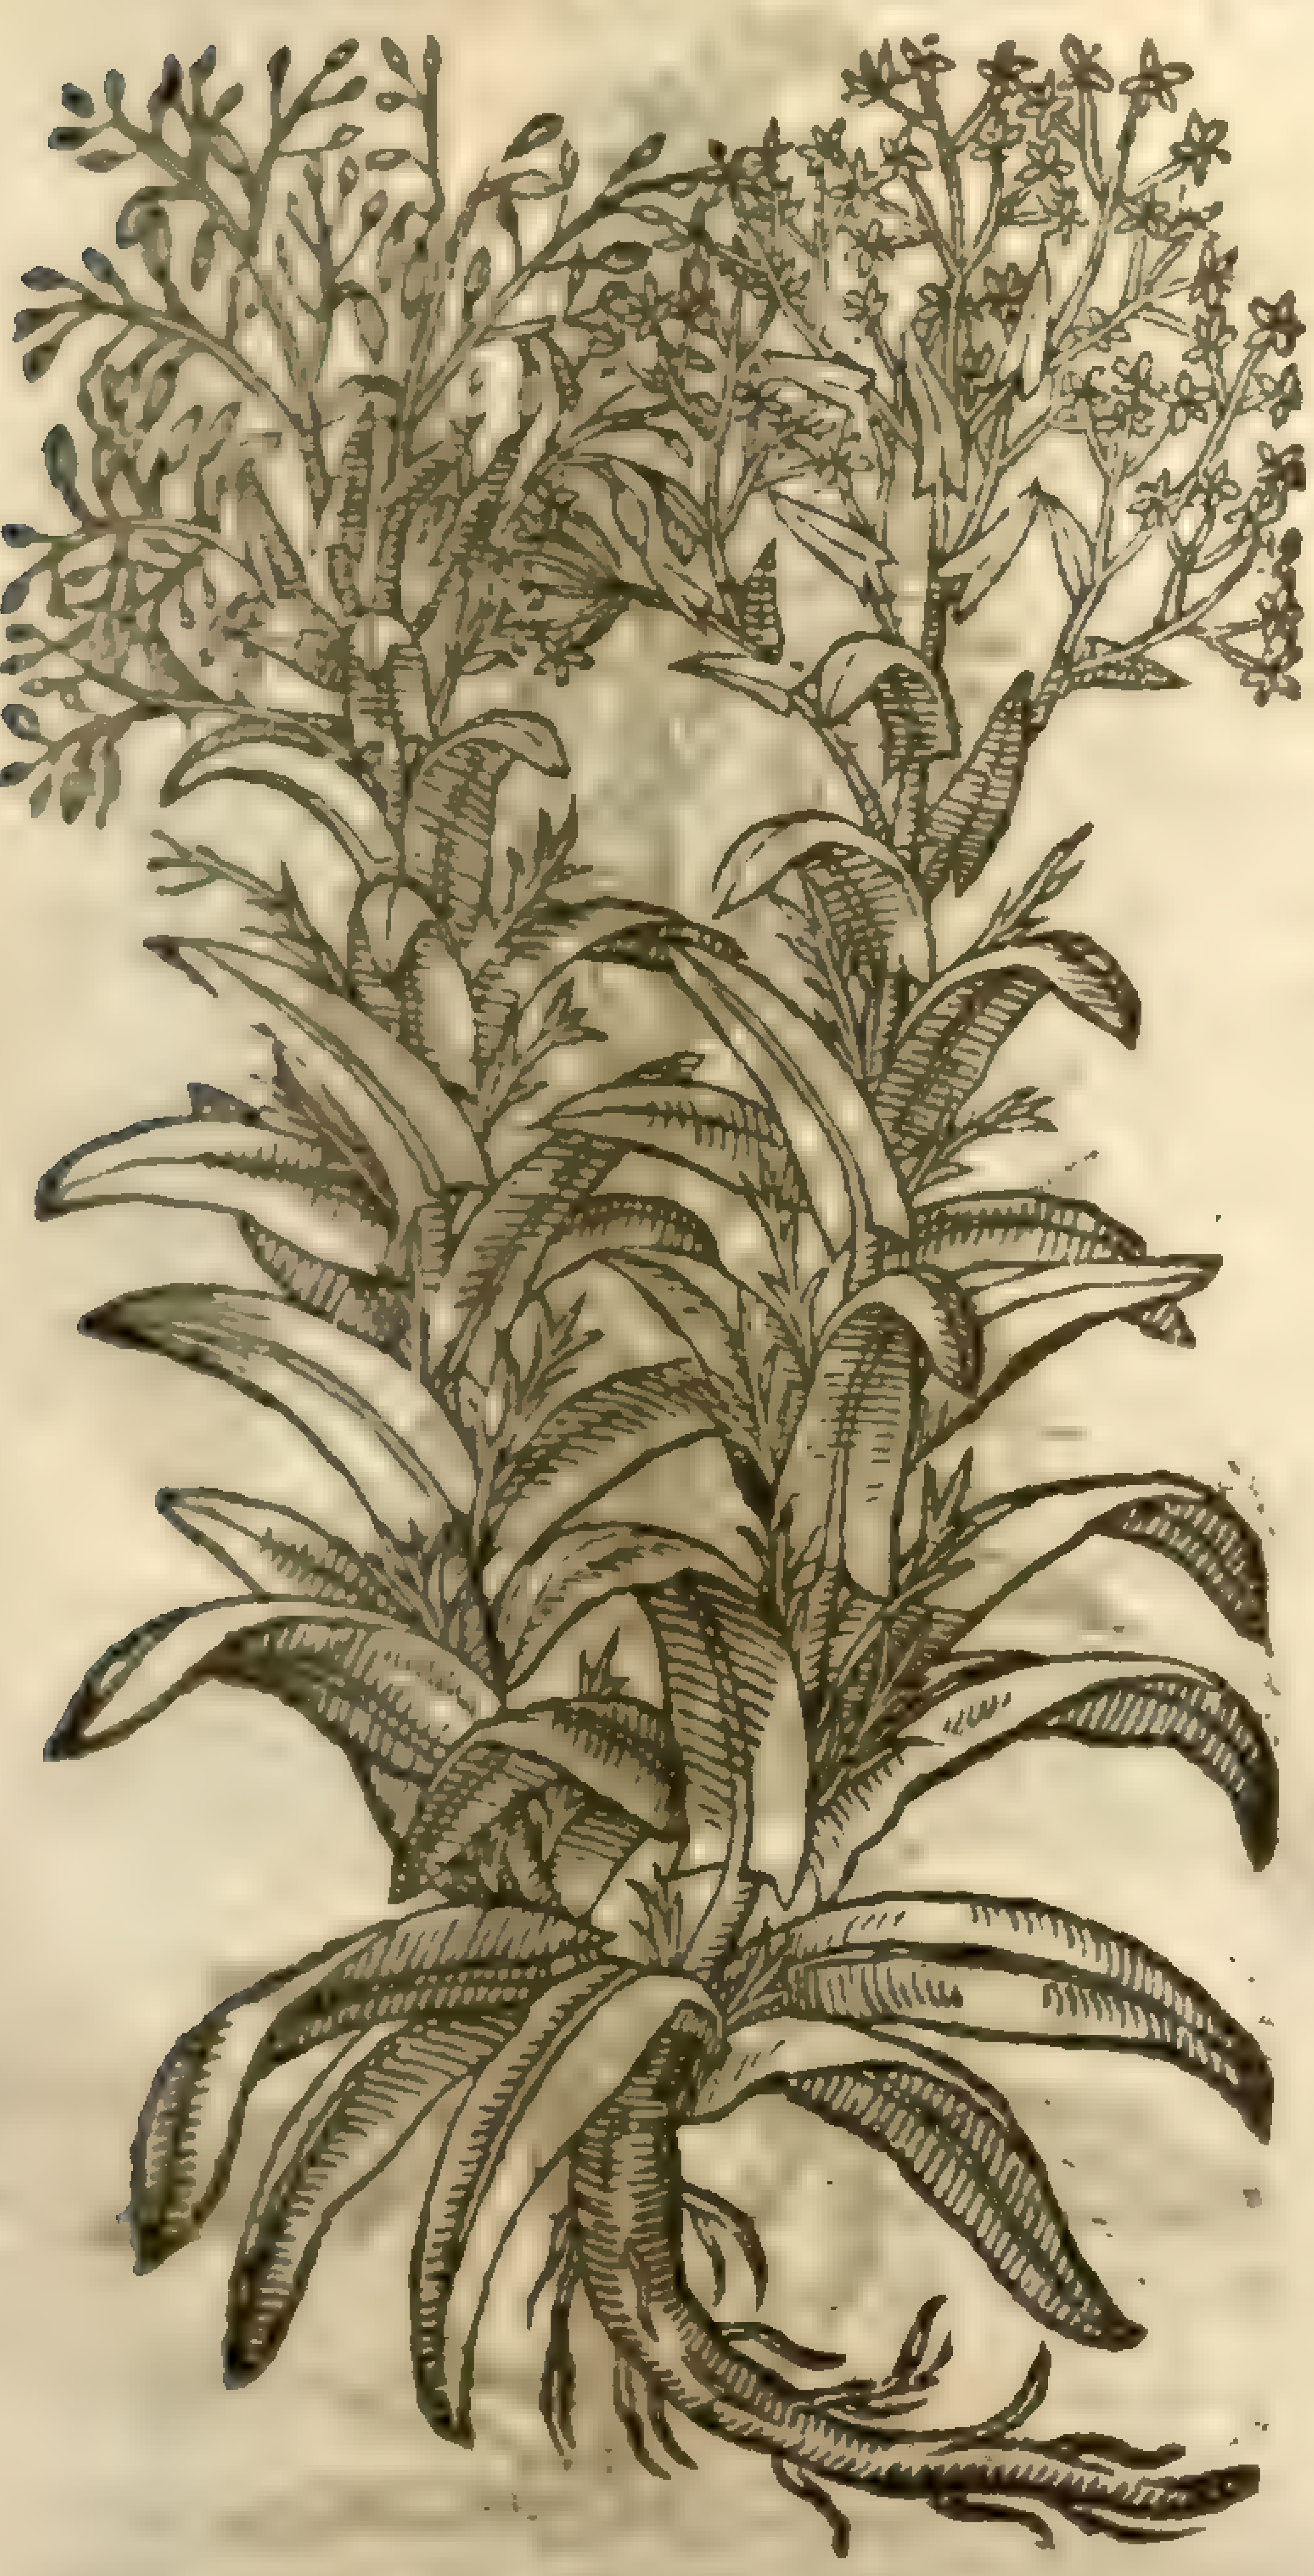
They floure from Iune to September.

¶ *The Names.*

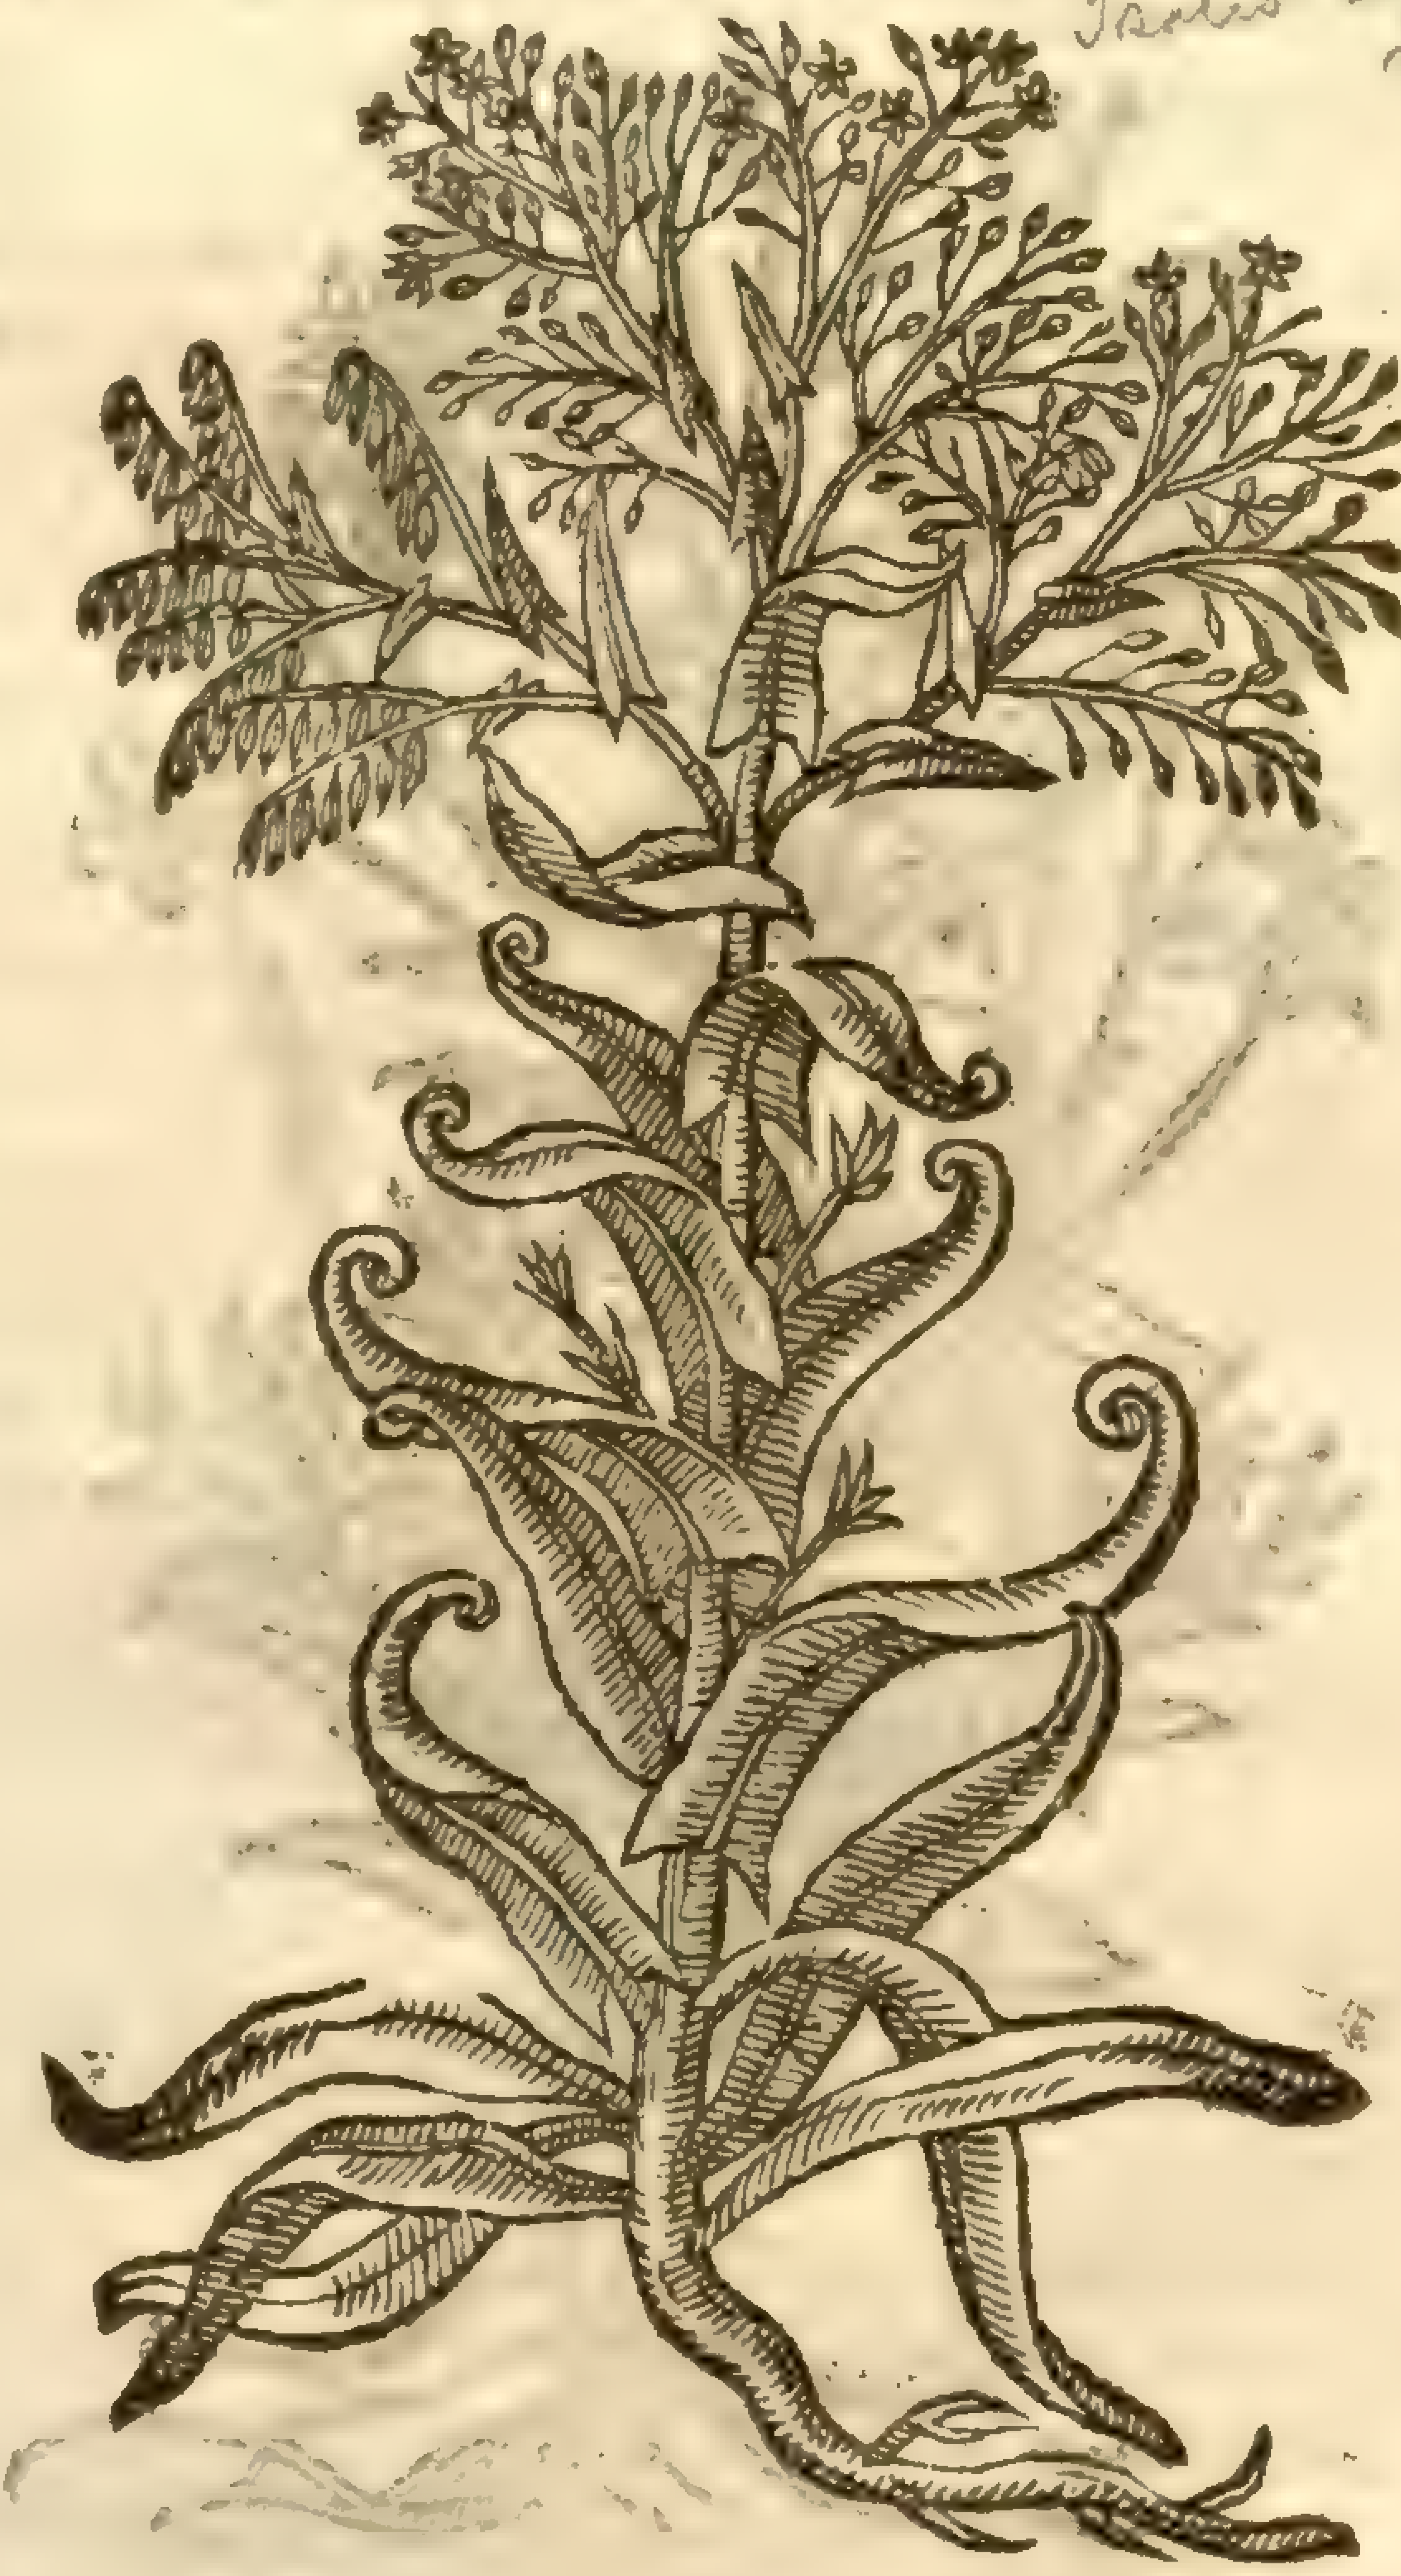
Woad is called in Greeke ἰσάτις: in Latine, *Iſatis*, and *Glaſtum*. *Cæſar*, *lib.* 5. of the French warres, ſaith, That all the Brittons do colour themſelues with Woad, which giueth a blew colour: which thing alſo *Pliny*, *lib.*22. *cap.*1. doth teſtifie: In France they call it *Glaſtum*, which is like vnto Plantaine, wherewith the Brittiſh wiues and their daughters are colored all ouer, and go naked in ſome kinde of ſacrifices. It is likewiſe called of diuers *Guadum*: of the Italians, *Guado*, a word as it ſeemeth wrung out of the word *Glaſtum*: in Spaniſh and French *Paſtel*: in Dutch, **Weet**: in Engliſh, Woad, and Wade.

¶ The

1 *Glaſtum ſatiuum.* [illegible]
Garden Woad. [illegible]



‡ 2 *Glaſtum ſylveſtre.*
Wilde Woad. Isatis tinctoria [illegible]



¶ *The Temperature.*

Garden Woad is dry without ſharpneſſe: the wilde Woad drieth more, and is more ſharp and biting.

¶ *The Vertues.*

The decoction of Woad drunken is good for ſuch as haue any ſtopping or hardneſſe in the milt or ſpleen, and is alſo good for wounds or vlcers in bodies of a ſtrong conſtitution, as of countrey people, and ſuch as are accuſtomed to great labour and hard courſe fare. A

It ſerueth well to dye and colour cloath, profitable to ſome few, and hurtfull to many. B

CHAP. 134. *Of Cow Baſill.*

¶ *The Deſcription.*

1 THis kinde of wilde Woad hath fat long leaues like *Valeriana rubra Dodonæi*, or *Behen rubrum*: the ſtalke is ſmall and tender, hauing thereupon little purple floures conſiſting of foure leaues; which being paſt, there come ſquare cornered husks ful of round black ſeed like Coleworts. The whole plant is couered ouer with a clammy ſubſtance like birdlime, ſo that in hot weather the leaues thereof will take flies by the wings (as *Muſcipula* doth) in ſuch manner as they cannot eſcape away.

2 *Ephemerum Matthioli* hath long fat and large leaues like vnto Woad, but much leſſe: among which riſeth vp a round ſtalke a cubit high, diuiding it ſelfe into many branches at the top, which are ſet with many ſmall white floures conſiſting of many leaues; which being paſt, there follow little round bullets containing the ſeed. The root is ſmall and full of fibres.

¶ *The Place.*

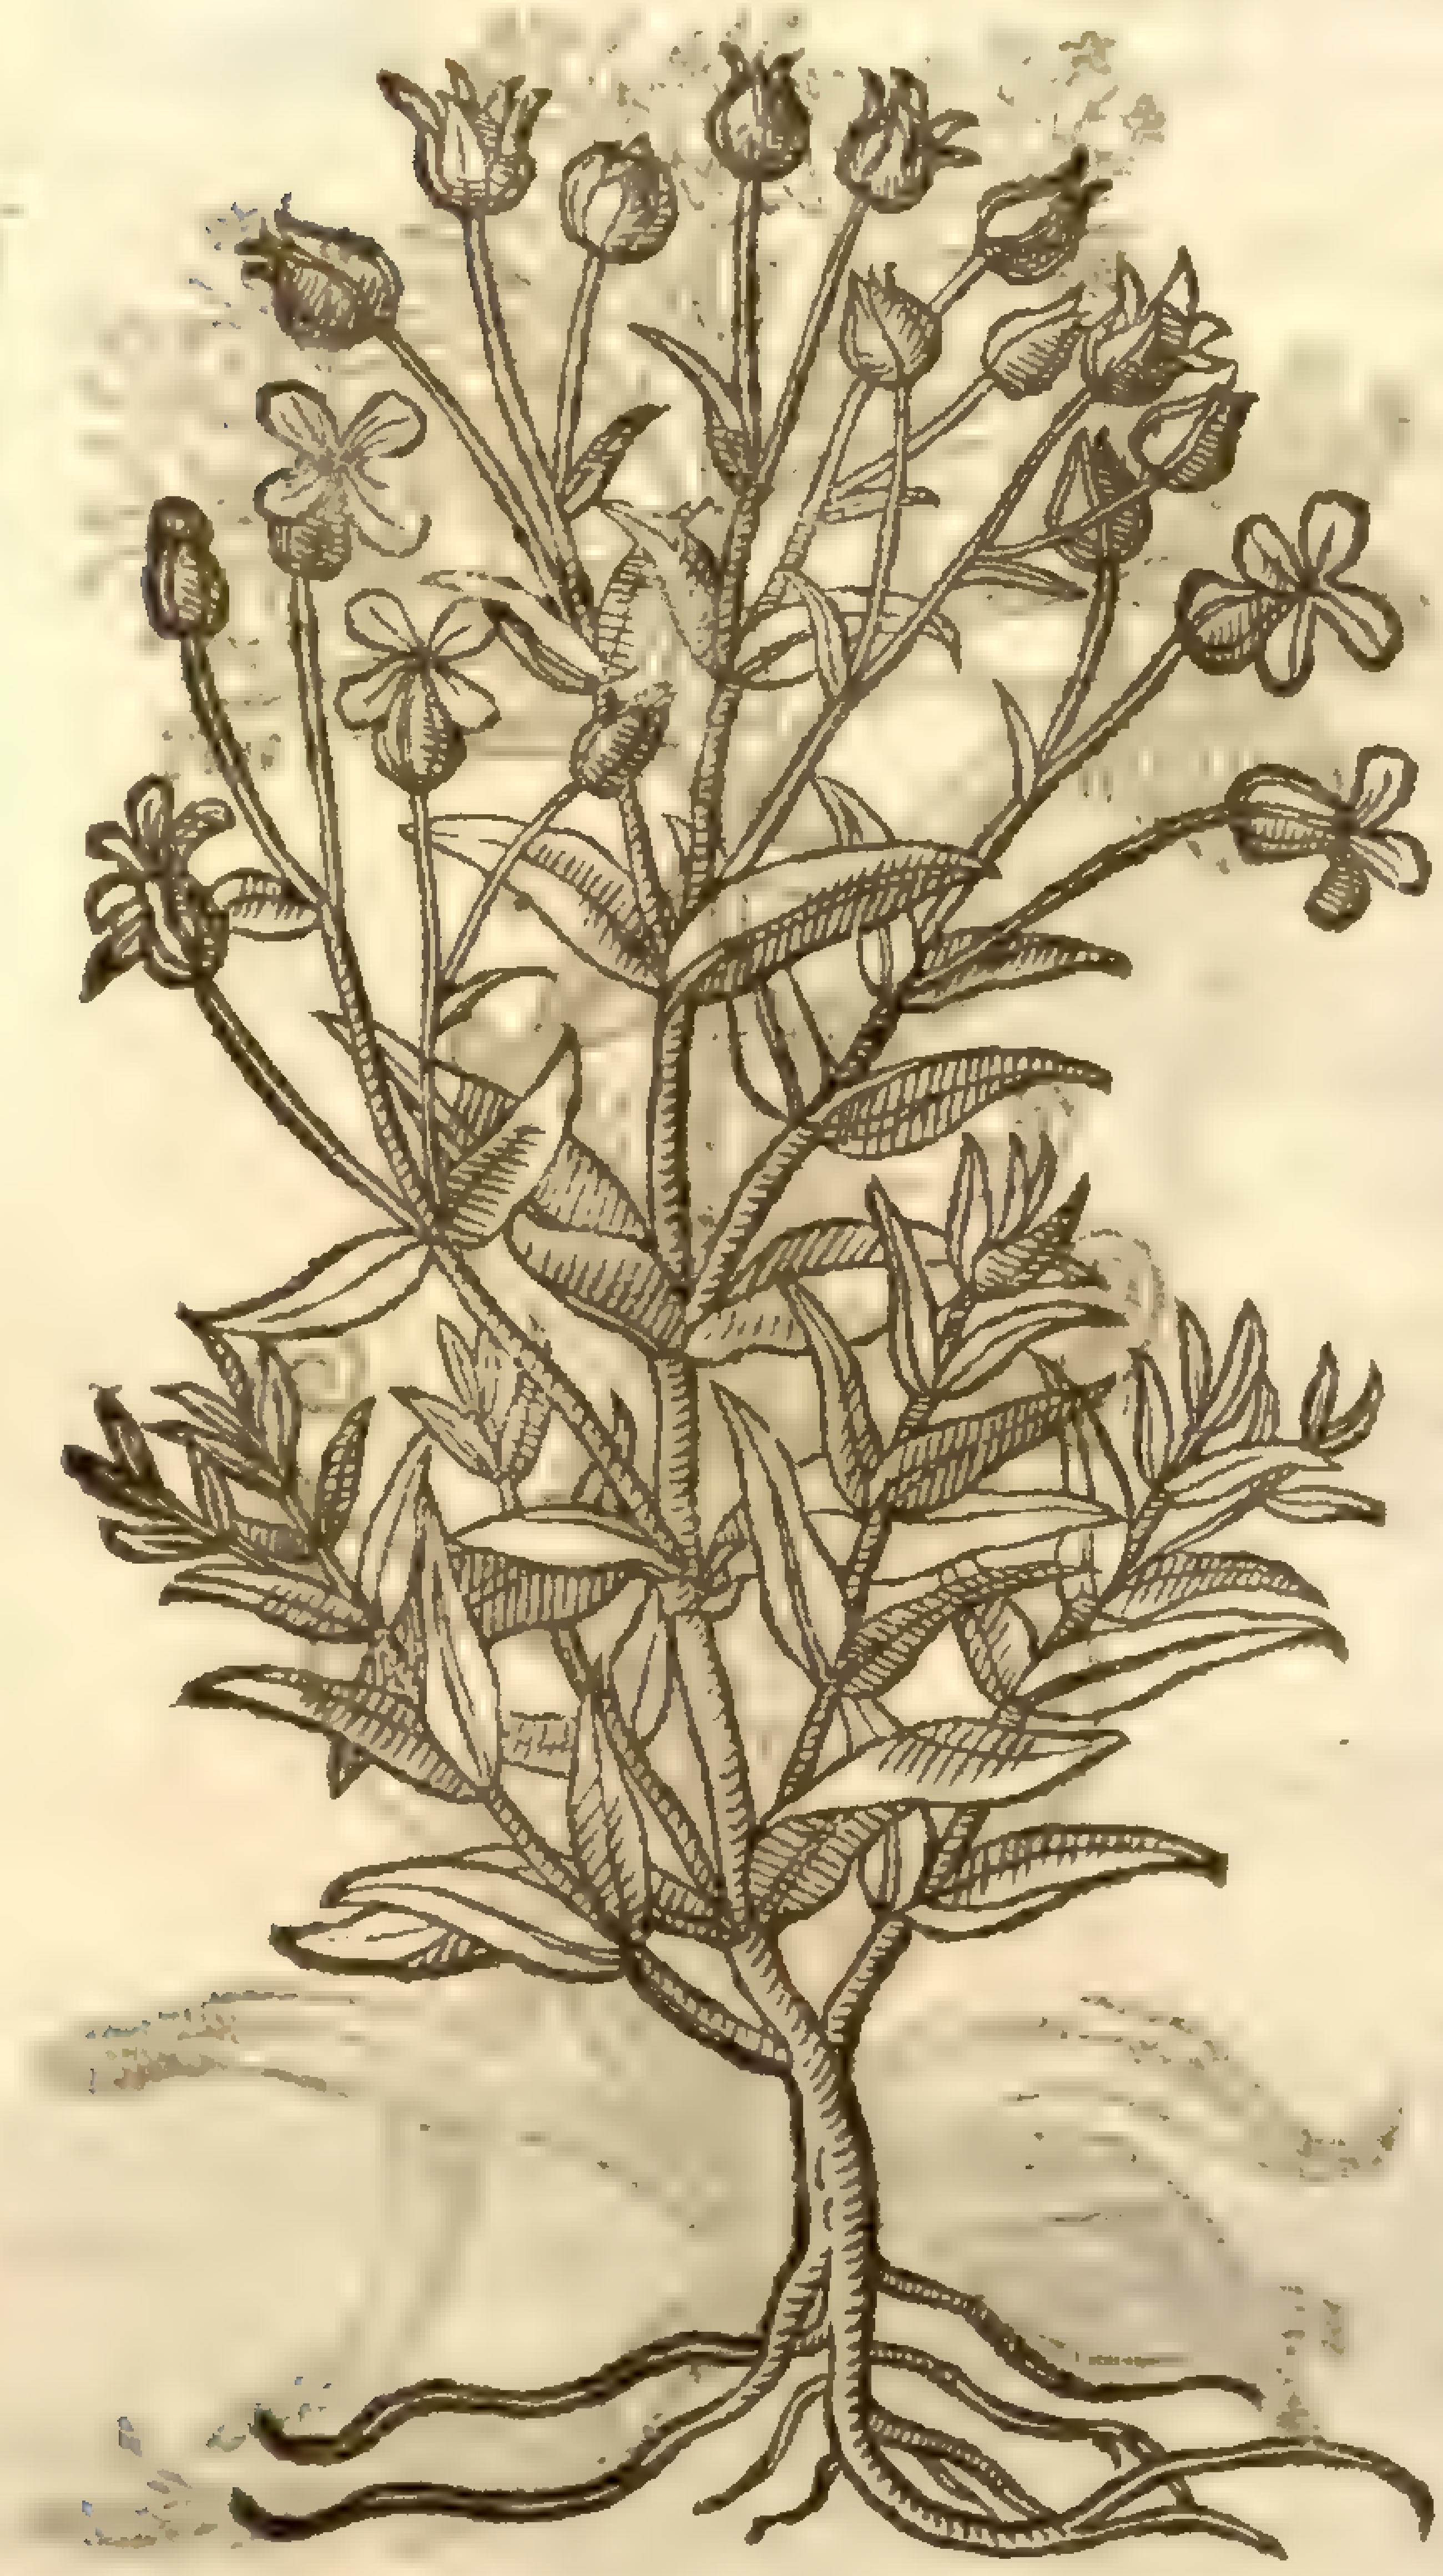
Cow-Baſill groweth in my garden, but *Ephemerum* is a ſtranger as yet in England.

¶ *The Time.*

They floure in May and Iune.

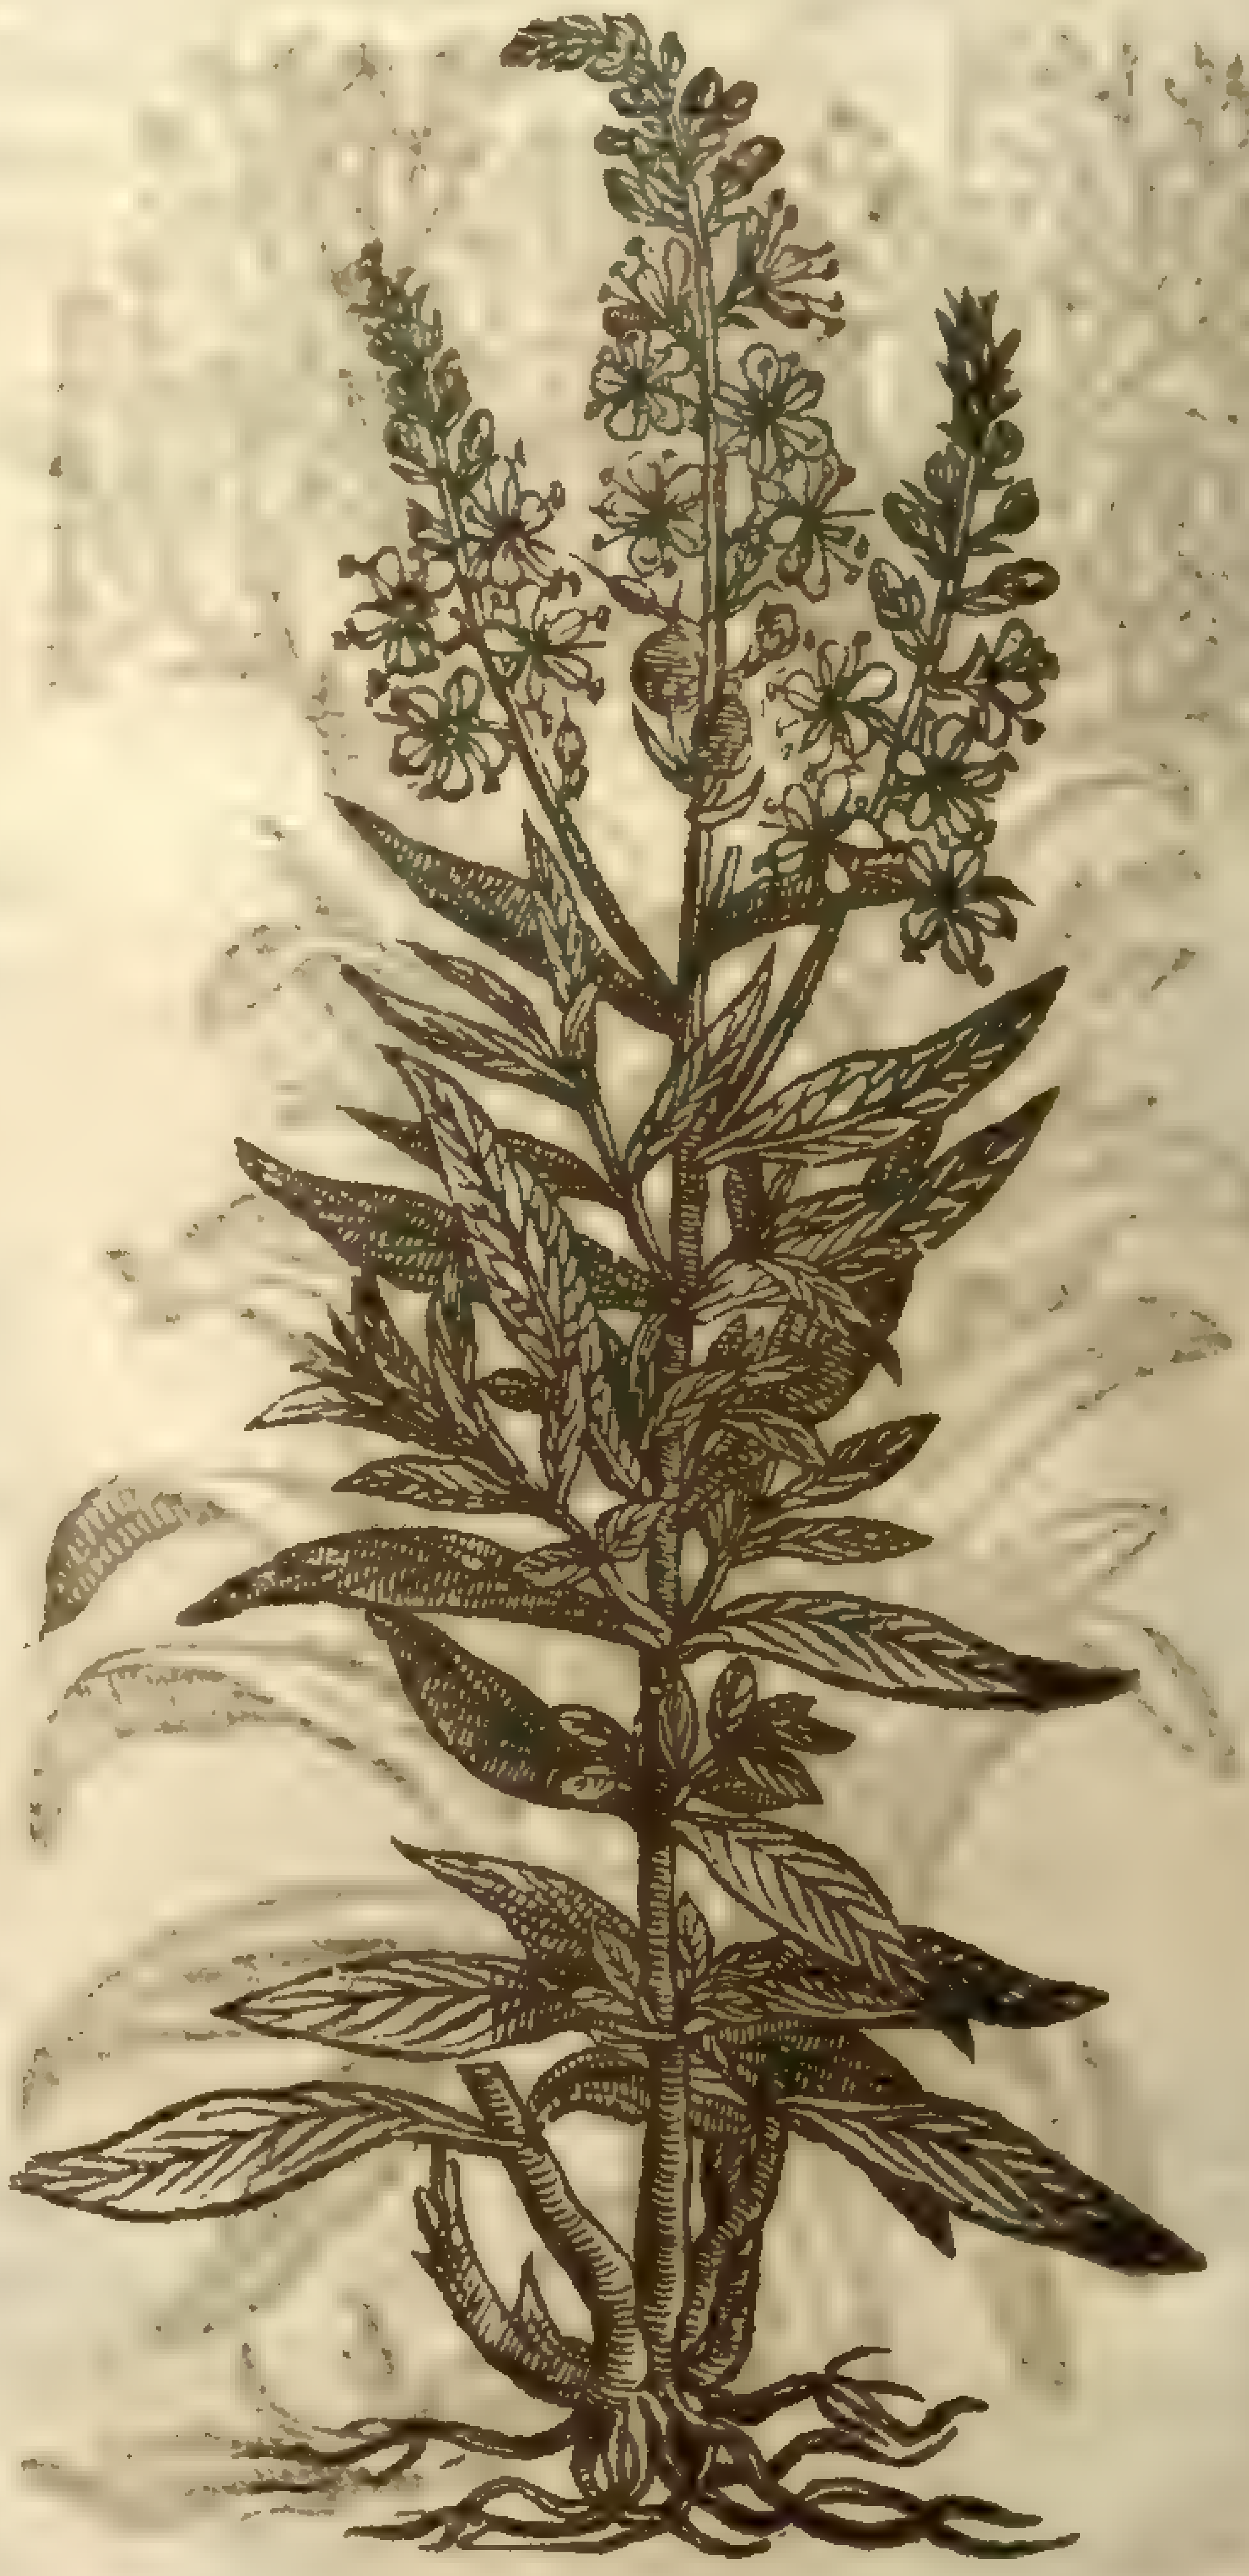
¶ The

1 *Vaccaria.*
Cow Baſill.



Saponaria vaccaria, L.
[illegible]

2 *Ephemerum Matthioli.*
Quick-fading floure.



‡ ¶ *The Names.*

1 Cow-Baſill is by *Cordus* called *Thamecnemon*: by ſome, according to *Geſner*, *Lychnis*, and *Perfoliata rubra*. *Lobel* termes it *Iſatis ſylueſtris*, and *Vaccaria*: the laſt of which names is retained by moſt late writers.

2 This by *Lobel* is ſaid to be *Ephemerum* of *Matthiolus*: yet I think *Matthiolus* his figure, which was in this place formerly, was but a counterfeit; and ſo alſo do *Columna* and *Bauhinus* iudge of it; and *Bauhine* thinks this of *Lobel* to be ſome kinde of *Lyſimachia*.

¶ *The Nature and Vertues.*

I finde not any thing extant concerning the Nature and Vertues of *Vaccaria* or Cow-Baſill.

A *Ephemerum* (as *Dioſcorides* writeth) boiled in Wine, and the mouth waſhed with the decoction thereof, taketh away the tooth-ache.

Chap. 135.

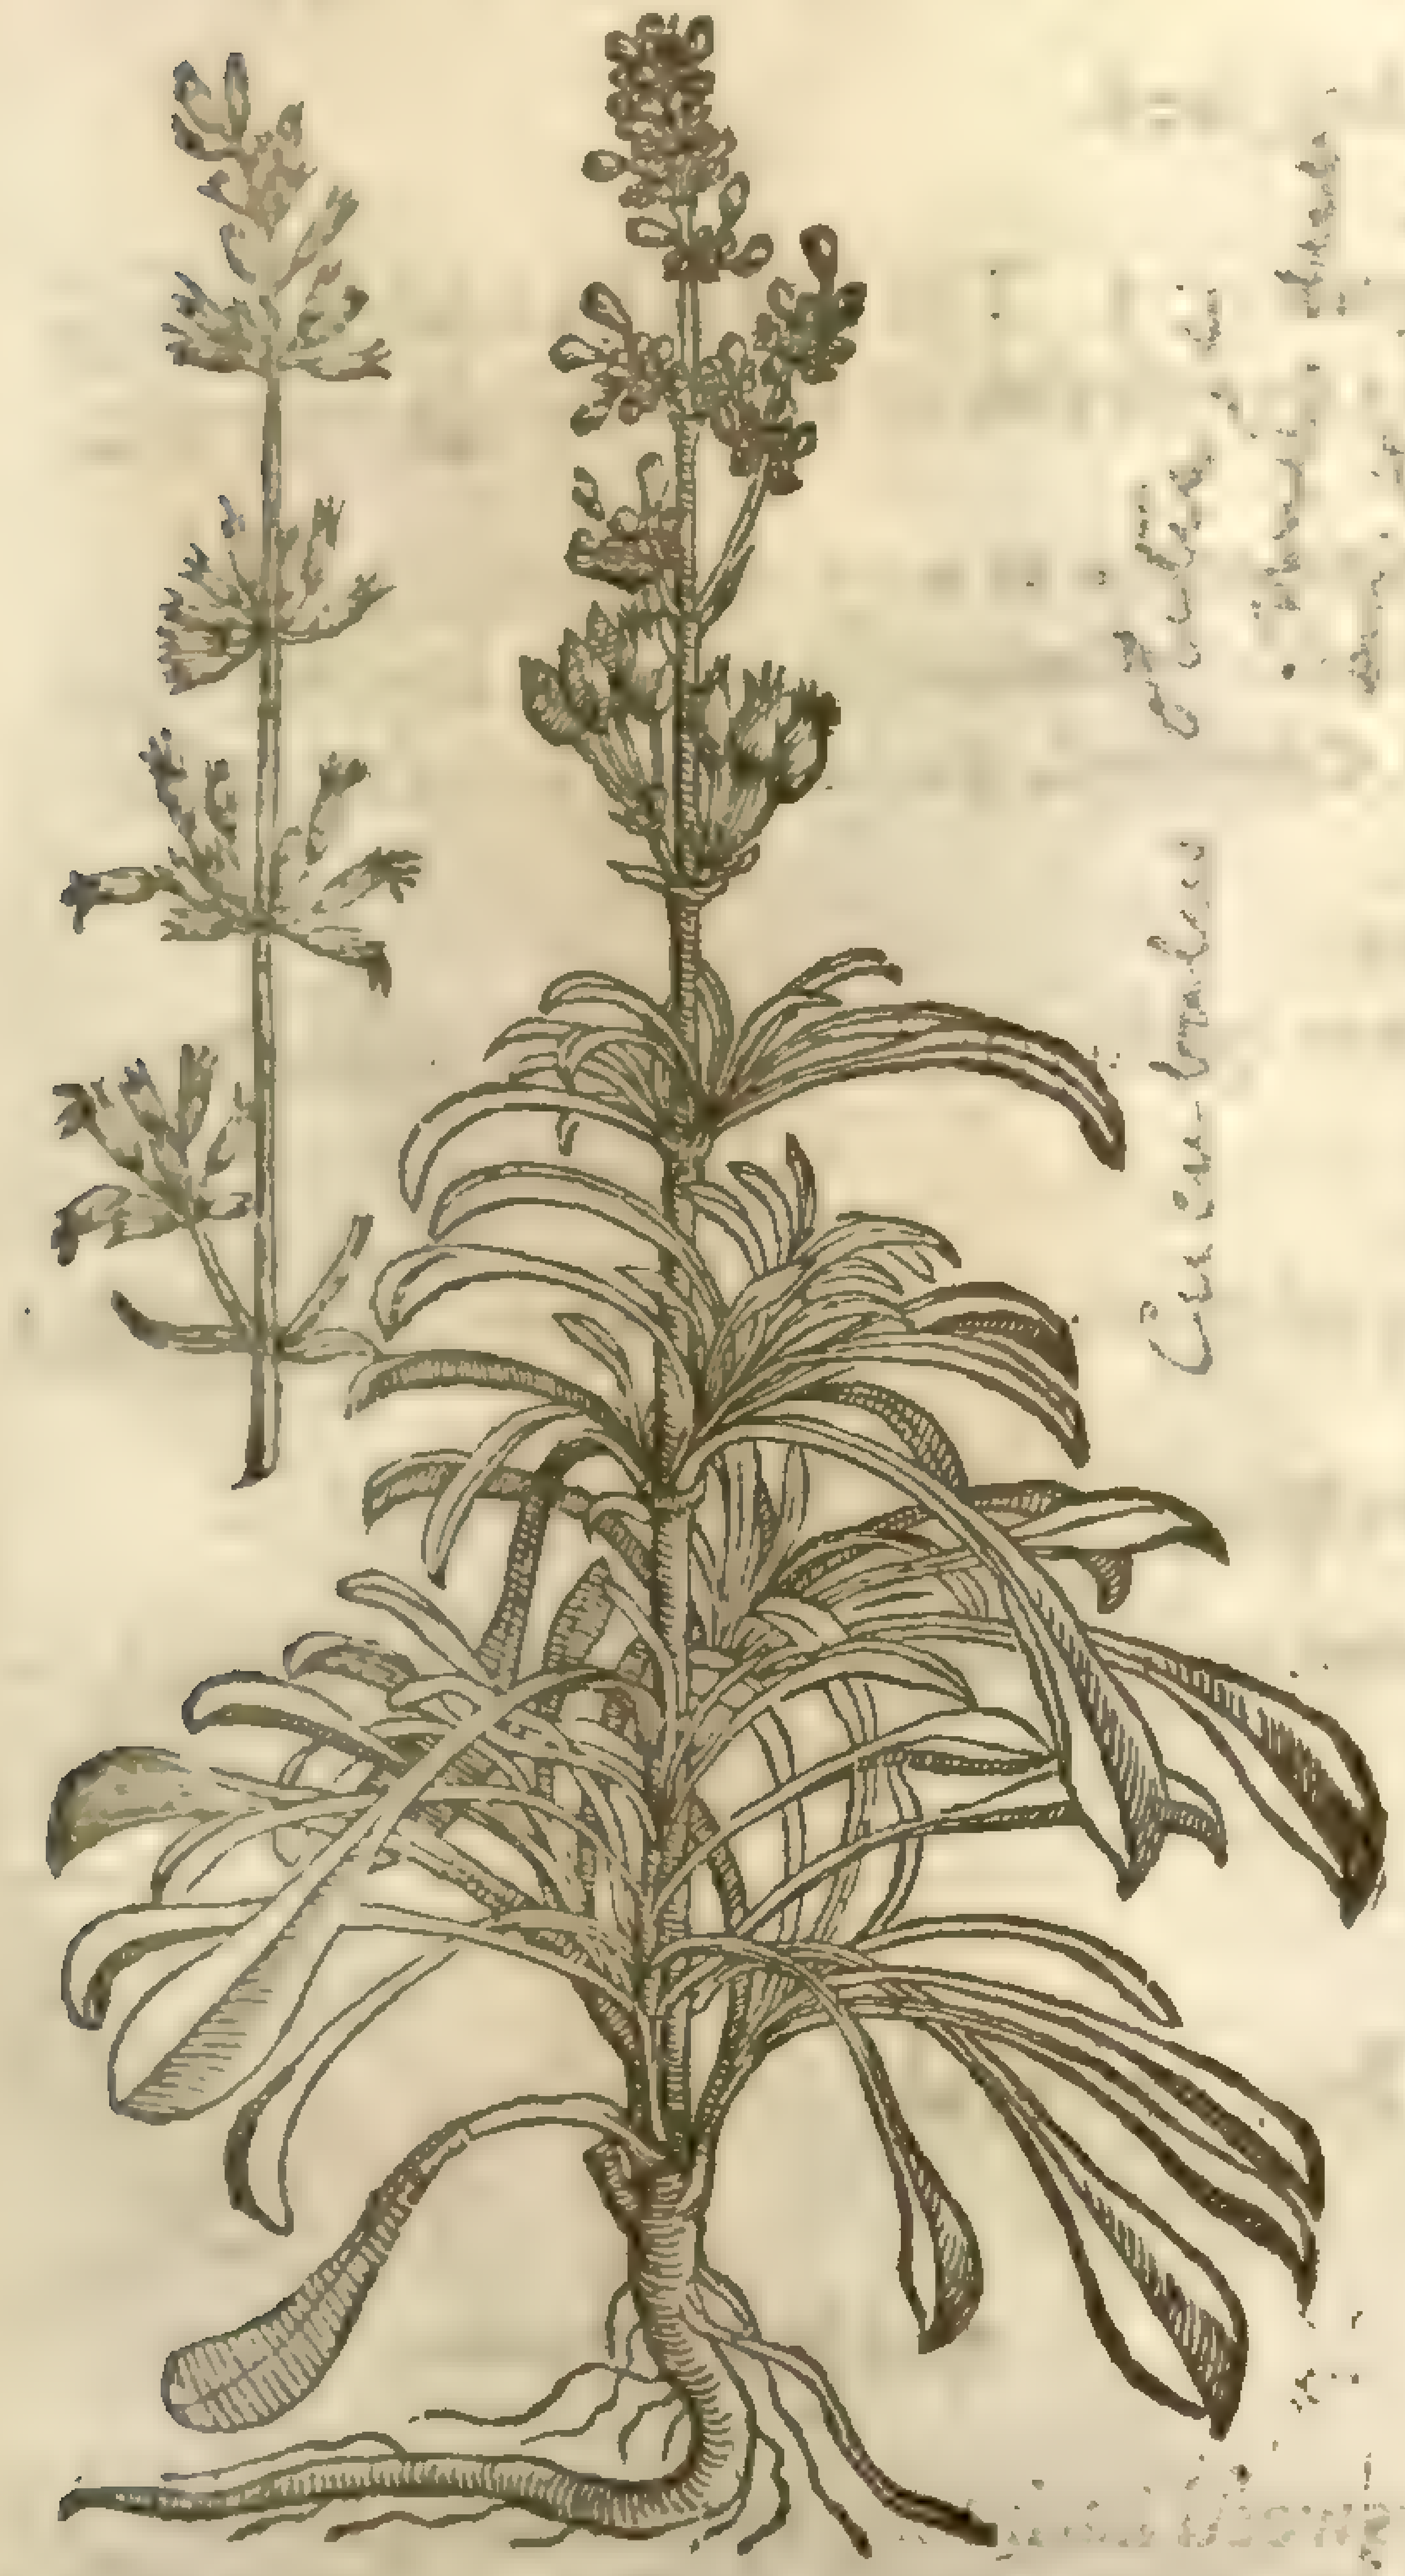
Of Seſamoides, or baſtard Weld or Woad.

¶ *The Deſcription.*

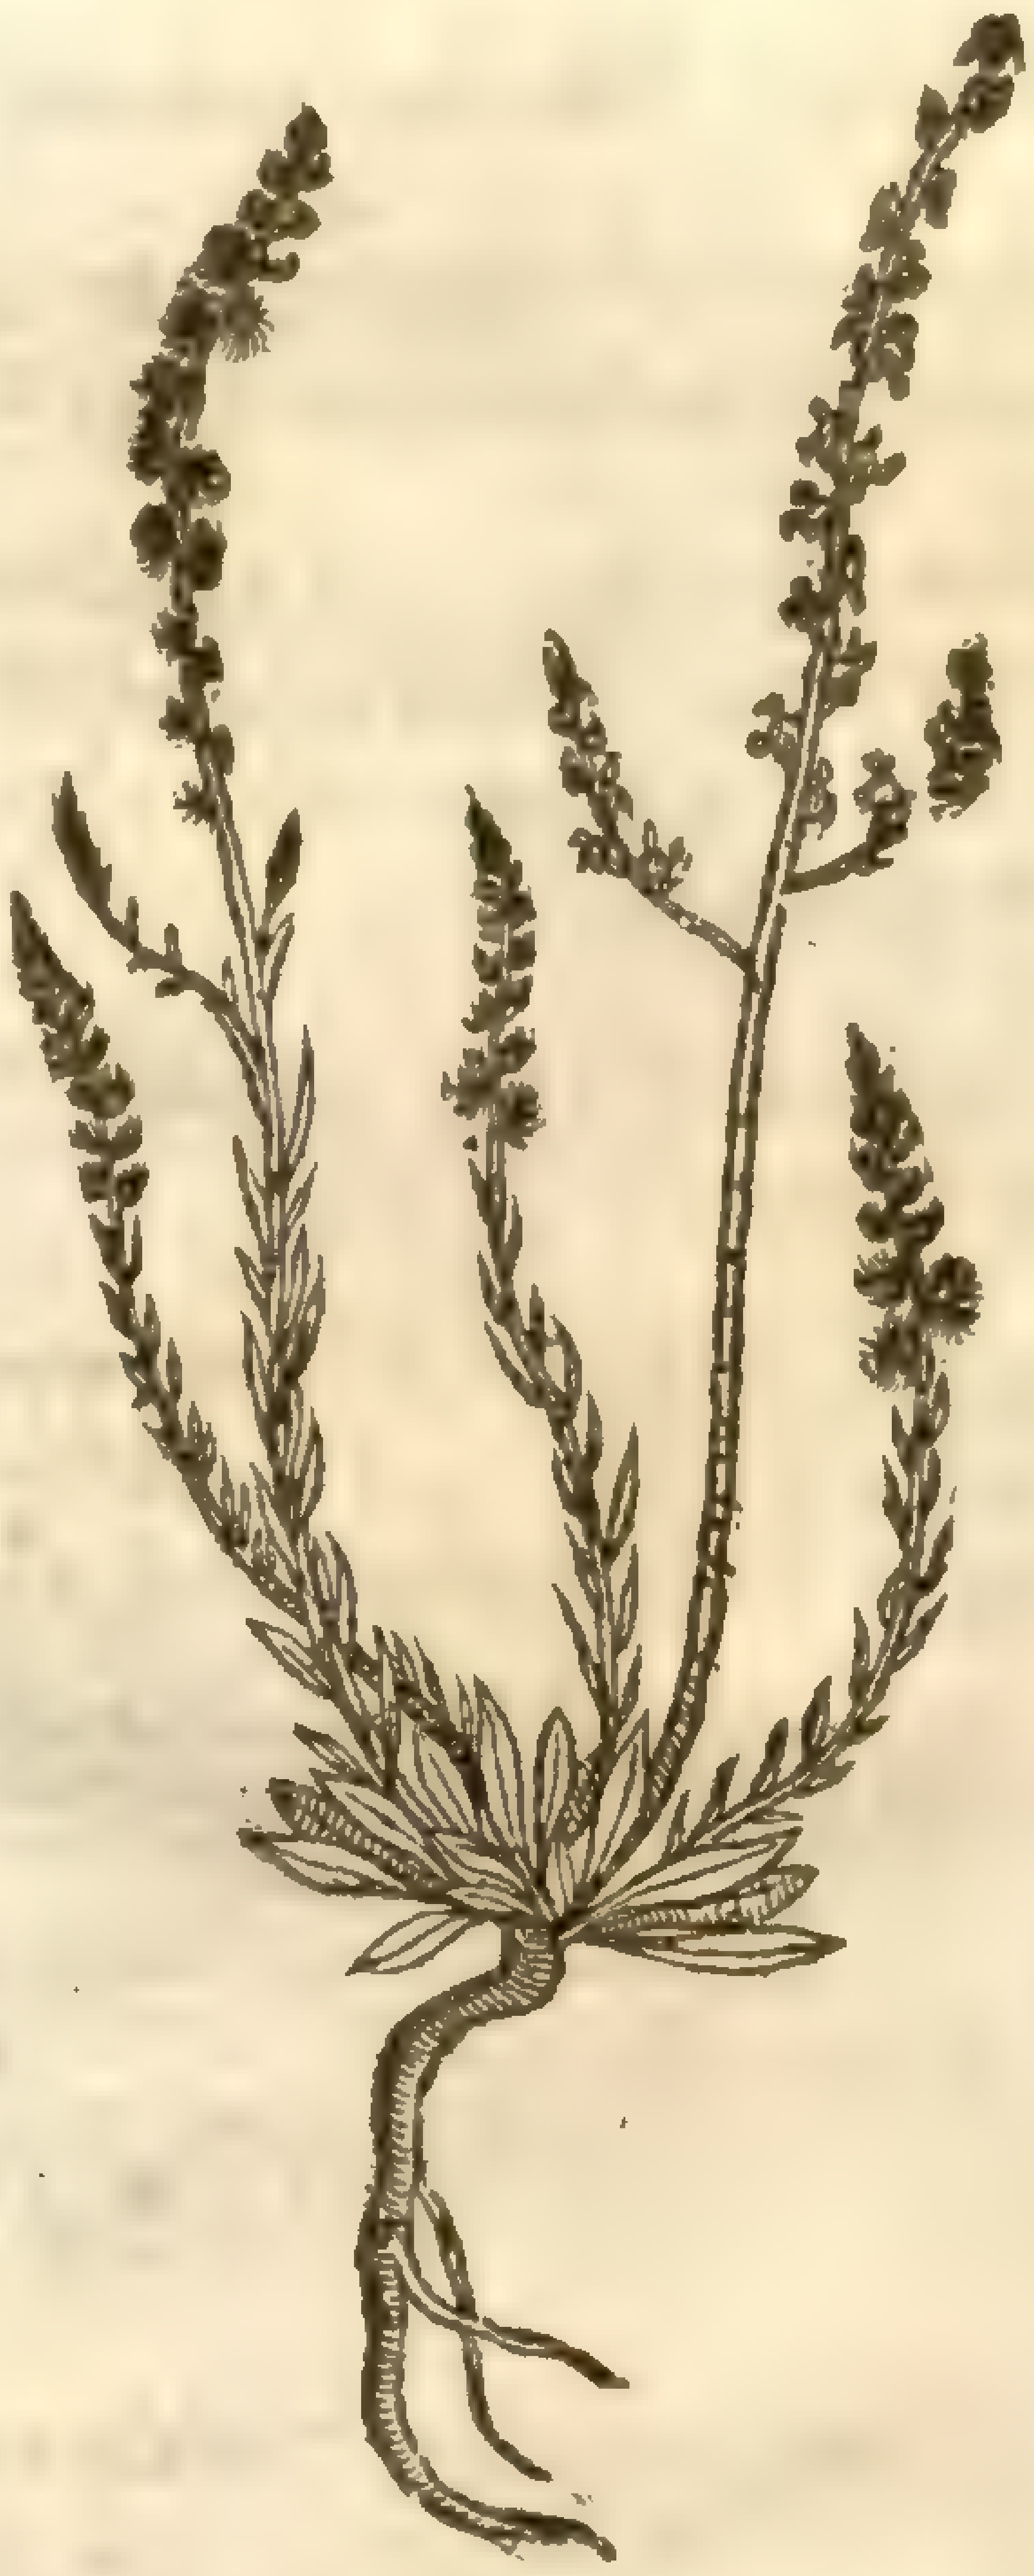
1 The great *Seſamoides* hath very long leaues and many, ſlender toward the ſtalk, and broader by degrees toward the end, placed confuſedly vpon a thick ſtiffe ſtalke: on the top whereof grow little fooliſh or idle white floures: which being paſt, there follow ſmall ſeeds like vnto Canary ſeed that birds are fed withall. The root is thick, and of a woody ſubſtance.

‡ 2 This leſſer *Seſamoides* of Salamanca, from a long liuing white hard and pretty thicke root ſends vp many little ſtalkes ſet thicke with ſmall leaues like thoſe of Line; and from the middle to the top of the ſtalke grow many floures, at firſt of a greeniſh purple, and then putting forth yellowiſh threds; out of the midſt of which appeare as it were foure greene graines, which when the floure is fallen grow into little cods full of a ſmall blackiſh ſeed. It growes in a ſtony ſoile vpon the hills neere Salamanca, where it floures in May, and ſhortly after perfects his ſeed. ‡

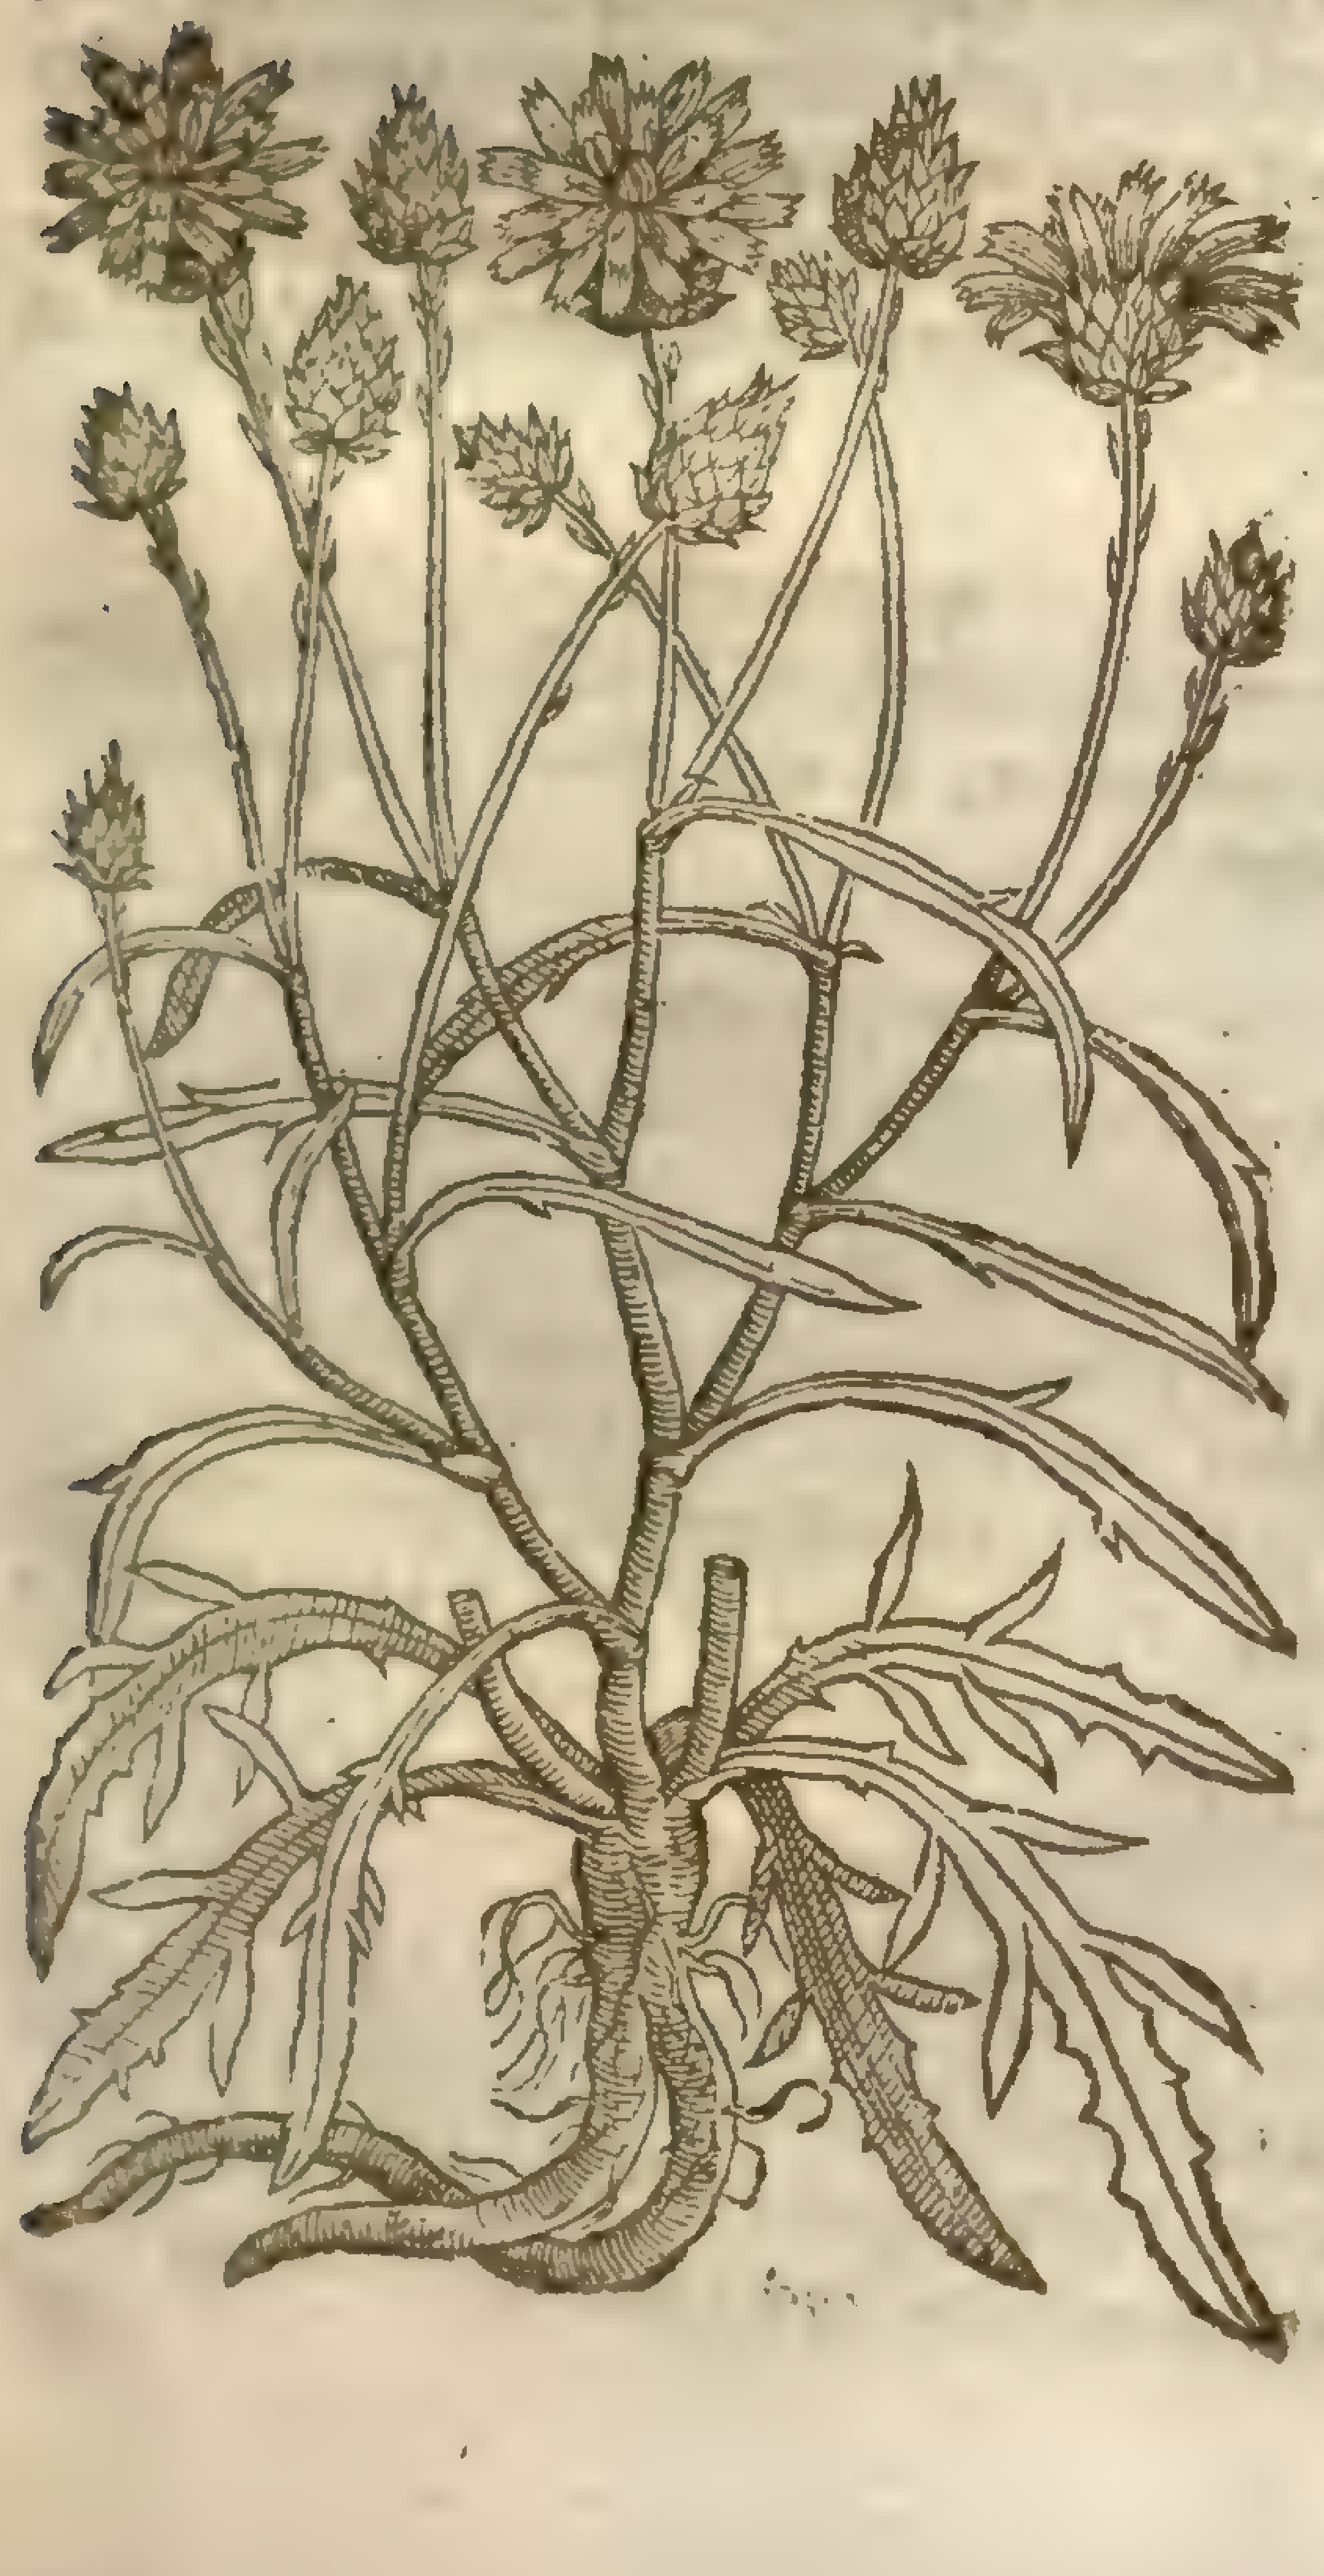
1 *Seſamoides Salamanticum magnum.*
Great baſtard Woad.



2 *Seſamoides Salamanticum paruum.*
Small baſtard Woad.



3 *Seſamoides paruum Matthioli.*
Bucks horne gum Succorie.



‡ 3 Our Authour formerly in the chapter of *Chondrylla* ſpoke (in *Dodonaus* his words) againſt the making of this plant a *Seſamoides*: for of this plant were the words of *Dodonaus*; which are theſe: Diuers (ſaith he) haue taken the plant with blew floures to be *Seſamoides paruum*, but without any reaſon; for that *Seſamoides* hath borrowed his name from the likeneſſe it hath with *Seſamum*. But this herb is not like to *Seſamum* in any one point, and therefore I thinke it better referred vnto the Gum Succories; for the floures haue the forme and colour of gum Succorie, and it yeeldeth the like milky juice. Our Author it ſeemes was either forgetfull or ignorant of what he had ſaid; for here hee made it one, and deſcribed it meerely by the figure and his own fancie. Now I following his tract, haue (though vnfitly) put it here, becauſe there was no hiſtorie nor figure of it formerly there, but both heere, though falſe and vnperfect. This plant hath a root ſomewhat like that of Goats-beard; from which ariſe leaues rough and hairy, diuided or cut in on both ſides after the manner of Bucks horne, and larger than they. The ſtalke is ſome foot high, diuided into branches, which on their tops carry flours of a faire blew colour like thoſe of Succory, which ſtand in rough ſcaly heads like thoſe of Knapweed. ‡

¶ *The Place.*

Theſe grow in rough and ſtony places,but are all ſtrangers in England.

¶ *The Time.*

They floure in May and Iune,and ſhortly after ripen their ſeed.

‡ ¶ *The Names.*

I thinke none of theſe to be the *Seſamoides* of the Antients. 1 The firſt is ſet forth by *Cluſius* vnder the name we here giue you: it is the ***Muſcipula altera muſcoſo flore*** of ***Lobel*** : ***Viſcago major*** of *Camerarius*.

2 This alſo *Cluſius* and *Lobel* haue ſet forth by the ſame name as we giue you them.

3 *Matthiolus*, *Camerarius*,and others haue ſet this forth for *Seſamoides parvum*, in the *Hiſt. Lugd.* it is called *Catanance quorundam*; but moſt fitly by ***Dodon. Chondrylla ſpecies tertia***, The third kind of Gum Succorie. ‡

¶ *The Temperature.*

Galen affirmeth,That the ſeed contains in it ſelfe a bitter quality,and ſaith that it heateth,breaketh,and ſcoureth.

¶ *The Vertues.*

A *Dioſcorides* affirmeth, that the weight of an halfepenny of the ſeed drunke with Mead or honied water,purgeth flegme and choler by the ſtoole.

B The ſame being applied,doth waſte hard knots and ſwellings.

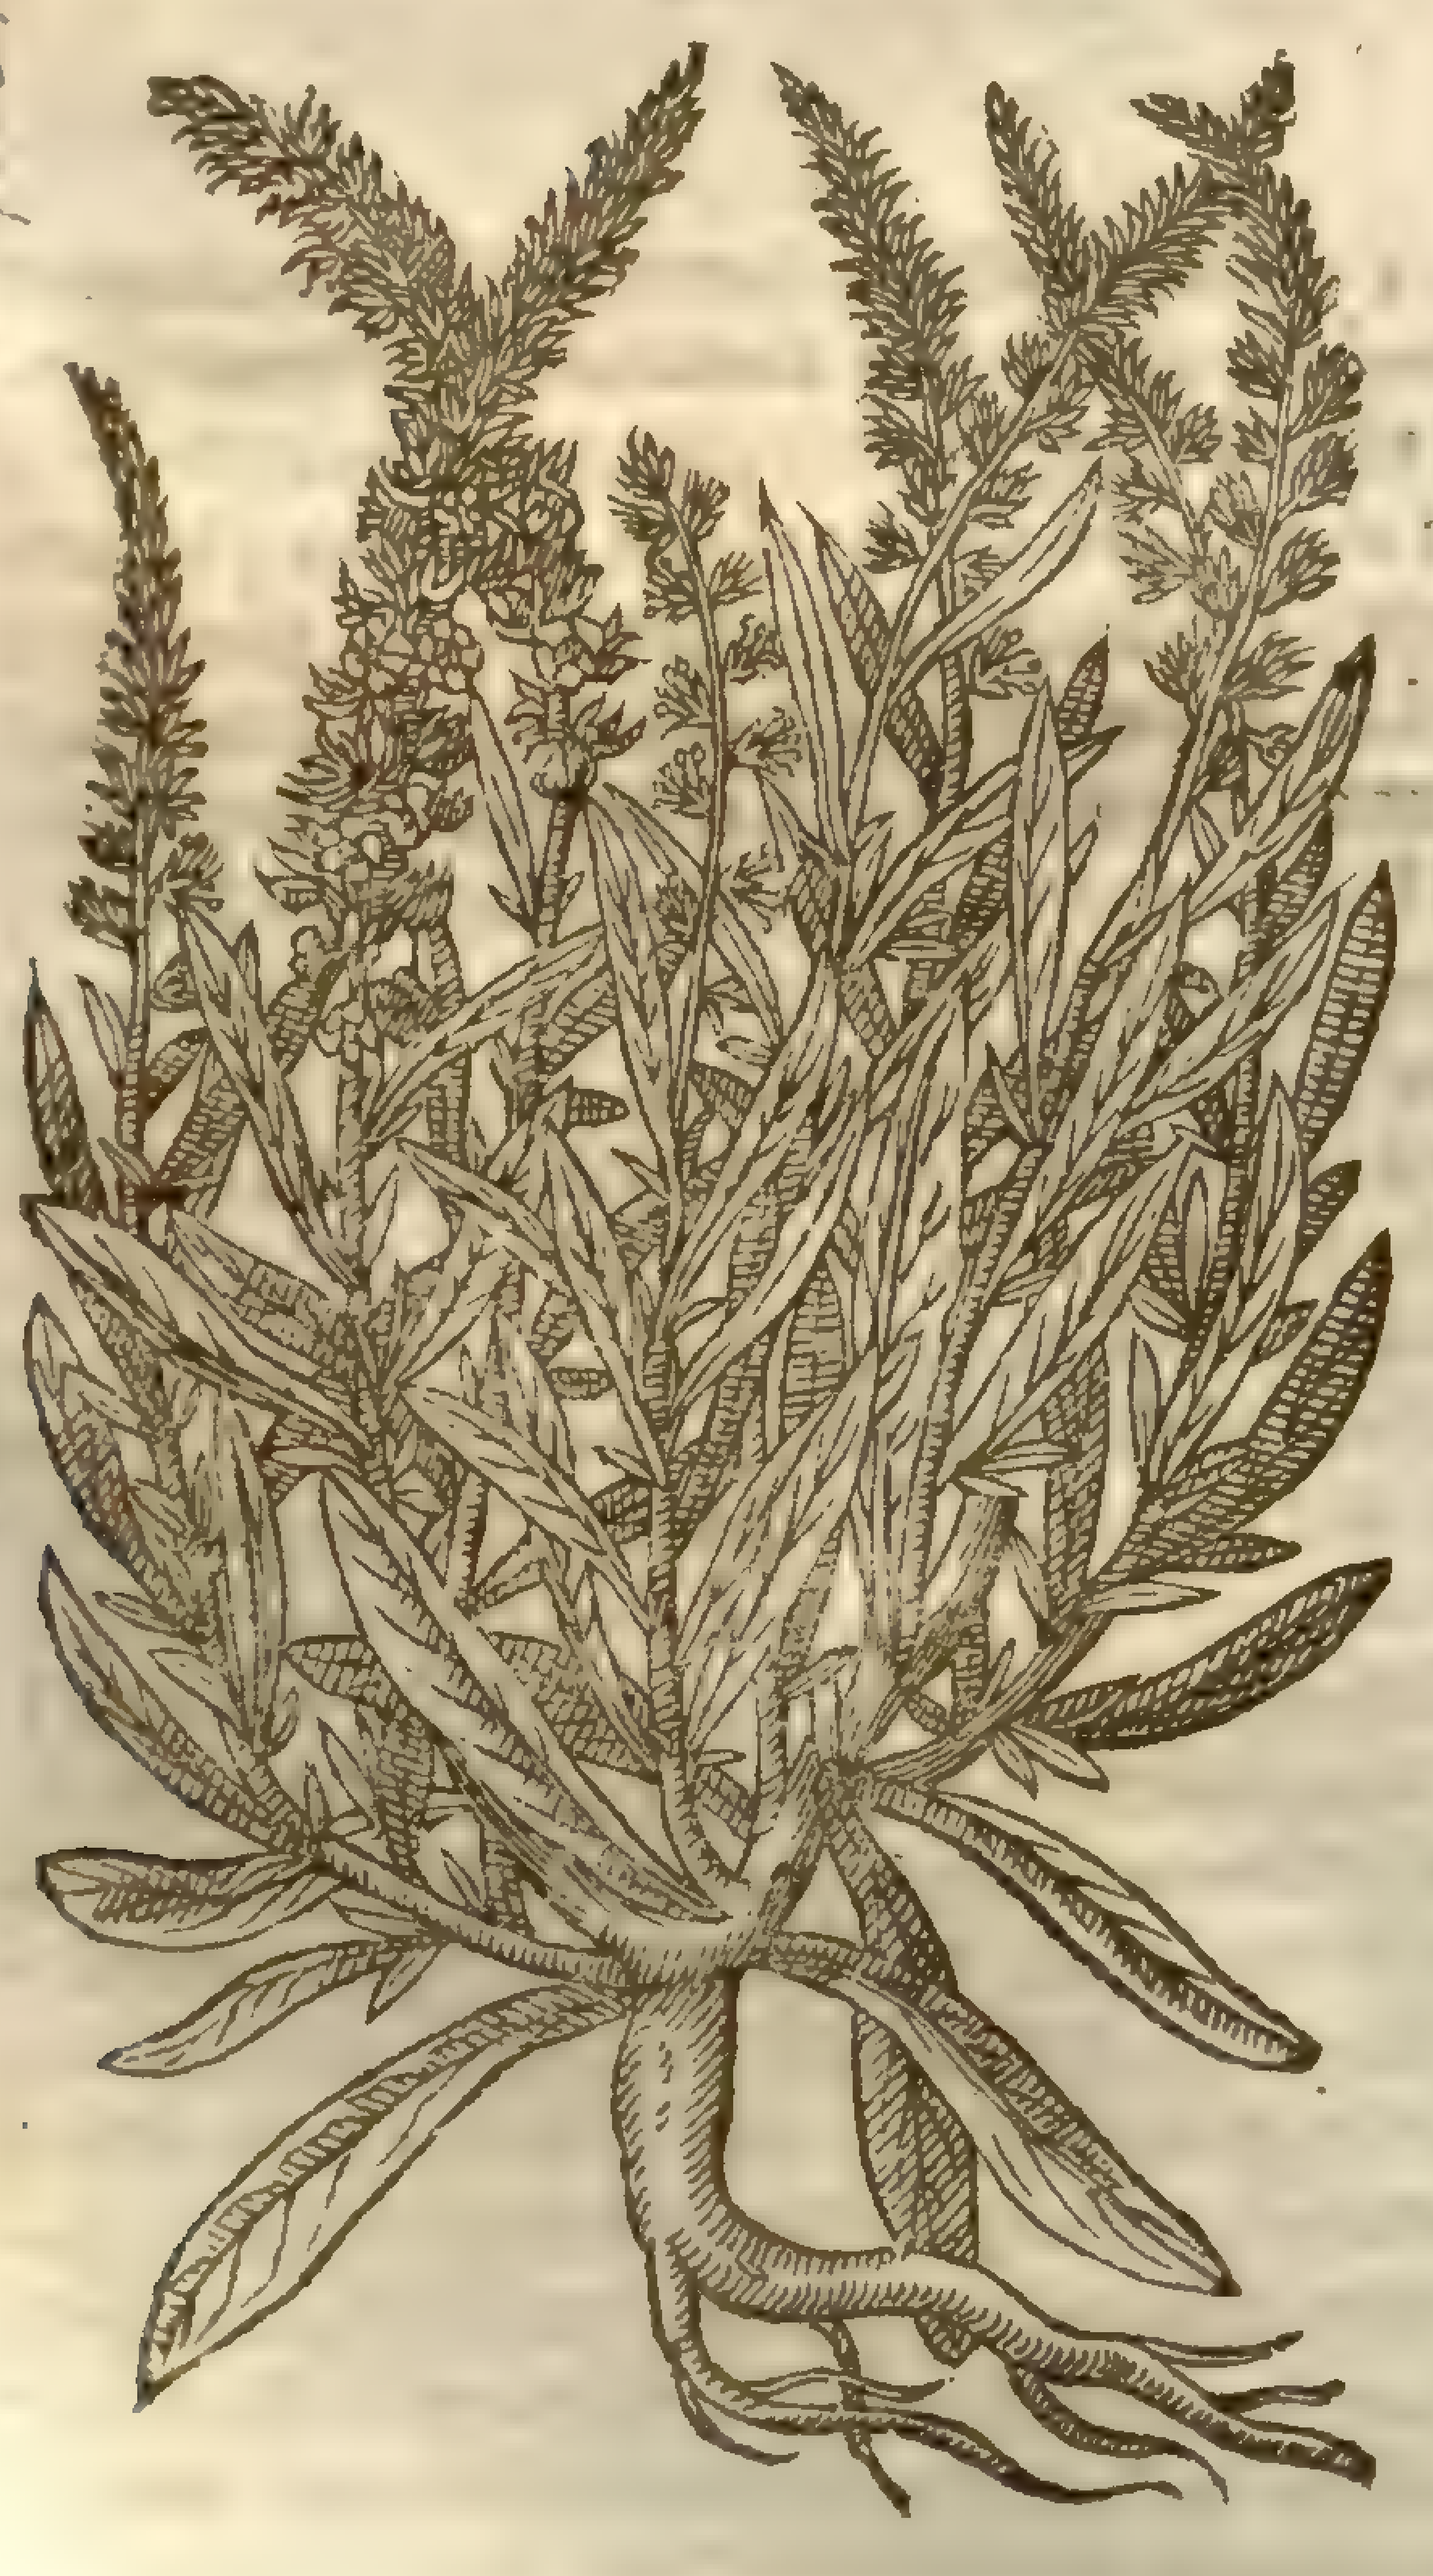
---

† That which here formerly enioyed the third place,by the title of *Seſamoides maius Scaligeri*, was no other than the plant that is hereafter deſcribed, by the name of *Tarton raire Gallo-prouincia*, where you may finde both the figure and deſcription.

Chap. 136. *Of Dyers Weed.*

Reseda Luteola [illegible]

Luteola. Dyers weed,or Yellow weed.



¶ *The Deſcription.*

Dyers weed hath long narrow and greeniſh yellow leaues not much vnlike to Woad, but a great deale ſmaller and narrower; from among which commeth vp a ſtalke two cubits high, beſet with little narrow leaues:euen to the top of the ſtalk come forth ſmall pale yellow floures,cloſely cluſtering together one within another, which doe turne into ſmall buttons, cut as it were croſſe-wiſe, wherein the ſeed is contained. The root is very long and ſingle.

¶ *The Place.*

Dyers weed groweth of it ſelfe in moiſt barren and vntilled places, in and about villages almoſt euerie where.

¶ *The Time.*

This herb flouriſheth in Iune and Iuly.

¶ *The Names.*

Pliny, lib. 33. *cap.* 5. maketh mention by the way of this herb,and calleth it *Lutea* : and *Vitruvius,li.*7. *Lutum* : it is the *Antirrhinum* of *Tragus* : and *Pſeudoſtruthium* of *Matthiolus*. *Virgil* in his Bucolicks, Eclog 4. calls it alſo *Lutum* : in Engliſh, Weld, or Dyers weed.

¶ *The Nature.*

It is hot and dry of temperature.

‡ ¶ *The Vertues.*

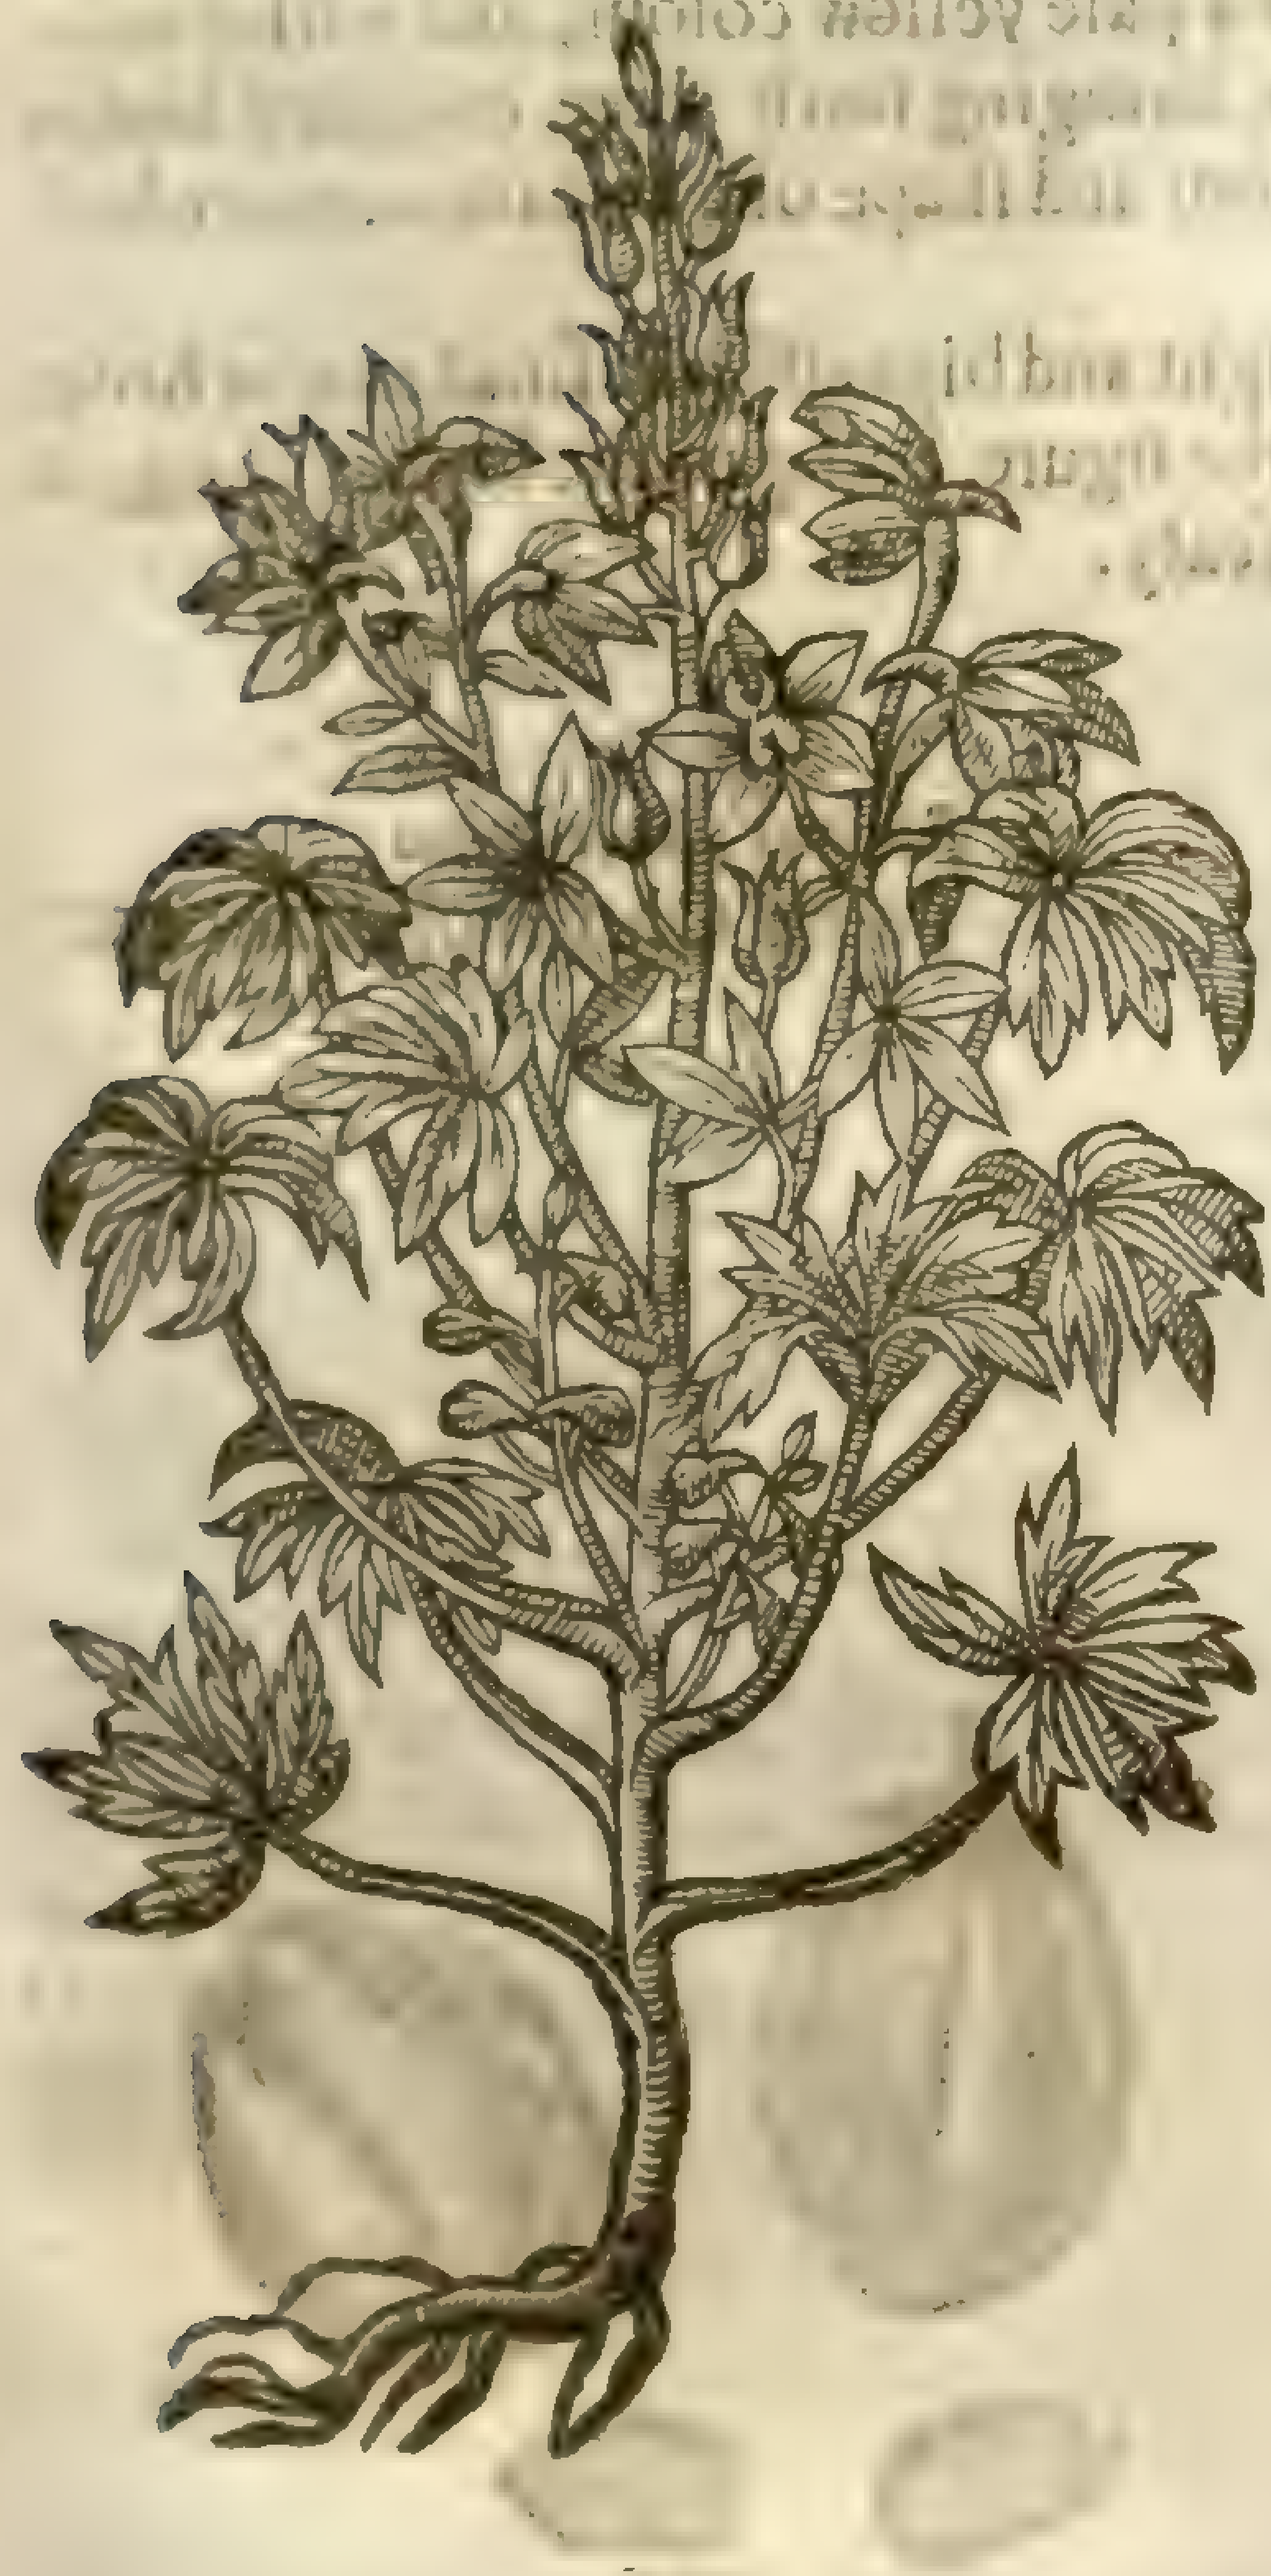
A The root as alſo the whole herb heates and dries in the third degree : it cuts, attenuates, reſolueth,opens,digeſts. Some alſo commend it againſt the punctures and bites of venomous creatures,

tures, not only outwardly applied to the wound, but alſo taken inwardly in drinke.

Alſo it is commended againſt infection of the plague: ſome for theſe reaſons term it *Theriacaria. Mat.* ‡ B

CHAP. 137. *Of Staues-acre.*

Staphis-agria. Staues-acre.



¶ *The Deſcription.*

SSaues-acre hath ſtraight ſtalks of a browne colour, with leaues clouen or cut into ſundry ſections, almoſt like the leaues of the wilde Vine: the floures grow vpon ſhort ſtems, faſhioned ſomwhat like vnto our common Monkes hood, of a perfect blew colour: which beeing paſt, there ſucceed welted huskes like thoſe of Wolfs-bane, wherein is contained triangular browniſh rough ſeed. The root is of a wooddy ſubſtance, and periſheth when it hath perfected his ſeed.

¶ *The Place.*

It is with great difficultie preſerued in our cold countries, albeit in ſome milde Winters I haue kept it couered ouer with a little Ferne, to defend it from the injurie of the March wind, which doth more harm to plants that come forth of hot countries, than doth the greateſt froſts.

¶ *The Time.*

It floureth in Iune, and the ſeed is ripe the ſecond yeare of his ſowing.

¶ *The Names.*

It is called in Greeke σταφὶς ἀγρία: in Latine, *Herba Pedicularis*, and *Peduncularia*, as *Marcellus* reporteth. *Pliny, lib.26.cap.13.* ſeems to name it *Vva taminia*: of ſome, *Pituitaria*, and *Paſſula montana*: in ſhops, *Staphiſagria*: in Spaniſh, *Yerva piolente*: in French, *Herbe aux poulx*: in high-Dutch, **Leuß kraut**: in low-Dutch, **Luyſcruit**: in Engliſh, Staues-acre, Louſe-wort, and Louſe-pouder.

¶ *The Temperature.*

The ſeeds of Staues-acre are extreame hot, almoſt in the fourth degree, of a biting and burning qualitie.

¶ *The Vertues.*

A Fifteen ſeeds of Staues-acre taken with honied water will cauſe one to vomit groſſe flegme and ſlimy matter, but with great violence; and therefore thoſe that haue taken them ought to walke without ſtaying, and to drinke honied water, becauſe it bringeth danger of choking and burning the throat, as *Dioſcorides* noteth: for which cauſe they are rejected and not vſed of Phyſitions, either in prouoking vomit, or elſe in mixing them with other inward medicines.

B The ſeed mingled with oile or greaſe driueth away lice from the head, beard, and all other parts of the body, and cureth all ſcuruy itch and mangineſſe.

C The ſame boiled in vineger and holden in the mouth, aſſwageth the tooth-ache.

D The ſame chewed in the mouth draweth forth much moiſture from the head, and cleanſeth the brain, eſpecially if a little of the root of Pellitorie of Spain be added thereto.

E The ſame tempered with vineger is good to be rubbed vpon louſie apparell, to deſtroy & driue away lice.

F The ſeeds hereof are perillous to be taken inwardly without good aduice, and correction of the ſame; and therefore I aduiſe the ignorant not to be ouer-bold in medling with it, ſith it is ſo dangerous that many times death enſueth vpon the taking thereof.

CHAP.

Chap. 138. *Of Palma Chriſti.*

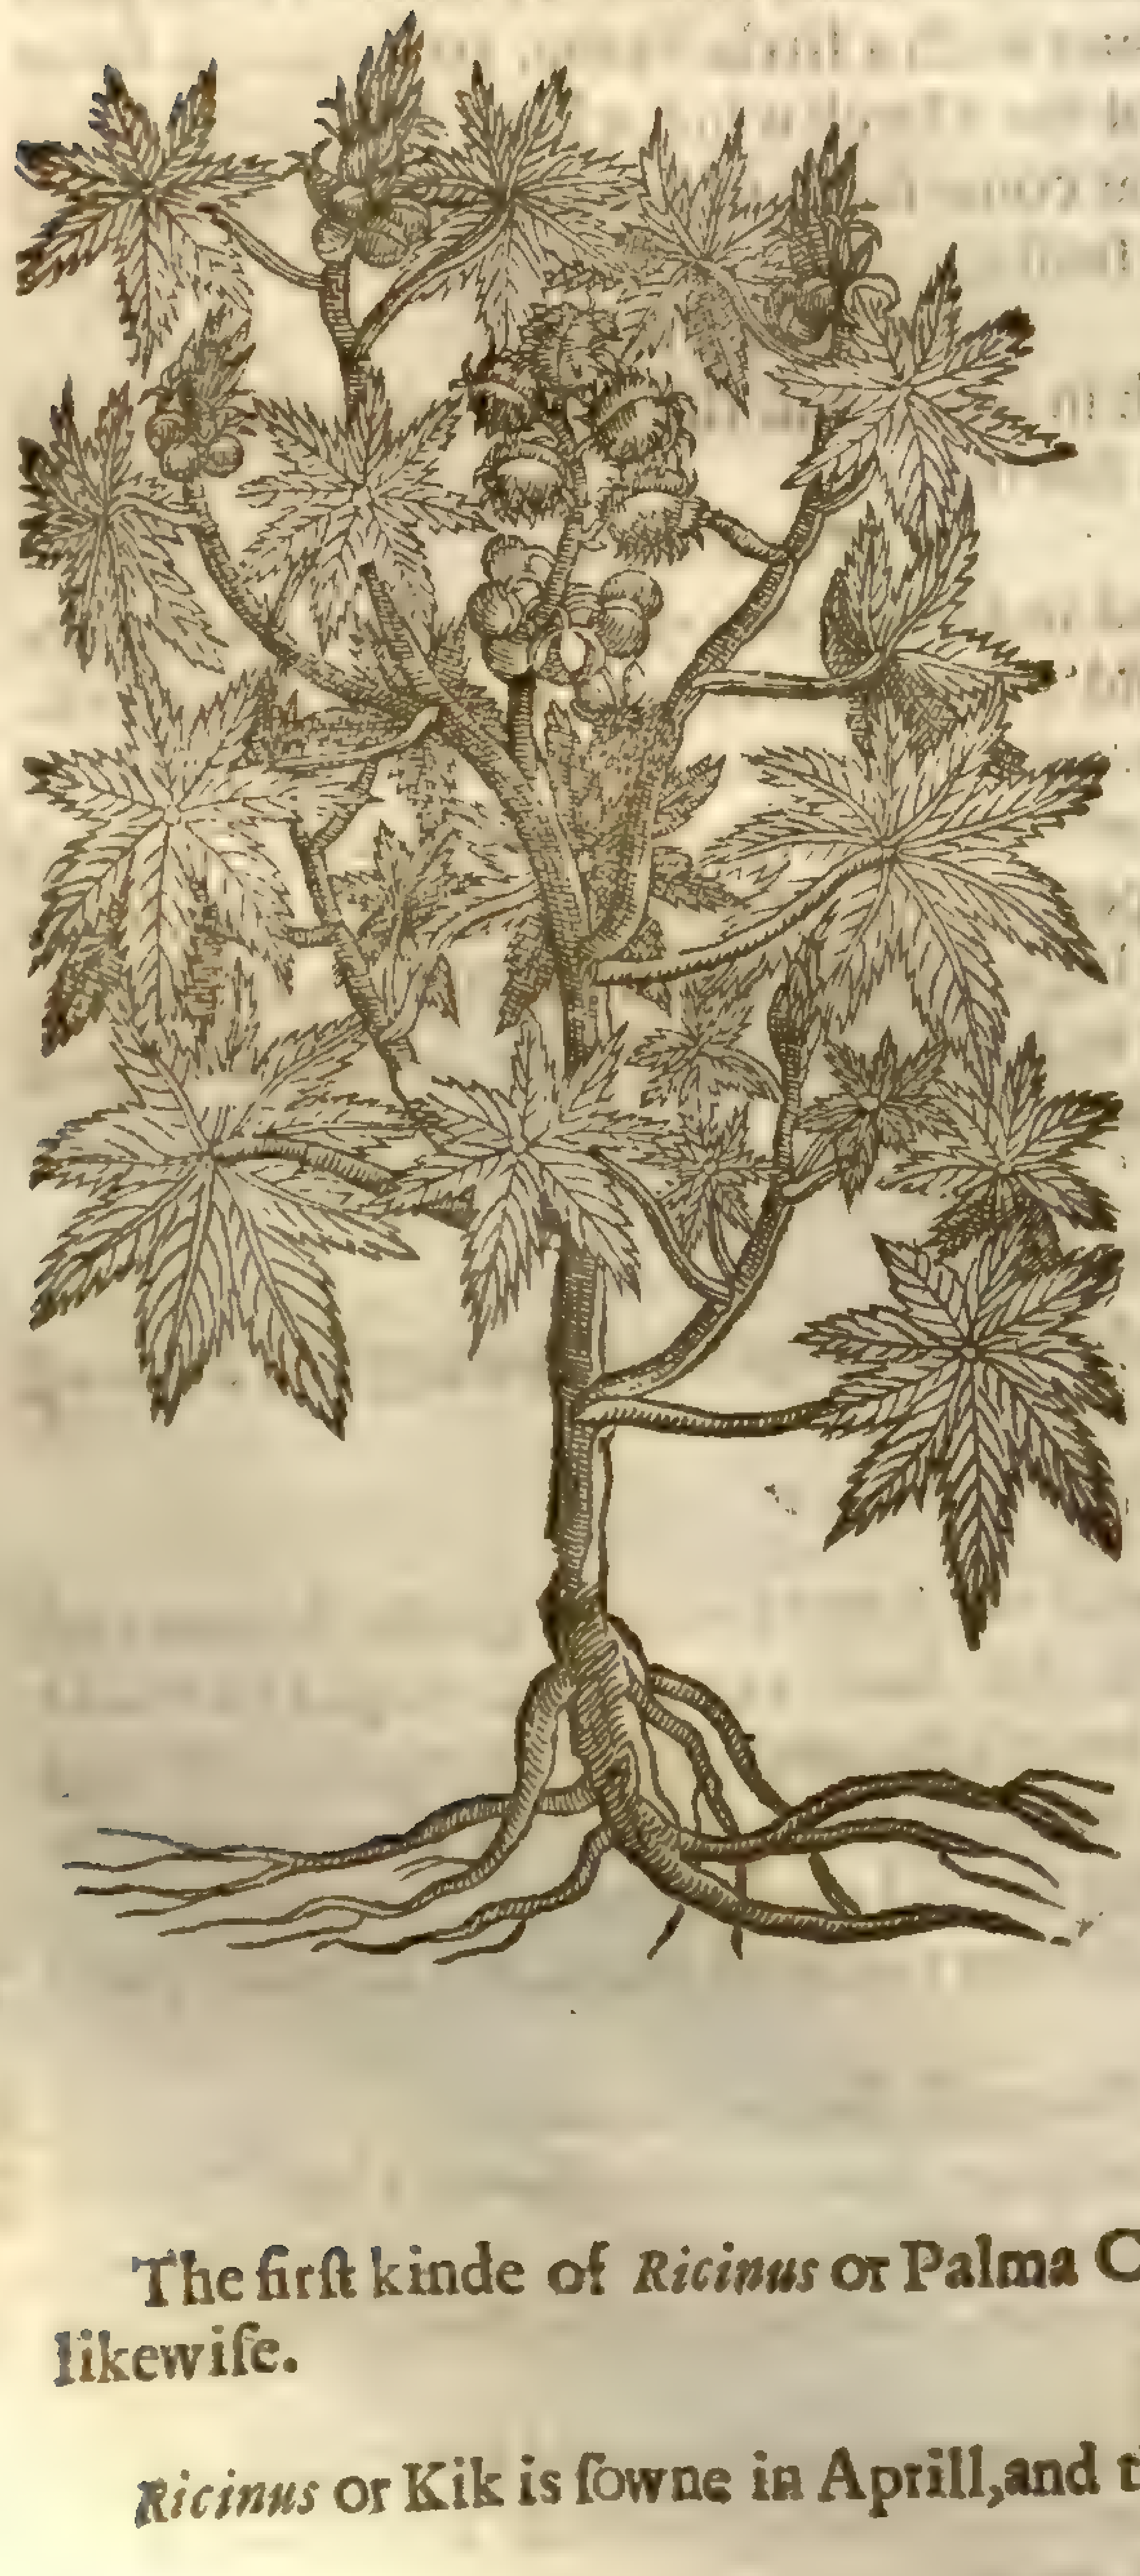
¶ *The Deſcription.*

1 Ricinus, *Palma Chriſti*, or *Kik*, hath a great round hollow ſtalke fiue cubits high, of a browne colour, died with a blewiſh purple vpon green. The leaues are great and large, parted into ſundry ſections or diuiſions, faſhioned like the leaues of a figtree, but greater, ſpred or wide open like the hand of a man, and hath toward the top a bunch of flours cluſtring together like a bunch of grapes; whereof the loweſt are of a pale yellow colour, and wither away without bearing any fruit; and the vppermoſt are reddiſh, bringing forth three cornered huskes which containe the ſeed as big as a kidney bean, of the colour and ſhape of a certain vermin which haunteth cattell, called a Tik.

2 This *Palma Chriſti* of America growes vp to the height and bigneſſe of a ſmal tree or hedge ſhrub, of a wooddy ſubſtance, whoſe fruit is expreſſed by the figure, being of the bignes of a great bean, ſomewhat long, and of a blackiſh colour, rough and ſcaly.

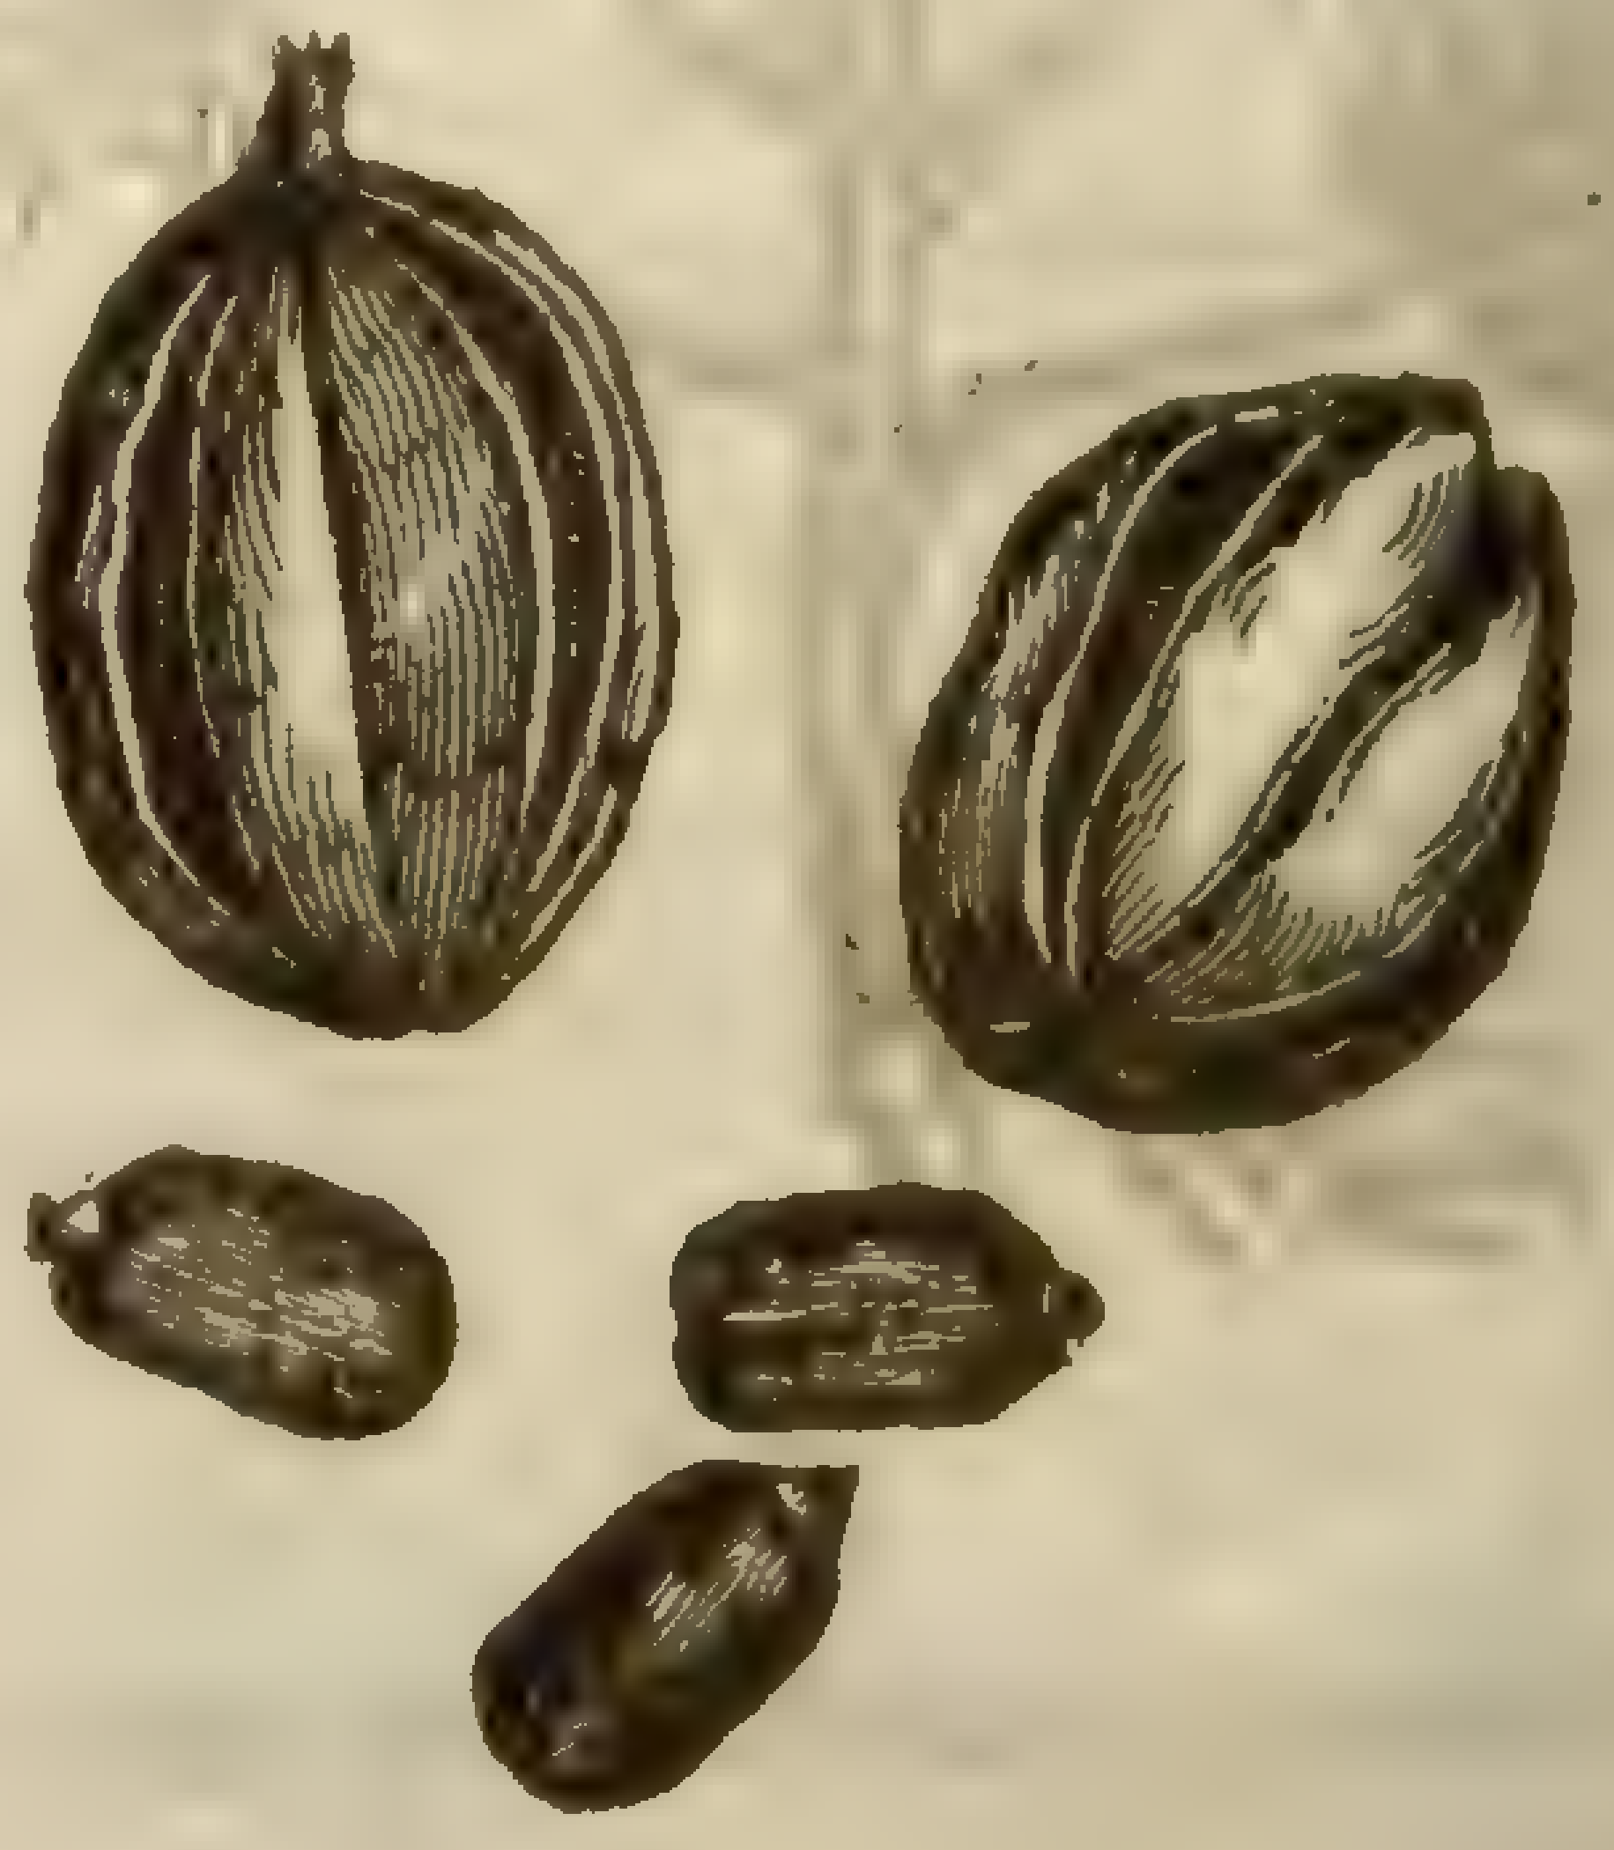
1 *Ricinus.*
Palma Chriſti.

R. communis, L.
mili. dict.



2 *Ricinus Americanus.*
Palma Chriſti of America.

R. communis, L. β
mili. dict.



Jatropha Curcas, L
mili. dict.

¶ *The Place.*

The firſt kinde of *Ricinus* or Palma Chriſti groweth in my garden, and in many other gardens likewiſe.

¶ *The Time.*

Ricinus or Kik is ſowne in Aprill, and the ſeed is ripe in the end of Auguſt.

The Name, and cauſe thereof.

Ricinus (whereof mention is made in the fourth chapter and ſixt verſe of the prophecie of *Ionas*) was called of the Talmudiſts, קיק *Kik*, for in the Talmud we reade thus, ולא בשמן קיק *Velo beſchemen Kik*: that is, in Engliſh, And not with the oyle of *Kik*: which oile is called in the Arabian tongue, *Alkerua*, as *Rabbi Samuel* the ſonne of *Hophni* teſtifieth. Moreouer a certaine Rabbine moueth a queſtion, ſaying, what is *Kik?* Hereunto *Reſch Lachiſh* maketh anſwer in Ghemara, ſaying, Kik is nothing elſe but *Ionas* his Kikaijon. And that this is true, it appeareth by that name κίκι: which the Antient Greeke Phyſitions, and the Ægiptians vſed; which Greeke word commeth of the Hebrew word *Kik*. Hereby it appeareth, that the old writers long agoe called this plant by the true and proper name. But the old Latine writers knew it by the name *Cucurbita*, which euidently is manifeſted by an hiſtory which Saint *Auguſtine* recordeth in his Epiſtle to Saint *Ierome*, where in effect he writeth thus; That name *Kikaijon* is of ſmall moment, yet ſo ſmall matter cauſed a great tumult in Africa. For on a time a certaine Biſhop hauing an occaſion to intreat of this which is mentioned in the fourth chapter of *Ionas* his propheſie (in a collation or ſermon, which he made in his cathedrall church or place of aſſembly) ſaid, that this plant was called *Cucurbita*, a Gourd, becauſe it encreaſed to ſo great a quantitie, in ſo ſhort a ſpace, or elſe (ſaith he) it is called *Hedera*. Vpon the nouelty and vntruth of this his doctrine, the people were greatly offended, and thereof ſuddenly aroſe a tumult and hurly burly, ſo that the Biſhop was enforced to goe to the Iewes, to aske their judgement as touching the name of this plant. And when he had receiued of them the true name, which was *Kikaijon*, he made his open recantation, and confeſſed his errour, and was iuſtly accuſed for a falſifier of the holy Scripture. ‡ The Greekes called this plant alſo κρότων: *i. Ricinus*, by reaſon of the ſimilitude that the ſeed hath with that inſect, to wit, a Tik. ‡

¶ *The Nature.*

The ſeed of Palma Chriſti, or rather *Kik*, is hot and dry in the third degree.

¶ *The Vertues.*

A *Ricinus* his ſeed taken inwardly, openeth the belly, and cauſeth vomit, drawing ſlimy flegme and choler from the places poſſeſſed therewith.

B The broth of the meat ſupped vp, wherein the ſeed hath beene ſodden, is good for the colicke and the gout, and againſt the paine in the hips called *Sciatica*: it preuaileth alſo againſt the jaundiſe and dropſie.

C The oyle that is made or drawne from the ſeed is called *Oleum Cicinum*: in ſhops it is called, *Oleum de Cherua*: it heateth and drieth, as was ſaid before, and is good to anoint and rub all rough hardneſſe and ſcuruineſſe gotten by itch.

D This oyle, as *Rabbi Dauid Chimchi* writeth, is good againſt extreme coldneſſe of the body.

Chap. 139. *Of Spurge.*

¶ *The Deſcription.*

1 The firſt kinde of Sea Spurge riſeth forth of the ſands, or baich of the ſea, with ſundry reddiſh ſtems or ſtalkes growing vpon one ſingle root, of a wooddy ſubſtance: and the ſtalkes are beſet with ſmall, fat, and narrow leaues like vnto the leaues of Flax. The floures are yellowiſh, and grow out of little diſhes or Saucers like the common kinde of Spurge. After the floures come triangle ſeeds, as in the other Tithymales.

2 The ſecond kinde (called *Helioſcopius*, or *Soliſequius*: and in Engliſh, according to his Greeke name, Sunne Spurge, or time Tithymale, of turning or keeping time with the Sunne) hath ſundry reddiſh ſtalkes of a foot high: the leaues are like vnto Purſlane, not ſo great nor thicke, but ſnipt about the edges: the floures are yellowiſh, and growing in little platters.

3 The third kinde hath thicke, fat, and ſlender branches trailing vpon the ground, beſet with leaues like Knee-holme, or the great Myrtle tree. The ſeed and floures are like vnto the other of his kinde.

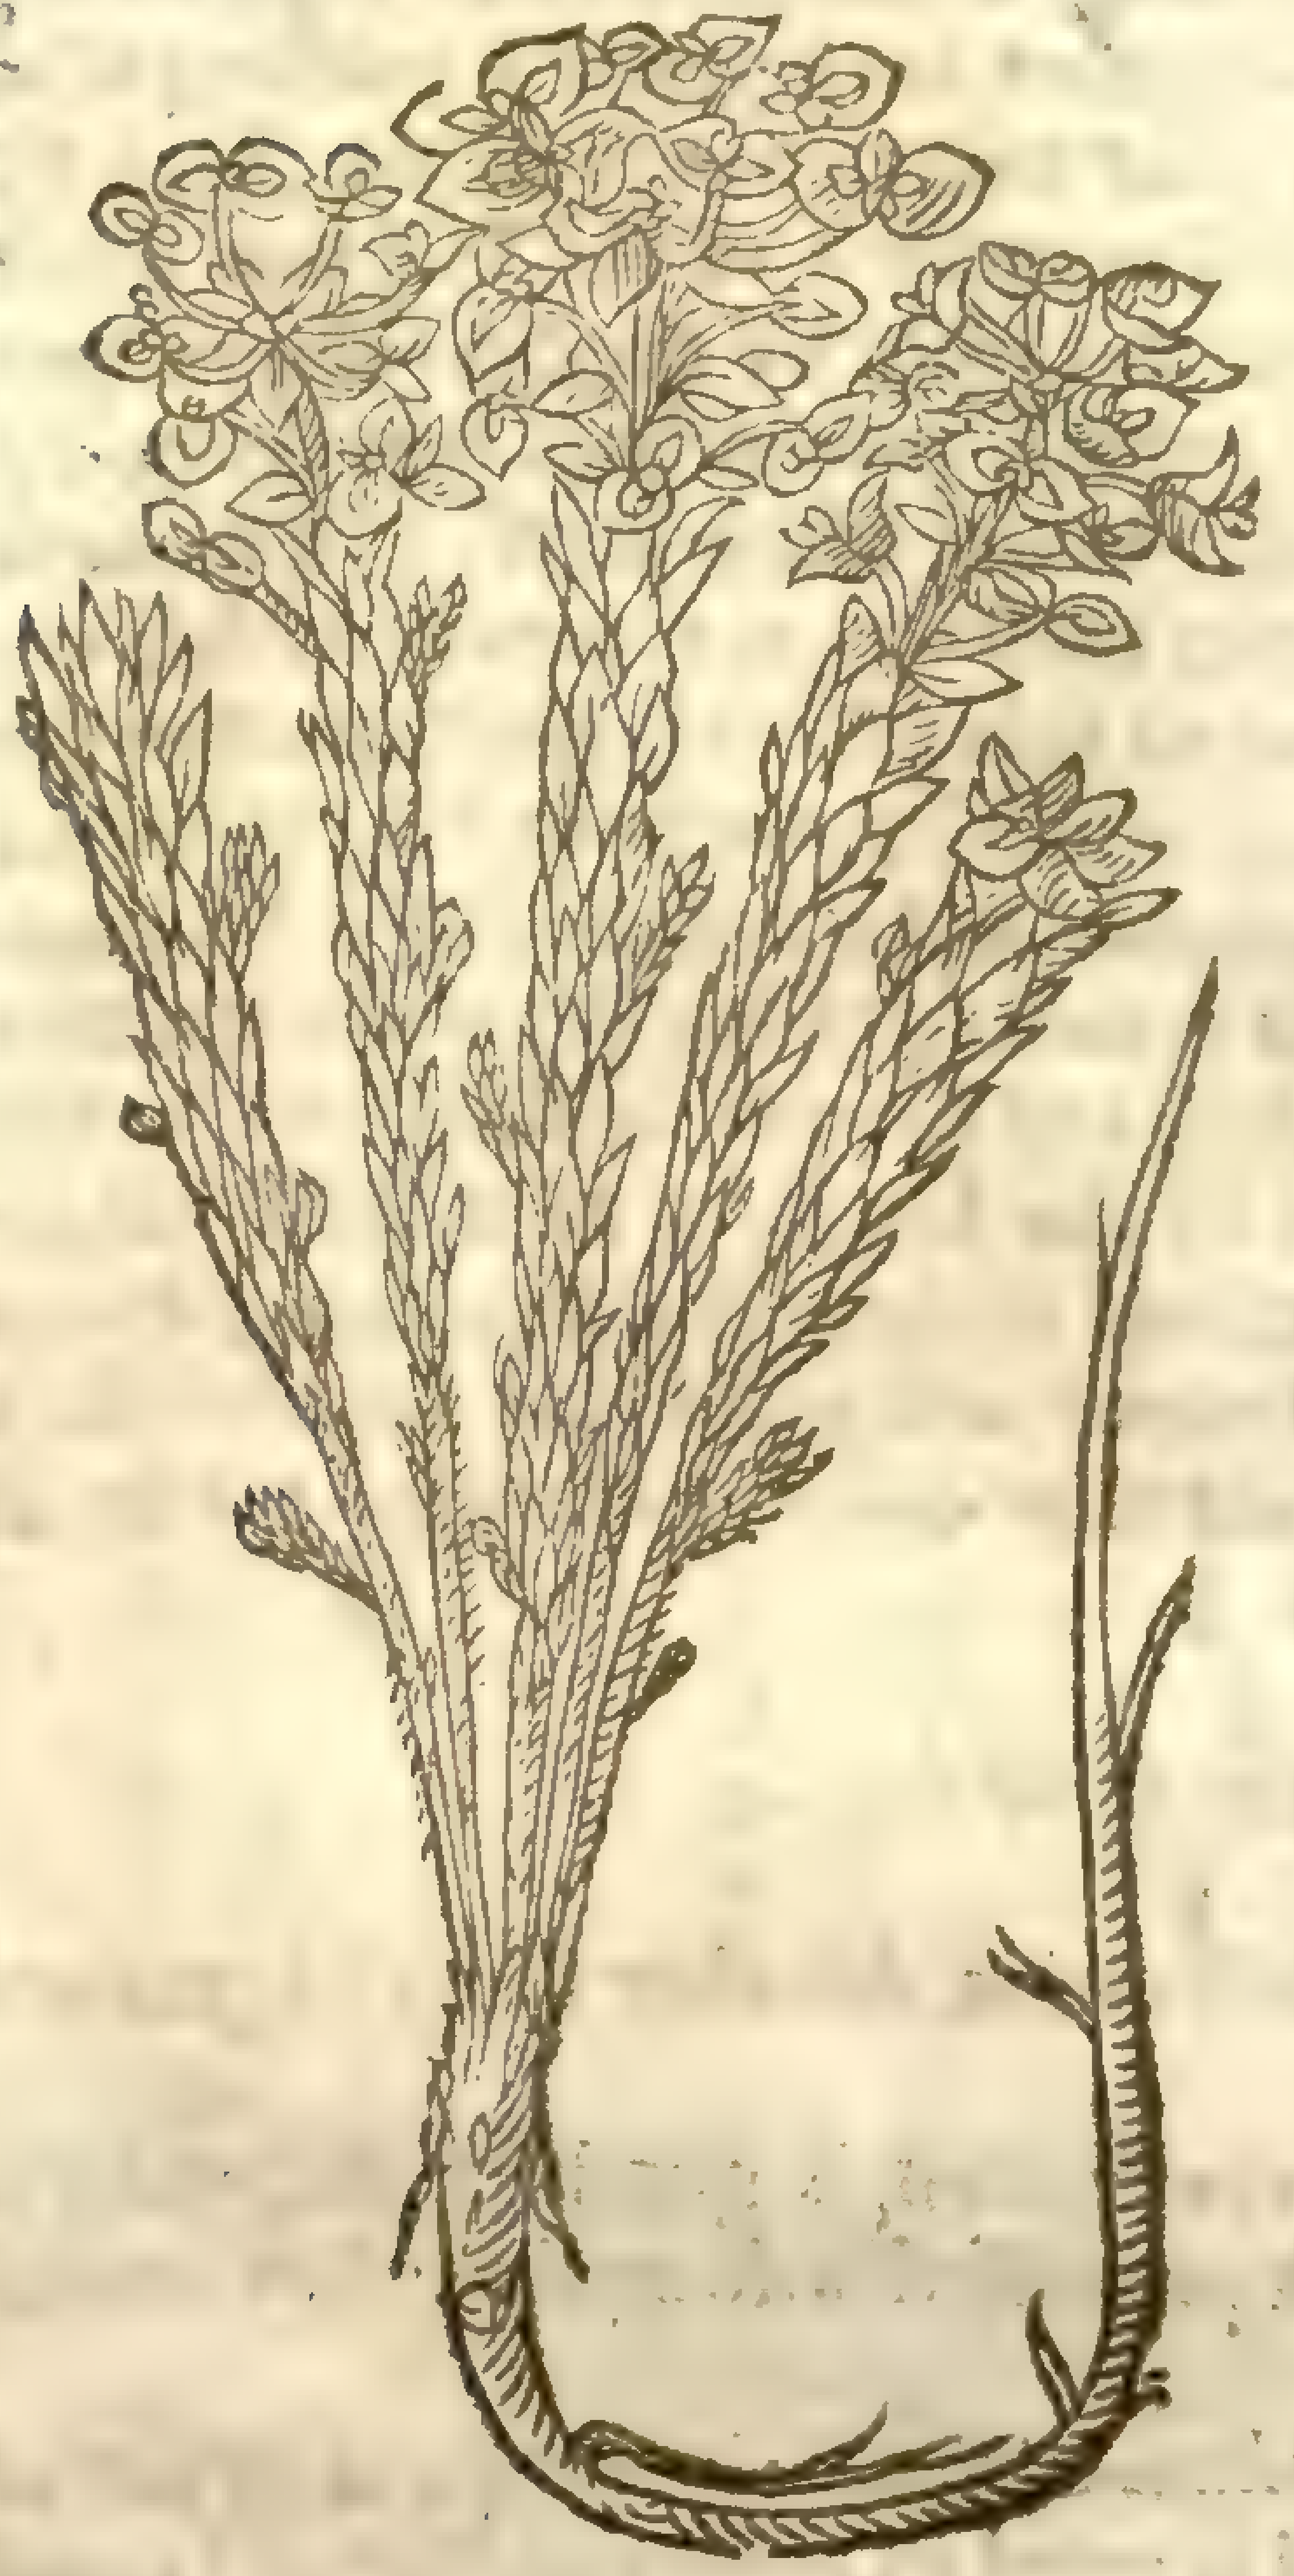
4 The fourth is like the laſt before mentioned, but it is altogether leſſer, and the leaues are narrower; it groweth more vpright, otherwaies alike.

5 Cyprus Tithymale hath round reddiſh ſtalkes a foot high, long and narrow like thoſe of Flax, and growing buſhie, thicke together like as thoſe of the Cyprus tree. The floures, ſeed, and root, are like the former, ſometimes yellow, oftentimes red.

6 The ſixt is like the former, in floures, ſtalkes, roots, and ſeeds, and differeth in that, this kinde hath leaues narrower, and much ſmaller, growing after the faſhion of thoſe of the Pine tree, otherwiſe it like.

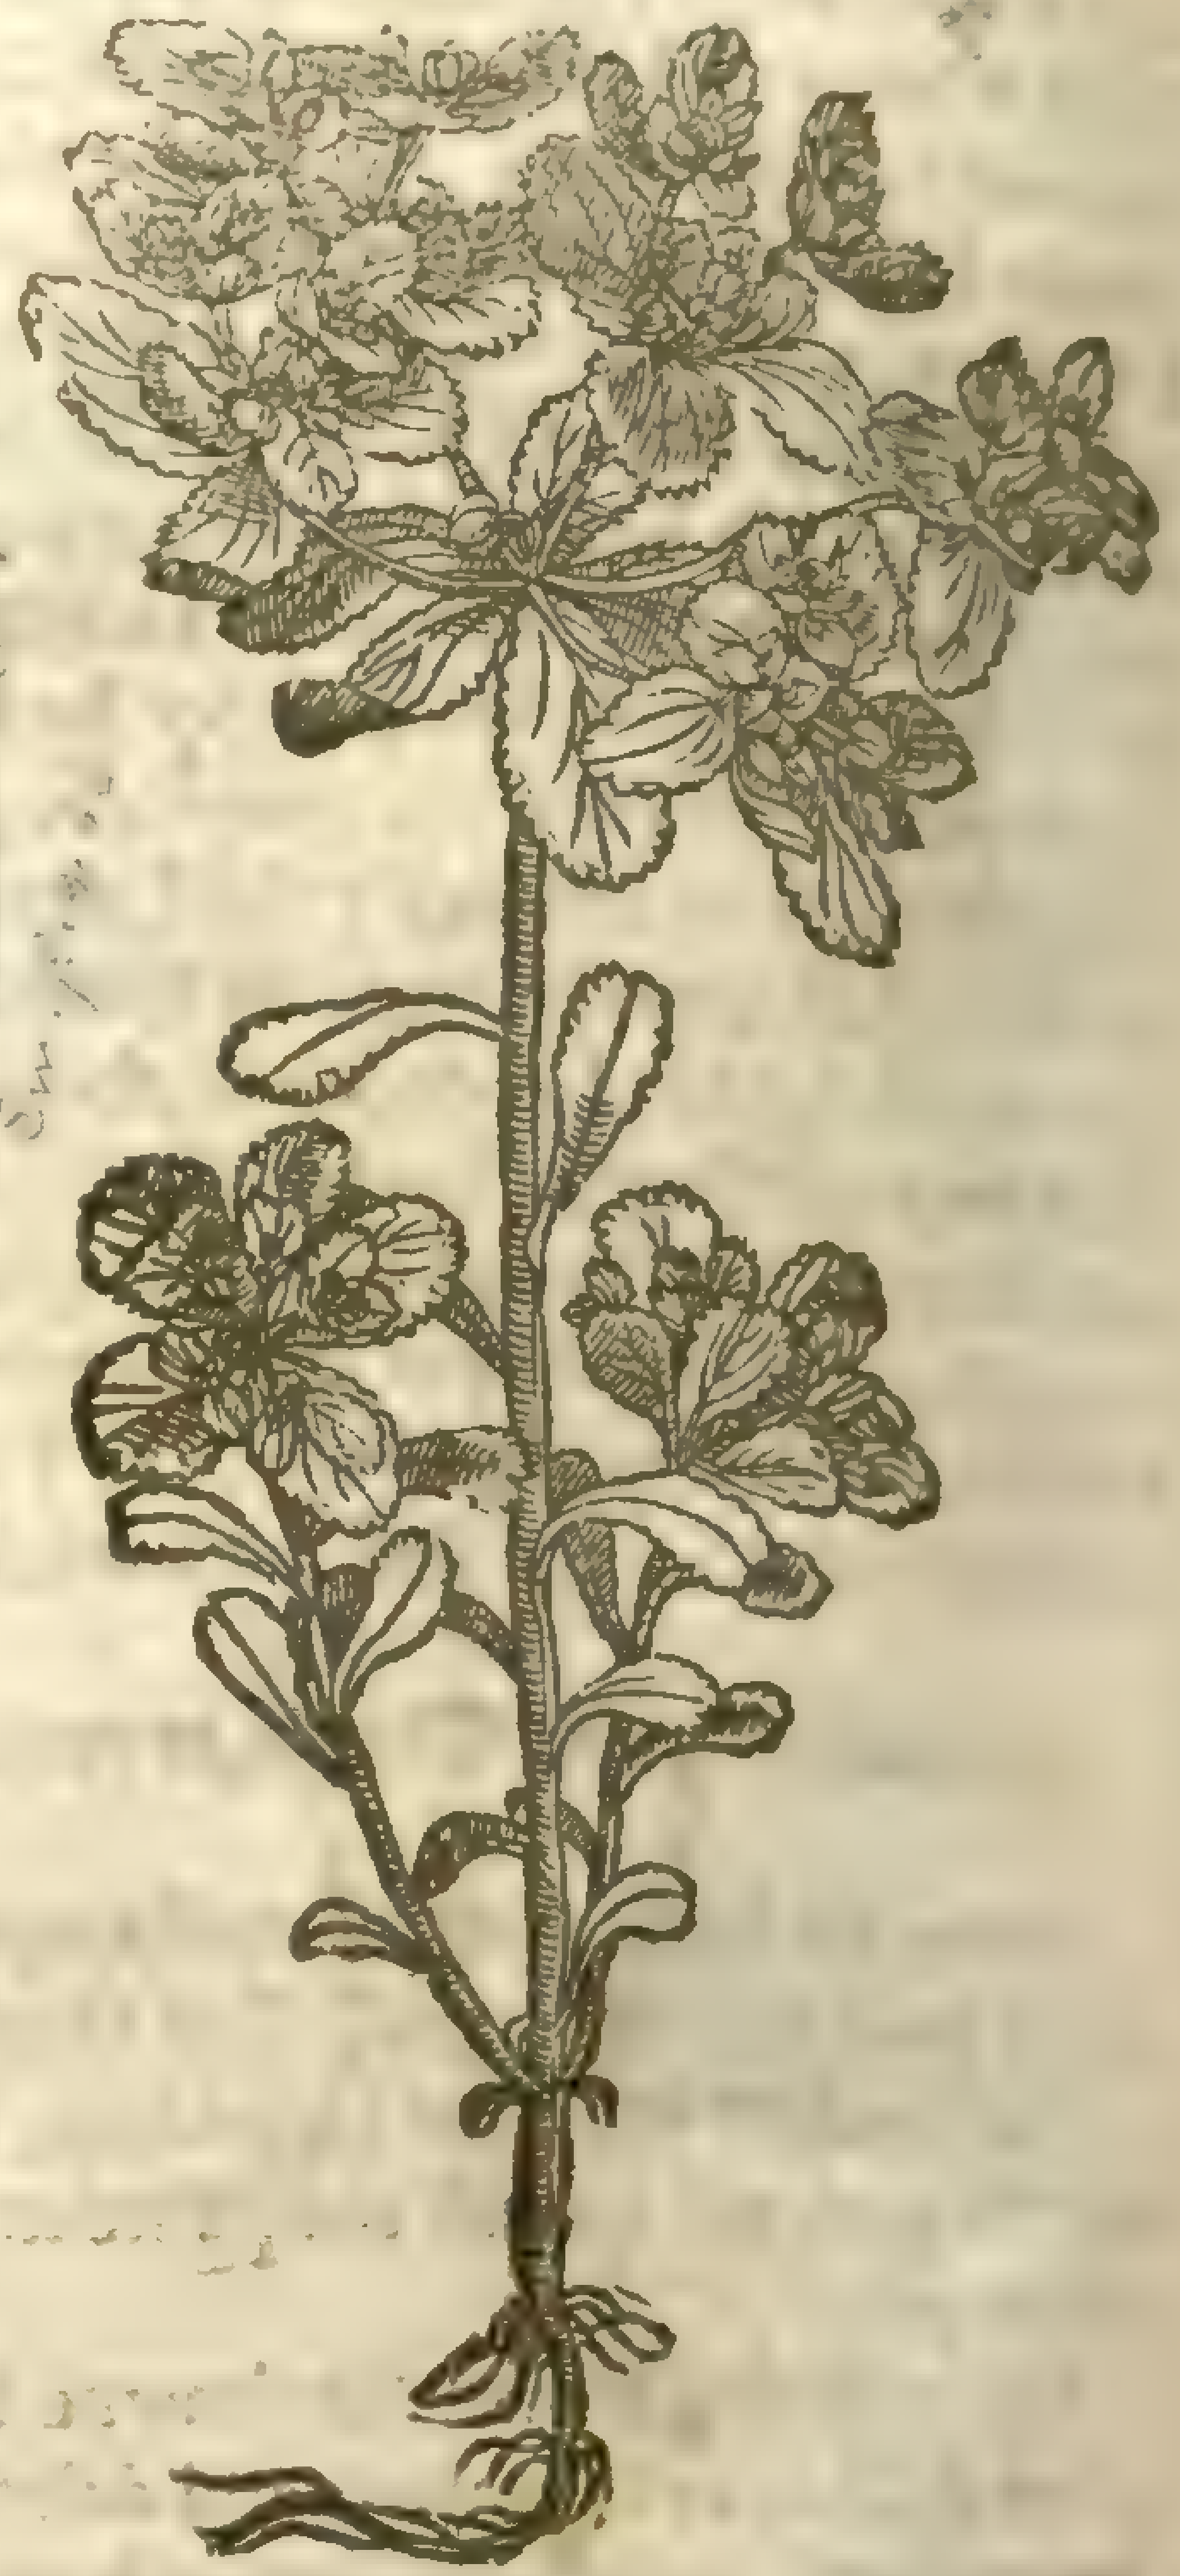
7 There is another kinde that groweth to the height of a man; the ſtalke is like the laſt mentioned

1 *Tithymalus paralius.*
Sea Spurge.



Euphorbia paralias [illegible]

2 *Tithymalus Helioſcopius.*
Sunne Spurge.



Euphorbia helioscopia [illegible]

3 *Tithymalus Myrtifolius latifolius.*

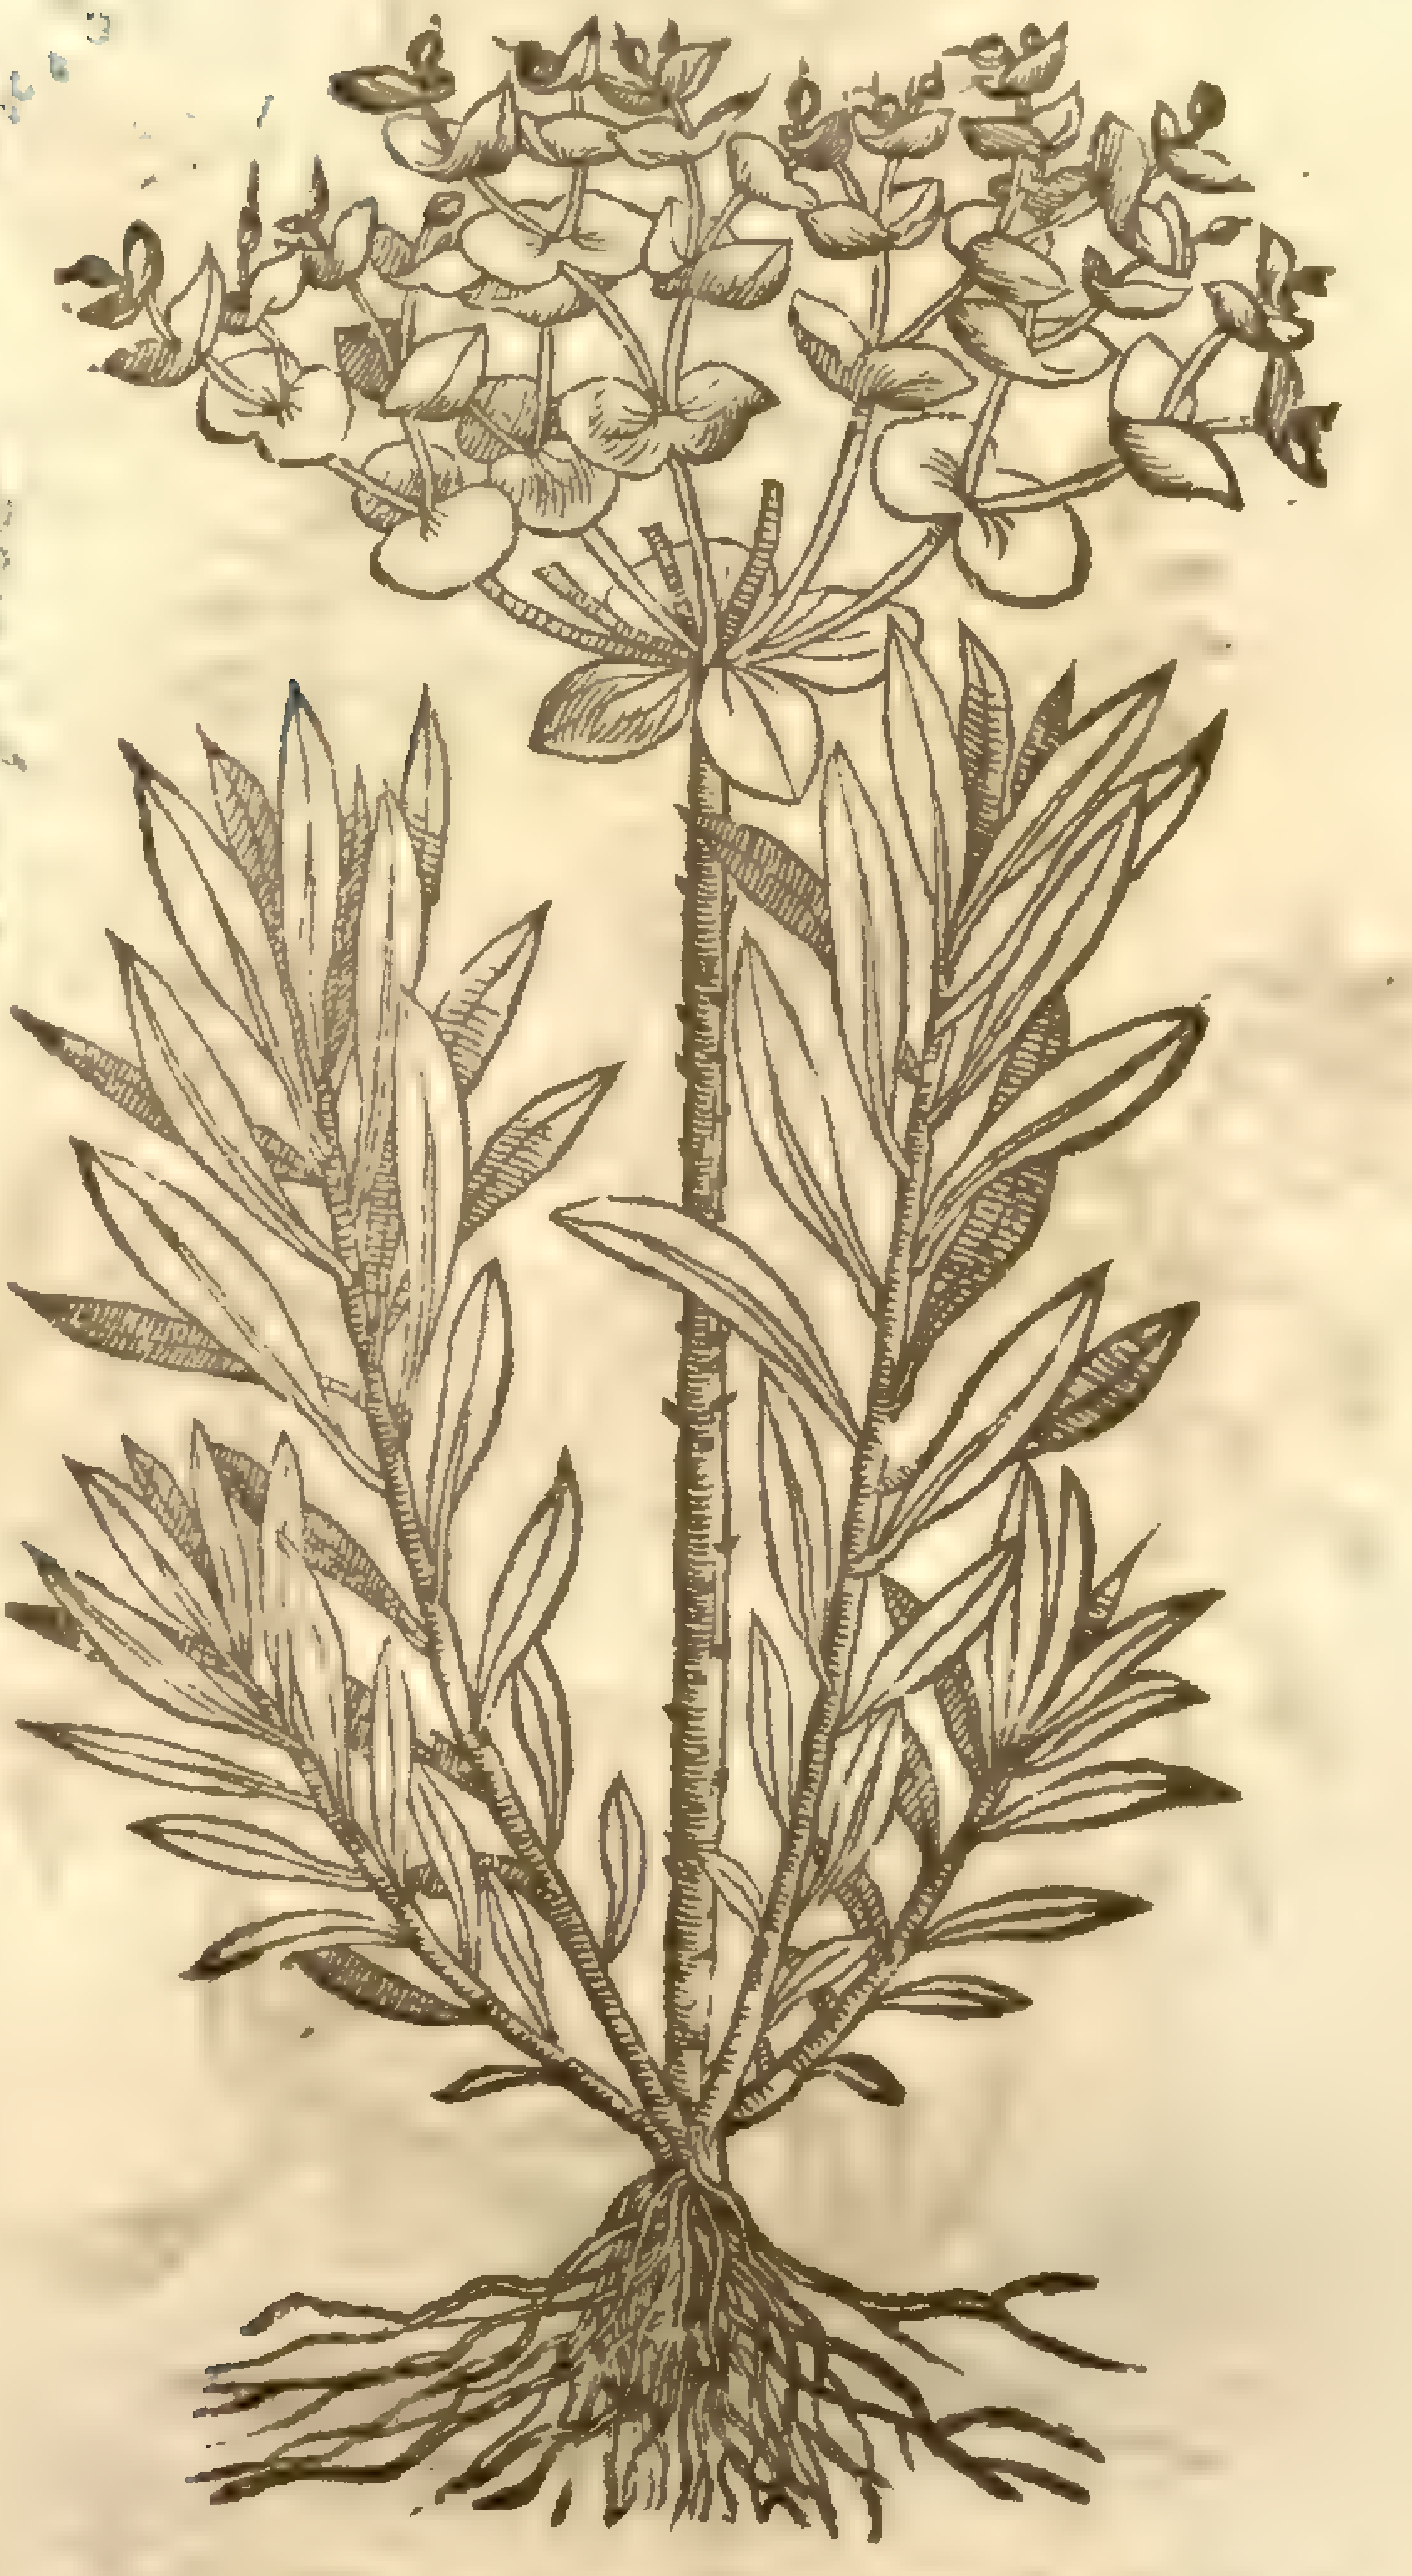
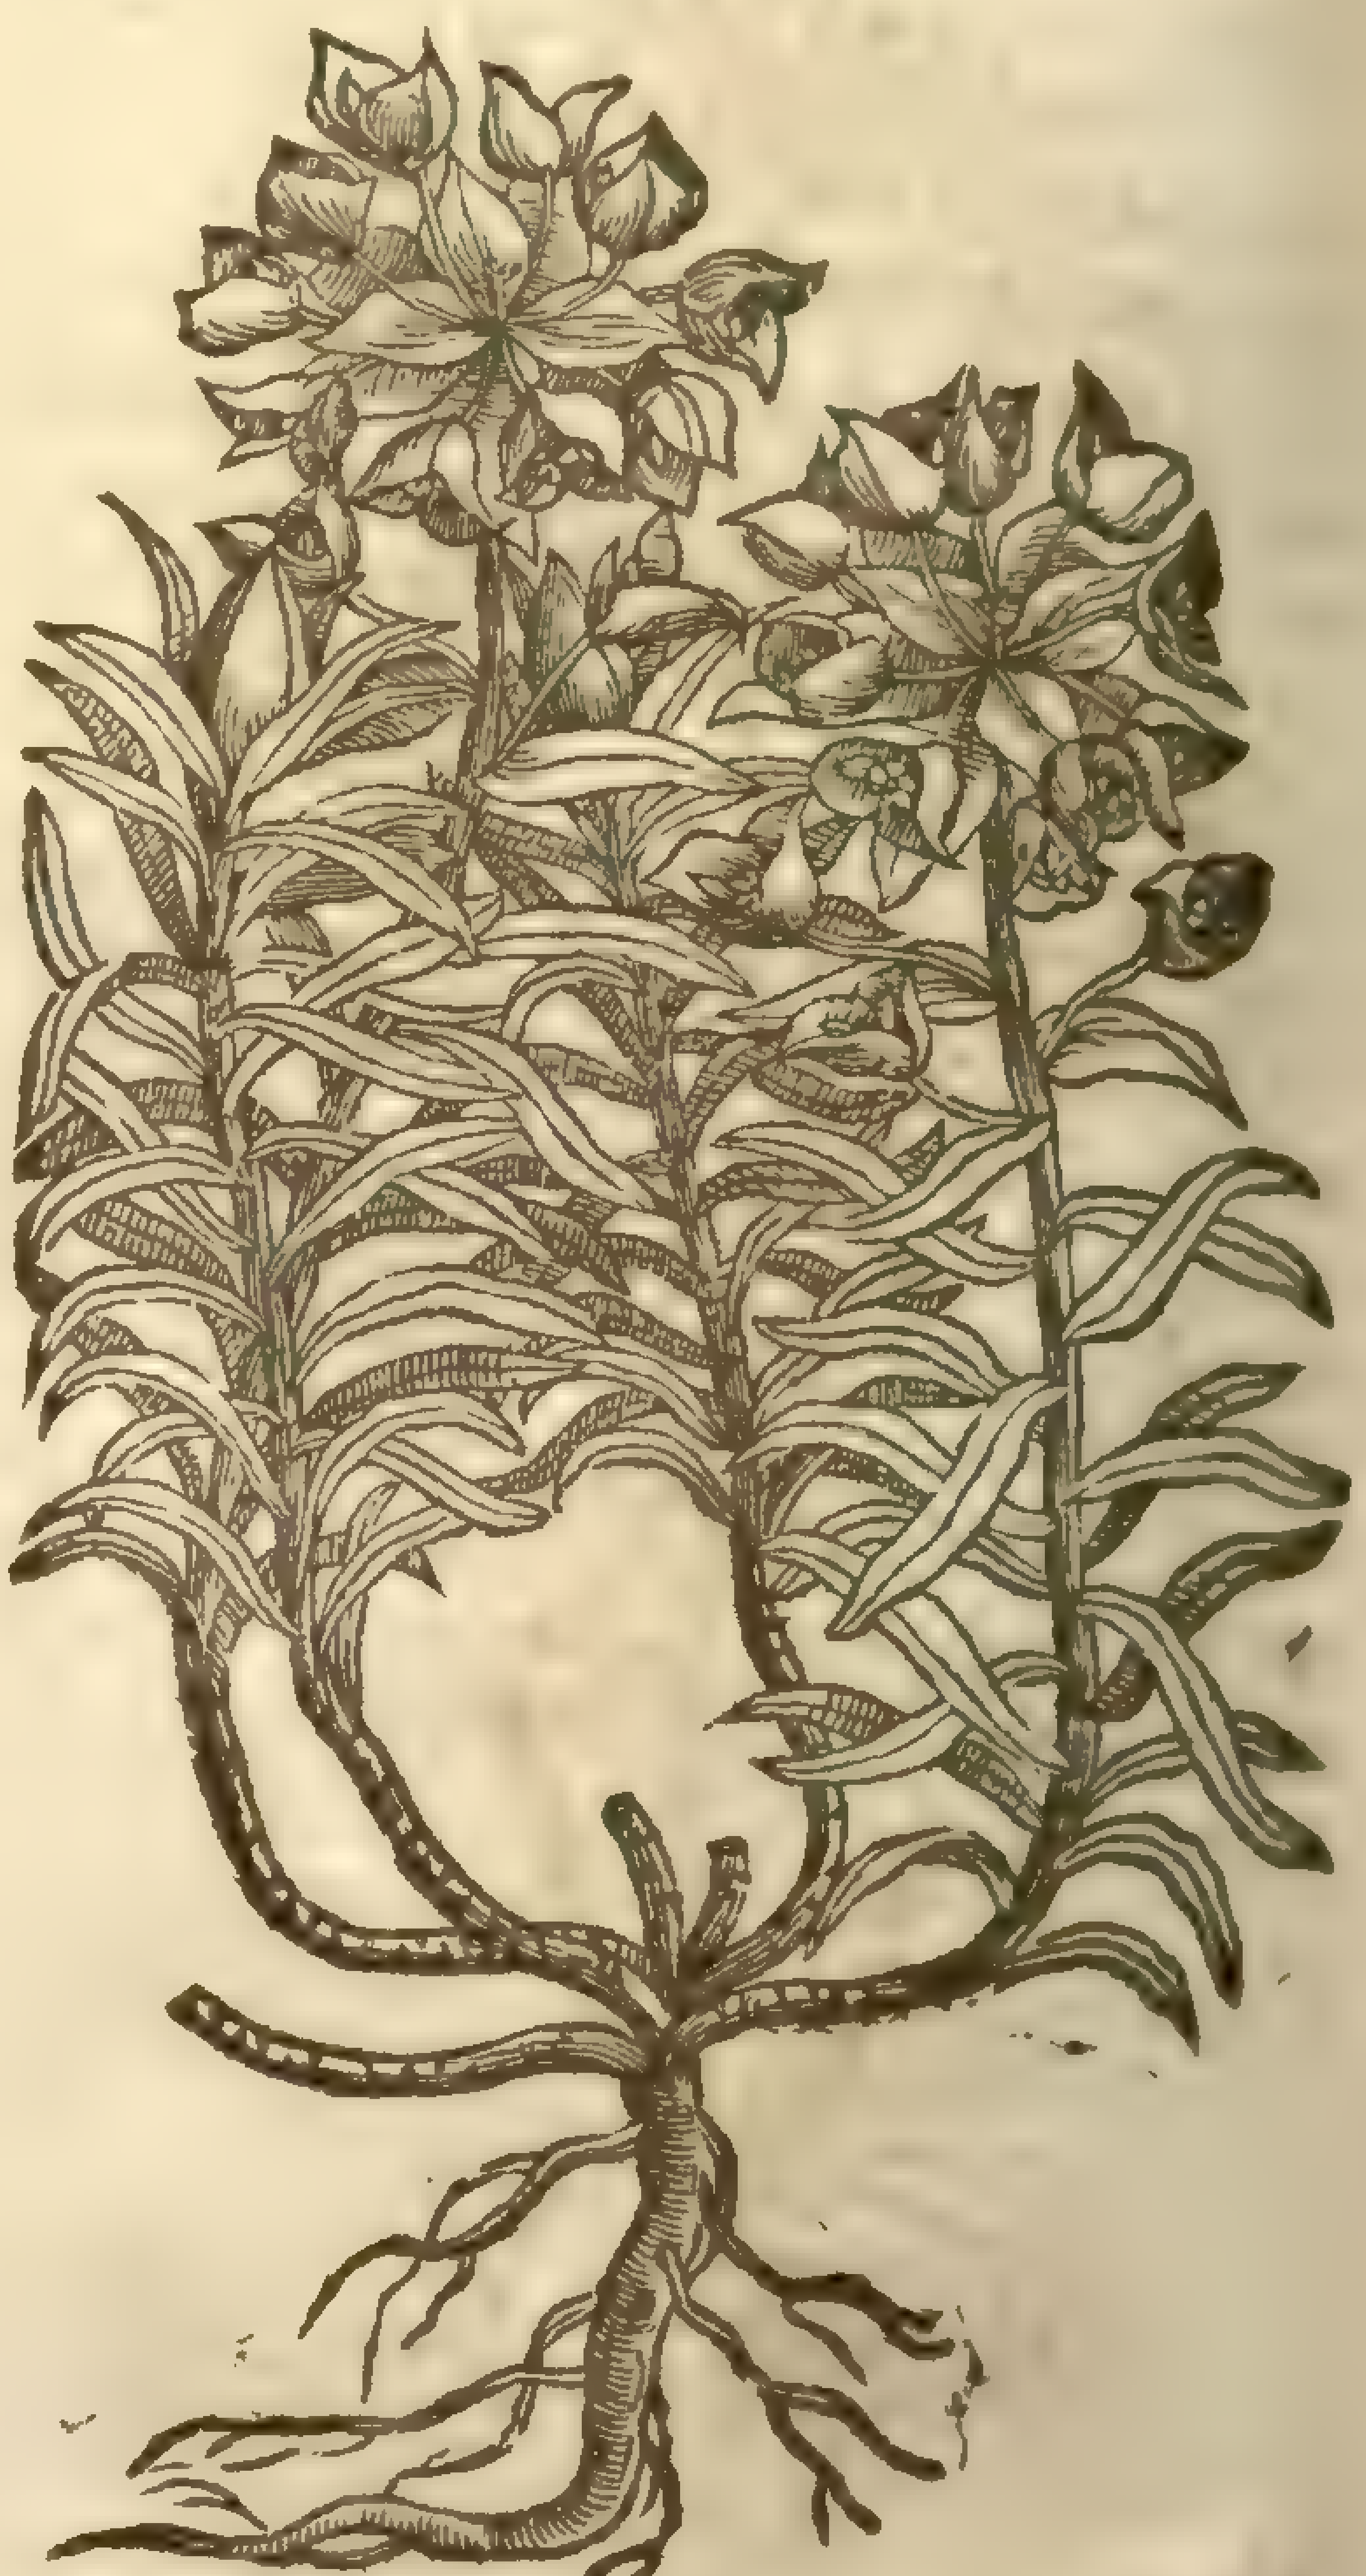
Euphorbia characias, [illegible]

† 9 *Tithymalus Characias Amygdaloides.*
Vnſauorie Wood-ſpurge.

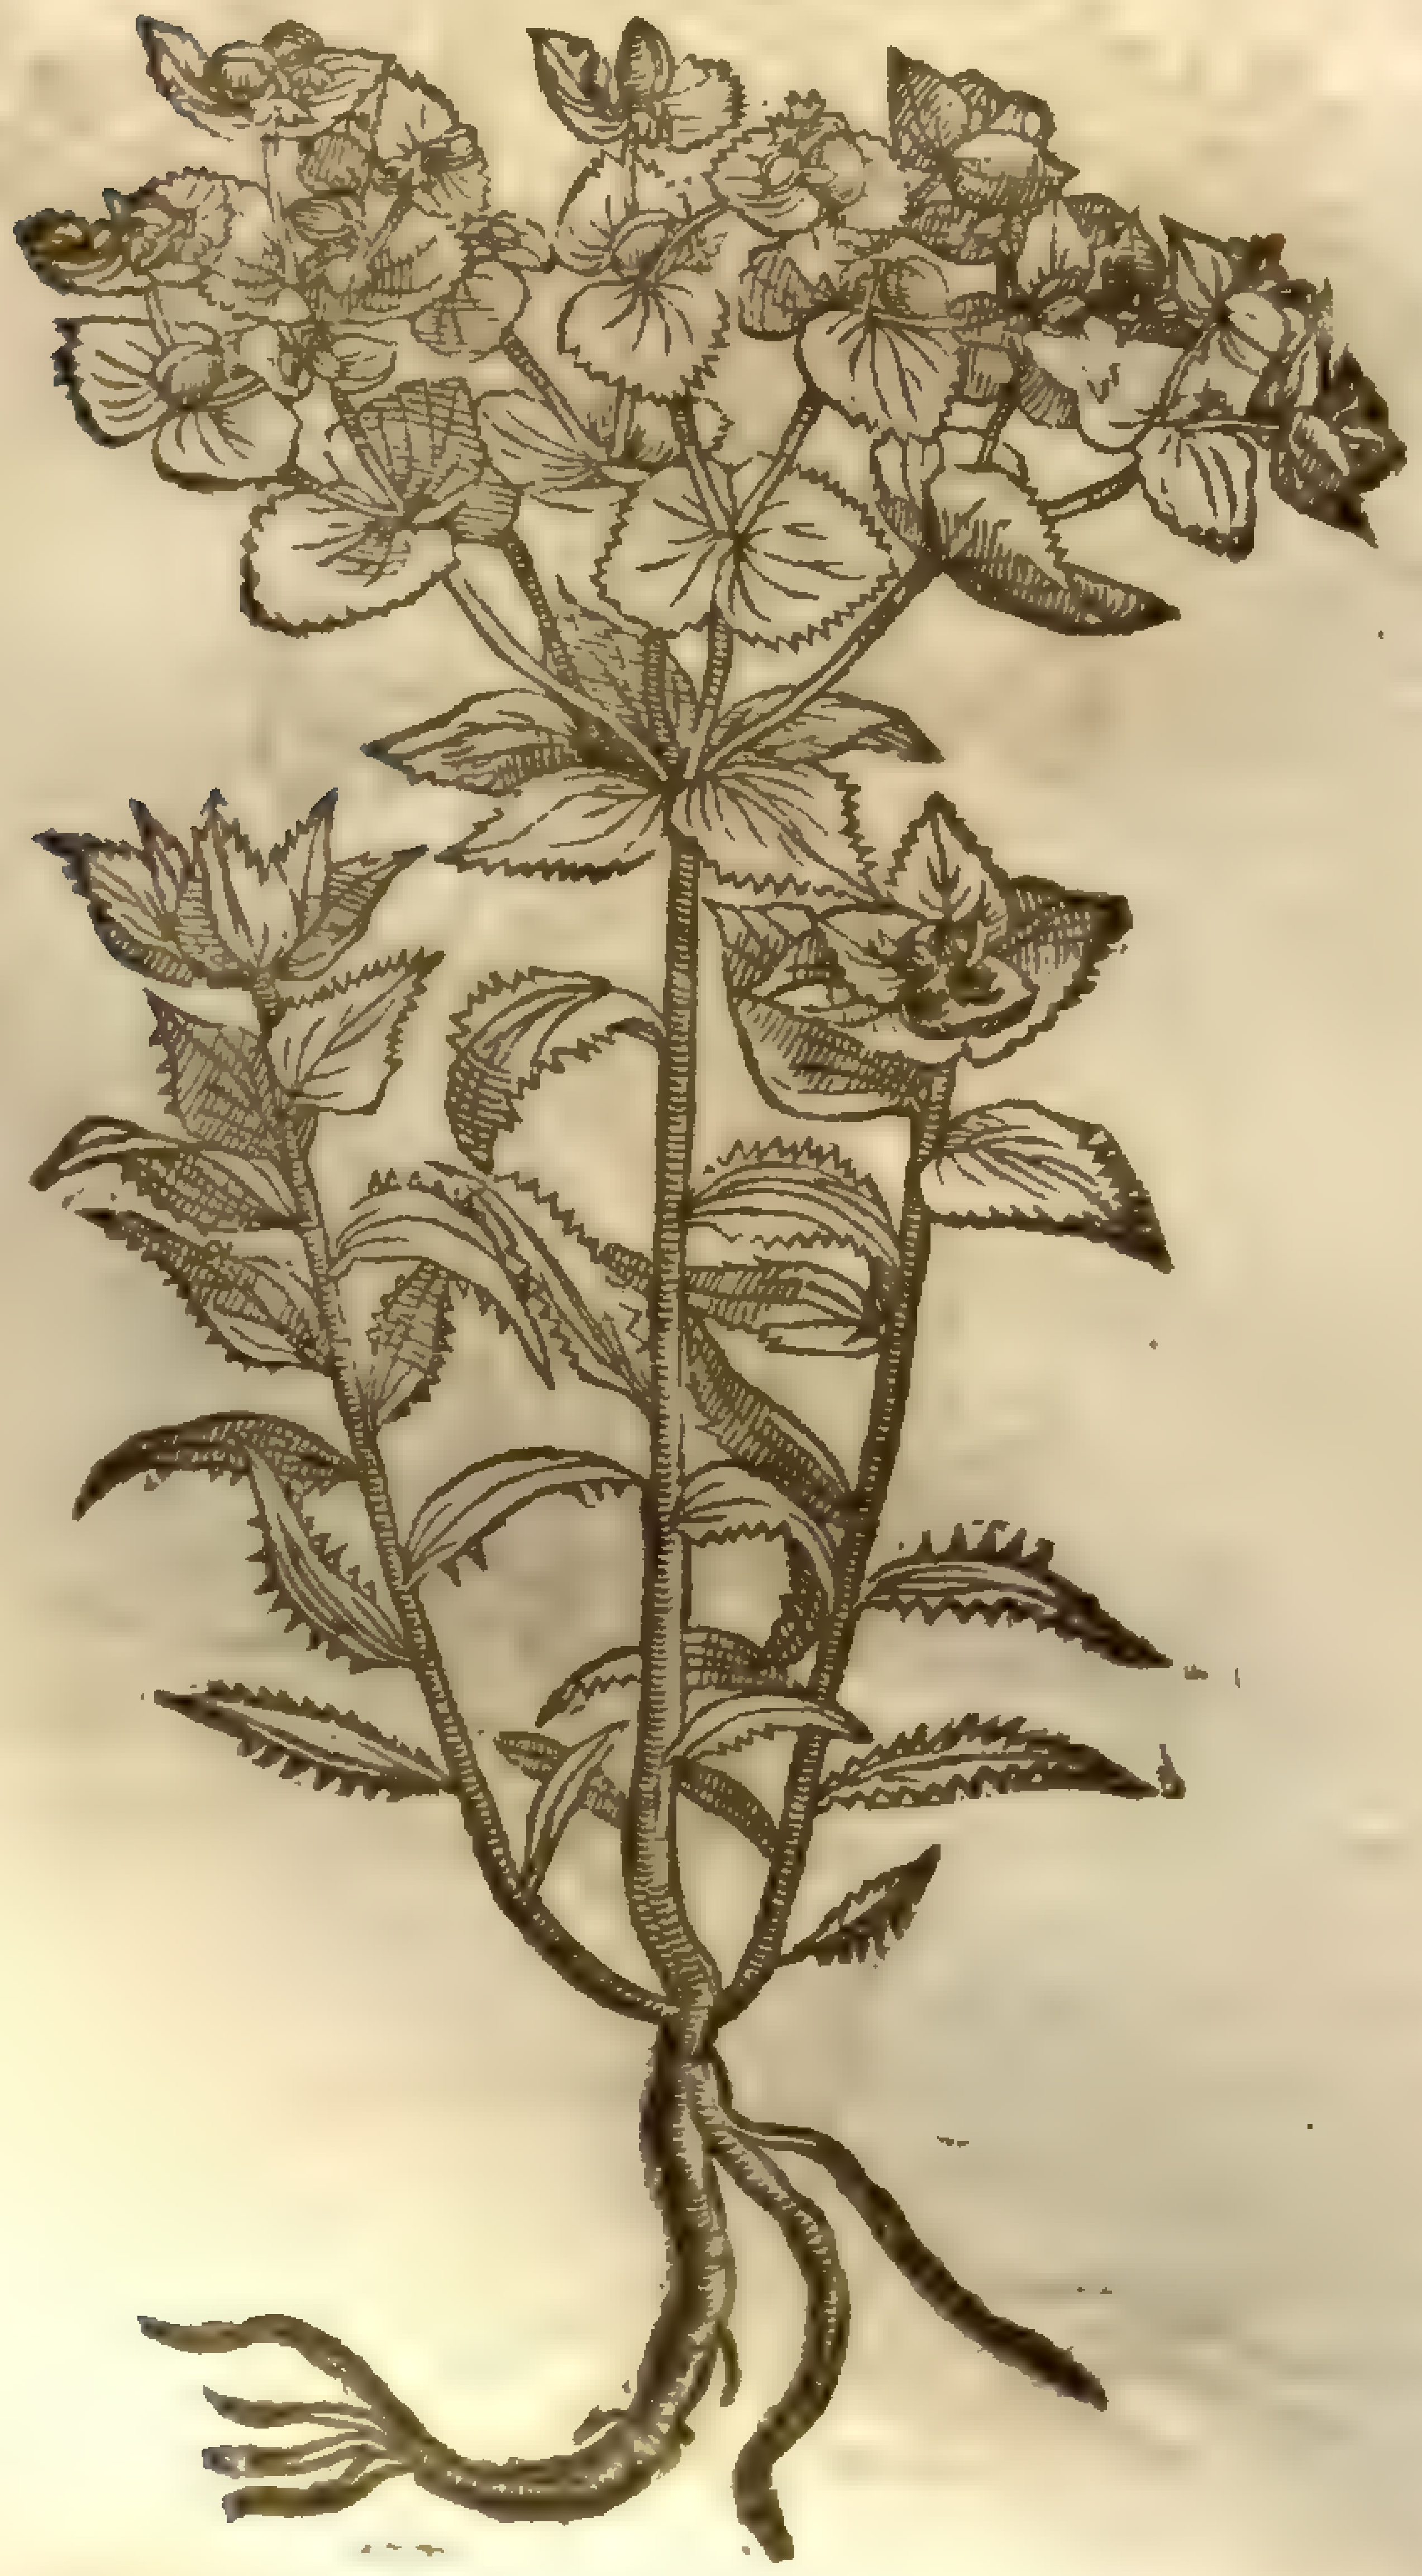


Euphorbia amygdaloides, L. [illegible]

‡ 10 *Tithymalus Characias anguſtifolius.*
Narrow leaued Wood-ſpurge.

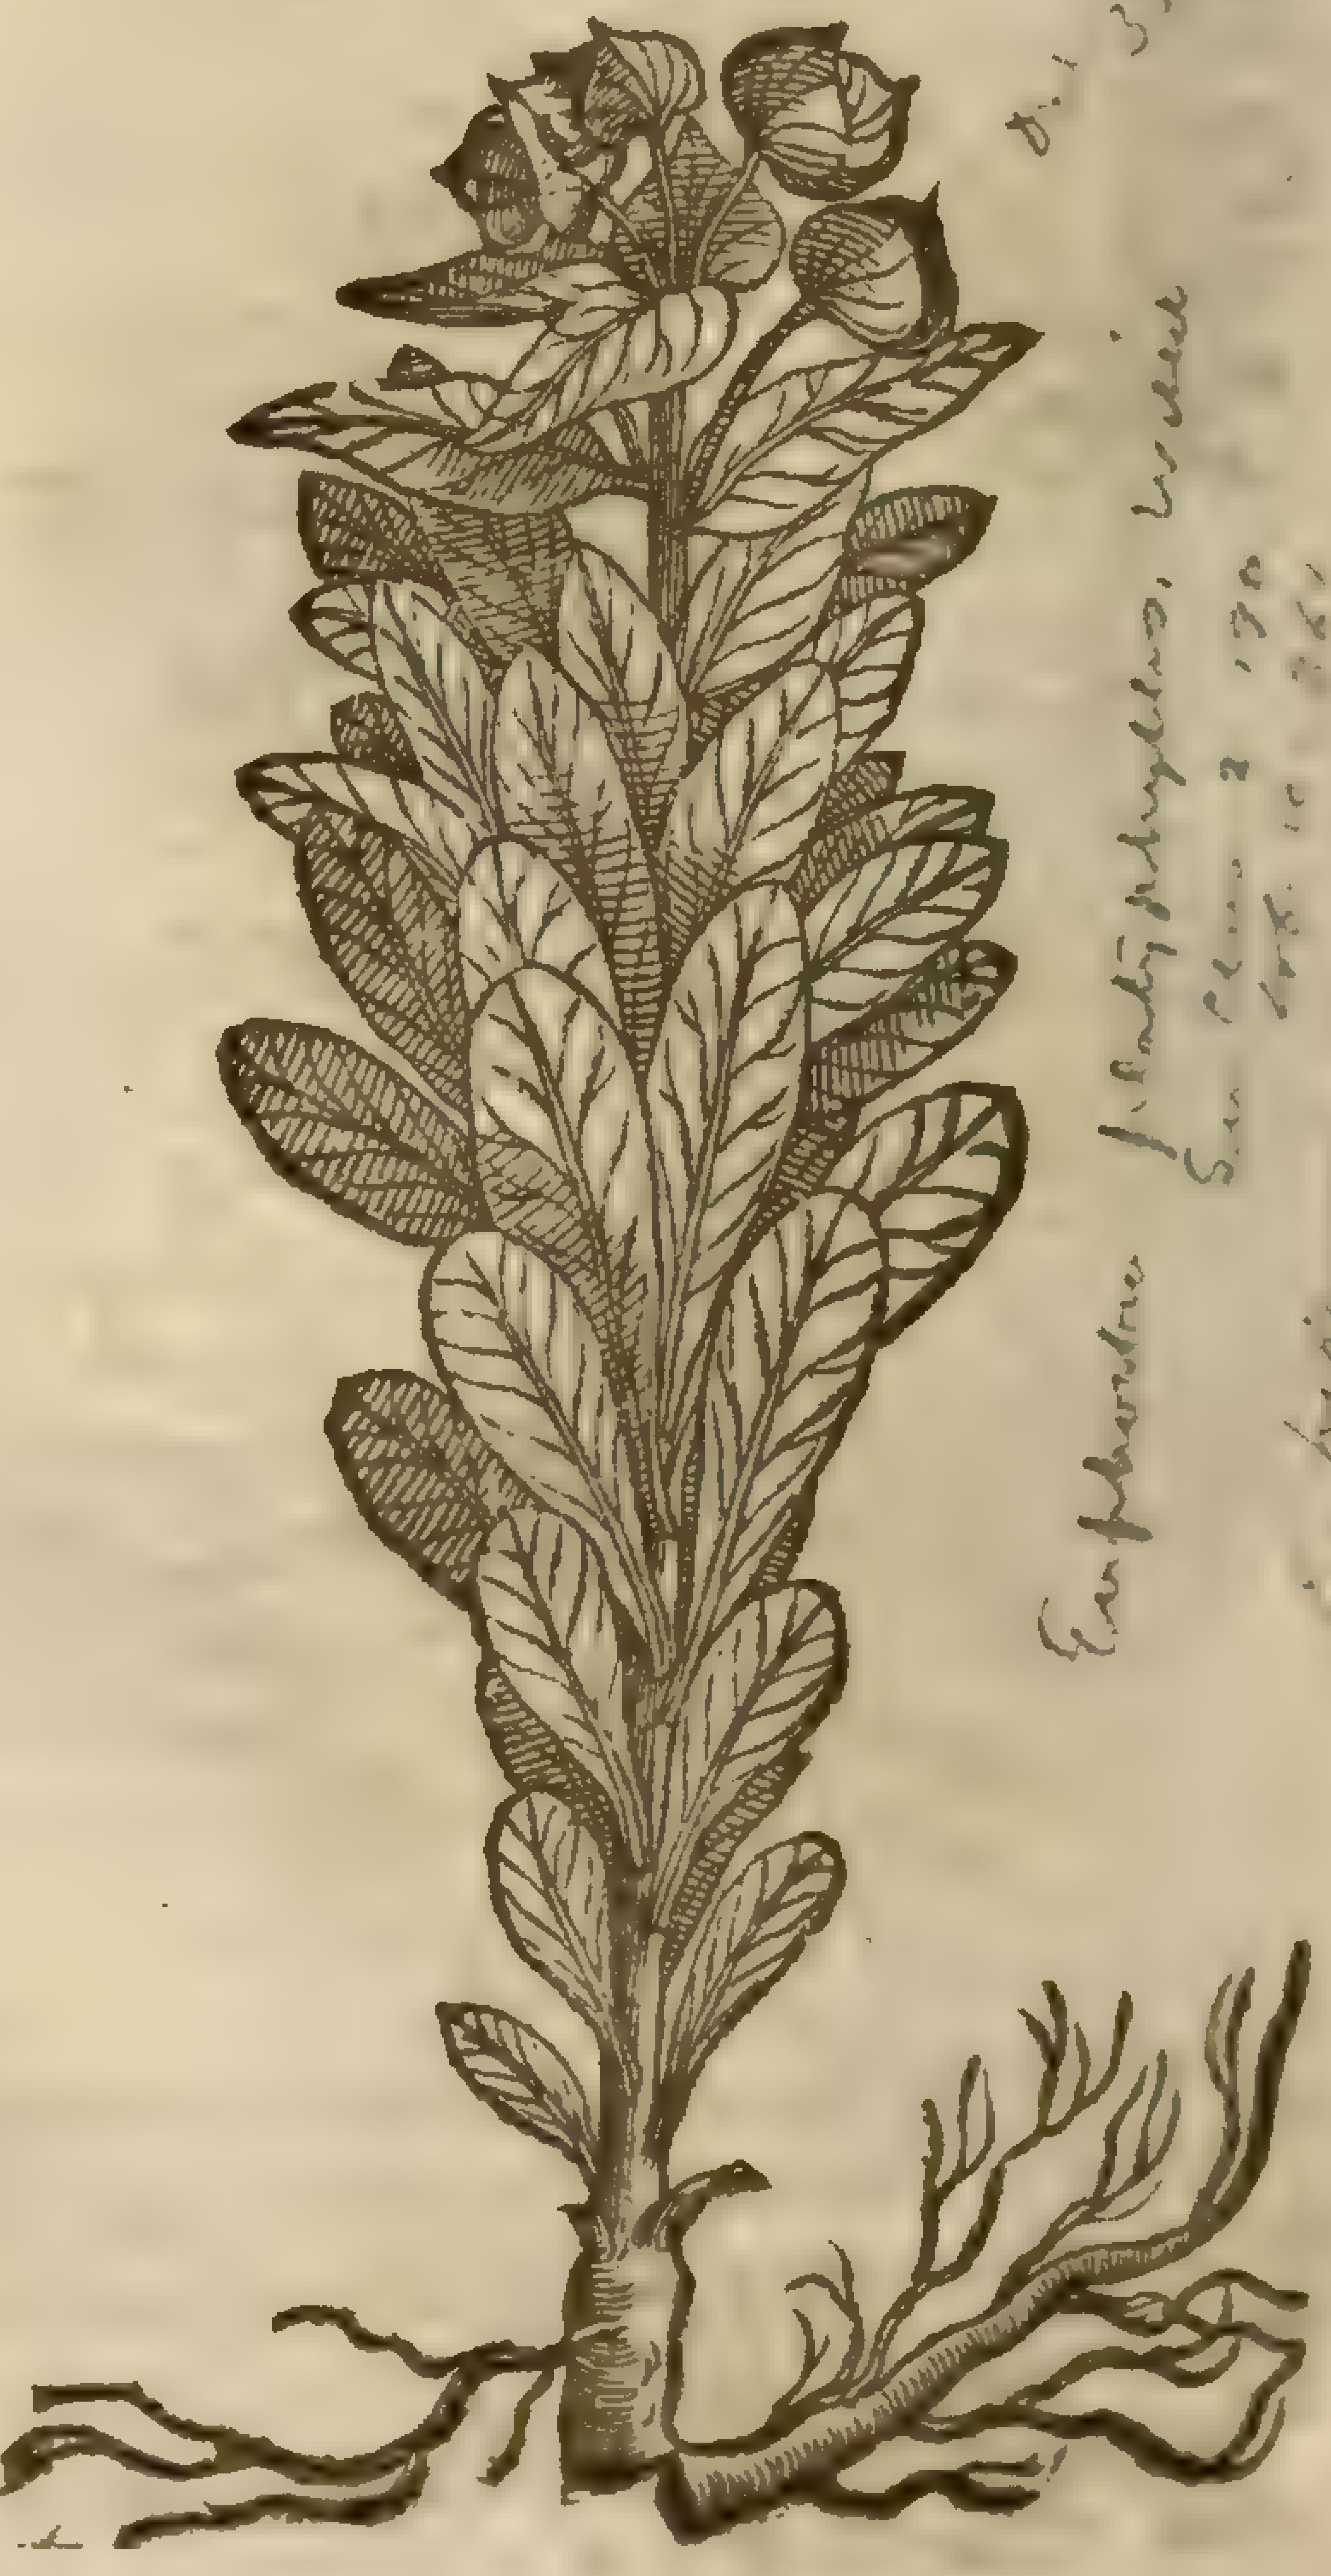


‡ 11 *Tithymalus Characias ſerratifolius.*
Cut leaued Wood-ſpurge.



Euphorbia serrata, L.
Sm. Dod. 369

12 *Tithymalus platyphyllos.*
Broad leaued Spurge.



Euphorbia platyphyllos, [illegible]
D. 372

mentioned, but diuided into ſundry branches a finger thicke, and ſomewhat hairy, not red as the others, but white: the leaues be long and narrow, whitiſh and a little downy: the floures are yellow, but in the other point like to the reſt of this kinde.

8 The eighth kinde riſeth vp with one round reddiſh ſtalke two cubits high, ſet about with long, thin, and broad leaues like the leaues of the Almond tree: the floures come forth at the top like the others, and of a yellow colour. The ſeed and root reſemble the other of his kinde.

9 The ninth (which is the common kinde growing in moſt woods) is like the former, but his leaues be ſhorter and leſſe, yet like to the leaues of an Almond tree: the floures are alſo yellow; and the ſeed contained in three cornered ſeed-veſſels.

‡ 10 This fourth kinde of *Tithymalus Characias*, or Valley Tithymale (for ſo the name imports) hath long, yet ſomewhat narrower leaues than the former, whitiſh alſo, yet not hoary; the vmbels or tufts of floures are of a greeniſh yellow, which before they be opened doe repreſent the
vmbels or tufts of floures are of a greeniſh yellow, which before they be opened doe repreſent the
ſhape of a longiſh fruit, as an Almond, yet in colour it is like the reſt of the leaues: the floures and ſeeds are like thoſe of the former, and the root deſcends deepe into the ground.

11 The fifth *Characias* hath alſo long leaues ſharpe pointed, and broader at their ſetting on, and of a light greene colour, and ſnipt or cut about the edges like the teeth of a ſaw. The vmbels are ſmaller, yet carry ſuch floures and ſeeds as the former. ‡

12 This kinde hath great broad leaues like the young leaues of Woad, ſet round about a ſtalk of a foot high, in good order: on the top whereof grow the floures in ſmall platters like the common kinde, of a yellow colour declining to purple. The whole plant is full of milke, as are all the reſt before ſpecified.

‡ 13 *Tithymalus Dendroides ex Cod. Caſareo.*
Great Tree Tithymale.

14 *Eſula maior Germanica.*
Quackſaluers Turbith.

Euphorbia palustris
[illegible]

13 There is another kinde of Tithymale, whoſe figure was taken forth of a Manuſcript of the Emperors by *Dodonæus*, that hath a ſtalke of the bigneſſe of a mans thigh, growing like a tree vnto the height of two tall men, diuiding it ſelfe into ſundry armes or branches toward the top, of a red colour. The leaues are ſmall and tender, much like vnto the leaues of *Myrtus*: the ſeed is like vnto that of wood Tithymale, or *Characias*, according to the authority of *Peter Bellone.*

14 There is a kinde of Tithymale called *Eſula maior*, which *Martinus Rulandus* had in great

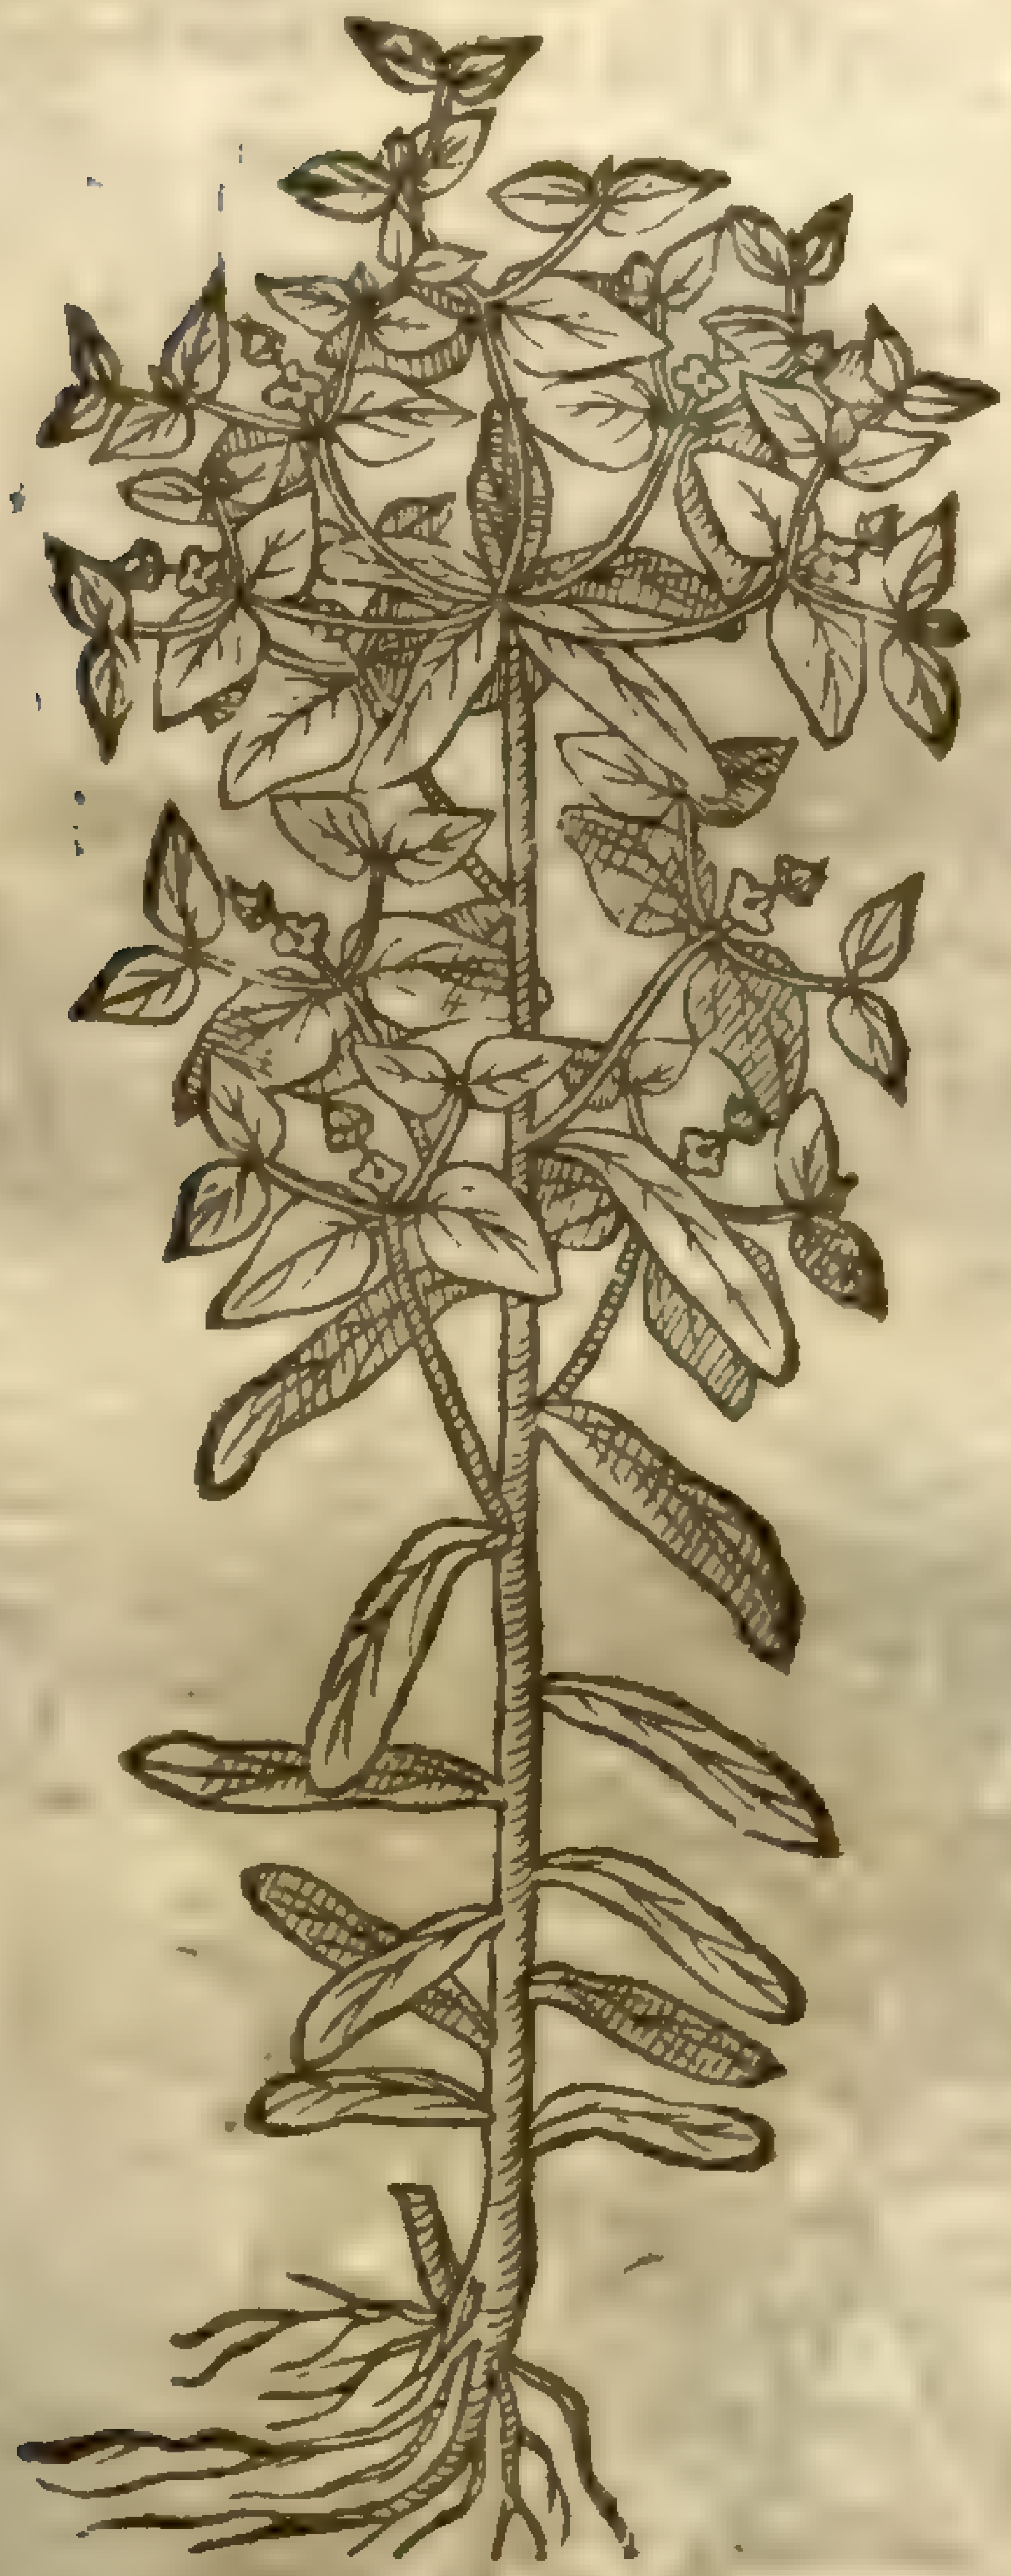
veneration, as by his extraction which he vſed for many infirmities may and doth appeare at large, in his booke entituled *Centuriæ curationum Empiricarum*, dedicated vnto the duke of Bauaria. This plant of *Rulandus* hath very great and many roots couered ouer with a thicke barke, plaited as it were with many ſurculous ſprigs; from which ariſe ſundry ſtrong and large ſtemmes of a fingers thickeneſſe, in height two cubits, beſet with many pretty large and long leaues like *Lathyris*, but that they are not ſo thicke: the ſeed and floure are not vnlike the other Tithymales.

15 This is like the fifth, ſaue that it hath ſmaller and more feeble branches; and the whole plant is altogether leſſer, growing but a ſpan or ſome foot high; and the floures are of a red or els a greene colour.

16 There is another rare and ſtrange kinde of *Eſula*, in alliance and likeneſſe neere vnto *Eſula minor*, that is the ſmall *Eſula* or *Pityuſa* vſed among the Phyſitions and Apothecaries of Venice as a kind of *Eſula*, in the confection of their *Benedicta* and Catharticke pills, in ſtead of the true *Eſula*: It yeeldeth a fungous, rough, and browne ſtalke two cubits high, diuiding it ſelfe into ſundry branches, furniſhed with ſtiffe and fat leaues like Liquorice, growing together by couples. The floures are pendulous, hanging downe their heads like ſmall bells, of a purple colour, and within they are of a darke colour like *Ariſtolochia rotunda*.

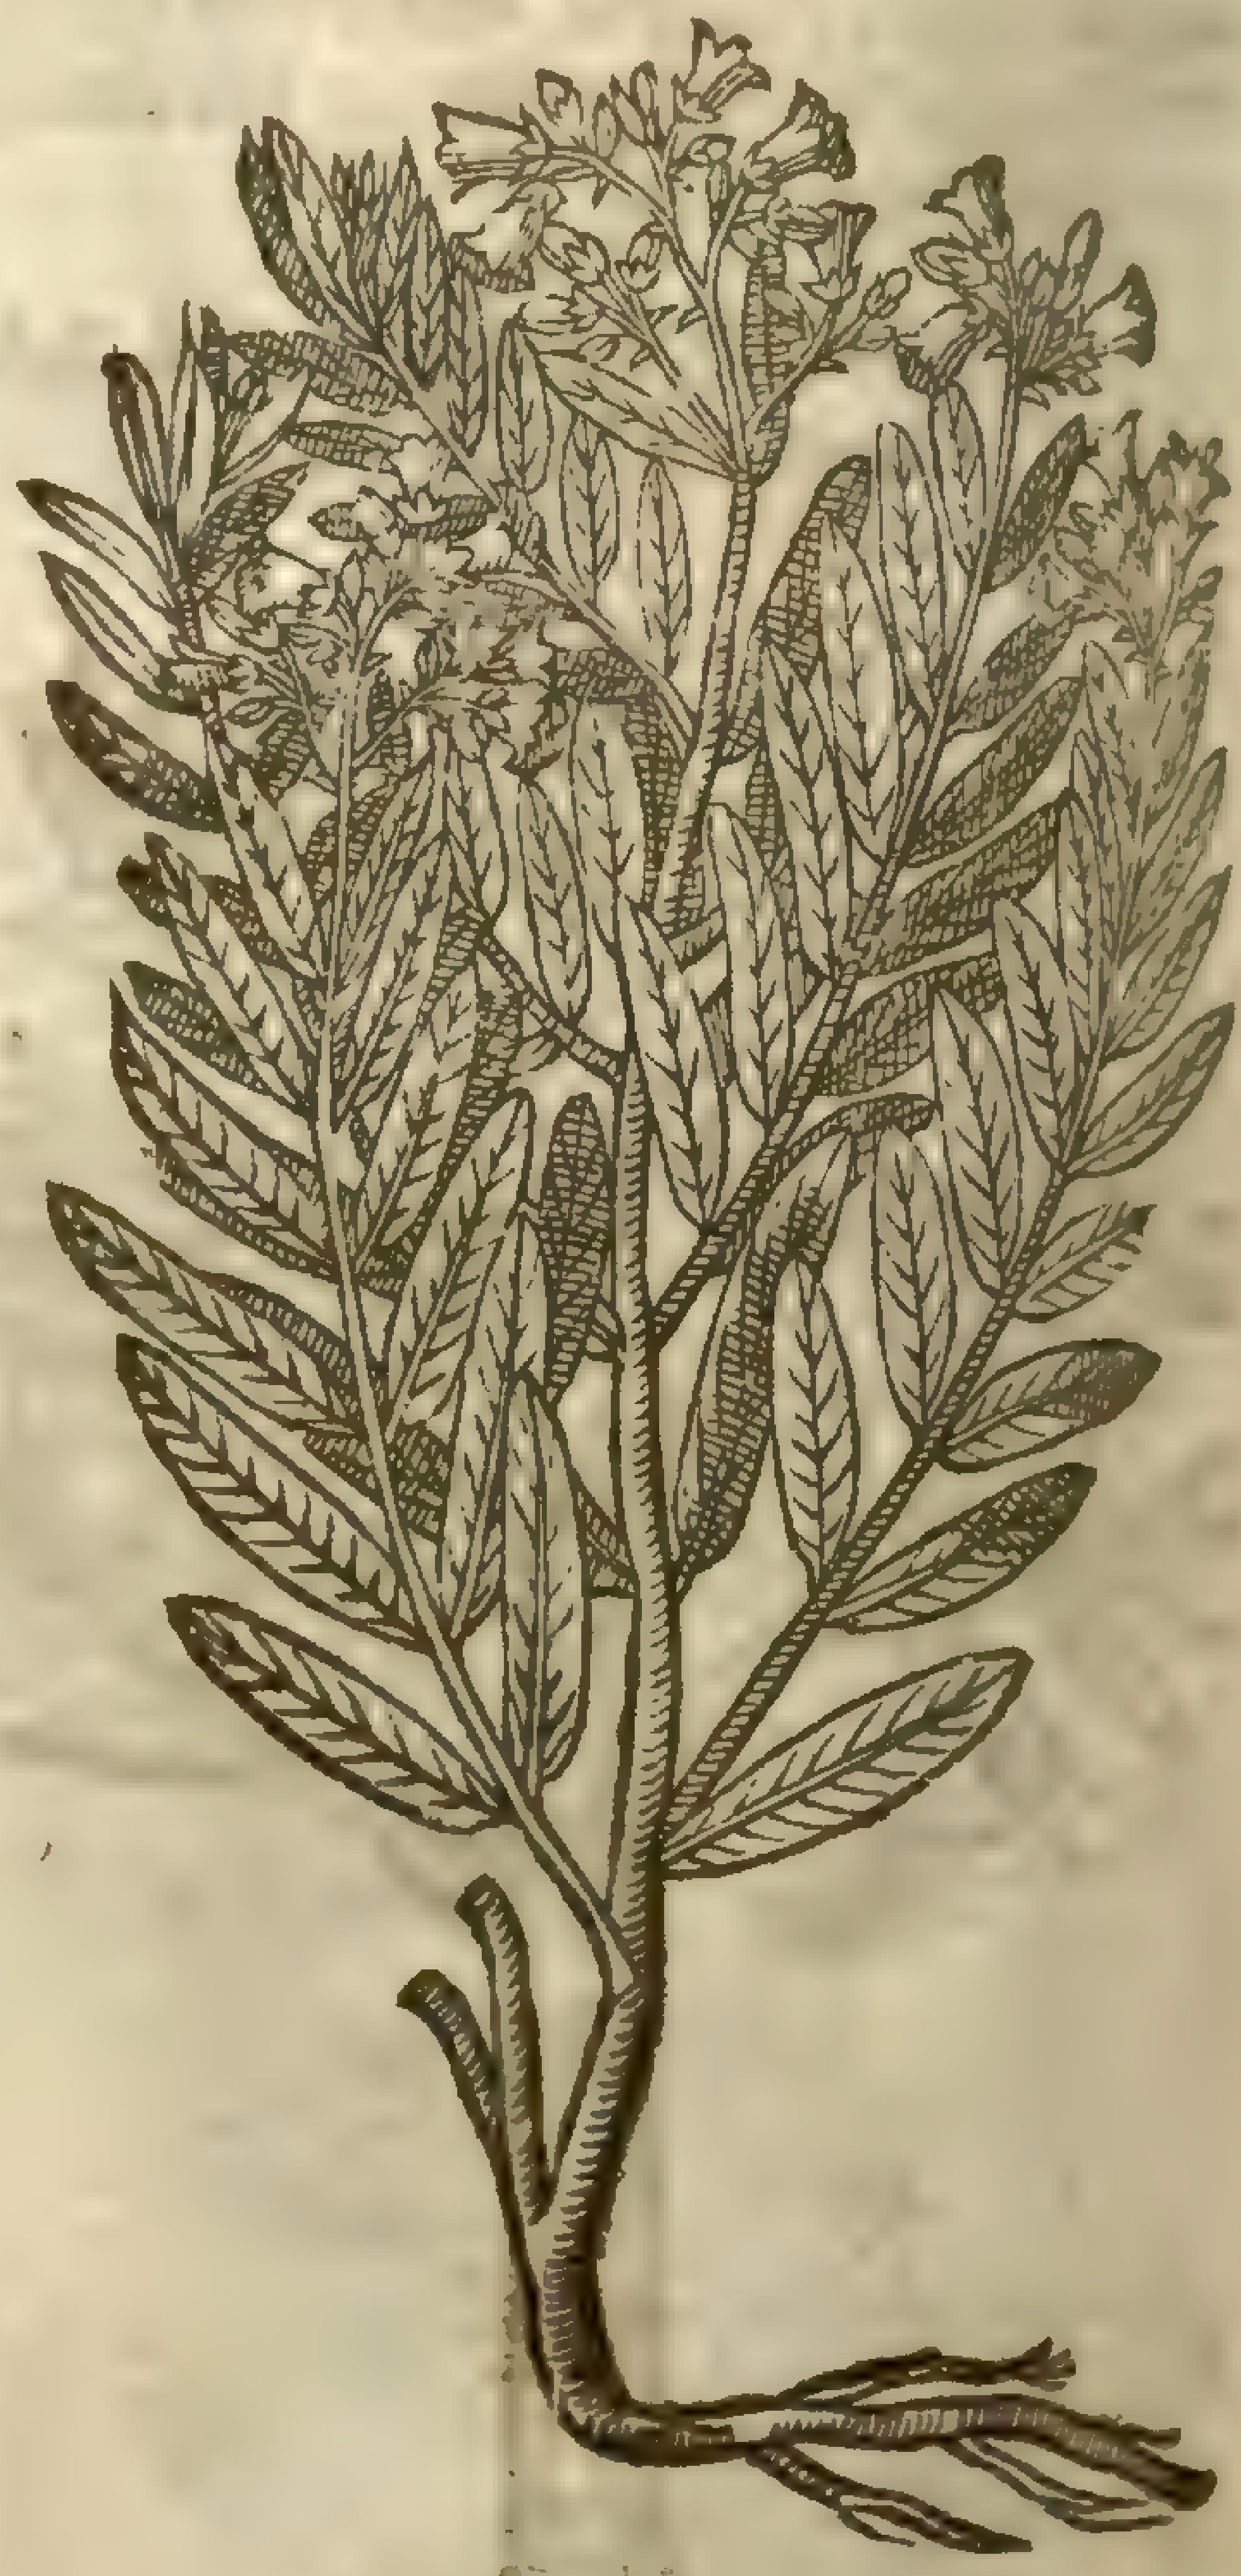
apocynum venetum [illegible] multi aut

† 15 *Eſula minor, ſeu Pityuſa.*
Small Eſula.



Euphorbia dulcis, L.
En. Bot. ic. 358.

‡ 16 *Eſula Veneta maritima.*
Venetian Sea-Spurge.



‡ 17 There growes in many chalkie grounds and ſuch dry hilly places, among corne, a ſmall Spurge which ſeldome growes to two handfuls high; the root is ſmall, and ſuch alſo are the ſtalkes and leaues, which grow pretty thicke thereon; which oft times are not ſharpe, but flat pointed: the ſeed-veſſels and floures are very ſmall, yet faſhioned like thoſe of the other Tithymales. It is to be found in corne fields in Iuly and Auguſt. ‡

18 The bigger *Cataputia* or the common garden Spurge is beſt knowne of all the reſt, and moſt vſed; wherefore I will not ſpend time about his deſcription.

The ſmall kinde of *Cataputia* is like vnto the former, but leſſer, whereby it may eaſily be diſtinguiſhed; being ſo well knowne vnto all, that I ſhall not need to deſcribe it.

‡ Theſe two (I meane the bigger and leſſer *Cataputia* of our Author) differ not but by reaſon of their age, and the fertileneſſe and barrenneſſe of the ſoile, whence the leaues are ſometimes broader, and otherwhiles narrower. ‡

‡ 17 *Eſula exigua Tragi.*

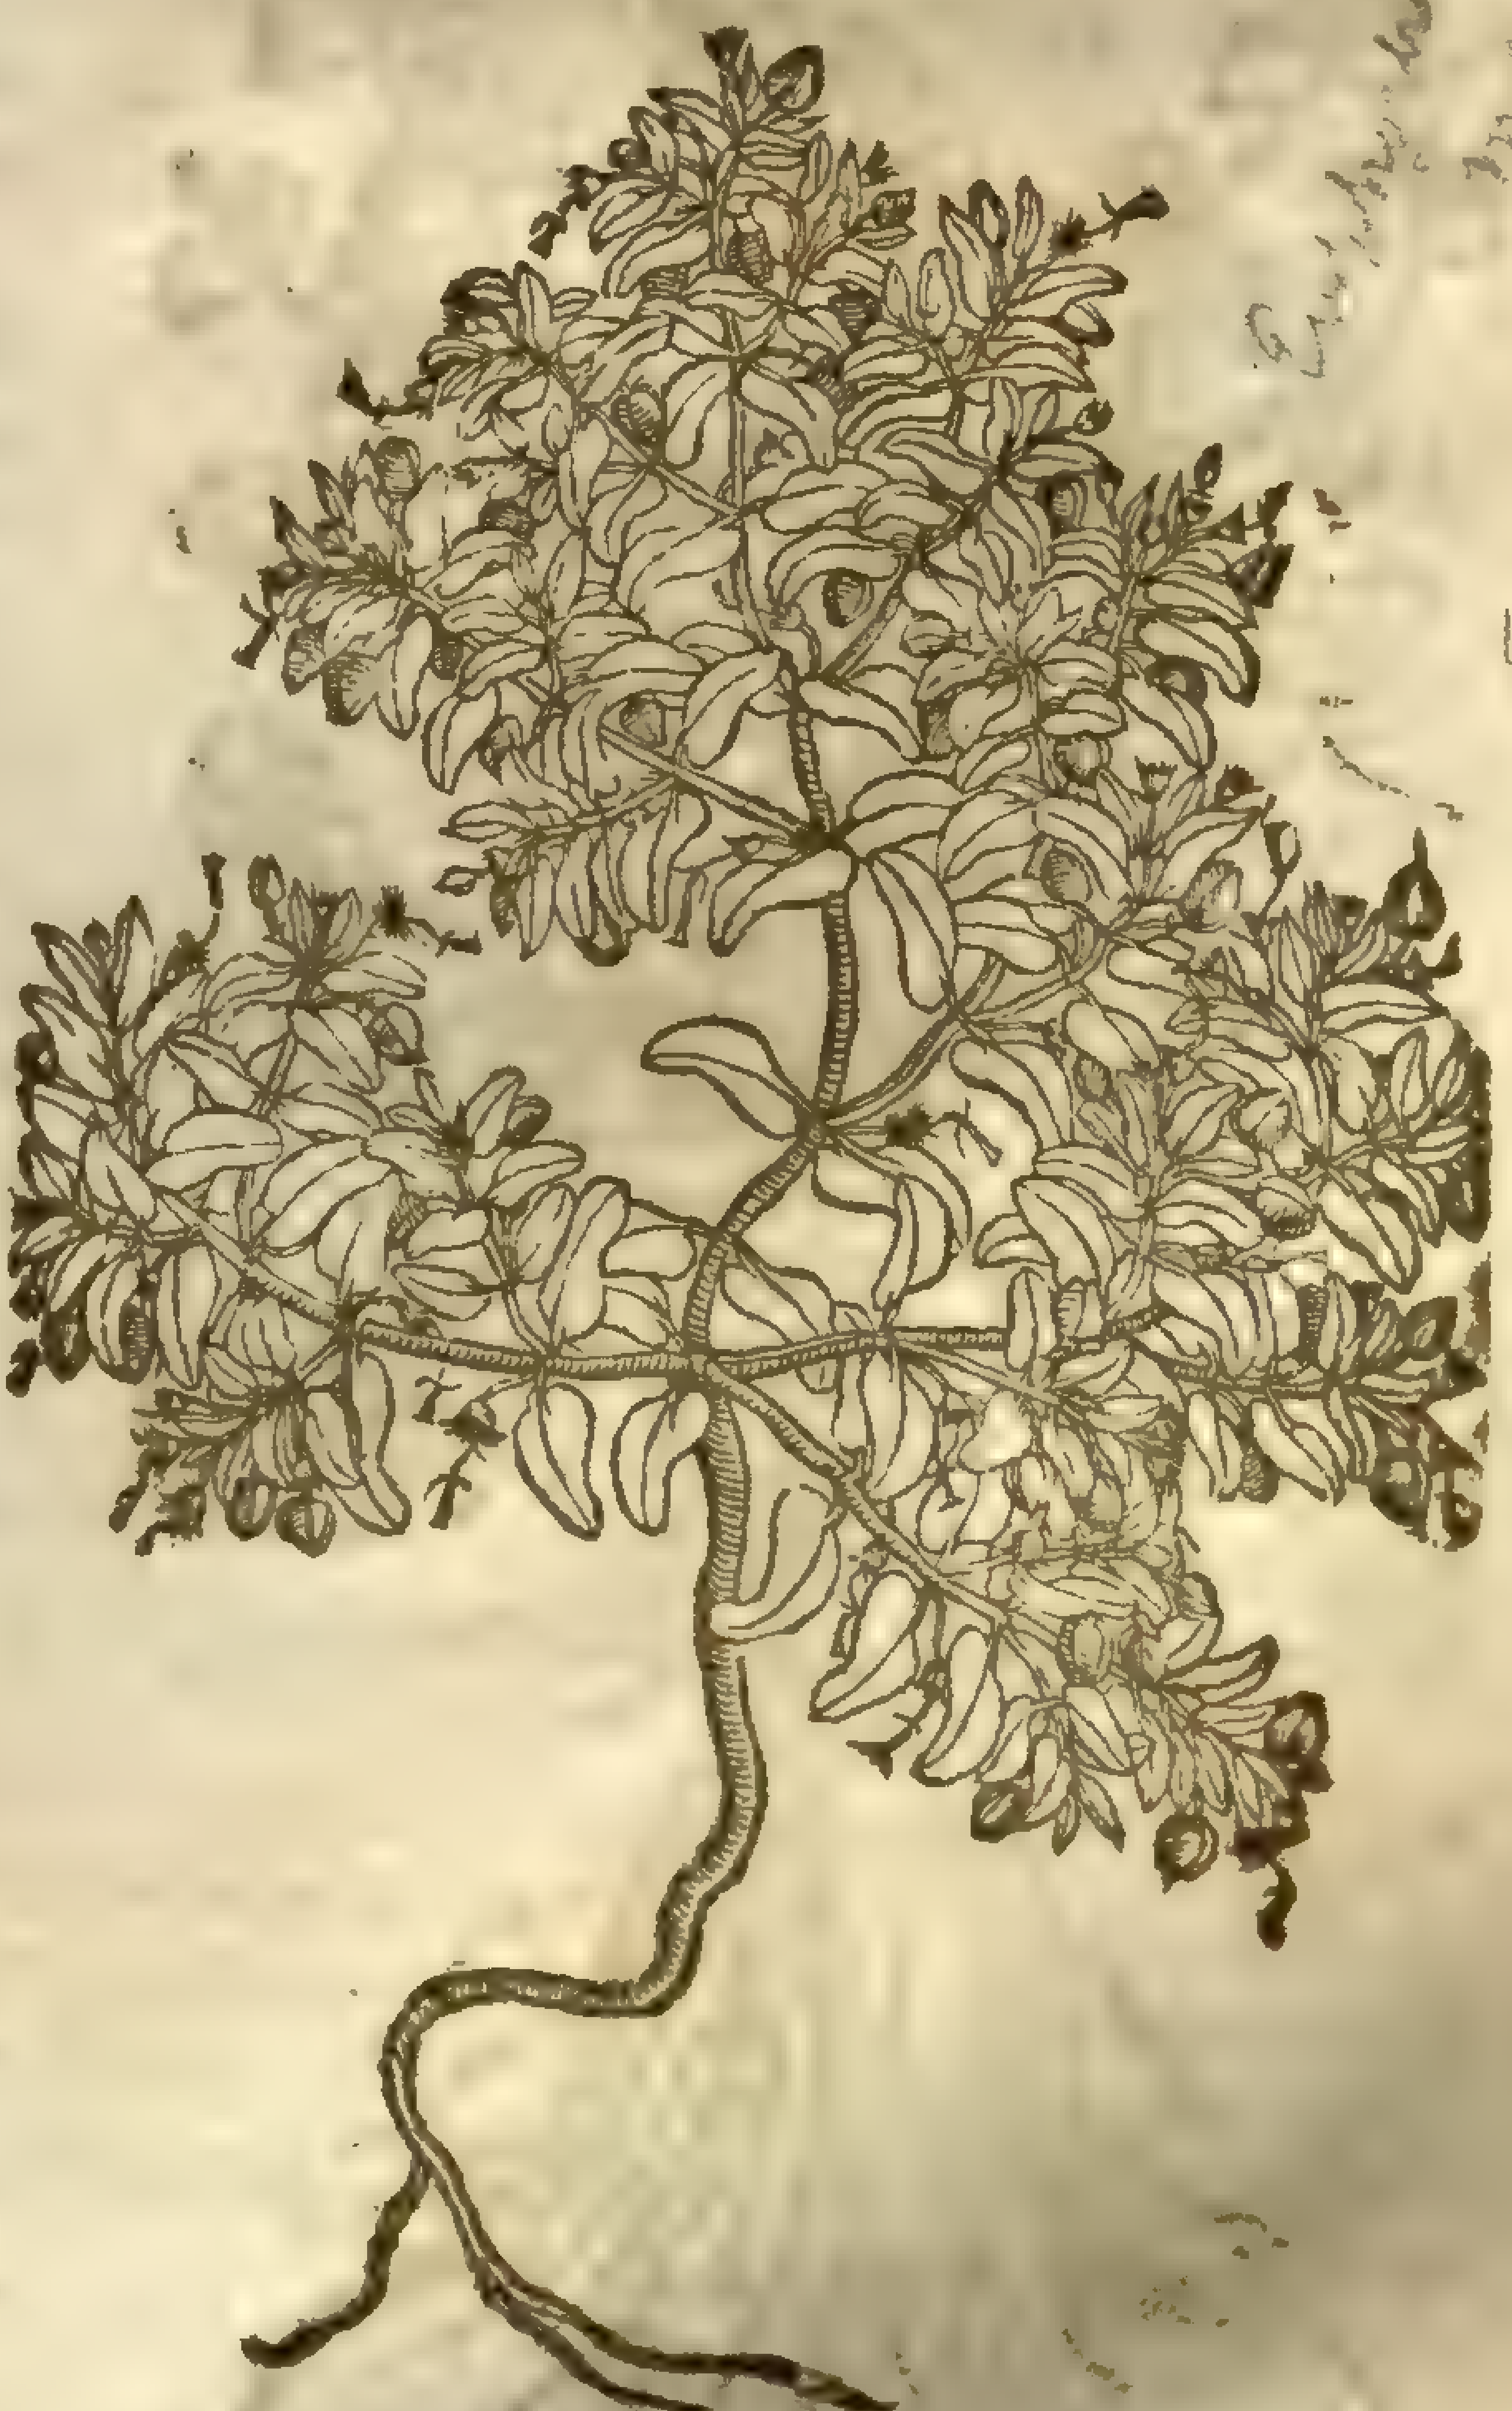
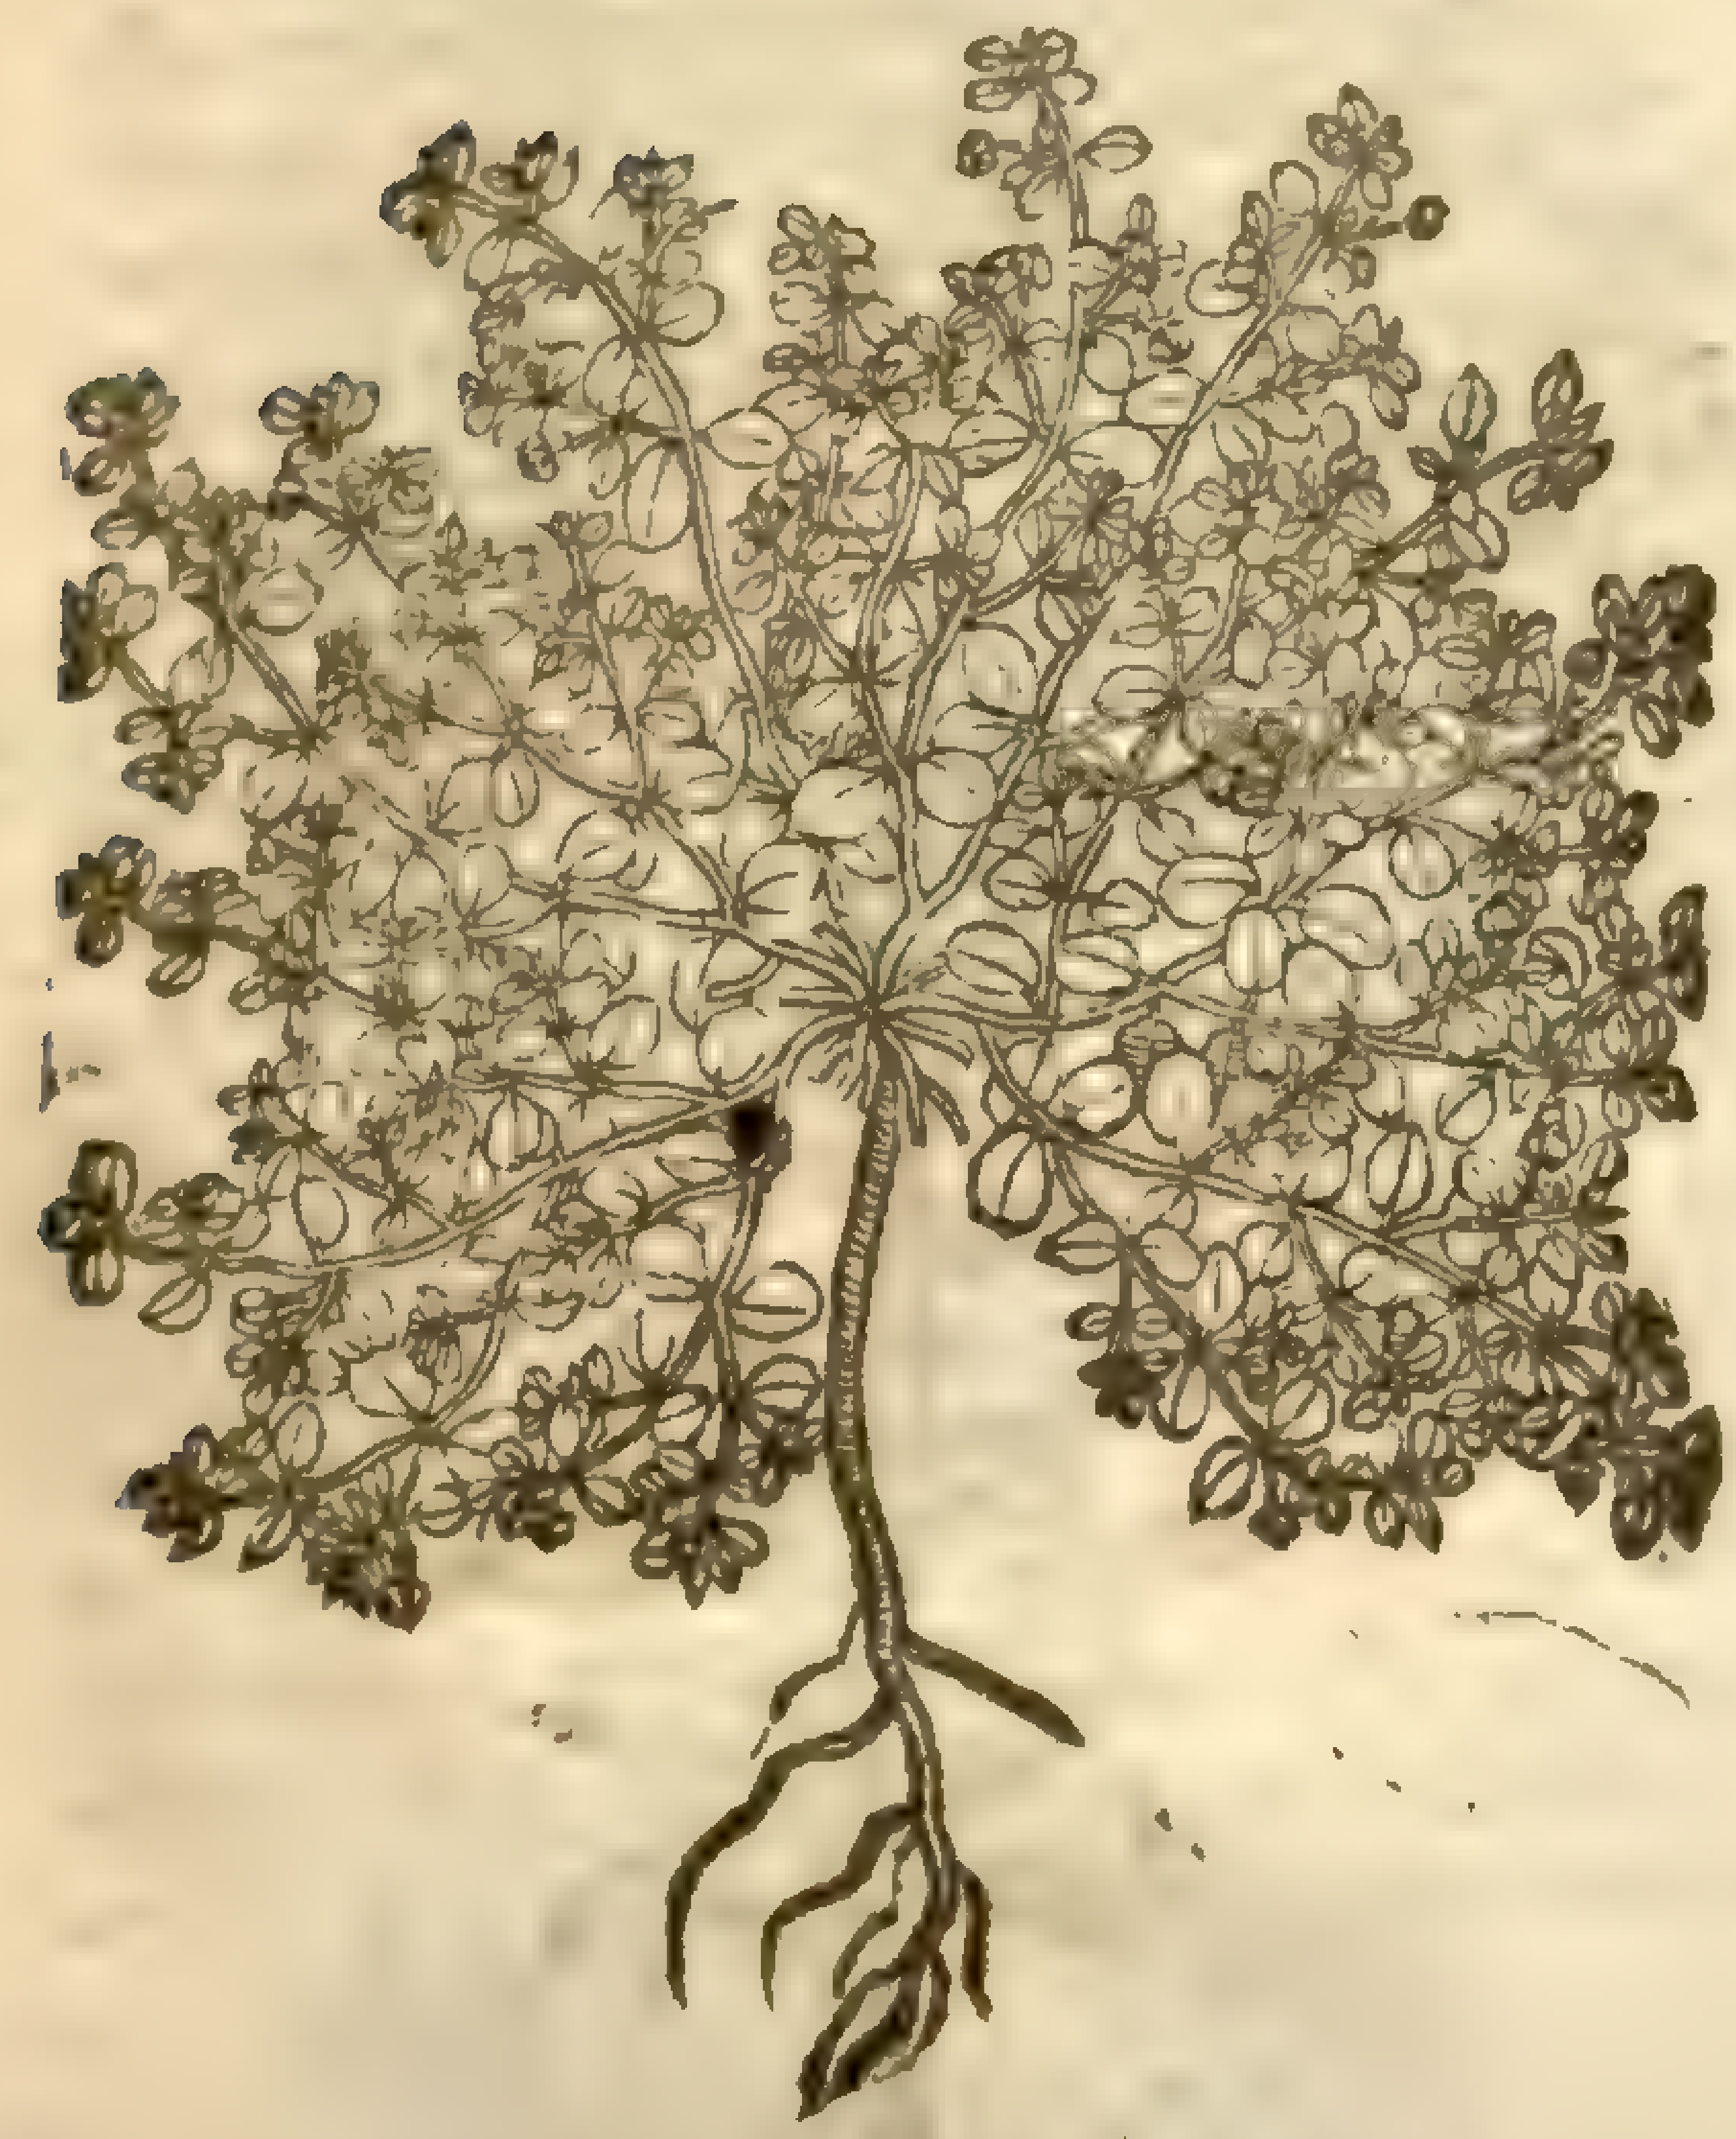
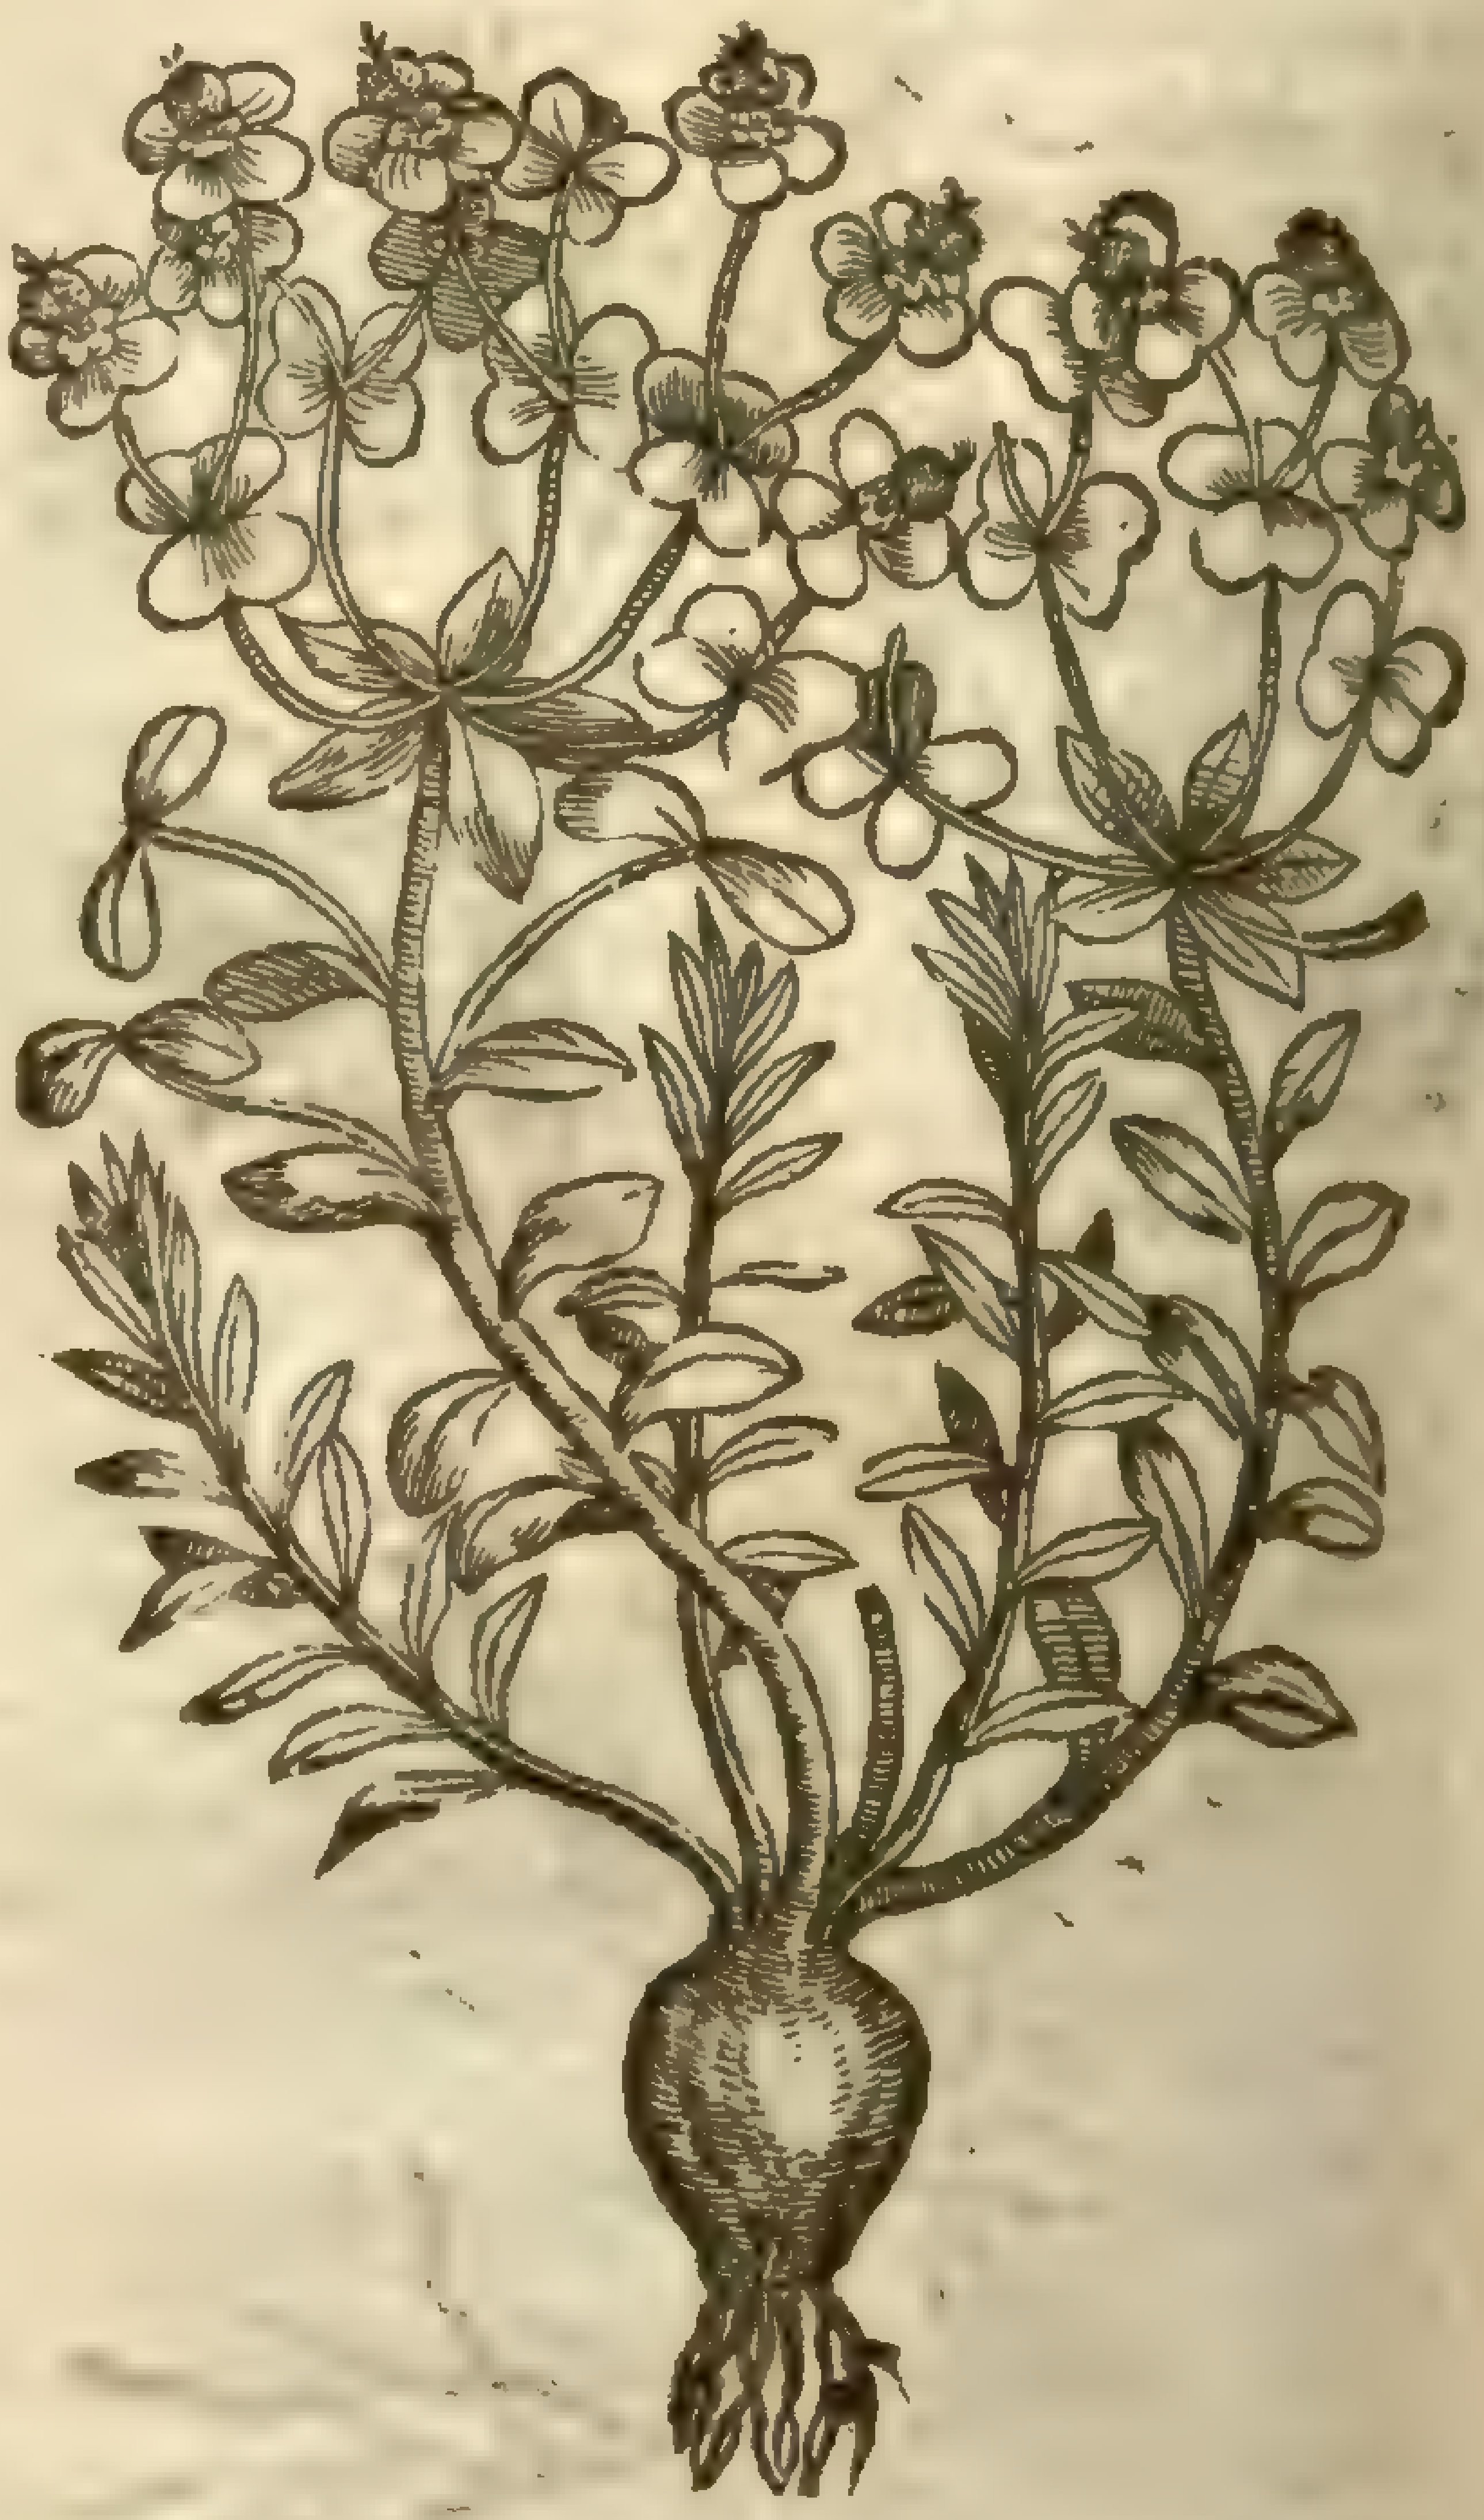
Lob. ic. 363



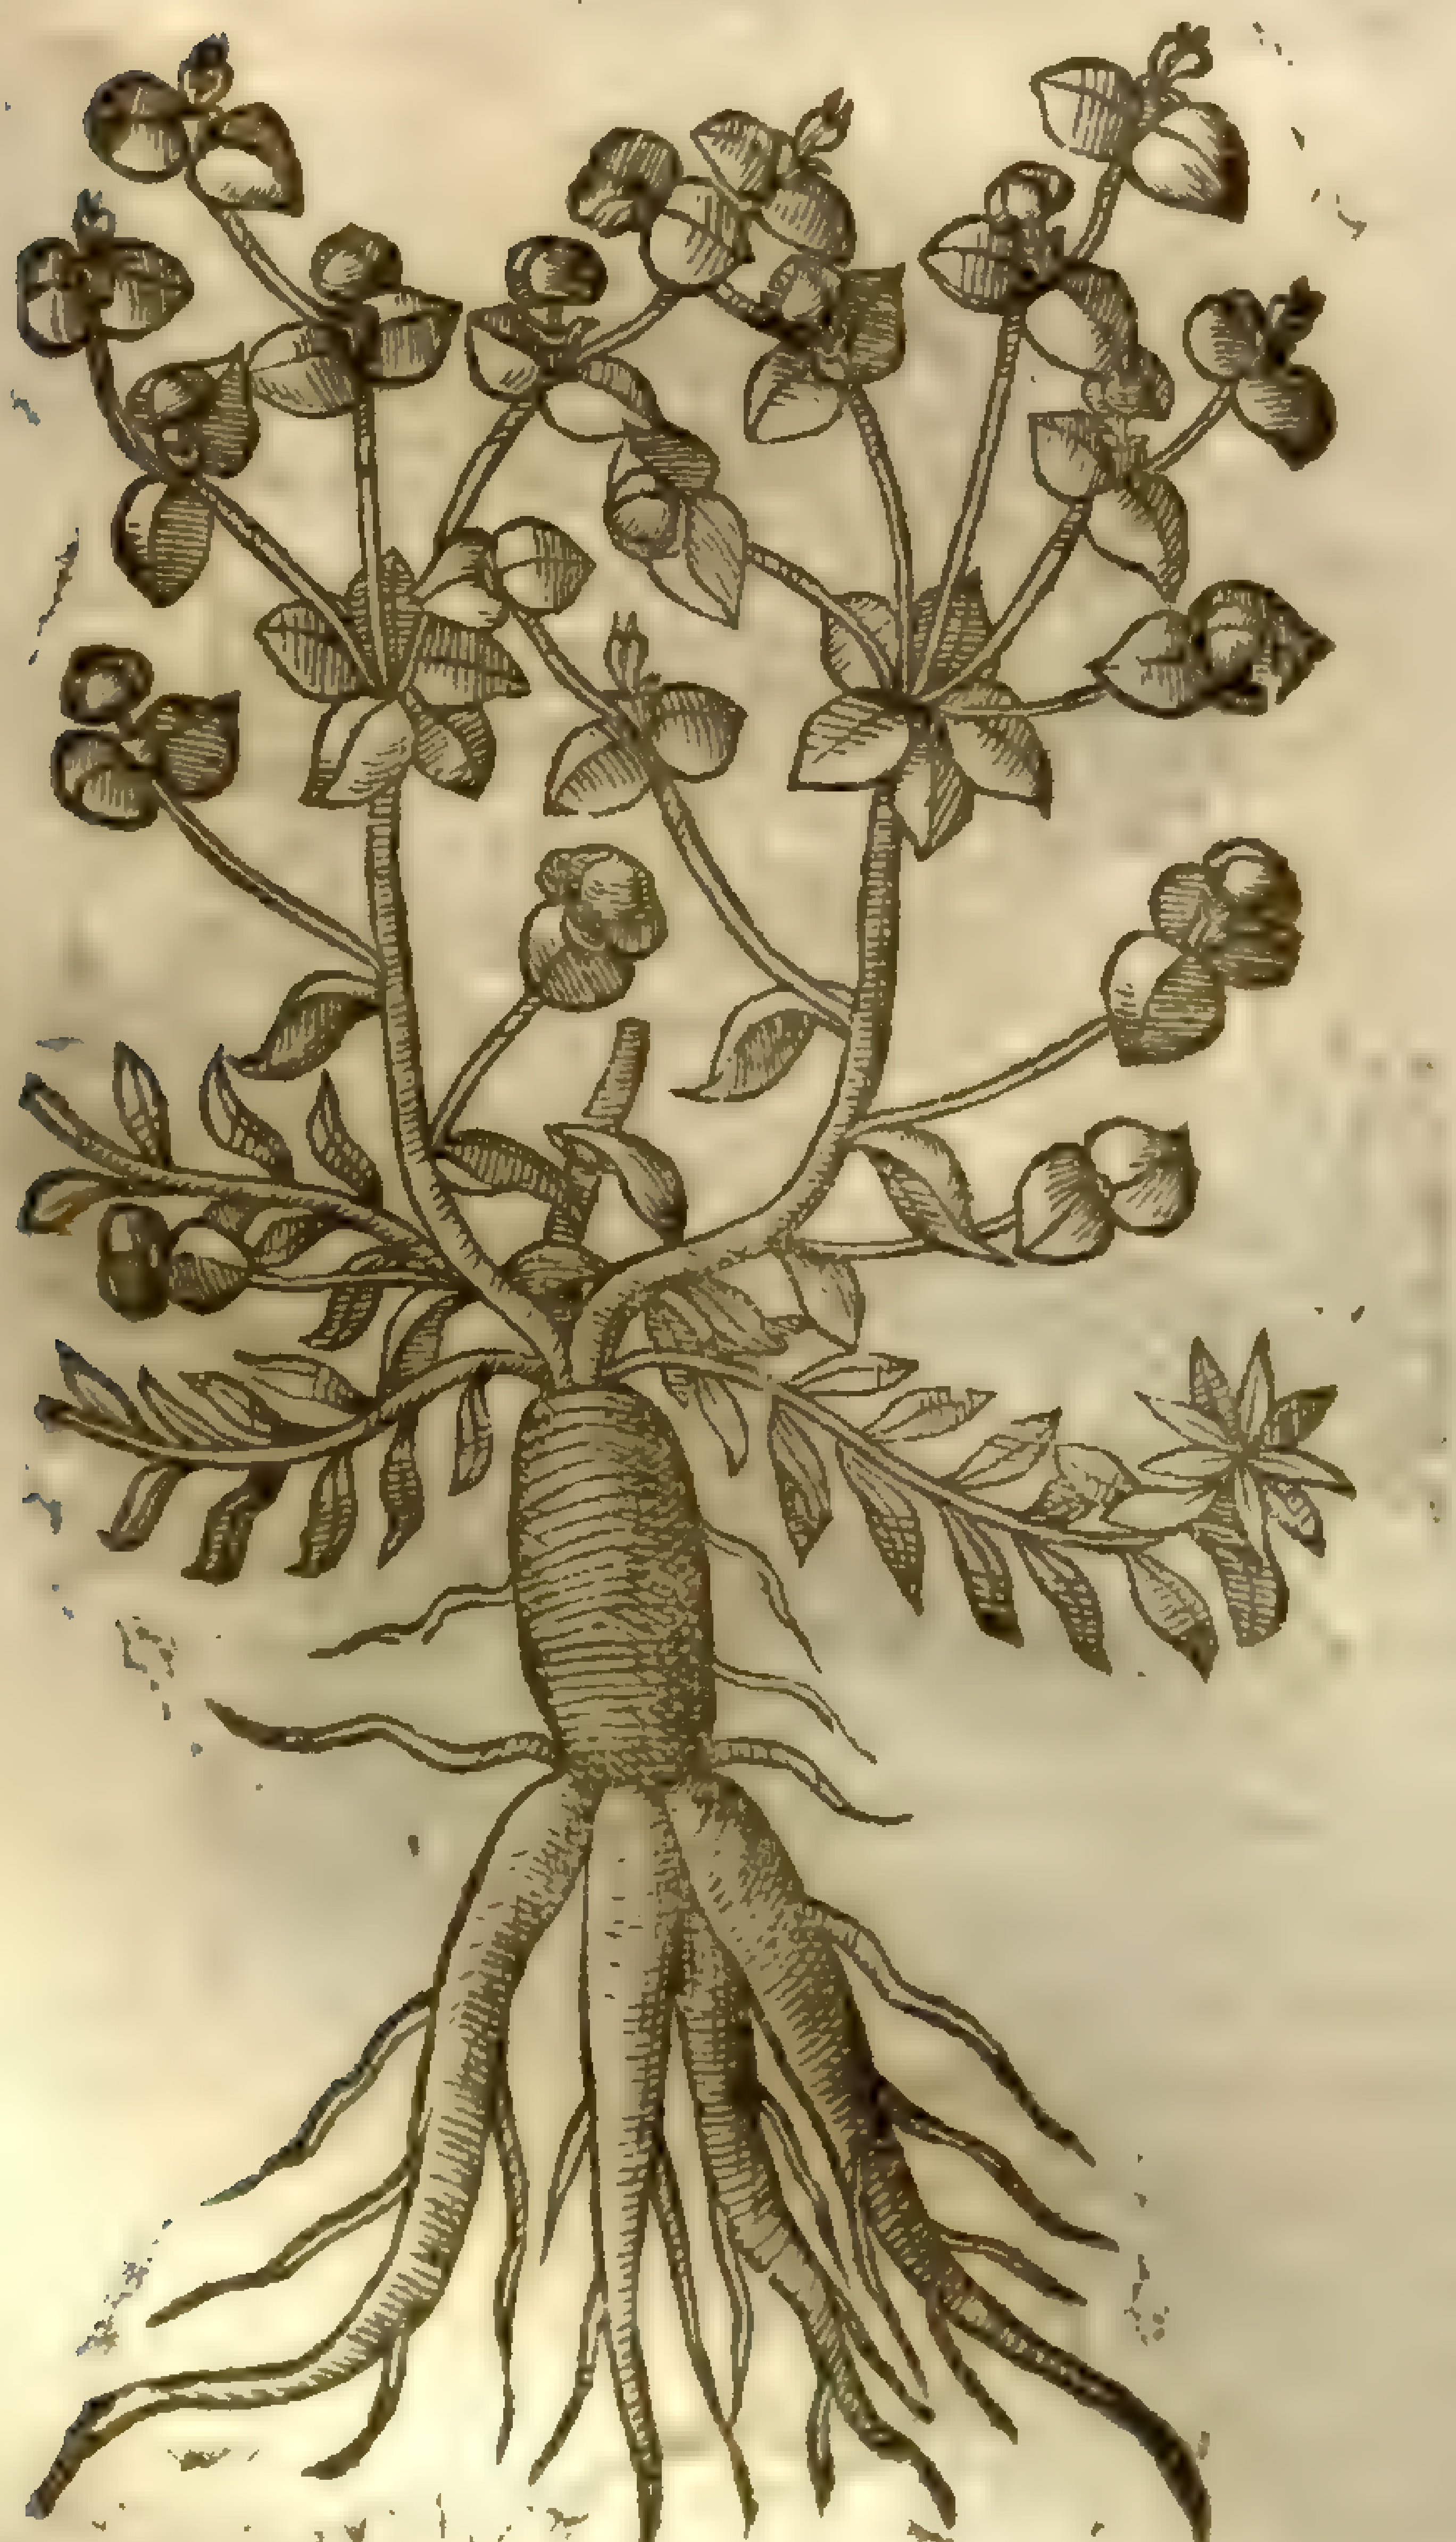
21 *Chamæſyce.*
Spurge Time.



22 *Apios vera.*
Knobbed Spurge.



‡ 23 *Apios radice oblonga.*
Long knottie rooted Spurge.



19 The nineteenth kind called *Peplus*, hath a ſmall, and fibrous root, bringing forth many fruitfull branches two handfuls long, but little and tender, with leaues like the Sun Tithymale, but rounder and much ſmaller: it hath alſo ſmall yellow floures: which being paſt there appeareth a ſlender pouchet, three cornered like the other Tithymales, hauing within it a very medullous whitiſh ſeed like Poppie: the whole plant yeeldeth a milky juyce, which argueth it to be a kinde of Tithymale.

20 As in name ſo in ſhape this twentieth reſembleth *Peplus*, and commeth in likelihood neerer the ſignification of *Peplum*, or *Flammeolum* than the other; therefore *Dioſcorides* affirmeth it to be *Thamnus amphilaphes*, for that it bringeth forth a greater plenty of branches, more cloſely knit and wound together, with ſhining twiſts and claſpers an handfull and a halfe long. The leaues are leſſer than thoſe of *Peplus*, of an indifferent likeneſſe and reſemblance betweene *Chamæſyce* and wilde Purſlane. The ſeed is great and like that of *Peplus*: the root is ſmall and ſingle.

21 The one and twentieth kinde may be eaſily knowne from the two *laſt* before mentioned, although they be very like. It

hath many branches and leaues creeping on the ground, of a pale greene colour, not vnlike to *Herniaria*, but giuing milke as all the other Tithymales doe, bearing the like ſeed, pouch, and floures, but ſmaller in each reſpect.

22 The two and twentieth kinde of Tithymale hath a round root like a ſmall Turnep, as euery Author doth report: yet my ſelfe haue the ſame plant in my garden which doth greatly increaſe, of which I haue giuen diuers vnto my friends, whereby I haue often viewed the roots, which do appeare vnto me ſomewhat tuberous, and therein nothing anſwering the deſcriptions which *Dioſcorides*, *Pena*, and others haue expreſſed and ſet forth. This argueth, that either they were deceiued, and deſcribed the ſame by hearesay, or elſe the plant doth degenerate being brought from his natiue ſoile. The leaues are ſet all alongſt a ſmall rib like *Fraxinella*, ſomewhat round, greene aboue, and reddiſh vnderneath. The ſeed groweth among the leaues like the ſeed of *Peplus*. The whole plant is full of milke like the other Tithymales.

‡ Our Author here wrongfully taxes other Writers of plants, and *Dioſcorides* and *Pena* by name, which ſhewes that hee either neuer read, or elſe vnderſtood not what they writ, for neither of them (nor any other that I know of) reſembles the root of this to a Turnep, but ſay it hath a tuberous peare faſhioned root, &c. as you may ſee in *Dioſc. lib. 4. cap. 177.* and in the *Aduerſaria, pag. 204.* The leaues alſo grow not by couples one againſt another, as in *Fraxinella*, but rather alternately, or elſe without any certaine order, as in other Tithymales.

23 This, ſaith *Cluſius*, hath alſo a tuberous root, but not peare faſhioned like as the former, but almoſt euery where of an equall thickeneſſe; being about an inch and ſometimes two inches long, and the lower part thereof is diuided into foure other roots, or thicke fibres, growing ſmaller by little and little, and ſending forth ſome few fibres: it is blacke without, and white within, and full of a milky iuyce: the ſtalkes are ſhort and weake, ſet with little leaues like thoſe of the former: the floures are of a yellowiſh red colour, and the ſeed is contained in ſuch veſſels as the other Tithymales. This is *Tithymalus tuberoſus*, or *Iſchas altera* of *Cluſius*.

¶ *The Place.*

The firſt kinde of Spurge groweth by the ſea ſide vpon the rowling Sand and Baich, as at Lee in Eſſex, at Lang-tree point right againſt Harwich, at Whitſtable in Kent, and in many other places.

The ſecond groweth in grounds that lie waſte, and in barren earable ſoile, almoſt euery where.

The third and fourth, as alſo the foureteenth and eighteenth, grow in Gardens, but not wilde in England.

The ninth Spurge called *Characias* groweth in moſt Woods of England that are drie and warme.

The eighteenth and nineteenth grow in ſalt marſhes neere the ſea, as in the Iſle of Thanet by the ſea ſide, betweene Reculvers and Margate in great plenty.

¶ *The Time.*

Theſe plants floure from Iune to the end of Iuly.

¶ *The Names.*

Sea Spurge is called in Latine *Tithymalus paralius*: in Spaniſh, *Leche treſua*: in high Dutch, **Wolfes milch**; that is to ſay, *Lupinum lac*, or Wolfes milke. Wood Spurge is called *Tithymalus characias*. The firſt is called in Engliſh, Sea Spurge, or ſea Wartwoort. The ſecond, Sun Spurge; the third and fourth, Mirtle Spurge: the fifth Cypreſſe Spurge; or among Women, Welcome to our houſe; the ſixth, Pine Spurge; the ſeuenth, Shrub Spurge and tree Mirtle Spurge; the eighth and ninth, Wood Spurge; the twelfth, Broad leafed Spurge; the thirteenth, Great Tree Spurge; the foureteenth and fifteenth, Quackſaluers Spurge; the ſixteenth, Venice Spurge, the ſeuenteenth, Dwarfe Spurge; the eighteenth, Common Spurge; the nineteenth and twentieth, Pettie Spurge; the one and twentieth, Spurge Time; the two and twentieth, True *Apios* or the knobbed Spurge.

¶ *The Temperature.*

All the kinds of Tithymales or Spurges are hot and dry almoſt in the fourth degree, of a ſharpe and biting quality, fretting or conſuming. Firſt the milke and ſap is in ſpeciall vſe, then the fruit and leaues, but the root is of leaſt ſtrength. The ſtrongeſt kinde of Tithymale, and of greateſt force is that of the ſea.

Some write by report of others, that it enflameth exceedingly, but my ſelfe ſpeak by experience; for walking along the ſea coaſt at Lee in Eſſex, with a Gentleman called Mr *Rich*, dwelling in the ſame towne, I tooke but one drop of it into my mouth; which neuertheleſſe did ſo inflame and ſwell in my throte that I hardly eſcaped with my life. And in like caſe was the Gentleman, which cauſed vs to take our horſes, and poſte for our liues vnto the next farme houſe to drinke ſome milke to quench the extremitie of our heat, which then ceaſed.

¶ *The Vertues.*

A The juyce of Tithymale, I do not meane ſea Tithymale, is a ſtrong medicine to open the belly, and cauſing vomit, bringeth vp tough flegme and cholericke humours. Like vertue is in the ſeed and root, which is good for ſuch as fall into the dropſie, being miniſtred with diſcretion and good aduice of ſome excellent Phyſition, and prepared with his Correctories by ſome honeſt Apothecarie.

B The juyce mixed with hony, cauſeth haire to fall from that place which is anointed therewith, if it be done in the Sun.

C The juyce or milke is good to ſtop hollow teeth, being put into them warily, ſo that you touch neither the gums, nor any of the other teeth in the mouth with the ſaid medicine.

D The ſame cureth all roughneſſe of the skin, mangineſſe, leprie, ſcurfe, and running ſcabs, and the white ſcurfe of the head. It taketh away all manner of warts, knobs, and the hard callouſneſſe of Fiſtulaes, hot ſwellings and Carbuncles.

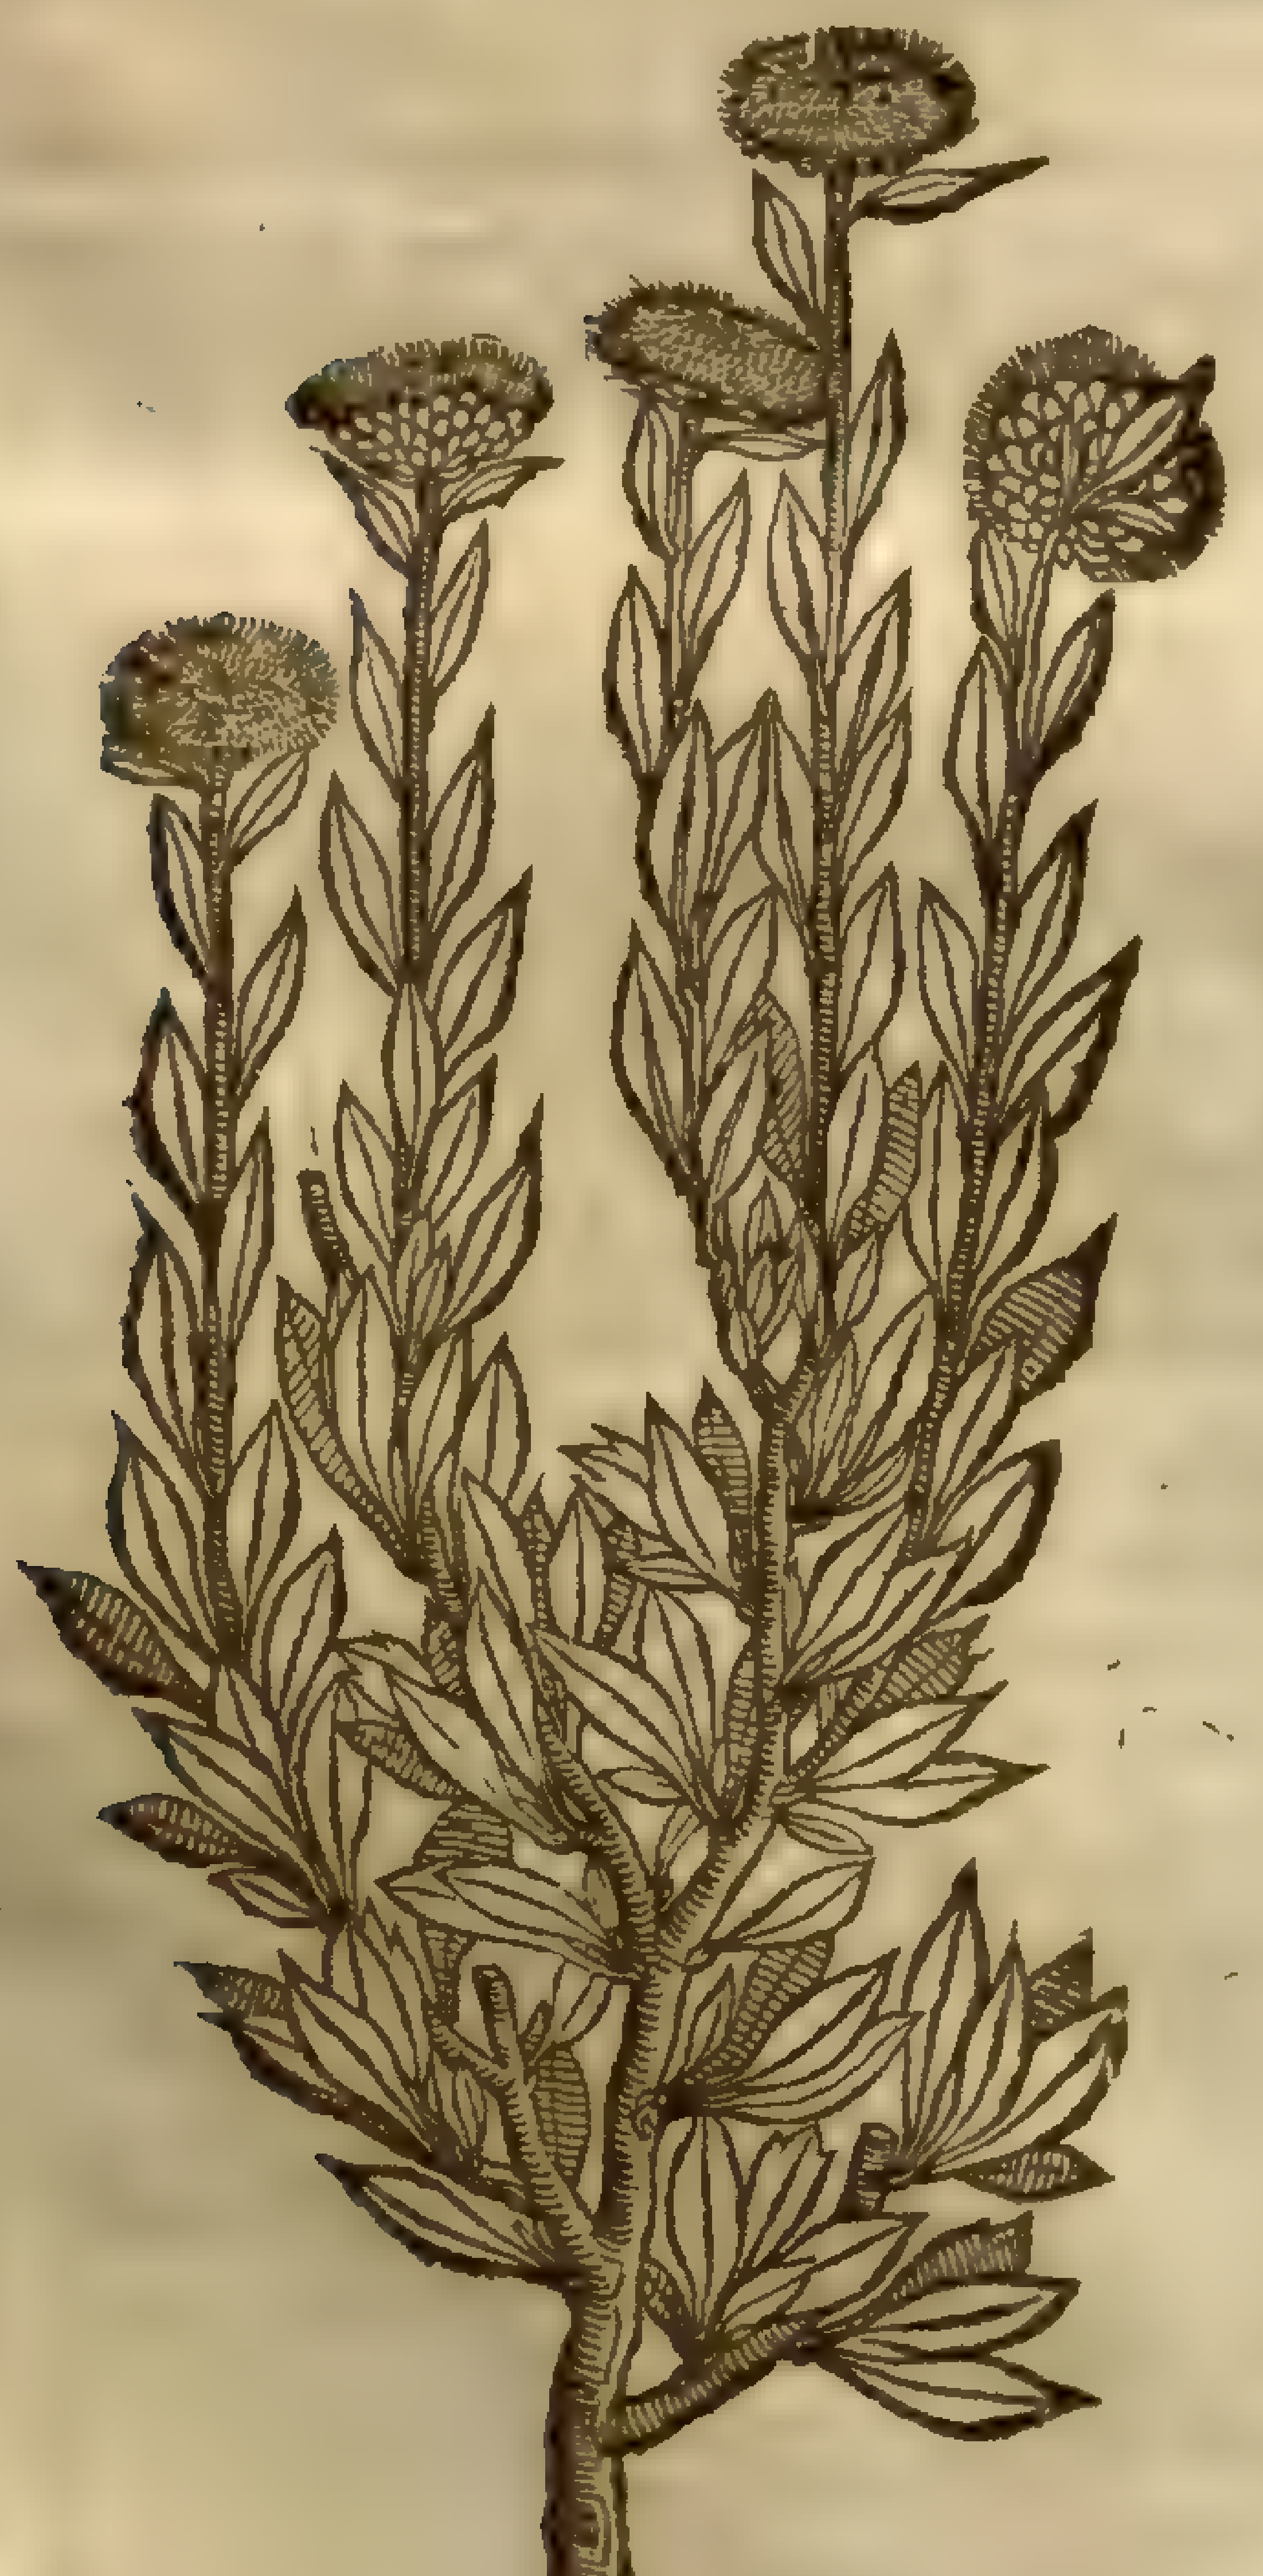
E It killeth fiſh, being mixed with any thing that they will eat.

F Theſe herbes by mine aduiſe would not be receiued into the body, conſidering that there be ſo many other good and wholeſome potions to be made with other herbes, that may be taken without perill.

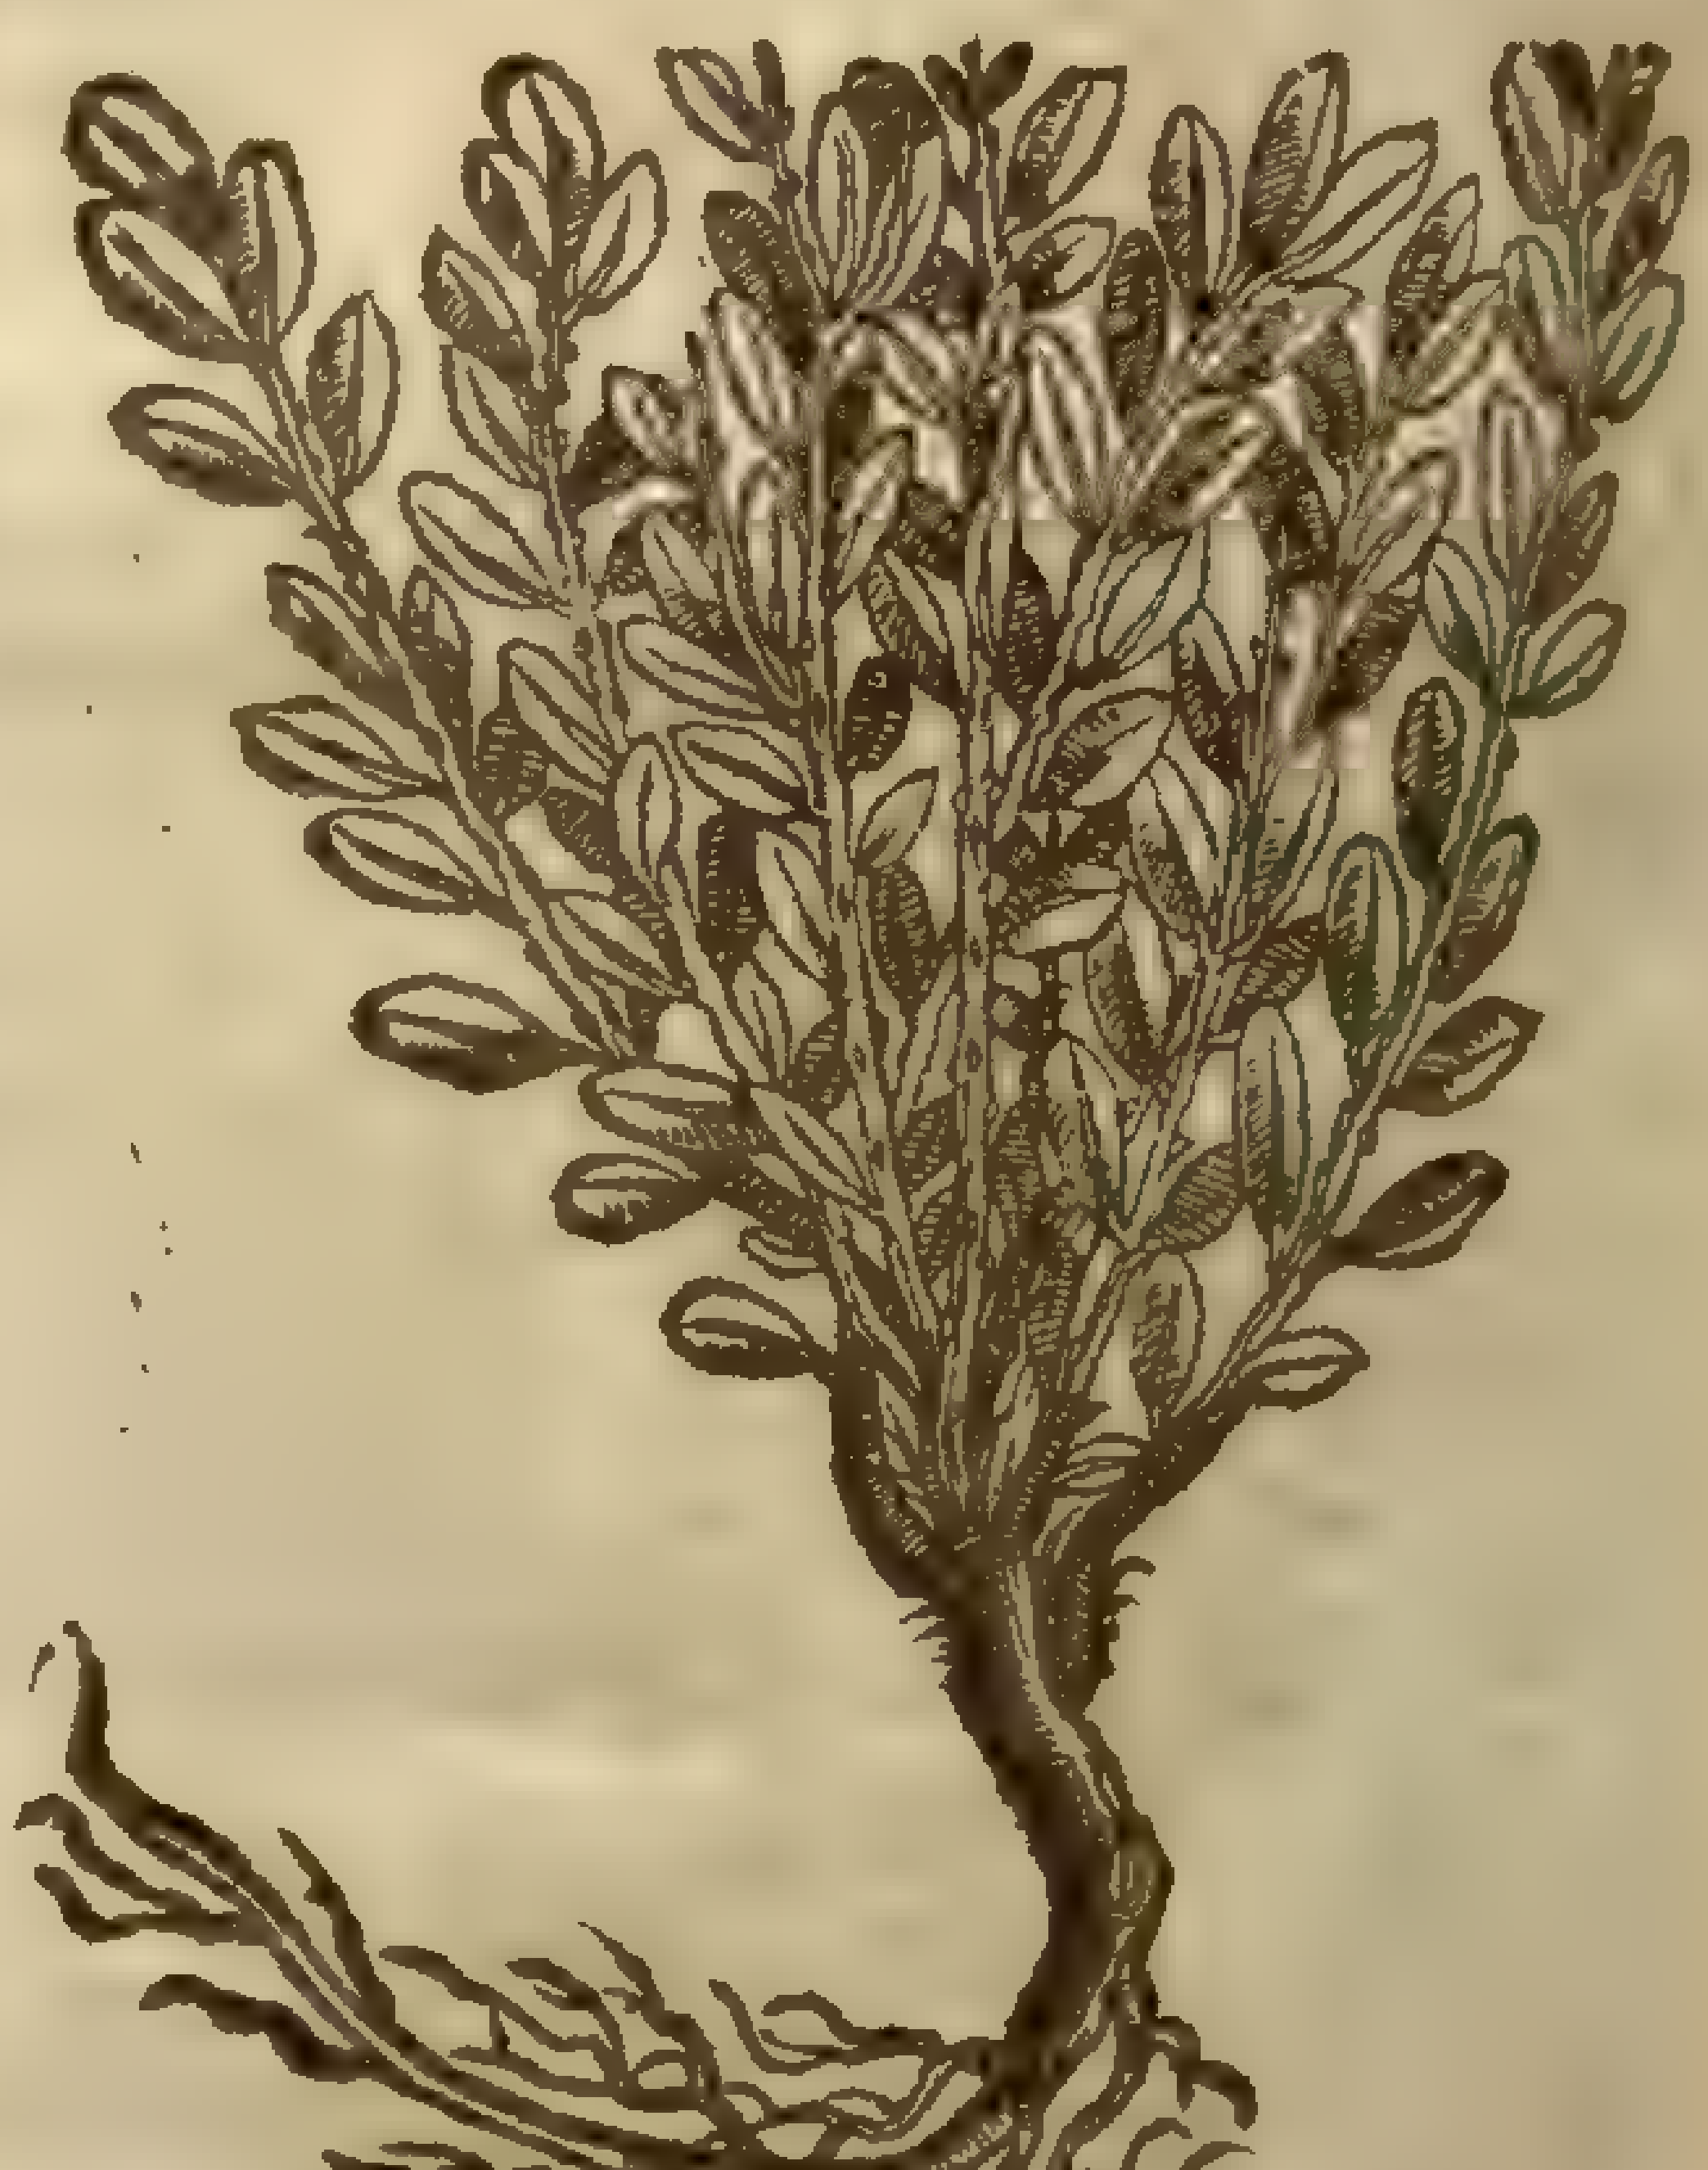
† The ſeuenth figure was formerly of *Tithymalus myrſinites 3. anguſtifolius* of *Tabernæmontanus*. The 8. and 9. were both of the ſame plant: the 12. was the figure of the *Eſula exigua Tragi*, whoſe hiſtory I haue giuen you in the 17. place.

Chap. 140. *Of Herbe Terrible.*

1 *Alypum montis Ceti.*
Herbe Terrible.



1 *Tarton-Raire Gallo-Prouincia.*
Gutwoort.



¶ *The Deſcription.*

1 Herbe Terrible is a ſmall ſhrub two or three cubits high, branched with many ſmall twigs, hauing a thinne rinde, firſt browne, then purple, with many little and thinne leaues like Myrtle: The floures are rough like the middle of Scabious floures, of a blew purple colour. The root is two fingers thicke, browne of colour, and of a wooddy ſubſtance: the whole plant very bitter, and of an vnpleaſant taſte like *Chamelæa*, yet ſomewhat ſtronger.

2 Tartonraire, called in Engliſh Gutwoort, groweth by the ſea, and is Catharticall, and a ſtranger with vs. In the mother tongue of the Maſſilians, it is called Tartonraire, of that abundant

and vnbridled faculty of purging, which many times do cauſe *Dyſenteriæ*, and ſuch like immoderate fluxes, eſpecially when one not skilfull in the vſe thereof ſhall adminiſter the pouder of the leaues mixed with any liquor. This plant groweth in manner of a ſhrub, like *Chamelæa*, and bringeth forth many ſmall, tough, and pliant twigs, ſet about with a thin and cottony haırineſſe, and hath many leaues of a gliſtering ſiluer color, growing from the loweſt part euen to the top, altogether like *Alypum* before mentioned: and vpon theſe tough and thicke branches (if my memory faile not) do grow ſmall floures, firſt white, afterward of a pale yellow: the ſeed is of a ruſſet colour: the root hard and wooddy, not very hot in the mouth, leauing vpon the tongue ſome of his inbred heat and taſte, ſomewhat reſembling common Turbith, and altogether without milke.

¶ *The Place.*

Theſe plants do grow vpon the mountaines in France, and other places in the grauelly grounds, and are as yet ſtrangers in England.

¶ *The Time.*

They flouriſh in Auguſt and September. ‡ The firſt *Cluſius* found flouring in diuerſe parts of Spaine, in February and March; and I conjecture the other floures about the ſame time, yet I can finde nothing ſaid thereof in ſuch as haue deliuered the hiſtory of it. ‡

¶ *The Names.*

There are not any other names appropriate to theſe plants more than are ſet forth in the titles.

‡ The firſt of theſe is the *Alypum montis Ceti*, and *Herba terribilis* of *Lobel*; *Cluſ.* cals it, *Hippogloſſum Valentinum*, and in *Hiſt. Lugd.* it is named *Alypum Penæ*, and *Empetrum Phacoides*. The ſecond is the *Tartonraire Galloprouinciæ Maſsilienſium*, in the *Aduerſaria*; *Seſamoides majus multorum* of *Daleſc.* and the *Seſamoides maius Scaligeri* of *Tabern.* by which title our Author alſo gaue his figure, in the 397. *pag.* of the former edition. ‡

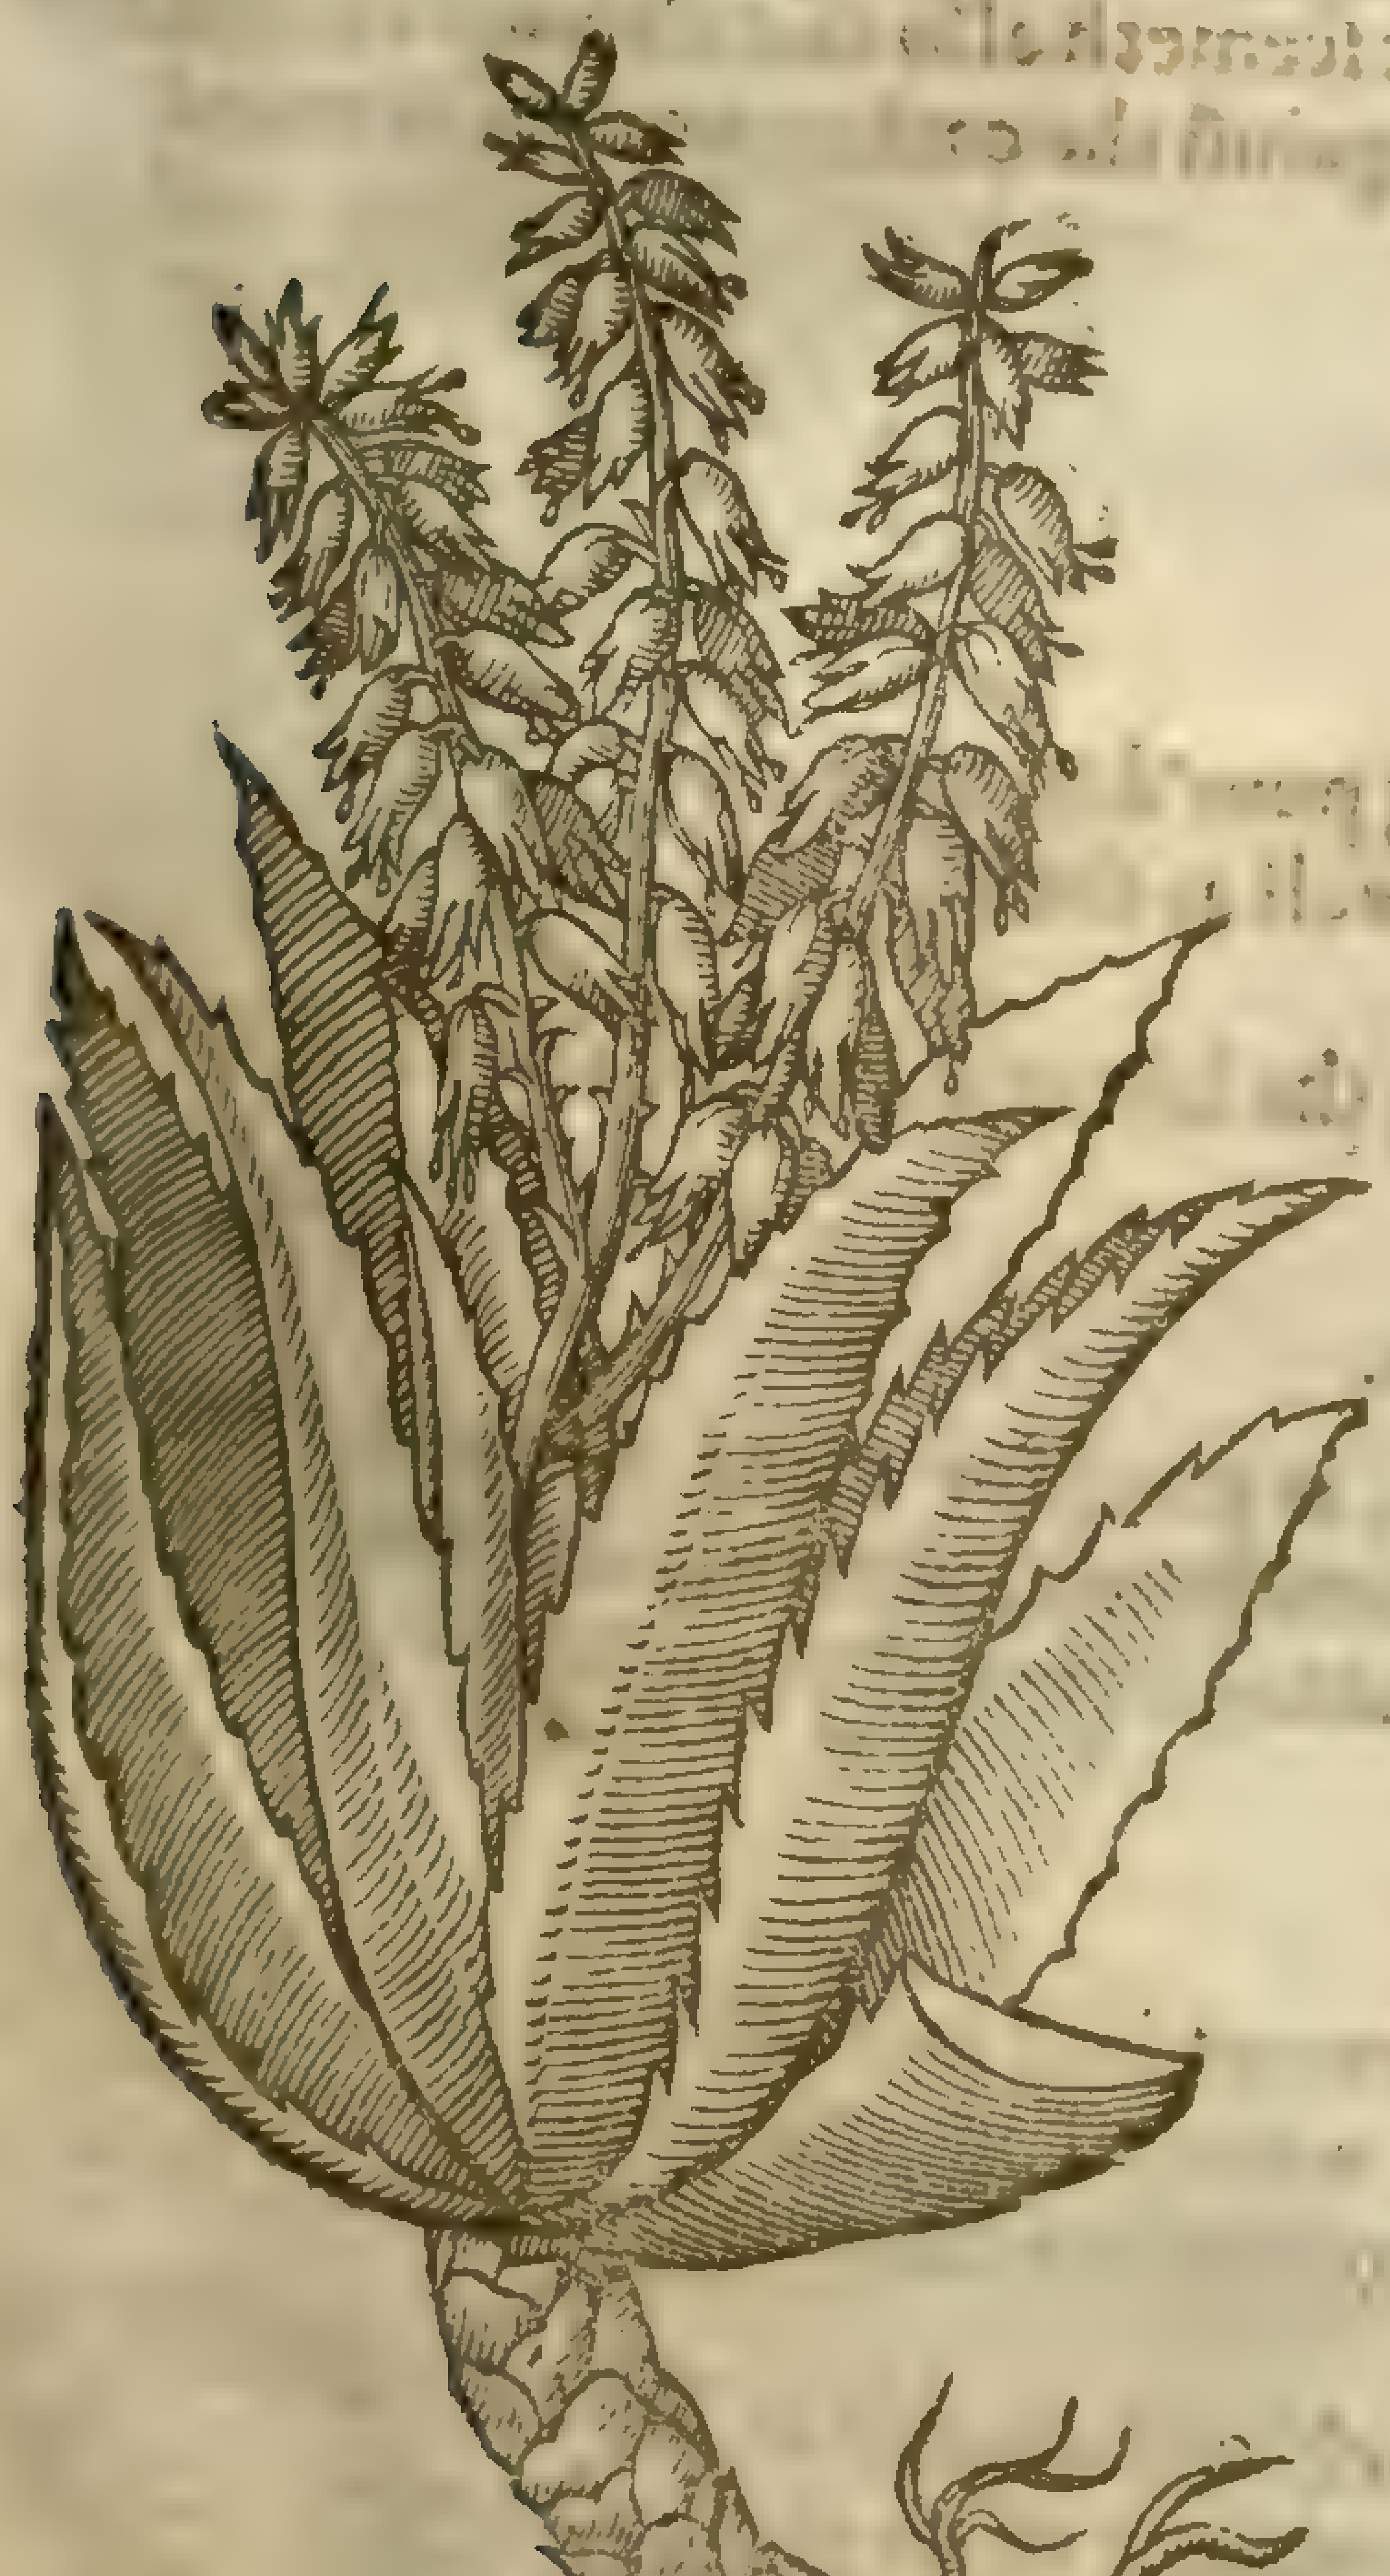
¶ *The Temperature and Vertues.*

There is nothing either of their nature or vertues, more than is ſet forth in the Deſcriptions.

‡ Both theſe plants haue a ſtrong purging faculty like as the Tithymales; but the later is far more powerfull, and comes neere to the quality of *Mezereon*; wherefore the vſe of it is dangerous, by reaſon of the violence and great heat thereof. ‡

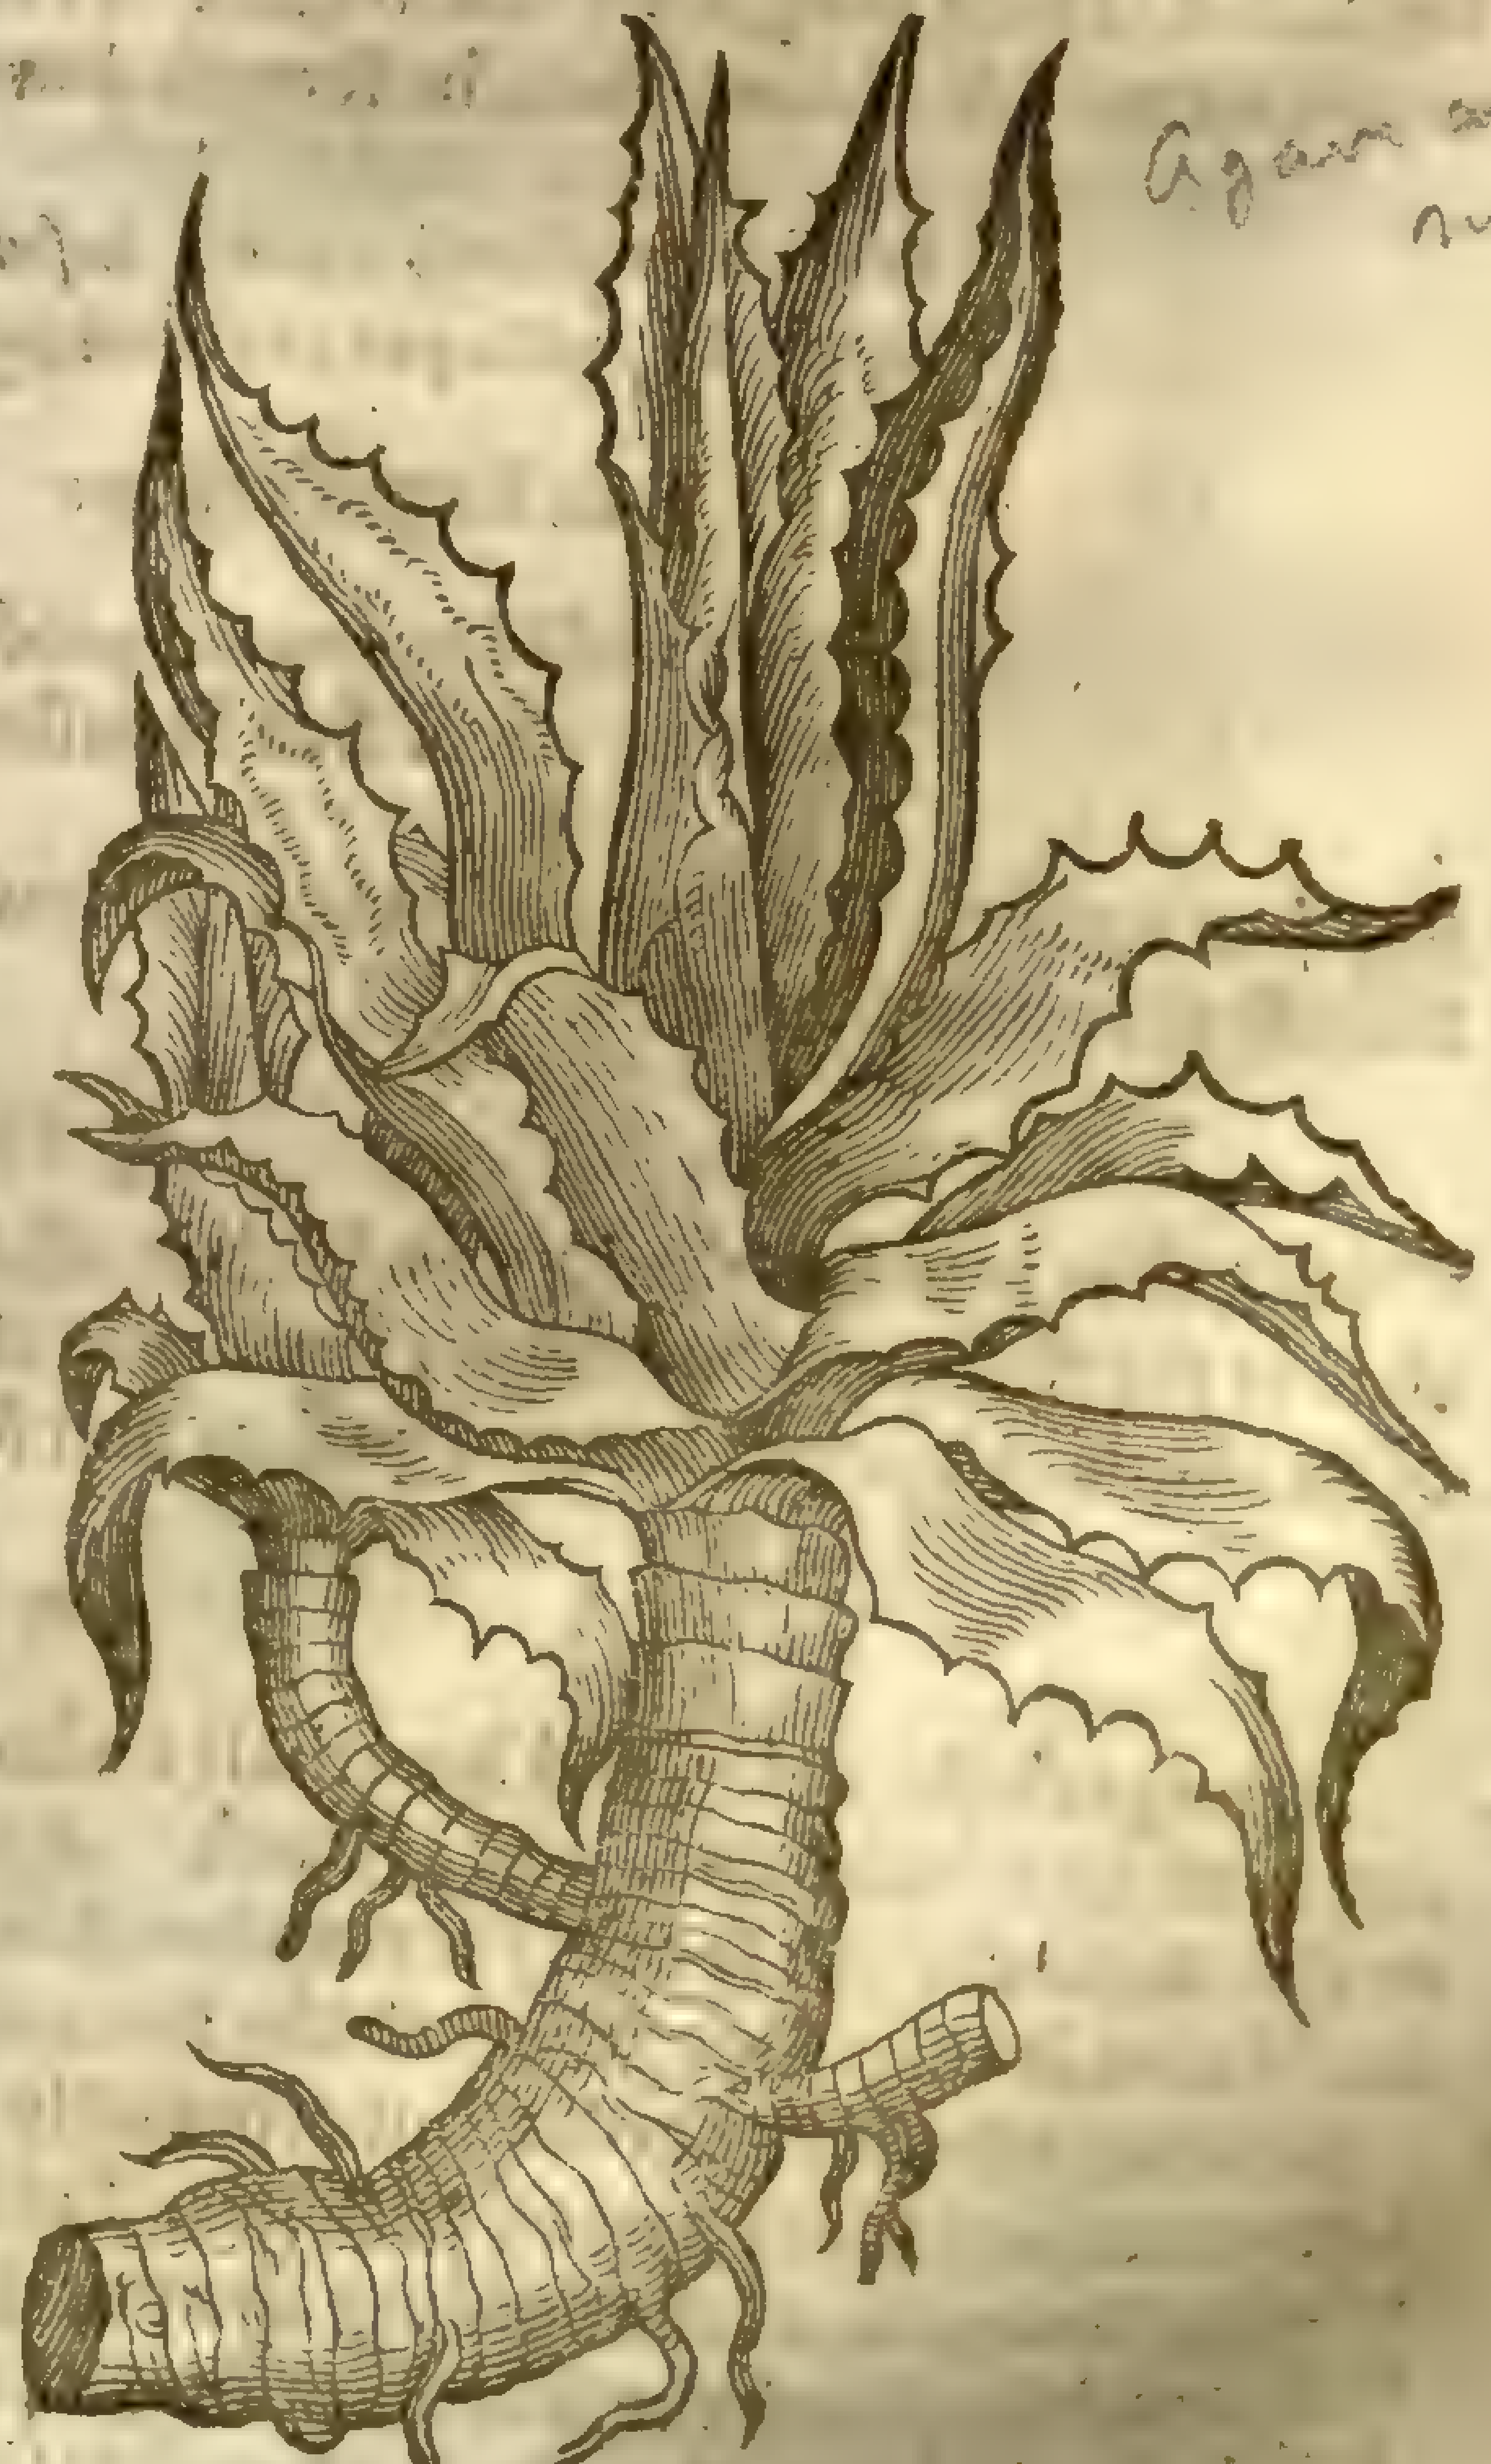
Chap. 141. *Of Herbe Aloe, or Sea Houſleeke.*

‡ 1 *Aloe vulgaris, ſive Sempervivum marinum.*
Common *Aloe*, or Sea-Houſleeke.



2 *Aloe folio mucronato.*
Prickly herbe Aloe, or Sea-Houſleeke.

Agave americana [illegible]



¶ *The Deſcription.*

1 Herbe Aloe hath hath leaues like thoſe of ſea Onion, very long, broad, ſmooth, thicke, bending backewards, notched in the edges, ſet with certaine little blunt prickles, full of tough and clammie juyce like the leaues of Houſleeke. The ſtalke, as *Dioſcorides* ſaith, is like to the ſtalke of Affodill: the floure is whitiſh; the ſeed like that of Affodill, the root is ſingle, of the faſhion of a thicke pile thruſt into the ground. The whole herbe is extreame bitter, ſo is the juyce alſo that is gathered thereof.

† 2 There is another herbe Aloe that groweth likewiſe in diuers prouinces of America; the leaues are two cubits long, alſo thicker, broader, greater, and ſharper pointed than the former, and it hath on the edges far harder prickles. The ſtalke is three cubits high, and a finger thicke, the which in long cups beares violet coloured floures. †

¶ *The Place.*

This plant groweth very plentifully in India, and in Arabia, Cœloſyria, and Ægipt, from whence the juyce put into skins is brought into Europe. It groweth alſo, as *Dioſcorides* writeth, in Aſia, on the ſea coaſts, and in Andros, but not very fit for juyce to be drawn out. It is likewiſe found it Apulia, and in diuers places of Granado and Andaluſia, in Spaine, but not farre from the ſea: the juyce of this is alſo vnprofitable.

¶ *The Time.*

The herbe is alwaies greene, and likewiſe ſendeth forth branches, though it remaine out of the earth, eſpecially if the root be couered with lome, and now and then watered: for ſo being hanged on the ſeelings and vpper poſts of dining roomes, it doth not onely continue a long time greene, but it alſo groweth and bringeth forth new leaues: for it muſt haue a warme place in Winter time, by reaſon it pineth away if it be frozen.

¶ *The Names.*

The herbe is called in Greeke ἀλόη: in Latine, and in ſhops alſo, *Aloë*: and ſo is likewiſe the juice. The plant alſo is named ἀμφίβιον, [illegible], [illegible], [illegible]: but they are baſtard words: it is called ἀμφίβιον becauſe it liueth not onely in the earth, but alſo out of the earth. It is named in French, *Poroquet*: in Spaniſh, *Azeuar*, and *Teruabauoſa*: in Engliſh, *Aloes*, herbe *Aloes*, Sea Houſeleeke, Sea Aigrene.

The herbe is called of the later Herbariſts oftentimes *Sempervivum*, and *Sempervivum Marinum*, becauſe it laſteth long, after the manner of Houſe-leeke. It ſeemeth alſo that *Columella* in his tenth booke nameth it *Sedum*, where he ſetteth downe remedies againſt the canker-wormes in trees.

Profuit & plantis latices infundere amaros
Marrubij, multoque Sedi contingere ſucco.

In Engliſh thus:

Liquors of Horehound profit much b'ing pour'd on trees:
The ſame effect Sea Houſleeke works as well as theſe.

For hee reciteth the juyce of *Sedum* or Houſleeke among the bitter juices, and there is none of the Houſleekes bitter but this.

¶ *The Temperature.*

Aloë, that is to ſay, the juyce which is vſed in Phyſicke, is good for many things. It is hot, and that in the firſt or ſecond degree, but dry in the third, extreme bitter, yet without biting. It is alſo of an emplaiſticke or clammie quality, and ſomething binding, externally applied.

¶ *The Vertues.*

A It purgeth the belly, and is withall a wholeſome and conuenient medicine for the ſtomacke, if any at all be wholeſome. For as *Paulus Ægineta* writeth, when all purging medicines are hurtfull to the ſtomacke, *Aloës* onely is comfortable. And it purgeth more effectually if it be not waſhed: and if it be, it then ſtrengtheneth the ſtomacke the more.

B It bringeth forth choler, but eſpecially it purgeth ſuch excrements as be in the ſtomacke, the firſt veines, and in the neereſt paſſages. For it is of the number of thoſe medicines, which the Grecians call ἐκκοπρωτικά, of the voiding away of the ordure; and of ſuch whoſe purging force paſſeth not far beyond the ſtomacke. Furthermore, *Aloës* is on enemie to all kindes of putrefactions; and defendeth the body from all manner of corruption. It alſo preſerueth dead carkaſes from putrifying;

it killeth and purgeth away all manner of wormes of the belly. It is good againſt a ſtinking breath proceeding from the imperfection of the ſtomacke: it openeth the piles or hemorrhoides of the fundament; and being taken in a ſmall quantity, it bringeth downe a monthly courſe: it is thought to be good and profitable againſt obſtructions and ſtoppings in the reſt of the intrals. Yet ſome there be who thinke, that it is not conuenient for the liuer.

One dramme thereof giuen, is ſufficient to purge. Now and then halfe a dramme or little more is enough. C

It healeth vp greene wounds and deepe ſores, clenſeth vlcers, and cureth ſuch ſores as are hardly to be helped, eſpecially in the fundament and ſecret parts. It is with good ſucceſſe mixed with ἐναίμοις, or medicines which ſtanch bleeding, and with plaiſters that be applied to bloudy wounds; for it helpeth them by reaſon of his emplaiſticke qualitie and ſubſtance. It is profitably put into medicines for the eies, foraſmuch as it clenſeth and drieth without biting. D

Dioſcorides ſaith, that it muſt be torrified or parched at the fire, in a cleane and red hot veſſell, and continually ſtirred with a *Spatula*, or Iron Ladle, till it bee torrified in all the parts alike: and that it muſt alſo bee waſhed, to the end that the vnprofitable and ſandie droſſe may ſinke downe vnto the bottome, and that which is ſmooth and moſt perfect be taken and reſerued. E

The ſame Author alſo teacheth, that mixed with honie it taketh away blacke and blew ſpots, which come of ſtripes: that it helps the inward ruggednes of the eye-lids, and itching in the corners of the eyes: it remedieth the head-ache, if the temples and forehead be anointed therewith, being mixed with vineger and oile of Roſes: being tempered with wine, it ſtaieth the falling off of the haire, if the head be waſhed therewith: and mixed with wine and honie, it is a remedie for the ſwelling of the Vvula, and ſwelling of the Almonds of the throat, for the gums and all vlcers of the mouth. F

The juice of this herbe *Aloë* (whereof is made that excellent and moſt familiar purger, called *Aloë Saccotrina*) the beſt is that which is cleare and ſhining, of a browne yellowiſh colour: it openeth the bellie, purging cold, flegmaticke, and cholericke humours, eſpecially in thoſe bodies that are ſurcharged with ſurfetting, either of meat or drinke, and whoſe bodies are fully repleat with humours, fairing daintily, and wanting exerciſe. This *Aloës* I ſay, taken in a ſmall quantitie after ſupper (or rather before) in a ſtewed prune, or in water the quantitie of two drammes in the morning, is a moſt ſoueraigne medicine to comfort the ſtomacke, and to cleanſe and driue foorth all ſuperfluous humours. Some vſe to mixe the ſame with Cinnamon, Ginger, and Mace, for the purpoſe abouesaid; and for the Iaundies, ſpitting of bloud, and all extraordinarie iſſues of bloud. G

The ſame vſed in vlcers, eſpecially thoſe of the ſecret parts or fundament, or made into pouder, and ſtrawed on freſh wounds, ſtaieth the bloud and healeth the ſame, as thoſe vlcers before ſpoken of.

The ſame taken inwardly cauſeth the Hemorrhoids to bleed, and beeing laid thereon it cauſeth them to ceaſe bleeding. I

Chap. 142. *Of Houſleeke or Sengreene.*

¶ *The Kindes.*

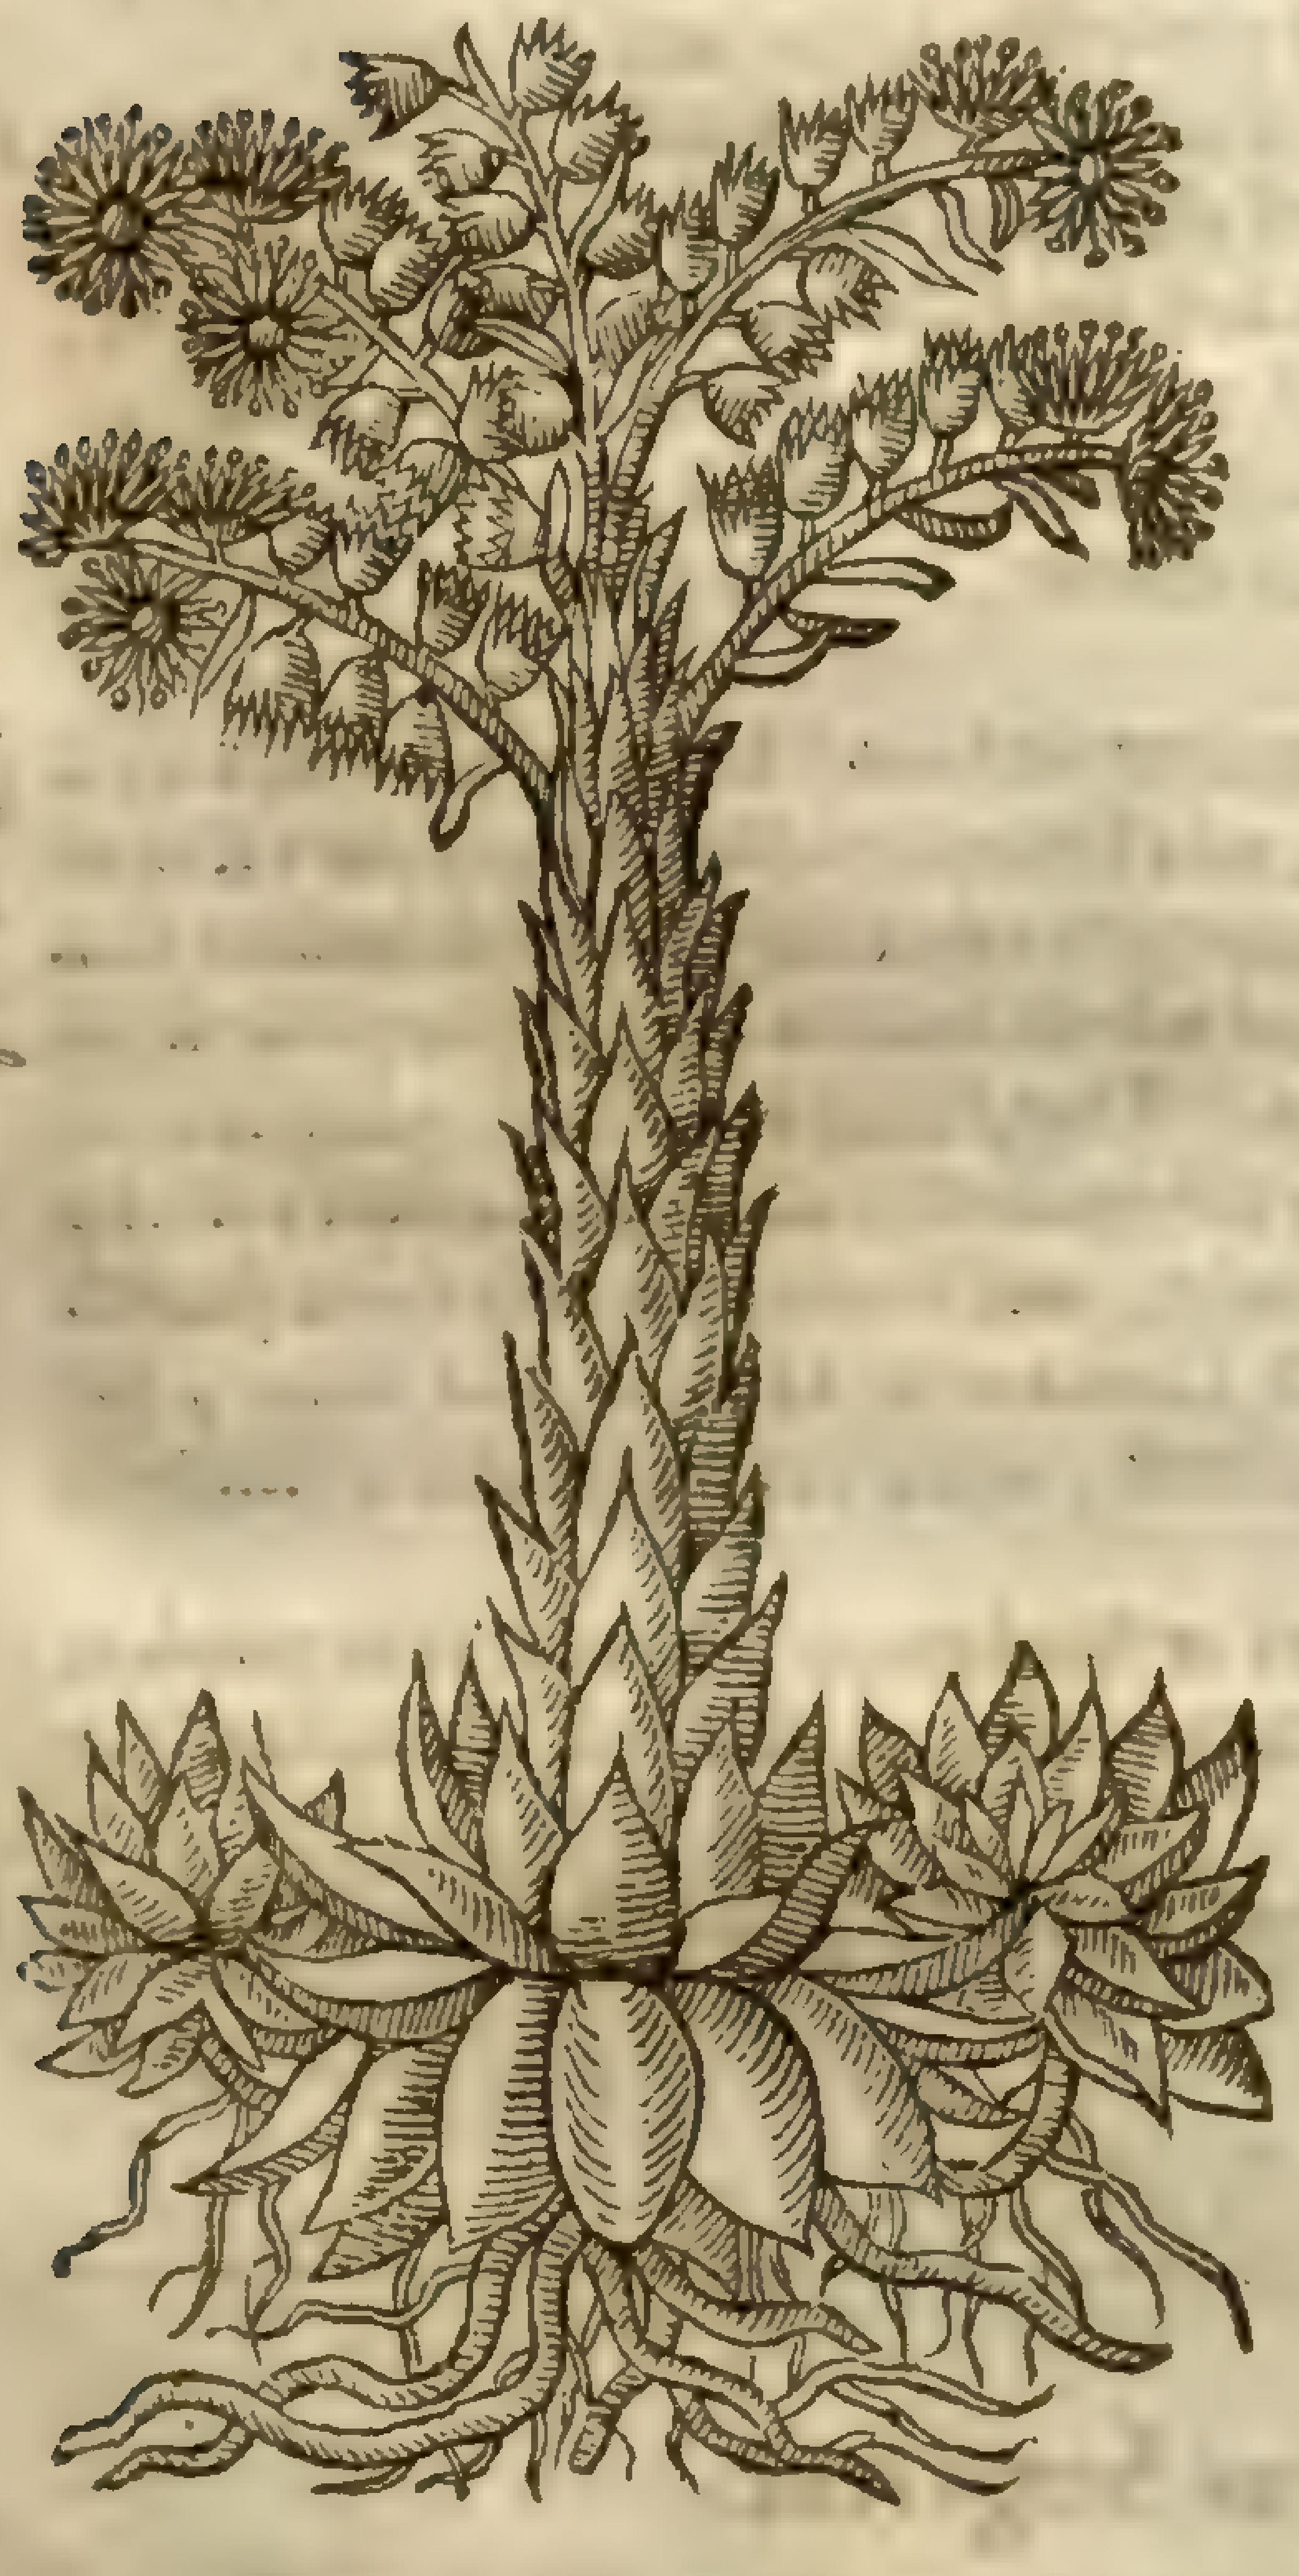
Sengreene, as *Dioſcorides* writeth, is of three ſorts, the one is great, the other ſmall, and the third is that which is called *Illecebra*, biting Stone-crop, or Wall-pepper.

¶ *The Deſcription.*

1 The great Sengreene, which in Latine is commonly called *Iouis barba*, Iupiters beard, bringeth forth leaues hard adioyning to the ground and root, thicke, fat, full of tough juice, ſharp pointed, growing cloſe and hard together, ſet in a circle in faſhion of an eye, and bringing forth verie many ſuch circles, ſpreading it ſelfe out all abroad: it oftentimes alſo ſendeth forth ſmall ſtrings, by which it ſpreadeth farther, and maketh new circles; there riſeth vp oftentimes in the middle of theſe an vpright ſtalke about a foot high couered with leaues growing leſſe and leſſe toward the points, parted at the top into certaine wings or branches, about which are floures orderly placed, of a darke purpliſh colour: the root is all of ſtrings.

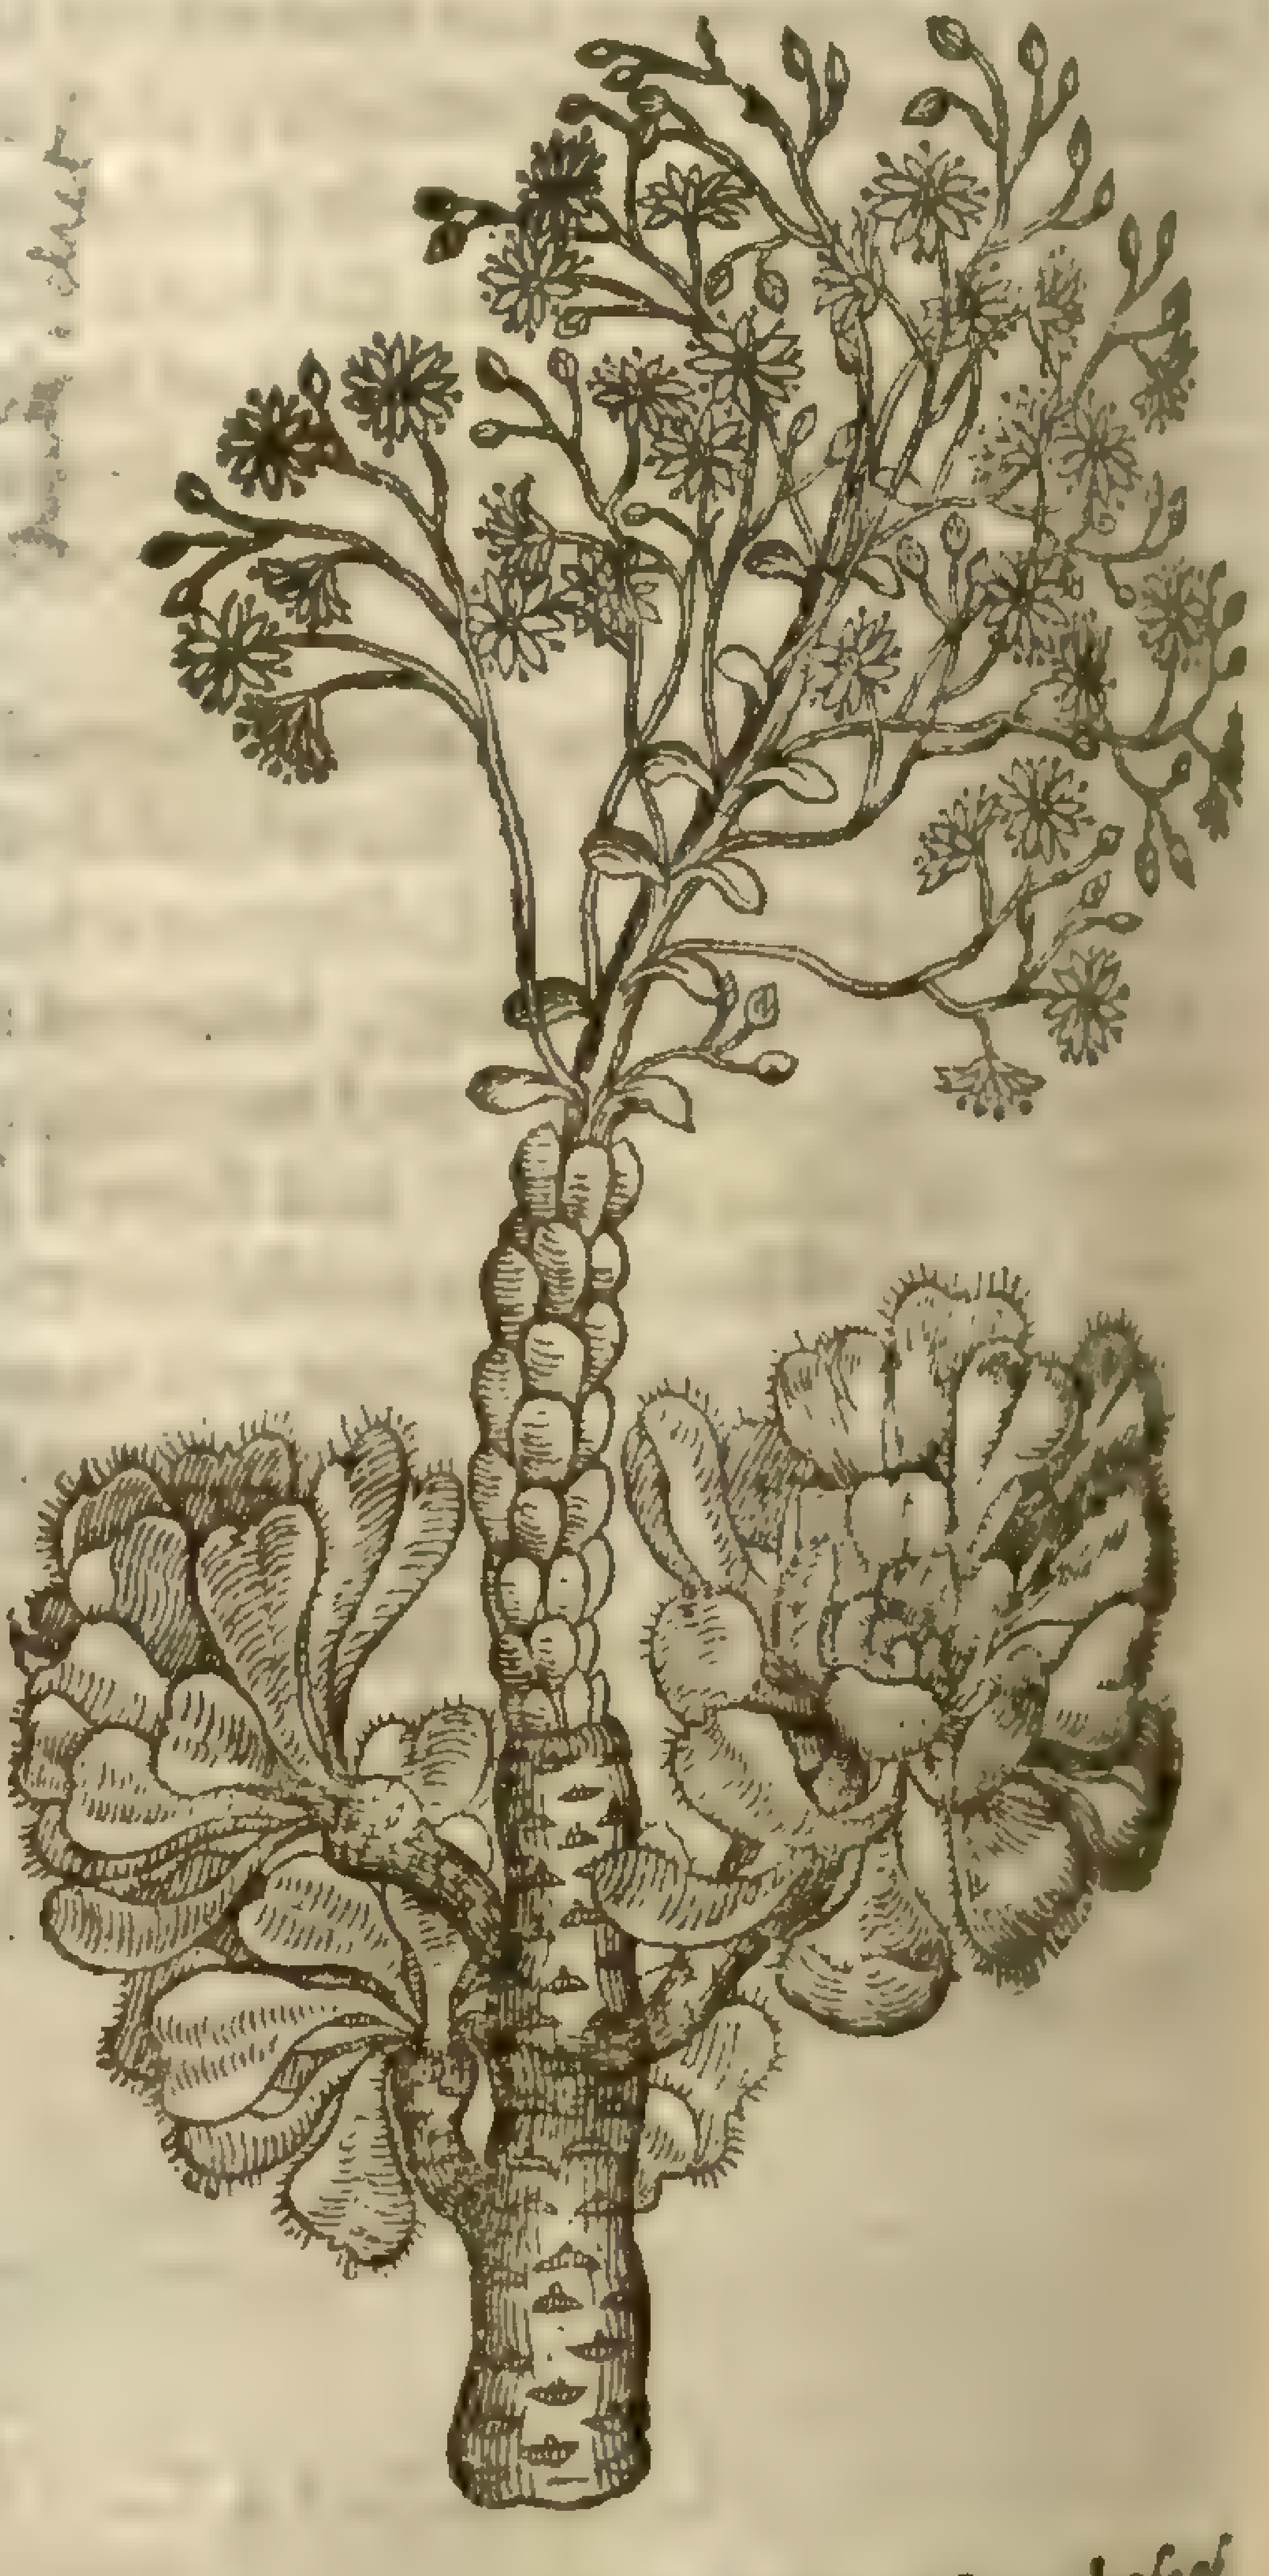
2 There is alſo another great Houſleek or Sengreene (ſyrnamed tree Houſleeke) that bringeth forth a ſtalke a cubit high, ſomtimes higher, and often two; which is thick, hard, wooddy, tough, and that can hardly be broken, parted into diuers branches, and couered with a thick groſſe bark, which in the lower part reſerueth certaine prints or impreſſed markes of the leaues that are fallen away. The leaues are fat, well bodied, full of juice, an inch long and ſomewhat more, like little tongues, very curiouſly minced in the edges, ſtanding vpon the tops of the braunches, hauing in them the ſhape of an eye. The floures grow out of the branches, which are diuided into many ſprings; which floures are ſlender, yellow, and ſpred like a ſtar; in their places commeth vp very fine ſeed, the ſprings withering away: the root is parted into many off-ſprings. This plant is alwaies greene, neither is it hurt by the cold in winter, growing in his natiue ſoile; whereupon it is named ἀείζωον, and *Sempervivum*, or Sengreene.

1 *Sempervivum majus.*
Great Houſleeke.



Sempervivum Tectorum, & Jovis barba
Sm. p. 2. 35.

‡ 2 *Sedum majus arboreſcens.*
Tree Houſleeke.



Sempervivum arboreum, & [illegible]

3 There is alſo another of this kinde, the circles whereof are anſwerable in bigneſſe to thoſe of the former, but with leſſer leaues, moe in number, and cloſely ſet, hauing ſtanding on the edges very fine haires as it were like ſoft prickles. This is ſomewhat of a deeper green: the ſtalke is ſhorter, and the floures are of a pale yellow. ‡ This is the third of *Dodonæus* deſcription, *Pempt.* 1. *lib.* 5. *cap.* 8. ‡

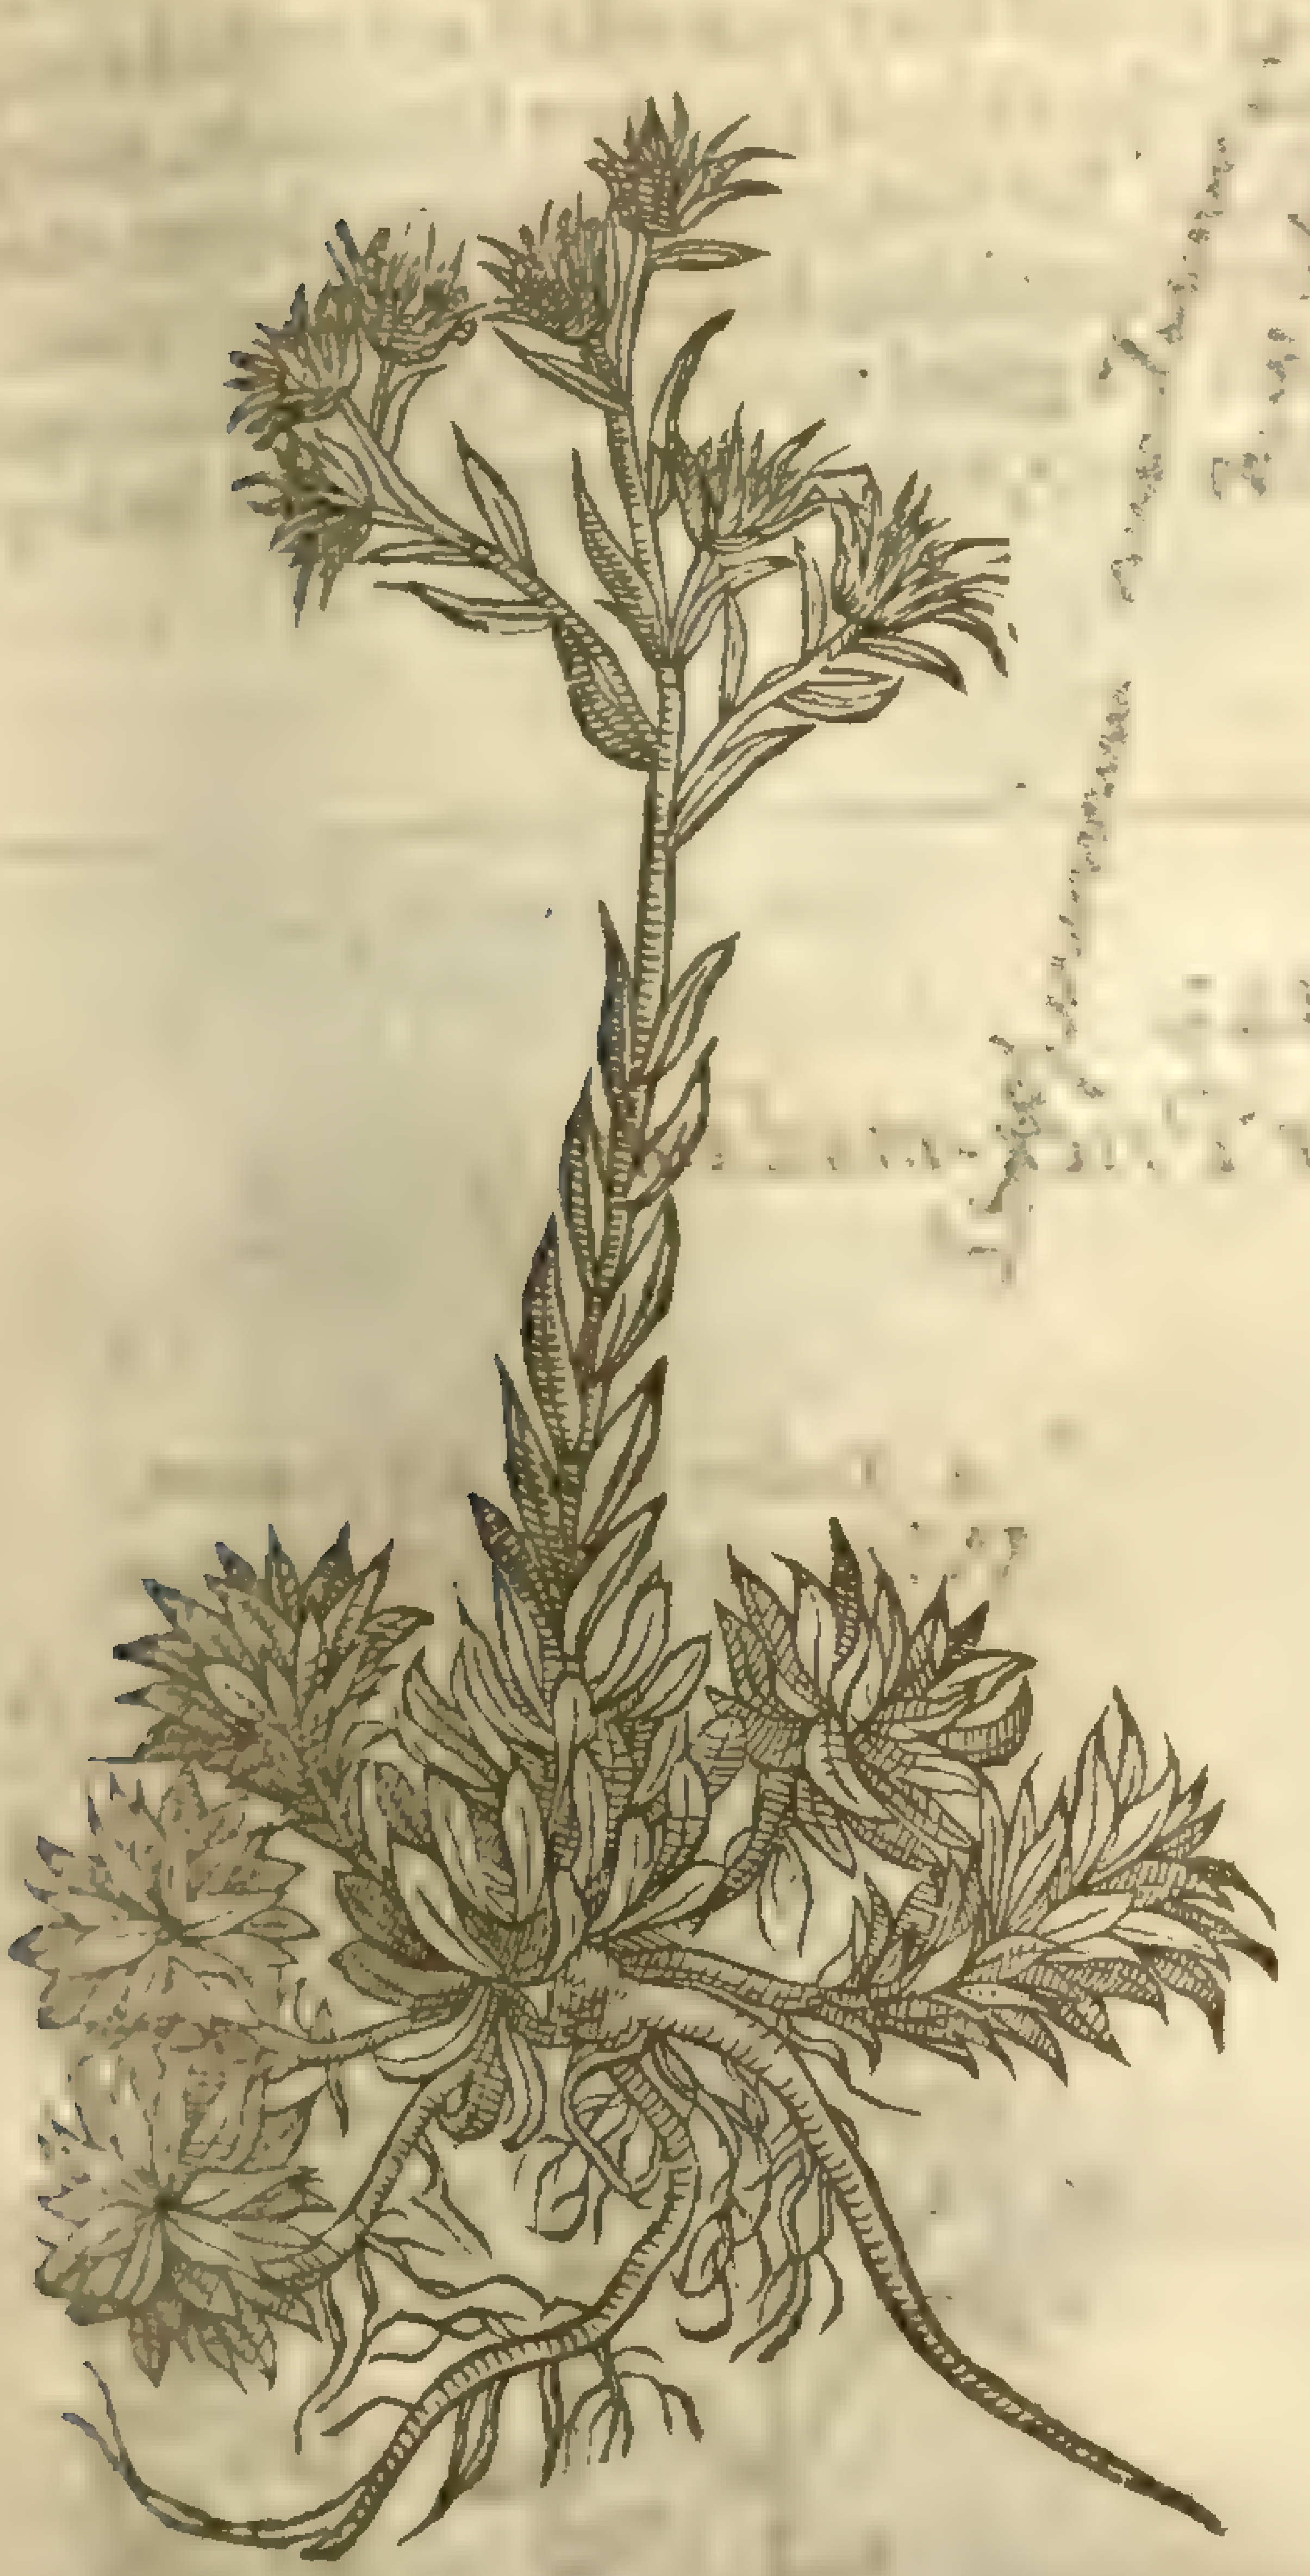
4 There is likewiſe a third to be referred hereunto: the leaues hereof be of a whitiſh green, and are very curiouſly nicked round about. ‡ The floure is great, conſiſting of ſix white leaues. This is that deſcribed by *Dodonæus* in the fourth place; being the *Cotyledon altera ſecunda* of *Cluſius*. ‡

5 There is alſo a fourth, the circles wherof are leſſer, the leaues ſharp pointed, very cloſely ſet, of a darke red colour on the top, and hairy in the edges: the floures on the ſprigs are of a gallant purple colour. ‡ This is the fift of *Dodonæus*, and the *Cotyledon altera tertia* of *Cluſius*. ‡

¶ *The Place.*

1 The great Sengreene is well knowne not onely in Italy, but alſo in France, Germany, Bohemia, and the Low-Countries. It groweth vpon ſtones in mountaines, vpon old walls, and auntient Buildings, eſpecially vpon the tops of houſes. The forme hereof doth differ according to the nature of the ſoile; for in ſome places the leaues are narrower and leſſer, but moe in number, and haue one only circle: in ſome they are fewer, thicker, and alſo broader: they are greene, and of a deeper greene

‡ 5 *Sedum maius anguſtifolium.*
Great narrow leaued Houſleek.



green in ſome places, and in others of a lighter green; for thoſe which we haue deſcribed grow not in one place, but in diuers and ſundry.

2 Great Sengreene is found growing of it ſelfe on the tops of houſes, old walls, and ſuch like places, in very many prouinces of the Eaſt, and of Greece, and alſo in the Iſlands of the Mediterranean ſea, as in Creet, now called Candy, Rhodes, Zant, and others: neither is Spain without it; for (as *Cluſius* witneſſeth) it groweth in many places of Portingall; otherwiſe it is cheriſhed in pots. In cold countries and ſuch as lie Northward, as in both the Germanies, it neither groweth of it ſelfe, nor yet laſteth long, though it be carefully planted, and diligently looked vnto, but through the extremitie of the weather and the ouermuch cold of winter it periſheth.

¶ *The Time.*

The ſtalk of the firſt doth at length floure after the Summer ſolſtice, which is in Iune about S. *Barnabies* day, and now and then in the month of Auguſt: but in Aprill, that is to ſay, after the Æquinoctiall of the Spring, which is about a moneth after the ſpring is begun, there grow out of this among the leaues ſmall ſtrings, which are the groundwork of the circles; by which beeing at length full grown, it ſpreads it ſelfe into verie many circles.

2 Houſleek that growes like a tree floureth in Portugall preſently after the winter ſolſtice, being in December about S. *Lucies* day.

¶ *The Names.*

The firſt is commonly called *Iovis barba*, or *Iupiters* beard, and alſo *Sedum majus vulgare*: the Germanes call it **Hauſzwurtz, Groſz Donderbaert**: the Low-Dutch, **Donderbaert**: the Hollanders, **Huyſlooek**: the Frenchmen *Ioubarbe*: the Italians, *Sempreuiuo maggiore*: the Spaniards, *Siempreuiua, yerua puntera*: the Engliſhmen, Houſleeke, Sengreen, and Aygreen: of ſome, Iupiters Eye, Bullocks eye, and *Iupiters* beard: of the Bohemians, *Netreske*. Many take it to be *Cotyledon altera Dioſcoridis*; but we had rather haue it one of the Sengreens, for it is continually green, and alwaies flouriſheth, and is hardly hurt by the extremitie of Winter.

The other without doubt is *Dioſcorides* his ἀείζωον μέγα; that is, *Sempervivum magnum*, or *Sedum majus*, great Houſleeke or Sengreen: *Apuleius* calleth it *Vitalis*, and *Semperflorium*: it is alſo named ζωόφθαλμον, στεργηθρον, ἀειθαλές.

¶ *The Temperature.*

The great Houſleeks are cold in the third degree; they are alſo dry, but not much, by reaſon of the waterie eſſence that is in them.

¶ *The Vertues.*

They are good againſt S. *Anthonies* fire, the ſhingles, and other creeping vlcers and inflammations, as *Galen* ſaith, that proceed of rheumes and fluxes; and as *Dioſcorides* teacheth, againſt the inflammation or fiery heate in the eies: the leaues, ſaith *Pliny*, being applied, and the juice laid on, are a remedie for rheumatick and watering eies. A

They take away the fire of burnings and ſcaldings, and being applied with barly meale dried, do take away the paine of the gout. B

Dioſcorides teacheth, that they are giuen to them that are troubled with a hot laske: that they likewiſe driue forth wormes of the belly, being drunke with wine. C

The juice put vp in a peſſary do ſtay the fluxes in women, proceeding of a hot cauſe; the leaues held in the mouth do quench the thirſt in hot burning feuers. D

The juice mixed with barly meale and vineger preuaileth againſt S. *Anthonies* fire, all hot burning and fretting vlcers, and againſt ſcaldings, burnings, and hot inflammations, and alſo the gout comming of an hot cauſe. E

The

F The juice of Houſleeke, garden Nightſhade, and the buds of Poplar boiled in *Axungia porci*, or hogs greaſe, make the moſt ſingular Populeon that euer was vſed in Surgerie.

G The juice hereof taketh away cornes from the toes and feet, if they be waſhed and bathed therewith, and euery day and night as it were emplaiſtered with the skin of the ſame Houſleeke, which certainly taketh them away without inciſion or ſuch like, as hath been experimented by my verie good friend Mr *Nicolas Belſon*, a man painfull and curious in ſearching forth the ſecrets of nature.

H The decoction of Houſleek or the juice thereof drunke, is good againſt the bloudy flixe, and cooleth the inflammation of the eyes, being dropped thereinto, and the herb bruiſed and layd vpon them.

¶ *The Deſcription.*

1 The firſt of theſe is a very little hearbe creeping vpon the ground with many ſlender ſtalks, which are compaſſed about with a great number of leaues that are thick, full of joints, little, long, ſharp pointed, inclining to a green blew. There riſe vp amongſt theſe little ſtalks an handfull high, bringing forth at the top as it were a ſhadowie tuft, and therein fine yellow floures: the root is full of ſtrings.

2 The other little Sengreene is alſo a ſmall herbe, bringing forth many ſlender ſtalkes, ſeldome aboue a ſpan high; on the tops whereof ſtand little floures like thoſe of the other, in ſmall looſe

Lob. ic. 374

Draba aizoides
Smith [illegible]

looſe tufts, but they are white & ſomthing leſſer: the leaues about the ſtalkes are few and little, but long, blunt, and round, bigger than wheaten cornes, ſomething leſſer than the kernels of Pine apples, otherwiſe not vnlike; which oftentimes are ſomthing red ſtalks and all: the root creepeth vpon the ſuperficiall or vppermoſt part of the earth, ſending downe ſlender threds.

3 This is a ſmall kinde of Stonecrop, which hath little narrow leaues, thick ſharp pointed and tender ſtalks ful of fatty juice; on the top wherof grow ſmal yellow flours ſtar-faſhion. The root is ſmall, and running by the ground.

4 There is likewiſe another Stonecrop called Frog Stonecrop, which hath little tufts of leaues riſing from ſmall and thready roots, creeping vpon the ground like to *Kali* or Frog-graſſe: from the which tufts of leaues riſeth a ſlender ſtalke ſet with a few ſuch like leaues, hauing at the top pretty large yellow floures, the ſmalneſſe of the plant being conſidered.

‡ 5 This is like that which is deſcribed in the ſecond place, but that the ſtalkes are leſſer, and not ſo tall, and the floures of this are ſtar-faſhioned and of a golden yellow colour. ‡

8 There is another Stonecrop or Prickmadam called *Aizoon Scorpioides*, which is altogether like the great kinde of Stonecrop, and differeth in that, that this kind of Stonecrop or Prickmadam hath his tuft of yellow floures turning againe, not much vnlike the taile of a ſcorpion, reſembling *Myoſitis ſcorpioides*, and the leaues ſomewhat thicker and cloſer thruſt together: the root is ſmall and tender.

7 There is a plant called *Sedum Portlandicum*, or Portland Stoncrop, of the Engliſh Iſland called Portland, lying in the South coaſt, hauing goodly branches, and a rough rinde. The leaues imitate *Laureola*, growing amongſt the Tithymales, but thicker, ſhorter, more fat and tender. The ſtalke is of a woody ſubſtance like *Laureola*, participating of the kindes of *Craſſula*, *Sempervivum*, and the Tithymales, whereof we thinke it to be a kinde: yet not daring to deliuer any vncertaine ſentence, it ſhall be leſſe prejudiciall to the truth, to account it as a ſhrub degenerating from both kindes.

‡ *Pena* and *Lobel*, who firſt ſet this forth, knew not very well what they ſhould ſay thereof; nor any ſince them: wherefore I haue onely giuen you their figure put to our Authours deſcription. ‡

8 There is a plant which hath receiued his name *Sedum petræum*, becauſe it doth for the moſt part grow vpon the rockes, mountaines, and ſuch like ſtony places, hauing very ſmall leaues comming forth of the ground in tufts like *Pſeudo-Moly*, that is, our common herb called Thrift: among the leaues come forth ſlender ſtalk, an handfull high, loden with ſmall yellow floures like vnto the common Prick-madam: after which come little thick ſharp pointed cods, which contain the ſeed, which is ſmall, flat, and yellowiſh.

¶ *The Place.*

The former of theſe groweth in gardens in the Low-Countries: in other places vpon ſtone wals and tops of houſes in England almoſt euerie where.

The other growes about rubbiſh in the borders of fields, and in other places that lie open to the Sun.

¶ *The Time.*

They floure in the Summer moneths.

¶ *The Names.*

The leſſer kinde is called in Greeke ἀείζωον μικρόν: in Latine, *Sedum*, and *Sempervivum minus*: of the Germanes, **Kleyn Donderbaer**, and **Kleyn Hauſzwurtz**: of the Italians, *Sempervivo minore*: of the Frenchmen, *Tricque-madame*: of the Engliſh, Prick-madam, dwarfe Houſleeke, and ſmall Sengreene.

The ſecond kind is named in ſhops *Craſſula minor*: and they doe ſyrname it *Minor*, for the difference between it and the other *Craſſula*, which is a kind of *Orchis*: it is alſo called *Vermicularis*: in Italian, *Pignola*, *Cranelloſa*, and *Graſella*: in low-Dutch, **Blader looſen**: in Engliſh, wild Prickmadam, Great Stone-crop, or Worm-graſſe. ‡ That which is vulgarly known and called by the name of Stonecrop is the *Illecebra* deſcribed in the following chapter, & ſuch as grow commonly with vs of theſe ſmall Houſleeks mentioned in this chapter are generally named Prickmadams: but our Author hath confounded them in this and the next chapter; which I would not alter, thinking it ſufficient to giue you notice thereof.

¶ *The Temperature and Vertues.*

A All theſe ſmall Sengreens are of a cooling nature like to the great ones, and are good for thoſe things that the others be. The former of theſe is vſed in many places in ſallads, in which it hath a fine relliſh, and a pldaſant taſte, and is good for the heart-burne.

Chap. 144.

‡ *Of diuers other ſmall Sengreenes.*

¶ *The Description.*

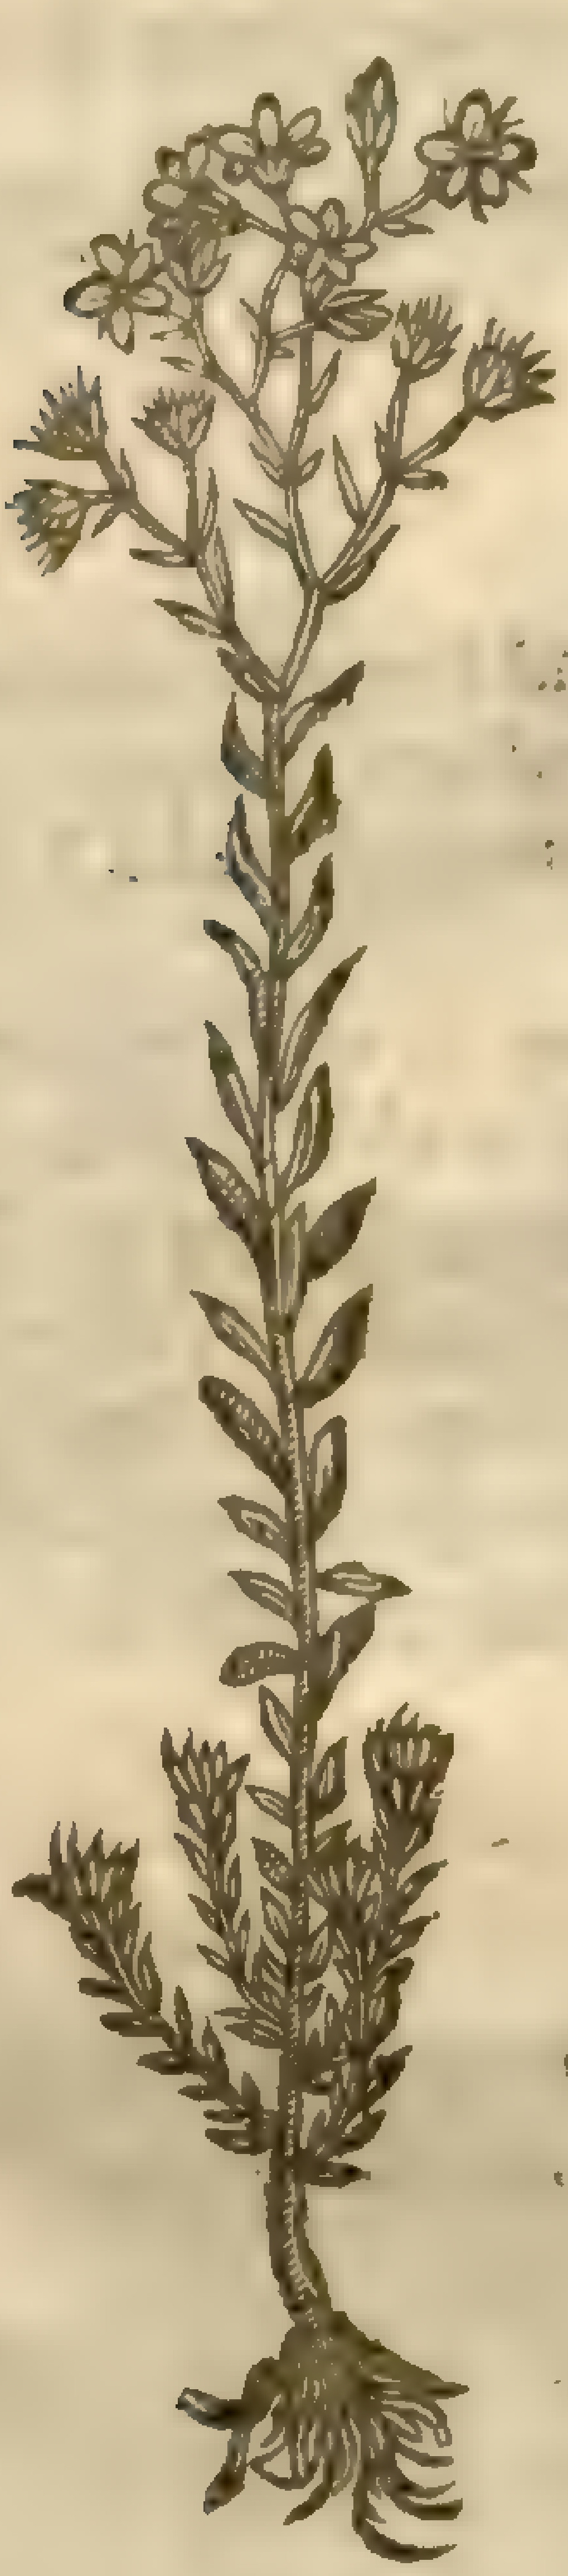
‡ 1 The ſtalke of this ſmall water Sengreene is ſome ſpan long, reddiſh, ſucculent, and weake; the leaues are longiſh, a little rough, and ful of juice: the floures grow vpon the tops of the ſtalks, conſiſting of ſix purple or elſe fleſh-colored leaues, which are ſucceeded by as many little cods containing a ſmall ſeed: the root is ſmall and threddy, & the whole plant hath an inſipide or wateriſh taſte. This was found by *Cluſius* in ſome waterie places of Germany about the end of Iune, and he calls it *Sedum minus* 3. *ſiue paluſtre*.

2 This ſecond from ſmall fibrous and creeping roots ſends vp ſundry little ſtalkes ſet with leaues like thoſe of the ordinary Prick-madam, yet leſſe, thick, and flatter, and of a more aſtringent taſte: the floures, which are pretty large, grow at the tops of the branches, and conſiſt of fiue pale yellowiſh leaues. It growes in diuers places of the Alps, and floures about the end of Iuly, and in Auguſt. This is the *Sedum minus* 6. or *Alpinum* 1. of *Cluſius*.

3 This hath ſmall little and thicke leaues, lying bedded, or compact cloſe together, and are of an Aſh-colour inclining to blew: the ſtalkes are ſome two inches long, ſlender, and almoſt naked; vpon which grow commonly ſome three floures conſiſting of fiue white leaues apiece, with ſome yellow threds in the middle. This mightily encreaſes, and will mat and couer the ground for a good ſpace together. It floures in Auguſt, and growes vpon the craggy places of the Alps. *Cluſius* cals it *Sedum minus nonum, ſiue Alpinum* 3.

3 The leaues of this are ſomwhat larger and longer, yet thick, and ſomwhat hairy about their edges; at firſt alſo of an acide taſte, but afterwards bitteriſh and hot: it alſo ſends forth ſhoots, and in the midſt of the leaues it puts forth ſtalkes ſome two inches high, which at the top as in an vmbel carry ſome ſix little floures conſiſting of fiue leaues apiece, hauing their bottomes of a yellowiſh colour. It is found in the like places, and floures at the ſame time as the former. *Cluſius* maketh it his *Sedum minus* 10. *Alpinum* 4. and in the *Hiſt. Lugd.* it is called *Iaſme montana*.

5 For



‡ 1 *Sedum minus paluſtre.*
Small water Sengreen.

Sedum villosum, L. [illegible] dict.

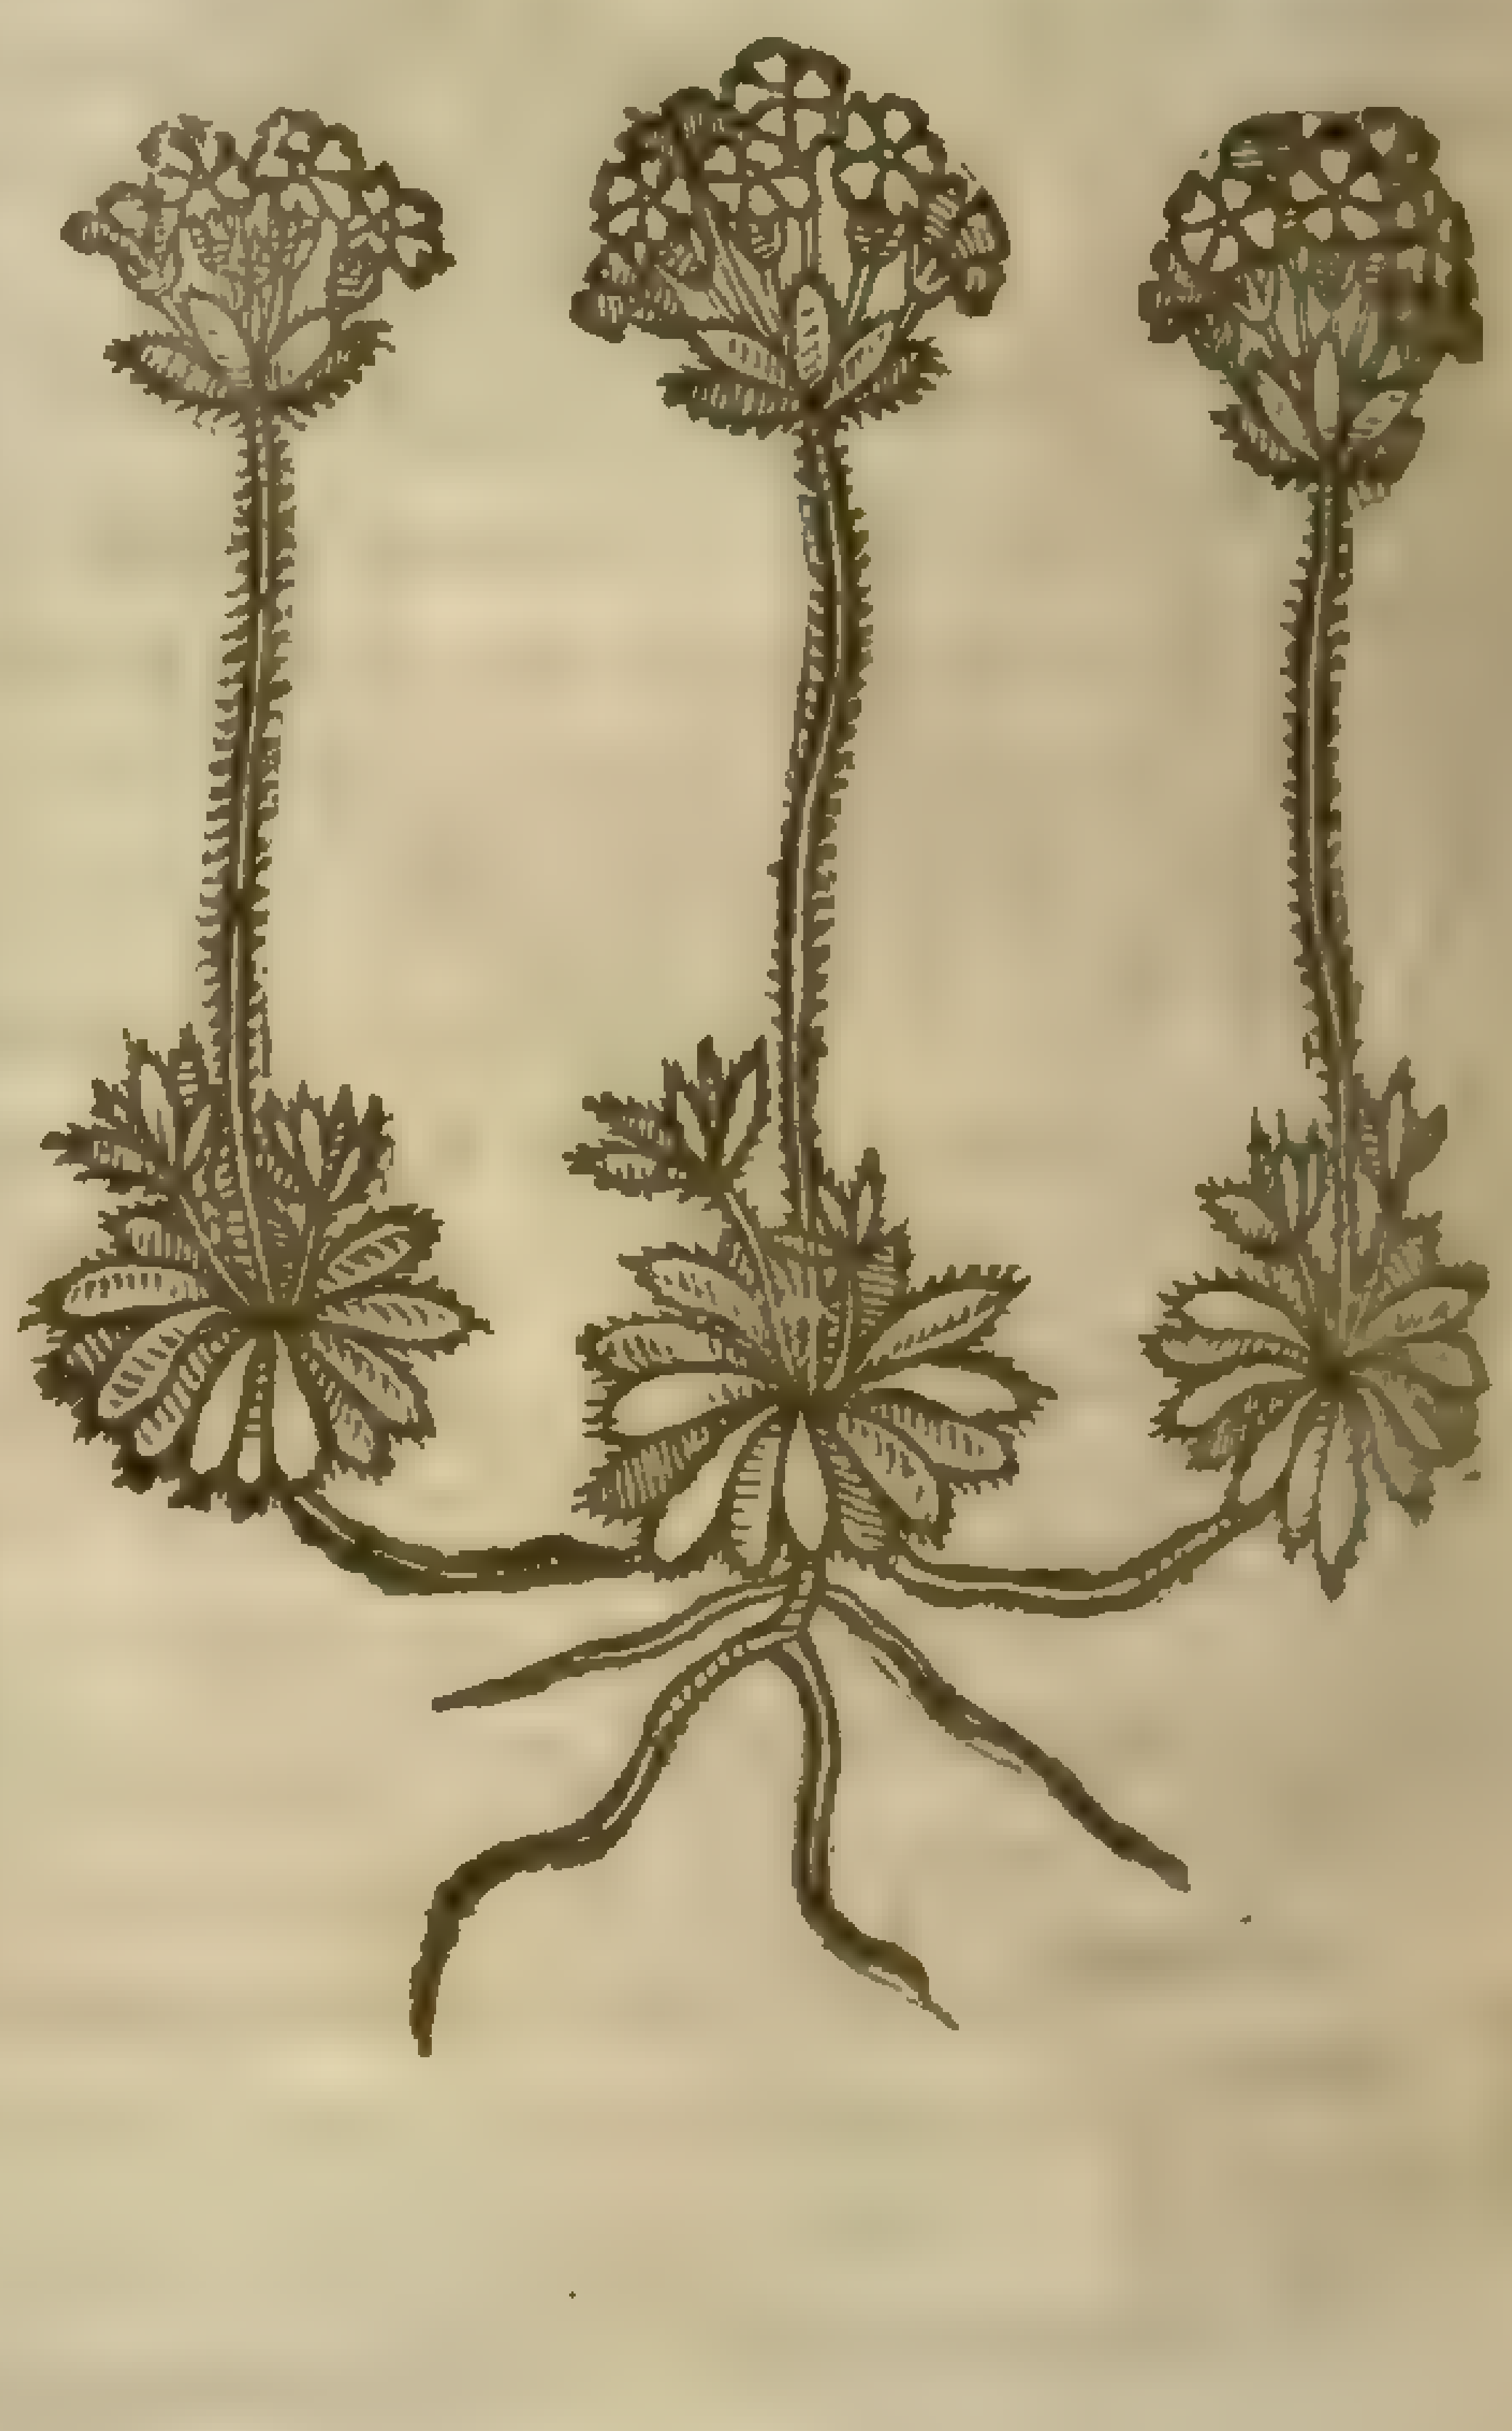
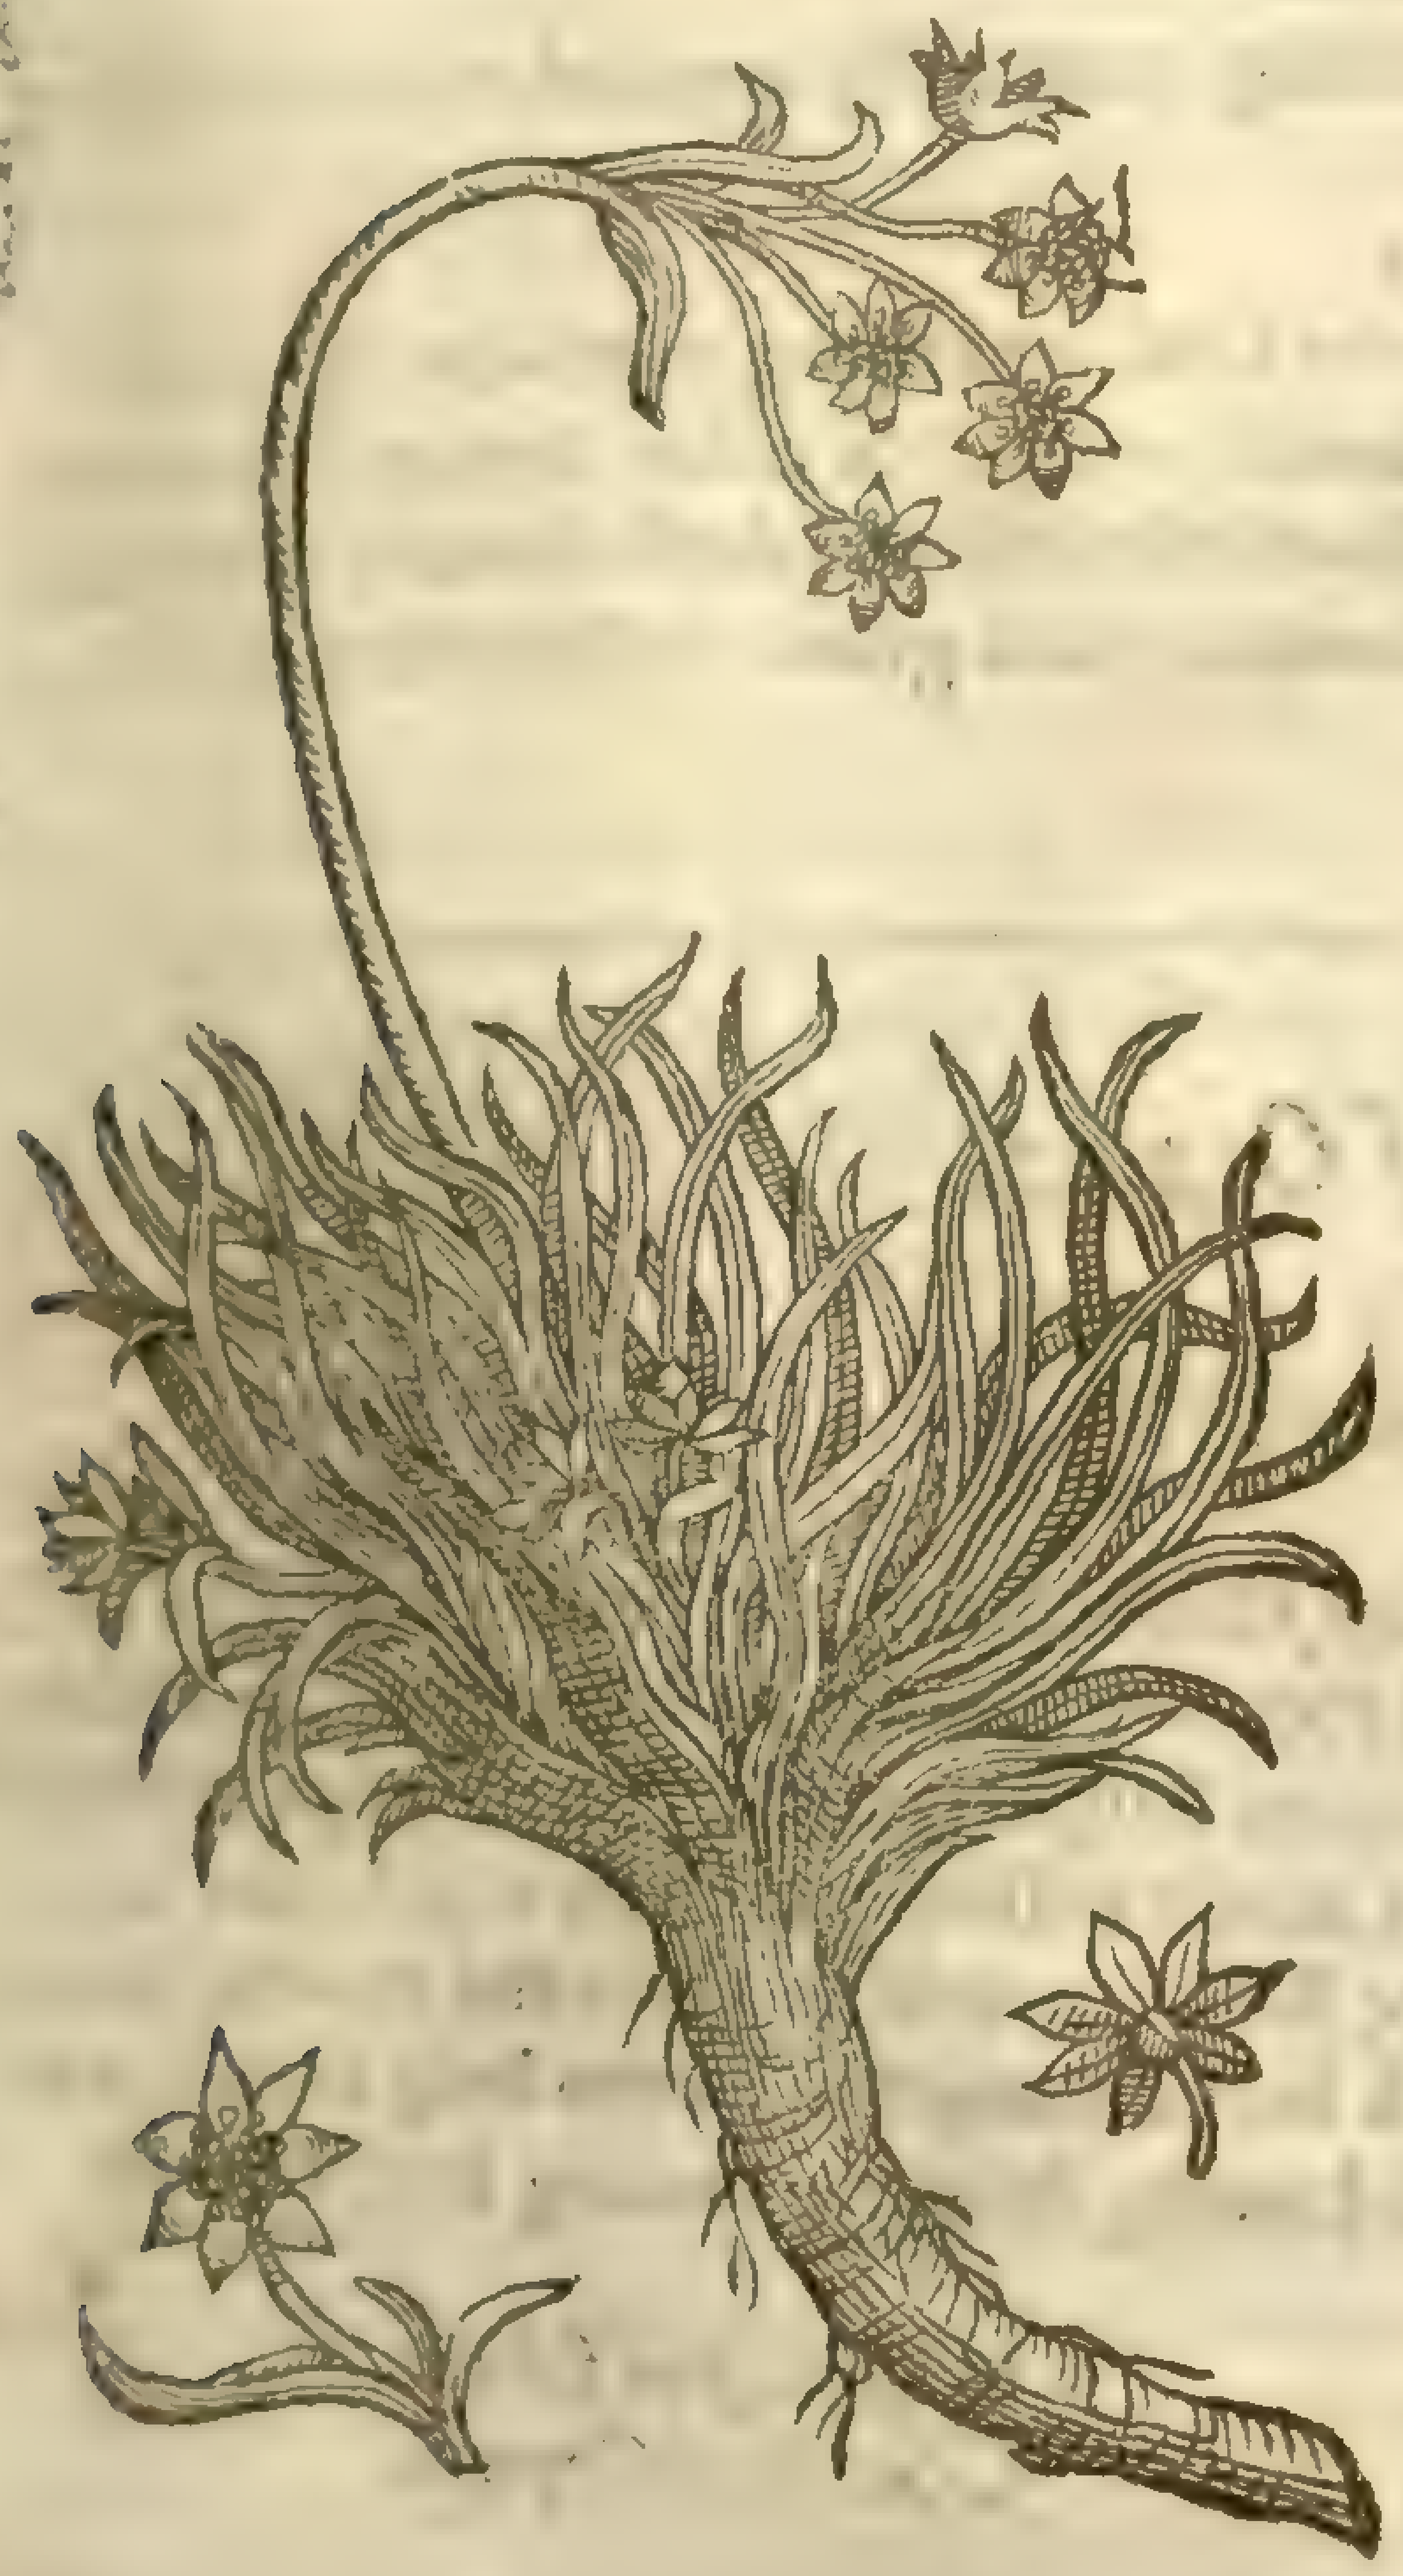
Mill. dict.



‡ 4 *Sedum Alpinum* 4. *Cluſij.*
Small Sengreen of the Alps.

‡ 5 *Sedum petræum Bupleuri folio.*
Long leaued rock Sengreen.

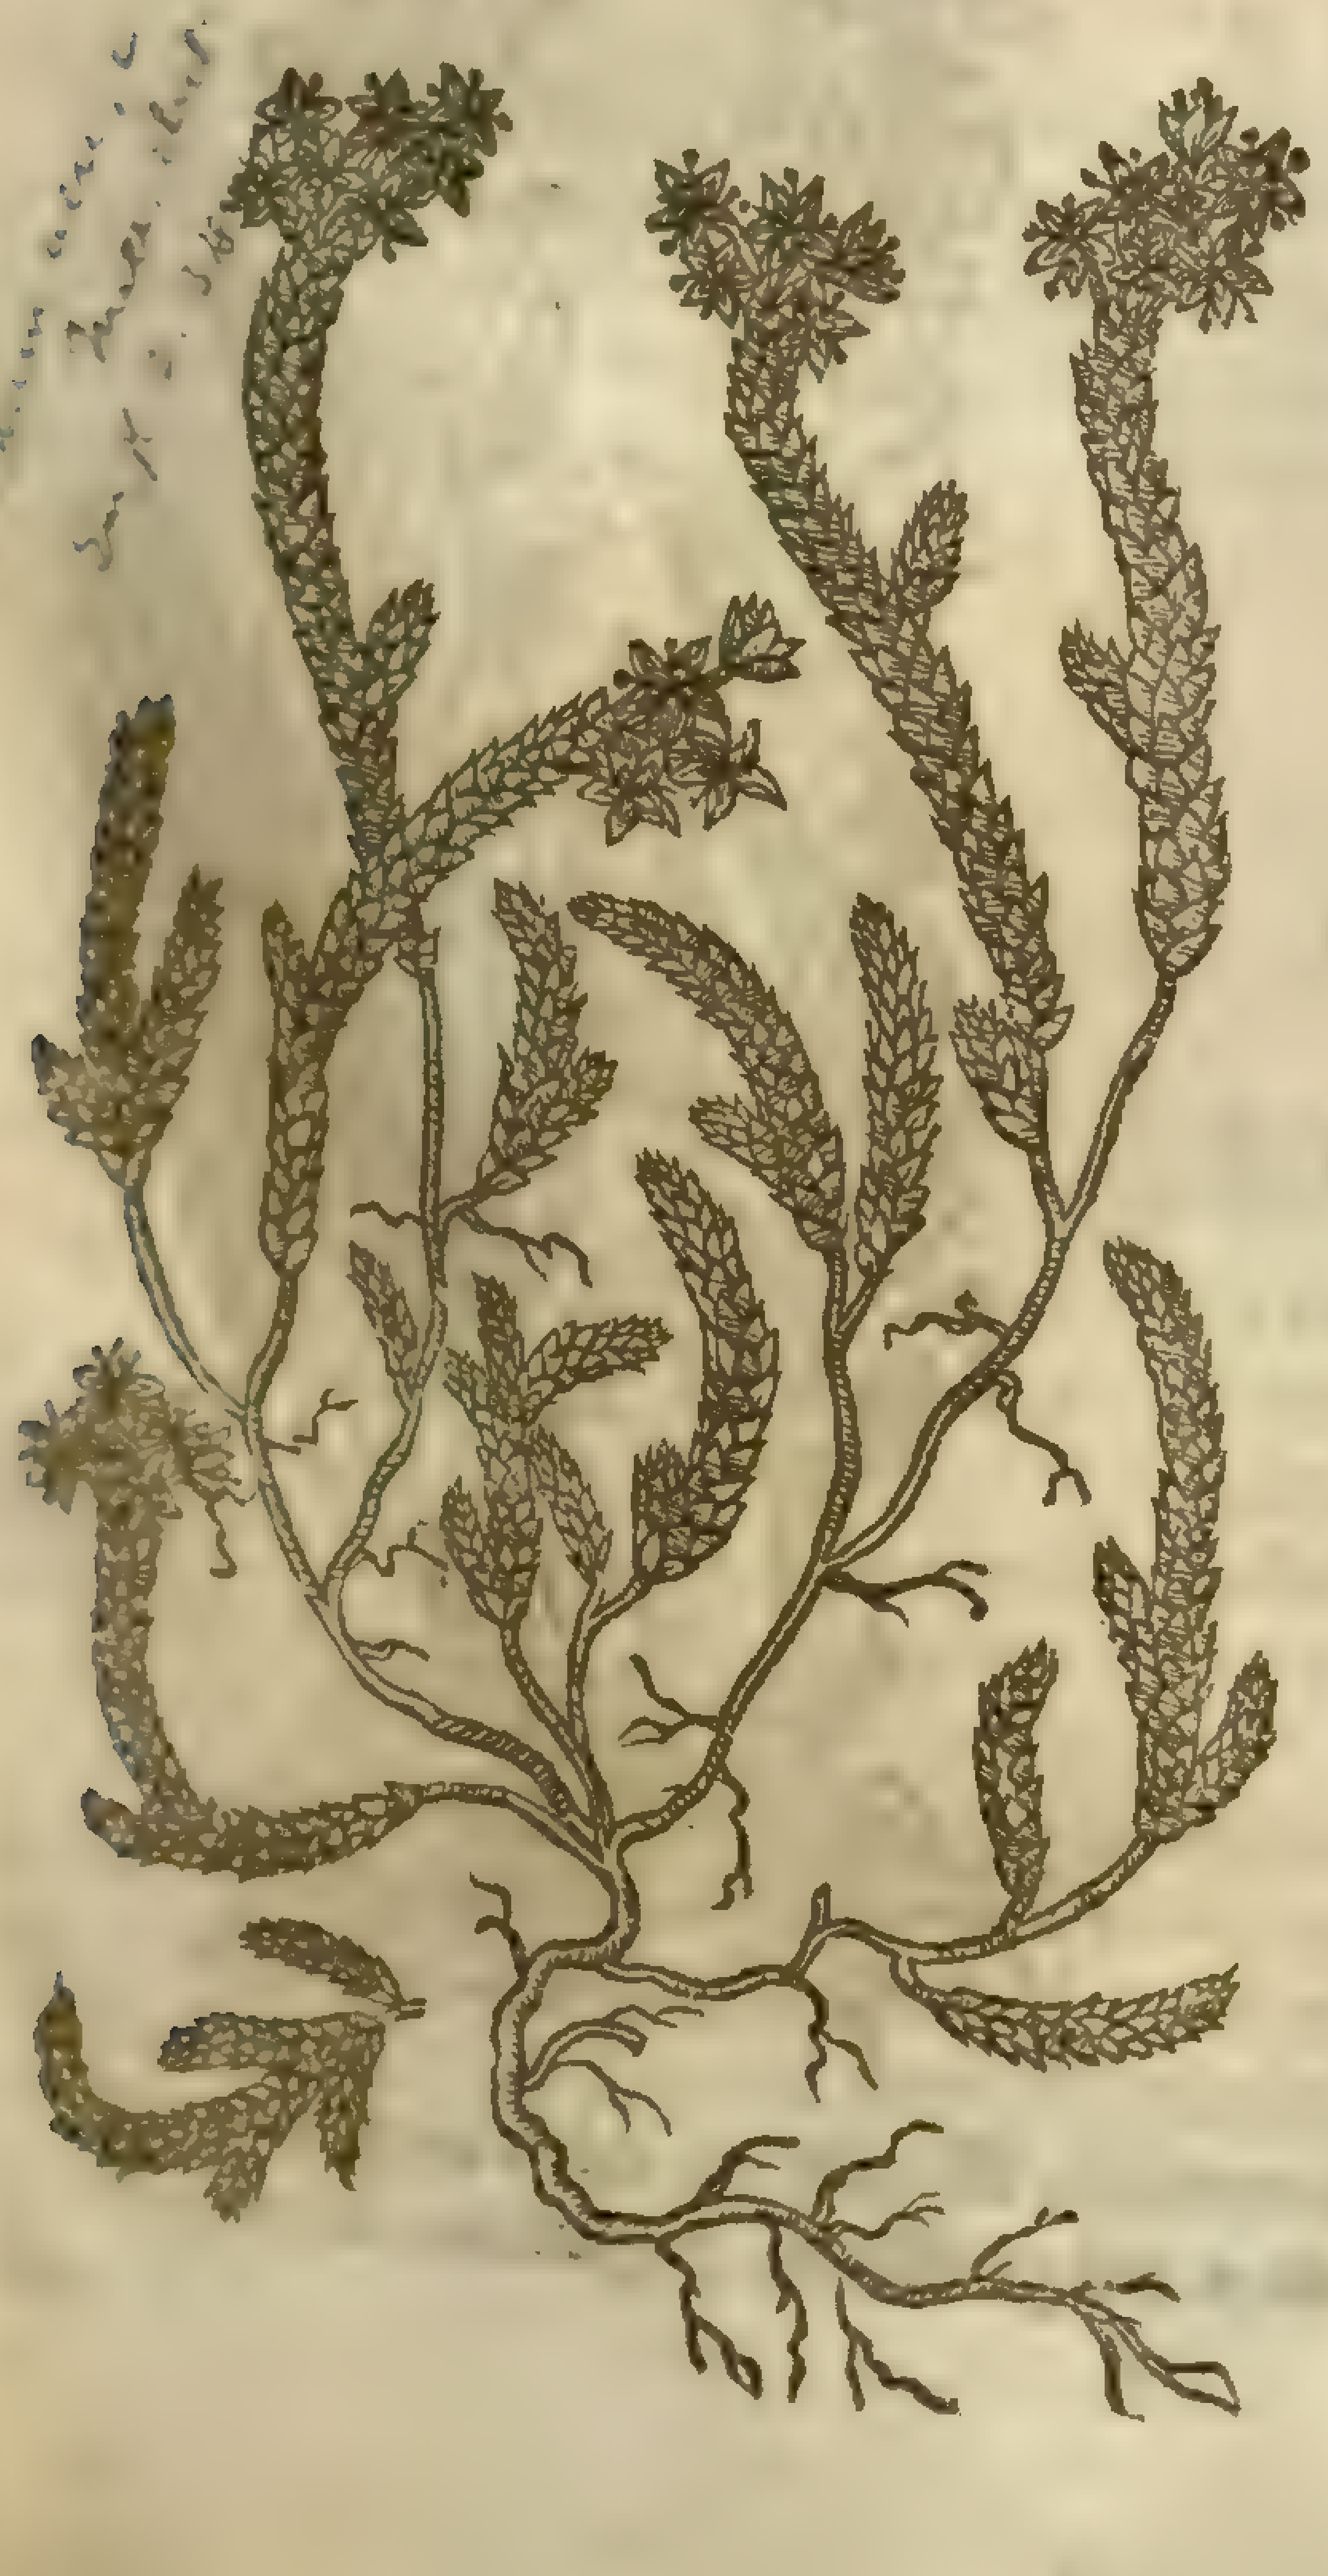


5 For theſe foure laſt deſcribed we are beholden to *Cluſius*, and for this fifth to *Pona*, who thus deſcribes it: it hath one thicke and large root with few or no fibres, but ſome knots bunching out here and there: it is couered with a thicke barke, and is of a blackiſh red colour on the out ſide: the leaues are many, long and narrow, lying ſpred vpon the ground: the ſtalke growes ſome foot high, and is round and naked, and at the top carries floures conſiſting of ſeuen ſharpe pointed pale yellow leaues; which are ſucceeded by ſeeds like thoſe of *Bupleurum*, and of a ſtrong ſmel: it floures about the middle of Iuly, and the ſeed is ripe about the middle of Auguſt. *Pona*, who firſt obſerued this growing vpon mount Baldus in Italy, ſets it forth by the name of *Sedum petræum Bupleuri folio. Bauhine* hath it by the name of *Perfoliata Alpina Gramineo folio*, and *Bupleuron anguſtifolium Alpinum*.

¶ *The Nature and Vertues.*

The three firſt deſcribed without doubt are cold, and partake in vertues with the other ſmal Sengreens: but the two laſt are rather of an hot and attenuating faculty. None of them are commonly known or vſed in phyſicke. ‡

Vermicularis, ſiue Illecebra minor acris.
Wall Pepper, or Stone-crop.



CHAP. 145.

Of Stonecrop, called Wall Pepper.

¶ *The Deſcription.*

THis is a low and little herbe, the ſtalkes be ſlender & ſhort; the leaues about theſe ſtand very thick, and ſmall in growth, ful bodied, ſharp pointed, and full of juice: The floures ſtand at the top, and are maruellous little; of colour yellow, and of a ſharpe biting taſte: the root is nothing but ſtrings.

¶ *The Place.*

It groweth euery where in ſtony and dry places, and in chinks and crannies of old walls, and on the tops of houſes: it is alwaies greene, and therefore it is very fitly placed amongſt the Sengreenes.

¶ *The Time.*

It floureth in the Summer moneths.

¶ *The Names.*

This is *Tertium ſempervivum Dioſcoridis*, or *Dioſcorides* his third Sengreen, which he ſaith is called of the Grecians, ἀείζωον ἄγριον: and τηλέφιον: and of the Romans *Illecebra*. *Pliny* alſo witneſſeth, that the Latines name it *Illecebra*: yet there is another ἀείζωον ἄγριον: and another τηλέφιον: the Germans call this herb **Maurpfeffer**, & **Katzen treuble**: the Frenchmen, *Pain d'oiſeau*: the Low-Dutch,

Muer Pepper: the Engliſhmen, Stonecrop, and Stonehore, little Stonecrop, Pricket, Mouſ-tail, Wall Pepper, Country Pepper, and Iack of the Butterie.

¶ *The Temperature.*

This little herb is ſharpe and biting, and very hot. Being outwardly applied it raiſeth bliſters, and at length exulcerateth.

¶ *The Vertues.*

A It waſteth away hard kernels and the Kings euill, if it be laid vnto them, as *Dioſcorides* writes.

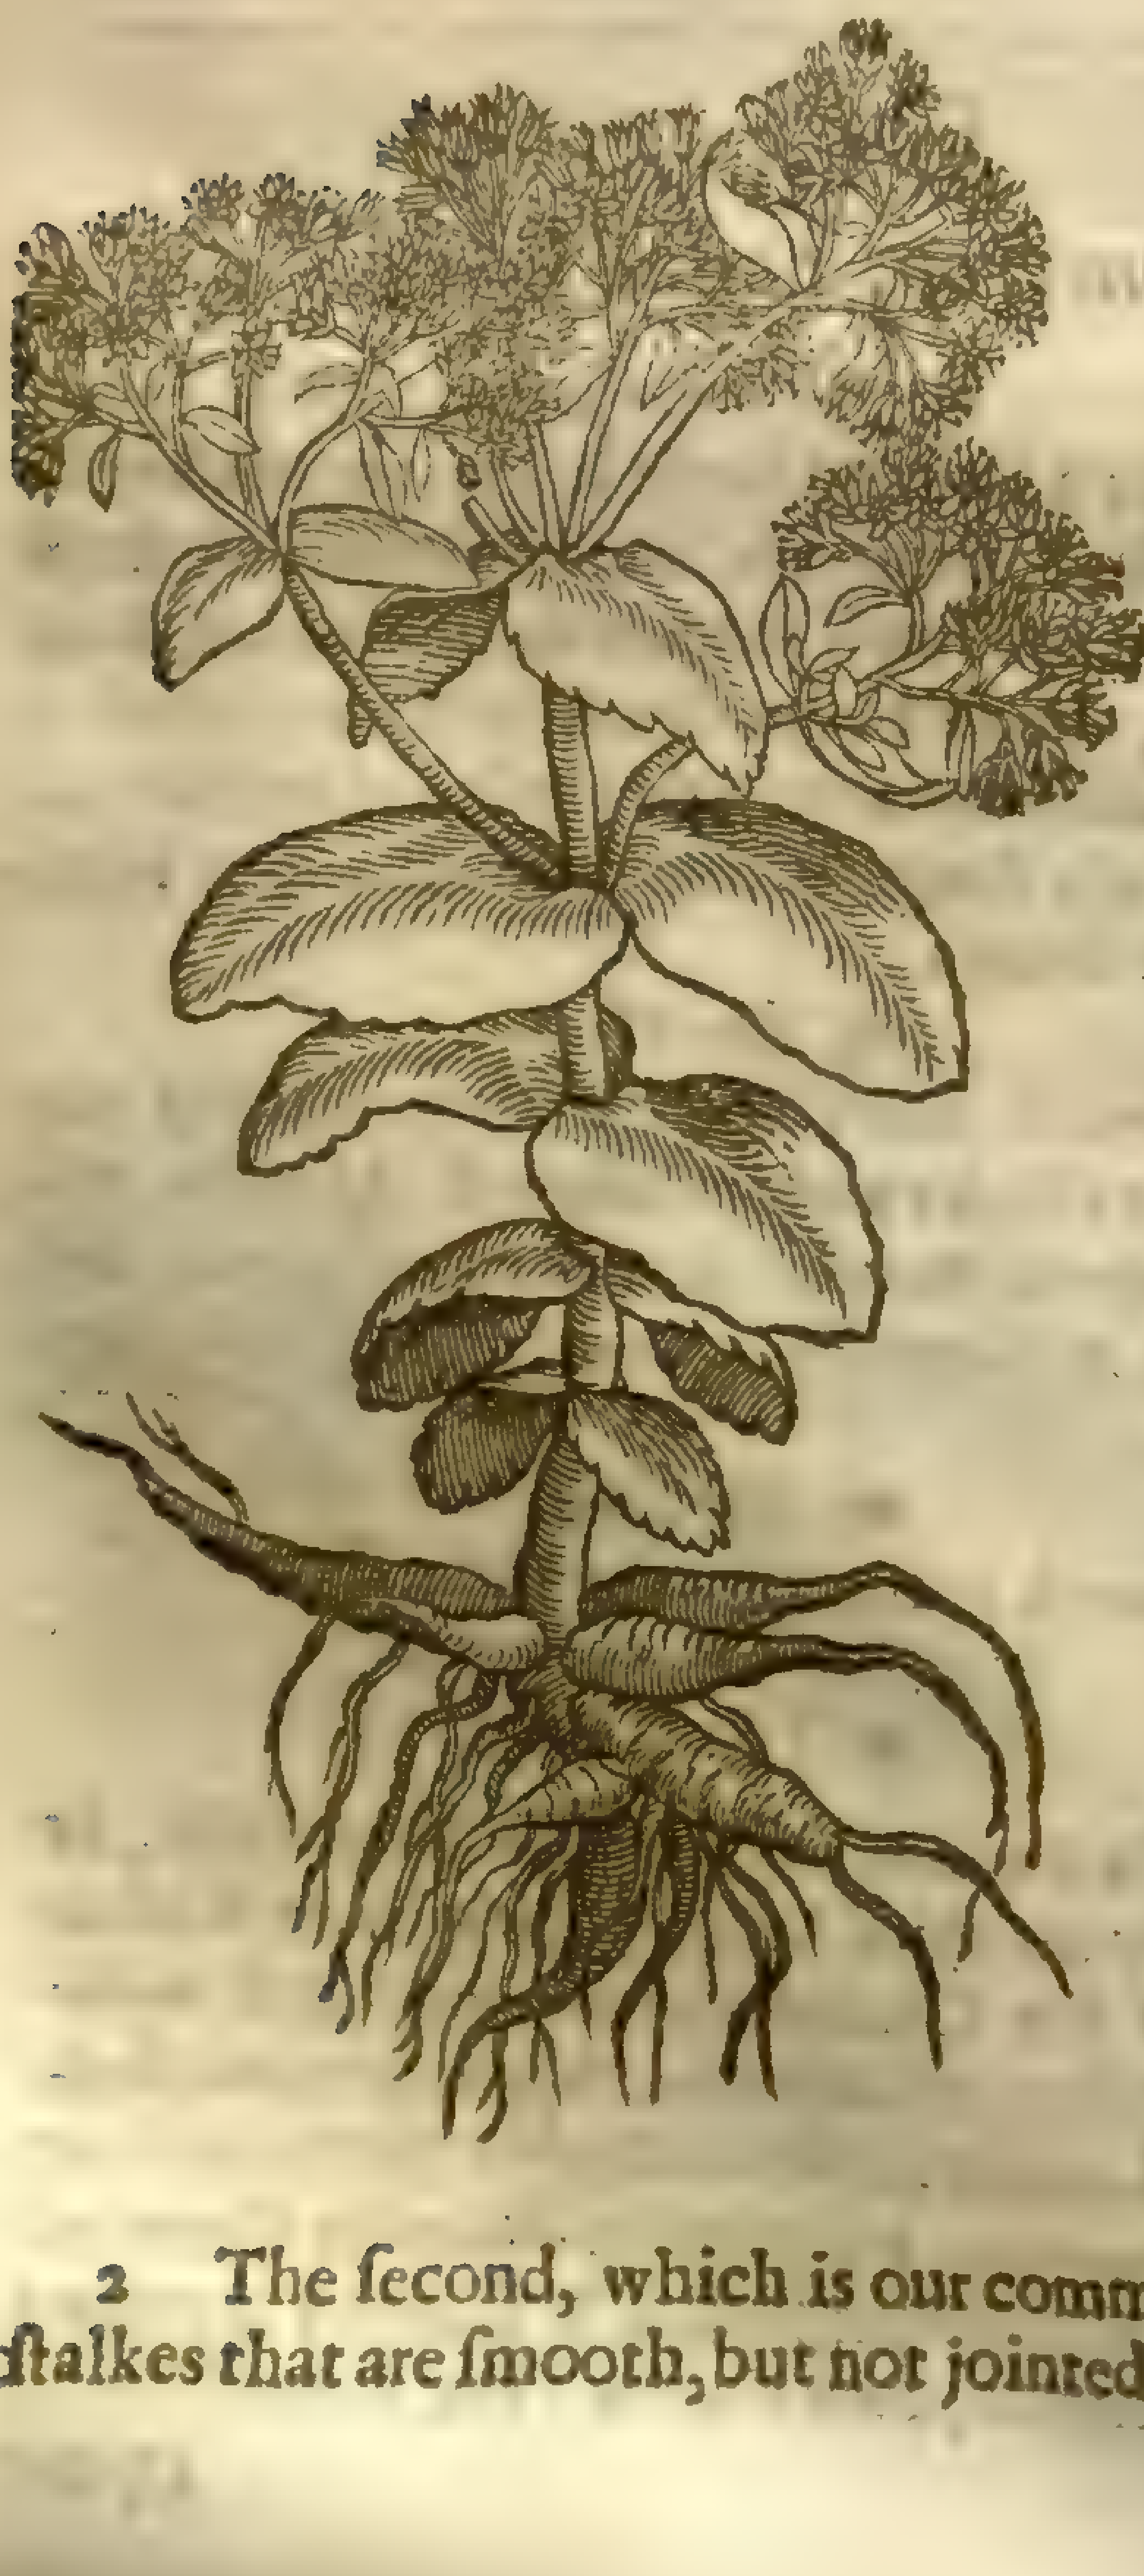
B The juice hereof extracted or drawne forth, and taken with vineger or other liquor, procures vomit, and brings vp groſſe and flegmatick humors, and alſo cholerick, and doth thereby often times cure the Quartan Ague and other Agues of long continuance: and giuen in this manner it is a remedie againſt poiſons inwardly taken.

Chap. 146. *Of Orpine.*

¶ *The Deſcription.*

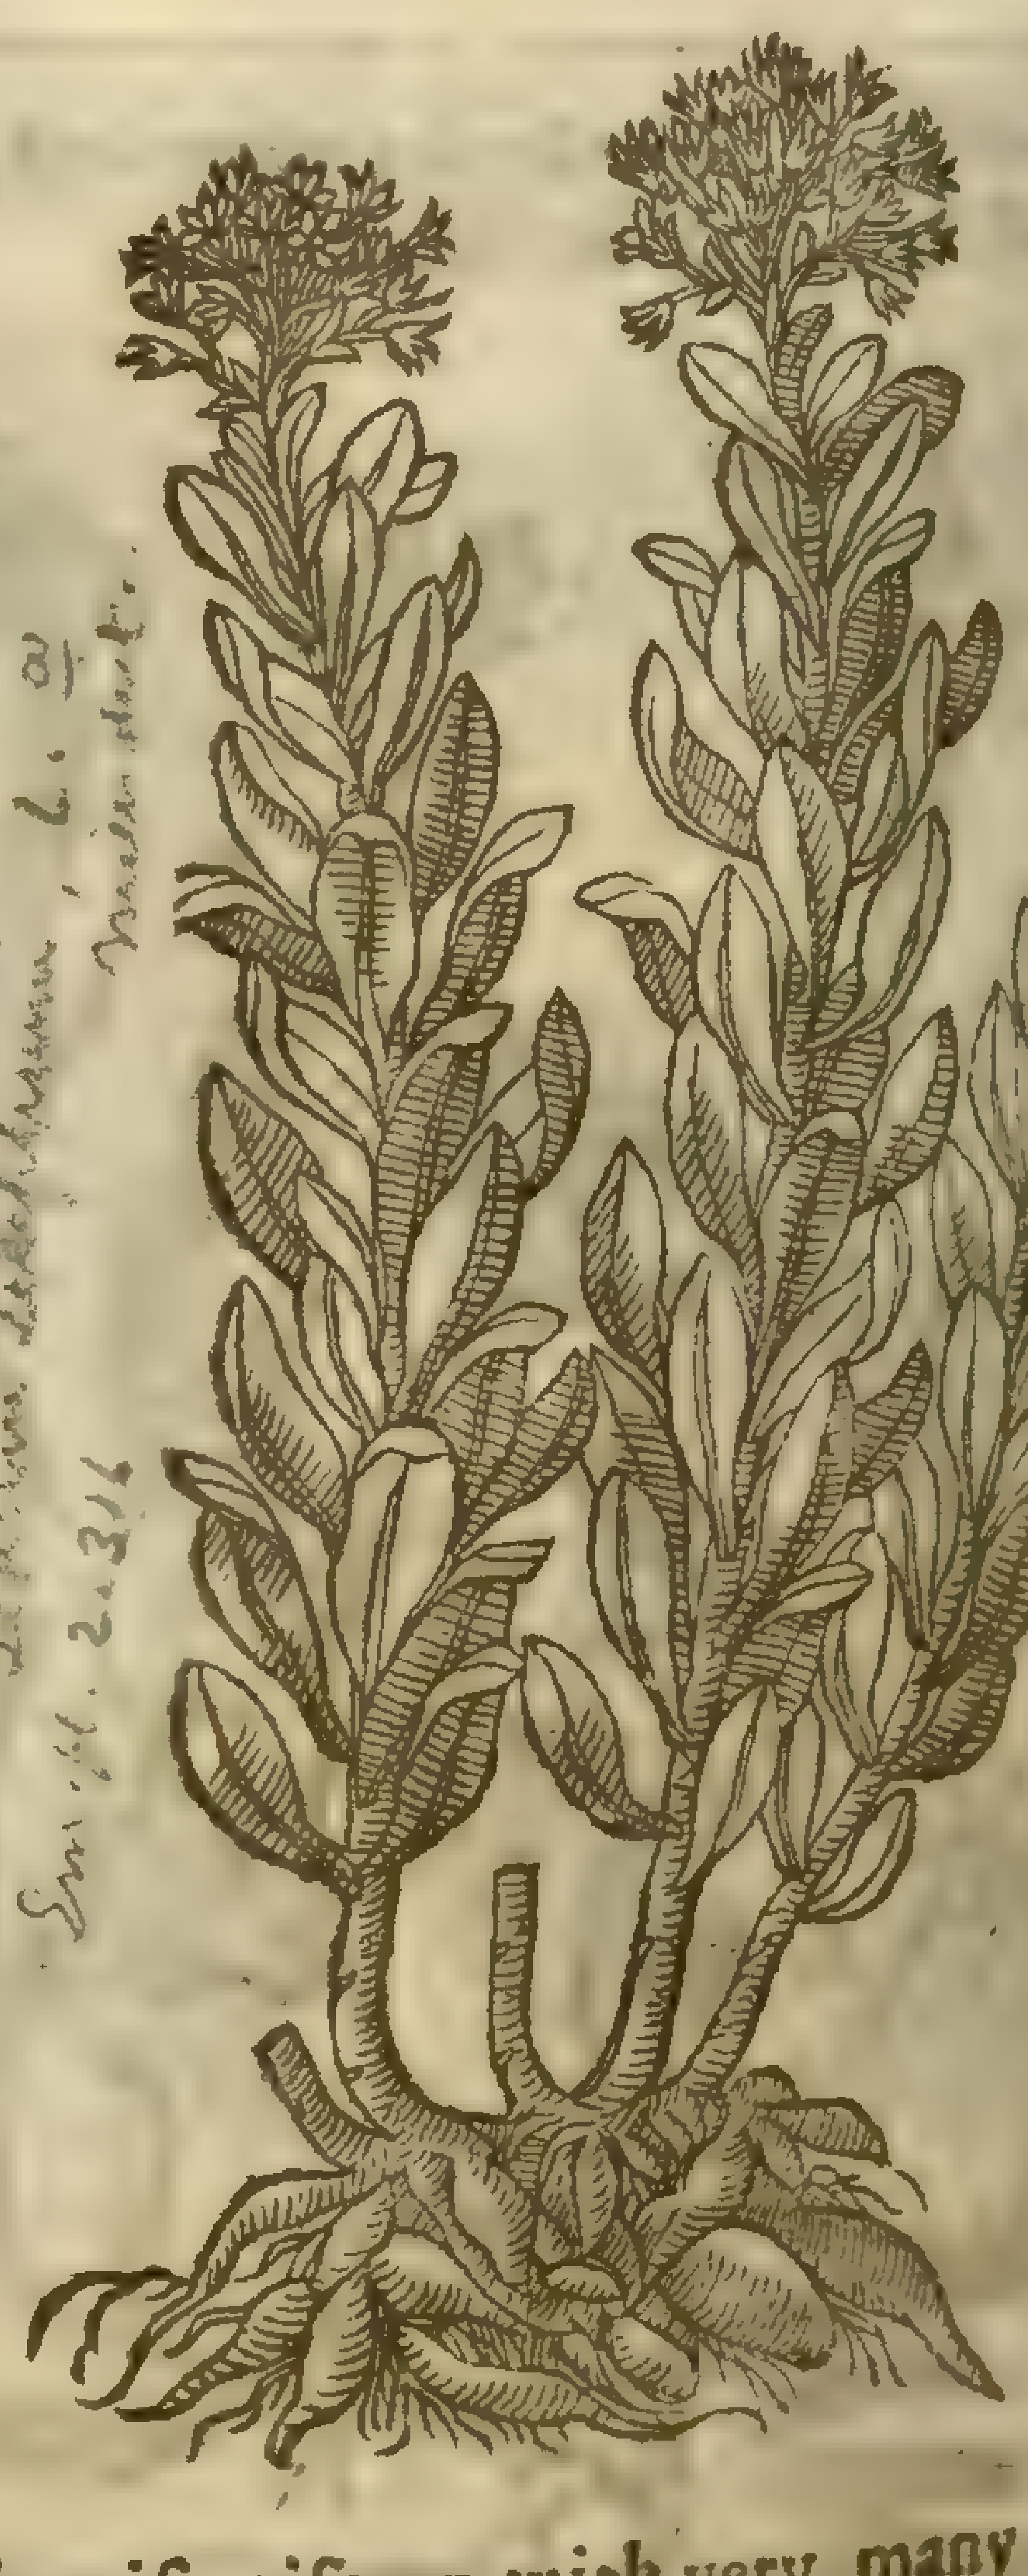
1 The Spaniſh Orpyne ſends forth round ſtalkes, thicke, ſlipperie, hauing as it were little joints ſomwhat red now and then about the root: the leaues in like manner be thicke, ſmooth, groſſe, full of tough juice, ſometimes ſleightly nicked in the edges, broader leafed, and greater than thoſe of Purſlane, otherwiſe not much vnlike; which by couples are ſet oppoſit one againſt another vpon euerie joint, couering the ſtalke in order by two and two: the floures in the round tufts are of a pale yellow: the root groweth ful of bumps like vnto long kernels, waxing ſharp toward the point: theſe kernels be white, and hauing ſtrings growing forth of them.

1 *Craſſula major Hiſpanica.*
Spaniſh Orpyne.



Sedum [illegible], L. [illegible]

2 *Craſſula ſiue faba inuerſa.*
Common Orpyne.



Sedum Telephium, L. [illegible]
Sm. fl. 2.316

2 The ſecond, which is our common Orpyne, doth likewiſe riſe vp with very many round ſtalkes that are ſmooth, but not jointed at all; the leaues are groſſe or corpulent, thicke, broad,

and oftentimes ſomewhat nicked in the edges, leſſer than thoſe of the former, placed out of order. The floures be either red or yellow, or elſe whitiſh: the root is white, wel bodied and full of kernels. This plant is very full of life: the ſtalks ſet only in clay continue greene a long time, and if they be now and then watered they alſo grow. Wee haue a wilde kinde of Orpyne growing in corne fields and ſhadowy woods in moſt places of England, in each reſpect like that of the garden, ſauing that it is altogether leſſer.

¶ *The Place.*

They proſper beſt in ſhadowie and ſtony places, in old wals made of lome or ſtone. *Oribaſius* ſaith That they grow in Vineyards and tilled places. The firſt groweth in gardens; the other euerie where; the firſt is much found in Spaine and Hungarie; neither is Germany without it; for it groweth vpon the bankes of the riuer of Rhene neere the Vineyardes, in rough and ſtony places, nothing at all differing from that which is found in Spaine.

The ſecond groweth plentifully both in Germany, France, Bohemia, England, and in other countries among Vines, in old lomy daubed and ſtony walls.

¶ *The Time.*

The Orpynes floure about Auguſt or before.

¶ *The Names.*

The firſt is that which is called of the Grecians τηλέφιον and ἀείζωον ἄγριον: of the Latines, *Telephium*, and *Semperviuum ſylveſtre*, and *Illecebra*: but *Illecebra* by reaſon of his ſharpe and biting quality differeth much from it, as we haue declared in the former chapter. Some there be that name it ἀνδράχνη, or *Portulaca ſylveſtris*: yet there is another *Portulaca ſylveſtris*, or wild Purſlane, like to that which groweth in gardens, but leſſer: we may call this in Engliſh, Spaniſh Orpyne, Orpyne of Hungarie, or ioynted Orpyne.

The ſecond kind of Orpyne is called in ſhops *Craſſula*, and *Craſſula Fabaria*, and *Craſſula major*, that it may differ from that which is deſcribed in the chapter of little Houſleeke: it is named alſo *Fabaria*: in high-Dutch, **Wandkraut**, **Knauenkraut**, **Fortzwang**, & **Fortzweyn**: in Italian *Fabagraſſa*: in French, *Ioubarbe des vignes*, *Feue eſpeſſe*: in Low-Dutch, **Smer wortele**, and **Hemel Sluetel**: in Engliſh, Orpyne: alſo Liblong or Liue-long.

¶ *The Temperature.*

The Orpyns be cold and dry, and of thin or ſubtile parts.

¶ *The Vertues.*

A *Dioſcorides* ſaith, That being laid on with vinegre, it taketh away the white morphew: *Galen* ſaith the black alſo; which thing it doth by reaſon of the ſcouring or clenſing quality that it hath: whereupon *Galen* attributeth vnto it an hot facultie, though the taſte ſheweth the contrarie: which aforeſaid ſcouring facultie declareth, That the other two alſo be likewiſe cold. But cold things may as well clenſe, if drineſſe of temperature and thinneſſe of eſſence be ioined together in them.

Chap. 147. *Of the ſmaller Orpyns.*

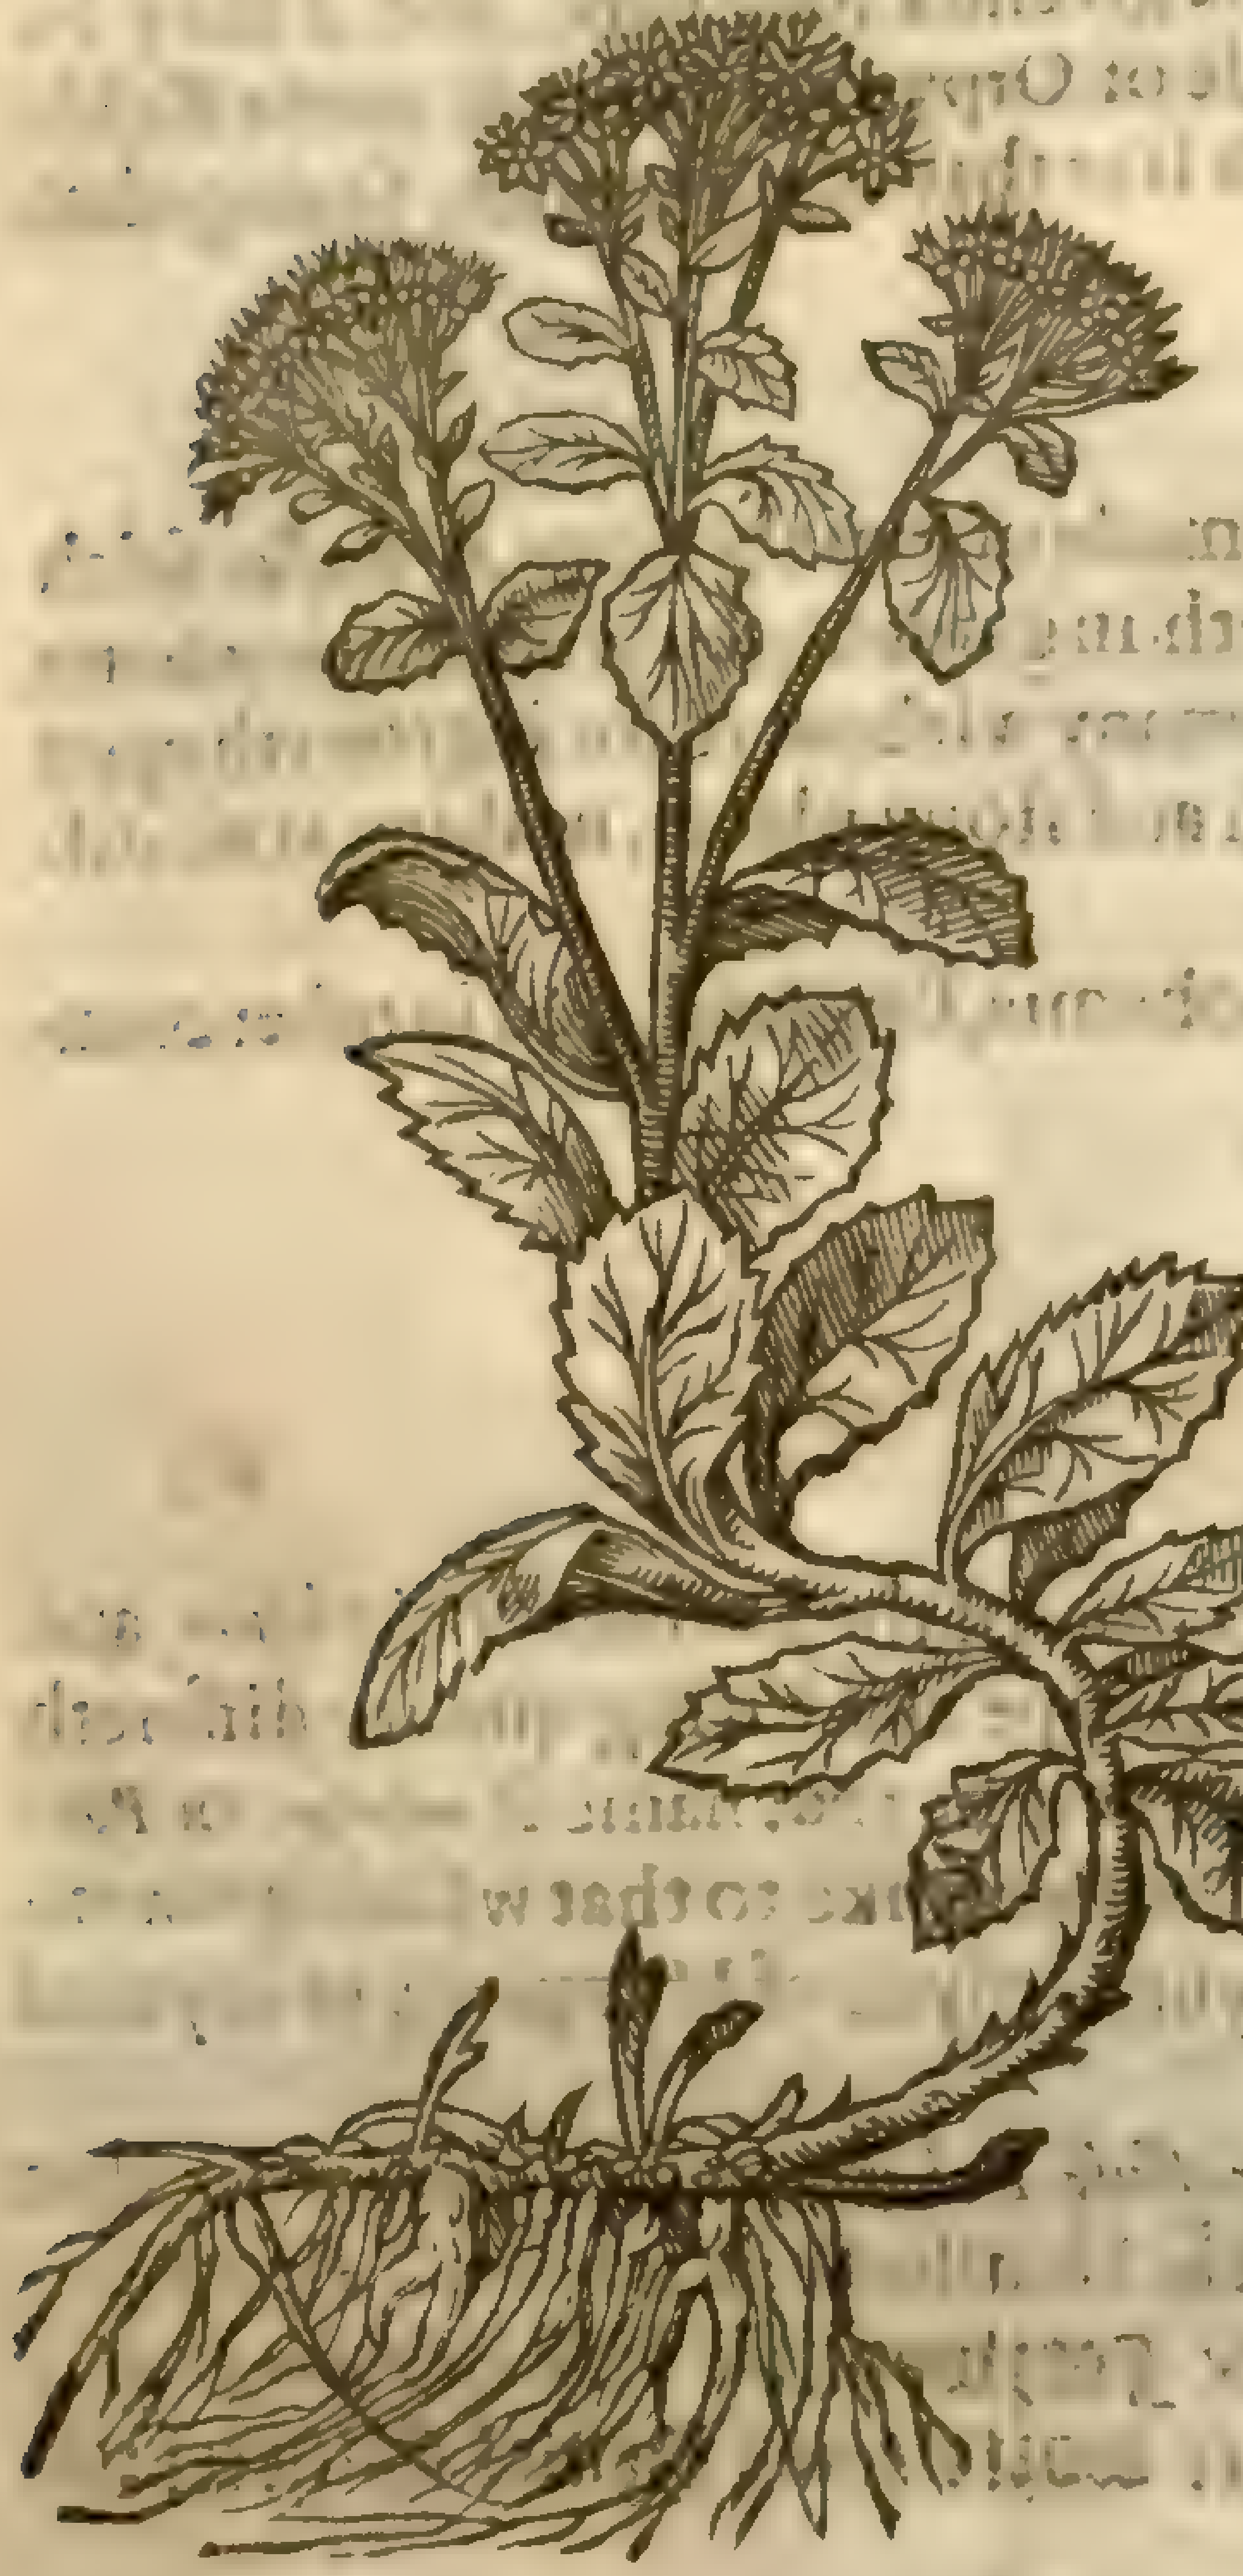
¶ *The Deſcription.*

1 The Orpyn with purple floures is lower and leſſer than the common Orpyn: the ſtalks be ſlenderer, and for the moſt part lie along vpon the ground. The leaues are alſo thinner and longer, & of a more blew greene, yet well bodied, ſtanding thicker below than aboue, confuſedly ſet together without order: the floures in the tufts at the tops of the ſtalkes be of a pale blew tending to purple. The roots be not ſet with lumpes or knobbed kernels, but with a multitude of hairy ſtrings.

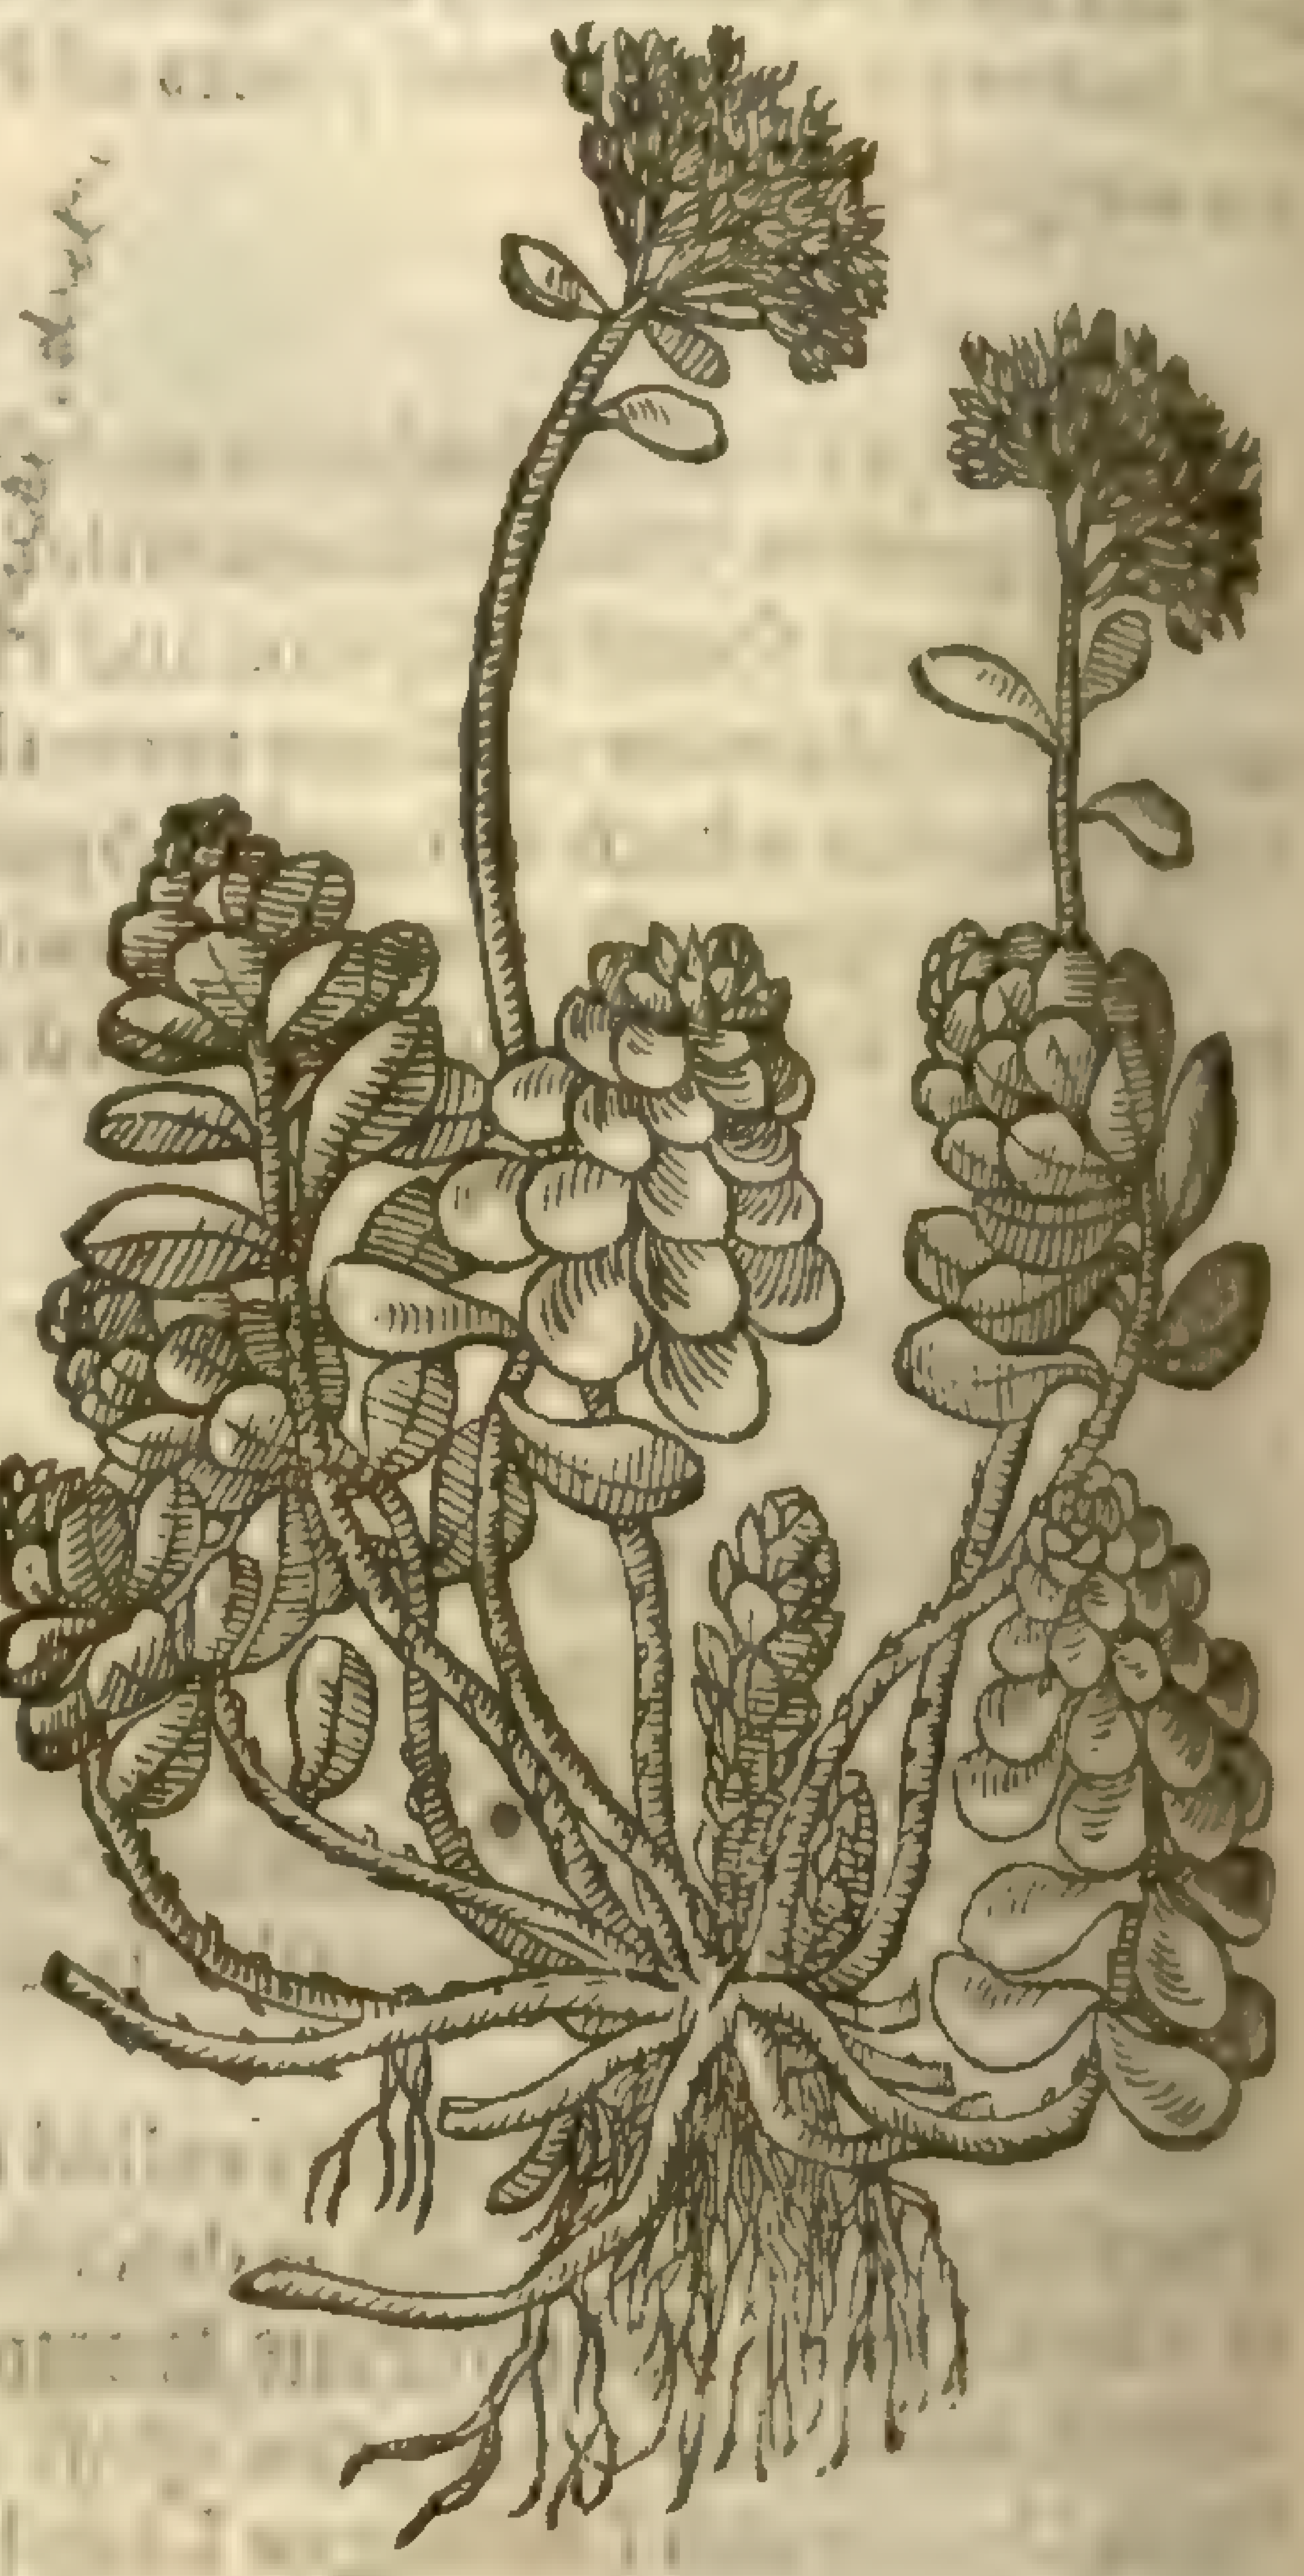
2 This ſecond Orpyn, as it is known to few, ſo hath it found no name, but that ſome Herbariſts doe call it *Telephium ſemperviuum* or *virens*: for the ſtalkes of the other do wither in winter, the root remaineth greene; but the ſtalkes and leaues of this endure alſo the ſharpneſſe of winter; and therefore we may call it in Engliſh, Orpyn euerlaſting, or neuer-dying Orpyn. This hath leſſer and rounder leaues than any of the former: the floures are red, and the root fibrous.

‡ 3 *Cluſius* receiued the ſeeds of this from *Ferranto Imperato* of Naples, vnder the name of

1 *Telephium floribus purpureis.*
Purple Orpyn.

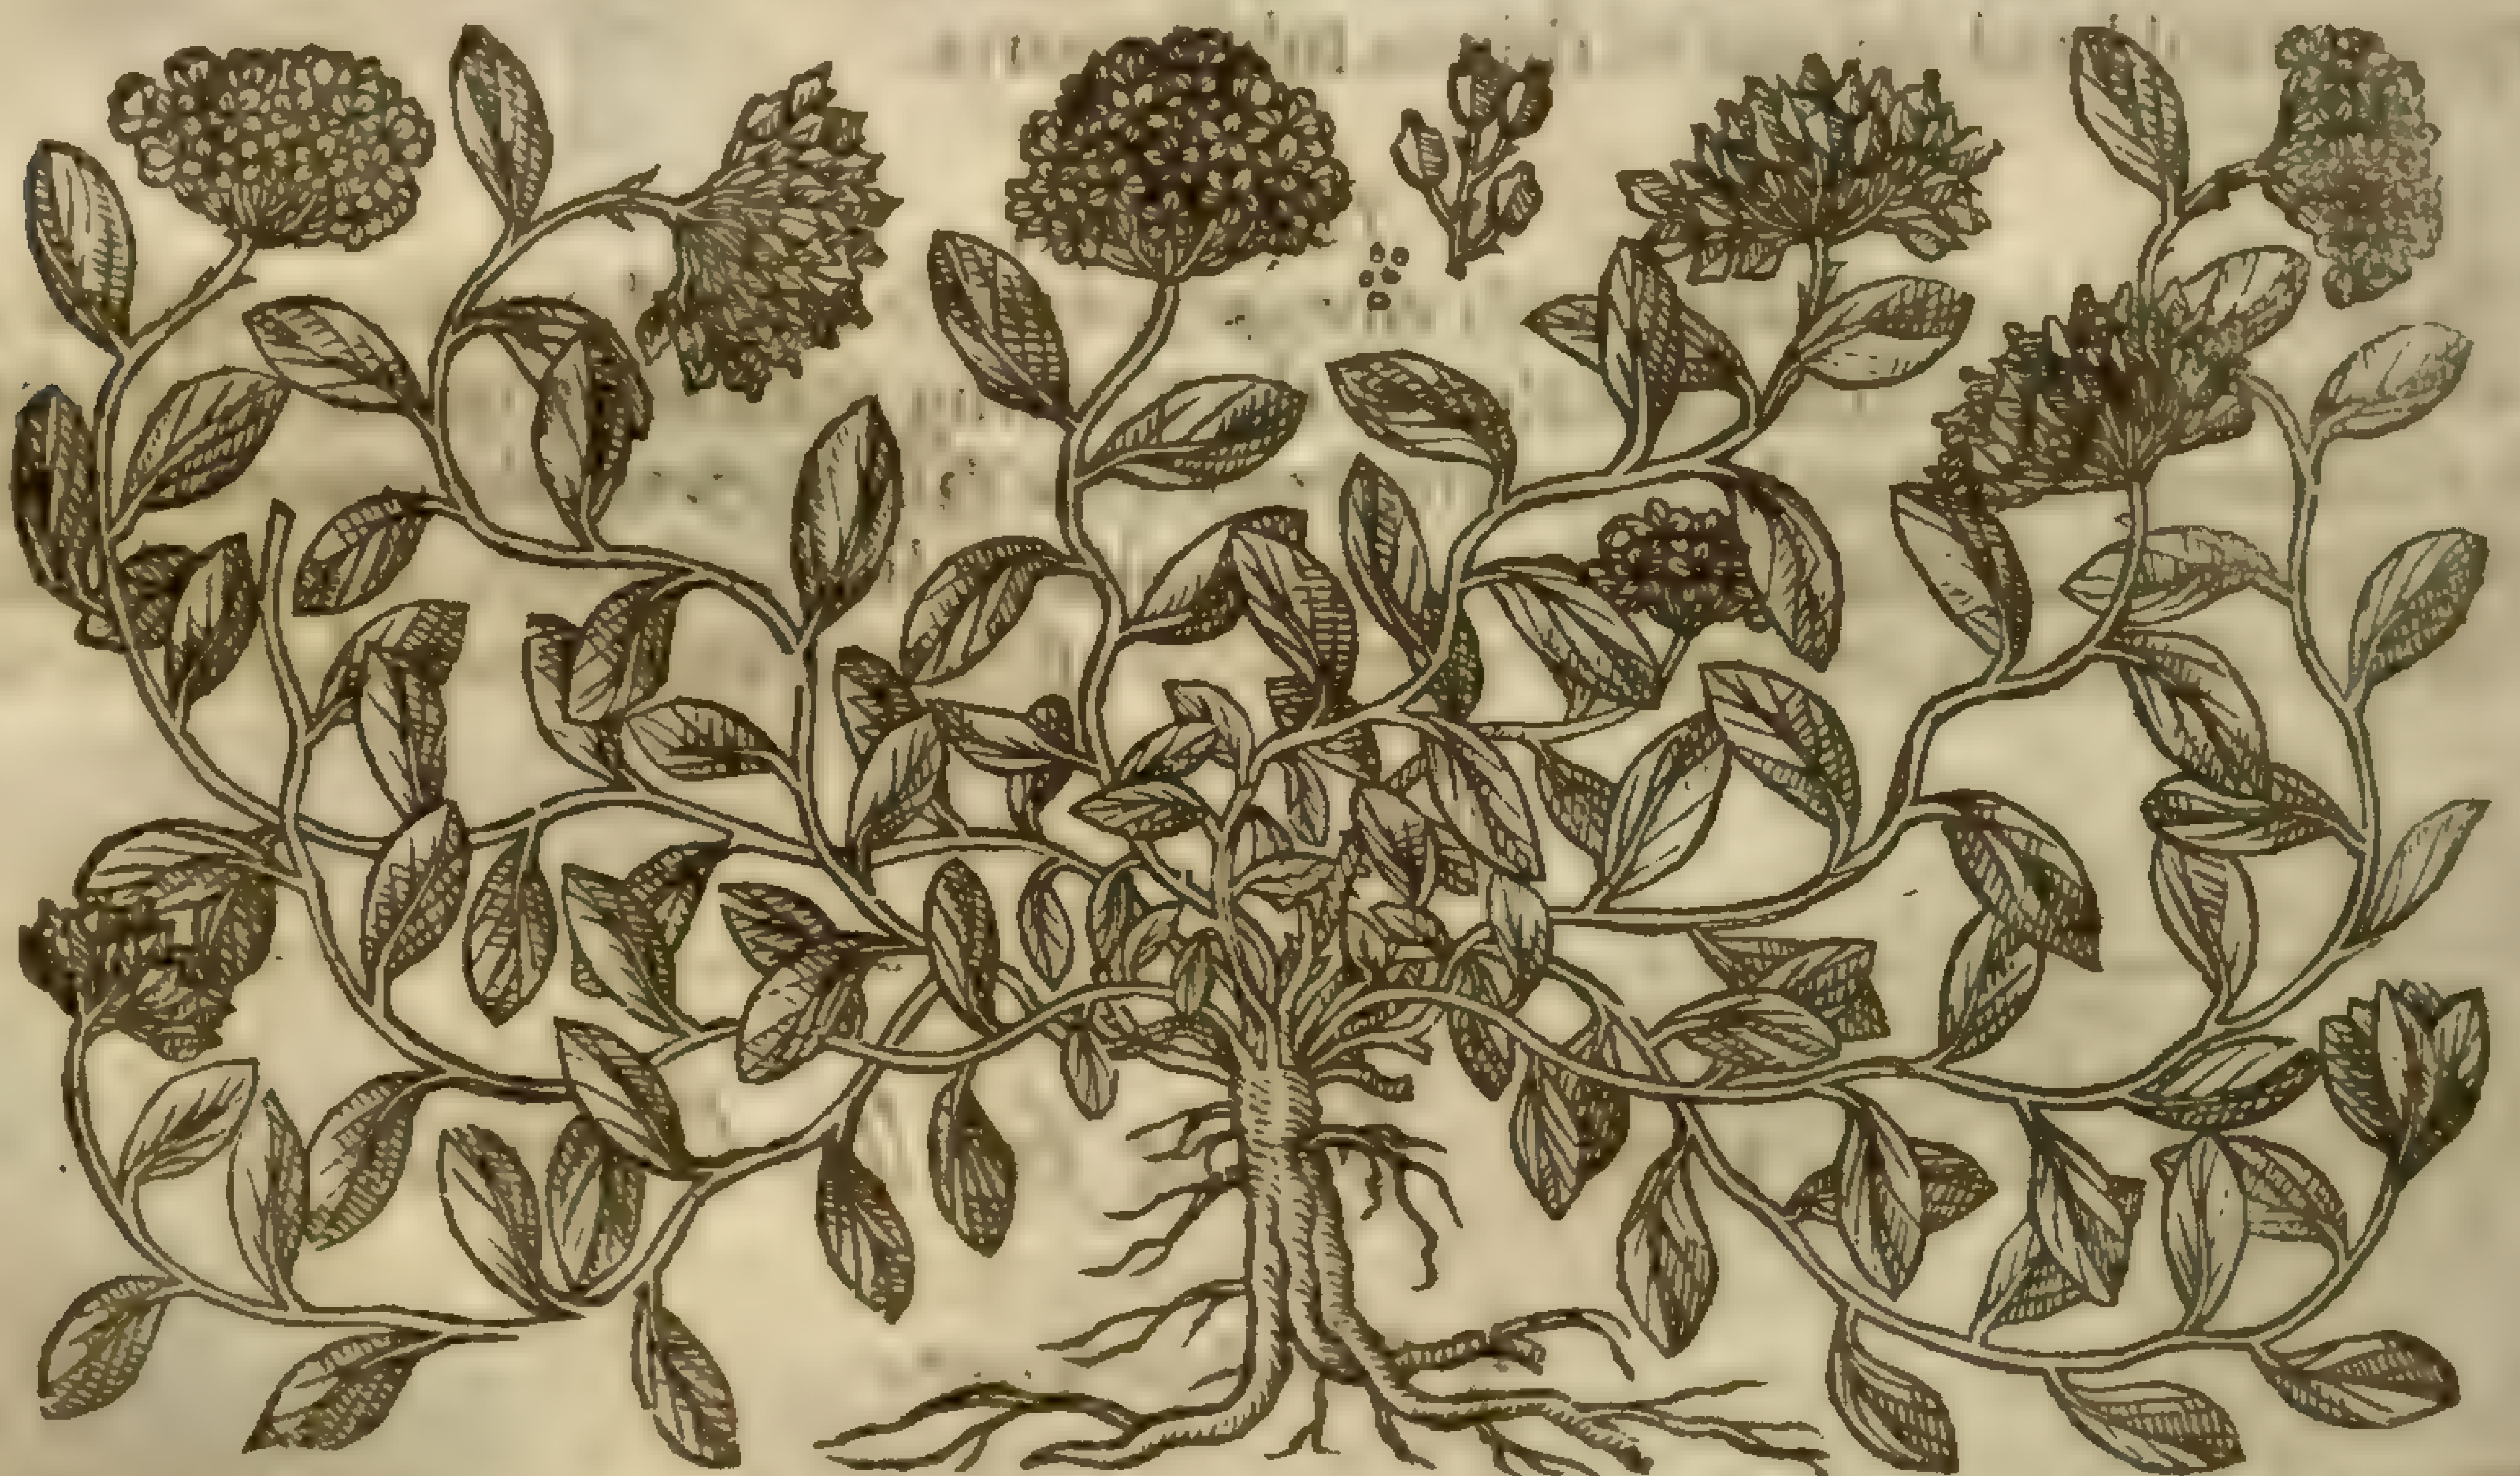


2 *Telephium ſemper-virens.*
Neuer-dying Orpyn.



[illegible]

‡ 3 *Telephium legitimum Imperati.* Creeping Orpyn.



Telephium imperati, [illegible] mile, diet.

Telephium legitimum; and he hath thus giuen vs the hiſtory thereof: It produces from the top of the root many branches ſpred vpon the ground, which are about a foot long, ſet with many leaues, eſpecially ſuch as are not come to floure; for the other haue fewer: theſe leaues are ſmaller, leſſe thick alſo and ſucculent than thoſe of the former kindes, neither are they ſo brittle: their colour is green, inclining a little to blew: the tops of the branches are plentifully ſtored with little floures growing thick together and compoſed of fiue little white leaues a peece: which fading, there ſucceed cornered ſeed veſſels full of a browniſh ſeed. The root is ſometimes as thicke as ones little finger, tough, white, diuided into ſome branches, and liuing many yeares. ‡

¶ *The Place, Time, Names, Temperature, and Vertues.*

The firſt growes not in England. The ſecond flouriſhes in my garden. ‡ The third is a ſtranger with vs. ‡ They floure when the common Orpyn doth. Their names are ſpecified in their ſeuerall deſcriptions: and their temperature and faculties in working are referred to the common Orpyn.

CHAP. 148. *Of Purſlane.*

¶ *The Deſcription.*

1 THe ſtalkes of the great Purſlane be round, thicke, ſomewhat red, full of juyce, ſmooth, glittering, and parted into certaine branches trailing vpon the ground: the leaues be an inch long, ſomething broad, thicke, fat, glib, ſomewhat greene, whiter on the nether ſide: the floures are little, of a faint yellow, and grow out at the bottome of the leaues. After them ſpringeth vp a little huske of a greene colour, of the bigneſſe almoſt of halfe a barly corne, in which is ſmall blacke ſeed: the root hath many ſtrings.

1 *Portulaca domeſtica.*
Garden Purſlane. [illegible] med. diet.

2 *Portulaca ſylueſtris.*
Wilde Purſlane. P. [illegible] med. diet.

2 The other is leſſer and hath like ſtalkes, but ſmaller, and it ſpreadeth on the ground: the leaues be like the former in faſhion, ſmoothneſſe, and thickeneſſe, but farre leſſer.

¶ *The Place.*

The former is fitly ſowne in gardens, and in the waies and allies thereof, being digged and dunged; it delighteth to grow in a fruitfull and fat ſoile not dry.

The other commeth vp of his owne accord in allies of gardens and vineyards, and oftentimes vpon rockes: this alſo is delighted with watery places: being once ſowne, if it be let alone till the ſeed be ripe it doth eaſily ſpring vp afreſh for certaine yeeres after.

¶ *The Time.*

It may be ſowne in March or Aprill; it flouriſheth and is greene in Iune, and afterwards euen vntill Winter.

Purſlane is called in Greeke, ἀνδράχνη: in Latine, *Portulaca*: in high Dutch, **Burkelkraut**: in French, *Poupier*: in Italian, *Prochaccia*: in Spaniſh, *Verdolagas*: in Engliſh, Purſlane, and Porcelane:

¶ *The Temperature.*

Purſlane is cold, and that in the third degree, and moiſt in the ſecond: but wilde Purſlane is not ſo moiſt.

¶ *The Vertues.*

A Raw Purſlane is much vſed in ſallades, with oyle, ſalt and vinegre: it cooleth an hot ſtomacke, and prouoketh appetite; but the nouriſhment which commeth thereof is little, bad, cold, groſſe, and moiſt: being chewed it is good for teeth that are ſet on edge or aſtonied; the juyce doth the ſame being held in the mouth, and alſo the diſtilled water.

B Purſlane is likewiſe commended againſt wormes in young children, and is ſingular good eſpecially if they be feueriſh withall, for it both allaies the ouermuch heate, and killeth the wormes: which thing is done through the ſaltnes mixed therewith, which is not only an enemy to wormes, but alſo to putrifaction.

C The leaues of Purſlane either raw, or boiled, and eaten as ſallades, are good for thoſe that haue great heate in their ſtomackes and inward parts, and doe coole and temper the inflamed bloud.

D The ſame taken in like manner is good for the bladder and kidnies, and allaieth the outragious luſt of the body: the juyce alſo hath the ſame vertue.

E The juyce of Purſlane ſtoppeth the bloudy flix, the flux of the hemorrhoides, monethly termes, ſpitting of bloud, and all other fluxes whatſoeuer.

F The ſame throwne vp with a mother ſyringe, cureth the inflammations, frettings, and vlcerations of the matrix; and put into the fundament with a cliſter pipe, helpeth the vlcerations and flux of the guts.

G The leaues eaten raw, take away the paine of the teeth, and faſten them; and are good for teeth that are ſet on edge, with eating of ſharpe or ſowre things.

H The ſeed being taken, killeth and driueth forth wormes, and ſtoppeth the laske.

Chap. 149.

Of ſea Purſlane, and of the ſhrubby Sengreenes.

¶ *The Deſcription.*

1 SEa Purſlane is not a herbe as Garden Purſlane, but a little ſhrub: the ſtalkes whereof be hard and wooddy: the leaues fat, full of ſubſtance, like in forme to common Purſlane, but much whiter and harder: the moſſie purple floures ſtand round about the vpper parts of the ſtalkes, as doe almoſt thoſe of Blyte, or of Orach: neither is the ſeed vnlike, being broad and flat: the root is wooddy, long laſting, as is alſo the plant, which beareth out the Winter with the loſſe of a few leaues.

† 2 There is another ſea Purſlane or *Halimus*, or after *Dodonæus*, *Portulaca marina*, which hath leaues like the former, but not altogether ſo white, yet are they ſomewhat longer and narrower, not much vnlike the leaues of the Oliue tree. The ſlender branches are not aboue a cubit or cubit and halfe long, and commonly lie ſpred vpon the ground, and the floures are of a deepe ouerworne herby colour, and after them follow ſeeds like thoſe of the former, but ſmaller.

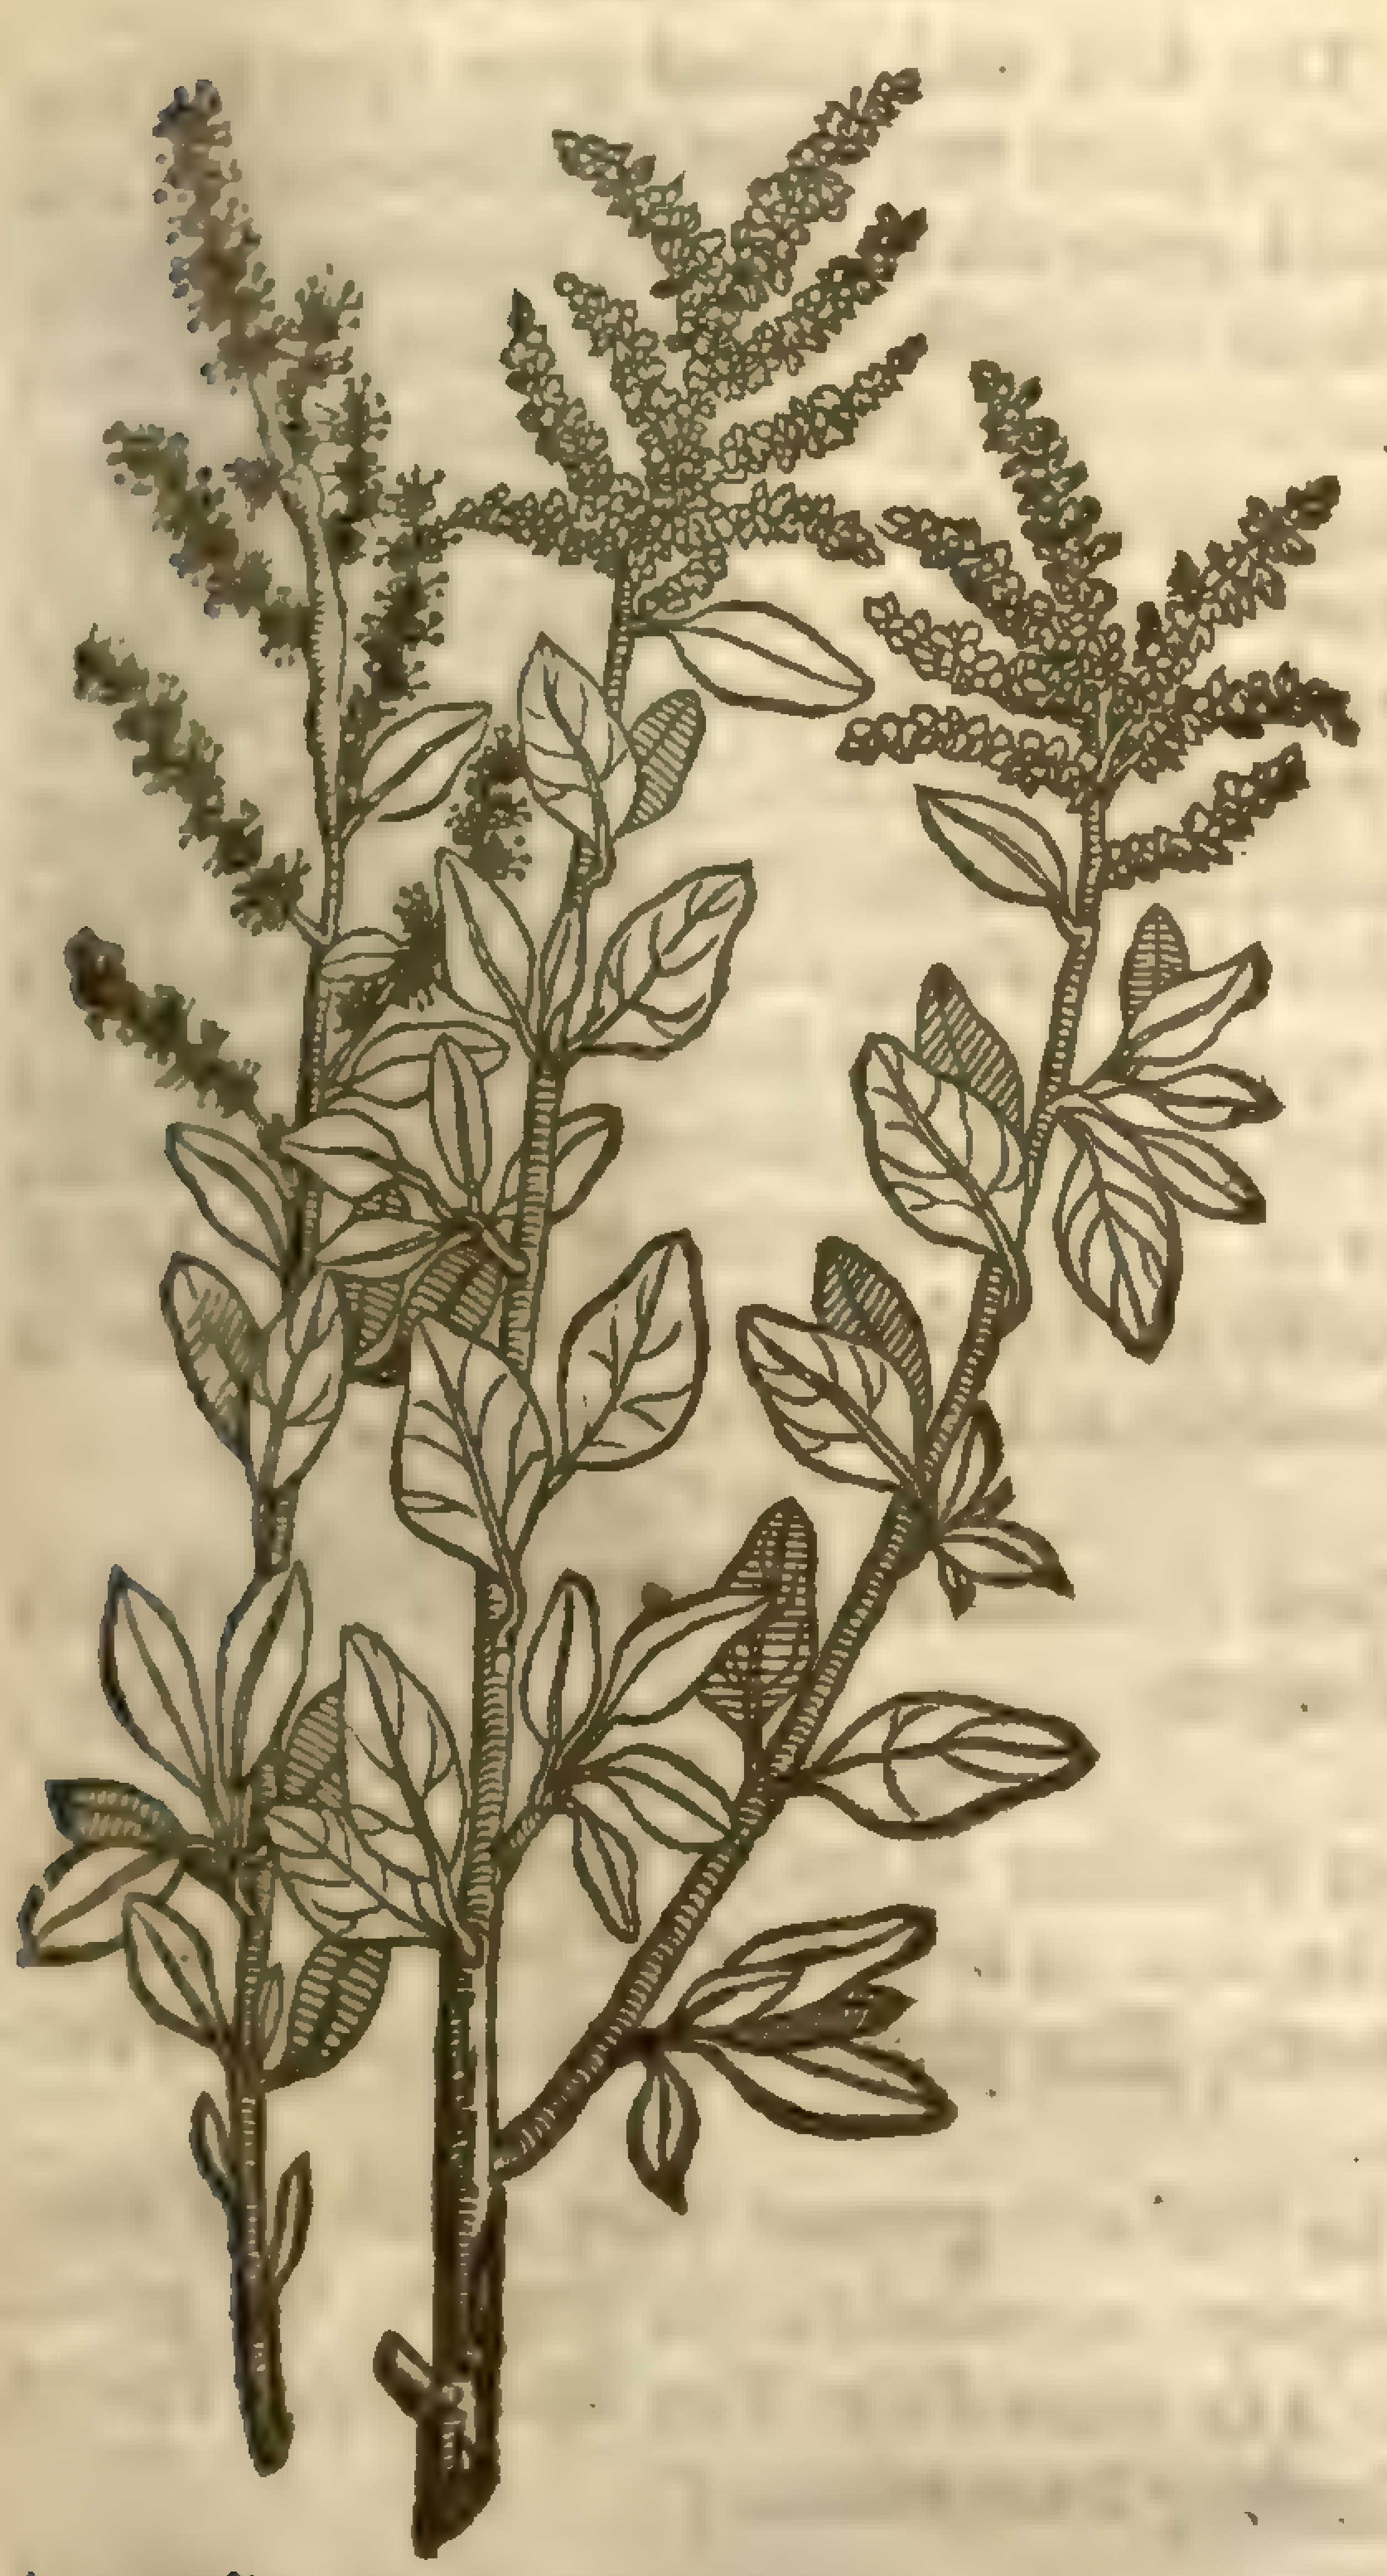
‡ 3 Our ordinary *Halimus* or ſea Purſlane hath ſmall branches ſome foot or better long, lying commonly ſpred vpon the ground, of an ouerworne grayiſh colour, and ſometimes purple; the leaues are like thoſe of the laſt mentioned, but more fat and thicke, yet leſſe hoary. The floures grow on the tops of the branches, of an herby purple colour, which is ſucceeded by ſmall ſeeds like to that of the ſecond kinde. ‡

4 There is found another wilde ſea Purſlane, whereof I haue thought good to make mention; which doth reſemble the kindes of Aizoons. The firſt kinde groweth vpright, with a trunke like a ſmall tree or ſhrub, hauing many vpright wooddy branches, of an aſh colour, with many thicke, darke, greene leaues like the ſmall Stone-crop, called *Vermicularis*: the floures are of an herby yellowiſh greene colour: the root is very hard and fibrous: the whole plant is of a ſalt tang taſte, and the juyce like that of Kali.

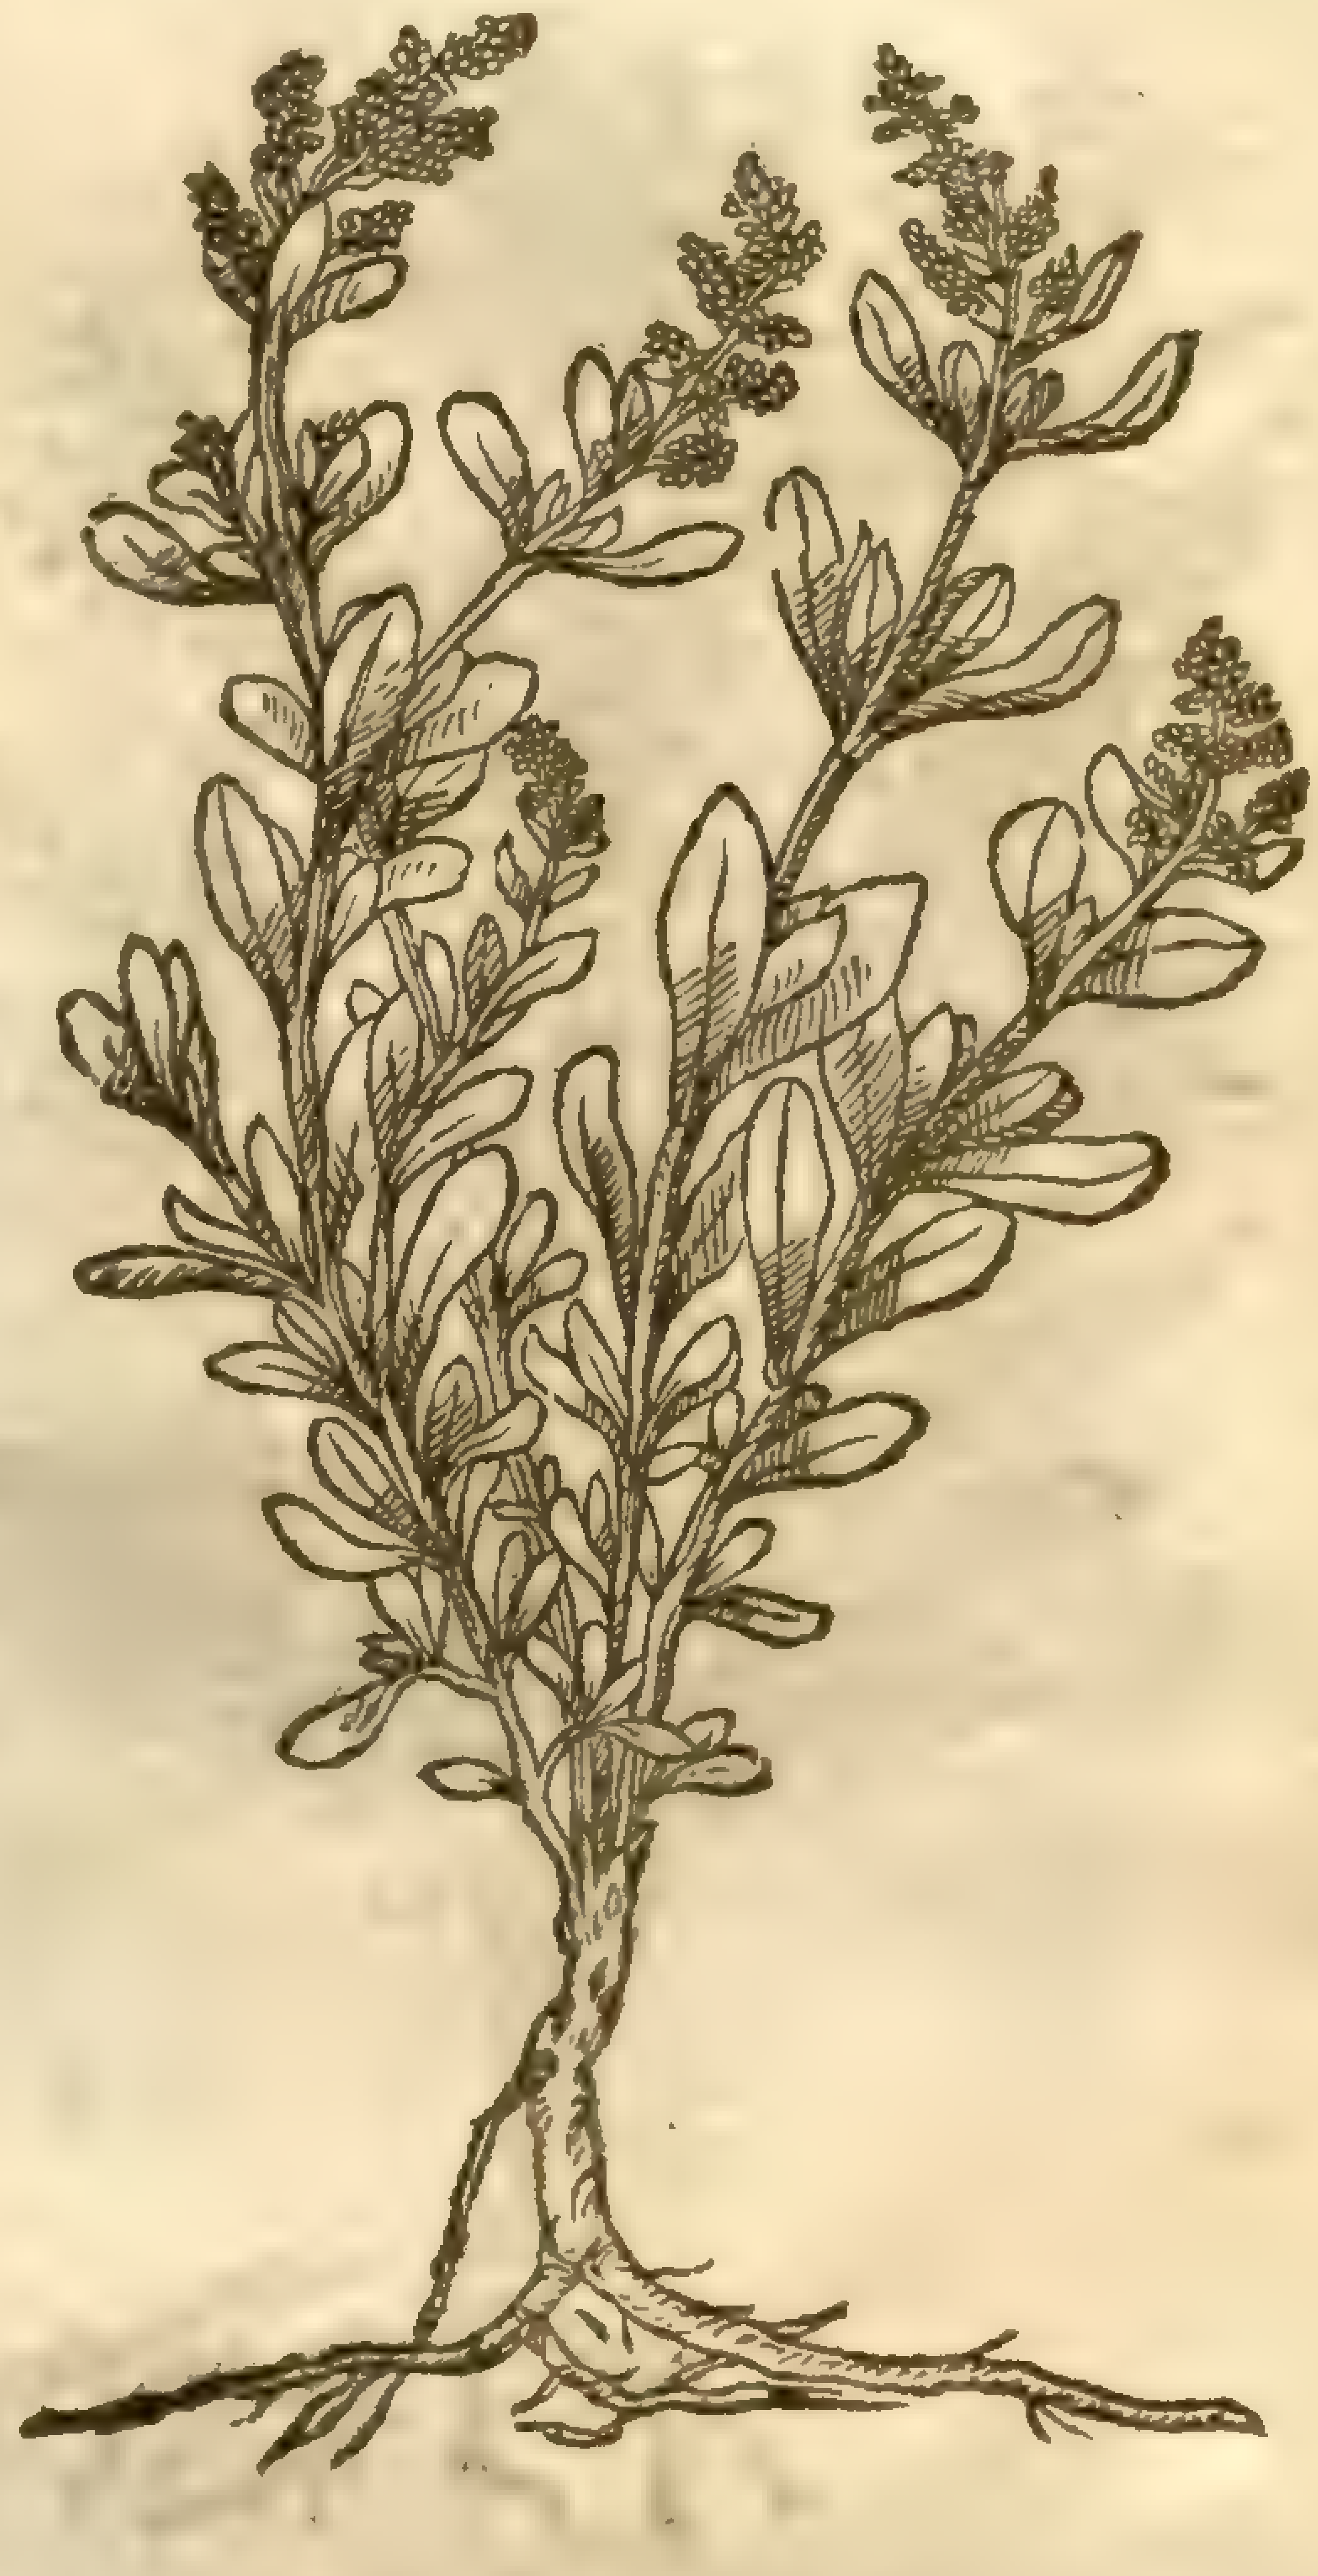
5 There is another kinde like the former, and differeth in that, this ſtrange plant is greater, the leaues more ſharpe and narrower, and the whole plant more wooddy, and commeth neere to the forme of a tree. The floures are of a greeniſh colour.

¶ The

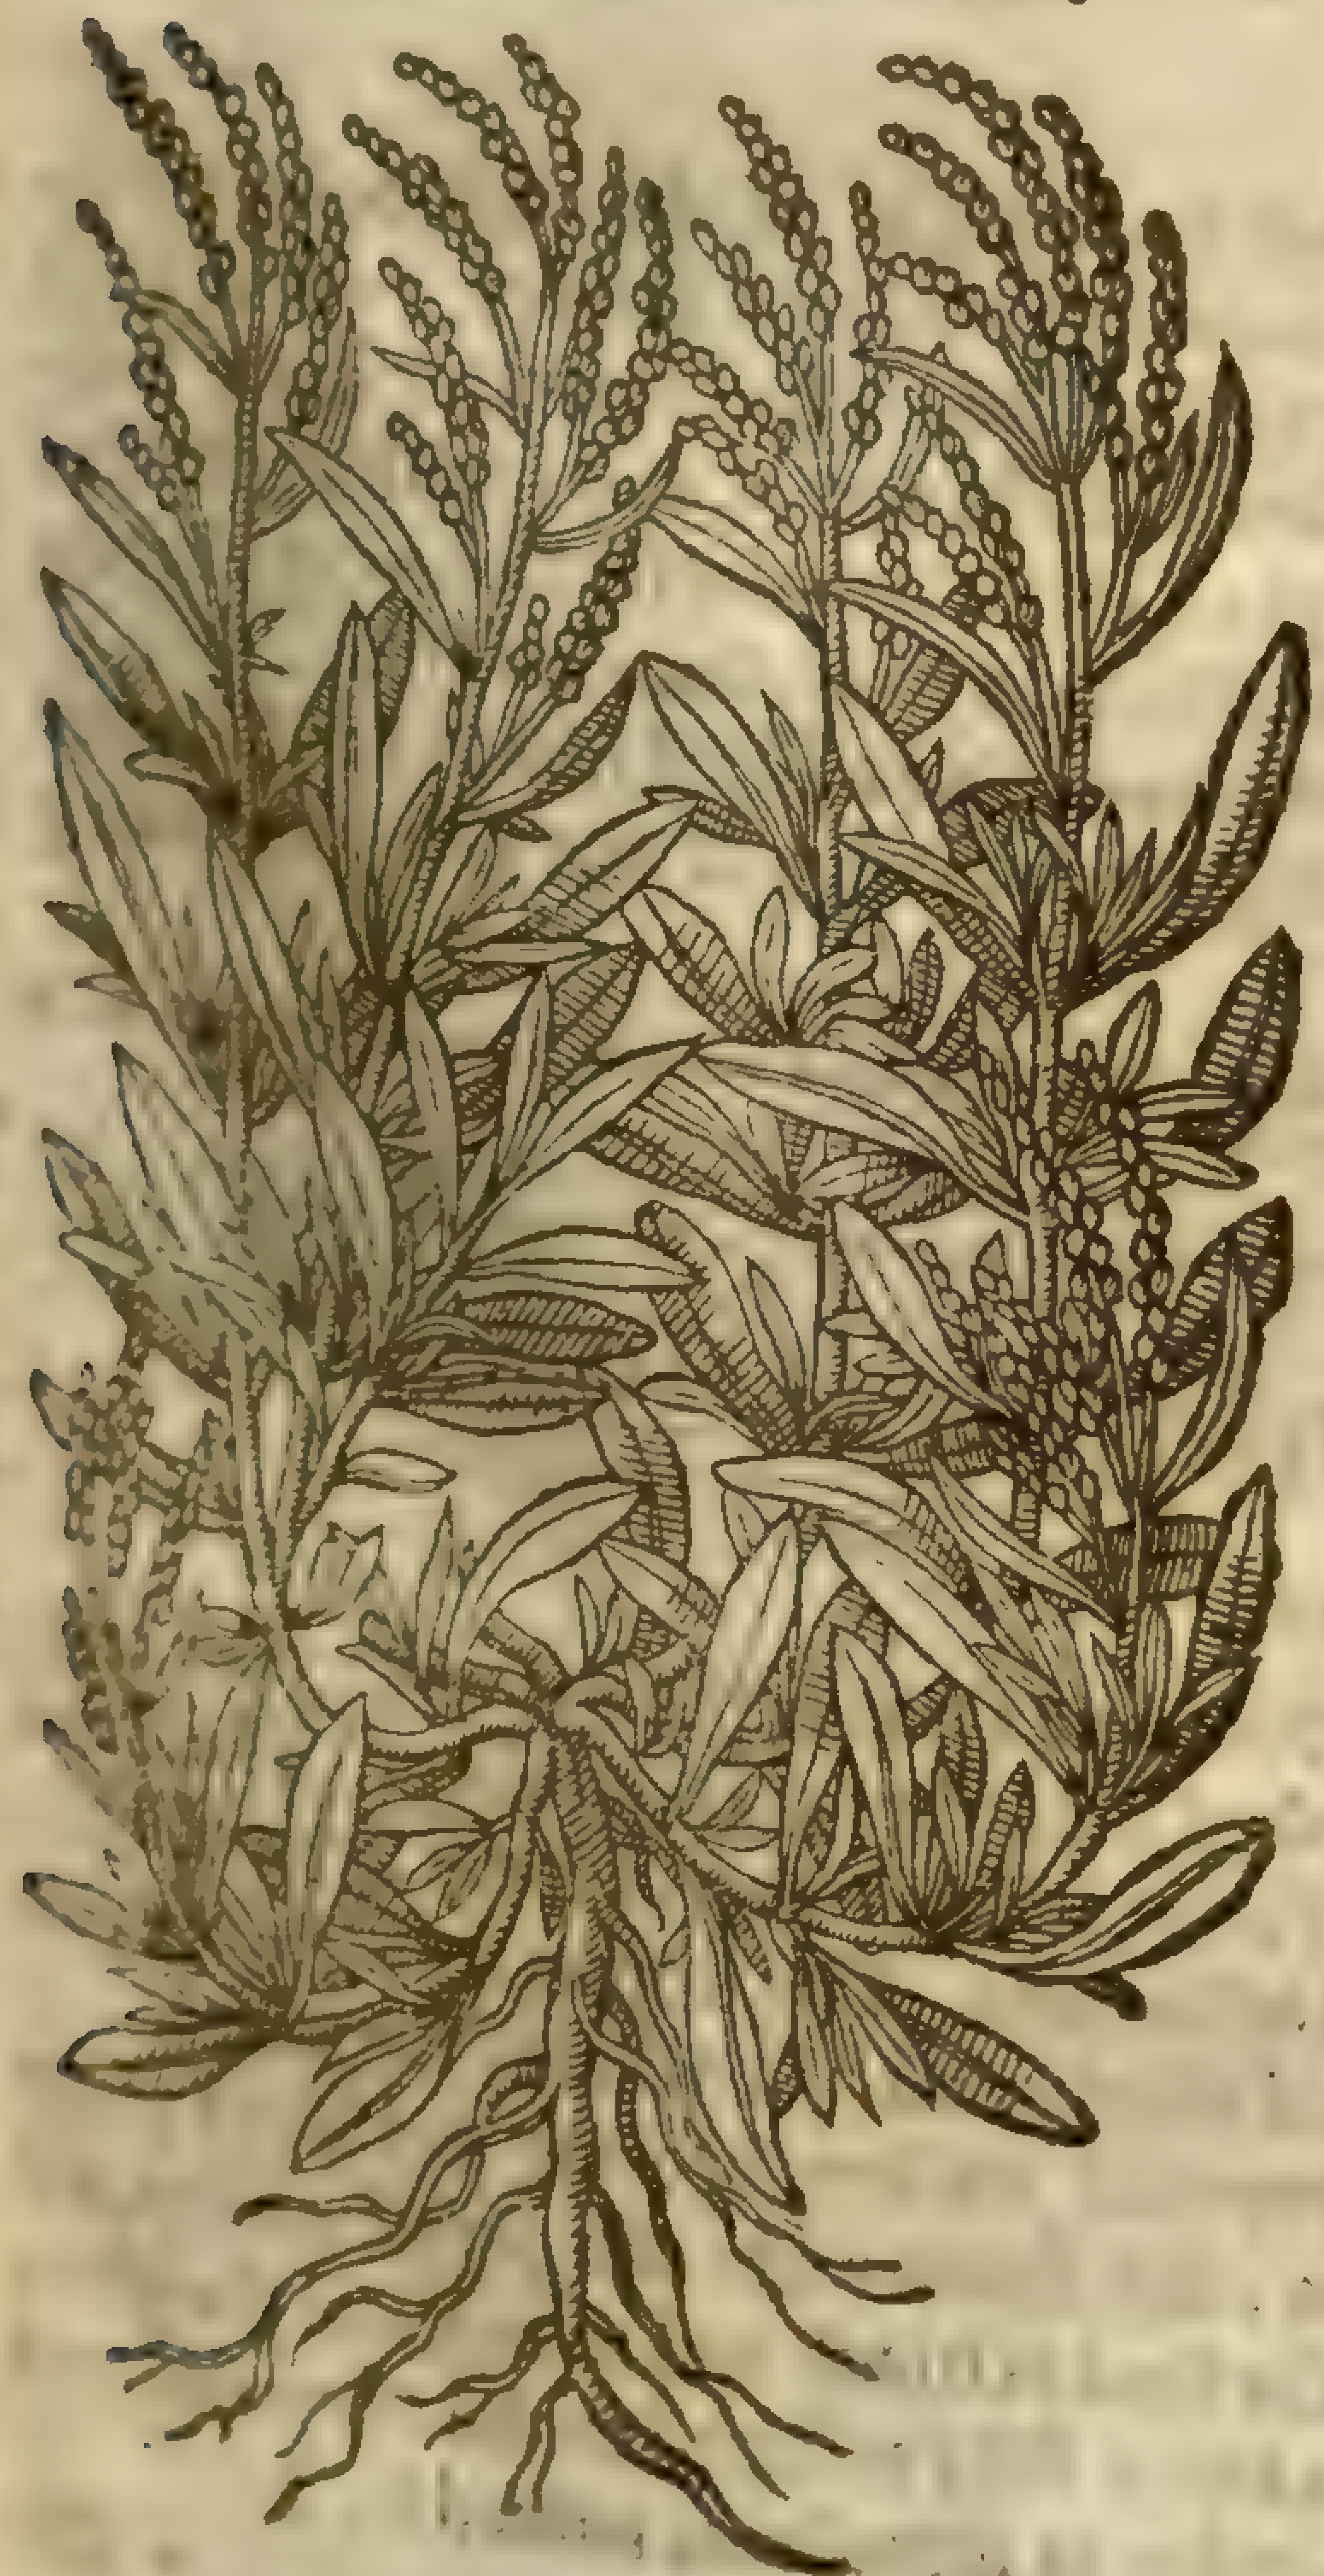
‡ 1 *Halimus latifolius.*
Tree Sea Purſlane.



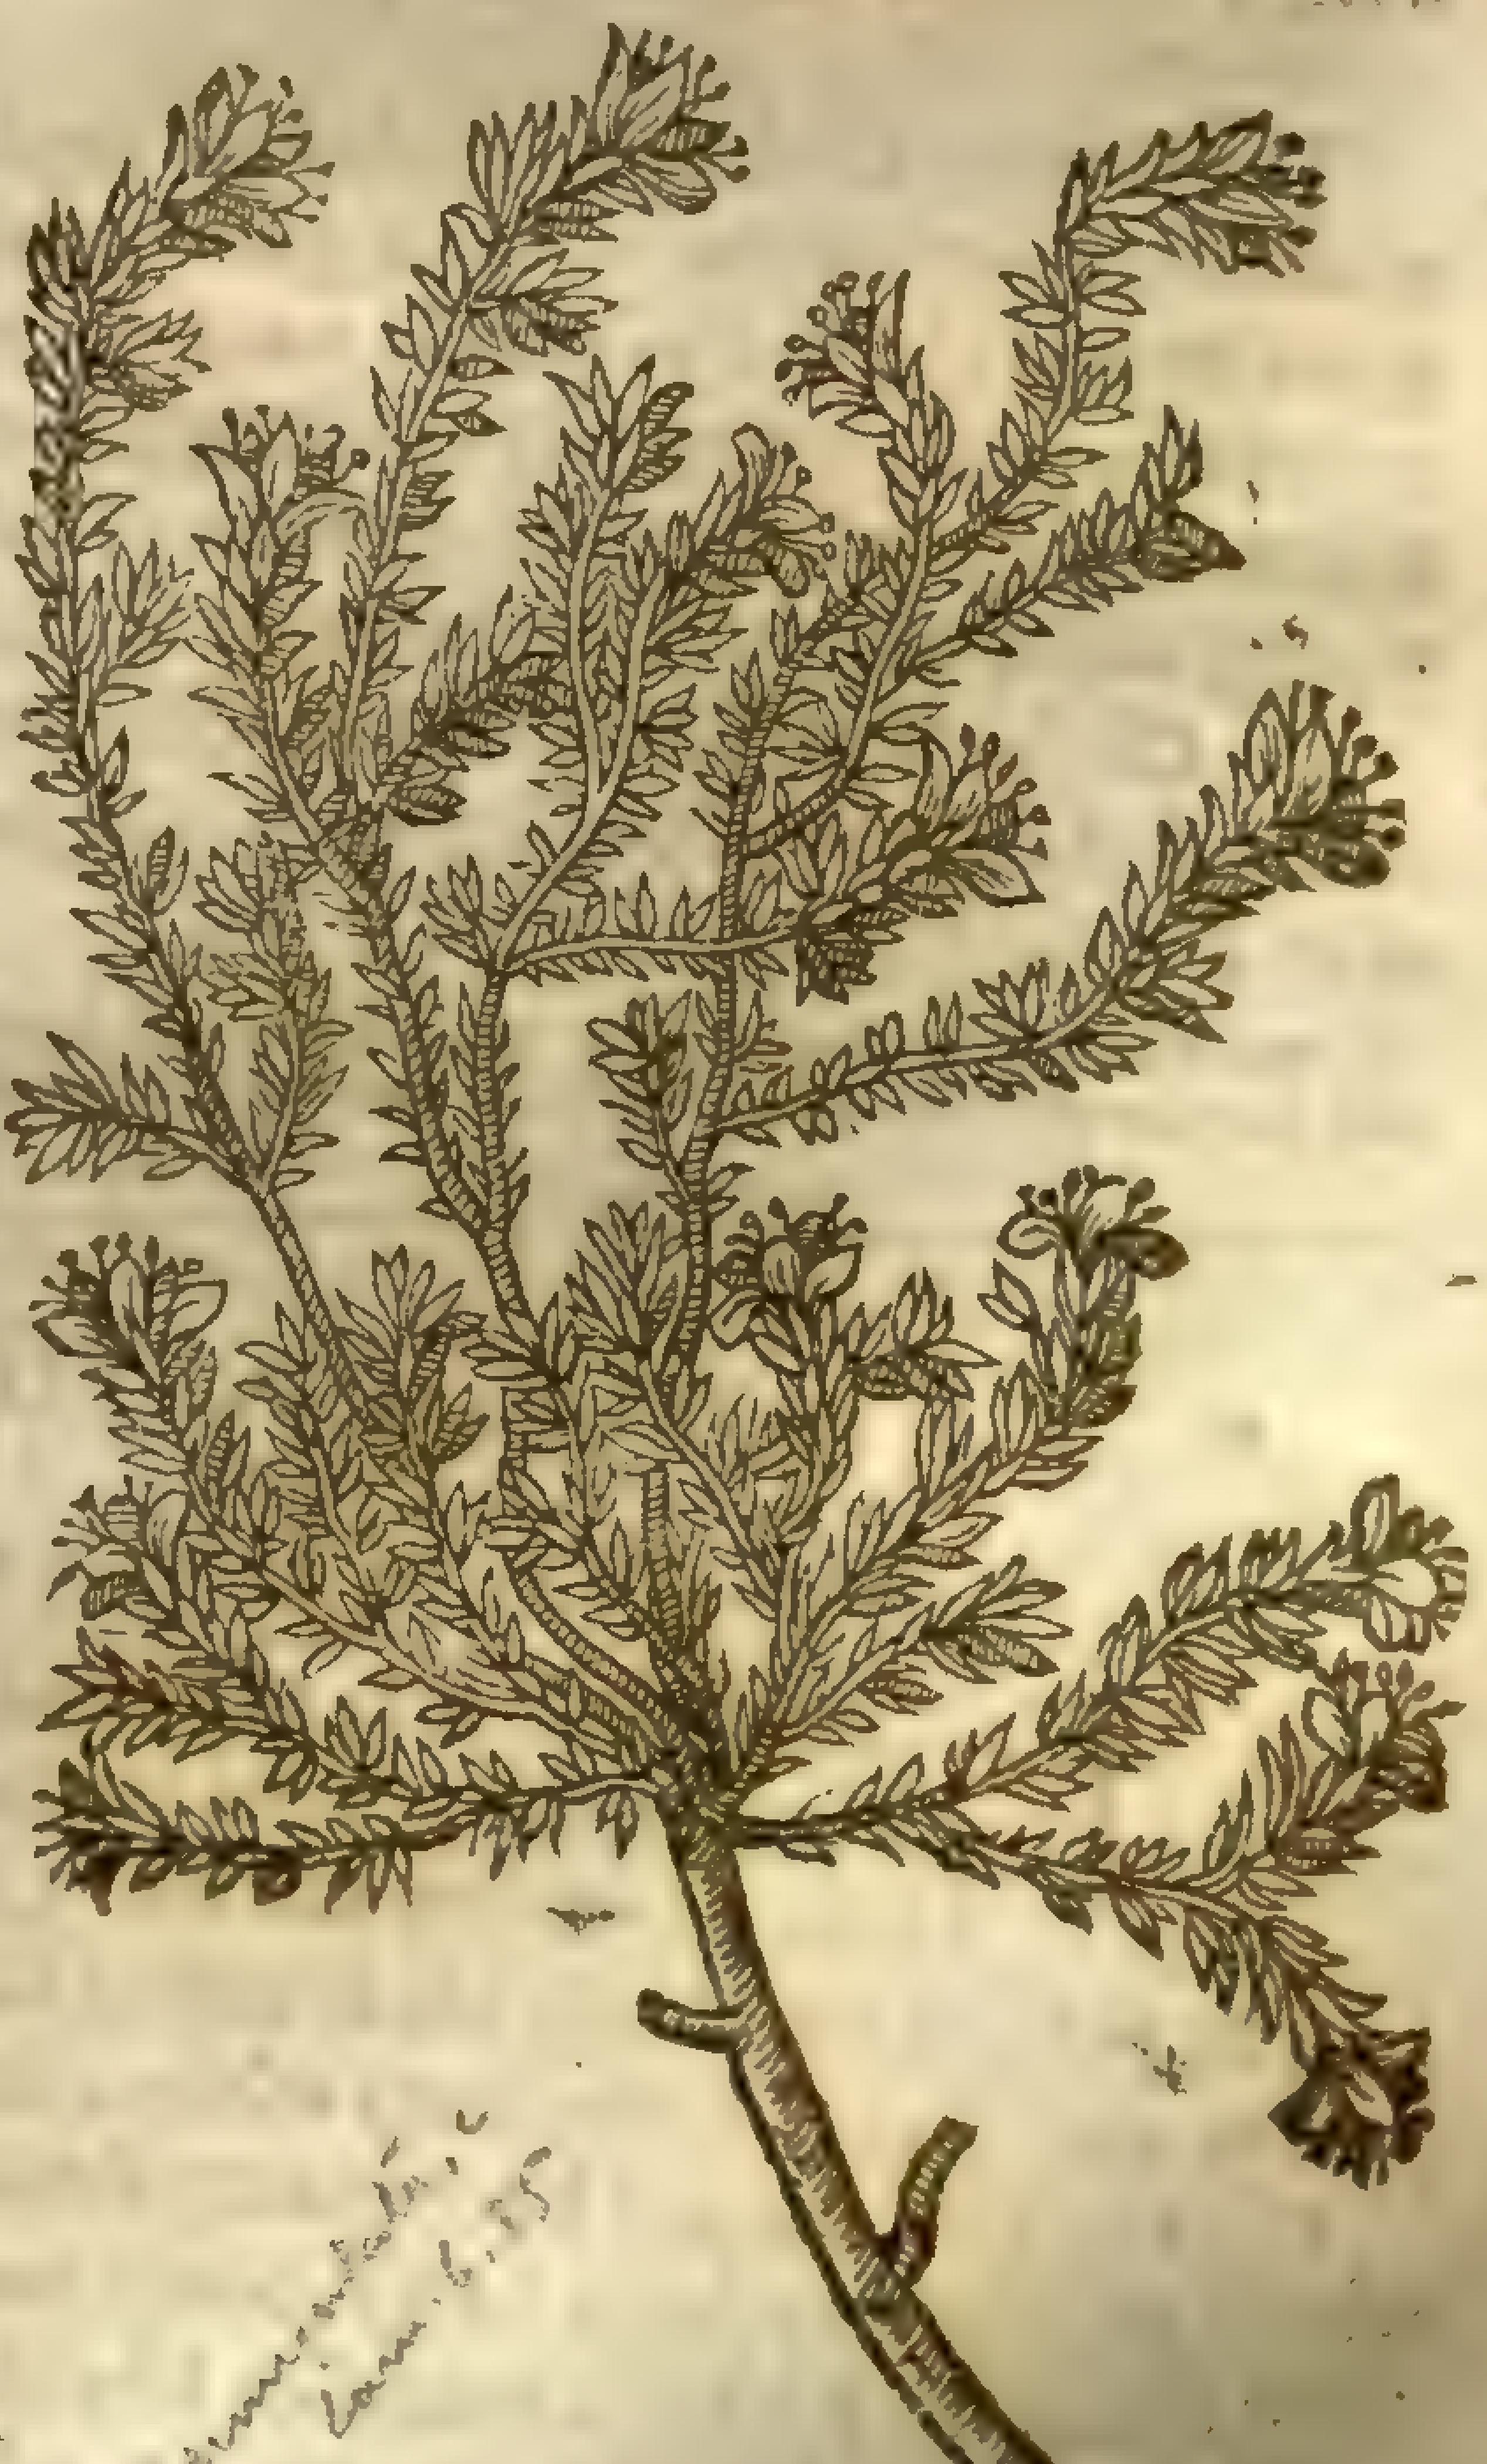
‡ 2 *Halimus anguſtifolius procumbens.*
Creeping Sea Purſlane.



† 3 *Halimus vulgaris, ſiue Portulaca marina.*
Common Sea Purſlane.



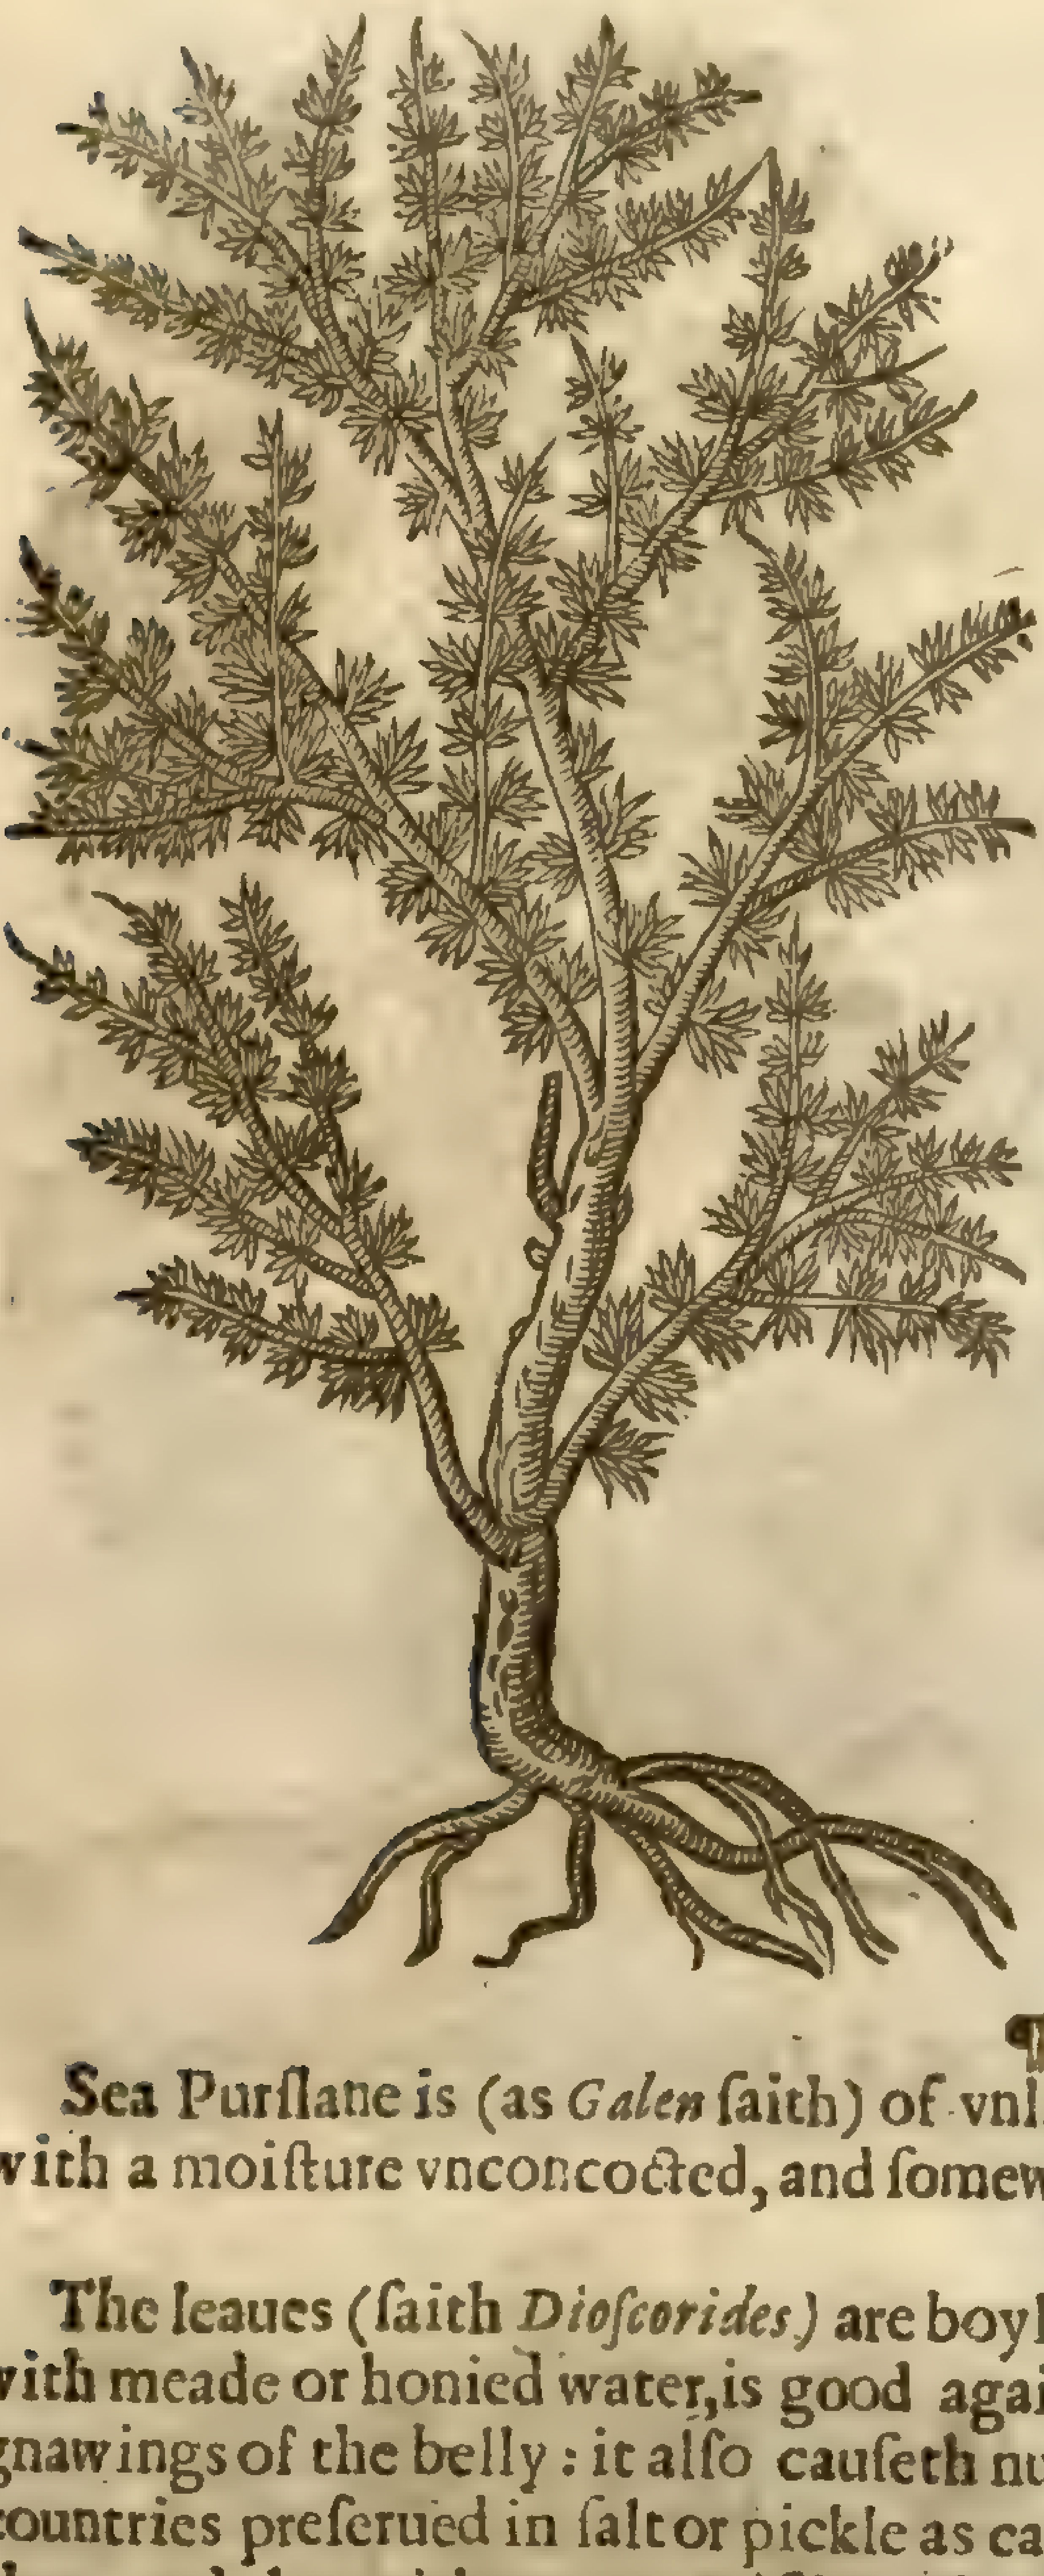
‡ 4 *Vermicularis frutex minor.*
The leſſer ſhrubby Sengreene.



Reaumuria vermiculata
Linn. 6.55

Salsola fruticosa 2
Mill. dict.

‡ 5 *Vermicularis frutex major.*
The greater Tree Stone-crop.



¶ *The Place.*

‡ The firſt and ſecond grow vpon the Sea coaſts of Spaine and other hot countries ‡: and the third groweth in the ſalt mariſhes neere the ſea ſide, as you paſſe ouer the Kings ferrey vnto the Iſle of Shepey, going to Sherland houſe (belonging ſometime vnto the Lord *Cheiny*, and in the yeare 1590, vnto the Worſhipfull Sr. *Edward Hobby*) faſt by the ditches ſides of the ſame mariſh: it groweth plentifully in the Iſle of Thanet as you go from Margate to Sandwich, and in many other places along the coaſt. The other ſorts grow vpon bankes and heapes of ſand on the Sea coaſts of Zeeland, Flanders, Holland, and in like places in other countries, as beſides the Iſle of Purbecke in England; and on Rauen-ſpurne in Holderneſſe, as I my ſelfe haue ſeene.

¶ *The Time.*

Theſe flouriſh and floure eſpecially in Iuly and Auguſt.

¶ *The Names.*

Sea Purſlane is called *Portulaca Marina*: In Greeke, ἅλιμος: it is alſo called in Latine, *Halimus*: in Dutch, **Zee Porceleijne**: in Engliſh, Sea Purſlane.

The baſtard ground Pine is called of ſome, *Chamepitys vermiculata*: in Engliſh, Sea ground Pine: ‡ or more fitly, Tree Ston-crop, or Pricket, or Shrubby Sengreene. ‡

¶ *The Temperature.*

Sea Purſlane is (as *Galen* ſaith) of vnlike parts, but the greater part thereof is hot in a meane, with a moiſture vnconcocted, and ſomewhat windie.

¶ *The Vertues.*

A The leaues (ſaith *Dioſcorides*) are boyled to be eaten: a dram weight of the root being drunke with meade or honied water, is good againſt cramps and drawings awrie of ſinewes, burſtings, and gnawings of the belly: it alſo cauſeth nurſes to haue ſtore of milke. The leaues be in the Low-countries preſerued in ſalt or pickle as capers are, to be ſerued and eaten at mens tables in ſtead of them, and that without any miſlike of taſte, to which it is pleaſant. *Galen* doth alſo report, that the young and tender buds are wont in Cilicia to be eaten, and alſo laid vp in ſtore for vſe.

B ‡ *Cluſius* ſaith, That the learned Portugal Knight *Damianus a Goes* aſſured him, That the leaues of the firſt deſcribed boyled with bran, and ſo applied, mitigate the paine of the Gout proceeding of an hot cauſe. ‡

† The figure that was formerly giuen by our Author with the title of *Portulaca marina*, and which is ſet forth by *Tabern.* vnder the ſame name, is either of [illegible] theſe plants, or elſe it is imperfect. *Bauhine* knowes not what to make of it, but queſtions it, *Quid ſit?*

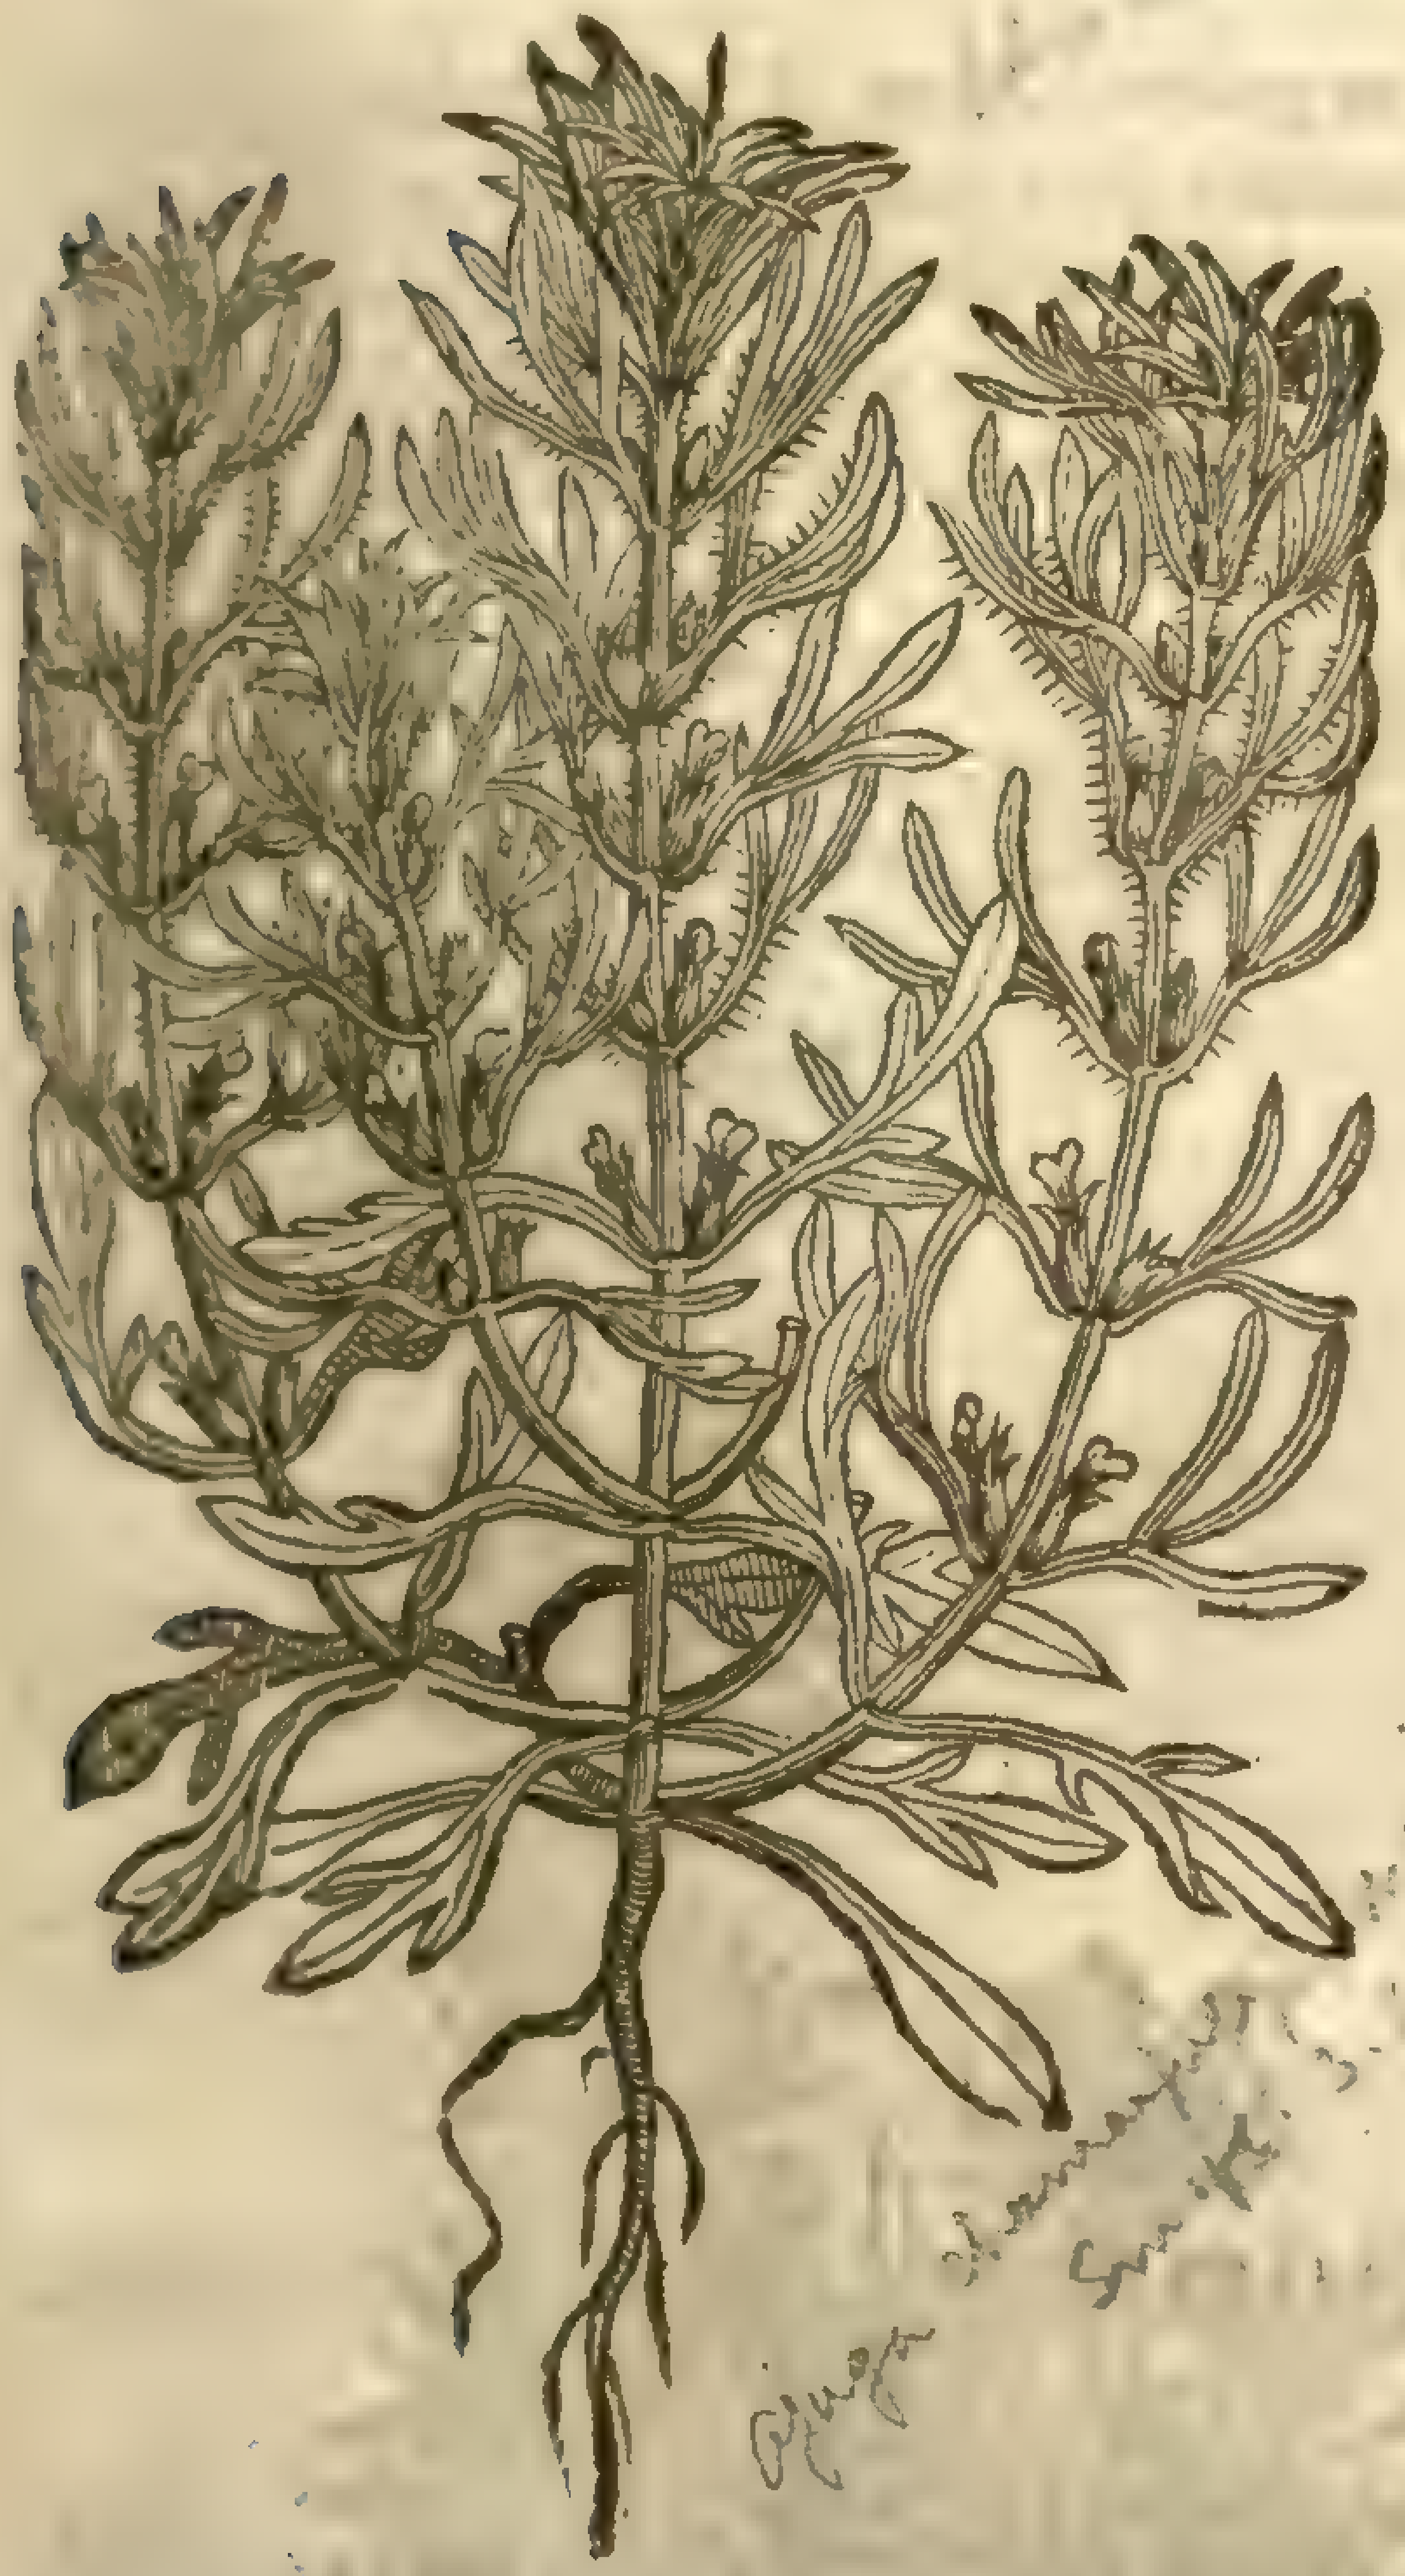
Chap. 150. *Of Herbe-Iuy, or Ground-Pine.*

¶ *The Deſcription.*

1 THe common kinde of *Chamæpitys* or Ground-Pine is a ſmal herbe and very tender, creeping vpon the ground, hauing ſmall and crooked branches trailing about. The leaues be ſmall, narrow and hairy, in ſauor like the Firre or Pine tree; but if my ſence of ſmelling be perfect, me thinkes it is rather like vnto the ſmell of hempe. The floures be little, of a pale yellow colour, and ſometimes white: the root is ſmall and ſingle, and of a wooddy ſubſtance.

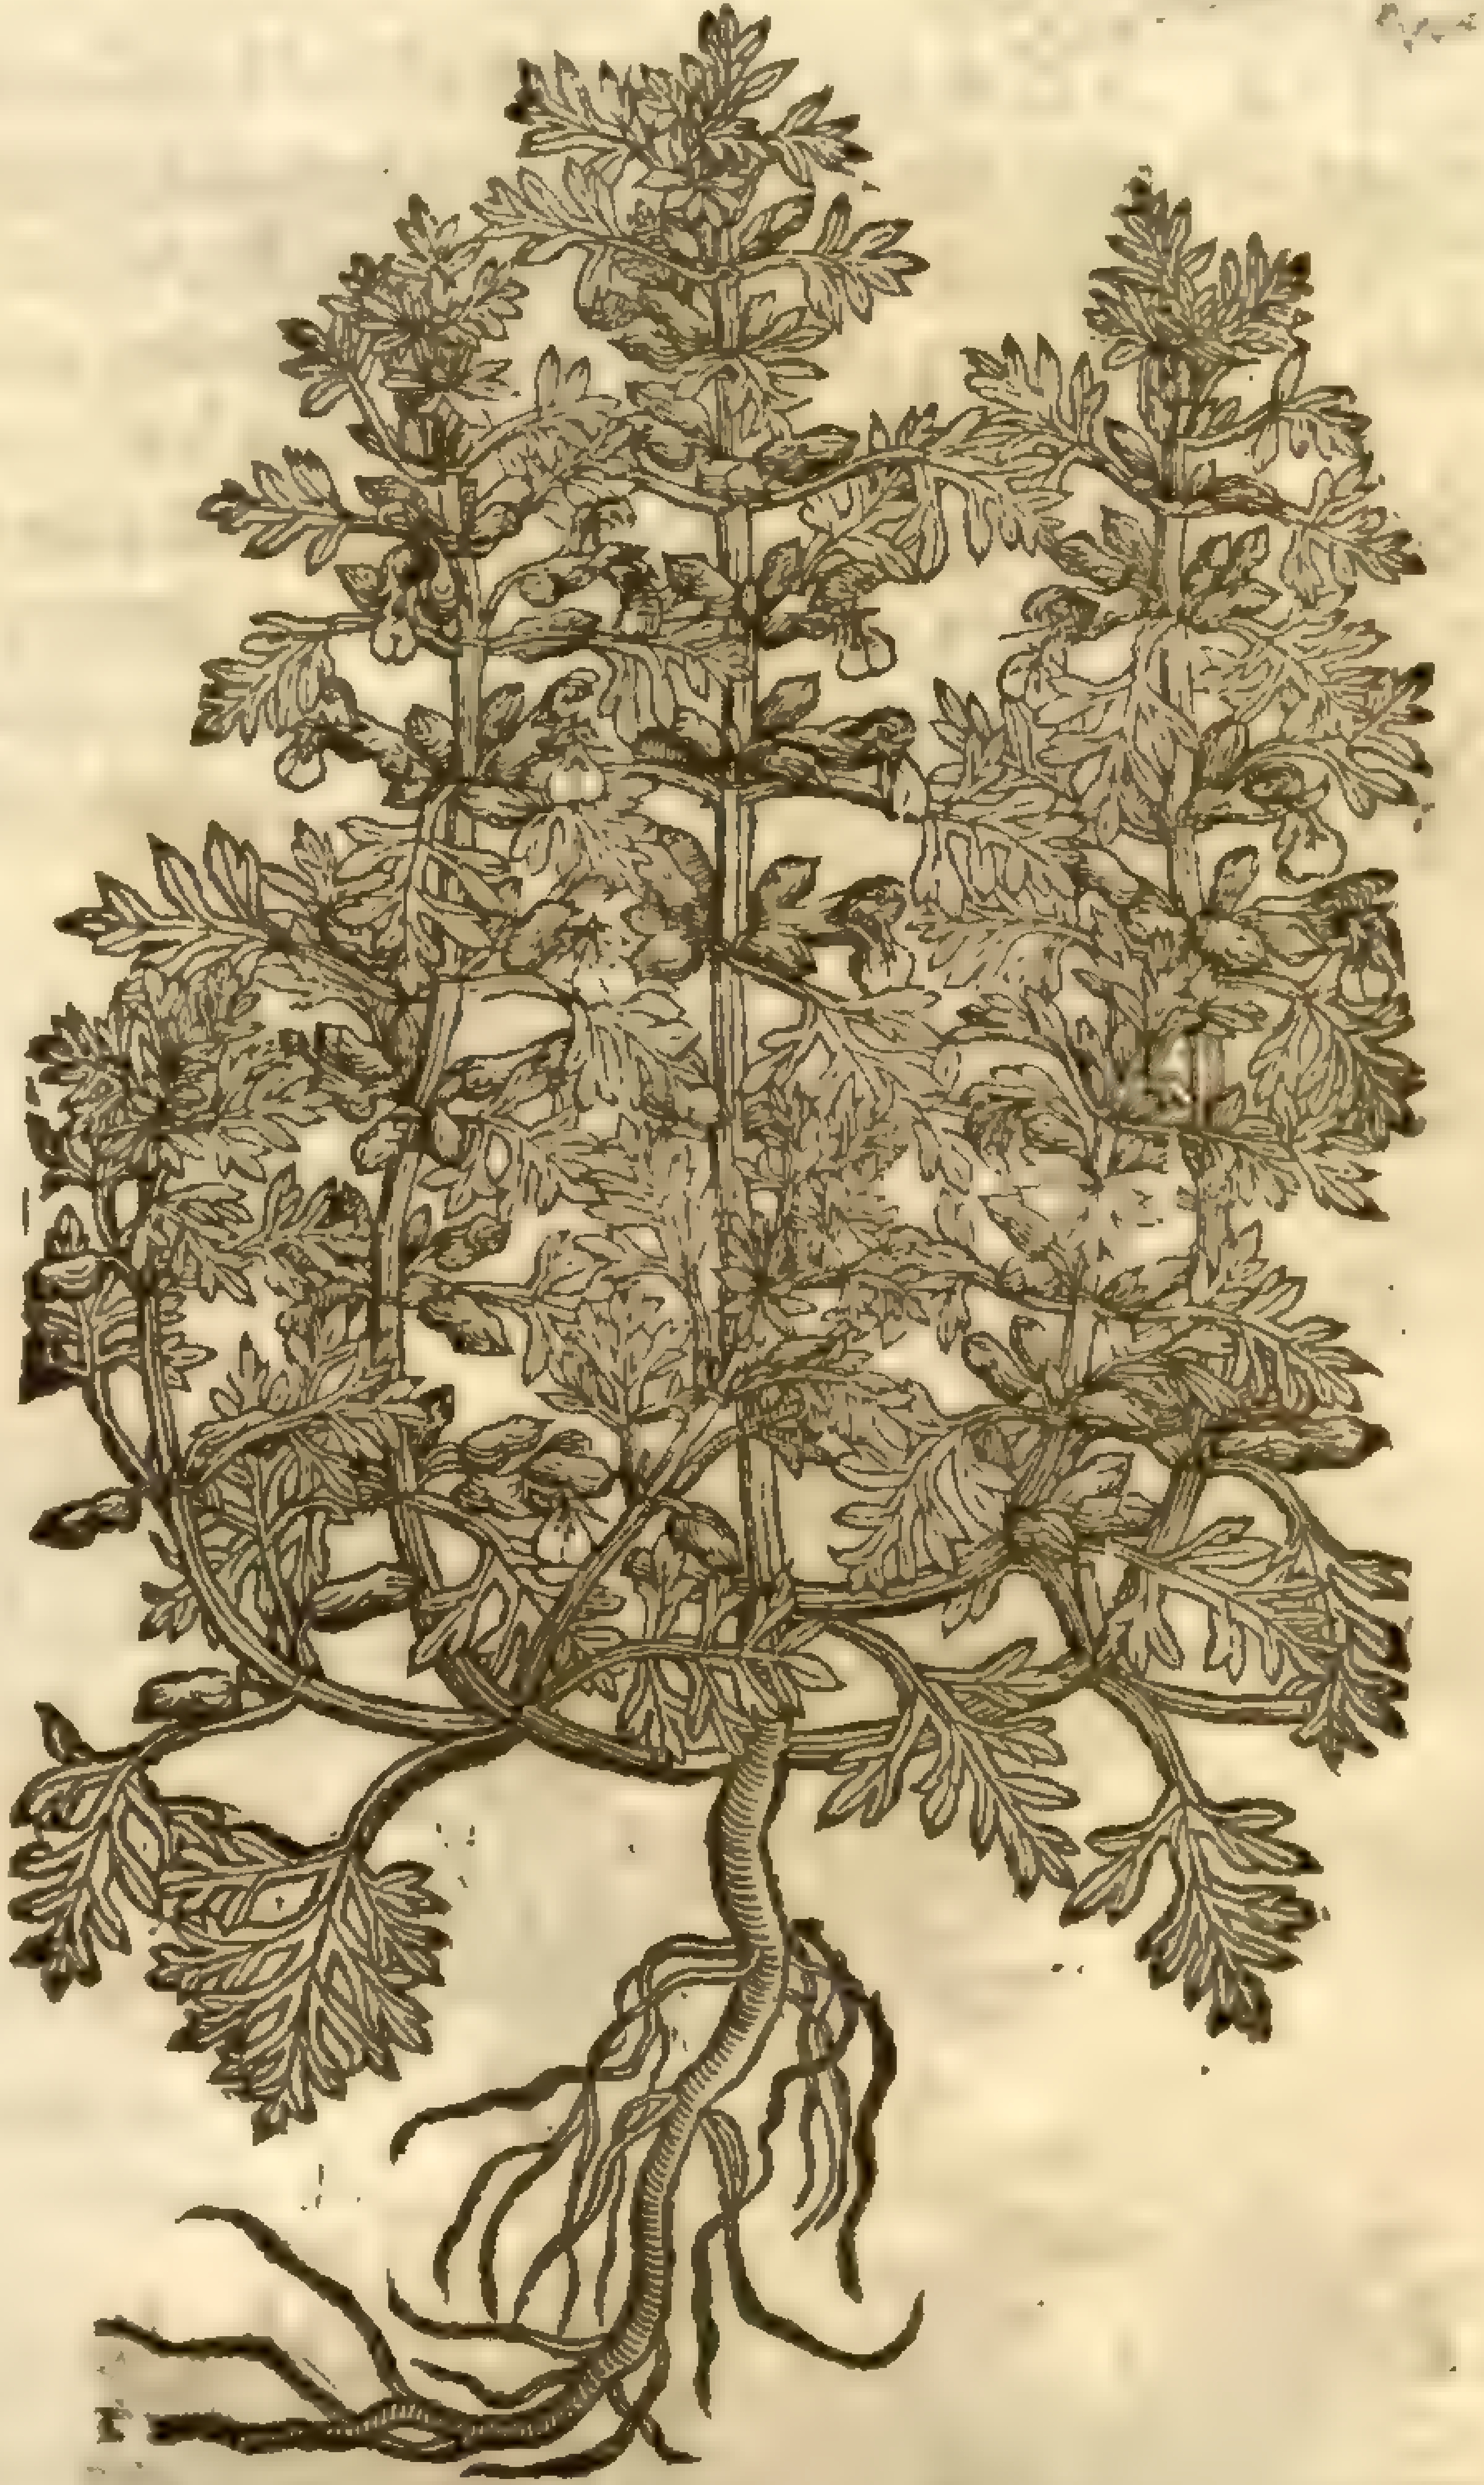
† 2 The ſecond hath pretty ſtrong foure ſquare joynted ſtalkes, browne and hairy; from which grow pretty large hairy leaues much clouen or cut: the floures are of a purple colour, and grow about the ſtalks in roundles like the dead Nettle: the ſeed is black and round, and the whole plant ſauouring like the former: ‡ which ſheweth this to be fitly referred to the *Chamæpitys*, and not to be well called *Chamædrys fæmina*, or jagged Germander, as ſome haue named it. ‡

1 *Chamæpitys mas.*
The male ground-Pine.

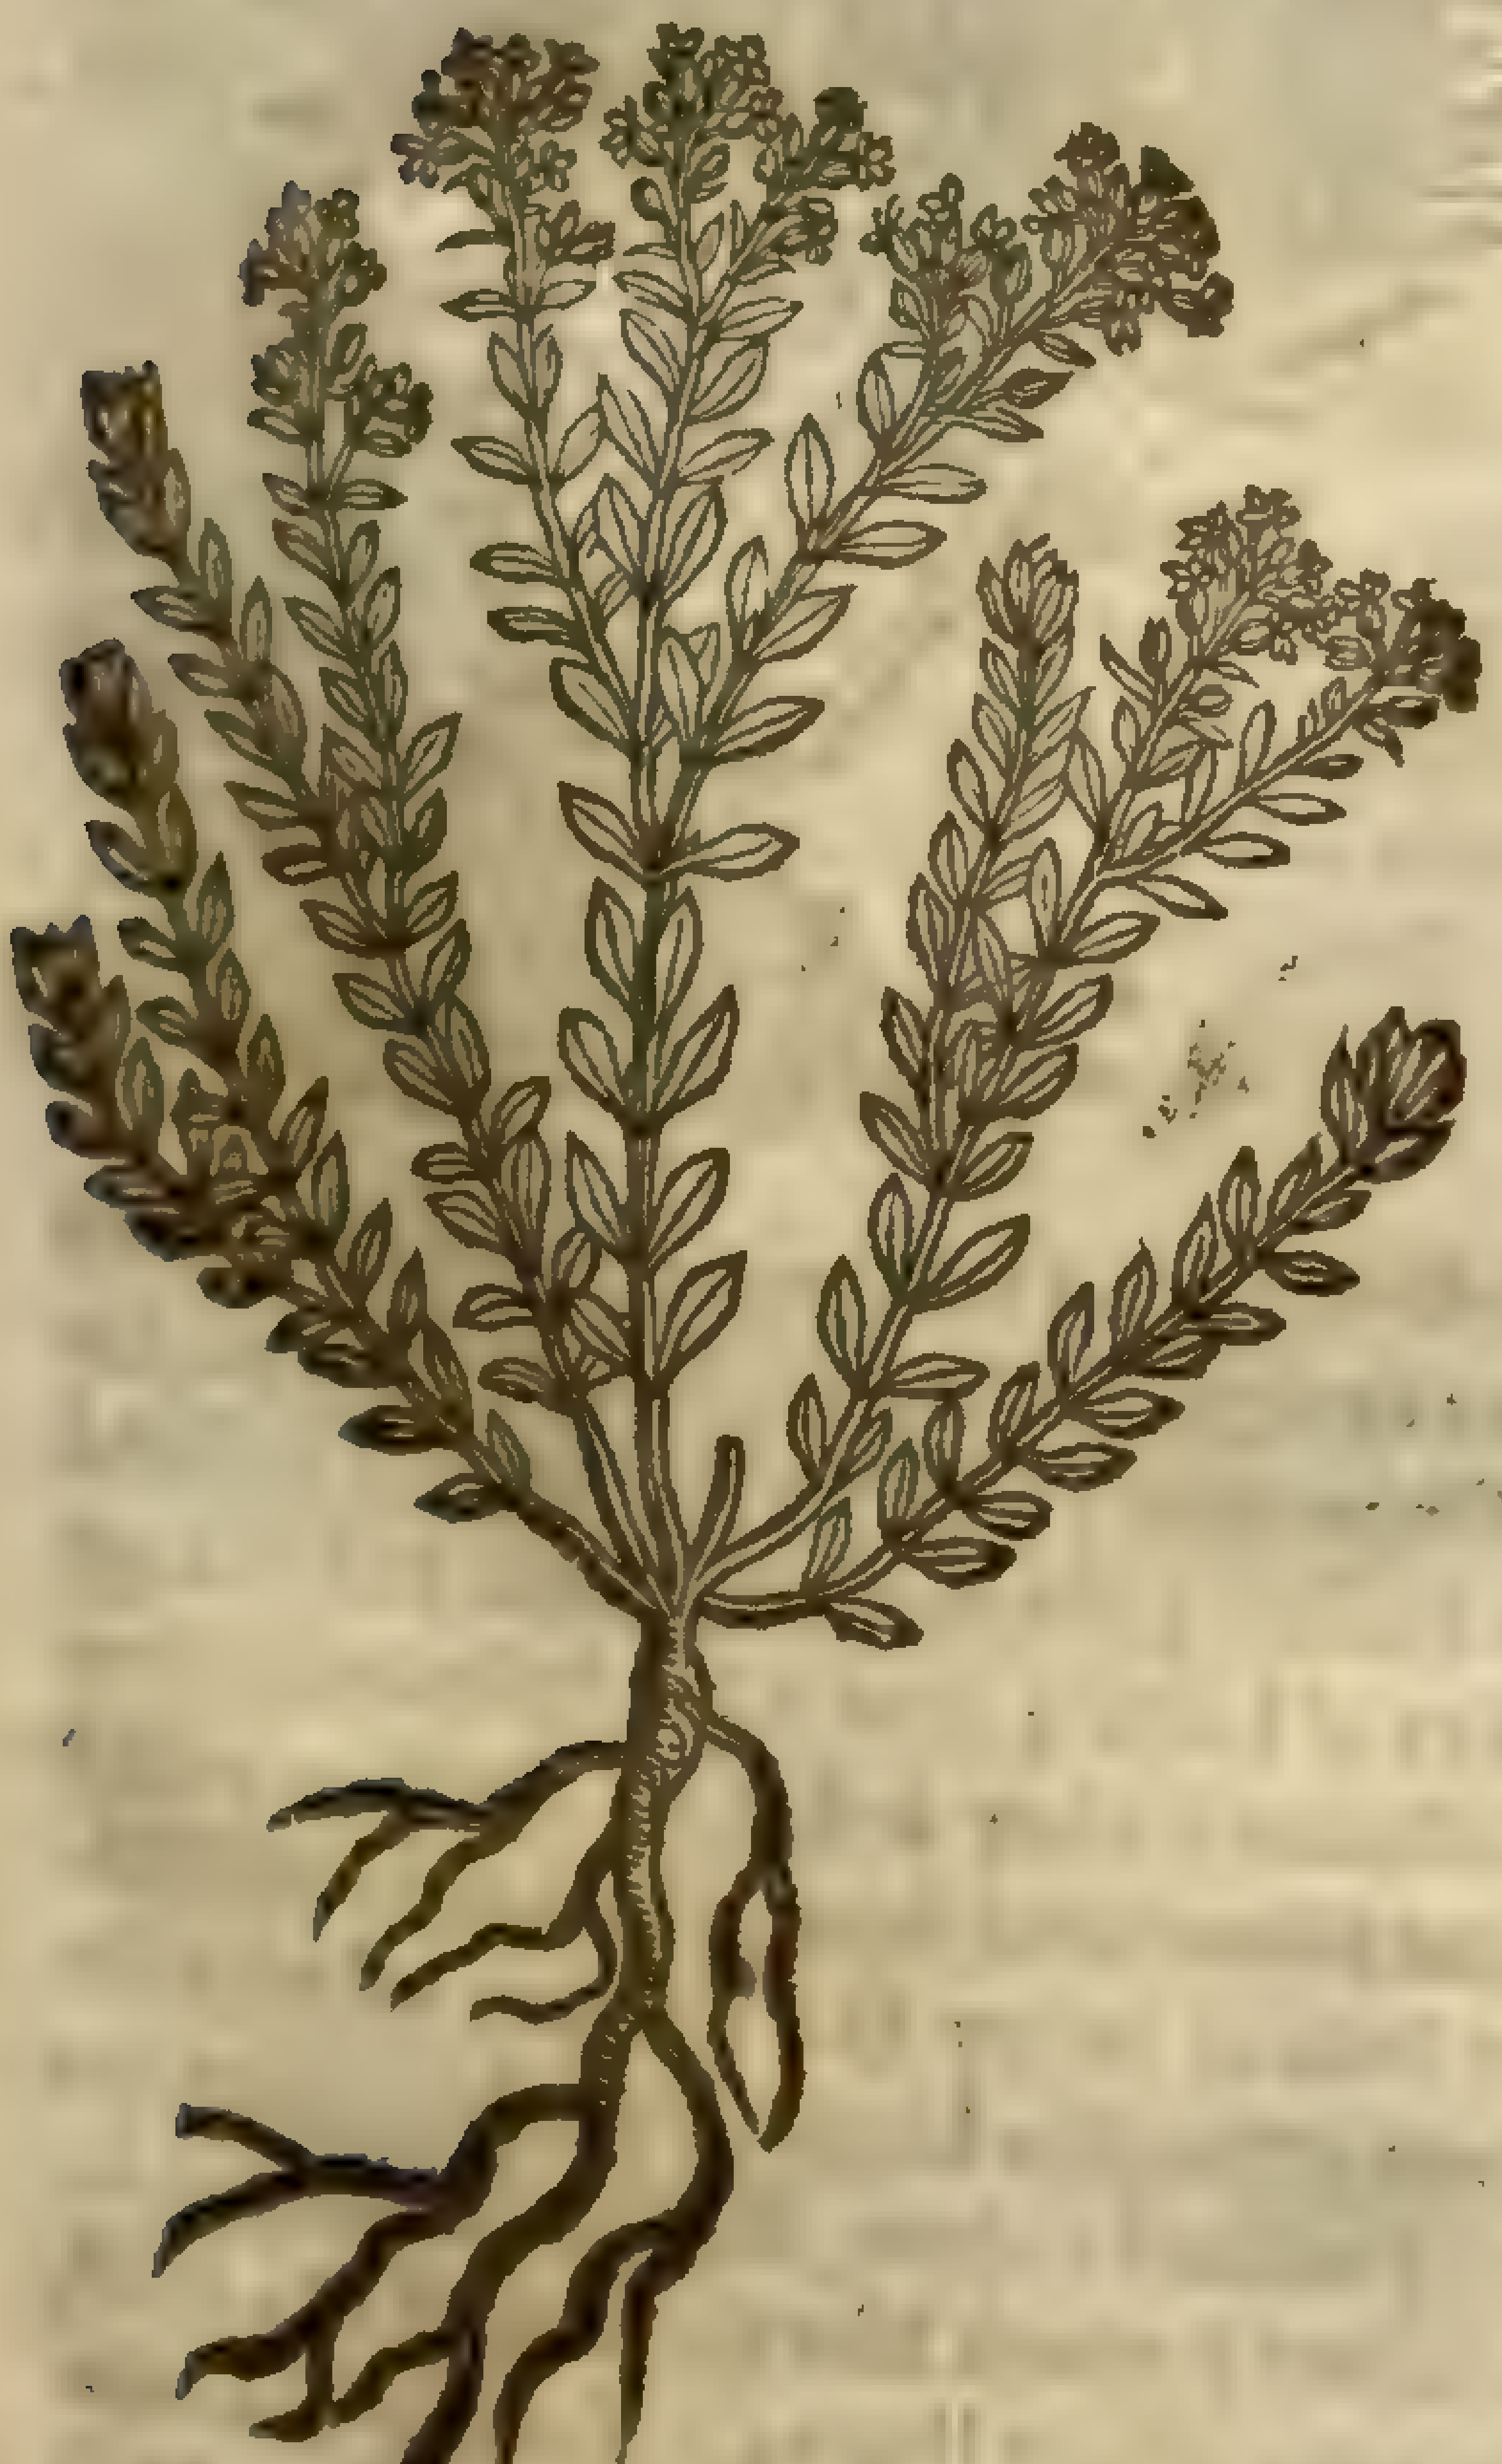


Ajuga chamæpitys
Smith

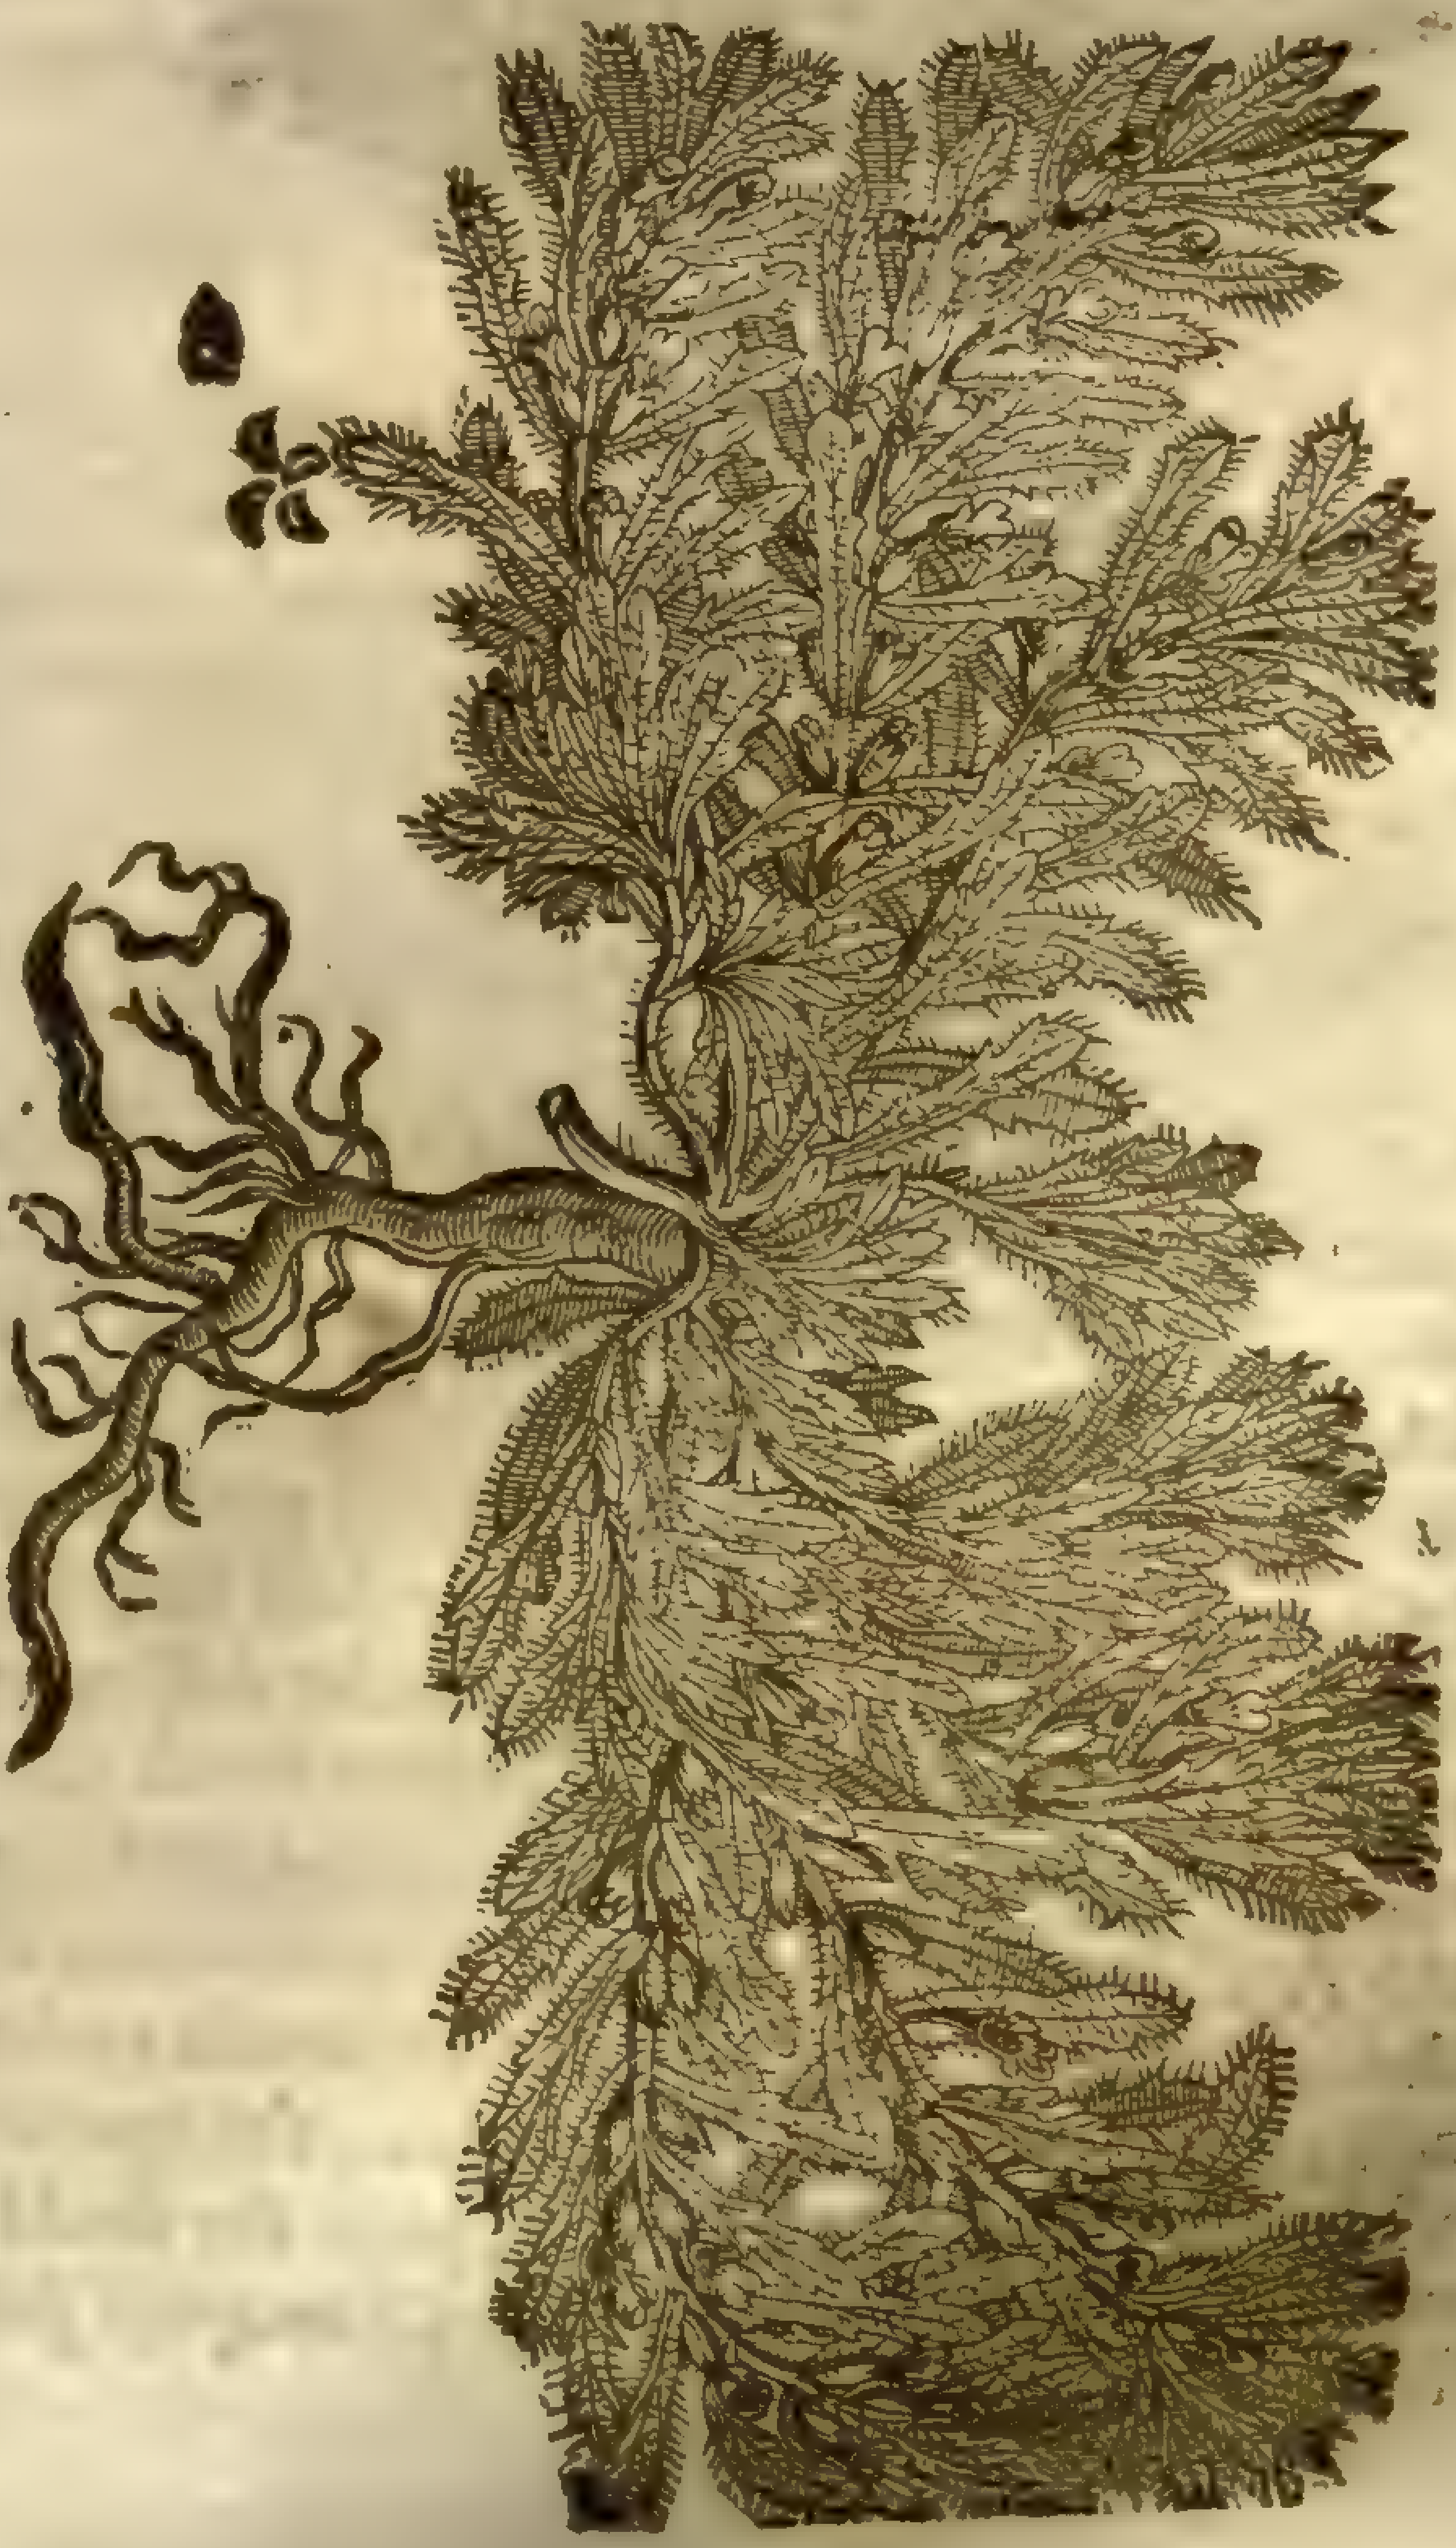
2 *Chamæpitys fœmina.*
The female ground-Pine.



3 *Chamæpitys* 3. *Dodon.*
Small Ground-Pine.



4 *Iua muſcata Monſpeliaca.*
French herbe-Iuy or Ground-Pine.

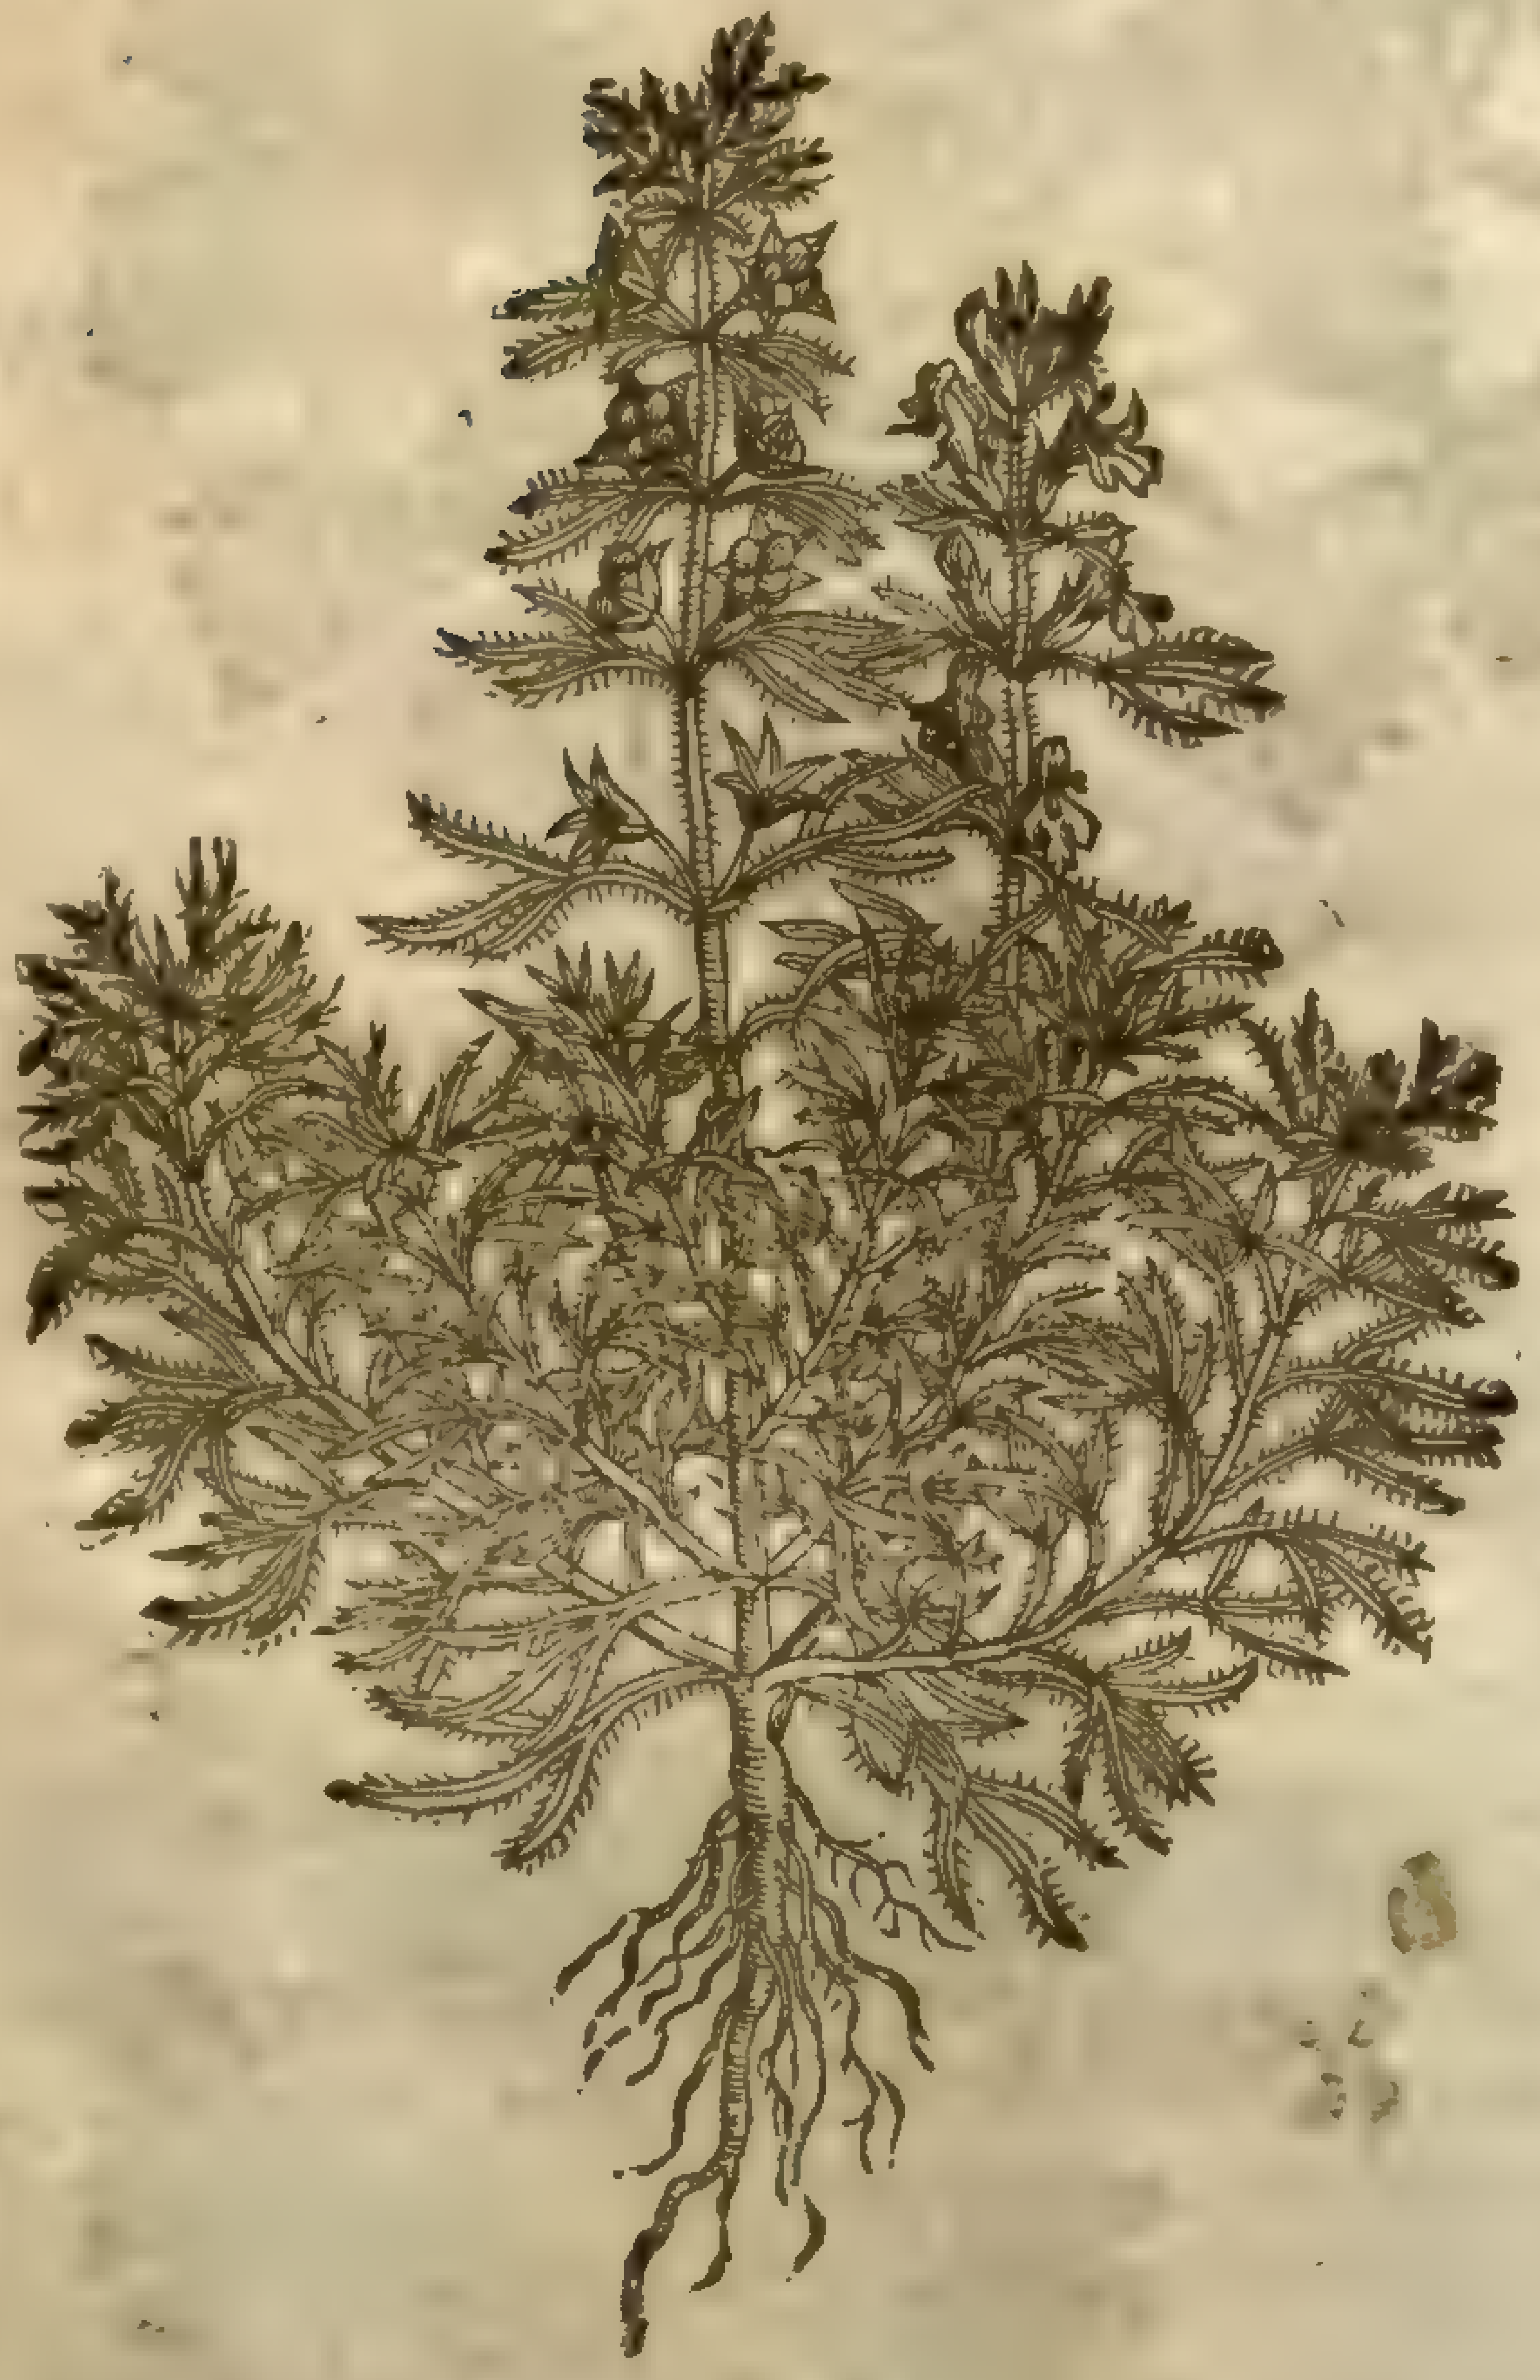


3 This kinde of Herbe-Iuy, growing for the moſt part about Montpelier in France, is the leaſt of all his kind, hauing ſmall white and yellow floures, in ſmell and proportion like vnto the others, but much ſmaller.

† 4 There is a wilde or baſtard kinde of *Chamæpitys*, or ground-Pine, that hath leaues ſomewhat like vnto the ſecond kinde, but not jagged in that manner, but onely ſnipt about the edges. The root is ſomewhat bigger, wooddy, whitiſh, and bitter, and like vnto the root of Succorie. All this herbe is very rough, and hath a ſtrong vnpleaſant ſmell, not like that of the ground-Pines.

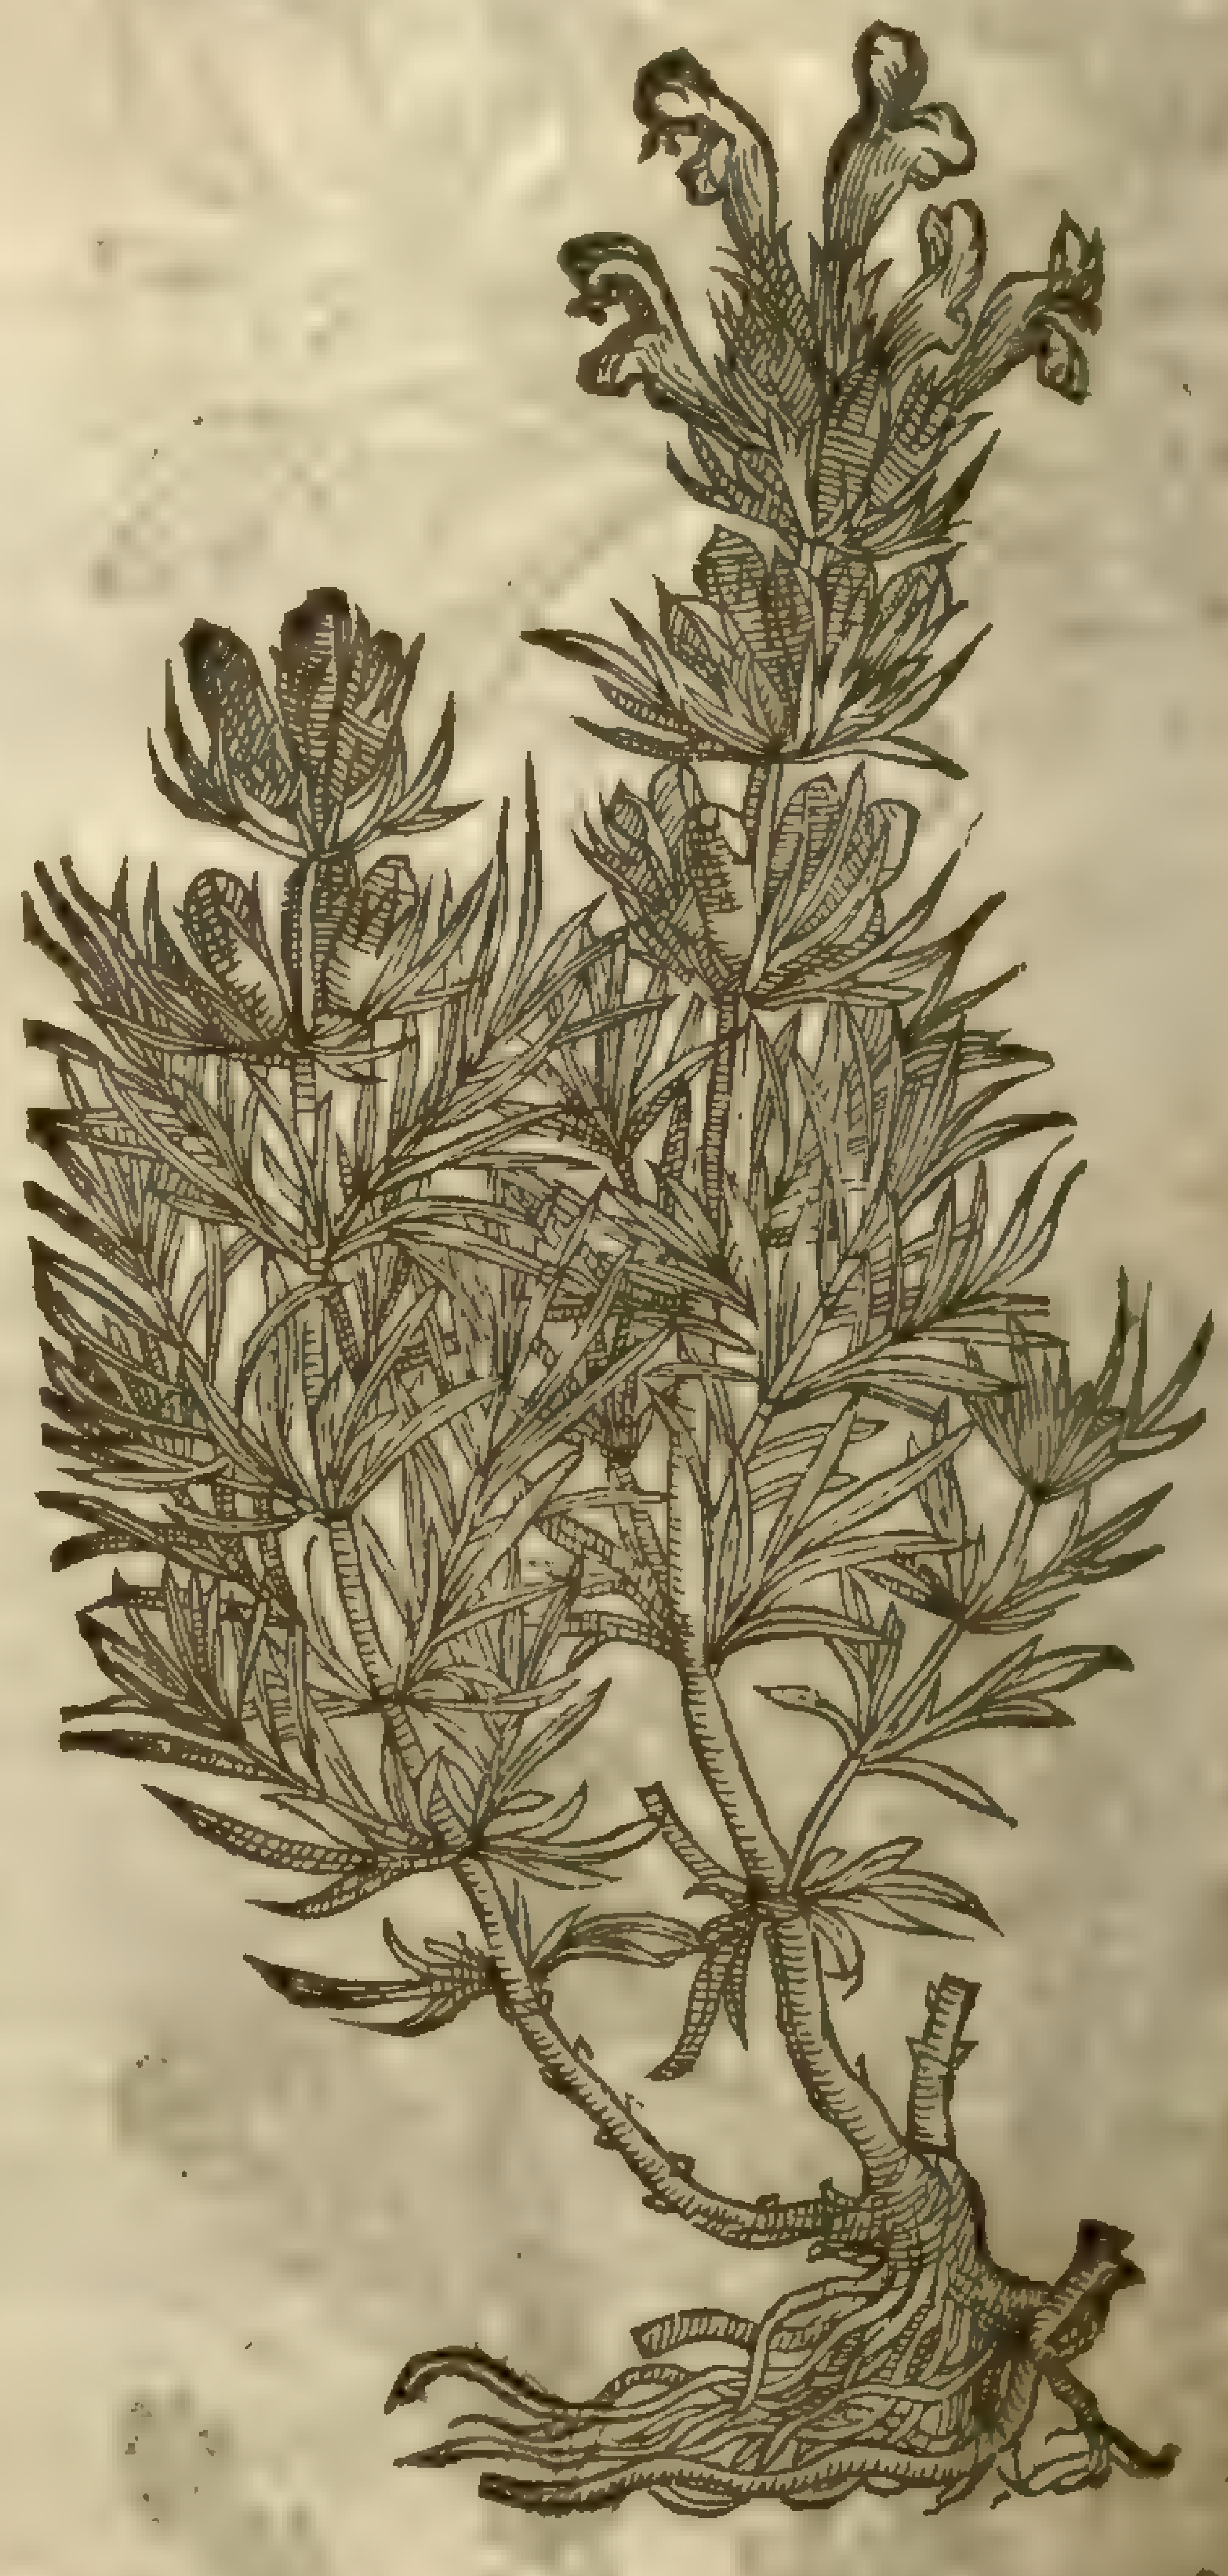
† 5 There is another kind that hath many ſmall and tender branches beſet with little leaues for the moſt part three together, almoſt like the leaues of the ordinary ground-Pine: at the top of which branches grow ſlender white floures; which being turned vpſide downe, or the lower part vpward, doe ſomewhat reſemble the floures of *Lamium*: the ſeeds grow commonly foure together in a cup, and are ſomewhat big and round: the root is thicke, whitiſh, and long laſting.

‡ 5 *Chamæpitys ſpuria altera Dodon.*
Baſtard Ground-Pine.



Teucrium pseudochamæpitys,
[illegible]

‡ 6 *Chamæpitys Auſtriaca.*
Auſtrian Ground-pine.



6 There groweth in Auſtria a kinde of *Chamæpitys*, which is a moſt braue and rare plant, and of great beautie, yet not once remembred either of the ancient or new Writers, vntill of late that famous *Carolus Cluſius* had ſet it forth in his Pannonicke Obſeruations; who for his ſingular skil and induſtrie hath woon the garland from all that haue written before his time. This rare and ſtrange plant I haue in my garden, growing with many ſquare ſtalkes of halfe a foot high, beſet euen from the bottome to the top with leaues ſo like our common Roſemary, that it is hard for him which doth not know it exactly to finde the difference; being greene aboue, and ſomewhat hairie and hoary vnderneath: among which come forth round about the ſtalkes (after the manner of roundles or coronets) certain ſmall cups or chalices of a reddiſh colour; out of which come the floures like vnto Archangell in ſhape, but of a moſt excellent and ſtately mixed colour, the outſide purple declining to blewneſſe, and ſometimes of a violet colour. The floure gapeth like the mouth of a beaſt, and hath as it were a white tongue; the lower and vpper jawes are white likewiſe, ſpotted with many bloudy ſpots: which being paſt, the ſeeds appeare very long, of a ſhining blacke colour, ſet in order in the ſmall huskes as the *Chamæpitys ſpuria.* The root is blacke and hard, with many hairy ſtrings faſtned thereto.

¶ *The Place.*

Theſe kindes of *Chamæpitys* (except the laſt) grow very plentifully in Kent, eſpecially about Grauesend, Cobham, Southfleet, Horton, Dartford, and Sutton, and not in any other ſhire in England that I euer could finde.

‡ None of theſe except the firſt, for any thing I know, or can learne, grow wilde in England; the ſecond I haue often ſeene in Gardens. ‡

¶ *The Time.*

They floure in Iune, and often in Auguſt.

¶ *The Names.*

Ground Pine is called in Greeke, χαμαίπιτυς: in Latine, *Ibiga, Aiuga*, and *Abiga*: in ſhops, *Iua Arthritica* and *Iua moſchata*: in Italian, *Iua*: in Spaniſh, *Chamæpiteos*: in high Dutch, **Vergiſs mich nicht**: in low Dutch, **Velt Cipres**: in French, *Ive moſchate*: in Engliſh, Herbe Iuie, Forget me not, Ground Pine, and field Cypreſſe.

‡ 1 The firſt of theſe is the *Chamæpitys prima*, of *Matthiolus*, *Dodonæus* and others, and is that which is commonly vſed in ſhops and in Phyſicke.

2 This *Matthiolus* cals *Chamædrys altera*: *Lobel*, *Chamædrys Liciniatis folijs*: *Lonicerus*, *Traxago vera*; *Tabernamontanus*, *Iva moſcata*; and *Dodon.* (whom in this chapter we chiefly follow) *Chamæpitys altera.*

3 Thirdly, this is the *Chamæpitys* 1. of *Fuchſius* and others; the *Chamæpitys* 1. *Dioſcoridis odoratior* of *Lobel*; and the *Chamæpitys* 3. of *Matthiolus* and *Dodonæus.*

4 *Geſner* cals this *Chamæpitys ſpecies Monſpelij*: *Cluſius* and *Dodon*: *Anthyllis altera*; and *Lobel*, *Anthyllis Chamepityides minor*; and *Tabern. Iva Moſchata Monſpelienſium.*

5 This is *Chamæpitys adulterina* of *Lobel*: *Pſeudochamæpitys* and *Aiuga adulterina* of *Cluſius*: and *Chamæpitys ſpuria altera* of *Dodon.*

6 This is *Chamæpitys Auſtriaca* of *Cluſius*; and *Chamæpitys cærulea* of *Camerarius.* ‡

¶ *The Temperature.*

Theſe herbes are hot in the ſecond degree, and dry in the third.

¶ *The Vertues.*

A The leaues of *Chamæpitys* tunned vp in Ale, or infuſed in wine, or ſodden with hony, and drunke by the ſpace of eight or ten daies, cure the jaundiſe, the Sciatica, the ſtoppings of the liuer, the difficultie of making water, the ſtoppings of the ſpleene, and cauſe women to haue their naturall ſickneſſe.

B *Chamæpitys* ſtamped greene with hony cureth wounds, malignant and rebellious vlcers, and diſſolueth the hardneſſe of womens breſts or paps, and profitably helpeth againſt poyſon, or biting of any venomous beaſt.

C The decoction drunke, diſſolueth congealed bloud, and drunke with vinegre, driueth forth the dead childe.

D It clenſeth the intrals: it helpeth the infirmities of the liuer and kidnies; it cureth the yellow jaundiſe being drunke in wine: it bringeth downe the deſired ſickeneſſe, and prouoketh vrine: being boiled in Mead or honied water and drunke, it helpeth the Sciatica in forty daies. The people of Heraclea in Pontus do vſe it againſt Wolfes bane in ſtead of counterpoyſon.

E The pouder hereof taken in pils with a fig, mollifieth the belly: it waſteth away the hardneſſe of the paps: it healeth wounds, it cureth putrified vlcers being applied with hony: and theſe things the firſt ground Pine doth performe, ſo do the other two: but not ſo effectually, as witneſſeth *Dioſcorides.*

F *Cluſius* of whom mention was made, hath not ſaid any thing of the Vertues of *Chamæpitys Auſtriaca*; but verily I thinke it better by many degrees for the purpoſes aforeſaid: my conjecture I take from the taſte, ſmell, and comely proportion of this Herbe, which is more pleaſing and familiar vnto the nature of man, than thoſe which wee haue plentifully in our owne Country growing.

CHAP. 151. *Of Nauelwoort, or Penniwoort of the Wall.*

¶ *The Deſcription.*

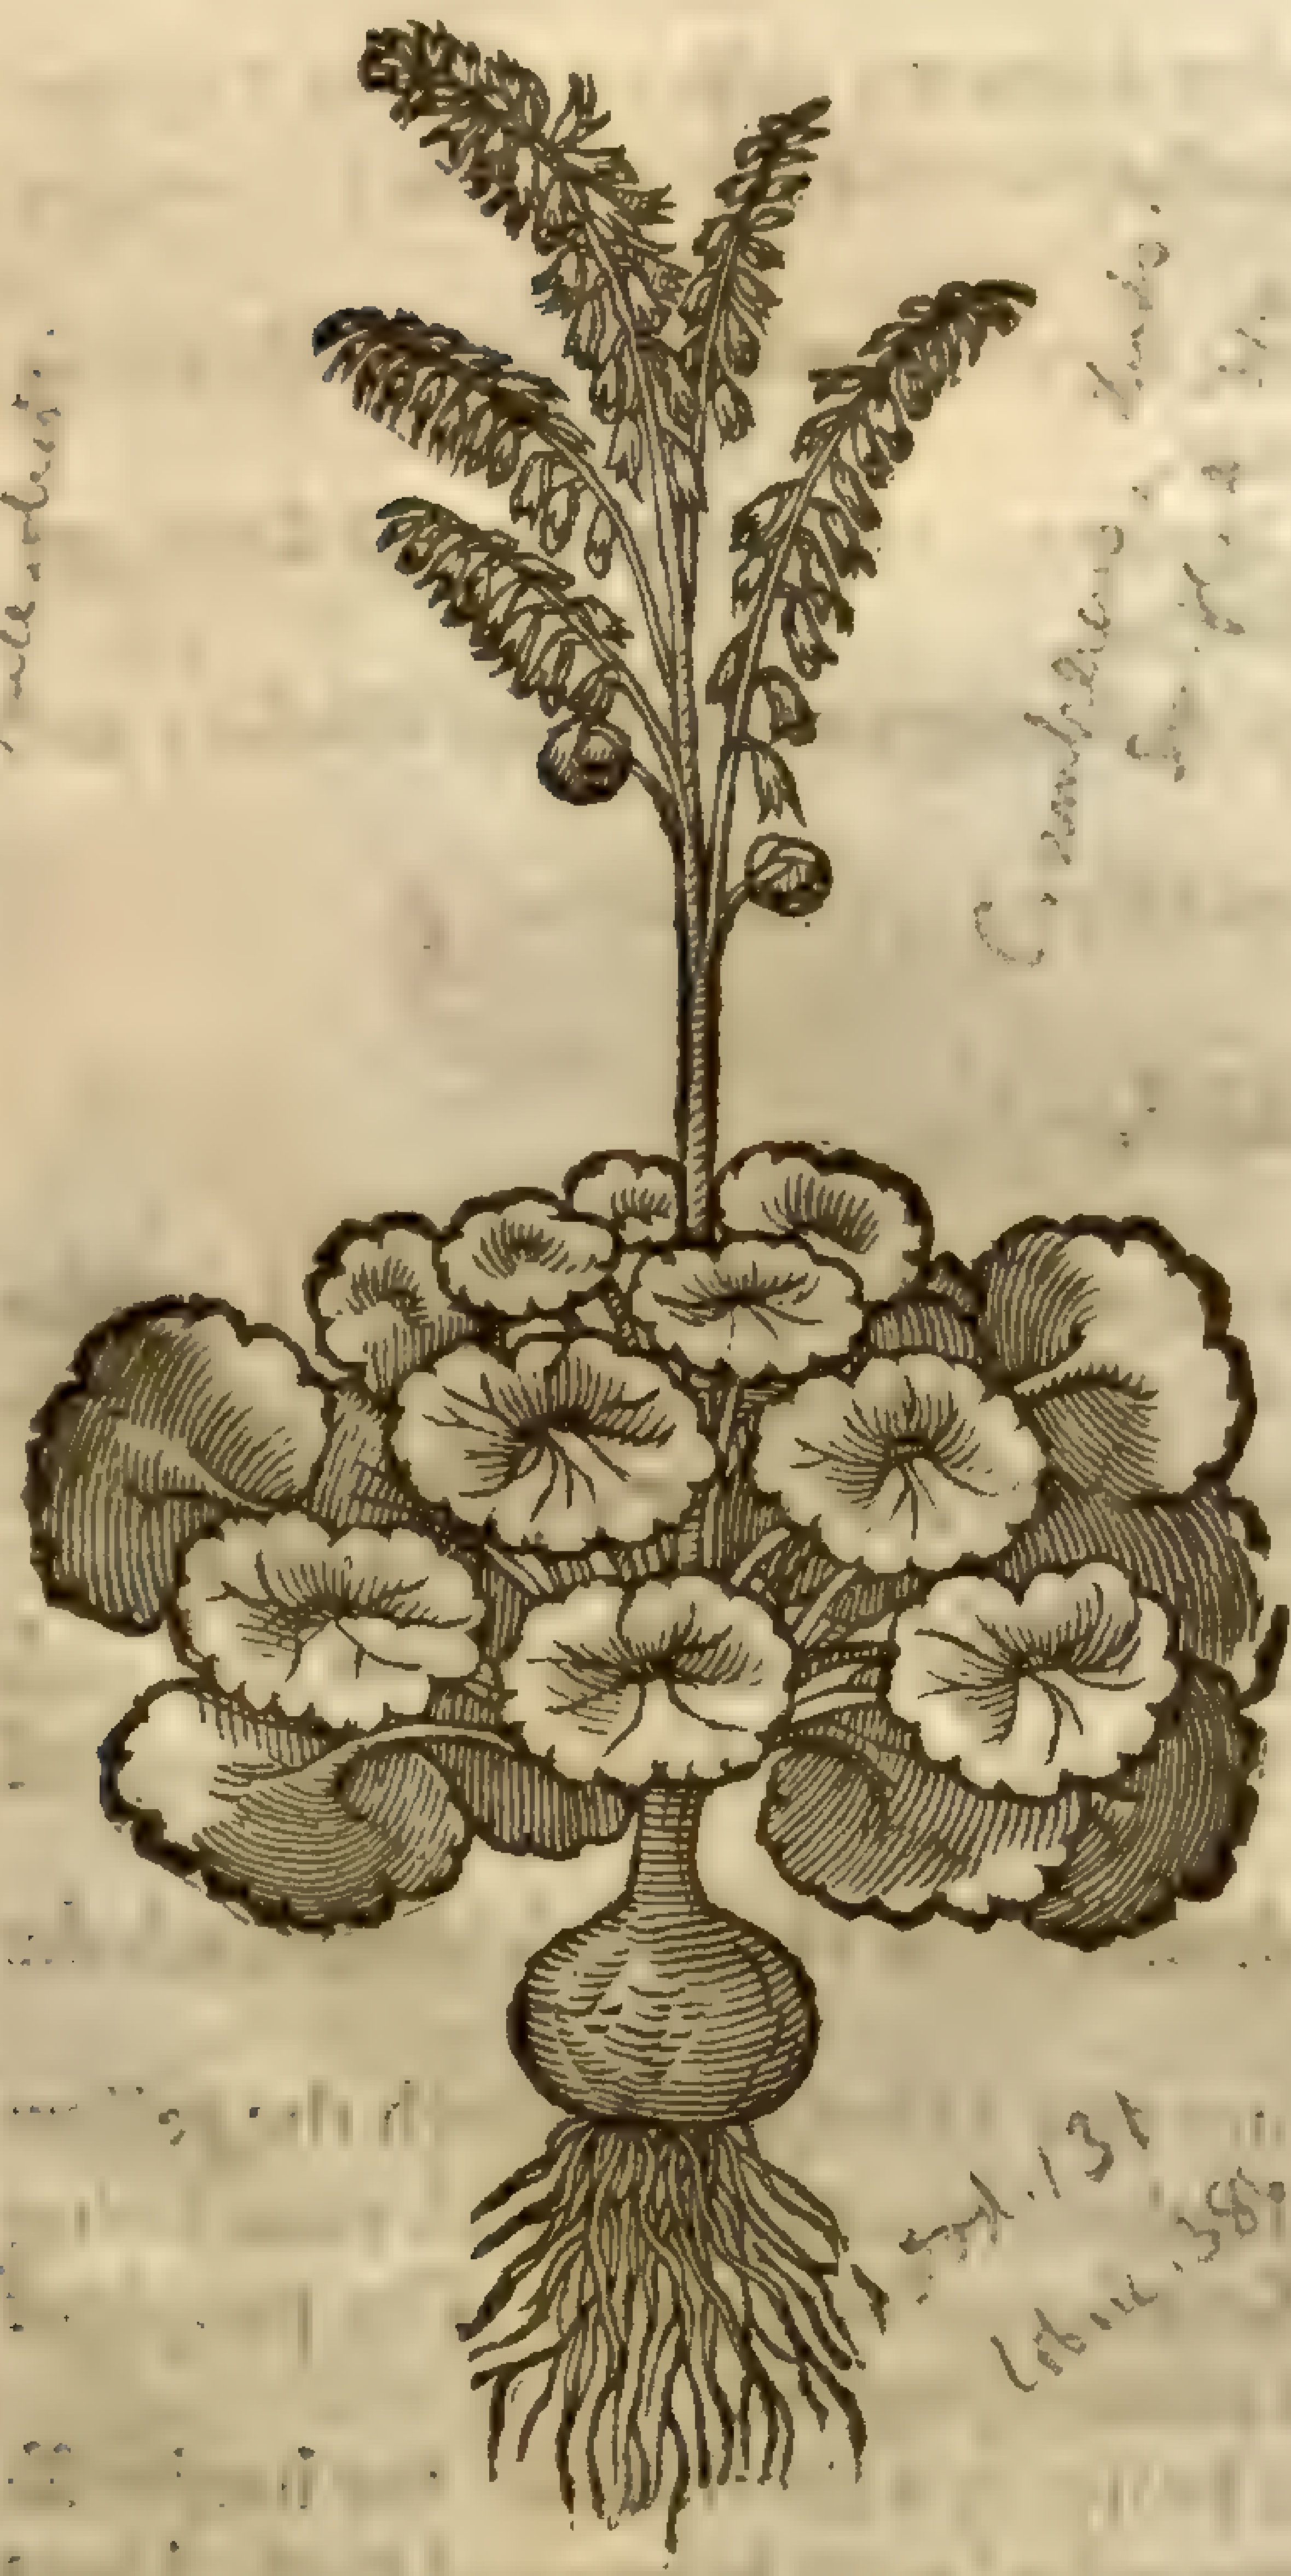
1 THe great Nauelwoort hath round and thicke leaues, ſomewhat bluntly indented about the edges, and ſomewhat hollow in the midſt on the vpper part, hauing a ſhort tender

ſtemme faſtened to the middeſt of the leafe, on the lower ſide vnderneath the ſtalke, whereon the floures do grow, is ſmall and hollow, an handfull high and more, beſet with many ſmall floures of an ouerworne incarnate colour. The root is ſmall like an oliue, of a white colour.

‡ The root is not well expreſt in the figure, for it ſhould haue been more vnequall or tuberous, with the fibres not at the bottome, but top thereof. ‡

2 The ſecond kinde of Wall Penniwort or Nauelwoort hath broad thicke leaues ſomewhat deepely indented about the edges: and are not ſo round as the leaues of the former, but ſomewhat long towards the ſetting on, ſpred vpon the ground in manner of a tuſt, ſet about the tender ſtalke, like to Sengreene or Houſleeke; among which riſeth vp a tender ſtalke whereon doe grow the like leaues. The floures ſtand on the top conſiſting of fiue ſmall leaues of a whitiſh colour, with redde ſpots in them. The root is ſmall and threddy. ‡ This by ſome is called *Sedum Serratum*. ‡

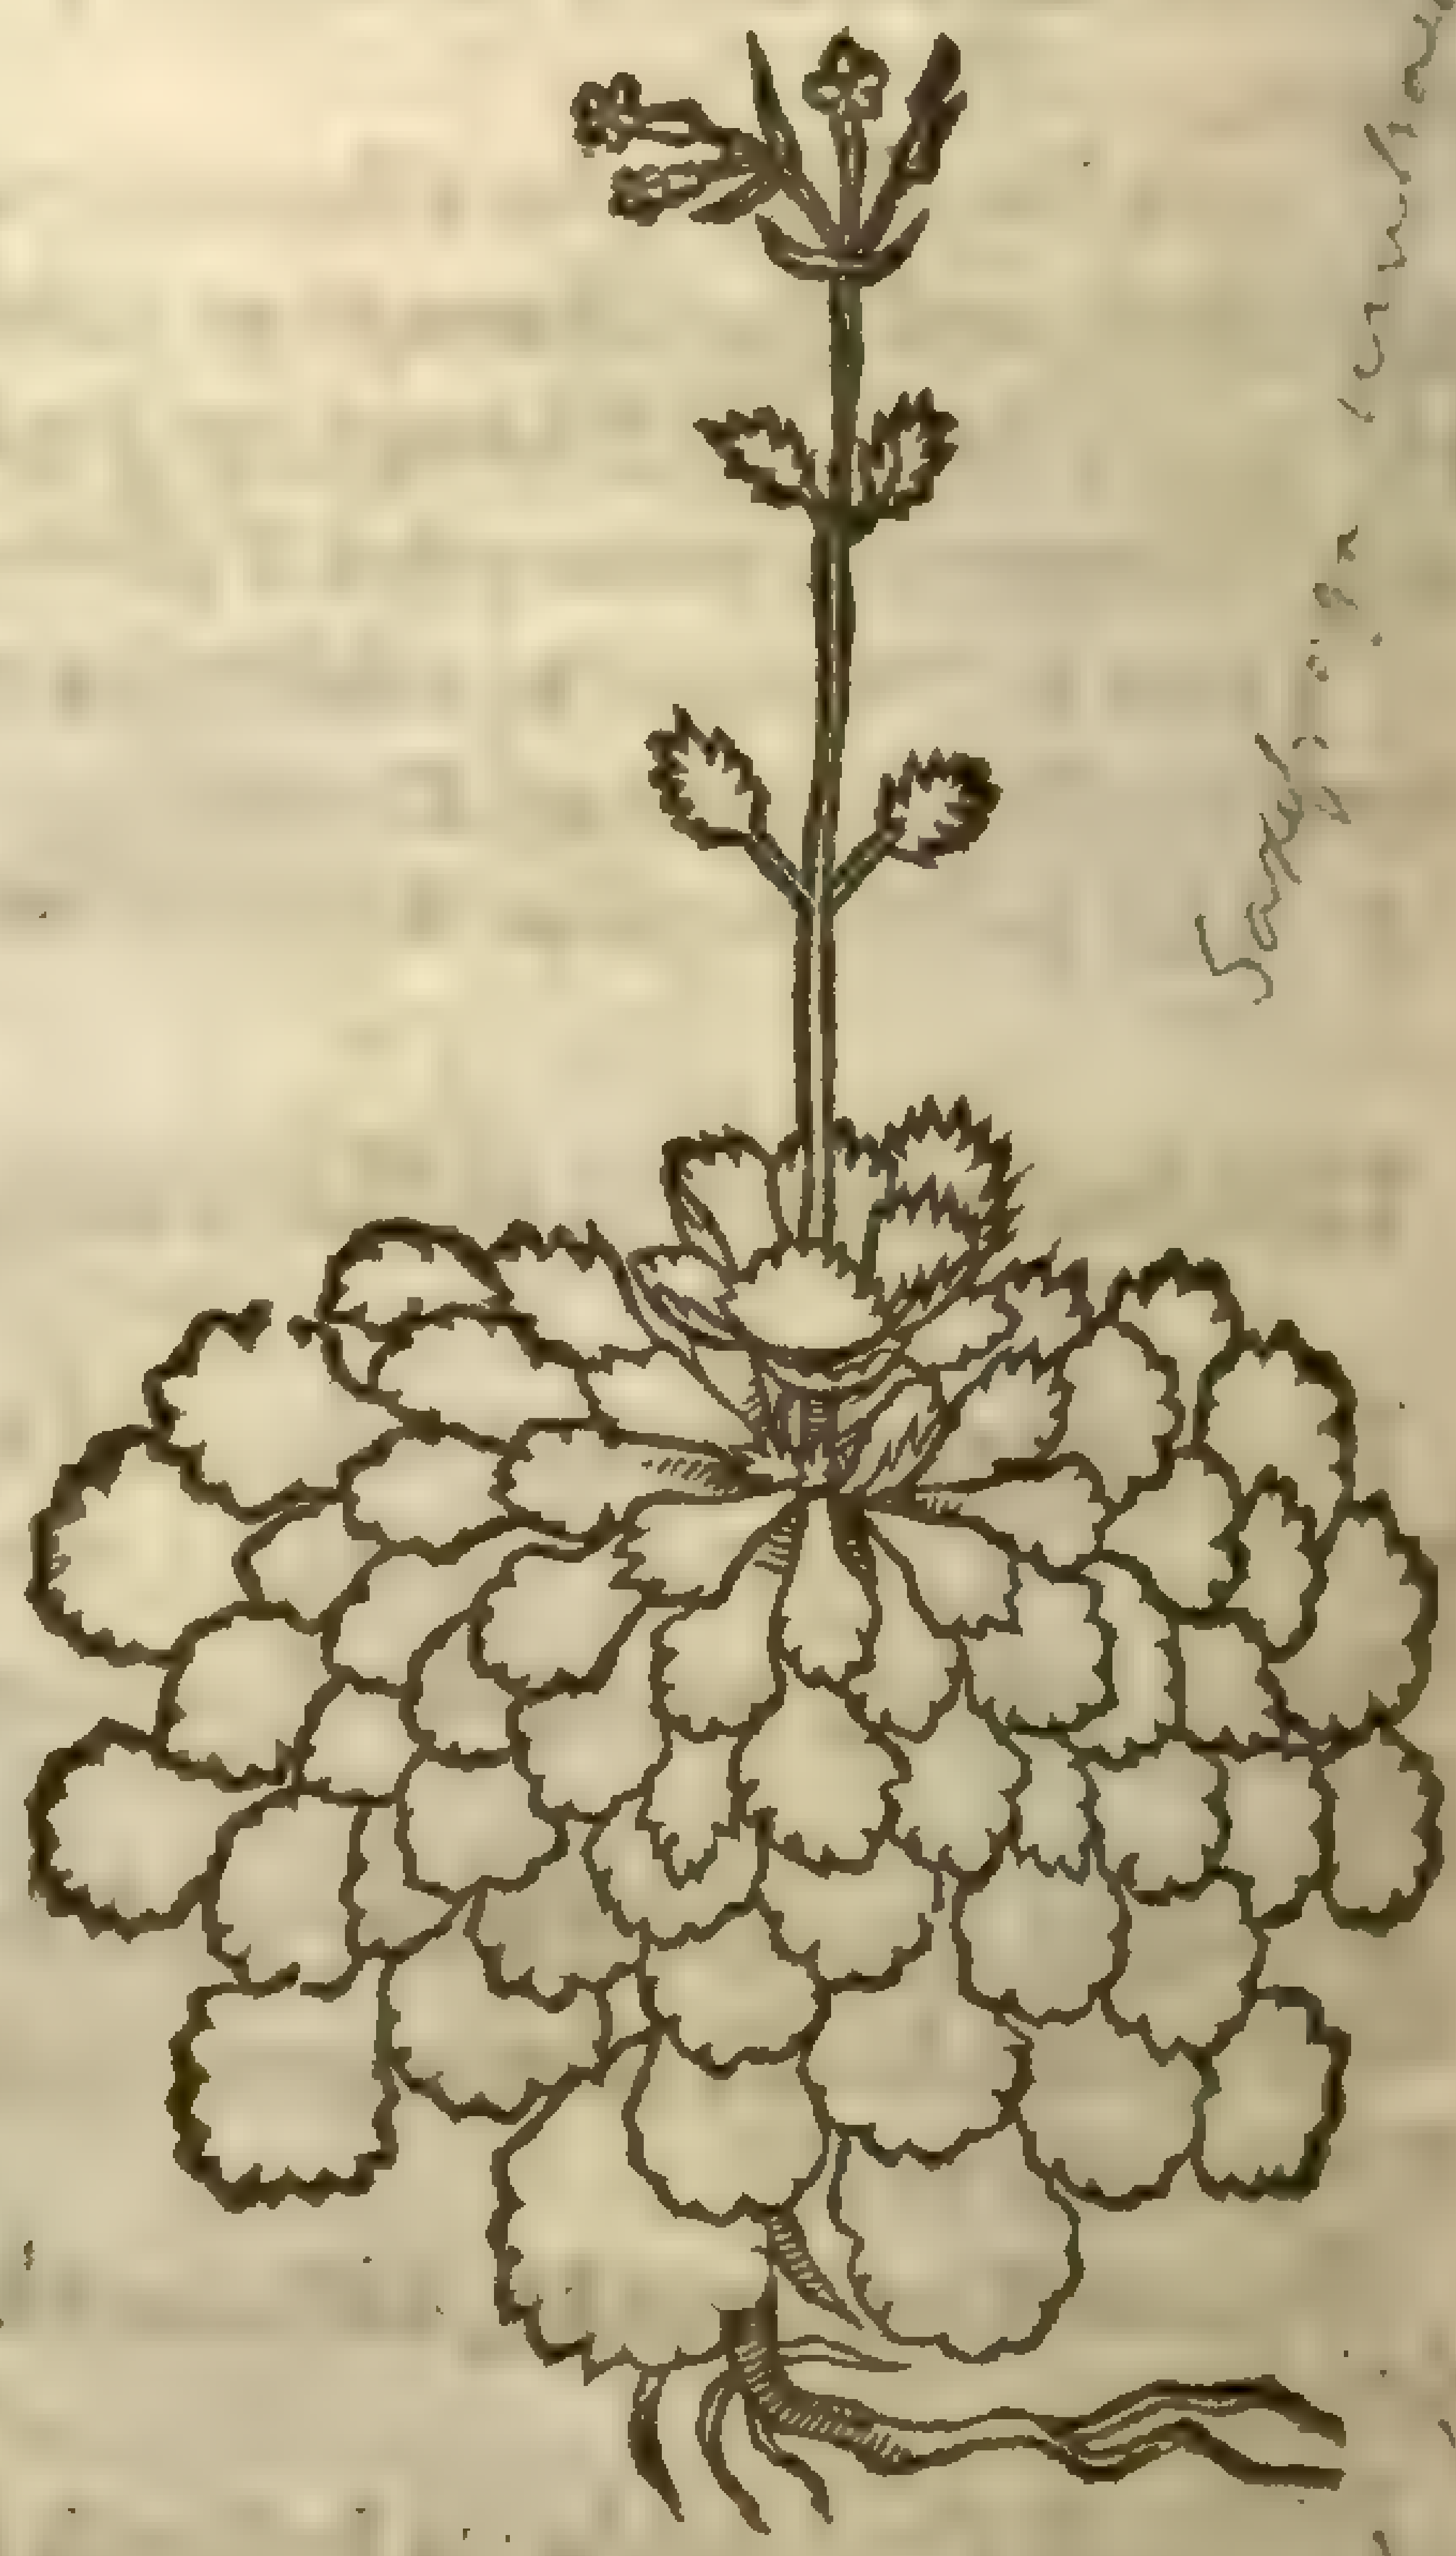
1 *Vmbilicus Veneris.*
Wall Penniwoort.



Cotyledon umbilicus

Syd. 131

‡ 2 *Vmbilicus Ven. ſive Cotyledon altera.*
Iagged or Roſe Penniwoort.



Saxifraga umbrosa

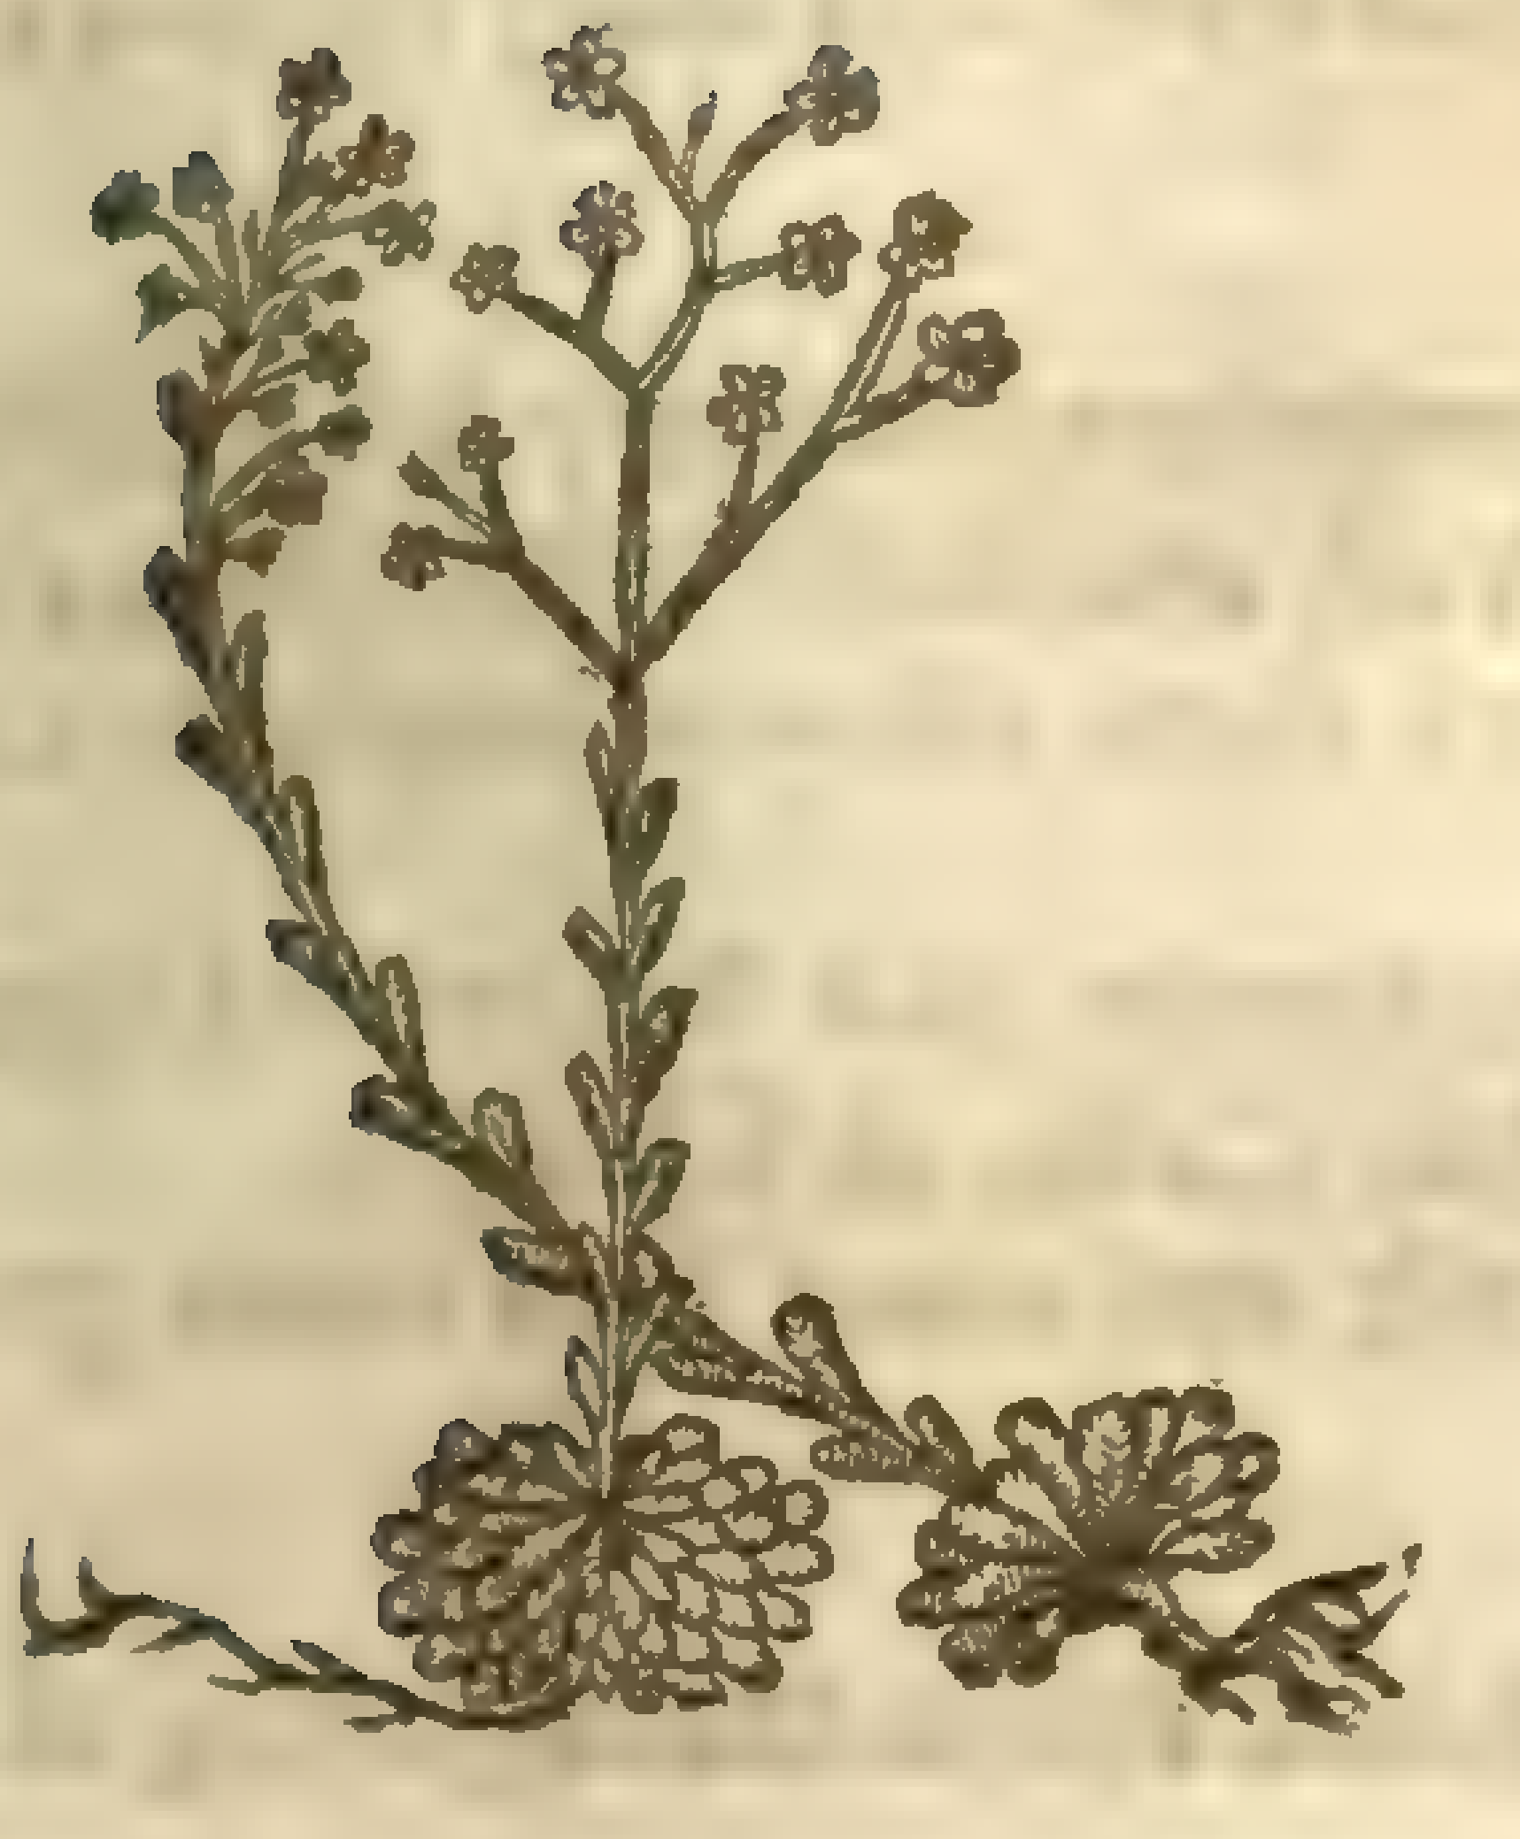
‡ 3 This third kinde hath long thicke narrow leaues, very finely ſnipt or nickt on the edges, which lie ſpred very orderly vpon the ground; and in the midſt of them riſeth vp a ſtalke ſome foot high, which beares at the top thereof vpon three or foure little branches, diuers white floures conſiſting of fiue leaues apiece.

4 The leaues of this are long and thicke, yet not ſo finely ſnipt about the edges, nor ſo narrow as thoſe of the former: the ſtalke is a foot high, ſet here and there with ſomewhat ſhorter and rounder leaues than thoſe below; and toward the top thereof, out of the boſomes of theſe leaues come ſundry little foot-ſtalkes, bearing on their tops pretty large floures of colour white, and ſpotted with red ſpots. The roots are ſmall, and here and there put vp new tufts of leaues, like as the common Houſleeke. ‡

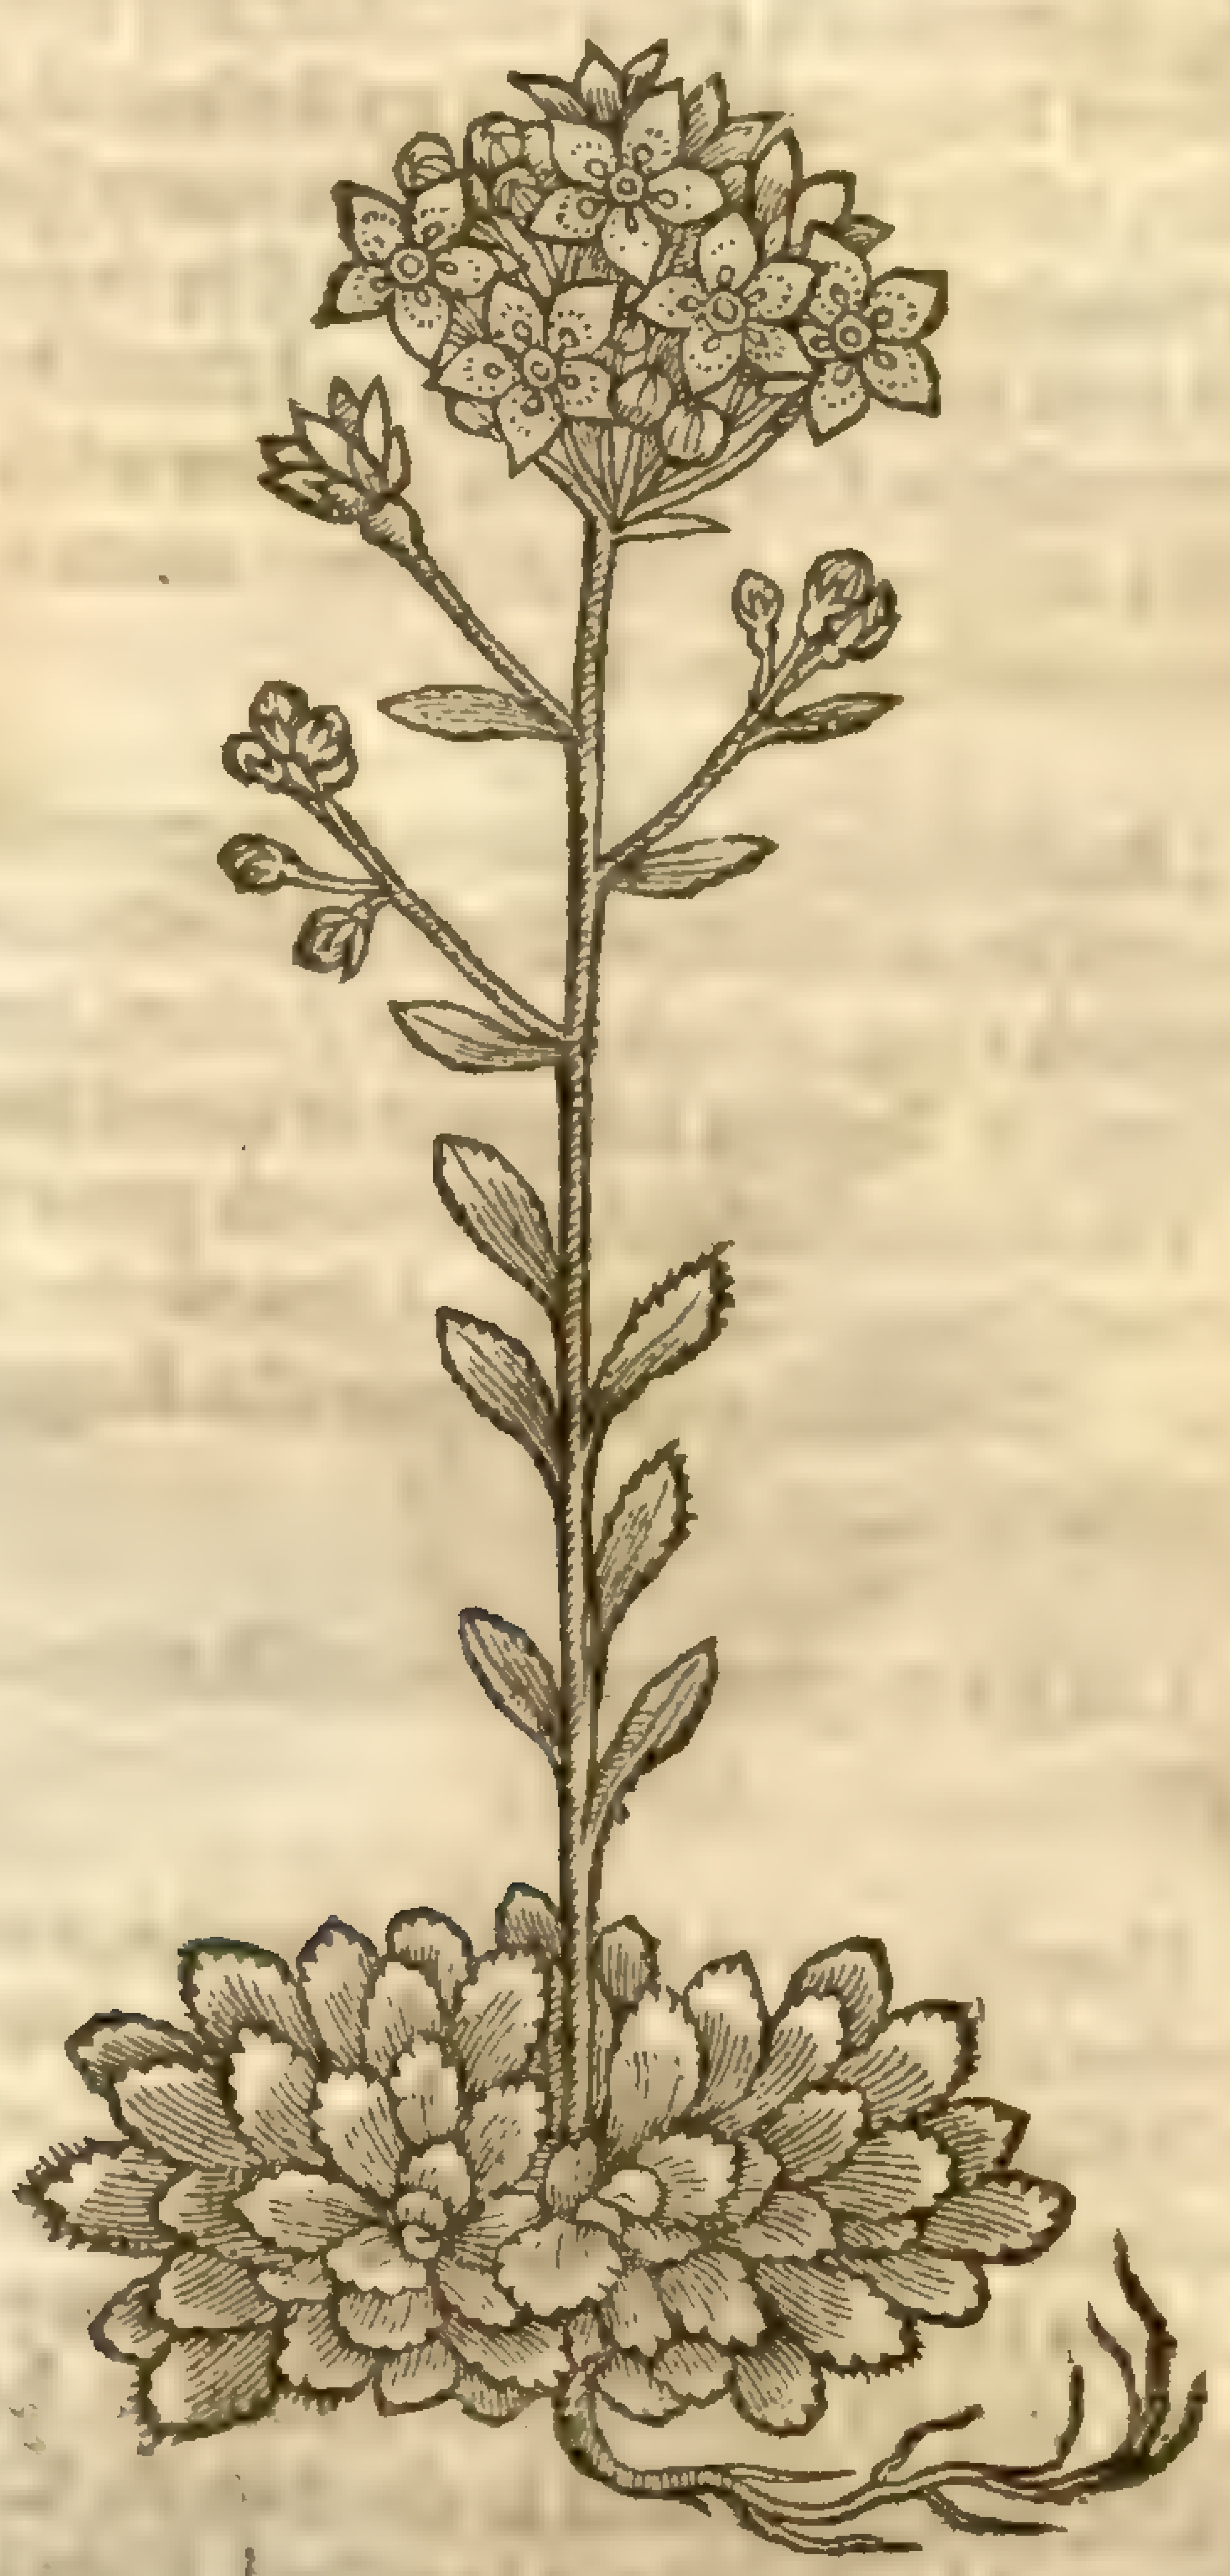
5 There is a kinde of Nauelwoort that groweth in watery places, which is called of the huſbandman Sheeps bane, becauſe it killeth ſheepe that do eat thereof: it is not much vnlike the precedent, but the round edges of the leaues are not ſo euen as the other; and this creepeth vpon the ground, and the other vpon the ſtone walls.

‡ 6 Becauſe ſome in Italy haue vſed this for *Vmbilicus Veneris*, and otherſome haue ſo called it, I thought it not amiſſe to follow *Matthiolus*, and giue you the hiſtory thereof in this place, rather than to omit it, or giue it in another which may be perhaps as vnfit, for indeed I cannot fitly ranke it

3 *Vmbilicus Veneris minor.*
Small Nauelwoort.

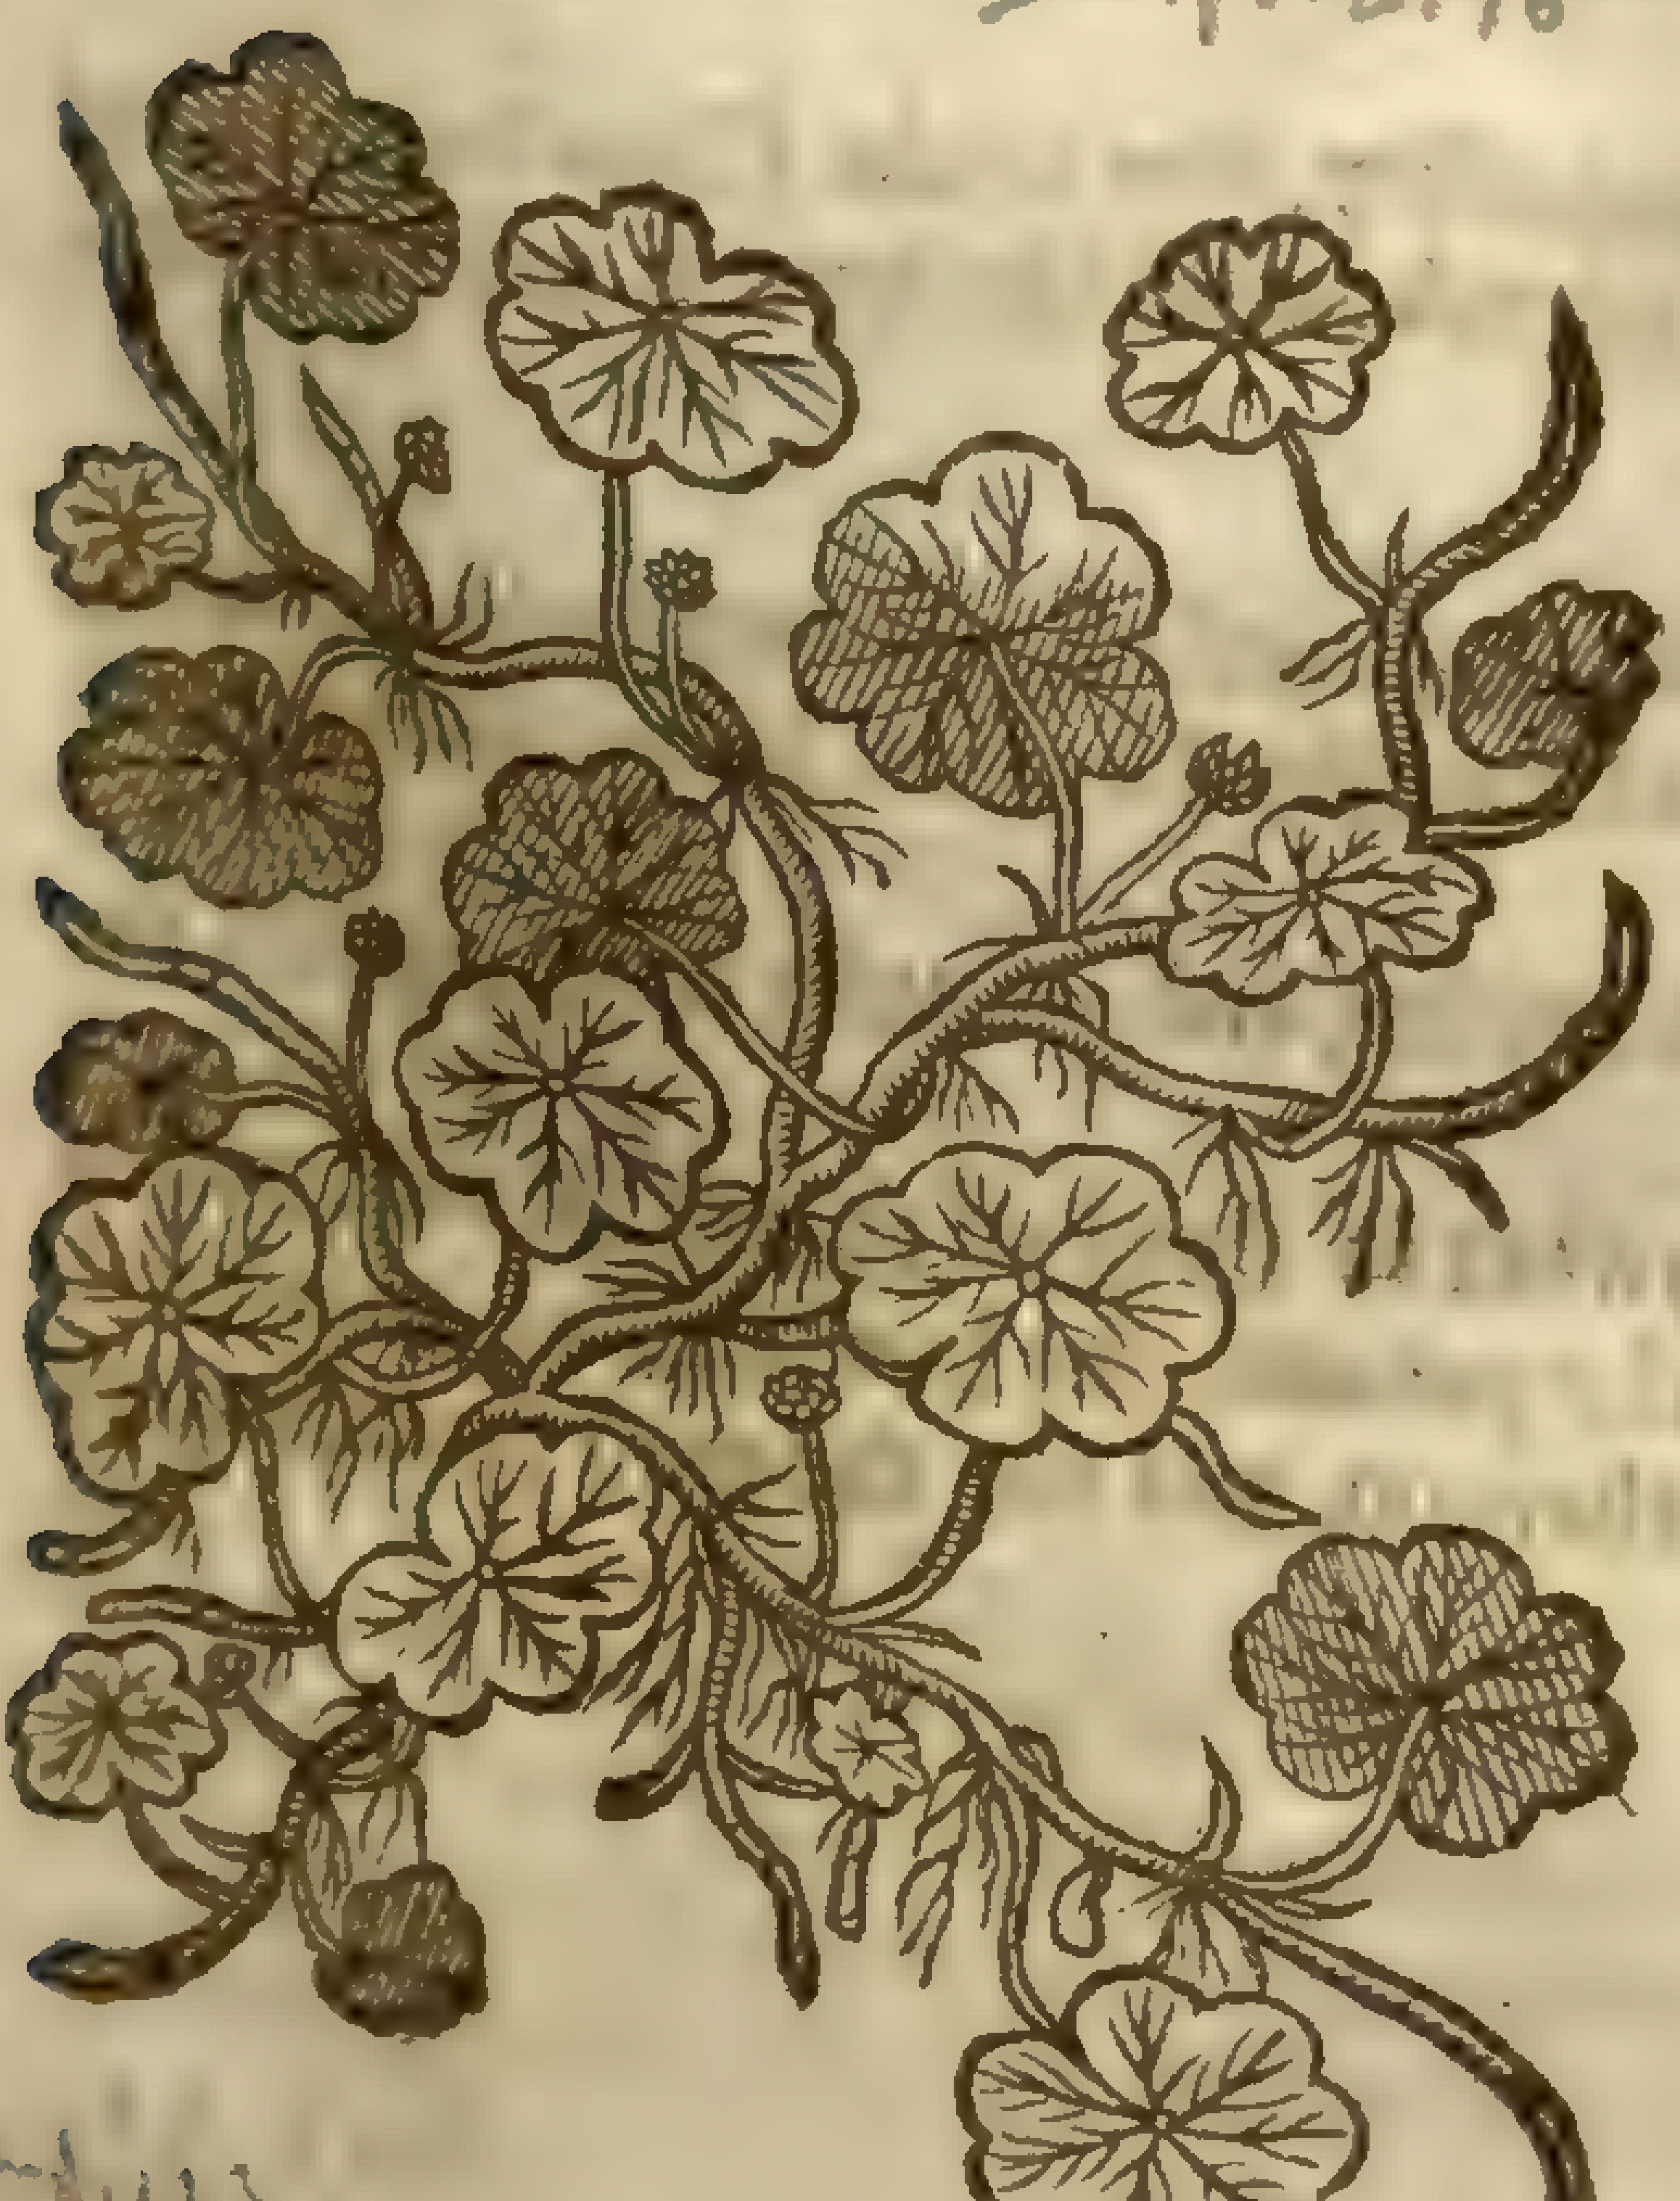


‡ 4 *Cotyledon minor montana altera.*
The other ſmall mountaine Nauelwoort.



5 *Cotyledon paluſtris.*
Water Penniwoort.

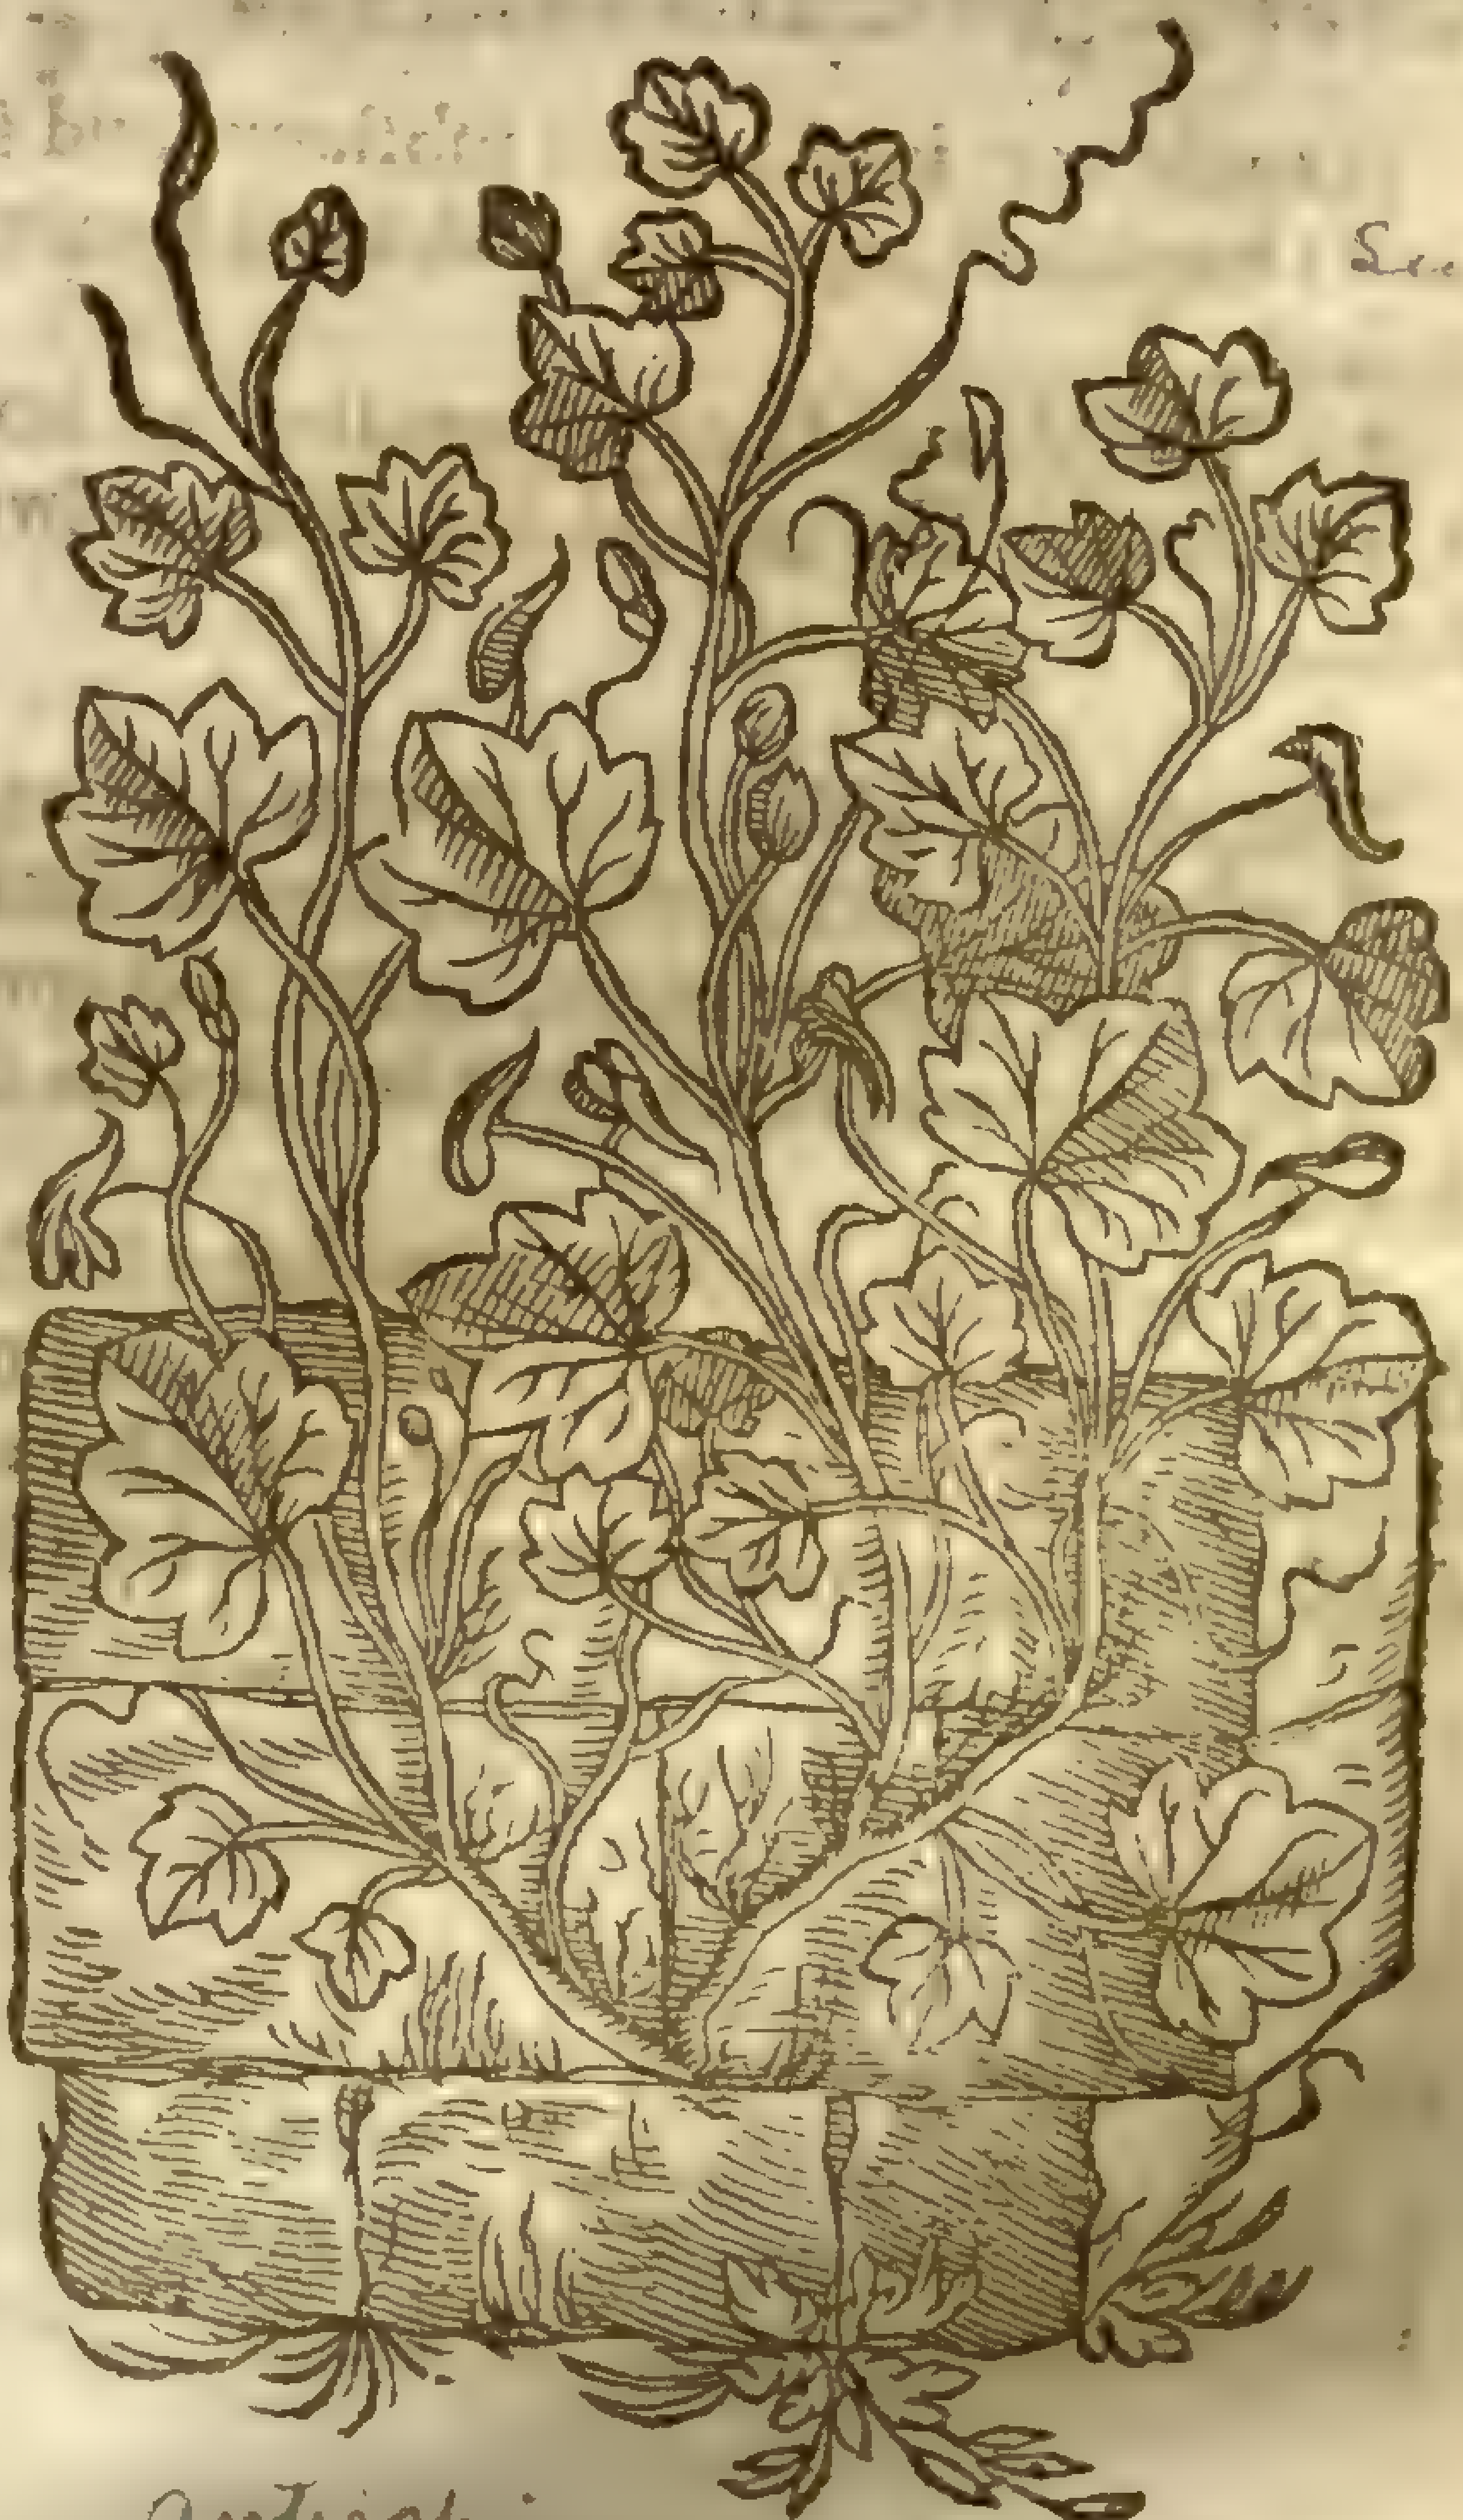
Hydrocotyle vulgaris. b
Sim. Fl. 2.96



Ad. 133

‡ 6 *Cymbalaria Italica.*
Italian Baſtard Nauelwoort.

See Lob. ic. 615



Antirrhinum

it with any other plant. *Bauhine* ſets it betweene *Hedera Terreſtris*, and *Naſturtium Indicum*: and *Columna* refers it to the *Linaria's*, but I muſt confeſſe I cannot referre it to any; wherefore I thinke it as proper to giue it here as in any other place. The branches of this are many, long, ſlender, and creeping, vpon which grow without any certaine order many little ſmooth thicke leaues faſhioned like thoſe of Ivie, and faſtened to ſtalkes of ſome inch long: and together with theſe ſtalkes come forth others of the ſame length, that carry ſpur-faſhioned floures, of the ſhape and bigneſſe of thoſe of the female Fluellen: their out ſide is purple, their inſide blew, with a ſpot of yellow in the opening. The root is ſmall, creeping and threddy. It floures toward the end of Summer, and growes wilde vpon walls in Italy, but in gardens with vs. *Matthiolus* calls it *Cymbalaria* (to which *Lobel* addes) *Italica Hederacio folio*: *Lonicerus* termes it *Vmbilicus Veneris Officinarum*: and laſtly *Columna* calls it *Linaria hederæ folio*. ‡

¶ *The Place.*

The firſt kind of Penniwoort groweth plentifully in Northampton vpon euery ſtone wall about the towne, at Briſtow, Bathe, Wells, and moſt places of the Weſt countrie vpon ſtone walls. It groweth vpon Weſtminſter Abbey, ouer the doore that leadeth from *Chaucers* tombe to the old palace. ‡ In this laſt place it is not now to be found. ‡

The ſecond, third, and fourth grow vpon the Alpes neere Piedmont, and Bauier, and vpon the mountaines of Germany: I found the third growing vpon Bieſton Caſtle in Cheſhire.

‡ The fifth growes vpon the Bogges vpon Hampſtead Heath, and many ſuch rotten grounds in other places. ‡

¶ *The Time.*

They are greene and flouriſh eſpecially in Winter: They floure alſo in the beginning of Summer.

¶ *The Names.*

Nauelwoort is called in Greeke, κοτυληδὼν: in Latine, *Vmbilicus Veneris*, and *Acetabulum*: of diuers, *Herba Coxendicum*: *Iacobus Manlius* nameth it, *Scatum Cœli*, and *Scatellum*: in Dutch, Nauelcruyt: in Italian, *Cupertoiule*: in French, *Eſcuelles*: in Spaniſh, *Capadella*: of ſome, *Hortus Veneris*, or Venus garden, and *Terræ vmbilicus*, or the Nauel of the earth: in Engliſh, Penniwoort, Wall-Penniwoort, Ladies Nauell, Hipwoort and Kidney-woort.

Water Penniwoort is called in Latine, *Cotyledon paluſtris*: in Engliſh, Sheepe-killing Pennigraſſe, Penny-rot, and in the North Countrey, White-rot: for there is alſo Red-rot, which is *Ros ſolis*: in Northfolke it is called, Flowkwoort. ‡ *Columna* and *Bauhine* fitly refer this to the *Ranunculi*, or Crowfeet; for it hath no affinitie at all with the Cotyledons (but onely in the roundneſſe of the leafe) the former of them calls it, *Ranunculus aquaticus vmbilicato folio*, and the later, *Ranunculus aquat. Cotyledonis folio*. ‡

¶ *The Temperature.*

Nauelwoort is of a moiſt ſubſtance and ſomewhat cold, and of a certaine obſcure binding qualitie: it cooleth, repelleth, or driueth backe, ſcoureth and conſumeth, or waſteth away, as *Galen* teſtifieth.

‡ The Water Pennywoort is of an hot and vlcerating quality, like to the Crowfeet, whereof it is a kinde. The baſtard Italian Nauelwoort ſeemes to partake with the true in cold and moiſture. ‡

¶ *The Vertues.*

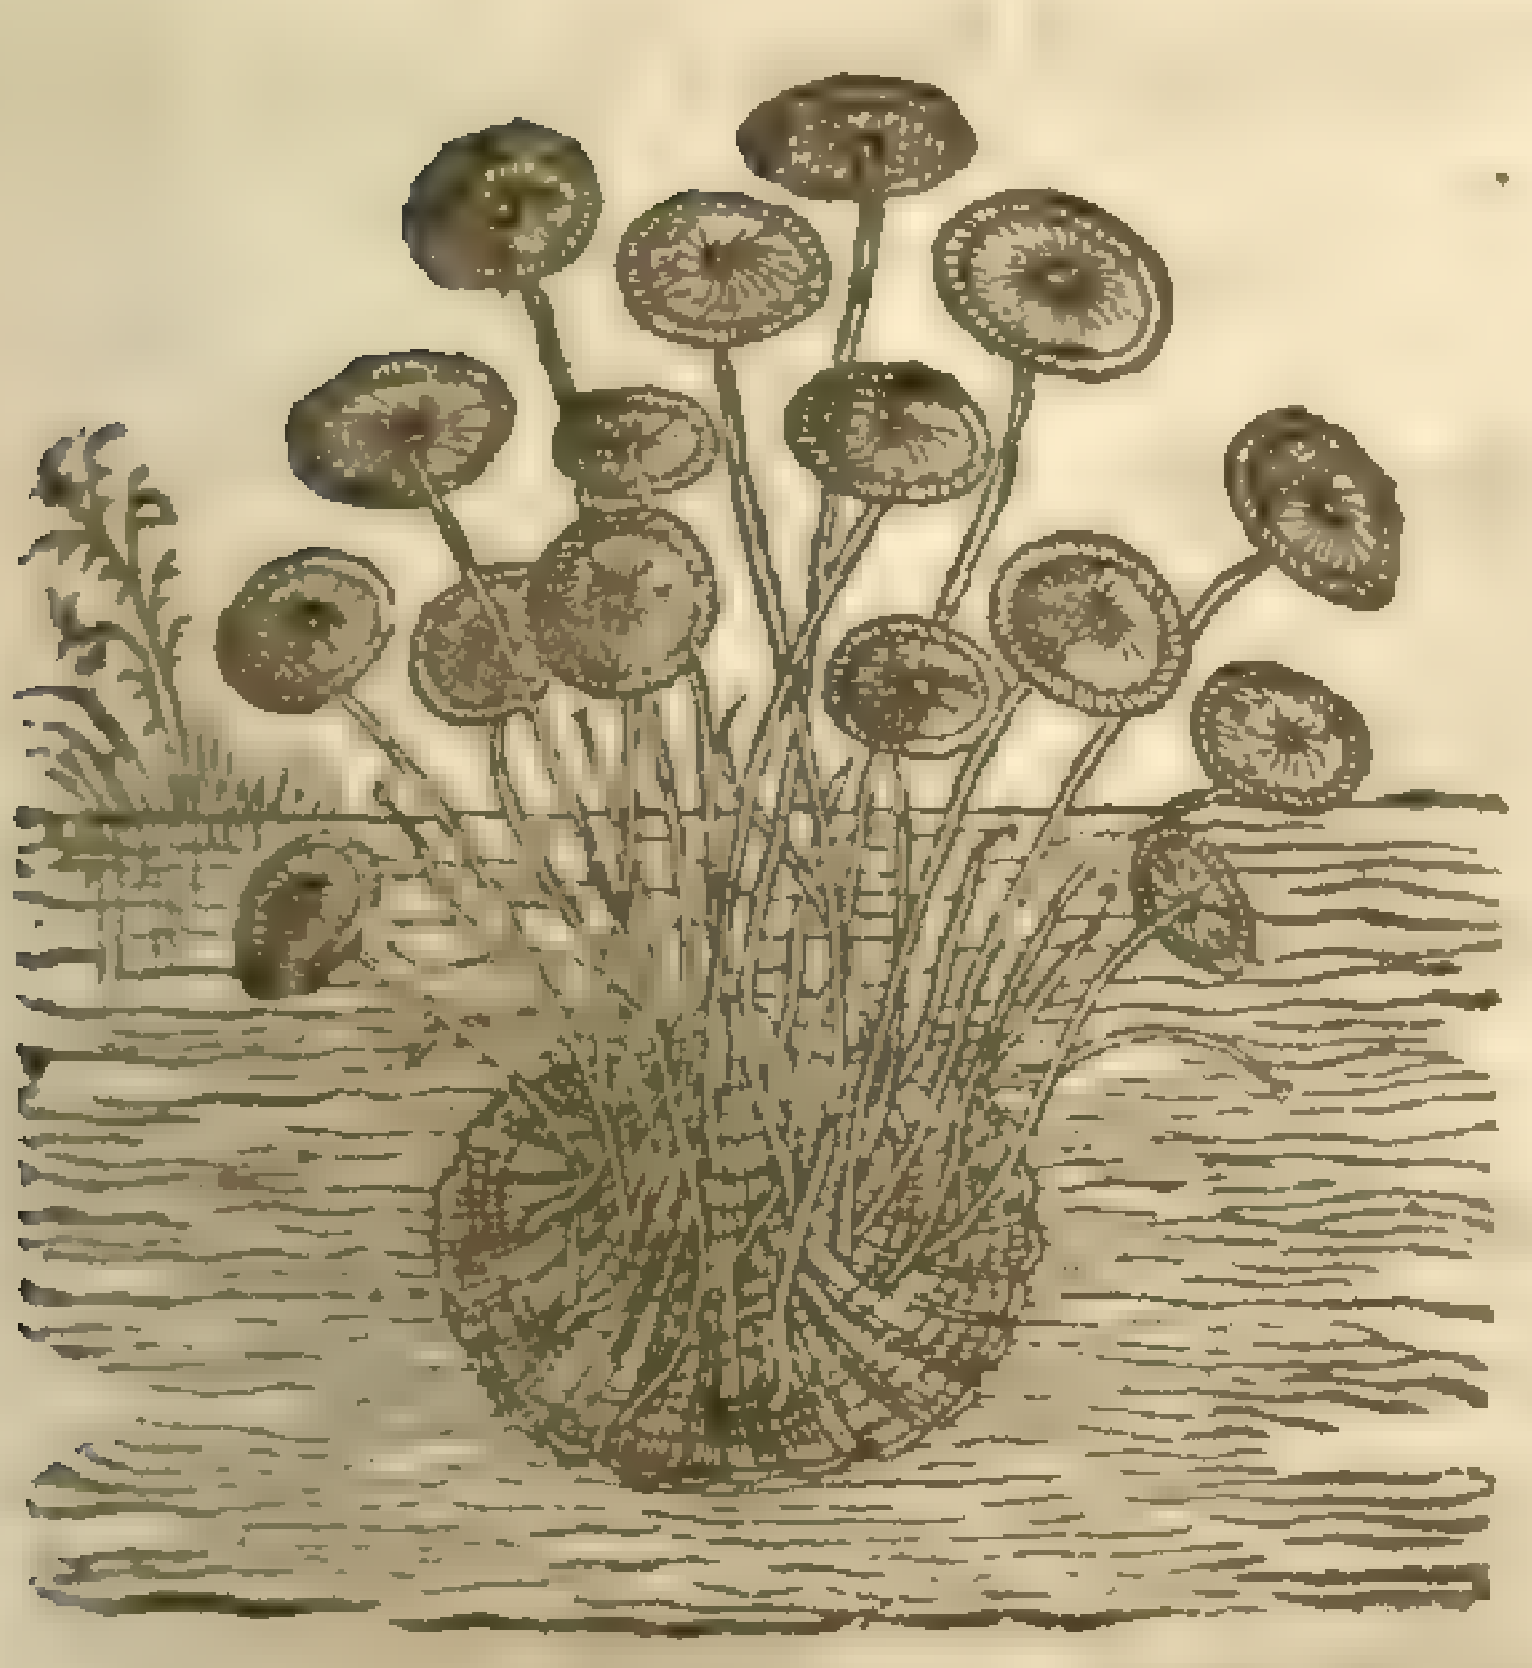
A The juyce of Wall Pennywoort is a ſingular remedy againſt all inflammations and hot tumors, as Eryſipelas, Saint Anthonies fire and ſuch like: and is good for kibed heeles, being bathed therewith, and one or more of the leaues laid vpon the heele.

B The leaues and roots eaten doe breake the ſtone, prouoke vrine, and preuaile much againſt the dropſie.

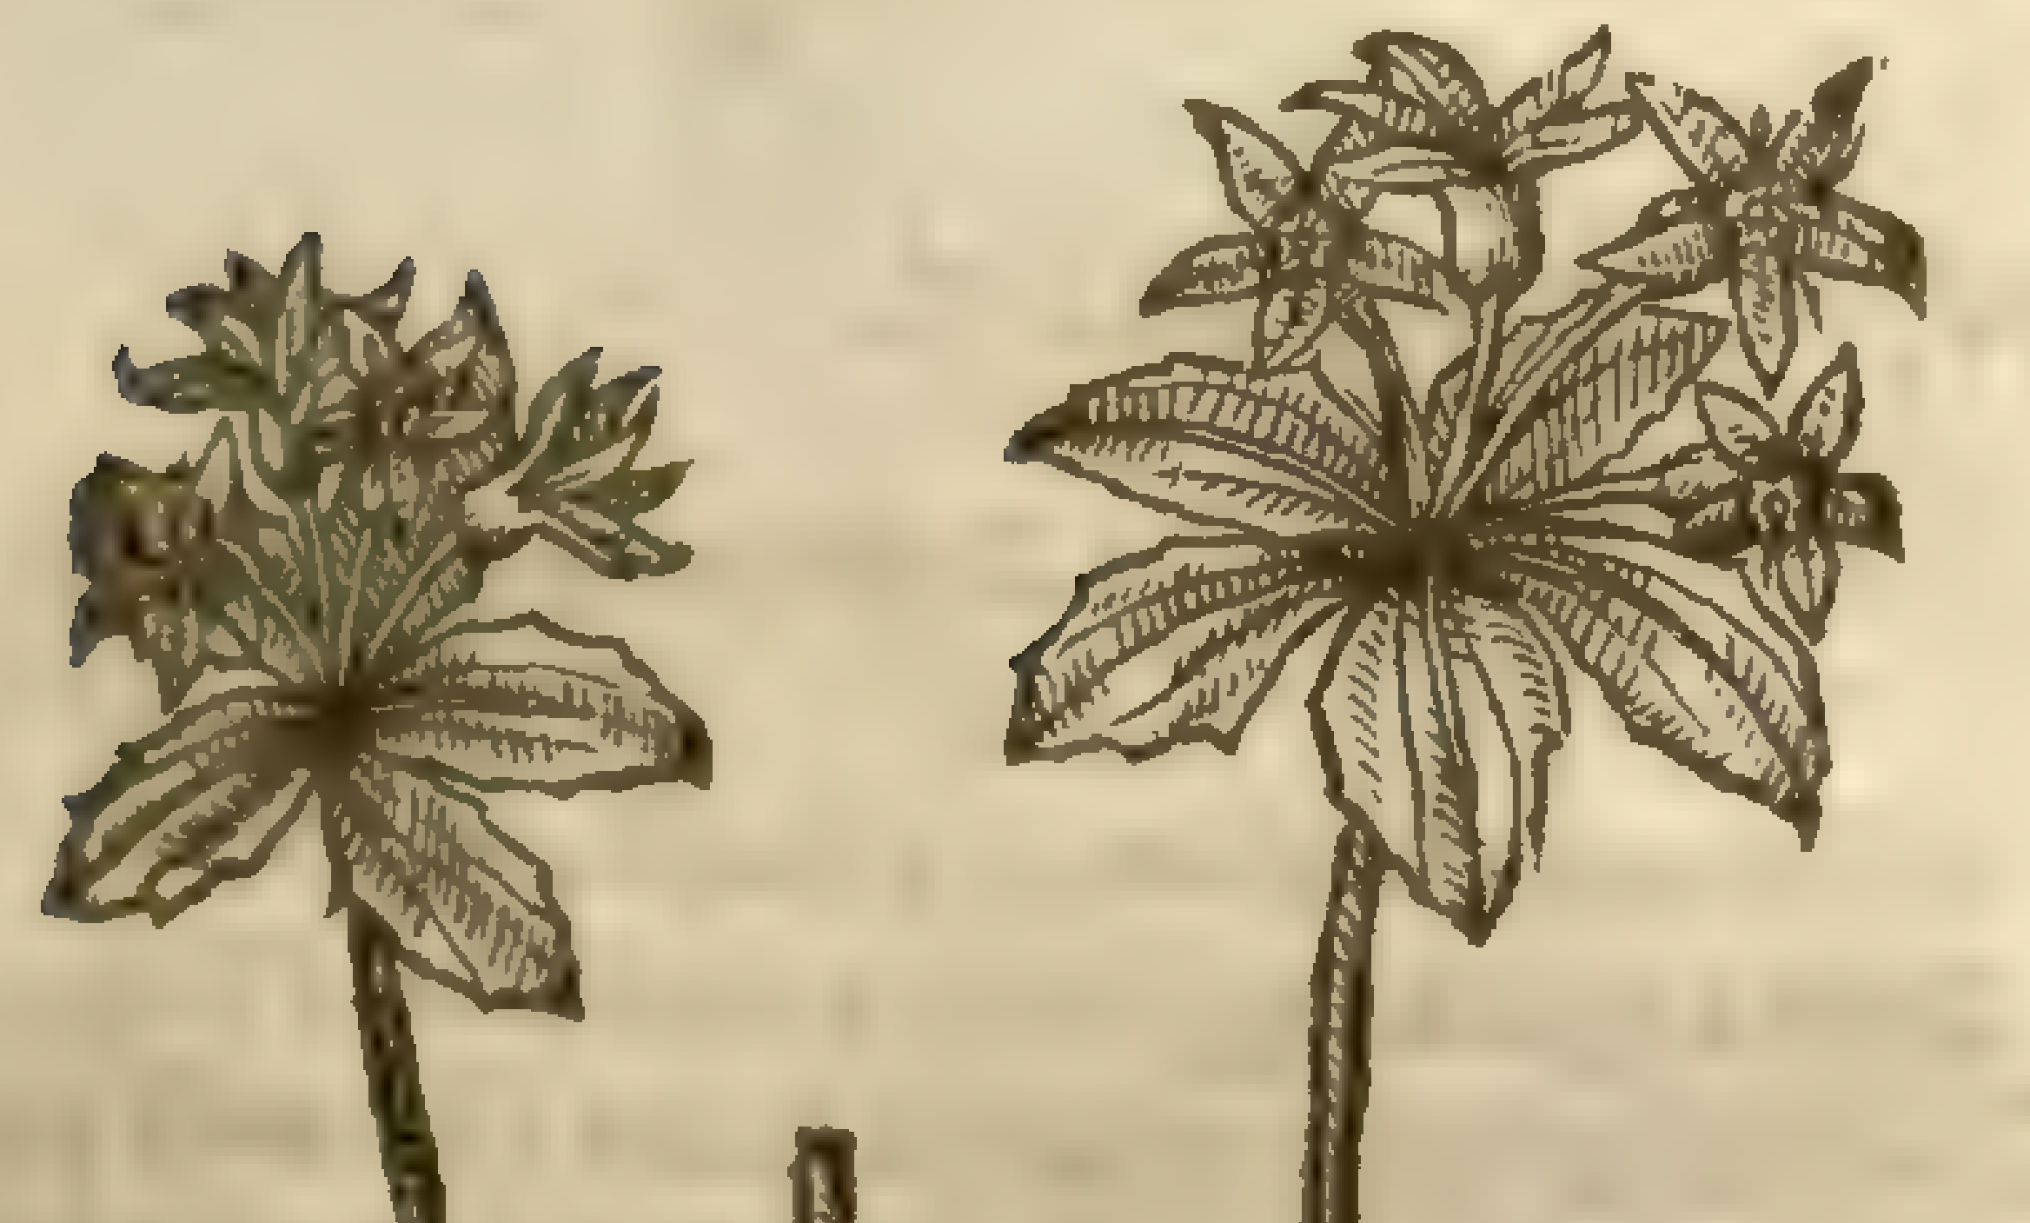
C The ignorant Apothecaries doe vſe the Water Pennywort in ſtead of this of the wall, which they cannot doe without great error, and much danger to the patient: for husbandmen know well, that it is noiſome vnto Sheepe, and other cattell that feed thereon, and for the moſt part bringeth death vnto them, much more to men by a ſtronger reaſon.

CHAP. 152. *Of Sea Pennywoort.*

1 *Androſace Matthioli.*
Sea Nauel-woort.



2 *Androſace annua ſpuria.*
One Sommers Nauell-woort.



¶ *The Deſcription.*

1 THe Sea Nauel-woort hath many round thicke leaues like vnto little ſaucers, ſet vpon ſmall and tender ſtalks, bright, ſhining, and ſmooth, of two inches long, for the moſt part growing vpon the furrowed ſhells of cockles or the like, euery ſmall ſtem bearing vpon the end or point, one little buckler and no more, reſembling a nauell: the ſtalke and leafe ſet together in the middle of the ſame. Whereupon the Herbariſts of Montpelier haue called it *Vmbilicus Marinus*, or ſea Nauell. The leaues and ſtalkes of this plant, whileſt they are yet in the water, are of a pale aſh colour, but being taken forth, they preſently wax white, as Sea Moſſe, called *Corallina*, or the ſhell of a Cockle. It is thought to be barren of ſeed, and is in taſte ſaltiſh.

2 The ſecond *Androſace* hath little ſmooth leaues, ſpred vpon the ground like vnto the leaues of ſmall Chickweed or Henbit, whereof doubtles it is a kind: among which riſeth vp a ſlender ſtem, hauing at the top certaine little chaffie floures of a purpliſh colour. The ſeed is contained in ſmall ſcaly husks, of a reddiſh colour, and a bitter taſte. The whole plant periſheth when it hath perfected his ſeed, and muſt be ſowne againe the next yere: which plant was giuen to *Matthiolus* by *Cortuſus*, who (as he affirmeth) receiued it from Syria; but I thinke hee ſaid ſo to make *Matthiolus* more joyfull: but ſurely I ſurmiſe hee picked it out of one old wal or other, where it doth grow euen as the ſmall Chickweed, or Nailewoort of the wall do.

‡ The figure that was here was that vnperfect one of *Matthiolus*; and the deſcription of our Author was framed by it, vnleſſe the laſt part thereof, which was taken out of the *Aduerſaria pag.* 166. to amend both theſe, wee here preſent you with the true figure and deſcription, taken out of the workes of the iudicious and painefull Herbariſt *Carolus Cluſius*. It hath (ſaith hee) many leaues lying flat vpon the ground, like to thoſe of Plantaine, but leſſer, and of a pale greene colour, and toothed about the edges, ſoft alſo and juycie, and of ſomewhat a biting taſte. Amongſt theſe leaues riſe vp fiue or ſix ſtalkes of an handfull high, commonly of a greene, yet ſometimes of a purple colour, naked and ſomwhat hairy, which at their tops carry in a circle fiue roundiſh leaues alſo a little toothed and hairy; from the midſt of which ariſe fiue or more foot-ſtalkes, each bearing a greeniſh rough or hairie cup parted alſo into fiue little leaues or jags, in the midſt of which ſtands a little white floure parted alſo into fiue; after which ſucceed pretty large ſeed veſſels,

which containe an vnequall red ſeed like that of Primroſes, but bigger: the root is ſingle and ſlender, and dies as ſoone as the ſeed is perfected. It growes naturally in diuers places of Auſtria, and amongſt the corne about the Bathes of Baden; whereas it floures in Aprill, and ripens the ſeed in May and Iune. ‡

¶ *The Place.*

Androſace will not grow any where but in water: great ſtore of it is about Frontignan by Montpellier in Languedoc, where euery fiſher-man doth know it.

The ſecond groweth vpon old ſtone and mud walls: notwithſtanding I haue (the more to grace *Matthiolus* great jewell) planted it in my garden.

¶ *The Time.*

The baſtard *Androſace* floureth in Iuly, and the ſeed is ripe in Auguſt.

¶ *The Names.*

Androſace is of ſome called *Vmbilicus marinus*, or ſea Nauell.

‡ The ſecond is knowne and called by the name of *Androſace altera Matthioli.* ‡

¶ *The Temperature.*

The ſea Nauell is of a diureticke qualitie, and more dry than *Galen* thought it to be, and leſſe hot than others haue deemed it: there can no moiſture be found in it.

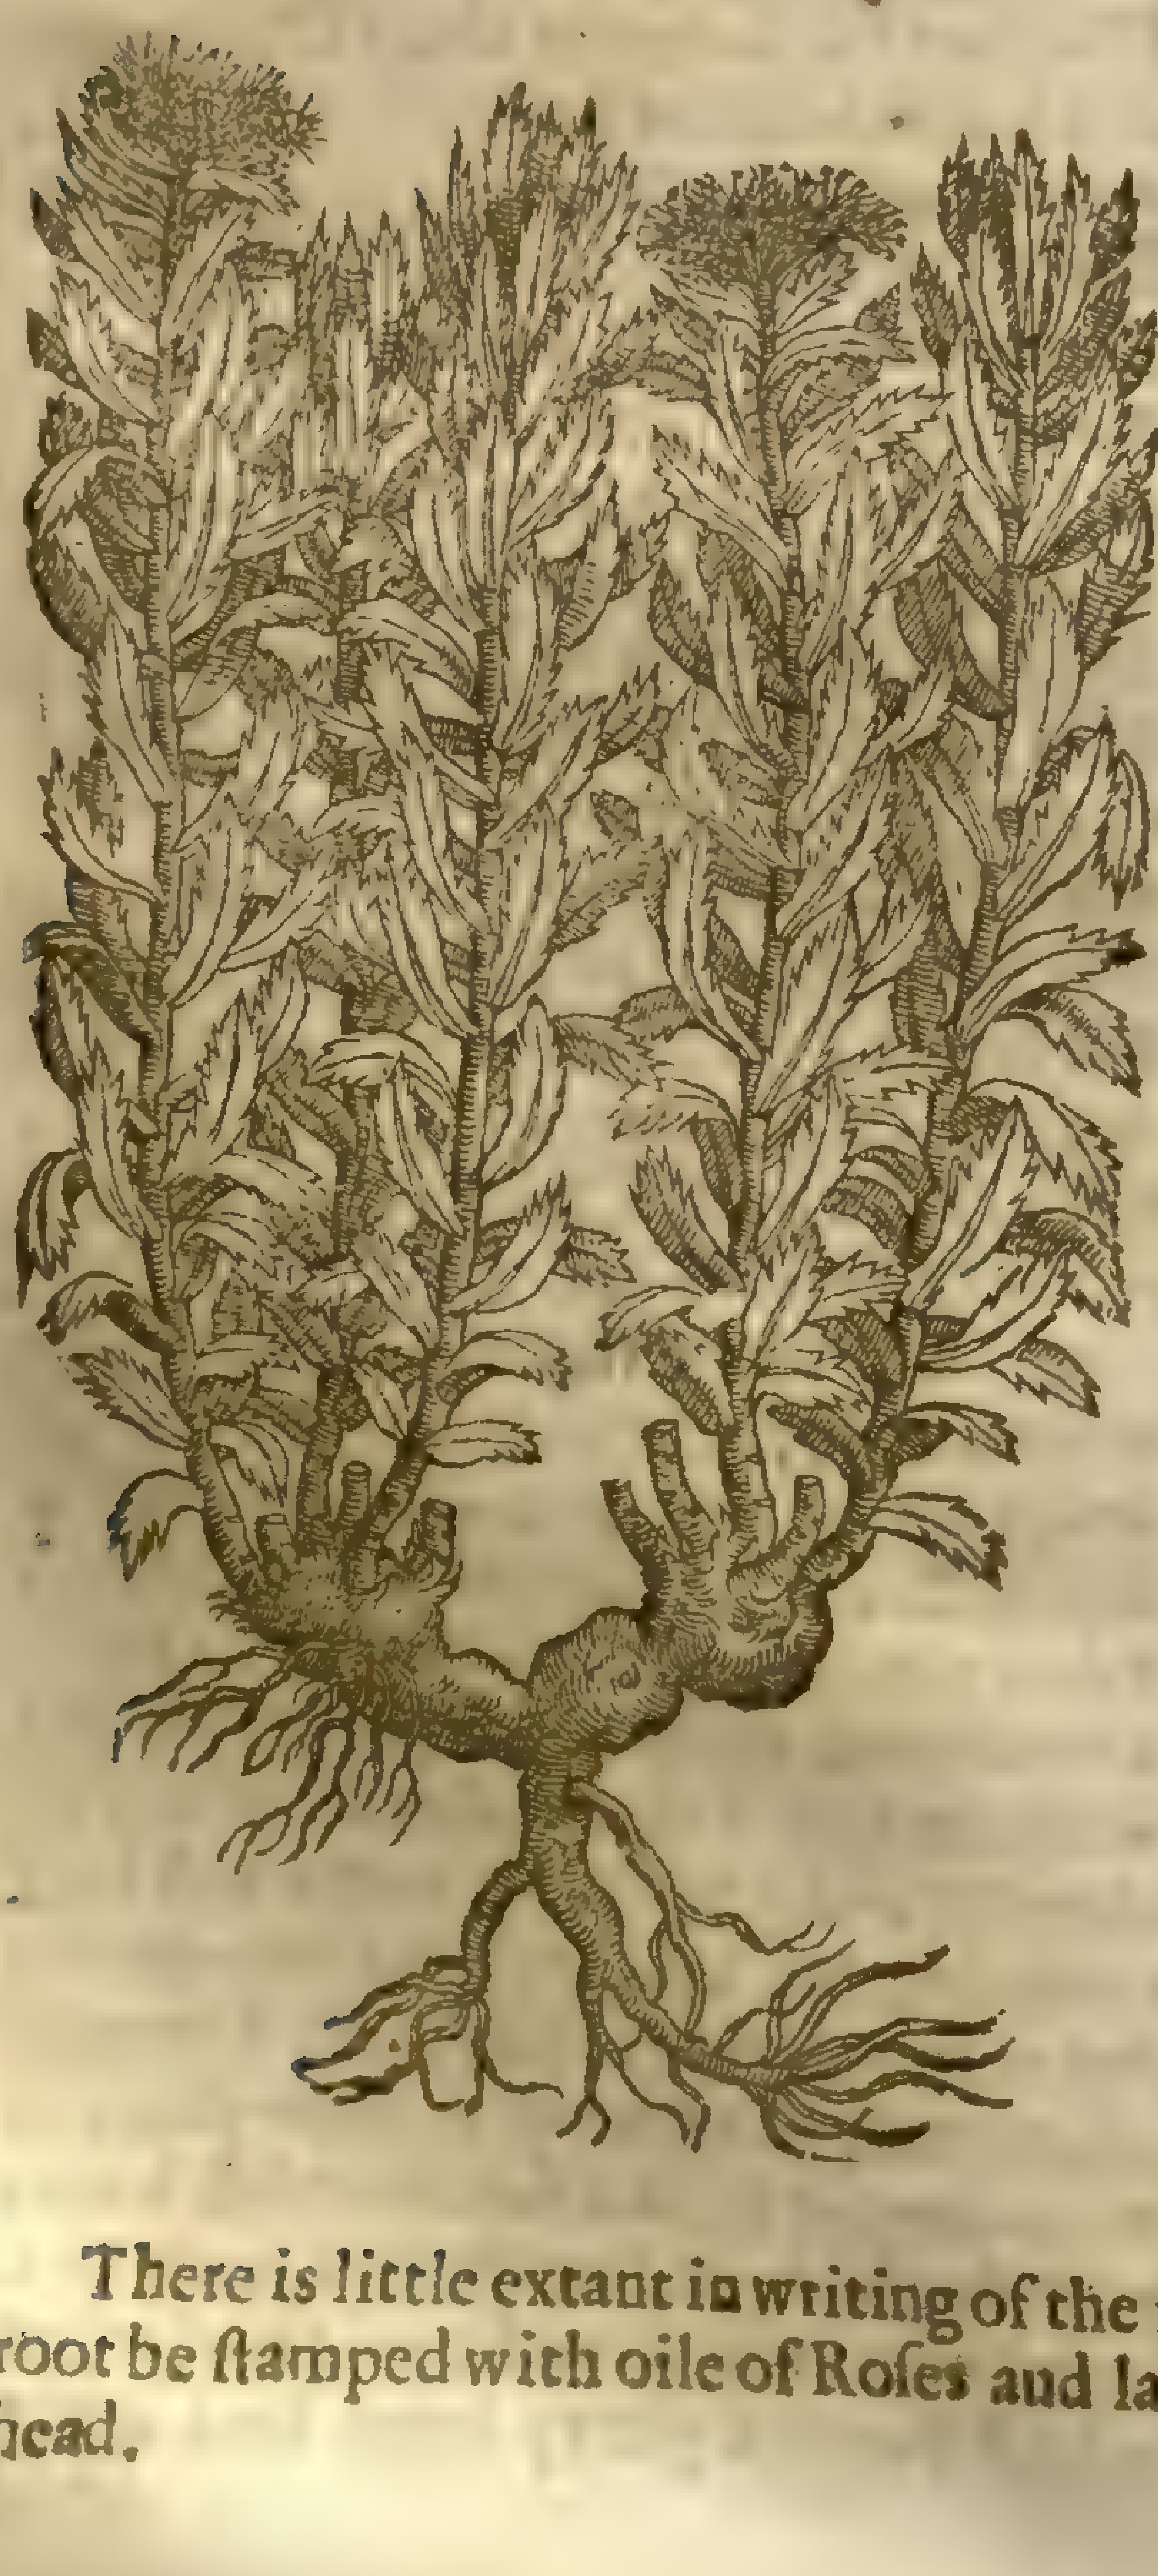
¶ *The Vertues.*

A Sea Nauel-woort prouoketh vrine, and digeſteth the filthineſſe and ſlimineſſe gathered in the joynts.

B Two drams of it, as *Dioſcorides* ſaith, drunke in wine, bring downe great ſtore of vrine out of their bodies that haue the dropſie, and it maketh a good plaiſter to eaſe the paine of the gout.

CHAP. 153. *Of Roſe-root, or Roſewoort.*

Rhodia Radix.
Rooſe-root.



Rhodiola rosea, [illegible] Sm. [illegible] 4. 246

¶ *The Deſcription.*

ROſewoort hath many ſmall, thicke, and fat ſtems, growing from a thicke and knobby root: the vpper end of it for the moſt part ſtandeth on the ground, and is there of a purpliſh colour, bunched & knobbed like the root of Orpin, with many hairy ſtrings hanging thereat, of a pleaſant ſmel when it is broken, like the damaske roſe, whereof it tooke his name. The leaues are ſet round about the ſtalks, euen from the bottome to the top, like thoſe of the field Orpin, but narrower, and more ſnipt about the edges. The floures grow at the top, of a faint yellow colour.

¶ *The Place.*

It groweth very plentifully in the North part of England, eſpecially in a place called Ingleborough Fels, neere vnto the brookes ſides, and not elſewhere that I can as yet finde out, from whence I haue had plants for my garden.

¶ *The Time.*

It floureth and flouriſheth in Iune, and the ſeed is ripe in Auguſt.

¶ *The Names.*

Some haue thought it hath taken the name *Rhodia* of the Iſland in the Mediterranean ſea, called Rhodes: but doubtleſſe it took his name *Rhodia radix*, of the root which ſmelleth like a roſe: in Engliſh, Roſe-root, and Roſe-woort.

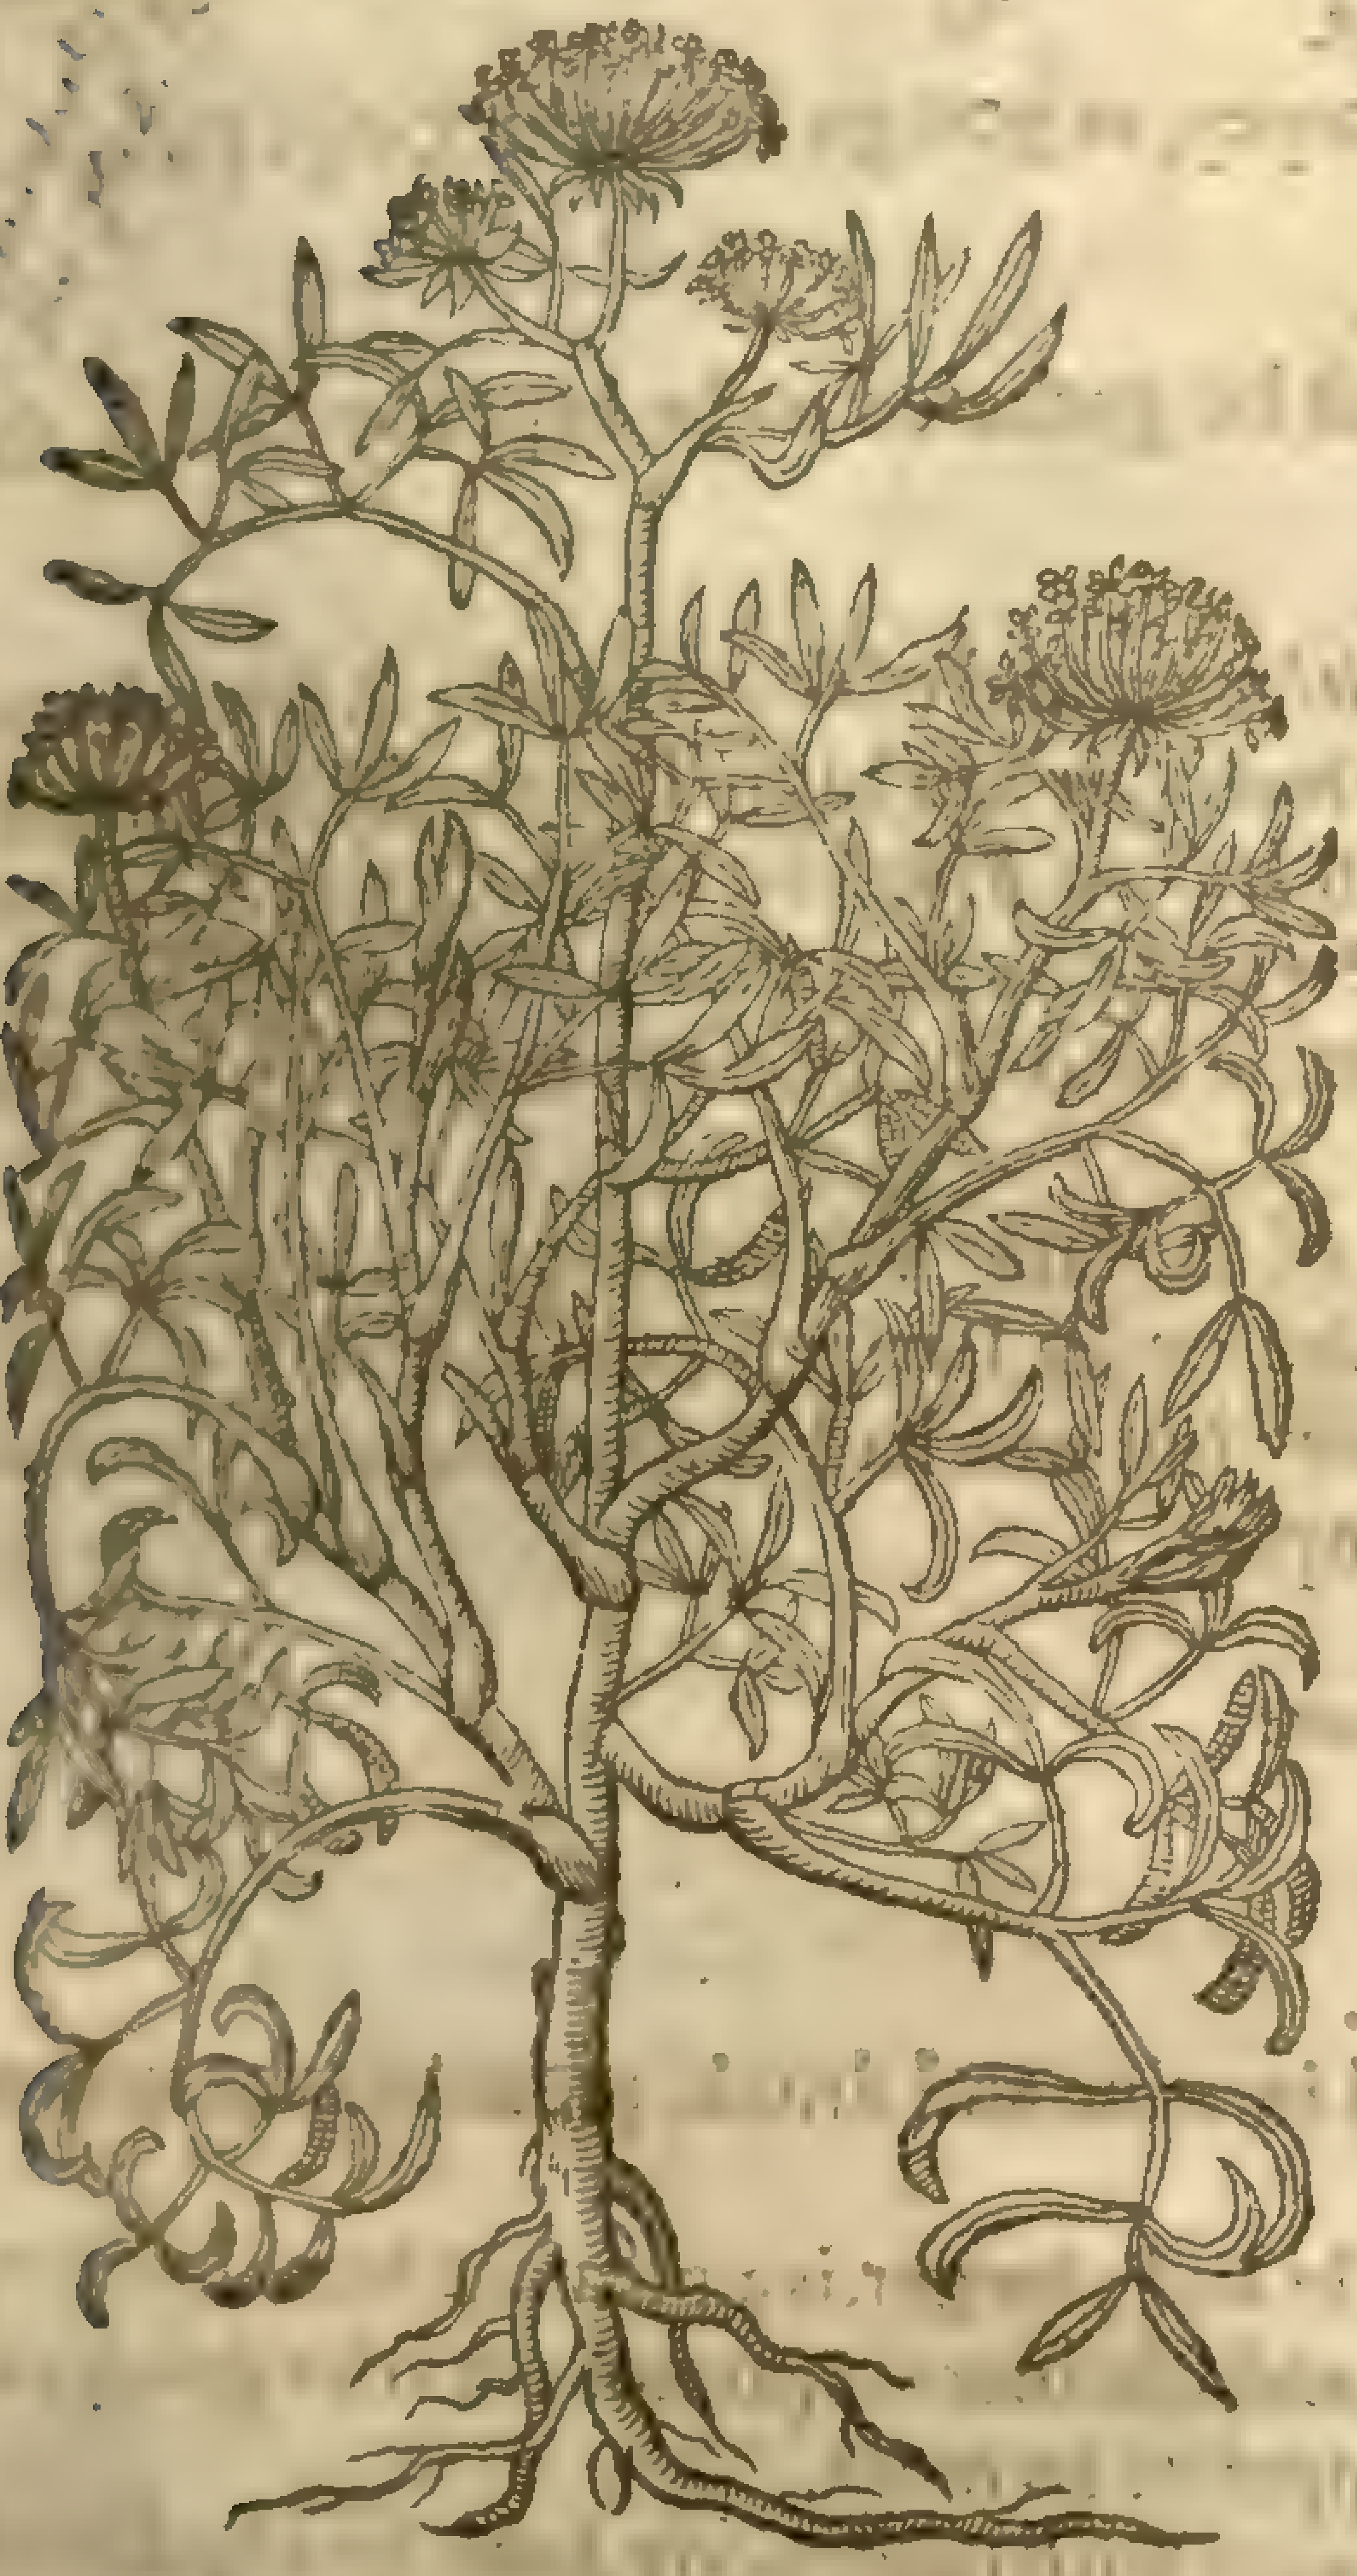
¶ *The Vertues.*

There is little extant in writing of the faculties of Roſewoort: but this I haue found, that if the root be ſtamped with oile of Roſes and laid to the temples of the head, it eaſeth the paine of the head.

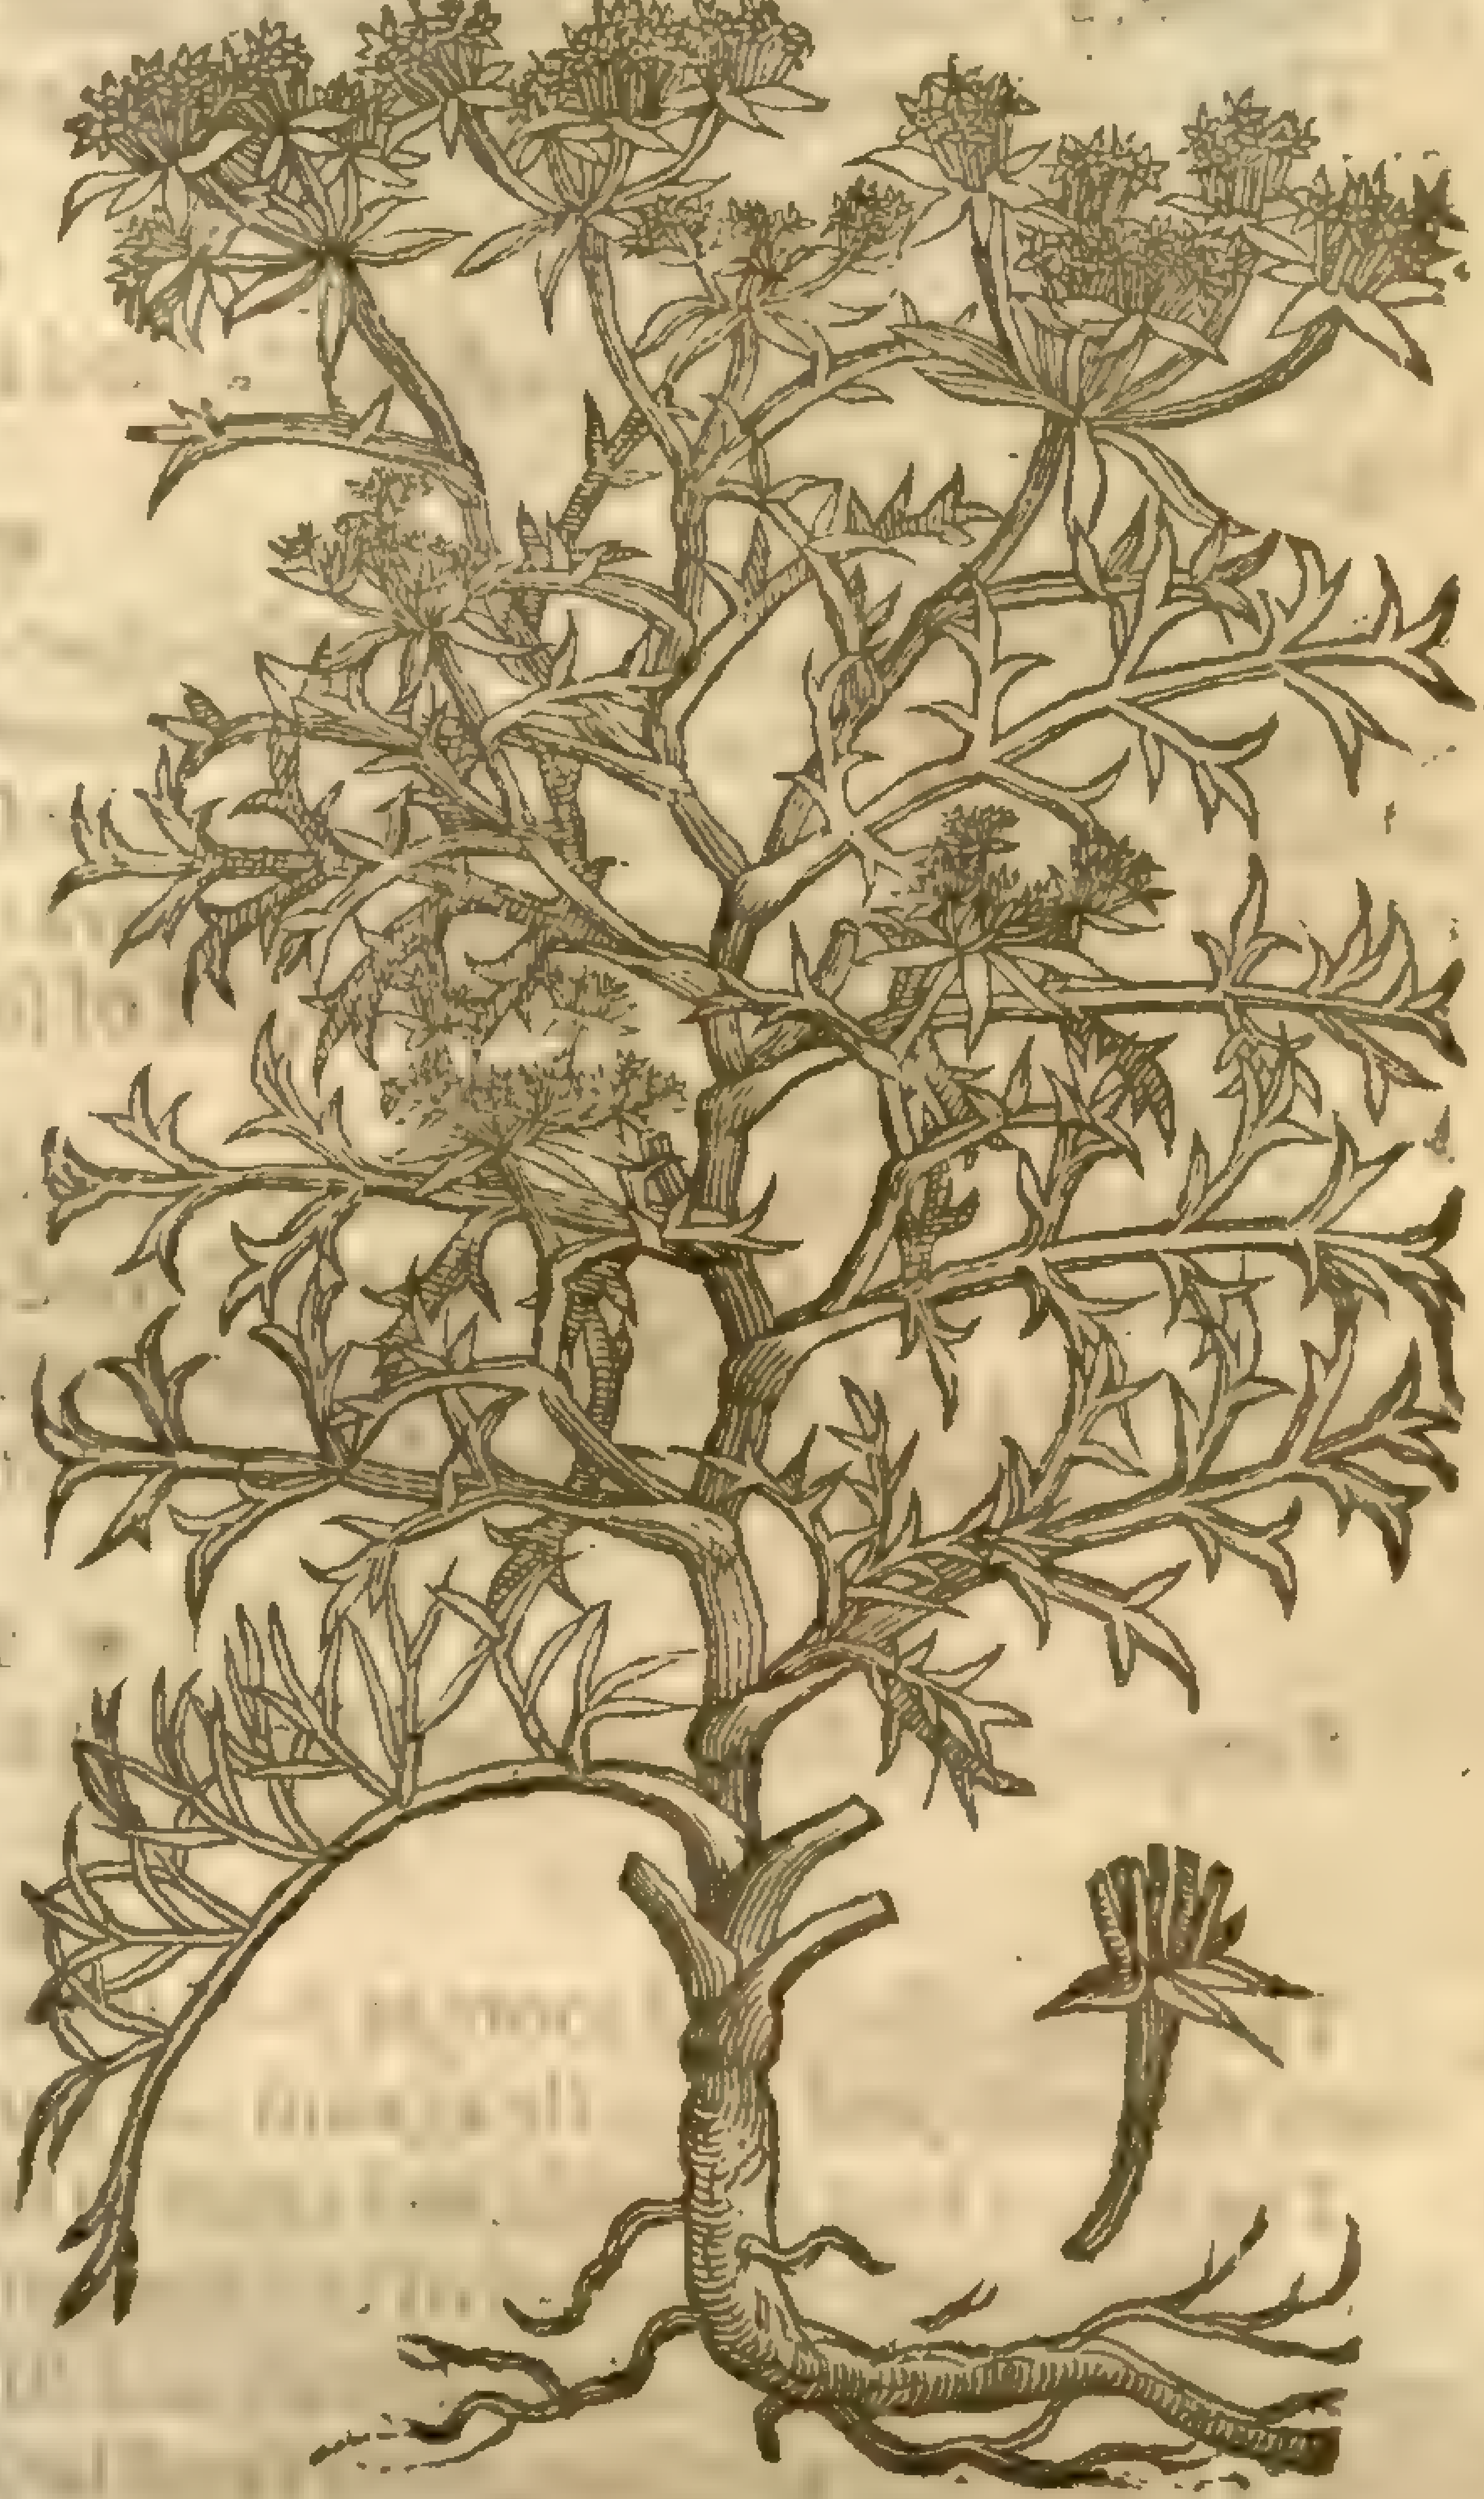
CHAP.

CHAP. 154. *Of Sampier.*

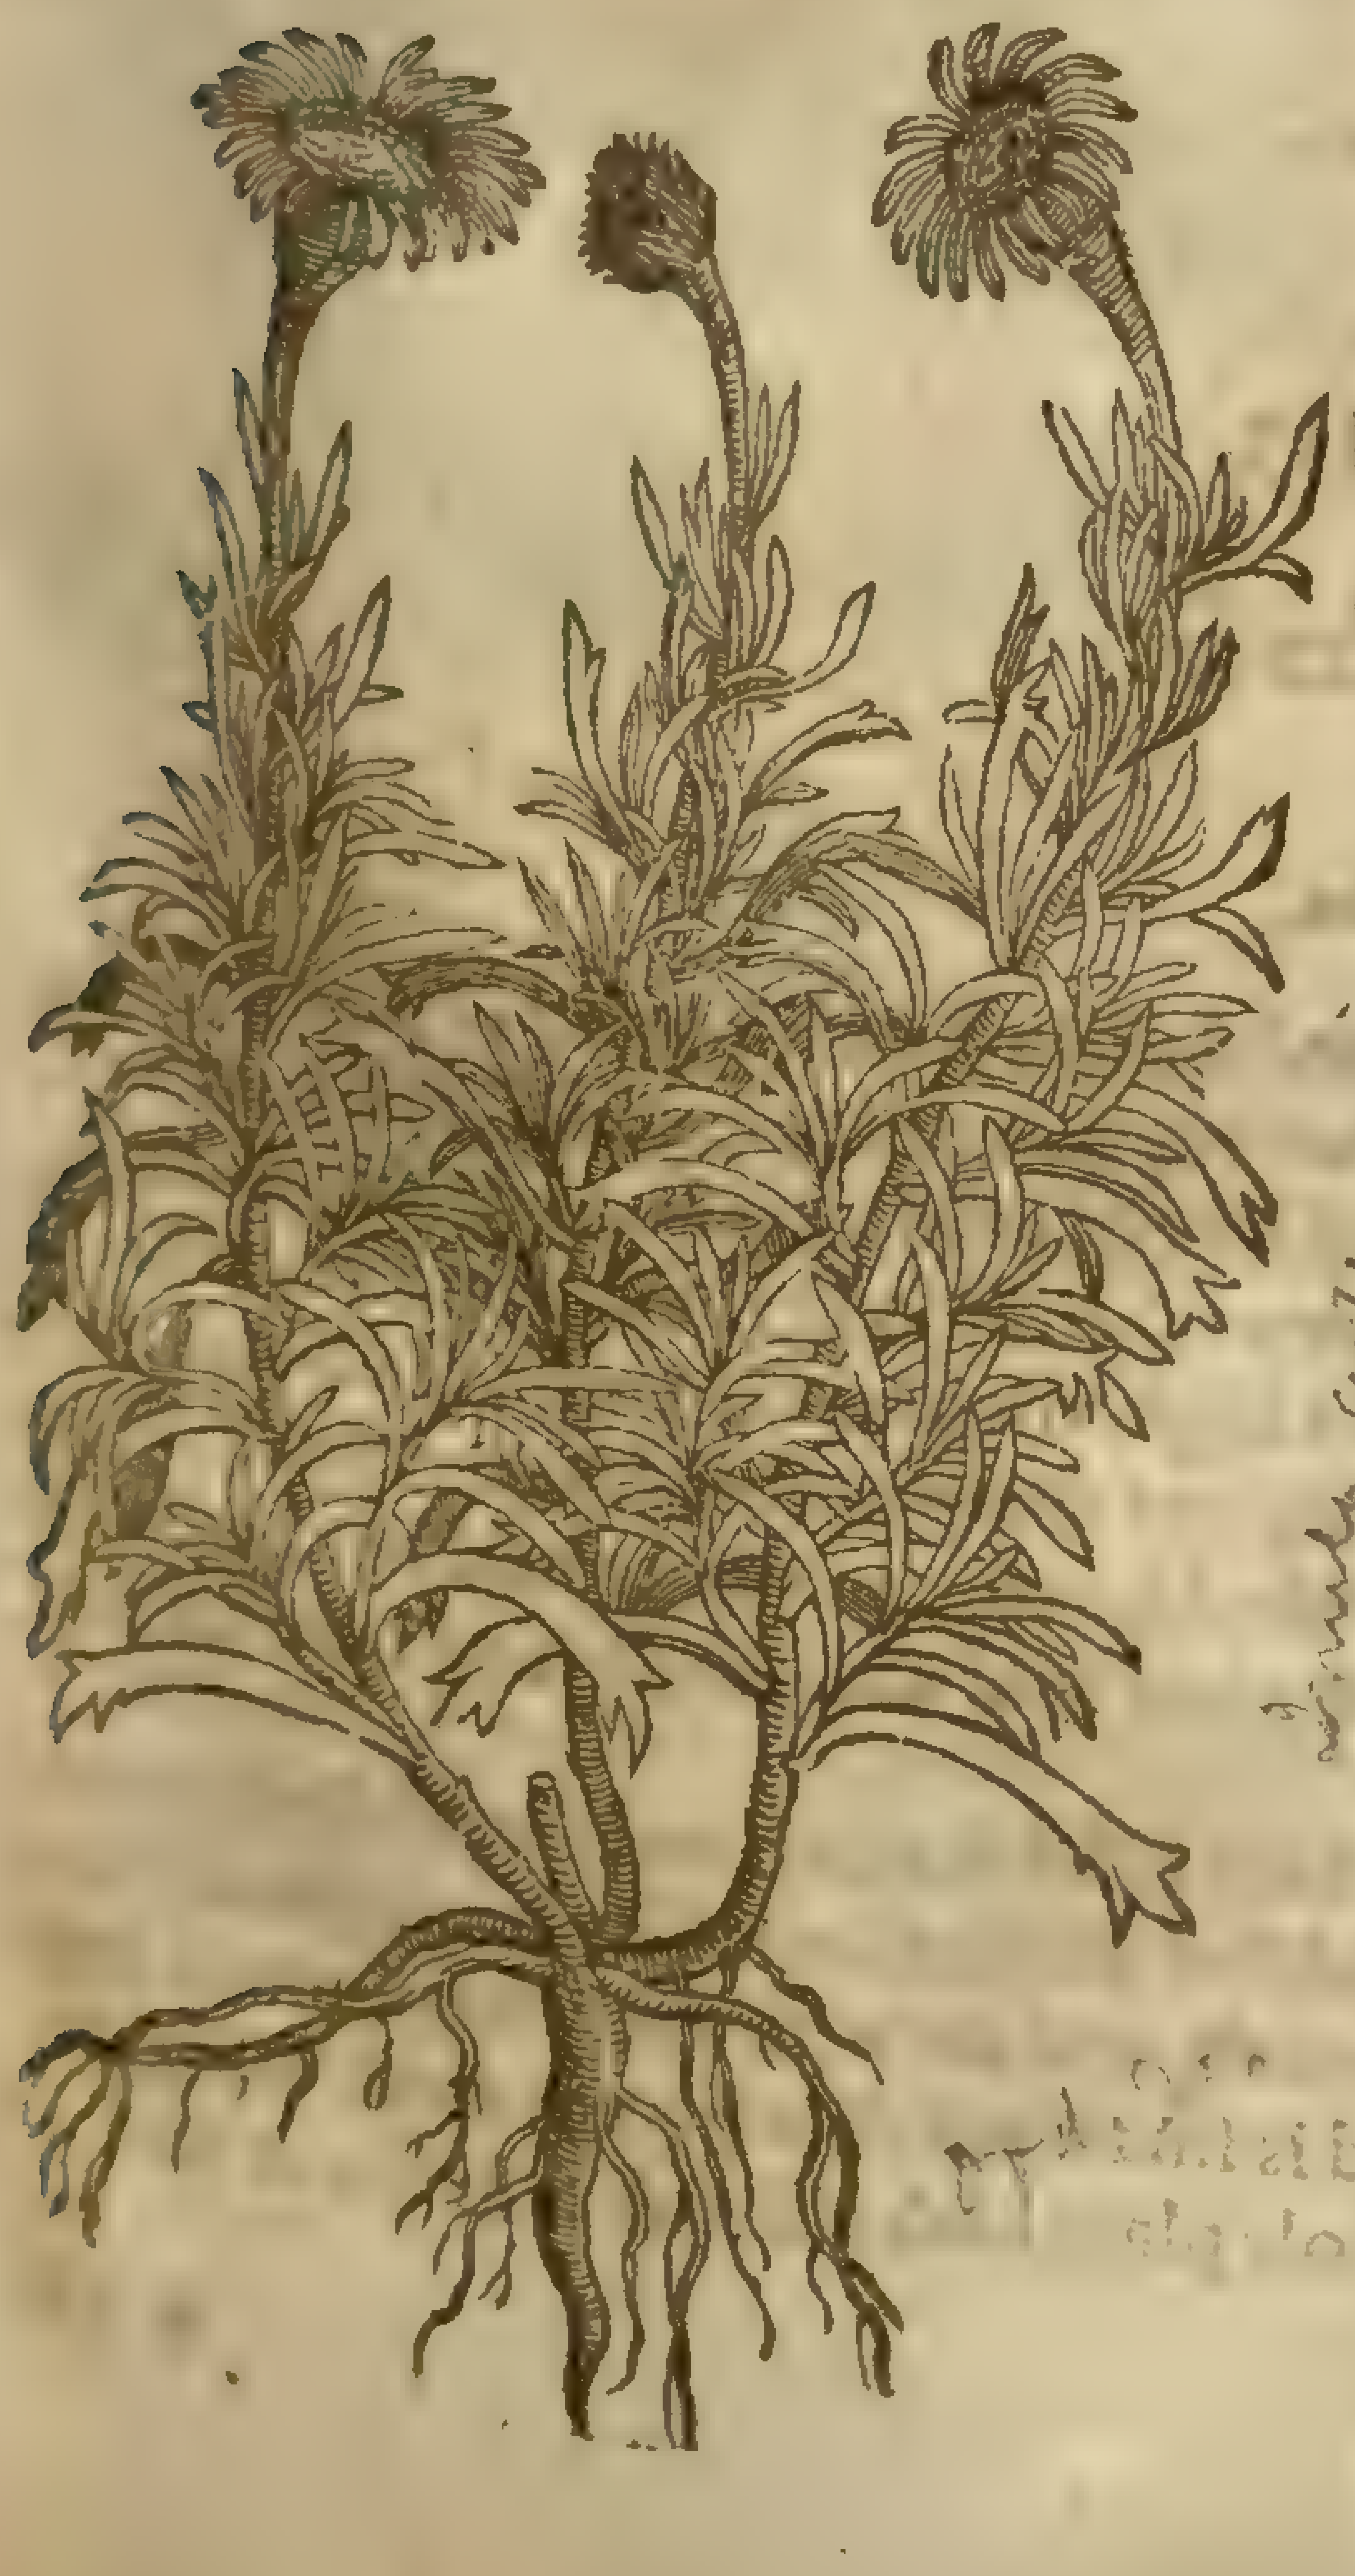
1 *Crithmum marinum.*
Rocke Sampier.



2 *Crithmum ſpinoſum.*
Thorny Sampier.



3 *Crithmum chryſanthemum.*
Golden Sampier.



Inula crithmoides [illegible]

¶ *The Deſcription.*

1 ROcke Sampier hath many fat and thicke leaues ſomwhat like thoſe of the leſſer Purſlane, of a ſpicie taſte,with a certain ſaltneſſe ; amongſt which riſes vp a ſtalk diuided into many ſmal ſpraies or ſprigs,on the top whereof grow ſpoky tufts of white floures , like the tufts of Fennell or Dill ; after that comes the ſeed, like the ſeed of Fenell,but greater : the root is thicke and knobby,beeing of ſmell delightfull and pleaſant.

2 The ſecond Sampier, called *Paſtinaca marina*,or ſea Parſnep,hath long fat leaues very much jagged or cut euen to the middle rib, ſharp or prickely pointed, which are ſet vpon large fat jointed ſtalks ; on the top wherof do grow tufts of whitiſh or elſe reddiſh floures. The ſeed is wrapped in thorny husks:the root is thicke and long,not vnlike to the Parſenep, very good and wholſome to be eaten.

3 Golden Sampier bringeth forth many ſtalks from one root, compaſſed about with a multitude of long fat leaues , ſet together by equal diſtances : at the top whereof come yellow floures. The ſeed is like thoſe of the rock Sampier.

¶ *The Place.*

Rocke Sampier growes on the rocky clifts at Douer, Winchelſey, by Rie, about Southampton, the Iſle of Wight, and moſt rocks about the Weſt and North parts of England.

The ſecond groweth neere the ſea vpon the ſands and Baych betweene Wnitſtable and the Iſle of Tenet, by Sandwich, and by the ſea neere Weſt-cheſter.

The third growes in the myrie marſh in the Iſle of Shepey, as you go from the Kings Ferrey to Sherland houſe.

¶ *The Time.*

Rocke Sampier flouriſheth in May and Iune, and muſt be gathered to be kept in pickle in the beginning of Auguſt.

¶ *The Names.*

Rock Sampier is called in Greeke κρίθμον: in Latine *Crithmum*, and of diuers *Bati*: in ſome ſhops, *Creta marina*: of *Petrus Creſcentius*, *Cretamum*, and *Rincum marinum*: in high-Dutch, Meerfenchel: which is in Latine *Fœniculum marinum*, or ſea Fennell: in Italian, *Fenocchio marino*, *Herba di San Pietro*; and hereupon diuers name it *Sampetra*: in Spaniſh, *Perexil de la mer*, *Hinoio marino*, *Fenol marin*: in Engliſh, Sampier, rock Sampier, and of ſome, Creſtmarine: and theſe be the names of the Sampier generally eaten in ſallads.

The other two be alſo *Crithma* or Sampiers, but moſt of the later Writers would draw them to ſome other plant; for one calls the ſecond *Paſtinaca marina*, or ſea Parſnep; and the third, *Aſter Atticus marinus*; and *Lobel* names it *Chryſanthemum littoreum*: but wee had rather entertaine them as *Matthiolus* doth, among the kindes of *Crithmum* or Sampier.

¶ *The Temperature.*

Sampier doth dry, warm, and ſcoure, as *Galen* ſaith.

¶ *The Vertues.*

A The leaues, ſeeds, and roots, as *Dioſcorides* ſaith, boiled in wine and drunk, prouoke vrine and womens ſickneſſe, and preuaile againſt the jaundice.

B The leaues kept in pickle, and eaten in ſallads with oile and vineger, is a pleaſant ſauce for meat, wholſome for the ſtoppings of the liuer, milt, kidnies, and bladder: it prouoketh vrine gently: it openeth the ſtoppings of the intrals, and ſtirreth vp an appetite to meat.

C It is the pleaſanteſt ſauce, moſt familiar, and beſt agreeing with mans body, both for digeſtion of meats, breaking of the ſtone, and voiding of grauell in the reins and bladder.

Chap. 155.

Of Glaſſe Saltwort.

¶ *The Description.*

1 Glaſſewort hath many groſſe thicke and round ſtalks a foot high, full of fat and thicke ſprigs, ſet with many knots or joints, without any leaues at all, of a reddiſh greene colour: the whole plant reſembles a branch of Corall: the root is very ſmall and ſingle.

2 There is another kind of Saltwort which hath been taken among the antient Herbariſts for a kinde of Sampier. It hath a little tender ſtalke a cubit high, diuided into many ſmall branches, ſet full of little thicke leaues very narrow, ſomewhat long and ſharp pointed, yet not pricking; amongſt which come forth ſmall ſeed wrapped in a crooked huske, turning round like a crooked perwinkle: the ſtalks are of a reddiſh colour: the whole plant is of a ſalt and biting taſt: the root is ſmall and threddy.

† 3 There is likewiſe another kinde of *Kali*, whereof *Lobel* maketh mention vnder the name of *Kali minus*, which is like to the laſt before remembred, but altogether leſſe, ‡ hauing many ſlender weake branches lying commonly ſpred vpon the ground, and ſet with many ſmall round long ſharp pointed leaues of a whitiſh green colour: the ſeed is ſmall and ſhining, not much vnlike that of Sorrell: the root is ſlender with many fibres: the whole plant hath a ſaltiſh taſte like as the former. *Dodon.* calls this *Kali album.*

¶ The

1 *Salicornia, ſiue Kali geniculatum.*
Glaſſewort, Saltwort, or Sea-graſſe.

‡ 3 *Kali minus.*
Small Glaſſewort.

ord. 81

¶ *The Place.*

Theſe plants are to be found in ſalt marſhes almoſt euerie where.

‡ The ſecond excepted, which groweth not here, but vpon the coaſts of the Mediterranean ſea. ‡

¶ *The Time.*

They floure and flouriſh in the Summer moneths.

¶ *The Names.*

Saltwort is called of the Arabians, *Kali*, and *Alkali*. *Avicen, cap.* 724. deſcribeth them vnder the name of *Vſnen*, which differs from *Vſnee*; for *Vſnee* is that which the Grecians call βρύον: and the Latines *Muſcus*, or Moſſe: of ſome, as *Bap-iſta Montanus*, it hath been iudged to be *Empetron*.

The axen or aſhes hereof, are named of *Matthiolus*, *Syluaticus Soda*: of moſt, *Sal Alkali*: diuers call it *Alumen catinum*. Others make this kinde of difference betweene *Sal Kali* and *Alumen catinum*; That *Alumen catinum* is the aſhes it ſelf, and that the ſalt that is made of the aſhes is *Sal Alkali*.

Stones are beaten to pouder and mixed with aſhes, which beeing melted together, become the matter whereof glaſſe is made. Which while it is made red hot in the furnace, and is melted, becomming liquid and fit to worke vpon, doth yeeld as it were a fat floting aloft; which when it is cold waxeth as hard as a ſtone, yet is it brittle and quickly broken. This is commonly called *Axungia vitri*: in Engliſh, Sandeuer: in French, *Suin de Voirre*: in Italian, *Fior de Criſtallo*, i. Floure of Cryſtal. The herb is alſo called of diuers, *Cali articulatum*, or jointed Glaſſewort: in Engliſh, Crab-graſſe, and Frog-graſſe.

¶ *The Temperature.*

Glaſſewort is hot and dry: the aſhes are both drier and hotter, and that euen to the fourth degree: the aſhes haue a cauſticke or burning facultie.

¶ *The Vertues.*

A A little quantitie of the herb taken inwardly doth not only mightily prouoke vrine, but in like ſort caſteth forth the dead childe. It draweth forth by ſiege waterie humors, and purgeth away the dropſie.

B A great quantitie taken is miſchieuous and deadly: the ſmel and ſmoke alſo of this herb being burnt driues away ſerpents.

C The aſhes are likewiſe tempered with thoſe medicines that ſerue to take away ſcabs and filth of the skin. It eaſily conſumeth proud and ſuperfluous fleſh that groweth in poiſonſome vlcers, as *Auicen* and *Serapio* report.

D We reade in the copies of *Serapio*, That *Kali* is a tree ſo great that a man may ſtand vnder the ſhadow thereof: but it is very like that this errour proceeds rather from the interpreter, than from the Author himſelfe.

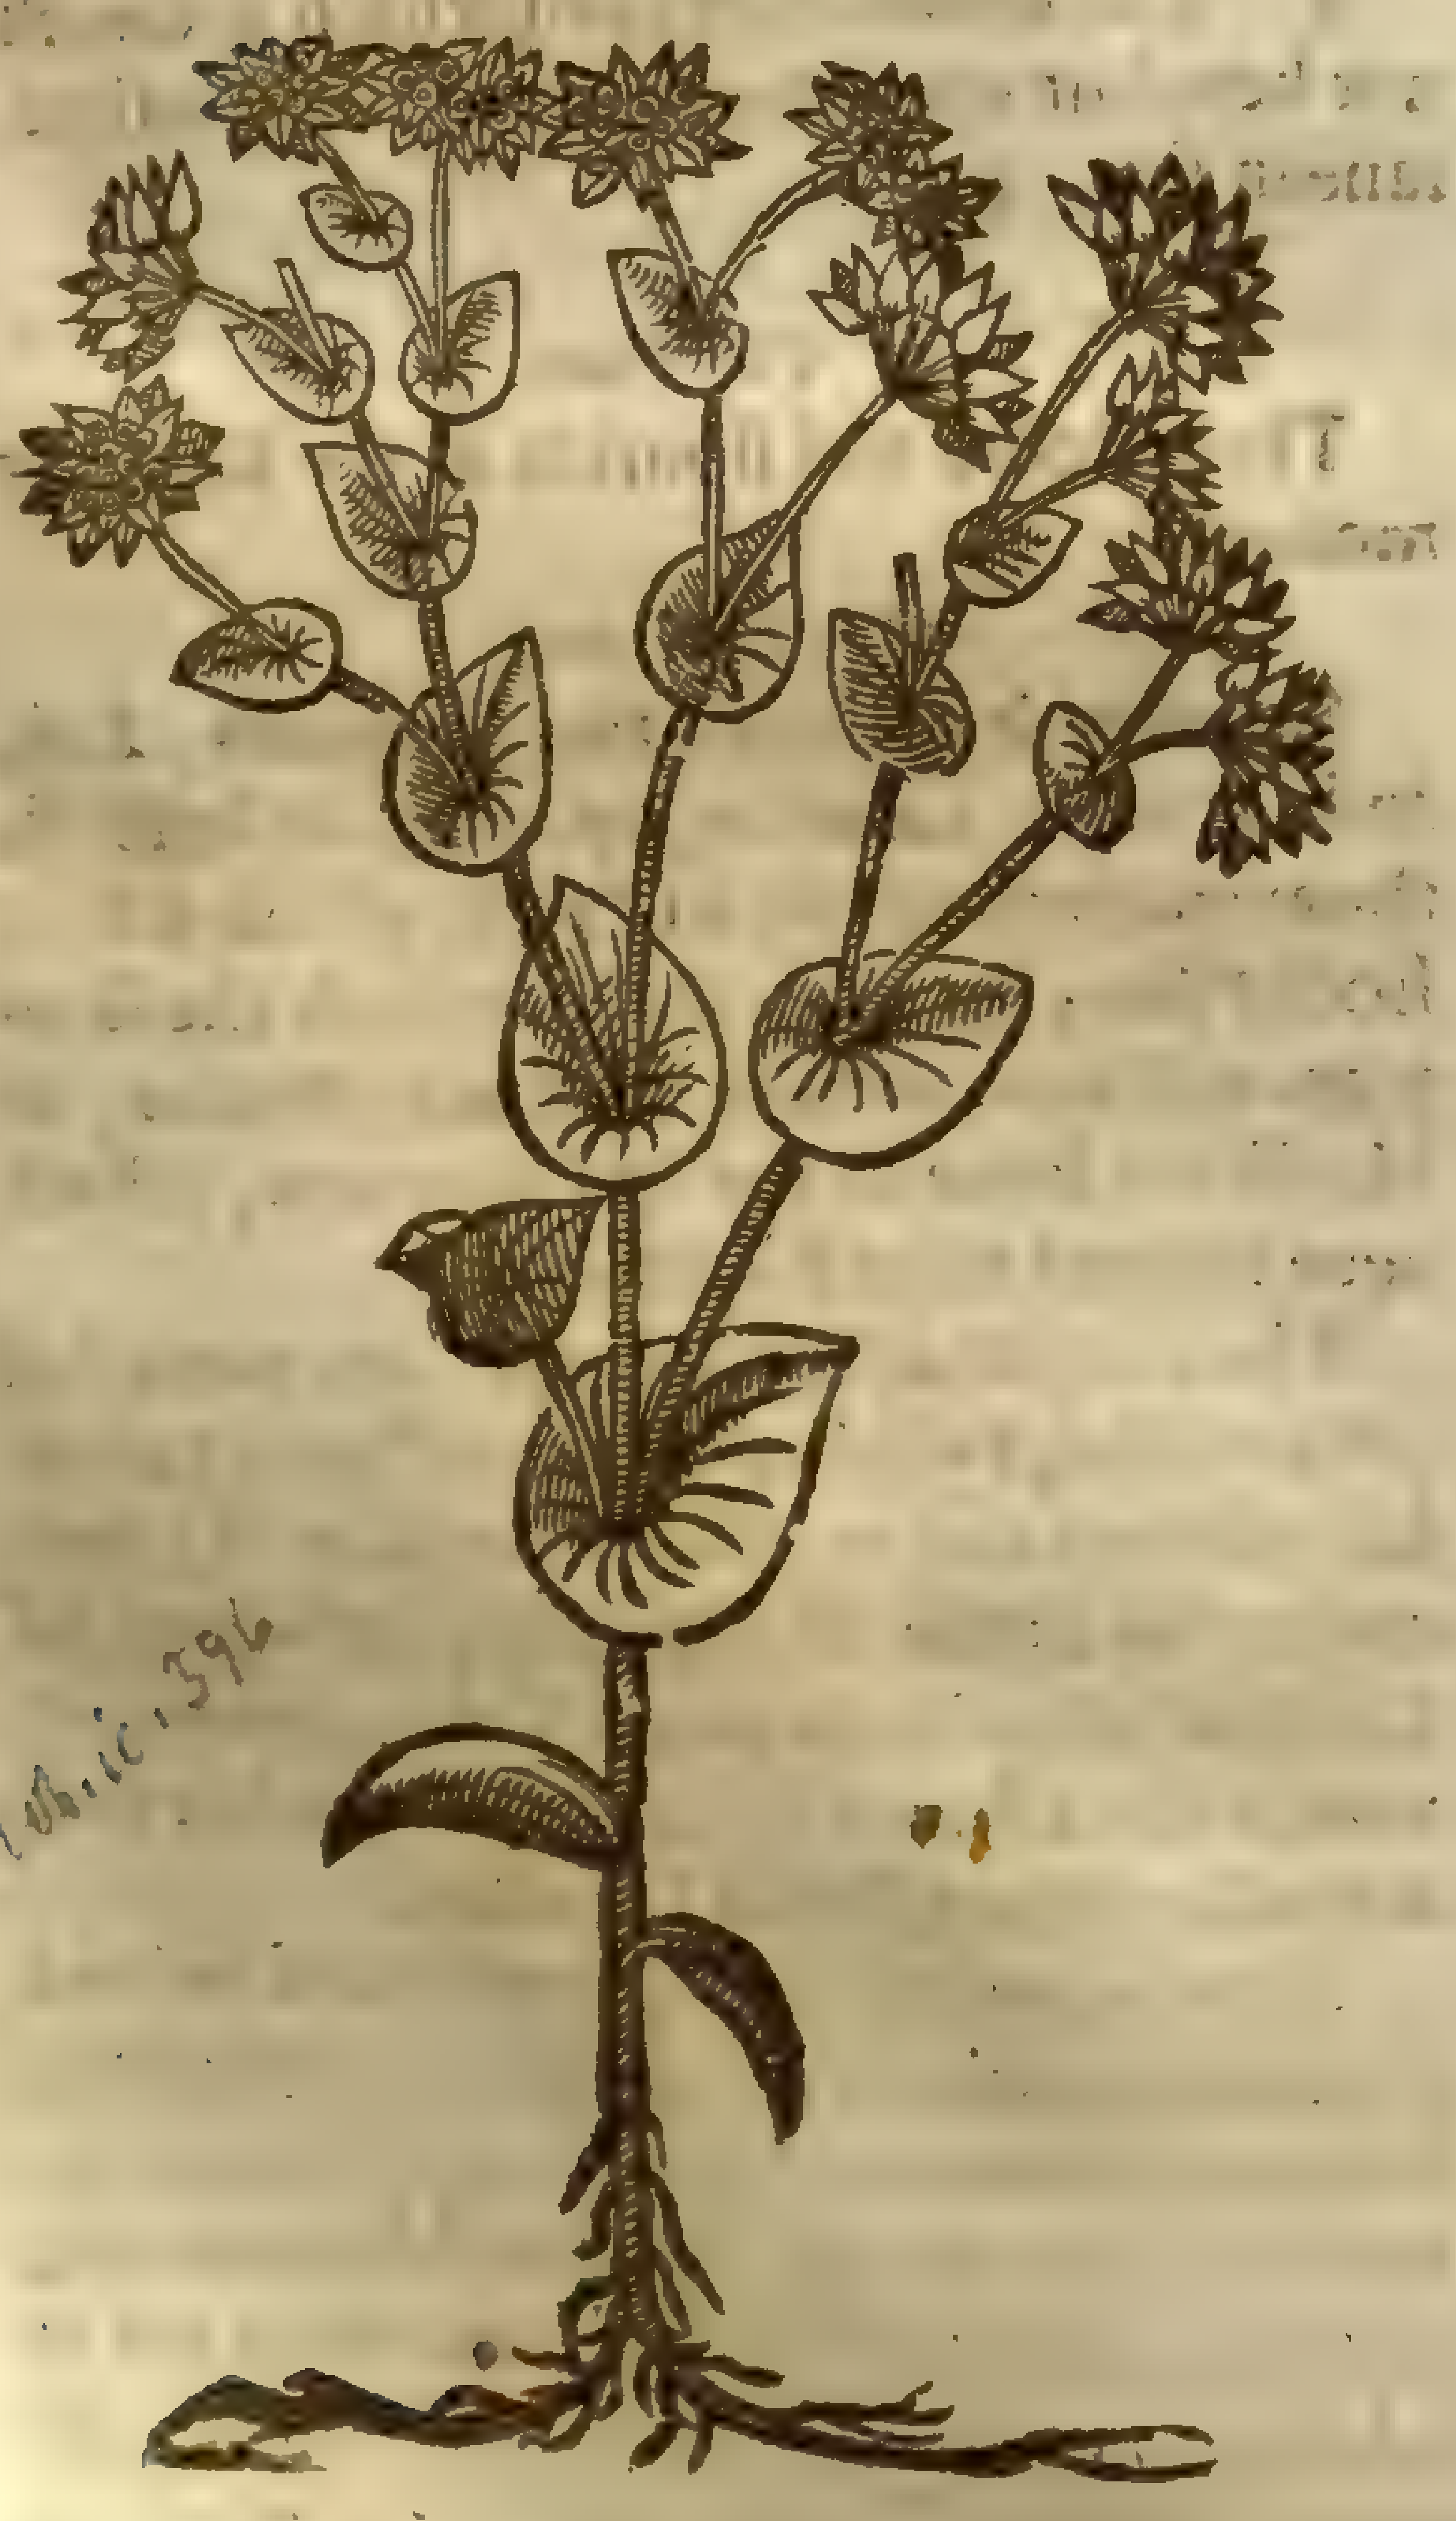
E The floure of Cryſtall, or as they commonly terme it Sandeuer, doth wonderfully dry: it eaſily taketh away ſcabs and mangineſſe, if the foule parts be waſhed and bathed with the water wherein it is boiled.

Chap. 156. *Of Thorow-Wax.*

Brassica orientalis L
[illegible] Smith [illegible]

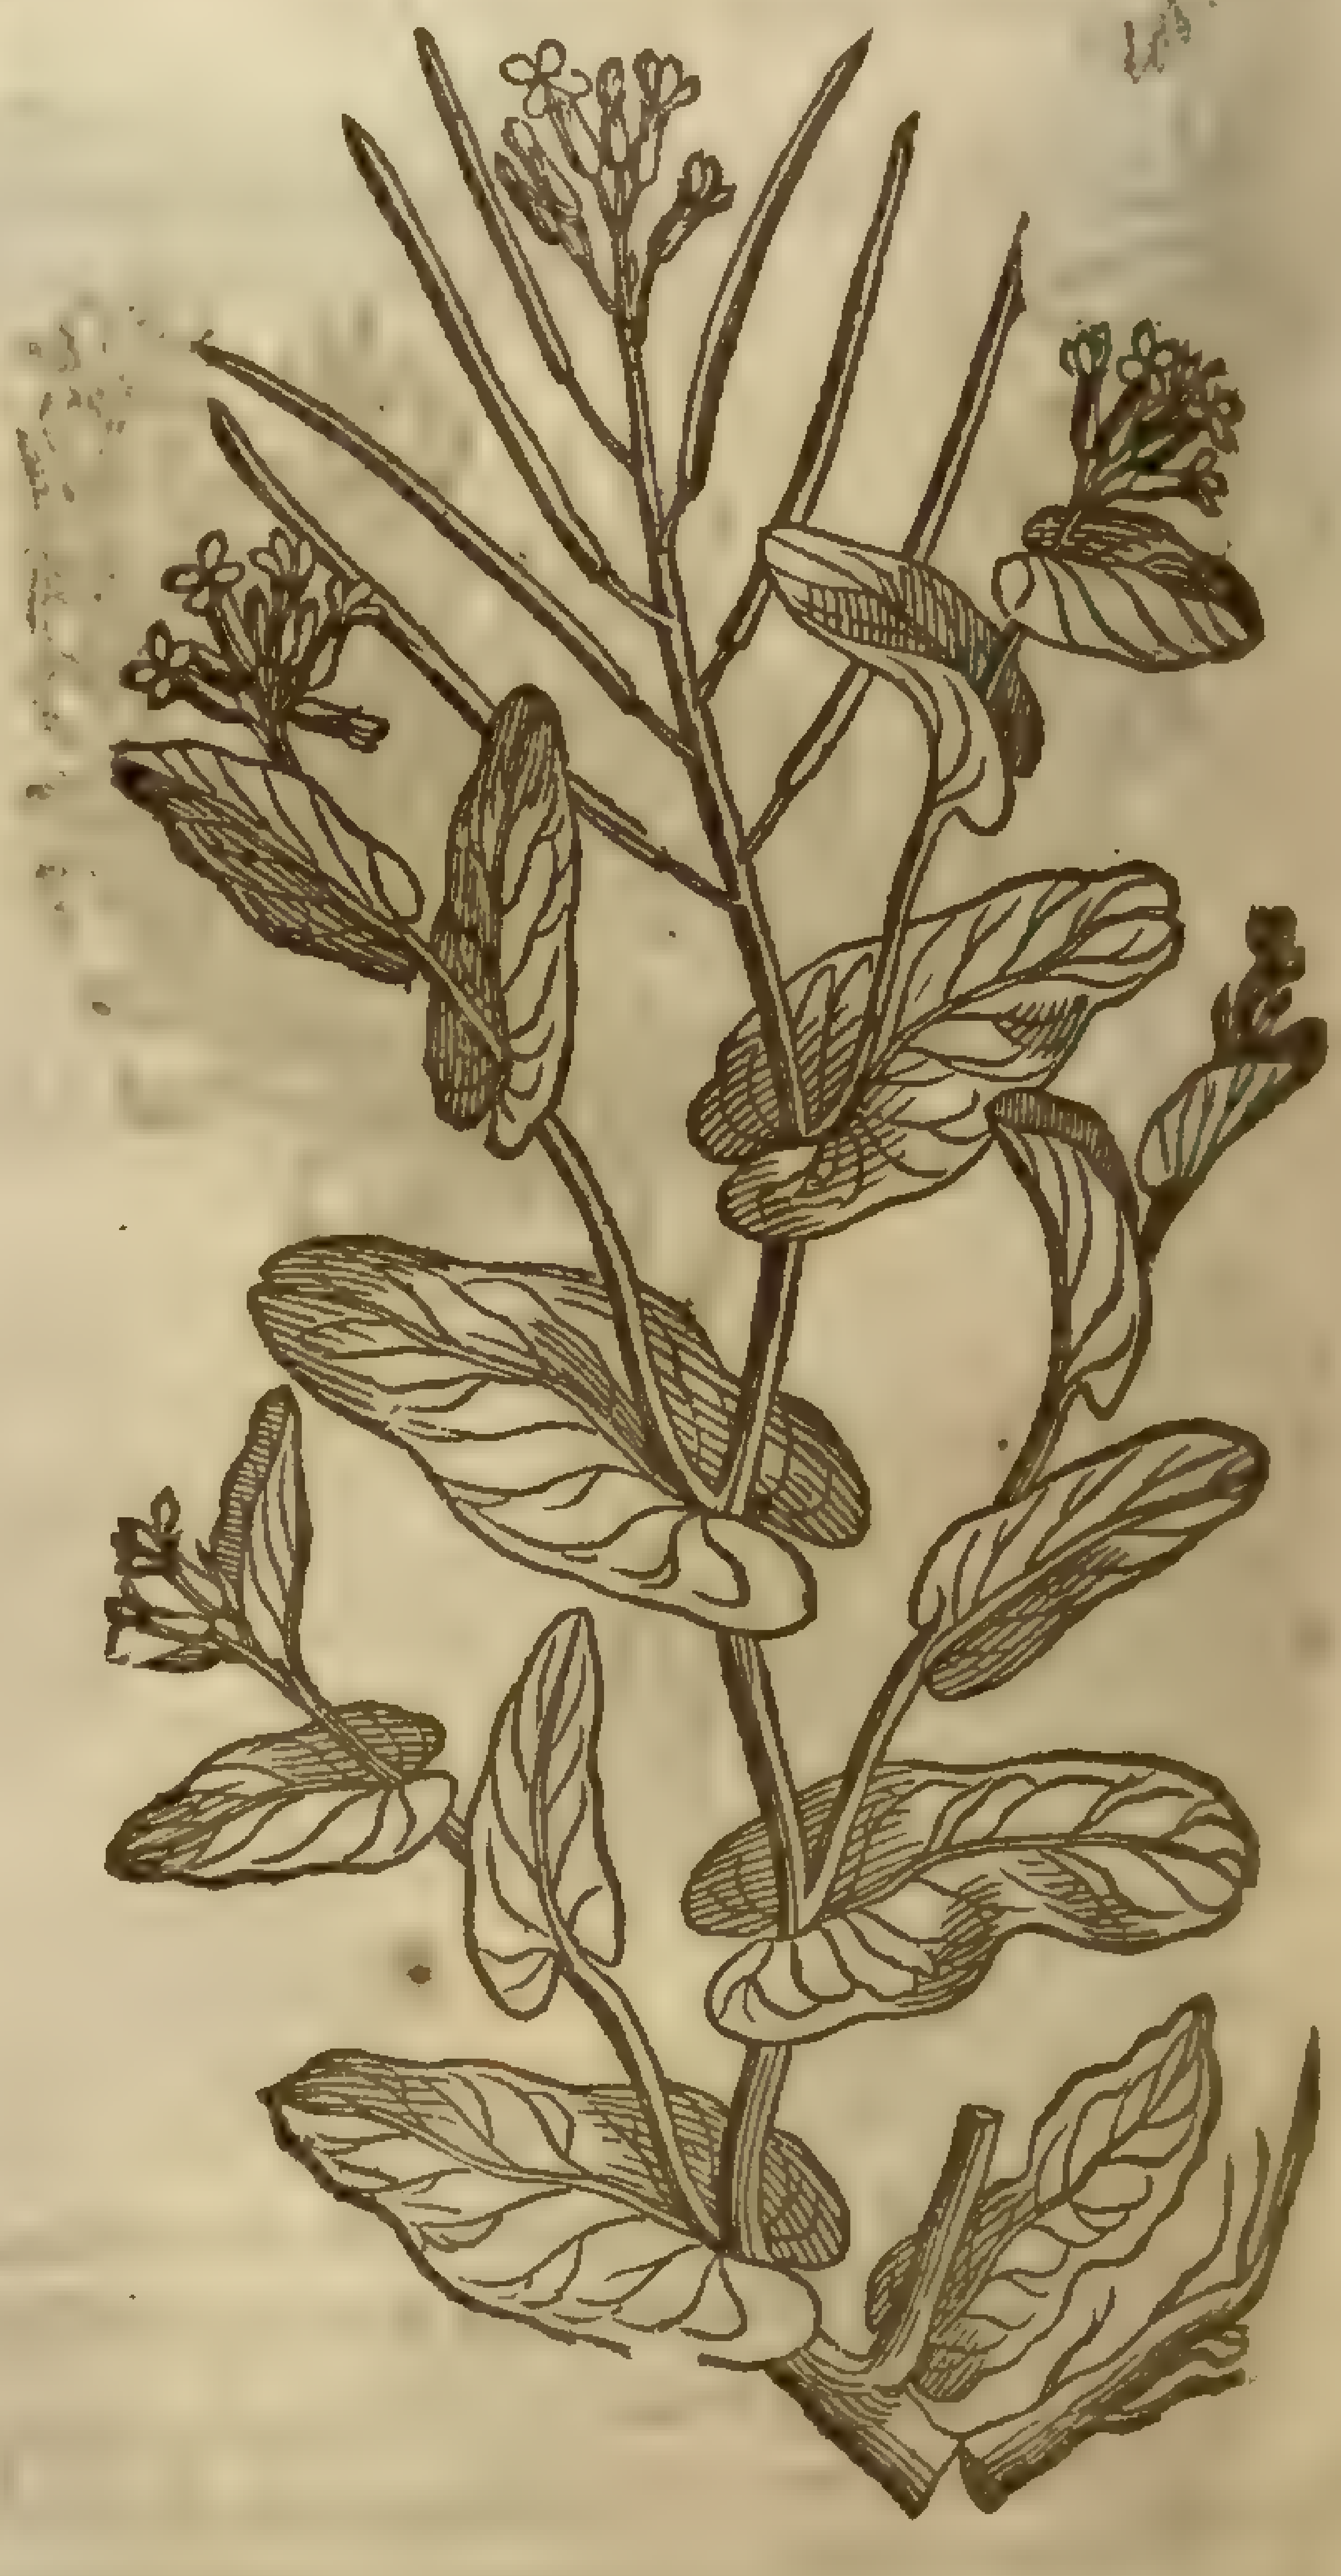
Bupleurum rotundifolium L
Sm. fl. 2, 93
Lob. ic. 396

1 *Perfoliata vulgaris.*
Common Thorow-wax.



2 *Perfoliata ſiliquoſa.*
Codded Thorow-wax.

Lob. ic.



¶ The

¶ *The Deſcription.*

1 Thorow-wax or Thorow leafe,hath a round,ſlender, and brittle ſtalke, diuided into many ſmal branches, which paſſe or go thorow the leaues,as though they had been drawn or thruſt thorow,and to make it more plain,euery branch grows thorow euery leaf,making them like hollow cups or ſaucers. The ſeed groweth in ſpoky tufts or rundles like Dill,long and blackiſh. The floures are of a faint yellow colour. The root is ſingle,white and threddy.

2 Codded Thorow-wax reckoned by *Dodonæus* among the Braſſickes or Colewoorts, hee making it a kind thereof, and calling it *Braſsica ſylveſtris perfoliata*: though in mine opinion without reaſon,ſith it hath neither ſhape, affinitie,nor likeneſſe with any of the Colewoorts,but altogether moſt vnlike,reſembling very well the common Thorow-wax; whereunto I rather refer it. It hath ſmall,tender,and brittle ſtalkes two foot high,bearing leaues, which wrap and incloſe themſelues round about, although they do not run thorow as the other do, yet they grow in ſuch manner,that vpon the ſudden view thereof,they ſeeme to paſſe thorow as the other:vpon the ſmall branches do grow little white floures; which being paſt,there ſucceed ſlender and long cods like thoſe of Turneps or Nauewes,whoſe leaues and cods do ſomewhat reſemble the ſame,from whence it hath the name *Napifolia*, that is, Thorow-wax with leaues like vnto the Nauew. The root is long and ſingle, and dieth when it hath brought forth his ſeed.

There is a wilde kinde hereof growing in Kent in many places among the corn, like the former in each reſpect,but altogether leſſe: the which no doubt brought into the garden would proue the very ſame.

¶ *The Place.*

‡ The firſt deſcribed growes plentifully in many places about Kent,and between Farningham and Ainsford it growes in ſuch quantitie(as I haue bin informed by M^r Bowles) in the corn fields on the tops of the hills,that it may well be termed the infirmitie of them.

The later growes not wilde with vs, that euer I could finde; though *Lobel* ſeemes to affirme the contrarie. ‡

They grow in the gardens of Herbariſts,and in my garden likewiſe.

¶ *The Time.*

They floure in May and Iune,and their ſeed is ripe in Auguſt.

¶ *The Names.*

1 It hath been called from the beginning *Perfoliata*, becauſe the ſtalk doth paſſe through the leafe; following the ſignification of the ſame. We call it in Engliſh, Thorow-wax, and Thorow-leafe.

‡ 2 This by the moſt and beſt part of Writers (though our Author be of another opinion) is very fitly referred to the wilde Coleworts,and called *Braſsica campeſtris* by *Cluſius* and by *Camerarius*: *Braſsica agreſtis* by *Tragus*: yet *Lobel* calls it *Perfoliata Napifolia Anglorum ſiliquoſa.* ‡

¶ *The Temperature.*

Thorow-wax is of a dry complexion.

¶ *The Vertues.*

The decoction of Thorow-wax made of water or wine healeth wounds. The juice is excellent for wounds,made either into oile or vnguent. A

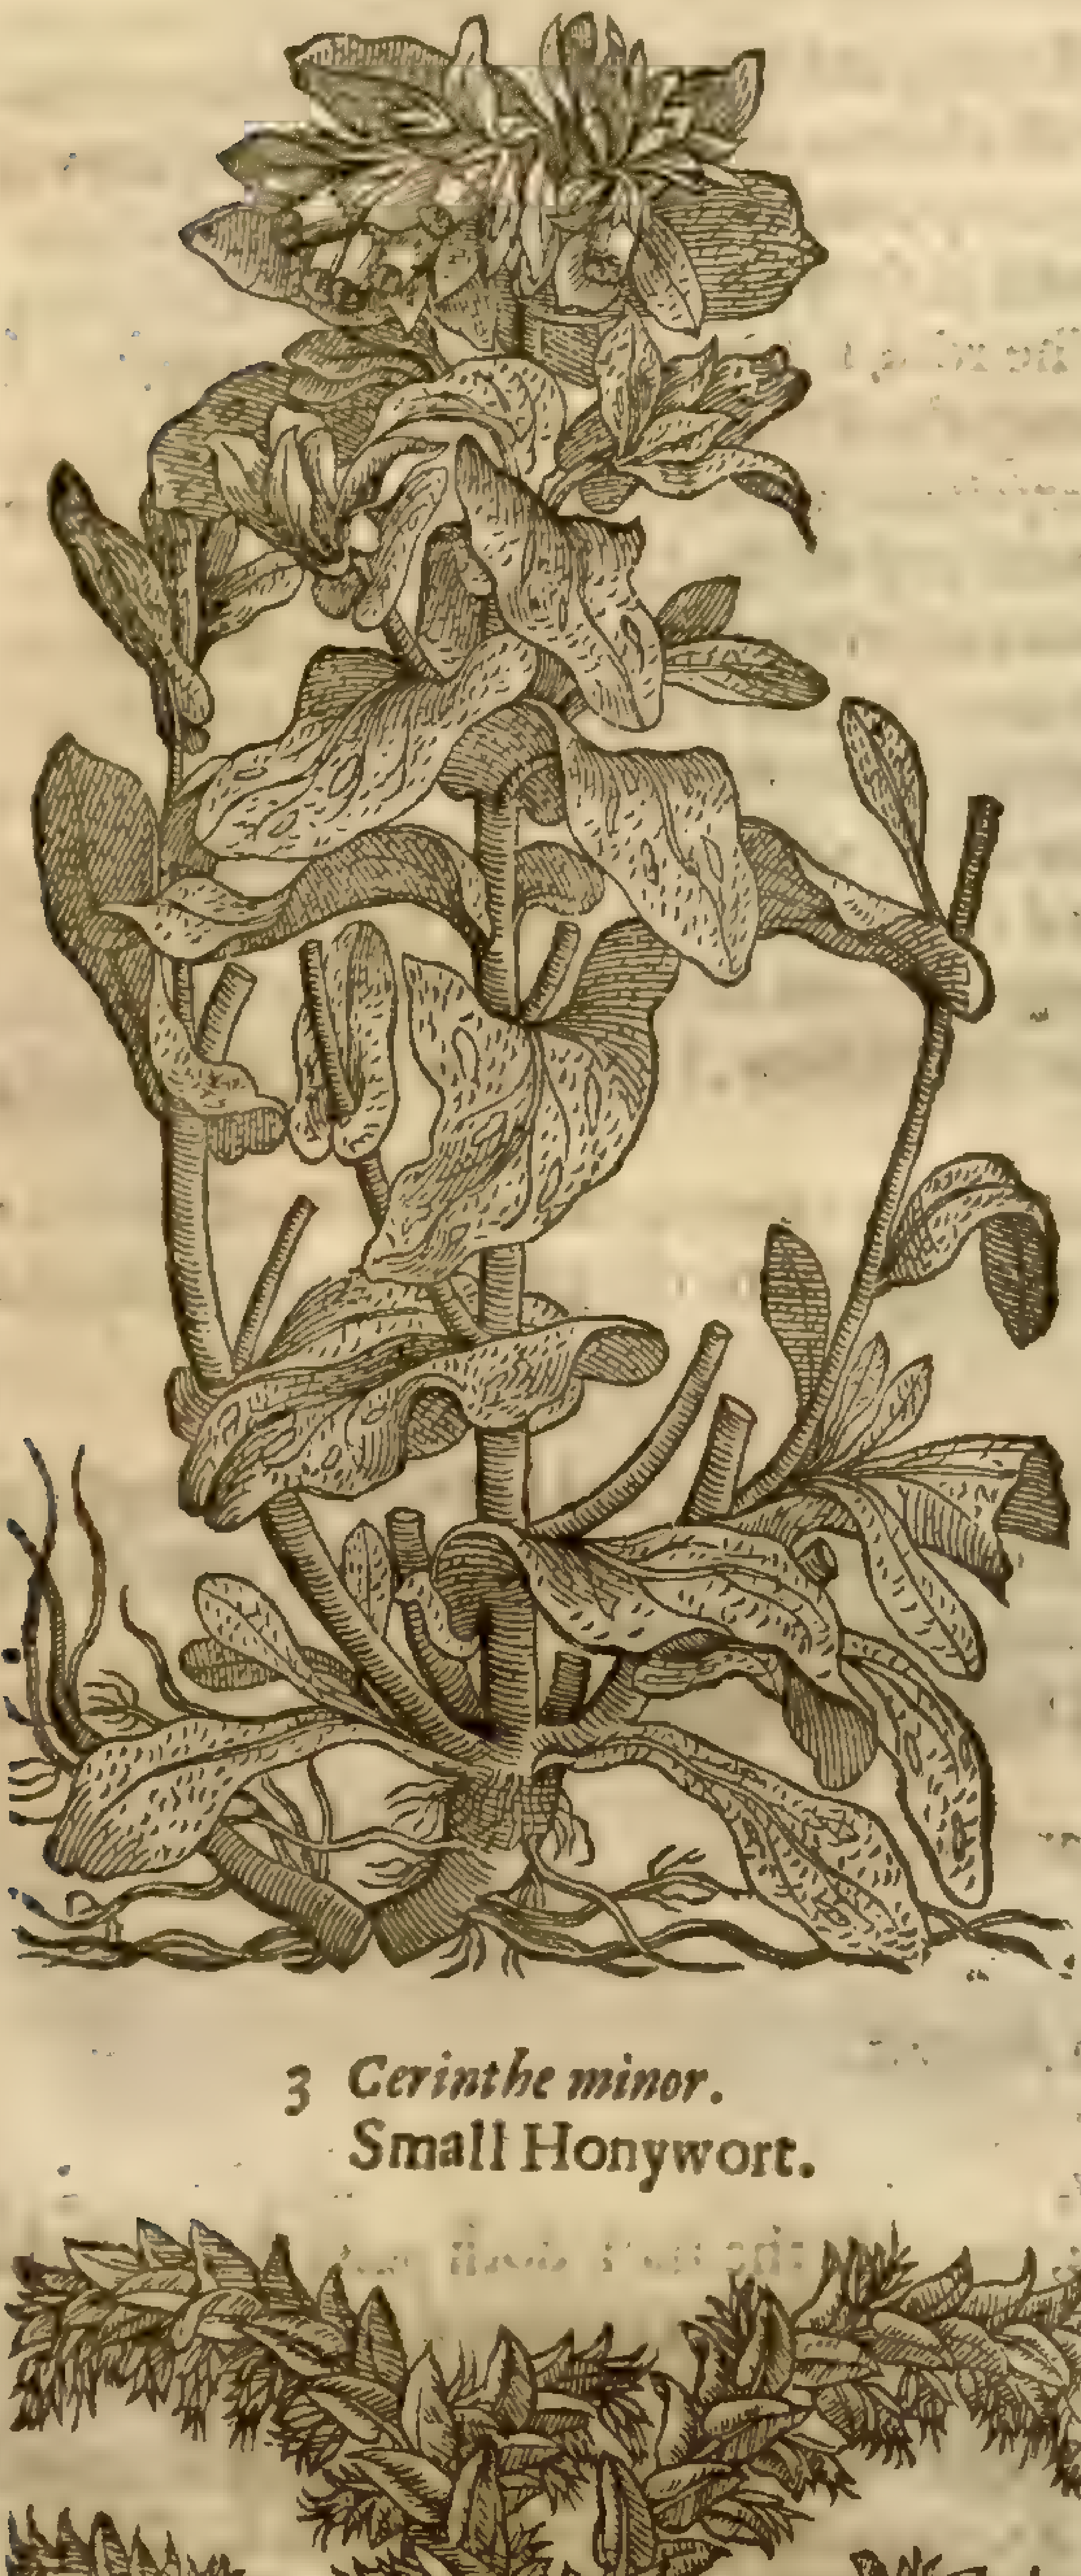
The greene leaues ſtamped,boiled with waxe, oile,roſin,and turpentine, make an excellent Vnguent or oile to incarnate, or bring vp fleſh in deep wounds. B

Chap. 157. *Of Hony-wort.*

¶ *The Deſcription.*

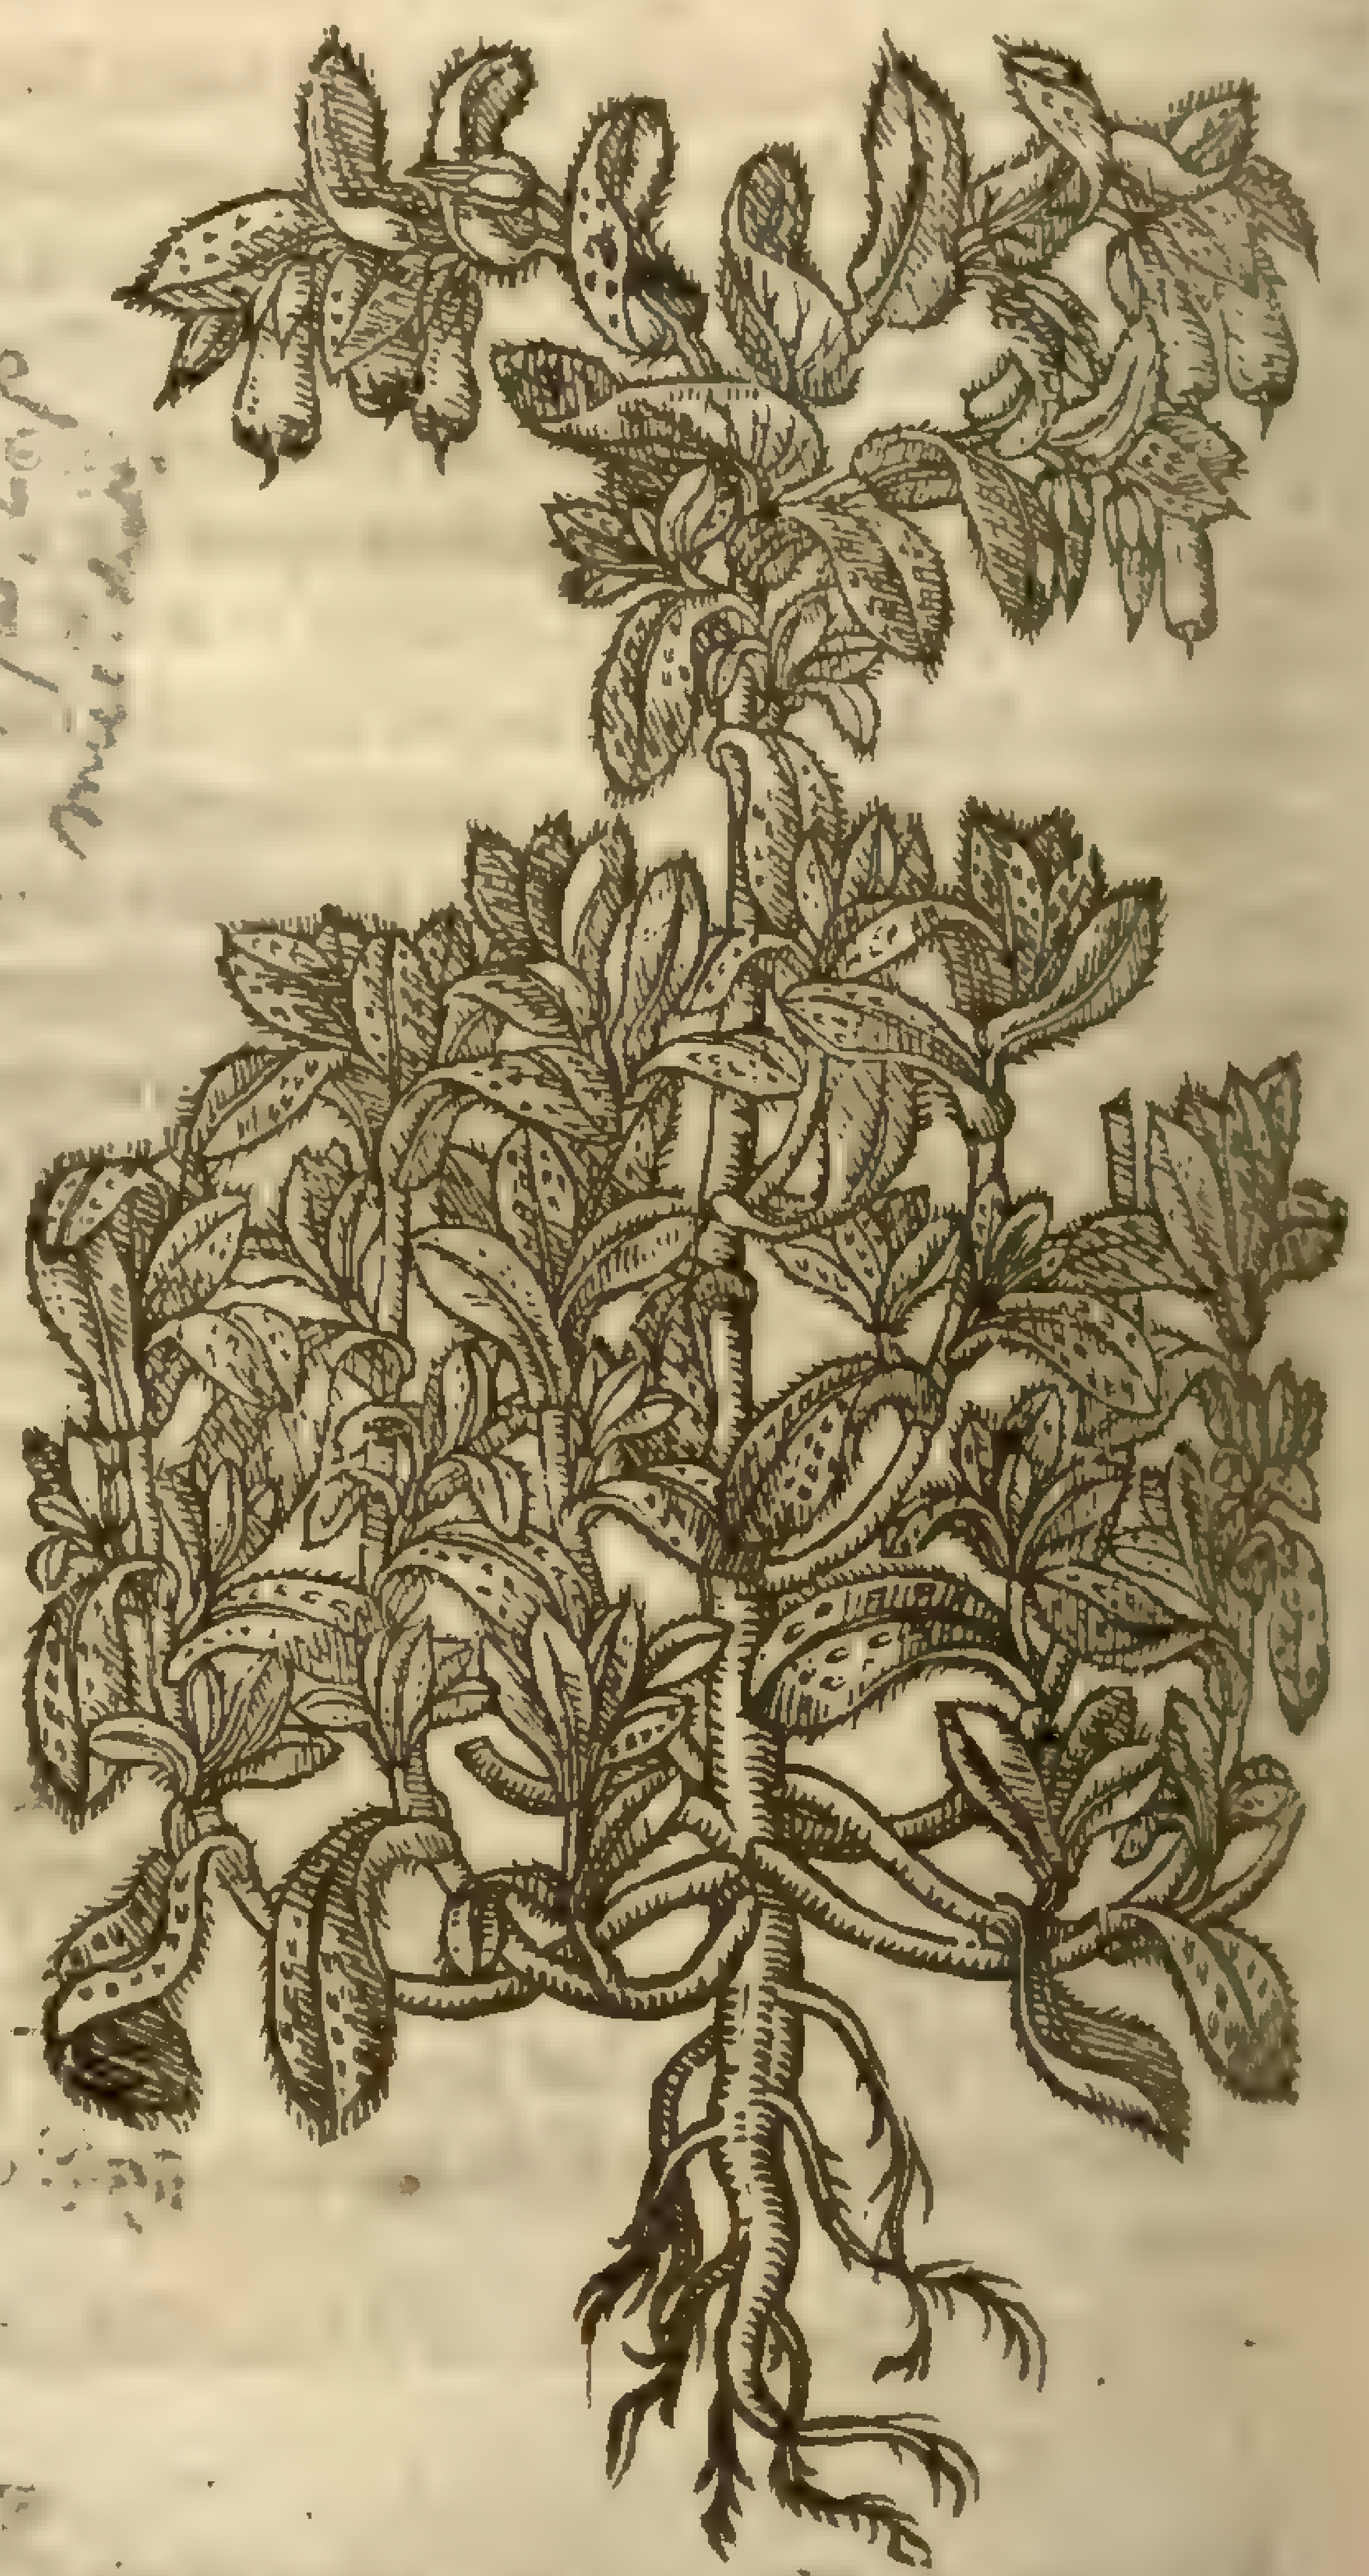
1 *Cerinthe* or Hony-wort riſeth forth of the ground after the ſowing of his ſeed,with two ſmall leaues like thoſe of Baſill; between the which leaues commeth forth a thick fat ſmooth tender and brittle ſtalke ful of juice,that diuides it ſelfe into many other branches, which alſo are diuided into ſundry other armes or branches likewiſe, crambling or leaning toward the ground,being not able without props to ſuſtain it ſelfe,by reaſon of the great weight of

1 *Cerinthe maior.*
Great Honywort.



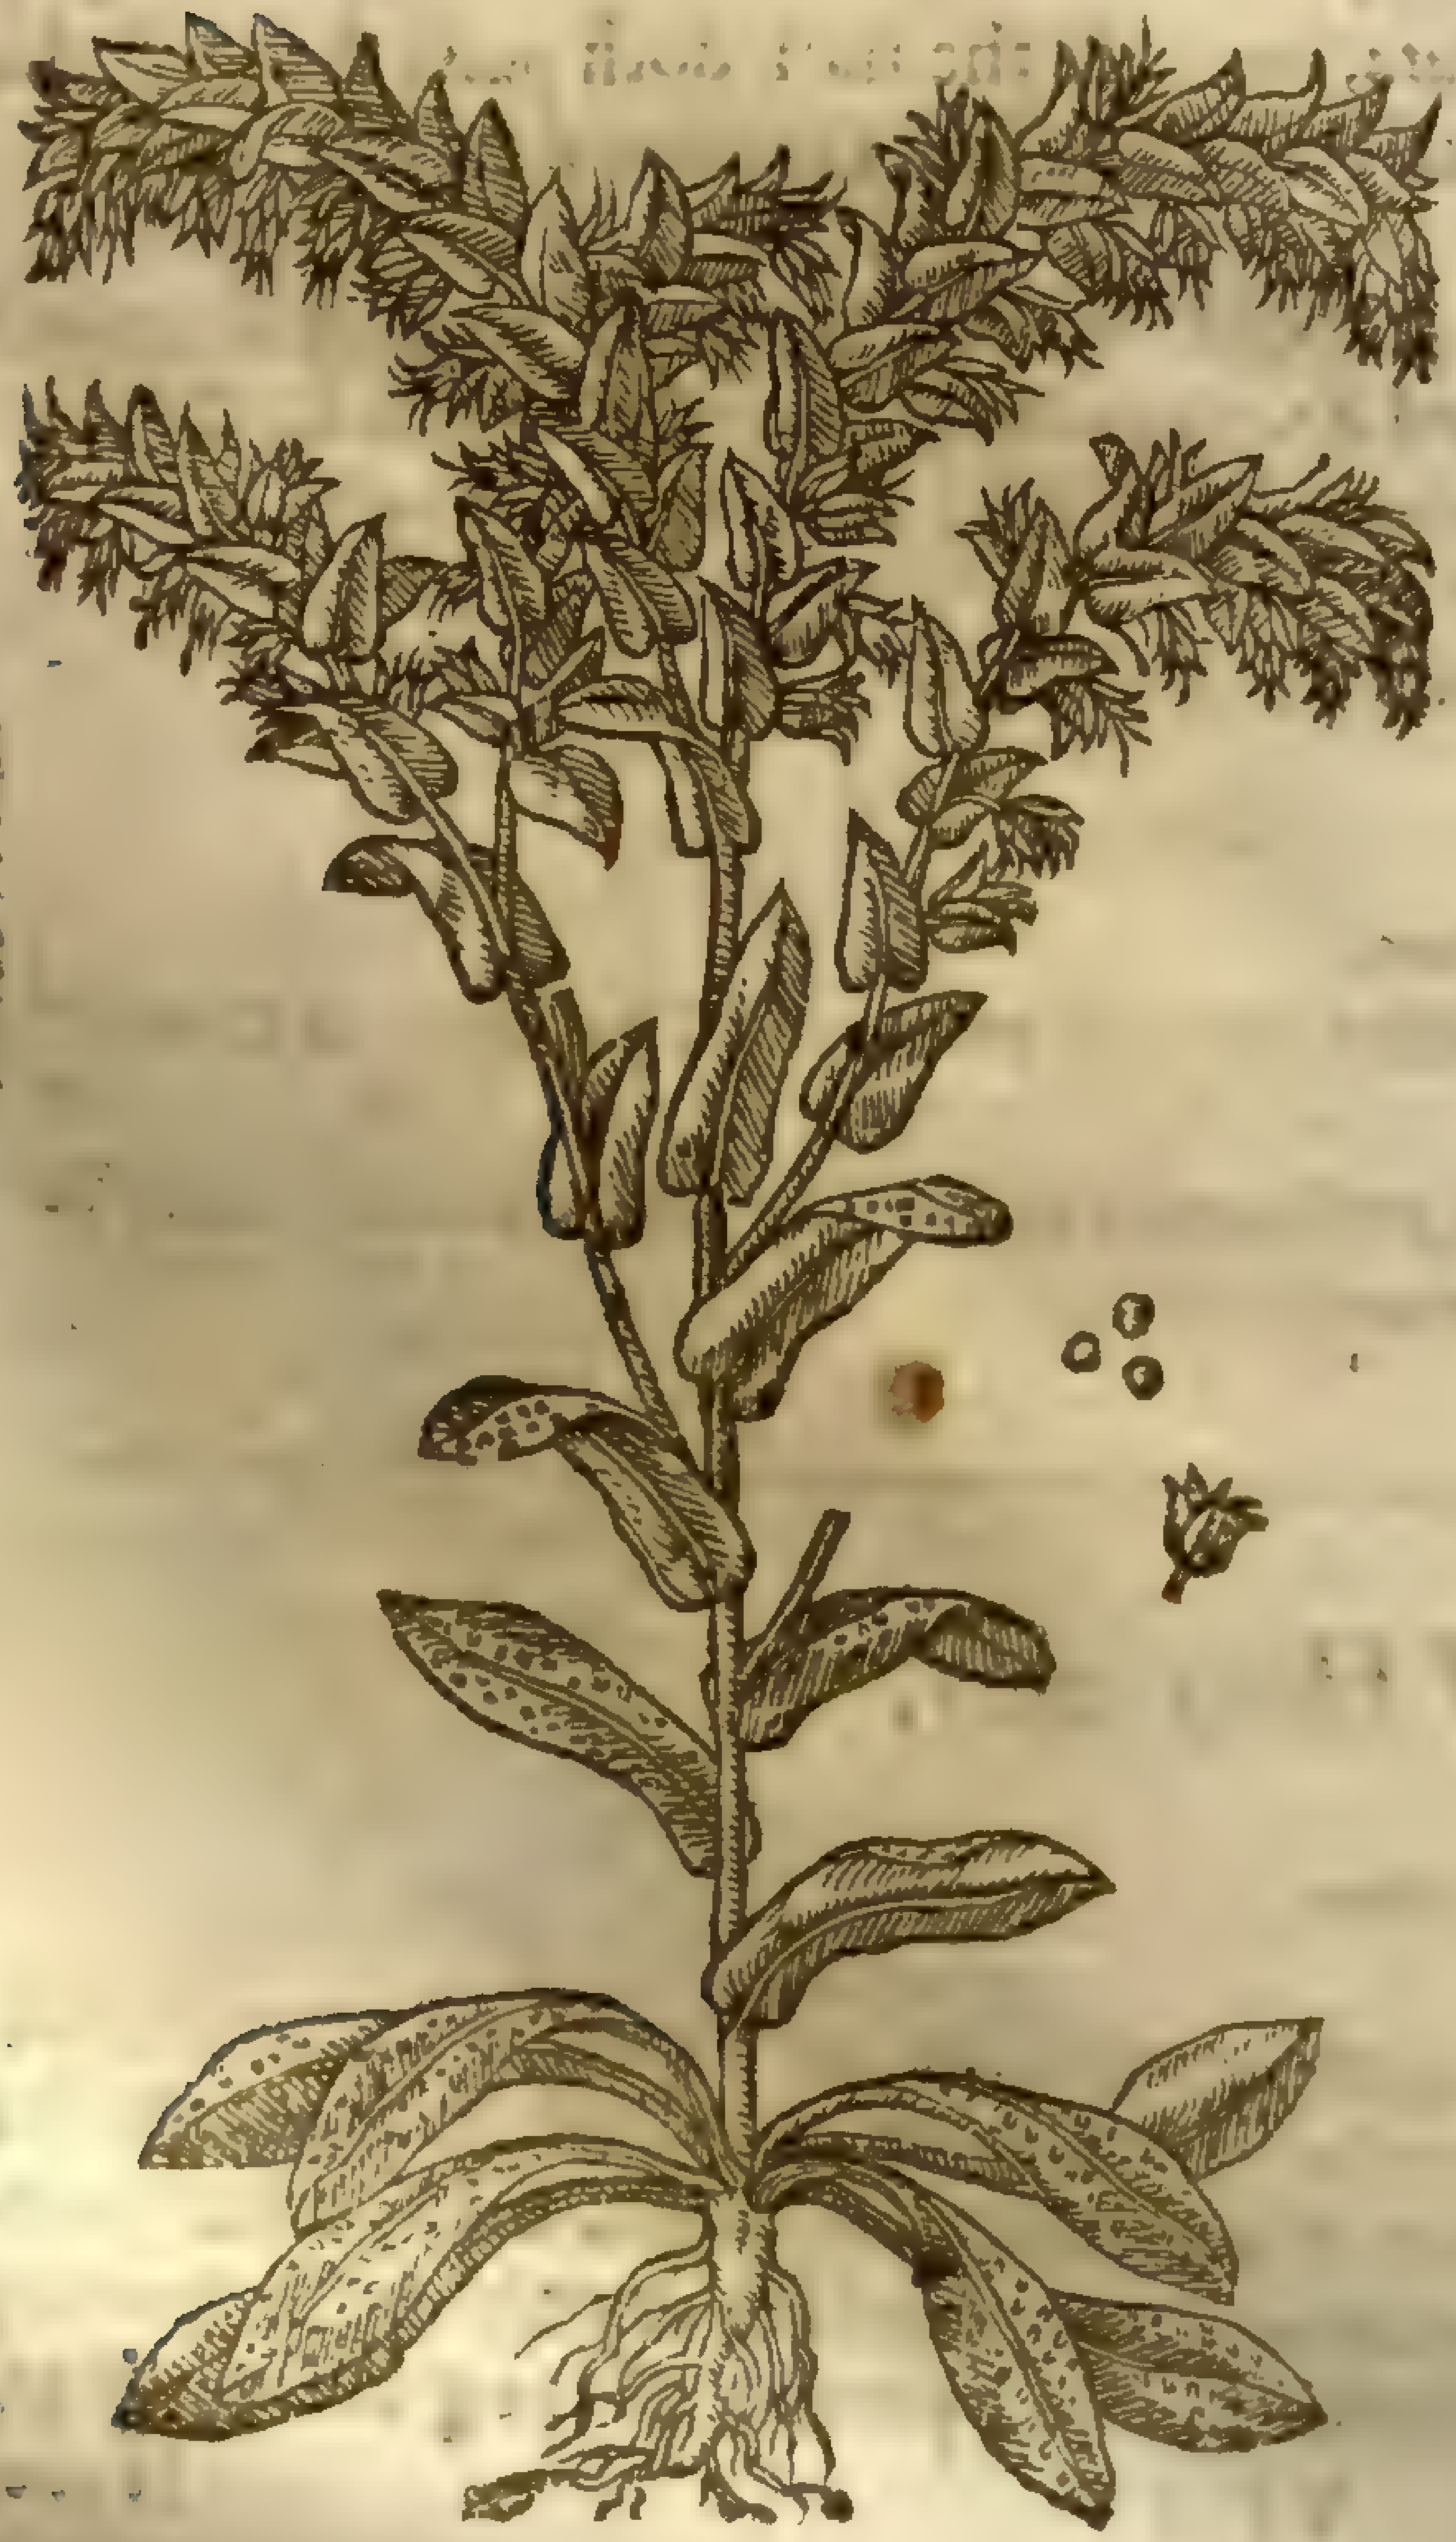
Cerinthe major, & mili, dict

‡ 2 *Cerinthe aſperior flore flauo.*
Rough Honywort.



C. major, L. mili. dict

3 *Cerinthe minor.*
Small Honywort.



C. minor, L mili. dict

leaues, branches, and much juice the whole plant is ſurcharged with; vpon which branches are placed many thicke rough leaues, ſet with very ſharp prickles like the rough skinne of a Thornback, of a blewiſh green colour, ſpotted very notably with white ſtrakes and ſpots, like thoſe leaues of the true *Pulmonaria* or Cowſlips of Ieruſalem, and in ſhape like thoſe of the codded Thorow-wax, which leaues do clip or embrace the ſtalke round about: from the boſome whereof come forth ſmall cluſters of yellow floures, with a hoope or band of bright purple round about the middeſt of the yellow floure. The floure is hollow, faſhioned like a little box, of the taſt of hony when it is ſucked, in the hollownes wherof are many ſmal chiues or threads; which beeing paſt, there ſucceed round blacke ſeed contained in ſoft skinny husks. The root periſheth at the firſt approch of winter. ‡ This varieth in the colour of the floures, which are yellow or purple, and ſometimes of both mixt together. ‡

‡ 2 The leaues of this other great Honywort of *Cluſius* deſcription, are ſhaped like thoſe laſt deſcribed, but are narrower at their ſetting on, and rougher; the floures alſo are yellow, but in ſhape & magnitude like the former, as it is alſo in the ſeeds & all other parts thereof. ‡

3 This

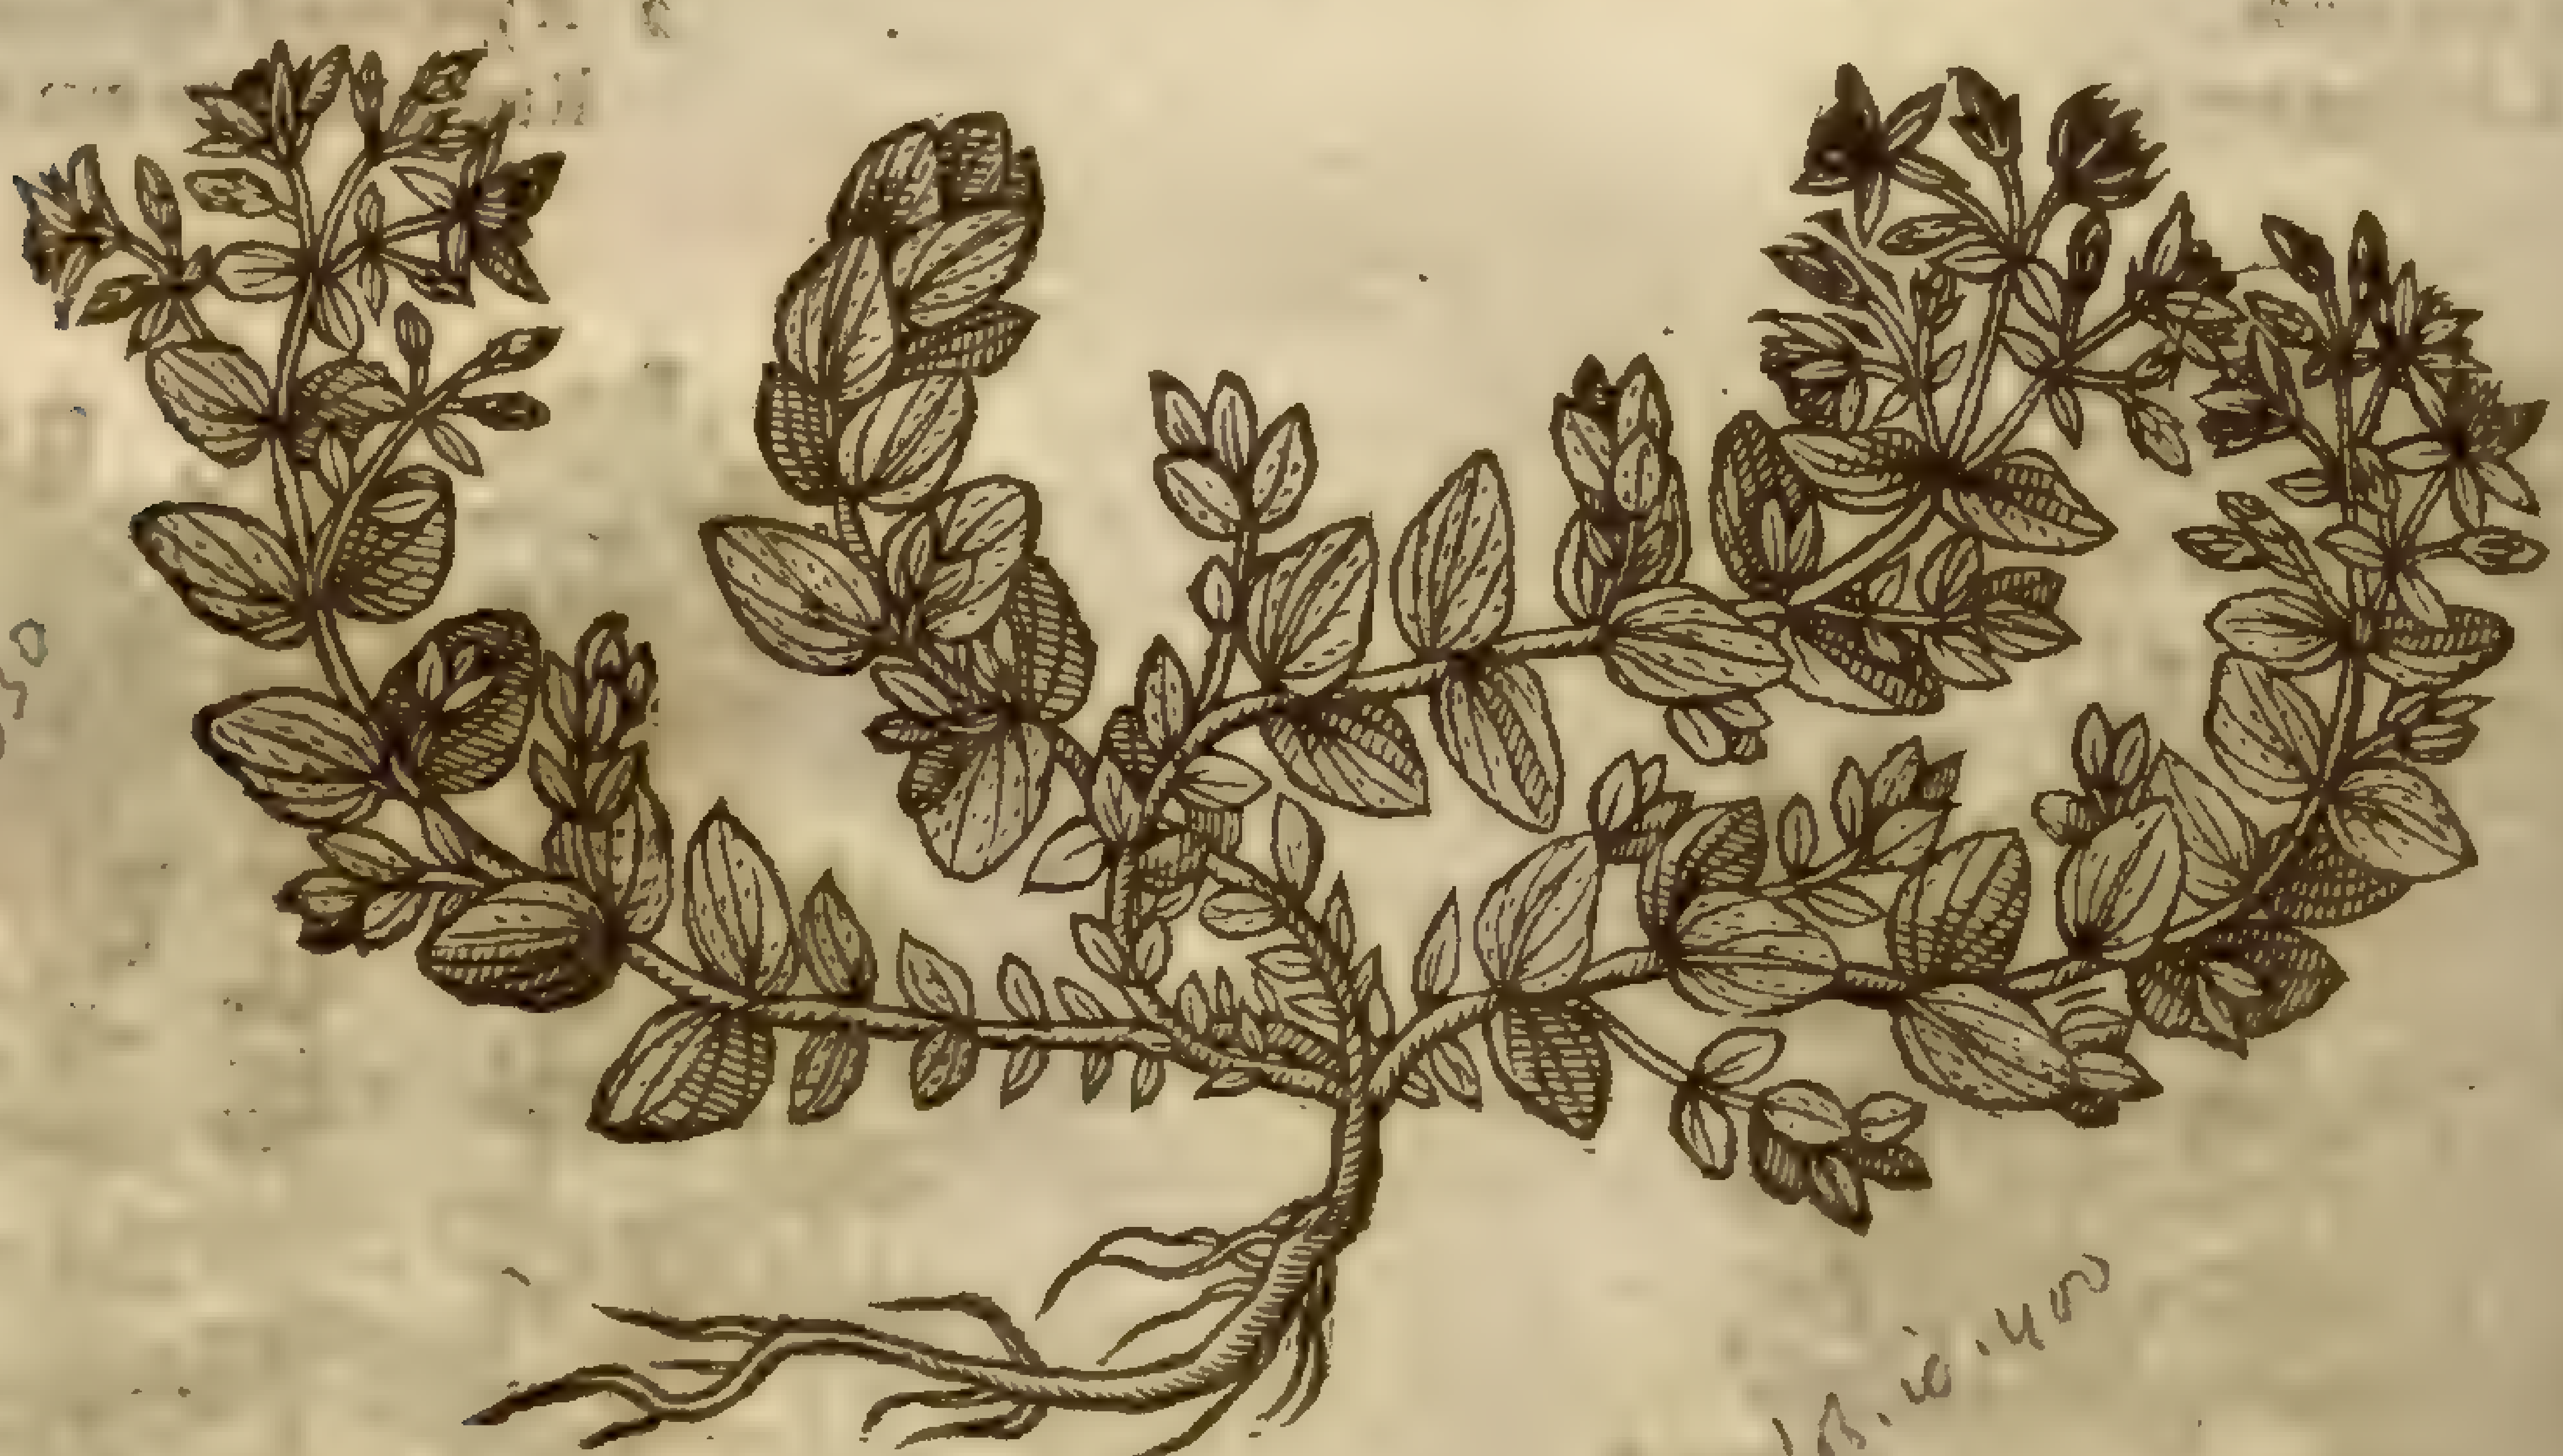
¶ *The Deſcription.*

1 Saint Iohns wort hath browniſh ſtalks beſet with many ſmall and narrow leaues, which if you behold betwixt your eies and the light, do appeare as it were bored or thruſt thorow in an infinite number of places with pinnes points. The branches diuide themſelues into ſundry ſmal twigs, at the top whereof grow many yellow floures, which with the leaues bruiſed do yeeld a reddiſh juice of the colour of bloud. The ſeed is contained in little ſharp pointed huskes blacke of colour, and ſmelling like Roſin. The root is long, yellow, and of a wooddy ſubſtance.

2 The ſecond kind of S. Iohns wort is named *Syriacum*, of thoſe that haue not ſeen the fruitful and plentifull fields of England, wherein it groweth aboundantly, hauing ſmall leaues almoſt like Rue or Herb-Grace: wherein *Dodonæus* hath failed, intituling the true *Androſæmum* by the name of *Ruta ſylueſtris*; whereas indeed it is no more like Rue than an Apple to an Oiſter. This plant is altogether like the precedent, but ſmaller, wherein conſiſteth the difference. ‡ It had beene fitter for our Author to haue giuen vs a better and perfecter deſcription of this plant (which as hee ſaith growes ſo abundantly with vs) than ſo abſurdly to cauil with *Dodonæus*, for calling (as he ſaith) the true *Androſæmum*, *Ruta ſylueſtris*: for if that be the true *Androſæmum* which *Dodonæus* made mention by the foreſaid name, why did not our Authour figure and deſcribe it in the next chapter ſaue one, for *Androſæmum*, but followed *Dodonæus* in figuring and deſcribing Tutſan for it? See more hereof in the chapter of Tutſan. I cannot ſay I haue ſeen this plant; but *Lobel* the Author & ſetter forth thereof thus briefly deſcribes it: The leaues are foure times leſſe than thoſe of ours, which grow thicke together as in rundles, vpon ſtalks being a cubit high. The floures are yellow, and like thoſe of our common kinde. ‡

3 Woolly S. Iohns wort hath many ſmall weake branches trailing vpon the ground, beſet with many little leaues couered ouer with a certain ſoft kinde of downineſſe: among which come forth weake and tender branches charged with ſmall pale yellow floures. The ſeeds and roots are like to the true S. Iohns wort.

‡ 3 *Hypericum tomentoſum Lobelij.* *Lobels* woolly S. Iohns wort.



Hypericum elodes, Sm. E. F. 3, 330

Lob. ic. 401

‡ The figure that our Author gaue was of that which I here giue you the ſecond in the third place, vnder the title of *Hyper. toment. Cluſij*: for *Cluſius* ſaith it was his, and blames *Lobel* for making it all one with that he found about Montpelier: whoſe figure alſo I giue you firſt in the third place that you may ſee what difference you can obſerue by them: for *Cluſius* ſaith, *Lobels* is but an handfull high; yet tells he not vs how high his growes, neither inſtances how they differ, neither can I gather it by *Lobels* deſcription: but I conjecture it thus; That of *Cluſius* his deſcription is taller, more white and hairy, and hath the floures growing along little foot-ſtalks, and not in maner of an vmbel, as in the other.

‡ 4 Beſides theſe two creeping hoary S. Iohns Worts here deſcribed, there is another ſmall kinde which is called by *Dodonæus*, *Hypericum minus*; and by *Lobel*, *Hypericum minimum ſupinum Septentrionale*. It growes ſome handfull or more high, with weake and ſlender branches ſet with leaues like thoſe of the ordinarie kinde, but leſſe: the floures are alſo like thoſe of the firſt deſcribed, but fewer in number, and leſſe. It is to be found in dry and barren grounds, and flours at the ſame time as the former.

5 I haue obſerued growing in S. Iohns Wood and other places, that kinde of S. Iohns Wort which

Dioſcorides ſaith, That the ſeed drunke for the ſpace of forty daies together cureth the Sciatica, and all aches that happen in the hips.

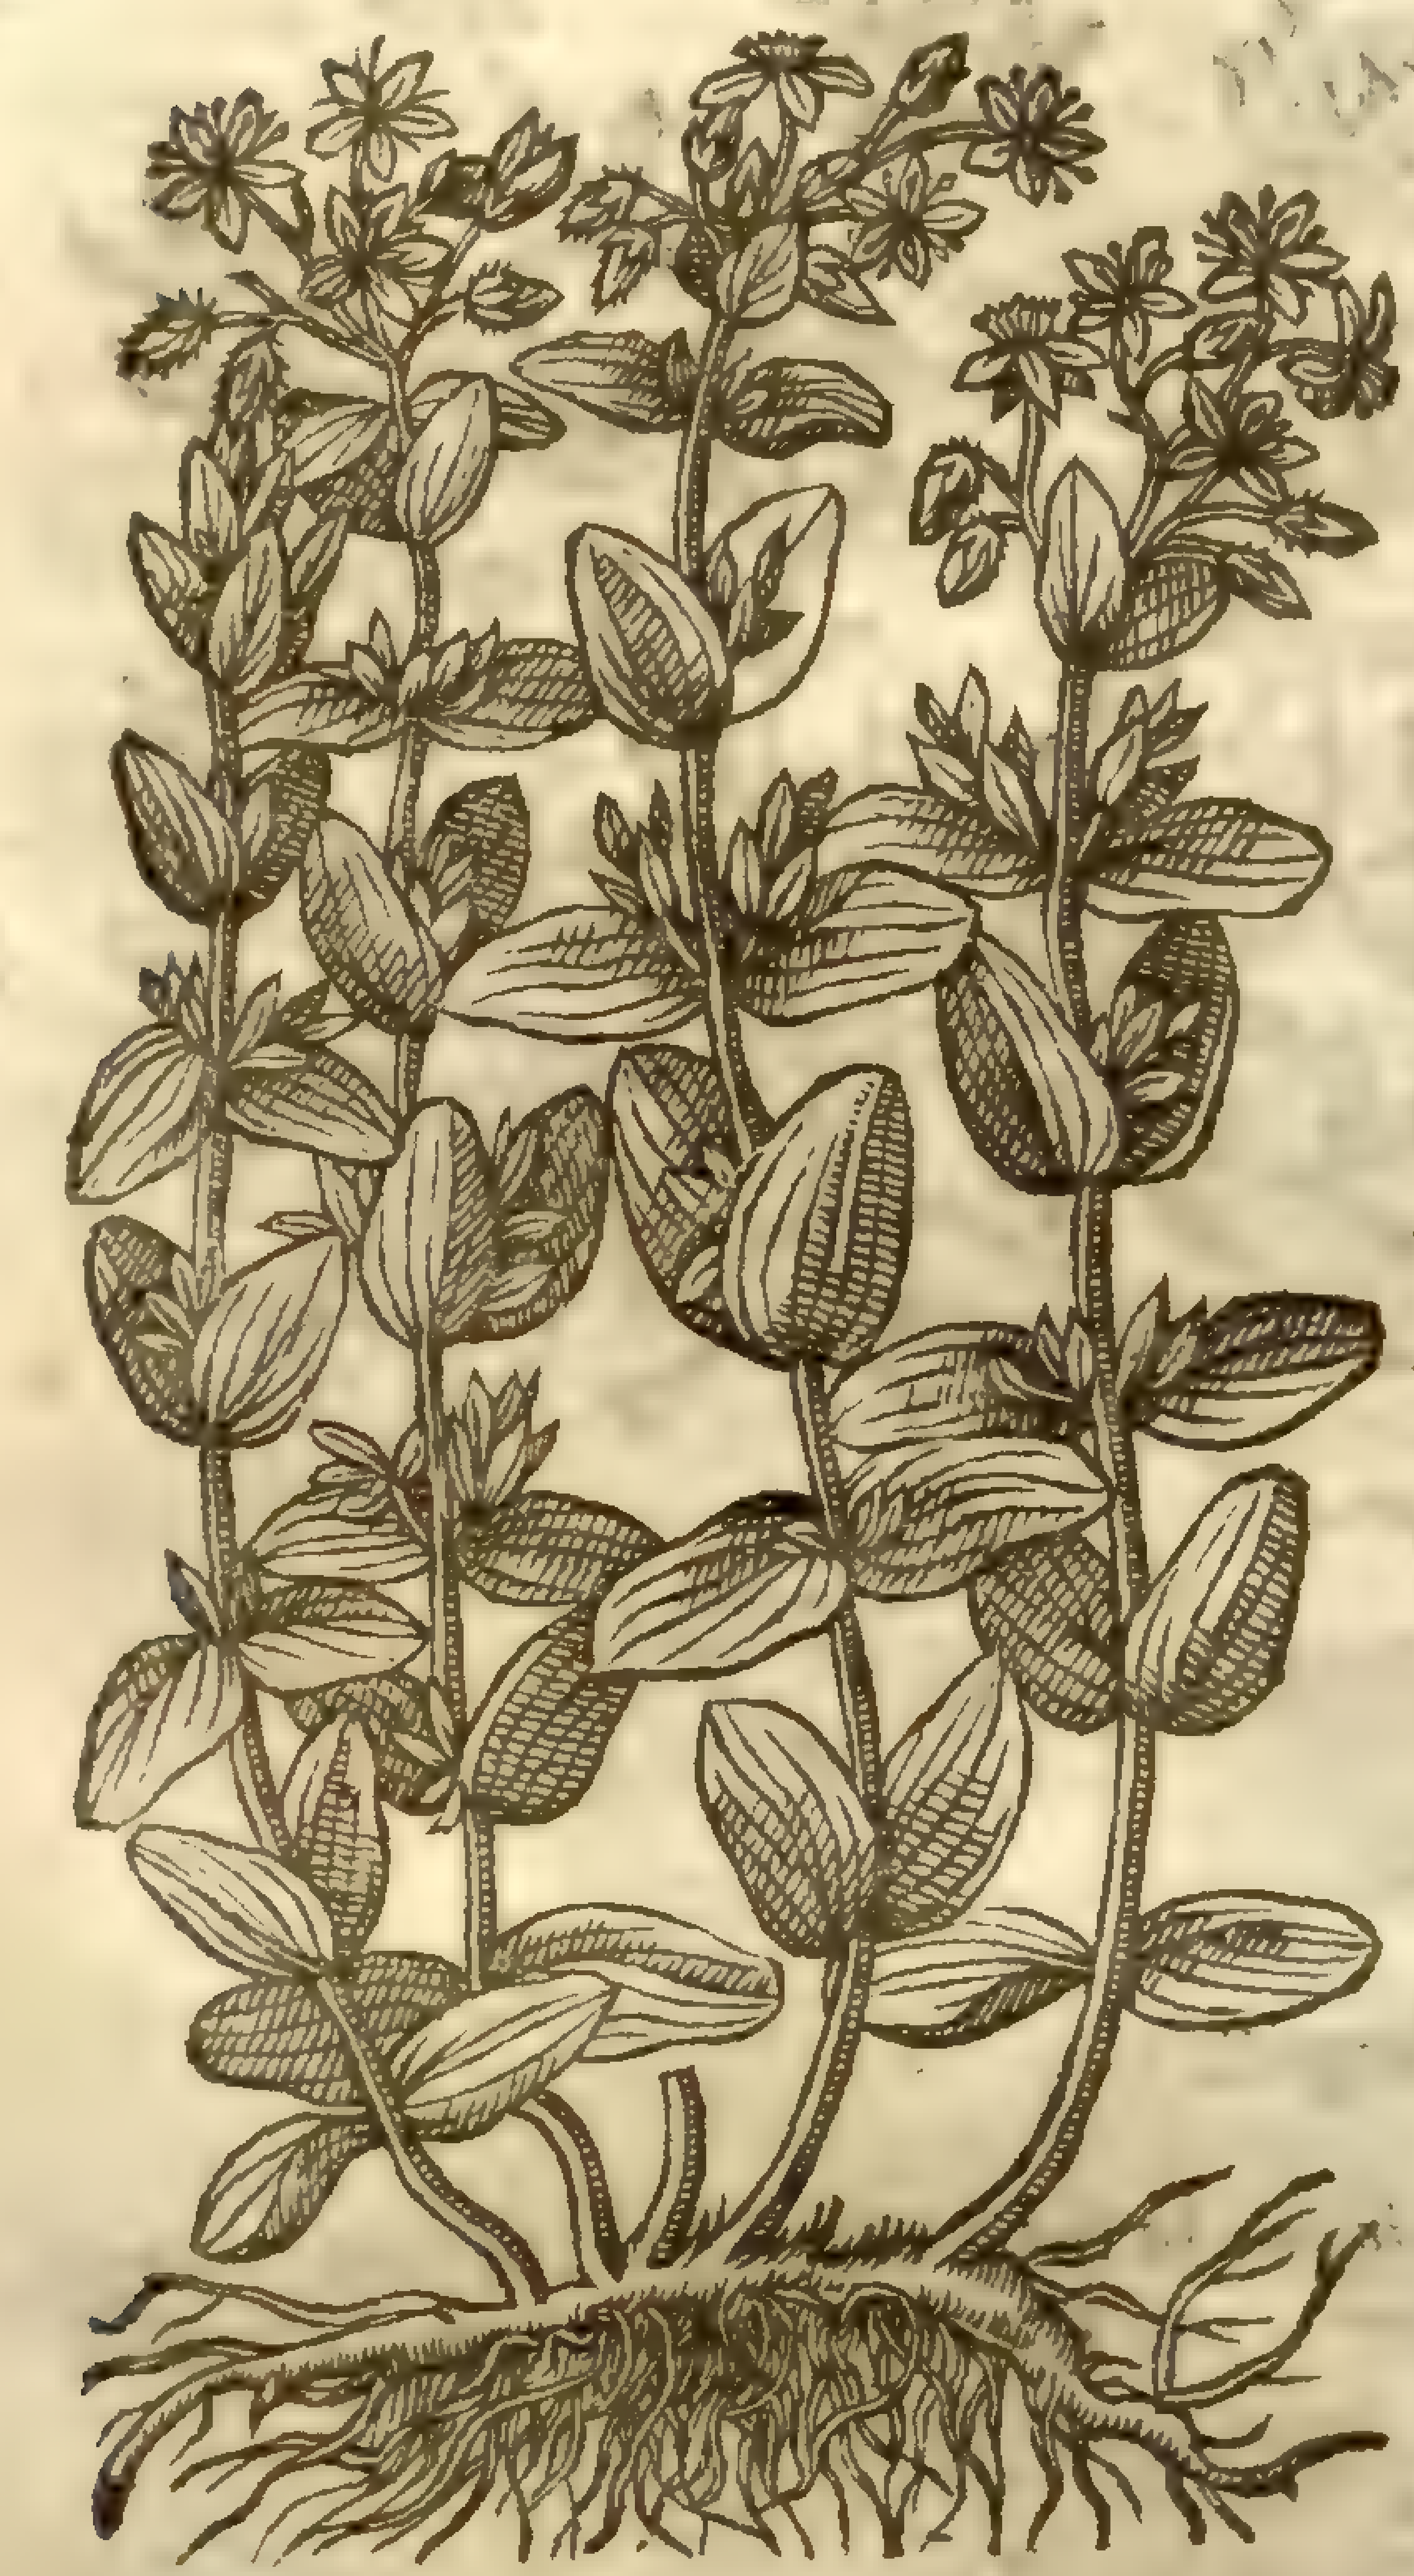
The ſame Author ſaith, That being taken in wine it takes away tertian and quartan Agues.

Chap. 159.

Of S. Peters wort or ſquare S. Iohns graſſe.

Hypericum [illegible]

1 *Aſcyron.*
S. Peters wort.



¶ *The Deſcription.*

1 Saint Peters wort groweth to the height of a cubit and a halfe, hauing a ſtraight vpright ſtalk ſomwhat brown, ſet by couples at certaine diſtances, with leaues much like thoſe of S. Iohns Wort, but greater, rougher, and rounder pointed: from the boſom of which leaues come forth many ſmall leaues, the which are not bored through, as thoſe of S. Iohns Wort are; yet ſomtimes there be ſome few ſo bored through. The floures grow at the top of the branches of a yellow colour: the leaues and floures when they are bruiſed do yeeld forth a bloudy juice as doth S. Iohns wort, whereof this is a kind. The root is tough, and of a wooddy ſubſtance.

‡ 2 Vpon diuers boggy grounds of this kingdome is to be found growing that S. Peters Wort which *Cluſius* deſcribes in his *Auctarium* by the name of *Aſcyrum ſupinum* ἑλῶδες. This ſends forth diuers round hairy creeping ſtalks, which heere and there put vp new fibres or roots, and theſe are ſet at certain ſpaces with very round and hairy leaues of a whitiſh colour, two at a joint, and on the tops of theſe ſtalks grow a few ſmall yellow floures which conſiſt of fiue leaues apiece. Theſe ſtalks ſeldome ſend forth branches, vnleſſe it be one or two at the tops: it may well be called in Engliſh, Round leaued S. Peters wort. ‡ 2. H. elodes L. [illegible]

¶ *The Place.*

S. Peters wort or S. Iohns graſſe groweth plentifully in the North parts of England, eſpecially in Landſdale and Crauen: I haue found it in many places of Kent, eſpecially in a copſe by Mr. *Sedleys* houſe neere South-fleet.

¶ *The Time.*

It floureth and flouriſheth when S. Iohns wort doth.

¶ *The Names.*

It is called in Greeke ἄσκυρον: the Latines haue no other name but this Greek name *Aſcyron.* It is called of ſome *Androſæmum*: *Galen* makes it both a kind of Tutſan and S. Iohns wort, & ſaith it is named *Aſcyron*, or *Aſcyroides*: in Engliſh, S. Peters wort, Square or great S. Iohns graſſe, and of ſome Hardhay. Few know it from S. Iohns wort.

¶ *The Temperature.*

This herb is of temperature hot and dry.

¶ *The Vertues.*

A It is endued with the ſame vertues that S. Iohns wort is. The ſeed, ſaith *Dioſcorides* and *Galen*, being drunk in foure ounces and a halfe of Meade, doth plentifully purge by ſiege cholericke excrements.

Chap.

CHAP. 160. *Of Tutſan or Parke leaues.*

¶ *The Deſcription.*

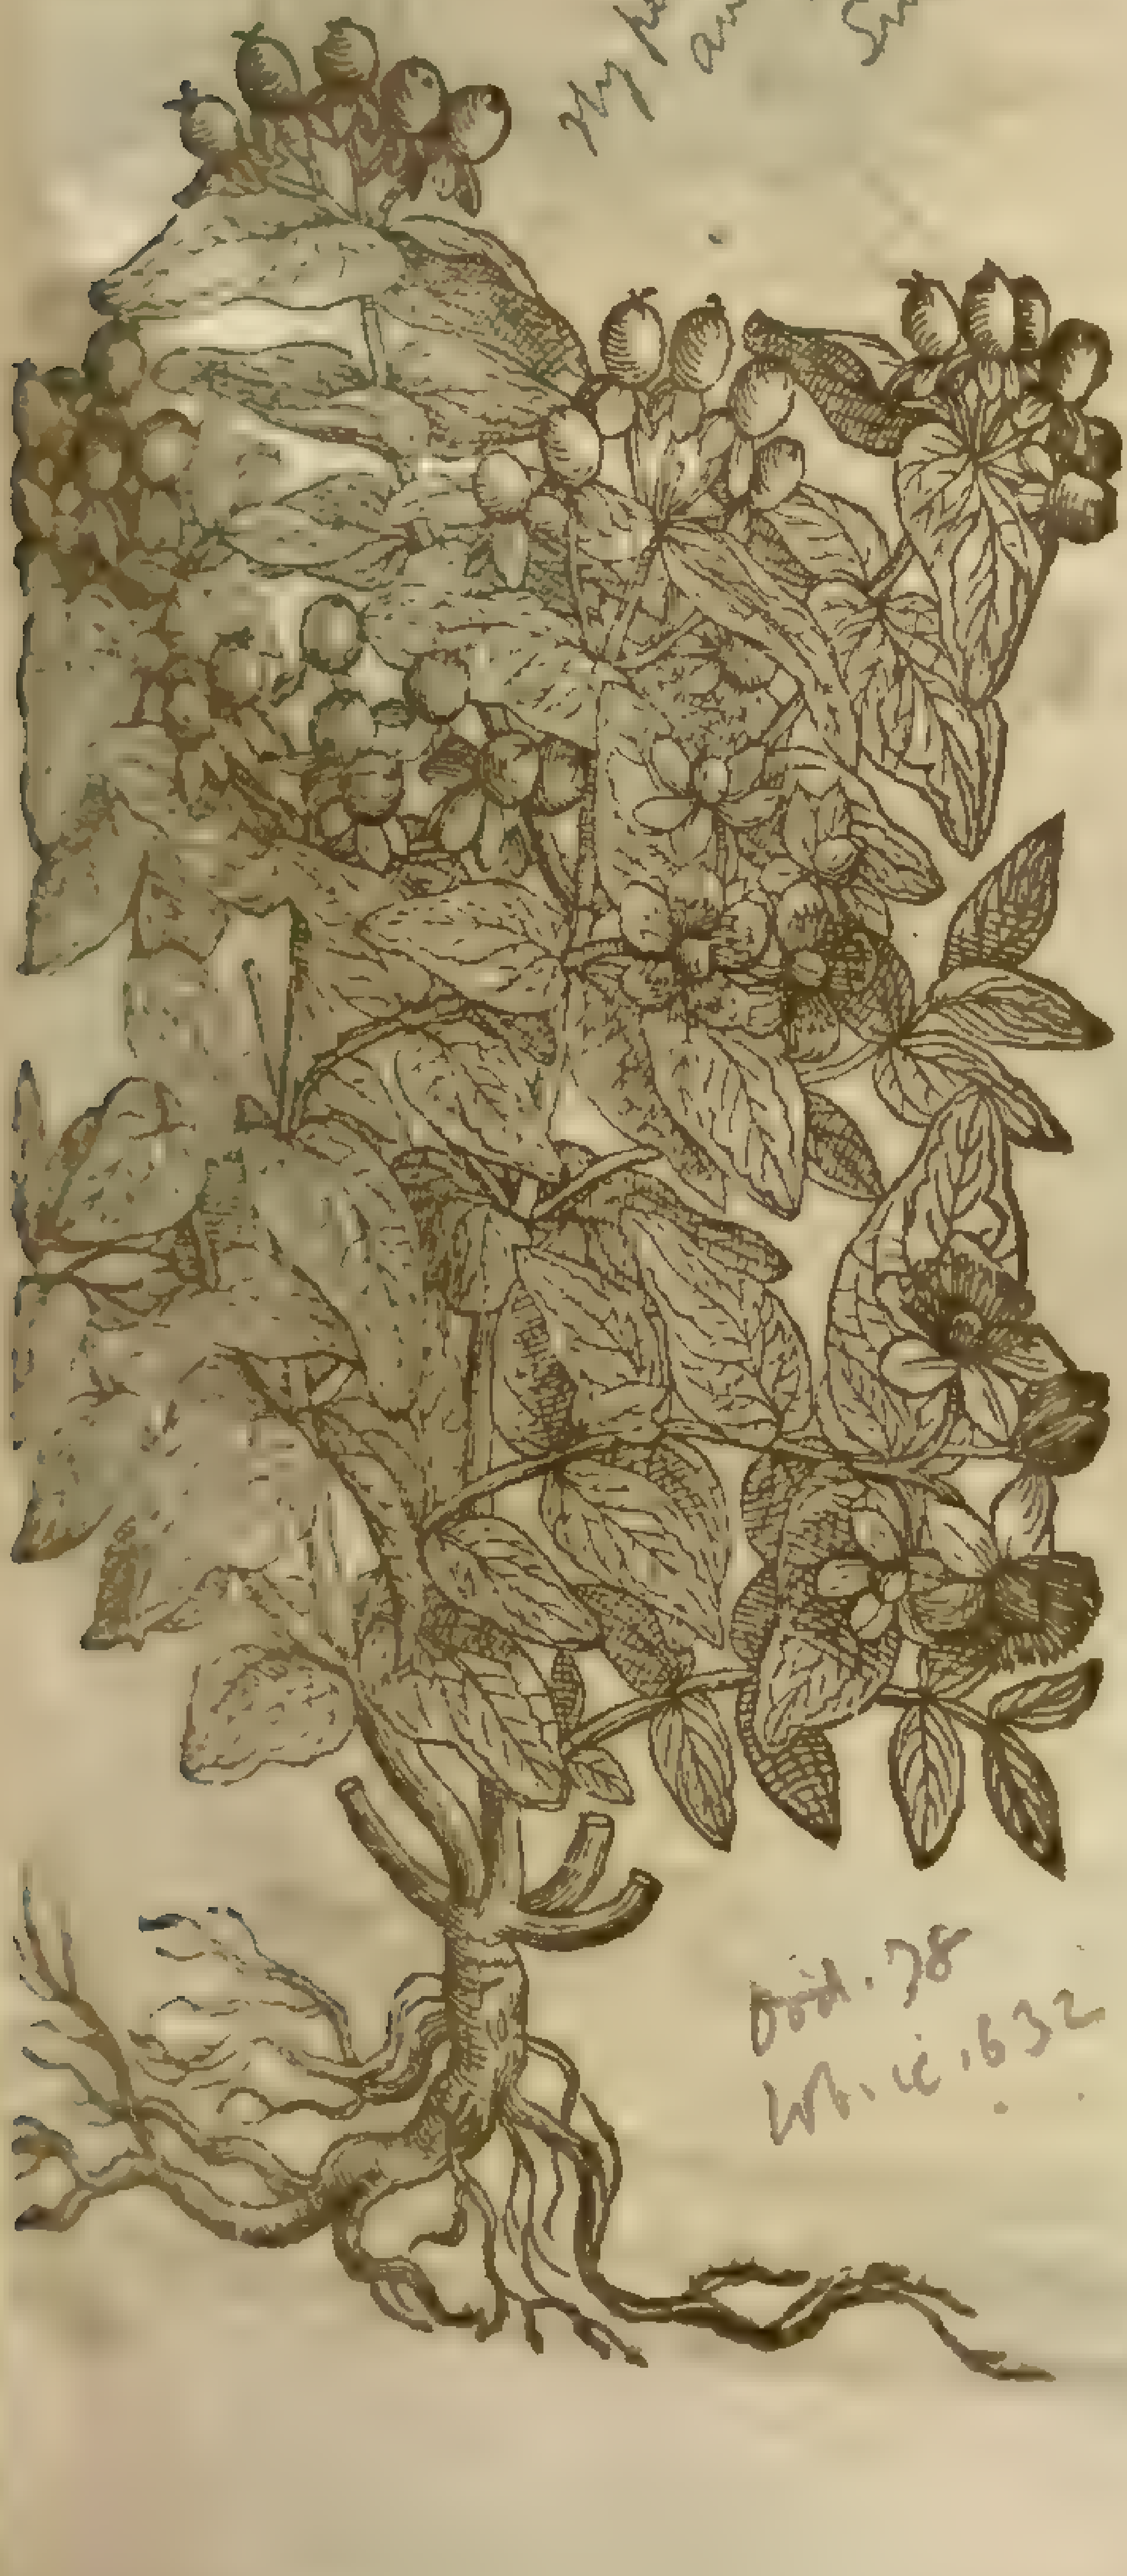
1 THe ſtalks of Tutſan be ſtraight,round,chamfered or creſted,hard and wooddy, beeing for the moſt part two foot high. The leaues are three or foure times bigger than thoſe of S.Iohns wort,which be at the firſt green; afterwards and in the end of Summer of a darke red colour: out of which is preſſed a juice not like blacke bloud, but Claret or Gaſcoigne wine. The floures are yellow,and greater than thoſe of S.Peters wort;after which riſeth vp a little round head or berry; firſt green,afterwards red,laſt of all blacke,wherein is contained yellowiſh red ſeed: the root is hard,wooddy,and of long continuance.

‡ 2 This,which *Dodonæus* did not vnfitly call *Ruta ſylveſtris Hypericoides*, and which others haue ſet forth for *Androſæmum*,and our Author the laſt chapter ſaue one affirmed to be the true *Androſæmum*, (though here it ſeemes he had either altered his mind,or forgot what he formerly wrot) may fitly ſtand in competition with the laſt deſcribed, which may paſſe in the firſt place for the *Androſæmum* of the Antients; for *adhuc ſub judice lis eſt*. I will not here inſiſt vpon the point of controuerſie,but giue you the deſcription of the plant,which is this:It ſends vp round ſlender reddiſh ſtalks ſome two cubits high,ſet with fewer yet bigger leaues than the ordinarie S.Iohns wort,and theſe alſo more hairy: the floures and ſeeds are like thoſe of the common S.Iohns wort,but ſomewhat larger: it growes in ſome mountainous wooddy places; and in the *Aduerſaria* it is called *Androſæmum excellentius,ſeu magnum*: and by *Dodonæus* (as we but now noted) *Ruta ſylveſtris Hypericoides*, thinking it to be the *Ruta ſylueſtris* which is deſcribed by *Dioſcorides, lib.*3. *cap*.48. in the old Greeke edition of *Manutius*, Κεφ. νμζ. And in that of *Marcellus Virgilius* his interpretation, in the chapter and booke but now mentioned; but rejected amongſt the *Nothi* in the Paris edition, *Anno* 1549. You may finde the deſcription alſo in *Dodonæus*, *Pempt. primæ, lib.*3. *cap*.25. whither I refer the Curious,being loth here to inſiſt farther vpon it. ‡

Hypericum androsaemum, Mill. dict. Sm. fl. 3.323

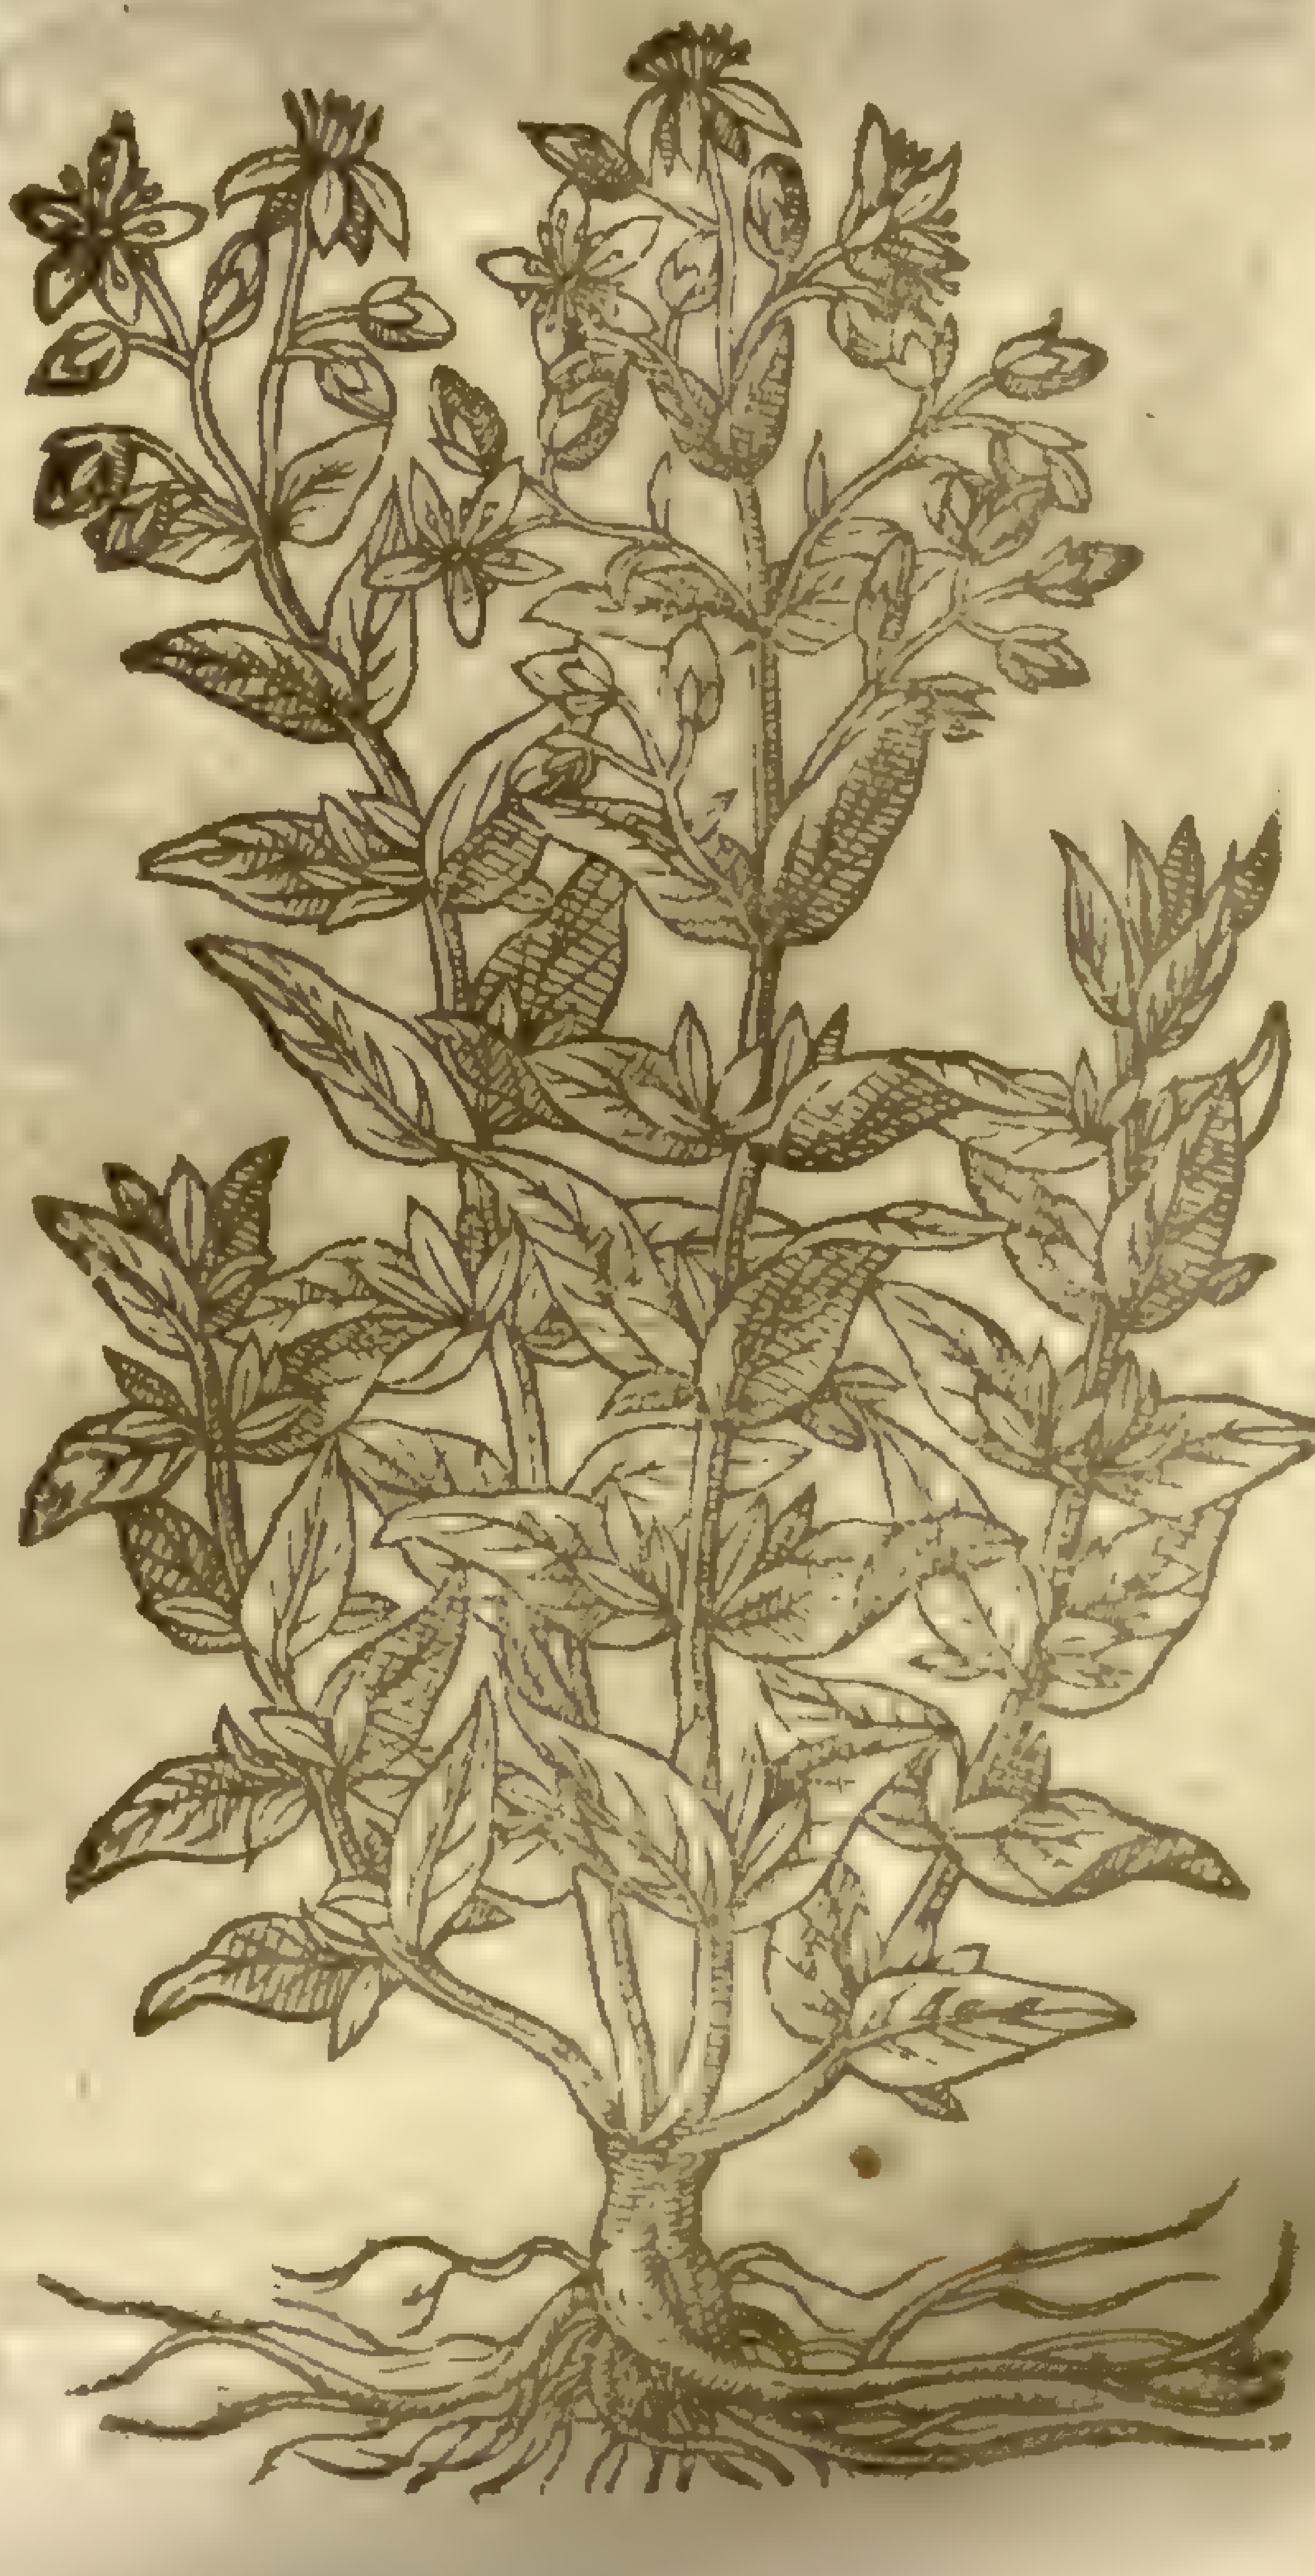
Hypericum hircinum, — Mill. dict.

1 *Clymenon Italorum.*
Tutſan or Parke leaues.



Dod. 78
Lob. ic. 632

‡ 2 *Androſæmum Hypericoides.*
Tutſan S.Iohns wort.



¶ *The Place.*

Tutſan groweth in woods and by hedges, eſpecially in Hampſted wood, where the Golden Rod doth grow; in a wood by Railie in Eſſex, and many other places.

¶ *The Time.*

It floures in Iune and Auguſt: the ſeed in the mean time waxeth ripe. The leaues become red in Autumne, at which time is very eaſily preſſed forth his winy juice.

¶ *The Names.*

It is called in Greeke ἀνδρόσαιμον: and the Latines alſo *Androſæmon*: it is likewiſe called *Dionyſias*, as *Galen* witneſſeth. They are farre from the truth that take it to be *Clymenum*, and it is needleſſe to finde fault with their error. It is alſo called *Siciliana*, and *Herba Siciliana*: in Engliſh, Tutſan, and Parke leaues.

¶ *The Temperature.*

The faculties are ſuch as S. Peters wort, which doth ſufficiently declare it to be hot and dry.

¶ *The Vertues.*

A The ſeed hereof beaten to pouder, and drunke to the weight of two drams, doth purge cholerick excrements, as *Dioſcorides* writeth; and is a ſingular remedie for the Sciatica, prouided that the patient drinke water for a day or two after purging.

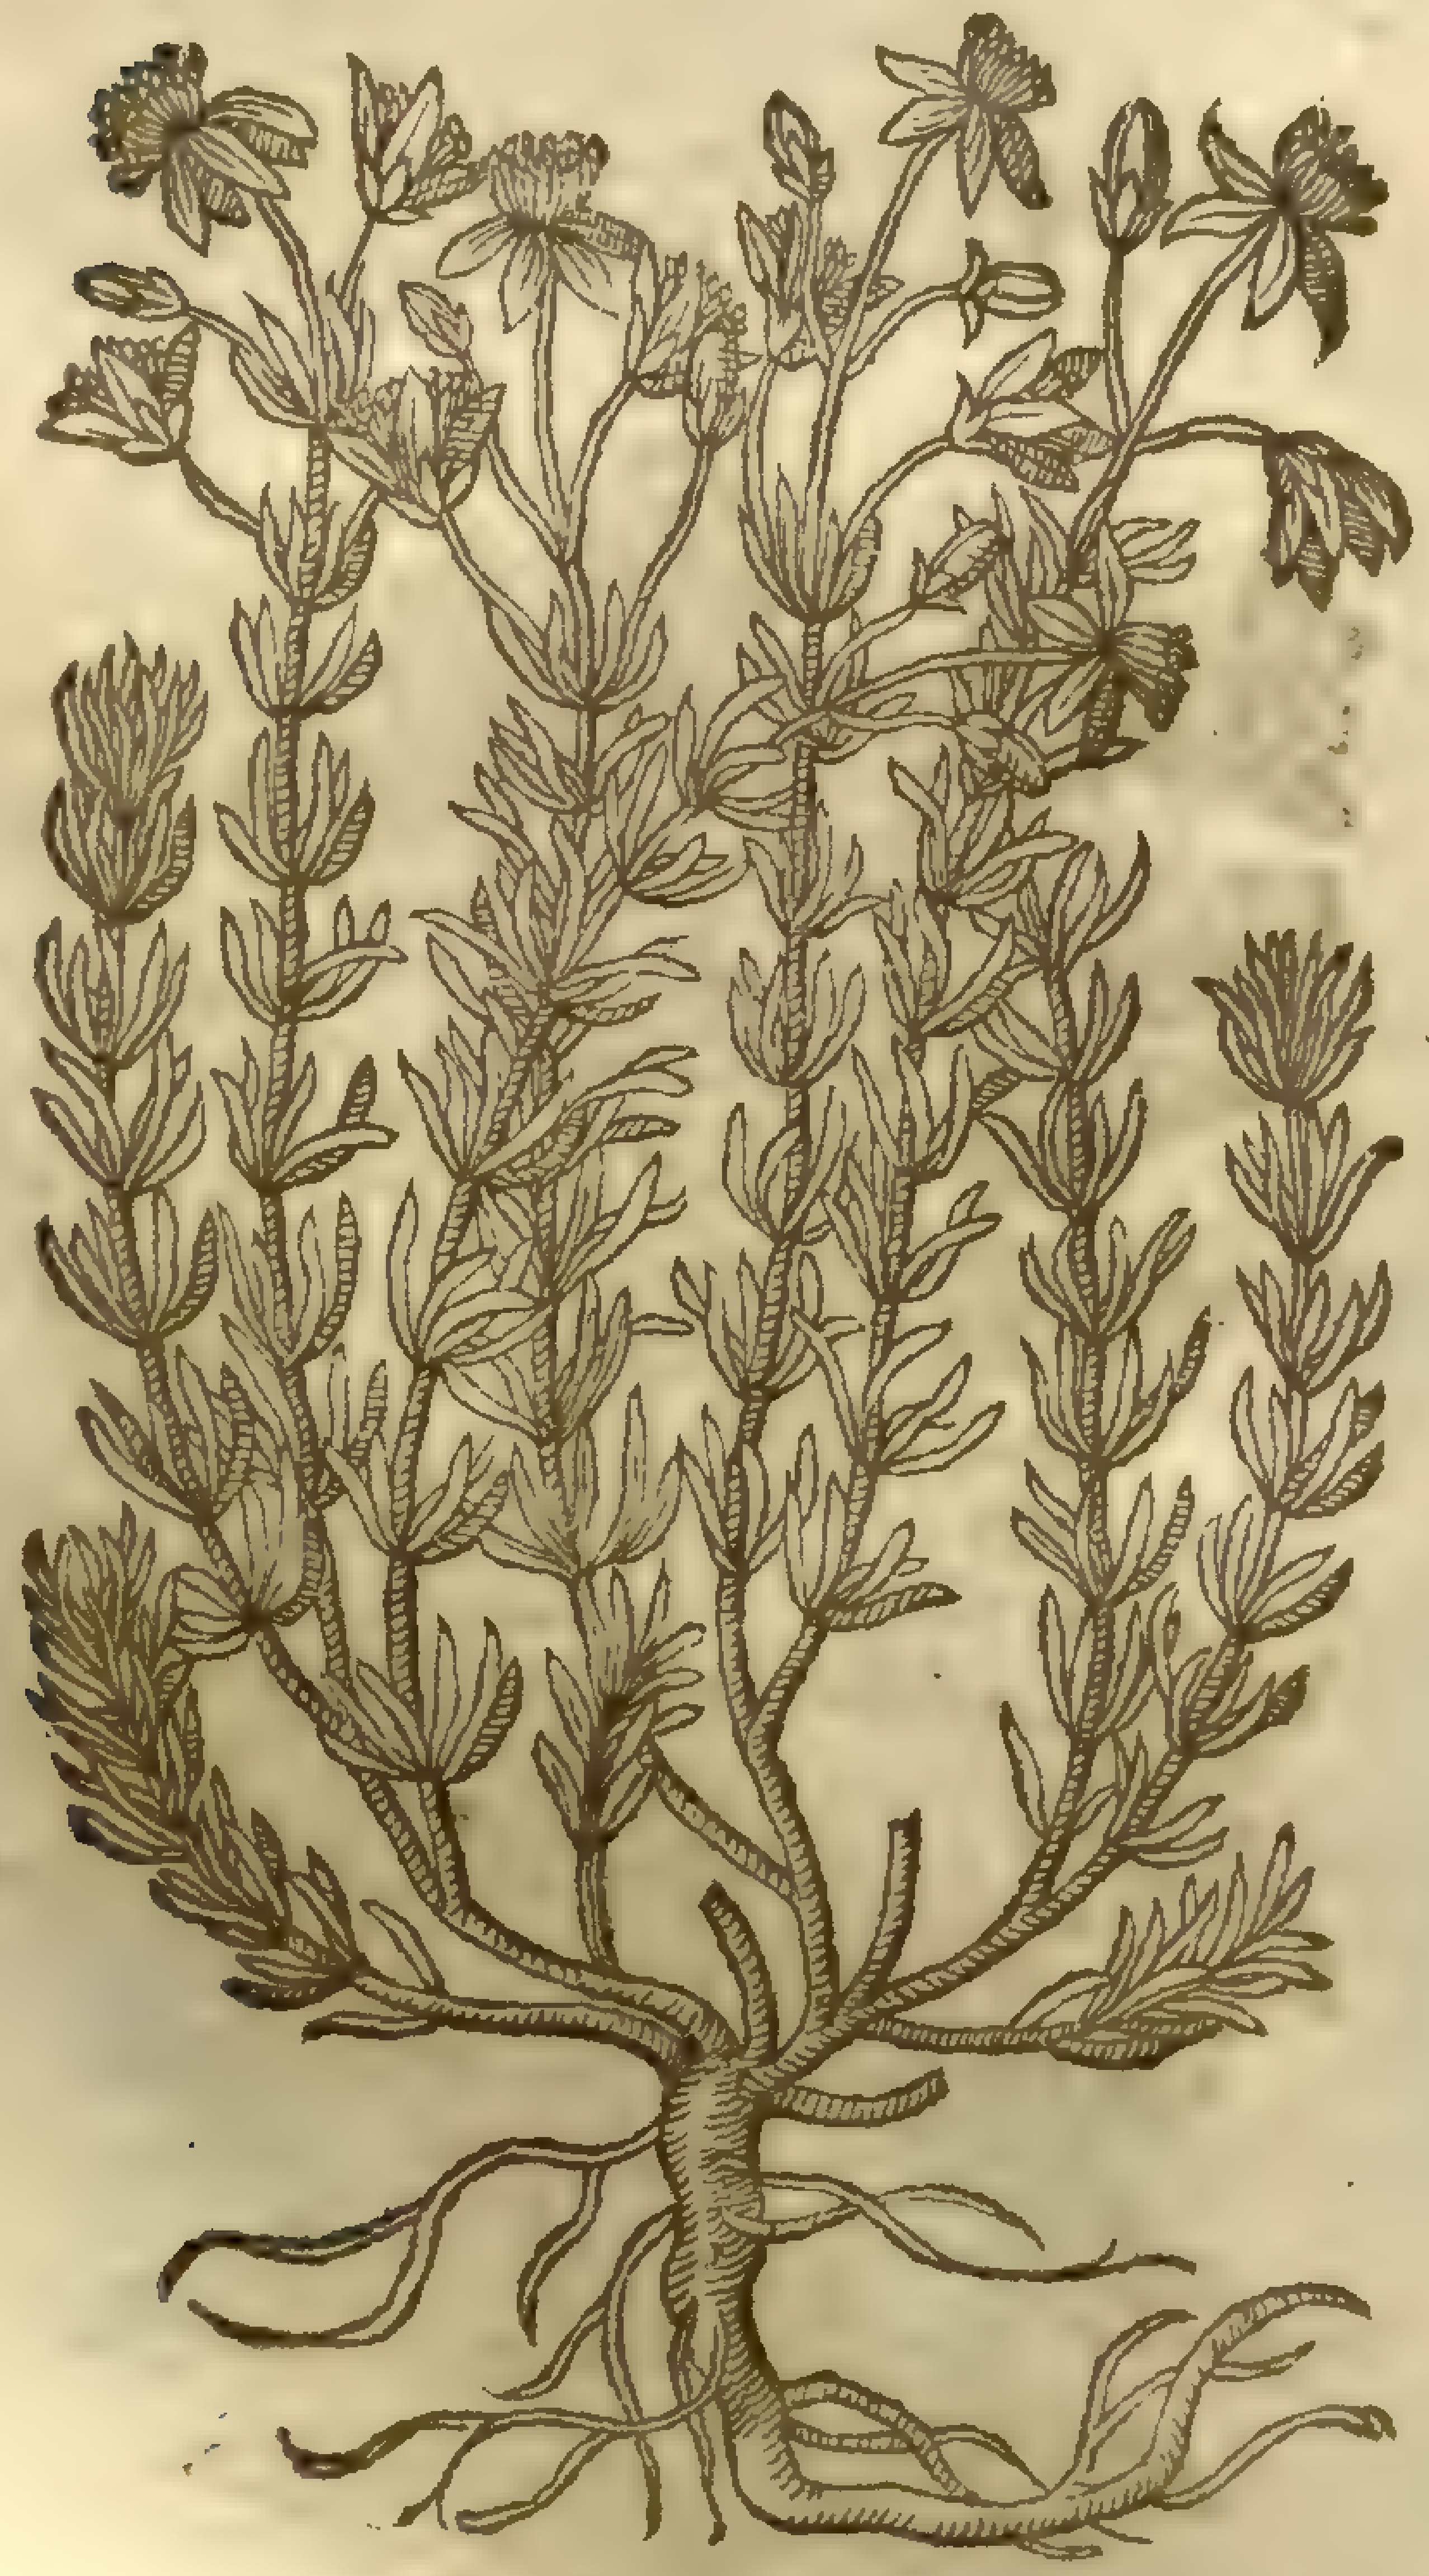
B The herbe cureth burnings, and applied vpon new wounds it ſtancheth the bloud and healeth them.

C The leaues laid vpon broken ſhins and ſcabbed legs heale them, and many other hurts & griefs; whereof it tooke his name Tout-ſaine or Tutſane, of healing all things.

‡ Chap. 161. *Of baſtard S. Iohns wort.*

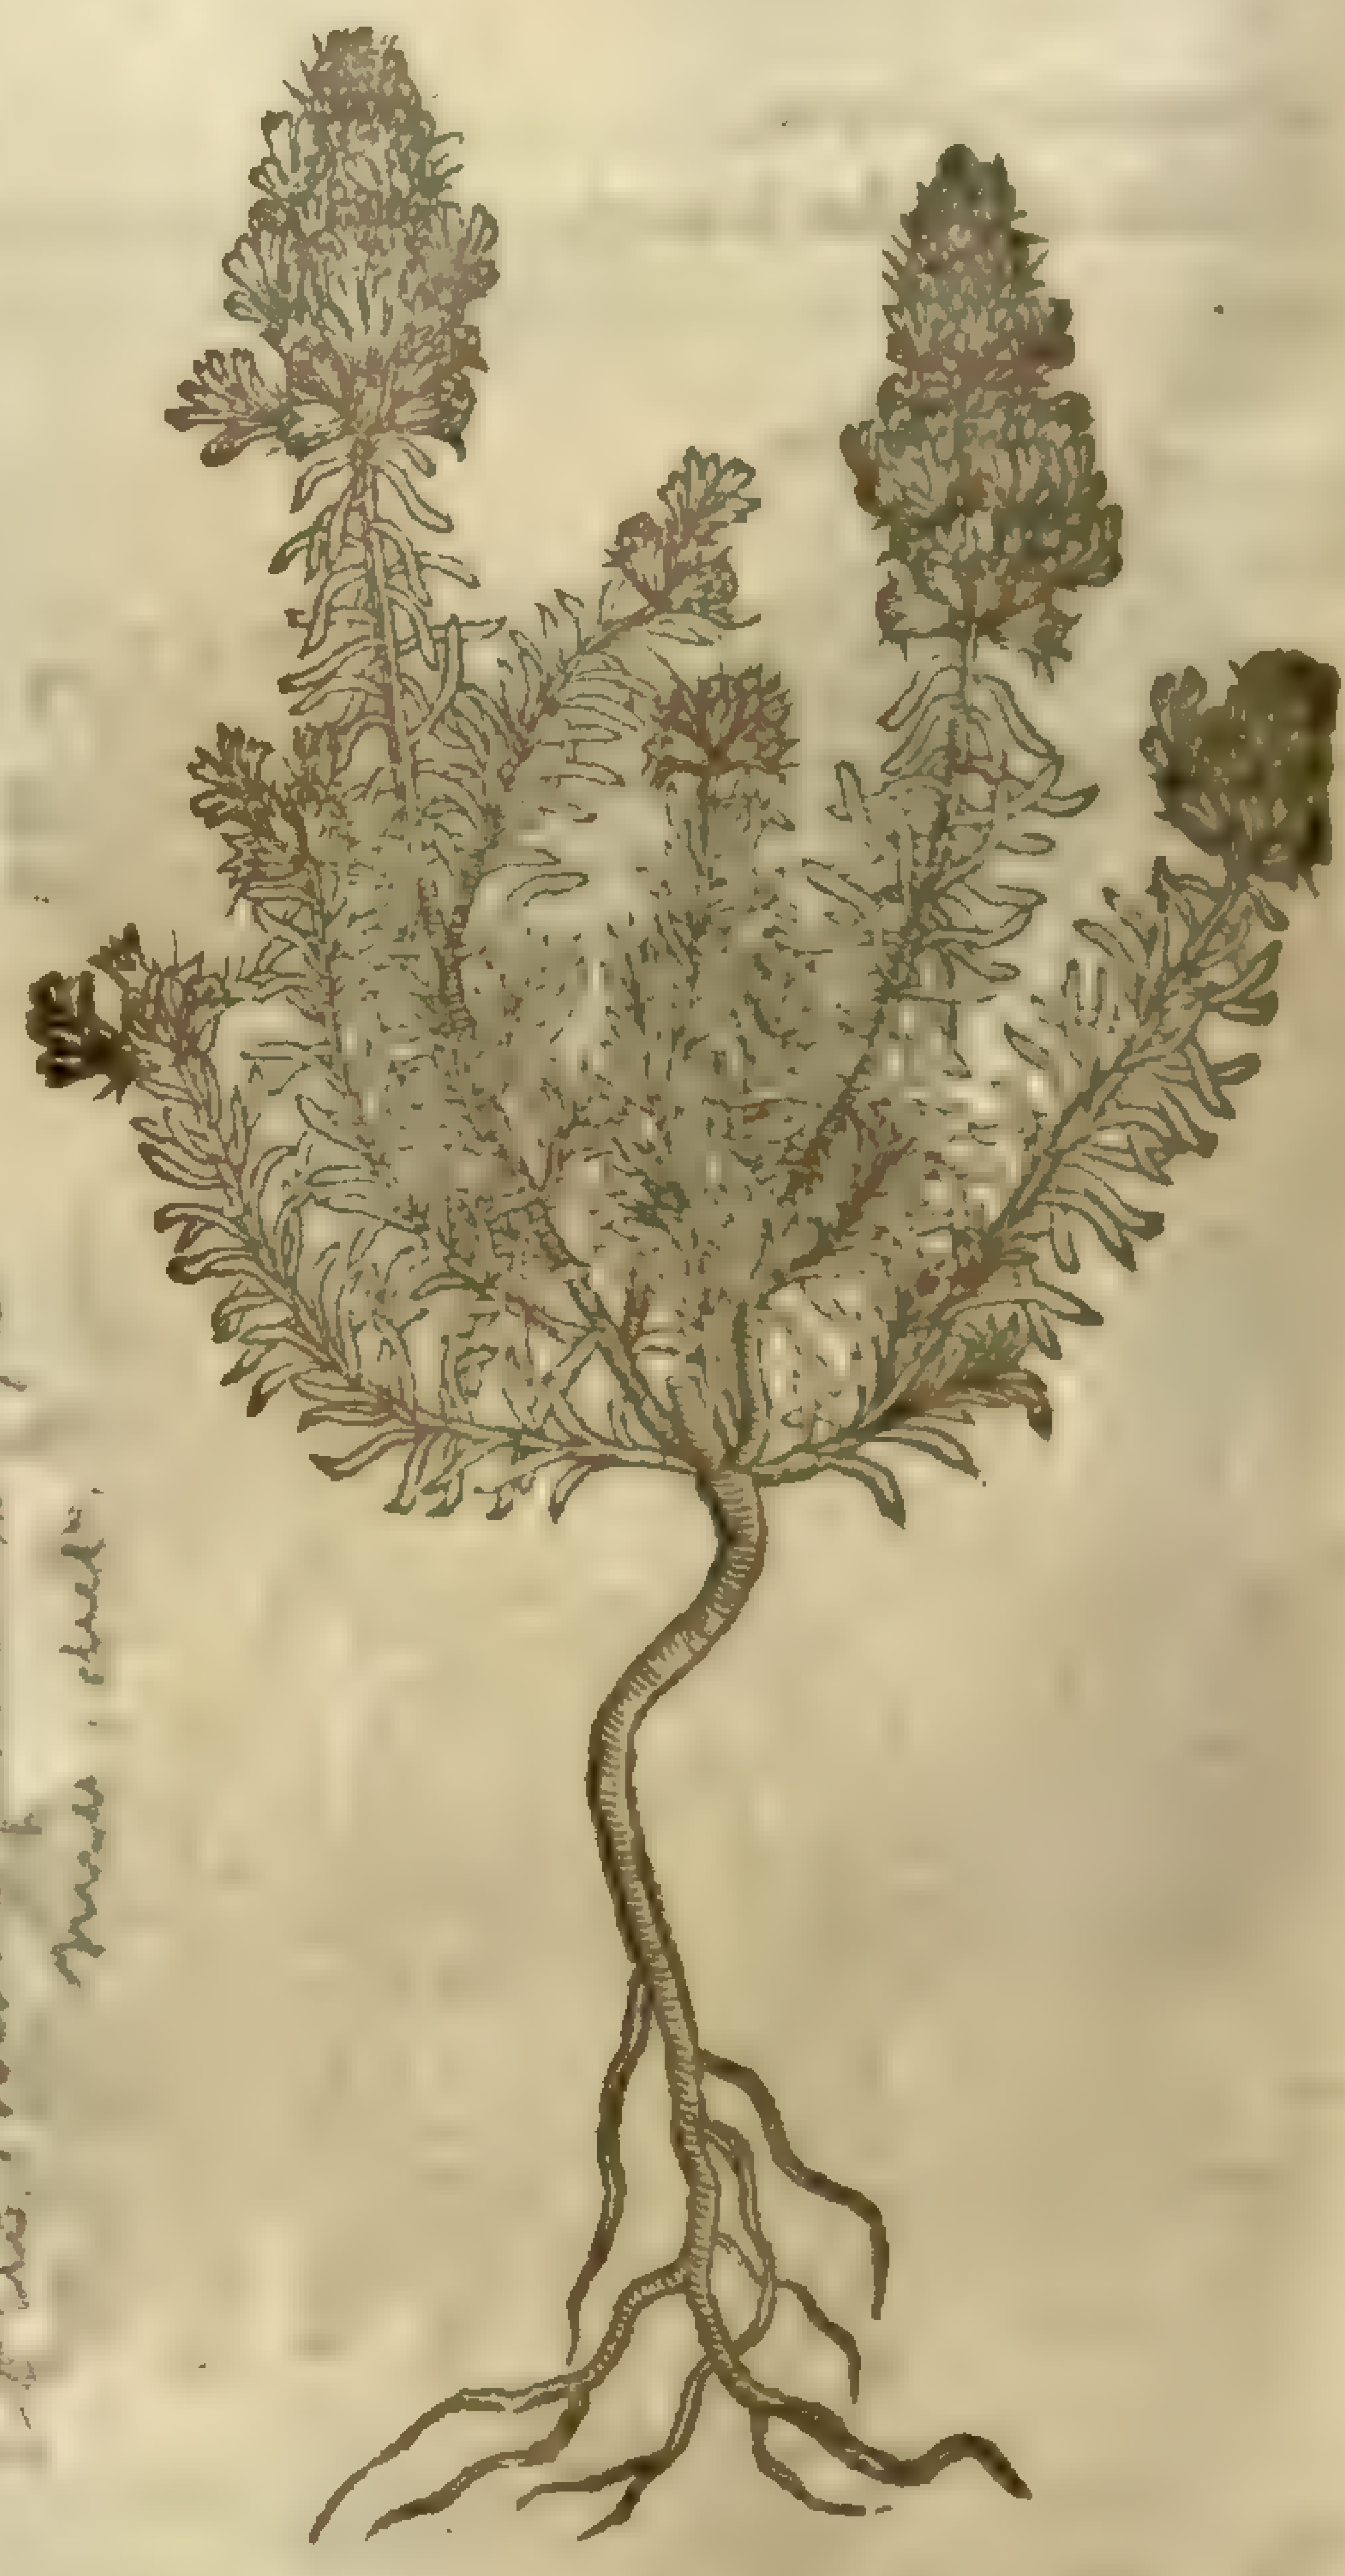
‡ 1 *Coris Matthioli.*
Matthiolus his baſtard S. Iohns wort.

Hypericum coris, [illegible]



‡ 2 *Coris cærulea Monſpeliaca.*
French baſtard S. Iohns wort.

Coris Monspeliensis, [illegible]



‡ The diligence of theſe later times hath been ſuch to finde out the *Materia Medica* of the Antients, that there is ſcarce any Plant deſcribed by them, but by ſome or other of late there haue been two or more ſeuerall plants referred thereto: and thus it hath happened vnto that

which *Dioſcorides lib.3.cap.*174. hath ſet forth by the name of *Coris*; and preſently deſcribes after the kindes of *Hypericon*, and that with theſe words; οἱ δὲ ϗ τοῦτο ὑπερικὸν καλοῦσι. Some alſo call this *Hypericon*; to which *Matthiolus* and others haue fitted a plant, which is indeed a kinde of *Hypericon*, as you may perceiue by the figure and deſcription which I giue you in the firſt place. Some (as *Heſychius*) referre it to *Chamæpitys*, (and indeed by *Dioſcorides* it is placed betweene *Androſæmon* and *Chamæpitys*) and to this that which is deſcribed by *Pena* and *Lobel* in the *Aduerſ.* and by *Cluſius* in his Hiſtorie, may fitly be referred: this I giue you in the ſecond place.

¶ *The Deſcription.*

1 THe firſt hath a wooddy thicke and long laſting root, which ſendeth vp many branches ſome foot or more high, and it is ſet at certaine ſpaces with round leaues like thoſe of the ſmall Glaſſe-wort or Sea-Spurry, but ſhorter: the tops of the ſtalkes are diuided into ſundry branches, which carry floures like thoſe of S. Iohns woort, of a whitiſh red colour, with threds in their middles hauing little yellow pendants. It growes in Italy and other hot countries, in places not far from the ſea ſide. This is thought to be the true *Coris*, by *Matthiolus*, *Geſner*, *Lonicerus*, *Lacuna*, *Bellus*, *Pena*, and others.

2 This from a thicke root red on the outſide ſendeth vp ſundry ſtalkes, ſome but an handfull, other ſome a foot or more long, ſtiffe, round, purpliſh, ſet thicke with leaues like thoſe of Heath, but thicker, more ſucculent and bitter, which ſometimes grow orderly, and otherwhiles out of order. The ſpikes or heads grow on the tops of the branches, conſiſting of a number of little cups, diuided into fiue ſharpe points, and marked with a blacke ſpot in each diuiſion: out of theſe cups comes a floure of a blew purple colour, of a moſt elegant and not fading colour; and it is compoſed of foure little bifide leaues, whereof the two vppermoſt are the larger: the ſeed, which is round and blackiſh, is contained in ſeed veſſels hauing points ſomewhat ſharpe or prickly. It floures in Aprill or May, and is to be found growing in many places of Spaine, as alſo about Mompelier in France; whence *Pena* and *Lobel* called it *Coris Monſpeliaca*; and *Cluſius*, *Coris quorundam Gallorum & Hiſpanorum.*

¶ *The Temperature.*

Theſe plants ſeeme to be hot in the ſecond or third degree.

¶ *The Vertues.*

A *Dioſcorides* ſaith, That the ſeeds of *Coris* drunke mooue the courſes and vrine, are good againſt the biting of the Spider *Phalangium*, and the Sciatica; and drunke in Wine, againſt that kinde of Convulſions which the Greekes call *Opiſthotonos*, (which is when the boby is drawne backwards) as alſo againſt the cold fits in Agues. It is alſo good annointed with oyle, againſt the aforeſaid Convulſions. ‡

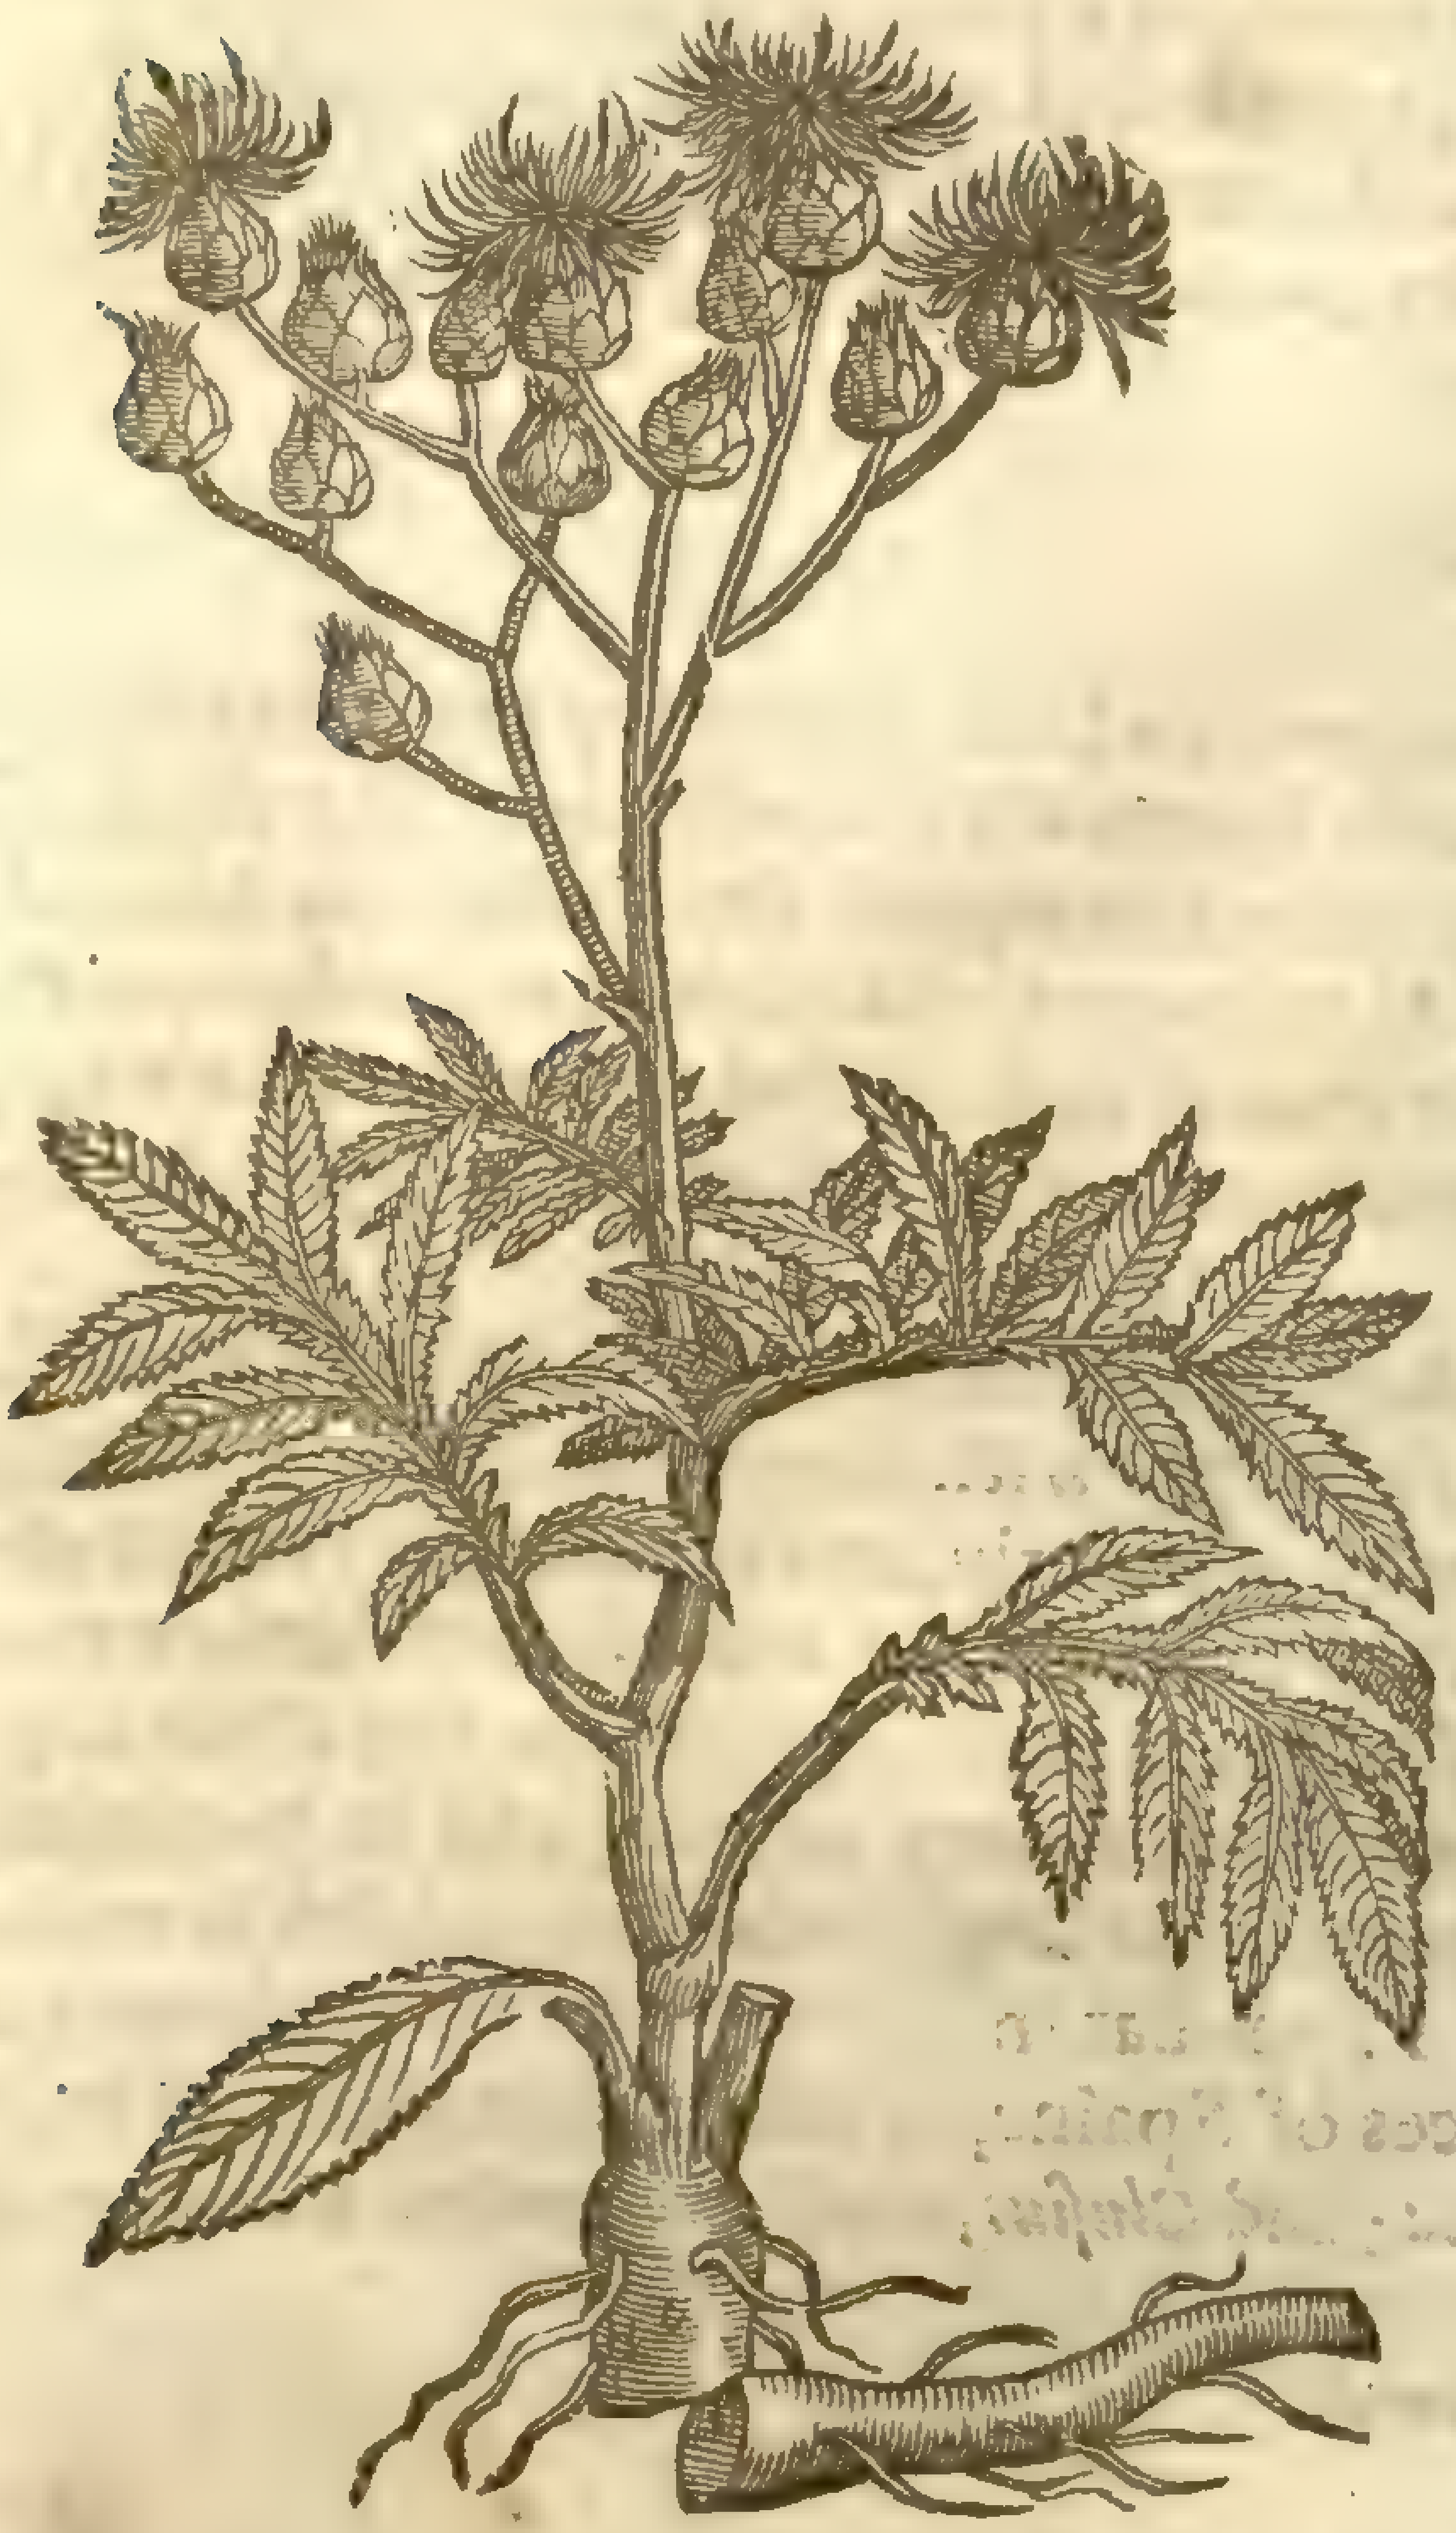
CHAP. 153. *Of the great Centorie.*

¶ *The Deſcription.*

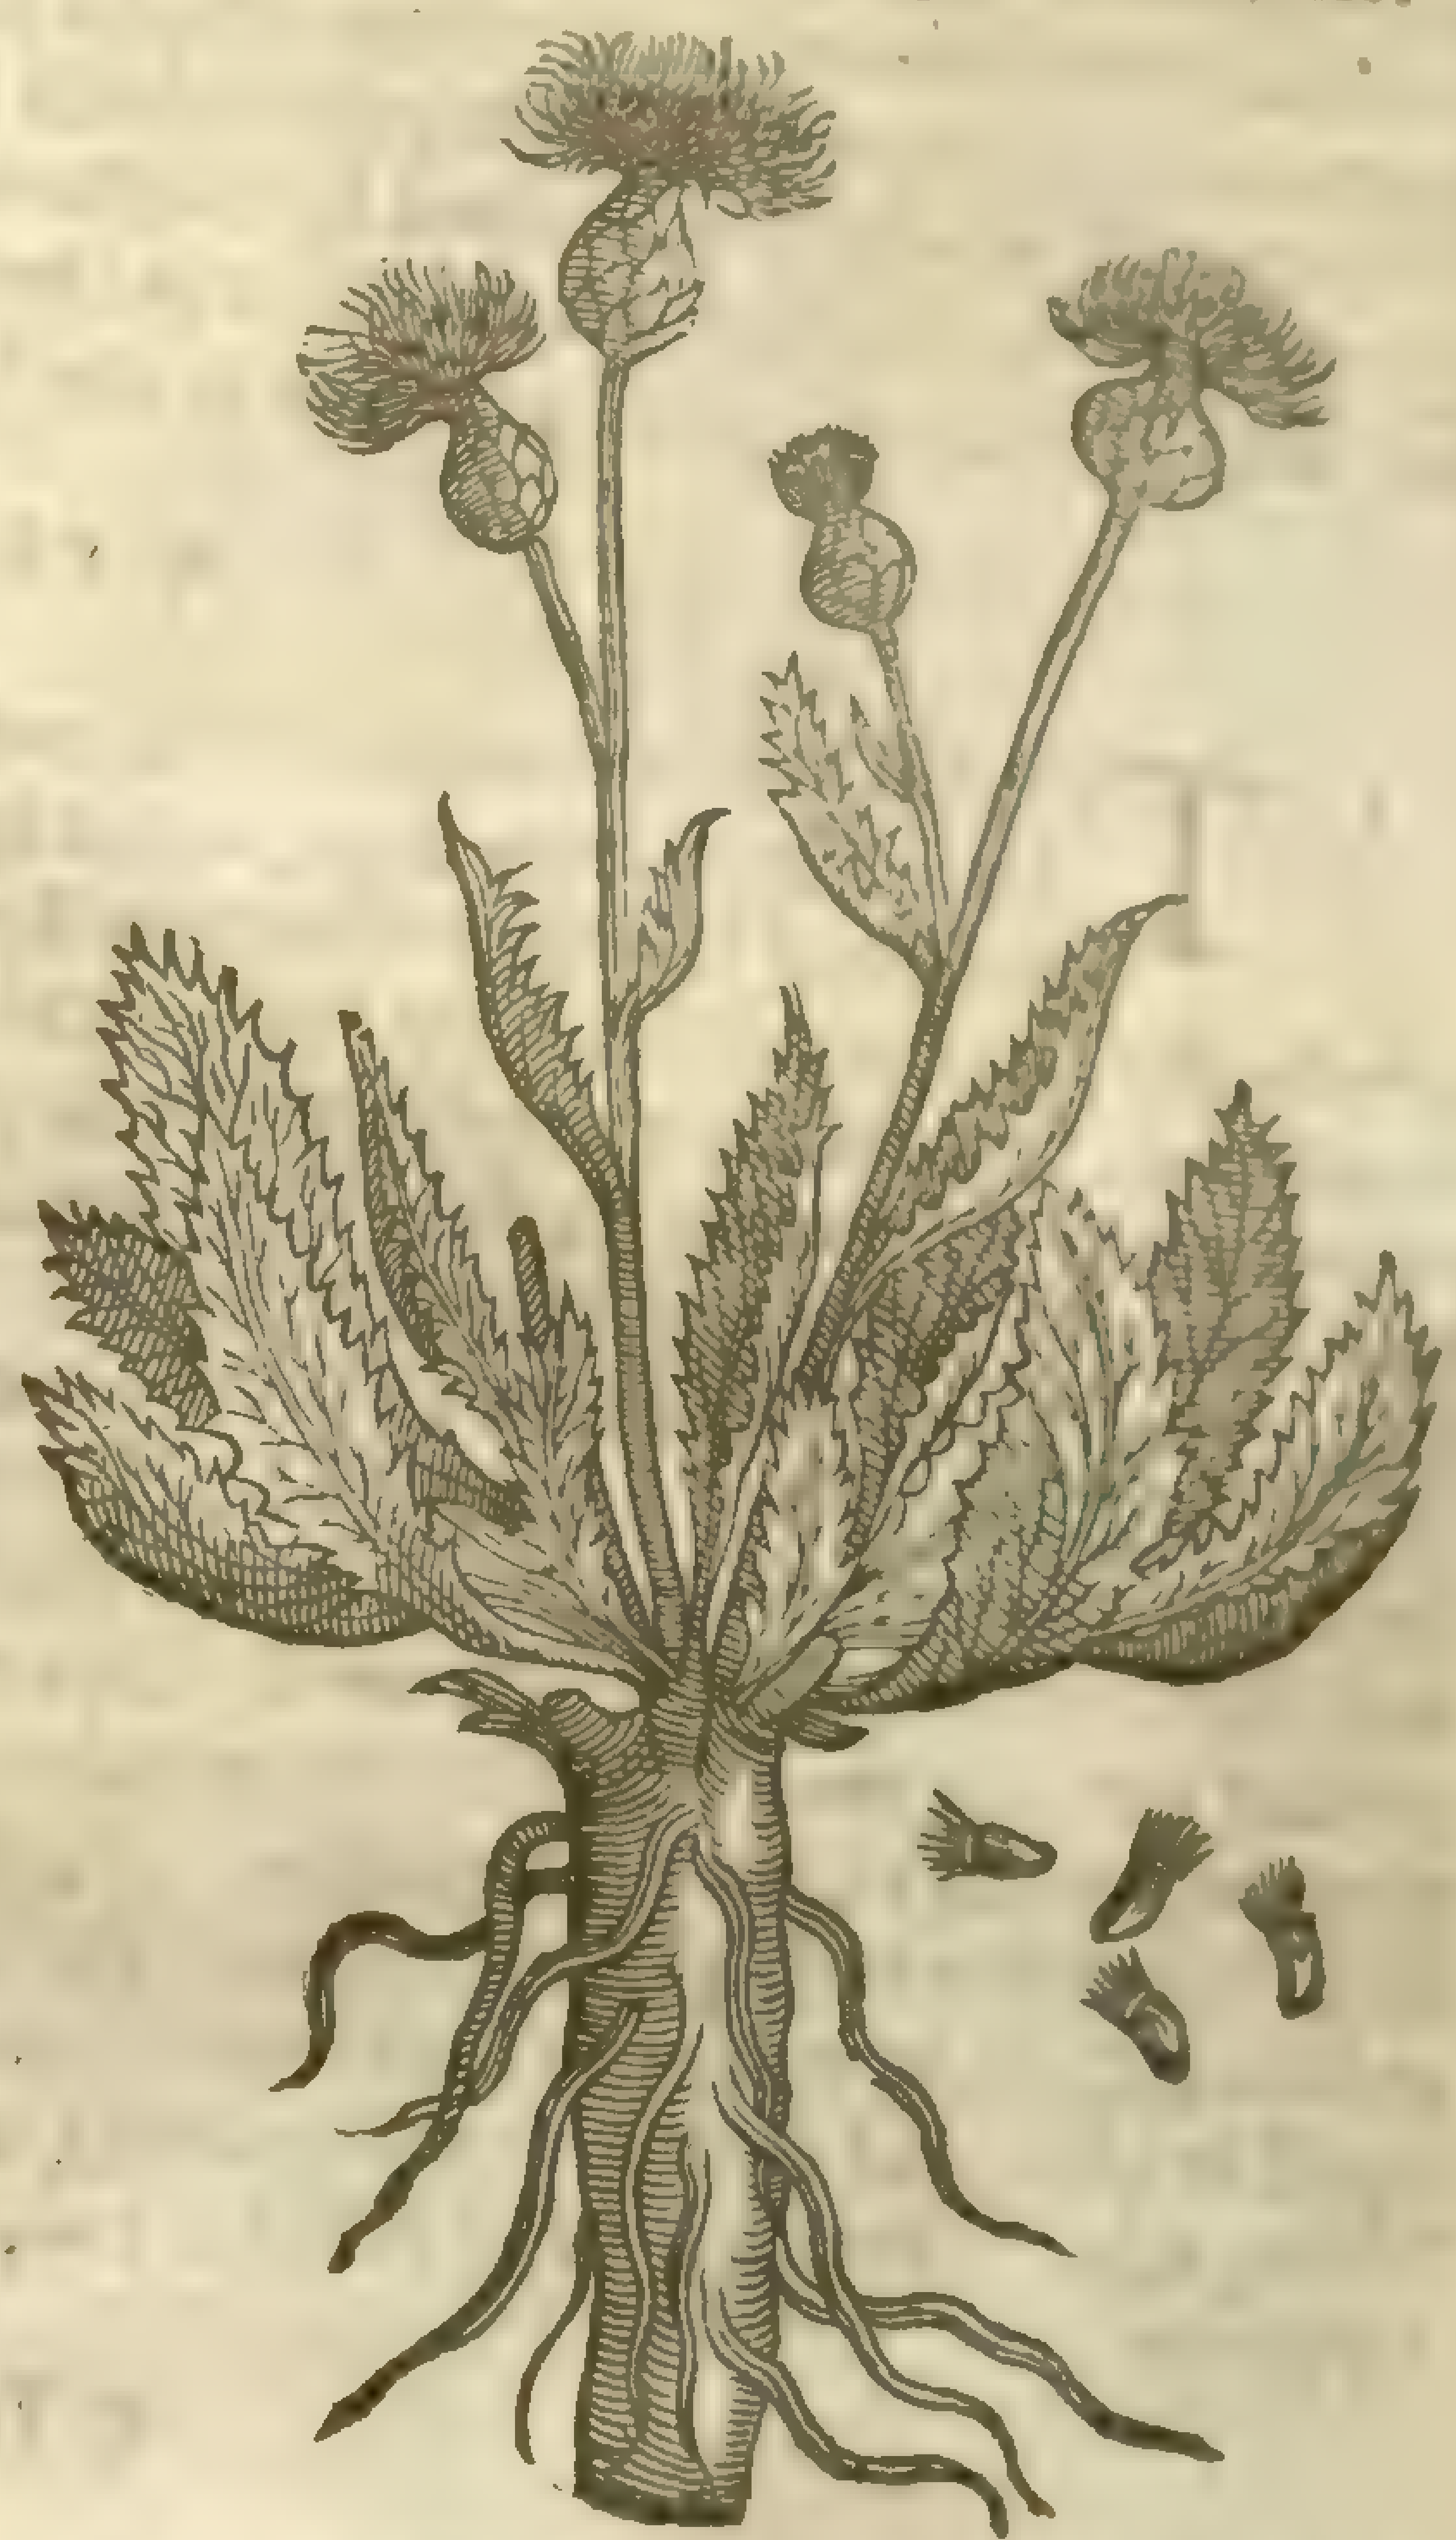
1 THe great Centorie bringeth forth round ſmooth ſtalkes three cubits high: the leaues are long, diuided as it were into many parcels like to thoſe of the Walnut tree, and of an ouerworne grayiſh colour, ſomewhat ſnipt about the edges like the teeth of a ſaw. The floures grow at the top of the ſtalkes in ſcaly knaps like the great Knapweed, the middle thrums whereof are of a light blew or sky colour: when the ſeed is ripe the whole knap or head turneth into a downy ſubſtance like the head of an Artichoke, wherein is found a long ſmooth ſeed, bearded at one end like thoſe of Baſtard Saffron, called *Cartamus*, or the ſeed of *Carduus Benedictus*. The root is great, long, blacke on the outſide, and of a ſanguine colour on the inſide, ſomewhat ſweet in taſte, and biting the tongue.

2 There is likewiſe another ſort, hauing great and large leaues like thoſe of the water Docke, ſomewhat ſnipt or toothed about the edges. The ſtalke is ſhorter than the other, but the root is more oleous or fuller of juyce, otherwiſe like. The floure is of a pale yellow purpliſh colour, and the ſeed is like that of the former.

1 *Centaurium magnum.*
Great Centorie.



‡ 2 *Centaurium majus alterum.*
Whole leaued great Centorie.



¶ *The Place.*

The great Centorie ioyeth in a fat and fruitfull ſoile, and in Sunny bankes full of Graſſe and herbes. It groweth very plentifully, ſaith *Dioſcorides*, in Lycia, Peloponneſus, Arcadia, and Morea: and it is alſo to be found vpon Baldus a Mountaine in the territories of Verona, and likewiſe in my Garden.

¶ *The Time.*

It floureth in Summer, and the roots may be gathered in Autumne.

¶ *The Names.*

It is called in Greeke, Κενταύριον τὸ μέγα: of *Theophraſtus* alſo *Centauris*: in diuers ſhops falſly *Rha Ponticum*: for *Rha Ponticum* is *Rha* growing in the countries of Pontus; a plant differing from great Centorie. *Theophraſtus* and *Pliny* ſet downe among the kindes of *Panaces* or All-heales, this great Centorie, and alſo the leſſer, whereof we will write in the next chapter following. *Pliny* reciting the words of *Theophraſtus*, doth in his twenty fifth booke, and fourth chapter write, that they were found out by *Chiron* the Centaure, and ſurnamed *Centauria*. Alſo affirming the ſame thing in his ſixth chapter (where he more largely expoundeth both the Centauries) hee repeateth them to be found out by *Chiron*: and thereupon he addeth, that both of them are named *Chironia*. Of ſome it is reported, That the ſaid *Chiron* was cured therewith of a wound in his foot, that was made with an arrow that fell vpon it when he was entertaining *Hercules* into his houſe; whereupon it was called *Chironium*: or of the curing of the wounds of his ſouldiers, for the which purpoſe it is moſt excellent.

¶ *The Temperature.*

It is hot and dry in the third degree. *Galen* ſaith, by the taſte of the root it ſheweth contrarie qualities, ſo in the vſe it performeth contrary effects.

¶ *The Vertues.*

A The root taken in the quantitie of two drams is good for them that be burſten, or ſpit bloud; againſt the crampe and ſhrinking of ſinewes, the ſhortneſſe of winde or difficulty of breathing, the cough and gripings of the belly.

B There is not any part of the herbe but it rather worketh miracles than ordinary cures in greene wounds; for it joyneth together the lips of ſimple wounds in the fleſh, according to the firſt intention, that is, glewing the lips together, not drawing to the place any matter at all.

The root of this plant (ſaith *Dioſcorides*) is a remedy for ruptures, convulſions, and cramps, taken in the weight of two drams, to be giuen with wine to thoſe that are without a feuer, and vnto thoſe that haue, with water. C

Galen ſaith, that the juyce of the leaues thereof performeth thoſe things that the root doth; which is alſo vſed in ſtead of *Lycium*, a kinde of hard juyce of a ſharpe taſte. D

Chap. 142. *Of Small Centorie.*

¶ *The Deſcription.*

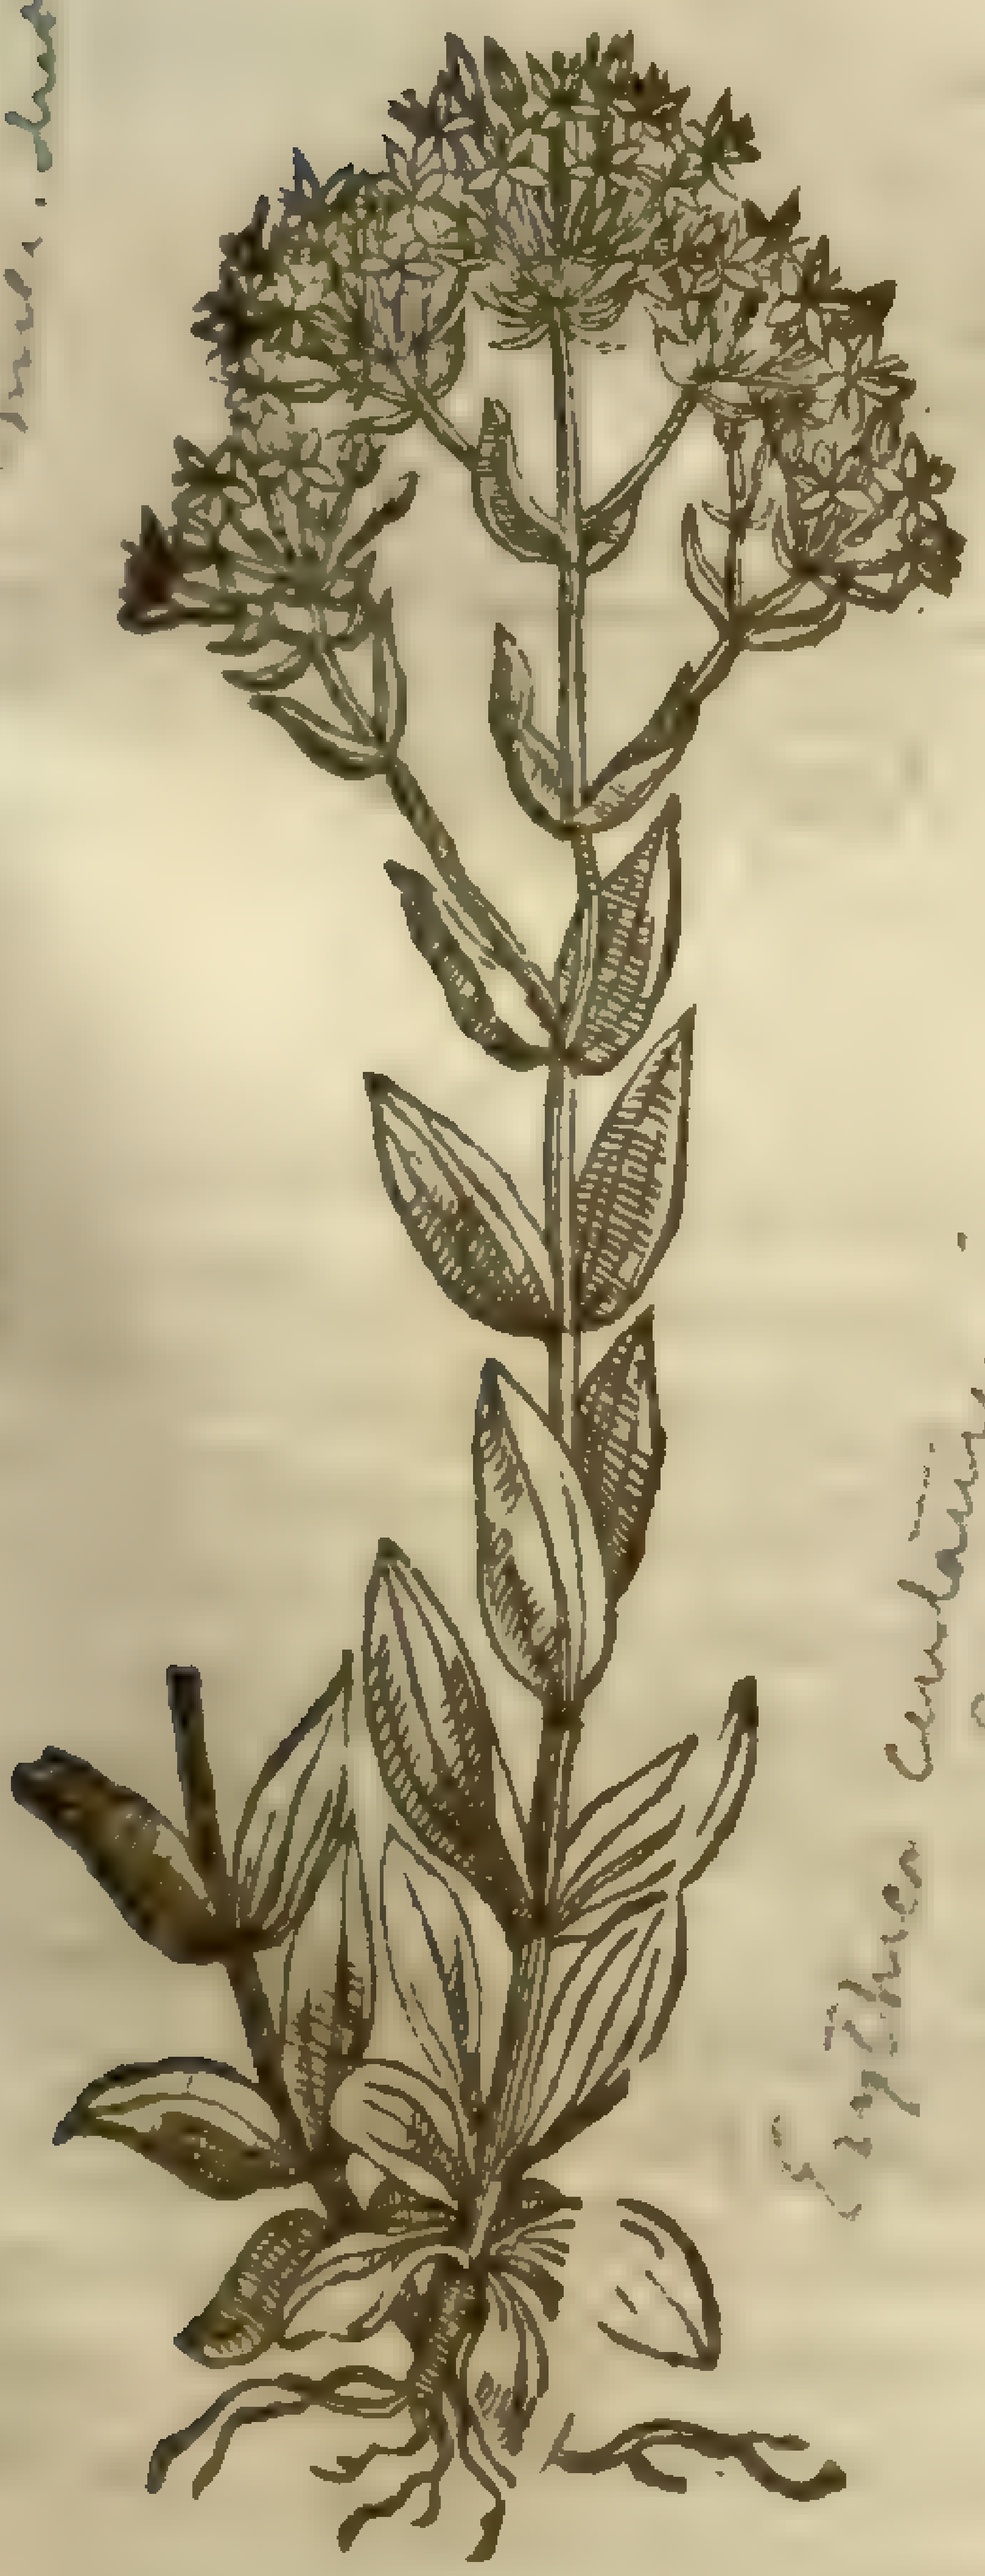
1 The leſſer Centorie is a little herbe: it groweth vp with a cornered ſtalke halfe a foot high, with leaues in forme and bigneſſe of S. Iohns wort: the floures grow at the top in a ſpoky buſh or rundle, of a red colour tending to purple; which in the day time and after the Sun is vp do open themſelues, but towards euening ſhut vp againe: after them come forth ſmall ſeed-veſſels, of the ſhape of wheat cornes; in which are contained very little ſeeds. The root is ſlender, hard, and ſoone fading.

2 The yellow Centory hath leaues, ſtalkes, and ſeed like the other, and is in each reſpect as like, ſauing that the floures hereof are of a perfect yellow colour, which ſetteth forth the difference.

‡ This is of two ſorts; the one with broad leaues through which the ſtalkes paſſe; and the other hath narrow leaues like thoſe of the common Centorie. ‡

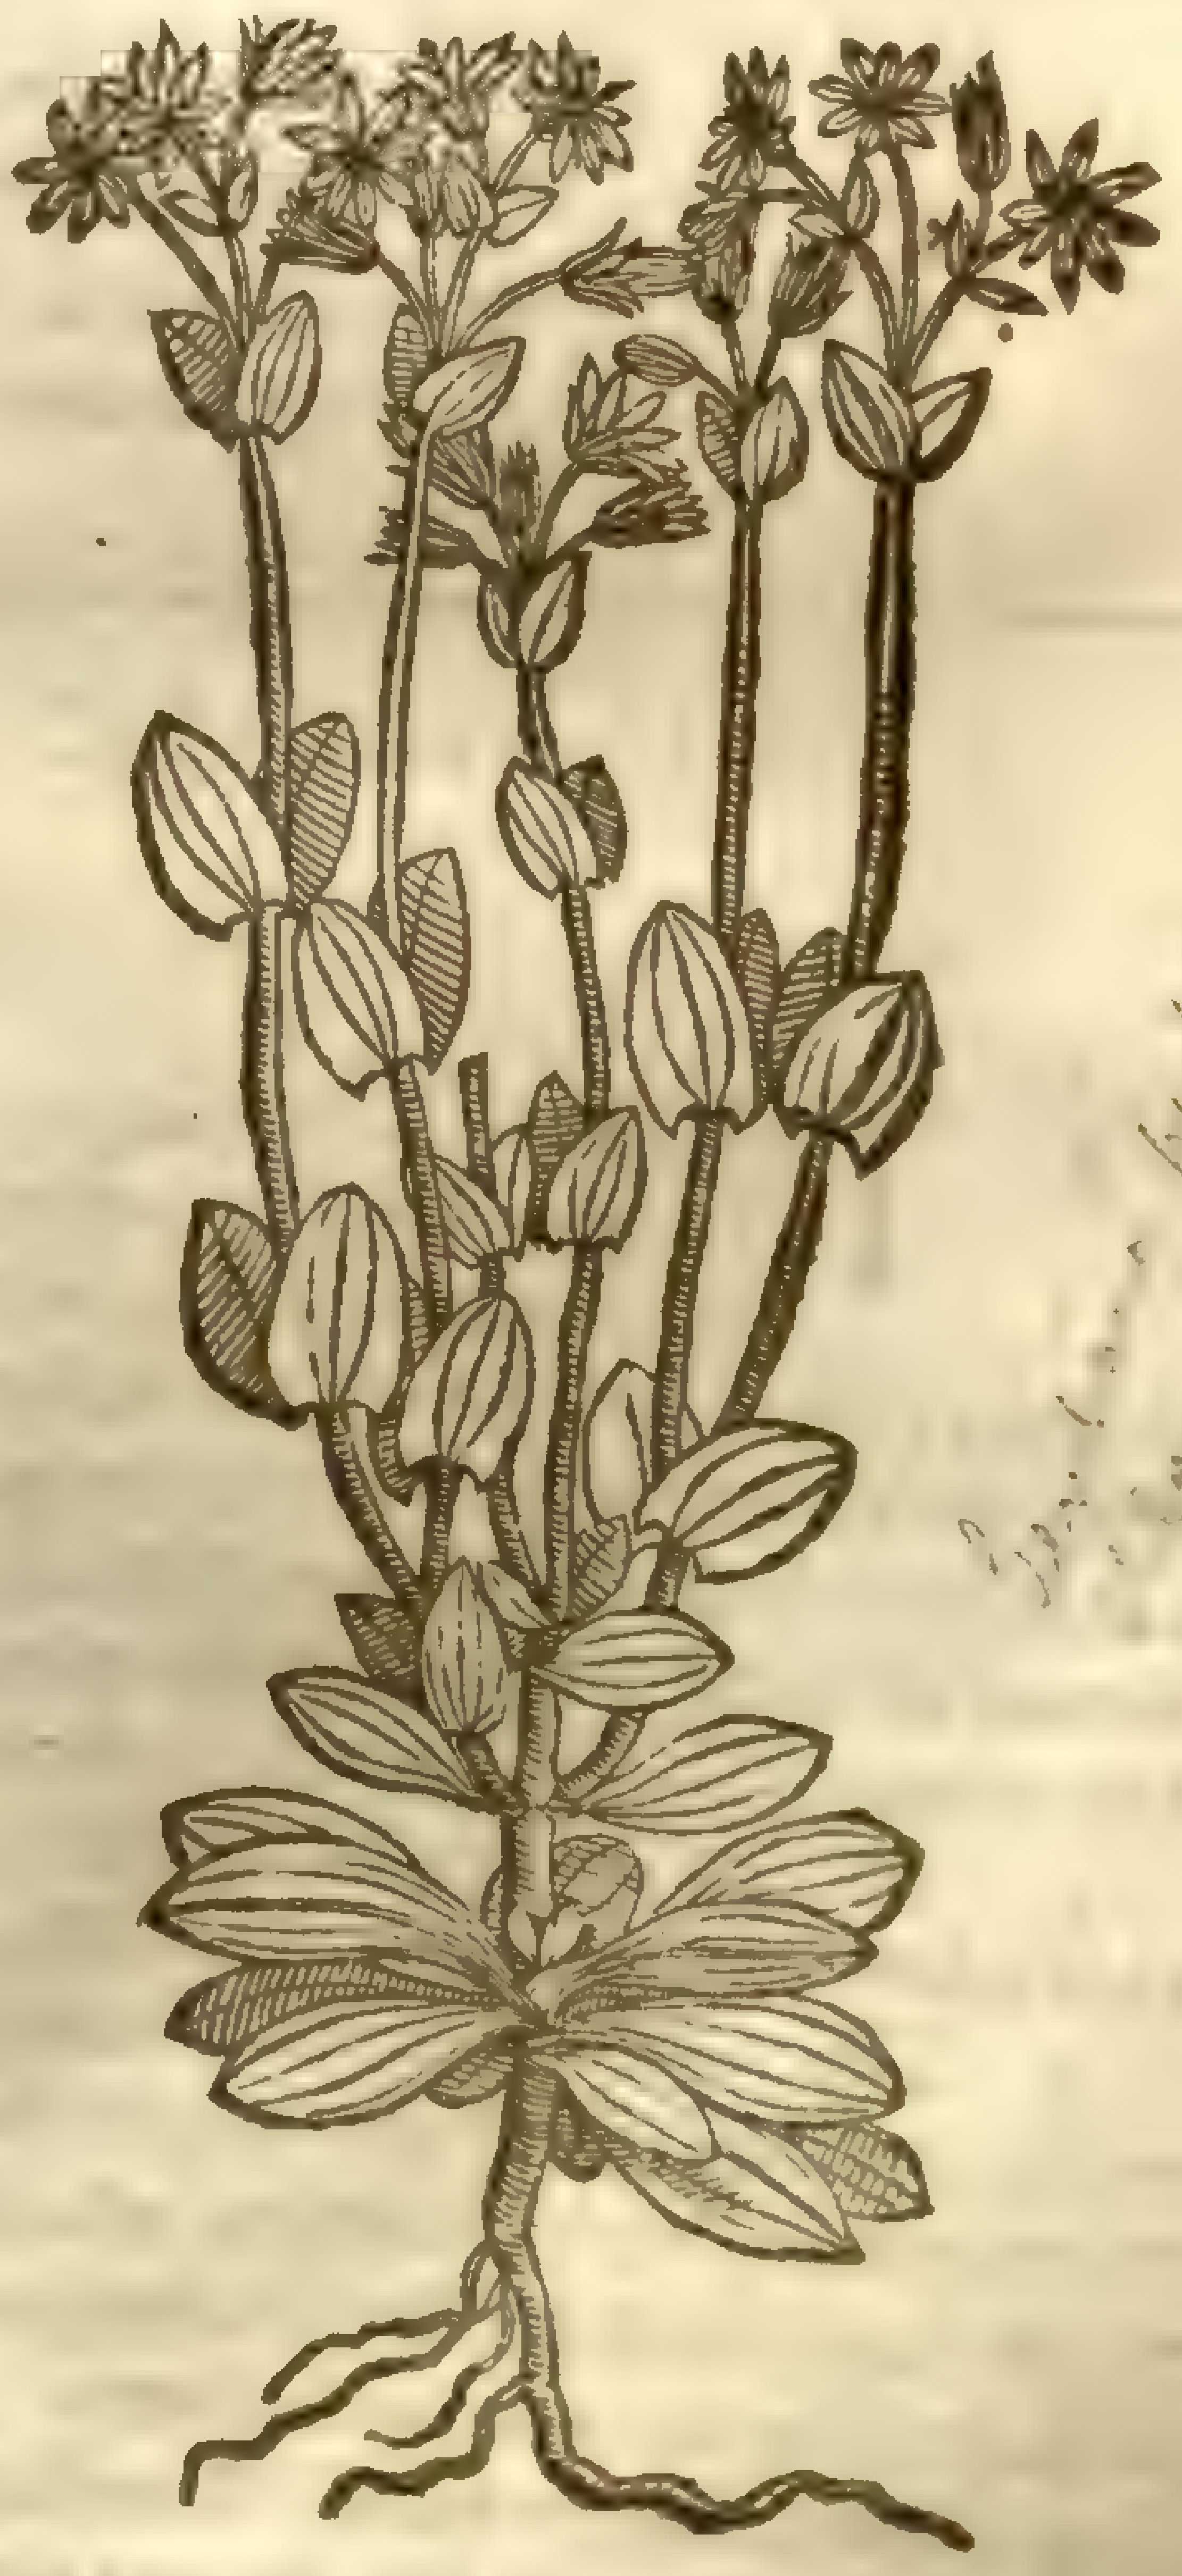
1 *Centaurium parvum.*
Small Centorie.

Gentiana [illegible]
[illegible]



Erythræa centaurium
[illegible] 520

2 *Centaurium parvum luteum Lobelij.*
Yellow Centorie.



[illegible] perfoliata
[illegible] 2.2.[illegible]

¶ *The Place.*

1 The firſt is growing in great plenty throughout all England, in moſt paſtures and graſſie fields.

2 The yellow doth grow vpon the chalkie cliffes of Greenehithe in Kent, and ſuch like places.

¶ *The Time.*

They are to be gathered in their flouring time, that is in Iuly and Auguſt: of ſome that gather them ſuperſtitiouſly they are gathered betweene the two Lady daies.

¶ *The Names.*

The Greekes call this, Κενταύριον μικρόν: in Latine it is called *Centaurium minus*; yet *Pliny* nameth it *Libadion*, and by reaſon of his great bitterneſſe, *Fel terræ*. The Italians in Hetruria call it, *Biondella*: in Spaniſh, *Centoria*: in low Dutch, **Centorye**: in Engliſh, ſmall, little, or common Centorie: in French, *Centoire*.

¶ *The Temperature.*

The ſmall Centorie is of a bitter quality, and of temperature hot and dry in the ſecond degree; and the yellow Centorie is hot and dry in the third degree.

¶ *The Vertues.*

A Being boyled in water and drunke it openeth the ſtoppings of the liuer, gall, and ſpleene, it helpeth the yellow jaundiſe, and likewiſe long and lingering agues: it killeth the wormes in the belly; to be briefe, it clenſeth, ſcoureth, and maketh thinne humours that are thicke, and doth effectually performe whatſoeuer biting things can.

B *Dioſcorides*, and *Galen* after him report, that the decoction draweth downe by ſiege choler and thicke humors, and helpeth the Sciatica; but though we haue vſed this often and luckily, yet could we not perceiue euidently that it purges by the ſtoole any thing at all, and yet it hath performed the effects aforeſaid.

C This Centorie being ſtamped and laid on whileſt it is freſh and greene, doth heale and cloſe vp greene wounds, cleanſeth old vlcers, and perfectly cureth them.

D The juyce is good in medicines for the eies; mixed with hony it cleanſeth away ſuch things as hinder the ſight; and being drunke it hath a peculiar vertue againſt the infirmities of the ſinues, as *Dioſcorides* teacheth.

E The Italian Phyſitians do giue the pouder of the leaues of yellow Centorie once in three daies in the quantity of a dram, with anniſe or caraway ſeeds, in wine or other liquor, which preuaileth againſt the dropſie and greene ſickeneſſe. Of the red floured, *Ioannes Poſtius* hath thus written:

Flos mihi ſuaue rubet, ſed ineſt quoque ſuccus amarus,
Qui juvat obſeſſum bile, aperitque jecur.

My floure is ſweet in ſmell, bitter my juyce in taſte,
Which purge choler, and helps liuer, that elſe would waſte.

Chap. 164. *Of Calues ſnout, or Snapdragon.*

¶ *The Description.*

1 THe purple Snapdragon hath great and brittle ſtalks, which diuideth it ſelfe into many fragile branches, whereupon do grow long leaues ſharpe pointed, very greene, like vnto thoſe of wilde flax, but much greater, ſet by couples one oppoſite againſt another. The floures grow at the top of the ſtalkes, of a purple colour, faſhioned like a frogs mouth, or rather a dragons mouth, from whence the women haue taken the name Snapdragon. The ſeed is blacke, contained in round huskes faſhioned like a calues ſnout, (whereupon ſome haue called it Calues ſnout) or in mine opinion it is more like vnto the bones of a ſheeps head that hath beene long in the water, or the fleſh conſumed cleane away.

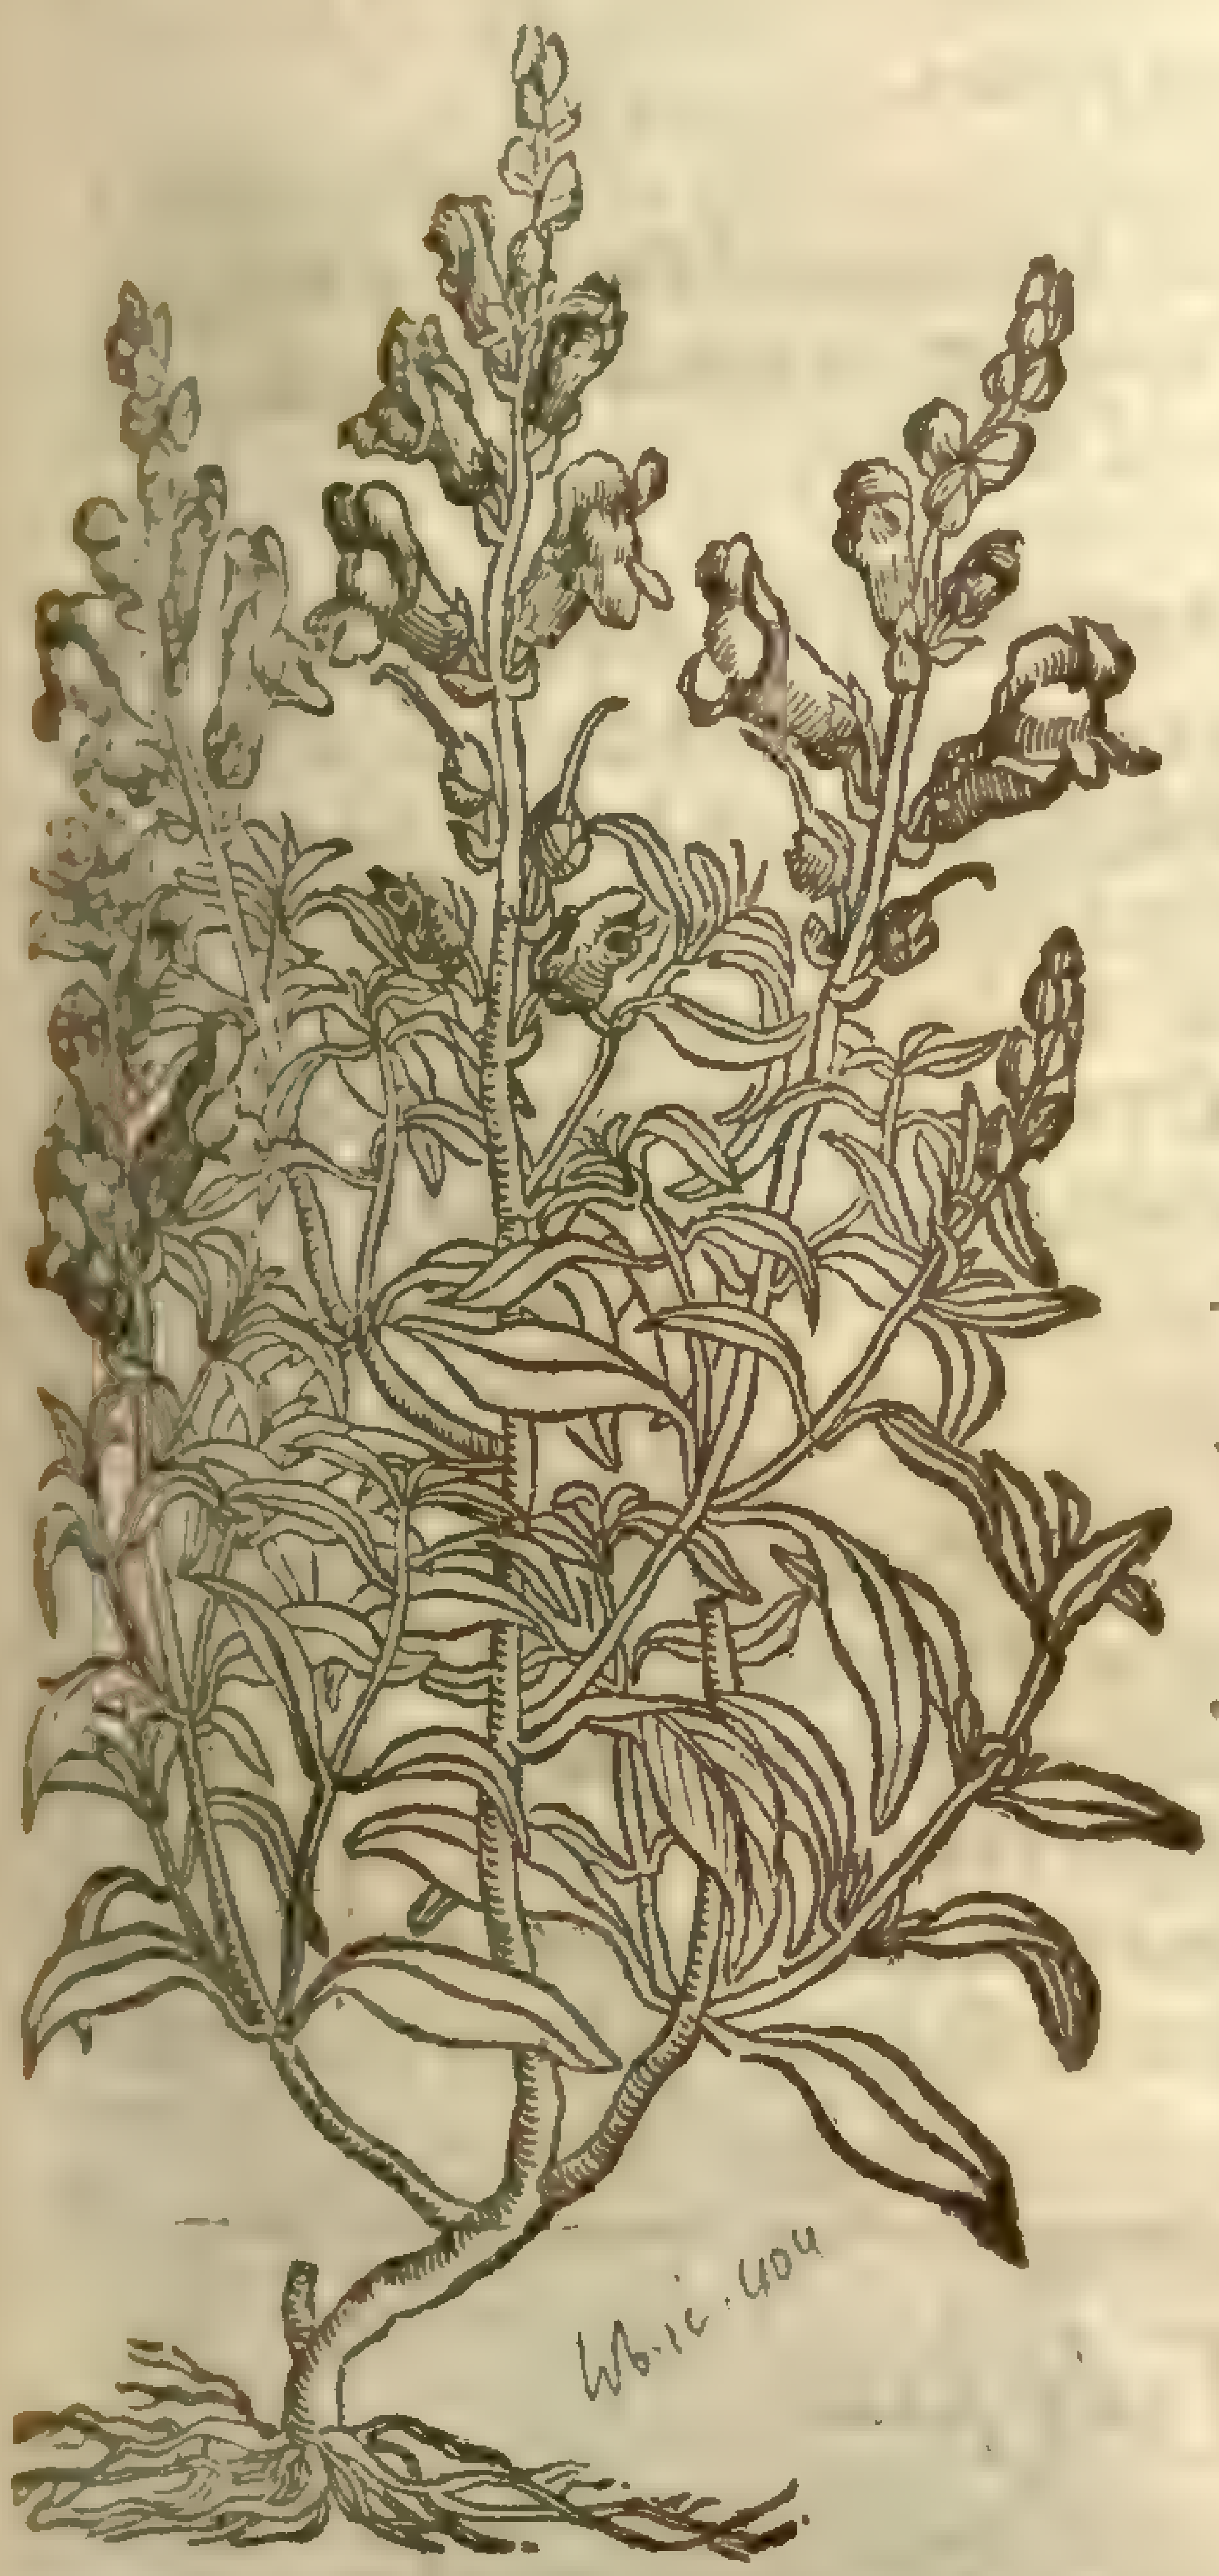
2 The ſecond agreeth with the precedent in euery part, except in the colour of the floures, for this plant bringeth forth white floures, and the other purple, wherein conſiſts the difference.

3 The yellow Snapdragon hath a long thicke wooddy root, with certain ſtrings faſtned thereto; from which riſeth vp a brittle ſtalke of two cubits and a halfe high, diuided from the bottome to the top into diuers branches, whereupon do grow long greene leaues like thoſe of the former, but greater and longer. The floures grow at the top of the maine branches, of a pleaſant yellow colour, in ſhape like vnto the precedent.

4 The ſmall or wilde Snapdragon differeth not from the others but in ſtature: the leaues are leſſer and narrower: the floures purple, but altogether ſmaller: the heads or ſeed-veſſels are alſo like thoſe of the former.

‡ 5 There is another kinde hereof which hath many ſlender branches lying oftentimes vpon the ground: the leaues are much ſmaller than theſe of the laſt deſcribed: the floures and ſeed-veſſels are alſo like, but leſſer, and herein conſiſts the onely difference. ‡

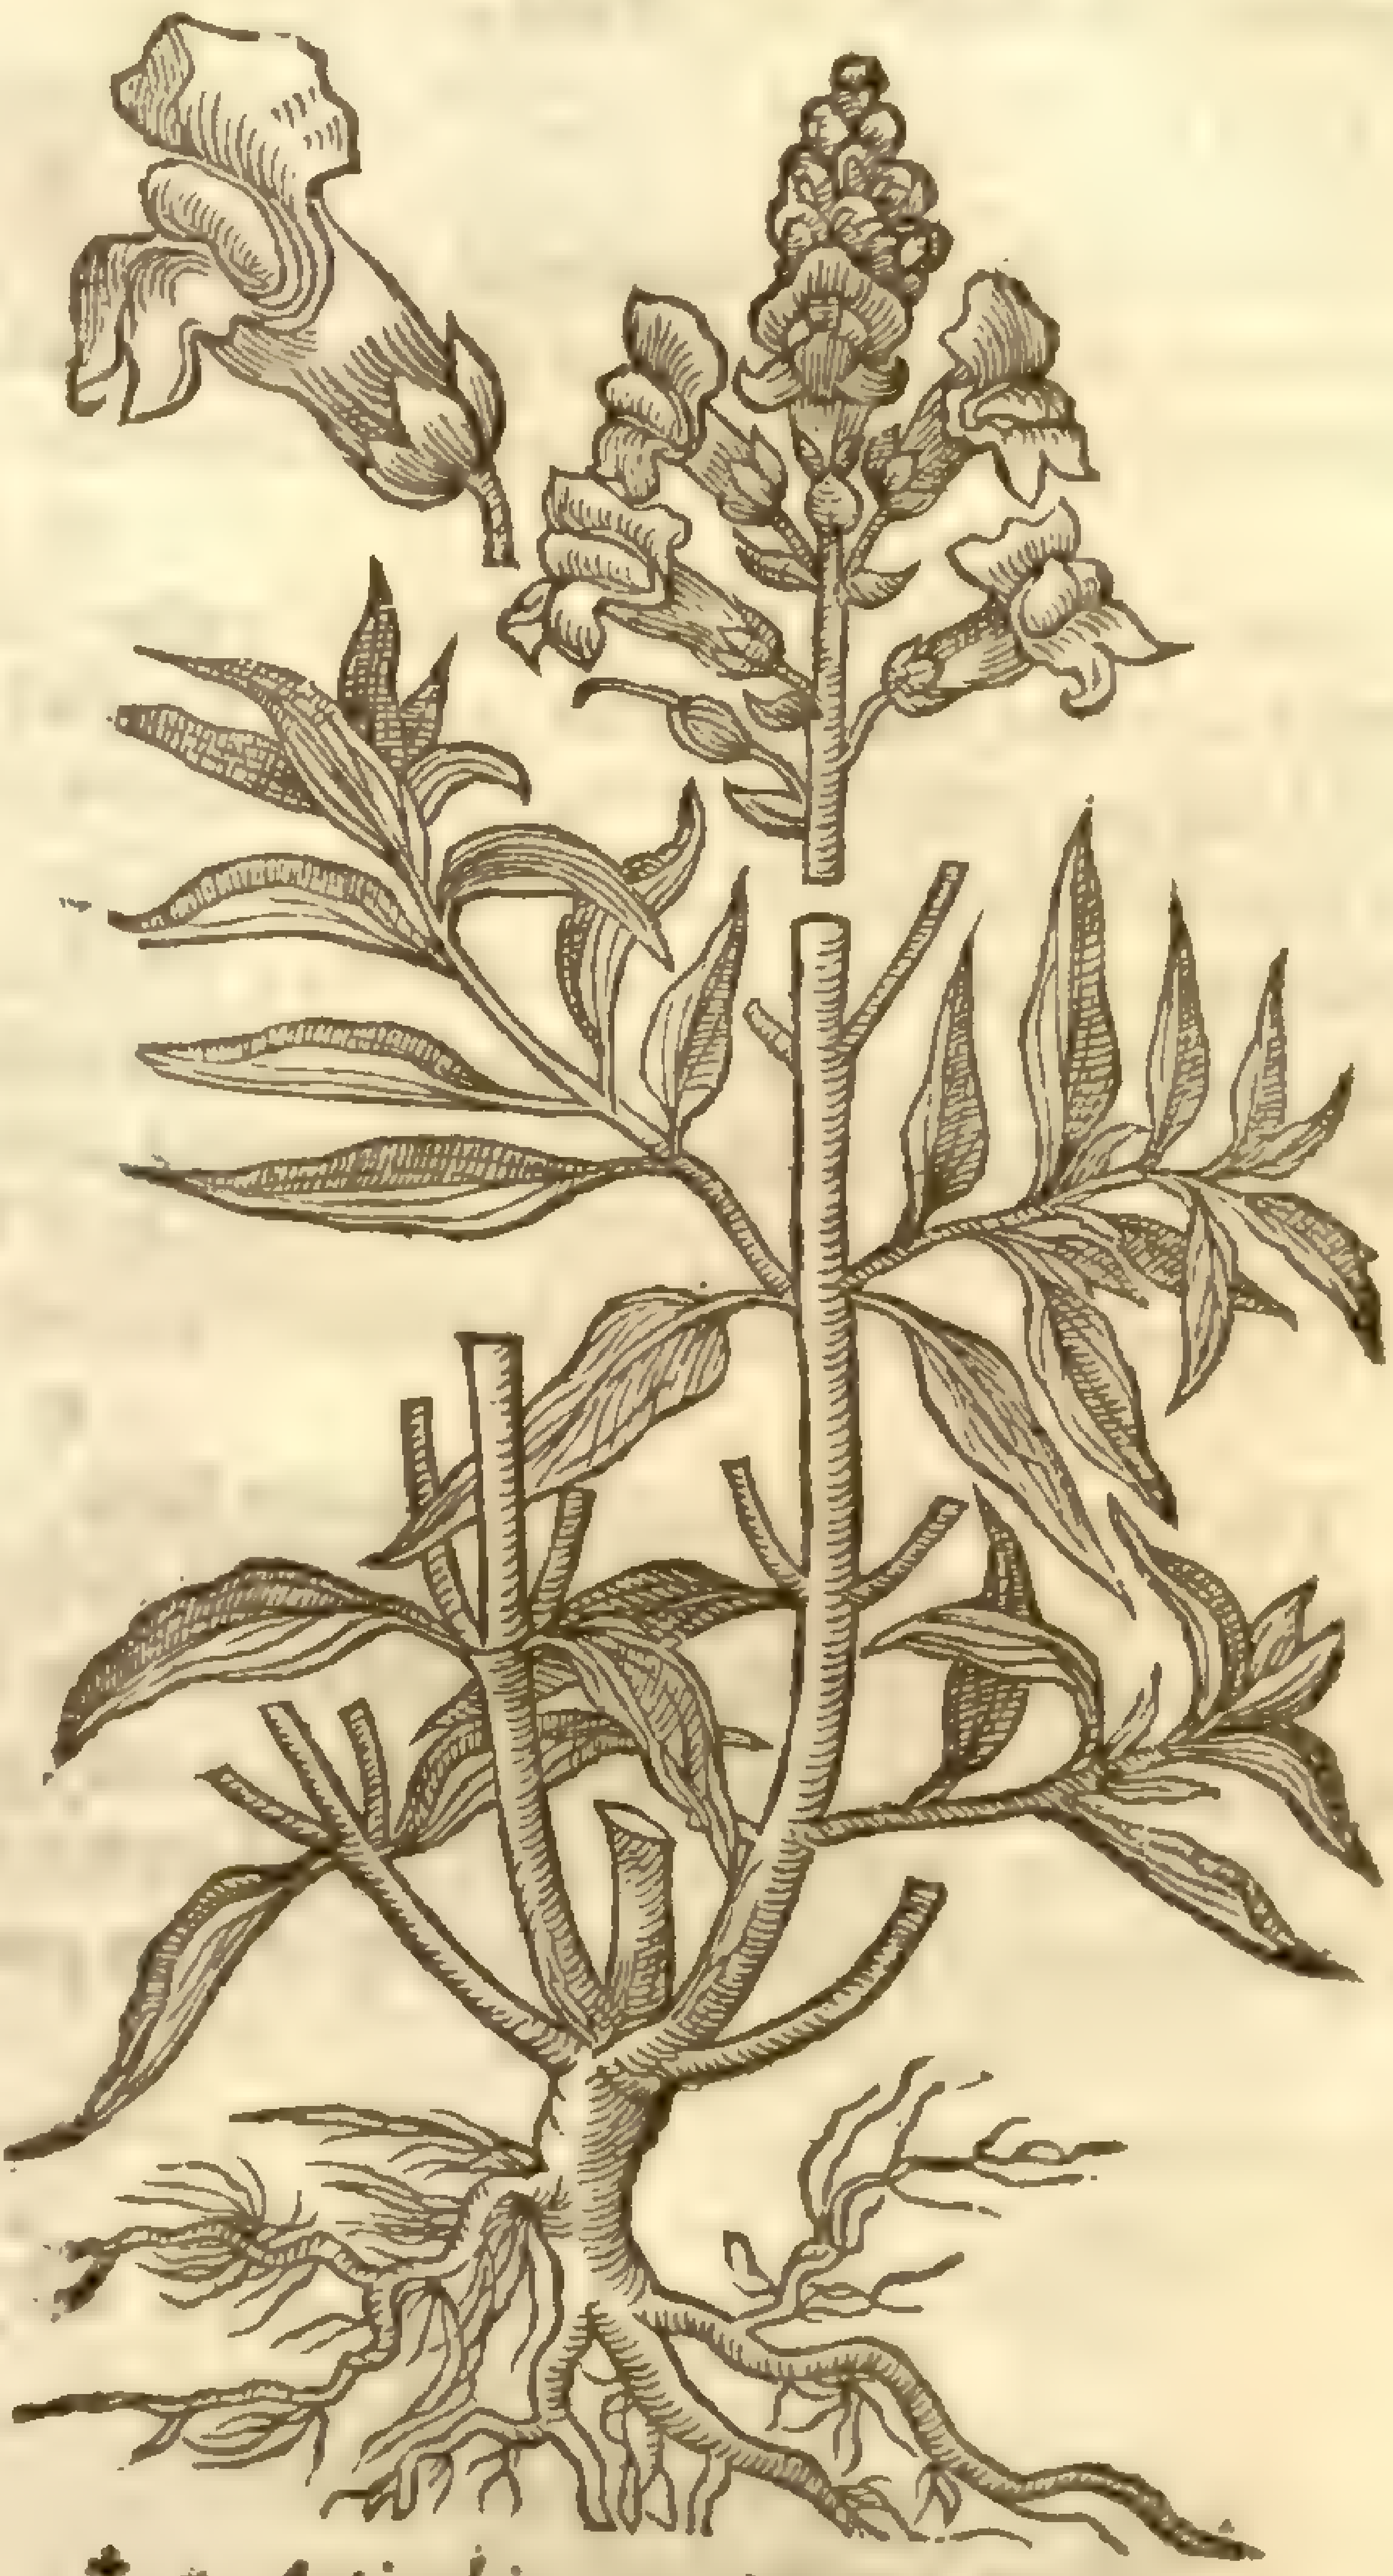
1 2 *Antirrhinum purpureum ſiue album.*
Purple or white floured Snapdragon.



Lob. ic. 404

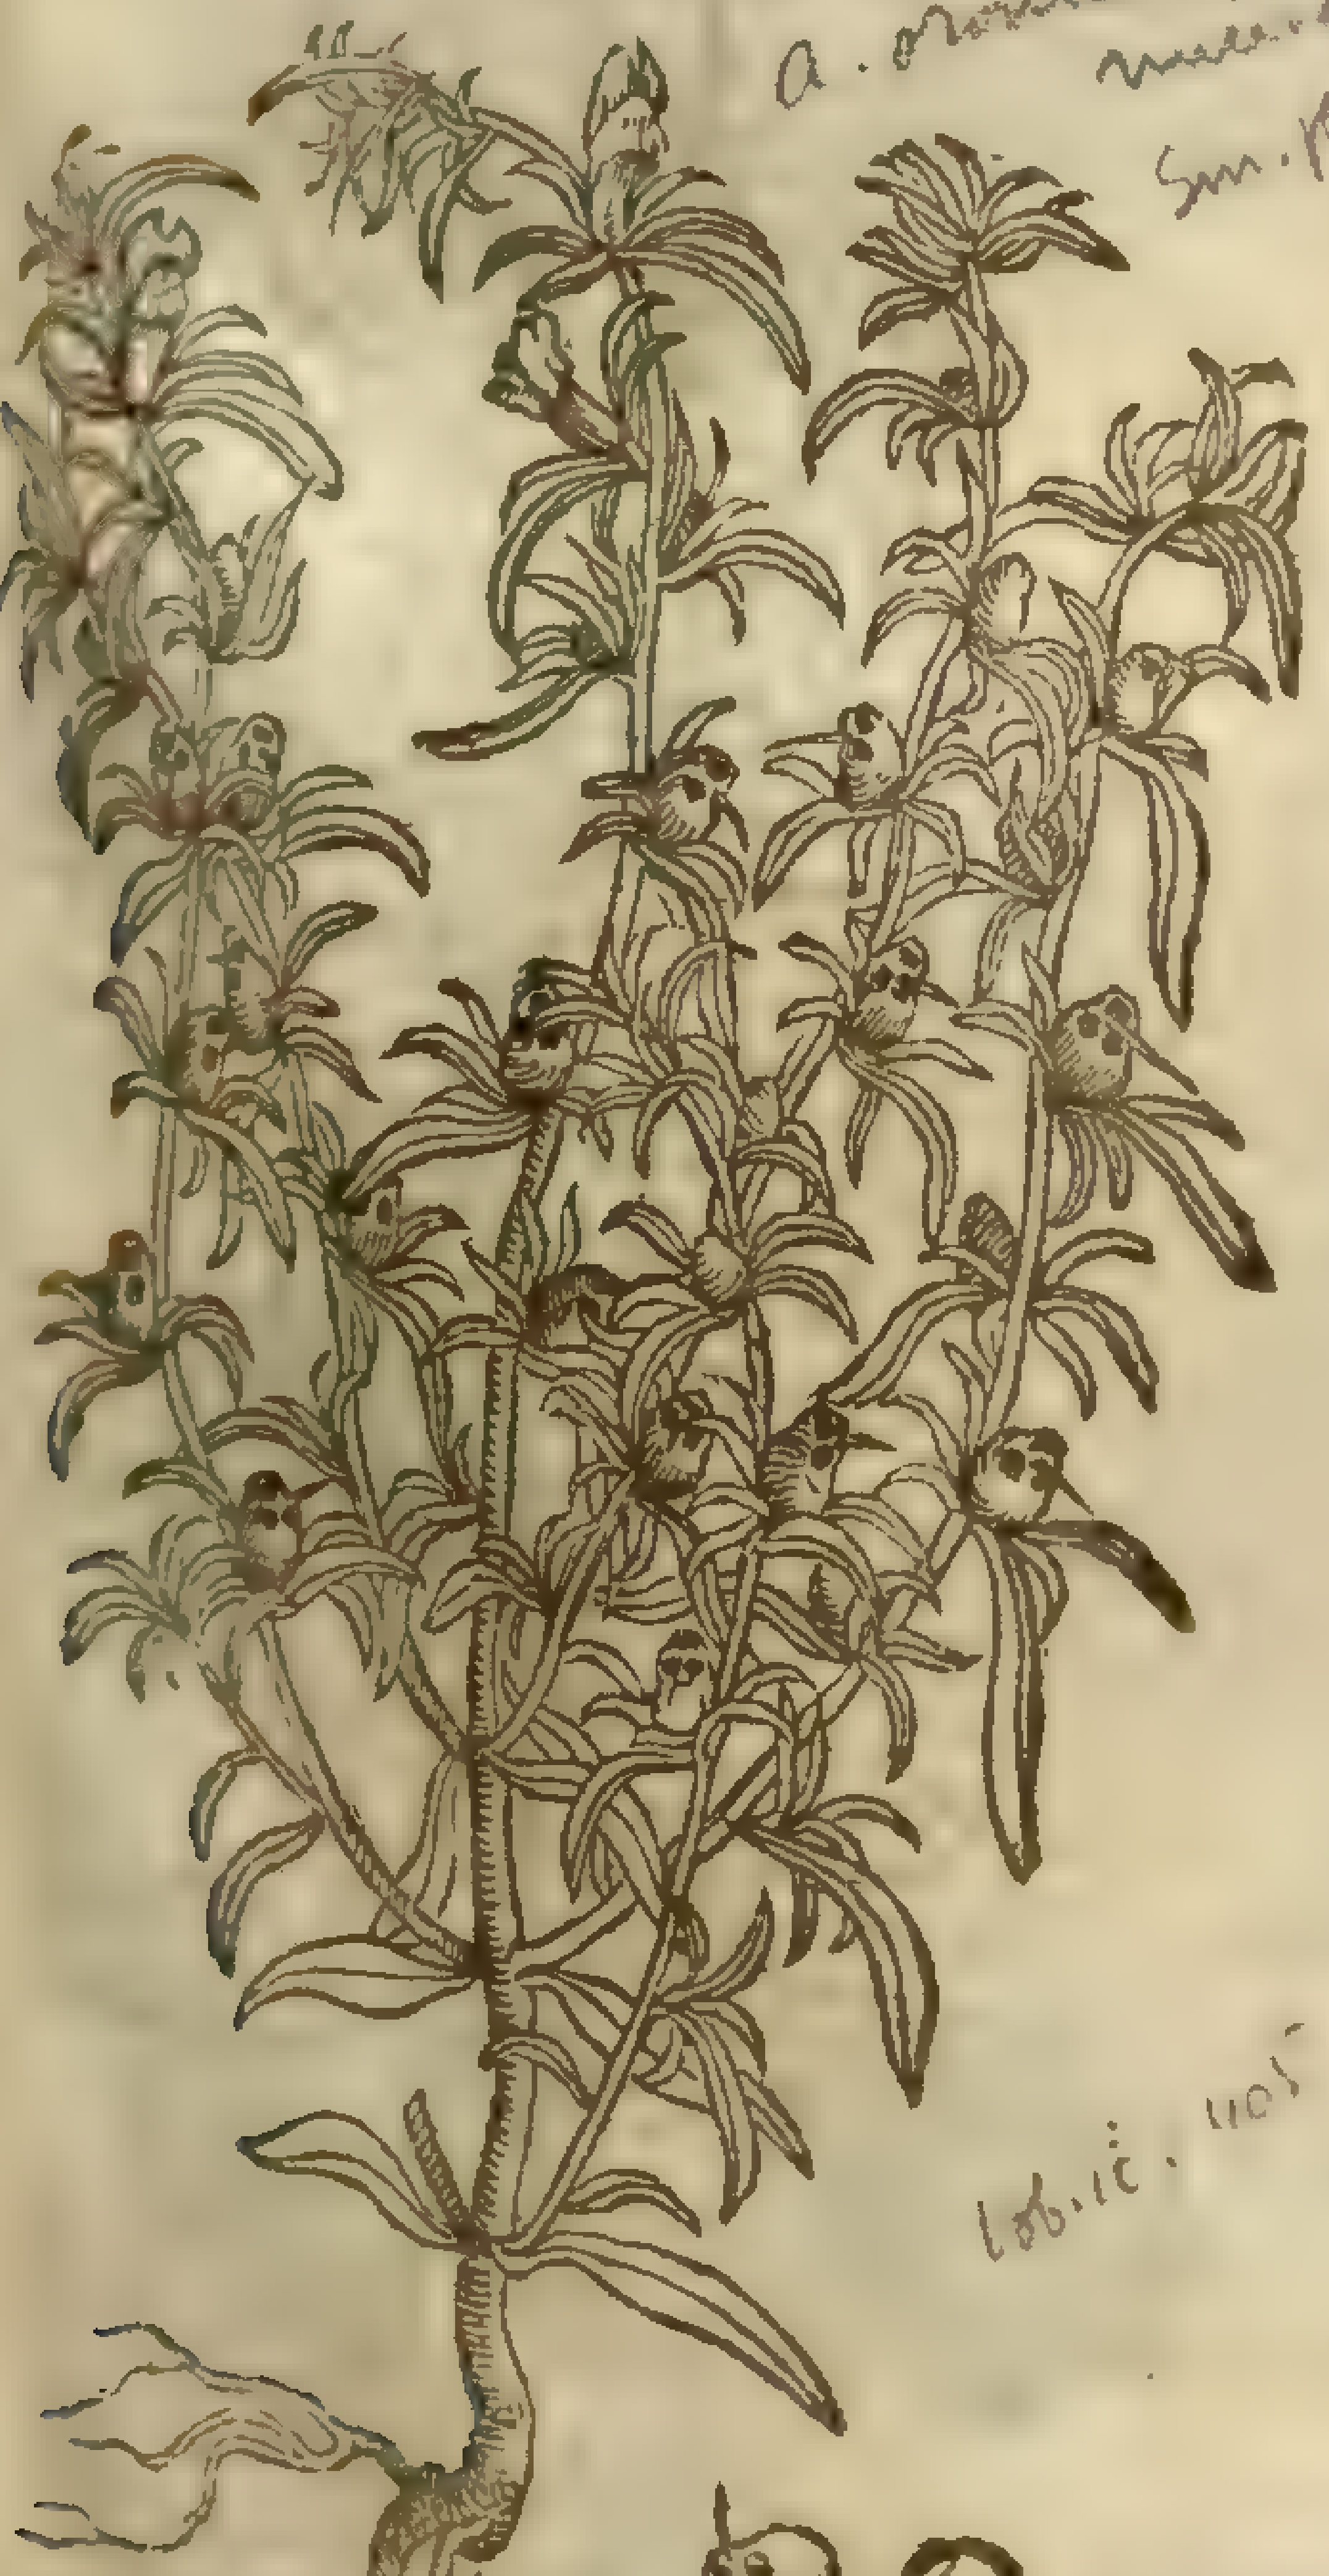
Antirrhinum majus, i. [illegible] dict. Sm. [illegible]

3 *Antirrhinum luteum.*
Yellow Snapdragon.



4 *Antirrhinum minus.*
Small Snapdragon.

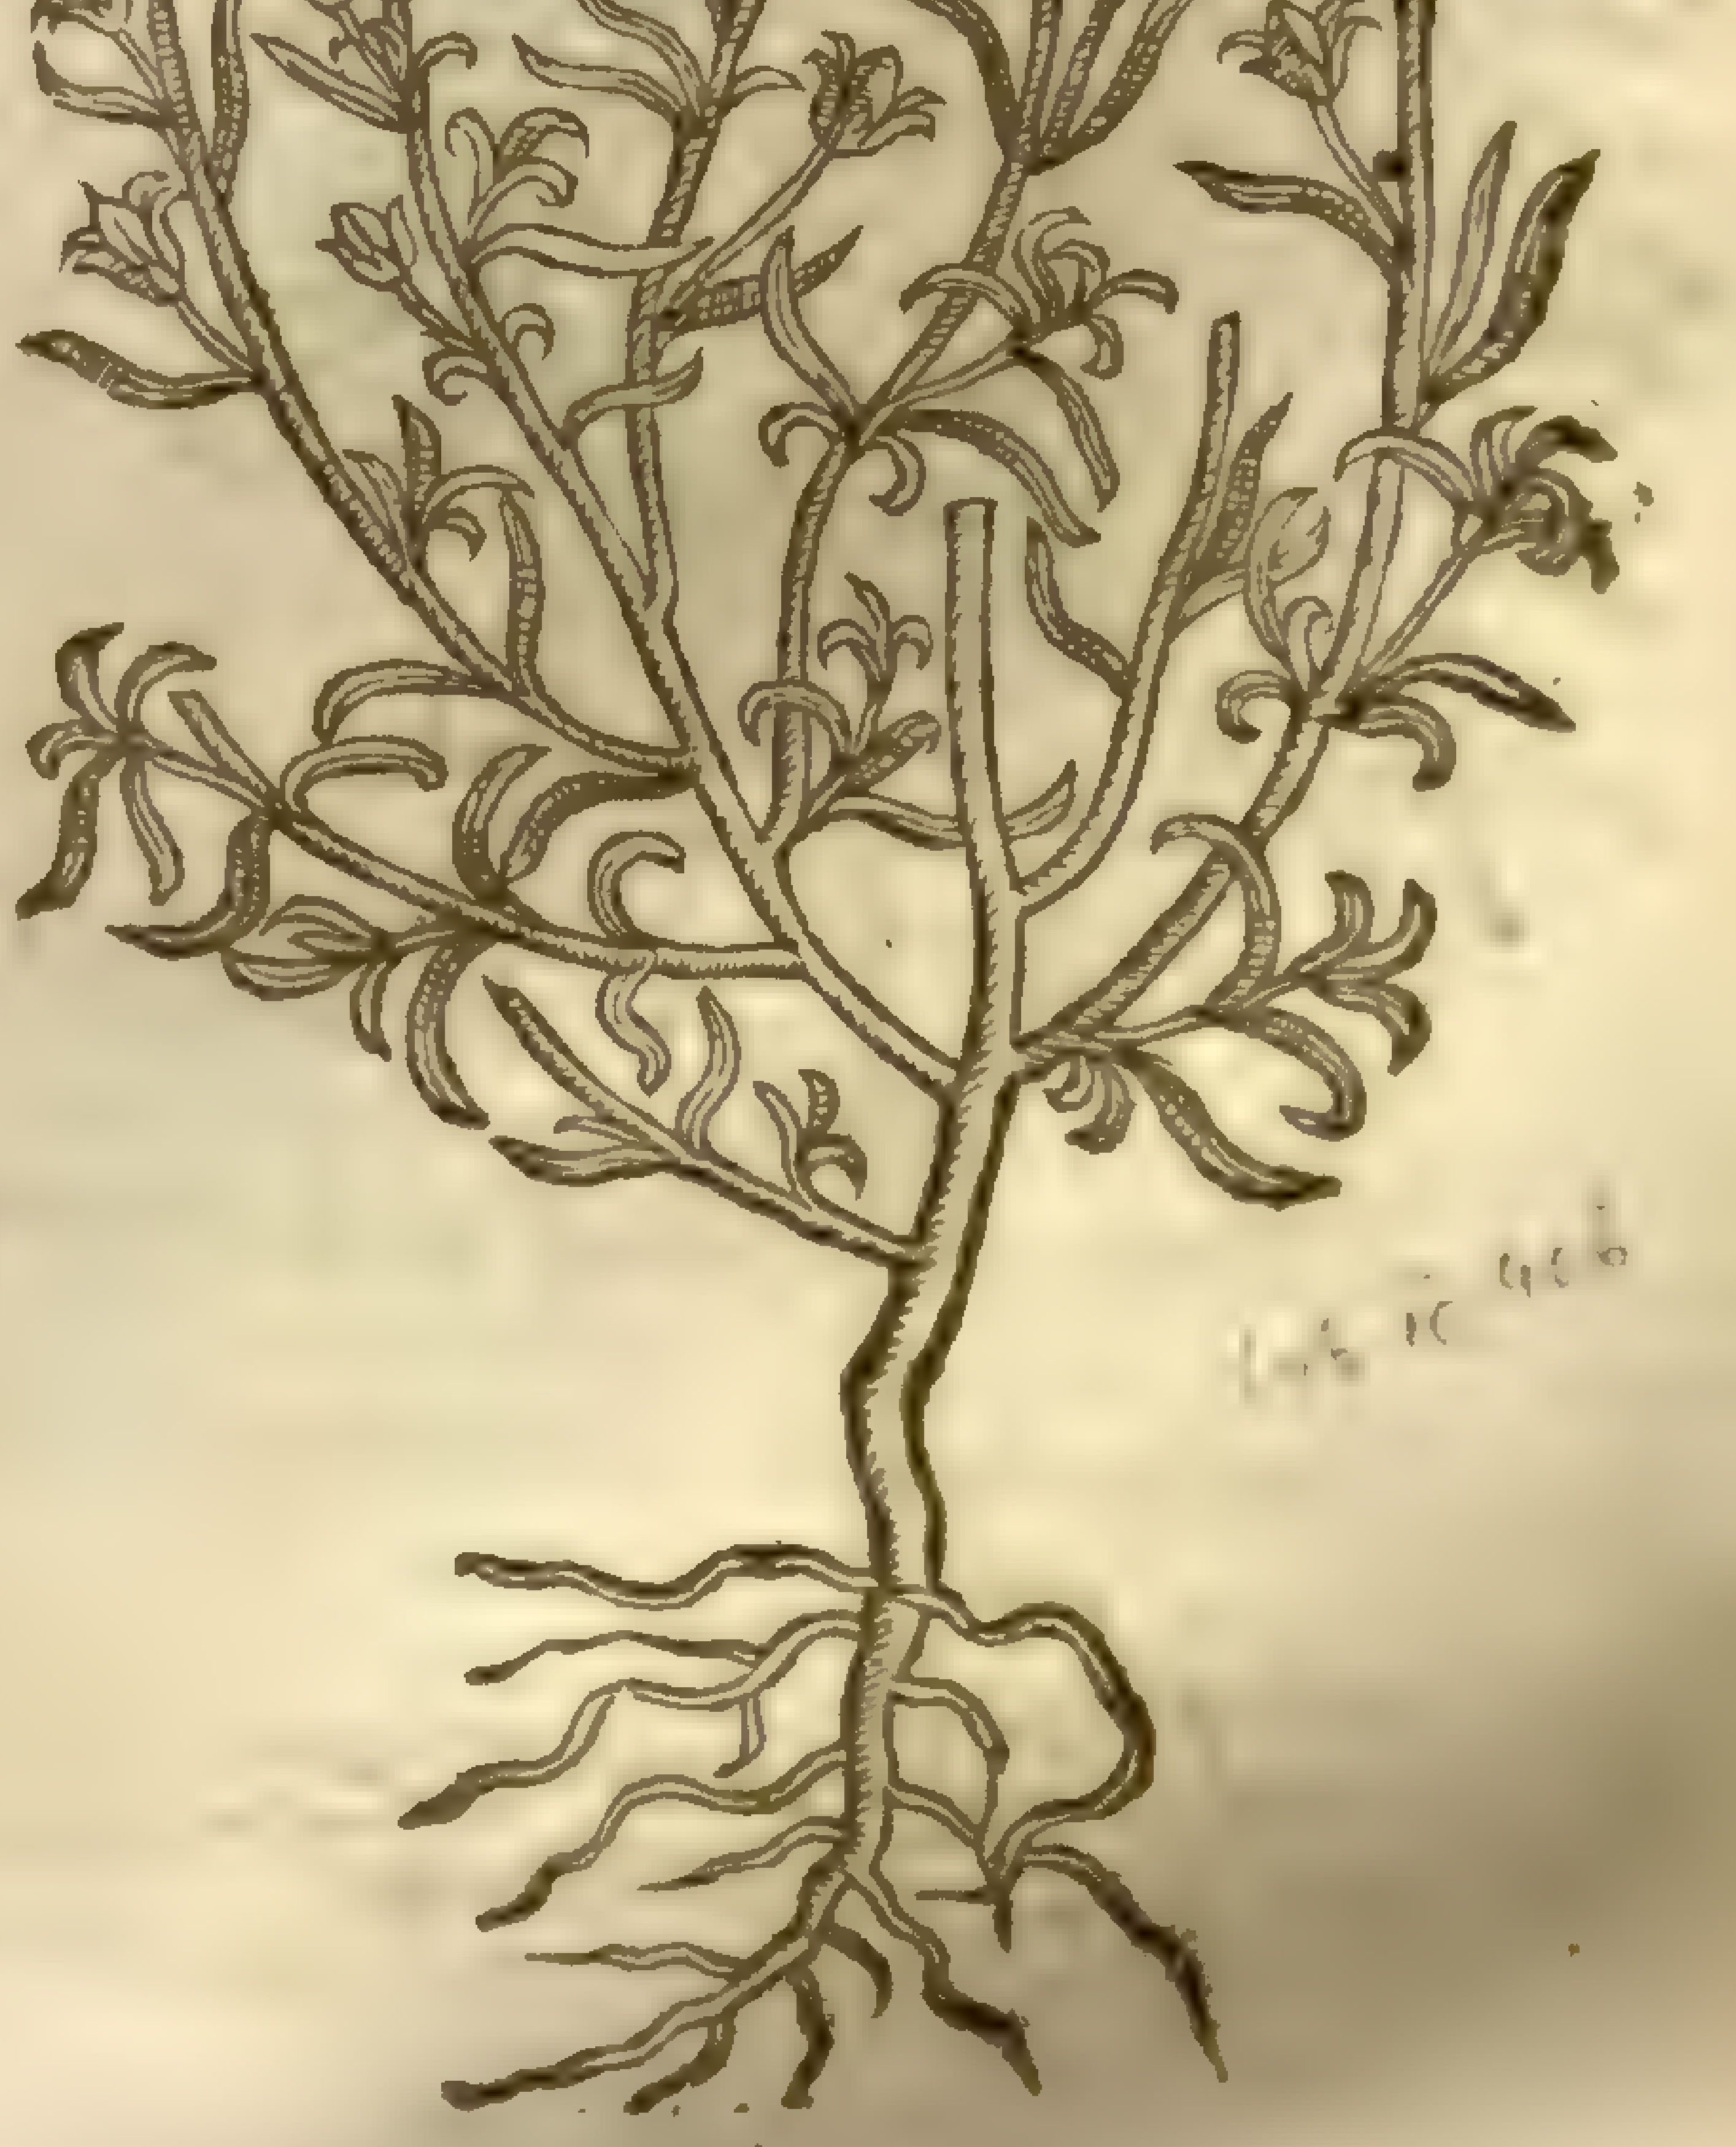
A. orontium, i. minor dict. Sm. p. 3. 136



Lob. ic. 405

‡ 5 *Antirrhinum minimum repens.*
Small creeping Snapdragon.

Antirrhinum minus, i. [illegible] dict. Sm. [illegible]



Lob. ic. 406

¶ *The Place.*

The three firſt grow in moſt gardens; but the yellow kinde groweth not common, except in the gardens of curious Herbariſts.

‡ The fourth and fifth grow wilde among corne in diuers places. ‡

¶ *The Time.*

That which hath continued the whole Winter doth floure in May, and the reſt of Summer afterwards; and that which is planted later, and in the end of Summer, floureth in the Spring of the following yeare: they do hardly endure the injurie of our cold Winter.

¶ *The Names.*

Snapdragon is called in Greeke, ἀντίῤῥινον: in Latine alſo, *Antirrhinum*: of *Apuleius*, *Canis cerebrum*, *Herba Simiana*, *Venuſta minor*, *Opalis grata*, and *Orontium*: it is thought to be *Leo herba*, which *Columella*, *lib.* 10. reckons among the floures: yet *Geſner* hath thought that this *Leo* is *Columbine*, which for the ſame cauſe he hath called *Leontoſtomium*: but this name ſeemeth to vs to agree better with Calues ſnout than with columbine; for the gaping floure of Calues ſnout is more like to Lyons ſnap than the floure of Columbine: it is called in Dutch, **Orant**: in Spaniſh, *Cabeza de ternera*: in Engliſh, Calues ſnout, Snapdragon, and Lyons ſnap: in French, *Teſte de chien*, and *Teſte de Veau*.

¶ *The Temperature.*

They are hot and dry, and of ſubtill parts.

¶ *The Vertues.*

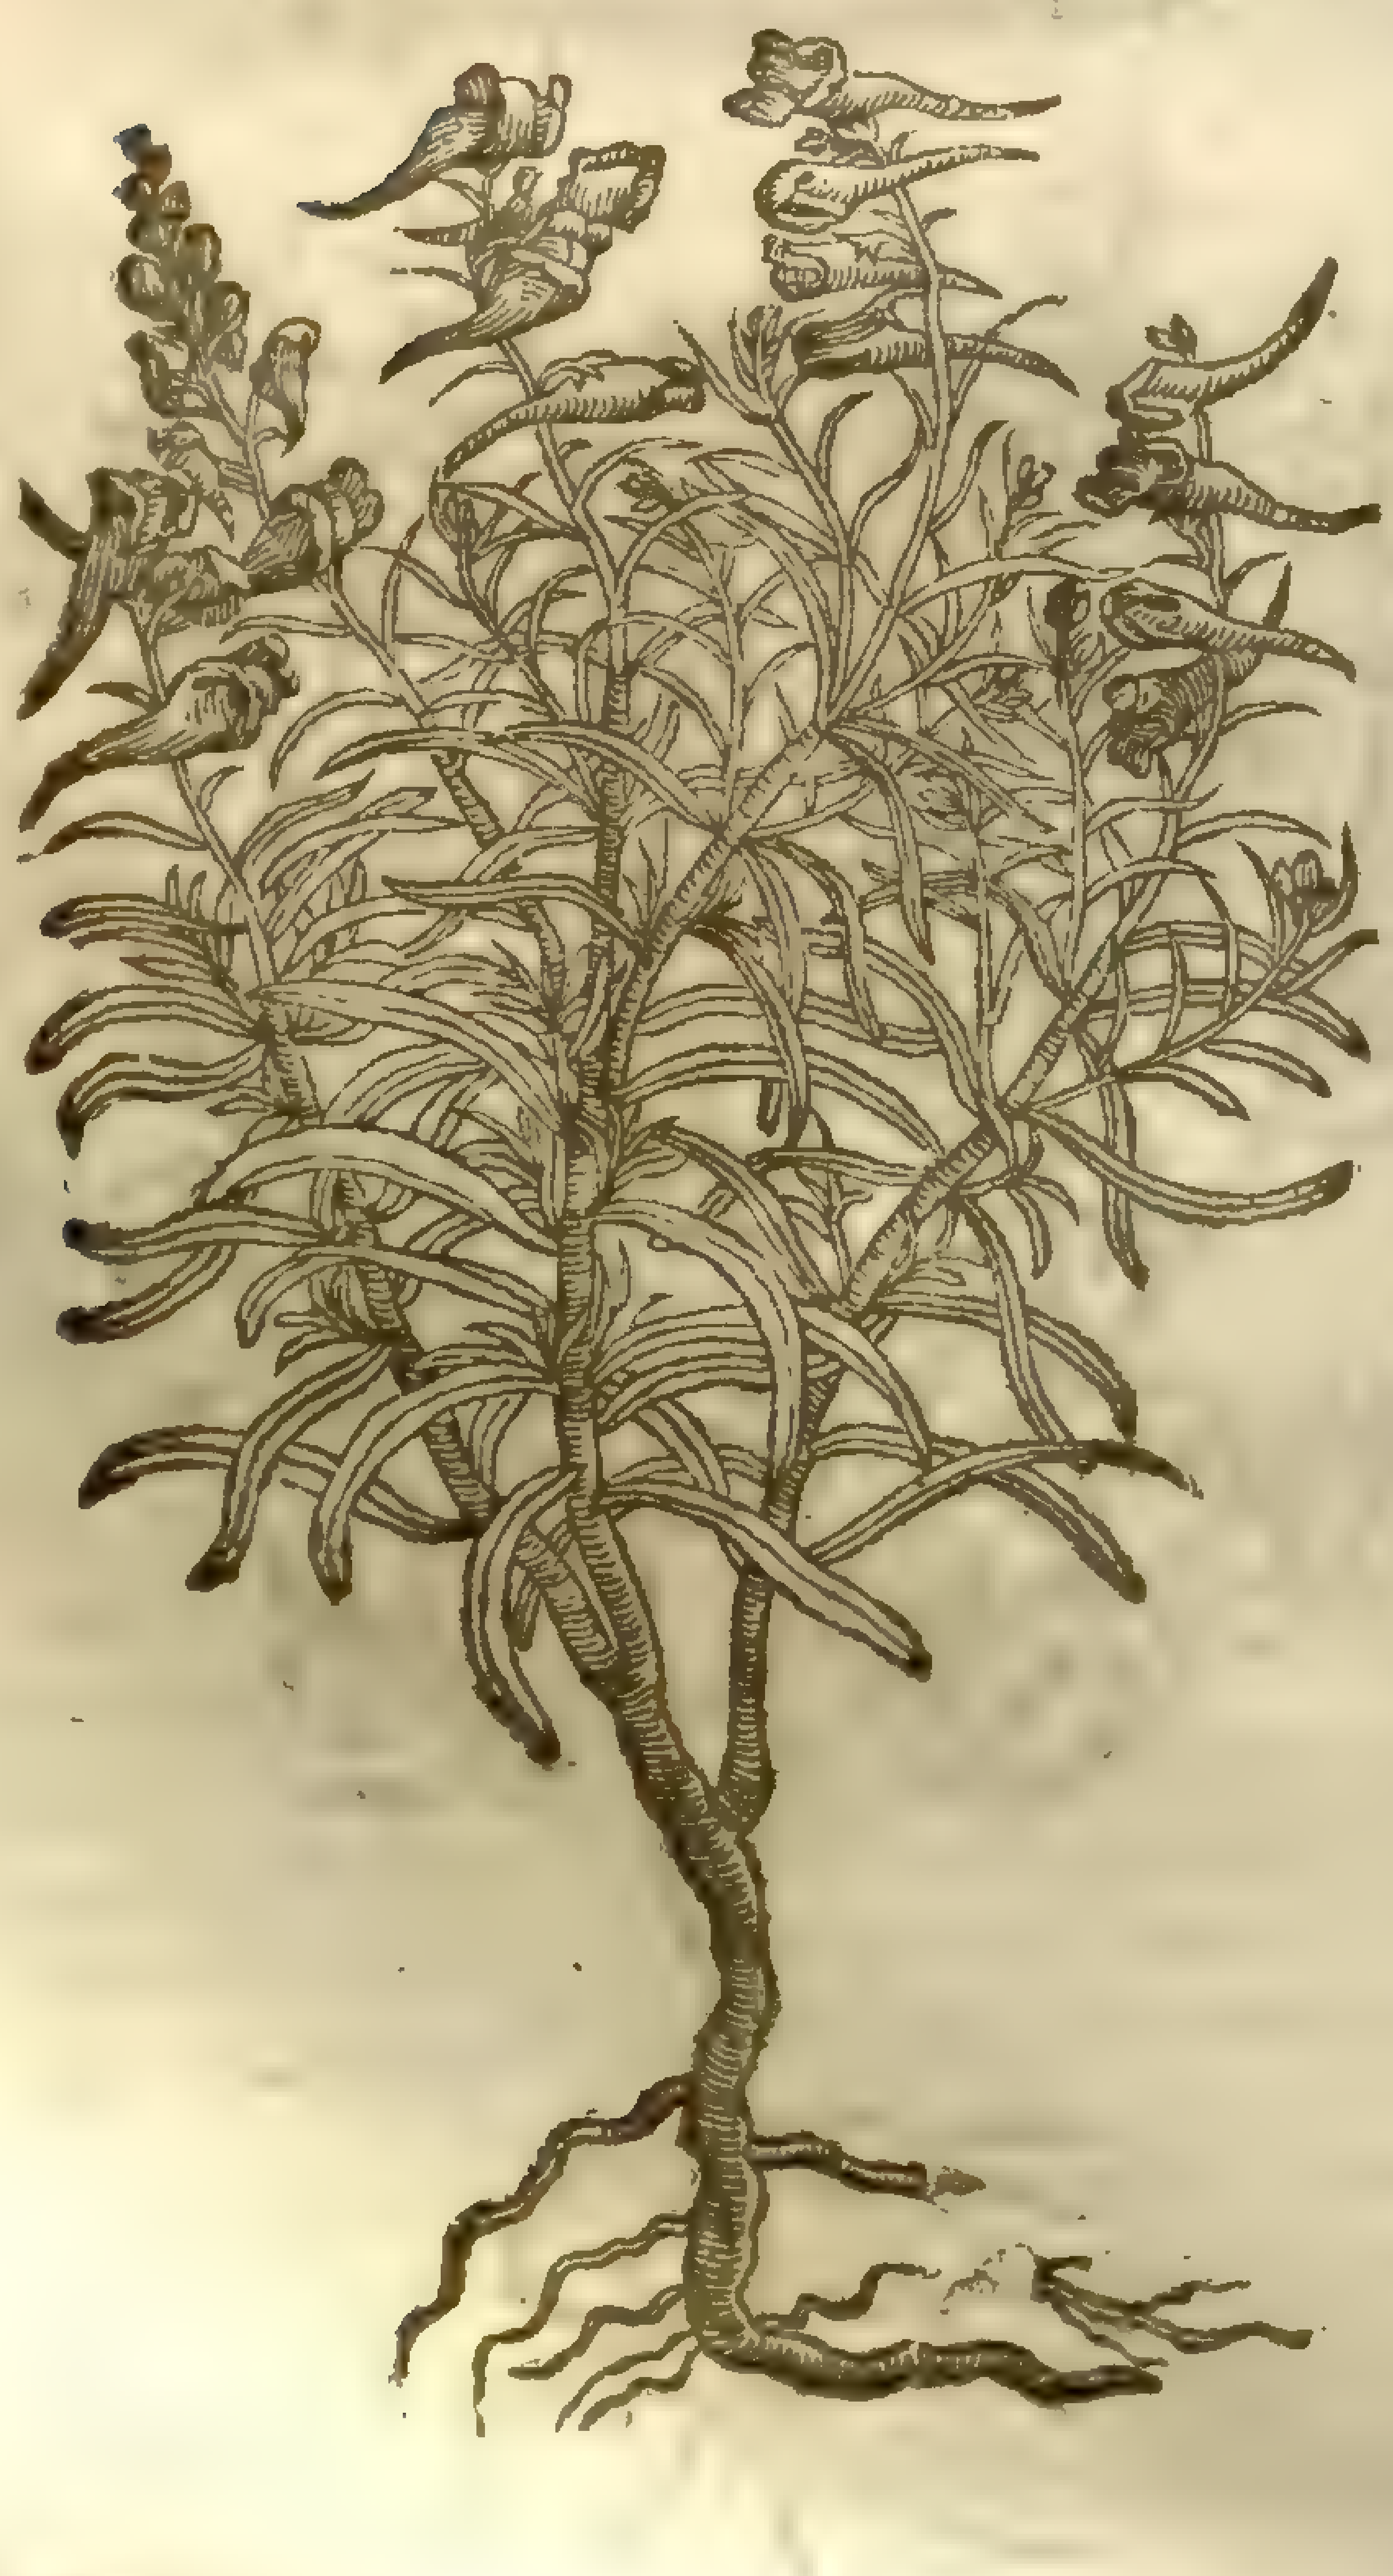
A The ſeed of Snapdragon (as *Galen* ſaith) is good for nothing in the vſe of Phyſicke, and the herb it ſelfe is of like faculty with *Bubonium* or Star-wort, but not ſo effectuall.

B They report (ſaith *Dioſcorides*) that the herbe being hanged about one preſerueth a man from being bewitched, and that it maketh a may gracious in the ſight of people.

C *Apuleius* writeth, that the diſtilled water, or the decoction of the herbe and root made in water, is a ſpeedy remedy for the watering of eies proceeding of a hot cauſe, if they be bathed therewith.

Chap. 165. *Of Tode-flax.*

1 *Linaria vulgaris lutea.*
Great Tode-flax.

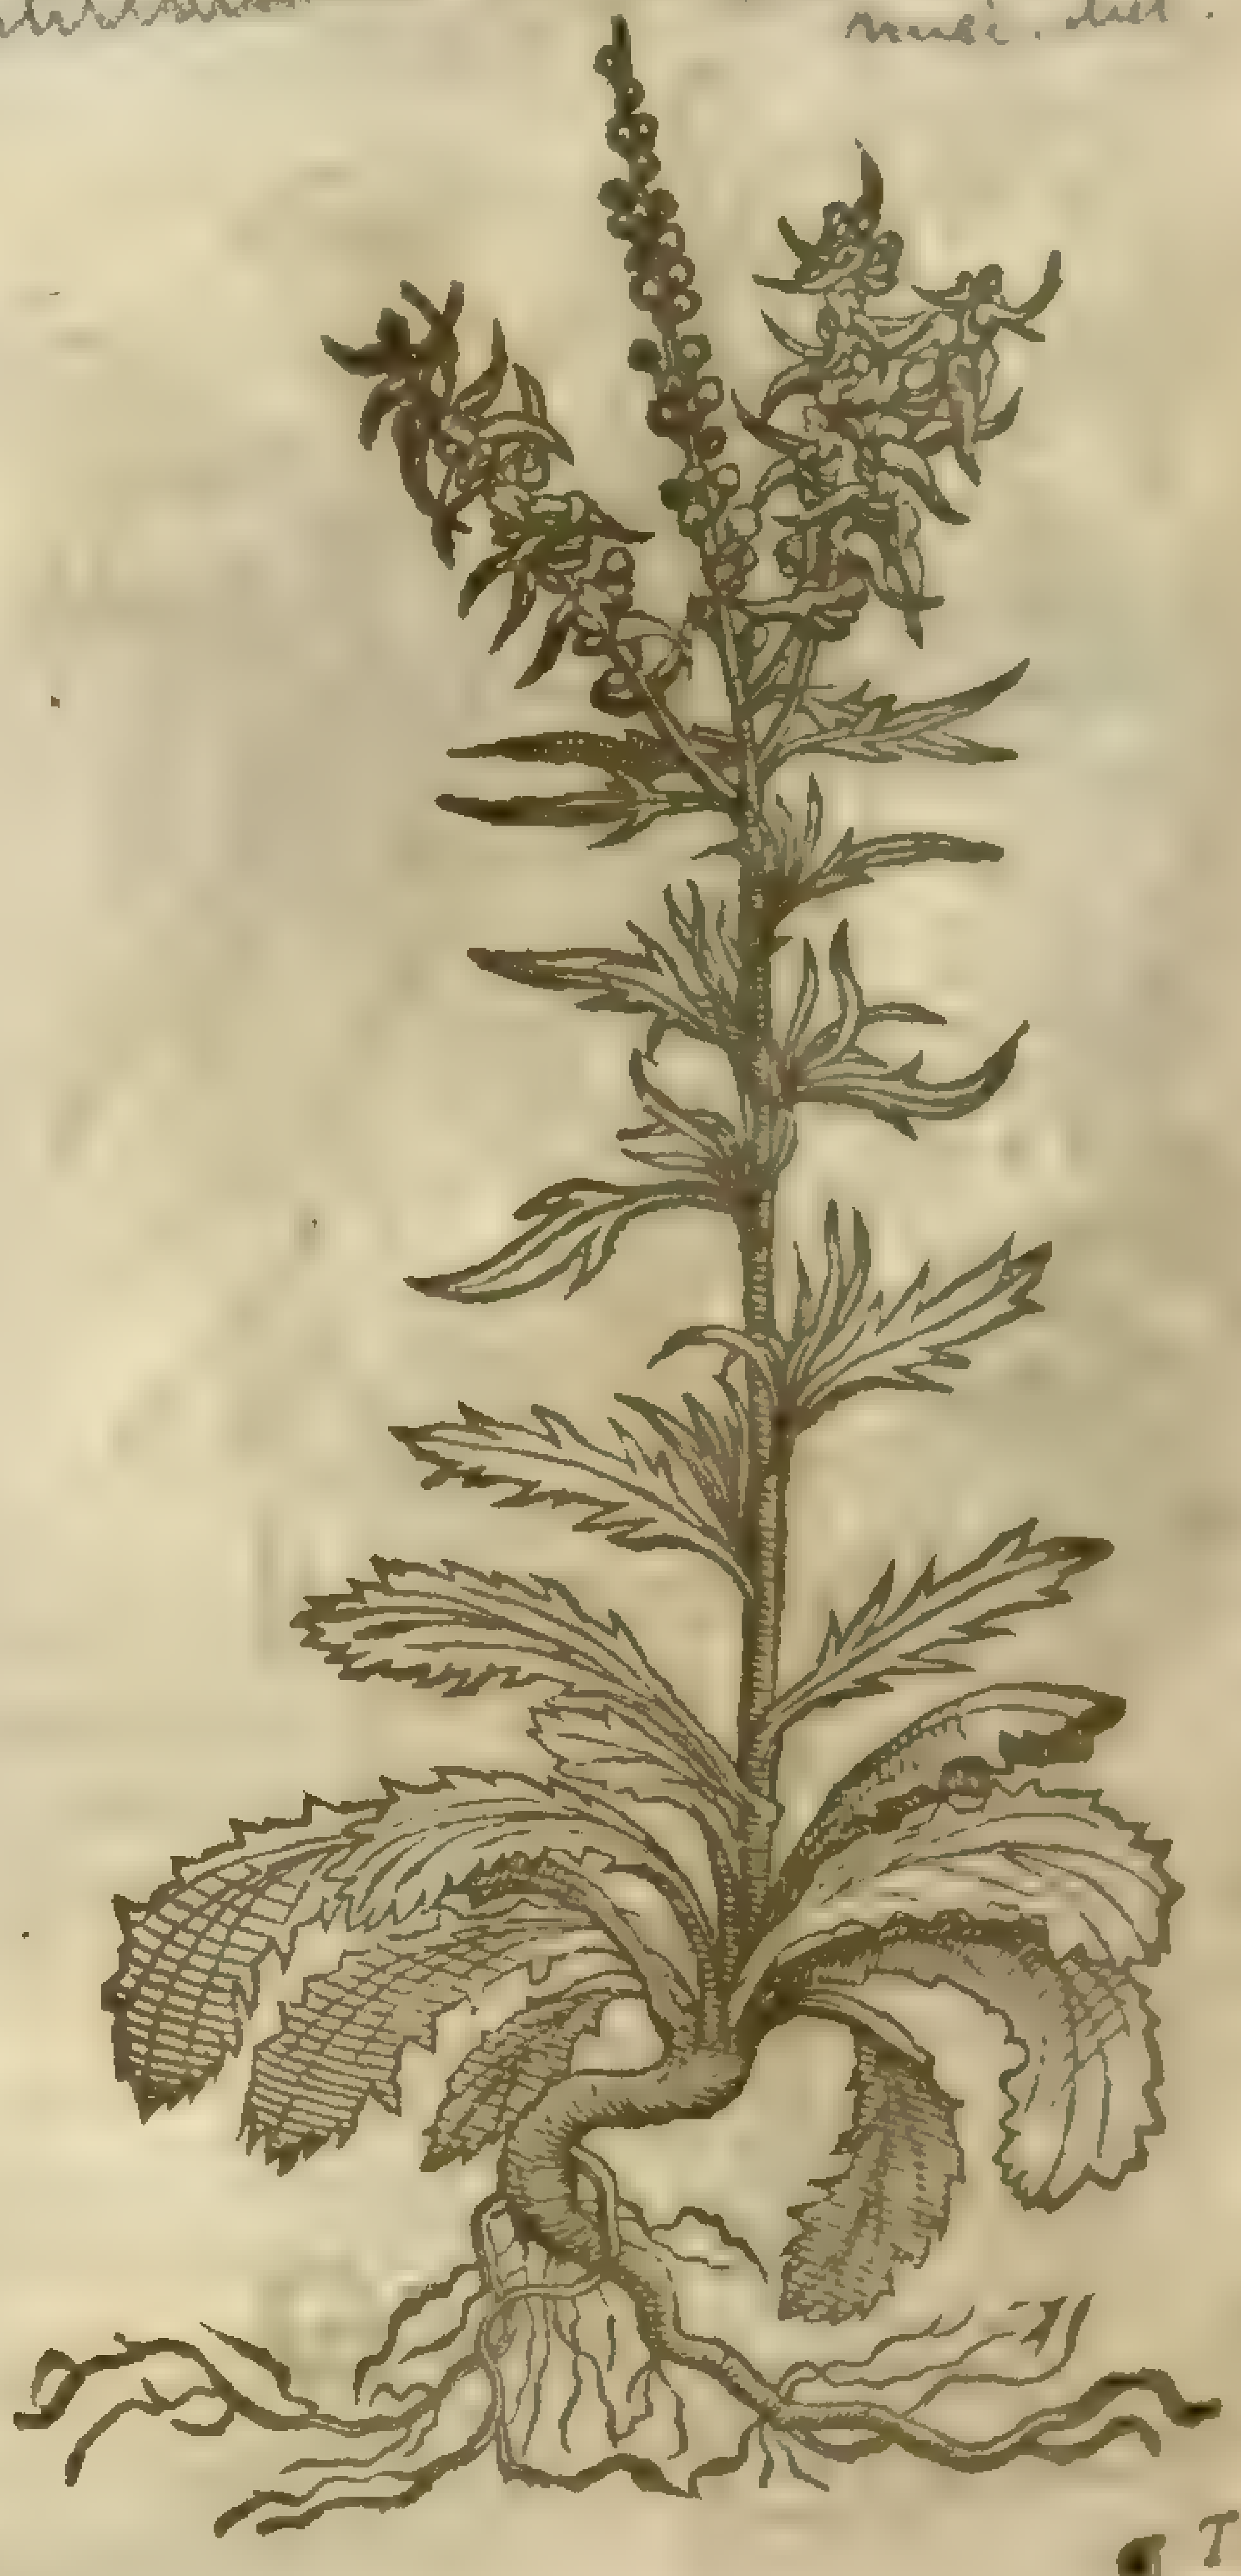


Antirrhinum [illegible]

[illegible] pt. 3, l. 134

2 *Linaria purpurea odorata.*
Sweet purple Tode-flax.

Antirrhinum [illegible]



¶ *The Deſcription.*

1 L*Inaria* being a kinde of *Antirrhinum*, hath ſmall, ſlender, blackiſh ſtalkes, from which do grow many long narrow leaues like flax. The floures be yellow, with a ſpur hanging at the ſame like vnto a Larkes ſpur, hauing a mouth like vnto a frogs mouth, euen ſuch as is to be ſeene in the common Snapdragon; the whole plant before it come to floure ſo much reſembleth *Eſula minor*, that the one is hardly knowne from the other, but by this old verſe:

Eſula lacteſcit, ſive lacte Linaria creſcit.

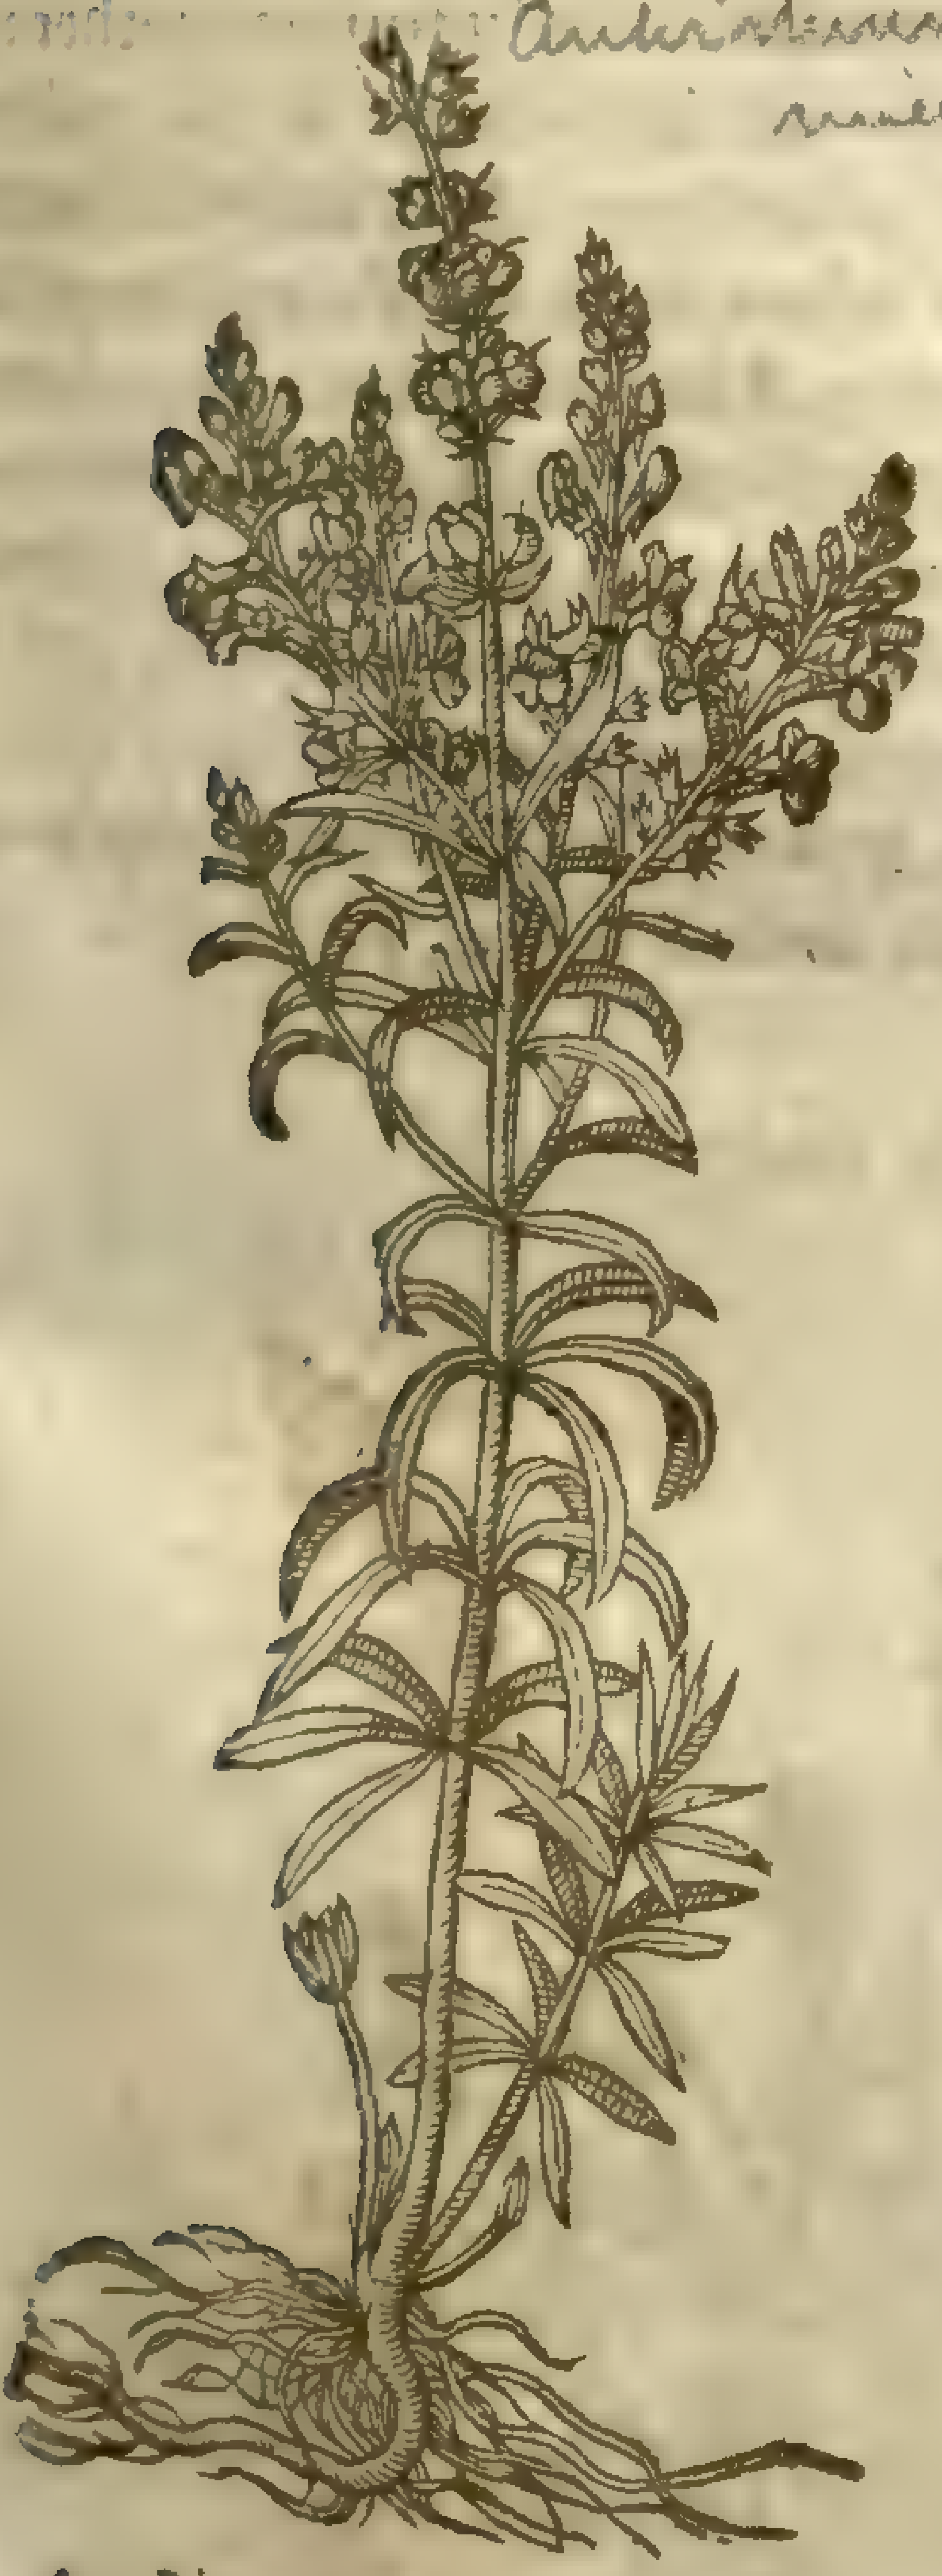
‡ *Eſula* with milke doth flow,
Toad-flax without milke doth grow. ‡

2 The ſecond kinde of Tode-flax hath leaues like vnto *Bellis maior*, or the great Daſie, but not ſo broad, and ſomewhat jagged about the edges. The ſtalke is ſmall and tender, of a cubit high, beſet with many purple floures like vnto the former in ſhape. The root is long, with many threds hanging thereat, the floures are of a reaſonable ſweet ſauour.

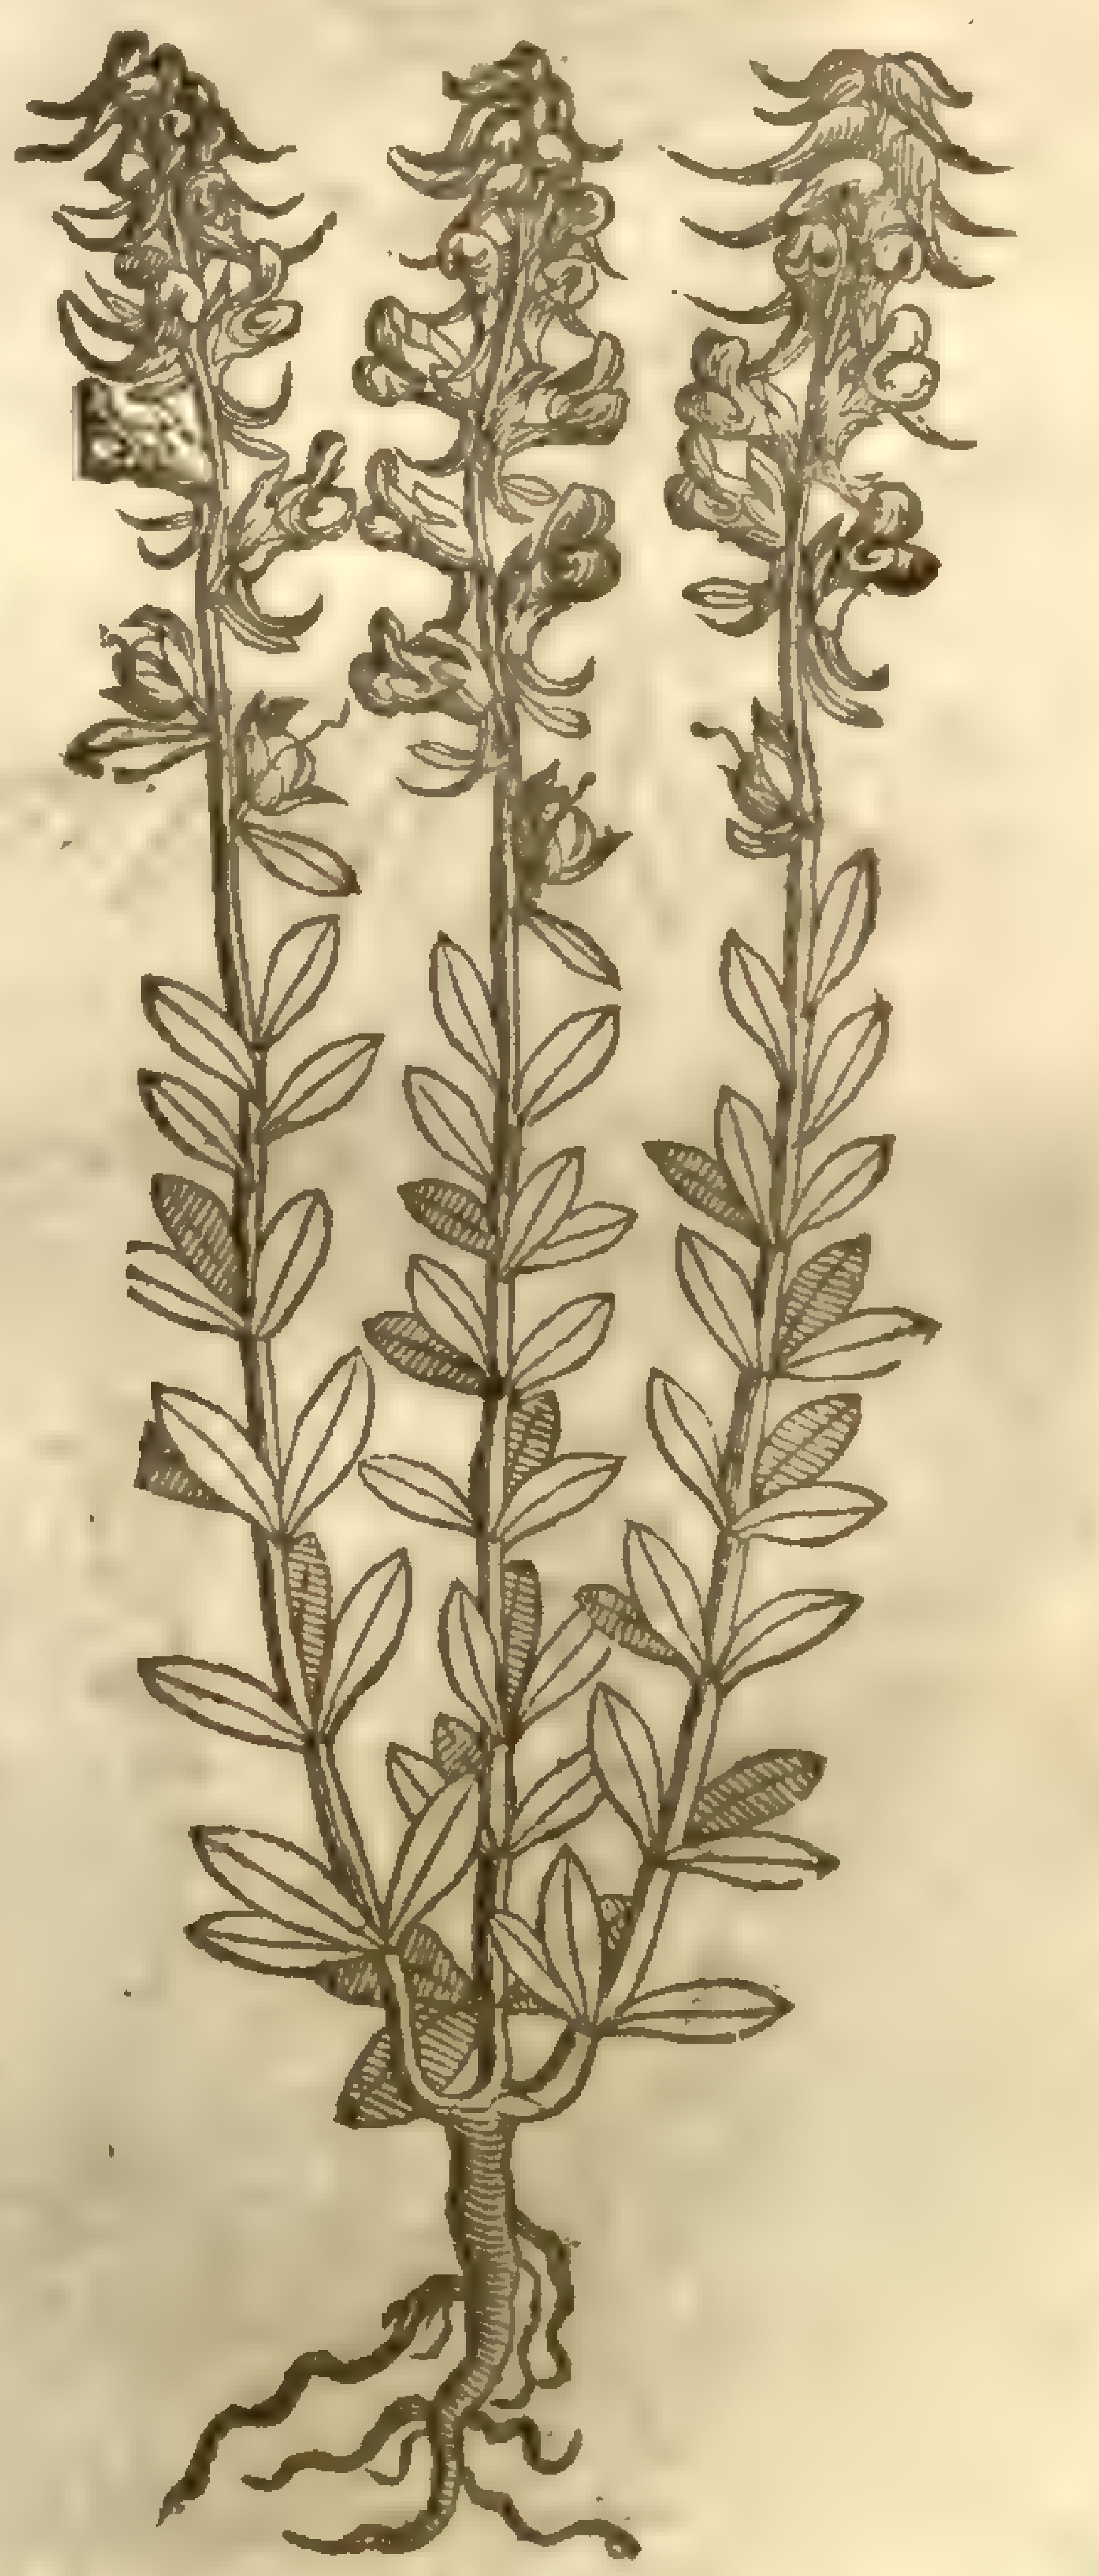
3 The third, being likewiſe a kinde of Tode-flax, hath ſmall and narrow leaues like vnto the firſt kinde of *Linaria*: the ſtalke is a cubit high, beſet with floures of a purple colour, in faſhion like *Cinaria*, but that it wanteth the taile or ſpurre at the end of the floure which the other hath. The root is ſmall and threddy.

† 3 *Linaria purpurea altera.*
Variable Tode-flax.

Antirrhinum purpureum [illegible]
minus · dut.



† 4 *Linaria Valentina Cluſ.*
Tode-flax of Valentia.

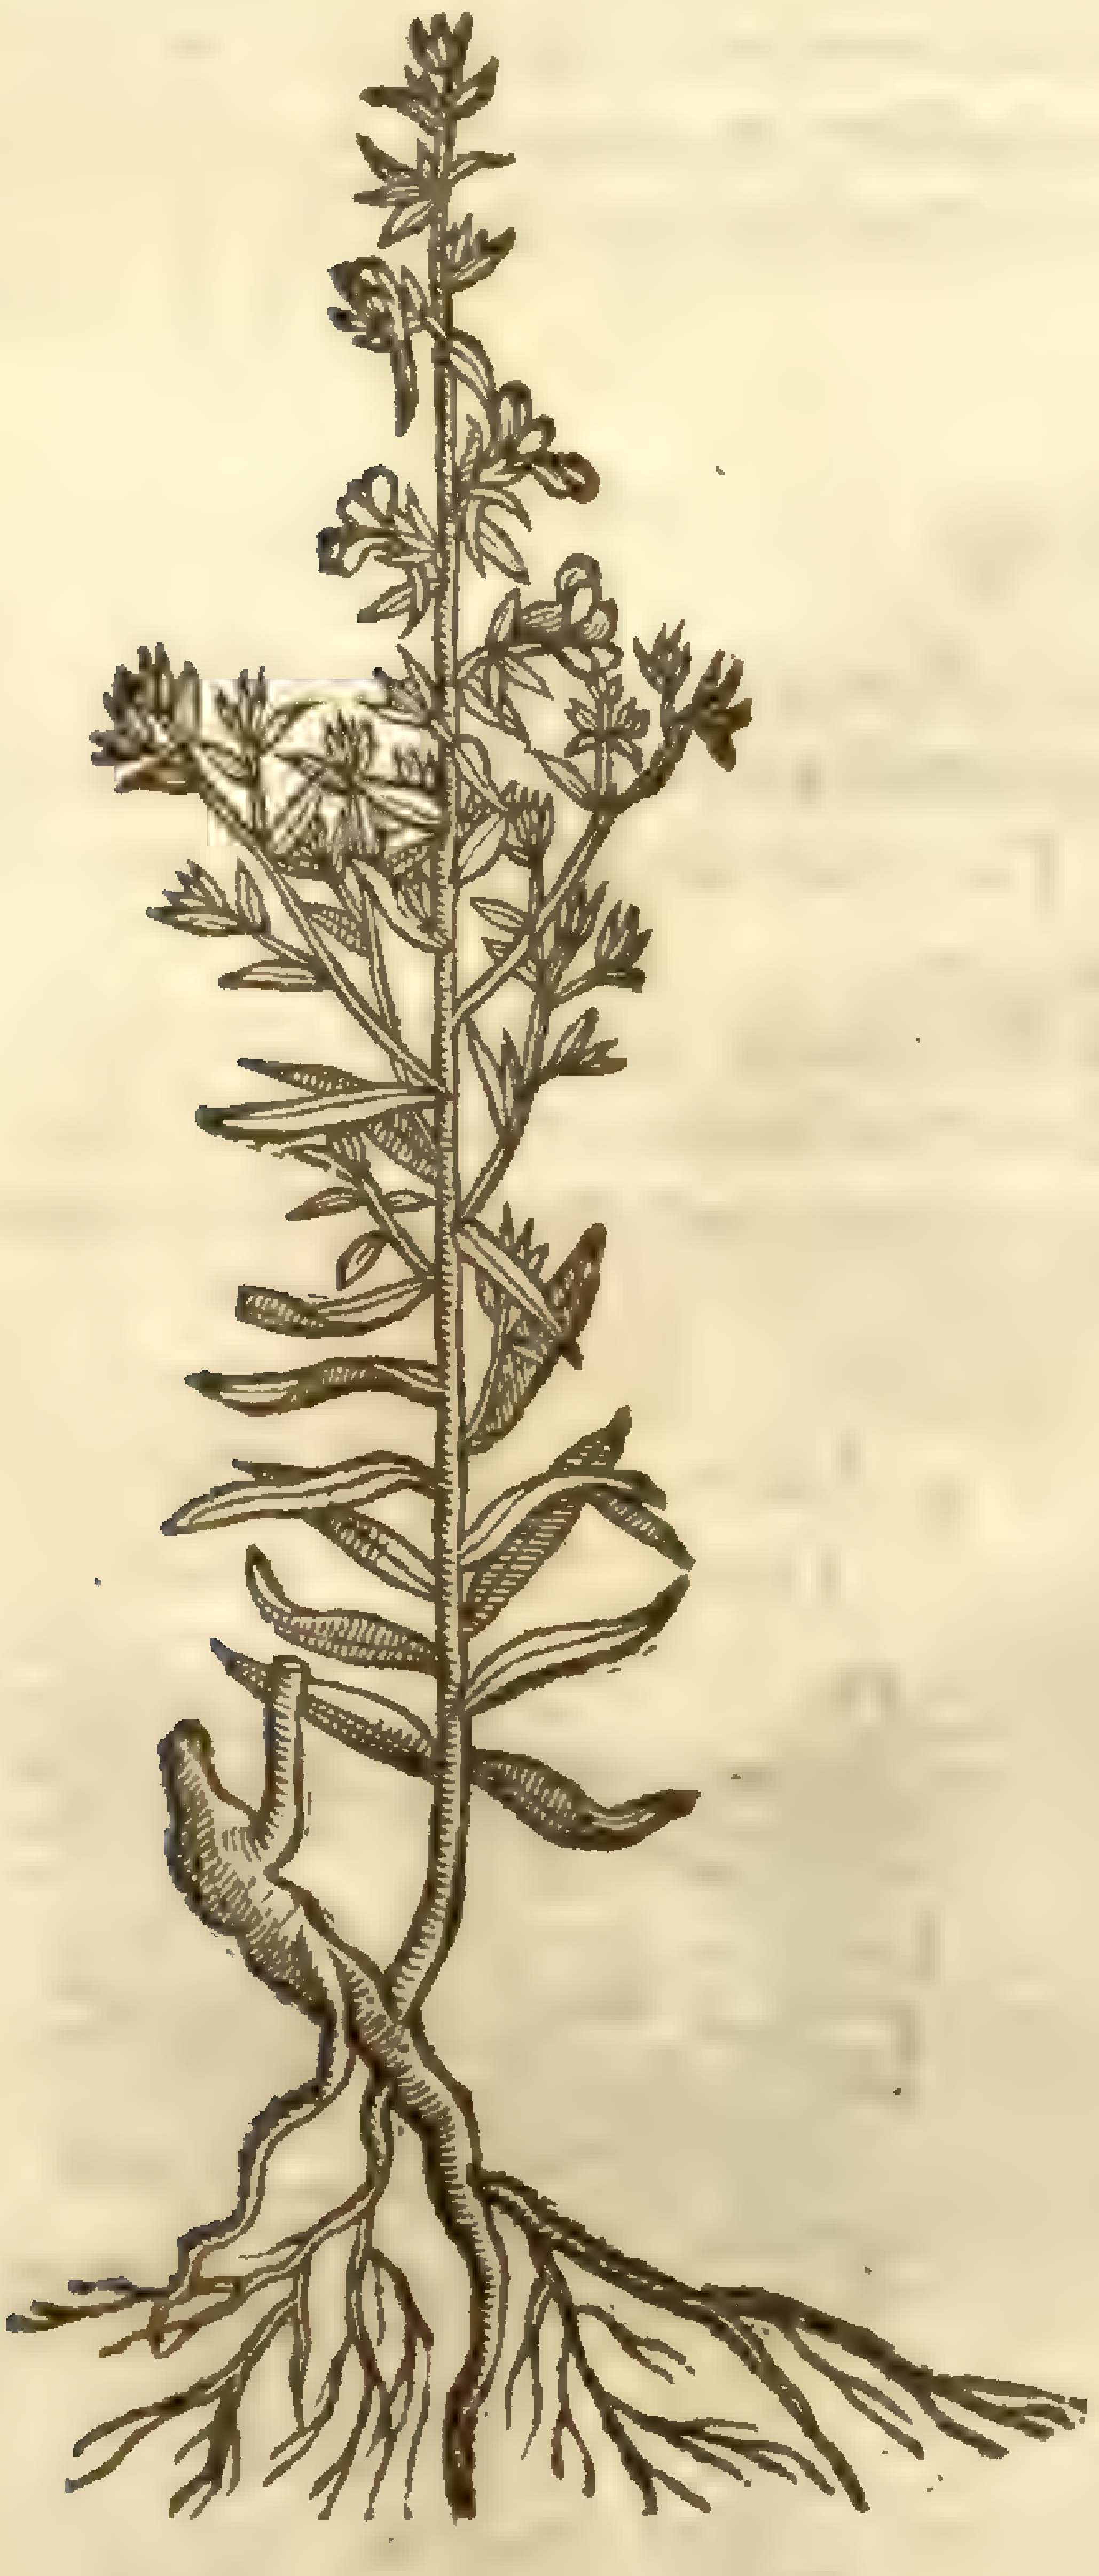


† 4 *Linaria Valentina* hath leaues like the leſſer Centorie, growing at the bottome of the ſtalke by three and three, but higher vp towards the top, without any certaine order: the ſtalkes are of a foot high; and it is called by *Cluſius*, *Valentina*, for that it was found by himſelfe in *Agro Valentino*, about Valentia in Spaine, where it beareth yellow floures about the top of the ſtalke like common *Linaria*, but the mouth of the floure is downy, or moſſie, and the taile of a purple colour. It floureth at Valentia in March, and groweth in the medowes there, and hath not as yet been ſeene in theſe Northerne parts.

5 *Oſyris alba* hath great, thicke, and long roots, with ſome threds or ſtrings hanging at the ſame, from which riſe vp many branches very tough and pliant, beſet towards the top with floures not much vnlike the common Toad-flax, but of a pale whitiſh colour, and the inner part of the mouth ſomewhat more wide and open, and the leaues like the common Tode-flax.

† 6 *Oſyris*

† 5 *Oſyris alba, Lob.*
White Tode-flax.

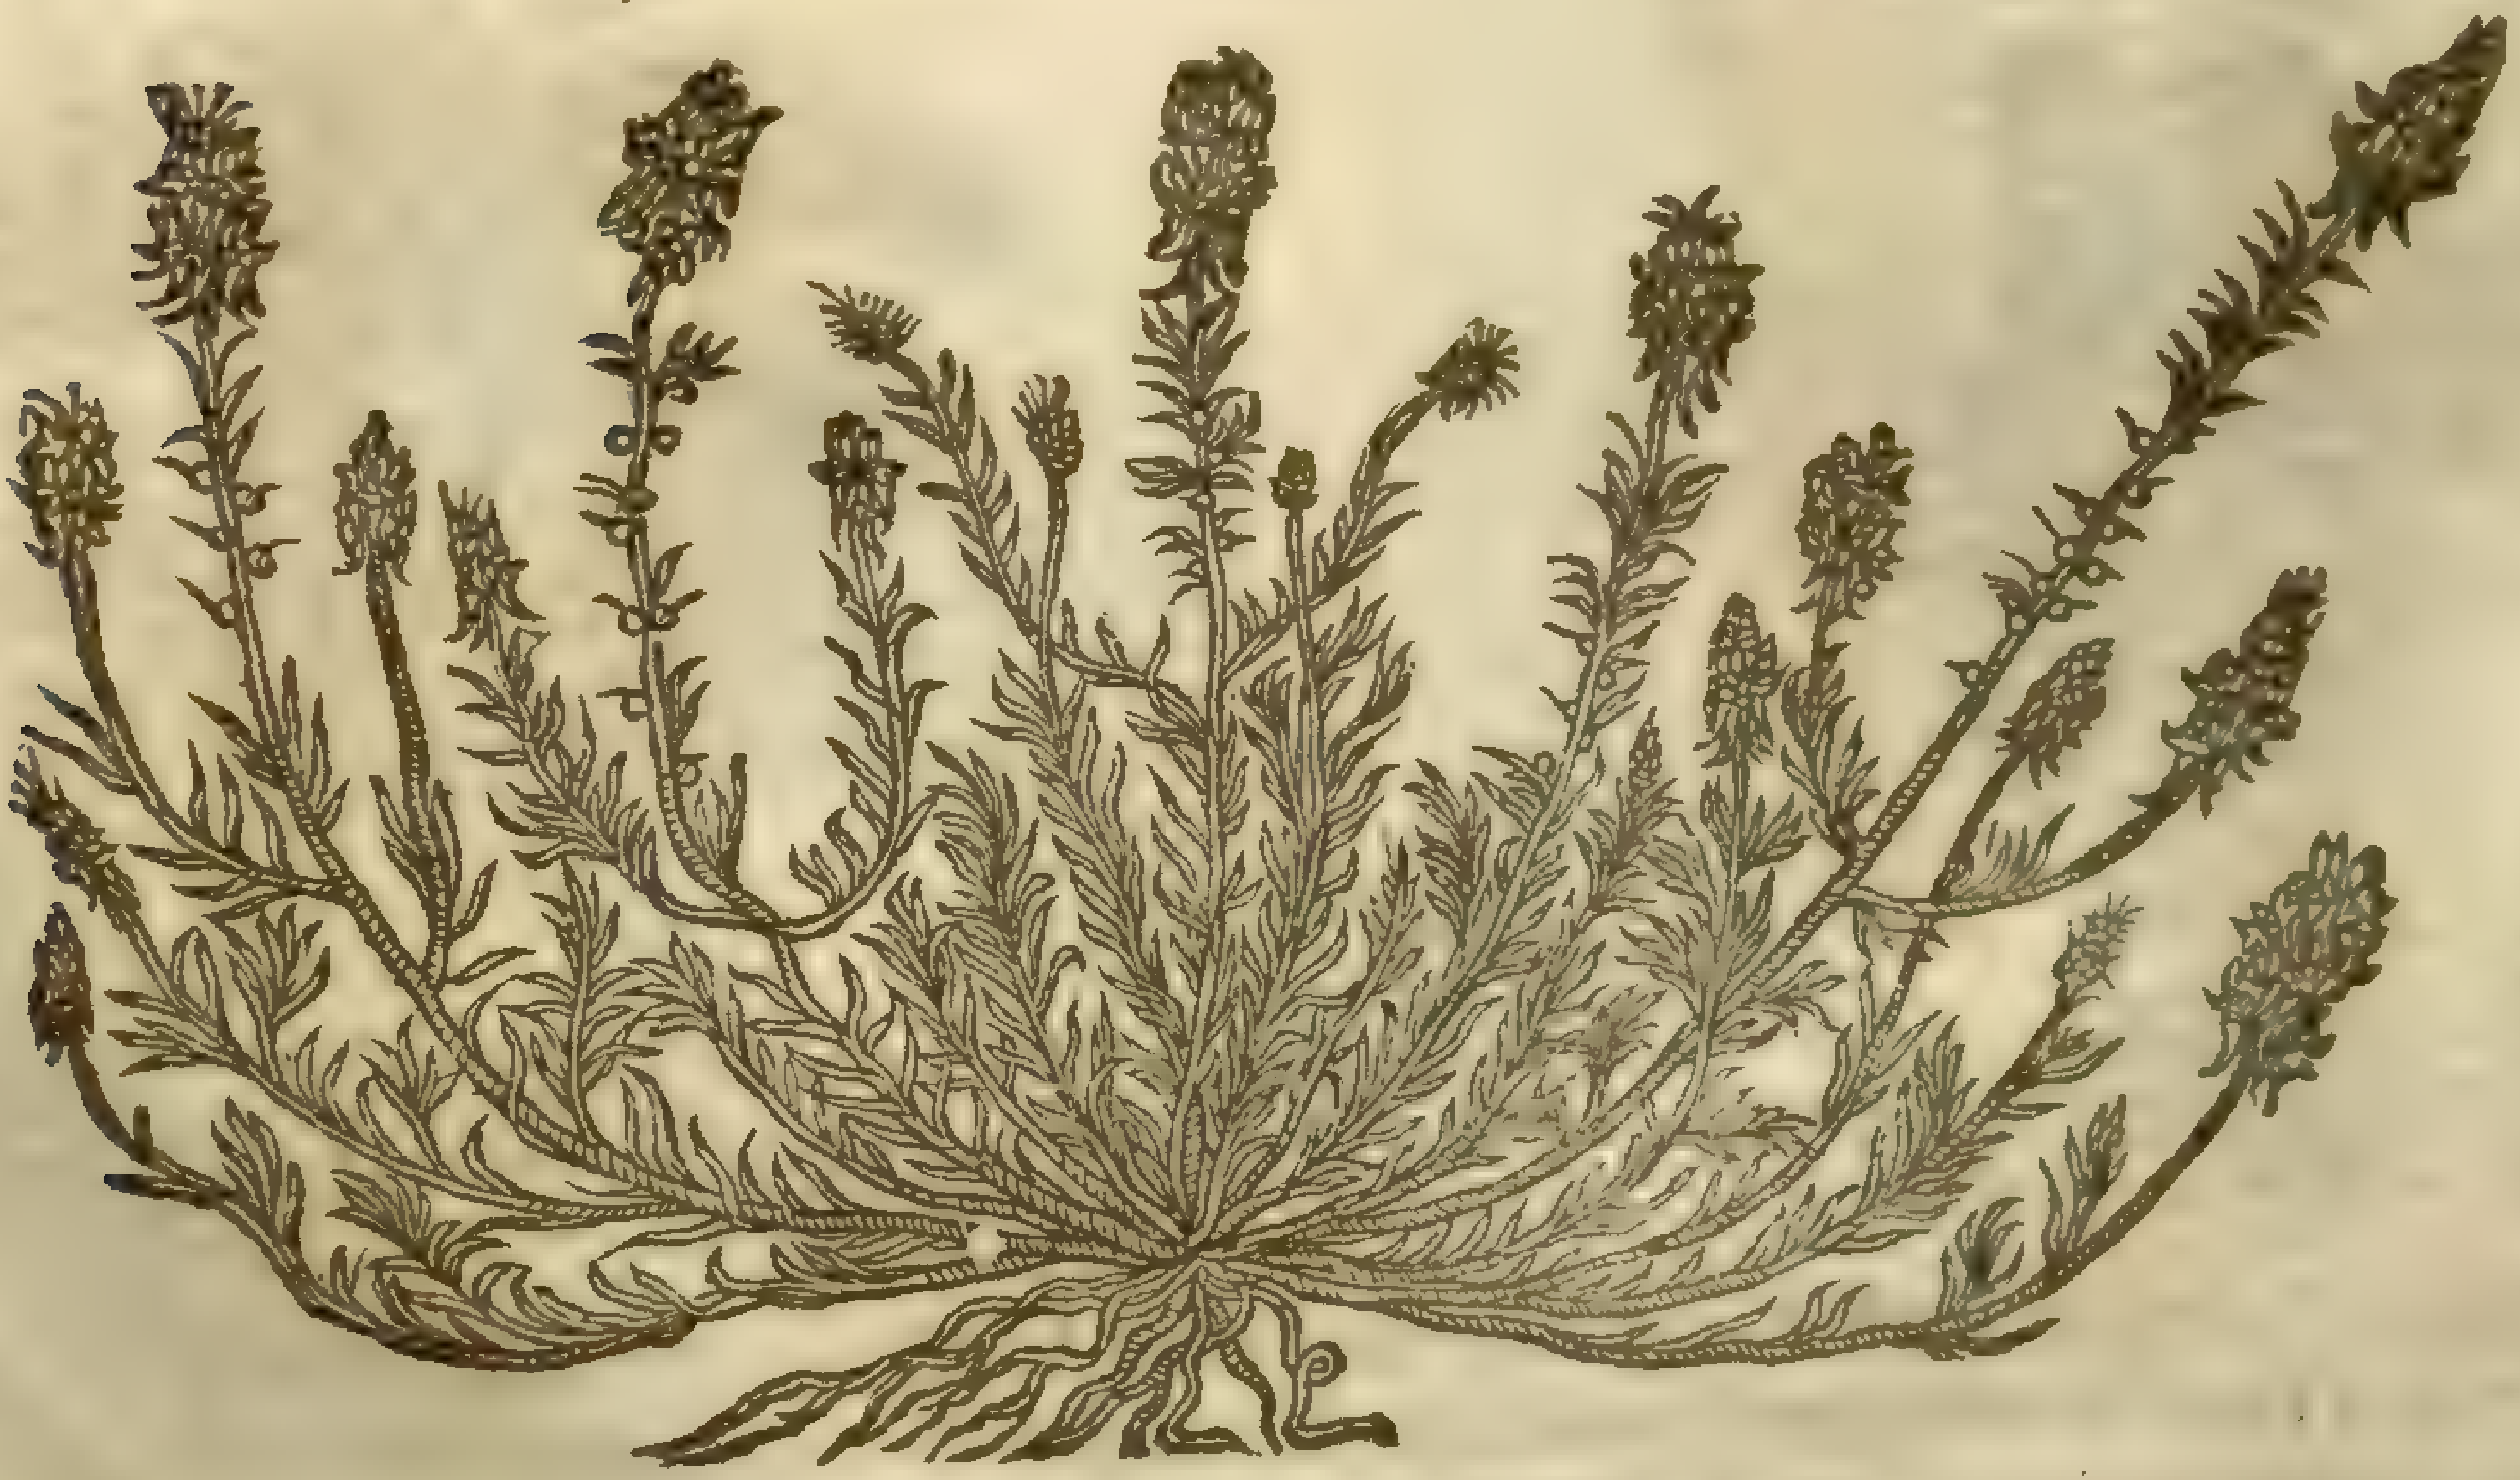


6 *Oſyris purpurocærulea* is a kinde of Tode-flax that hath many ſmall and weake branches, trailing vpon the ground, beſet with many little leaues like flax. The floures grow at the top of the ſtalke like vnto the common kinde, but of a purple colour declining to blewneſſe. The root is ſmall and threddy.

‡ 7 This hath many ſmall creeping branches ſome handfull or better high, and hath ſuch leaues, floures, and ſeed, as the common kind, but all of them much leſſe, and therein conſiſteth the difference. It growes naturally in the dry fields about Salamanca in Spaine, and floures all Summer long. *Lobel* cals it *Oſyris flava ſylueſtris*; and *Cluſius*, *Linaria Hiſpanica*.

8 The branches of this eight kind are ſpred vpon the ground, and of the length of thoſe of the laſt deſcribed: the leaues are leſſer than thoſe of the common Tode-flax, thicke, juycie, and of a whitiſh greene colour, and they grow not diſorderly vpon the ſtalks, but at certain ſpaces, ſometimes three, but moſt vſually foure together: the floures in ſhape are like thoſe of the ordinarie kinde, but of a moſt perfect Violet colour, and the lower lip where it gapes of a golden yellow; the taſte is bitter. After the floures are paſt come veſſels round & thick, which contain a flat black ſeed in two partitions or cels: the root is ſlender, white, and long laſting, and it floures vnto the end of Autumne. It growes naturally vpon the higheſt Alps. *Geſner* cals it, *Linaria Alpina*: and *Cluſius*, *Linaria tertia Styriaca.* ‡

† 6 *Oſyris Purpurocærulea repens.* Purple Tode-flax.

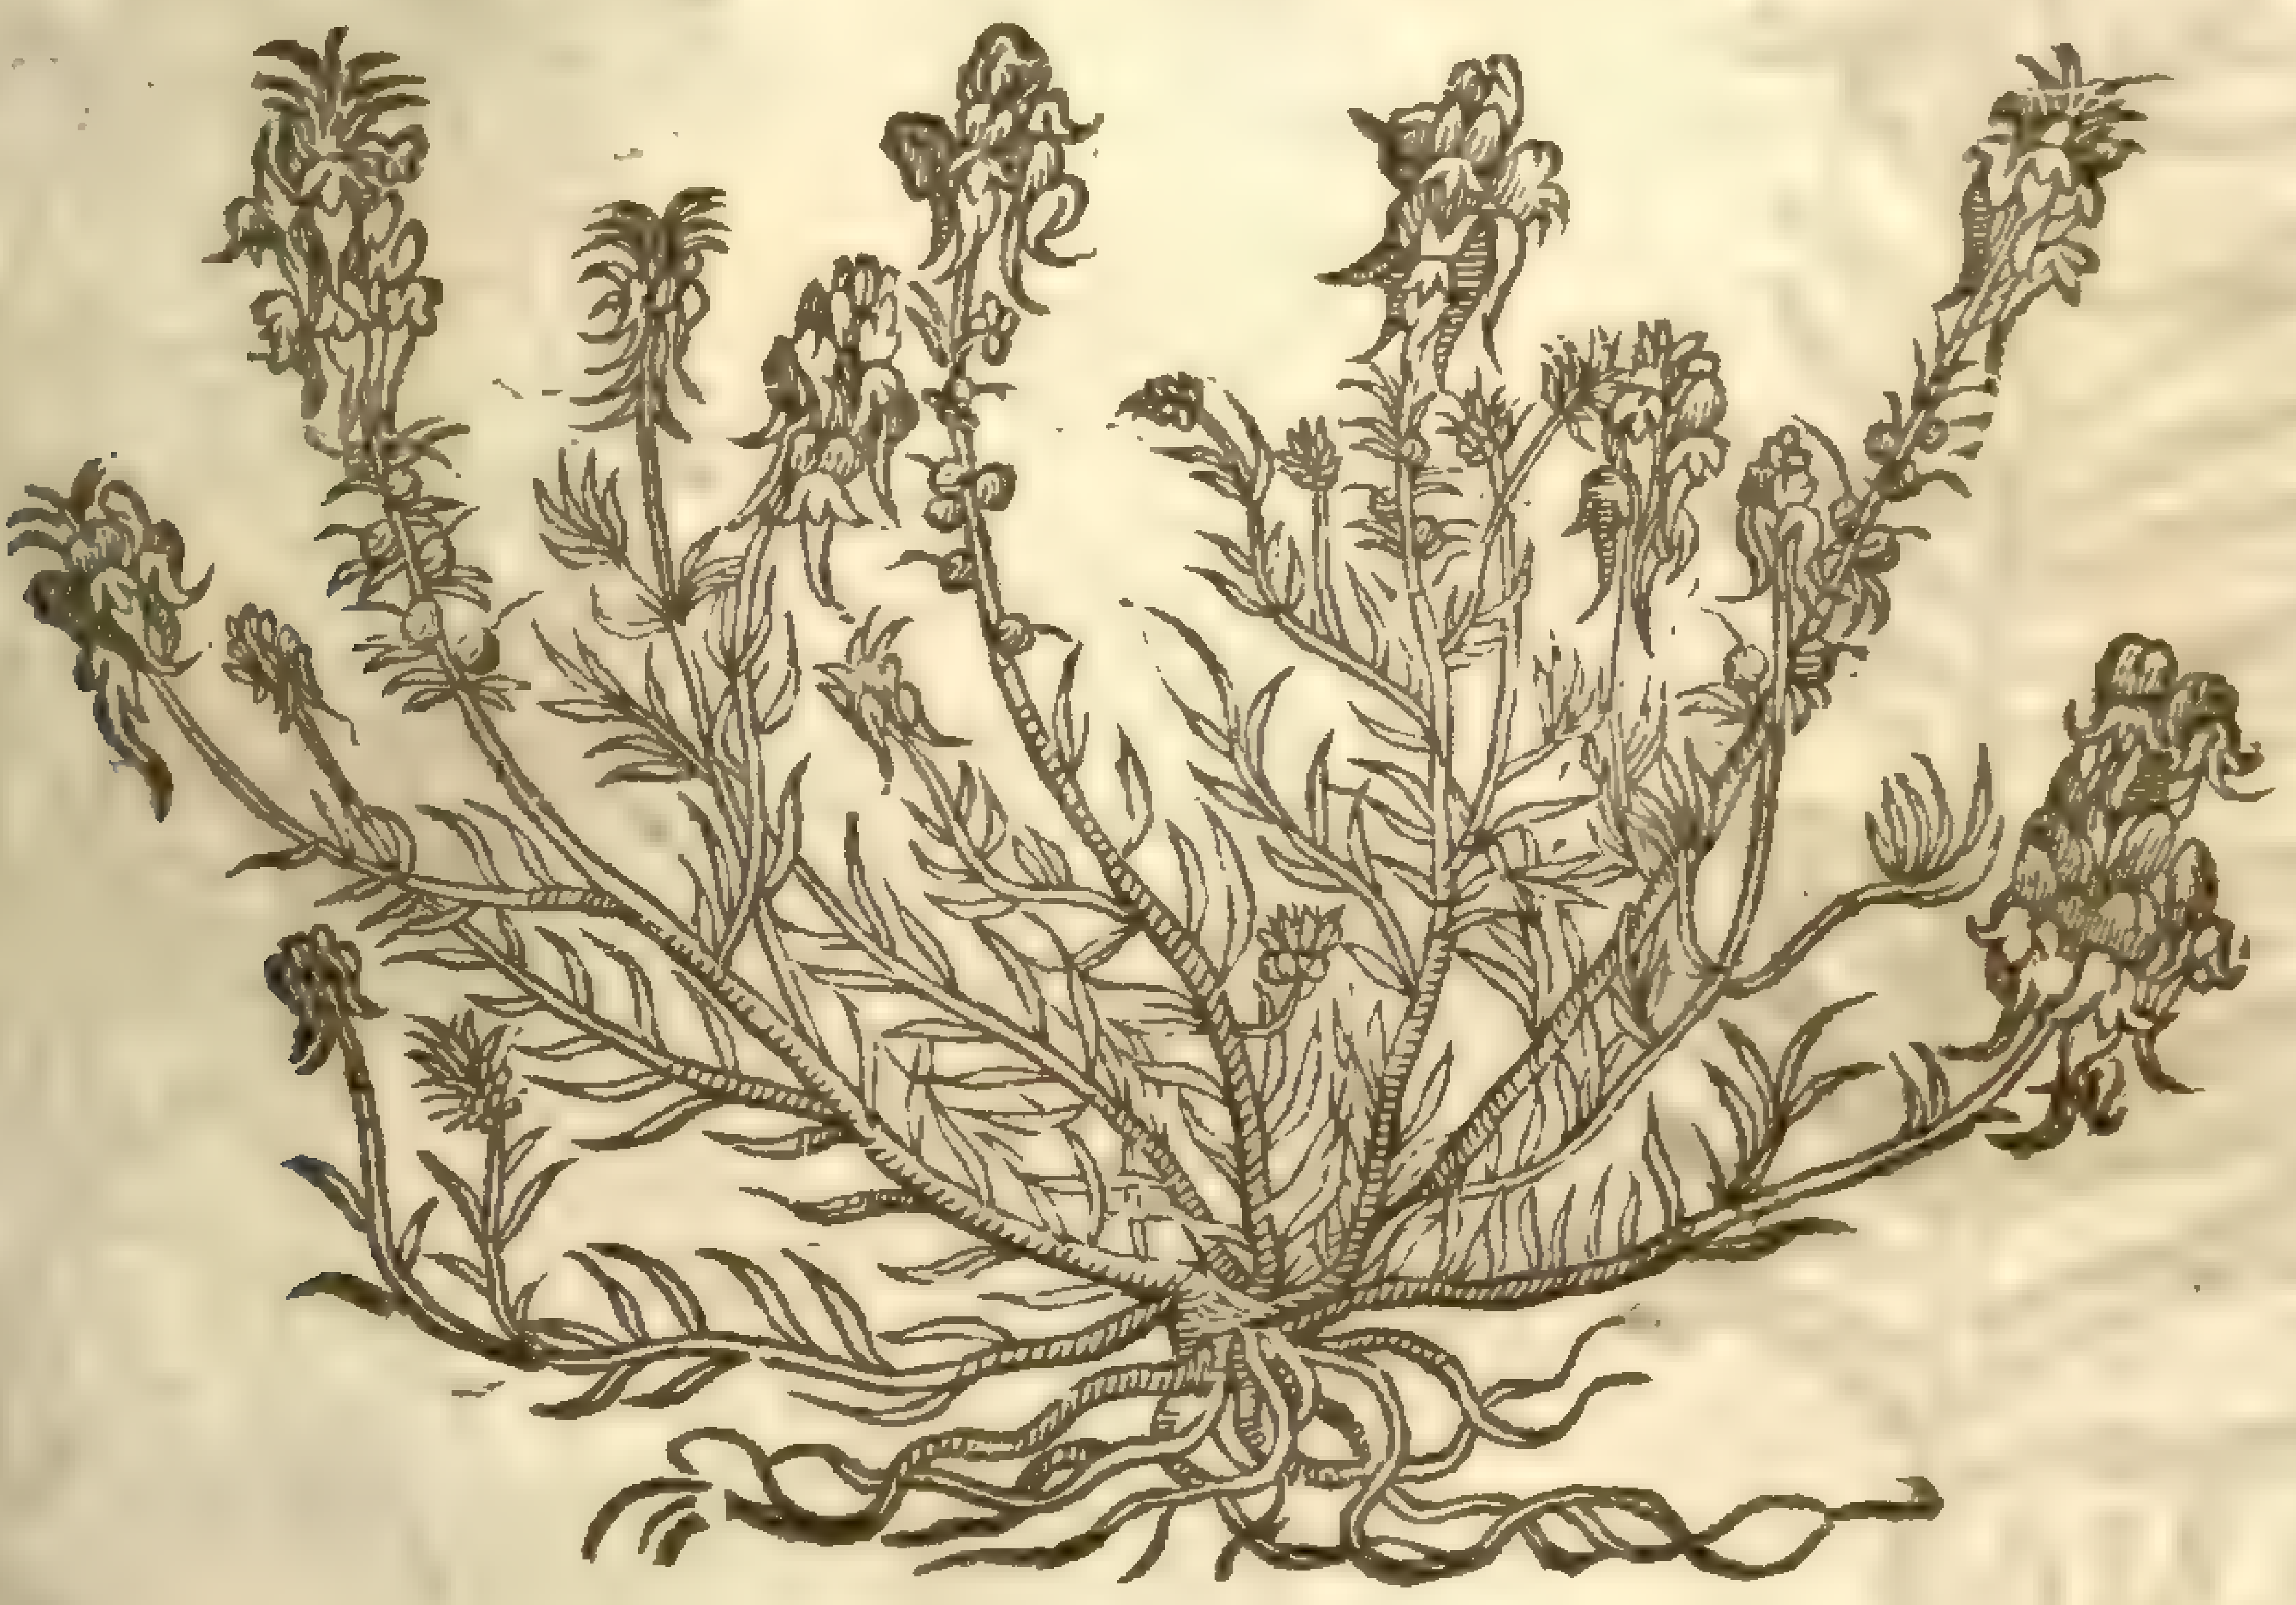


† 9 Foraſmuch as this plant is ſtalked and leafed like common flaxe, and thought by ſome to be *Oſyris*; the new writers haue called it *Lynoſyris*: it hath ſtalkes very ſtiffe and wooddy, beſet with leaues like the common *Linaria*, with floures at the top of the ſtalkes of a faint ſhining yellow colour, in forme and ſhape ſomewhat like vnto *Conyza major*. The whole plant groweth to the height of two cubits, and is in taſte ſharpe and clammie, or glutinous, and ſomewhat bitter. The root is compact of many ſtrings, intangled one within another.

† 10 *Guillandinus* calleth this plant *Hyſſopus vmbellifera Dioſcoridis*, that is, *Dioſcorides* his Hyſope,

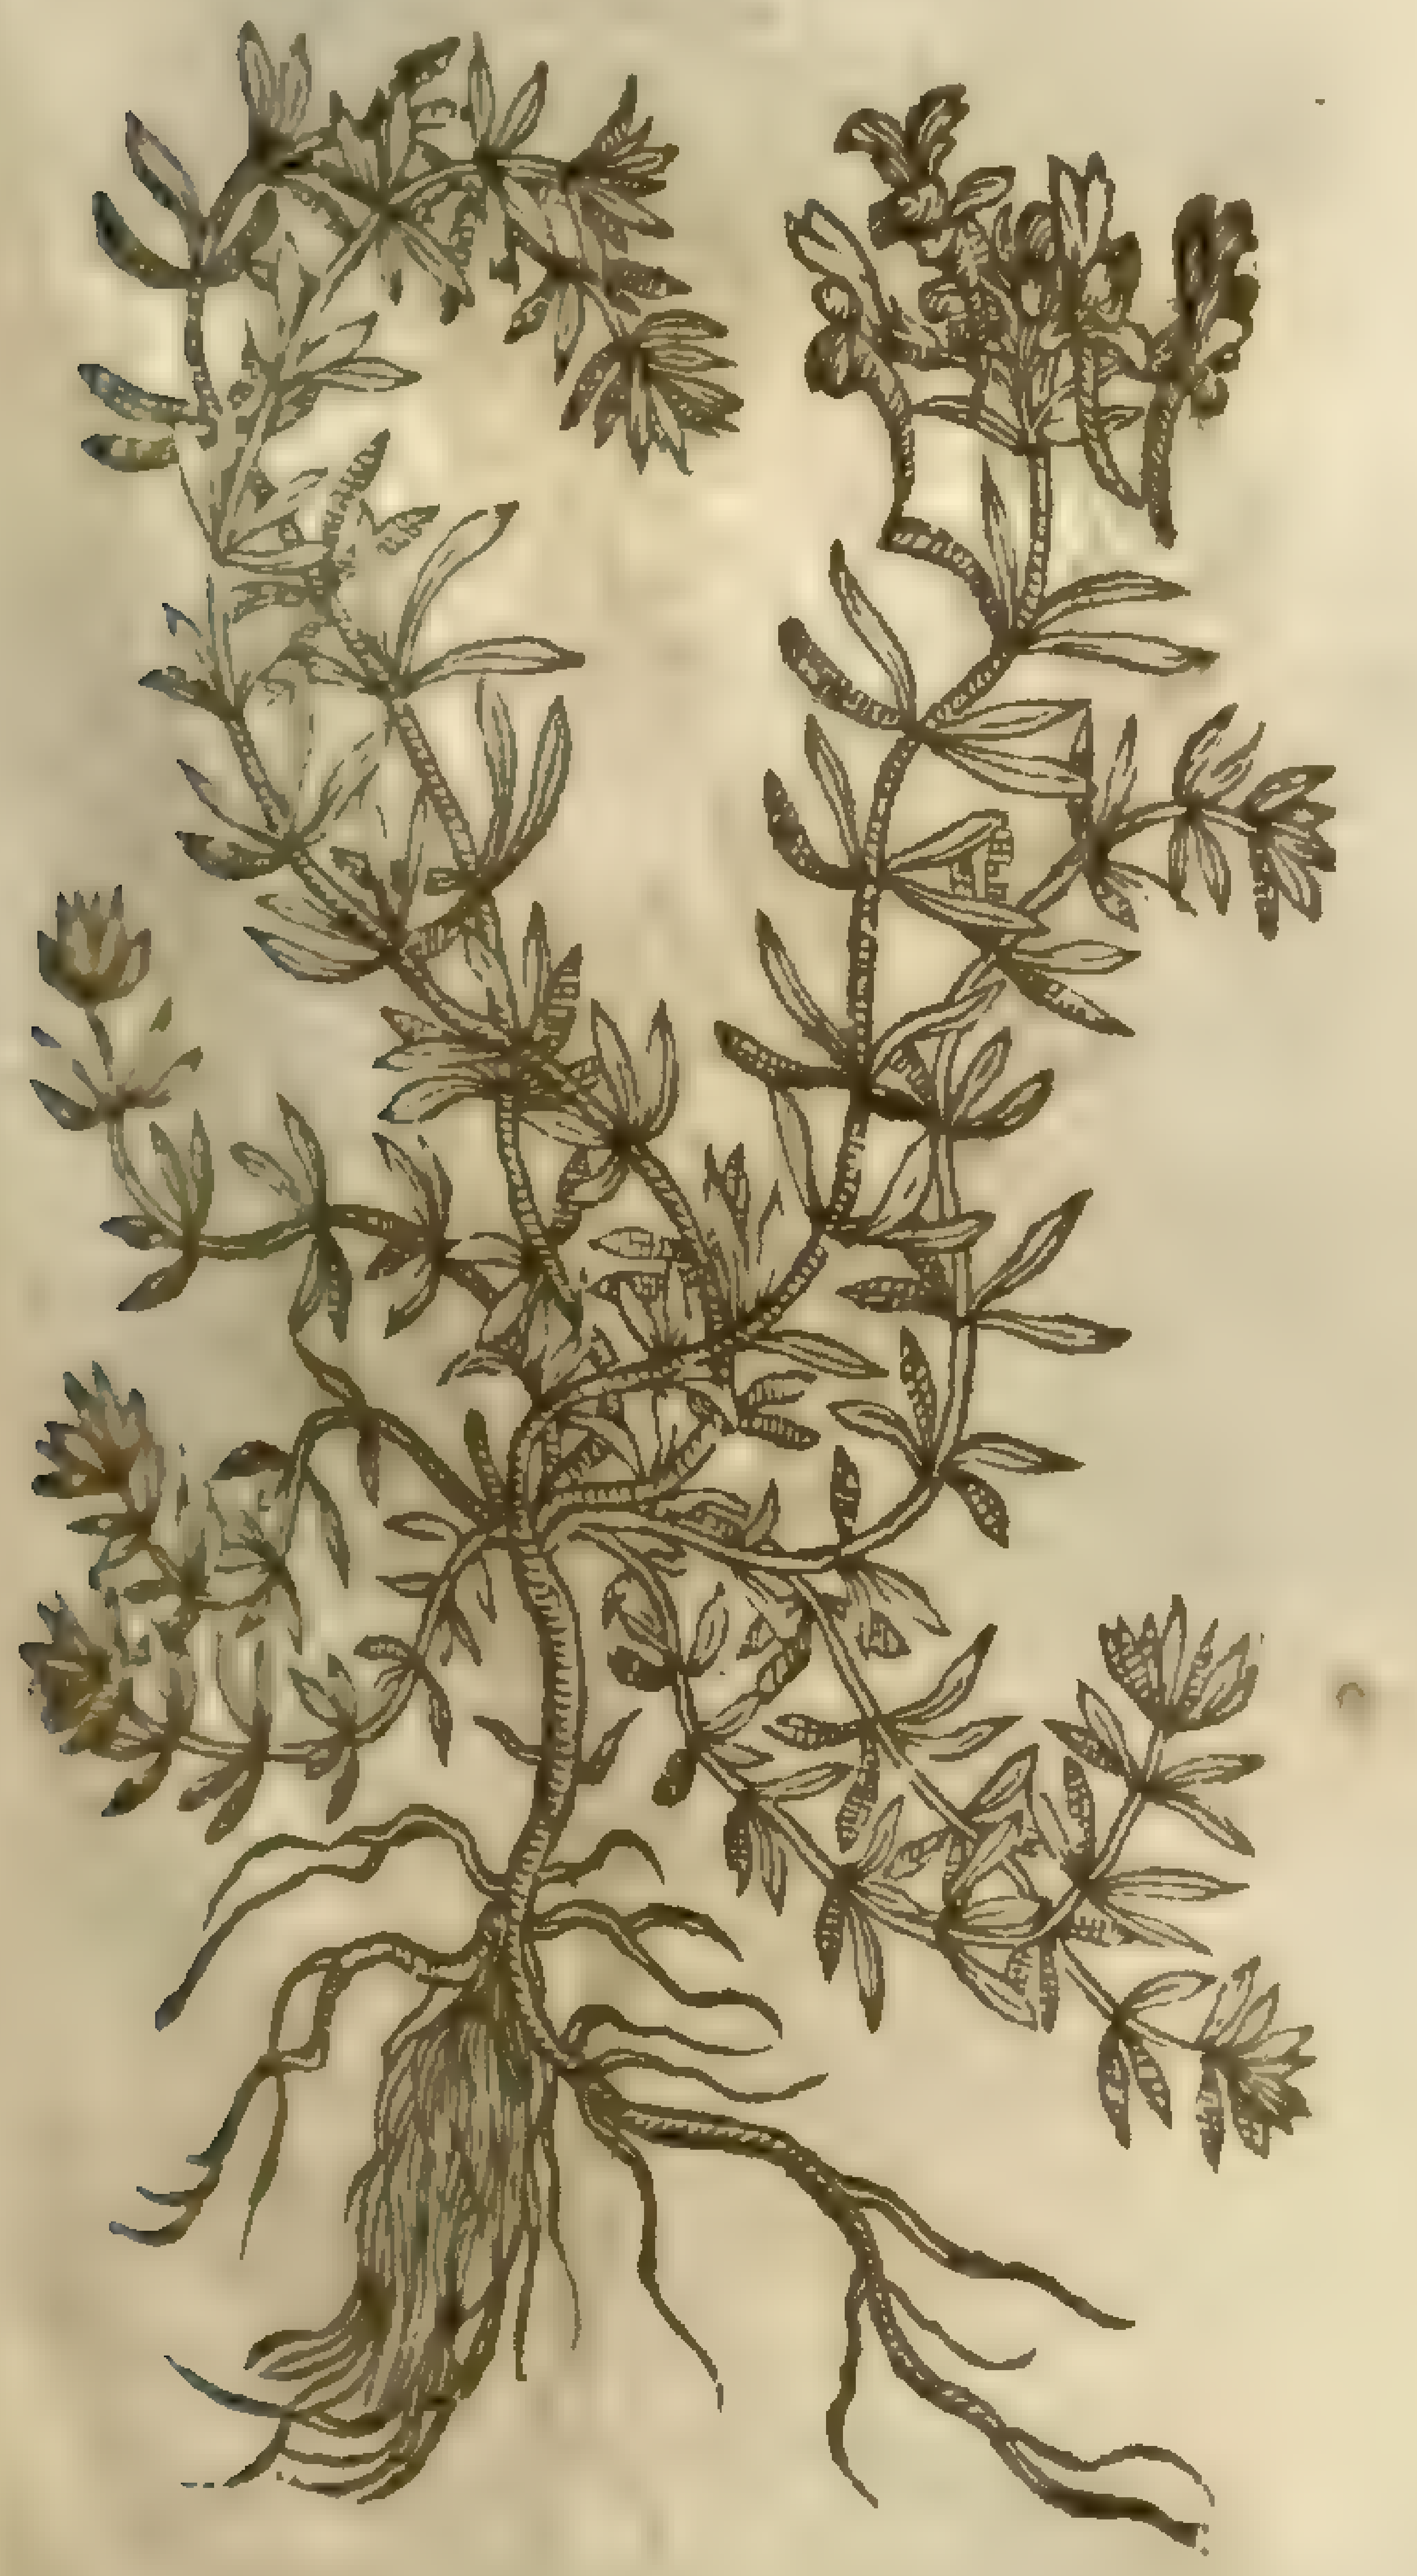
ſope, which beareth a tuft in all points like *Linoſyris*, whereof it is a kinde, not differing from it in ſhew and leaues. The ſtalkes are a cubit high, diuided aboue into many ſmall branches, the tops whereof are garniſhed with tufts of ſmall floures, each little floure being parted into fiue parts with a little thred or peſtle in the middle, ſo that it ſeemes full of many golden haires or thrums. The ſeed is long and blackiſh, and is carried away with the winde. ‡ *Bauhine* in his *Pinax* makes this all one with the former, but vnfitly, eſpecially if you marke the deſcription of their floures which are far vnlike. *Fabius Columna* hath proued this to be the *Chryſocome* deſcribed by *Dioſc. lib.* 4. *cap.* 55. ‡

‡ 7 *Oſyris flava ſylueſtris.* Creeping yellow Tode-flax.

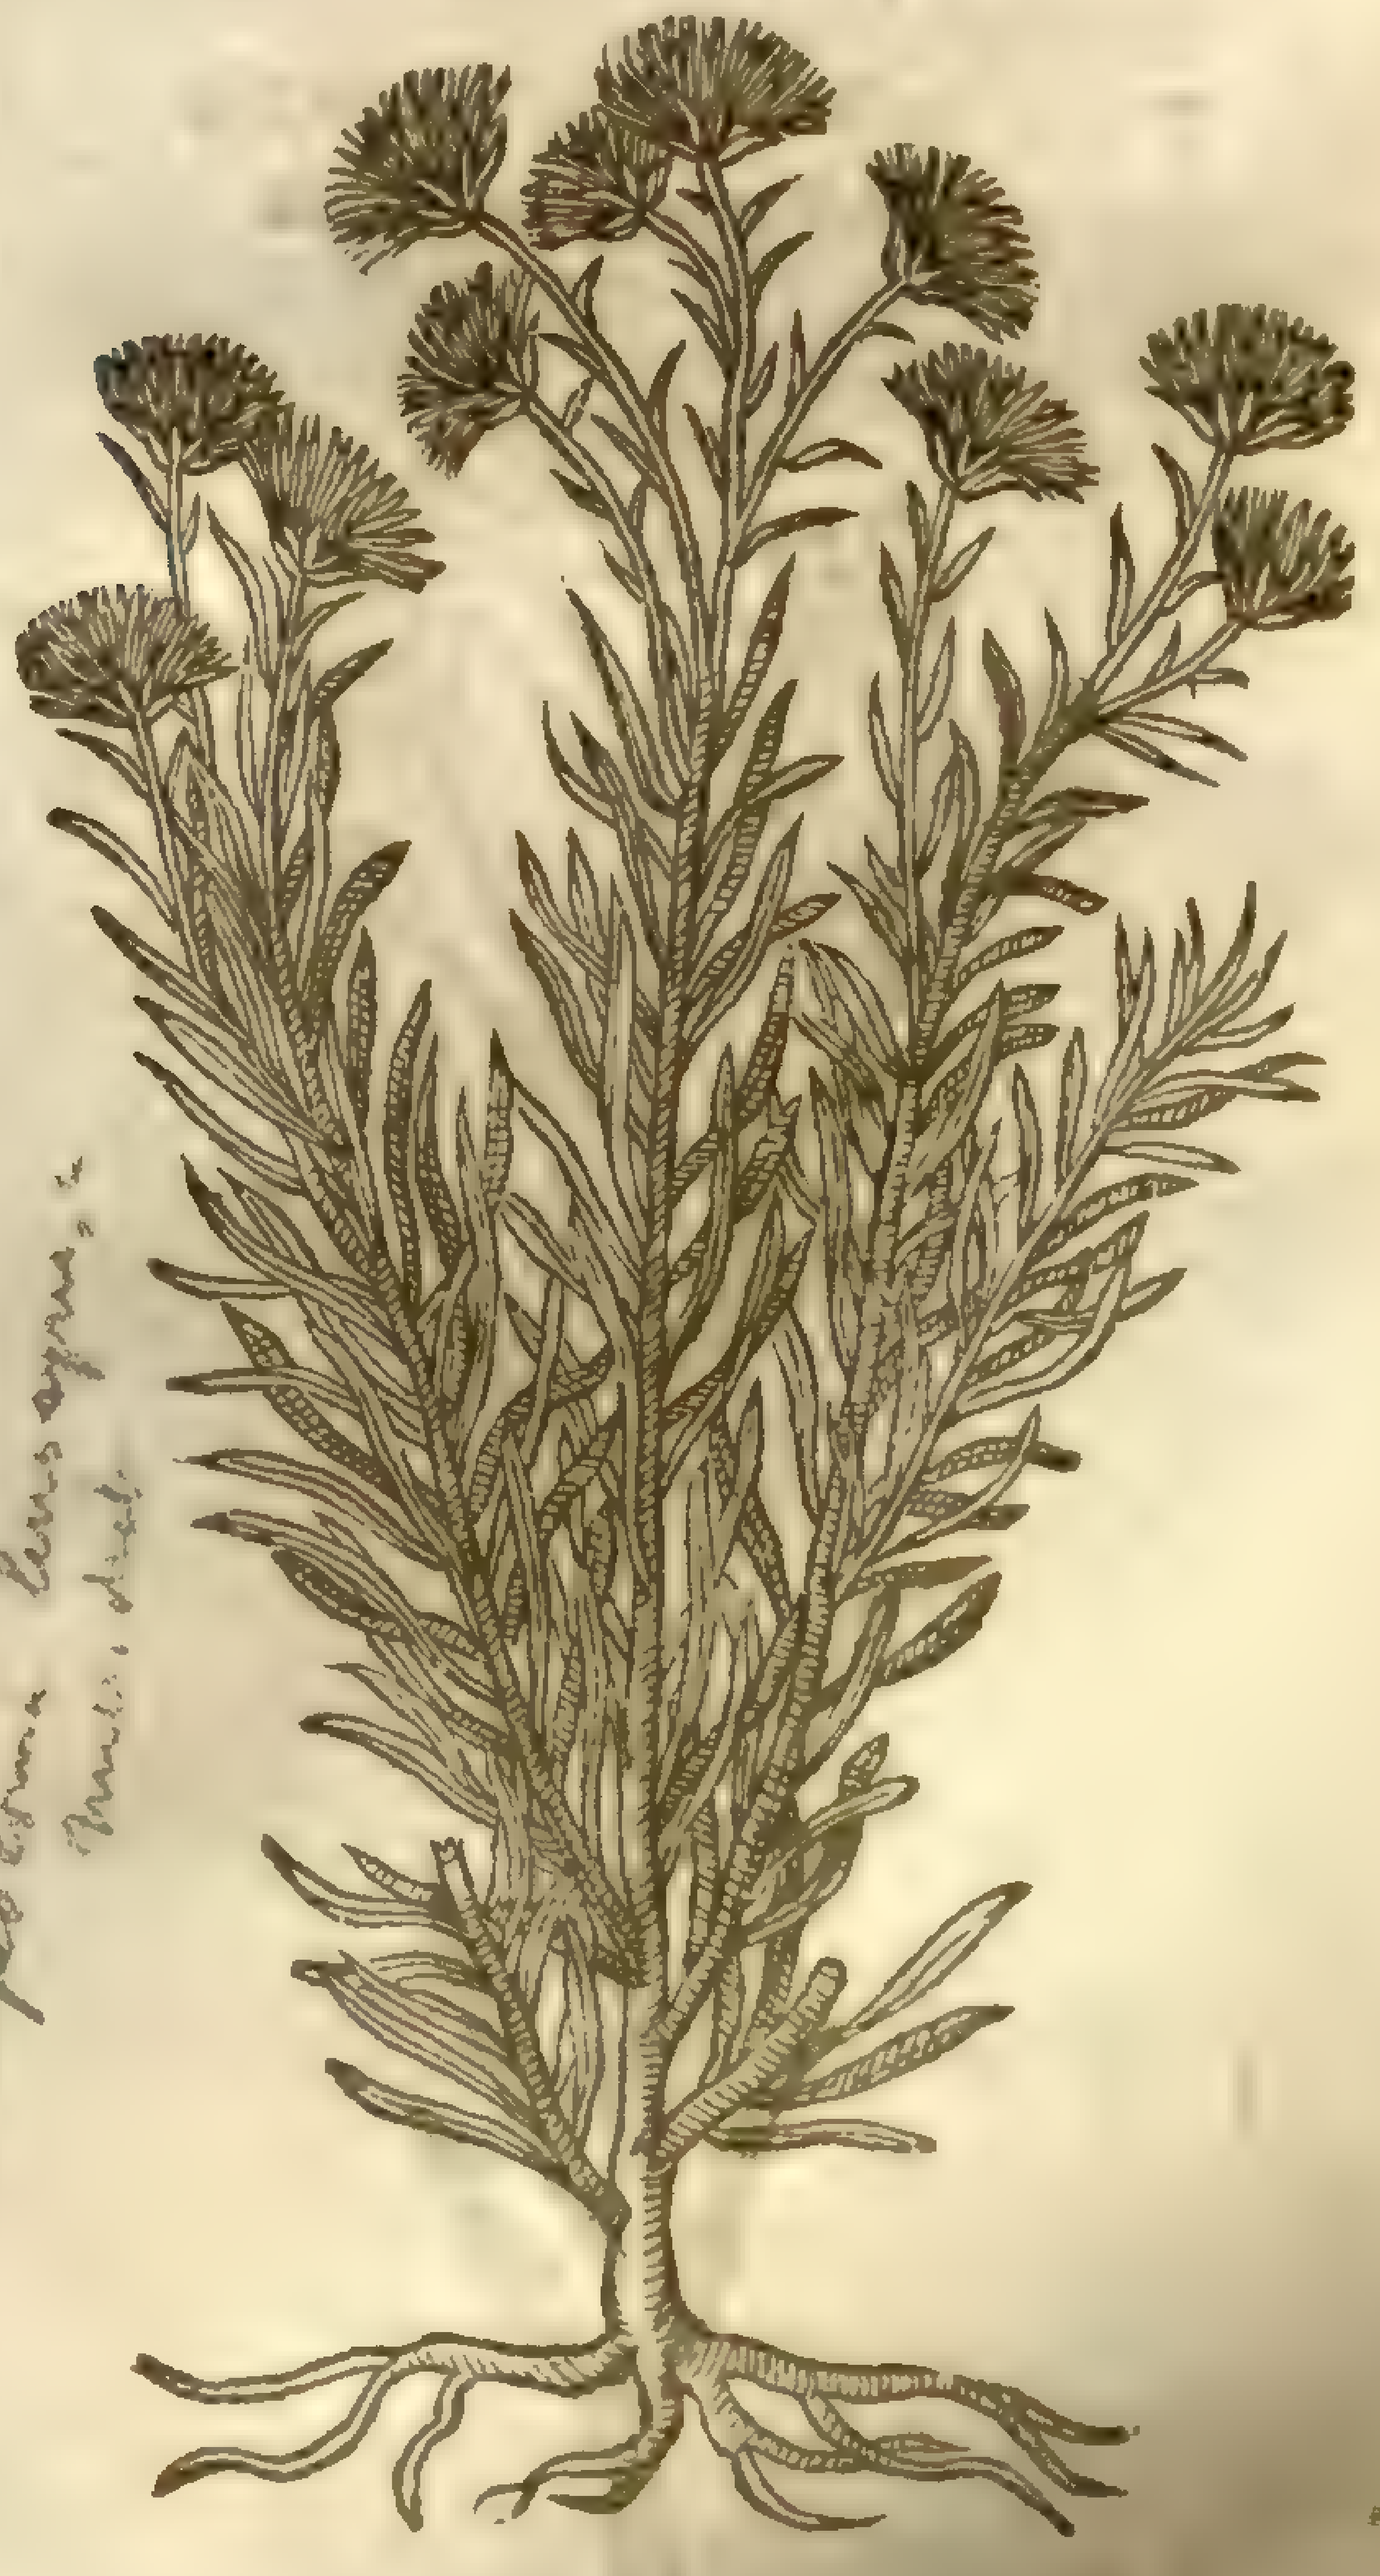


‡ 8 *Linaria quadrifolia ſupina.*
Foure leaued creeping Tode-flax.

Antirrhinum arvense, Mill. dict.

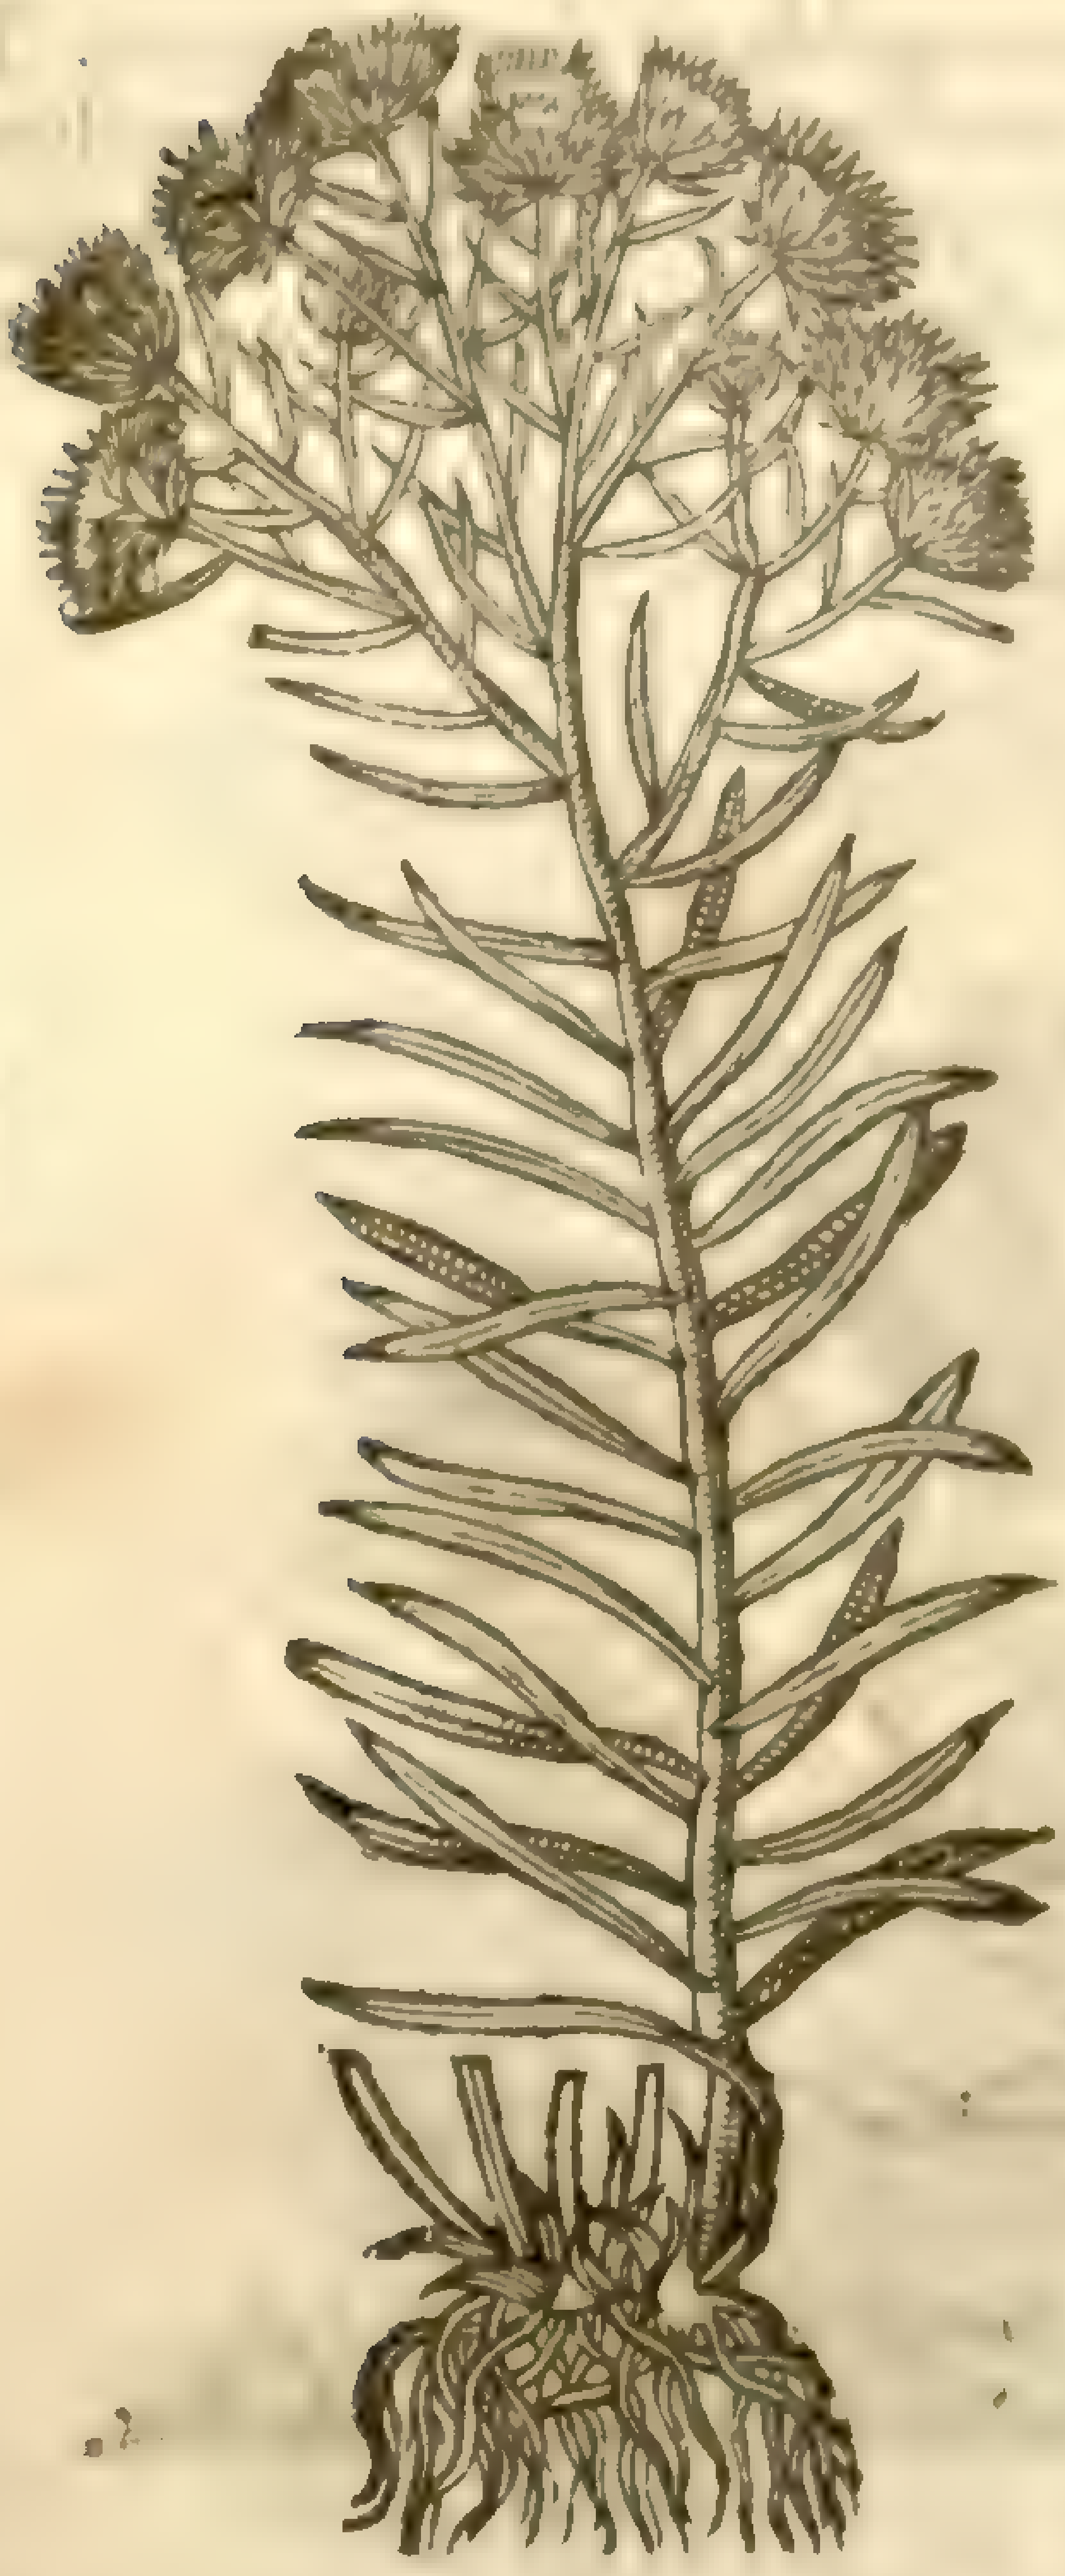


† 9 *Linoſyris Nuperorum, Lob.*
Golden Star-faſhioned Tode-flax.



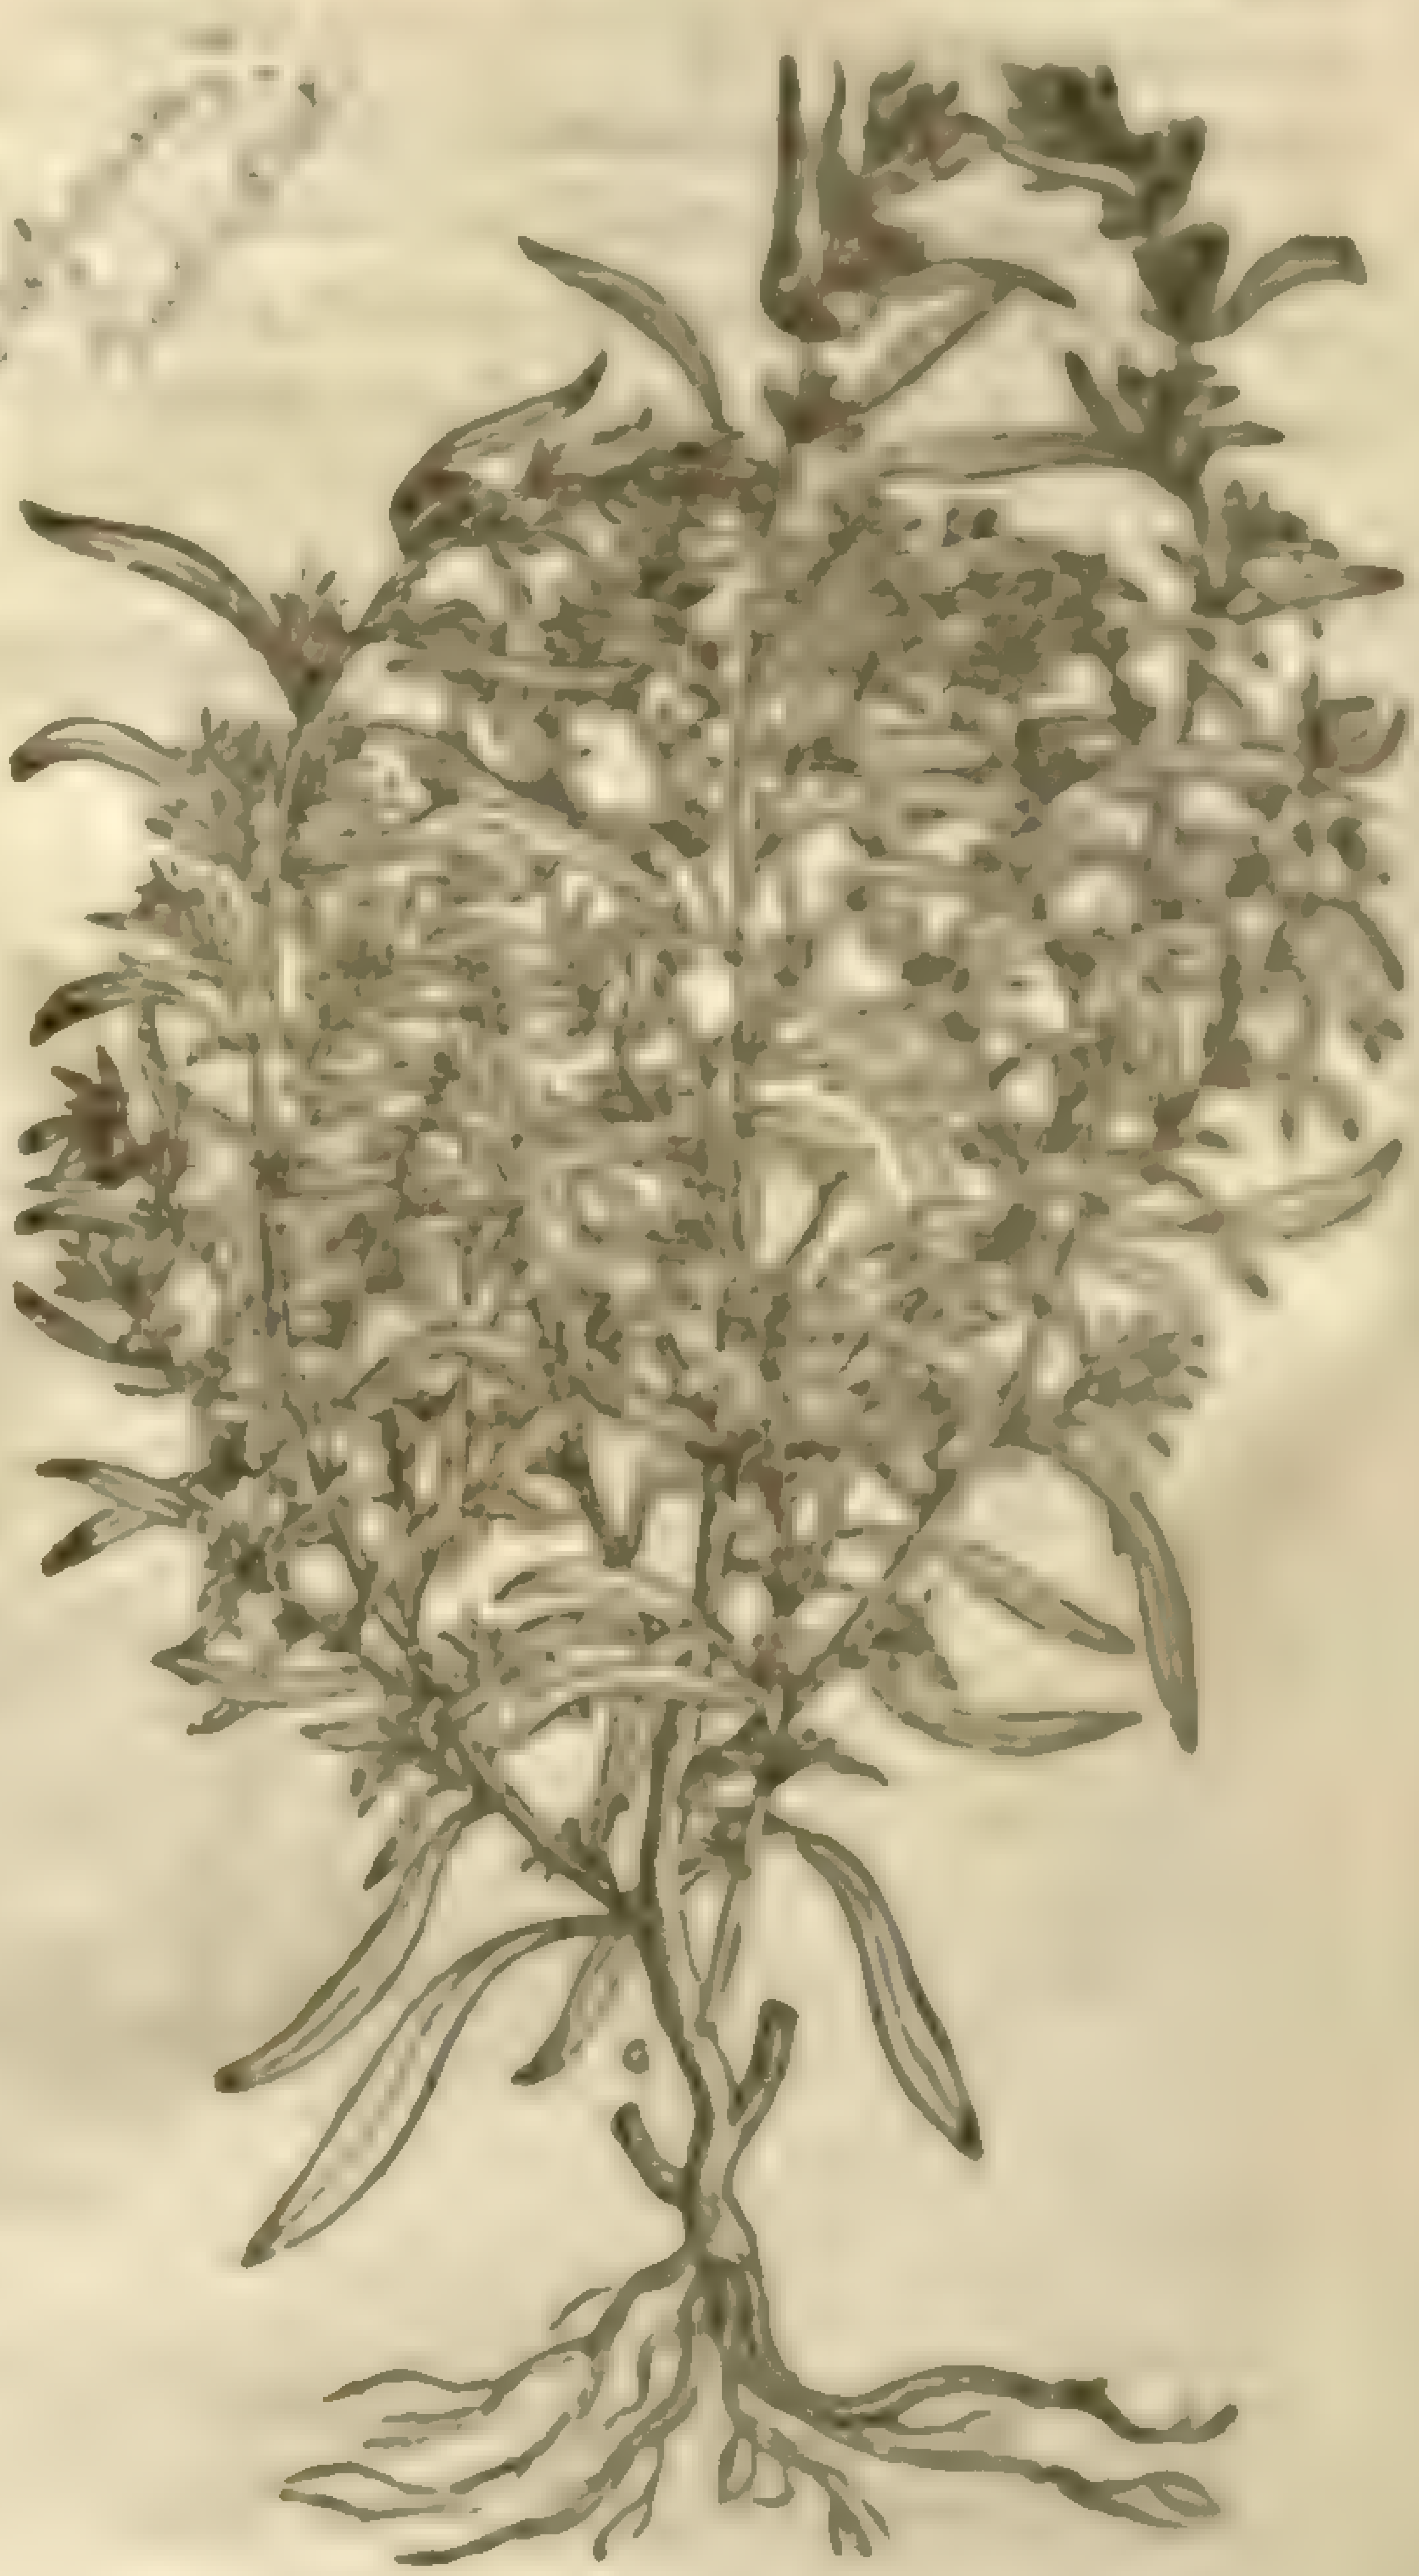
Chrysocoma linosyris, Mill. dict.

10 *Linaria aurea Tragi.*
Golden Tode-flax.

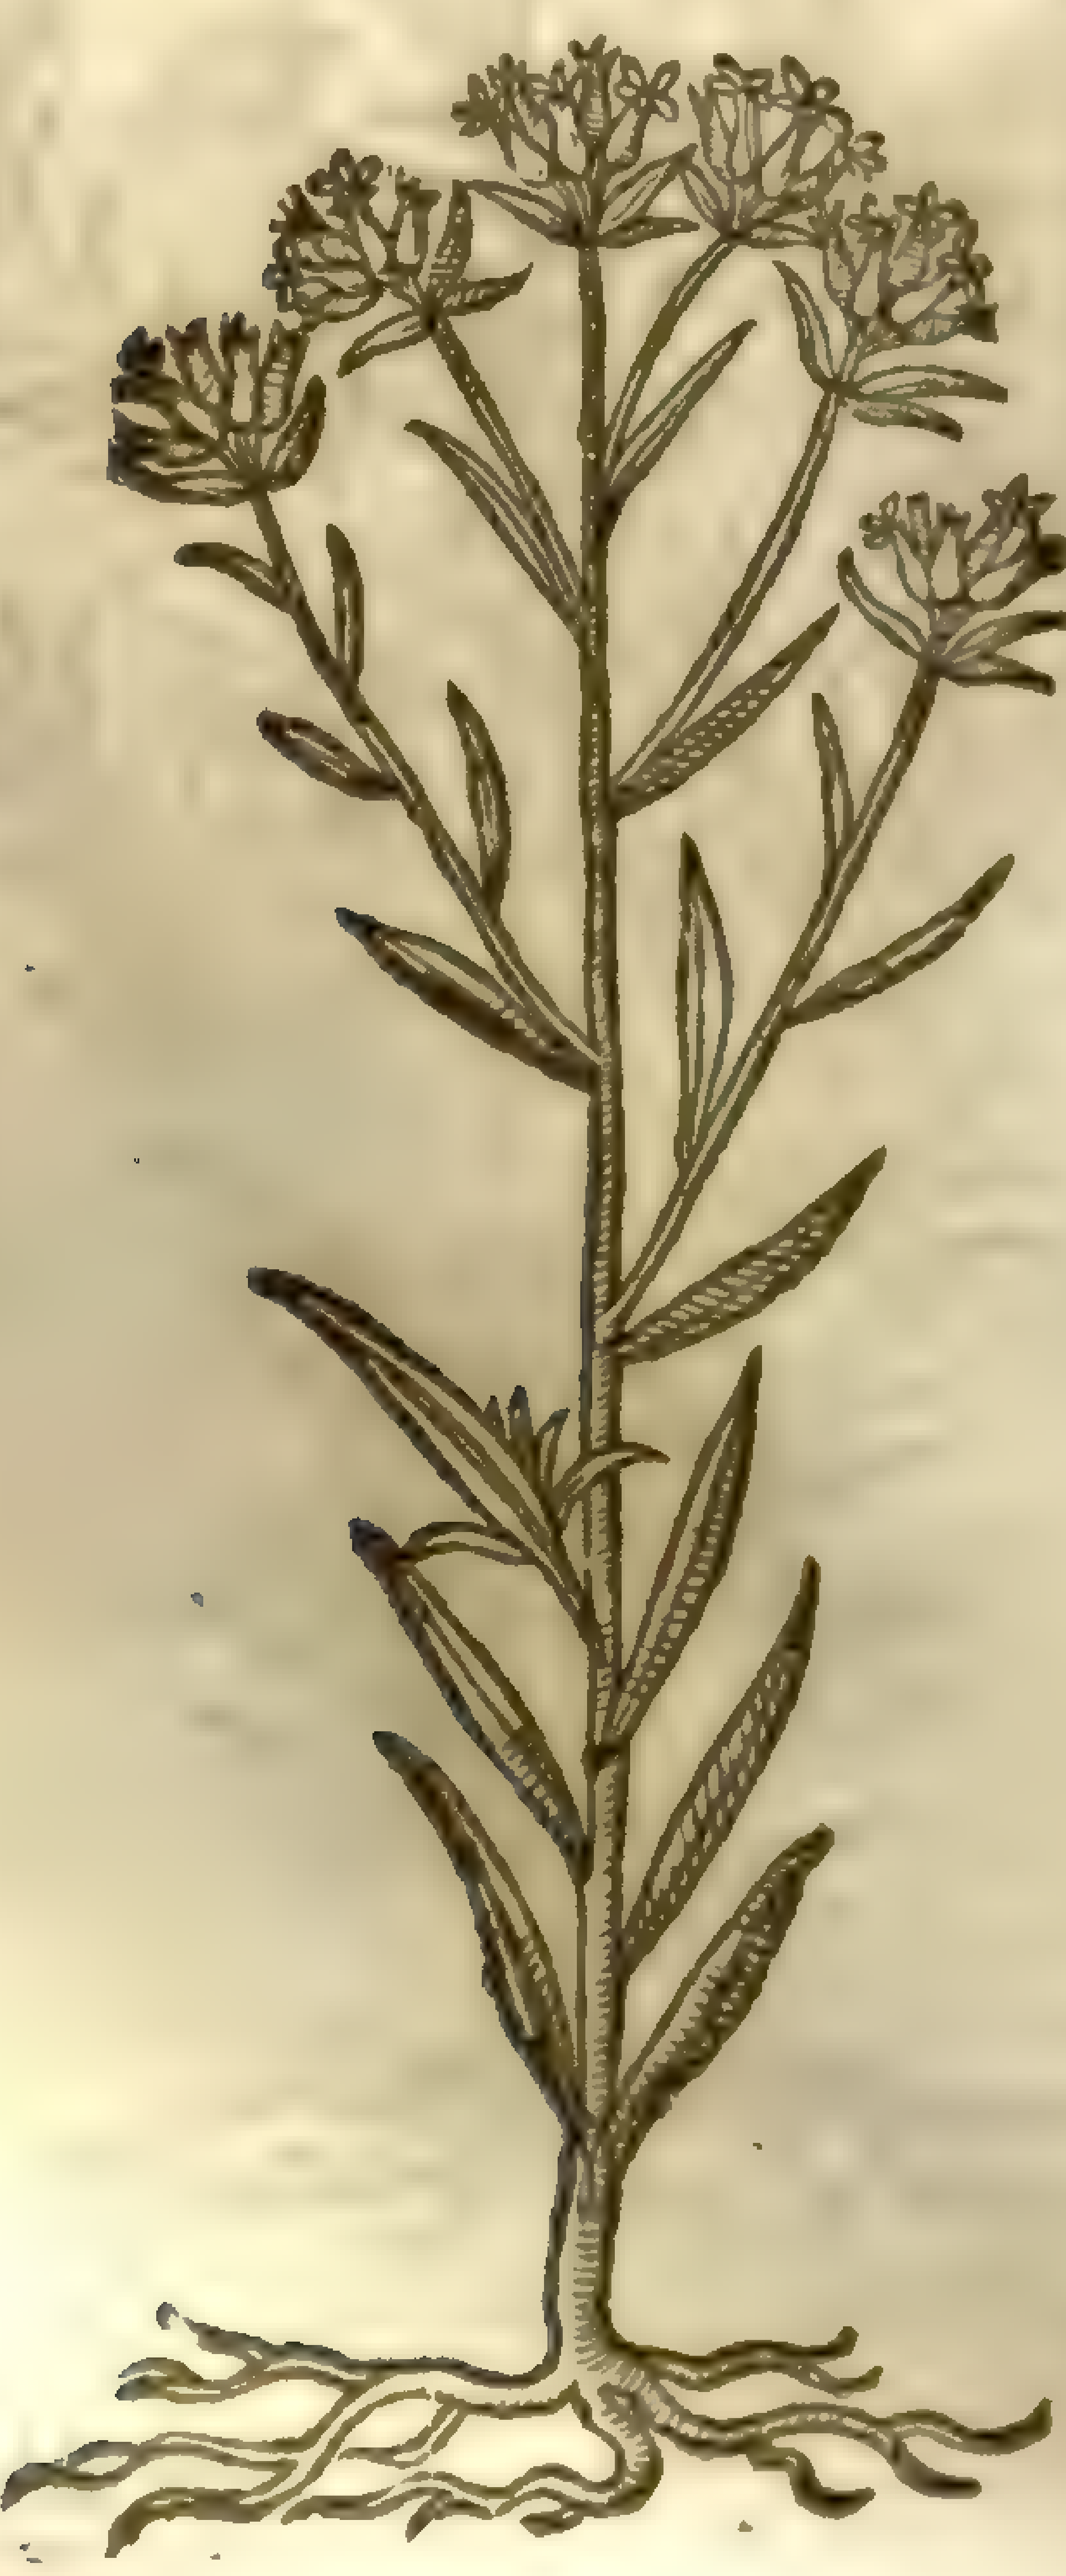


Chryſocoma [illegible]

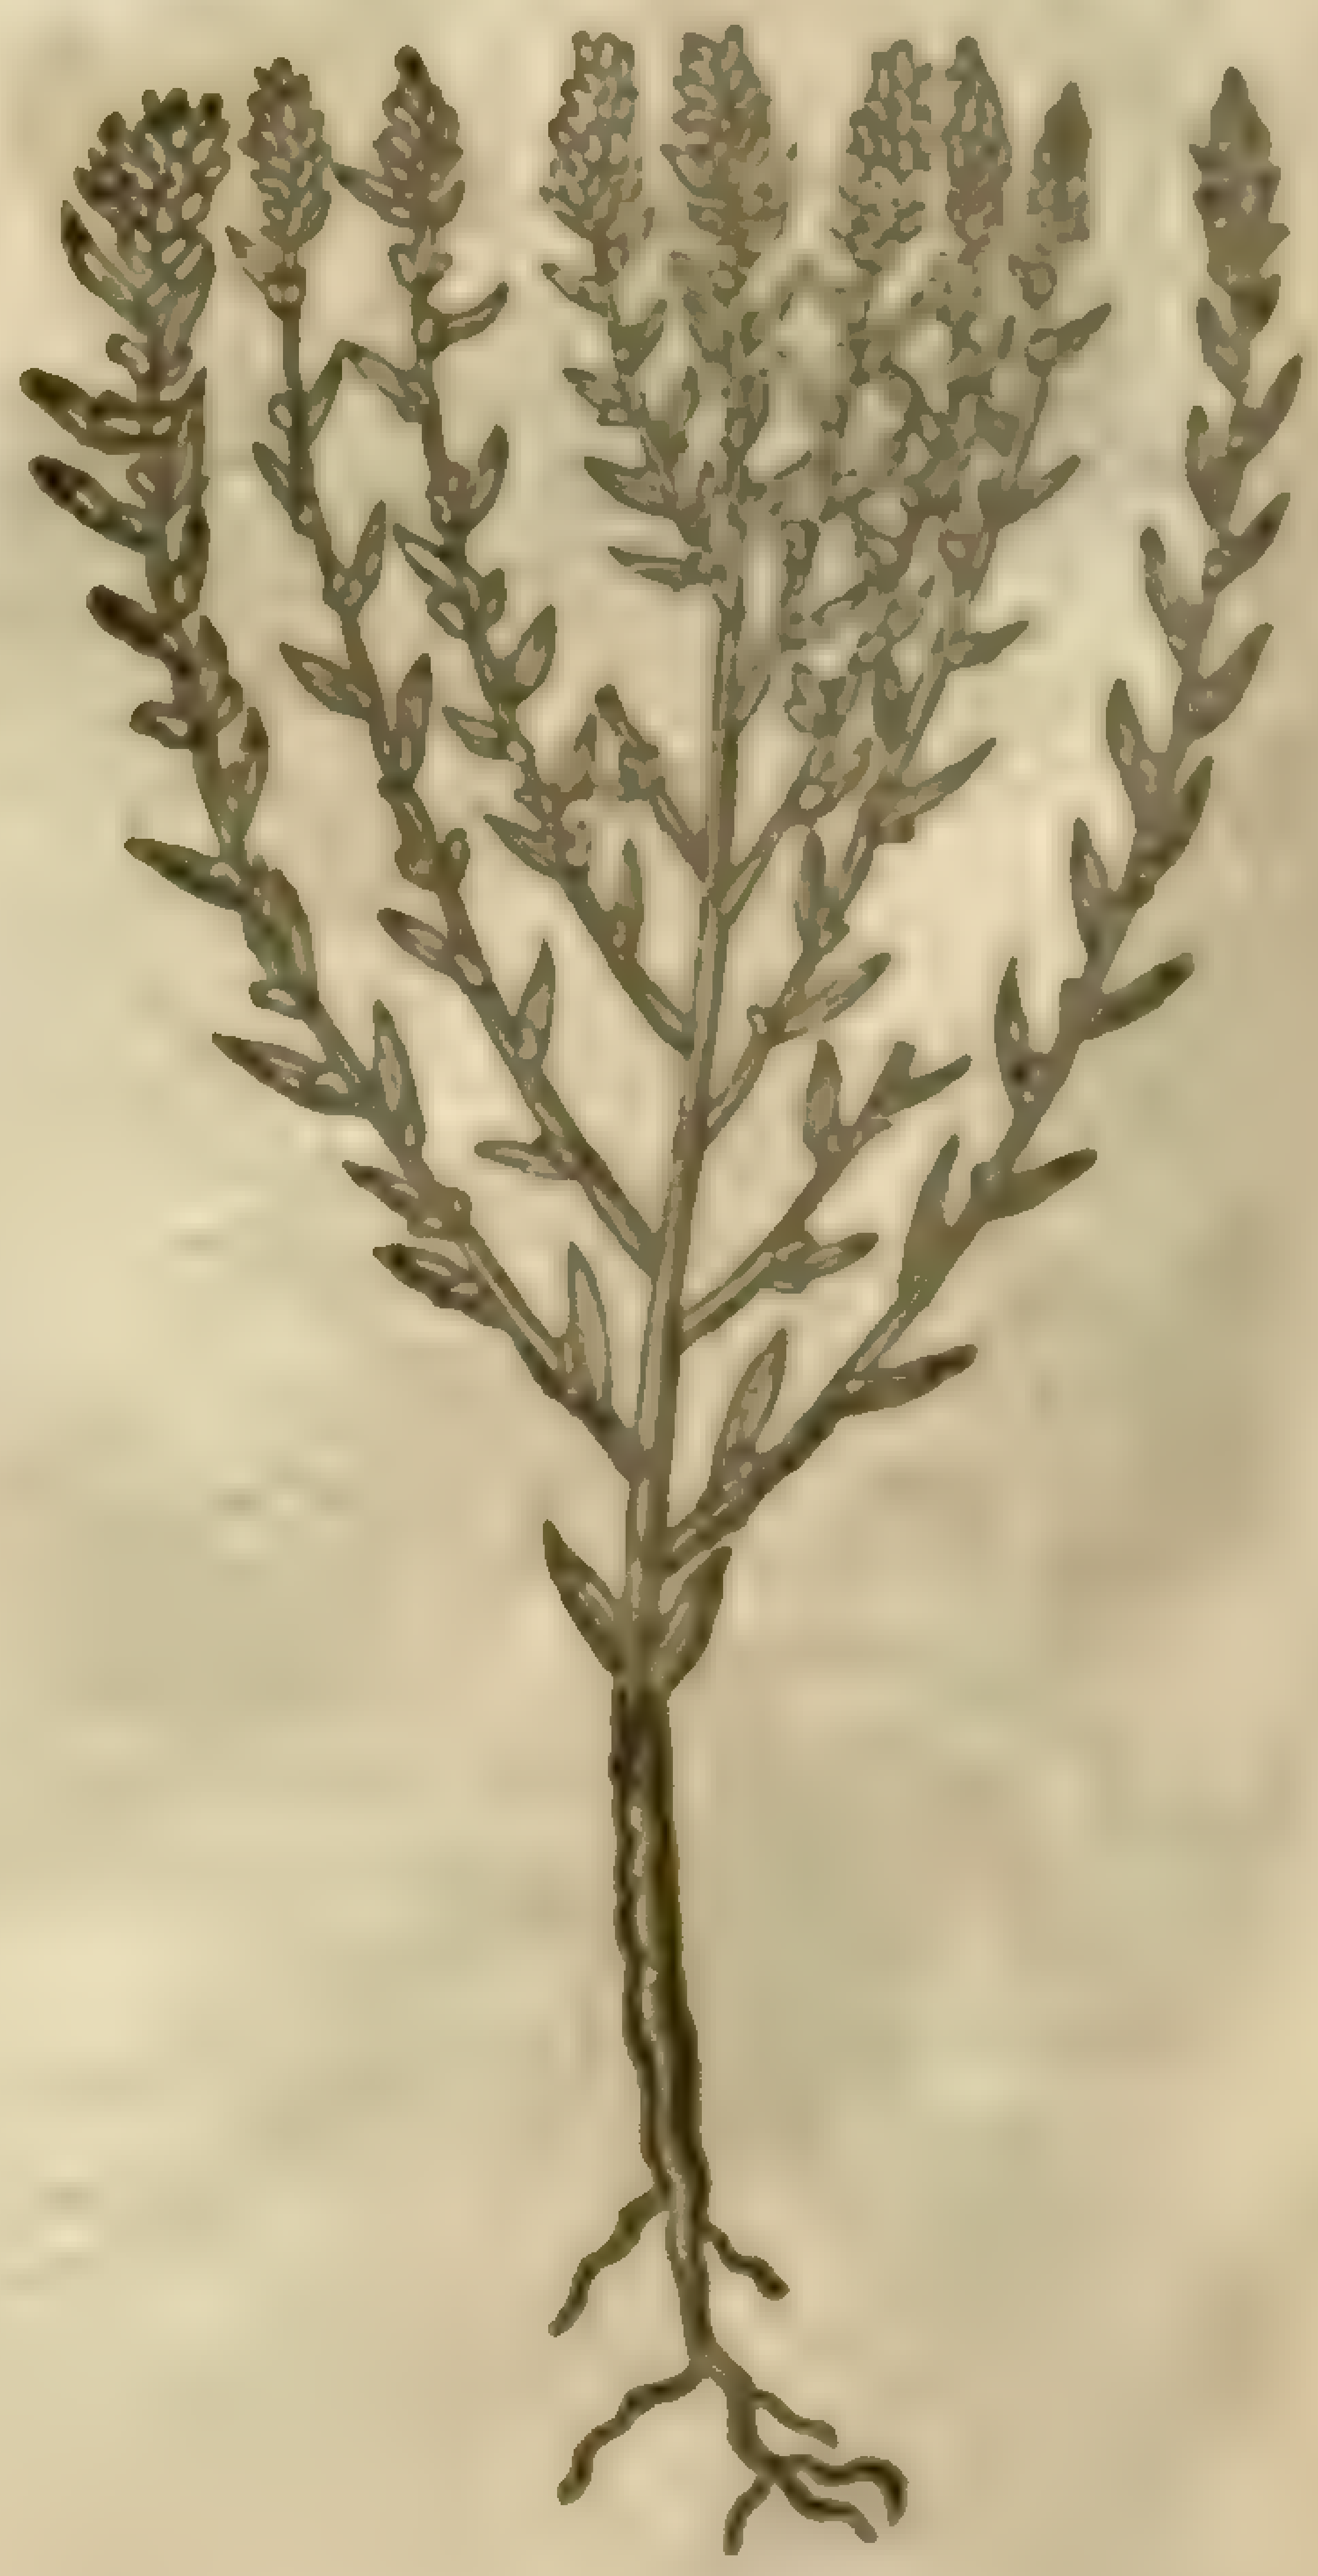
11 *Scoparia ſive Oſyris Græcorum.*
Buſhie or Beſome Tode-flax.



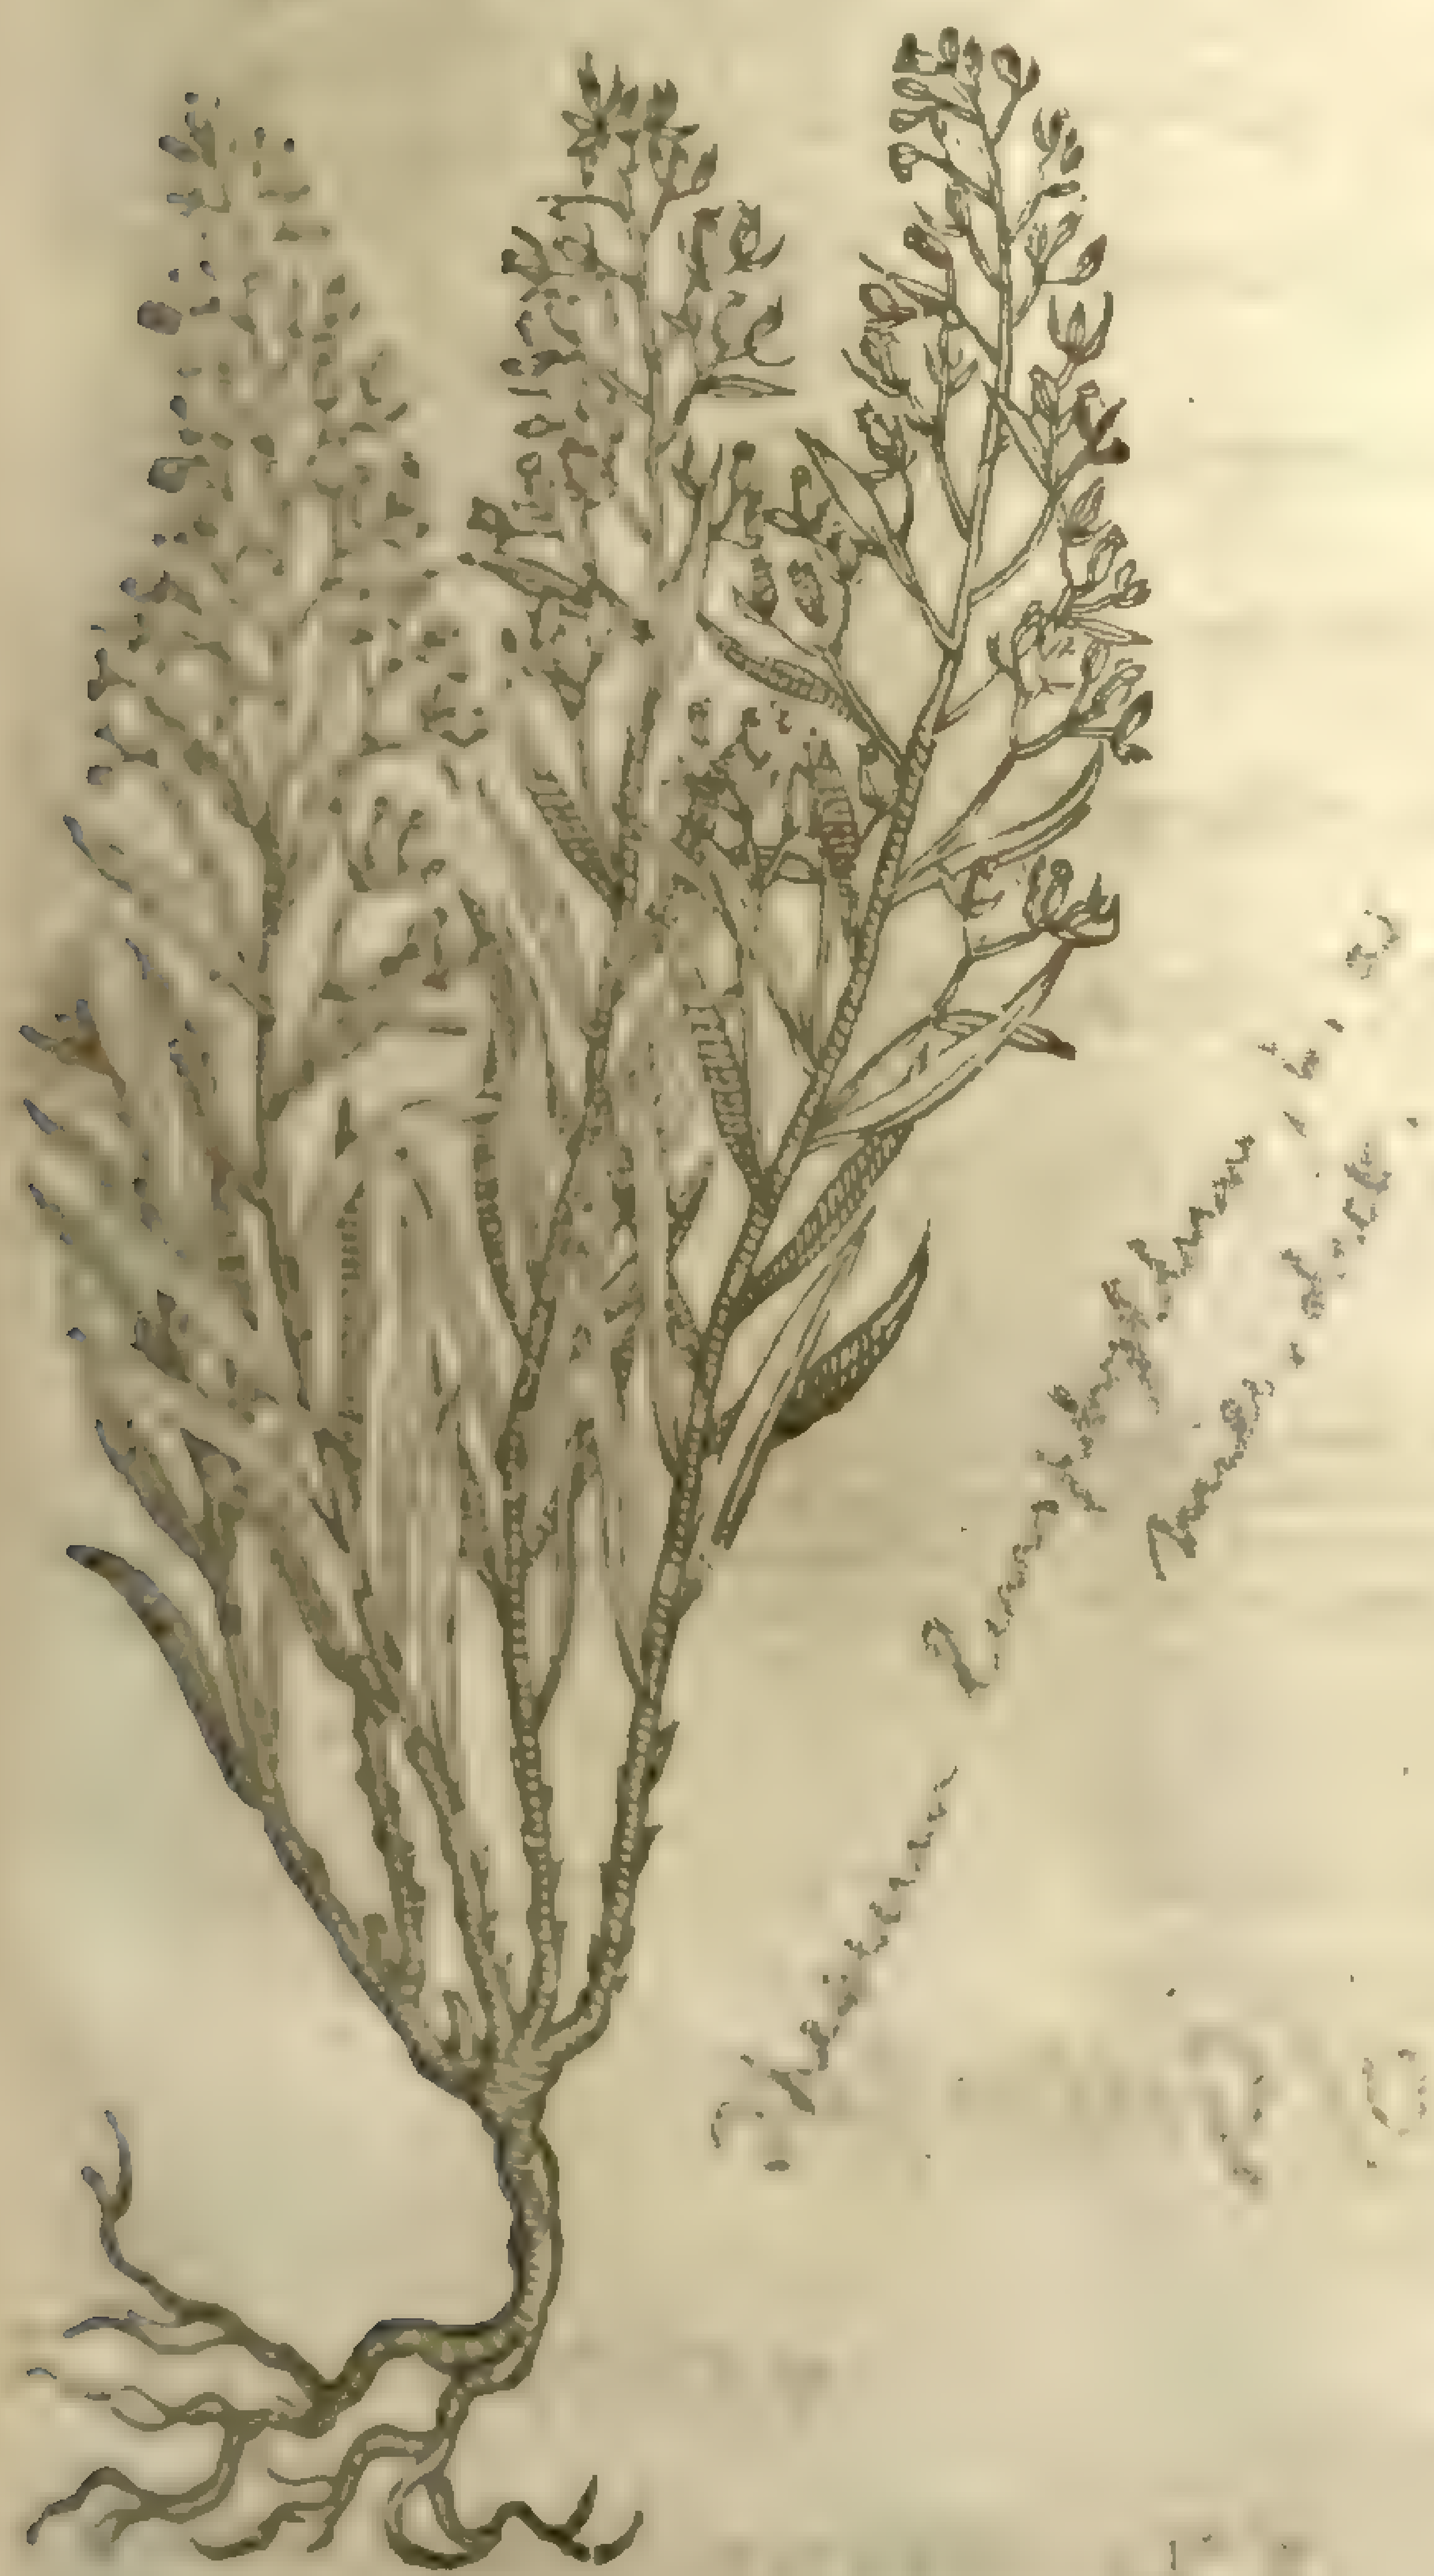
† 12 *Paſſerina linariæ folio, Lob.*
Sparrowes Tode-flax.



† 13 *Paſſerina altera.*
Sparrow-tongue.



‡ 14 Linaria adulterina.
Baſtard Tode-flax.



† 11 *Scoparia*, or after *Dodonæus*, *Oſyris*, which the Italians cal *Belvidere*, hath very many ſhoots or ſprigs riſing from one ſmall ſtalk, making the whole plant to reſemble a Cypres tree, the branches grow ſo handſomely: now it growes ſome three foot high, and very thick and buſhie, ſo that in ſome places where it naturally groweth they make beſomes of it, whereof it tooke the name *Scoparia*. The leaues be ſmall and narrow, almoſt like to the leaues of flax. The floures be ſmall, and of an herby colour, growing among the leaues, which keep greene all the Winter. ‡ I neuer knew it here to ripen the ſeed, nor to outliue the firſt froſt. ‡

12 This plant alſo for reſemblance ſake is referred to the Linaries, becauſe his leaues be like *Linaria*. At the top of the ſmall branched ſtalkes doe grow little yellowiſh floures, pale of colour, ſomewhat like the tops of *Chryſocome*. *Iohn Mouton* of Turnay taketh it to be *Chryſocome altera*. And becauſe there hath been no accordance among Writers, it is ſufficient to ſet forth his deſcription with his name *Paſſerina*. ‡ *Bauhine* refers it to the *Gromills*, and cals it, *Lithoſpermum Linariæ folio Monſpeliacum*.

‡ 13 This which *Tabern.* calls *Lingua Paſſerina*, and whoſe figure was giuen by our Authour for the former, hath a ſmall ſingle whitiſh root, from which it ſends vp a ſlender ſtalke ſome cubit and halfe high, naked on the lower part, but diuided into little branches on the top, which branches are ſet thicke with little narrow leaues like thoſe of Winter Sauorie or Time, amongſt which grow many little longiſh ſeeds of the bigneſſe and taſte of Millet, but ſomewhat hotter and bitterer. The floures conſiſt of foure ſmall yellow leaues. *Tragus* calls this *Paſſerina*; *Dodonæus* makes it, *Lithoſpermum minus*: and *Columna* hath ſet it forth by the name of *Linaria altera botryodes montana*.

14 This which *Cluſius* hath ſet forth by the name of *Anonymos*, or Nameleſſe, is called in the *Hiſt. Lugd. pag.* 1150. *Anthyllis montana*; and by *Tabern. Linaria adulterina*. It hath many hard pale greene branches of ſome foot high; and vpon theſe without any order grow many hard narrow long leaues like thoſe of flaxe, at firſt of a very tart, and afterwards of a bitteriſh taſte: the tops of the ſtalkes are branched into ſundry foot ſtalkes, which carry little white floures conſiſting of fiue leaues lying ſtarre-faſhion, with ſome threds in their middles: after which at length come the ſeeds fiue cornered, containing a white pith in a hard filme or skin. The root is white, diuided into ſundry branches, and liues long, euery yeare ſending vp many ſtalkes, and ſometimes creeping like that of Tode-flax. It floures in May, and growes vpon mountainous places of Germany; Mr. *Goodyer* found it growing wilde on the ſide of a chalkie hill in an incloſure on the right hand of the way, as you go from Droxford to Poppie hill in Hampſhire. ‡

¶ *The Place.*

The kindes of Tode-flax grow wilde in many places, as vpon ſtone walls, grauelly grounds, barren medowes, and along by hedges.

‡ I do not remember that I haue ſeene any of theſe growing wilde with vs, vnleſſe the firſt ordinary kinde, which is euery where common. ‡

¶ *The Time.*

They floure from Iune to the end of Auguſt.

¶ *The Names.*

Tode-flax is called of the Herbariſts of our time, *Linaria*, or Flax-weed, and *Vrinalis*: of ſome, in high Dutch, **Lynkraut**, and **Unſer fraumen flaſch**: in low Dutch, **Wilt Vlas**: in Engliſh, Wilde flax, Tode-flax, and Flax-weed: the eleuenth is called in Italian, *Bel-videre*, or faire in ſight. The ſame plant is alſo called *Scoparia*, and *Herba ſtudioſorum*, becauſe it is a fit thing to make brooms of, wherewith ſchollers and ſtudents may ſweepe their owne ſtudies and cloſets. The particular names are expreſſed both in Latine and Engliſh in their ſeuerall titles, whereby they may be diſtinguiſhed. ‡ It is thought by moſt, that this *Belvidere*, or *Scoparia*, is the *Oſyris* deſcribed by *Dioſcorides, lib.4.cap.*143. For beſides the notes it hath agreeing with the deſcription, it is at this day by the Greekes called ἀξυρις. ‡

¶ *The Temperature.*

The kindes of Tode-flax are of the ſame temperature with wilde Snap-dragons, whereof they are kindes.

¶ *The Vertues.*

A The decoction of Tode-flax taketh away the yellowneſſe and deformitie of the skinne, being waſhed and bathed therewith.

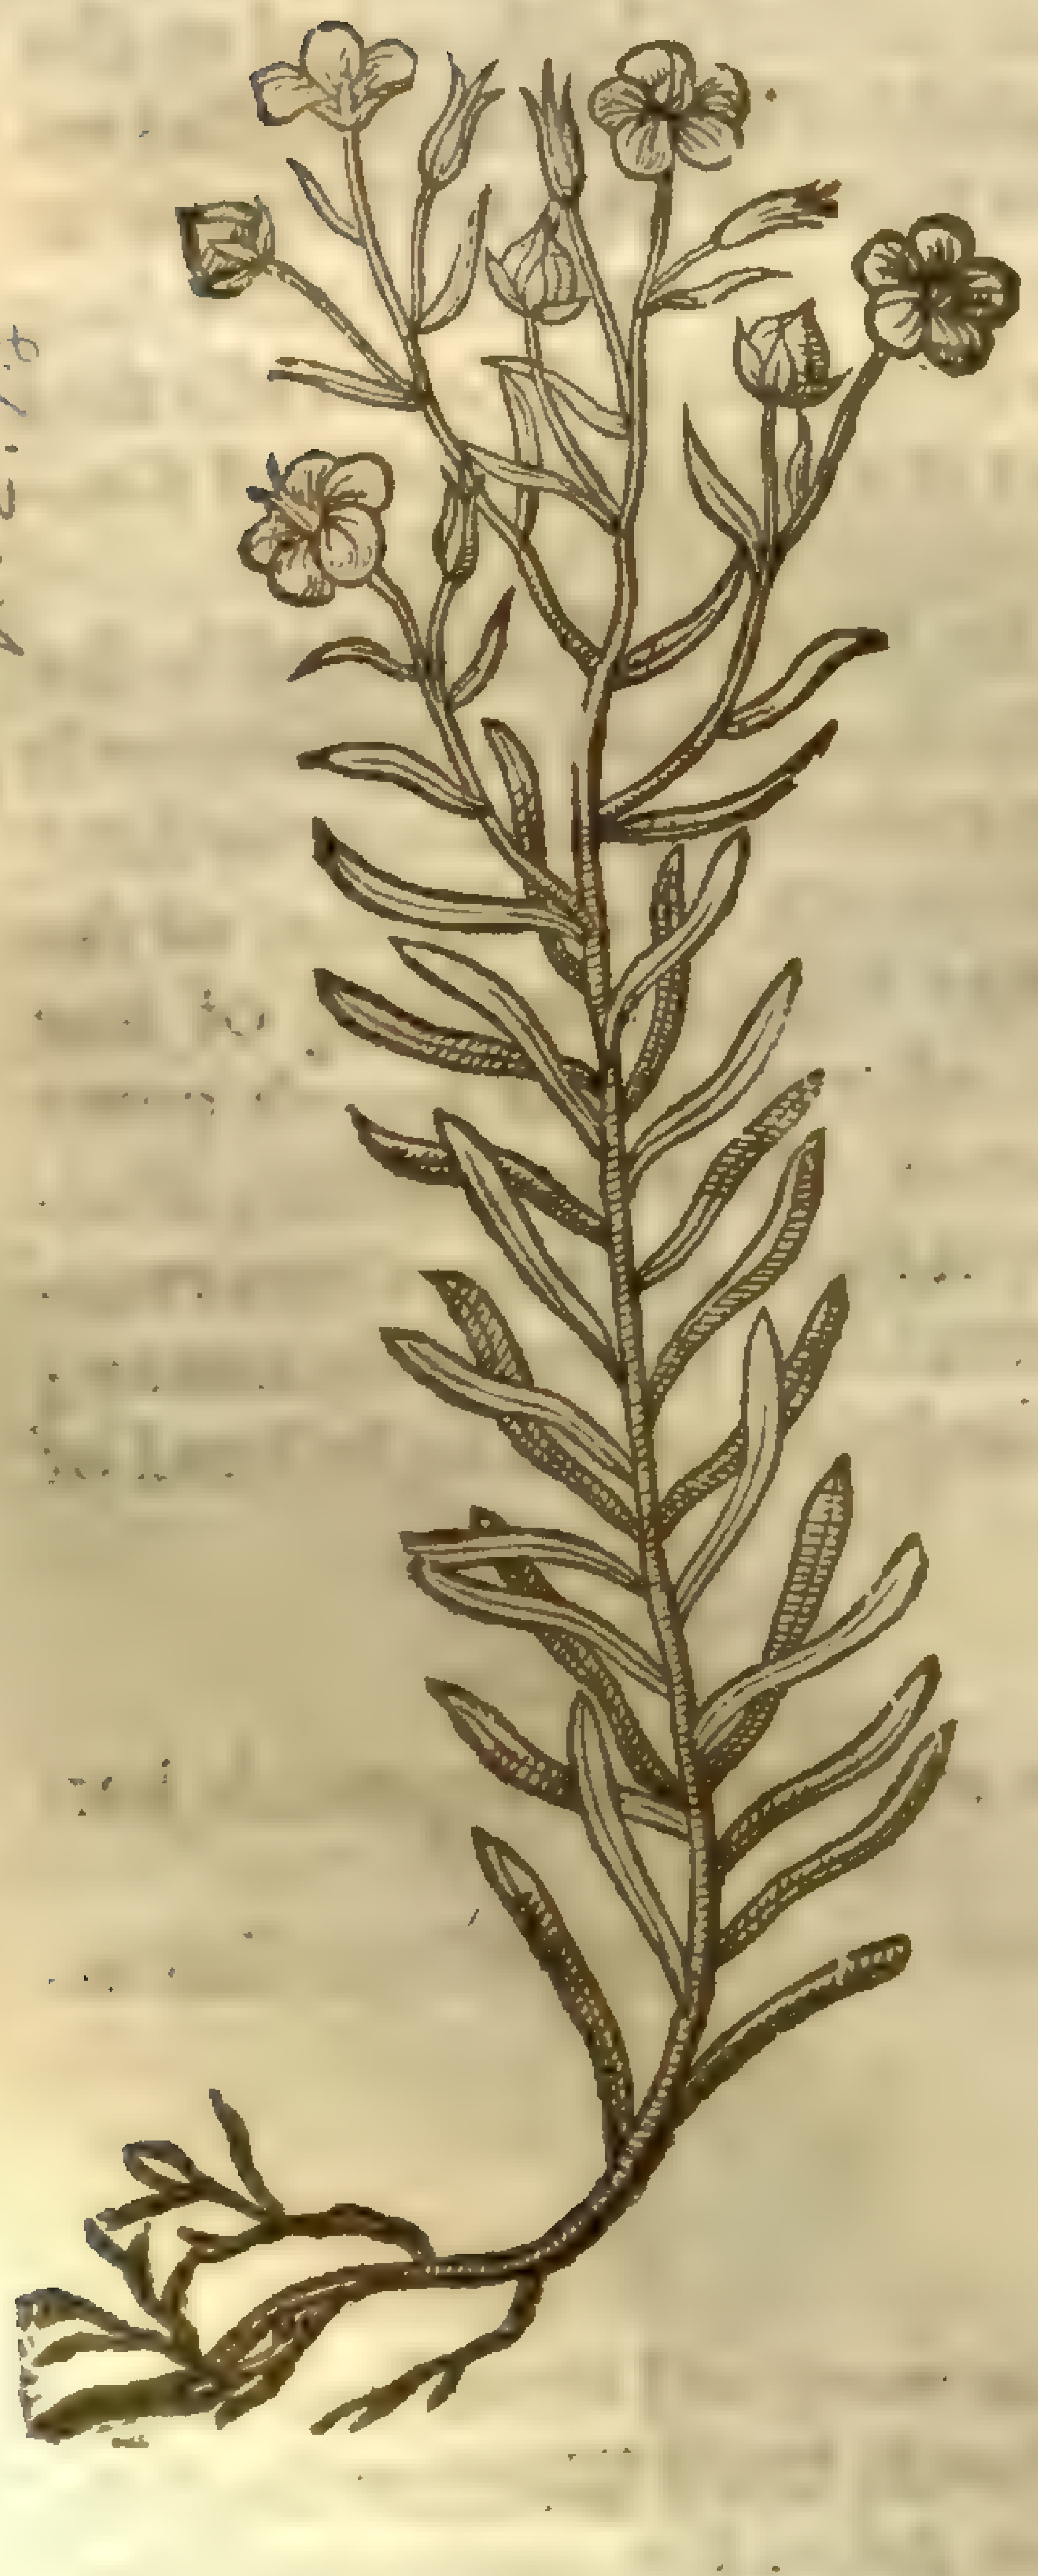
B The ſame drunken, openeth the ſtoppings of the Liuer and Spleene, and is ſingular good againſt the jaundiſe which is of long continuance.

C The ſame decoction doth alſo prouoke vrine, in thoſe that piſſe drop after drop, vnſtoppeth the kidnies and bladder.

† The figures in this chapter were moſt of them falſe placed, as thus: The third was of *Linaria Panon.*1. of *Cluſius*, being the *Linaria* [illegible] of *Lobel* deſcribed in the fifth place. The fourth was of the *Oſyris flava ſyl.* of *Lobel*, deſcribed here by mee in the ſeuenth place. The fifth was of *Linaria* 3 *Stiriaca* of *Cluſius*, which you finde deſcribed by me in the eighth place. The ſixth was of *Linaria aurea minor* of *Tabern.* being onely a variety of the *Linarea aurea* ſet forth in the tenth place. The ſeuenth was of the *Linaria Adulterina*, whoſe hiſtorie I haue giuen you in the fourteenth place. That which was formerly vnder the title of *Paſſerina Linaria* now hath a figure fitted thereto in the thirteenth place.

Chap. 146. *Of Garden flaxe.*

† *Linum ſativum.*
Garden flax.



L. [illegible]
Sm. fl. 2. 1[illegible]

¶ *The Deſcription.*

Flax riſeth vp with ſlender and round ſtalks. The leaues thereof bee long, narrow, and ſharpe pointed: on the tops of the ſprigs are faire blew floures, after which ſpring vp little round knobs or buttons, in which is contained the ſeed, in forme ſomewhat long, ſmooth, glib or ſlipperie, of a darke colour. The roots be ſmall and threddy.

¶ *The Place.*

It proſpereth beſt in a fat and fruitfull ſoile, in moiſt and not dry places; for it requireth, as *Columella* ſaith, a very fat ground, and ſomewhat moiſt. Some, ſaith *Palladius*, do ſow it thicke in a leane ground, and by that meanes the flaxe groweth fine. *Pliny* ſaith that it is to be ſowne in grauelly places, eſpecially in furrowes: *Nec magis feſtinare aliud*: and that it burneth the ground, and maketh it worſer: which thing alſo *Virgil* teſtifieth in his Georgickes.

Vrit lini campum ſeges, vrit Avena.
Vrunt lethæo perfuſa papauera ſomno.

In Engliſh thus:

Flaxe and Otes ſowne conſume
The moiſture of a fertile field:
The ſame worketh Poppy, whoſe
Iuyce a deadly ſleepe doth yeeld.

¶ The

¶ *The Time.*

Flaxe is ſowne in the ſpring, it floureth in Iune and Iuly. After it is cut downe (as *Pliny*, *lib.19.cap.1.* ſaith) the ſtalks are put into the water, ſubject to the heat of the Sun, & ſome weight laid on them to be ſteeped therein; the looſenes of the rinde is a ſigne when it is well ſteeped: then is it taken vp and dried in the Sun, and after vſed as moſt huſwiues can tell better than my ſelfe.

¶ *The Names.*

It is called both in Greeke and Latine λίνον, *Linum*: in high Dutch, **Flachſz**: in Italian and Spaniſh, *Lino*: in French, *Dulin*: in low Dutch, **Vlas**: in Engliſh, Flax, and Lyne.

¶ *The Temperature and Vertues.*

A *Galen* in his firſt booke of the faculties of nouriſhments ſaith, that diuers vſe the ſeed hereof parched as a ſuſtenance with *Garum*, no otherwiſe than made ſalt.

B They alſo vſe it mixed with hony, ſome likewiſe put it among bread; but it is hurtfull to the ſtomack, and hard of digeſtion, and yeelds to the body but little nouriſhment: but touching the quality which maketh the belly ſoluble, neither will I praiſe or diſpraiſe it; yet that it hath ſome force to prouoke vrine, is more apparant when it is parched: but then it alſo ſtaieth the belly more.

C The ſame author in his books of faculties of ſimple medicines ſaith, that Lineſeed being eaten is windy although it be parched, ſo full it is of ſuperfluous moiſture: & it is alſo after a ſort hot in the firſt degree, and in a meane between hot and dry. But how windy the ſeed is, and how full of ſuperfluous moiſture it is in euery part, might very well haue beene perceiued a few yeares ſince as at Middleborough in Zeland, where for want of grain and other corne, moſt of the Citizens were fain to eat bread and cakes made hereof with hony and oile, who were in ſhort time after ſwolne in the belly below the ſhort ribs, faces, and other parts of their bodies in ſuch ſort, that a great number were brought to their graues therby: for theſe ſymptomes or accidents came no otherwiſe than by the ſuperfluous moiſture of the ſeed which cauſeth windineſſe.

D Lineſeed, as *Dioſcorides* hath written, hath the ſame properties that Fenugreek hath: it waſteth away & mollifieth al inflammations or hot ſwellings, as wel inward as outward, if it be boiled with hony, oile, and a little fair water, and made vp with clarified hony; it taketh away blemiſhes of the face, and the Sun burning, being raw and vnboiled; and alſo foule ſpots, if it be mixed with ſalt-peter and figs: it cauſeth rugged and ill fauored nails to fall off, mixed with hony and water-Creſſes.

E It draweth forth of the cheſt corrupted flegme and other filthy humours, if a compoſition with hony be made thereof to licke on, and eaſeth the cough.

F Being taken largely with pepper and hony made into a cake, it ſtirreth vp luſt.

G The oile which is preſſed out of the ſeed, is profitable for many purpoſes in Phyſicke and Surgerie, and is vſed of painters, picture makers, and other artificers.

H It ſoftneth all hard ſwellings; it ſtretcheth forth the ſinewes that are ſhrunke and drawne together, mitigateth pain, being applied in manner of an ointment.

I Some alſo giue it to drinke to ſuch as are troubled with pain in the ſide and collick; but it muſt be freſh and newly drawne: for if it be old and ranke, it cauſeth aptneſſe to vomit, and withall it ouermuch heateth.

K Lineſeed boiled in water with a little oile, and a quantity of Anniſe ſeed, impoudered and implaiſtred vpon an *angina*, or any ſwelling in the throat, helpeth the ſame.

L It is with good ſucceſſe vſed plaiſterwiſe, boiled in vineger, vpon the diſeaſes called *Coliaca* and *Dyſenteria*, which are bloudy fluxes and paines of the belly.

M The ſeeds ſtamped with the roots of wild Cucumbers, draweth forth ſplinters, thornes, broken bones, or any other thing fixed in any part of the body.

N The decoction is an excellent bath for women to ſit ouer for the inflammation of the ſecret parts, becauſe it ſoftneth the hardneſſe thereof, and eaſeth paine and aking.

O The ſeed of Line and Fenugreek made into pouder, boiled with Mallowes, Violet leaues, Smallage, and Chickweed, vntill the herbs be ſoft; then ſtamped in a ſtone morter with a little hogges greaſe to the forme of a cataplaſme or pulteſſe, appeaſeth all manner of paine, ſoftneth all cold humors or ſwellings, mollifieth and bringeth to ſuppuration all apoſtumes; defends wounded members from ſwelling and rankling, and when they be already rankled, it taketh the ſame away, being applied very warme euening and morning.

---

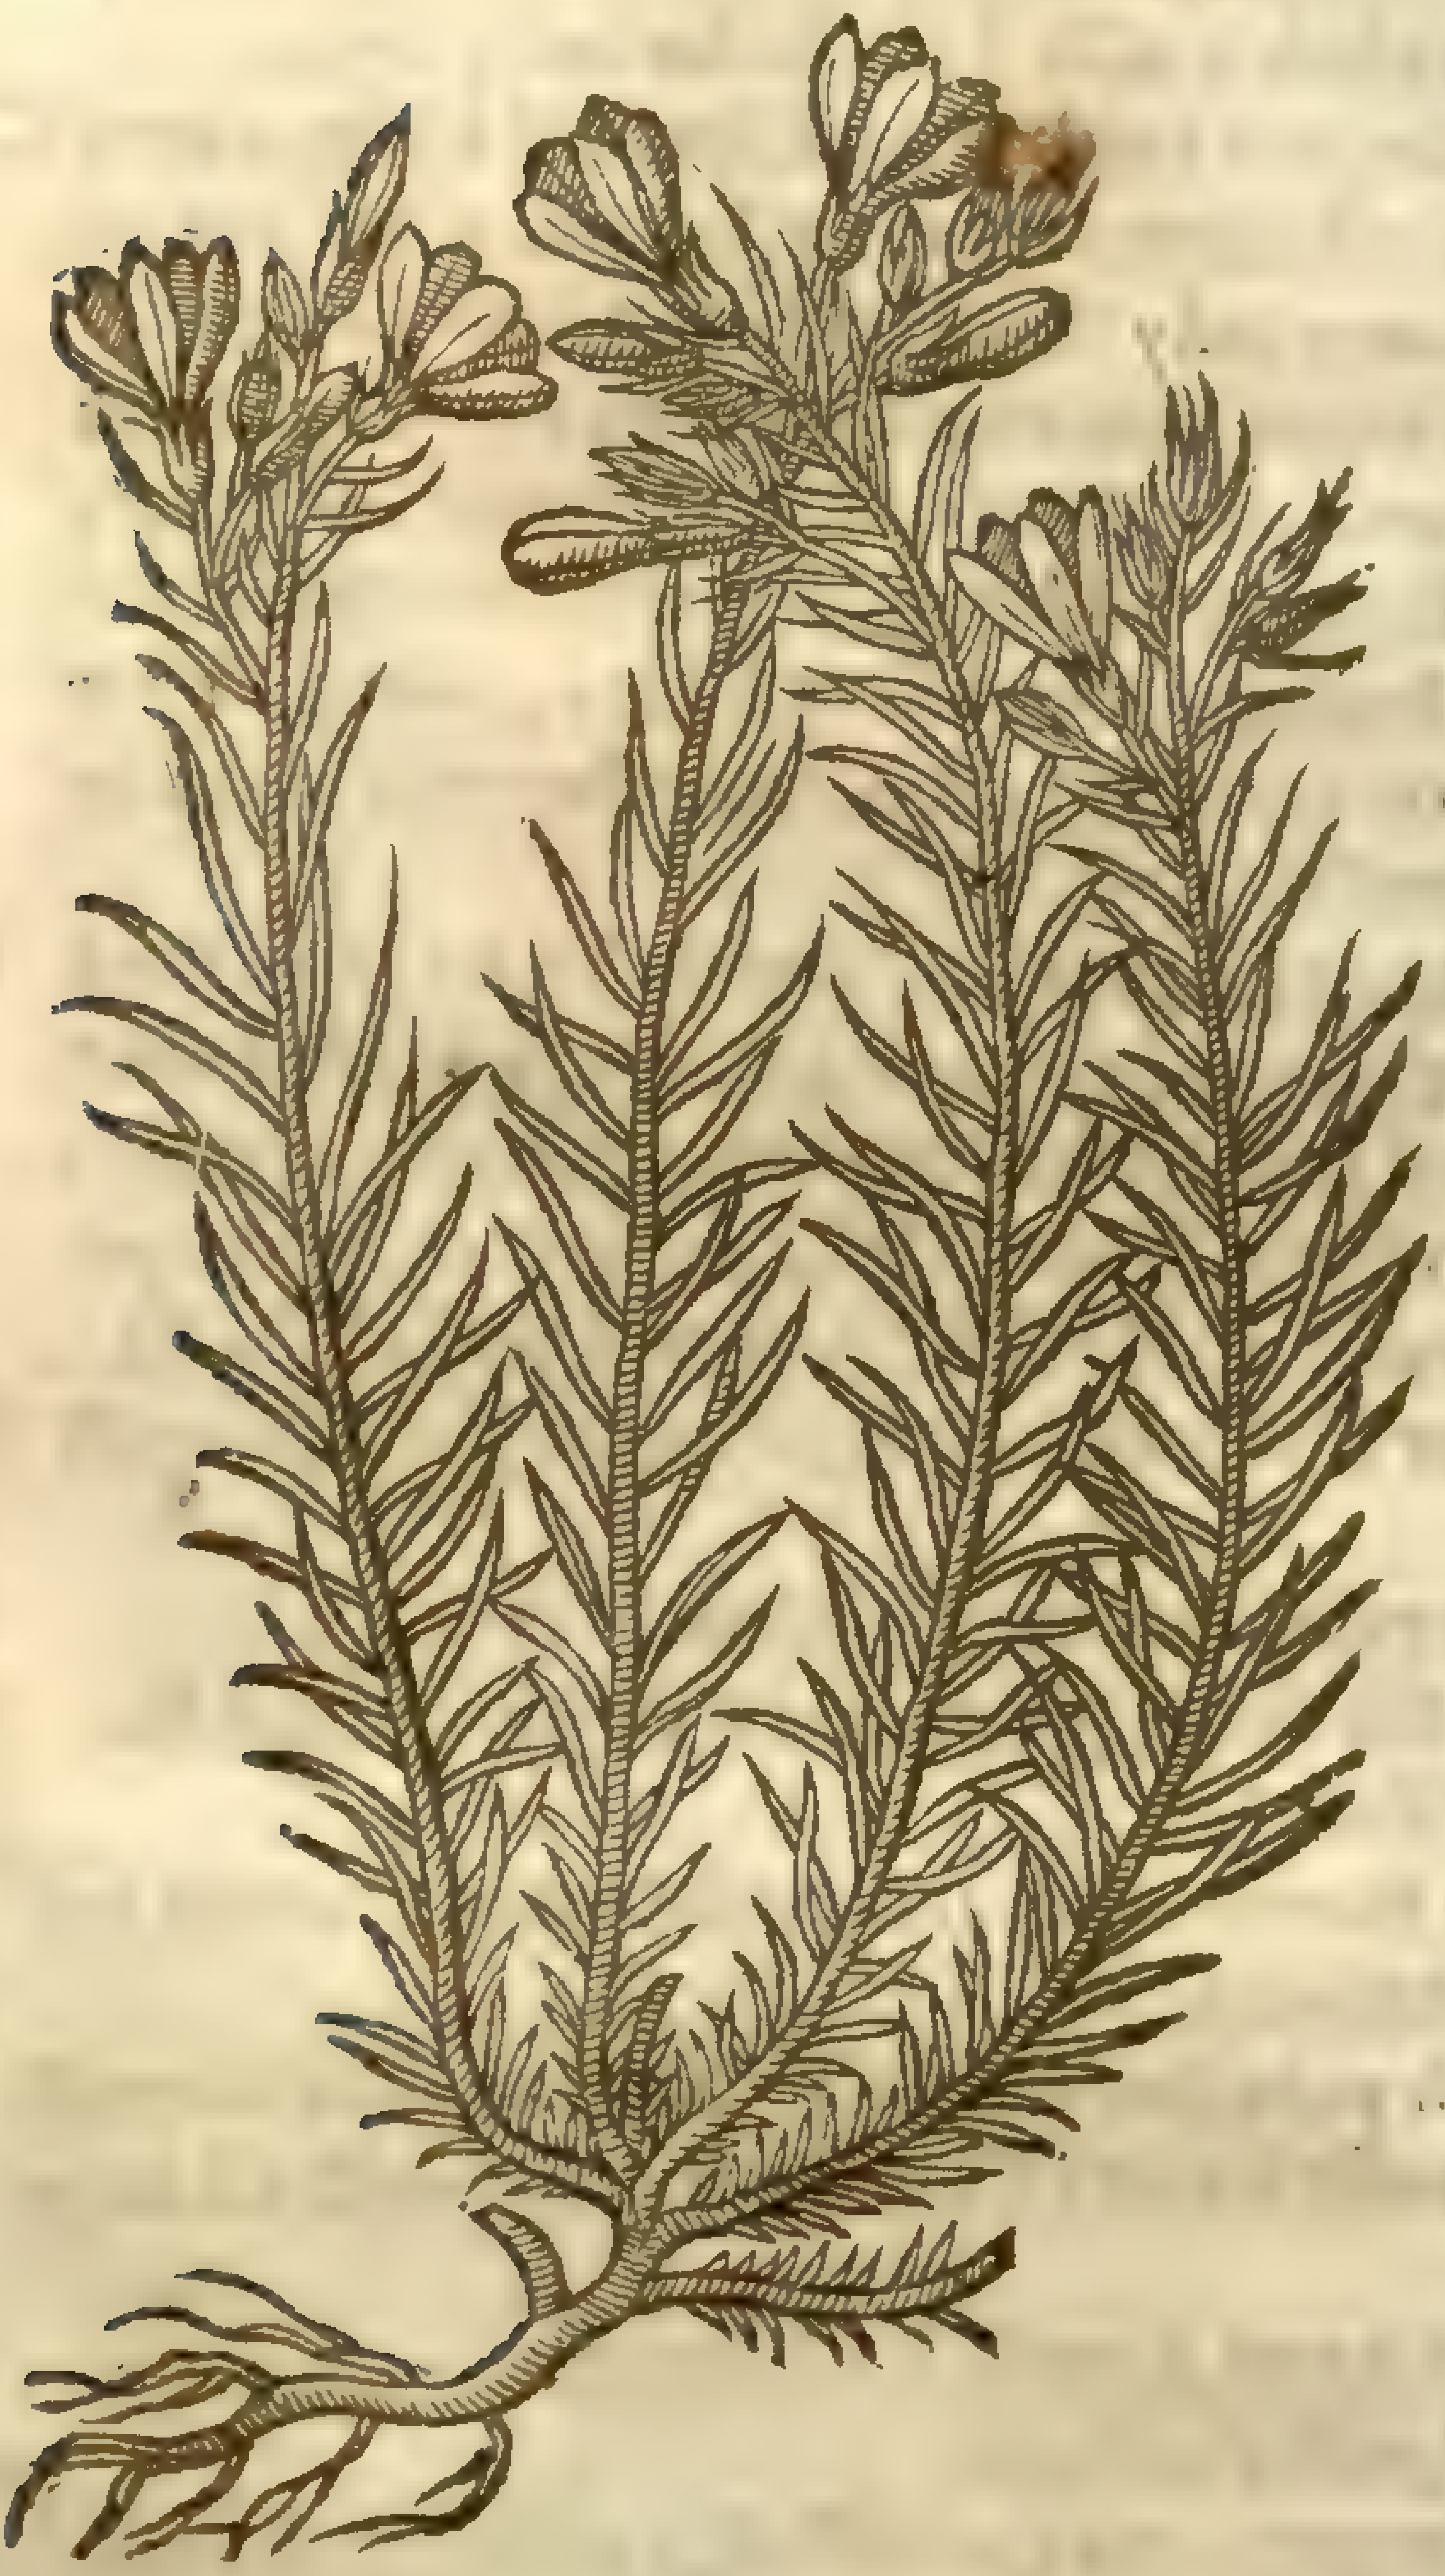
† The figure that was formerly in this place, for the ordinary flax was of *Linum ſylveſtre latifolium* 3. of *Cluſius*, which is deſcribed by me in the ſixth place in the enſuing Chapter.

Chap. 167. *Of Wilde Flaxe.*

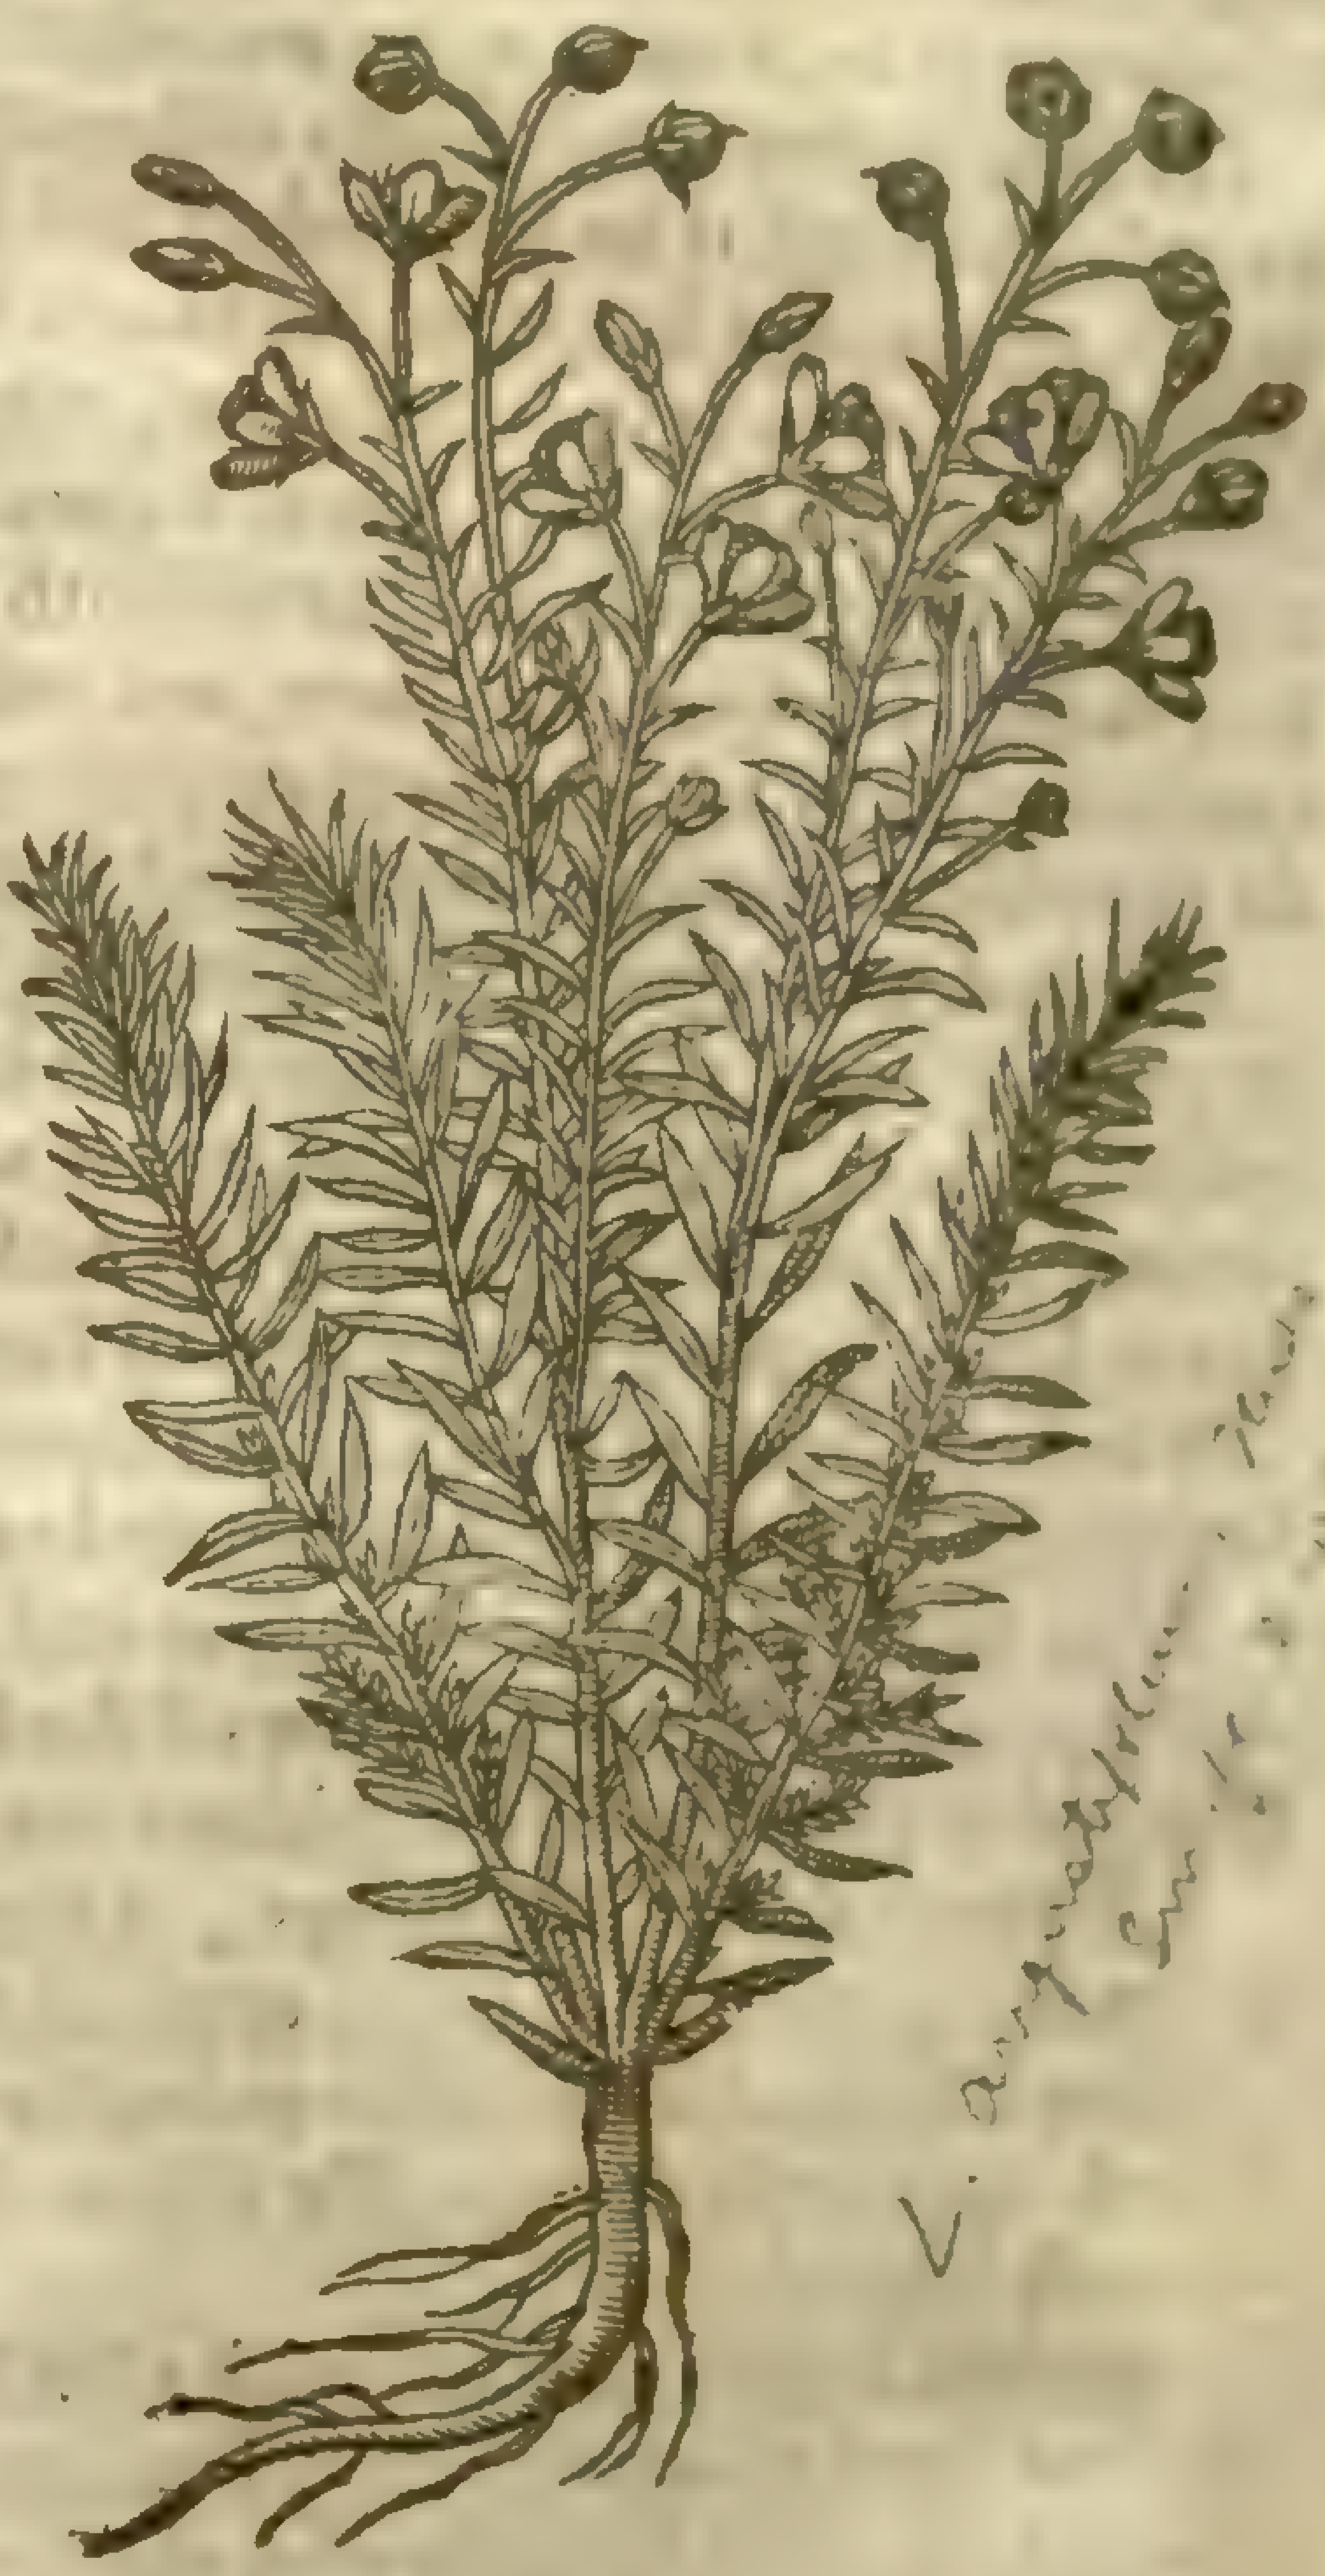
¶ *The Deſcription.*

1 THis wilde kinde of Line or Flaxe hath leaues like thoſe of garden Flaxe,but narrower, growing vpon round bright and ſhining ſprigs, a foot long, and floures like the manured Flax,but of a white colour. The root is tough and ſmall,with ſome fibres annexed thereto. ‡ This is ſometimes found with deep blew floures,with violet colored floures,and ſometimes with white,ſtreaked with purple lines.

1 *Linum ſylveſtre floribus albis.*
Wilde white flaxe.



2 *Linum ſylveſtre tenuifolium.*
Thin leaued wilde flaxe.



V L. angustifolium. Huds.
Eng. [illegible]

2 The narrow and thin leafed kind of Line is very like to the common Flax, but in all points leſſer. The floures conſiſt of fiue leaues, which do ſoone fade and fall away, hauing many ſtalkes proceeding from one root, of a cubit high, beſet with ſmall leaues,yea leſſer than thoſe of *Linaria purpurea.*

‡ Our Author in the former edition gaue two figures vnder this one title of *Linum ſylveſtre tenuifolium*,making them the ſecond & third;but the deſcription of the third was of the rough broad leaued wilde Flaxe, whoſe figure therefore we haue put in that place. Now the two whoſe figures were formerly here are but varieties of one ſpecies, and differ thus; the former of them (whoſe figure we haue omitted as impertinent) hath fewer leaues, which therefore ſtand thinner vpon the ſtalke, and the floures are either blew or elſe white. The later, whoſe figure you may finde here ſet forth, hath more leaues, and theſe growing thicker together: the floure is of a light purple, or fleſh colour. ‡

3 There is a kinde of wilde flaxe which hath many hairy branches, riſing vp from a very ſmall root,which doth continue many yeres without ſowing,increaſing by roots into many other plants, with ſtalks amounting to the height of one cubit, beſet with many rough and hairy broad leaues: at the top of the ſtalkes do grow many blew floures,compact of fiue leaues, much greater and fairer than common Line or flaxe; which being paſt,there ſucceed ſmall ſharpe pointed heads full of ſeeds,like Line ſeed,but of a blackiſh ſhining colour.

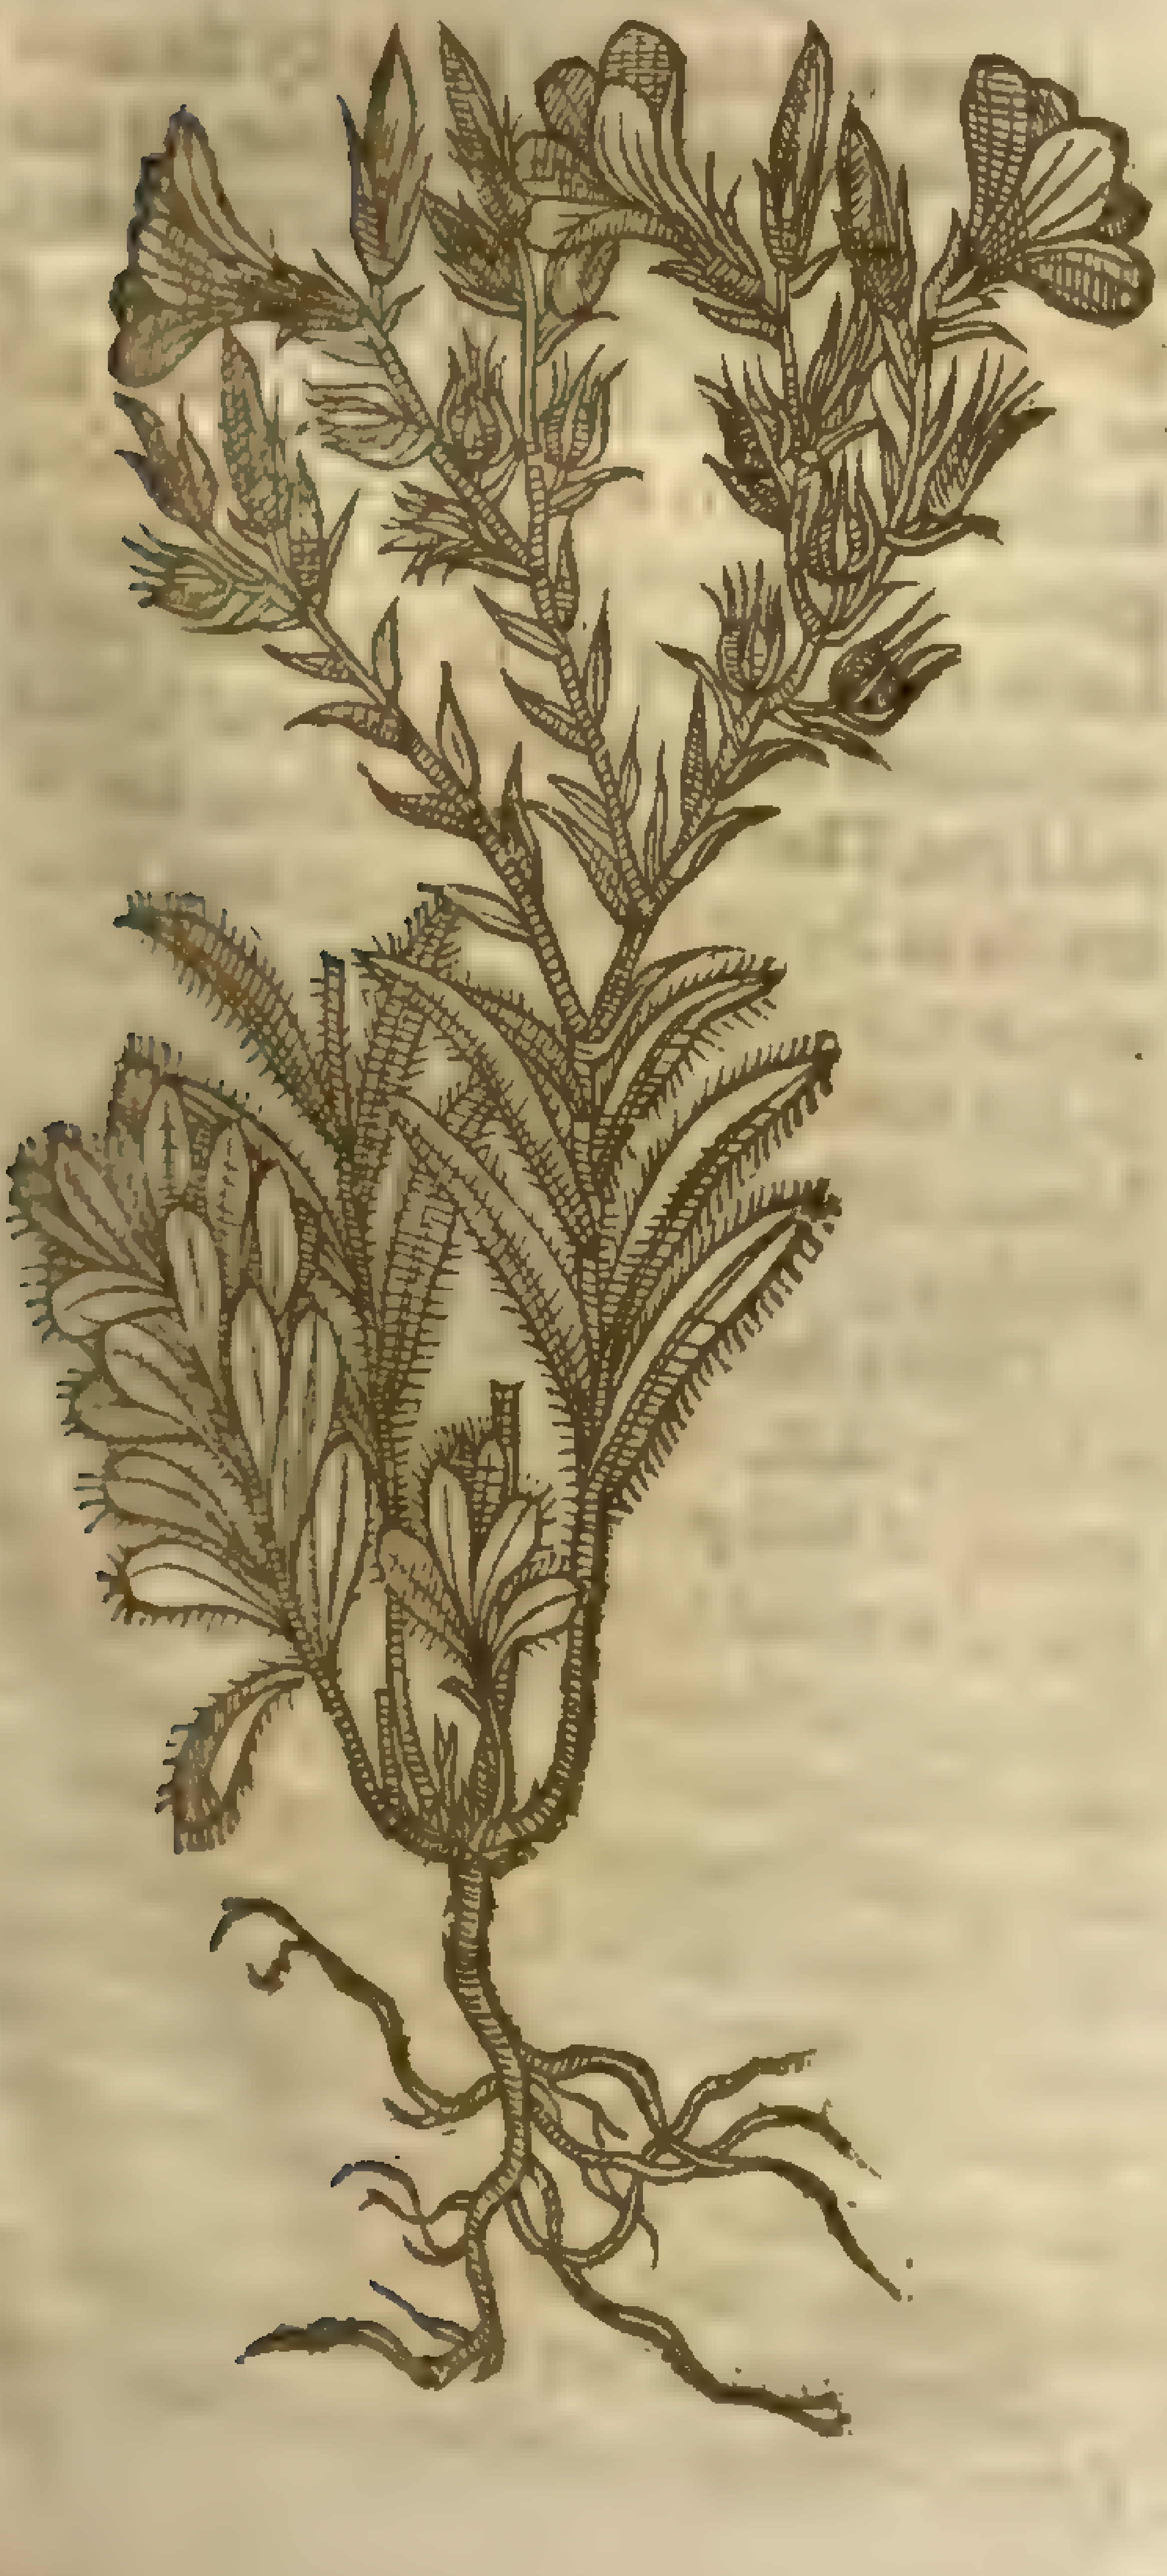
4 *Chamælinum*, of ſome called *Linum ſylveſtre perpuſillum*, and may be called in Engliſh, very low or dwarfe wilde Flax: for this word *Chamæ* ioyned to any Simple, doth ſignifie, that it is a low or dwarfe kinde thereof; being ſcarce an handful high, hath pale and yellow floures: but as it is in all things like vnto flax, ſo the floures, leaues, ſtalkes, and all other parts thereof, are foure times leſſer than *Linum*.

‡ 5 There is alſo growing wilde in this kingdome a ſmall kinde of wilde Flax, which I take to be the *Linocarpos* deſcribed by *Thalius*, and mentioned by *Camerarius*, by the name of *Linum ſylveſtre puſillum candicantibus floribus*. *Anno* 1529, when I firſt found it, in a Iournall written of ſuch plants as I gathered, I ſet this by the name of *Linum ſylveſtre puſillum candidis floribus*; which my friend Mr *Iohn Goodyer* ſeeing, he told me he had long knowne the plant, and refer'd it to the Lines: but there were ſome which called it in Engliſh Mil-mountain, and vſed it to purge; and of late he hath ſent me this hiſtorie of it, which you ſhall haue as I receiued it from him.

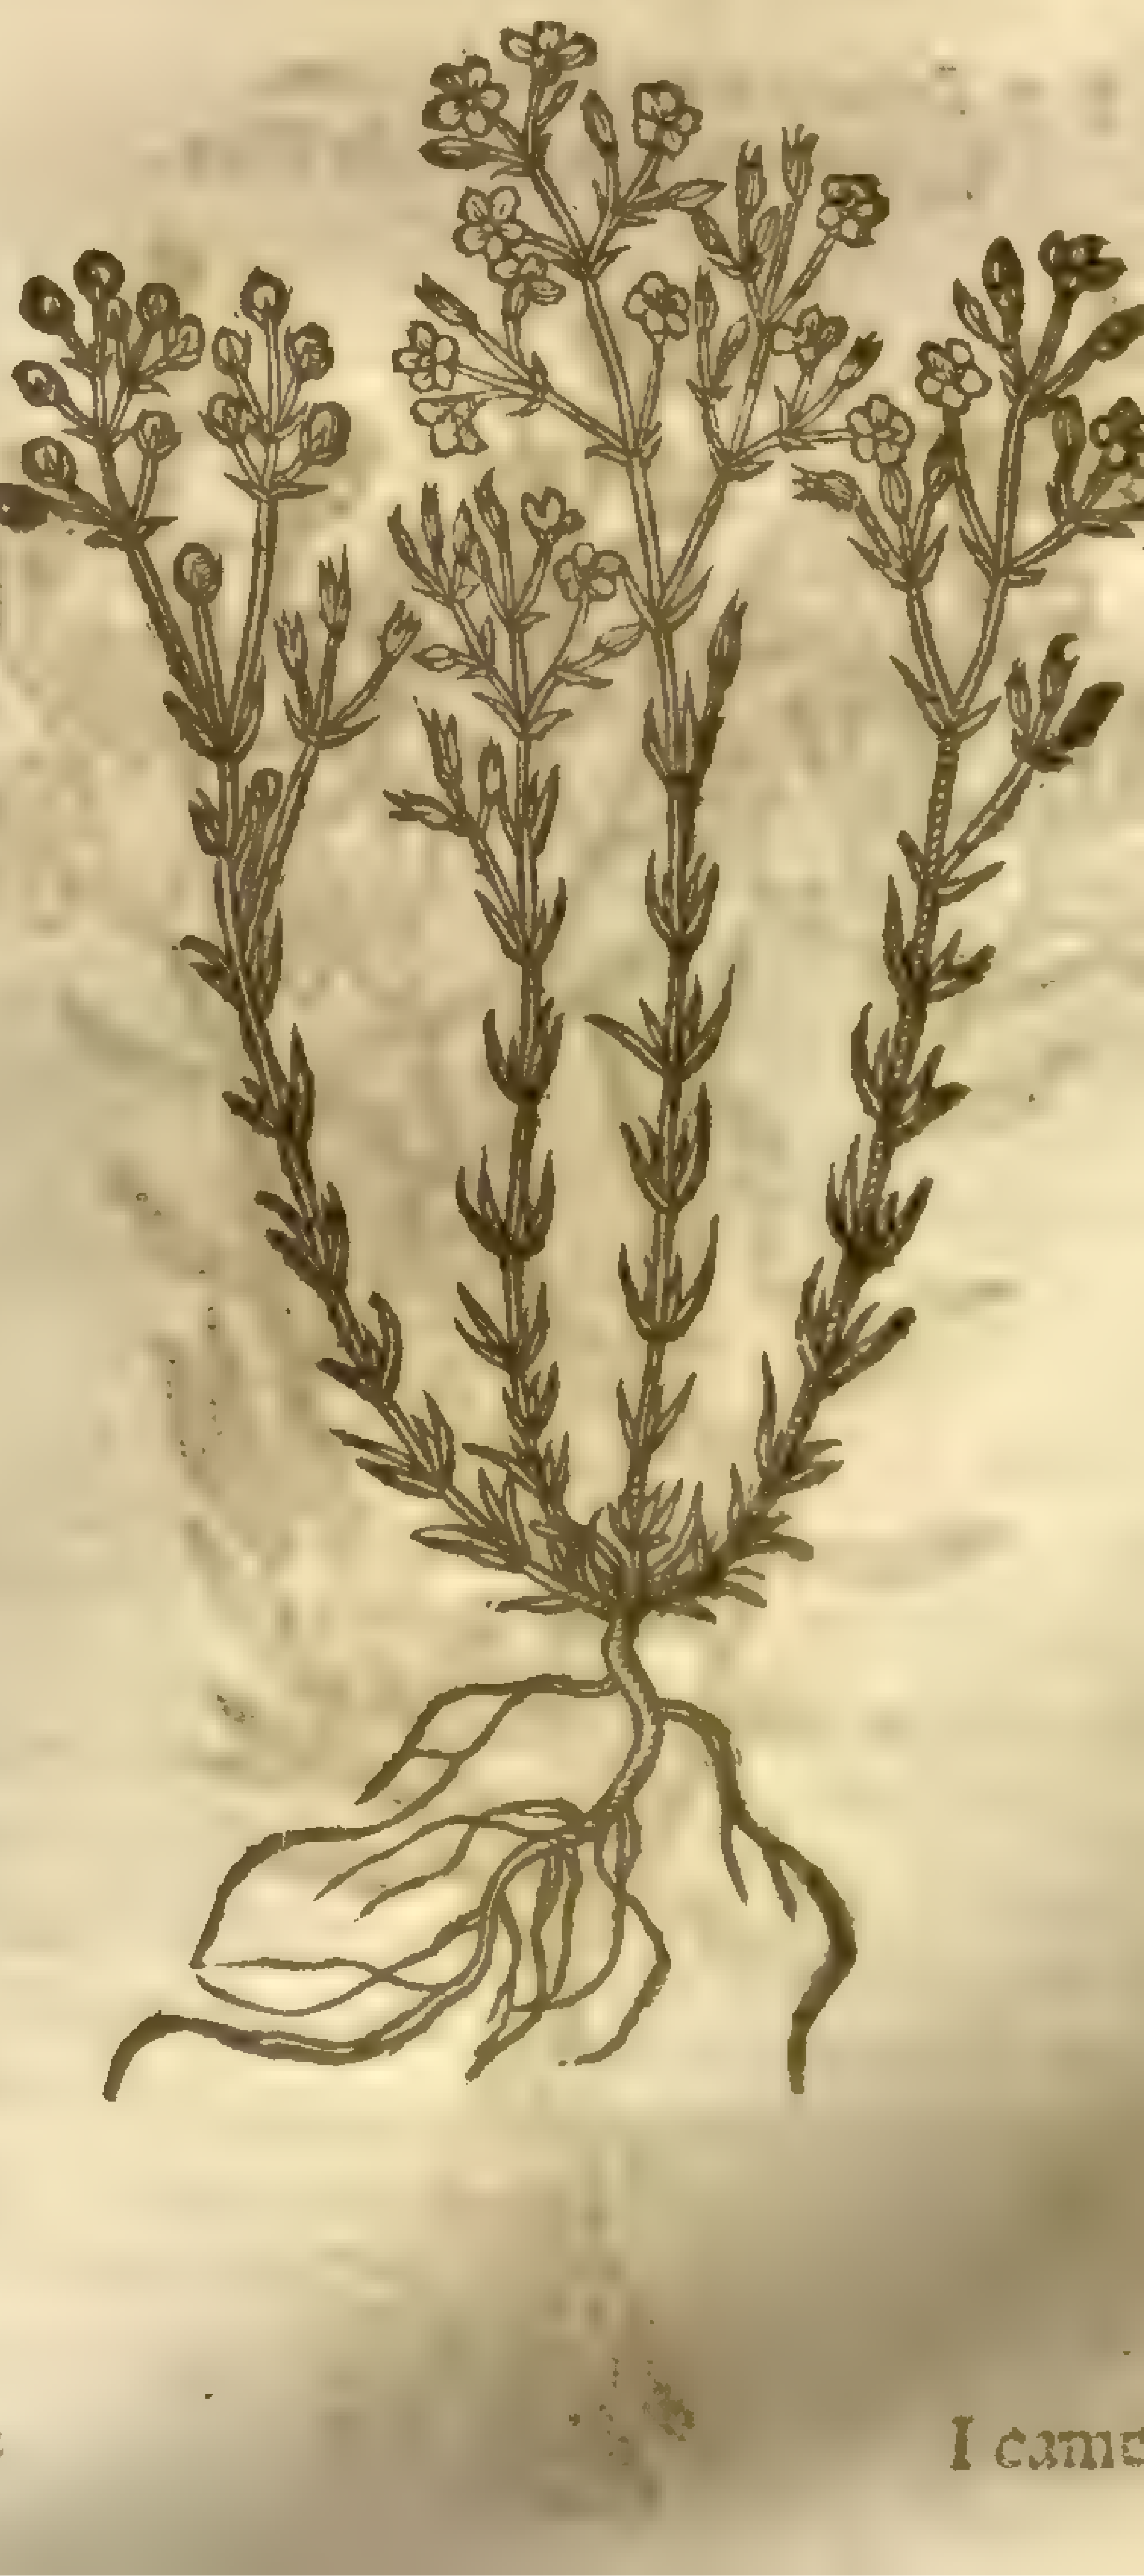
Linum ſylveſtre Catharticum. Mil-mountaine

It riſeth vp from a ſmall white threddy crooked root, ſometimes with one, but moſt commonly with fiue or ſix or more round ſtalks, about a foot or nine inches high, of a brown or reddiſh color, euery ſtalk diuiding it ſelfe neere the top, or from the middle vpward, into many parts or branches of a greener colour than the lower part of the ſtalke: the leaues are ſmall, ſmooth, of colour green, of the bigneſſe of Lentill leaues, and haue in the middle one rib or ſinew, and no more that may be perceiued, and grow alongſt the ſtalke in very good order by couples one oppoſit againſt the other: at the tops of the ſmall branches grow the floures, of a white colour, conſiſting of fiue ſmall leaues a peece, the nailes whereof are yellow: in the inſide are placed ſmall ſhort chiues alſo of a yellow colour; after which come vp little knobs or buttons, the top whereof when the ſeed is ripe diuides it ſelfe into fiue parts; wherein is contained ſmall ſmooth flat ſlipperie yellow ſeed: when the ſeed is ripe the herb periſheth: the whole herb is of a bitter taſt, and herby ſmell. It groweth plentifully in the vnmanured incloſures of Hampſhire, on chalky downes, and on Purfleet hils in Eſſex, and in many other places. It riſeth forth of the ground at the beginning of the ſpring, and floureth all the Summer.

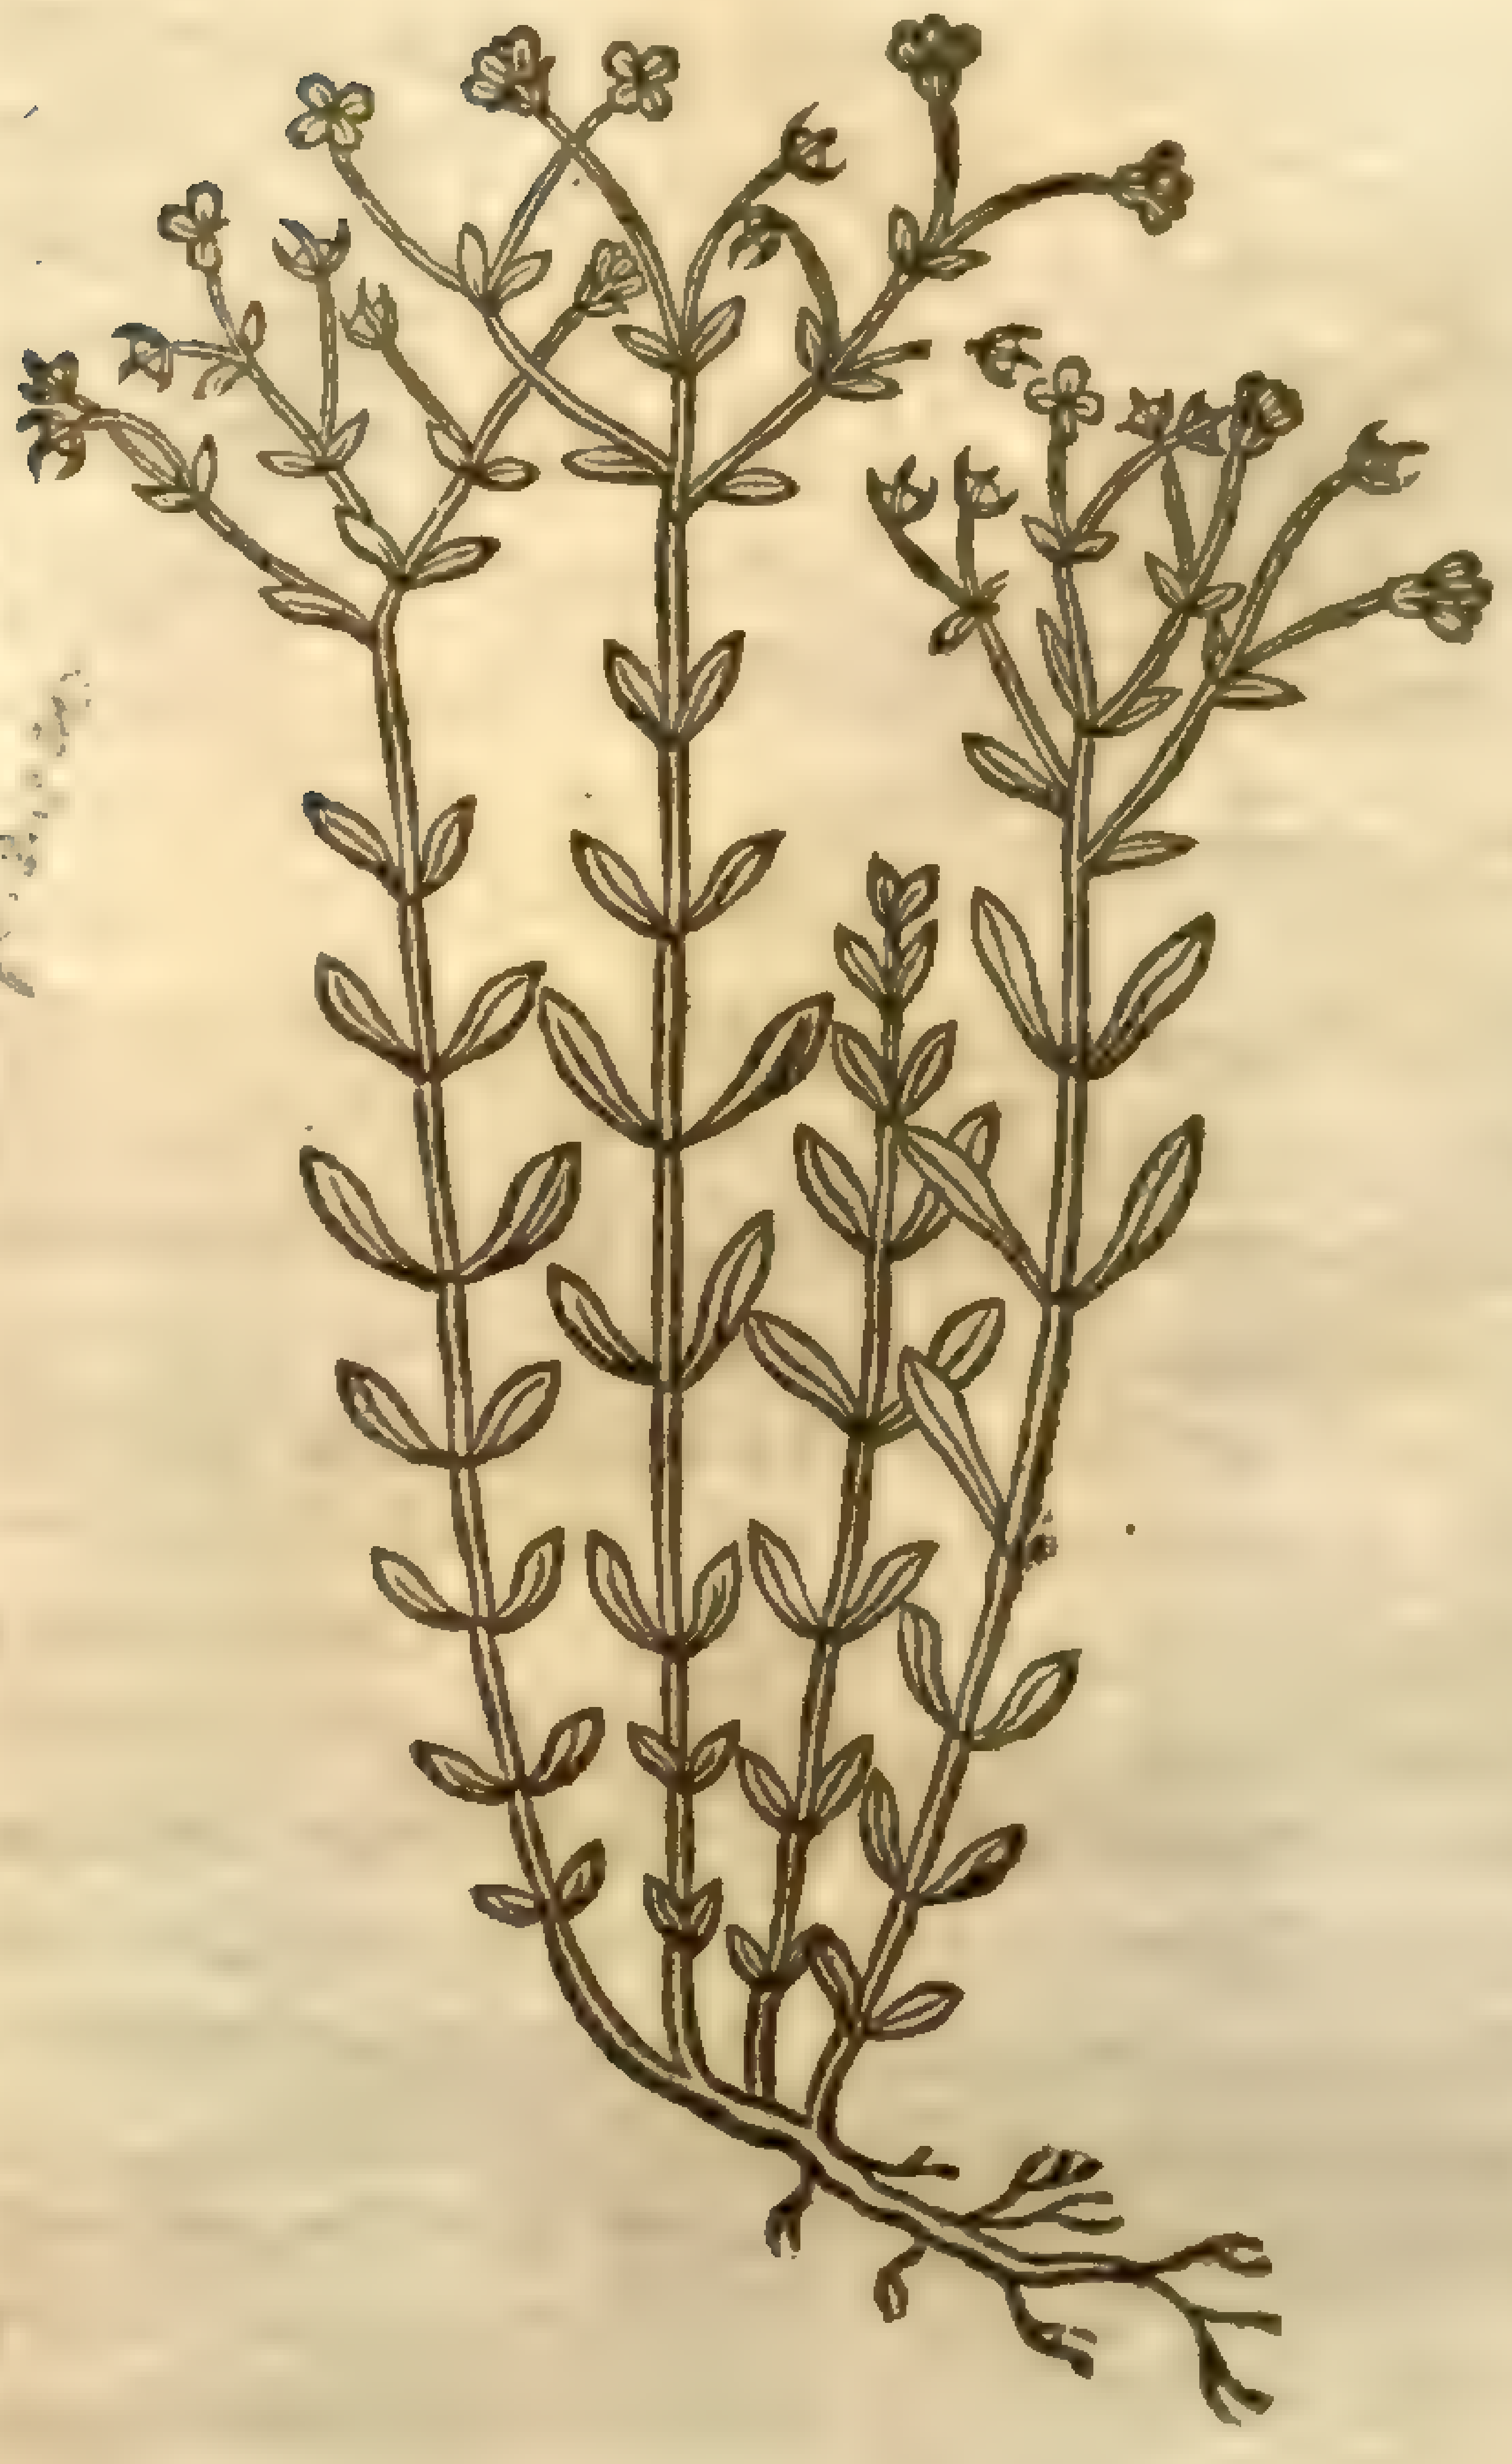
‡ 3 *Linum ſylveſtre latifolium.*
Broad leaued wilde Flax.



4 *Chamælinum perpuſillum.*
Dwarfe wilde Flax.

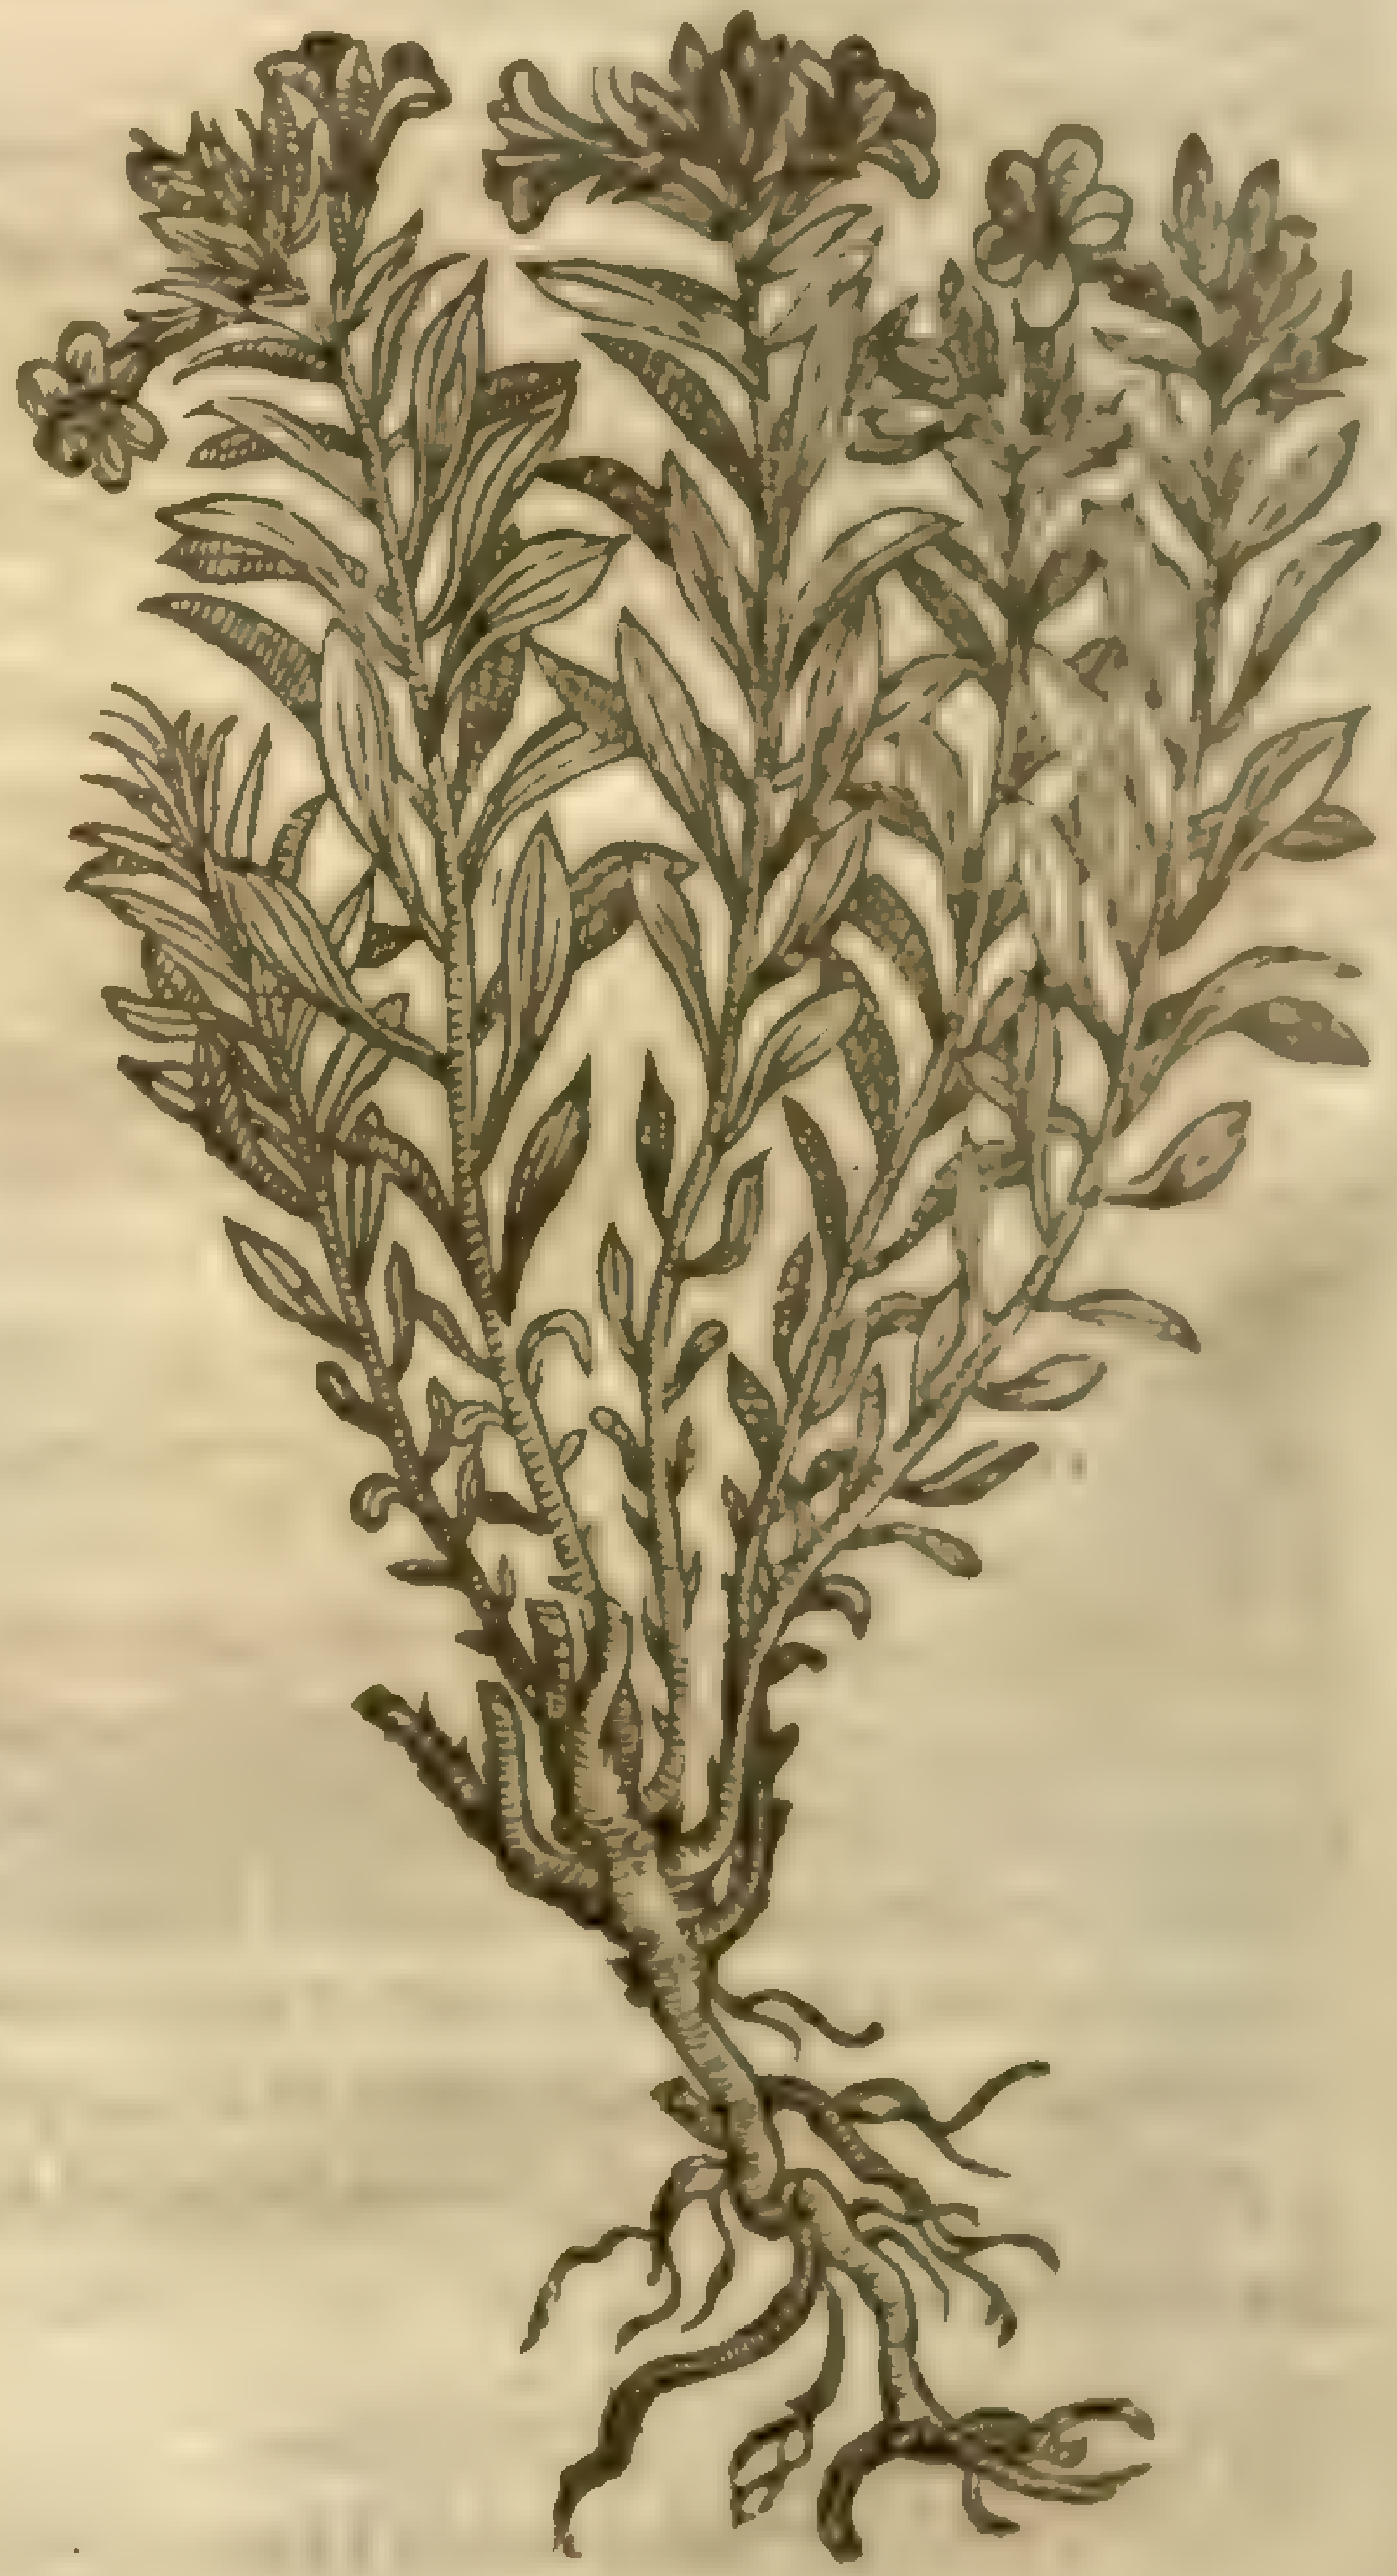


‡ 5 *Linum ſyl. catharticum.*
Mill-mountaine.

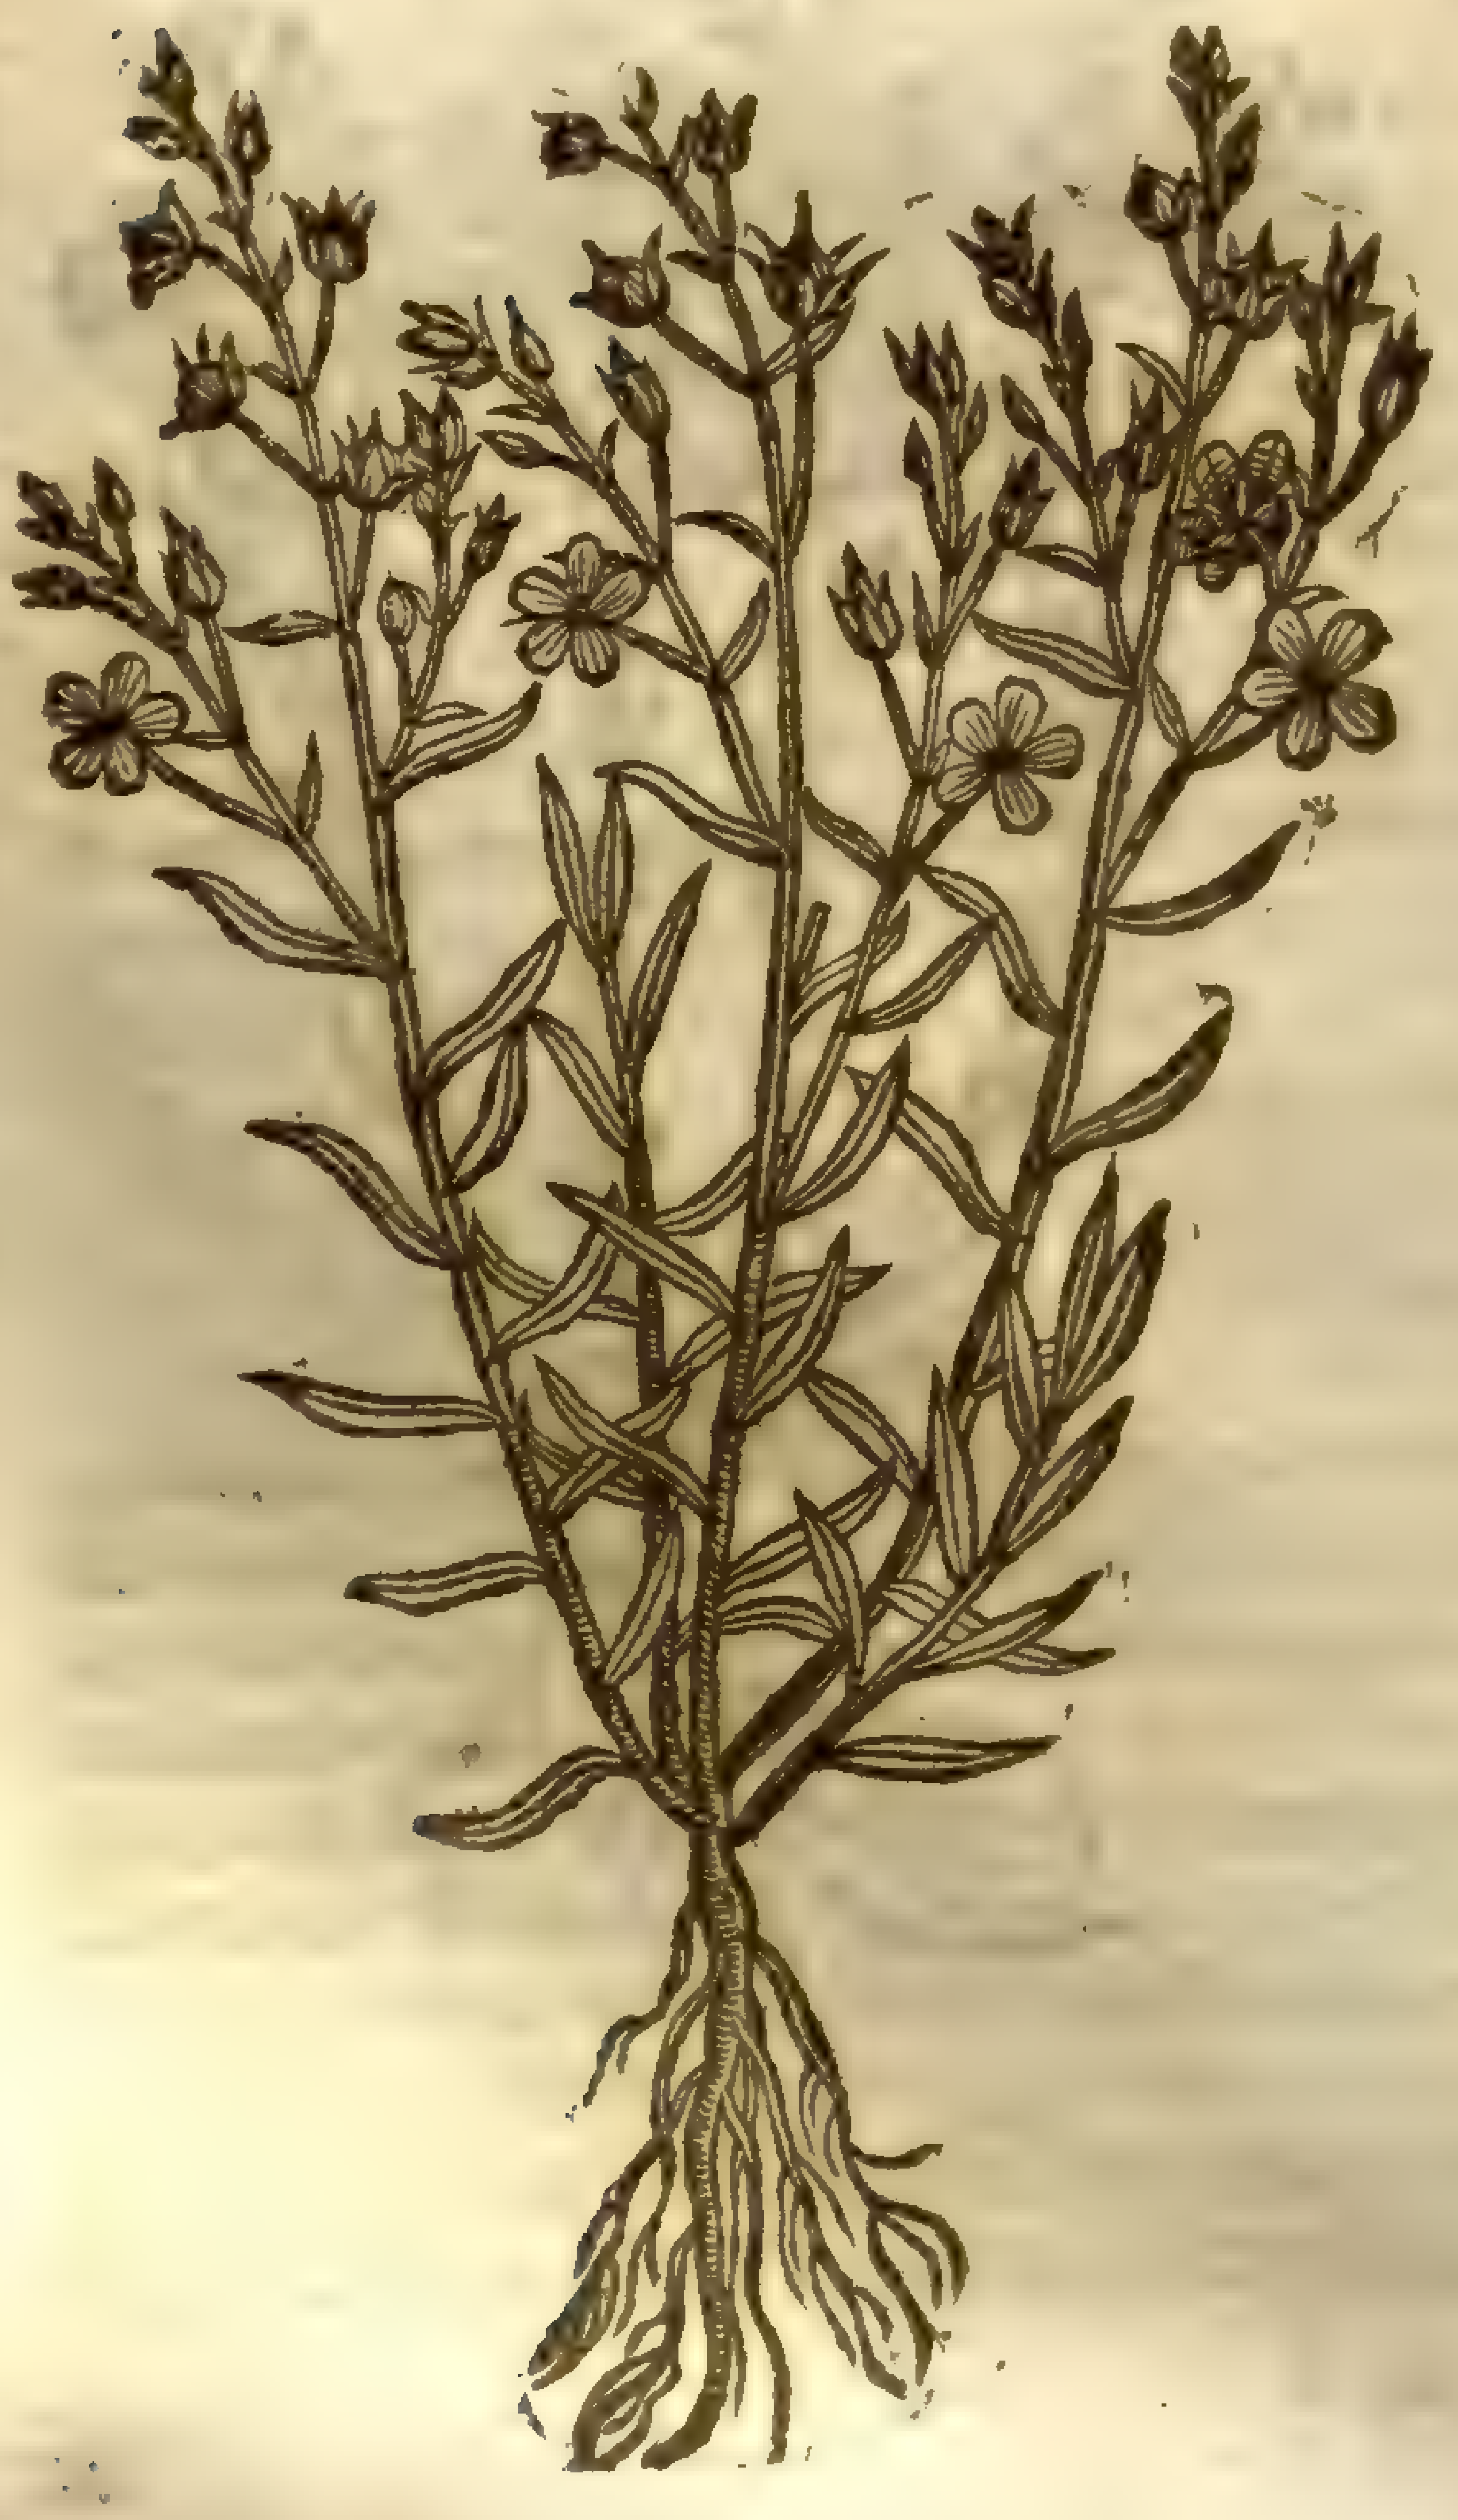


L. catharticum [illegible]

‡ 4 *Linum ſyl. latifolium 3.Cluſ.*
The third broad leaued wild Flax.



‡ 7 *Linum marinum luteum.*
Yellow floured wilde Flax.



L. maritimum, L. [illegible]

I came to know this herbe by the name of Mill-mountaine, and his vertue, by this meanes: On the ſecond of October, 1617, going to Mr *Colſons* ſhop an Apothecarie of Wincheſter in Hampſhire, I ſaw this herb lying on his ſtall, which I had ſeene growing long before; I deſired of him to know the name of it; he told mee that it was called Mill-mountaine; and hee alſo told me, That beeing at Doctour *Lake* his houſe at Saint Croſſe a mile from Wincheſter, ſeeing a man of his haue this herb in his hand, he deſired the name: hee told him as before; and alſo the vſe of it, which is this:

A Take a hand full of Mil-mountain, the whole plant, leaues, ſeeds, floures and all, bruiſe it and put it in a ſmal tunne or pipkin of a pinte filled with white Wine, and ſet it in on the embers to infuſe all night, and drinke that Wine in the morning faſting, and hee ſaid it would giue eight or ten ſtooles. This Dr *Lake* was afterwards made Biſhop of Bathe and Wels, who alwaies vſed this herbe for his purge, after the ſaid manner, as his man affirmed, Iuly 20, 1619. *Iohn Goodyer.*

B I haue not as yet made trial hereof, but ſince in *Geſn. de Lunarijs, p. 34.* I haue found the like or a more purging facultie attributed to this herb, as I thinke (for I cannot refer it to any other) where he would haue it to be *Helleborine* of the Antients. I thinke it not amiſſe here to ſet downe his words, becauſe the booke is not commonly to be had, being ſet forth *Anno* 1555: *Ante annos* 15. *aut circitèr, cùm Anglicus ex Italia radiens, me ſalutaret* (Turnerus *is fuerit, vir excellentis tum in re medica, tum alijs plerisque diſciplinis doctrinæ, aut alius quiſpiam, vix ſatis memini) inter alias rariorum ſtirpium icones quas depingendas commodabat, Elleborinem quoque oſtendebat pictam, herbulam fruticoſam, pluribus ab vna radice cauliculis quinque ferè digitorum proceritate erectis, foliolis perexiguis, binis per interualla (eiuſmodi vt ex aſpectu genus quoddam Alſine exiguum videretur) vaſculis in ſummo exiguis, rotundis tanquam lini. Hanc ajebat creſcere in pratis ſiccis, vel cliuis Montium: inutili radice, ſubamara, purgare vtrinque & in Anglia vulgò vſurpari à ruſticis.* Thus much for *Geſner*.

6 *Cluſius* amongſt other wilde Lines or Flaxes hath ſet forth this, which from a liuing thicke wrythen root ſends vp many ſtalkes almoſt a cubit high, ſomewhat red and ſtiffe, ſet with prettie large and thicke leaues not rough and hairy, but ſmooth and hard: the floures grow plentifully on the tops of the ſtalkes, being large, and compoſed of fiue leaues of a faire yellow colour, with fiue threds comming forth of their middles, with as many ſmaller and ſhorter haires. The ſeed is contained in flatter heads than thoſe of the firſt deſcribed, containing a blacke but not ſhining ſeed. It floures in Iune and Iuly, and ripens the ſeed in Auguſt. It growes naturally vpon diuers hills in Germany.

7 *Matthiolus* and *Dodonæus* haue vnder the name of *Linum ſylueſtre*; and *Lobel* by the name of *Linum marinum lateum Narbonenſe*, ſet forth another yellow floured wilde flax. This growes with ſlender ſtalks ſome cubit high, ſet with leaues like thoſe of flaxe, but ſomewhat leſſer, and fewer in number: at the tops of the ſtalks grow floures ſmaller than thoſe of the common Lyne, and yellow of colour. It growes naturally vpon the coaſts of France that lie towards the Mediterranean ſea, but not in England that I haue heard of. ‡

¶ *The Place.*

They grow naturally in grauelly grounds: the firſt growes in wel manured places, as in gardens and ſuch like ſoiles. The ſecond groweth by the ſea ſide. The third and fourth grow vpon rockes and cliffes neere the ſea ſide: I haue ſeen them grow vpon the ſea banks by Lee in Eſſex, & in many places of the Iſle of Shepey. They grow alſo between Quinborow and Sherland houſe.

‡ I haue not ſeen any of theſe growing wilde, but only the fift of my deſcription. ‡

¶ *The Time.*

They floure from May to the end of Auguſt.

¶ *The Names.*

Their names are ſufficiently expreſt in their ſeuerall titles.

¶ *The Nature and Vertues.*

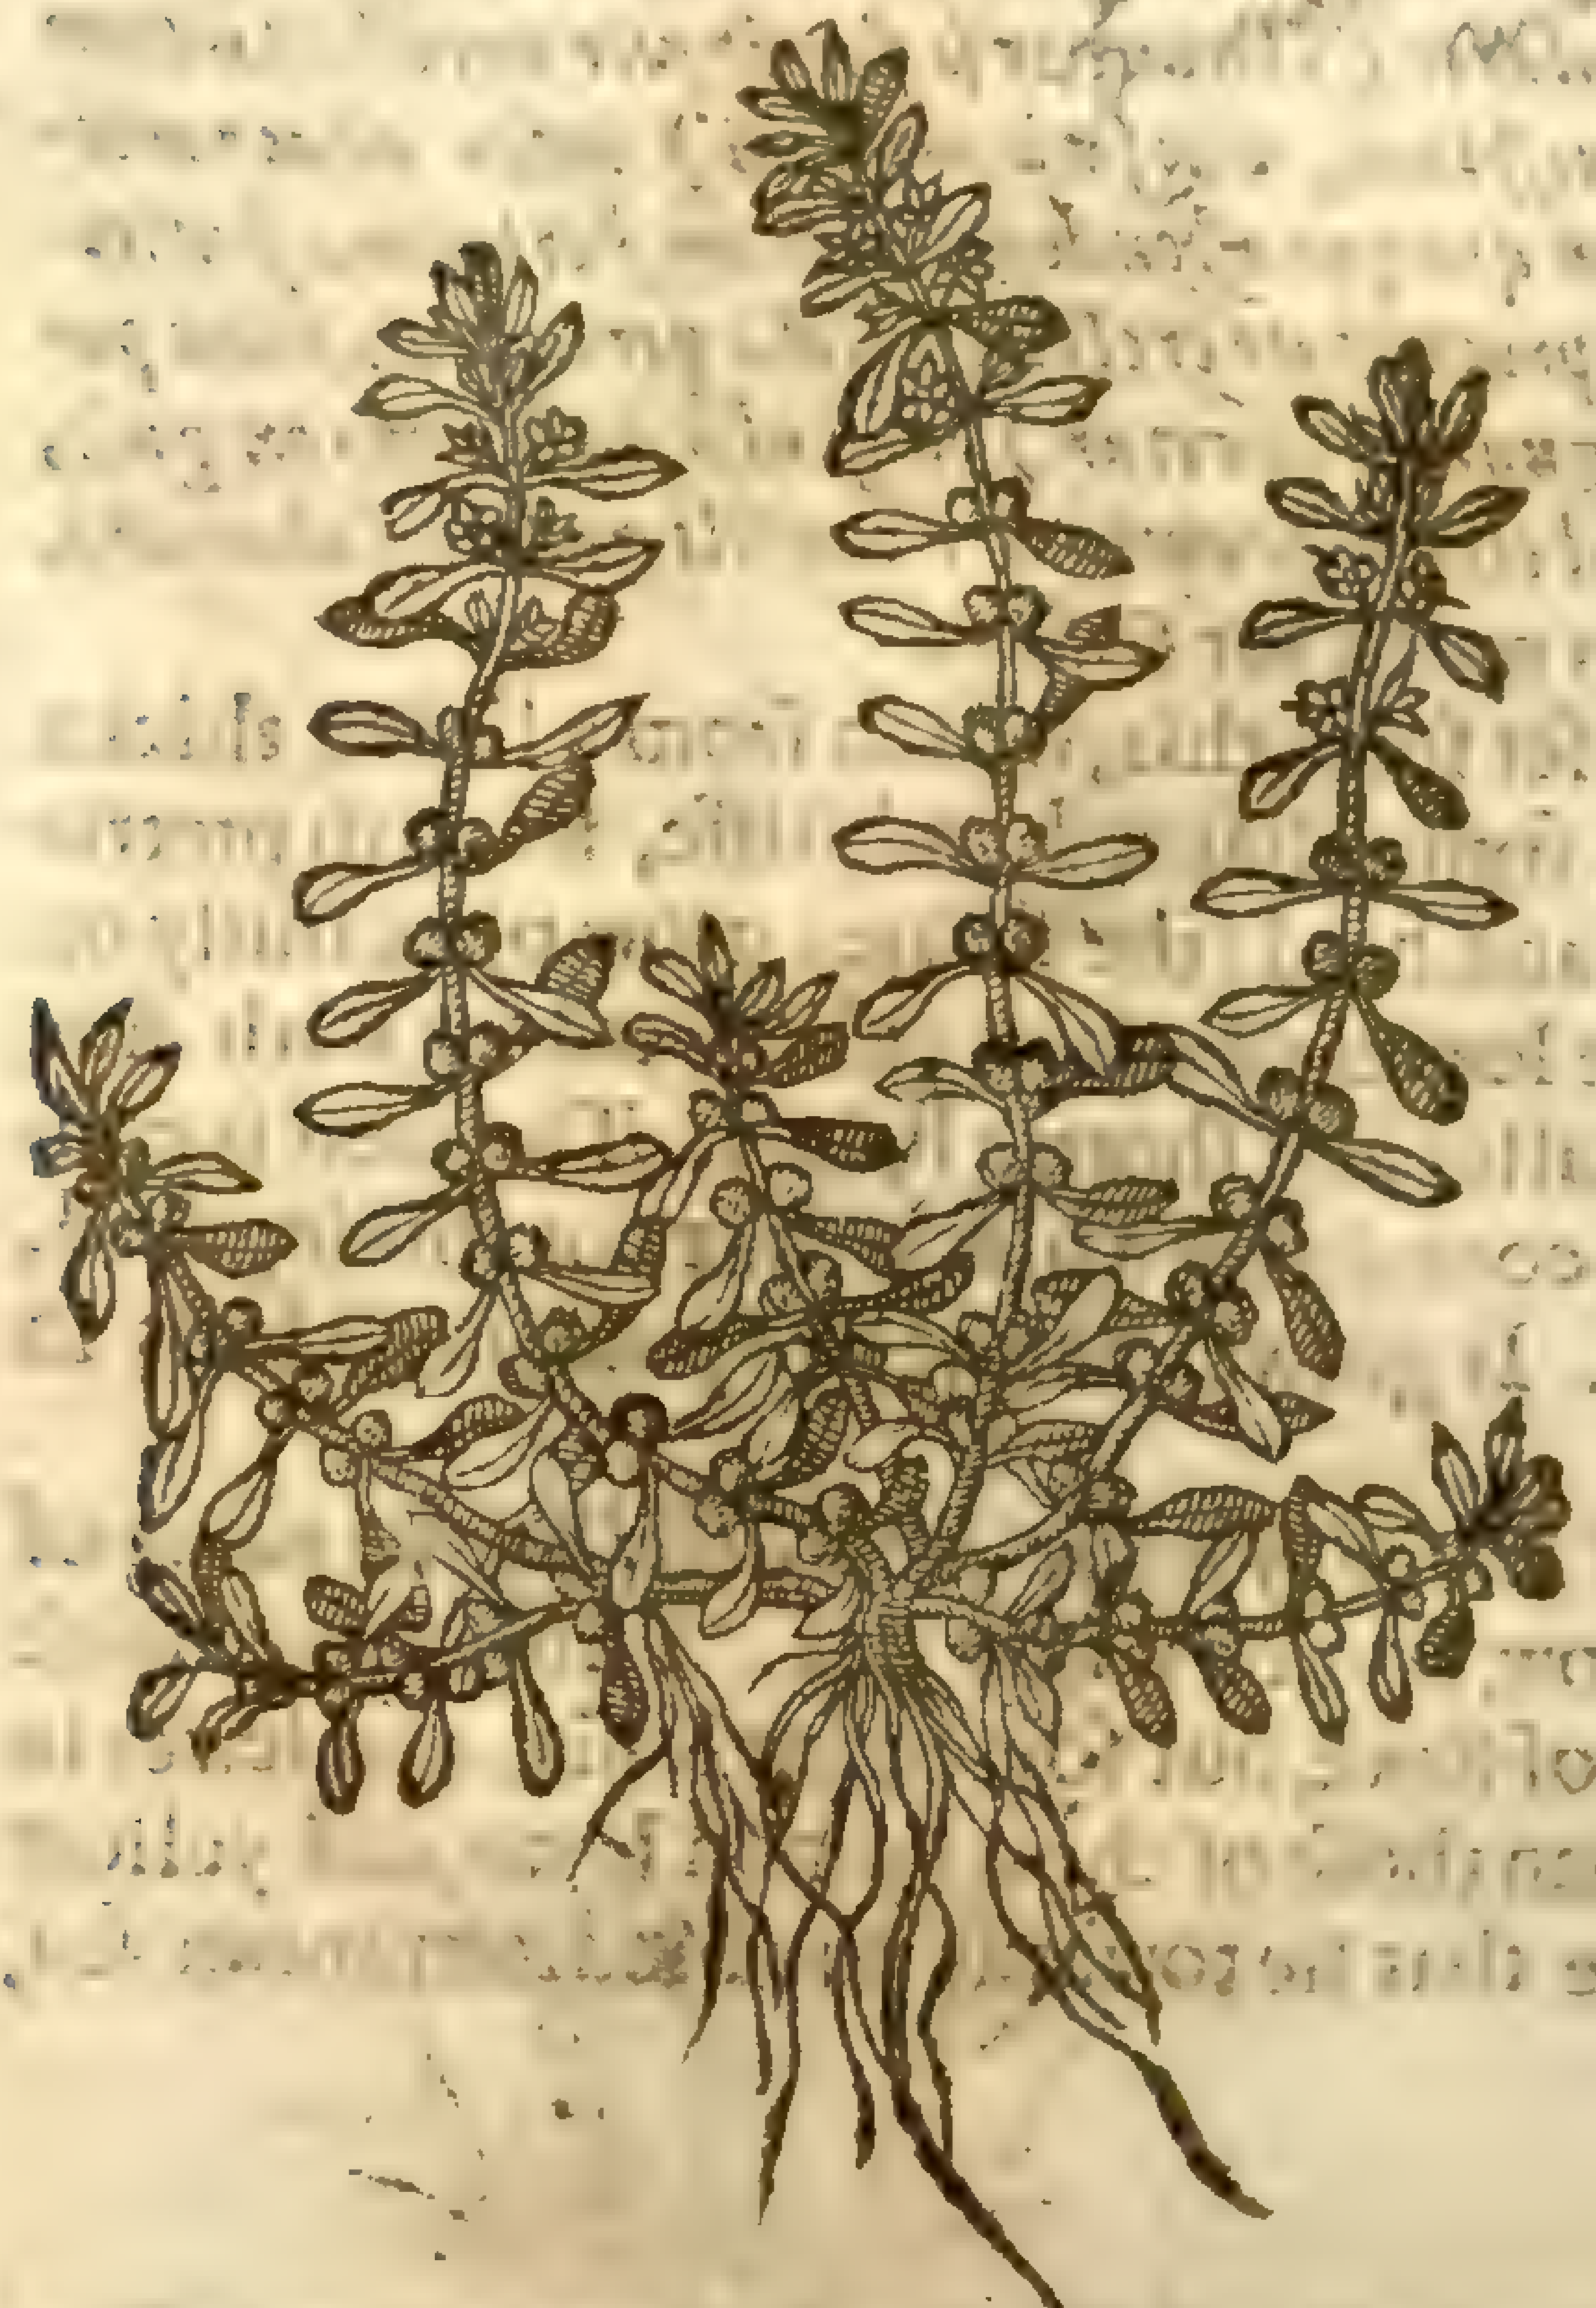
The faculties of theſe kindes of wilde flax are referred vnto the manured flax, but they are ſeldome vſed either in phyſicke or ſurgerie.

Chap. 168. *Of black Saltwort.*

¶ *The Deſcription.*

IN old time, ſaith the Authors of the *Aduerſaria*, this plant was vſed for meat, & receiued among the *Legumina*. It was called *Glaux* by reaſon of the colour of the leaues, which are of a blewiſh gray colour, called in Latine *Glaucus color*, ſuch as is in the Sallow leaf: of others it is called *Galax* or *Glax*; and *Eugalacton, quaſi lactea*, or *Lactifica*, becauſe it is good to encreaſe milk in the breſts of women, if it be much vſed. *Ruellius* and others haue ſet downe *Galega, Securidaca, Polygala*, & many other plants for the true *Glaux*, which hath bred a confuſion. The true *Glaux* of *Dioſcorides* hath many ſmall branches, ſome creeping on the ground, and ſome ſtanding vpright, tender and ſmal, beſet with many little fat leaues like *Tribulus ſylueſtris*, or *Herniaria*, growing along the ſtalks by couples, between which grow ſmall purple floures: which beeing paſt, there ſucceed little bullets or ſeed-veſſels. The root is very ſmall and threddy, and taking hold of the vpper face of the earth, it runnes abroad, by which means it mightily encreaſeth.

Glaux exigua maritima.
Blacke Saltwort.



¶ *The Place.*

The true *Glaux* or Milkwort groweth very plentifully in ſalt places & marſhes neer the ſea, from whence I haue brought it into my garden, where it proſpereth as wel as in his natiue ſoile. I found it eſpecially betweene Whitſtable and the Iſle of Thanet in Kent, & by Graueſend in the ſame countie, by Tilberry Blockhouſe in Eſſex, and in the Iſle of Shepey, going from Kings ferry to Sherland houſe.

¶ *The Time.*

It floureth in May, and the ſeed is ripe in Iune.

¶ *The Names.*

The names haue been ſufficiently ſpoken of in the deſcription. It ſhall ſuffice to call it in Engliſh, ſea Milkwort.

¶ *The Nature.*

Paulus Ægineta ſaith it is hot and moiſt of temperature.

¶ *The Vertues.*

This Milkwort taken with milk, drinke, or pottage, ingendereth ſtore of milke, and therefore it is good to be vſed by Nurſes that want the ſame.

Chap. 169. *Of Milkewort.*

¶ *The Deſcription.*

1 THere haue been many plants neerely reſembling *Polygala*, and yet not the ſame indeed, which doth verifie the Latine ſaying, *Nullum ſimile eſt idem.* This neere reſemblance doth rather hinder thoſe that haue ſpent much time in the knowledge of Simples, than increaſe their knowledge: and this alſo hath been an occaſion that many haue imagined a ſundrie *Polygala* vnto themſelues, and ſo of other plants. Of which number this whereof I ſpeake is one, obtaining this name of the beſt writers and herbariſts of our time, deſcribing it thus: It hath many thicke ſpreading branches creeping on the ground, bearing leaues like thoſe of *Herniaria*, ſtanding in rowes like the ſea Milkwort; among which grow ſmal whorles or crownets of white floures, the root being exceeding ſmall and threddy.

2 The ſecond kinde of *Polygala* is a ſmall herbe with pliant ſlender ſtemmes, of a wooddy ſubſtance, an handfull long, creeping by the ground: the leaues be ſmall and narrow like to Lintels, or little Hyſſop. The floures grow at the top, of a blew colour, faſhioned like a little bird, with wings, taile, and body eaſie to be diſcerned by them that do obſerue the ſame: which being paſt, there ſucceed ſmall pouches like thoſe of *Burſa paſtoris*, but leſſer. The root is ſmall and wooddy.

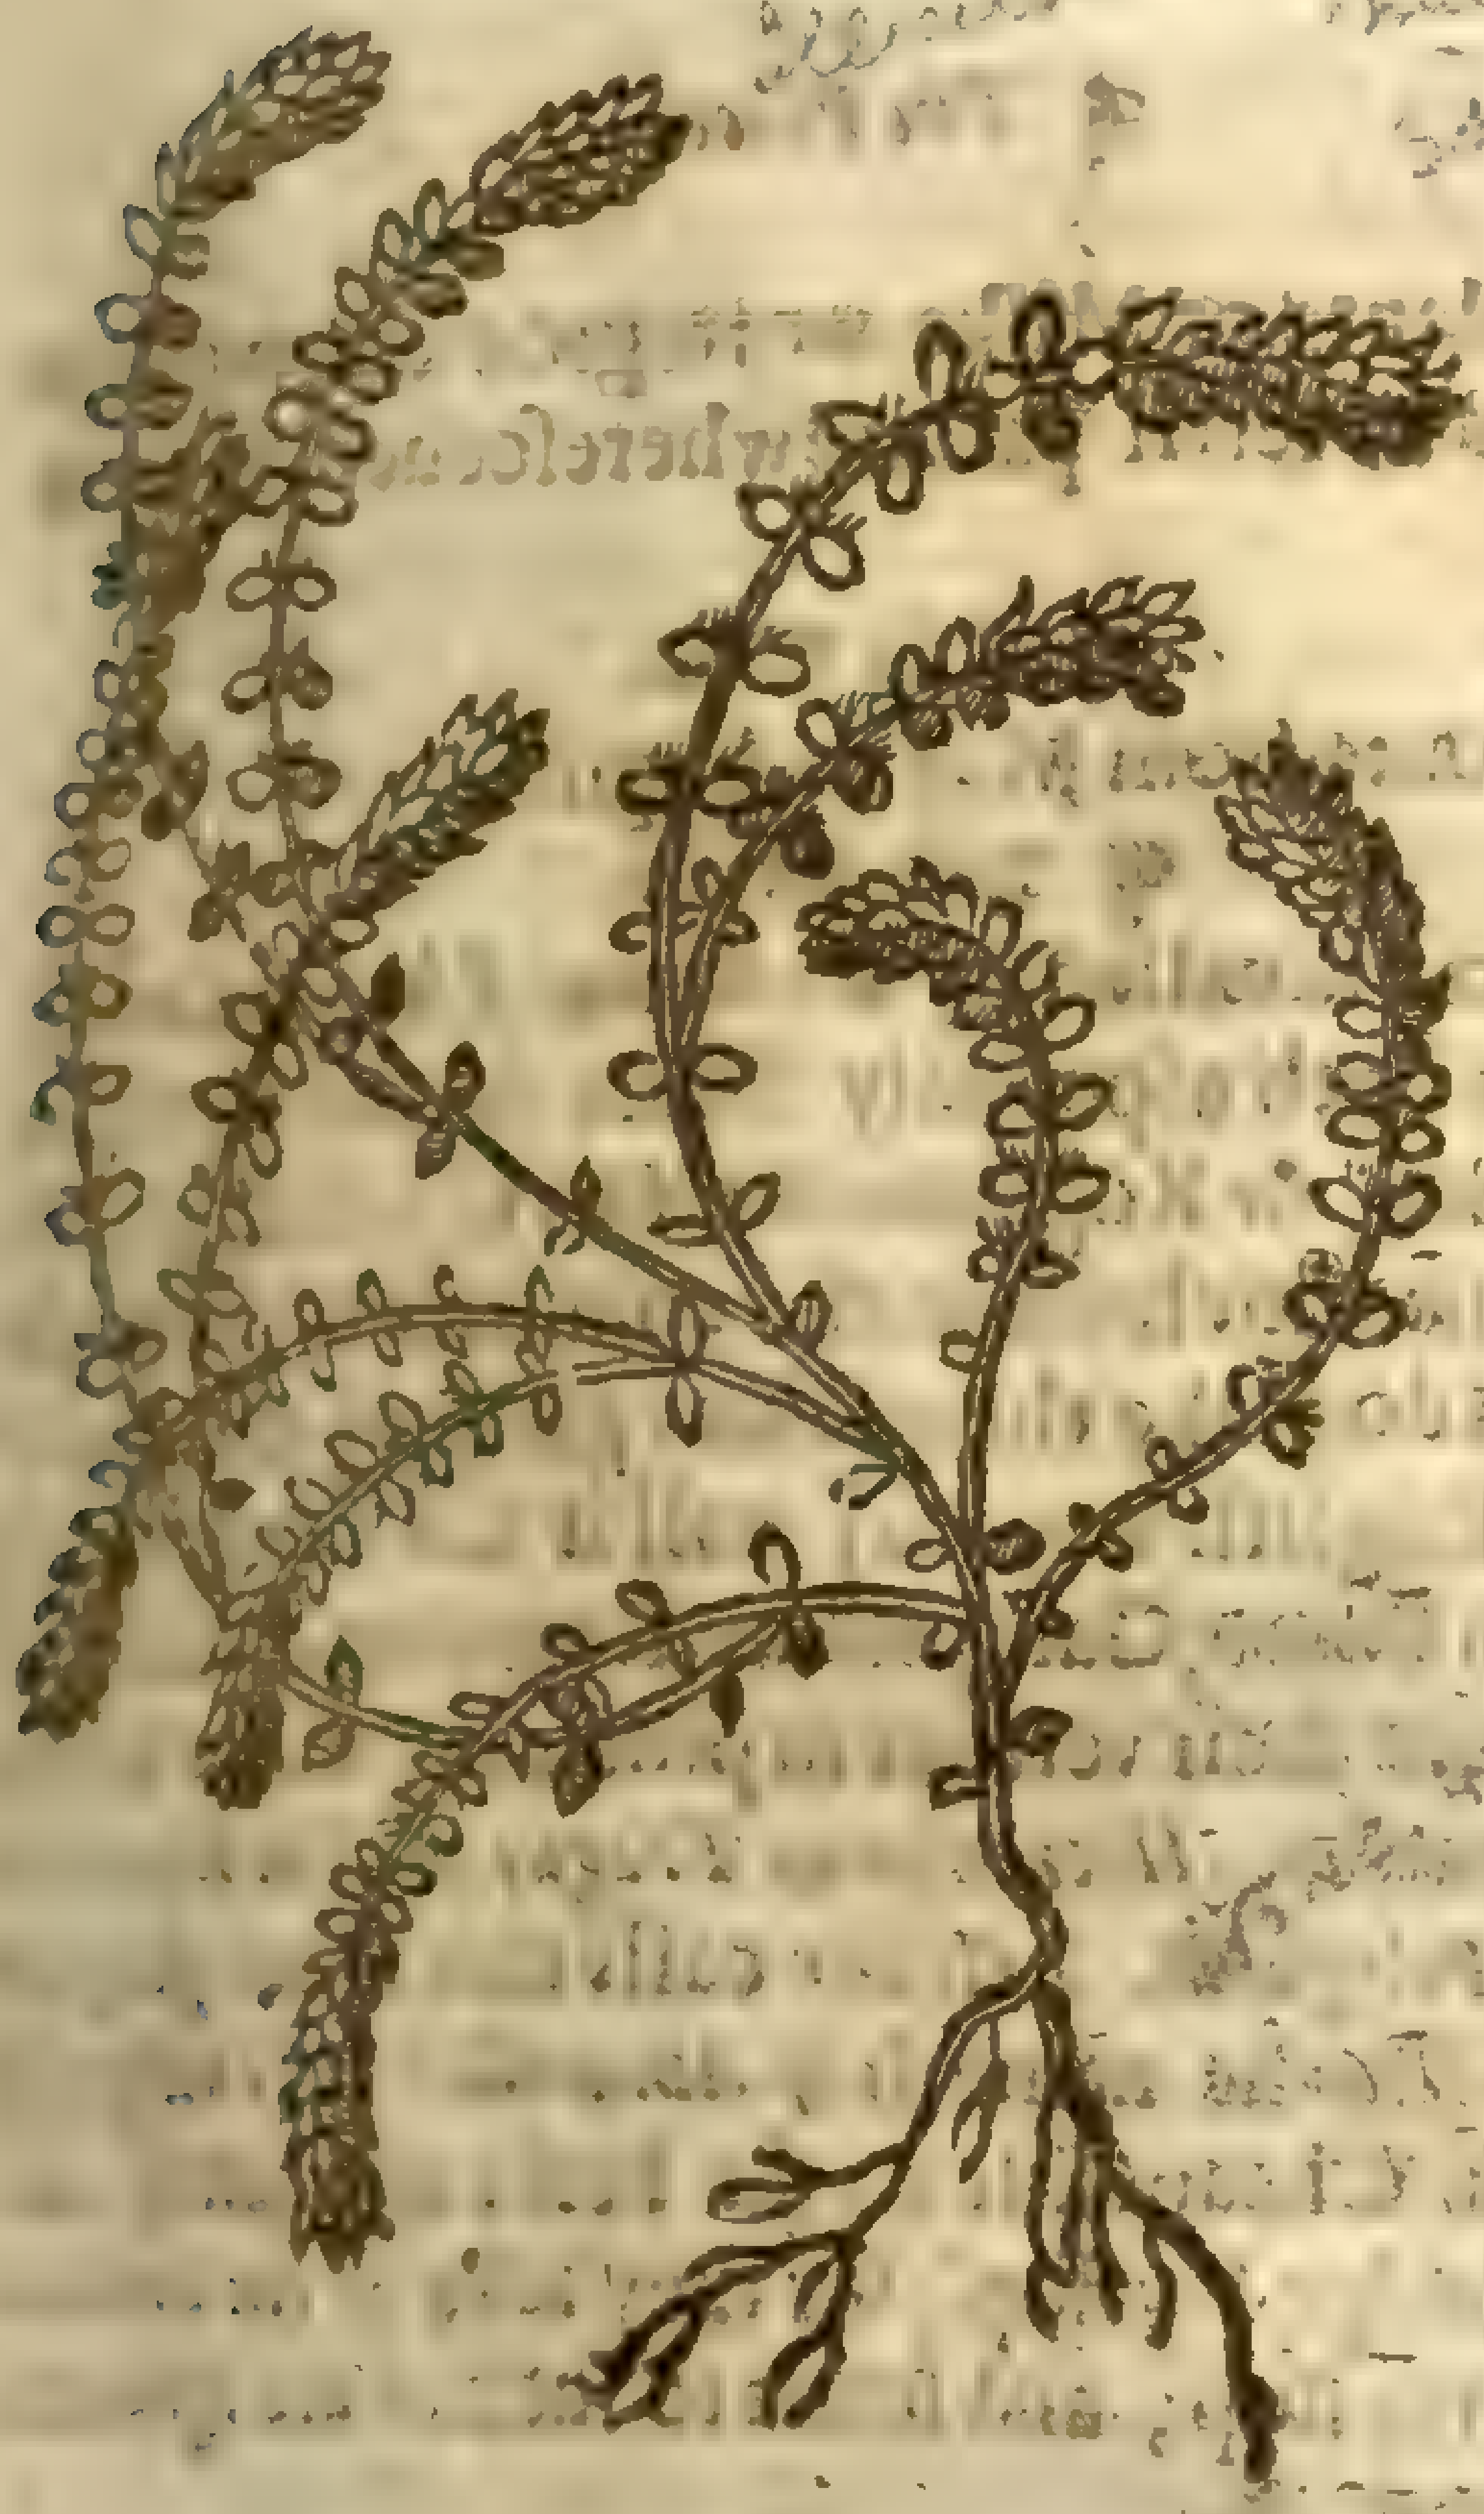
3 This third kinde of *Polygala* or Milkwort, hath leaues and ſtalkes like the laſt before mentioned, and differeth from it only herein, that this kinde hath ſmaller branches, and the leaues are not ſo thicke thruſt together, and the floures are like the other, but that they be of a red or purple colour.

4 The fourth kinde is like the laſt ſpoken of in euery reſpect, but that it hath white floures, otherwiſe it is very like.

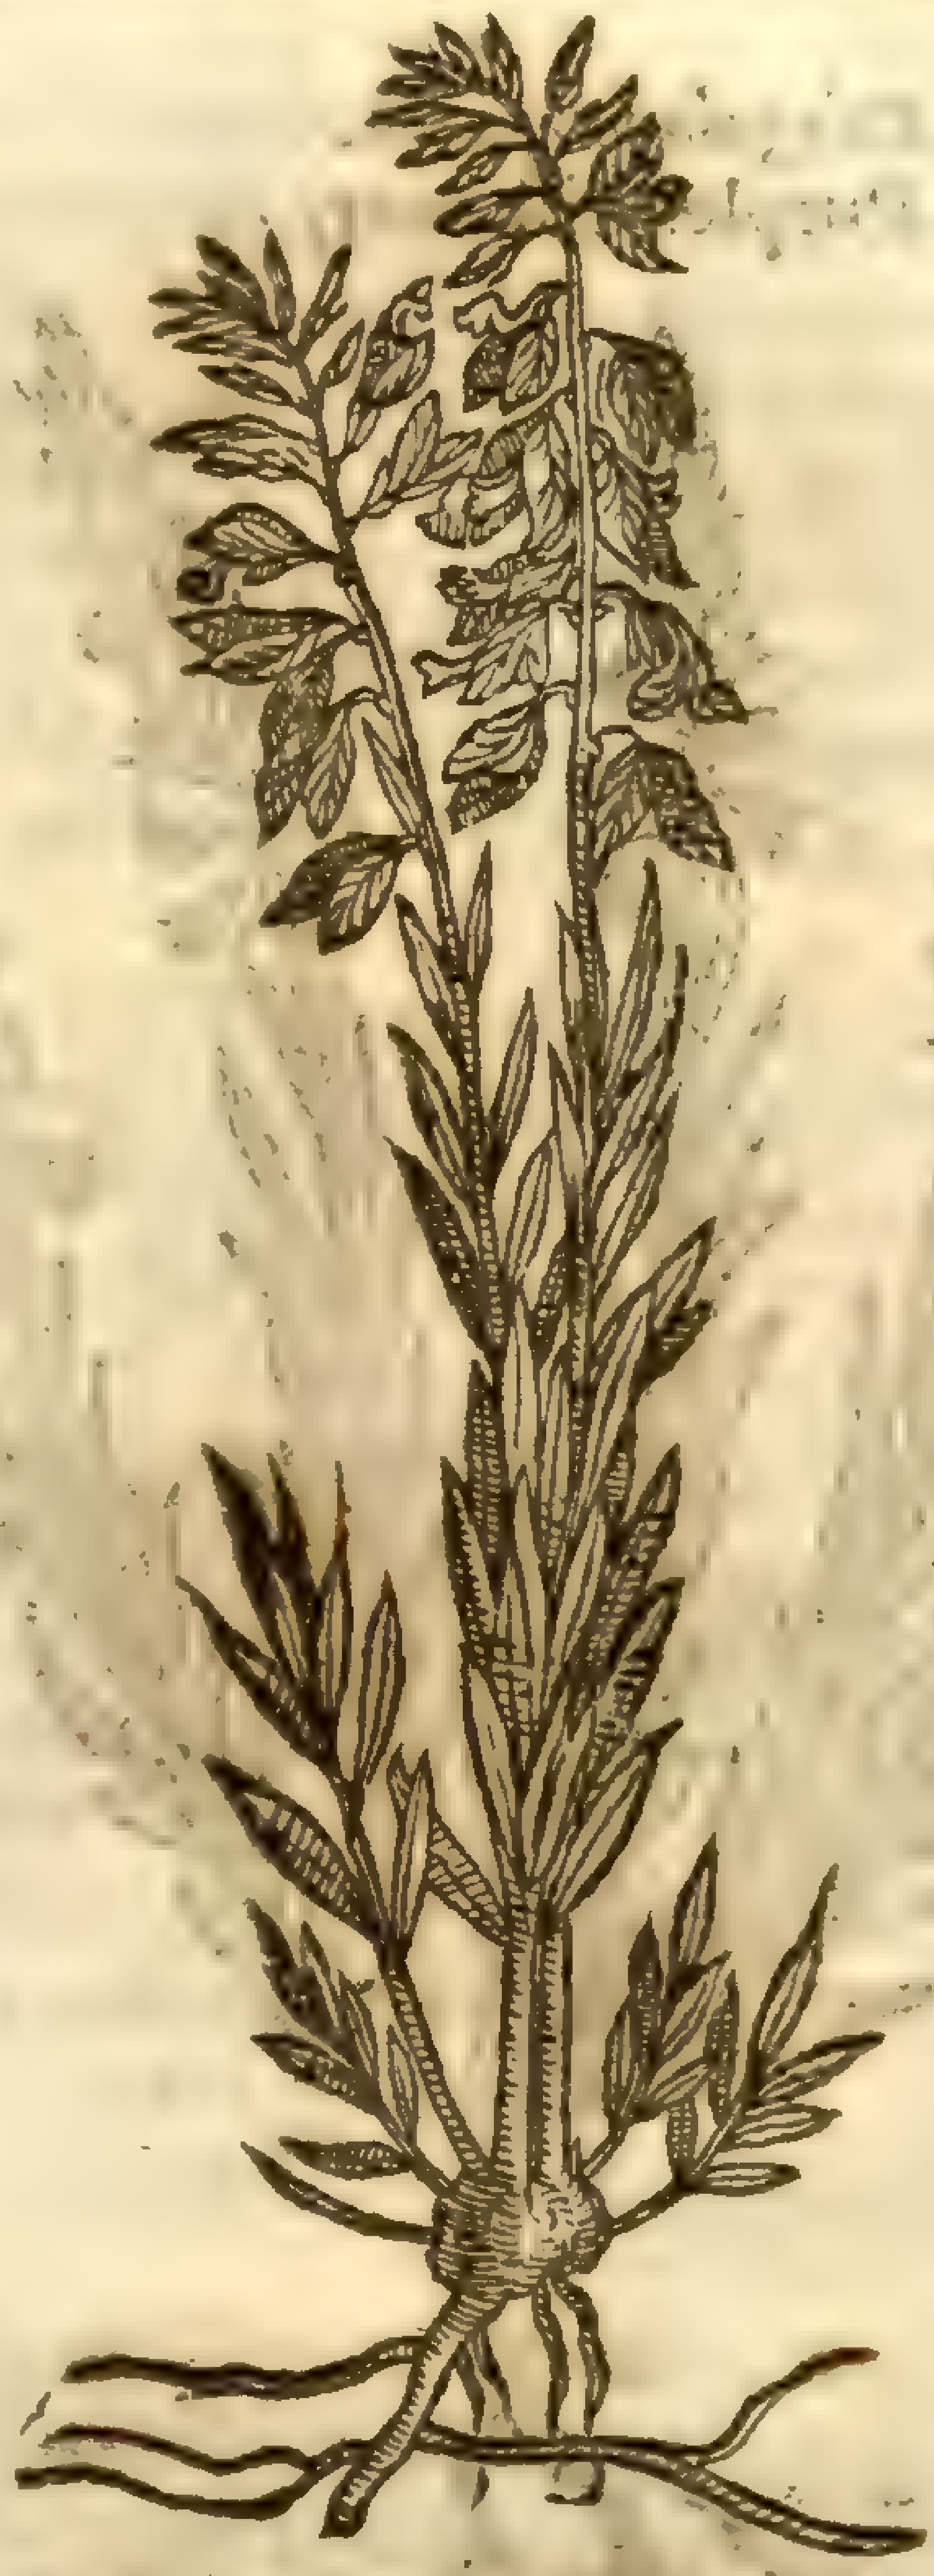
5 Purple Milkewort differeth from the others in the colour of the floures, it bringeth forth moe branches than the precedent, and the floures are of a purple colour, wherin eſpecially conſiſts the difference.

1 *Polygala repens.*
Creeping Milkwort.

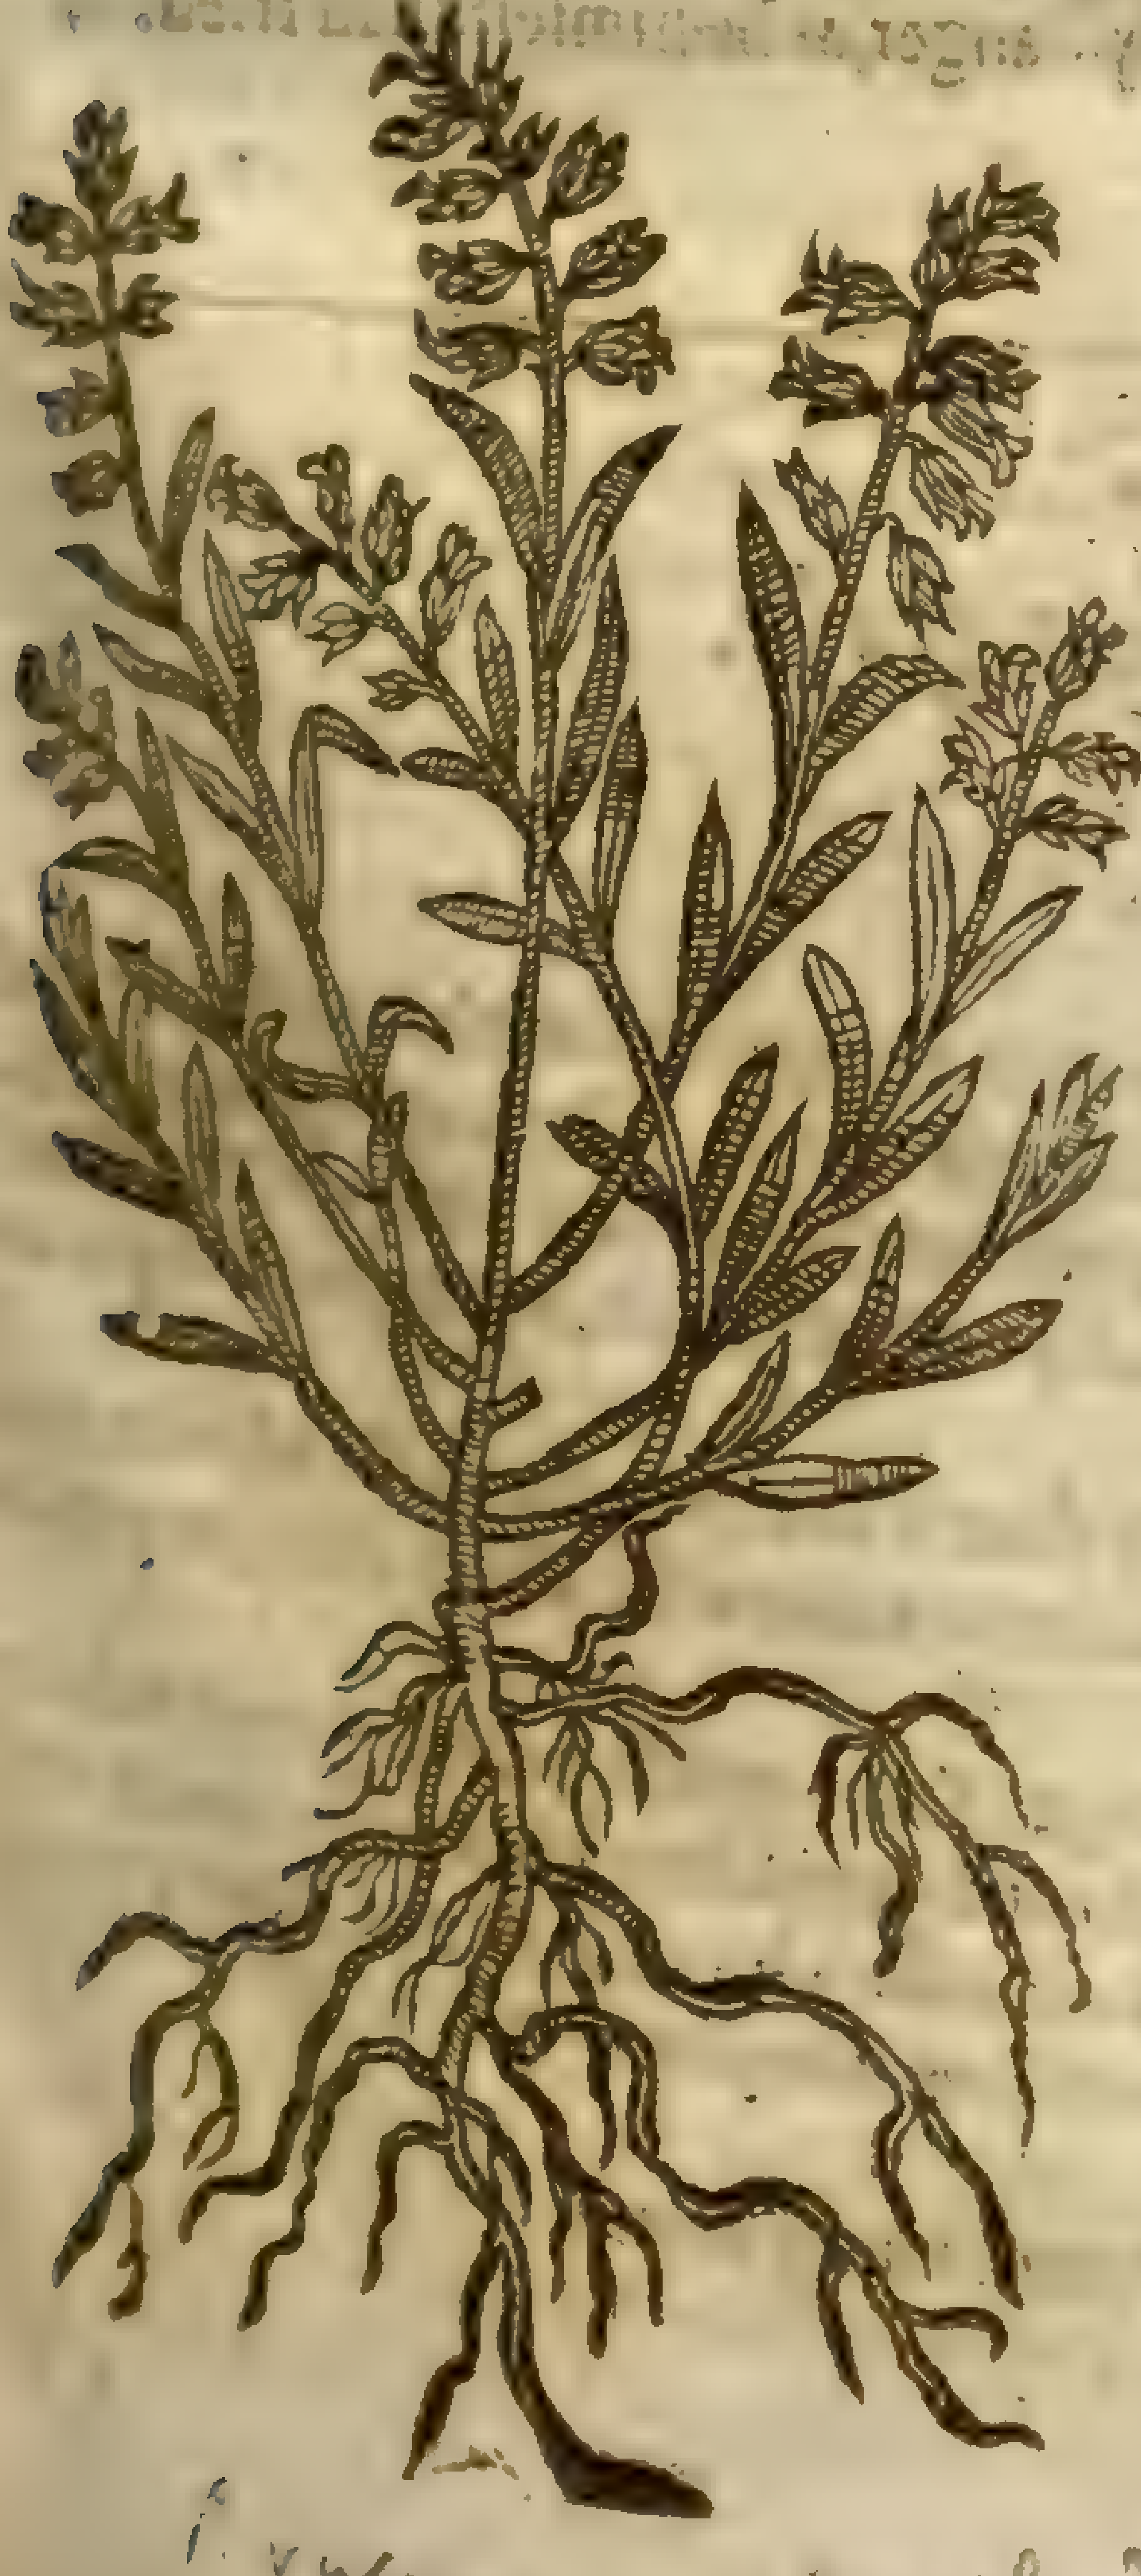
[illegible]



2 *Polygala flore cæruleo.*
Blew Milkewort.

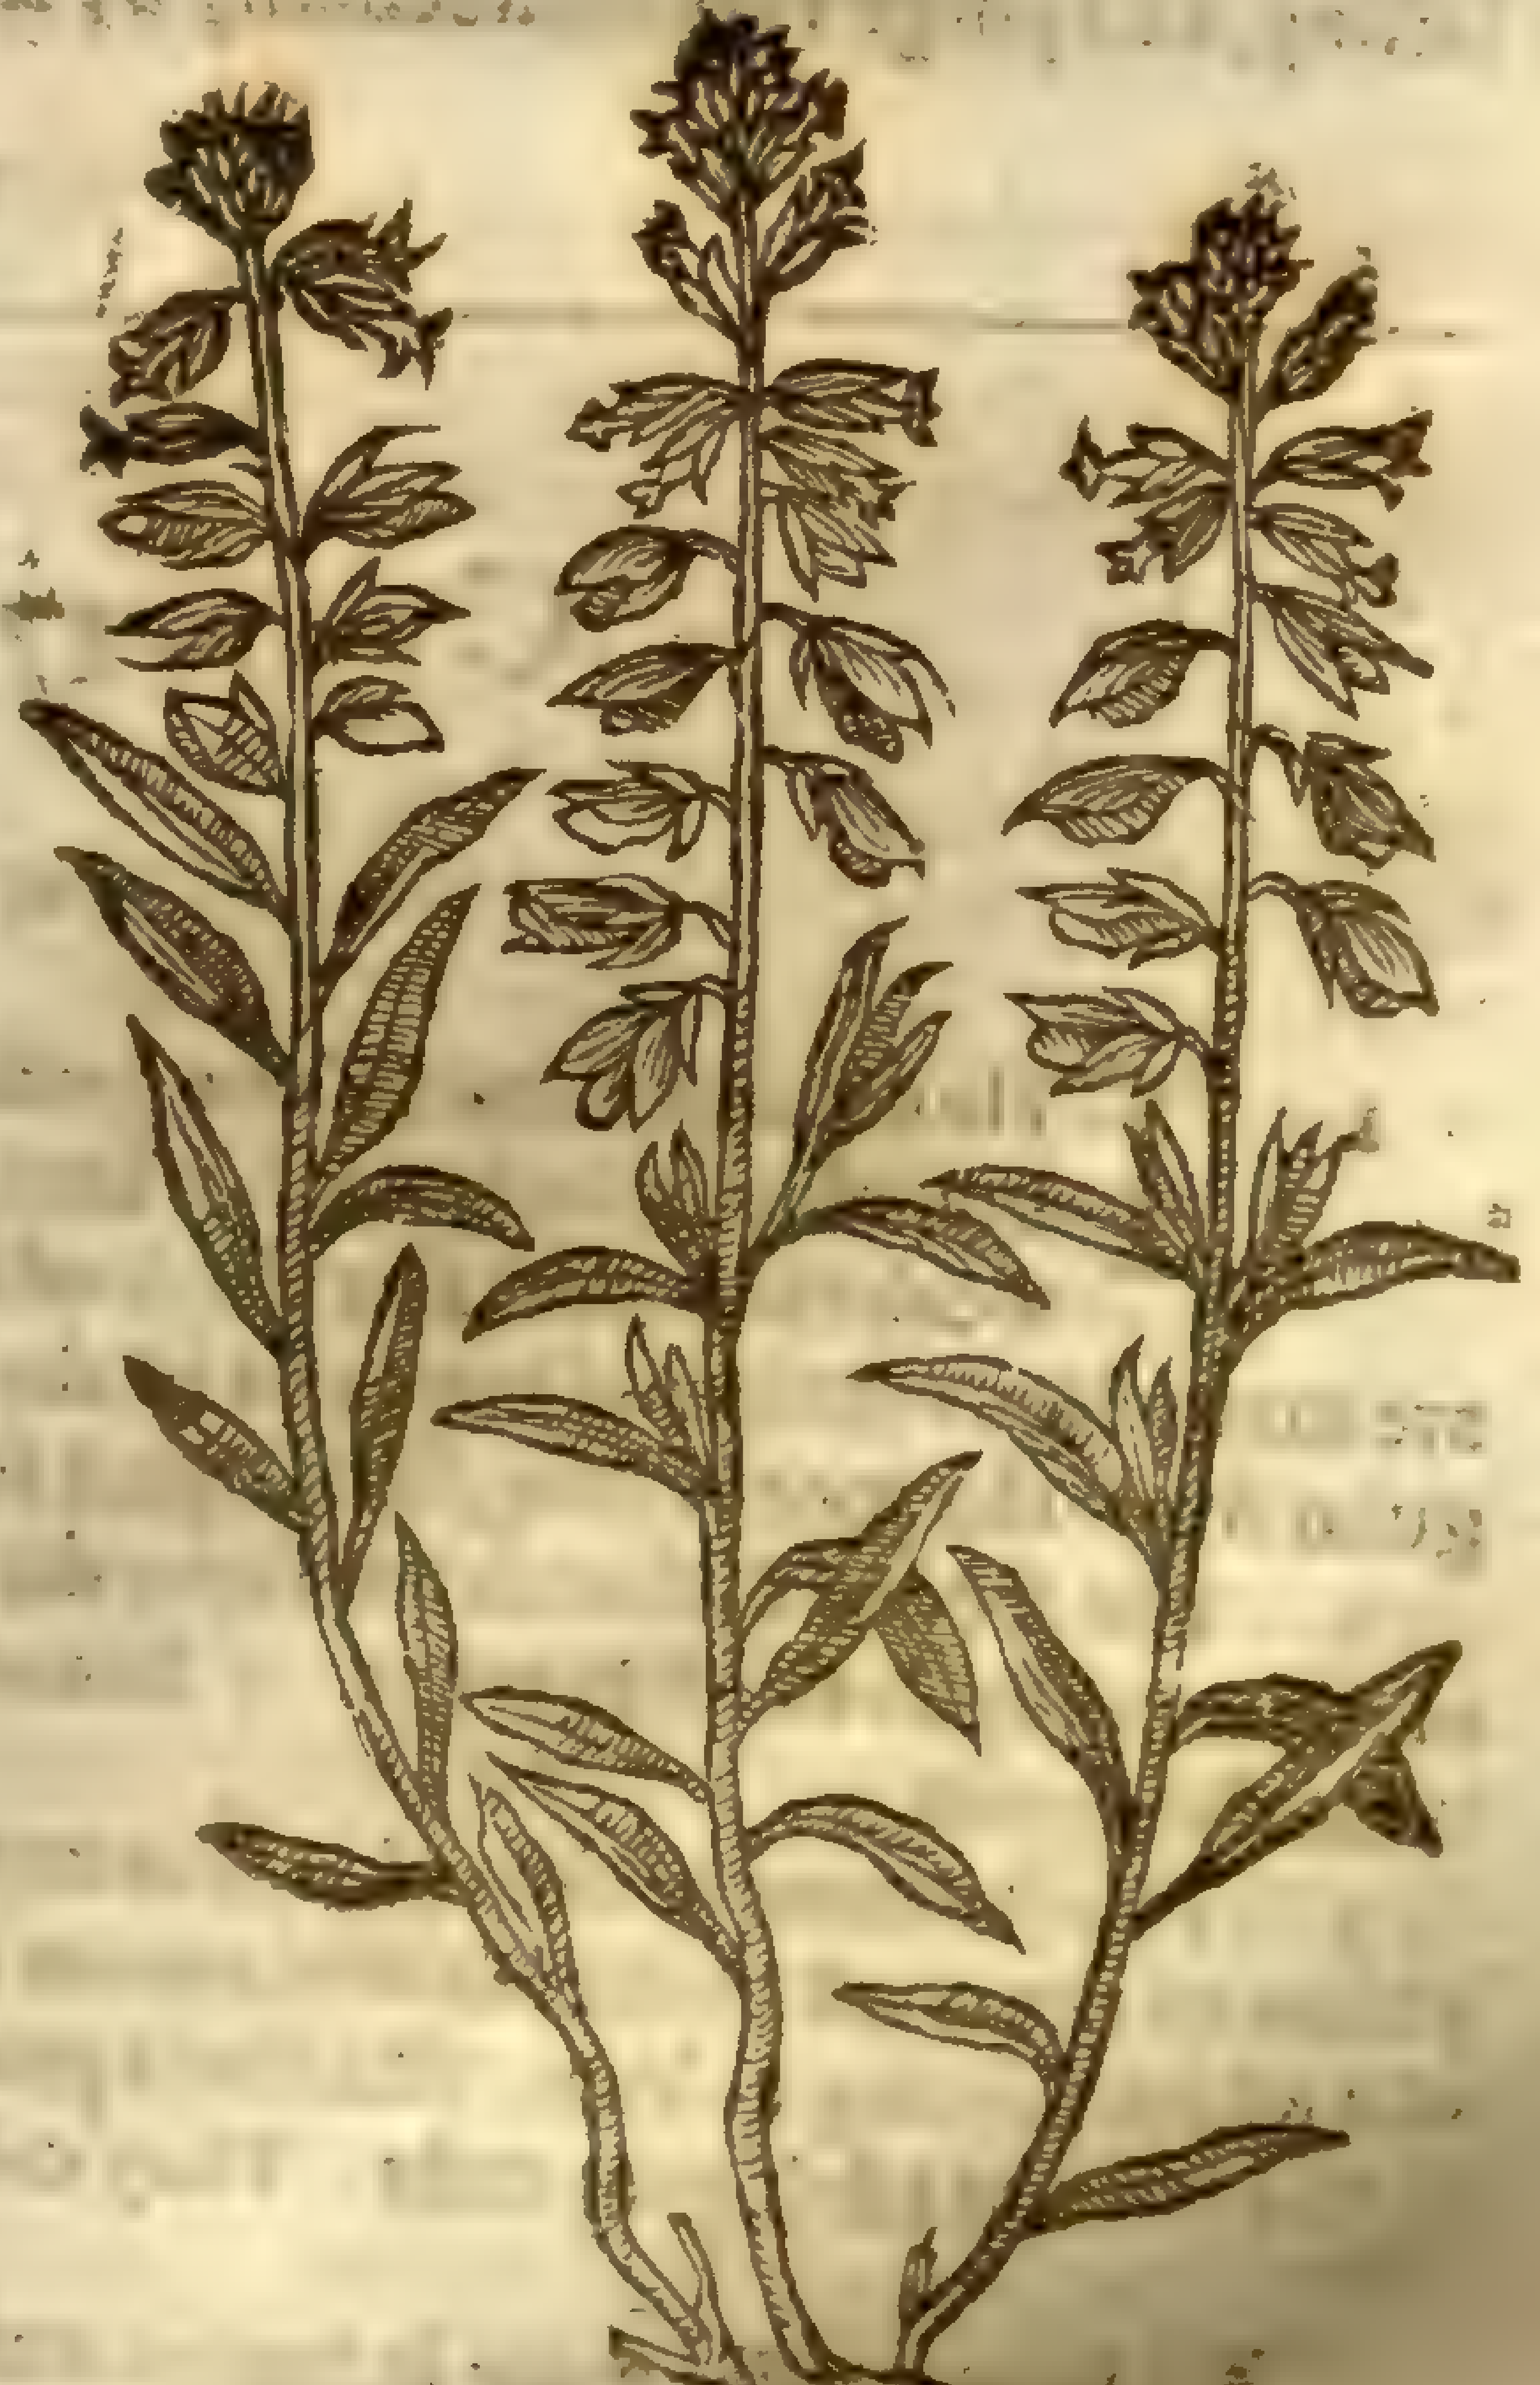


3 *Polygala rubris floribus.*
Red Milkwort.



P. vulgaris, L. Sm. fl. 3.258
Sm. Libr. 417

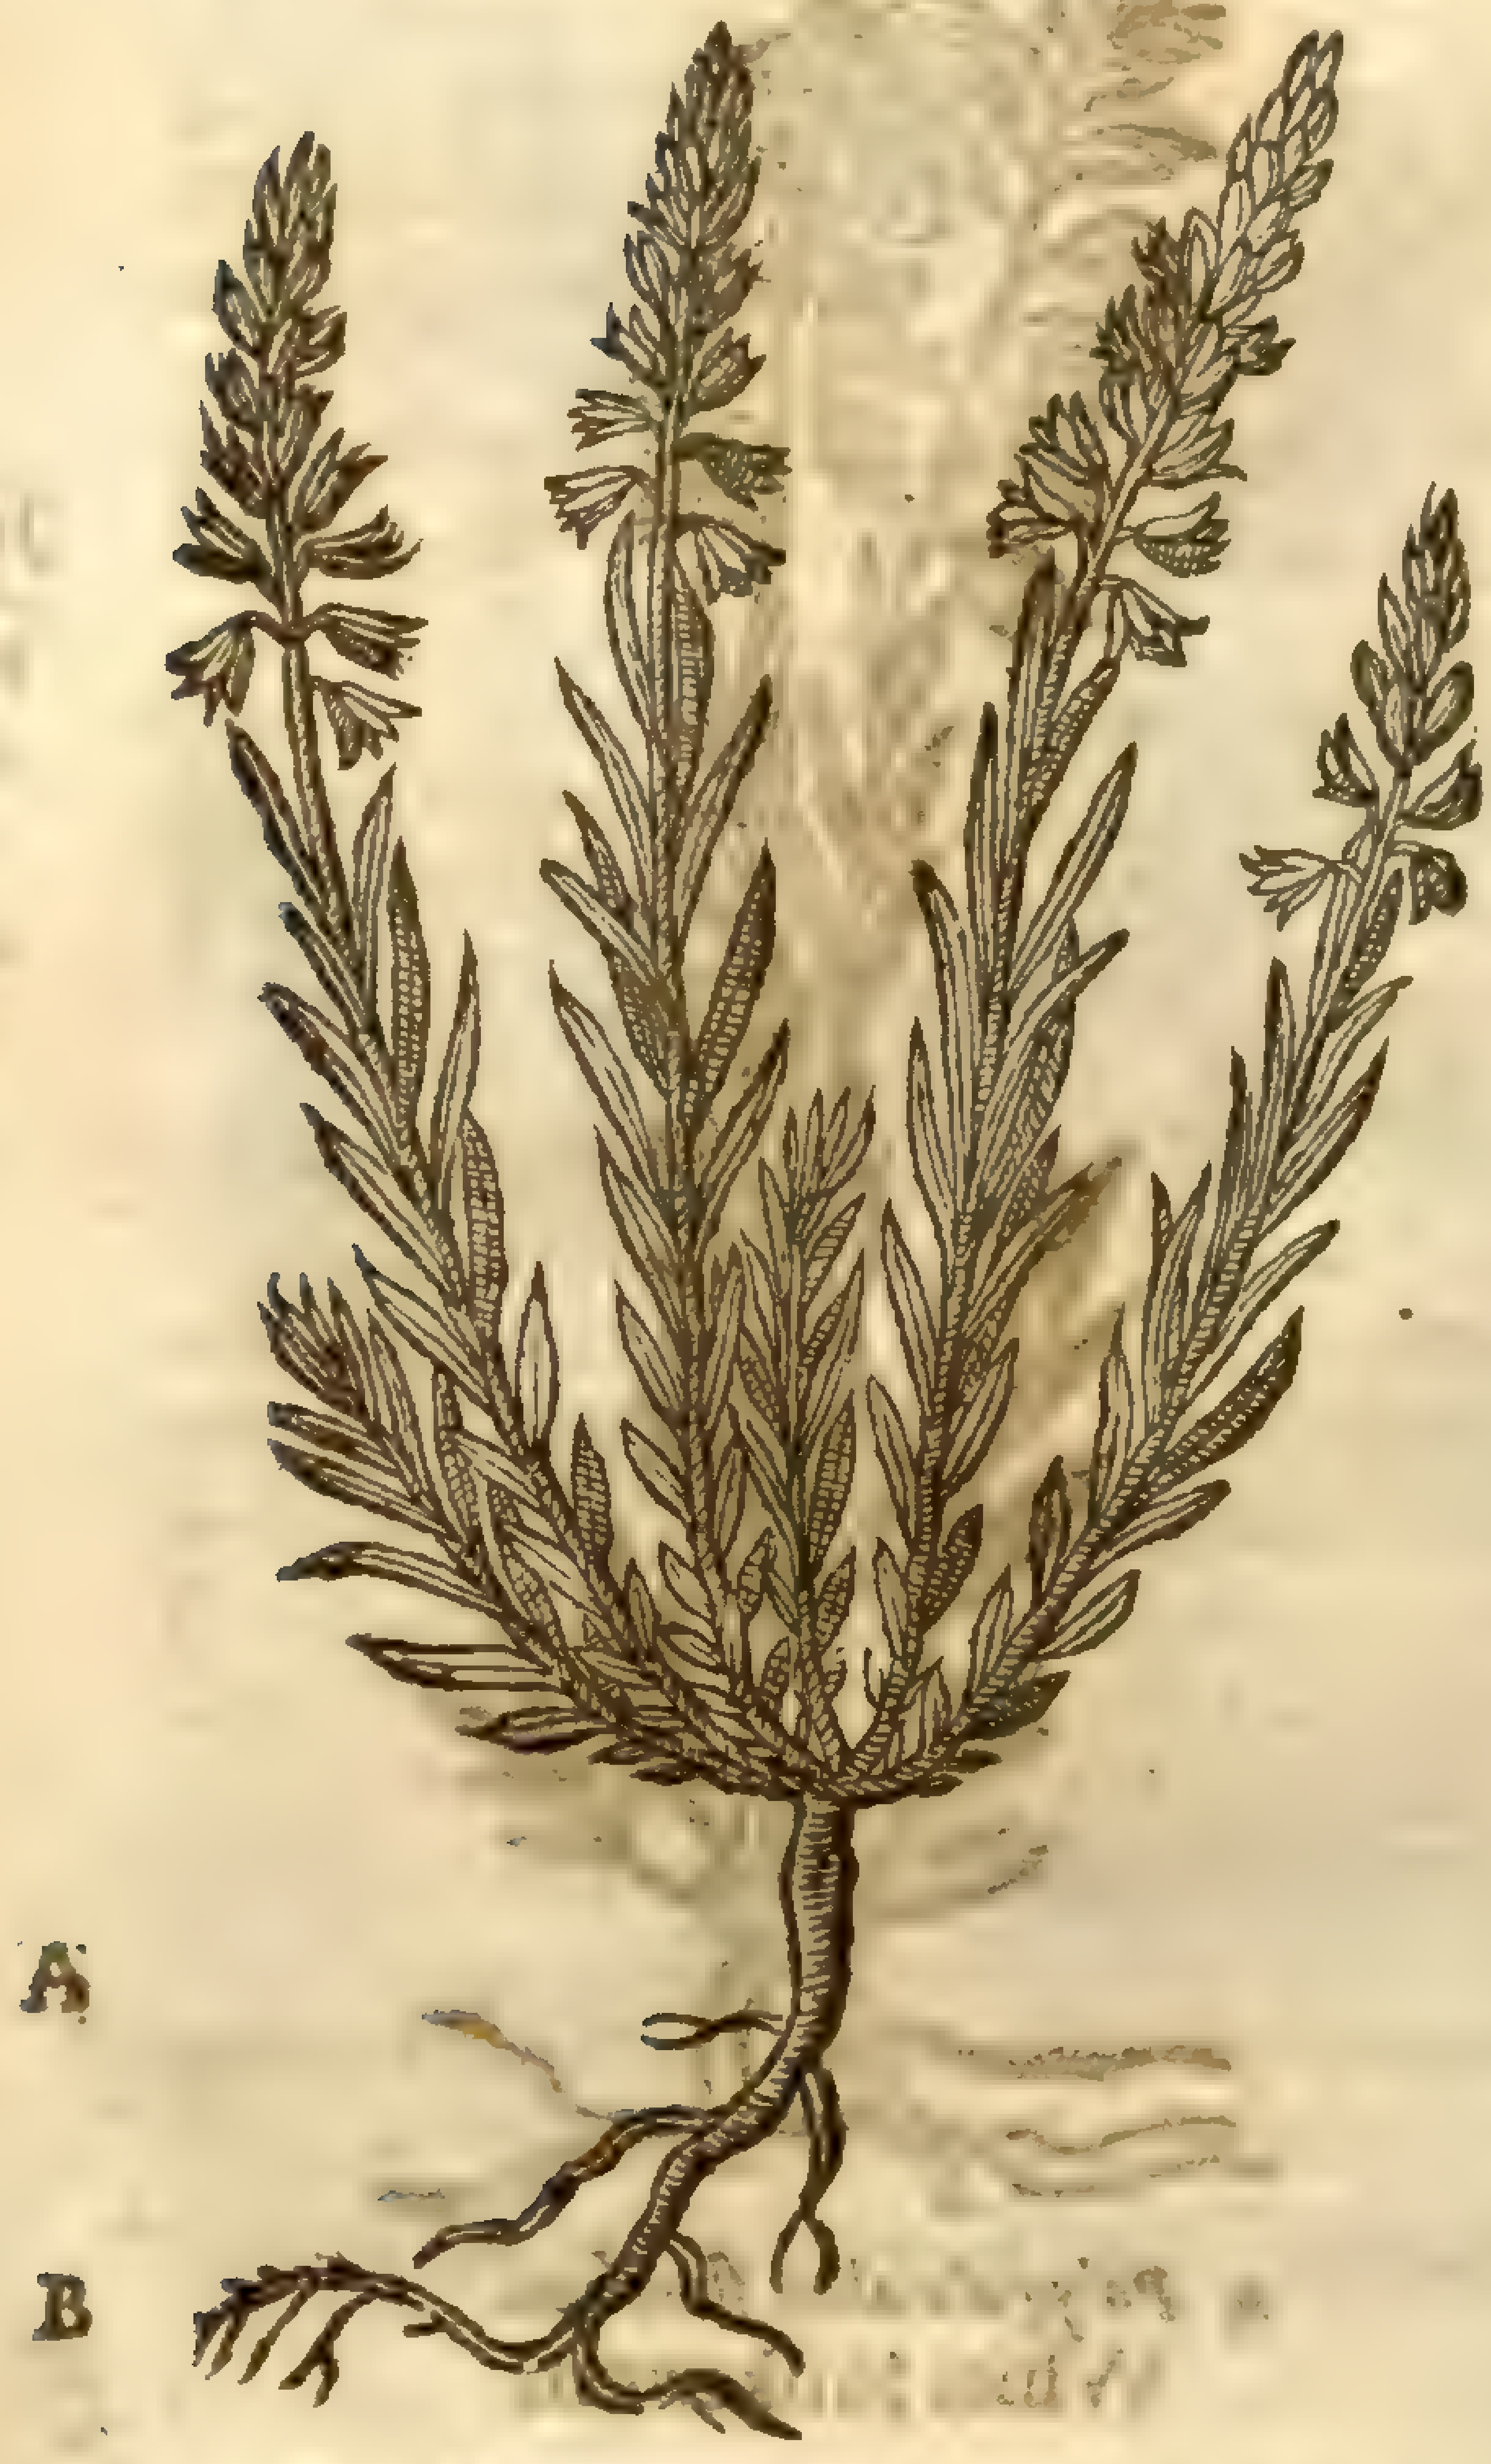
4 *Polygala albis floribus.*
White Milkewort.



P. vulgaris, L.
[illegible] 417

6 The ſixt Milkwort is like vnto the reſt in each reſpect, ſauing that the floures are of an ouer-worne ilfauored colour, which maketh it to differ from all the other of his kinde.

5 *Polygala purpurea.*
Purple Milkwort.



¶ *The Place.*

Theſe plants or Milke-worts grow commonly in euery wood or fertil paſture whereſoeuer I haue trauelled.

¶ *The Time.*

They floure from May to Auguſt.

¶ *The Names.*

Milkwort is called by *Dodonæus*, *Flos Ambarualis*, becauſe it doth eſpecially floure in the Croſſe or Gang weeke, or Rogation weeke: of which floures the maidens which vſe in the countries to walke the Proceſſion do make themſelues garlands and Noſegaies: in Engliſh wee may call it Croſſe-floure, or Proceſſion floure, Gang-floure, Rogation-floure, and Milkwort, of their vertues in procuring milke in the breſts of nurſes. *Hieronymus Tragus* as alſo *Dioſcorides* call it *Polygalon*. ‡ *Geſner* calls this *Crucis flos*; and in his Epiſtles he nameth it *Amarella*: it is vulgarly knowne in Cheapeſide to the herbe women by the name of hedge Hyſſop; for they take it for *Gratiola* or hedge Hyſſop, and ſell it to ſuch as are ignorant for the ſame. ‡

¶ *The Vertues.*

Galen, *Dioſcorides*, and *Theophraſtus* doe account theſe for Milke-woorts, and that they may without errour be vſed for thoſe purpoſes whereunto *Glaux* ſerueth.

‡ I doubt that this is not the *Polygalon* of *Dioſcorides*: for *Geſner* affirmes, That an handfull hereof ſteeped all night in wine, and drunk in the morning, faſting, will purge choler effectually by ſtoole without any danger, as he himſelfe had tried. ‡

Chap. 170. *Of Knot-graſſe.*

¶ *The Deſcription.*

1 THe common male Knot-graſſe creepes along vpon the ground, with long ſlender weak branches full of joints or knots, whereof it tooke his name. The leaues grow vpon the weake branches like thoſe of ſmall S. Iohns wort, but longer and narrower. The floures are maruellous little, and grow out of the knots, of an hearby colour; in their places come vp triangular ſeed: the root is long, ſlender, and full of ſtrings.

2 The ſecond differeth not from the former, but only that it is altogether leſſer, wherein eſpecially conſiſteth the difference. ‡ Becauſe the difference is no otherwiſe I haue thought good to omit the figure.

3 The Authors of the *Aduerſaria* mention another larger Knot-graſſe, which growes in diuers places of the coaſt of the Mediterranian ſea, hauing longer and larger branches and leaues, & thoſe of a white ſhining colour. The ſeeds grow at the joints in chaffie white husks, and the whole plant is of a ſalt and aſtringent taſte. They call it *Polygonum marinum maximum* ‡

¶ *The Place.*

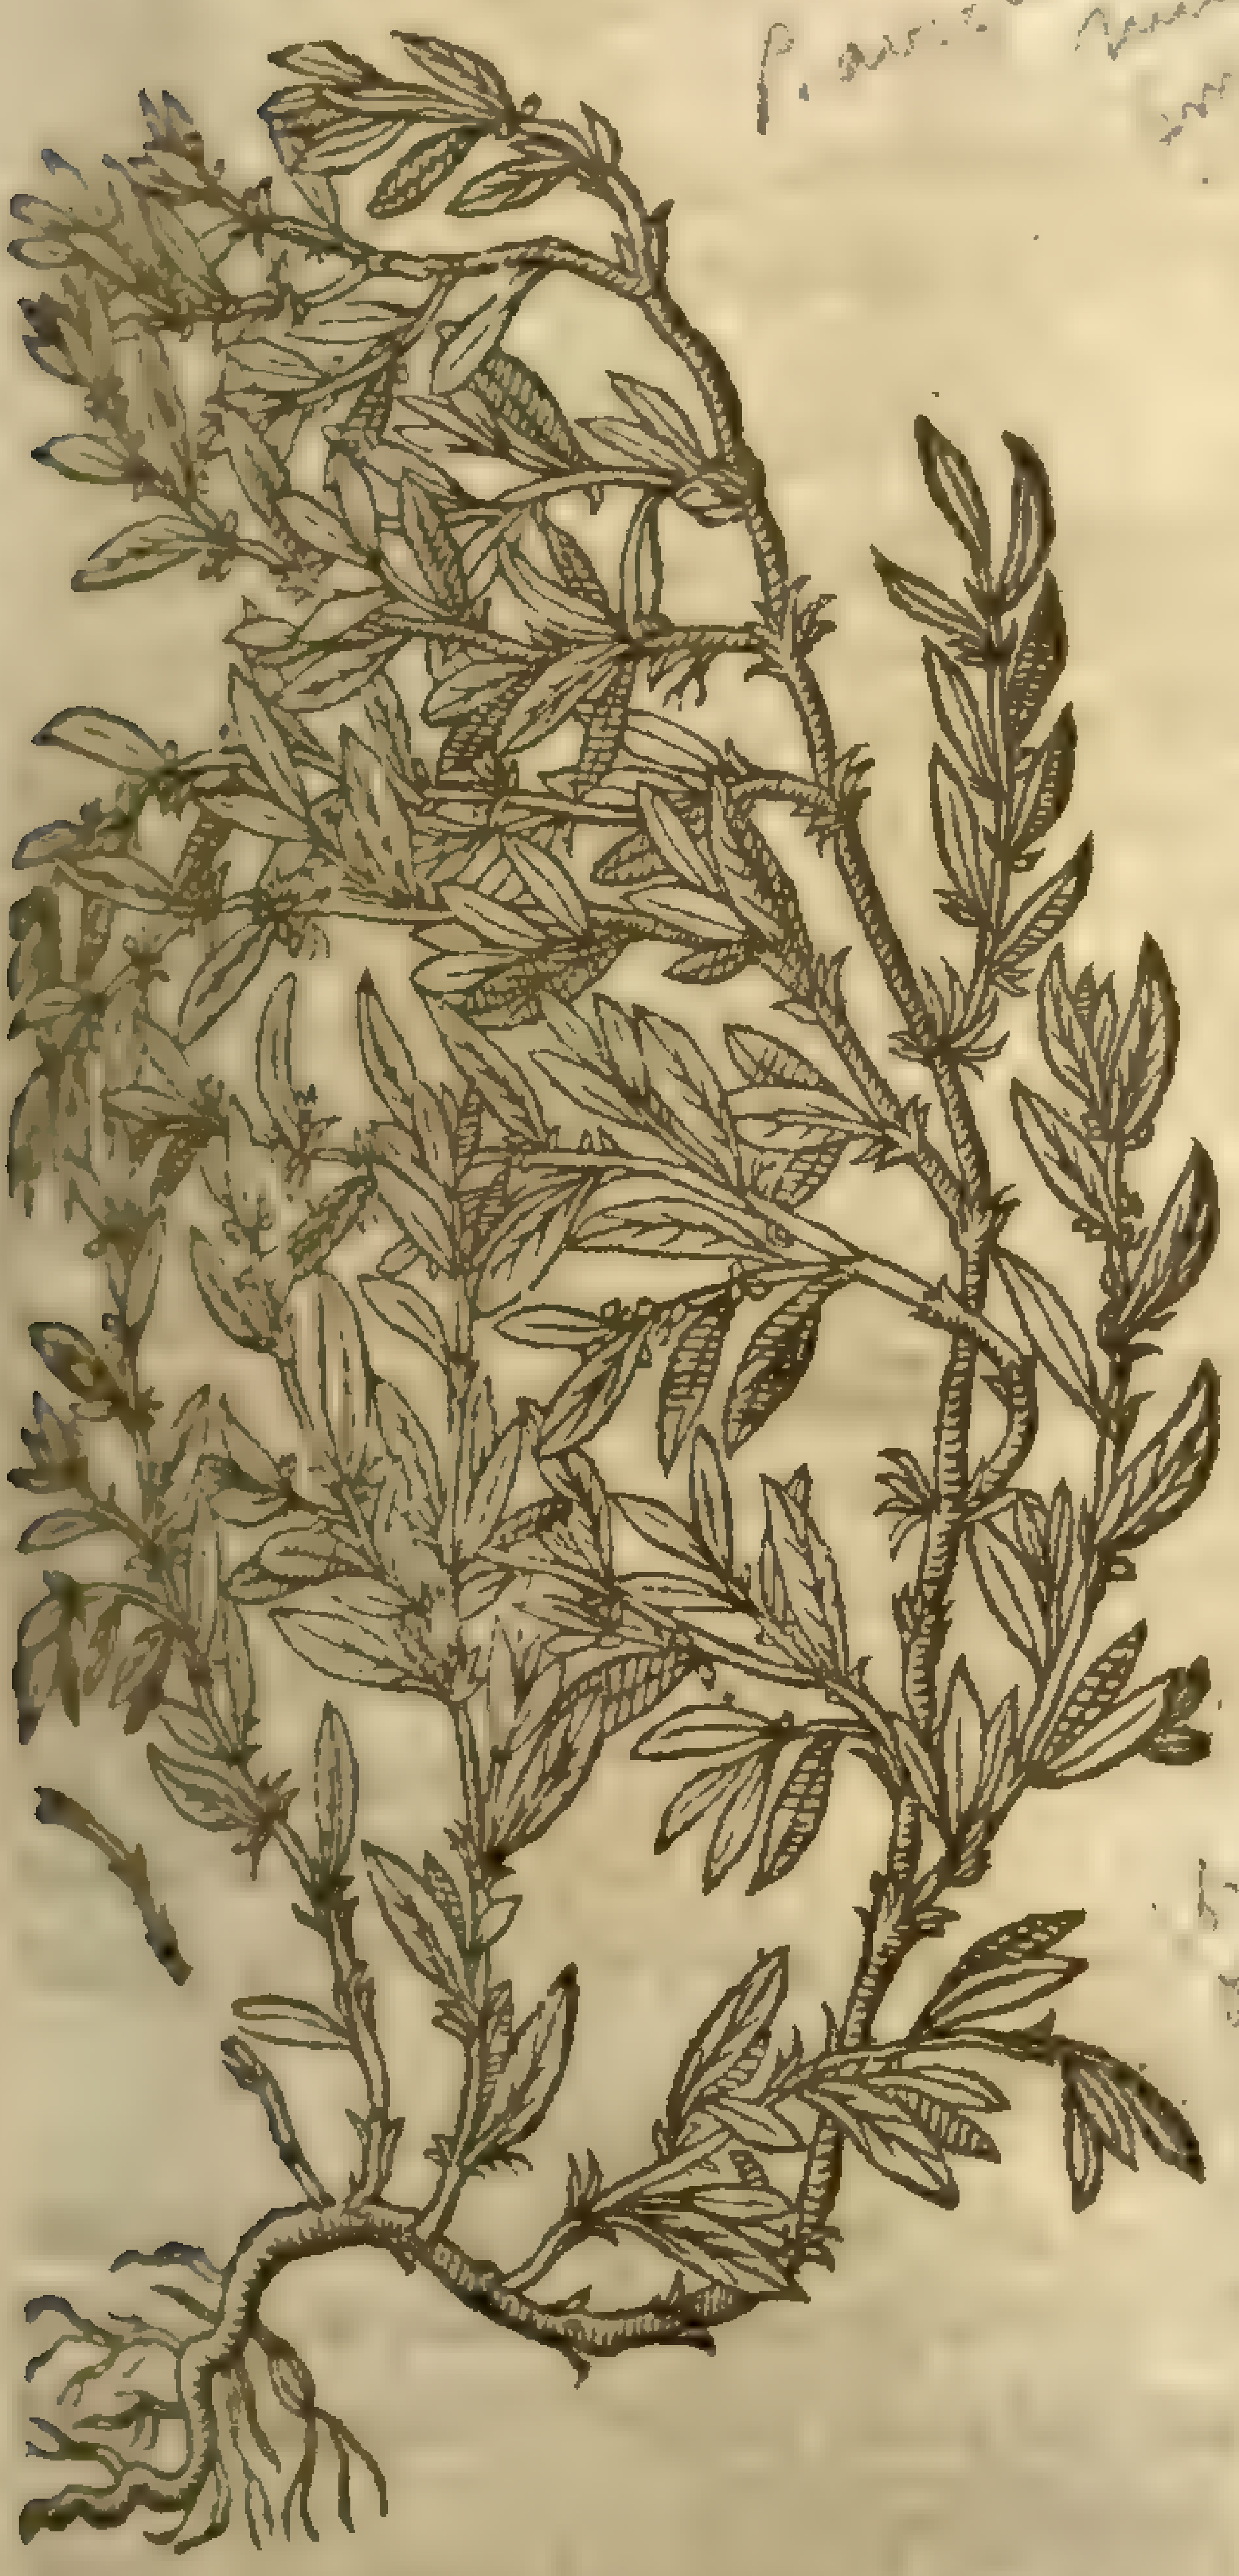
Theſe Knot-graſſes grow in barren and ſtony places almoſt euery where.

¶ *The Time.*

They are in floure and ſeed all the Summer long.

1 *Polygonum mas vulgare.*
Common Knot-graſſe.

P. aviculare [illegible]



¶ *The Names.*

Knot-graſſe is called in Greeke, πολύγονον ἄῤῥεν: that is to ſay, *Polygonum mas*, or male Knot-graſſe: in Latine, *Seminalis, Sanguinaria*: of *Columella, Sanguinalis*: in ſhops, *Centumnoda*, and *Corrigiola*: of *Apuleius, Proſerpinaca*: in high-Dutch, **Moagdꝛyt**: in low-Dutch, **Verkens gras**, & **Duiſent knop**: in Italian, *Polygono*: in Spaniſh, *Carriola*: in French *Renovee*: in Wallon, *Mariolaine de Cure*: in Engliſh Knot-graſſe, and Swines graſſe: in the North, Birds tongue.

¶ *The Temperature.*

Knot-graſſe, as *Galen* teacheth, is of a binding qualitie, yet is it cold in the ſecond if not in the beginning of the third degree.

¶ *The Vertues.*

The juice of Knot-graſſe is good againſt the ſpitting of bloud, the piſſing of bloud, and al other iſſues or fluxes of bloud, as *Braſauolus* reporteth: and *Camerarius* ſaith he hath cured many with the juice thereof, that haue vomited bloud, giuen in a little ſtiptick wine. It greatly preuaileth againſt the Gonorrhæa or running of the reines, and the weakeneſſe of the back comming by means thereof, being ſhred and made in a tanſie with eggs, and eaten. A

The decoction of it cureth the diſeaſe aforeſaid in as ample manner as the juice: or giuen in pouder in a reare egge it helpeth the backe very much. B

The herbe boiled in wine and honey cureth the vlcers and inflammations of the ſecret parts of man or woman, adding thereto a little allom, and the parts waſhed therewith. C

Dioſcorides ſaith that it prouoketh vrine, and helpeth ſuch as do piſſe drop after drop, when the vrine is hot and ſharp. D

It is giuen vnto Swine with good ſucceſſe, when they are ſicke and will not eat their meat: whervpon country people do call it Swines graſſe, or Swines skir. E

Chap. 171.

Of ſundry ſorts of Knot-graſſes.

¶ *The Deſcription.*

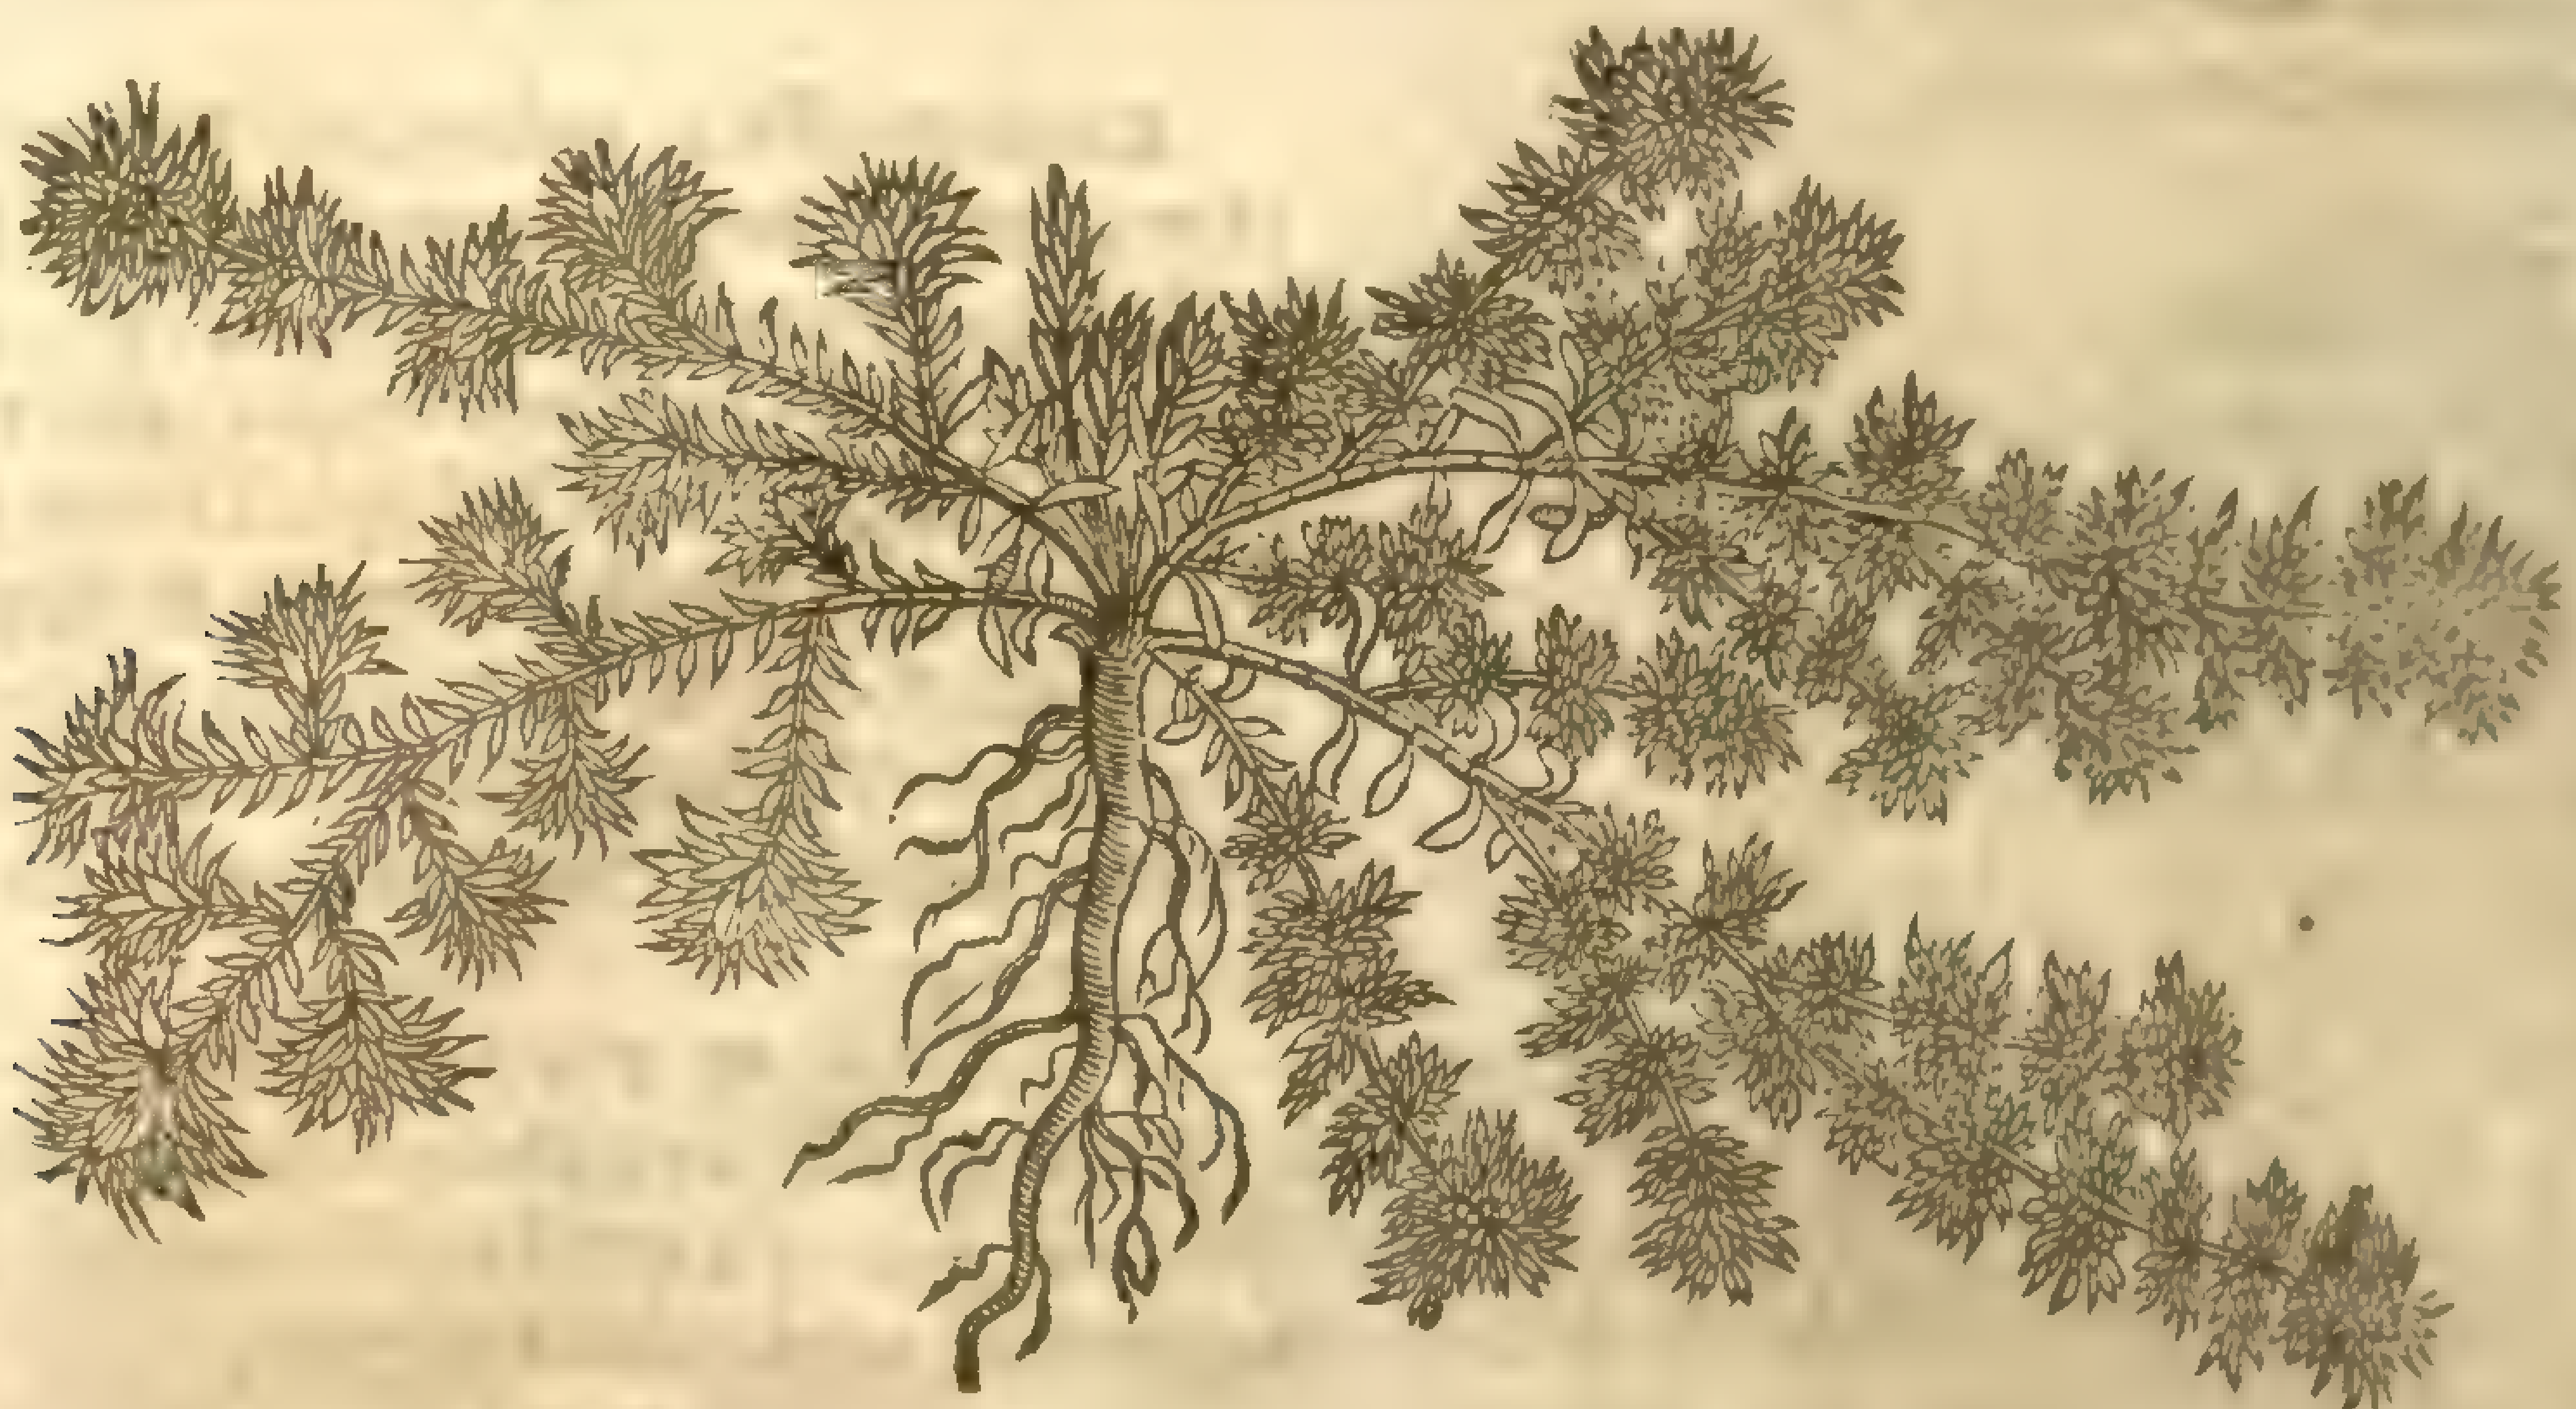
1 The ſnowy white and leaſt kinde of *Polygonum* or Knot-graſſe, called of *Cluſius, Paronychia Hiſpanica*, is a ſtrange and worthy plant to behold, handle, and conſider, although it be but ſmall. It is ſeldome aboue a foot long, hauing ſmall branches, thick, rough, hard, and full of joints; out of which the leaues come forth like ſmal teeth, leſſe than the leaues of *Her-* *aria*, or *Thymum tenuifolium*. At the top of the ſtalks ſtand moſt delicate floures, framed by nature as it were with fine parchment leaues about them, ſtanding in their ſingular whiteneſſe and ſnowie colour, reſembling the perfect white ſilke, ſo many in number at the top, and ſo thicke, that they uerſhadow the reſt of the plant beneath. The root is ſlender and of a wooddy ſubſtance: the ſeed s couered as it were with chaffe, and is as ſmall as duſt or the motes in the ſun.

2 *Anthyllis* of Valentia being likewiſe a kind of Knot-graſſe, hath ſmall leaues like *Glaux exi-* *gua*, or rather like *Chamæſyce*, ſet orderly by couples at the joints: among which come floures con- ſiſting of foure little whitiſh purple leaues, and other ſmall leaues like the firſt, but altogether leſ- ſer. The root is ſmall, blacke, and long, and of a wooddy ſubſtance.

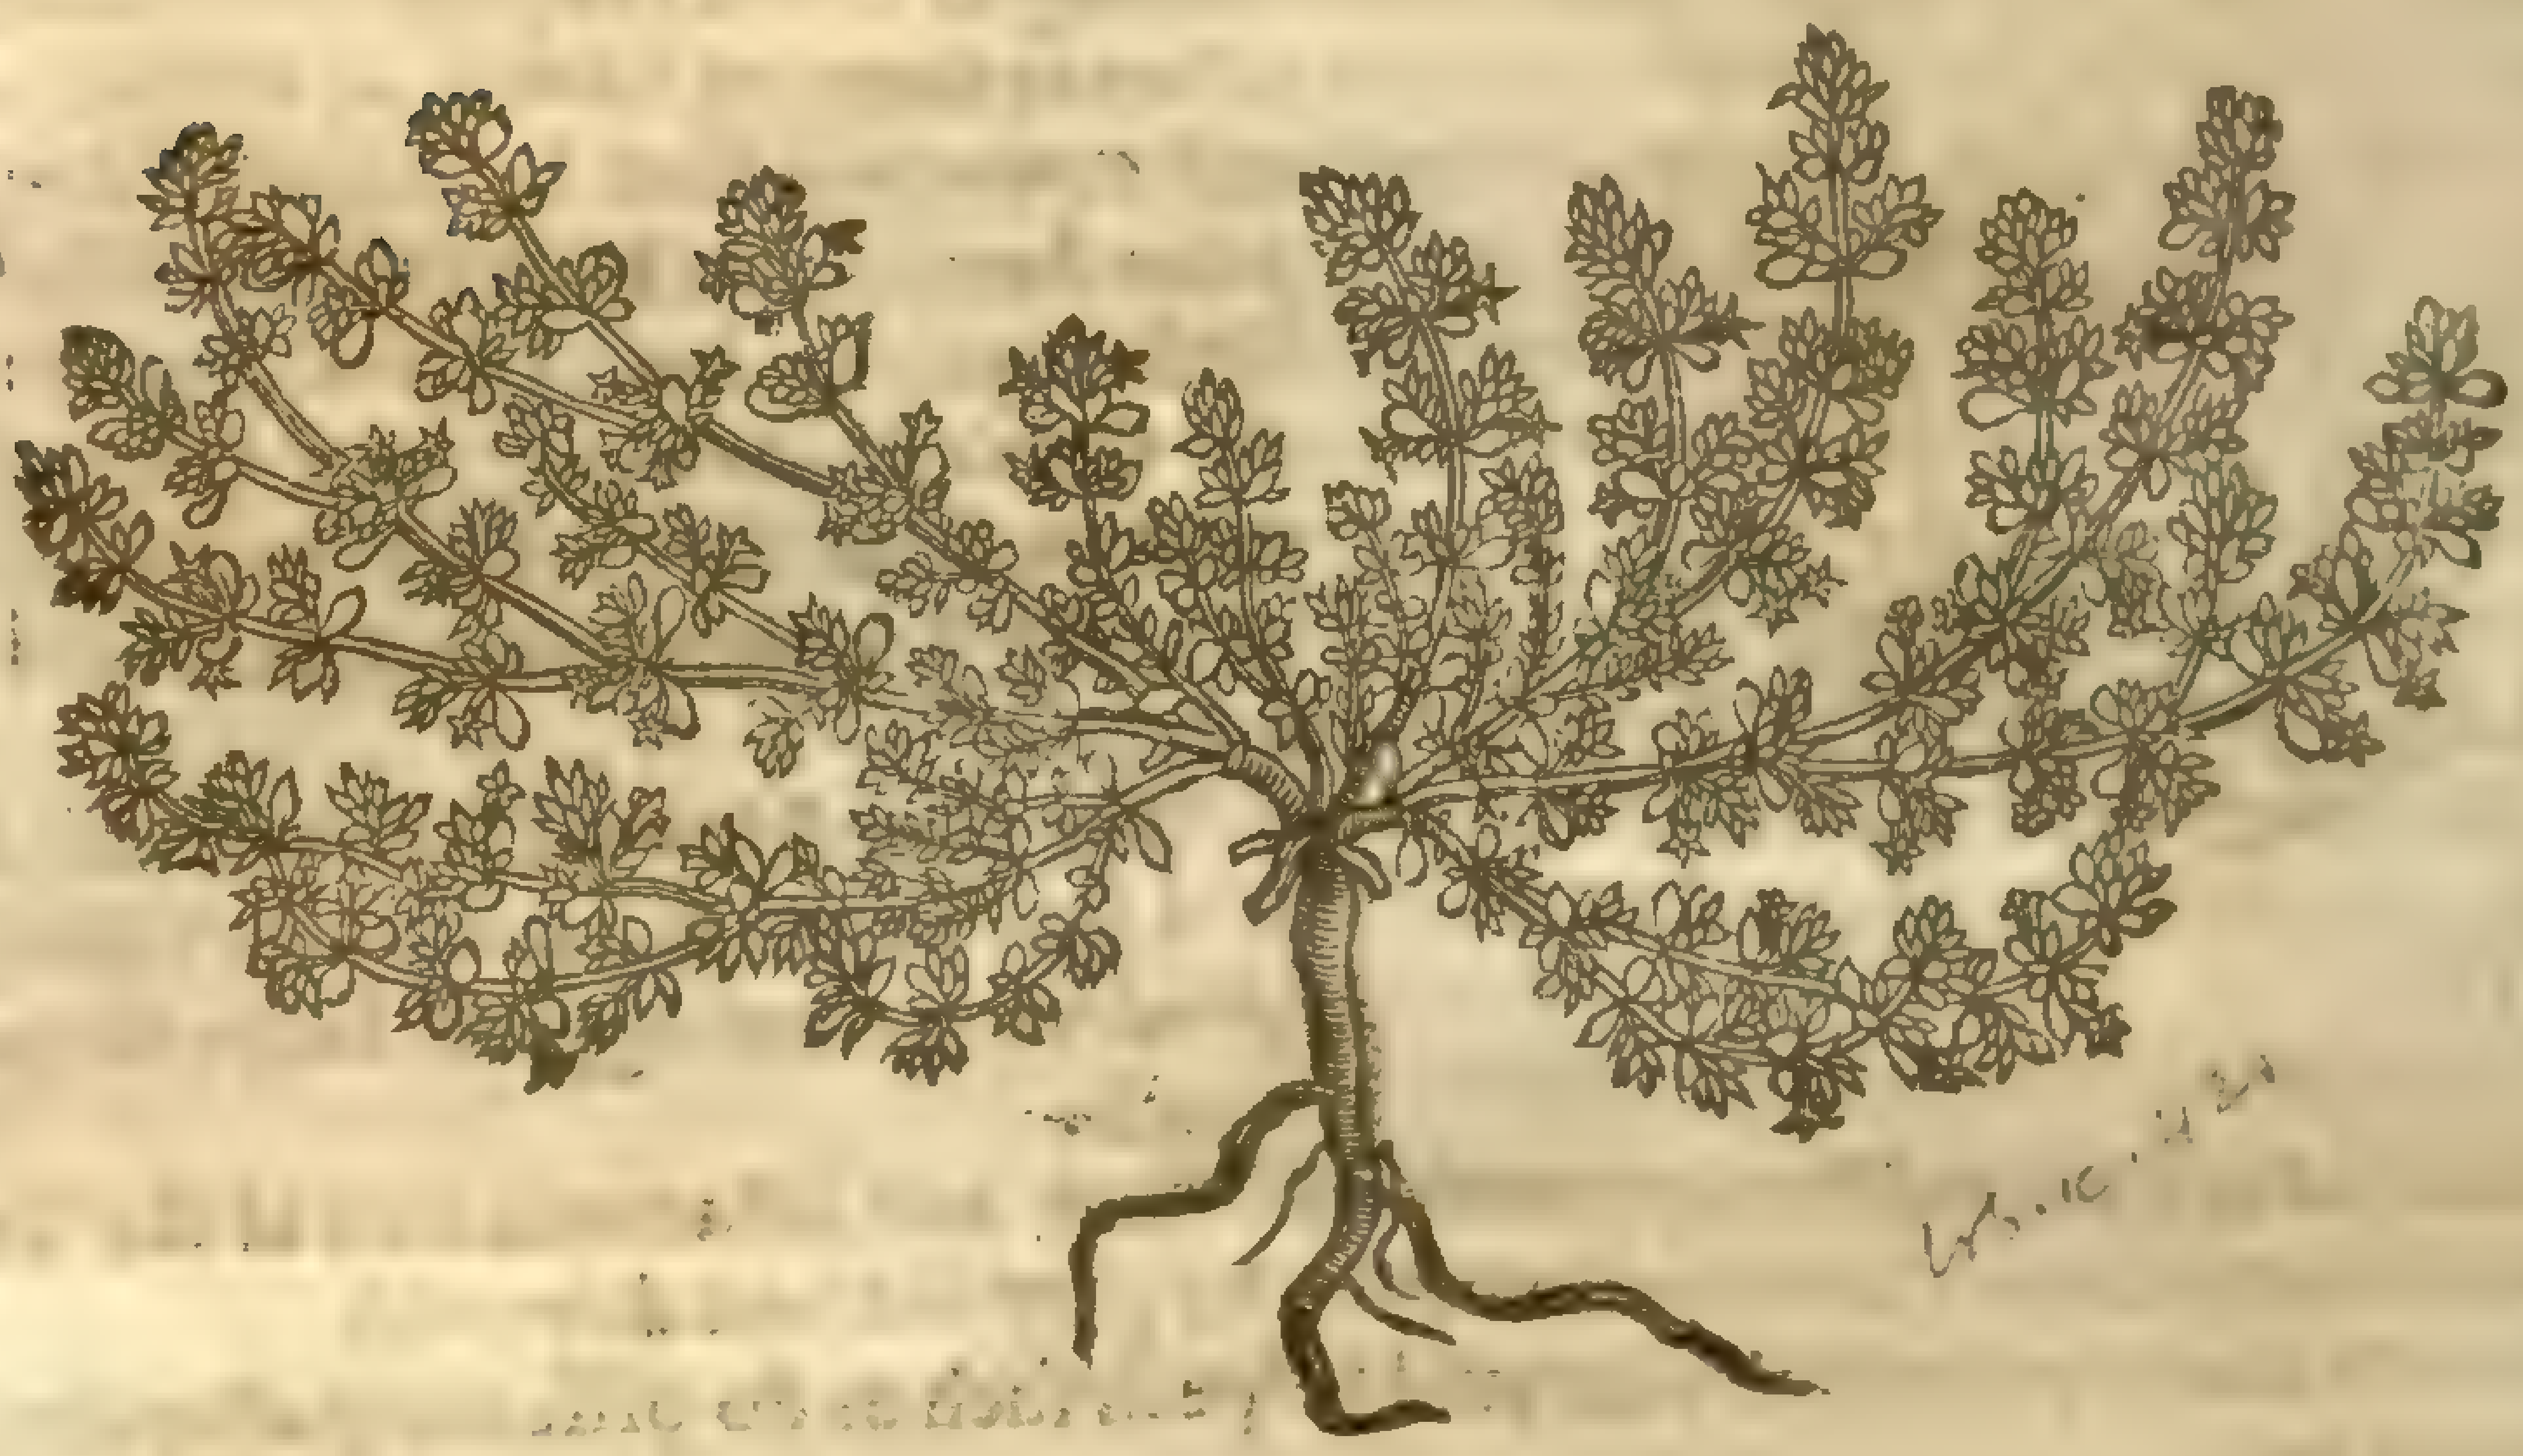
‡ Our Author, though hee meant to haue giuen vs the figure of Knawel in the third place, as ay be perceiued by the title, yet he deſcribed it in the fourth, and in the third place went about

to

1 *Polygonum montanum.* Mountaine Knot-graſſe.



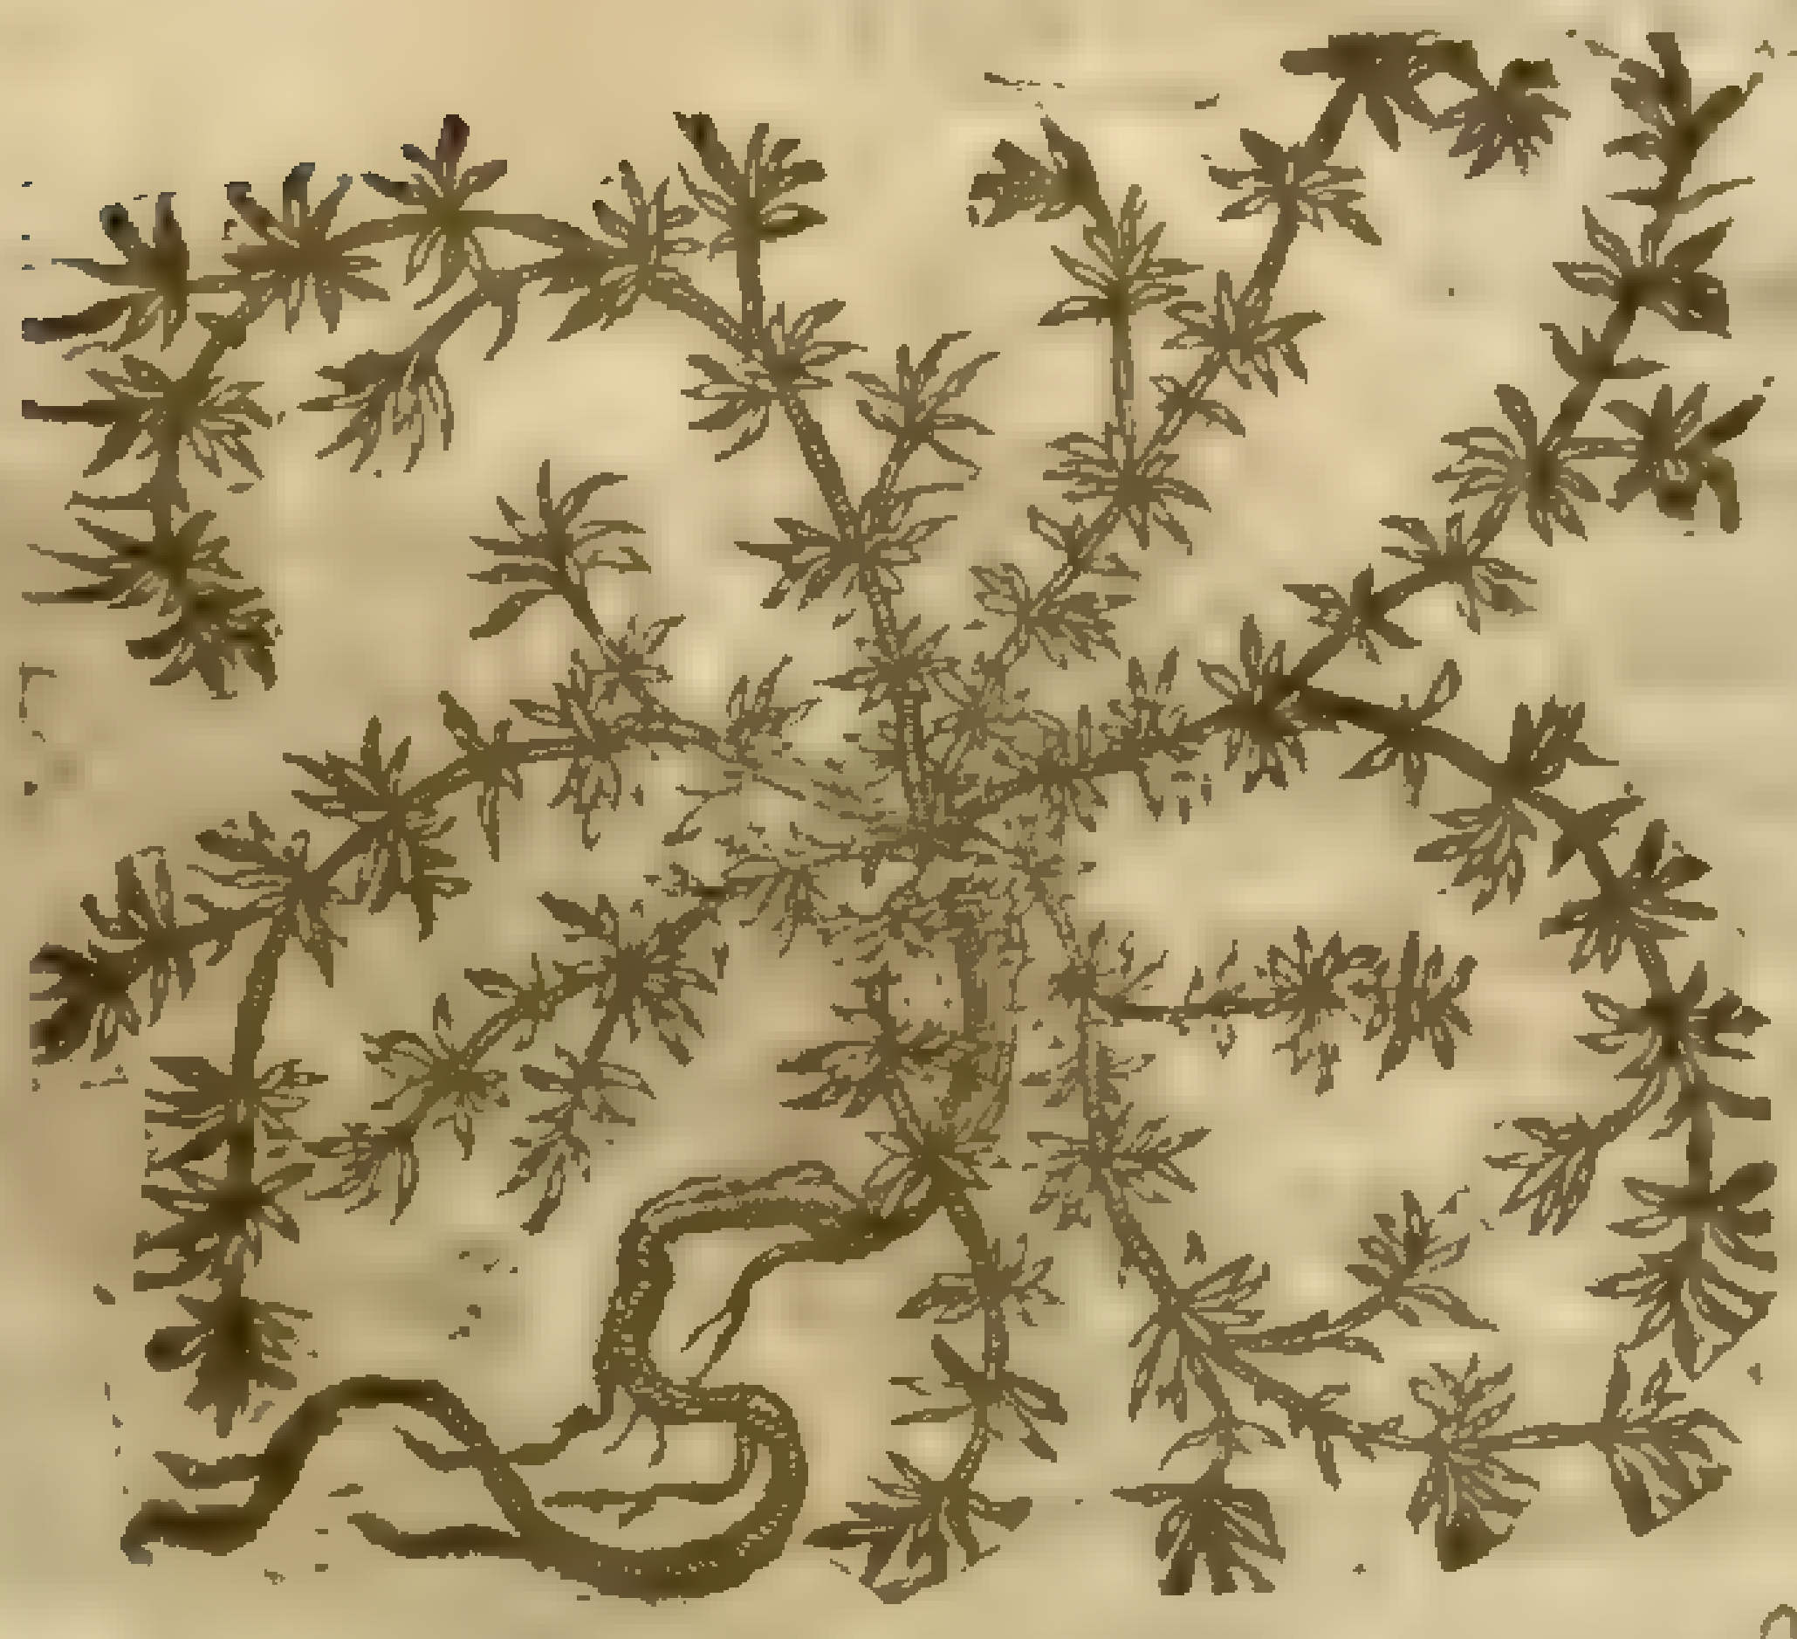
‡ 2 *Anthyllis Valentina Cluſij.* Valentia Knot-graſſe.



Frankenia pulverulenta. [illegible]

Lob. ic. 424

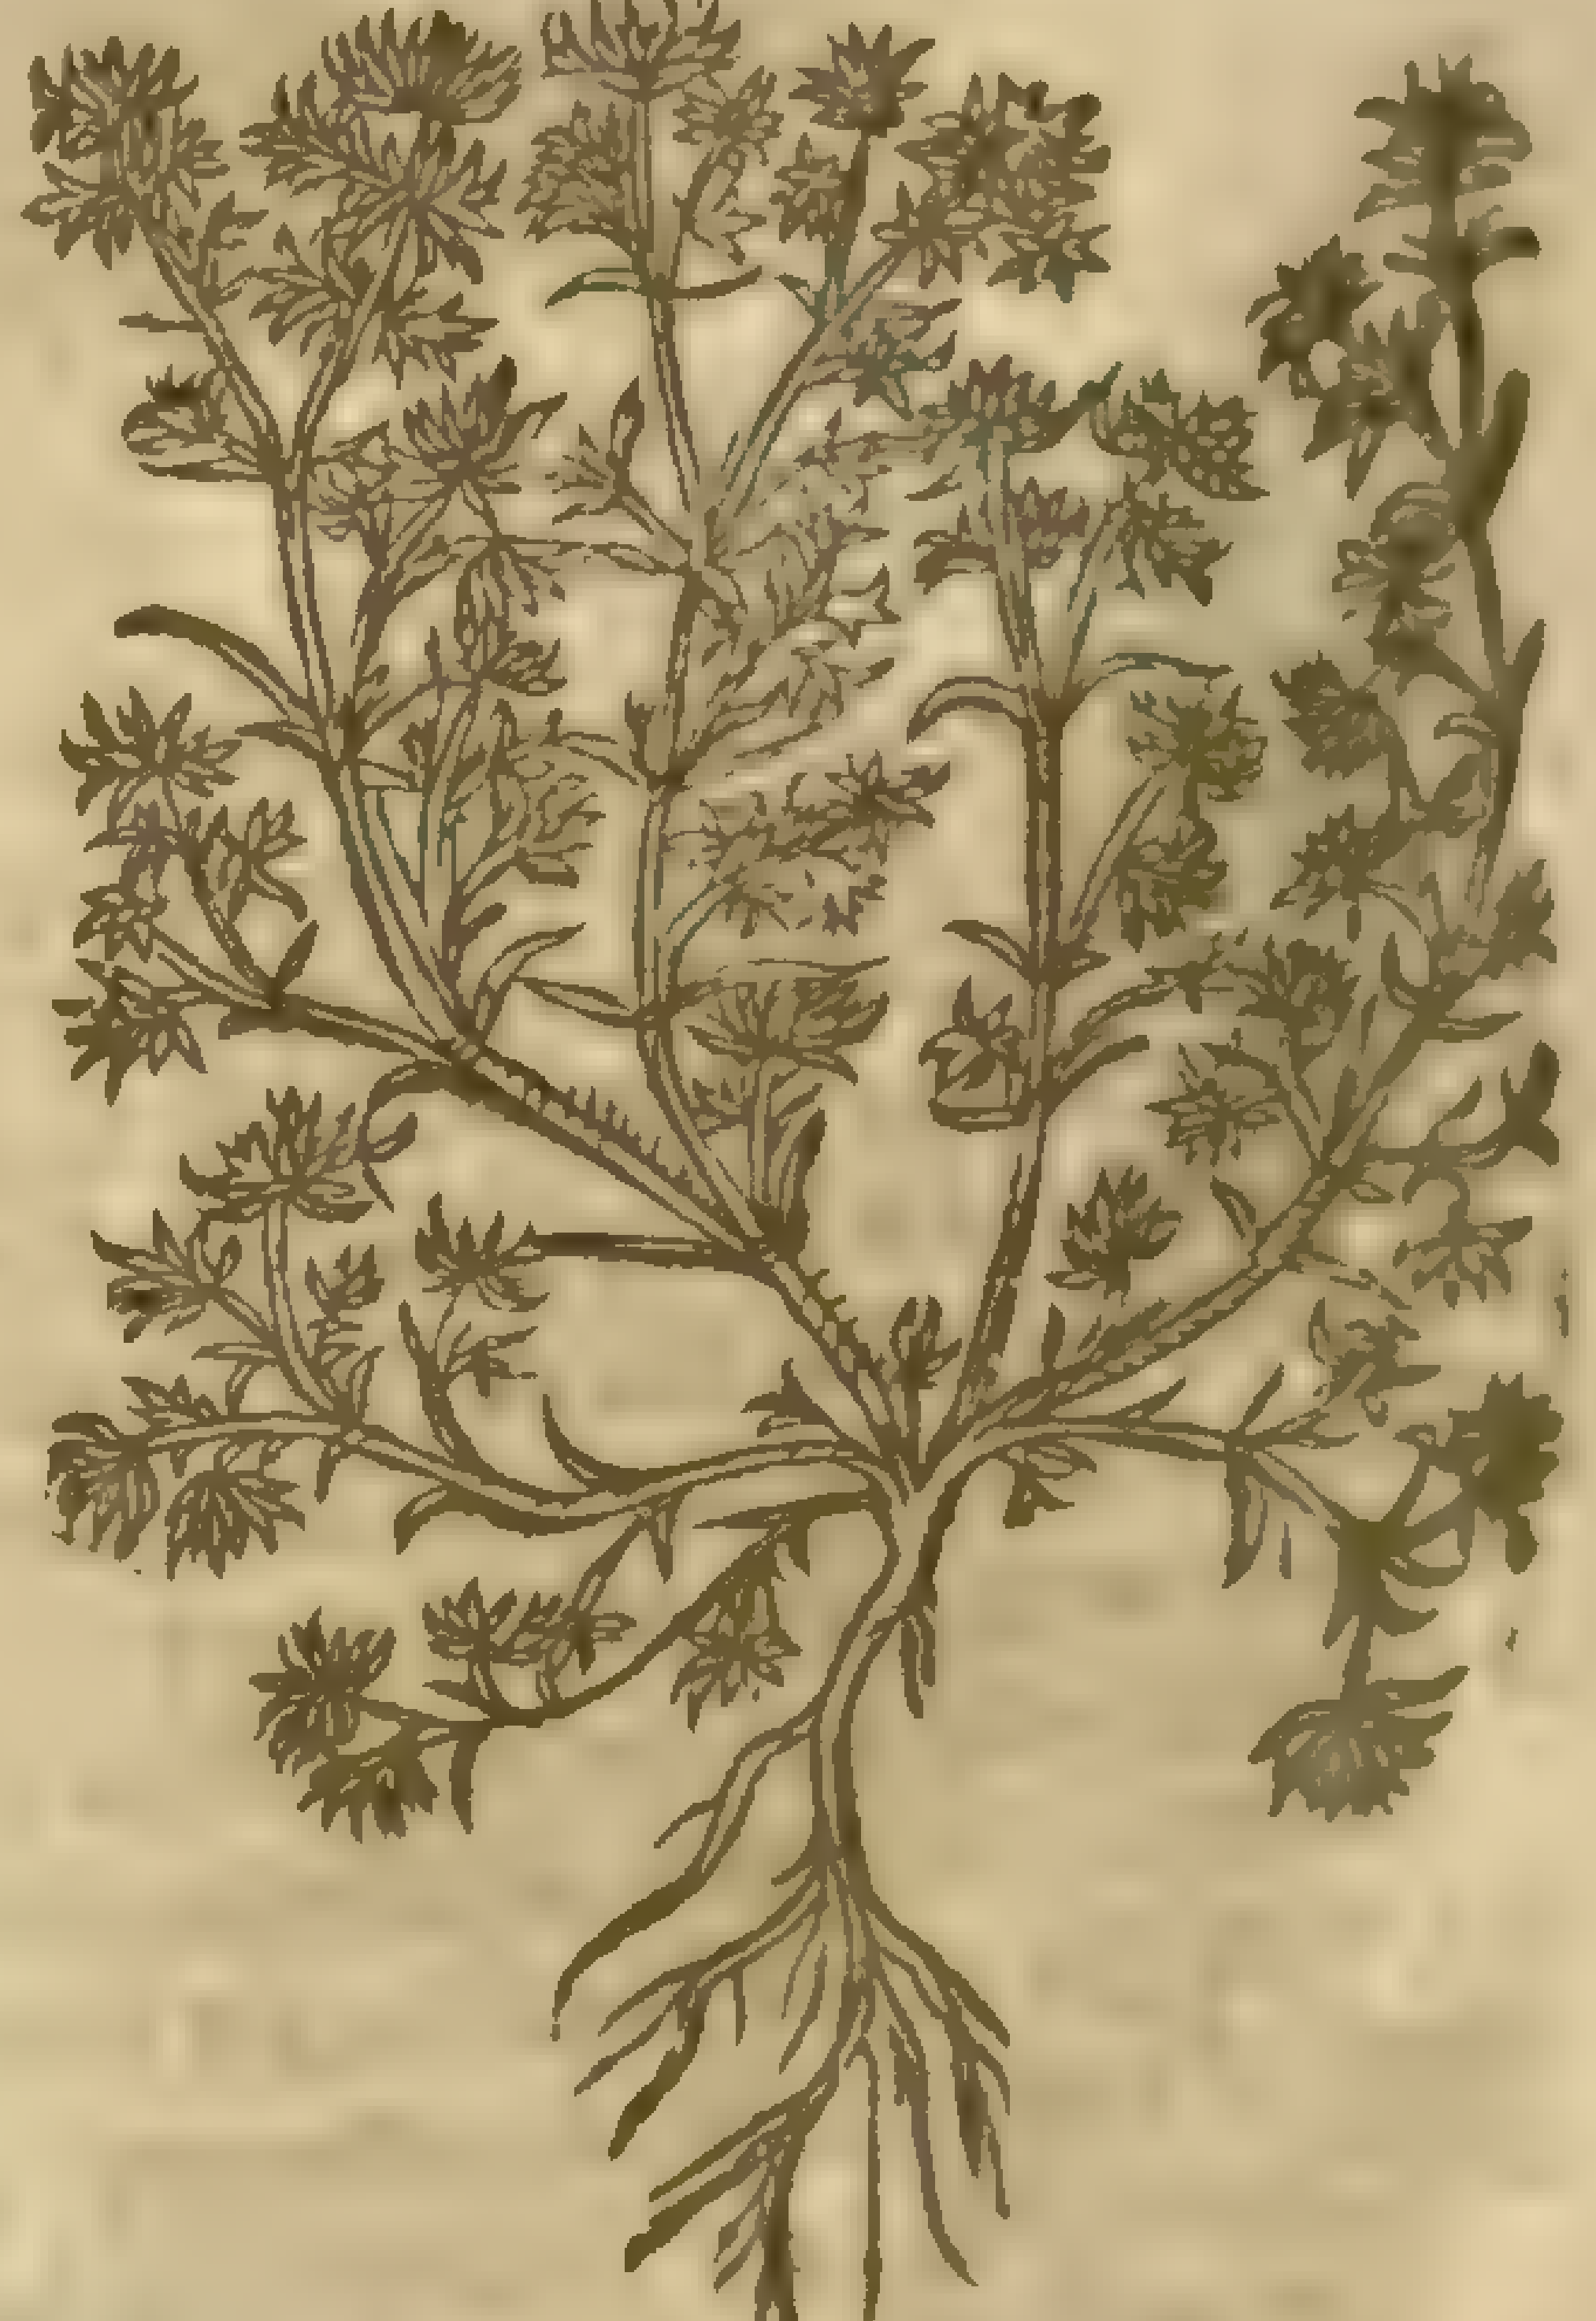
‡ 3 *Polygonum ſerpillifolium.*
Small round leaued Knot-graſſe.



Frankenia laevis [illegible]

Lob. ic. 422

† 4 *Polygonum Selinoides, ſiue Knavel.*
Parſley-Piert.



Scleranthus annuus [illegible]

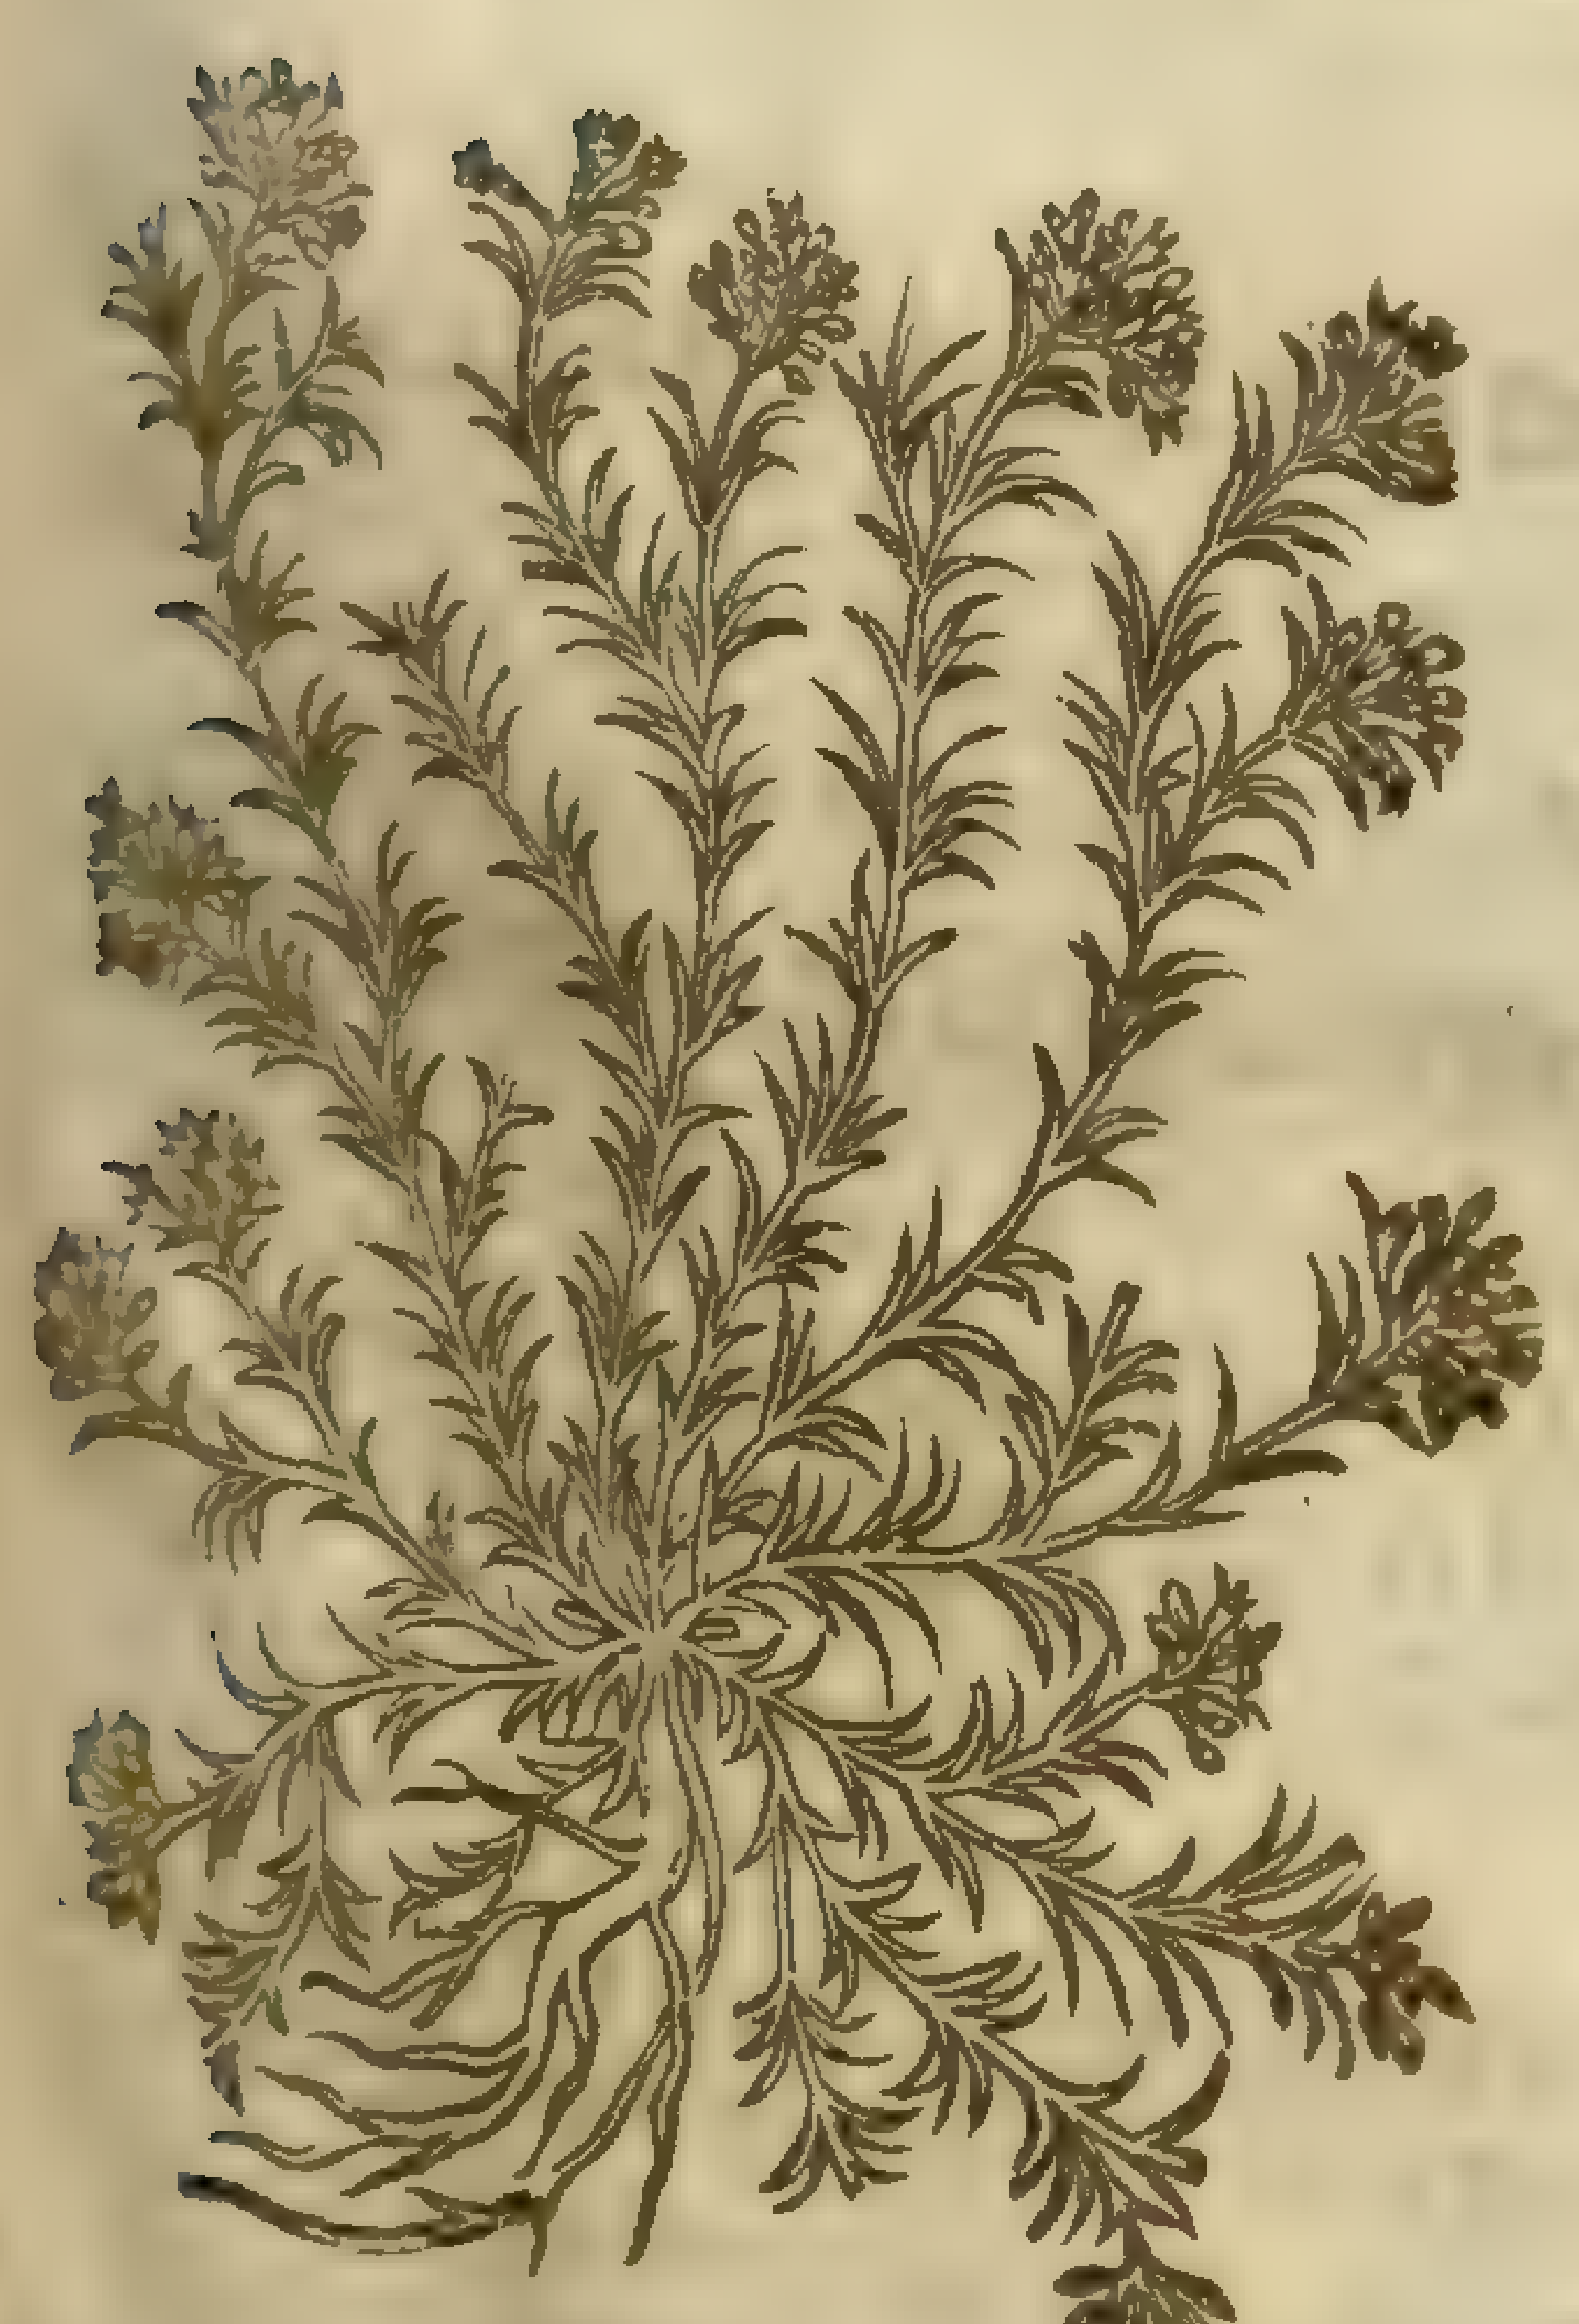
to deſcribe *Polygonum Serpillifolia* of *Pena*;as may be gathered by the deſcription which ſhould haue ſtood, but that I opportunely receiued a better from my oft mentioned friend Mr.*Goodyer*,which therefore I thought good to impart vnto you.

Polygonum alterum puſillo vermiculato Serpilli foliolo Pena.

This hath many ſmall round ſmooth wooddy branches,ſomwhat reddiſh,trailing on the ground, nine inches or a foot long;wheron by ſmall diſtances on ſhort joints grow tufts of very ſmall ſhort blunt topped ſmooth greene leaues,in a manner round, like thoſe of the ſmalleſt Time, but much ſmaller,and without ſmel,diuiding themſelues at the boſoms of thoſe leaues into ſmall branches; at the tops of which branches grow ſmall floures,one floure on a branch,and no more,conſiſting of foure little round topped leaues apiece of a faint or pale purpliſh colour:I obſerued no ſeed. The root is wooddy,blackiſh without, very bitter,with ſome taſt of heate, and groweth deepe into the ground. The leaues are nothing ſo full of juice as Aizoon. I found it flouring the third day of September 1621, on the ditch banks at Burſeldon ferrey by the ſea ſide in Hampſhire. *Io.Goodyer.* ‡

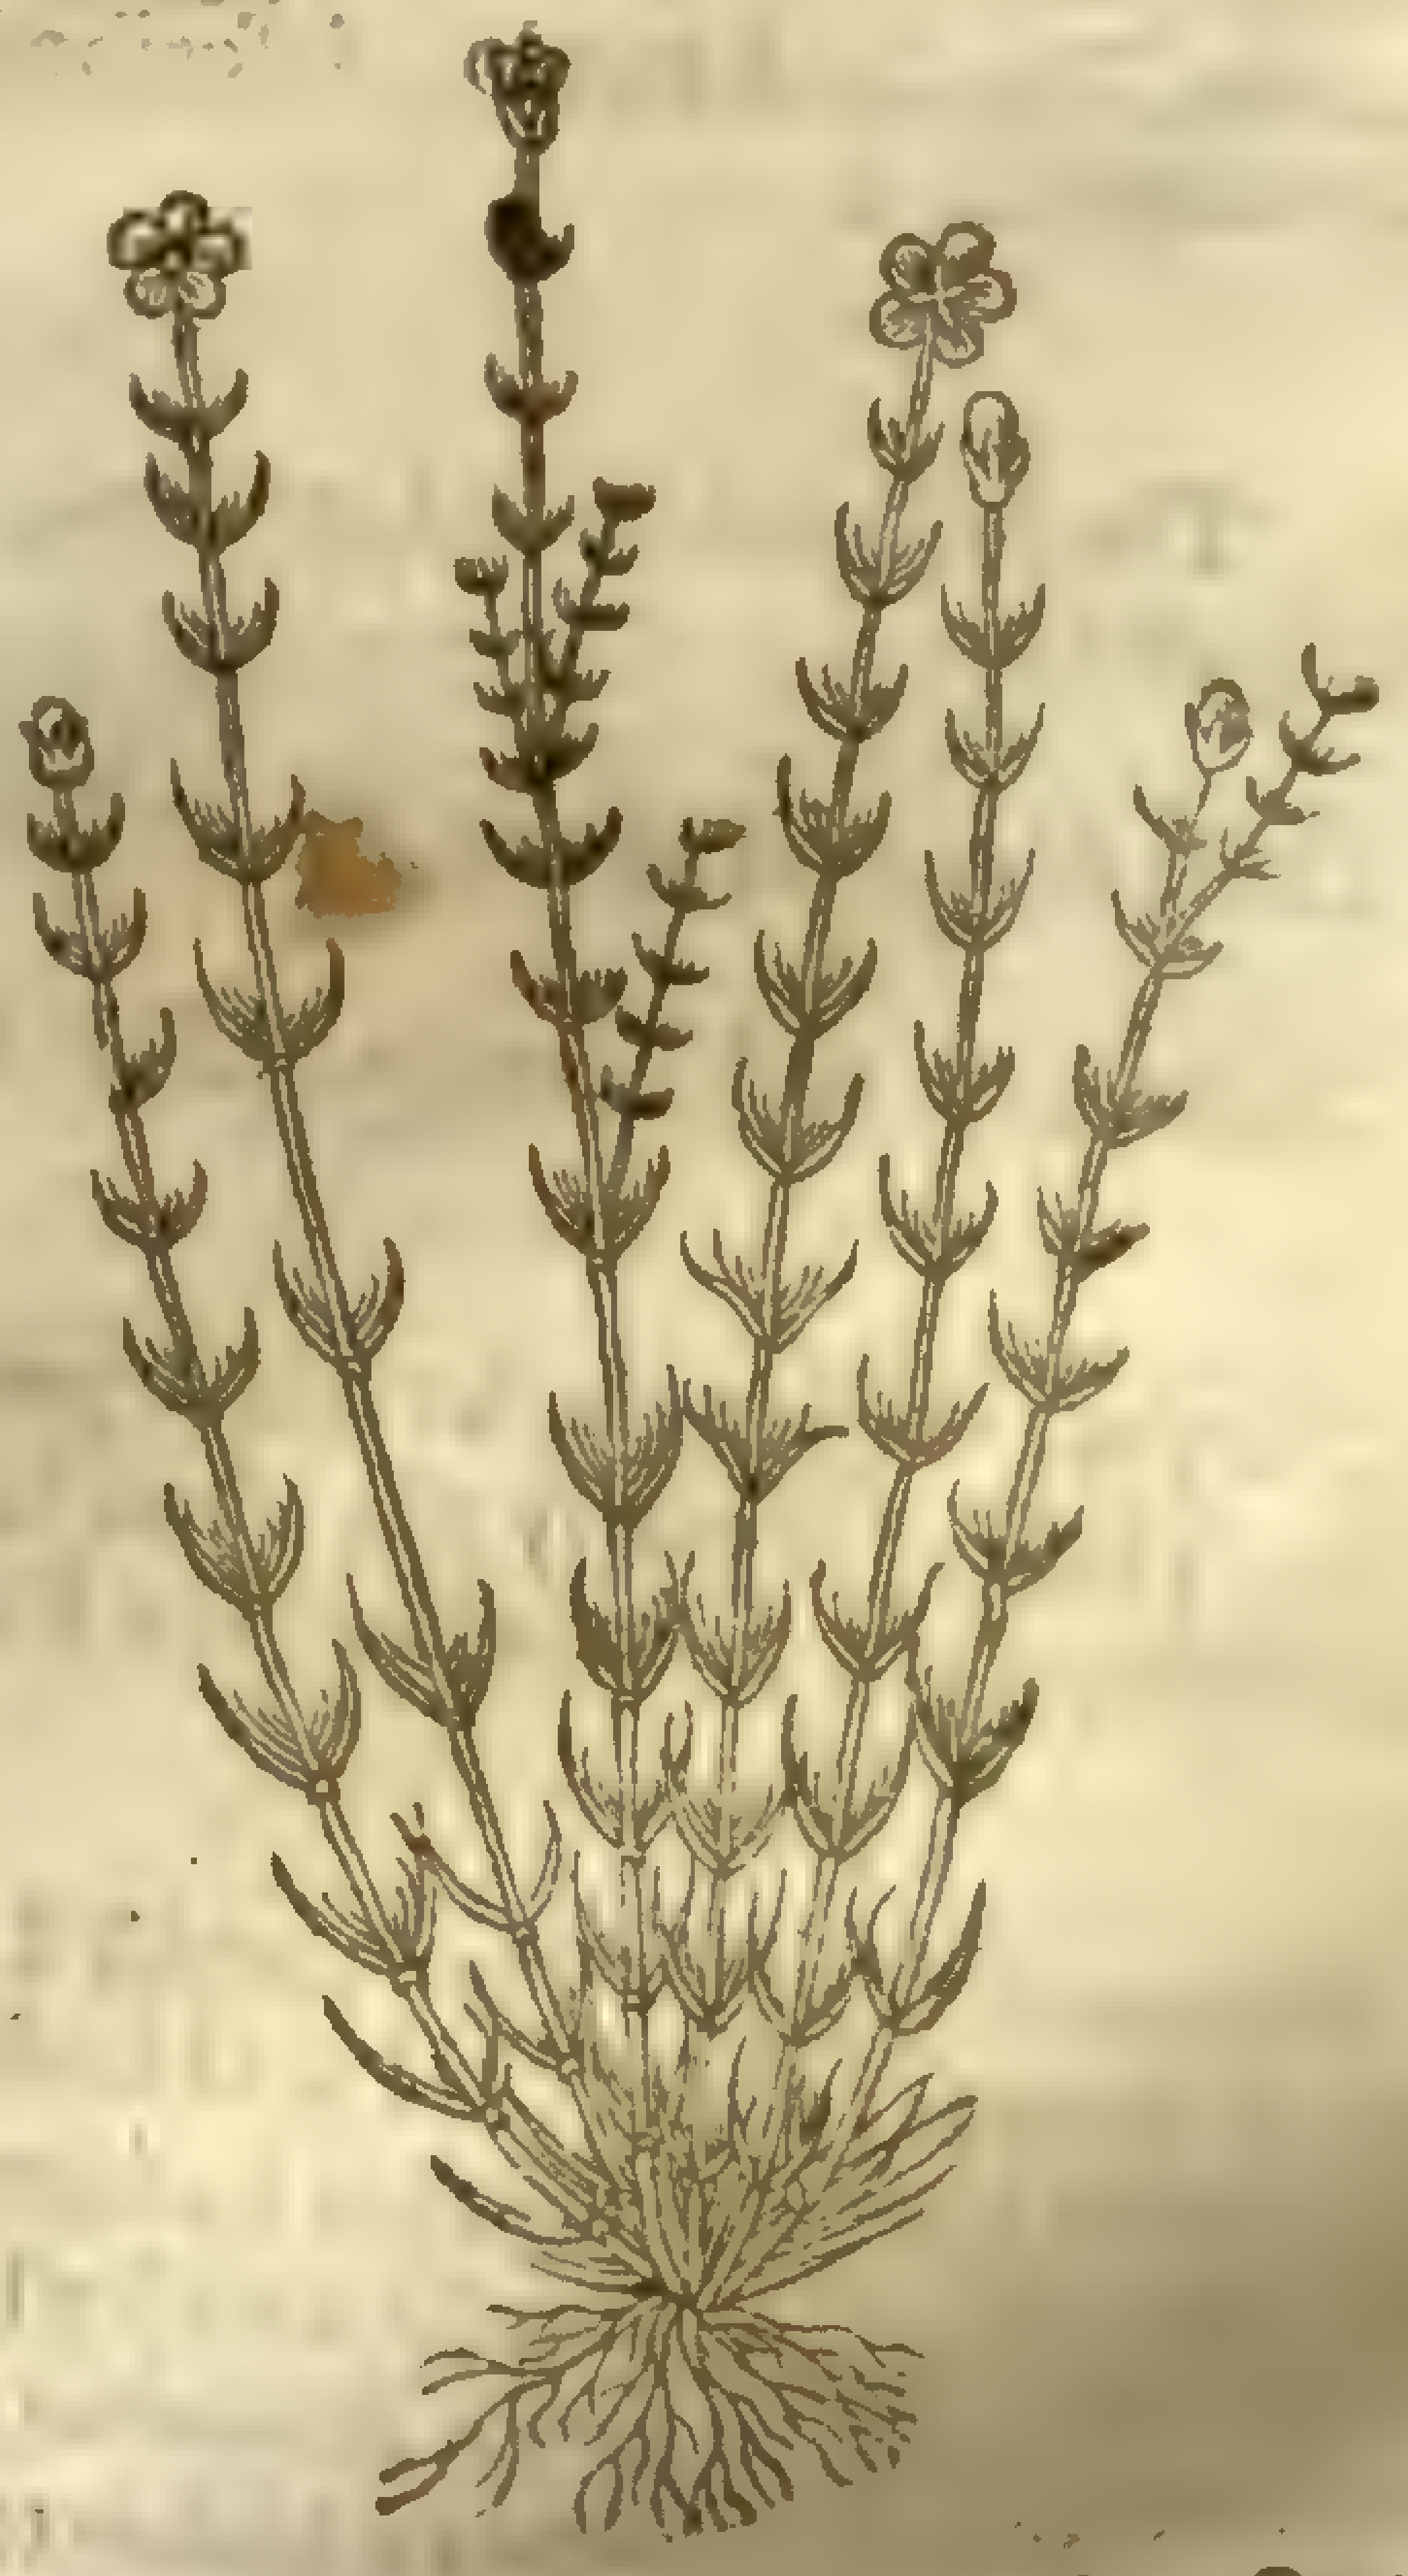
4 Among the Knot-graſſes may well be ſuted this ſmal plant,but lately written of,and not ſo commonly knowne as growing in England,being about an handfull high, and putting out from a fibrous root ſundry ſlender ſtalkes full of little branches and joints: about which grow confuſedly many narrow leaues, for the moſt part of an vnequall quantity, yet here and there two longer than the reſt,and much alike in greatneſſe:at the outmoſt part of the branches and ſtalks (where it hath thickeſt tufts) appeare out of the middeſt of the leaues little floures of an herby colour,which are ſucceeded by ſeed-veſſels ending in fiue ſharp points:the whole plant is of a whitiſh colour. If my memorie faile me not, *Pena* means this herbe where he ſpeaketh of *Saxifr.Angl.*in his *Adver.p.*103. and alſo reporteth that he found this plant by the way ſide as he rode from London to Briſtow,on a little hill not far from Chipnam:his picture doth very well reſemble the kinde of Knot-graſſe called among the Germanes **Knawel**:and calling it *Saxifraga Anglicana* cauſeth me to thinke, that ſome in the Weſt parts where he found it do call it Saxifrage, as we do call ſundry other herbs,eſpecially if they ſerue for the ſtone. My friend Mr.*Stephen Bredwell*, Practitioner of Phyſicke in thoſe parts, heard of a ſimple man who did much good with a medicine that he made with Parſley Piert againſt the ſtone, which he miniſtred vnto all ſorts of people. This my friend requeſted the poore man to ſhew him the hearbe called Parſley Piert; who frankly promiſed it him,and the next morning brought him an handfull of the herb, and told him the compoſition of his medicin withall,which you ſhal find ſet downe in the vertues, and proued by ſundry of good account to be a ſingular remedie for the ſame.

† 5 *Saxifraga Anglicana alſinefolia.*
Chick-weed Breake-ſtone.



Scleranthus perennis L.
[illegible]
Sm. Fl. 2.182.

‡ 6 *Saxifraga paluſtris alſinefolia.*
Small water Saxifrage.



‡ 5 Out

‡ 4 Our Author here in the fourth place deſcribed the Knawel,& he figured it in the ſecond place,vnder the title of *Anthyllis Valentina Cluſij*:for the figure which was in the third place we here giue you in the fifth;and I conjecture it is not of Knawel, but thought to bee of *Saxifraga anglicana* of the *Adverſ.* But the conjecture of *Pena* and *Lobel* being true,who judge their *Saxifraga Anglicana* to be *Synanchice Daleſchampij*,then is it neither *Knawel*, as our Authour had it,nor this which I giue,but a ſmall plant which you ſhal find among the *Rubia's*.Now this plant that I once took here to be *Saxifraga Anglicana* of *Pena* and *Lobel*,is a ſmall little herbe growing thicke,with very many branches ſome two or three inches high,with ſome ſtalks ſtanding vpright,and other ſome creeping: at each joynt grow two ſhort narrow ſharp pointed greene leaues, out of whoſe boſomes come diuers leſſer leaues:at the tops of the branches vpon prety long ſtalks grow vpon each ſtalk one round whitiſh ſcaly head, conſiſting commonly of foure vnder greeniſh leaues which make the cup, and foure grayiſh or whitiſh leaues which are the floure. Now after theſe come to ſome maturitie they appeare all of a whitiſh colour,and through the thin films of theſe heads appeares the ſeed, which at the firſt view ſeems to be pretty large and blacke ; for it lieth all cluſtering together ; but if you rub it out you ſhall find it as ſmall as ſand,and of a darke reddiſh colour. The taſt of this plant is very hot and piercing like that of Golden rod or our common Saxifrage, and without doubt it is more effectuall to moue vrine than the former Knawel. I haue found it growing in many places about brick and ſtone walls,and vpon chalky barren grounds. I called this in my Iournall *An.1632. Saxifraga minor altera floſculis albis ſemine nigro* ; and queſtioned whether it were not *Alſine Saſifraga anguſtifol.minima mont*.of *Columna*.But now I think it rather(if the number of leaues in the flour did not diſagree) the other which is deſcribed in the next place, of which I ſince that time haue receiued both the figure and deſcription, as alſo a dry plant from Mr.*Goodyer*. He conjectures it may be this plant which I haue here deſcribed, that is ſet forth in the *Hiſt Lugd.pag*.1235.by the name of *Alſine muſcoſa*.

Alſine paluſtris,folijs tenuiſſimis : ſiue Saxifraga paluſtris alſinefolia.

Spergula [illegible] nov. dict.

6 This hath a great number of very ſmall graſſe-like leaues , growing from the root, about an inch long,a great deale ſmaller and ſlenderer than ſmall pins ; among which ſpring vp many ſmall ſlender round ſmooth firme branches ſome handfull or handfull and halfe high,from which ſometimes grow a few other ſmaller branches,whereon at certain joints grow leaues like the former,and thoſe ſet by couples with other ſhorter comming forth of their boſomes ; and ſo by degrees they become ſhorter and ſhorter towards the top, ſo that toward the top this plant ſomwhat reſembleth *Thymum durius*. The floures are great for the ſlenderneſſe of the plant, growing at the tops of the branches,each floure conſiſting of 5 ſmall blunt roundiſh topped white floures, with white chiues in the midſt:the ſeed I obſerued not. The root is ſmall,growing in the myre with a few ſtrings:this groweth plentifully on the boggy ground below the red Wel of Wellingborough in Northampton ſhire. This hath not bin deſcribed that I find. I obſerued it at the place aforeſaid *Aug*.12. 1626. *Iohn Goodyer*. ‡

The Place.

† The firſt and ſecond are ſtrangers in England:the reſt grow in the places mentioned in their deſcriptions.

¶ *The Time.*

Theſe floure for the moſt part from May to September.

¶ *The Names.*

That which hath been ſaid of their names in their ſeuerall deſcriptions ſhall ſuffice.

¶ *The Temperature.*

They are cold in the ſecond degree,and dry in the third,aſtringent and making thick.

‡ Theſe,eſpecially the three laſt,are hot in the ſecond or third degree,and of ſubtil parts,but the Parſley Piert ſeemes not to be ſo hot as the other two. ‡

¶ *The Vertues.*

A Here according to my promiſe I haue thought good to inſert this medicin made with Knawel: which herbe is called(as I ſaid before)Parſley Piert, but if I might without offence, it ſhould bee called *Petra pungens*: for that barbarous word Parſley Piert was giuen by ſome ſimple man (‡ alſo the other ſauors of ſimplicitie‡) who had not well learned the true terme. The compoſition which followeth muſt be giuen in warme white wine,halfe a dram,two ſcruples,or more,according to the conſtitution of the body which is to receiue it.

The leaues of Parſley Piert, Mouſ-eare, of each one ounce when the herbes be dried, bay berries, Turmericke, Cloues, the ſeeds of the great Burre, the ſeeds in the berries of Hippes, or Briertree, Fenugreeke, of each one ounce, the ſtone in the oxe gall, the weight of 24. Barley cornes, or halfe a dram, made together into a moſt fine and ſubtill pouder, taken and drunke in maner aforeſaid, hath been proued moſt ſingular for the diſeaſe aforeſaid. E

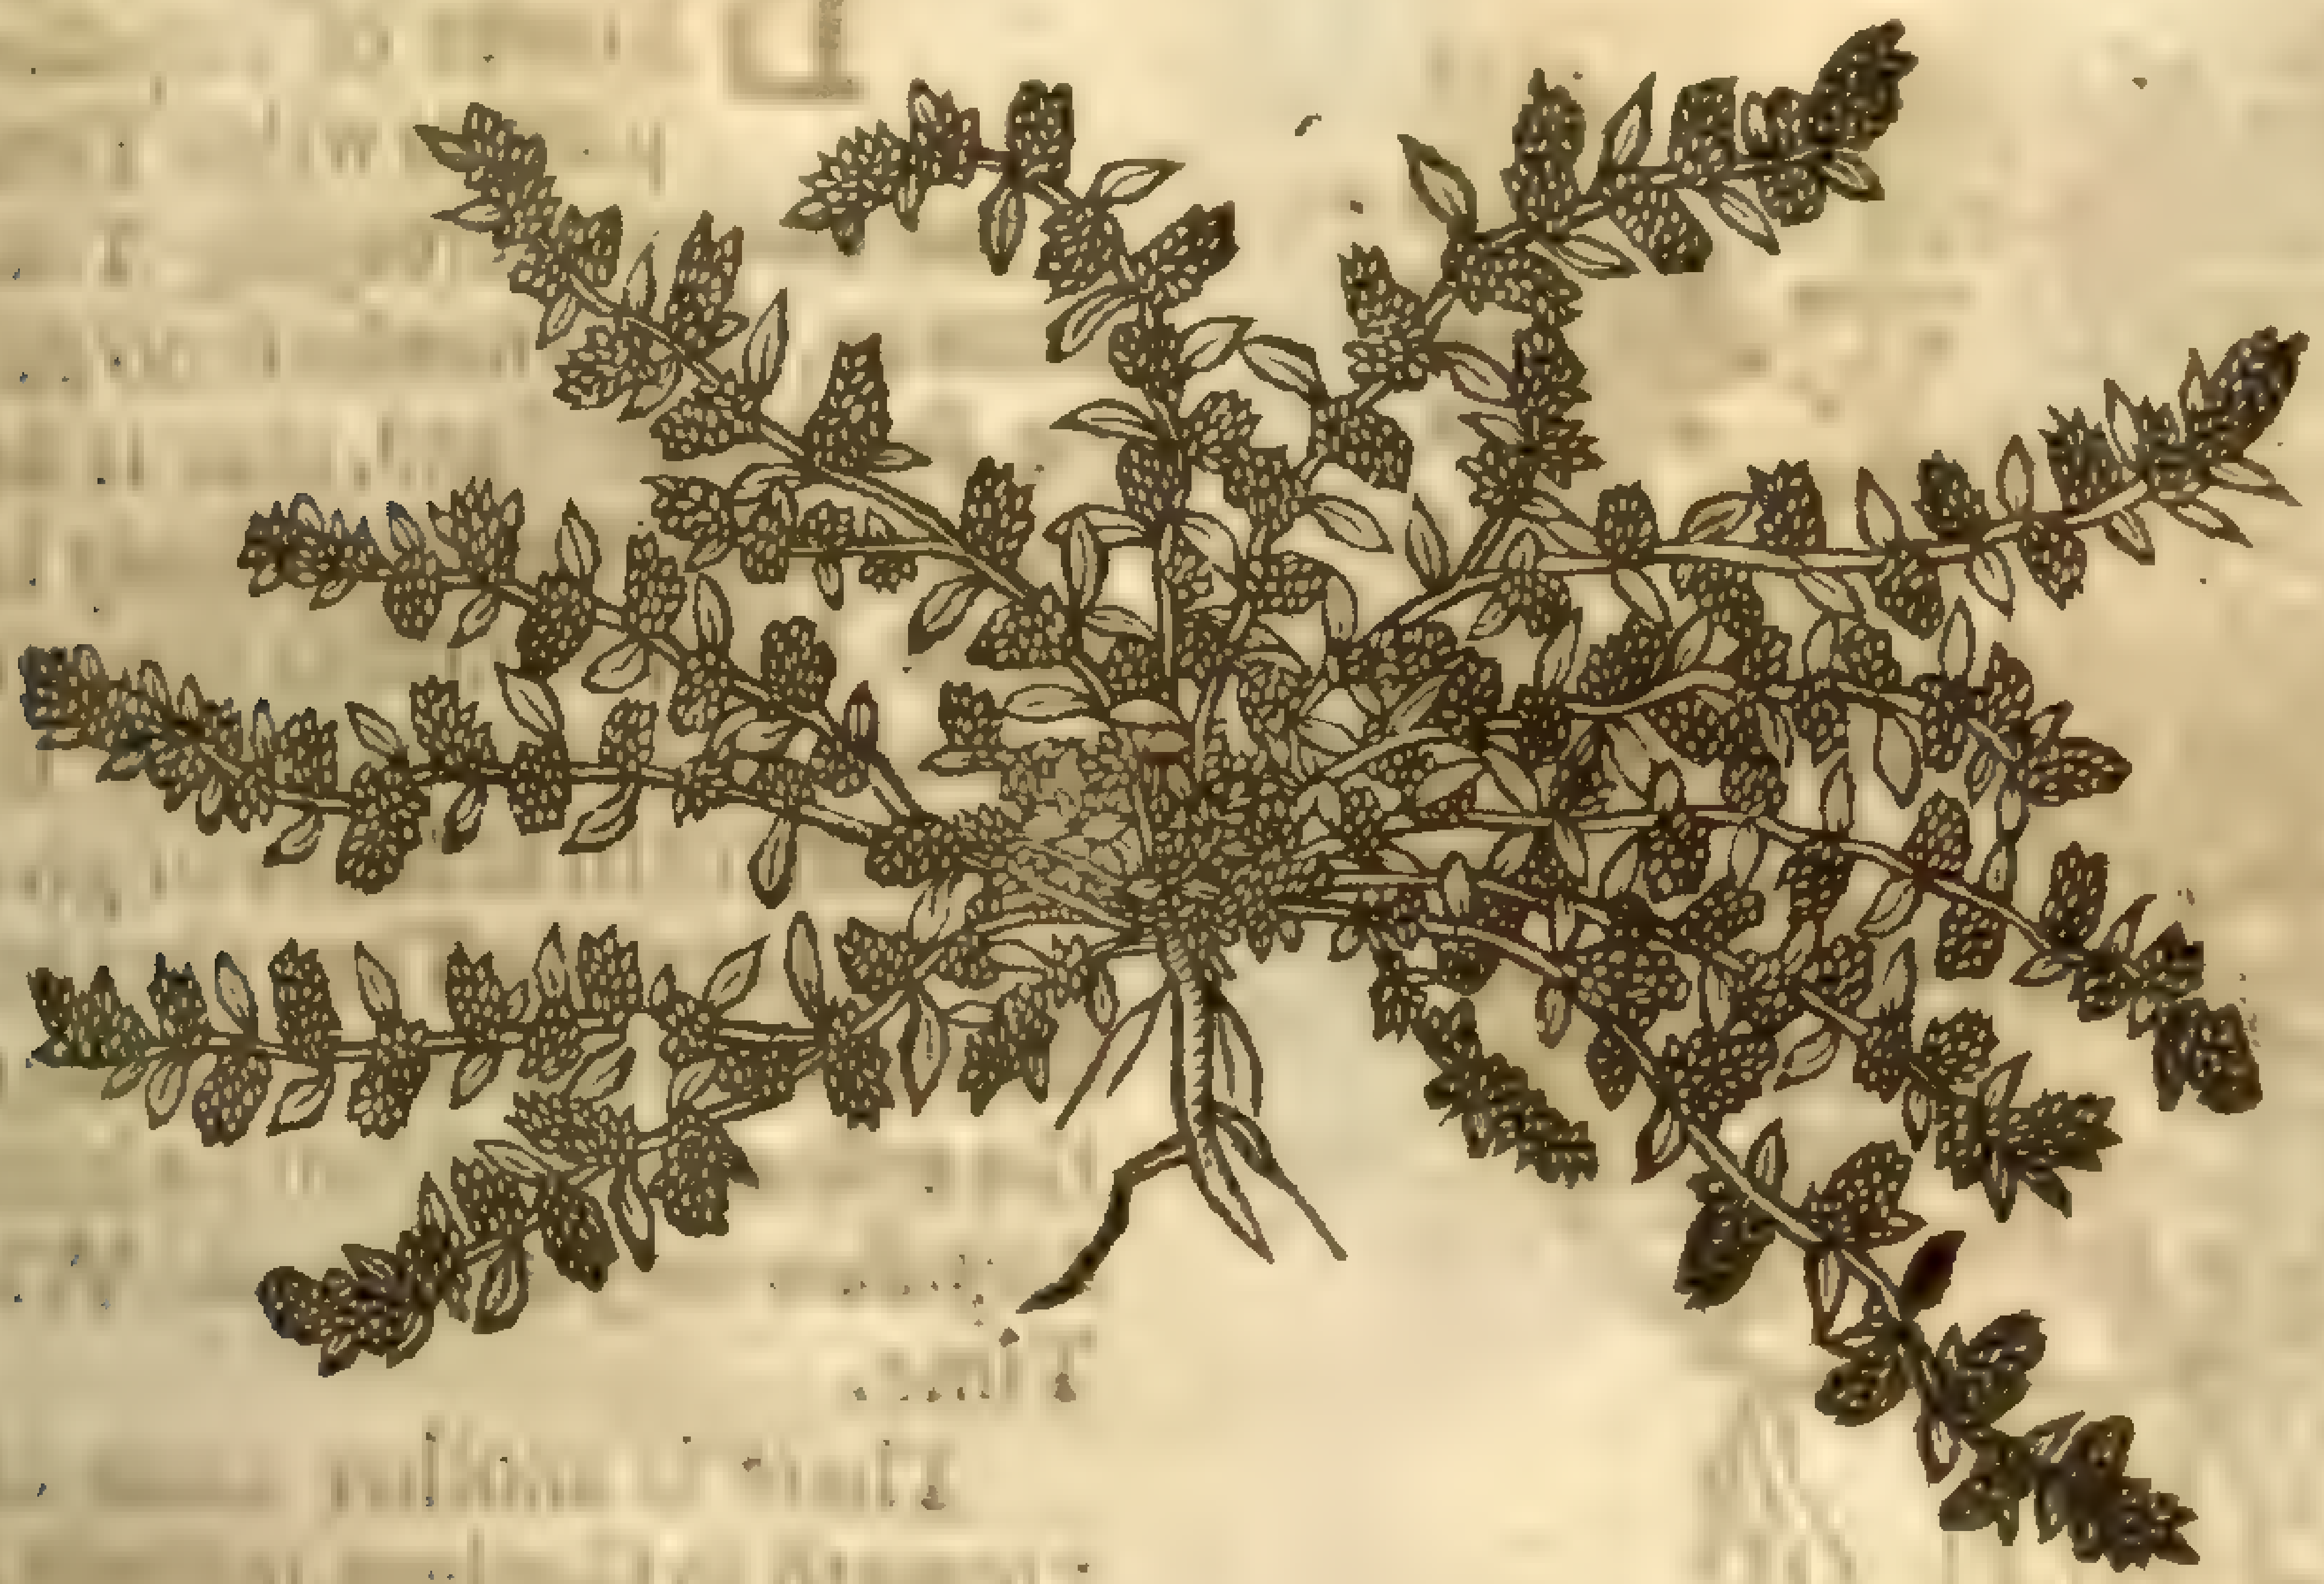
‡ The fifth and fixth are of the ſame faculty, and may be vſed in the like caſes. ‡ F

† The figure that formerly was in the ſecond place was of Knawell, and that in the third place of *Polygonum minus Polycarpon* of Tabern.

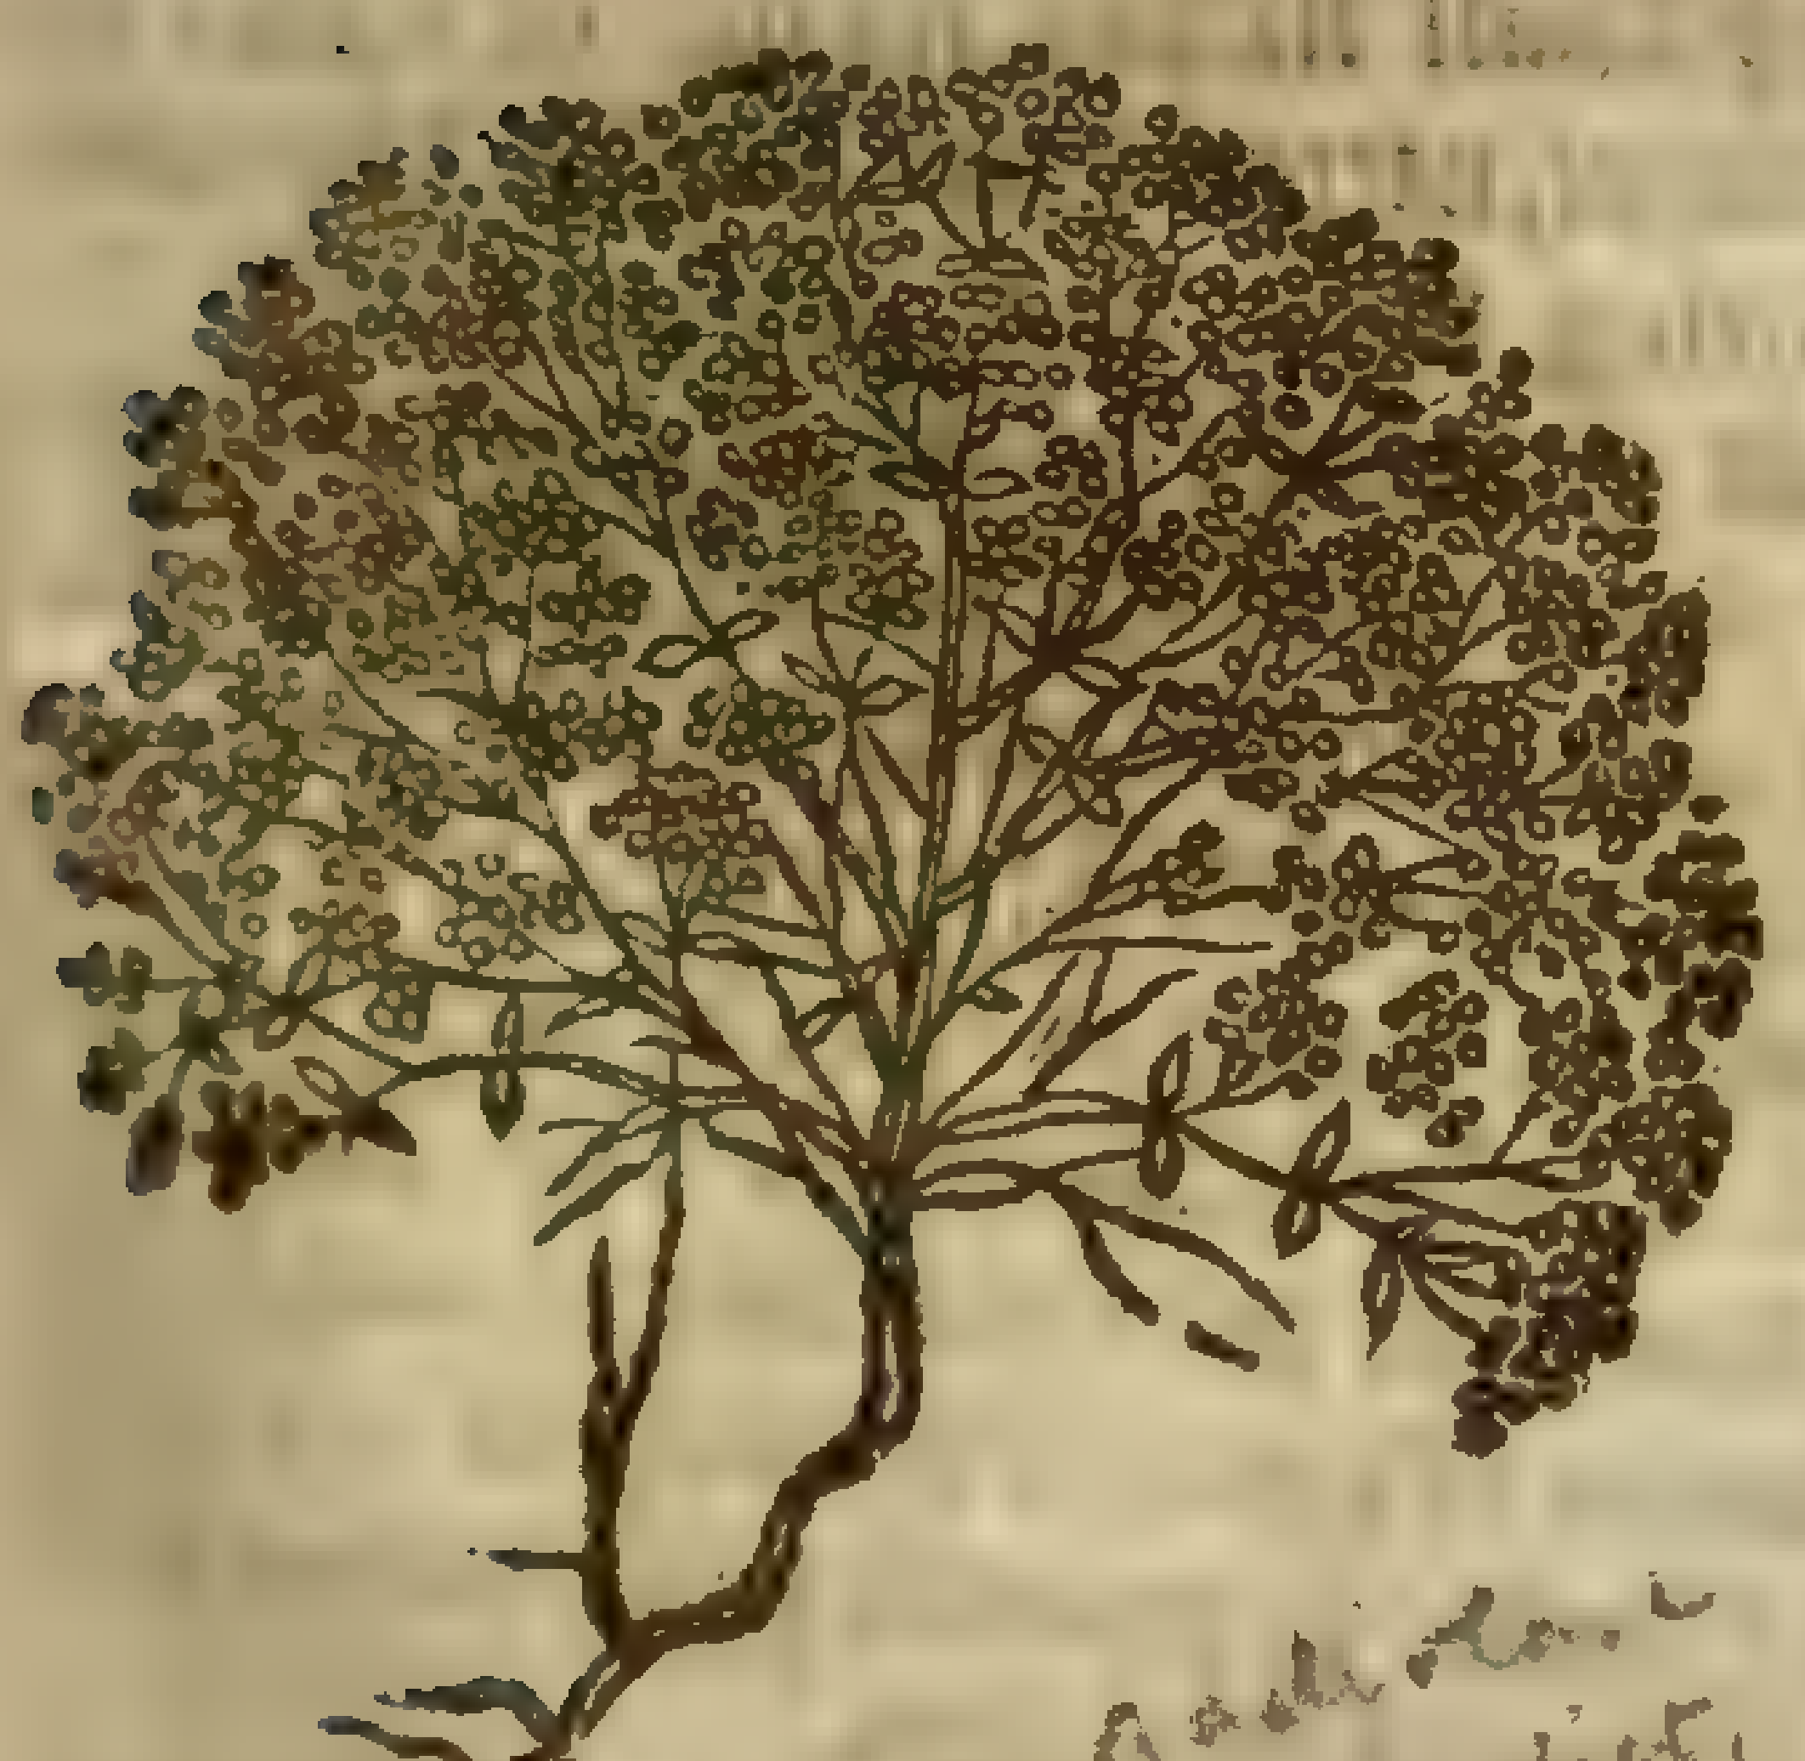
CHAP. 172. *Of Rupture wort.*

[illegible]

1 *Herniaria.* Rupture wort.



‡ 2 *Millegrana minima.*
Dwarfe All-ſeed.



Linum radiola multidist. Sm. pl. 1. 243

¶ *The Deſcription.*

1 There is alſo a kinde of Knot-graſſe commonly called in Latine *Herniaria*: in Engliſh, Rupture woort, or Rupture graſſe. It is a baſe and low creeping herbe, hauing many ſmall ſlender branches trailing vpon the ground, yet very tough, and full of little knots ſomewhat reddiſh, whereupon doe grow very many ſmall leaues like thoſe of Time; among which come forth little yellowiſh flours which turne into very ſmall ſeed, and great quantitie thereof, conſidering the ſmalneſſe of the plant, growing thicke cluſtering together by certain ſpaces. The whole plant is of a yellowiſh greene colour. The root is very ſlender and ſingle.

2 There is alſo a kinde of *Herniaria*, called *Mille grana* or All-ſeed, that groweth vpright an handfull high, with many ſmall and tender branches, ſet with leaues like the former, but few in number, hauing as it were two ſmall leaues and no more. The whole plant ſeemeth as it were couered ouer with ſeeds or graines, like the ſeed of Panicke, but much leſſer. ‡ I haue not ſeene many plants of this, but all that euer I yet ſaw neuer attained to the height of two inches. ‡

¶ *The Place.*

1 It ioyeth in barren and ſandy grounds, and is likewiſe found in dankiſh places that lie wide open to the ſun: it doth grow and proſper in my garden exceedingly. ‡ 2 I found this in Kent on a Heath not farre from Chiſte-hurſt, being in company with Mr *Bowles* and diuers others, in Iuly, 1630. ‡

¶ *The Time.*

It floureth and flouriſheth in May, Iune, Iuly and Auguſt.

¶ *The Names.*

It is called of the later Herbariſts *Herniaria* and *Herniola*; taken from the effect in curing the diſeaſe *Hernia*: of diuers, *Herba Turca*, and *Empetron*; in French, *Boutonet*: in Engliſh, Rupture wort, and Burſtwort.

¶ *The Temperature and Vertues.*

A Rupture wort doth notably drie, and throughly cloſeth vp together and faſteneth. It is reported that being drunke it is ſingular good for Ruptures, and that very many that haue been burſten were reſtored to health by the vſe of this herbe; alſo the pouder hereof taken with wine, doth make a man to piſſe that hath his water ſtopt; it alſo waſteth away the ſtones in the kidnies, and expelleth them.

Chap. 173. Of wilde Time.

1 *Serpillum vulgare.*
Wilde Time.

Thymus serpyllum [illegible]

3 *Serpillum majus flore purpureo.*
Great purple wilde Time.

Thymus serpyllum, b. S. [illegible]

¶ *The Deſcription.*

1 Both *Dioſcorides* and *Pliny* make two kindes of *Serpillum*, that is, of creeping or wilde Time, whereof the firſt is our common creeping Time, which is ſo well knowne, that it needeth no deſcription; yet this ye ſhall vnderſtand, that it beareth floures of a purple colour, as euery body knoweth. Of which kinde I found another ſort, with floures as white as ſnow, and haue planted it in my garden, where it becommeth an herbe of great beauty.

2 This wilde Time that bringeth forth white floures differeth not from the other, but onely in the colour of the floures, whence it may be called *Serpillum vulgare flore albo*. White floured Wilde Time.

There is another kinde of *Serpillum* which groweth in Gardens, in ſmell and ſauour reſembling Marjerome. It hath leaues like Organy, or wilde Marjerome, but ſomewhat whiter, putting forth many ſmall ſtalkes, ſet full of leaues like Rue, but longer, narrower, and harder. The floures are of a biting taſte, and pleaſant ſmell. The whole plant groweth vpright, whereas the other creepeth along vpon the earth, catching hold where it growes, & ſpreading it ſelfe far abroad.

3 This great wilde Time creepeth not as the others doe, but ſtandeth vpright, and bringeth forth little ſlender branches full of leaues like thoſe of Rue; yet narrower, longer, and harder. The floures be of a purple colour, and of a twinging biting taſte: it groweth vpon rockes, and is hotter than any of the others.

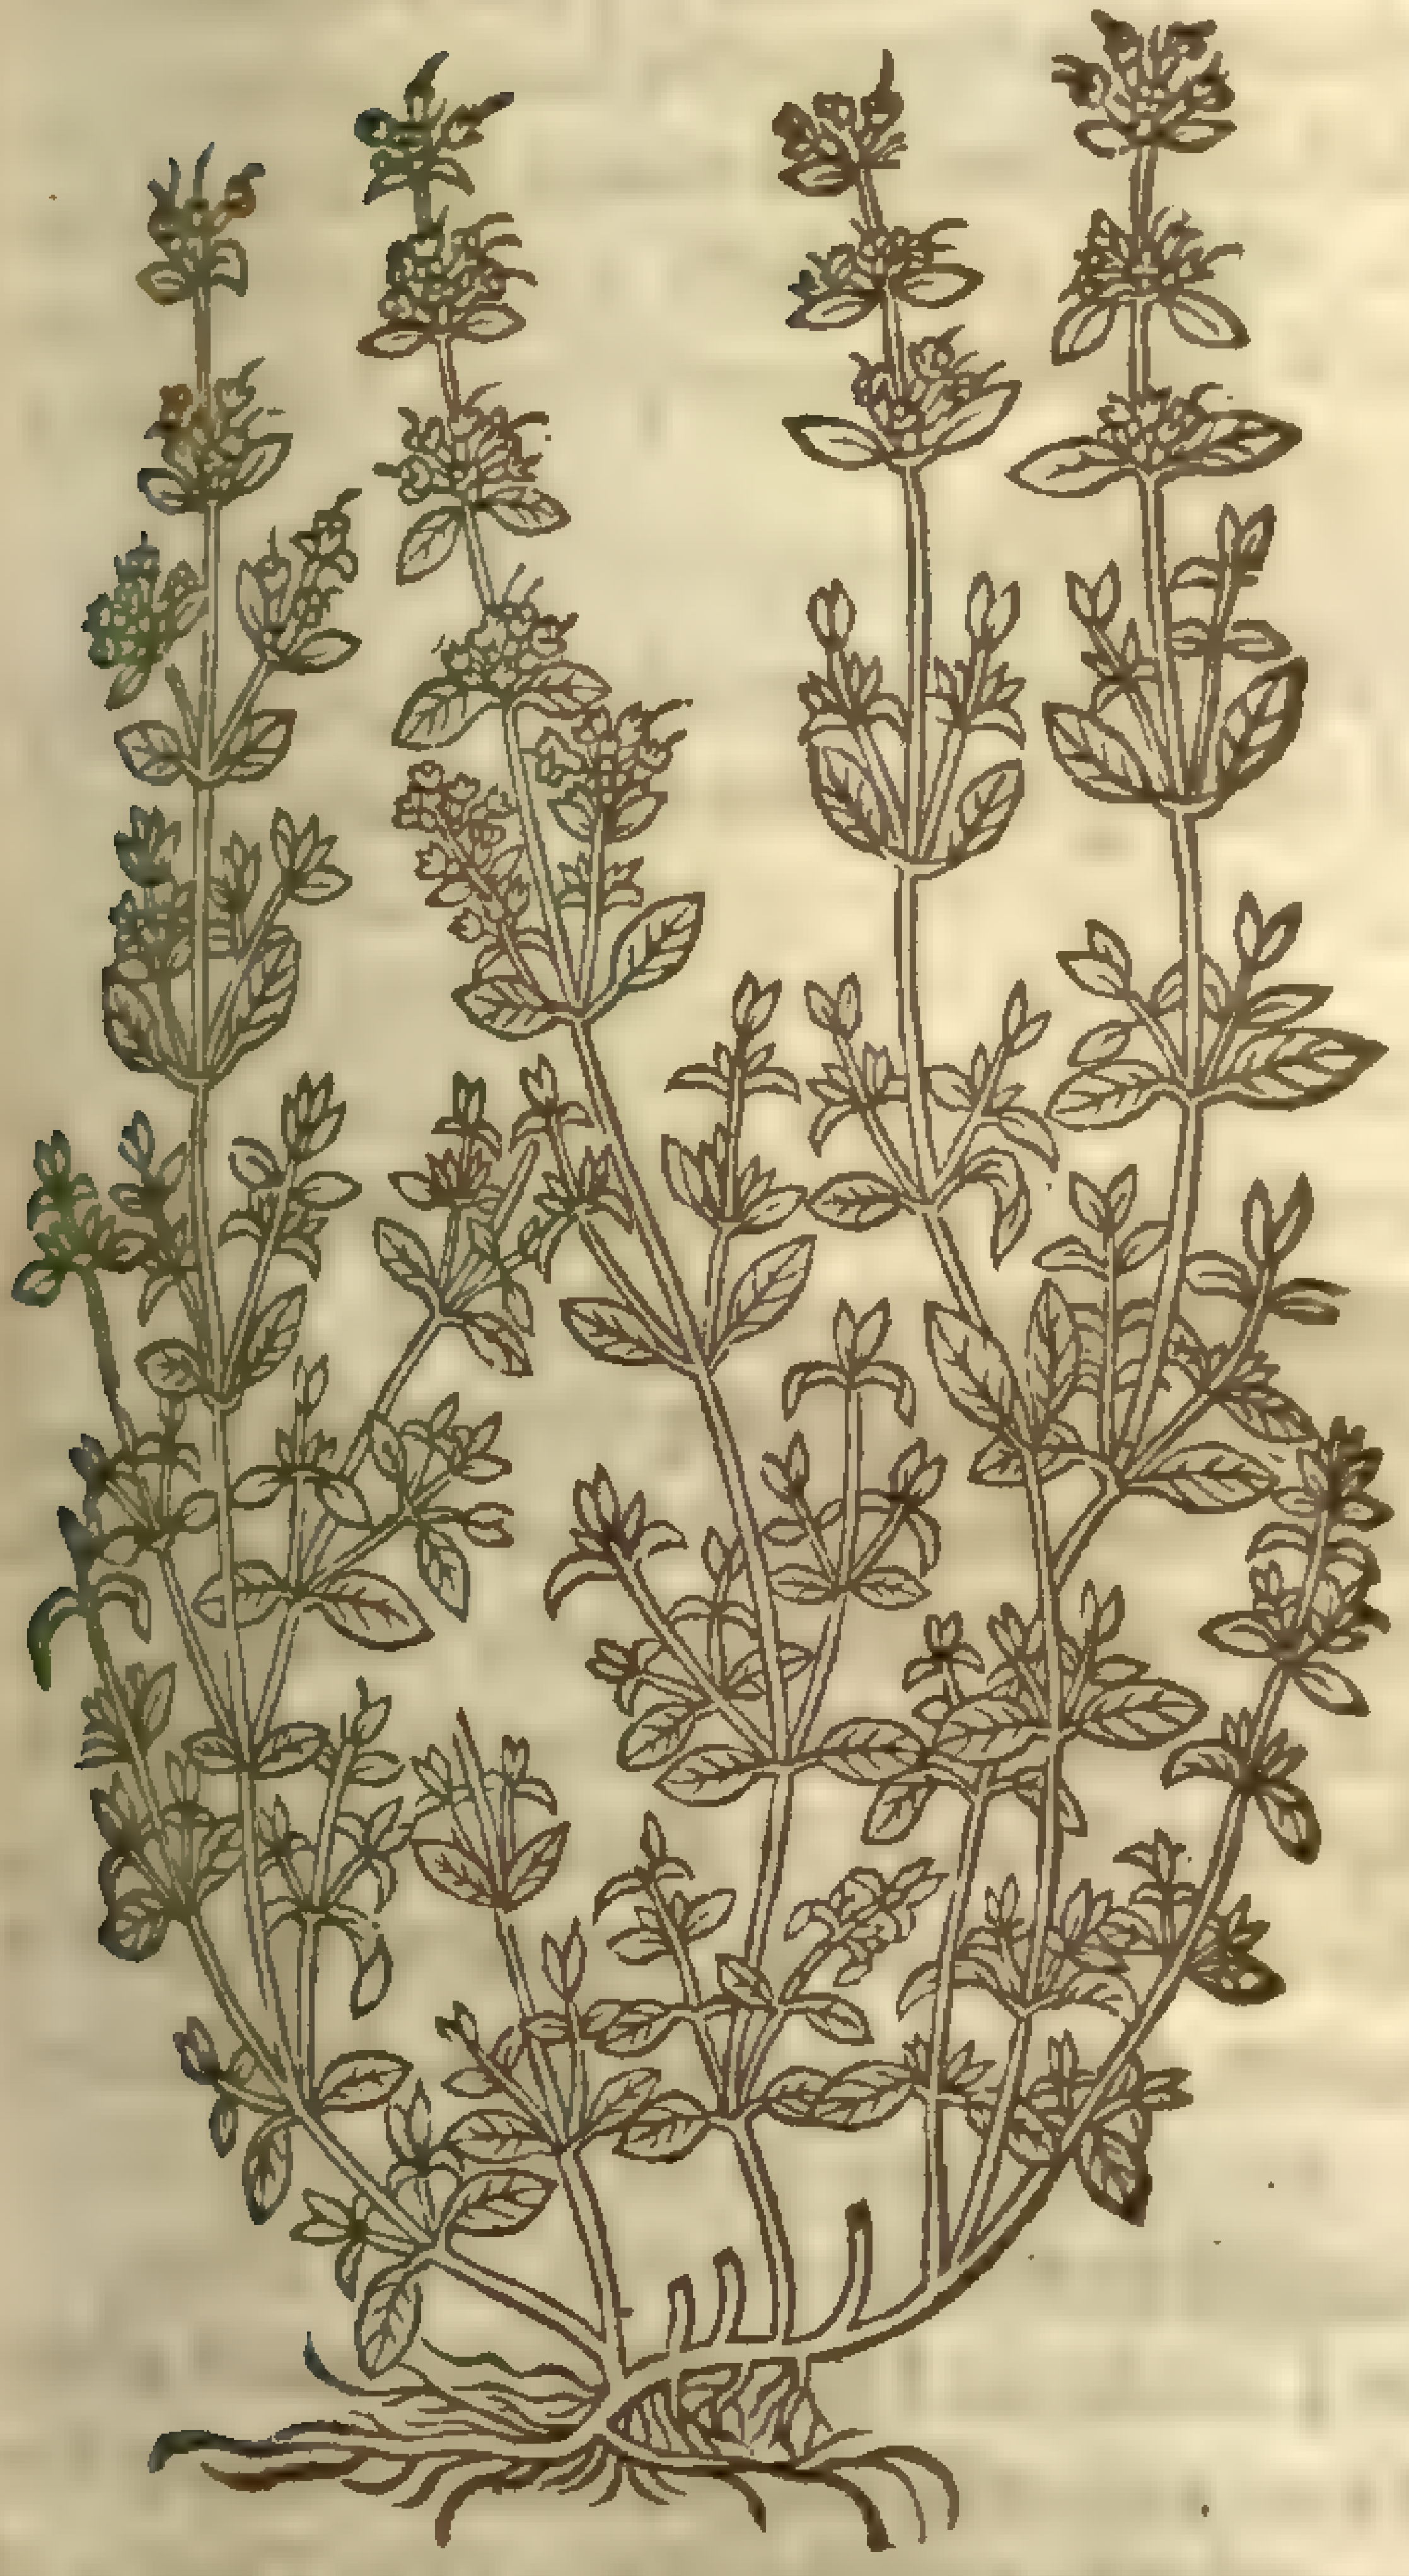
4 This other great one with white floures differeth not from the precedent, hauing many knaps or heads, of a milke-white colour, which ſetteth forth the difference; and it may be called *Serpillum majus flore albo*. Great white floured wild Time.

5 This wilde Time creepeth vpon the ground, ſet with many leaues by couples like thoſe of Marjerome, but leſſer, of the ſame ſmel: the flours are of a reddiſh color. The root is very threddy.

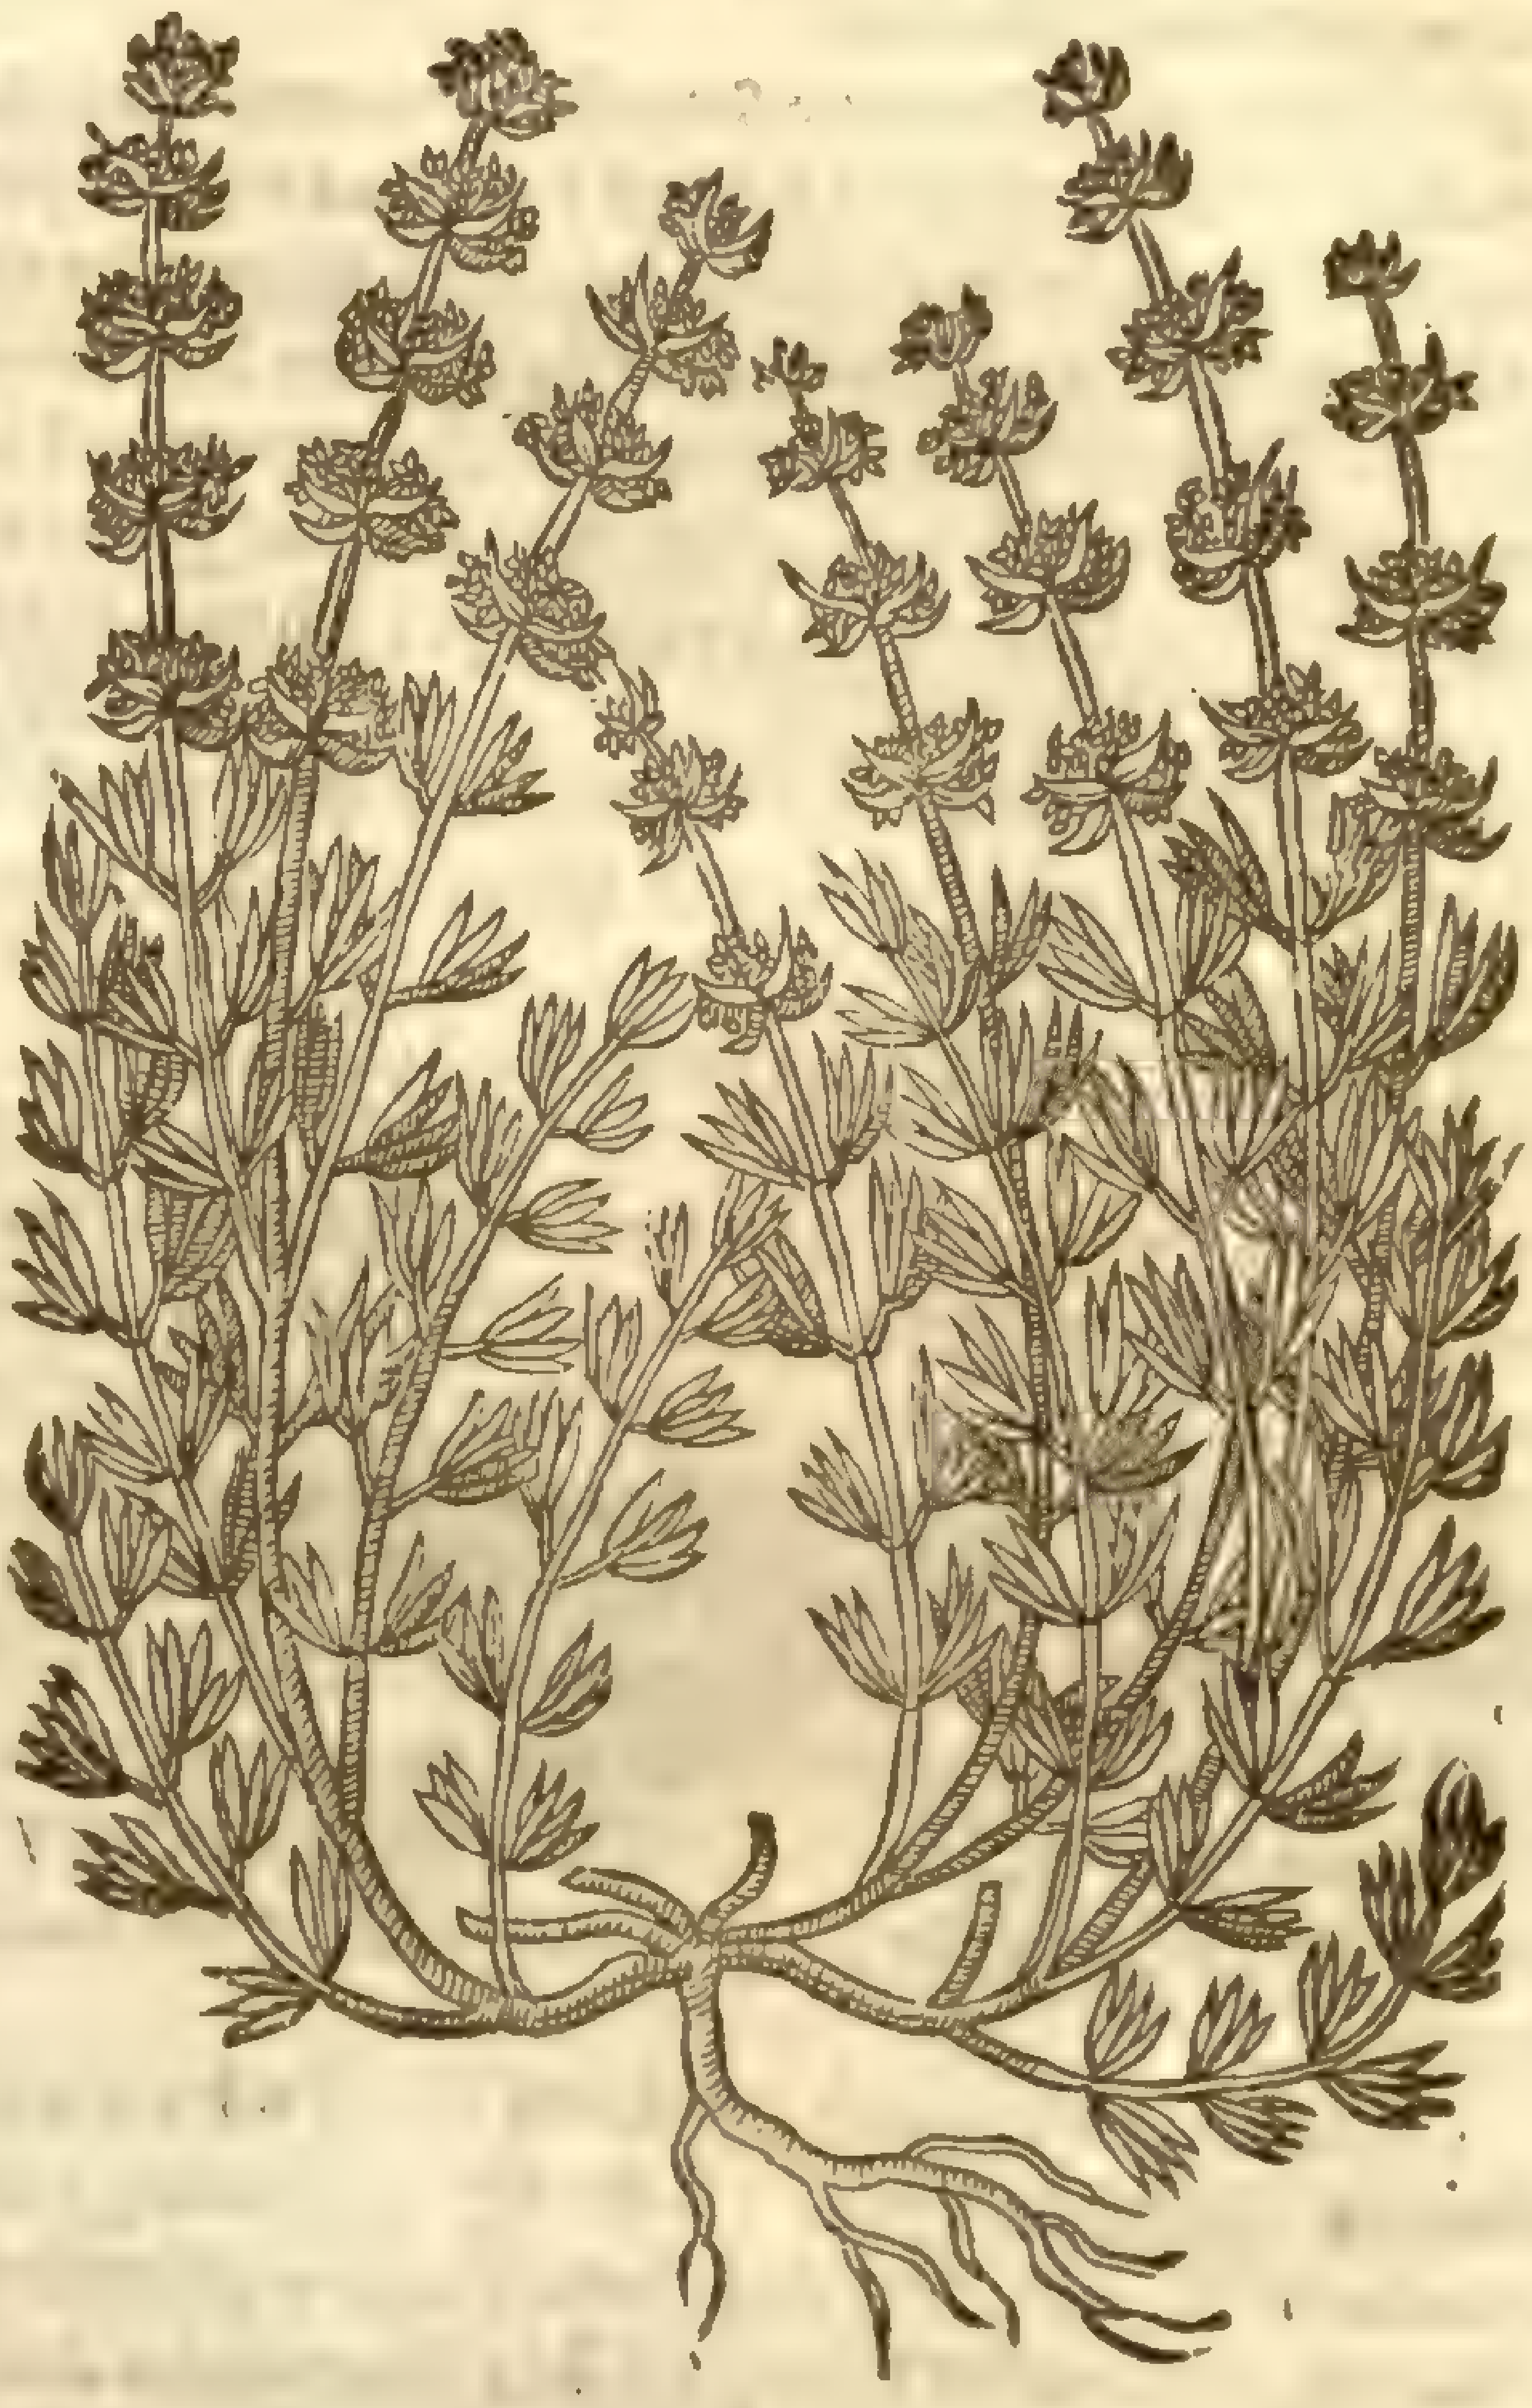
6 Wilde Time of Candy is like vnto the other wild Times, ſauing that his leaues are narrower and longer, and more in number at each joynt. The ſmell is more aromaticall than any of the others, wherein is the difference.

7 There is a kinde of wilde Time growing vpon the mountaines of Italy, called *Serpillum Citratum*,

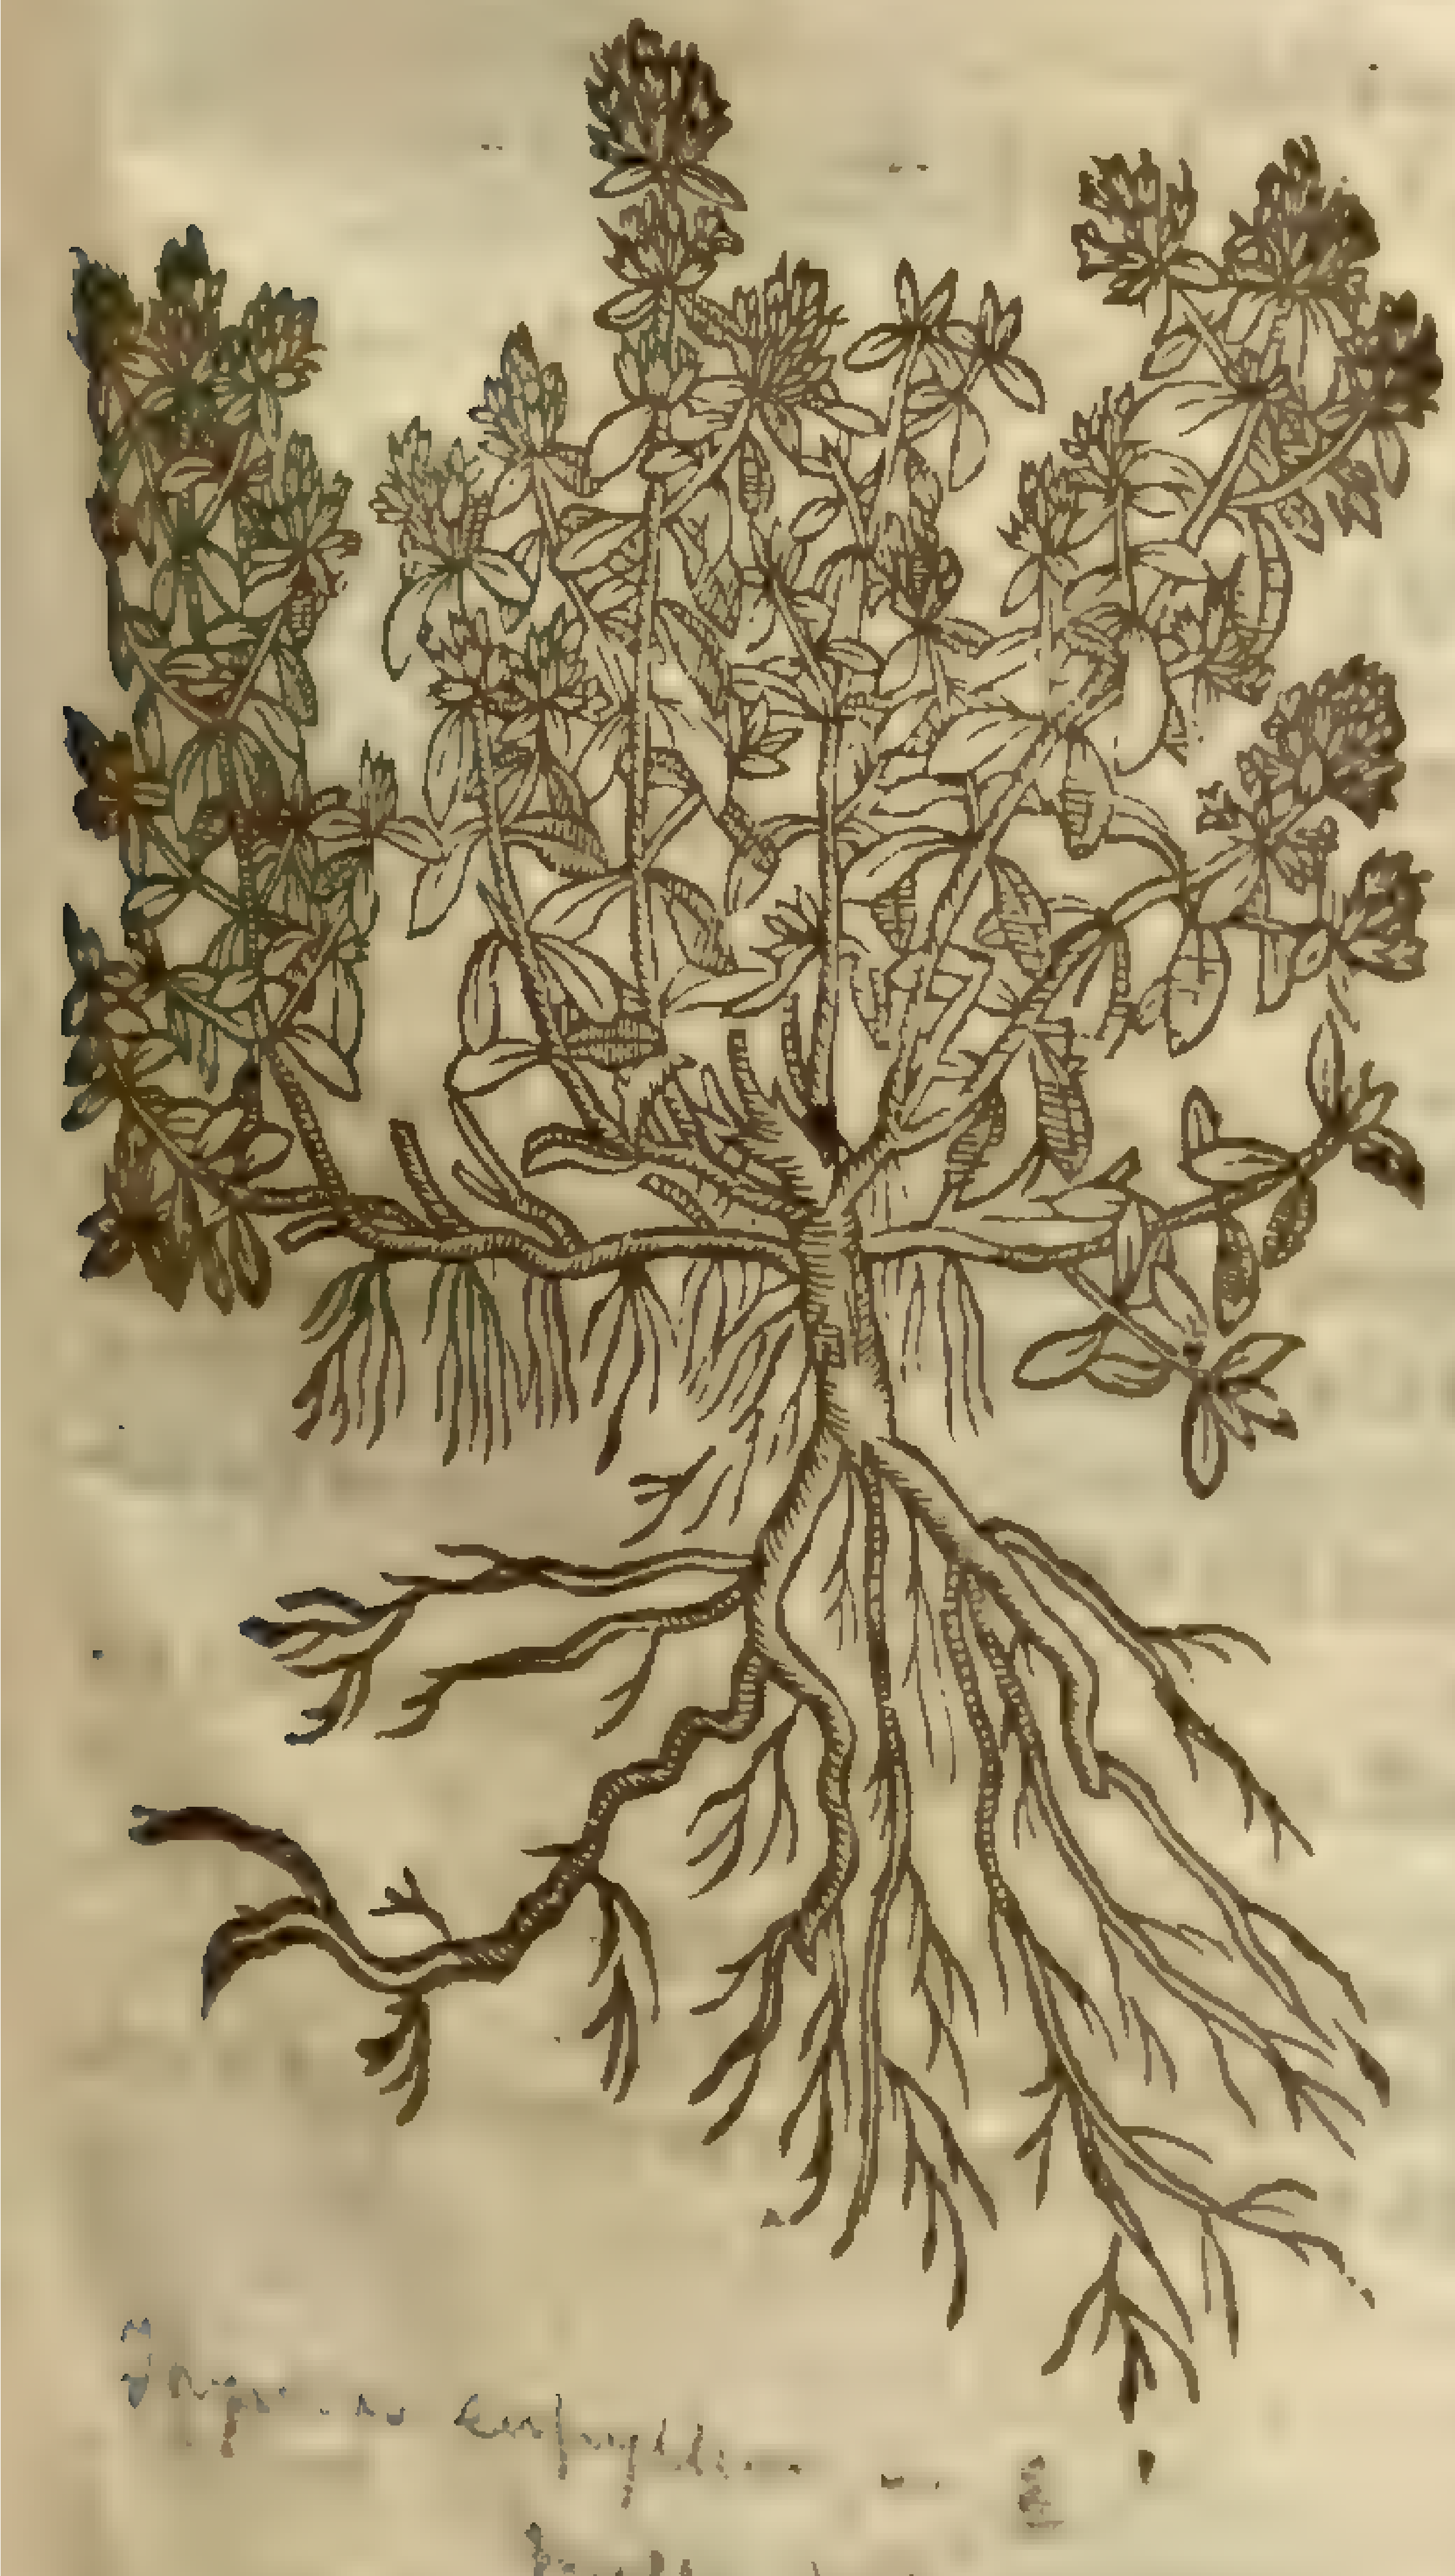
5 *Serpillum folijs amaraci.*
Marjerome Time.



6 *Serpillum Creticum.*
Wilde Time of Candy.

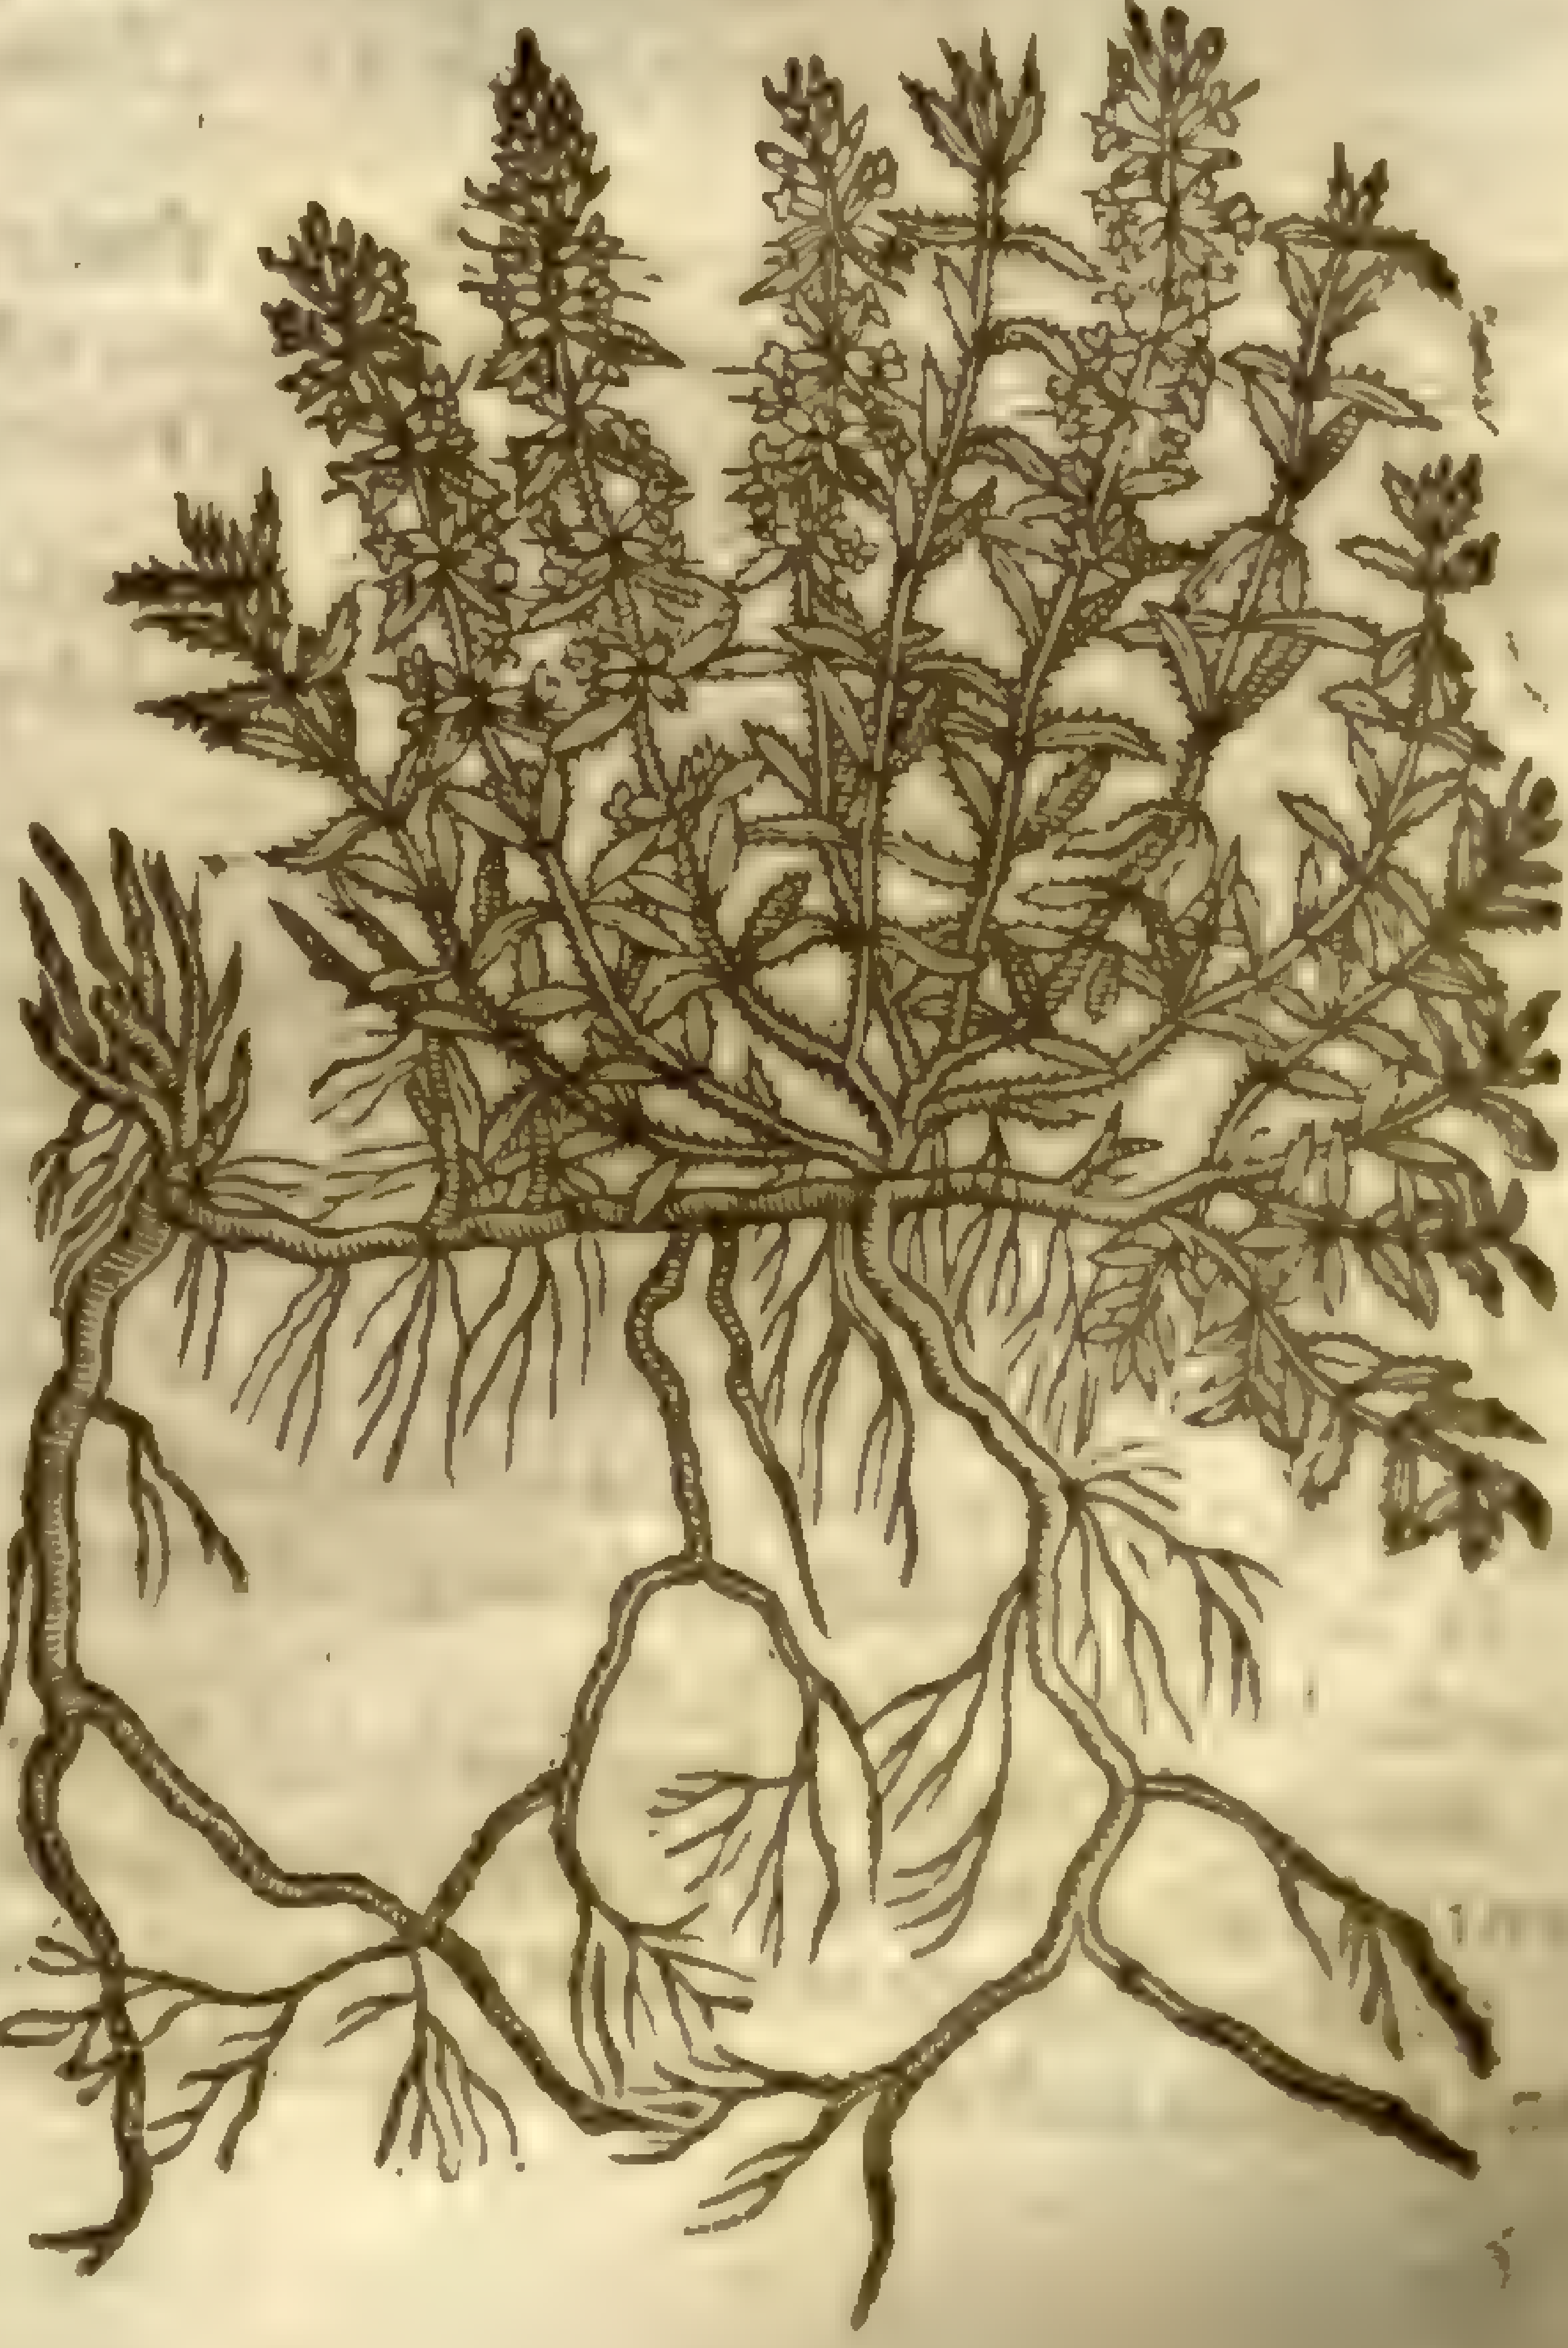


‡ 7 *Serpillum cictatum.*
Limon Time.



[illegible] [illegible] [illegible]
[illegible] [illegible]
Sm. fl. 3.108

‡ 8 *Serpillum hirſutum.*
Hoary wilde Time.



Citratum, that is, hauing the ſmell of a Pome-Citron, or a Limon, which giueth it the difference from the other wilde times. ‡ It growes in many gardens alſo, and (as I haue been told) wilde in diuers places of Wales.

8 This (which is the *Serpillum Pannonicum* 3.of *Cluſius)* runnes or ſpreds it ſelfe far vpon the ground. For though it haue a hard and woddy root like as the former kindes, yet the branches which lie ſpread round about here and there take root, which in time become as hard and wooddie as the former. The leaues and ſtalkes are like thoſe of the laſt deſcribed,but rough and hoarie: the floures alſo are not vnlike thoſe of the common kinde. The whole plant hath a kinde of reſinous ſmell. It floures in Iune with the reſt,and growes vpon the like mountainous places; but whether with vs in England or no I cannot yet affirme any thing of certaintie. ‡

¶ *The Place.*

The firſt groweth vpon barren hills and vntoiled places: the ſecond groweth in Gardens. The white kinde I found at South fleet in Kent,in a barren field belonging to one Mr *William Swan.*

¶ *The Time.*

They floure from May to the end of Summer.

¶ *The Names.*

Wild Time is called in Latine,*Serpillum,à ſerpendo*, of creeping:in high and low Dutch, **Quendel**, and **wilden Thymus**, and alſo **Onſer Vrouwen bedſtroo**: in Spaniſh, *Serpoll*: in Italian, *Serpillo*: in French,*Pillolet*: in Engliſh, wilde Time, Puliall mountaine, Pella Mountaine, running Time,creeping Time, Mother of Time: in ſhops it is called *Serpyllum*; yet ſome call it, *Pulegium montanum*: and it is euery where(ſaith *Dodonæus)* thought to be the *Serpyllum* of the Antients.Notwithſtanding it anſwereth not ſo well to the wilde Times as to *Dioſcorides* his *Saxifranga*; for if it be diligently compared with the deſcription of both the *Serpilla* and the *Saxifranga*, it ſhall be found to be little like the wilde Times, but very much like the *Saxifranga*: for (ſaith *Dioſcorides)* *Saxifranga* is an herbe like Time,growing on rockes, where our common wilde Time is oftentimes found.

Ælianus in his ninth booke of his ſundry Hiſtories ſeemeth to number wilde Time among the floures. *Dionyſius Iunior* (ſaith he) comming into the city Locris in Italy, poſſeſſed moſt of the houſes of the city,and did ſtrew them with roſes,wilde Time,and other ſuch kindes of floures. Yet *Virgil* in the ſecond Eclog of his Bucolicks doth moſt manifeſtly teſtifie, that wilde Time is an herbe,in theſe words:

Theſtylis & rapido feſſis meſſoribus æſtu
Allia, ſerpillumque, herbas contundit olentes.

Theſtilis for mowers tyr'd with parching heate,
Garlicke,wilde Time, ſtrong ſmelling herbes doth beate.

Out of which place it may be gathered, that common wilde time is the true and right *Serpillum*, or wilde Time,which the Grecians call ἕρπυλλος. *Marcellus* an old antient Author among the Frenchmen ſaith it is called *Gilarum*; as *Plinius Valerianus* ſaith it is called of the ſame,*Laurio.*

¶ *The Temperature.*

Wilde Time is of temperature hot and dry in the third degree: it is of thin and ſubtill parts, cutting and much biting.

¶ *The Vertues.*

A It bringeth downe the deſired ſickeneſſe,prouoketh vrine,applied in bathes and fomentations it procureth ſweat: being boyled in wine, it helpeth the ague, it eaſeth the ſtrangurie, it ſtayeth the hicket, it breaketh the ſtones in the bladder, it helpeth the Lethargie, frenſie,and madneſſe, and ſtayeth the vomiting of bloud.

B Wilde Time boiled in wine and drunke, is good againſt the wambling and gripings of the belly,ruptures,conuulſions,and inflammations of the liuer.

C It helpeth againſt the bitings of any venomous beaſt, either taken in drinke,or outwardly applied.

D *Aëtius* writeth,That *Serpillum* infuſed well in Vinegre,and then ſod and mingled with roſe water, is a right ſingular remedy to cure them that haue had a long phrenſie or lethargie.

E *Galen* preſcribeth one dram of the juyce to be giuen in vinegre againſt the vomiting of bloud, and helpeth ſuch as are grieued with the ſpleene.

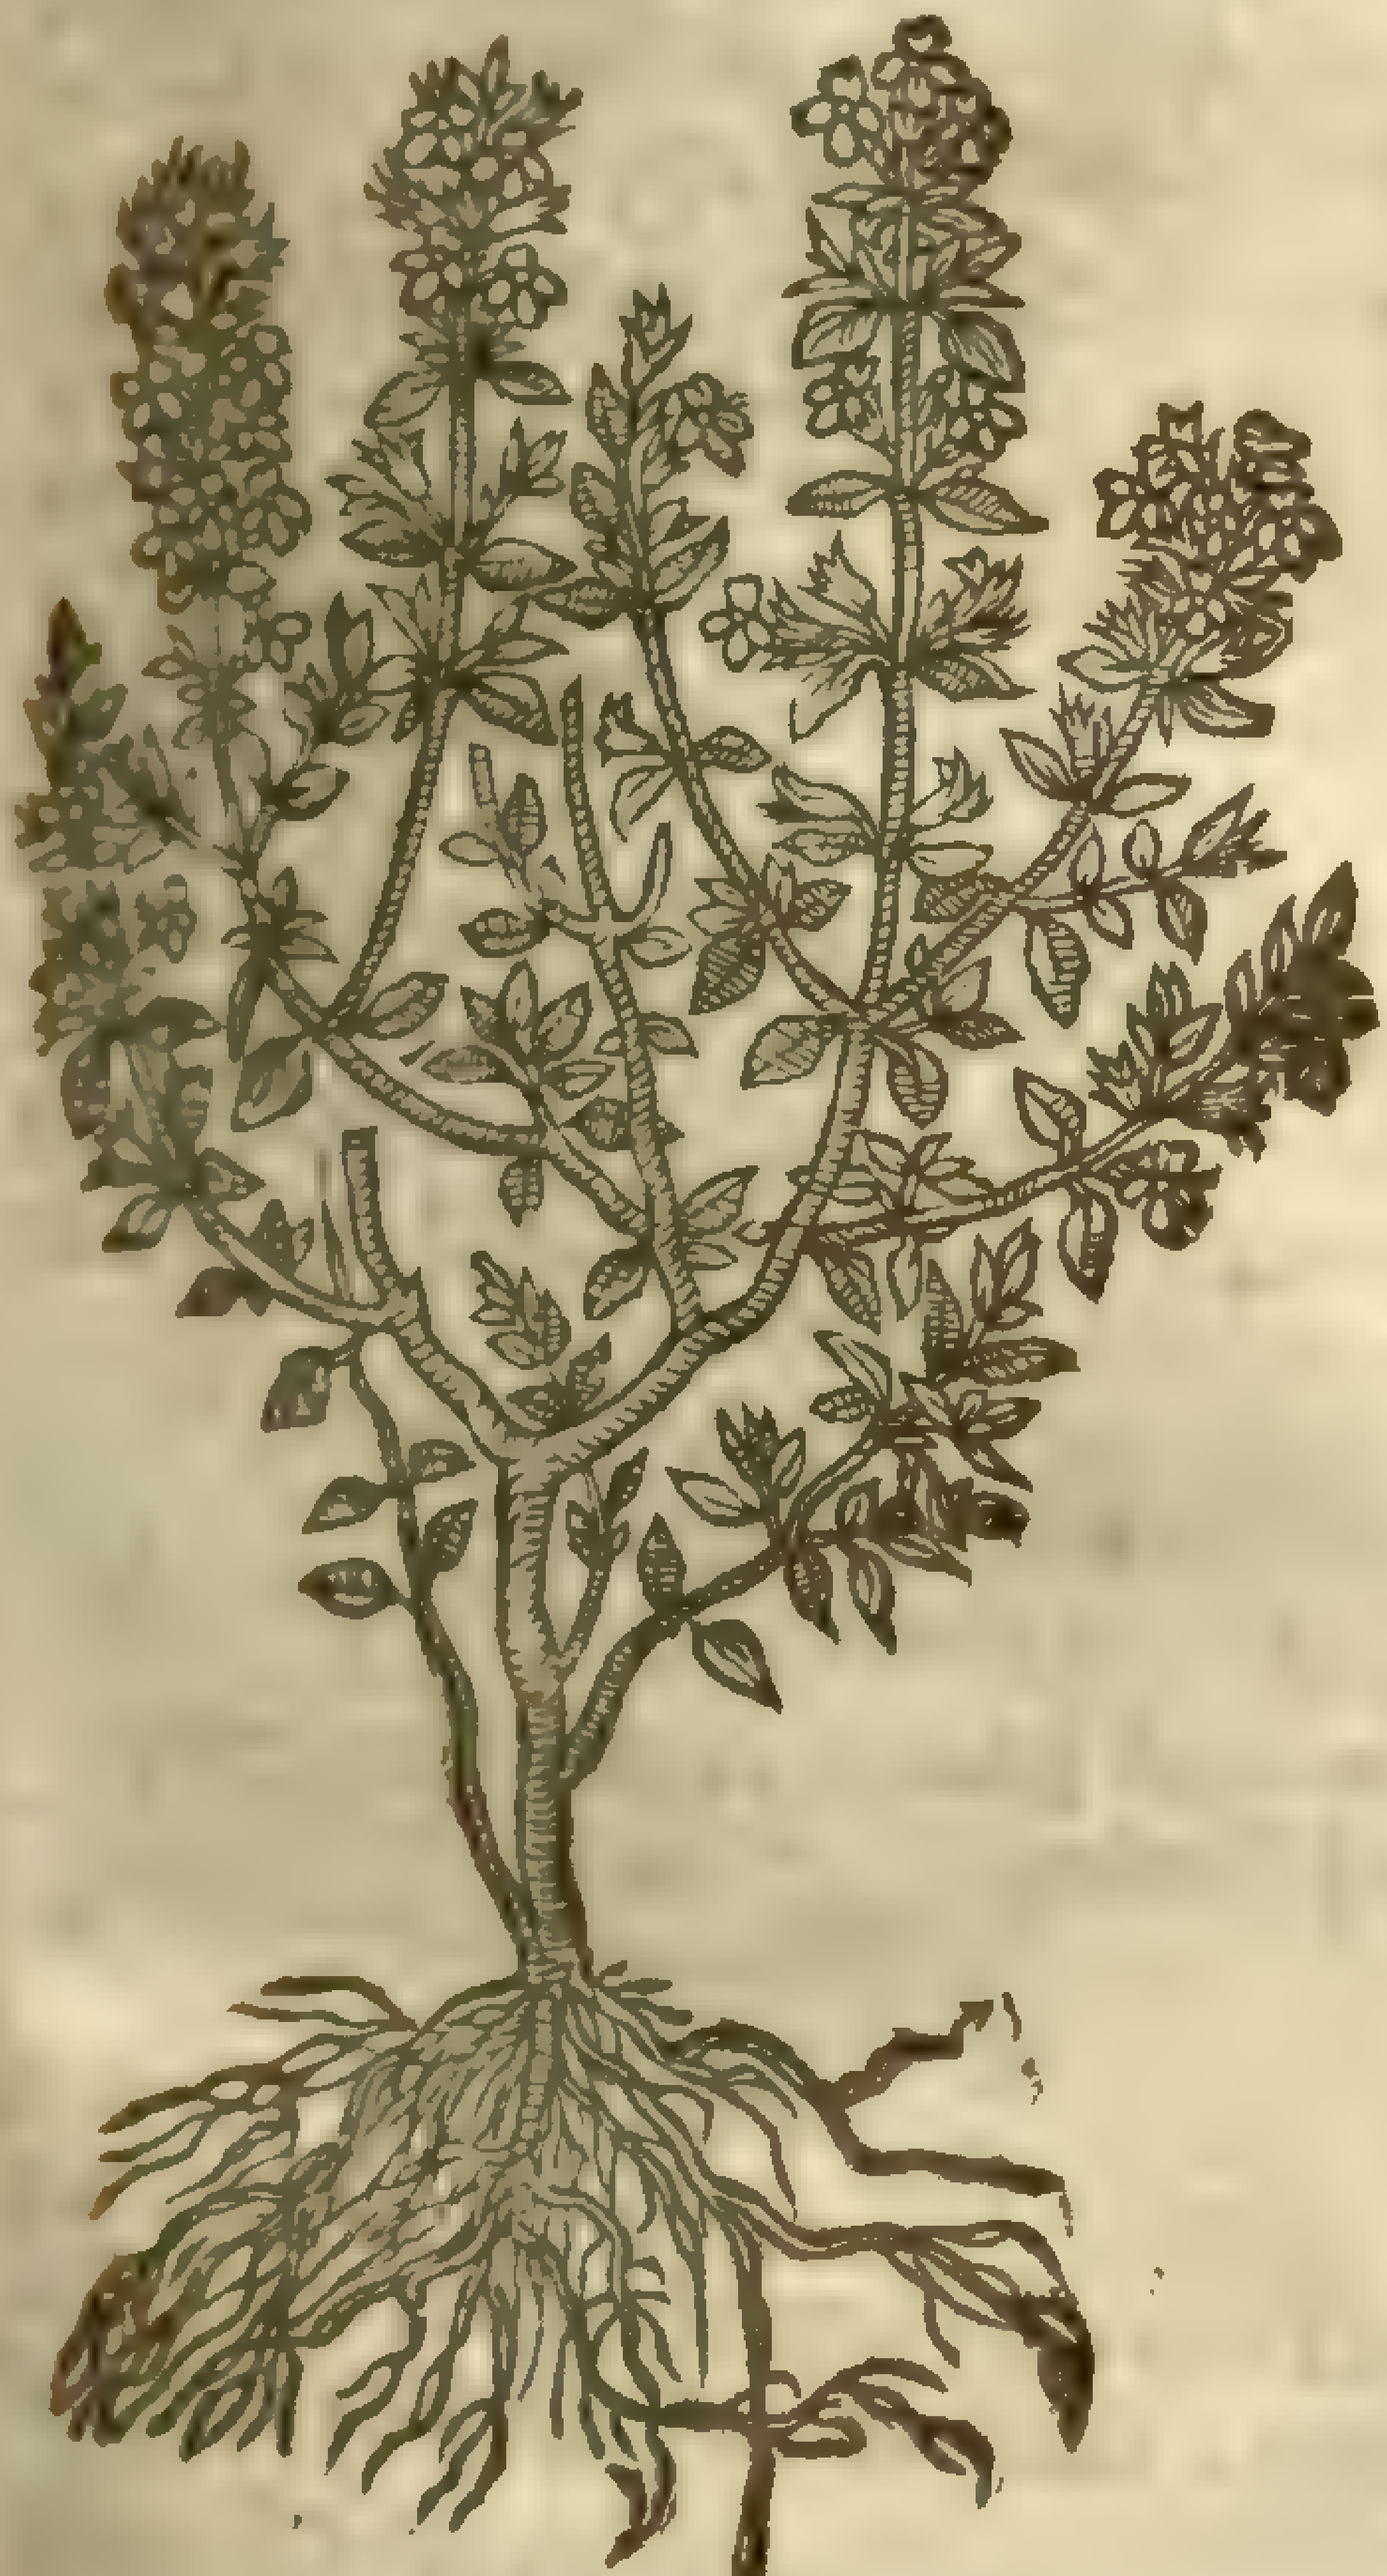
Chap. 174. *Of Garden Time.*

¶ *The Deſcription.*

1 The firſt kinde of Time is ſo well knowne that it needeth no deſcription; becauſe there is not any which are ignorant what *Thymum durius* is, I meane our common garden Time.

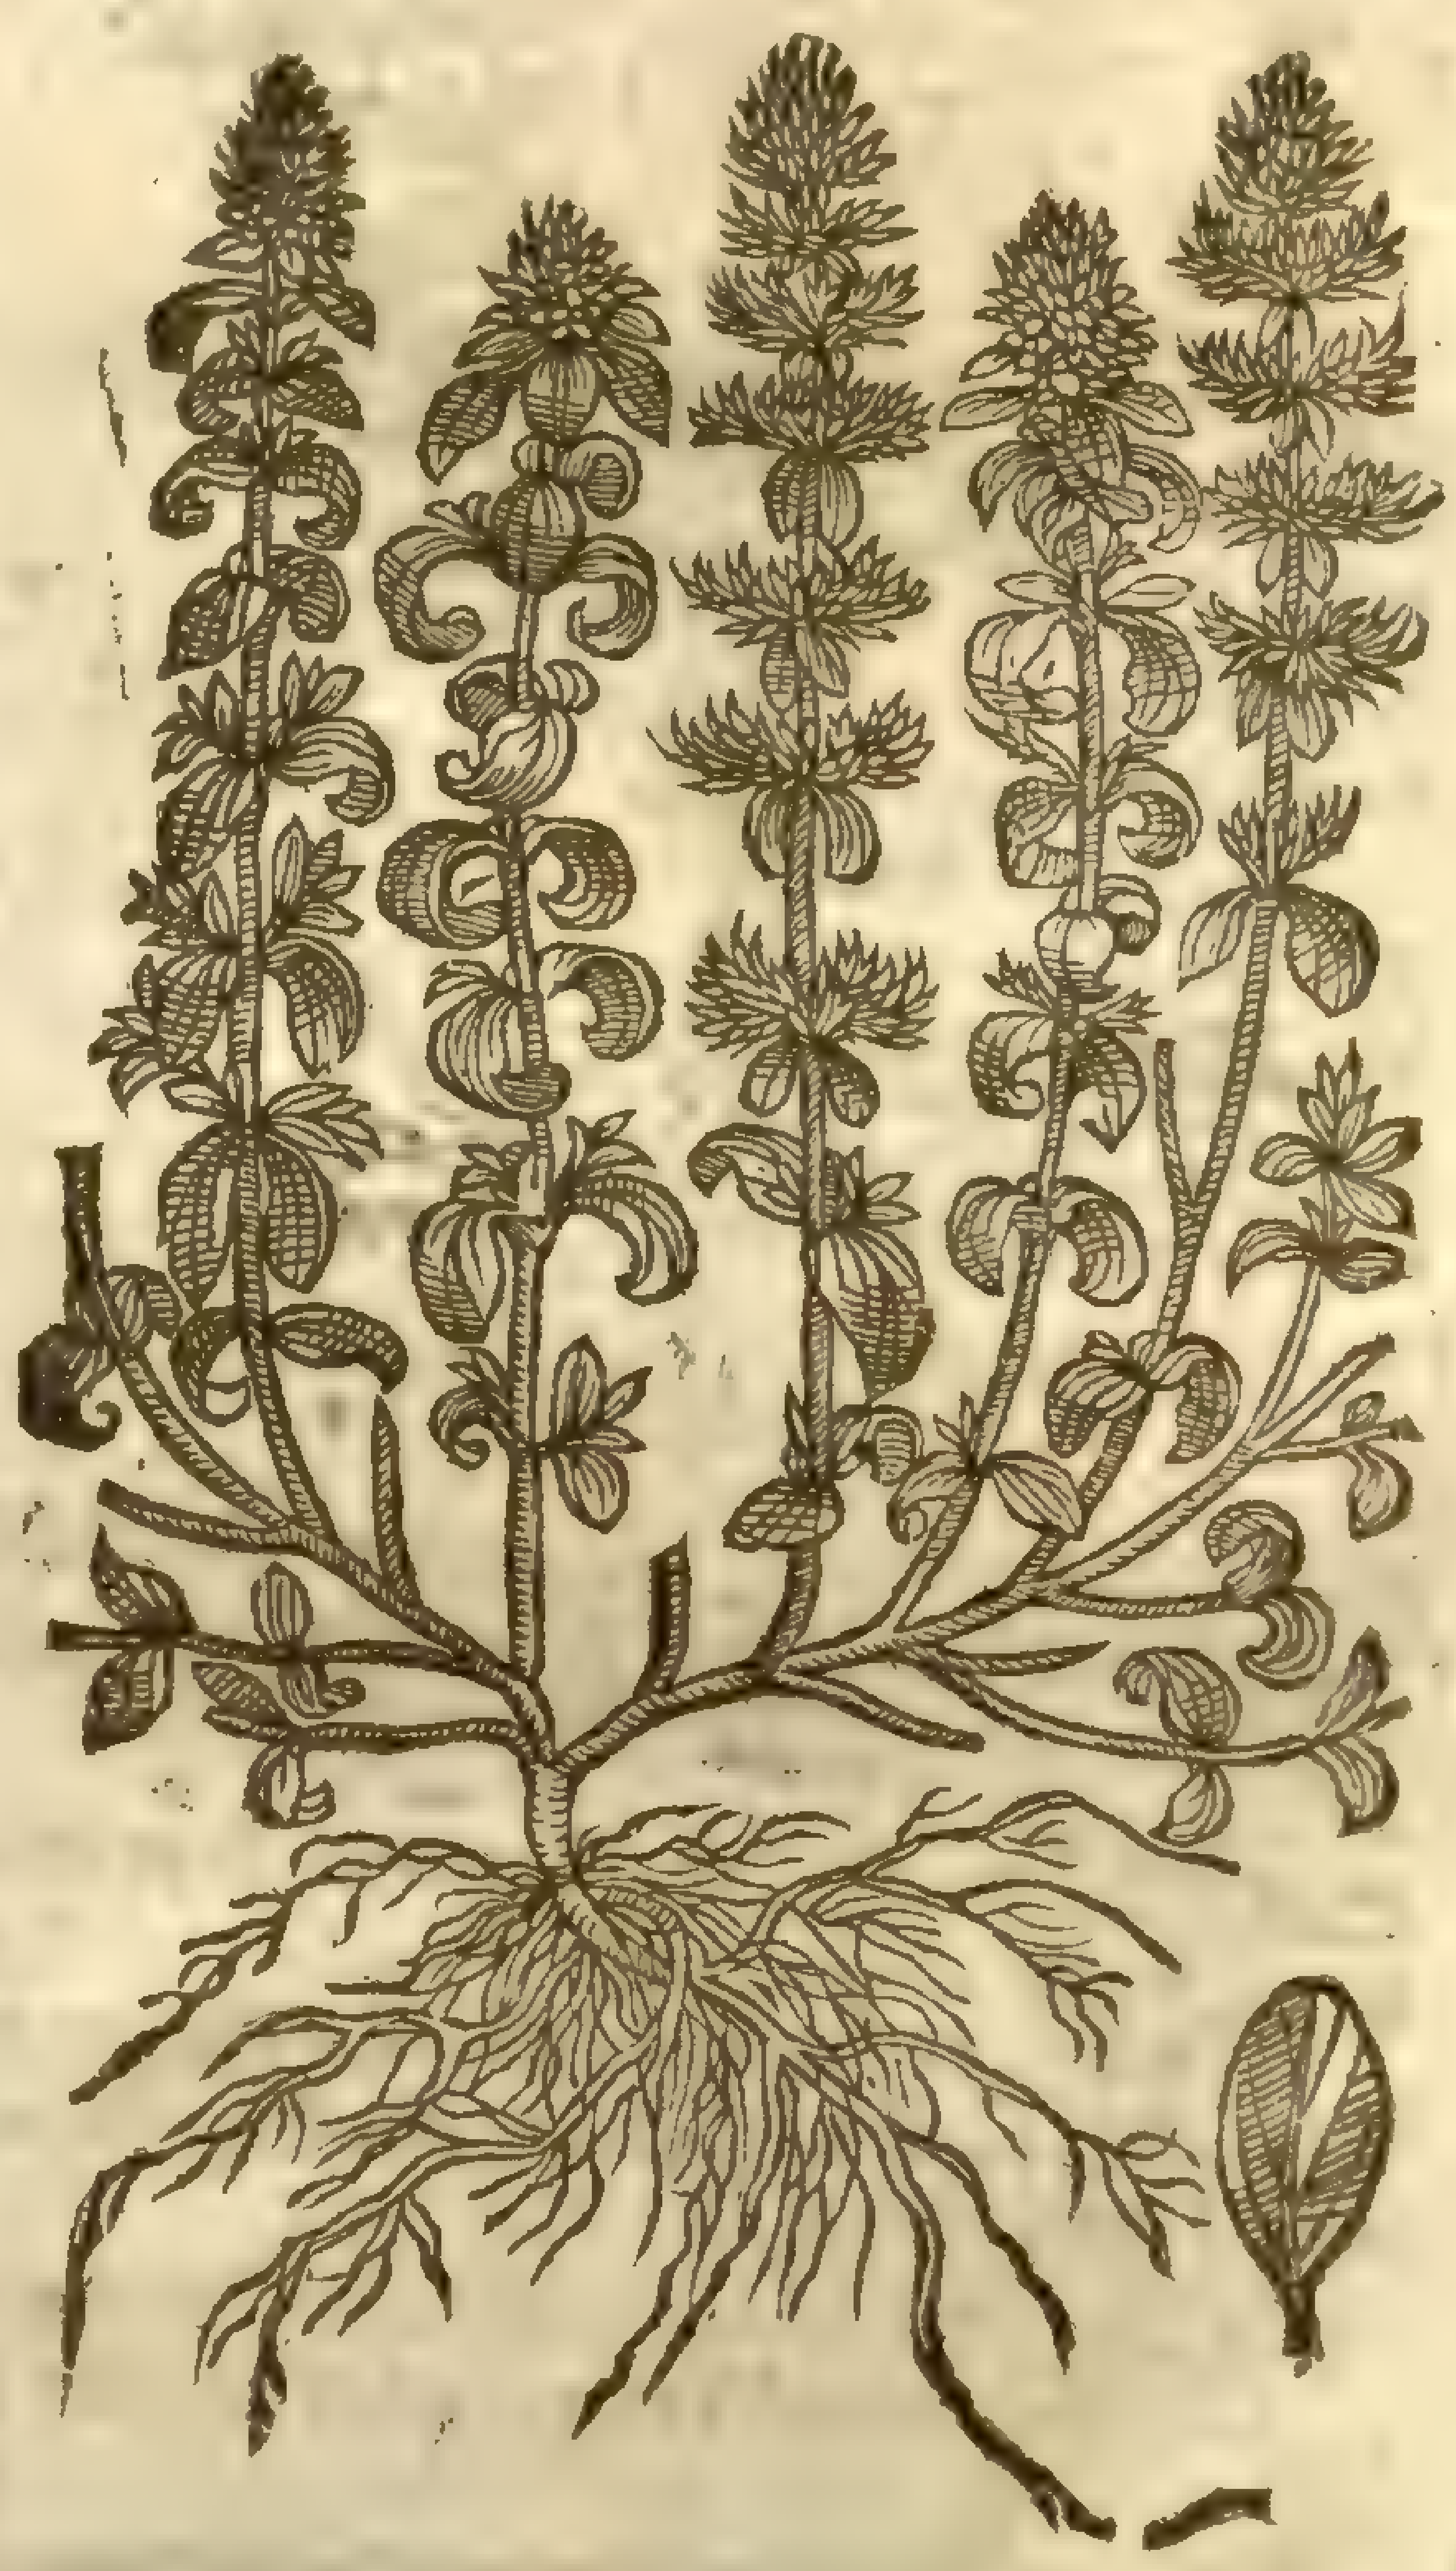
2 The ſecond kinde of Time with broad leaues hath many woddy branches riſing from a threddy root, beſet with leaues like *Myrtus*. The floures are ſet in rundles about the ſtalke like Horehound. The whole plant is like the common Time in taſte and ſmell.

1 *Thymum durius.*
Hard Time.



Thymus vulgaris, L. β
[illegible]

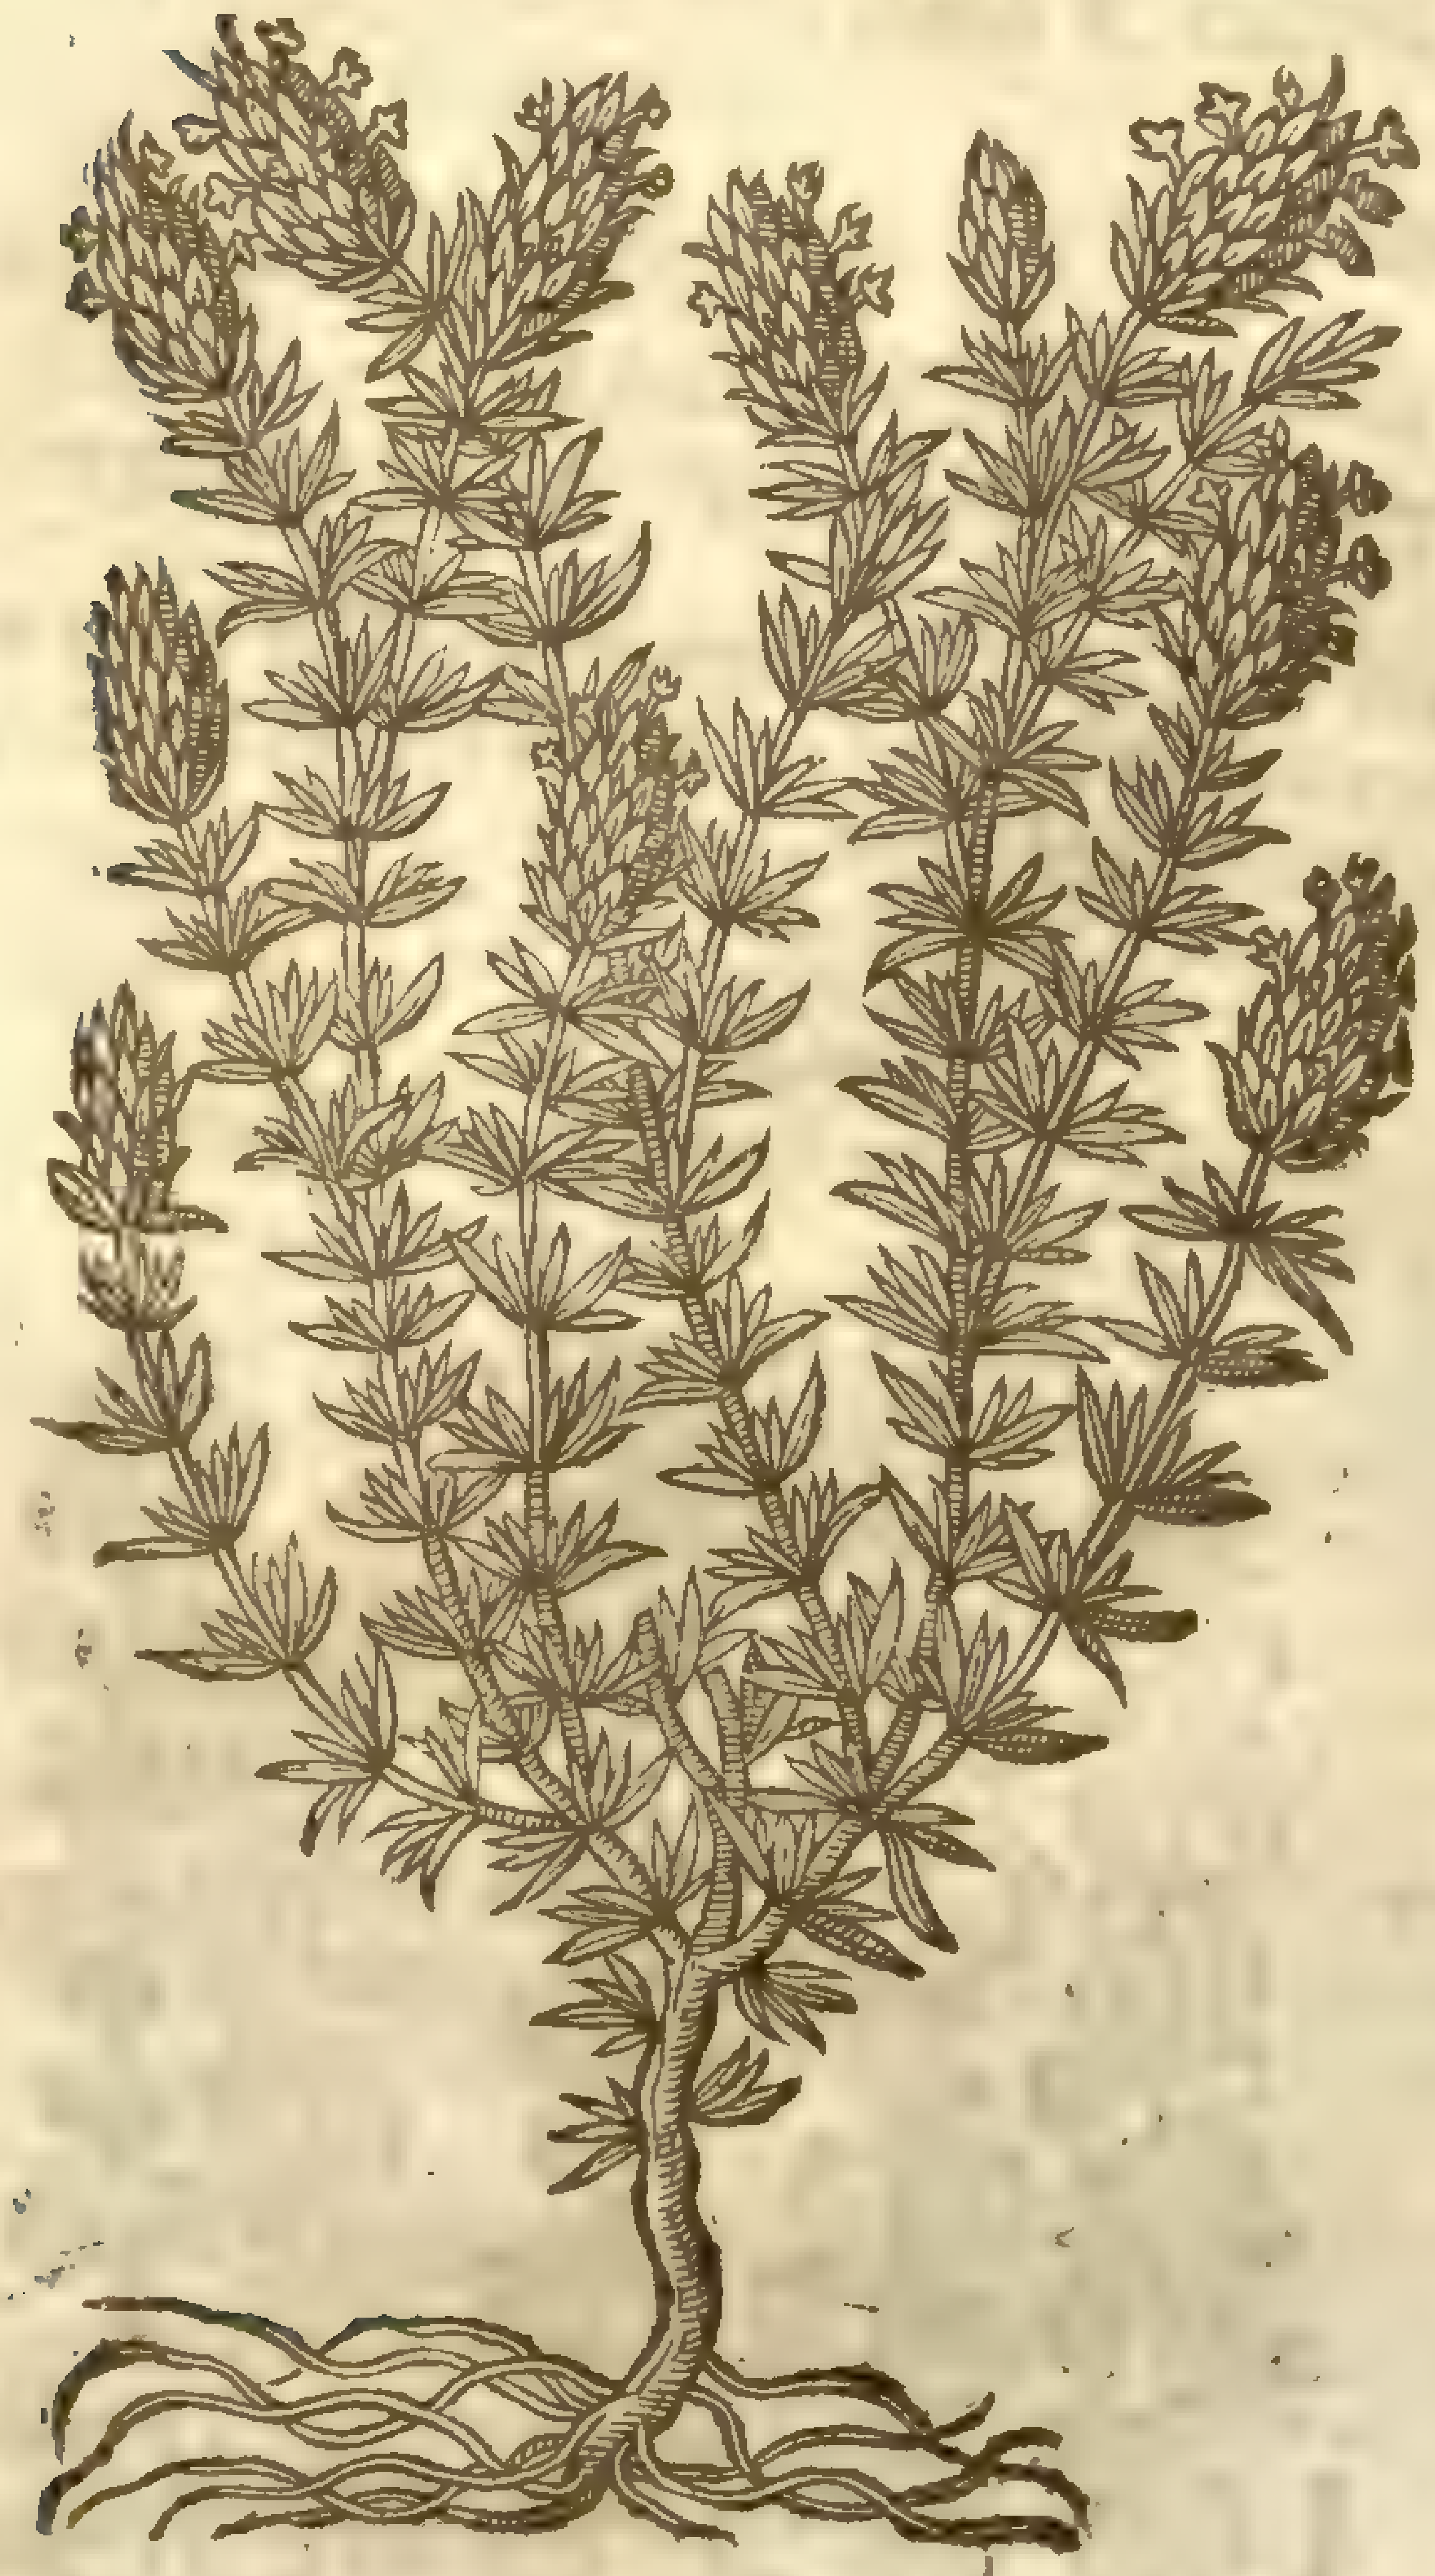
† 2 *Thymum latifolium.*
Great broad leaued Time.



3 Time of Candy is in all reſpects like vnto common Time, but differeth in that, that this kinde hath certaine knobby tufts not much vnlike the ſpikes or knots of *Stæcados*, but much leſſer, beſet with ſlender floures of a purple colour. The whole plant is of a more gracious ſmell than any of the other Times, and of another kinde of taſte, as it were ſauouring like ſpice. The root is brittle, and of a wooddy ſubſtance.

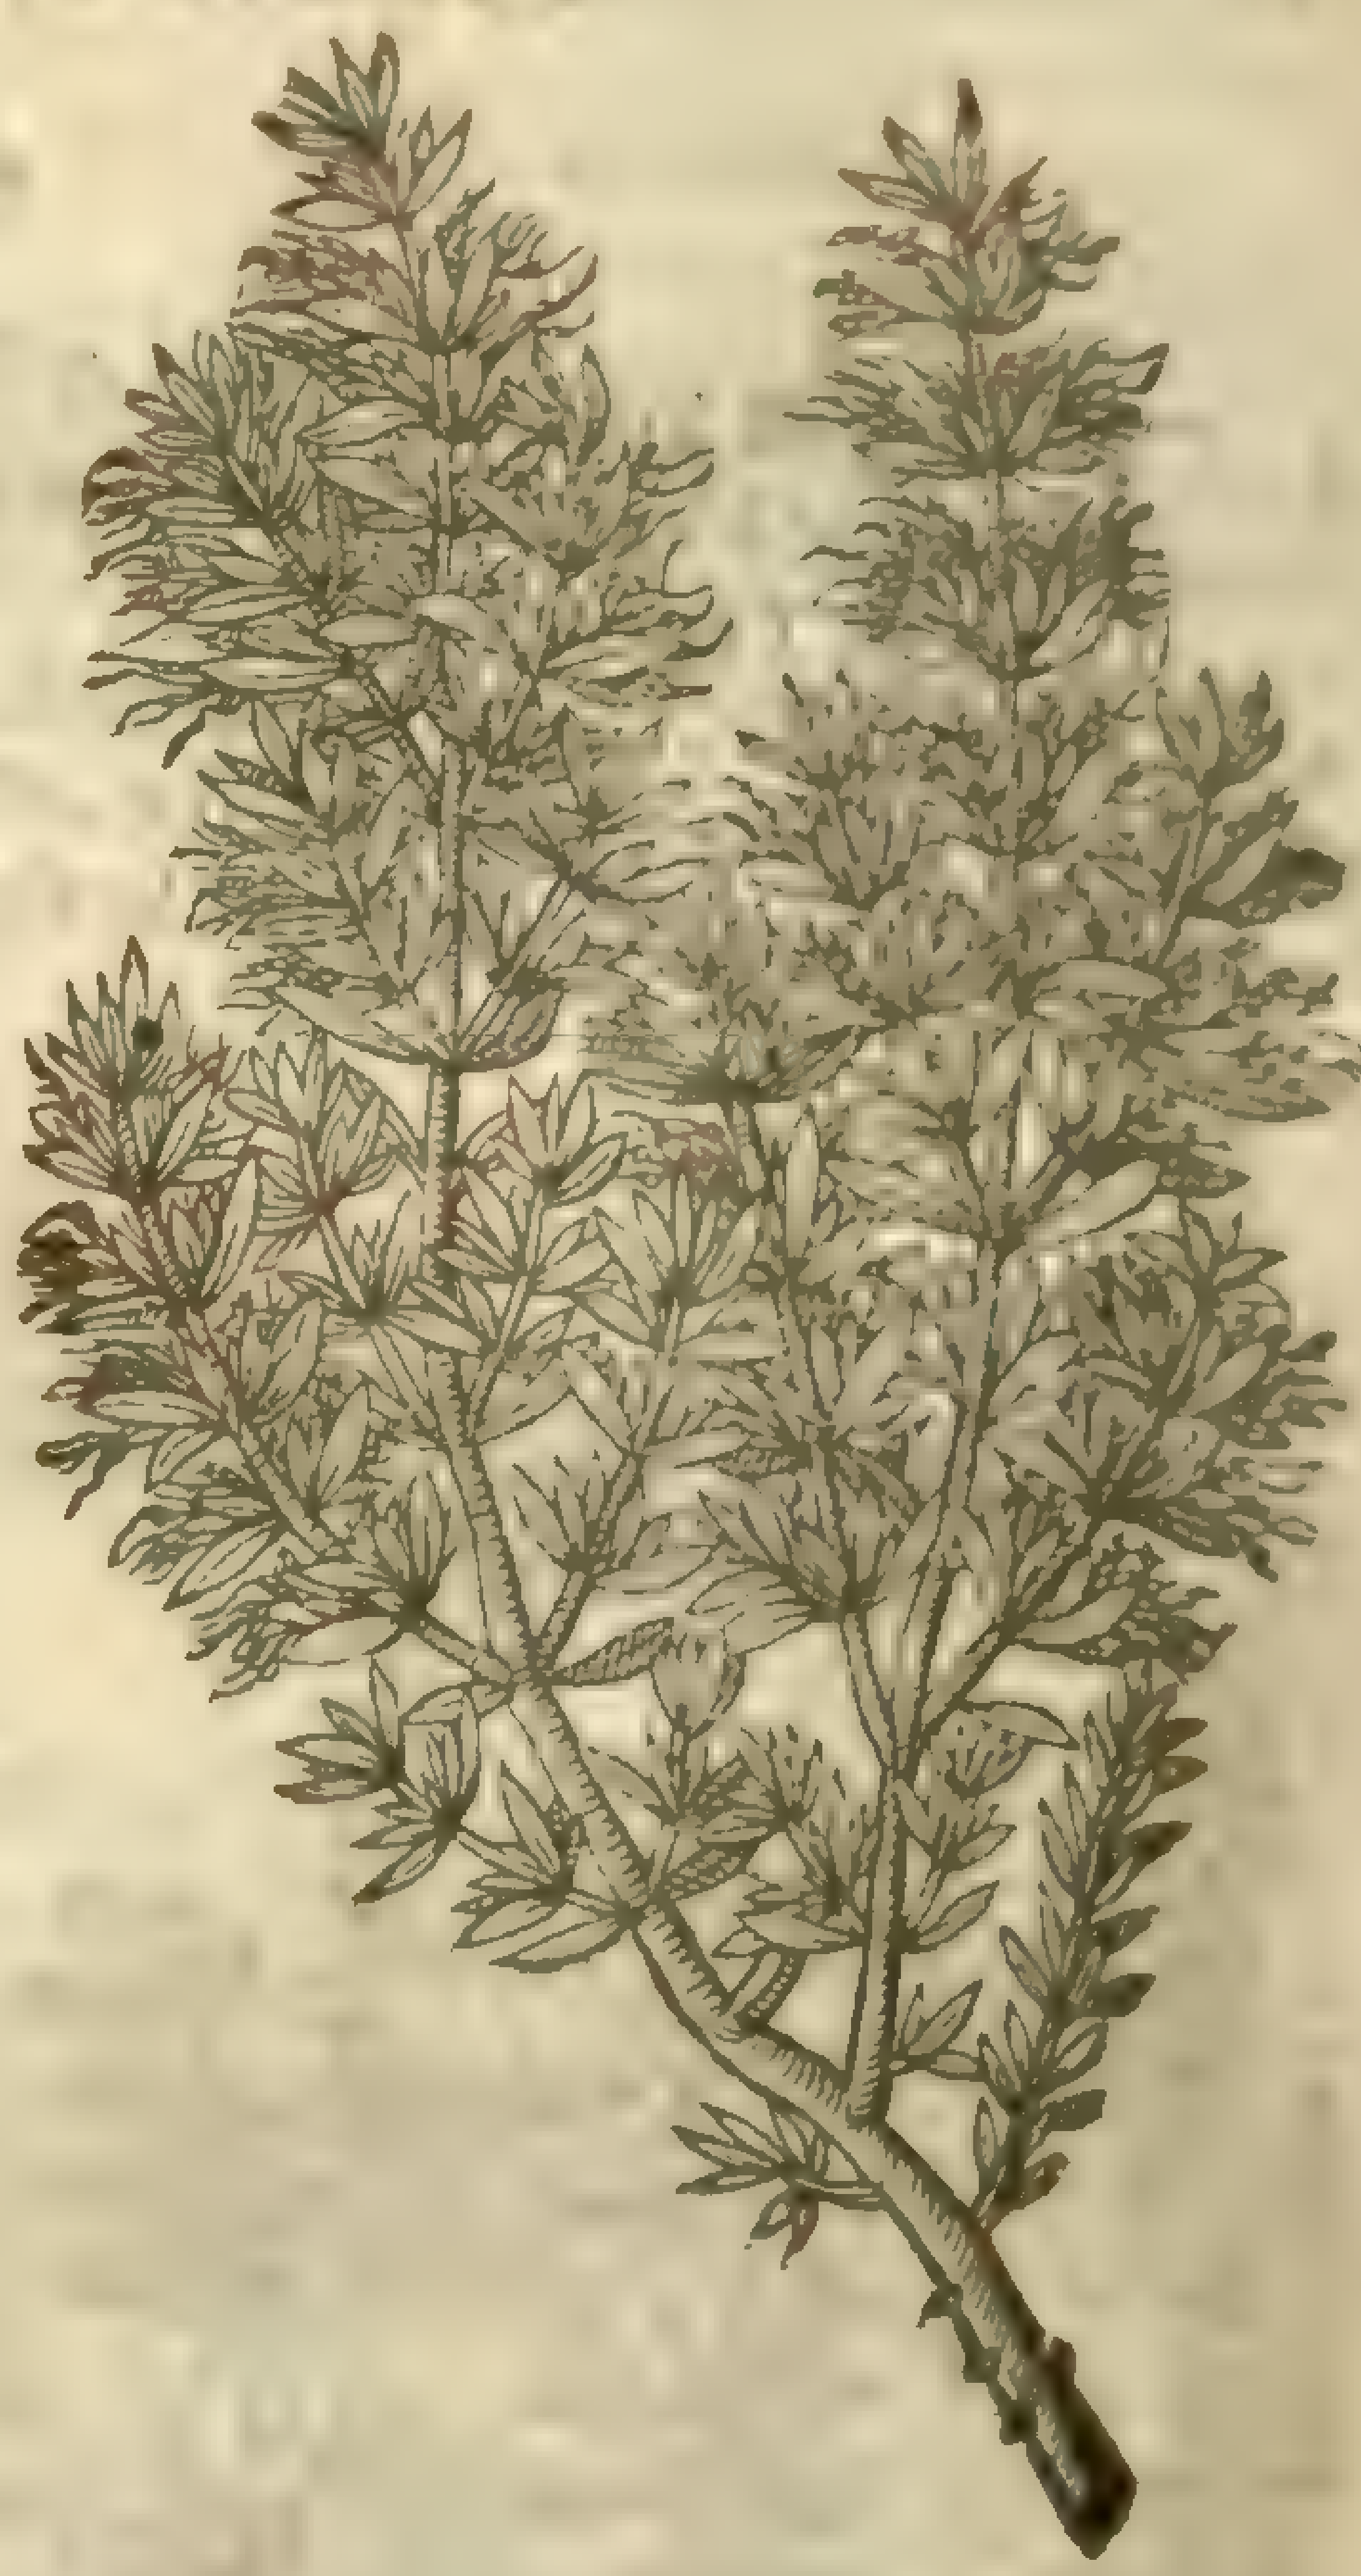
4 Doubtleſſe that kinde of Time whereon *Epithymum* doth grow, and is called for that cauſe *Epithymum*, and vſed in ſhops, is nothing elſe but Dodder that growes vpon Time; and is all one with ours, though *Matthiolus* makes a controuerſie and difference thereof: for *Pena* trauelling ouer the hills in Narbone neere the ſea, hath ſeene not onely the garden Time, but the wilde Time alſo loden and garniſhed with this *Epithymum*. So that by his ſight and mine owne knowledge I am aſſured, that it is not another kinde of Time that beareth *Epithymum*, but is common Time: for I haue often found the ſame in England, not only vpon our Time, but vpon Sauorie, and other herbes alſo: notwithſtanding thus much I may conjecture, that the clymate of thoſe Countries doth yeeld the ſame forth in greater abundance than ours, by reaſon of the intemperance of *cold*, *whereunto* our country is ſubject.

† 3 *Thymum Creticum.*
Time of Candy.



Satureia capitata, in Med. Bot.

4 *Epithymum Græcorum.*
Laced Time.



¶ *The Place.*

Theſe kindes of Time grow plentifully in England in moſt gardens euery where, except that with broad leaues, and Time of Candy which I haue in my Garden.

¶ *The Time.*

They flouriſh from May vnto September.

¶ *The Names.*

The firſt may be called hard Time, or common Garden Time: the ſecond, broad leaued Time; the third, Time of Candy; our Engliſh women call it Muske Time: the laſt may be called Dodder Time.

¶ *The Temperature.*

Theſe kindes of Time are hot and dry in the third degree.

¶ *The Vertues.*

A Time boyled in water and hony drunken, is good againſt the cough and ſhortnes of the breath; it prouoketh vrine, expelleth the ſecondine or after-birth, and the dead childe, and diſſolues clotted or congealed bloud in the body.

B The ſame drunke with vinegre and ſalt purgeth flegme: or boyled in Mede or Methegline, it cleanſeth the breaſt, lungs, reines, and matrix, and killeth wormes.

C Made into pouder, and taken in the weight of three drams with Mede or honied vinegre, called Oxymel, and a little ſalt, it purgeth by ſtoole tough and clammy flegme, ſharpe and cholericke humors, and all corruption of bloud.

D The ſame taken in like ſort, is good againſt the Sciatica, the paine in the ſide and breſt, againſt the winde in the ſide and belly, and is profitable alſo for ſuch as are fearefull, melancholicke, and troubled in minde.

E It is good to be giuen vnto thoſe that haue the falling ſickeneſſe to ſmell vnto.

F *Epithymum*, after *Galen*, is of more effectuall operation in Phyſicke than Time, being hot and dry in the third degree, more mightily cleanſing, heating, drying, and opening than *Cuſcuta*, hauing right good effect to eradicat melancholy, or any other humor in the ſpleen, or other diſeaſe, ſprung by occaſion of the ſpleene.

It helpeth the long continued paine of the head, and beſides his ſingular effects about ſplenetical matters, it helpeth the lepry, or any diſeaſe of melancholy; all quartaine agues, and ſuch like griefes proceeding from the ſpleene. G

Dioſcorides ſaith, *Epithymum* drunke with honied water, expelleth by ſiege, flegme, and melancholy. H

Of his natiue propertie it relieueth them which be melancholicke, ſwolne in the face and other parts, if you pound *Epithymum*, and take the fine pouder thereof in the quantitie of foure ſcruples in the liquor which the Apothecaries call *Paſſum*, or with Oxymell and ſalt, which taketh away all flamous humors and ventoſities. I

---

‡ The ſecond figure was of *Serpillum Citratum* deſcribed in the ſeuenth place of the foregoing chapter; the third was of *Marum Matthioli*, Tabern. being the *Tragoriganum alterum* of *Lobel*.

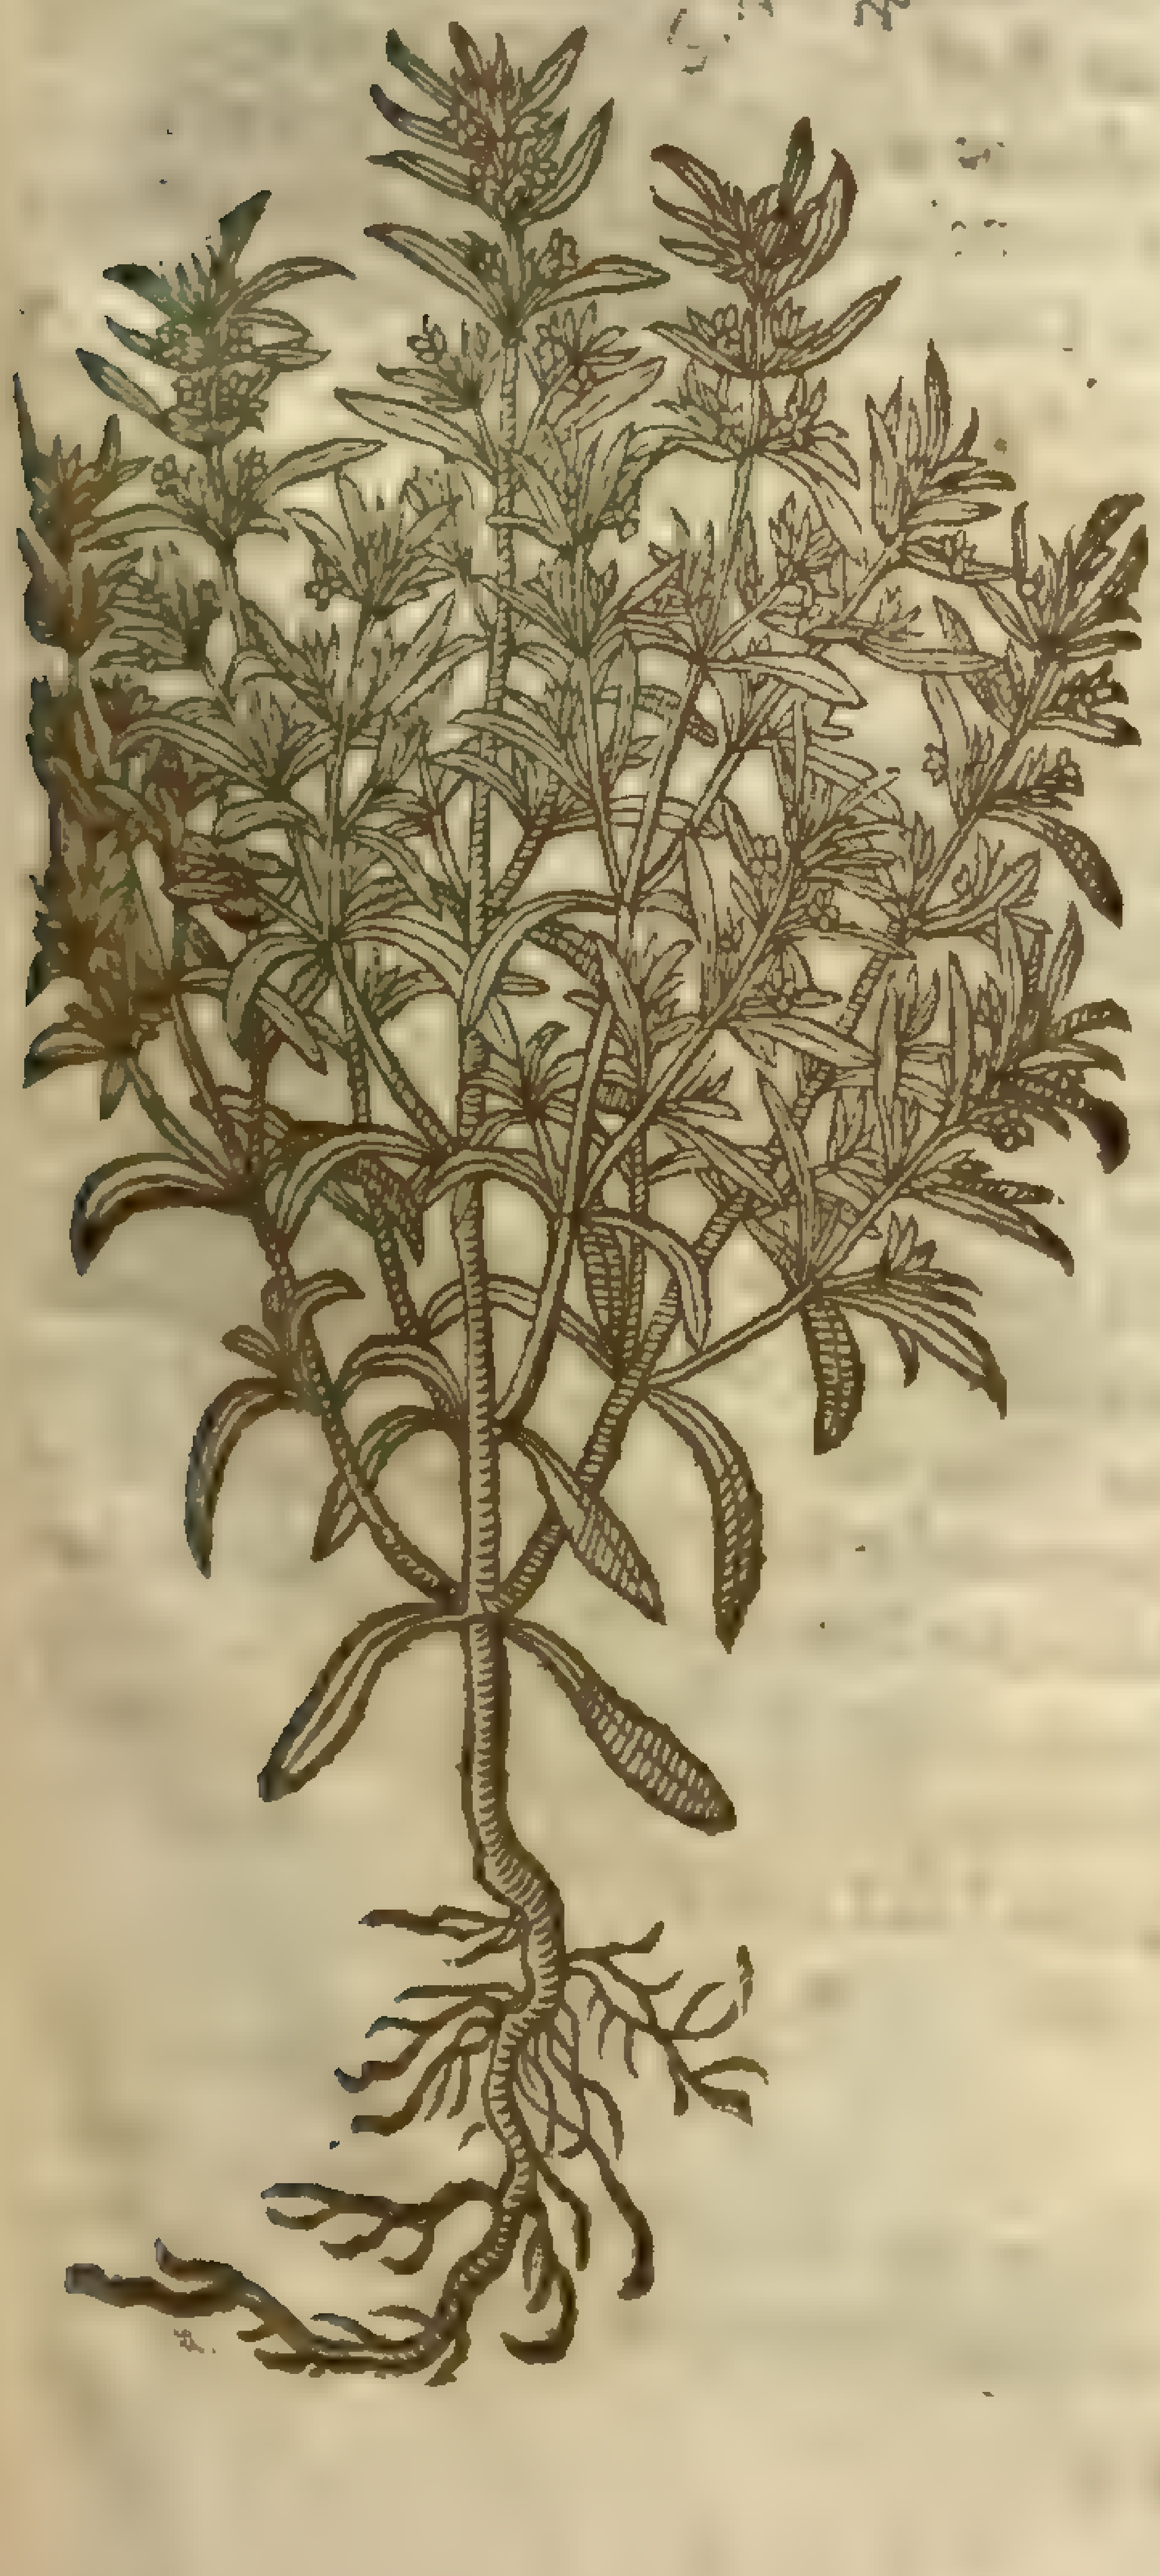
CHAP. 175. *Of Sauorie.*

¶ *The Kindes.*

There be two kindes of Sauorie, the one that indureth Winter, and is of long continuance: the other an annuall or yearely plant, that periſheth at the time when it hath perfected his ſeed, and muſt be ſowne againe the next yeare; which we call Summer Sauorie, or Sauorie of a yeare. There is likewiſe another, which is a ſtranger in England, called of *Lobel*, *Thymbra S. Iuliani*, denying it to be the right *Satureia*, or Sauorie: whether that of *Lobel*, or that we haue in our Engliſh gardens be the true Winter Sauorie, is yet diſputable; for we thinke that of S. Iulians rocke to be rather a wilde kinde than otherwiſe. ‡ *Pena* and *Lobel* do not deny, but affirme it in theſe words, *Nullus non fatetur Satureiam veram*; that is, which none deny to be the true *Satureia* or Sauorie. *Vid. Aduerſar. pag.* 182. ‡

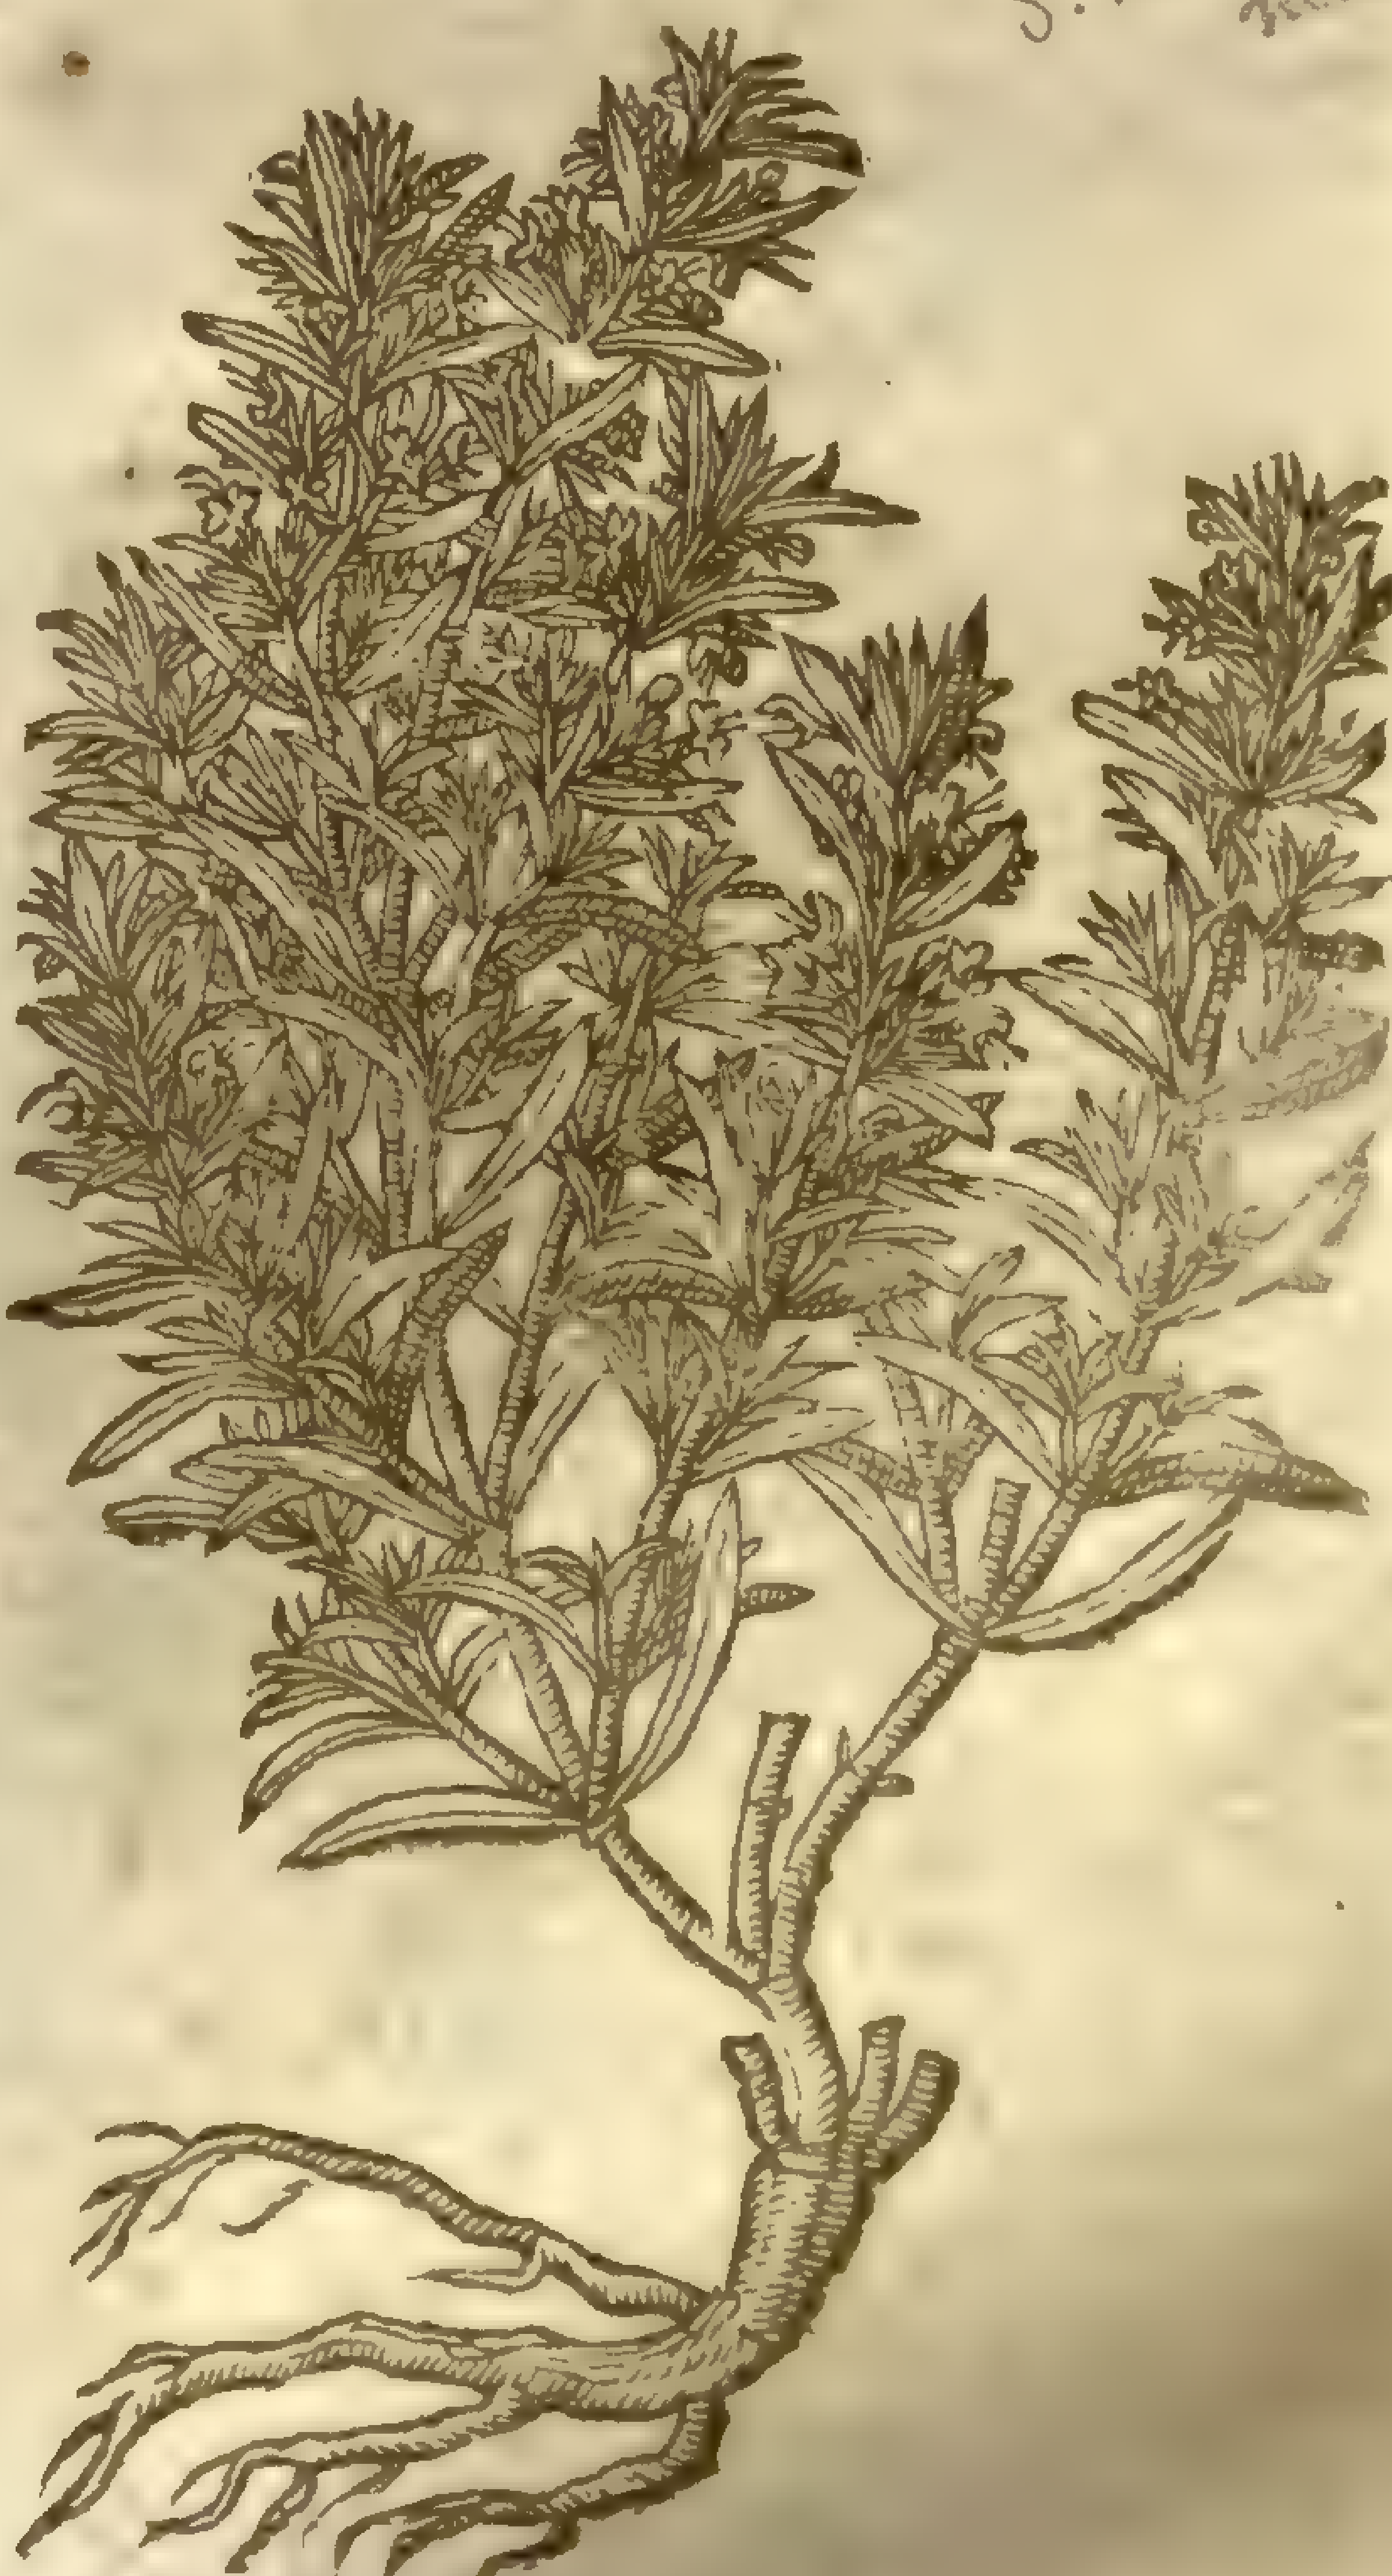
1 *Satureia hortenſis.*
Winter Sauorie.

S. montana, v
mei. dict.



2 *Satureia hortenſis æſtiua.*
Summer Sauorie.

S. hortensis, v
mei. dict.



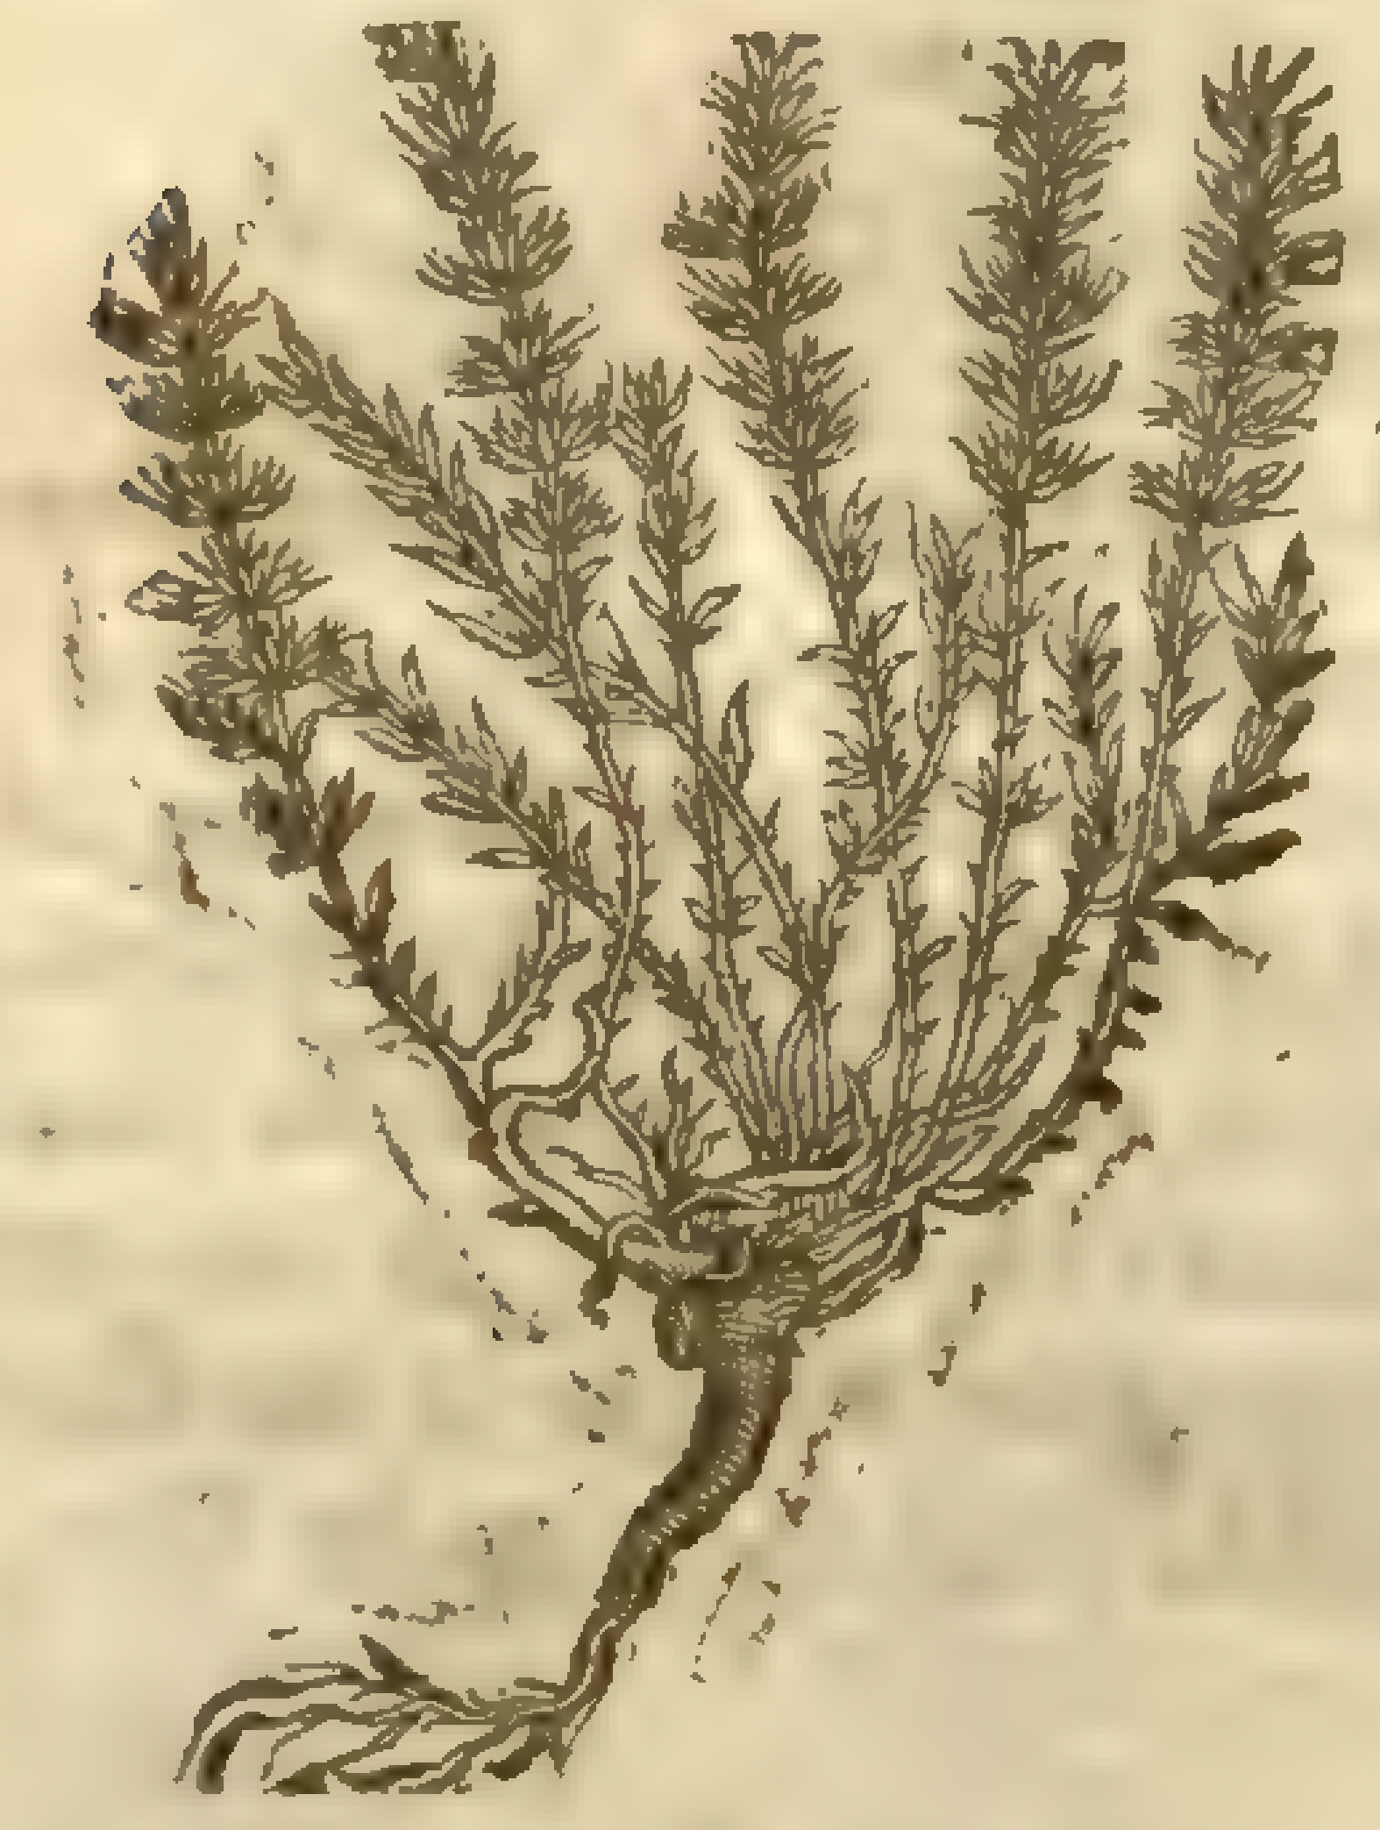
¶ The

¶ *The Deſcription.*

1 Winter Sauorie is a plant reſembling Hyſſope, but lower, more tender and brittle: it bringeth forth very many branches, compaſſed on euery ſide with narrow and ſharpe pointed leaues, longer than thoſe of Time; among which grow the floures from the bottome to the top, out of ſmall huskes, of colour white, tending to a light purple. The root is hard and wooddy, as is the reſt of the plant.

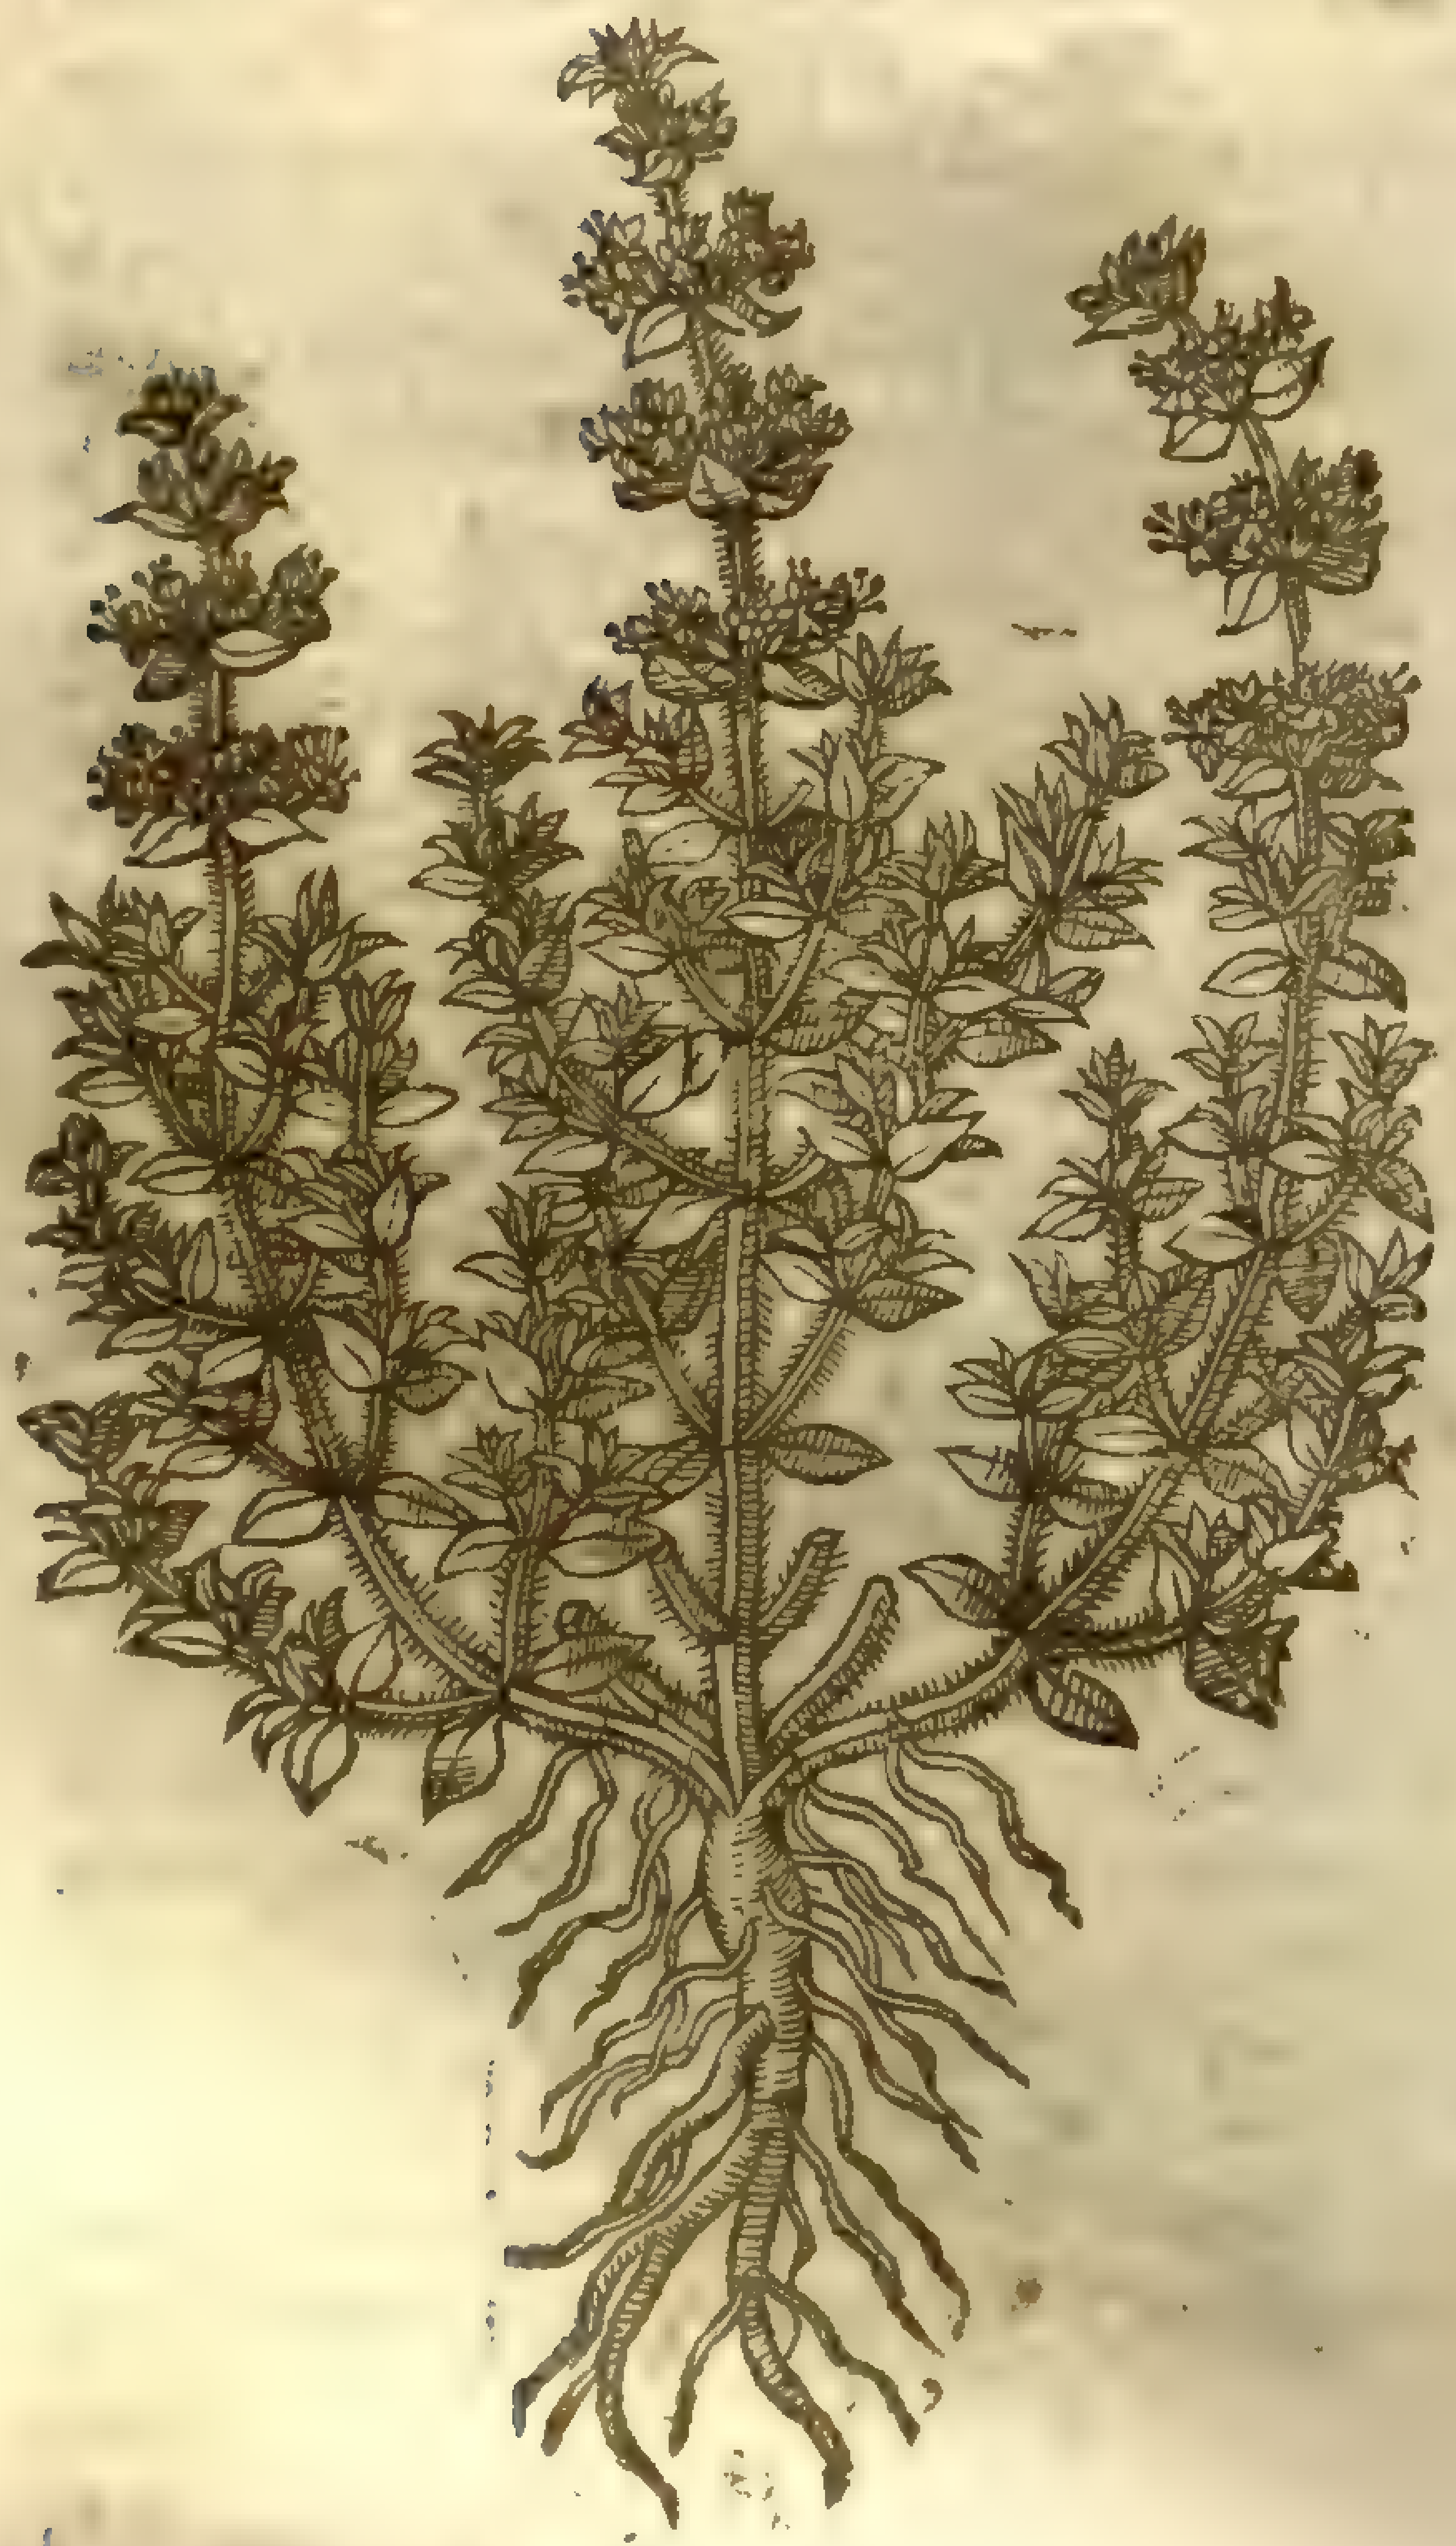
2 Summer Sauorie groweth with a ſlender brittle ſtalke of a foot high, diuided into little branches: the leaues are narrow, leſſer than thoſe of Hyſſope, like the leaues of Winter Sauorie, but thinner ſet vpon the branches. The floures ſtand hard to the branches, of a light purple tending to whiteneſſe. The root is ſmall, full of ſtrings, and periſheth when it hath perfected his ſeed.

3 *Satureia Sancti Iuliani.*
Rocke Sauorie.



S. Juliani, a [illegible] shelf

‡ 4 *Satureia Cretica.*
Candy Sauorie.



S. Thymbra, a [illegible] shelf

3 This ſmall kinde of Sauorie, which *Lobel* hath ſet forth vnder the title of *Thymbra S. Iuliani*, becauſe it groweth plentifully vpon the rough cliffes of the Tyrrhenian ſea in Italie, called Saint Iulians rocke, hath tender twiggie branches an handfull high, of a wooddie ſubſtance, ſet full of leaues from the bottome to the top, very thicke thruſt together like vnto thoſe of Time, ſauing that they be ſmaller and narrower, bringing forth at the top of the ſprigs a round ſpikie tuft of ſmall purpliſh floures. The whole plant is whitiſh, tending to a bleake colour, and of a very hot and ſharpe taſte, and alſo well ſmelling.

‡ 4 This in the opinion of *Honorius Bellus*, *Cluſius*, and *Pona*, is thought, and not without good reaſon, to be the true *Thymbra*, or *Satureia* of *Dioſcorides* and the Antients, for beſides that it agrees with their deſcription, it is to this day called in Candie θρύμβη and θρύμβι. *Cluſius* deſcribes it thus: It ſends forth many branches immediately from the root like as Time, and thoſe quadrangular, rough, and of a purpliſh colour: vpon theſe grow alternately little roughiſh leaues much like thoſe of the true Tyme; and out of their boſomes come little branches ſet with the like, but leſſer leaues. The toppes of the branches are compaſſed with a rundle made of many little leaues, whereout come floures of a fine purple colour, and like the floures of Tyme, being diuided into foure parts, whereof the lower is the broader, and hangs downe: The vpper is alſo broad, but ſhorter, and the other two leſſe. Out of the middle of the floure come fine whitiſh threds, pointed with browne and a forked ſtile. The ſeed is ſmall and blacke like that of Tyme. The root hard and wooddie. It floured with *Cluſius* (who receiued the ſeeds out of Candie from *Honorius Bellus*) in October and Nouember. ‡

¶ *The Place.*

They are ſowne in Gardens, and bring forth their floures the firſt yeare of their ſowing.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

Sauorie is called in Greeke, θύμβρα, neither hath it any other true name in Latine than *Thymbra*: The Interpreters would haue it called *Saturea*, wherein they are repugnant to *Columella* a Latine Writer, who doth ſhew a manifeſt difference betweene *Thymbra* and *Satureia*, in his tenth booke, where he writeth, that Sauorie hath the taſte of Tyme, and of *Thymbra* or the Winter Sauorie.

Et Satureia Thymi referens Thymbraque ſaporem.

† Notwithſtanding this aſſertion of *Columella*, *Pliny lib.9.cap.8.* makes *Satureia*, or Sauorie, to be that *Thymbra* which is called alſo *Cunila*. Sauorie in high Dutch is called, **Knuel Saturey**, and **Sadaney**: in low Dutch, **Ceulen**: which name as it ſeemeth is drawne of out *Cunila*: in Italian, *Santoreggia*: in Spaniſh *Axedrea* and *Sagorida*: in French, *Sarriette*: in Engliſh, Sauorie, Winter Sauorie, and Summer Sauorie.

¶ *The Temperature and Vertues.*

A Winter Sauorie is of temperature hot and dry in the third degree, it maketh thinne, cutteth, it clenſeth the paſſages: to be briefe, it is altogether of like vertue with Tyme.

B Summer Sauorie is not full ſo hot as Winter Sauorie, and therefore ſaith *Dioſcorides*, more fit to be vſed in medicine: it maketh thin and doth maruelloully preuaile againſt winde: therefore it is with good ſucceſſe boyled and eaten with beanes, peaſon, and other windie pulſes, yea, if it be applied to the belly in a fomentation, it forthwith helpeth the affects of the mother proceeding from winde.

Chap. 176. *Of Dodder.*

Cuſcuta ſive Caſſuthe.
Dodder.

Cuscuta [illegible]

¶ *The Deſcription.*

Cuſcuta, or Dodder, is a ſtrange herbe, altogether without leaues or root, like vnto threds very much ſnarled or wrapped together, confuſedly winding it ſelfe about buſhes and hedges, and ſundry kindes of herbes. The threds are ſomewhat redde: vpon which grow here & there little round heads or knops, bringing forth at the firſt ſlender white floures, afterward a ſmall ſeed.

¶ *The Place.*

This herbe groweth vpon ſundry kindes of herbes, as vpon Time, Winter Sauorie, Germander, and ſuch like, taking his name from the herbe whereupon it doth grow, as that vpon Tyme is called *Epithymum*, vpon Line or flax, *Epilinum*: and ſo of others, as *Dodonæus* ſetteth forth at large: yet hath he forgotten one among the reſt, which groweth very plentifully in Summerſetſhire vpon nettles: neither is it the leaſt among many, either in beautie or operation, but comparable to the beſt *Epithymum*: following therefore the example of *Dioſcorides*, I haue thought good to call it *Epiurtica*, or rather, Ἐπικνίδη, and ſo of the reſt according to the herbes whereon they grow.

¶ *The Names.*

The greateſt is called in ſhops euery where *Cuſcuta*: and of diuers becauſe it groweth vpon

Flaxe

fluxe or Lyne, *Podagra Lini*; the better learned do name it *Caſſutha*, or *Caſſytha*: and *Geſnerus*, λινάγχη: the Arabians, *Keſſuth* and *Chaſuth*: in Dutch, **Schorfte**, and **Wranghe**: in high Dutch, **Filkraut**: in French, *Goute d'Lin*, and *Tigne de Lin*: in Engliſh, Dodder.

The leſſer and ſlenderer which wrappeth it ſelfe vpon Time and Sauorie, is called of *Dioſcorides* ἐπίθυμον: the Apothecaries keep the name *Epithymum*: others, among whom is *Actuarius*, name that *Epithymum* which groweth vpon Time only, and that which groweth on Sauorie *Epithymbrum*, and that alſo which hangeth vpon *Stæbe*, they terme *Epiſtæbe*; giuing a peculiar name to euery kinde.

¶ *The Nature.*

The nature of this herbe changeth and altereth, according to the nature and qualitie of the herbs whereupon it groweth: ſo that by ſearching the nature of the plant you may eaſily finde out the temperament of the laces growing vpon the ſame. But more perticularly: it is of temperature ſomewhat more dry than hot, and that in the ſecond degree: it alſo cleanſeth with a certaine aſtrictiue or binding quality, and eſpecially that which is found growing vpon the bramble: for it alſo receiueth a certaine nature from his parents on which it groweth; for when it groweth vpon the hotter herbes, as Time and Sauory, it becommeth hotter and dryer, and of thinner parts. that which commeth of Broome prouoketh vrine more forcibly, and maketh the belly more ſoluble: and that is moiſter which groweth vpon flax: that which is found vpon the bramble hath joyned with it, as we haue ſaid, a binding qualitie, which by reaſon of this facultie joyned with it is good to cure the infirmities of the Liuer and Milt: for ſeeing that it hath both a binding and purging facultie vnited to it, it is moſt ſingular good for the entrals: for *Galen* in his thirteenth booke of the Method of curing, doth at large declare, that ſuch medicines are fitteſt of all for the liuer and Milt.

¶ *The Vertues.*

A Dodder remooueth the ſtoppings of the liuer and of the milt or ſpleene, it diſburdeneth the veines of flegmaticke, cholericke, corrupt and ſuperfluous humors: prouoketh vrine gently, and in a meane openeth the kidnies, cureth the yellow jaundiſe which are joyned with the ſtopping of the liuer and gall: it is a remedy againſt lingring agues, baſtard and long tertians, quartains alſo, and properly agues in infants and young children, as *Meſues* ſaith in *Serapio*; who alſo teacheth, that the nature of Dodder is to purge choler by the ſtoole, and that more effectually if it haue Wormewood joyned with it; but too much vſing of it is hurtfull to the ſtomacke: yet *Auicen* writeth, that it doth not hurt it, but ſtrengtheneth a weake and feeble ſtomacke; which opinion alſo we do better allow of.

B *Epithymum*, or the Dodder which groweth vpon Time, is hotter and dryer than the Dodder that groweth vpon flax, that is to ſay euen in the third degree, as *Galen* ſaith. It helpeth all the infirmities of the milt: it is a remedy againſt obſtructions and hard ſwellings. It taketh away old headaches, the falling ſickeneſſe, madneſſe that commeth of melancholy, and eſpecially that which proceedeth from the ſpleene and parts thereabout: it is good for thoſe that haue the French diſeaſe, and ſuch as be troubled with contagious vlcers, the leproſie, and ſcabby euill.

C It purgeth downewards blacke and Melancholy humors, as *Aëtius*, *Actuarius*, and *Meſue* write, and alſo flegme, as *Dioſcorides* noteth: that likewiſe purgeth by ſtoole which groweth vpon Sauory and Scabious, but more weakely, as *Actuarius* ſaith.

D *Cuſcuta*, or Dodder that groweth vpon flax, boiled in water or wine and drunke, openeth the ſtoppings of the liuer, the bladder, the gall, the milt, the kidnies and veines, and purgeth both by ſiege and vrine cholericke humours.

E It is good againſt the ague which hath continued a long time, and againſt the Iaundiſe, I meane that Dodder eſpecially that groweth vpon brambles.

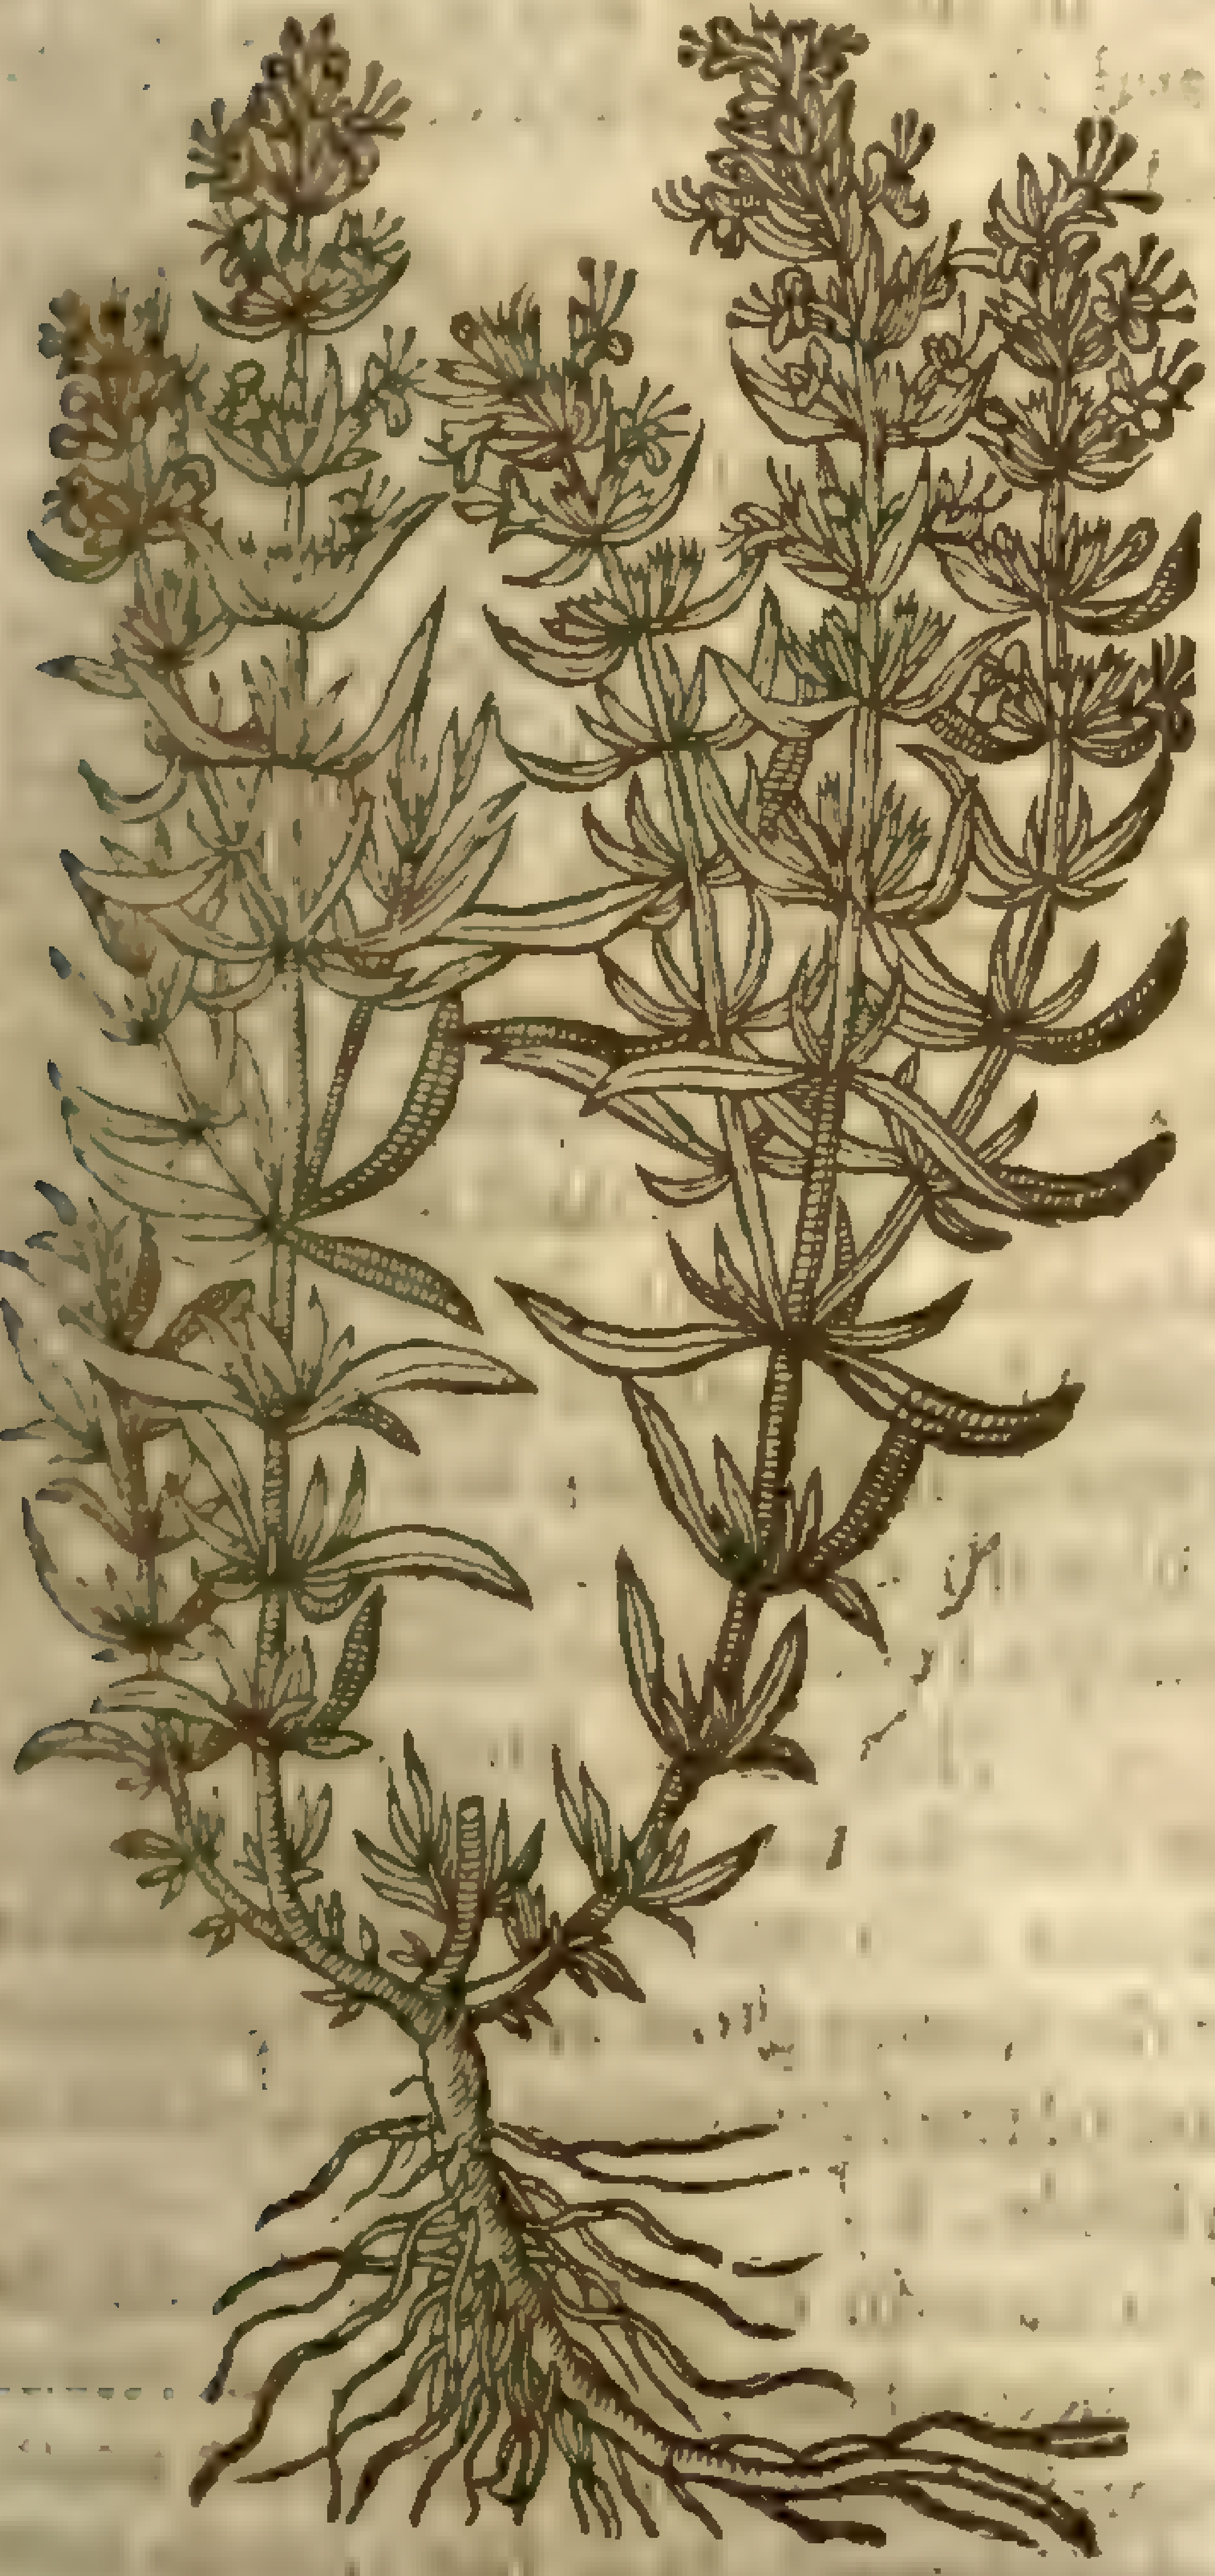
F *Epiurtica* or Dodder growing vpon nettles, is a moſt ſingular and effectuall medicine to prouoke vrine, and to looſe the obſtructions of the body, and is proued oftentimes in the Weſt parts with good ſucceſſe againſt many maladies.

Chap. 177. *Of Hyſſope.*

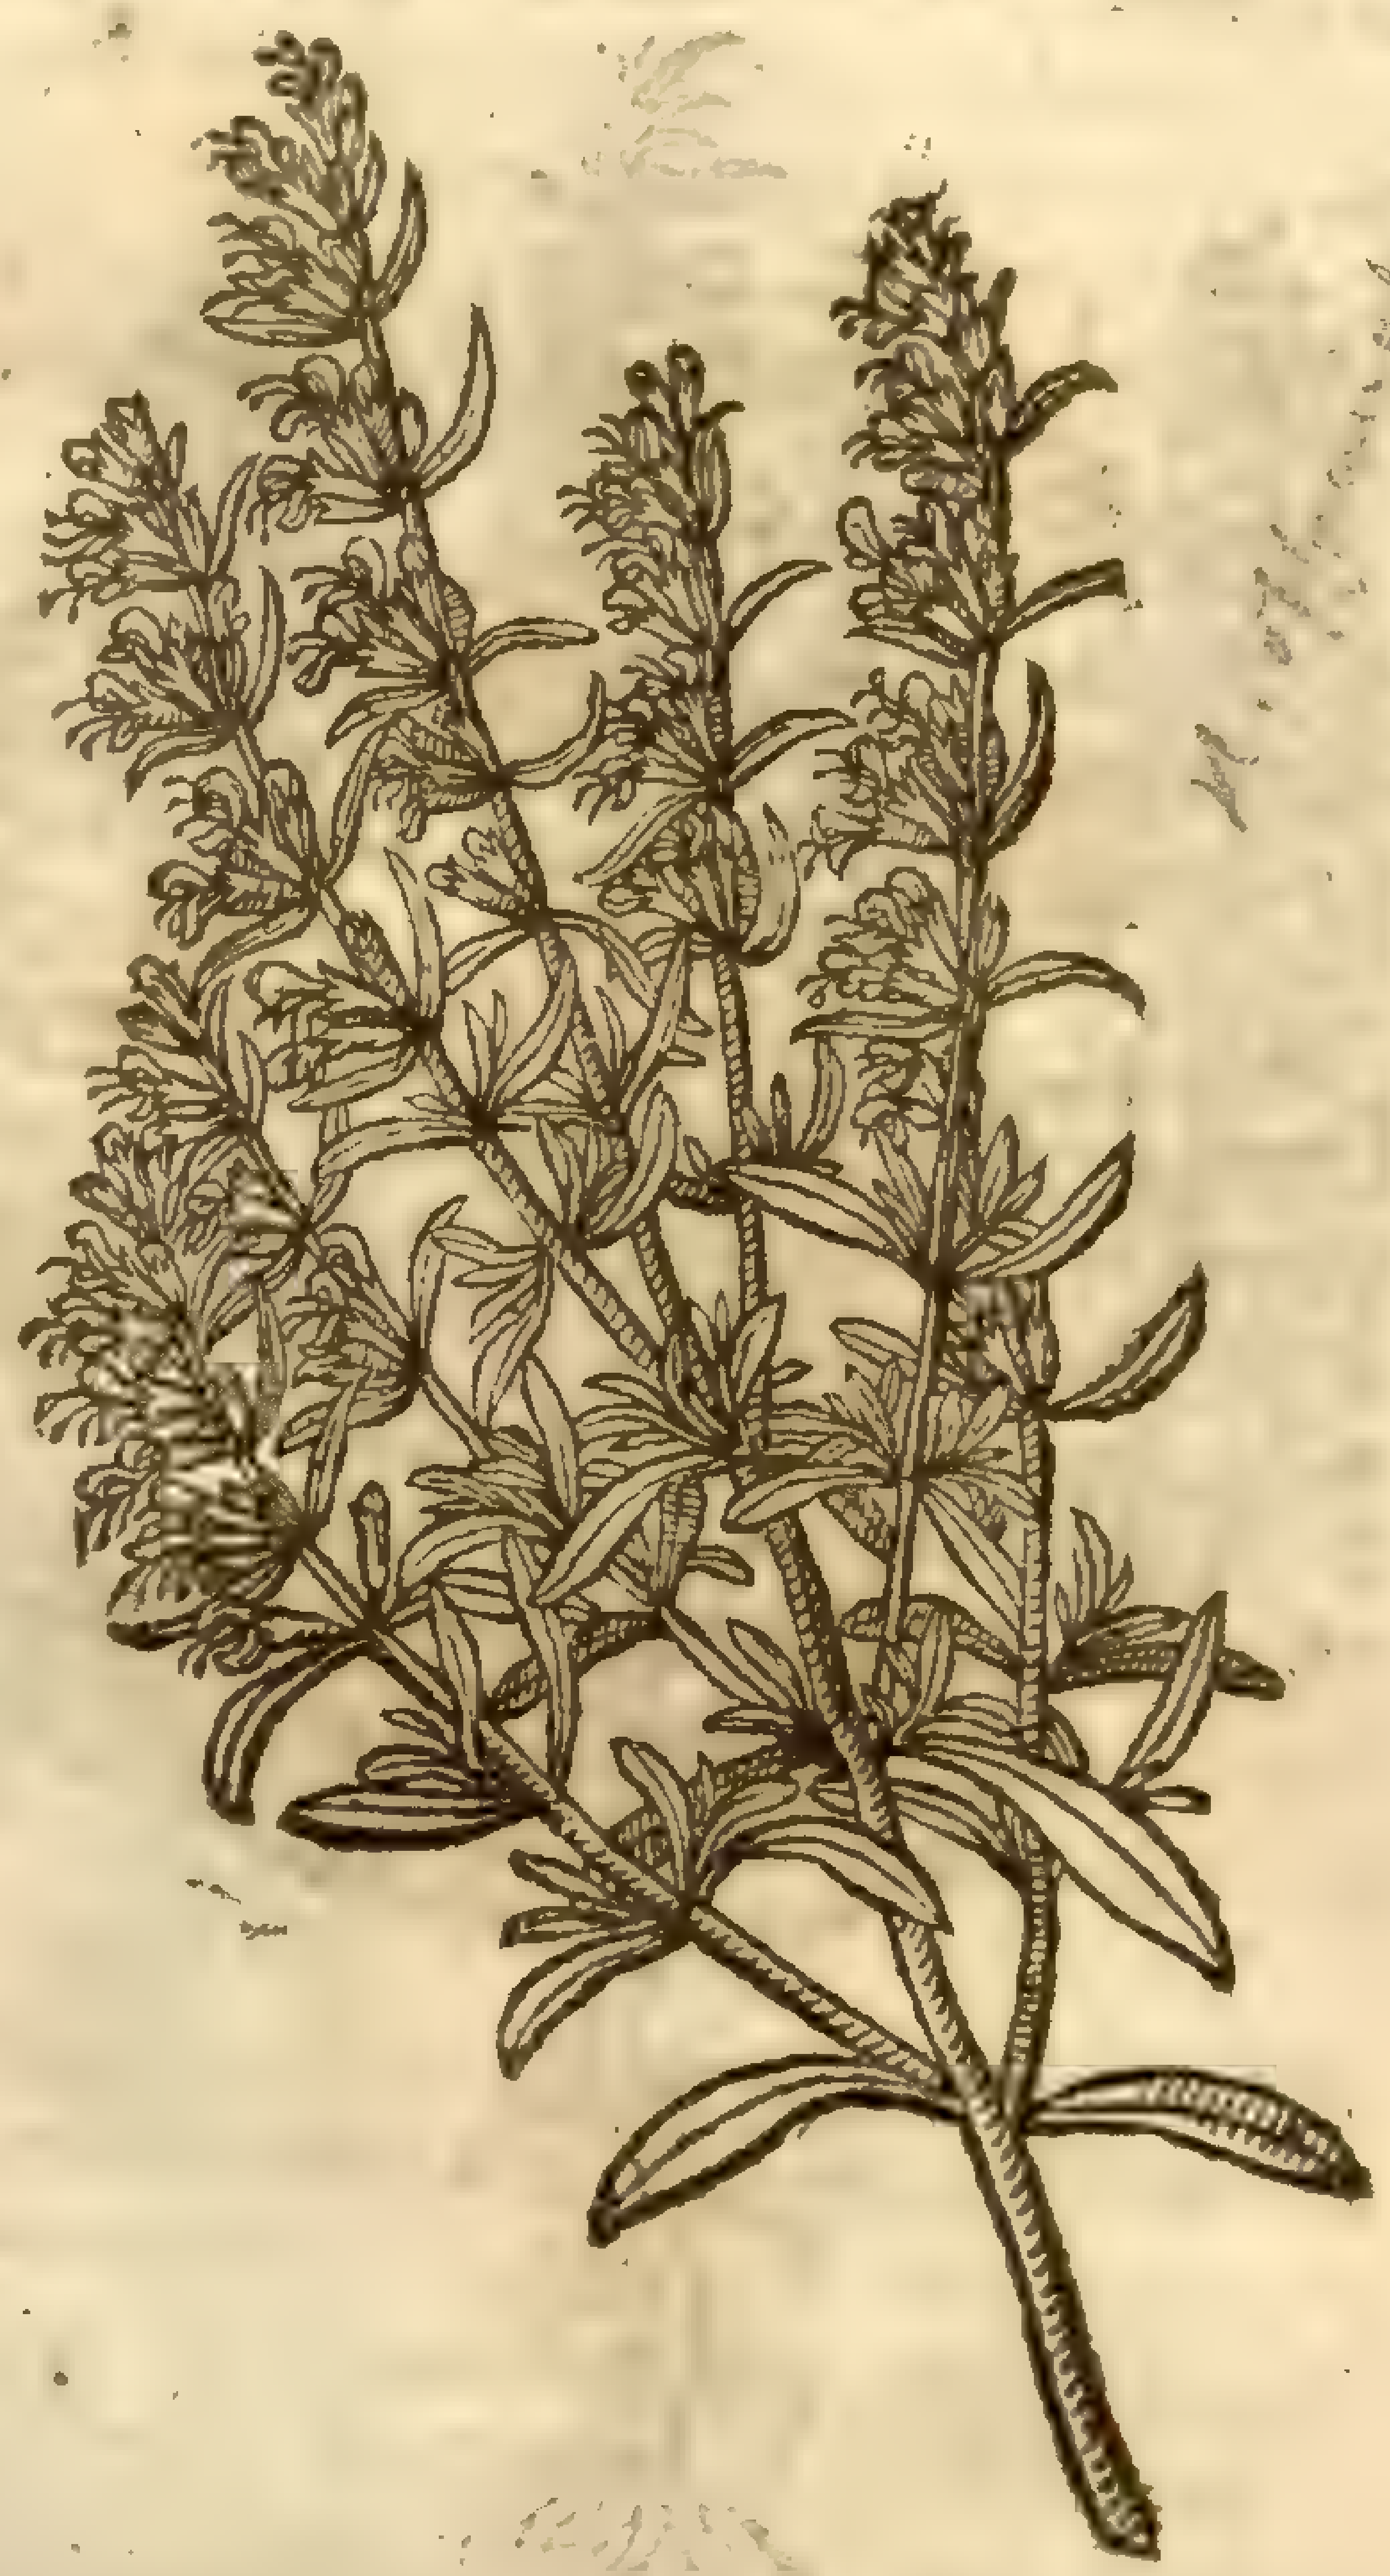
¶ *The Deſcription.*

1 Dioſcorides that gaue ſo many rules for the knowledge of ſimples, hath left Hyſſope altogether without deſcription, as being a plant ſo well knowne that it needed none: whoſe example I follow not onely in this plant, but in many others which be common, to auoid tediousneſſe to the Reader.

1 *Hyſſopus Arabum.*
Hyſſope with blew floures.

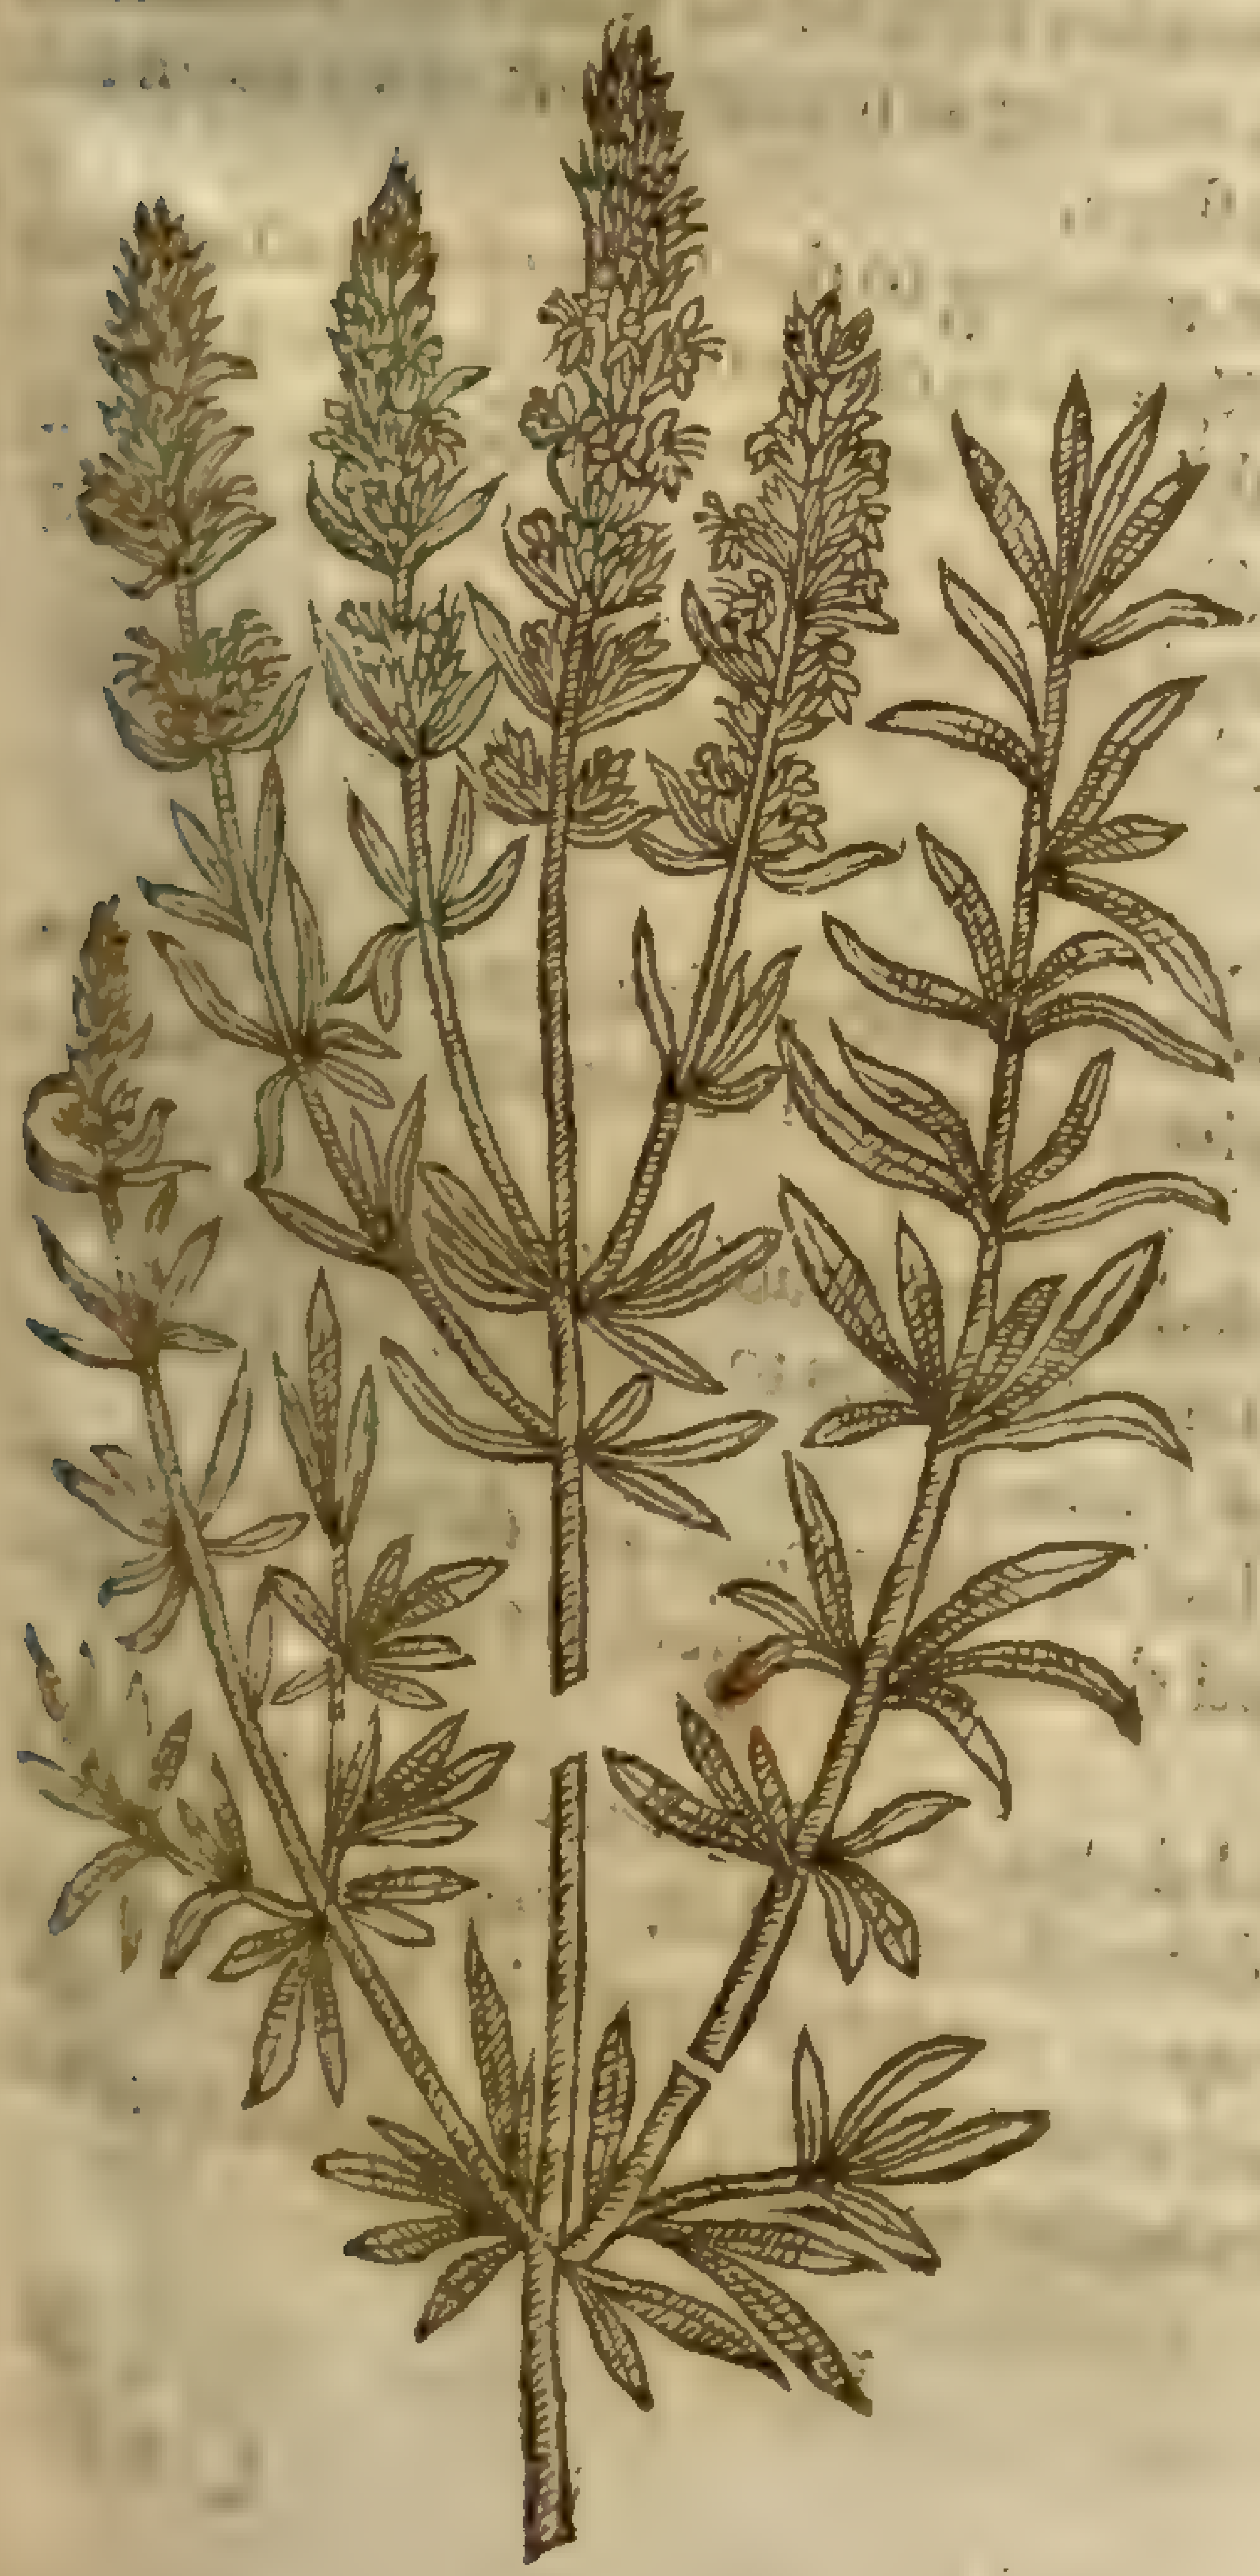


2 *Hyſſopus Arabum flore rubro.*
Hyſſope with reddiſh floures.

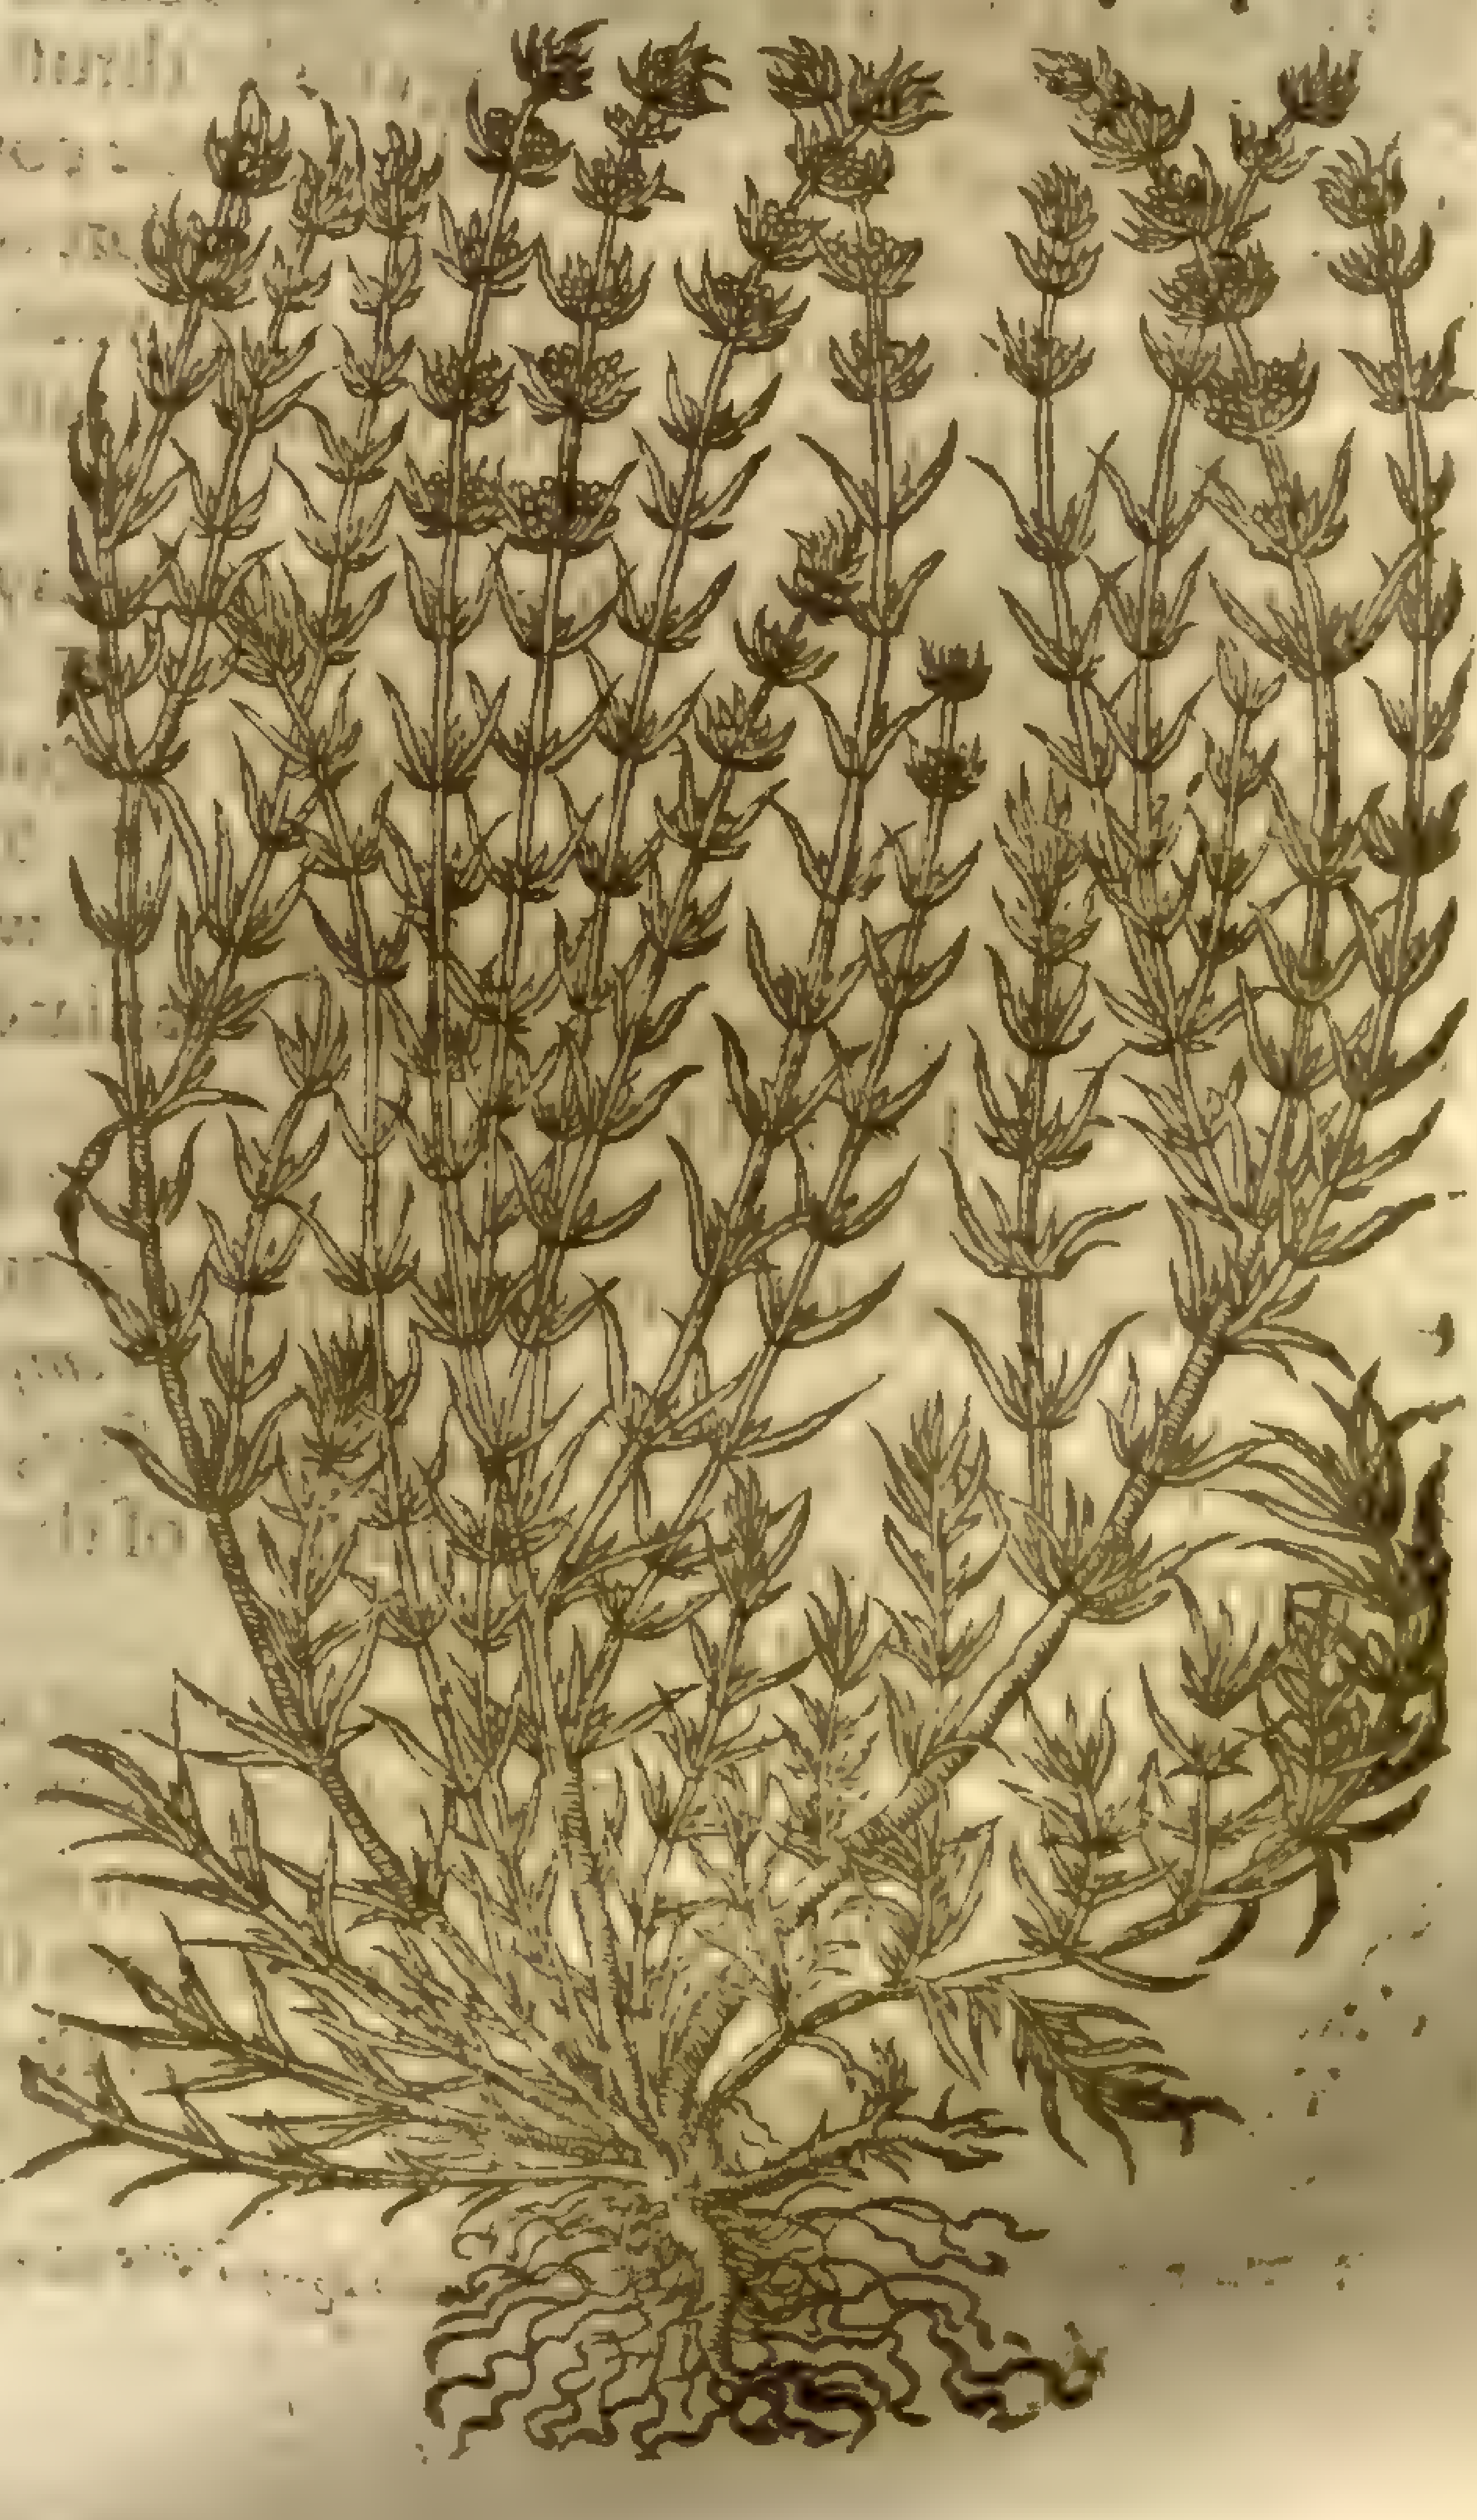


H. officinalis β
[illegible]

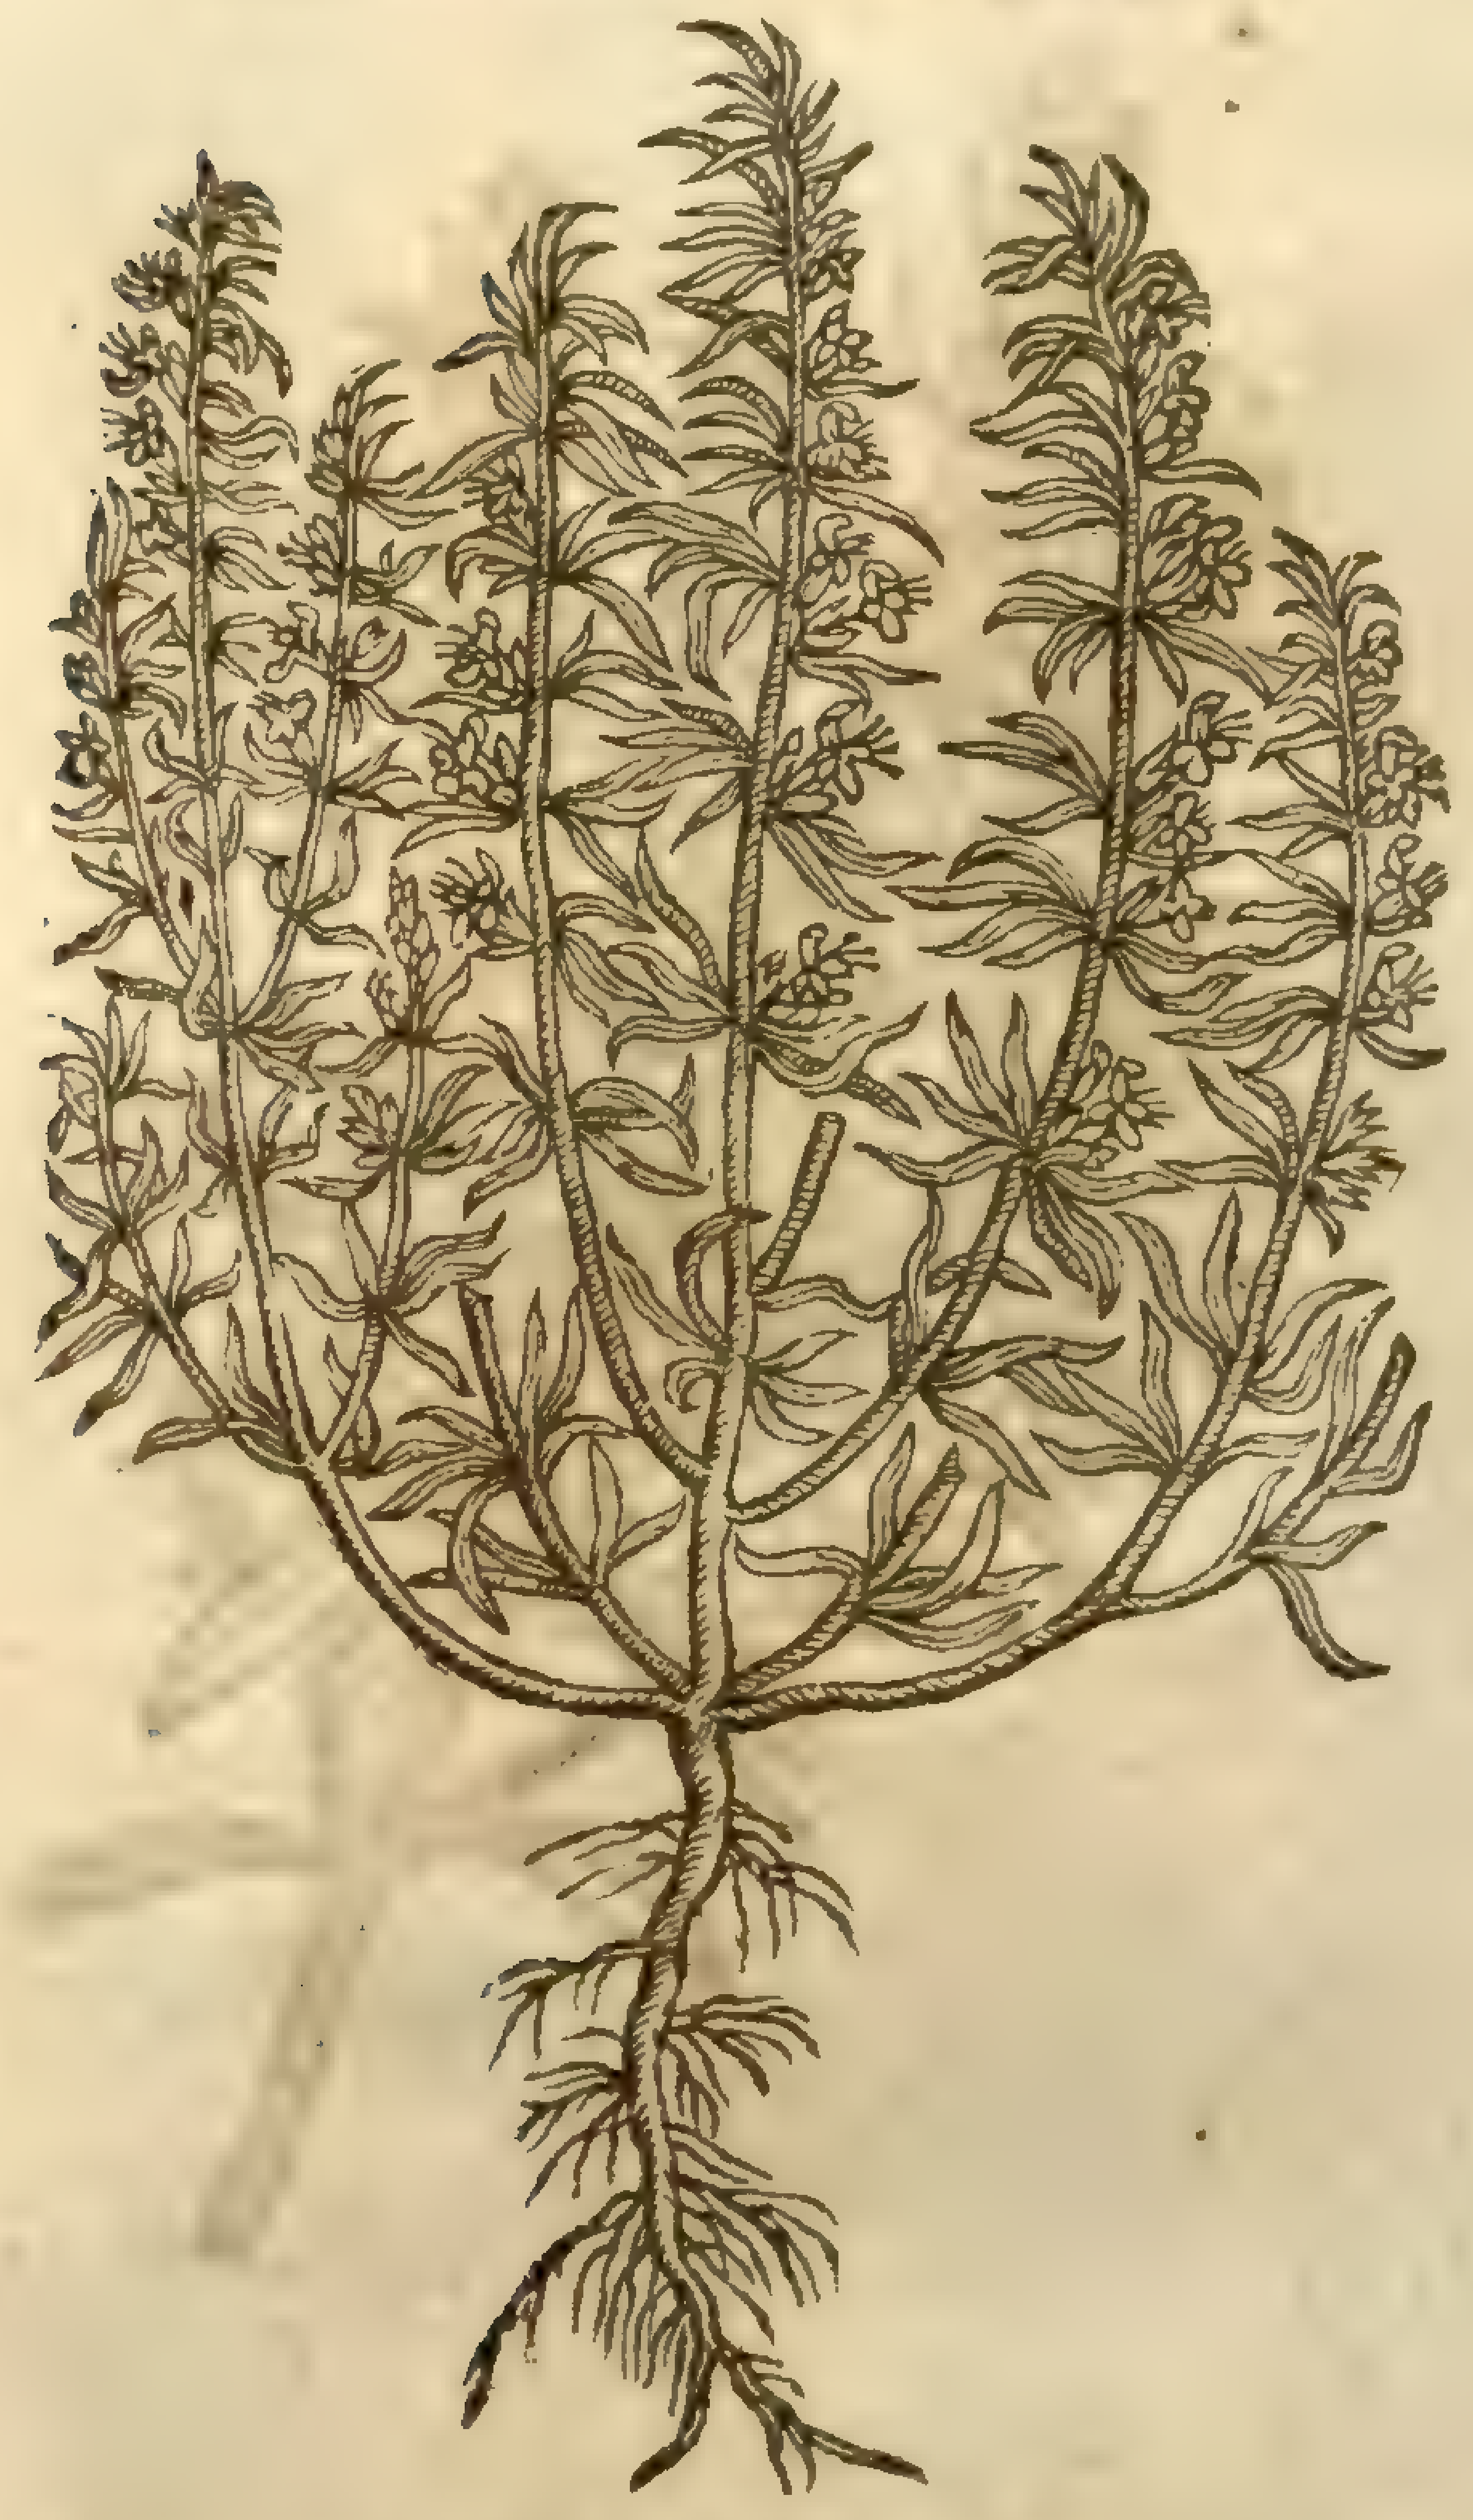
†3 *Hyſſopus albis floribus.*
White floured Hyſſope.



4 *Hyſſopus tenuifolia.*
Thinne leafed Hyſſope.



‡ 5 *Hyſſopus parva anguſtis folijs.*
Dwarfe narrow leaued Hyſſope.



2 The ſecond kinde of Hyſſope is like the former, which is our common Hyſſope, and differeth in that, that this Hyſſope hath his ſmall and ſlender branches decked with faire red floures.

3 The third kinde of Hyſſope hath leaues ſtalkes, branches, ſeed, and root, like the common Hyſſope, and differeth in the floures onely, which are as white as ſnow.

4 This kinde of Hyſſope of all the reſt is of the greateſt beautie; it hath a wooddy root tough, and full of ſtrings; from which riſe vp ſmall, tough, and ſlender flexible ſtalkes, whereupon doe grow infinite numbers of ſmall Fennell-like leaues, much reſembling thoſe of the ſmalleſt graſſe; of a pleaſant ſweet ſmel, & aromaticke taſte, like vnto the reſt of the Hyſſops but much ſweeter; at the tops of the ſtalkes do grow amongſt the leaues ſmal hollow floures, of a blewiſh colour tending to purple. The ſeeds as yet I could neuer obſerue.

‡ 5 This differs from the firſt deſcribed, in that the ſtalkes are weaker and ſhorter, the leaues alſo narrower, and of a darker colour: the floures grow after the ſame manner, and are of the ſame colour as thoſe of the common kinde. ‡

We haue in England in our Gardens another kinde, whoſe picture it ſhall be needleſſe to expreſſe, conſidering that in few words it may be deliuered. It is like vnto the former, but the leaues are ſome of them white, ſome greene, as the other; and ſome greene and white mixed and ſpotted, very goodly to behold.

Of which kindes we haue in our Gardens moreouer another ſort, whoſe leaues are wonderfully curled, rough, and hairie, growing thicke thruſt together, making as it were a tuft of leaues; in taſte and ſmell, and all other things like vnto the common Hyſſope.

I haue likewiſe in my garden another ſort of Hyſſope, growing to the forme of a ſmall wooddie ſhrub, hauing very faire broad leaues like vnto thoſe of *Numularia*, or Monywort, but thicker, fuller of juyce, and of a darker greene colour; in taſte and ſmell like the common Hyſſope.

¶ *The Place.*

All theſe kindes of Hyſſope do grow in my Garden, and in ſome others alſo.

¶ *The Time.*

They floure from Iune to the end of Auguſt.

¶ *The Names.*

Hyſſope is called in Latine, *Hyſſopus*: the which name is likewiſe retained among the Germans, Brabanders, Frenchmen, Italians, and Spaniards. Therefore that ſhall ſuffice which hath beene ſet downe in their ſeuerall titles.

‡ This is by moſt Writers iudged to be Hyſſope vſed by the Arabian Phyſitions, but not that of the Greekes, which is neerer to *Origanum* and Marjerome, as this is to *Satureia* or Sauorie. ‡

¶ *The Temperature and Vertues.*

A A decoction of Hyſſope made with figs, and gargled in the mouth and throte, ripeneth and breaketh the tumors and impoſthumes of the mouth and throte, and eaſeth the difficultie of ſwallowing, comming by cold rheumes.

B The ſame made with figges, water, honey, and rue, and drunken, helpeth the inflammation of the lungs, the old cough, and ſhortneſſe of breath, and the obſtructions and ſtoppings of the breaſt.

C The ſirrup or juyce of Hyſſope taken with the ſirrup of vnegre, purgeth by ſtoole tough and clammie flegme, and driueth forth wormes if it be eaten with figges.

D The diſtilled water drunke, is good for thoſe diſeaſes before named, but not with that ſpeed and force.

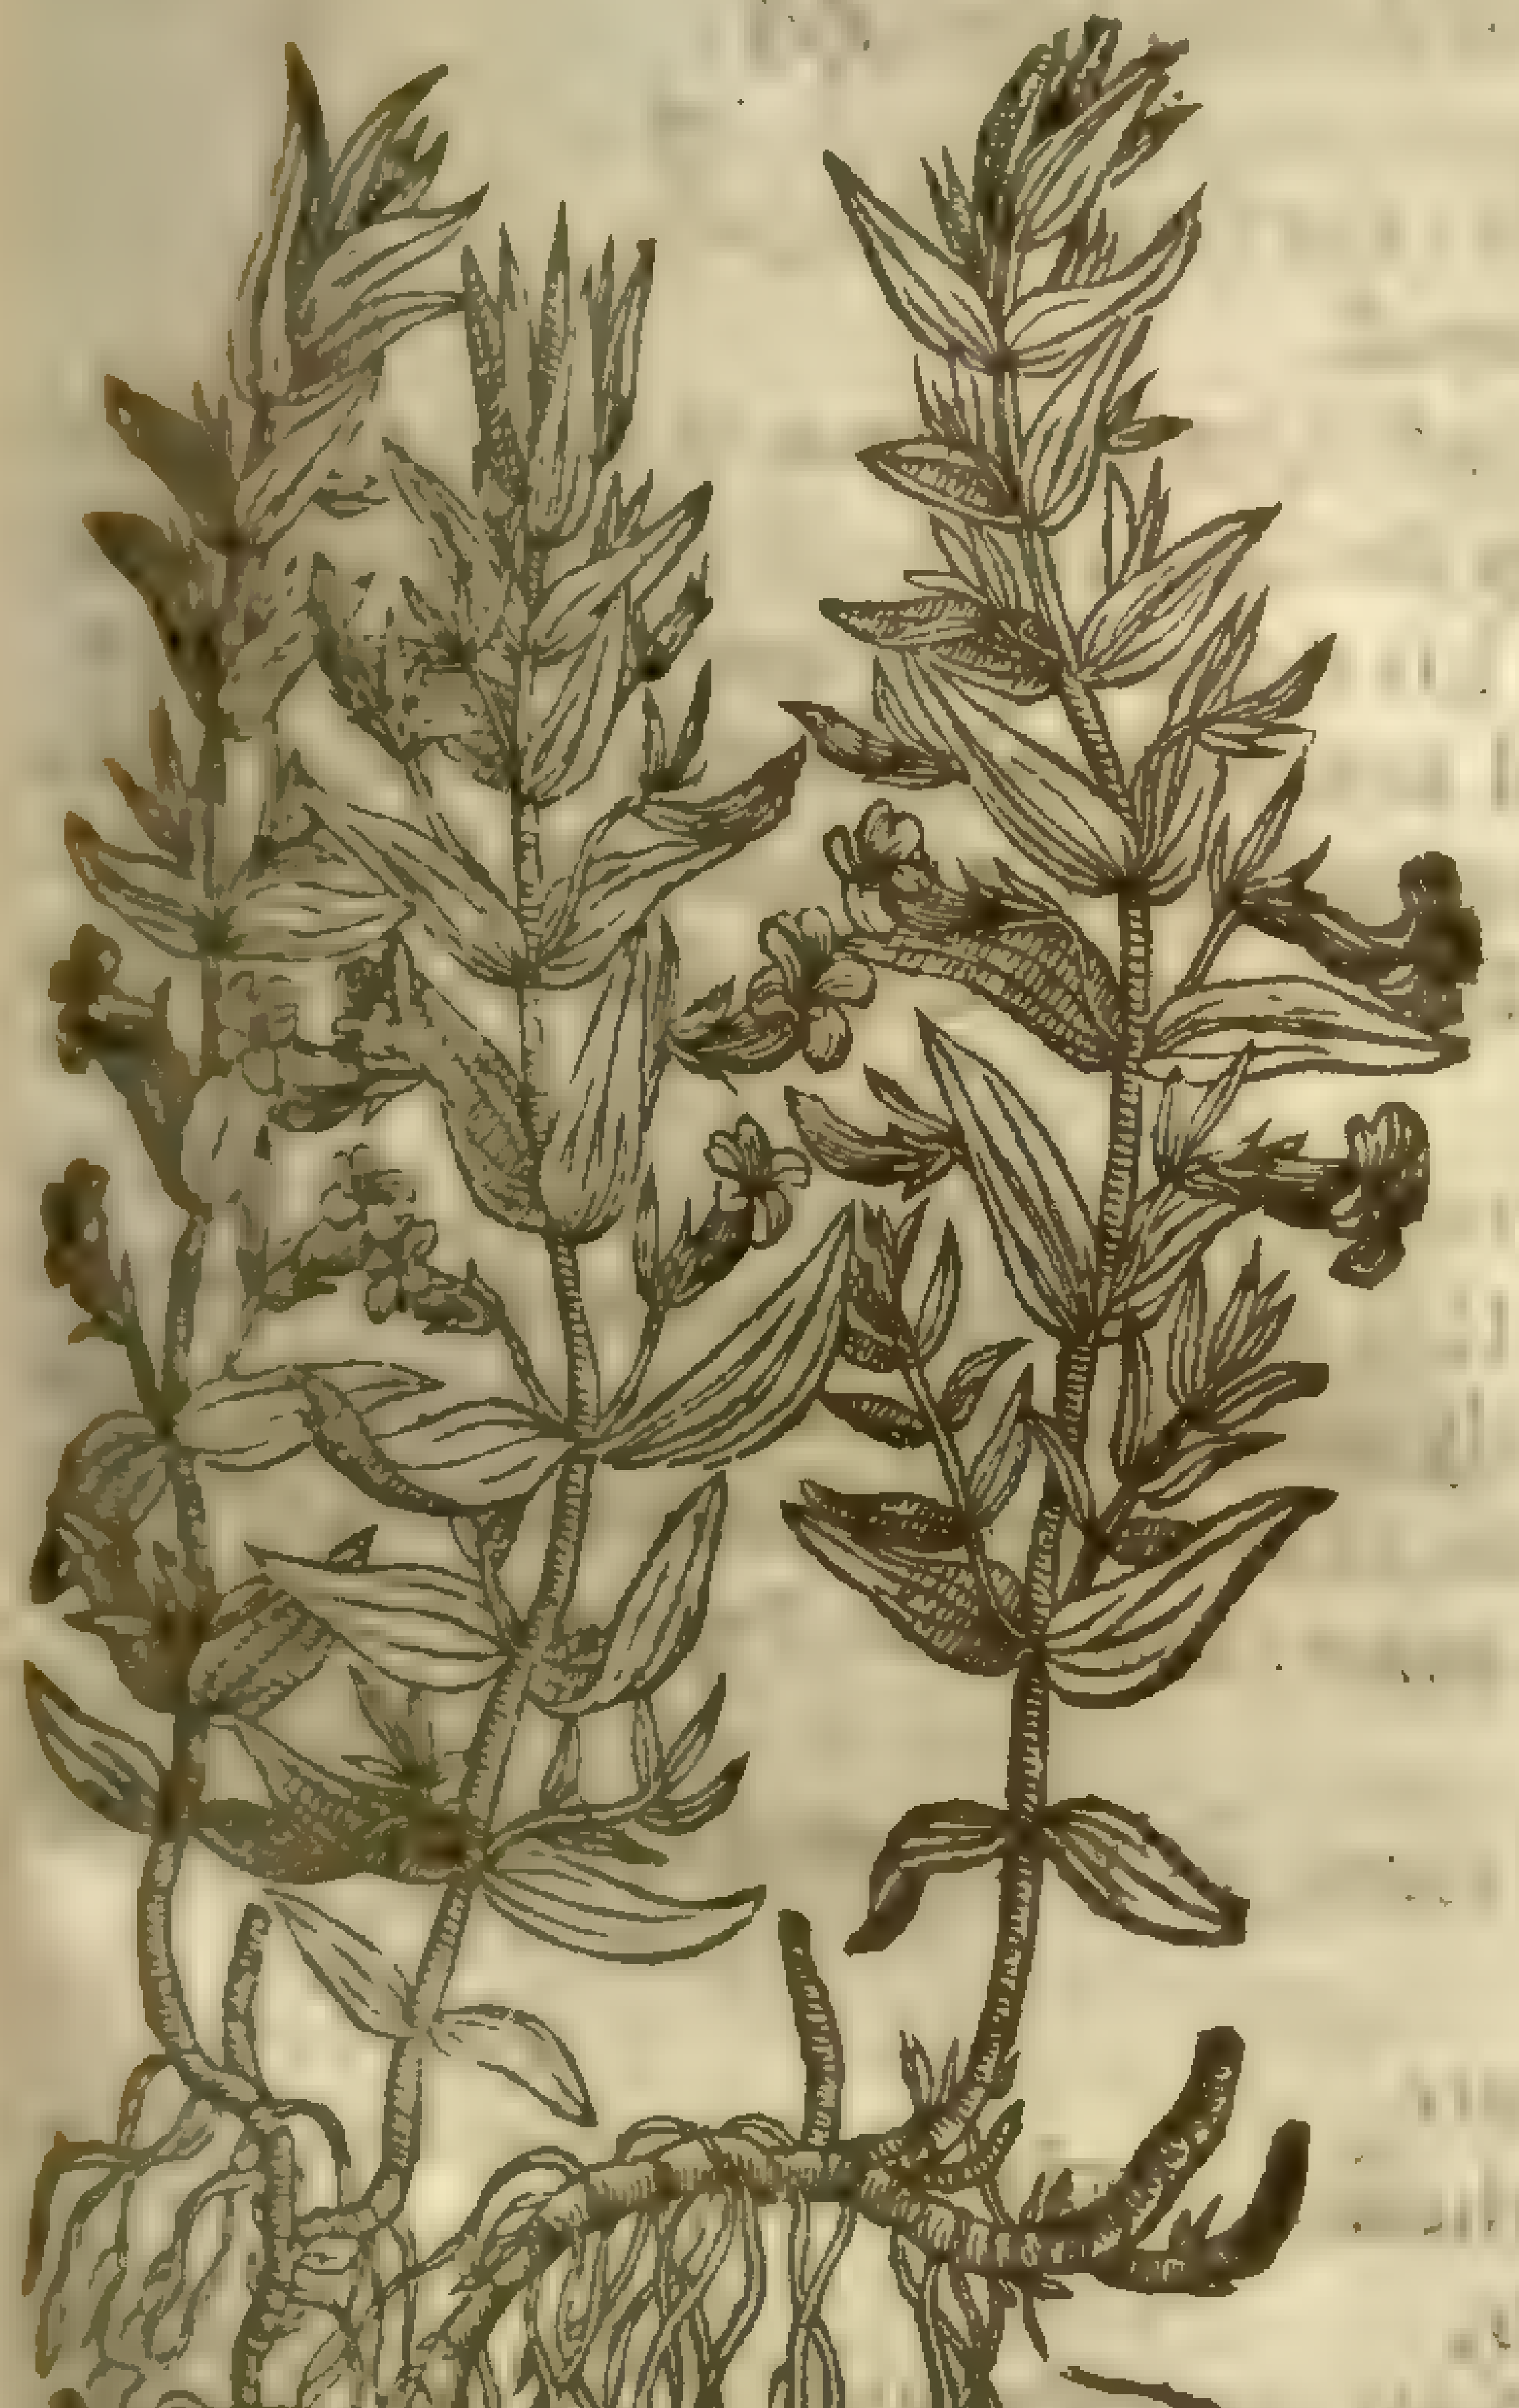
† That figure in the third place was of the *Satureia Romana*, 1. of *Tabernamontanus*.

CHAP. 178. *Of Hedge Hyſſope.*

¶ *The Deſcription.*

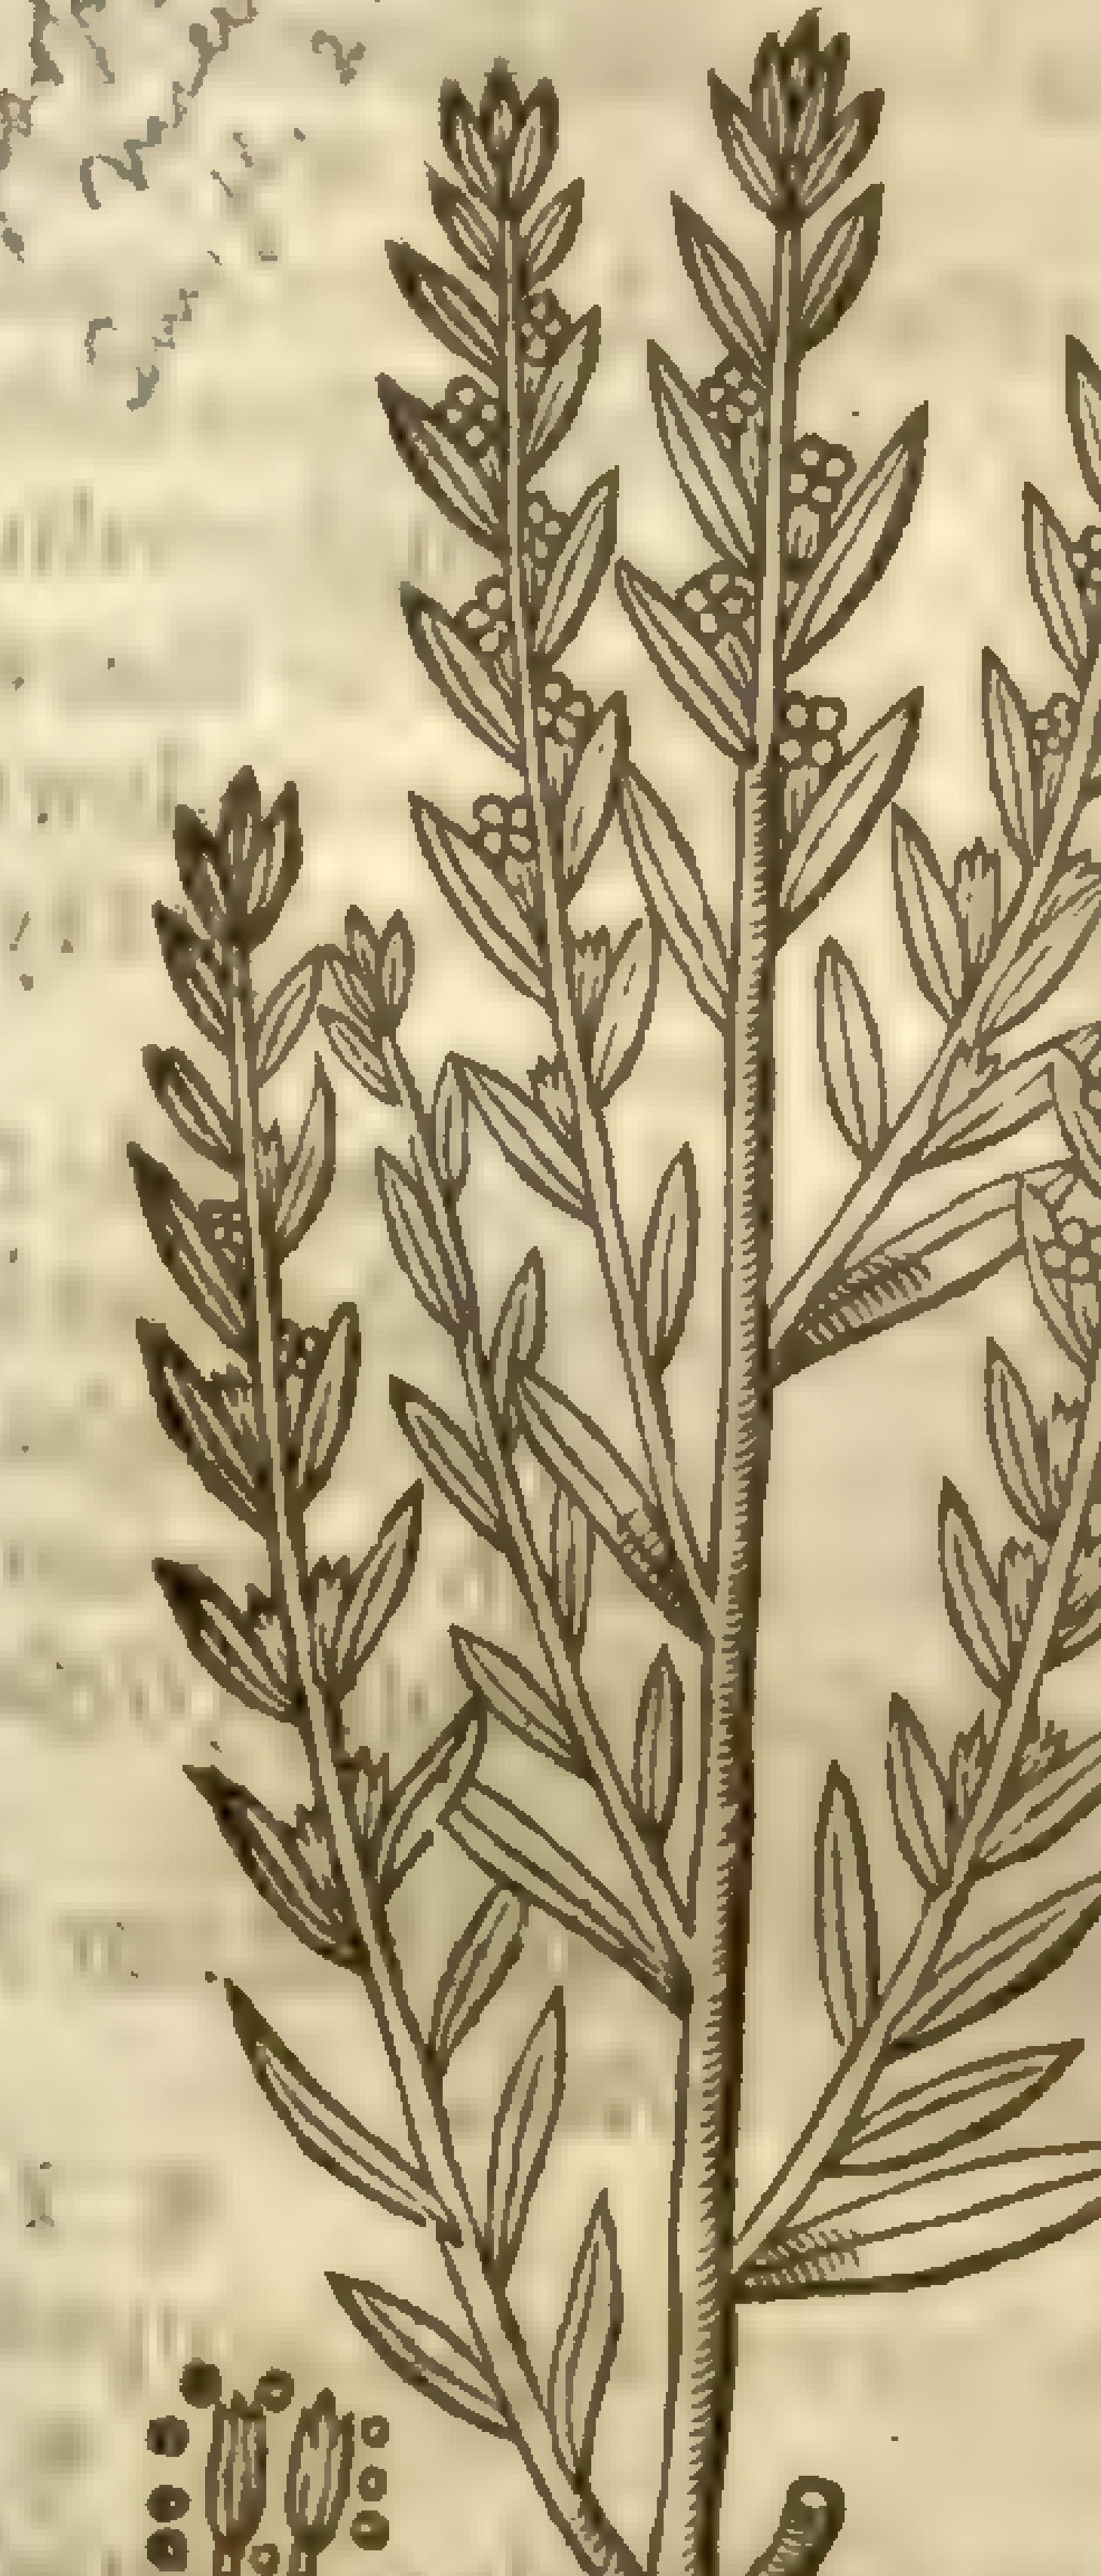
1 Hedge Hyſſop is a low plant or herb about a ſpan long,very like vnto the common Hyſſope,with many ſquare ſtalks or ſlender branches, beſet with leaues ſomewhat larger than Hyſſope,but very like : the floures grow betwixt the leaues vpon ſhort ſtems,of a white colour declining to blewneſſe. All the herb is of a moſt bitter taſte like the ſmall Centory. The root is little and threddy,dilating it ſelfe far abroad ; by which means it multiplieth greatly, and occupieth much ground where it groweth.

1 *Gratiola.*
Hedge Hyſſope.



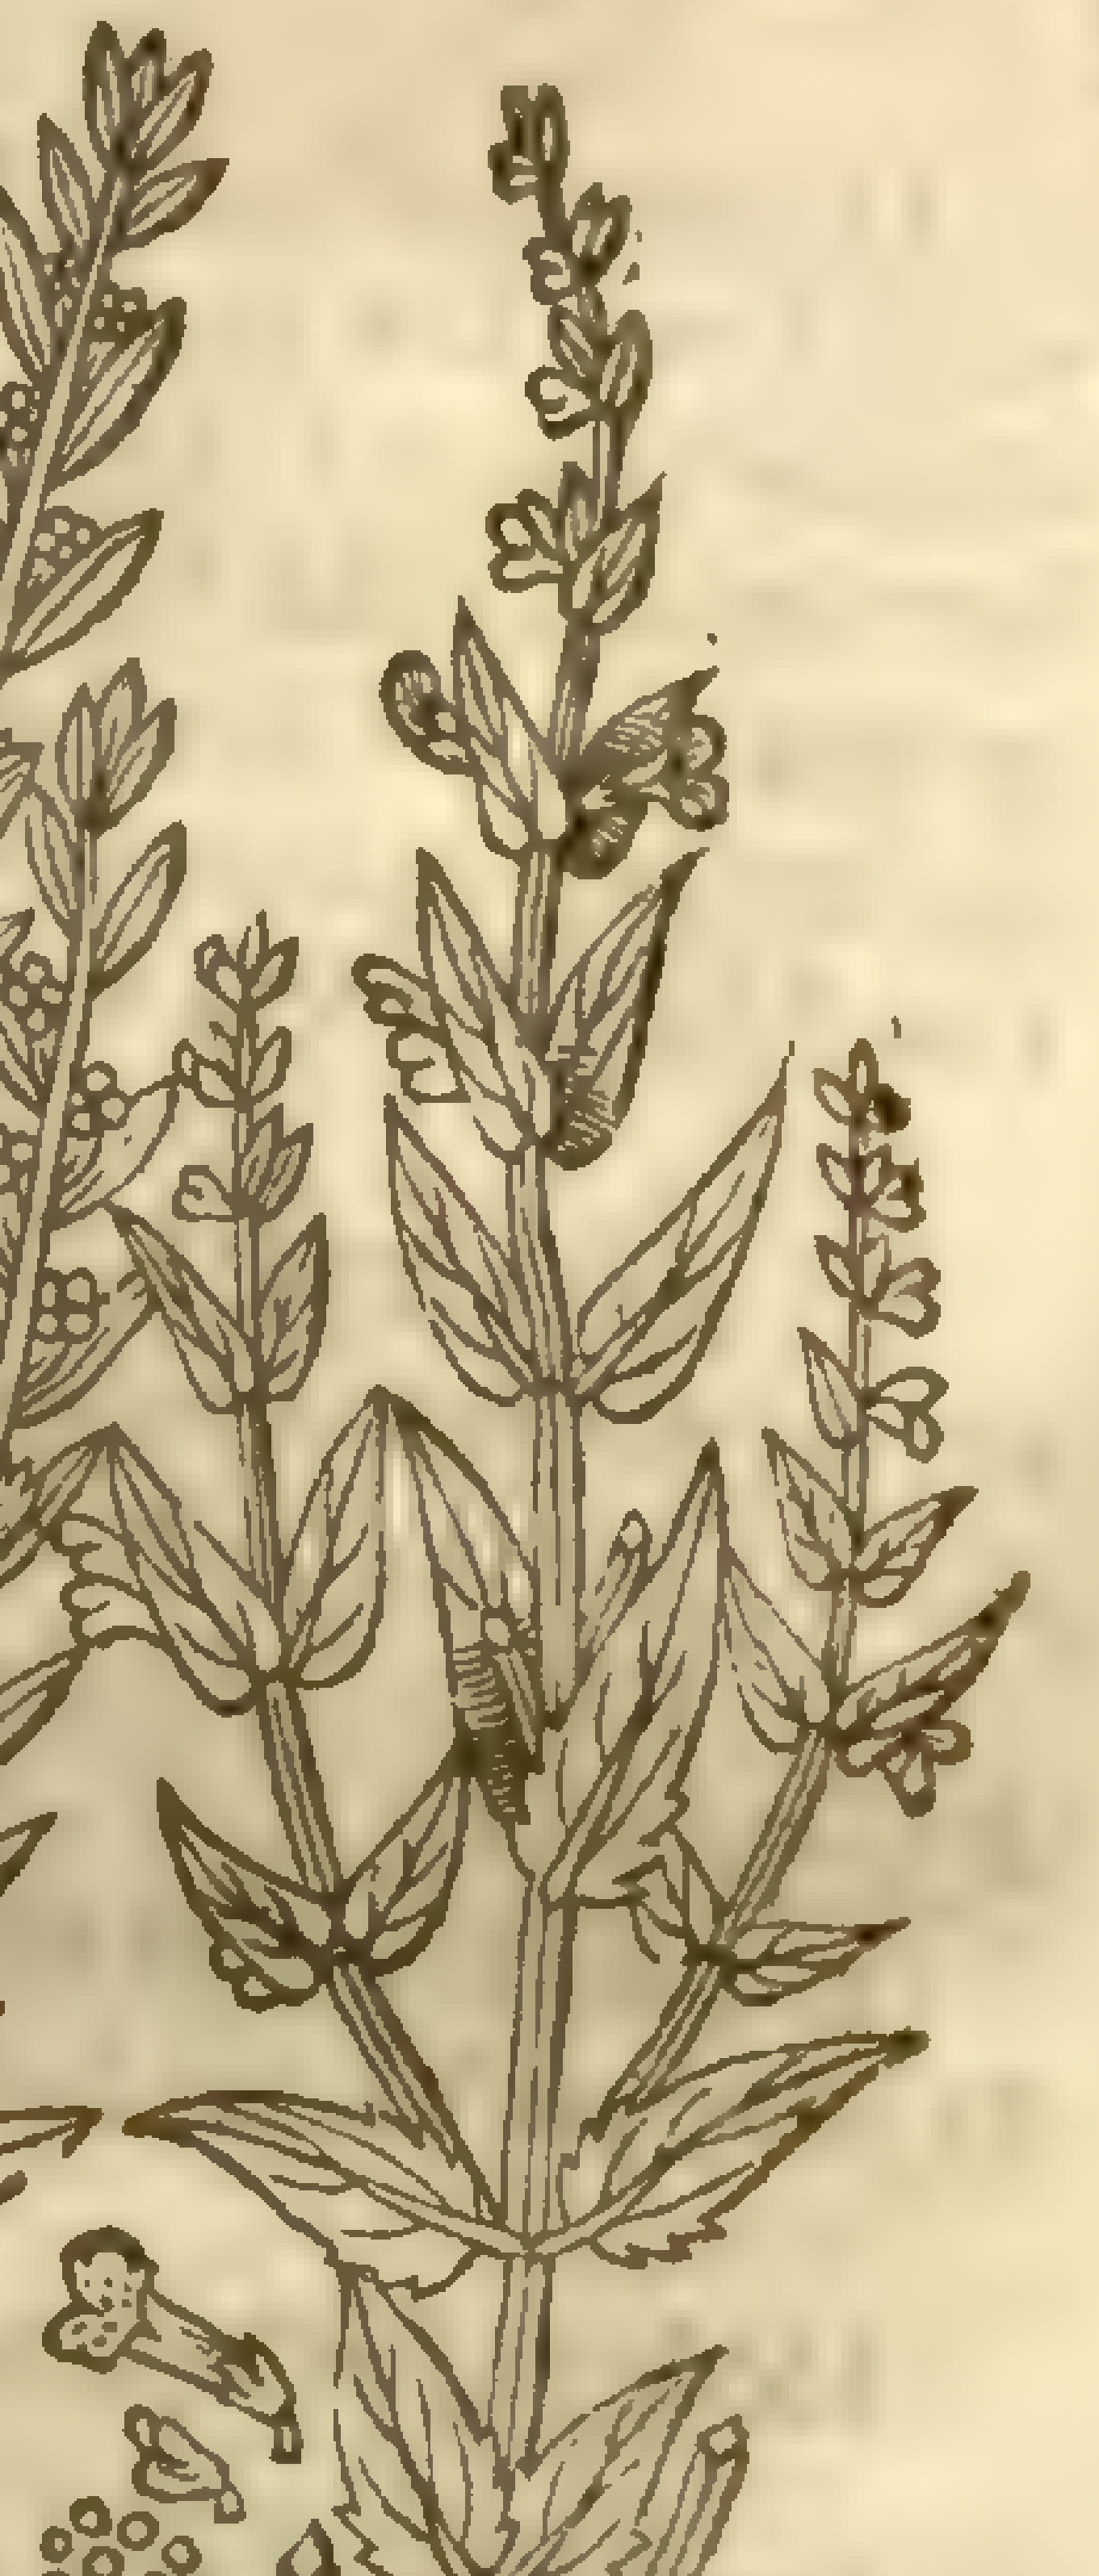
‡ 2 *Gratiola anguſtifolia.*
Graſſe Poley.

Lythrum hyssopifolium [illegible]
Sm. Fl. 2. 34



3 *Gratiola latifolia.*
Broad leaued hedge Hyſſop.

[illegible]
Sm. Fl. 3. 114



‡ 2 Narrow leaued hedge Hyſſop from a ſmall fibrous white root ſends vp a reddiſh round creſted ſtalke diuided into ſundry branches,which are ſet with leaues like thoſe of Knot-graſſe, of a pale greene colour,and without any ſtalks : out of the boſome of theſe come floures ſet in long cups compoſed of foure leaues of a pleaſing blew colour, which are ſucceeded by longiſh ſeed veſſels containing a ſmall dusky ſeed. The whole plant is without ſmell, neither hath it any bitterneſſe or other manifeſt taſte. It varies in leaues,ſometimes broader,and otherwhiles narrower : the plant growing ſomtimes but an handfull, and otherwhiles a foot high. *Geſner* called this *Gratiola minor* : and *Camerarius*,*Hyſſopoides* : *Bauhine* onely hath figured it,and that by the name of *Hyſſopifolia,ſiue Gratiola minor*. *Cordus* firſt mentioned it,and that by the Dutch name of Graſſe Poly,which name we may very fitly retain in Engliſh. ‡

3 Broad leaued hedge Hyſſope hath many ſmall and tender branches,foure ſquare,and ſomewhat hollow or furrowed,beſet with leaues by couples one oppoſit againſt the other, like vnto the former, but ſomewhat ſhorter, and much broader : amongſt which grow the floures of a purple

colour,ſpotted on the inſide with white,and of a brighter purple than the reſt of the floure,faſhioned like the ſmalleſt *Antirrhinum* or leaſt Snapdragon: which being paſt,there ſucceed little ſeed veſſels,faſhioned like the nut of a croſſe-bow, which contain ſmall yellowiſh ſeed extreame bitter of taſte; the whole plant is likewiſe bitter, as the common or well knowne *Gratiola*. The root is compact of a great number of whitiſh ſtrings intangled one within another, which mightily encreaſeth or ſpreadeth abroad.

‡ This plant is only a leſſer kinde of the *Lyſimachia galericulata* of *Lobel*,which ſome haue called *Gratiola latifolia*. Our Authors figure was very ill,wherefore I haue endeauored with the helpe of ſome dried plants and my memorie,to preſent you with a better expreſſion thereof. ‡

¶ *The Place.*

The firſt groweth in low and moiſt places naturally,which I haue planted in my garden.

‡ The ſecond was found growing by my oft mentioned friend Mr *Bowles*,at Dorcheſter in Oxford ſhire,at the backe ſide of the incloſed grounds on the left hand of the town, if you would ride from thence to Oxford, in the graſſy places of the champian corne fields. ‡

The third growes likewiſe in moiſt places: I found it growing vpon the bog or mariſh ground at the farther end of Hampſted heath,and vpon the ſame heath toward London,neere vnto the head of the ſprings that were digged for water to be conueied to London,1590.attempted by that carefull citiſen *Iohn Hart* Knight,Lord Major of the City of London; at which time my ſelfe was in his Lordſhips company,viewing for my pleaſure the ſame goodly ſprings.

¶ *The Time.*

The firſt floureth in May: the ſecond in Iune and Iuly: the third in Auguſt.

¶ *The Names in generall.*

Hedge Hyſſope is called in Latine *Gratiola*, and *Gratia Dei*, or the Grace of God; notwithſtanding there is a kinde of *Geranium* or Storks bill called by the later name: of *Cordus*, *Limneſium*,and *Centauroides*: of *Anguillara* it is thought to be *Dioſcorides* his *Papauer Spumeum*, or Spatling Poppy: but ſome thinke *Papauer ſpumeum* to be that which we cal *Beken album*:in Dutch it is called **Godts gratie**: in Italian,*Stanea cauallo*,becauſe horſes hauing eaten thereof wax lean, and languiſh thereupon: In Engliſh, Gratia Dei,and hedge Hyſſop. The ſeed hereof is called *Gelbenech*,which name the Arabians retain to this day.

¶ *The Names in particular.*

‡ 1 *Matthiolus*,*Dodonæus*,and others haue called this *Gratiola*: *Anguillara*,*Gratia Dei*: *Cordus*,*Limneſium*,*Centauroides*; he alſo thought it(but vnfitly)to be the *Eupatorium* of *Meſue*: *Geſner* thinks it may be *Polemonium paluſtre amarum* of *Hippocrates*,that write of the diſeaſes of cattell.

2 *Cordus* called this Graſſe Poley; *Geſner*, *Gratiola minor*: *Camerarius*,*Hyſſopoides*: and *Bauhine*, *Hyſſopifolia*.

3 This is not ſet forth by any but our Author,and it may fitly be named *Lyſimachia galericulata minor*,as I haue formerly noted.

¶ *The Temperature.*

Hedge Hyſſope is hot and dry of temperature; and the firſt is only vſed in medicine.

¶ *The Vertues.*

A Whoſo taketh but one ſcruple of *Gratiola* bruiſed, ſhall perceiue euidently his effectual operation and vertue,in purging mightily, and that in great aboundance,wateriſh groſſe and ſlimy humors. *Conradus Geſnerus* experimented this,and found it to be true,and ſo haue I my ſelfe,and many others.

B *Gratiola* boiled,and the decoction drunke or eaten with any kinde of meat,in manner of a ſallad, openeth the belly,and cauſeth notable looſeneſſe,ſcouring freely,whereby it purgeth groſſe flegm and cholericke humors.

C *Gratiola* or hedge Hyſſop boiled in wine and giuen to drinke,helpeth feuers of what ſort ſoeuer, and is moſt excellent in dropſies and ſuch like diſeaſes proceeding of cold and waterie cauſes.

D The extraction giuen with the pouder of Cinnamon, and a little of the juice of Calamint, preuaileth againſt tertian and quotidian feuers, ſet downe for moſt certain by the learned *Ioachimus Camerarius*.

Chap. 179. *Of Lauander Spike.*

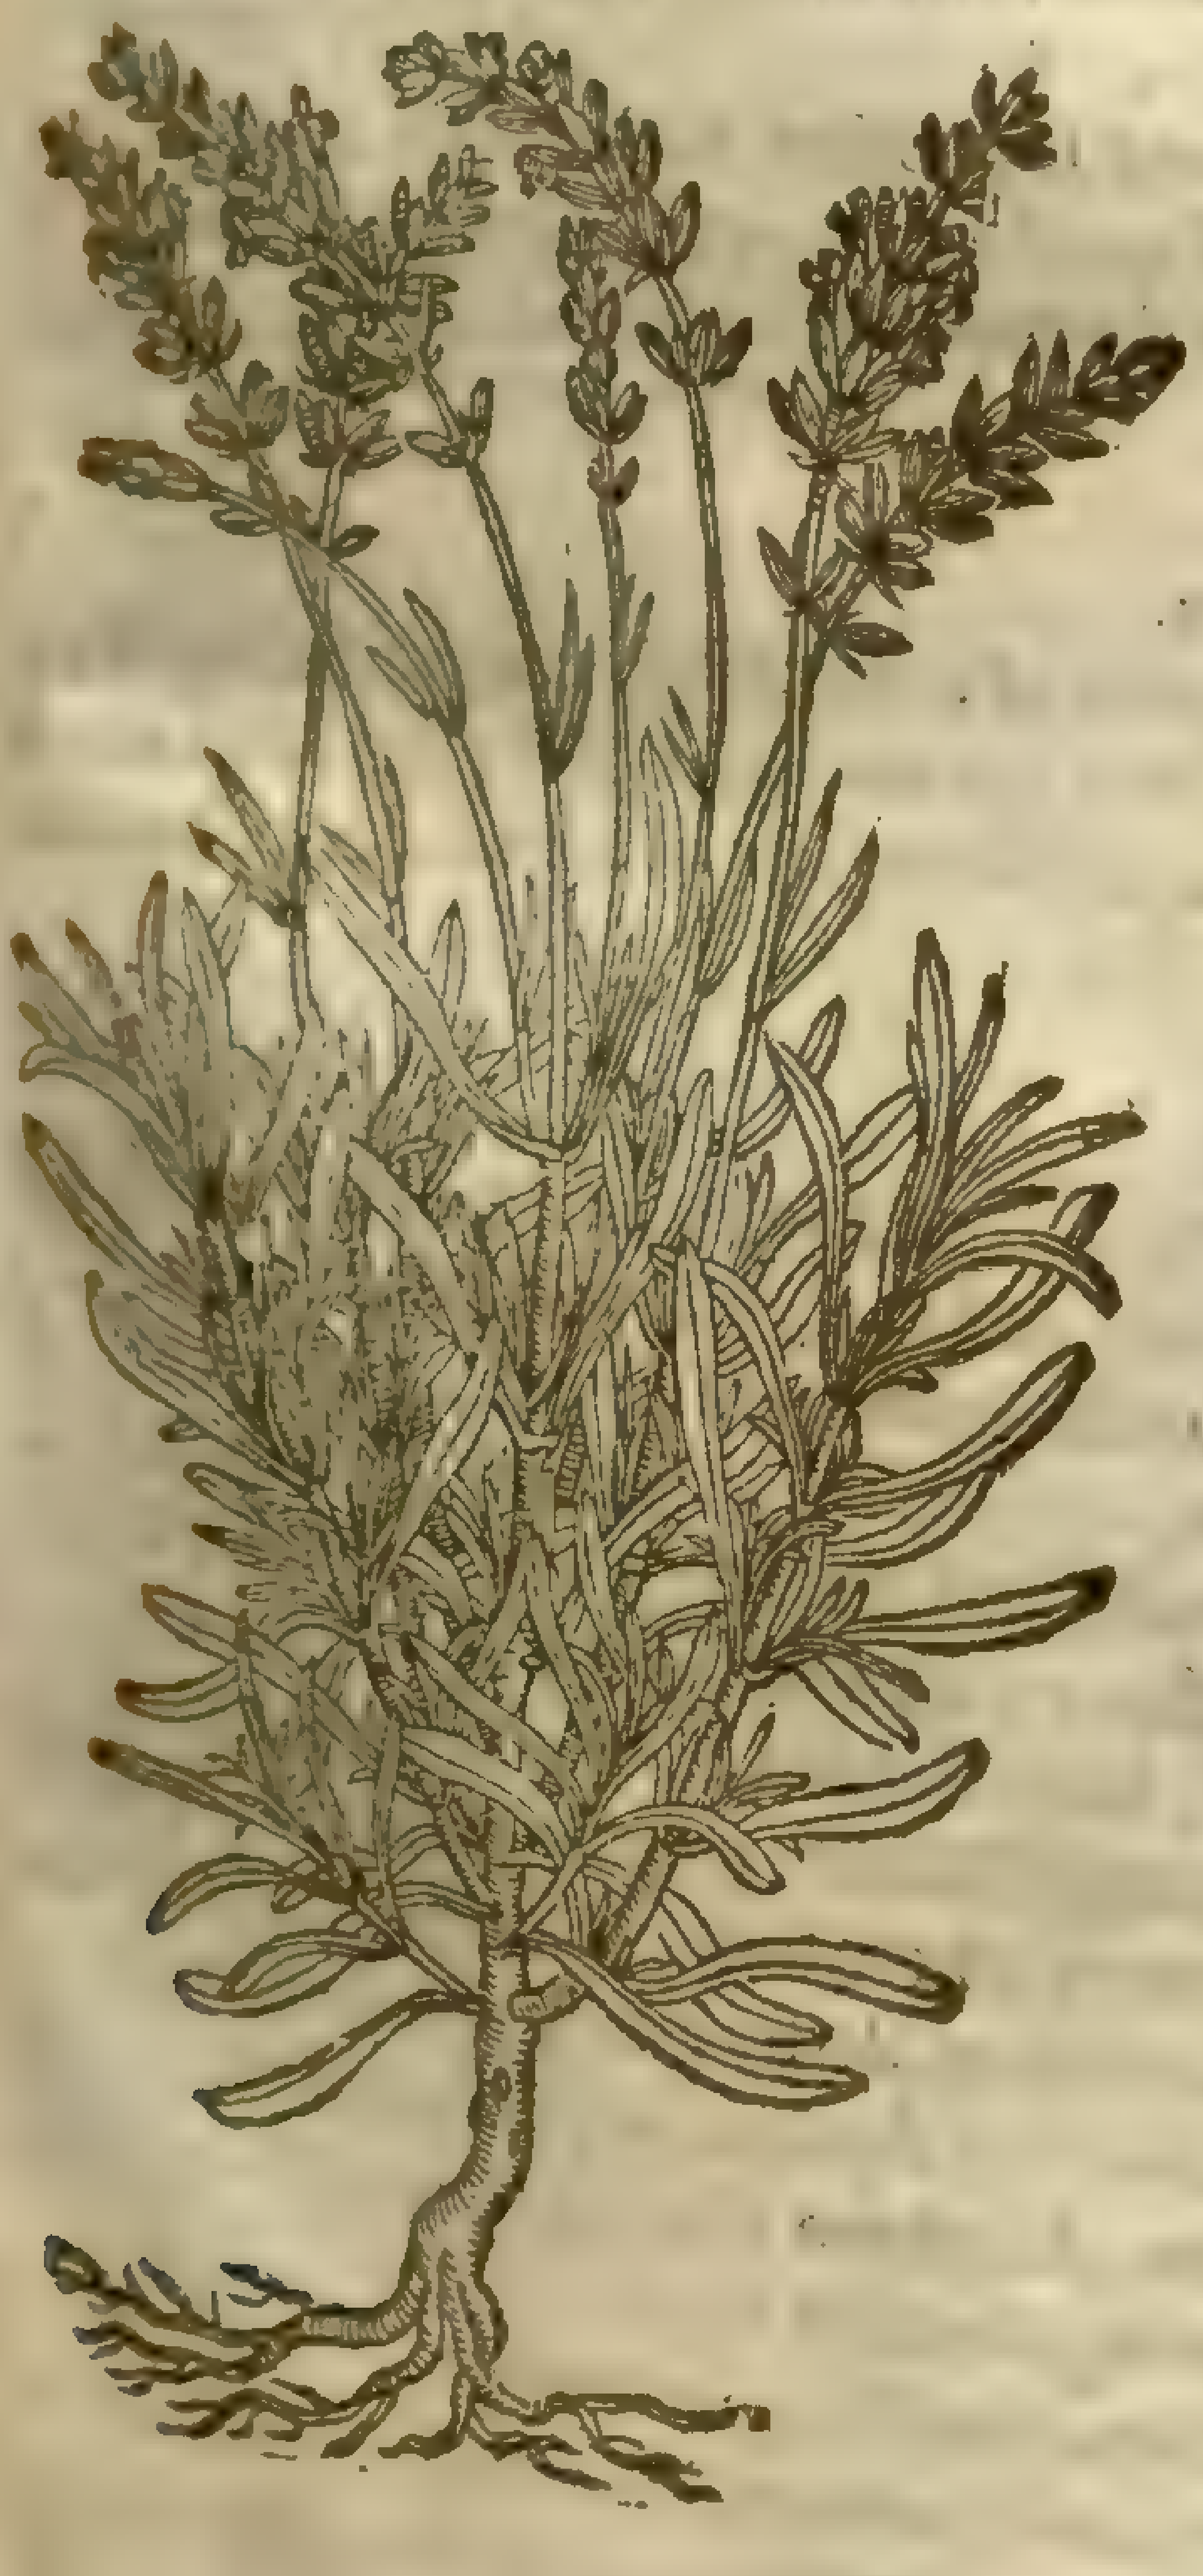
¶ *The Deſcription.*

1 Lauander Spike hath many ſtiffe branches of a wooddy ſubſtance, growing vp in the manner of a ſhrub, ſet with many long hoarie leaues, by couples for the moſt part, of a ſtrong ſmell, and yet pleaſant enough to ſuch as do loue ſtrong ſauors. The floures grow at the top of the branches, ſpike faſhion, of a blew colour. The root is hard and wooddie.

2 The ſecond differeth not from the precedent, but in the colour of the floures: For this plant bringeth milke white floures; and the other blew, wherein eſpecially conſiſteth the difference.

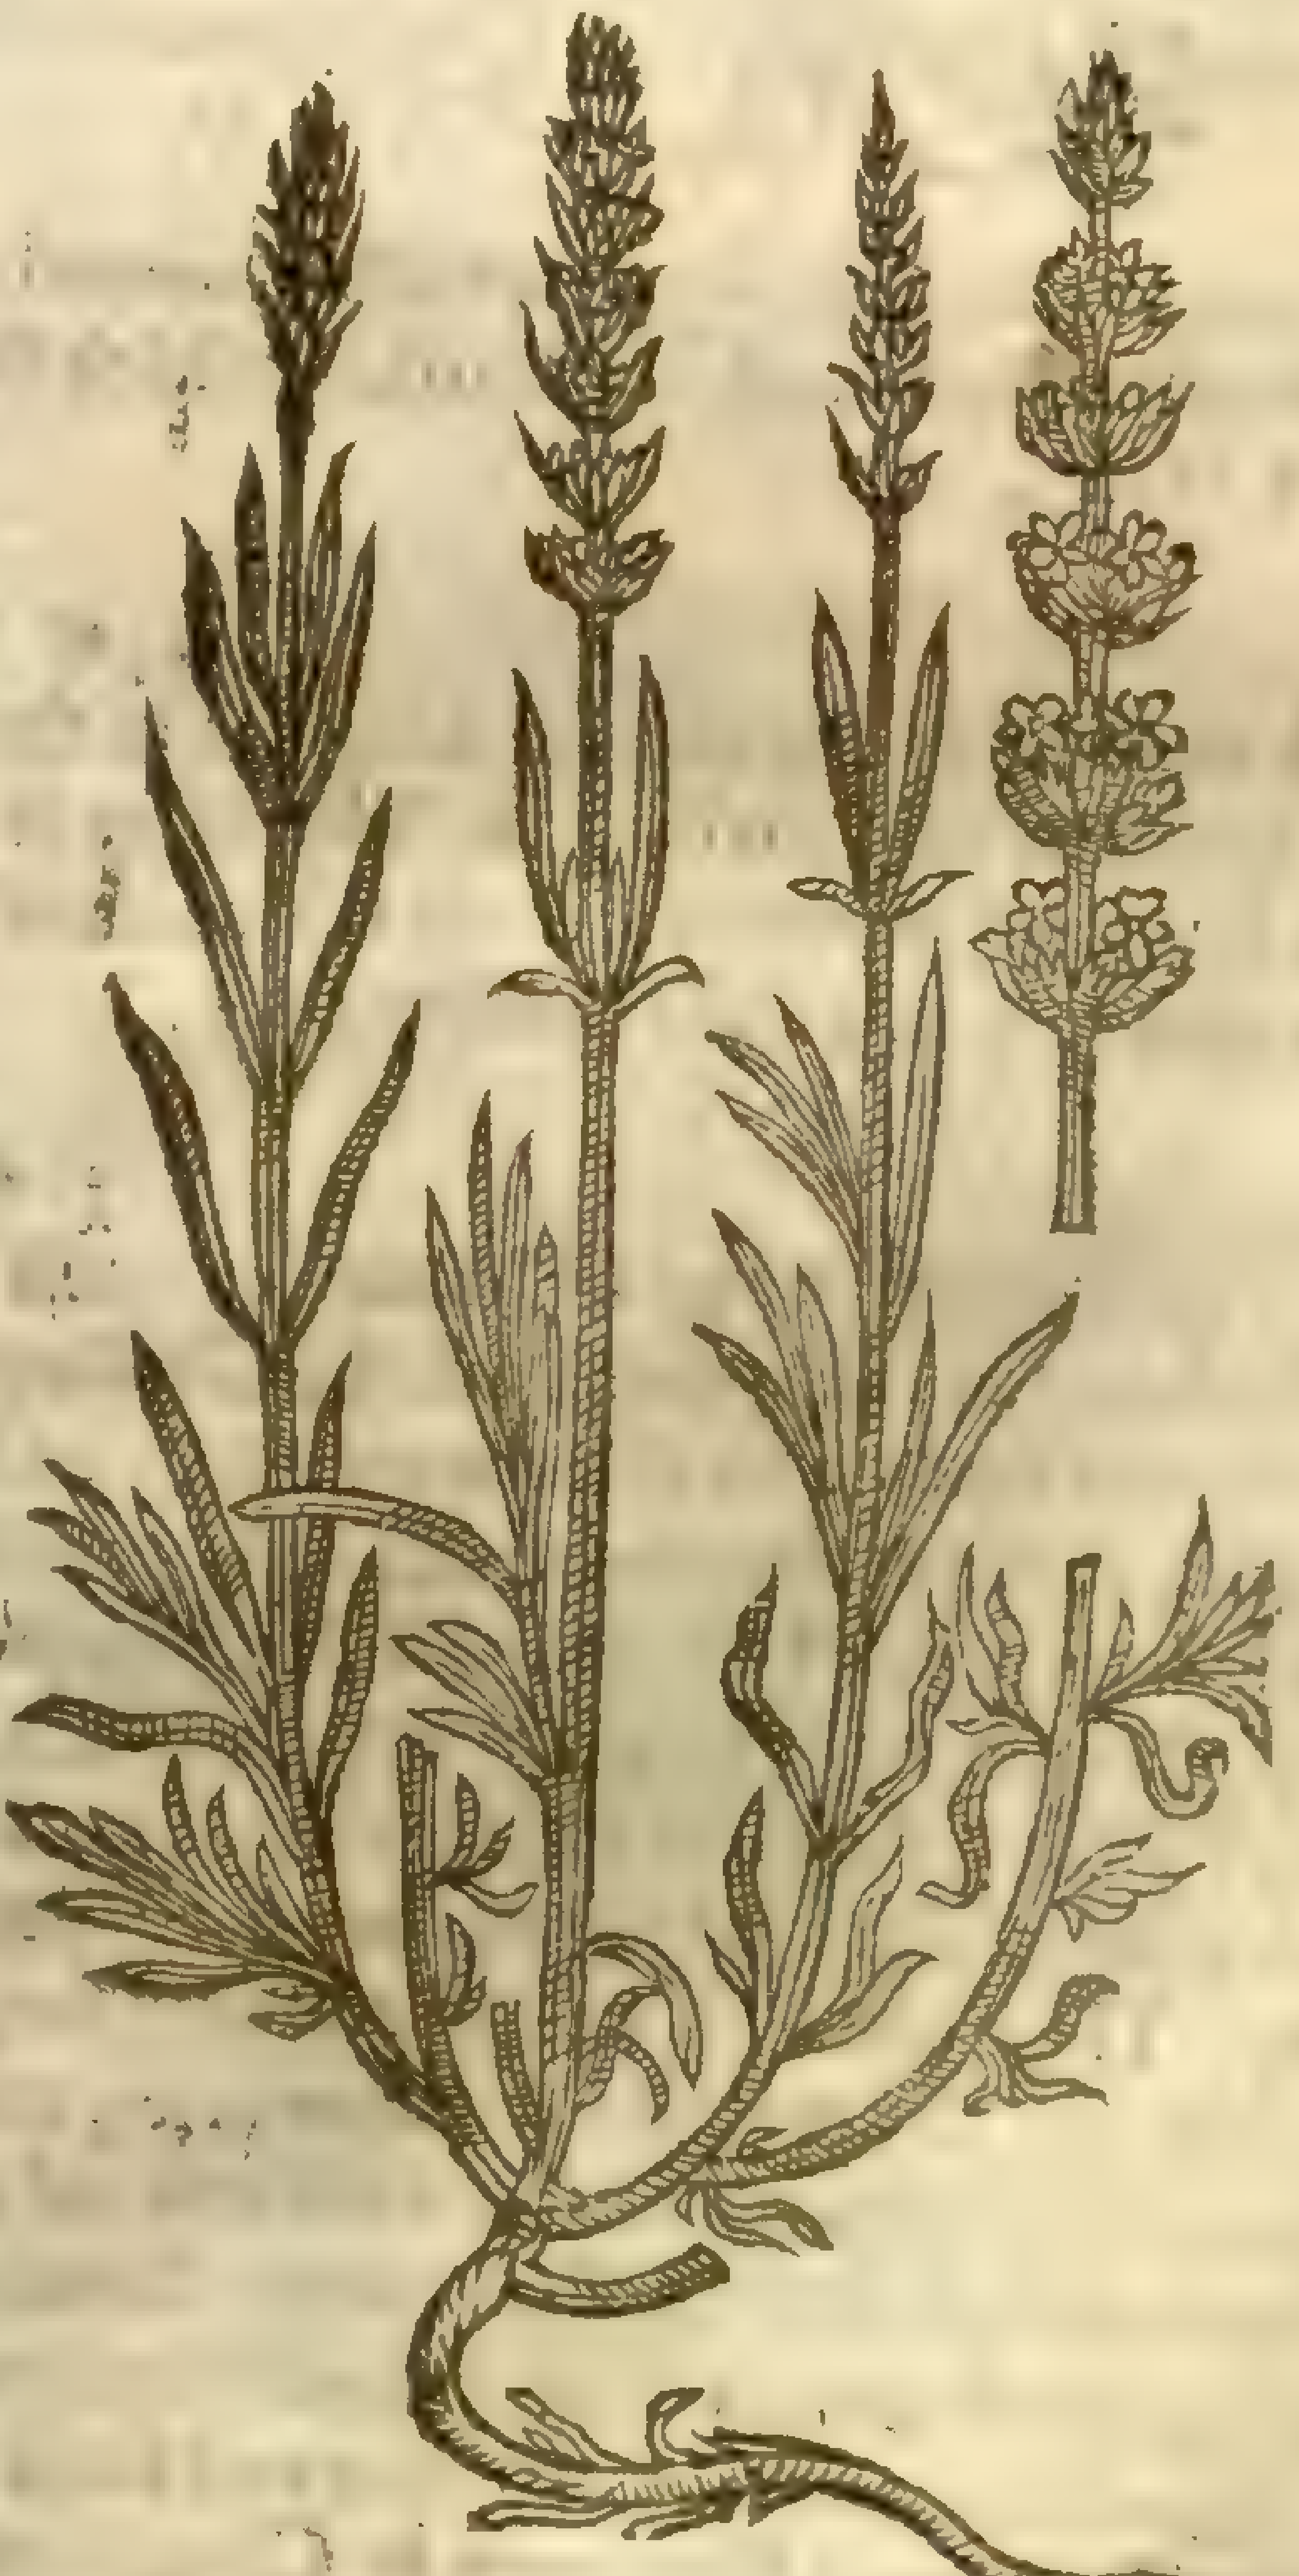
3 We haue in our Engliſh gardens a ſmall kinde of Lauander, which is altogether leſſer than the other, ‡ and the floures are of a more purple colour, and grow in much leſſe and ſhorter heads; yet haue they a far more gratefull ſmell: the leaues are alſo leſſe and whiter than thoſe of the ordinarie ſort. This did, and I thinke yet doth grow in great plenty, in his Majeſties priuate garden at White-Hall. And this is called Spike, without addition, and ſometimes Lauander Spike: and of this by diſtillation is made that vulgarly known and vſed oile which is tearmed *Oleum ſpicæ*, or oile of Spike. ‡

1 *Lavandula flore cæruleo.*
Common Lauander.



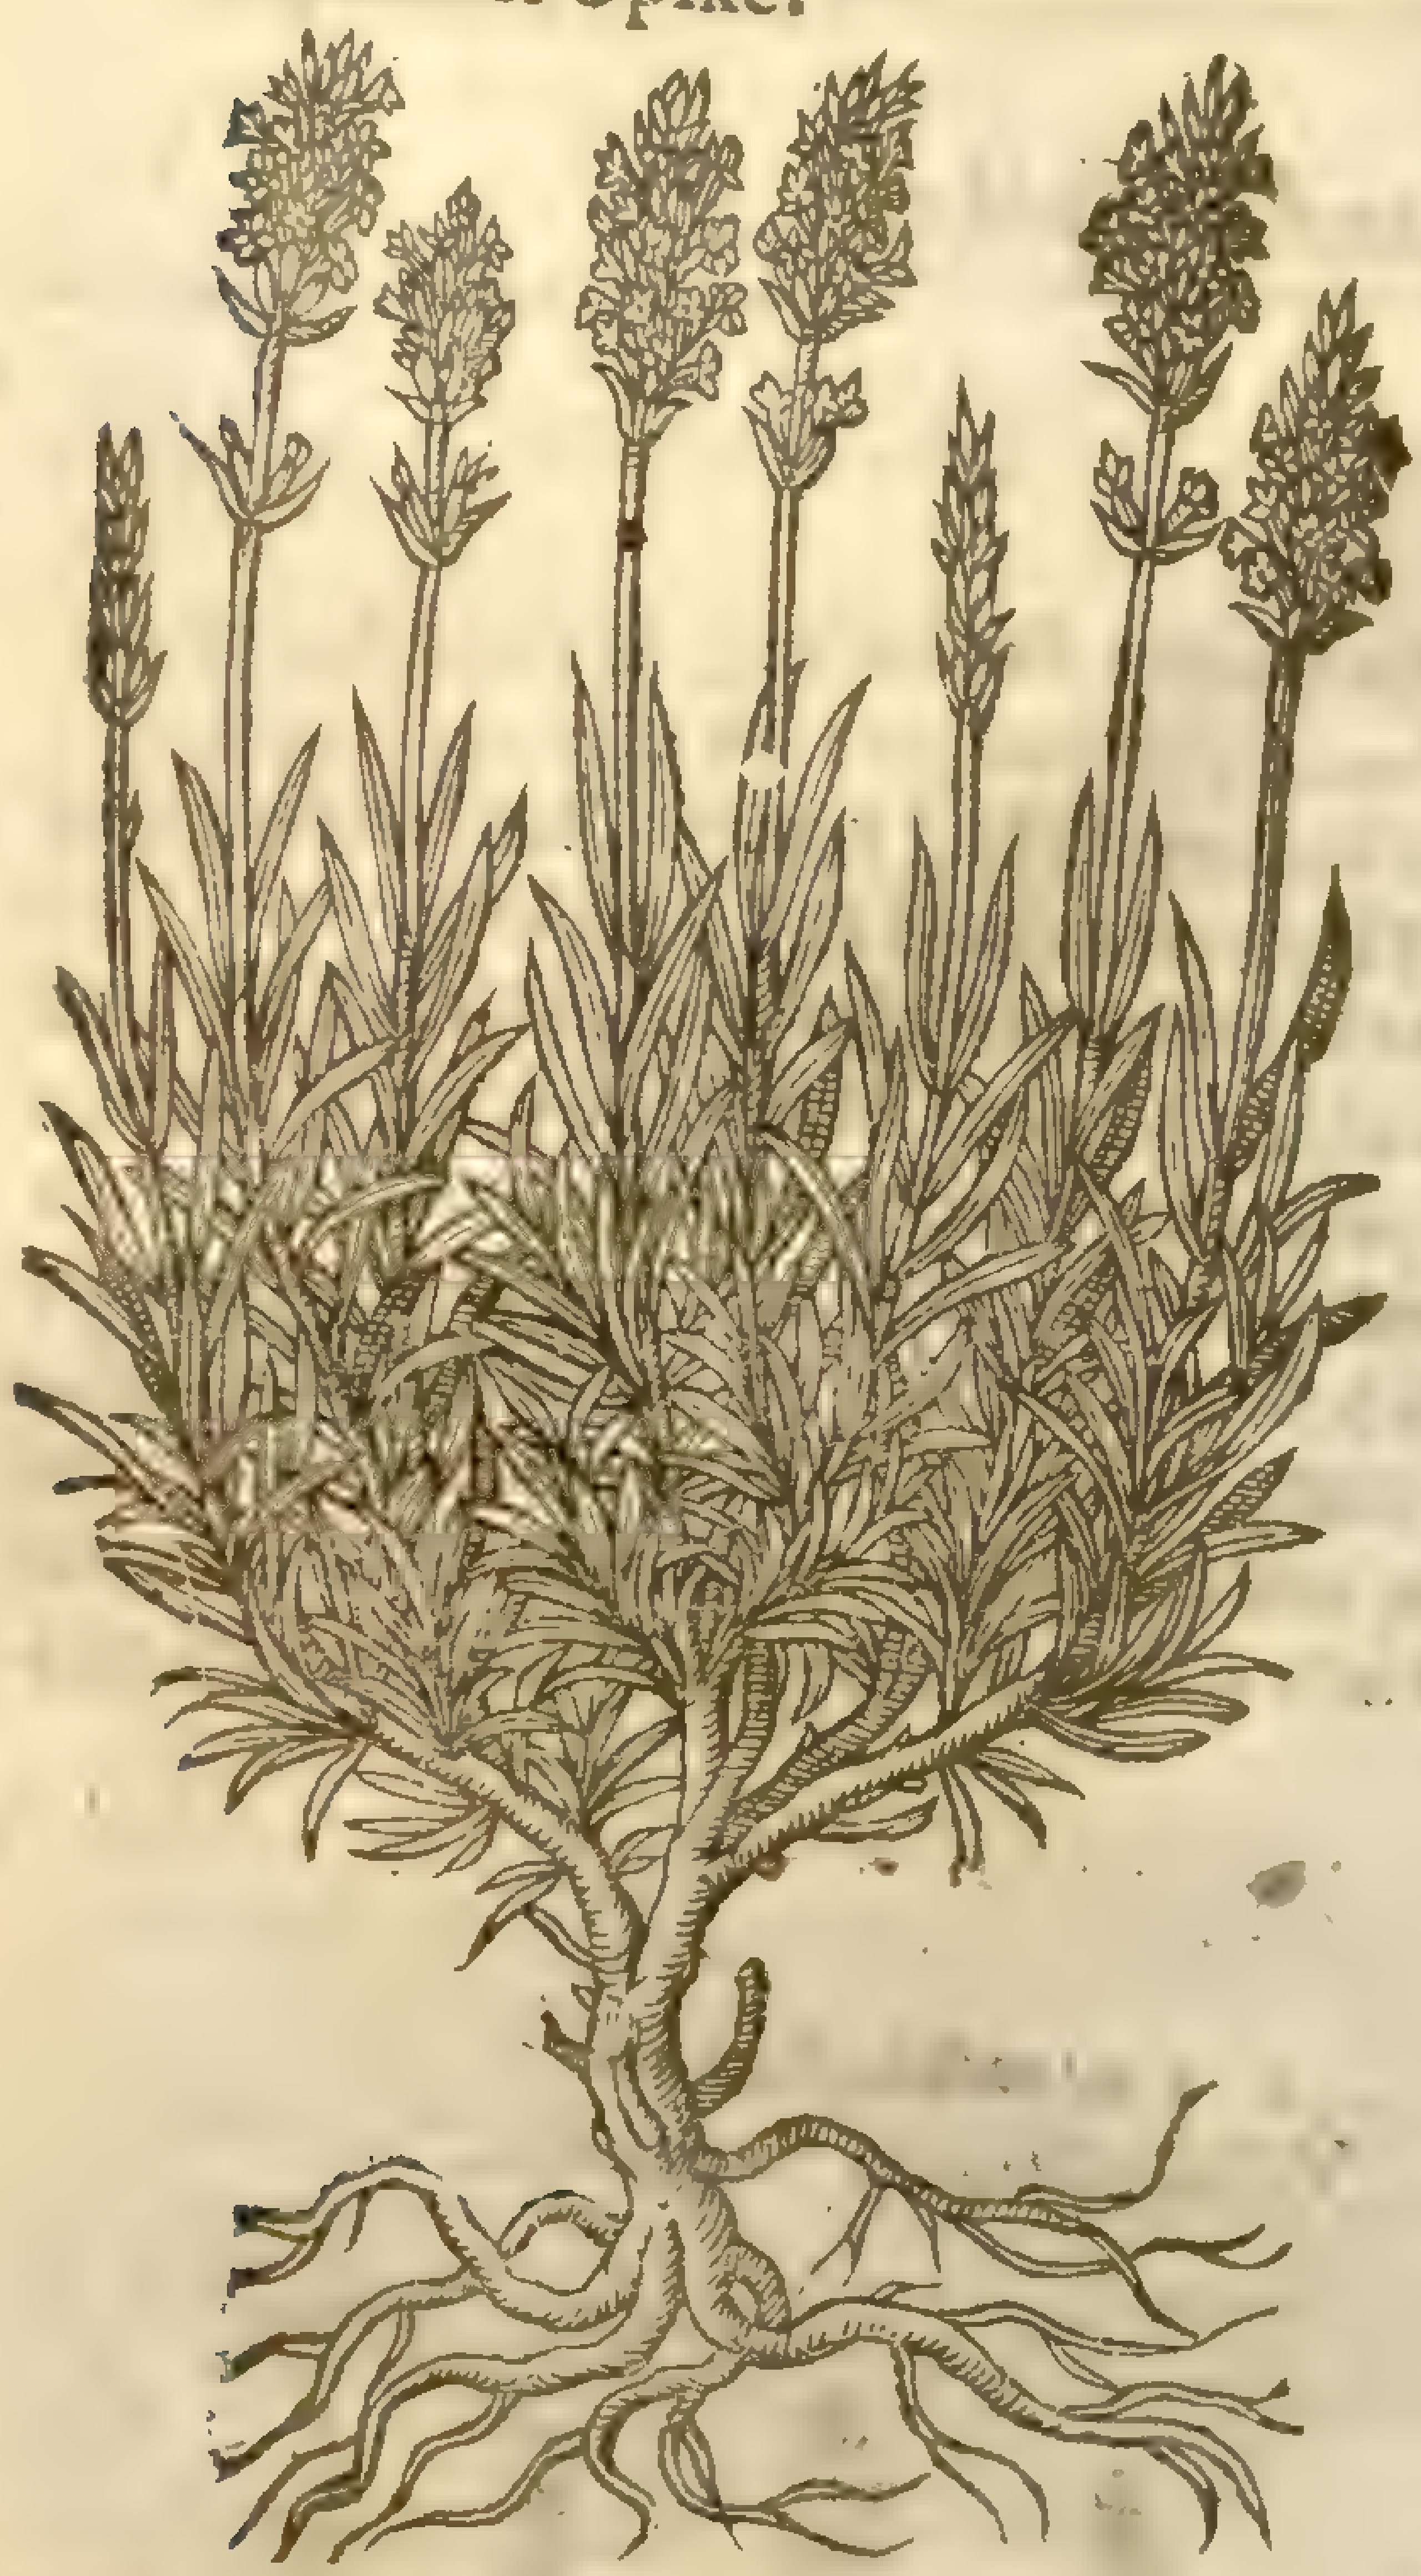
Lavandula spica [illegible] both

2 *Lavandula flore albo.*
White floured Lauander.



¶ *The Place.*

In Spaine and Languedock in France, moſt of the mountaines and deſert fieldes, are as it were



3 *Lavendula minor, ſiue Spica.*
Lauander Spike.

couered ouer with Lauander. In theſe cold countries they are planted in gardens.

¶ *The Time.*

They floure and flouriſh in Iune and Iuly.

¶ *The Names.*

Lauander Spike is called in Latine *Lauendula*, and *Spica:* in Spaniſh, *Spigo*, and *Languda*. The firſt is the male, and the ſecond the female. It is thought of ſome to bee that ſweet herbe *Caſia*, whereof *Virgil* maketh mention in the ſecond Eclog of his Bucolicks:

Tum Caſia atque alijs intexens ſuauibus herbis,
Mollia luteola pingit vacinia caltha.

And then ſhee'l Spike and ſuch ſweet hearbs infold
And paint the Iacinth with the Marigold.

And likewiſe in the fourth of his Georgickes, where he intreateth of chuſing of ſeats and places for Bees, and for the ordering thereof, he ſaith thus:

Hac circum Caſia virides & olentia late
Serpilla, & grauiter ſpirantis copia Thymbra
Floreat; &c.——————

About them let freſh Lauander and ſtore
Of wilde Time with ſtrong Sauorie to floure.

Yet there is another *Caſia* called in ſhops *Caſia Lignea*, as alſo *Caſia nigra*, which is named *Caſia fiſtula*; and another a ſmall ſhrubby plant extant amongthe ſhrubs or hedge buſhes, which ſome think to be the *Caſia Poëtica*, mentioned in the precedent verſes.

¶ *The Temperature.*

Lauander is hot and dry, and that in the third degree, and is of a thin ſubſtance, conſiſting of many airie and ſpirituall parts. Therefore it is good to be giuen any way againſt the cold diſeaſes of the head, and eſpecially thoſe which haue their original or beginning not of abundance of humors, but chiefely of a cold quality only.

¶ *The Vertues.*

A The diſtilled water of Lauander ſmelt vnto, or the temples and forehead bathed therewith, is a refreſhing to them that haue the Catalepſy, a light migram, and to them that haue the falling ſickneſſe, and that vſe to ſwoune much. But when there is abundance of humours, eſpecially mixt with bloud, it is not then to be vſed ſafely, neither is the compoſition to be taken which is made of diſtilled wine: in which ſuch kinds of herbes, floures, or ſeeds, and certain ſpices are infuſed or ſteeped, though moſt men do raſhly and at aduenture giue them without making any difference at al. For by vſing ſuch hot things that fill and ſtuffe the head, both the diſeaſe is made greater, and the ſick man alſo brought into daunger, eſpecially when letting of bloud, or purging haue not gon before. Thus much by way of admonition, becauſe that euery where ſome vnlearned Phyſitians and diuers raſh & ouerbold Apothecaries, and other fooliſh women, do by and by giue ſuch compoſitions, and others of the like kind, not only to thoſe that haue the Apoplexy; but alſo to thoſe that are taken, or haue the Catuche or Catalepſis with a Feuer; to whom they can giue nothing worſe, ſeeing thoſe things do very much hurt, and oftentimes bring death it ſelfe.

B The floures of Lauander picked from the knaps, I meane the blew part and not the huſk, mixed with Cinnamon, Nutmegs, & Cloues, made into pouder, and giuen to drinke in the diſtilled water thereof, doth helpe the panting and paſſion of the heart, preuaileth againſt giddineſſe, turning, or ſwimming of the braine, and members ſubiect to the palſie.

C Conſerue made of the floures with ſugar, profiteth much againſt the diſeaſes aforeſaid, if the quantitie of a beane be taken thereof in the morning faſting.

D It profiteth them much that haue the palſie, if they be waſhed with the diſtilled water of the floures, or anointed with the oile made of the floures, and oile oliue, in ſuch maner as oile of Roſes is, which ſhall be expreſſed in the treatiſe of Roſes.

Chap. 180. *Of French Lauander or Stickadoue.*

¶ *The Temperature.*

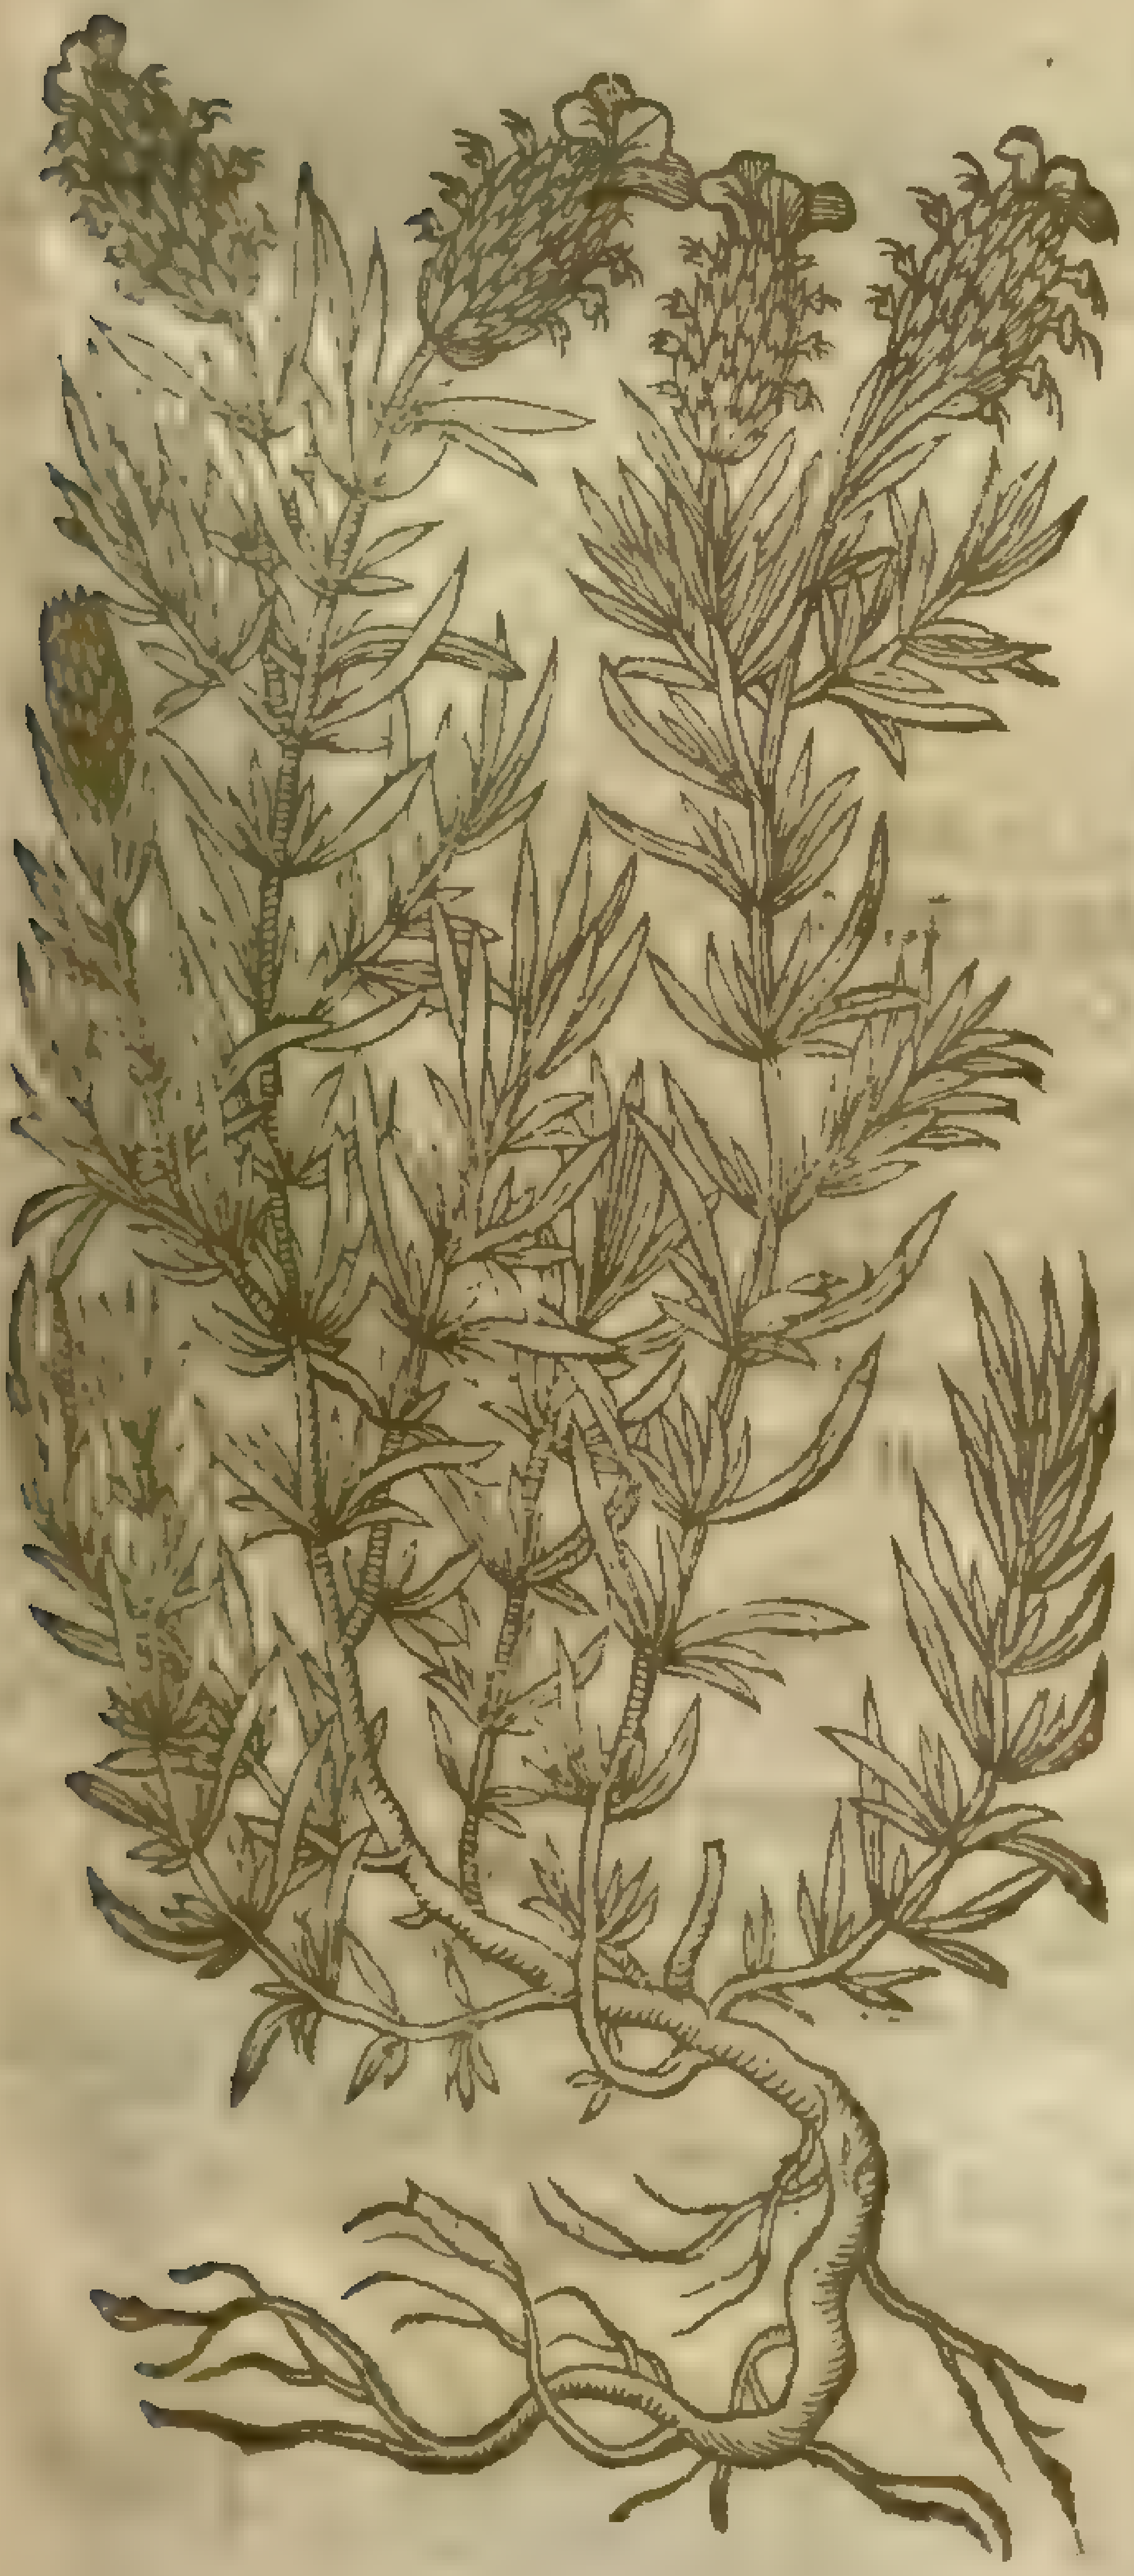
1 French Lauander hath a body like Lauander, ſhort, and of a woody ſubſtance, but ſlenderer, beſet with long narrow leaues of a whitiſh colour, leſſer than thoſe of Lauander: it hath in the top buſhy or ſpiky heads, well compact or thruſt together; out of the which grow forth ſmall purple floures of a pleaſant ſmel. The ſeed is ſmall and blackiſh: the root is hard and wooddy.

2 This jagged Sticadoue hath many ſmall ſtiffe ſtalks of a woody ſubſtance; whereupon doe grow jagged leaues in ſhape like the leaues of Dil, but of an hoary colour: on the top of the ſtalks grow ſpike flours of a blewiſh colour, and like vnto the common Lauander Spike. The root is likewiſe wooddy. ‡ This by *Cluſius* who firſt deſcribed it, as alſo by *Lobel*, is called *Lauendula multifido folio*, or Lauander with the diuided leafe; the plant more reſembling Lauander than Stickadoue. ‡

3 There is alſo a certain kind hereof, differing in ſmalneſſe of the leaues only, which are round about the edges nicked or toothed like a ſaw, reſembling thoſe of Lauander cotton: the root is likewiſe wooddy.

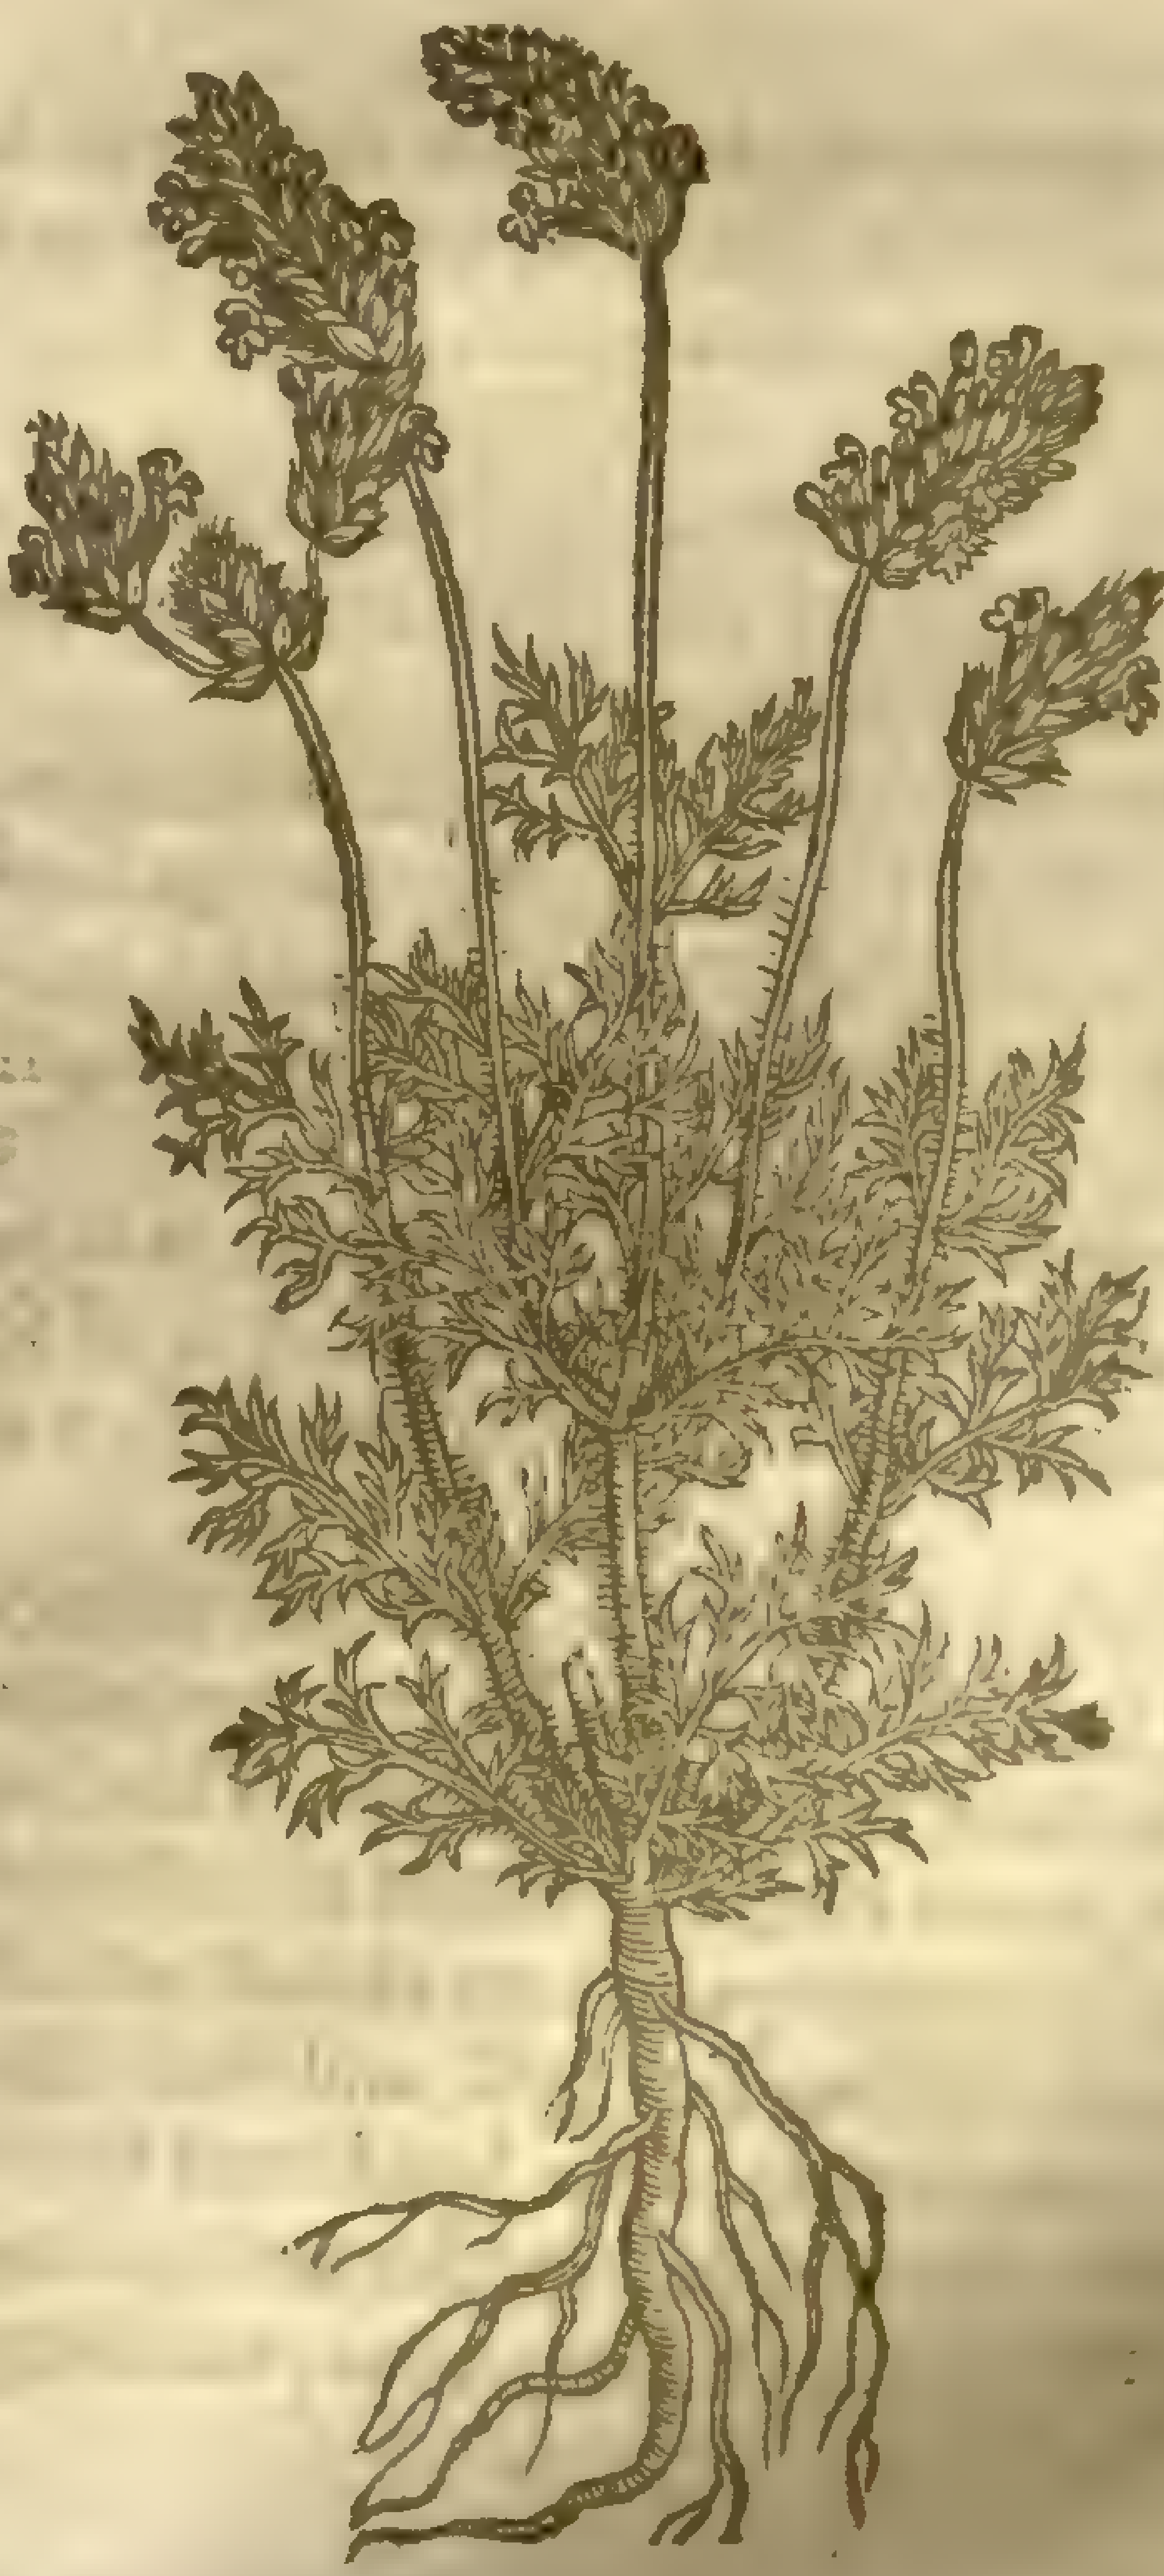
‡ 4 There is alſo another kinde of *Stæchas* which differs from the firſt or ordinarie kinde, in that the tops of the ſtalks are not ſet with leaues almoſt cloſe to the head, as in the common kinde, but are naked and wholly without leaues: alſo at the top of their ſpike or floures (as it were to recompence their defect below) there grow larger and fairer leaues than in the other ſorts. The other parts of the plant differ not from the common *Stæchas*.

† 1 *Stæchas, ſiue Spica hortulana.*
Sticadoue and Sticados.



Lavandula sativa stæchas. Brunf. desc.

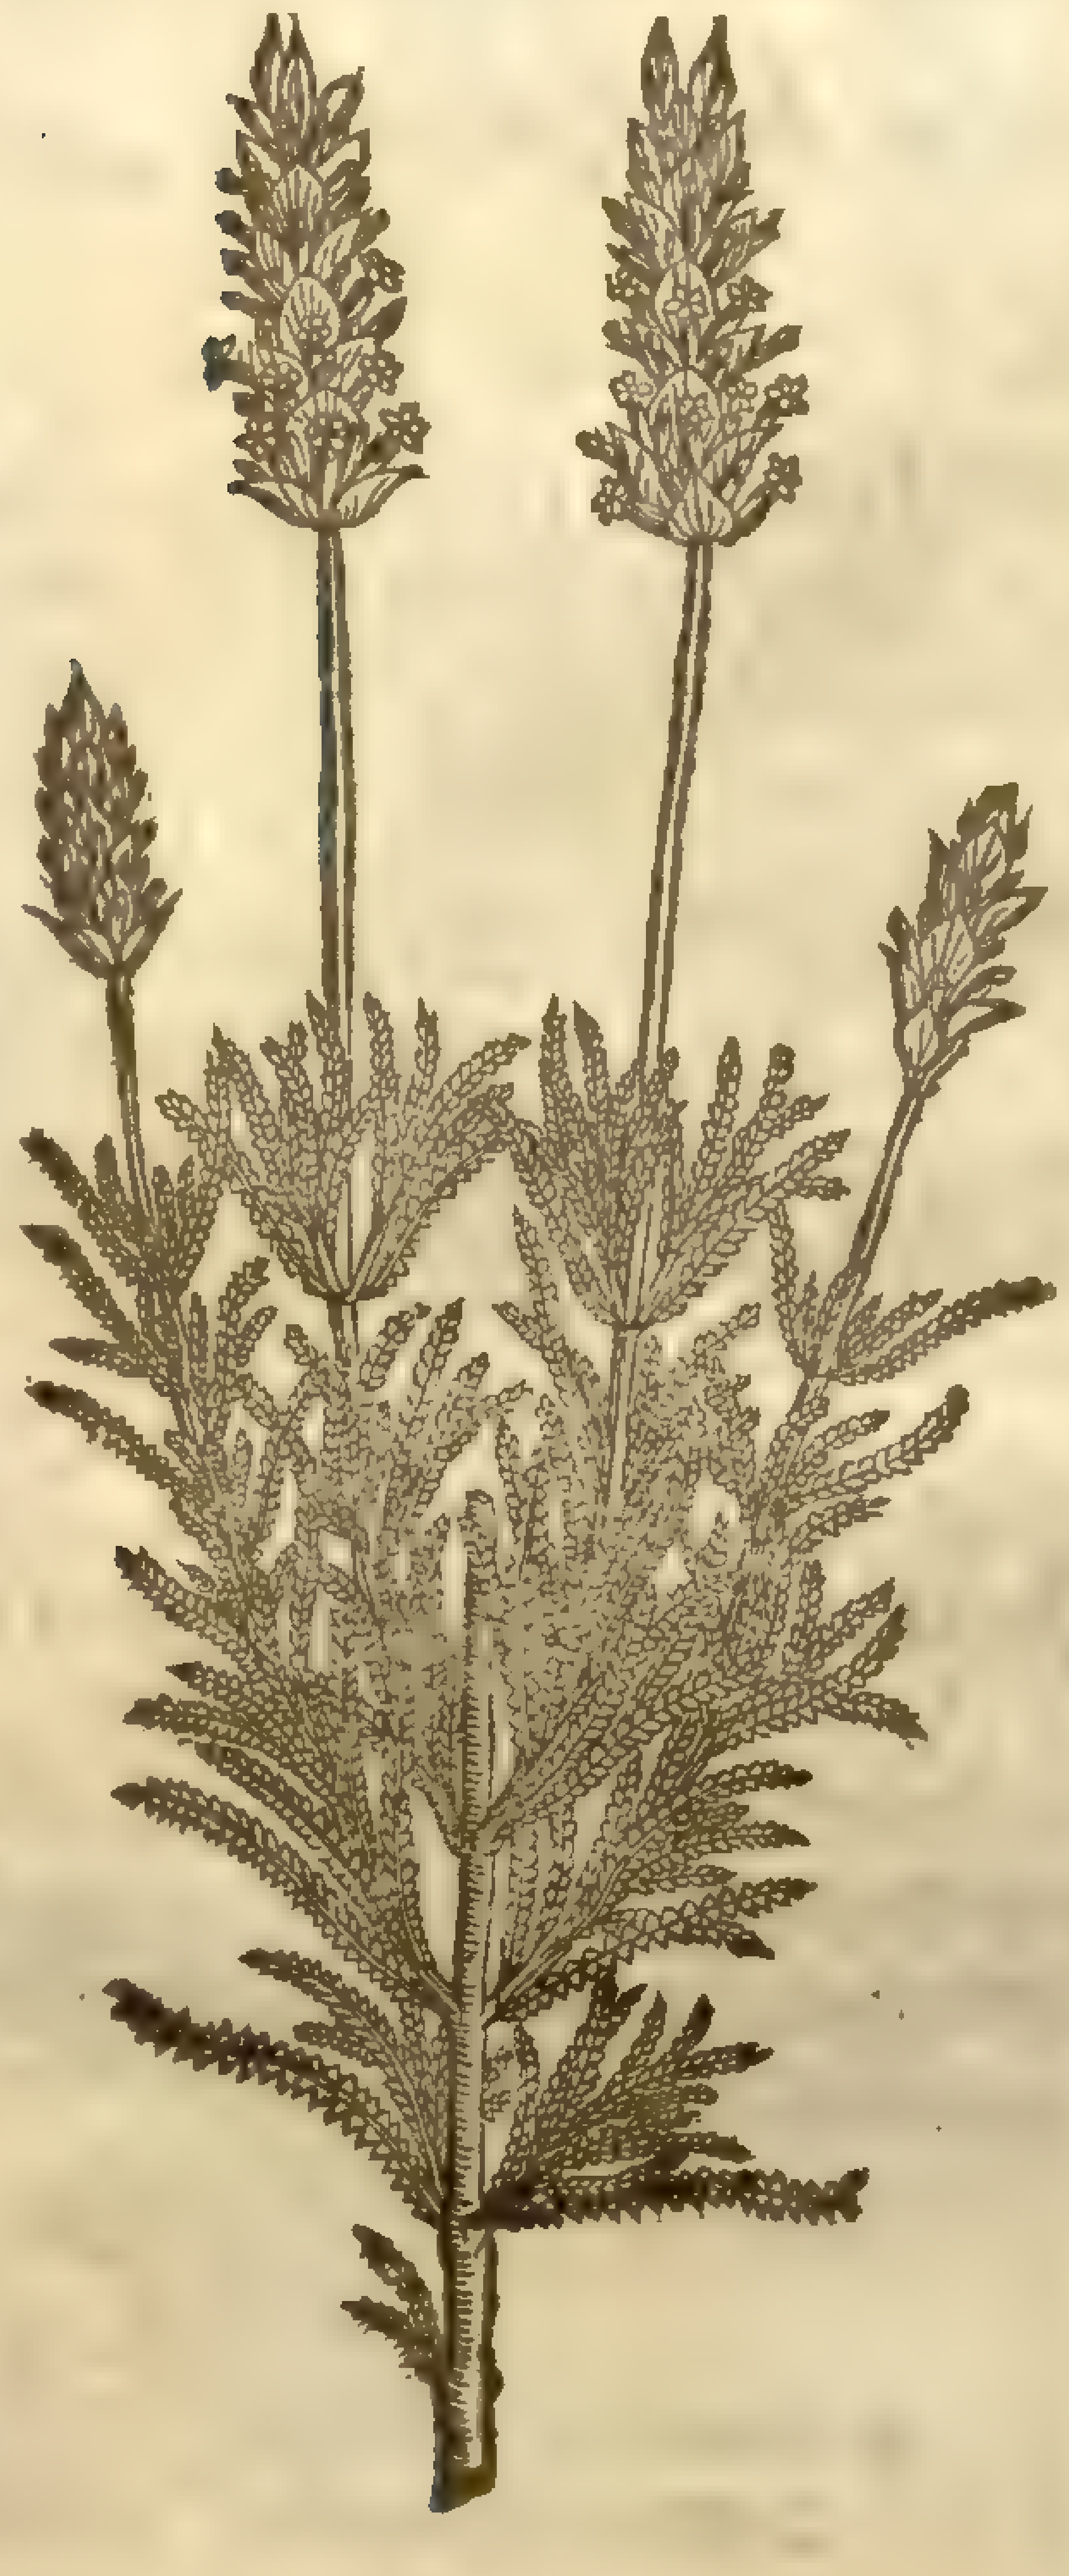
2 *Stæchas multifida.*
Iagged Sticados.



Lavandula multifida. mile. desc.

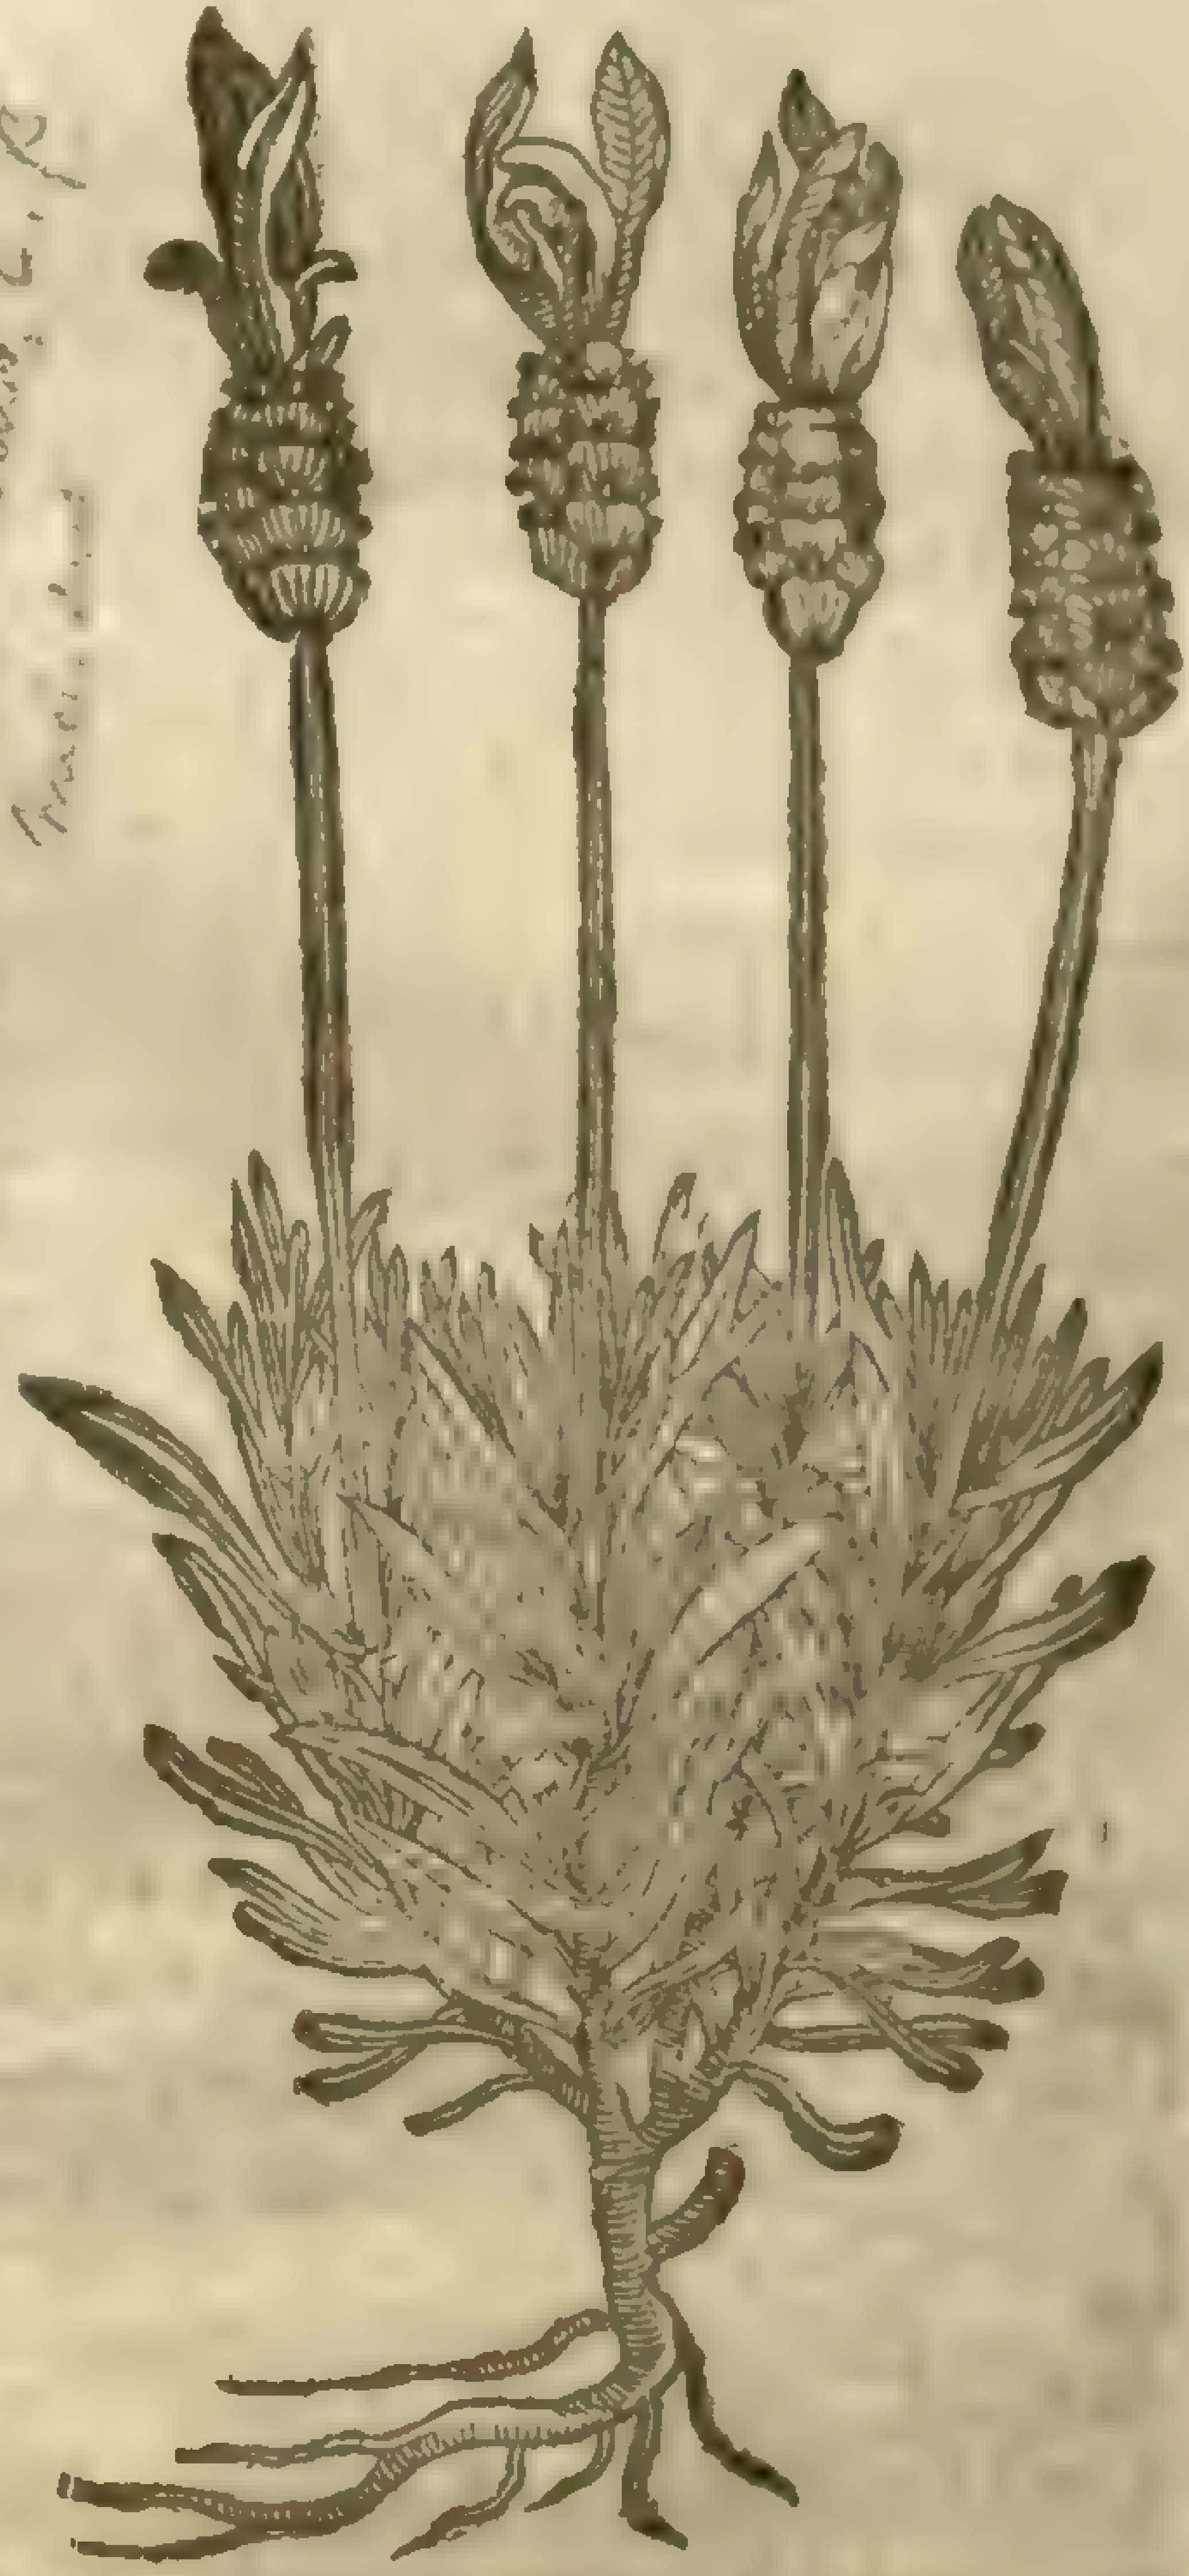
¶ The

3 *Stæchas folio ſerrato.*
Toothed Sticadoue.



Lavandula dentata, L.
[illegible]

‡ 4 *Stæchas ſummis cauliculis nudis.*
Naked Sticadoue.



Lavandula Stoechas, L. P
[illegible]

¶ *The Place.*

Theſe herbes grow wilde in Spaine, in Languedoc in France, and the Iſlands called Stœchades ouer againſt Maſſilia: we haue them in our gardens, and keep them with great diligence from the injurie of our cold clymat.

¶ *The Time.*

They are ſowne of ſeed in the end of Aprill, and couered in Winter from the cold, or elſe ſet in pots or tubs with earth, and caried into houſes.

¶ *The Names.*

The Apothecaries call the floure *Stæcados: Dioſcorides,* στιχὰς: *Galen,* στοιχὰς, by the dipthong *οι* in the firſt ſyllable: in Latine, *Stæchas:* in high-Dutch, **Stichas kraut:** in Spaniſh, *Thomani,* and *Cantueſſo:* in Engliſh, French Lauander, Stecado, Stecadoue, Sticadoue, Caſſidonie, and ſome ſimple people imitating the ſame name do call it Caſt me downe.

¶ *The Temperature.*

French Lauander, ſaith *Galen,* is of temperature compounded of a little cold earthy ſubſtance, by reaſon whereof it bindeth: it is of force to take away obſtructions, to extenuate or make thin, to ſcoure and clenſe, and to ſtrengthen not only all the intrals, but the whole body alſo.

¶ *The Vertues.*

A *Dioſcorides* teacheth, That the decoction hereof doth help the diſeaſes of the cheſt, and is with good ſucceſſe mixed with counterpoiſons.

B The later Phyſitions affirm, That *Stæchas,* and eſpecially the floures of it, are moſt effectuall againſt paines of the head, and all diſeaſes thereof proceeding of cold cauſes, and therefore they bee mixed in all compoſitions almoſt which be made againſt head-ache of long continuance, the Apoplexy, the falling ſickneſſe, and ſuch like diſeaſes.

C The decoction of the heads and floures drunke, openeth the ſtoppings of the liuer, the lungs, the milt, the mother, the bladder, and in one word, all other inward parts, clenſing and driuing forth all euill and corrupt humors, and procuring vrine.

CHAP. 181. *Of Fleawort.*

¶ *The Deſcription.*

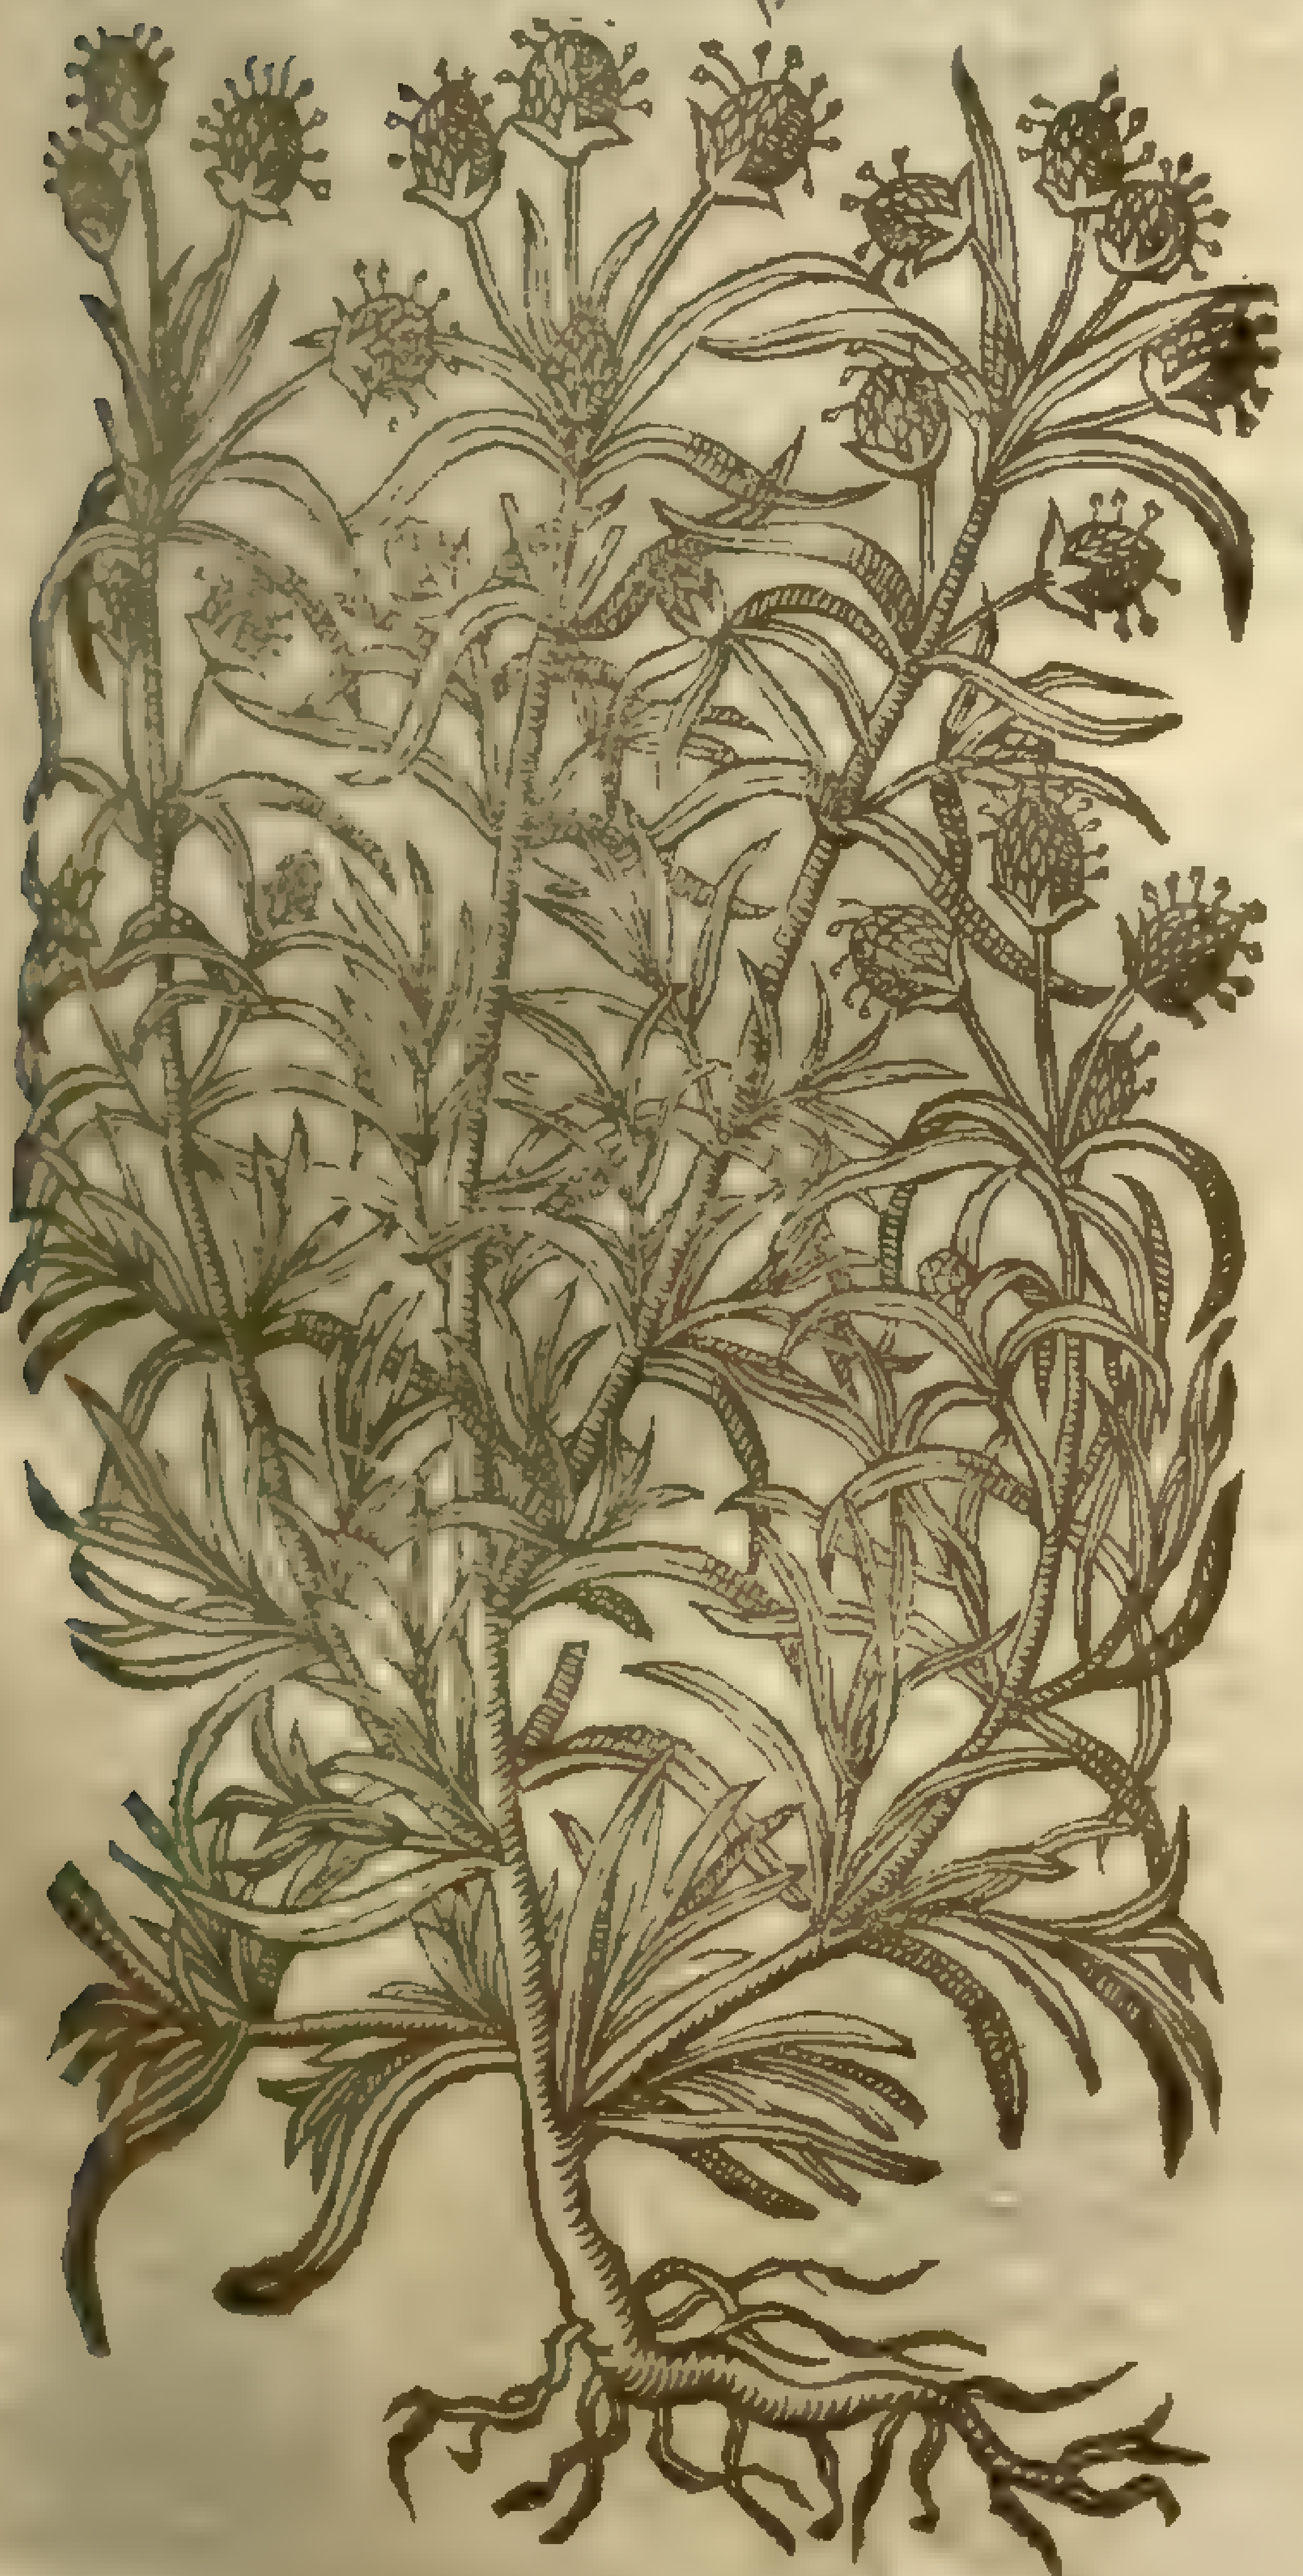
1 PSyllium, or the common Fleawort, hath many round and tender branches, ſet full of long and narrow leaues ſomewhat hairy. The tops of the ſtalks are garniſhed with ſundrie round chaffie knops beſet with ſmall yellow floures: which beeing ripe containe many little ſhining ſeeds, in proportion, colour, and bigneſſe like vnto fleas.

2 The ſecond kinde of *Pſyllium* Fleawort hath long and tough branches, of a woody ſubſtance like the precedent, but longer and harder, with leaues reſembling the former, but much longer and narrower. The chaffie tuft which containeth the ſeed is like the other, but more like the eare of *Phalaris*, which is the eare of *Alpiſti*, the Canary ſeed which is meat for birds that come from the Iſlands of Canarie. The root hereof laſteth all the winter, and likewiſe keepes his greene leaues; whereof it tooke this addition of *Sempervirens*.

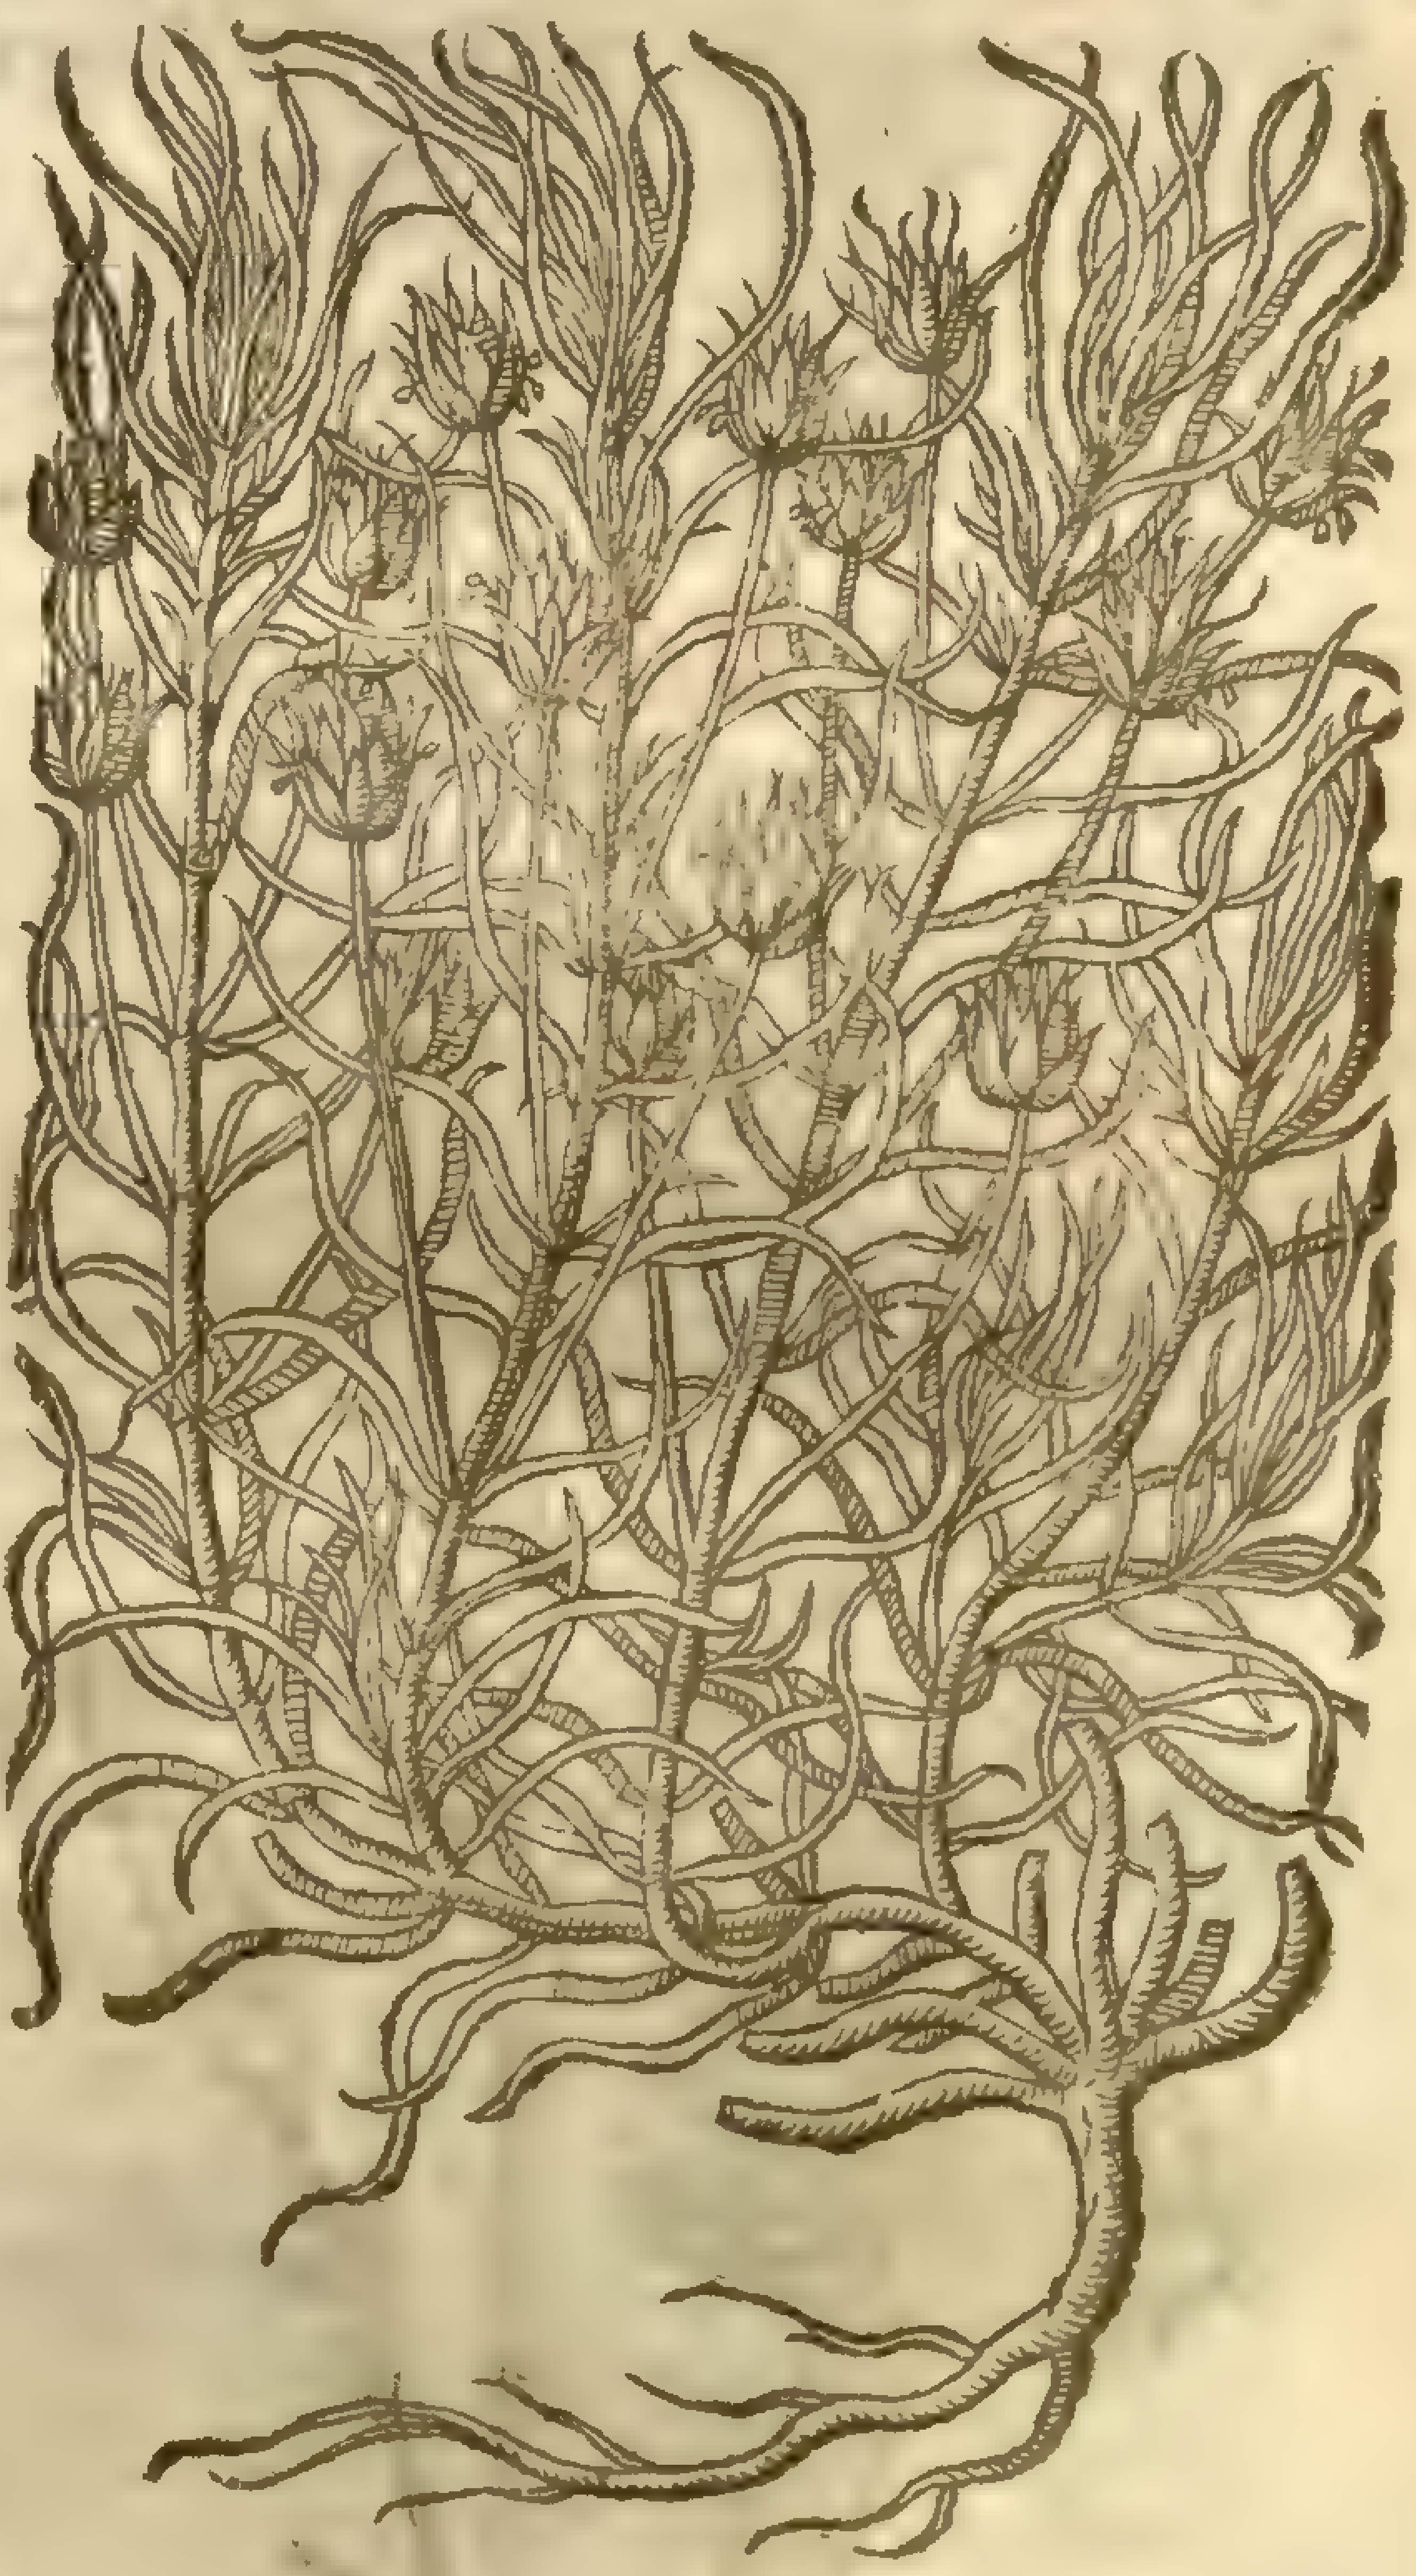
Plantago Cynops [illegible]

1 *Pſyllium, ſiue pulicaris herba.*
Fleawort.

Plantago psyllium [illegible]



2 *Pſyllium ſempervirens Lobelij.*
Neuer dying Fleawort.



The Place.

Theſe plants are not growing in our fields of England, as they do in France and Spaine, yet I haue them growing in my garden.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Fleawort is called in Greeke ψύλλιον: in Latine, *Pulicaria*, and *Herba Pulicaris*: in ſhops, *Pſyllium*: in Engliſh, Fleawort; not becauſe it killeth fleas, but becauſe the ſeeds are like fleas: of ſome, Fleabane, but vnproperly: in Spaniſh, *Zargatona*: in French, *L'herbe aus pulces*: in Dutch, **Duyls vloye cruyt.**

¶ *The Temperature.*

Galen and *Serapio* record, That the ſeed of *Pſyllium* (which is chiefly vſed in medicine) is cold in the ſecond degree, and temperat in moiſture and drineſſe.

¶ *The Vertues.*

A The ſeed of Fleawort boiled in water or infuſed, and the decoction or infuſion drunke, purgeth downwards aduſt and cholericke humors, cooleth the heate of the inward parts, hot feuers, burning agues, and ſuch like diſeaſes proceeding of heate, and quencheth drowth and thirſt.

B The ſeed ſtamped, and boiled in water to the form of a plaiſter, and applied, takes away all ſwellings of the joints, eſpecially if you boile the ſame with vineger and oile of roſes, and apply it as aforeſaid.

C The ſame applied in manner aforeſaid, vnto any burning heate called S. *Anthonies* fire, or any hot and violent impoſtume, aſſwageth the ſame, and bringeth it to ripeneſſe.

D Some hold, That the herb ſtrewed in the chamber where any fleas be, will driue them away; for which cauſe it tooke the name Fleawort: but I thinke it is rather becauſe the ſeed doth reſemble a flea ſo much, that it is hard to diſcern the one from the other.

¶ *The Danger.*

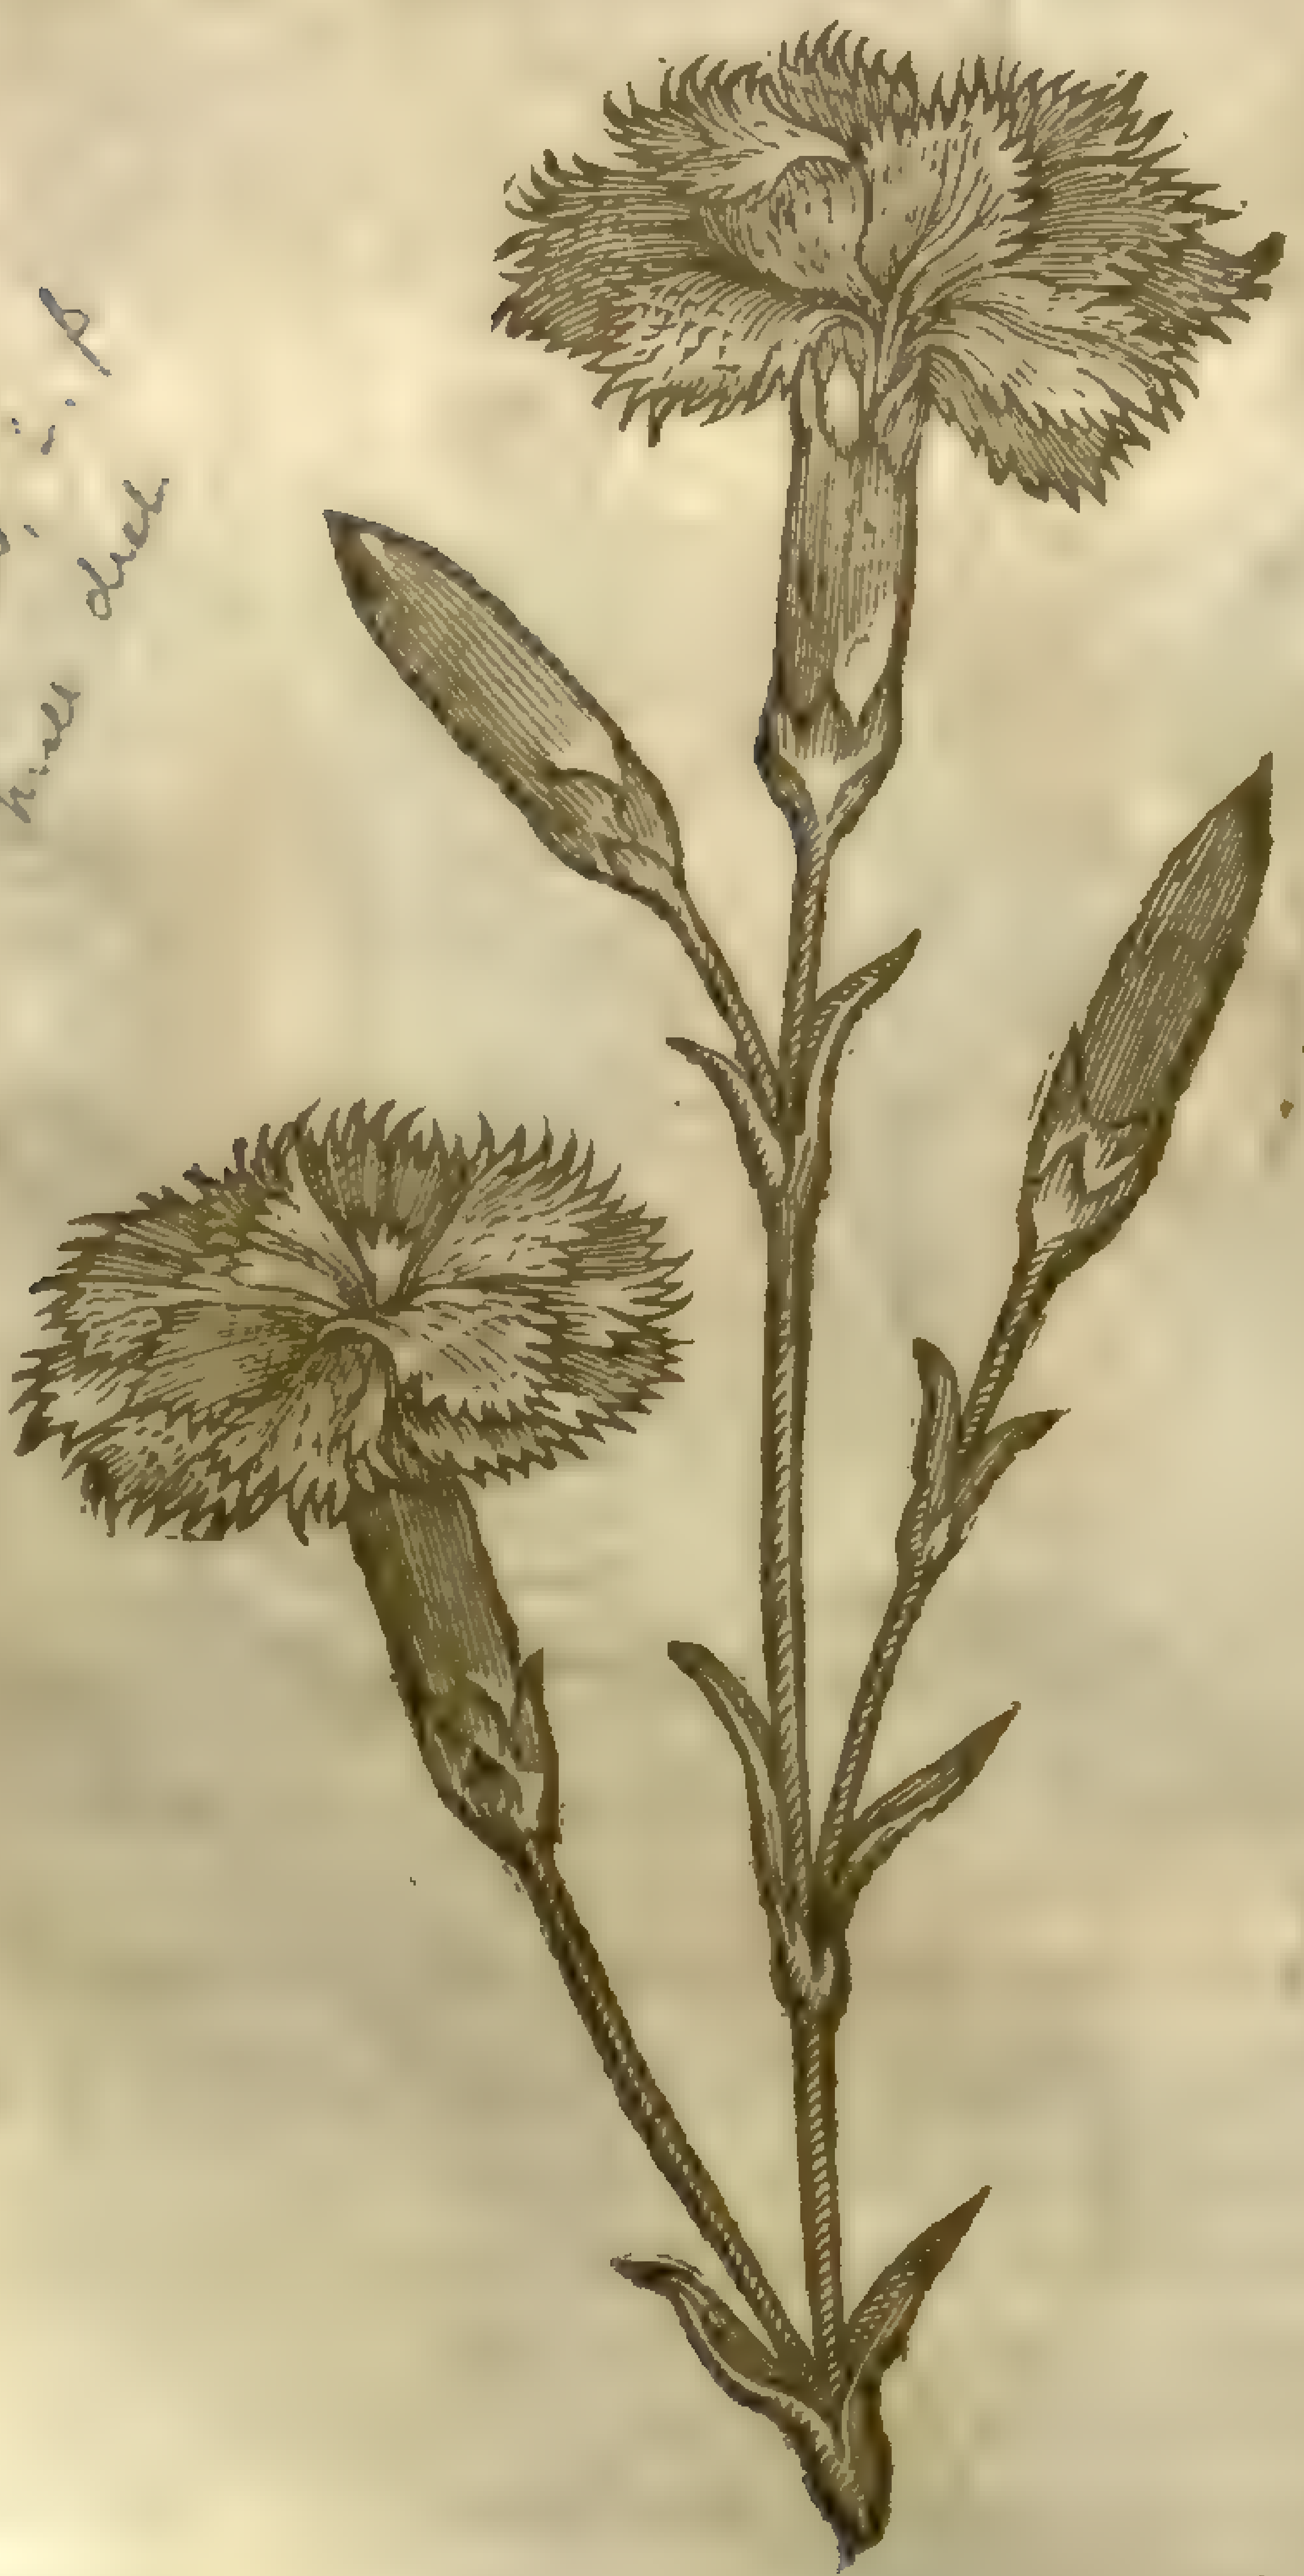
Too much Fleawort ſeed taken inwardly is hurtfull to mans nature: ſo that I wiſh you not to follow the minde of *Galen* and *Dioſcorides* in this point, being a medicine rather bringing a malady, than taking away the griefe: remembring the old prouerb, A man may buy gold too deare, and the hony is too deare that is lickt from thorns.

‡ *Dioſcorides* nor *Galen* mention no vſe of this inwardly: but on the contrary, *Dioſcorides, lib. 6.* which treats wholly of the curing and preuenting poiſons, mentions this in the tenth chapter for a poiſon, and there ſets down the ſymptomes which it cauſes, and refers you to the foregoing chapter for the remedies. ‡

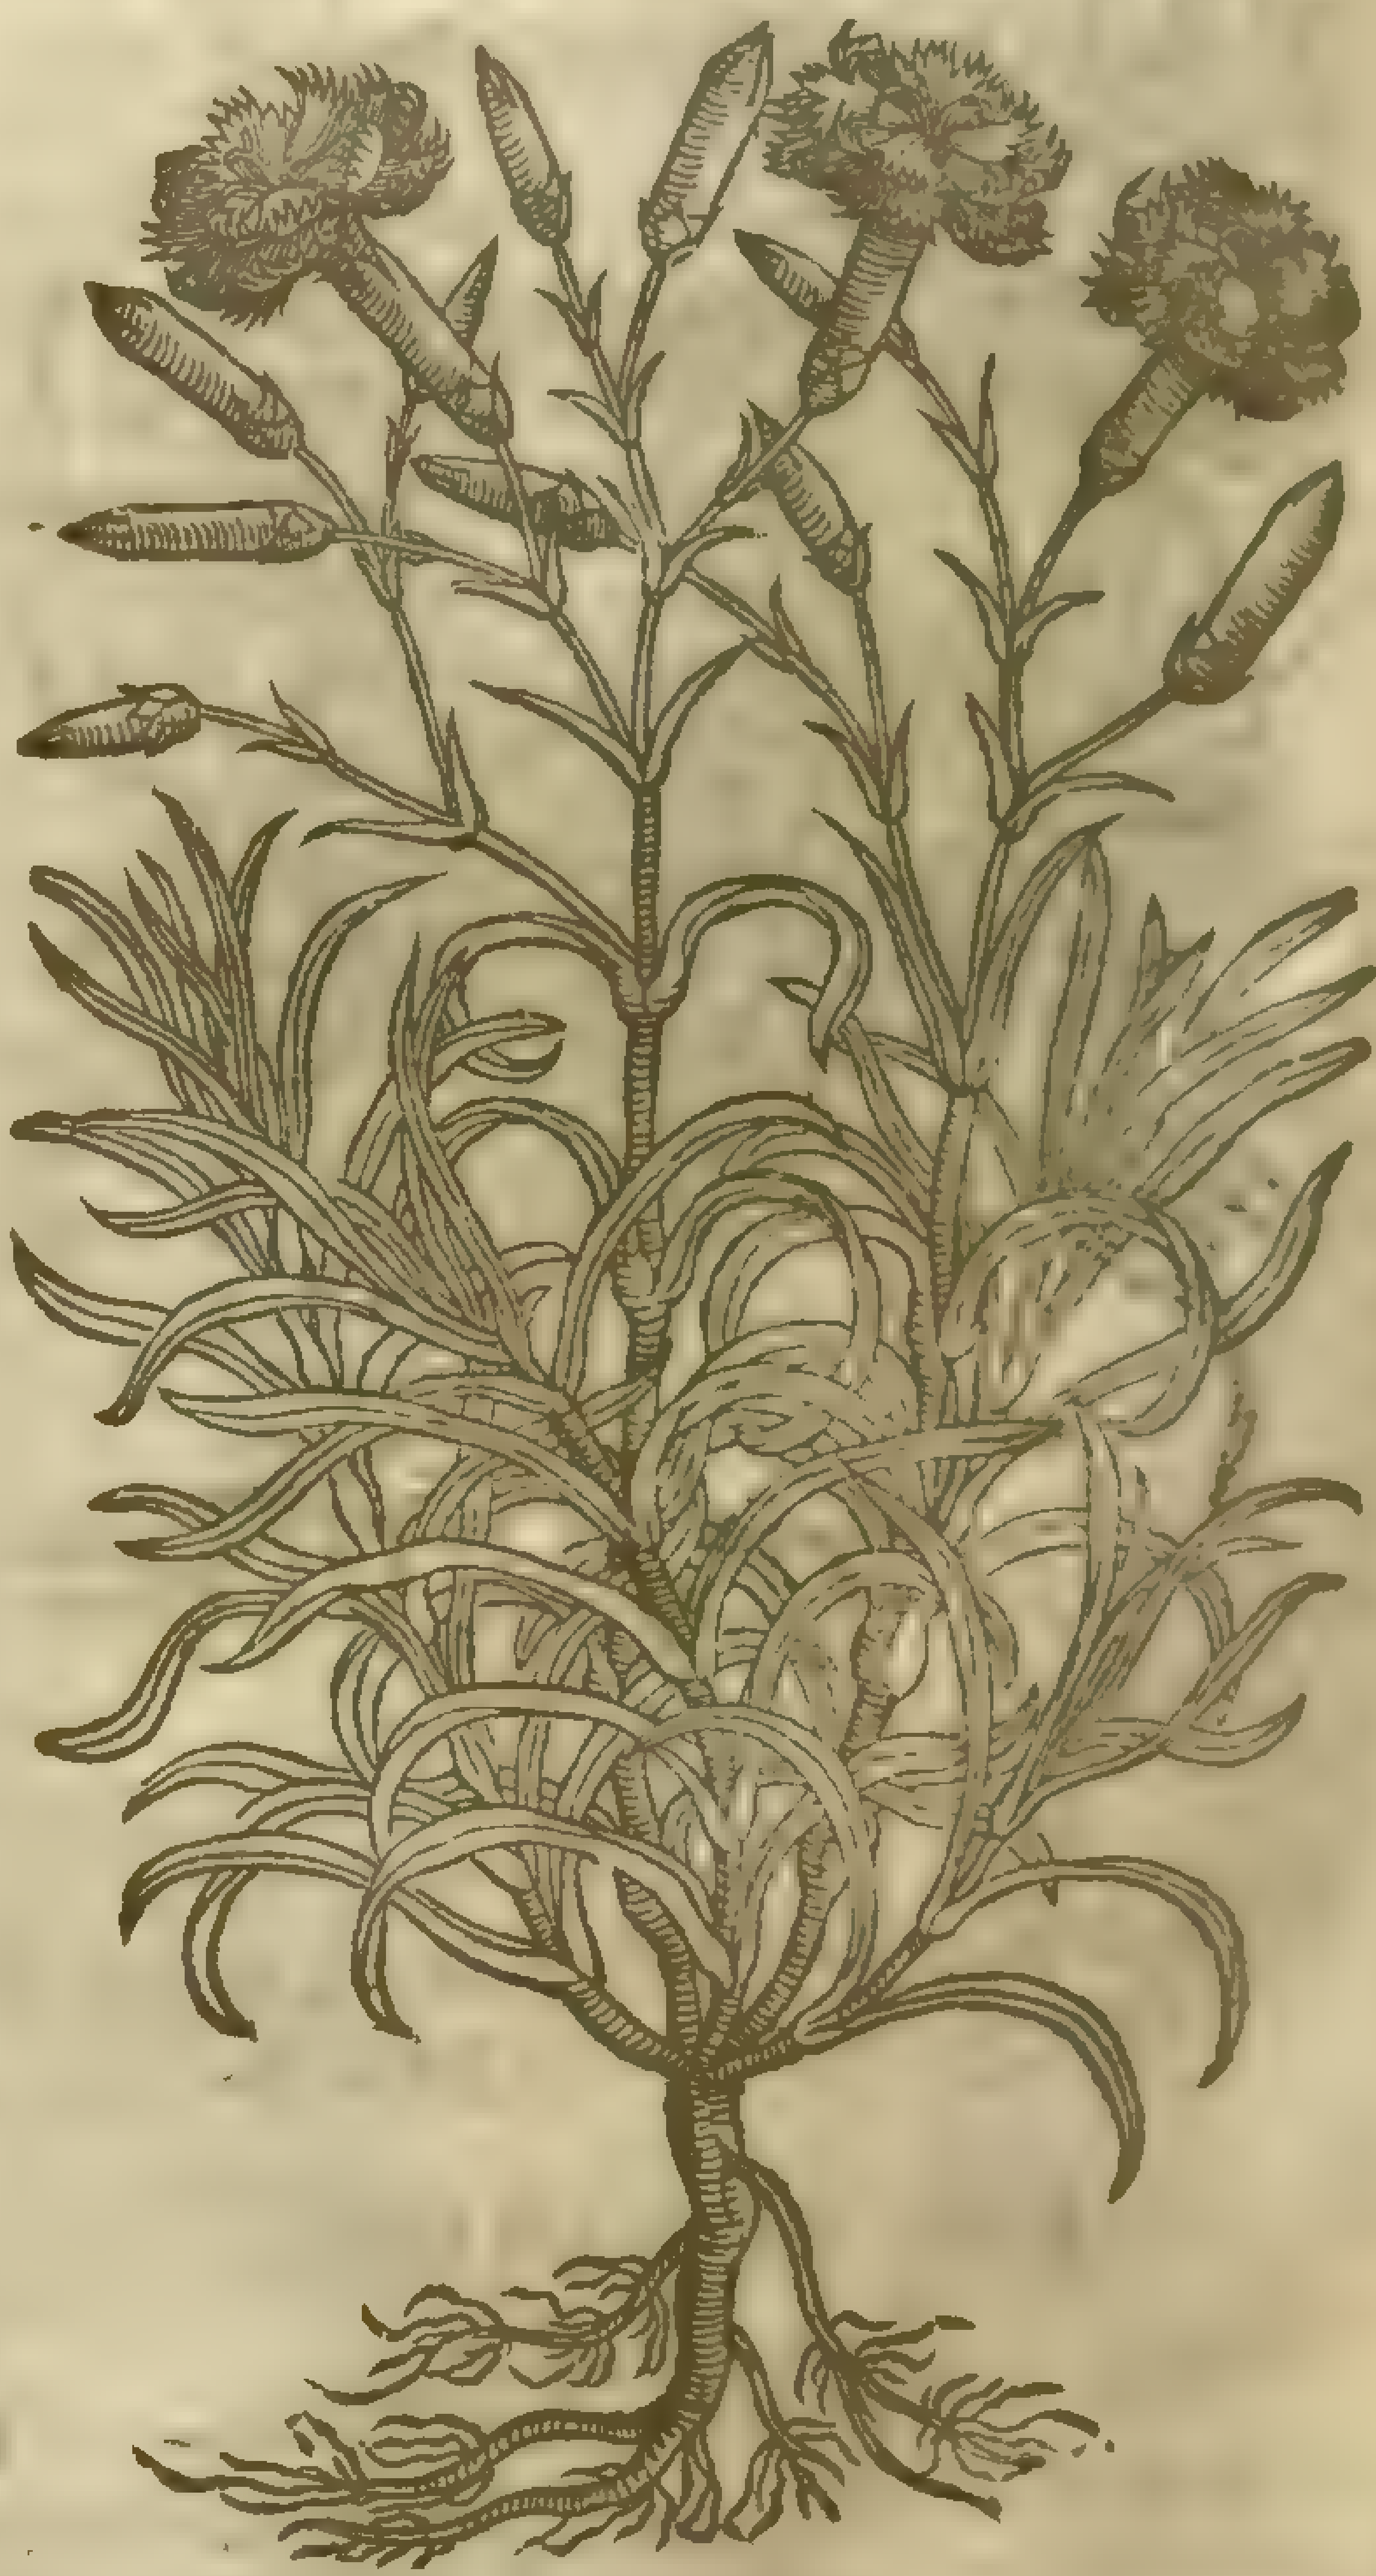
Chap. 182. *Of Cloue Gilloſloures.*

1 *Cariophyllus maximus multiplex.*
The great double Carnation.

Dianthus caryophyllus, L. p
Mill. dict



2 *Cariophyllus multiplex.*
The double Cloue Gilloſloure.

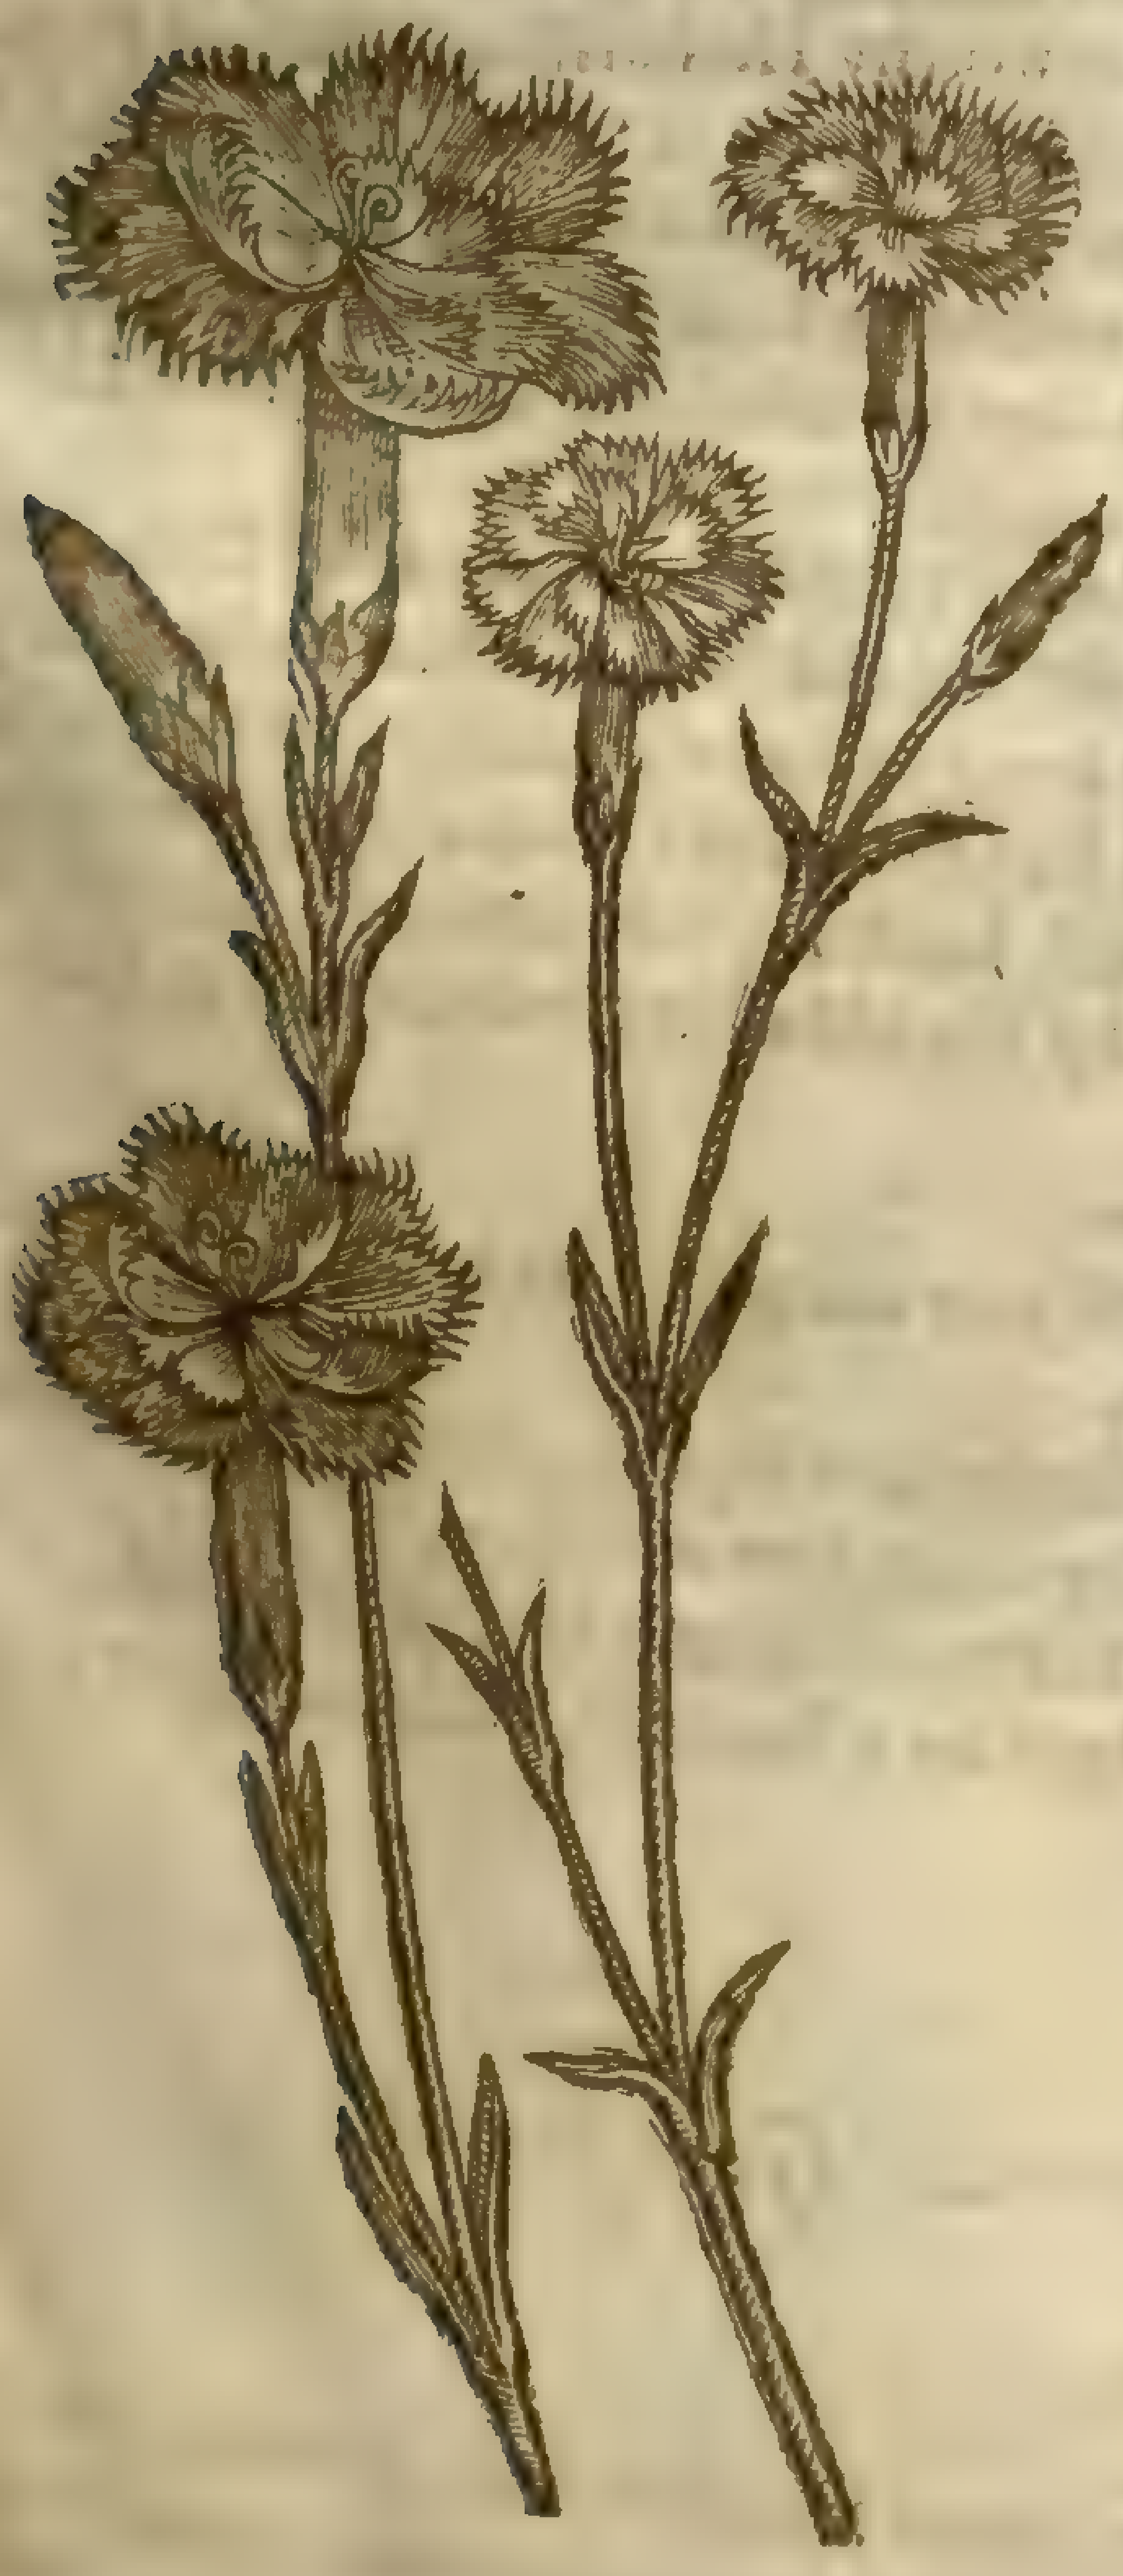


¶ *The Kindes.*

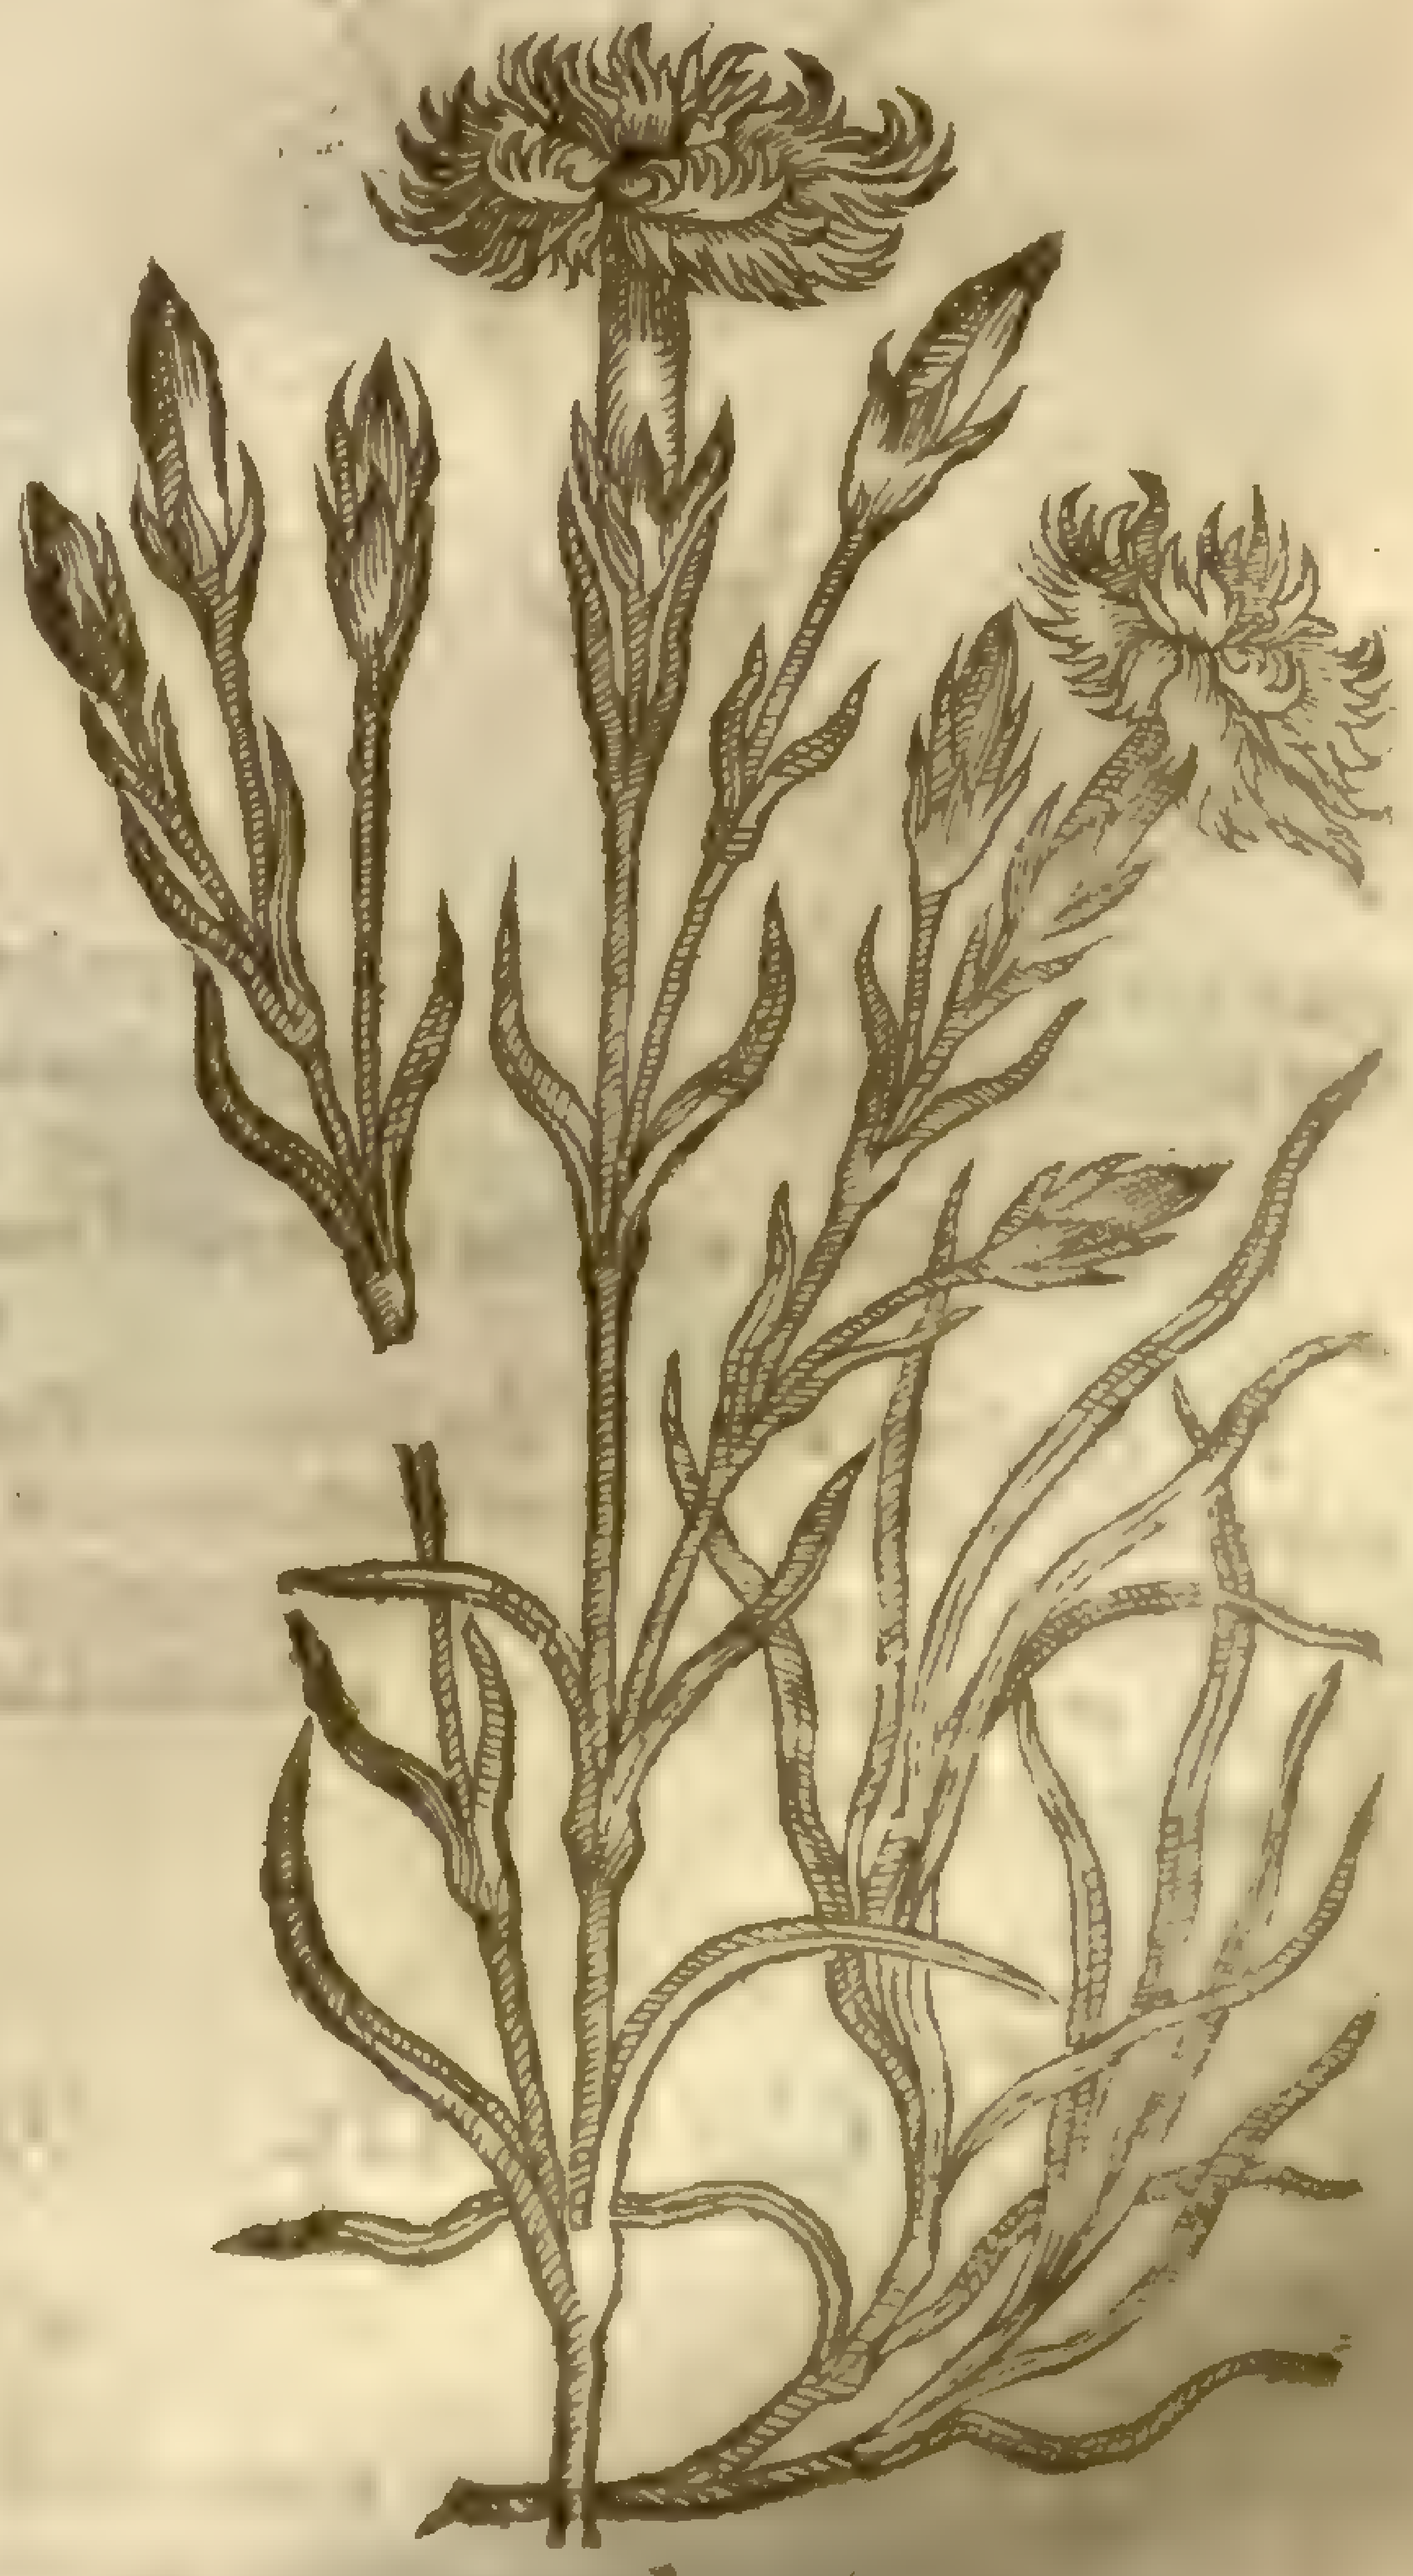
There are at this day vnder the name of *Cariophyllus* comprehended diuers and ſundry ſorts of plants, of ſuch various colours, and alſo ſeuerall ſhapes, that a great and large volume would not ſuffice to write of euery one at large in particular; conſidering how infinite they are, and how euery yeare euery clymate and country bringeth forth new ſorts, ſuch as haue not heretofore been written of; ſome whereof are called Carnations, others Cloue Gillofloures,ſome Sops in wine, ſome Pagiants,or Pagion color,Horſe-fleſh,blunket,purple,white,double and ſingle Gillofloures; as alſo a Gillofloure with yellow flours:the which a worſhipful Merchant of London Mr. *Nicholas Lete* procured from Poland,and gaue me thereof for my garden, which before that time was neuer ſeen nor heard of in theſe countries. Likewiſe there be ſundry ſorts of Pinks comprehended vnder the ſame title, which ſhall be deſcribed in a ſeuerall chapter. There be vnder the name of Gillofloures alſo thoſe floures which we call Sweet-Iohns and Sweet-Williams. And firſt of the great Carnation and Cloue Gillofloure.

‡ There are very many kinds both of Gillofloures,Pinkes,and the like,which differ very little in their roots,leaues,ſeeds,or maner of growing,though much in the colour,ſhape,and magnitude of their floures;whereof ſome are of one colour,other ſome of more;and of them ſome are ſtriped others ſpotted,&c. Now I (holding it a thing not ſo fit for me to inſiſt vpon theſe accidental differences of plants, hauing ſpecifique differences enough to treat of) refer ſuch as are addicted to theſe commendable and harmeleſſe delights, to ſuruey the late and oft mentioned Worke of my frend Mr. *Iohn Parkinſon*, who hath accurately and plentifully treated of theſe varieties;and if they require further ſatisfaction,let them at the time of the yeare repair to the garden of Miſtreſſe *Tuggy* (the wife of my late deceaſed friend Mr. *Ralph Tuggy*) in Weſtminſter,which in the excellencie and varietie of theſe delights exceedeth all that I haue ſeen:as alſo he himſelfe whilſt he liued exceeded moſt,if not all of his time, in his care,induſtry,and skil in raiſing,encreaſing,and preſeruing of theſe plants and ſome others;whoſe loſſe therefore is the more to be lamented by all thoſe that are louers of plants. I will only giue you the figures of ſome three or foure more,whereof one is of the ſingle one,which therefore ſome tearme a Pinke, though in mine opinion vnfitly, for that it is produced by the ſeed of moſt of the double ones, and is of different colour and ſhape as they are, varying from them only in the ſingleneſſe of the floures. ‡

‡ *Caryophyllus major & minor, rubro & albo variegati.*
The white Carnation, and Pageant.



‡ *Caryophyllus purpureus profunde laciniatus.*
The blew, or deep purple Gillofloure.



¶ *The Deſcription.*

1 The great Carnation Gillo-floure hath a thick round wooddy root, from which riſeth vp many ſtrong joynted ſtalks ſet with long green leaues by couples: on the top of the ſtalks do grow very fair floures of an excellent ſweet ſmell, and pleaſant Carnation colour, whereof it tooke his name.

2 The Cloue Gilloſloure differeth not from the Carnation but in greatneſſe as well of the flowres as leaues. The floure is exceeding well knowne, as alſo the Pinkes and other Gillofloures; wherefore I will not ſtand long vpon the deſcription.

‡ *Caryophyllus ſimplex major.*
The ſingle Gillofloure or Pinke.

¶ *The Place.*

Theſe Gillofloures, eſpecially the Carnations, are kept in pots from the extremitie of our cold Winters. The Cloue Gillofloure endureth better the cold, and therefore is planted in gardens.

The Time.

They flouriſh and floure moſt part of the Summer.

¶ *The Names.*

The Cloue Gillofloure is called of the later Herbariſts *Caryophylleus Flos*, of the ſmell of cloues wherewith it is poſſeſſed: in Italian, *Garofoli*: in Spaniſh, *Clauel*: in French, *Oeilletz*: in low-Dutch, **Ginoffelbloemen**: in Latine of moſt, *Ocellus Damaſcenus*, *Ocellus Barbaricus*, and *Barbarica*: in Engliſh, Carnations, and Cloue Gillofloures. Of ſome it is called *Vetonica*, and *Herba tunica*. The which *Bernardus Gordonius* hath ſet downe for *Dioſcorides* his *Polemonium*.

That worthy Herbariſt and learned Phyſition of late memorie Mr. Doctor *Turner* maketh *Caryophyllus* to be *Cantabrica*; which *Plin. lib. 23. cap. 8.* writeth to haue been found out in Spaine about *Auguſtus* time, and that by thoſe of Biſcay.

Iohannes Ruellius ſaith, That the Gillofloure was vnknowne to the old writers: whoſe judgement is very good, eſpecially becauſe this herb is not like to that of *Vetonica*, or *Cantabrica*. It is maruell, ſaith he, that ſuch a famous floure, ſo pleaſant & ſweet, ſhould lie hid, and not be made known by the old writers: which may be thought not inferior to the roſe in beautie, ſmell, and varietie.

¶ *The Temperature.*

The Gillofloure with the leaues and roots for the moſt part are temperat in heate and drineſſe.

¶ *The Vertues.*

A The conſerue made of the floures of the Cloue Gillofloure and ſugar, is exceeding cordiall, and wonderfully aboue meaſure doth comfort the heart, being eaten now and then.

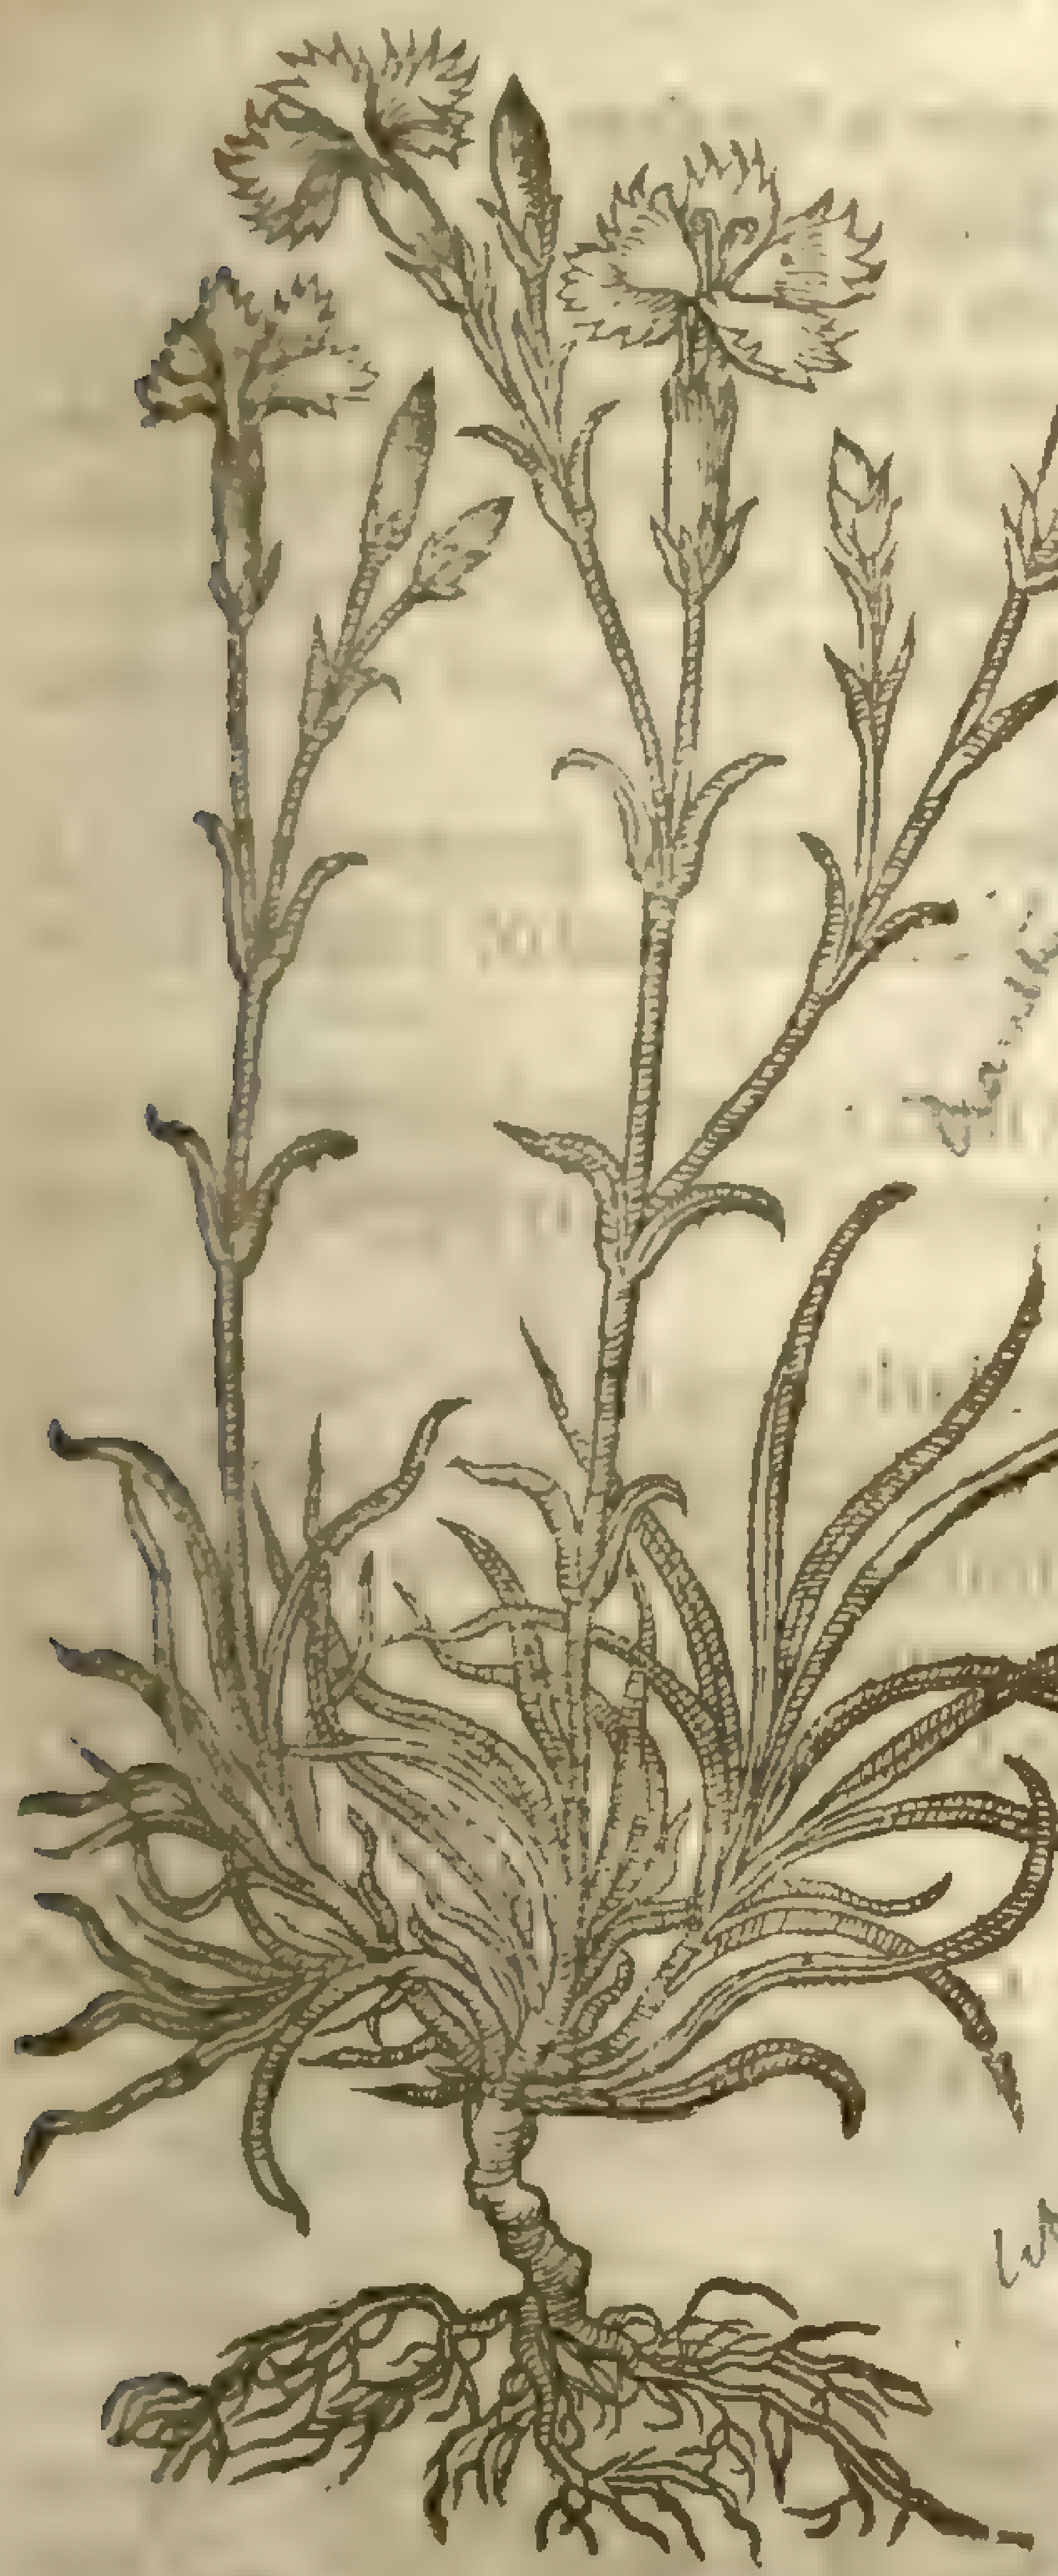
B It preuaileth againſt hot peſtilentiall feuers, expelleth the poiſon and furie of the diſeaſe, and greatly comforteth the ſicke, as hath of late been found out by a learned Gentleman of Lee in Eſſex, called Mr. *Rich.*

Chap. 183. *Of Pinks, or wilde Gillofloures.*

¶ *The Deſcription.*

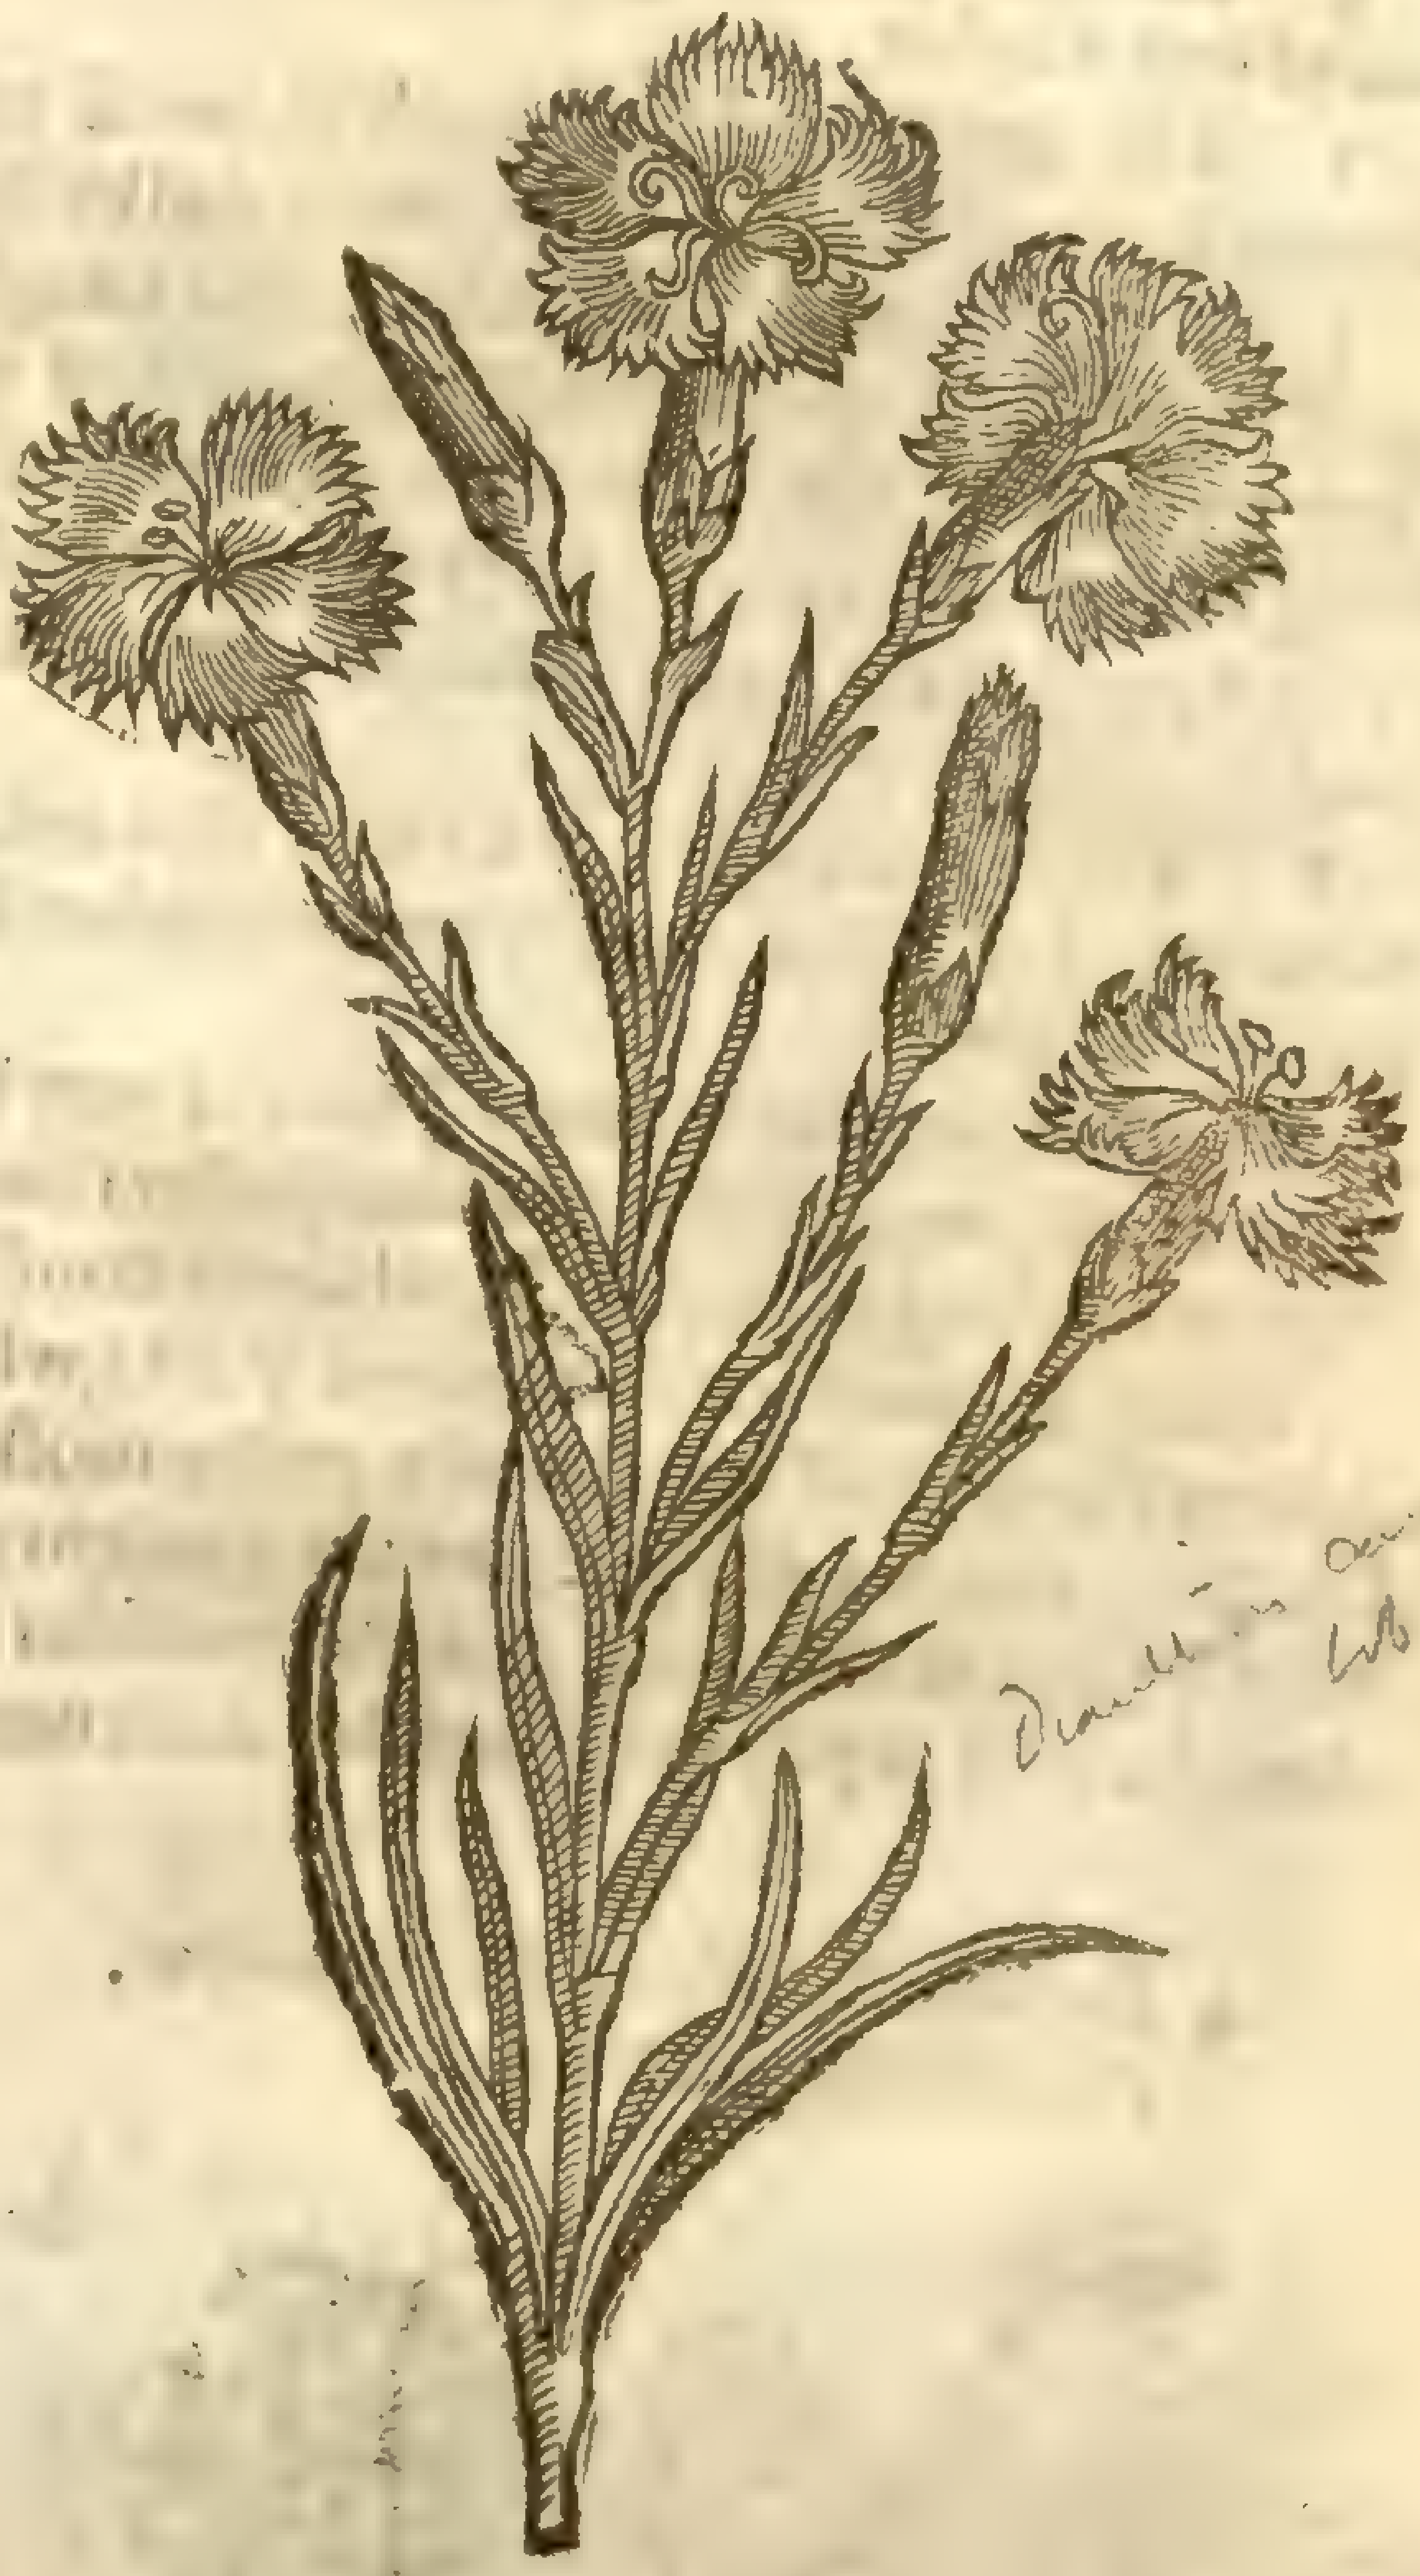
1 The double purple Pinke hath manie graſſie leaues ſet vpon ſmall joynted ſtalkes by couples, one oppoſite againſt another, whereupon doe grow pleaſant double purple floures,

1 *Cariophyllus ſylueſtris ſimplex.*
Single purple Pinks.



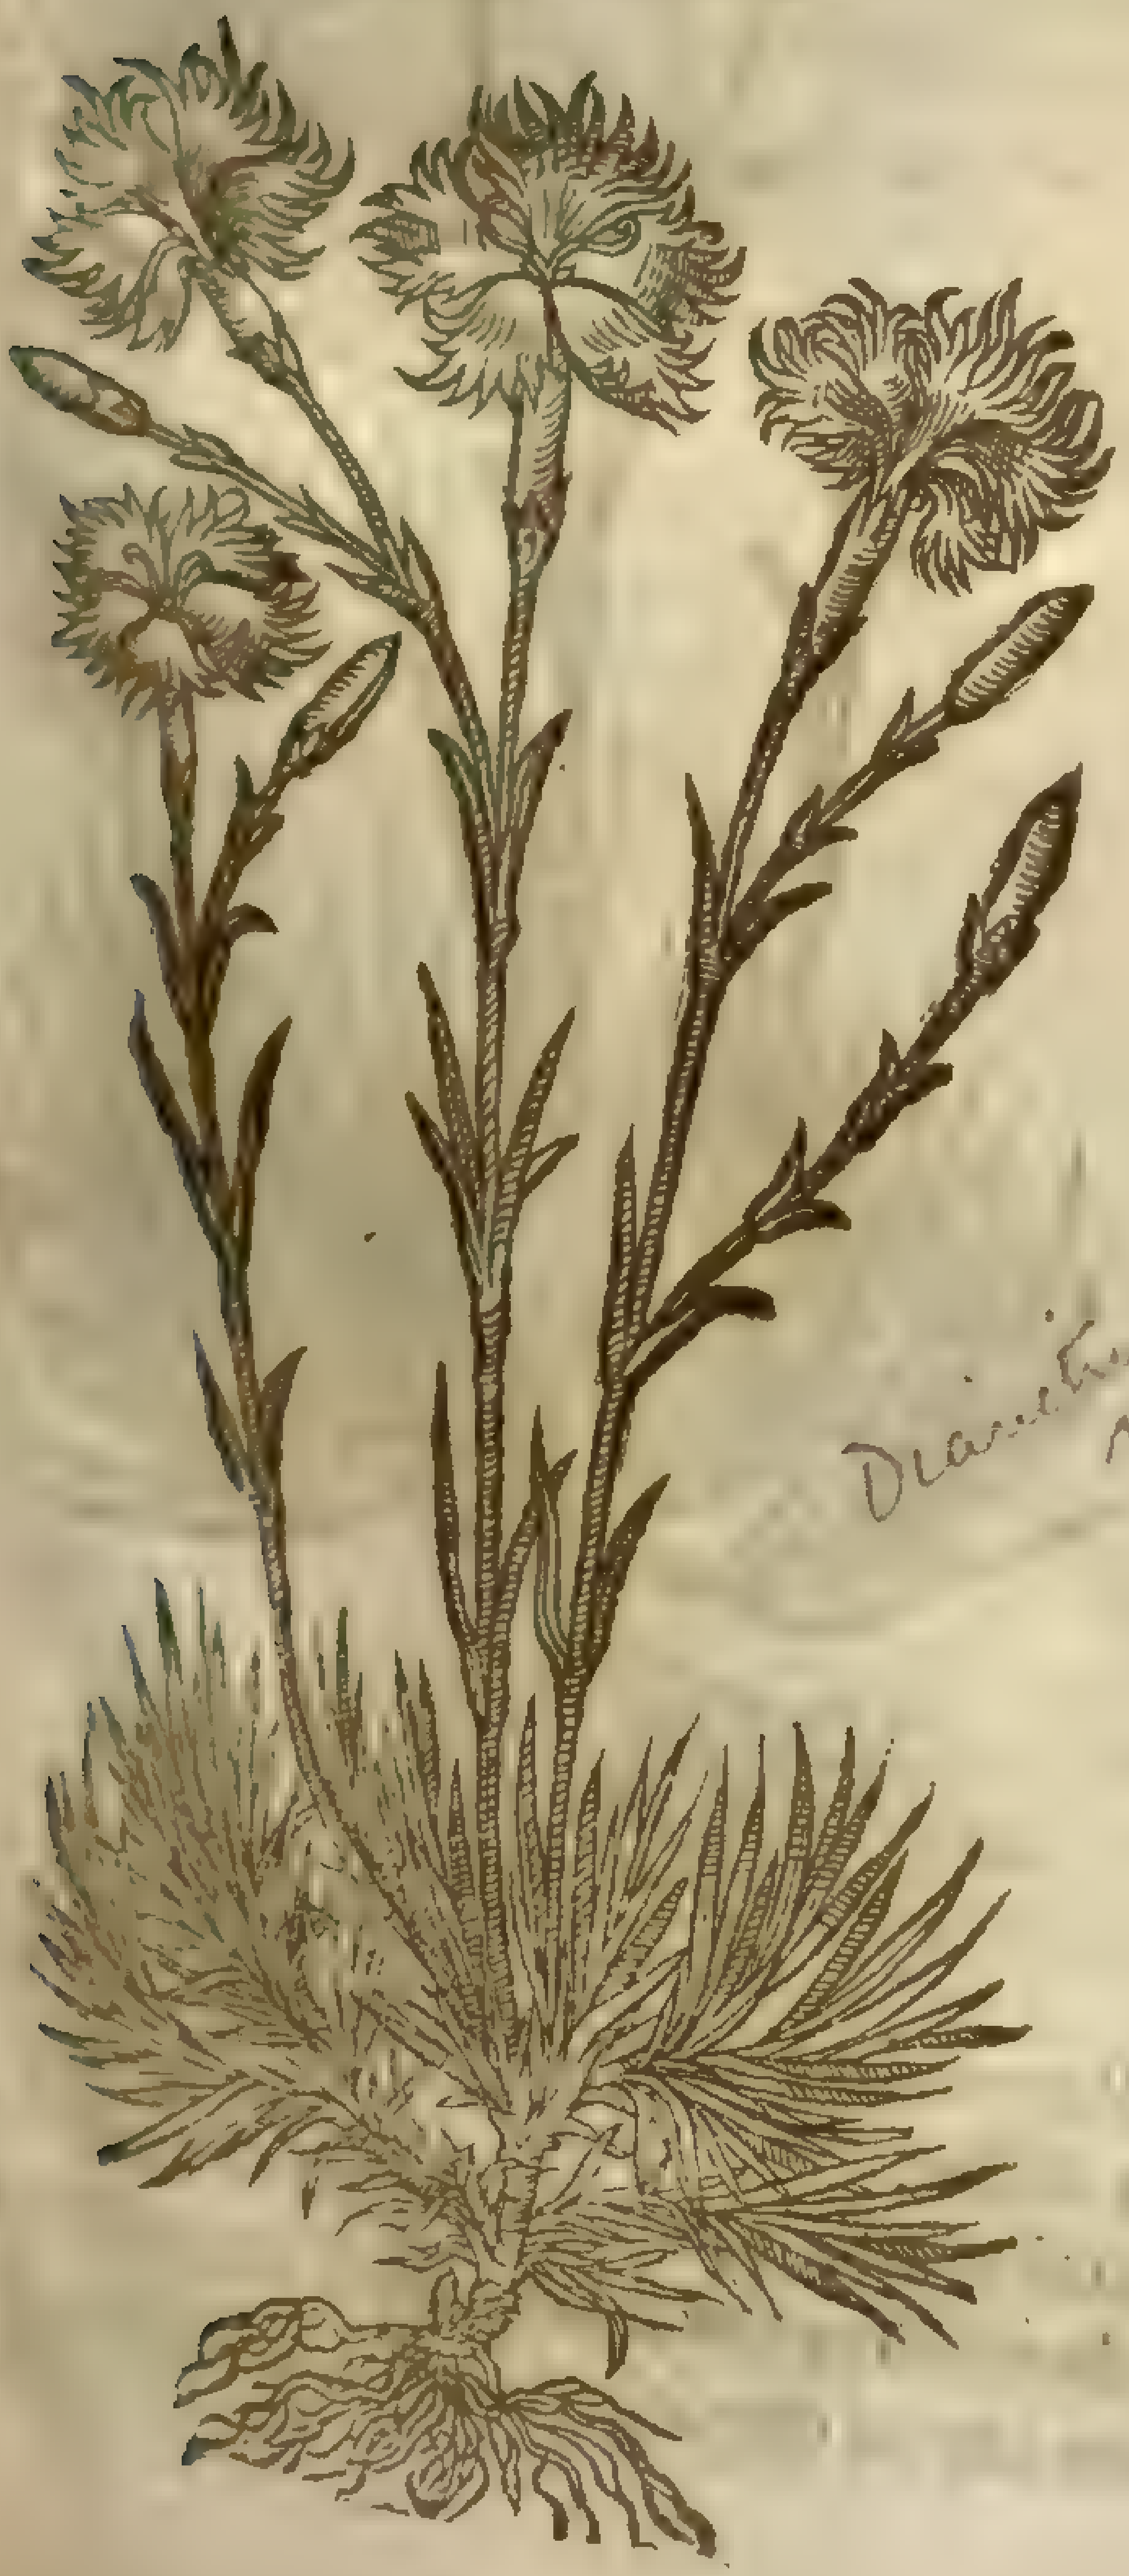
Dianthus caryophyllus
Lob. ic. 443

2 *Cariophyllus ſylueſtris ſimplex ſuaue rubens.*
Single red Pinks.



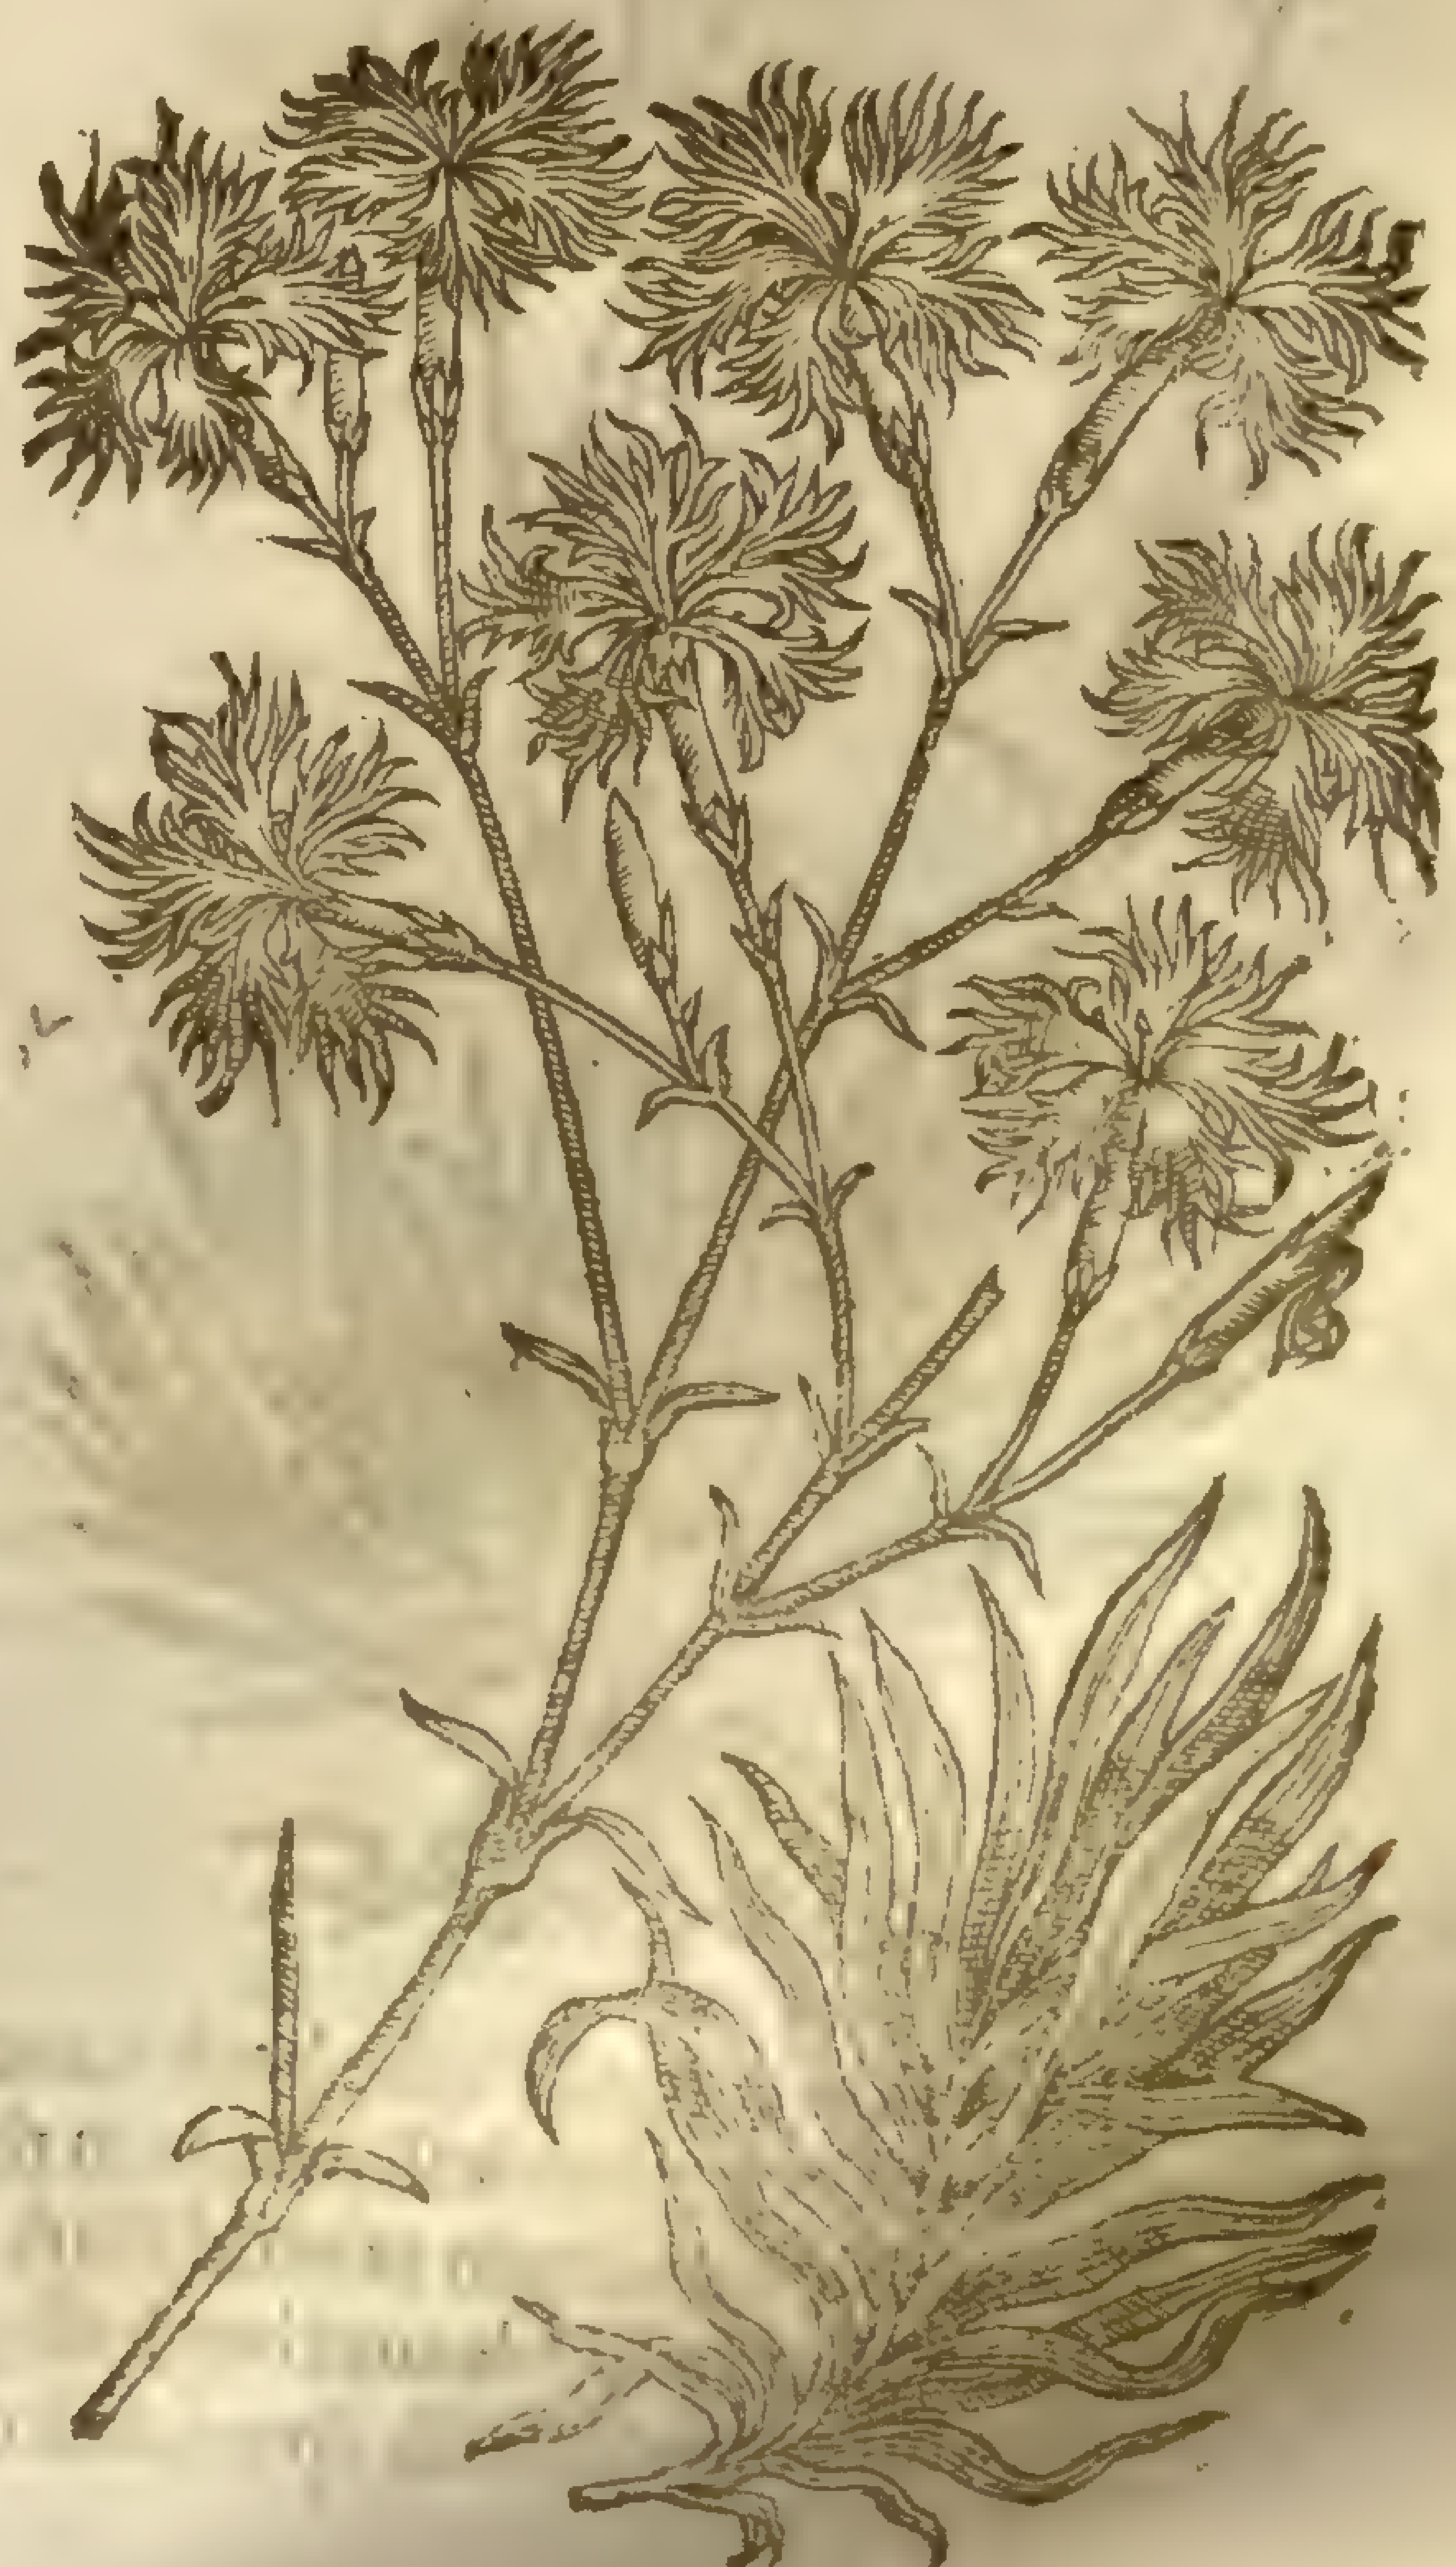
Dianthus caryophyllus
Lob. ic. 443

3 *Cariophyllus plumarius albus.*
White jagged Pinks.



Dianthus plumarius, L.
Mus. det.
Brit.

‡ *Cariophyllus plumarius albus odoratior.*
Large white jagged Pinks.



floures of a moſt fragrant ſmell, not inferior to the Cloue Gillofloure; the root is ſmal & woody.

‡ There is alſo a ſingle one of this kinde, whoſe figure I heere giue you in ſtead of the double one of our Author. ‡

2 The ſingle red Pinke hath likewiſe many ſmall graſſy leaues leſſer than the former. The floures grow at the top of the ſmall ſtalks ſingle, and of a ſweet bright red colour.

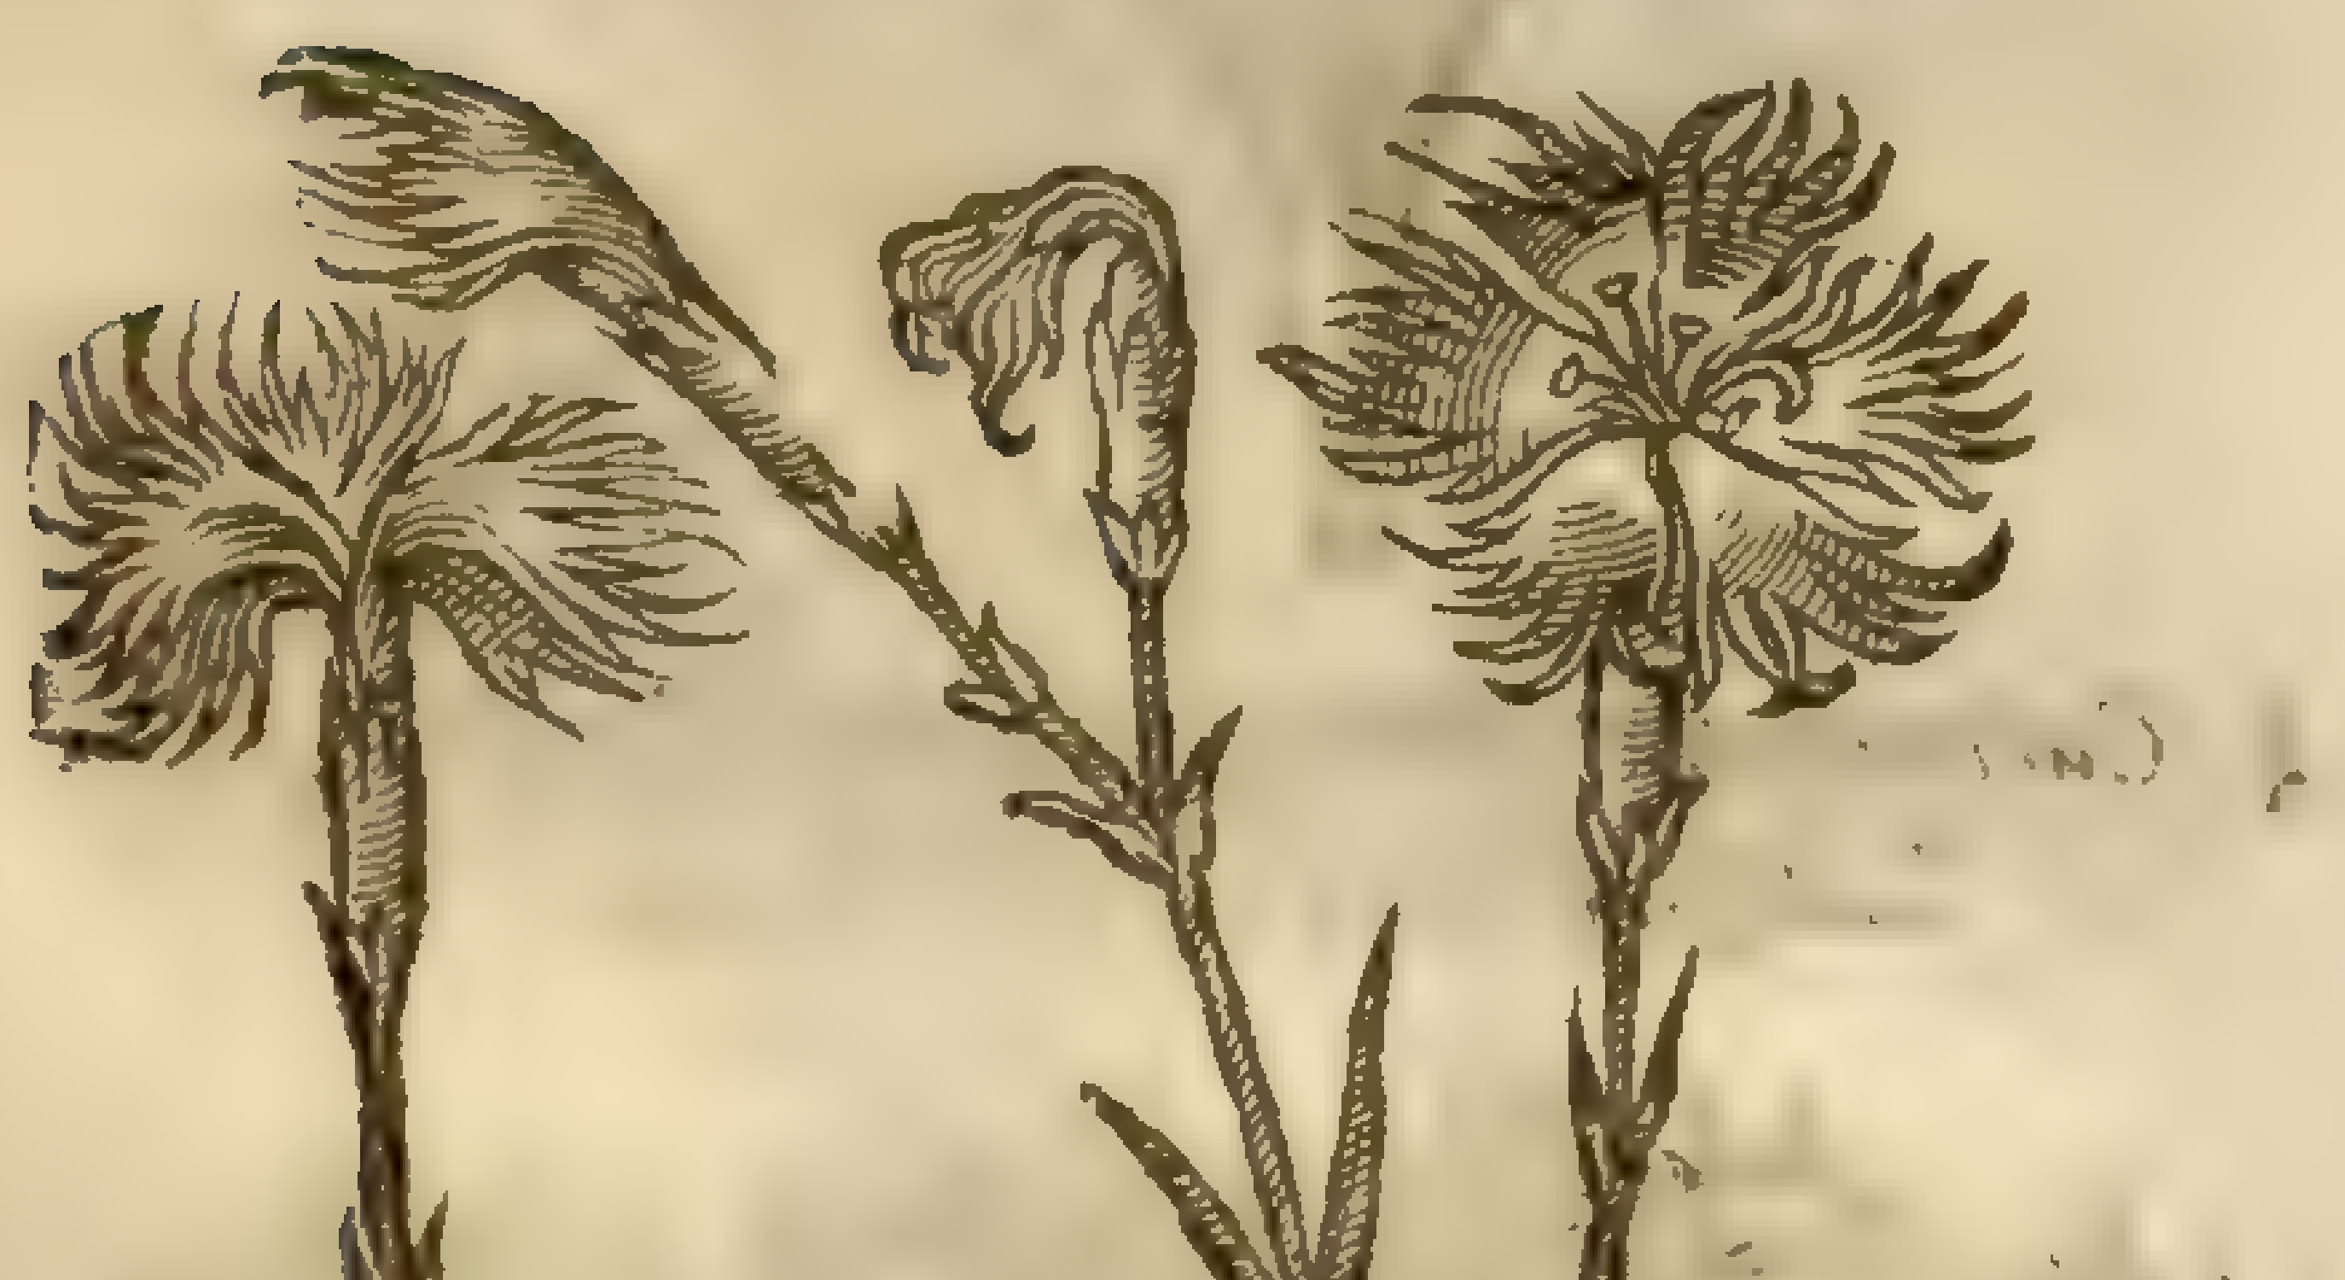
3 The white jagged Pinke hath a tough wooddy root, from which riſe immediately many graſſie leaues ſet vpon a ſmall ſtalke full of joints or knees, at euery joint two one againſt another euen to the top; whereupon do grow faire double purple floures of a ſweet and ſpicy ſmell, conſiſting of fiue leaues, ſomtimes more, cut or deeply jagged on the edges, reſembling a feather: whereupon I gaue it the name *Plumarius*, or feathered Pink. The ſeed is ſoft, blackiſh, and like vnto onion ſeed.

‡ There is another varietie of this, with the leaues ſomewhat larger and greener than the laſt mentioned: the floures alſo are ſomewhat bigger, more cut in or diuided, and of a much ſweeter ſmell. ‡

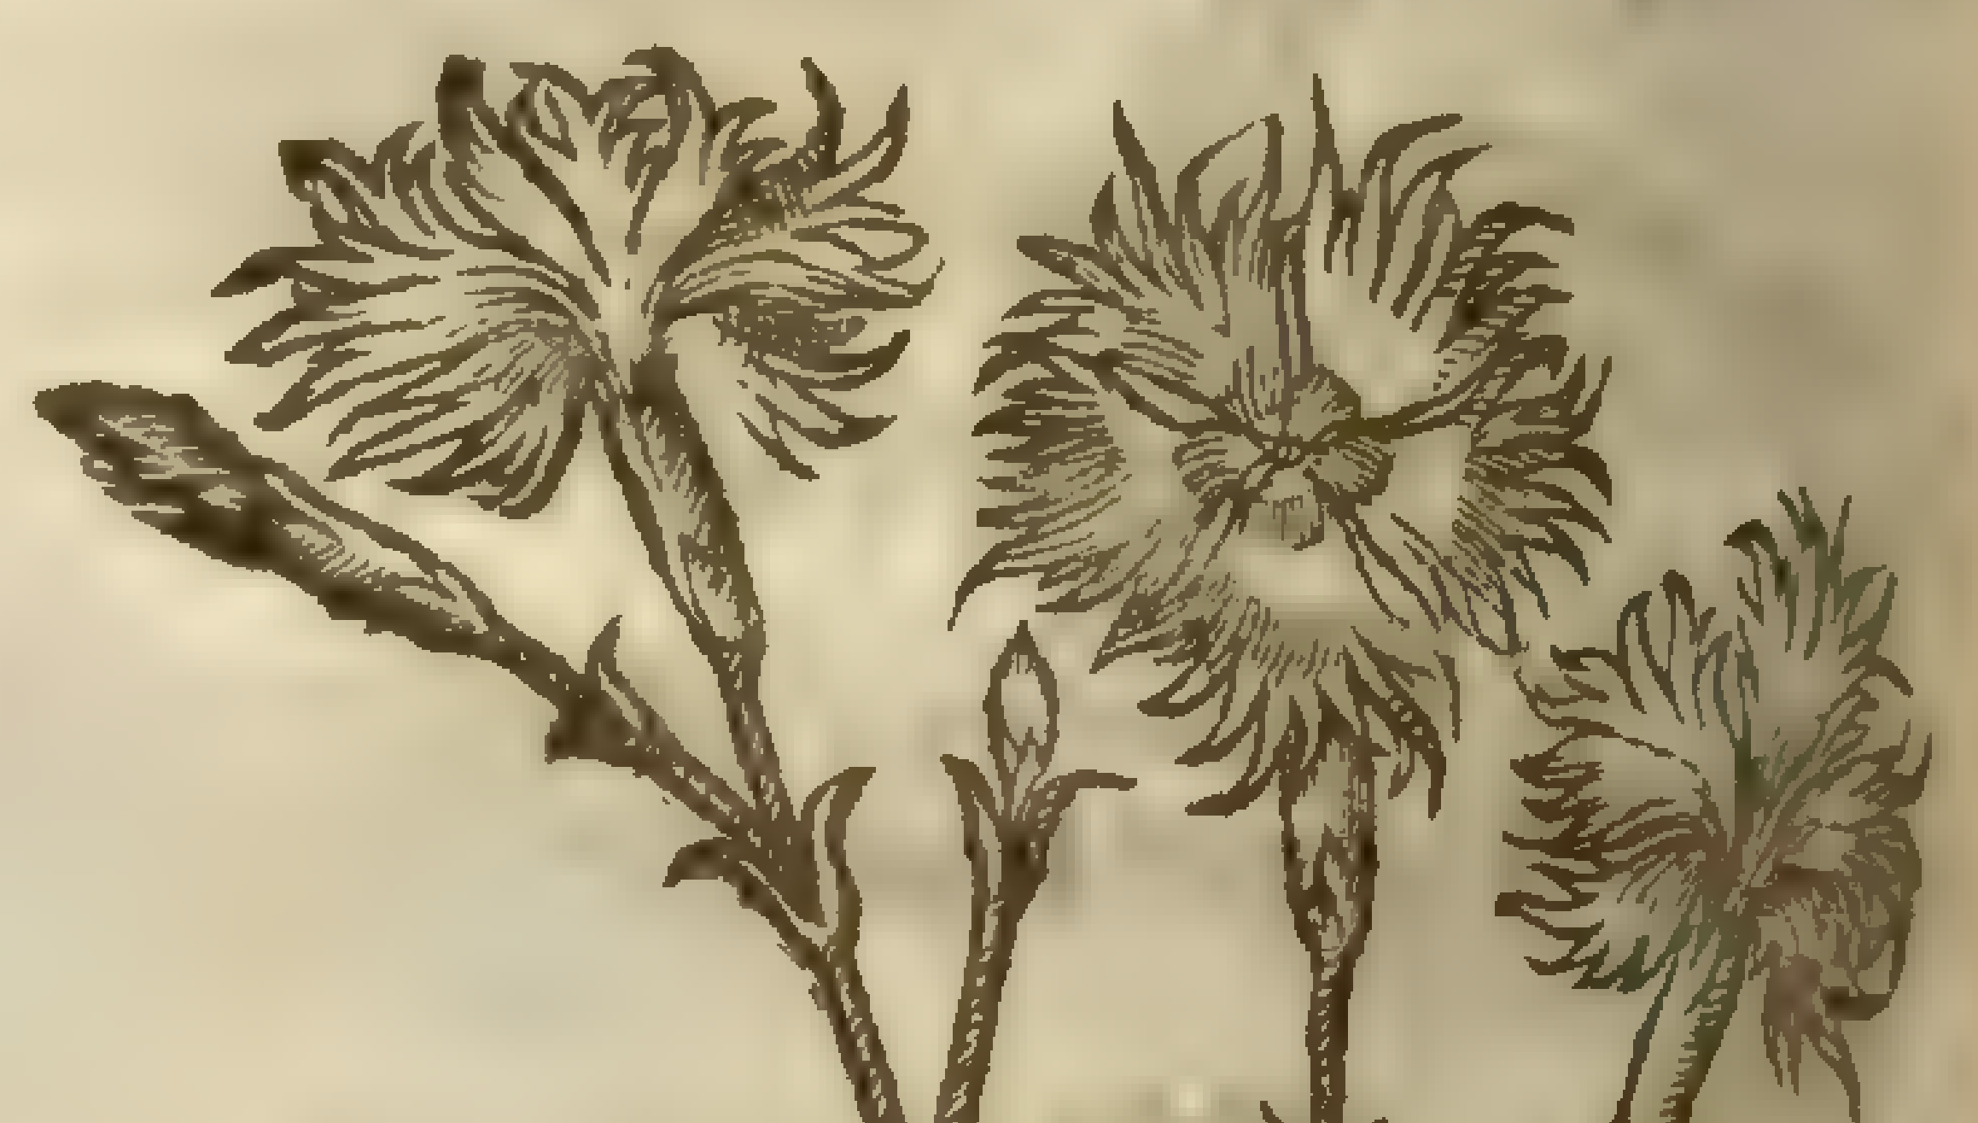
4 This purple coloured Pinke is very like the precedent in ſtalks, roots, and leaues: the floures grow at the tops of the branches, leſſer than the laſt deſcribed, and not ſo deeply jagged, of a purple colour tending to blewneſſe, wherein conſiſteth the difference.

There be diuers other ſorts of Pinks, whereof to write particularly were to ſmall purpoſe, conſidering they are all well known to the moſt, if not to all. Therefore theſe few ſhall ſerue at this time for thoſe that we doe keep in our gardens: notwithſtanding I thinke it conuenient to place theſe wilder ſorts in this ſame chapter, conſidering their nature and vertues do agree, and few or none of them be vſed in phyſicke; beſides their neereneſſe in kindred and neighborhood.

4 *Cariophyllus plumarius purpureus.*
Purple jagged Pinks.



5 *Cariophyllus plumarius ſylueſtris albus.*
White wilde jagged Pinks.

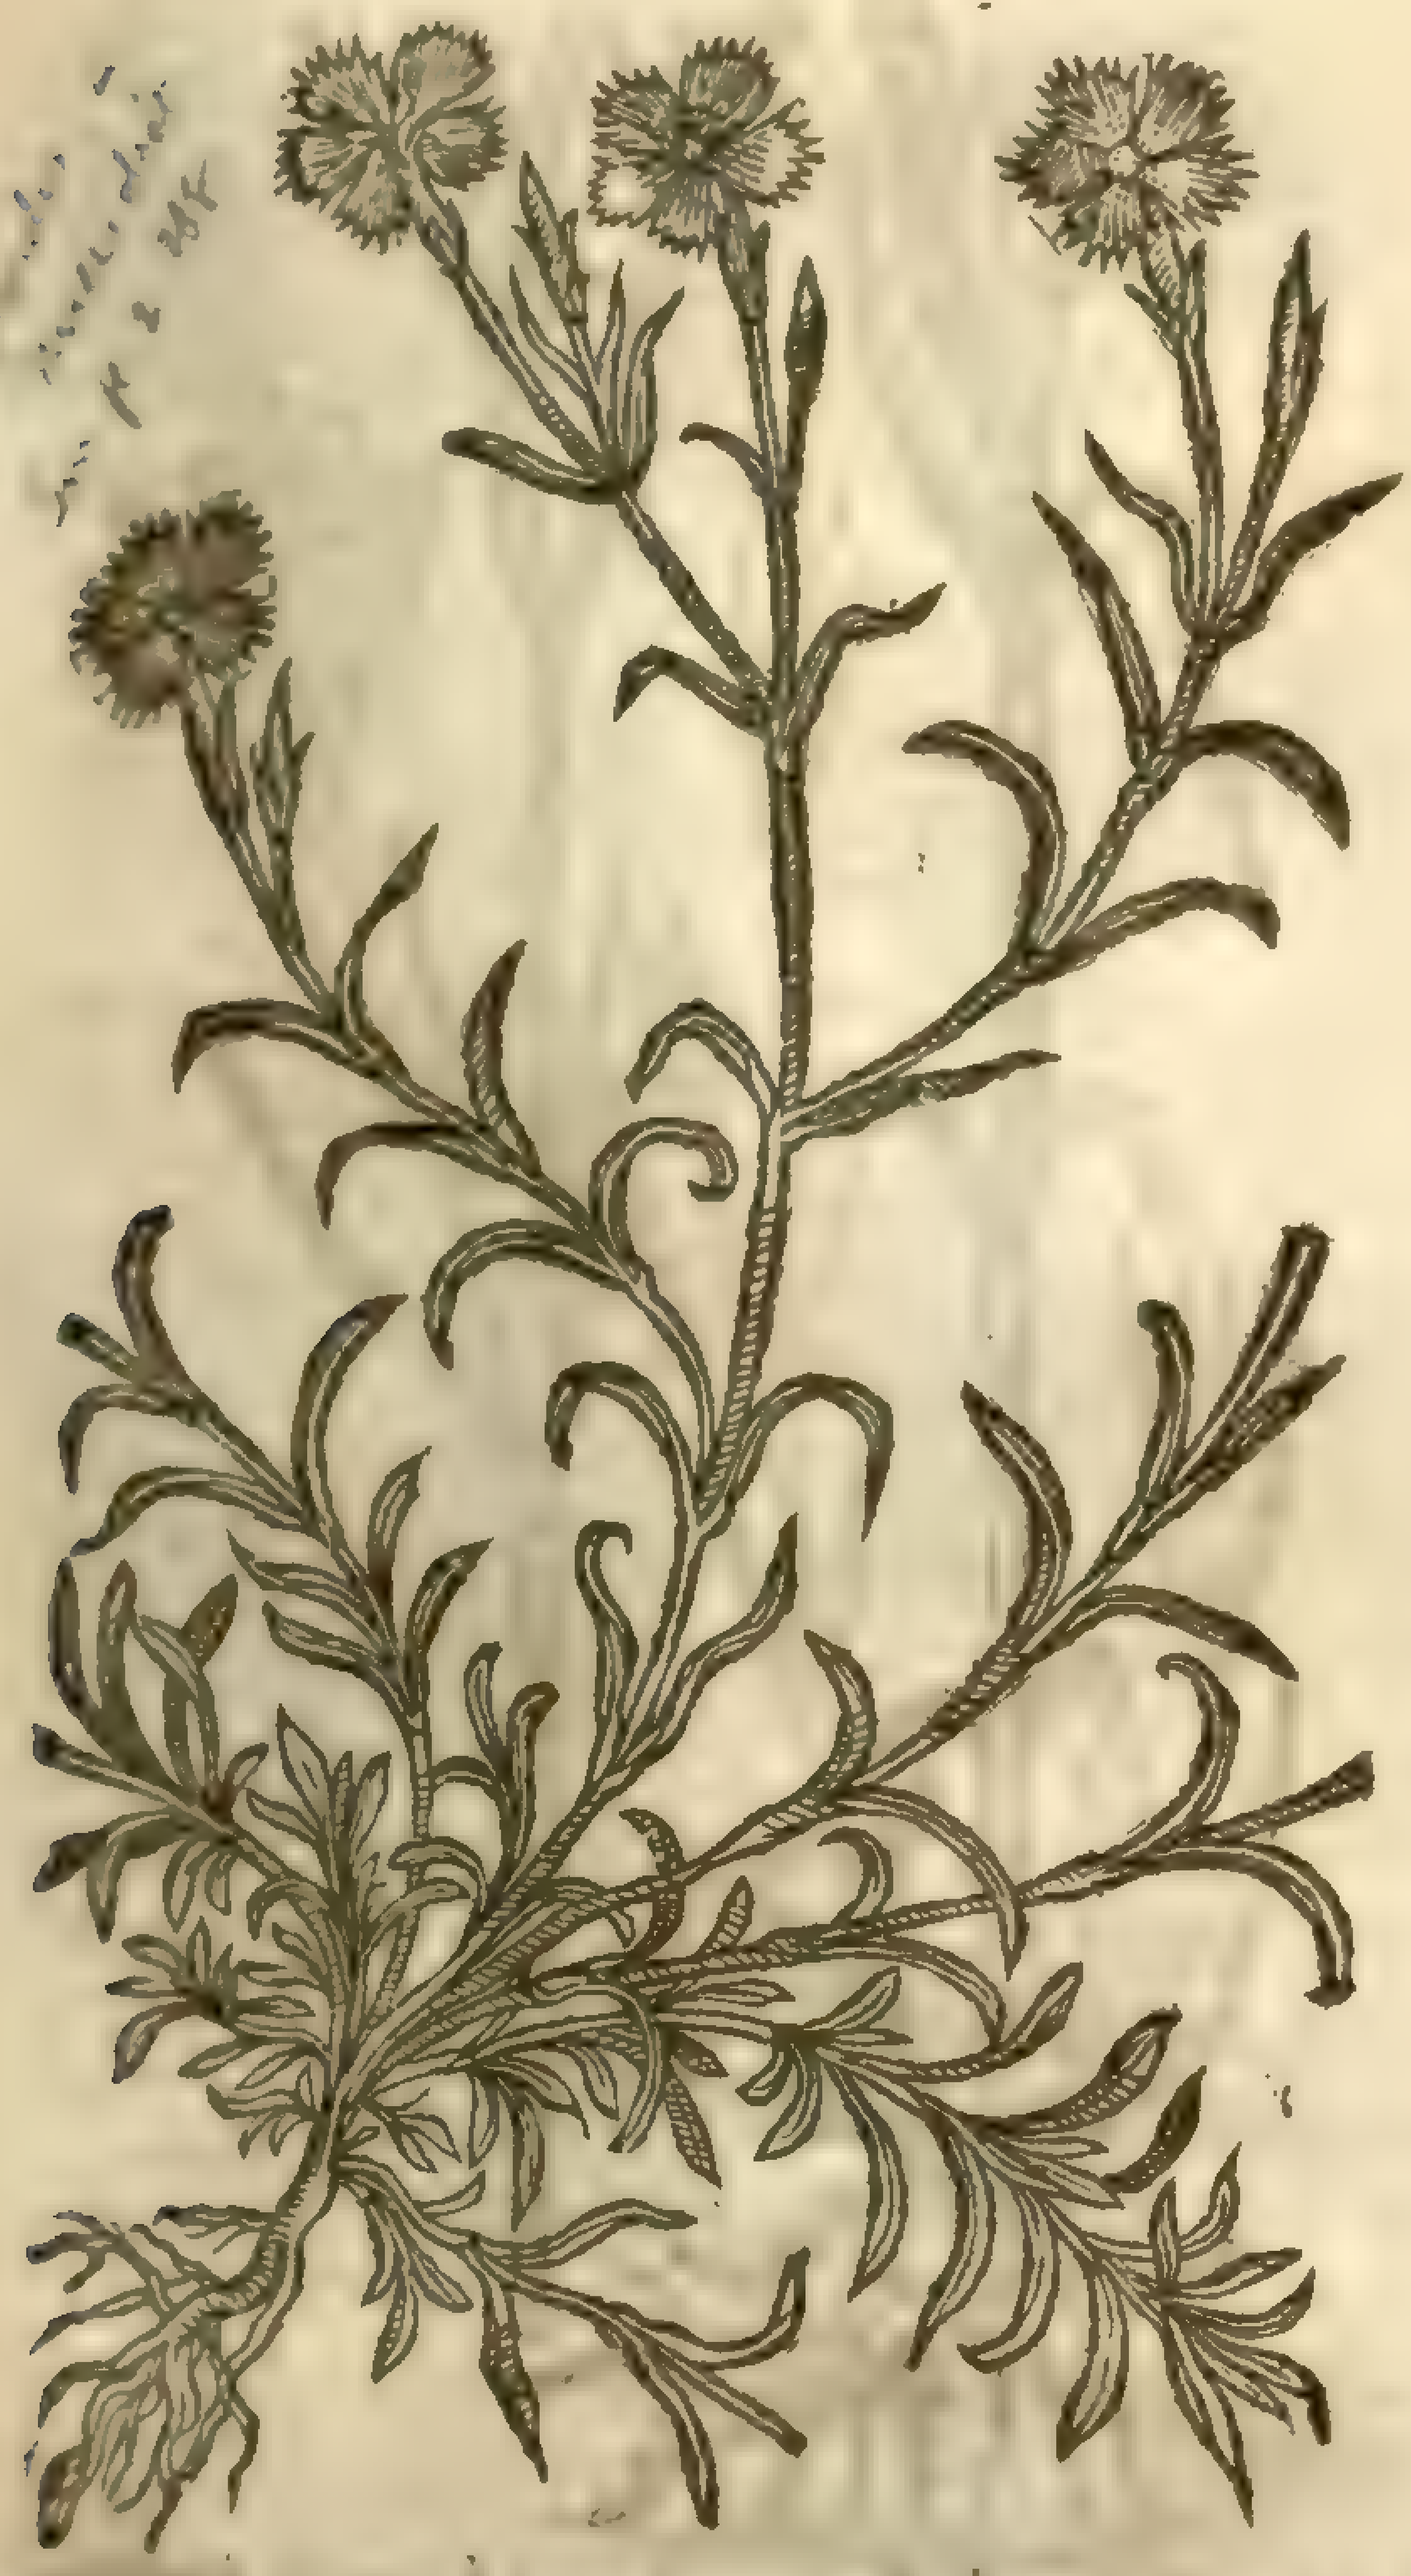


5 This wilde jagged Pinke hath leaues, ſtalks, and floures like vnto the white jagged Pinke of the garden, but altogether leſſe, wherein they eſpecially differ.

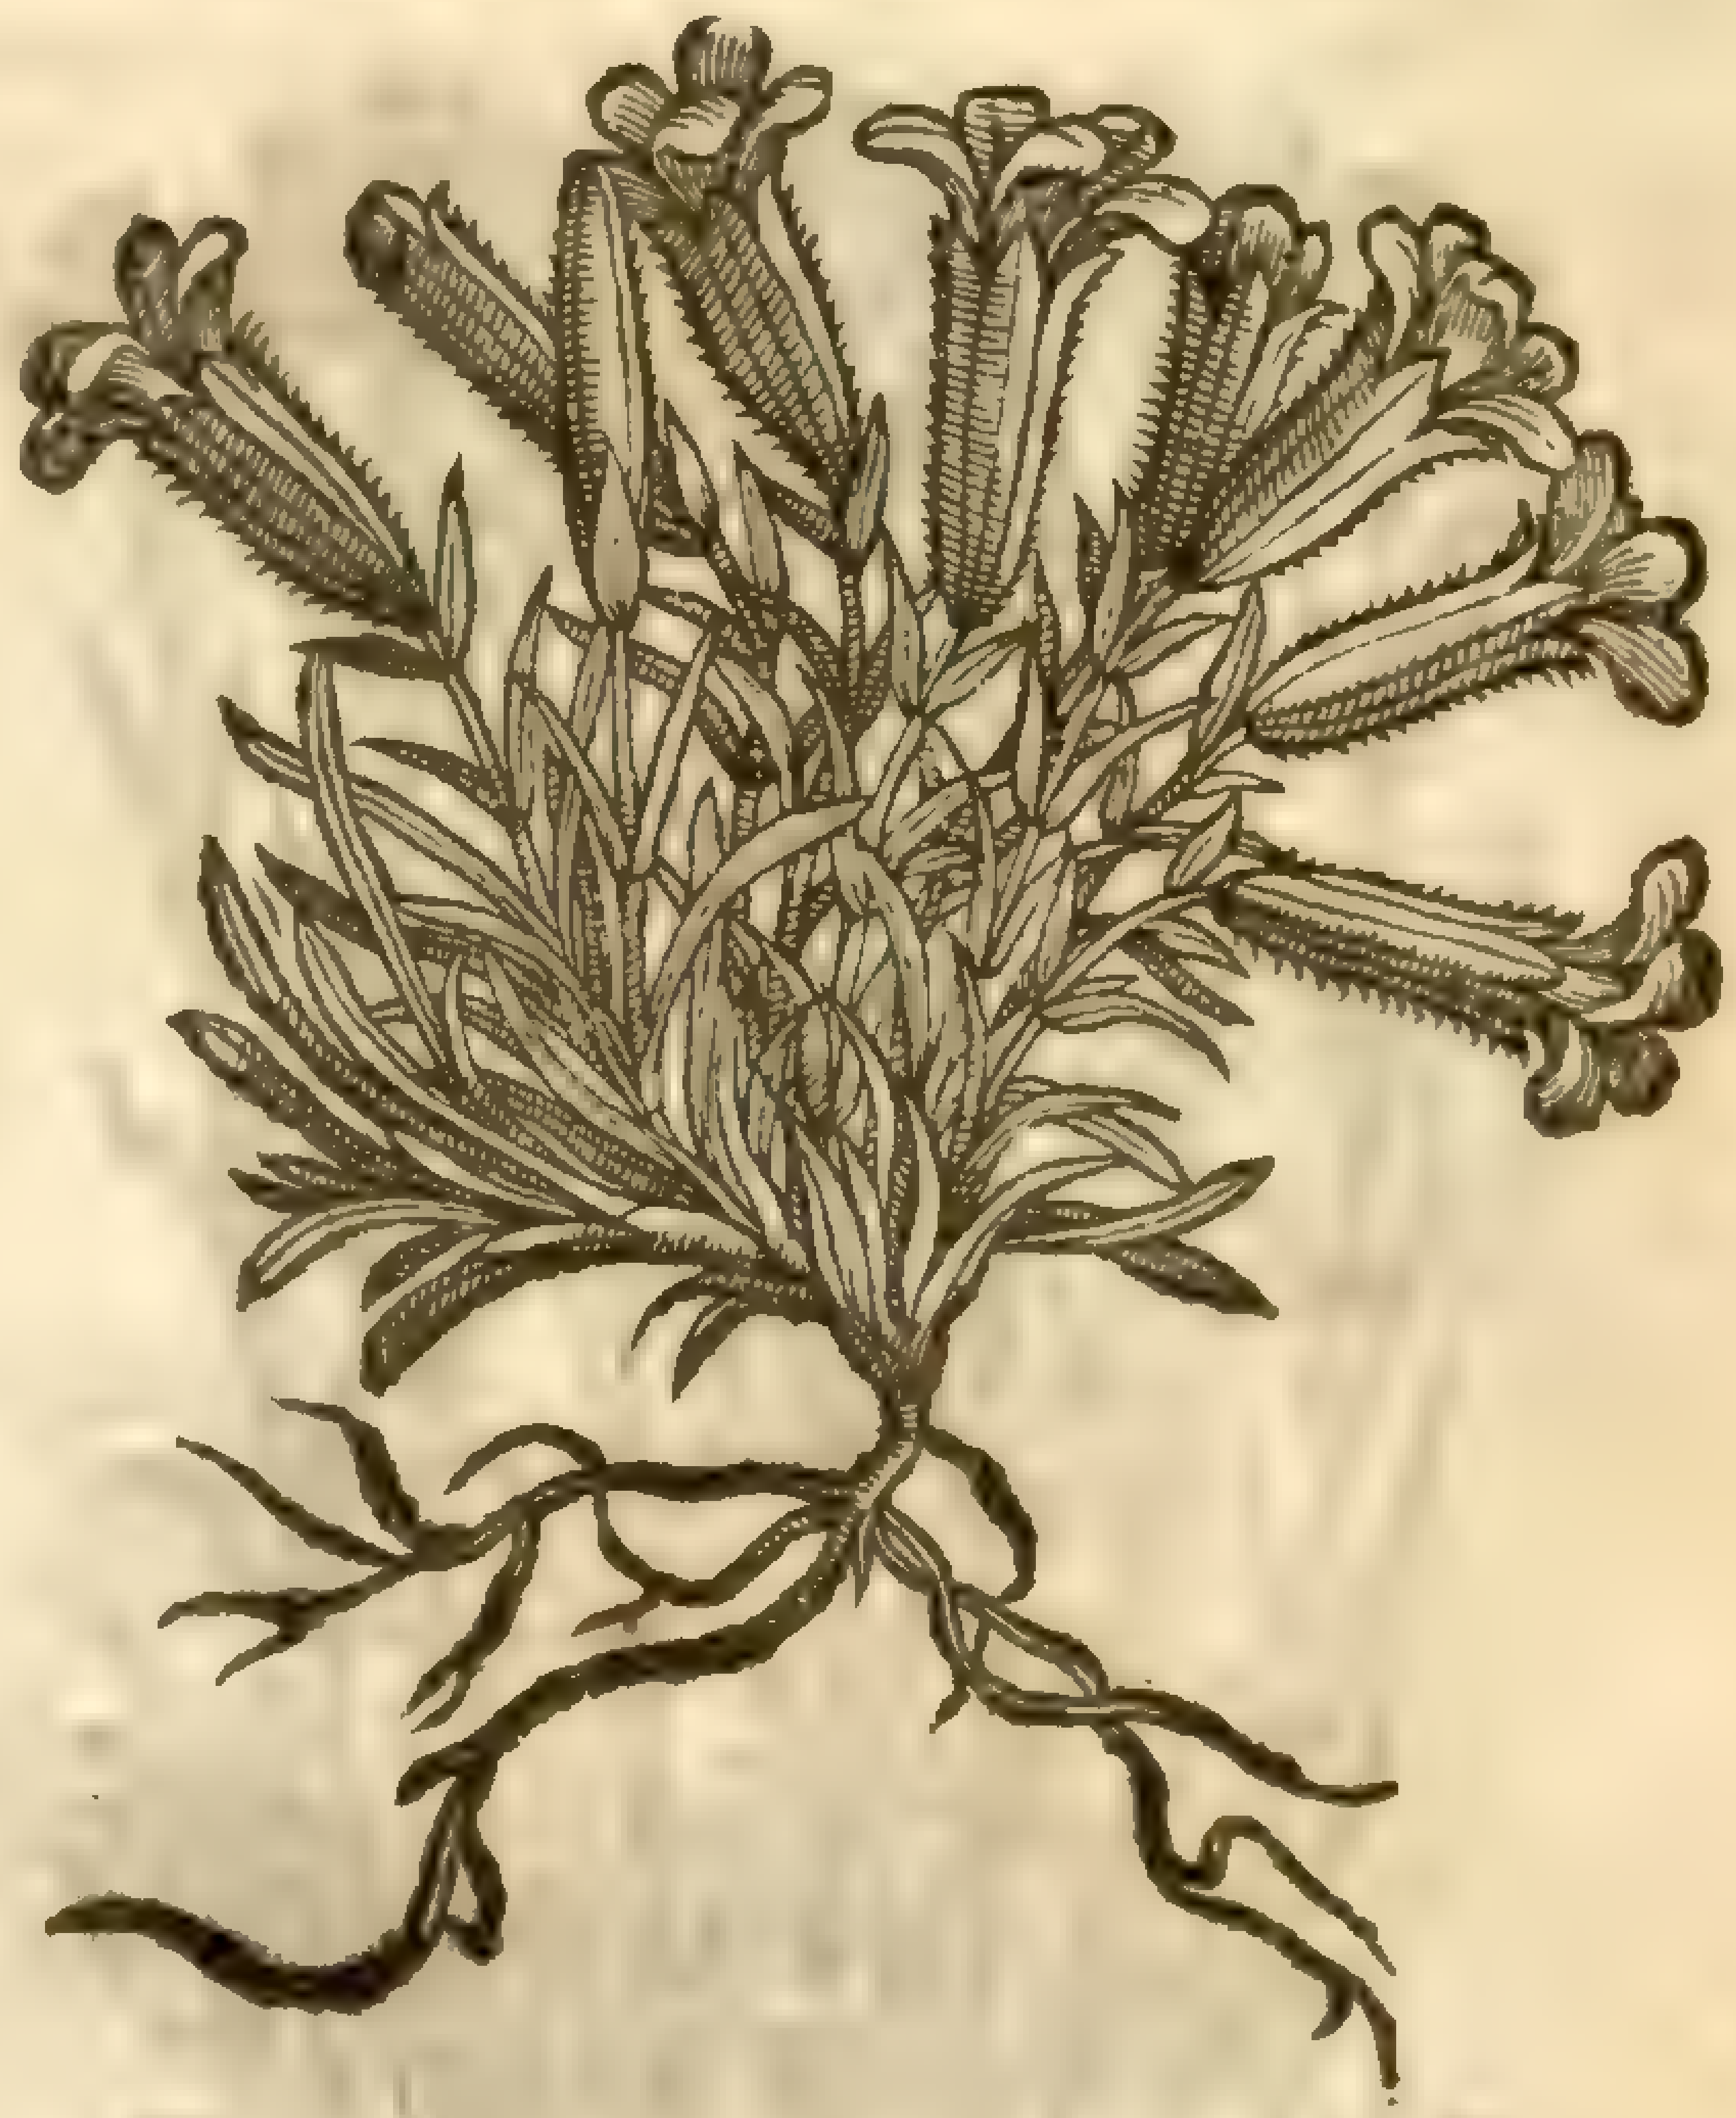
6 The purple mountain or wild Pink hath many ſmal graſſy leaues: among which riſe vp ſlender ſtalks ſet with the like leaues but leſſe; on the top wherof do grow ſmall purple floures, ſpotted finely with white or yellowiſh ſpots, and much leſſe than any of the others before deſcribed.

6 *Caryophyllus montanus purpureus.*
Wilde Purple jagged Pinke.

[illegible]

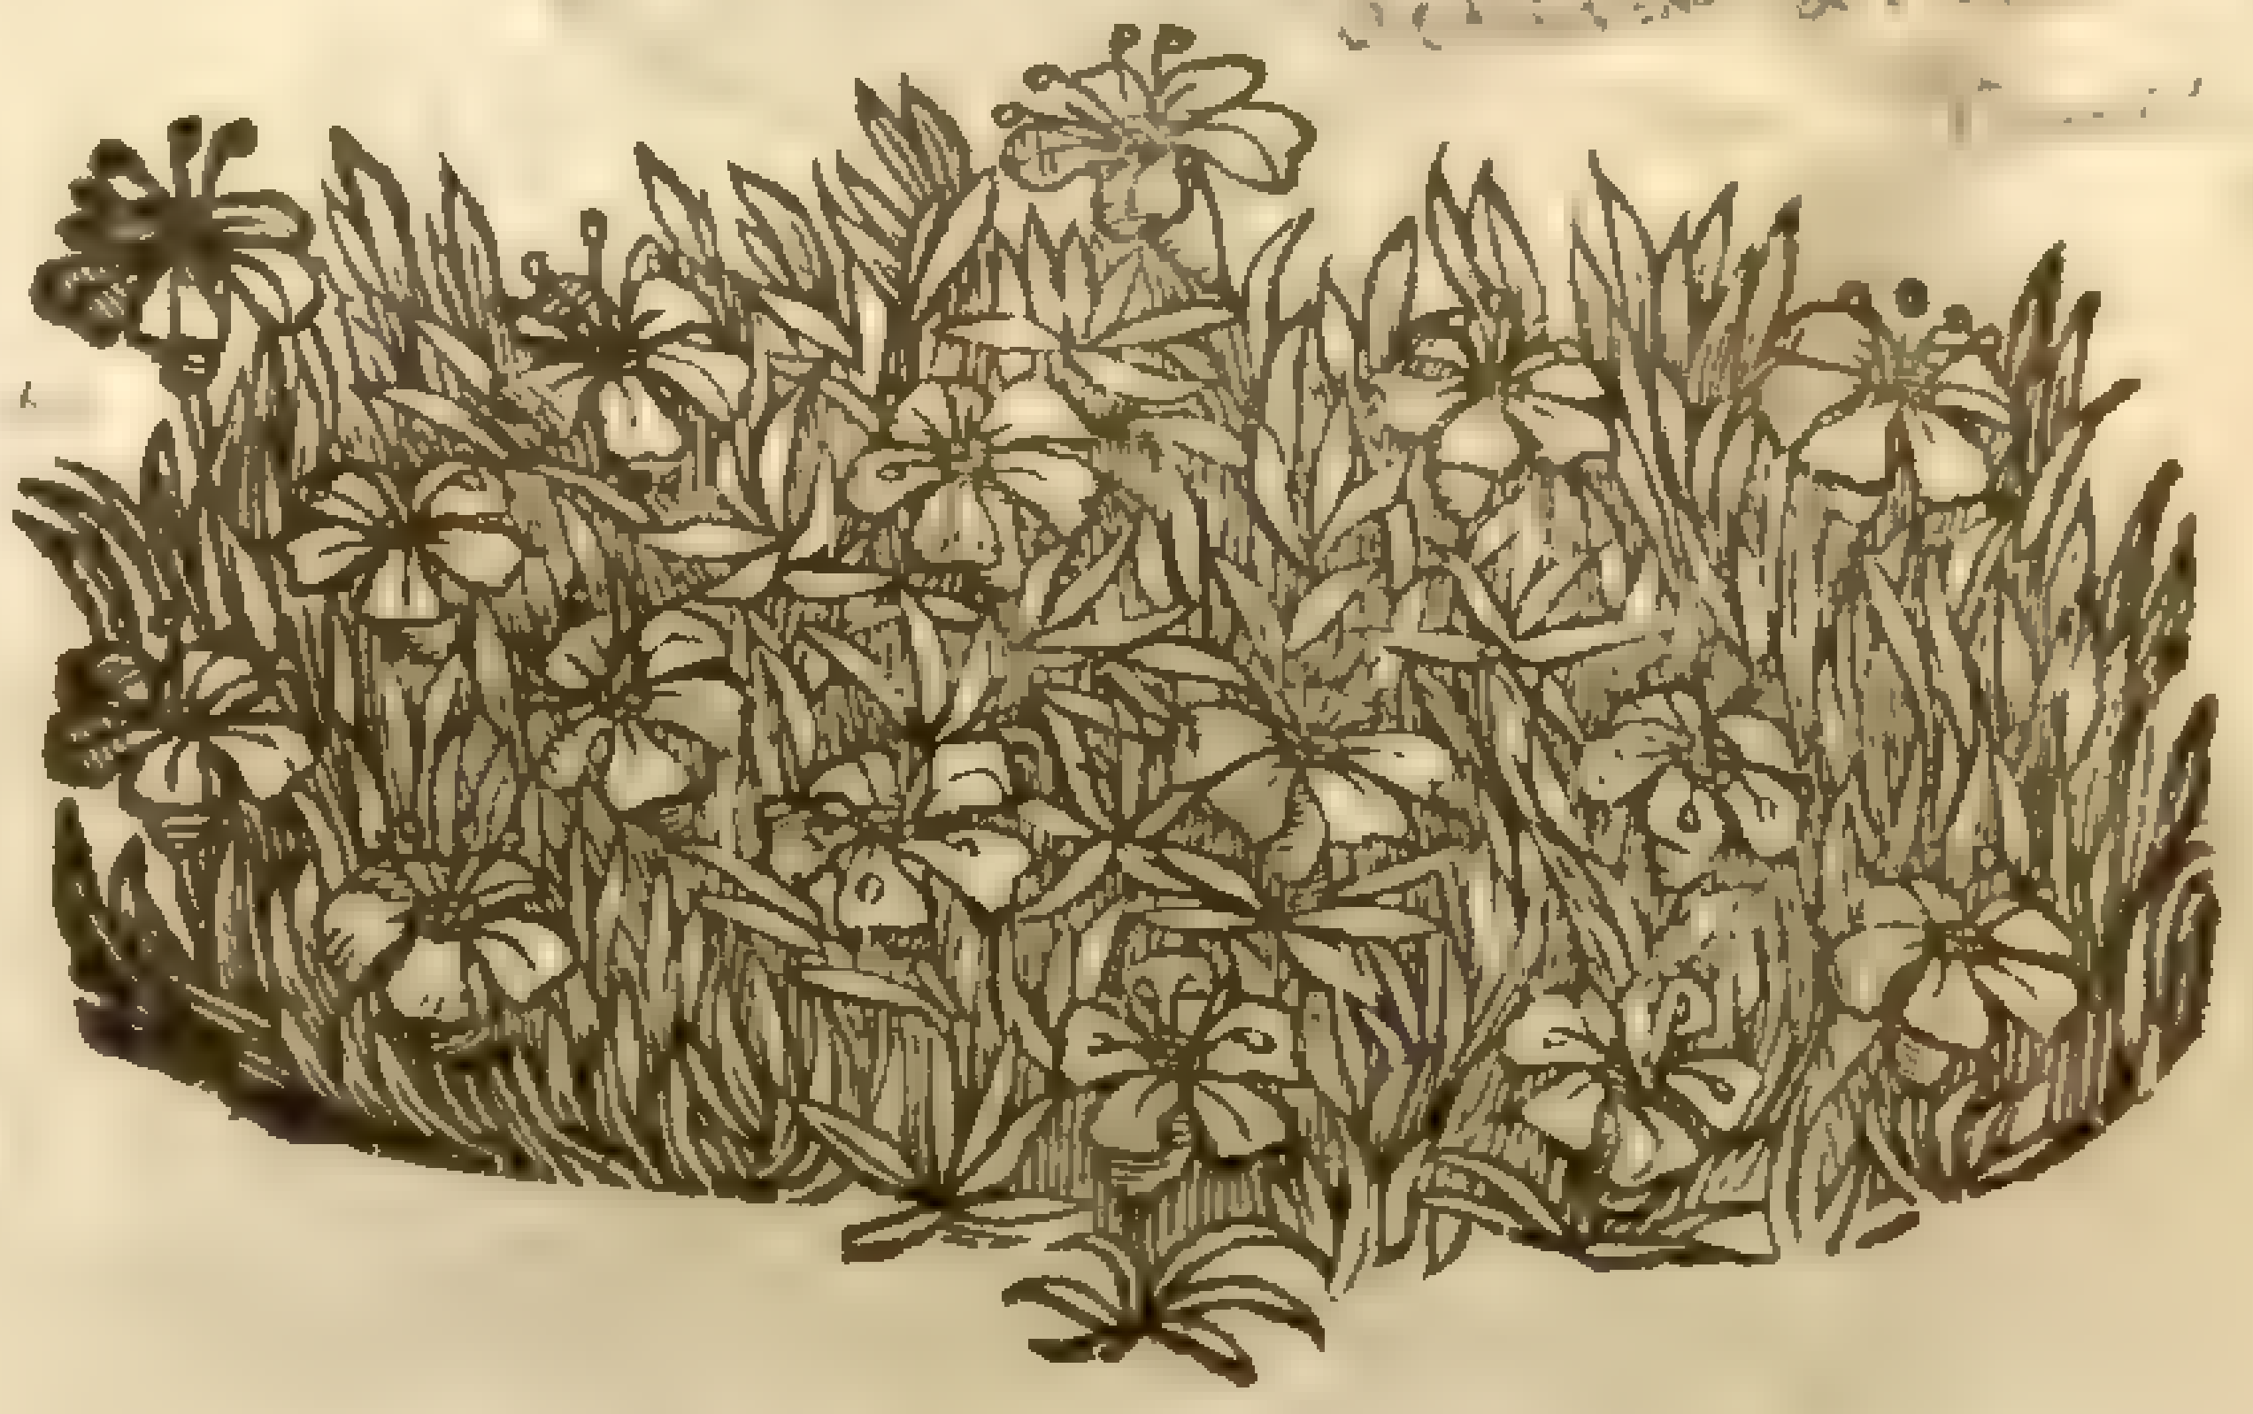


7 *Caryophyllus montanus Cluſij.*
Cluſius mountaine Pinke.

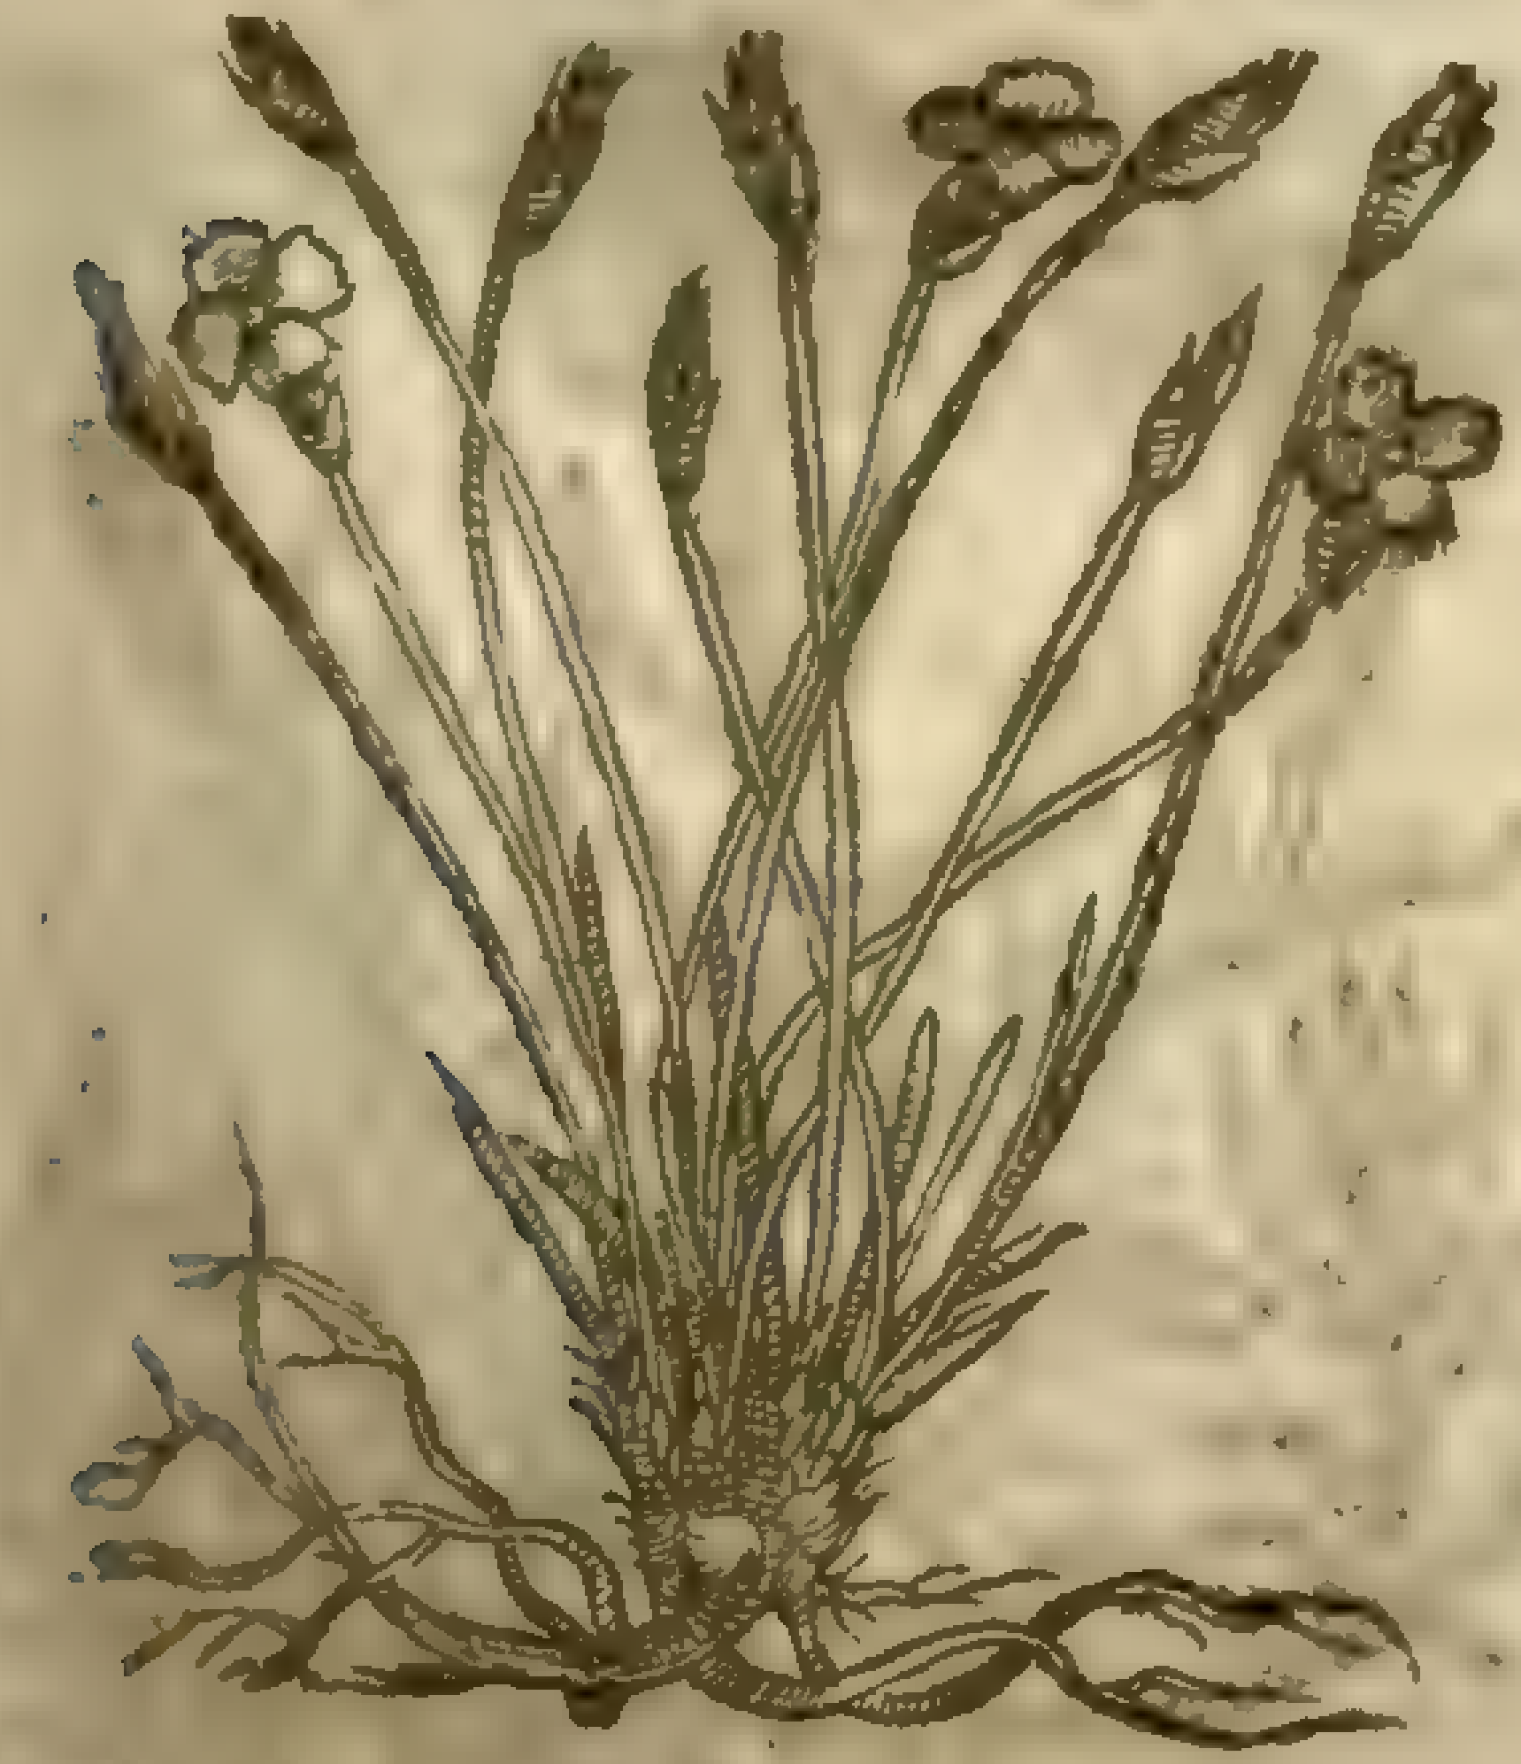


‡ 8 *Caryophyllus pumilio Alpinus.*
Dwarfe Mountaine Pinke.

Silene acaulis [illegible]
Sm. fl. 2. 299



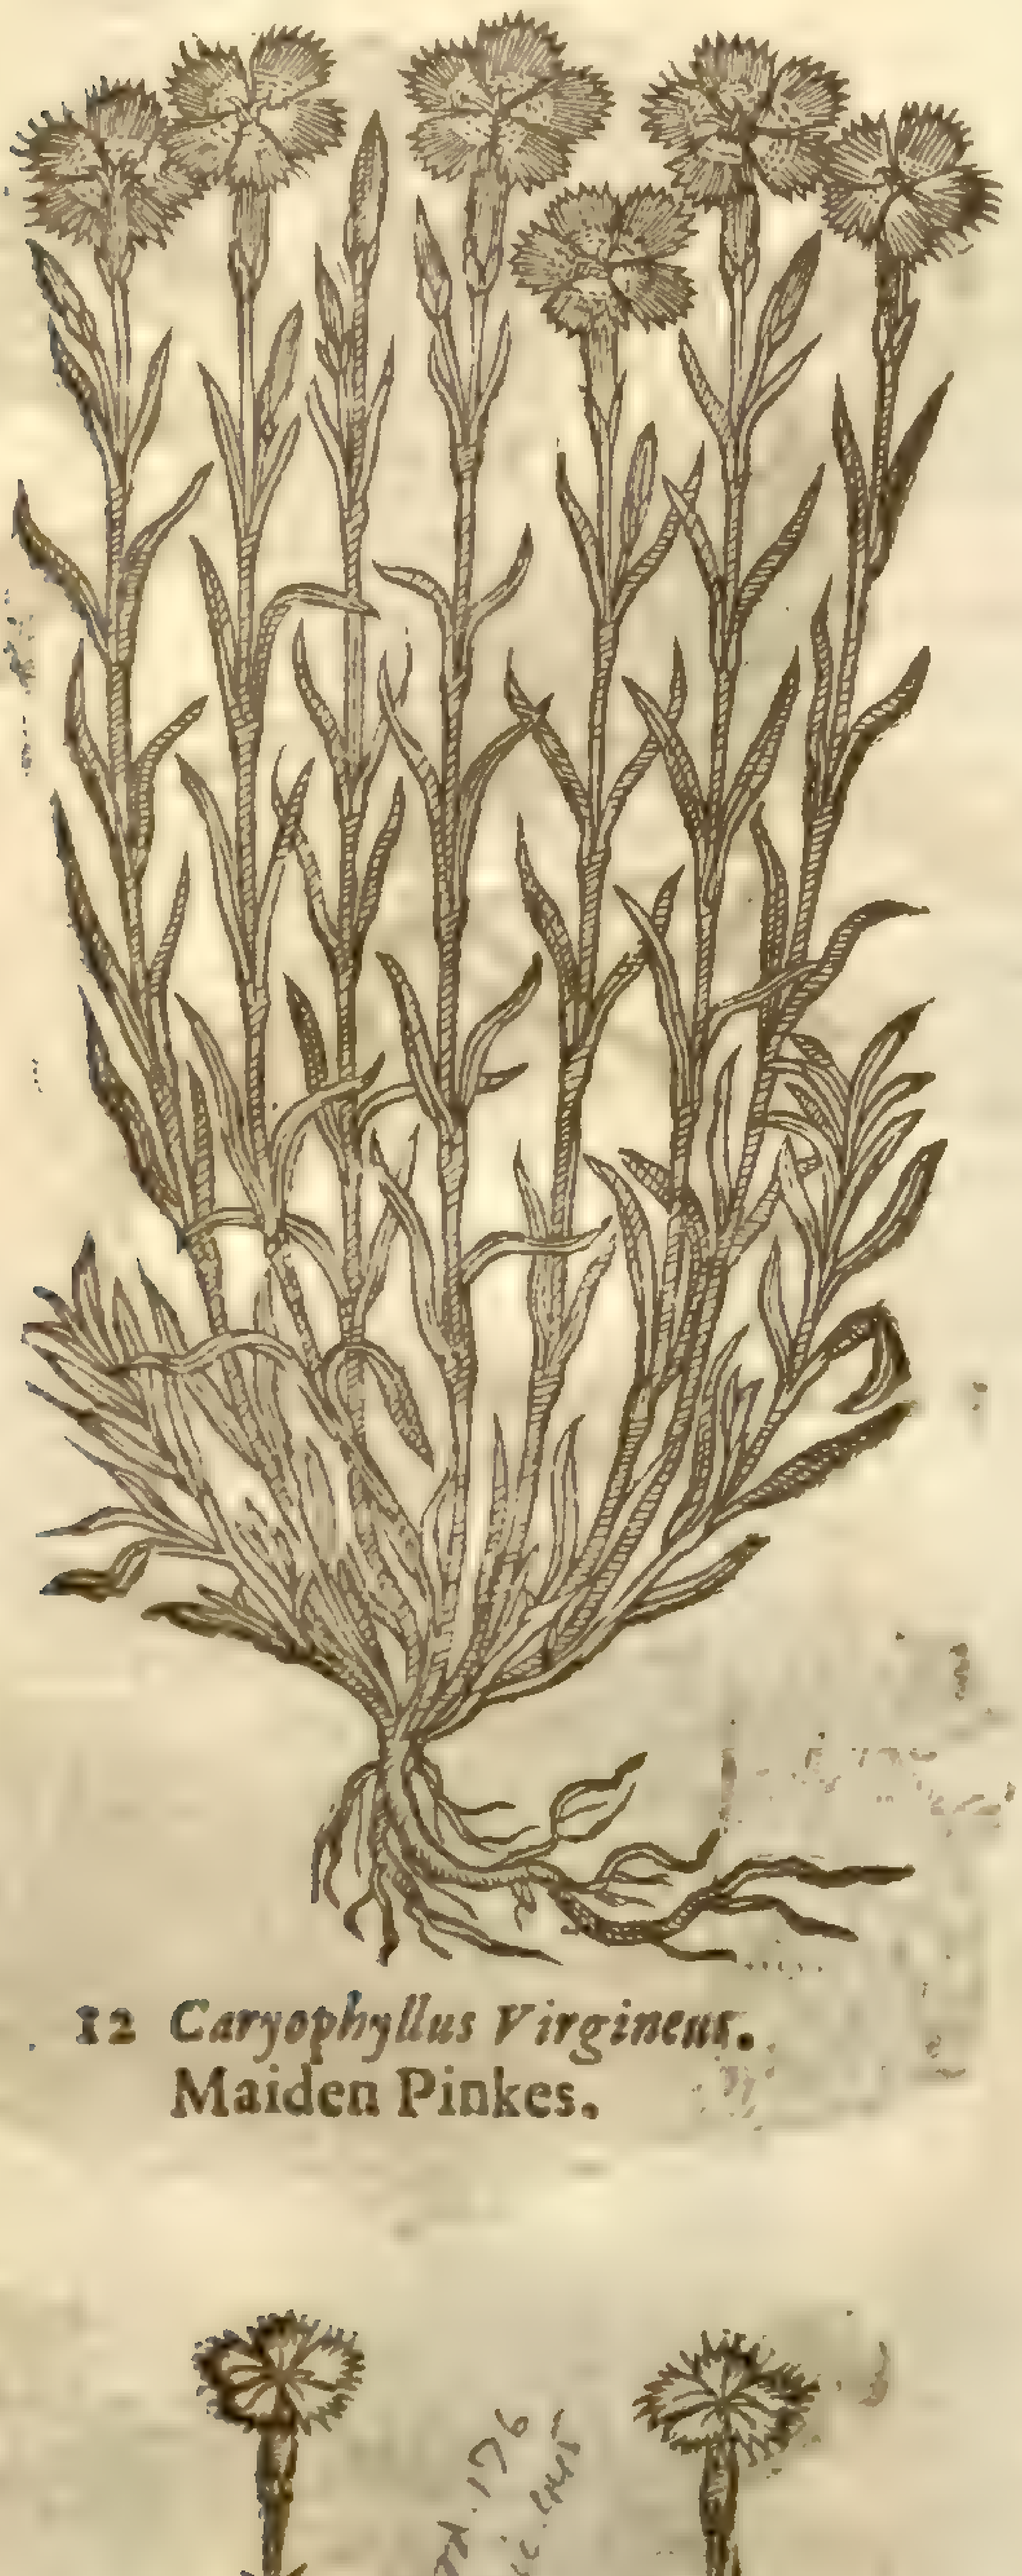
9 *Caryophyllus cæruleus ſiue Aphyllanthos.*
Leafeles Pinke, or ruſhy Pinke.



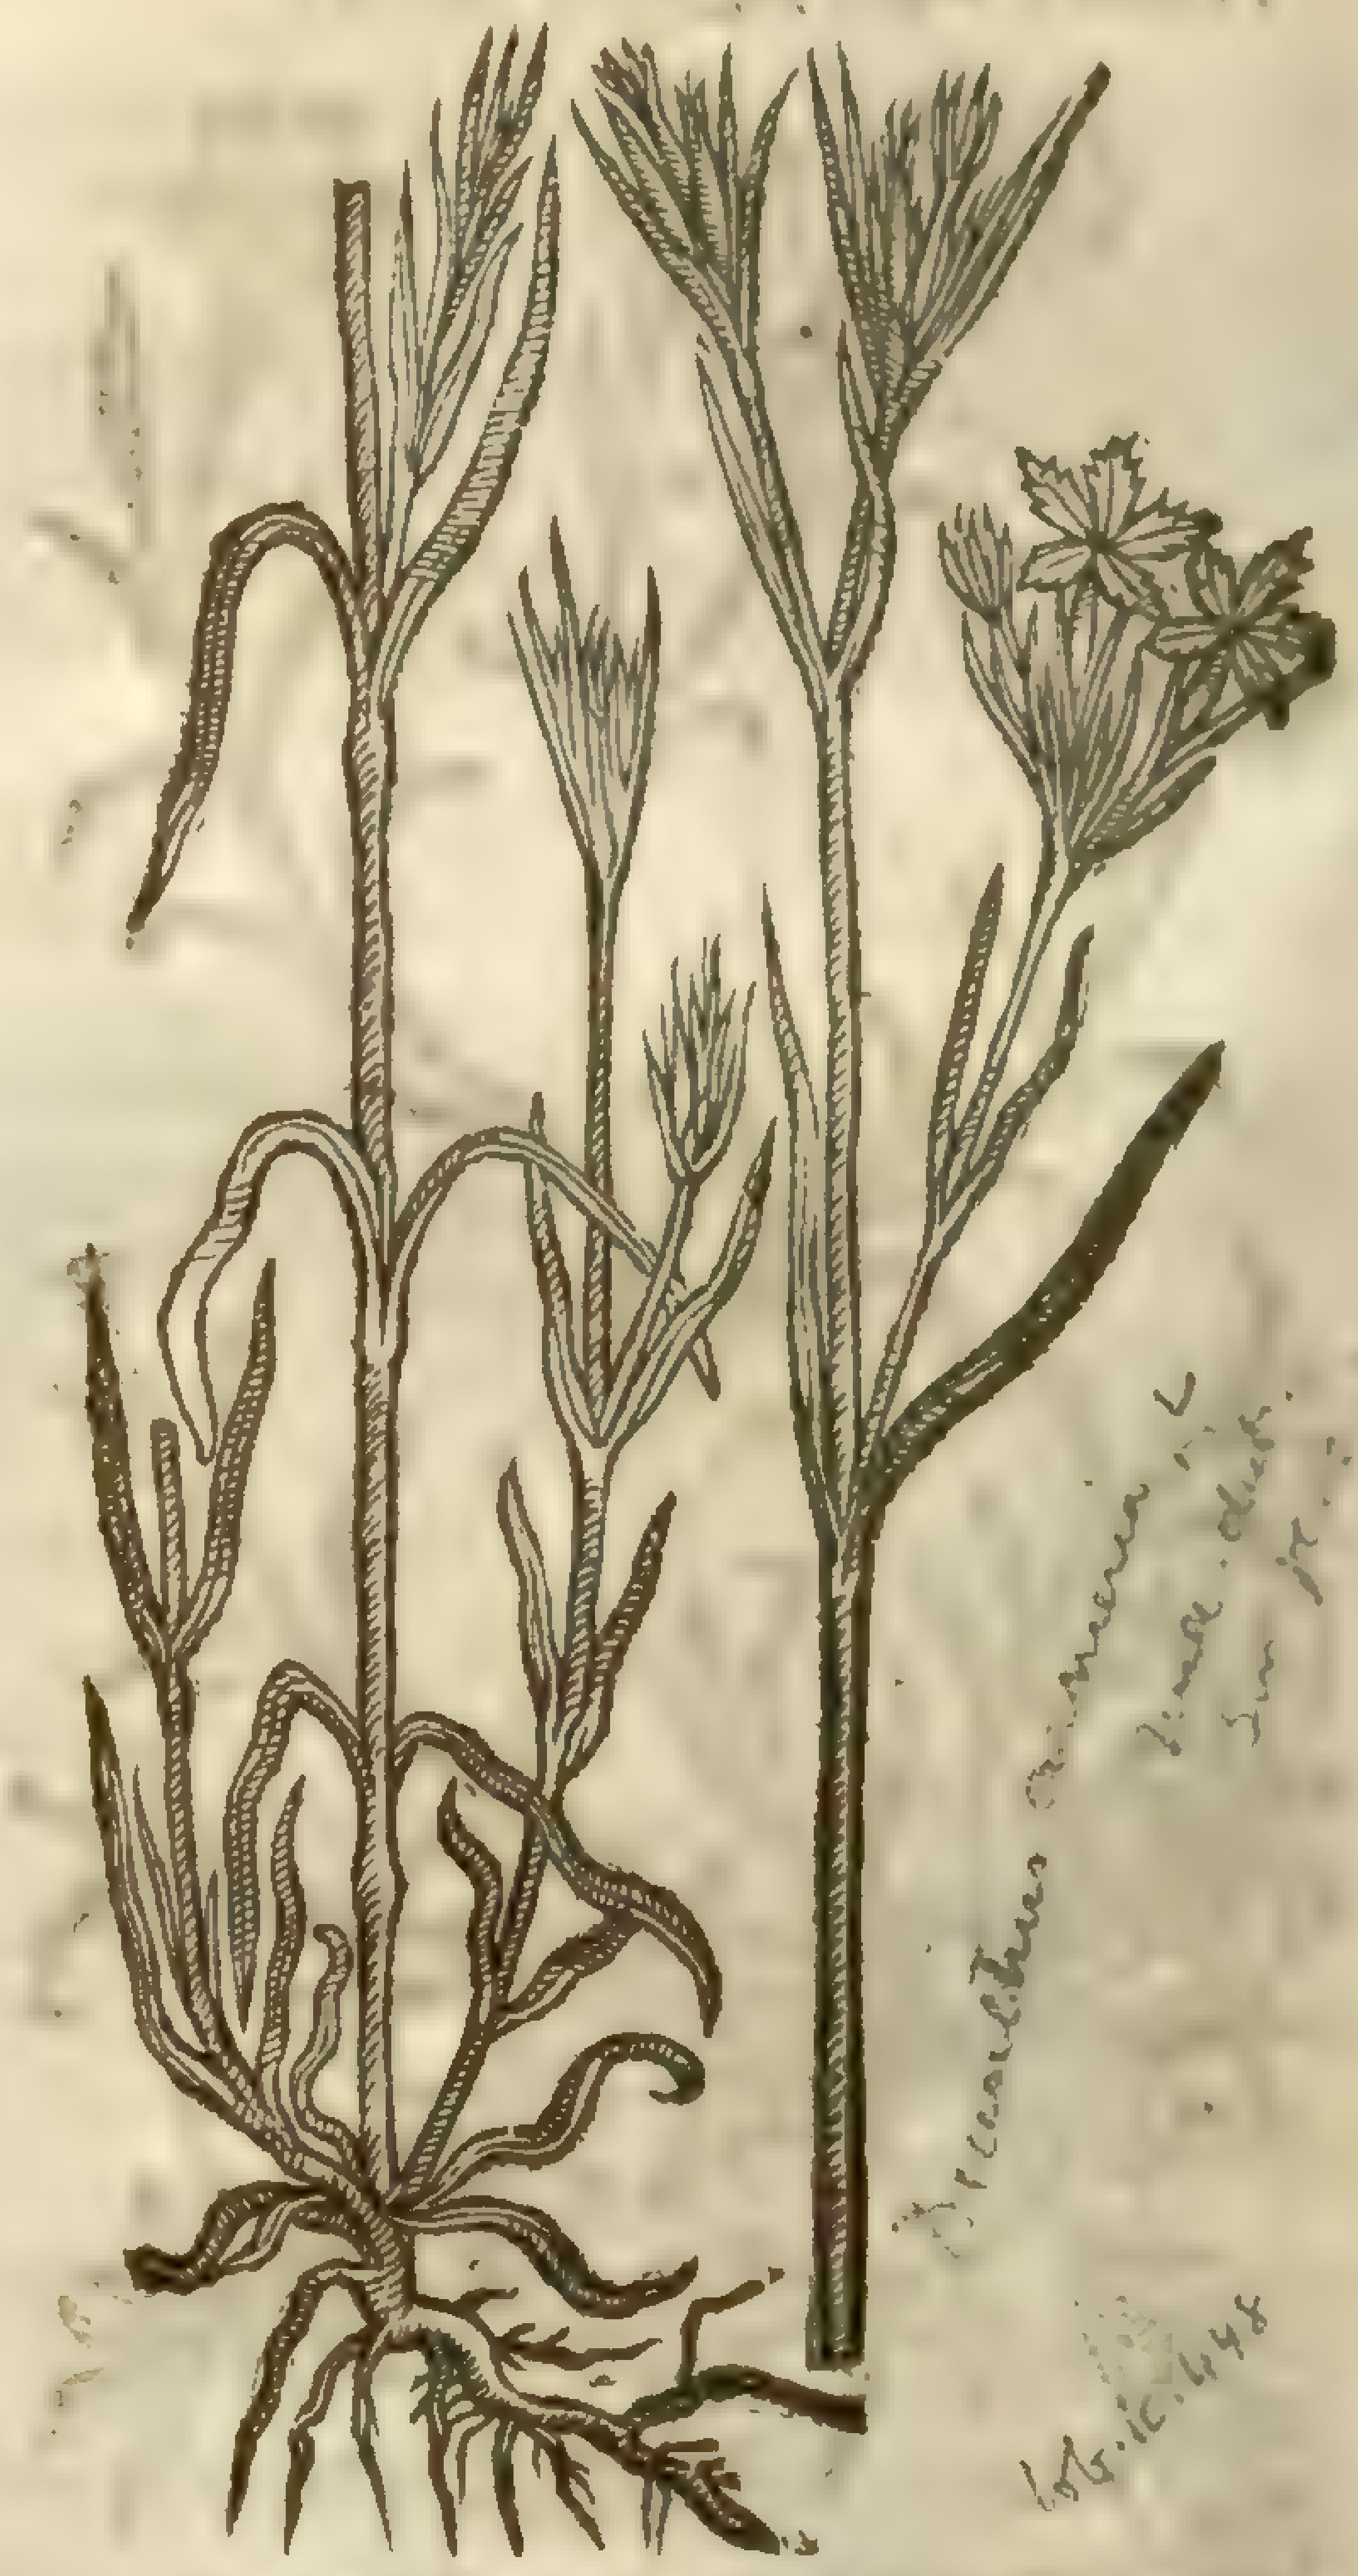
7 The Mountaine Pinke of *Cluſius* deſcription hath many large leaues growing in a tuft like vnto thoſe of Thrift, and of a bitter taſte: among which riſe vp ſmall tender foot-ſtalkes, rather than ſtalkes or ſtems themſelues, of the height of two inches; whereupon do grow ſuch leaues as thoſe that were next the ground, but leſſer, ſet by couples one oppoſite to another: at the top of each ſmall foot-ſtalke doth ſtand one red floure without ſmell, conſiſting of fiue little leaues ſet in a rough hairy huſke or hoſe fiue cornered, of a greeniſh colour tending to purple. The root is tough and thicke, caſting abroad many ſhoots, whereby it greatly encreaſeth.

‡ 8 This for his ſtature may juſtly take the next place; for the ſtalke is ſome inch high, ſet with little ſharpe pointed greene graſſie leaues: the floures which grow vpon theſe ſtalkes are compoſed of fiue little fleſh-coloured leaues a little diuided in their vpper parts: the ſeed is contained in blacke ſhining heads, and it is ſmall and reddiſh, and ſhaped ſomewhat like the faſhion of a kidney, whereby it comes neerer to the *Lychnides*, than to the *Caryophylli* or Pinkes. The root *is long*, blacke, and much ſpreading, whereby this little plant couers the ground a good ſpace together like as a moſſe, and makes a curious ſhew when the floures are blowne, which *is commonly in* Iune. It

10 *Caryophyllus montanus albus.*
White mountaine Pinke.



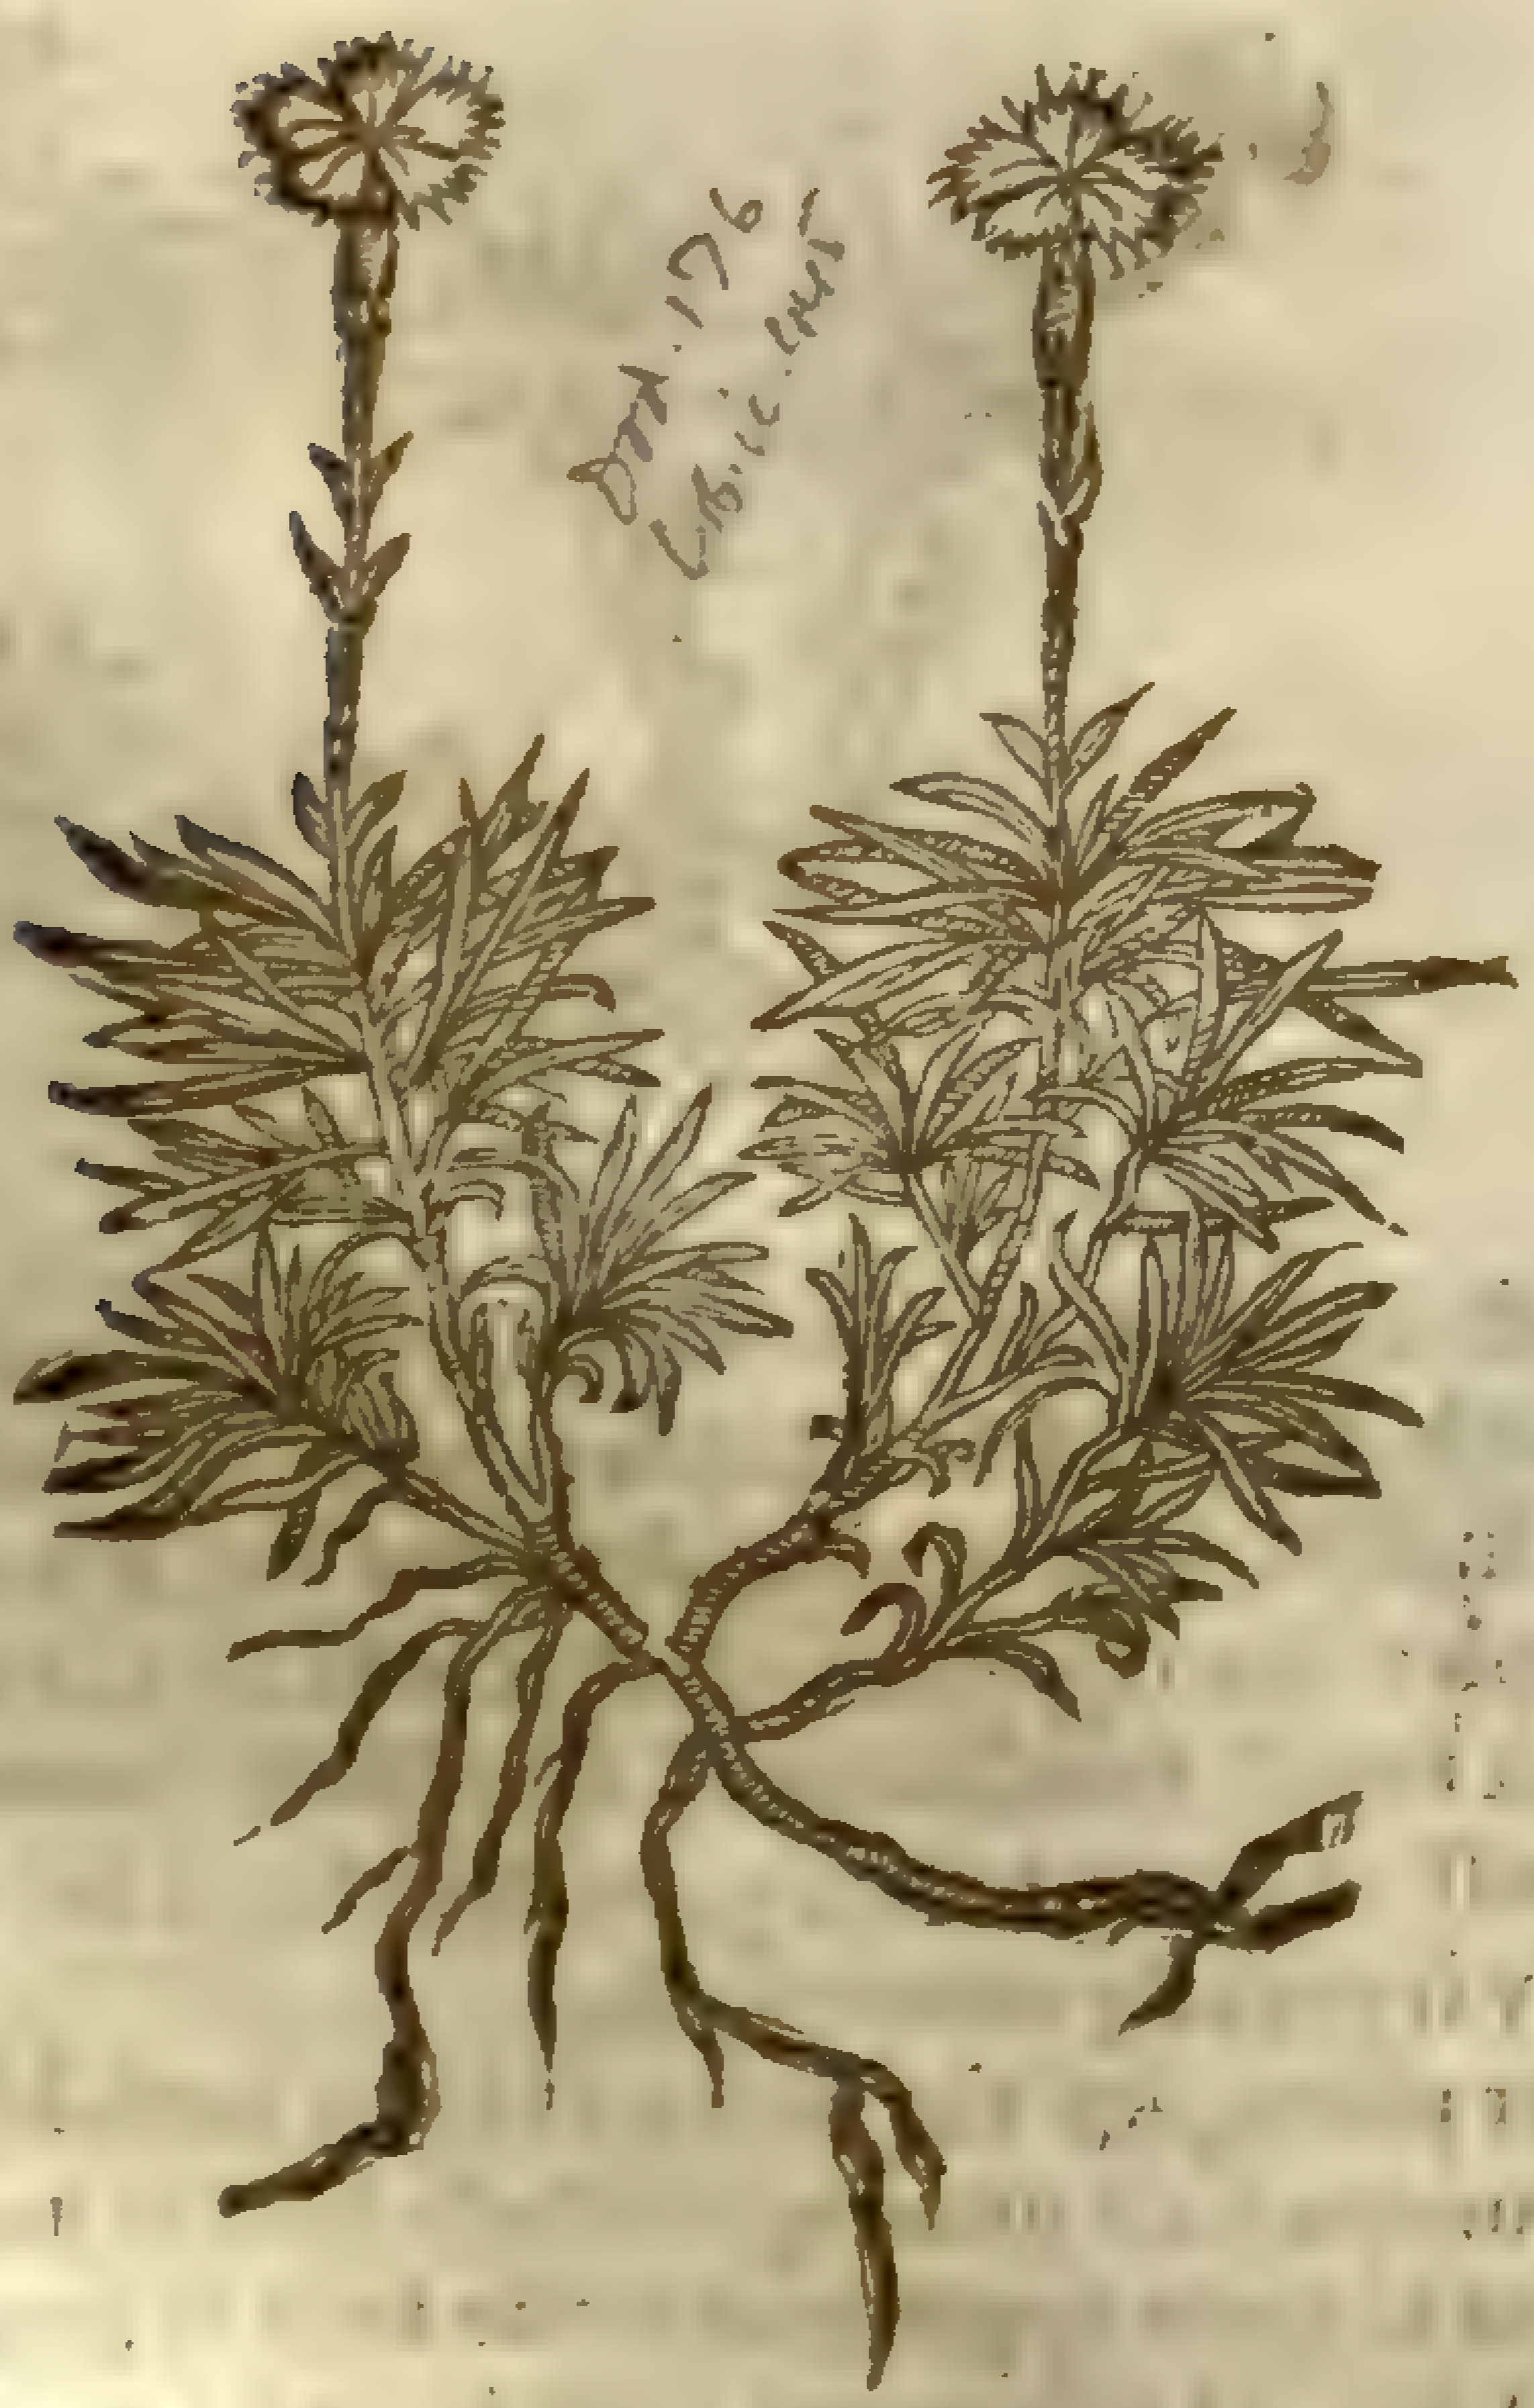
‡ 11 *Caryophyllus pratenſis.*
Deptford Pinke.



Dianthus armeria L. Linn. dict. Sm. fl.

Lob. ic. 448

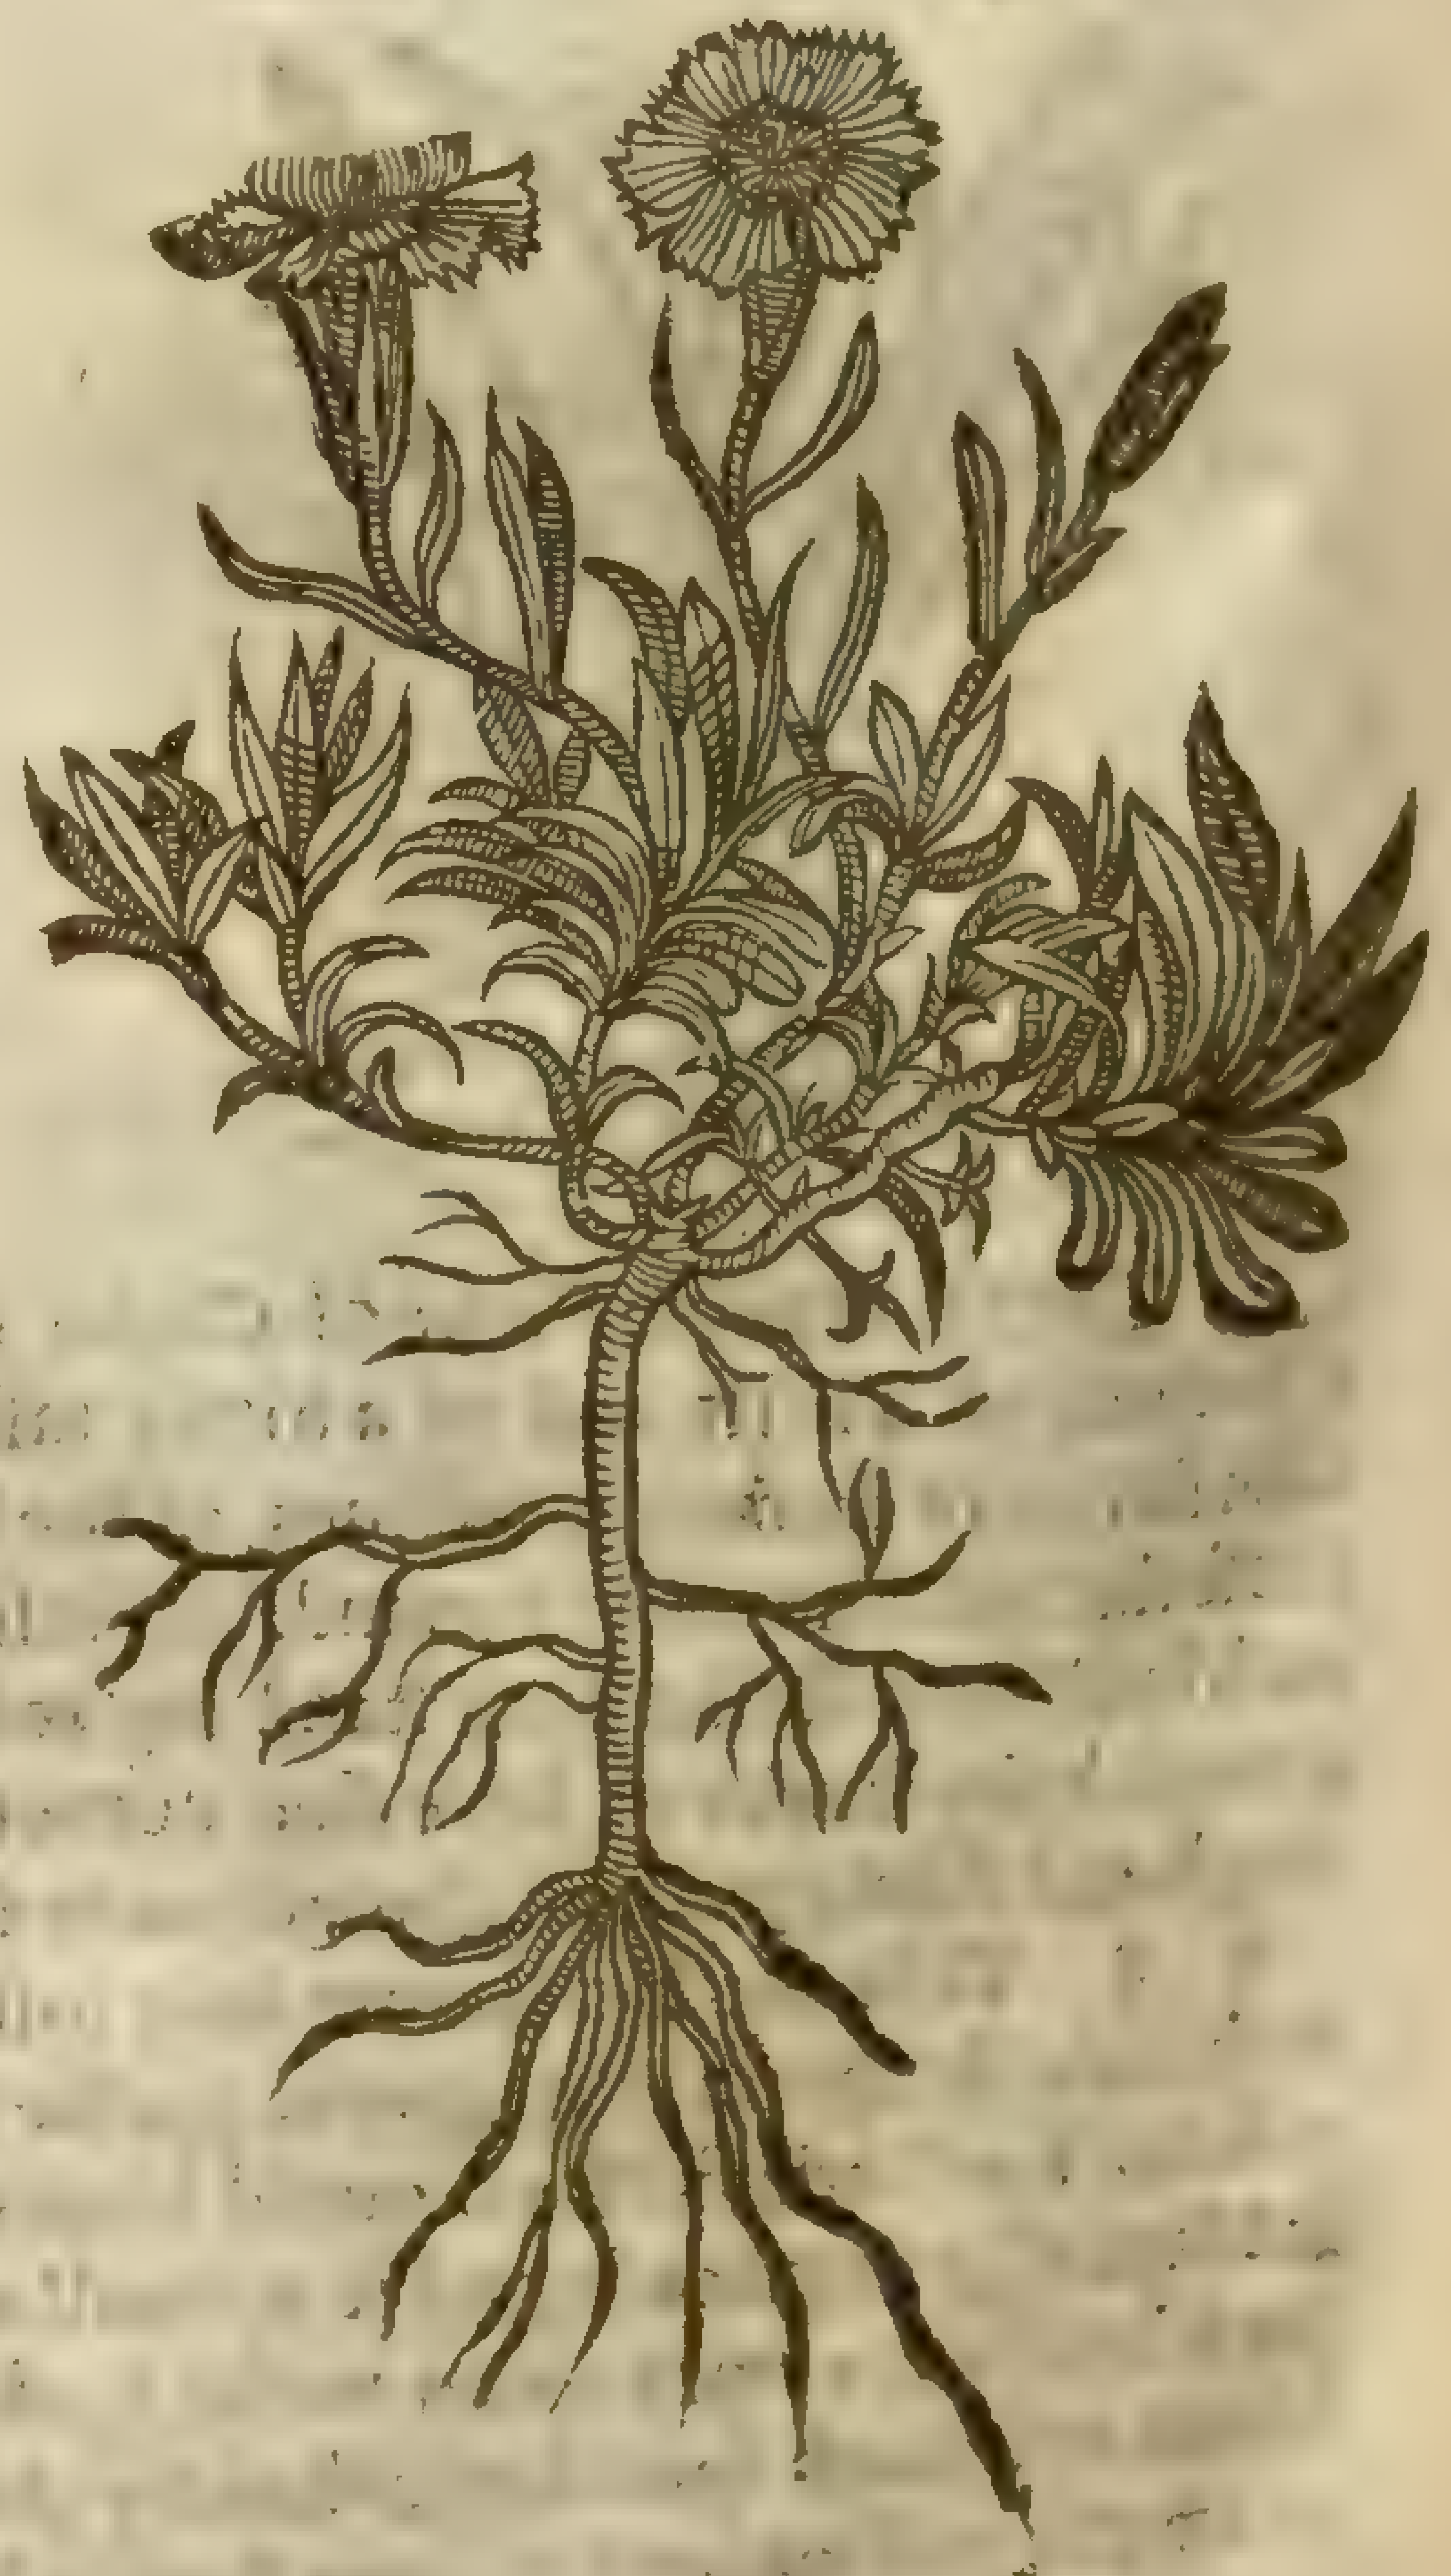
12 *Caryophyllus Virgineus.*
Maiden Pinkes.



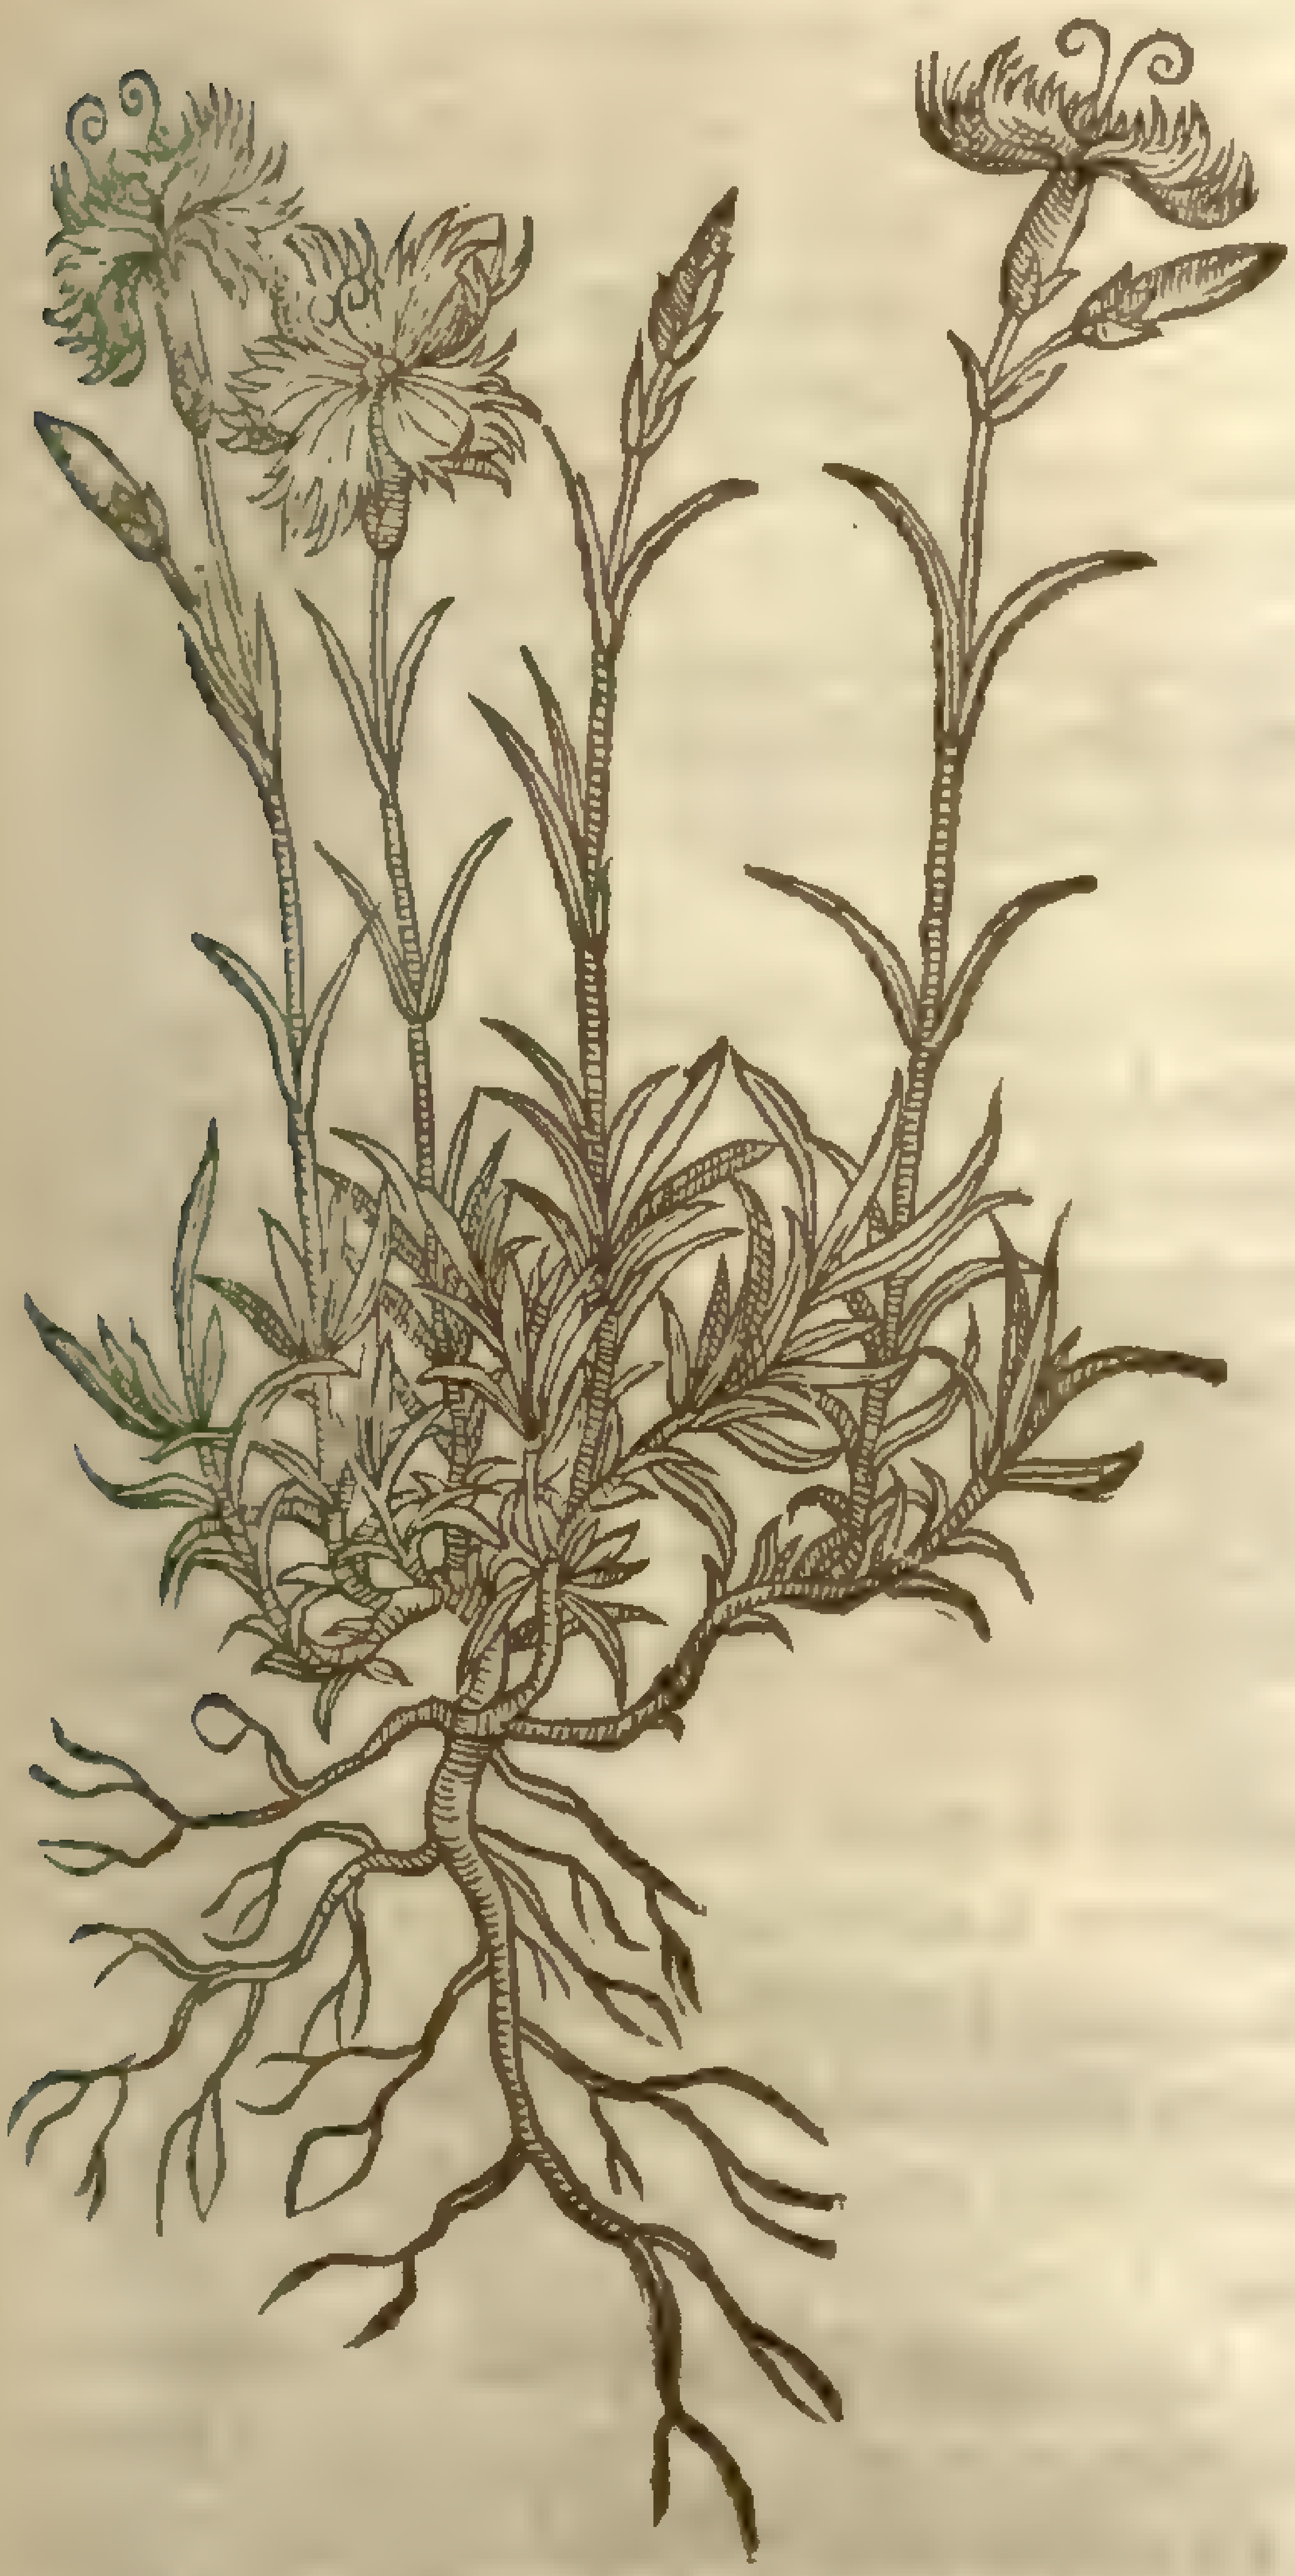
Dod. 176 Lob. ic. 445

Dianthus caesius, Withl. Sm. fl. b. 289

‡ 13 *Caryophyllus montanus humilis latifolius.*
Small mountaine broad leaued Pinke.

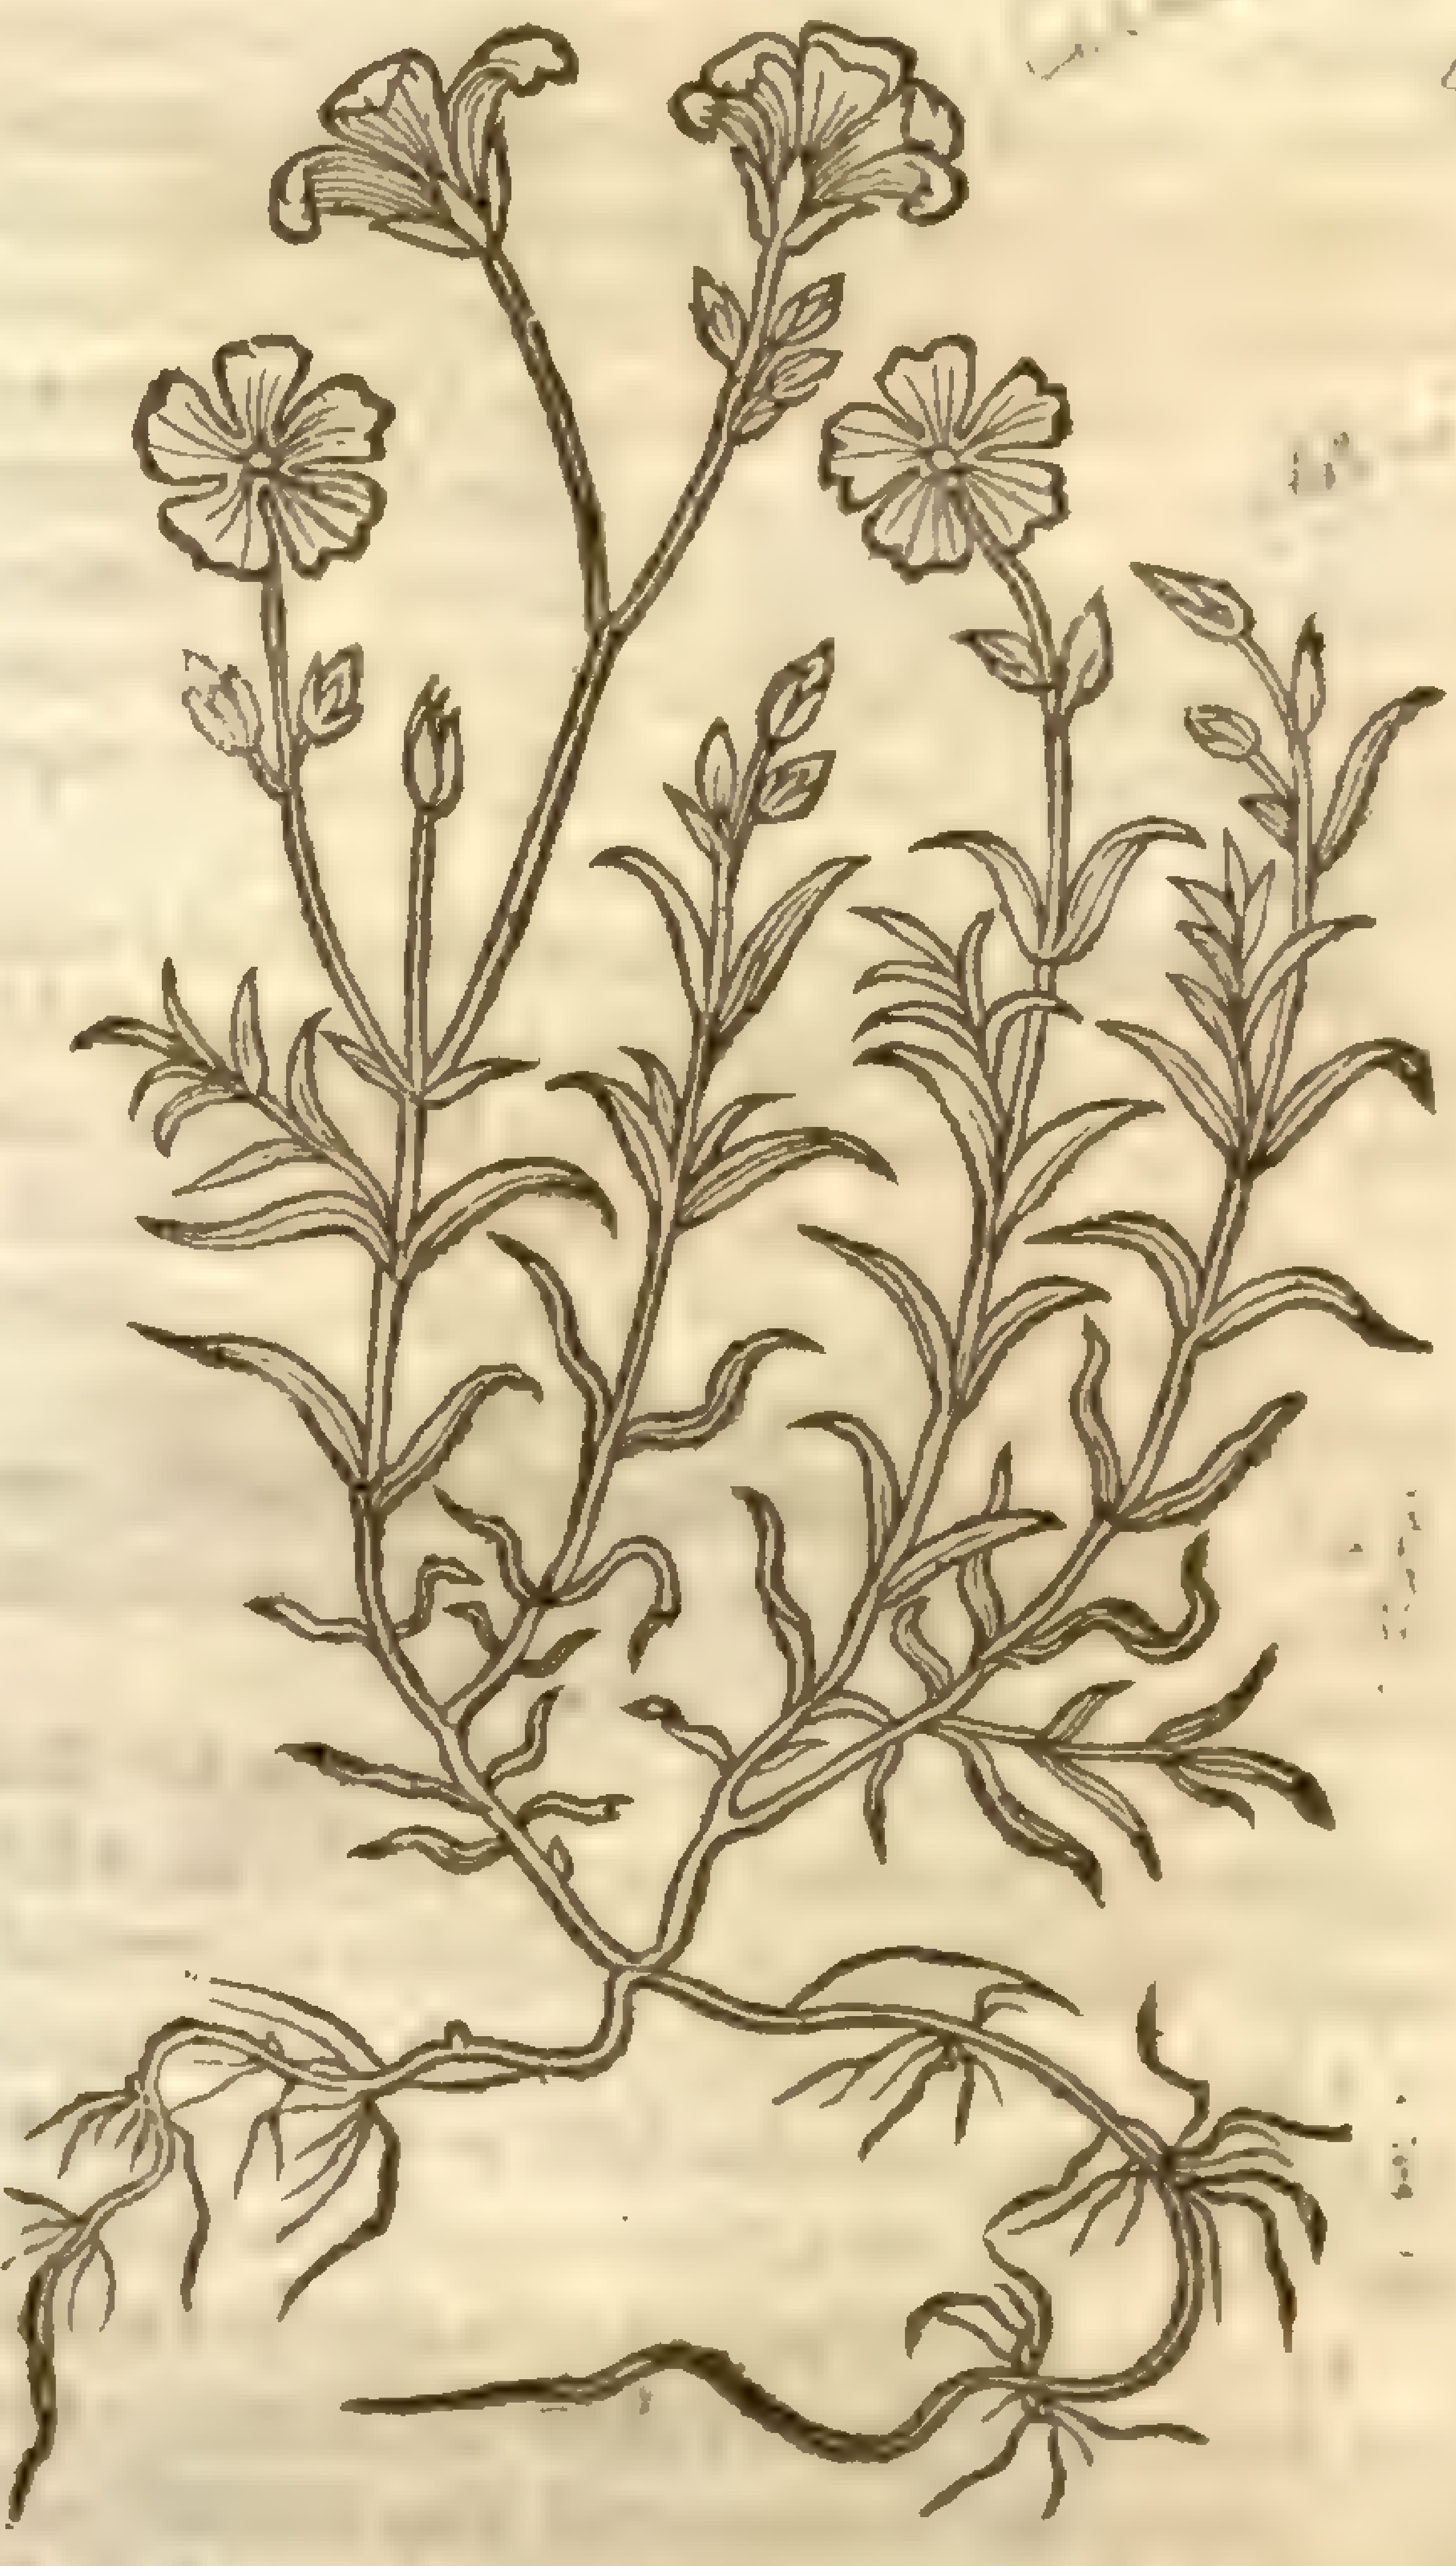


‡ 14 *Caryophyllus montanus albus.*
White mountaine Pinke.

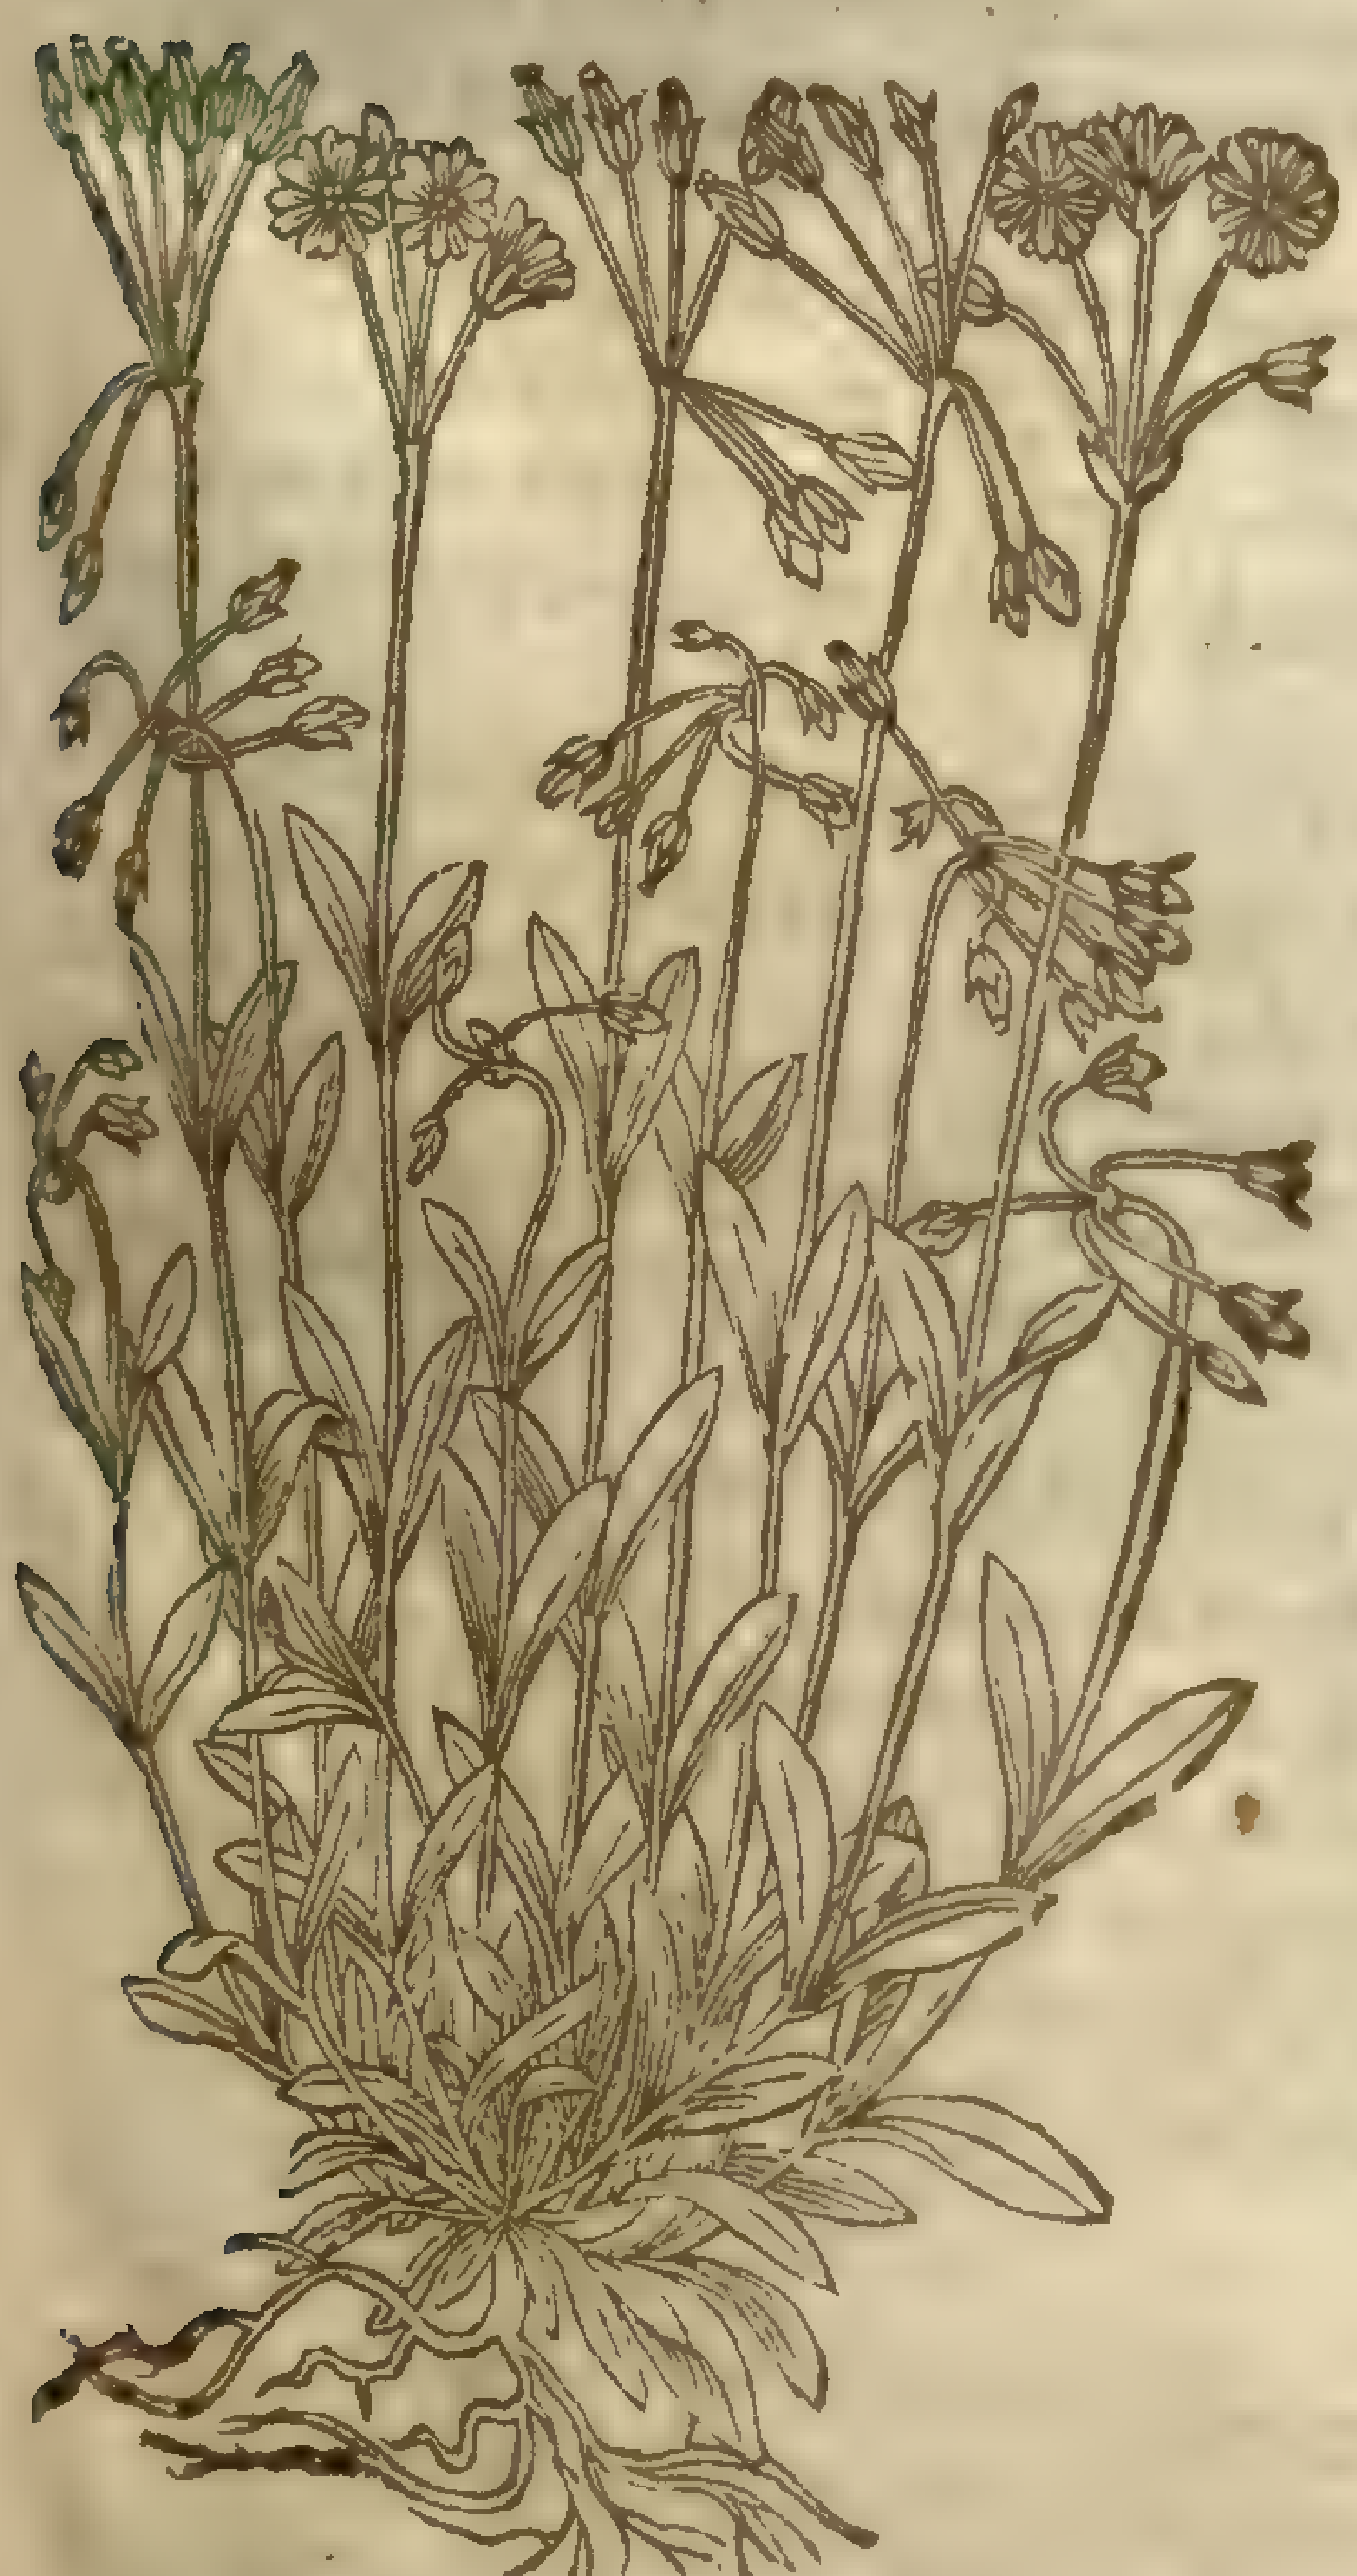


15 *Caryophyllus Holoſtius.*
Wilde Sea Pinke.

Cerastium arvense [illegible]
mai. diet
Sm. [illegible]

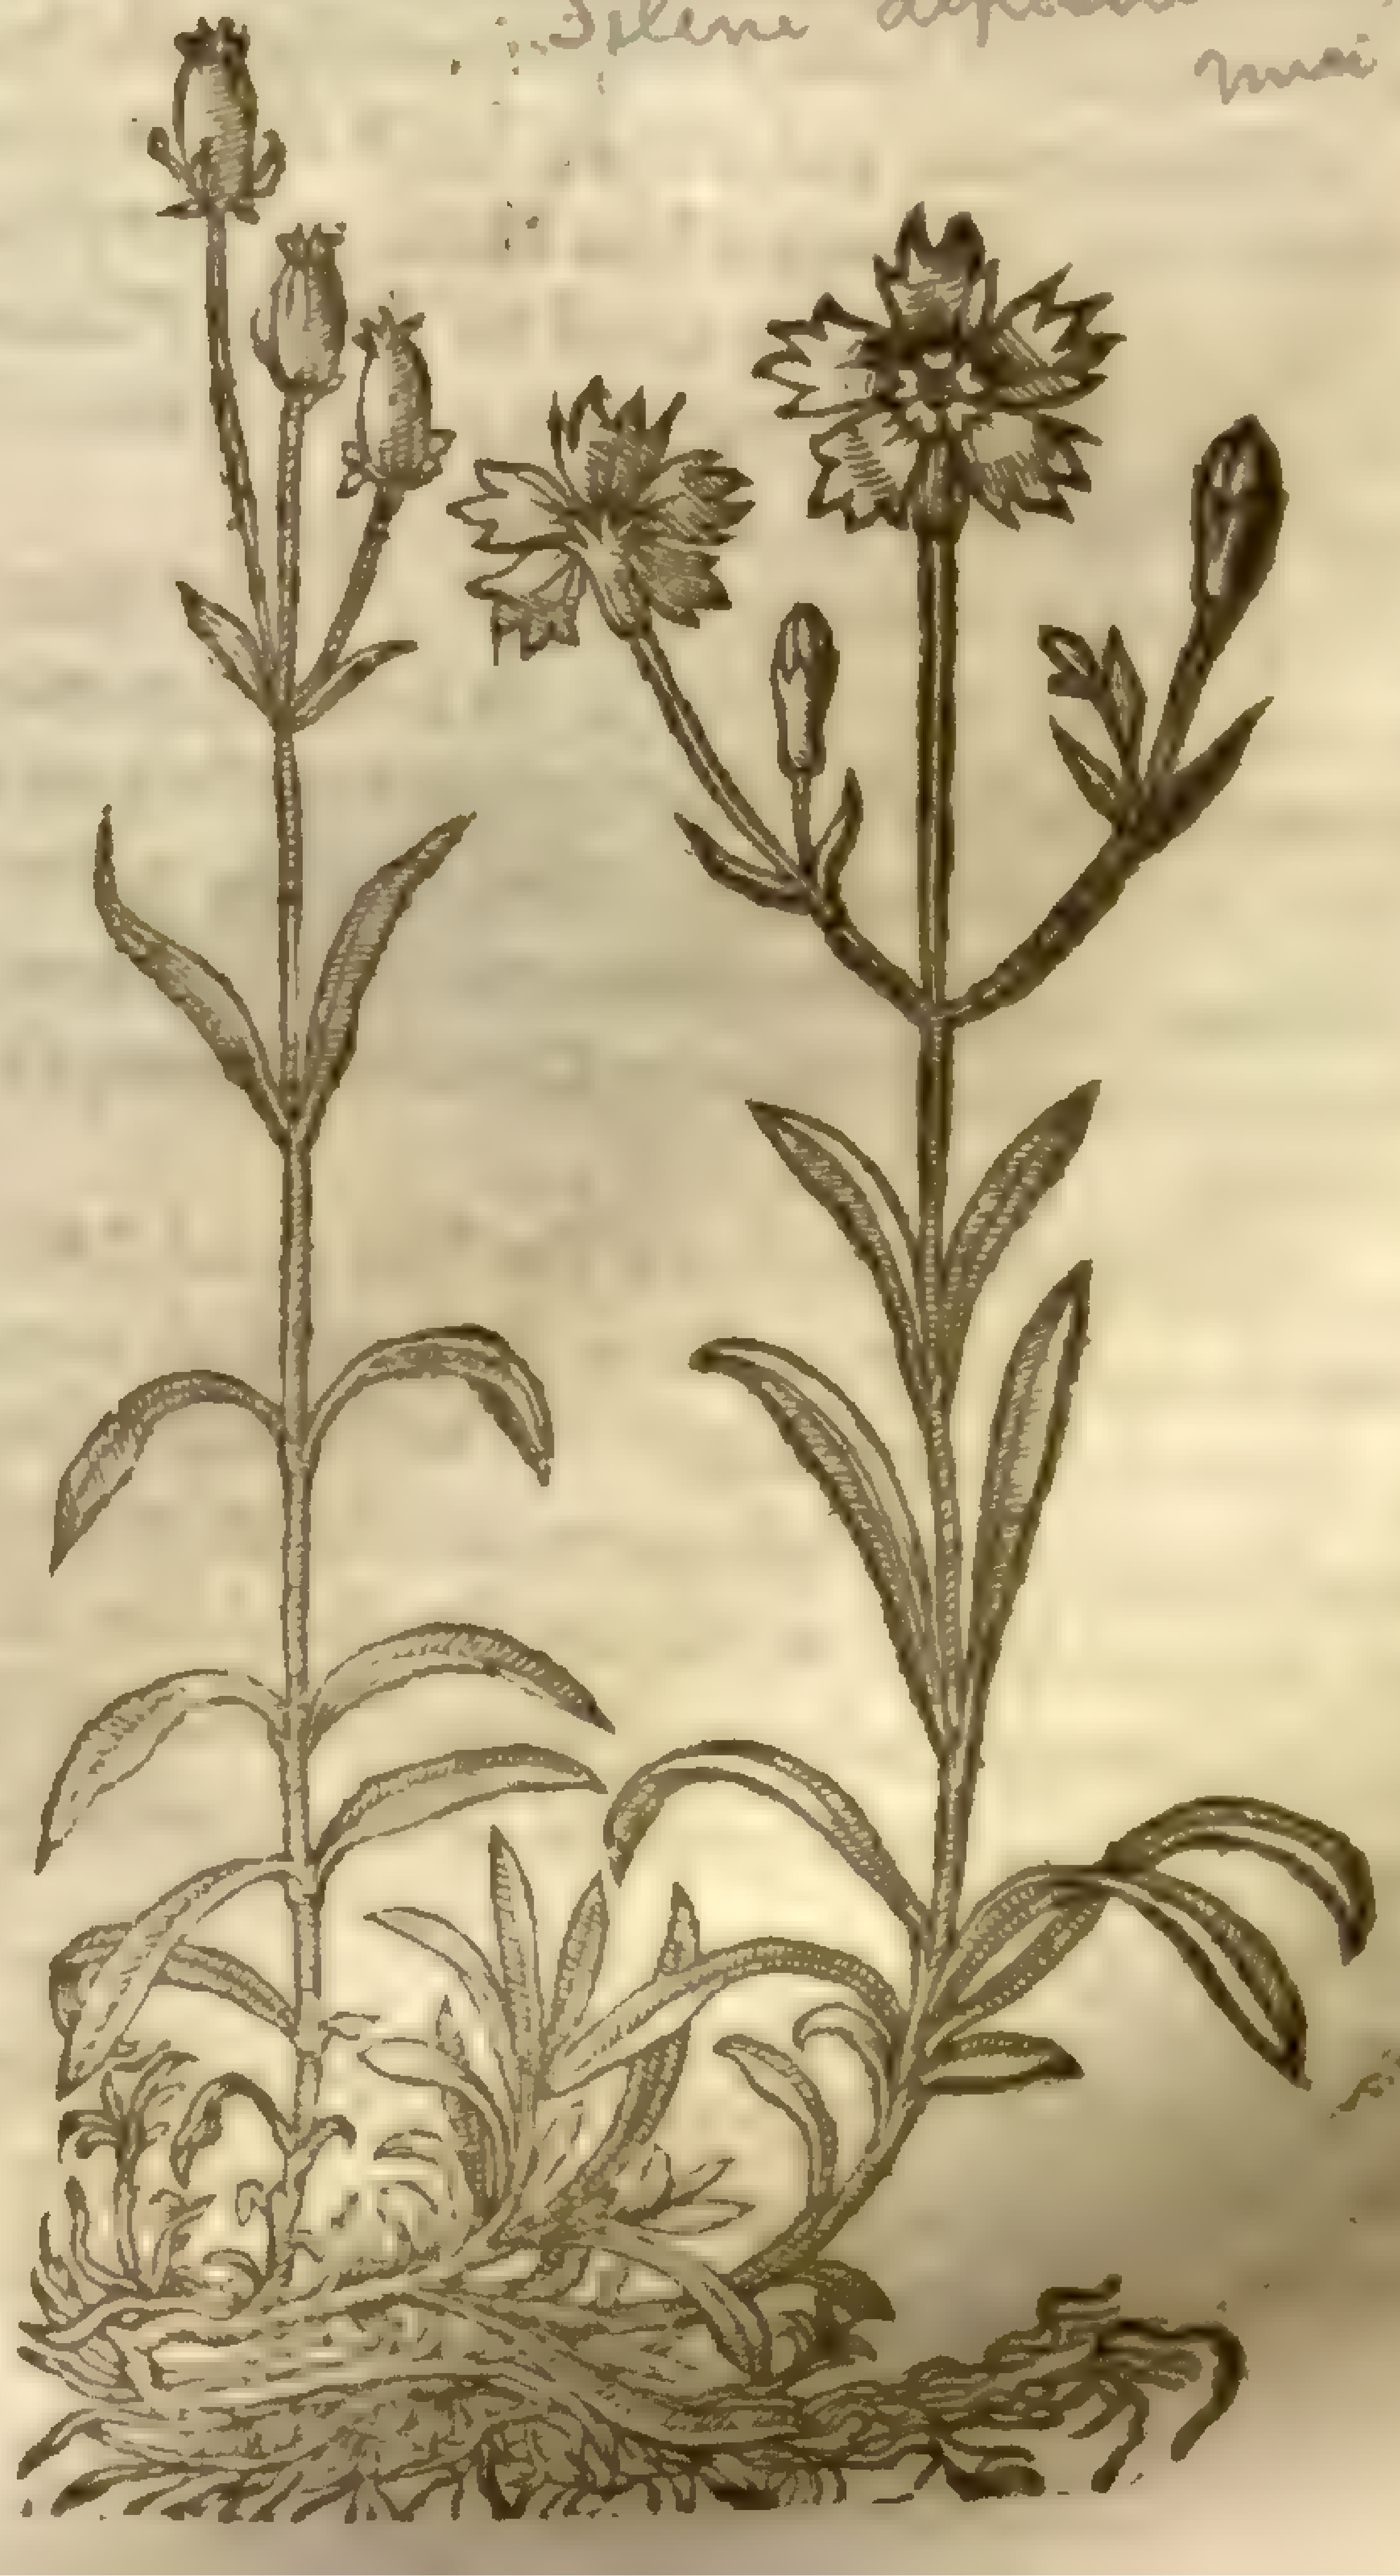


16 *Caryophyllus Holoſtius arvenſis.*
Broad leafed wilde Pinke.



‡ 17 *Caryophyl. humilis flor. caud. ameno.*
White Campion Pinke.

Silene alpestris
mai. diet



It growes naturall on diuers places of the Alpes. *Geſner* called it *Muſcus floridus*: *Pona, Ocimo* *Mnſcoſus*: and *Cluſius, Caryophyllus pumilio Alpinus* 9. ‡

9 This leafe-leſſe Pinke (as the Greeke word doth ſeeme to import) hath many ſmall ruſhy or benty leaues riſing immediately from a tough ruſhy root: among which riſe vp ſtalkes like vnto ruſhes, of a ſpan high, without any joynt at all, but ſmooth and plaine; on the top whereof groweth a ſmall floure of a blewiſh or sky colour, conſiſting of foure little leaues ſomewhat jagged in the edges, not vnlike thoſe of wilde flax. The whole plant is very bitter, and of a hot taſte.

10 The white mountaine Pinke hath a great thicke and wooddy root; from the which immediately riſe vp very many ſmall and narrow leaues, finer and leſſer than graſſe, not vnlike to the ſmalleſt ruſh: among which riſe vp little tender ſtalkes, joynted or kneed by certaine diſtances, ſet with the like leaues euen to the top by couples, one oppoſite againſt another: at the top whereof grow pretty ſweet ſmelling floures compoſed of fiue little white leaues. The ſeed is ſmall and blackiſh.

11 There is a wilde creeping Pinke which groweth in our paſtures neere about London, and in other places, but eſpecially in the great field next to Detford, by the path ſide as you go from Redriffe to Greenewich; which hath many ſmall tender leaues ſhorter than any of the other wilde Pinkes, ſet vpon little tender ſtalkes which lie flat vpon the ground, taking hold of the ſame in ſundry places, whereby it greatly encreaſeth: whereupon grow little reddiſh floures. The root is ſmall, tough, and long laſting.

12 This Virgin-like Pinke is like vnto the reſt of the Garden Pinkes in ſtalkes, leaues, and roots. The floures are of a bluſh colour, whereof it tooke his name, which ſheweth the difference from the other.

‡ This whoſe figure I giue you for that ſmall leaued one that was formerly in this place, hath ſlender ſtalkes ſome ſpanne high, ſet with two long narrow hard ſharpe pointed leaues at each joynt. The floures (which grow commonly but one on a ſtalke) conſiſt of fiue little ſnipt leaues of a light purple colour, rough and deeper coloured about their middles, with two little crooked threds or hornes: the ſeed is chaffie and blacke: the root long, and creeping: it floures in Aprill and May, and is the *Flos caryophylleus ſylueſtris* 1. of *Cluſius*. ‡

13 *Cluſius* mentions alſo another whoſe ſtalkes are ſome three inches high: the leaues broader, ſofter, and greener than the former: the floures alſo that grow vpon the top of the ſtalkes are larger than the former, and alſo conſiſt of fiue leaues of a deeper purple than the former, with longer haires finely intermixt with purple and white.

‡ 14 This from a hard wooddy root ſends vp ſuch ſtalkes as the former, which are ſet at the joynts with ſhort narrower and darker greene leaues: the floures are white, ſweet-ſmelling, conſiſting of fiue much diuided leaues, hauing two threds or hornes in their middle. It floures in May, and it is the *Caryophyllus ſylueſtris quintus* of *Cluſius*. ‡

15 This wilde ſea Pinke hath diuers ſmall tender weake branches trailing vpon the ground, whereupon are ſet leaues like thoſe of our ſmalleſt garden Pinke, but of an old hoary colour tending to whiteneſſe, as are moſt of the ſea Plants. The floures grow at the top of the ſtalkes, in ſhape like thoſe of Stitch-woort, and of a whitiſh colour. Neither the ſeeds nor ſeed-veſſels haue I as yet obſerued: the root is tough and ſingle.

16 There is another of theſe wilde Pinkes which is found growing in ploughed fields, yet in ſuch as are neere vnto the ſea: it hath very many leaues ſpread vpon the ground of a freſh green colour; amongſt which riſe vp tender ſtalkes of the height of a foot, ſet with the like leaues by couples at certaine diſtances. The floures grow at the top many together, in manner of the Sweet-William, of a white or ſometimes a light red colour. The root is ſmall, tough and long laſting.

‡ This is a kinde of *Gramen Leucanthemum*, or *Holoſteum Ruellij*, deſcribed in the 38. Chapter of the firſt booke.

17 *Cluſius* makes this a *Lychnis*: and *Lobel* (whom I here follow) a Pinke, calling it *Caryophyllus minimus humilis alter exoticus flore candido amæno*. This from creeping roots ſendeth vp euery yeare many branches ſome handfull and better high, ſet with two long narrow greene leaues at each joynt: the floures which grow on the tops of the branches are of a pleaſing white colour, compoſed of fiue jagged leaues without ſmell. After the floures are gone there ſucceed round blunt pointed veſſels, containing a ſmall blackiſh flat ſeed like to that of the other Pinks. This hath a viſcous or clammy juyce like as that of the *Muſcipula's* or Catch-flies. *Cluſius* makes this his *Lychnis ſylueſtris decima*. ‡

¶ *The Place.*

Theſe kindes of Pinkes do grow for the moſt part in gardens, and likewiſe many other ſorts, the which were ouer long to write of particulary. Thoſe that be wilde do grow vpon mountaines, ſtony rockes, and deſert places. The reſt are ſpecified in their deſcriptions.

¶ *The*

¶ *The Time.*

They floure with the Cloue Gillofloure, and often after.

¶ *The Names.*

The Pinke is called of *Pliny* and *Turner*, *Cantabrica* and *Statice*: of *Fuchſius* and *Dodonæus*, *Vetonica altera*, and *Vetonica altilis*: of *Lobelius* and *Fuchſius*, *Superba*: in French, *Gyrofflees*, *Oeilletz*, and *Violettes herbues*: in Italian, *Garofoli*, and *Garoni*: in Spaniſh, *Clauis*: in Engliſh, Pinkes and ſmall Honeſties.

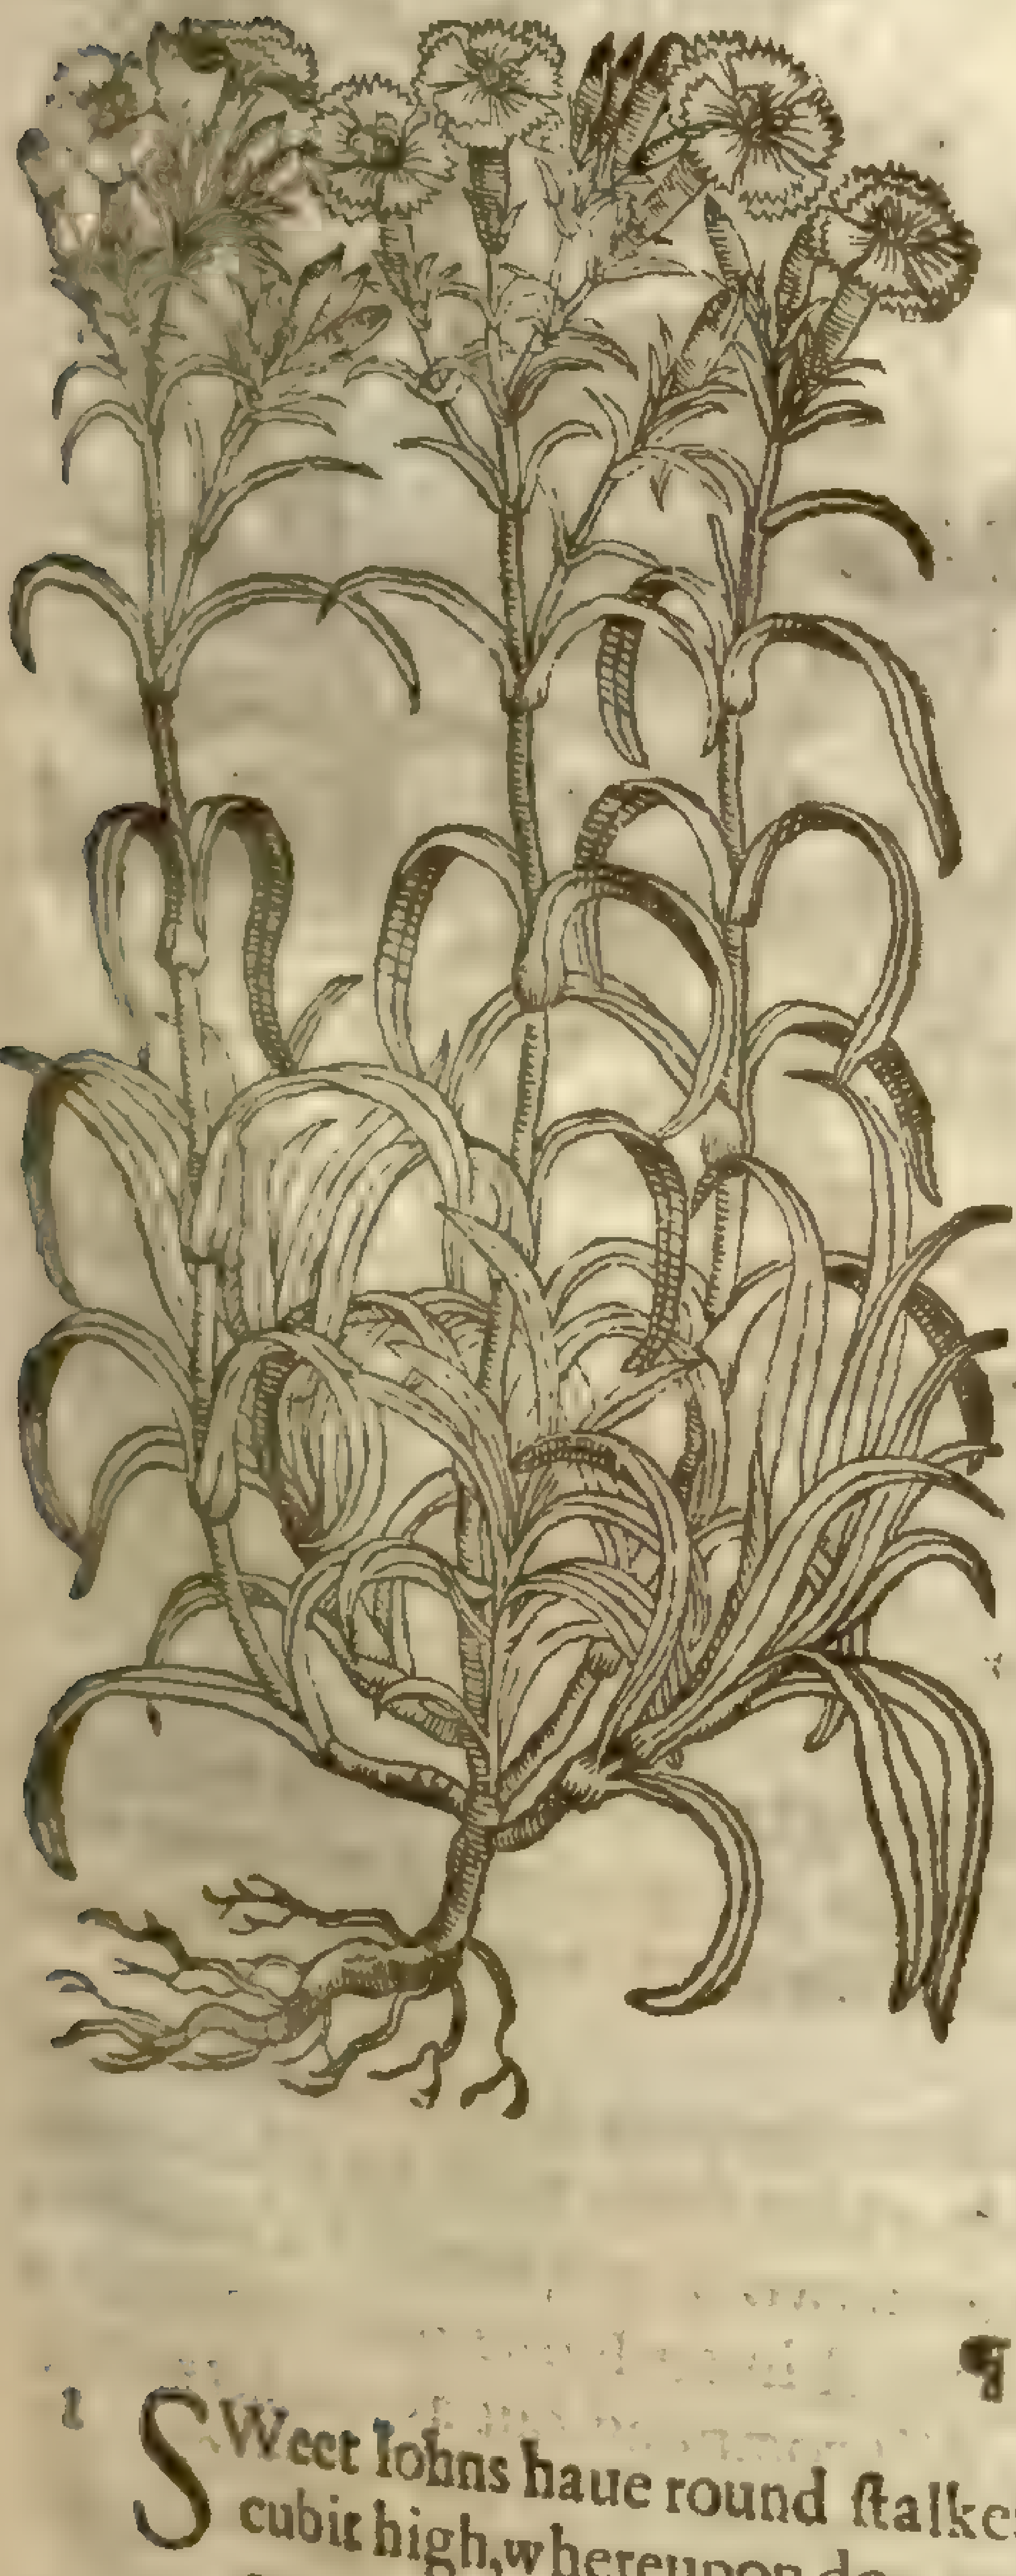
¶ *The Temperature.*

The temperature of the Pinkes is referred to the Cloue Gillofloures.

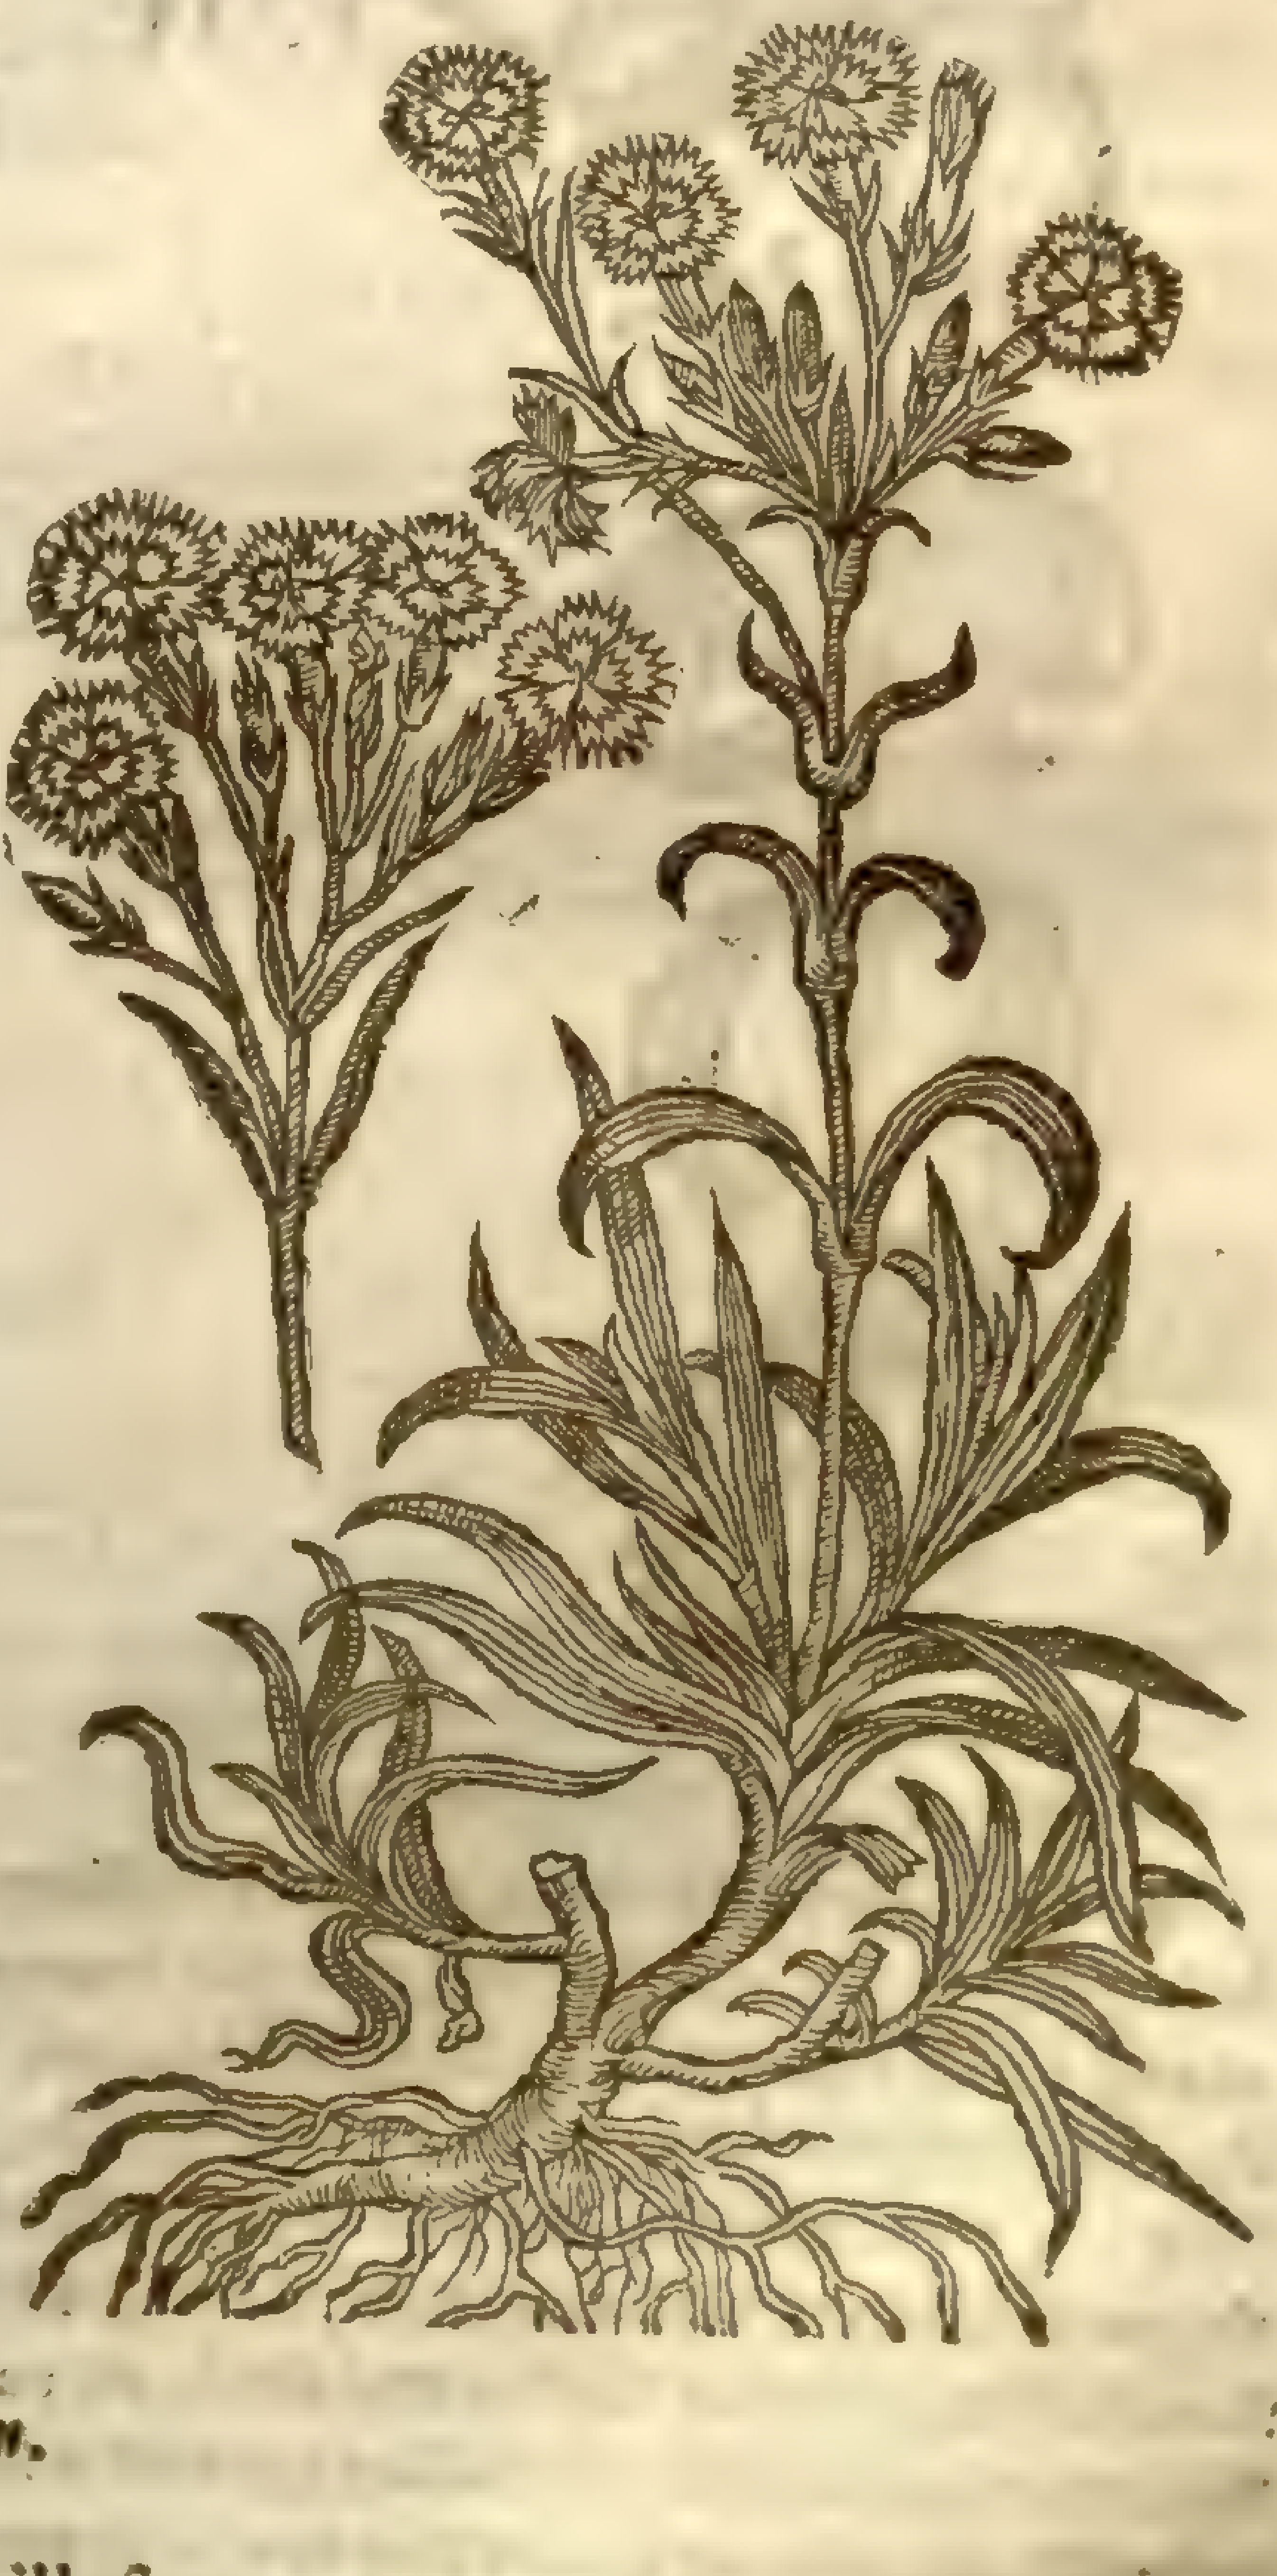
¶ *The Vertues.*

Theſe are not vſed in Phyſicke, but eſteemed for their vſe in Garlands and Noſegaies. They are good to be put into Vinegre, to giue it a pleaſant taſte and gallant colour, as *Ruellius* writeth. *Fuchſius* ſaith, that the roots are commended againſt the infection of the plague; and that the iuyce thereof is profitable to waſte away the ſtone, and to driue it forth: and likewiſe to cure them that haue the falling ſickeneſſe.

CHAP. 184. *Of Sweet Saint Iohns and Sweet Williams.*



1 *Armeria alba.*
White Iohns.



2 *Armeria alba & rubra multiplex.*
Double white and red Iohns.

¶ *The Deſcription.*

1 Sweet Iohns haue round ſtalkes as haue the Gillofloures, (whereof they are a kinde) a cubit high, whereupon doe grow long leaues broader than thoſe of the Gillofloure, of a greene graſſie colour: the floures grow at the top of the ſtalkes, very like vnto Pinkes, of a perfect white colour.

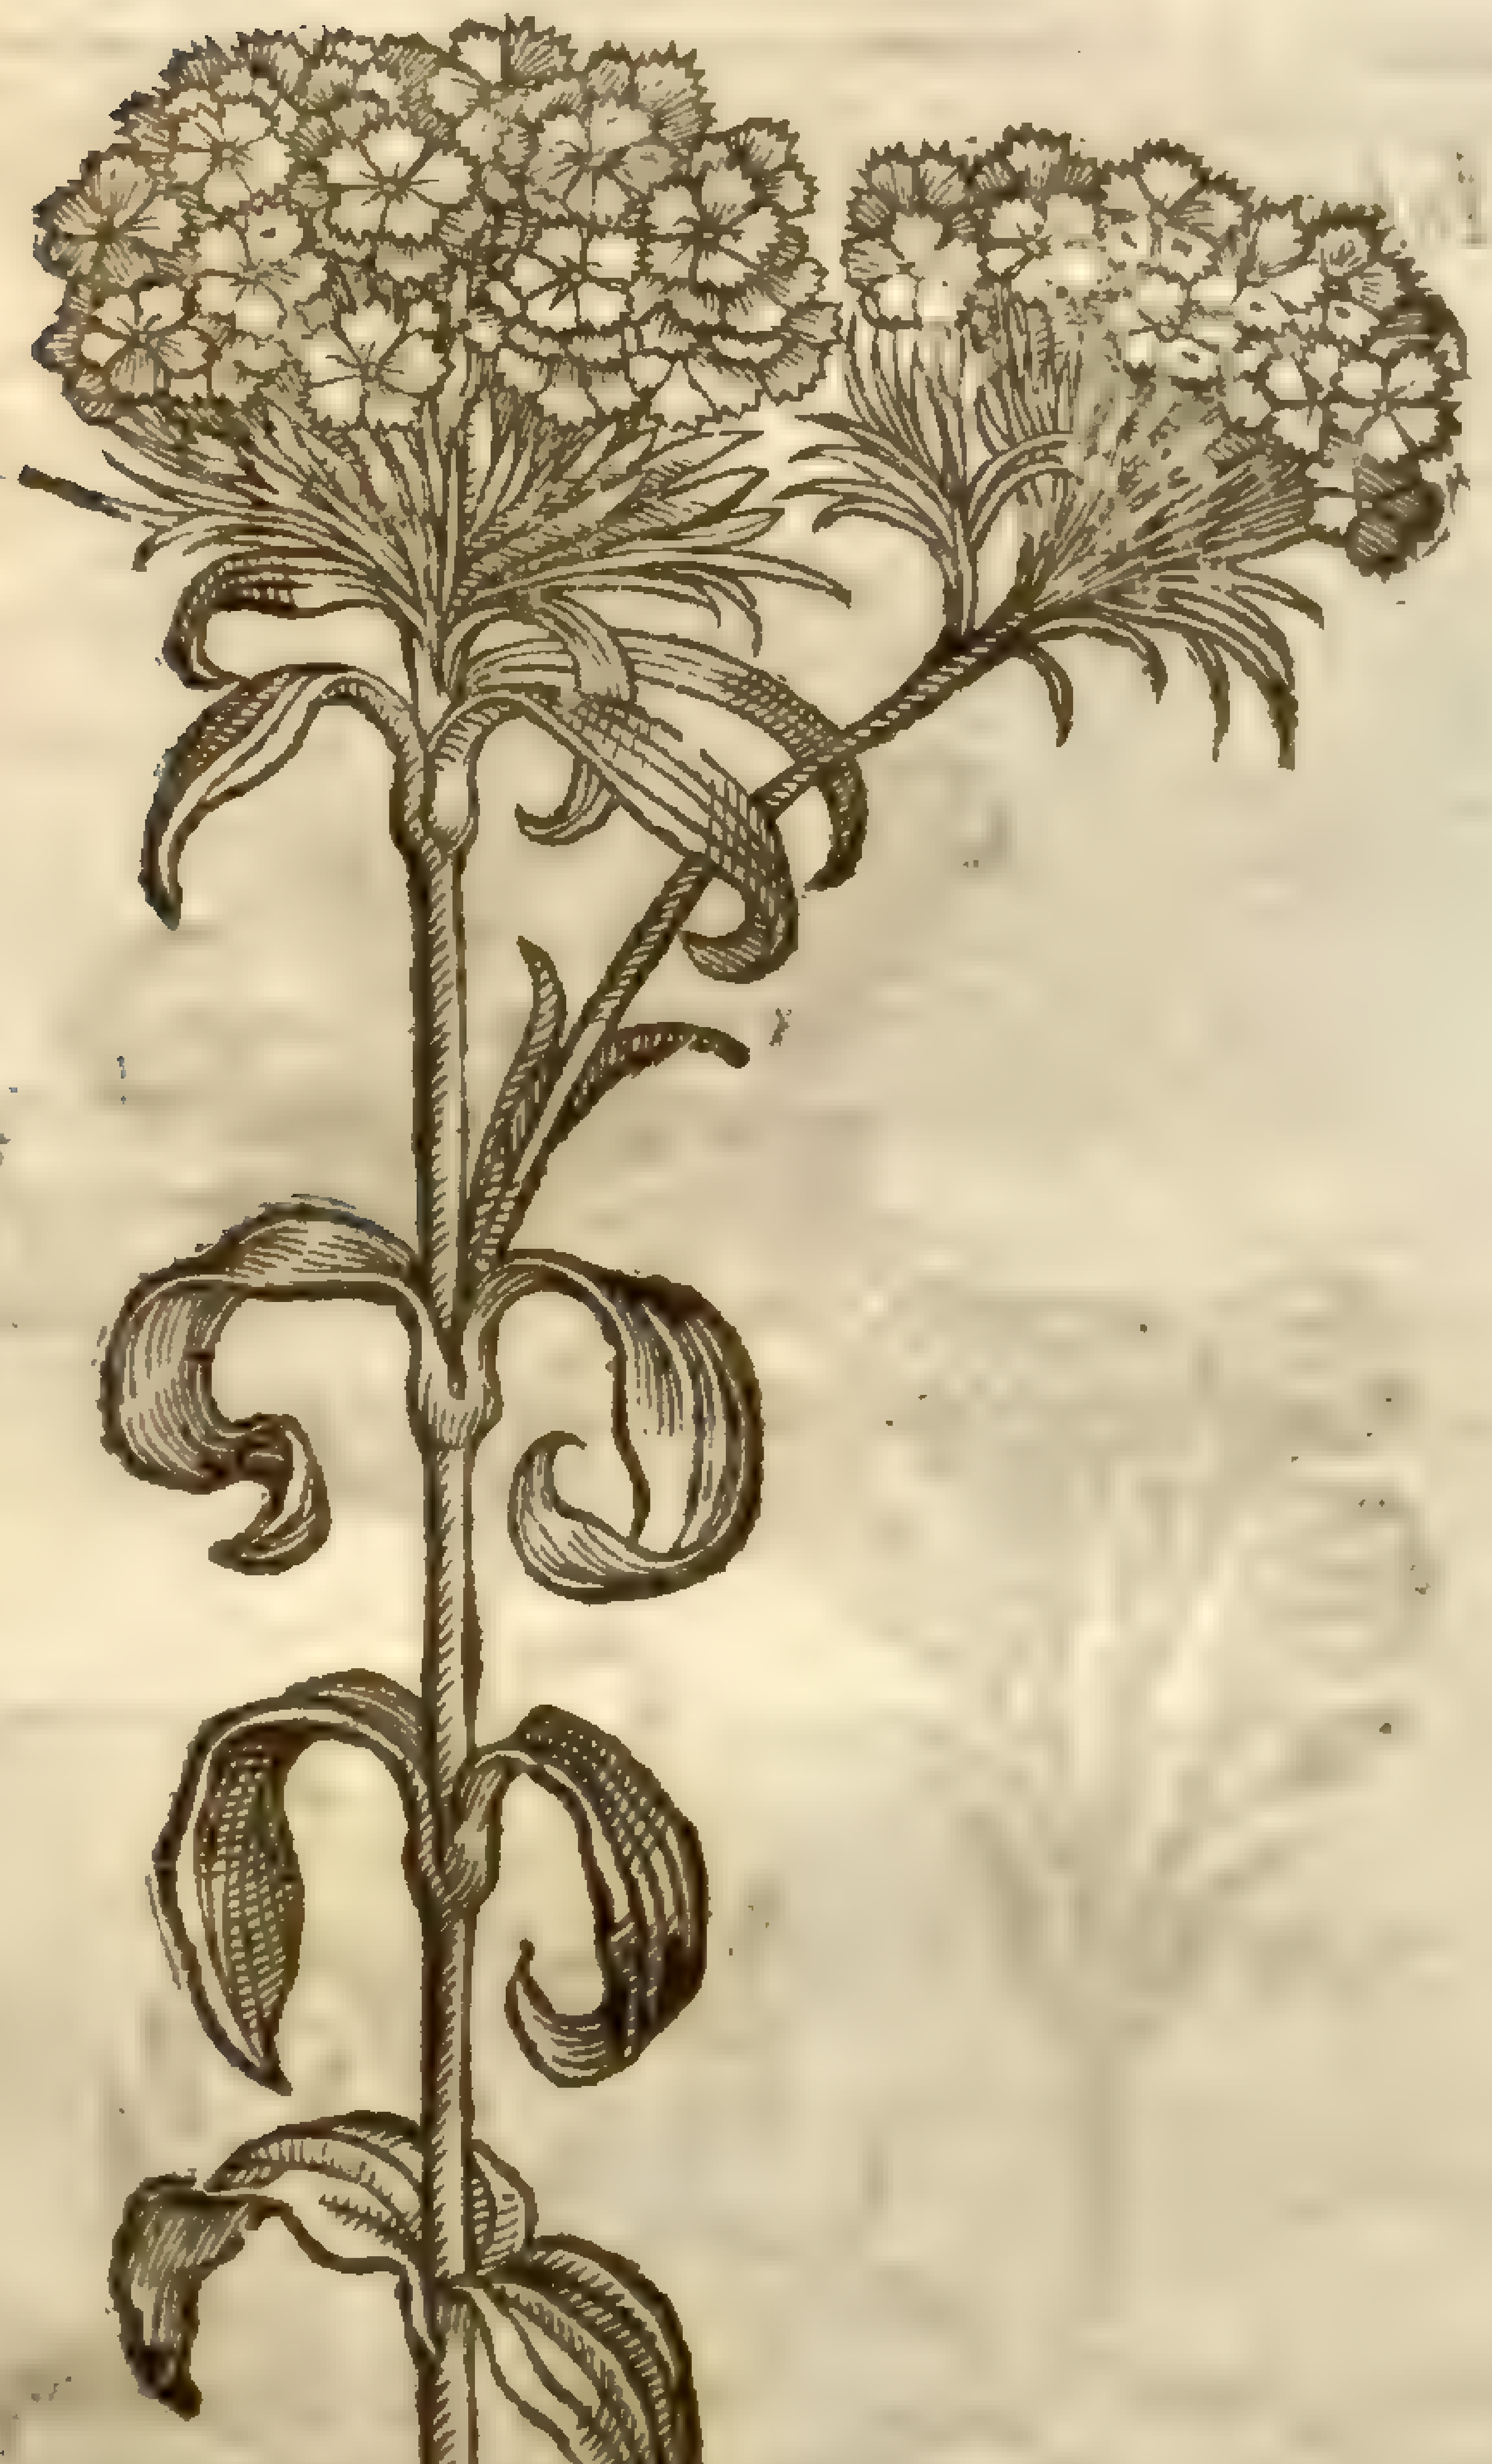
2 The ſecond differeth not from the other but in that, that this plant hath red floures, and the other white.

We haue in our London Gardens a kinde hereof bearing moſt fine and pleaſant white floures, ſpotted very confuſedly with reddiſh ſpots, which ſetteth forth the beautie thereof; and hath bin taken of ſome (but not rightly) to be the plant called of the later Writers *Superba Auſtriaca*, or the Pride of Auſtria. ‡ It is now commonly in moſt places called London-Pride. ‡

† We haue likewiſe of the ſame kinde bringing forth moſt double floures, and theſe either very white, or elſe of a deepe purple colour.

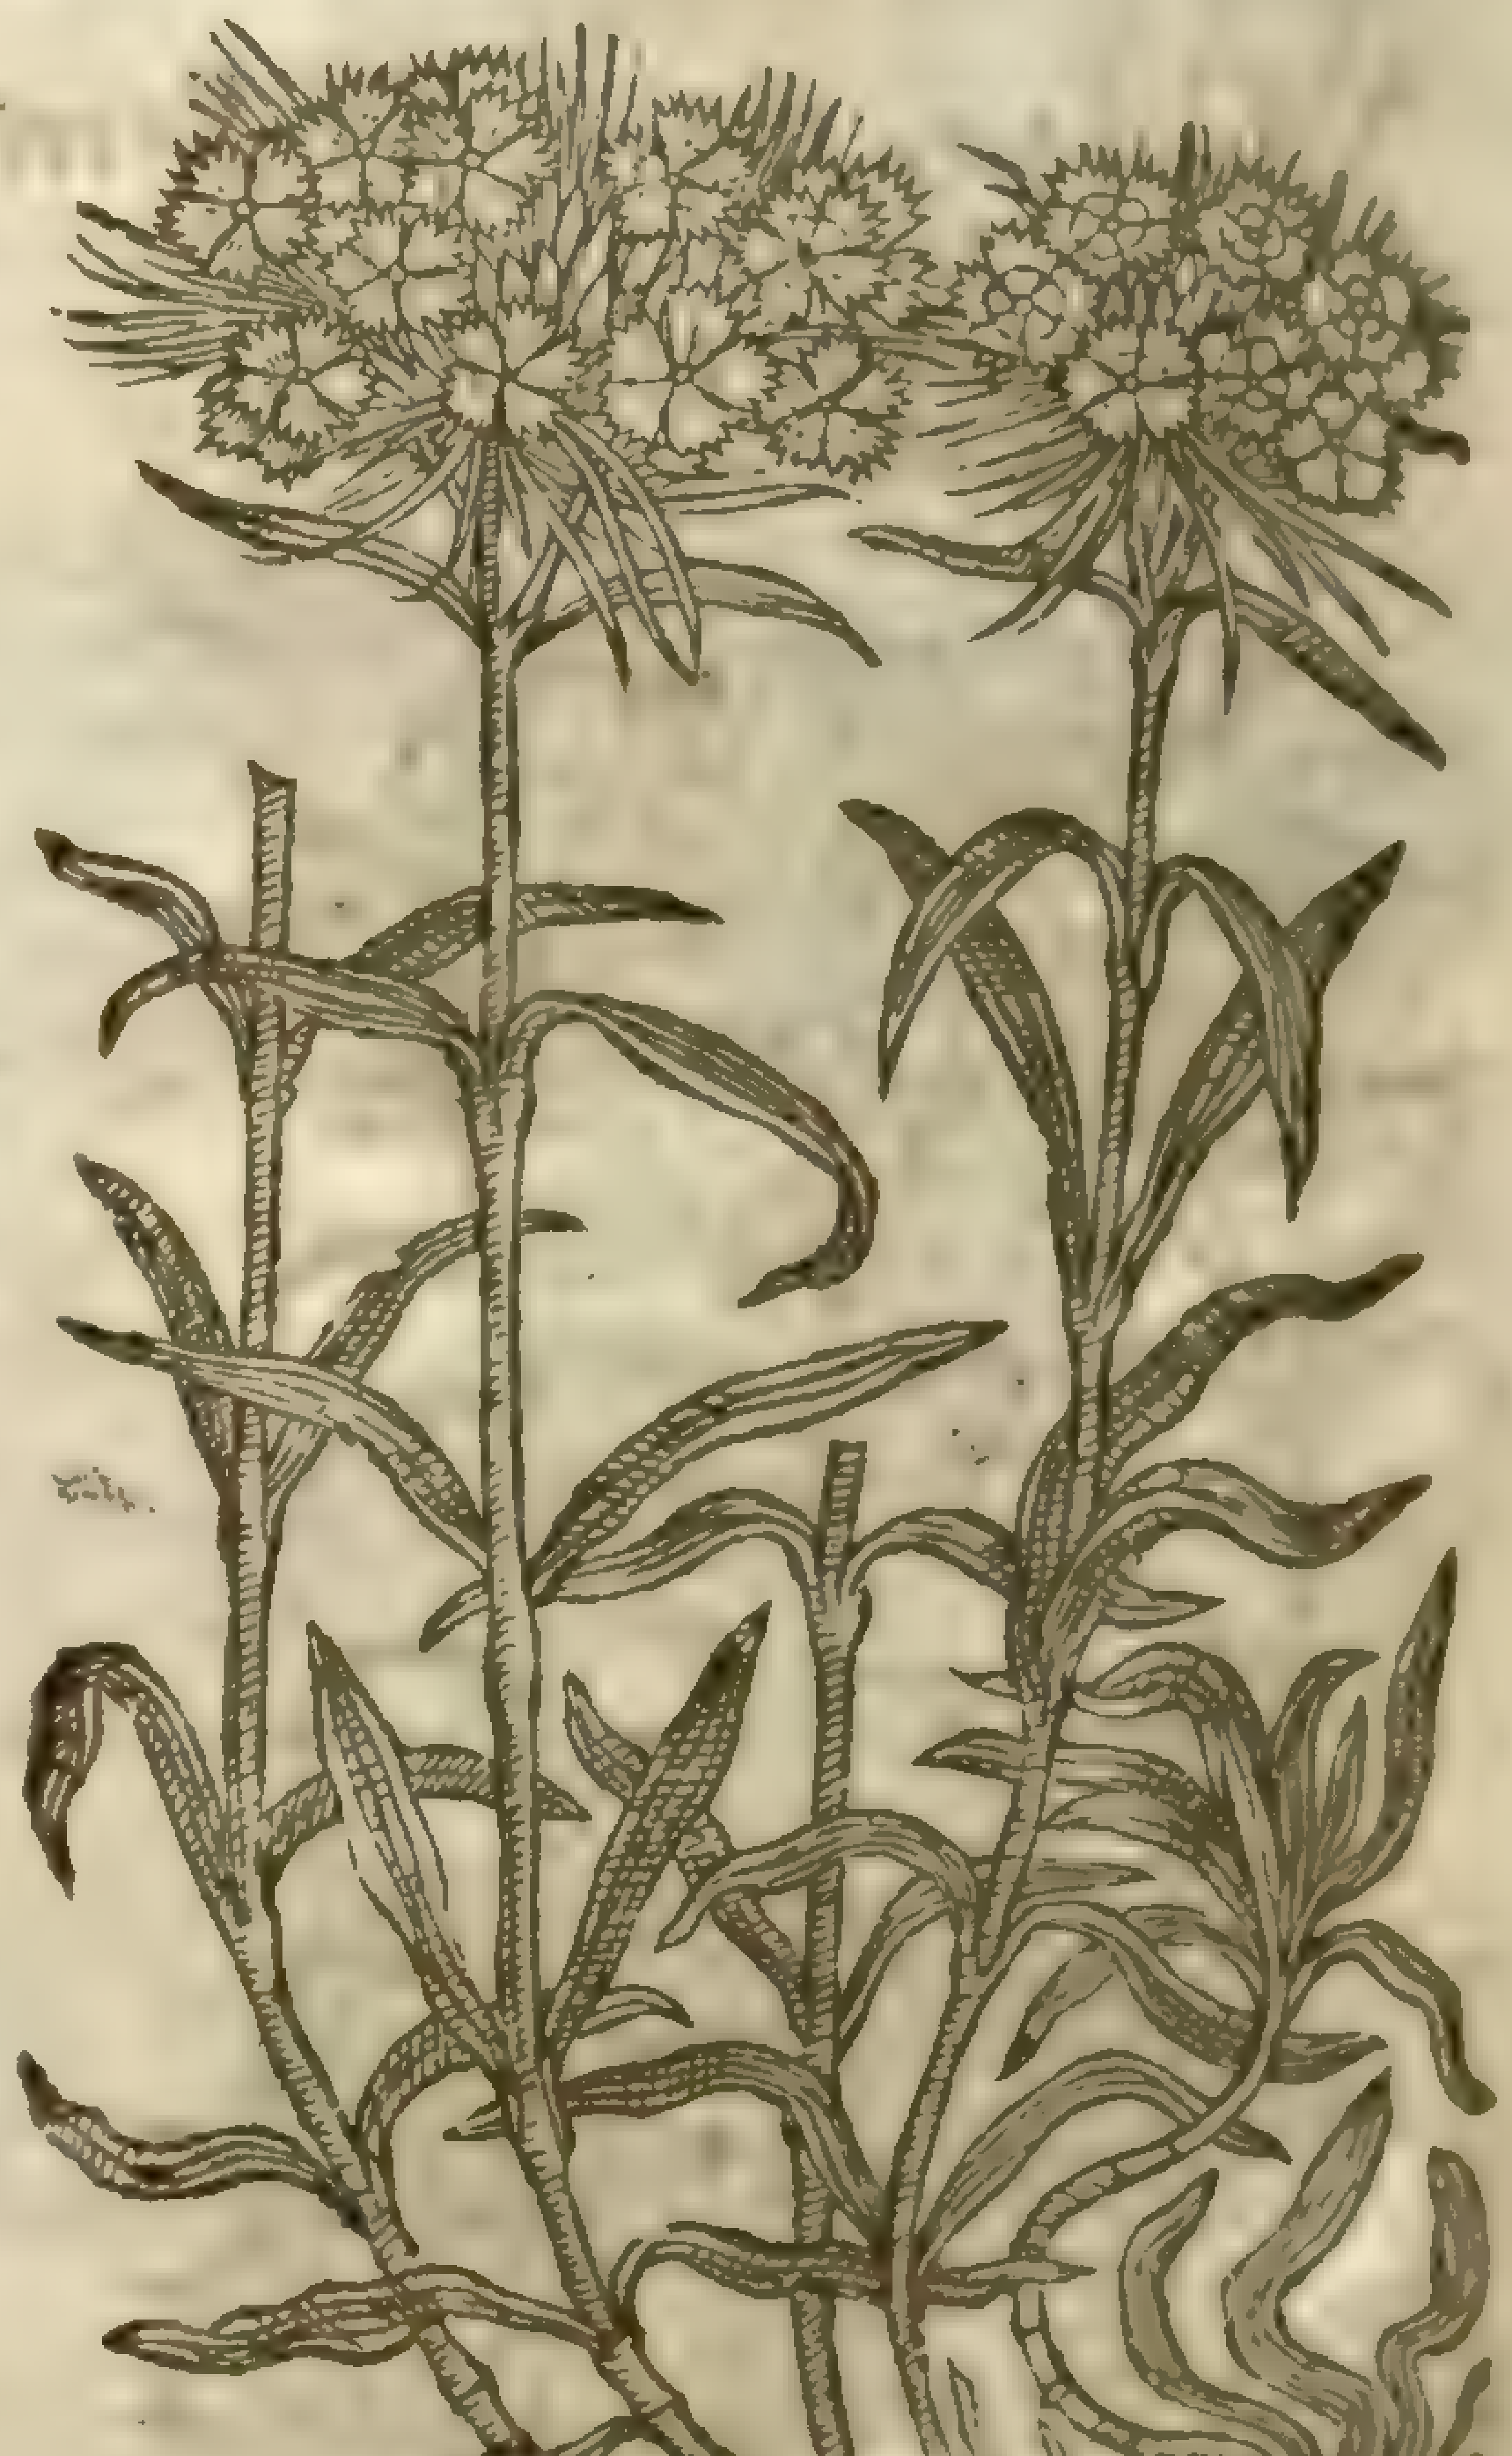
3 The great Sweet-William hath round joynted ſtalkes thicke and fat, ſomewhat reddiſh about the lower joynts, a cubit high, with long broad and ribbed leaues like as thoſe of the Plantaine, of a greene graſſie colour. The floures at the top of the ſtalkes are very like to the ſmall Pinkes, many joyned together in one tuft or ſpoky vmbell, of a deepe red colour: the root is thicke and wooddy.

3 *Armeria rubra latifolia.*
Broad leaued Sweet-William.



Dianthus barbatus, L.
[illegible]

4 *Armeria ſuave rubens.*
Narrow leaued Sweet-Williams.



Dianthus barbatus, L. β.
[illegible]

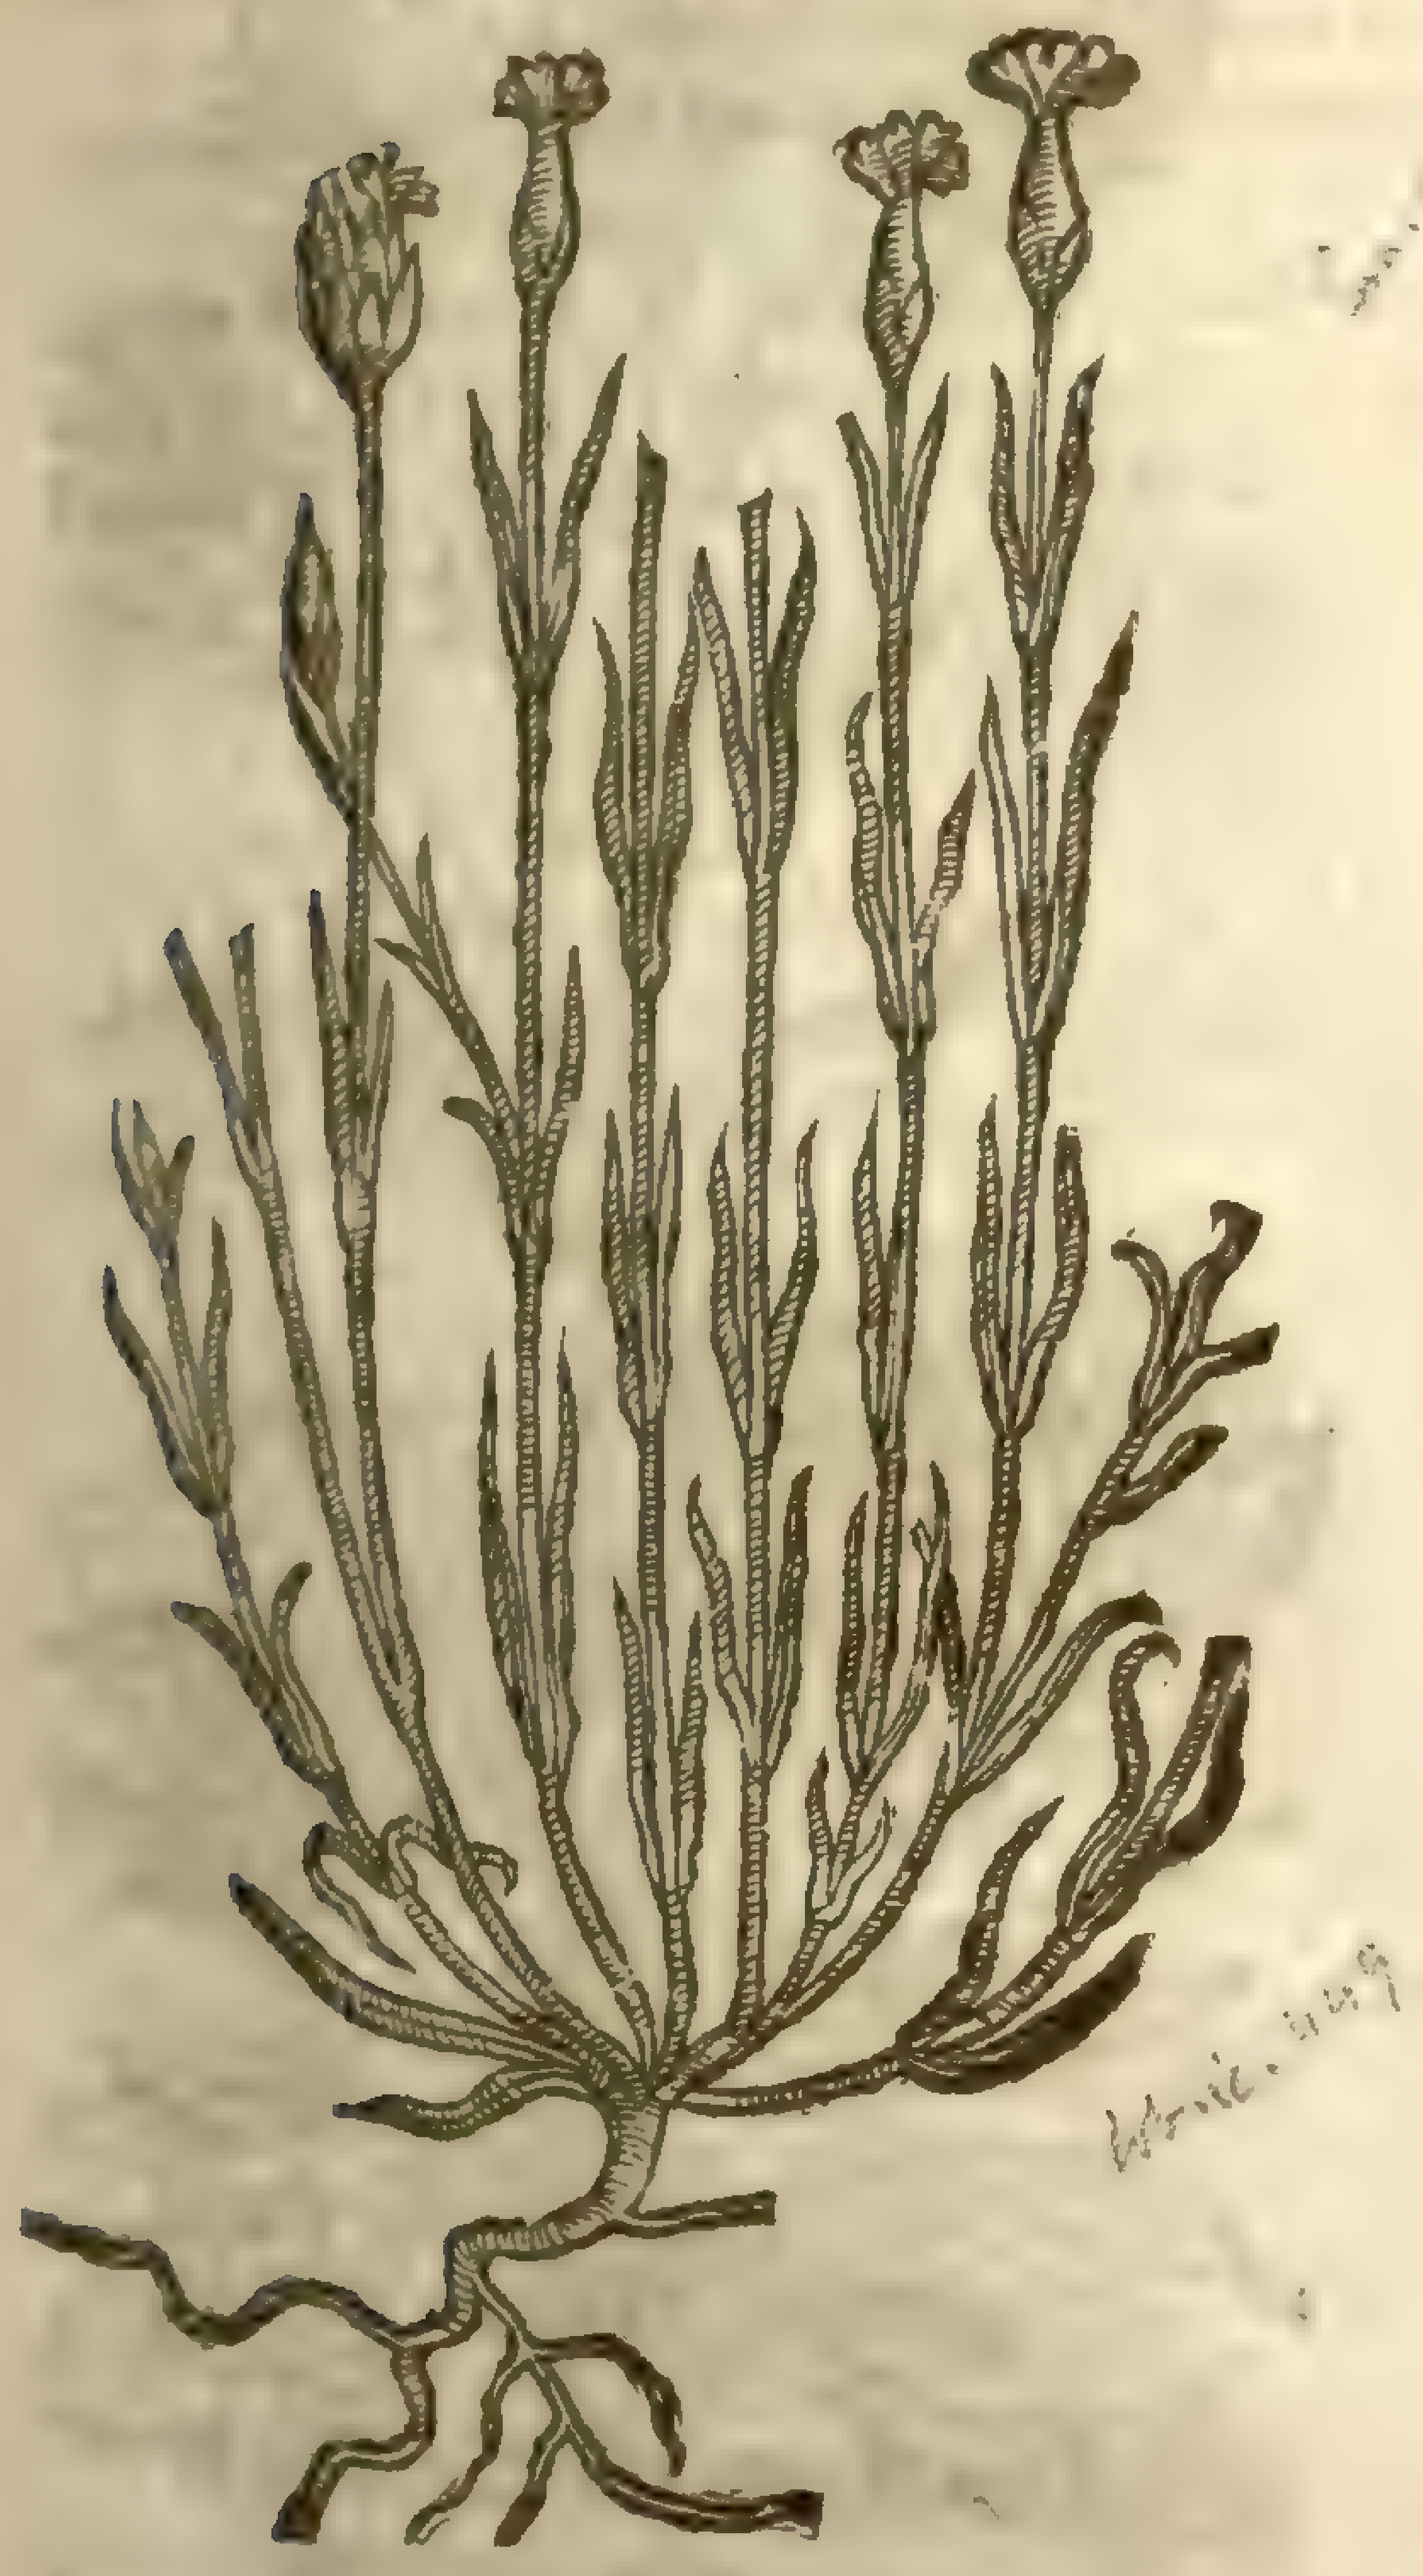
4 The narrow leaued Sweet-William groweth vp to the height of two cubits, very well reſembling the former, but leſſer, and the leaues narrower: the floures are of a bright red colour, with many ſmall ſharpe pointed graſſie leaues ſtanding vp among them, wherein eſpecially conſiſteth the difference.

‡ 5 this little fruitfull Pinke (whoſe figure our Author formerly gaue in the firſt place of the next chapter ſaue one) hath a ſmall whitiſh wooddy root, which ſends forth little ſtalkes ſome handfull and better high; and theſe at each joynt are ſet with two thinne narrow little leaues: at the top of each of theſe ſtalkes growes a ſingle skinny ſmooth ſhining huske, out of which (as in other Pinkes) growes not one onely floure, but many, one ſtill comming out as another withers; ſo that oft times out of one head come ſeuen, eight, or nine floures one after another, which as they fade leaue behinde them a little pod containing ſmall blacke flattiſh ſeed. The floure is of a light red, and very ſmall, ſtanding with the head ſomewhat far out of the hoſe or huske. ‡

¶ *The Place.*

Theſe plants are kept and maintained in gardens more for to pleaſe the eye, than either the noſe or belly.

‡ 5 *Armeria prolifera, Lob.*
Childing ſweet Williams.



¶ *The Time.*

They flouriſh and bring forth their floures in Aprill and May, ſomewhat before the Gilloſloures, and after beare their floures the whole Summer.

¶ *The Names.*

The ſweet Iohn, and alſo the ſweet William are both comprehended vnder one title, that is to ſay, *Armeria*: of ſome, *Superba*, and *Caryophyllus ſylueſtris*: of ſome Herbariſts, *Vetonica agreſtis*, or *Sylueſtris*: of ſome, *Herba tunica*: but it doth no more agree herewith than the Cloue Gillo-floure doth with *Vetonica altera*, or *Polemonium*: in French, *Armories*: hereupon *Ruellius* nameth them *Armerij Flores*: in Dutch, **Keykens**: as though you ſhould ſay, a bundle or cluſter, for in their vulgar tongue, bundles of floures or noſegaies they call **Keykens**: doubtleſſe they are wild kindes of Gilloſloures: In Engliſh the firſt two are called Sweet Iohns; and the two laſt, Sweet Williams, Tolmeiners, and London Tufts.

¶ *The Temperature and Vertues.*

Theſe plants are not vſed either in meat or medicine, but eſteemed for their beauty to decke vp gardens, the boſomes of the beautifull, garlands and crownes for pleaſure.

CHAP. 185. *Of Crow floures, or Wilde Williams.*

¶ *The Deſcription.*

1 BEſides theſe kindes of Pinkes before deſcribed, there is a certaine other kinde, either of the Gilloſloures or elſe of the Sweet Williams, altogether and euery where wilde, which of ſome hath beene inſerted amongſt the wilde Campions; of others taken to be the true *Flos Cuculi*. Notwithſtanding I am not of any of their mindes, but doe hold it for neither, but rather a degenerate kinde of wilde Gilloſloure. The Cuckow floure I haue comprehended vnder the title of *Siſimbrium* Engliſhed, Ladies ſmockes; which plant hath been generally taken for *Flos Cuculi*. It hath ſtalks of a ſpan or a foot high, whereupon the leaues do ſtand by couples out of euery joynt; they are ſmall and bluntly pointed, very rough and hairy. The floures are placed on the tops of the ſtalkes, many in one tuft, finely and curiouſly ſnipt in the edges, leſſer than thoſe of Gilloſloures, very well reſembling the Sweet William (whereof no doubt it is a kinde) of a light red or skarlet colour.

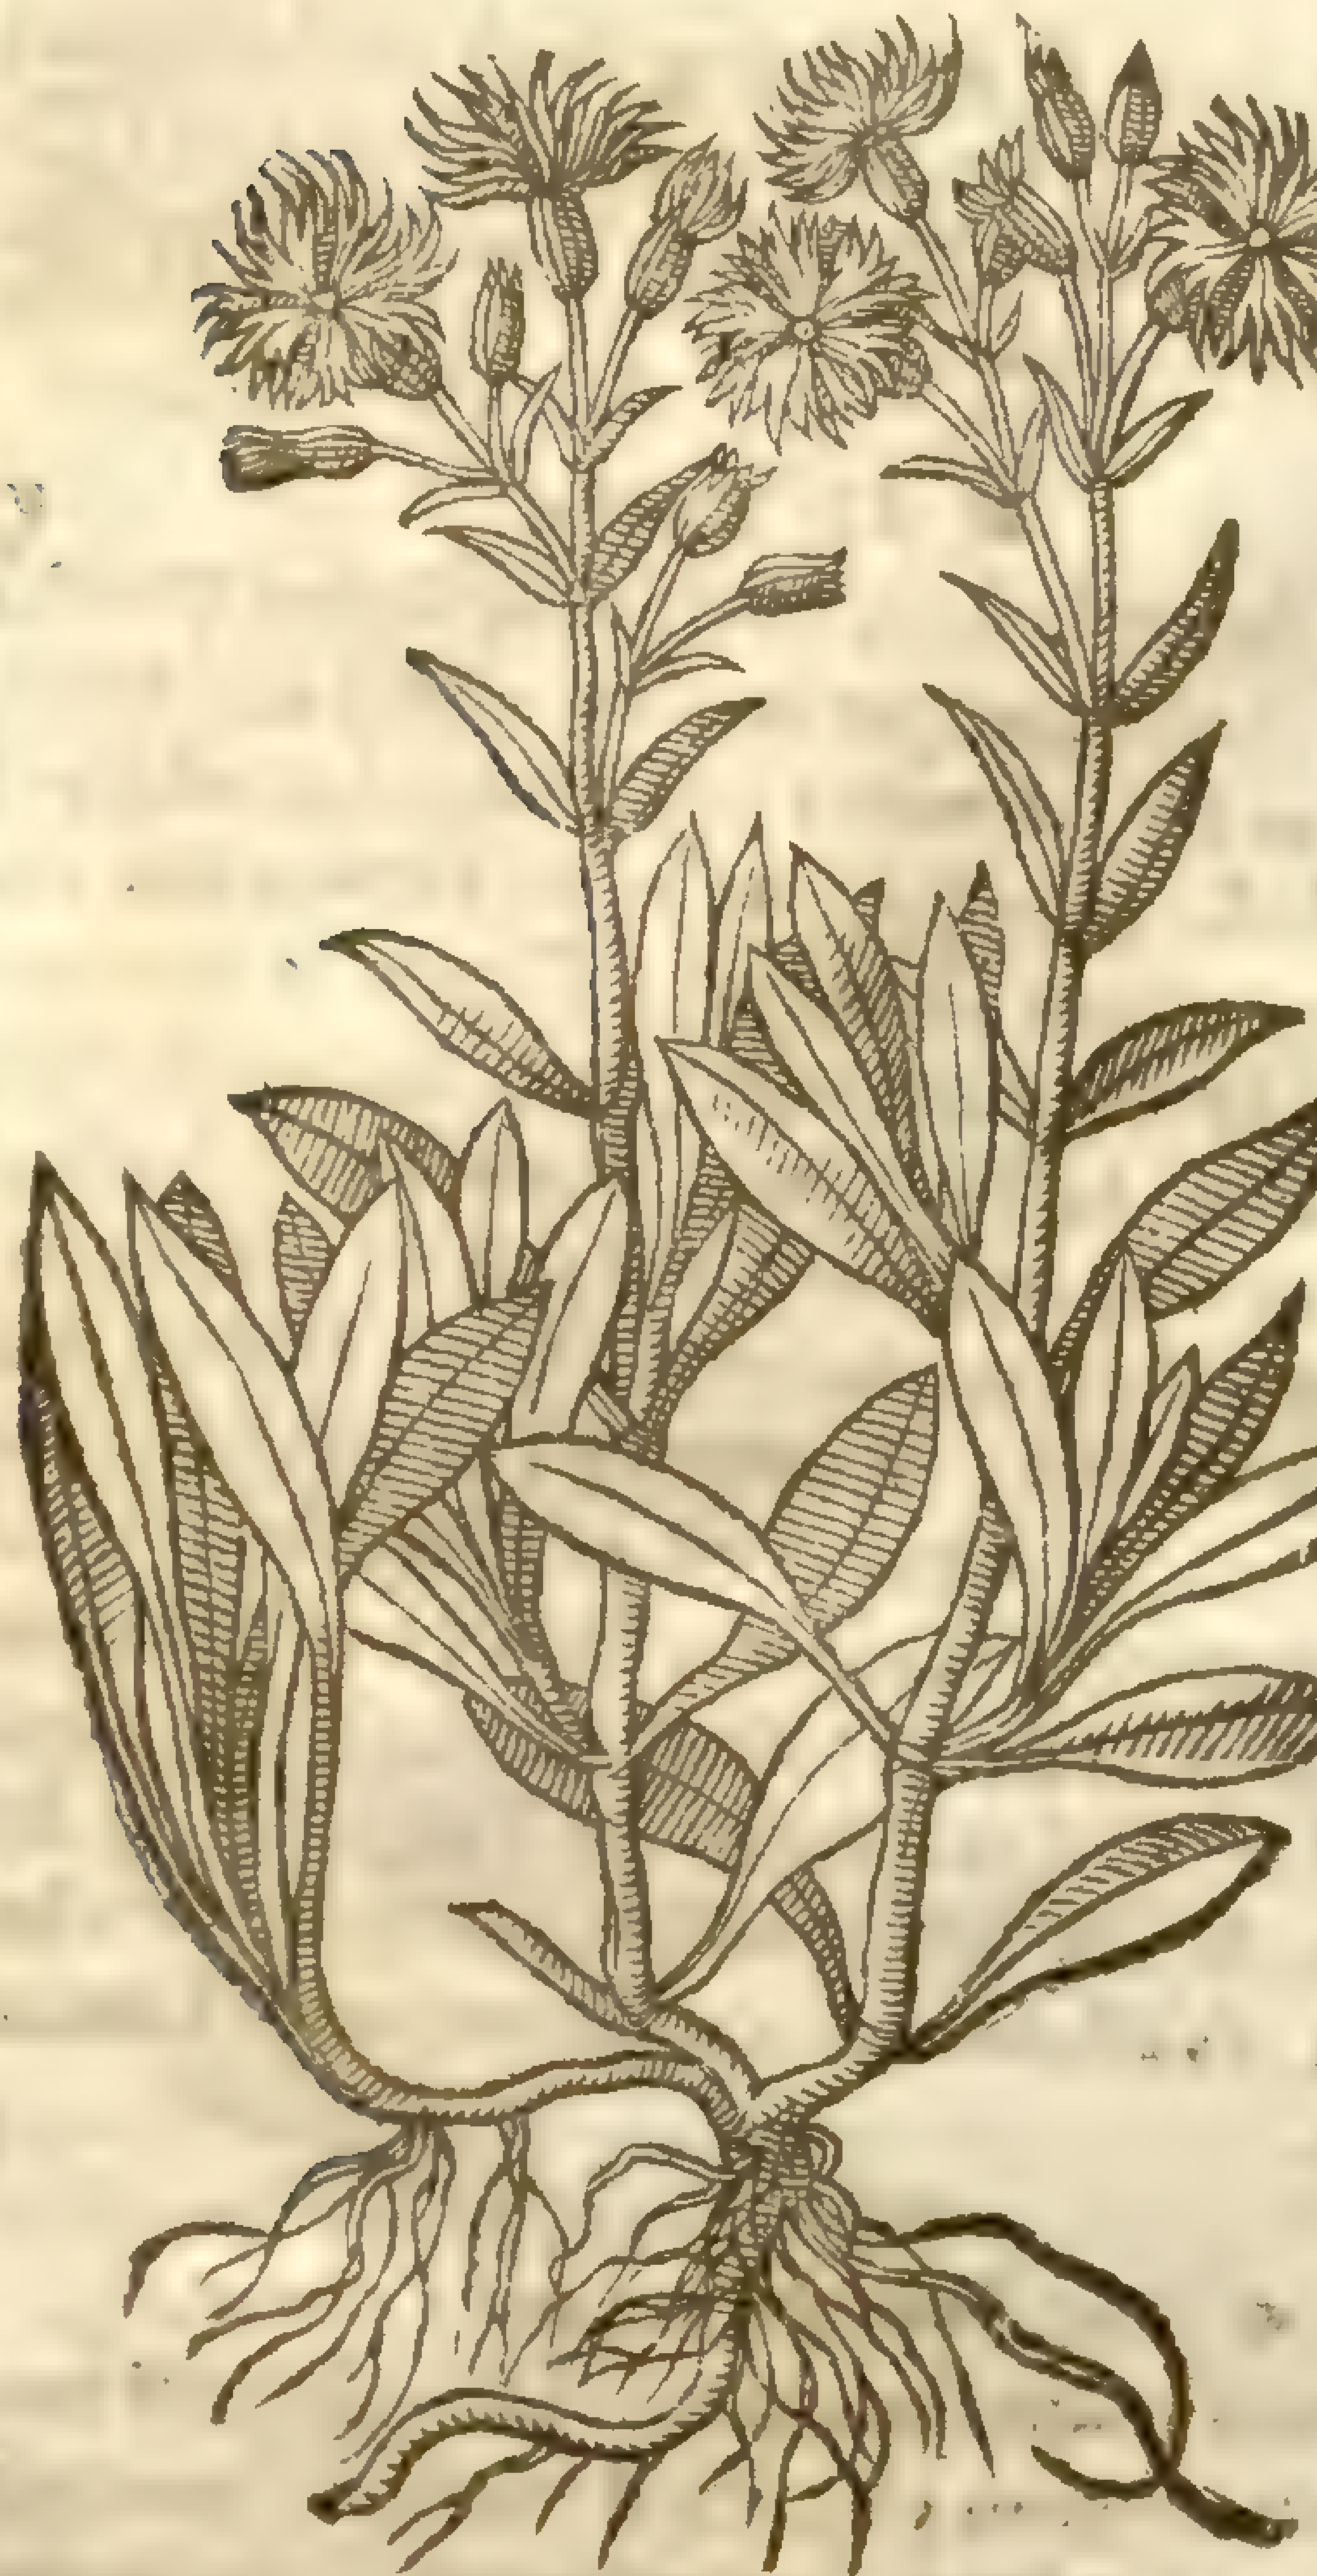
2 This female Crow-floure differeth not from the male, ſauing that this plant is leſſer, and the floures more finely jagged like the feathered Pinke, whereof it is a kinde.

3 Of this Crow-floure wee haue in our Gardens one that doth not differ from the former of the field, ſauing that the plant of the garden hath many faire red double floures, and thoſe of the field ſingle.

¶ *The Place.*

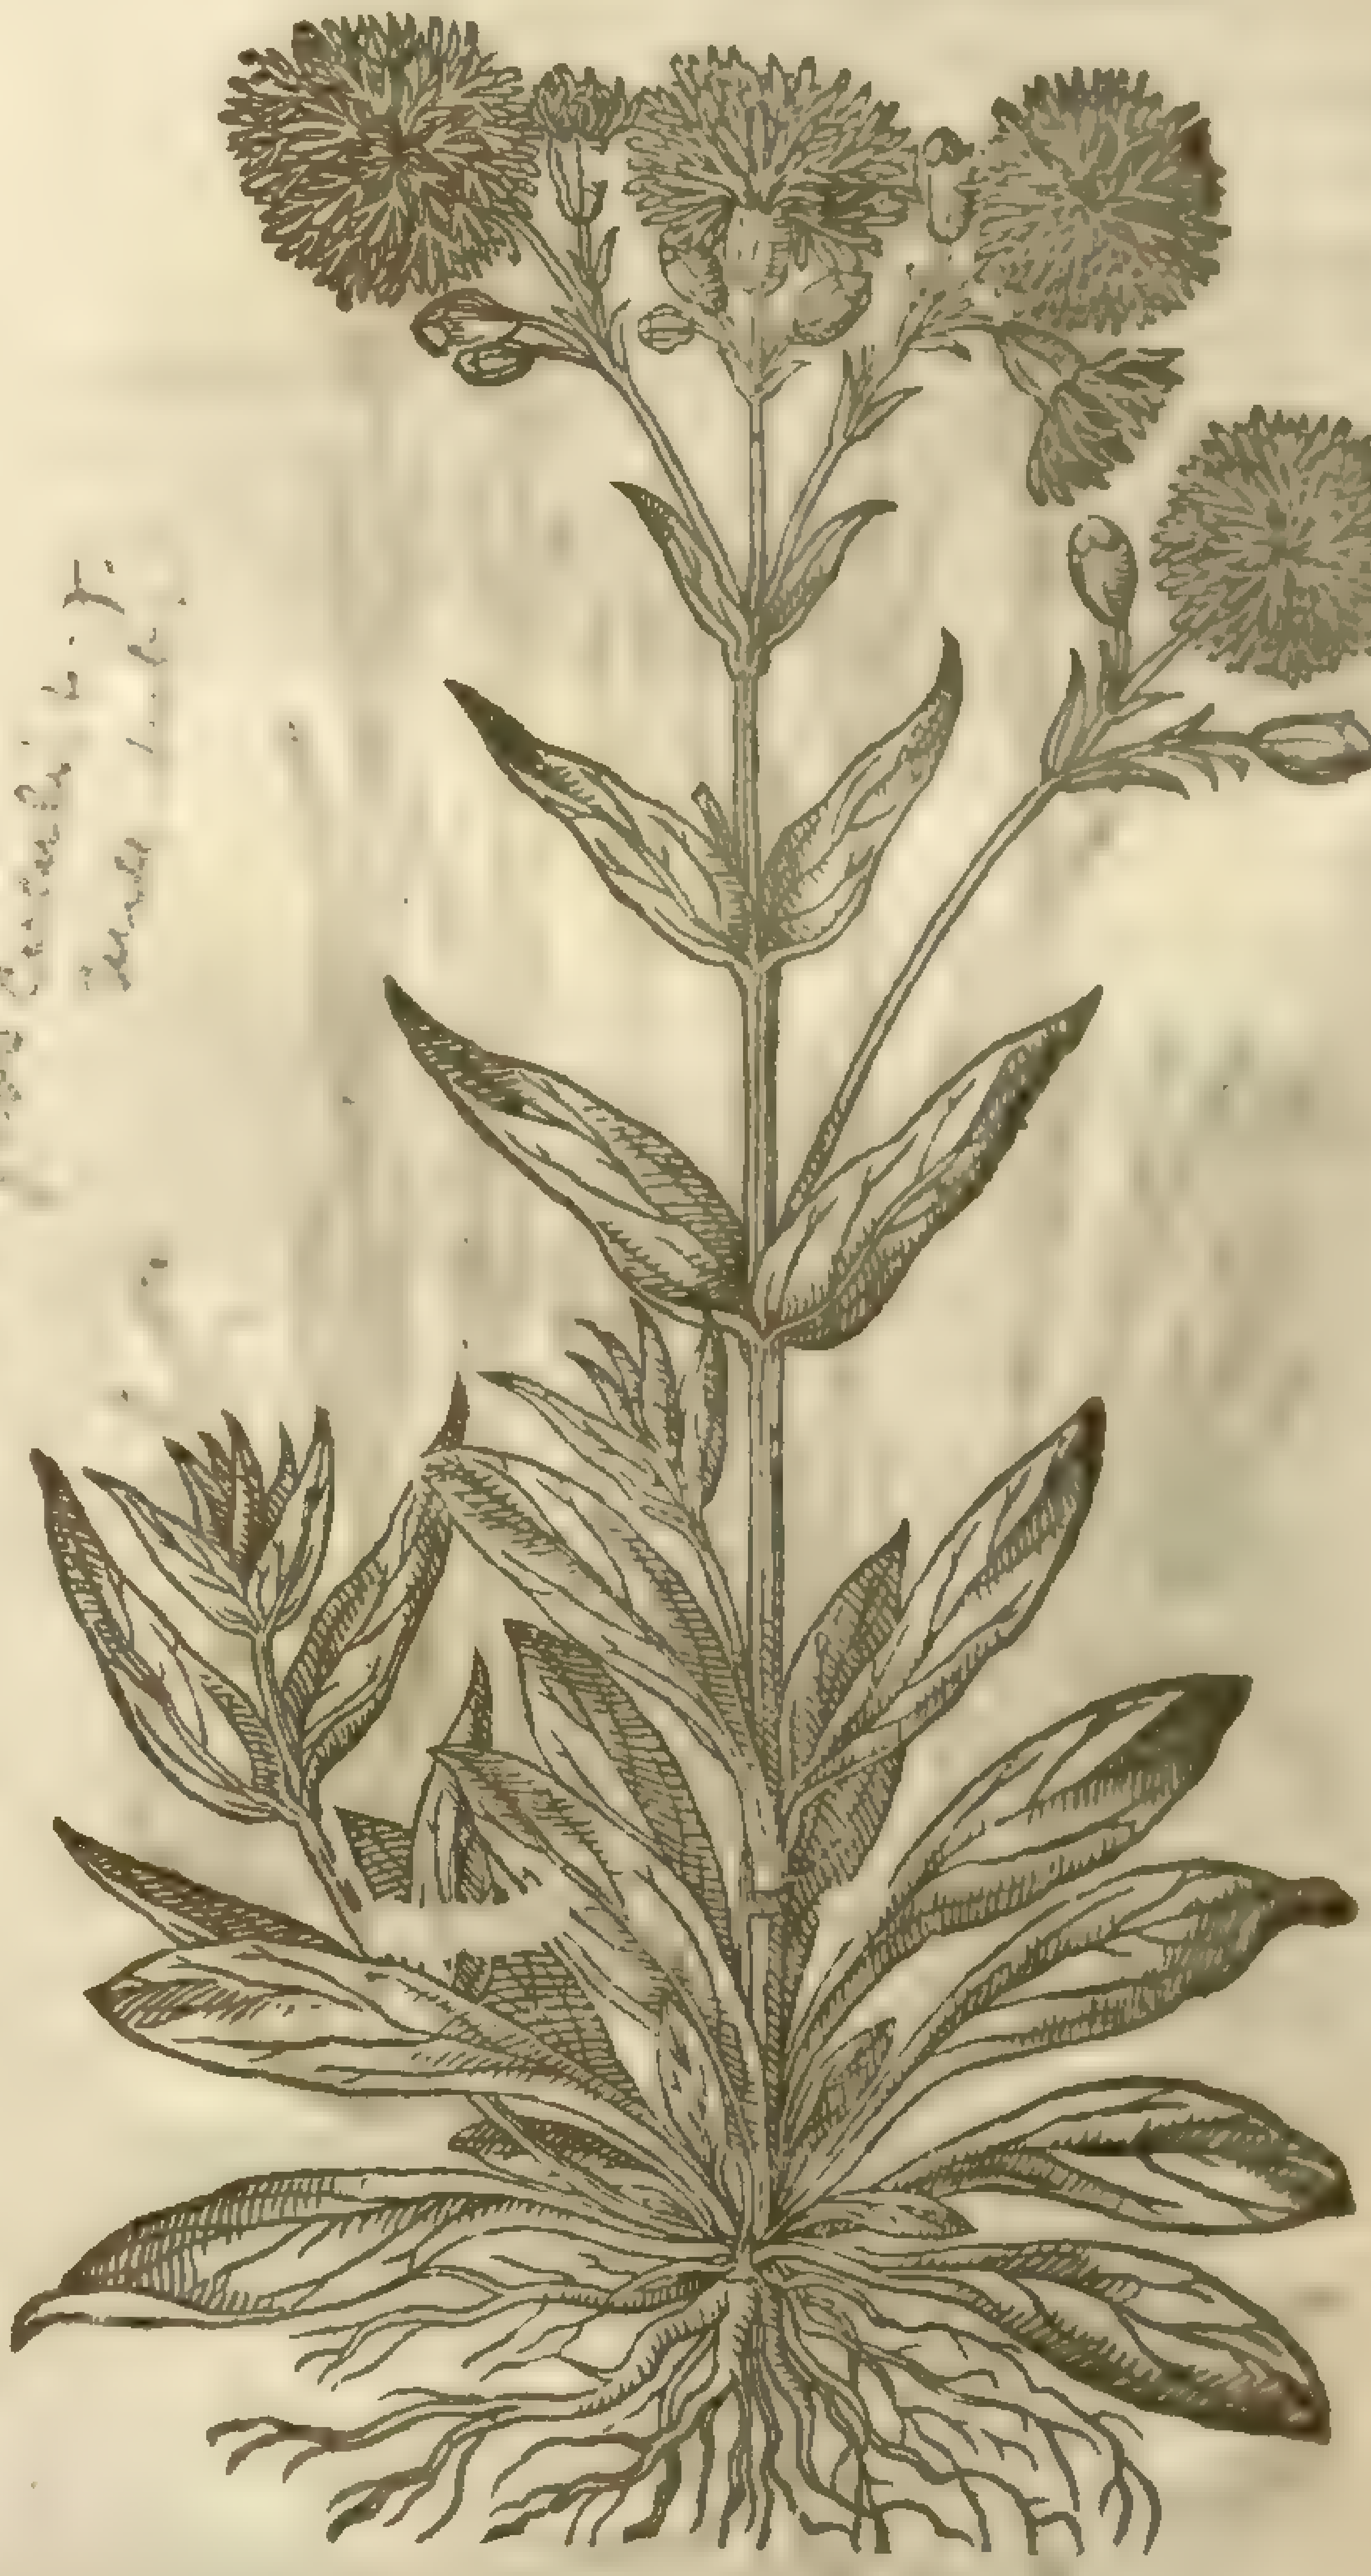
Theſe grow all about in Medowes and paſtures, and dankiſh places.

1 *Armoraria pratenſis mas.*
The male Crow-floure.



Lychnis [illegible]

‡ 3 *Armoraria pratenſis flore pleno.*
The double Crow floure.



Lychnis [illegible]

¶ *The Time.*

They begin to floure in May and end in Iune.

¶ *The Names.*

The Crow-floure is called in Latine, *Armoraria ſylueſtris*, and *Armoracia*: of ſome, *Flos Cuculi*, but not properly; it is alſo called, *Tunix*: of ſome *Armeria*, *Armerius flos primus* of *Dodonæus*, and likewiſe, *Caryophyllus minor ſylueſtris folijs latioribus*: in Dutch, **Craͤkenbloemkens**: that is to ſay, *Cornicis floris*: in French, *Cuydrelles*: in Engliſh, Crow-floures, wilde Williams, marſh Gillofloures, and Cuckow Gillofloure.

¶ *The Temperature and Vertues.*

Theſe are not vſed either in medicine or in nouriſhment: but they ſerue for garlands and crowns, and to decke vp gardens.

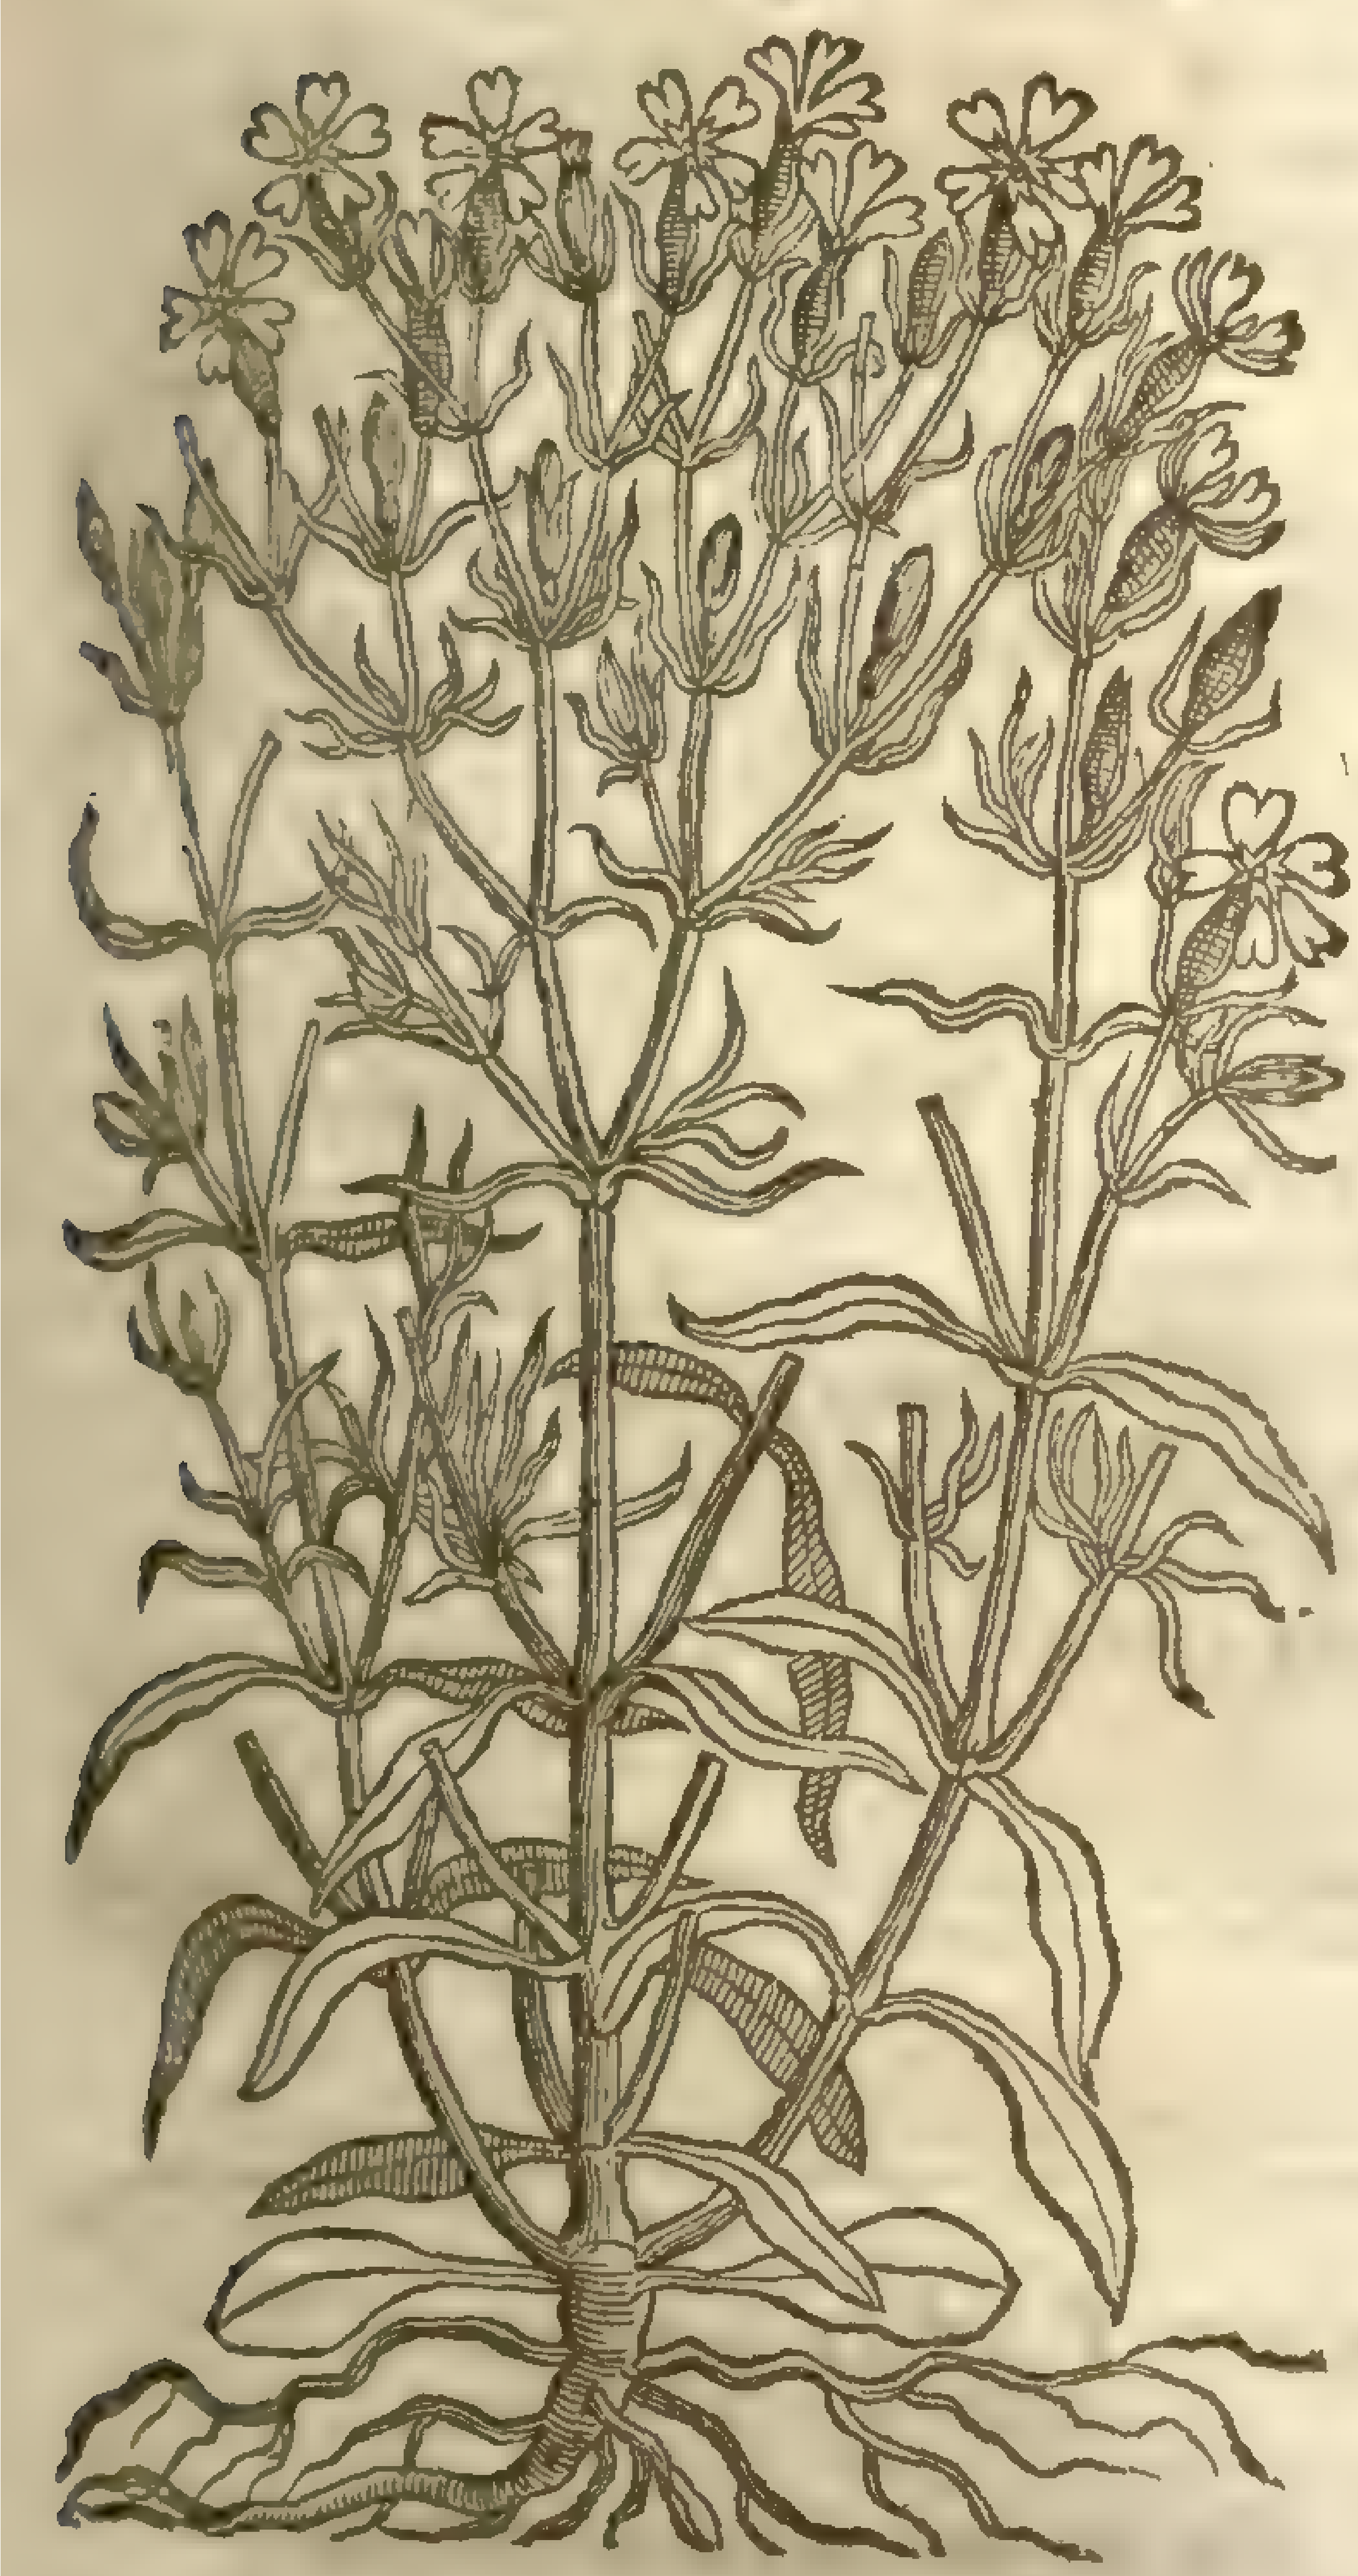
Chap. 146. *Of Catch-flie, or Limewort.*

¶ *The Deſcription.*

1 This plant, called *Viſcaria*, or Lymewort, is likewiſe of the ſtocke and kindred of the wilde Gillofloures: notwithſtanding *Cluſius* hath joined it with the wilde Campions, making it a kinde thereof, but not properly. *Lobel* among the ſweet Williams, whereof doubtleſſe it is a kinde. It hath many leaues riſing immediately from the root like thoſe of the Crowfloure, or wilde ſweet William: among which riſe vp many reddiſh ſtalkes joynted or kneed at certaine ſpaces, ſet with leaues by couples one againſt another: at the top whereof come forth pretty red floures; which being paſt, there commeth in place ſmall blackiſh ſeed. The root is large with many fibres. The whole plant, as well leaues and ſtalkes, as alſo the floures are here and there couered ouer with a moſt thicke and clammy matter like vnto Bird-lime, which if you take in your hands,

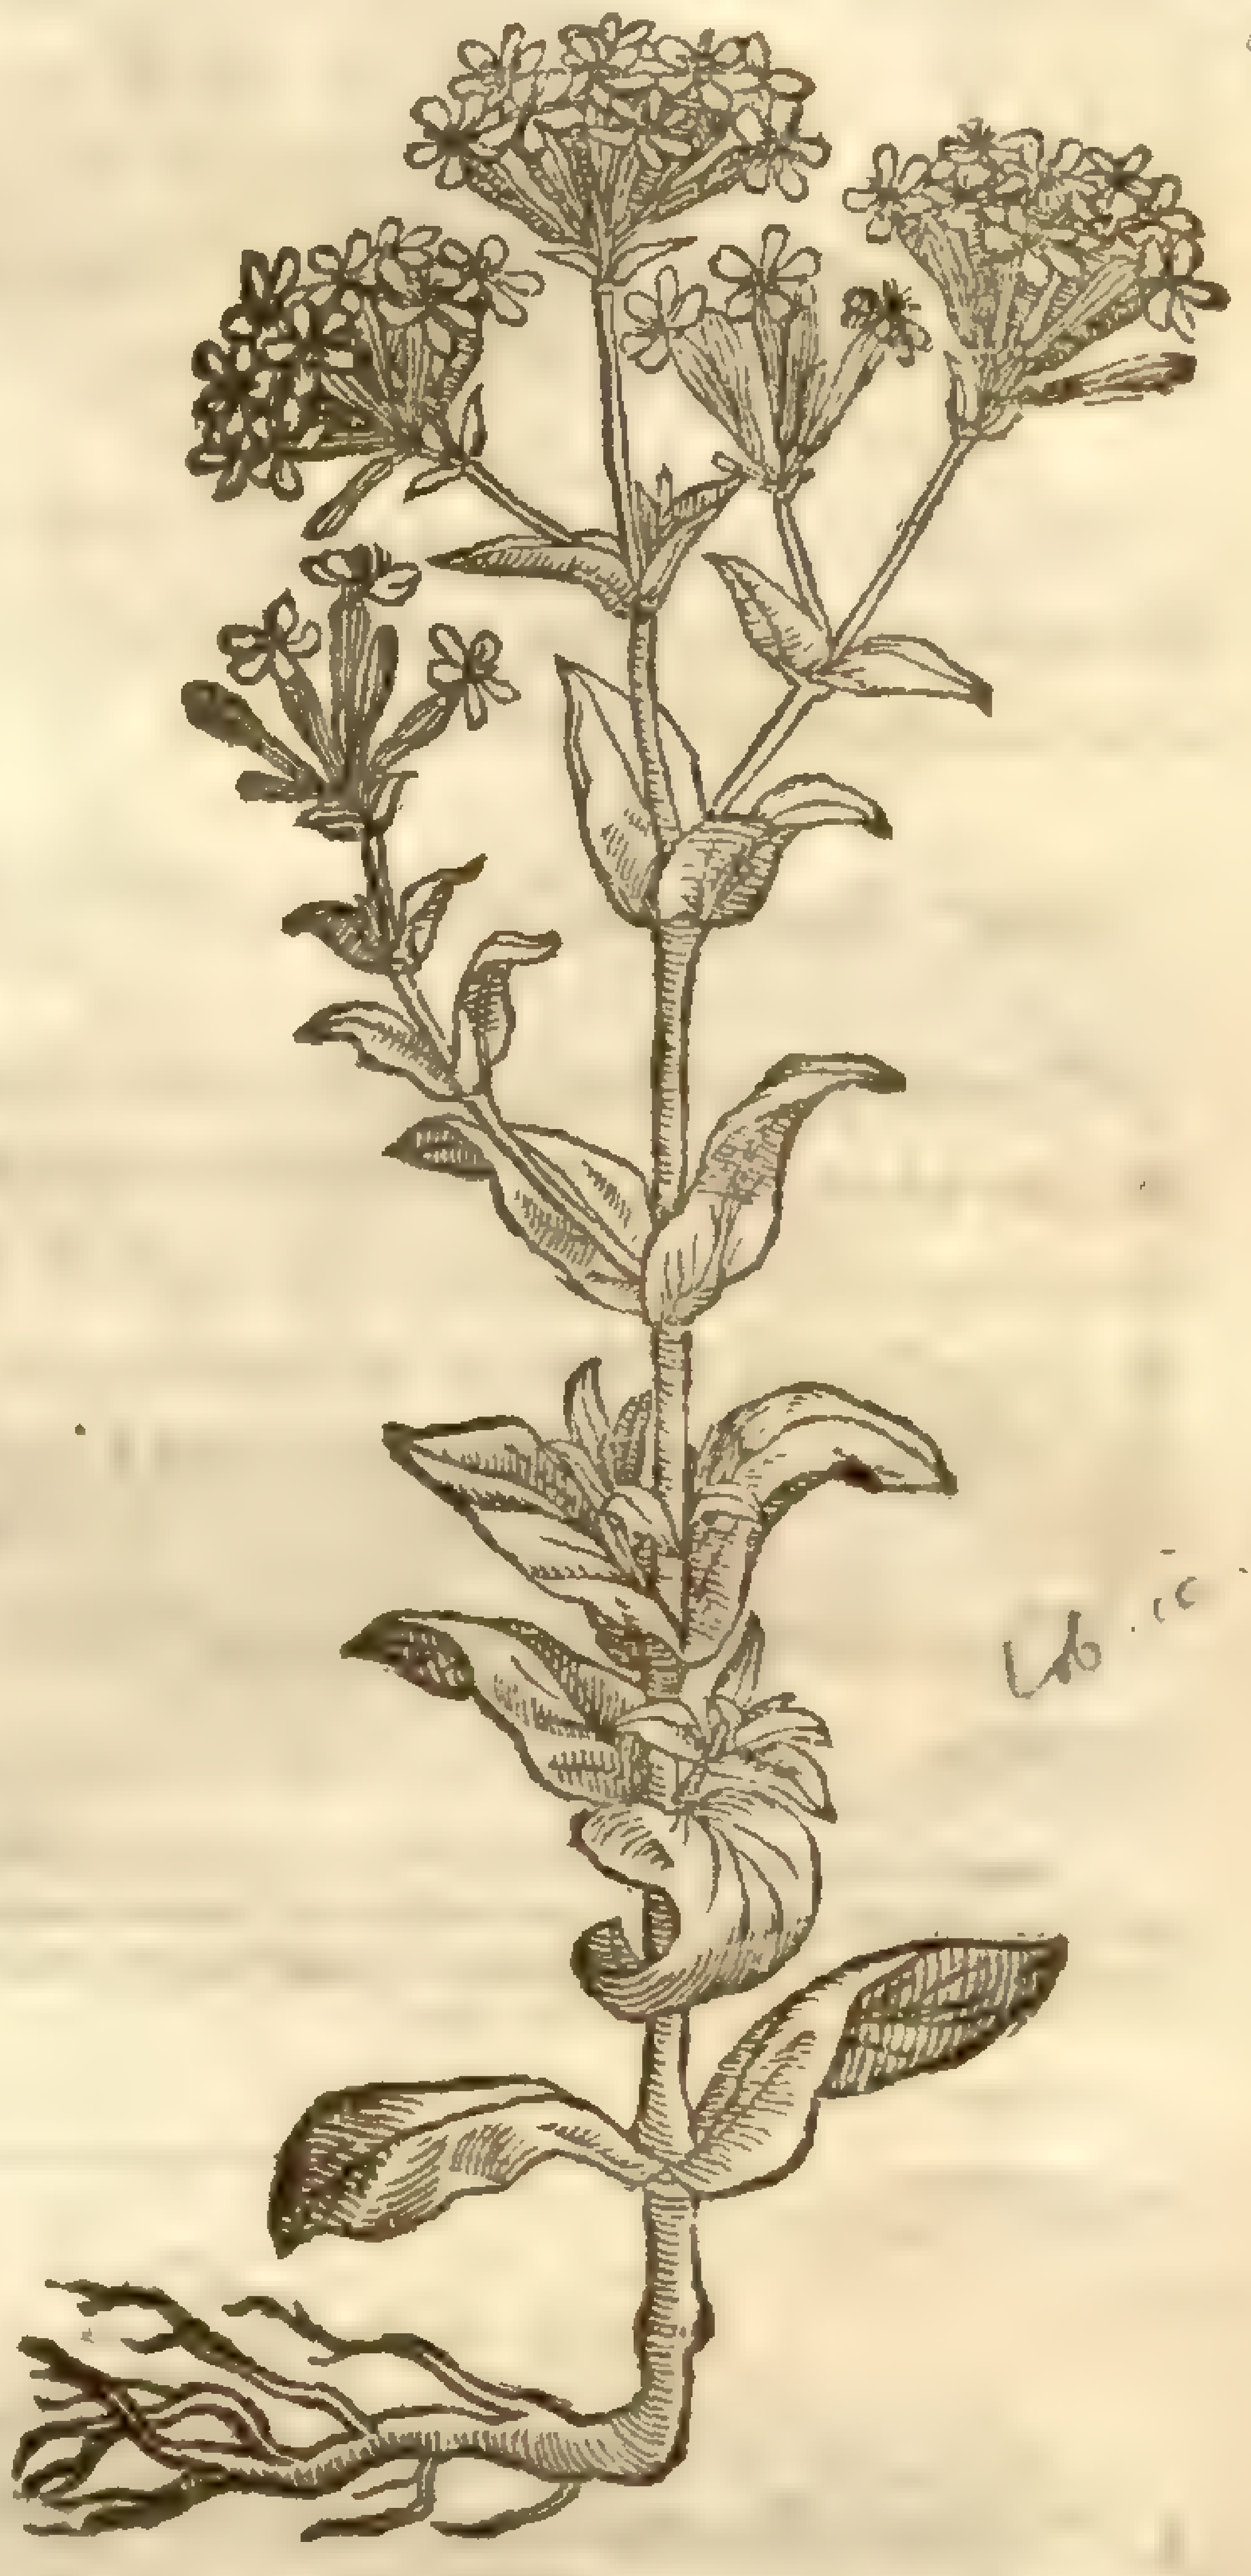
† 1 *Viſcaria, ſiue Muſcipula.*
Limewort.

[illegible]



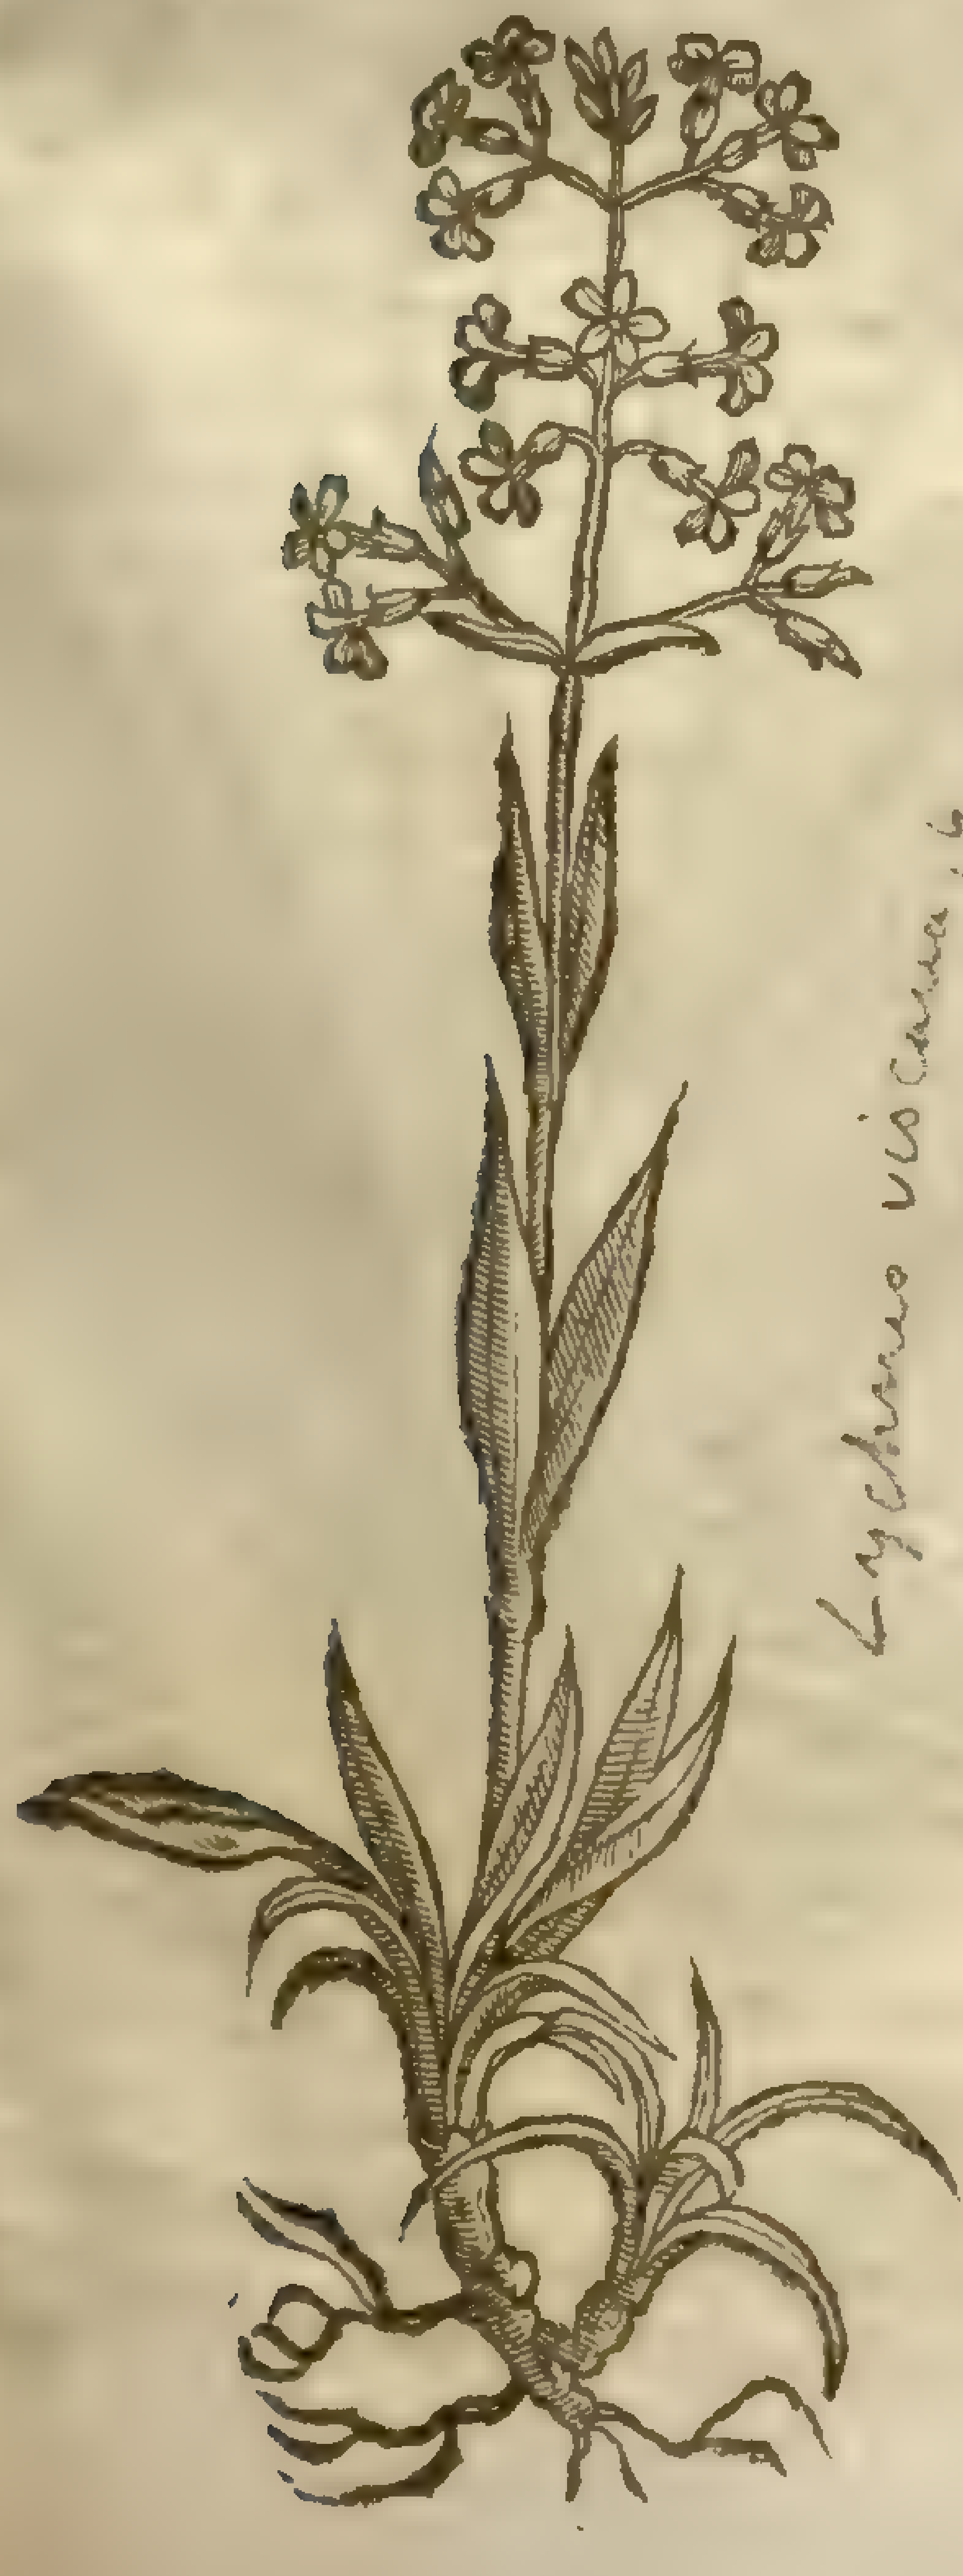
2 *Muſcipula Lobelij.*
Catch Flie.

Silene armeria [illegible]
Sm. fl. 2.296



Lob. ic. 454

‡ 3 *Muſcipula anguſtifolia.*
Narrow leaued Catch-flie.



Lychnis viscaria, [illegible]
Sm. fl. 2.52

hands, the ſlimineſſe is ſuch, that your fingers will ſticke and cleaue together, as if your hand touched Bird-lime: and furthermore, if flies doe light vpon the ſame, they will be ſo intangled with the limineſſe, that they cannot flie away; inſomuch that in ſome hot day or other you ſhal ſee many flies caught by that means. Whereupon I haue called it Catch Flie, or Limewort. ‡ This is *Lychnis ſyl.* 3. of *Cluſius*; *Viſcago* of *Camerarius*, and *Muſcipula ſiue Viſcaria* of *Lobel.* ‡

2 This plant hath many broad leaues like the great ſweet William, but ſhorter (whereof it is likewiſe a kinde) ſet vpon a ſtiffe and brittle ſtalk; from the boſom of which leaues ſpring forth ſmaller branches, clothed with the like leaues, but much leſſer. The floures grow at the top of the ſtalkes many together tuft faſhion, of a bright red colour. The whole plant is alſo poſſeſſed with the like limineſſe as the other is, but leſſe in quantity. ‡ This is *Lychnis ſyl.* 1. of *Cluſius*; and *Muſcipula ſiue Armoraria altera* of *Lobel*: *Dodonæus* calls it *Armerius flos* 3. in his firſt Edition: but makes it his fourth in the laſt Edition in *Folio.* ‡

‡ 3 There is alſo belonging vnto this kindred another plant which *Cluſius* makes his *Lychnis ſyl.* 4. It comes vp commonly with one ſtalke a foot or more high, of a greene pur-

pliſh colour, with two long ſharpe pointed thicke greene leaues, ſet at each joynt: from the middle to the top of the ſtalke grow little branches, which vpon pretty long ſtalkes carry floures conſiſting of fiue little round leaues, yet diuided at the tops; they are of a faire incarnate colour, with a deepe purple ring in their middles, without ſmell: after the floures are paſt, ſucceed skinny and hard heads, ſmaller towards the ſtalkes, and thicker aboue; and in theſe are contained very ſmall darke red ſeeds. The root is thicke and blacke with many fibres, putting vp new ſhoots and ſtalkes after the firſt yeare, and not dying euery yeare like as the two laſt deſcribed.

¶ *The Place.*

Theſe plants do grow wilde in the fields in the Weſt part of England, among the corne: we haue them in our London gardens rather for toies of pleaſure, than any vertues they are poſſeſſed with, that haue as yet beene knowne.

¶ *The Time.*

They floure and flouriſh moſt part of the Summer.

¶ *The Names.*

Catch Flies hath beene taken for *Behen*, commonly ſo called, for the likeneſſe that it hath with *Behen rubente flore:* or with *Behen* that hath the red floure, called of ſome *Valeriana rubra*, or red Valerian; for it is ſomething like vnto it in jointed ſtalkes and leaues, but more like in colour: of *Lobel, Muſcipula* and *Viſcaria:* of *Dodon. Armerius flos tertius:* of *Cluſius, Lychnis ſylueſtris, Silene Theophraſti*, and *Behen rubrum Salamanticum:* in Engliſh, Catch Flie, and Limewort.

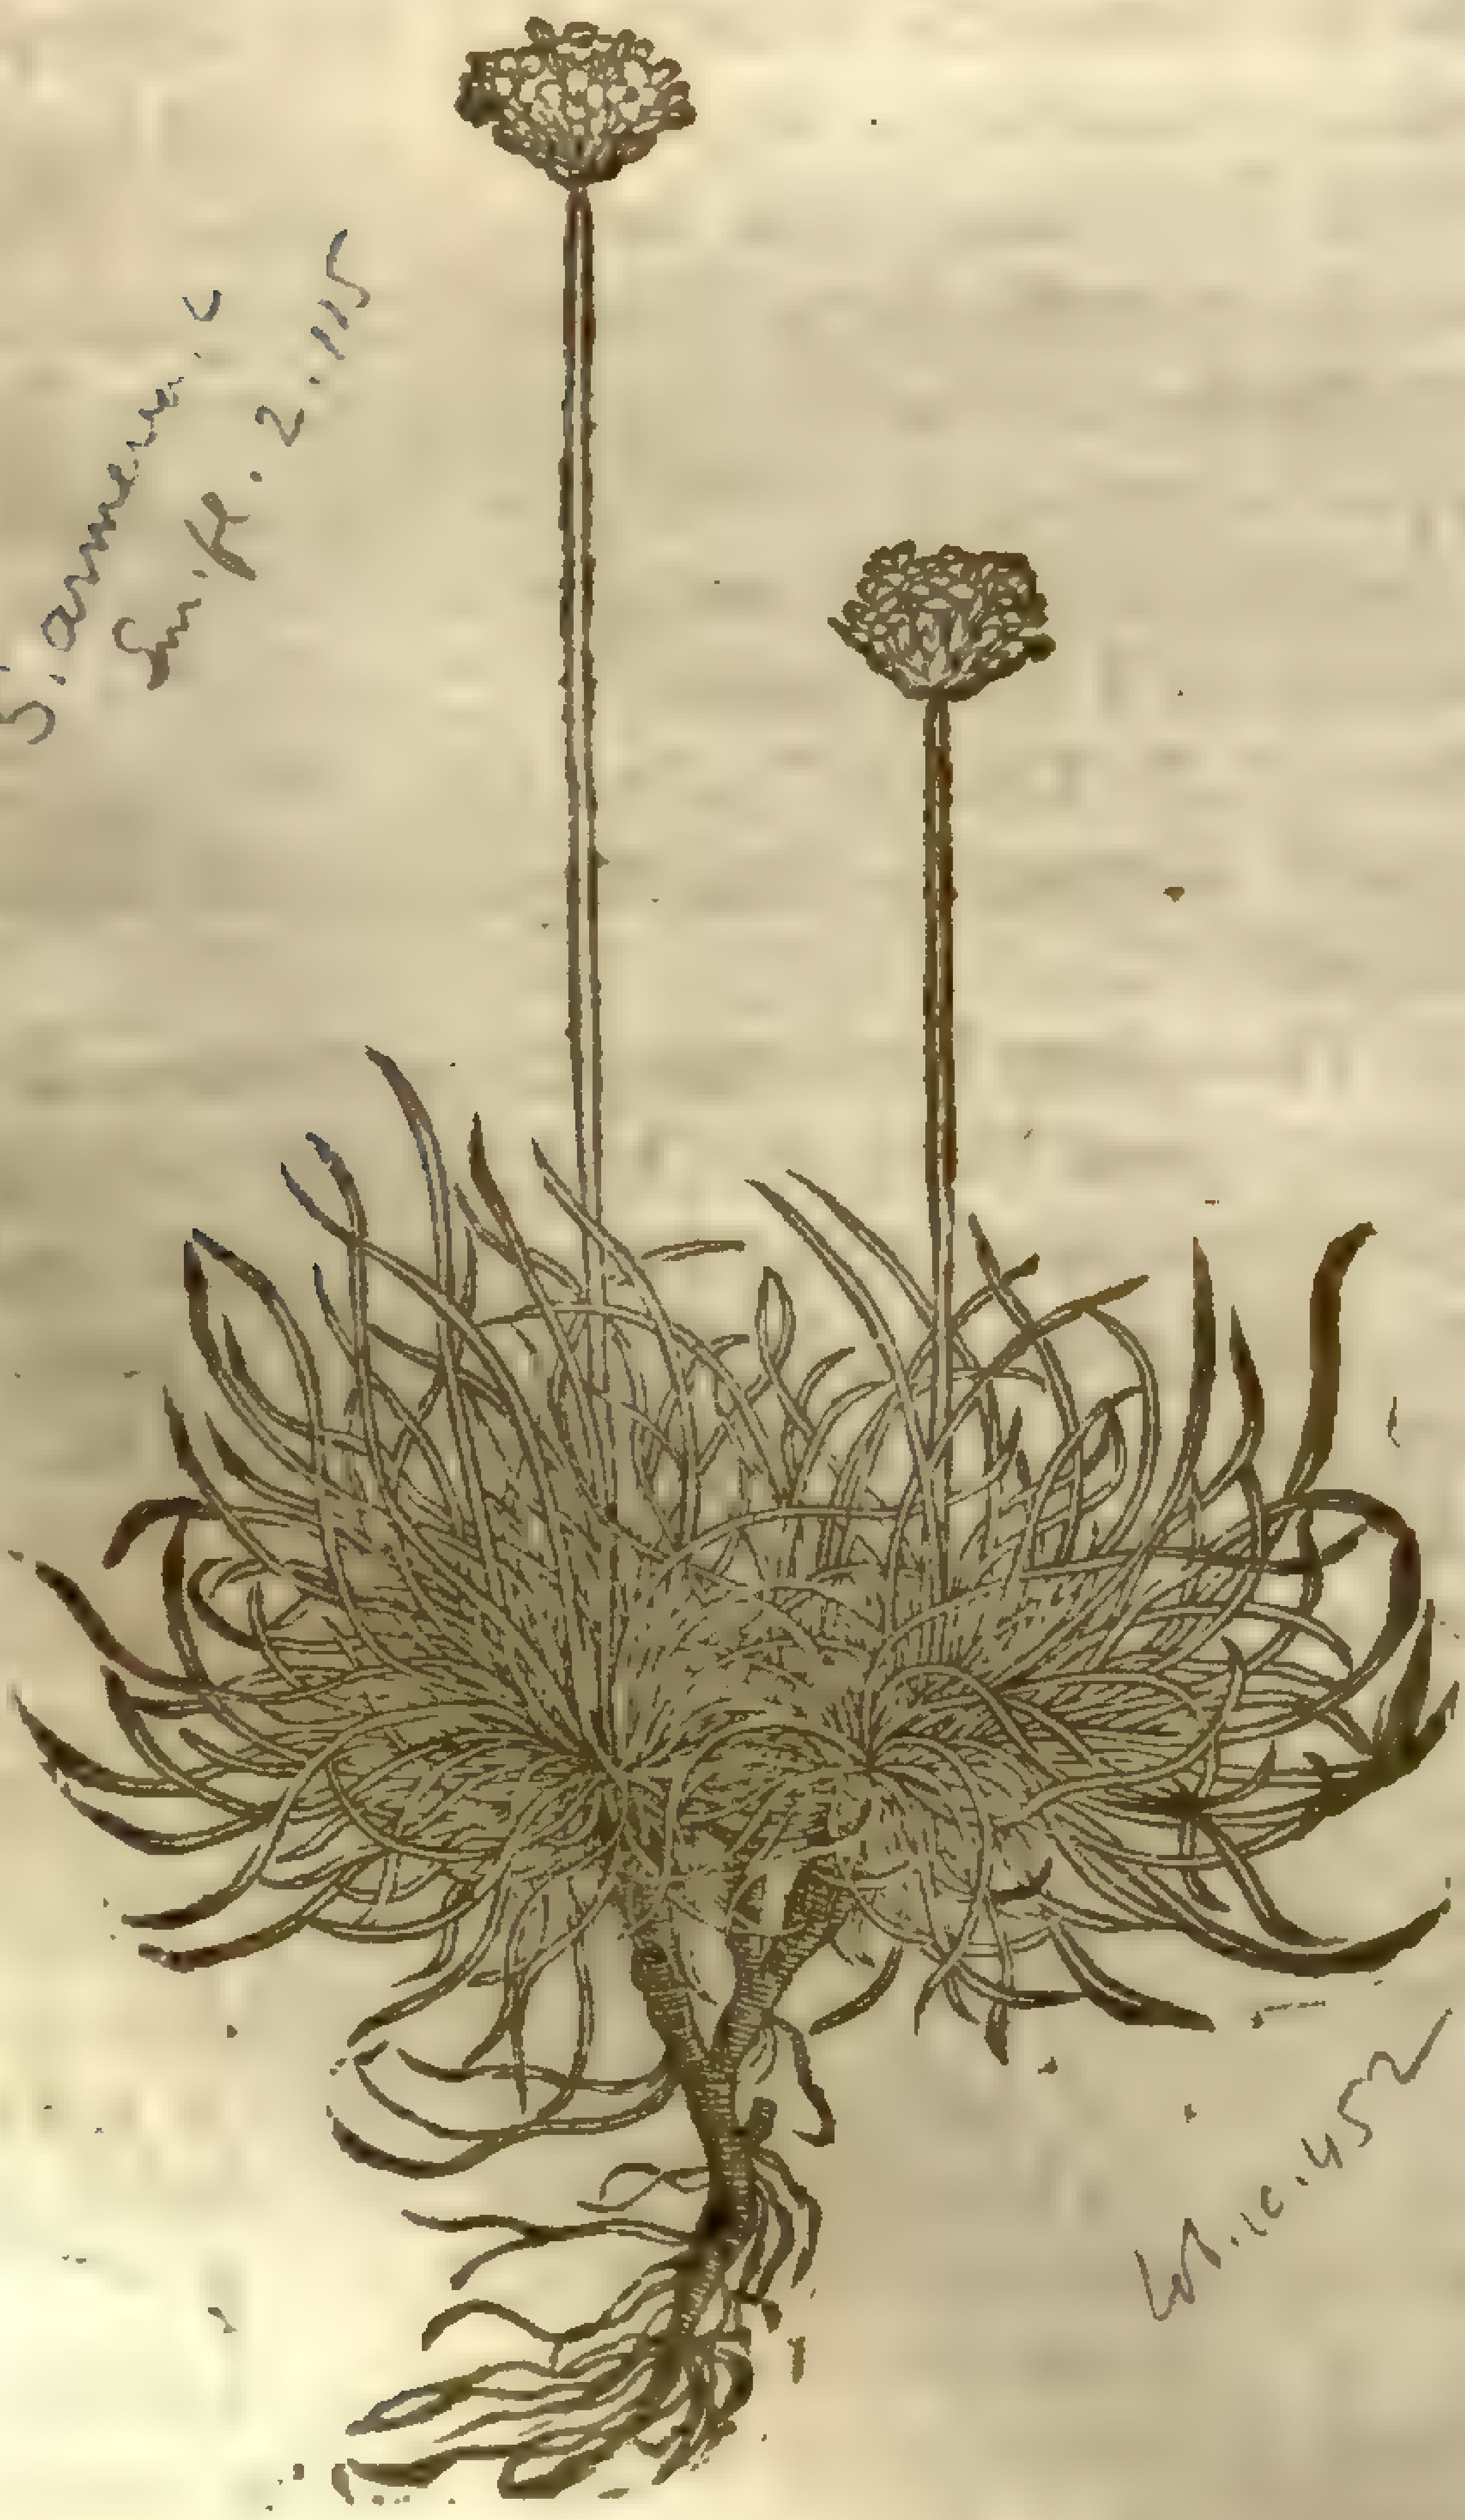
¶ *The Nature and Vertues.*

The nature and vertues of theſe wilde Williams are referred to the Wilde Pinkes and Gillofloures.

† Our Author certainely intended in this firſt place to figure and deſcribe the *Muſcipula* or *Viſcaria* of *Lobel*, but the figure he here gaue in the firſt place was of that plant which I haue giuen you in the laſt Chapter ſaue one by the name of *Armeria prolifera Lobelii.* The figure which belonged to this place was in the Chapter of wilde Campions, vnder the title of *Lychnis ſylueſtris incana.*

CHAP. 167. *Of Thrift, or our Ladies Cuſhion.*

1 *Caryophyllus marinus minimus Lobelij.*
Thrift, or Sea Gillofloure.

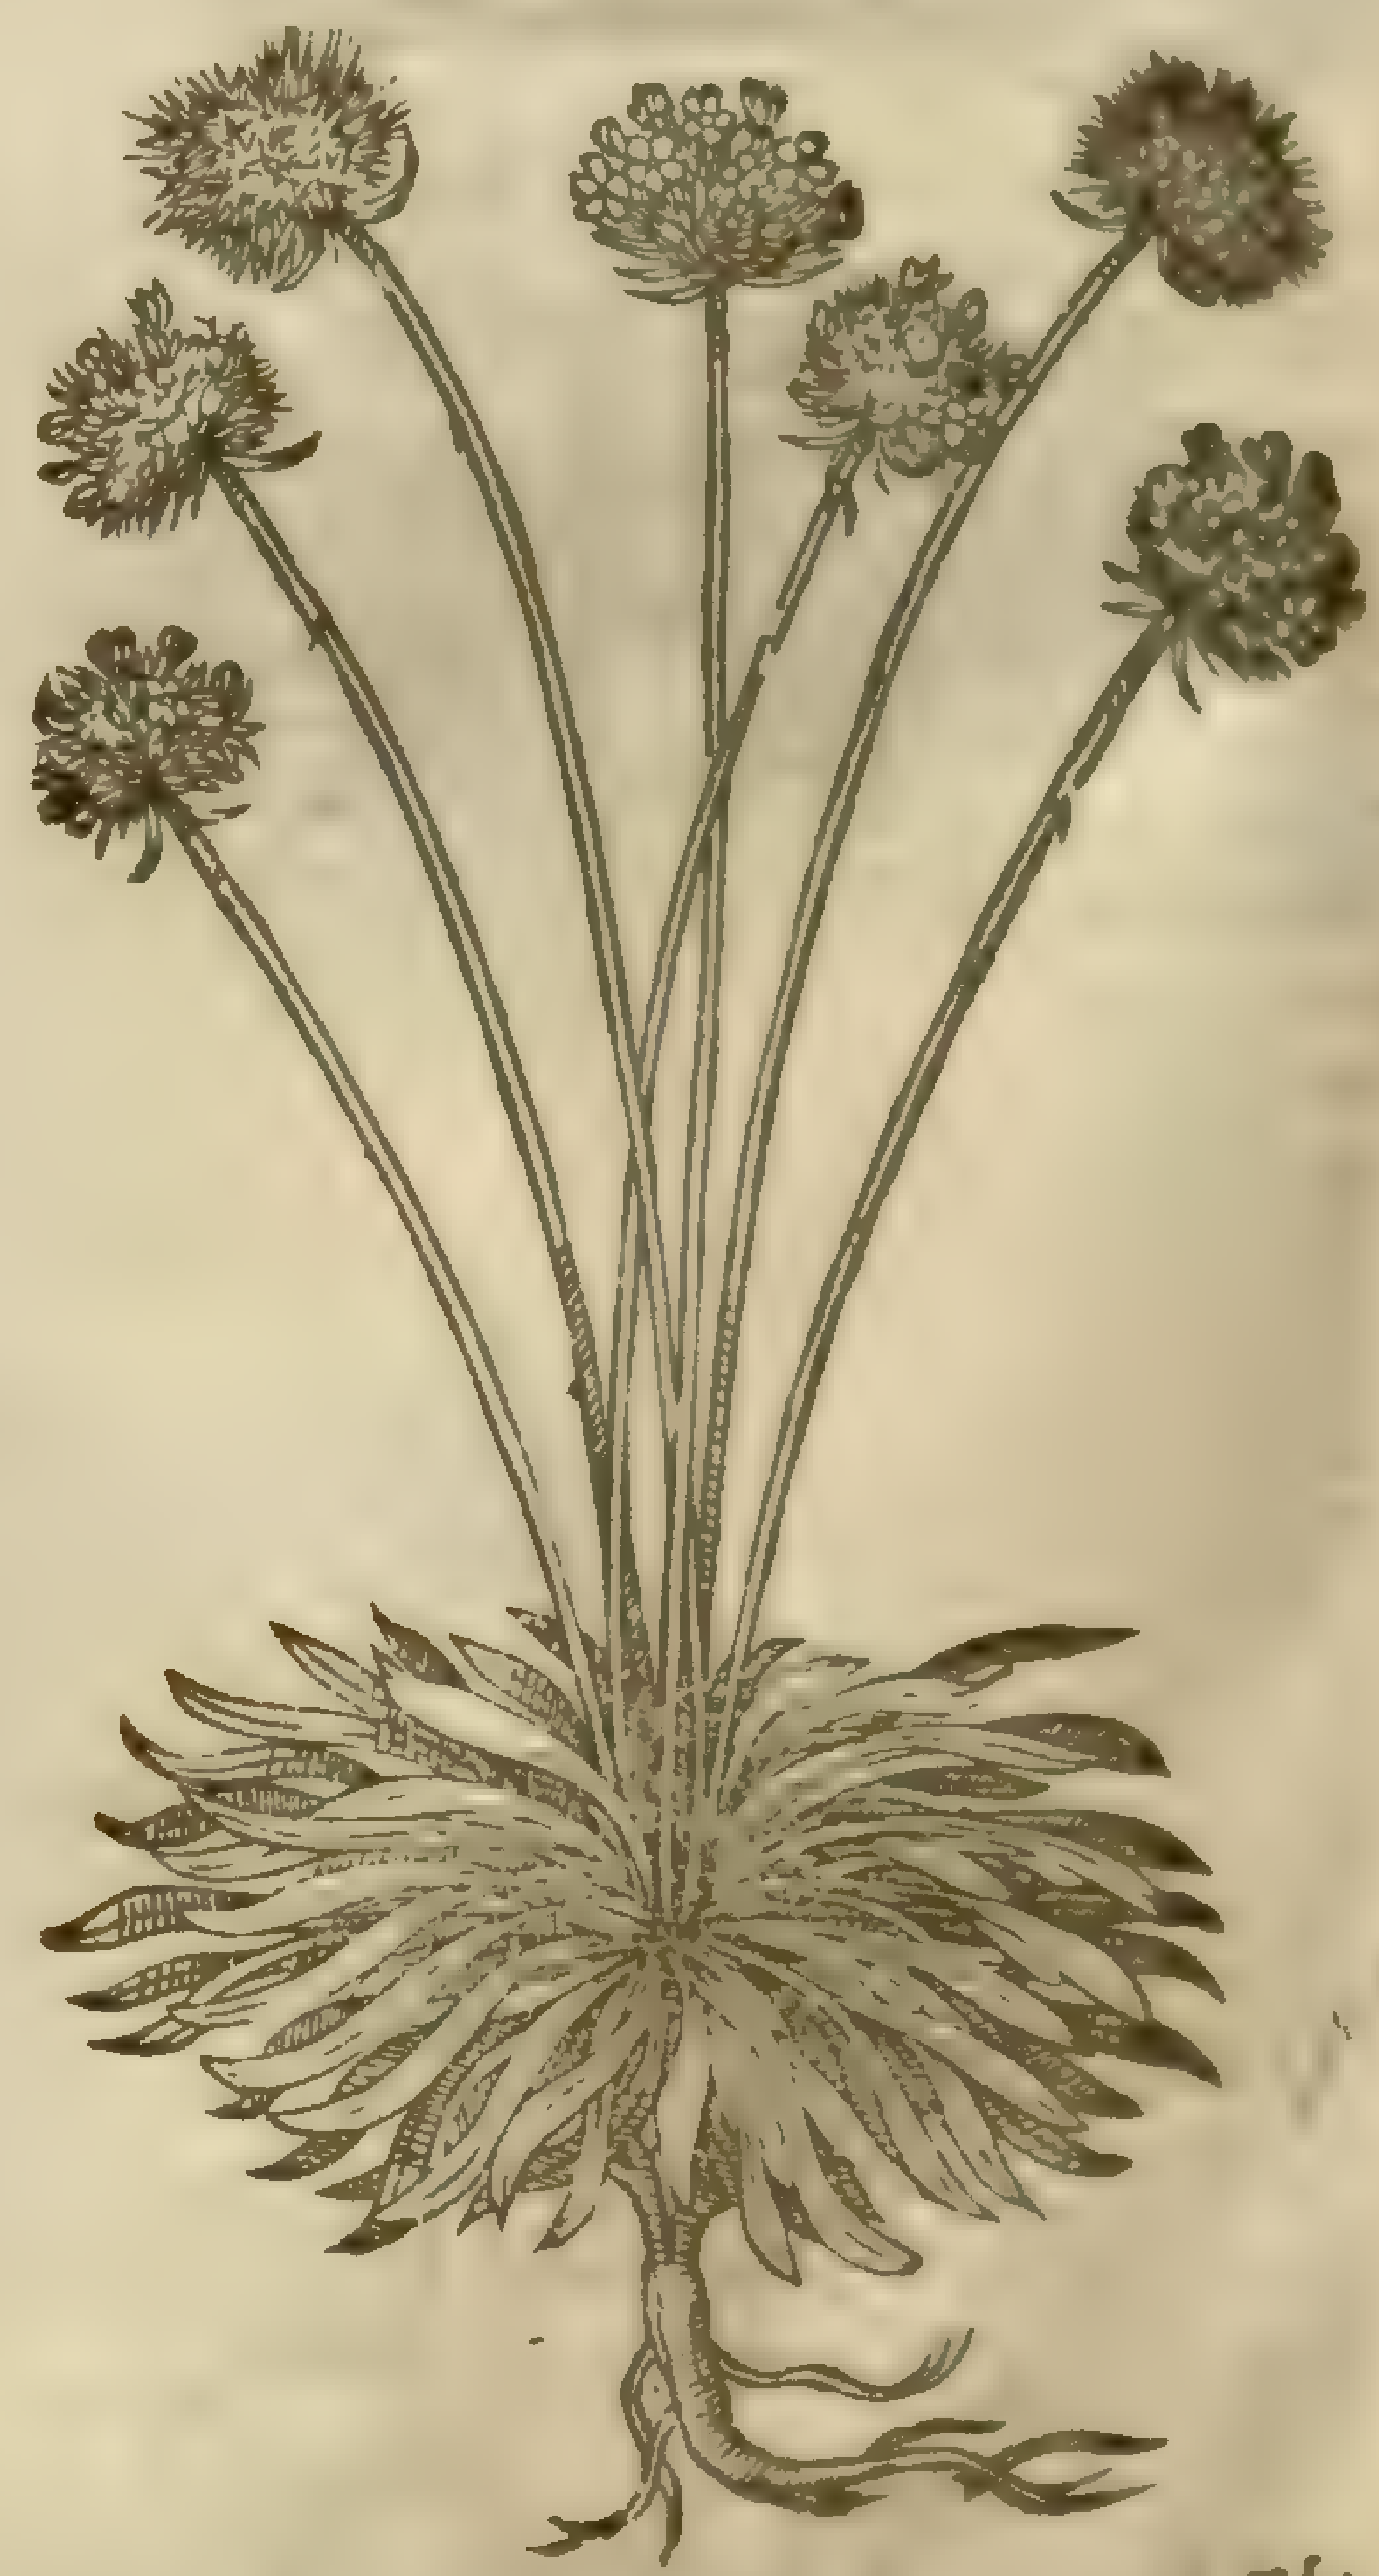


S. armeria
Sm. Fl. 2. 115

Statice armeria L. β
mei. dict.

W. ic. 452

2 *Caryophyllus Mediterraneus.*
Leuant Thrift, or Sea Gillofloure.



Statice armeria
mei. dict.

¶ The

¶ *The Deſcription.*

1 Thrift is alſo a kinde of Gillofloure, by *Dodonæus* reckoned among graſſes, which brings forth leaues in great tufts, thicke thruſt together, ſmaller ſlenderer and ſhorter than graſſe: among which riſe vp ſmall tender ſtalkes of a ſpanne high, naked and without leaues; on the tops whereof ſtand little floures in a ſpokie tuft, of a white colour tending to purple. The root is long and threddy.

2 The other kind of Thrift, found vpon the mountaines neer vnto the Leuant or Mediterranean ſea, differeth not from the precedent in leaues, ſtalkes or floures, but yet is altogether greater, and the leaues are broader.

¶ *The Place.*

1 The firſt is found in the moſt ſalt marſhes in England, as alſo in Gardens, for the bordering vp of beds and bankes, for the which it ſerueth very fitly. The other is a ſtranger in theſe Northerne Regions.

¶ *The Time.*

They floure from May, till Summer be farre ſpent.

¶ *The Names.*

Thrift is called in Latine, *Gramen Polyanthemum*, of the multitude of the floures: of ſome, *Gramen marinum*: of *Lobel*, *Caryophyllus Marinus*: in Engliſh, Thrift, Sea-graſſe, and our Ladies Cuſhion.

¶ *The Temperature and Vertues.*

Their vſe in Phyſicke as yet is not knowne, neither doth any ſeeke into the Nature thereof, but eſteeme them only for their beautie and pleaſure.

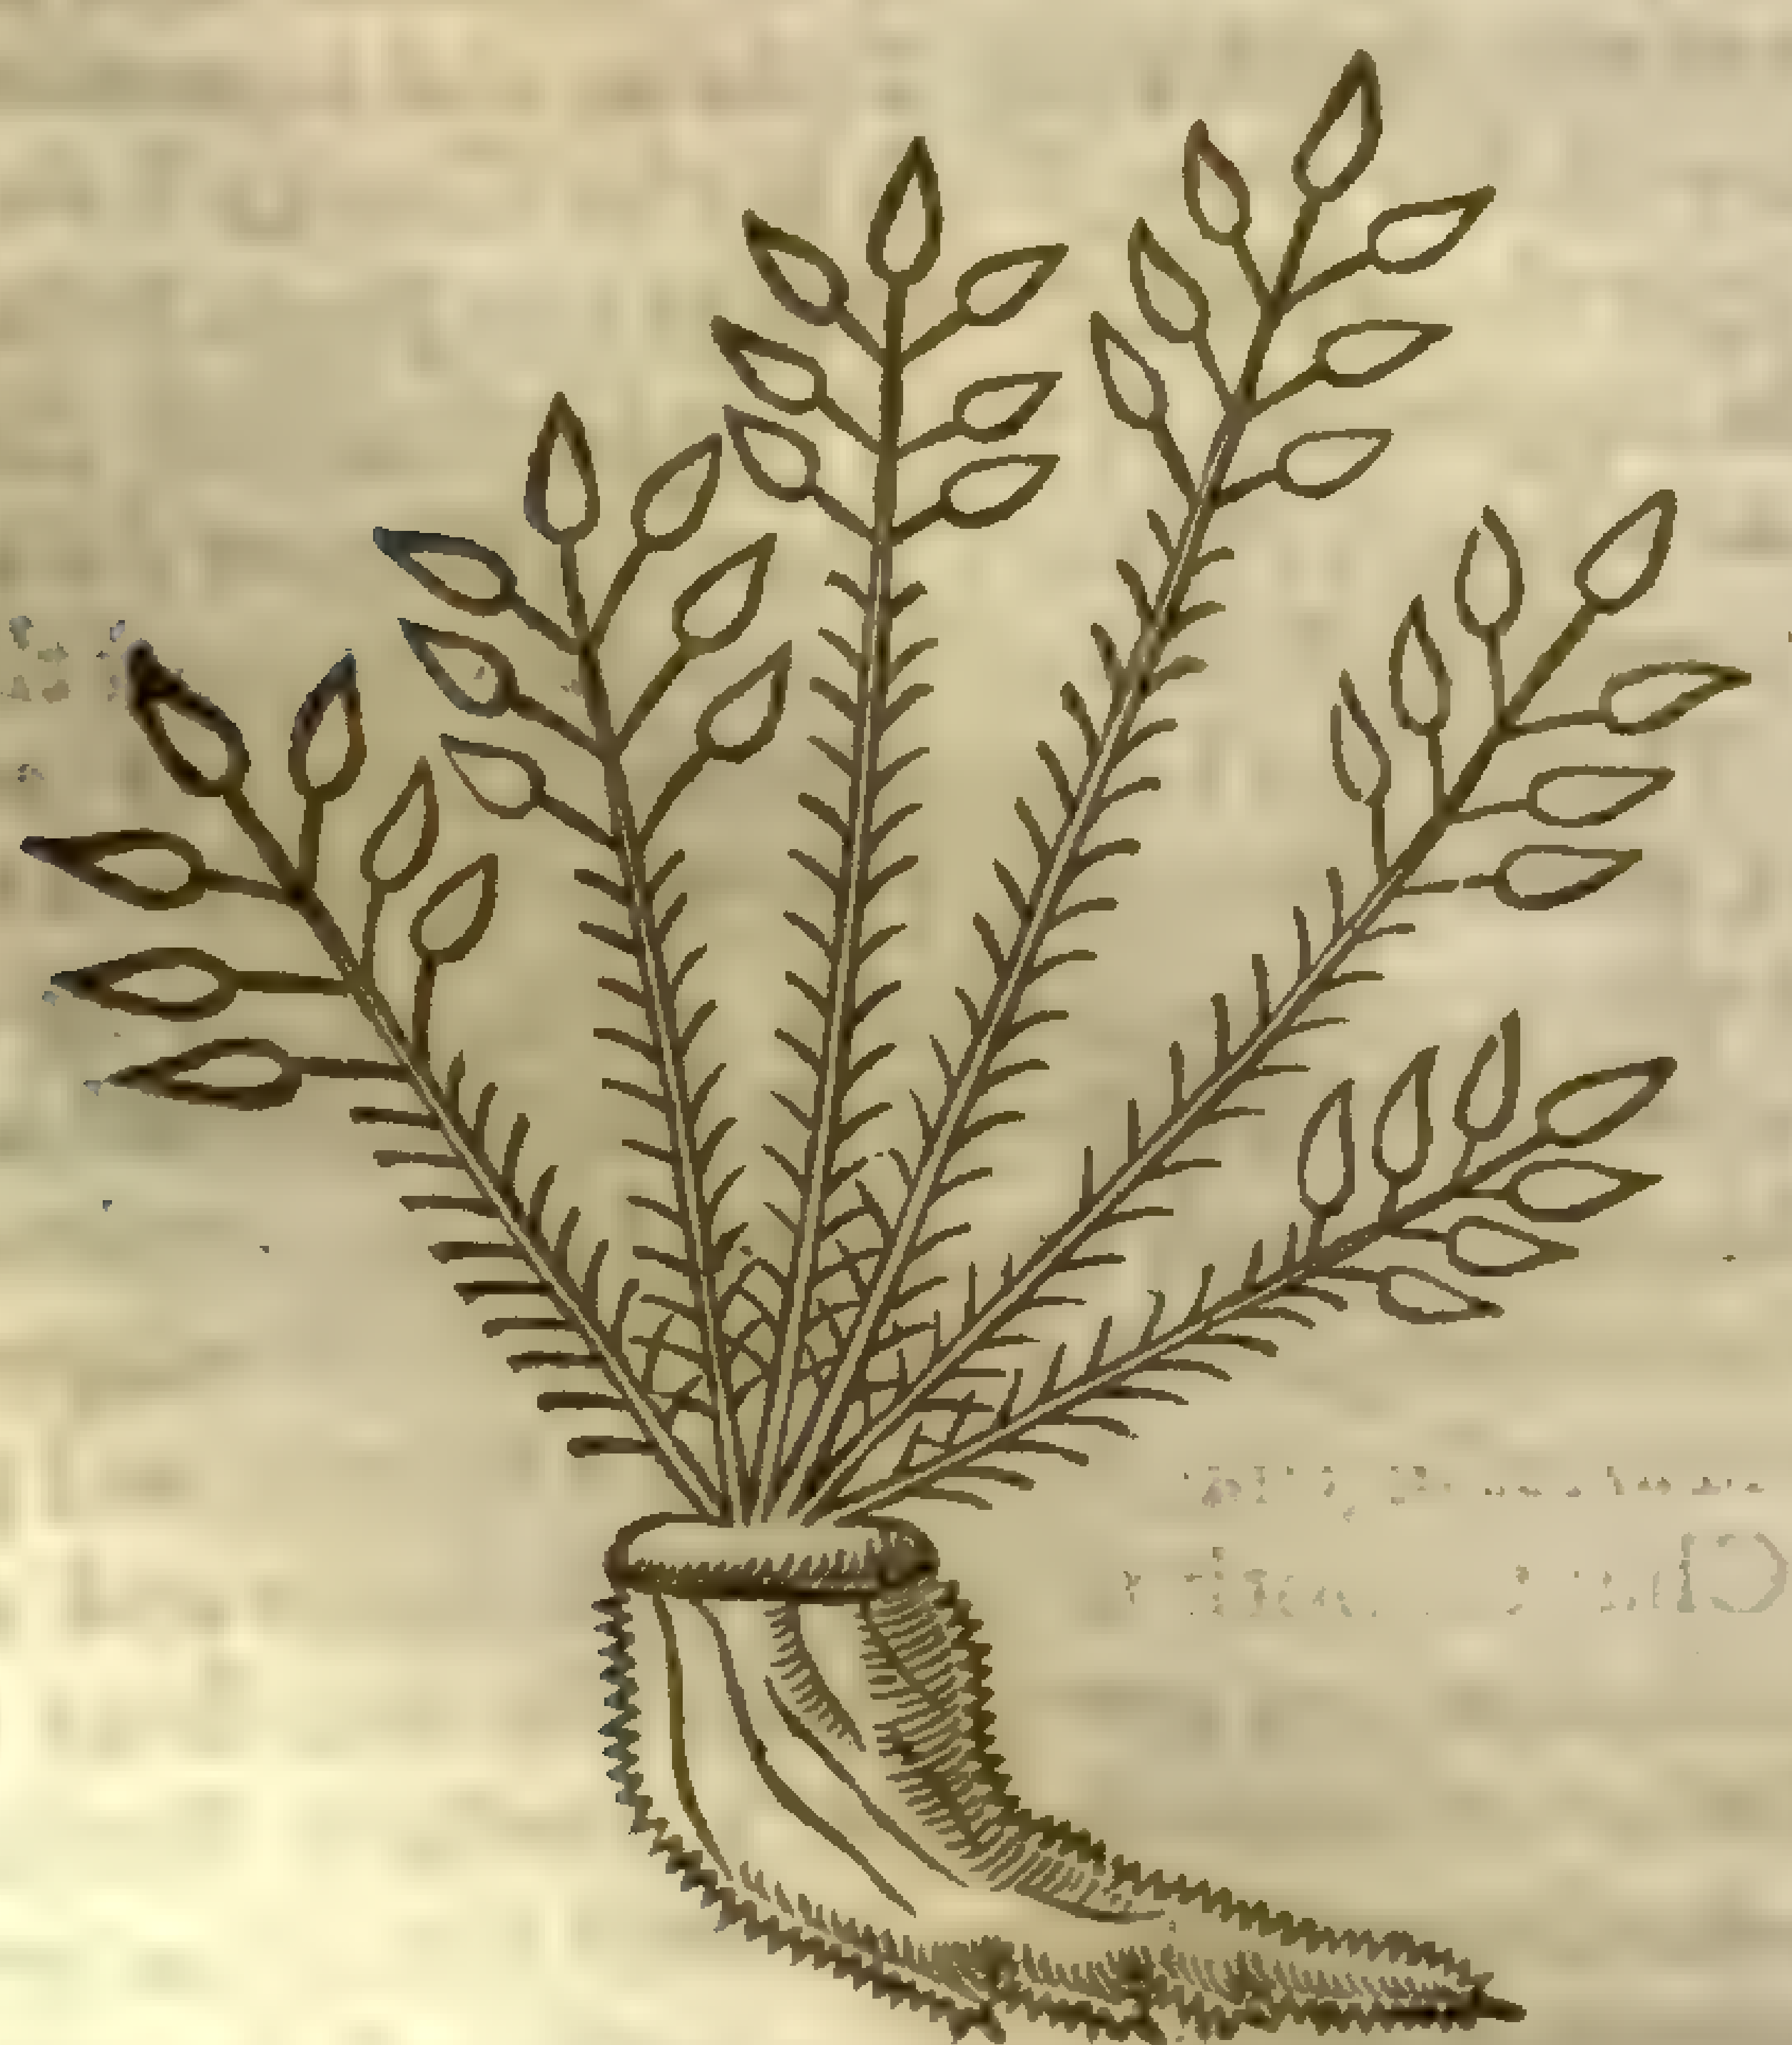
‡ Chap. 188.

Of the Saxifrage of the Antients, and of the great one of Matthiolus, with that of Pena and Lobel.

‡ This name *Saxifraga* or Saxifrage, hath of late beene impoſed vpon ſundry plants farre different in their ſhapes, places of growing, & temperature, but all agreeing in this one faculty of expelling or driuing the ſtone out of the Kidnies, though not all by one meane or manner of operation. But becauſe almoſt all of them are deſcribed in their fit places by our Author, I will not inſiſt vpon them: yet I thinke it not amiſſe a little to enquire, whether any *Saxifraga* were knowne to the Antients; and if knowne, to what kinde it may probably be referred? Of the Antients, *Dioſcorides*, *Paulus Ægineta*, and *Apuleius*, ſeeme to mention one *Saxifraga*, but *Pliny*, *lib.22.cap.21.* by the way ſhewes, that ſome called *Adianthum* by the name of *Saxifragum*: but this is nothing to the former; wherefore I will not inſiſt vpon it, but returne to examine that the other three haue written thereof. *Dioſcorides lib.4.* betweene the chapters of *Tribulus* and *Limonium*, to wit, in the ſeuenteenth place hath deliuered the Hiſtory of this plant, both in the Greeke Edition of *Aldus Manutius*, as alſo in that of *Marcellus Virgilius*, yet the whole chapter in the Paris Edition, 1549, is rejected and put amongſt the *Notha*. The beginning thereof (againſt which they chiefely except) is thus: Σαρξίφαγον, οἱ δὲ σαρξίφραγγον, οἱ δ' ἔμπετρον, Ῥωμαῖοι σαρξίφραγγα, (i) *Sarxiphagon, alij vero Sarxifrangon, alij vero Empetron, Romani, Sarxifranga.* The firſt exception of *Marcellus Virgilius* againſt this Chapter is *Peregrina Græcis & aliena vox Saxifraga eſt, &c.* The ſecond is, *Quod multo feliciores in componendo ad certiorem rei alicuius ſignificationem vocibus Græci, quam Latini, &c.* The third is, *Solam in toto hoc opere primam, & à principio propoſitam audiri Romanam vocem, tamque inopes in appellanda hac herba fuiſſe Græcos, vt niſi Romana voce eam indicaſſent, nulla ſibi futura eſſet.* Theſe are the arguments which he vſes againſt this Chapter; yet rejects it not, but by this means hath occaſioned others without ſhewing any reaſon to doe it: Now I will ſet downe what my opinion is concerning this matter, and ſo leaue it to the judgement of the learned. I grant *Marcellus*, that *Saxifraga* is a ſtrange and no Greeke word; but the name in the title, and firſt in the Chapter both in his owne Edition and all the Greeke Editions that I haue yet ſeene is Σαρξίφαγον, which none, no not he himſelfe can deny to haue a Greeke originall ἀπὸ τοῦ τὰς σάρκας φάγειν: of eating the fleſh: yet becauſe there is no ſuch facultie as this denomination imports attributed thereto by the Authour, therefore he will not allow it to be ſo. But you muſt note that many names are impoſed by the vulgar, and the reaſon of the name not alwaies explained by thoſe that haue written of them, as in this ſame Author may be ſeene in

the Chapters of *Catanance*, *Cynosbatos*, *Hemerocallis*, *Crotæogonon*, and diuers others, which are or ſeeme to be ſignificant, and to import ſomething by their name; yet he ſaith nothing thereof. It may be that which they would expreſſe by the name, was, that the herbe had ſo piercing a faculty that it would eat into the very fleſh. The ſecond and third argument both are anſwered, if this firſt word be Greeke, as I haue already ſhewed it to be, and there are not many words in Greeke that more frequently enter into ſuch compoſition than φάγος: as *Pamphagos*, *Polyphagos*, *Opſiphagos*, and many other may ſhew. Moreouer, it had been obſurd, for *Dioſcorides*, or any elſe how ſimple ſoeuer they were, if they had knowne the firſt word to haue beene Latine, and *Saxifraga*, to ſay againe preſently after, that the Romanes called it *Saxifranga*, or *Saxifraga*, for ſo it would be and not *Sarxifranga*: but I feare that the affinitie of ſounds more than of ſignification hath cauſed this confuſion, eſpecially in the middle times betweene vs and *Dioſcorides*, when learning was at a very low ebbe. The chiefe reaſons that induce me to thinke this chapter worthy to keepe his former place in *Dioſcorides*, are theſe: Firſt, the generall conſent of all both of Greeke and Latine copies (as *Marcellus* ſaith) how antient ſoeuer they be. Secondly, the mention of this herbe, for the ſame effect in ſome Greeke Authors of a reaſonable good antiquitie; for *Paulus Ægineta* teſtifieth, that Σαρξίφαγος διουρητικόν ἐστι καὶ λίθων θρυπτικόν. Then *Trallianus* amongſt other things in a *Conditum Nephriticum* mentions Σαρξίφαγον: but *Nonus* a later Greeke calls it Σαξίφραγος: ſo that it is euident they knew and vſed ſome ſimple medicine that had both the names of *Sarxiphagon* and *Saxiphragos*, which is the Latine *Saxifraga*. Now ſeeing they had, and knew ſuch a ſimple medicine, it remaines we enquire after the ſhape and figure thereof. *Dioſcorides* deſcribes it to be a ſhrubby plant, growing vpon rockes and craggie places, like vnto *Epithymum*. boyled in wine and drunke, it hath the faculty to helpe the Strangurie and Hicket; it alſo breakes the ſtone in the bladder and prouokes vrine. This word *Epithymum* is not found in moſt copies, but a ſpace left for ſome word or words that were wanting: But *Marcellus* ſaith, he found it expreſt in a booke which was *Omnium vetuſtiſſimus & probatiſſimus*: and *Hermolaus Barbarus* ſaith, *Veterum in* Dioſcoride *picturam huius herbæ vidi, non plus folijs quam cirris minutis per ramos ex intervallo conditis, nec frequentibus, in cacumine ſurculorum flocci ſeu arentes potius quam floſculi, ſubrubida radice non ſiue fibris.* A figure reaſonable well agreeing with this deſcription of *Hermolaus*, I lately receiued from my friend M^r^ *Goodyer*, who writ to me that he had ſought to know what *Saxifraga* (to wit, of the Ancients) ſhould be: and finding no antient Author that had deſcribed it to any purpoſe, he ſought *Apuleius*; which word *Apuleius* (ſaith he) is the printed title: my Manuſcript acknowledgeth no Author but *Apolienſis Plato*; there is no deſcription neither, but the Manuſcript hath a figure which I haue drawne and ſent you, and all that *verbatim* that he hath written of it, I ſhould be glad to haue this figure cut and added to your worke, together with his words, becauſe there hath beene ſo little written thereof by the Antients. This his requeſt I though fit to performe, and haue (for the better ſatisfaction of the Reader) as you ſee made a further enquirie thereof: wherefore I will onely adde this, that the plants here deſcribed, and the *Alſine Saxifraga* of *Colum.* together with the two Chickweed *Saxifrages* formerly deſcribed Chap. 171. come neereſt of any that I know to the figure and delineation of this of the Antients.

Nomen iſtius herbæ, Saxifraga.



Icon & deſcriptio ex Manuſcripto vetuſtiſſimo.

Quidam dicunt eam Scolopendriam, alij Scoliomos, alij Vitis canum, quidam vero Brucos. Itali Saxifragam. Egyptij Peperem, alij Lamprocam eam nominant. Naſcitur enim in Montibus & locis ſaxoſis.

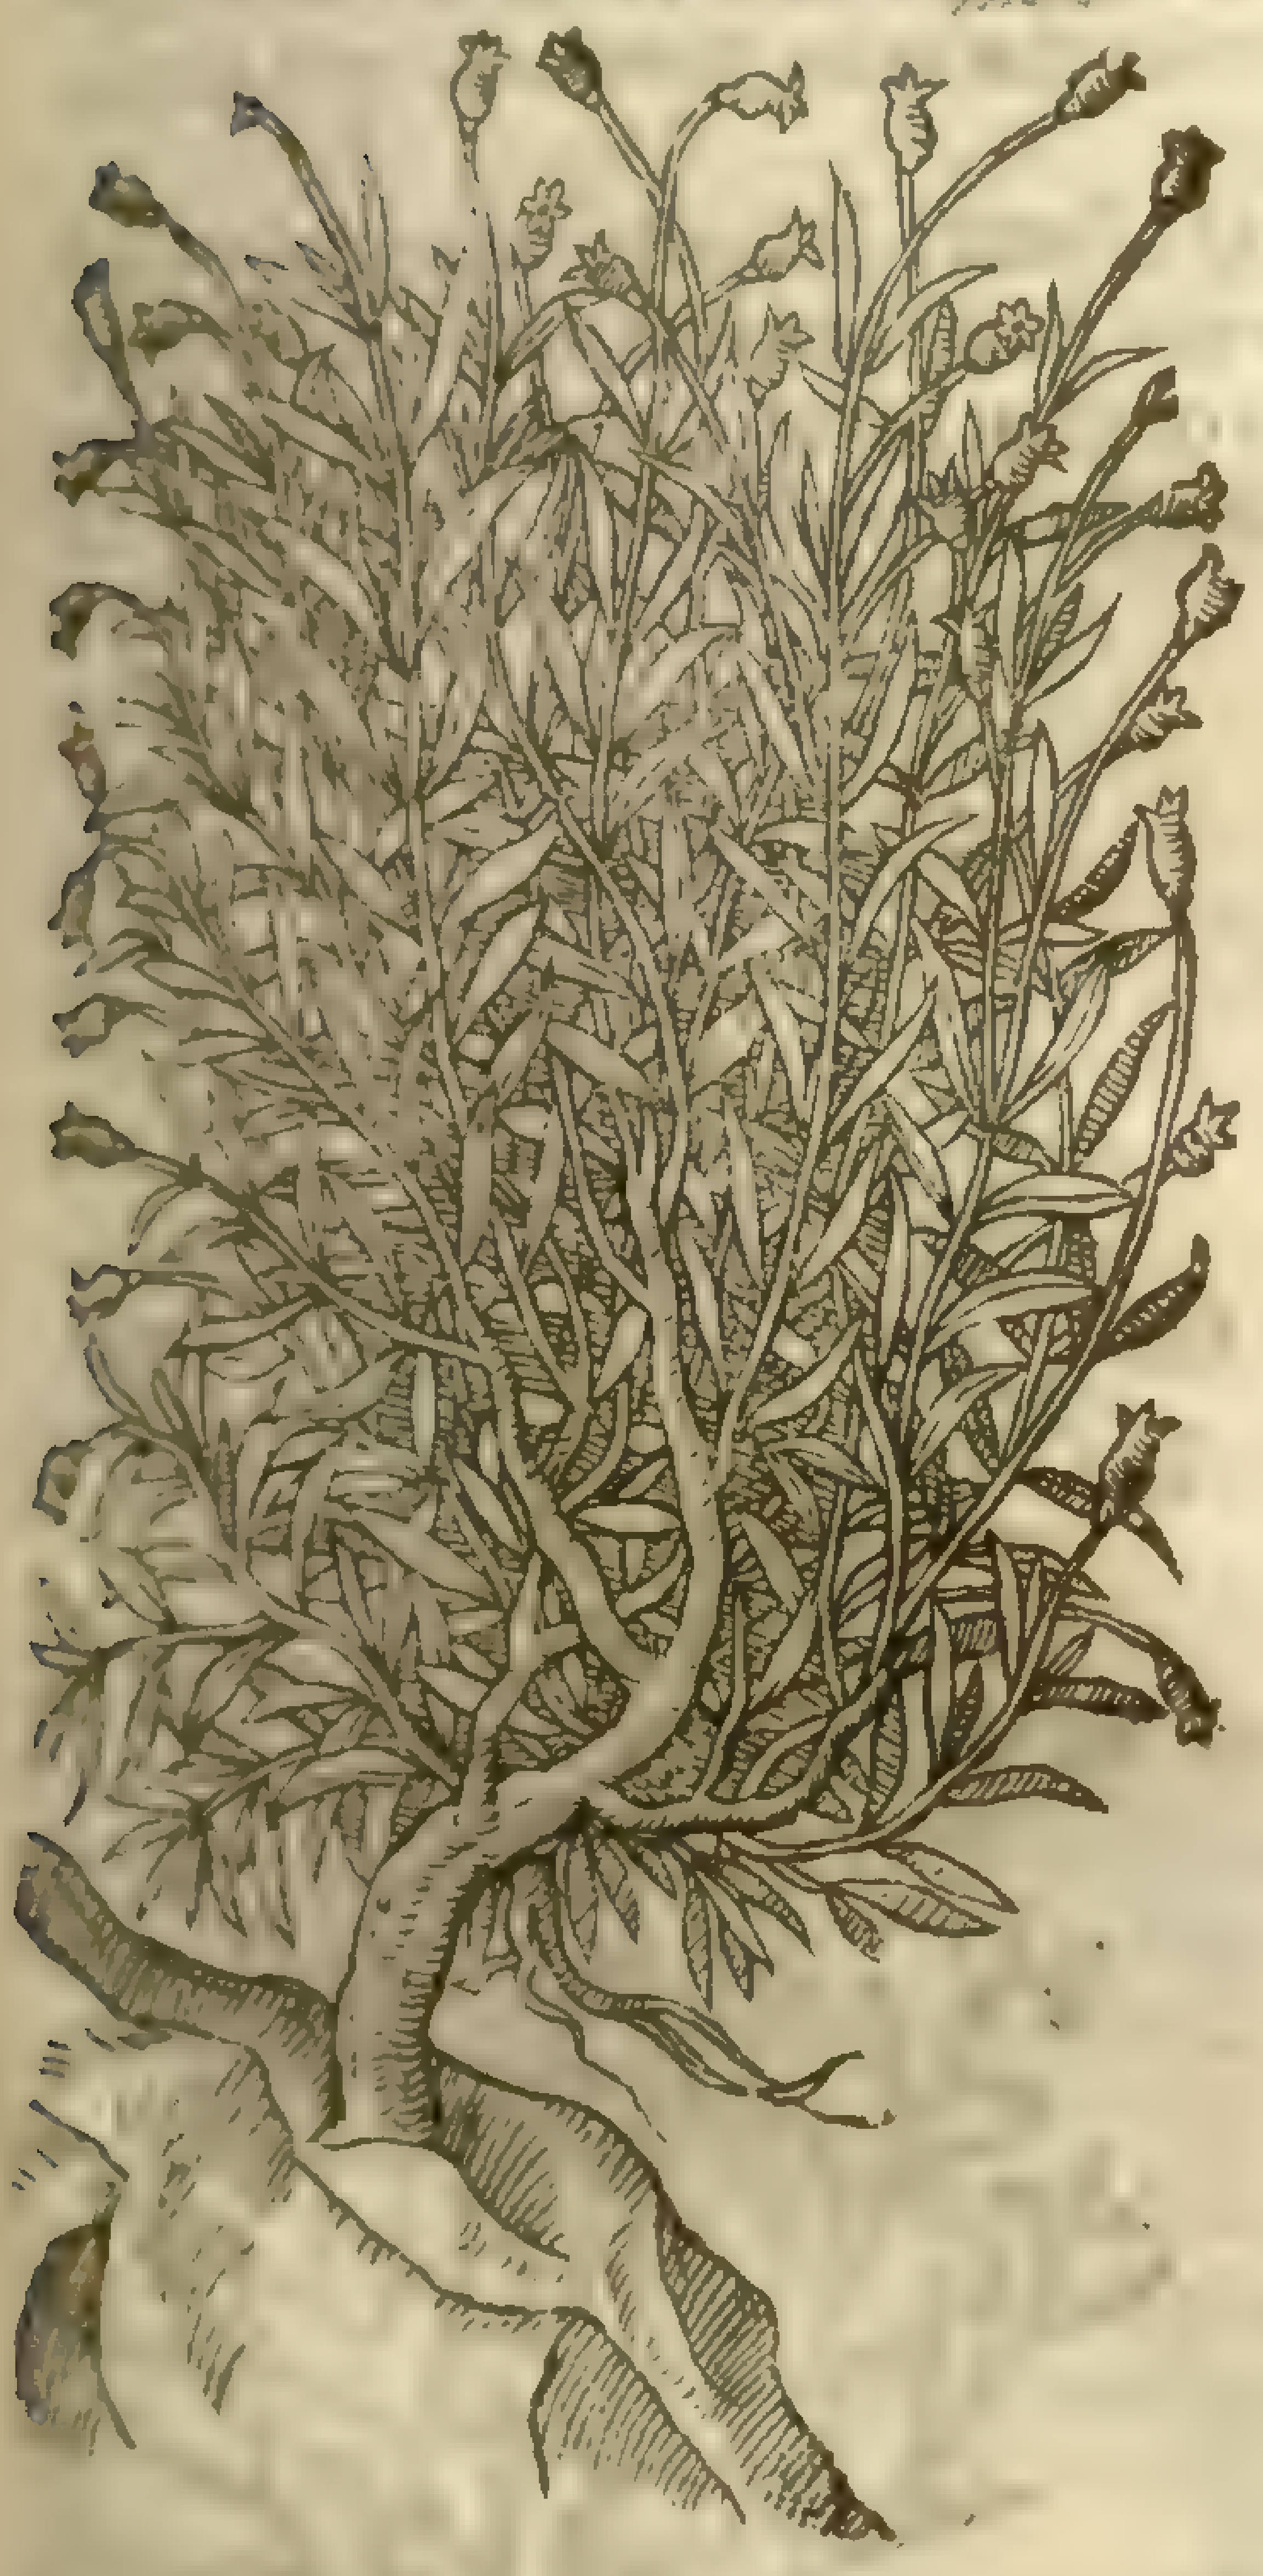
Vna cura ipſius ad calculos expellendos.

Herbam iſtam Saxifragam contuſam calculoſo potum dabis in vino. Ipſe vero ſi febricitauerit cum aqua calida, tam preſens effectum ab expertis traditum, vt eodem die perfectis eiectiſque calculis ad ſanitatem vſque producit.

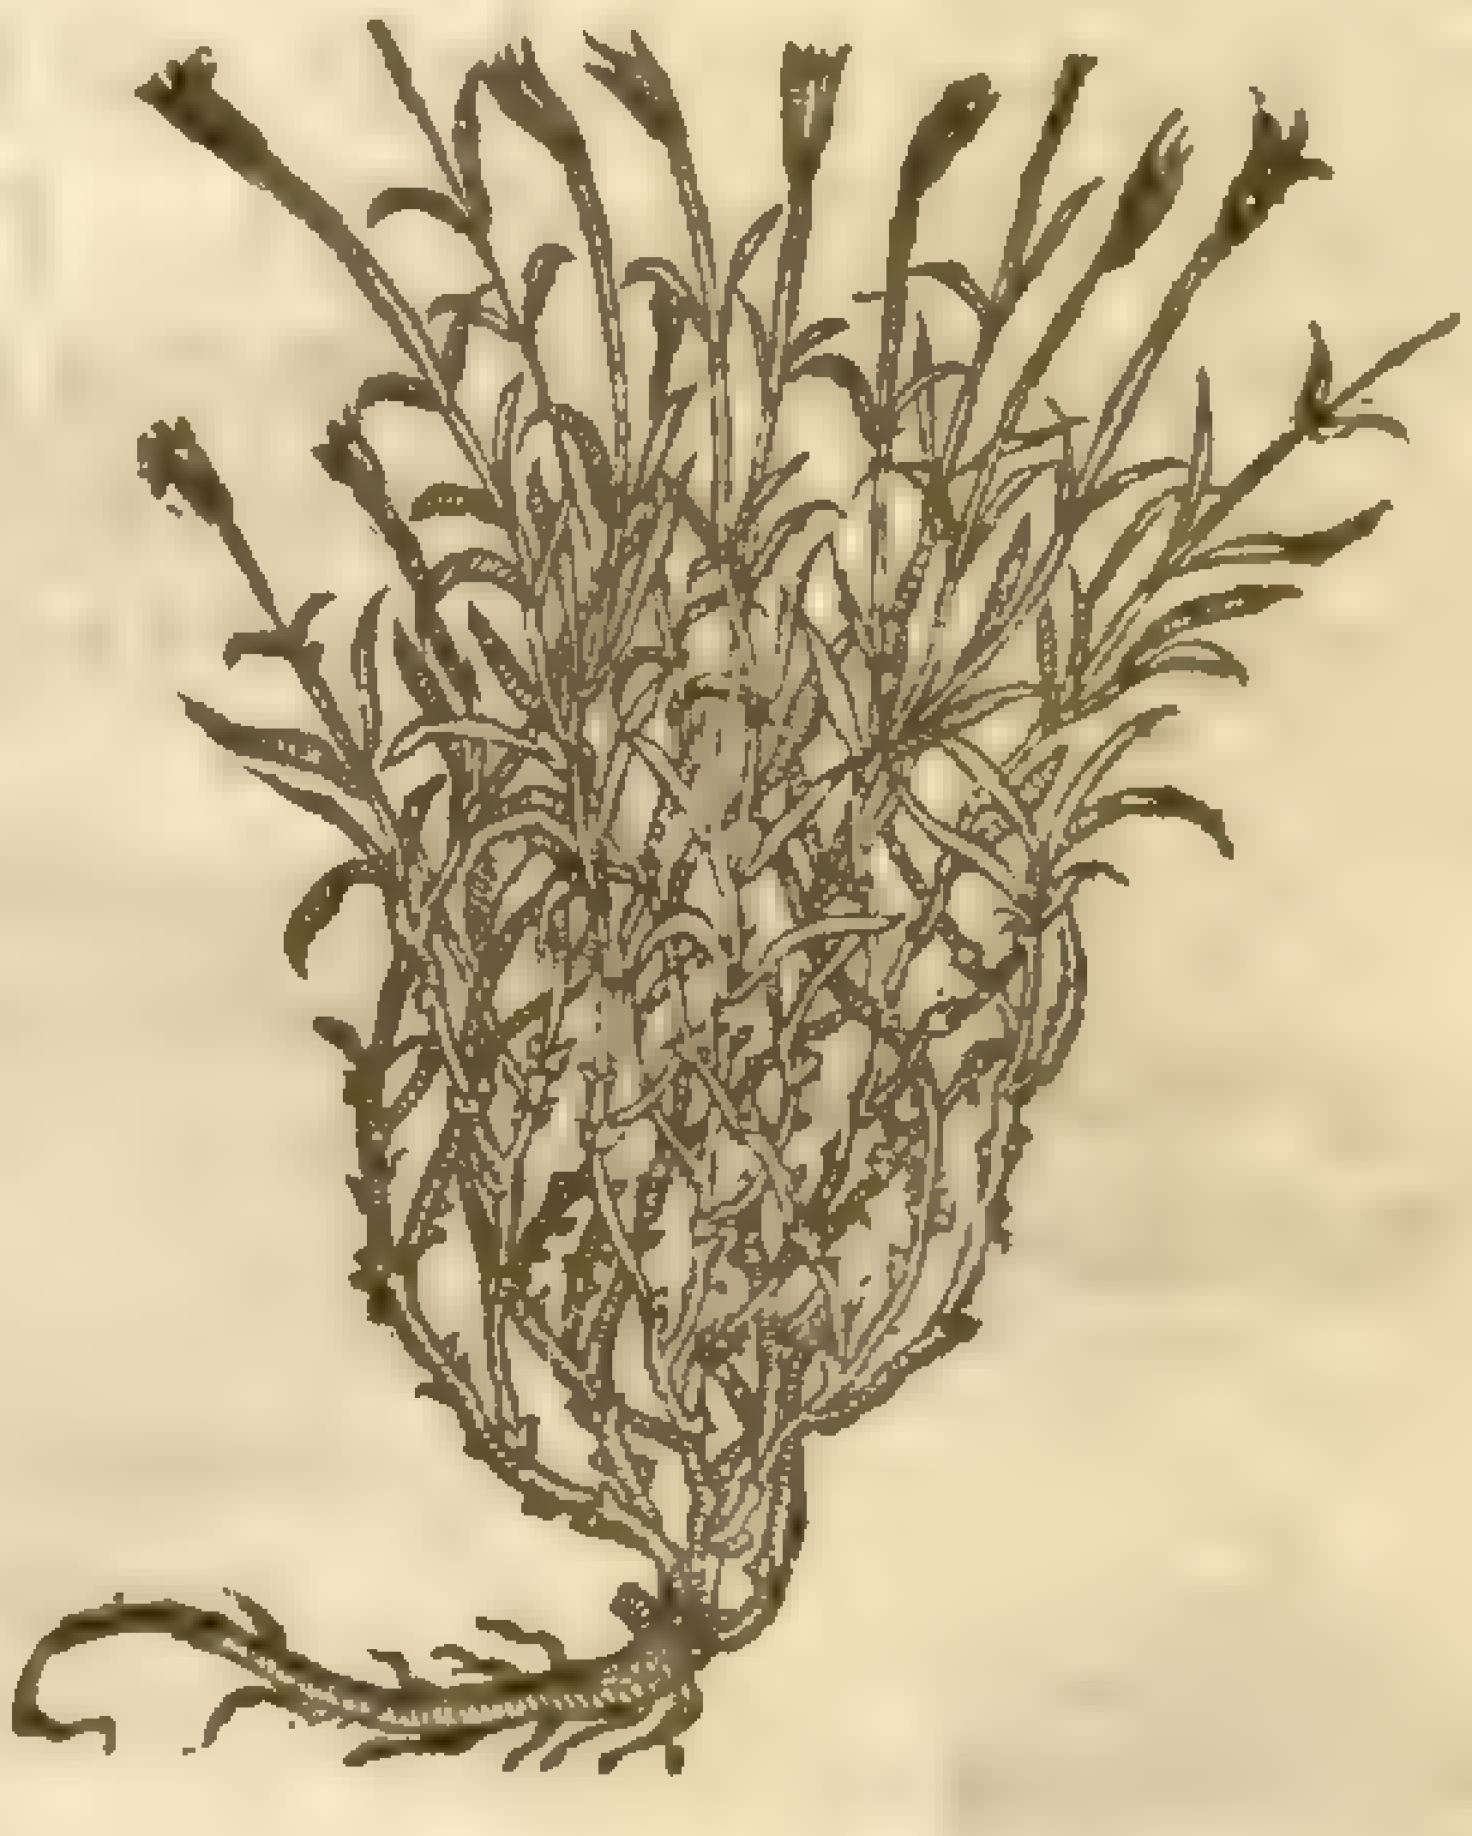
1 This firſt little herbe, ſaith *Camerarius*, hath been called *Saxifraga magna*, not from the greatneſſe of his growth, but of his faculties: The ſtalke is wooddie,

writhen, and below ſometimes as thicke as ones little finger, from which grow many ſmall and hard branches, and thoſe ſlender ones; the leaues are little, long and ſharpe pointed: the floures are white and ſmall, and grow in cups, which are finely ſnipt at the top in manner of a coronet, wherein is contained a ſmall red ſeed: the roots grow ſo faſt impact in the Rockes, that they cannot by any means be got out. It grows vpon diuers rocks in Italy and Germany; and is the *Saxifraga magna* of *Matthiolus*, and the Italians.

‡ 1 *Saxifraga magna Matthioli.*
Matthiolus his great Saxifrage.
Silene [illegible]



‡ 2 *Saxifraga Antiquorum, Lob.*
Saxifrage of the Antients, according to *Lob.*



2 *Pena* and *Lobel* ſay, this growes in great plenty in Italie, in Dolphonie in France, and England, hauing many ſmall ſlender branches a foot high, intricately wrapped within one another, where they are ſet with many graſſie joints: the root is ſmall and white, with ſome few fibres: the leaues ſtand by couples at the joints, being long and narrow; of the bigneſſe and ſimilitude of thoſe of the wild Pinkes, or Rocke Sauorie: vpon each wooddie, ſmall, capillarie, ſtraight, and creeping little branch, grows one little flour ſomwhat like a Pinke, being finely ſnipt about the edges: and in the head is contained a round ſmall reddiſh ſeed. The foreſaid Authors call this *Saxifragia, ſiue Saxifraga Antiquorum.*

¶ *The Vertues.*

1 *Matthiolus* ſaith, that *Calceolarius* of Verona mightily commended this plant to him, for the ſingular qualitie it had to expell or driue forth the ſtone of the kidneies, and that I might in verie deed beleeue it, he ſent me abundance of ſtones, whereof diuers exceeded the bigneſſe of a beane, which were voided by drinking of this plant by one onely Citizen of Verona, called *Hieronymo de Tortis*; but this made me moſt to wonder, for that there were ſome ſtones among them that ſeemed rather to come out of the Bladder, than forth of the Kidneies. A

2 This (ſay the Authors of the *Adverſ.*) as it is the lateſt receiued in vſe and name for Saxifrage, ſo is it the better and truer, eſpecially ſo thought by the Italians, both for the highly commended facultie, as alſo for the neere affinitie which it ſeems to haue with *Epithymum*, &c. ‡ B

Chap. 189.

Of Sneeſewoort.

¶ *The Deſcription.*

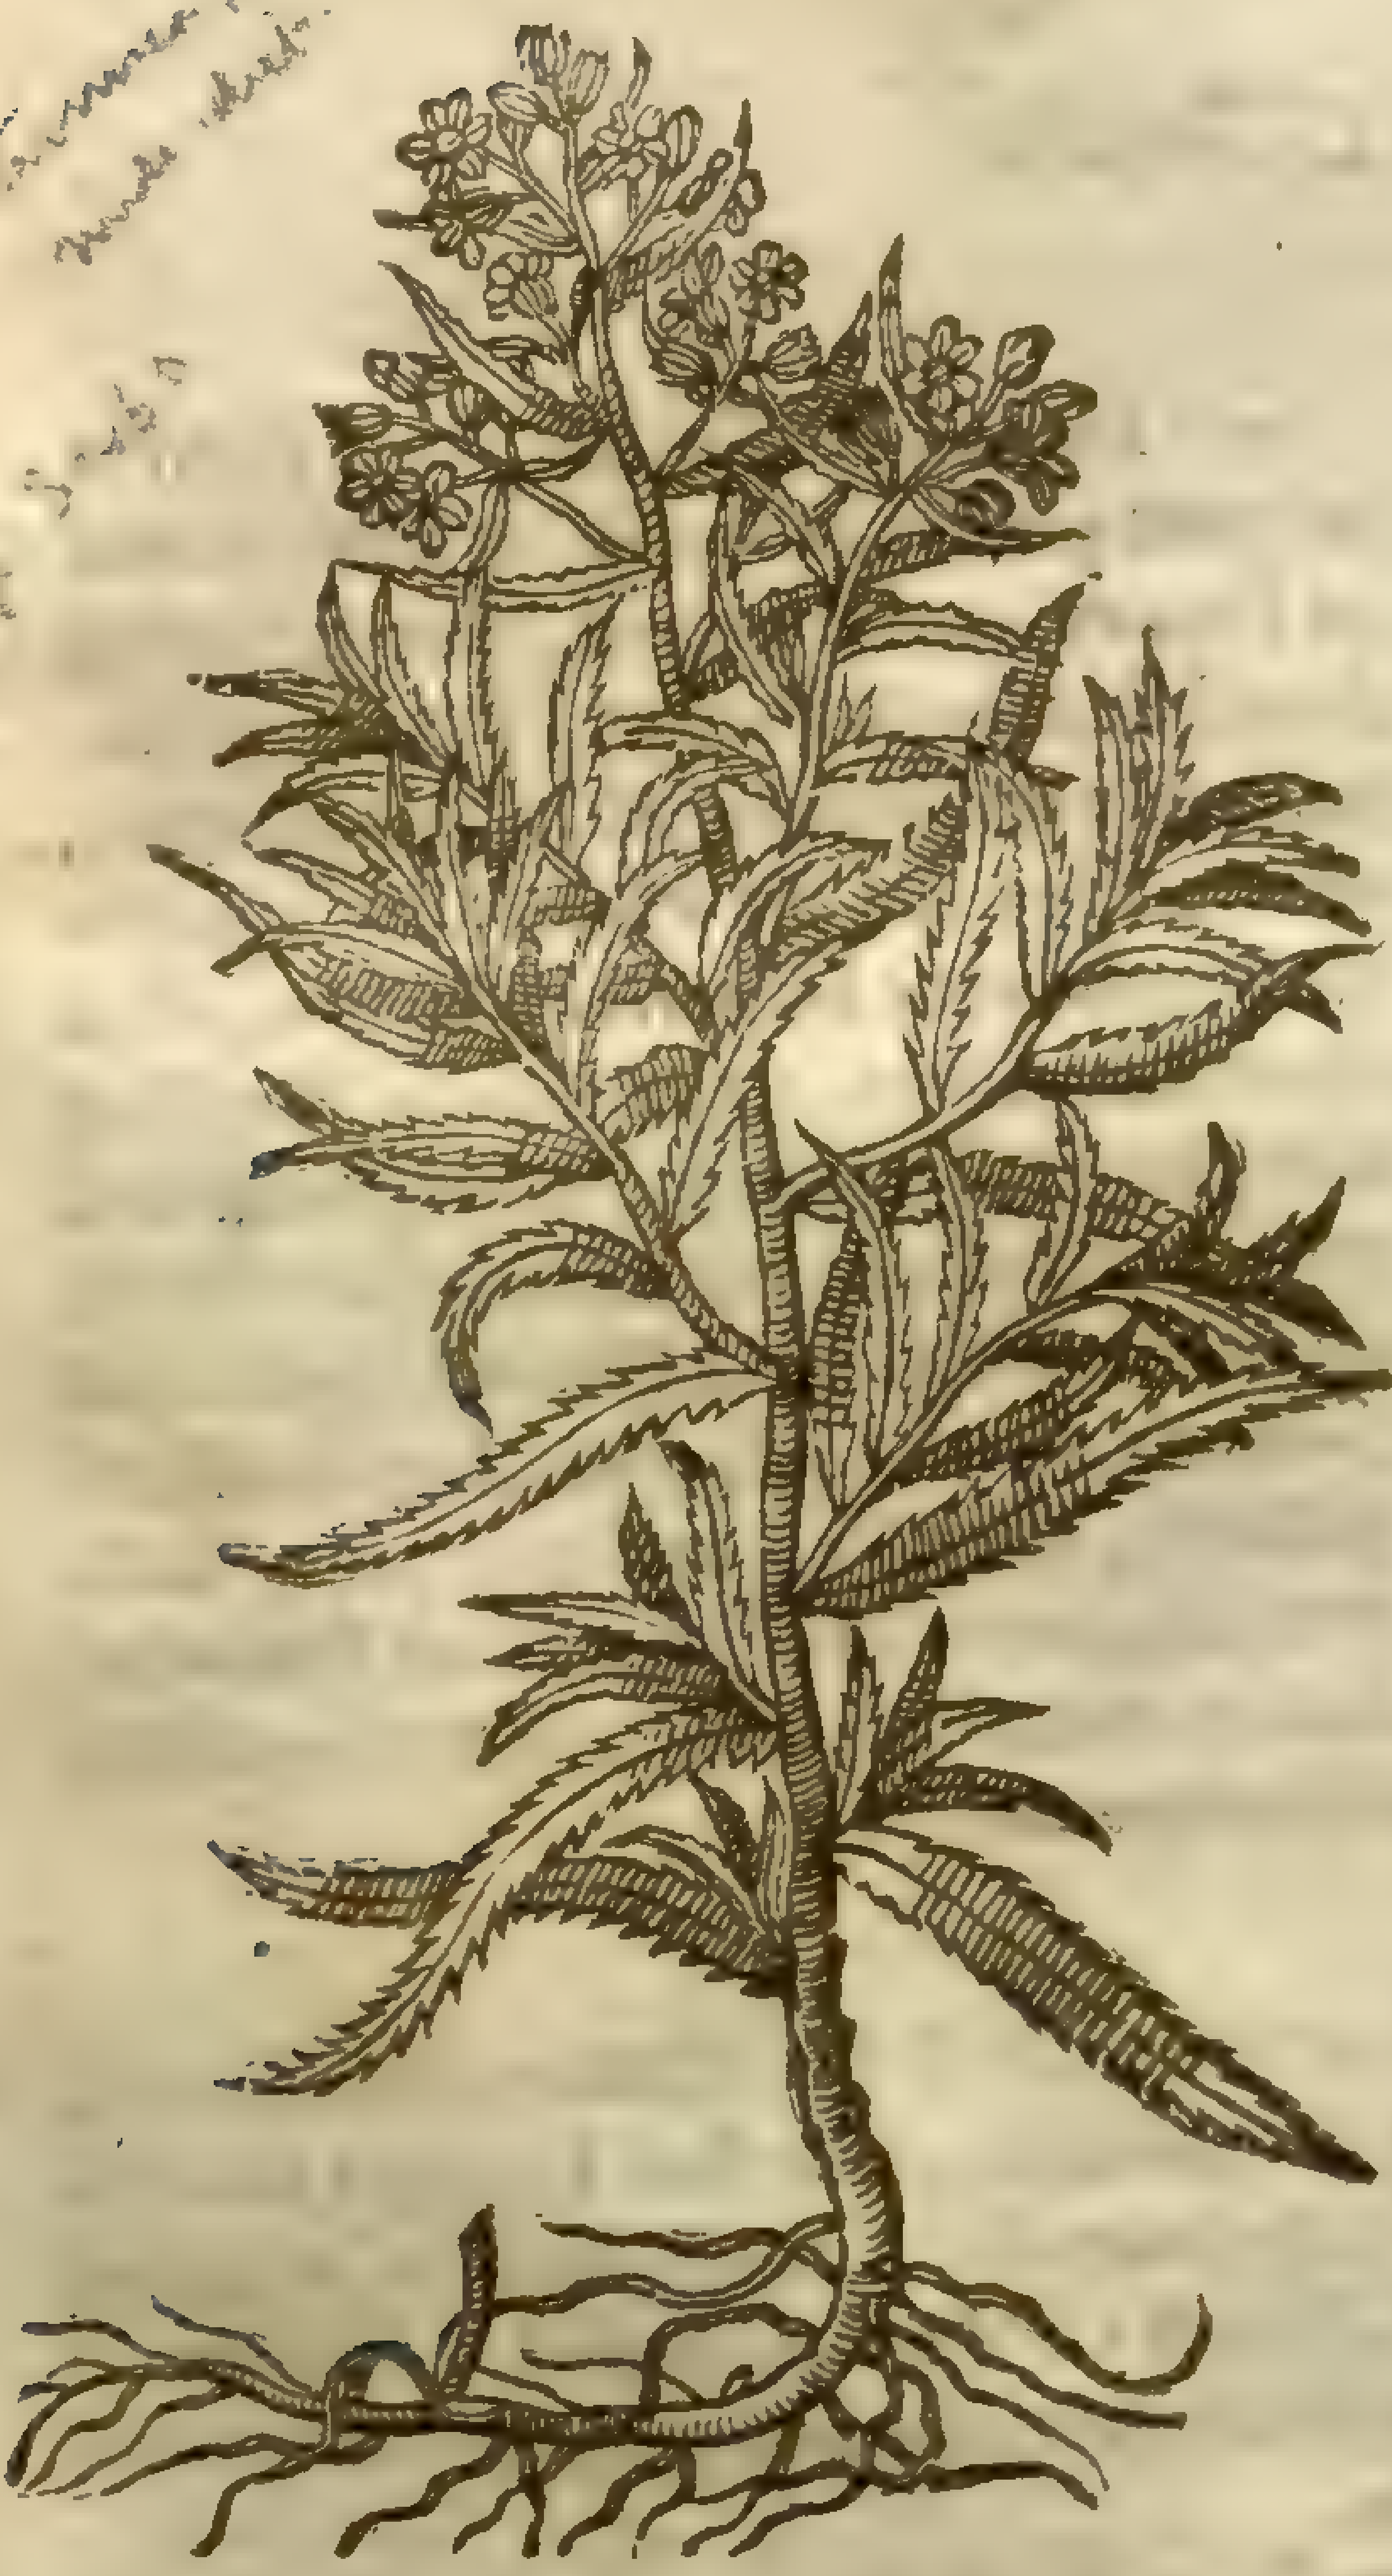
1 THe ſmall Sneeſe-woort hath many round and brittle branches, beſet with long & narrow leaues, hackt about the edges like a ſaw; at the tops of the ſtalks do grow ſmal ſingle floures like the wild field Daiſie. The root is tender and full of ſtrings, creeping far abroad in the earth, and in ſhort time occupieth very much ground: the whole plant is ſharp, biting the tongue and mouth like Pellitorie of Spaine, for which cauſe ſome haue called it wild Pellitorie. The ſmel of this plant procureth ſneeſing, whereof it tooke the name *Sternutamentoria*, that is, the herbe which procureth ſneeſing, or Neeſewoort.

2 Double floured Sneeſwoort, or *Ptarmica*, is like vnto the former in leaues, ſtalks, and roots, ſo that vnleſſe you behold the floure, you cannot diſcerne the one from the other, and it is exceeding white, and double like vnto double Fetherfew. This plant is of great beautie, and if it be cut downe in the time of his flouring there will come within a moneth after a ſupplie or crop of floures fairer than the reſt.

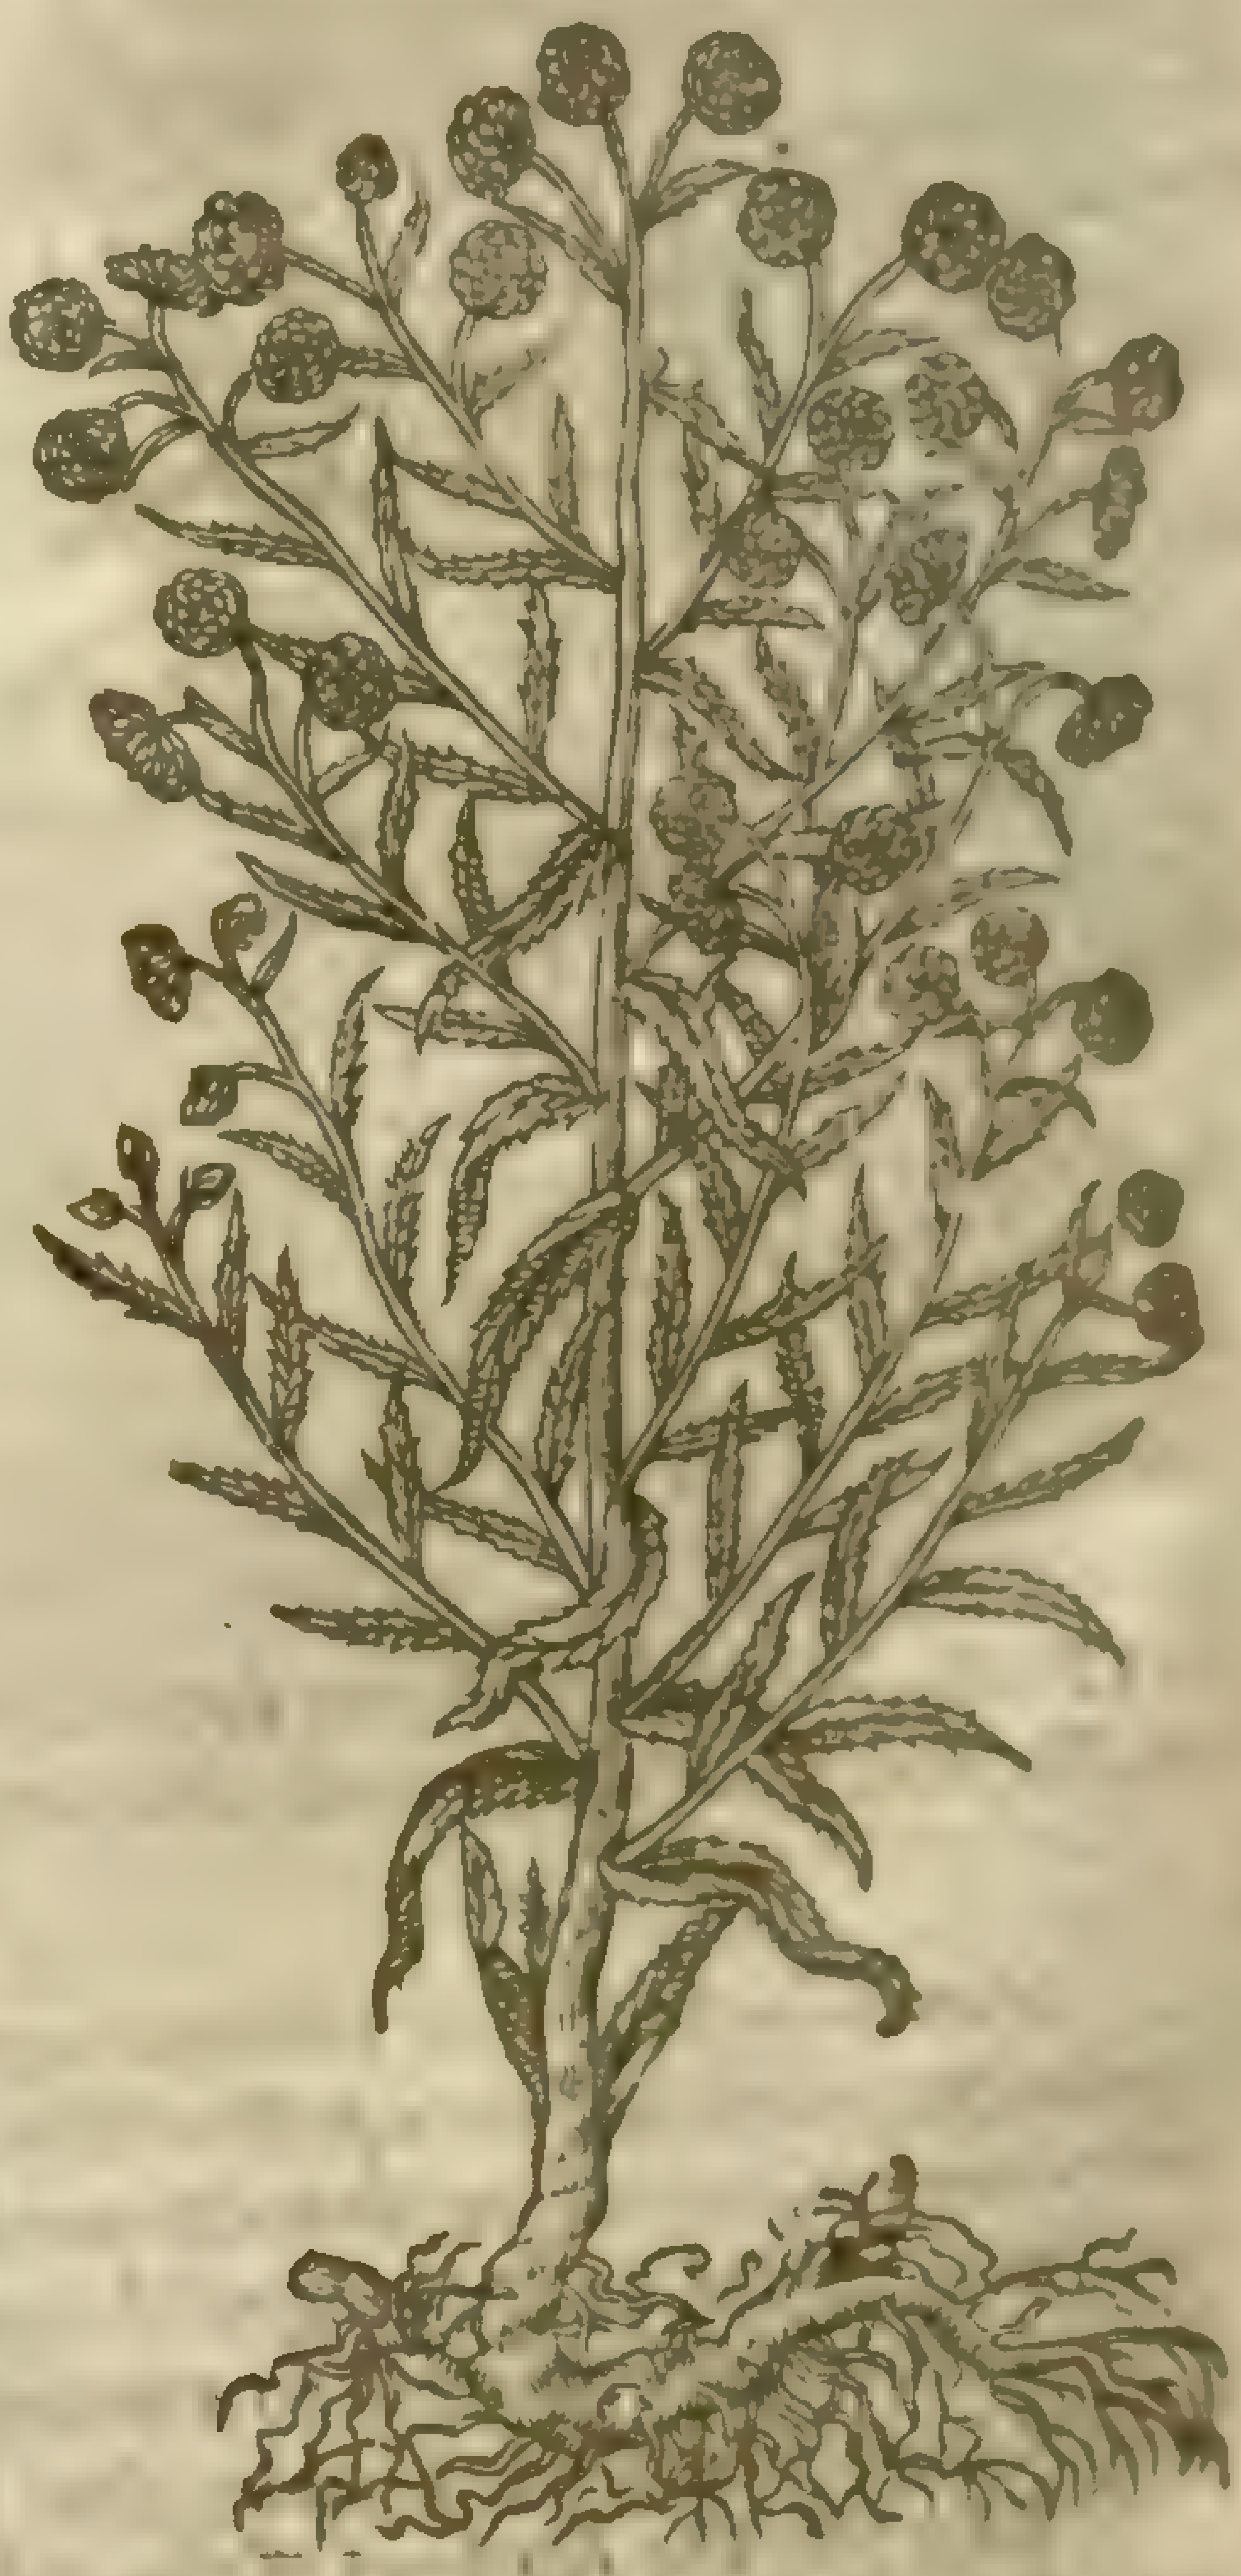
1 *Ptarmica.*
Sneeſewoort.

Achillea ptarmica [illegible]

[illegible]



2 *Ptarmica duplici flore.*
Double floured Sneeſwort.

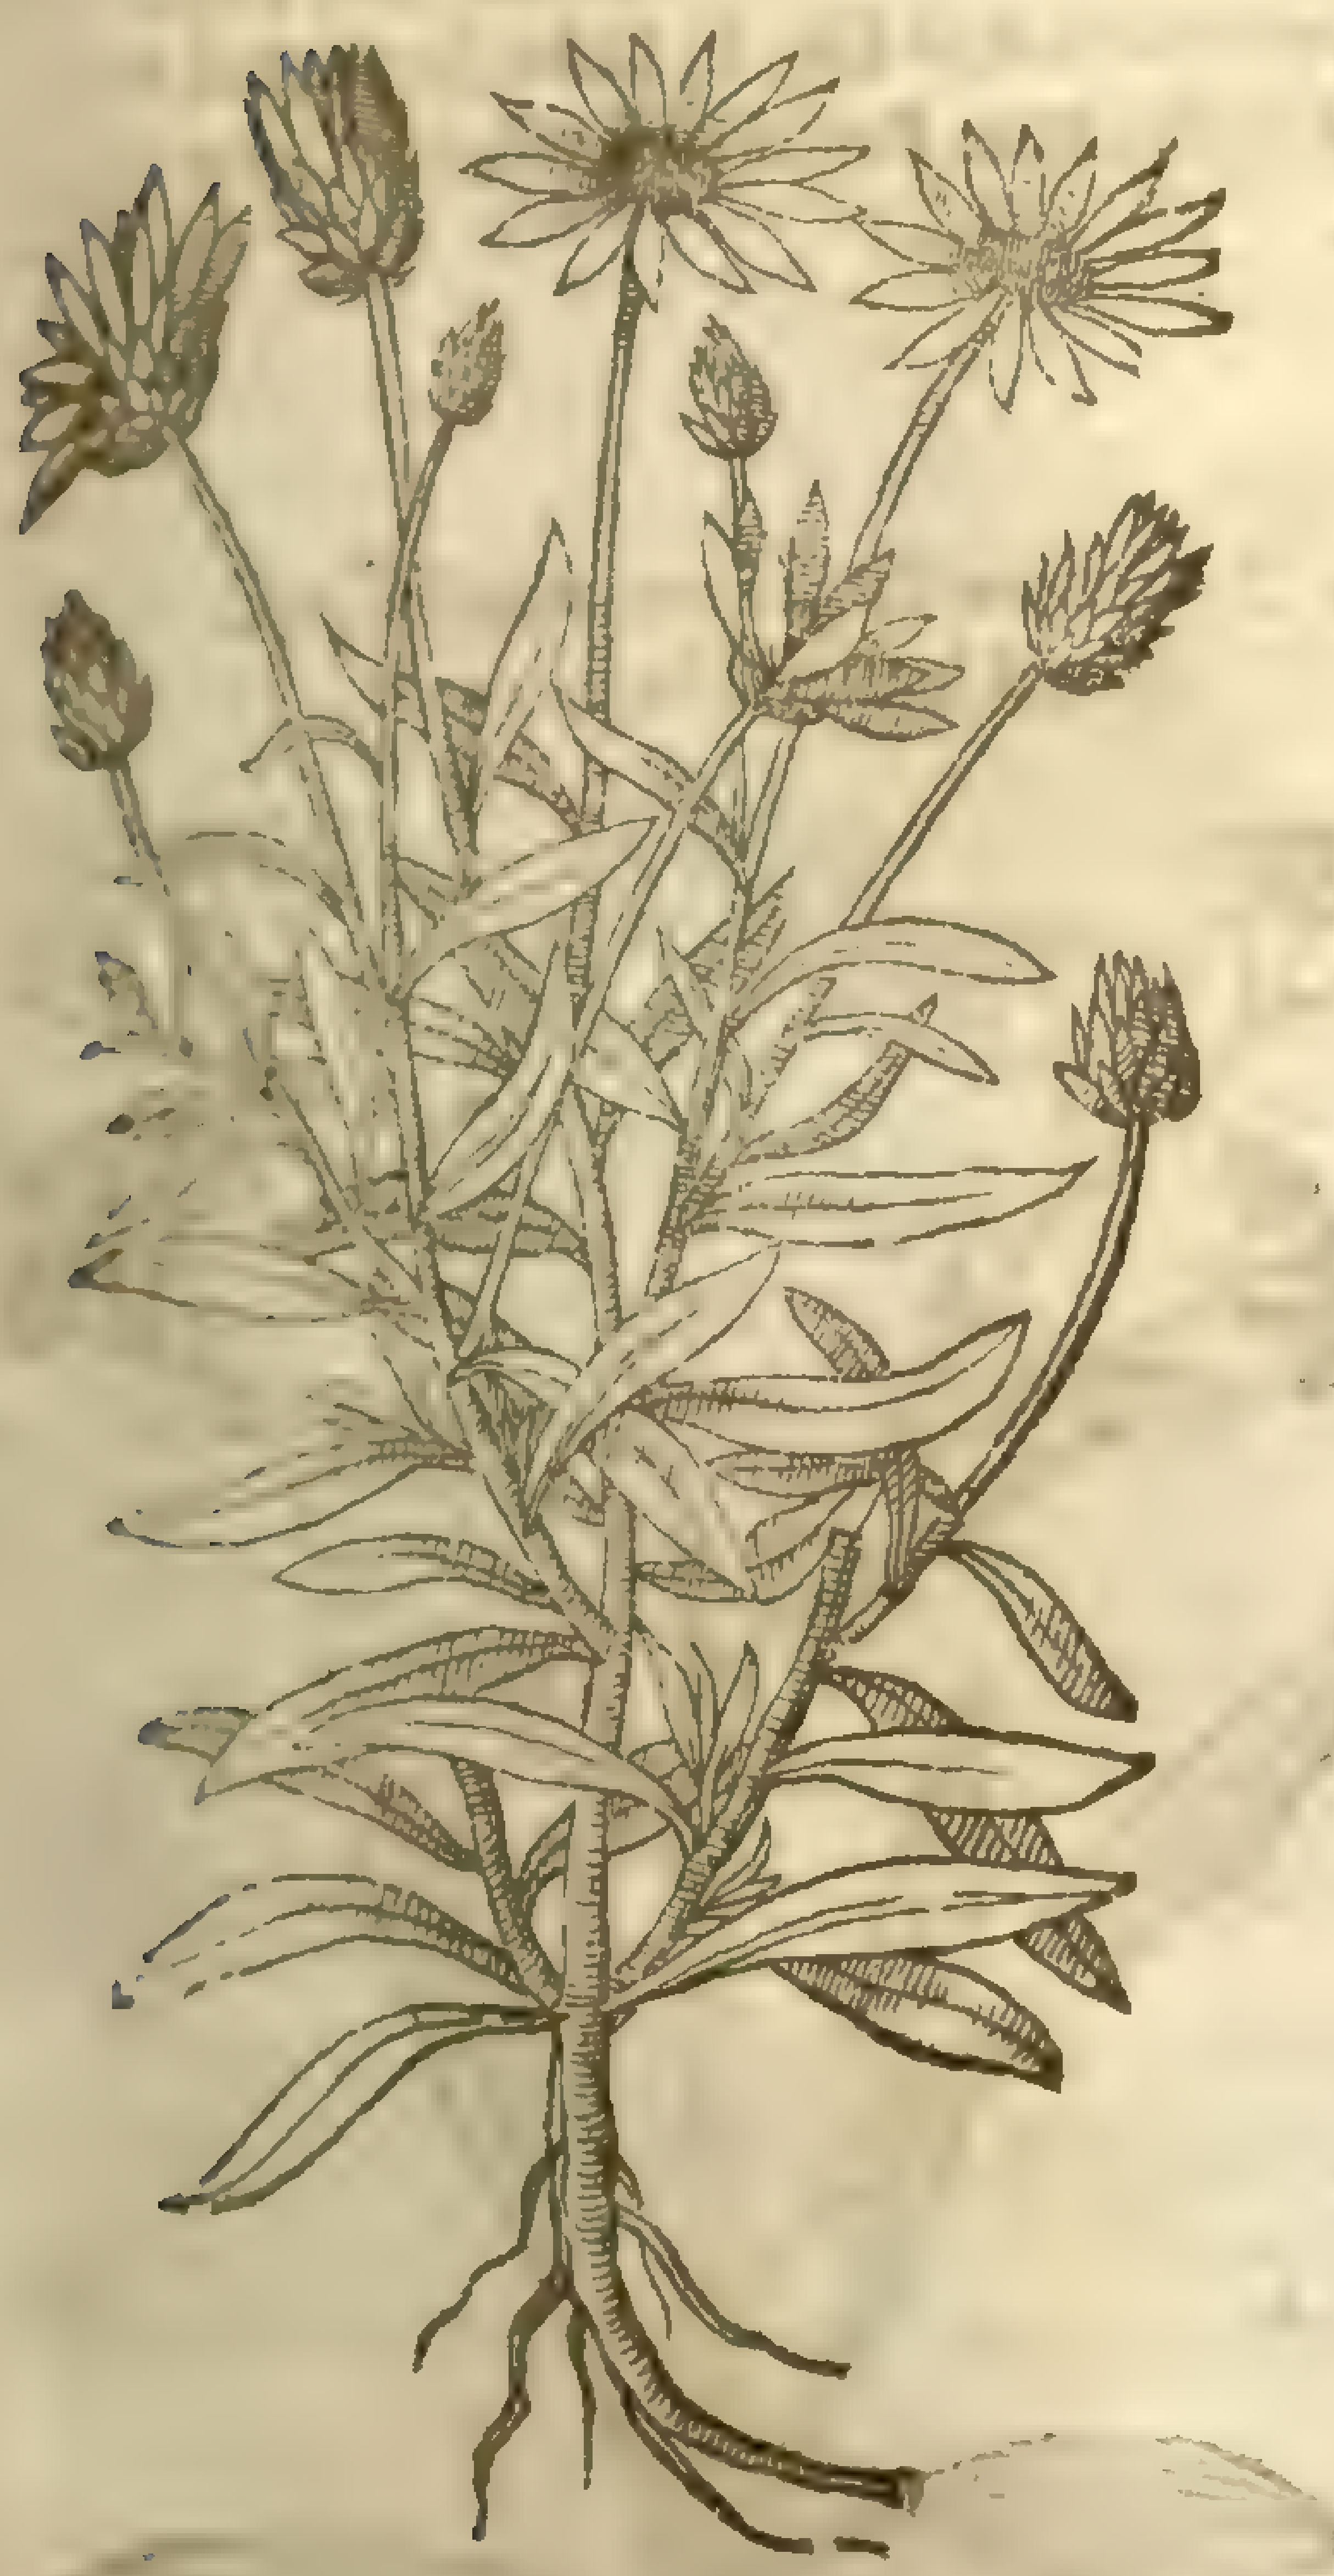


3 There is alſo another kind hereof, of exceeding great beauty, hauing long leaues ſomewhat narrow like thoſe of Oliue tree: the ſtalks are of a cubit high, on the top whereof grow very beautifull floures of the bigneſſe of a ſmall ſingle Marygold, conſiſting of fifteen or ſixteen large leaues, of a bright ſhining red colour tending to purple; ſet about a ball of thrummy ſubſtance, ſuch as is in the middle of the Daiſie, in manner of a pale; which floures ſtand in ſcalie knops like thoſe of Knapweed or Matfellon. The root is ſtraight, and thruſteth deepe into the ground.

‡ *Ptarmica Imperati; an Ptarmicæ Auſtriacæ ſpecies Cluſ. Cur. poſt. p. 32?*

4 This riſeth vp with a ſmall hard tough cornered whitiſh woolly ſtalke, diuided into many branches,

3 *Ptarmica Auſtriaca.*
Sneeſewort of Auſtrich.



branches, & thoſe againe diuided into other branches, like thoſe of *Cyanus*, about two foot high, wheron grow long narrow whitiſh cottony leaues without order, of a bitter taſt, whiter below than aboue, of the colour of the leaues of Wormewood, hauing but one rib or ſinew, and that in the middle of the leafe, and commonly turne downewards: on the top of each ſlender branch groweth one ſmall ſcaly head or knap like that of *Cyanus*, which bringeth forth a pale purple floure without ſmell, containing ſix, ſeuen, eight, or more ſmall hard dry ſharpe pointed leaues; in the middle whereof groweth many ſtiffe chiues, their tops being of the colour of the floures: theſe floures fall not away till the whole herb periſheth, but change into a ruſtie colour: amongſt thoſe chiues grow long flat blackiſh ſeed, with a little beard at the top. The root is ſmall, whitiſh, hard, and threddy, and periſheth when the ſeed is ripe, and ſoon ſpringeth vp by the fall of the ſeed, and remaineth green all the Winter, and at the Spring ſendeth forth a ſtalk as aforeſaid. The herb touched or rubbed ſendeth forth a pleaſant aromaticall ſmell. Iuly *26. 1610.* *Iohn Goodyer.* ‡

¶ *The Place.*

The firſt kind of Sneeſewort growes wild in dry and barren paſtures in many places, and in the three great fields next adioyning to a village neer London called Kentiſh towne, and in ſundry fields in Kent about Southfleet.

† The reſt grow only in gardens.

¶ *The Names.*

Sneeſewort is called of ſome, *Ptarmica*, and *Pyrethrum ſylueſtre*, and alſo *Draco ſylueſtris*, or *Tarcon ſylueſtris*: of moſt, *Sternutamentoria*, taken from his effect, becauſe it procureth ſneeſing: of *Tragus* and *Tabern. Tanacetum acutum album*: in Engliſh, wild Pellitorie, taking that name from his ſharp and biting taſte: but it is altogether vnlike in proportion to the true Pellitorie of Spain.

¶ *The Temperature.*

They are hot and dry in the third degree,

¶ *The Vertues.*

The juice mixed with vineger and holden in the mouth, eaſeth much the pain of the tooth-ach. A

The herb chewed and held in the mouth, bringeth mightily from the braine ſlimie flegme like Pellitorie of Spain; and therefore from time to time it hath bin taken for a wild kinde thereof. B

Chap. 190.

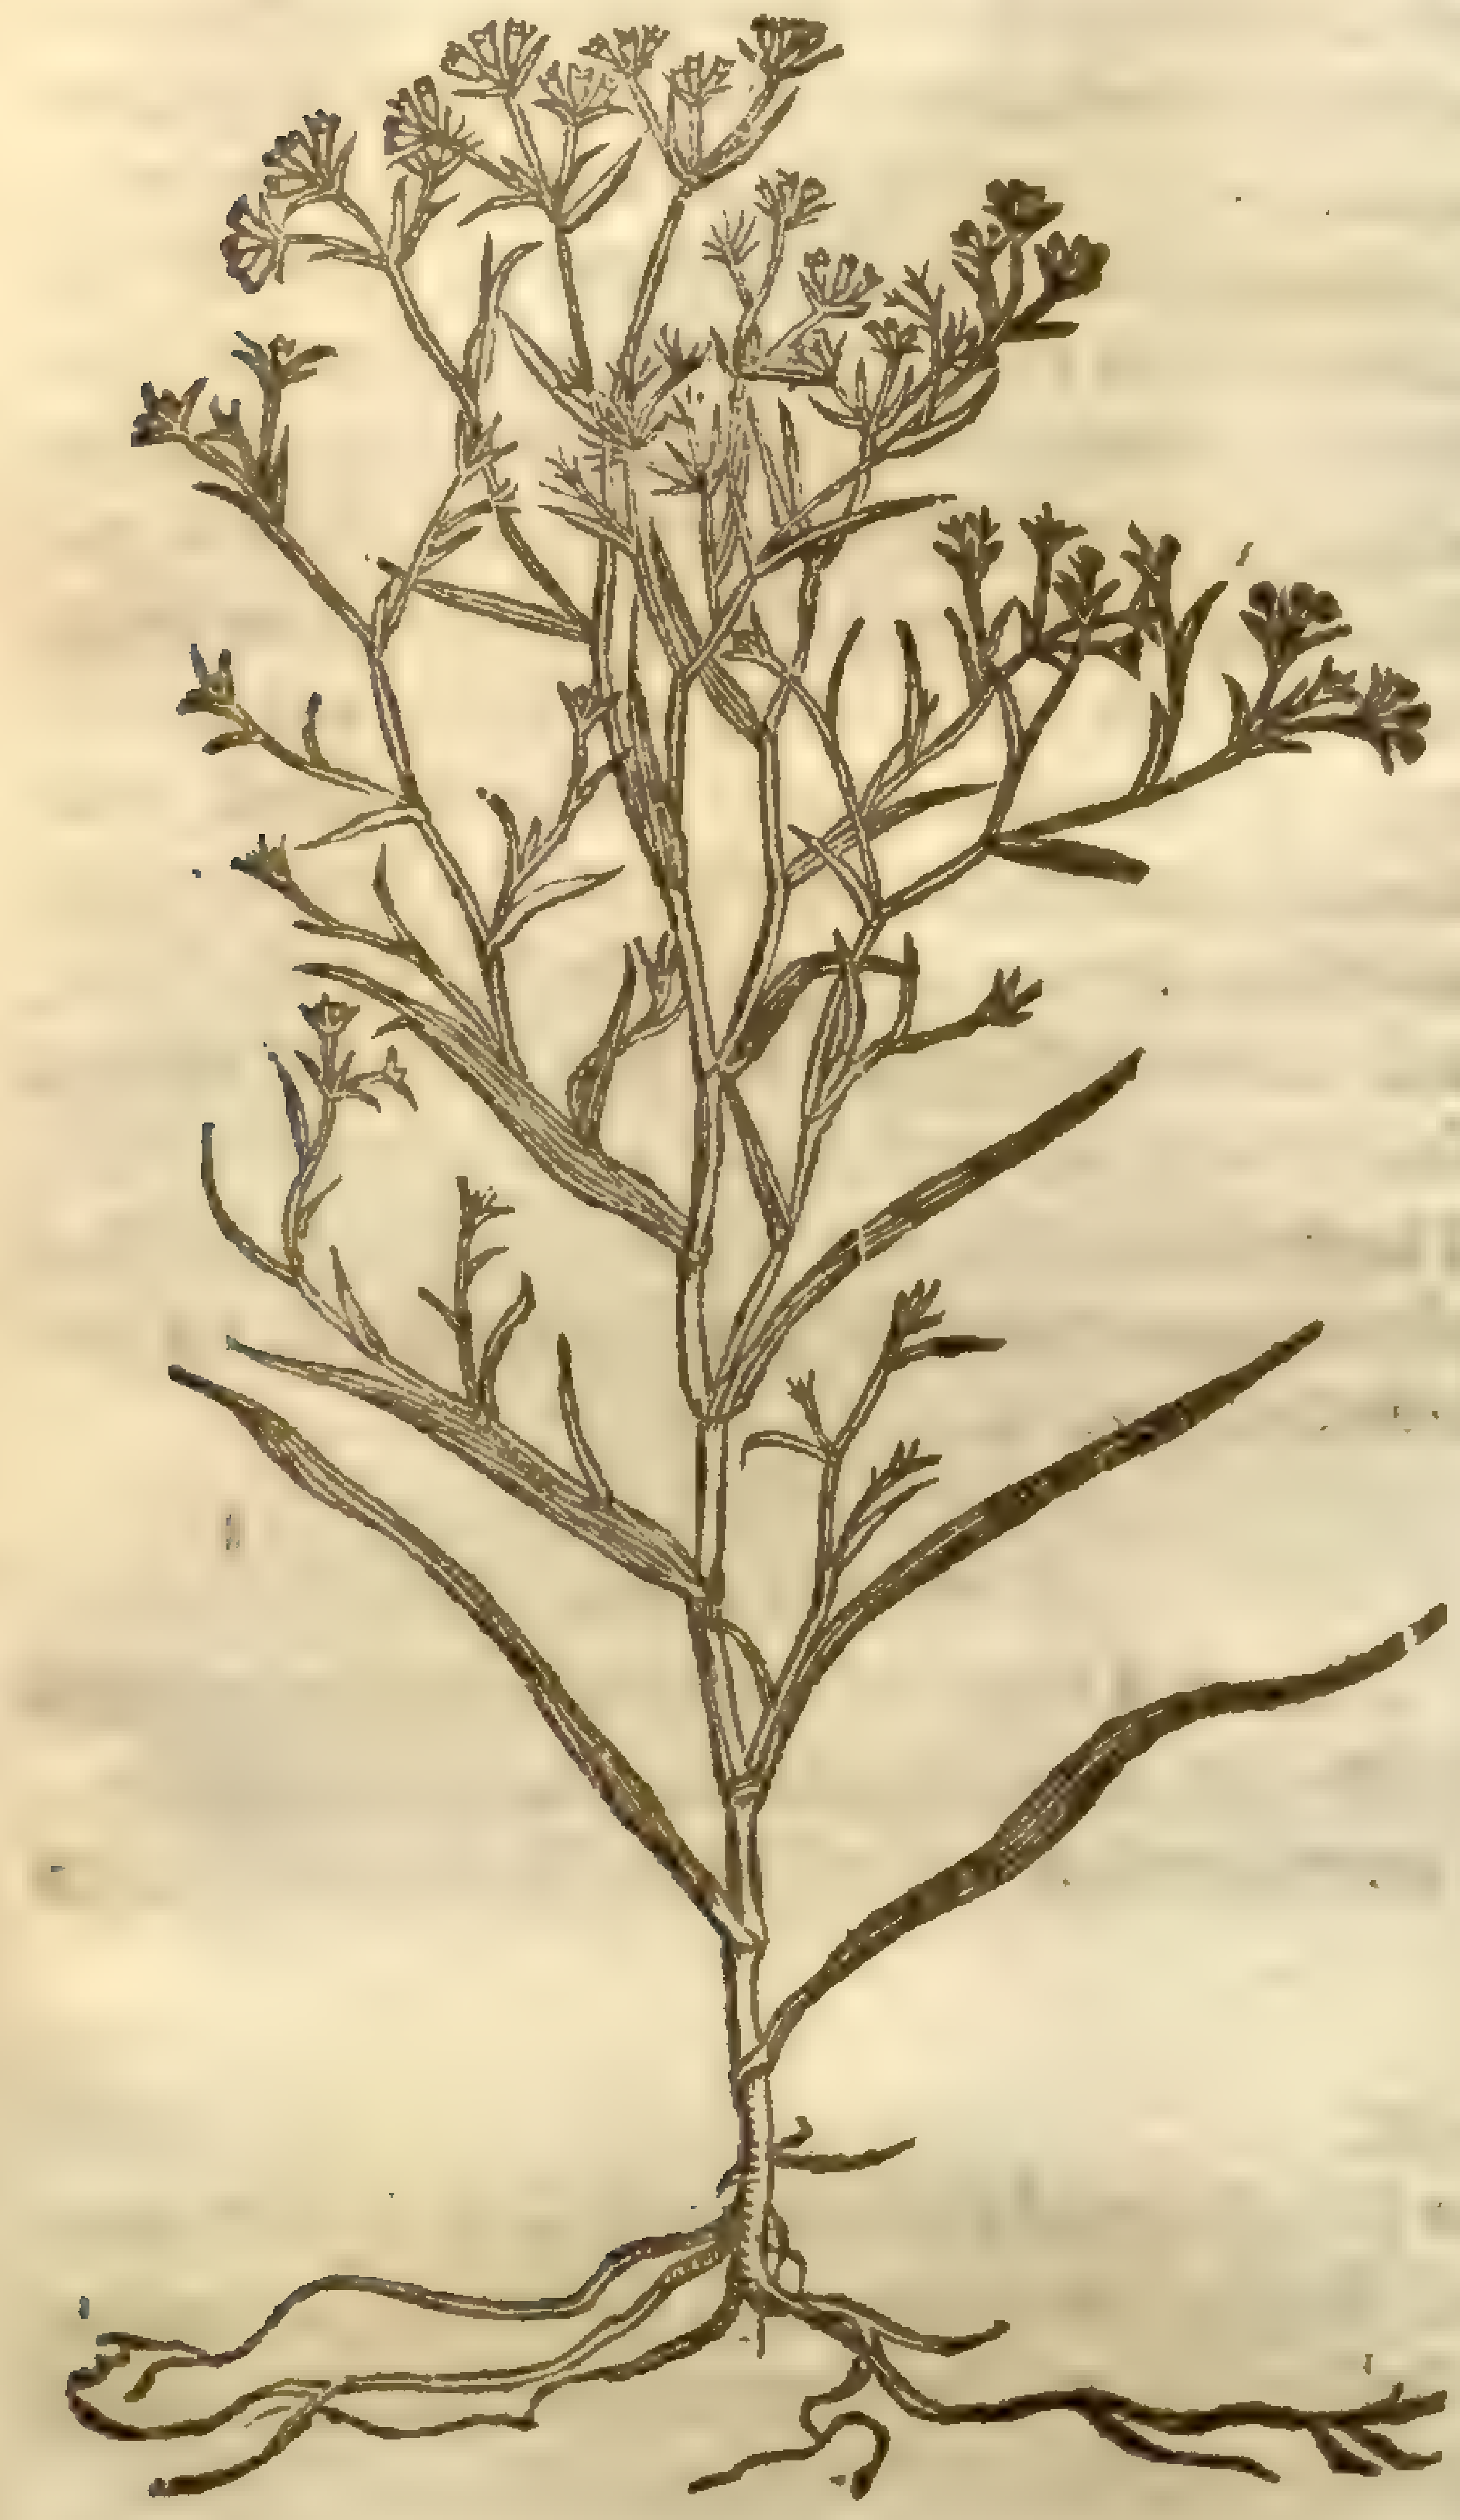
Of Hares Eares.

¶ *The Deſcription.*

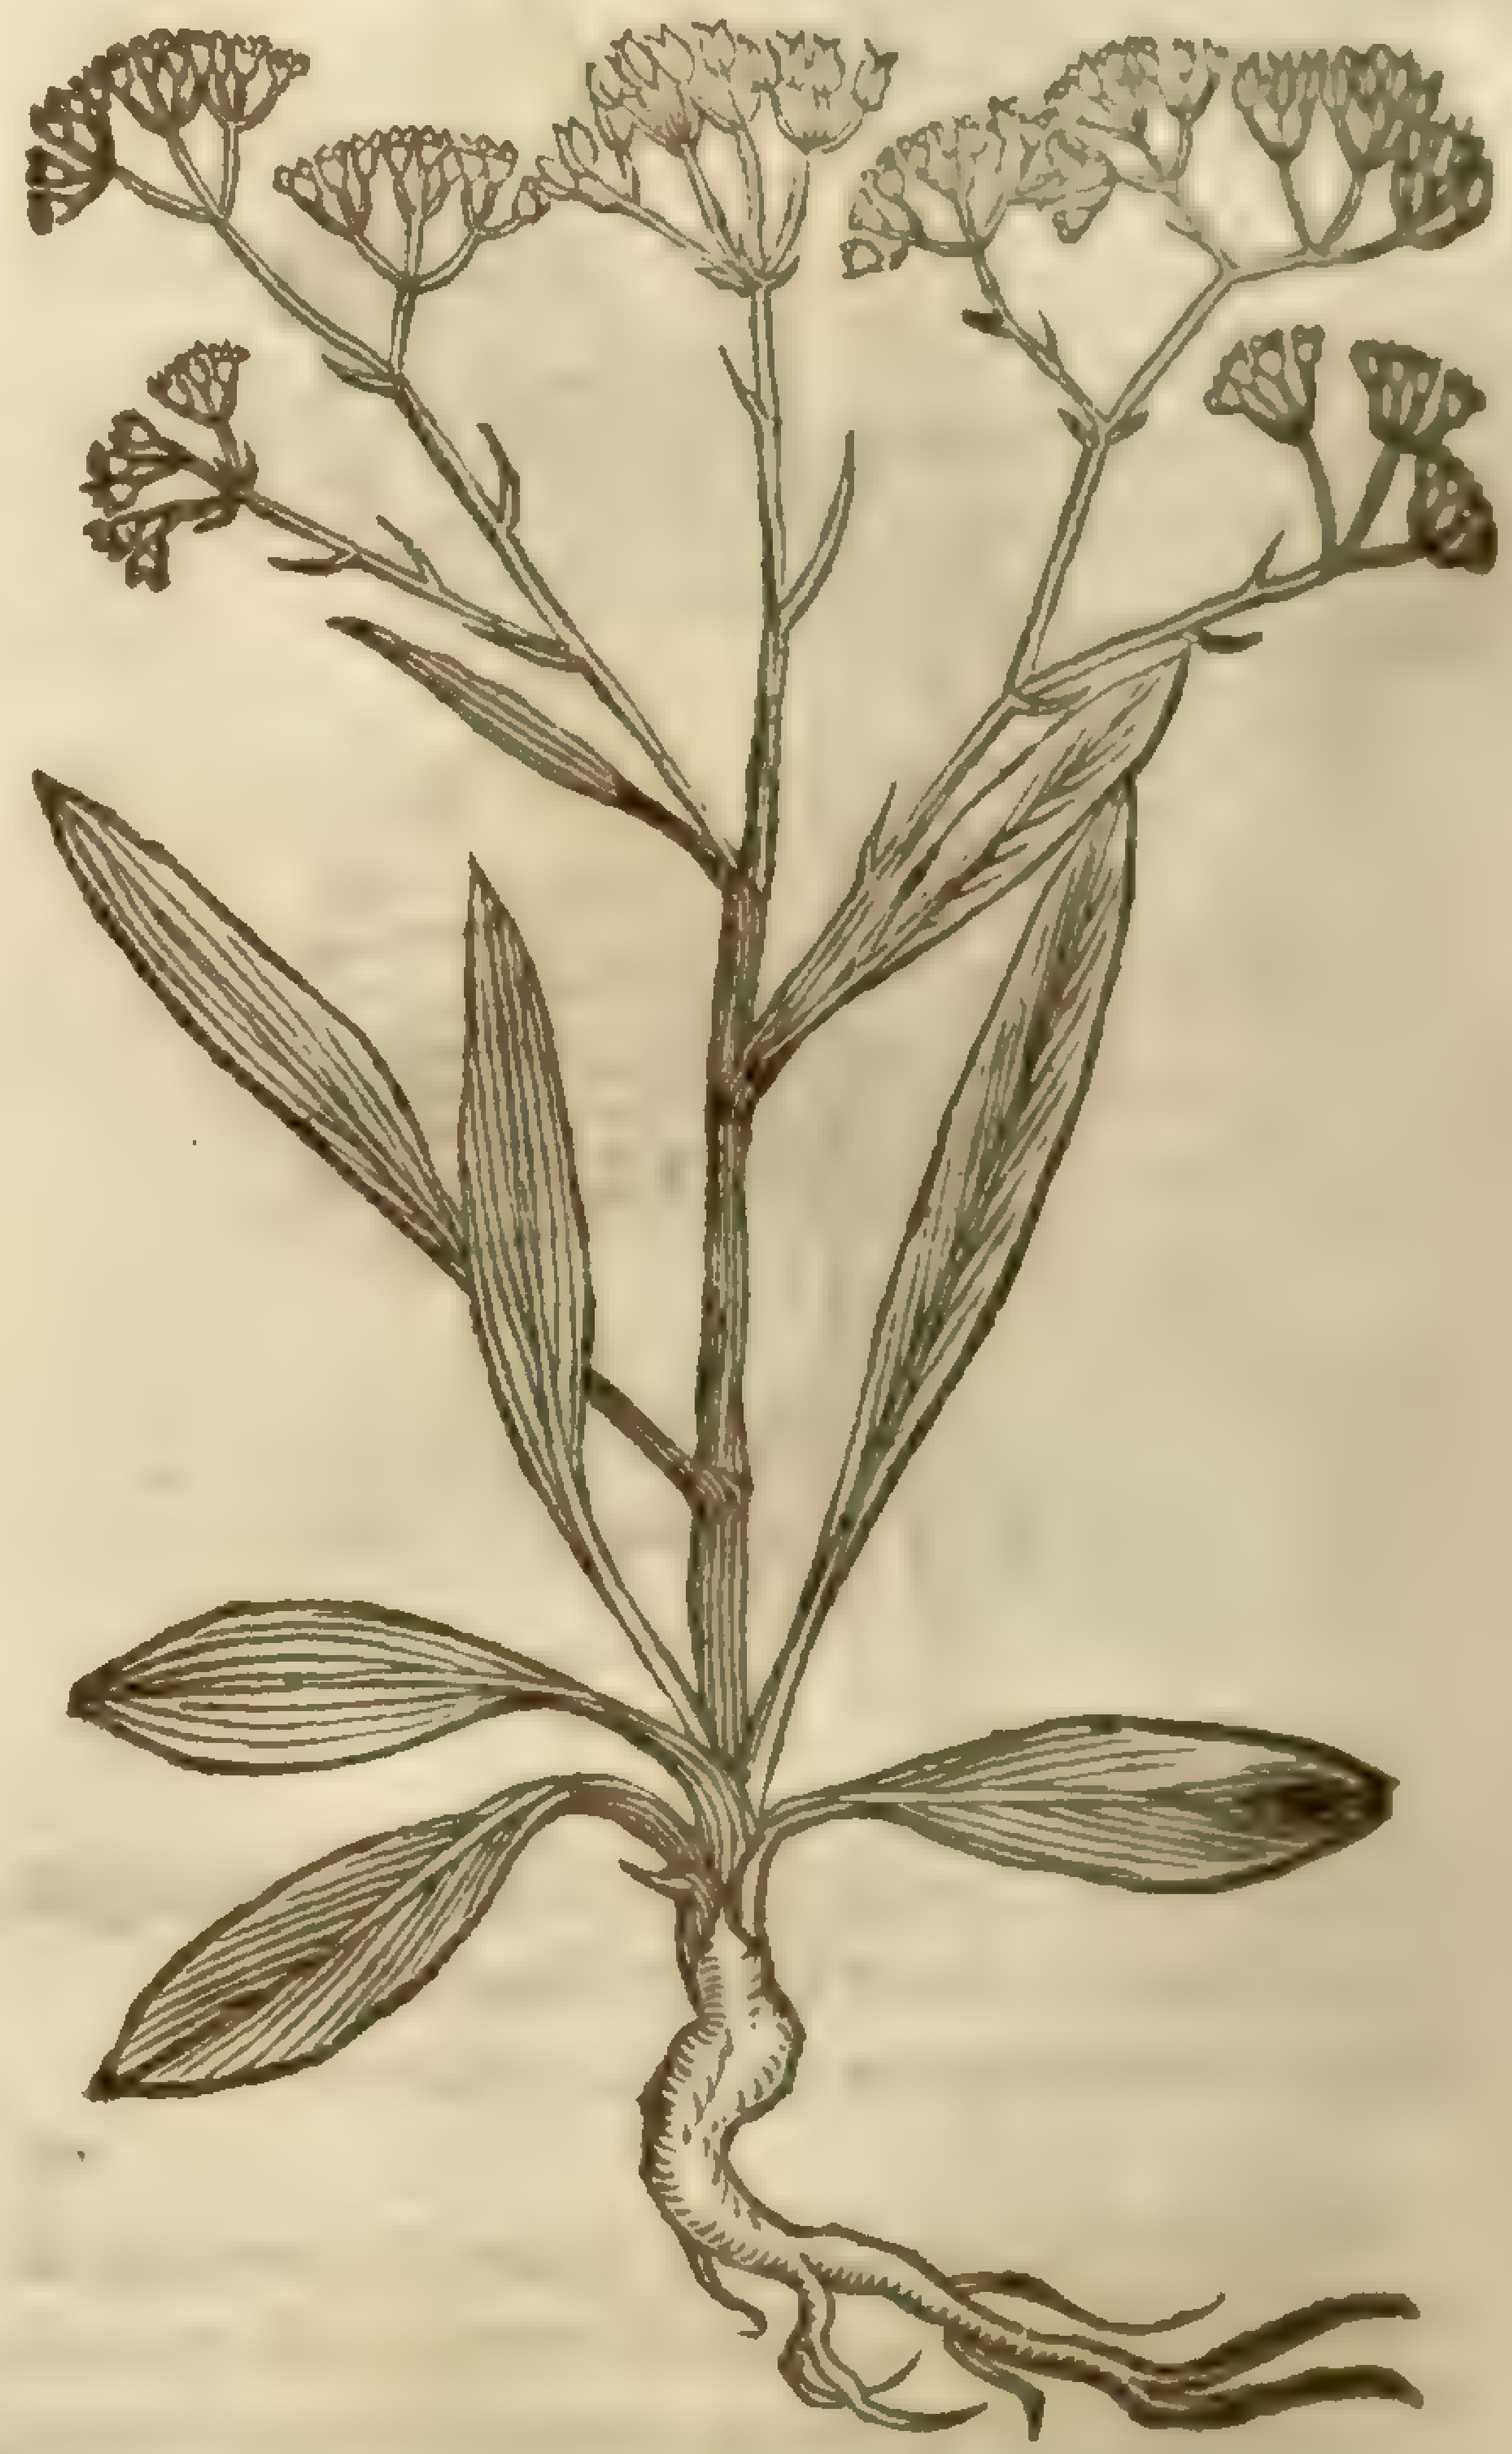
1 Narrow leaued Hares eares is called in Greek, Βούπλευρον; and it is reputed of the late writers to be *Bupleurum Plinij*, from which name the figure diſagreeth not: it hath the long narrow and graſſy leaues of *Lachrima Iob*, or *Gladiolus*, ſtreaked or balked as it were with ſundry ſtiffe ſtreaks or ribs running along euery leafe, as *Pliny* ſpeaketh of his *Heptapleurum*. The

ſtalks are a cubit and a halfe long, full of knots or knees, very rough or ſtiffe, ſpreading themſelues into many branches: at tops whereof grow yellow floures in round tufts or heads like Dill. The root is as big as a finger, and blacke like *Peucedanum*, whereunto it is like in taſte, ſmell, and reſemblance of ſeed, which doth the more perſuade me that it is the true *Bupleurum*, wherof I now ſpeak, and by the authoritie of *Nicander* and *Pliny* confirmed.

1 *Bupleurum anguſtifolium monſpelienſe.*
Narrow leaued Hares eare.



2 *Bupleurum latifolium monſpelienſe.*
Broad leaued Hares eare.



2 The ſecond kinde, called broad leaued Hares eares, in figure, tufts, and floures is the verie ſame with the former kinde, ſaue that the leaues are broader and ſtiffer, and more hollow in the midſt: which hath cauſed me to call it Hares eares, hauing in the middle of the leafe ſome hollowneſſe reſembling the ſame. The root is greater, and of a wooddy ſubſtance.

¶ *The Place.*

They grow among Oken woods in ſtony and hard grounds in Narbon. I haue found them growing naturally among the buſhes vpon Bieſton caſtle in Cheſhire.

¶ *The Time.*

They floure and bring forth their ſeed in Iuly and Auguſt.

¶ *The Names.*

Hares eare is called in Latine *Bupleurum*: in Greeke, Βούπλευρον: the Apothecaries of Montpelier in France do call it *Auricula Leporis*, and therefore I terme it in Engliſh Hares eare: *Valerius Cordus* nameth it *Iſophyllon*, but whence hs had that name it is not knowne.

¶ *The Temperature.*

They are temperate in heate and drineſſe.

¶ *The Vertues.*

A *Hippocrates* hath commended it in meats; for ſallads and Pot-herbs: but by the authority of *Glaucon* and *Nicander*, it is effectuall in medicine, hauing the taſt and ſauor of *Hypericon*, ſeruing in the place thereof for wounds, and is taken by *Tragus* for *Panax Chironium*, who reckoneth it *inter Herbas vulnerarias*.

The leaues ſtamped with ſalt and wine, and applied, do conſume and driue away the ſwelling of the necke called the Kings euill; and are vſed againſt the ſtone and grauell.

CHAP. 191. Of Gromell.

¶ The Deſcription.

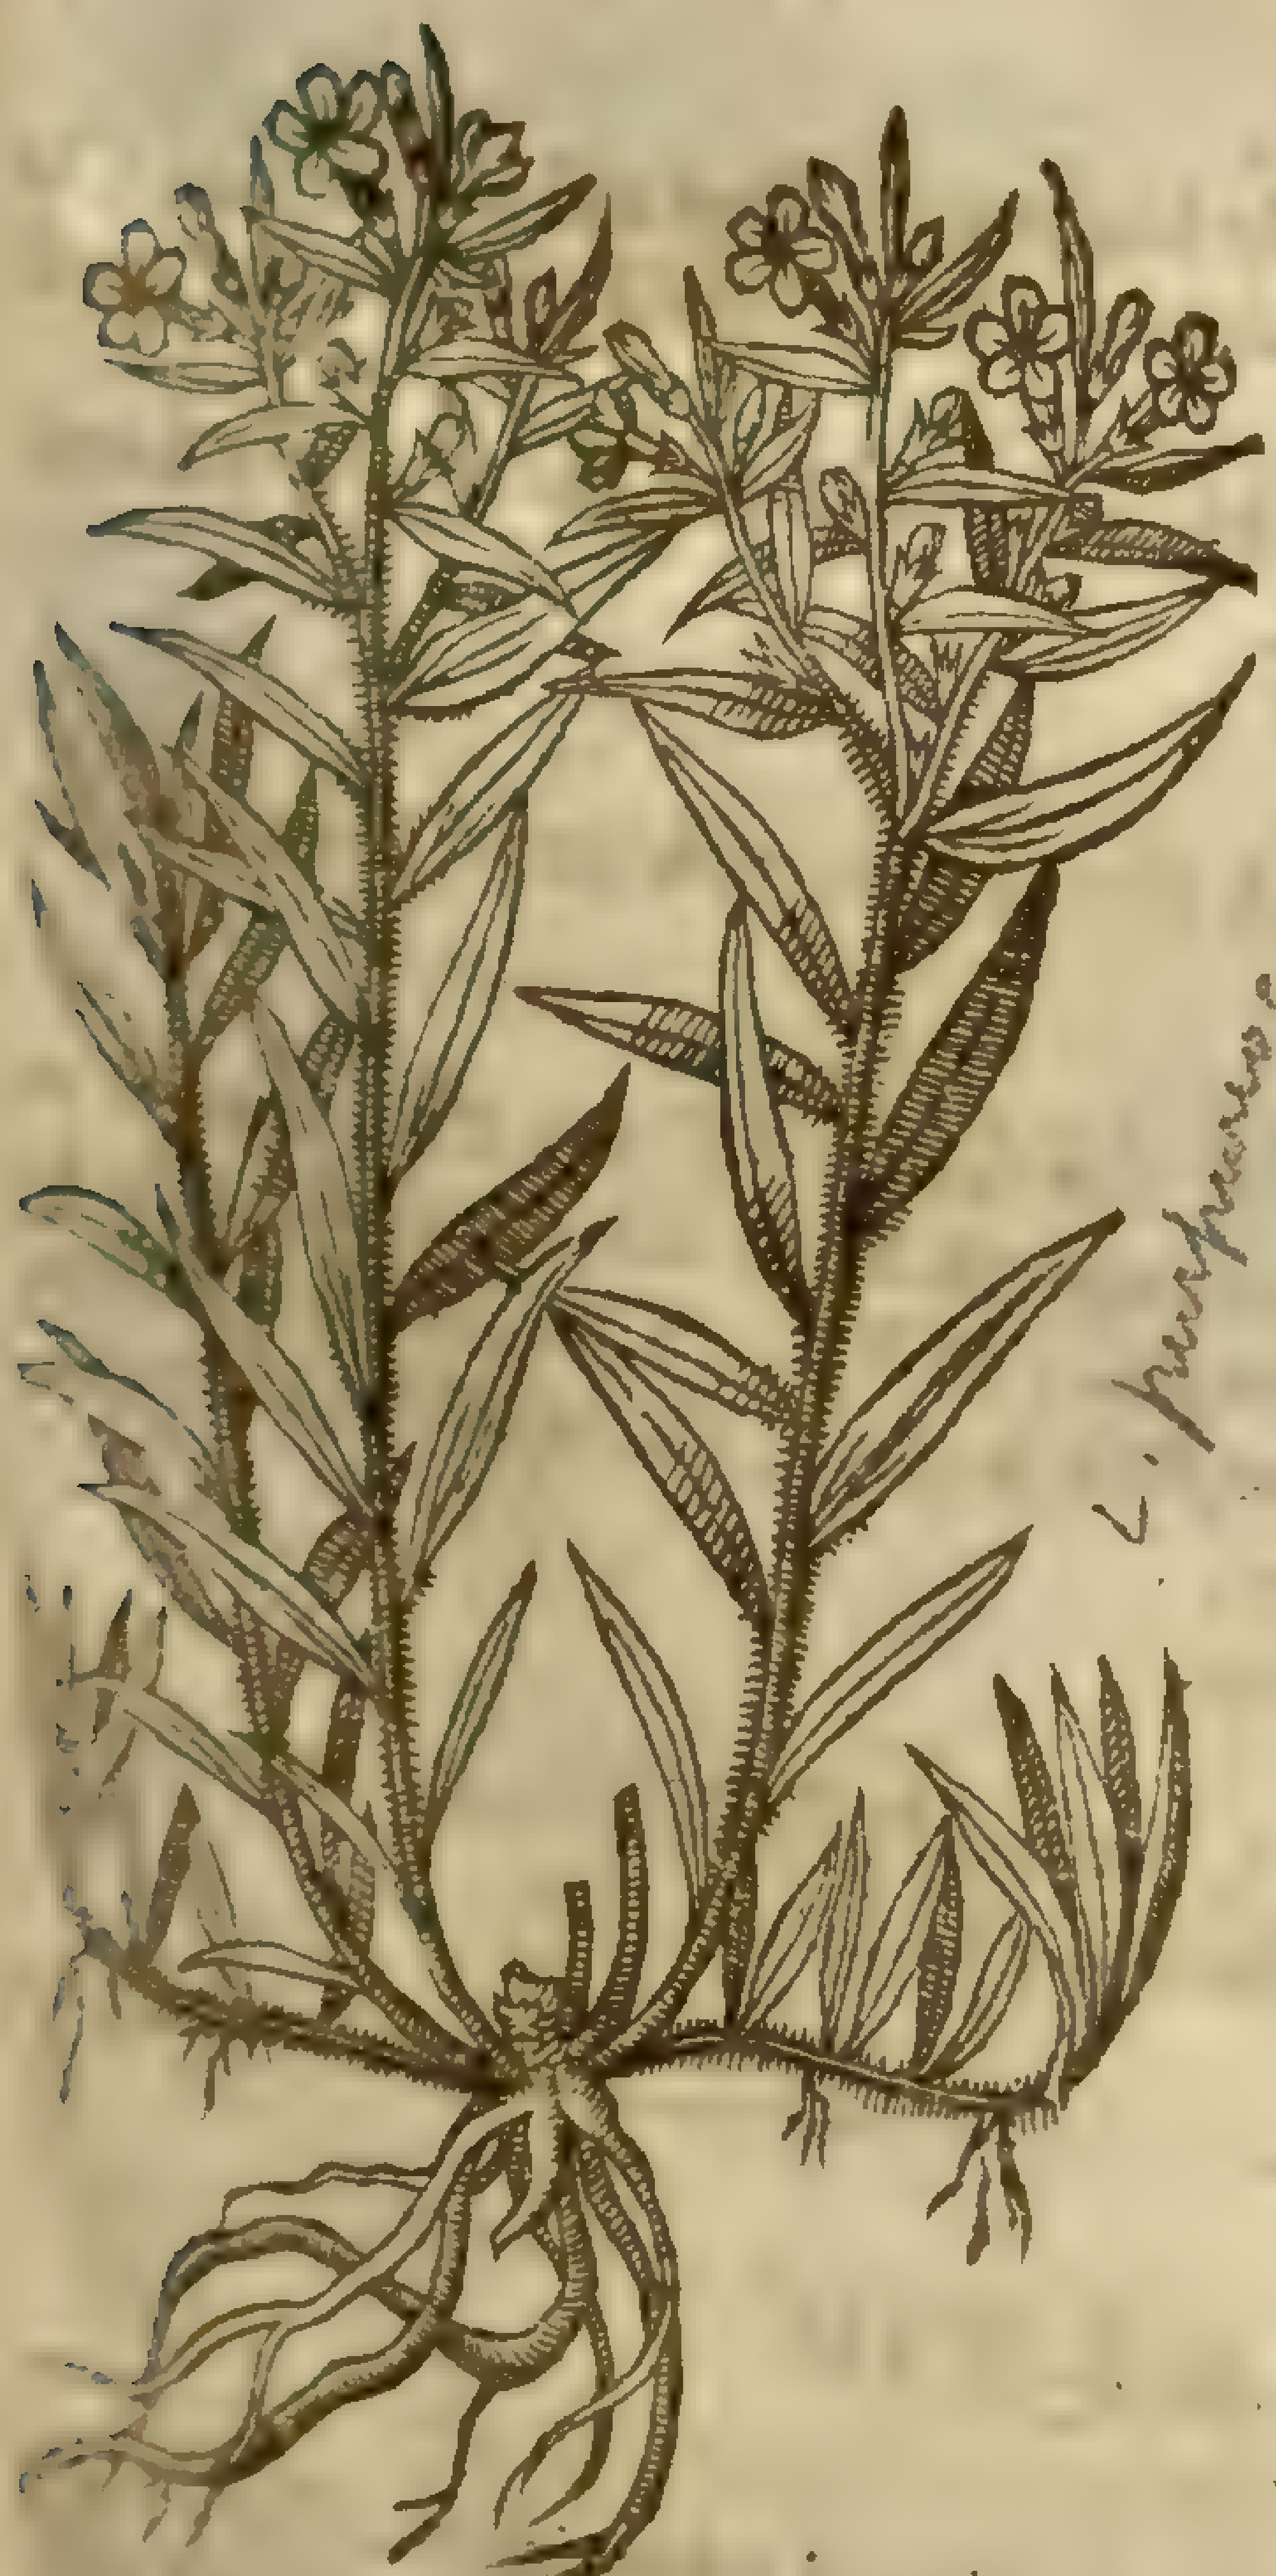
1 THe great Gromel hath long ſlender and hairy ſtalks, beſet with long brown and hoarie leaues, among which grow certain bearded husks, bearing at the firſt ſmal blew flours; which being paſt, there ſucceedeth a gray ſtony ſeed ſomewhat ſhining. The root is hard, and of a wooddy ſubſtance.

2 The ſecond kinde of Gromel hath ſtraight round wooddy ſtalks full of branches, the leaues long, ſmall, and ſharp, of a dark green colour, ſmaller than the leaues of great Gromel: among which come forth little white floures; which being paſt, there followes ſuch ſeed as the former hath, but ſmaller.

‡ 3 There is another kinde of Gromel which hath leaues and ſtalks like the ſmall kind: the ſeed is not ſo white, neither ſo ſmooth and plain, but ſomewhat ſhriueled or wrinkled: the leaues are ſomewhat rough like vnto the common Gromel, but the floures are of a purple colour, and in ſhape like thoſe of that wilde kinde of Bugloſſe called *Anchuſa*; for which cauſe it carrieth that additament *Anchuſæ facie*.

4 There is alſo a degenerat kind hereof called *Anchuſa degener*, being either a kind of wilde Bugloſſe or wilde Gromel, or elſe a kinde of neither of both, but a plant participating of both kindes. It hath the ſeeds and ſtalks of *Milium ſolis* or Gromel, the leaues and roots of *Anchuſa*, which is Alkanet, and is altogether of a red colour like the ſame.

1 *Lithoſpermum majus.*
Great Gromel.



L. purpureo coeruleum in
Miller's dict.

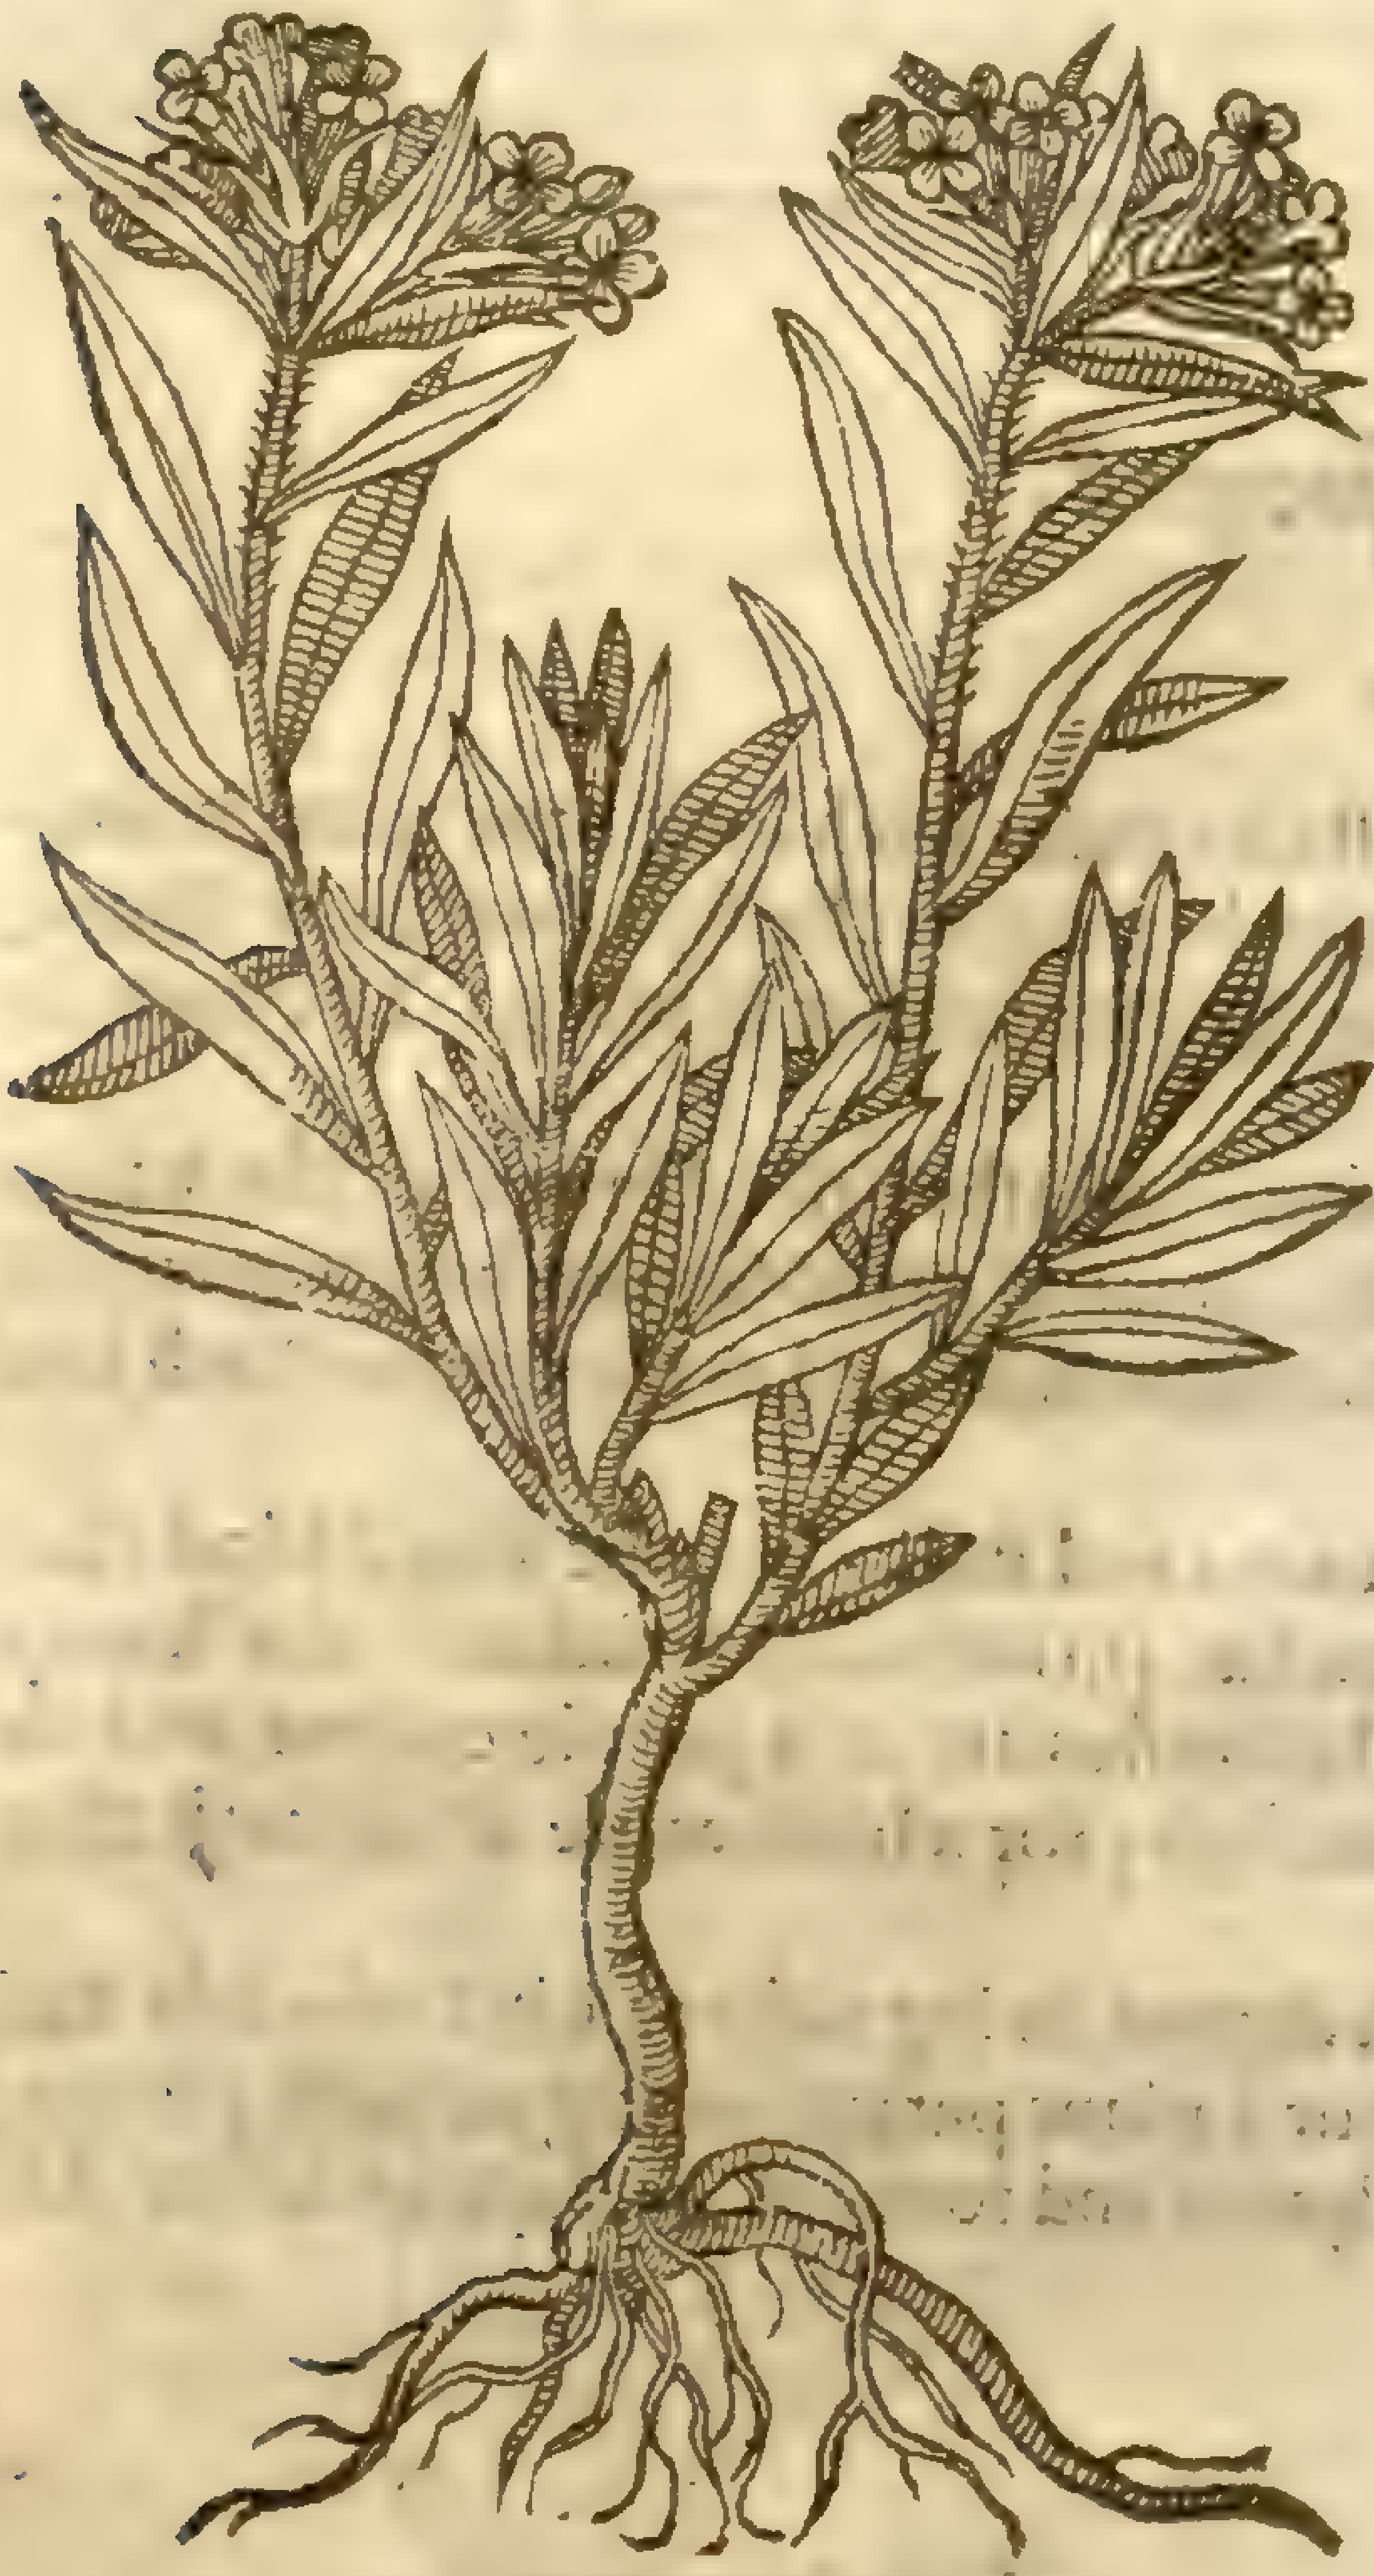
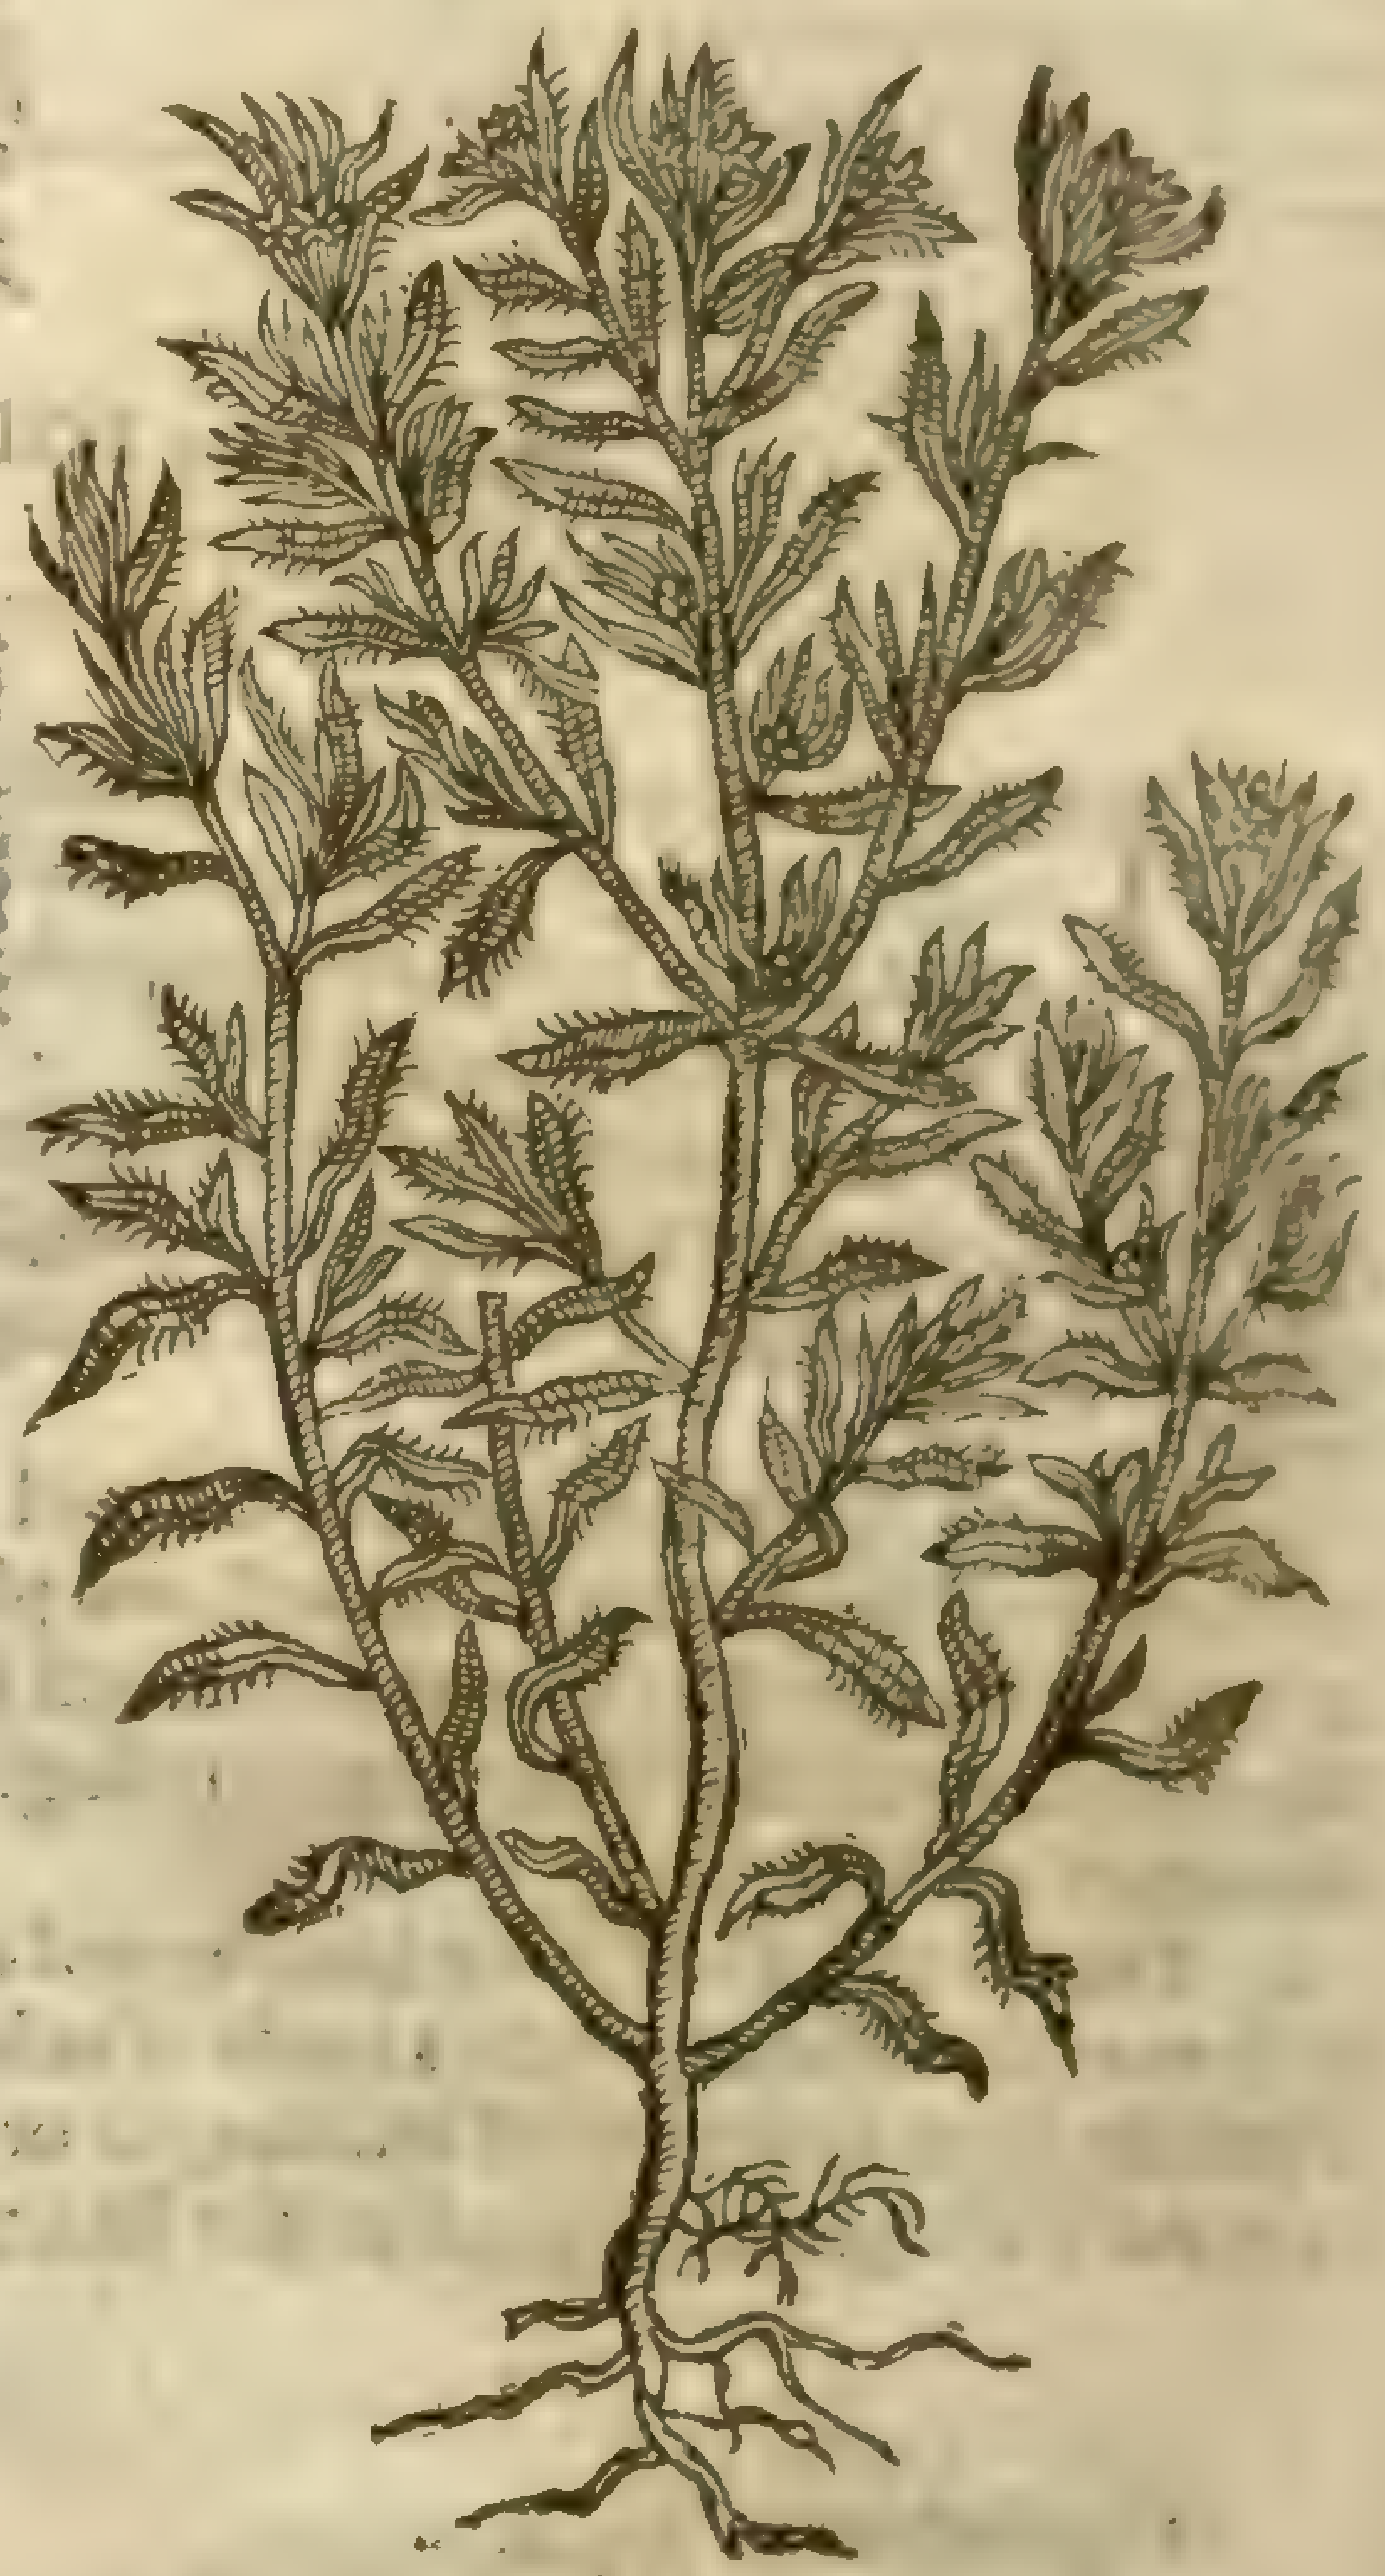
¶ The

‡ 3 *Lithoſpermum Anchuſæ facie.*
Purple floured Gromell.



Lithospermum arvense L. [illegible]

‡ 4 *Anchuſa degener facie Milij folio.*
Baſtard Gromell.



¶ *The Place.*

The two firſt kindes do grow in vntoiled places,as by the highwayes ſides and barren places, in the ſtreet at Southfleet in Kent,as you go from the Church vnto a worſhipſull gentlemans houſe called Mr *William Swan*,and in ſundry other places.

The two laſt kindes grow vpon the ſands and baich of the ſea,in the Iſle of Thanet neere Reculuers,among the kindes of wilde Bugloſſe there growing.

¶ *The Time.*

They floure in the Summer Solſtice,or from the twelfth day of Iune euen vnto Autumne,and in the mean ſeaſon the ſeed is ripe.

¶ *The Names.*

Gromel is called in Greeke λιθόσπερμον,of the hardneſſe of the ſeed : of diuers *Gorgonium* : of others, *Aegonychon*, *Leontion*,or *Dioſperon*,or *Dioſpyron*,as *Pliny* readeth it,and alſo *Heracleos* : of the Arabians, *Milium ſoler* : in ſhops and among Italians, *Milium ſolis* : in Spaniſh, *Mijo del ſol*: in French, *Gremil*,and *Herbe aux perles* : in Engliſh, Gromell : of ſome,Pearle plant ; and of others, Lichwale.

¶ *The Temperature.*

The ſeed of Gromel is hot and dry in the ſecond degree.

¶ *The Vertues.*

A The ſeed of Gromel pound and drunke in white wine, breaketh, diſſolueth, and driueth forth the ſtone,and prouoketh vrine,and eſpecially breaketh the ſtone in the bladder.

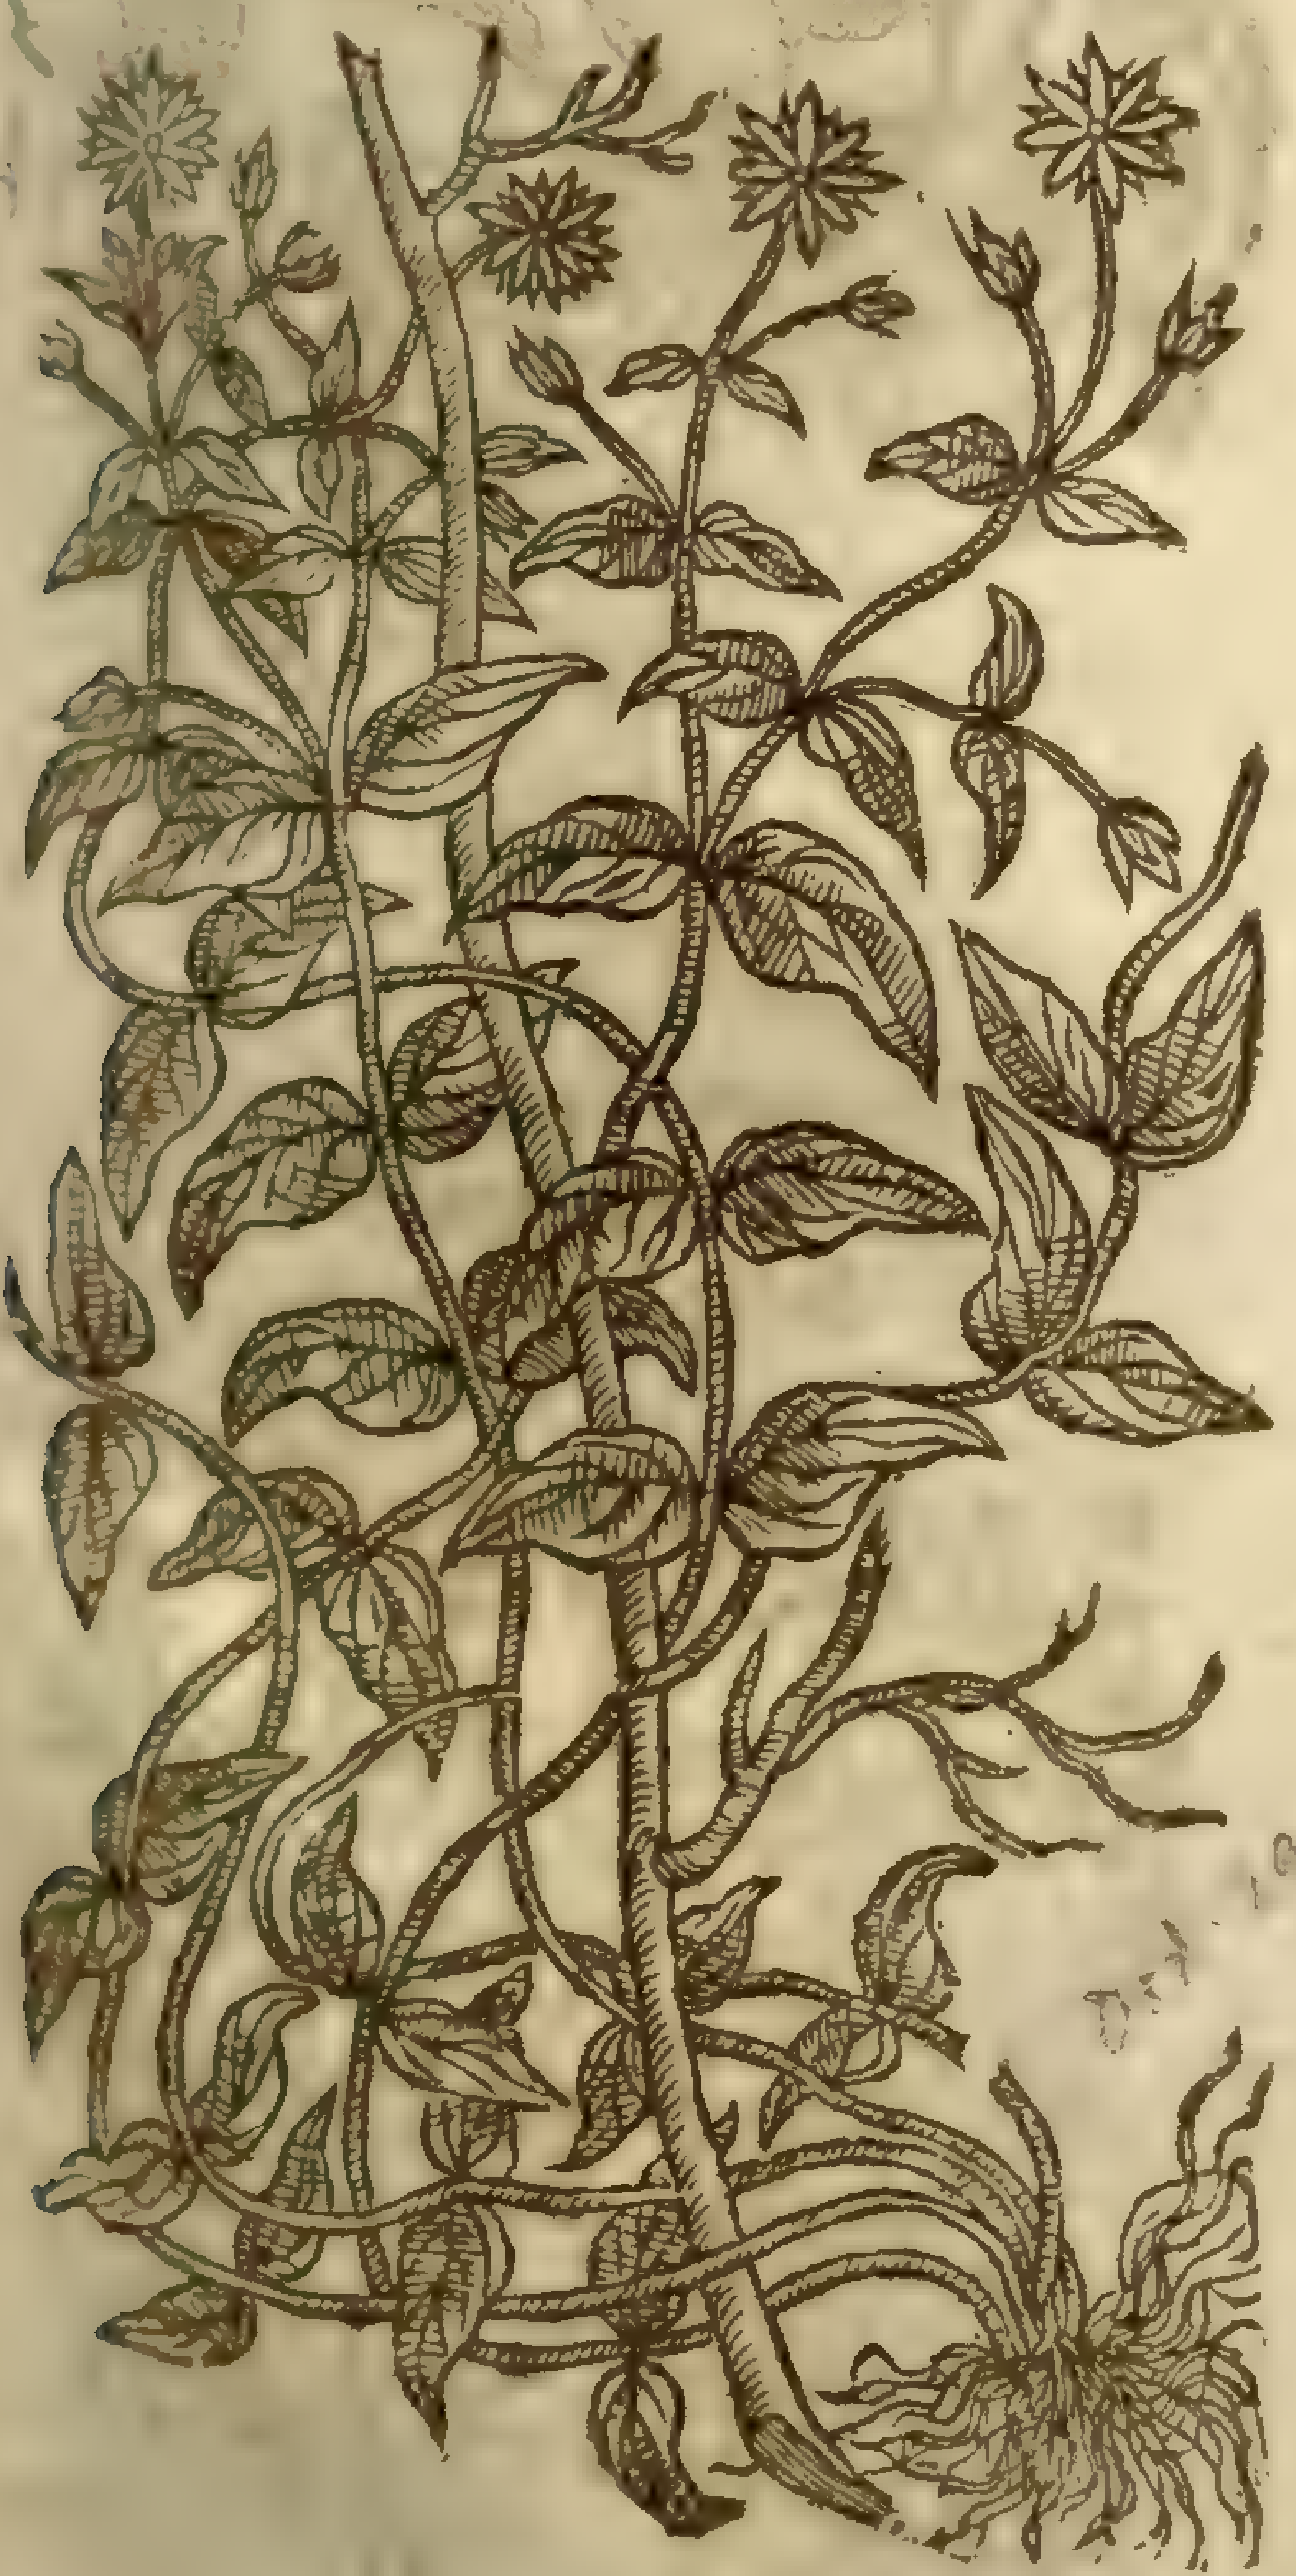
Chap. 192. *Of Chick-Weed.*

1 The great Chickweed riſeth vp with ſtalks a cubit high and ſometimes higher , a great many from one root,long and round,ſlender,full of joints,with a couple of leaues grow-

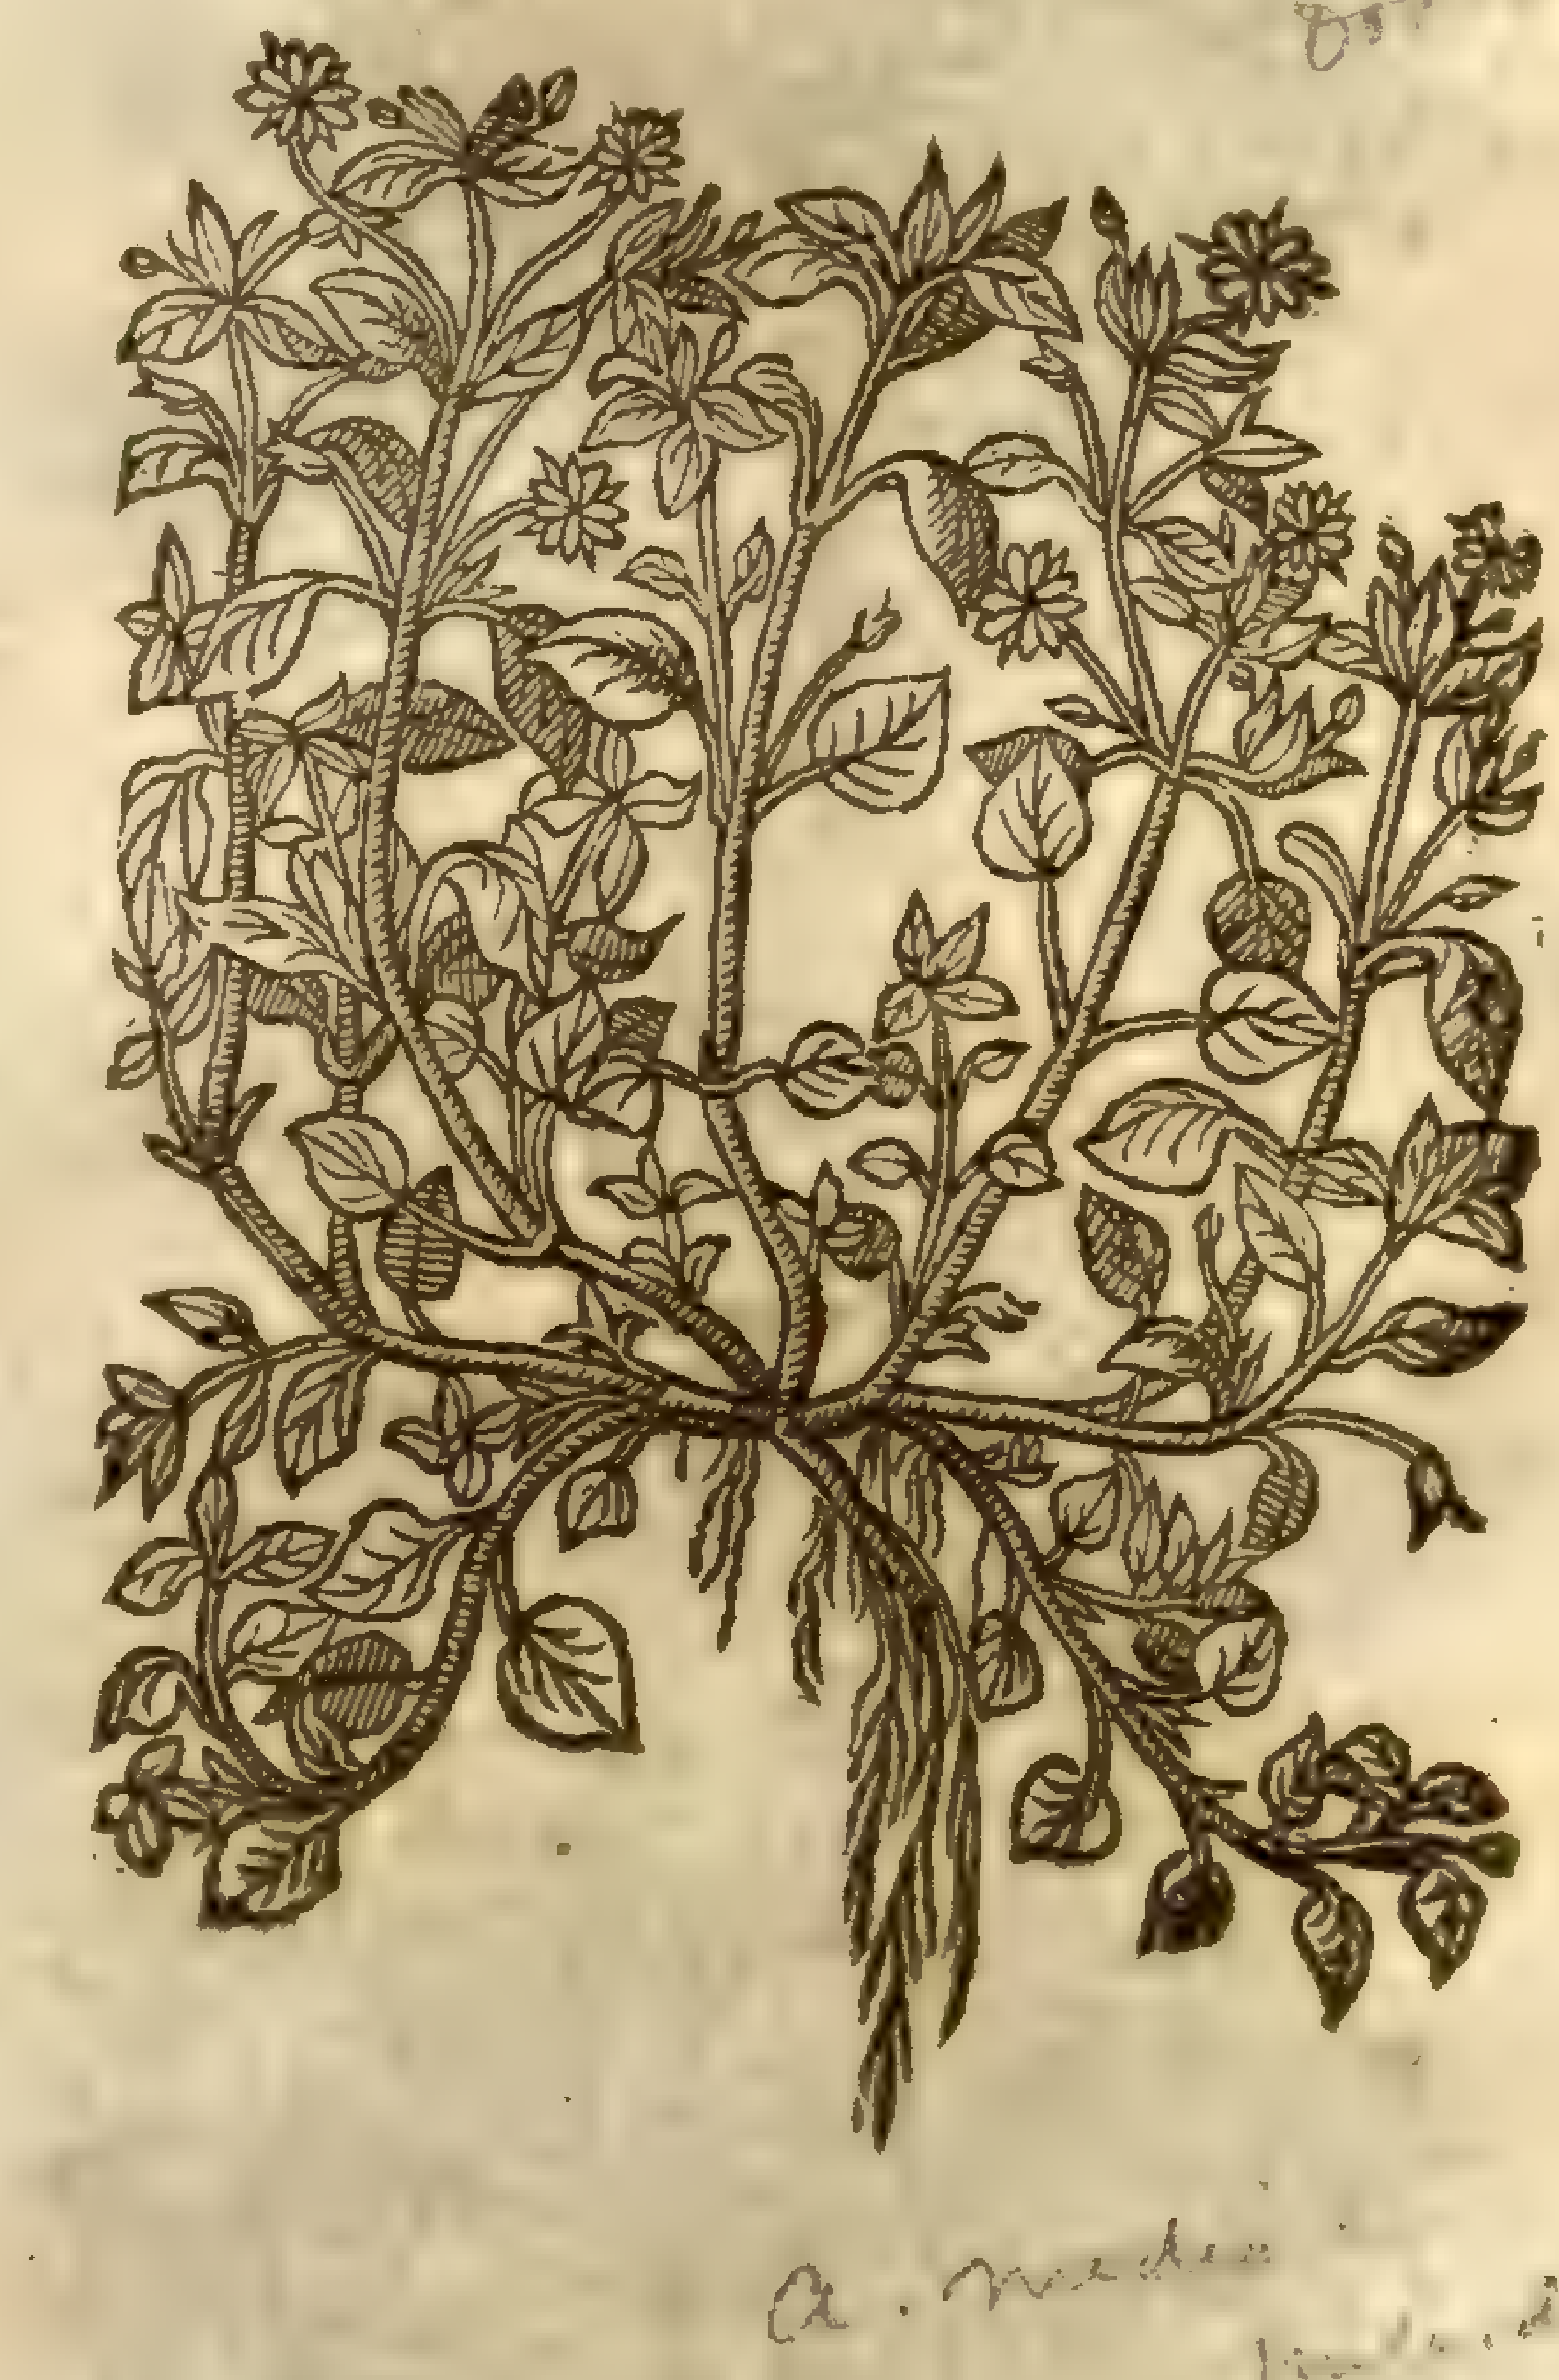
ing out of euery knot or joint aboue an inch broad,and longer than the leaues of Pellitorie of the wall, whereunto they are very like in ſhape, but ſmooth without haires or downe, and of a light green colour: the ſtalks are ſomething cleare,and as it were tranſparent or thorow-ſhining, and about the joints they be oftentimes of a very light red colour,as be thoſe of Pellitorie of the wall: the floures be whitiſh on the top of the branches,like the floures of Stitchwort, but yet leſſer: in whoſe places ſucceed long knops,but not great,wherein the ſeed is contained. The root conſiſts of fine little ſtrings like haires.

2 The ſecond Chickweed for the moſt part lieth vpon the ground: the ſtalks are ſmall, ſlender,long,and round,and alſo jointed: from which ſlender branches doe ſpring leaues reſembling the precedent,but much leſſer,as is likewiſe the whole herbe, which in no reſpect attaineth to the greatneſſe of the ſame: the floures are in like ſort little and white: the knops or ſeed-heads are like the former: the root is alſo full of little ſtrings.

1 *Alſine major.*
Great Chickweed.



2 *Alſine minor, ſiue media.*
Middle or ſmall Chickweed.



A. media

3 The third is like the ſecond,but far leſſe: the ſtalks be moſt tender and fine; the leaues verie ſmall,the floures very little,the root maruellous ſlender.

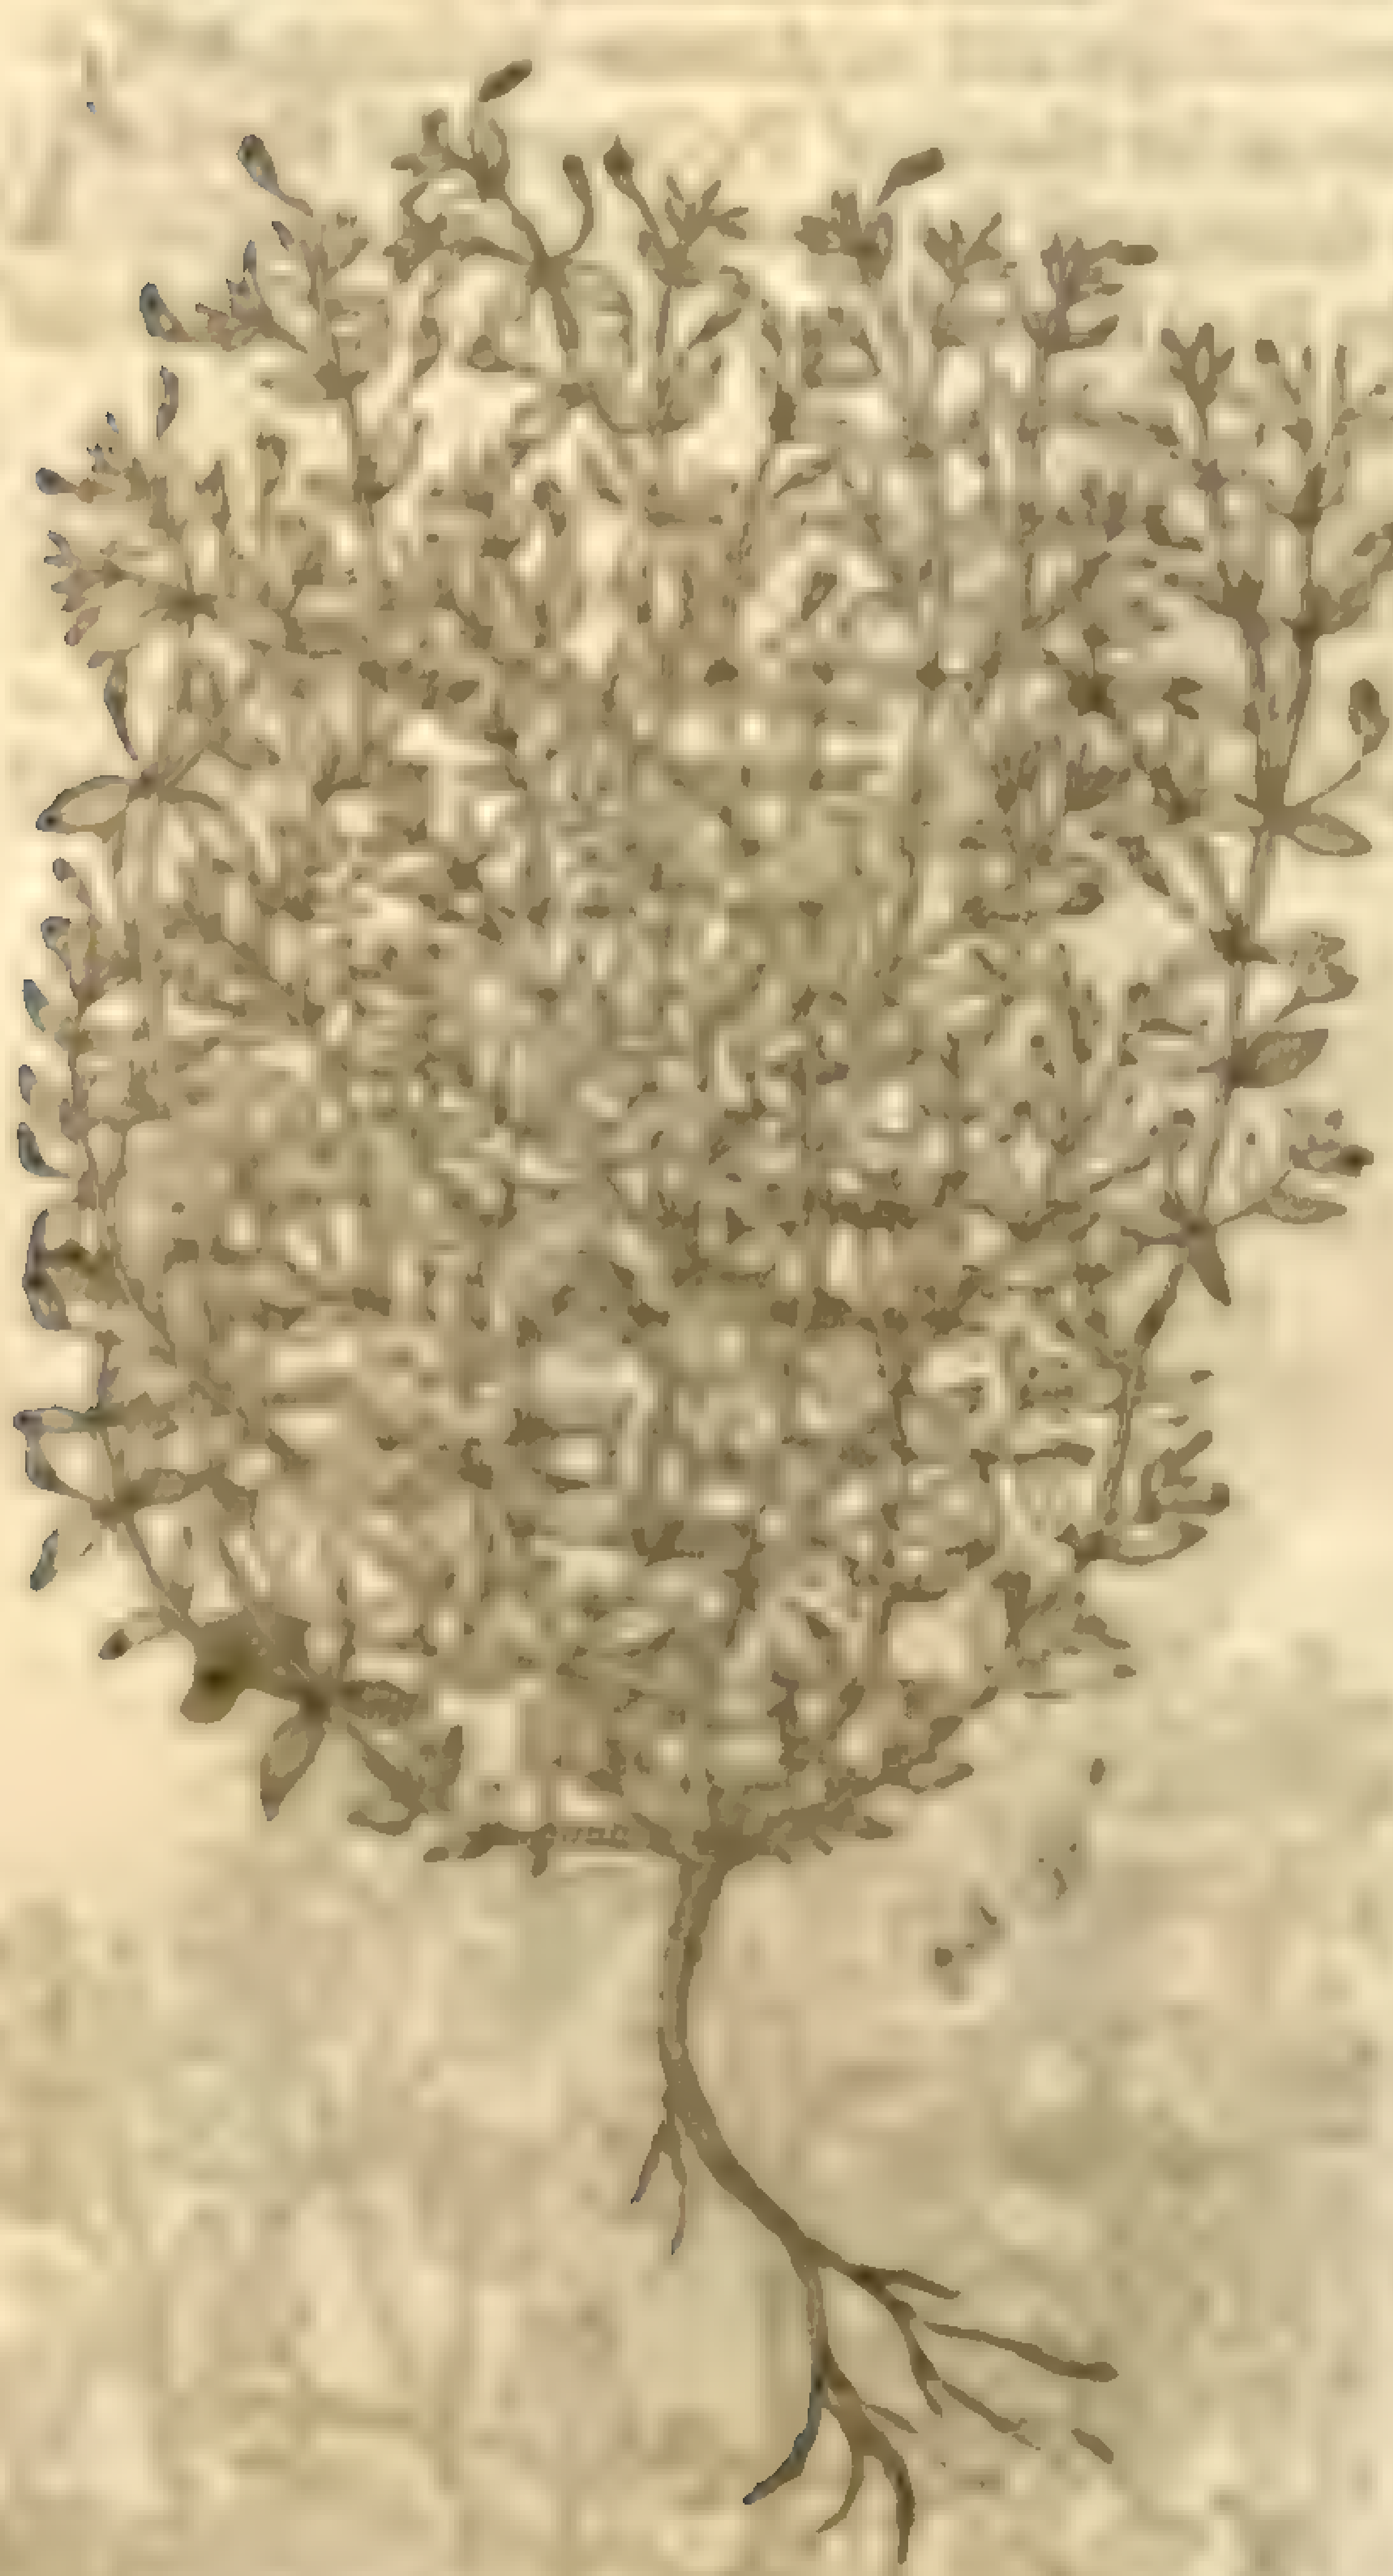
4 Alſo there is a fourth kinde growing by the ſea, which is like the ſecond, but the ſtems are thicker,ſhorter,and fuller of juice: the leaues alſo be thicker, the knops or ſeed-heads be not long and round,but ſomewhat broad,in which are three or foure ſeeds contained.

5 The vpright Chickweed hath a very ſmall ſingle threddy root, from which riſeth vp a ſlender ſtem diuiding it ſelfe into diuers branches euen from the bottome to the top: whereon grow ſmall leaues thicke and fat in reſpect of the others,in ſhape like thoſe of Rue or herb Grace. The floures grow at the top of the branches,conſiſting of foure ſmall leaues of a blew colour.

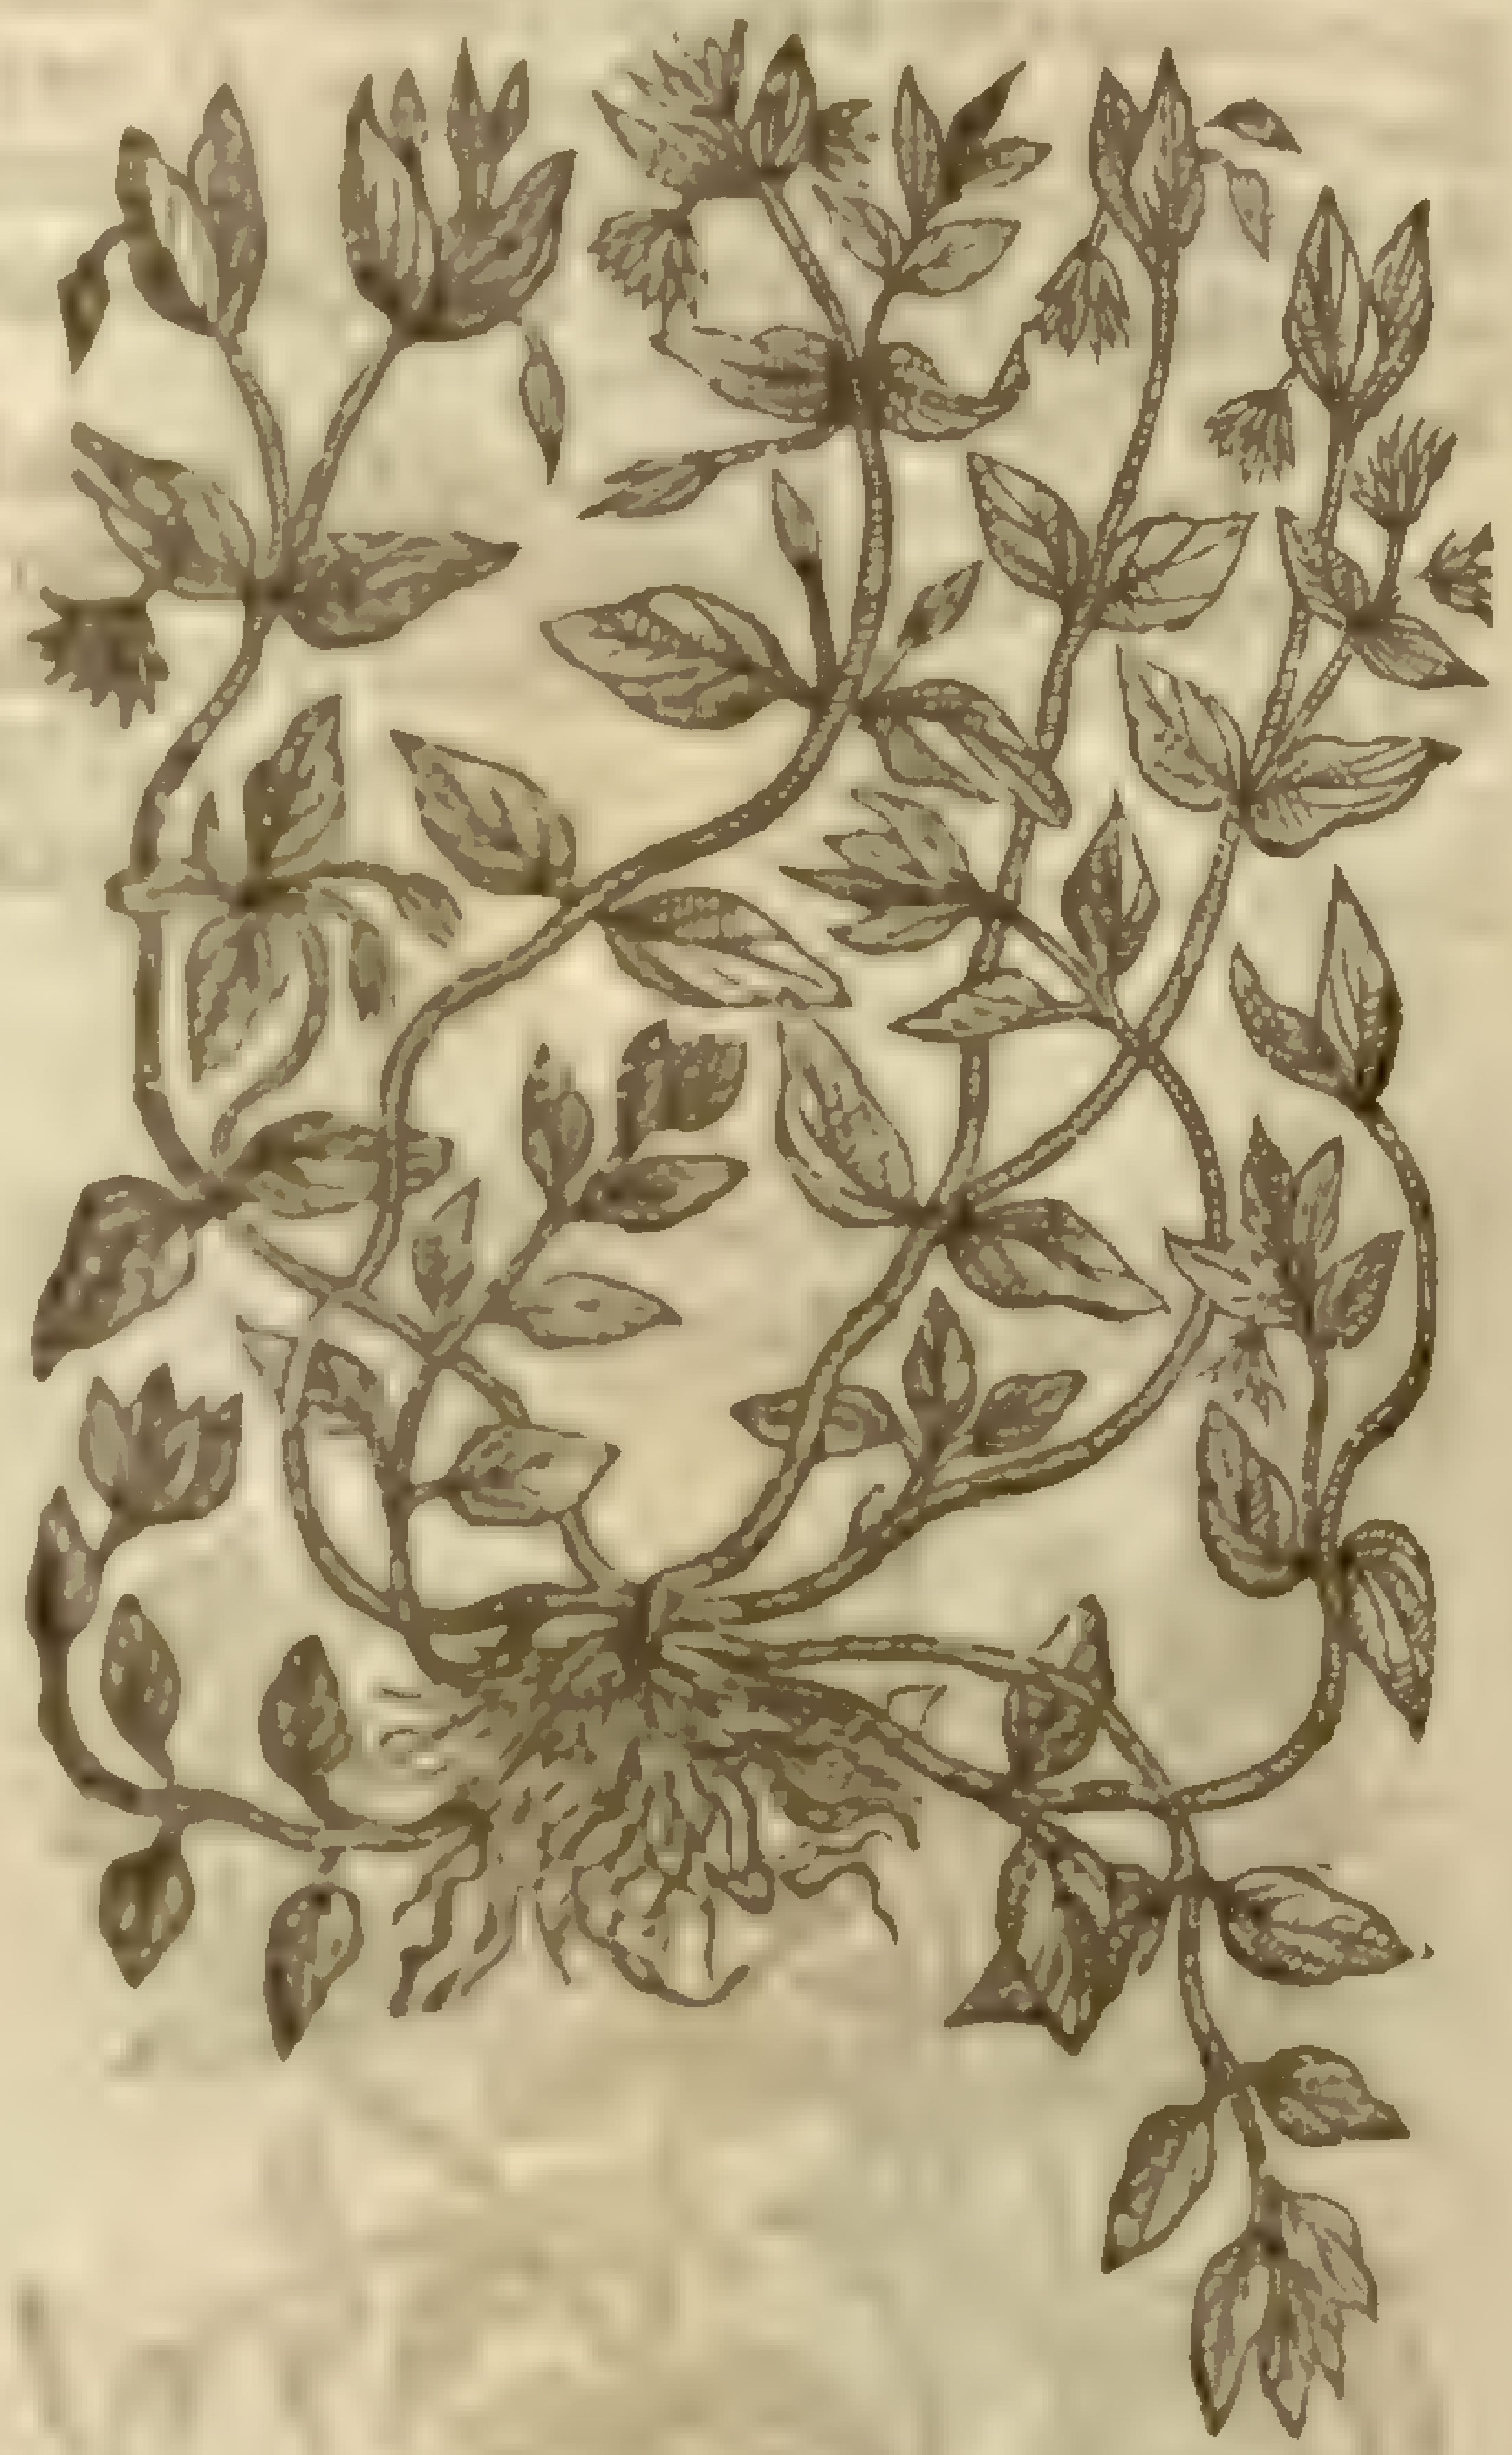
6 The ſtone Chickweed is one of the common Chickeweeds, hauing very threddy branches couering the ground far abroad as it groweth: the leaues be ſet together by couples: the flours be ſmall and very white: the root is tough and very ſlender.

7 Speedwell

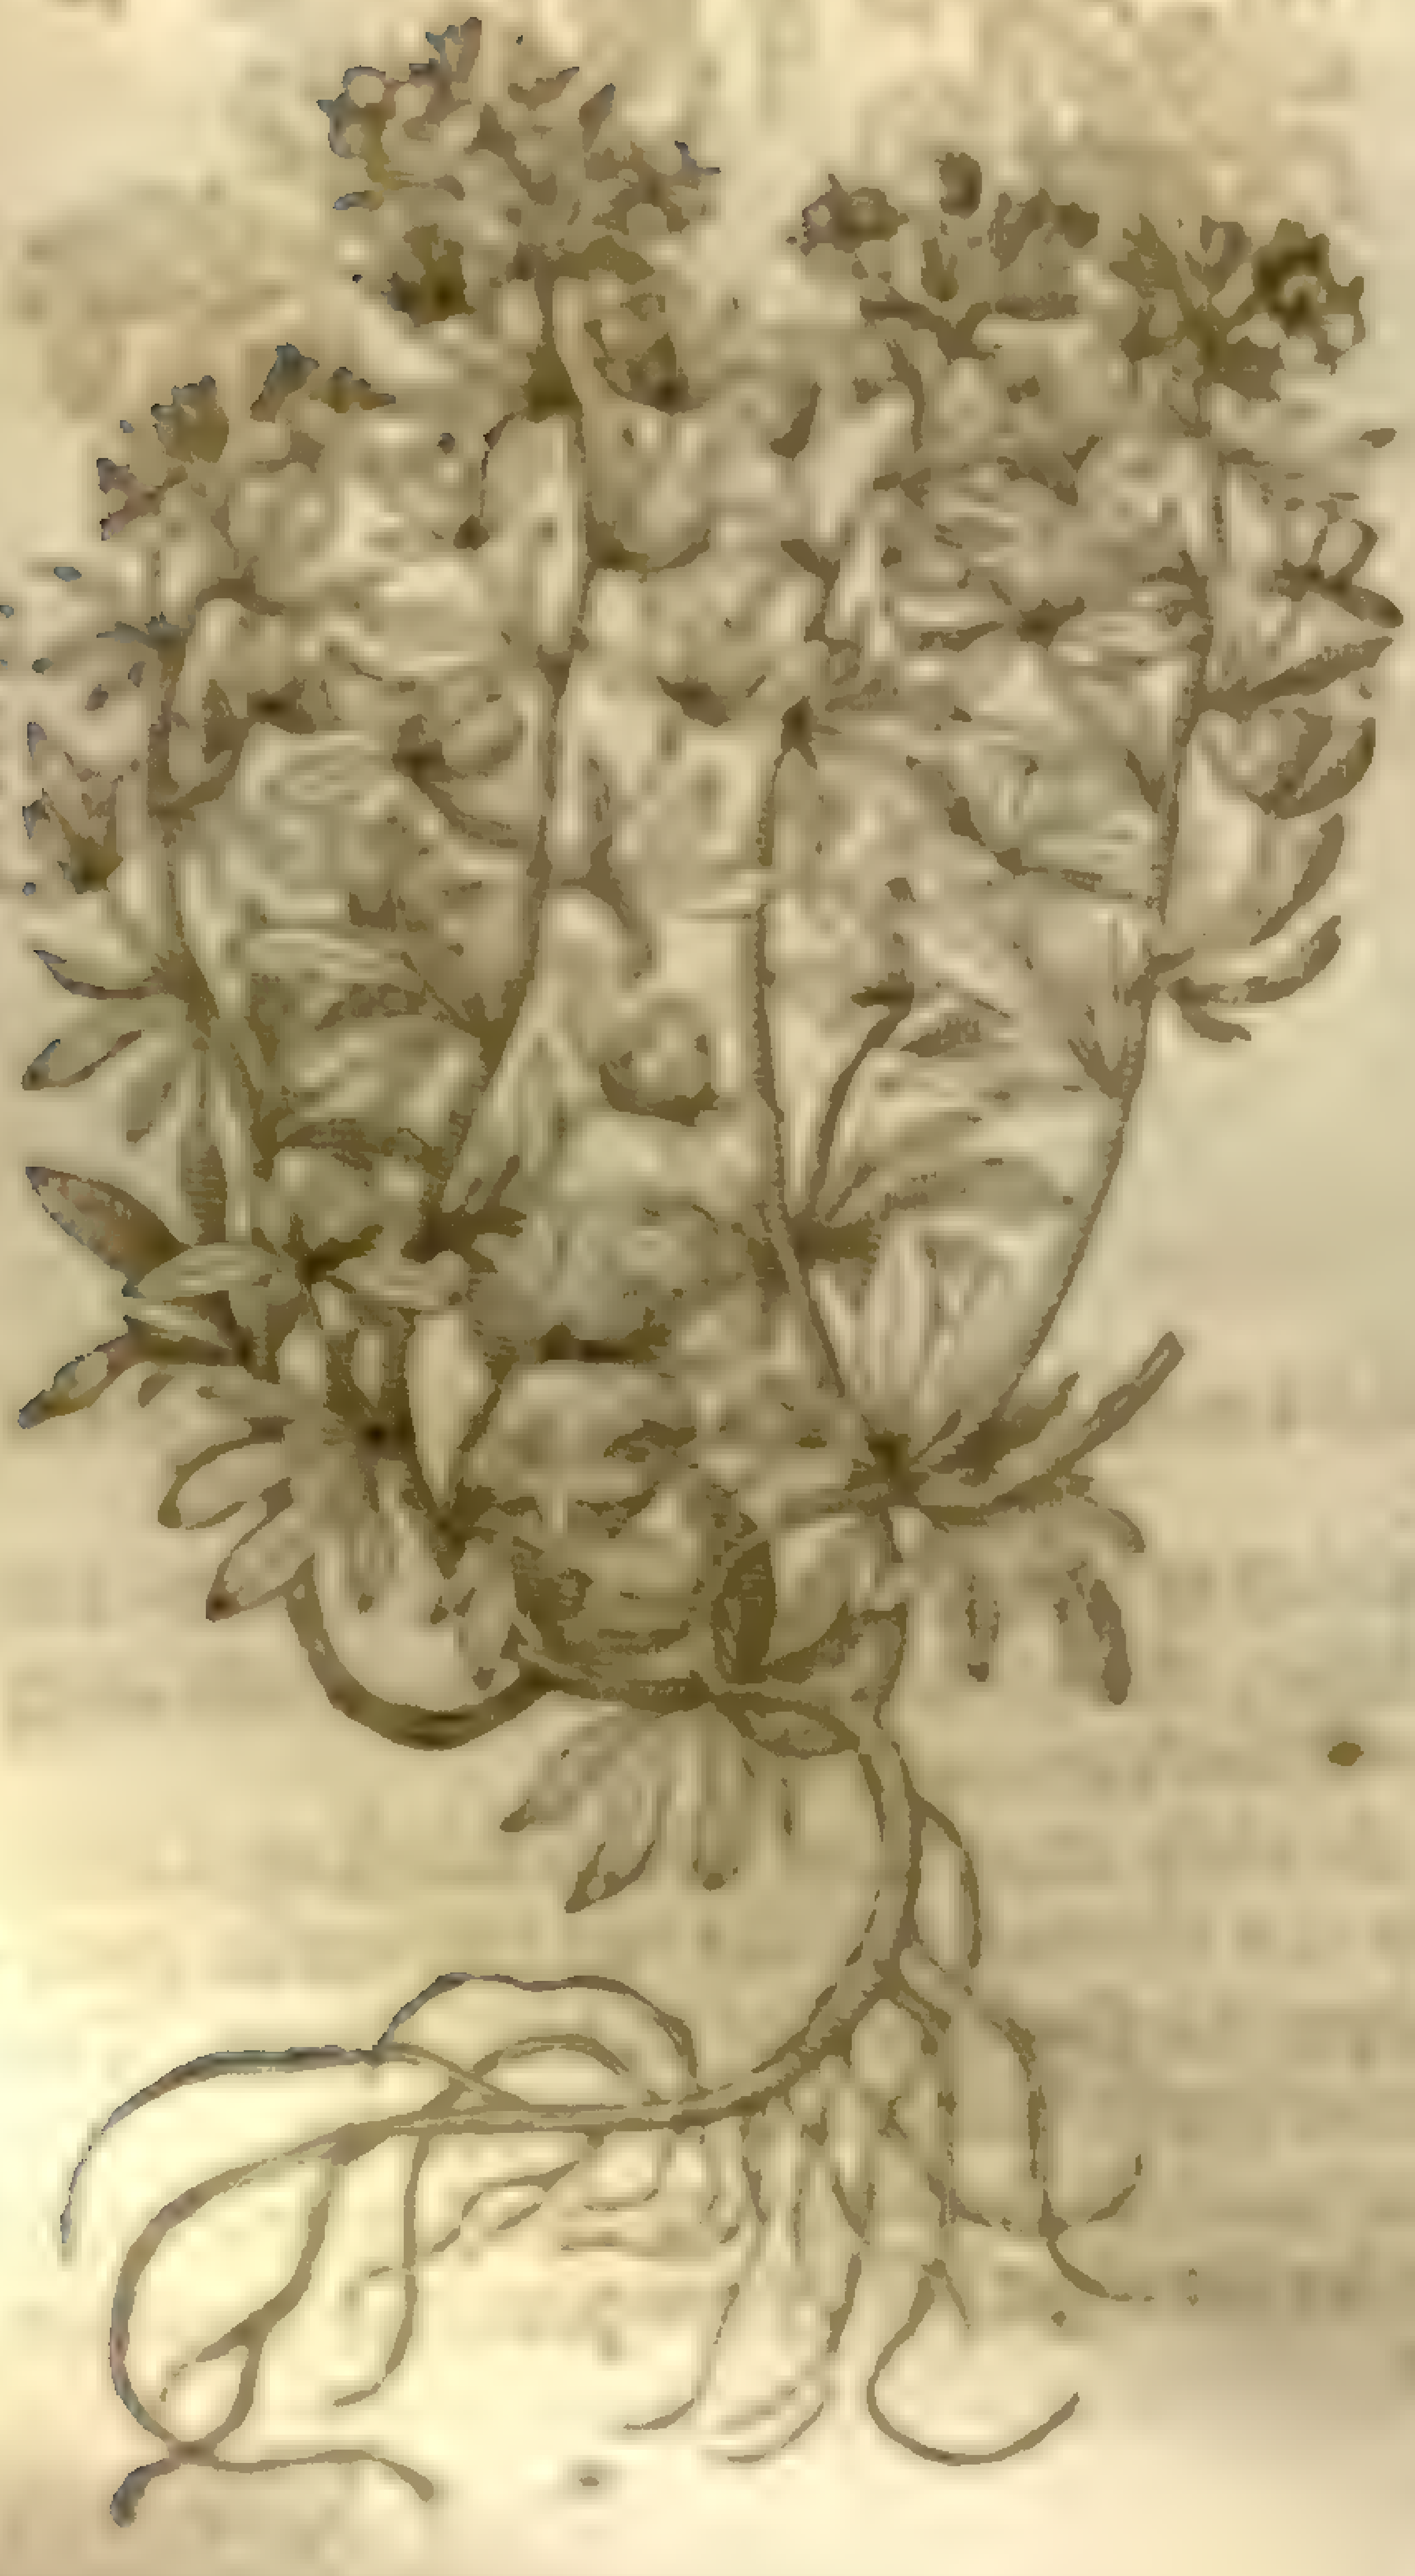
3 *Alſine minima.*
Fine Chickweed.



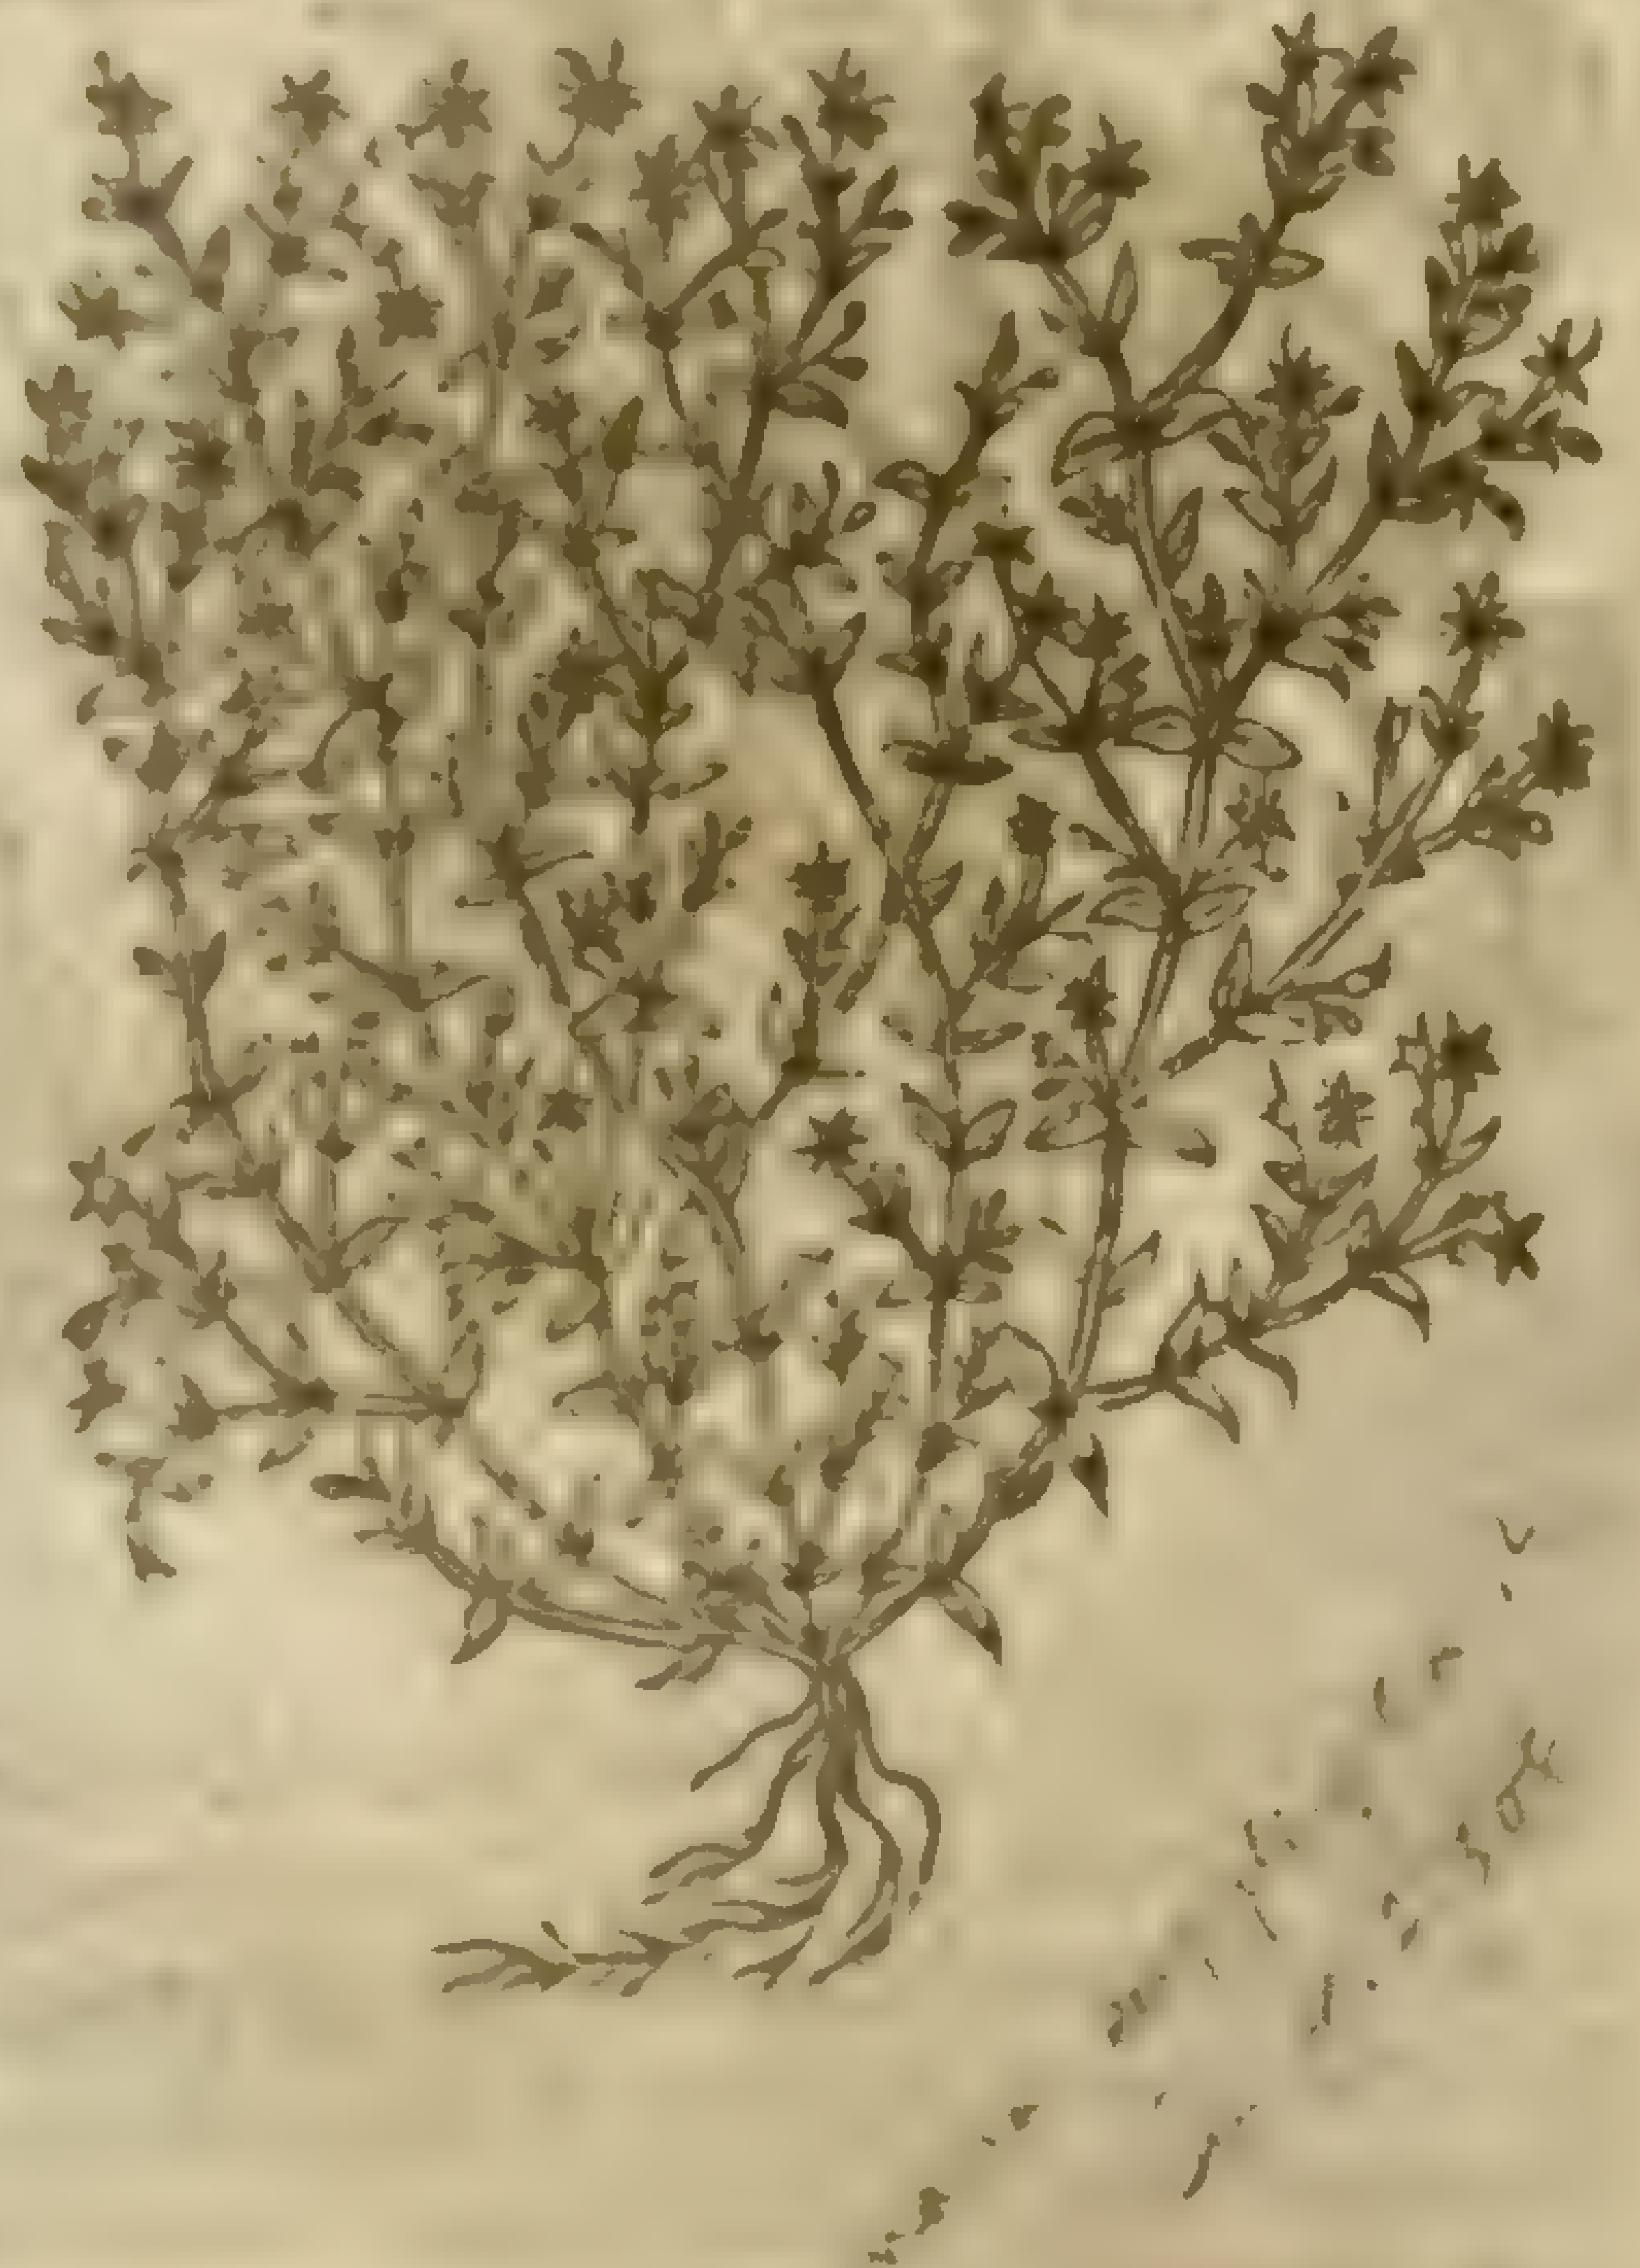
4 *Alſine marina.*
Sea Chickweed.



5 *Alſine recta.*
Right Chickweed.

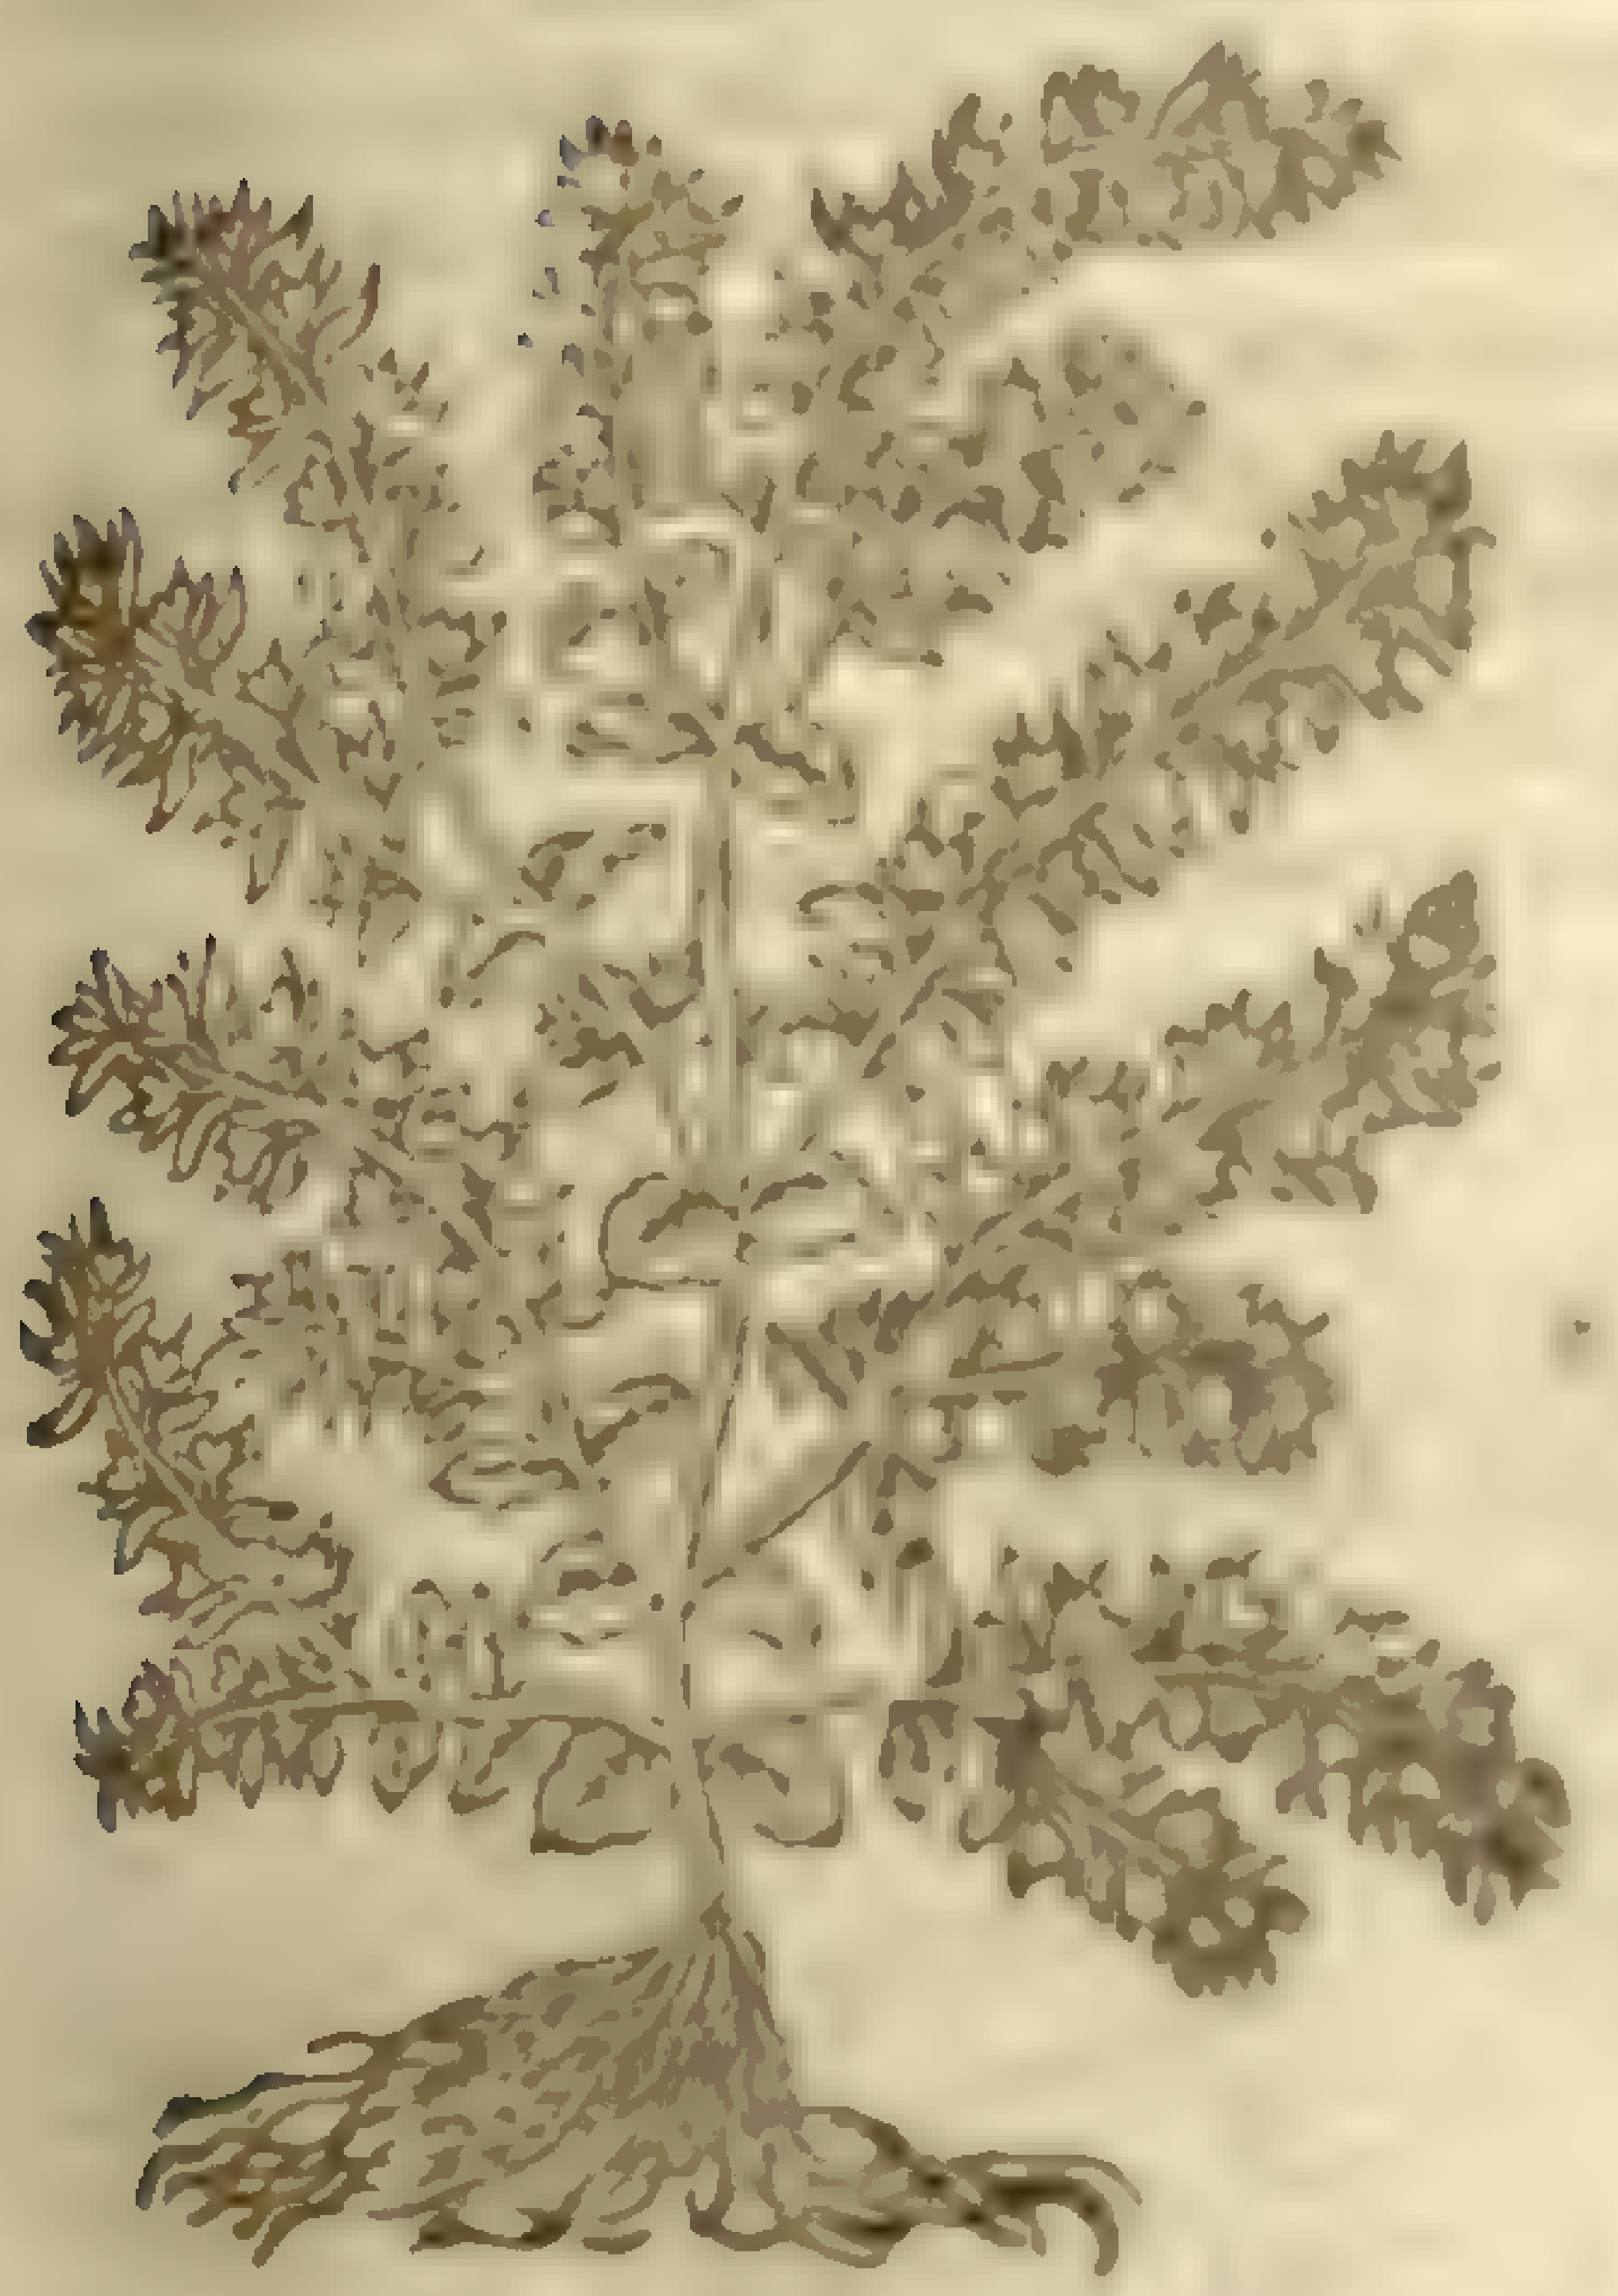


6 *Alſine petræa.*
Stone Chickweed.



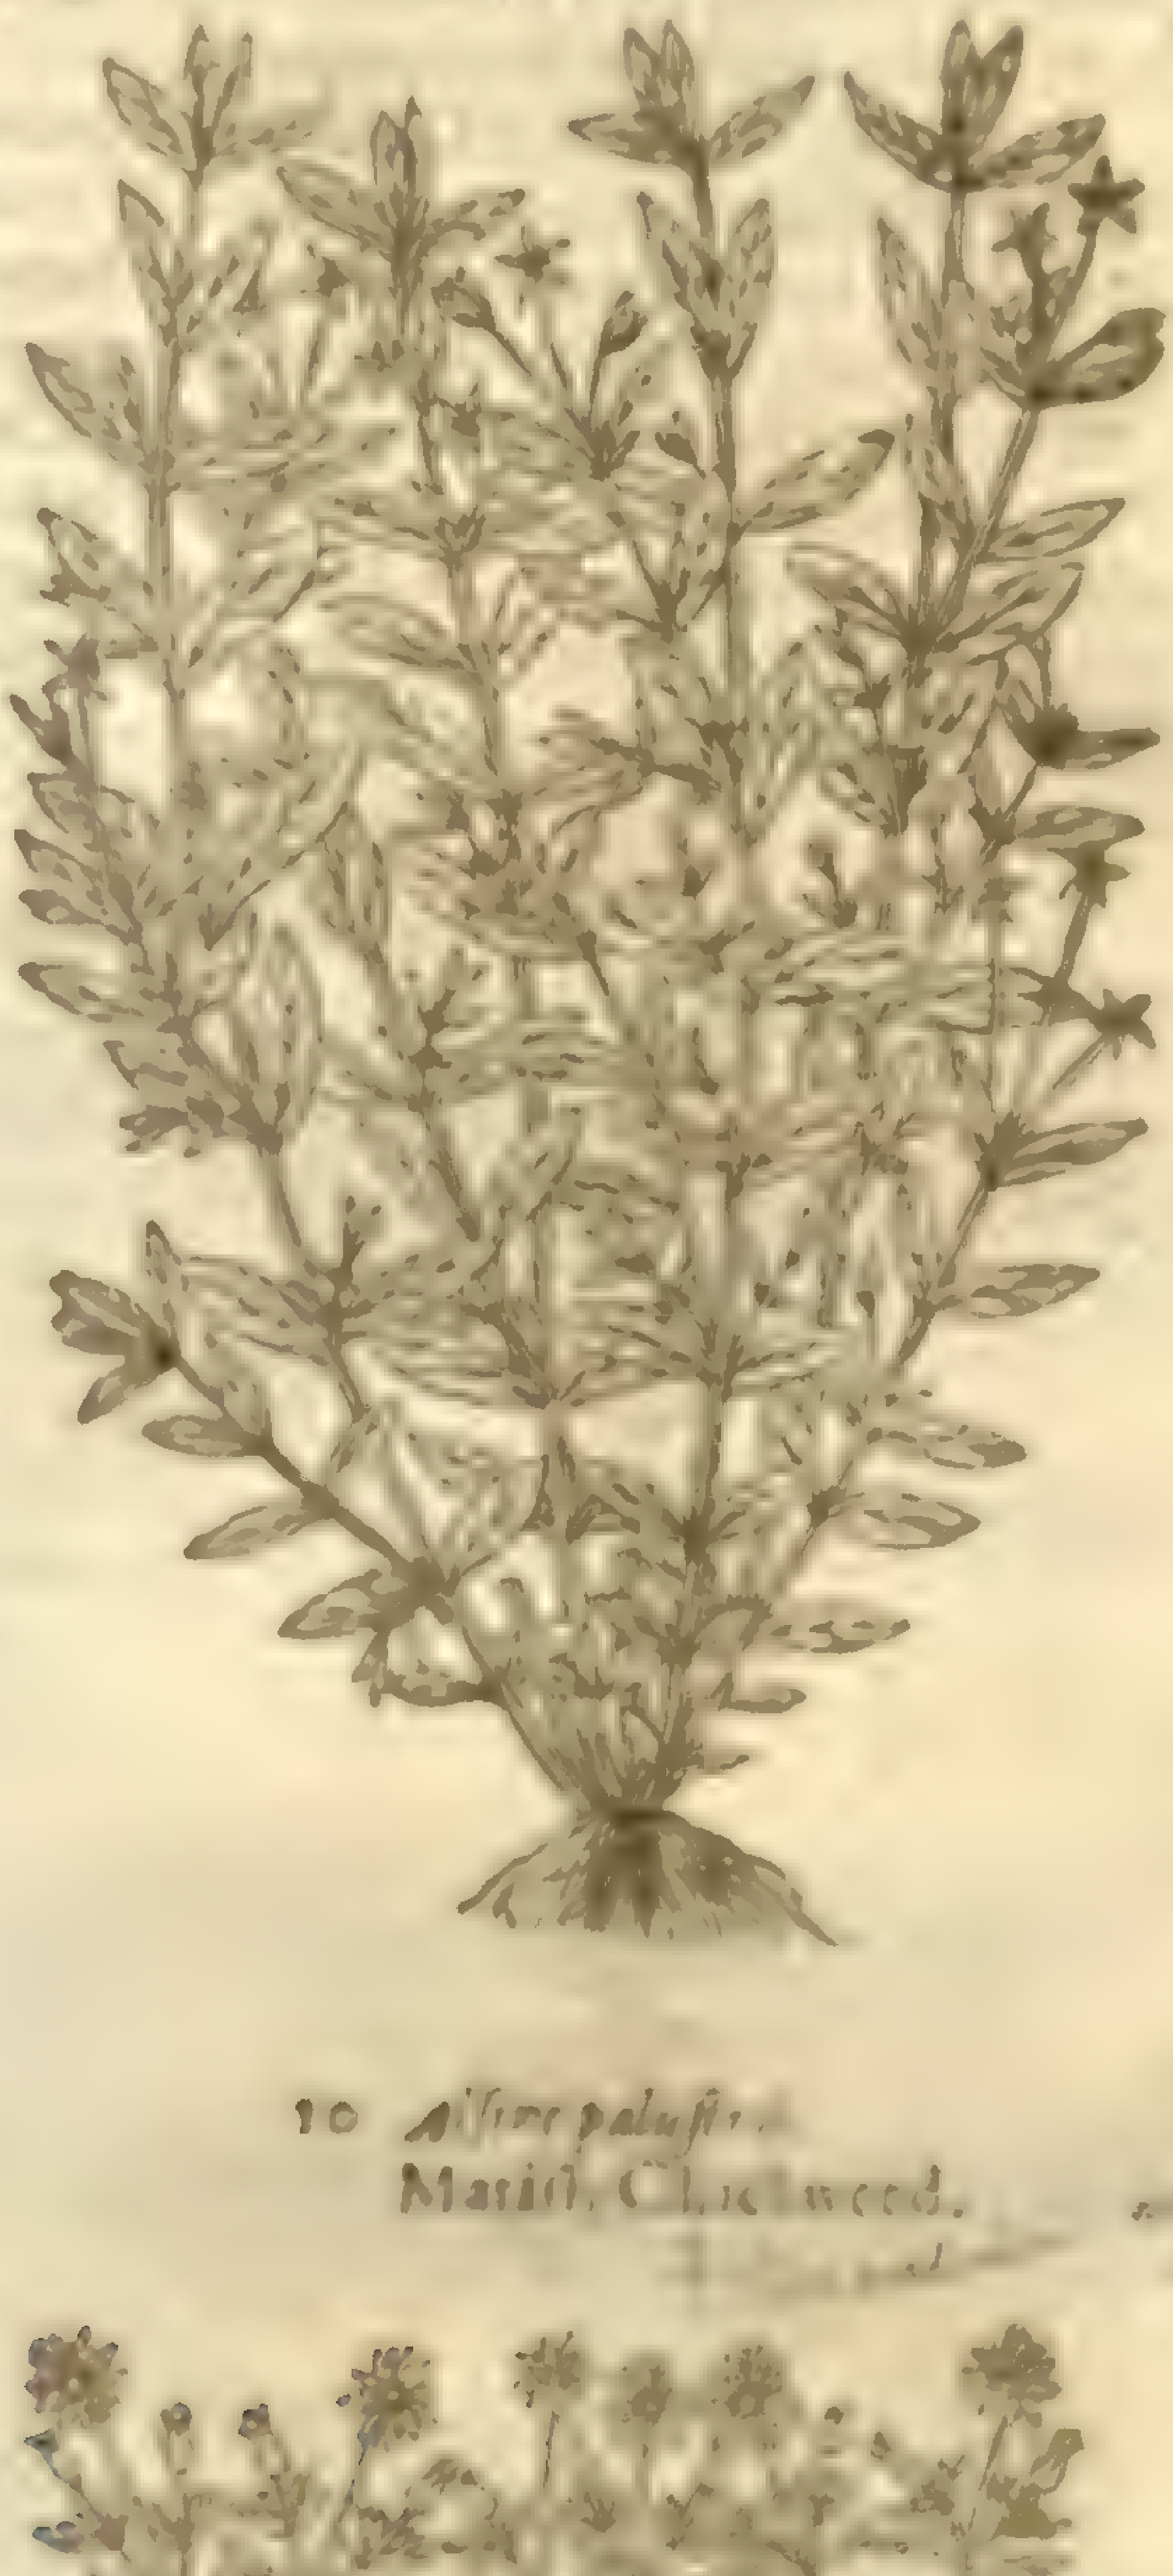
7 *Alſine folijs Veronicæ.*
Speed-well Chickweed.

[illegible]

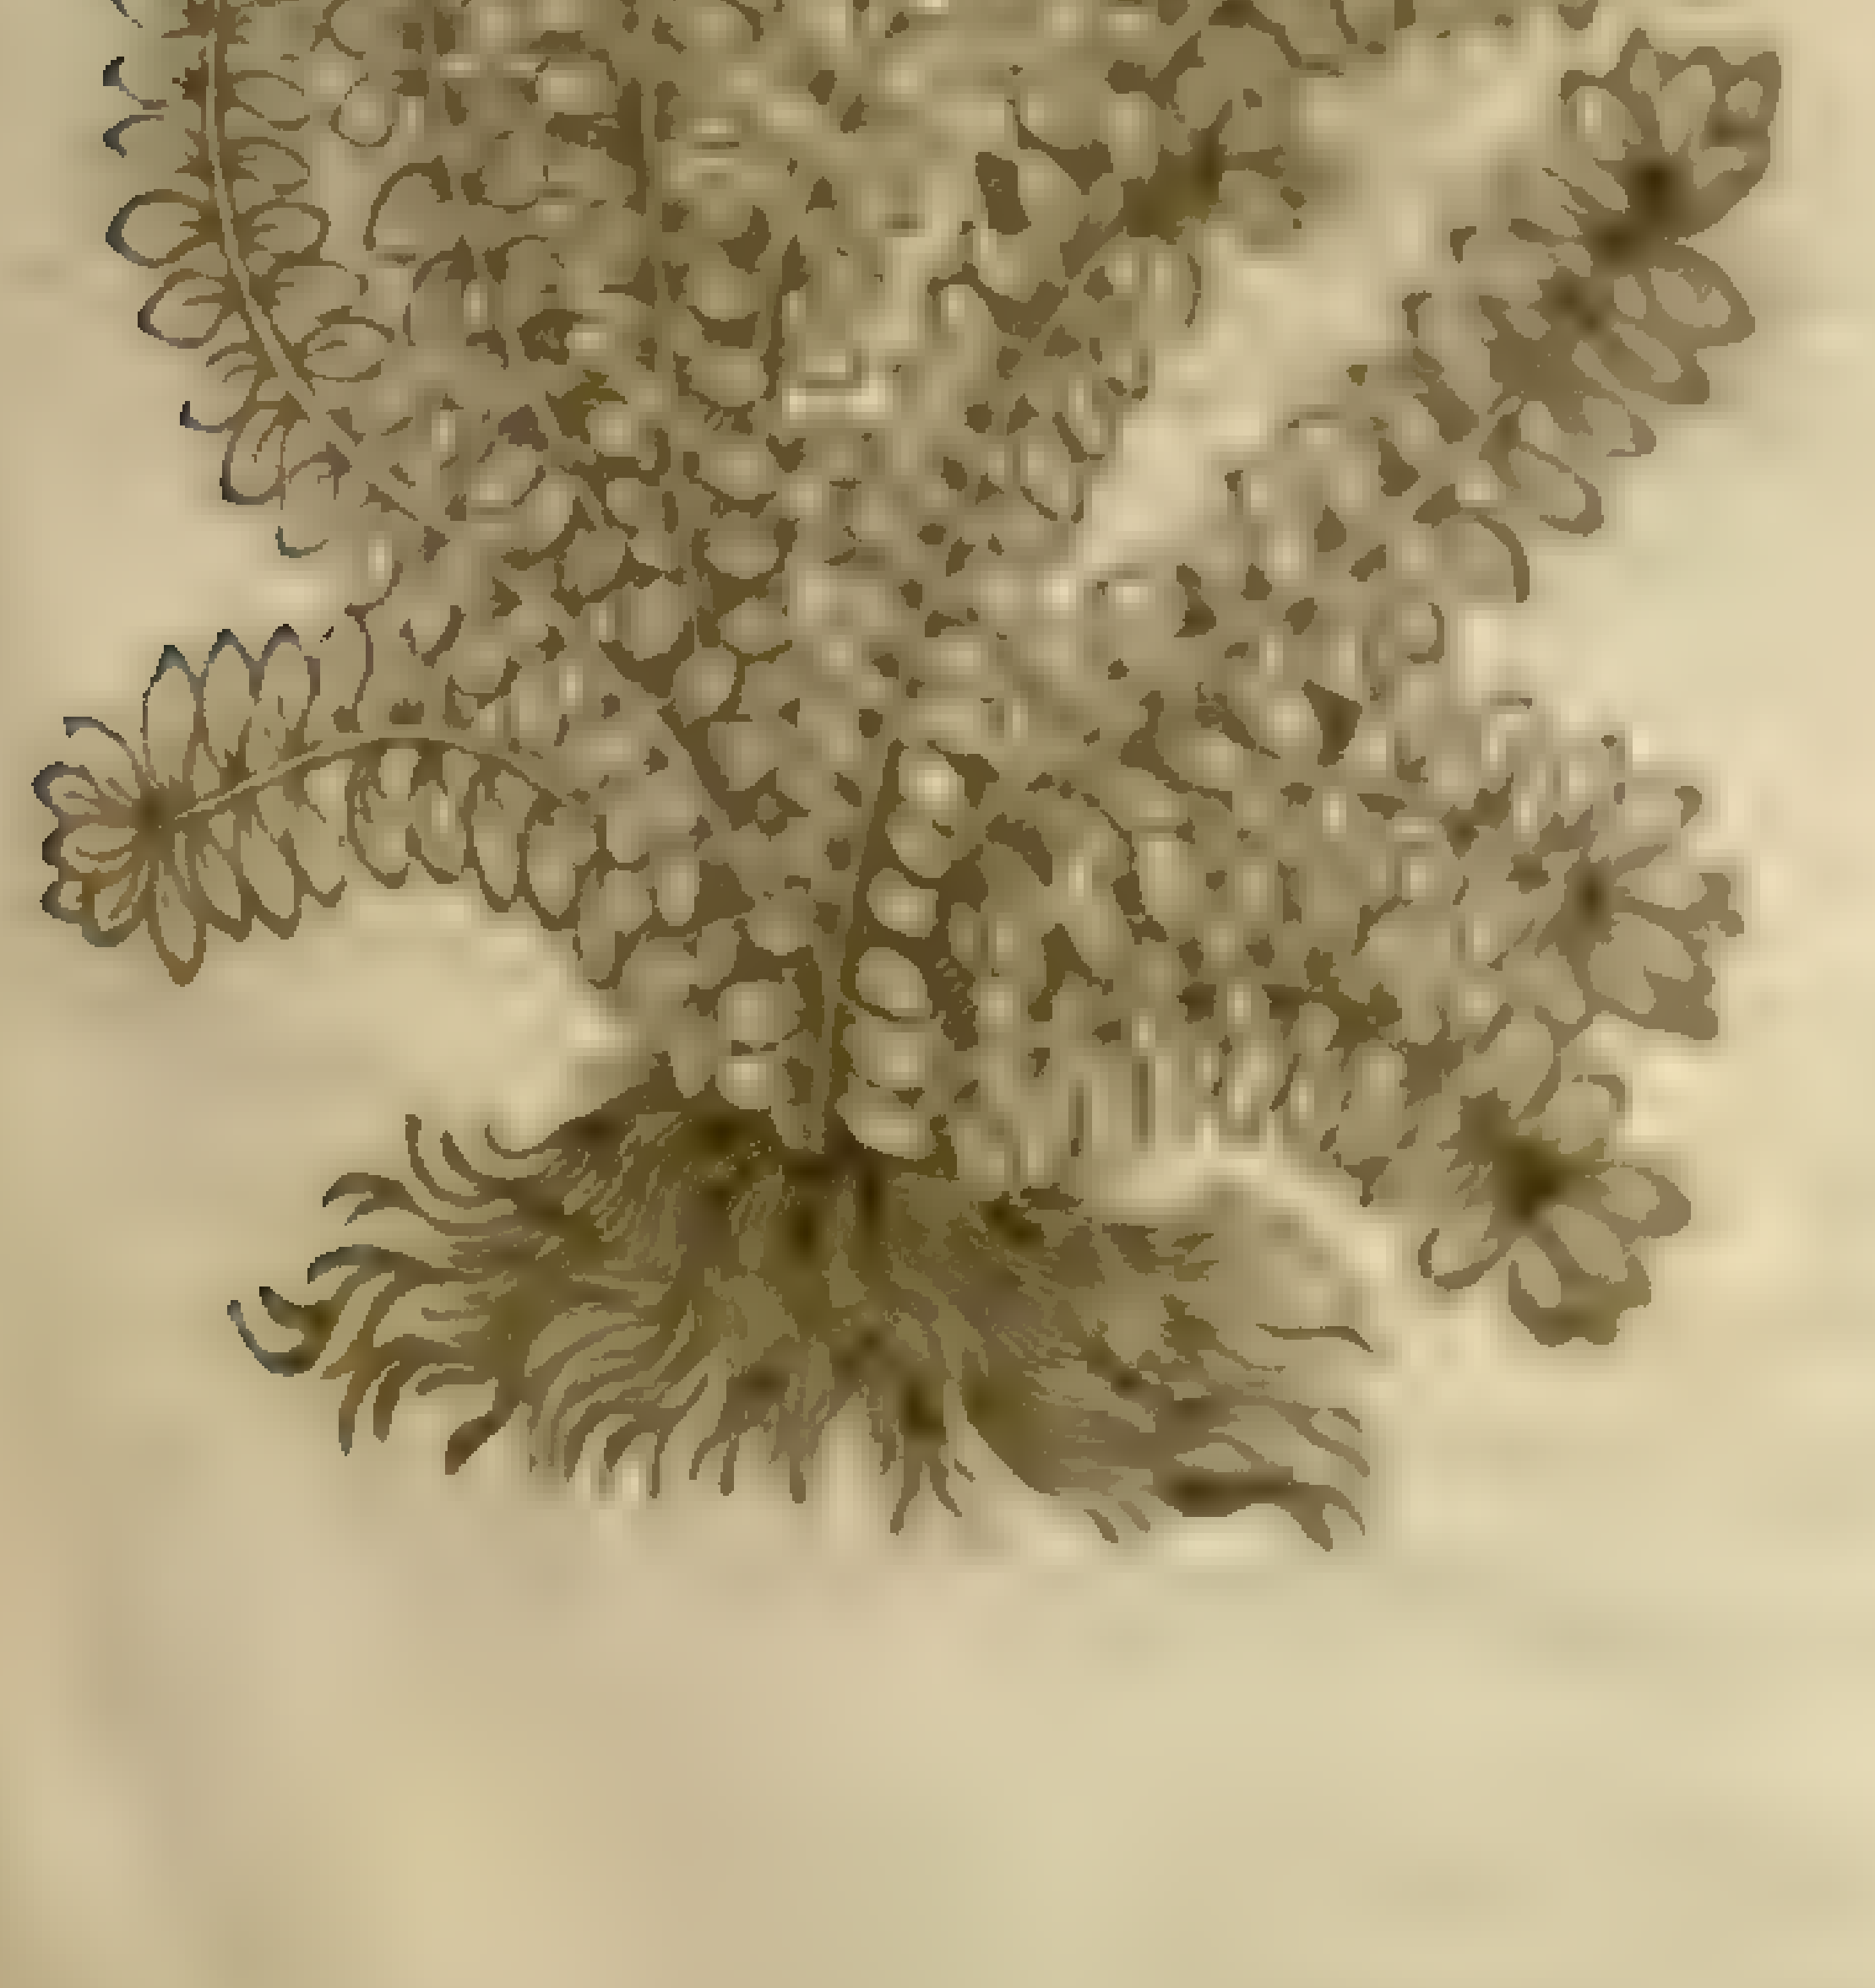


8 *Alſine fontana.*
Fountaine Chickweed

[illegible]

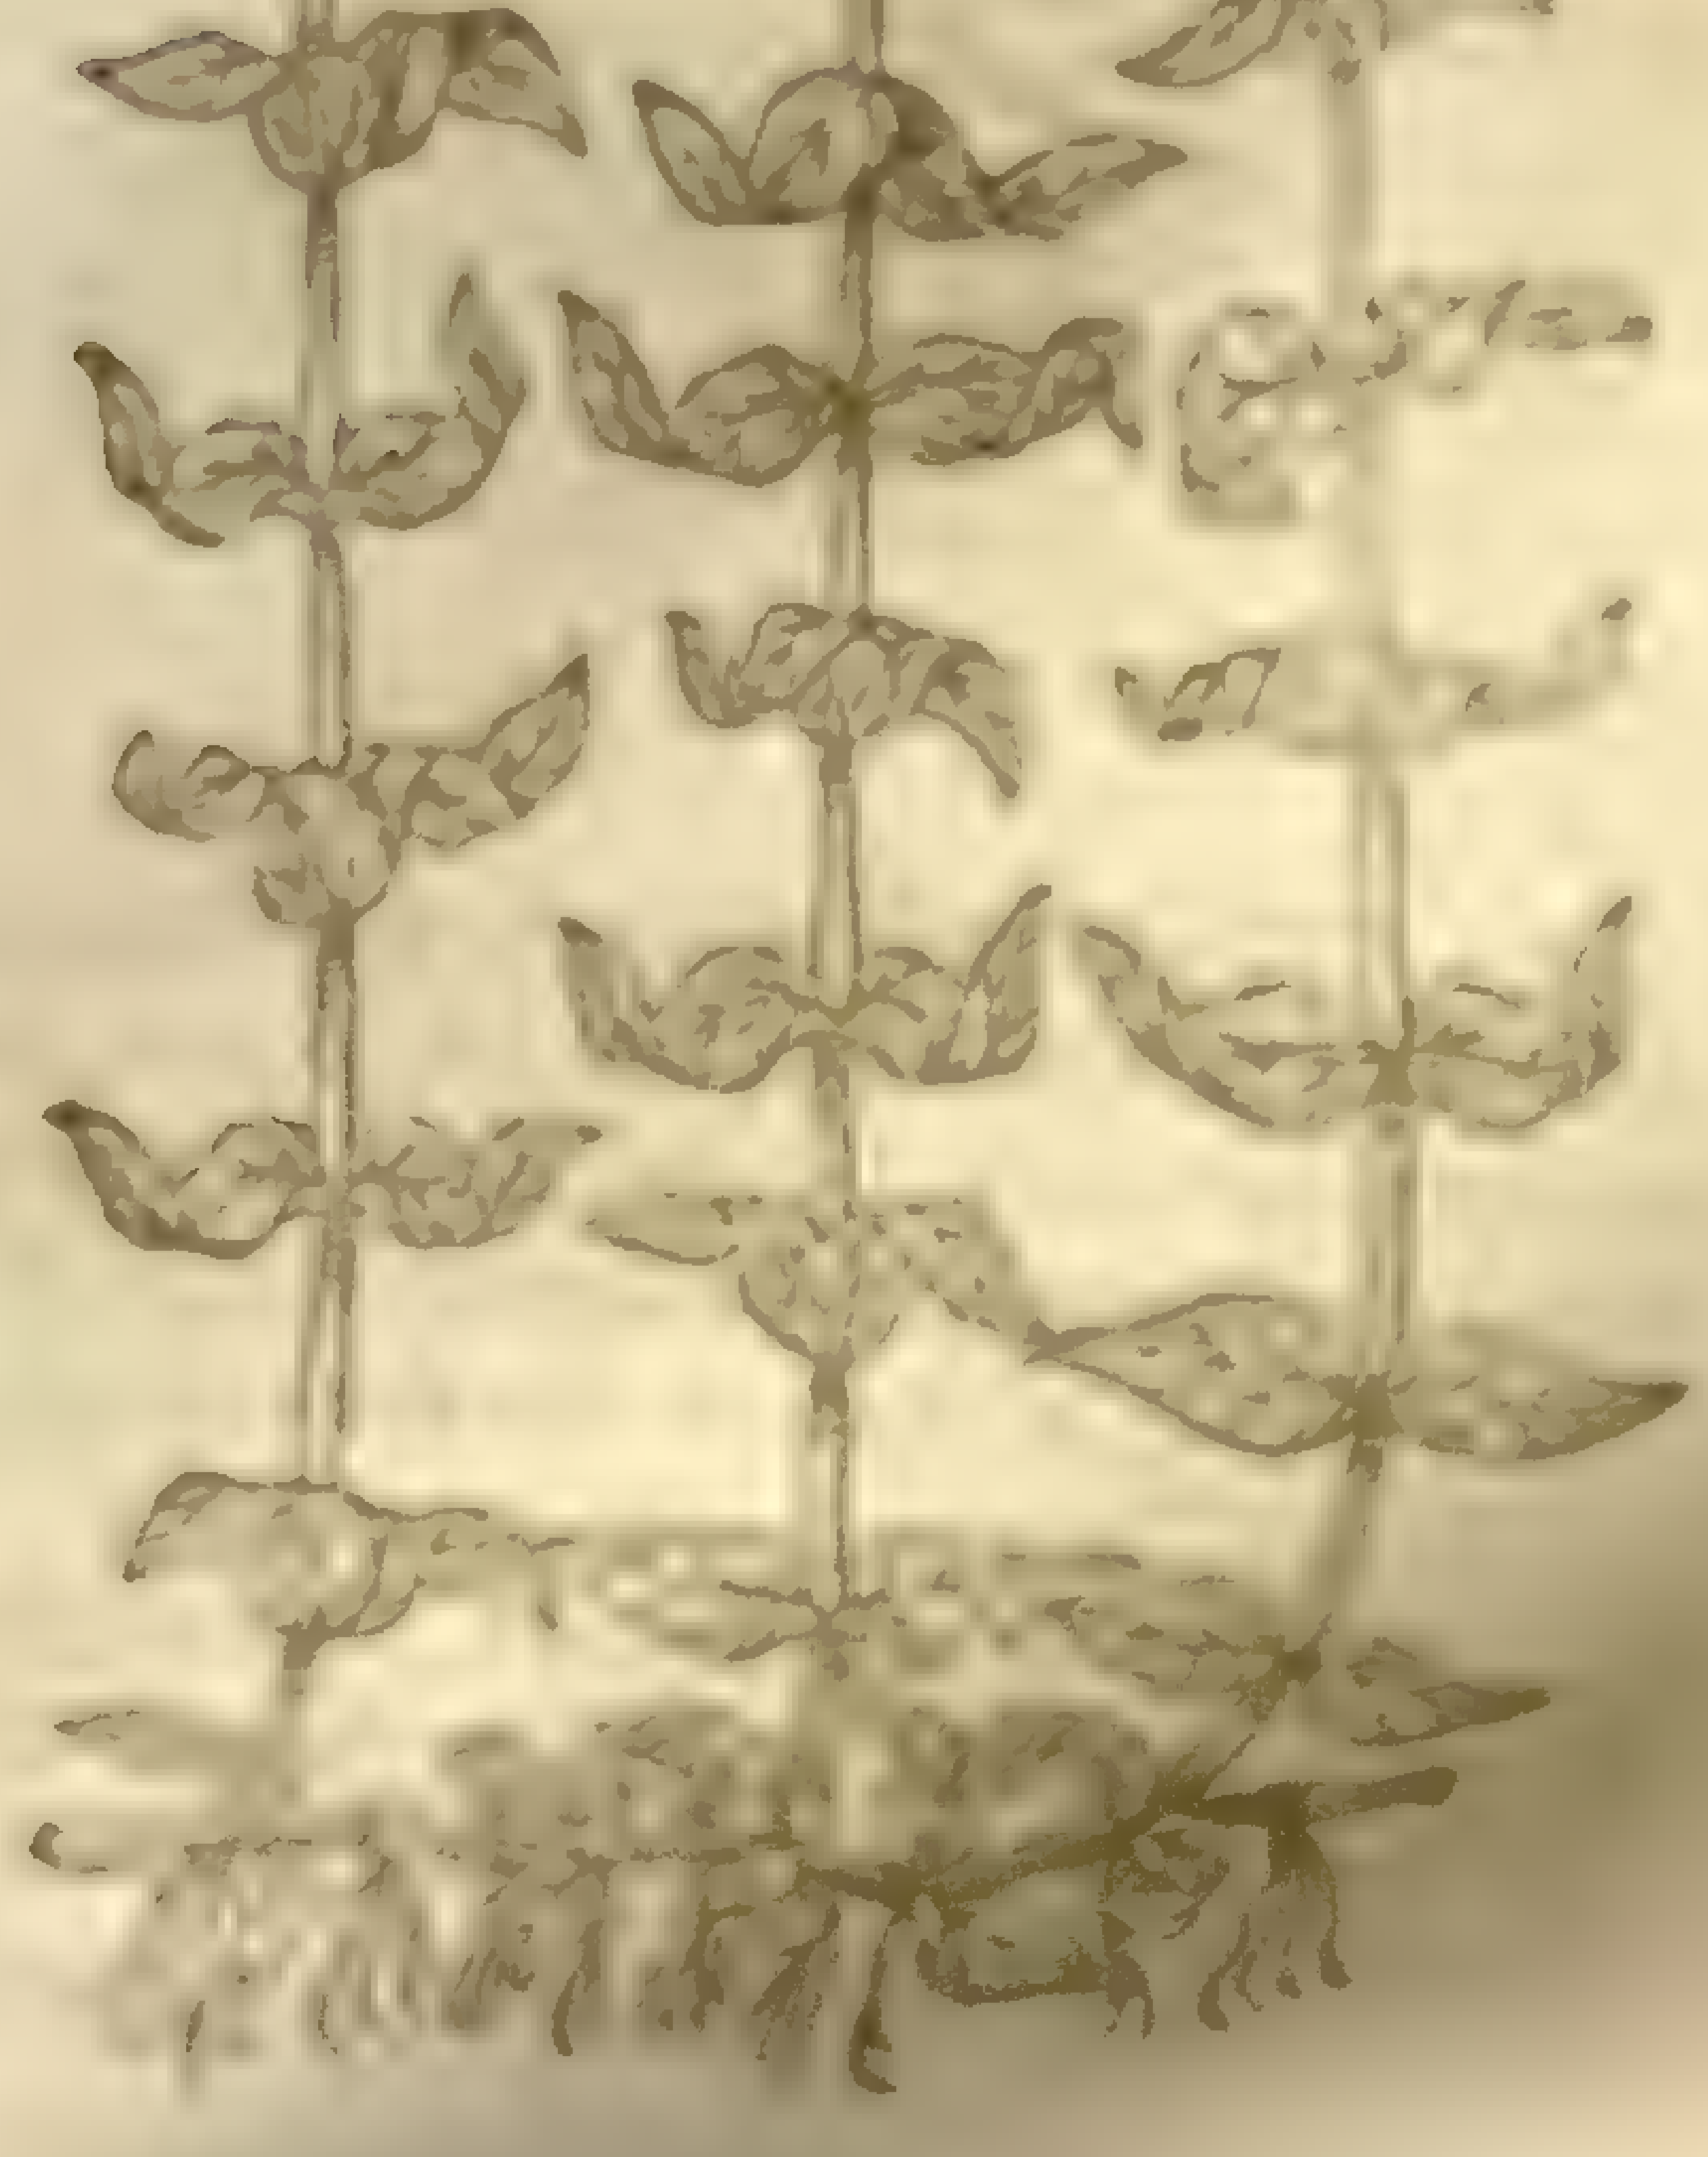


9 *Alſine fluuiatilis.*
Riuer Chickweed.



10 *Alſine paluſtris.*
Mariſh Chickweed.

[illegible]



7 Speedwel Chickweed hath a little tender ſtalk, from which come diuers ſmal arms or branches as it were wings, ſet together by couples; whereon grow leaues ſet likewiſe by couples, like thoſe of *Veronica* or herbe Fluellen, whereof it tooke his name. The floures grow along the branches, of a blew colour; after which come little pouches wherein is the ſeed. The root is ſmall and likewiſe threddy. ‡ This in the *Hiſt. Lugd.* is called *Elatine polyſchides*: and *Fabius Columna* iudgeth it to be the *Alyſſon* of *Dioſcorides*. ‡

8 There is a kinde of Chickweed growing in the brinks and borders of Wels, Fountaines, and ſhallow ſprings, hauing many threddy roots from which riſe vp diuers tender ſtalkes; whereupon grow long narrow leaues, from the boſomes of which come forth diuers ſmaller leaues of a bright green colour. The floures grow at the top of the ſtalks, ſmall, and white of colour.

9 There is likewiſe another water Chickweed ſmaller than the laſt deſcribed, hauing for his root a thicke haſſock or tuft of threddy ſtrings; from which riſe vp very many tender ſtems, ſtretching or trailing along the ſtream, whereupon grow long leaues ſet vpon a middle rib like thoſe of Lentils or wilde Fetch: the floures and ſeeds are like the precedent, but much ſmaller.

11 *Alſine rotundifolia, ſiue Portulaca aquatica.*
Water Purſlane.

Peplis [illegible]

‡ 12 *Alſine paluſtris ſerpillifolia.*
Creeping water Chickweed.

13 *Alſine baccifera.*
Berry-bearing Chickweed.

Cucubalus baccifera [illegible]

10 There growes in the mariſh or waterie grounds another ſort of Chickweed, not much vnlike the reſt of the ſtock or kindred of the Chickweeds. It hath a long root of the bigneſſe of a wheat ſtraw, with diuers ſtrings hanging thereat, very like the root of Couch-graſſe: from which riſeth vp diuers vpright ſlender ſtalks, ſet with pretty large ſharpe pointed leaues ſtanding by couples at certain diſtances: on the top of the ſtalkes grow ſmall white floures like thoſe of Stitchwort, but leſſer, and of a white colour.

‡ 11 To theſe water Chickweeds may fitly be added thoſe two which I mentioned and figured in my laſt Iournall: rhe former of which, that I haue there called *Alſine aquatica folijs ro*-*dioribus, ſiue Portulaca aquatica*; that is, round leaued Chickeweed, or water Purſlane, hath a ſmall ſtringy root which ſends forth diuers creeping ſquare branches, which here and there at the ioints

put out ſmall fibres,and take root againe: the leaues grow at the joints by couples, ſomewhat longiſh,and round at the points, reſembling thoſe of Purſlane, but much ſmaller,and of a yellowiſh greene colour:at the boſomes of the leaues come forth little floures, which are ſucceeded by little round ſeed-veſſels containing a ſmall round ſeed. *Bauhine* hath ſet this forth by the name of *Alſine paluſtris minor folijs oblongis.*

12 The other water Chickweed, which *Iohn Bauhine* hath mentioned by the name of *Serpillifolia*;and *Casper Bauhine* by the title of *Alſine paluſtris minor Serpillifolia*, hath alſo weake and tender creeping branches lying ſpred vpon the ground; ſet with two narrow ſharp pointed leaues at each joynt,greene aboue, and of a whitiſh colour below:at the ſetting on of theſe leaues grow ſmall veſſels parted as it were into two, with a little creſt on each ſide,and in theſe is contained a very ſmall ſeed. Both theſe may be found in waterie places in Iuly and Auguſt,as betweene Clapham heath and Touting,and betweene Kentiſh towne and Hampſtead.

13 This plant that *Cluſius* and others haue called *Alſine repens major*, and ſome haue thought the *[illegible] altera* of *Dioſcorides*;and *Cucubalus* of *Pliny*, may fitly be put in this ranke; for it ſendeth vp many long weake branches like the great Chickweed,ſet with two leaues at a joint,bigger than thoſe of the greateſt Chickeweed, yet like them in ſhape and colour: at the tops of the branches, out of pretty large cups come whitiſh greene floures, which are ſucceeded by berries as big as thoſe of Iuniper,at firſt green,but afterwards black:the ſeed is ſmal and ſmooth:the root white, very fibrous,long and wooddy, and it endures for many yeares. It floures moſt part of Summer, and growes wild in ſundry places of Spain and Germany, as alſo in Flanders and England, according to *Pena* and *Lobel*: yet I haue not ſeen it growing but in the garden of my friend Mr. *Pemble* at Marribone. The Authors laſt mentioned affirme the berries hereof to haue a poiſonous facultie like as thoſe of Dwale or deadly Nightſhade. ‡

¶ *The Place.*

Chickweeds, ſome grow among buſhes and briers,old walls, gutturs of houſes, and ſhadowie places.The places where the reſt grow are ſet forth in their ſeuerall deſcriptions.

¶ *The Time.*

The Chickweeds are greene in Winter, they floure and ſeed in the Spring.

¶ *The Names.*

Chickweed or Chickenweed is called in Greeke Ἀλσίνη: in Latine it retaineth the ſame name *Alſine*: of ſome of the Antients it is called *Hippia*. The reſt of the plants are diſtinguiſhed in their ſeuerall titles,with proper names which likewiſe ſetteth forth the place of their growings.

¶ *The Temperature.*

Chickweed is cold and moiſt, and of a wateriſh ſubſtance;and therefore it cooleth without aſtriction or binding,as *Galen* ſaith.

¶ *The Vertues.*

A The leaues of Chickweed boiled in water very ſoft,adding thereto ſome hogs greaſe,the pouder of Fenugreek and Lineſeed,and a few roots of marſh Mallowes, and ſtamped to the form of a cataplaſme or pulteſſe, take away the ſwellings of the legs or any other part, bring to ſuppuration or matter hot apoſtumes;diſſolue ſwellings that will not willingly yeeld to ſuppuration; eaſe members that are ſhrunk vp;comfort wounds in ſinewie parts;defend foule maligne and virulent vlcers from inflammation during the cure:in a word,it comforteth,digeſteth,defendeth,and ſuppurateth very notably.

B The leaues boiled in Vineger and ſalt are good againſt mangineſſe of the hands and legs,if they be bathed therewith.

C Little birds in cages (eſpecially Linnets)are refreſhed with the leſſer Chickeweed when they loath their meat: whereupon it was called of ſome *Paſſerina*.

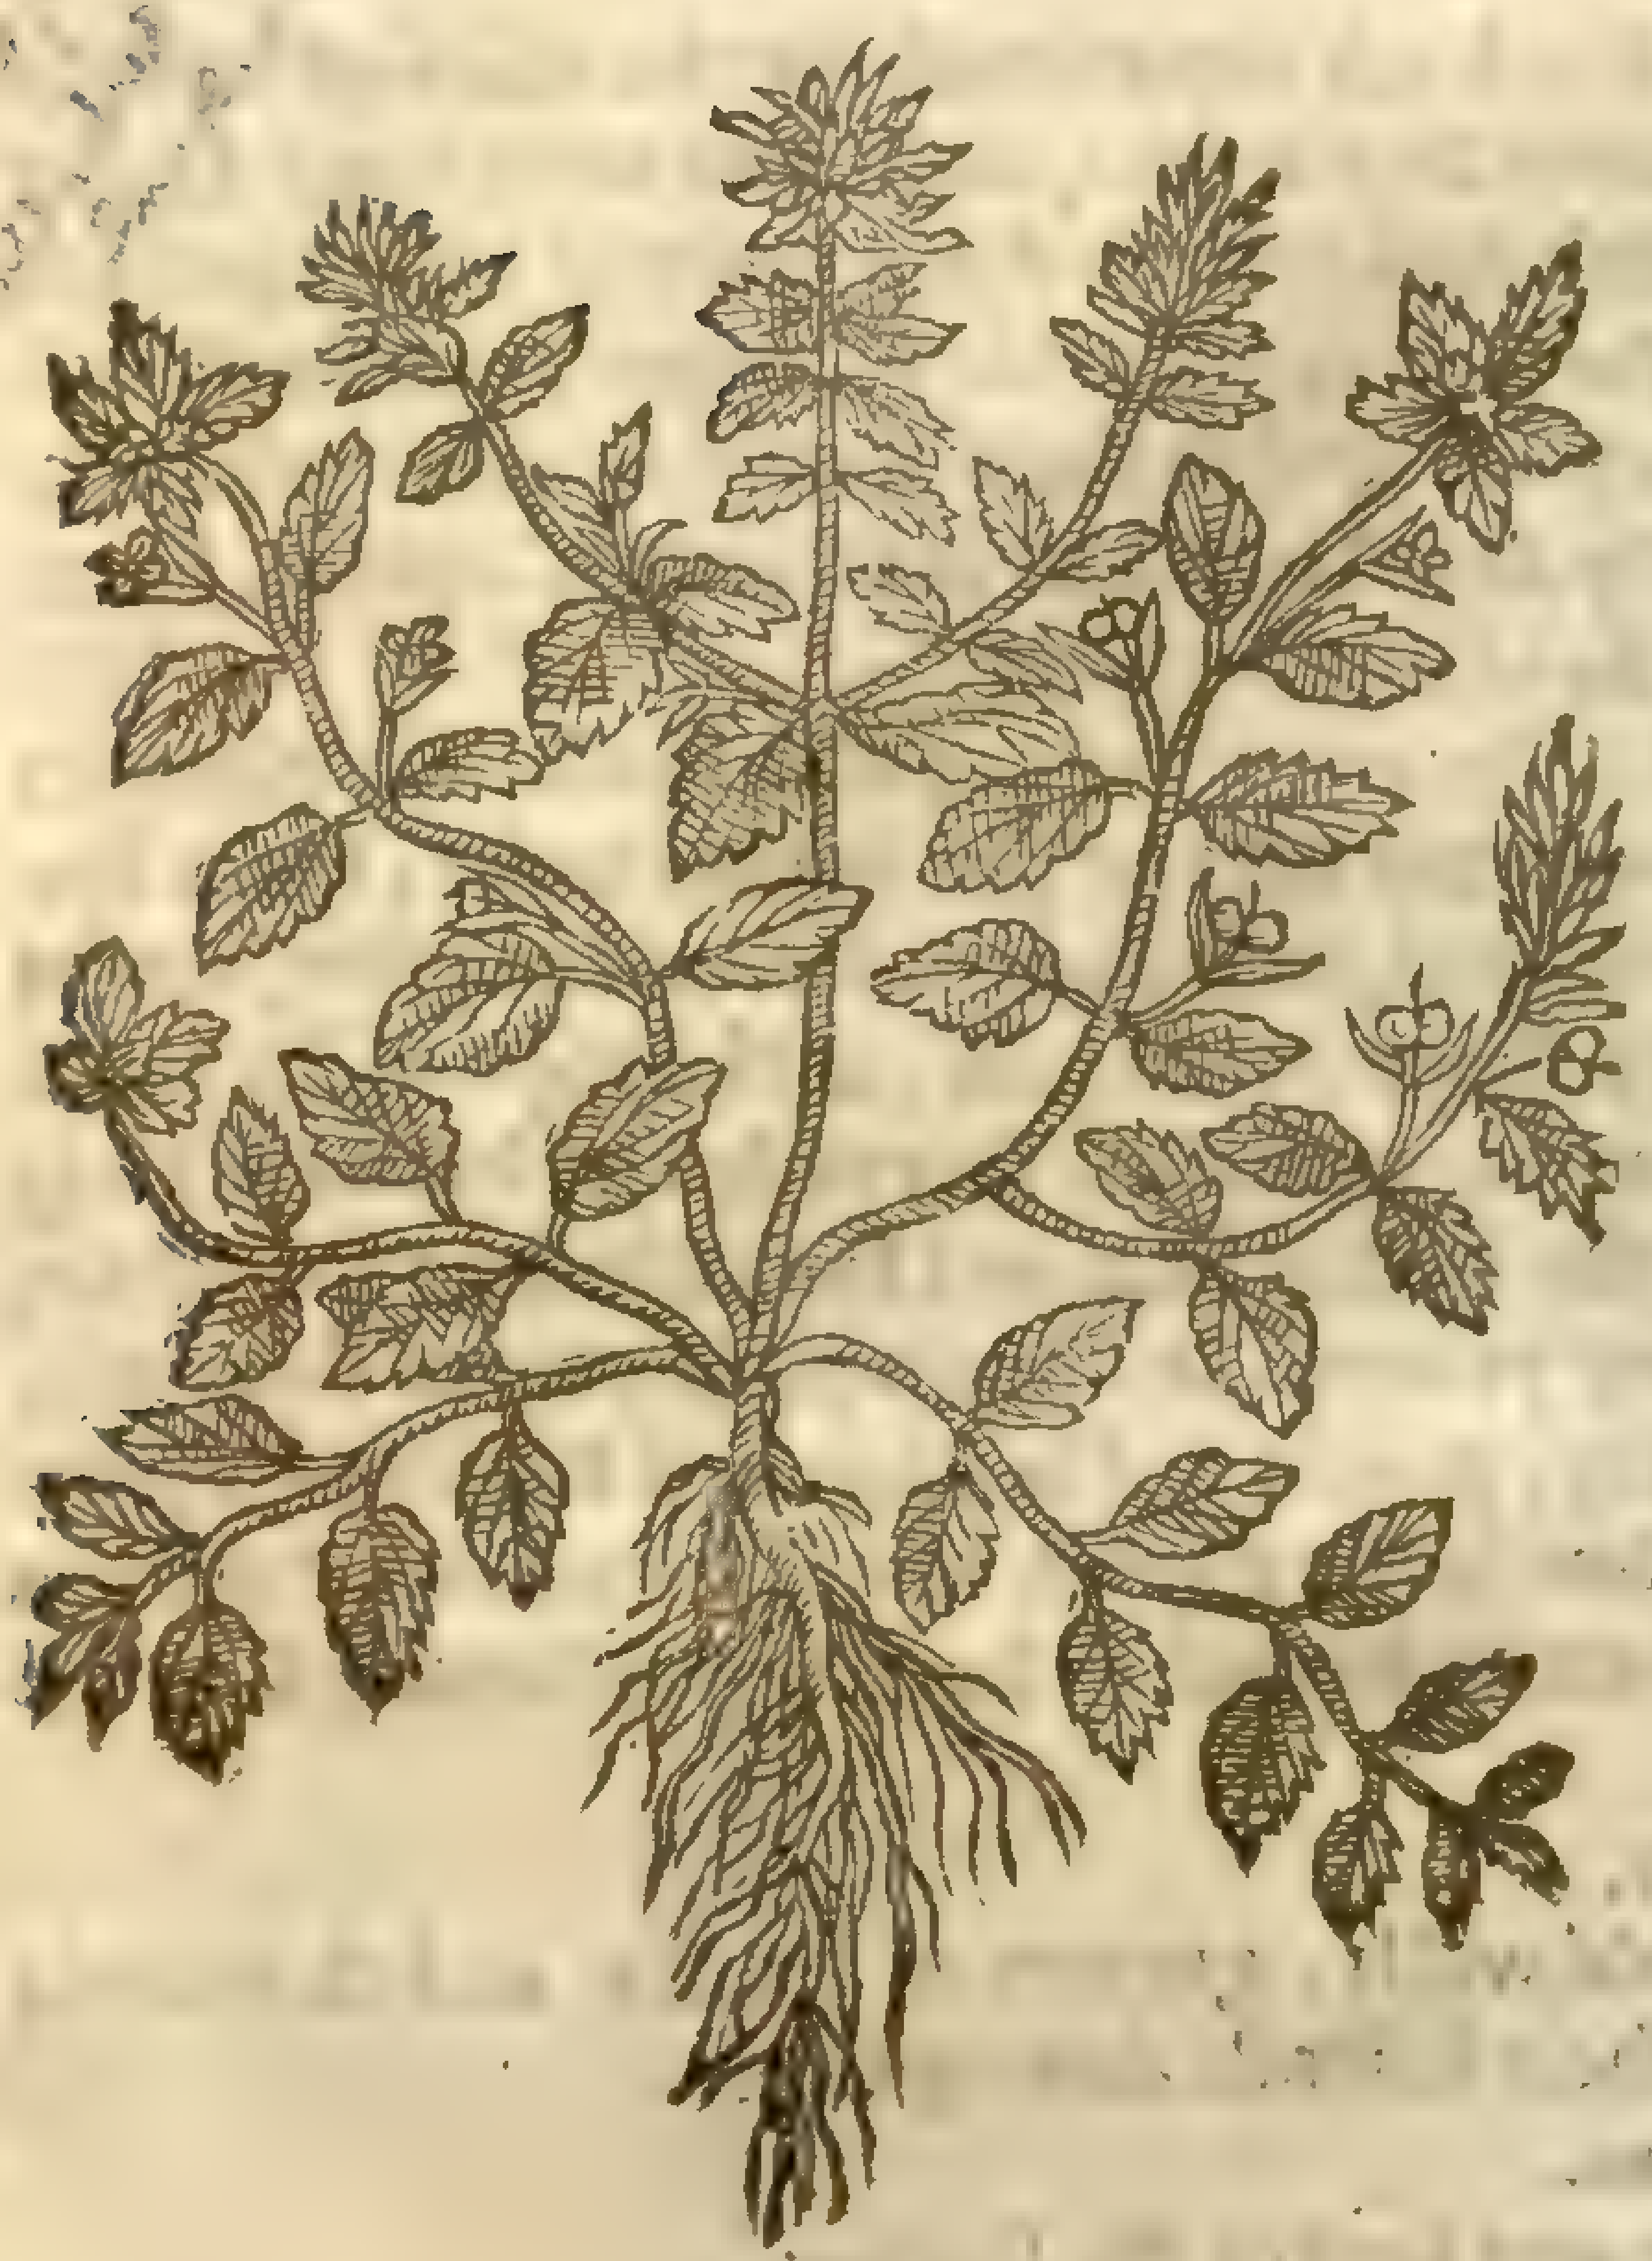
Chap. 193. *Of the baſtard Chickweeds.*

¶ *The Deſcription.*

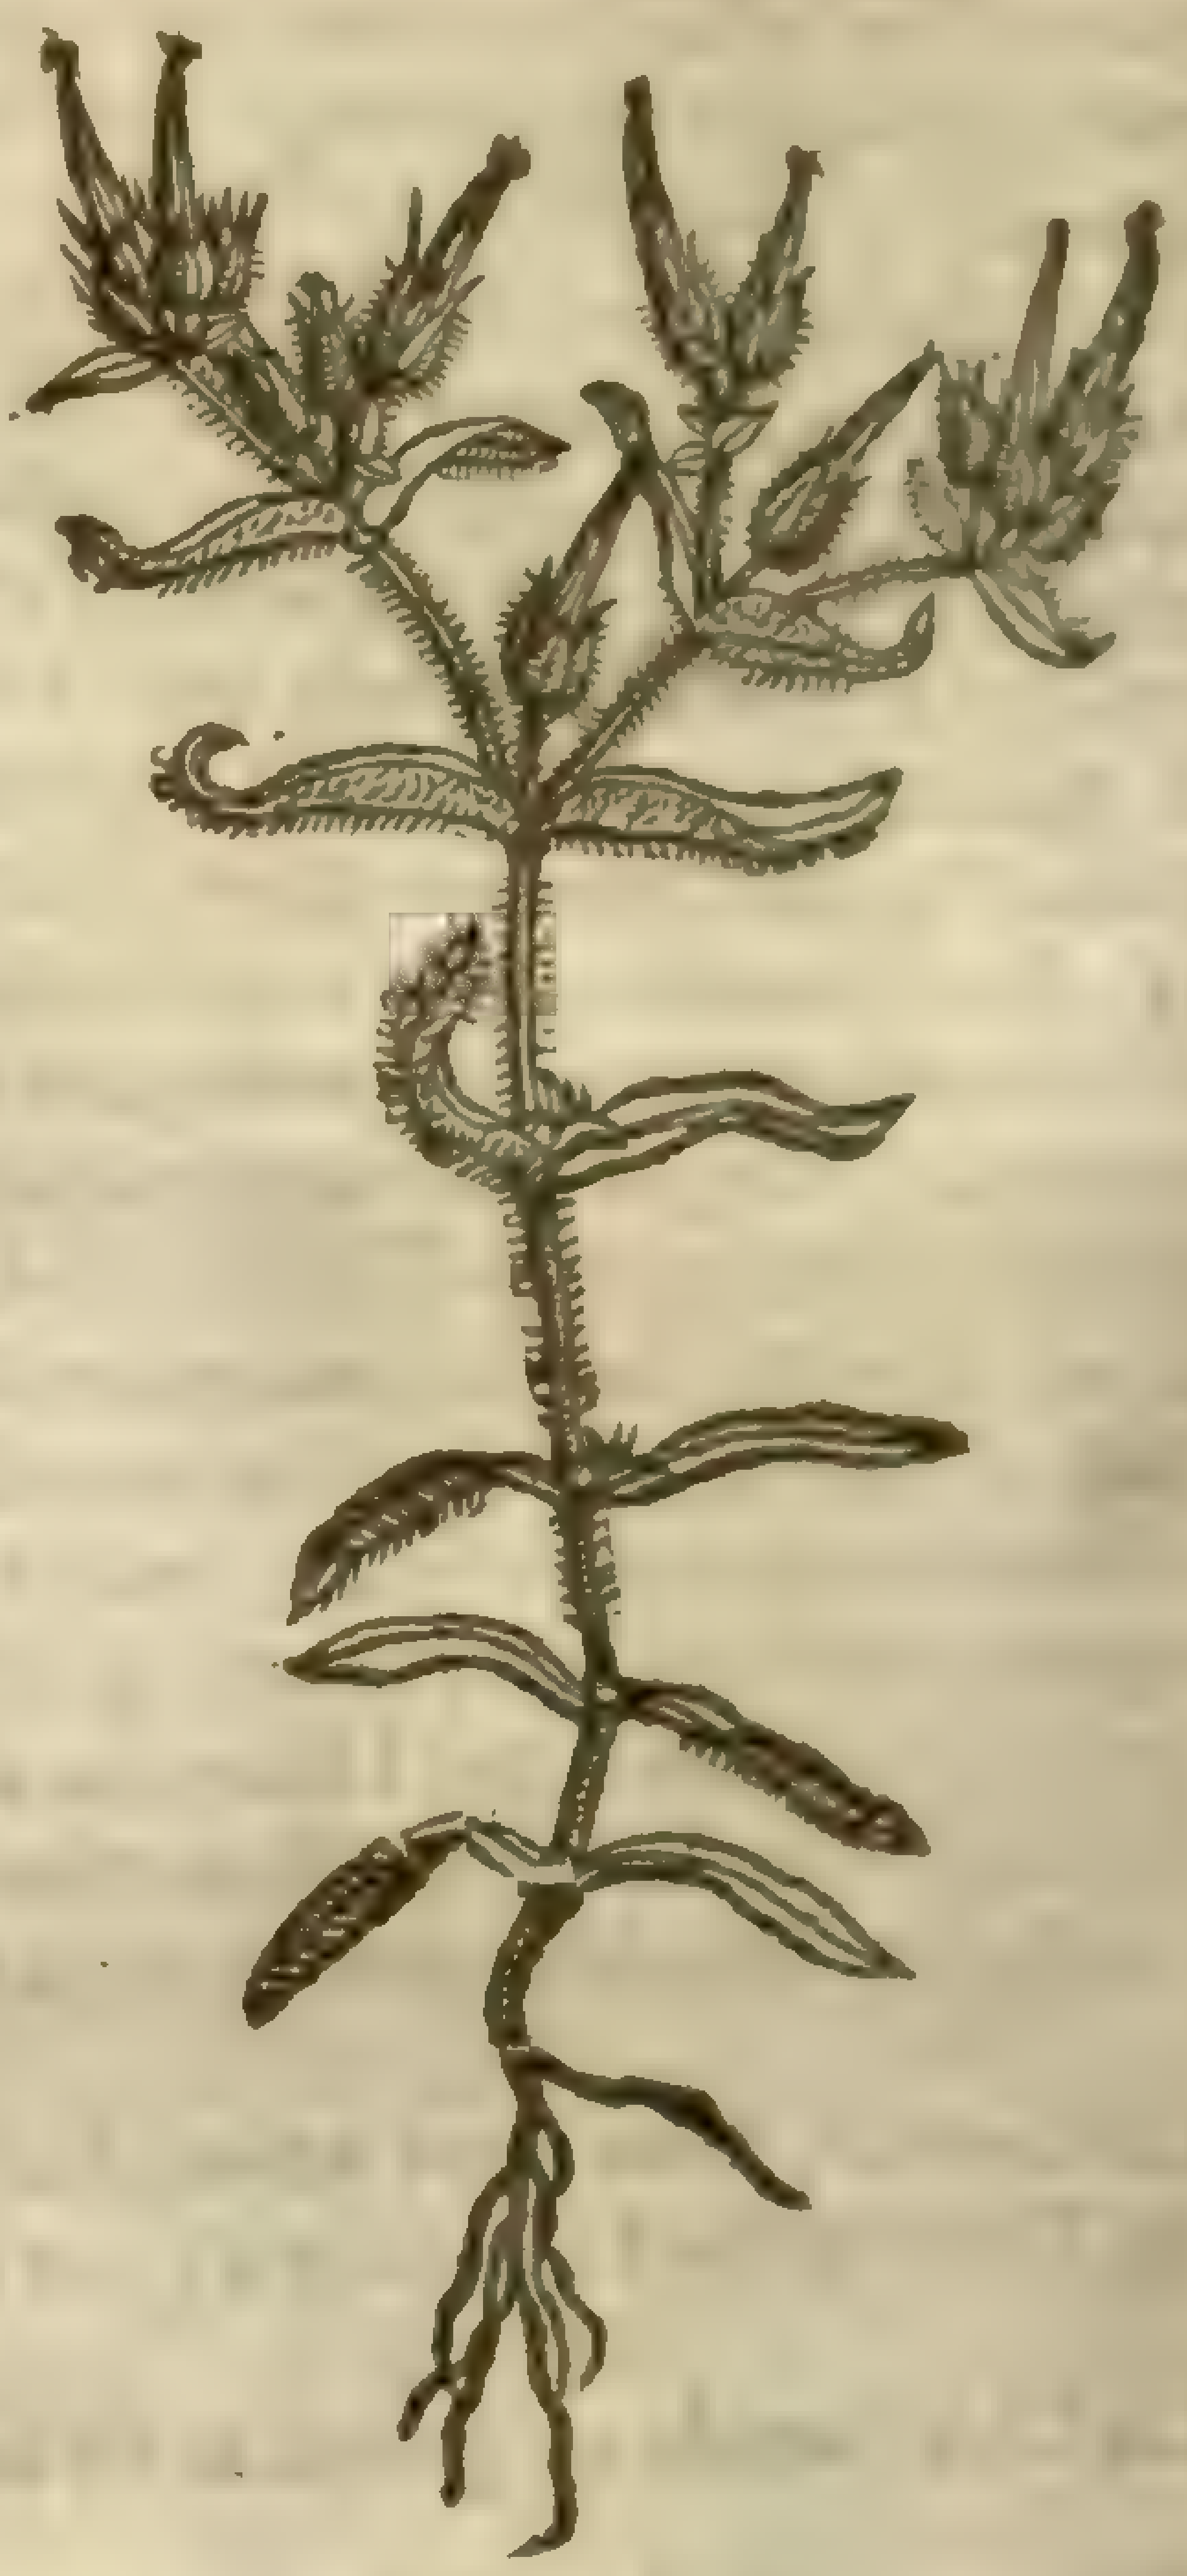
1 Germander Chickweed hath ſmal tender branches trailing vpon the ground,beſet with leaues like vnto thoſe of *Scordium* or Water Germander. Among which come forth little blew floures:which being faded,there appear ſmall flat husks or pouches, wherin ieth the ſeed. The root is ſmall and threddie; which being once gotten into a garden ground,is hard to be deſtroied,but naturally commeth vp from yeare to yeare as a noiſome weed.

1 *Alſine folijs Triſſaginis.*
Germander Chickweed.

[illegible]

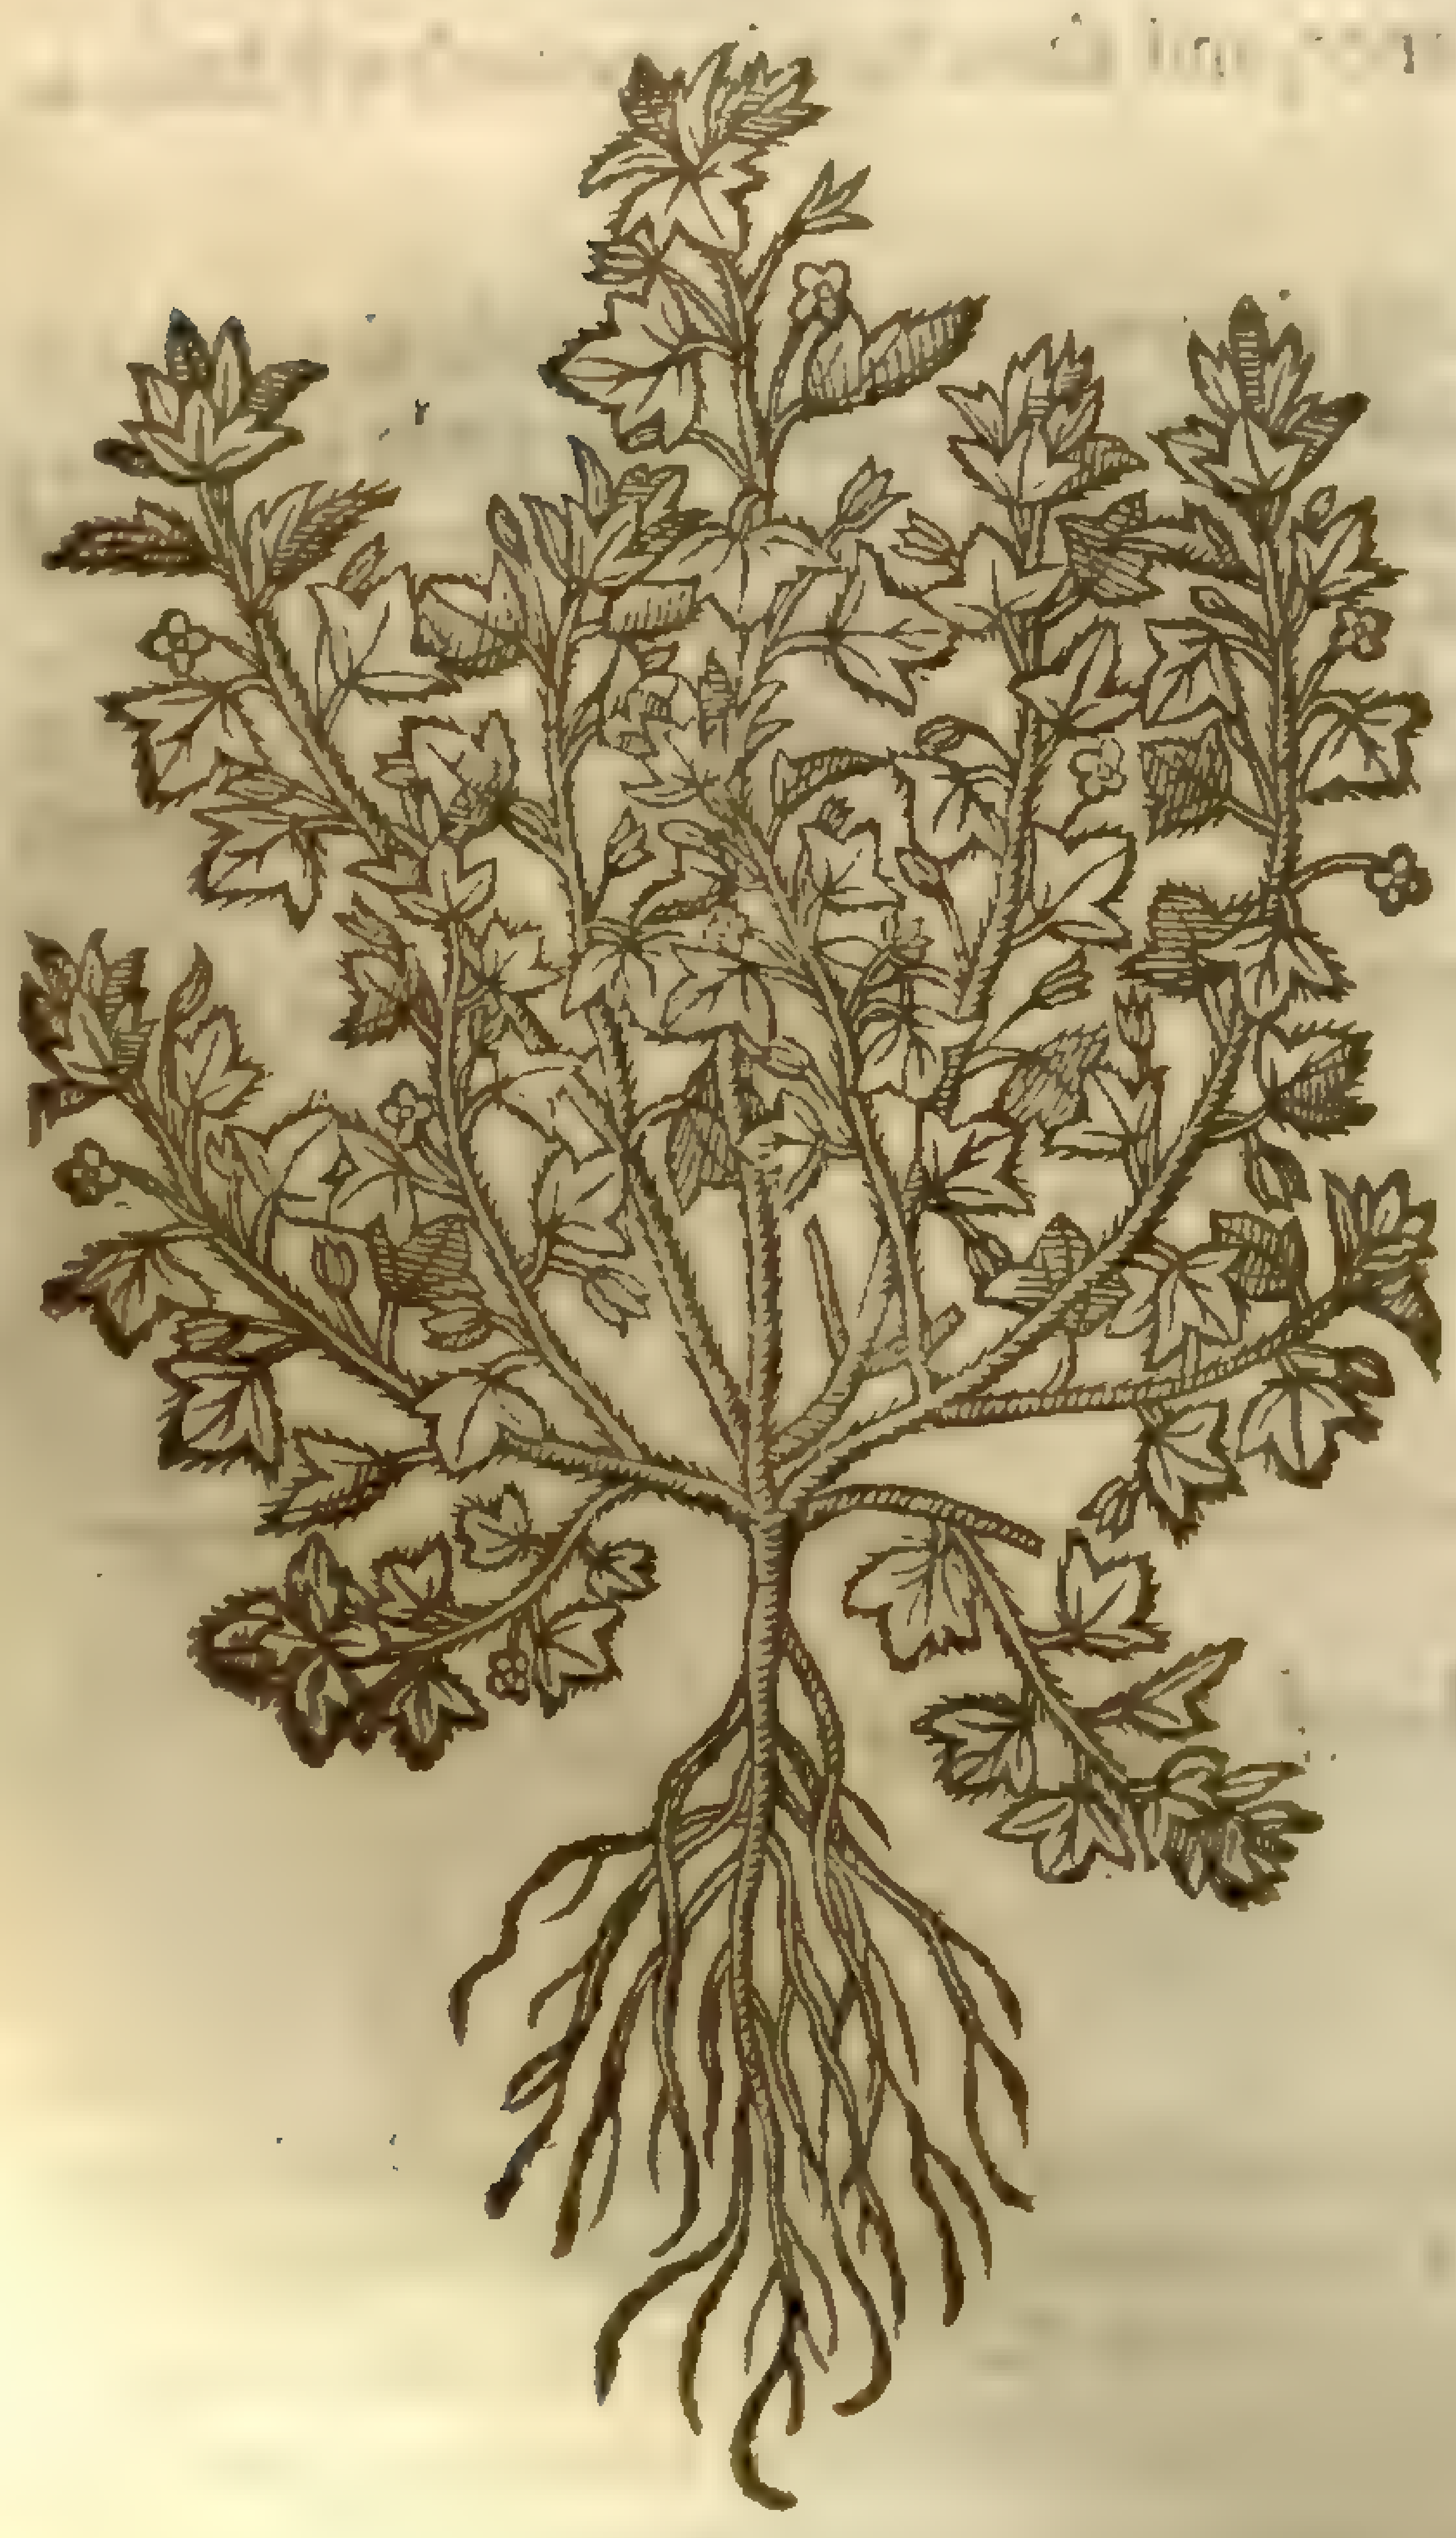


2 *Alſine Corniculata Cluſij.*
Horned Chickweed.



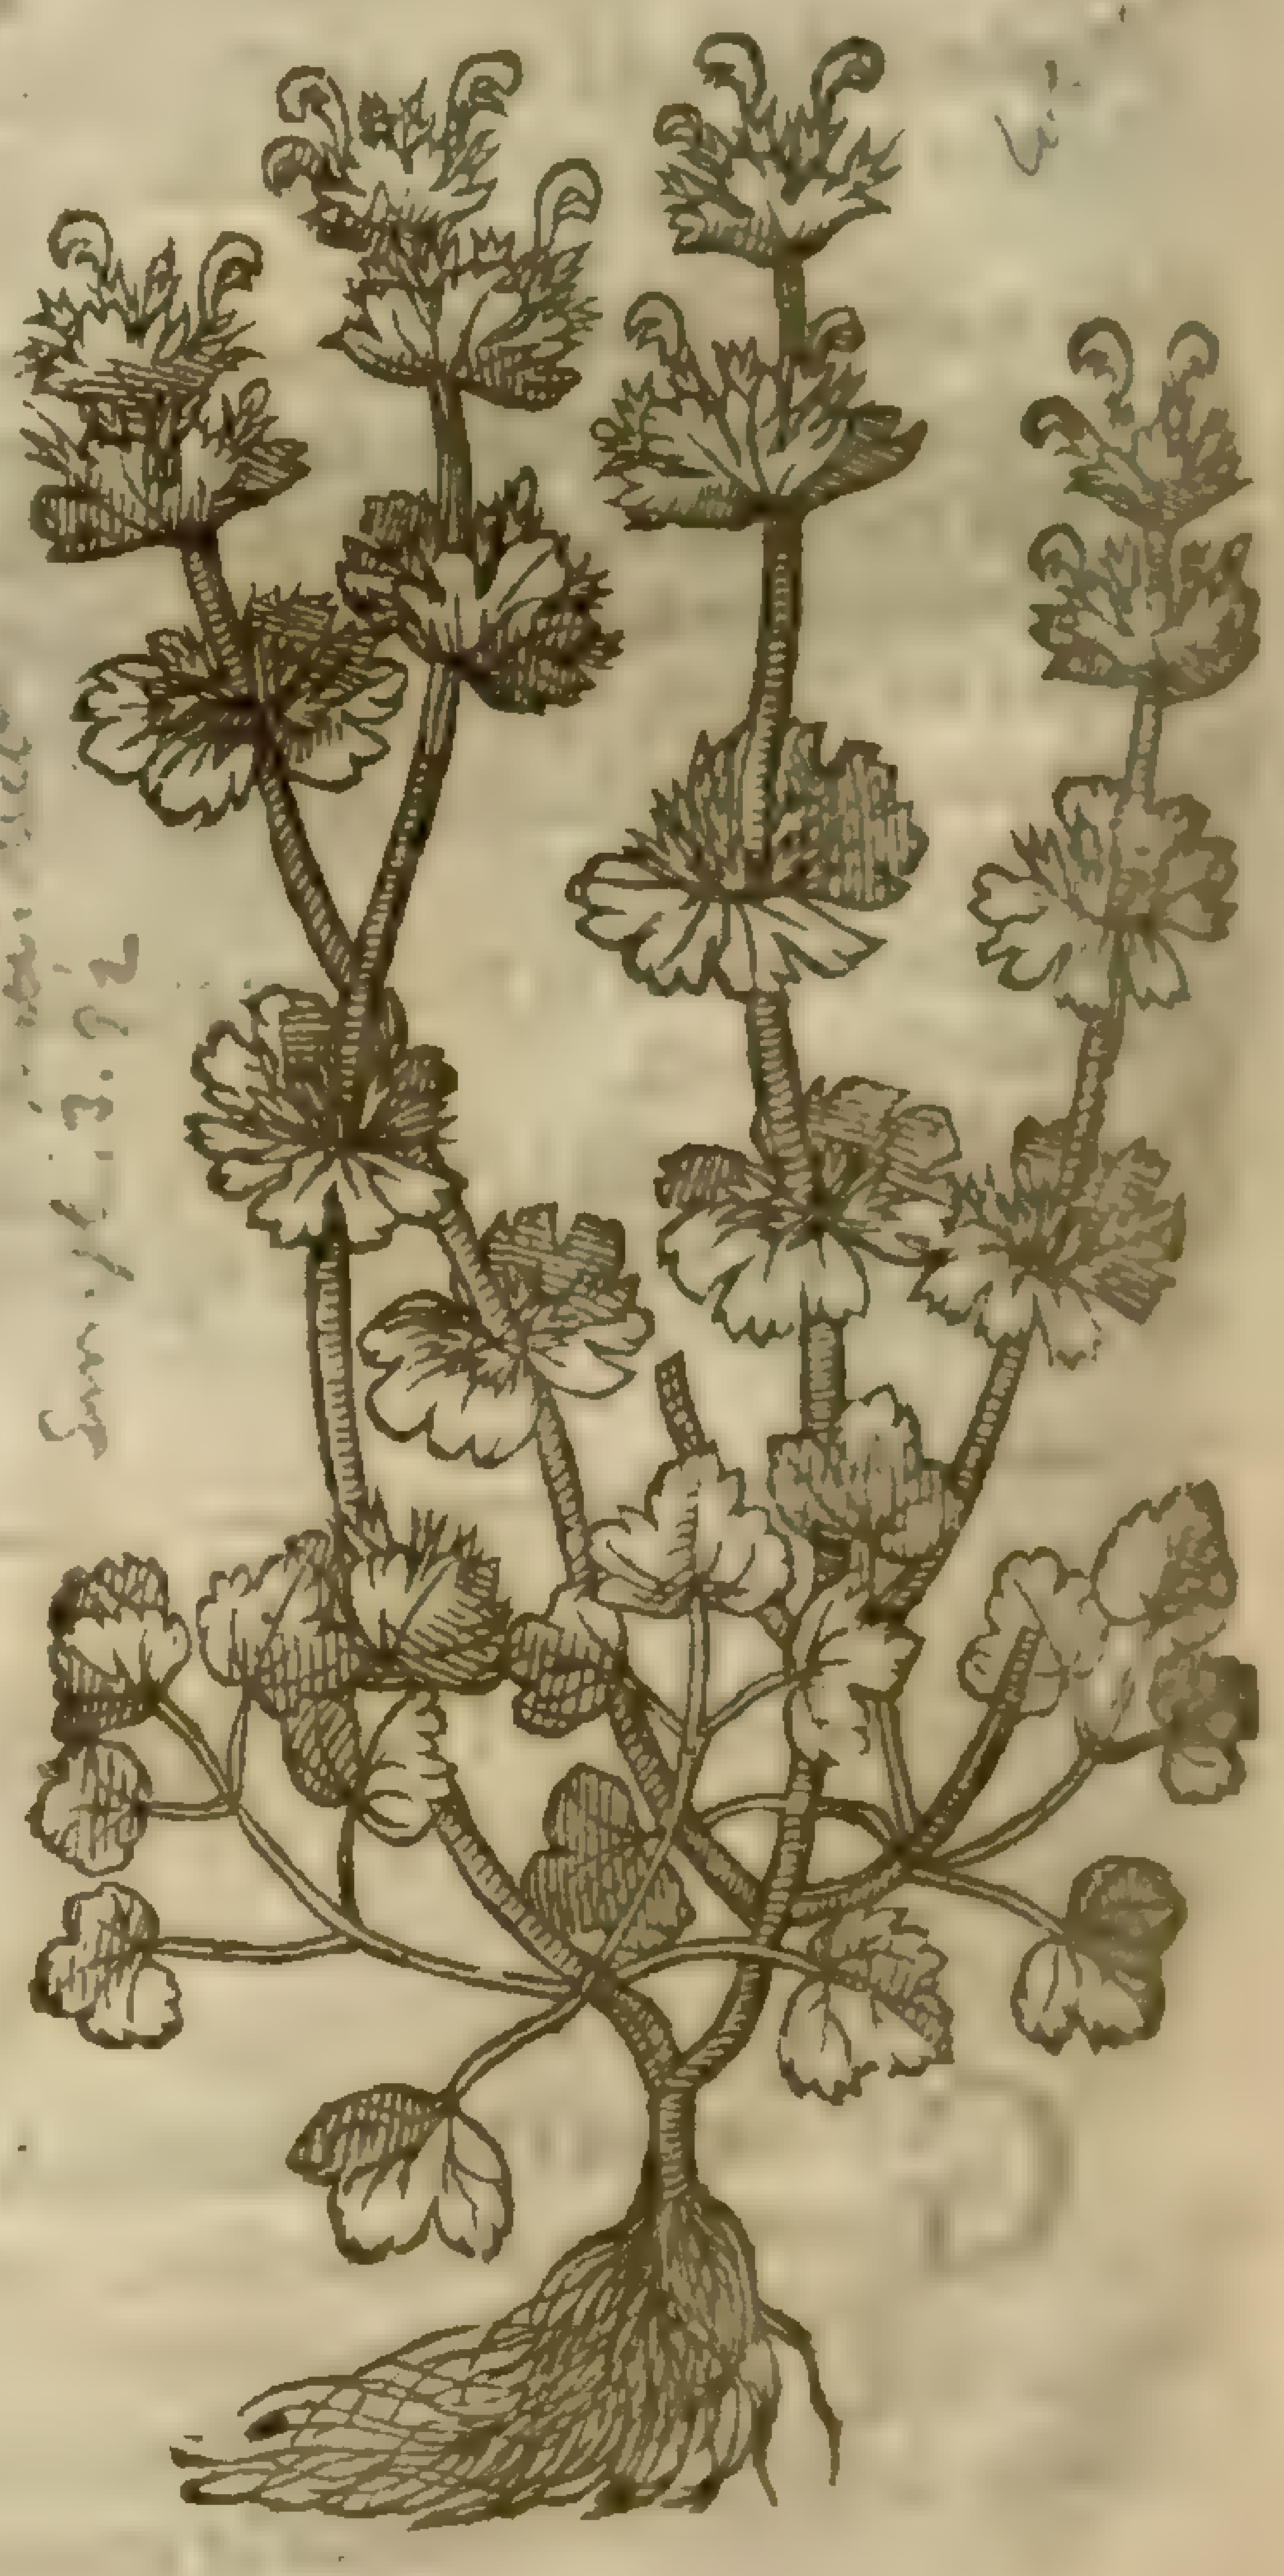
3 *Alſine Hederacea.*
Iuy Chickweed.

Veronica hederaefolia
Linn. [illegible]
Sm. pl. 625



4 *Alſine Hederula altera.*
Great Henne-bit.

Lamium amplexicaule
[illegible]
Sm. pl. 3.92



2 *Cluſius*, a man ſingular in the knowledge of plants, hath ſet downe this herbe for one of the Chickweeds, which doth very well reſemble the Storks bill, and might haue beene there inſerted. But the matter being of ſmall moment I let it paſſe; for doubtleſſe it participateth of both, that is, the head or beake of Storkes bill, and the leaues of Chickweed, which are long and hairy, like thoſe of Scorpions Mouſe-eare. The floures are ſmall, and of an herby colour; after which come long horned cods or ſeed veſſels, like vnto thoſe of the Storks bill. The root is ſmall and ſingle, with ſtrings faſtened thereto.

3 Iuie Chickweed or ſmall Henbit, hath thin hairy leaues ſomewhat broad, with two cuts or gaſhes in the ſides, after the manner of thoſe of ground Iuie, whereof it tooke his name, reſembling the backe of a Bee when ſhe flieth. The ſtalks are ſmall, tender, hairy, and lying flat vpon the ground. The floures are ſlender, and of a blew colour. The root is little and threddy.

4 The great Henbit hath feeble ſtalkes leaning toward the ground, whereupon do grow at certaine diſtances leaues like thoſe of the dead Nettle; from the boſome whereof come forth ſlender blew floures tending to purple; in ſhape like thoſe of the ſmall dead Nettle. The root is tough, ſingle, and a few ſtrings hanging thereat.

¶ *The Place.*

Theſe Chickweeds are found in gardens among pot-herbes, in darke ſhadowie places, and in the fields after the corne is reaped.

¶ *The Time.*

They flouriſh and are greene when the other Chickweeds are.

¶ *The Names.*

The firſt and third is called *Morſus Gallinæ*, Hens bit, *Alſine Hederula*, and *Hederacea*: *Lobel* alſo cals the fourth, *Morſus Galinæ folio Hederulæ alter*: in high Dutch, **Hunerbiſz**: in French, *Morſgelin*, and *Morgeline*: in low Dutch, **Hoenderebeet**: in Engliſh, Henbit the greater and the leſſer.

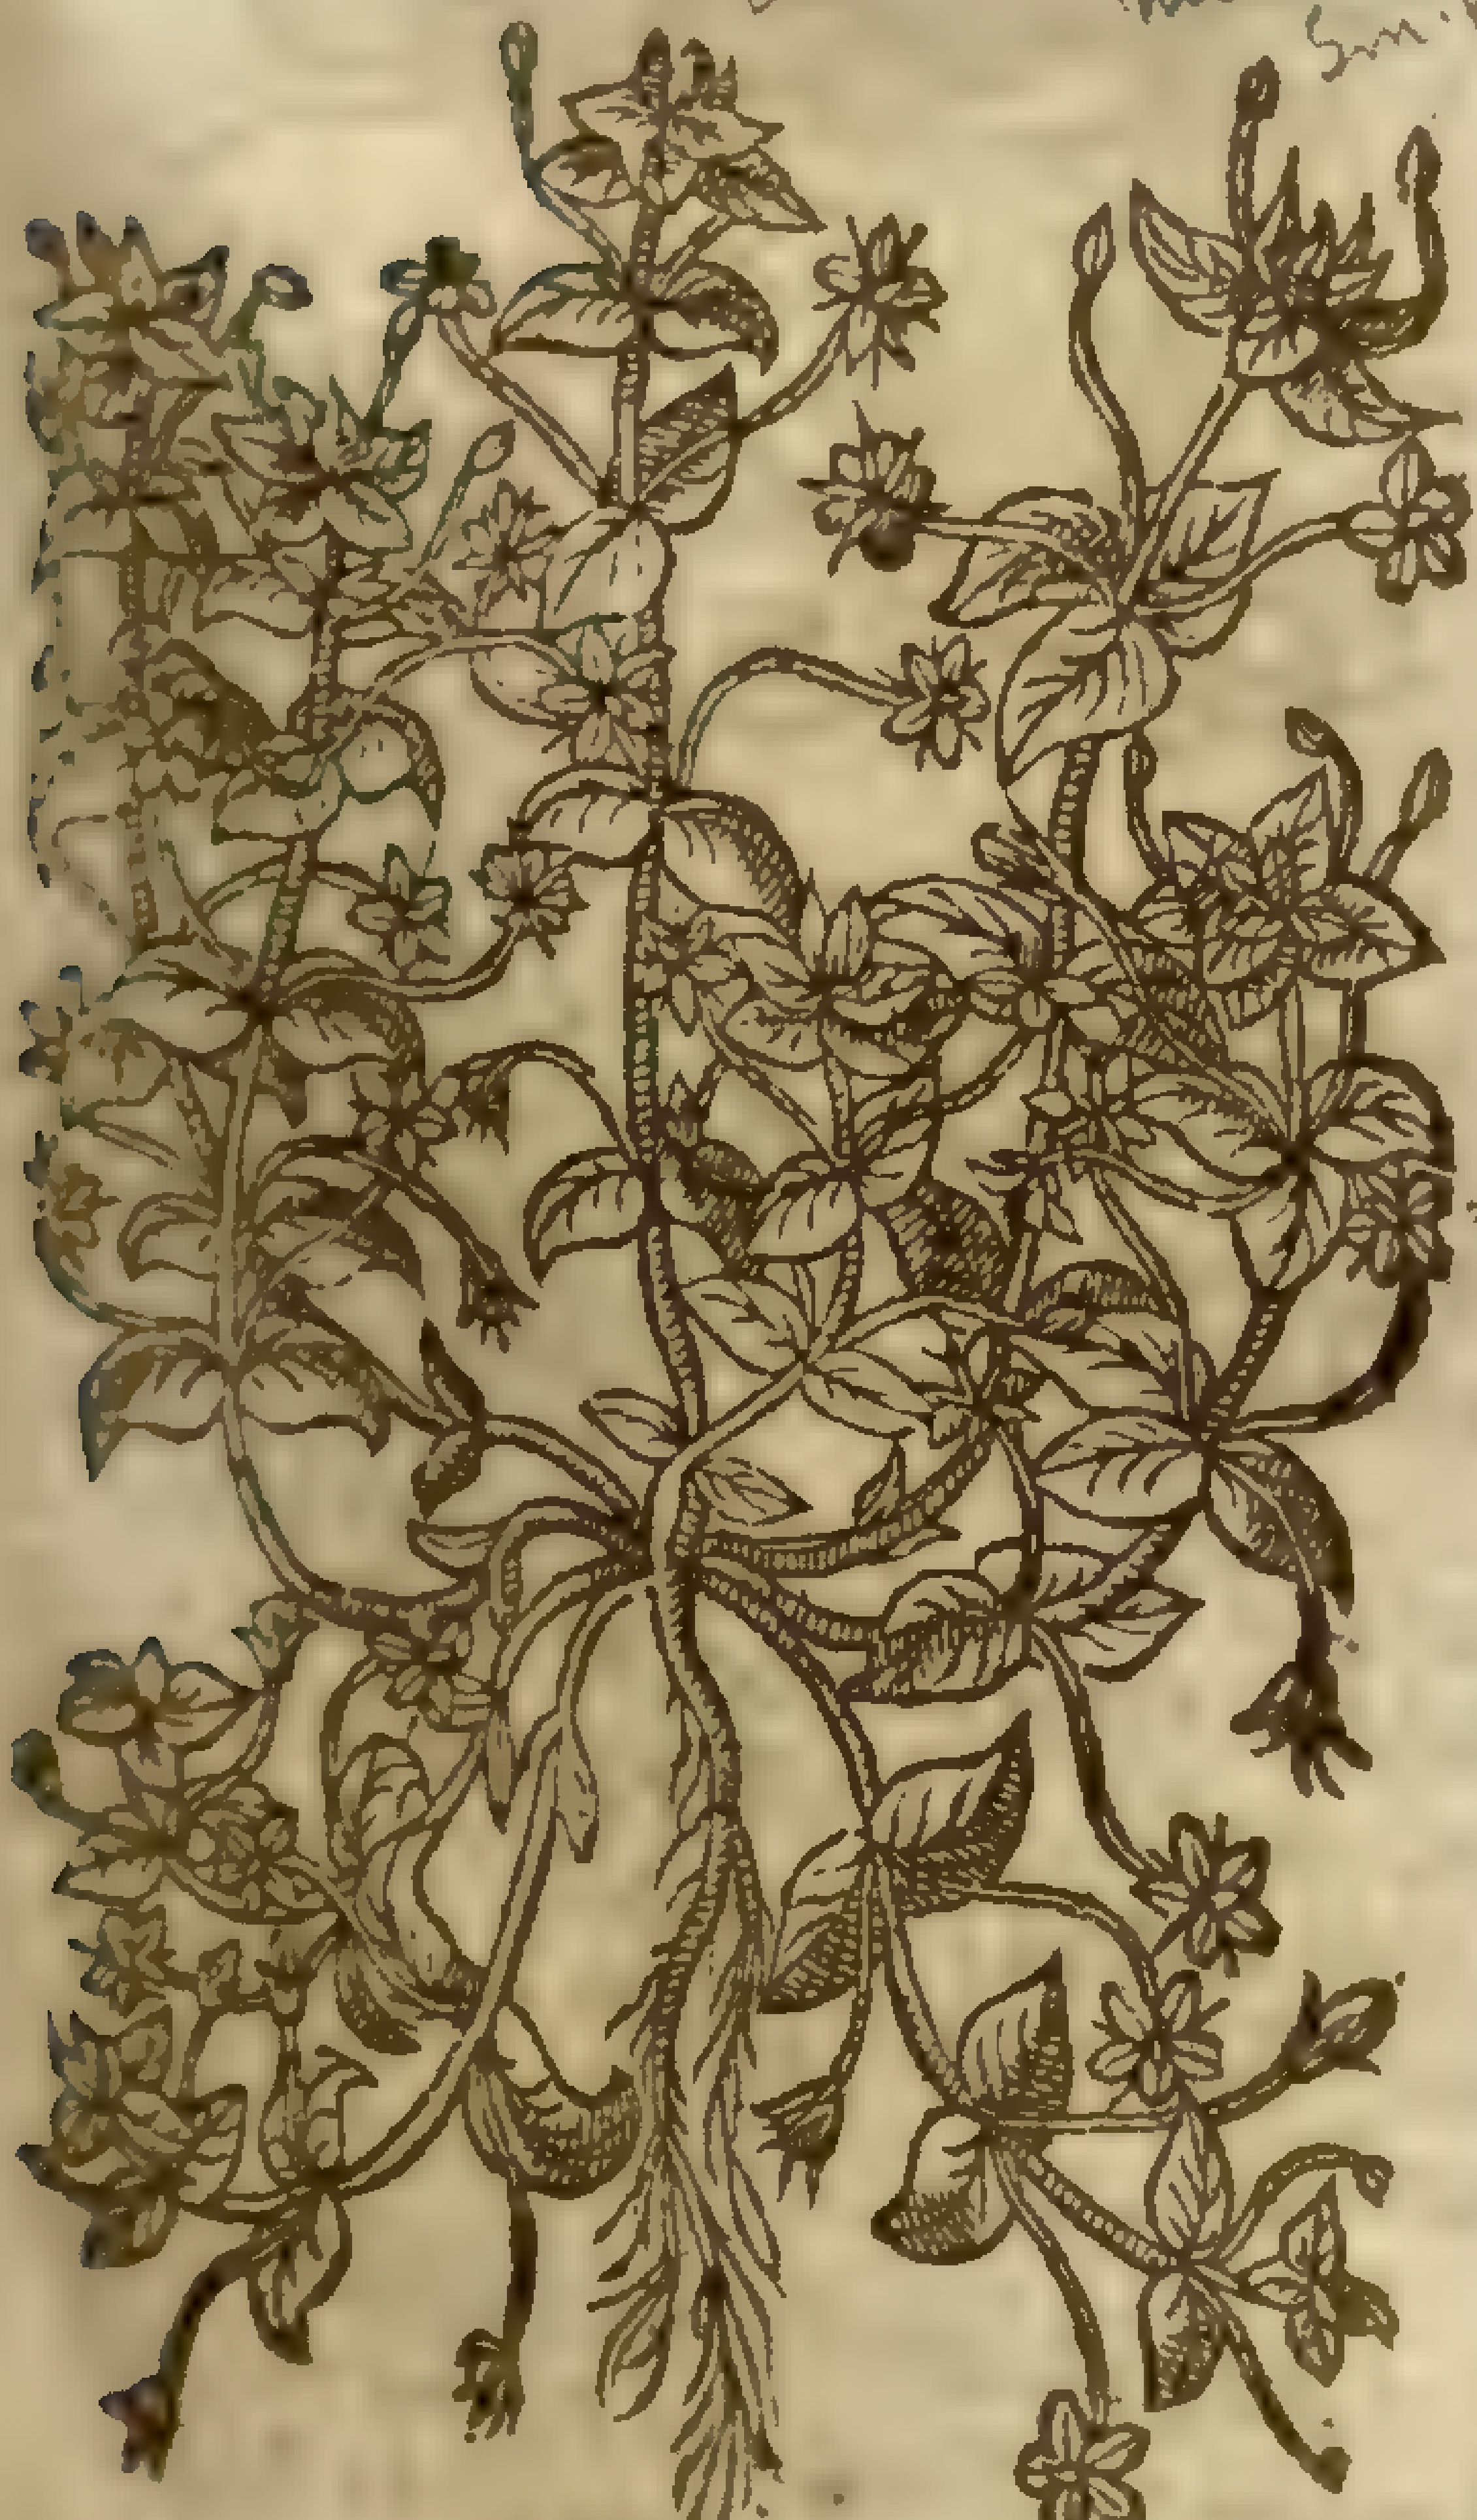
¶ *The Temperature and Vertues.*

Theſe are thought alſo to be cold and moiſt, and like to the other Chickweeds in vertue and operation.

CHAP. 185. *Of Pimpernell.*

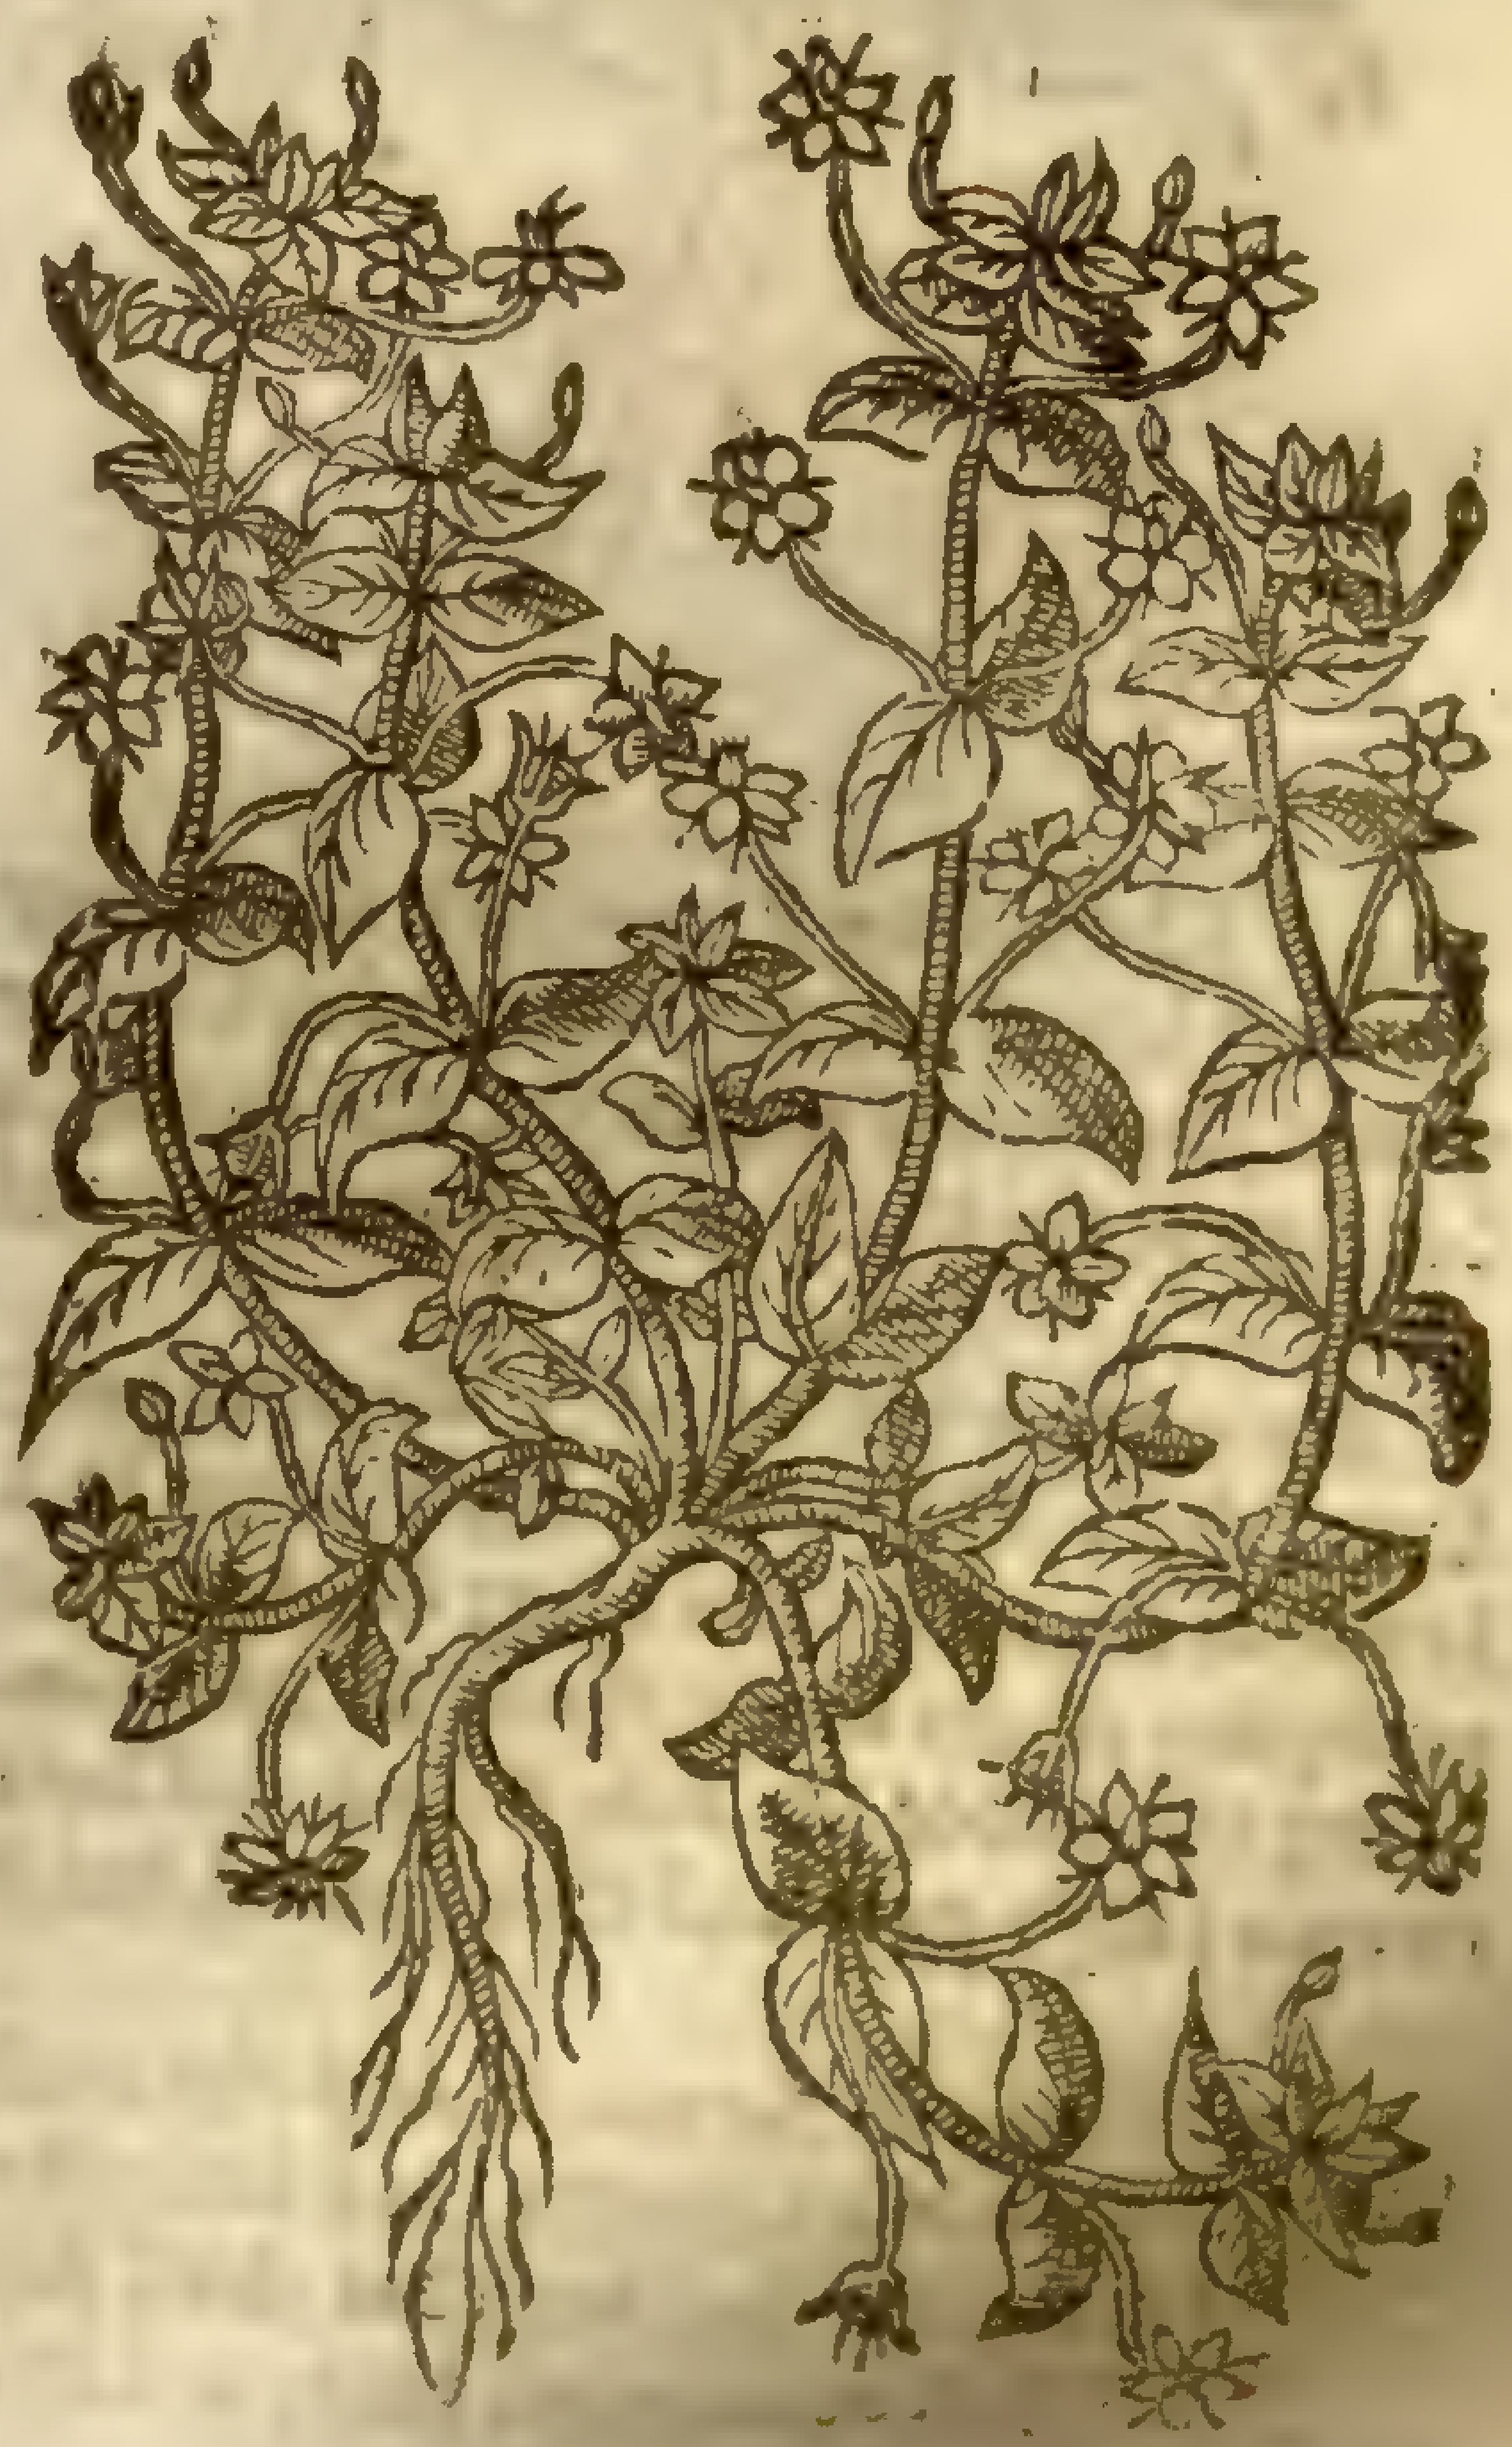
1 *Anagallis mas.*
Male Pimpernell.

A. arvensis, L. mas. dict. Sm. fl. 1 280



2 *Anagallis fœmina.*
Female Pimpernell.

A. arvensis, L. β [illegible] dict.



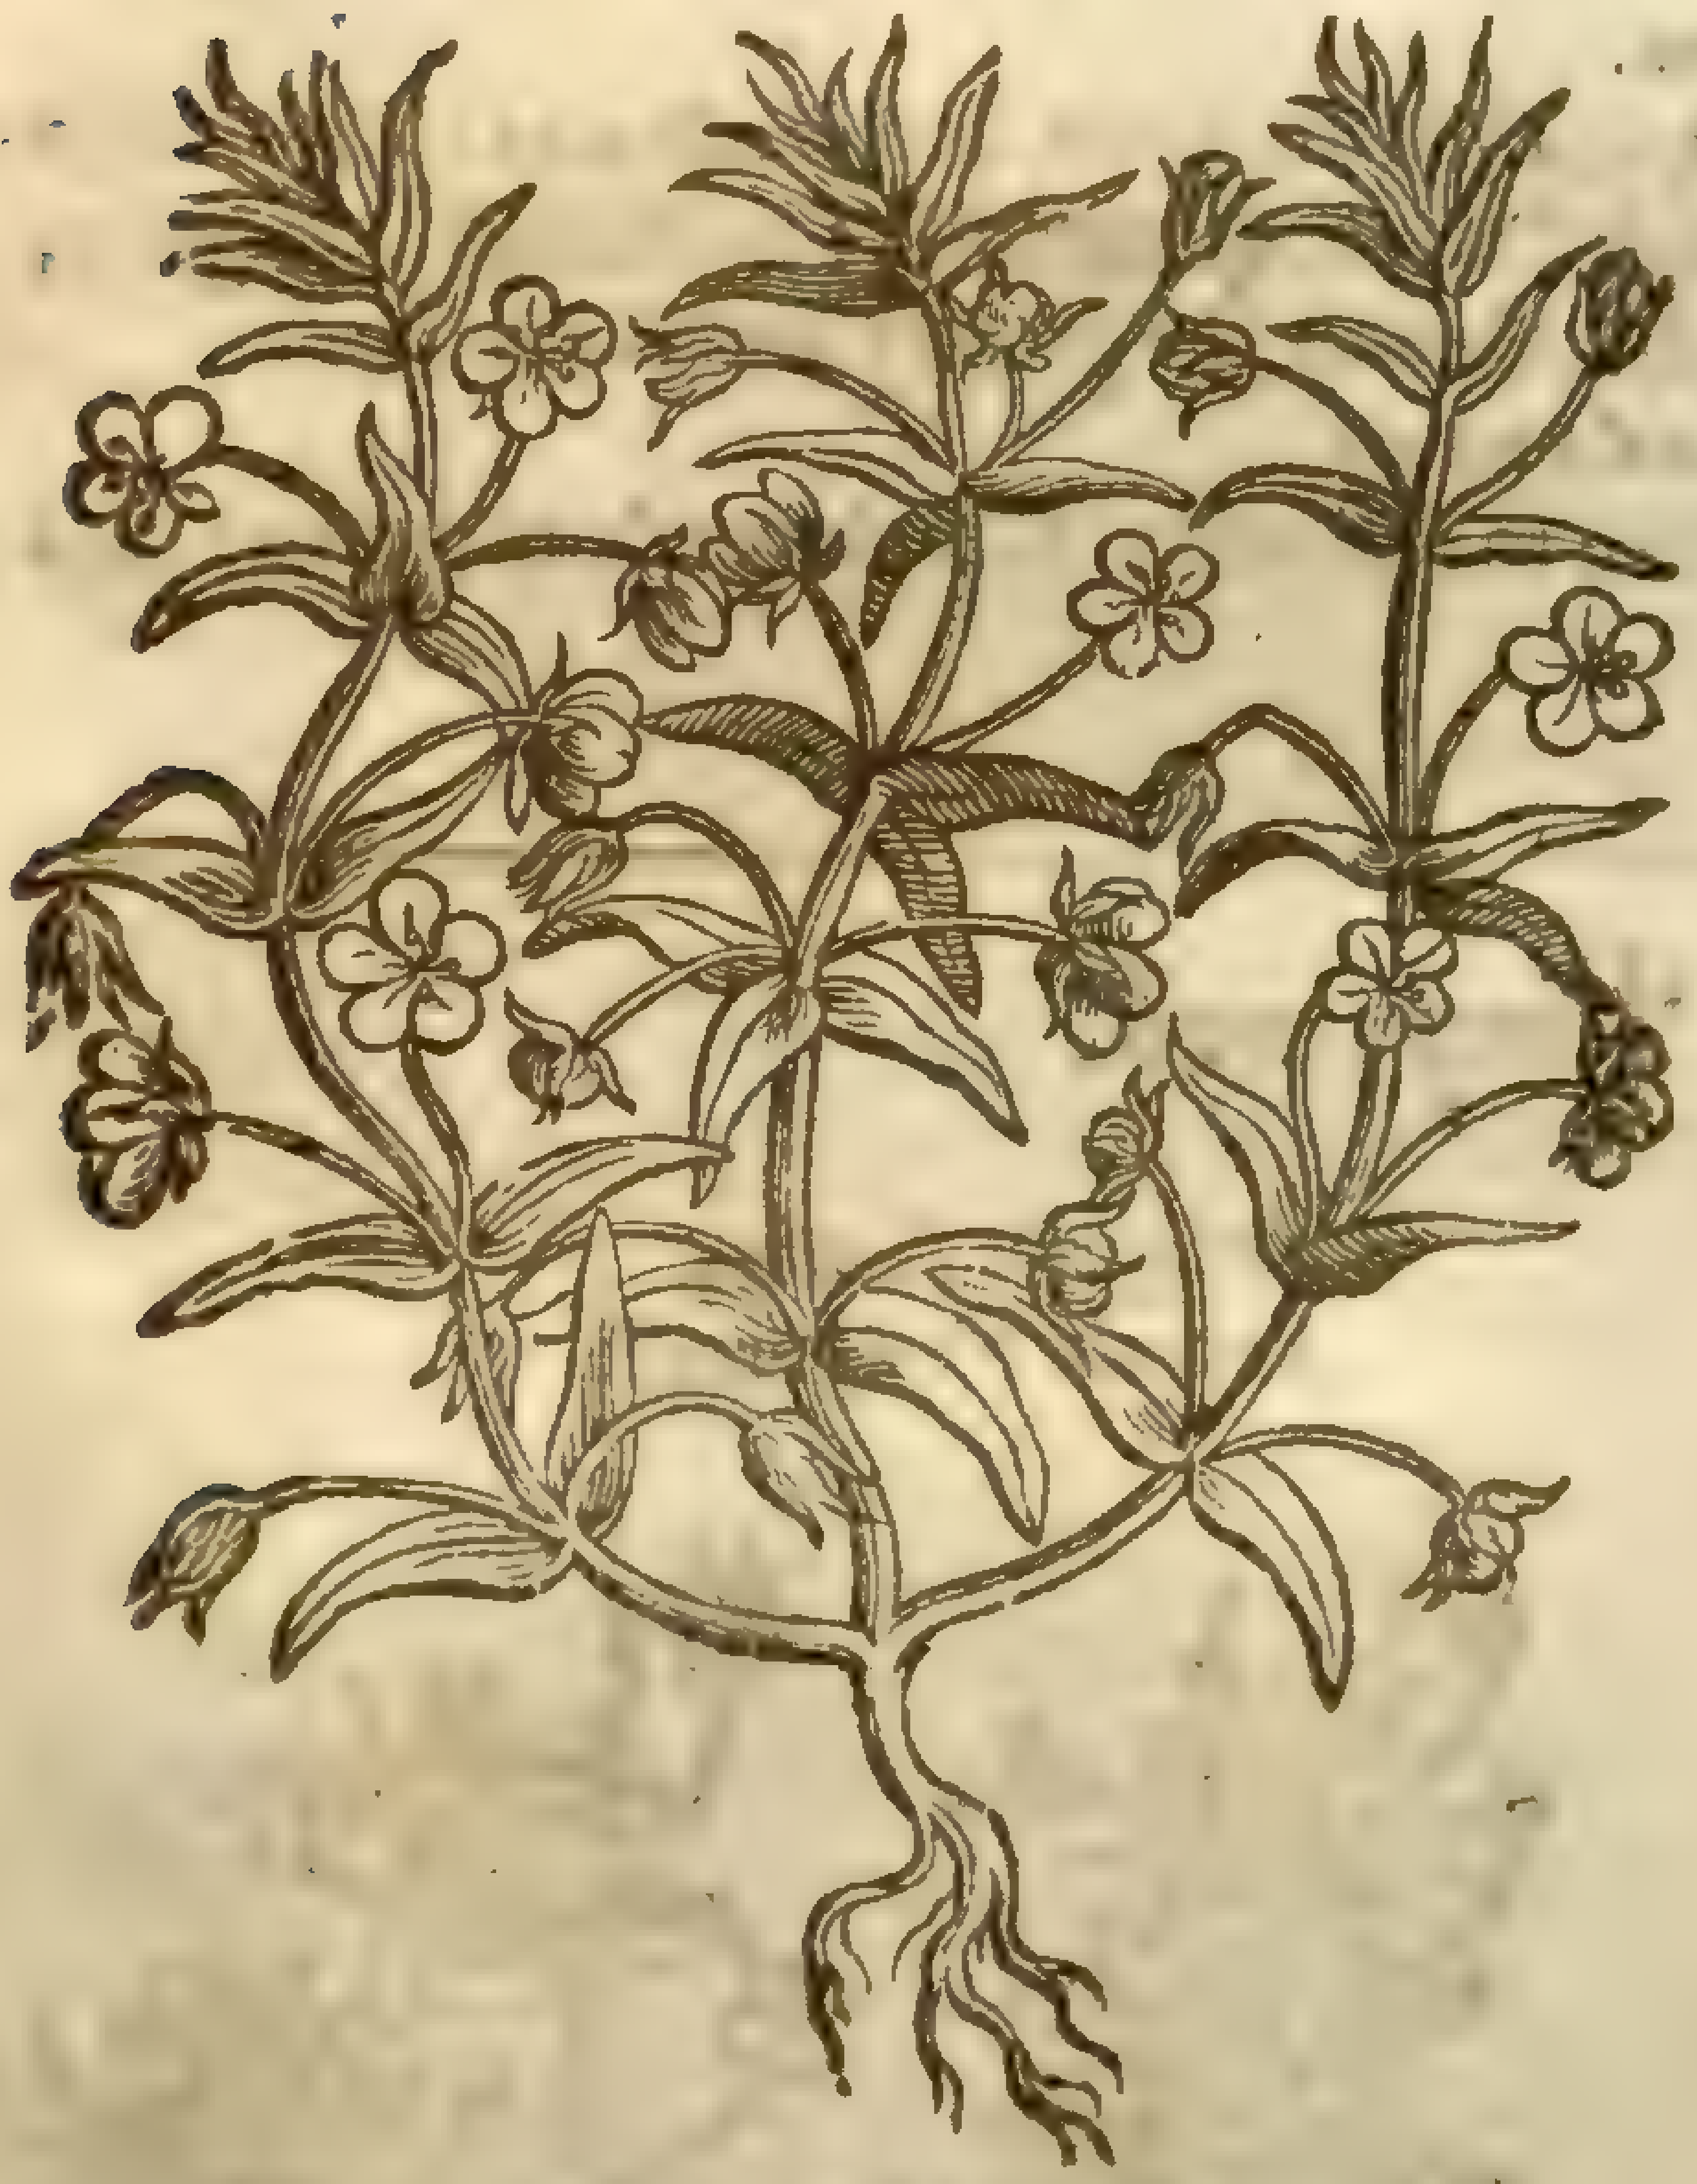
¶ *The Deſcription.*

1 Pimpernell is like vnto Chickweed; the ſtalkes are foure ſquare, trailing here and there vpon the ground, whereupon do grow broad leaues, and ſharpe pointed, ſet together by couples: from the boſomes whereof come forth ſlender tendrels, whereupon doe grow ſmall purple floures tending to redneſſe: which being paſt there ſucceed fine round bullets, like vnto the ſeed of Coriander, wherein is contained ſmall duſty ſeed. The root conſiſteth of ſlender ſtrings.

2 The female Pimpernell differeth not from the male in any one point, but in the colour of the floures; for like as the former hath reddiſh floures, this plant bringeth forth floures of a moſt perfect blew colour; wherein is the difference.

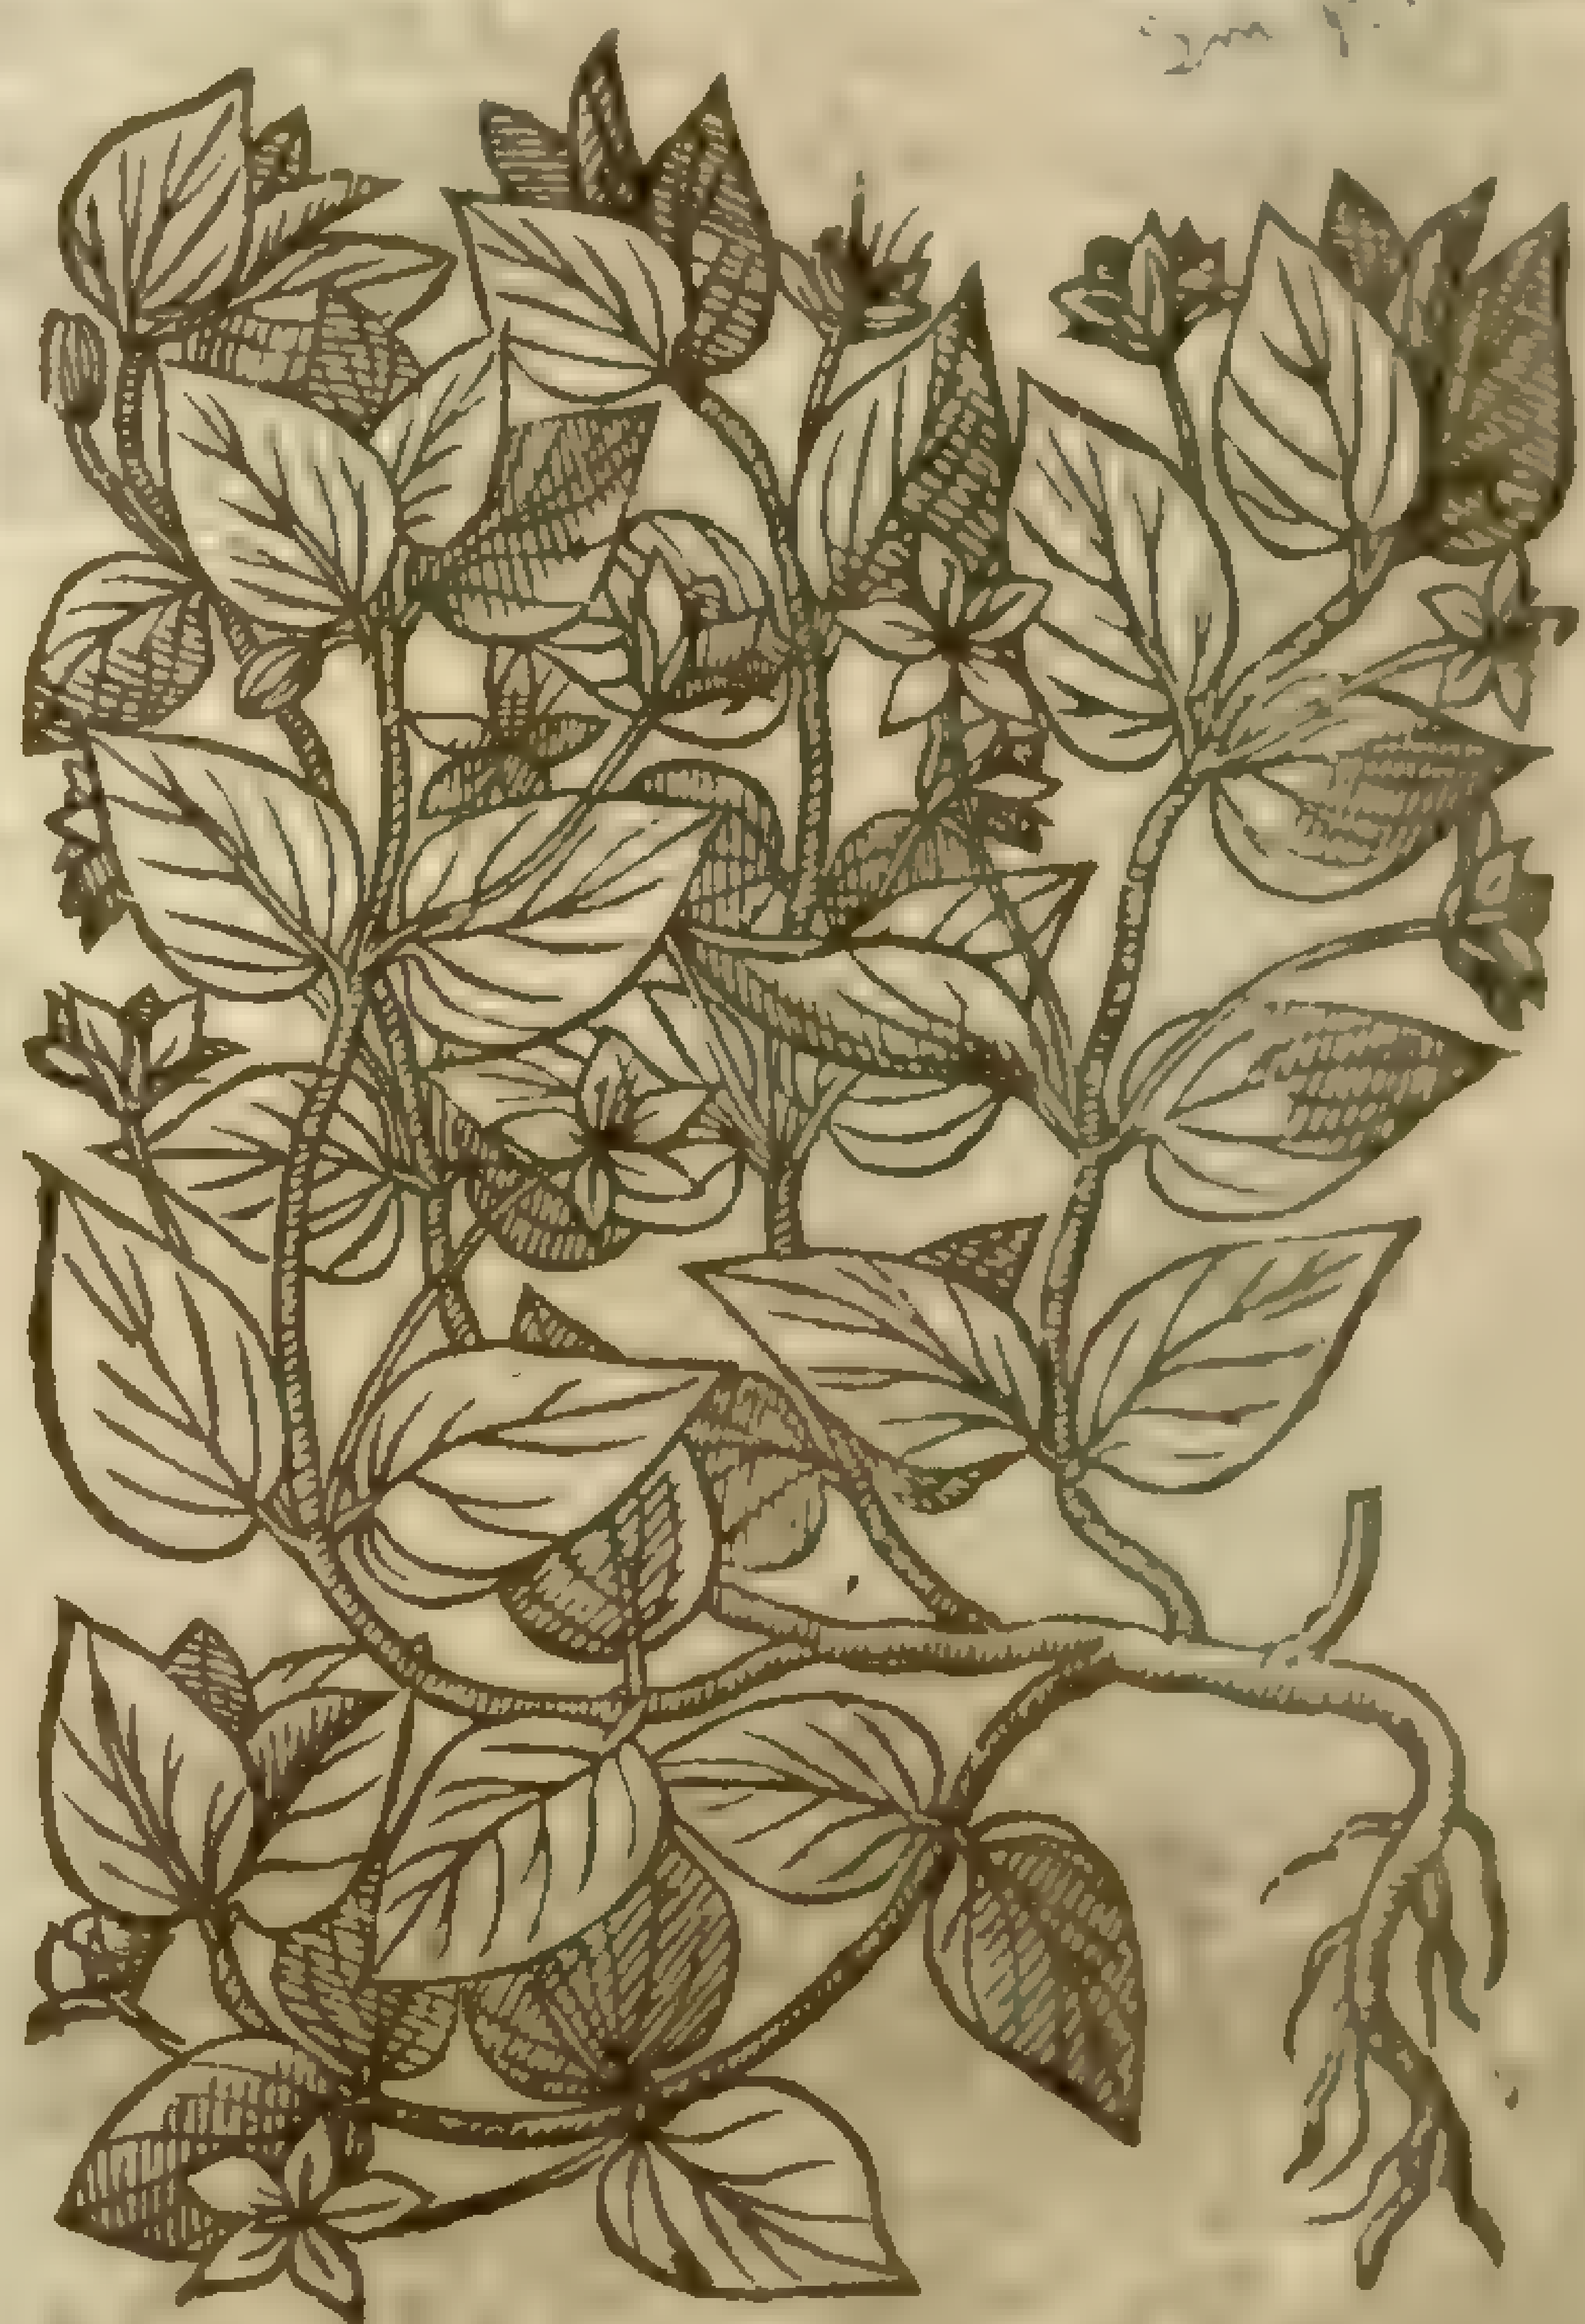
‡ 3 Of this there is another variety ſet forth by *Cluſius* by the name of *Anagallis tenuifolia Monelli*, becauſe he receiued the figure and Hiſtory thereof from *Iohn Monell* of Tourney in France; it differs thus from the laſt mentioned, the leaues are longer and narrower, ſomewhat like thoſe of *Gratiola*, and they now and then grow three at a joynt, and out of the boſomes of the leaues come commonly as many little foot-ſtalkes as there are leaues, which carry floures of a blew colour with the middle purpliſh, and theſe are ſomewhat larger than them of the former, otherwiſe like. ‡

‡ 3 *Anagallis tenuifolia.*
Narrow leaued Pimpernell.



4 *Anagallis lutea.*
Yellow Pimpernell.

Lysimachia nemorum [illegible]



4 The yellow Pimpernell hath many weake and feeble branches trailing vpon the ground, beſet with leaues one againſt another like the great Chickweed, not vnlike to *Nummularia*, or Moneywoort; betweene which and the ſtalkes, come forth two ſingle and ſmall tender foot-ſtalkes, each bearing at their top one yellow floure and no more. The root is ſmall and threddy.

¶ *The Place.*

They grow in plowed fields neere path waies, in Gardens and Vineyards almoſt euery where. I found the female with blew floures in a chalkie corne field in the way from Mr. *William Swaines* houſe of Southfleet to Long field downes, but neuer any where elſe. ‡ I alſo being in Eſſex in the company of my kinde friend Mr. *Nathaniel Wright* found this among the corne at Wrightsbridge, being the ſeat of Mr. *Iohn Wright* his brother. ‡ The yellow Pimpernell growes in the woods betweene High-gate and Hampſtead, and in many other woods.

¶ *The Time.*

They floure in Summer, and eſpecially in the moneth of Auguſt, at what time the husbandmen hauing occaſion to go vnto their harueſt worke, will firſt behold the floures of Pimpernell, whereby they know the weather that ſhall follow the next day after; as for example, if the floures be ſhut cloſe vp, it betokeneth raine and foule weather; contrariwiſe, if they be ſpread abroad, faire weather.

¶ *The Names.*

It is called in Greeke, Ἀναγαλλὶς: in Latine alſo *Anagallis*: of diuers, (as *Pliny* reporteth) *Corchorus*, but vntruly: of *Marcellus* an old Writer, *Macia*; the word is extant in *Dioſcorides* among the baſtard names. That with the crimſon floure, being the male, is named *Phœnicion*, and *Corallion* of this is made the compoſition or receit called *Diacorallion*, that is vſed againſt the gout; which compoſition *Paulus Ægineta* ſetteth downe in his ſeuenth booke. Amongſt the baſtard names it hath been called *Aëtitis*, *Ægitis*, and *Sauritis*: in Engliſh, red Pimpernell, and blew Pimpernell.

¶ *The Temperature.*

Both the ſorts of Pimpernell are of a drying faculty without biting, and ſomewhat hot, with a certaine drawing quality, inſomuch that it doth draw forth ſplinters and things fixed in the fleſh, as *Galen* writeth.

¶ *The Vertues.*

Dioſcorides writes, That they are of power to mitigate paine, to cure inflammations and hot ſwellings, to draw out of the body and fleſh thornes, ſplinters, or ſhiuers of wood, and to helpe the Kings Euill. A

The iuyce purgeth the head by gargariſing or waſhing the throat therewith; it cures the toothach being ſnift vp into the noſethrils, eſpecially into the contrary noſethrill. B

It helpeth thoſe that be dim ſighted: the juyce mixed with hony cleanſes the vlcers of the eye called in Latine *Argema*. C

Moreouer he affirmeth, That it is good againſt the ſtinging of Vipers, and other venomous beaſts. D

It preuaileth againſt the infirmities of the liuer and kidnies, if the juyce be drunke with wine. E
He addeth further, how it is reported, That Pimpernel with the blew floure helpeth vp the fundament that is fallen downe, and that red Pimpernell applied, contrariwiſe bringeth it downe.

CHAP. 184. *Of Brooke-lime, or water Pimpernell.*

¶ *The Deſcription.*

1 Brooke-lime or Brooklem hath fat thicke ſtalkes, round, and parted into diuers branches: the leaues be thicke, ſmooth, broad, and of a deepe greene colour. The floures grow vpon ſmall tender foot-ſtalkes, which thruſt forth of the boſome of the leaues, of a perfect blew colour, not vnlike to the floures of land Pimpernell: the root is white, low creeping, with fine ſtrings faſtned thereto: out of the root ſpring many other ſtalkes, whereby it greatly increaſeth.

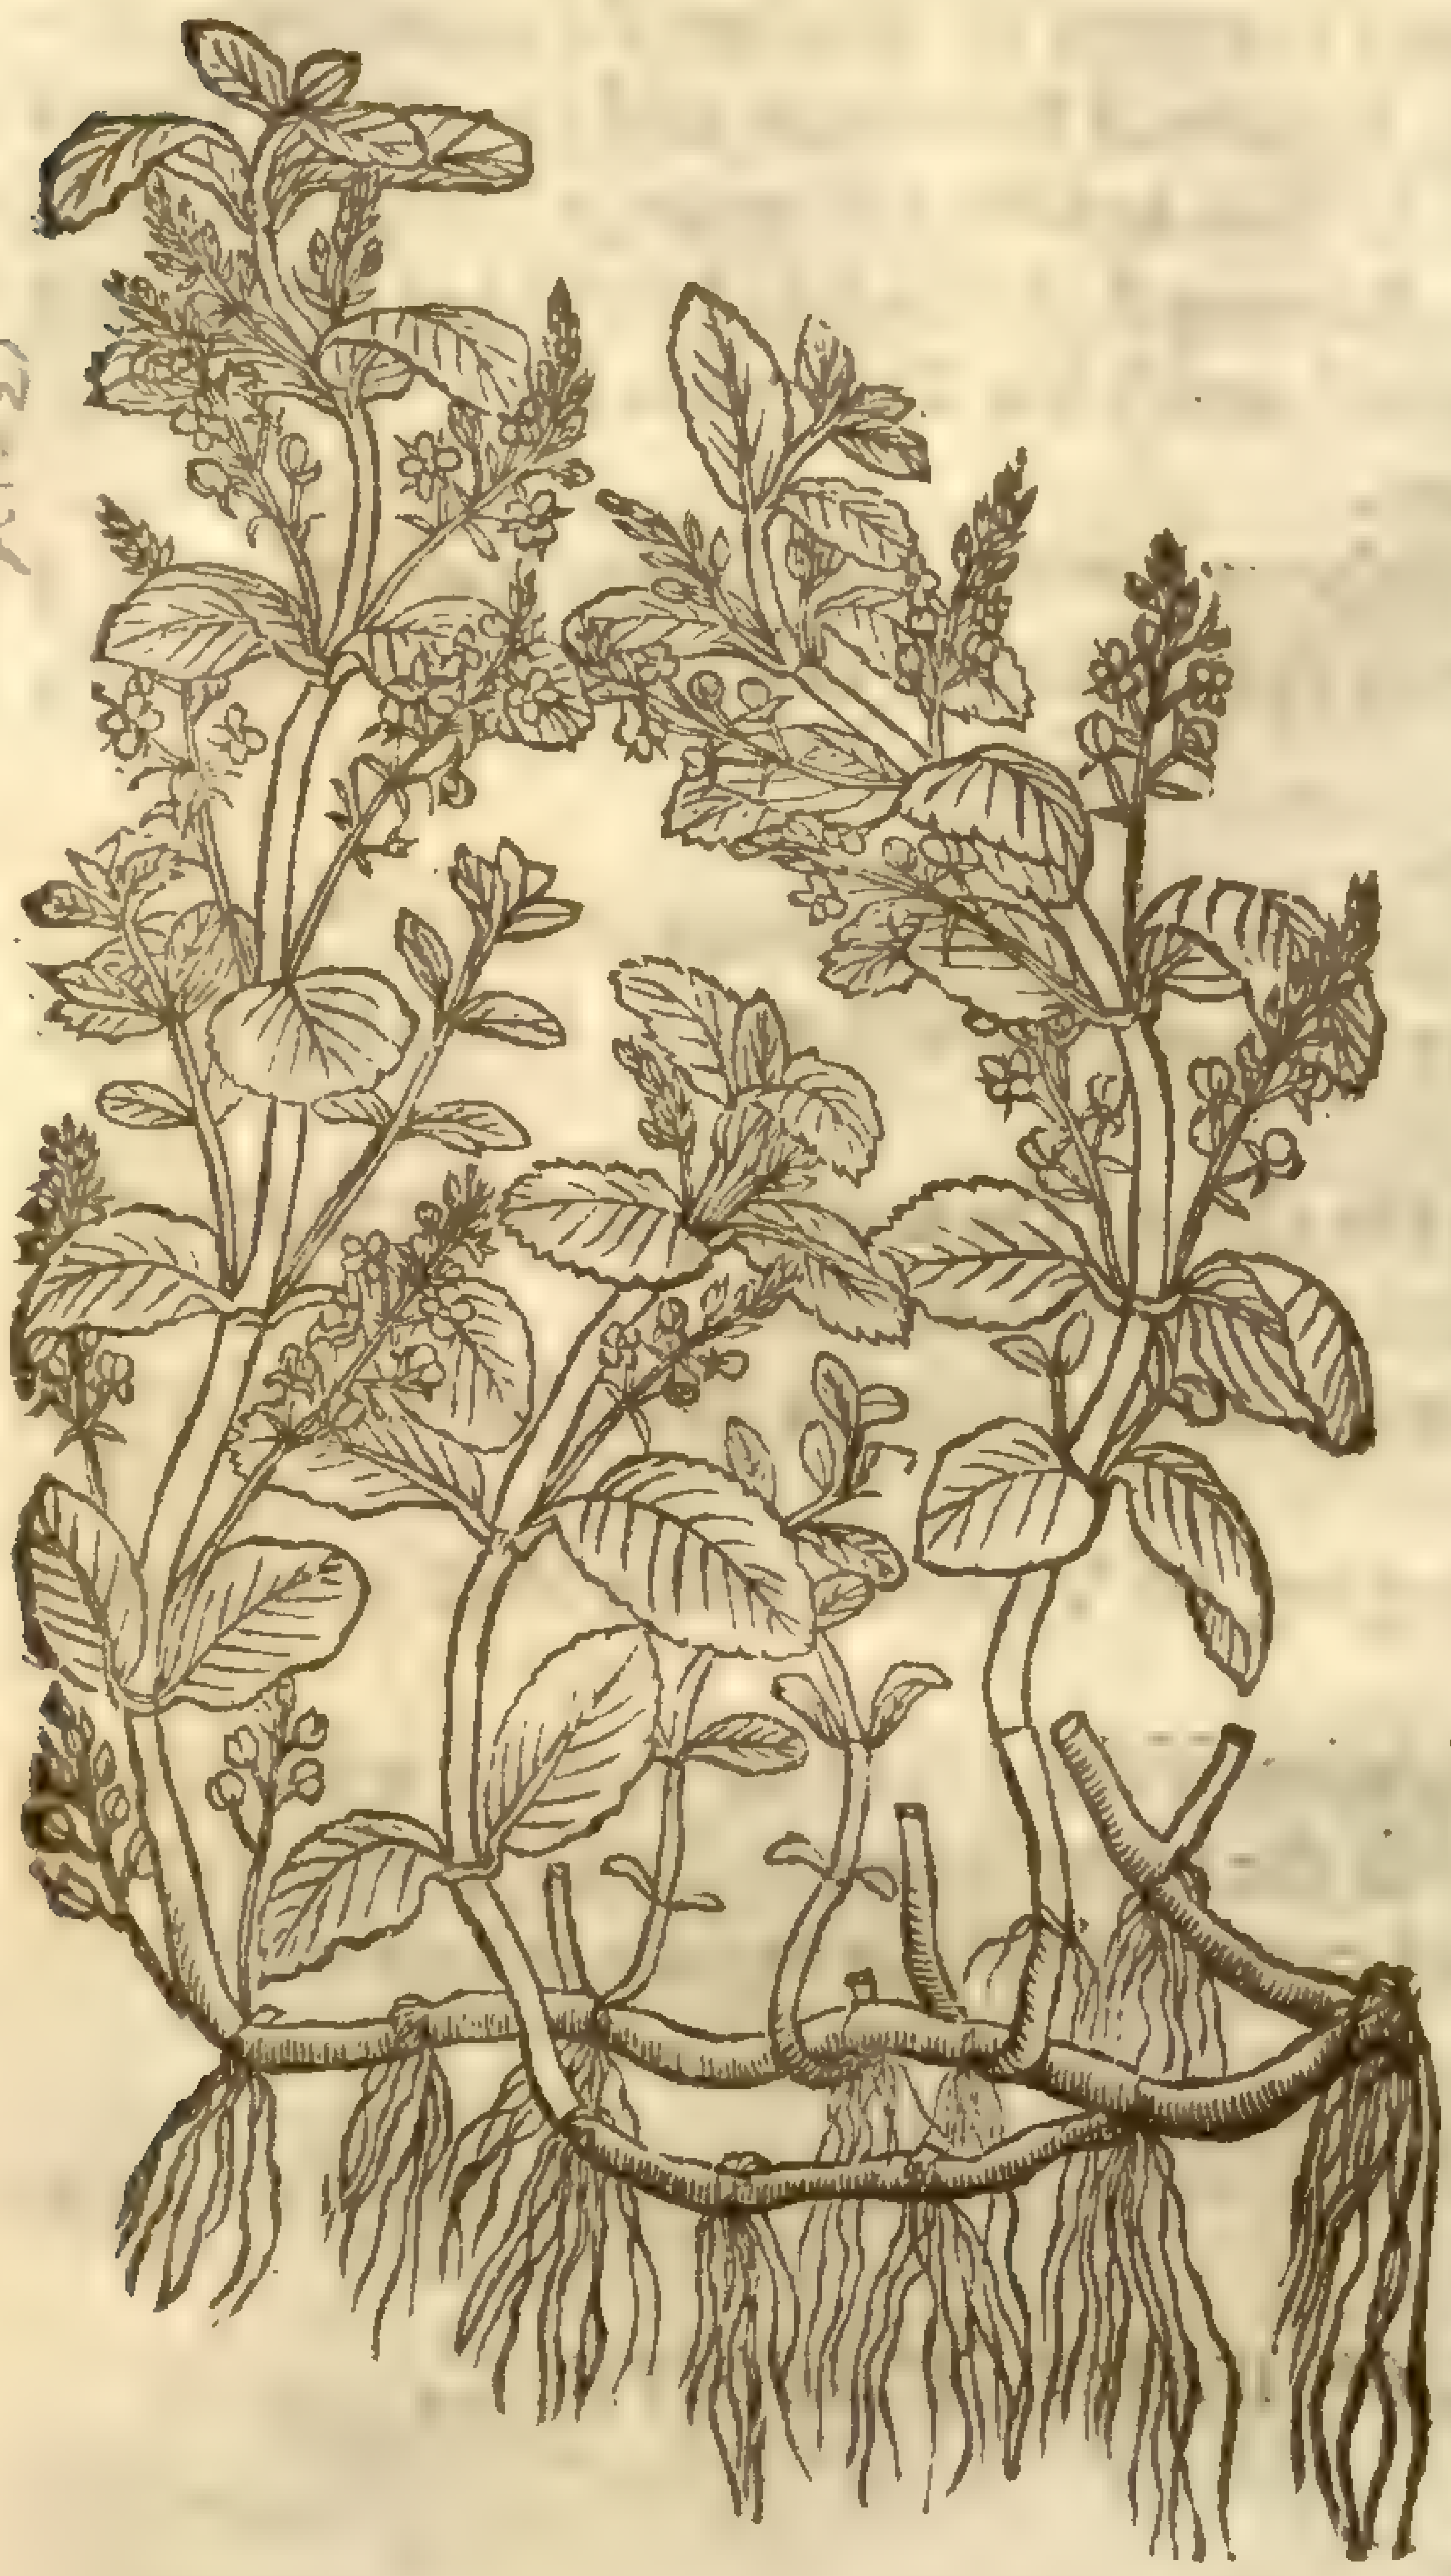
‡ There is a leſſer variety of this, which our Author ſet forth in the fourth place, differing not from this but only that it is leſſe in all the parts thereof; wherefore I haue omitted the hiſtory and figure, to make roome for more conſpicuous differences. ‡

2 The great water Pimpernell is like vnto the precedent, ſauing that this plant hath ſharper pointed or larger leaues, and the floures are of a more whitiſh or a paler blew colour, wherein conſiſteth the difference.

‡ There is alſo a leſſer varietie of this, whoſe figure and deſcription our Author gaue in the next place; but becauſe the difference is in nothing but the magnitude I haue made bold to omit it alſo.

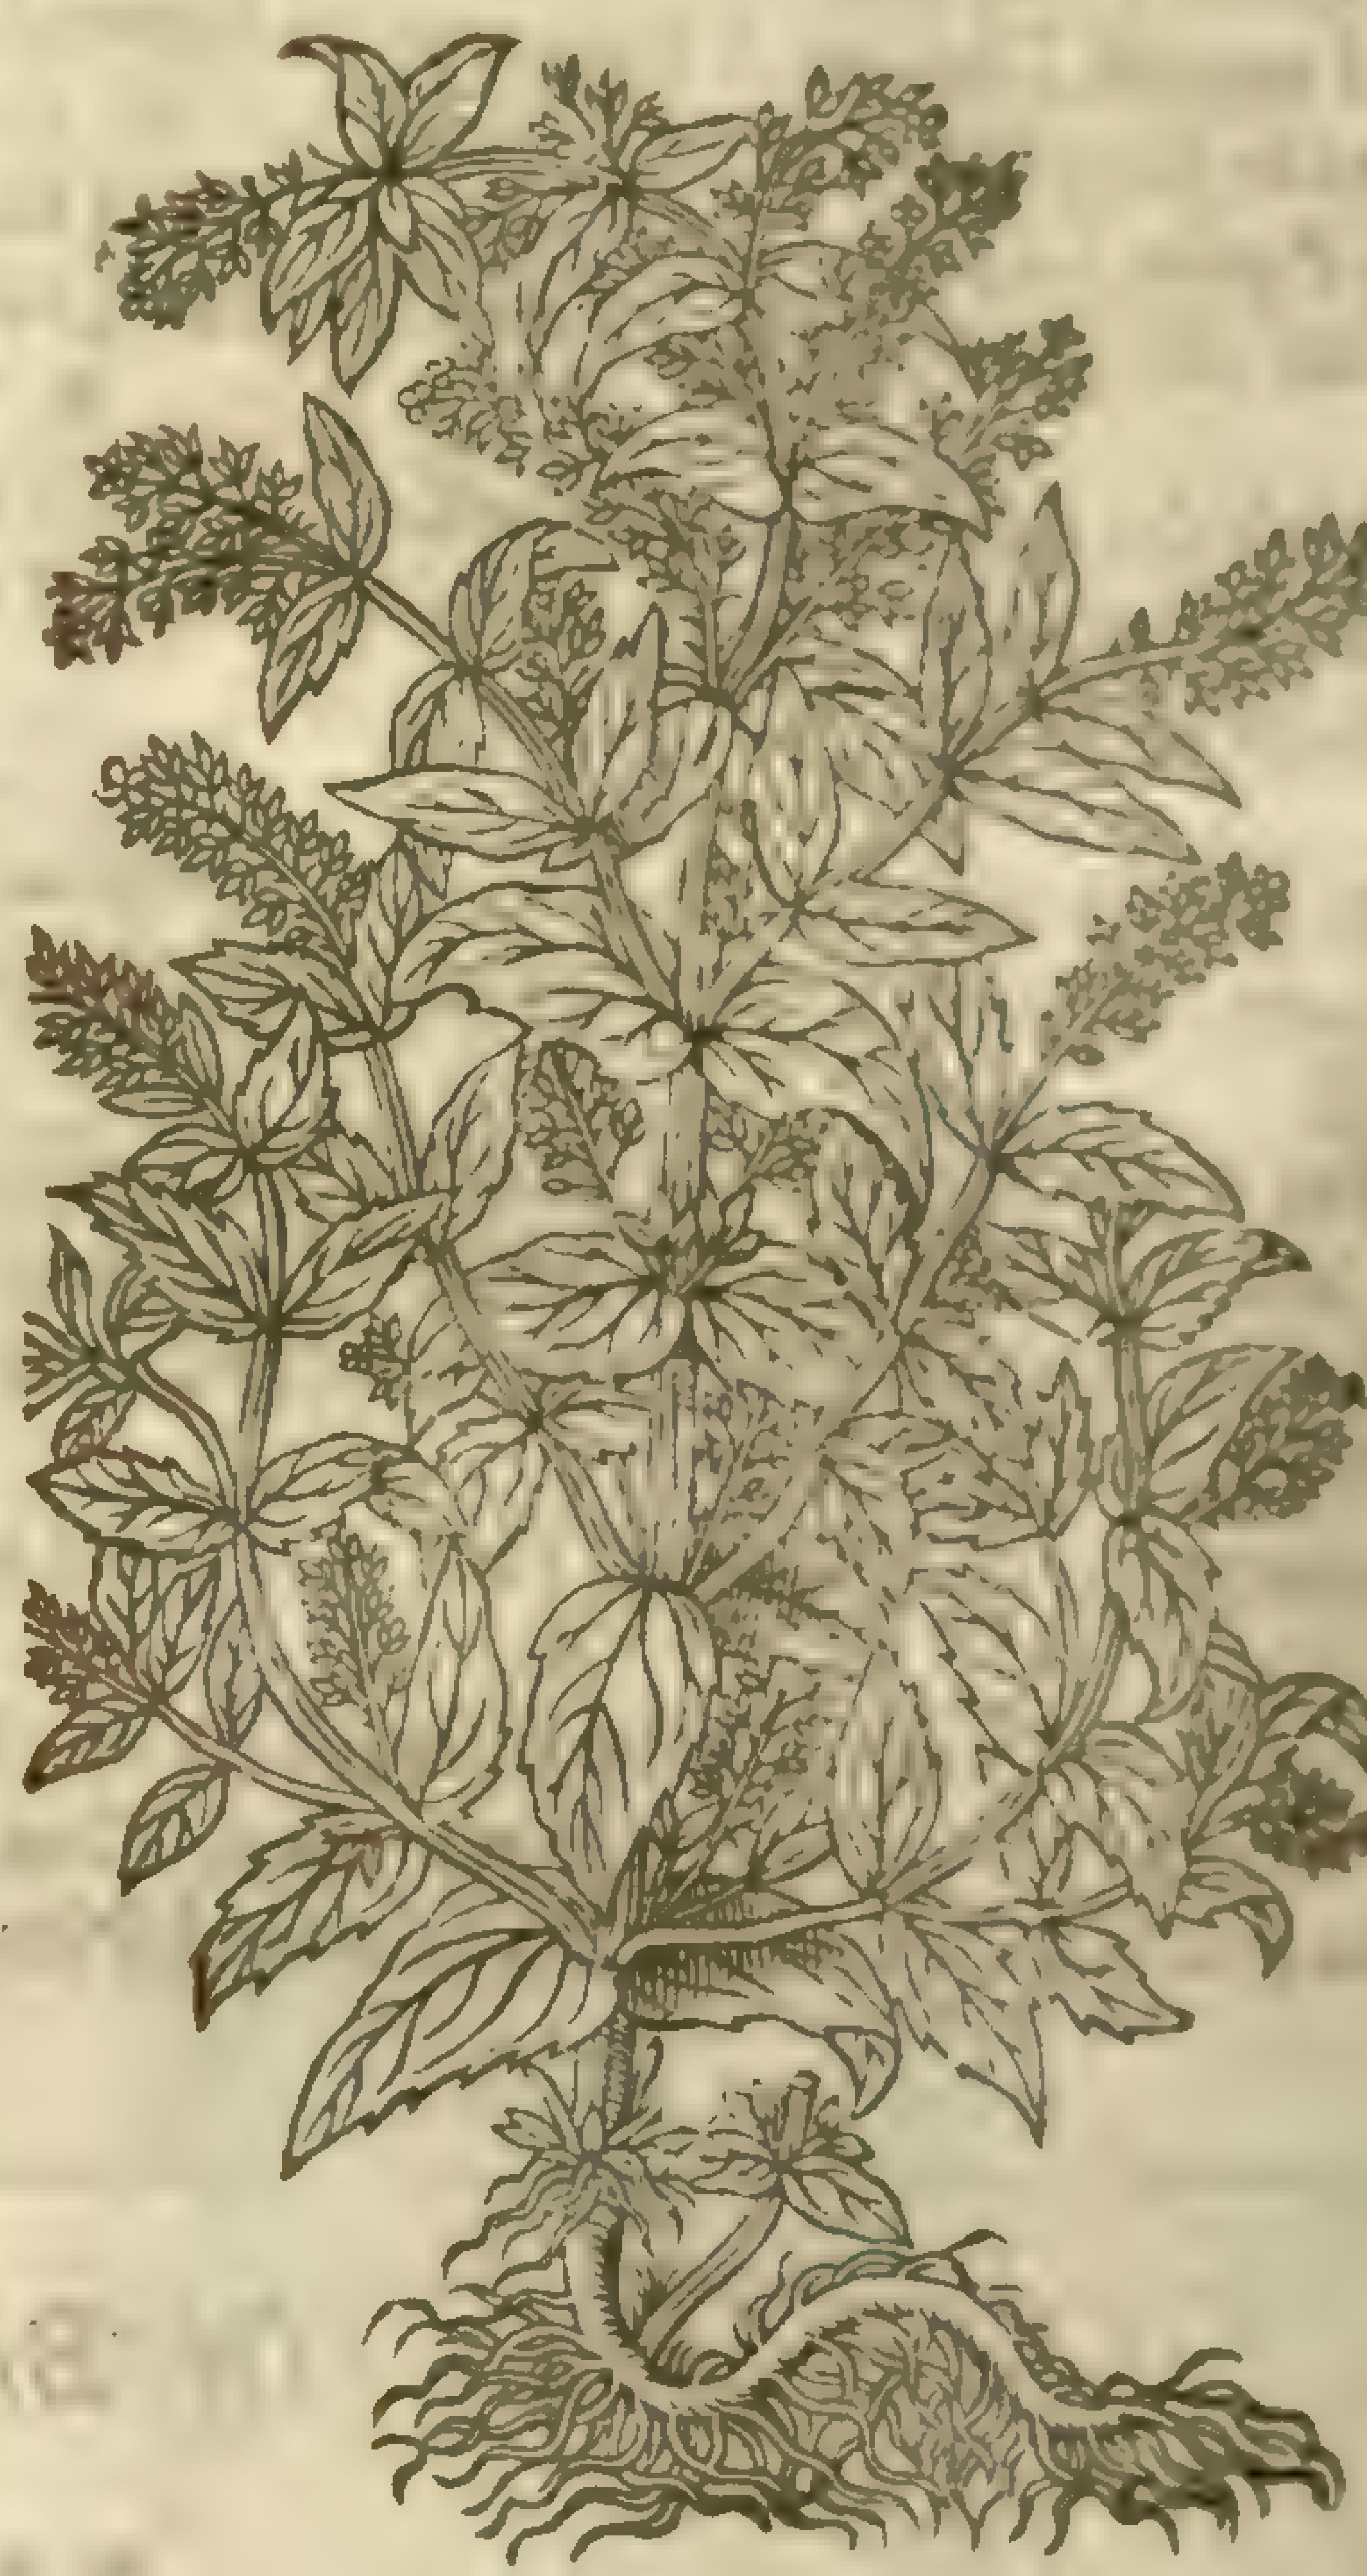
3 Now that I haue briefely giuen you the hiſtory of the foure formerly deſcribed by our Author, I will acquaint you with two or three more plants which may fitly be here inſerted: The firſt of theſe *Lobel* cals *Anagallis aquatica tertia*; and therefore I haue thought fit to giue you it in the ſame place here. It hath a white and fibrous root; from which ariſeth a round ſmooth ſtalke a foot and more high, (yet I haue ſometimes found it not aboue three or foure inches high:) vpon the ſtalkes grow leaues round, greene and ſhining, ſtanding not by couples, but one aboue another on all ſides of the ſtalkes. The leaues that lie on the ground are longer than the reſt, and are in ſhape ſomewhat like thoſe of the common Daiſie, but that they are not ſnipped about the edges: the floures are white, conſiſting of one leafe diuided into fiue parts; and they grow at the firſt as it were in an vmbel, but afterwards more ſpike faſhioned. It floures in Iune and Iuly, and groweth in many watery places, as in the mariſhes of Dartford in Kent, alſo between Sandwich and Sandowne caſtle, and in the ditches on this ſide Sandwich. *Bauhine* ſaith, That *Guillandinus* called it ſomtimes *Aliſma*, and otherwhiles *Cochlearia*: and others would haue it to be *Samolum* of *Pliny, lib. 25. cap. 11.* *Bauhine* himſelfe fitly calls it *Anagallis aquatica folio rotundo non crenato.*

1 *Anagallis ſeu Becabunga.*
Brooke-lime.



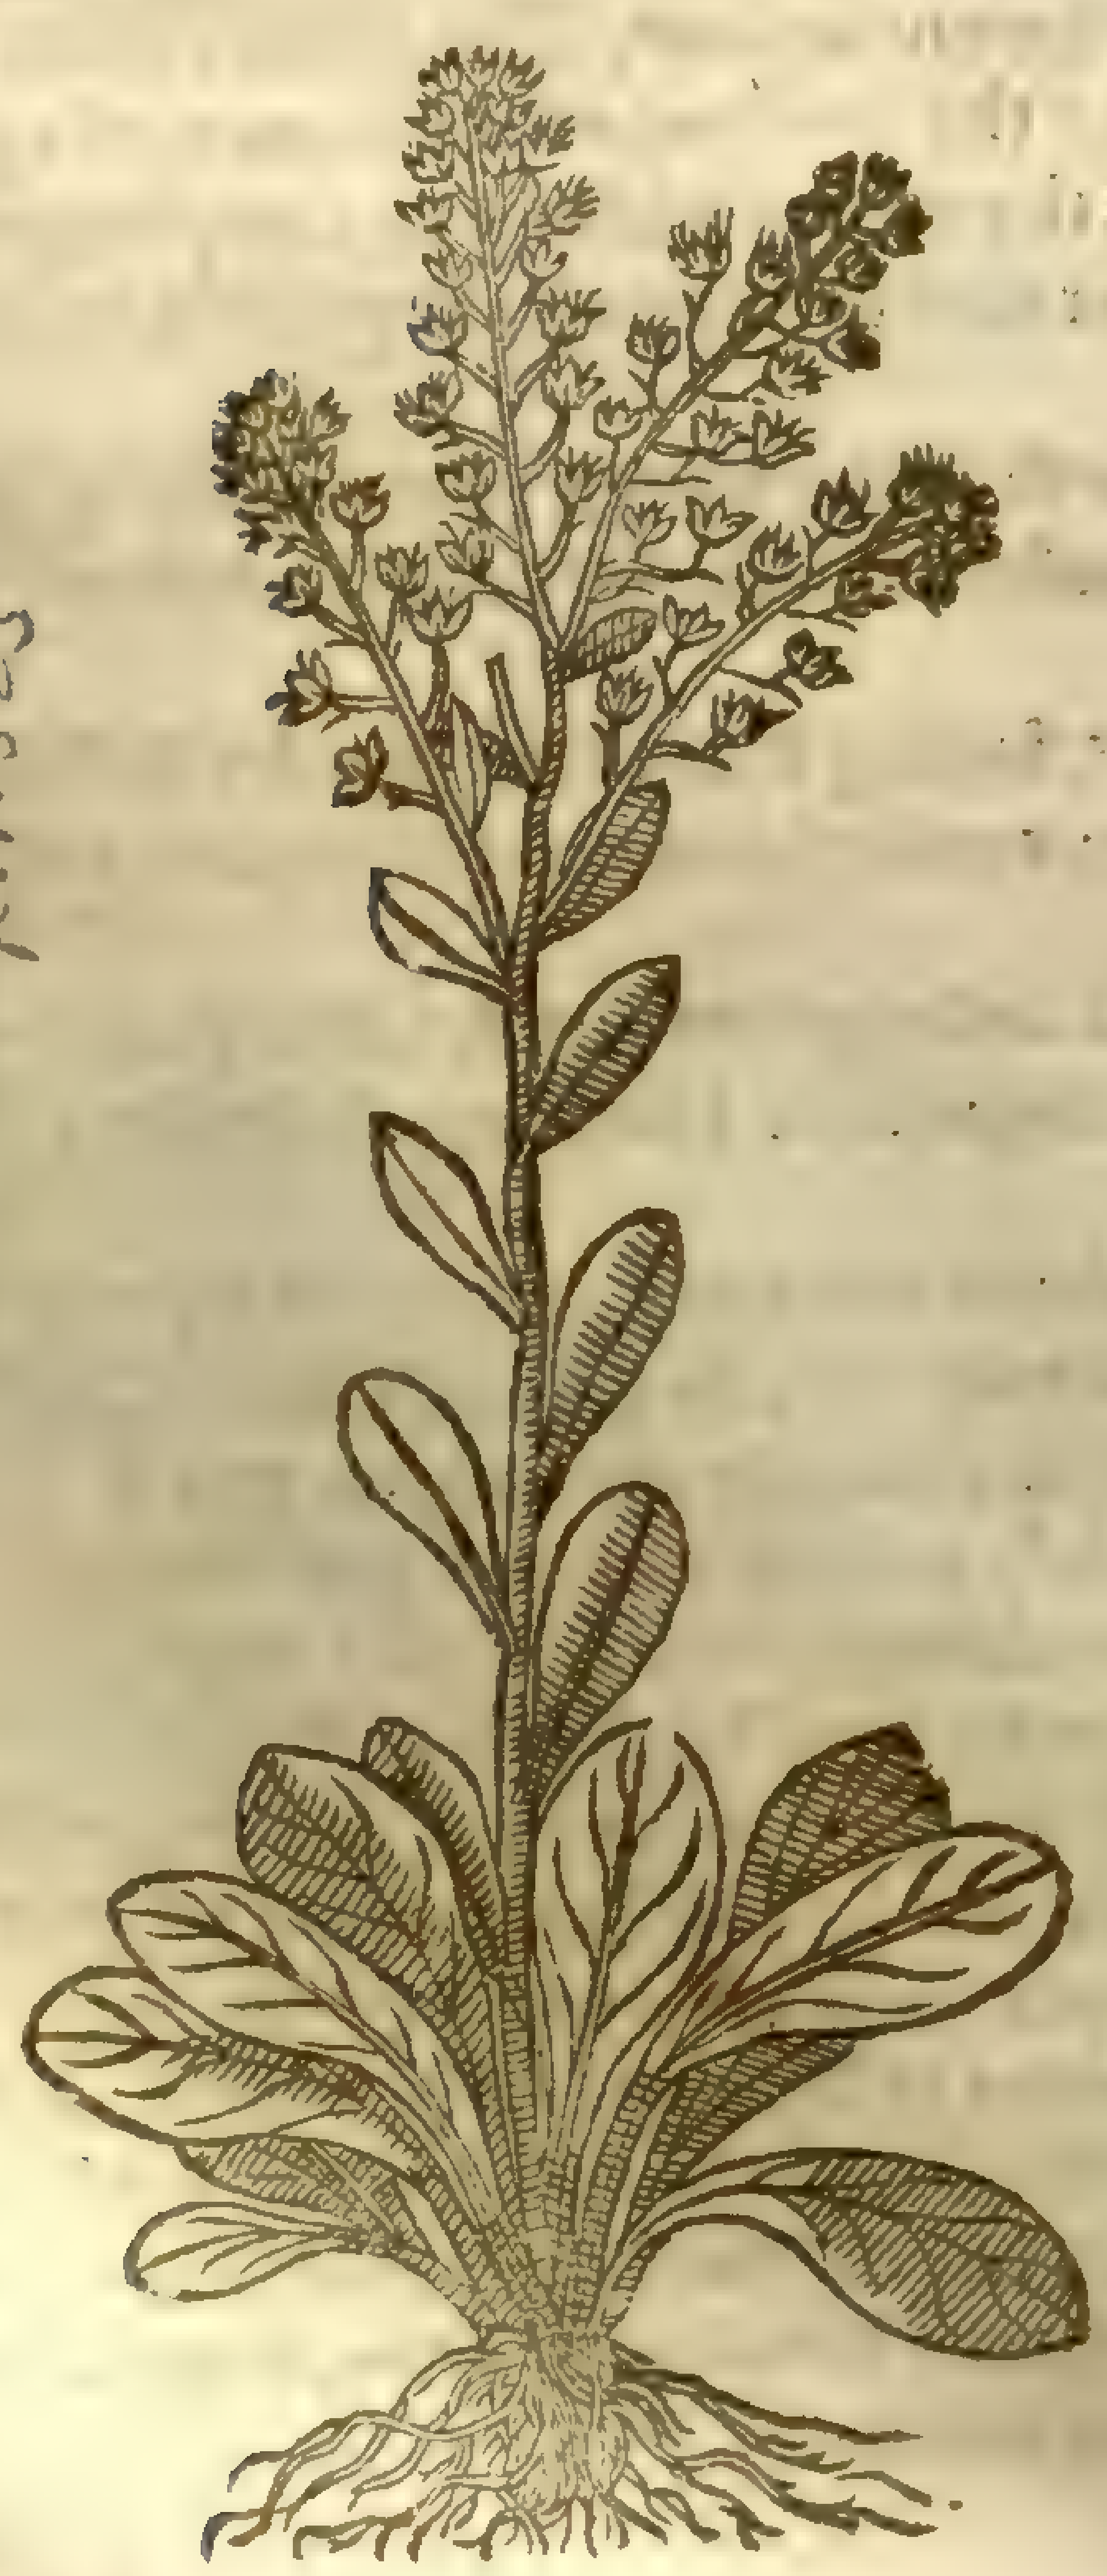
Veronica beccabunga, [illegible] Sm. pl. 21

2 *Anagallis aquatica major.*
Great long leaued Brook-lime.



Veronica anagallis

‡ 3 *Anagallis aquatica rotundifolia.*
Round leaued water Pimpernell.



Samolus valerandi, [illegible] Sm. pl. 1.323

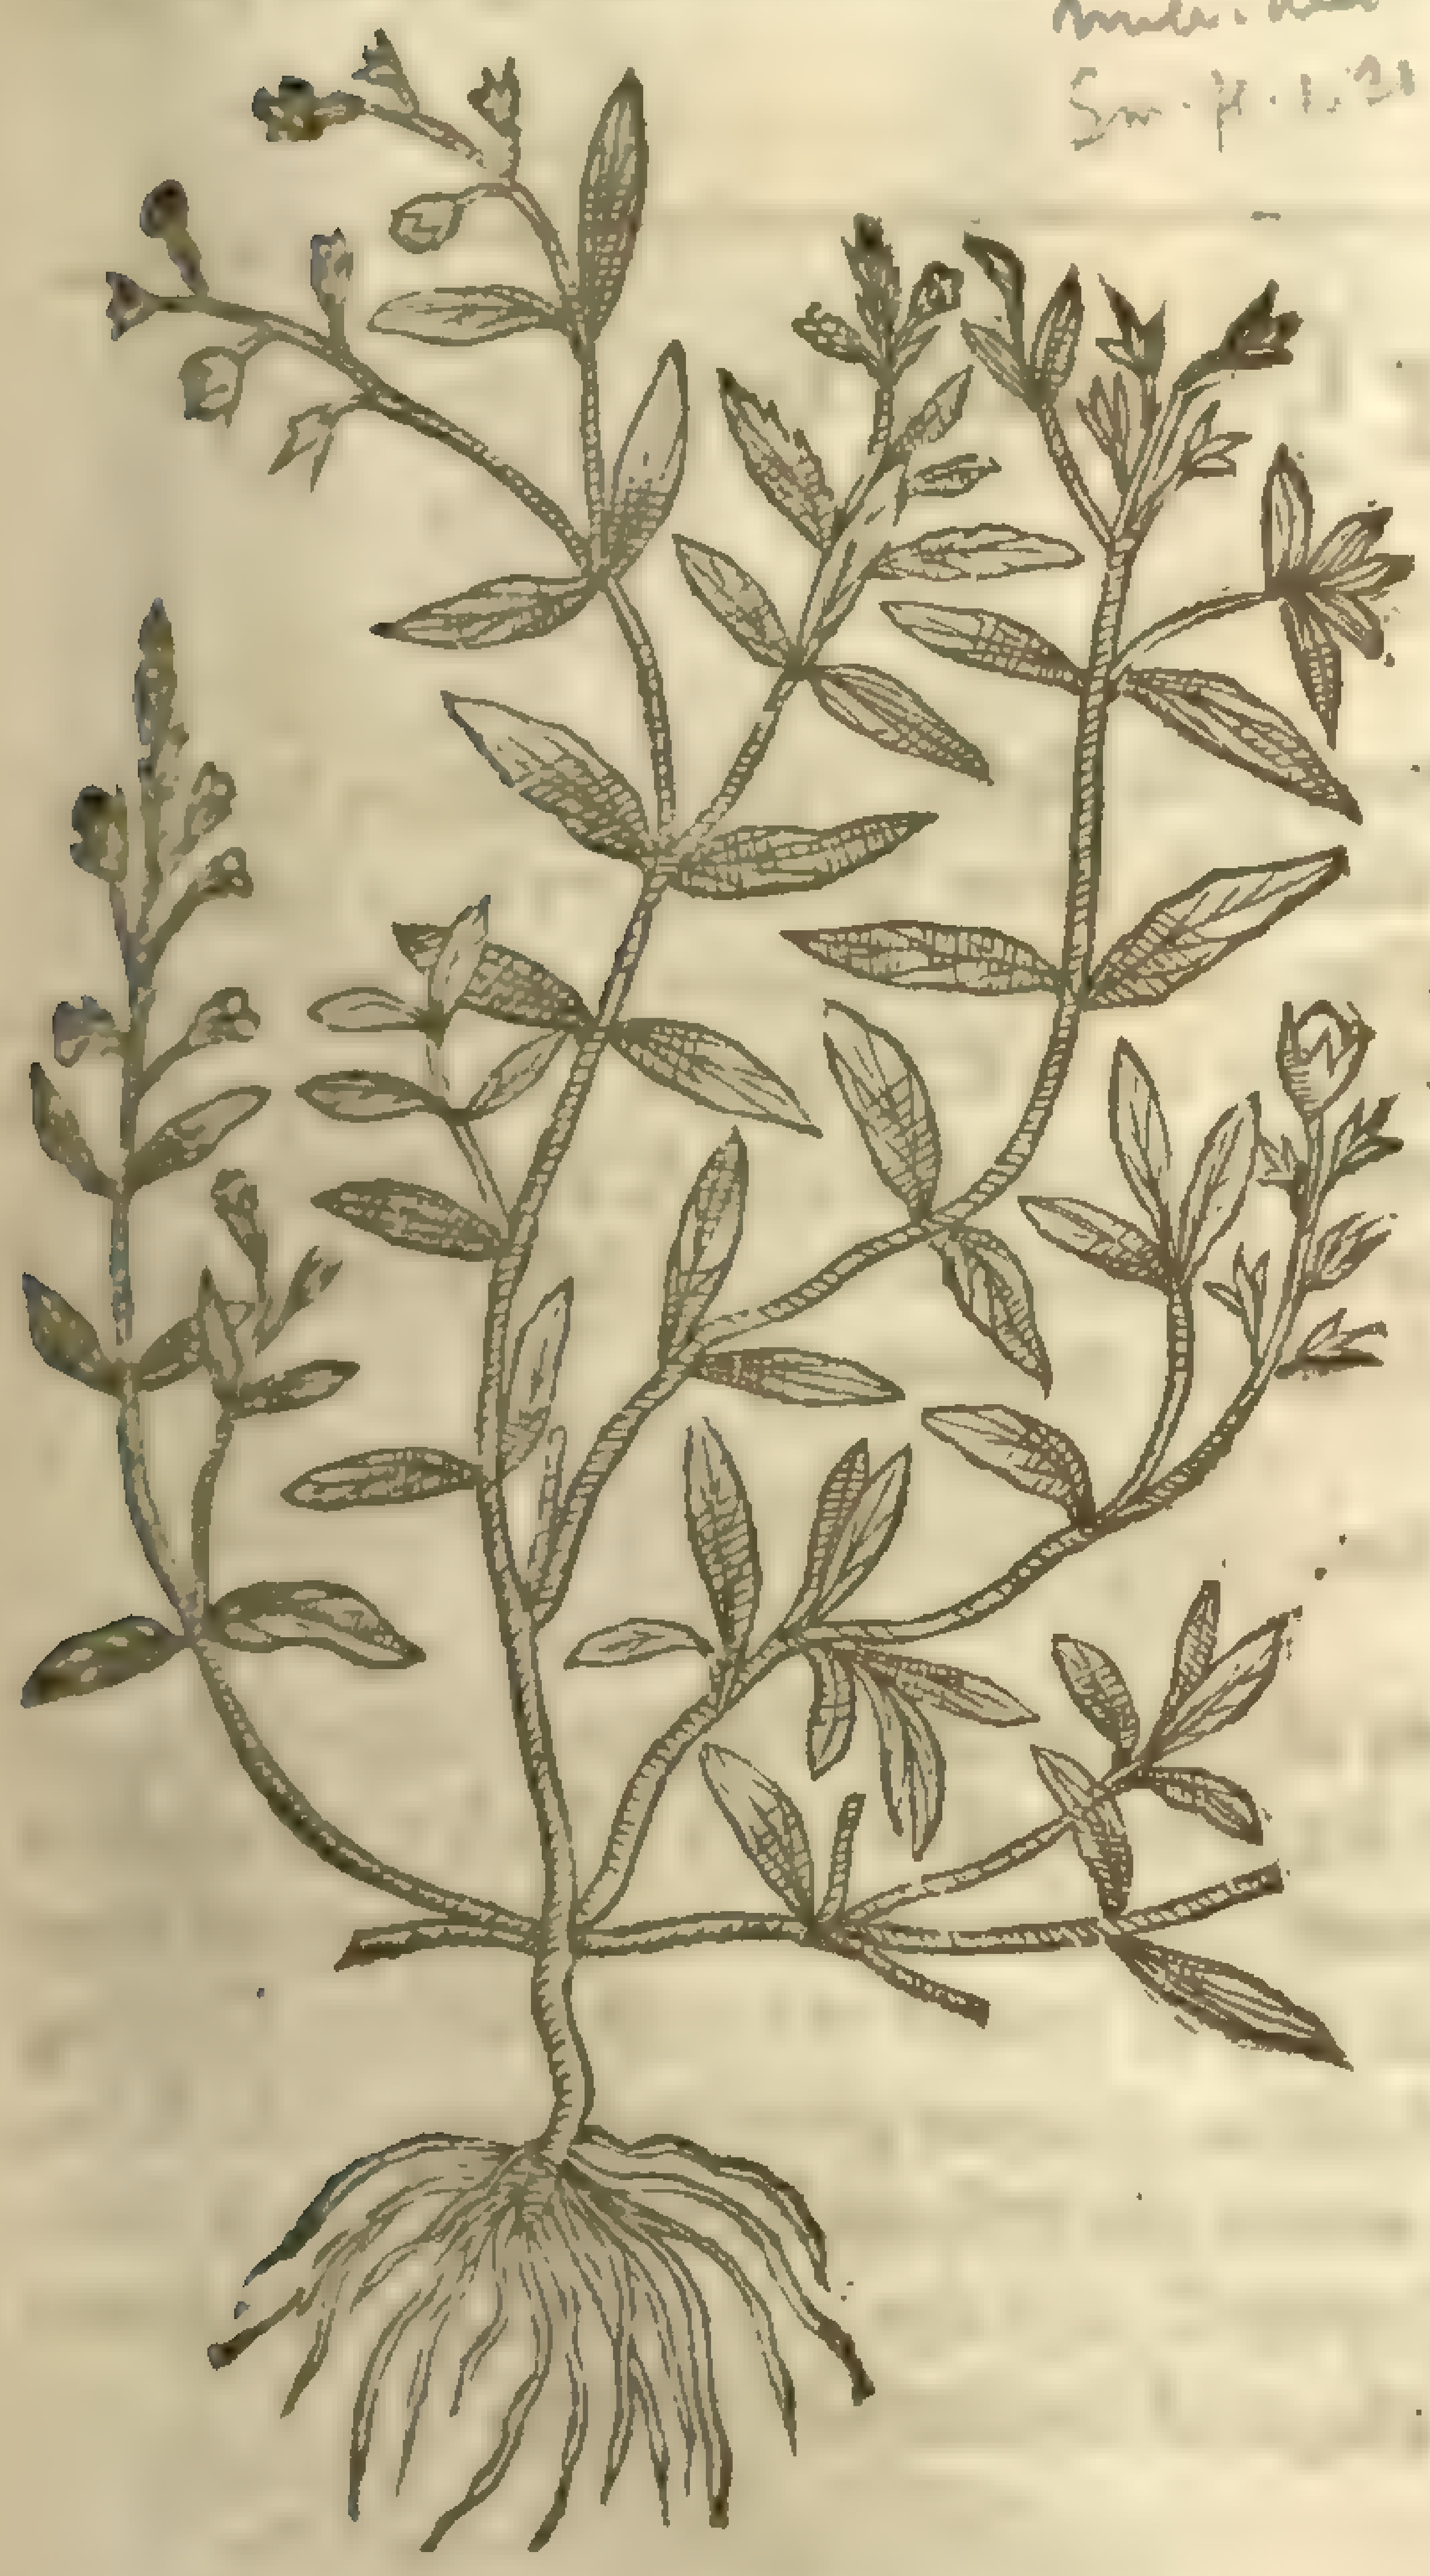
4 I conjecture this figure which we here giue you with the Authors title to be onely the leſſer variety of that which our Author deſcribes in the ſecond place; but becauſe I haue no certainty hereof (for that *Lobel* hath giuen vs no deſcription thereof in any of his Latine Workes, and alſo *Bauhinus* hath diſtinguiſhed them) I am forced to giue you onely the figure thereof; not intending to deceiue my Reader by giuing deſcriptions from my fancie and the figure, as our Author ſometimes made bold to do.

5 This which is ſet forth by moſt Writers for *Cepæa*, and which ſome may object to be more fit to be put next the Purſlanes, I will here giue you, hauing forgot to do it there; and I thinke this place not vnfit, becauſe our Author in the Names in this Chapter takes occaſion in *Dodonæus* his words to make mention thereof. It hath a ſmall vnprofitable root, ſending vp a ſtalke ſome foot high, diuided into many weake branches, which are here and there ſet with thicke leaues like thoſe of Purſlane, but much leſſe, and narrower, and ſharper pointed: the floures which grow in good plenty vpon the tops of the branches are compoſed of fiue ſmall white leaues; whereto ſucceeds ſmall heads, wherein is contained a ſeed like that of Orpine. This by *Matthiolus* and others is called *Cepæa*: but *Cluſius* doubts that it is not the true *Cepæa* of the Antients. ‡

¶ The

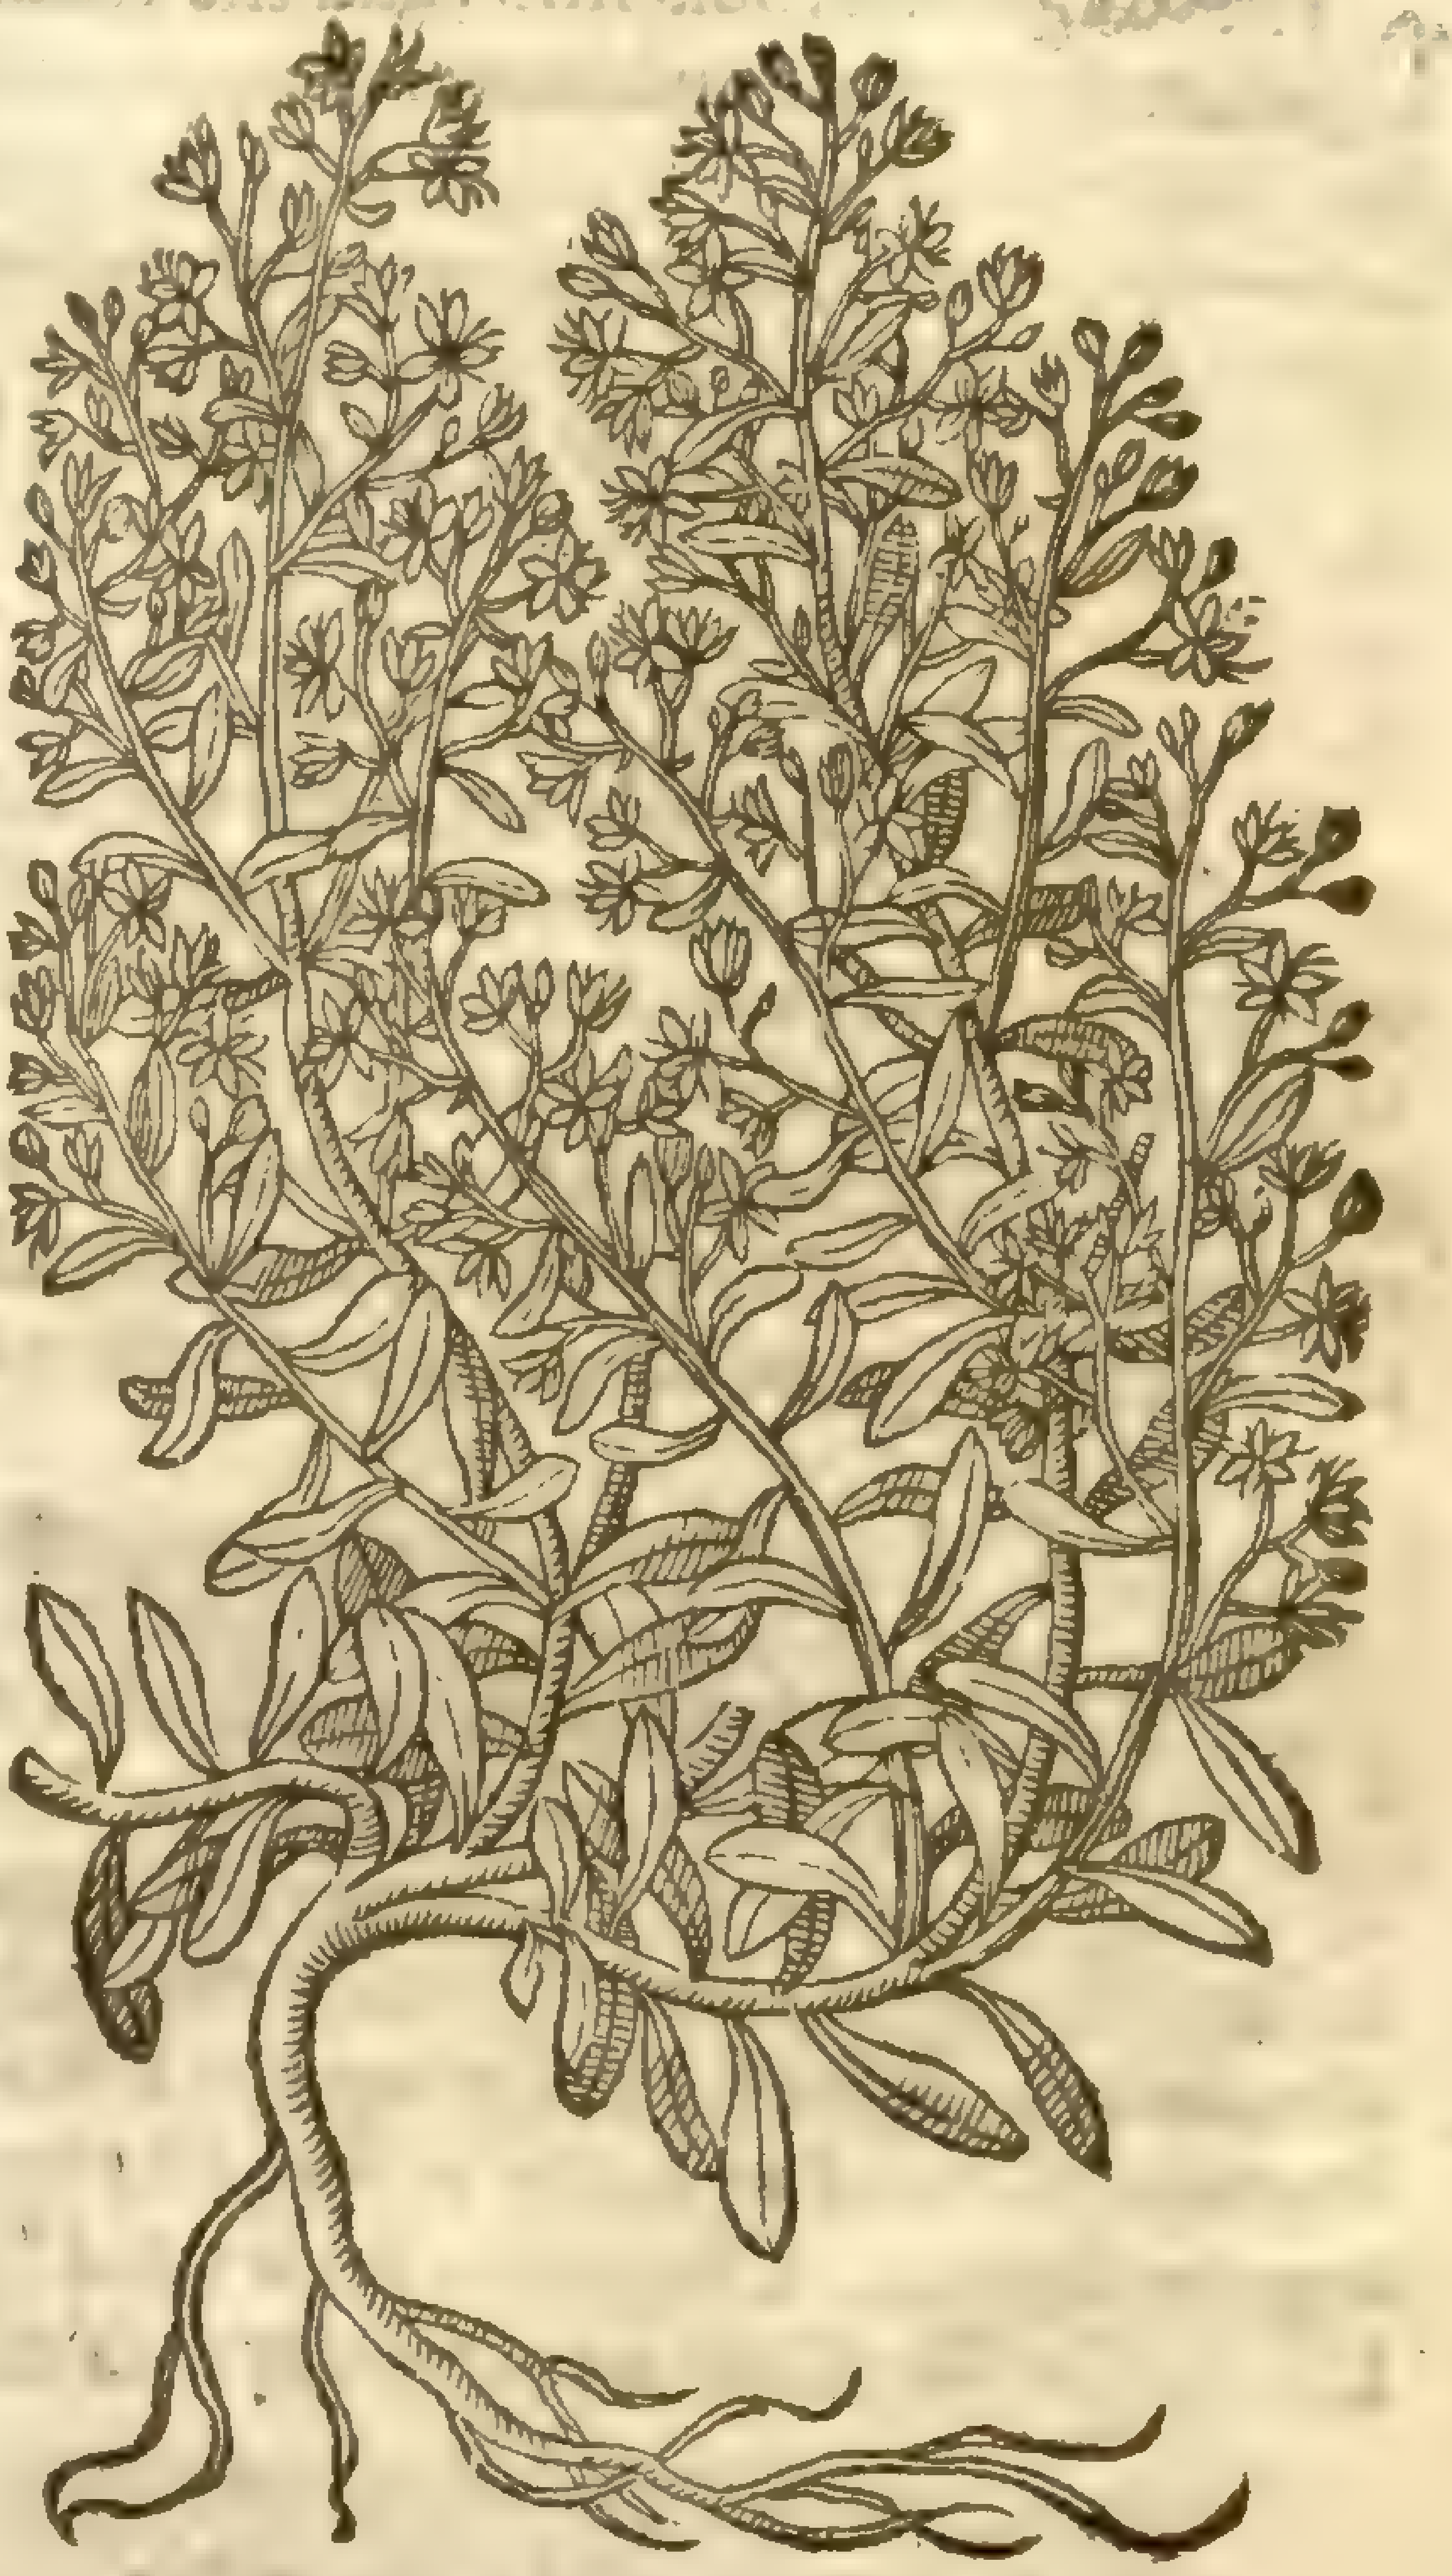
‡ 4 *Anagallis aquatica quarta, Lob.*
Lobels fourth water Pimpernel.

Veronica [illegible]
mihi dub.
Sm. p. 1. 21



‡ 5 *Cepæa.*
Garden Brook-lime.

[illegible]



¶ *The Place.*

They grow by riuers ſides, ſmall running brookes, and watery ditches. The yellow Pimpernell I found growing in Hampſted wood neere London, and in many other woods and copſes.

¶ *The Time.*

They bring forth their floures and ſeed in Iune, Iuly, and Auguſt.

¶ *The Names.*

Water Pimpernell is called *Anagallis aquatica* : of moſt, *Becabunga*, which is borrowed of the Germane word, **Bachpunghen**: in low Dutch, **Beeckpunghen**: in French, *Berle*; whereupon ſome do call it *Berula*: notwithſtanding, *Marcellus* reporteth, That *Berula* is that which the Grecians call [illegible], or rather Creſſes: it is thought to be *Cepæa*, that is to ſay, of the garden; which *Dioſcorides* writeth to be like vnto Purſlane, whereunto this Brook-lime doth very well agree. But if it be therefore ſaid to be [illegible] becauſe it groweth either only or for the moſt part in Gardens, this Pimpernell or Brooklime ſhall not be like vnto it, which groweth no where leſſe than in gardens, being altogether of his owne nature wilde, deſiring to grow in watery places, and ſuch as be continually ouerflowne: in Engliſh the firſt is called Brooklime, and the reſt by no particular names; but we may call them water Pimpernels, or Brooklimes.

¶ *The Temperature.*

Brooklime is of temperature hot and dry like water Creſſes, yet not ſo much.

¶ *The Vertues.*

A Brooke-lime is eaten in ſallads as Water Creſſes are, and is good againſt that ἐγχώριον *malum* of ſuch as dwell neere the Germane ſeas, which they call **Seuerbuycke**: or as we terme it, the Scuruie or Skiruy, being vſed after the ſame manner that Water-Creſſes and Scuruy graſſe is vſed, yet is it not of ſo great operation and vertue.

B The herbe boyled maketh a good fomentation for ſwollen legs and the dropſie.

C The leaues boyled, ſtrained, and ſtamped in a ſtone morter with the pouder of Fenugreeke, Lineſeeds, the root of mariſh Mallowes, and ſome hogs greaſe, vnto the forme of a cataplaſme, or pulteſſe, take away any ſwelling in leg or arme; wounds alſo that are ready to fall into apoſtumation it mightily defendeth, that no humor or accident ſhall happen thereunto.

D The leaues of Brooke-lime ſtamped, ſtrained, and giuen to drinke in wine, helpe the ſtrangurie, and grieſes of the bladder.

E The leaues of Brook-lime, and the tendrels of *Aſparagus*, eaten with oyle, vinegre, and pepper, helpe the ſtrangurie and ſtone.

Chap. 196. *Of ſtinking Ground-Pine.*

¶ *The Kindes.*

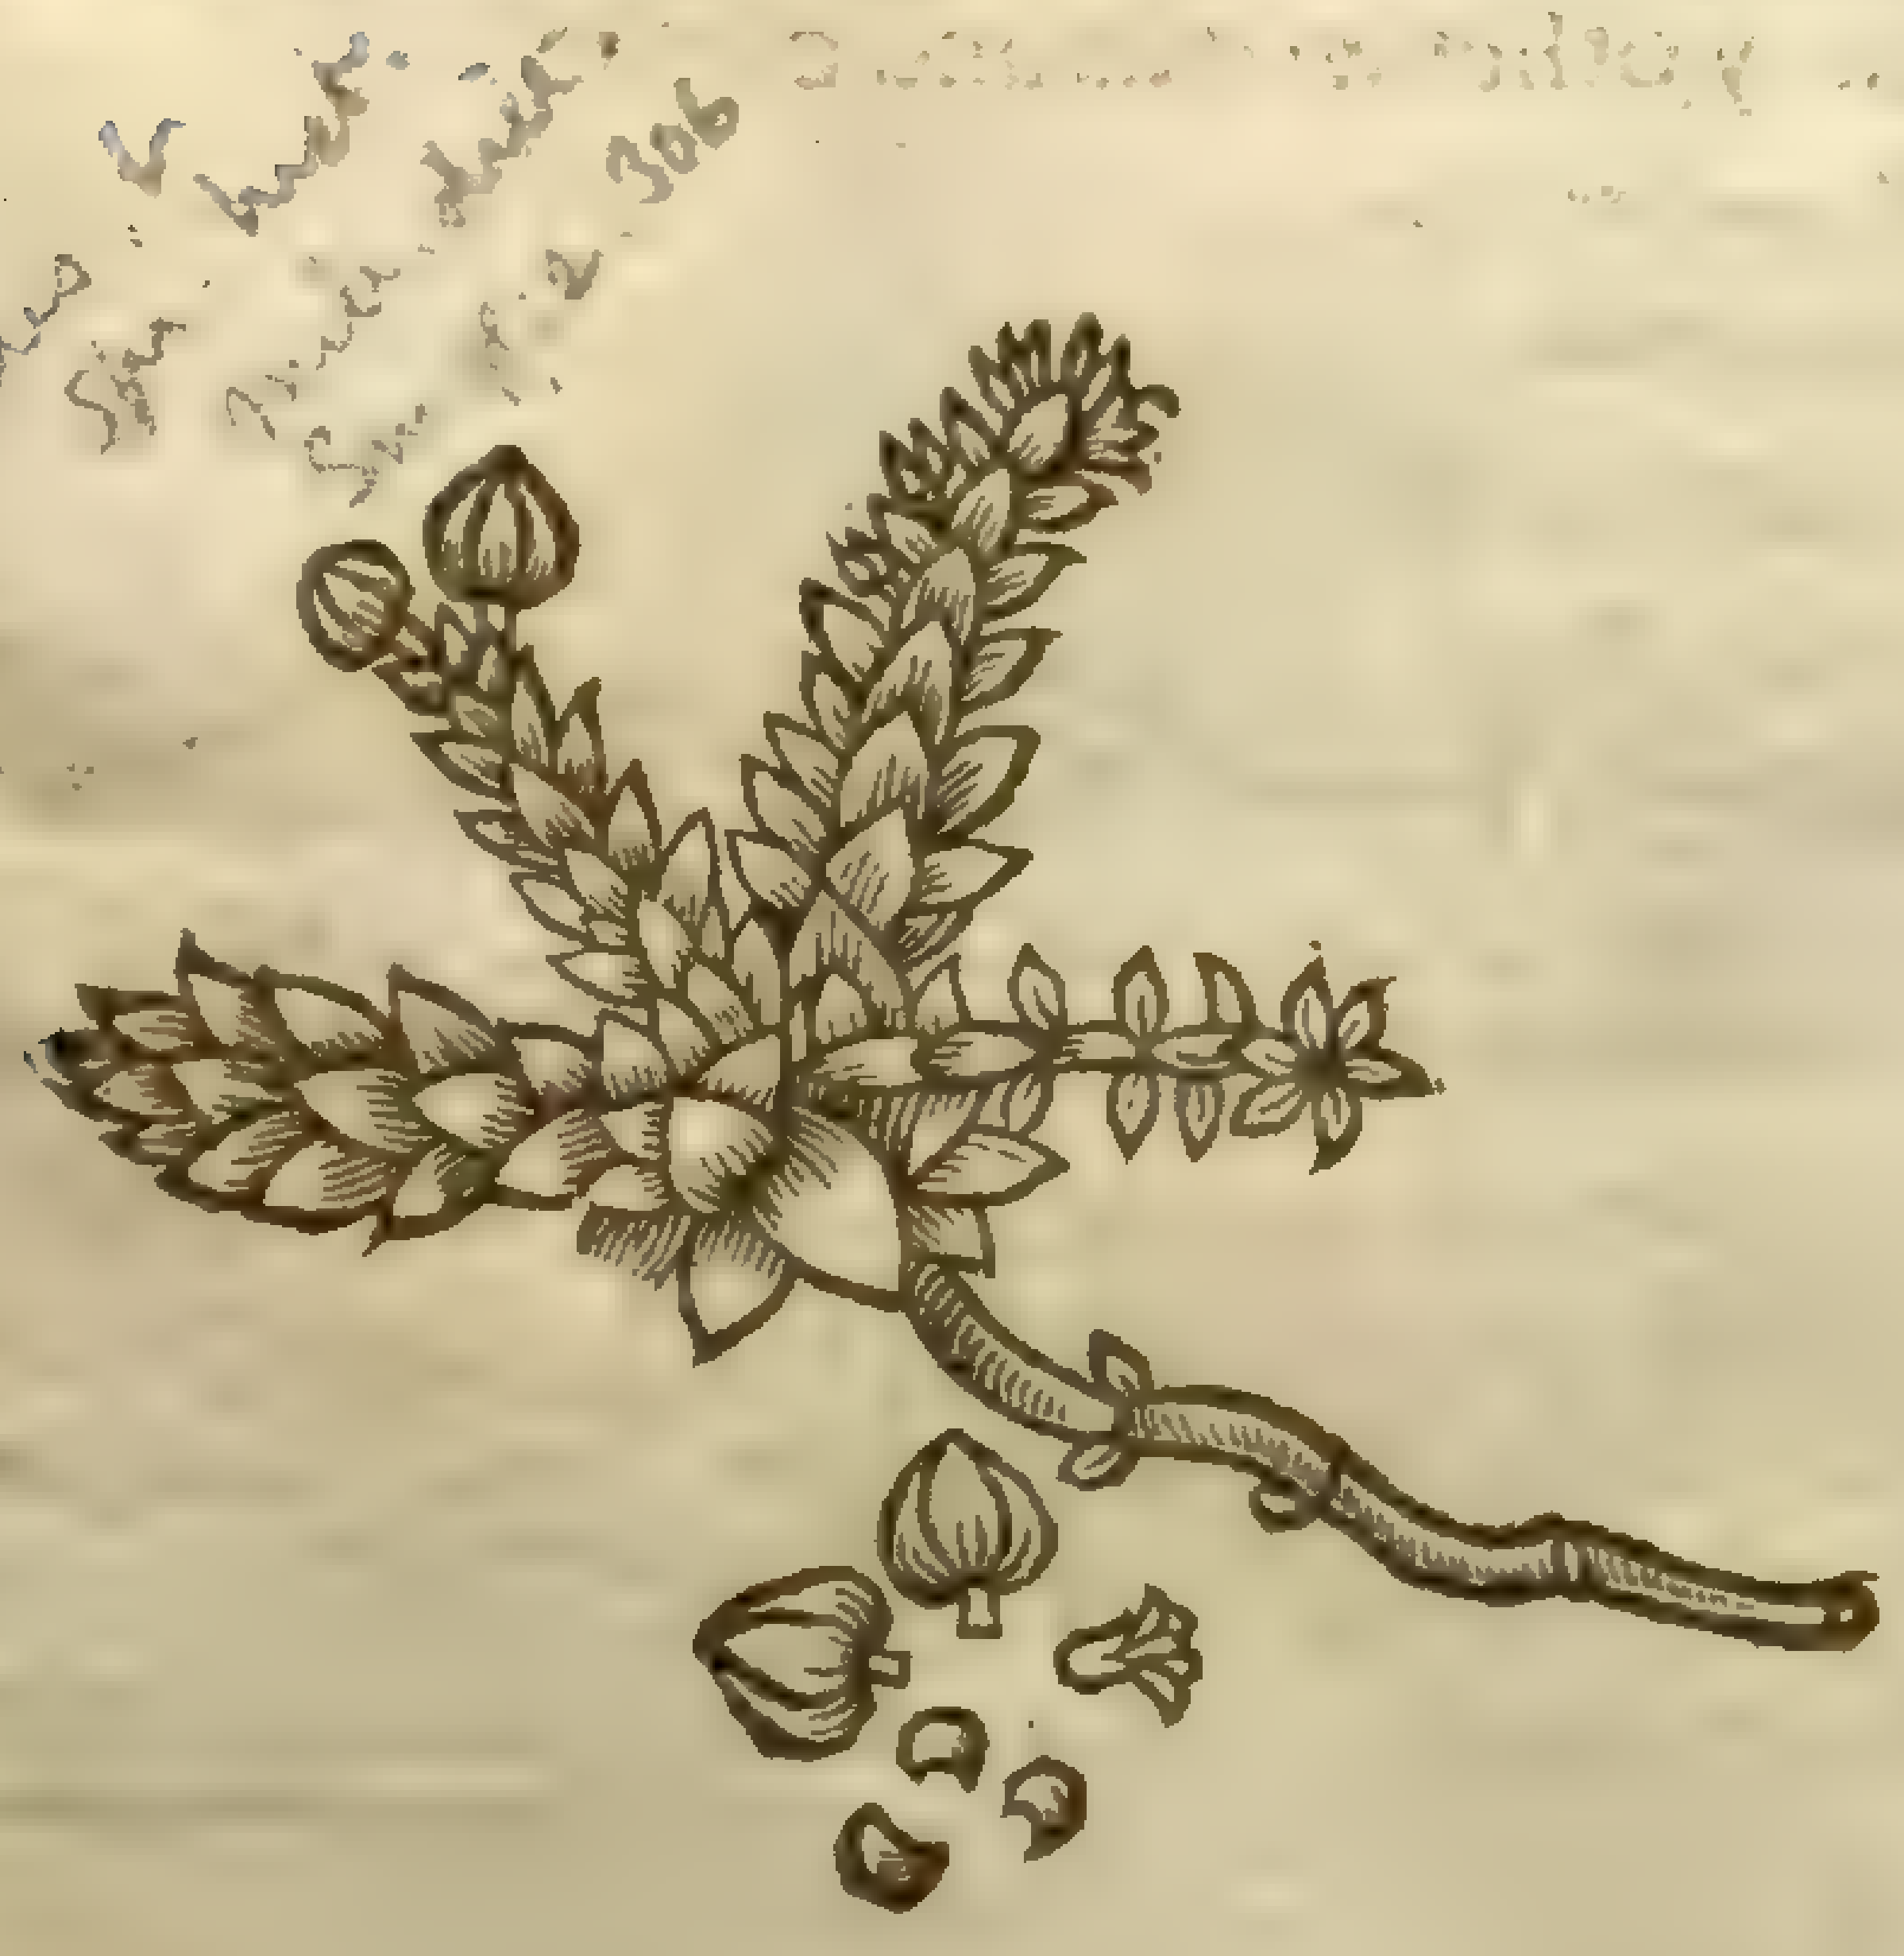
‡ Dioſcorides hath antiently mentioned two ſorts of *Anthyllis*: one with leaues like to the Lentill, and the other like to *Chamæpytis*. To the firſt, ſome late writers haue referred diuers plants, as the two firſt deſcribed in this Chapter; The *Anthyllis Leguminoſa Belgarum* hereafter to be deſcribed; the *Anthyllis Valentina Cluſij* formerly ſet forth Chap. 171. To the ſecond are referred the *Iua Moſcata Monſpeliaca*, deſcribed in the fourth place of the 150. Chap. of this booke; the *Linaria adulterina* deſcribed formerly chap. 165. in the 14. place, and that which is here deſcribed in the third place of this chapter, by the name of *Anthyllis altera Italorum*. ‡

¶ *The Deſcription.*

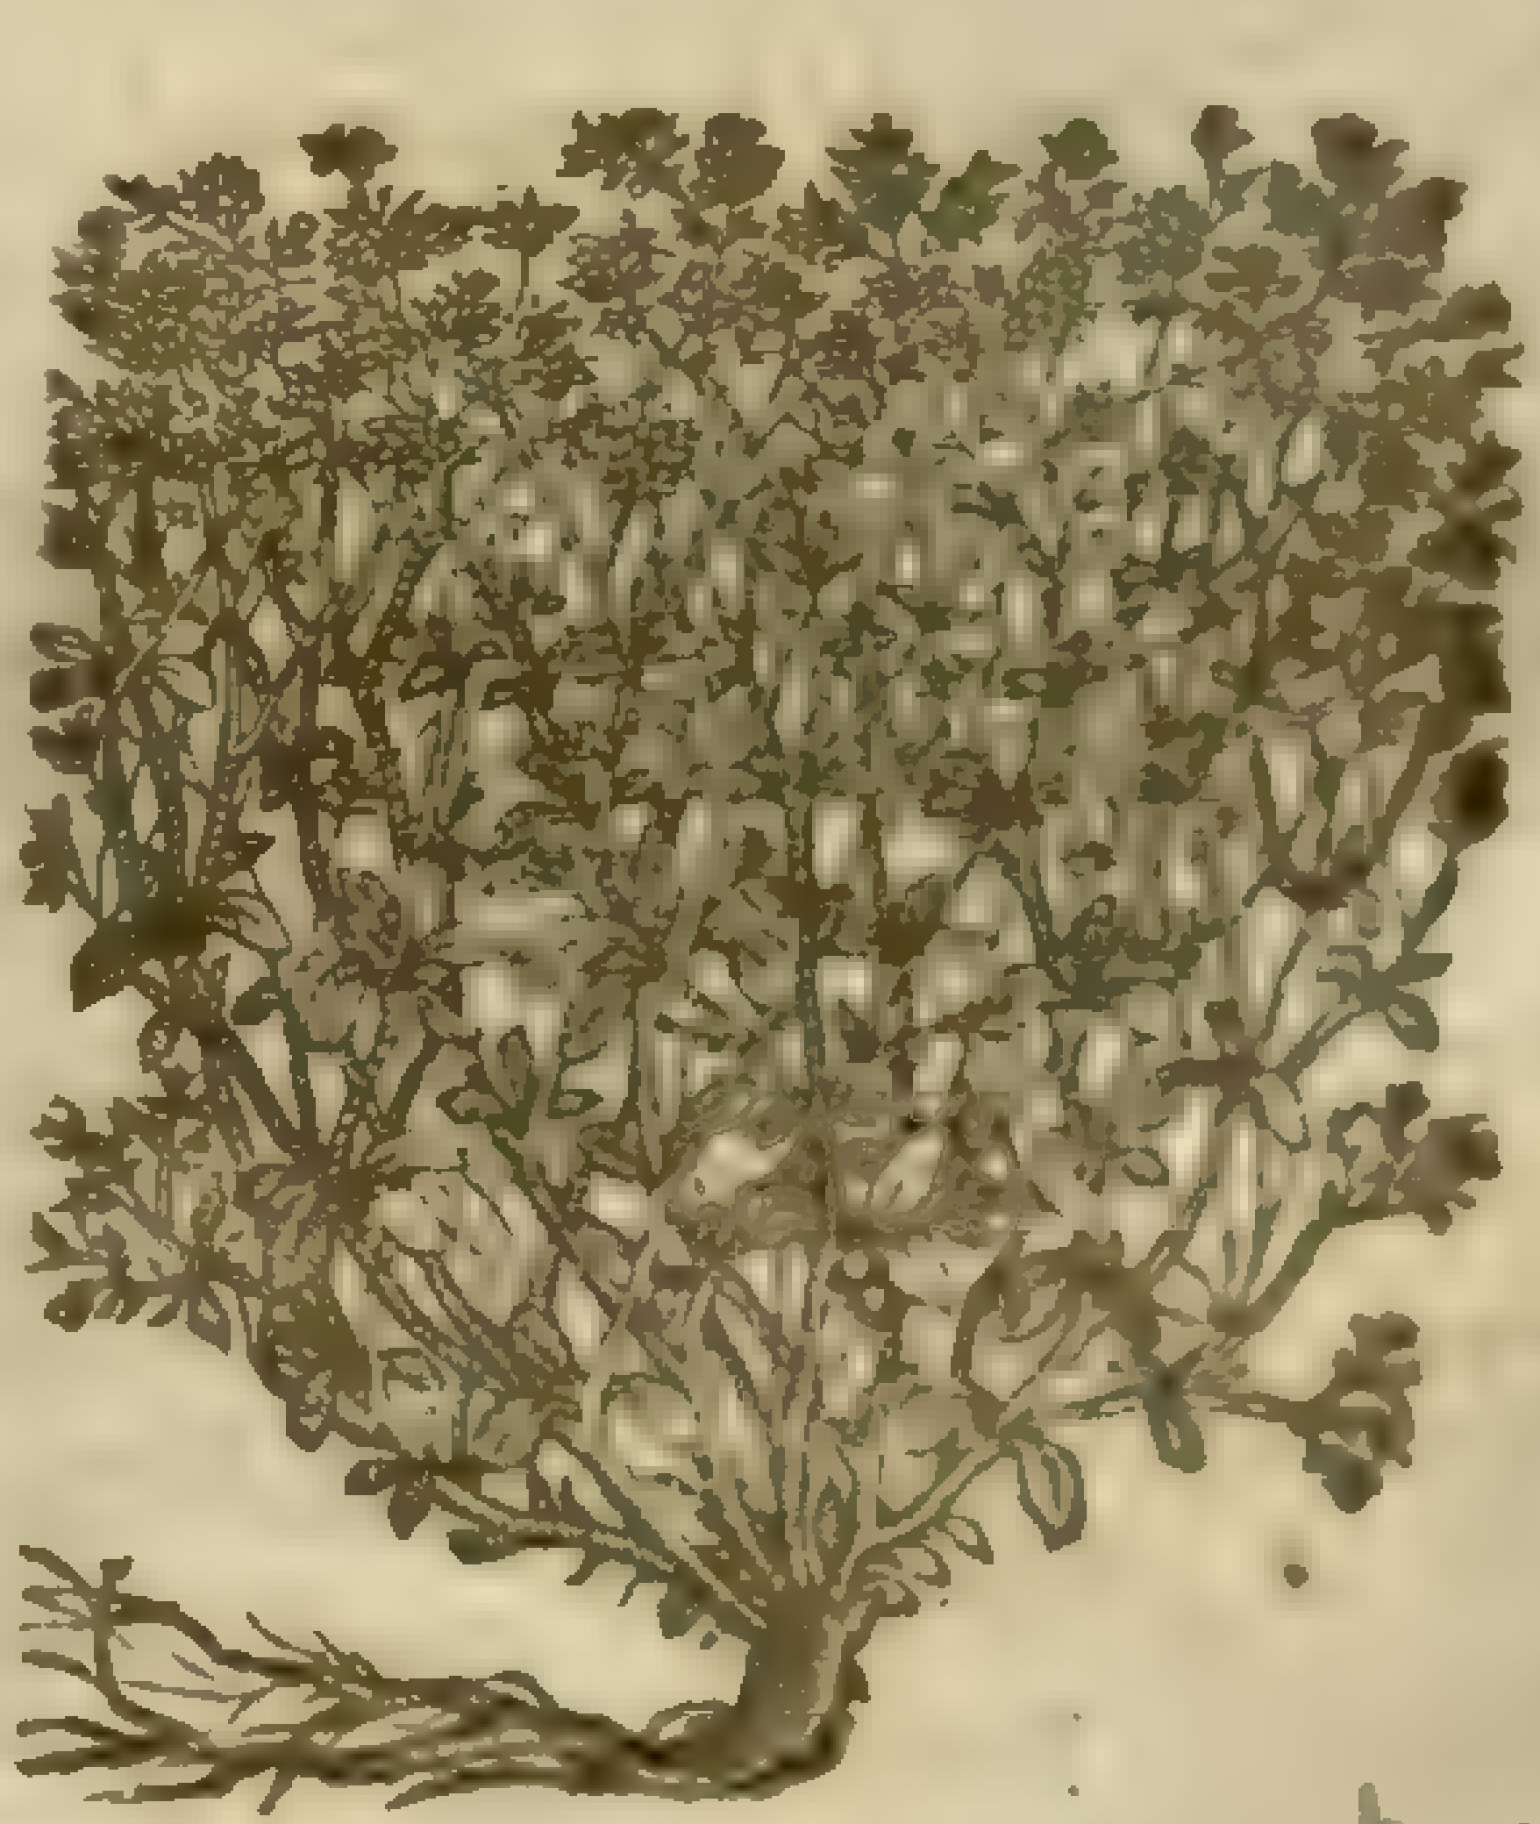
1 There hath beene much adoe among Writers about the certaine knowledge of the true *Anthyllis* of *Dioſcorides*: I will therefore ſet downe that plant which of all others is found moſt agreeable thereunto. It hath many ſmall branches full of joynts, not aboue an handfull high, creeping ſundry waies, beſet with ſmall thicke leaues of a pale colour, reſembling *Lenticula*, or rather *Alſine minor*, the leſſer Chickeweed. The floures grow at the top of the ſtalke, ſtarre-faſhion, of an herby colour like boxe, or *Sedum minus*: it foſtereth his ſmall ſeeds in a three cornered huske. The root is ſomewhat long, ſlender, joynted, and deepely thruſt into the ground like *Soldanella*: all the whole plant is ſaltiſh, bitter in taſte, and ſomewhat heating.

‡ 1 *Anthyllis lentifolia, ſiue Alſine cruciata marina.*
Sea Pimpernell.

Arenaria peploides L. Sp. hist. Mill. dict. Sp. pl. 2. 306



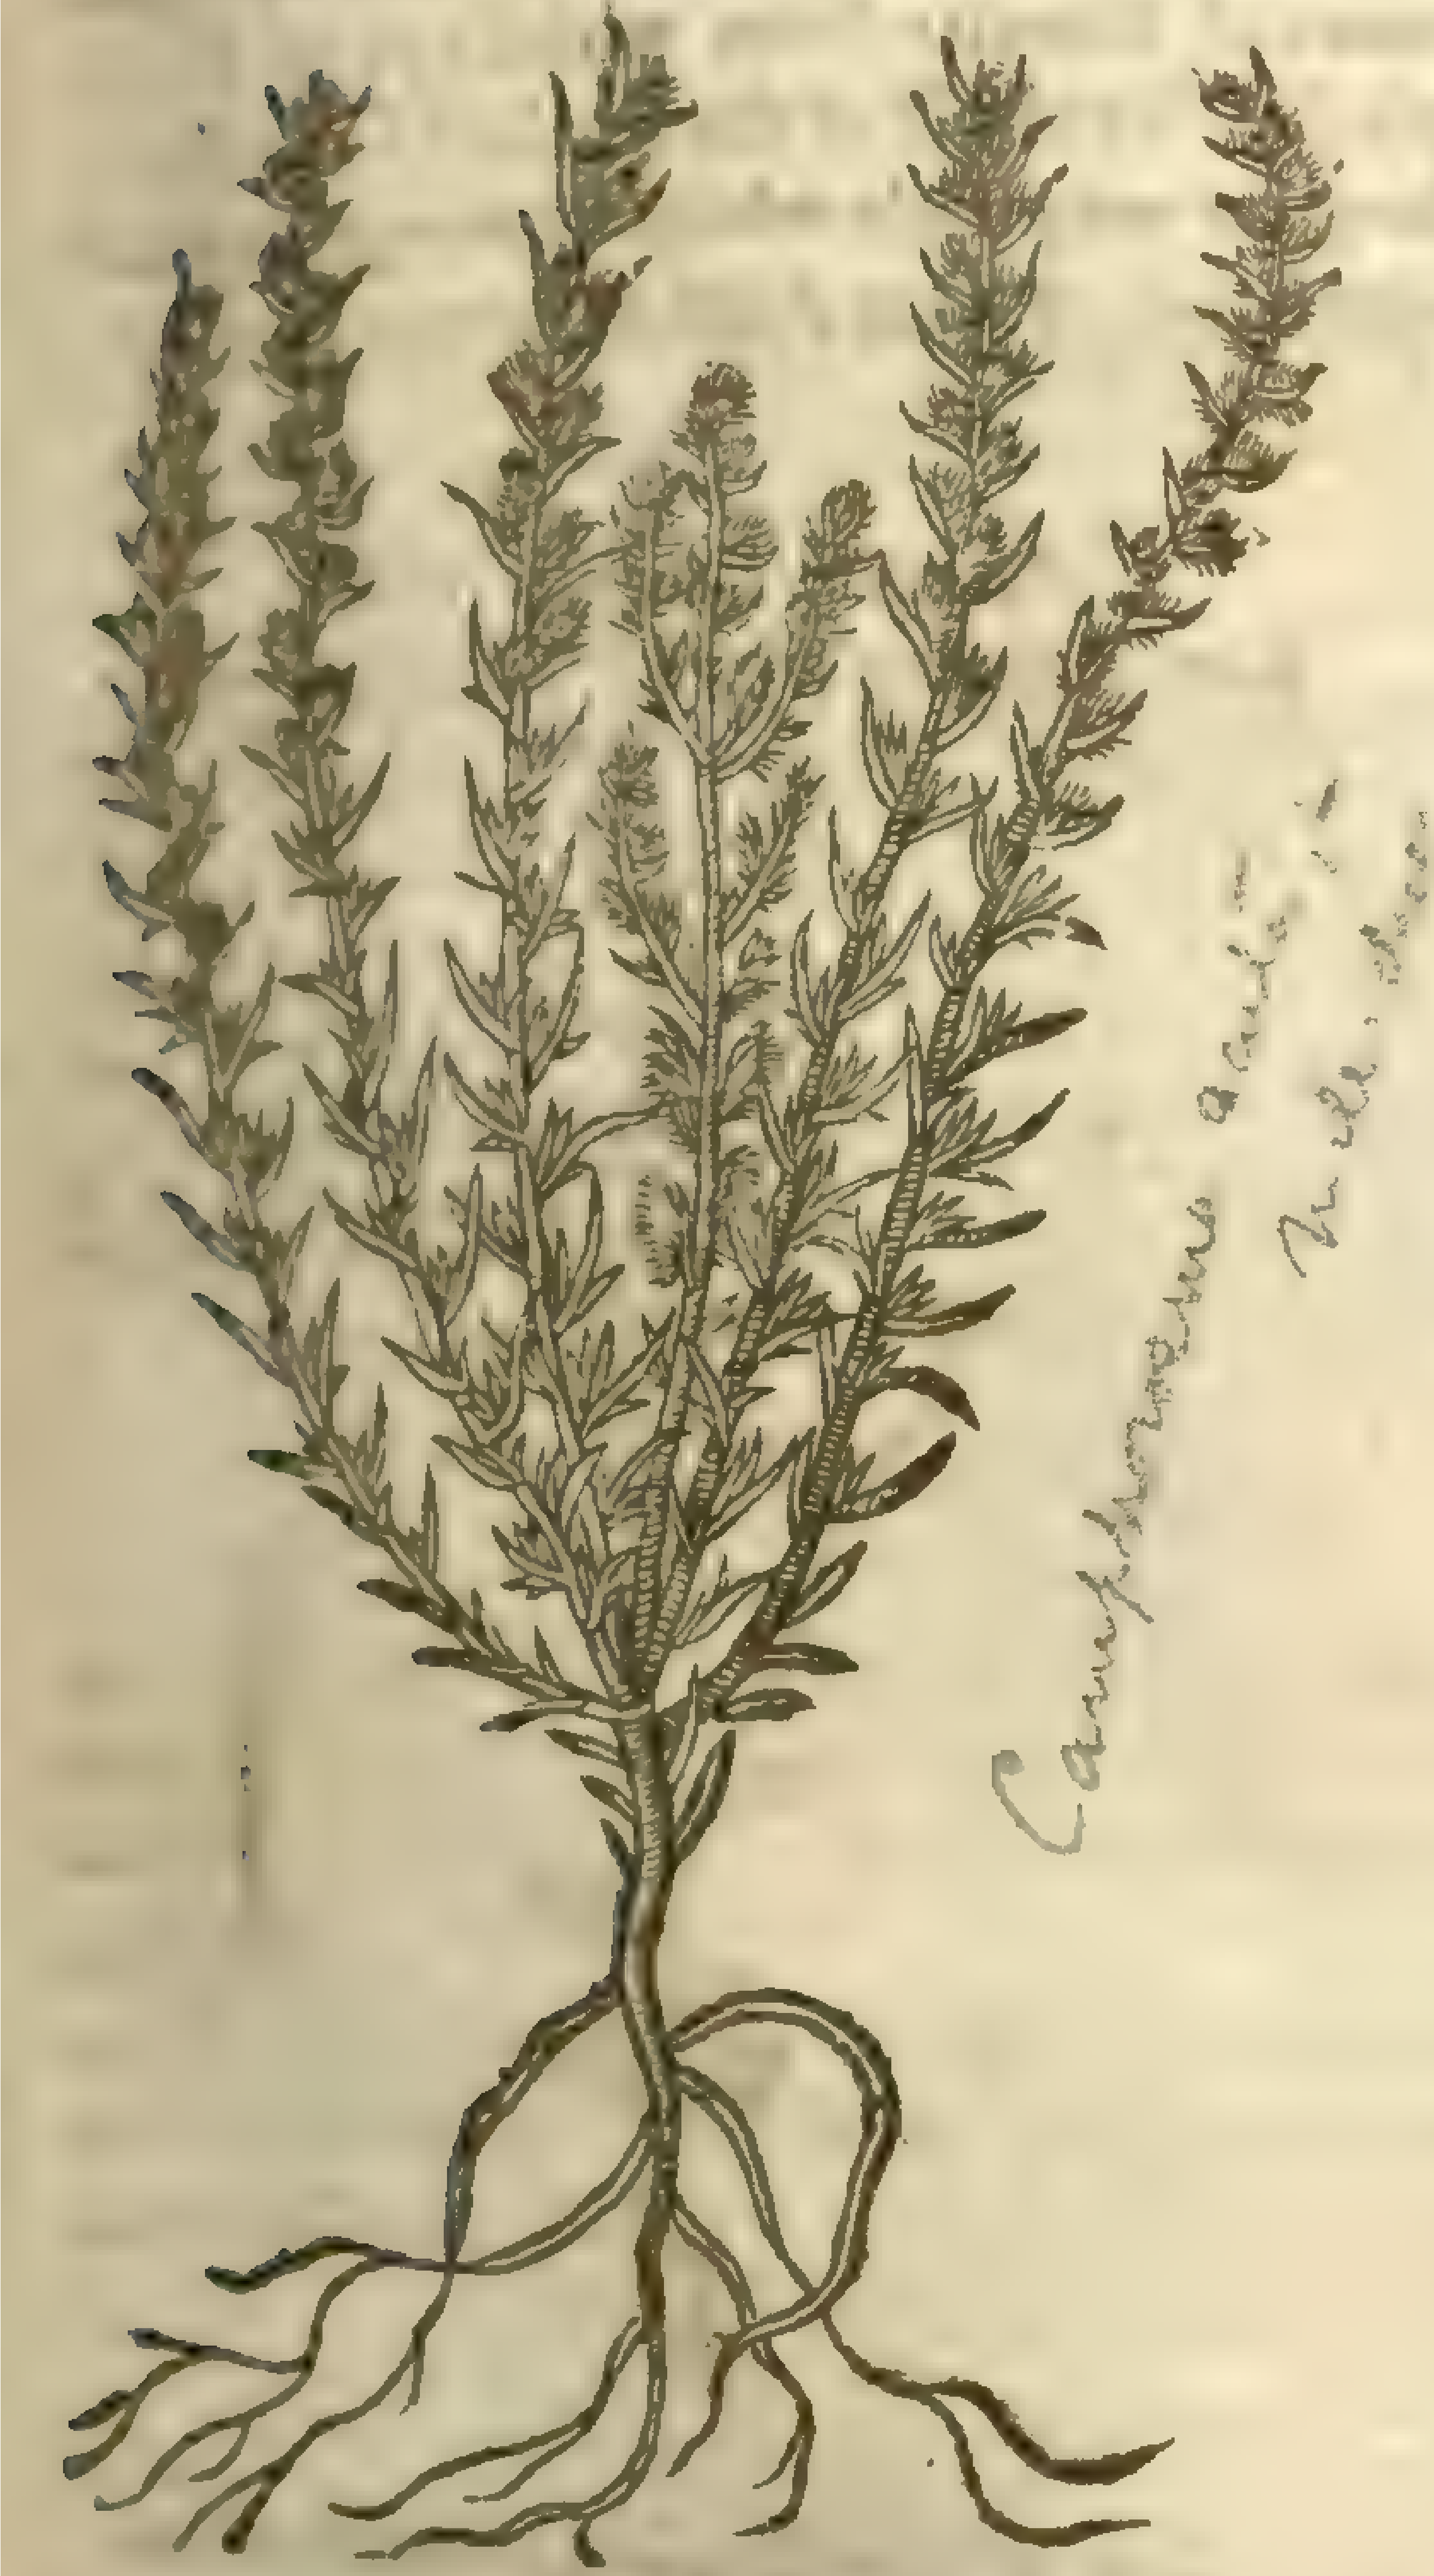
‡ 2 *Anthyllis Marina incana Alſinefolia.*
Many floured Ground-Pine.



Polycarpon tetraphyllum L. [illegible] dict. Sp. pl. 1. 189

‡ This deſcription was taken out of the *Aduerſaria, pag.* 195. where it is called *Anthyllis prior lentifolia Peplios effigie maritima*: alſo *Cluſius* hath deſcribed it by the name of *Alſines genus pelagicum*: I haue called it in my laſt journall by the name of *Alſine cruciata marina*, becauſe the leaues which grow thicke together by couples croſſe each other, as it happens in moſt plants which haue ſquare ſtalkes with two leaues at each joynt. I haue Engliſhed it ſea Pimpernell, becauſe the leaues in ſhape are liker thoſe of Pimpernell then of any other Plant; and alſo for that our Author hath called another plant by the name of Sea Chickweed. The figure of the *Aduerſaria* was not good, and *Cluſius* hath none; which hath cauſed ſome to reckon this *Anthyllis* of *Lobel*, and *Alſine* of *Cluſius* for two ſeuerall plants, which indeed are not ſo. I haue giuen you a figure hereof which I tooke from the growing plant, and which well expreſſeth the growing hereof. ‡

3 *Anthyllis altera Italorum.*
Stinking ground Pine.



Camphoroſma acuta

2 There is likewiſe another ſort of *Anthyllis* or Sea Ground Pine, but in truth nothing els than a kinde of Sea Chickeweed, hauing ſmall branches trailing vpon the ground of two hands high; whereupon do grow little leaues like thoſe of Chickweed, not vnlike thoſe of *Lenticula marina*, or Sea Lentils: on the top of the ſtalkes ſtand many ſmall moſſie floures of a white colour. The whole plant is of a bitter and ſaltiſh taſte. ‡ This is the *Marina incana Anthyllis Alſine folia Narbonenſium* of *Lobel*: the *Paronychia altera* of *Matthiolus*. ‡

‡ 3 To this figure (which formerly was giuen for the firſt of theſe by our Author) I will now giue you a briefe deſcription. This in the branches, leaues, and whole face thereof is very like the French Herbe-Iuie, or Ground Pine, but that it is much leſſe in all the parts thereof, but chiefely in the leaues which alſo are not ſnipt like thoſe of the French Ground Pine, but ſharp pointed: the tops of the branches are downy or woolly, and ſet with little pale yellow floures. ‡

¶ *The Place.*

Theſe do grow in the South Iſles belonging to England, eſpecially in Portland in the grauelly and ſandy ſoords, which lie low and againſt the ſea; and likewiſe in the Iſle of Shepey neere the water ſide. ‡ I haue only found the firſt deſcribed, and that both in Shepey, as alſo in Weſt-gate bay by Margate in the Iſle of Thanet. ‡

¶ *The Time.*

They floure and flouriſh in Iune and Iuly.

¶ *The Names.*

Their titles and deſcriptions ſufficiently ſet forth their ſeuerall names.

¶ *The Temperature.*

Theſe ſea herbes are of a temperate faculty betweene hot and cold.

¶ *The Vertues.*

A Halfe an ounce of the dried leaues drunke, preuaileth greatly againſt the hot piſſe, the ſtranguri, or difficulty of making water, and purgeth the reines.

B The ſame taken with Oxymell or honied water is good for the falling ſickeneſſe, giuen firſt at morning, and laſt at night.

† There was formerly three deſcriptions, yet but one figure in this chapter, and that was marked with the figure 1. and called *Anthyllis lentifolia*, but vnfitly: wherefore I haue giuen you the title which *Lobel* the firſt Author thereof puts vpon it with a deſcription thereto, that it may not ſtand as a cipher, as it formerly did. That deſcription which formerly held the ſecond place was of the *Anthyllis Valentina* of *Cluſius*, deſcribed chap. 171. and therefore I haue omitted it here.

CHAP. 197. *Of Whiteblow, or Whitelow Graſſe.*

¶ *The Deſcription.*

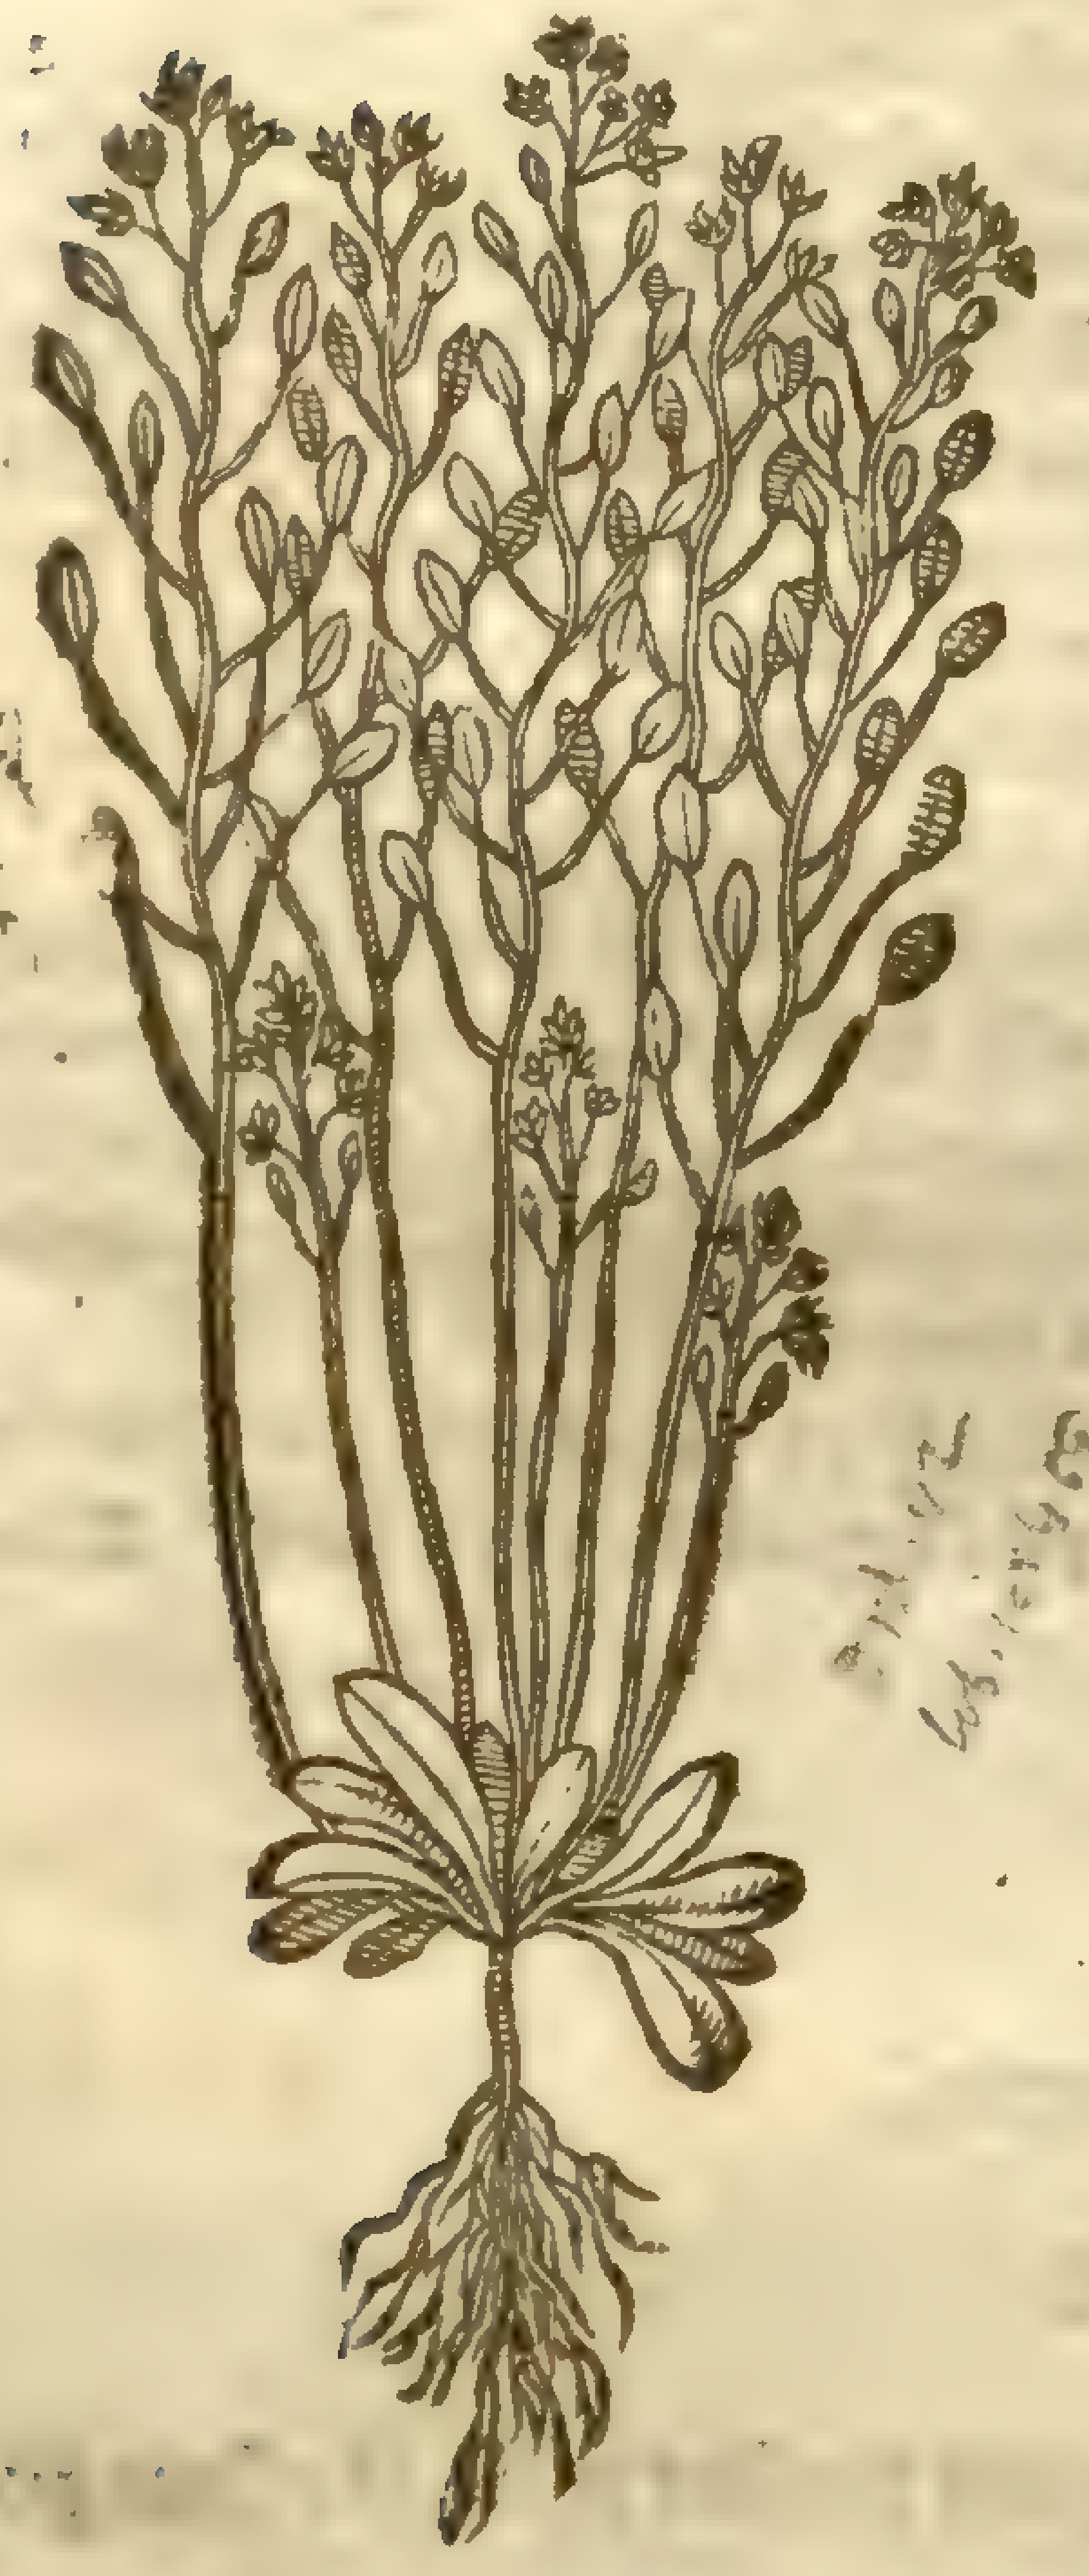
1 THe firſt is a very ſlender plant hauing a few ſmall leaues like the leaſt Chickeweed, growing in little tufts, from the midſt whereof riſeth vp a ſmall ſtalke, three or foure inches long; on whoſe top do grow very little white floures; which being paſt there come in place ſmall flat pouches compoſed of three filmes; which being ripe, the two outſides fall away, leauing the middle part ſtanding long time after, which is like white Sattin, as is that of *Bolbonac*, which our women call white Sattin, but much leſſer: the taſte is ſomewhat ſharpe.

2 This kinde of *Paronychia*, hath ſmall thicke and fat leaues, cut into three or more diuiſions, much reſembling the leaues of Rue, but a great deale ſmaller. The ſtalkes are like the former, & the

leaues alſo; but the caſes wherein the ſeed is contained, are like vnto the ſeed veſſels of *Myoſotis Scorpioides*, or mouſ-eare Scorpion graſſe. The floures are ſmall and white.

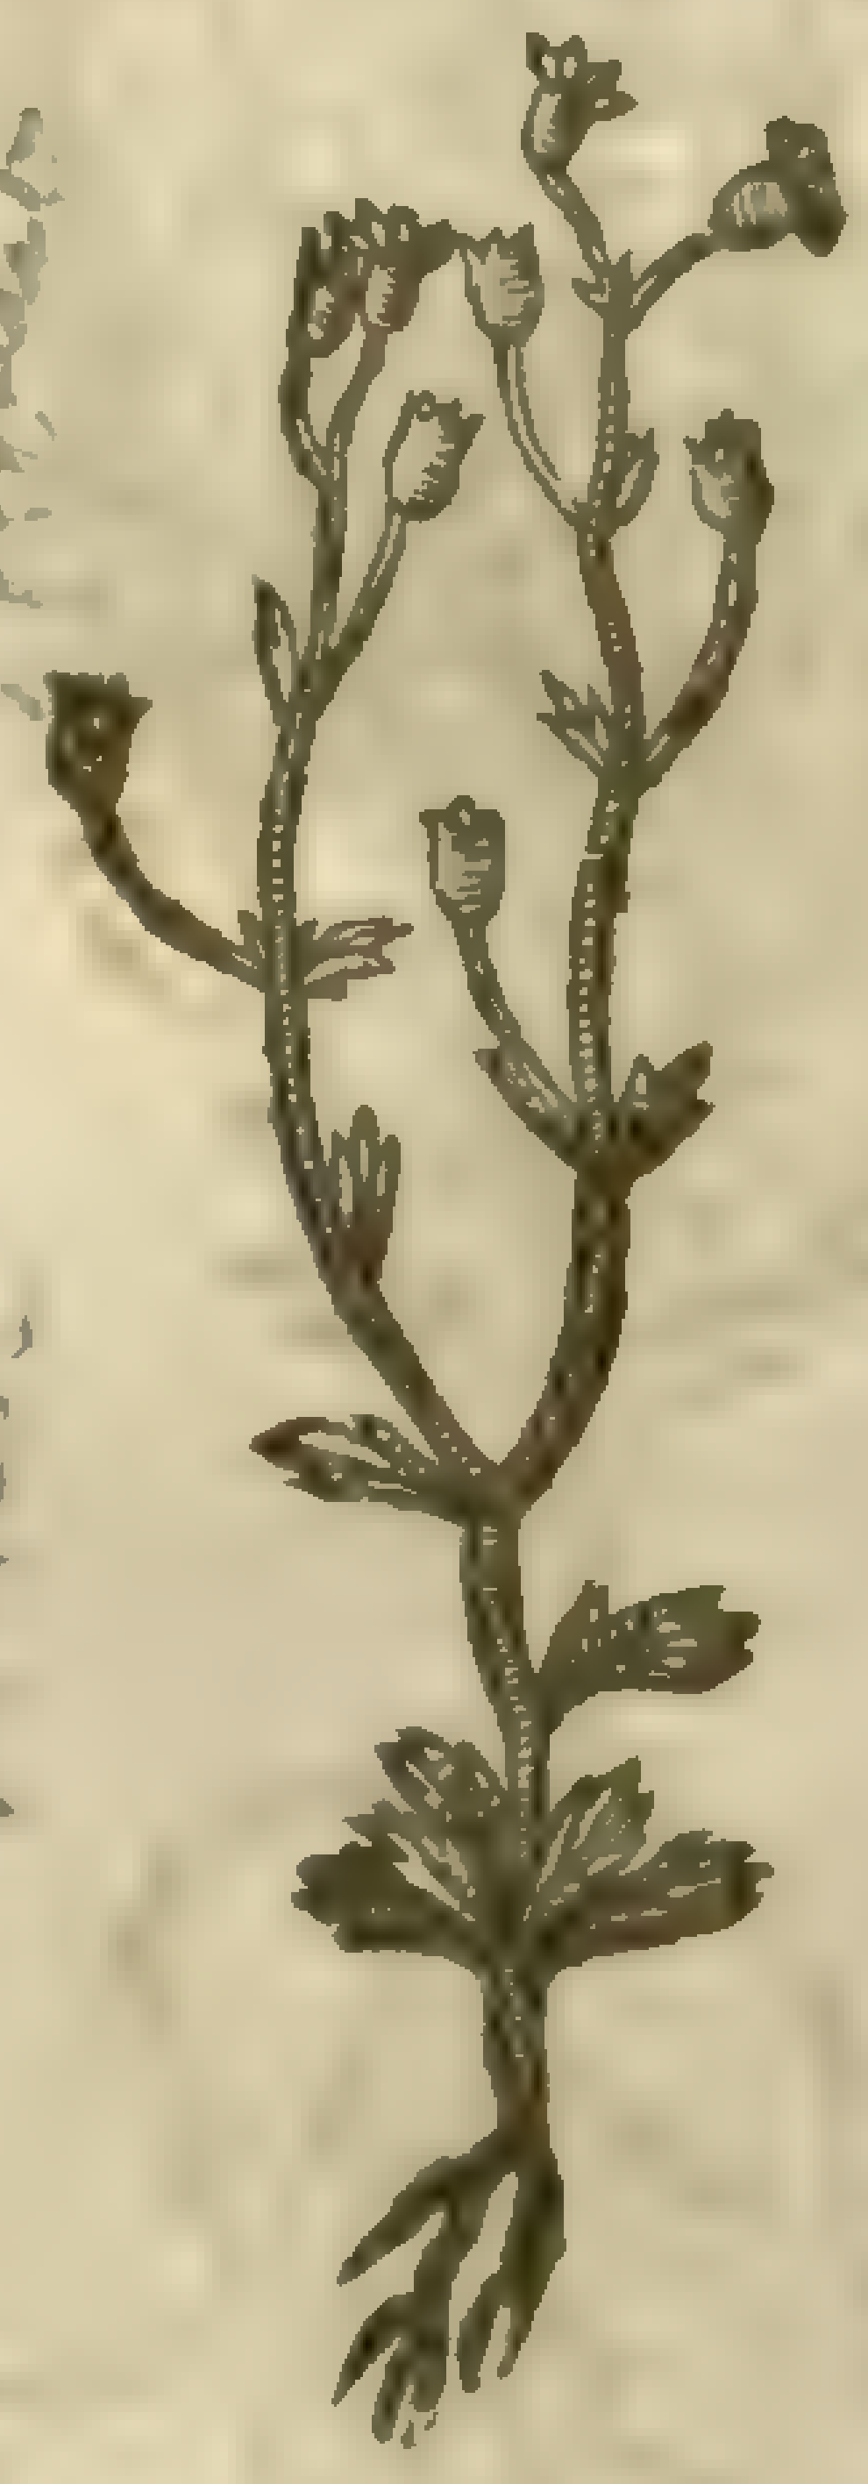
There is another ſort of Whitlow graſſe or Nailewoort, that is likewiſe a low or baſe herbe, hauing a ſmall tough root, with ſome threddy ſtrings annexed thereto: from which riſe vp diuerſe ſlender tough ſtalks, ſet with little narrow leaues confuſedly like thoſe of the ſmalleſt Chickweed, whereof doubtleſſe theſe be kindes: alongſt the ſtalks do grow very little white floures, after which come the ſeeds in ſmall buttons, of the bigneſſe of a pins head. ‡ Our Author ſeemes here to deſcribe the *Paronychia* 2. of *Tabern.* ‡

1 *Paronychia vulgaris.*
Common Whitlow graſſe.



Draba verna
Lin. sp. pl. 3.157

2 *Paronychia Rutaceo folio.*
Rew leafed or jagged Whitlow graſſe.



Saxifraga tridactylites
Lin. sp. pl. 2.222

¶ *The Place.*

Theſe ſmall baſe and low herbs grow vpon bricke and ſtone walls, vpon old tiled houſes, which are growne to haue much moſſe vpon them, and vpon ſome ſhadowie and dry muddy wals. It groweth plentifully vpon the bricke wall in Chancery Lane, belonging to the Earle of Southampton, in the Suburbs of London, and ſundry other places.

¶ *The Time.*

Theſe floure many times in Ianuary and February, and when hot weather approacheth, they are no more to be ſeene all the yeare after.

¶ *The Names.*

The Græcians haue called theſe plants παρωνυχία: which *Cicero* calleth *Redauia:* There be many kindes of plants, called by the ſame name of *Paronychia*, which hath cauſed many writers to doubt of the true kinde: but you may very boldly take theſe plants for the ſame, vntill time hath reuealed or raiſed vp ſome new plant, approching neerer vnto the truth: which I thinke will neuer be, ſo that we may call them in Engliſh, Naile-woort, and Whitlow graſſe.

¶ *The Temperature and Vertues.*

A As touching the quality hereof, we haue nothing to ſet downe: only it hath beene taken to heale the diſeaſe of the nailes called a Whitlow, whereof it tooke his name.

‡ Our Author here gaue vs two figures, and as many deſcriptions of both theſe plants, wherefore I haue omitted two of the figures, and the more ſuperfluous deſcription.

Chap.

CHAP. 198. *Of the female Fluellen, or Speedwell.*

¶ *The Deſcription.*

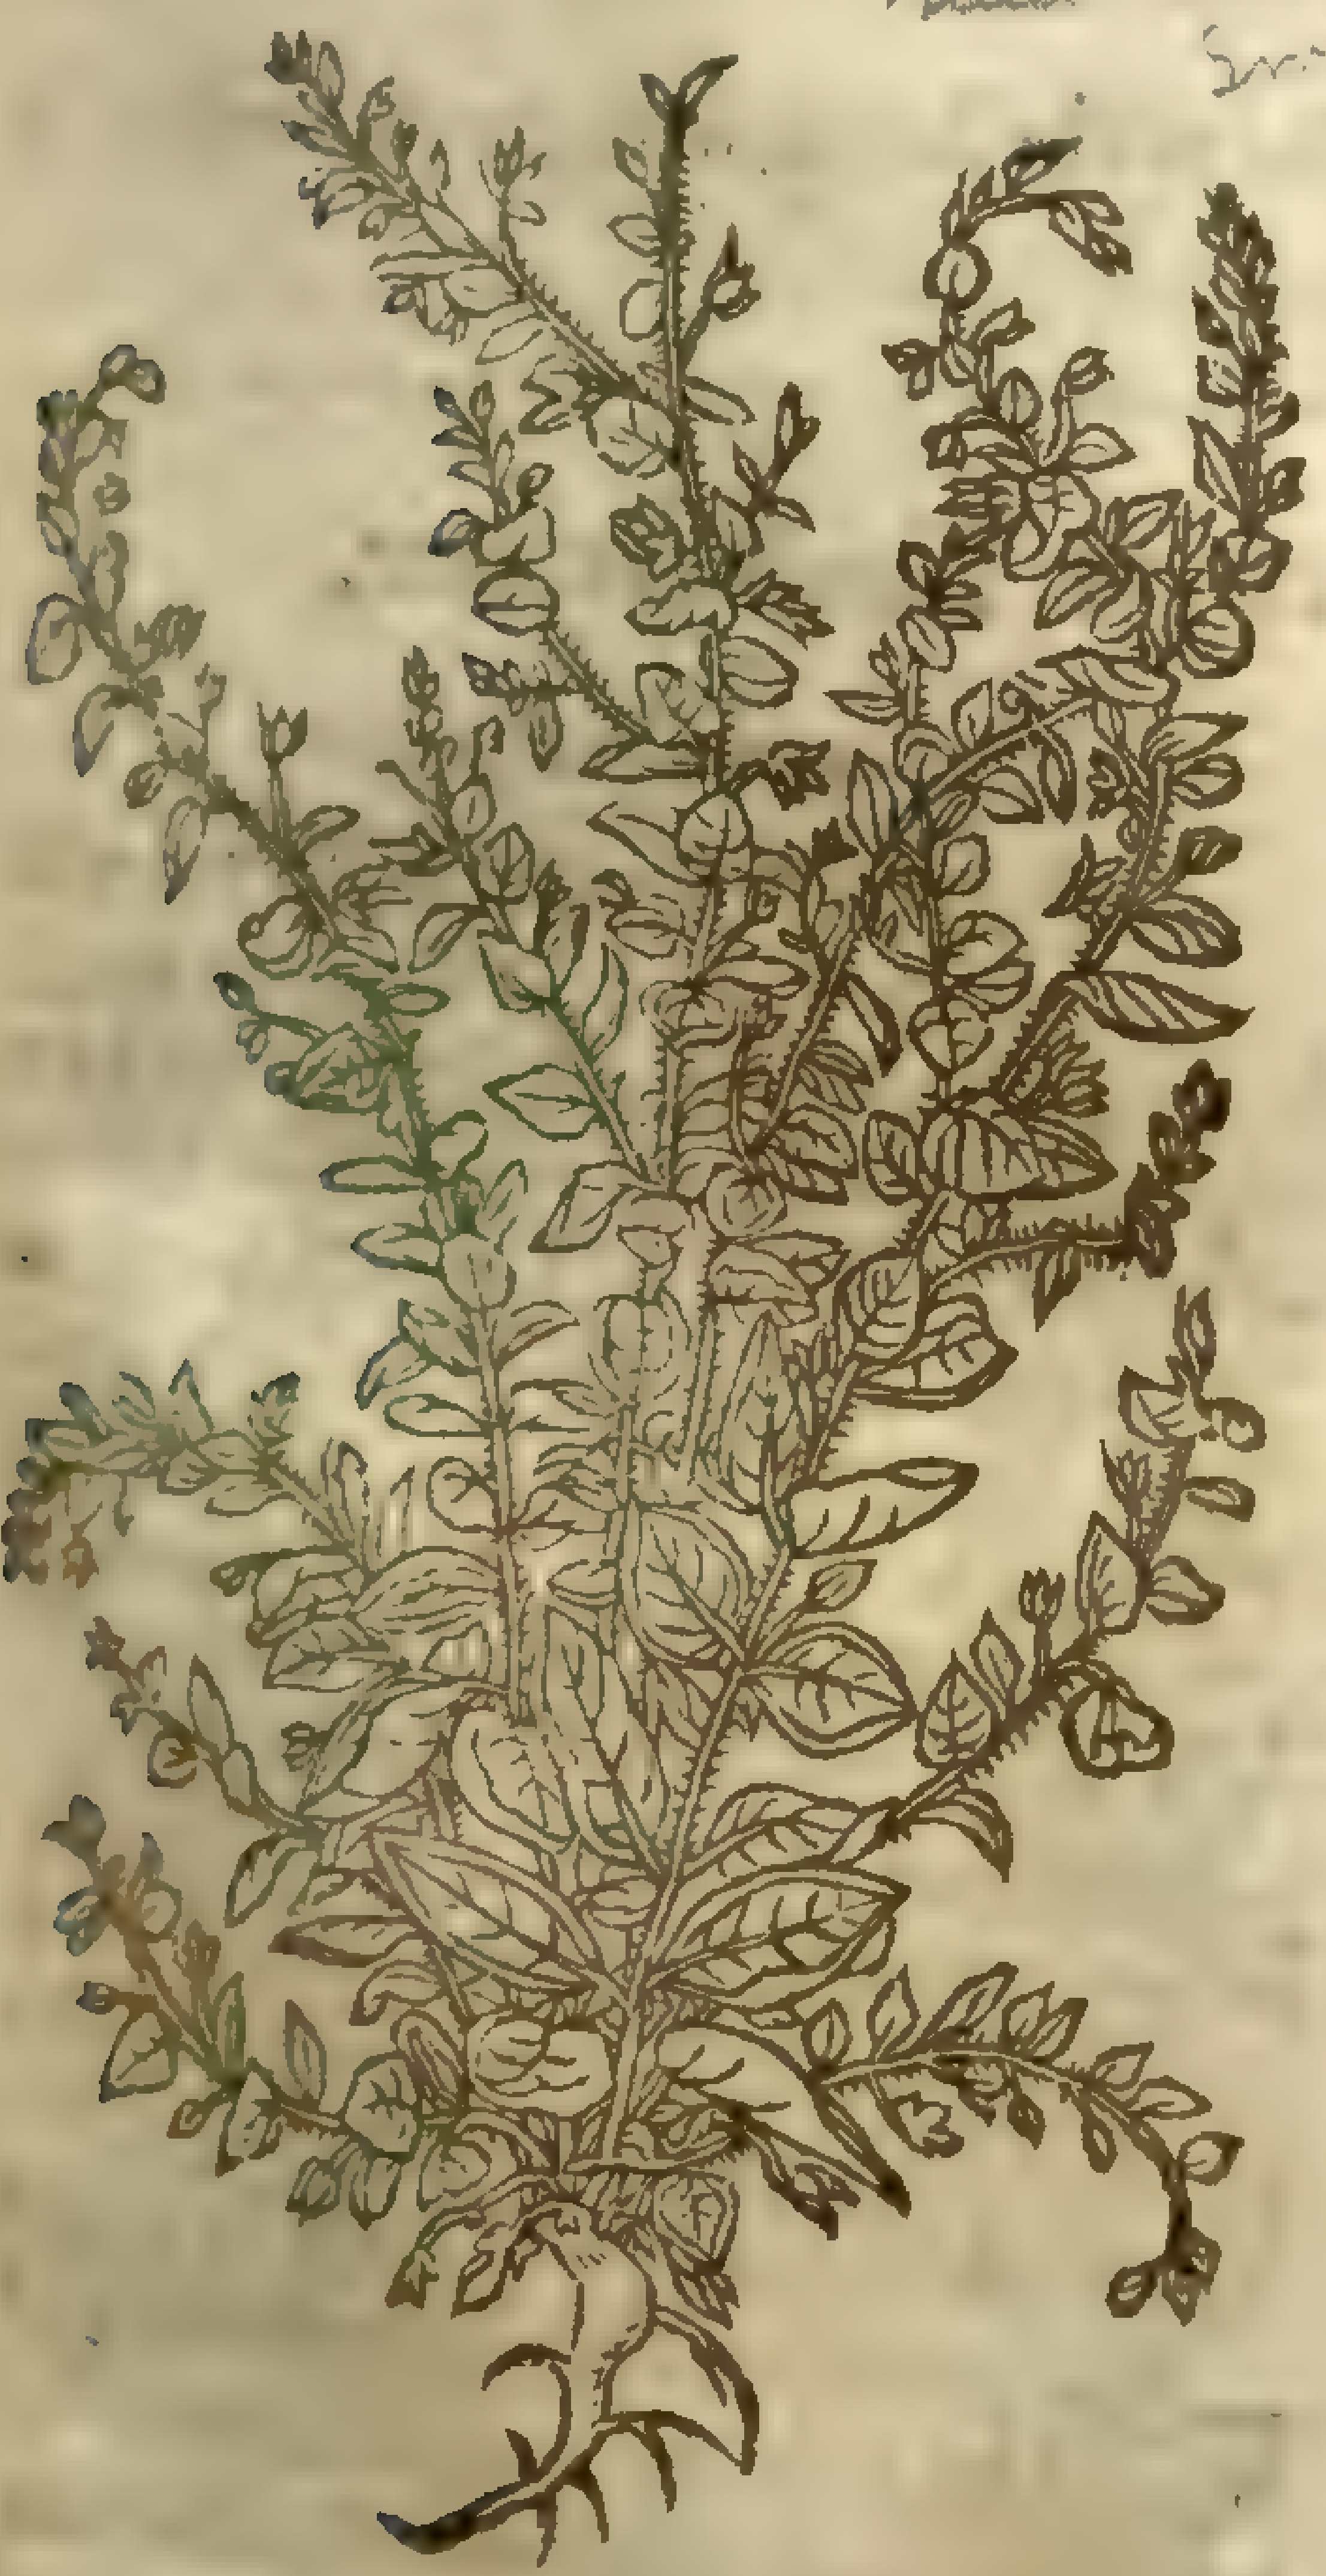
1 THe firſt kinde of *Elatine*, being of *Fuchſius* and *Matthiolus*, called *Veronica fœmina*, or the female Fluellen, ſhooteth from a ſmall and fibrous root many flexible and tender branches, diſperſed flat vpon the ground, ramping and creeping with leaues like *Nummularia*, but that the leaues of *Elatine* are of an hoarie, hairie, and ouerworne greene colour; among which come forth many ſmall floures, of a yellow colour mixed with a little purple, like vnto the ſmall Snapdragon, hauing a certaine taile or Spurre faſtened vnto euery ſuch floure, like the herbe called Larkes Spurre. The lower jaw or chap of the floure is of a purple colour, and the vpper jaw of a faire yellow; which being paſt, there ſucceeds a ſmall blacke ſeed contained in round huſks.

2 The ſecond kinde of *Elatine* hath ſtalkes, branches, floures, and roots, like the firſt: but the leaues are faſhioned like the former, but that they haue two little ears at the lower end, ſomewhat reſembling an arrow head, broad at the ſetting on: but the ſpur or taile of the floure is longer, and more purple mixed with the yellow in the floure.

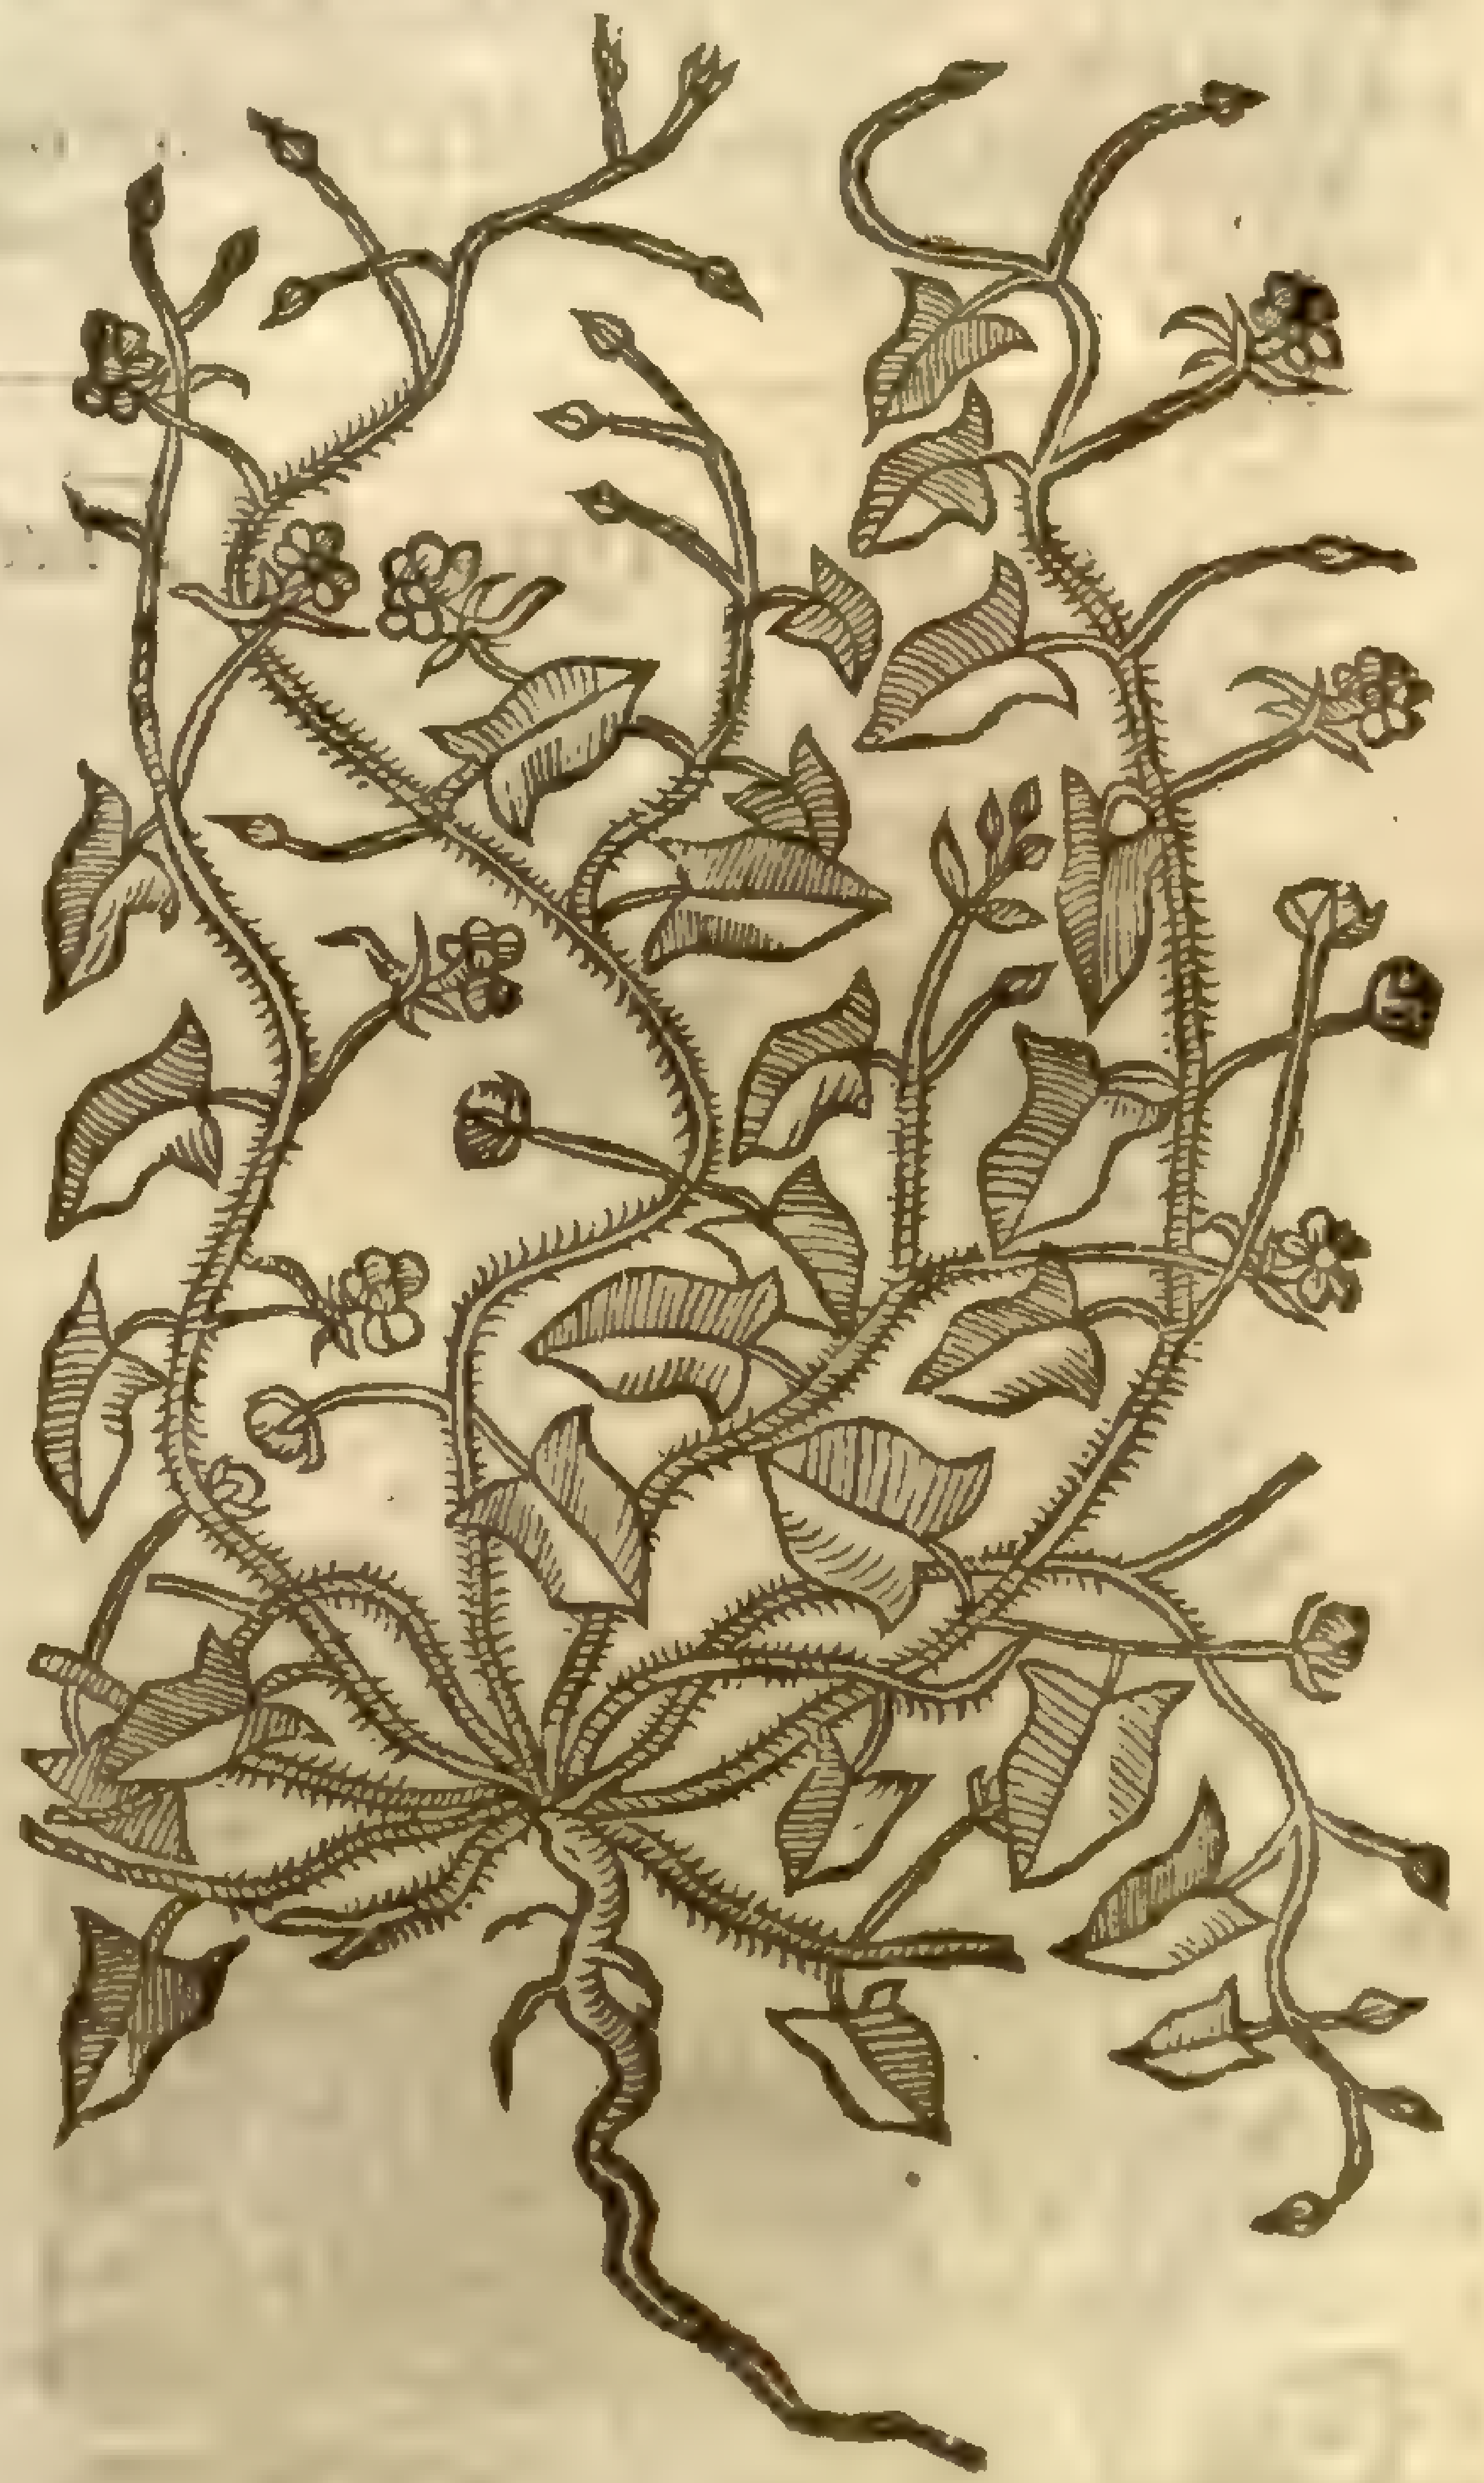
Antirrhinum elatine, & mas. dext. Sim. pl. 3. 132

1 *Veronica fœmina Fuchſij, ſiue Elatine.*
The Female Fluellen.

Antirrhinum spurium, & [illegible] dext. Sim. pl. 3. 132



2 *Elatine altera.*
Sharpe pointed Fluellen.



¶ *The Place.*

Both theſe plants I haue found in ſundry places where corne hath growne, eſpecially barley, as in the fields about Southfleet in Kent, where within ſix miles compaſſe there is not a field wherein it doth not grow.

Alſo it groweth in a field next vnto the houſe ſometime belonging to that honourable Gentleman Sir *Francis Walſingham*, at Barn-elmes, and in ſundry places of Eſſex; and in the next field vnto the Churchyard at Chiſwicke neere London, toward the midſt of the field.

¶ *The Time.*

They floure in Auguſt and September.

¶ *The Names.*

Their ſeuerall titles ſet forth their names as well in Latine as Engliſh.

¶ *The Nature and Vertues.*

A These plants are not onely of a ſingular aſtringent faculty, and thereby helpe them that be grieued with the Dyſentery and hot ſwelling; but of ſuch ſingular efficacy to heale ſpreading and eating cankers, and coroſiue vlcers, that their vertue in a manner paſſeth all credit in theſe fretting ſores, vpon ſure proofe done vnto ſundry perſons, and eſpecially vpon a man whom *Pena* reporteth to haue his noſe eaten moſt grieuouſly with a canker or eating ſore, who ſent for the Phyſitions and Chirurgions that were famouſly knowne to be the beſt, and they with one conſent concluded to cut the ſaid noſe off, to preſerue the reſt of his face: among theſe Surgeons and Phyſitions came a poore ſorie Barber, who had no more skill than he had learned by tradition, and yet vndertooke to cure the patient. This foreſaid Barbar ſtanding in the company and hearing their determination, deſired that he might make triall of an herbe which he had ſeene his Mr. vſe for the ſame purpoſe, which herbe *Elatine*, though he were ignorant of the name whereby it was called, yet he knew where to fetch it. To be ſhort, this herbe he ſtamped, and gaue the juyce of it vnto the patient to drinke, and outwardly applied the ſame plaiſterwiſe, and in very ſhort ſpace perfectly cured the man, and ſtaied the reſt of his body from further corruption, which was ready to fall into a leproſie, *Aduerſ. pag.* 197.

B *Elatine* helpeth the inflammation of the eies, and defendeth humors flowing vnto them, being boiled and as a pultus applied thereto.

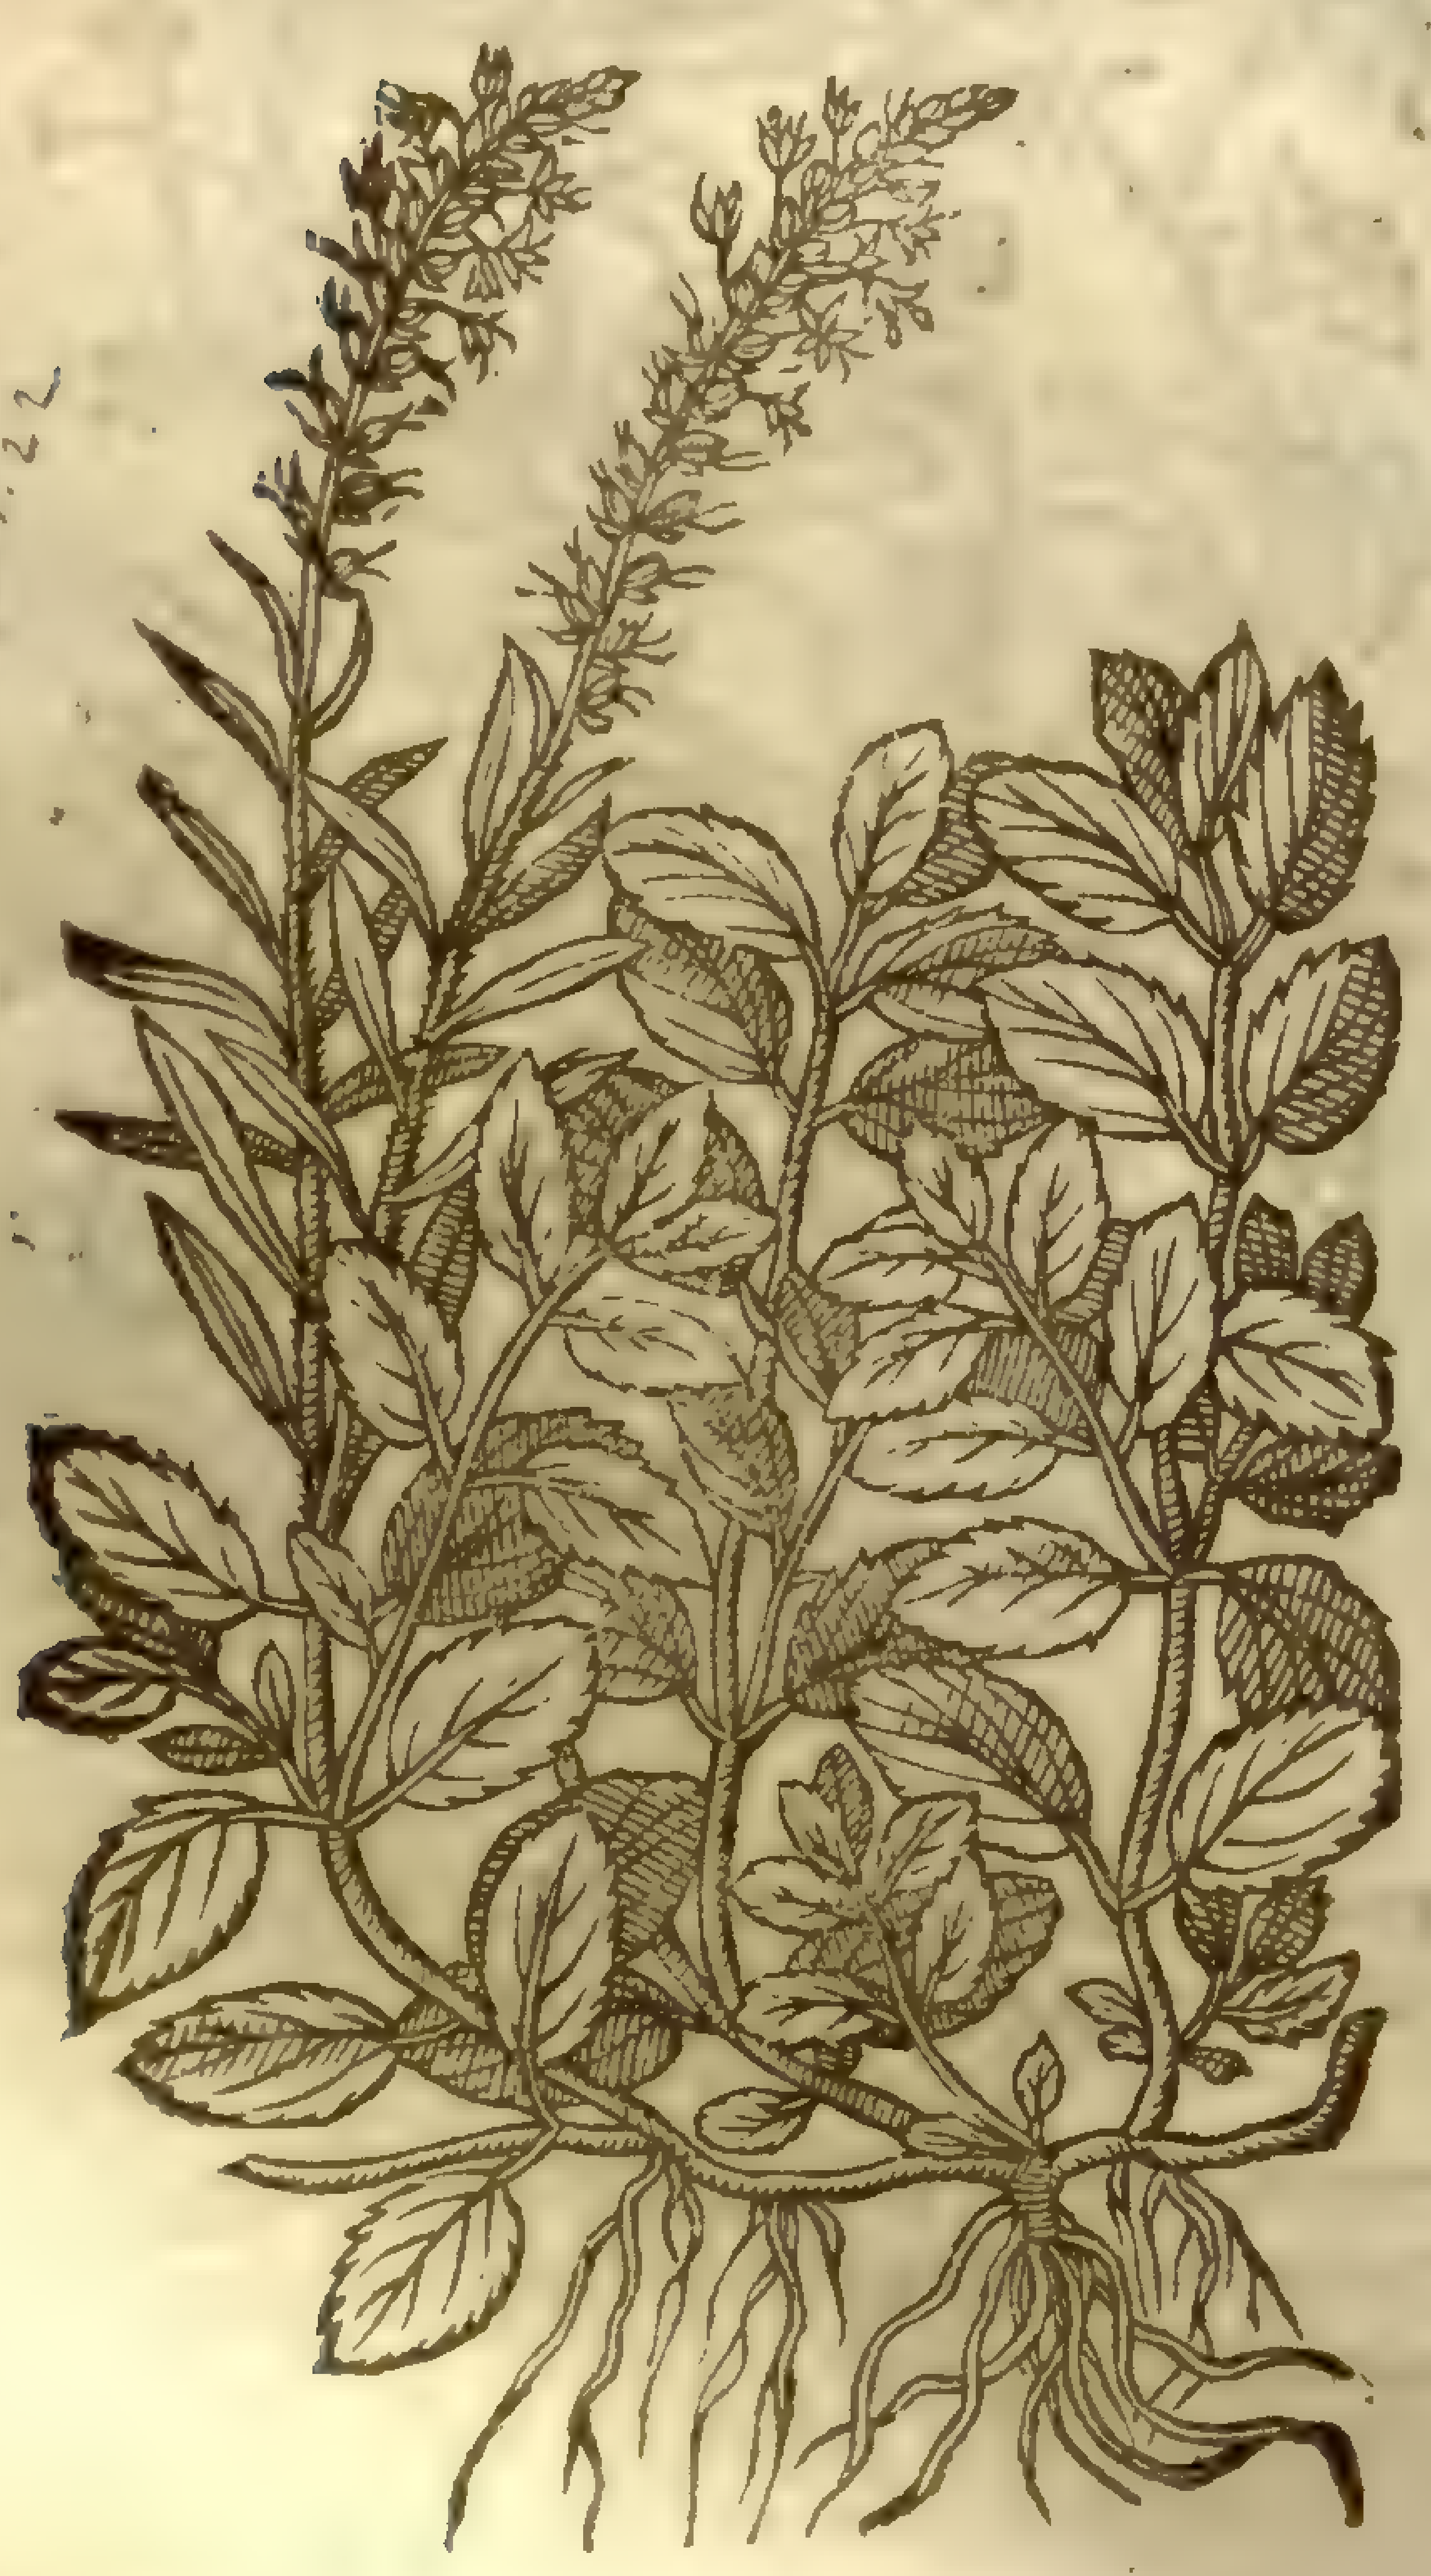
C The leaues ſodden in the broth of a hen, or Veale, ſtay the dyſentery.

D The new writers affirme, that the female Fluellen openeth the obſtructions or ſtoppings of the liuer and ſpleene, prouoketh vrine, driueth forth ſtones, and clenſeth the kidnies and bladder, according to *Paulus*.

E The weight of a dram or of a French crowne, of the pouder of the herbe, with the like weight of treacle, is commended againſt peſtilent Feuers.

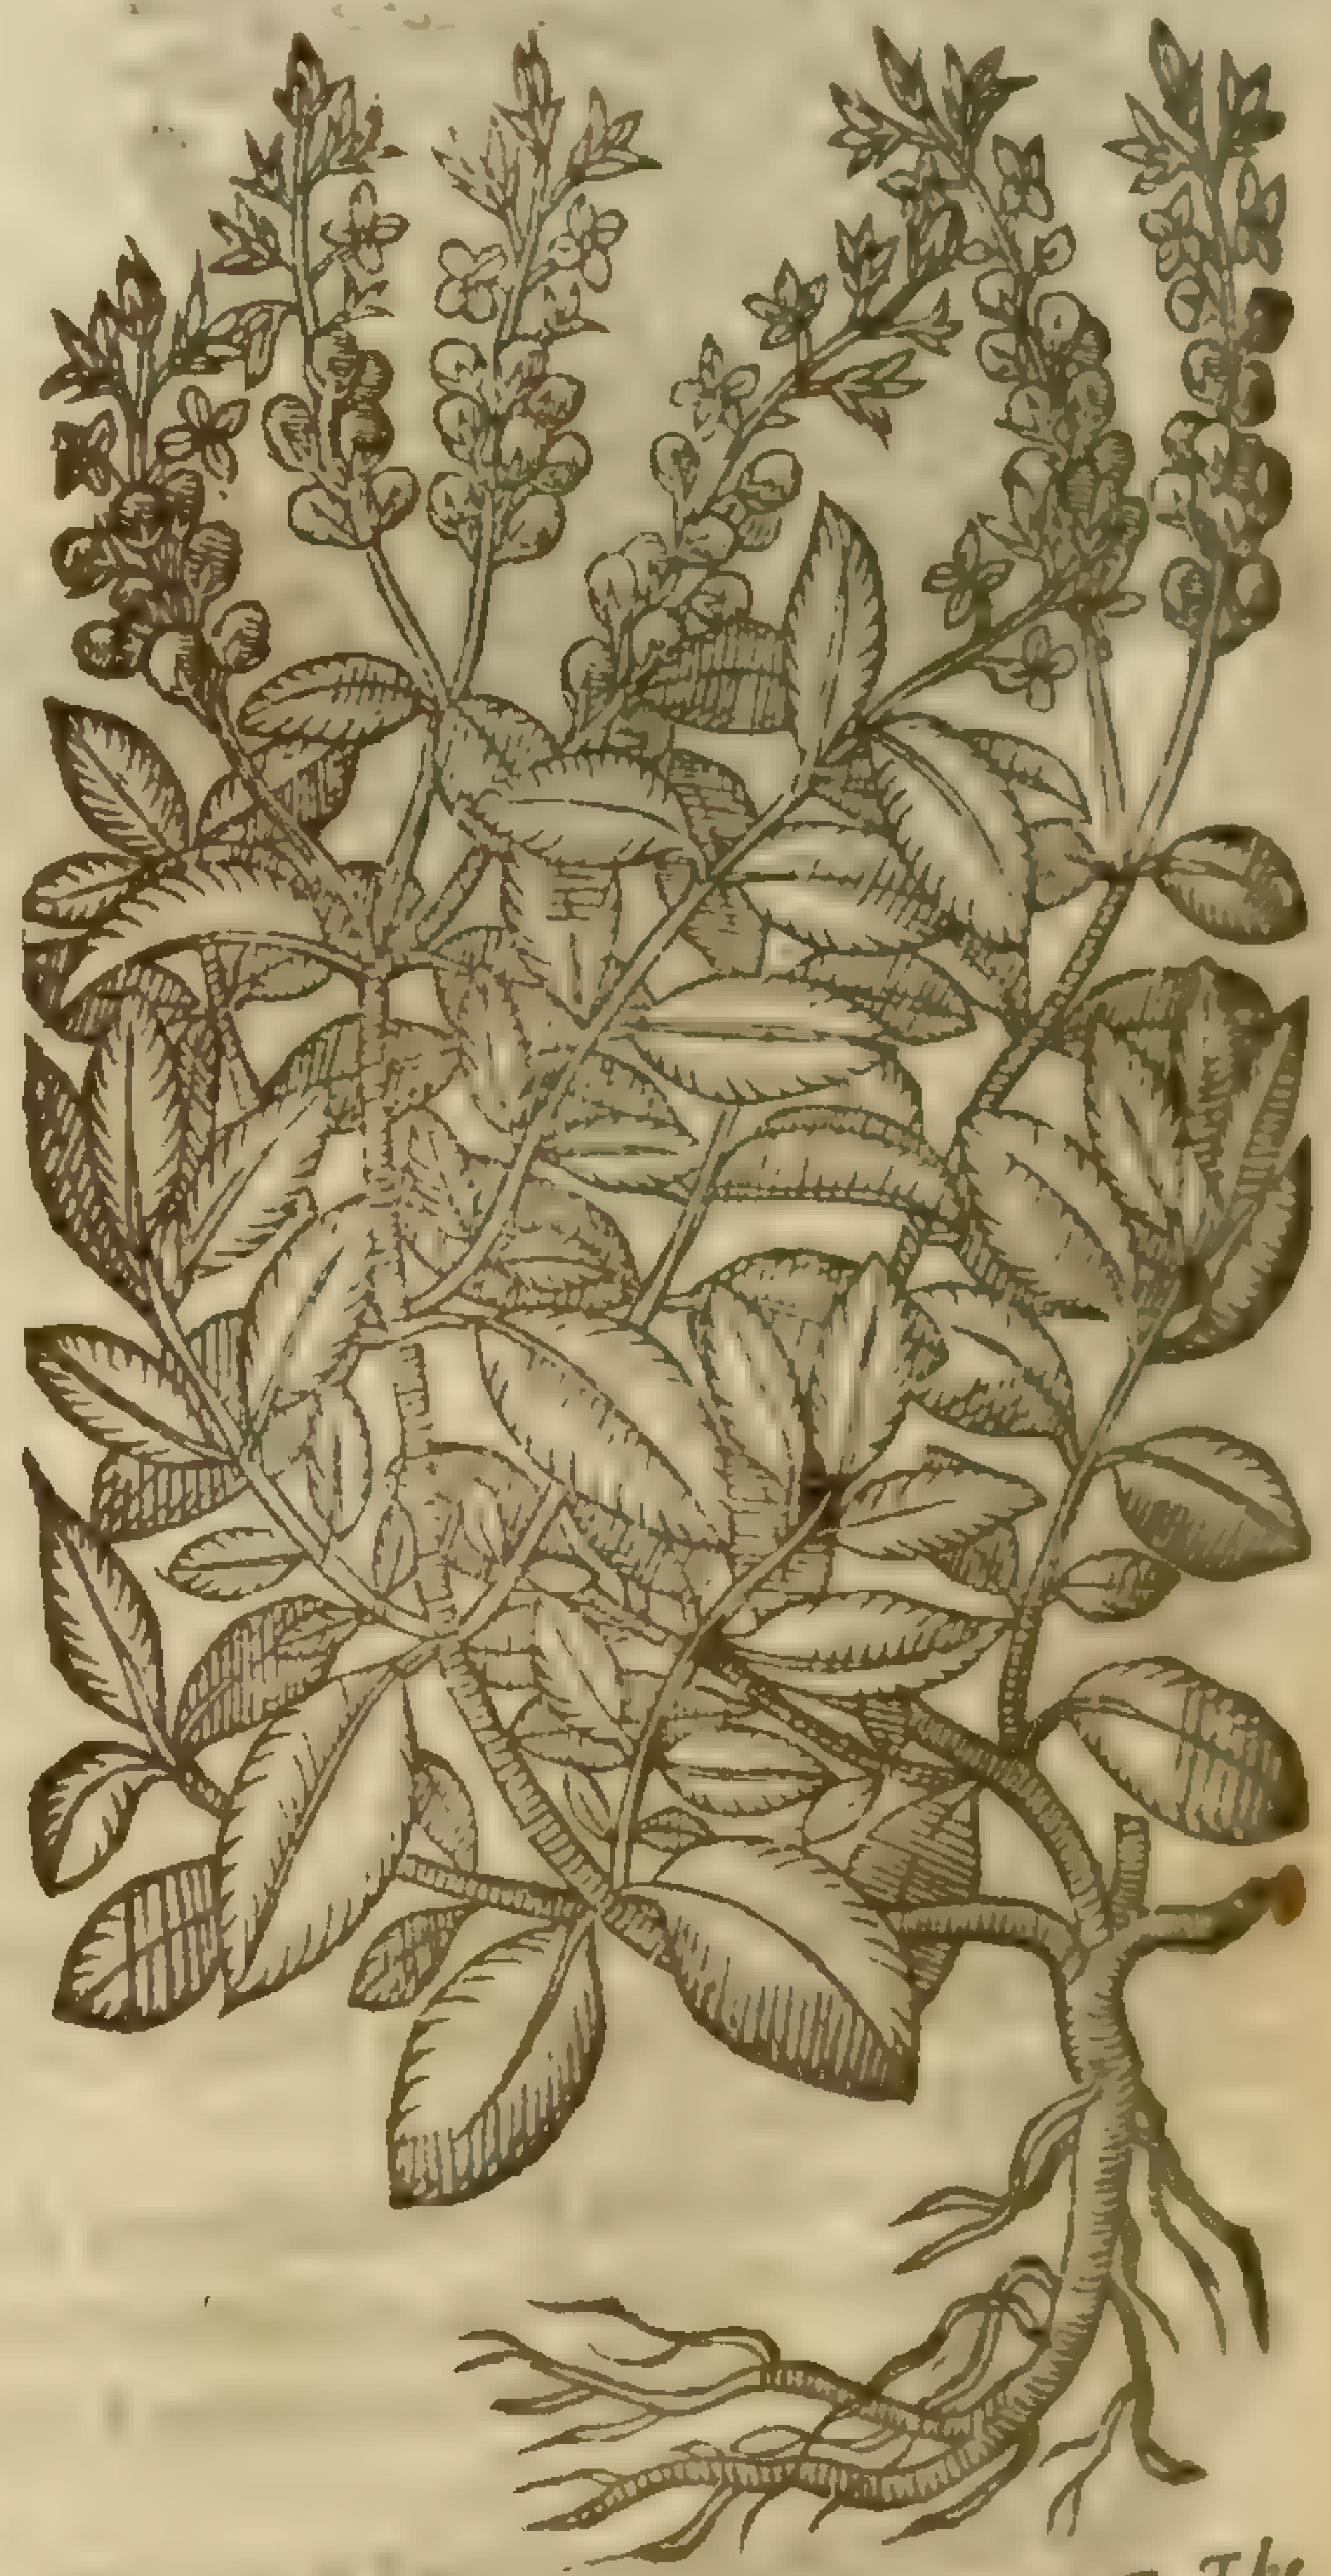
Chap. 199. *Of Fluellen the male, or Pauls Betonie.*

1 *Veronica vera & major.*
Fluellen, or Speedwell.



V. officinalis,
With. Bot.
Sm. Fl. 1.22

† 2 *Veronica recta mas.*
The male Speedwell.



¶ The

¶ *The Deſcription.*

1 THe firſt kind of *Veronica* is a ſmal herbe, and creepeth by the ground, with little reddiſh and hairy branches. The leafe is ſomething round and hairy, indented or ſnipped round about the edges. The floures are of a light blew colour, declining to purple: the ſeed is contained in little flat pouches: the root is fibrous and hairy.

† 2 The ſecond doth alſo creepe vpon the ground, hauing long ſlender ſtemmes, ſome foot high, and ſomewhat large leaues a little hairy, and pleaſantly ſoft. The floures be blew like as thoſe of the former, but ſomewhat bigger, and of a brighter colour; and they are alſo ſucceeded by round ſeed veſſels.

3 The third kinde of *Veronica*, creepeth with branches and leaues like vnto *Serpillum*, for which cauſe it hath been called *Veronica Serpillifolia.* The floures grow along the ſmall and tender branches, of a whitiſh colour declining to blewneſſe. The root is ſmall and threddy, taking hold vpon the vpper face of the earth, where it ſpreadeth. The ſeed is contained it ſmall pouches like the former.

4 The fourth hath a root ſomewhat wooddy, from the which riſe vp leaues like vnto the former. The ſmall vpright ſtalke is beſet with the like leaues, but leſſer; at the top whereof commeth forth a ſlender ſpike cloſely thruſt together, and full of blewiſh floures, which are ſucceeded by many horned ſeed veſſels.

‡ 5 This hath many wooddy round ſmooth branches, ſome handfull and halfe high or better: the leaues are like thoſe of wilde Tyme, but longer, and of a blacker colour, ſometimes lightly ſnipt: at the tops of the branches grow floures of a whitiſh blew colour, conſiſting of foure, fiue, or elſe ſix little leaues a piece; which falling, there follow round ſeed veſſels, containing a round ſmall and blacke ſeed. It floures in Auguſt, and growes vpon cold and high mountaines, as the Alpes. *Pona* cals this *Veronica Alpina minima Serpilli folio:* and *Cluſius* hath it by the name of *Veronica fruticans.* ‡

2 *Veronica minor.*
Little Fluellen.

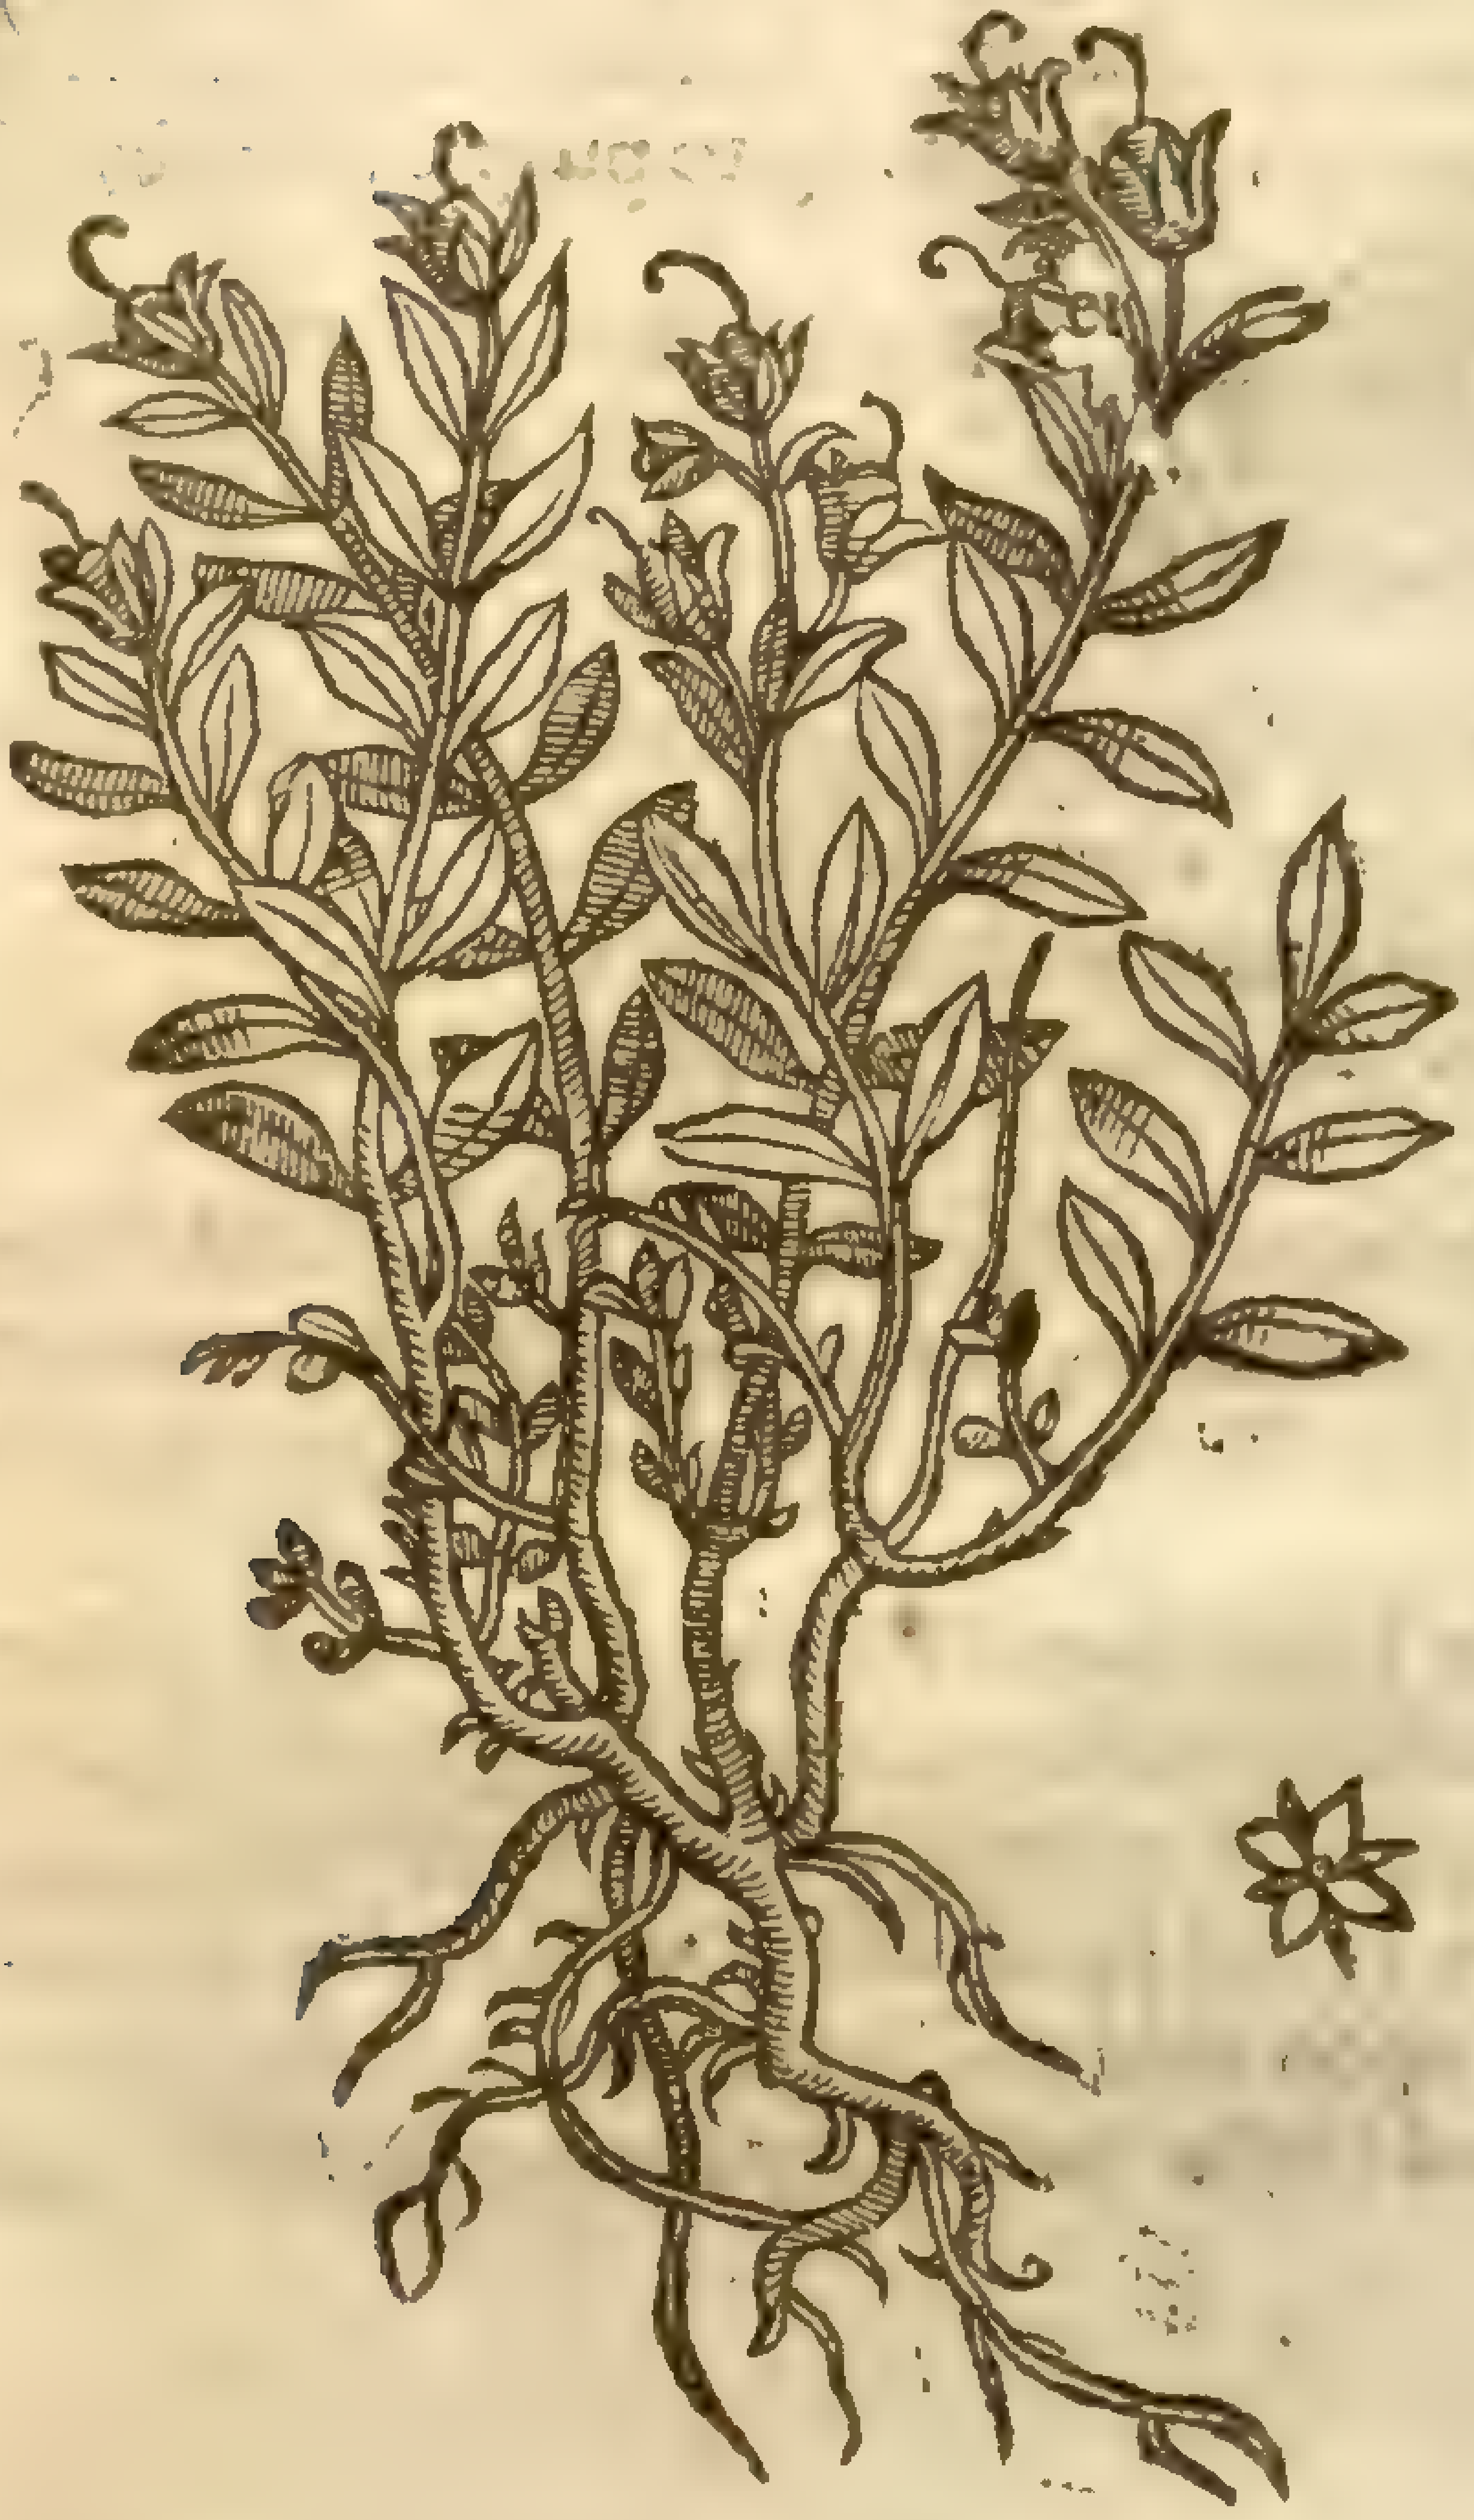
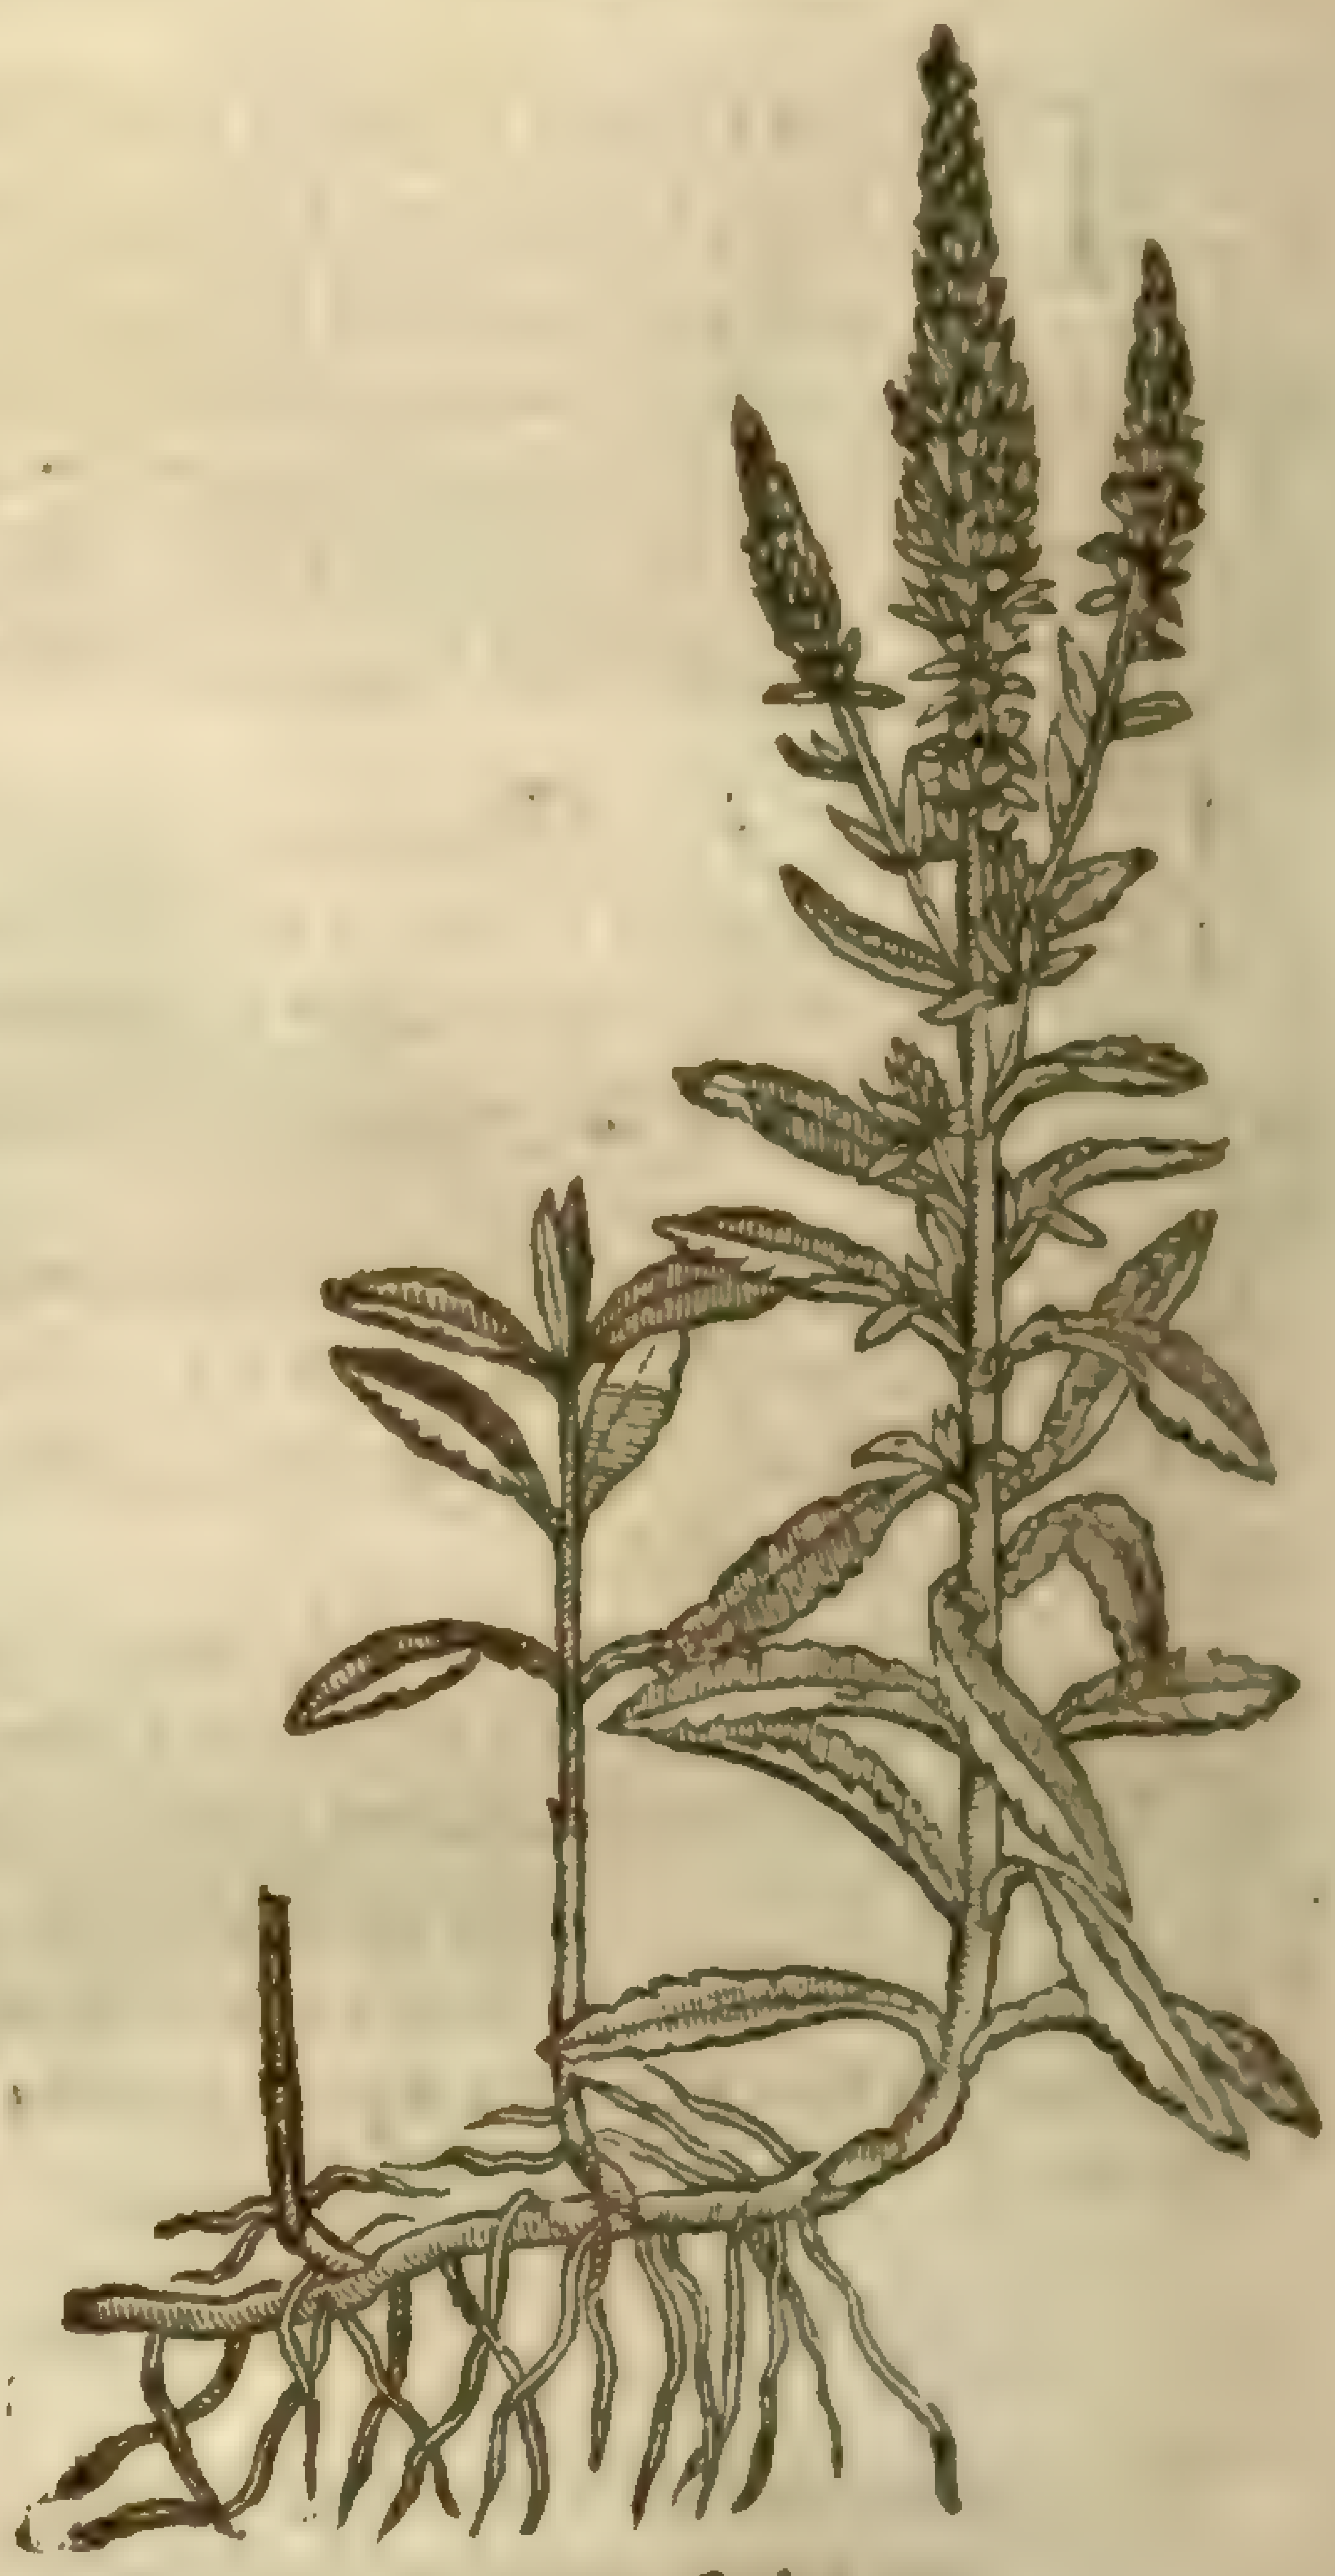
‡ 5 *Veronica fruticans Serpillifolia.*
Shrubby Fluellen.

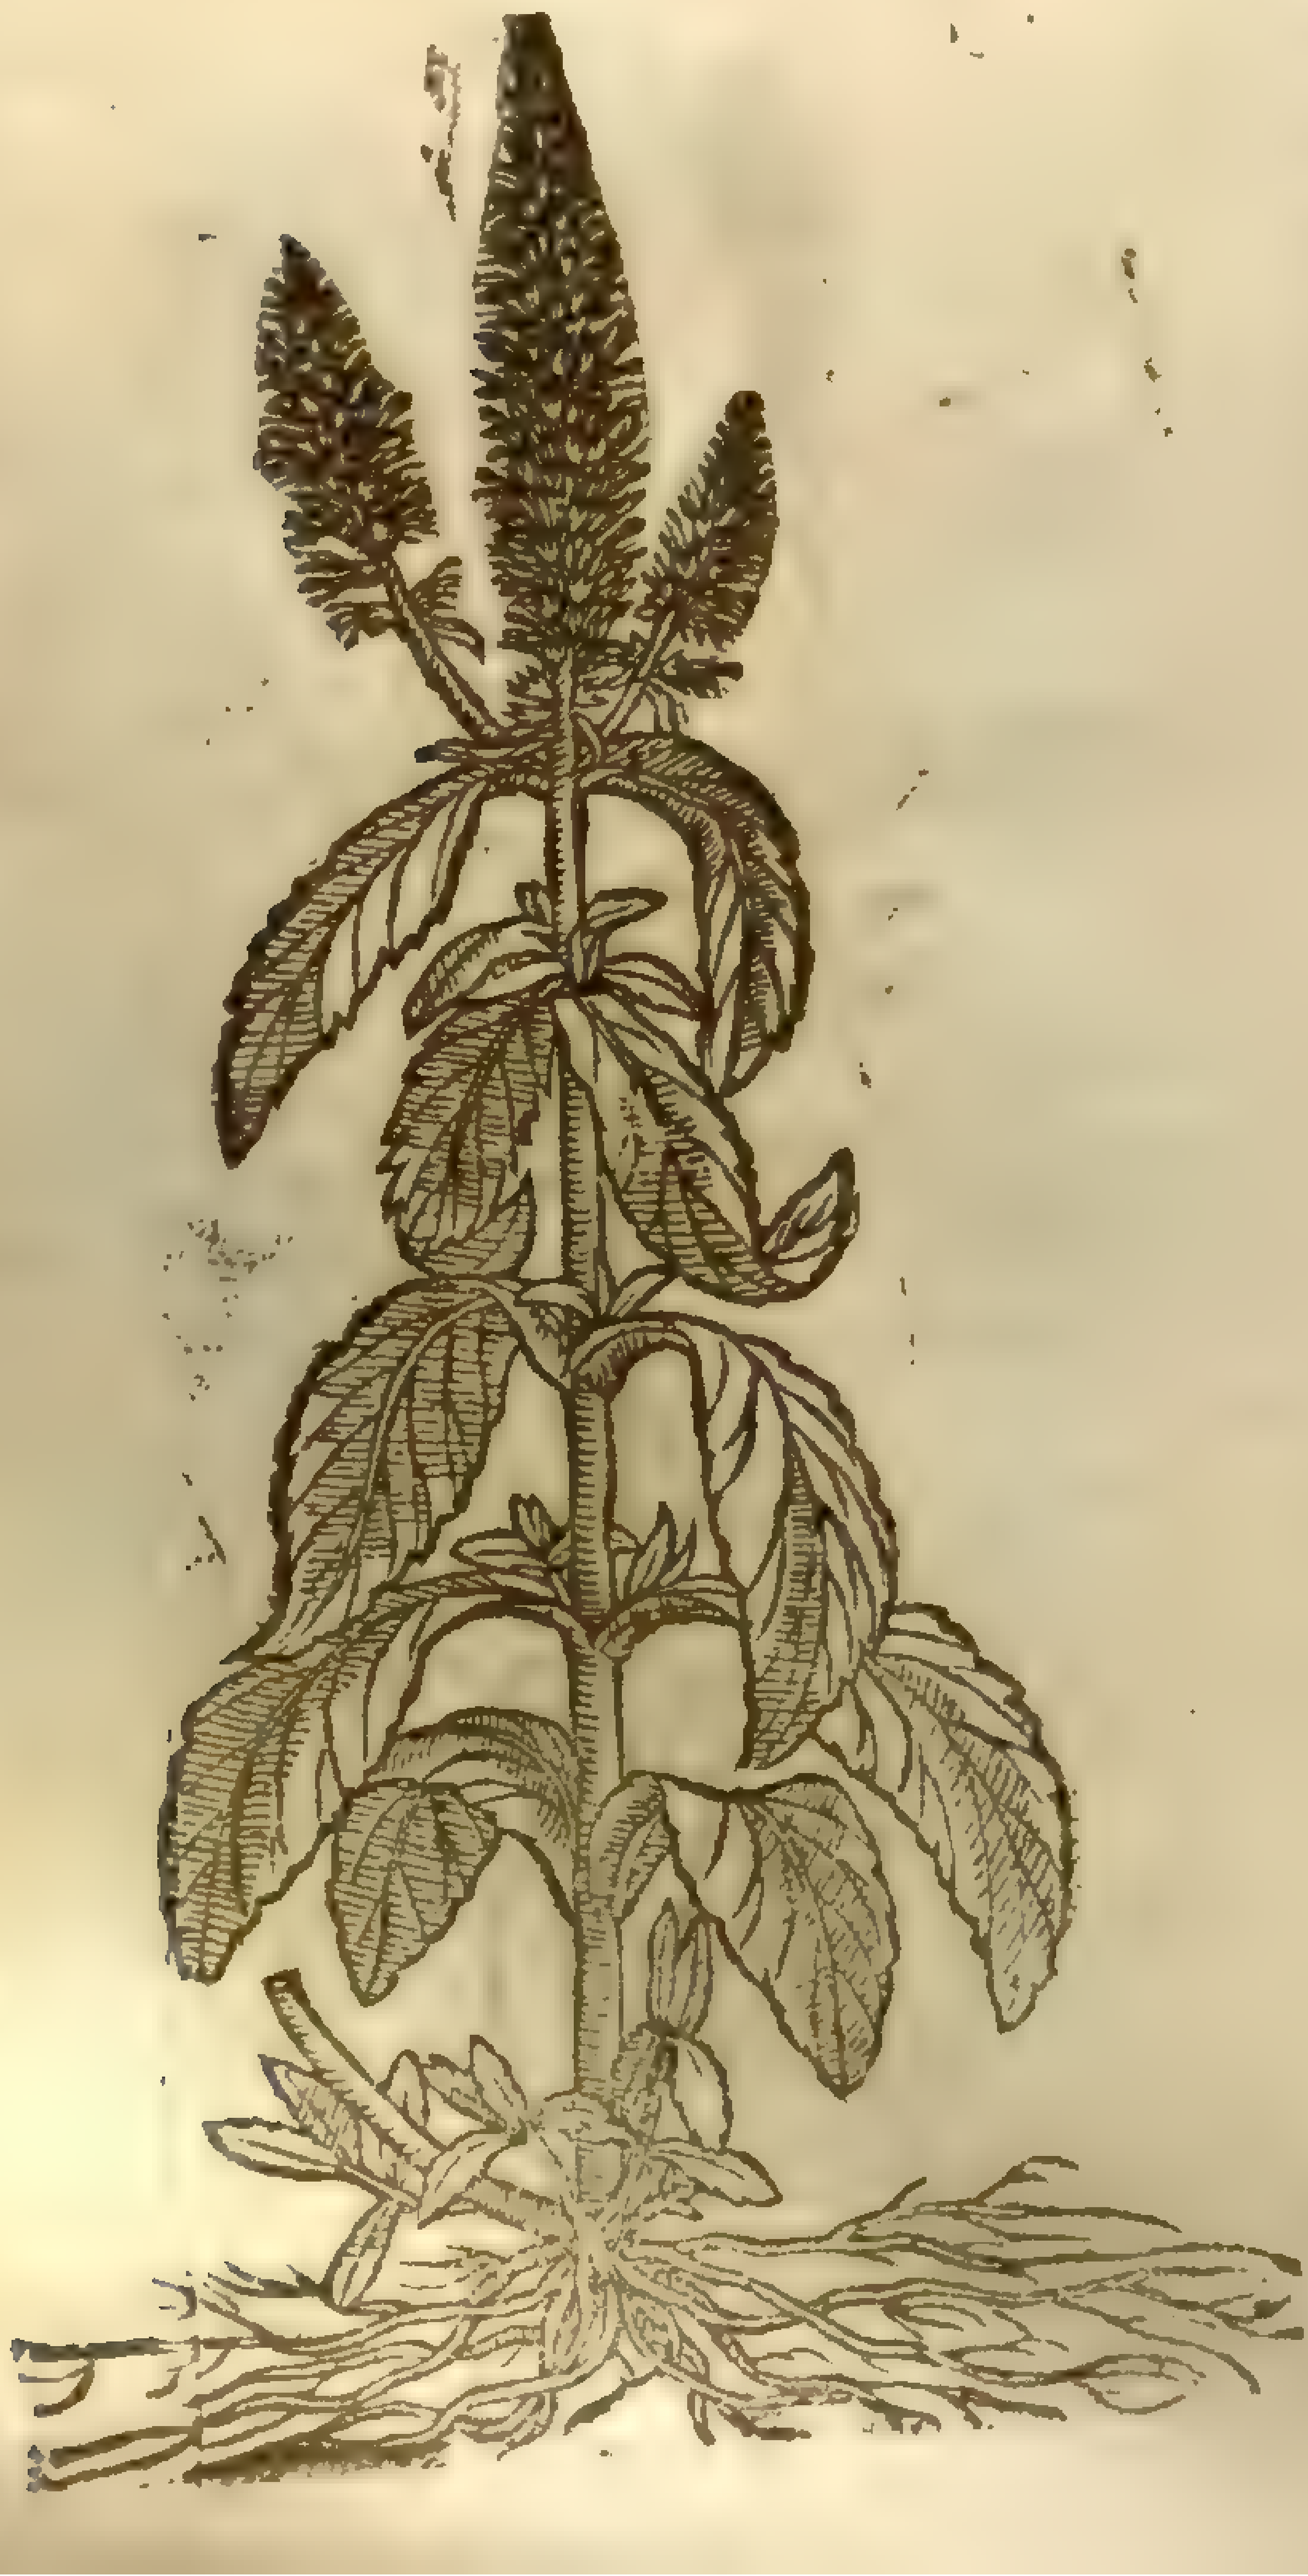


6 *Veronica aſſurgens, ſive Spicata.*
Tree Fluellen.

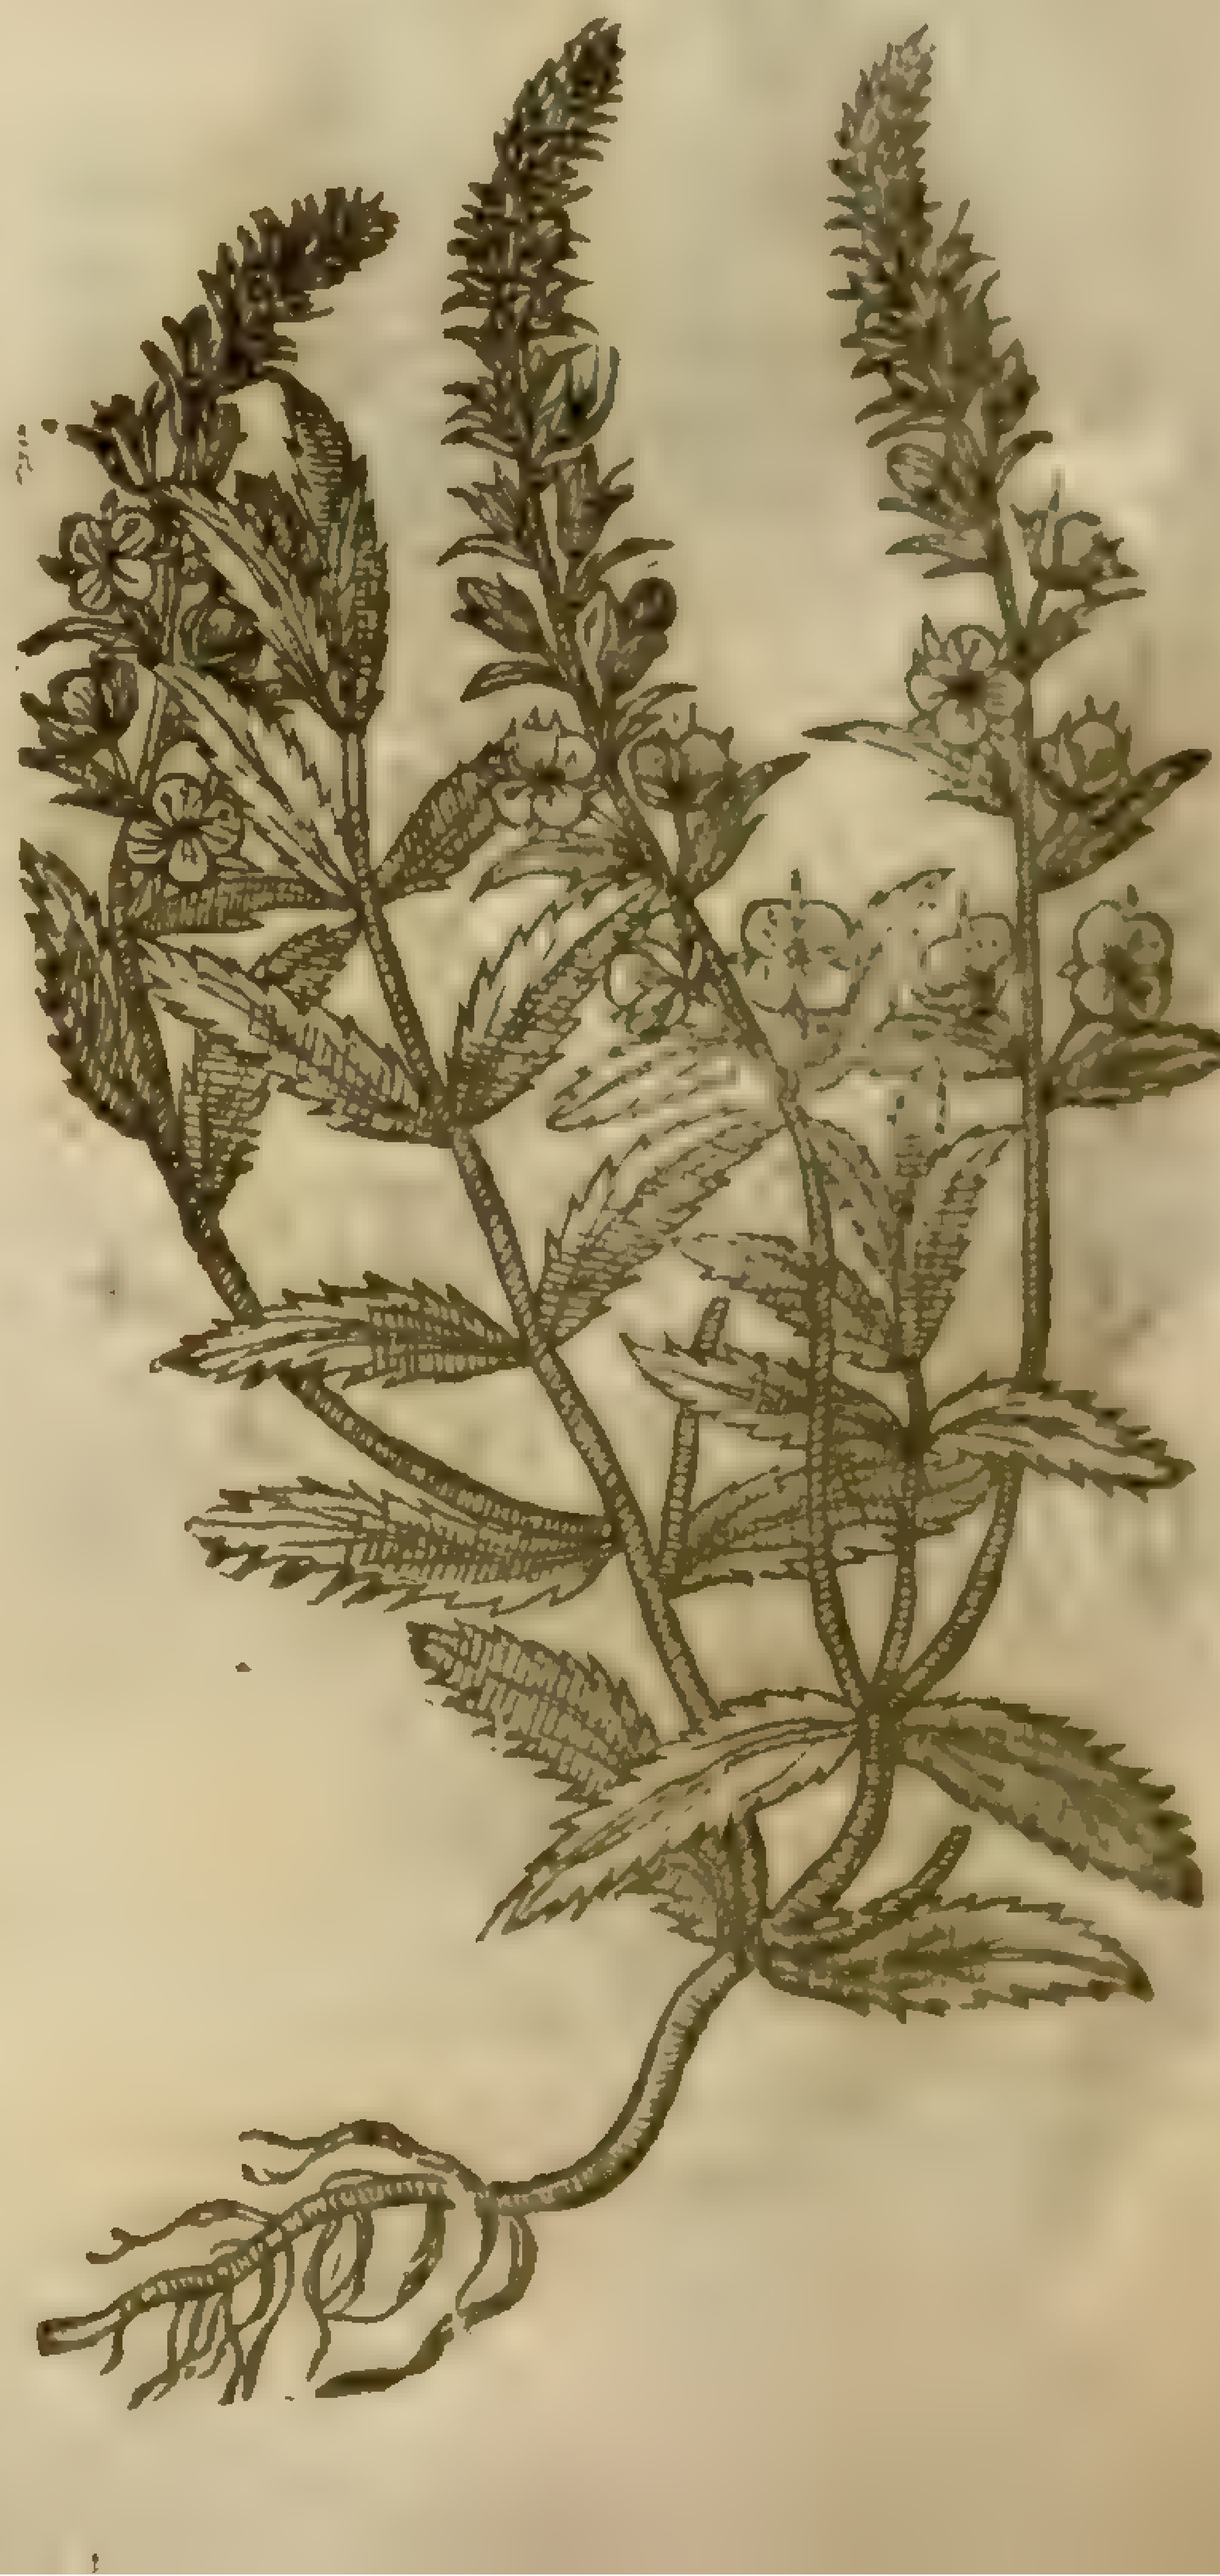


V. longifolia, L.
mihi dict.

† 7 *Veronica ſpicata latifolia.*
Vpright Fluellen.



‡ 8 *Veronica ſupina.*
Leaning Fluellen.



6 The ſixt kinde of *Veronica* hath many vpright branches a foot high and ſomtimes more, diuiding themſelues into ſundry other ſmall twigs; at the tops whereof grow faire ſpiky tufts, bearing bright and ſhining blew floures. The leaues are ſomewhat long, indented about the edges like a ſaw: the root is compact of many threds, or ſtrings.

‡ 7 This hath ſtalkes ſome cubit high and ſometimes more, and theſe not very full of branches, yet hauing diuers joints, at each whereof do grow forth two leaues, two or three inches long, and one broad, and theſe leaues are alſo thicke, ſmooth, and ſhining, lightly ſnipt or cut about the edges, and of a very aſtringent and drying taſt, and at laſt ſomwhat biting. At the top of the ſtalkes grow ſpokie tufts or blew floures like thoſe of the laſt mentioned, but of ſomwhat a lighter color, and they begin firſt to floure or ſhew themſelues below, and ſo go vpwards; the ſeed, which is ſmal and blacke, is contained in flat ſeed veſſells: the root is thicke with many fibres, euery yeare thruſting vp new ſhoots. There is a variety of this with the leaues not ſo black and ſhining, but hauing more branches; and another which hath a longer ſpike or tuft of floures. *Cluſius* calls this *Veronica maior latifolia.* ‡

8 The eighth hauing his ſtalks leaning vpon the ground, looketh with his face vpright, hauing ſundry flexible branches, ſet with leaues like vnto wilde Germander by couples, one right againſt another, deepely jagged about the edges, in reſpect of the other before mentioned. The floures are of a blew colour: the root is long, with ſome threds appendant thereto.

¶ *The Place.*

Veronica groweth vpon bankes, borders of fields, and graſſie mole-hils, in ſandy grounds, and in woods, almoſt euery where.

The fourth kinde, my good friend Mr. *Stephen Bredwell*, practitioner in phyſick, found and ſhewed it me in the cloſe next adjoining to the houſe of Mr. *Bele*, chiefe of the Clerkes of her Majeſties Counſell, dwelling at Barns neere London. The ſixth is a ſtranger in England, but I haue it growing in my garden.

¶ *The Time.*

Theſe floure from May to September.

¶ *The Names.*

† Theſe plants are comprehended vnder this generall name *Veronica*; and *Dodonæus* would haue the firſt of them to be the *Betonica* of *Paulus Ægineta*; and *Turner* and *Geſner* the third: wee doe call them in Engliſh, Pauls Betonie, or Speedwell: in Welch it is called Fluellen, and the Welch people attribute great vertues to the ſame: in high Dutch, **Grundheill**: in low Dutch, **Eeren prijs**, that is to ſay, honor and praiſe.

¶ *The Temperature.*

Theſe are of a meane temperature, betweene heat and drineſſe.

¶ *The Vertues.*

The decoction of *Veroneca* drunke, ſodereth and healeth all freſh and old wounds, cleanſeth the bloud from all corruption, and is good to be drunke for the kidneies, and againſt ſcuruineſſe and foule ſpredding tettars, and conſuming and fretting ſores, the ſmall pox and meaſels. A

The water of *Veronica* diſtilled with wine, and re-diſtilled ſo often till the liquor wax of a reddiſh colour, preuaileth againſt the old cough, the drineſſe of the lungs, and all vlcers and inflammation of the ſame. B

The ſecond and third were both figures of that deſcribed in the third place: and thoſe that were formerly in the fifth and ſixth places, were alſo of the ſame plant: to wit that which is here deſcribed in the ſixth place and which was formerly in the fifth.

Chap. 199. *Of Herbe Two-pence.*

¶ *The Deſcription.*

1 Herbe Two-pence hath a ſmal and tender root, ſpreding and diſperſing it ſelfe far within the ground, from which riſe vp many little, tender, flexible ſtalks trailing vpon the ground, ſet by couples at certaine ſpaces, with ſmooth greene leaues ſomewhat round, whereof it tooke his name: from the boſome of which leaues ſhoot forth ſmall tender foot-ſtalks, whereon do grow little yellow floures, like thoſe of Cinkefoile or Tormentill.

2 There is a kinde of Money-woort or herbe Two-pence, like the other of his kind in each reſpect, ſauing it is altogether leſſer, wherein they differ.

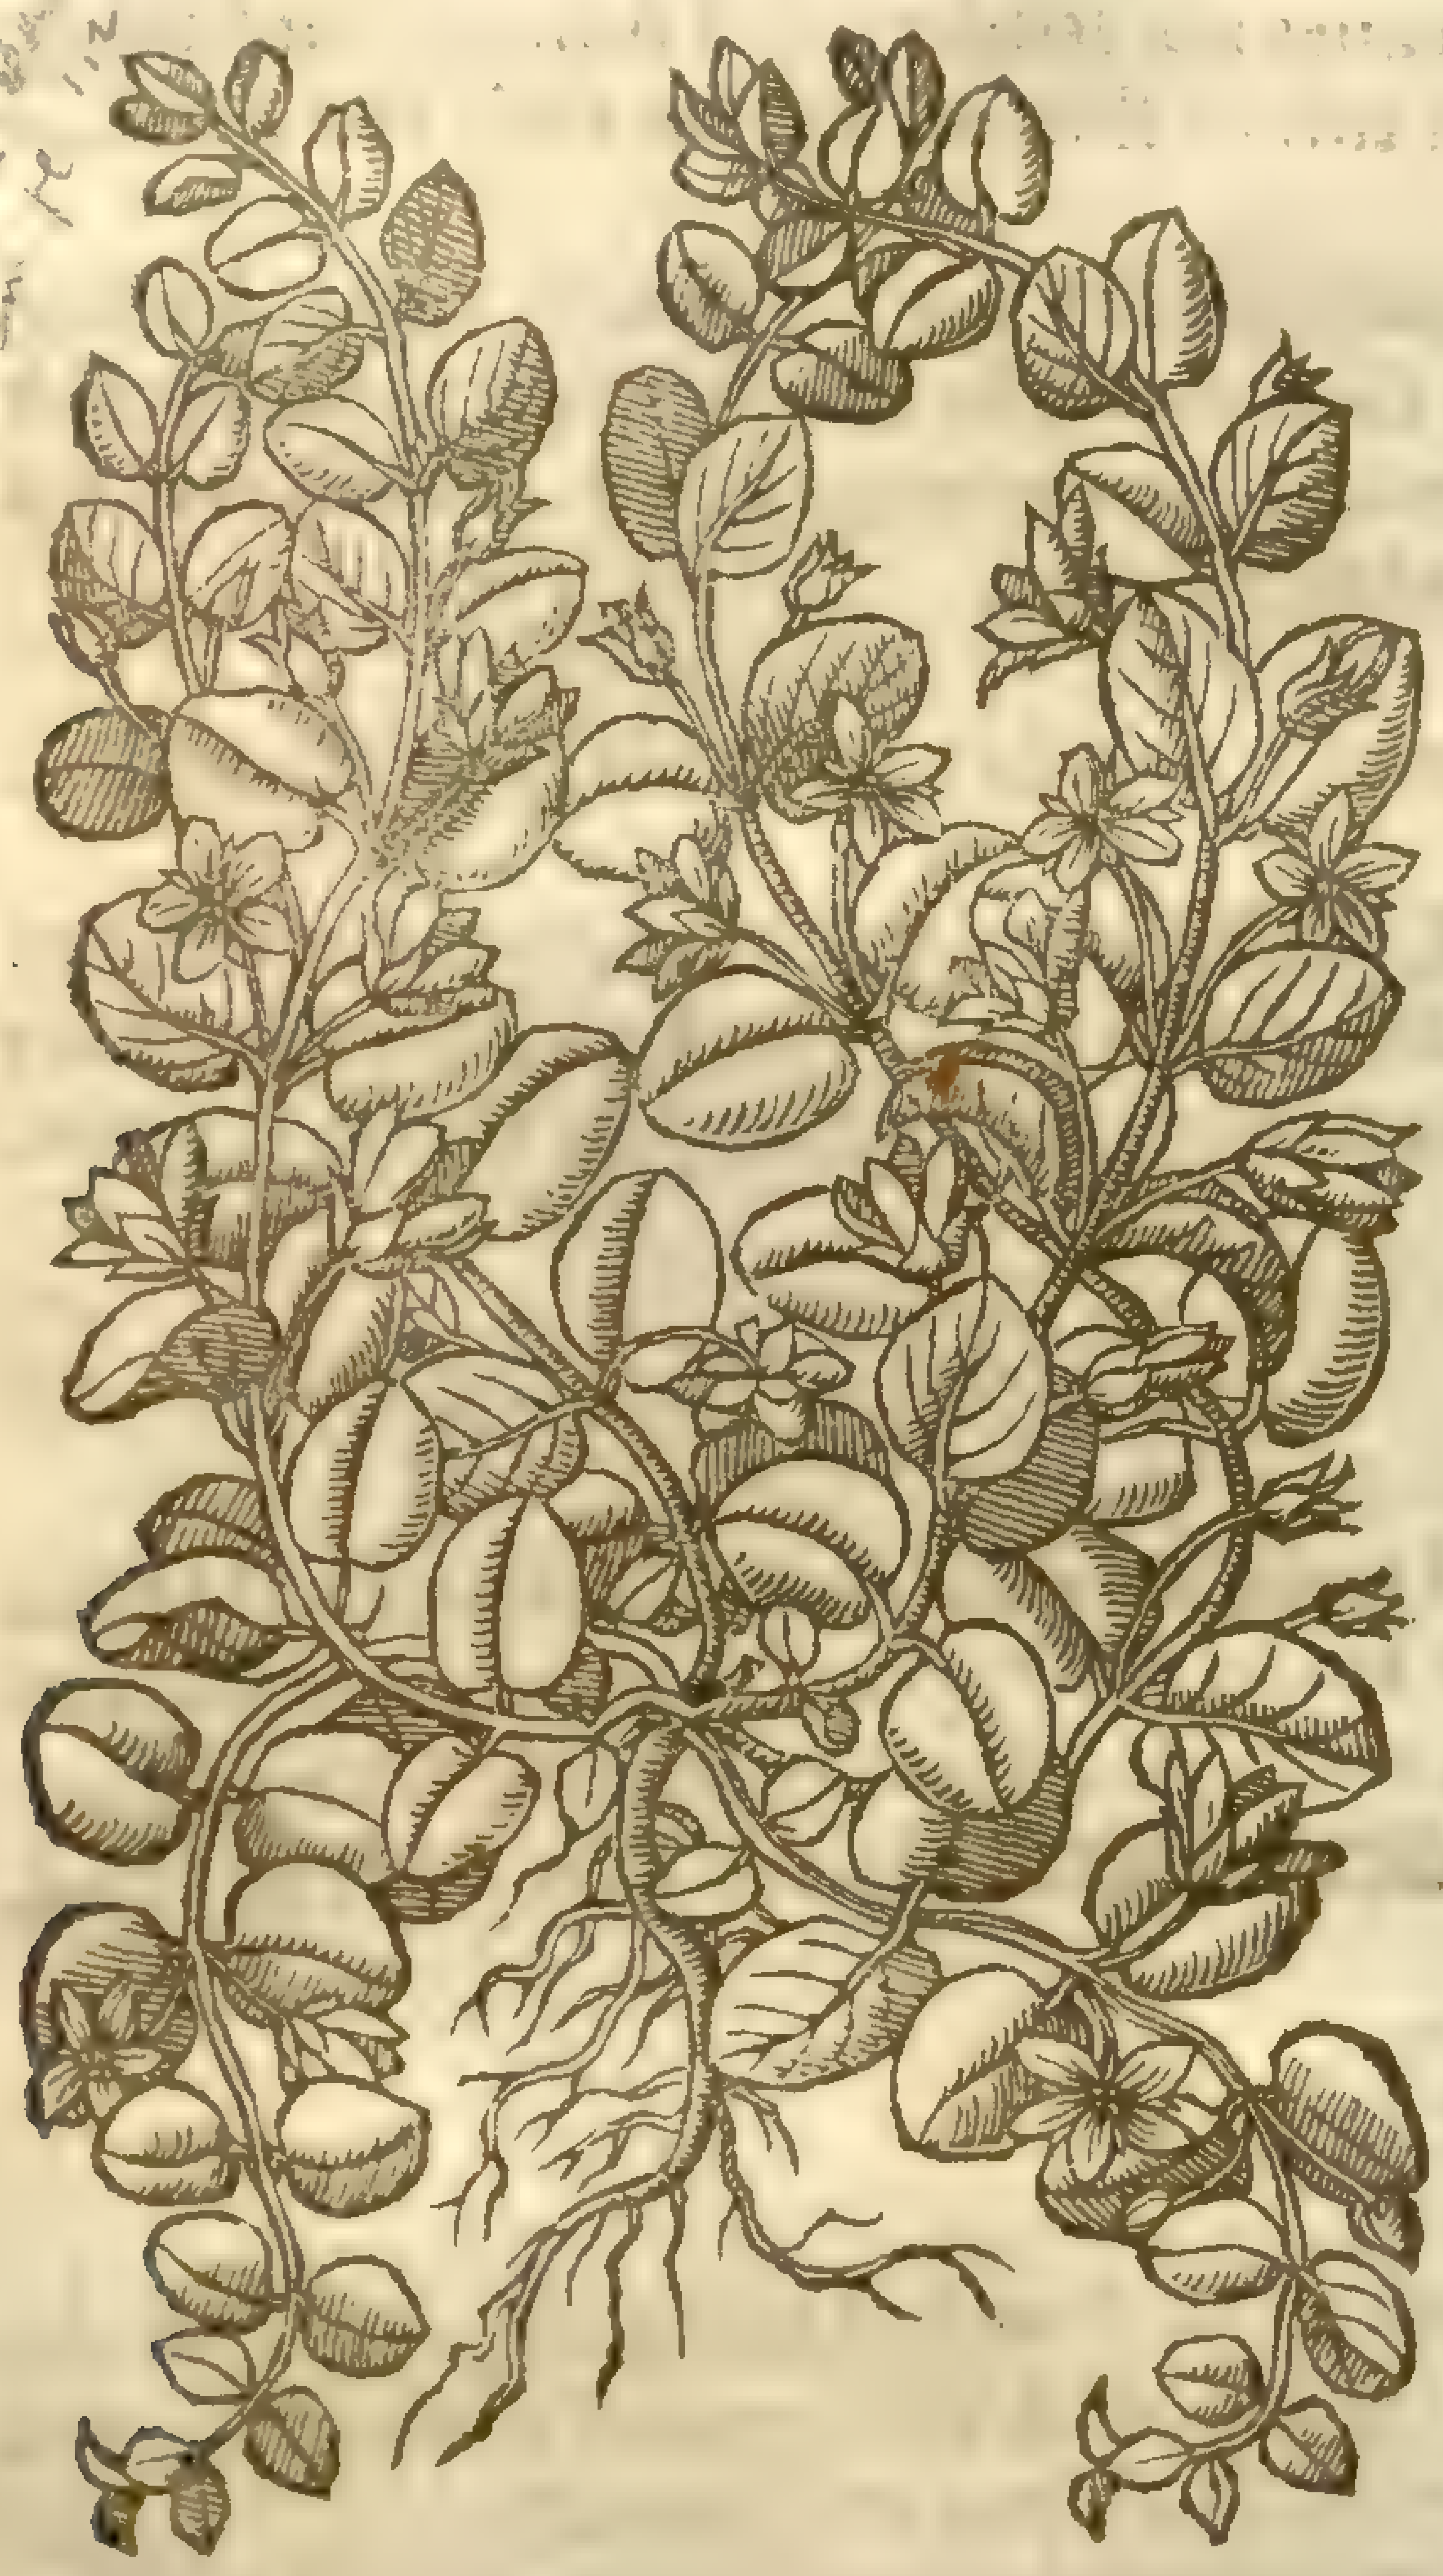
‡ 3 There is another kind of Money-wort which hath many very ſlender creeping branches which here and there put forth fibres, and take root againe: the leaues are ſmall and round, ſtanding by couples one againſt another; and out of the boſomes come ſlender foot-ſtalkes bearing pretty

little whitiſh purple floures conſiſting of fiue little leaues ſtanding together in manner of a little bell-floure, and ſeldome otherwiſe: the ſeed is ſmall, and contained in round heads. This grows in many wet rotten grounds, and vpon bogges: I firſt found it *Anno* 1626, in the Biſhopricke of Durham, and in two or three places of Yorkſhire, and not thinking any had taken notice thereof, I drew a figure of it and called it *Nummularia puſilla flore ex albo purpuraſcente*; but ſince I haue found that *Bauhine* had formerly ſet it forth in his *Prodromus* by the name of *Nummularia flore purpuraſcente*. It growes alſo on the bogs vpon the heath neer Burntwood in Eſſex. It floures in Iuly and Auguſt. ‡

1 *Nummularia.*
Herbe Two-pence.

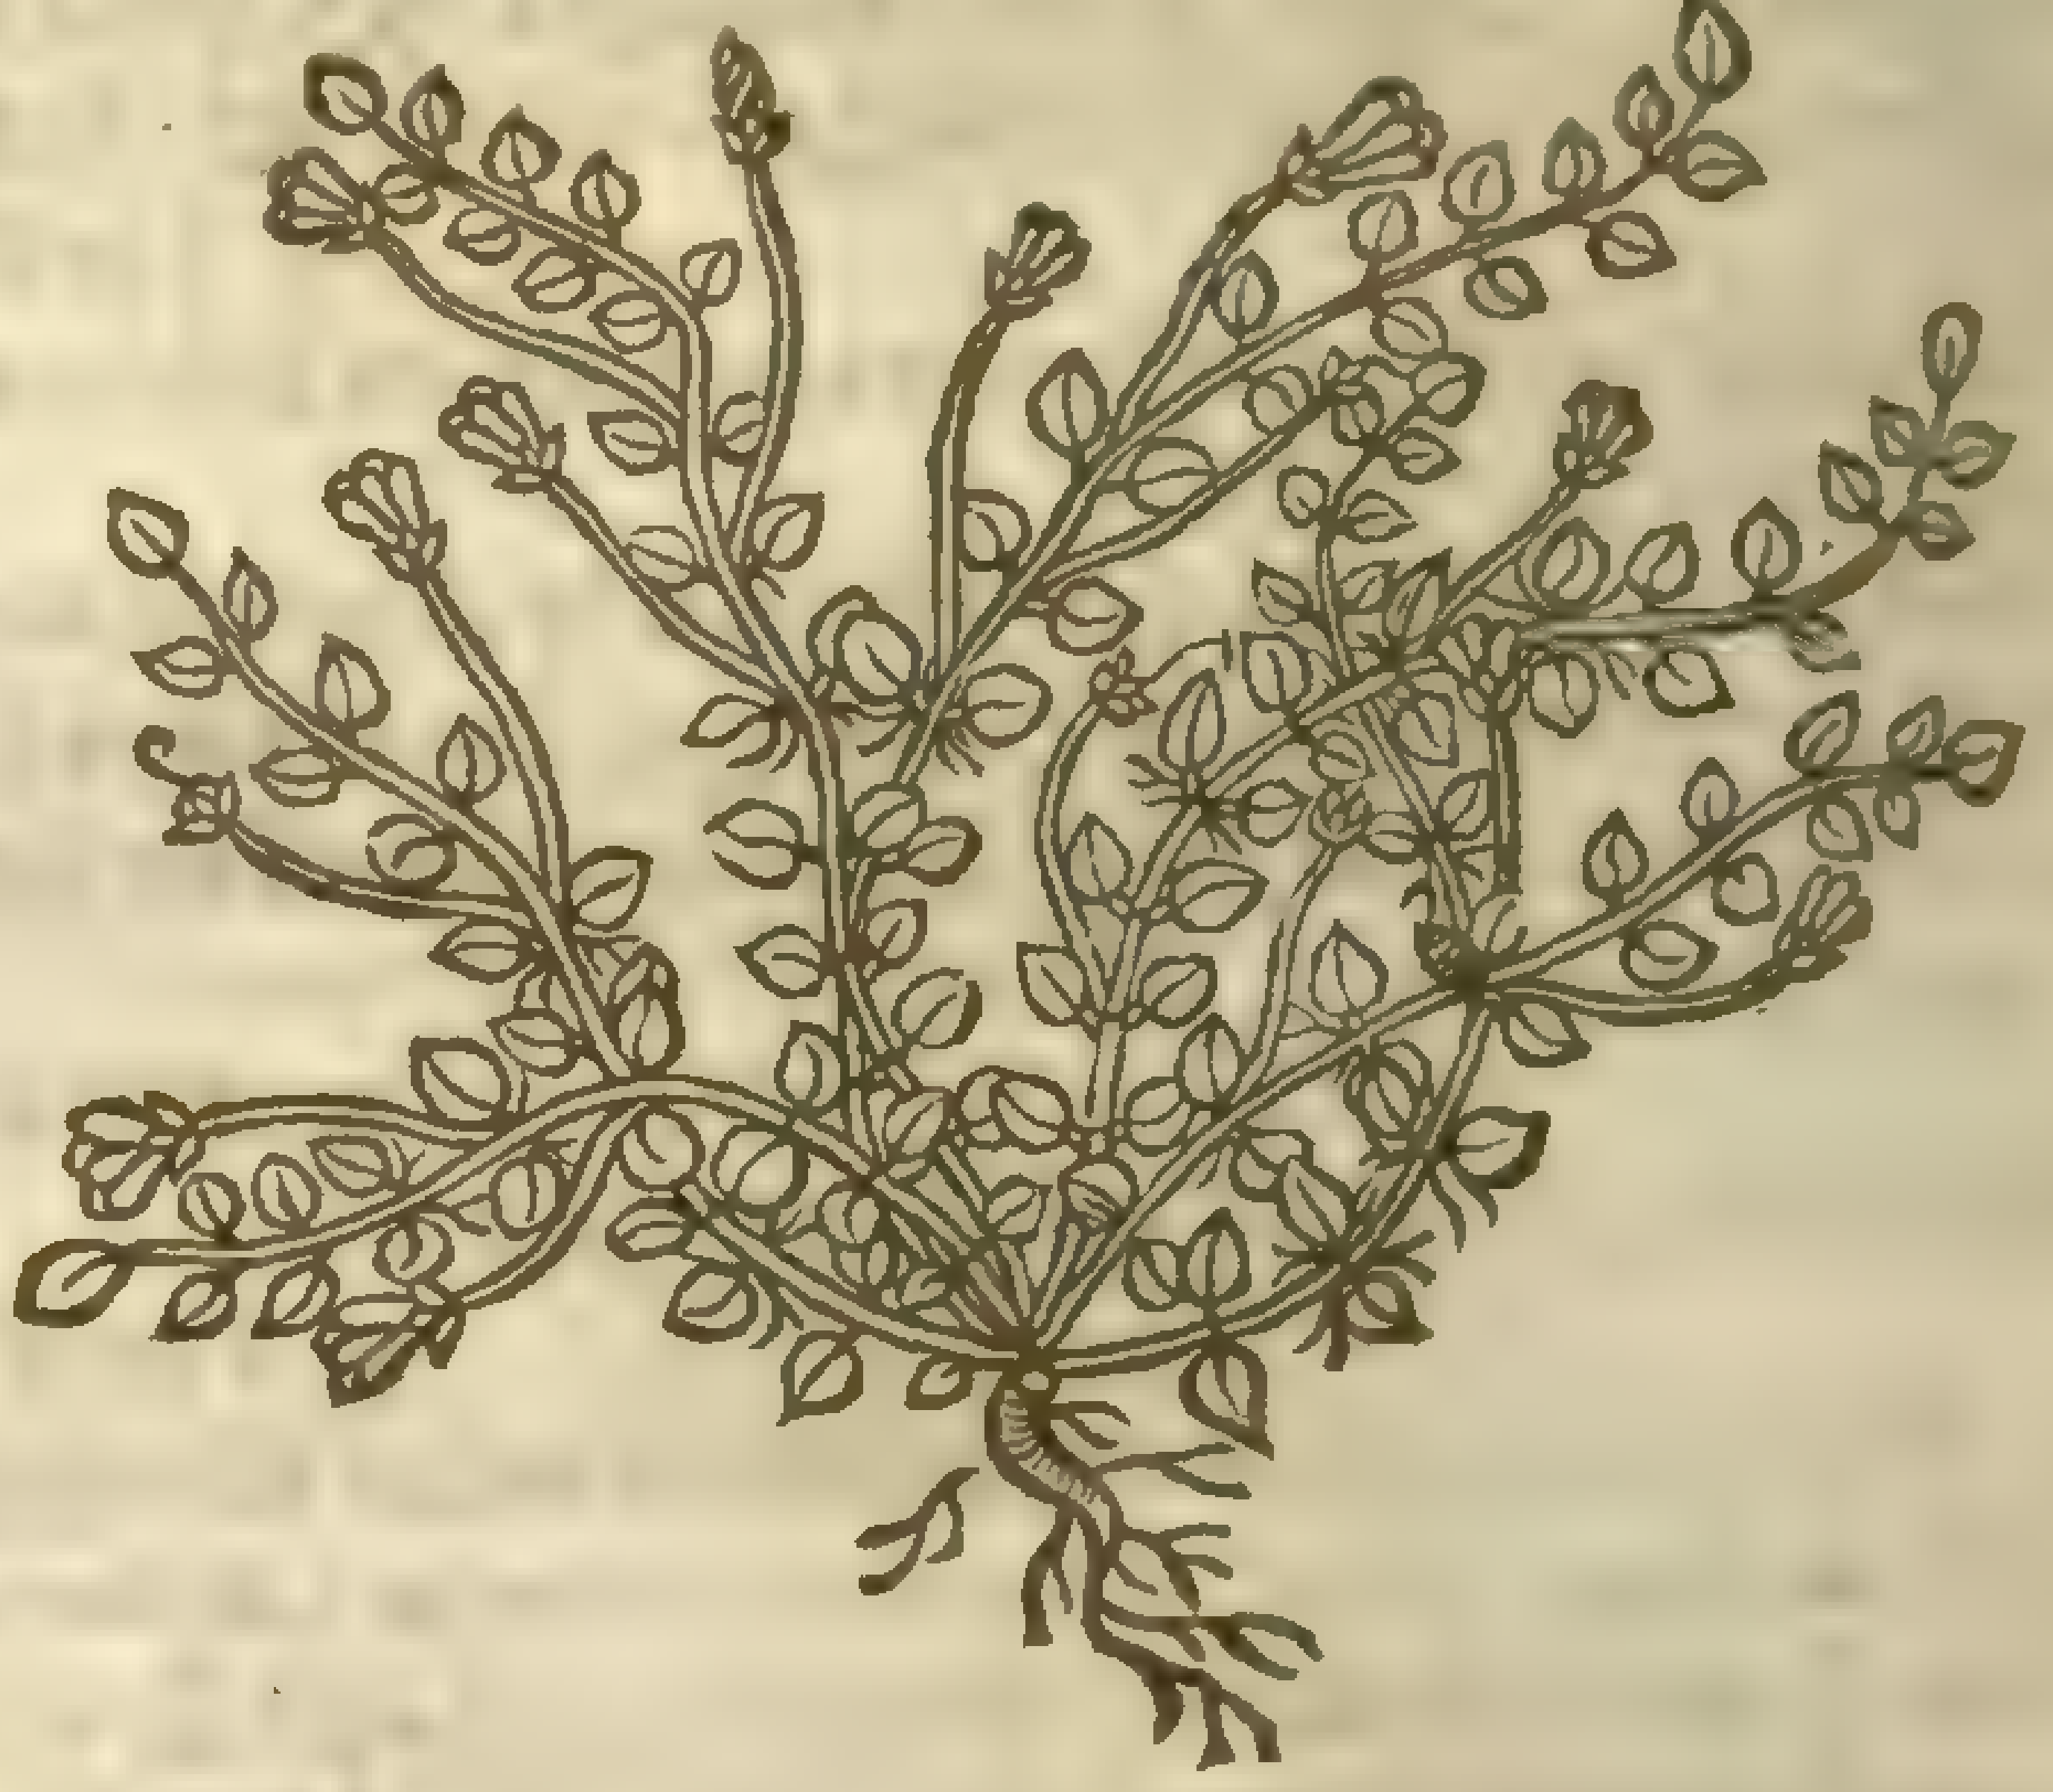
Lysimachia nummularia [illegible]

[illegible]



‡ 3 *Nummularia flore purpuraſcente.*
Purple floured Money-wort.

Anagallis Tenella [illegible]
Sm. fl. 1.281



¶ *The Place.*

It groweth neere vnto ditches and ſtreames, and other waterie places, and is ſomtimes found in moiſt woods: I found it vpon the banke of the riuer of Thames, right againſt the Queenes palace of White-hall; and almoſt in euery countrey where I haue trauelled.

¶ *The Time.*

It floureth from May till Summer be well ſpent.

¶ *The Names.*

Herb Two-pence is called in Latine *Nummularia* and *Centummorbia*: and of diuers *Serpentaria*. It is reported, that if ſerpents be hurt or wounded, they do heale themſelues with this herb, wherupon came the name *Serpentaria*: it is thought to be called *Centummorbia*, of the wonderfull effect which it hath in curing diſeaſes; and it is called *Nummularia* of the forme of money, whereunto the leaues are like: in Dutch, **Penninckcruyt**: in Engliſh, Money-woort, Herbe Two-pence, and Two-penny graſſe.

¶ *The Temperature.*

That this herbe is dry, the binding taſt thereof ſheweth: it is alſo moderatly cold.

¶ *The Vertues.*

A The floures and leaues ſtamped and laid vpon wounds and vlcers do cure them: but it worketh moſt effectually being ſtamped and boiled in oile oliue, with ſome roſin, wax, and turpentine added thereto.

The juice drunke in wine is good for the bloudy flix and all other iſſues of bloud in man or woman; the weakneſſe and looſneſſe of the belly and laske; it helpeth thoſe that vomit bloud, & the Whites in ſuch as haue them. B

Boiled with wine and hony it cureth the wounds of the inward parts, and vlcers of the lungs; & in a word, there is not a better wound herb, no not Tabaco it ſelfe, nor any other whatſoeuer. C

The herb boiled in wine, with a little hony or mead, preuaileth much againſt the cough in children, called the Chin-cough. D

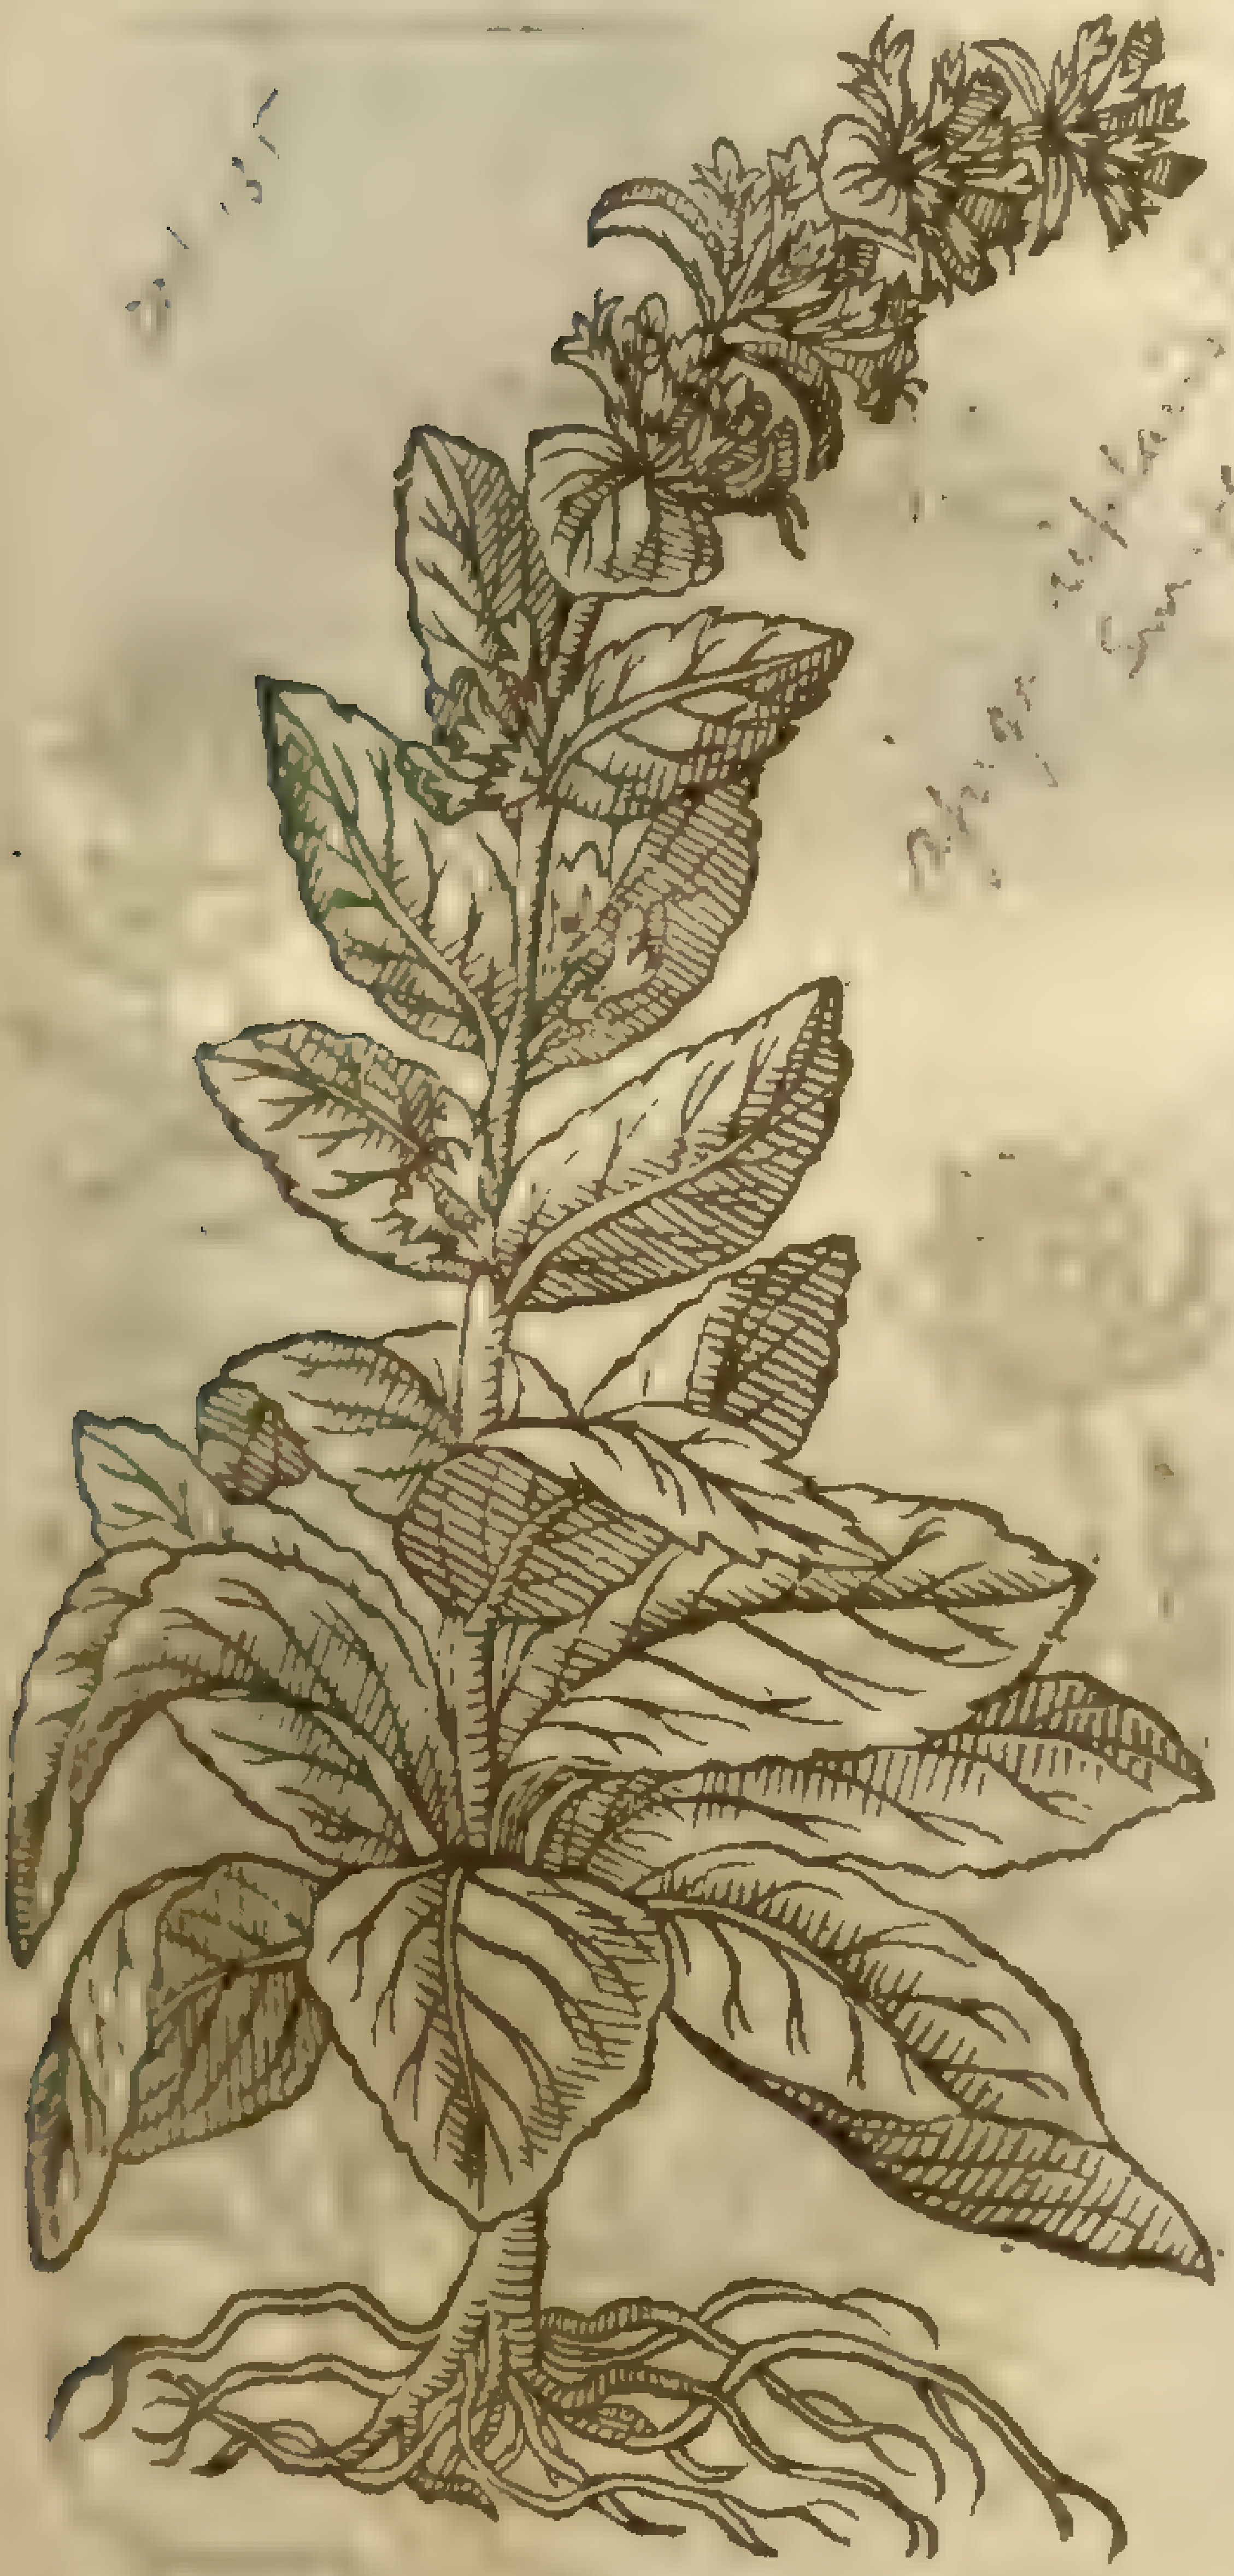
Chap. 200.

Of Bugle or middle Comfrey.

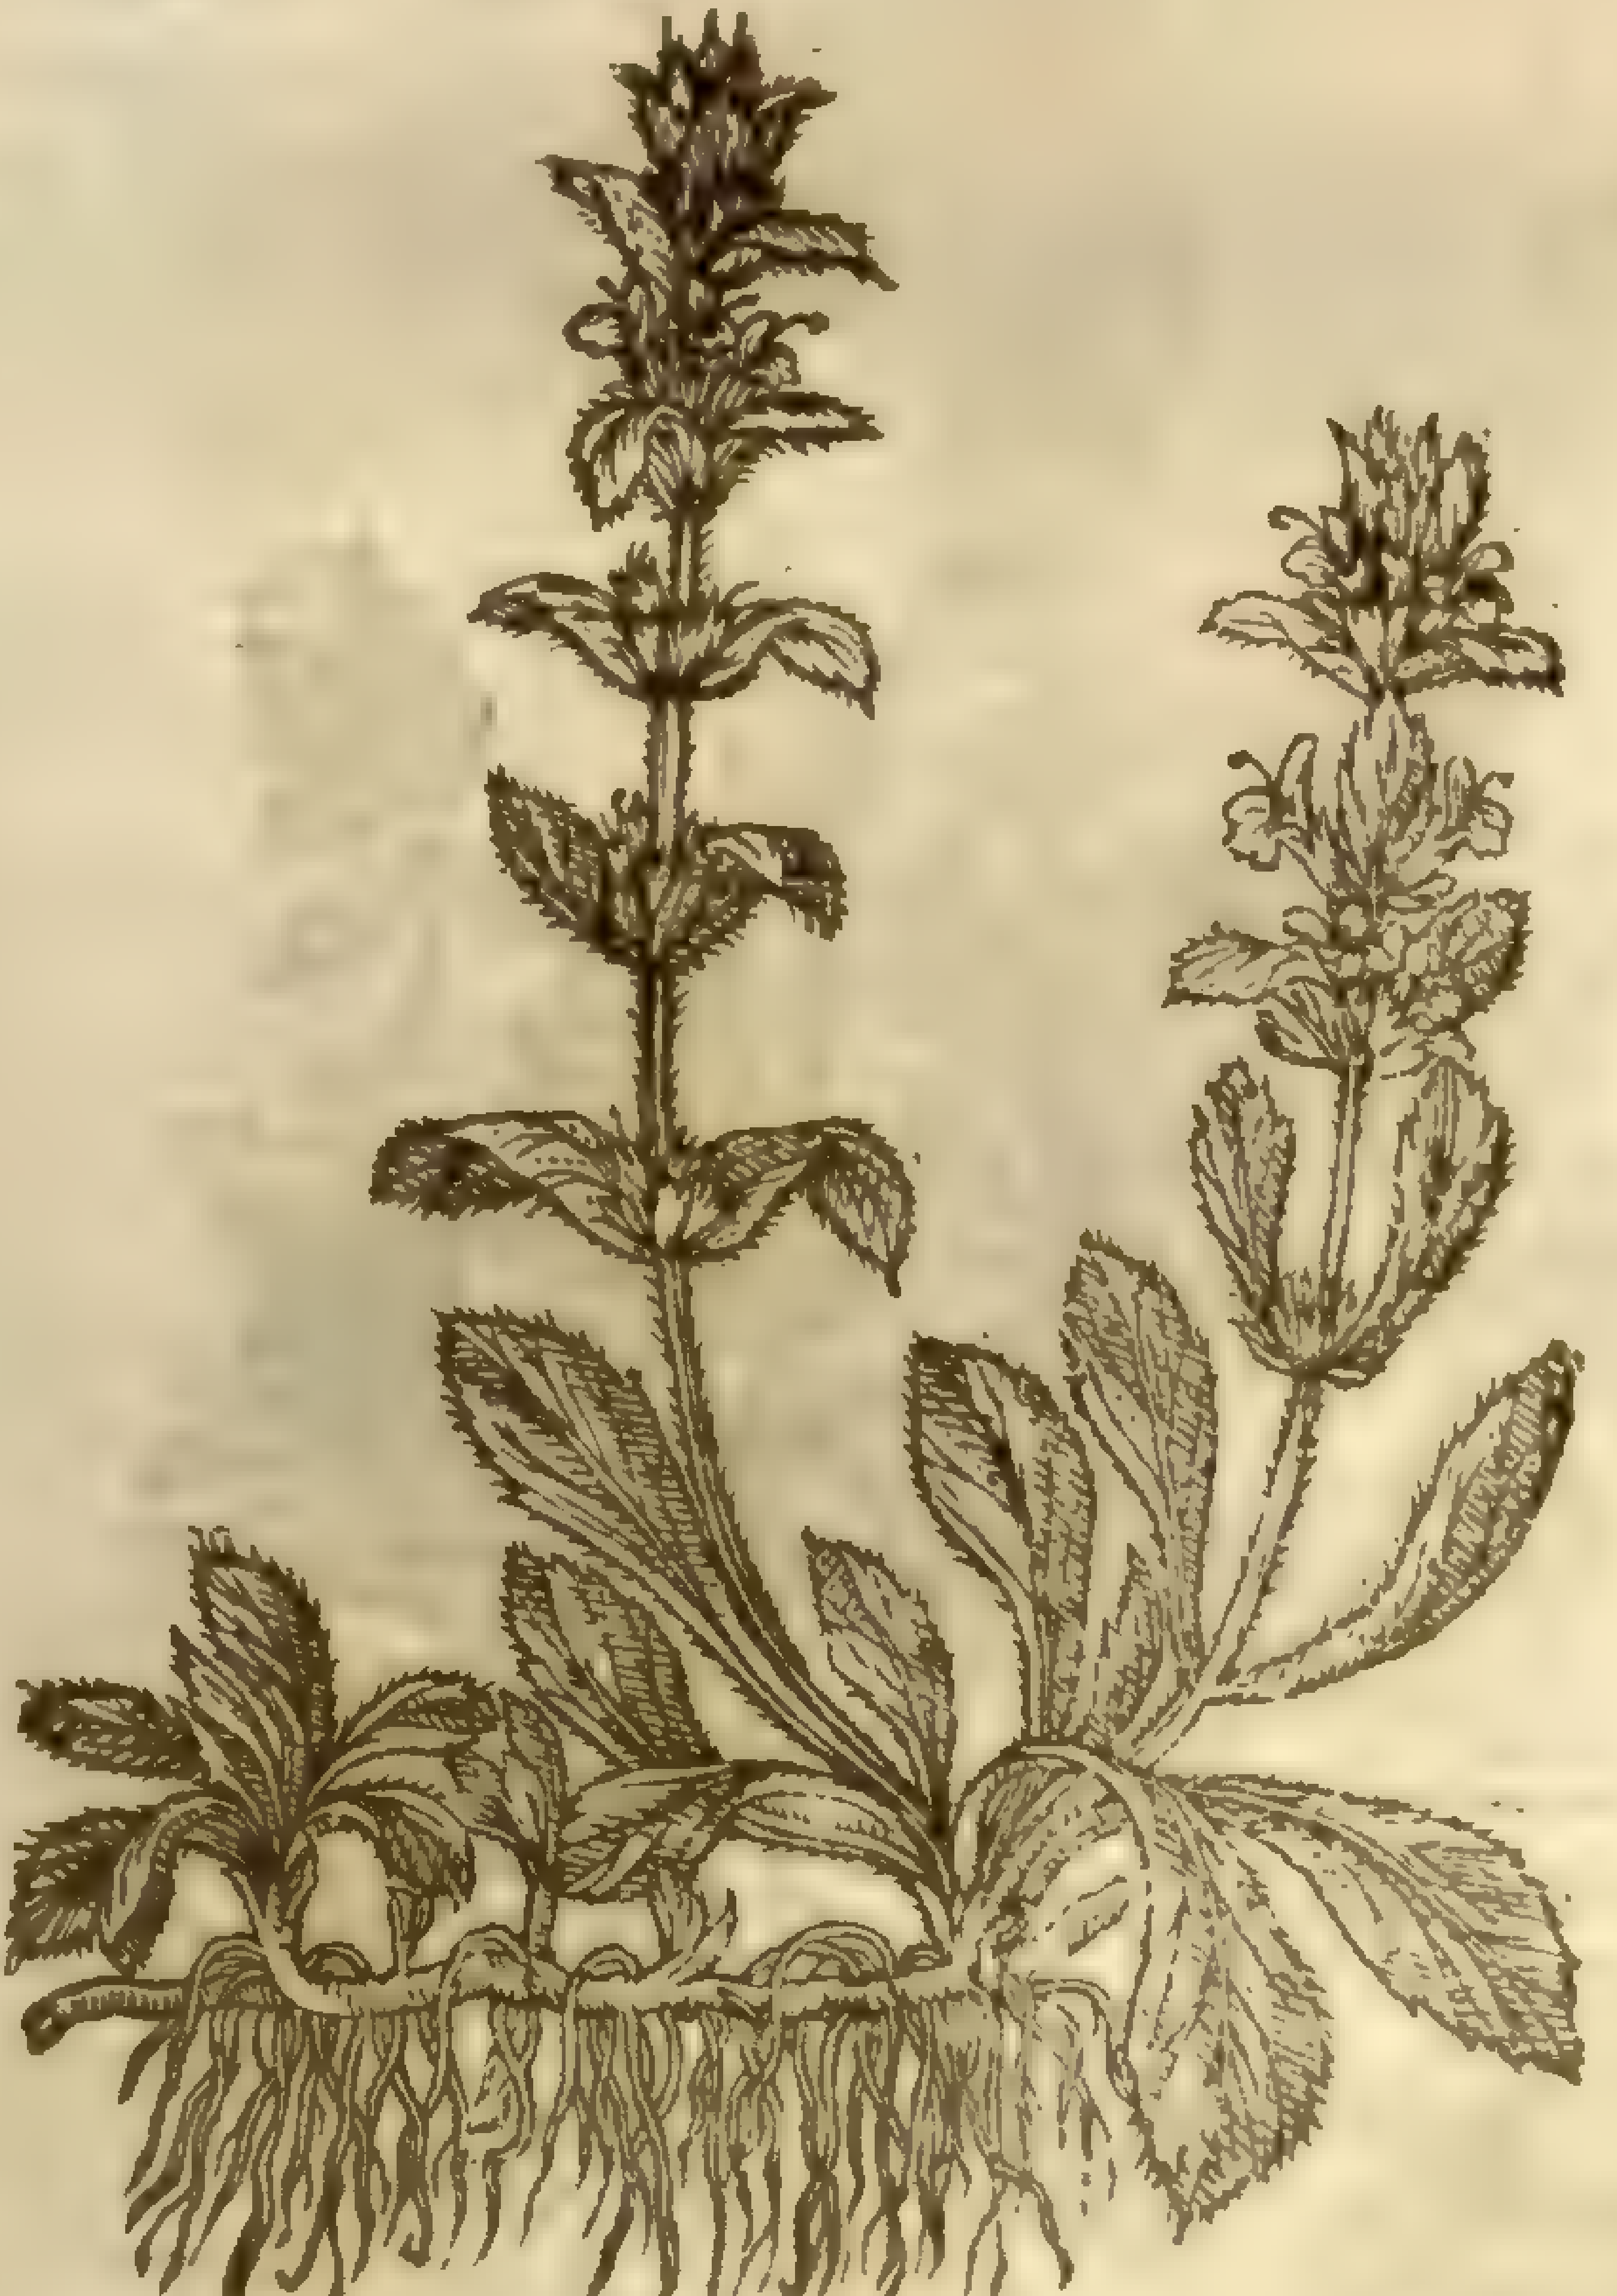
¶ *The Deſcription.*

1 *Bugula* ſpreadeth and creepeth along the ground like Monywort: the leaues be long, fat, and oleous, and of a browne colour for the moſt part. The floures grow about the ſtalks in rundles, compaſſing the ſtalke, leauing between euery rundle bare or naked ſpaces, and are of a faire blew colour, and often white. I found many plants of it in a moiſt ground vpon black-Heath neere London, faſt by a village called Charleton; but the leaues were green, and not brown at all like the other.

1 *Bugula.*
Middle Conſound.



2 *Bugula flore albo ſiue carneo.*
White or carnation floured Bugle.



2 Bugle with the white floure differs not from the precedent in roots, leaues, and ſtalkes; the only difference is, that this plant bringeth forth faire milke white floures, and the other thoſe that are blew. ‡ It is alſo found with a fleſh coloured floure, and the leaues are leſſe ſnipt than thoſe of the former. *Bauhine* makes mention of one much leſſe than thoſe, with round ſnipt leaues and a yellow floure, which he ſaith he had out of England, but I haue not as yet ſeene it, nor found any other mention thereof. ‡

¶ *The Place.*

Bugula groweth almoſt in euery wood and copſe, and ſuch like ſhadowie and moiſt places, and is much planted in gardens: the other varieties are ſeldome to be met withall.

¶ *The Time.*

Bugula floureth in Aprill and May.

¶ *The Names.*

Bugle is reckoned among the Conſounds or wound-herbs; and it is called of ſome, *Conſolida media, Bugula,* and *Buglum*: in high Dutch, **Guntzel**: in low Dutch, **Senegroen**: of *Matthiolus, Herba Laurentina*: in Engliſh, browne Bugle: of ſome, Sicklewort, and herb Carpenter, but not truly.

¶ *The Temperature.*

Bugle is of a mean temperature between heate and dryneſſe.

¶ *The Vertues.*

A It is commended againſt inward burſtings, and members torne, rent, and bruiſed: and therefore it is put into potions that ſerue for nodes, in which it is of ſuch vertue, that it can diſſolue & waſte away congealed and clotted bloud. *Ruellius* writeth that they commonly ſay in France, how hee needs neither Phyſition nor Surgeon, that hath Bugle and Sanicle; for it doth not onely cure rotten wounds, being inwardly taken, but alſo applied to them outwardly: it is good for the infirmities of the liuer, taking away the obſtructions, and ſtrengthning it.

B The decoction of Bugle drunke diſſolueth clotted or congealed bloud within the body, healeth and maketh ſound all wounds of the body both inward and outward.

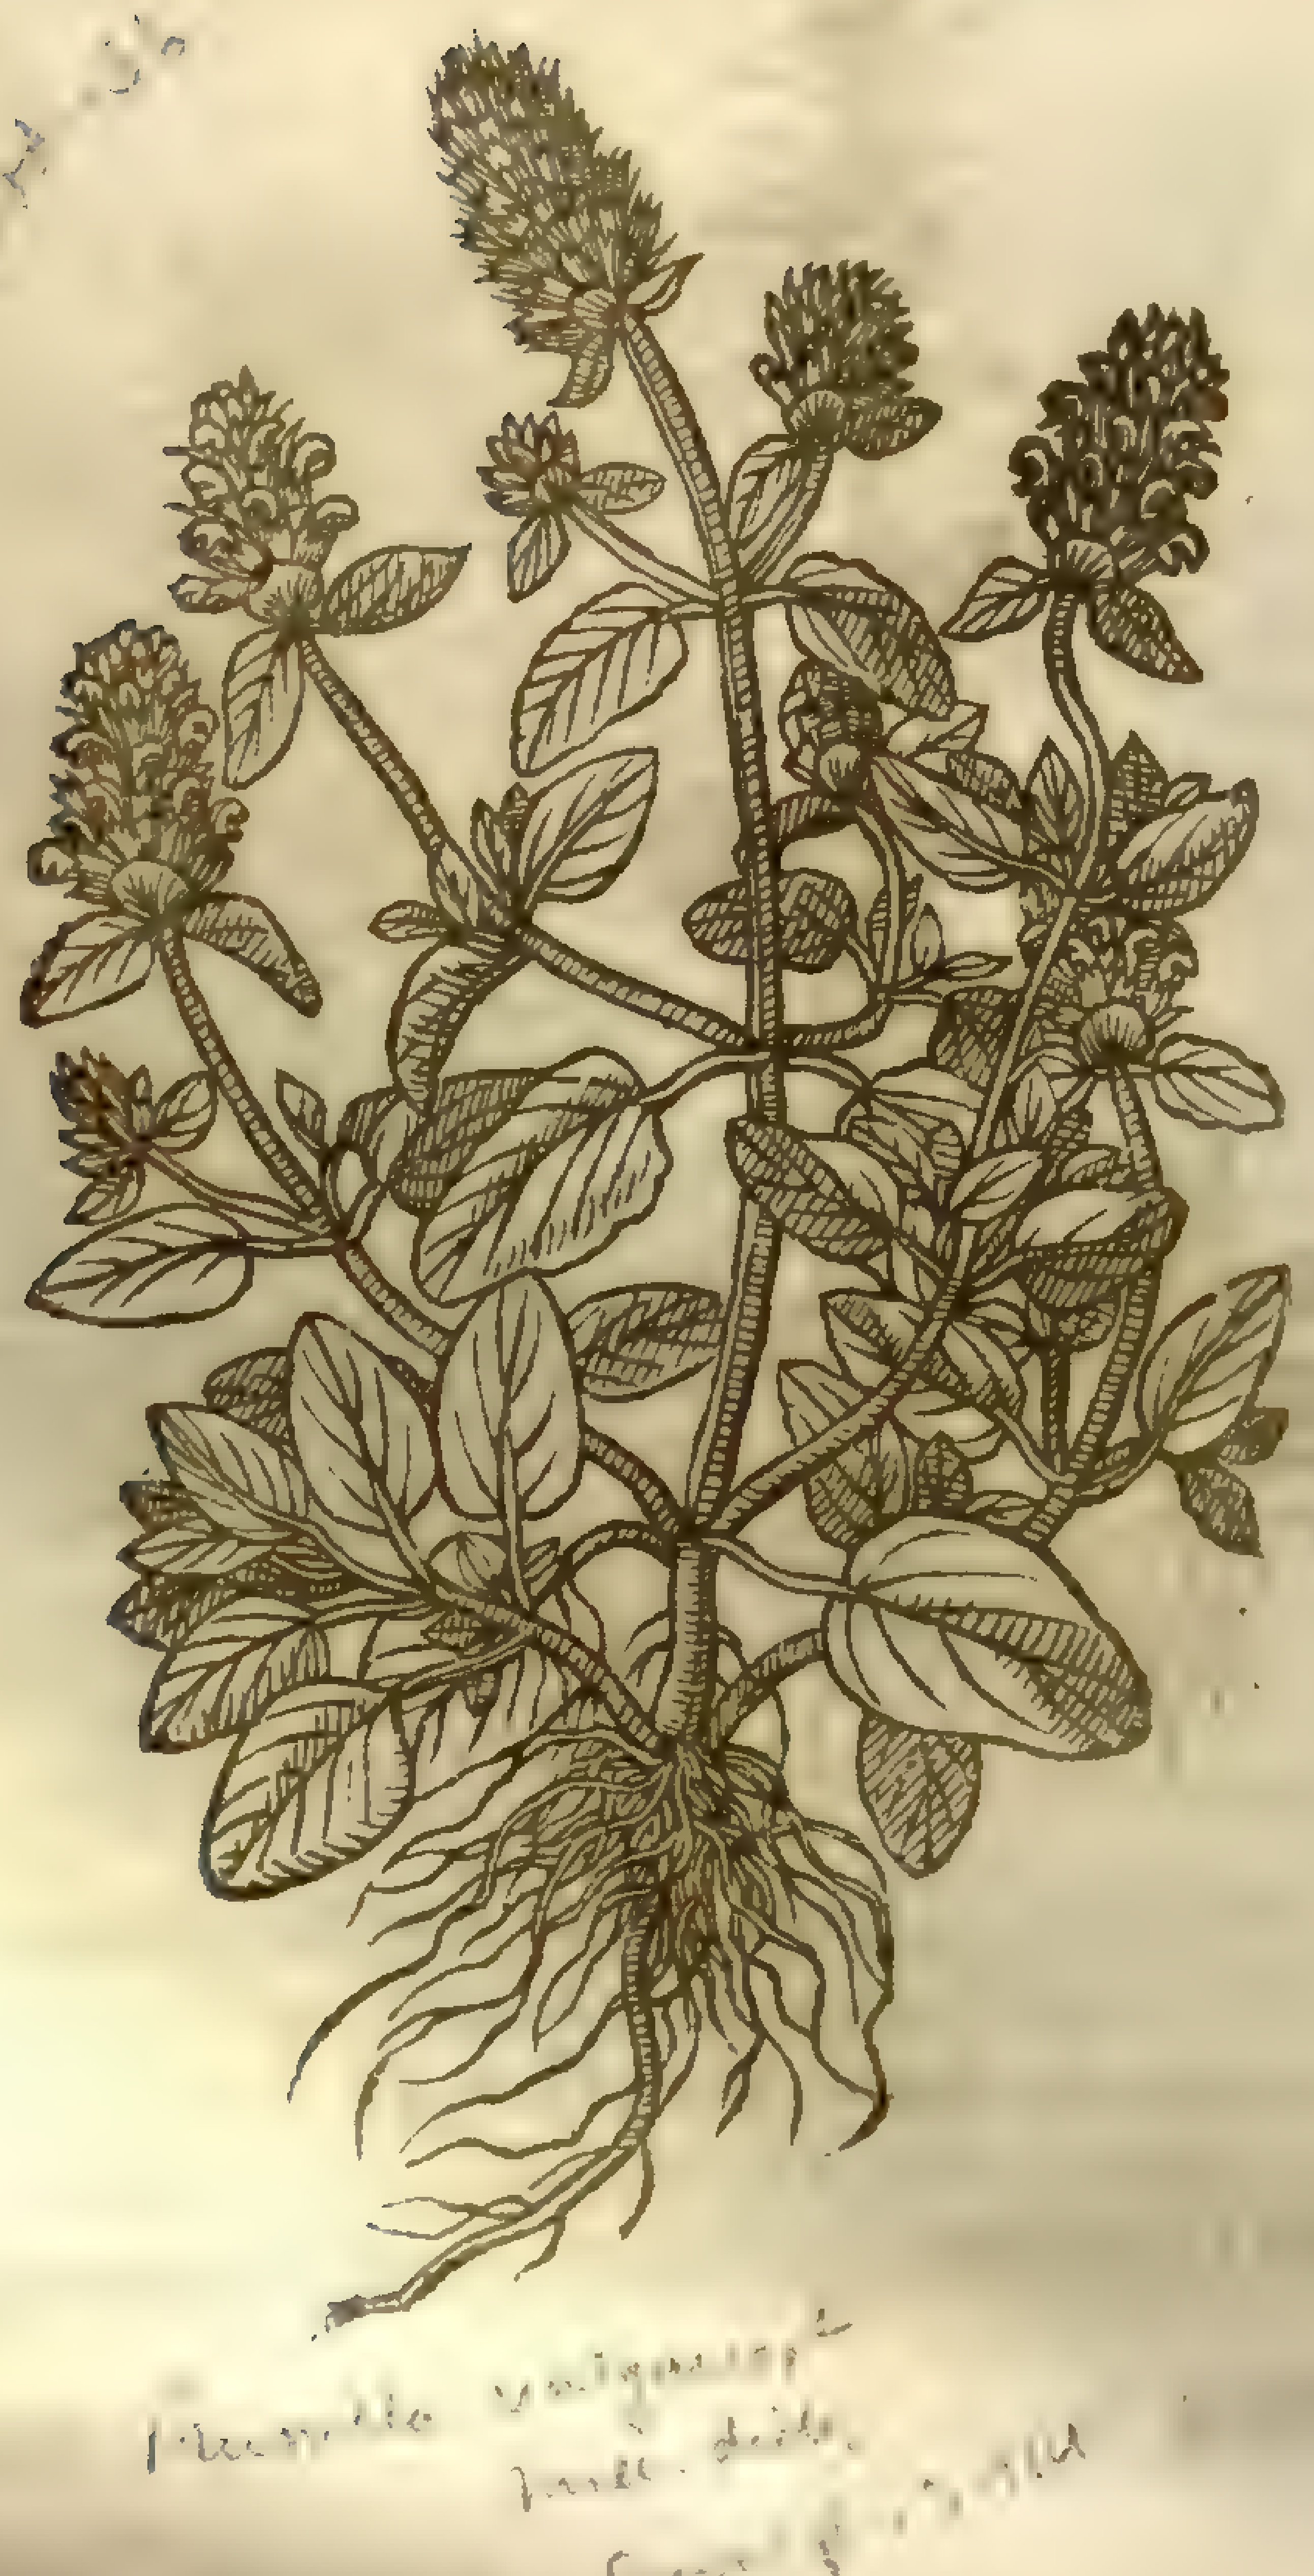
C The ſame openeth the ſtoppings of the liuer and gall, and is good againſt the jaundice and feuers of long continuance.

D The ſame decoction cureth the rotten vlcers and ſores of the mouth and gums.

E *Bugula* is excellent in curing wounds and ſcratches, and the juice cureth the wounds, vlcers, and ſores of the ſecret parts, or the herb bruiſed and laid theron.

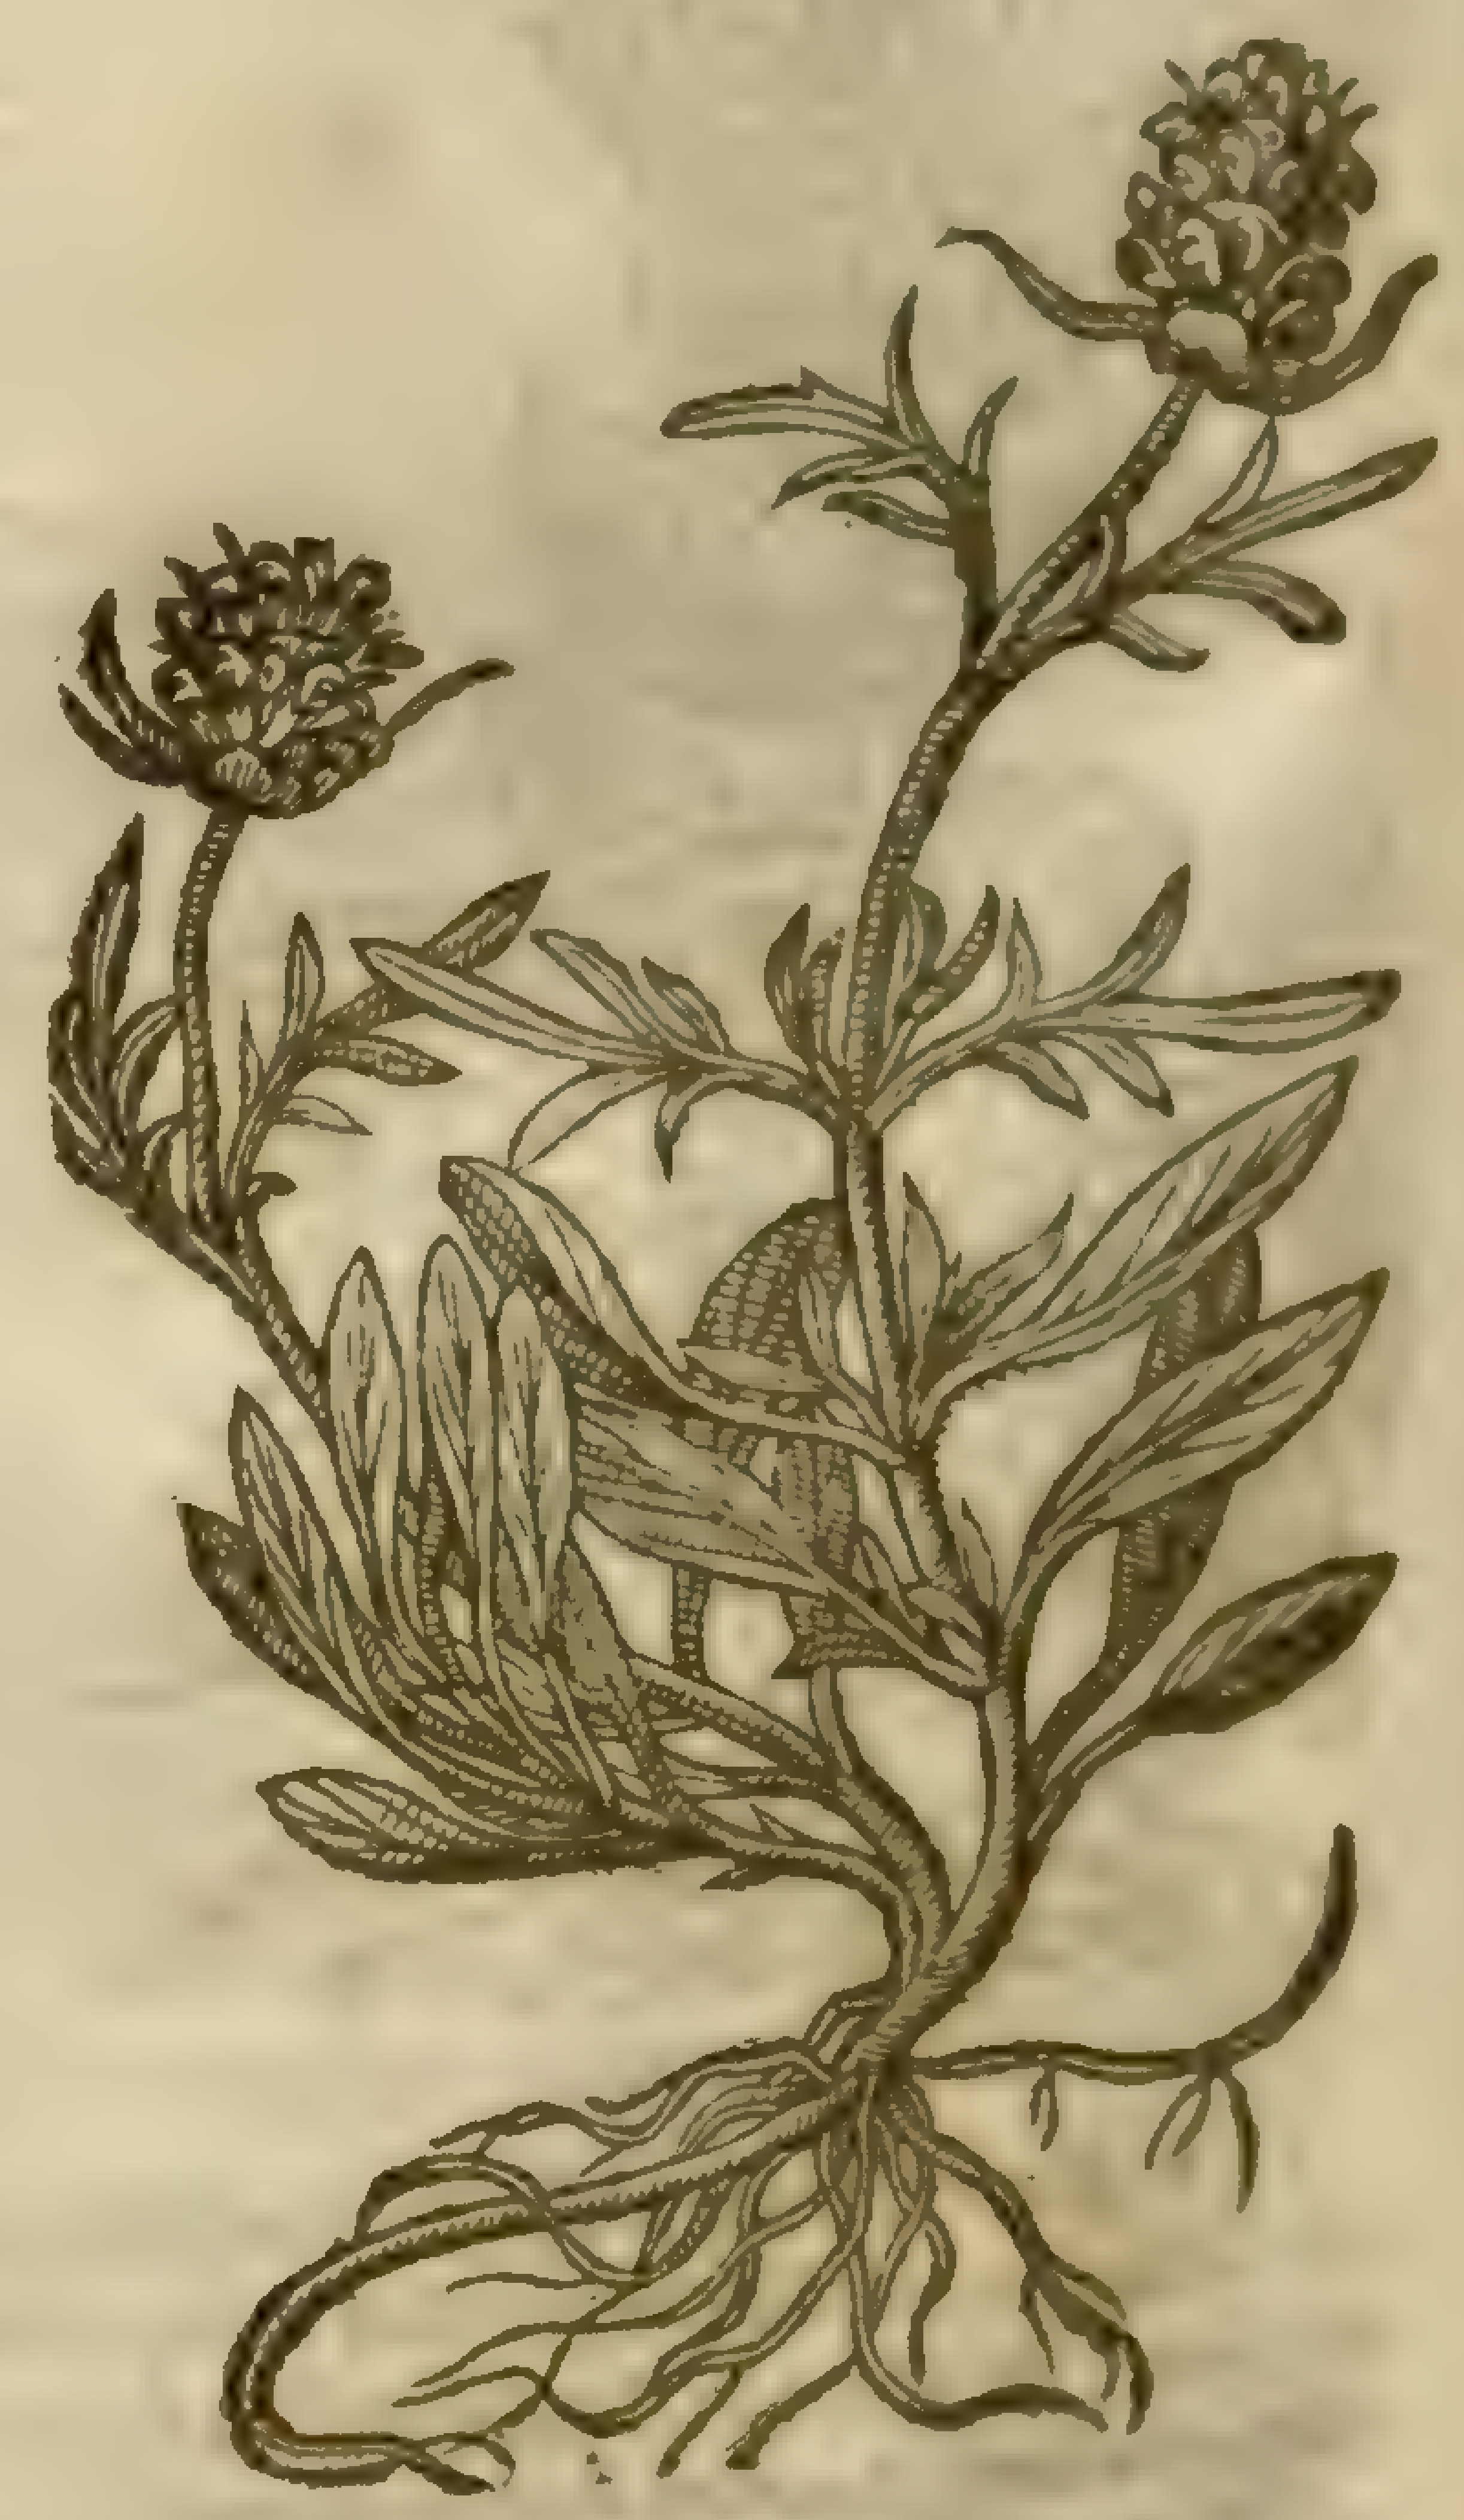
Chap. 201. *Of Selfe-heale.*

1 *Prunella.*
Selfe-heale.

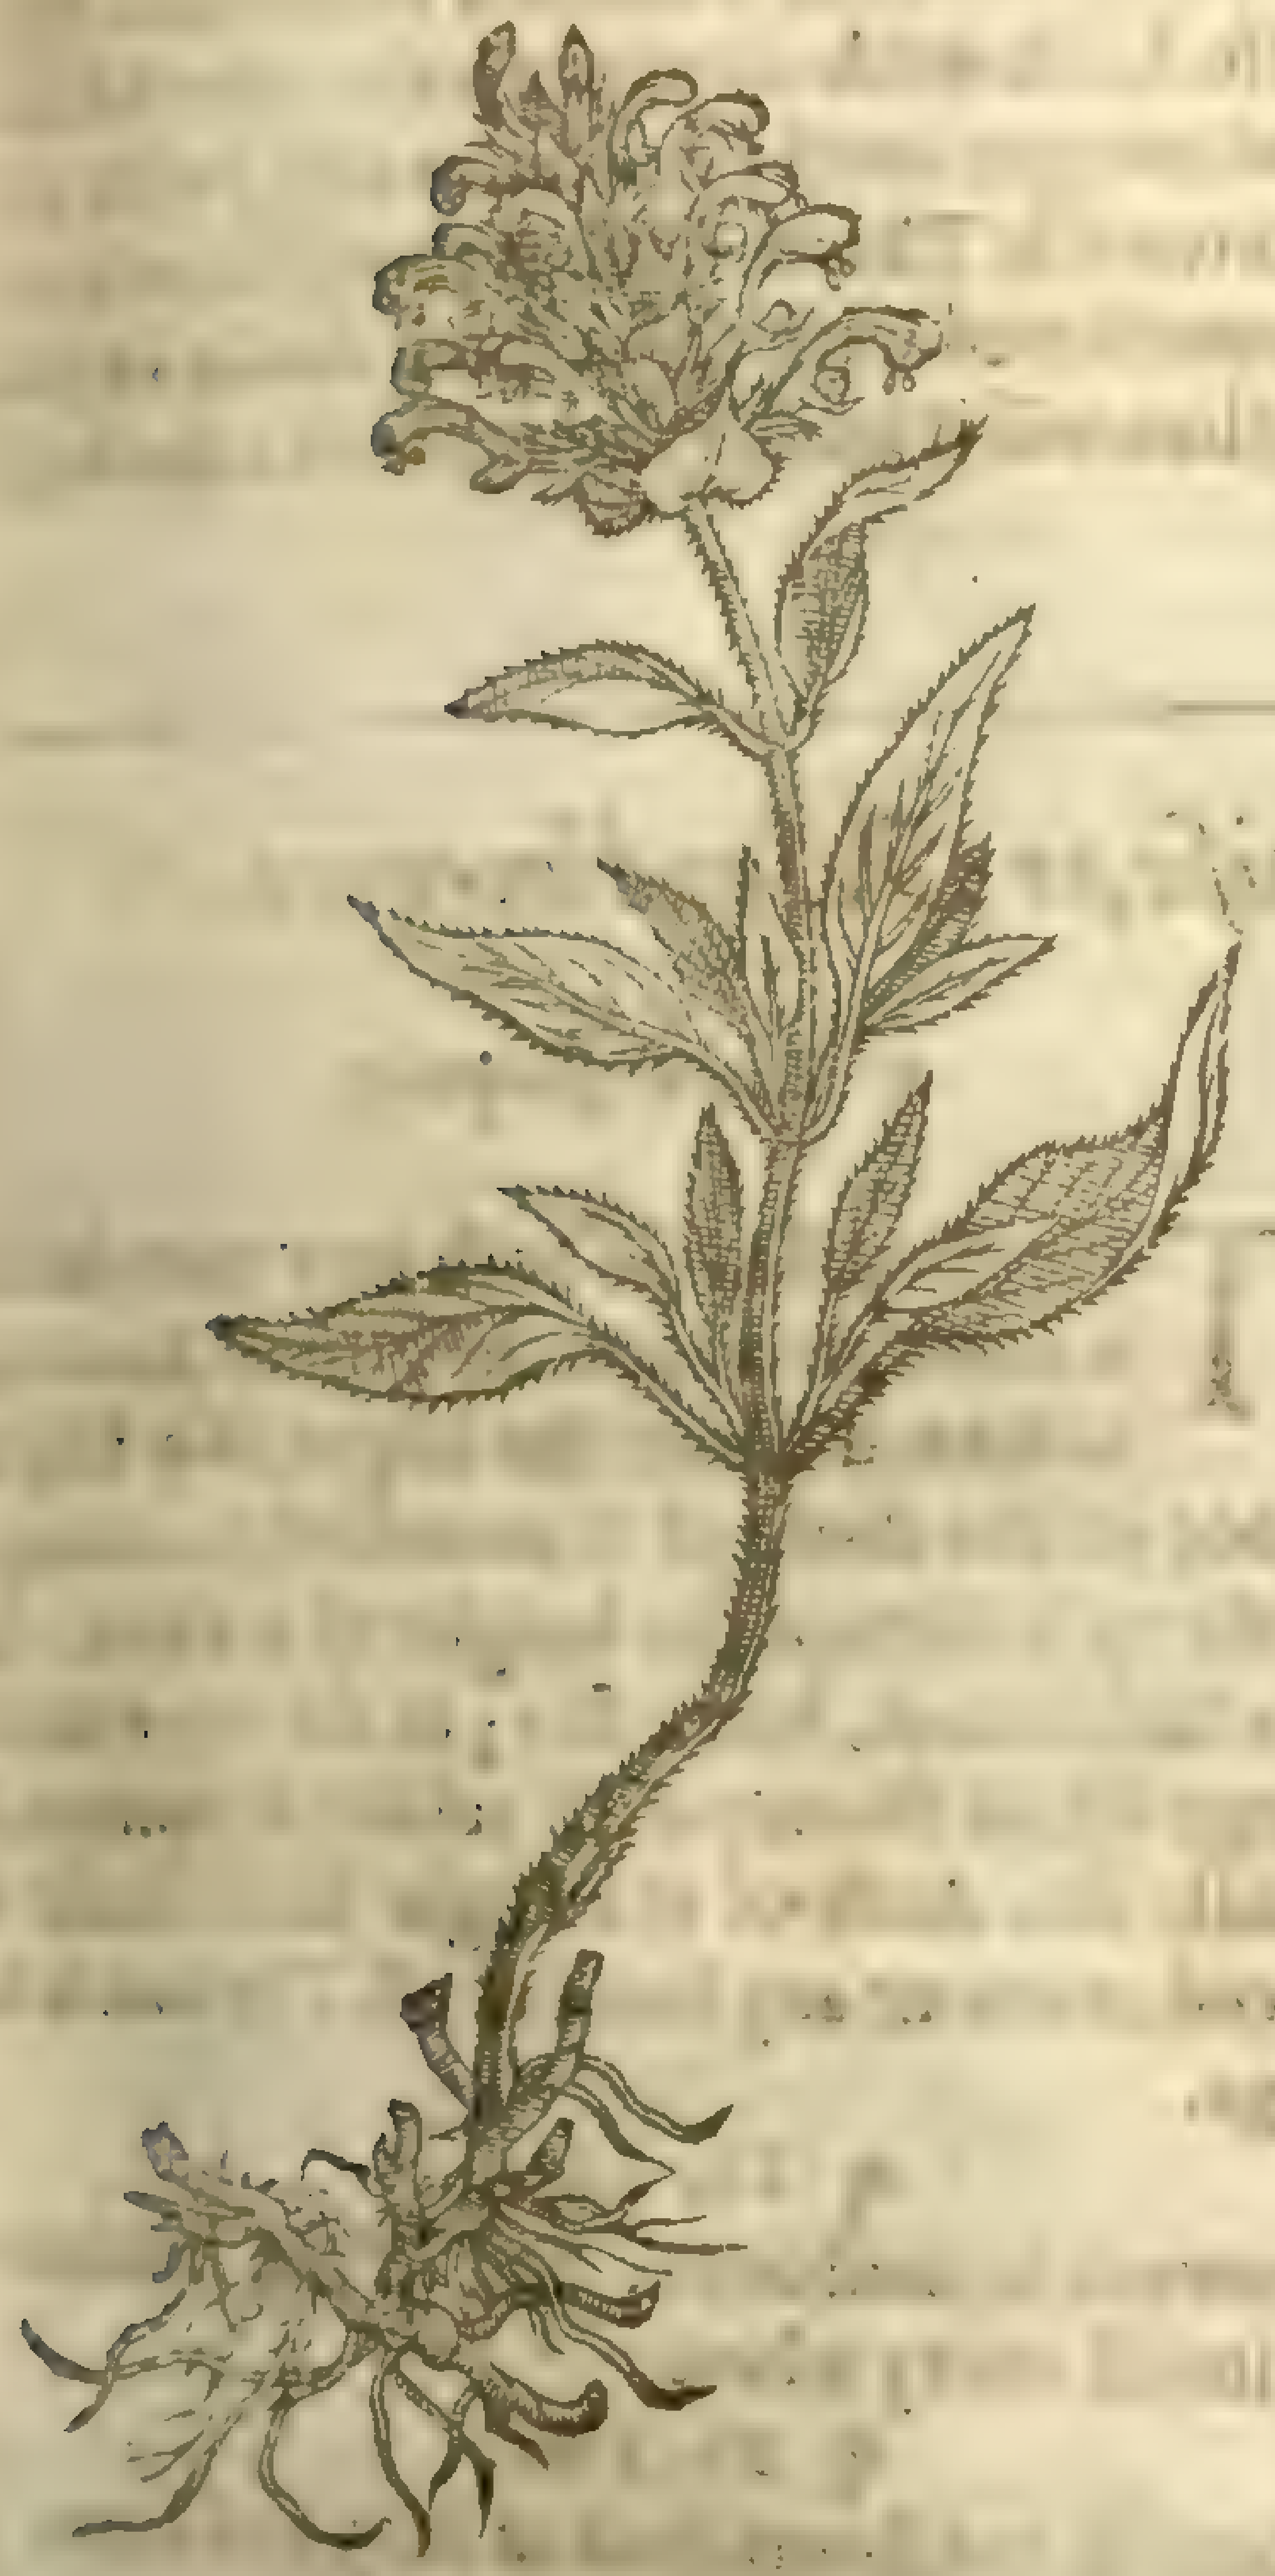


Prunella vulgaris [illegible]

2 *Prunella Lobelij.*
The ſecond Selfe-heale.



3 *Prunella flore albo.*
White floured Selfe-heale.



¶ *The Deſcription.*

1 Prunell or Brunell hath ſquare hairie ſtalks of a foot high, beſet with long hairy and ſharp pointed leaues, and at the top of the ſtalkes grow floures thicke ſet together like an eare or ſpiky knap, of a brown colour, mixed with blew floures and ſometimes white; of which kinde I found ſome plants in Eſſex neere Heningham caſtle. The root is ſmall and very threddy.

† 2 *Prunella altera*, or after *Lobel* and *Pena*, *Symphytum petræum*, hath leaues like the laſt deſcribed, but ſomewhat narrower, and the leaues that grow commonly toward the tops of the ſtalkes are deeply diuided or cut in after the manner of the leaues of the ſmall Valerian, and ſometimes the lower leaues are alſo diuided, but that is more ſeldome: the heads and floures are like thoſe of the former, and the colour of the floures is commonly purple, yet ſometimes it is found with fleſh coloured, and otherwhiles with white or aſh-coloured floures.

3 The third ſort of Selfe-heale is like vnto the laſt deſcribed in root, ſtalk, and leaues, and in euery other point, ſauing that the floures hereof are of a perfect white colour, and the others not ſo, which maketh the difference.

‡ The figure which our Author gaue in the third place, was of the *Prunella ſecunda* of *Tabern.* which I iudge to be all one with the *Prunella* 1. *non vulgaris* of *Cluſius*; & that becauſe the floures of that in *Tabernamontanus* are expreſſed *Ventre laxiore*, which *Cluſius* complaines his drawer did not obſerue; the other parts alſo agree: now this of *Cluſius* hath much larger floures than the ordinarie, and thoſe commonly of a deeper purple colour, yet they are ſometimes whitiſh, and otherwhiles of an aſh-colour: the leaues alſo are ſomewhat more hairy, long and ſharper pointed than the ordinarie, and herein conſiſts the greateſt difference. ‡

¶ *The Place.*

The firſt kinde of Prunell or Brunel groweth very commonly in all our fields throughout England.

The ſecond Brunel or *Symphytum petræum* groweth naturally vpon rocks, ſtony mountaines, and grauelly grounds.

‡ The third for any thing I know is a ſtranger with vs; but the firſt common kind I haue found with white floures. ‡

¶ *The Time.*

Theſe plants floure for the moſt part all Summer long.

¶ *The Names.*

Brunell is called in Engliſh, Prunel, Carpenters herb, Selfe-heale, Hook-heale, and Sicklewort. It is called of the later Herbariſts, *Brunella* and *Prunella*: of *Matthiolus*, *Conſolida minor*, and *Solidago minor*: but ſaith *Ruellius*, the Daiſie is the right *Conſolida minor* and alſo the *Solidago minor*.

¶ *The Nature.*

Theſe herbs are of the temperature of *Bugula*; that is to ſay, moderatly hot and dry, and ſomething binding.

¶ *The Vertues.*

A The decoction of Prunell made with wine and water, doth joine together and make whole and ſound all wounds both inward and outward, euen as Bugle doth.

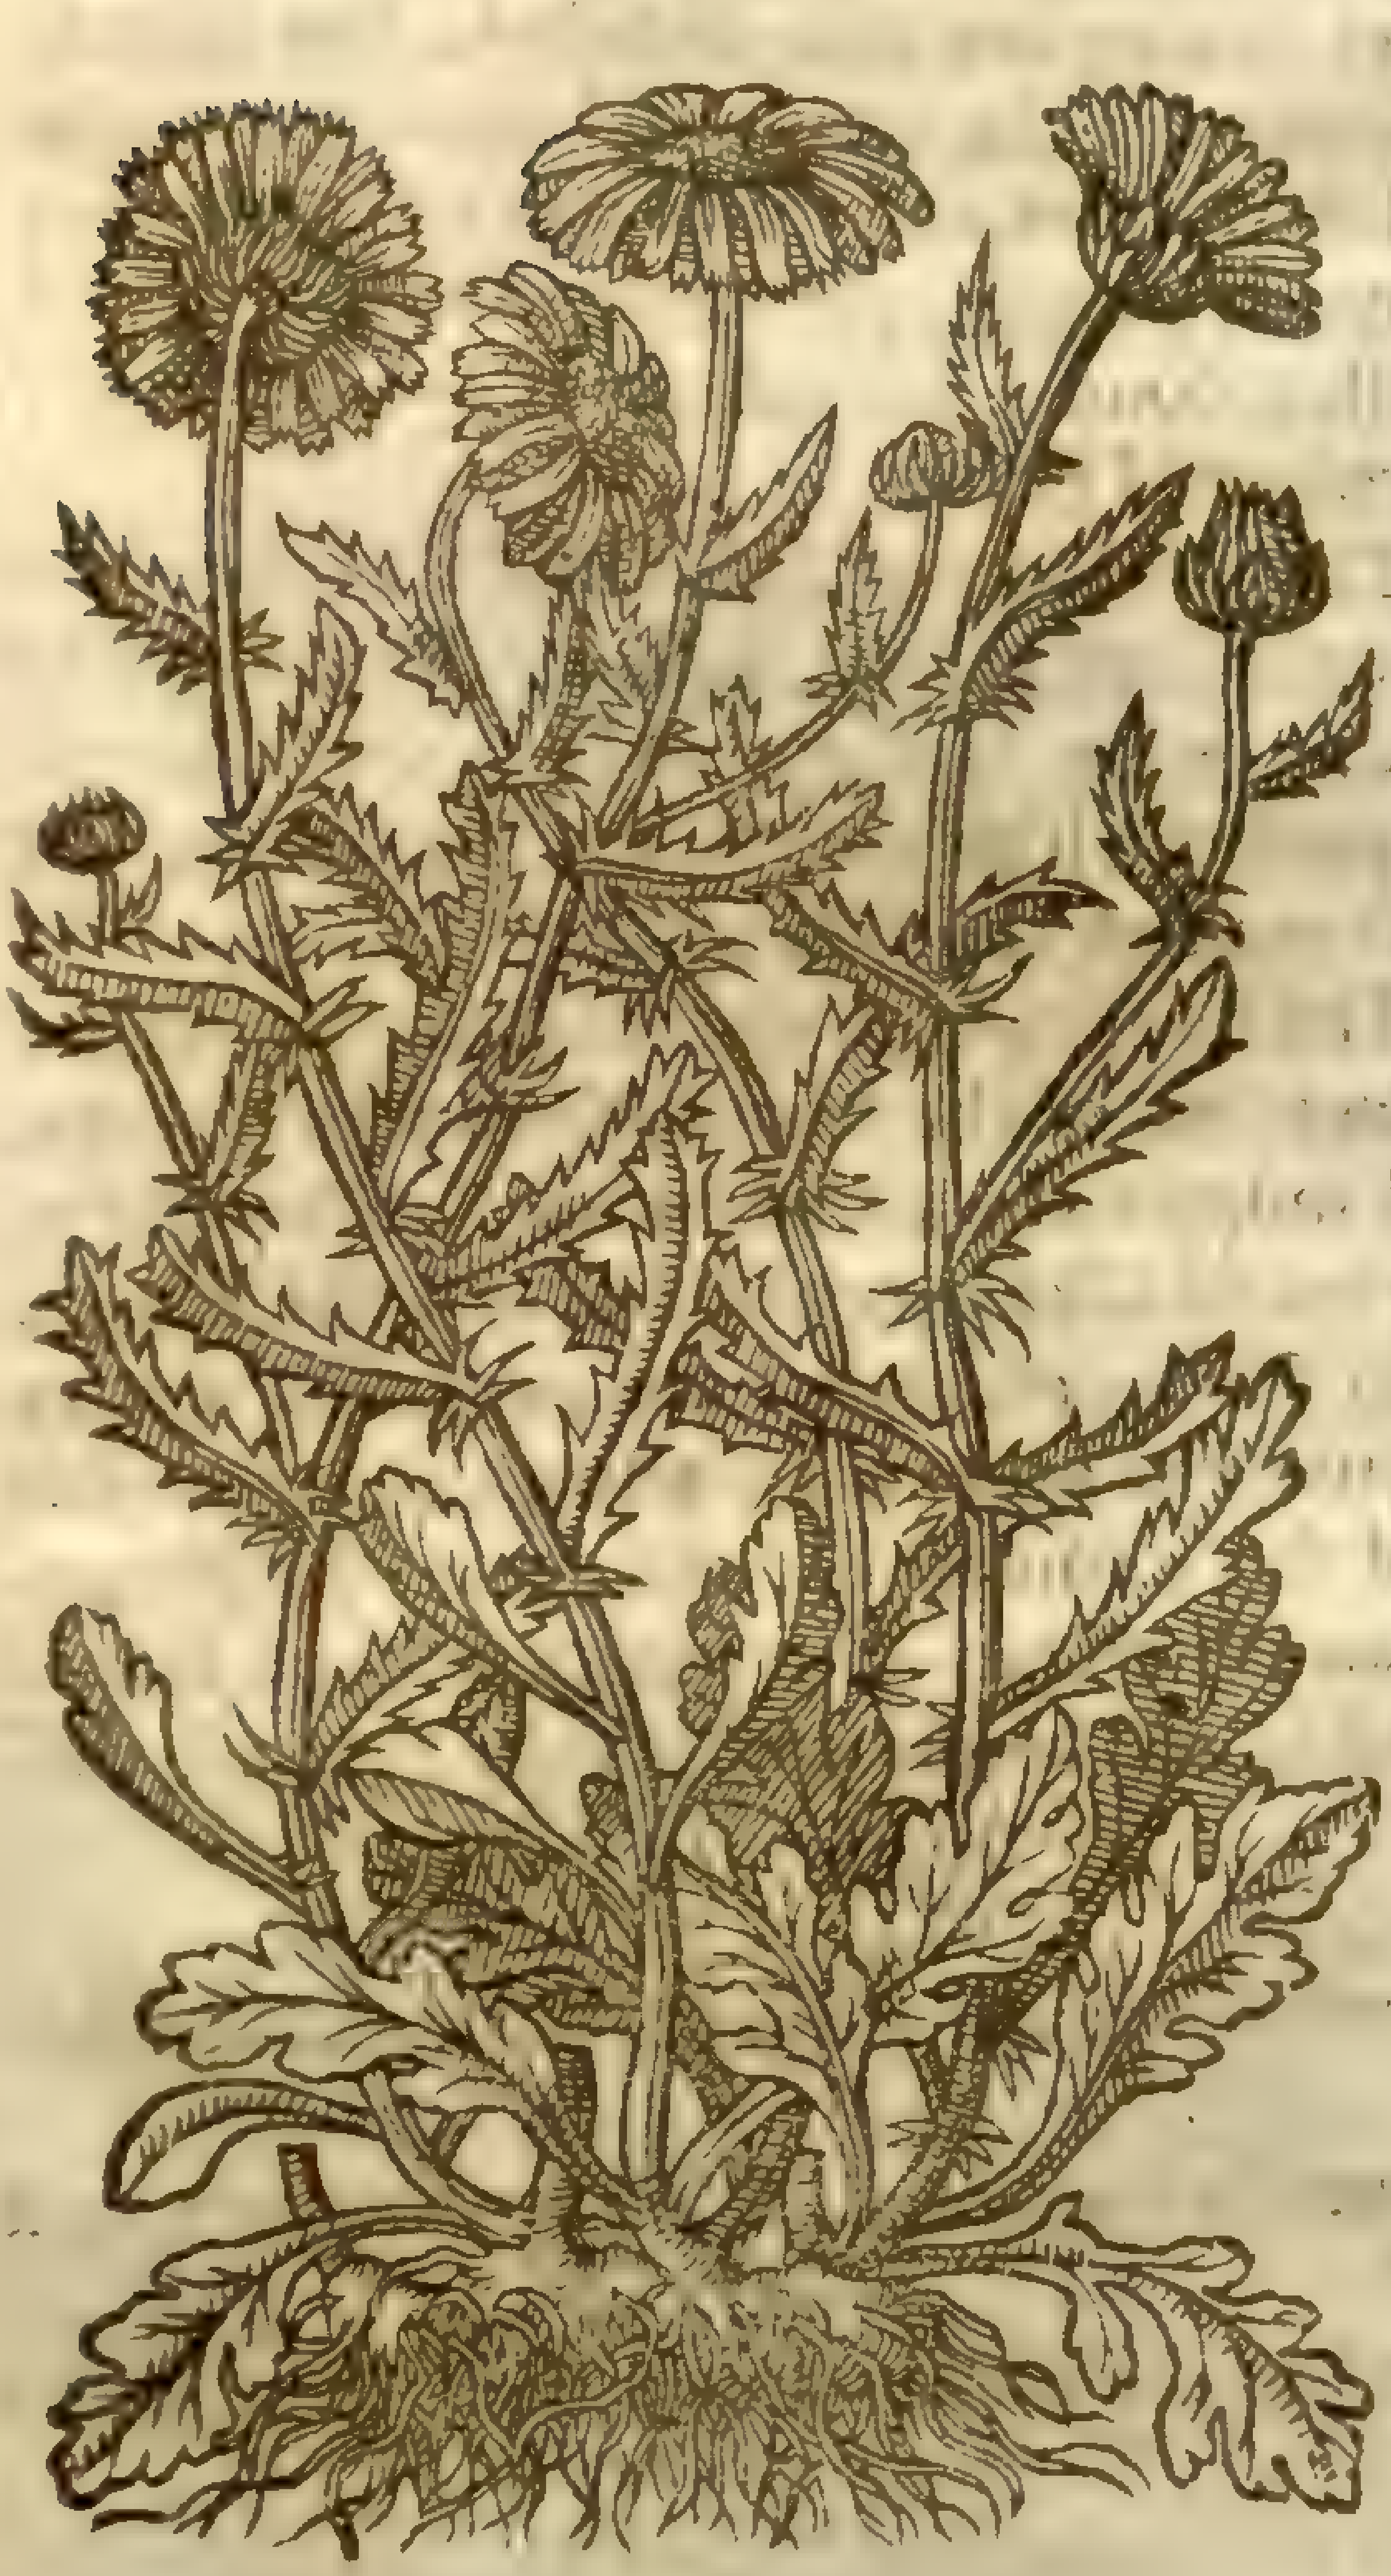
B Prunel bruiſed with oile of roſes and vineger, and laid to the forepart of the head, ſwageth and helpeth the pain and aking thereof.

C To be ſhort, it ſerueth for the ſame that Bugle doth, and in the world there are not two better wound herbs, as hath bin often proued.

D It is commended againſt the infirmities of the mouth, and eſpecially the ruggedneſſe, blacknes and drineſſe of the tongue, with a kinde of ſwelling in the ſame. It is an infirmitie among ſoldiers that lie in campe: the Germanes call it **De Braun**, which hapneth not without a continuall ague and frenſie. The remedie hereof is the decoction of Selfe-heale with common water, after bloud-letting out of the veins of the tongue; and the mouth and tongue muſt be often waſhed with the ſame decoction, and ſometimes a little vineger mixed therewith. This diſeaſe is thought to be vnknowne to the old writers: but notwithſtanding if it be conferred with that which *Paulus Ægineta* calleth *Eryſipelas cerebri*, an inflammation of the brain, then wil it not be thought to be much differing, if it be not the very ſame.

Chap. 202. *Of the great Daiſie, or Maudlin-wort.*

1 *Bellis major.*
The great Daiſie.



Chrysanthemum leucanthemum

¶ *The Deſcription.*

1 The great Daiſie hath very many broad leaues ſpred vpon the ground, ſomwhat indented about the edges, of a fingers bredth, not vnlike thoſe of Groundſwell: amongſt which riſe vp ſtalkes of the height of a cubit, ſet with the like leaues, but leſſer; in the top whereof grow large white floures with yellow thrummes in the middle like thoſe of the ſingle field Daiſie or May-weed, without any ſmell at all. The root is ful of ſtrings.

¶ *The Place.*

It groweth in medowes, and in the borders of fields almoſt euery where.

¶ *The Time.*

It floureth and flouriſheth in May and Iune.

¶ *The Names.*

It is called (as we haue ſaid) *Bellis major*, and alſo *Conſolida media vulnerariorum*, to make a difference between it and *Bugula*, which is the true *Conſolida media*. Notwithſtanding this is holden of all to be *Conſolida medij generis*, or a kinde of middle Conſound: in high Dutch, as *Fuchſius* reports, **Genſblume**: in Engliſh, the great Daiſie, and Maudlin-wort.

¶ *The Nature.*

This great Daiſie is moiſt in the end of the ſecond degree, and cold in the beginning of the ſame

¶ *The Vertues.*

A The leaues of the great Maudlin-wort are good againſt all burning vlcers and apoſtems, againſt the inflammation and running of the eies, being applied thereto.

B The ſame made vp in an vnguent or ſalue, with Wax, oile, and Turpentine, is moſt excellent for wounds, eſpecially thoſe wherein is any inflammation, and will not come to digeſtion or maturation, as are thoſe weeping wounds made in the knees, elbowes, and other joints.

C The juice, decoction, or diſtilled water is drunke to very good purpoſe againſt the rupture or any inward burſtings.

D The herb is good to be put into vulnerarie drinks or potions, as one ſimple belonging thereto moſt neceſſarie, to the which effect, the beſt practiſed do vſe it, as a ſimple in ſuch caſes of great effect.

E It likewiſe aſſwageth the cruell torments of the gout, vſed with a few mallowes and butter boiled and made to the forme of a pultis.

F The ſame receit aforeſaid vſed in cliſters, profiteth much ngainſt the vehement heate in agues, and ceaſeth the torments or wringing of the guts or bowels.

Chap. 203. *Of little Daiſies.*

¶ *The Deſcription.*

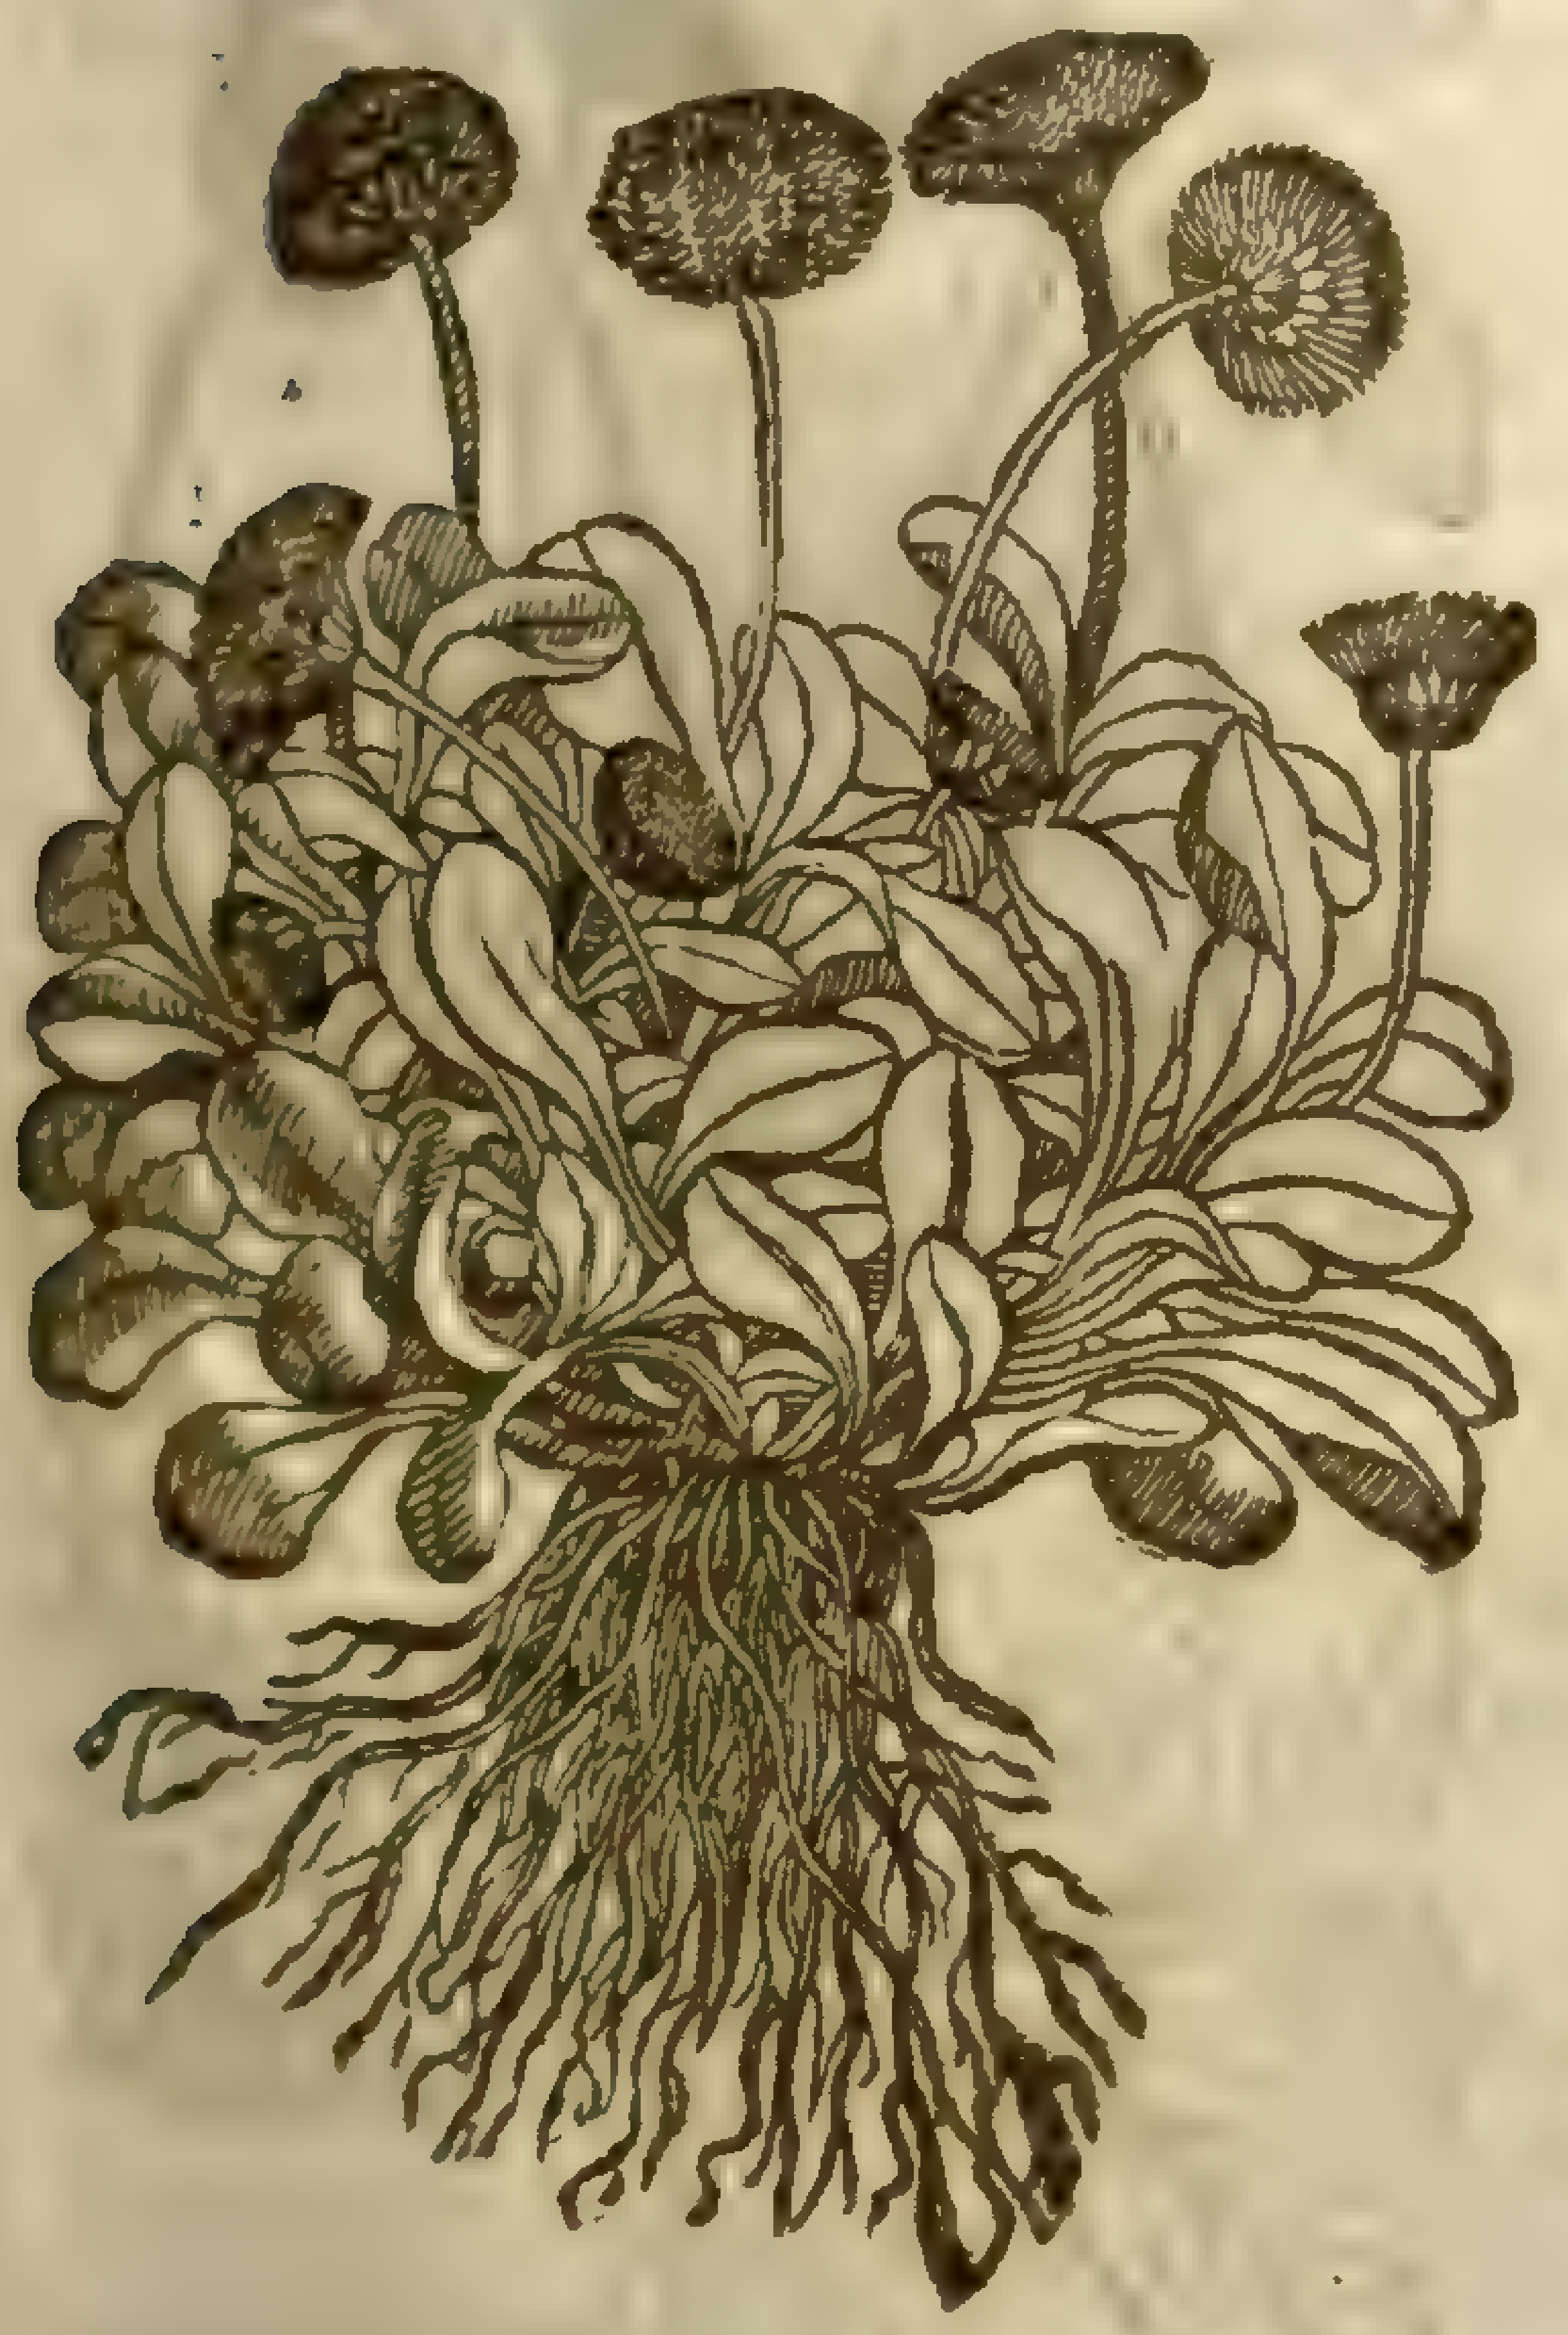
1 The Daiſie bringeth forth many leaues from a threddy root, ſmooth, fat, long, and ſomwhat round withall, very ſleightly indented about the edges, for the moſt part lying vpon the ground: among which riſe vp the floures, euerie one with his owne ſlender ſtem, almoſt like thoſe of Camomill, but leſſer, of a perfect white colour, and very double.

2 The double red Daiſie is like vnto the precedent in euerie reſpect, ſauing in the color of the floures; for this plant bringeth forth floures of a red colour; and the other white as aforeſaid.

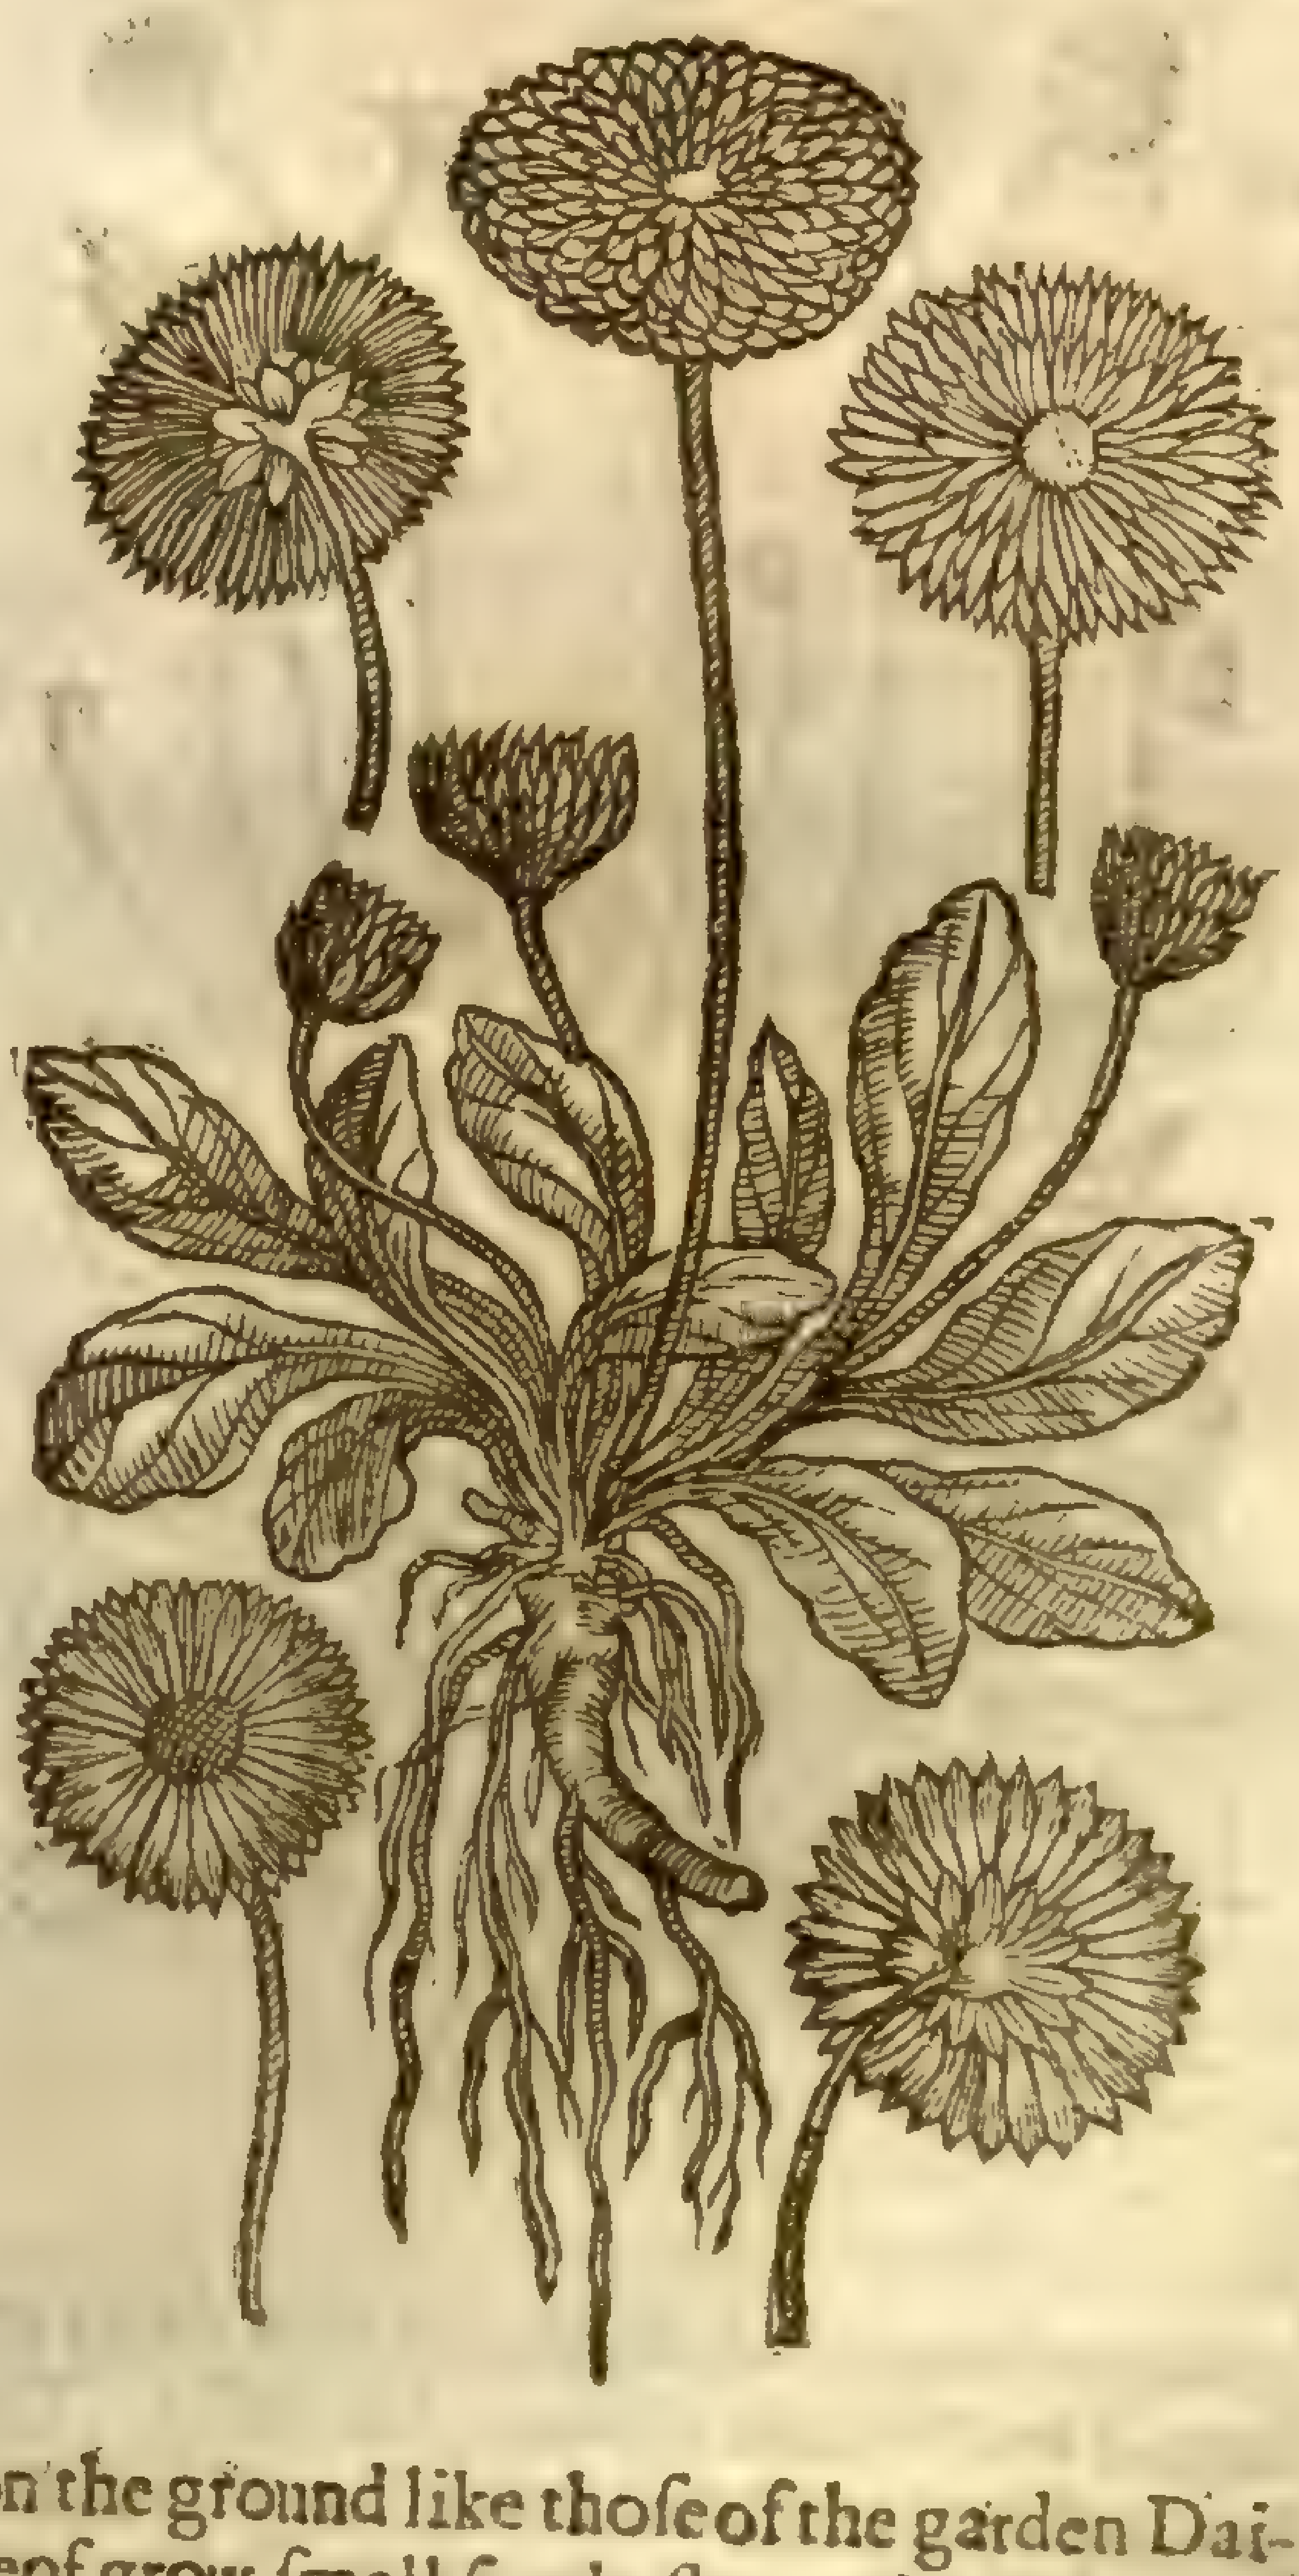
‡ Theſe double Daiſies are of two ſorts, that is to ſay, either ſmaller or larger; and theſe again either white or red, or of both mixed together: wherefore I haue giuen you in the firſt place the figure of the ſmall, and in the ſecond that of the larger.

3 Furthermore, There is another pretty Daiſie which differs from the firſt deſcribed onely in the floure, which at the ſides thereof puts forth many footſtalks, carrying alſo little double flours, being commonly of a red colour; ſo that each ſtalke carrieth as it were an old one and the brood thereof; whence they haue fitly termed it the childing Daiſie. ‡

1 *Bellis minor multiplex flore albo vel rubro.*
The leſſer double red or white Daiſie.



2 *Bellis media multiplex flore albo vel rubro.*
The larger double white or red Daiſie.

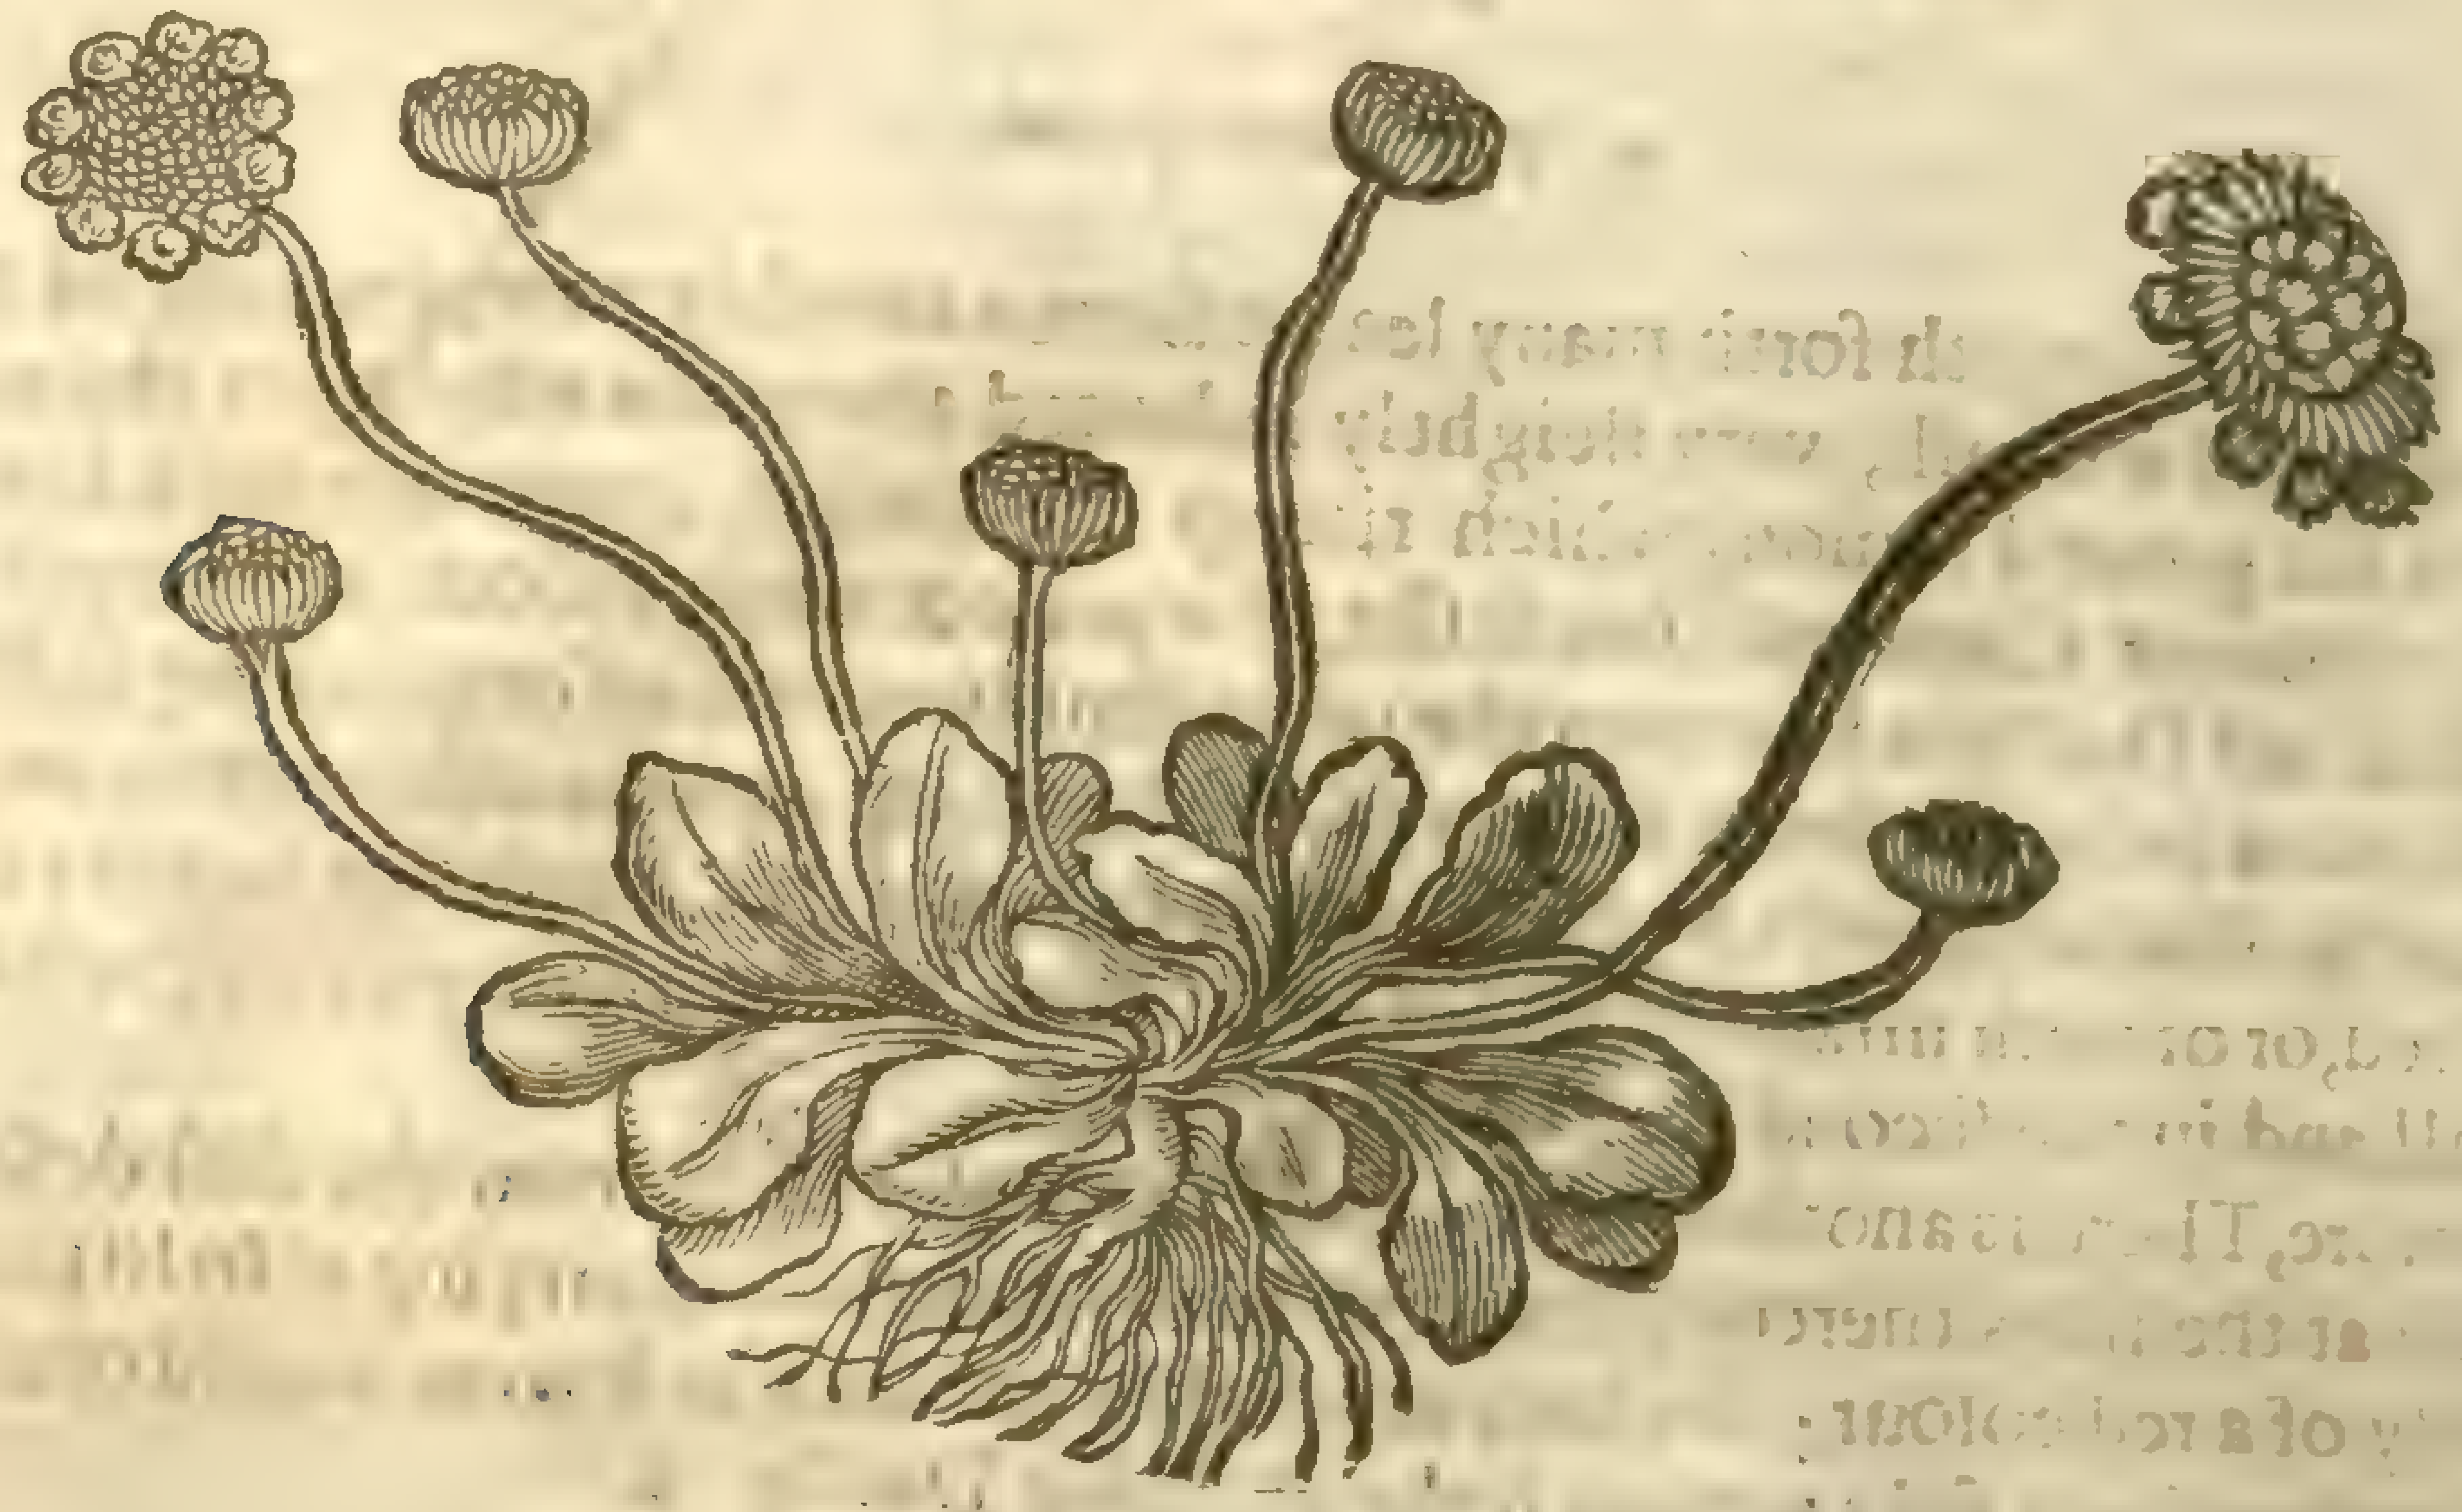


4 The wild field Daiſie hath many leaues ſpred vpon the ground like thoſe of the garden Daiſie; among which riſe vp ſlender ſtems; on the top whereof grow ſmall ſingle floures like thoſe of Camomill, ſet about a bunch of yellow thrums, with a pale of white leaues, ſometimes white, now and then red, and often of both mixed together: the root is threddy.

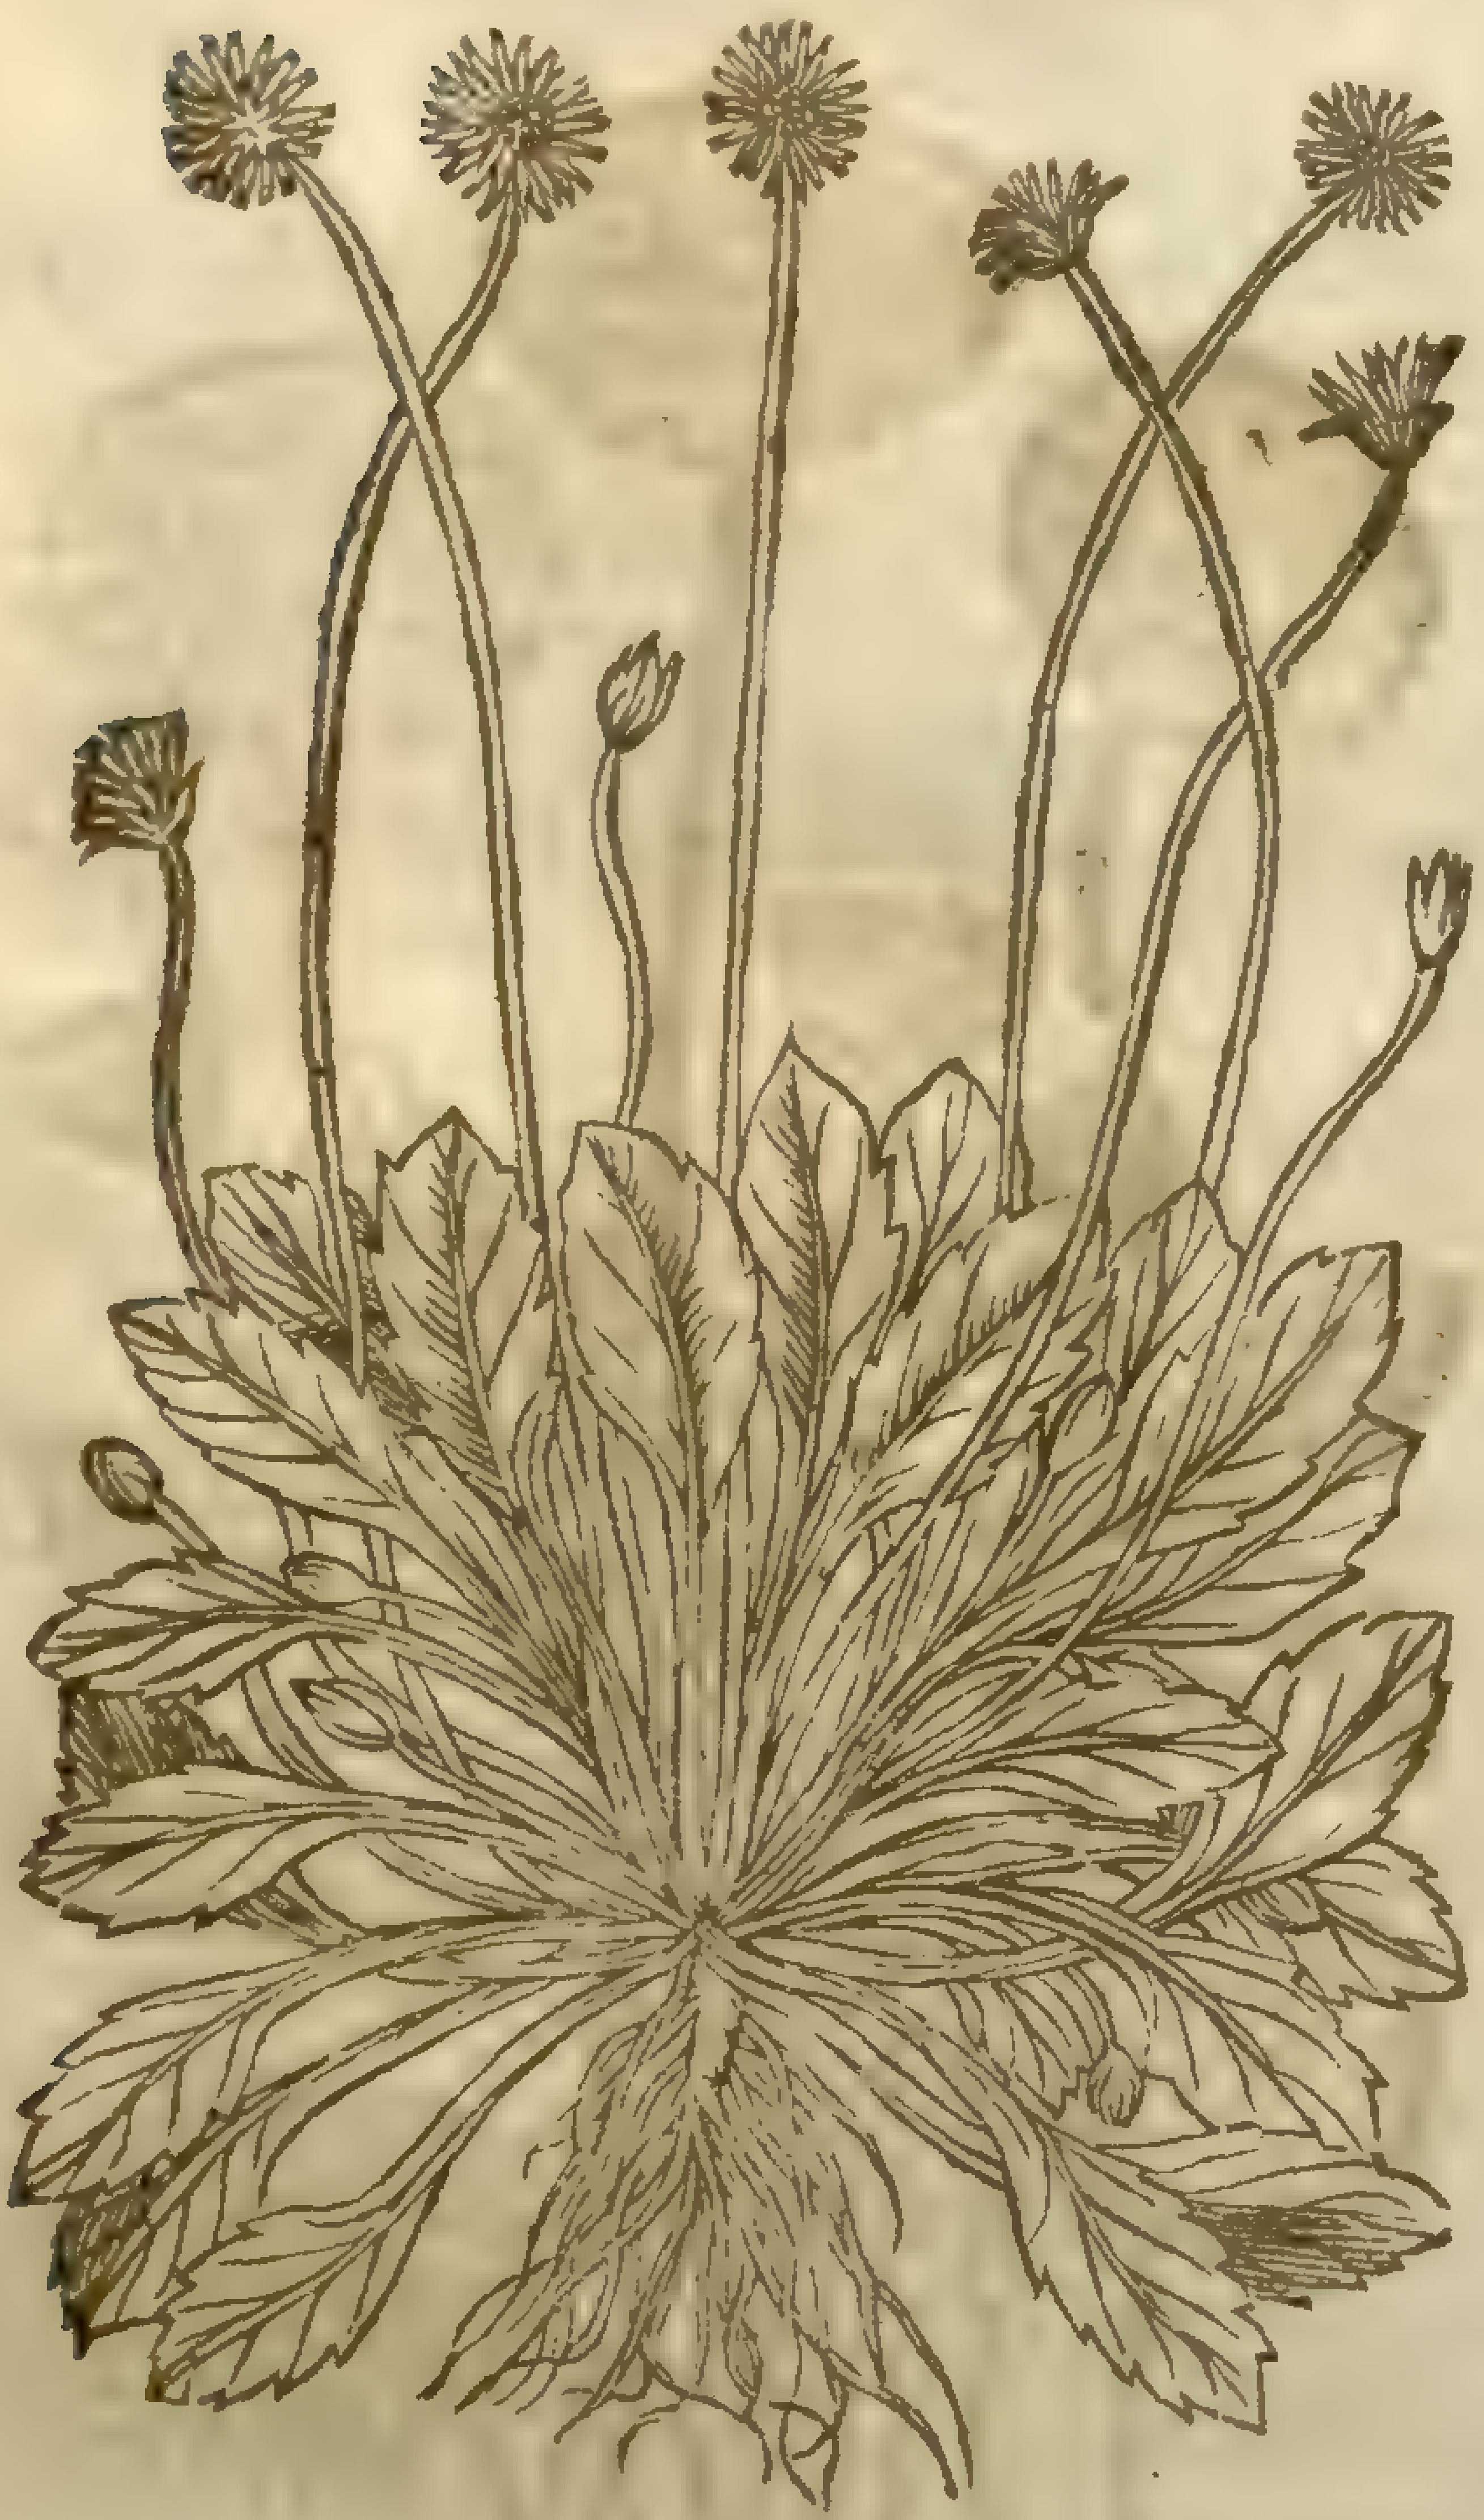
5 There doth likewiſe grow in the fields another ſort of wilde Daiſie, agreeing with the former in each reſpect, ſauing that it is ſomewhat greater than the other, and the leaues are ſomewhat more cut in the edges, and larger,

6 The blew Italian Daiſie hath many ſmall threddie roots, from the which riſe vp leaues like thoſe

‡ 3 *Bellis minor prolifera.*
Childing Daiſie.

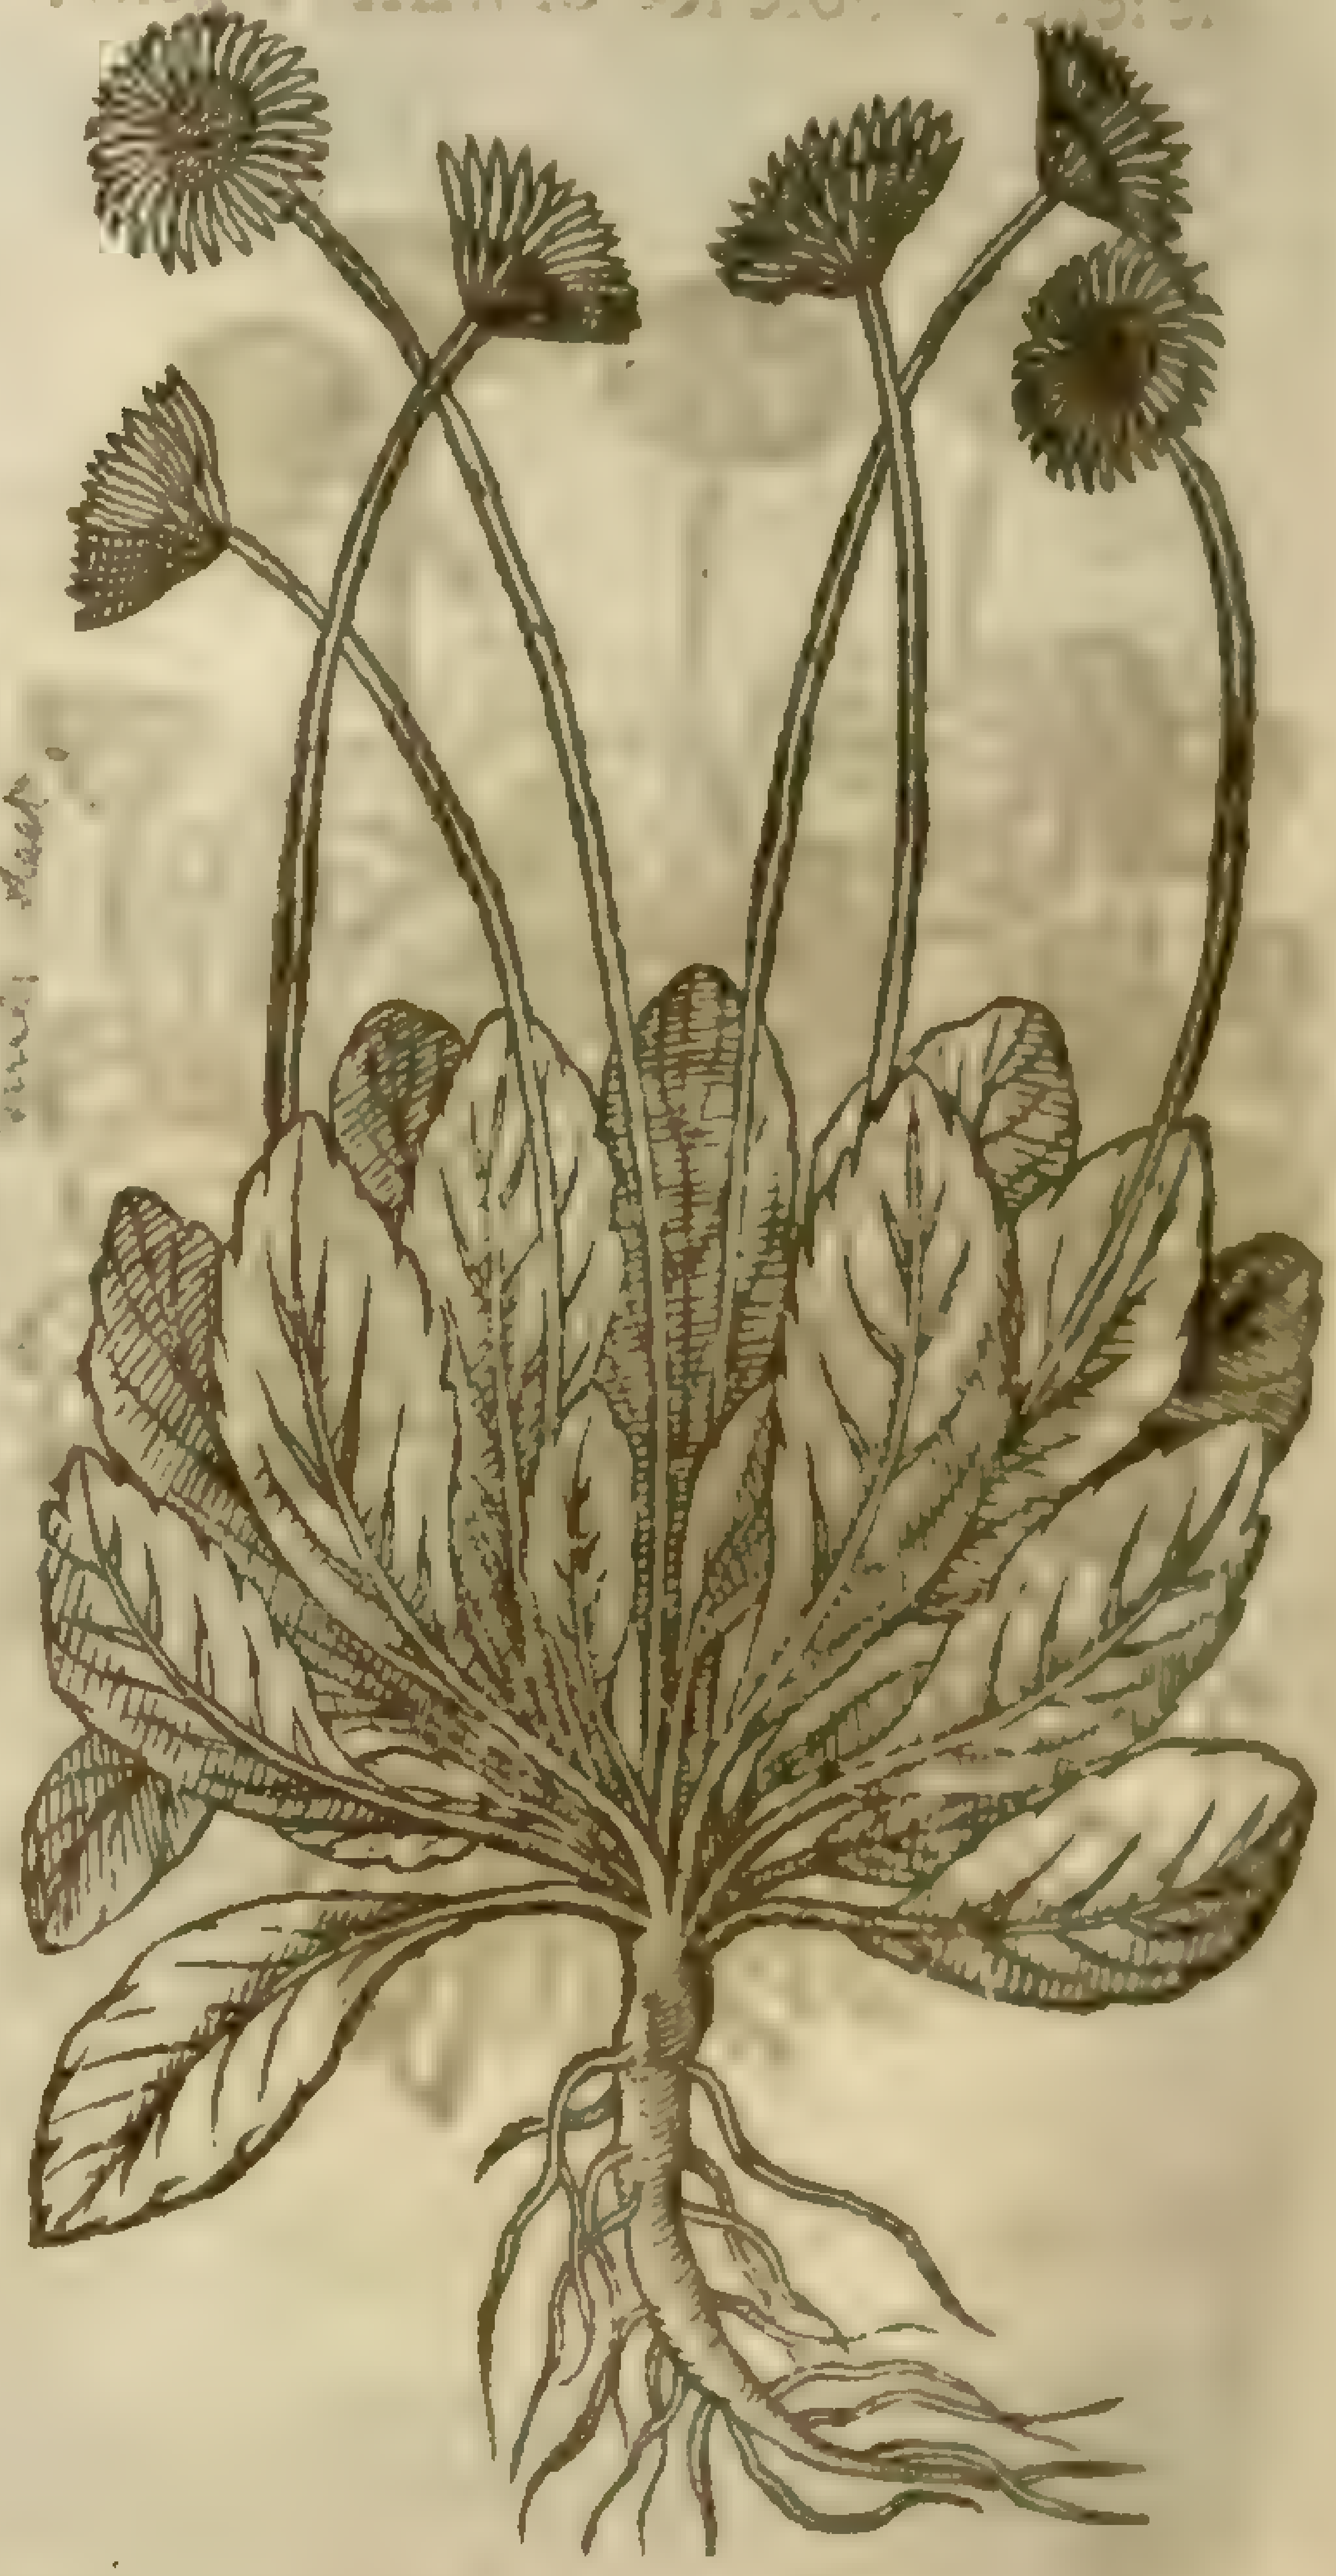


4 *Bellis minor ſylueſtris.*
The ſmall wilde Daiſie.



B. perennis, L.
Syn. pl. 3. [illegible]

5 *Bellis media ſylueſtris.*
The middle wilde Daiſie.



Bellis perennis –
[illegible]

those of the common Daiſie, of a darke green colour: among which comes vp a fat ſtem ſet round abont with the like leaues, but leſſer. The floures grow at the top globe-faſhion, or round like a ball, of a perfect blew colour, very like vnto the floures of mountain Scabious.

7 The French blew Daiſie is like vnto the other blew Daiſies in each reſpect, ſauing it is altogether leſſe, wherein conſiſteth the difference.

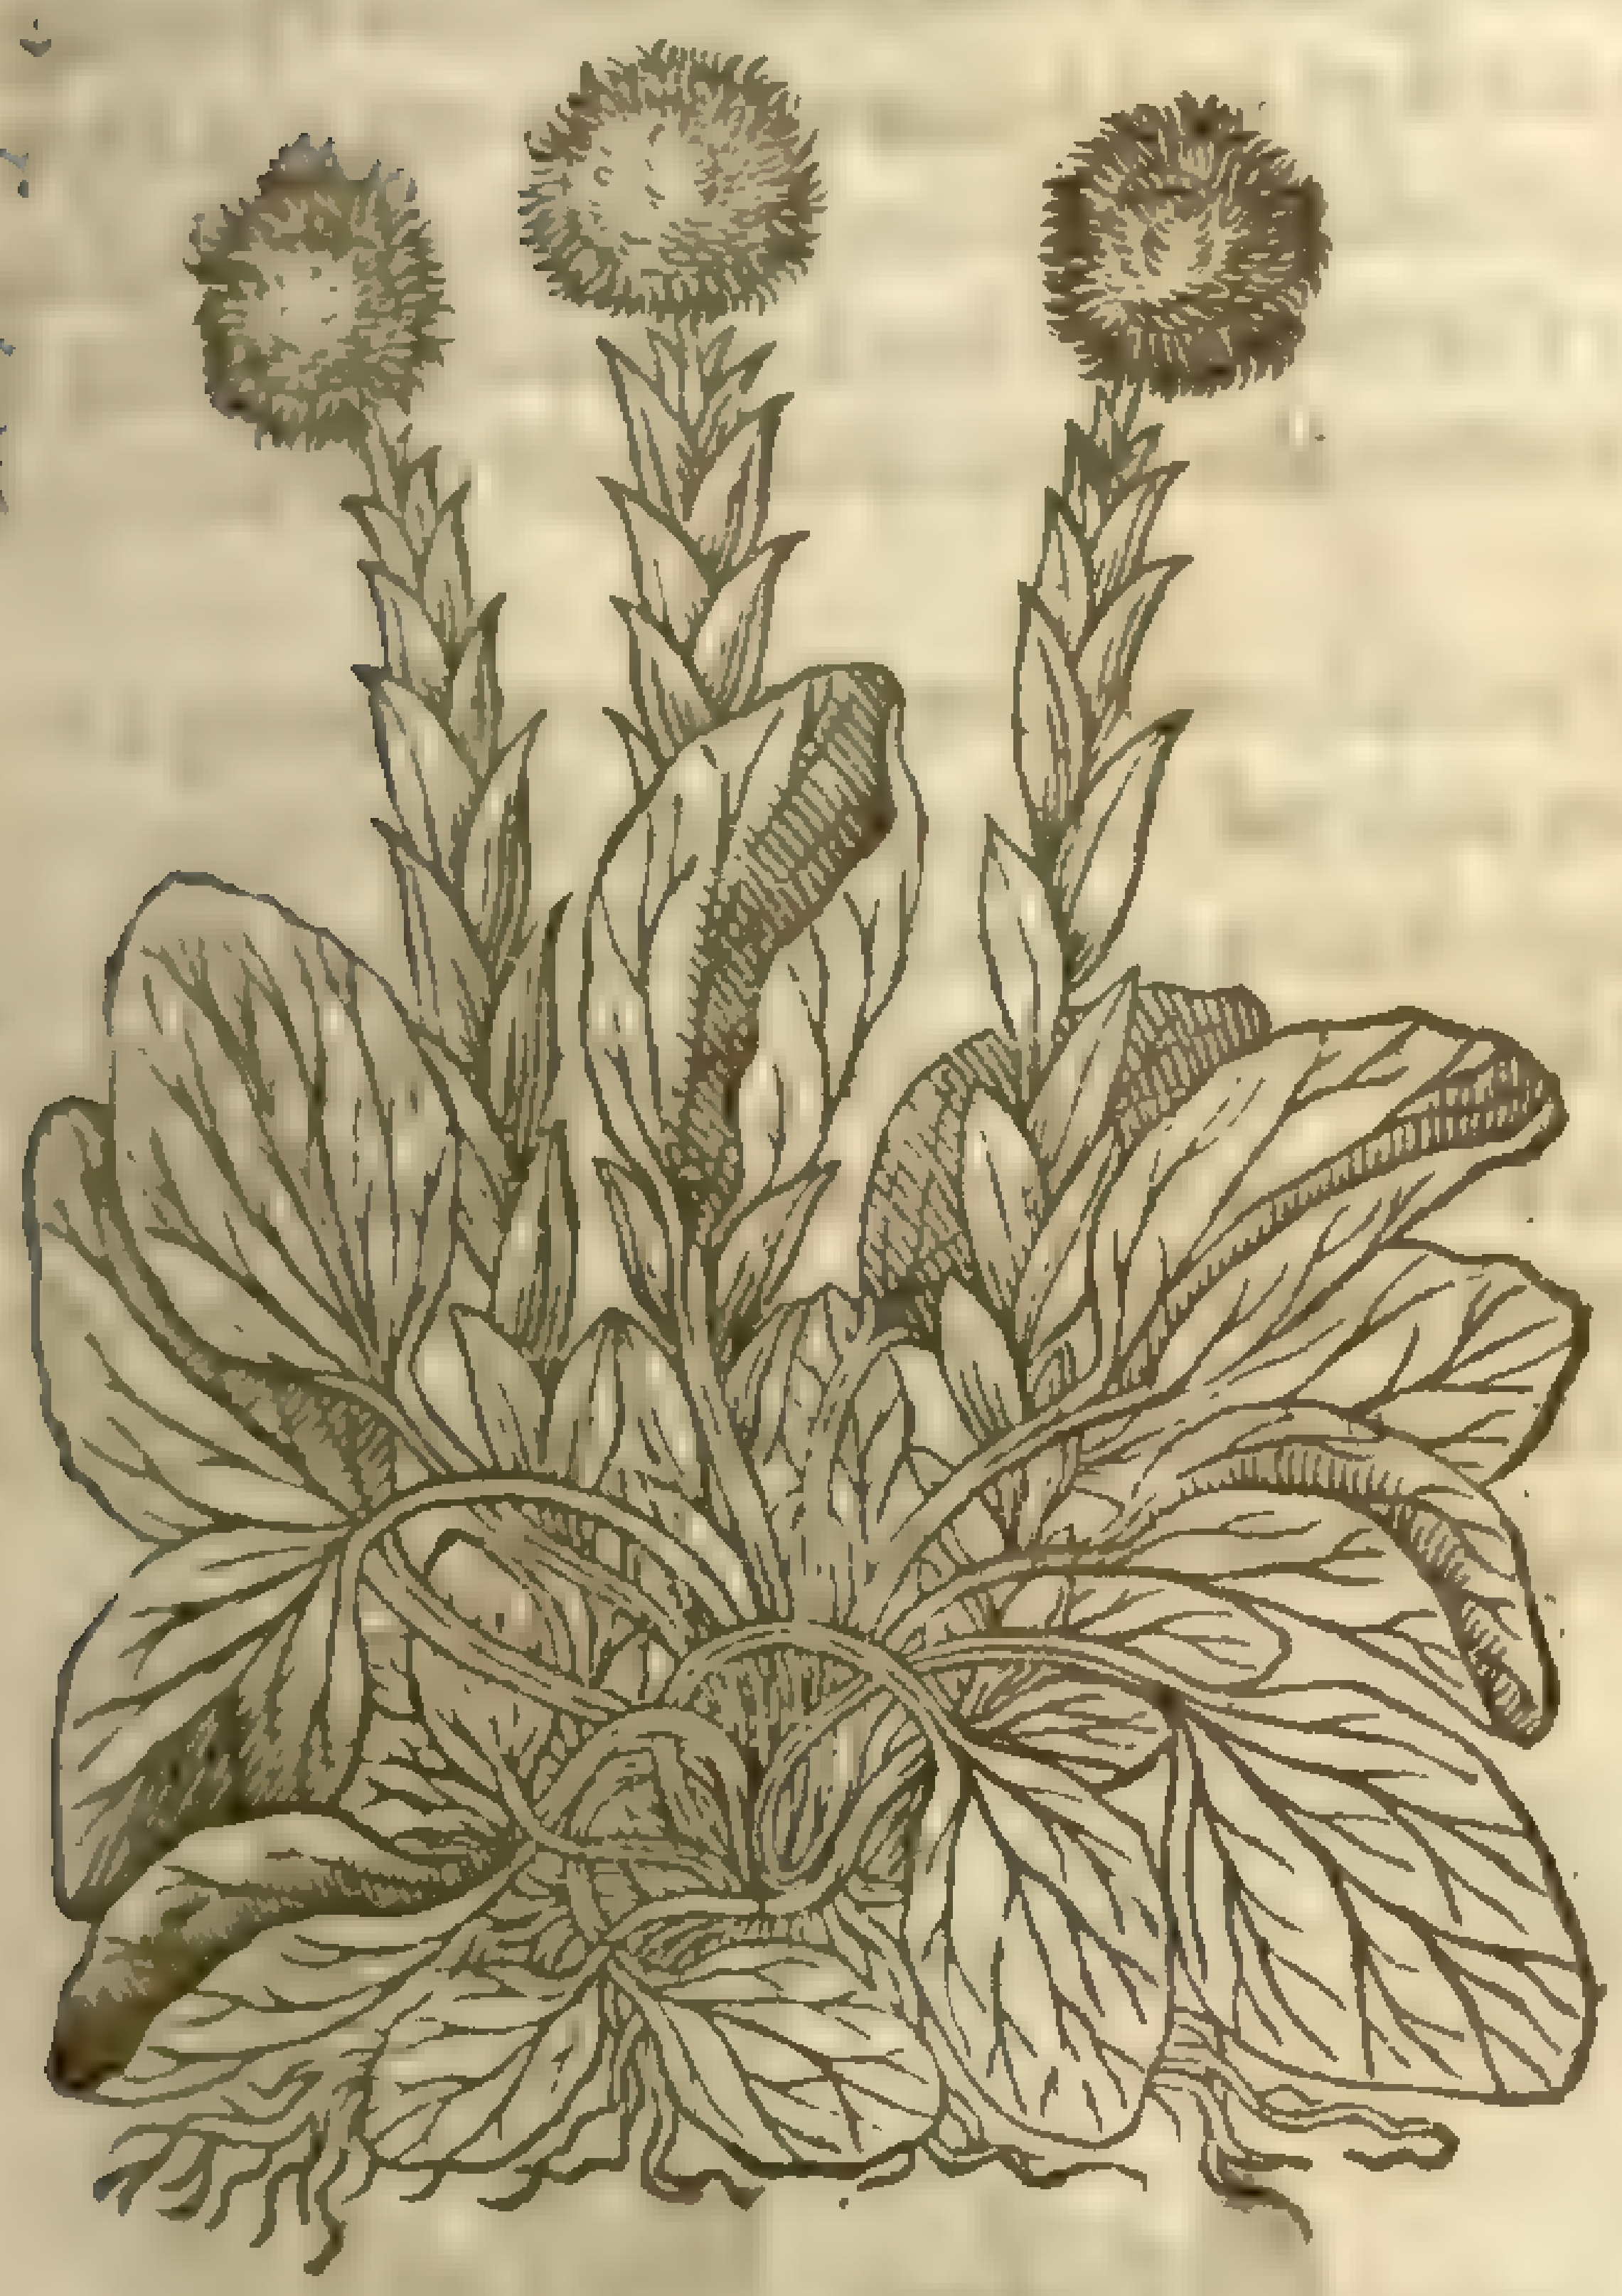
‡ There were formerly three figures and deſcriptions of this blew Daiſie, but one of them might haue ſerued; for they differ but in the talneſſe of their growth, and in the bredth and narrowneſſe of their leaues. ‡

¶ *The Place.*

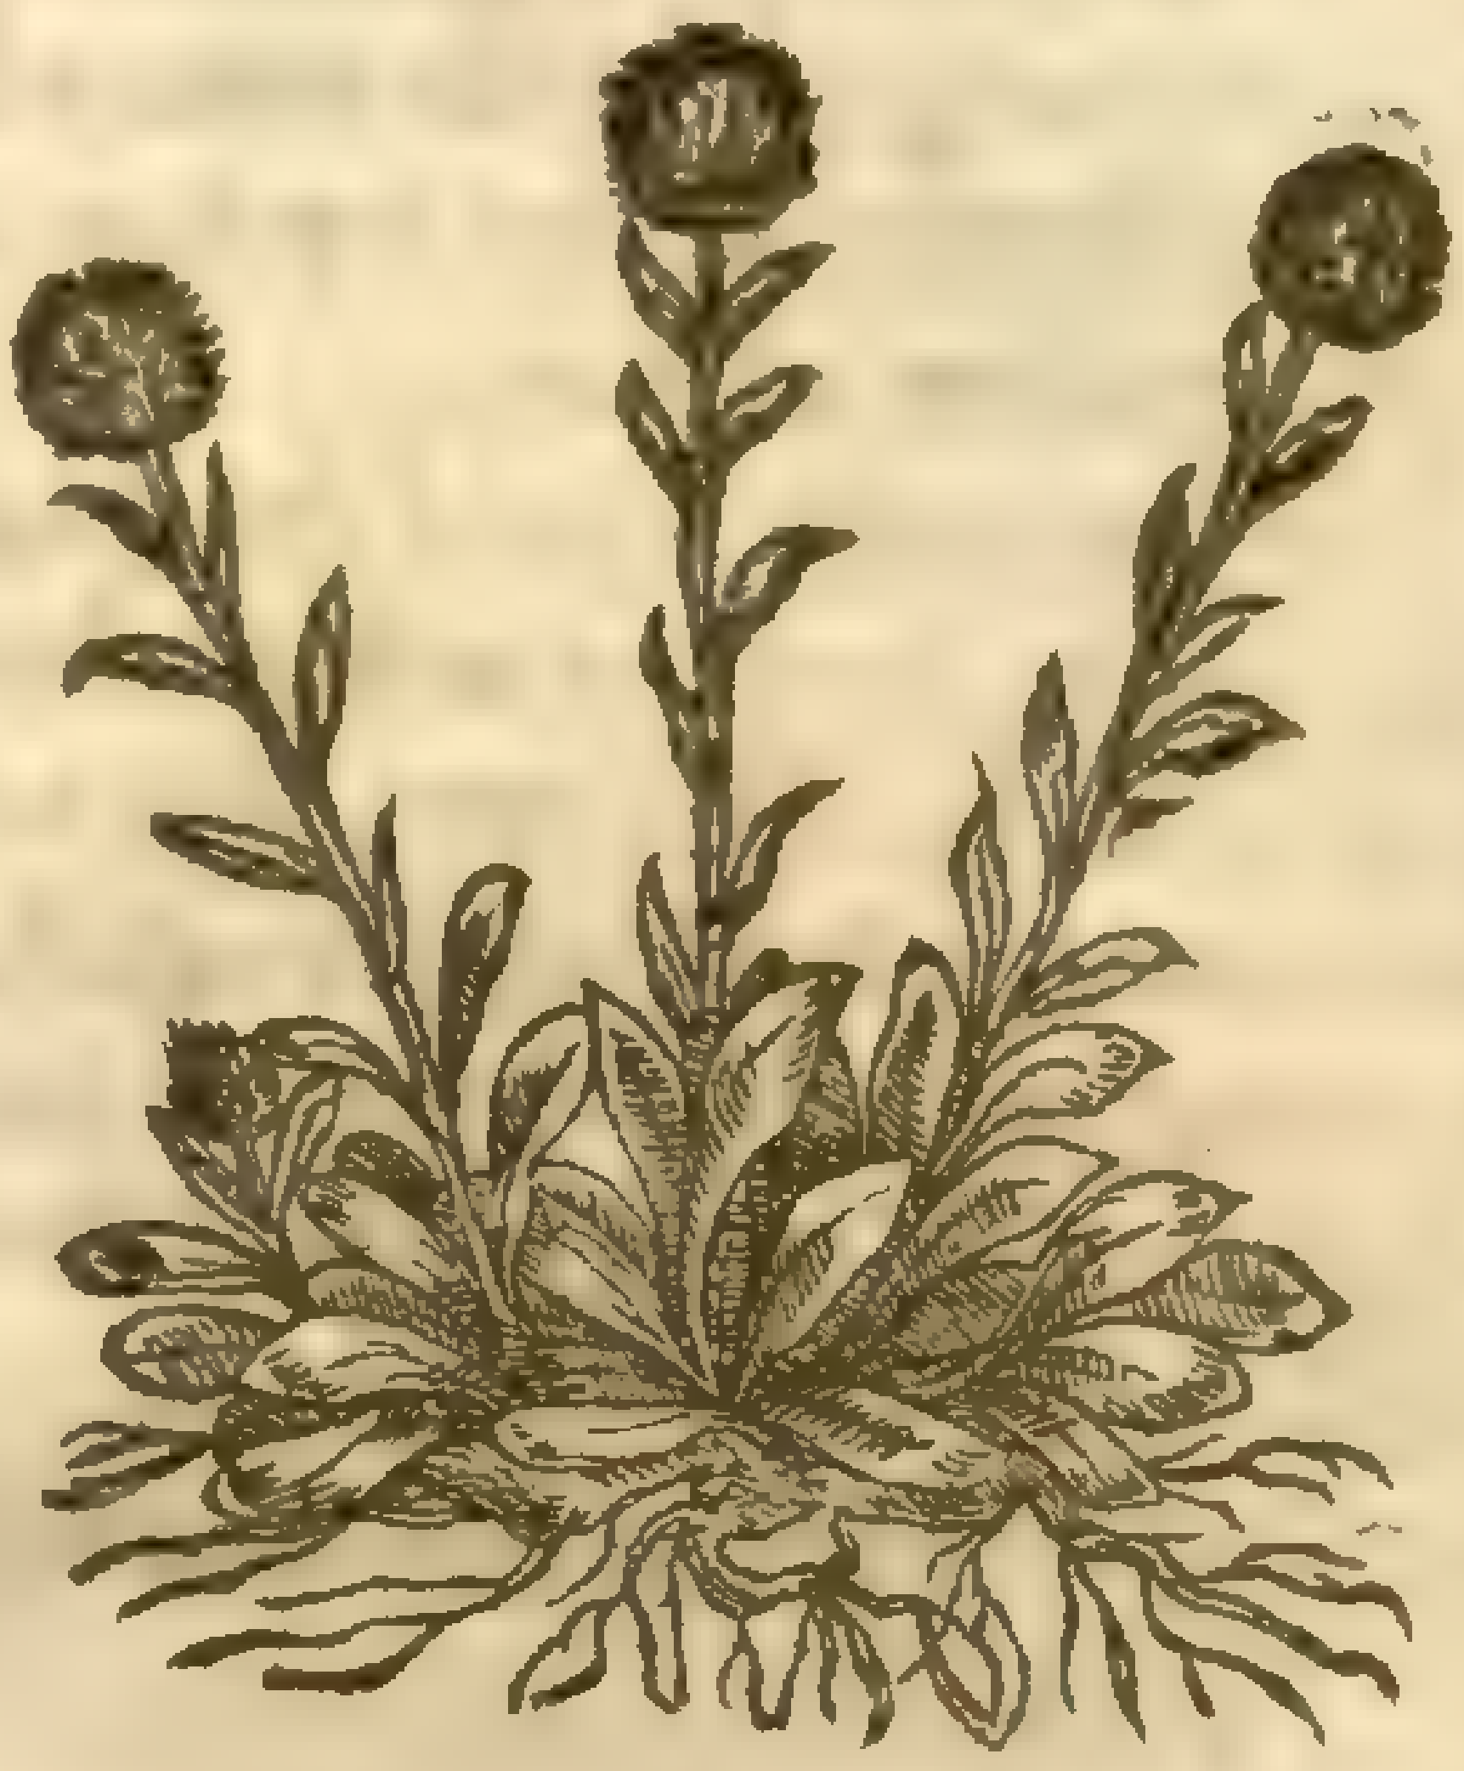
The double Daiſies are planted in gardens: the others grow wilde euery where.

The blew Daiſies are ſtrangers in England; their naturall place of abode is ſet forth in their ſeuerall titles.

6 *Bellis cærulea ſiue Globularia Apula.*
The blew Italian Daiſie.



7 *Bellis cærulea Monſpeliaca.*
Blew French Daiſies.



Globularia vulgaris L.

¶ *The Time.*

The Daiſies do floure moſt part of the Summer.

¶ *The Names.*

The Daiſie is called in high-Dutch, **Maßlieben**: in low-Dutch, **Margrieten**: in Latine, *Bellis minor*, and *Conſolida minor*, or the middle Conſound: of *Tragus*, *Primula veris*; but that name is more proper vnto Primroſe: of ſome, *Herba Margarita*, or Margarites herb: in French, *Marguerites*, and *Caſſaudes*: in Italian, *Fiori di prima veri gentili*: In Engliſh, Daiſies, and Bruiſewort.

The blew Daiſie is called *Bellis cærulea*: of ſome, *Globularia*, of the round forme of the floure: it is alſo called *Aphyllanthes*, and *Frondiflora*: in Italian, *Botanaria*: in Engliſh, Blew Daiſies, & Globe Daiſie.

¶ *The Temperature.*

The leſſer Daiſes are cold and moiſt, being moiſt in the end of the ſecond degree, and cold in the beginning of the ſame.

¶ *The Vertues.*

A The Daiſies do mitigate all kinde of paines, but eſpecially in the joints, and gout proceeding from an hot and dry humor, if they be ſtamped with new butter vnſalted, and applied vpon the pained place: but they worke more effectually if Mallowes be added thereto.

B The leaues of Daiſies vſed among other pot-herbs, do make the belly ſoluble; and they are alſo put into Clyſters with good ſucceſſe, in hot burning feuers, and againſt the inflammation of the inteſtines.

C The juice of the leaues and roots ſnift vp into the noſthrils, purgeth the head mightily of foule and filthy ſlimy humors, and helpeth the megrim.

D The ſame giuen to little dogs with milke, keepeth them from growing great.

E The leaues ſtamped take away bruiſes and ſwellings proceeding of ſome ſtroke, if they be ſtamped and laid thereon; whereupon it was called in old time Bruiſewort.

F The juice put into the eies cleareth them, and taketh away the watering of them.

G The decoction of the field Daiſie (which is the beſt for phyſicks vſe) made in water and drunke, is good againſt agues, inflammation of the liuer and all other the inward parts.

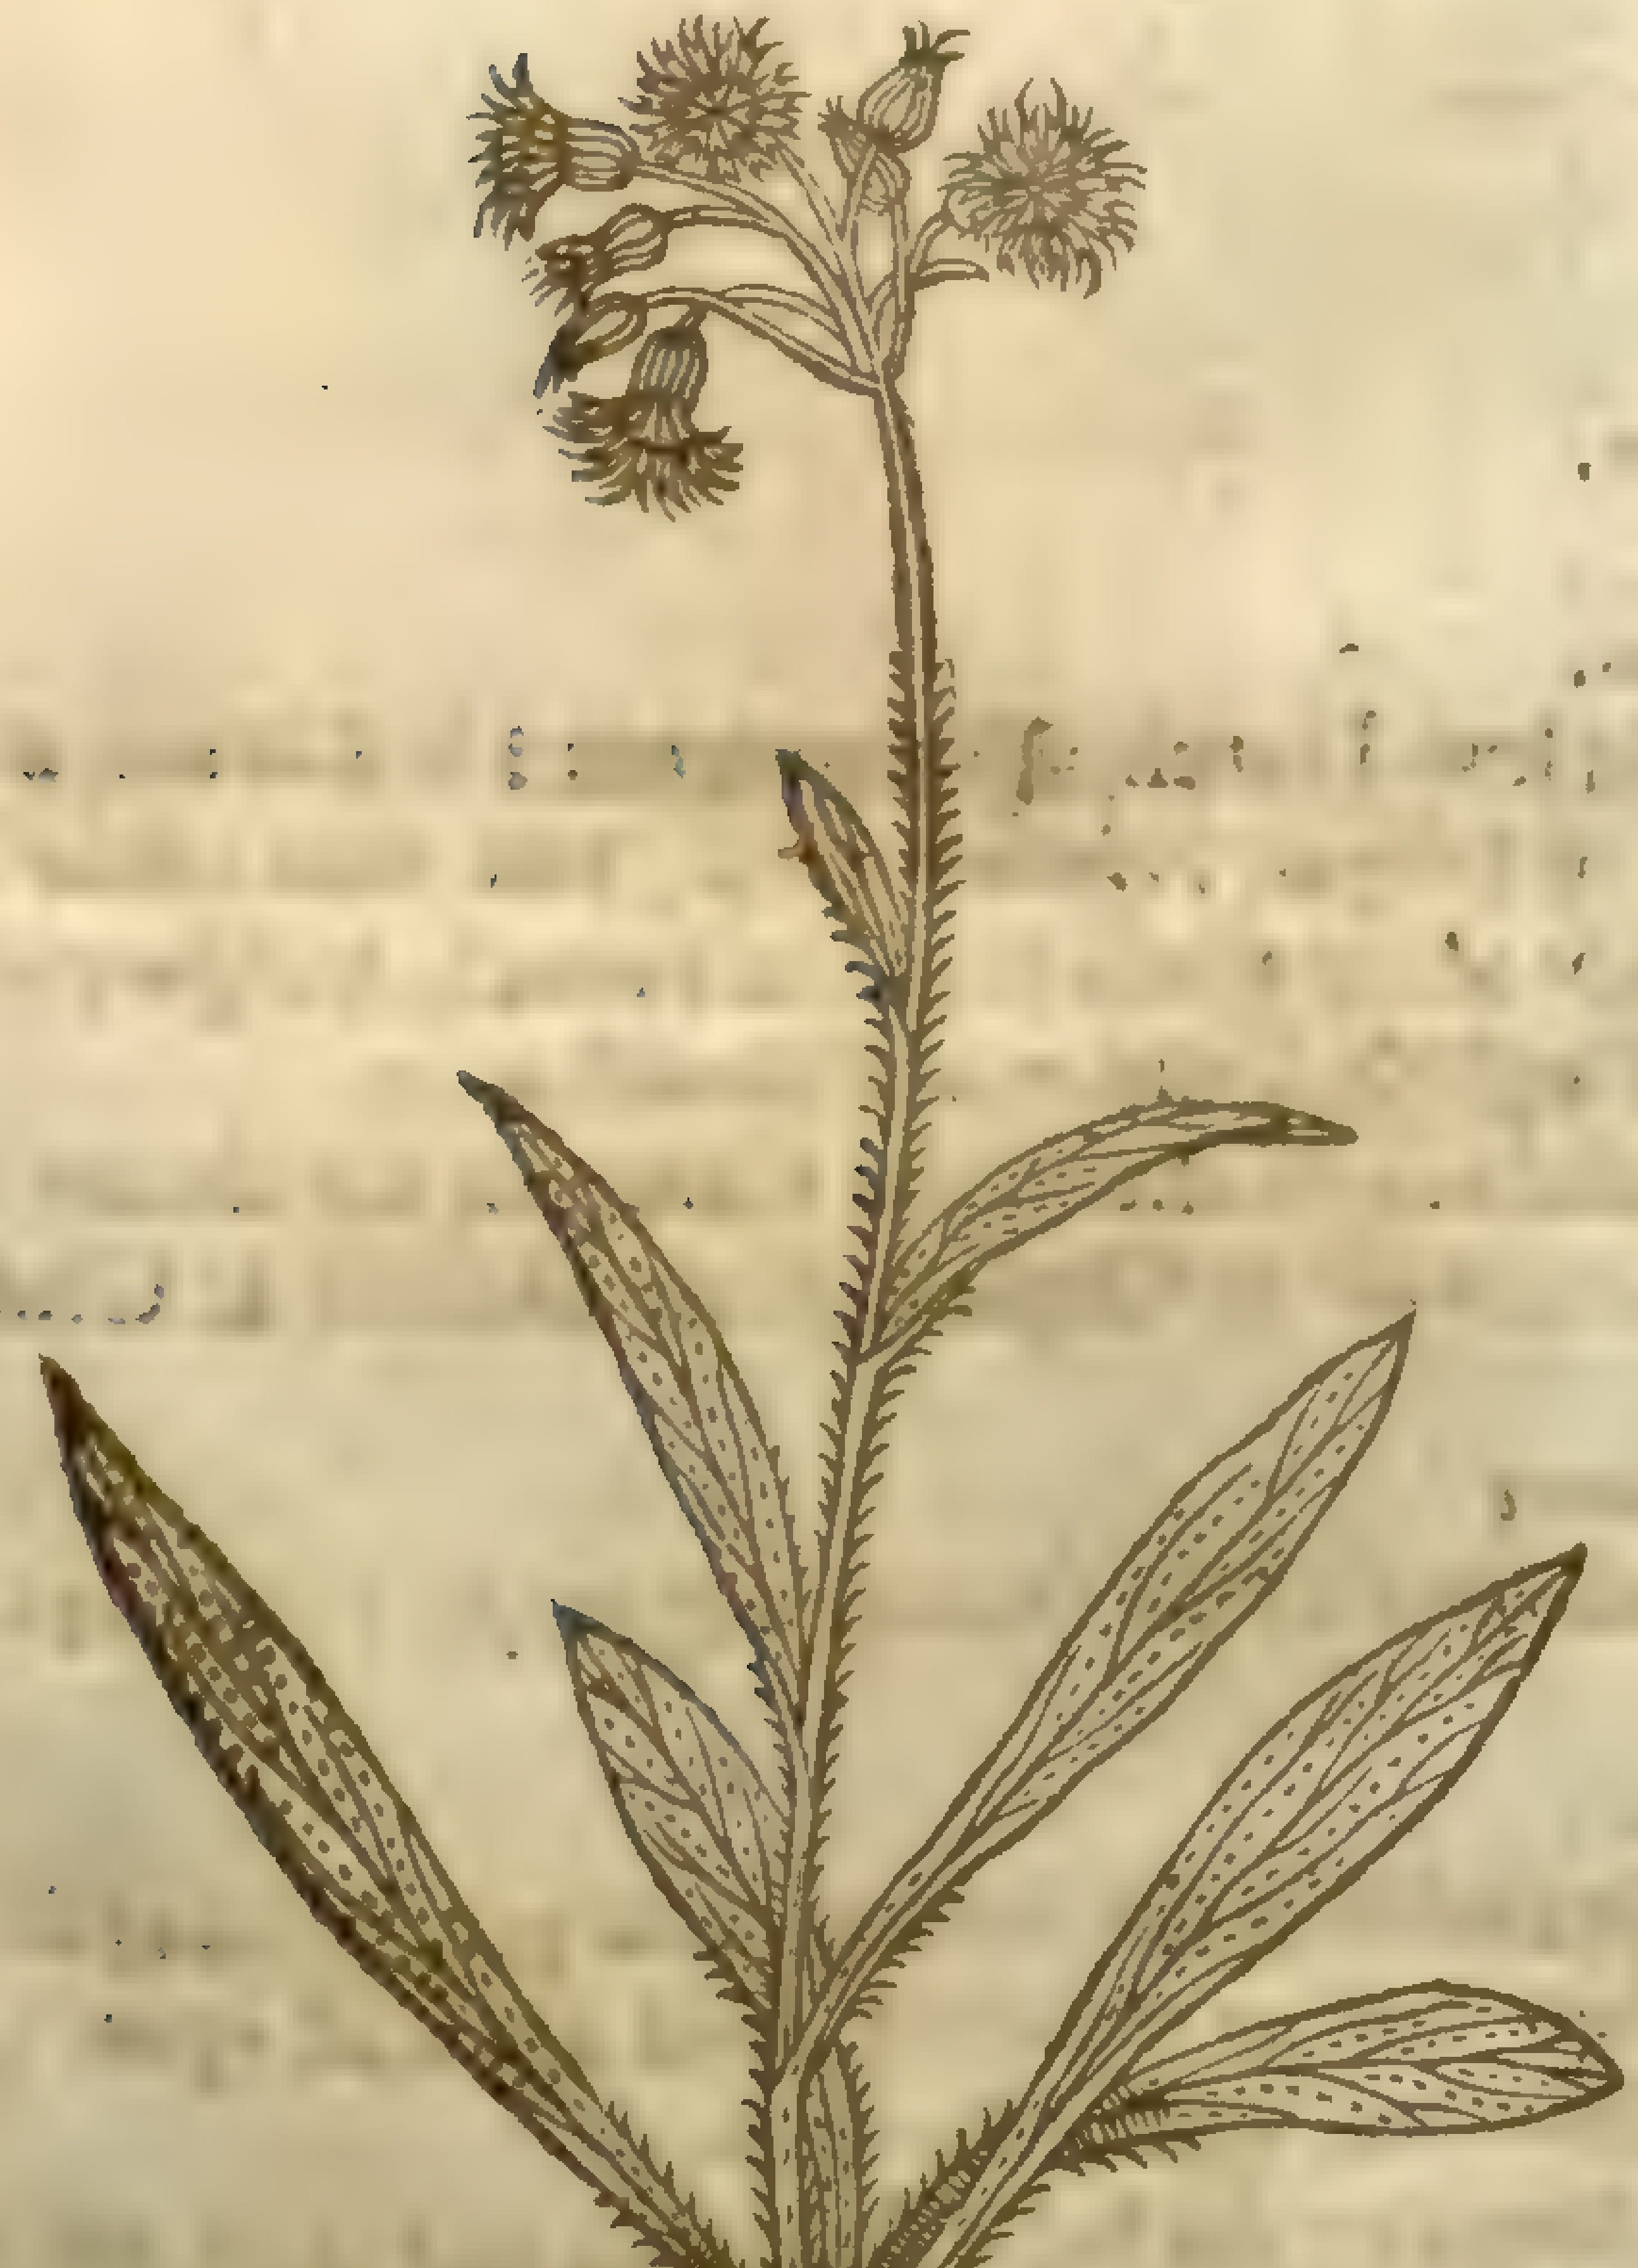
Chap. 204. *Of Mouſe-eare.*

¶ *The Deſcription.*

1 The great Mouſe-eare hath great and large leaues greater than our common *Pyloſella*, or Mouſe-eare, thicke, and full of ſubſtance: the ſtalkes and leaues bee hoary and white, with a ſilken moſſineſſe in handling like ſilke, pleaſant and faire in view: it bears three or foure quadrangle ſtalkes ſomewhat knotty, a foot long: the roots are hard, wooddy, and full of ſtrings; the floures come forth at the top of the ſtalk, like vnto the ſmall Piſſeabed or Dandelion, of a bright yellow colour.

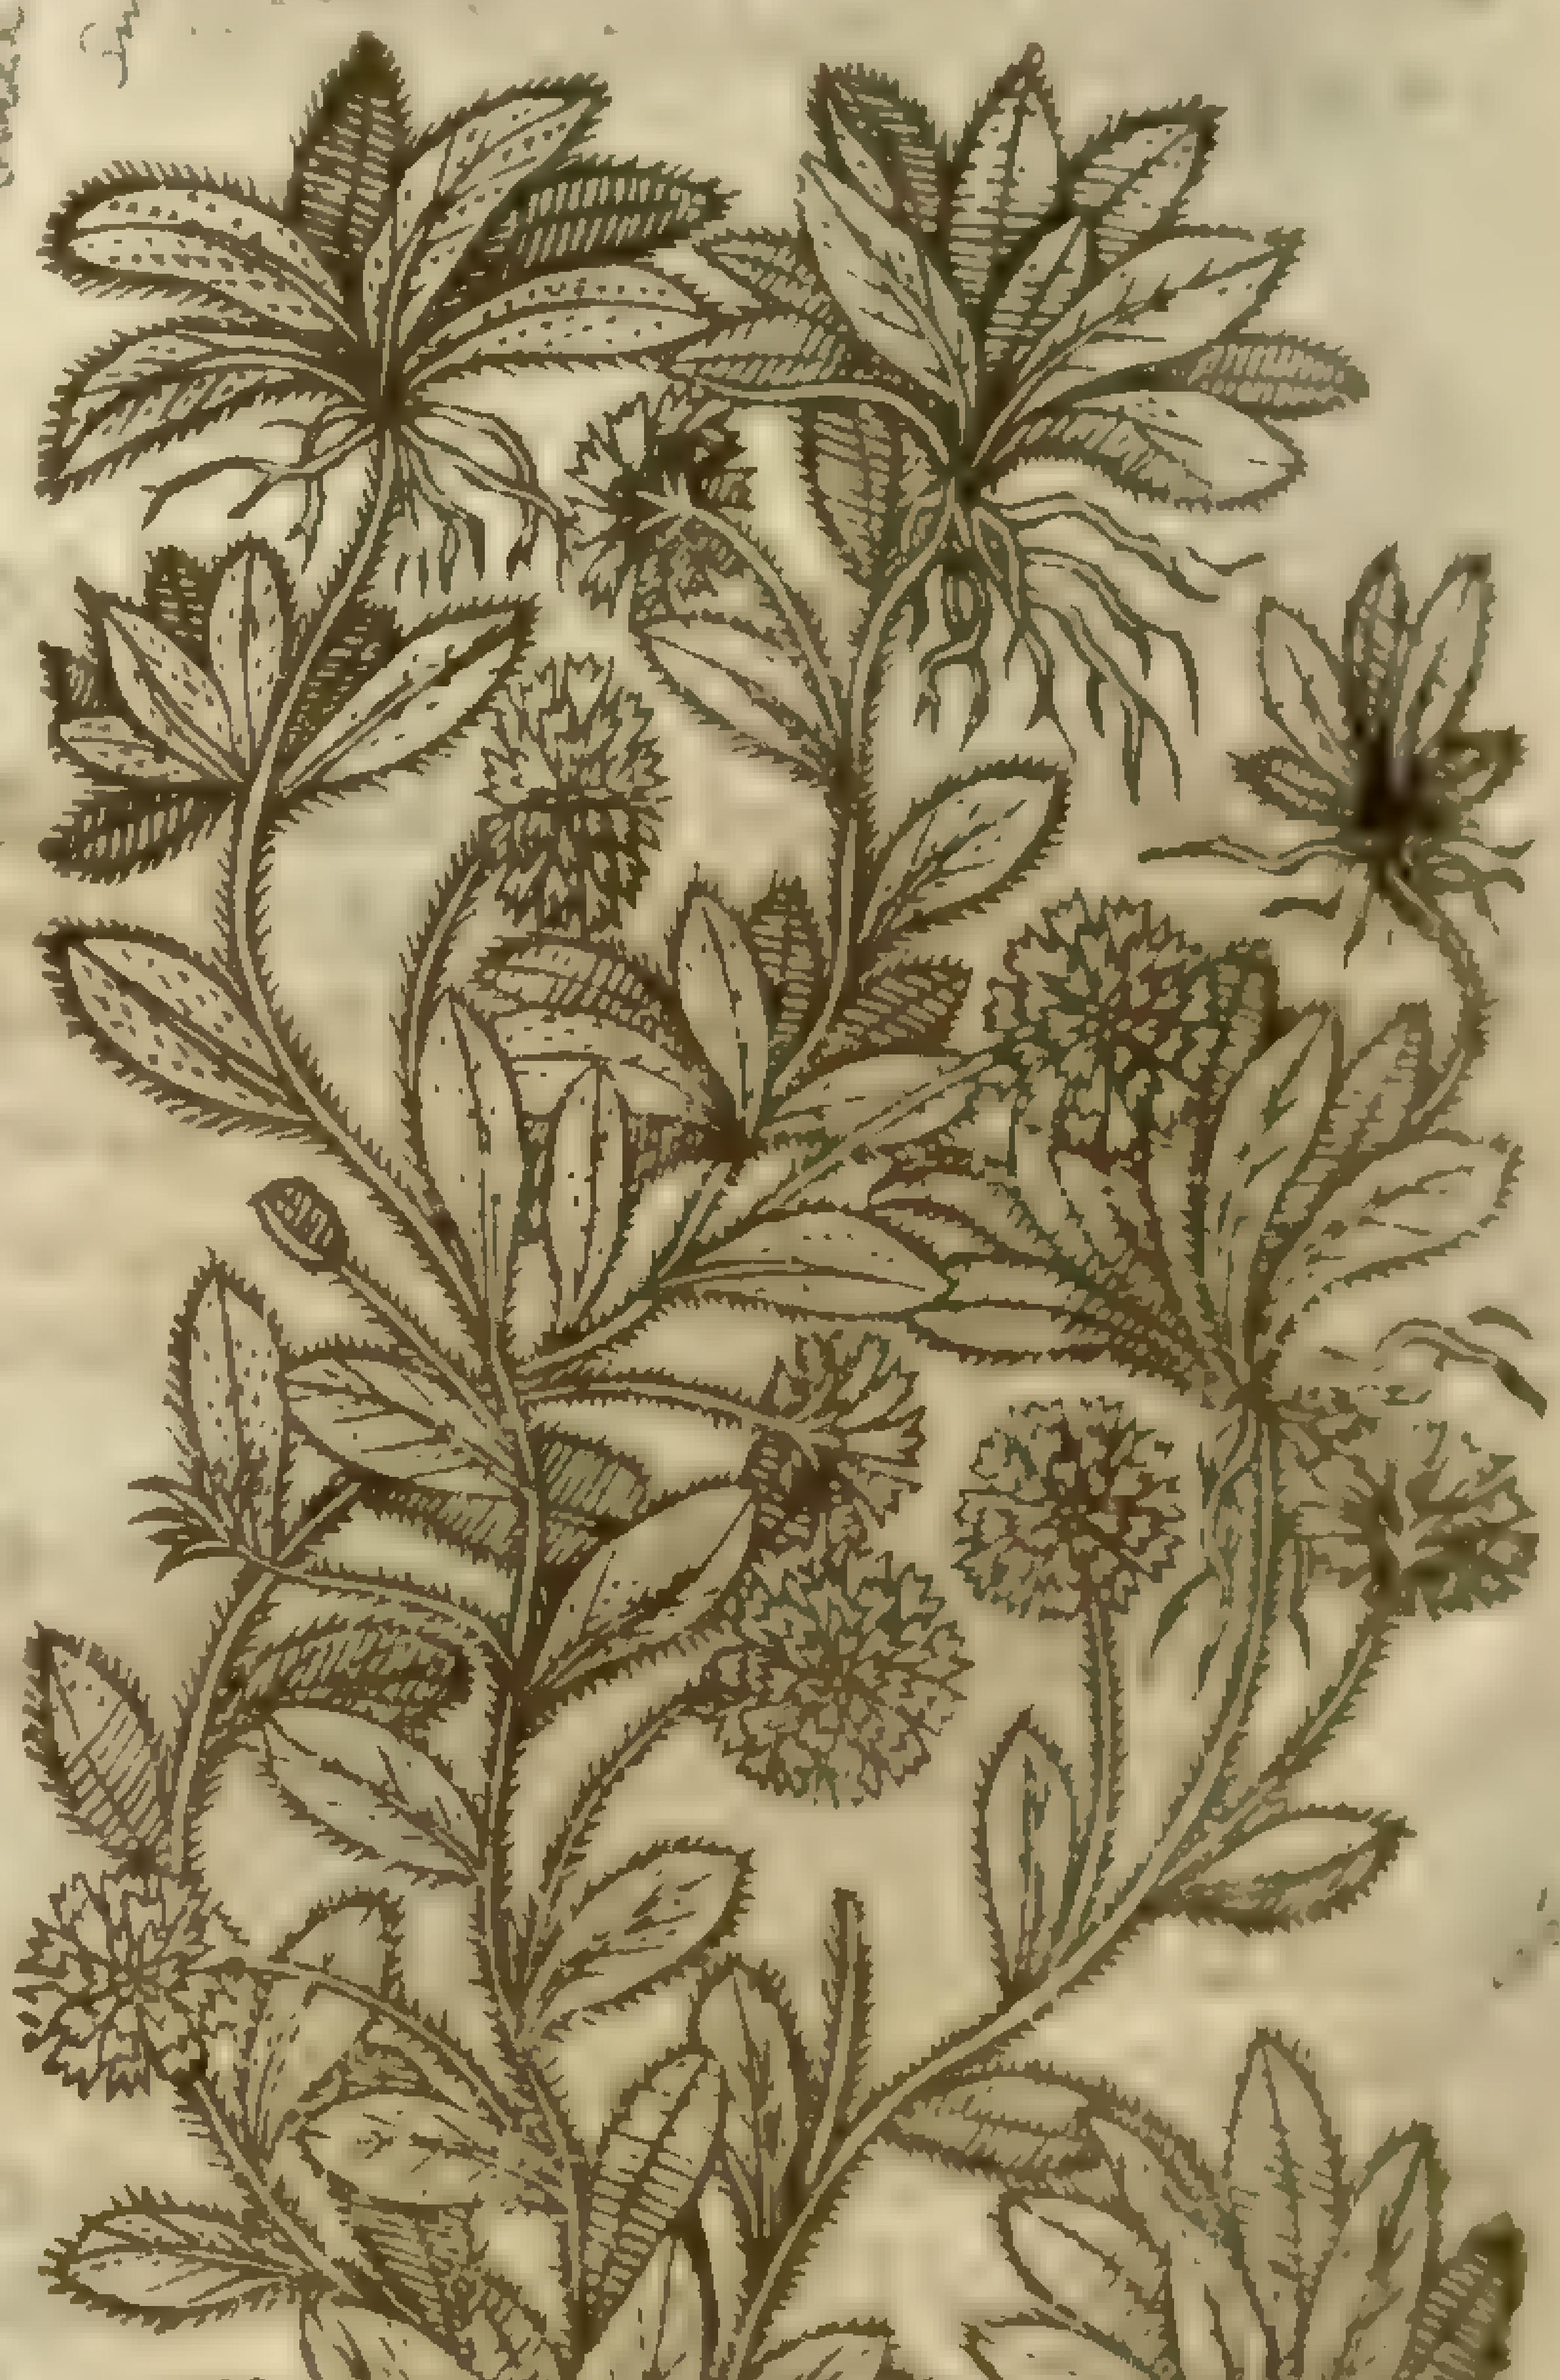
2 The ſecond kinde of *Pyloſella* is that which we call *Auricula muris*, or Mouſ-eare, being a very common herbe, but few more worthy of conſideration becauſe of his good effect, and yet not remembred of the old writers. It is called *Pyloſella*, of the rough hairy and whitiſh ſubſtance growing vpon the leaues, which are ſomewhat long like the little Daiſie, but that they haue a ſmall hollowneſſe in them reſembling the eare of a mouſe: vpon which conſideration ſome haue called it *Myoſotis*; wherein they were greatly deceiued, for it is nothing like vnto the *Myoſotis* of *Dioſcorides*. his ſmall ſtalks are likewiſe hairy, ſlender, and creeping vpon the ground; his floures are double, and of a pale yellow colour, much like vnto *Sonchus*, or *Hieracium*, or Hawk-weed.

1 *Pyloſella major.*
Great Mouſe-eare.



Hieracium pilosella, L. mult. decl. Sm. p. 335

2 *Pyloſella repens.*
Creeping Mouſe-eare.



3 The ſmall Mouſe-eare with broad leaues hath a ſmall tough root, from which riſe vp many hairy and hoary broad leaues ſpred vpon the ground, among which growes vp a ſlender ſtem, at the top whereof ſtand two or three ſmall yellow floures, which being ripe turne into down that is caried away with the winde.

¶ *The Place.*

They grow vpon ſandy banks and vntoiled places that lie open to the aire.

¶ *The Time.*

They floure in May and Iune.

¶ The Names.

Great Mouſe-eare is called of the later Herbariſts, *Pyloſella*: the ſmaller likewiſe *Pyloſella*, and *Auricula muris*: in Dutch, **Nagelcruit**, and **Muyſoor**: *Lacuna* thinkes it *Holoſtium*: in French, *Oreille de ſouris*: in Italian, *Peloſella*: in Engliſh, Mouſe-eare.

¶ The Temperature.

They are hot and dry of temperature, of an excellent aſtringent facultie, with a certaine hottenitie admixed.

¶ The Vertues.

The decoction of *Pyloſella* drunke doth cure and heale all wounds, both inward and outward: it cureth hernies, ruptures, or burſtings. A

The leaues dried and made into pouder, doe profit much in healing of wounds, beeing ſtrewed thereupon. B

The decoction of the juice is of ſuch excellencie, that if ſteele-edged tooles red hot be drenched, and cooled therein oftentimes, it maketh them ſo hard, that they will cut ſtone or iron, bee they neuer ſo hard, without turning the edge or waxing dull. C

This herbe being vſed in gargariſmes cureth the looſeneſſe of the Vvula. D

Being taken in drinke it healeth the fluxes of the wombe, as alſo the diſeaſes called *Dyſenteria* and *Enterocele*: it glueth and conſoundeth wounds, ſtaieth the ſwelling of the ſpleen, and the bloudy excrements procured thereby. E

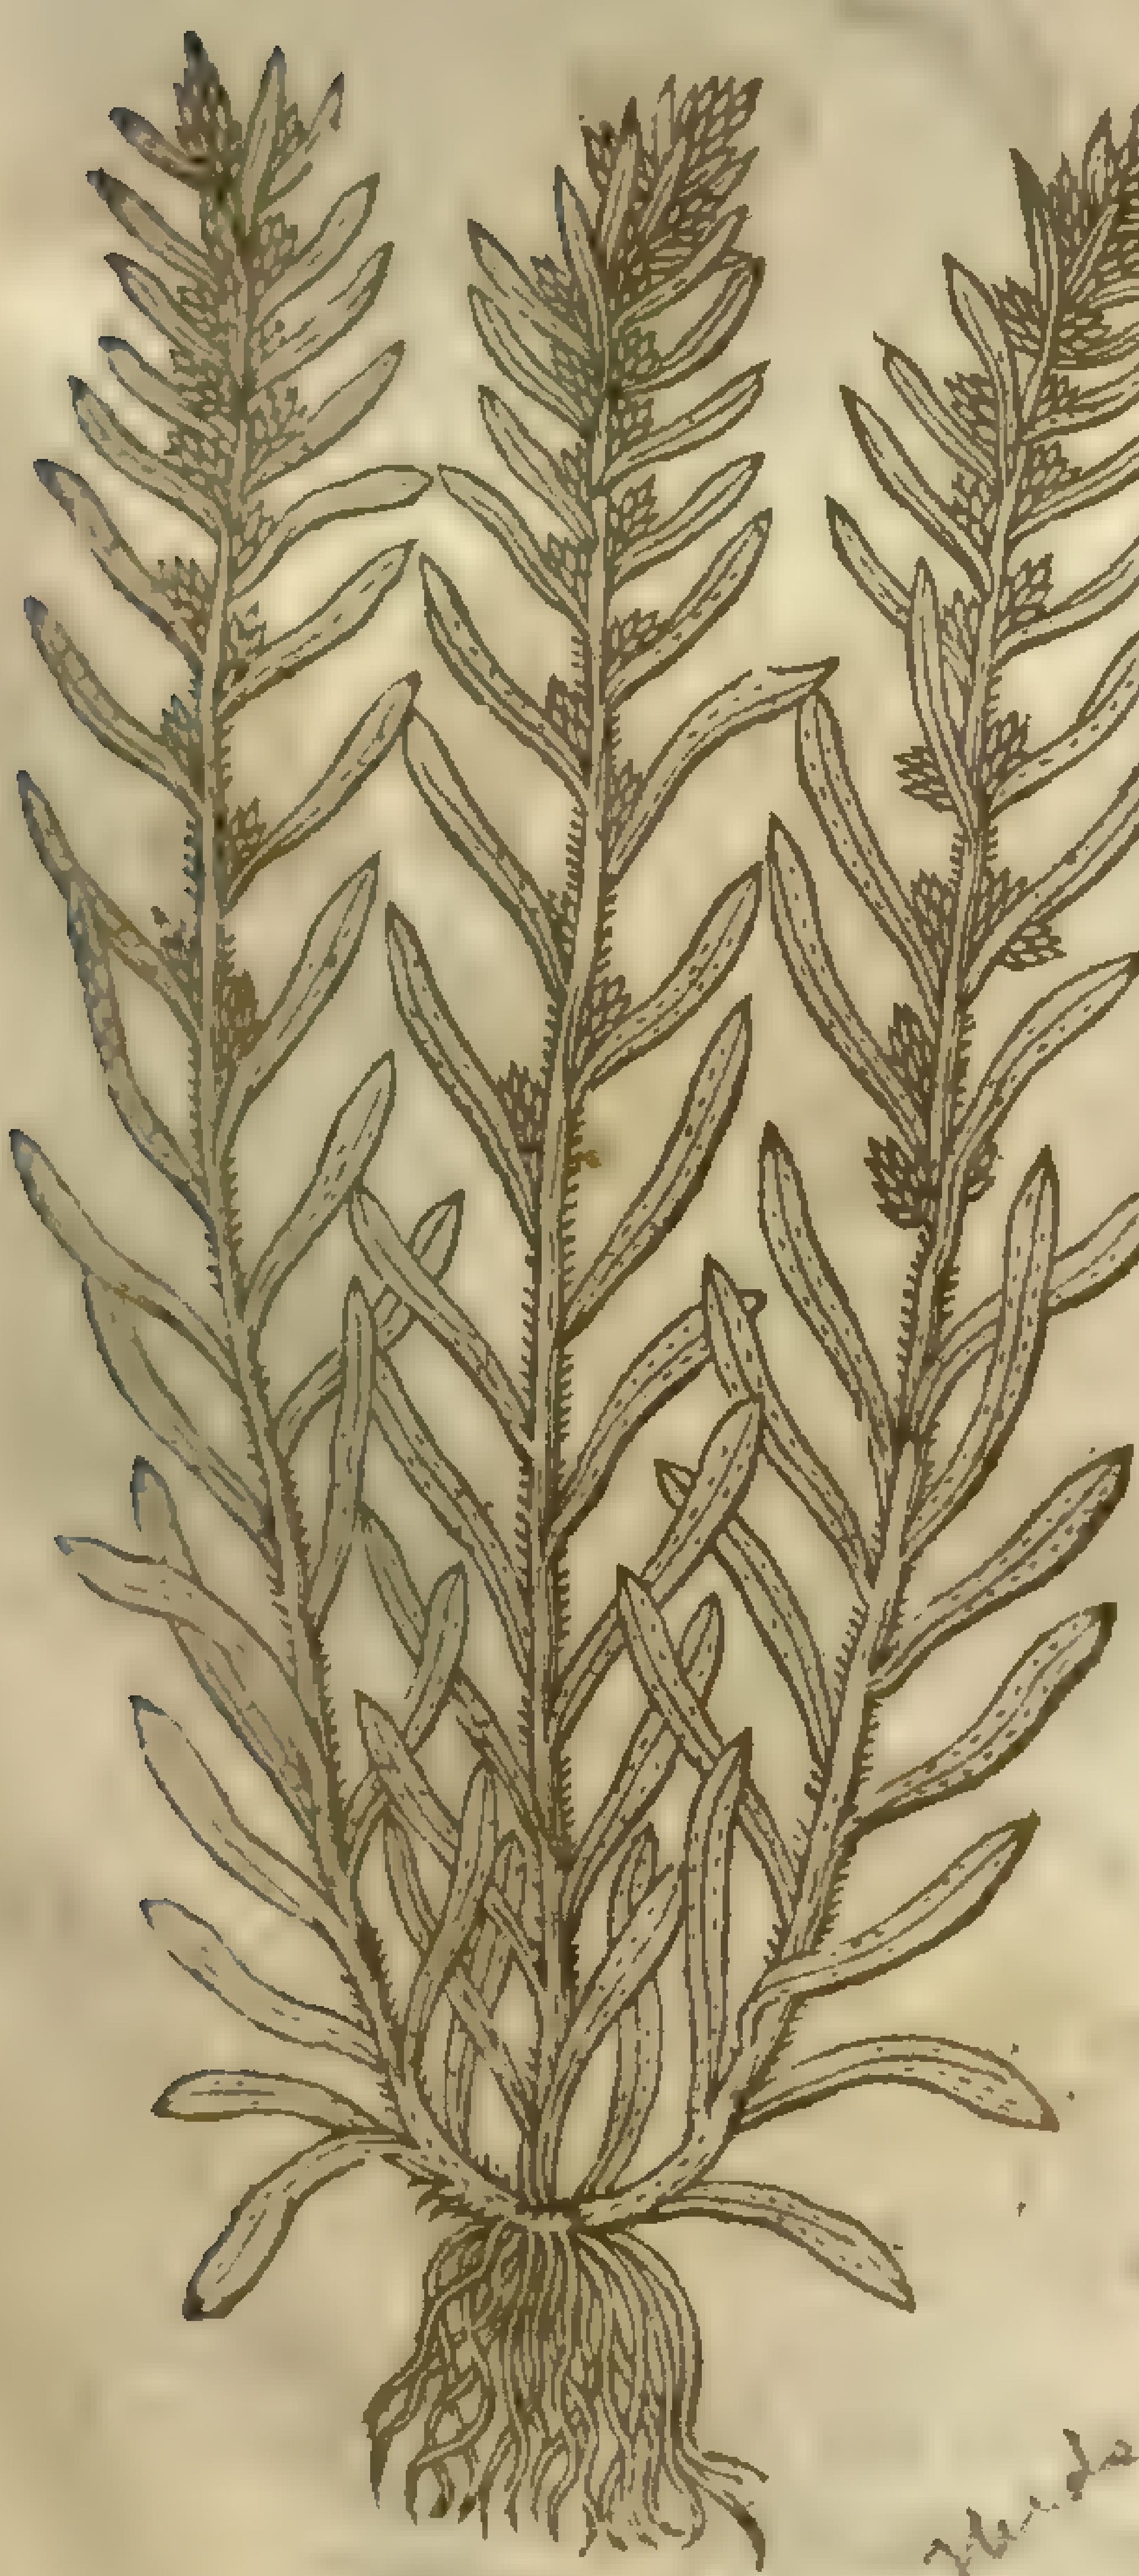
The Apothecaries of the Low-countries make a ſyrrup of the juice of this herb, which they vſe for the cough, conſumption and ptiſike. F

‡ I haue in this chapter omitted two figures and one deſcription: the firſt of the two omitted figures, which ſhould haue been the third, differs little from the firſt, but in the ſmallneſſe of the ſtalke, and fewneſſe of the floures at the top thereof: the other, which was in the fourth place, was figured and deſcribed by me formerly in the fourth place of the 54 chapter of this booke.

Chap. 205. Of Cotton-weed or Cud-weed.

[illegible]

1 *Gnaphalium Anglicum.*
English Cudweed.



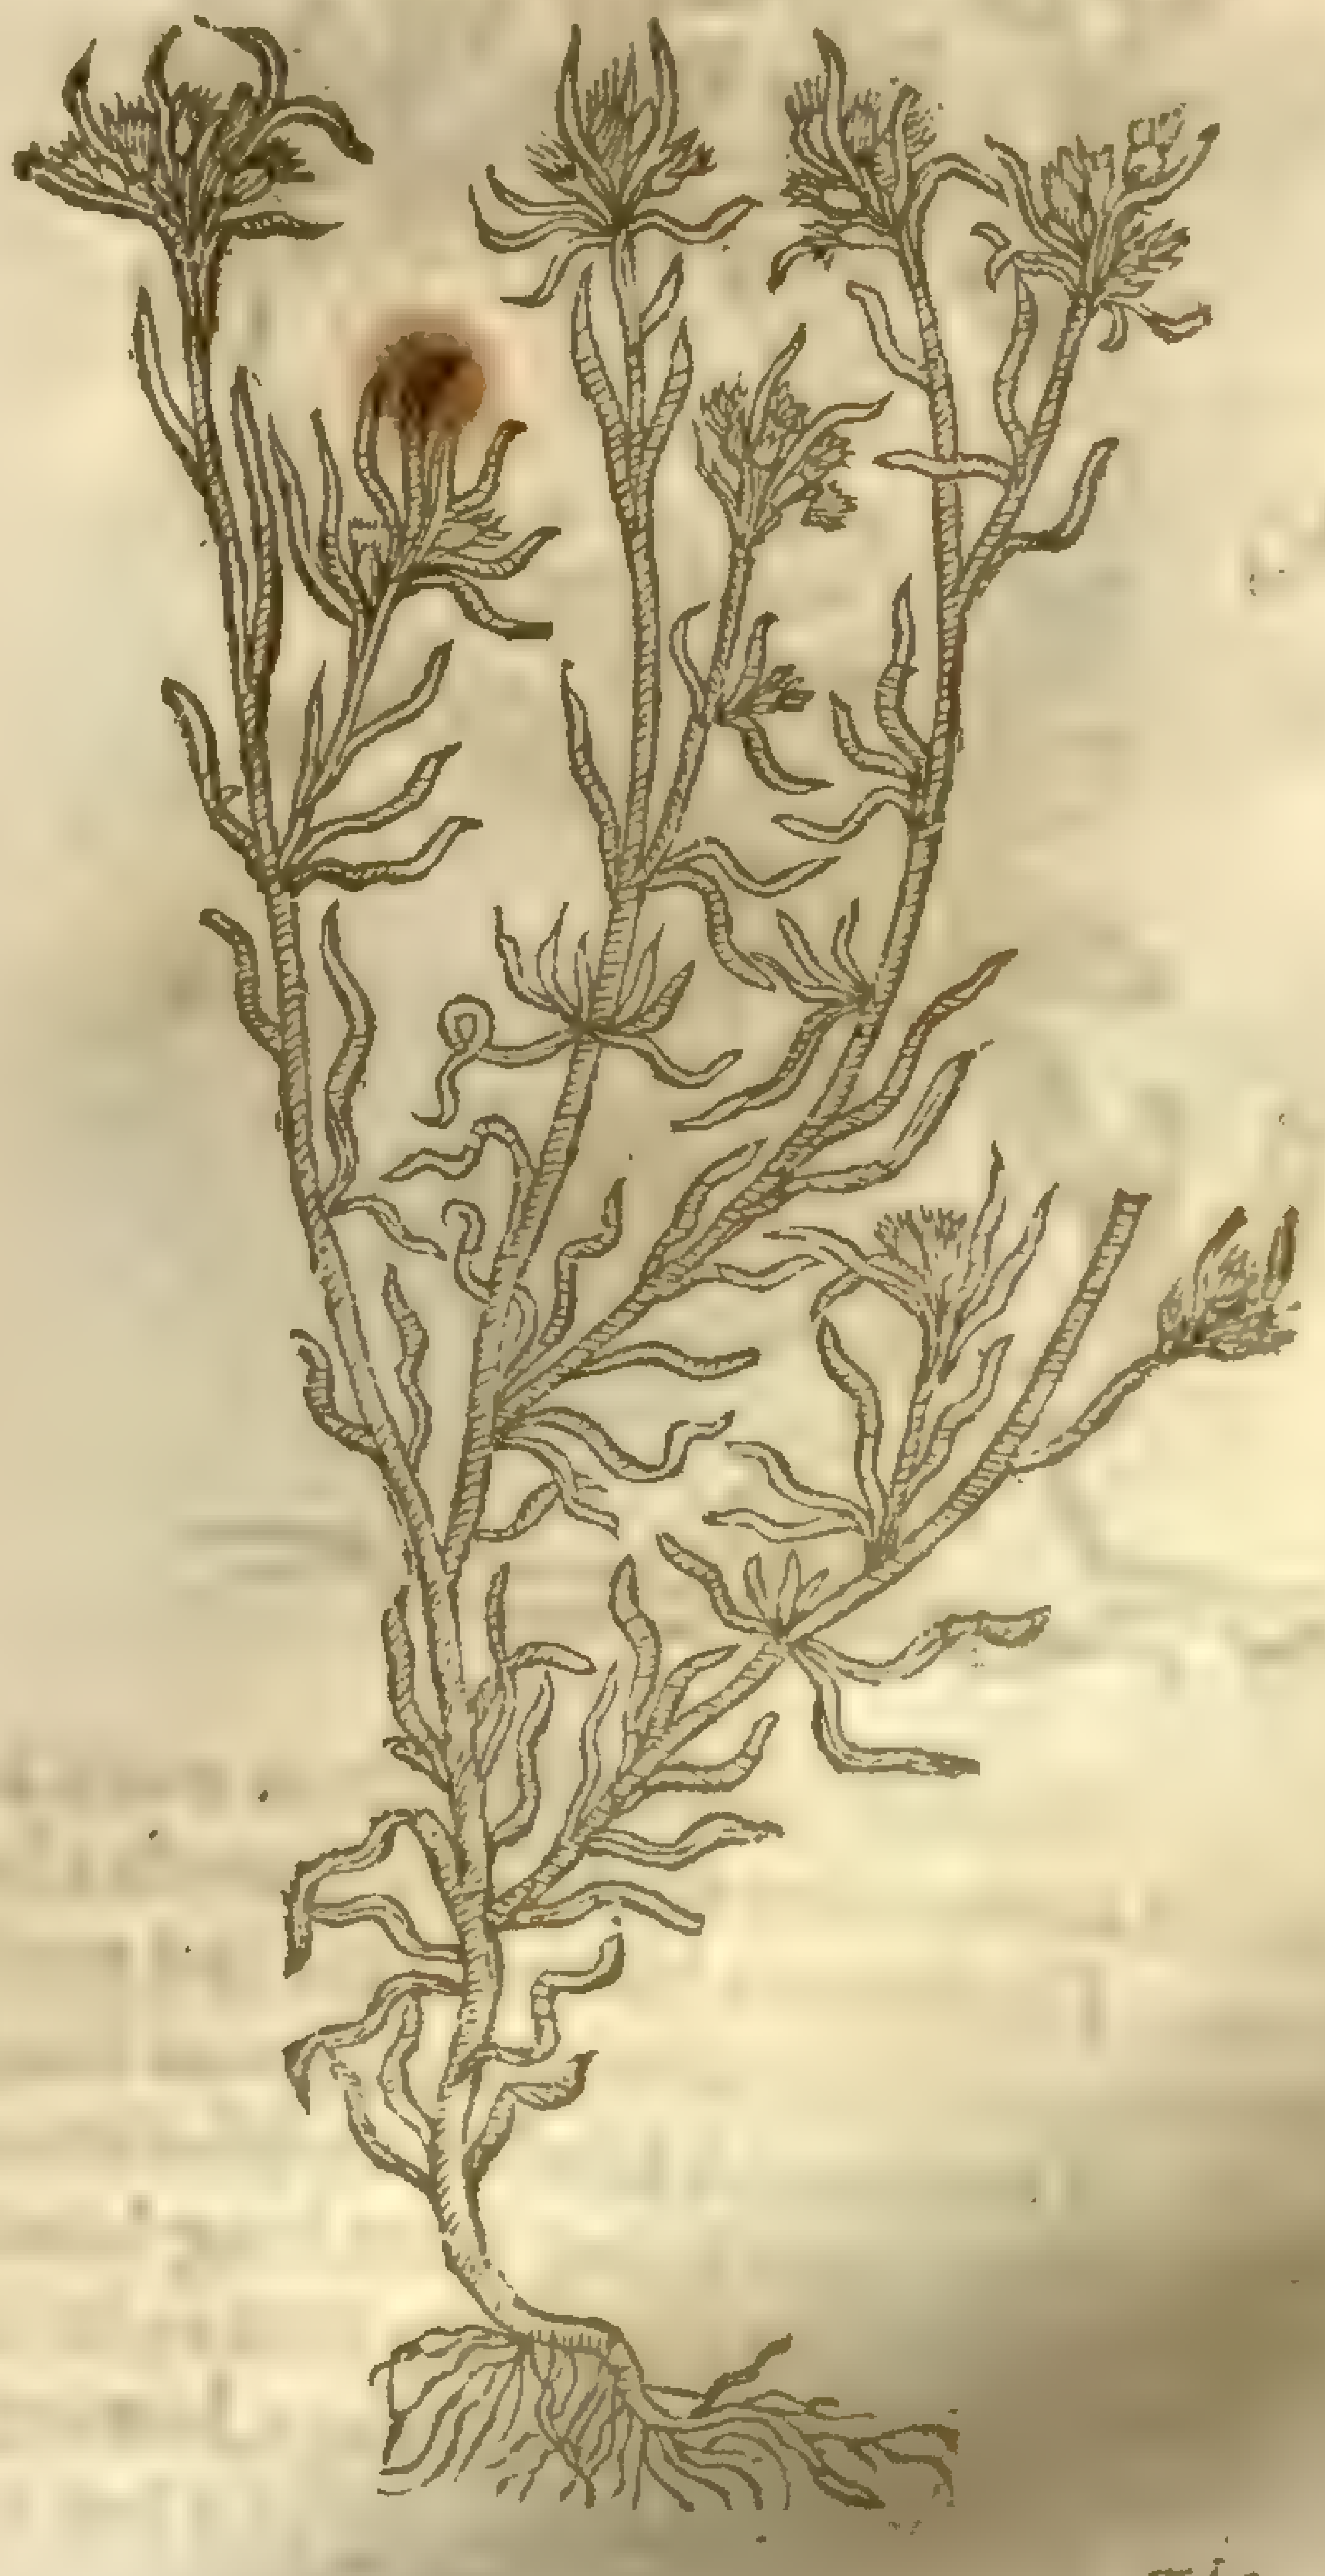
[illegible]

Sm. fl. 3.415

2 *Gnaphalium vulgare.*
Common Cudweed.

[illegible]

Sm. fl. 3.416



481

¶ *The Deſcription.*

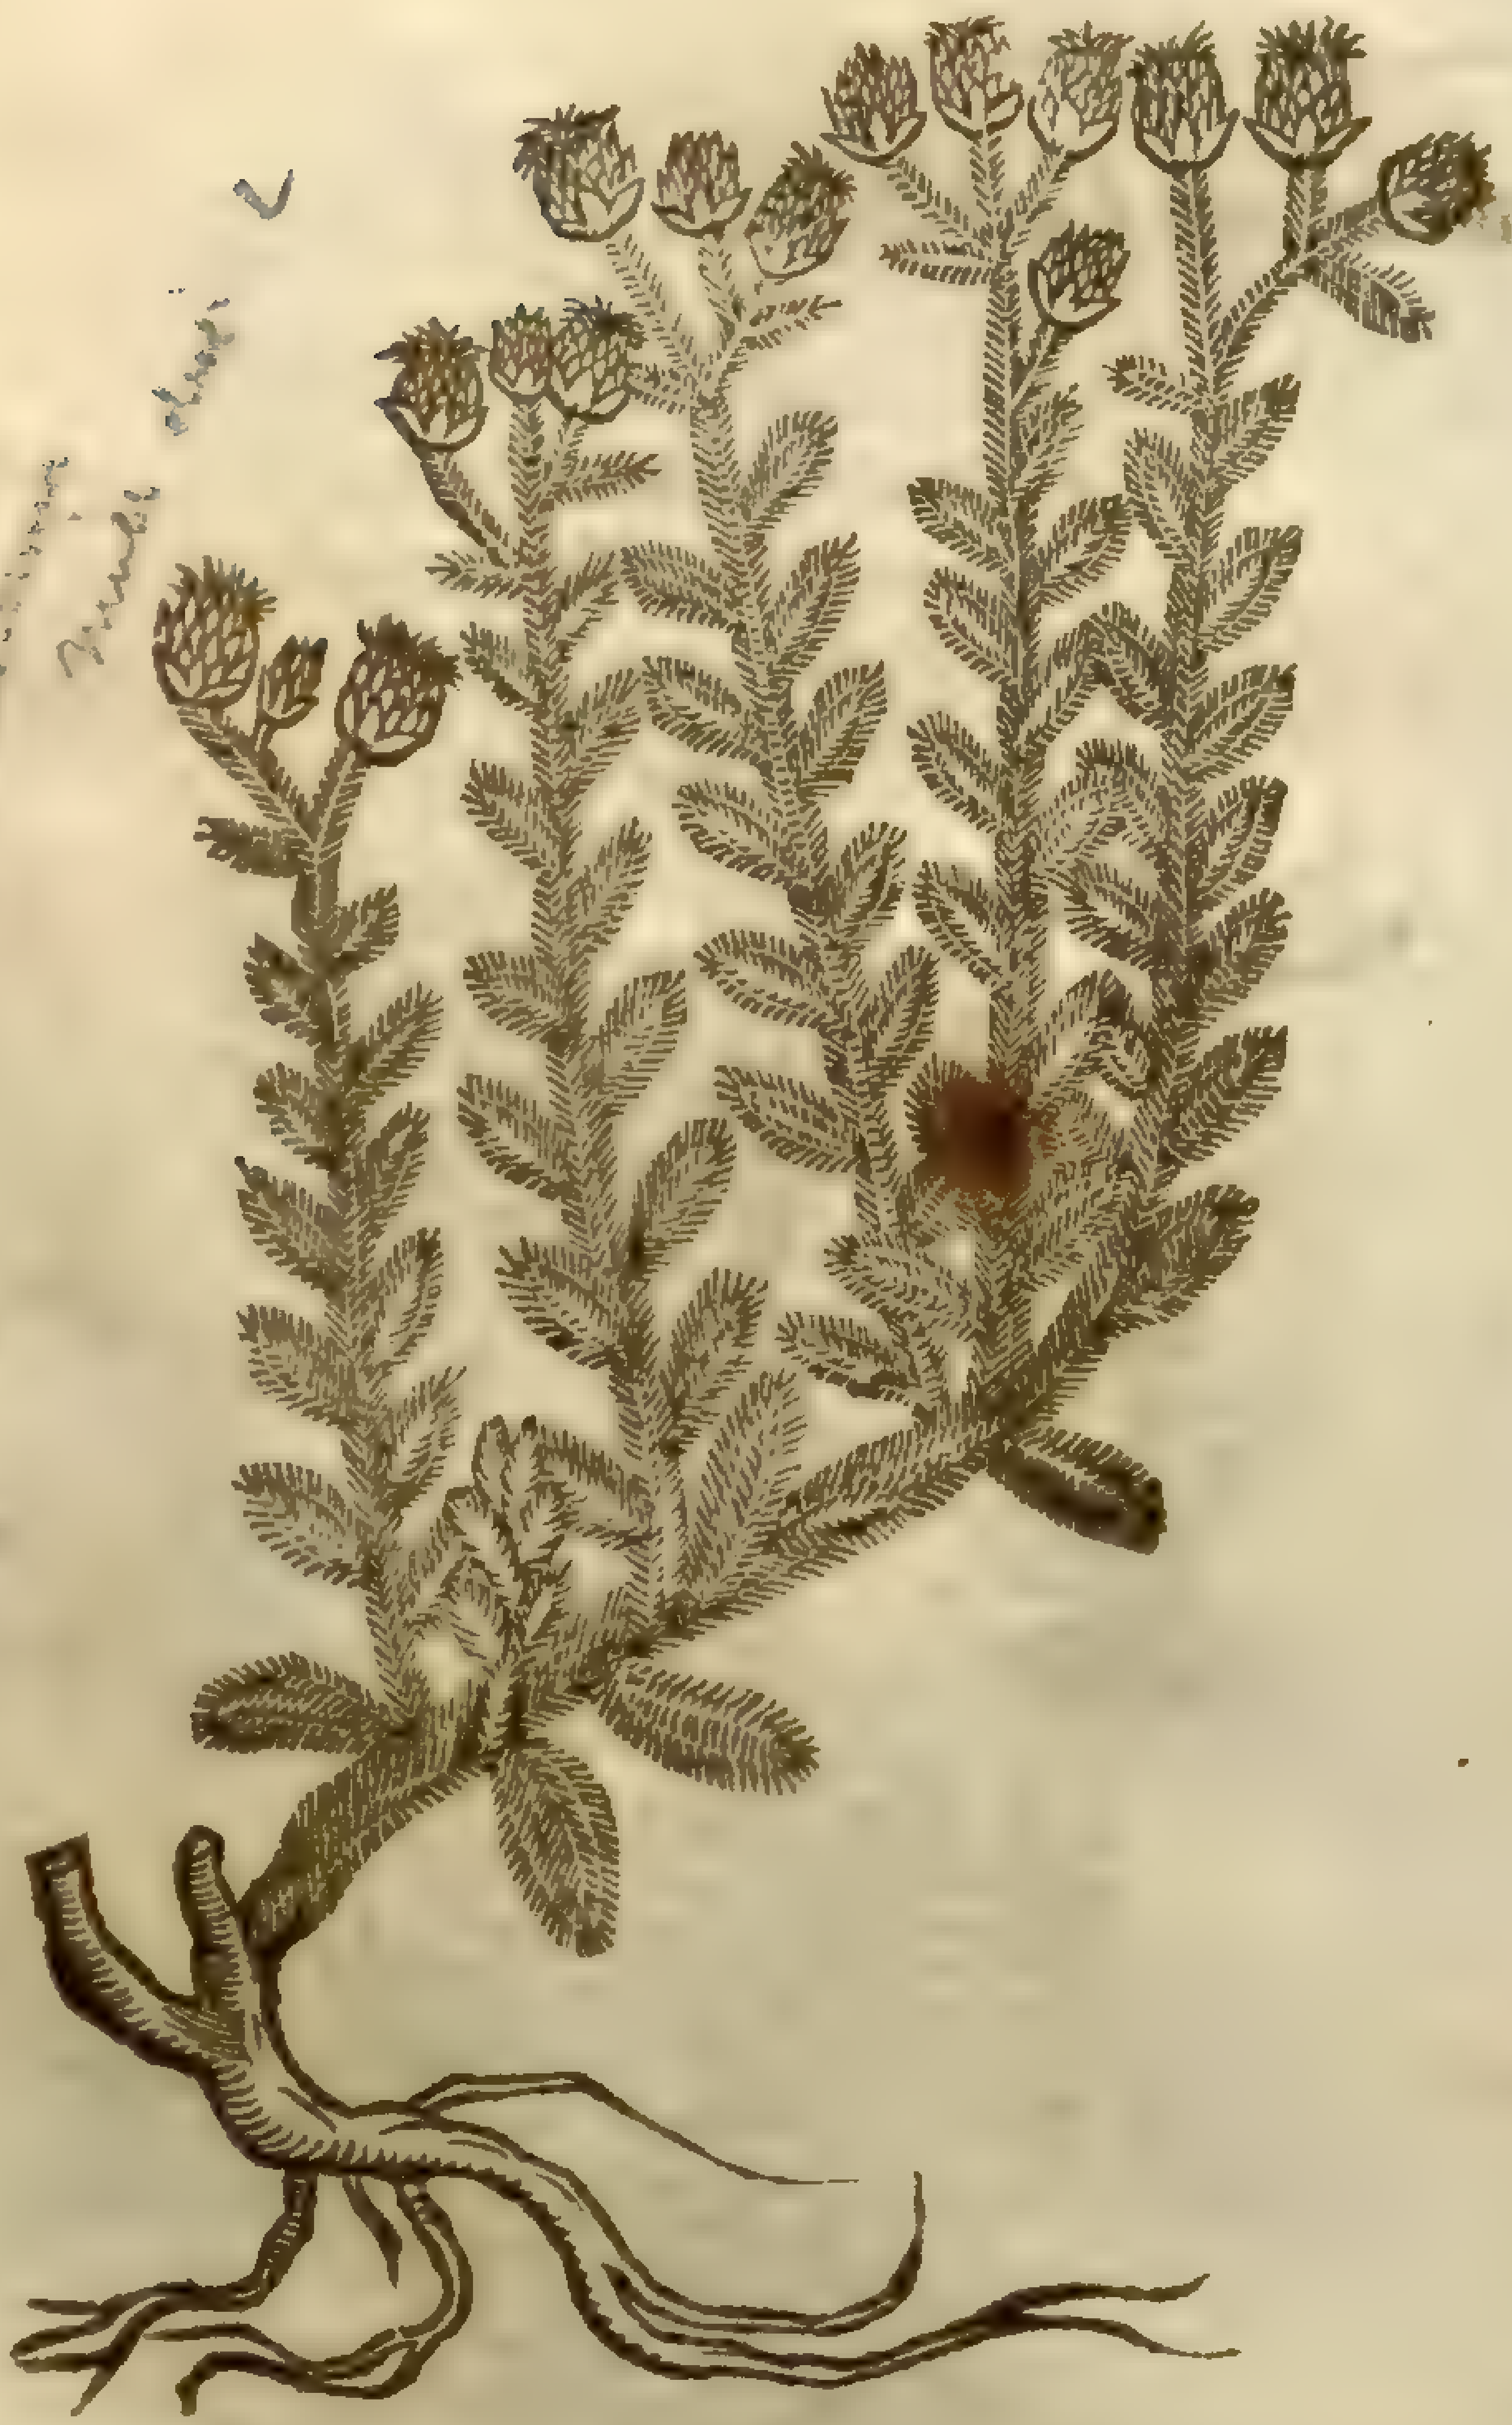
1 English Cudweed hath ſundry ſlender and vpright ſtalks diuided into many branches, and groweth as high as common Wormwood, whoſe colour and ſhape it much reſembleth. The leaues ſhoot from the bottome of the turfe full of haires, in ſhape ſomwhat like a Willow leafe below, but aboue they be narrower, and like the leaues of *Pſyllium* or Flea-wort: among which do grow ſmall pale coloured floures like thoſe of the ſmal *Coniza* or Flea-bane. The whole plant is of a bitter taſte.

2 The ſecond being our common *Gnaphalium* or Cudweed is a baſe or low herbe, nine or ten inches long, hauing many ſmall ſtalks or tender branches, and little leaues couered all ouer with a certaine white cotton or fine wooll, and very thick: the floures be yellow, and grow like buttons at the top of the ſtalkes.

3 The third kind of Cudweed or Cotton-weed, being of the ſea, is like vnto the other Cudweed laſt deſcribed, but is altogether ſmaller and lower, ſeldome growing much aboue a handfull high: the leaues grow thicke vpon the ſtalkes, and are ſhort, flat, and very white, ſoft and woolly. The floures grow at the top of the ſtalkes in ſmall round buttons, of colour and faſhion like the other Cudweed.

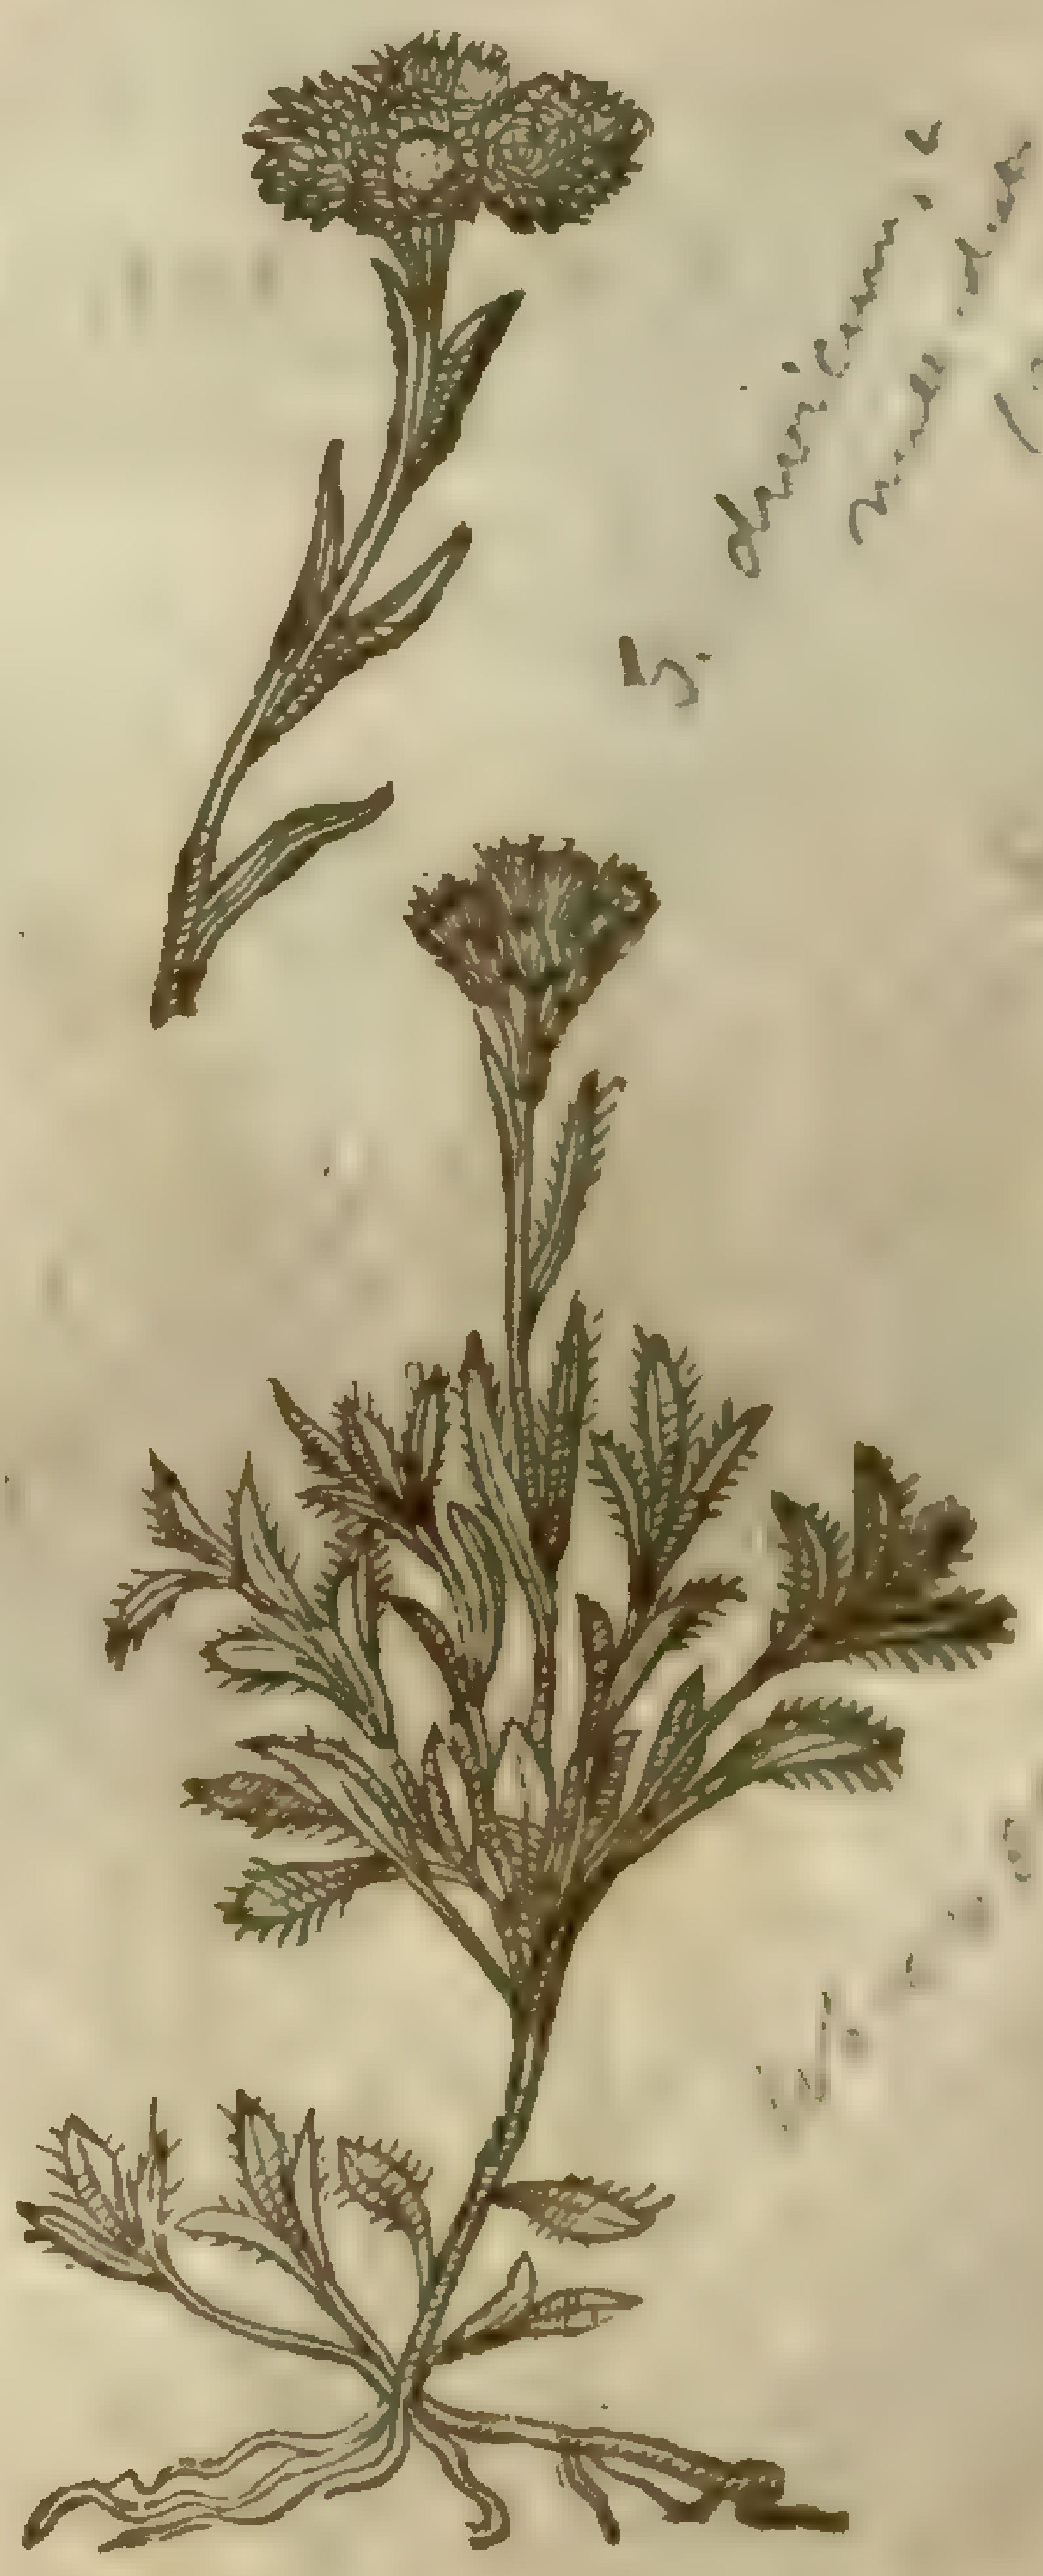
4 The fourth being the Cotton-weed of the hils and ſtony mountaines is ſo exceeding white and hoary, that one would think it to be a plant made of wooll, which may very eaſily be known by his picture, without other deſcription.

3 *Gnaphalium marinum.*
Sea Cudweed.



[illegible]

4. 5. *Gnaphalium montanum purpureum & album.*
White and purple mountain Cotton-weed.



5 [illegible]

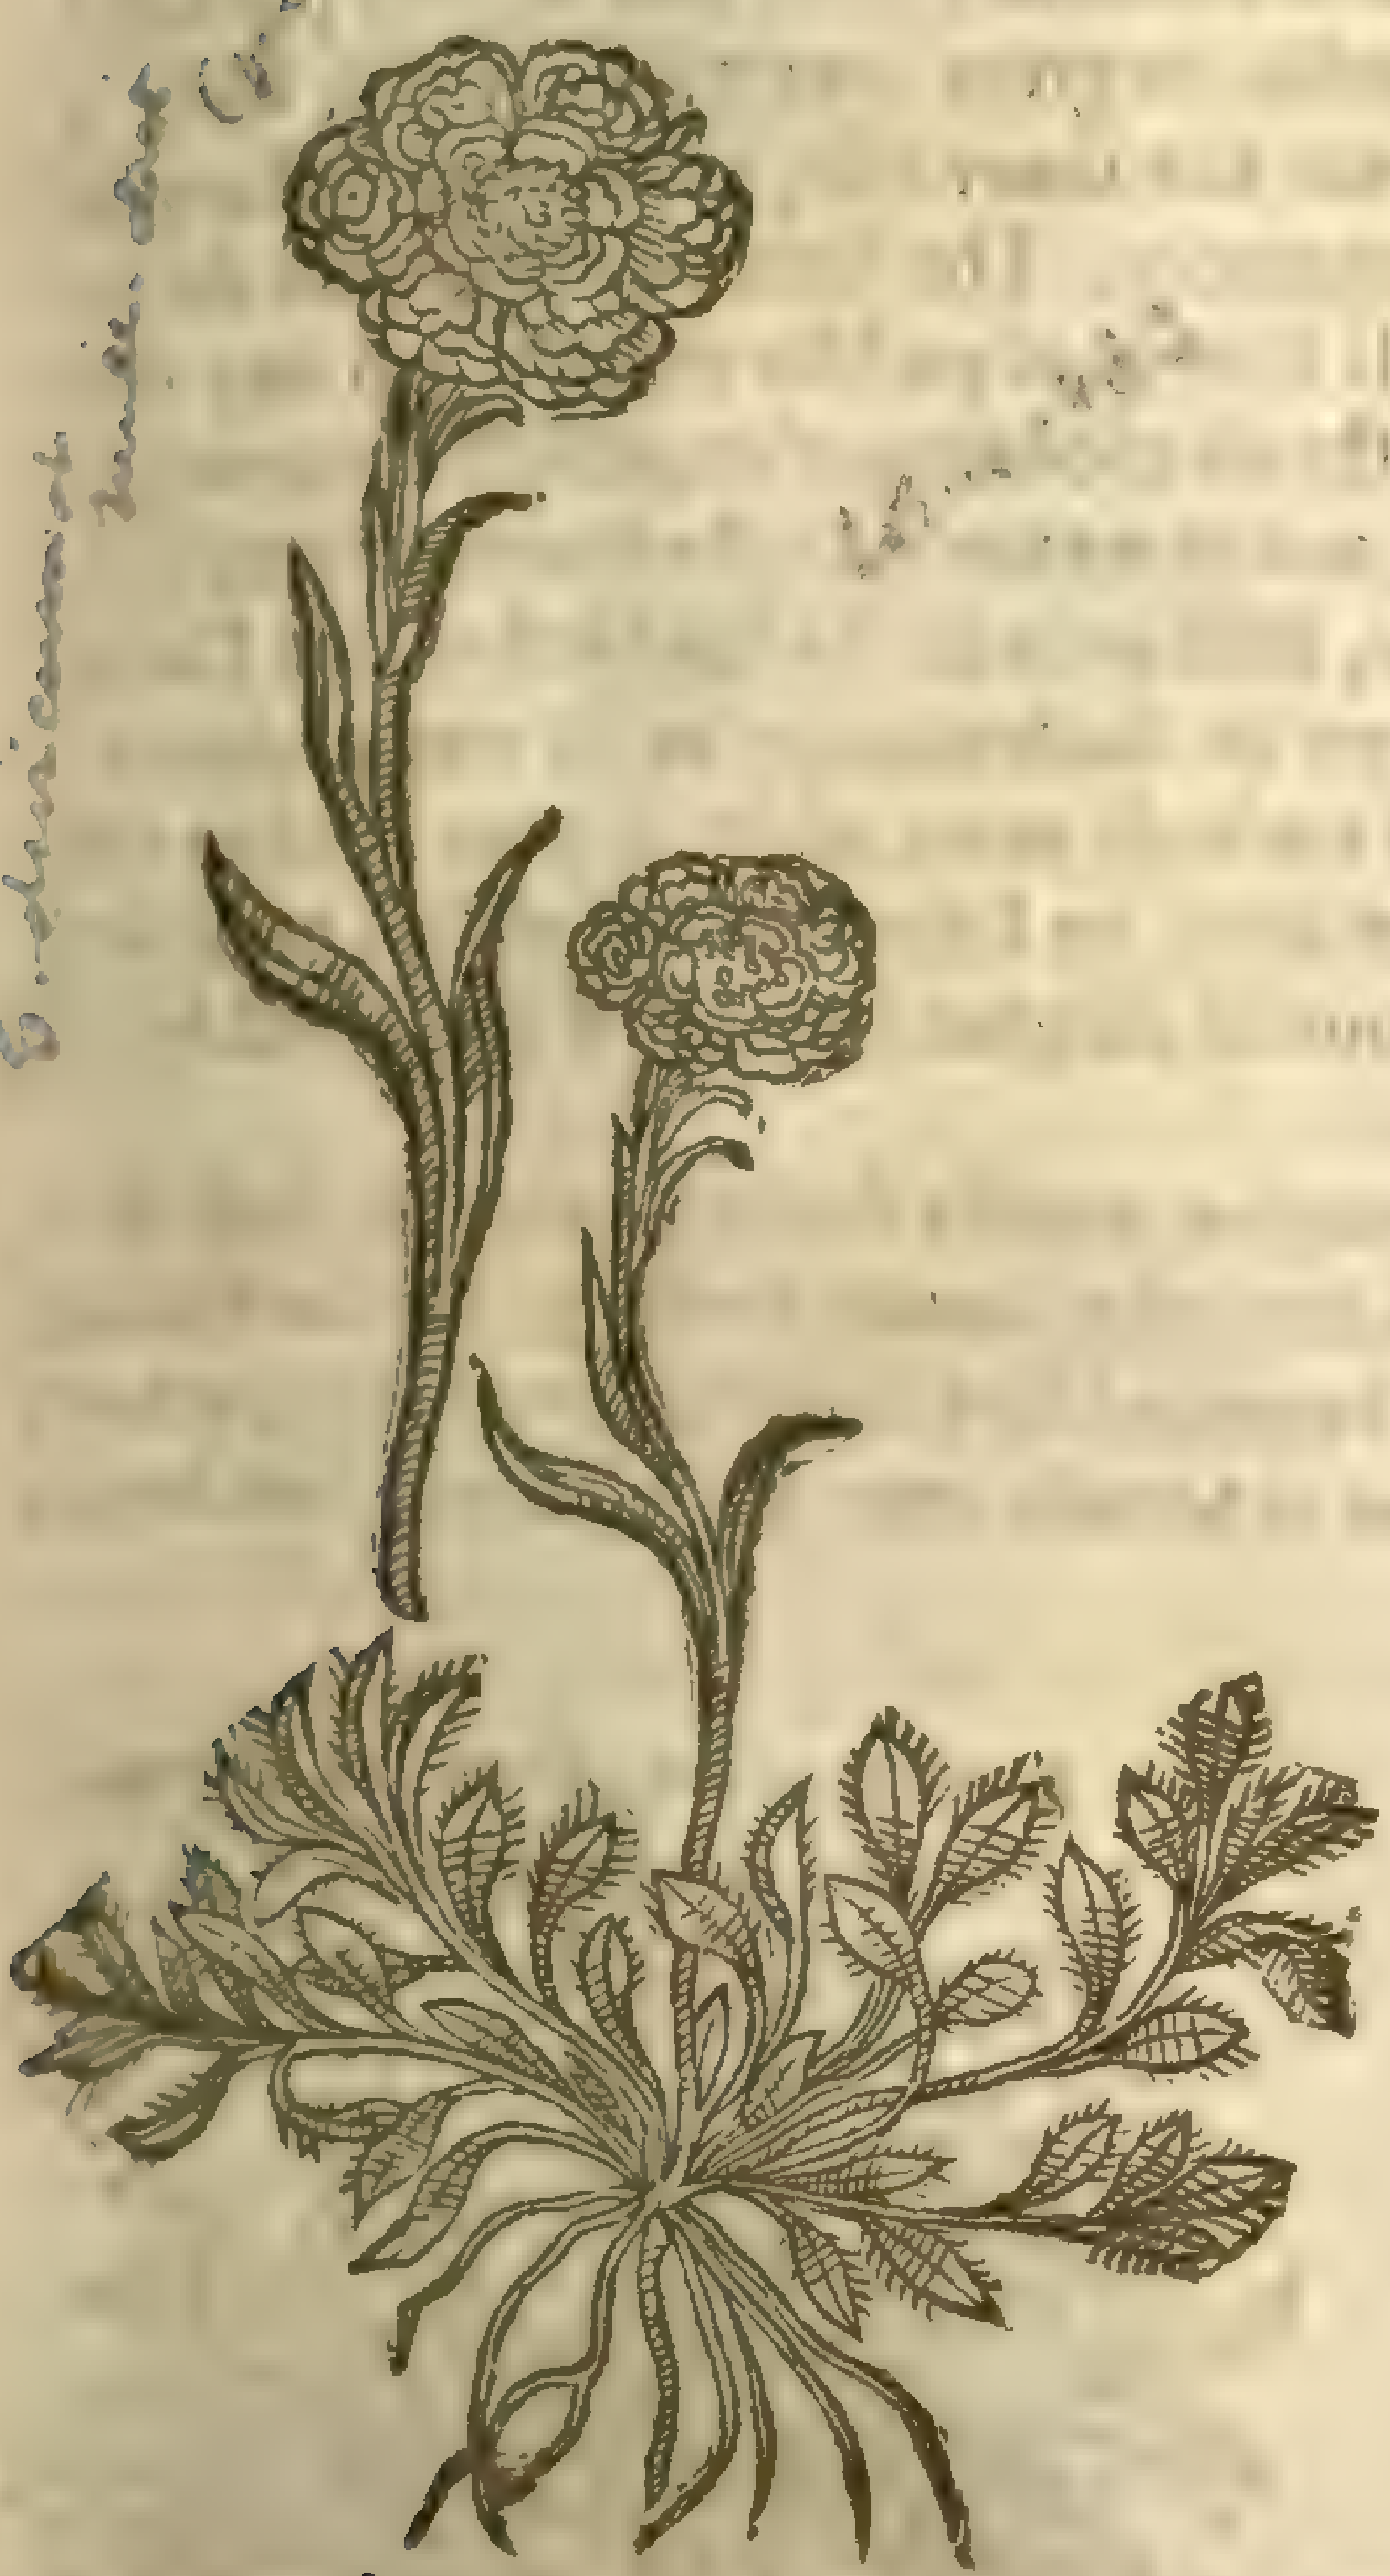
5 The fift kinde of Cotton-weed hath leaues and ſtalkes like the other of his kinde, and differeth in that, that this plant beareth a buſh or tuft of purple floures, otherwiſe it is very like.

6 The ſixth is like vnto the laſt recited, but greater: the leaues are of an exceeding bright red colour, and of an aromaticall ſweet ſmell.

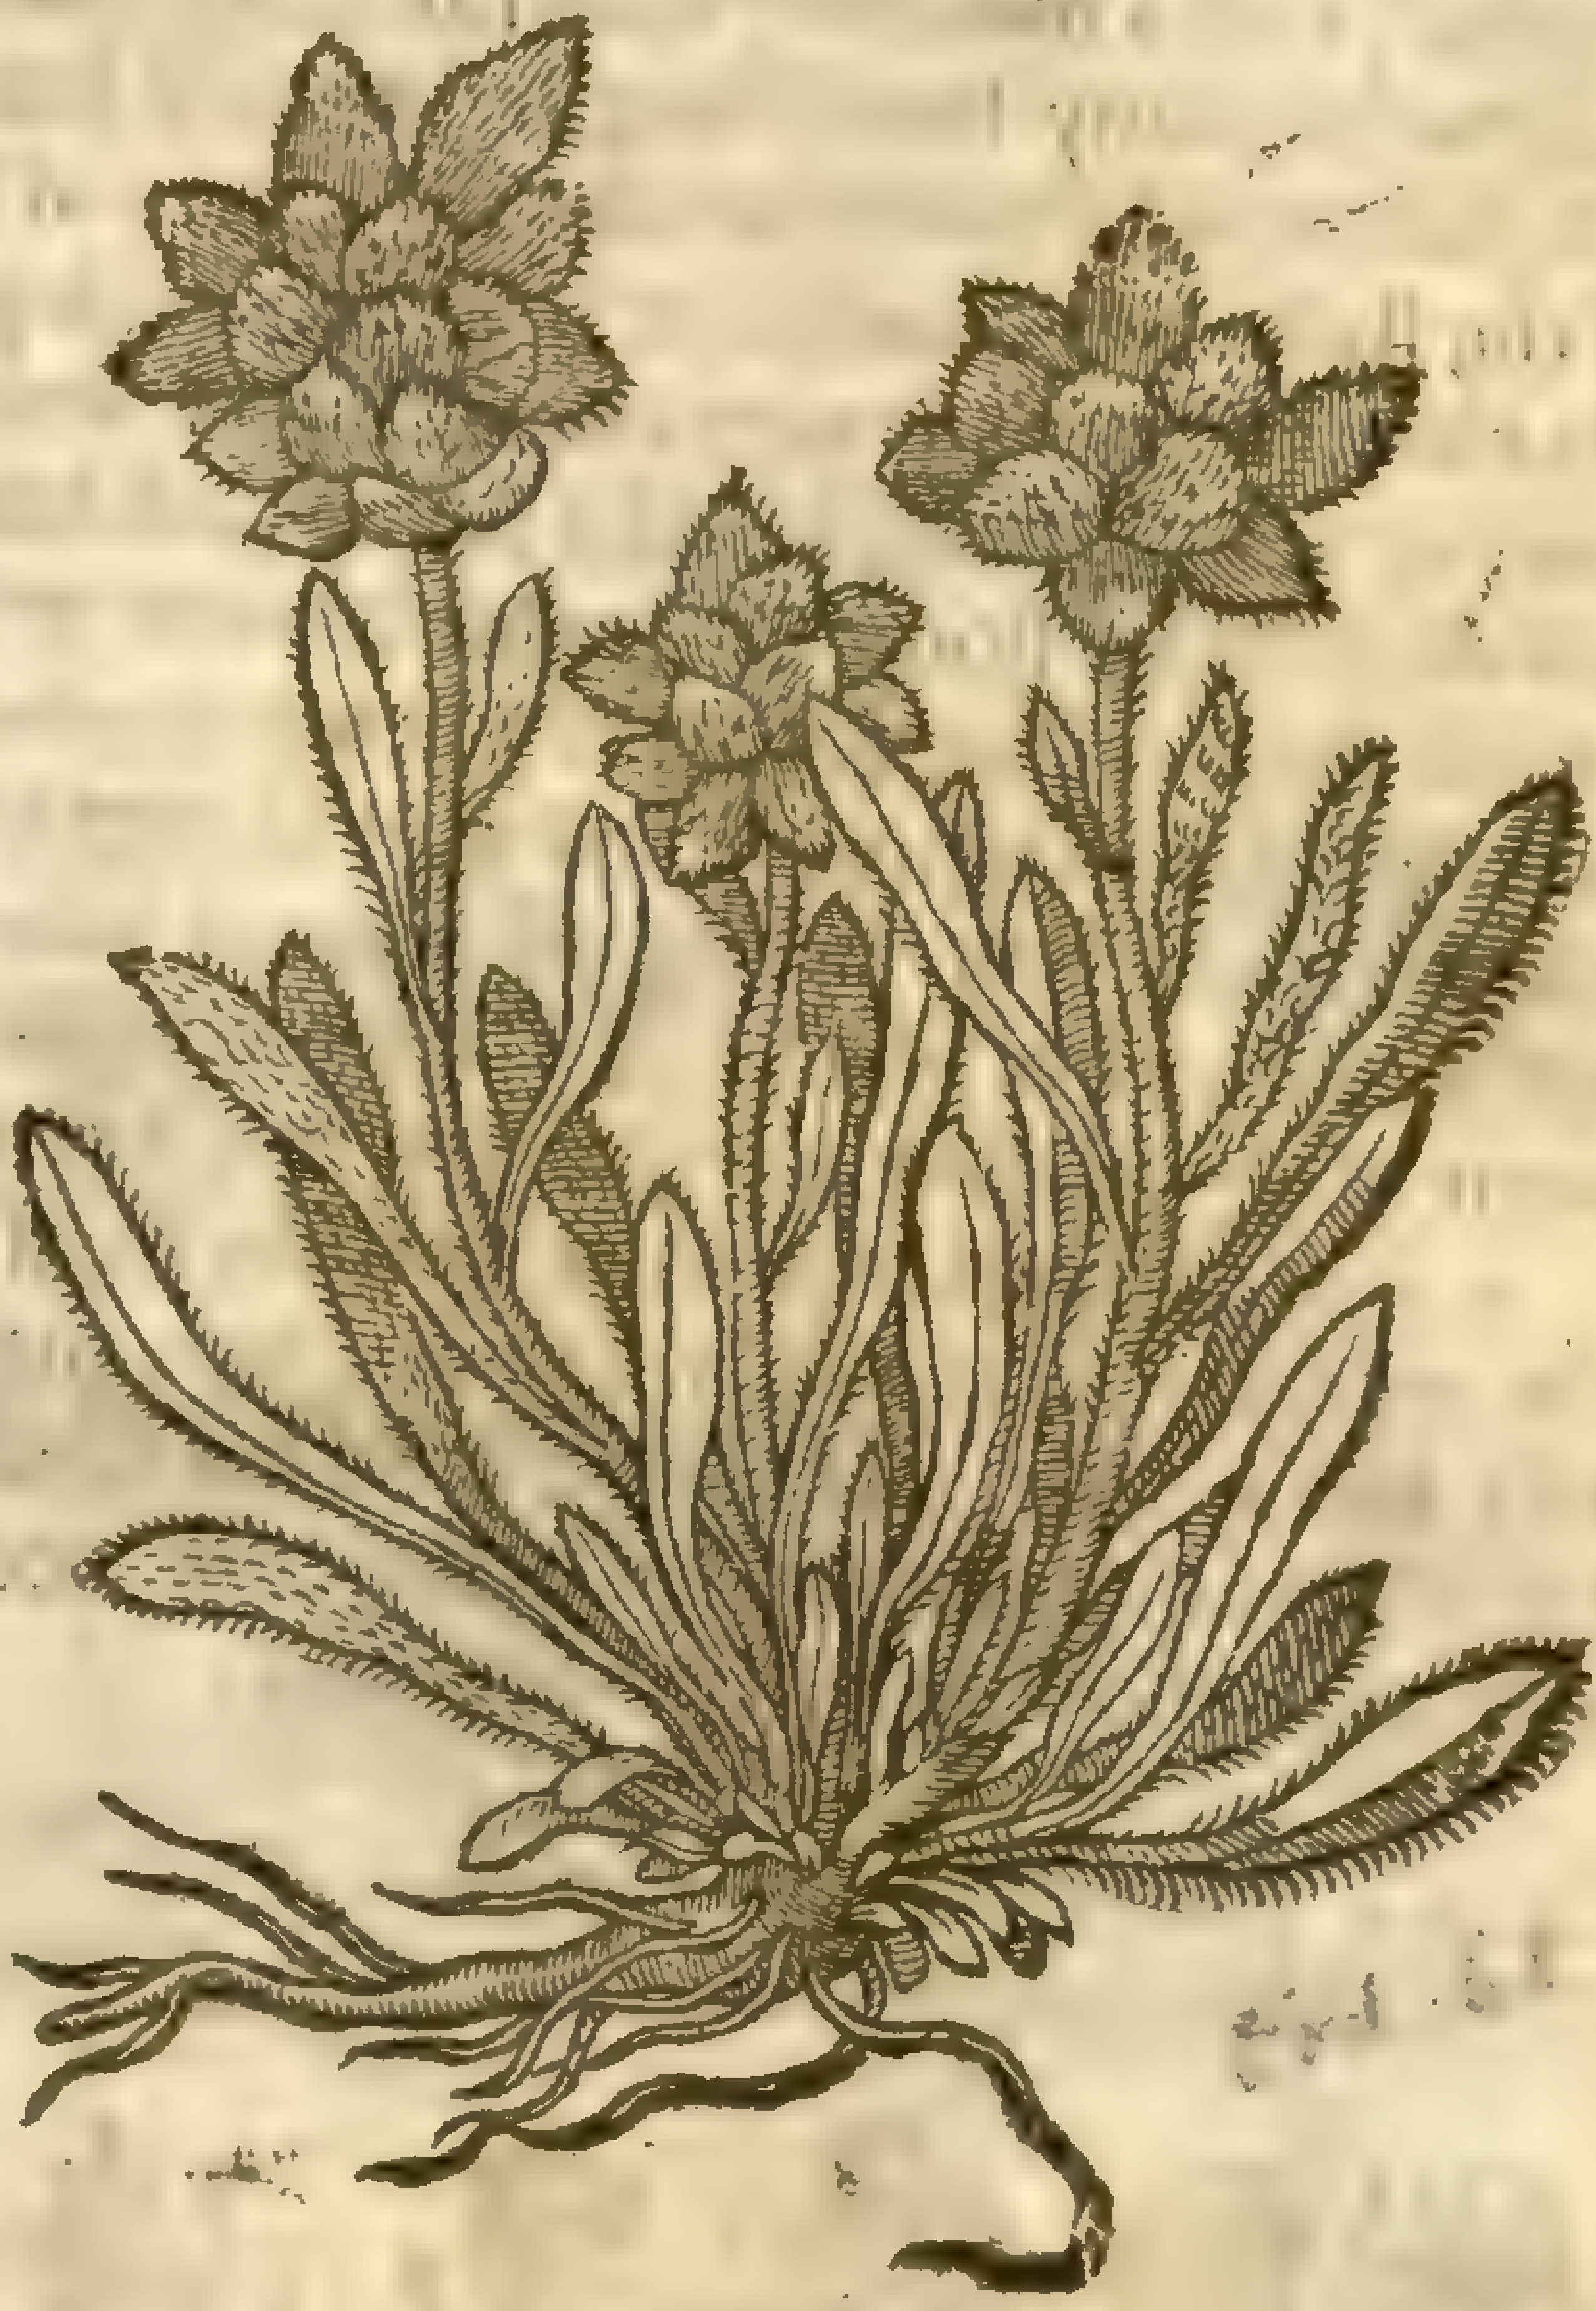
7 The ſeuenth kind of *Gnaphalium* or Cotton-weed of *Cluſius* his deſcription, growes nine or ten inches high, hauing little long leaues like the ſmall Mouſe-eare, woolly within, and of a hoarie colour on the outſide: the ſtalkes in like manner are very woolly, at the top whereof commeth forth a faire floure and a ſtrange, hauing ſuch woolly leaues bordering the floure about, that a man would thinke it to be nothing elſe but wooll it ſelfe: and in the middeſt of the floure come forth ſundry

6 *Gnaphalium montanum ſuaue rubens.*
Bright red mountaine Cottonweed.

G. dioicum β
mill. dict.

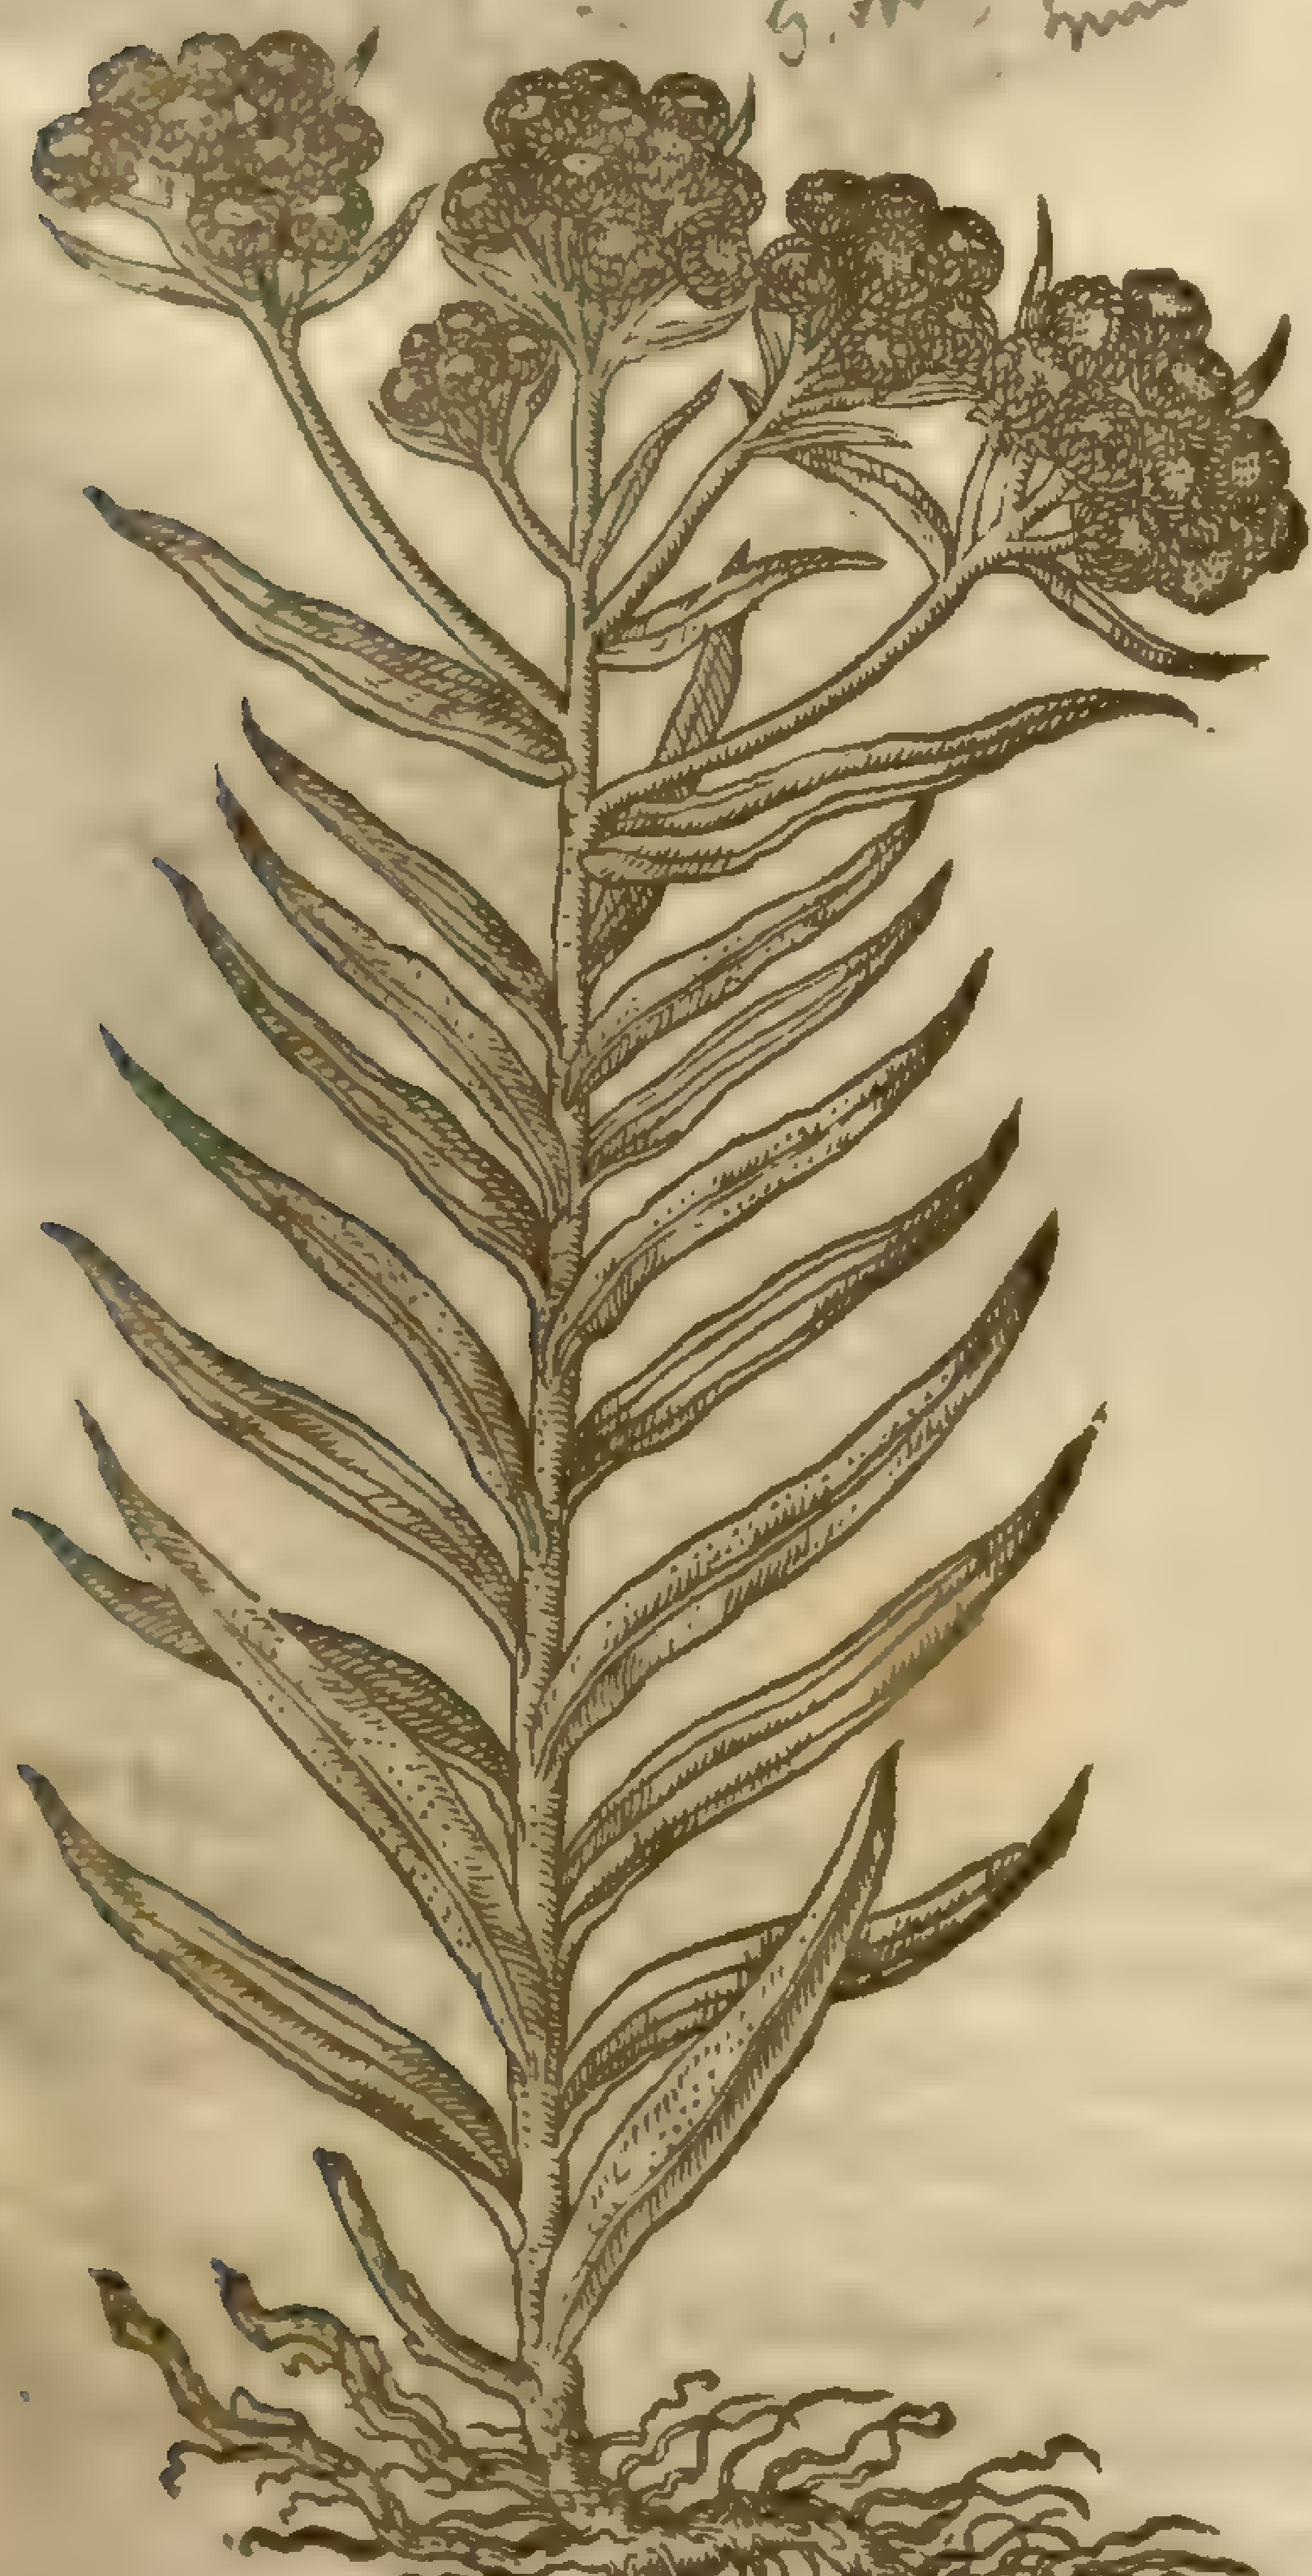


† 7 *Gnaphalium Alpinum.*
Rocke Cotton-weed.



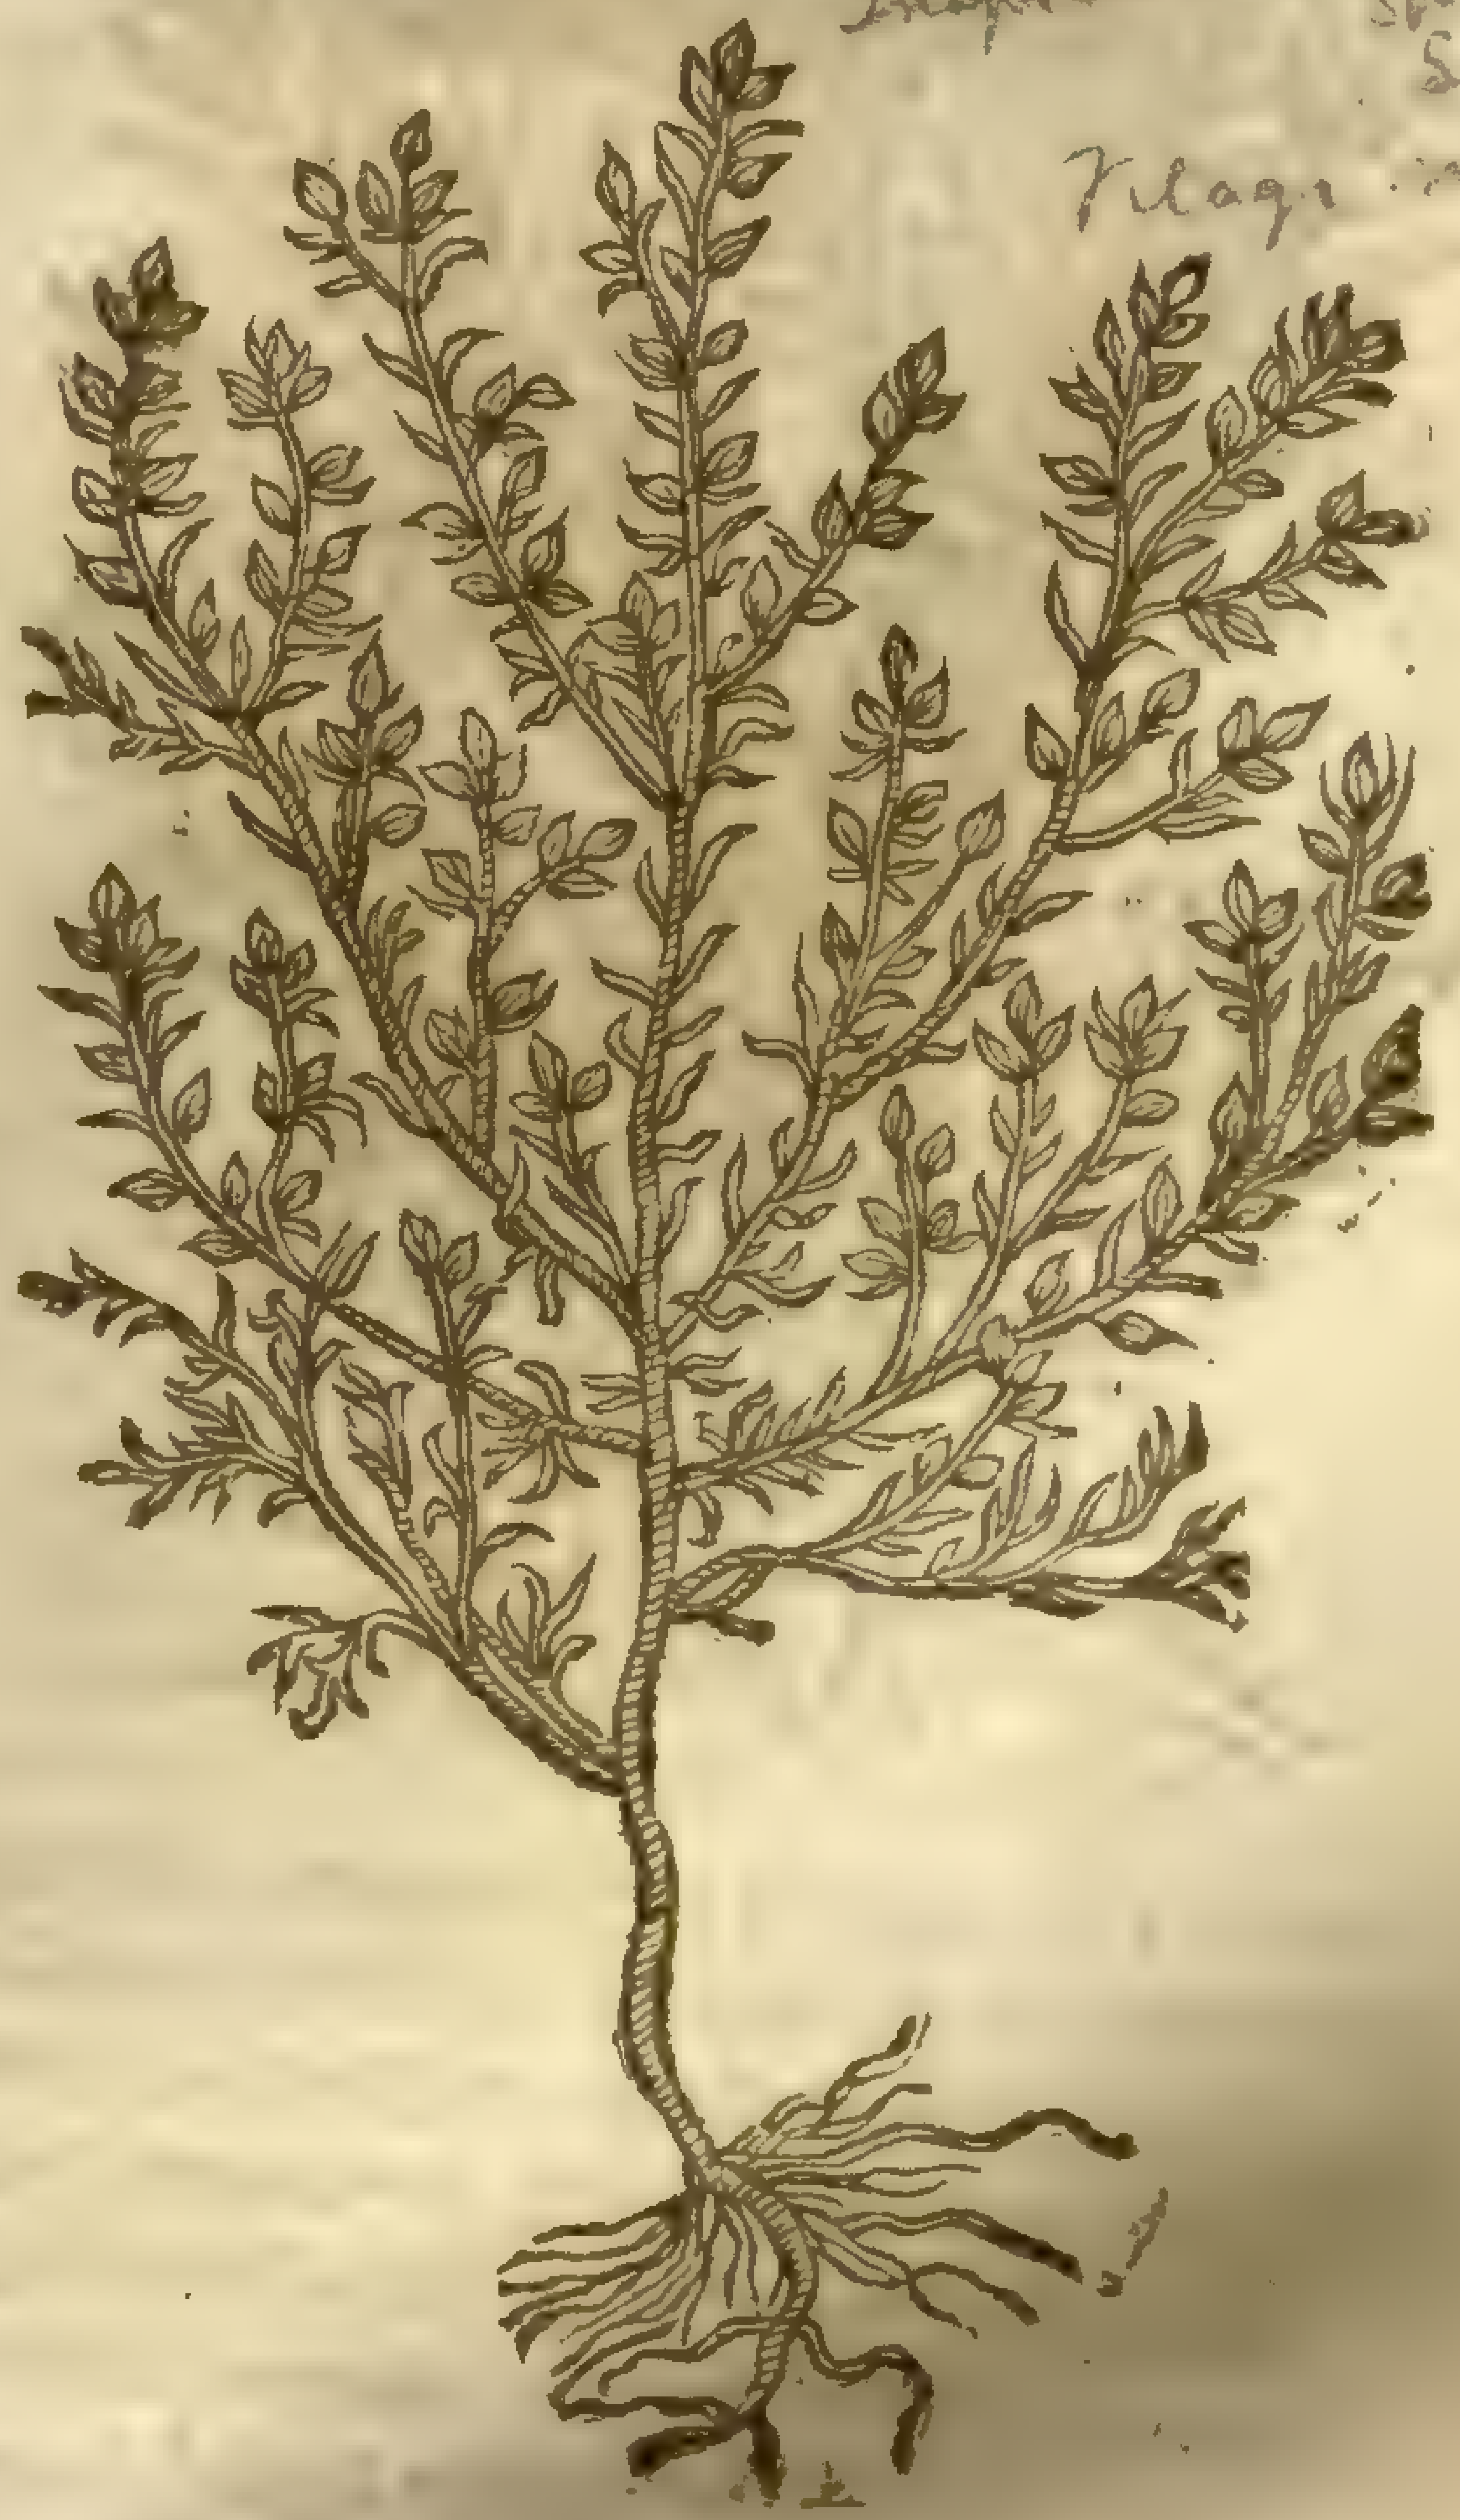
‡ 8 *Gnaphalium Americanum.*
Liue for euer.

G. margaritaceum,
mill. dict.



9 *Filago minor.*
Small Cud-weed.

Gnaphalium minimum.
Sh. [illegible]
Filago [illegible]
mill. dict.



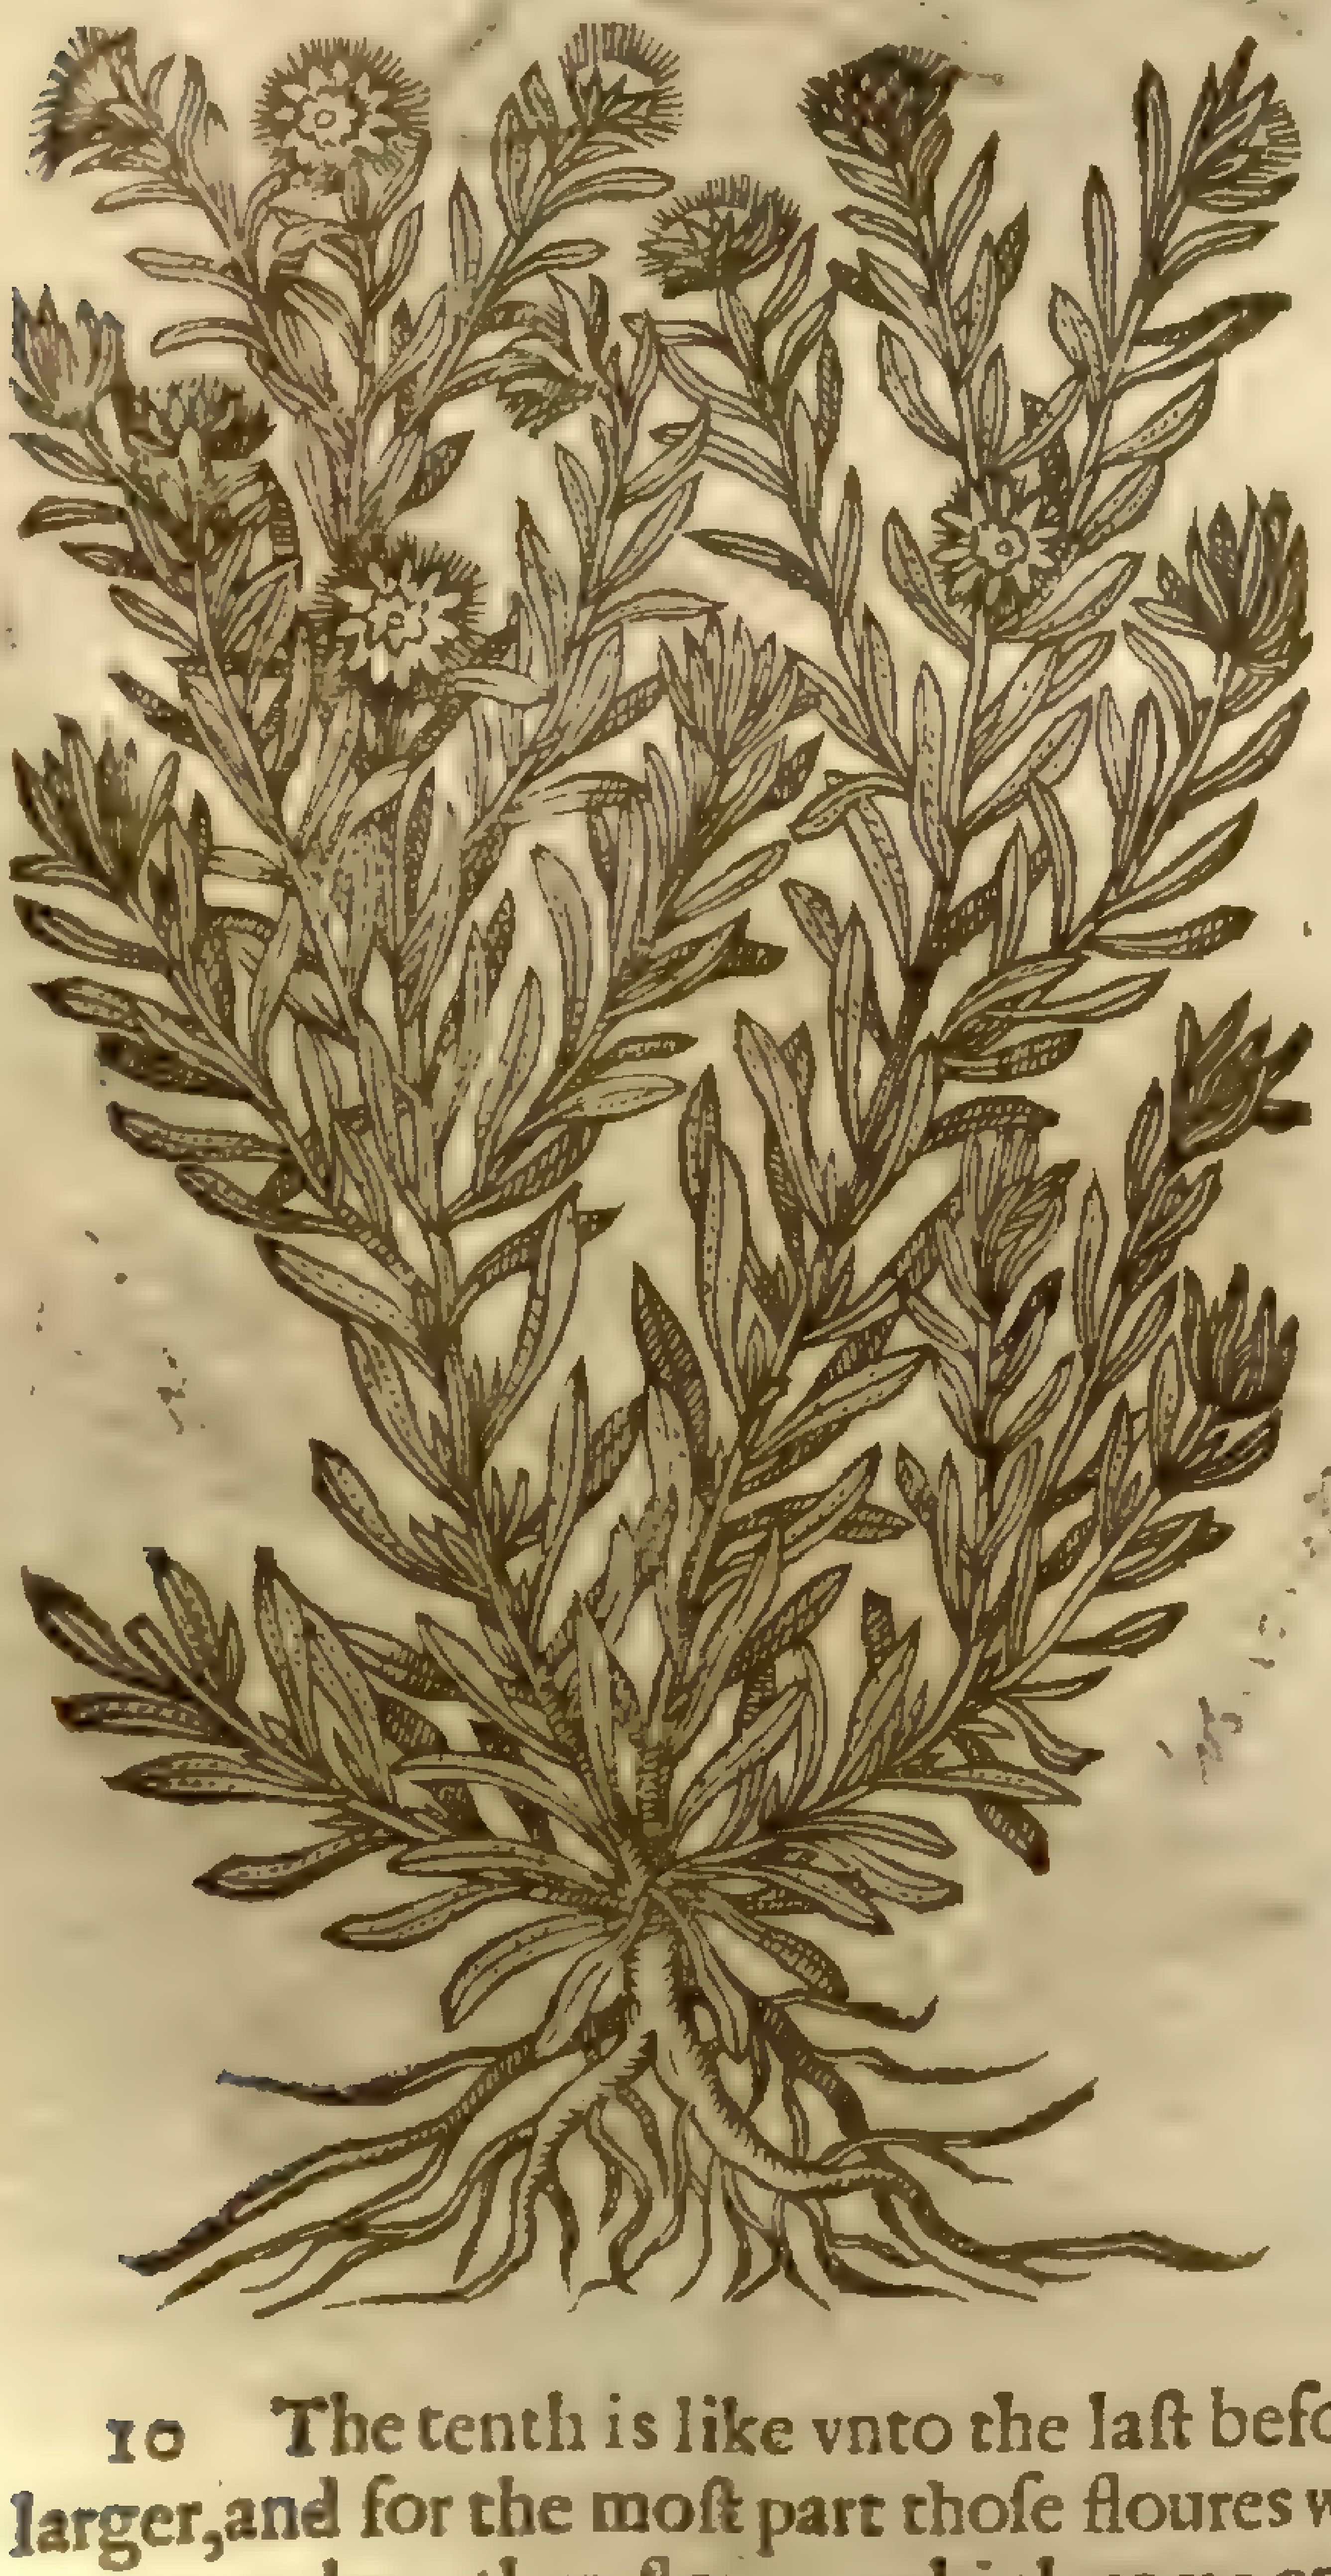
ſundry ſmall heads of a pale yellow colour, like vnto the other of this kinde. The root is blacke and ſomewhat fibrous.

8 There is a kinde of Cotton-weed, being of greater beautie than the reſt, that hath ſtrait and vpright ſtalkes 3 foot high or more, couered with a moſt ſoft and fine wooll, and in ſuch plentifull manner, that a man may with his hands take it from the ſtalke in great quantitie: which ſtalke is beſet with many ſmall long and narrow leaues, greene vpon the inner ſide, and hoary on the other ſide, faſhioned ſomewhat like the leaues of Roſemary, but greater. The floures do grow at the top of the ſtalkes in bundles or tufts, conſiſting of many ſmall floures of a white colour, and very double compact, or as it were conſiſting of little ſiluer ſcales thruſt cloſe together, which doe make the ſame very double. When the floure hath long flouriſhed, and is waxen old, then comes there in the middeſt of the floure a certaine browne yellow thrumme, ſuch as is in the middeſt of the Daiſie: which floure being gathered when it is young, may be kept in ſuch manner as it was gathered (I meane in ſuch freſhneſſe and well liking) by the ſpace of a whole yeare after, in your cheſt or elſewhere: wherefore our Engliſh women haue called it Liue-long, or Liue for euer, which name doth aptly anſwer his effects. ‡ *Cluſius* receiued this plant out of England, and firſt ſet it forth by the name of *Gnaphalium Americanum*, or *Argyrocome.* ‡

9 This plant hath three or foure ſmall grayiſh cottony or woolly ſtalkes, growing ſtrait from the root, and commonly diuided into many little branches: the leaues be long, narrow whitiſh, ſoft and woolly, like the other of his kinde: the floures be round like buttons, growing very many together at the top of the ſtalkes, but nothing ſo yellow as Mouſe-eare, which turne into downe, and are caried away with the winde.

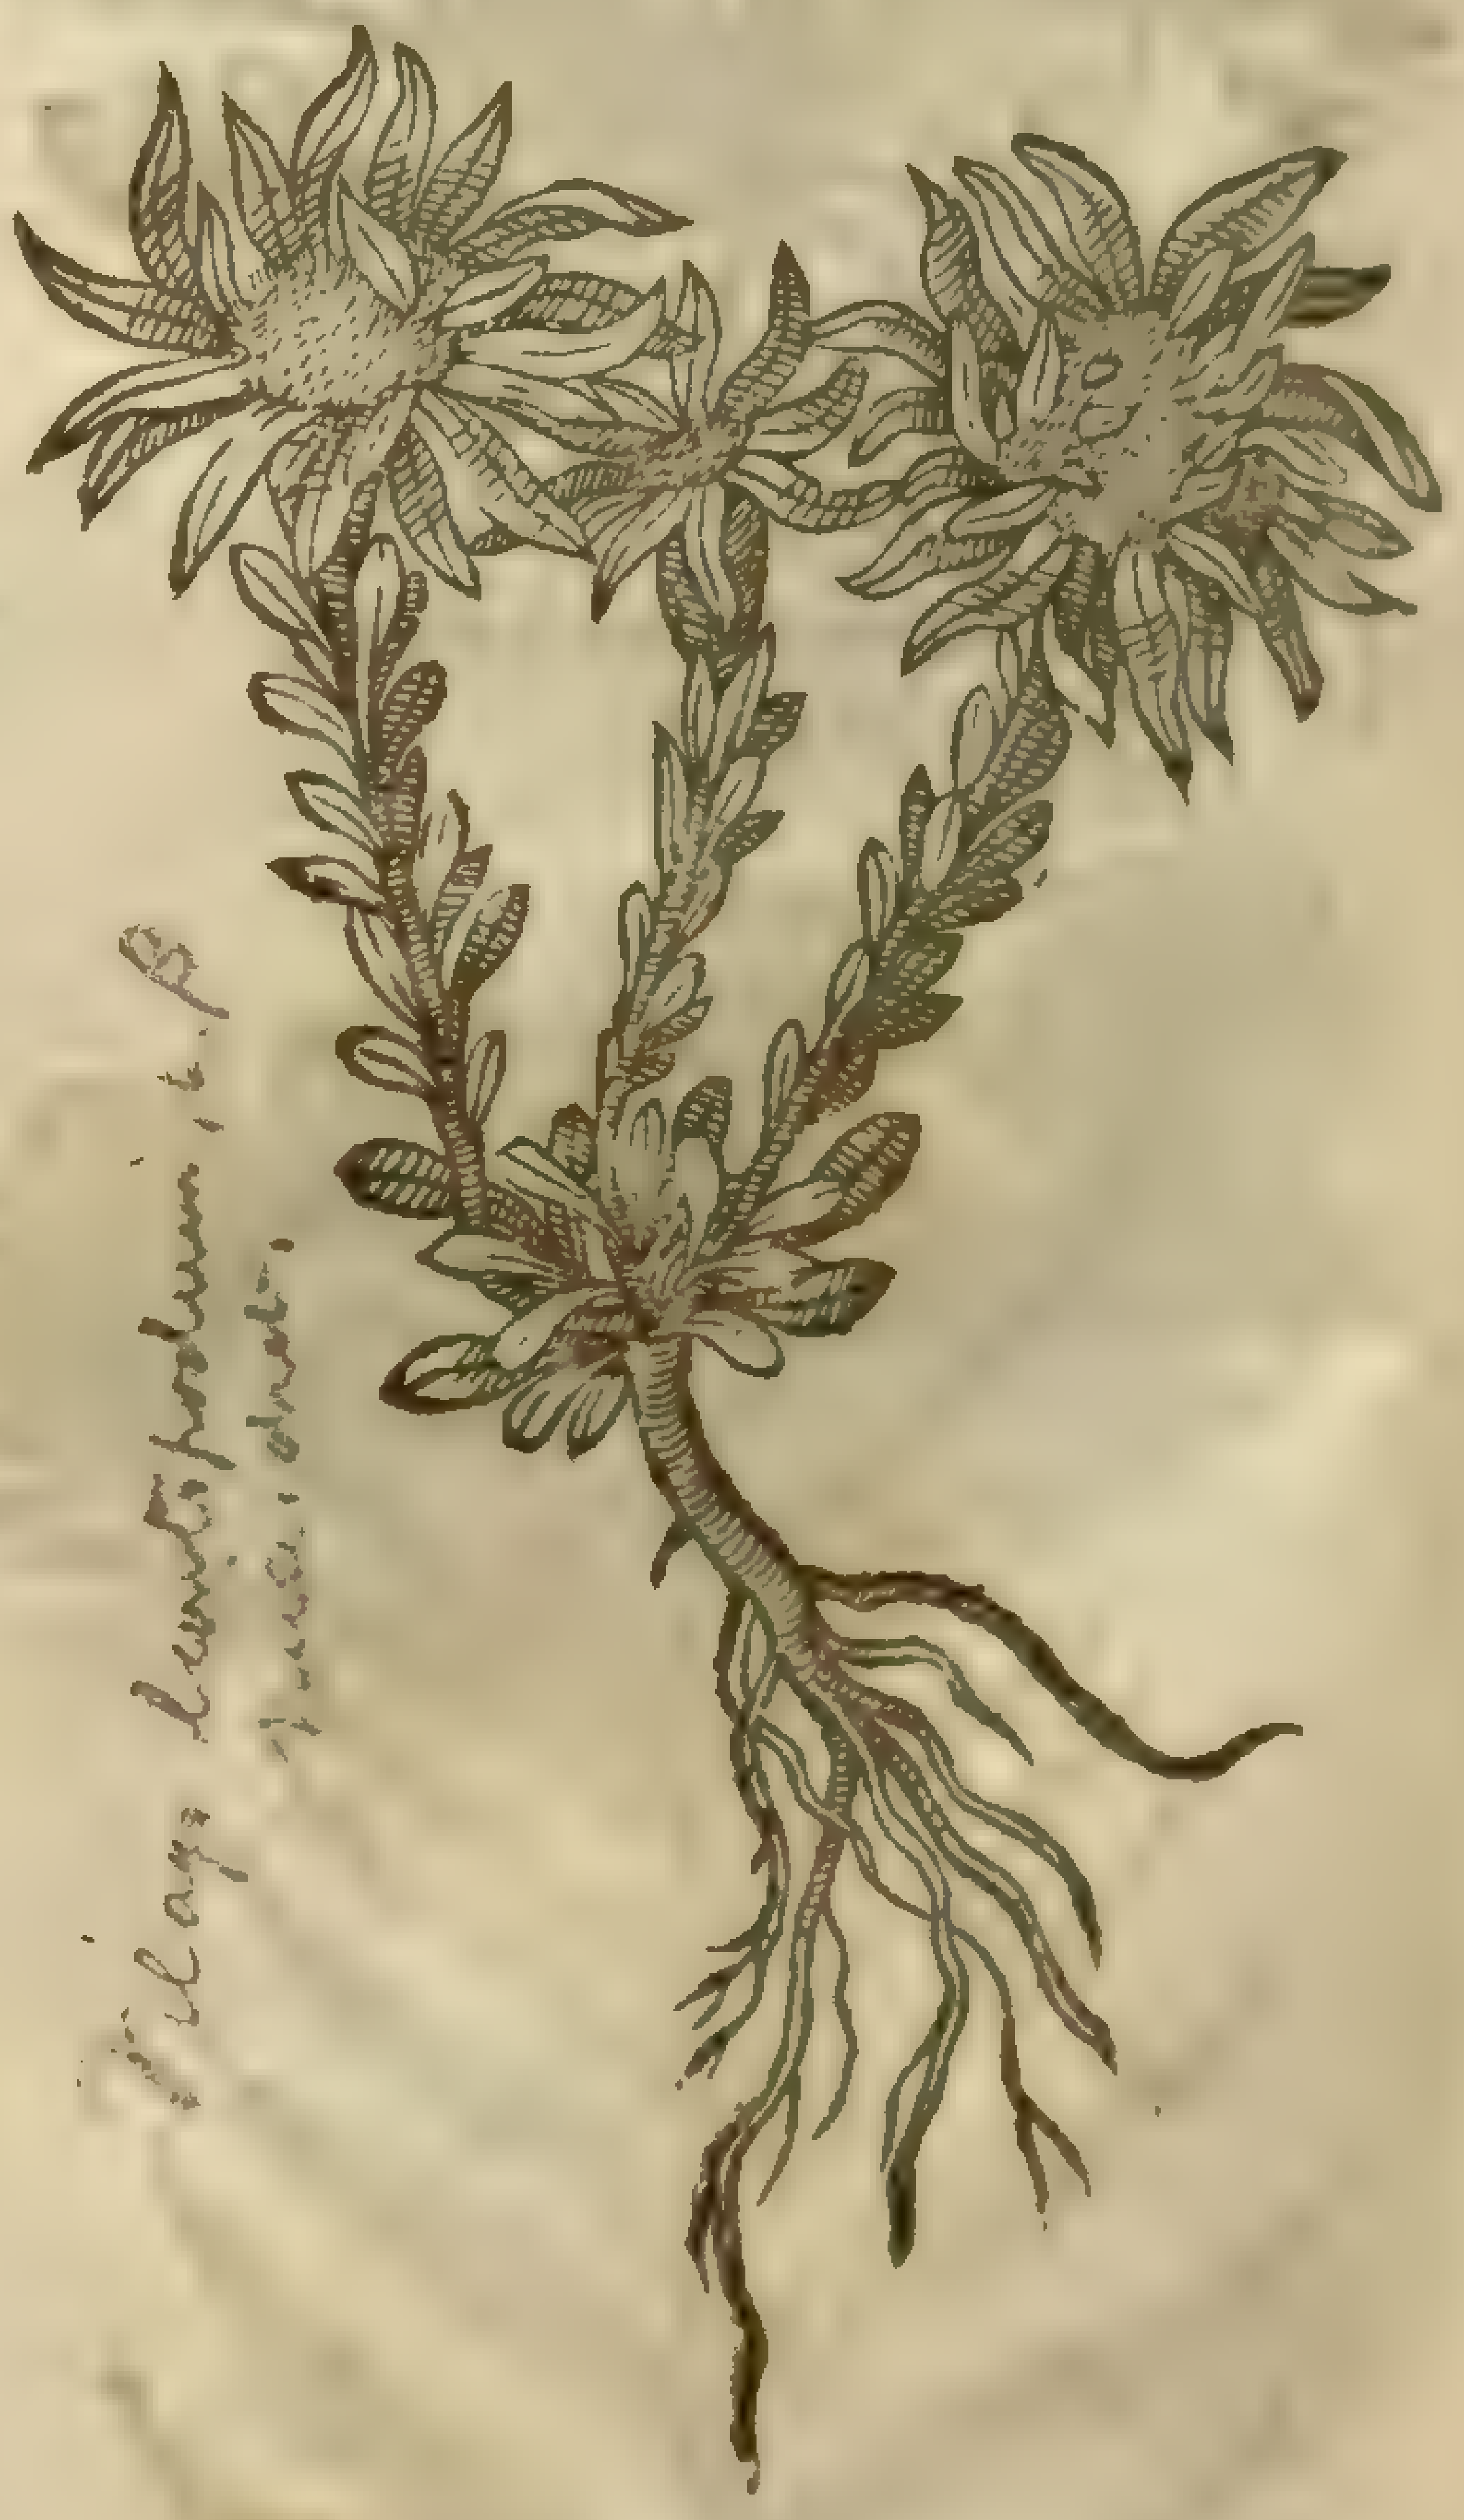
10 *Filago ſiue Herba impia.*
Herbe impious, or wicked Cudweed.

Sm sp. 3.6.9 [illegible]



11 *Leontopodium, ſiue Pes Leoninus.*
Lions Cudweed.

Filago leontopodium, i. B [illegible]

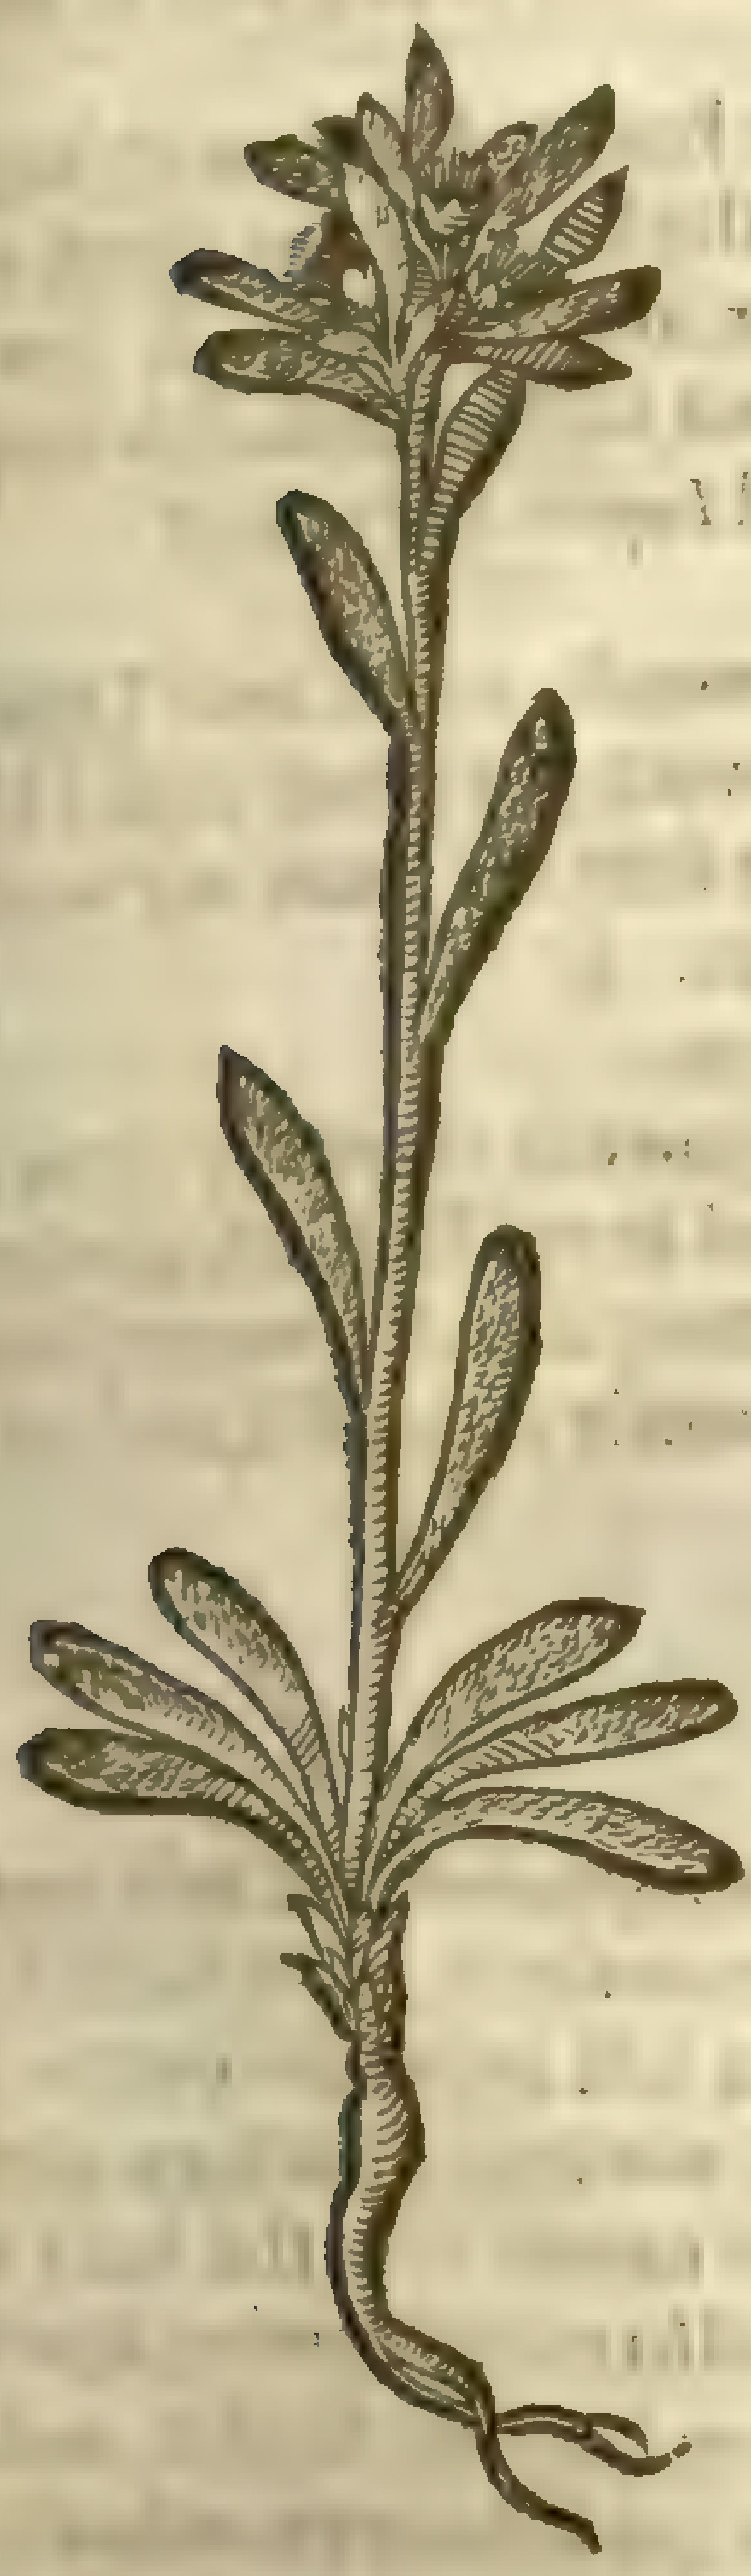


10 The tenth is like vnto the laſt before mentioned, in ſtalkes, leaues, and floures, but much larger, and for the moſt part thoſe floures which appeare firſt are the loweſt, and baſeſt, and they are ouertopt by other floures which come on younger branches, and grow higher, as children ſeeking to ouergrow or ouertop their parents, (as many wicked children do) for which cauſe it hath beene called *Herba impia*, that is, the wicked Herbe, or Herbe Impious.

11 This plant may be comprehended vnder the title of *Gnaphalium*, being without doubt a kinde thereof, as may appeare by the ſhape of his floures and ſtalkes, couered ouer with a ſoft wooll like vnto the other kindes of Cotton-weed it is an handfull high or thereabouts, beſet with leaues

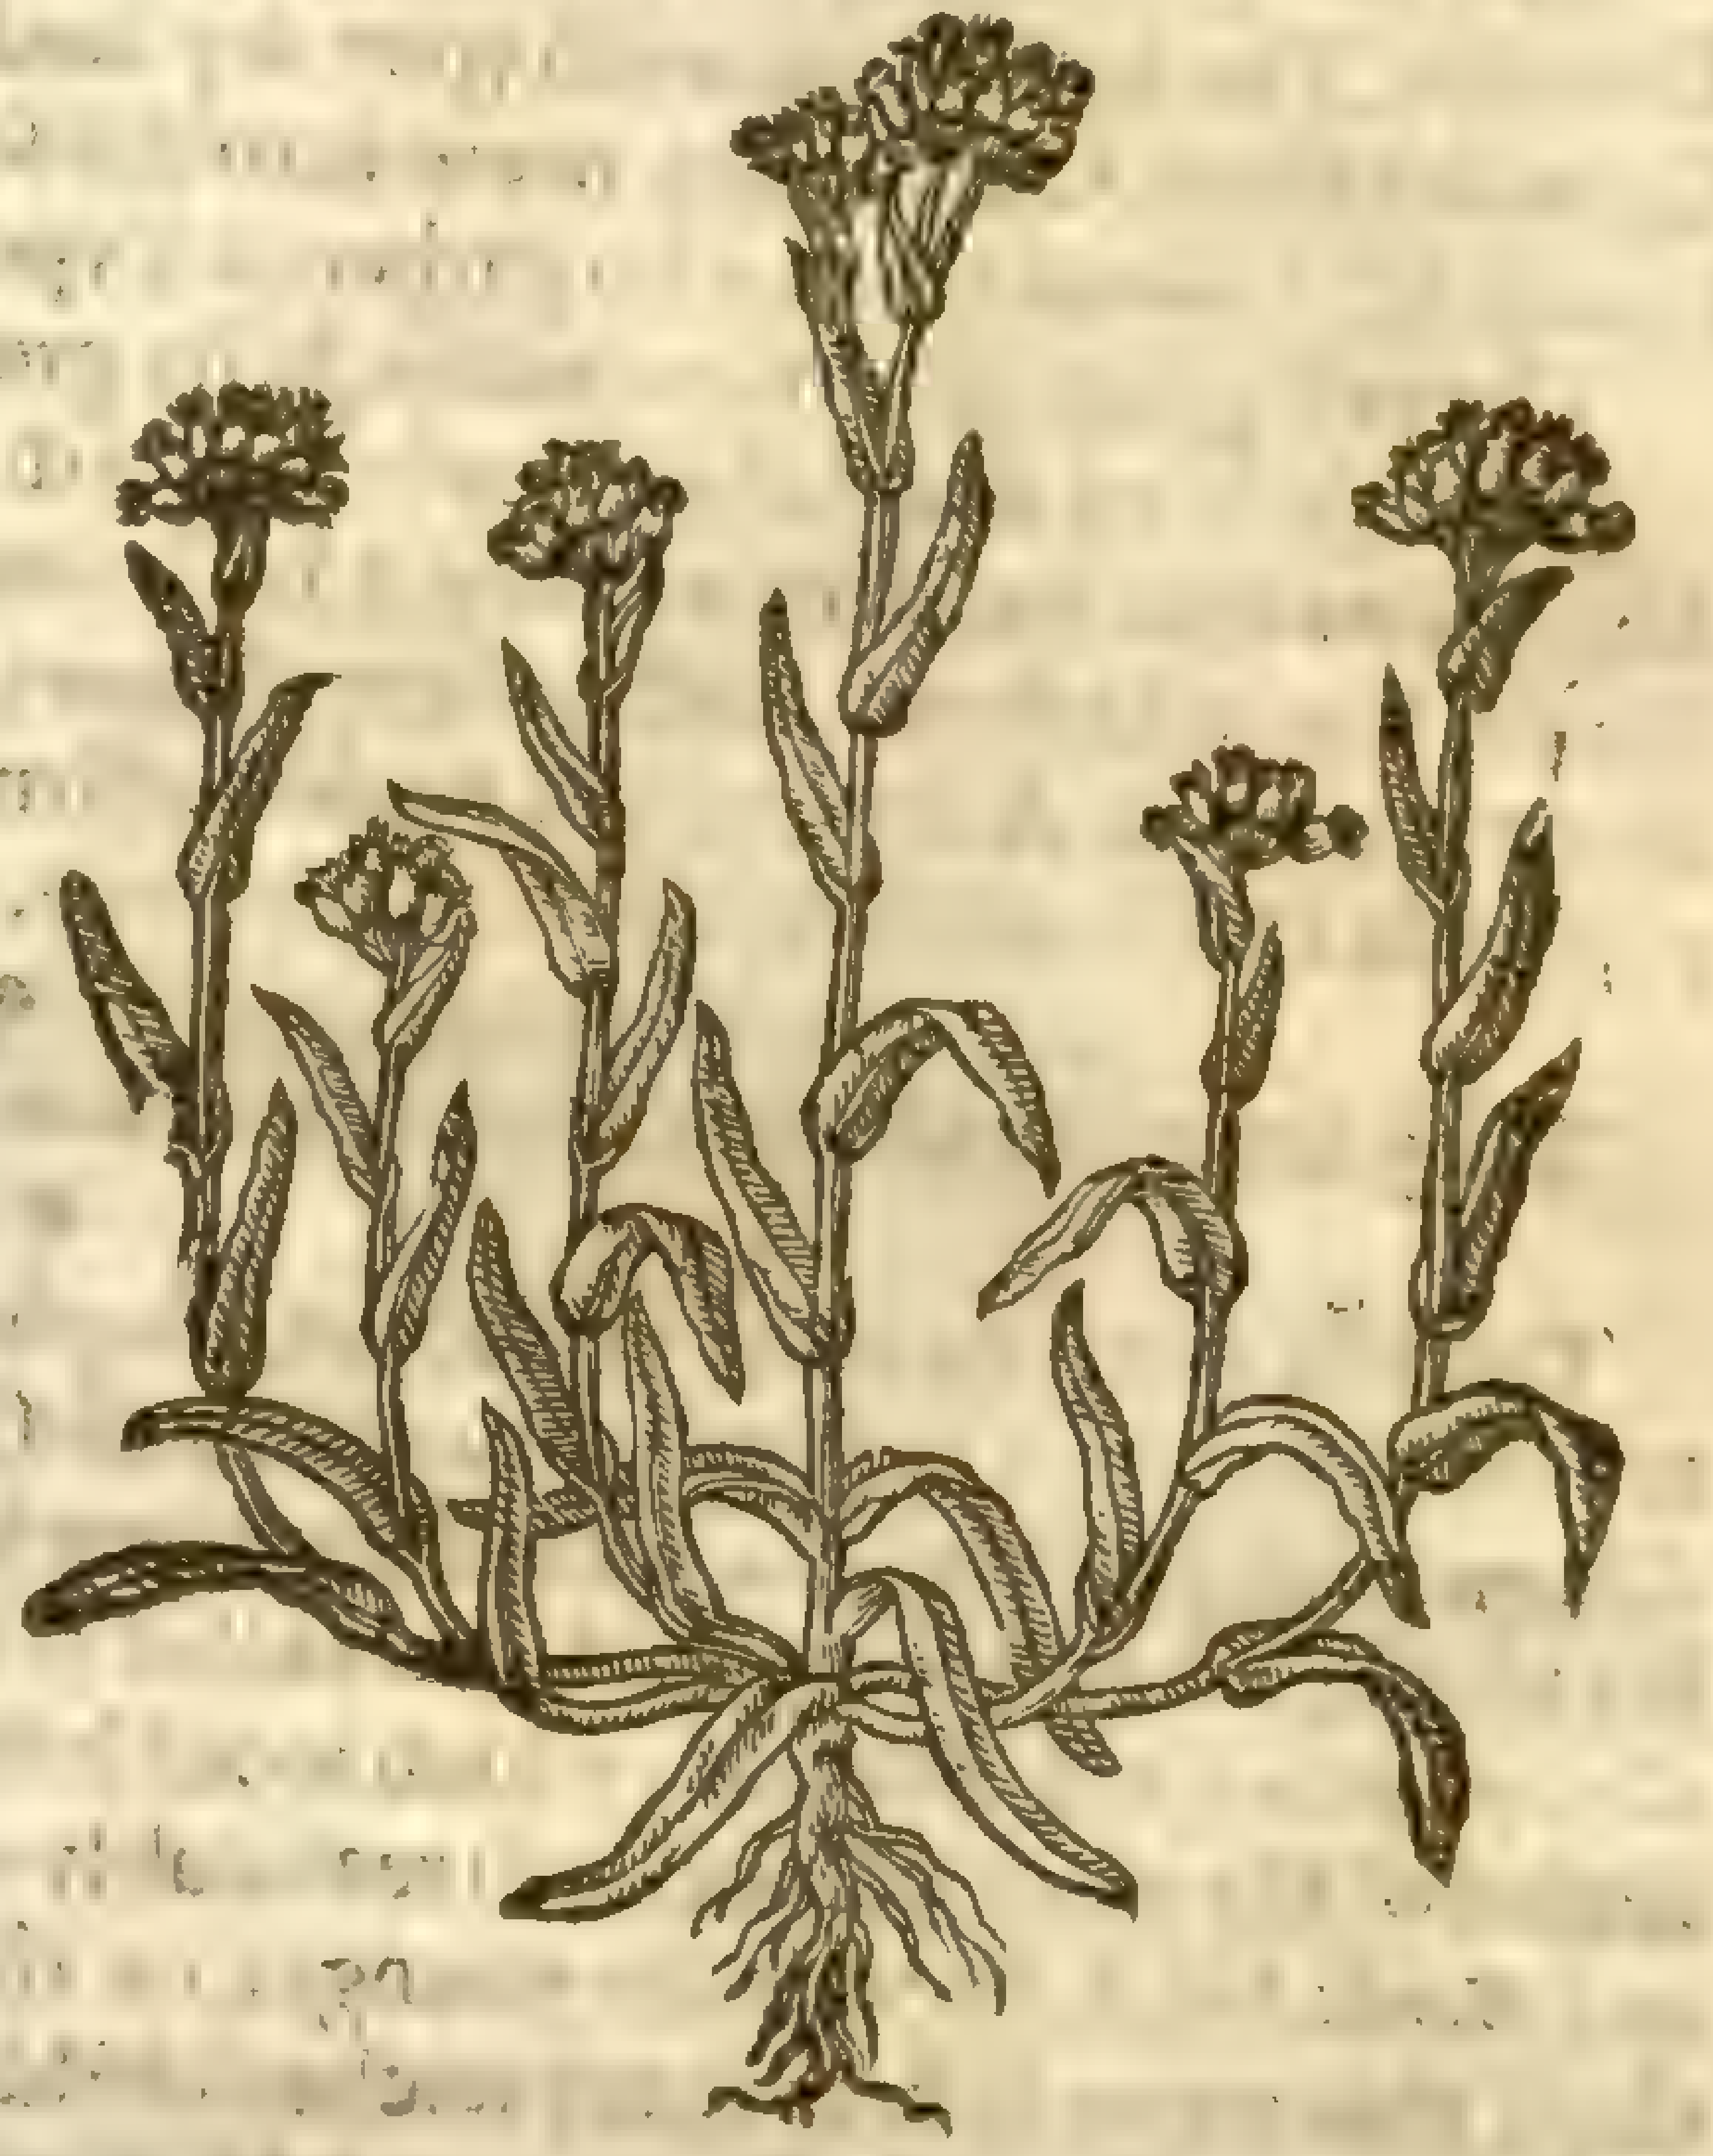
like

† 12 *Leontopodium parvum.*
Small Lyons Cudweed.

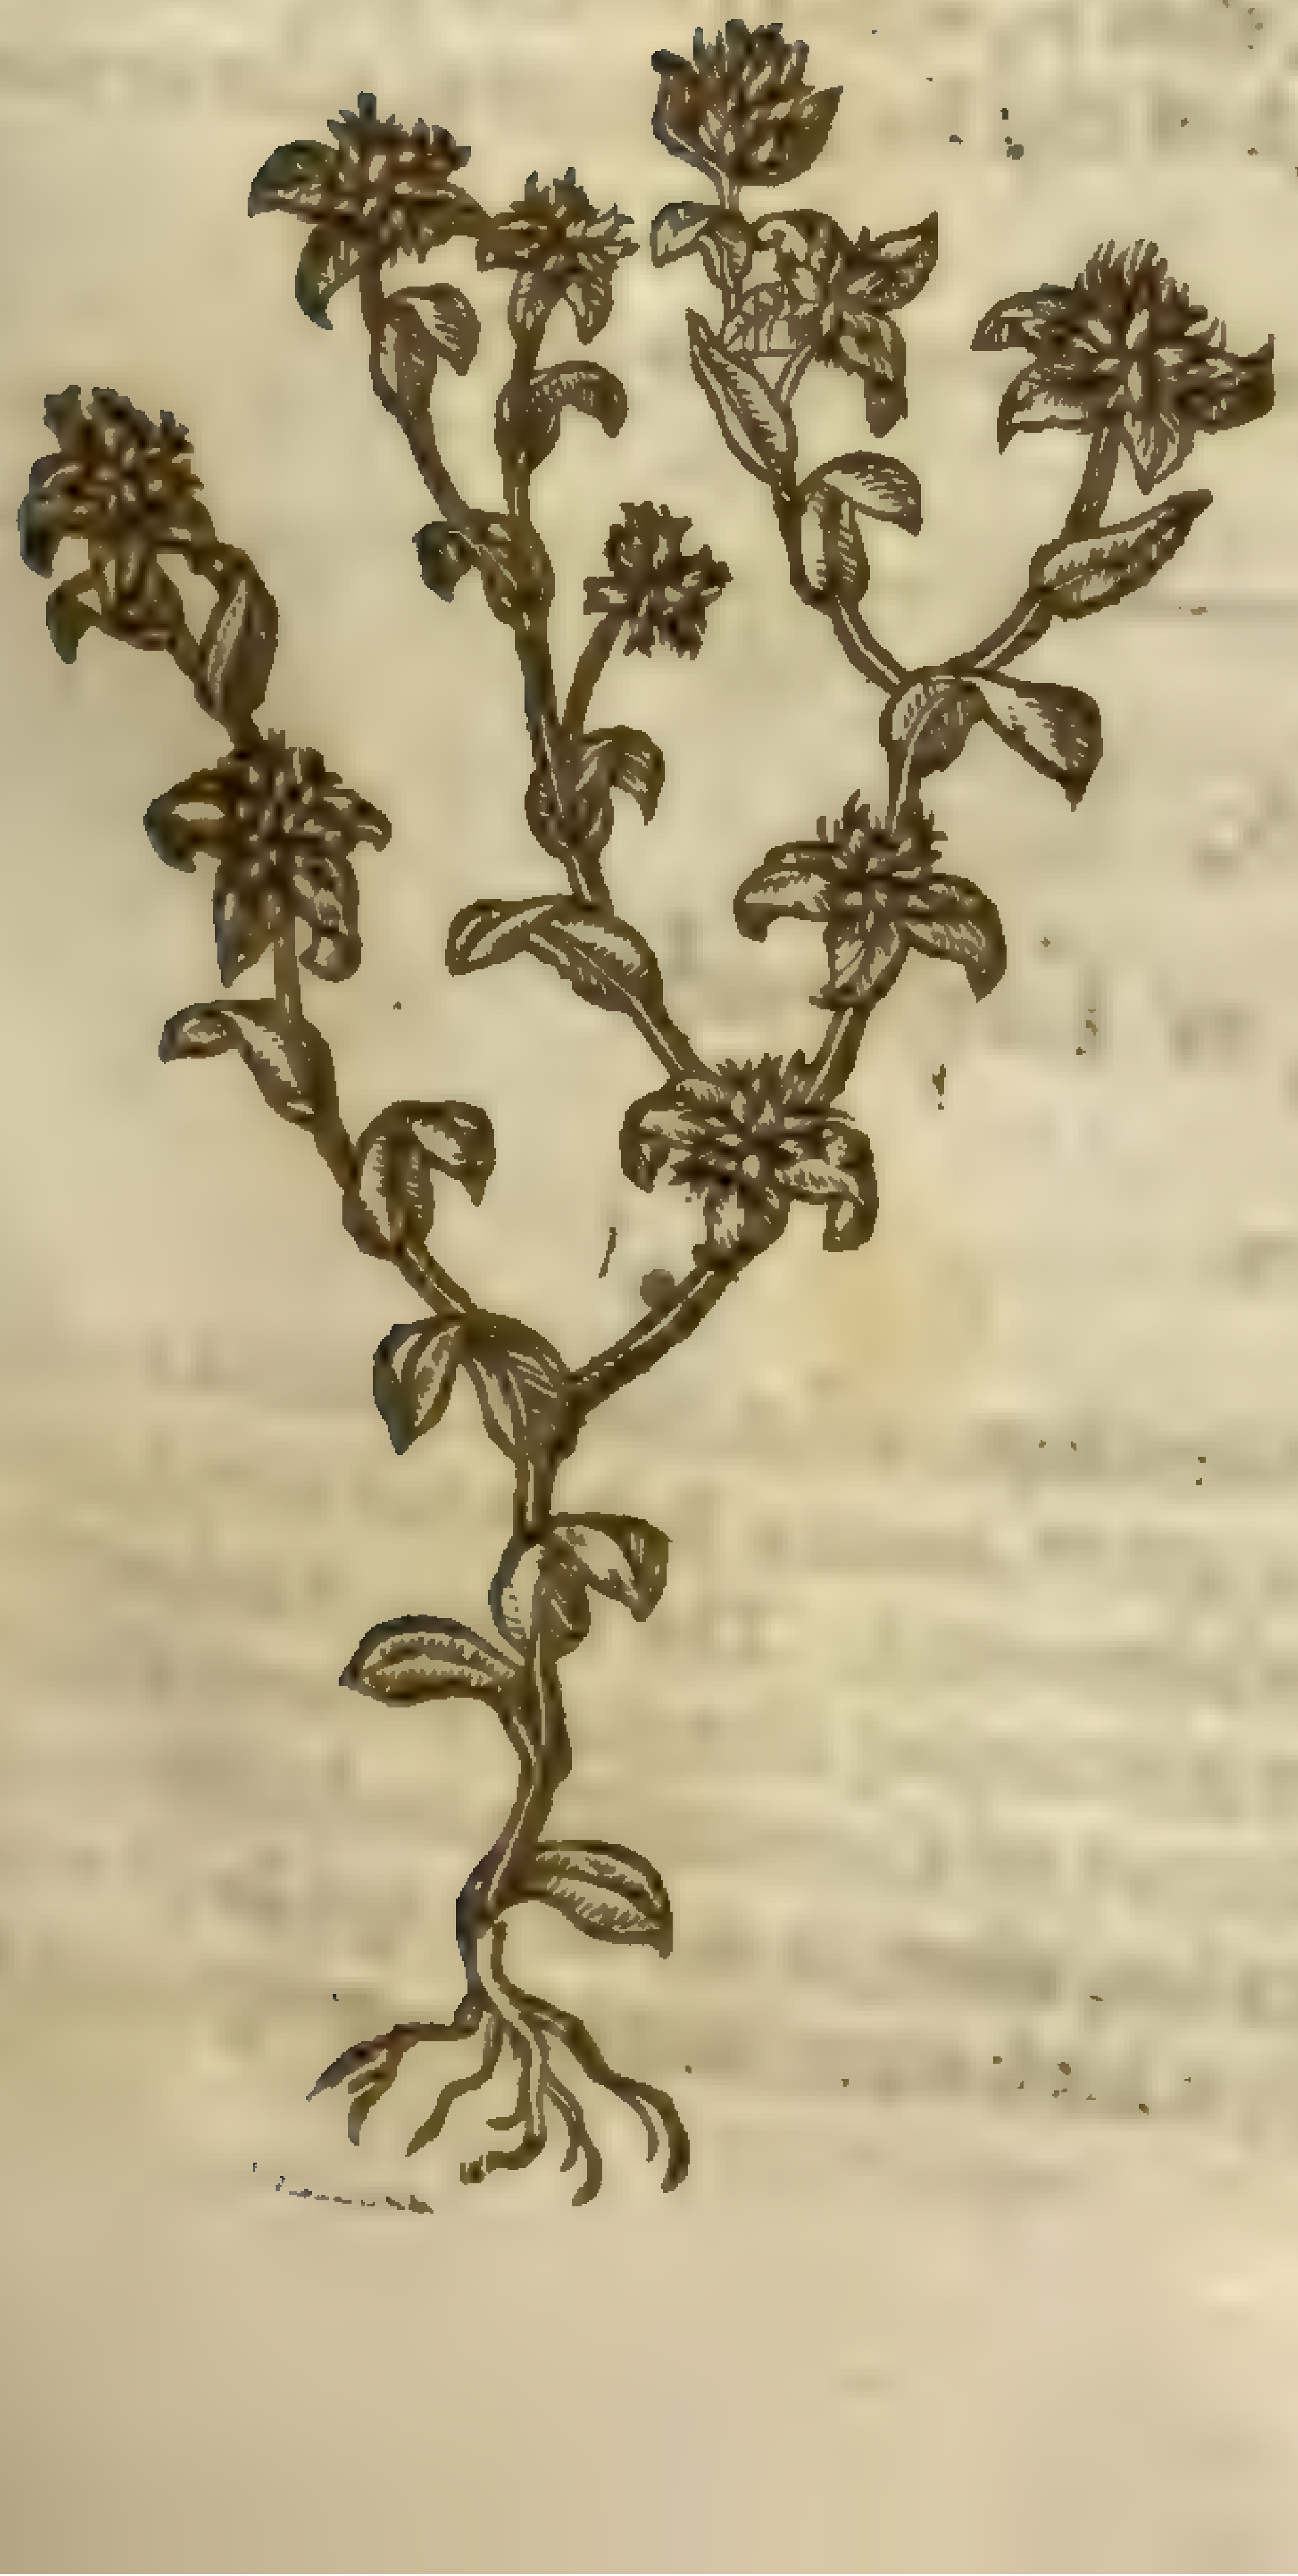


‡ 13 *Gnaphalium oblongo folio.*
Long leaued Cudweed.

[illegible]



‡ 14 *Gnaphalium minus latiore folio.*
Small broad leaued Cudweed.



like *Gnaphalium Anglicum,* but ſomewhat broader. At the top of the ſtalke groweth a floure of a blackiſh brown violet colour, beſet about with rough and woolly hairie leaues, which make the whole floure to reſemble the rough haired foot of a Lyon, of a Hare, or a Beare, or rather in mine opinion of a rough footed Doue. The heads of theſe floures when they are ſpread abroad carry a greater circumference than is required in ſo ſmall a plant; and when the floure is faded, the ſeed is wrapped in ſuch a deale of wooll that it is ſcarſely to be found out.

12 This ſmall kinde of *Leontopodium* being likewiſe a kind of Cotton-weed, neither by *Dioſcorides* or any other antient writer once remembred, hath one ſingle ſtalke nine inches in height, and the leaues of *Gnaphalium montanum*; which leaues and ſtalkes are white, with a thick hoary woollineſſe, bearing at the top pale yellow floures like *Gnaphalium montanum*: the root is ſlender and wooddy.

‡ 13 This, which *Cluſius* calls *Gnaphalium Plateau* 2. hath ſmall ſtalkes ſome handfull high or ſomewhat more, of which

ſome ſtand vpright, others lie along vpon the ground, being round, hairy, and vnorderly ſet with ſoft hoary leaues ingirting their ſtalkes at their ſetting on, and ſharpe pointed at their vpper ends. The tops of the ſtalkes carry many whitiſh heads full of a yellowiſh downe: the root is thicke and blackiſh, with ſome fibres.

14 This ſends vp one ſtalke parted into ſeuerall branches ſet here and there with broad ſoft and hoary leaues, and at the diuiſion of the branches and amongſt the leaues grow ſeuen or eight little heads thicke thruſt together, being of a grayiſh yellow colour, and full of much downe: the root is vnprofitable, and periſhes as ſoone as it hath perfected his ſeed. *Cluſius* calls this *Gnaphalium Plateau* 3. he hauing as it ſeemes receiued them both from his friend *Iaques Plateau*. ‡

¶ *The Place.*

The firſt groweth in the darke woods of Hampſted, and in the woods neere vnto Deptford by London. The ſecond groweth vpon dry ſandy banks. The third groweth at a place called Merezey, ſix miles from Colcheſter, neere vnto the ſea ſide. ‡ I alſo had it ſent me from my worſhipfull friend Mr *Thomas Glynn*, who gathered it vpon the ſea coaſt of Wales. ‡

The reſt grow vpon mountaines, hilly grounds, and barren paſtures.

The kinde of *Gnaphalium* newly ſet forth (to wit *Americanum*) groweth naturally neere vnto the Mediterranean ſea, from whence it hath beene brought and planted in our Engliſh gardens. ‡ If this be true which our Author here affirmes, it might haue had a fitter (at leaſt a neerer) denomination than from America: yet *Bauhine* affirmes that it growes frequently in Braſill, and it is not improbable that both their aſſertions be true. ‡

¶ *The Time.*

They floure for the moſt part from Iune to the end of Auguſt.

¶ *The Names.*

Cotton-weed is called in Greeke, *Gnaphalion*; and it is called *Gnaphalion*, becauſe men vſe the tender leaues of it in ſtead of bombaſte or Cotton, as *Paulus Ægineta* writeth. *Pliny* ſaith it is called *Chamæxylon*, as though he ſhould ſay Dwarfe Cotton; for it hath a ſoft and white cotton like vnto bombaſte, whereupon alſo it was called of diuers *Tomentitia*, and *Cotonaria*: of others, *Centunculus*, *Centuncularis*, and *Albinum*; which word is found among the baſtard names: but the later word, by reaſon of the white colour, doth reaſonably well agree with it. It is alſo called *Bombax*, *Humilis filago*, and *Herba Impia*, becauſe the younger, or thoſe floures that ſpring vp later, are higher, and ouertop thoſe that come firſt, as many wicked children do vnto their parents, as is before touched in the deſcription: in Engliſh, Cottonweed, Cudweed, Chaffe-weed, and petty Cotton.

¶ *The Temperature.*

Theſe herbes be of an aſtringent or binding and drying quality.

¶ *The Vertues.*

A *Gnaphalium* boyled in ſtrong lee cleanſeth the haire from nits and lice: alſo the herb being laid in ward-robes and preſſes keepeth apparell from moths.

B The ſame boiled in wine and drunken, killeth wormes and bringeth them forth, and preuaileth againſt the bitings and ſtingings of venomous beaſts.

C The fume or ſmoke of the herbe dried, and taken with a funnell, being burned therein, and receiued in ſuch manner as we vſe to take the fume of Tabaco, that is, with a crooked pipe made for the ſame purpoſe by the Potter, preuaileth againſt the cough of the lungs, the great ache or paine of the head, and cleanſeth the breaſt and inward parts.

† The figure that was formerly in the ſeuenth place ſhould haue beene in the eleuenth; and that in the eleuenth in the ſeuenth.

Chap. 206.

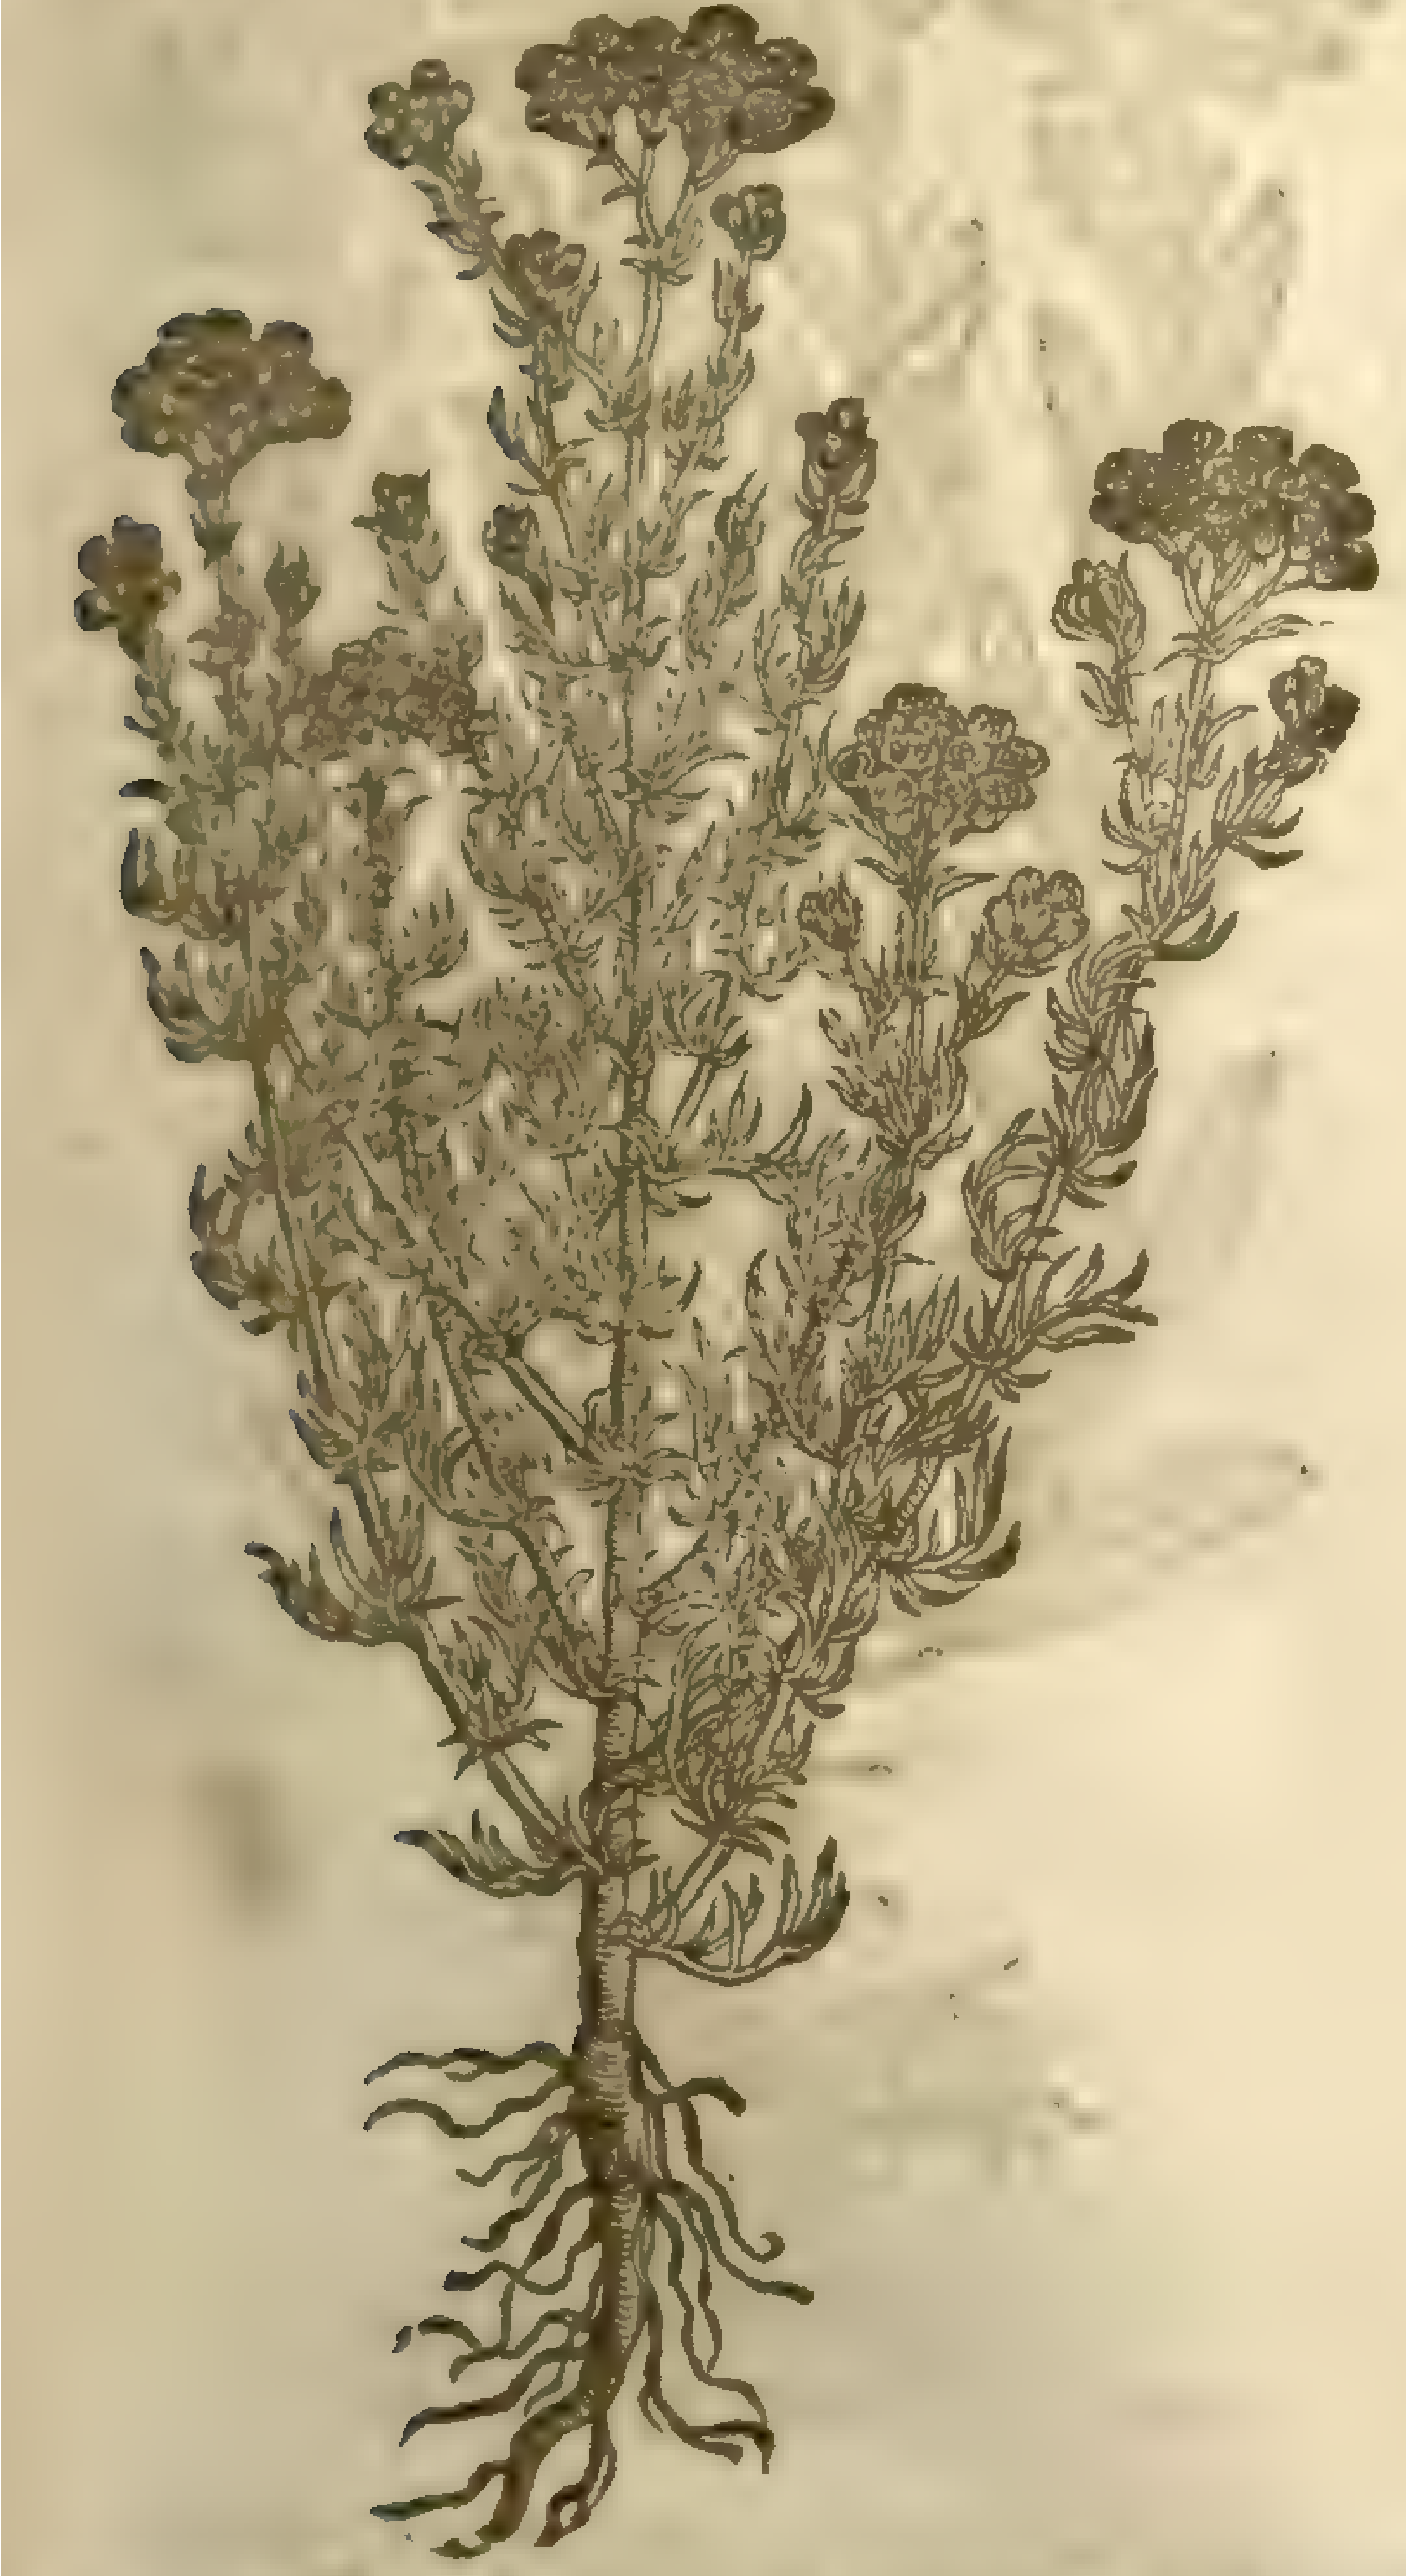
Of Golden Moth-wort, or Cudweed.

¶ *The Deſcription.*

1 GOlden Mothwort bringeth forth ſlender ſtalkes ſomewhat hard and wooddy, diuided in diuers ſmall branches; whereupon doe grow leaues ſomewhat rough, and of a white colour, very much jagged like Southernwood. The floures ſtand on the tops of the ſtalkes, ioyned together in tufts, of a yellow colour glittering like gold, in forme reſembling the ſcaly floures of Tanſie, or the middle button of the floures of Camomill; which being gathered before they be ripe or withered, remaine beautifull long time after, as my ſelfe did ſee in the hands of Mr *Wade*, one of the Clerks of her Majeſties counſell, which were ſent him among other things

from Padua in Italy. For which cauſe of long laſting, the images and carued gods were wont to weare garlands thereof; whereupon ſome haue called it Gods floure. For which purpoſe *Ptolomy* King of Ægypt did moſt diligently obſerue them, as *Pliny* writeth.

1 *Elychryſon, ſiue Coma aurea.*
Golden Moth-wort.



¶ *The Place.*

It growes in moſt vntilled places of Italy and Spaine, in medowes where the ſoile is barren, and about the bankes of riuers; it is a ſtranger in England.

¶ *The Time.*

It floures in Auguſt and September: notwithſtanding *Theophraſtus* and *Pliny* reckon it among the floures of the Spring.

¶ *The Names.*

Golden Moth-wort is called of *Dioſcorides Elichryſon*: *Pliny* and *Theophraſtus* call it *Helichryſon*: *Gaza* tranſlates it *Aurelia*: in Engliſh, Gold-floure, Golden Moth-wort.

¶ *The Temperature.*

It is (ſaith *Galen*) of power to cut and make thinne.

¶ *The Vertues.*

Dioſcorides teacheth, that the tops thereof drunke in wine are good for them that can hardly make water, againſt the ſtingings of Serpents, paines of the huckle bones: and taken in ſweet wine it diſſolueth congealed bloud. A

The branches and leaues laid amongſt cloathes keepeth them from mothes, whereupon it hath beene called of ſome Moth-weed, or Moth-wort. B

† Here formerly were two figures and deſcriptions of the ſame Plant.

Chap. 207. *Of Golden Floure-Gentle.*

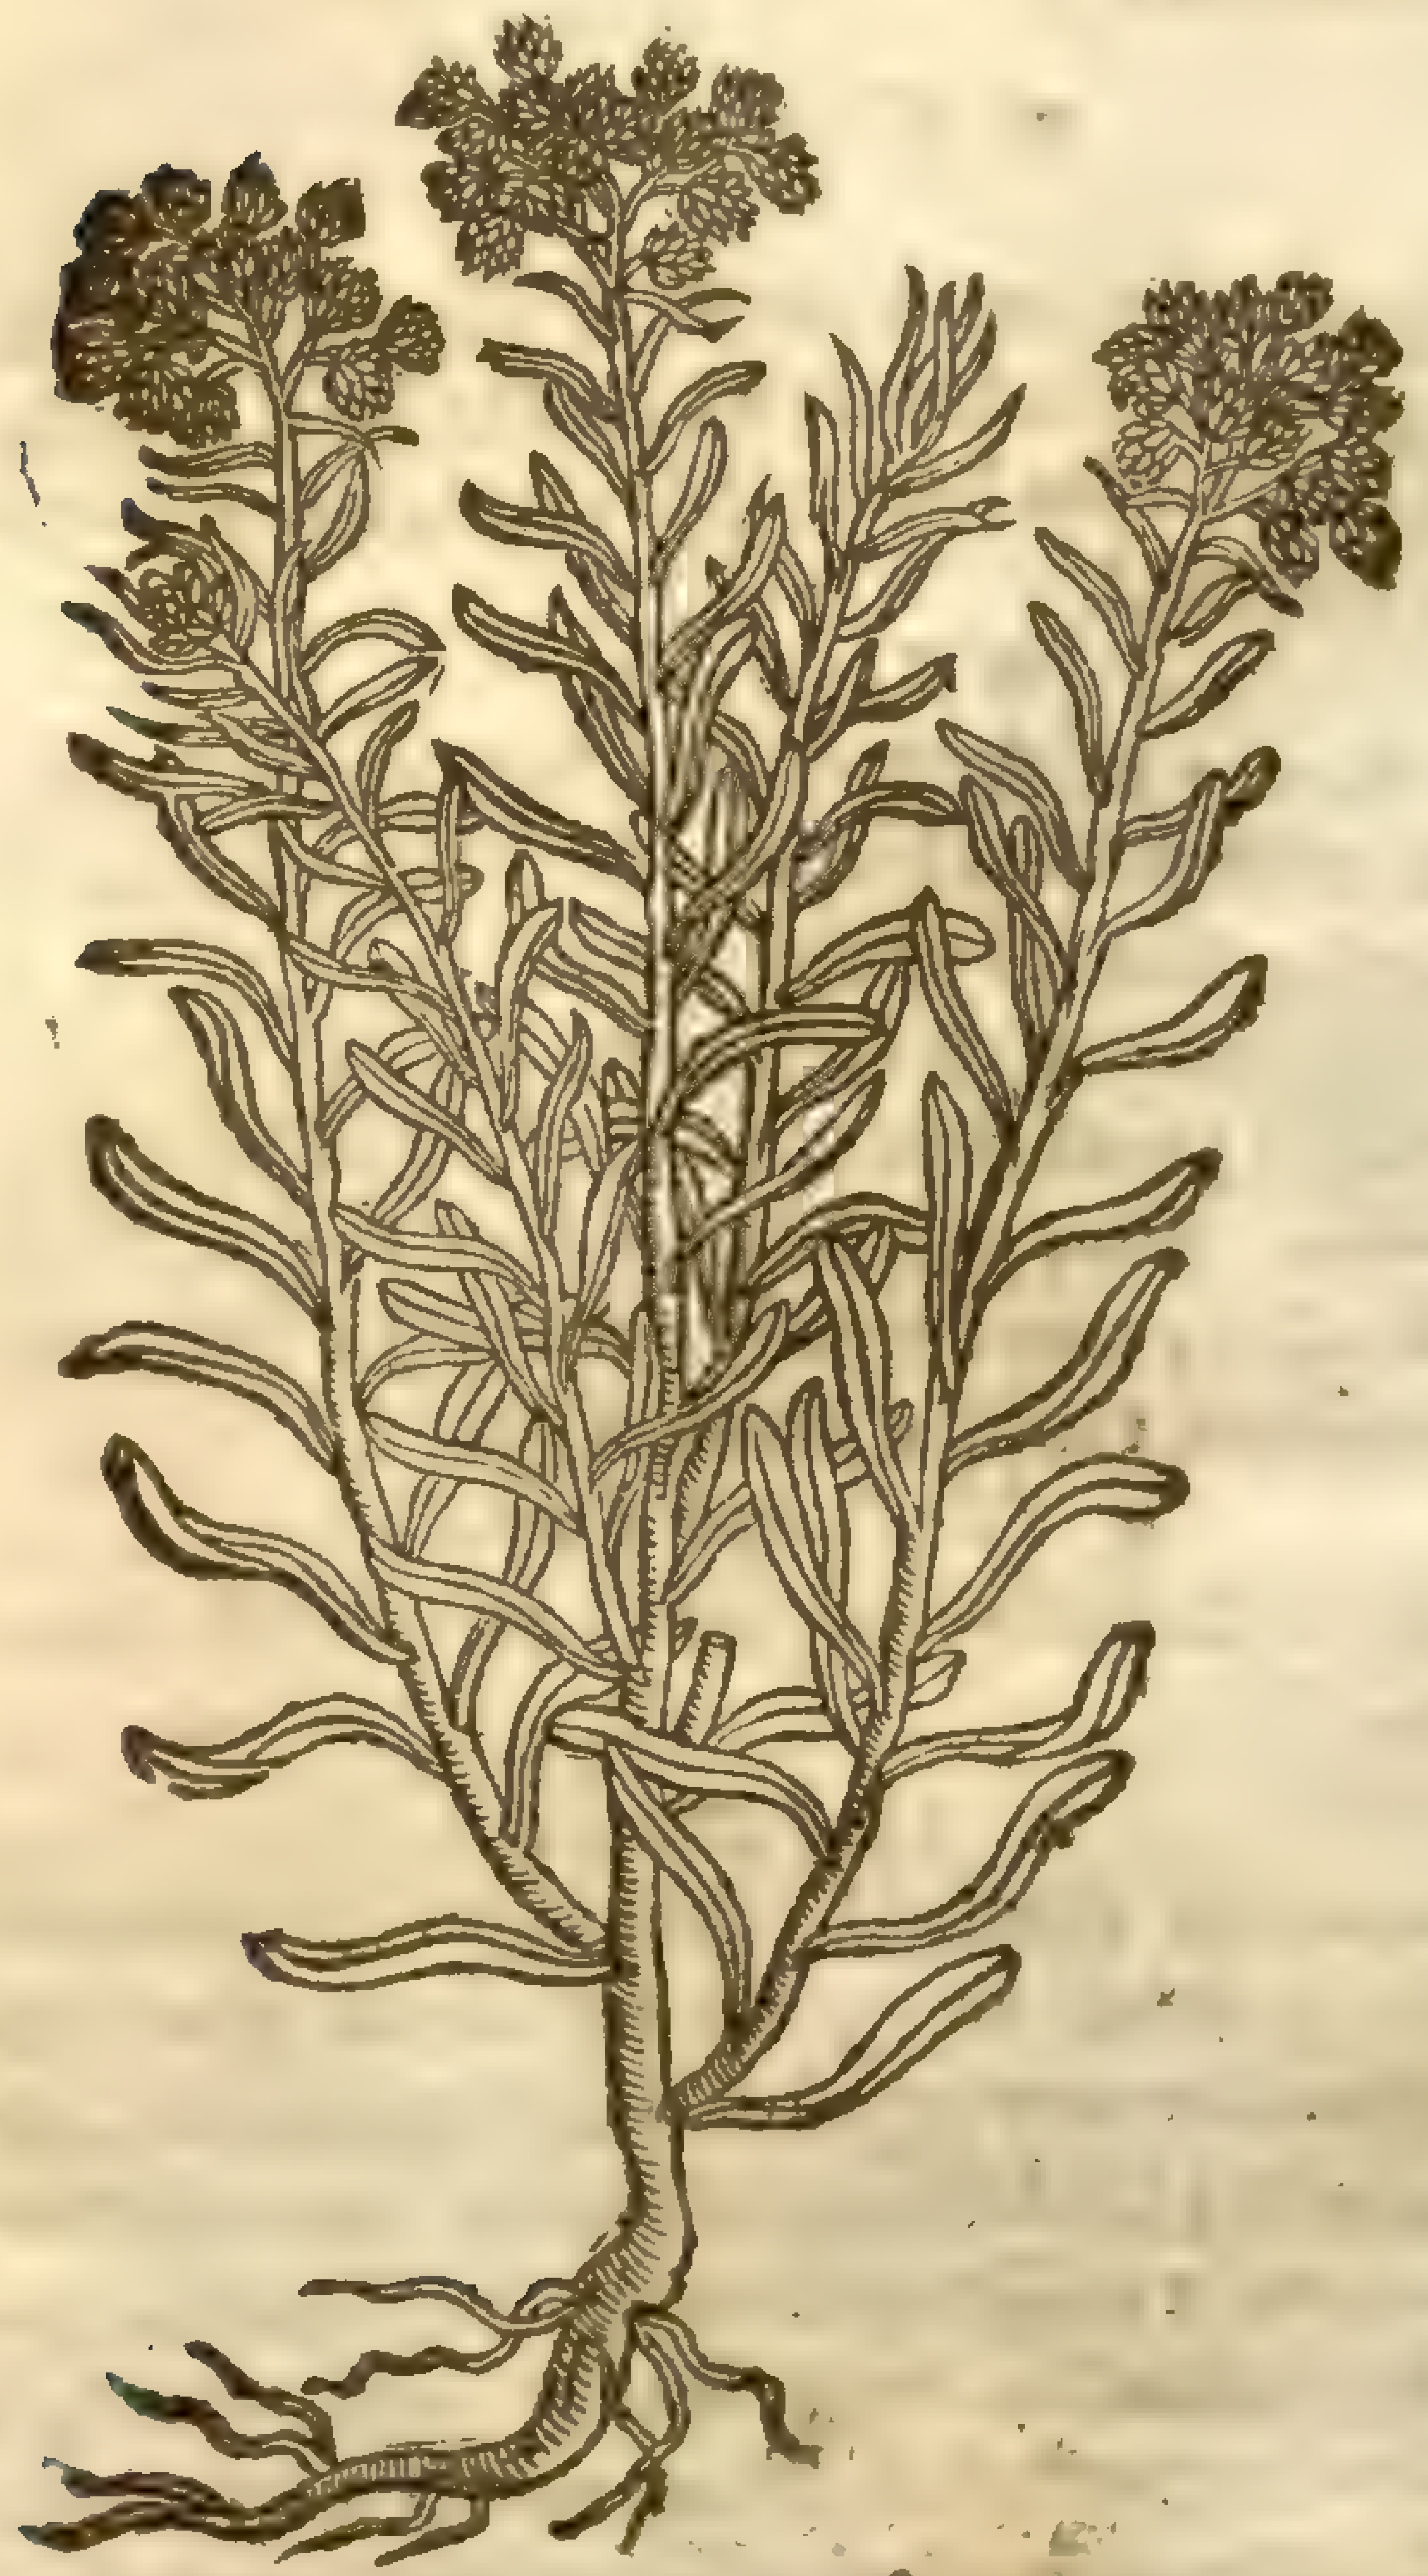
¶ *The Deſcription.*

1 THis yellow Euerlaſting or Floure-Gentle, called of the later Herbariſts Yellow Stœcas, is a plant that hath ſtalkes of a ſpan long, and ſlender, whereupon do grow narrow leaues white and downie, as are alſo the ſtalkes. The floures ſtand on the tops of the ſtalkes, conſiſting of a ſcattered or diſordered ſcaly tuft, of a reaſonable good ſmell, of a bright yellow colour; which being gathered before they be ripe, do keep their colour and beautie a long time without withering, as do moſt of the Cottonweeds or Cudweeds, whereof this is a kinde. The root is blacke and ſlender. ‡ There is ſome variety in the heads of this plant, for they are ſometimes very large and longiſh, as *Camerarius* notes in his Epitome of *Matthiolus*; otherwhiles they are very compact and round, and of the bigneſſe of the ordinary.

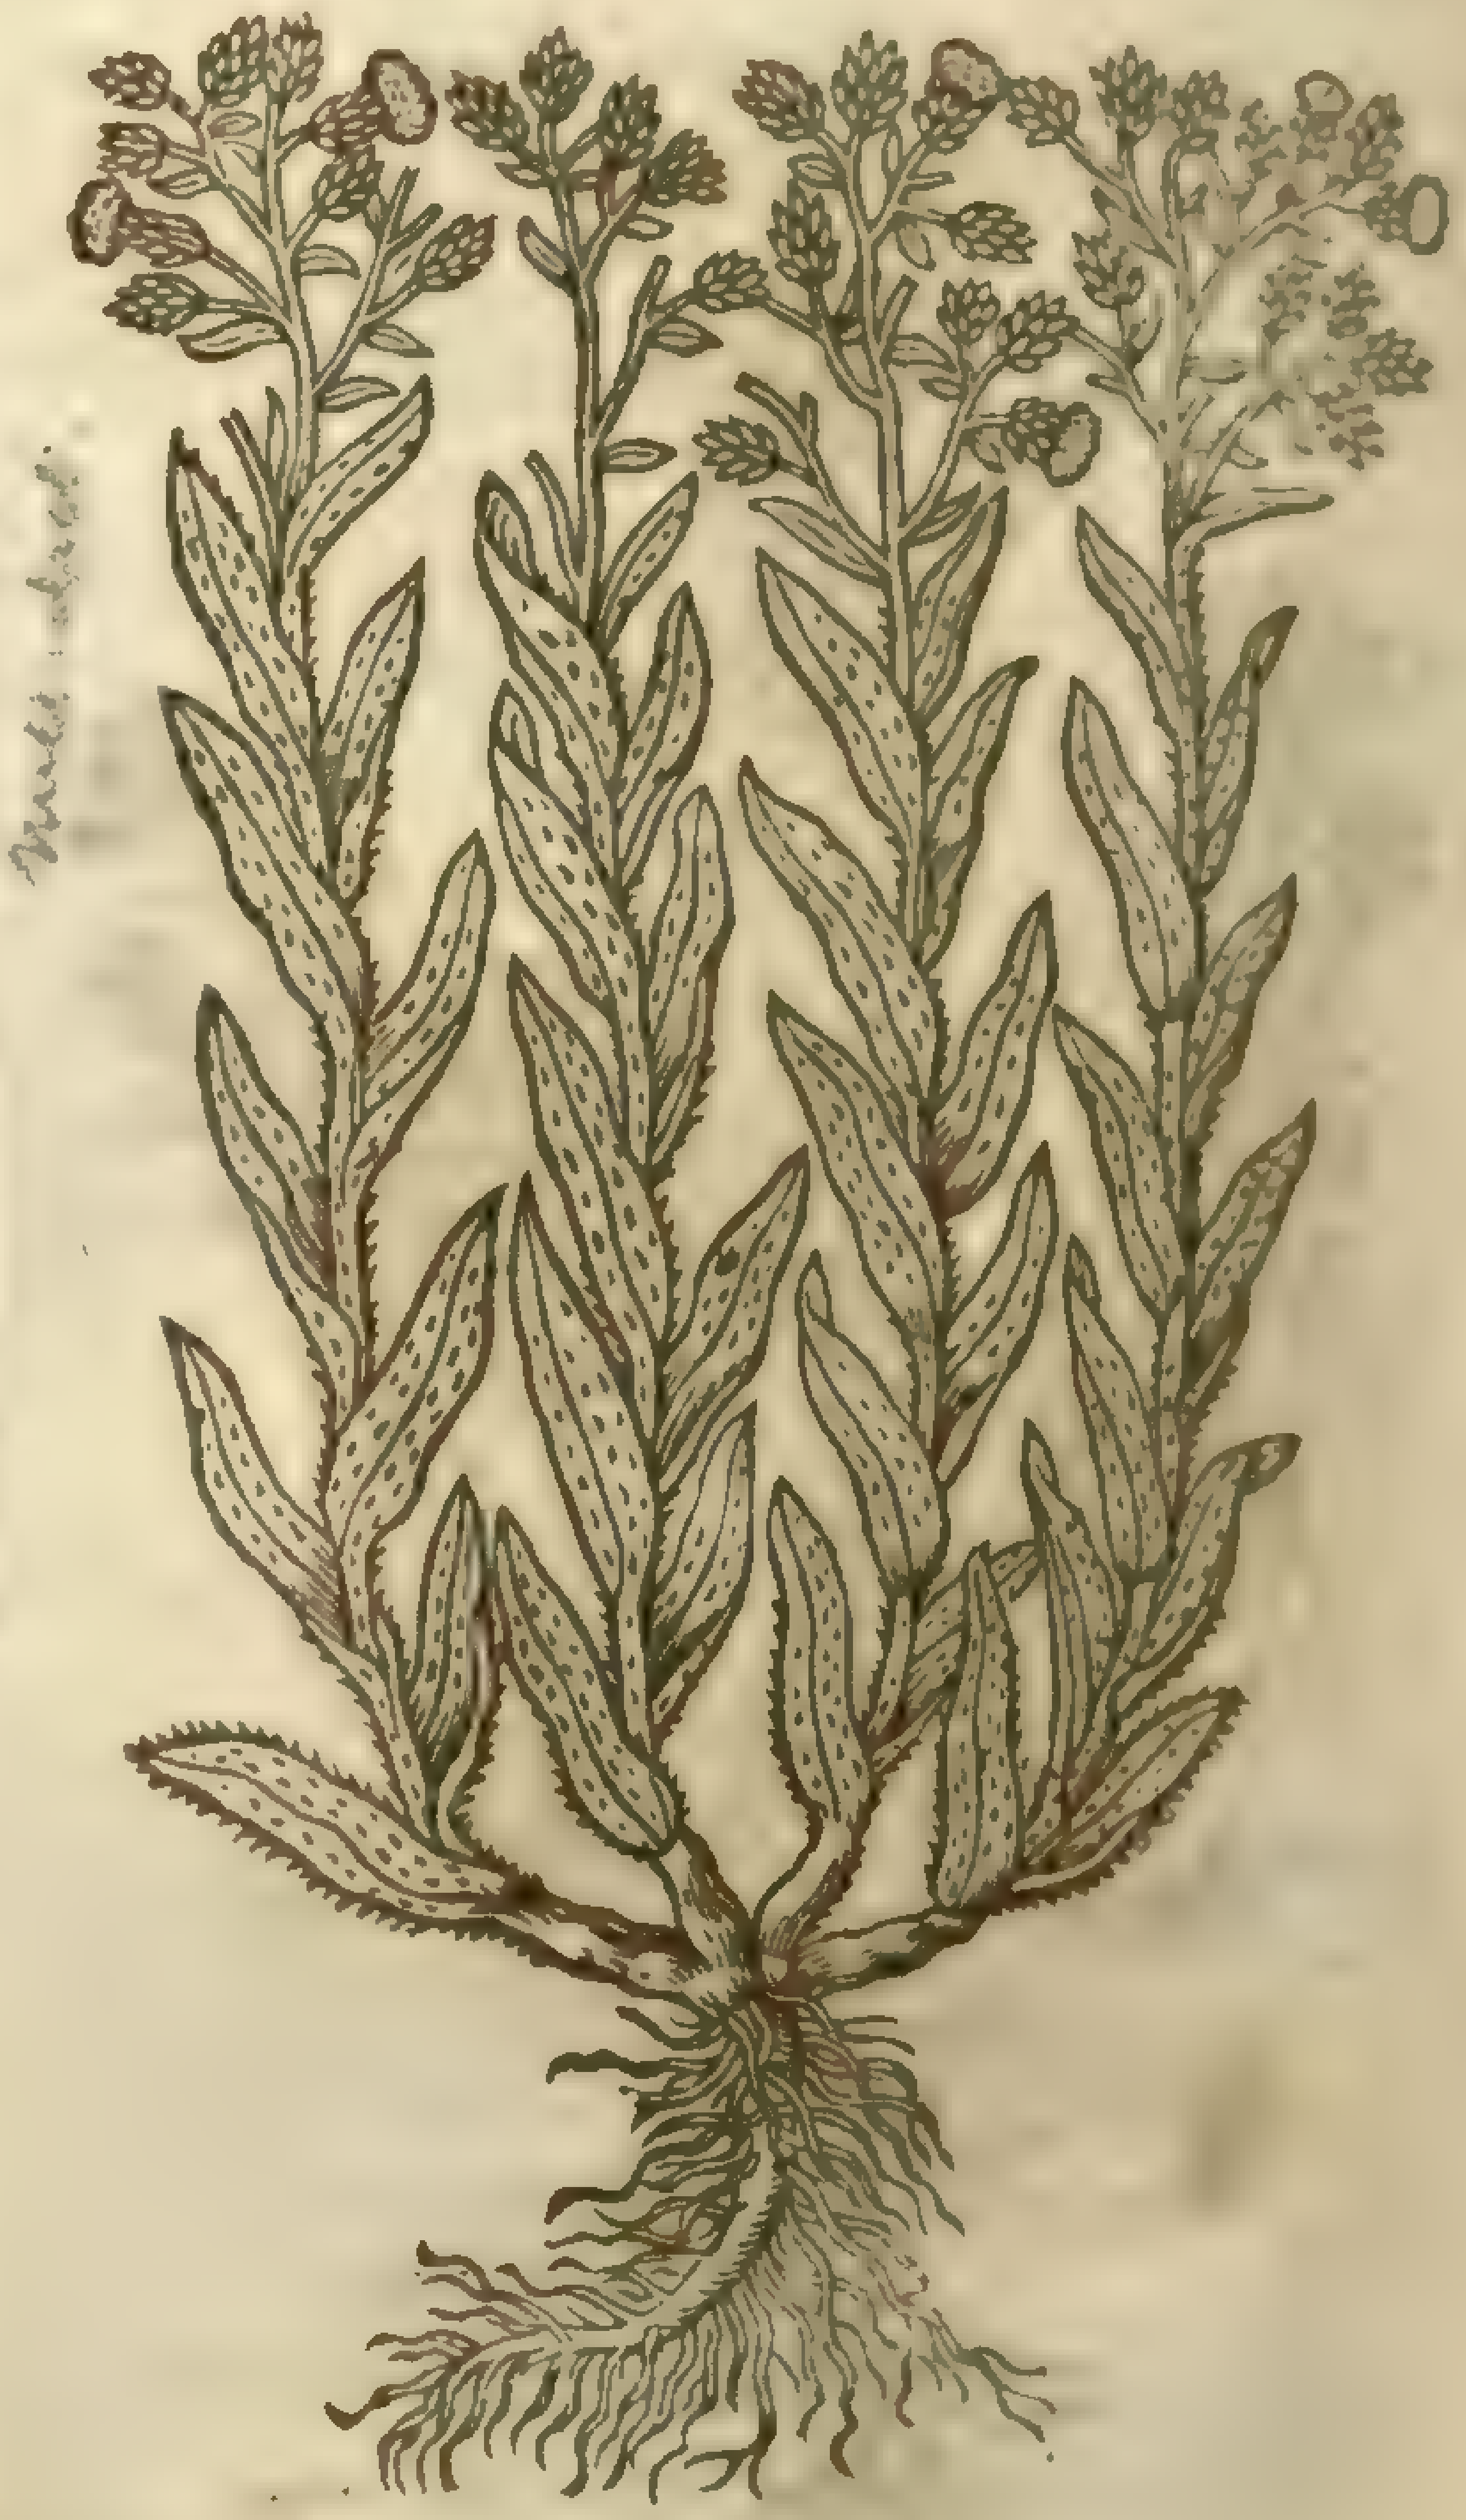
2 This growes to ſome foot or more high, and hath round downy leaues like the former, but broader: the floures are longer, but of the ſame yellow colour and long continuance as thoſe of the laſt deſcribed. This varies ſomething in the bredth and length of the leaues, whence *Tabernamontanus* gaue three figures thereof, and therein was followed by our Author, as you ſhall find more particularly ſpecified at the end of the chapter. ‡

3 About Nemauſium and Montpelier there growes another kinde of *Chryſocome*, or as *Lobel* termes it, *Stœchas Citrina altera*, but that as this plant is in all points like, ſo in all points it is leſſer and ſlenderer, blacker, and not of ſuch beautie as the former, growing more neere vnto an aſh colour, conſiſting of many ſmall twigs a foot long. The root is leſſer, and hath fewer ſtrings annexed thereto, and it is ſeldome found but in the cliffes and crags, among rubbiſh, and on walls of cities. This plant is browne, without ſent or ſauor like the other: euery branch hath his owne bunch of floures comming forth of a ſcaly or round head, but not a number heaped together, as in the firſt kinde. It proſpereth well in our London Gardens.

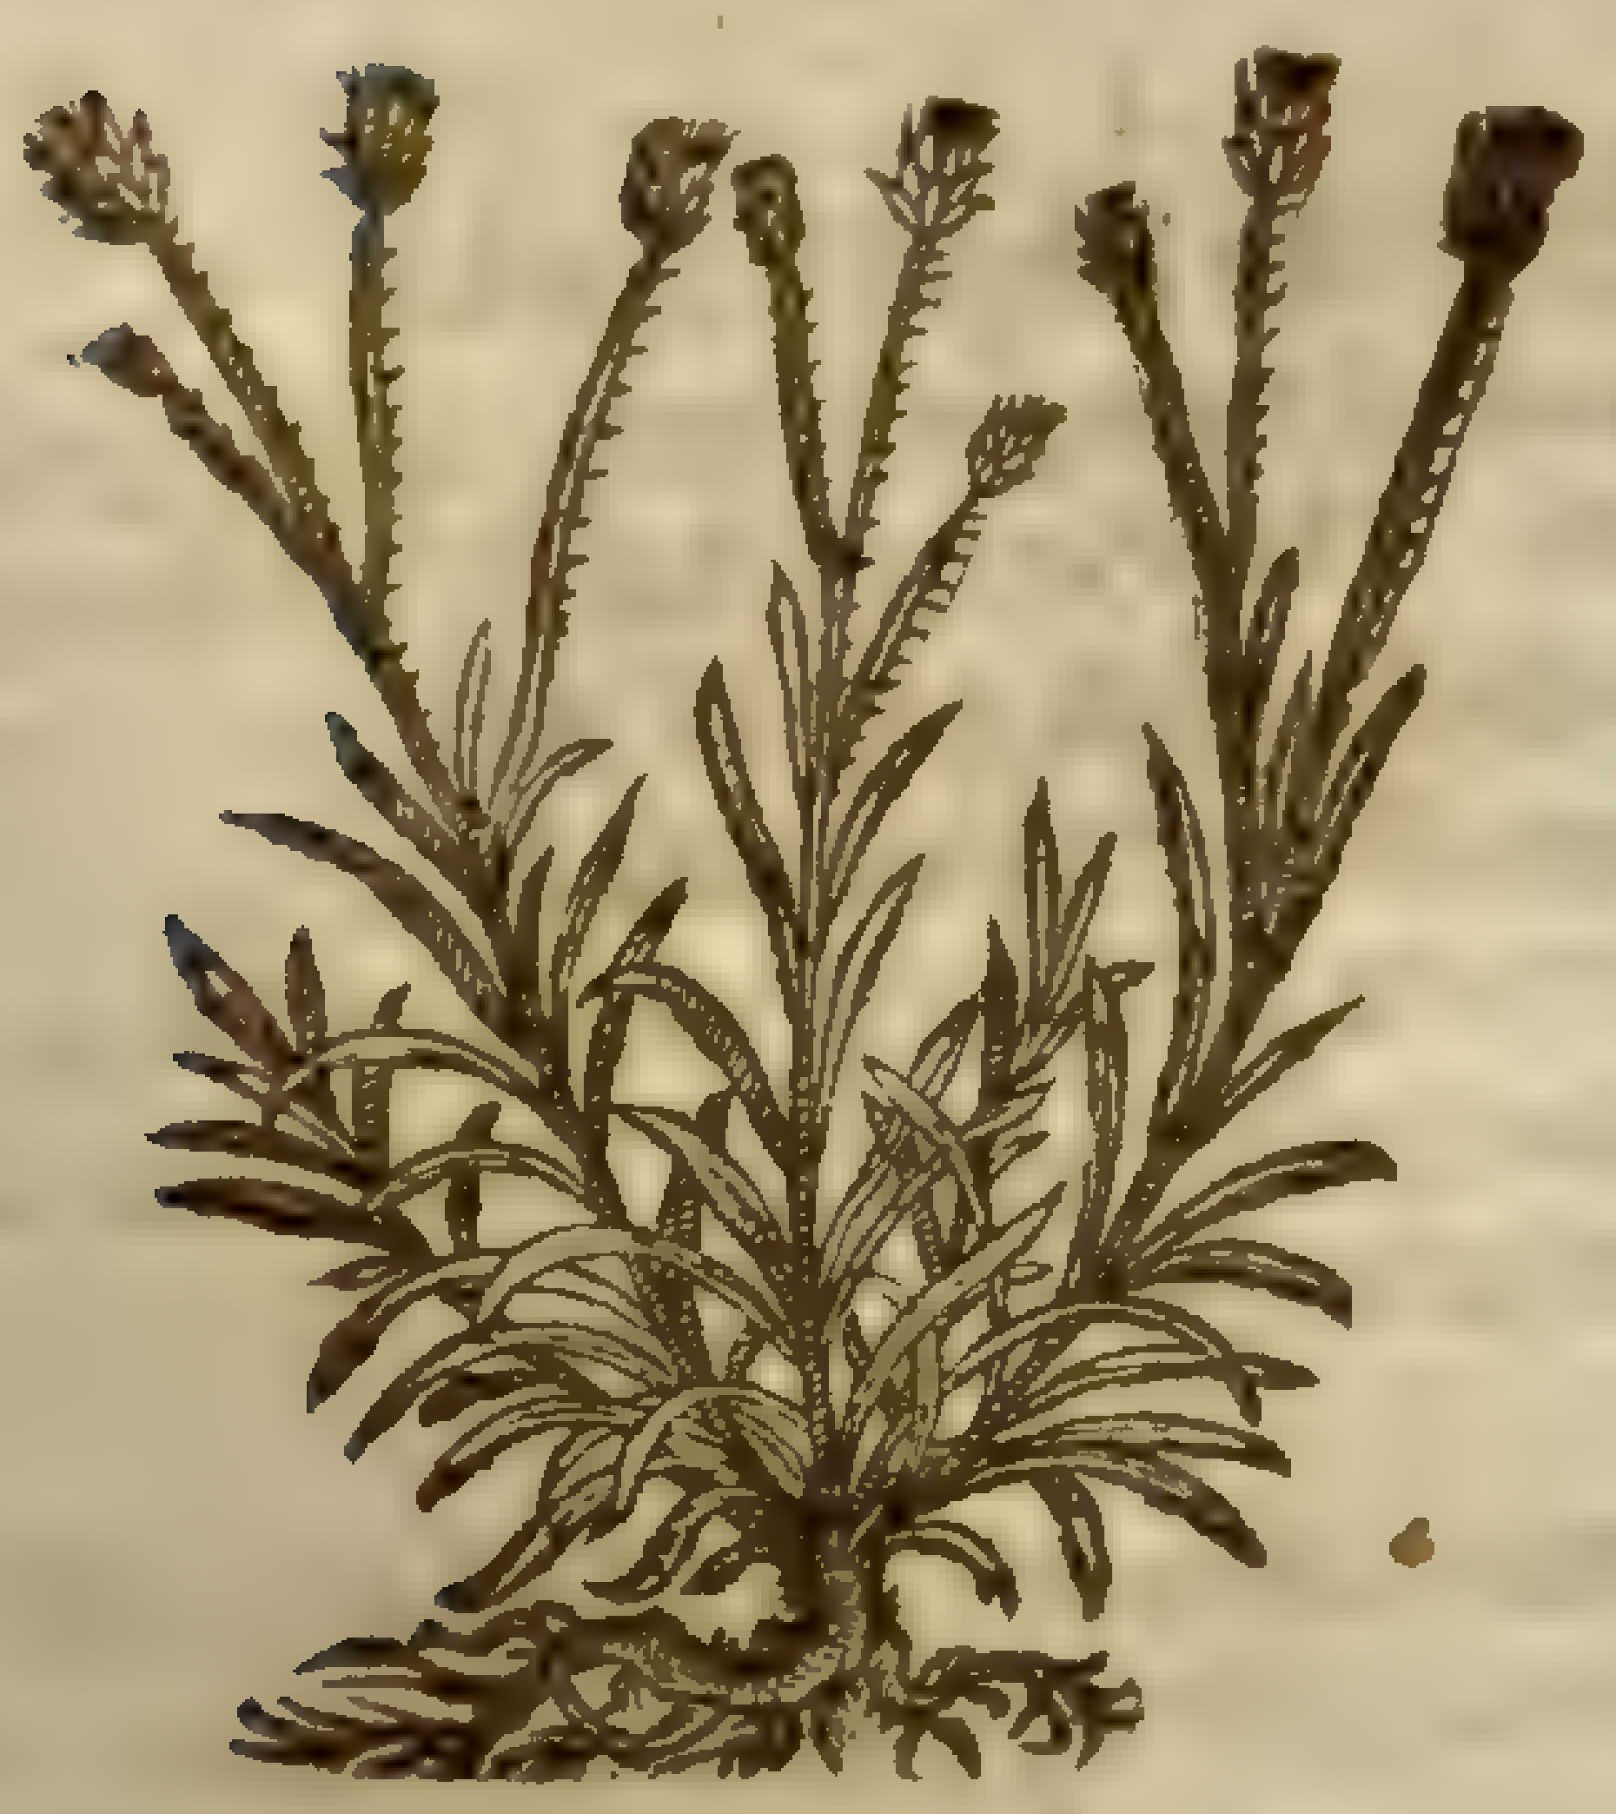
† 1 *Stœchas Citrina, ſiue Amaranthus luteus.*
Golden Scœchas, or Goldilockes.



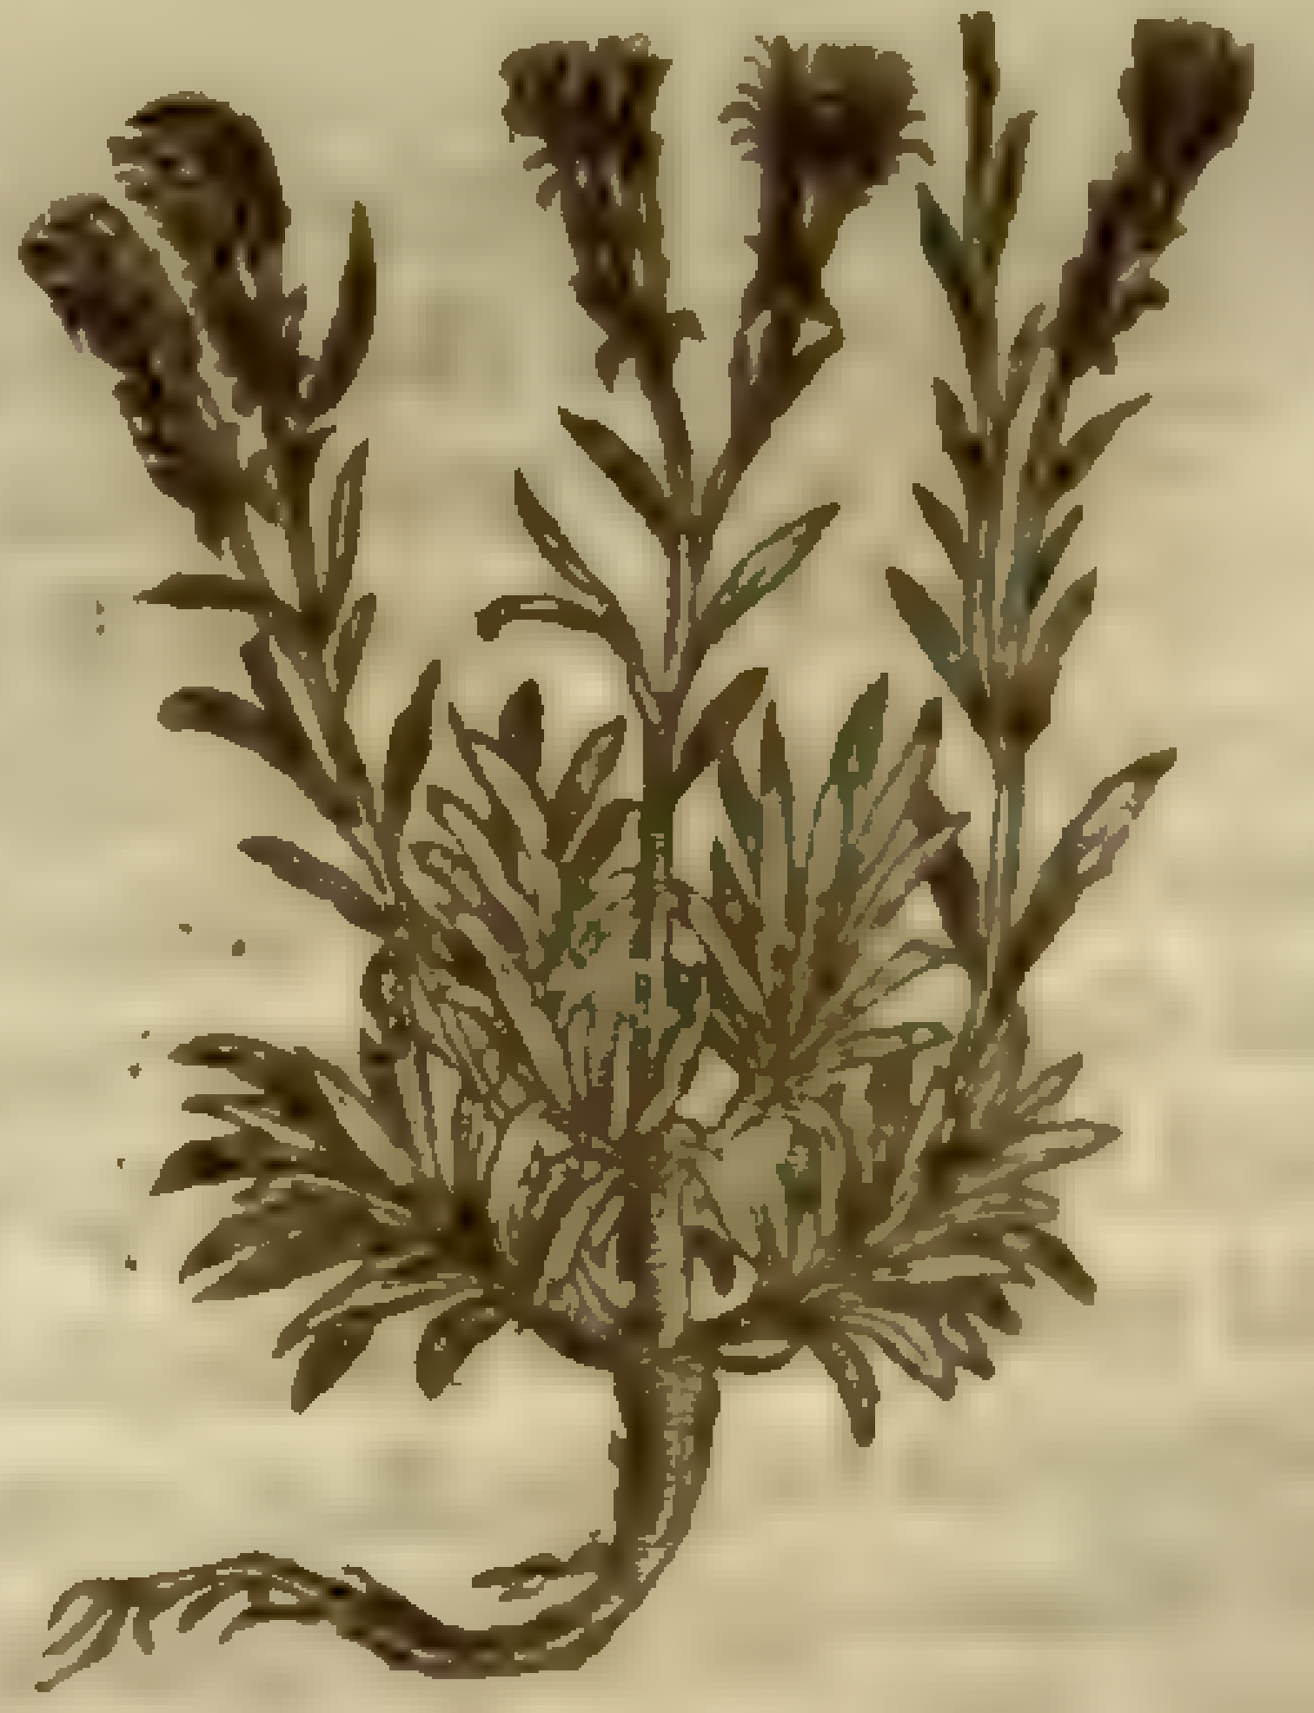
† 2 *Amaranthus luteus latifolius.*
Broad leaued Goldilockes.



† 3 *Chryſocome capitulis conglobatis.*
Round headed Goldilockes.



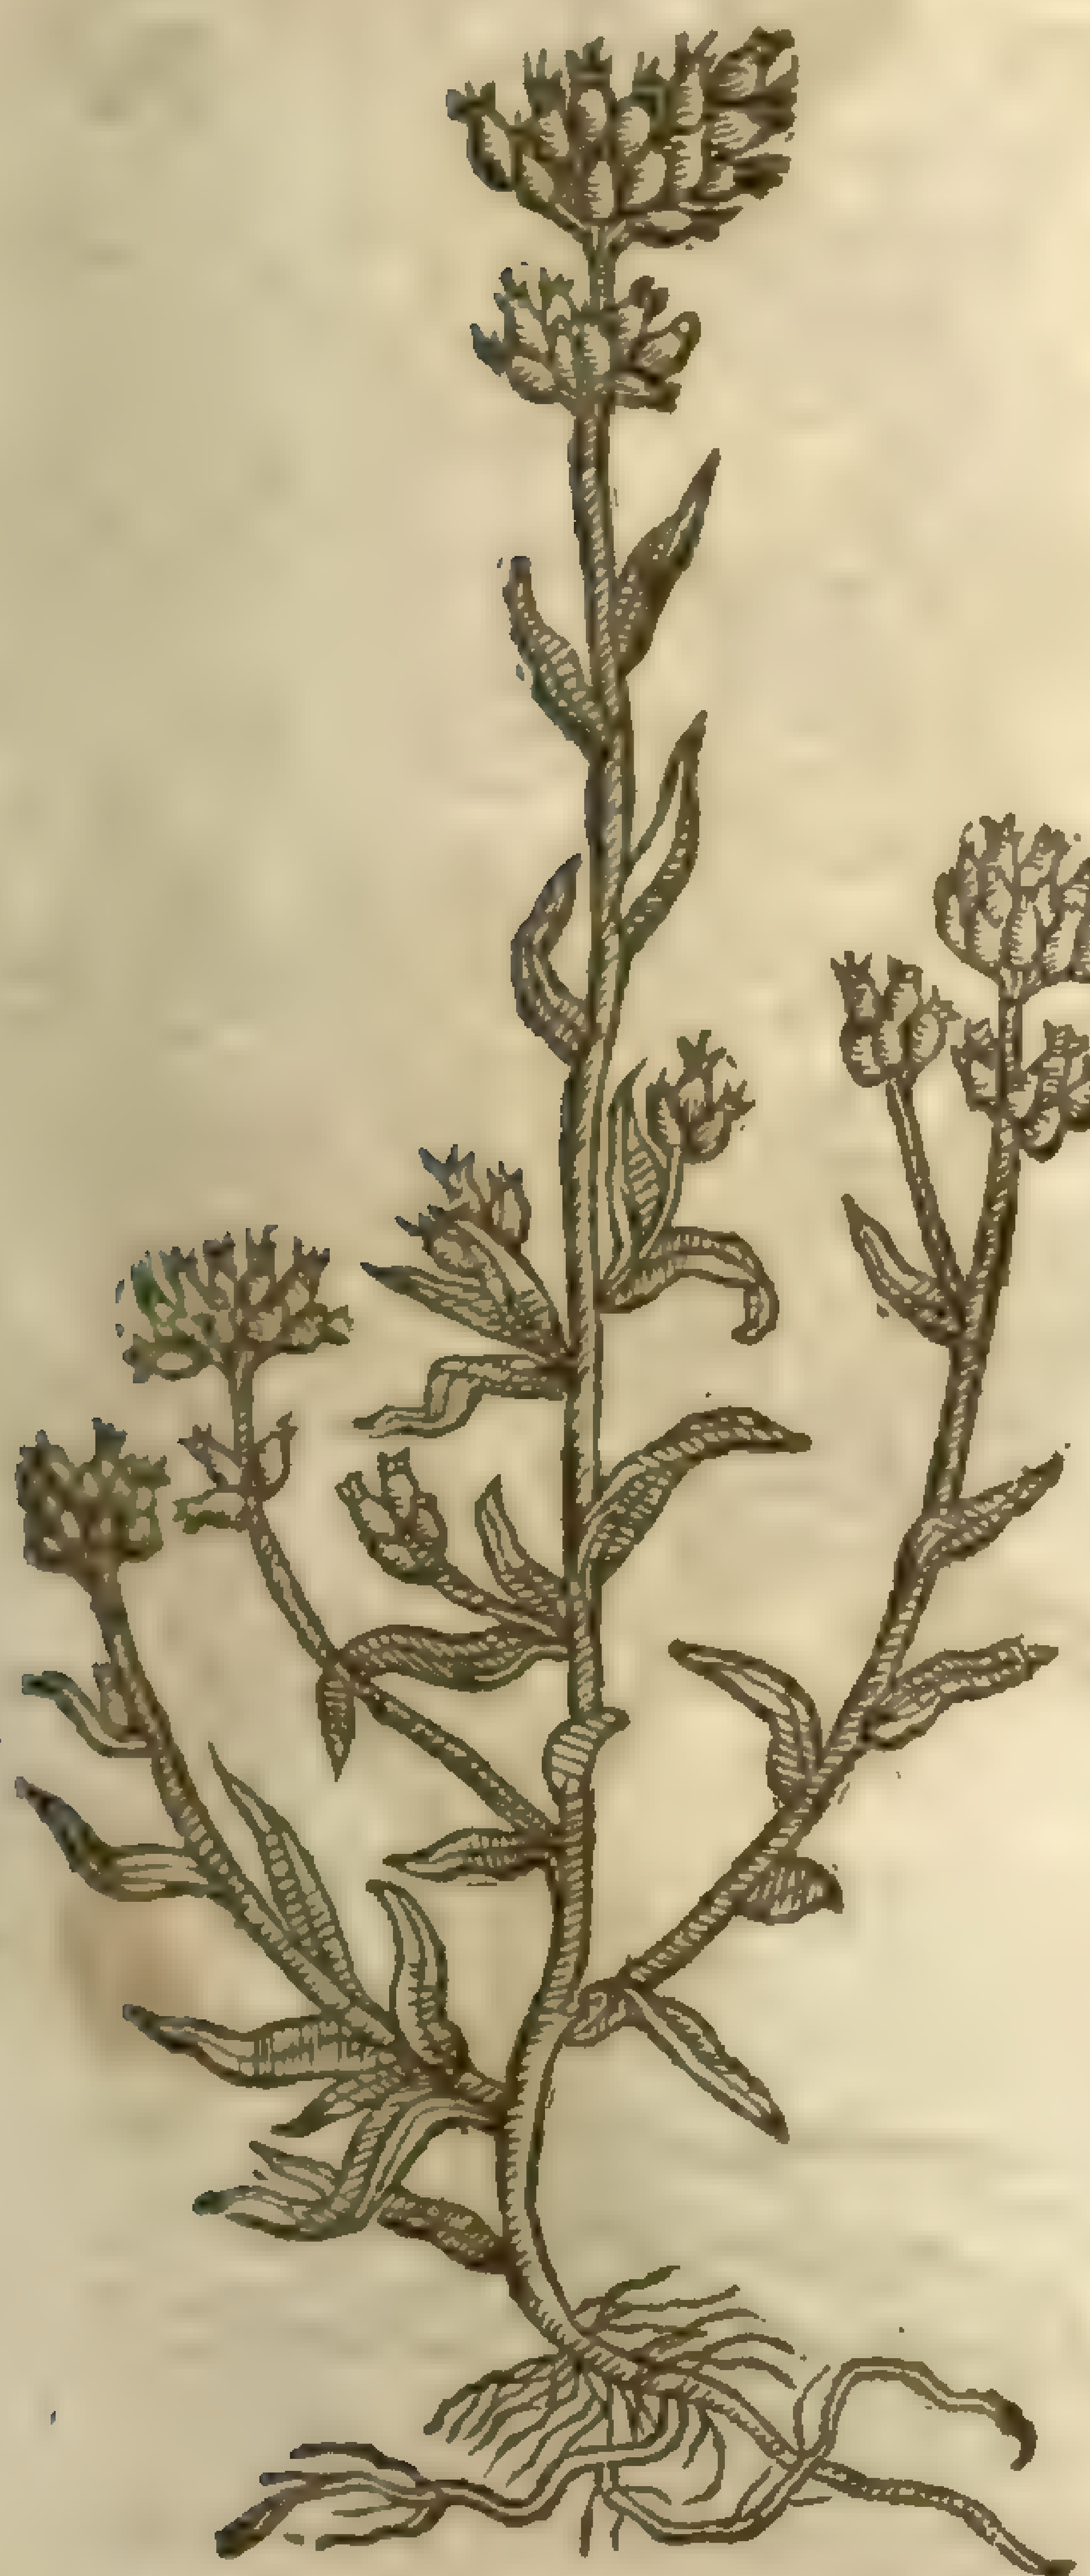
† 4 *Amaranthus luteus flore oblongo.*
Golden Cudweed.



4 There is kinde hereof being a very rare plant, and as rare to be found where it naturally groweth, which is in the woods among the Scarlet-Okes betweene Sommieres and Mountpellier. It is a fine and beautifull plant, in ſhew paſſing the laſt deſcribed *Stœchas Citrina altera*: but the leaues of this kinde are broad, and ſomewhat hoarie, as is all the reſt of the whole plant; the ſtalke a foot long, and beareth the very floures of *Stœchas Citrina altera*, but bigger and longer, and ſomewhat like the floures of *Lactuca agreſtis*: the root is like the former, without any manifeſt ſmell, little knowne, hard to finde, whoſe faculties be yet vnknowne.

† 3 This

† 5 *Heliochryſon ſylueſtris.*
Wile Goldylockes.



† 5 This is a wilde kinde (which *Lobel* ſetteth forth) that here may be inſerted, called *Eliochryſos ſylueſtris*. The woolly or flockey leafe of this plant reſembleth *Gnaphalium vulgare*, but that it is ſomewhat broader in the middle: the floures grow cluſtering together vpon the tops of the branches, of a yellow colour, and almoſt like thoſe of Maudline: the roots are blacke and wooddy.

¶ *The Place.*

The firſt mentioned growes in Italy, and other hot Countries: and the ſecond growes in rough and grauelly places almoſt euery where neere vnto the Rhene, eſpecially between Spires and Wormes.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Golden floure is called in Latine *Coma aurea*, of his Golden lockes or beautifull buſh, and alſo *Tineraria*: in ſhops *Stæchas citrina, Amaranthus luteus, Fuchſij, & Tragi*: of ſome, *Linaria aurea*, but not truely: in Greeke, *Chryſocome*: in Dutch, **Reynbloemen**, and **Motten cruyt**: in Italian, *Amarantho Giallo*: in Engliſh, Gold-floure, Gods floure, Goldilockes, and Golden *Stæchas*.

¶ *The Temperature and Vertues.*

A The floures of Golden Stœchados boiled in wine and drunke, expell wormes out of the belly; and being boiled in Lee made of ſtrong aſhes doth kill lice and nits, if they bee bathed therewith. The other faculties are referred to the former plants mentioned in the laſt chapter.

---

† There were formerly the ſame number of figures as are now in this Chapter, but no way agreeing with the deſcriptions; the firſt was of *Milleſolium Luteum*, being the *Helichryſum Italicum* of *Matthiolus*: The ſecond was of the *Amaranthus primus* of *Tragus* which ſtill keeps the 2. place: and the 4. and 5. were only varieties of this, according to *Bauhine*: but if they be not varieties, but made to expreſſe the 2. figures of the *Aduerſ.* which we here giue, as I coniecture they were, then ſhould the fourth haue been put in the third place, and the fifth in the fourth, and the third ſhould haue beene put in the fifth, as you may ſee now it is.

Chap. 208. *Of Coſtmarie and Maudelein.*

¶ *The Deſcription.*

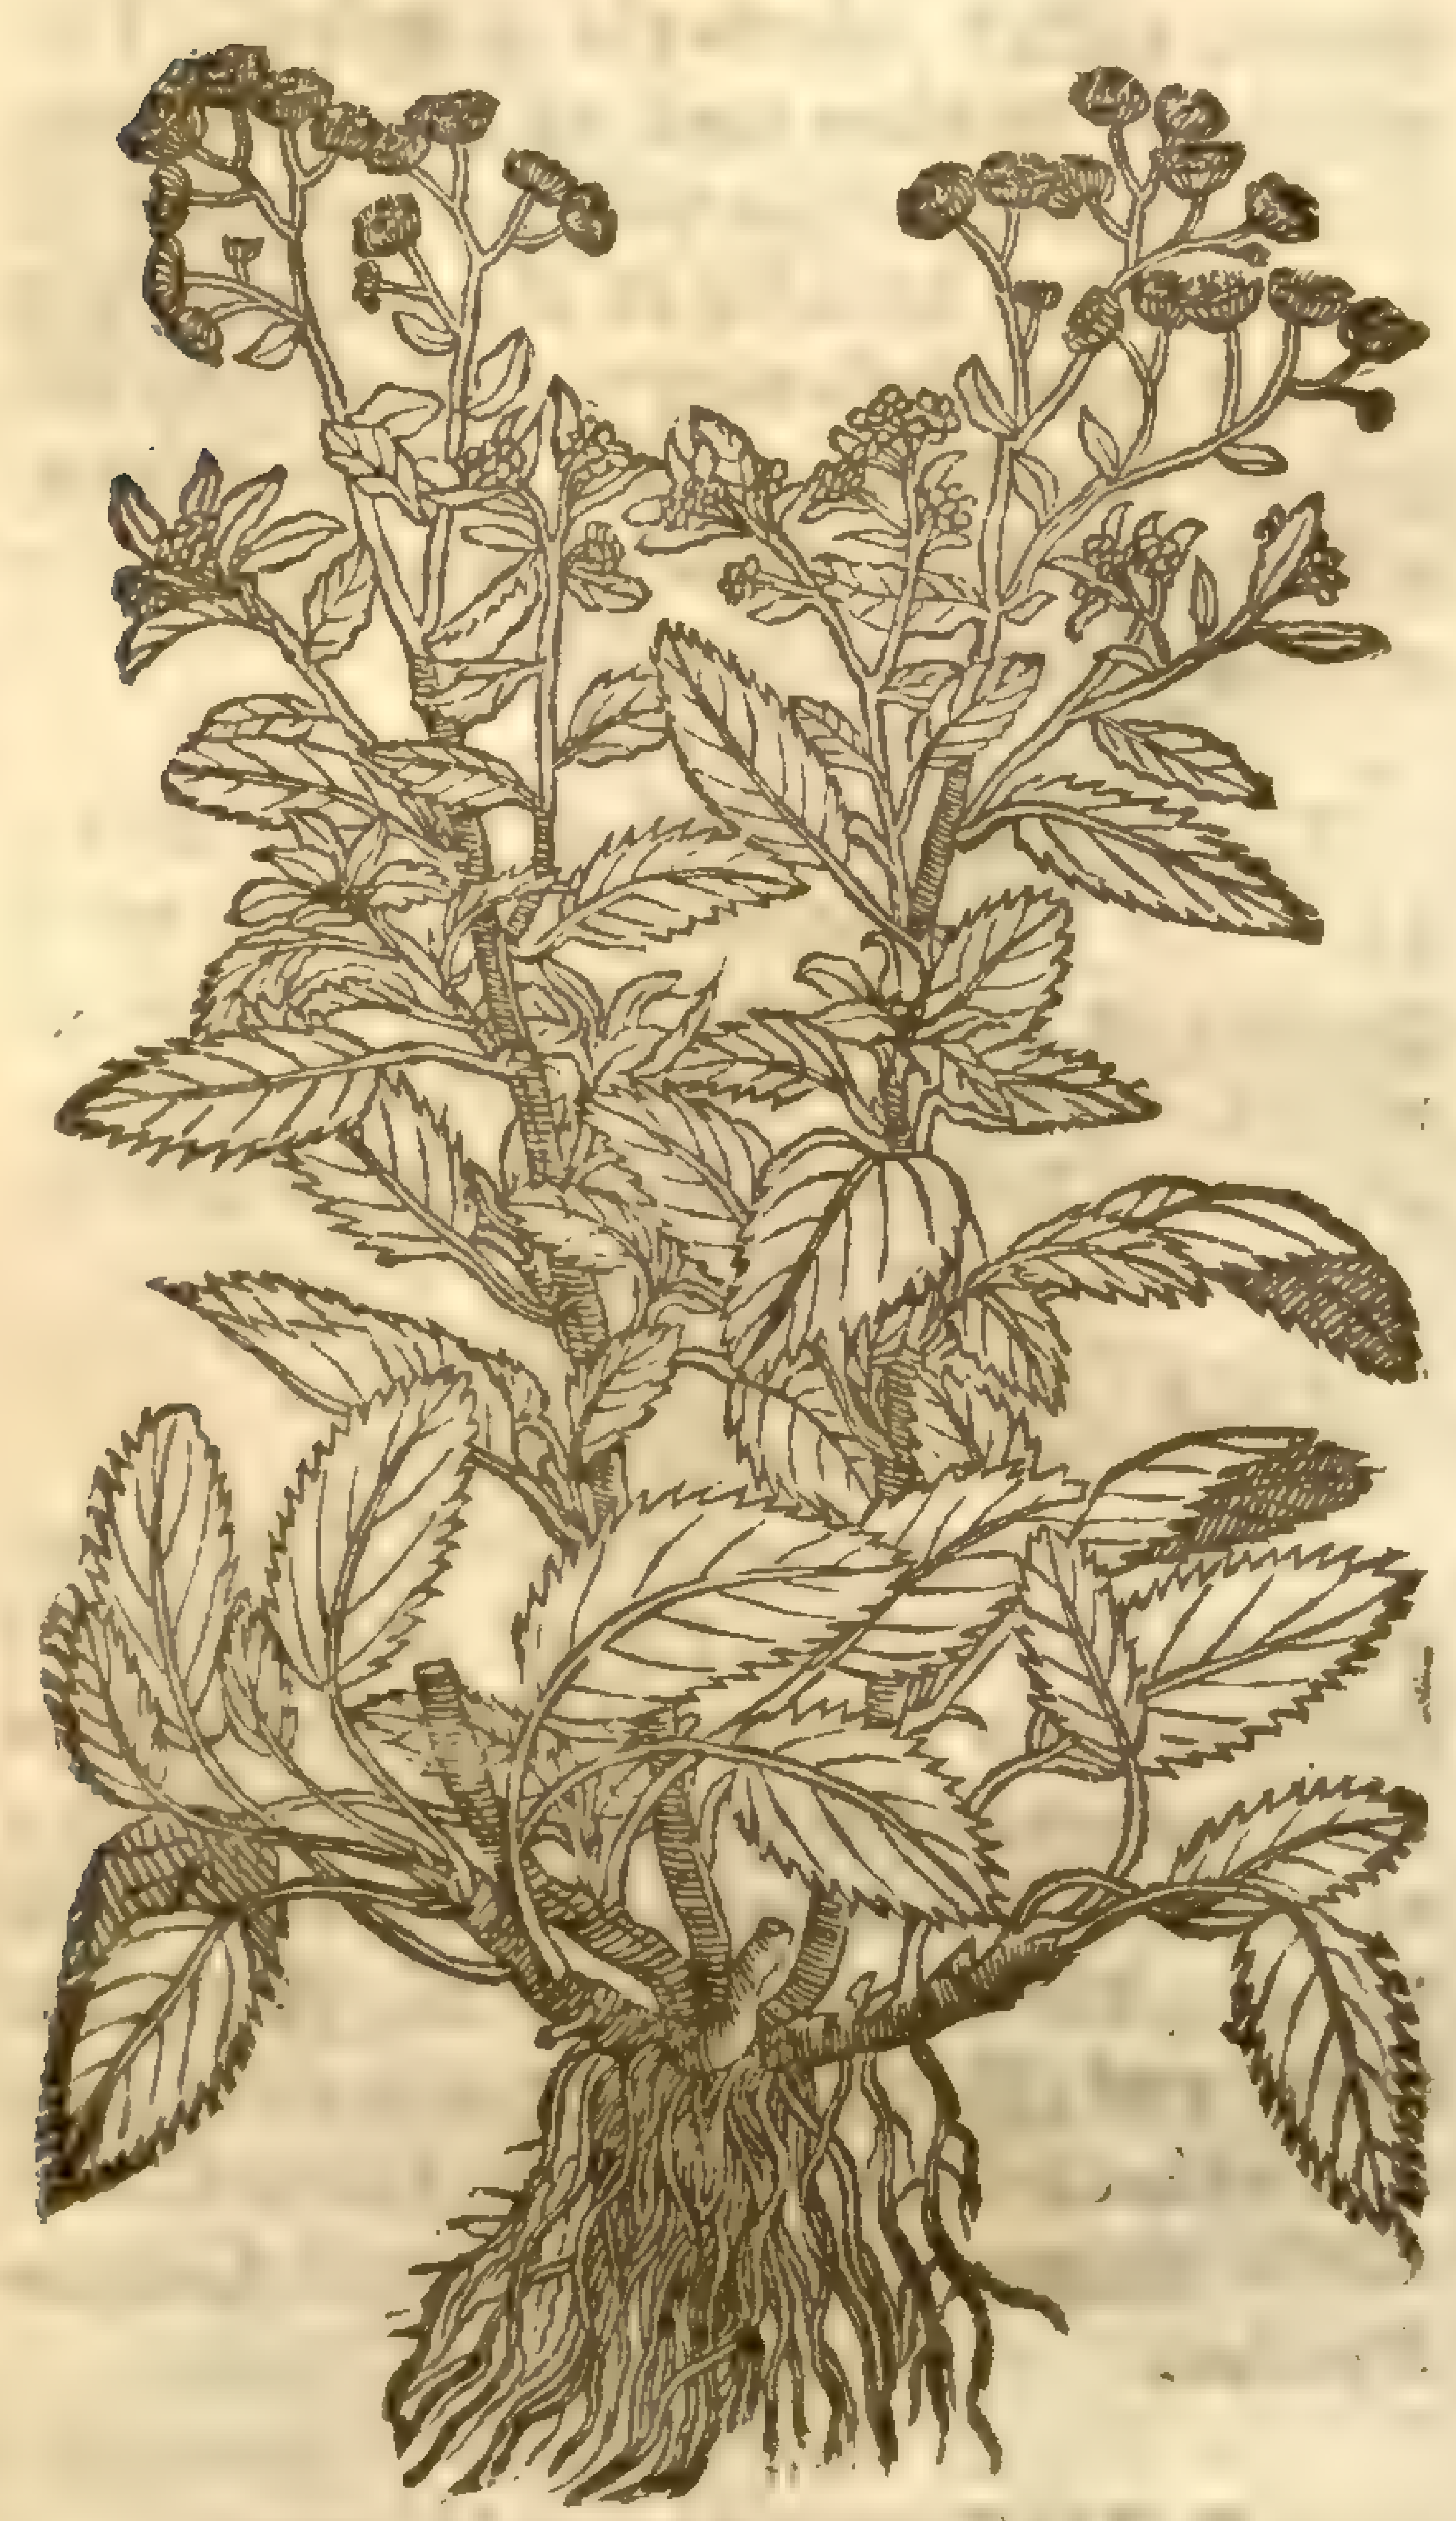
1 Coſtmary groweth vp with round hard ſtalkes two foot high, bearing long broad leaues finely nicked in the edges, of an ouerworne whitiſh greene colour. The tuft or bundle is of a Golden colour, conſiſting of many little floures like cluſters, ioyned together in a rundle after the manner of golden Stœchados. The root is of a woody ſubſtance, by nature very durable, not without a multitude of little ſtrings hanging thereat. The whole plant is of a pleaſant ſmell, ſauour or taſte.

2 Maudeline is ſomewhat like to Coſtmary (whereof it is a kinde) in colour, ſmell, taſte, and in the golden floures, ſet vpon the tops of the ſtalkes in round cluſters. It bringeth forth a number of ſtalkes, ſlender, and round. The leaues are narrow, long, indented, and deepely cut about the edges. The cluſter of floures is leſſer than that of Coſtmarie, but of a better ſmell, and yellower colour. The roots are long laſting and many.

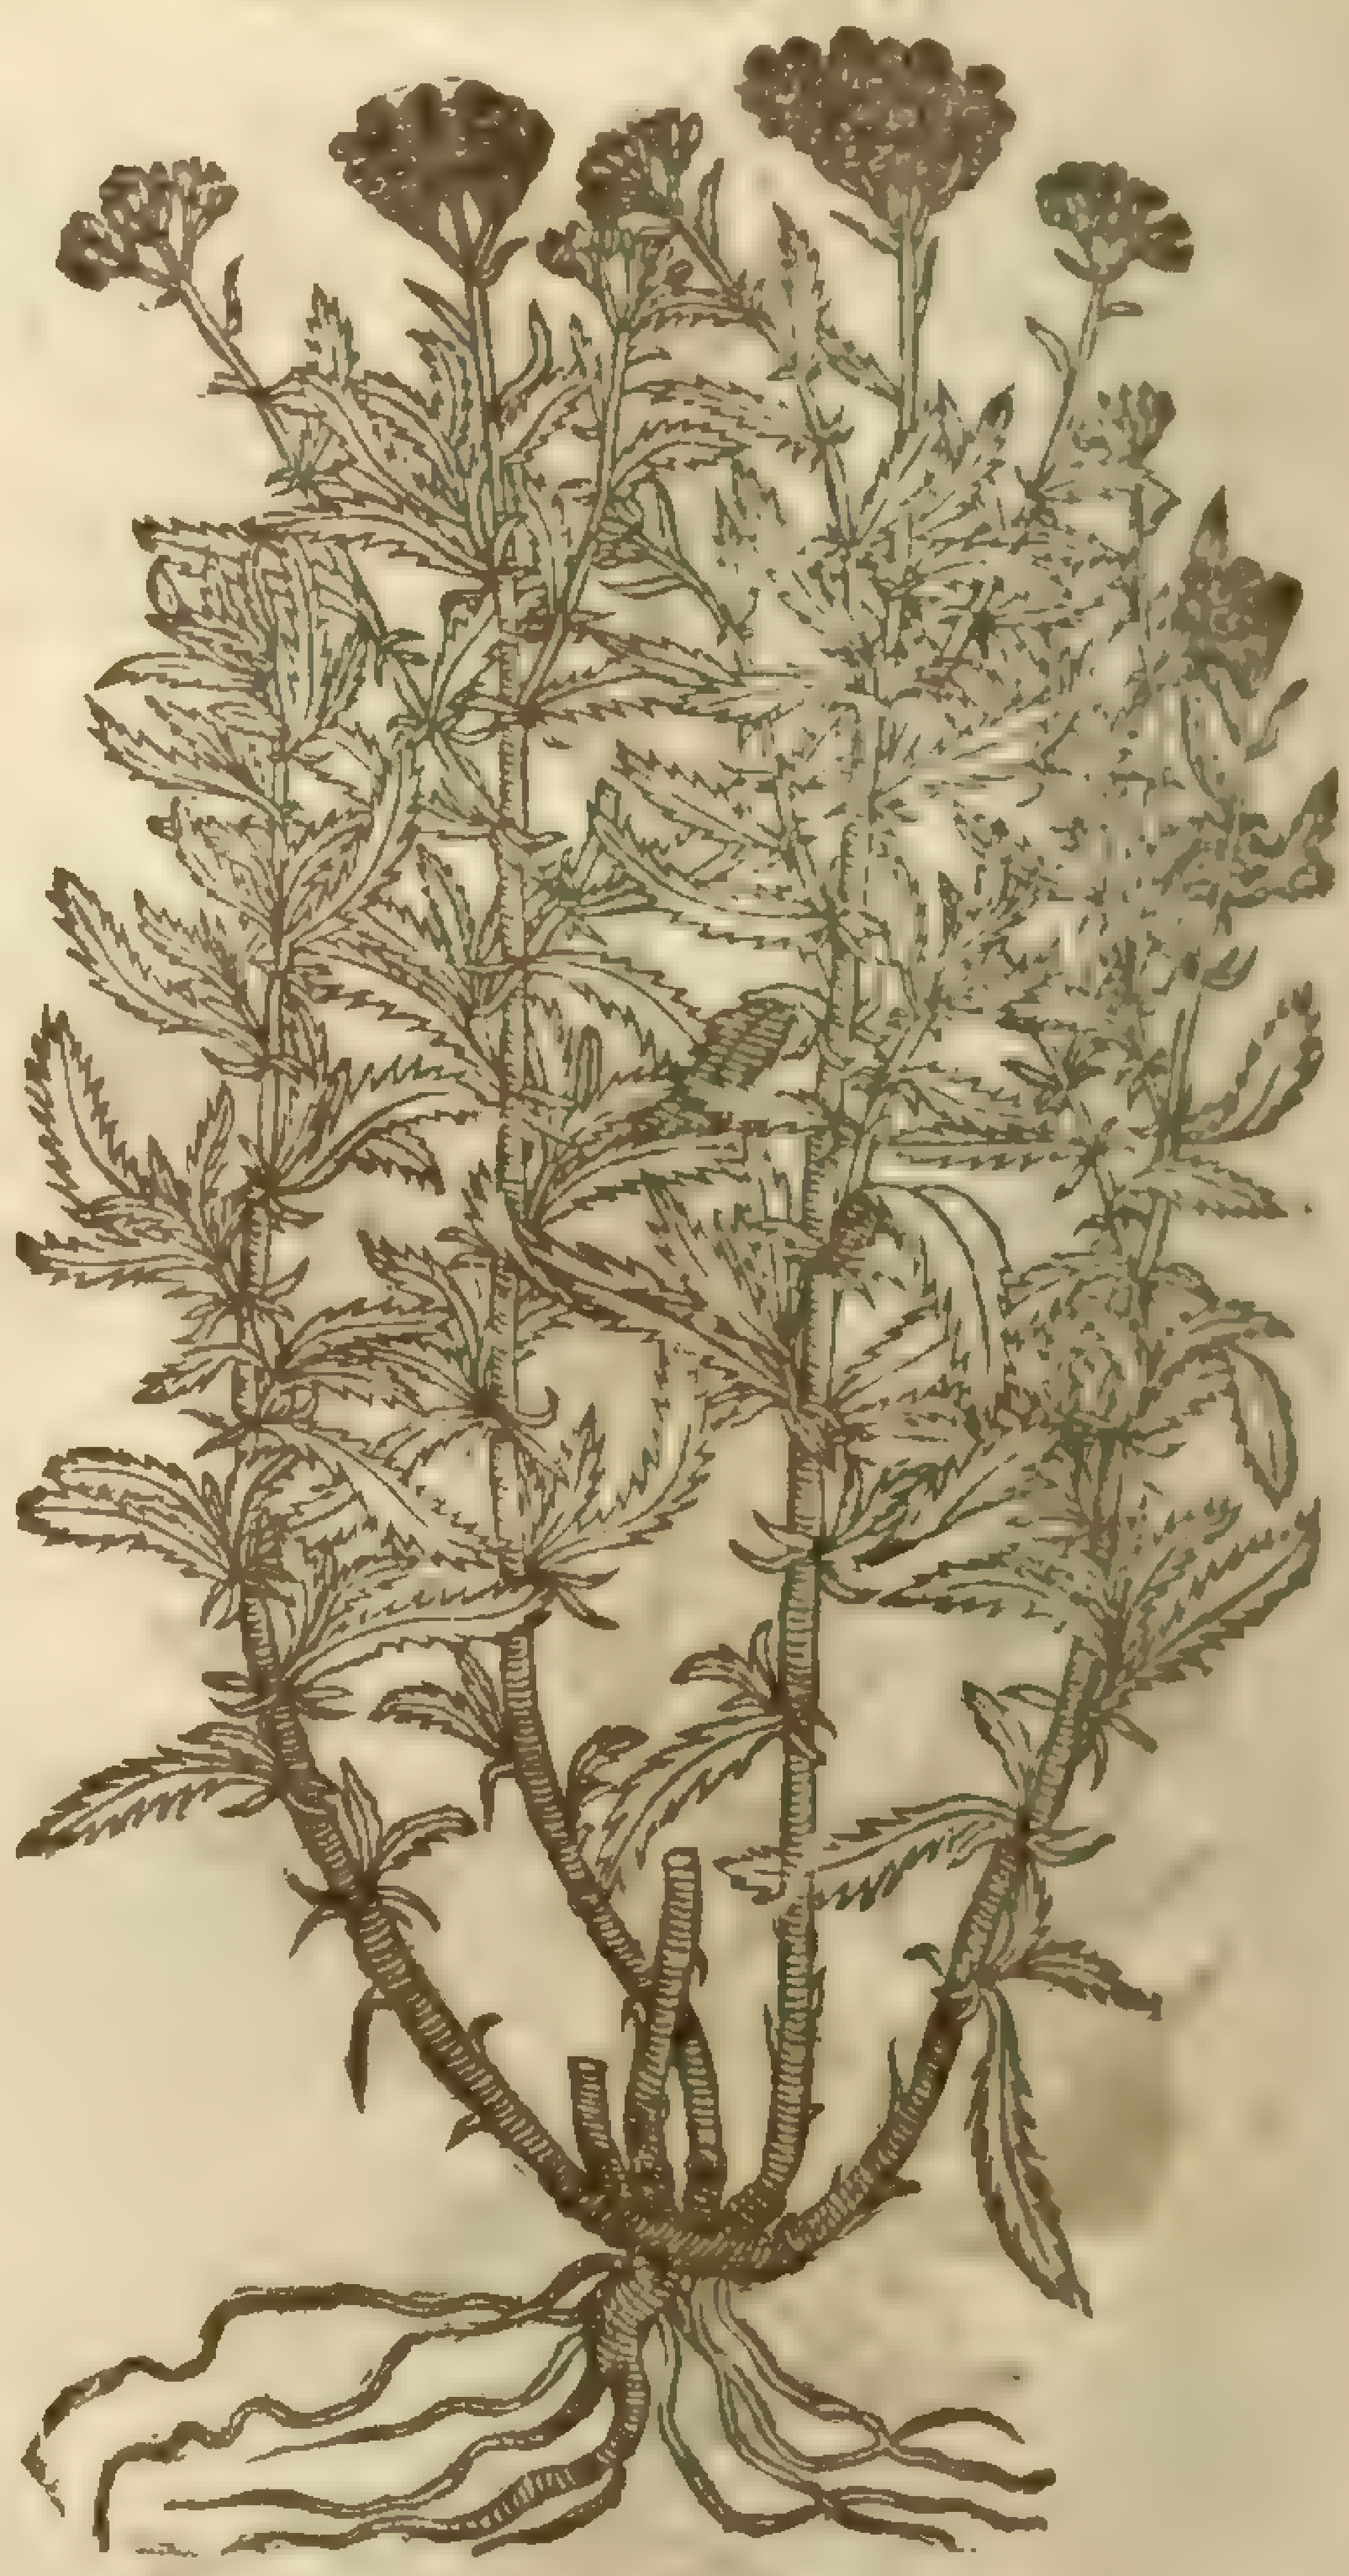
‡ 3 There is another kinde of *Balſamita minor*, or *Ageratum*, which hath leaues leſſer and narrower than the former, and thoſe not ſnipt about the edges; the vmbel *or tuft of* floures is

yellow

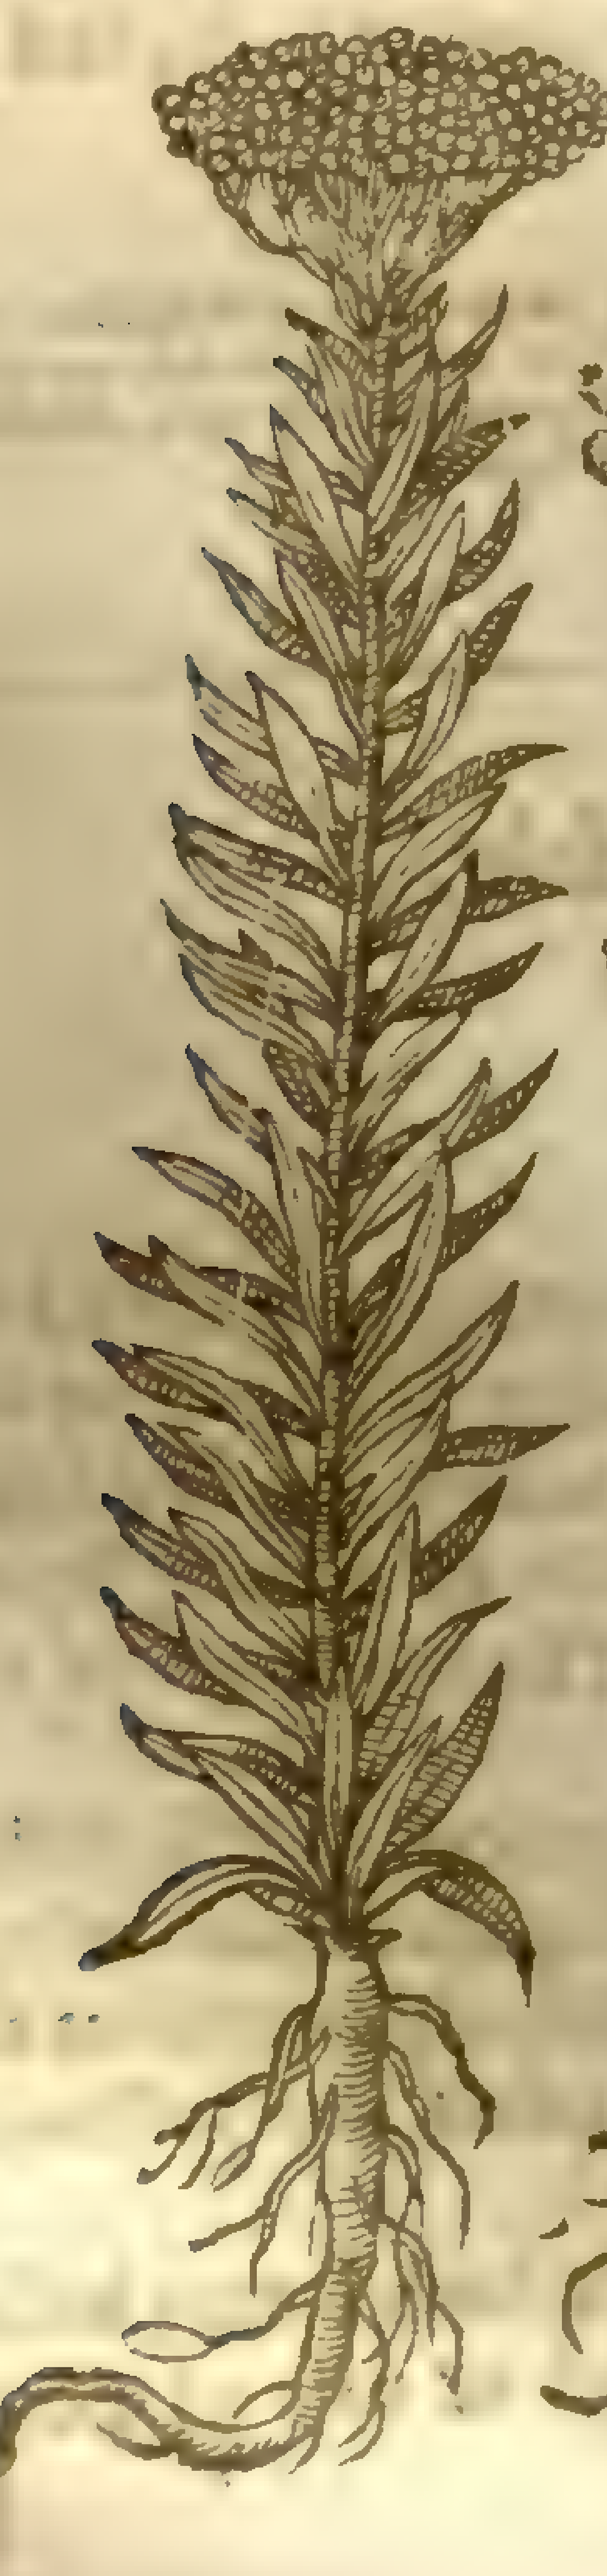
1 *Balſamita mas.*
Coſtmarie.

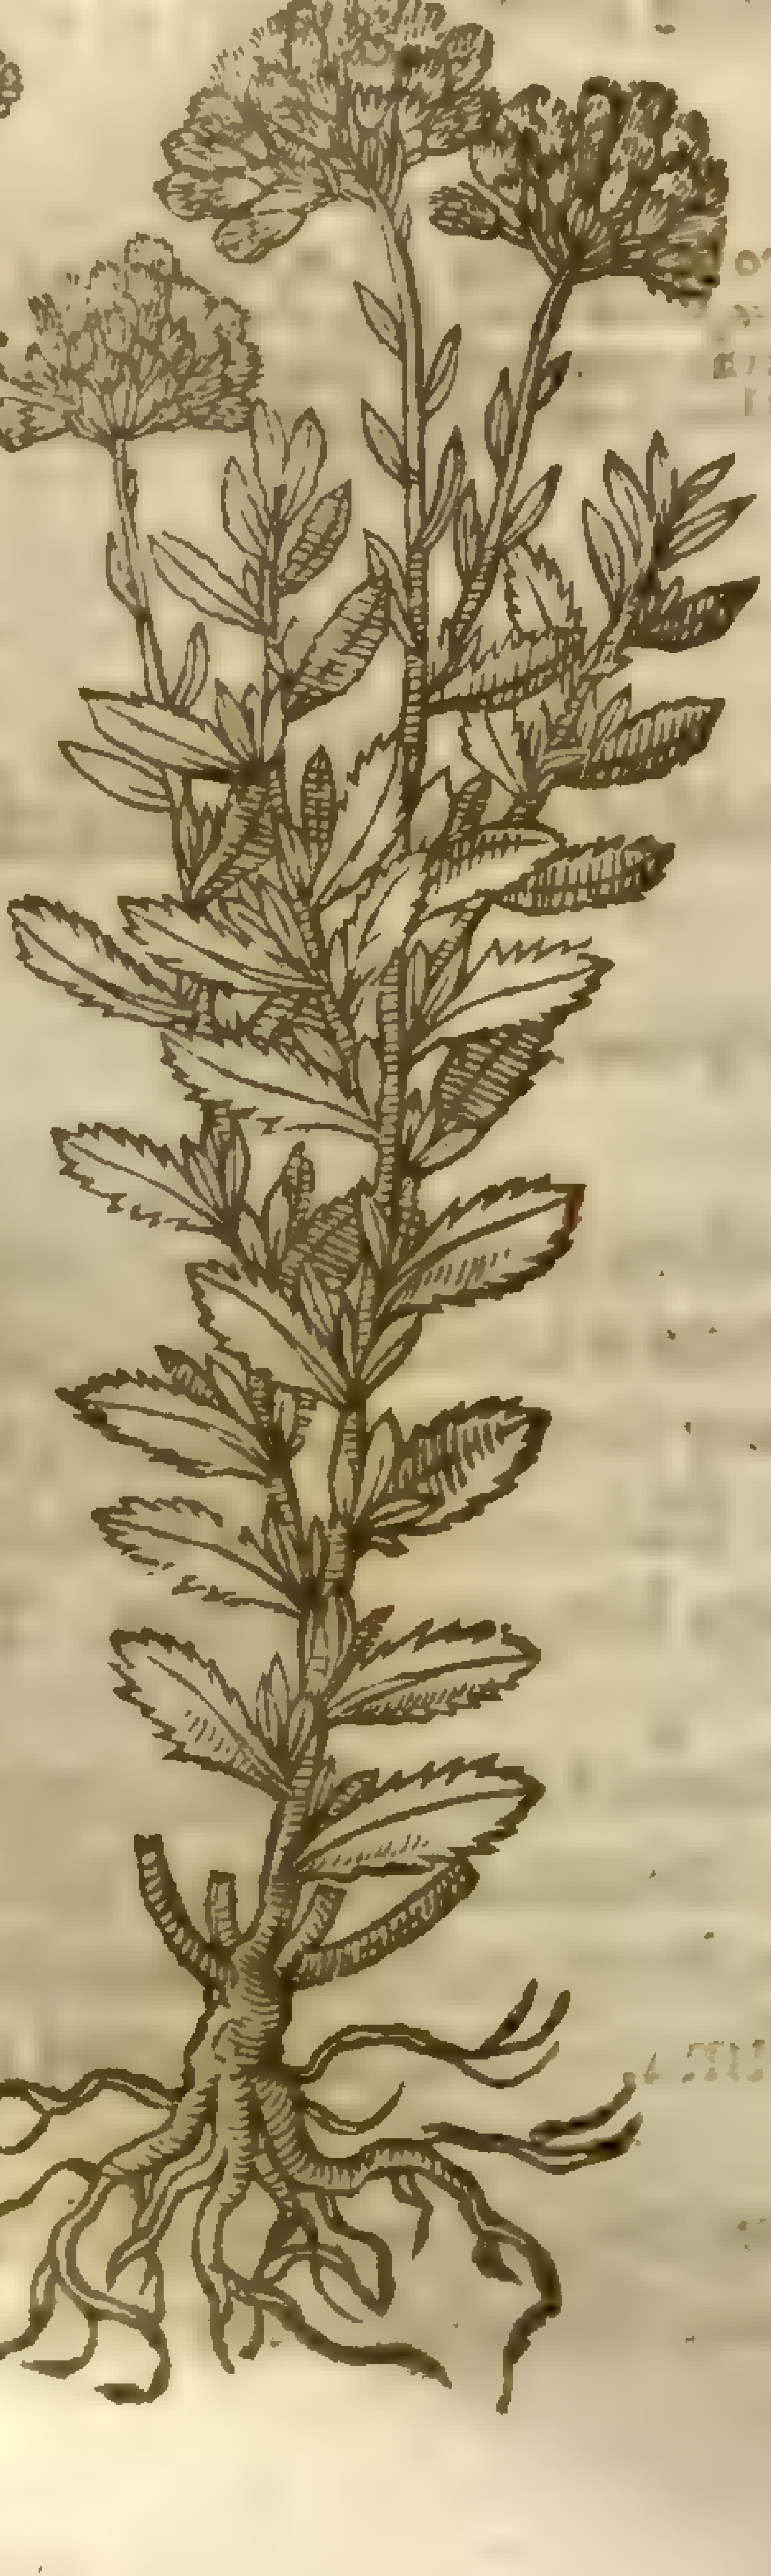


2 *Balſamita fœmina, ſive Ageratum.*
Maudelein.



‡ 3 *Ageratum folijs non ſerratis.* 4. *Ageratum floribus albis.*
Maudelein with vncut leaues. White floured Maudlein.





yellow like as the former, and you may call each of theſe laſt deſcribed at your pleaſure, either *Ageratum*, or *Balſamita*: the Græcians call it Ἀγήρατον, which is in Latine *Ageratum, vel non ſeneſcens*, called in ſhops (though vntruly) *Eupatorium Meſuæ*. The floures are of a beautifull and ſeemely ſhew, which will not loſe their excellency of grace in growing, vntill they be very old, and therefore called *Ageratum*, or *Non ſeneſcens*, as before, and are like in tuft to *Eliochryſon*, and this is thought to be the true and right *Ageratum* of *Dioſcorides*, although there hath beene great controuerſie which ſhould be the true plant.

‡ 4 This differeth not from the common Maudelein, but in the colour of the floures, which are white, when as thoſe of the ordinary ſort are yellow. ‡

¶ *The Place.*

They grow euery where in gardens, and are cheriſhed for their ſweet floures and leaues.

¶ *The Time.*

They bring forth their tufts of yellow floures in the Summer moneths.

¶ *The*

¶ *The Names.*

Coſtmarie is called in Latine *Balſamita maior* or *mas* : of ſome, *Coſtus hortorum* : it is alſo called *Mentha Græca* : and *Saracenica Officinarum* : of *Tragus*, *Aliſma* : of *Matthiolus*, *Herba Græca* : of others, *Saluia Romana*, and *Herba laſſulata* : of ſome, *Herba D. Mariæ* : in Engliſh, Coſtmarie, and Ale-coaſt : in high Dutch, **Frauwenkraut** : in low Dutch, **Heydniſch windkraut** : in French, *Coq*.

Maudlein is without doubt a kinde of Coſtmarie, called of the Italians *Herba Giulia* : of *Valerius Cordus*, *Mentha Corymbifera minor* : and *Eupatorium Meſue*. It is iudged to be *Dioſcorides* his *Ageratum*, and it is the *Coſtus minor hortenſis* of *Geſner* : we call it in Engliſh, Maudelein.

¶ *The Nature.*

They are hot and dry in the ſecond degree.

¶ *The Vertues.*

These plants are very effectuall, eſpecially Maudlein, taken either inwardly or elſe outwardly to prouoke vrine ; and the fume thereof doth the ſame, and mollifieth the hardneſſe of the Matrix. A

Coſtmarie is put into Ale to ſteepe, as alſo into the barrels and Stands amongſt thoſe herbes wherewith they do make Sage Ale ; which drinke is very profitable for the diſeaſes before ſpoken of. B

The leaues of Maudleine and Adders tongue ſtamped and boyled in Oile Oliue, adding thereto a little wax, roſin, and a little turpentine, make an excellent healing vnguent, or incarnatiue ſalue to raiſe or bring vp fleſh from a deepe and hollow wound or vlcer, whereof I haue had long experience. C

The Conſerue made with the leaues of Coſtmarie and Sugar, doth warme and dry the braine, and openeth the ſtoppings of the ſame : ſtoppeth all Catarrhes, rheumes, and diſtillations, taken in the quantitie of a beane. D

The leaues of Coſtmarie boyled in wine and drunken, cure the griping paine of the belly, the guts and bowels, and cureth the bloudy flix. E

It is good for them that haue the greene ſickneſſe, or the dropſie, eſpecially in the beginning; and it helpeth all that haue a weake and cold liuer. F

The ſeed expelleth all manner of wormes out of the belly, as wormeſeed doth. G

Chap. 209. *Of Tanſie.*

¶ *The Deſcription.*

1 Tanſie groweth vp with many ſtalkes, bearing on the tops of them certaine cluſtered tufts, with floures like the round buttons of yellow Romane Cammomill, or Feuerfew (without any leaues paled about them) as yellow as gold. The leaues be long, made as it were of a great many ſet together vpon one ſtalke, like thoſe of Agrimony, or rather wild Tanſie, very like to the female Ferne, but ſofter and leſſer, and euery one of them ſlaſhed in the edges as are the leaues of Ferne. The root is tough and of a wooddy ſubſtance. The whole plant is bitter in taſte, and of a ſtrong ſmell, but yet pleaſant.

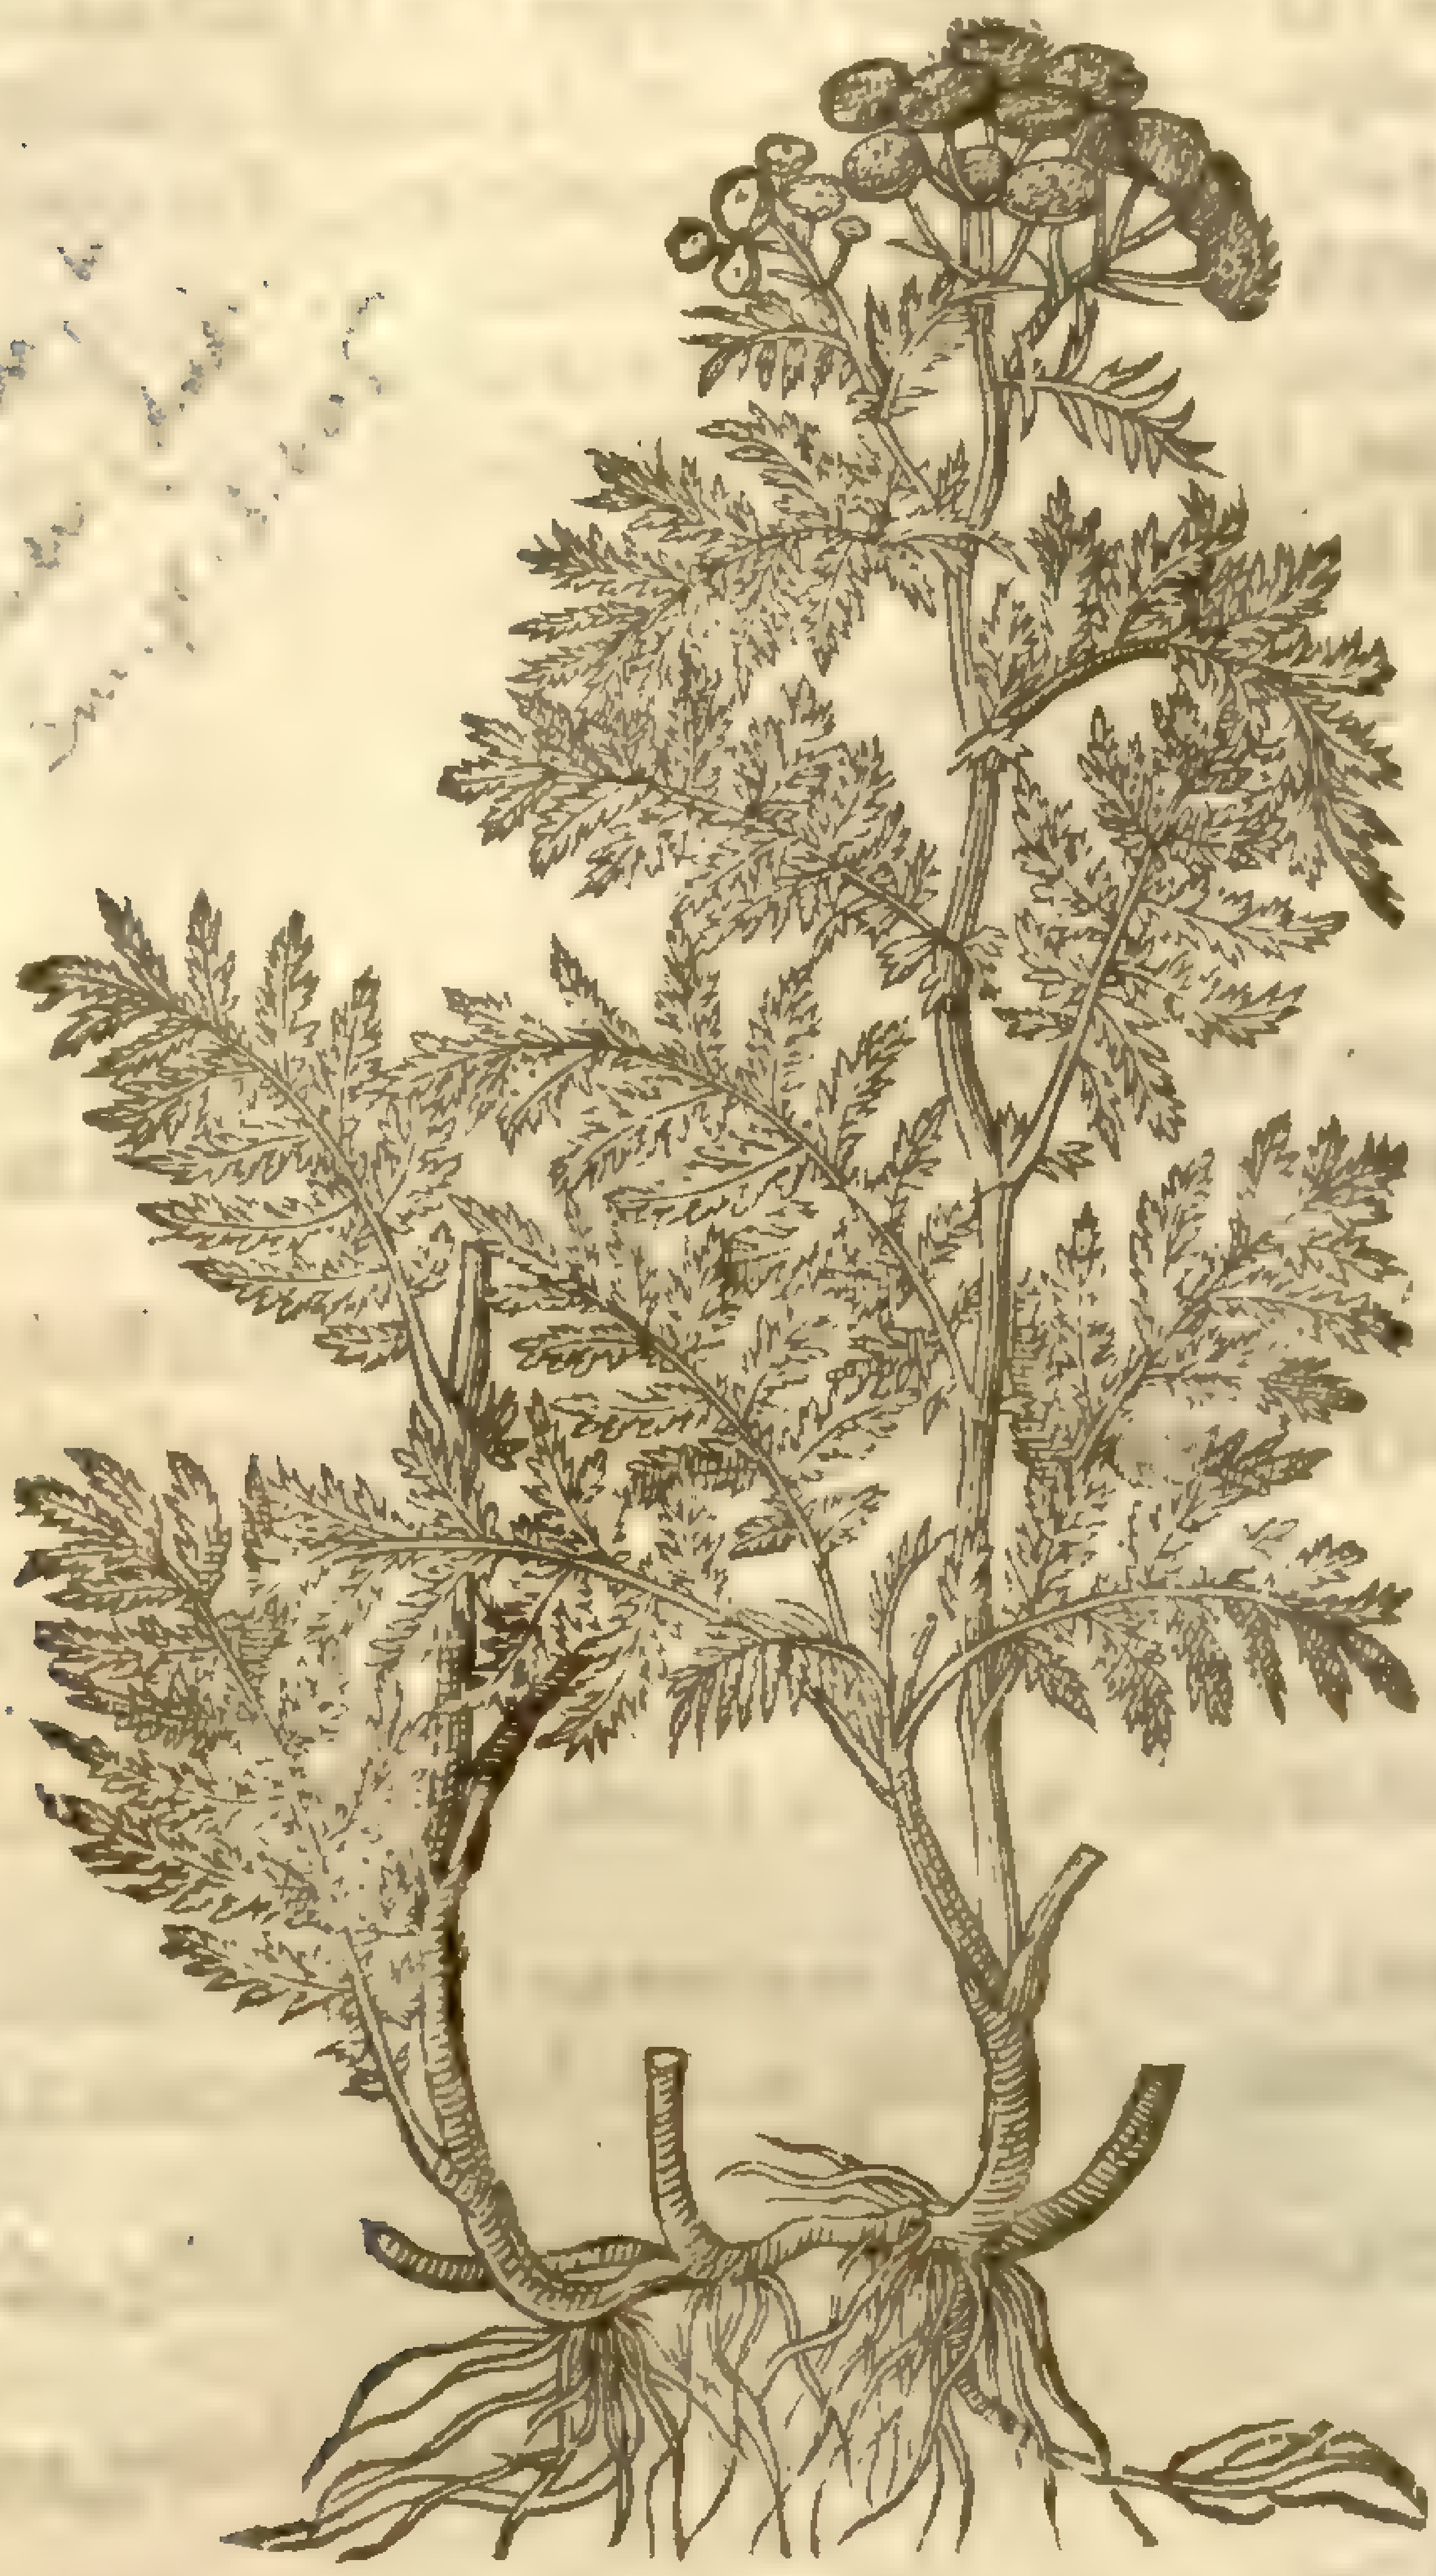
2 The double Engliſh Tanſie hath leaues infinitly jagged and nicked, and curled withall, like vnto a plume of Feathers : it is altogether like vnto the other, both in ſmell and taſte, as alſo in floures, but more pleaſantly ſmelling by many degrees, wherein eſpecially conſiſteth the difference.

3 The third kinde of Tanſie hath leaues, roots, ſtalkes, and branches like the other, and differeth from them, in that this hath no ſmell or ſauour at all, and the floures are like the common ſingle Fetherfew.

‡ 4 *Cluſius* hath deſcribed another bigger kind of vnſauorie Tanſie, whoſe figure here we giue you; it grows ſome cubit and halfe high, with creſted ſtalks, hauing leaues ſet vpon ſomwhat longer ſtalkes than thoſe of the laſt deſcribed, otherwiſe much like them : the floures are much larger, being of the bigneſſe of the great Daiſie, and of the ſame colour : the ſeed is long and blacke : The root is of the thickneſſe of ones finger, running vpon the ſurface of the ground, and putting forth ſome fibres, and it laſts diuers yeares, ſo that the plant may be encreaſed thereby. This floures in May and Iune, and growes wilde vpon diuers hills in Hungary and Auſtria. ‡

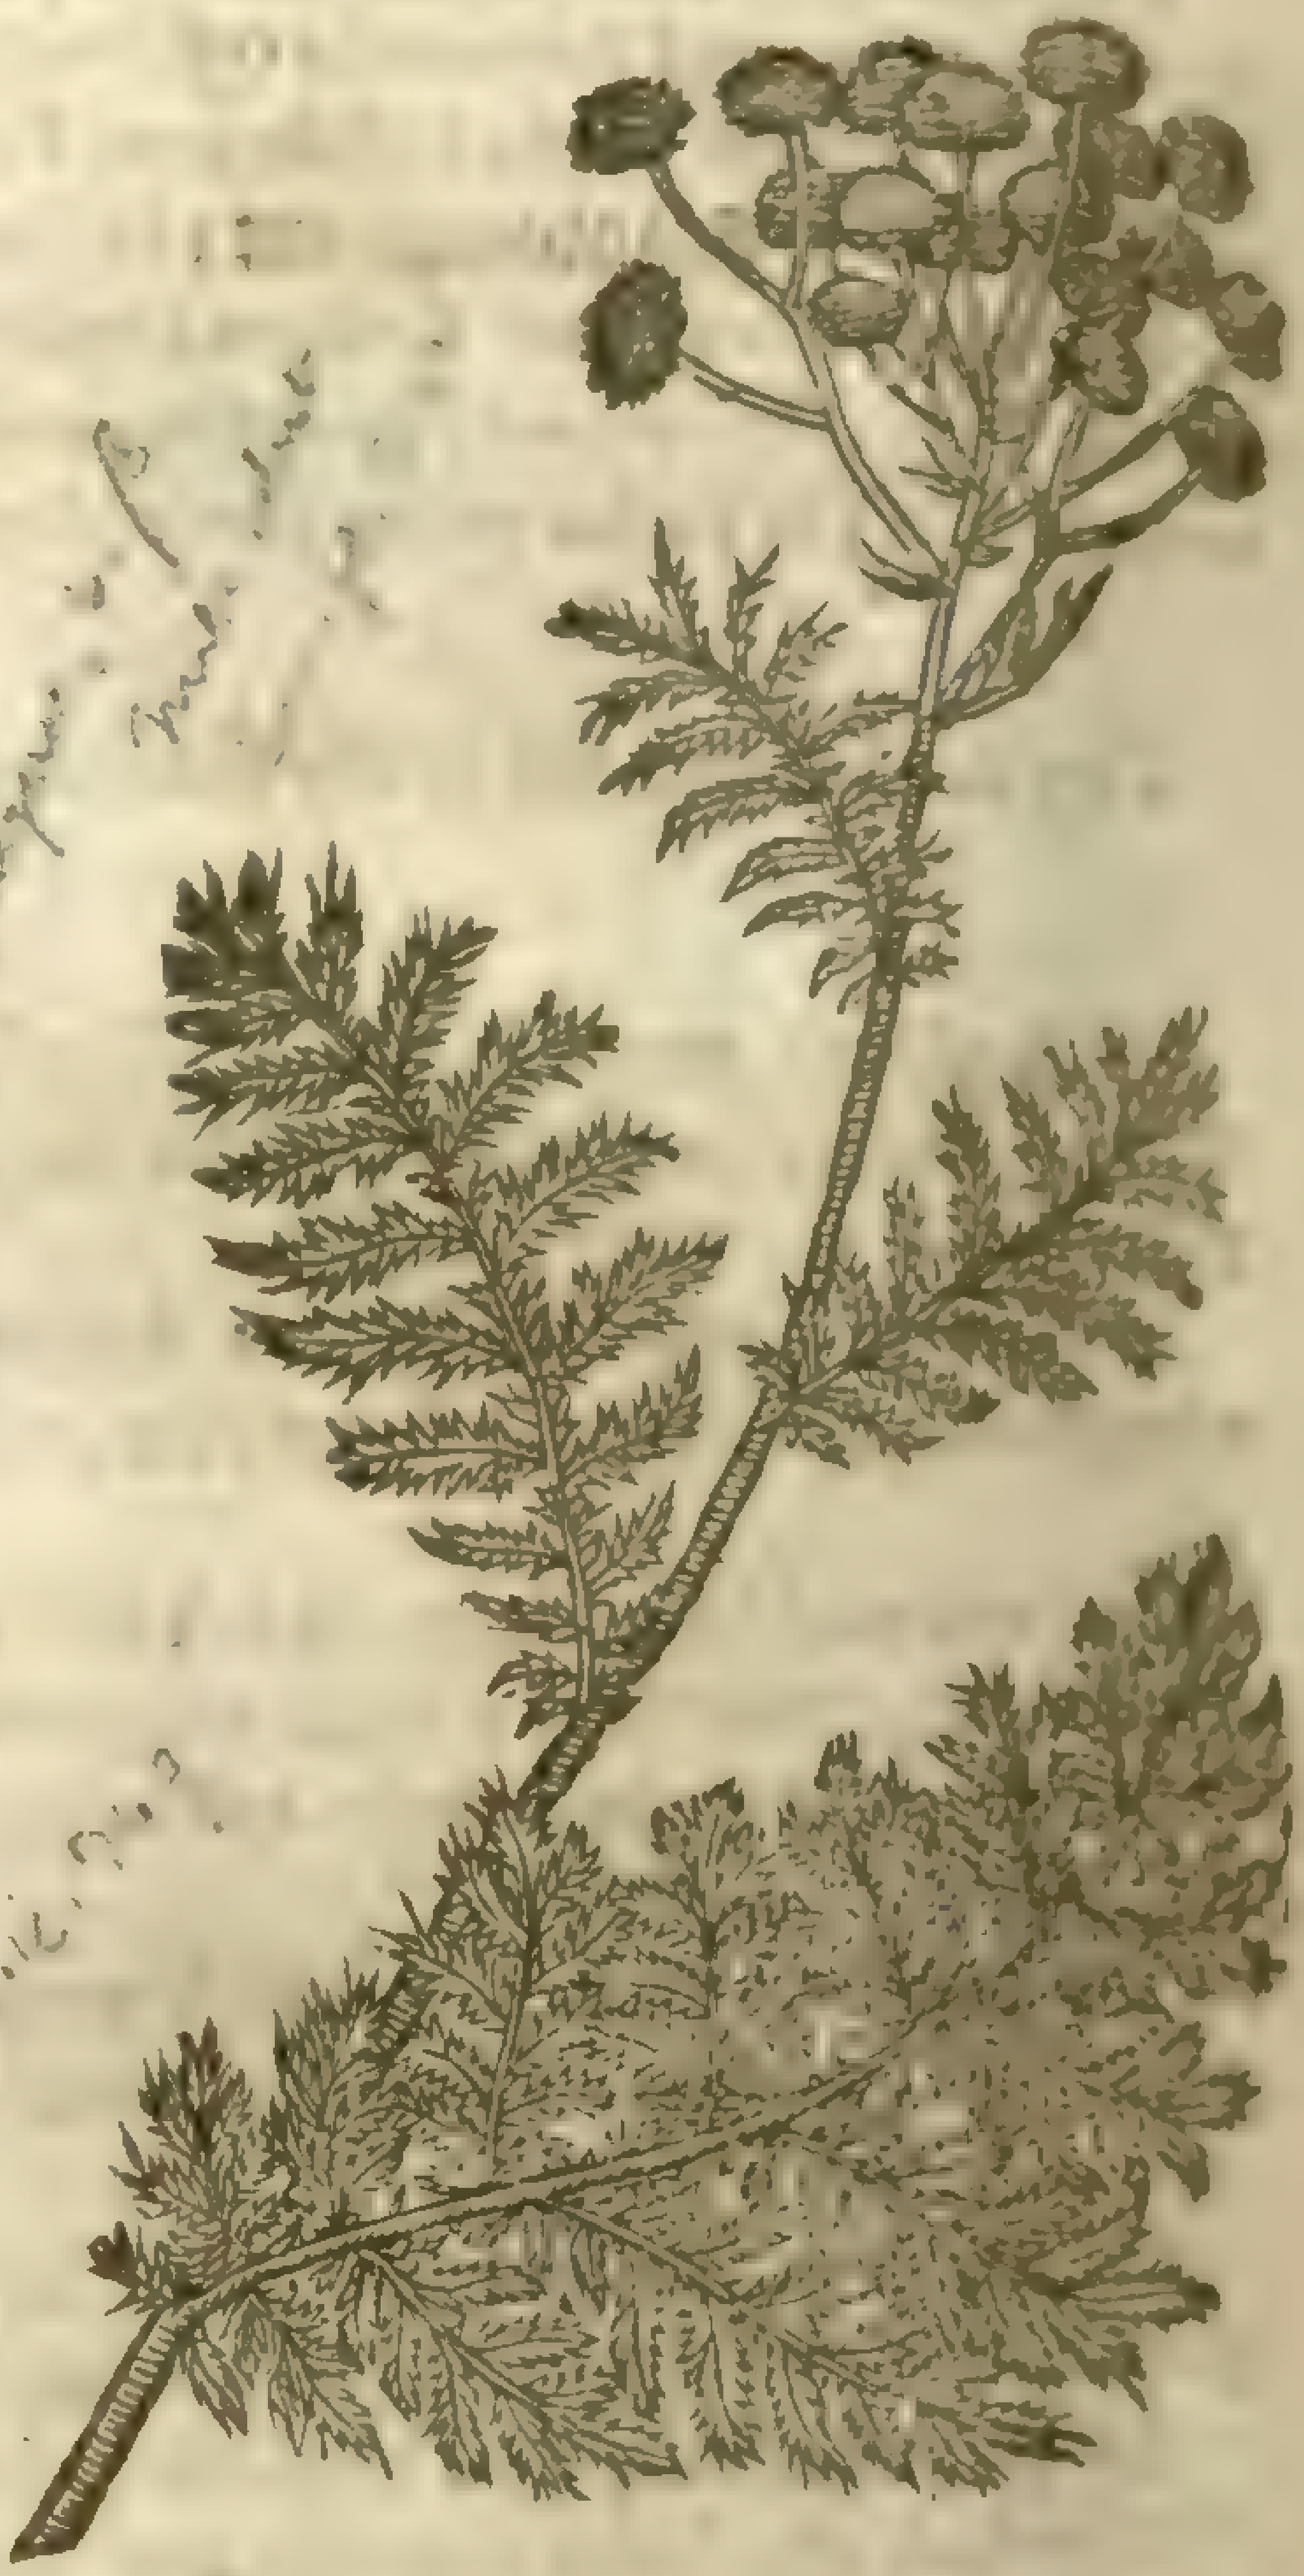
1 *Tanacetum.*
Tanſie.

Tanacetum vulgare L. [illegible]

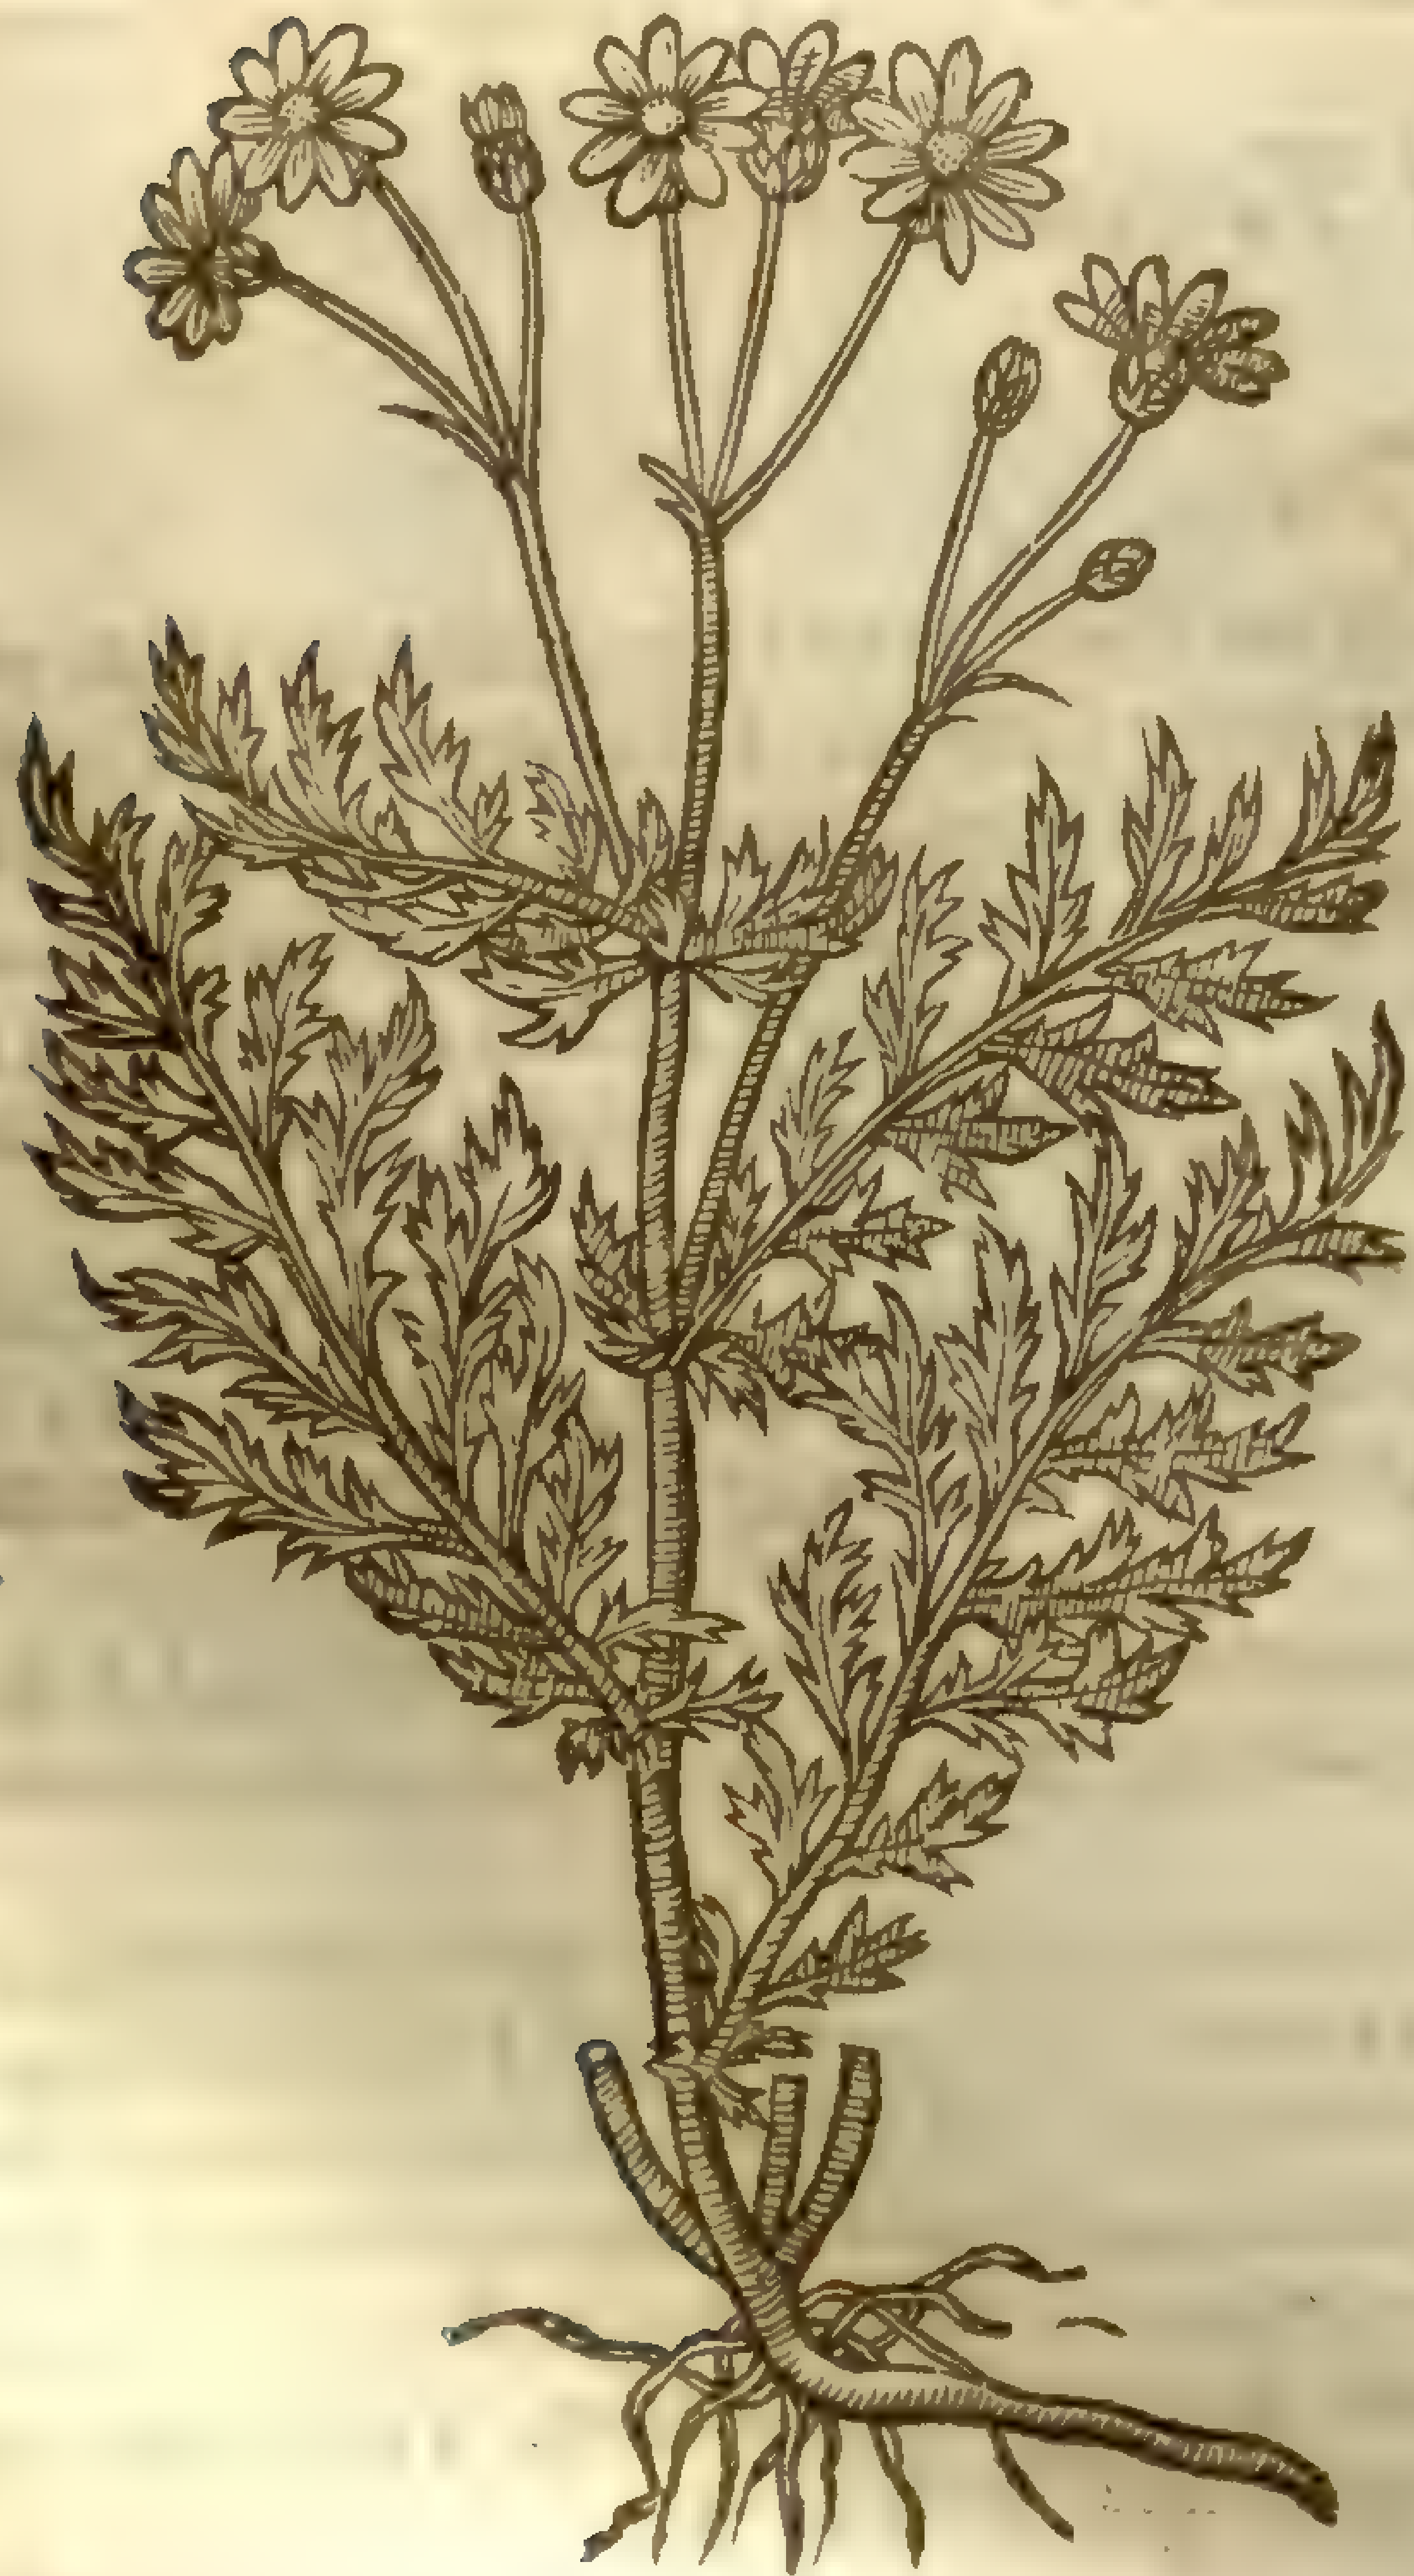


2 *Tanacetum criſpum Anglicum.*
Double Engliſh Tanſie.

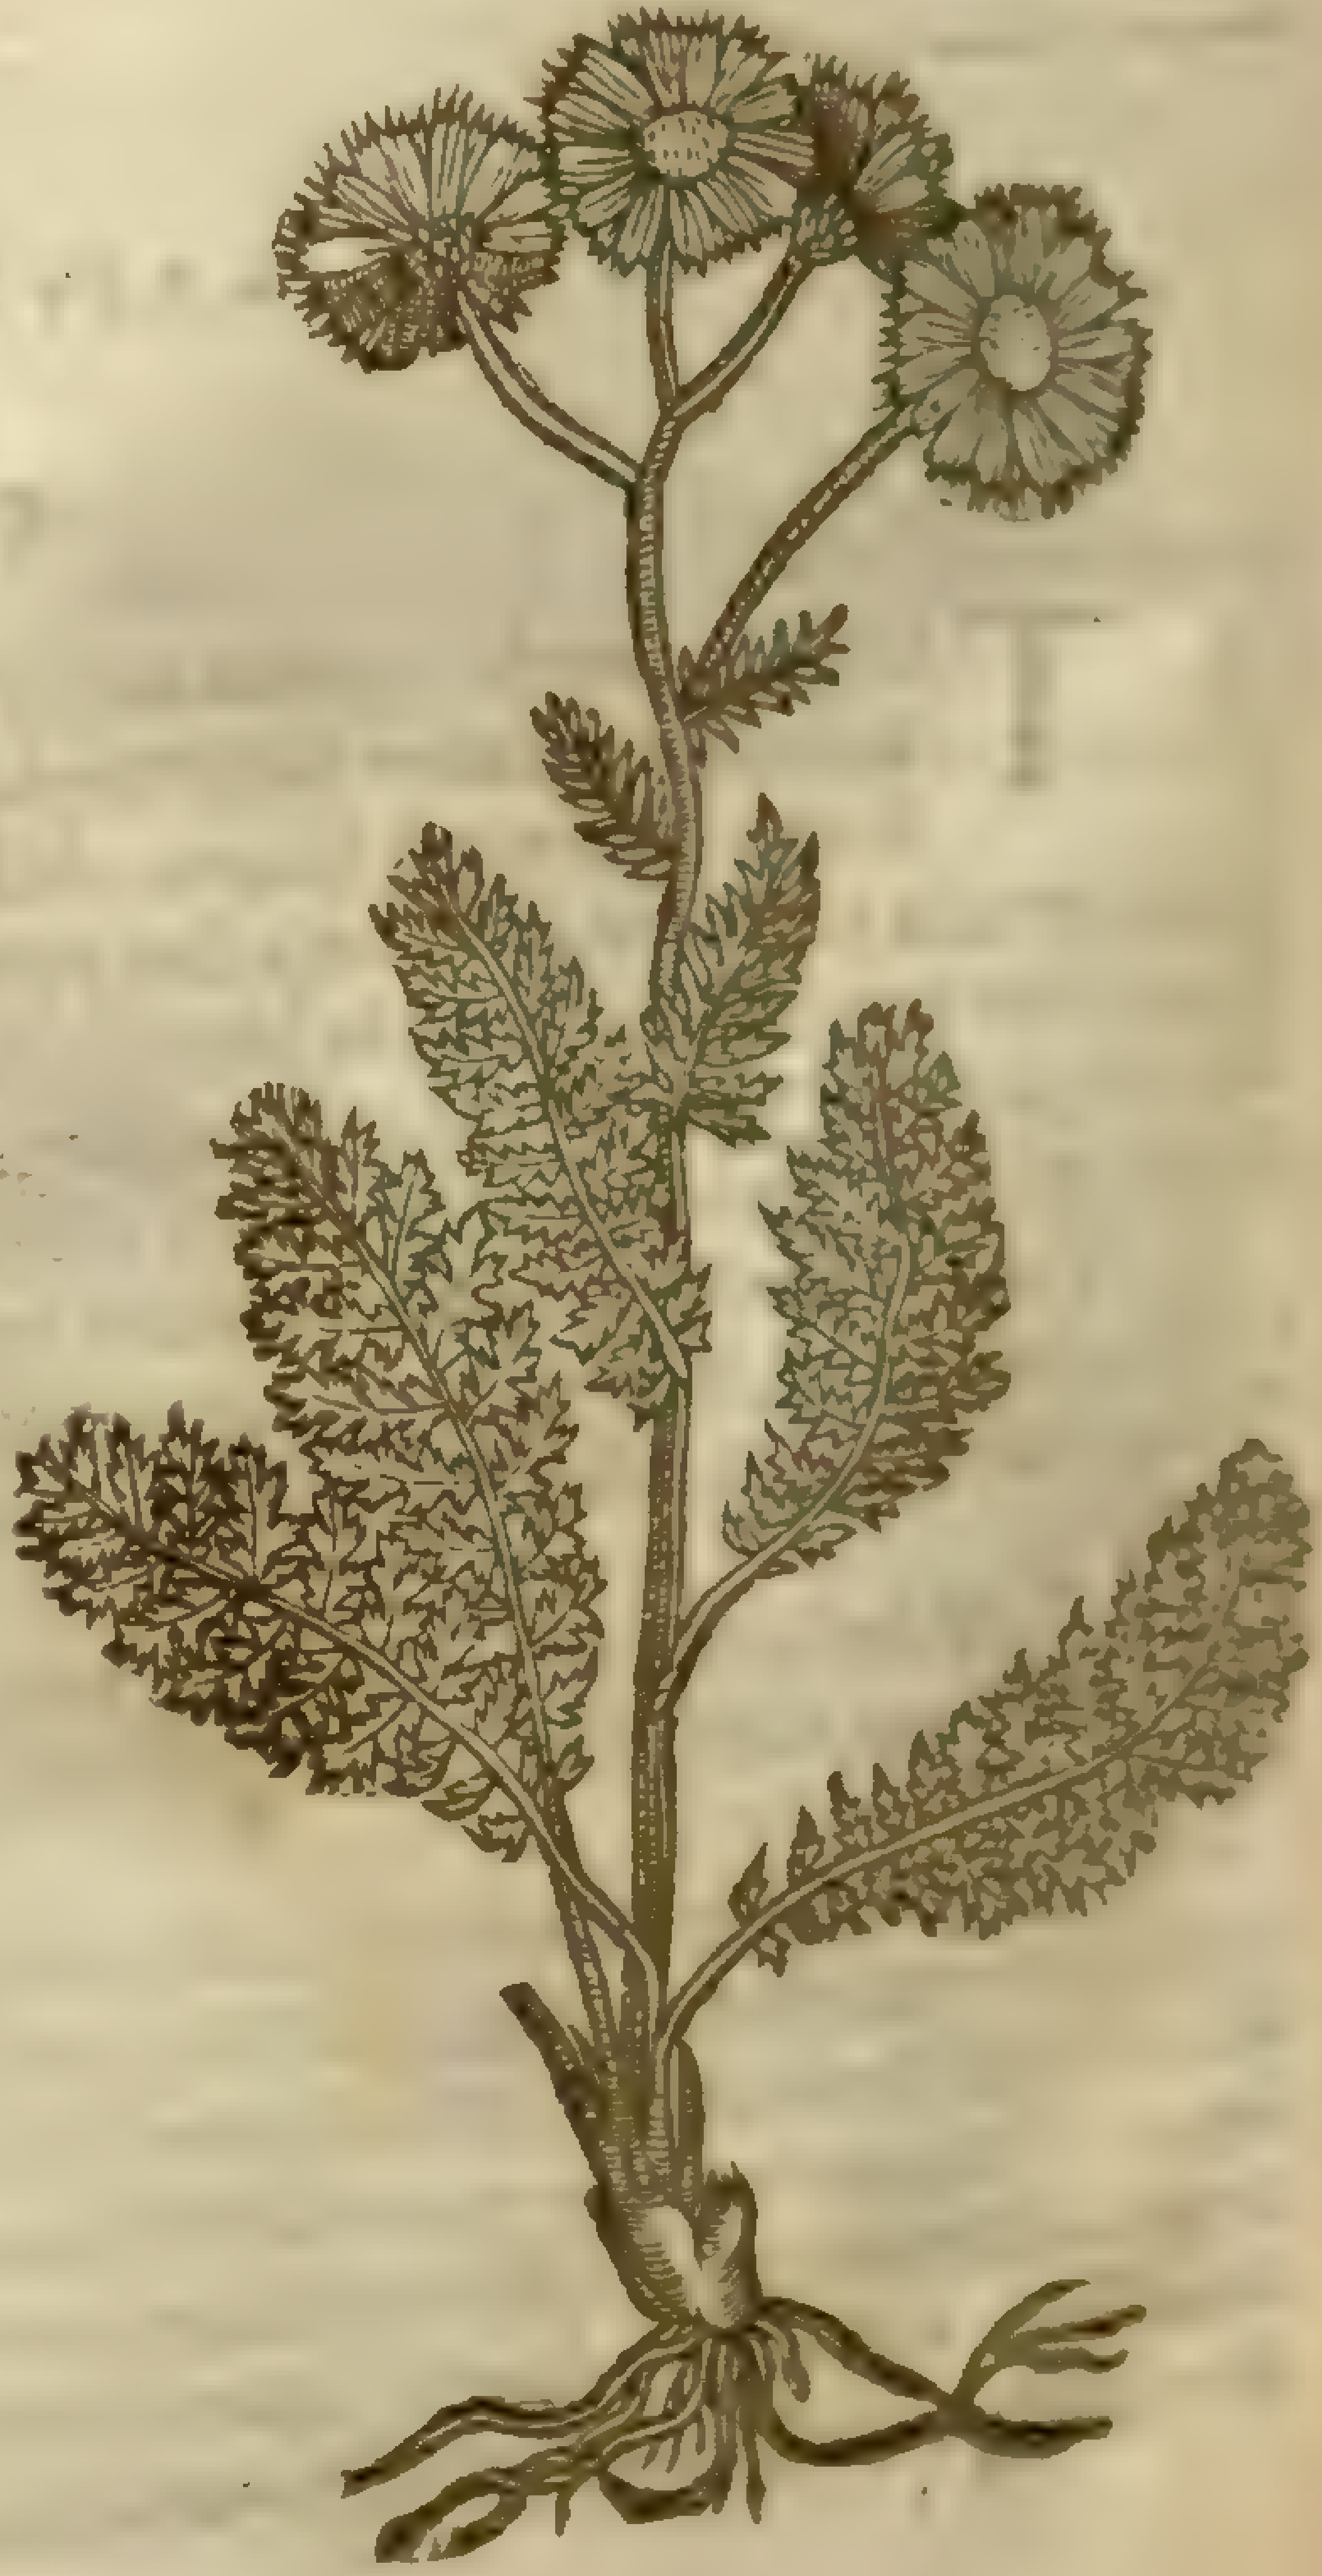
Tanacetum vulgare L. [illegible]

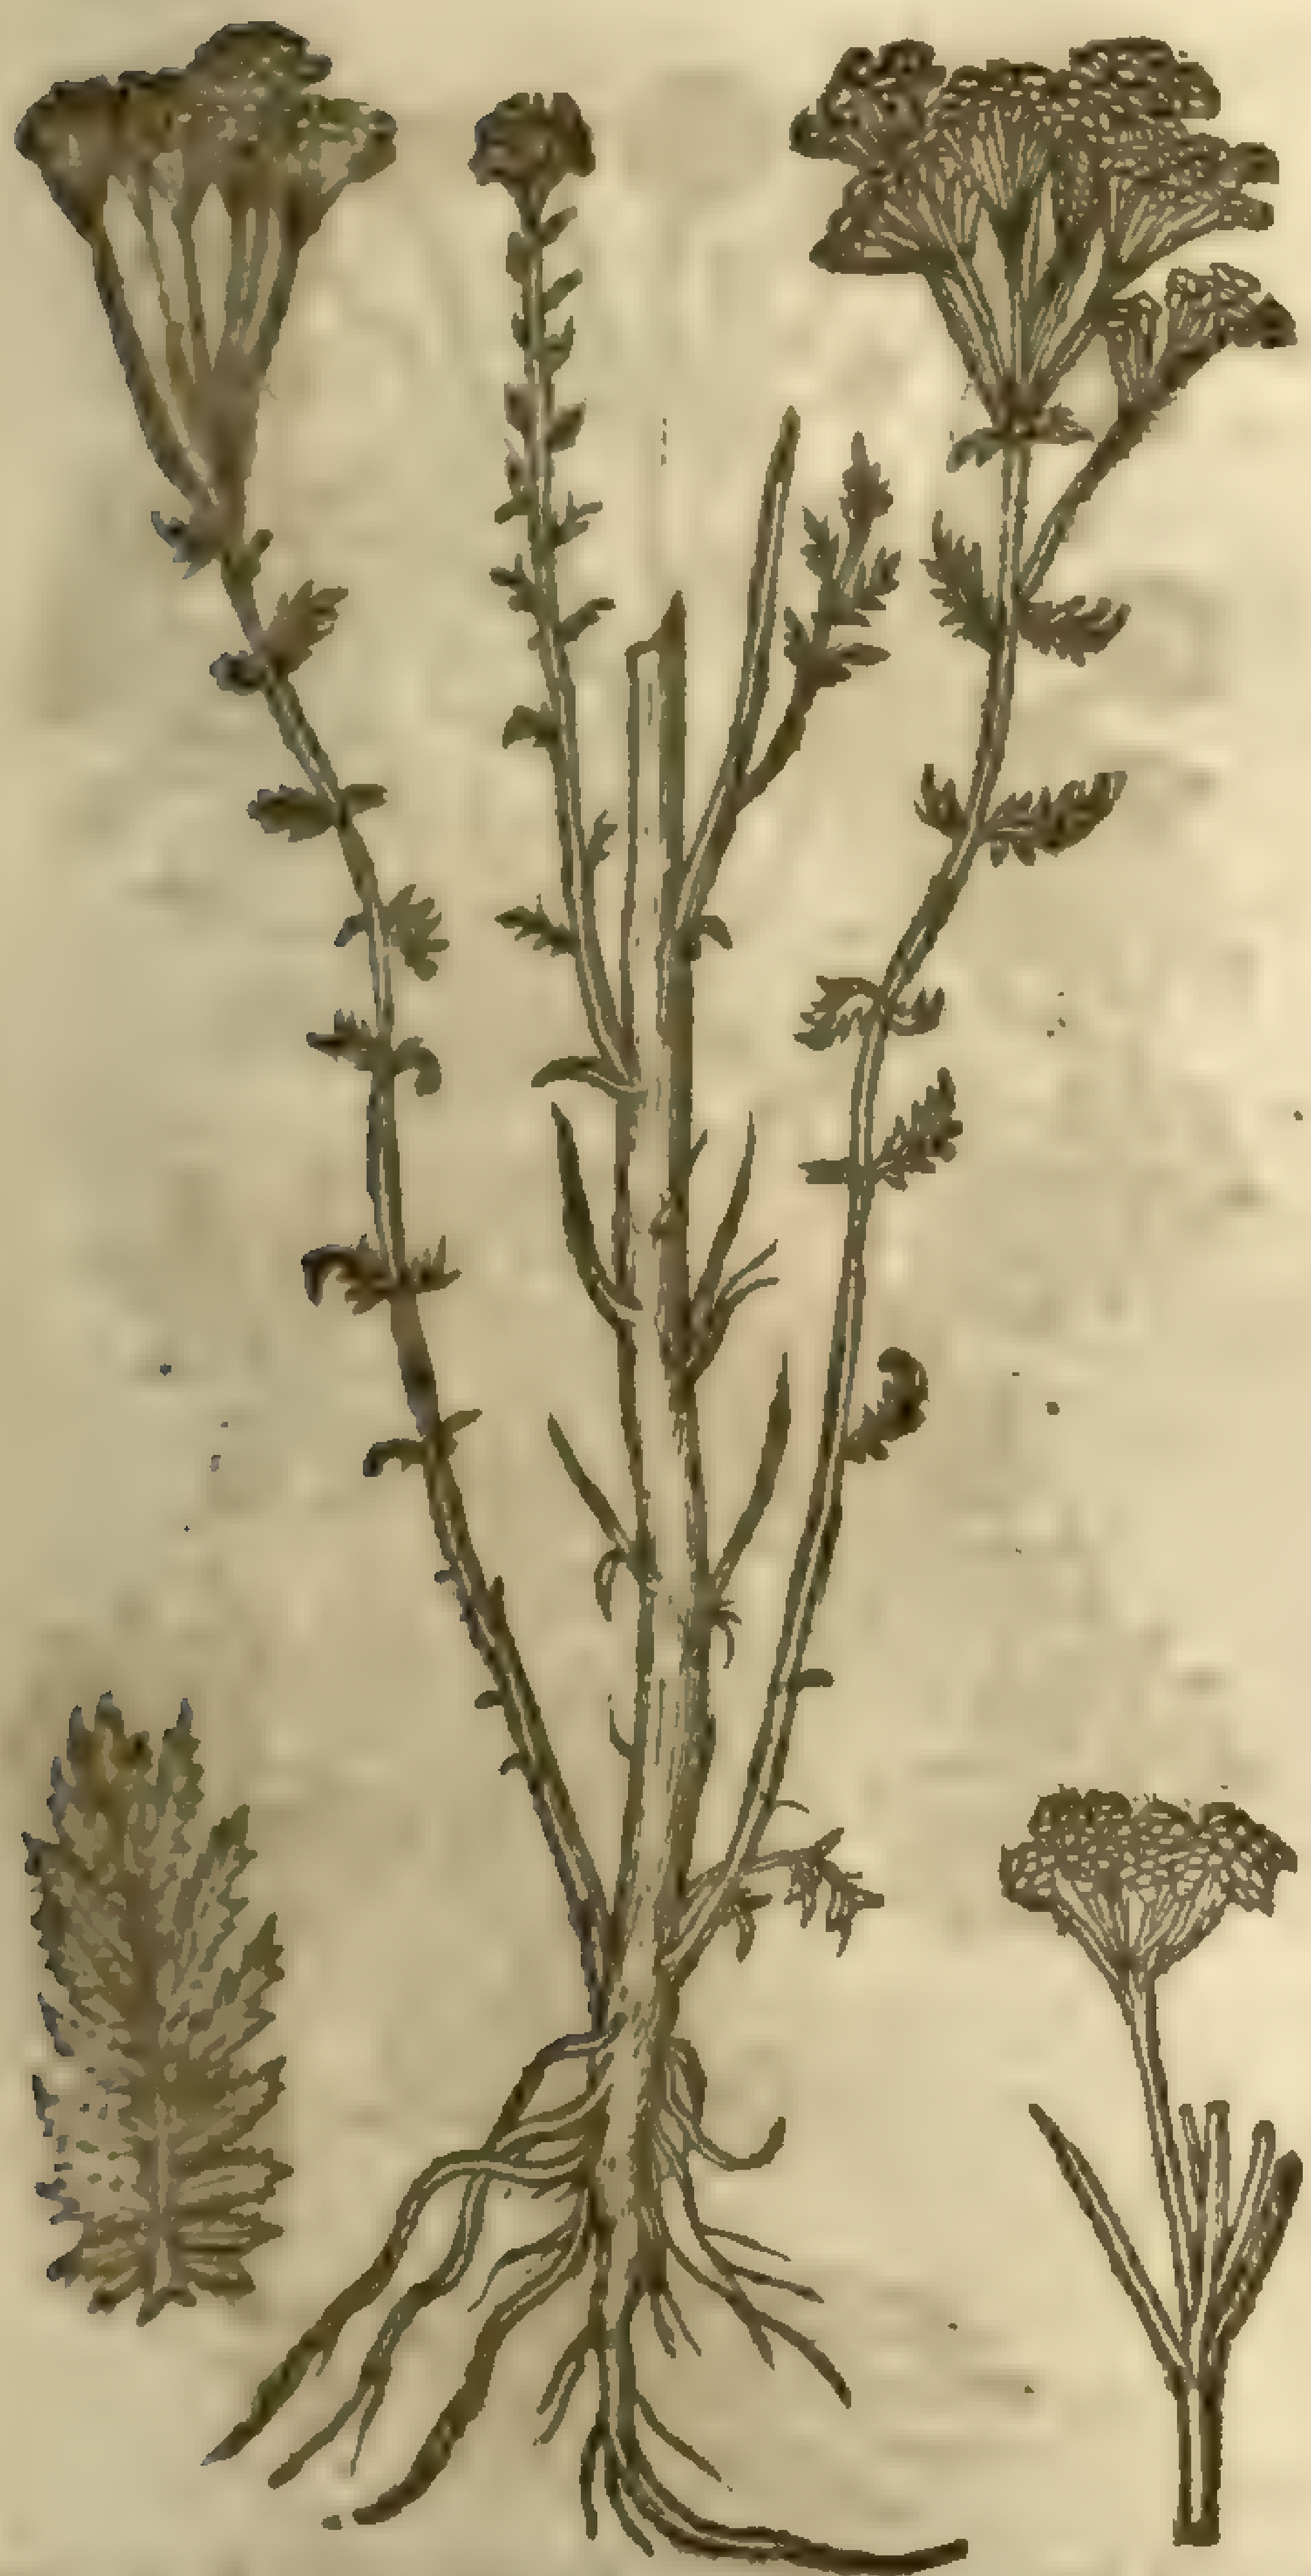


3 *Tanacetum non odorum.*
Vnſauorie Tanſie.



‡ 4 *Tanacetum inodorum majus.*
Great vnſauorie Tanſie.





† 5 *Tanacetum minus album.*
Small white Tanſie.

5 The fifth kinde of Tanſie hath broad leaues, much jagged and wel cut, like the leaues of Fetherfew, but ſmaller, and more deeply cut. The ſtalke is ſmall, a foot long, whereupon doe grow little tufts of little white floures, like the tuft of Milfoile or Yarrow. The herbe is in ſmell and ſauour like the common Tanſie, but not altogether ſo ſtrong.

¶ *The Place.*

The firſt groweth wilde in fields as well as in gardens: the others grow in my garden.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

The firſt is called Tanſie; the ſecond, double Tanſie; the third, vnſauory Tanſie; the laſt, white Tanſie: in Latine, *Tanacetum*, and *Athanaſia*, as though it were immortall: becauſe the floures do not ſpeedily wither: of ſome, *Artemiſia*, but vntruly.

¶ *The Nature.*

The Tanſies which ſmel ſweet are hot in the ſecond degree, and dry in the third. That without ſmell is hot and dry, and of a meane temperature.

¶ *The Vertues.*

A In the Spring time are made with the leaues hereof newly ſprung vp, and with egs, cakes or tanſies, which be pleaſant in taſte, and good for the ſtomacke. For if any bad humours cleaue thereunto, it doth perfectly concoct them, and ſcowre them downewards. The root preſerued with hony or ſugar, is an eſpeciall thing againſt the gout, if euery day for a certaine ſpace, a reaſonable quantity thereof be eaten faſting.

B The ſeed of Tanſie is a ſingular and approued medicine againſt Wormes, for in what ſort ſoeuer it be taken, it killeth and driueth them forth.

C The ſame pound, and mixed with oyle Oliue, is very good againſt the paine and ſhrinking of the ſinewes.

D Alſo being drunke with wine, it is good againſt the paine in the bladder, and when a man cannot piſſe but by drops.

† The figure that was formerly in the fourth place was only the varietie of the ordinary Tanſie, hauing a white floure, but that which agreed with the deſcription is now pag. 915 vnder the title of *Achilles, ſiue Millefolium nobile*.

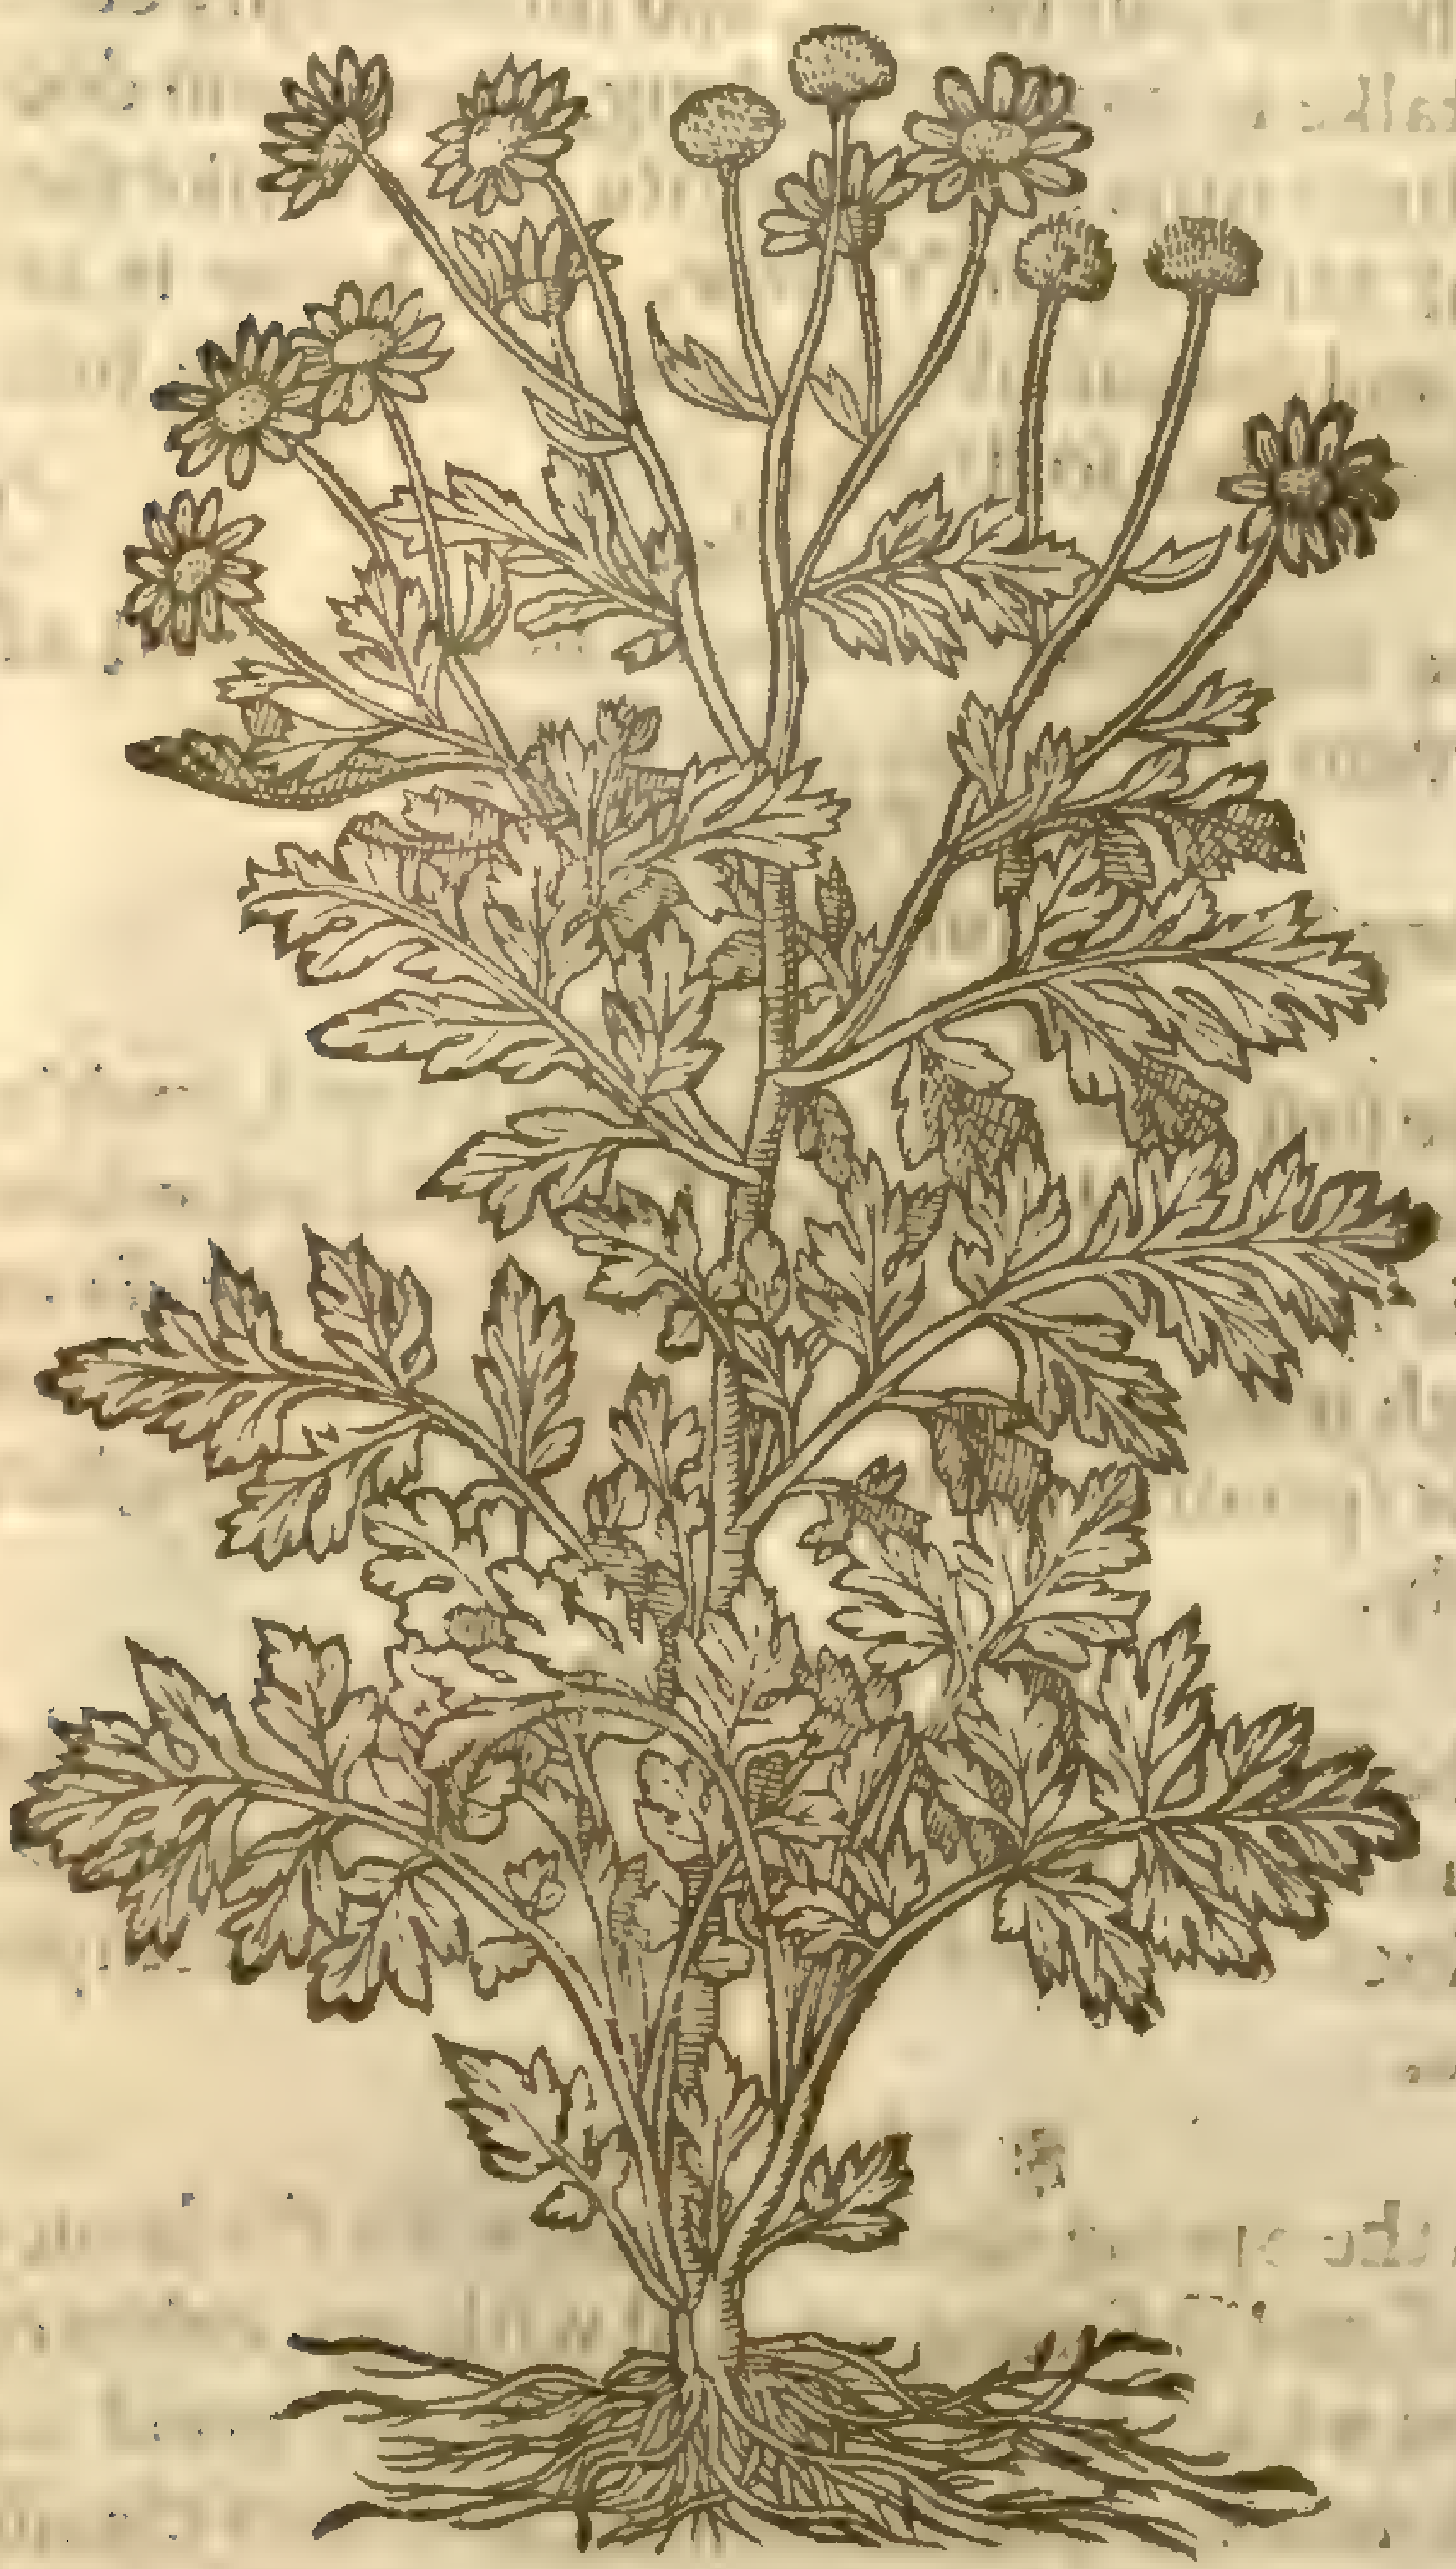
Chap. 210. *Of Fetherfew.*

¶ *The Deſcription.*

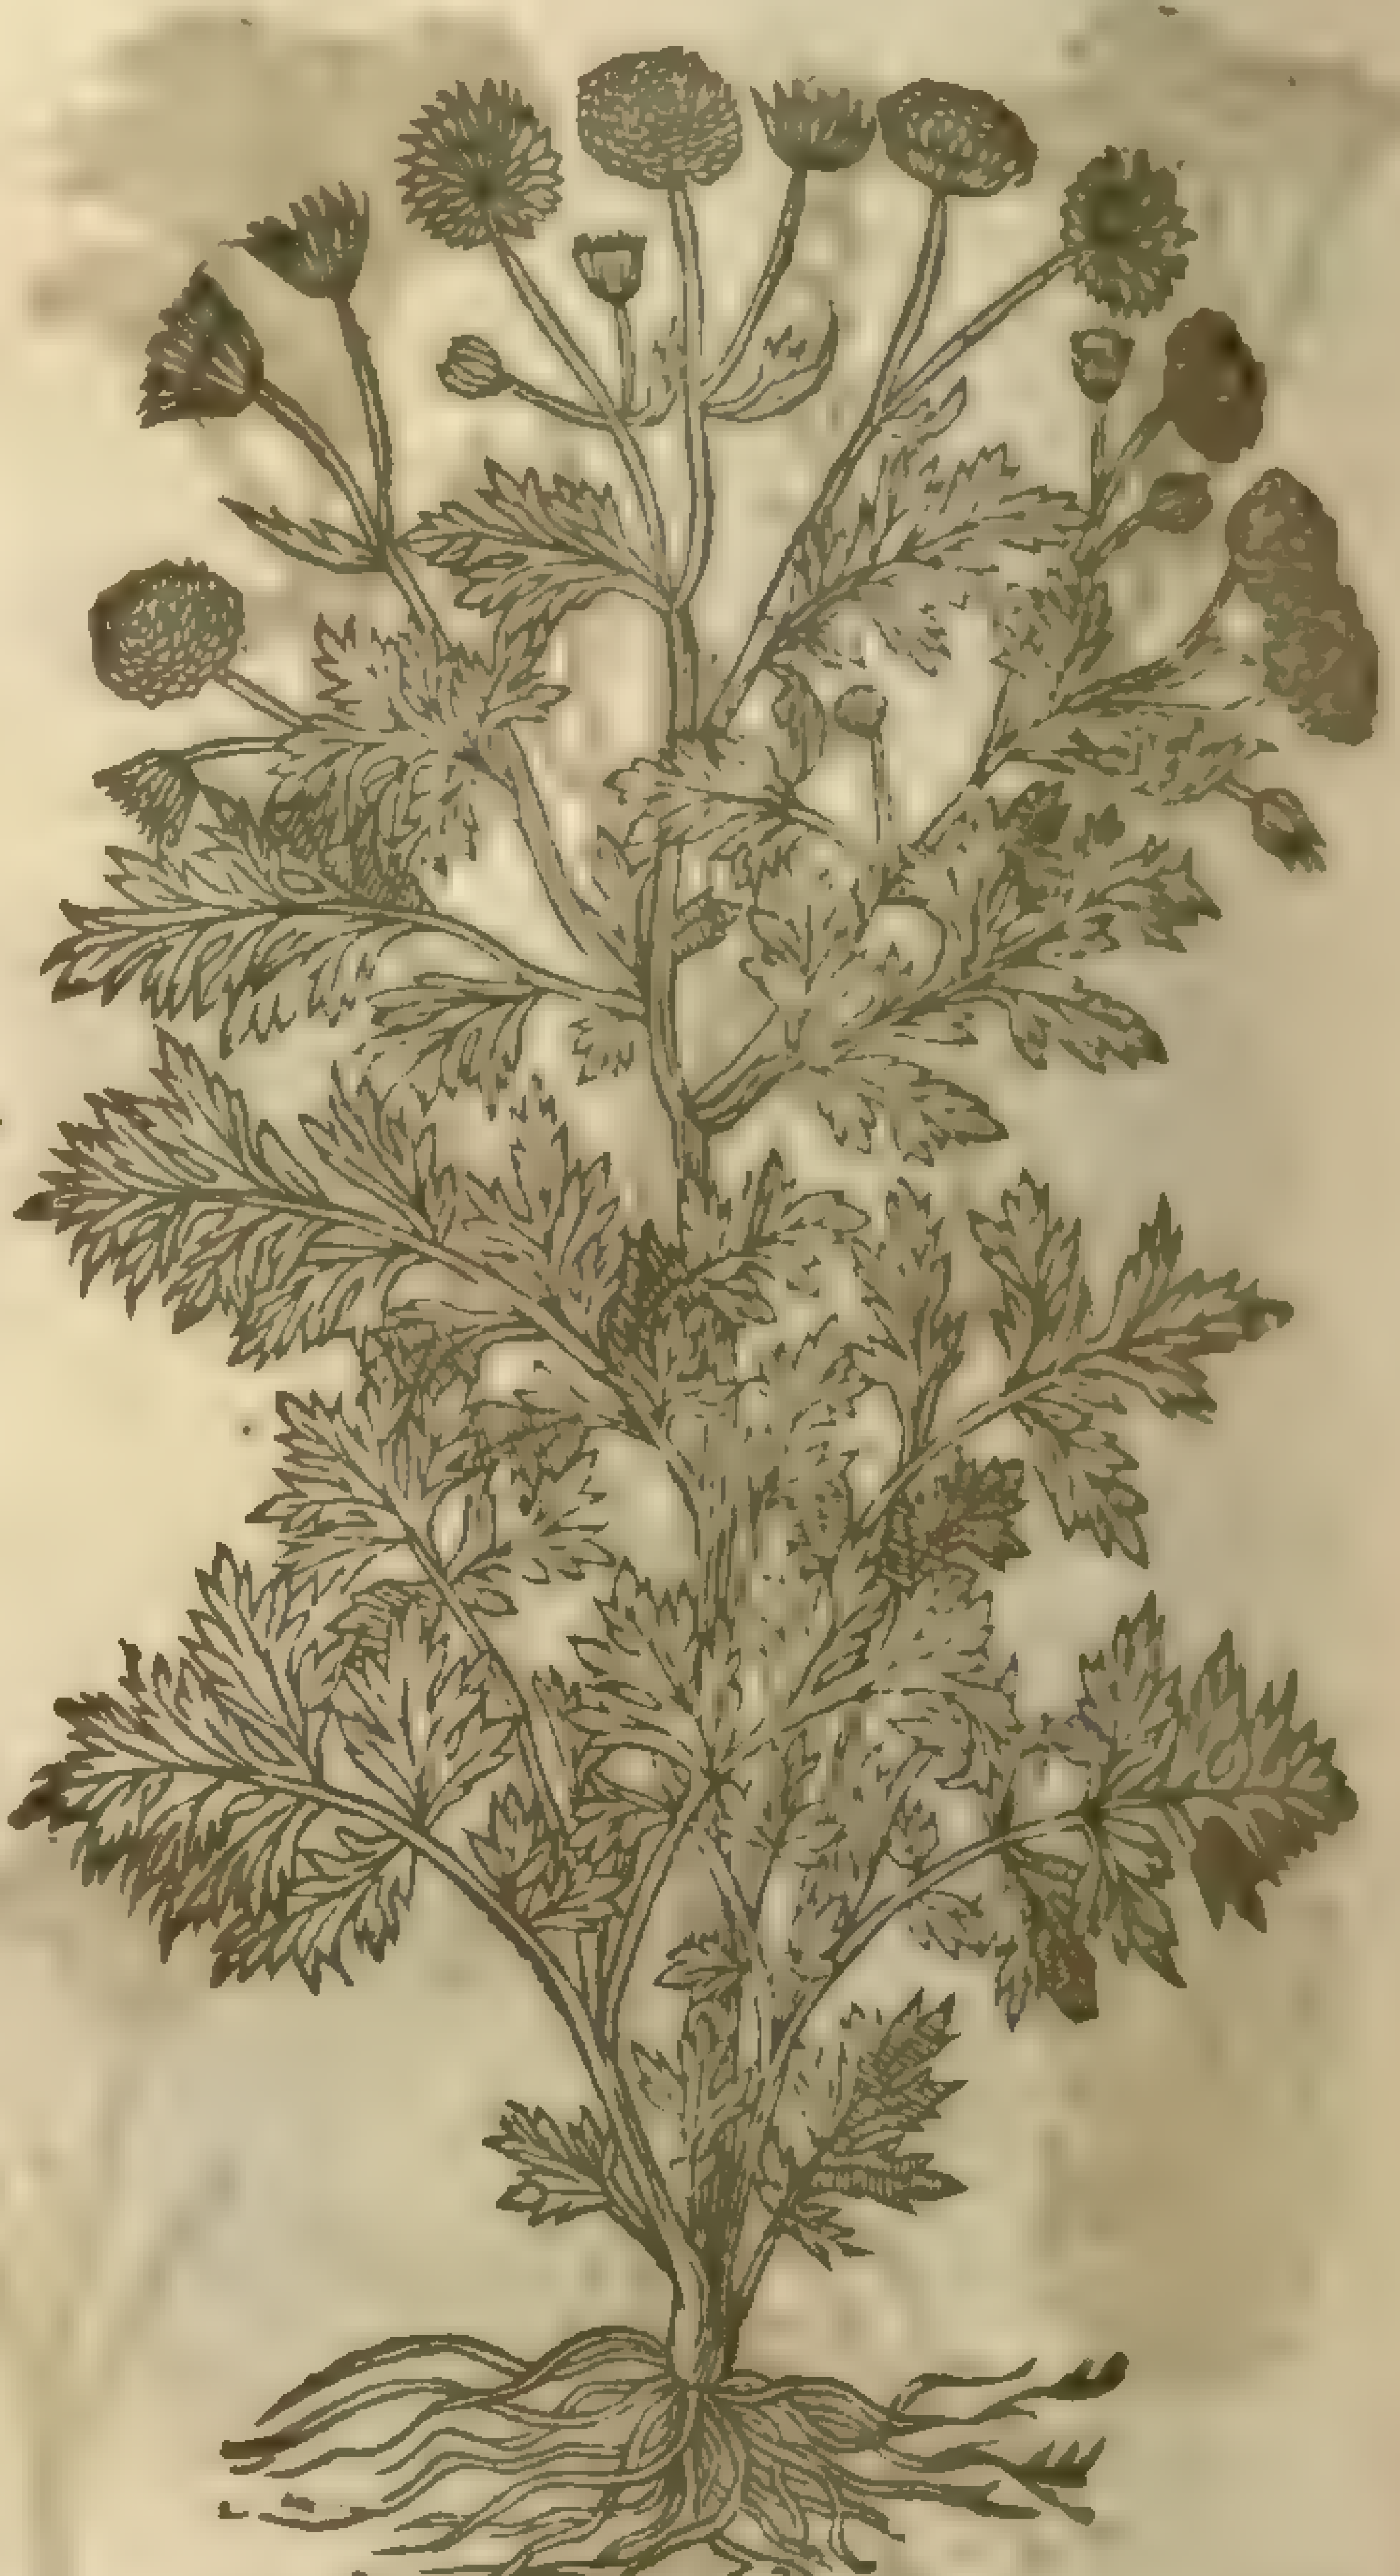
1 Feuerfew bringeth forth many little round ſtalkes, diuided into certaine branches. The leaues are tender, diuerſly torne and jagged, and nickt on the edges like the firſt and nethermoſt leaues of Coriander, but greater. The floures ſtand on the tops of the branches, with a ſmall pale of white leaues, ſet round about a yellow ball or button, like the wild field Daiſie. The root is hard and tough: the whole plant is of a light whitiſh greene colour, of a ſtrong ſmell, and bitter taſte.

2 The ſecond kinde of Feuerfew, *Matricaria*, or *Parthenium*, differeth from the former, in that it hath double floures; otherwiſe in ſmell, leaues, and branches, it is all one with the common Feuerfew.

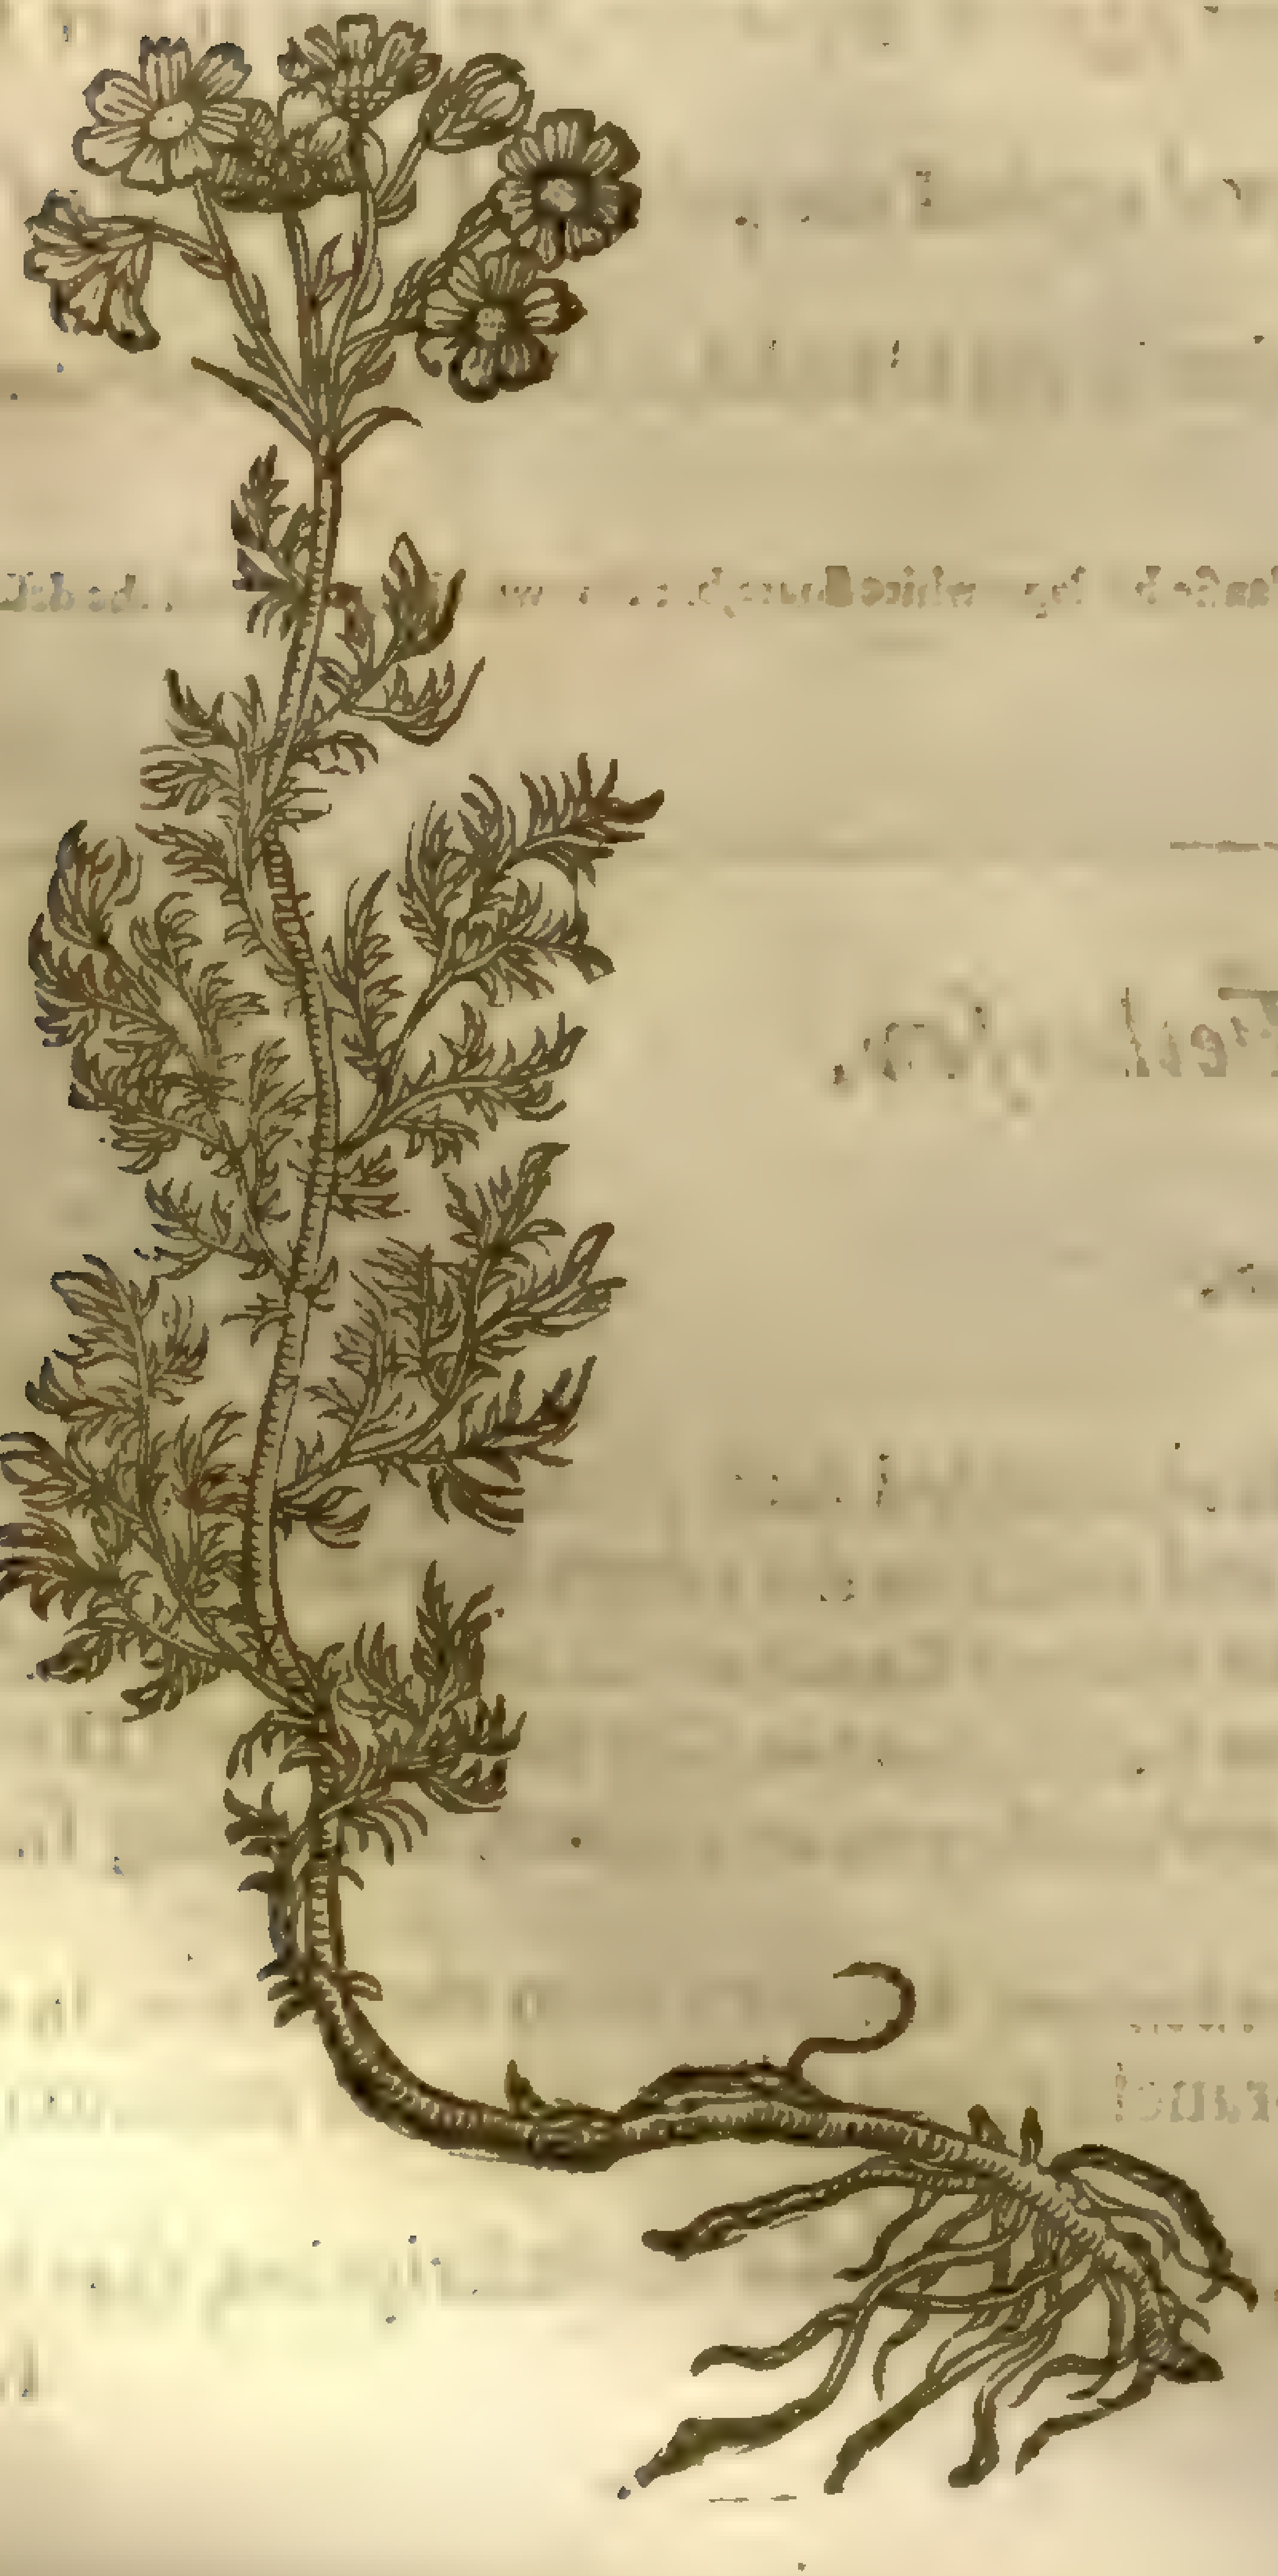
3 There is a third ſort called Mountaine Feuerfew, of *Carolus Cluſius* his deſcription, that hath ſmall



1 *Matricaria.*
Feuerfew.



2 *Matricaria duplici flore.*
Double Feuerfew.



‡ 3 *Matricaria Alpina Cluſij.*
Mountaine Feuerfew.

ſmall and fibrous roots; from which proceed ſlender wooddie ſtalks, a foot high and ſomewhat more, beſet or garniſhed about with leaues like Camomill, deepely jagged or cut, of the ſauour or ſmell of Feuerfew, but not ſo ſtrong; in taſte hot, but not vnpleaſant. At the top of the ſtalks there come forth ſmall white floures not like vnto the firſt, but rather like vnto *Abſynthium album*, or White Wormewood.

4 I haue growing in my Garden another ſort, like vnto the firſt kinde, but of a moſt pleaſant ſweet ſauour, in reſpect of any of the reſt. ‡ This ſeemes to be the *Matricaria altera ex Ilua*, mentioned by *Camerarius* in his *Hortus medicus*. ‡

¶ *The Place.*

The common ſingle Feuerfew groweth in hedges, gardens, and about old wals, it joyeth to grow among rubbiſh. There is oftentimes found when it is digged vp a little cole vnder the ſtrings of the root, and neuer without it, whereof *Cardane* in his booke of Subtilties ſetteth down diuers vaine and trifling things.

¶ *The Time.*

They floure for the moſt part all the Summer long.

¶ *The Names.*

Feuerfew is called in Greeke of *Dioſcorides* παρθένιον: of *Galen*, and *Paulus* one of his ſect, ἀμάρακος: in Latine, *Parthenium*, *Matricaria*, and *Febrifu-*

Febrifuga: of *Fuchſius*, *Artemeſia tenuifolia*, in Italian, *Amarella*: in Dutch **Moeder crupt**: in French, *Eſpargoute*: in Engliſh, Fedderfew and Feuerfew, taken from his force of driuing away Agues.

¶ *The Temperature.*

Feuerfew manifeſtly heateth, it is hot in the third degree, and dry in the ſecond; it clenſeth, purgeth, or ſcoureth, openeth, and fully performeth all that bitter things can do.

¶ *The Vertues.*

It is a great remedie againſt the diſeaſes of the matrix; it procureth womens ſicknes with ſpeed; it bringeth forth the after birth and the dead child, whether it be drunke in a decoction, or boiled in a bath and the woman ſit ouer it; or the herbes ſodden and applied to the priuie part, in manner of a cataplaſme or pultis. A

Dioſcorides alſo teacheth, that it is profitably applied to S. Anthonies fire, to all hot inflammations, and hot ſwellings, if it be laid vnto, both leaues and floures. B

The ſame Author affirmeth, that the pouder of Feuerfew drunk with Oxymell, or ſyrrup of Vineger, or wine for want of the others, draweth away flegme and melancholy, and is good for them that are purſie, and haue their lungs ſtuffed with flegme; and is profitable likewiſe to be drunke againſt the ſtone, as the ſame Author ſaith. C

Feuerfew dried and made into pouder, and two drams of it taken with hony or ſweet wine, purgeth by ſiege melancholy and flegme; wherefore it is very good for them that are giddie in the head, or which haue the turning called *Vertigo*, that is, a ſwimming and turning in the head. Alſo it is good for ſuch as be melancholike, ſad, penſiue, and without ſpeech. D

The herbe is good againſt the ſuffocation of the mother, the hardnes and ſtopping of the ſame, being boiled in wine, and applied to the place. E

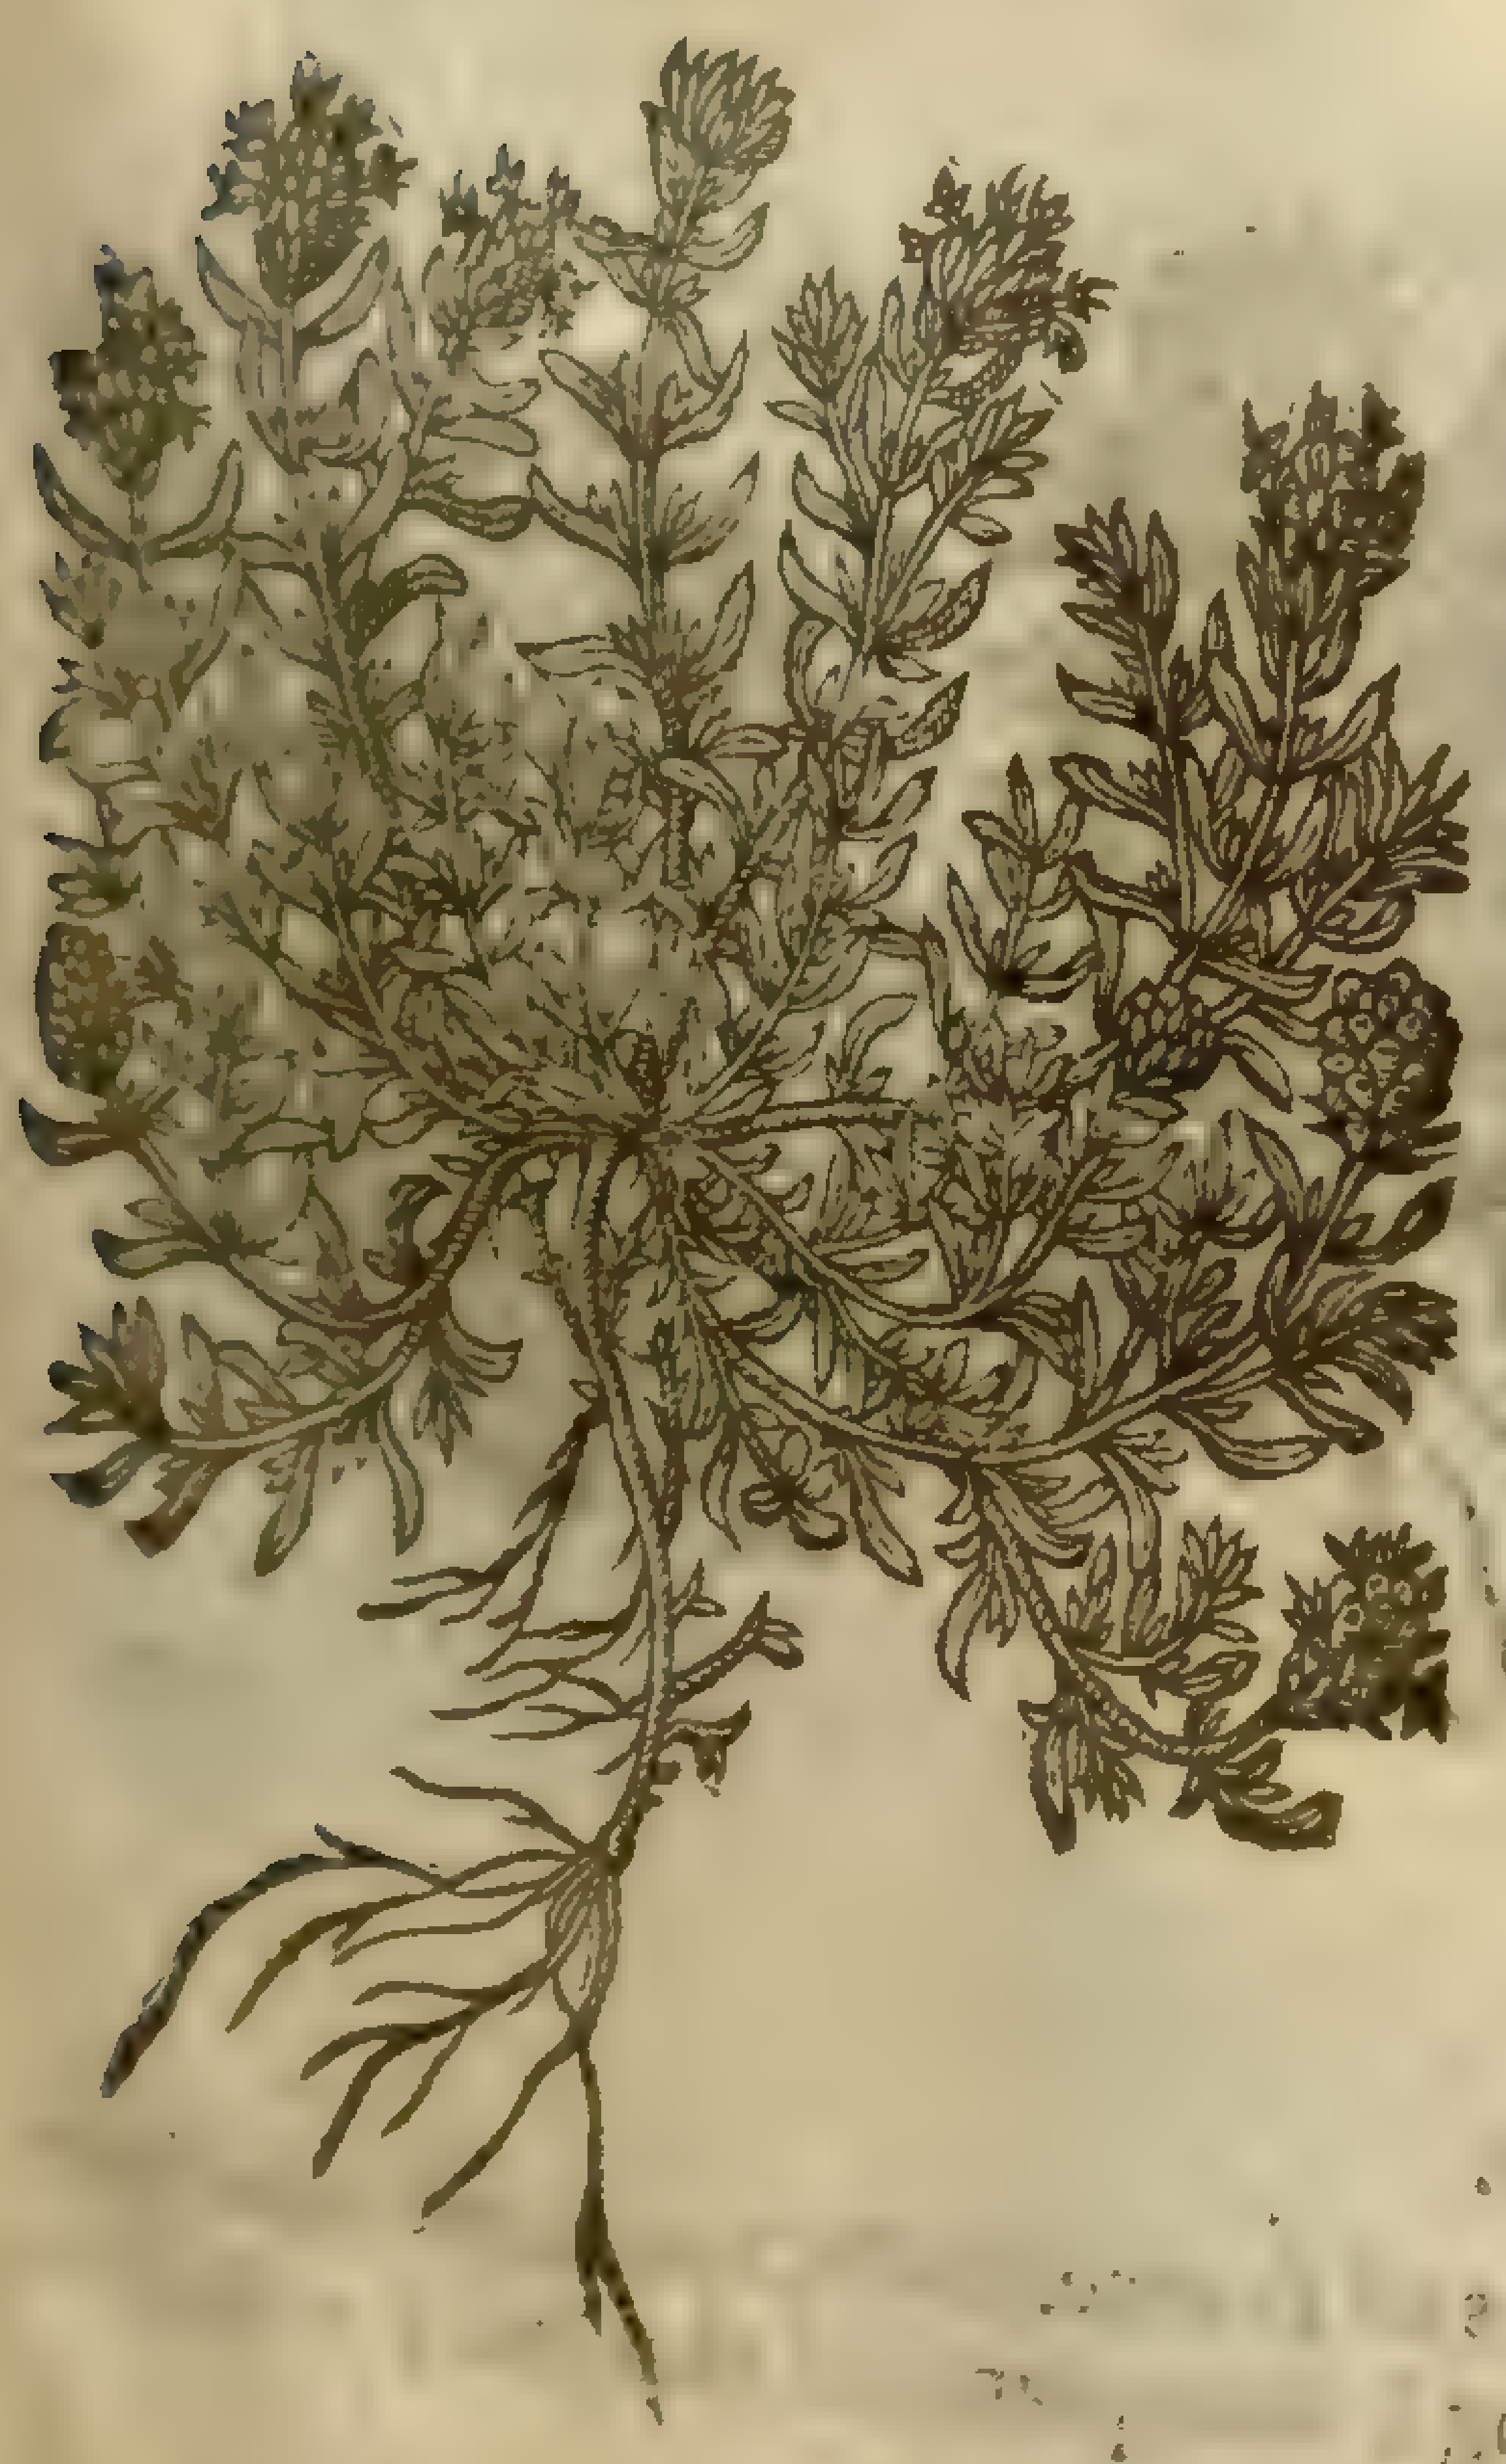
The decoction of the ſame is good for women to ſit ouer, for the purpoſes aforeſaid. F

It is vſed both in drinks, and bound to the wreſts with bay ſalt, and the pouder of glaſſe ſtamped together, as a moſt ſingular experiment againſt the Ague. G

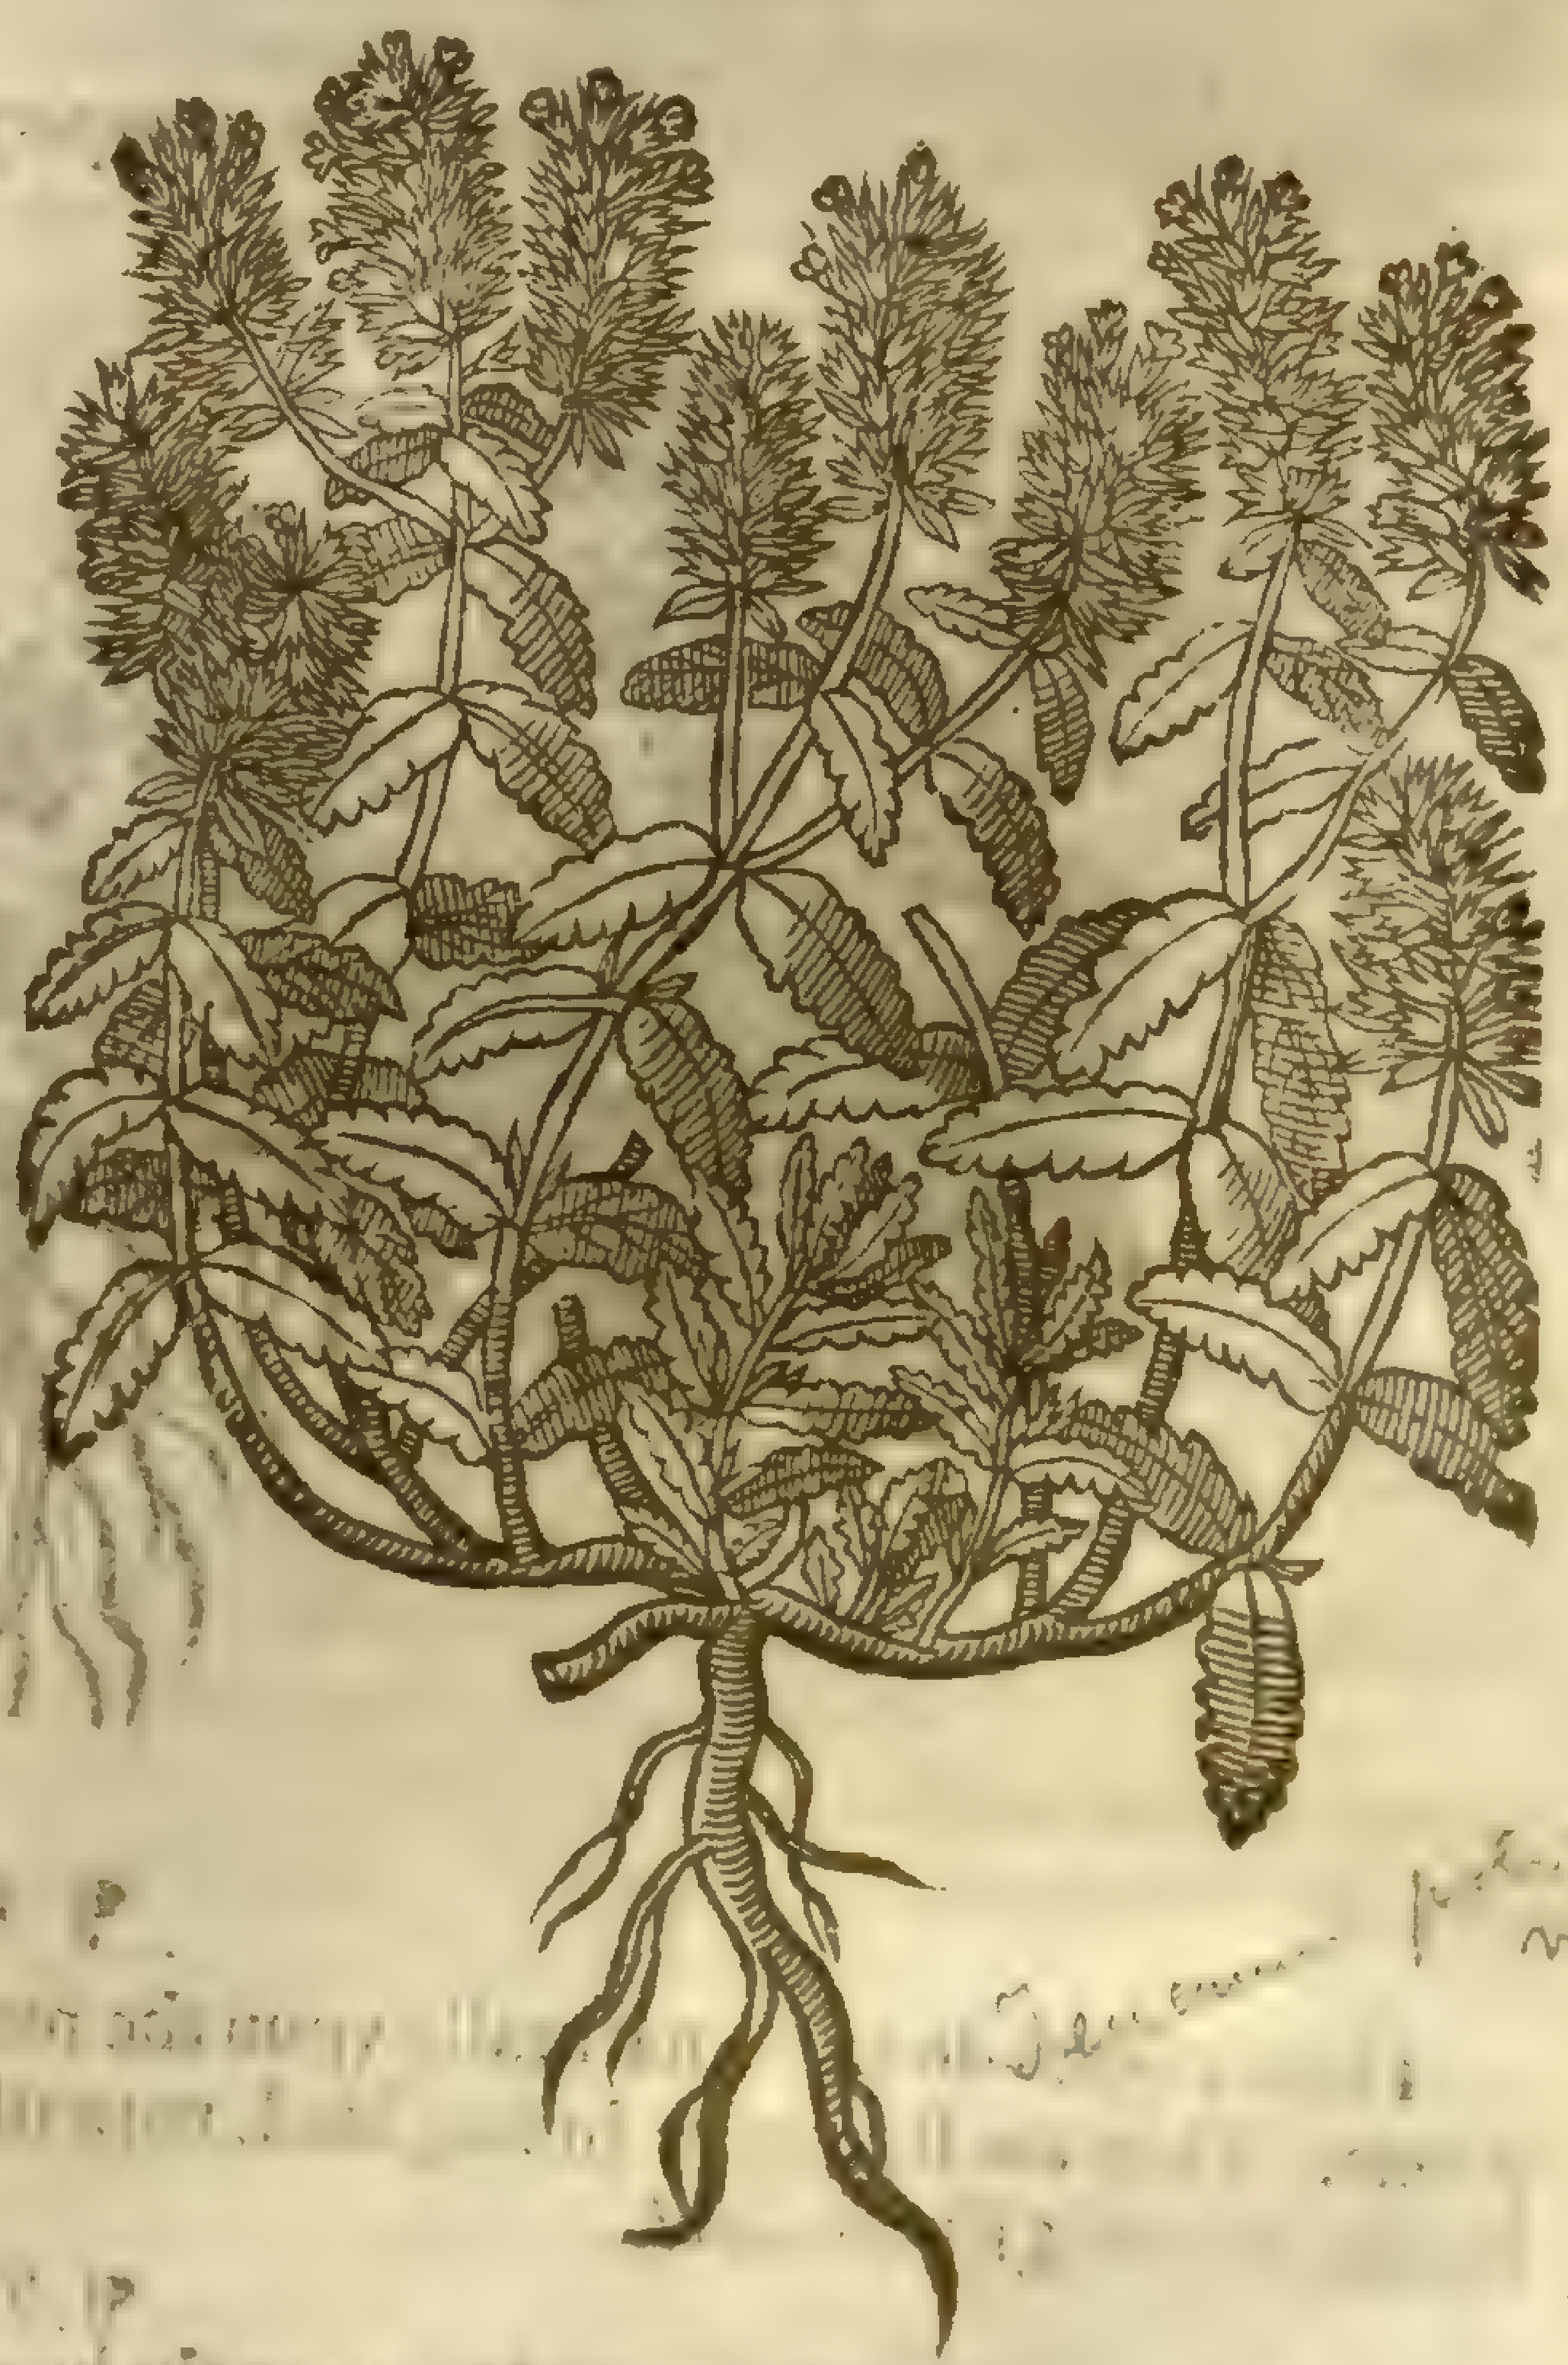
Chap. 211. *Of Poley, or Pellamountaine.*

1 *Polium montanum album.*
White Poley mountaine.

Teucrium polium, L. β
Mill. Dict.



2 *Polium montanum luteum.*
Yellow Poley mountaine.



Teucrium polium, L. α
Mill. Dict.

¶ *The Deſcription.*

1 THe firſt kind of *Polium*, or in Engliſh Poley of the mountain, is a little tender and ſweet ſmelling herbe, very hoarie, whereupon it tooke his name: for it is not onely hoarie in part, but his hoarie flockineſſe poſſeſſeth the whole plant, tufts and all, being no leſſe hoarie than *Gnaphalium*, eſpecially where it groweth neer the ſea at the bending of the hils, or neer the ſandie ſhores of the Mediterranean ſea: from his wooddie and ſomewhat threddie root ſhoote forth ſtraight from the earth a number of ſmall round ſtalkes nine inches long, and by certaine diſtances from the ſtalk proceed ſomwhat long leaues like *Gnaphalium*, which haue light necks about the edges, that ſtand one againſt another, incloſing the ſtalke: in the top of the ſtalkes ſtand ſpokie tufts of floures, white of colour like *Serpillum*. This plant is ſtronger of ſent or ſauor than any of the reſt following, which ſent is ſomwhat ſharp, and affecting the noſe with his ſweetneſſe.

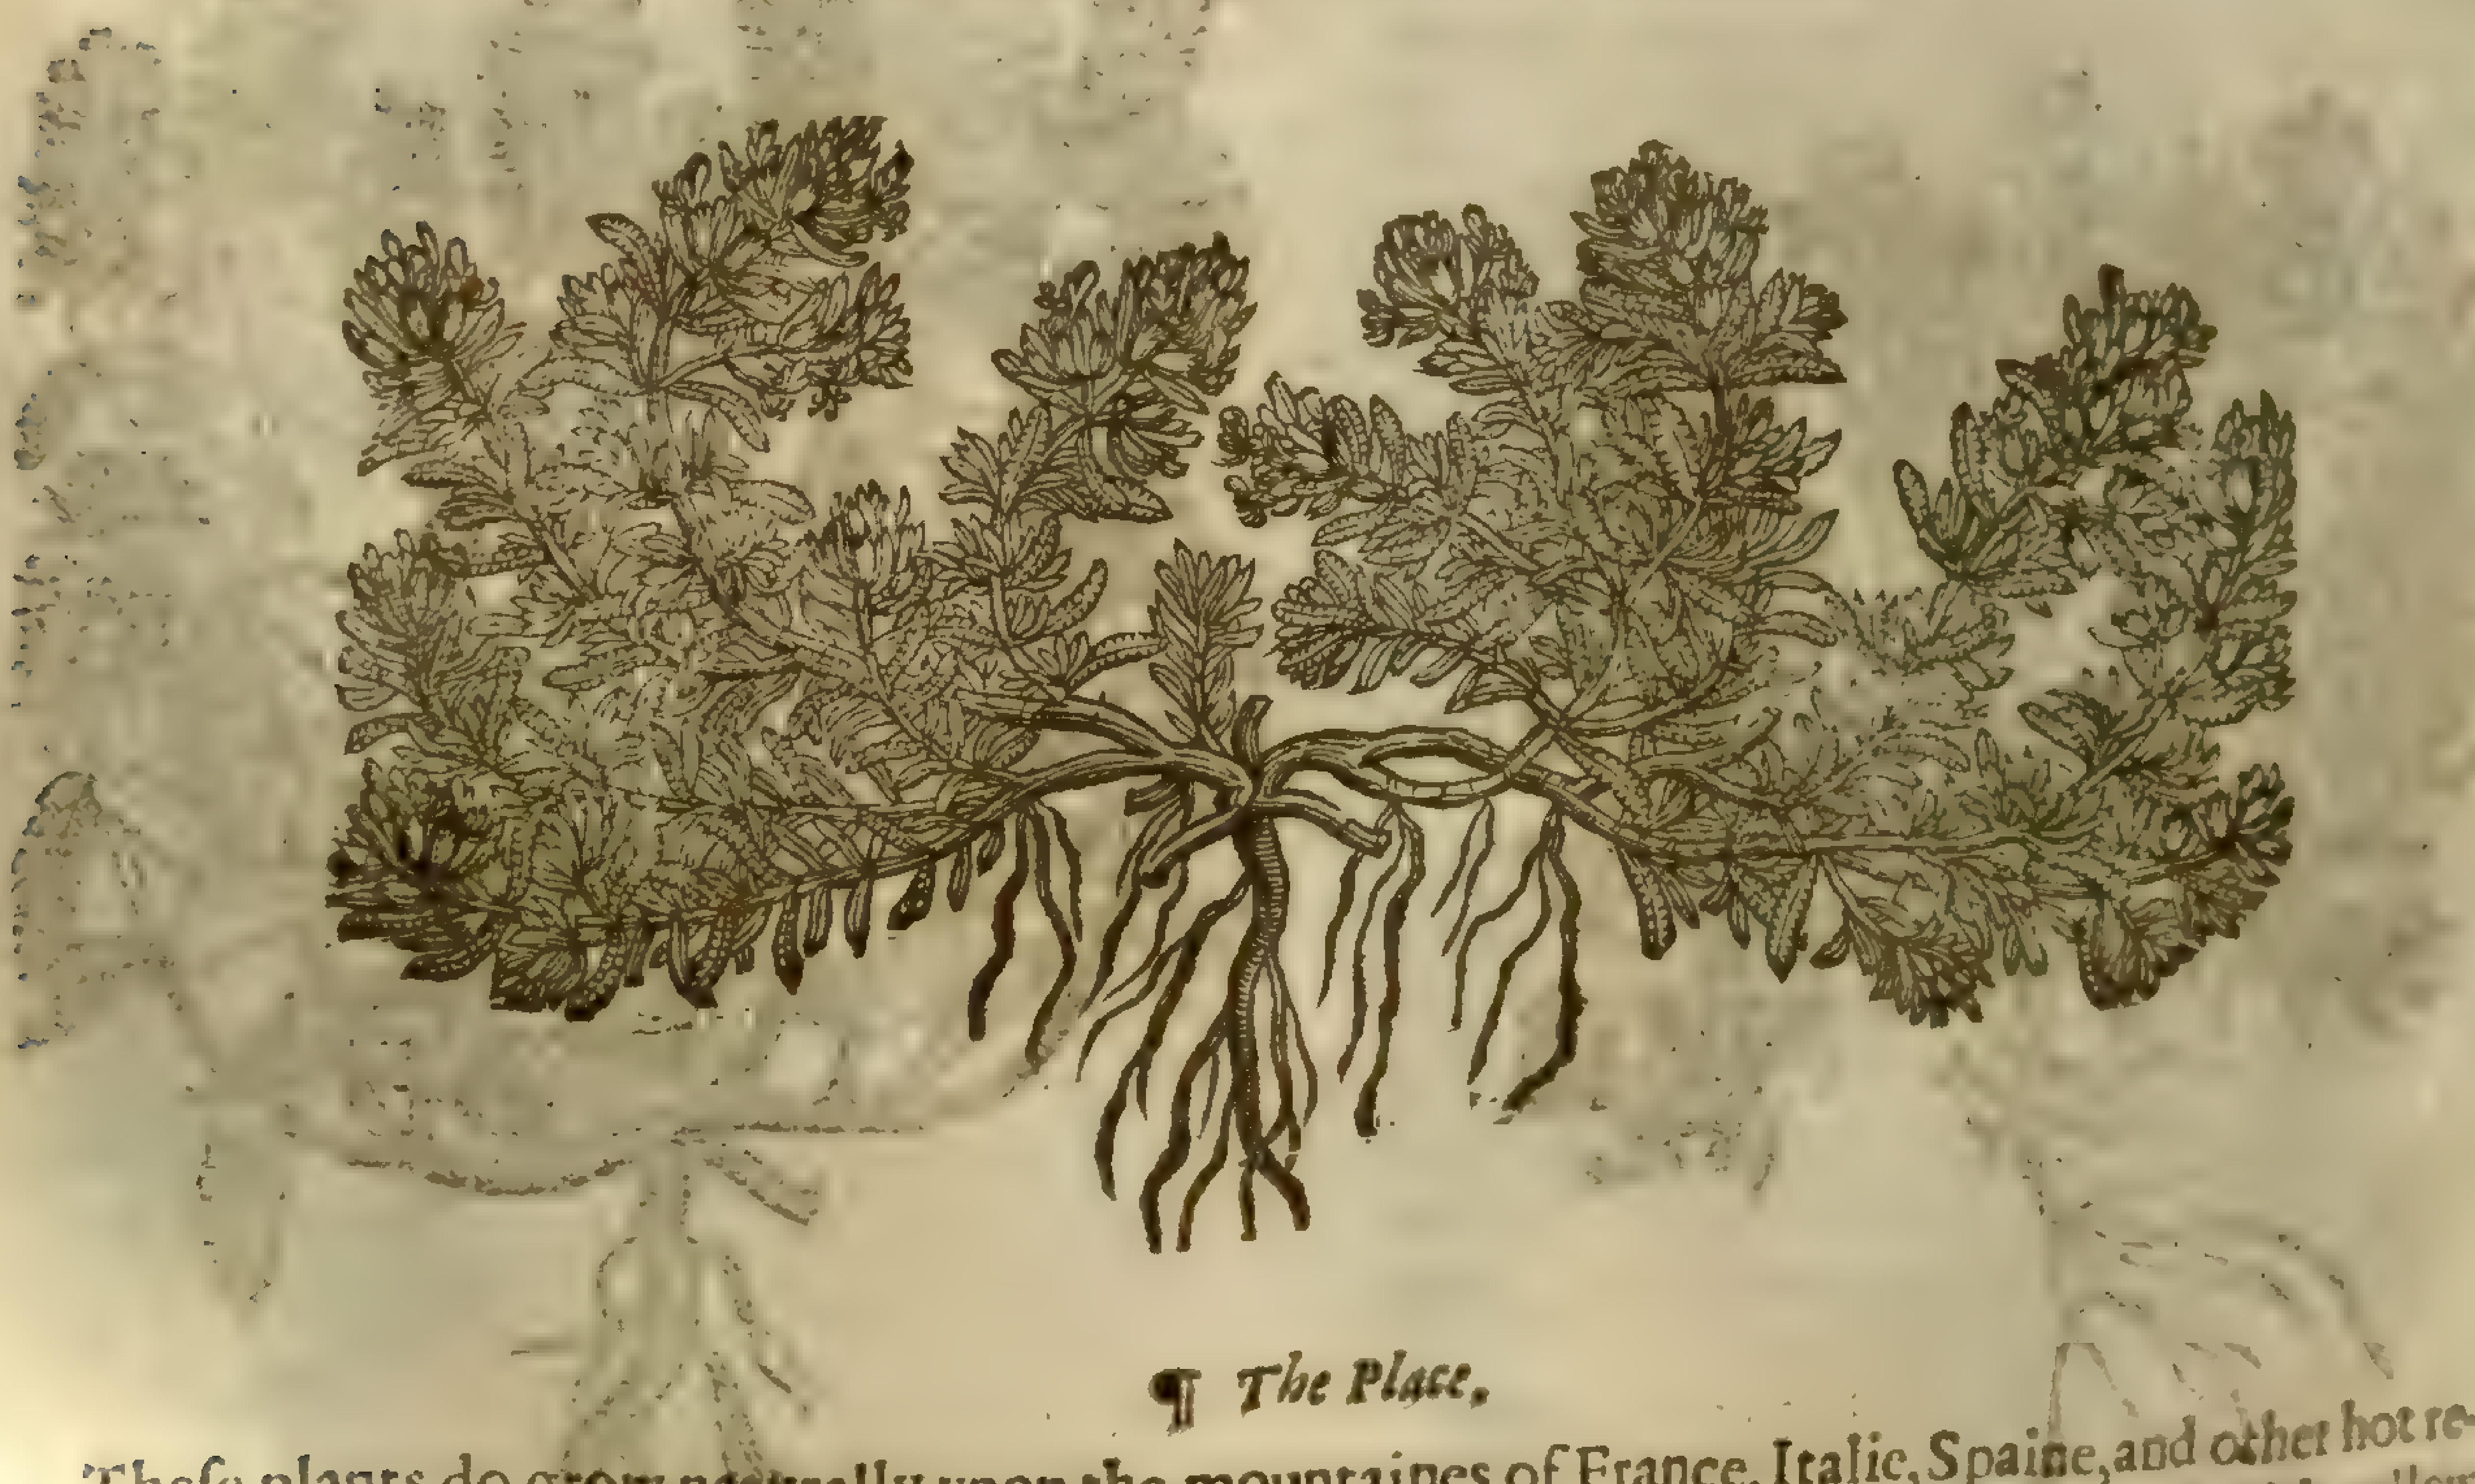
2 The tufts of the ſecond kind of *Polium* are longer than the tufts or floures of the laſt before mentioned, and they are of a yellow color; the leaues alſo are broader, otherwiſe they are very like.

3 From the wooddie roots of this third kind of *Polium*, proceed a great number of ſhoots like vnto the laſt rehearſed, lying flat vpright vpon the ground, whoſe ſlender branches take hold on the vpper part of the earth where they creep. The floures are like the other, but of a purple colour.

4 The laſt kinde of *Polium*, and of all the reſt the ſmalleſt, is of an indifferent good ſmell, in all points like vnto the common *Polium*, but that it is foure times leſſer, hauing the leaues not ſnipt, and the floures white.

‡ 5 This ſends vp many branches from one root like to thoſe of the firſt deſcribed, but ſhorter and more ſhrubbie, lying partly vpon the ground, the leaues grow by couples at certain ſpaces, ſomwhat like, but leſſer than thoſe of Roſemarie or Lauander, greene aboue, and whitiſh beneath, not ſnipt about their edges; their taſt is bitter, and ſmell ſomewhat pleaſant: the floures grow plentifully vpon the tops of the branches, white of colour, and in ſhape like thoſe of the other Poleyes: they grow on a bunch together, and not Spike faſhion: the ſeed is blackiſh and contained in ſmall veſſels: the root is hard and wooddie with many fibres. *Cluſius* calls this *Polium* 7. *albo flore*. It is the *Polium alterum* of *Matthiolus*, and *Polium recentiorum fœmina Lavandulæ folio* of *Lobel*. I here giue you as (*Cluſius* alſo hath don) two figures to make one good one: the former ſhews the floures and their manner of growing; the other, the ſeed veſſels, and the leaues growing by couples together, with a little better expreſſion of the root. ‡

3 *Polium montanum purpureum*. Purple Poley.



¶ *The Place.*

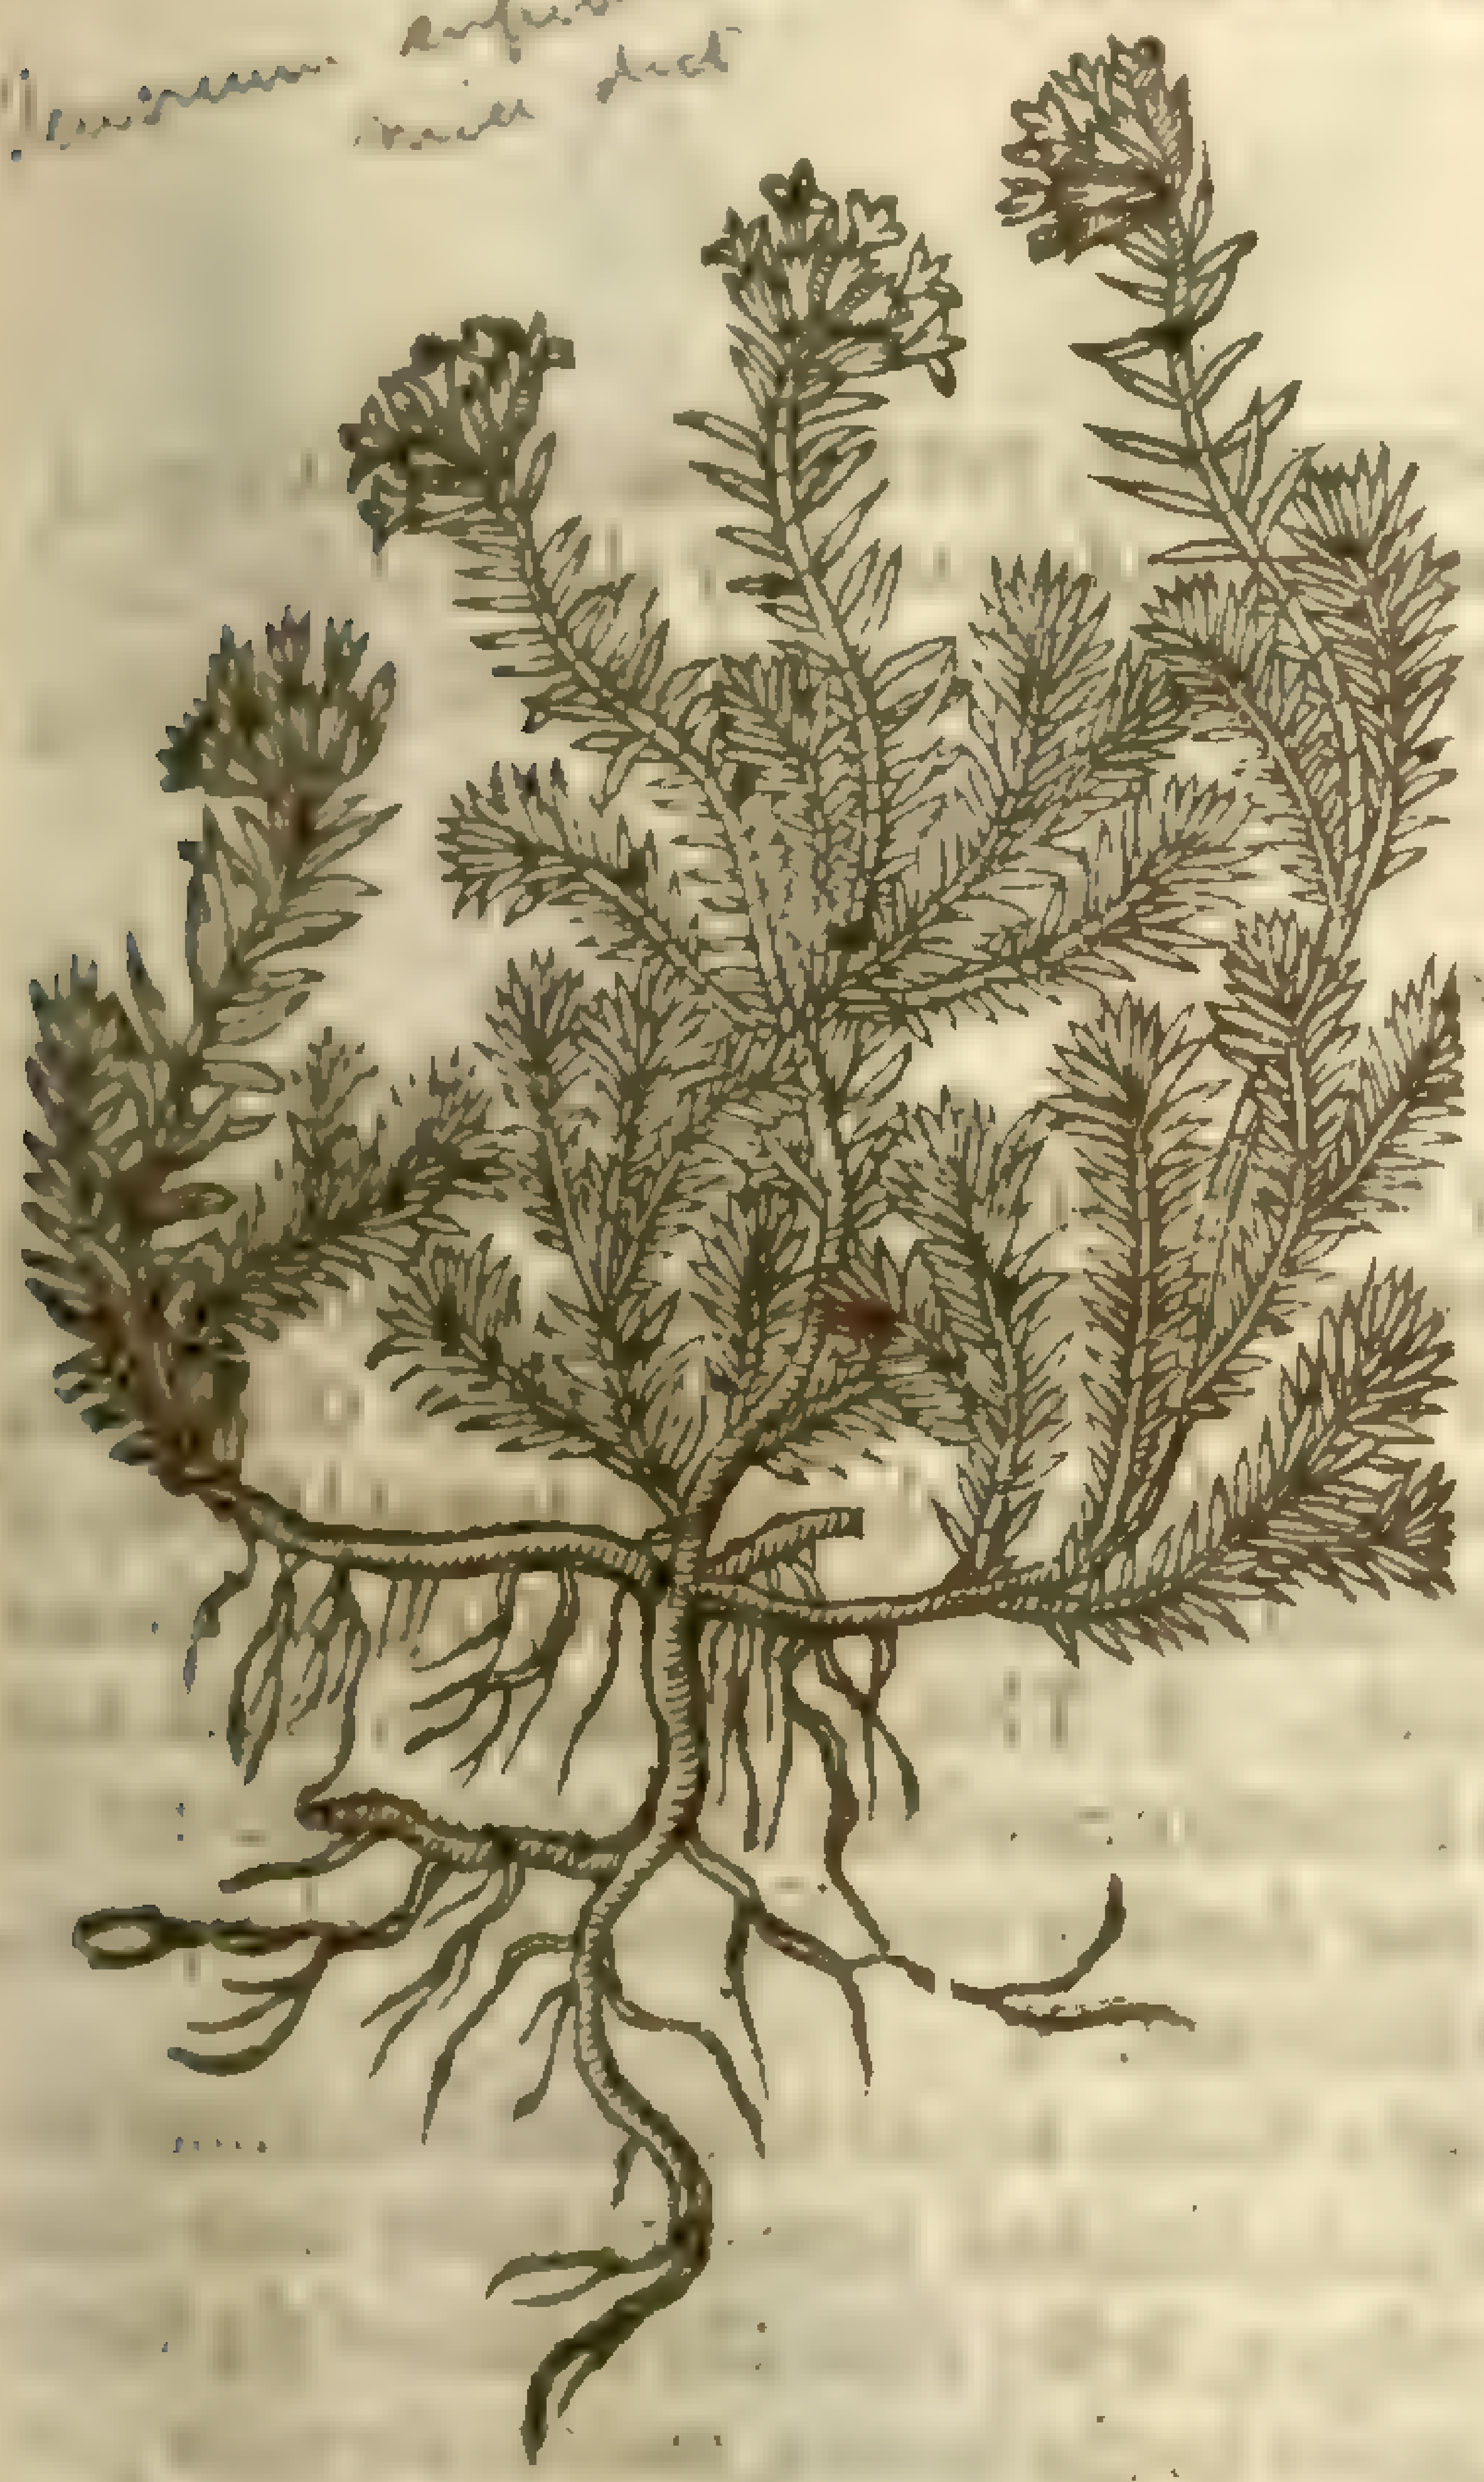
Theſe plants do grow naturally vpon the mountaines of France, Italie, Spaine, and other hot regions. They are ſtrangers in England, notwithſtanding I haue plants of that Poley with yellow floures by the gift of *Lobel*.

¶ *The Time.*

They floure from the end of May, to the beginning of Auguſt.

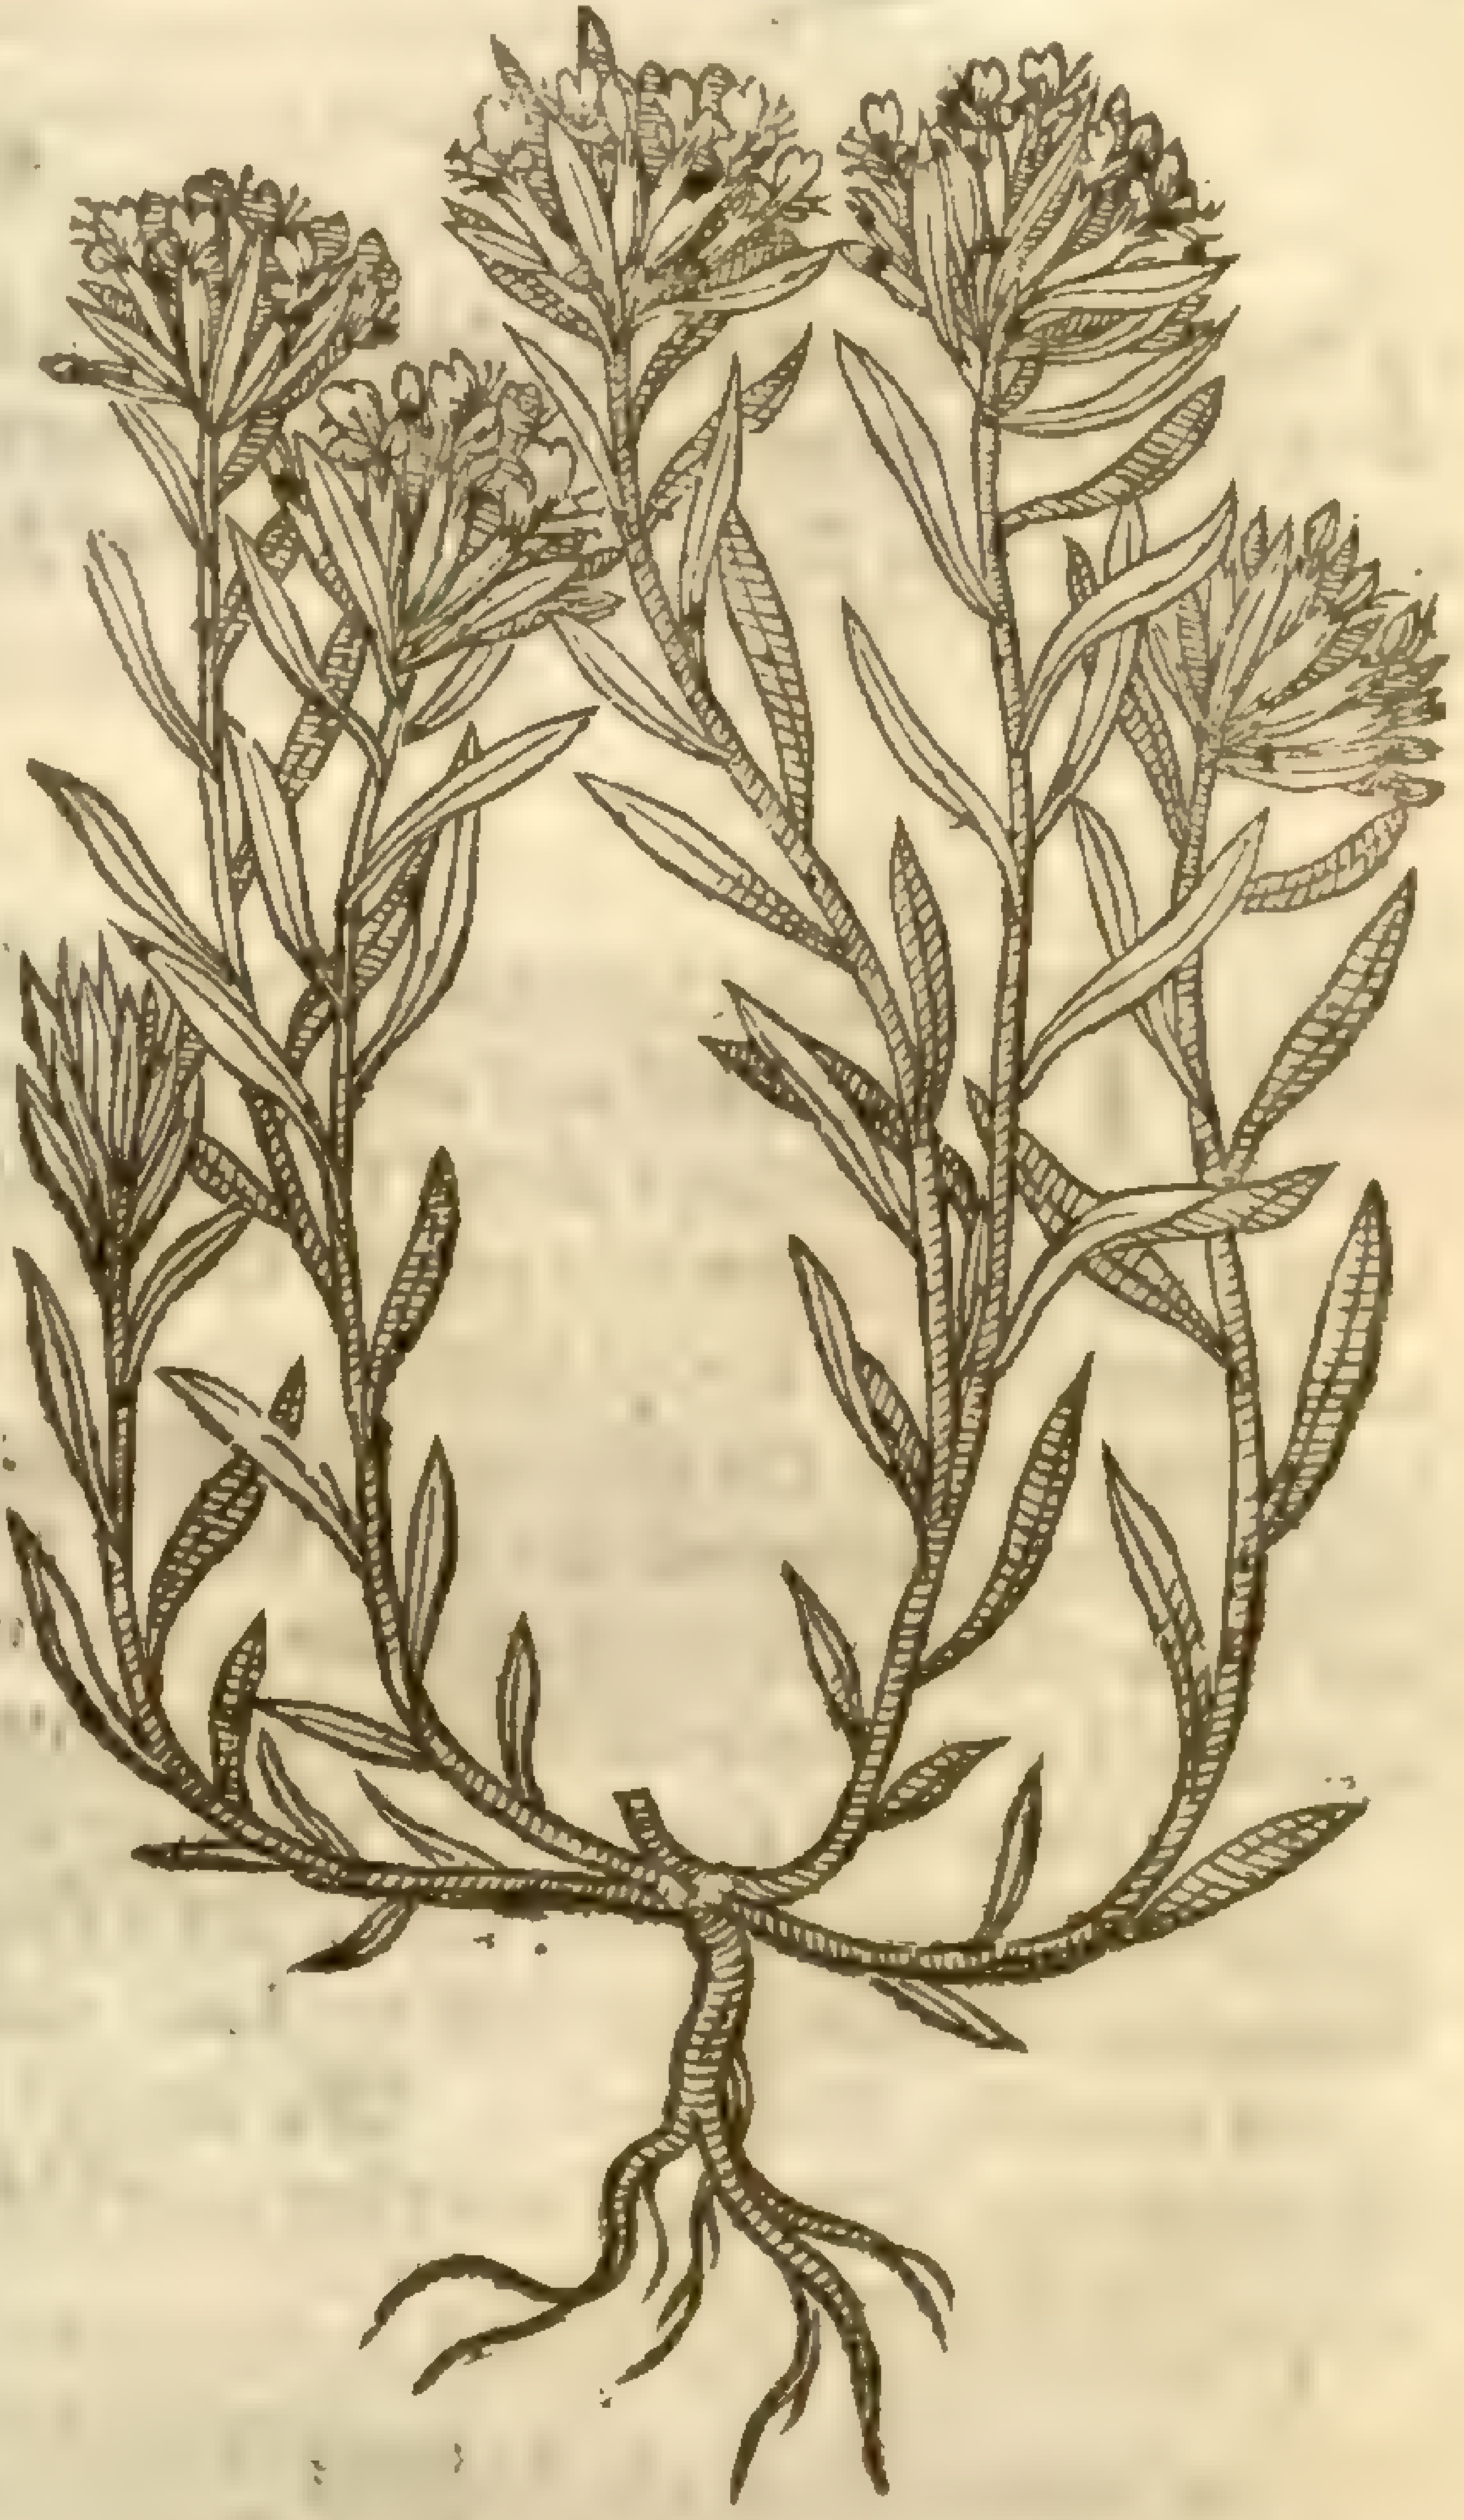
4 *Polium montanum minimum.*
Creeping Poley.

Teucrium supinum [illegible]

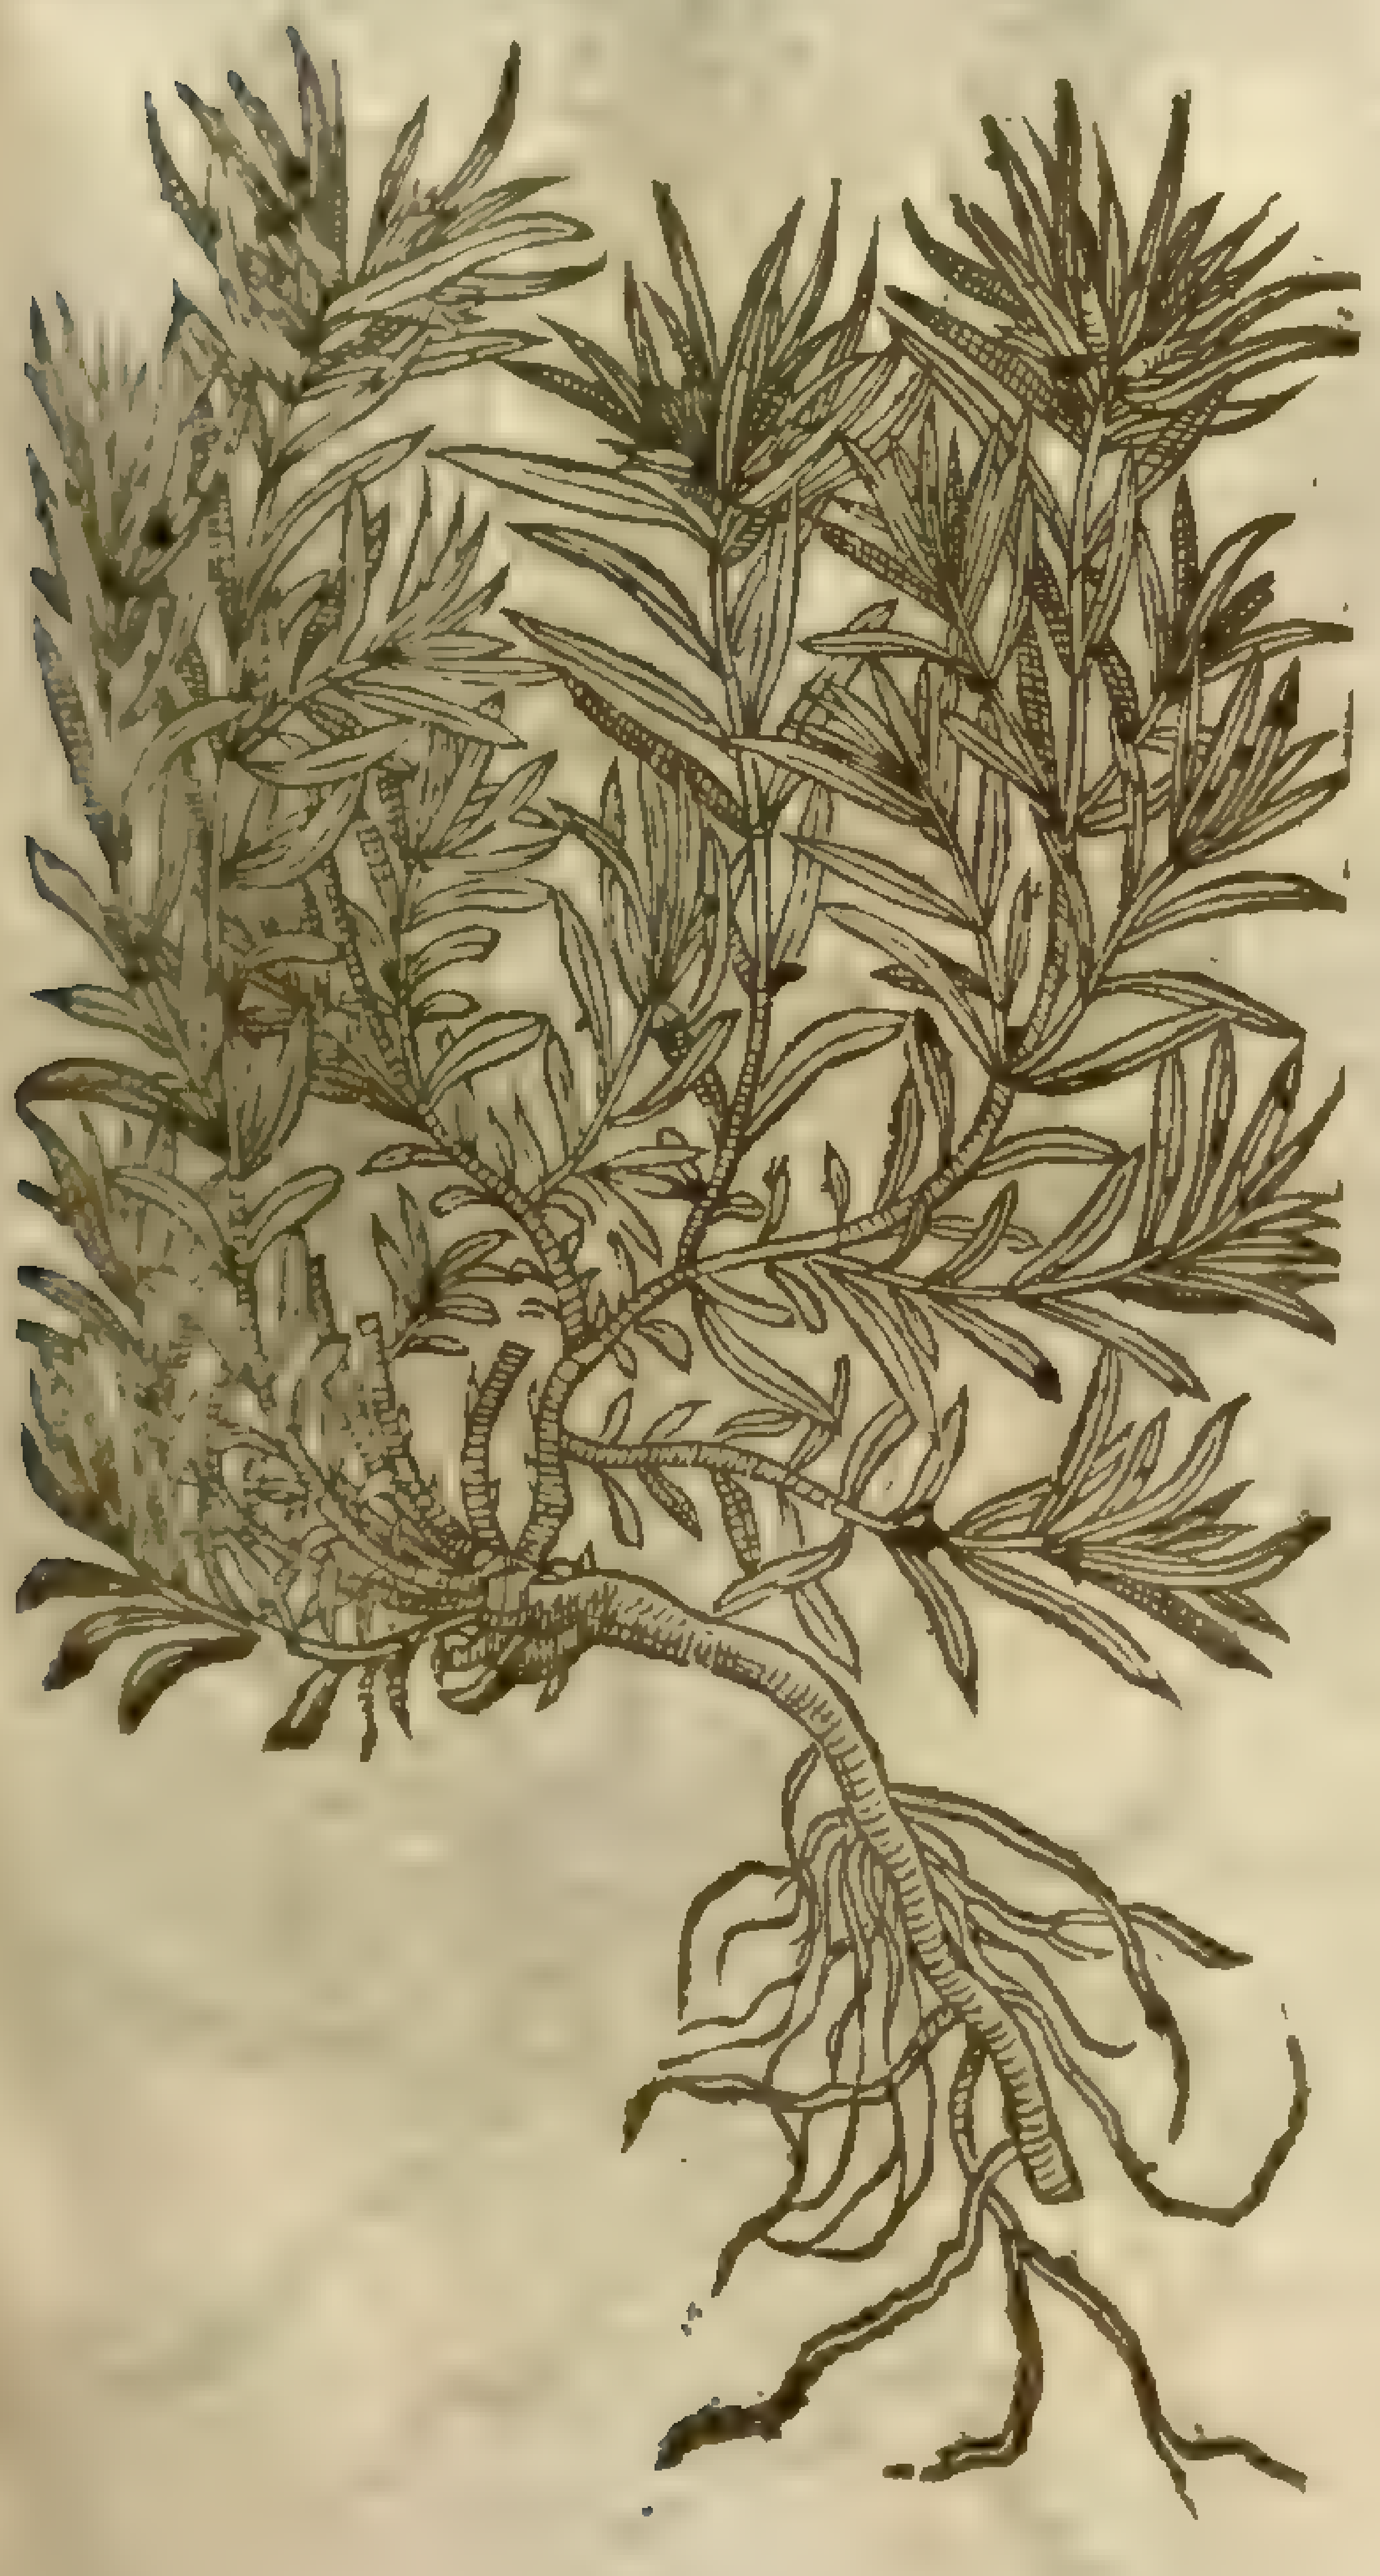


‡ 5 *Polium Lauandulæ folio, flore albo.*
Lauander leaued Poley.

Teucrium montanum [illegible]



Another figure of the Lauander leaued Poley.



¶ *The Names.*

Poley mountaine is called in Greeke, πόλιον, of his hoarineſſe; and in Latine alſo *Polium*. Diuers ſuſpect that *Polium* is *Leucas*; and that *Dioſcorides* hath twice treated of that herbe, vnder diuers names: the kinds, the occaſion of the names, and likewiſe the faculties do agree. There be two of the *Leucades*; one ὀρεινὴ, that is, of the mountaine; the other, ἥμερος, which is that of the garden. It is called *Leucas* of the whitiſh colour, and *Polion*, of the hoarineſſe, becauſe it ſeemeth like to a mans hoary head; for whatſoeuer waxeth hoary is ſaid to be white.

¶ *The Temperature.*

Poley is of temperature dry in the third degree, and hot in the end of the ſecond.

¶ *The Vertues.*

Dioſcorides ſaith it is a remedie for thoſe that haue the dropſie, the yellow jaundice, and that are troubled with the ſpleen. A

It prouoketh vrine, and is put into Mithridate, Treacle, and counterpoiſons. B

It profiteth much againſt the bitings of venomous beaſts, driuing them away from the place where it is ſtrewed or burnt. C

The ſame drunke with vineger is good for the diſeaſes of the milt and ſpleen; it troubleth the ſtomacke, afflicteth the head, and prouokes looſneſſe of the belly. D

CHAP. 212. *Of Germander.*

¶ *The Kindes.*

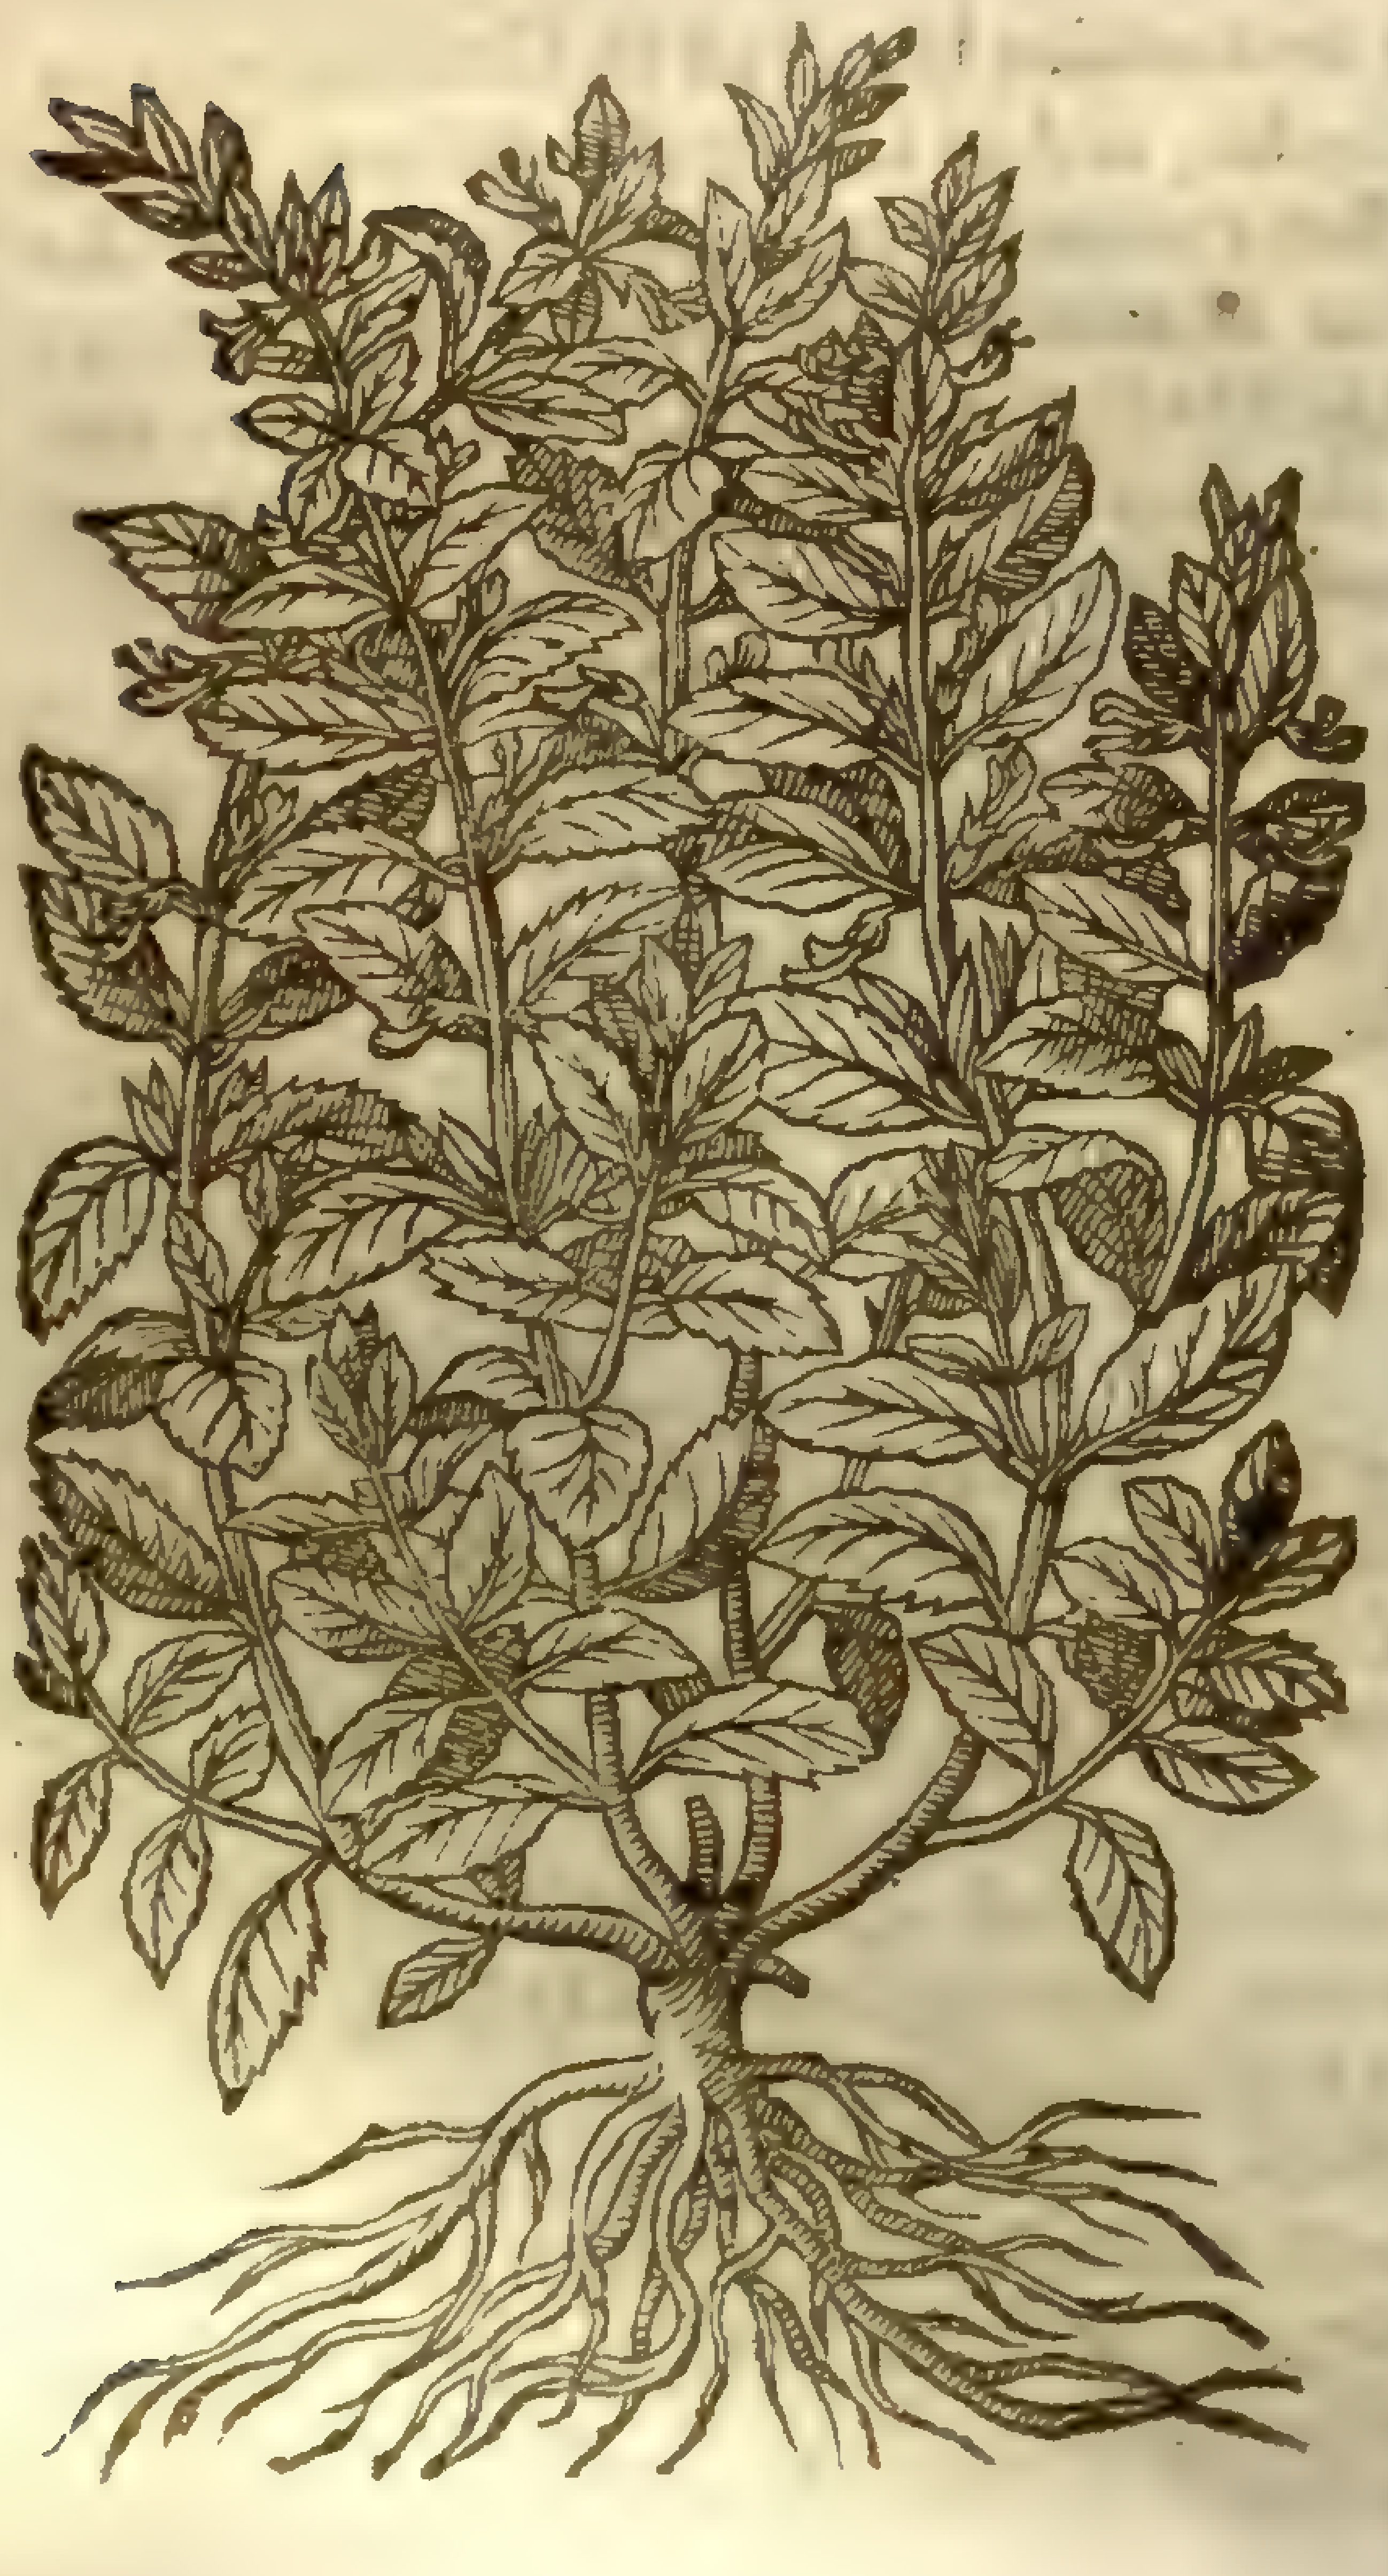
THe old writers haue ſet downe no certain kindes of Germander; yet we haue thought it good, and not without cauſe, to treat of more ſorts than haue been obſerued by all, diuiding thoſe vnder the title of *Teucrium*, from *Chamædrys*, although they are both of one kinde, but yet differing very notably.

¶ *The Deſcription.*

1 THe firſt Germander groweth low, with very many branches lying vpon the ground, tough, hard, and wooddy, ſpreading it ſelfe here and there; whereupon are placed ſmall leaues ſnipt about the edges like the teeth of a Saw, reſembling the ſhape of an Oken leafe. The floures are of a purple colour, very ſmall, ſtanding cloſe to the leaues toward the top of the branches: the ſeed is little and black: the root ſlender and full of ſtrings, creeping, and alwaies ſpreading within the ground, whereby it greatly encreaſeth. ‡ This is ſometimes found with bigger leaues, otherwhiles with leſſe; alſo the floure is ſometimes white and otherwhiles red in the ſame plant, whence *Tabernæm.* gaue two figures, and our Author two figures and deſcriptions, whereof I haue omitted the later, and put the two titles into one. ‡

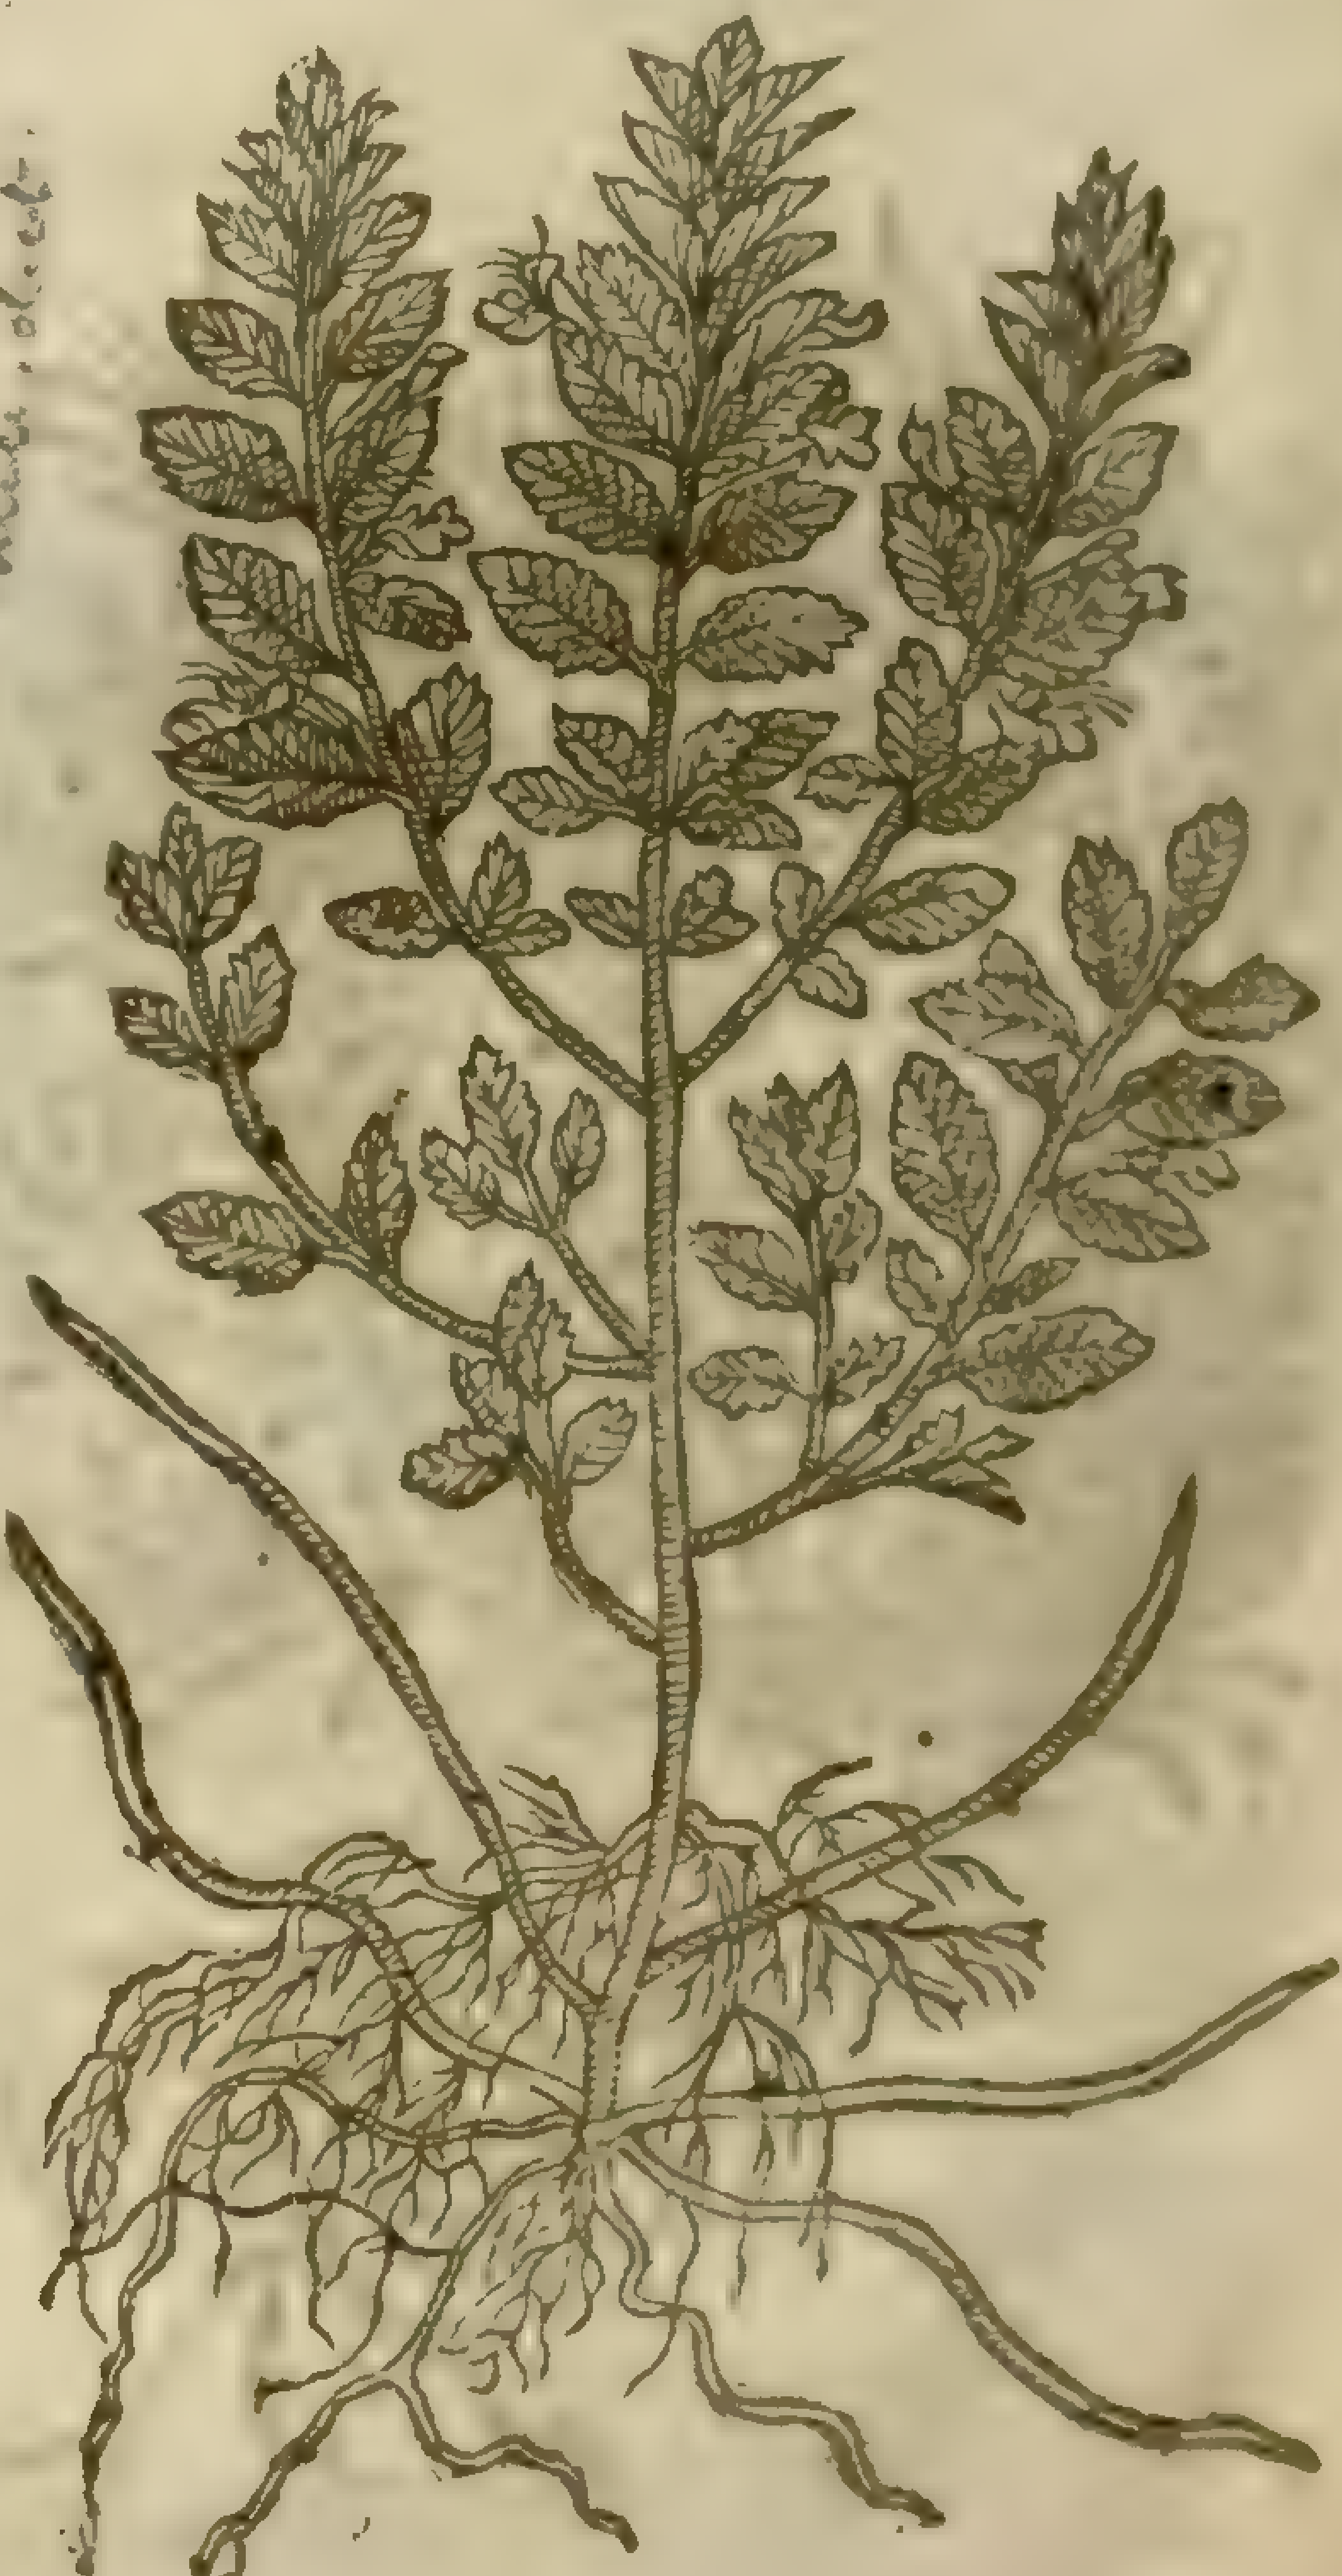
2 The ſecond Germander riſeth vp with a little ſtraight ſtalke a ſpan long and ſometimes longer, wooddy and hard like vnto a little ſhrub: it is afterwards diuided into very many little ſmall branches. The leaues are indented and nicked about the edges, leſſer than the leaues of the former great creeping Germander. The floures likewiſe ſtand neere to the leaues, and on the vpper parts of the ſprigs, of colour ſometimes purple, and oftentimes tending to blewneſſe: the root is diuerſly diſperſed with many ſtrings.

1 *Chamædrys maior latifolia.*
Great broad leaued Germander.



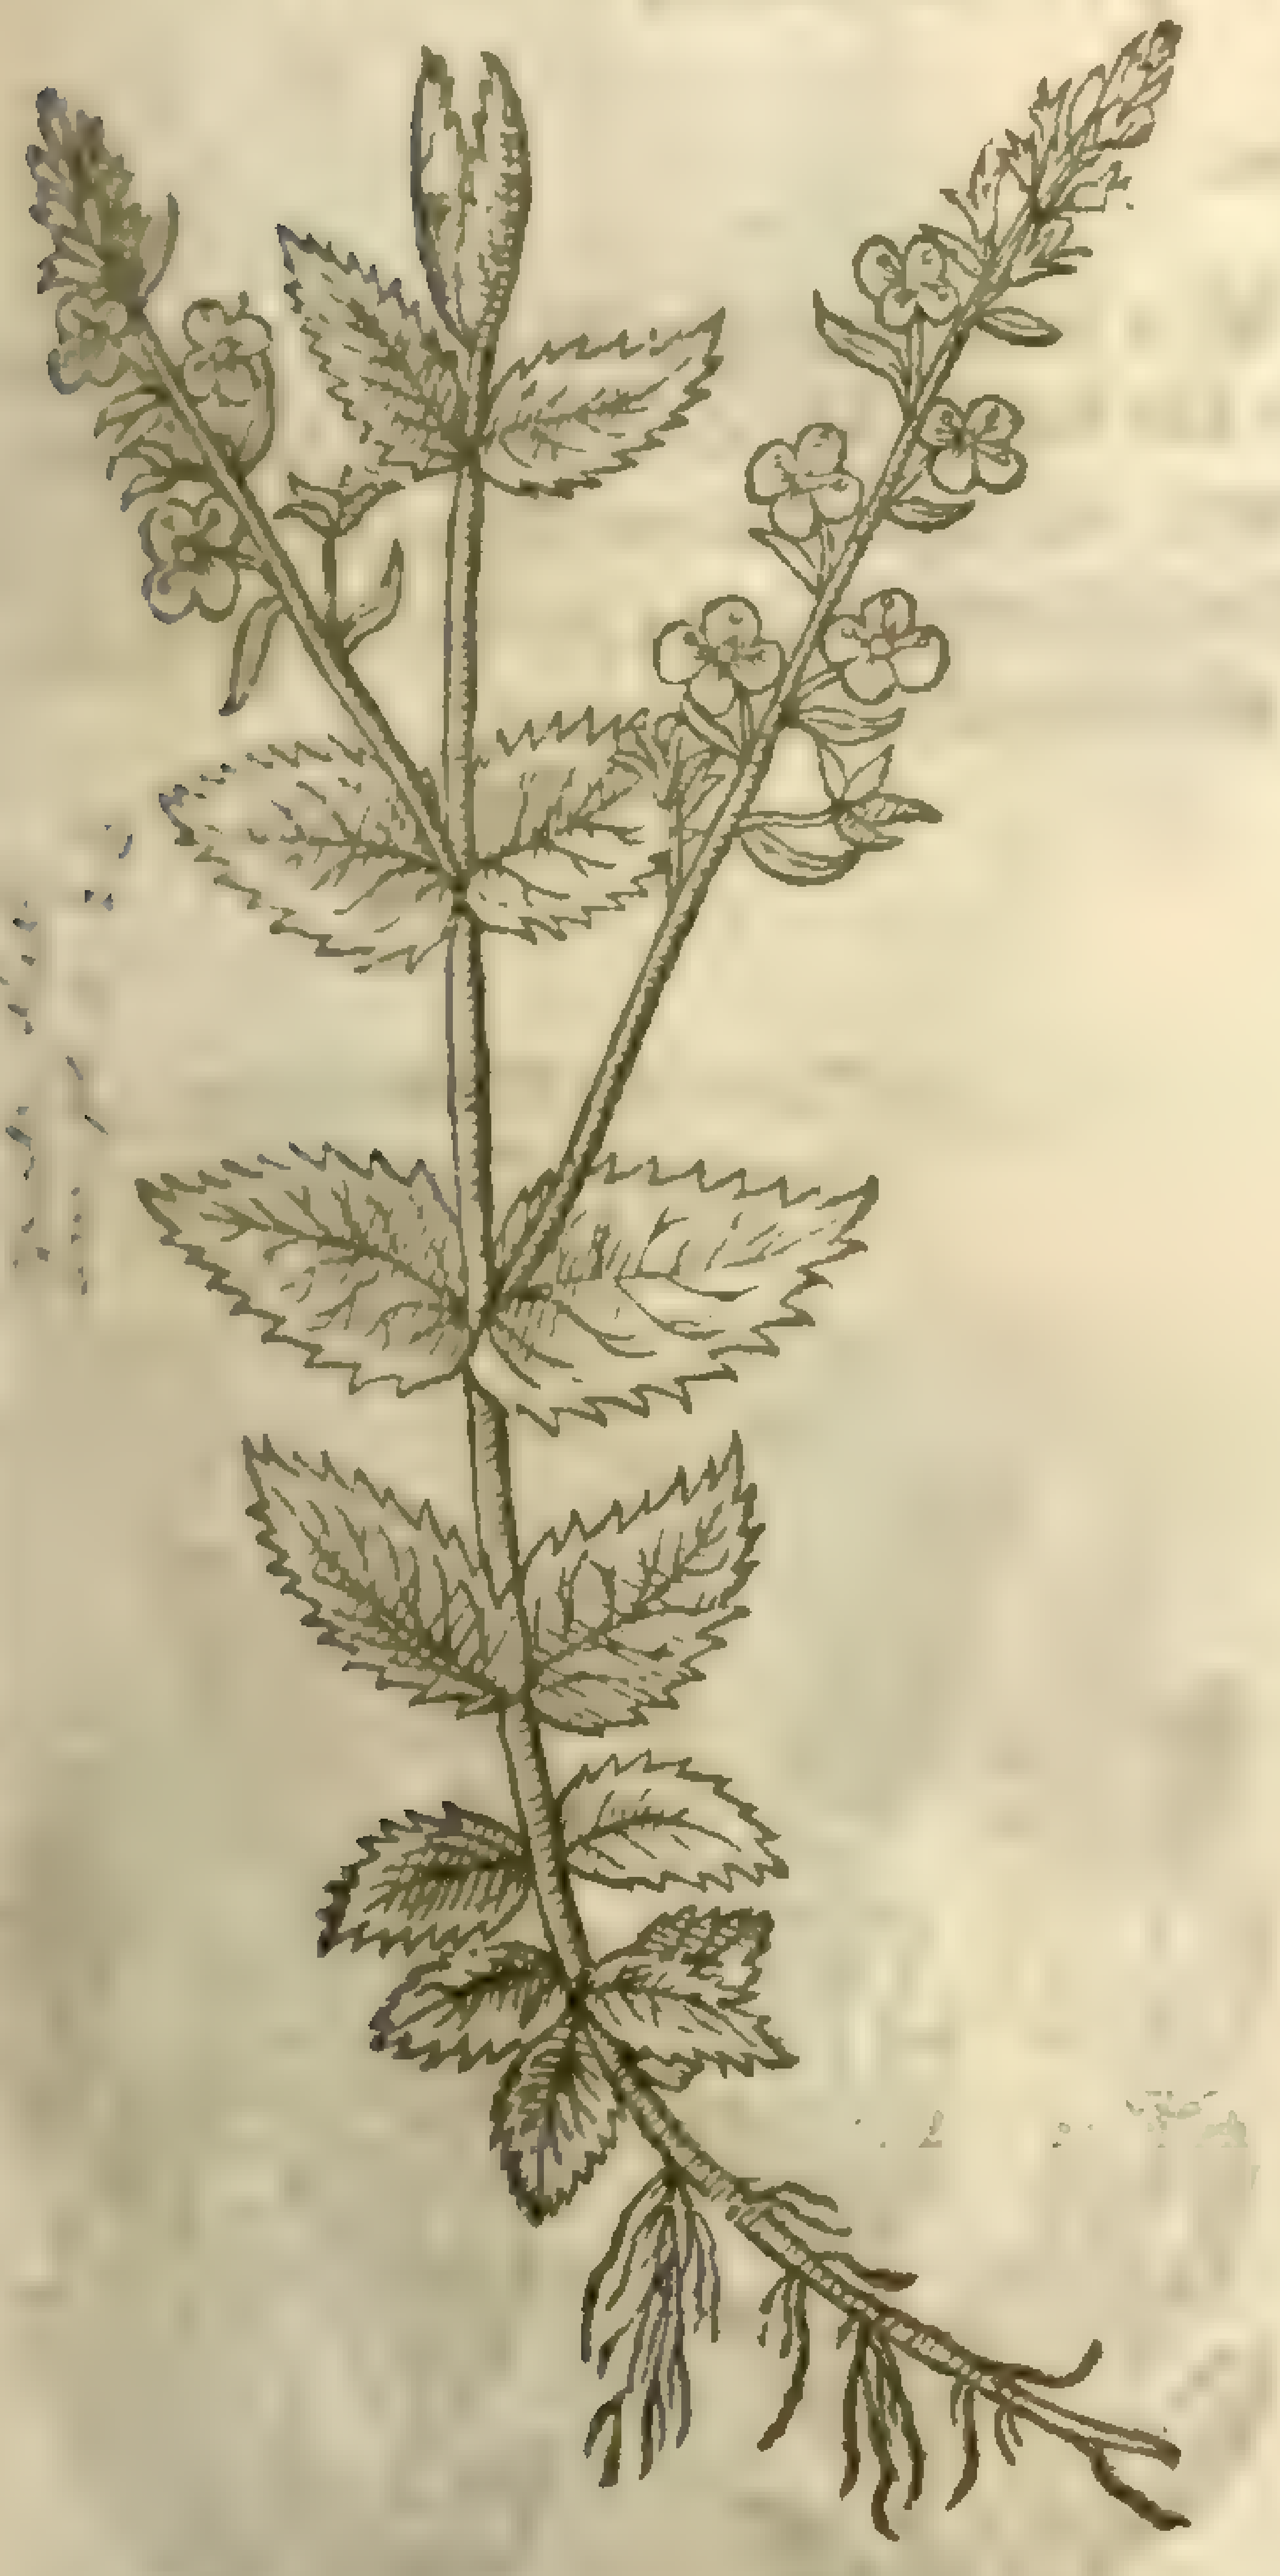
Teucrium chamædrys, b. nec. dict. Sm. pl. 3.69

2 *Chamædrys minor.*
Small Germander.



Teucrium chamædrys, b. β vari. dict.

3 *Chamædrys ſylueſtris.*
Wilde Germander.



3 Wilde Germander hath little ſtalks weake and feeble, edged or cornered, ſomwhat hairie, and ſet as it were with joints; about the which by certaine diſtances there come forth at each joint two leaues ſomthing broad, nicked in the edges, & ſomwhat greater than the leaues of creeping Germander, and ſofter. The floures be of a gallant blew colour, made of foure ſmall leaues apiece, ſtanding orderly on the tops of the tender ſpriggy ſpraies; after which come in place little husks or ſeedveſſels. The root is ſmall and threddy.

¶ *The Place.*

Theſe plants grow in rocky and rough grounds, and in gardens they do eaſily proſper.

The wilde Germander groweth in many places about London in medowes and fertill fields, and in euerie place whereſoeuer I haue trauelled in England.

¶ *The Time.*

They floure and flouriſh from the end of May to the later end of Auguſt.

¶ *The Names.*

Garden Germander is called in Greeke, χαμαίδρυς *Chamædrys*: of ſome, *Triſſago*, & *Trixago*, and likewiſe *Quercula minor*; notwithſtanding moſt of theſe names do more properly belong to *Scordium* or water Germander: in Italian, *Quercinola*: in Engliſh, Germander, or Engliſh Treacle: in French, *Germandre.* Before creeping Germander was knowne, this wilde kinde bare the name of Germander amongſt the Apothecaries, and was vſed for the right Germander in the compoſitions of medicines: but after the former were brought to light, this began to be named *Sylueſtris*, and *Spuria Camædrys*; that is, wilde and baſtard Germander: of ſome, *Teucrium pratenſe*; and without error, becauſe al the ſorts of plants comprehended vnder the title of *Teucrium*, are doubtleſſe kindes of Germander: of ſome it hath bin thought to be the plant that *Dioſcorides* called ἱεροβοτάνη, *Hierabotane*; that is to ſay, the holy herb, if ſo be that the holy herb and *Verbenaca* or Veruain (which is called in Greek περιστερεὼν) be ſundry herbs. *Dioſcorides* maketh them ſundry herbs, deſcribing them apart one after another: but other Authors, as *Paulus*, *Aëtius*, and *Oribaſius*, make no mention of *Herba ſacra*, the holy Herbe, but only of *Periſtereon*; and this is found to be likewiſe called *Hierabotane*, or the holy Herb; and therefore it is euident, that it is one and the ſelfe ſame plant, called by diuers names: the which things conſidered, if they ſay ſo, and ſay truly, this wilde Germander cannot be *Hierabotane* at all, as diuers haue written and ſaid it to be.

¶ *The Temperature.*

Garden Germander is of thin parts, and hath a cutting facultie, it is hot and dry almoſt in the third degree, euen as *Galen* writeth of *Teucrium* or wilde Germander.

The wilde Germander is likewiſe hot and dry, and is not altogether without force or power to open and clenſe: it may be counted among the number of them that do open the liuer and ſpleen.

¶ *The Vertues.*

A Germander boiled in water and drunke, deliuereth the body from all obſtructions or ſtoppings, diuideth and cutteth tough and clammy humors: being receiued as aforeſaid, it is good for them that haue the cough and ſhortneſſe of breath, the ſtrangurie or ſtopping of vrine, and helps thoſe which are entring into a dropſie.

B The leaues ſtamped with hony and ſtrained, and a drop at ſundry times put into the eies, taketh away the web or haw in the ſame, or any dimneſſe of ſight.

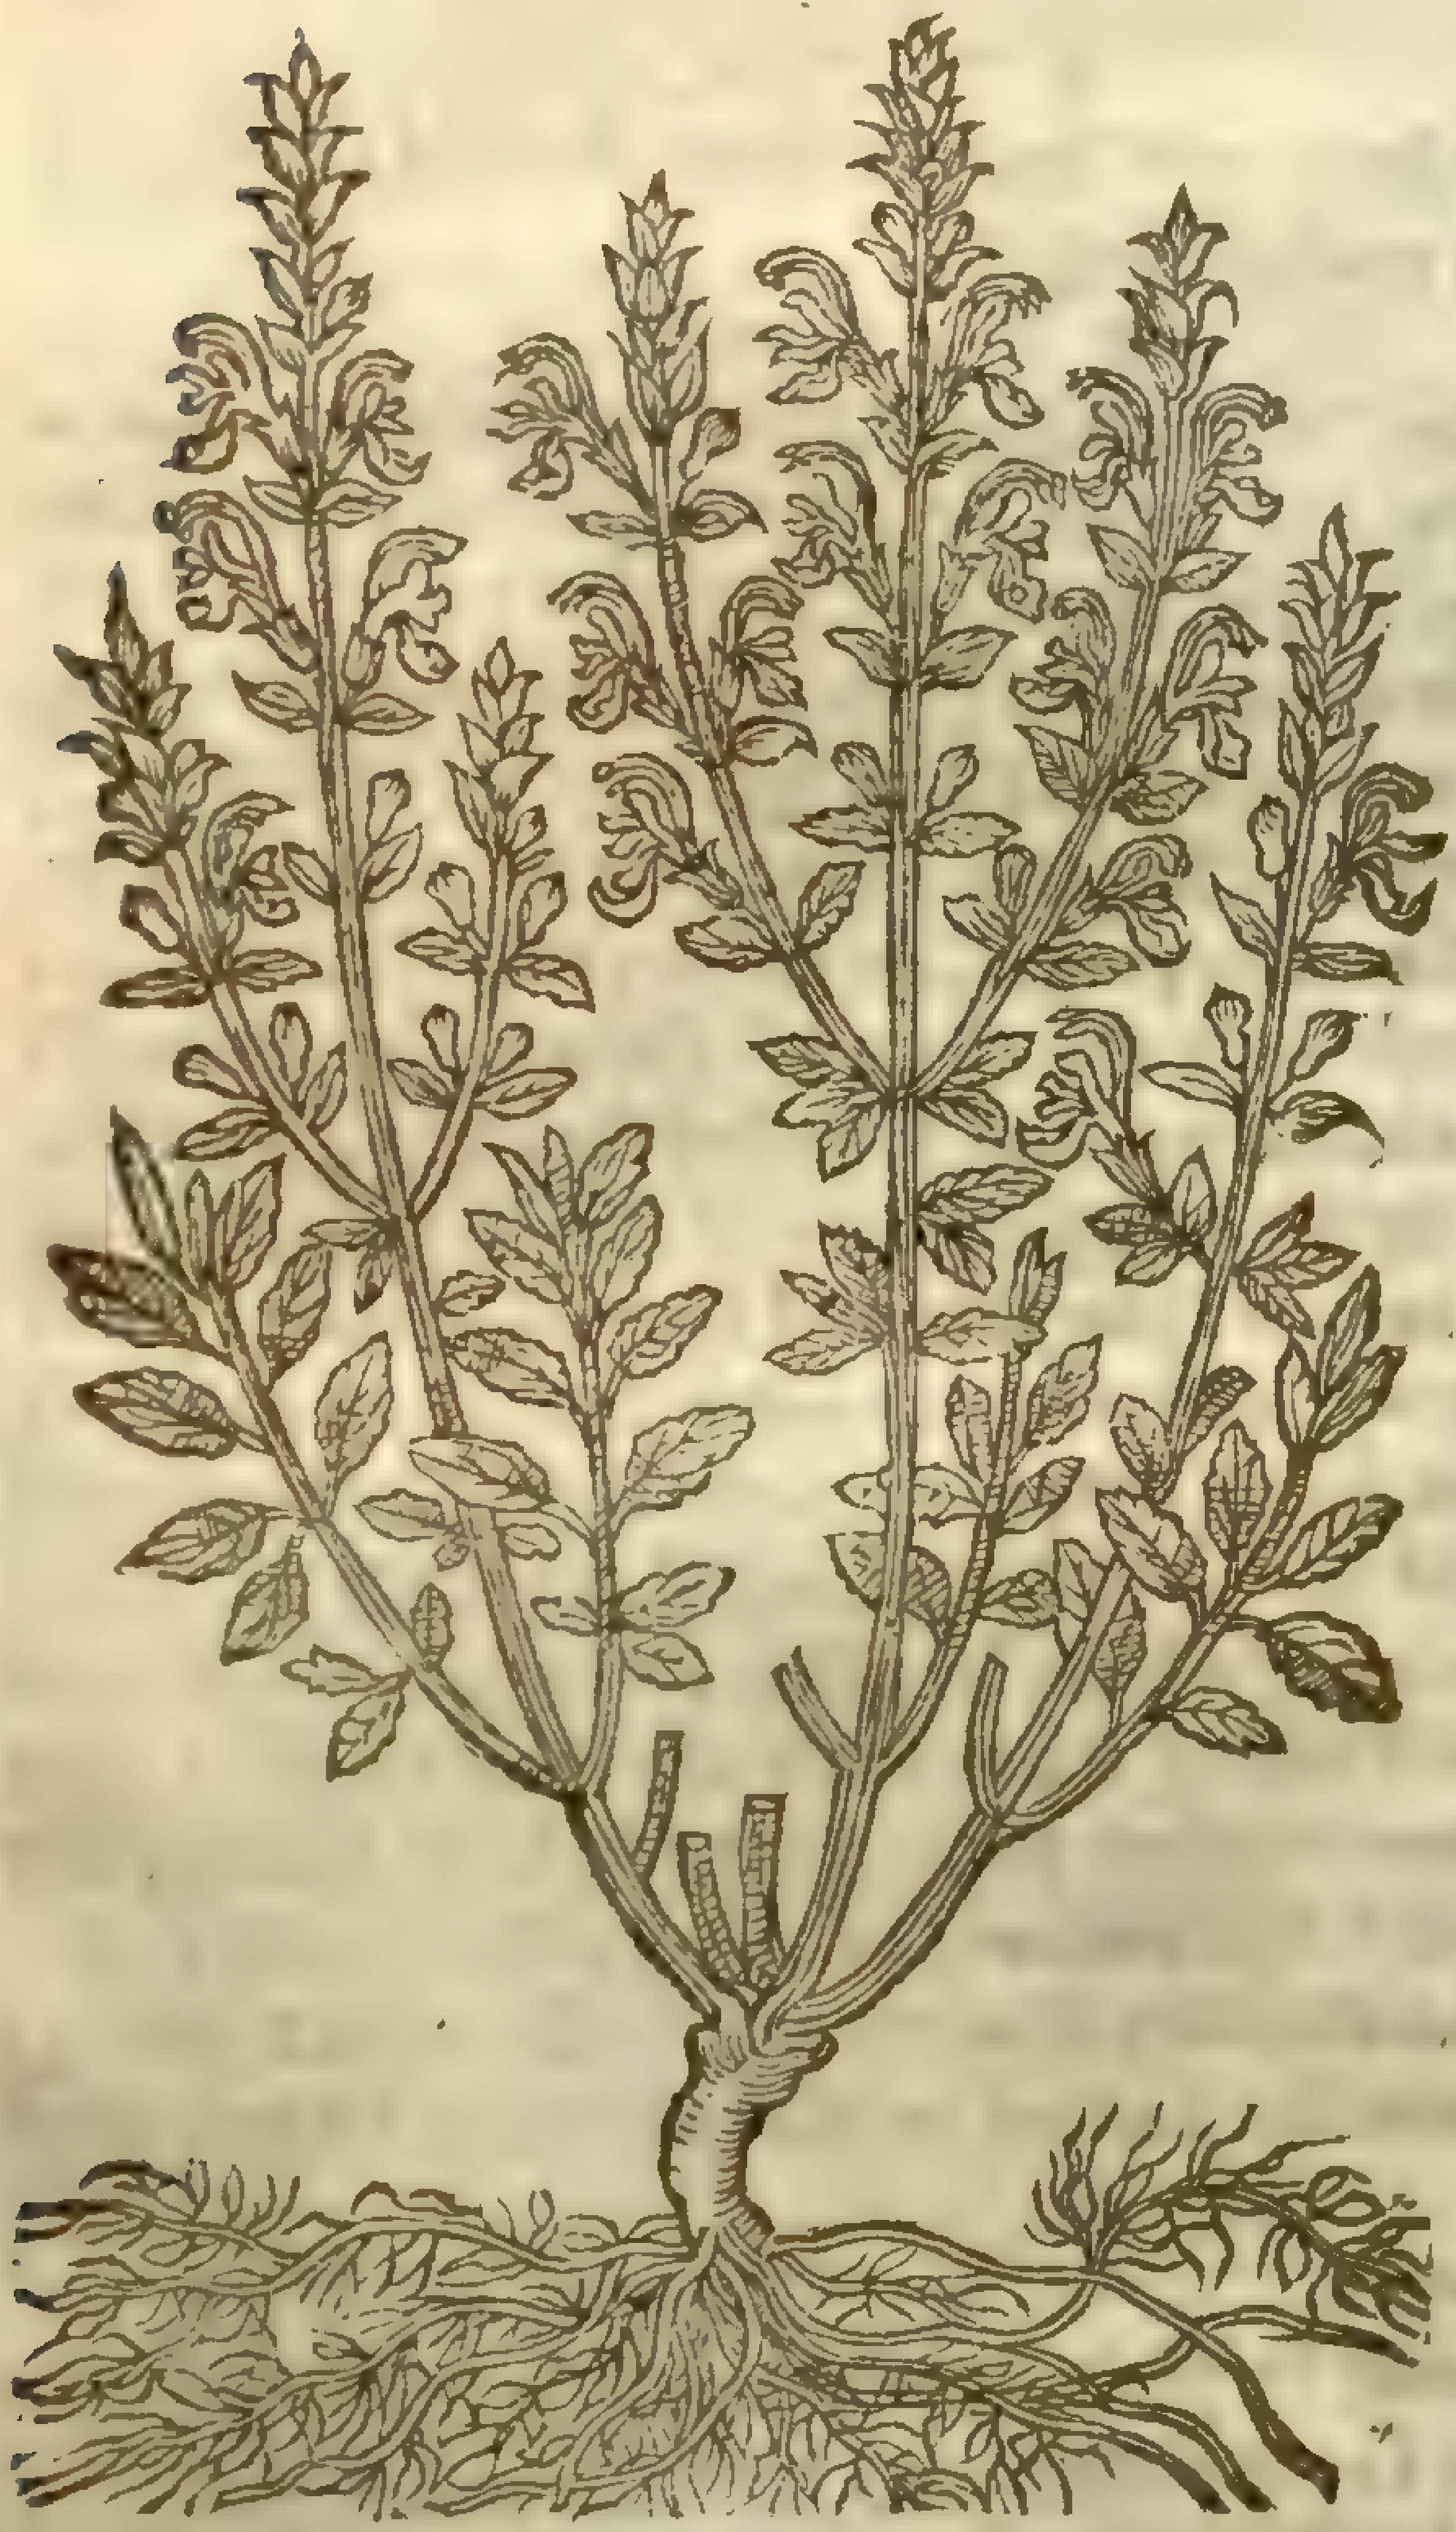
C It prouoketh the terms mightily, being drunke in wine, and the decoction drunke; with a fomentation or bath made alſo thereof, and the ſecret parts bathed therewith.

Chap. 213. *Of Tree Germander.*

¶ *The Deſcription.*

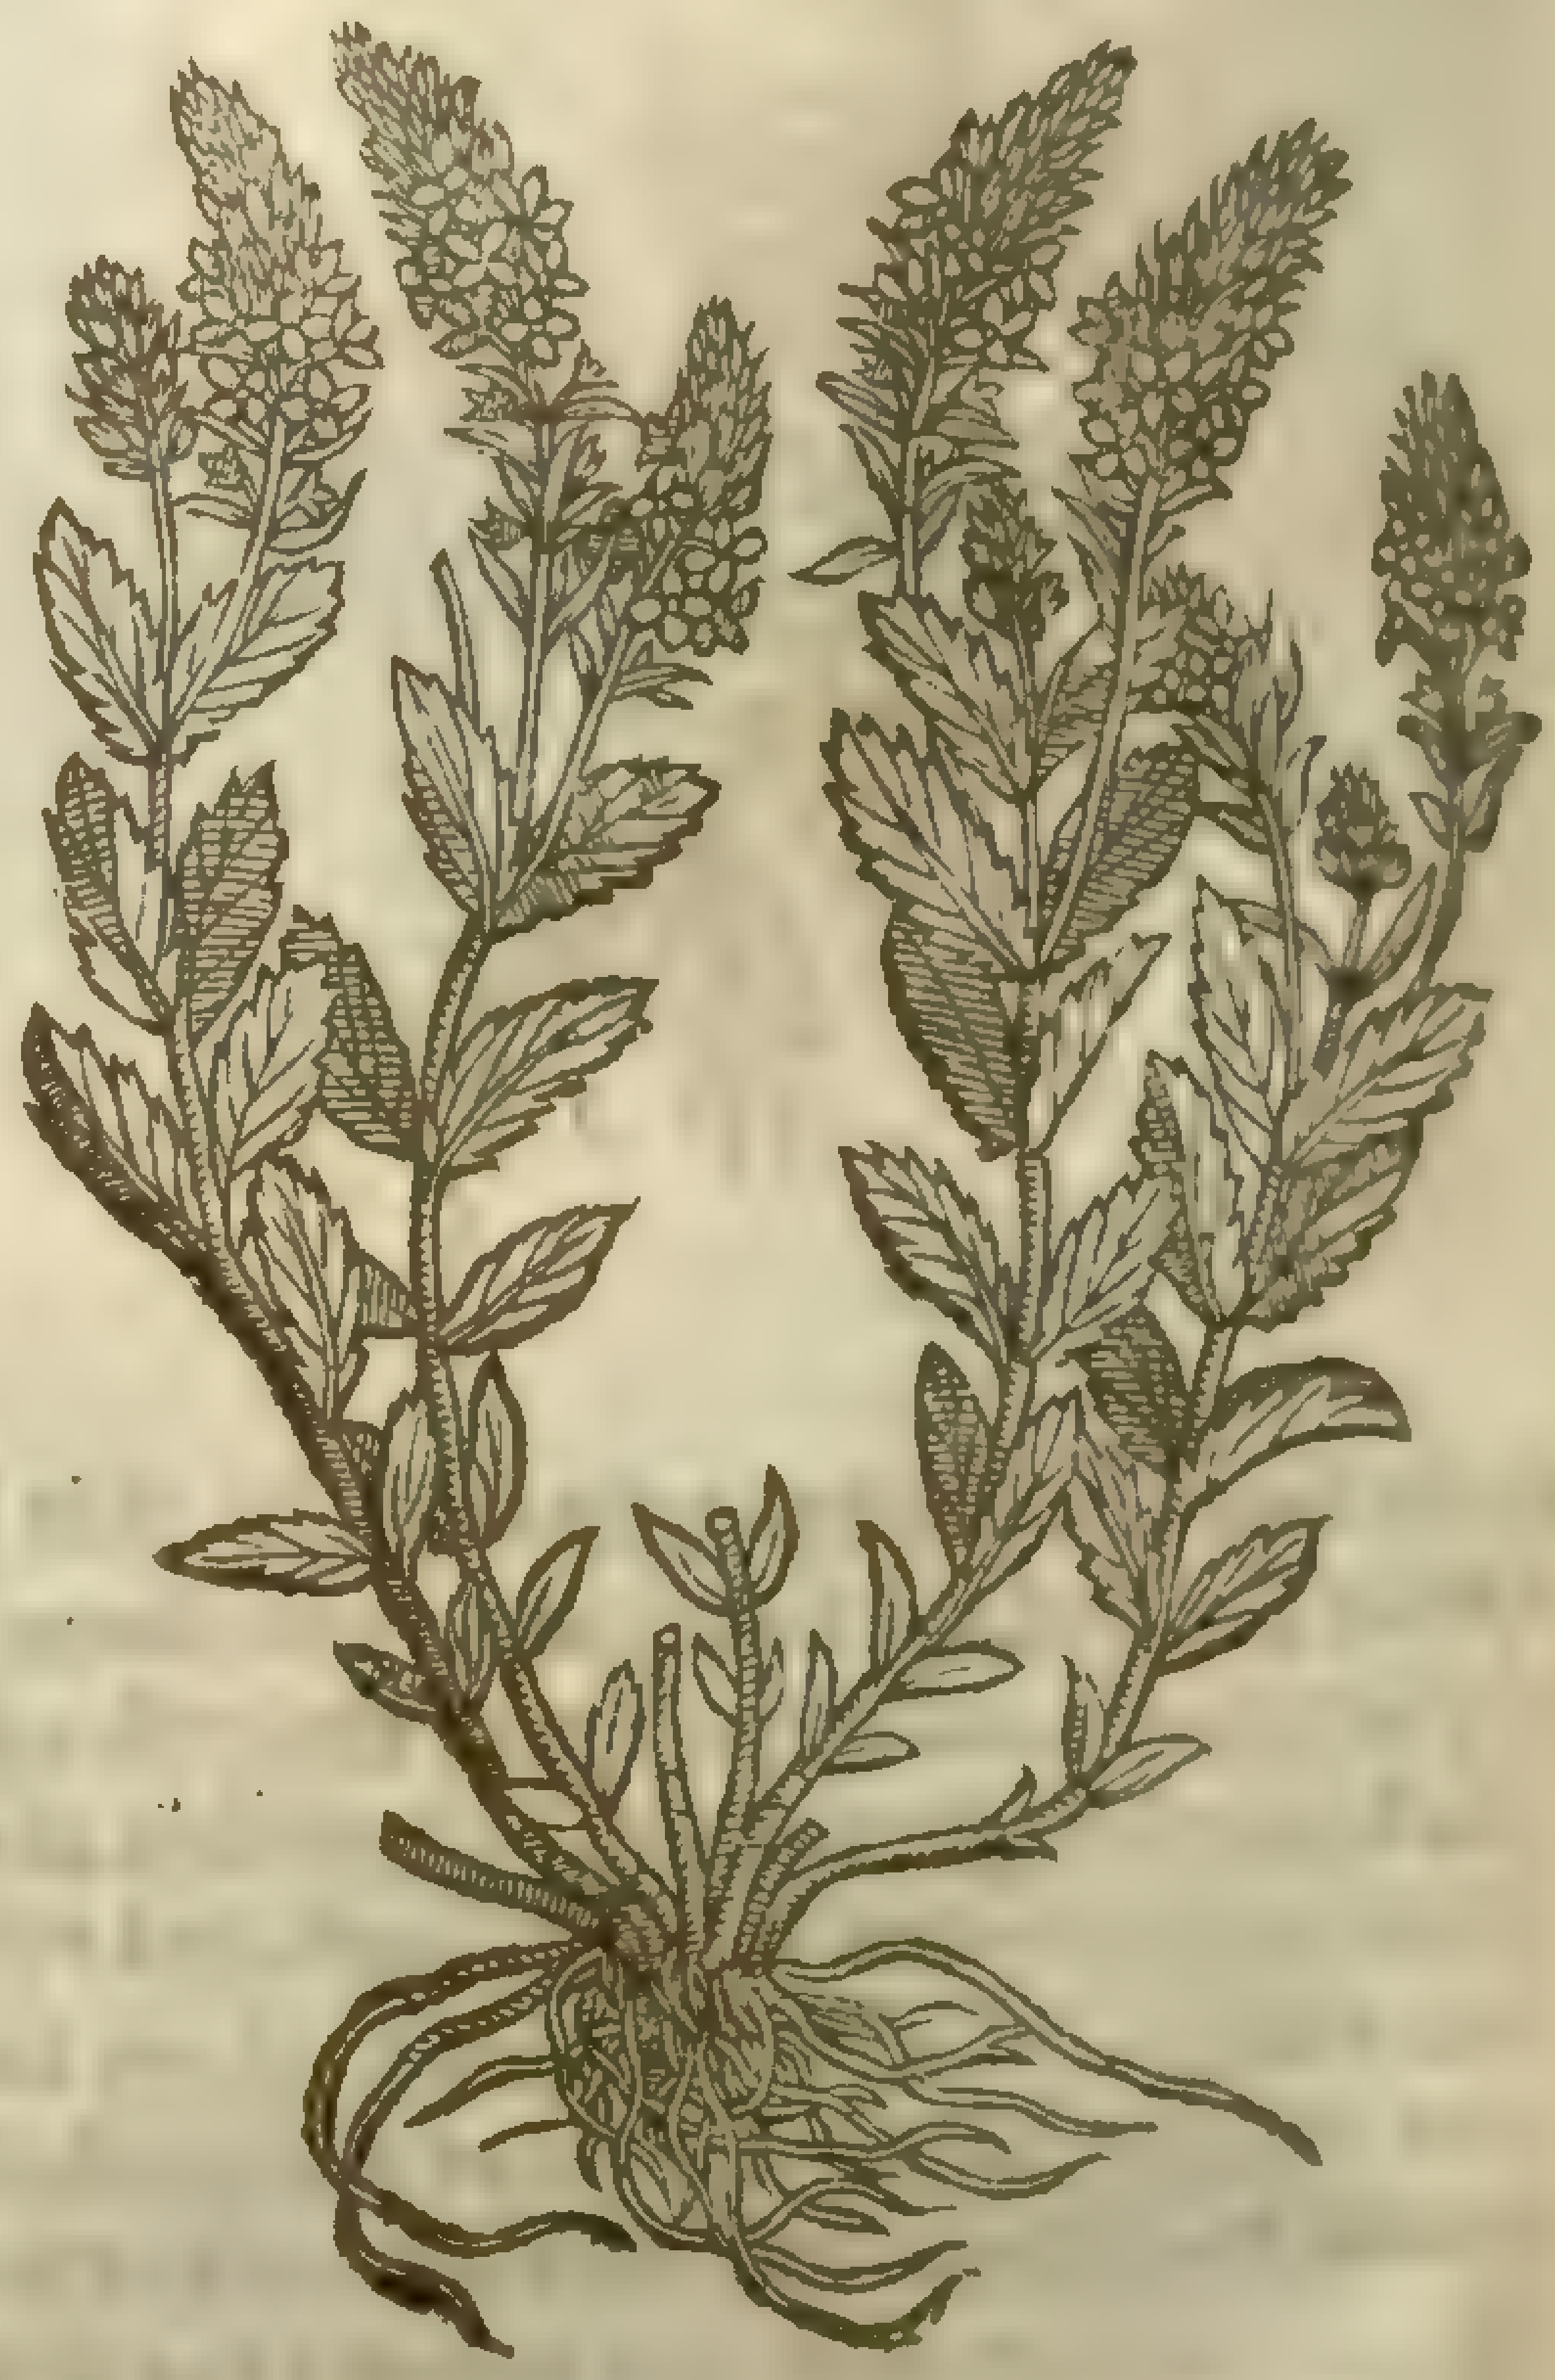
1 THe firſt kind of Tree Germander riſeth vp with a little ſtraight ſtalk a cubit high, woodie and hard like vnto a ſmall wooddy ſhrub: the ſtalke diuideth it ſelfe from the bottome to the top into diuers branches; whereon are ſet indented leaues nicked about the edges, in ſhape not much vnlike the leafe of the common Germander. The floures grow among the leaues, of a purple colour. The root is wooddy, as is all the reſt of the plant.

1 *Teucrium latifolium.*
Tree Germander with broad leaues.



Teucrium flavum, L. mihi dict.

2 *Teucrium Pannonicum.*
Hungarie Germander.

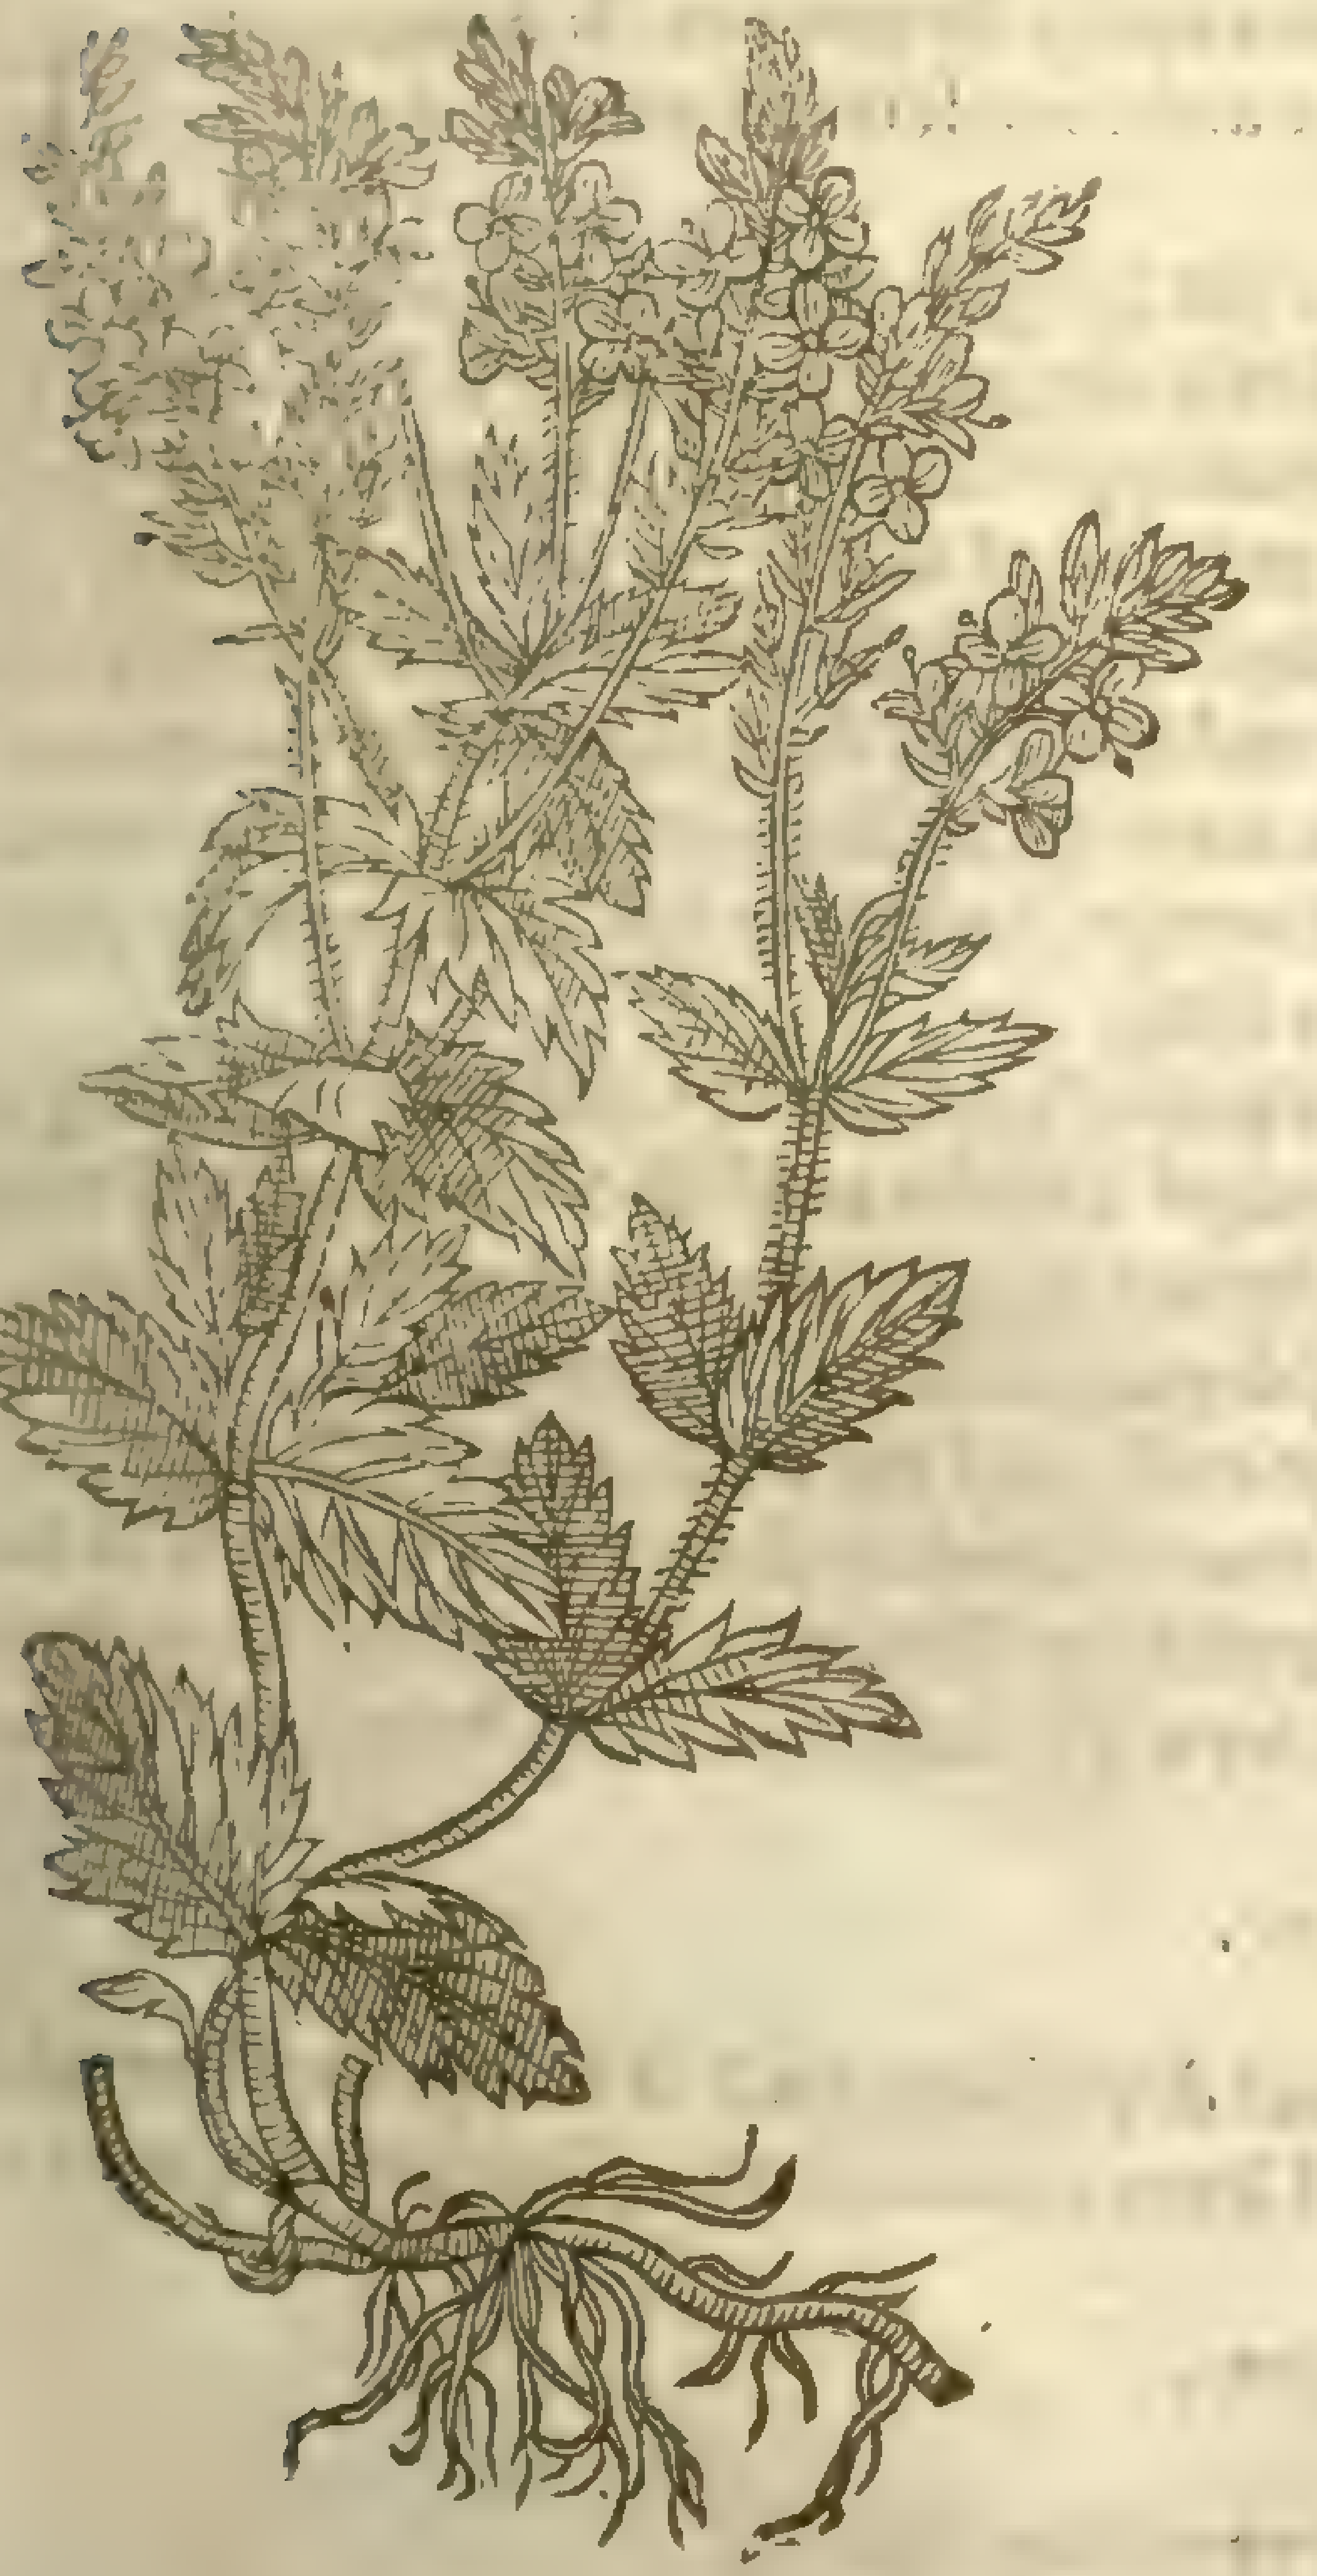


2 The tree Germander of Hungarie hath many tough threddy roots, from which riſe vp diuers weake and feeble ſtalks reeling this way and that way; whereupon are ſet together by couples long leaues jagged in the edges, not vnlike thoſe of the vpright Fluellen: on the tops of the ſtalks ſtand the floures ſpike-faſhion, thicke thruſt together, of a purple colour tending towards blewneſſe.

‡ 3 This (which is the fourth of *Cluſius* deſcription) hath diuers ſtalkes ſome cubit high, foure ſquare, rough, and ſet at certaine ſpaces with leaues growing by couples like thoſe of Wilde Germander: the tops of the ſtalks are diuided into ſundry branches, carrying long ſpokes of blew floures conſiſting of foure leaues, wherof the vppermoſt leafe is the largeſt, and diſtinguiſhed with veins: after the floures are paſt, follow ſuch flat ſeed-veſſels as in Fluellen: the root is fibrous, and liues long, ſending forth euerie yeare new branches. ‡

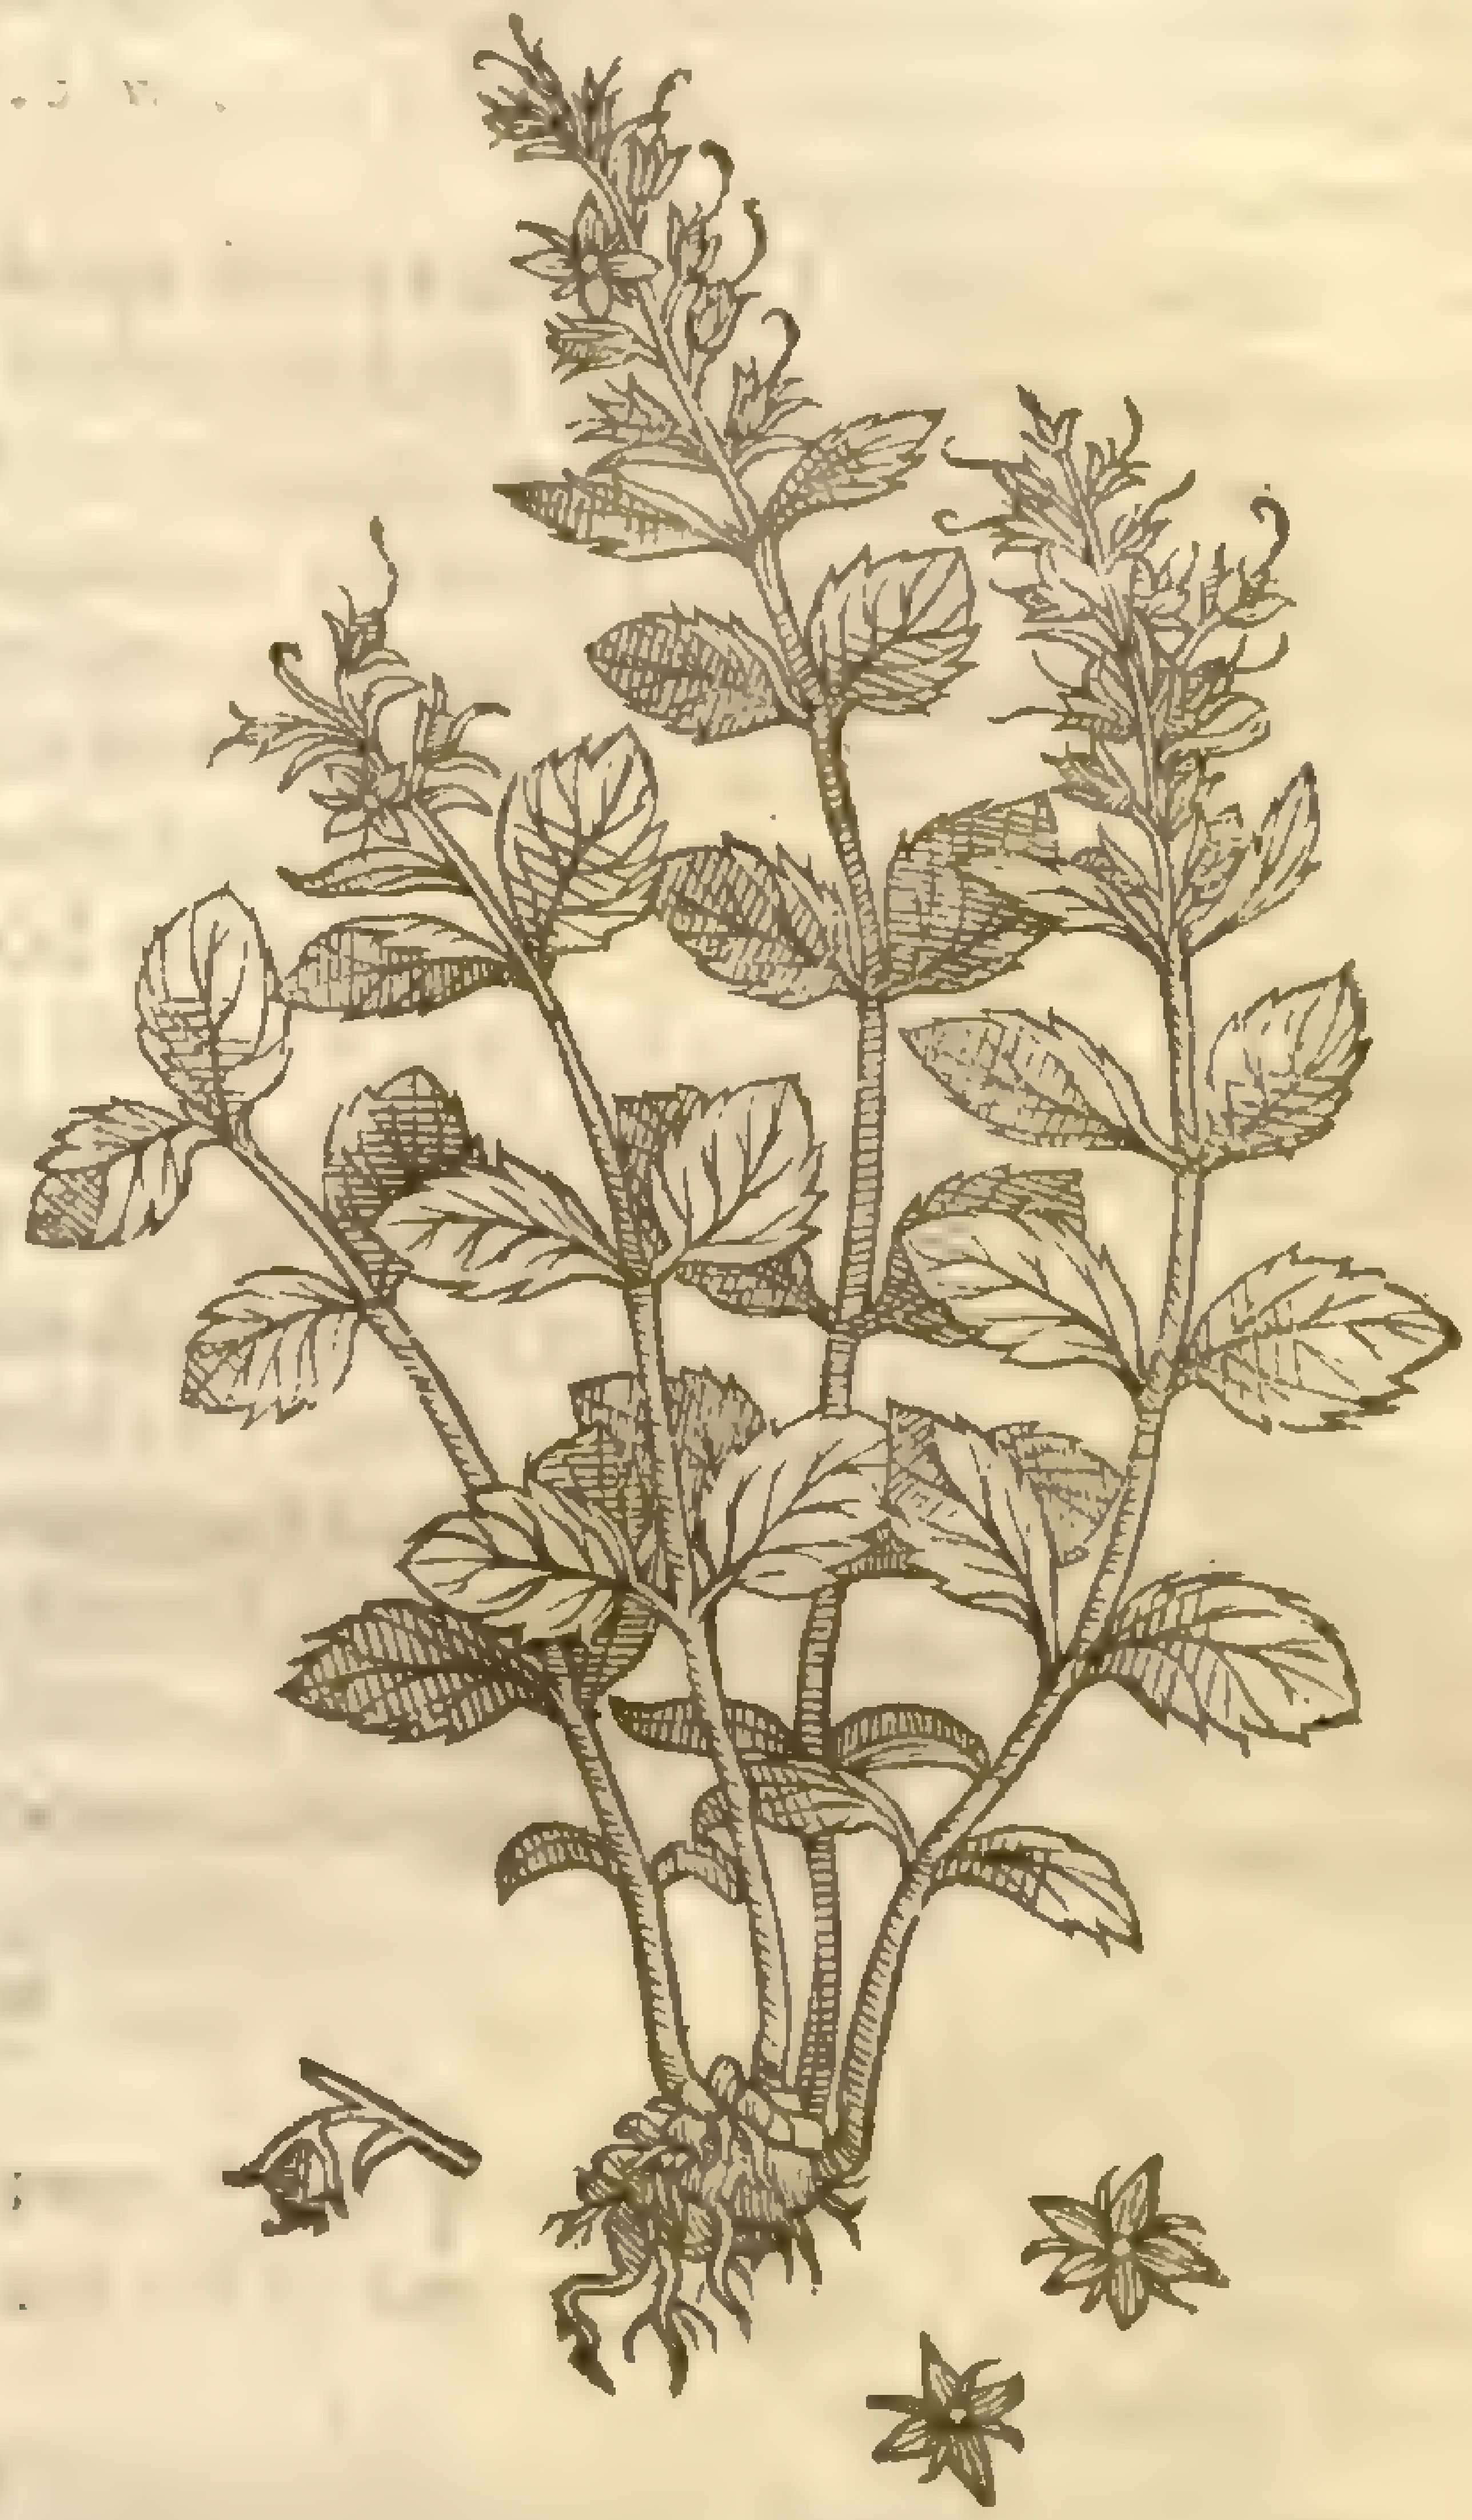
4 This dwarfe Germander ſends vp ſtalks ſome handfull high, round, not branched: the leaues grow vpon theſe ſtalks by couples, thicke, ſhining, a little hairy and green on their vpper ſides, and whitiſh

‡ 3 *Teucrium majus Pannonicum.*
Great Auſtrian Germander.

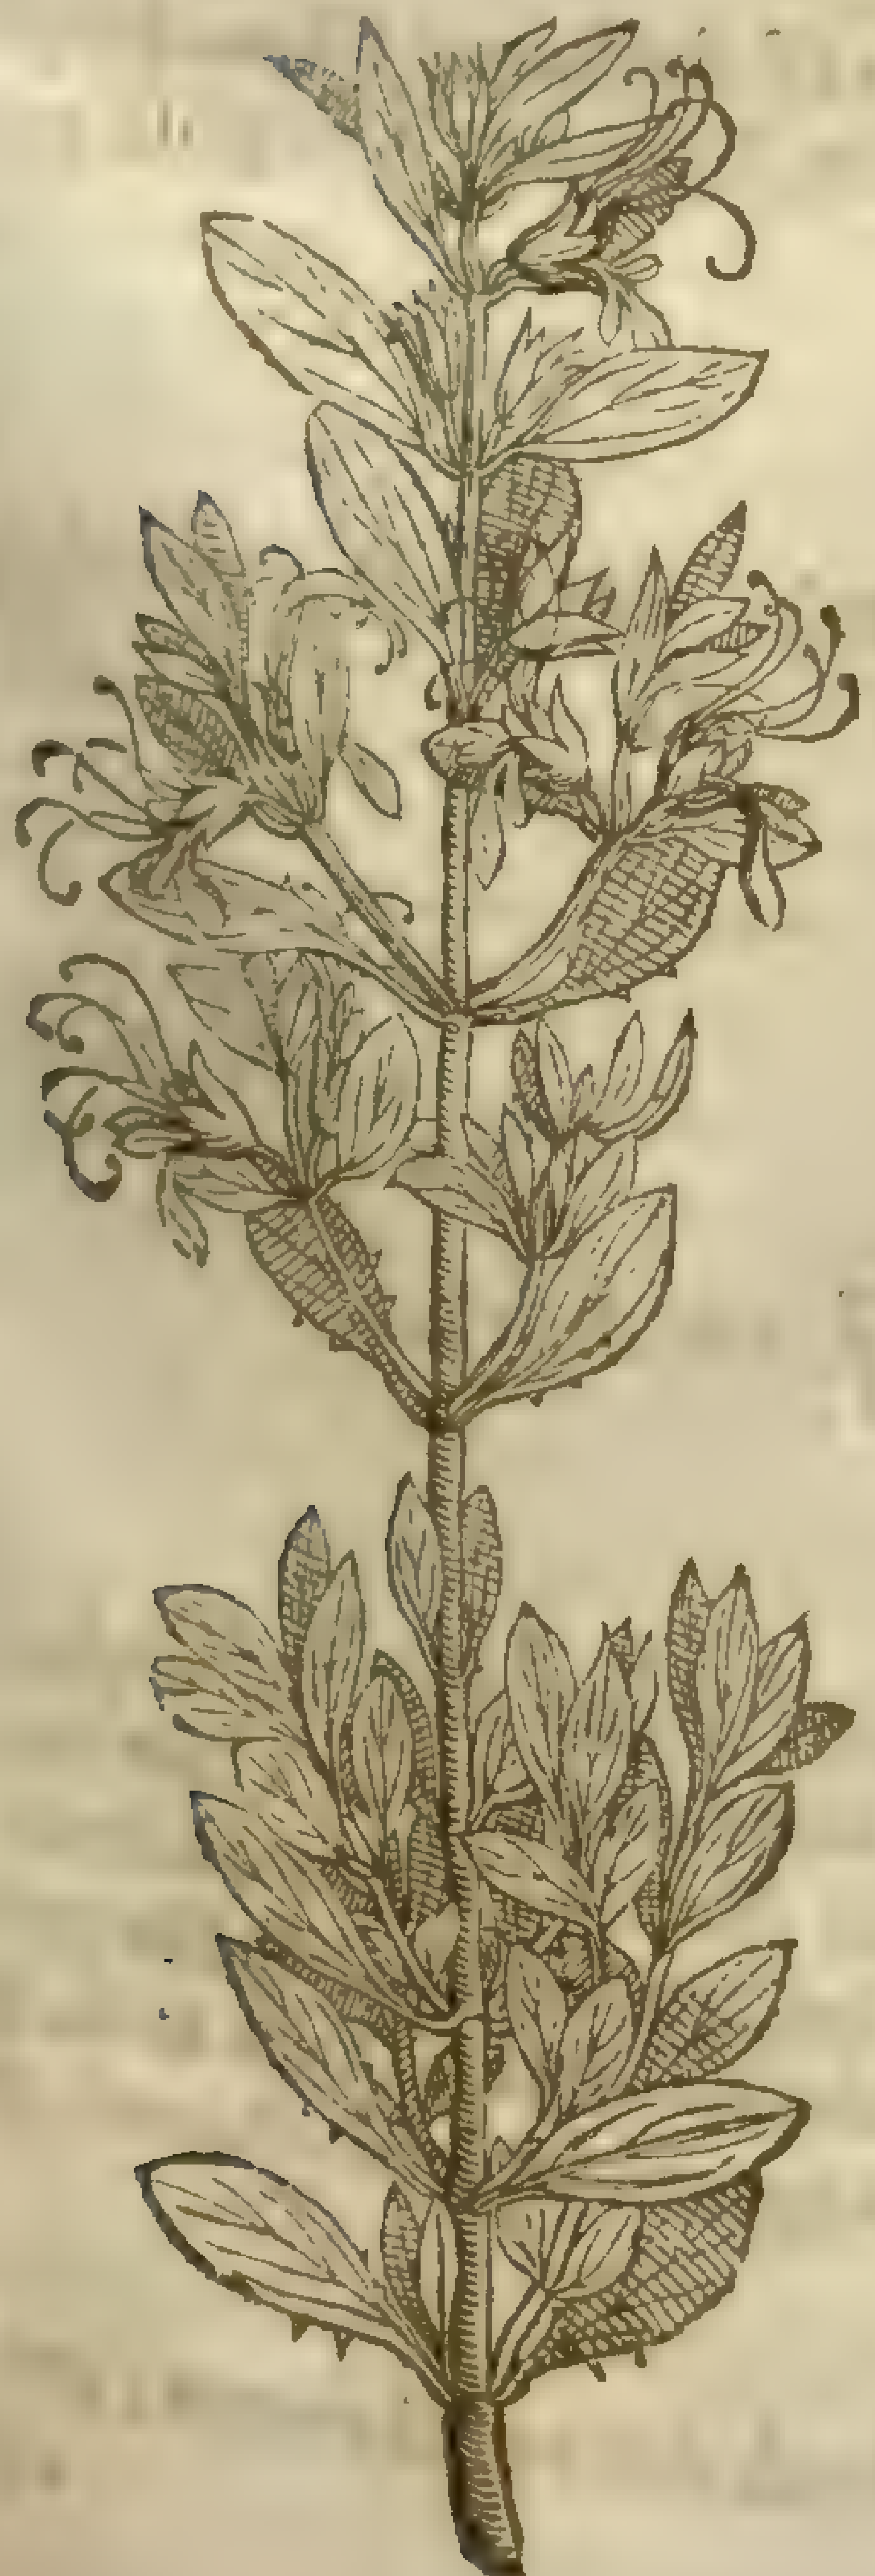


Veronica Teucrium, L

‡ 4 *Teucrium petræum pumilum.*
Dwarfe Rock Germander.

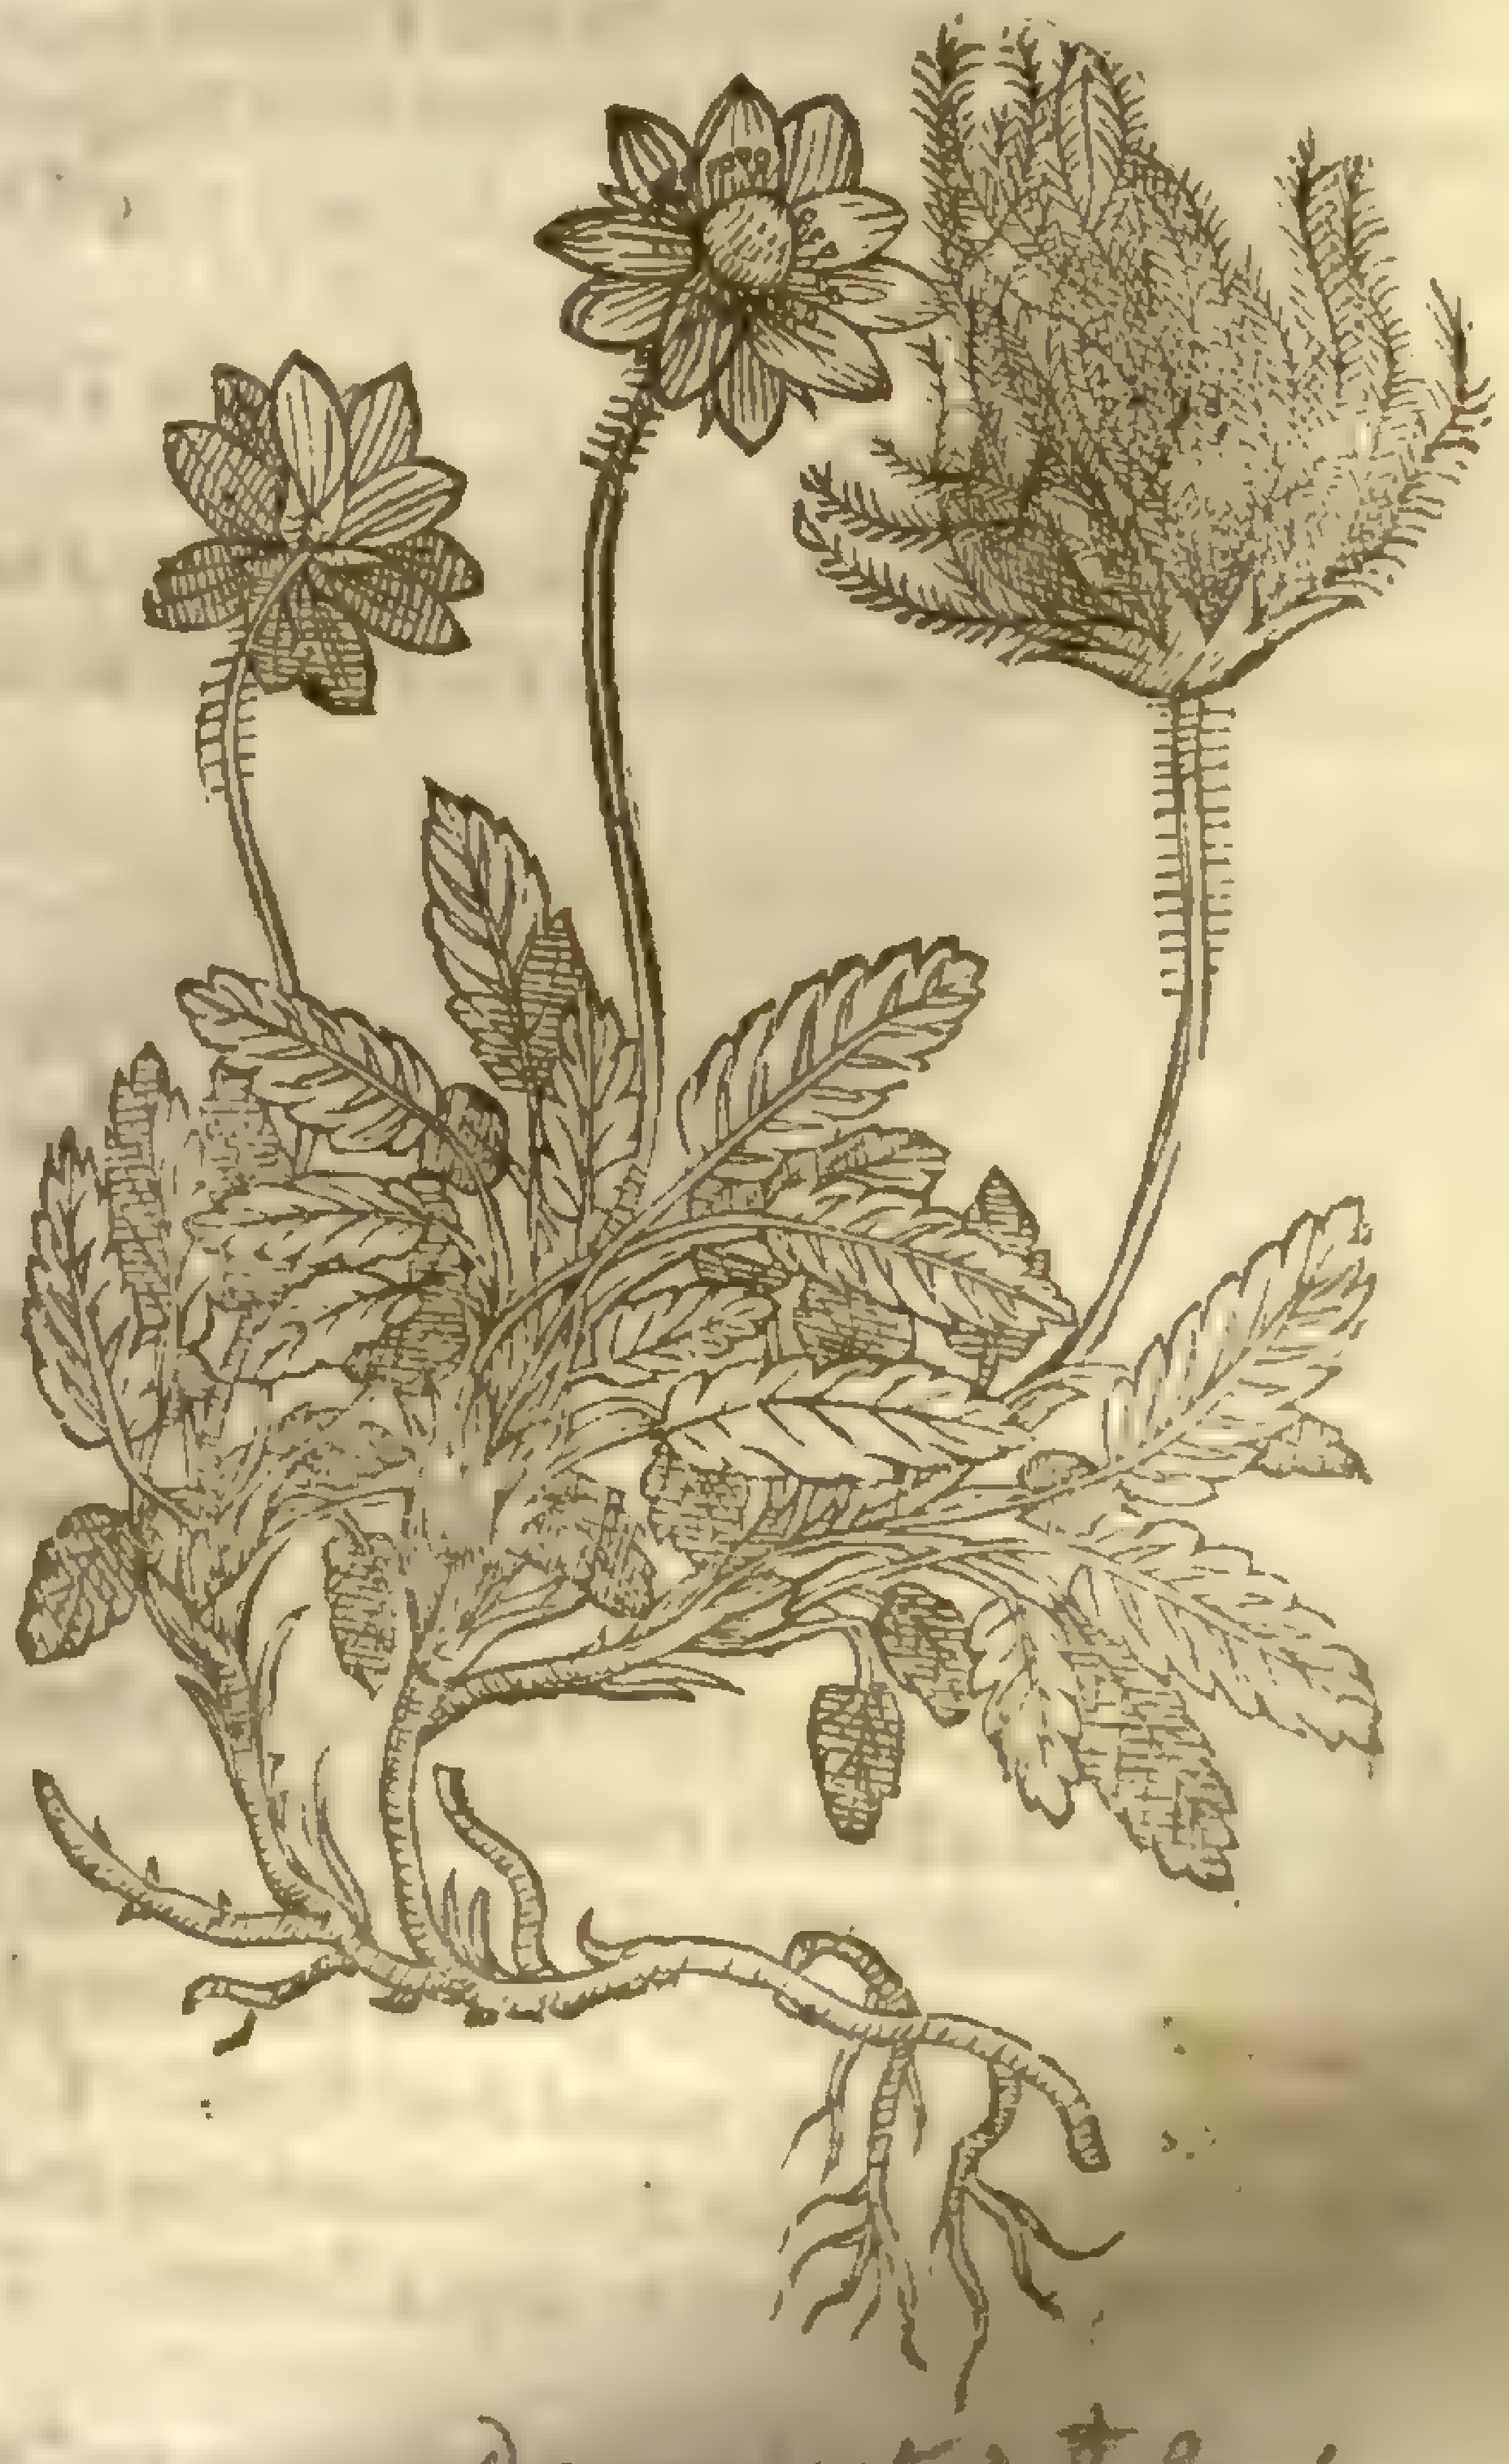


5 *Teucrium Bæticum.*
Spaniſh tree Germander.



[illegible]

6 *Teucrium Alpinum Ciſti flore.*
Rough headed tree Germander.



Dryas octopetala, L

[illegible]

whitiſh below: the tops of the ſtalks carry ſpoky tufts of flours conſiſting of foure or fiue blewiſh leaues; which falling, there followes a ſeed-veſſell as in the *Veronica's*. The root is knotty and fibrous, and growes ſo faſt among the rocks that it cannot eaſily be got out. It floures in Iuly. *Cluſius* deſcribes this by the name of *Teucrium 6. pumilum*: and *Pona* ſets it forth by the name of *Veronica petræa ſemper-virens*. ‡

5 This Spaniſh Germander riſeth vp oft times to the height of a man, in manner of an hedge buſh, with one ſtiffe ſtalke of the bigneſſe of a mans little finger, couered ouer with a whitiſh bark diuided ſometimes into other branches, which are alwaies placed by couples one right againſt an other, of an ouerworne hoary colour: and vpon them are placed leaues not much vnlike the common Germander; the vpper parts whereof are of a grayiſh hoary colour, and the lower of a deepe green, of a bitter taſte, and ſomwhat crooked, turning and winding themſelues after the manner of a welt. The flours come forth from the boſome of the leaues, ſtanding vpon ſmall tender footſtalks of a white colour, without any helmet or hood on their tops, hauing in the middle many threddy ſtrings: the whole plant keepeth green all the winter long.

6 Among the reſt of the tree Germanders this is not of leaſt beauty and account, hauing many weake and feeble branches trailing vpon the ground, of a darke reddiſh colour, hard and woody; at the bottom of which ſtalks come forth many long broad jagged leaues not vnlike the precedent, hoary vnderneath, and green aboue, of a binding and drying taſte. The floures grow at the top of the ſtalks, not vnlike to thoſe of *Ciſtus fœmina*, or Sage-roſe, and are white of colour, conſiſting of eight or nine leaues, in the middle whereof do grow many threddy chiues without ſmel or ſauor: which being paſt, there ſucceedeth a tuft of rough threddy or flocky matter, not vnlike to thoſe of the great *Auens* or *Pulſatilla*: the root is wooddy, and ſet with ſome few hairy ſtrings faſtned to the ſame.

¶ *The Place.*

Theſe plants do ioy in ſtony rough mountaines and dry places, ſuch as lie open to Sun and aire, and proſper well in gardens: and of the ſecond ſort I haue receiued one plant for my garden of Mr *Garret* Apothecarie.

¶ *The Time.*

They floure, flouriſh, and ſeed when the other Germanders do.

¶ *The Names.*

Tree Germander is called in Greeke χαμαίδρυς; retaining the name of the former *Chamædrys*; and τεύκριον, according to the authoritie of *Dioſcorides* and *Pliny*: in Latine, *Teucrium*: in Engliſh, great Germander, vpright Germander, and tree Germander.

¶ *The Temperature and Vertues.*

Their temper and faculties are referred vnto the garden Germander, but they are not of ſuch force in working, wherefore they be not ſo much vſed in phyſicke.

Chap. 214.

Of Water Germander, or Garlicke Germander.

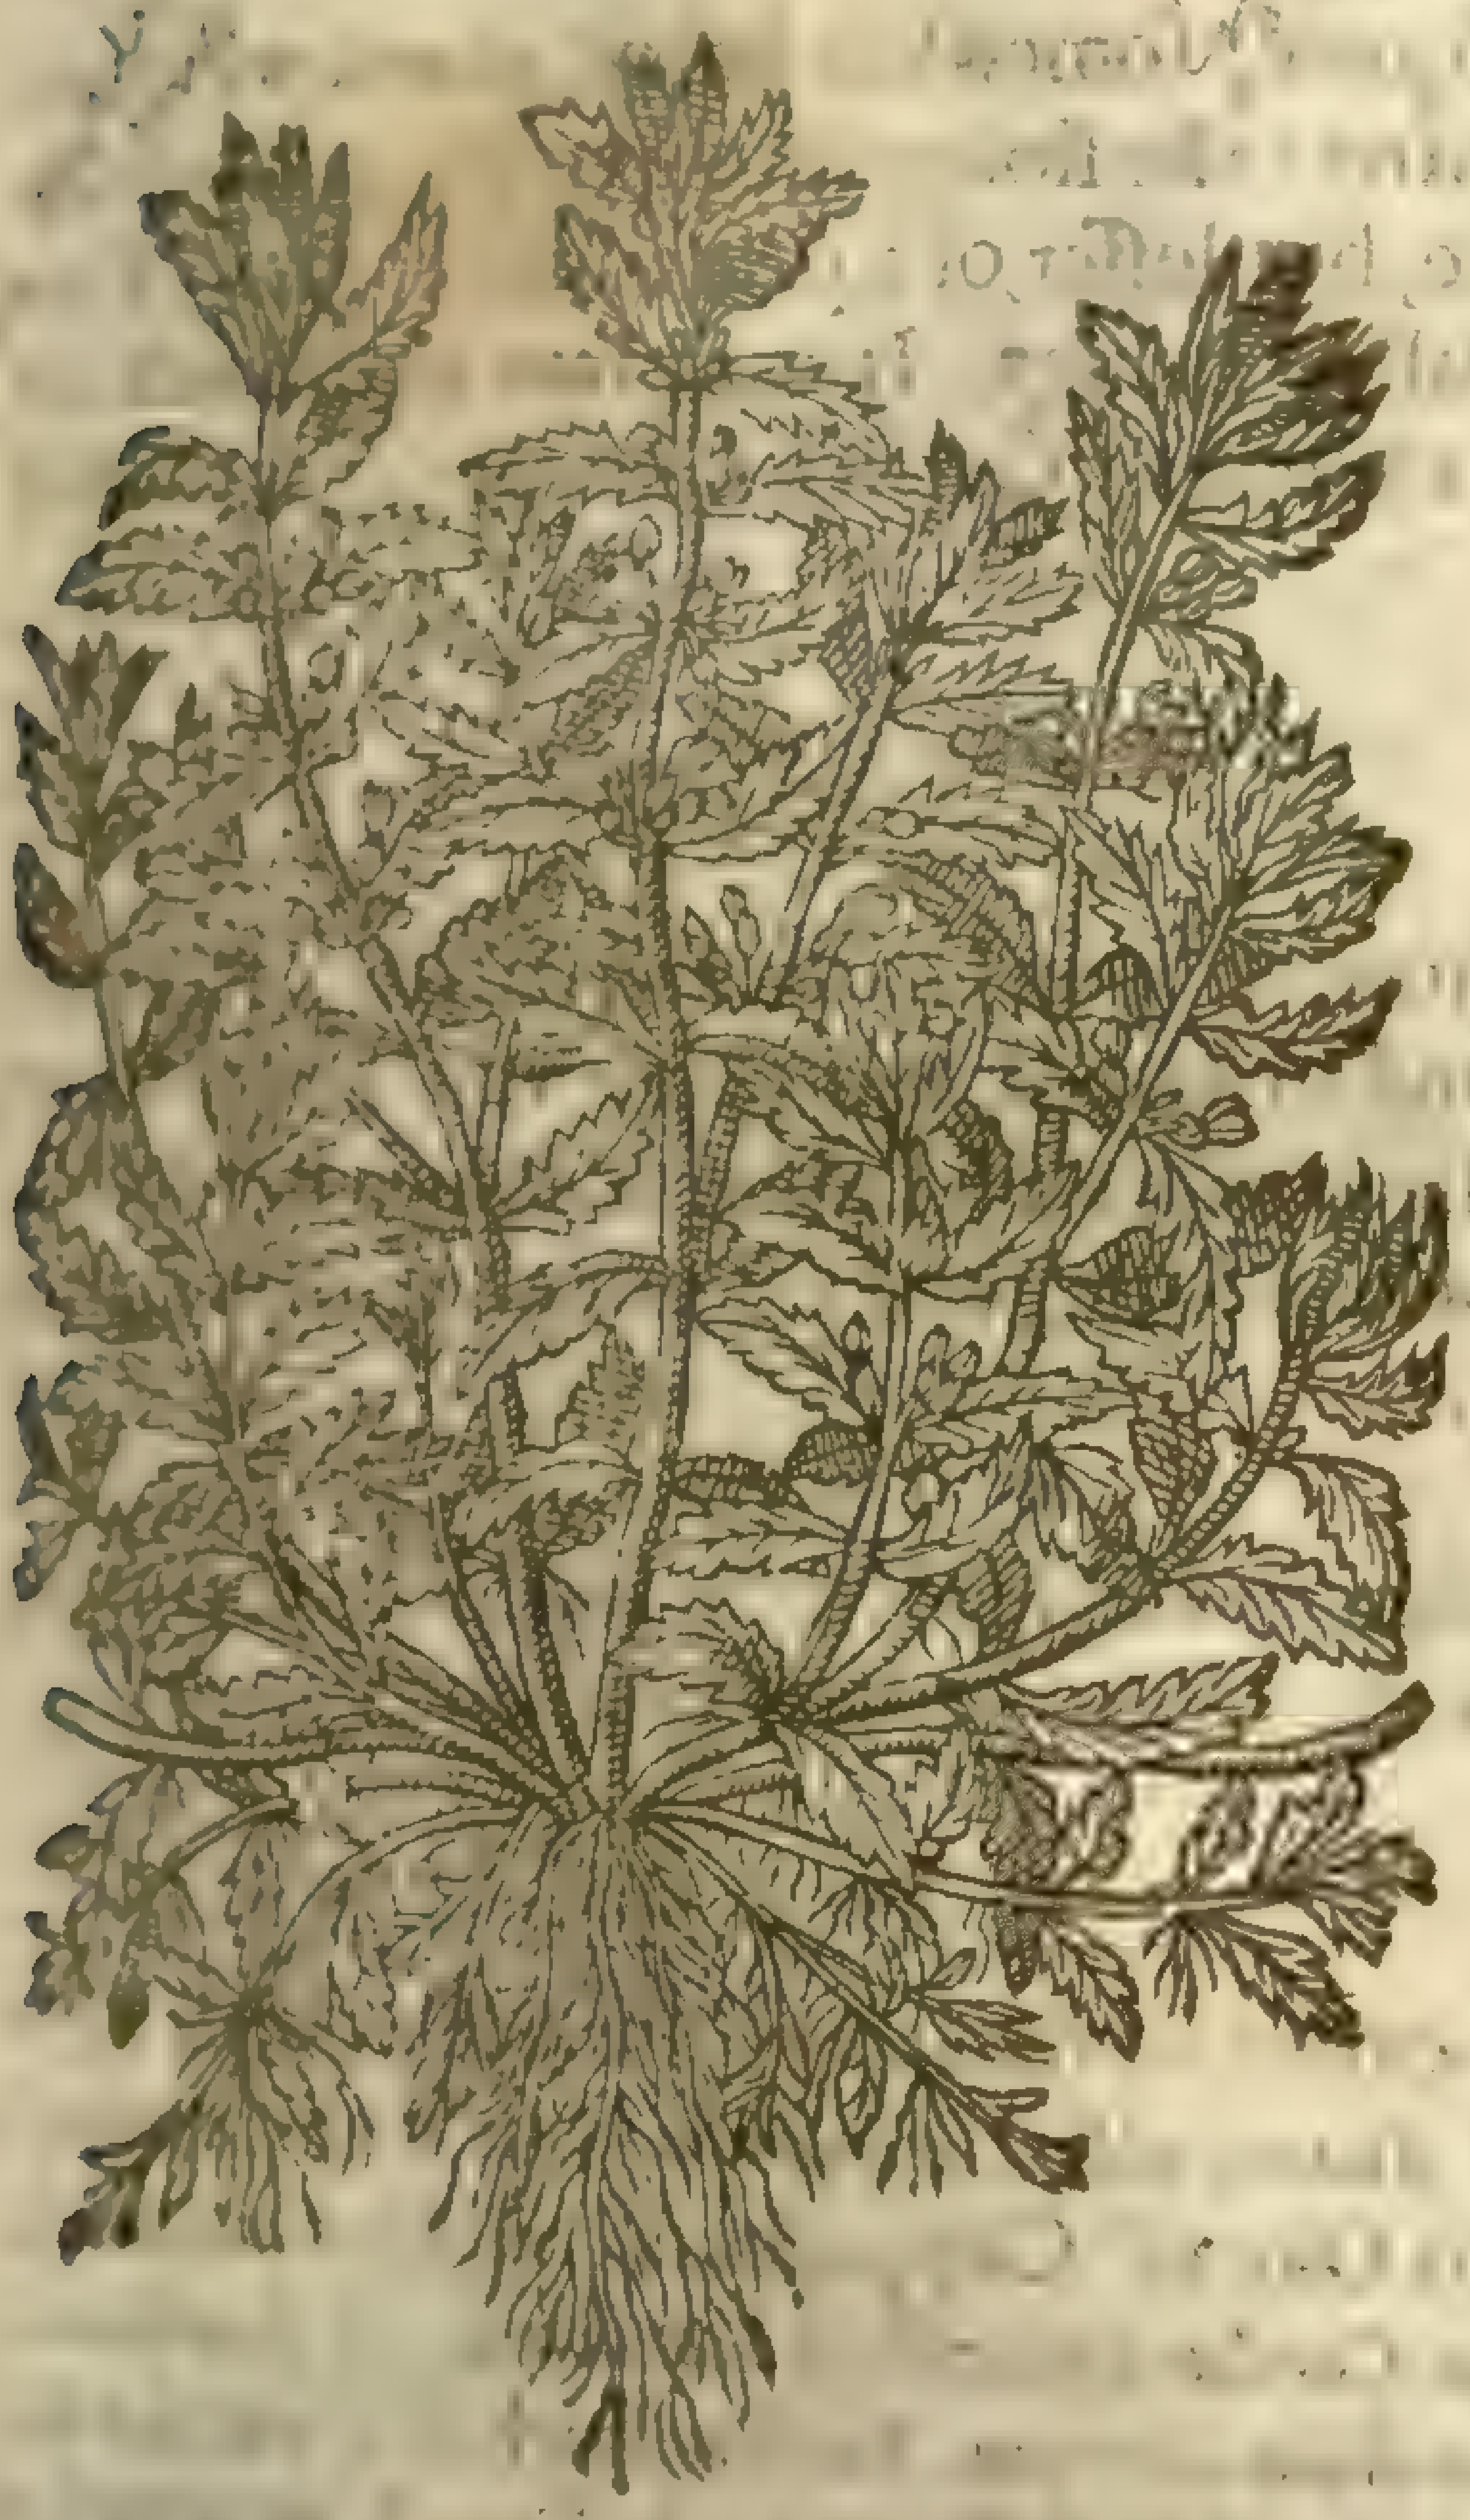
¶ *The Deſcription.*

1 Scordium or water Germander hath ſquare hairy ſtalks creeping by the ground, beſet with ſoft whitiſh crumpled leaues, nickt and ſnipt round about the edges like a Saw: among which grow ſmall purple floures like the floures of dead Nettle. The root is ſmall and threddy, creeping in the ground very deeply. The whole plant being bruiſed ſmelleth like garlick, whereof it tooke that name *Scordium*. ‡ This by reaſon of goodneſſe of ſoile varies in the largeneſſe thereof; whence *Tabernamontanus* and our Author made a bigger and a leſſer thereof, but I haue omitted the later as ſuperfluous. ‡

¶ *The Place.*

Water Germander groweth neere to Oxenford, by Ruley, on both ſides of the water, and in a medow by Abington called Nietford, by the relation of a learned gentleman of S. *Iohns* in the ſaid towne of Oxford, a diligent φιλοβοτανικός, my very good friend, called Mr *Richard Slater*. Alſo it groweth in great plenty in the Iſle of Ely, and in a medow by Harwood in Lancaſhire, and in diuers other places.

Scordium.
Water Germander.



¶ *The Time.*

Theſe floures appeare in Iune and Iuly: it is beſt to gather the herb in Auguſt: it periſheth not in Winter, but only loſeth the ſtalks which come vp againe in Summer: the root remaineth freſh all the yeare.

¶ *The Names.*

The Grecians call it Σκόρδιον: the Latines do alſo call it *Scordium*: the Apothecaries haue no other name: it is called of ſome, *Trixago paluſtris*, *Quercula*, and alſo *Mithridatium*, of *Mithridates* who firſt found it out. It tooke the name *Scordium* from the ſmell of Garlicke, by the Grecians called σκόροδον, and δύσοσμον, of the rancknesſe of the ſmell: in high-Dutch, **Waſſer battenig**: in French, *Scordion*: in Italian, *Chalamandrina paluſtre*: in Engliſh, Scordium, Water Germander, and garlicke Germander.

¶ *The Nature.*

Water Germander is hot and dry: it hath a certain bitter taſte, harſh and ſharpe, as *Galen* witneſſeth.

¶ *The Vertues.*

A Water Germander clenſeth the intrals and likewiſe old vlcers, being mixed with honey according to art: it prouoketh vrine, and bringeth downe the monethly ſickneſſe: it draweth out of the cheſt thicke flegme and rotten matter: it is good for an old cough, paine in the ſides comming of ſtopping and cold, and for burſtings and inward ruptures.

B The decoction made in wine and drunke, is good againſt the bitings of ſerpents, and deadly poiſons; and is vſed in antidotes or counterpoyſons with good ſucceſſe.

C It is reported to mitigate the pain of the gout, being ſtamped and applied with a little vineger and water.

D Some affirm, That raw fleſh being laid among the leaues of Scordium, may be preſerued a long time from corruption.

E Being drunke with wine, it openeth the ſtoppings of the liuer, milt, kidnies, bladder, and matrix, prouoketh vrine, helpeth the ſtrangurie, that is, when a man cannot piſſe but by drops, and is a moſt ſingular cordial to comfort and make merry the heart.

F The pouder of Scordion taken to the quantitie of two drams in Mede or honied water, cureth and ſtoppeth the bloudy flix, and comforteth the ſtomacke. Of this Scordium is made a moſt ſingular medicine called *Dioſcordium*, which ſerueth very notably for all the purpoſes aforeſaid.

G The ſame medicine made with Scordium is giuen with very good ſucceſſe vnto children and aged people, that haue the ſmall pocks, meaſles, or purples, or any other peſtilent ſickneſſe whatſoeuer, euen the plague it ſelfe, giuen before the ſickneſſe haue vniuerſally poſſeſſed the whole body.

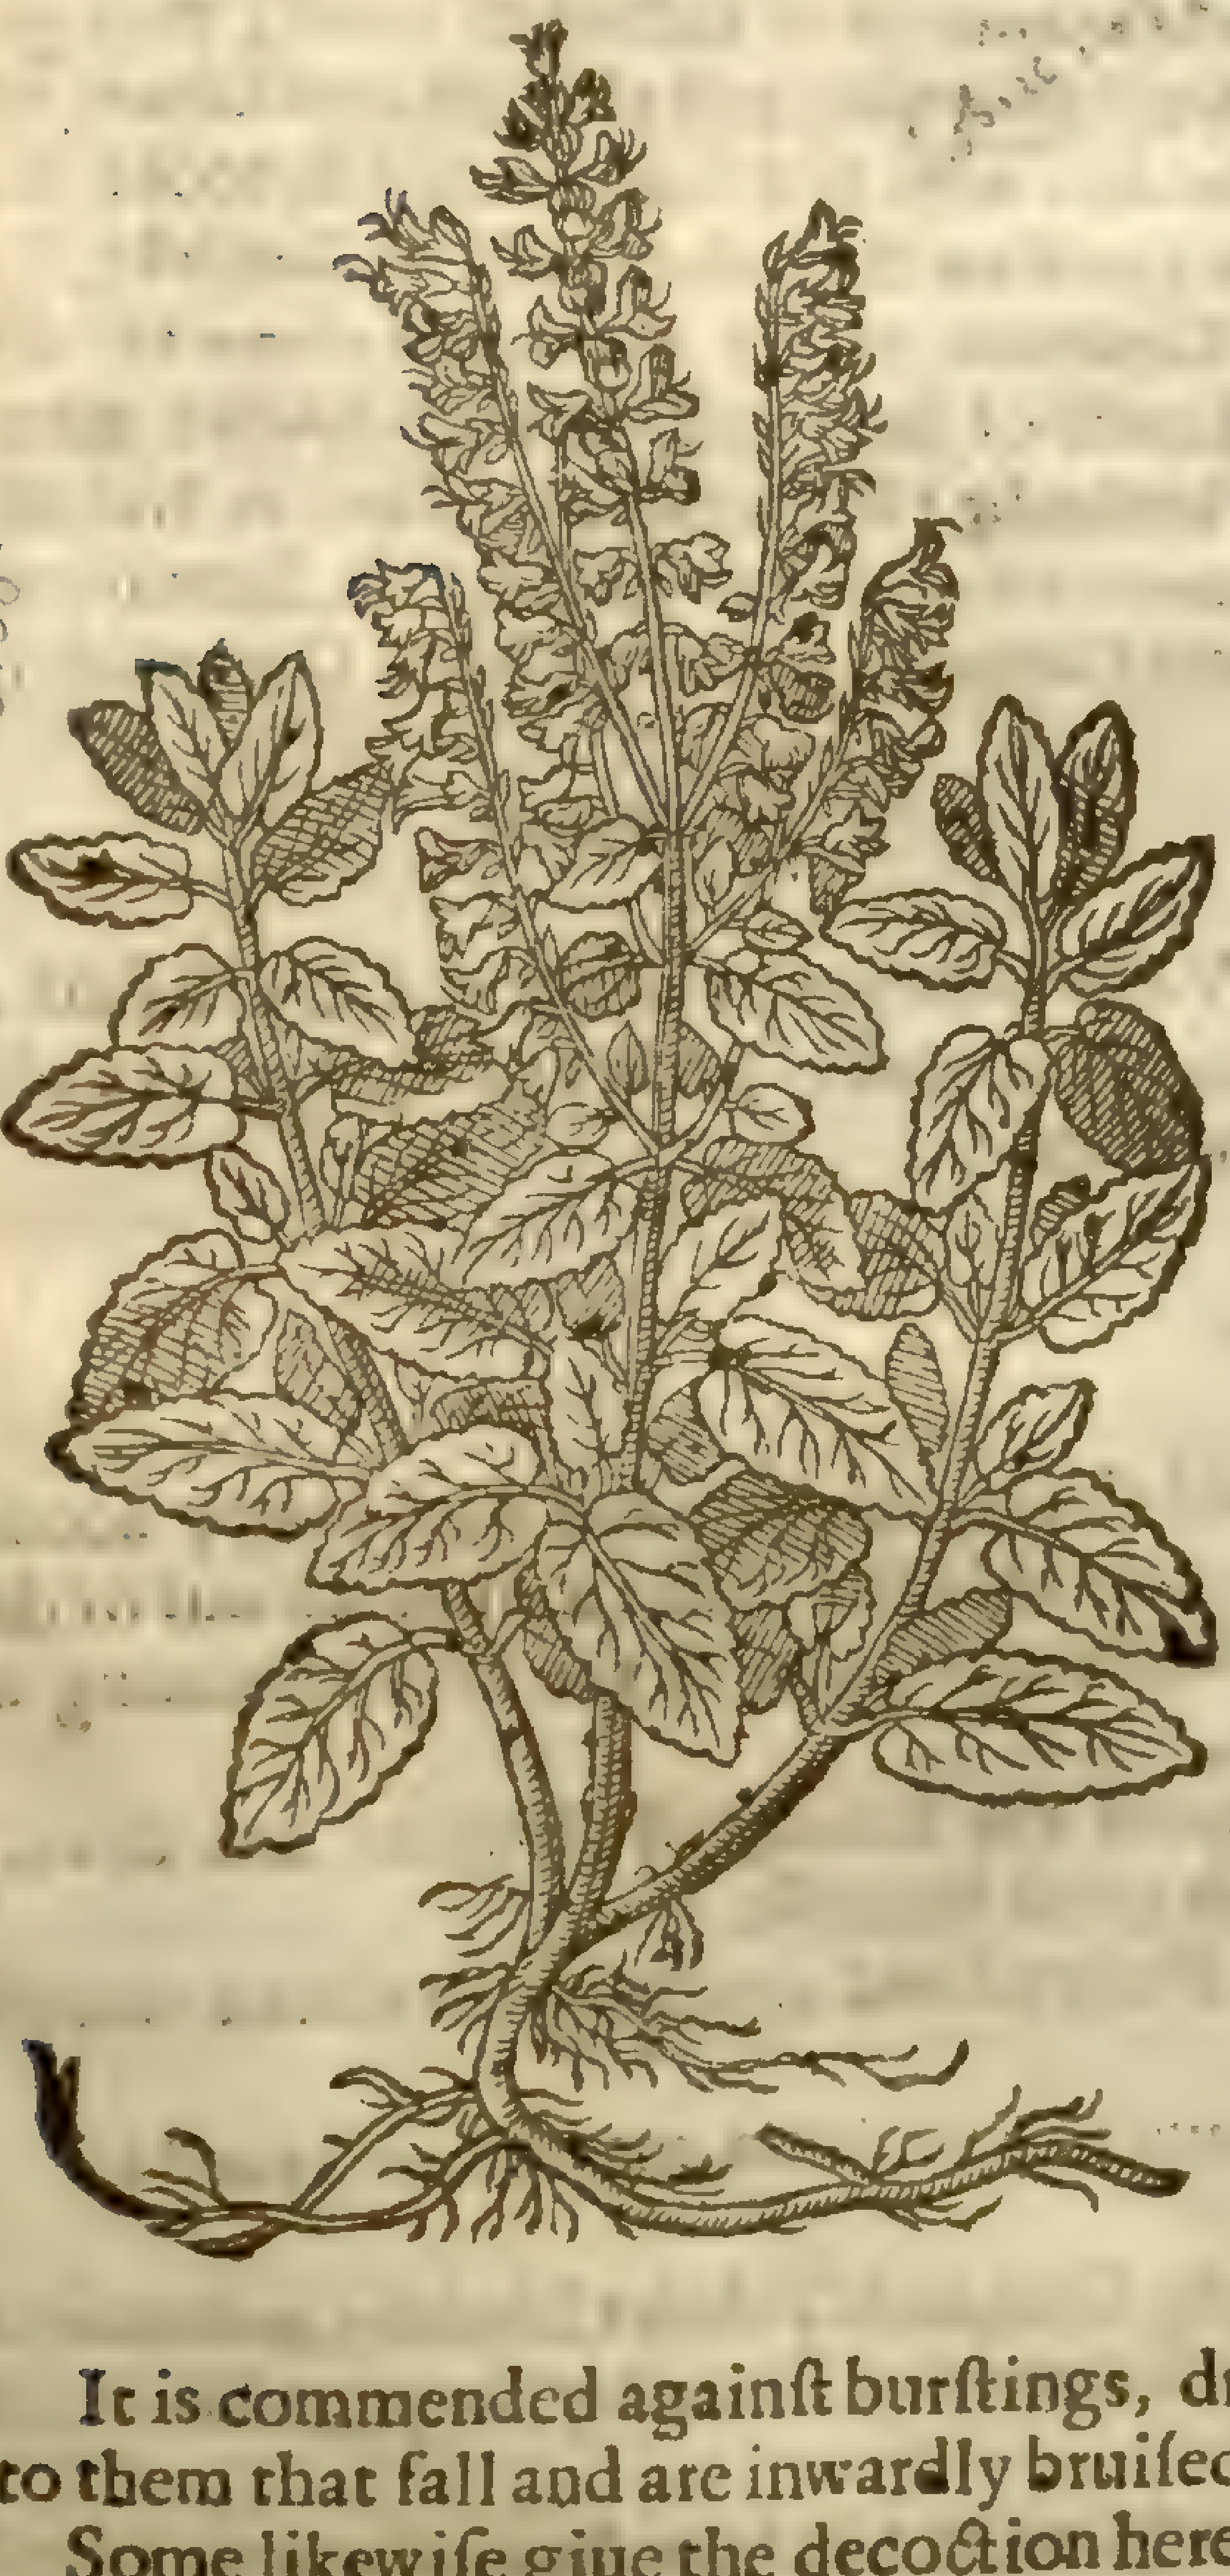
Chap. 215.

Of Wood Sage, or Garlicke Sage.

¶ *The Deſcription.*

That which is called wilde Sage hath ſtalkes foure ſquare, ſomewhat hairy, about which are leaues like thoſe of Sage, but ſhorter, broader, and ſofter: the floures grow vp all vpon one ſide of the ſtalke, open and forked as thoſe of dead Nettle, but leſſer, of a pale white colour. Then grow the ſeeds foure together in one huske: the root is full of ſtrings. It is a plant that liueth but a yeare: it ſmelleth of Garlicke when it is bruiſed, being a kinde of Garlick Germander, as the ſaid ſmell of garlick teſtifieth.

† *Scorodonia, ſiue Saluia agreſtis.*
Wood Sage, or Garlicke Sage.



Teucrium Scorodonia, L.
[illegible] Sm. pl. 3.68

¶ *The Place.*

It groweth vpon heaths and barren places: it is alſo found in woods, and neere vnto hedge rowes about the borders of fields: it ſomewhat delighteth in a lean ſoile, and yet not altogether barren and dry.

¶ *The Time.*

It floureth and ſeedeth in Iune, Iuly, & Auguſt, and it is then to be gathered and laid vp.

¶ *The Names.*

It is called of the later Herbariſts, *Saluia Agreſtis*: of diuers alſo *Ambroſia*; but true *Ambroſia* which is Oke of Cappadocia, differs from this. *Valerius Cordus* nameth it *Scordonia*, or *Scorodonia*, and *Scordium alterum*. *Ruellius* ſaith it is called *Boſcisaluia*, or *Saluia Boſci*: in high-Dutch, **Wald ſalbey**: in Engliſh, wilde Sage, wood Sage, and Garlicke Sage.

It ſeemeth to be *Theophraſtus* his *σφάκος*. *Sphacelus*, which is alſo taken for the ſmall Sage, but not rightly.

¶ *The Temperature.*

Wilde Sage is of temperature hot and drie, yet leſſe than common Sage, being hot and dry in the ſecond degree.

¶ *The Vertues.*

A It is commended againſt burſtings, dry-beatings, and wounds: the decoction thereof is giuen to them that fall and are inwardly bruiſed: it alſo prouoketh vrine.

B Some likewiſe giue the decoction hereof to drinke with good ſucceſſe to them that are infected with the French pox: for it cauſeth ſweat, drieth vp vlcers, digeſteth humors, waſteth away & conſumeth ſwellings, if it be taken thirty or forty dayes together, or put into the decoction of *Guaiacum* in ſtead of *Epithymum* and other adjutories belonging to the ſaid decoction.

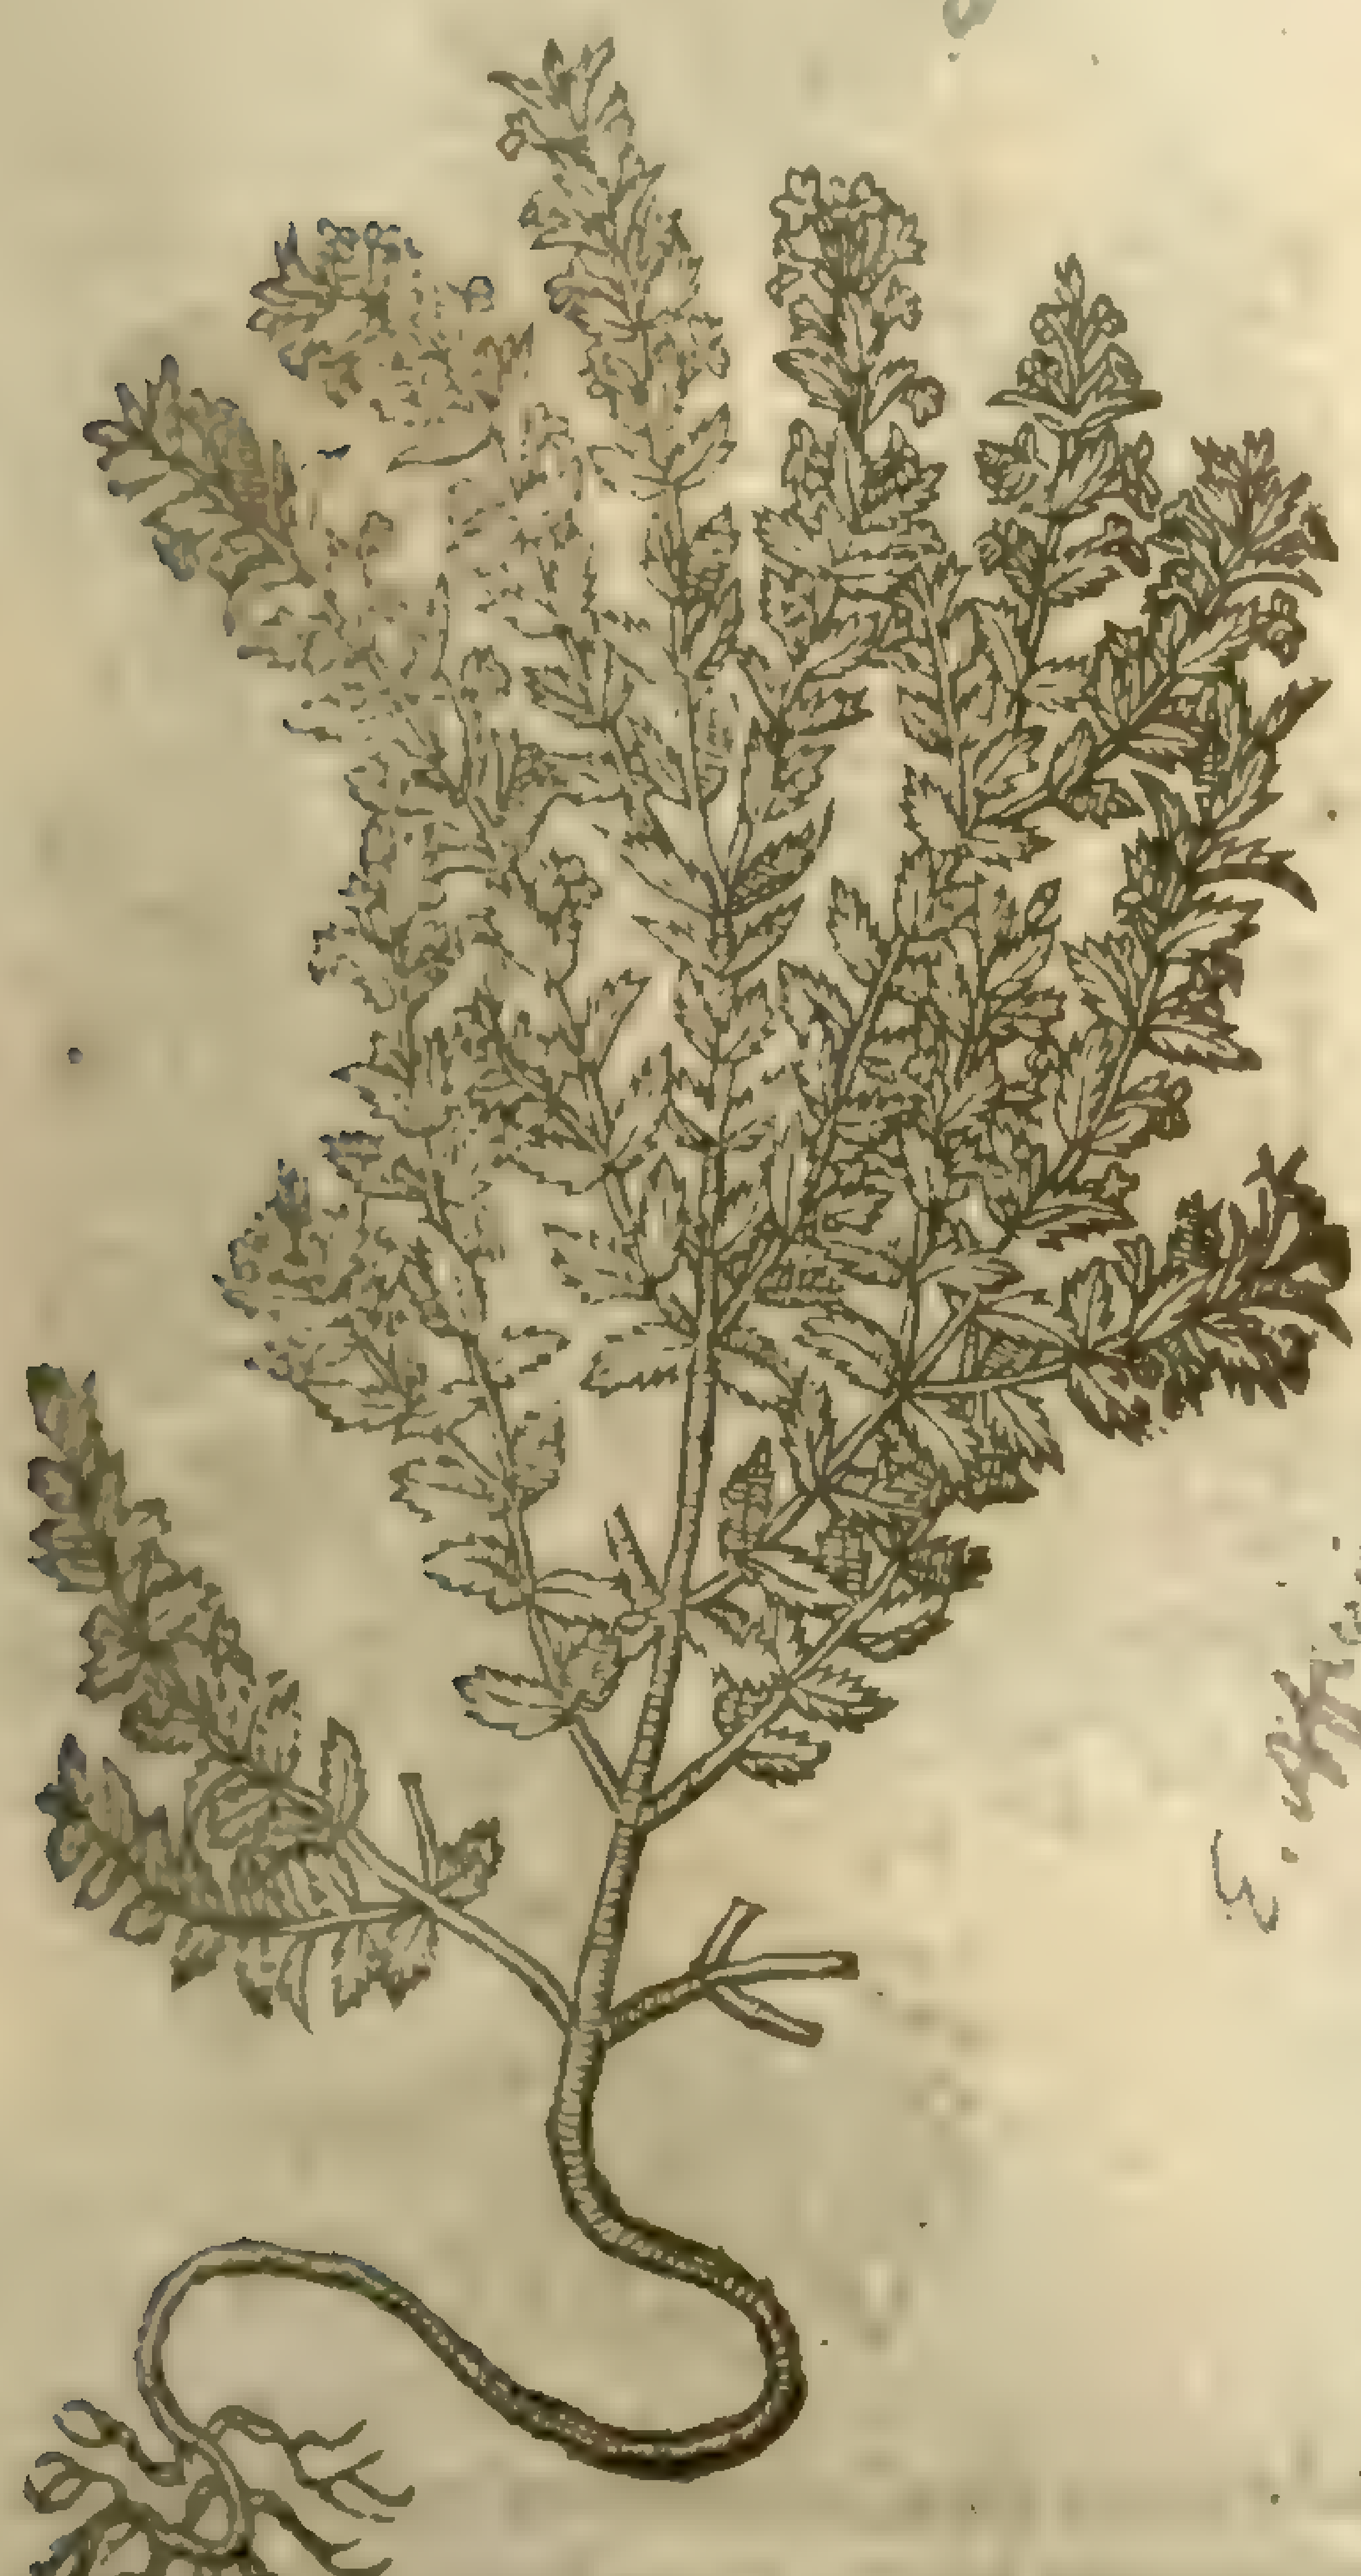
† The figure which was formerly here was of *Calamintha montana præſtantior* of *Lobel*.

Chap. 216. Of Eye-bright.

¶ *The Deſcription.*

Euphraſia or Eye-bright is a ſmall low herbe not aboue two handfulls high, full of branches, couered with little blackiſh leaues dented or ſnipt about the edges like a Saw. The floures are ſmall and white, ſprinkled and poudered on the inner ſide, with yellow and purple ſpeckes mixed therewith. The root is ſmall and hairie.

Euphraſia.
Eye-bright.



¶ *The Place.*

This plant groweth in dry medowes, in greene and graſſie waies and paſtures ſtanding againſt the Sun.

¶ *The Time.*

Eye-bright beginneth to floure in Auguſt, and continueth vnto September, and muſt bee gathered while it floureth for phyſicks vſe.

¶ *The Names.*

It is commonly called *Euphraſia*, as alſo *Euphroſine*; notwithſtanding there is another *Euphroſine, viz.* Bugloſſe: it is called of ſome *Ocularis* and *Ophthalmica*, of the effect: in high-Dutch, **Augentroſt**: in low-Dutch, **Ooghentrooſt**: in Italian, Spaniſh, and French, *Eufraſia*, after the Latine name: in Engliſh, Eye-bright.

¶ *The Nature.*

This herbe is hot and dry, but yet more hot than dry.

¶ *The Vertues.*

It is very much commended for the eies. Being taken it ſelfe alone, or any way elſe, it preſerues the ſight, and being feeble & loſt it reſtores the ſame: it is giuen moſt fitly being beaten into pouder; oftentimes a like quantitie of Fennell ſeed is added thereto, and a little mace, to the which is put ſo much ſugar as the weight of them all commeth to. A

Eye-bright ſtamped and laid vpon the eyes, or the juice thereof mixed with white Wine, and dropped into the eyes, or the diſtilled water, taketh away the darkneſſe and dimneſſe of the eyes, and cleareth the ſight. B

Three parts of the pouder of Eye-bright, and one part of maces mixed therewith, taketh away all hurts from the eyes, comforteth the memorie, and cleareth the ſight, if halfe a ſpoonefull be taken euery morning faſting with a cup of white wine. C

‡ That which was formerly here ſet forth in the ſecond place vnder the title of *Euphraſia Cærulea Taber.* was deſcribed by our Author amongſt the Scorpion graſſes, in the third place, Chap. 54. and the figure is pag. 338. vnder the title of *Myoſotis Scorpioides paluſtris.*

Chap. 217. *Of Marjerome.*

¶ *The Deſcription.*

1 Sweet Marjerome is a low and ſhrubbie plant, of a whitiſh colour and maruellous ſweet ſmell, a foot or ſomwhat more high. The ſtalkes are ſlender, and parted into diuers branches, about which grow forth little leaues ſoft and hoarie: the floures grow at the top in ſcalie or chaffie ſpiked eares, of a white colour like vnto thoſe of Candy Organy. The root is compact of many ſmall threds. The whole plant and euerie part thereof is of a moſt pleaſant taſt and aromaticall ſmell, and periſheth at the firſt approch of Winter.

2 Pot Marjerome or Winter Marjerome hath many threddy tough roots, from which riſe immediatly diuers ſmall branches, whereon are placed ſuch leaues as the precedent, but not ſo hoary, nor yet ſo ſweet of ſmell, bearing at the top of the branches tufts of white floures tending to purple. The whole plant is of long continuance, and keepeth greene all the Winter; whereupon our Engliſh women haue called it, and that very properly, Winter Marjerome.

3 Marjerome gentle hath many branches, riſing from a threddy root, whereupon do grow ſoft and ſweet ſmelling leaues of an ouerworne ruſſet colour. The floures ſtand at the top of the ſtalks, compact

1 *Marjorana major.*
Great ſweet Marjerome.

Origanum majorana, L. mus. dub.

Marjorana major Anglica.
Pot Marjerome.

3 *Marjorana tenuifolia.*
Marjerome gentle.

Origanum majorana, L. β mus. dub.

compact of diuers ſmall chaffie ſcales, of a white colour tending to a bluſh. The whole plant is altogether like the great ſweet Marjerome, ſauing that it is altogether leſſer, and far ſweeter, wherein eſpecially conſiſteth the difference.

4 *Epimajorana* is likewiſe a kind of Marjerome, differing not from the laſt deſcribed, ſauing in that, that this plant hath in his naturall countrey of Candy, and not elſewhere, ſome laces or threds faſtned vnto his branches, ſuch, and after the ſame manner as thoſe are that doe grow vpon Sauorie, wherein is the difference.

¶ *The Place.*

Theſe plants do grow in Spain, Italy, Candy, and other Iſlands thereabout, wild, and in the fields; from whence wee haue the ſeeds for the gardens of our cold countries.

¶ *The Time.*

They are ſowne in May, and bring forth their ſcaly or chaffie husks or ears in Auguſt. They are to be watered in the middle of the day, when the Sun ſhineth hotteſt, euen as Baſill ſhould be, and not in the euening nor morning, as moſt plants are.

¶ *The Names.*

Marjerome is called *Marjorana*, and *Amaracus*, and alſo *Marum* and *Sampſychum* of others: in High-Dutch, **Mayoꝛan**: in Spaniſh, *Mayorana*, *Moradux*, and *Almoradux*: in French, *Mariolaine*: in Engliſh, Sweet Marjerome, Fine Marjerome, and Marierome ſome gentle; of the beſt ſort of Marjerane. The pot Marjerome is alſo called Winter Marjerome. Some haue made a doubt whether *Majorana* and *Sampſycum* be all one; which doubt, as I take it, is becauſe that *Galen* maketh a difference betweene them, intreating of them apart, and attributeth to either of them their operations. But *Amaracus Galeni* is *Parthenium*, or Feuerfew. *Dioſcorides* likewiſe witneſſeth, that ſome do call *Amaracus*, *Parthenium*; and *Galen* in his booke of the faculties of ſimple medicines, doth in no place make mention of *Parthenium*, but by the name of *Amaracus*. *Pliny* in his 21. booke, chap. 2. witneſſeth, that *Diocles* the phyſition, and they of Cicily did call that *Amaracus*, which the Ægyptians and the Syrians did call *Sampſycum*.

Virgil in the firſt booke of his *Æneidos* ſheweth, that *Amaracus* is a ſhrub bearing floures, writing thus;

——— Vbi mollis Amaracus illum
Floribus, & dulci aſpirans complectitur vmbra.

Likewiſe *Catullus* in his *Epithalamium*, or mariage ſong of *Iulia* and *Mallius* ſaith.

Cinge tempora floribus
Suaue olentis Amaraci.

Compaſſe the temples of the head with floures
Of Amarac, affording ſweet ſauours.

Notwithſtanding it may not ſeeme ſtrange, that Majorane is vſed in ſtead of *Sampſycum*, ſeeing that in *Galens* time alſo *Marum* was in the mixture of the ointment called *Amaracinum vnguentum*, in the place of *Sampſycum*, as he himſelfe witneſſeth in his firſt booke of counterpoyſons.

¶ *The Temperature.*

They are hot and dry in the ſecond degree; after ſome copies, hot and dry in the third.

¶ *The Vertues.*

A Sweet Marjerome is a remedy againſt cold diſeaſes of the braine and head, being taken any way to your beſt liking; put vp into the noſthrils it prouokes ſneeſing, and draweth forth much baggage flegme: it eaſeth the tooth-ache being chewed in the mouth; being drunke it prouoketh vrine and draweth away wateriſh humors, and is vſed in medicines againſt poyſon.

B The leaues boiled in water, and the decoction drunke, helpeth them that are entering into the dropſie: it eaſeth them that are troubled with difficulty of making water, and ſuch as are giuen to ouermuch ſighing, and eaſeth the paines of the belly.

C The leaues dried and mingled with honey, and giuen, diſſolue congealed or clotted bloud, and put away blacke and blew markes after ſtripes and bruſes, being applied thereto.

D The leaues are excellent good to be put into all odoriferous ointments, waters, pouders, broths, and meates.

E The dried leaues poudered, and finely ſearched, are good to put into Cerotes, or Cere-clothes, and ointments, profitable againſt cold ſwellings, and members out of joynt.

F There is an excellent oyle to be drawne forth of theſe herbes, good againſt the ſhrinking of ſinewes, crampes, conuulſions, and all aches proceeding of a colde cauſe.

Chap. 218. *Of wilde Marjerome.*

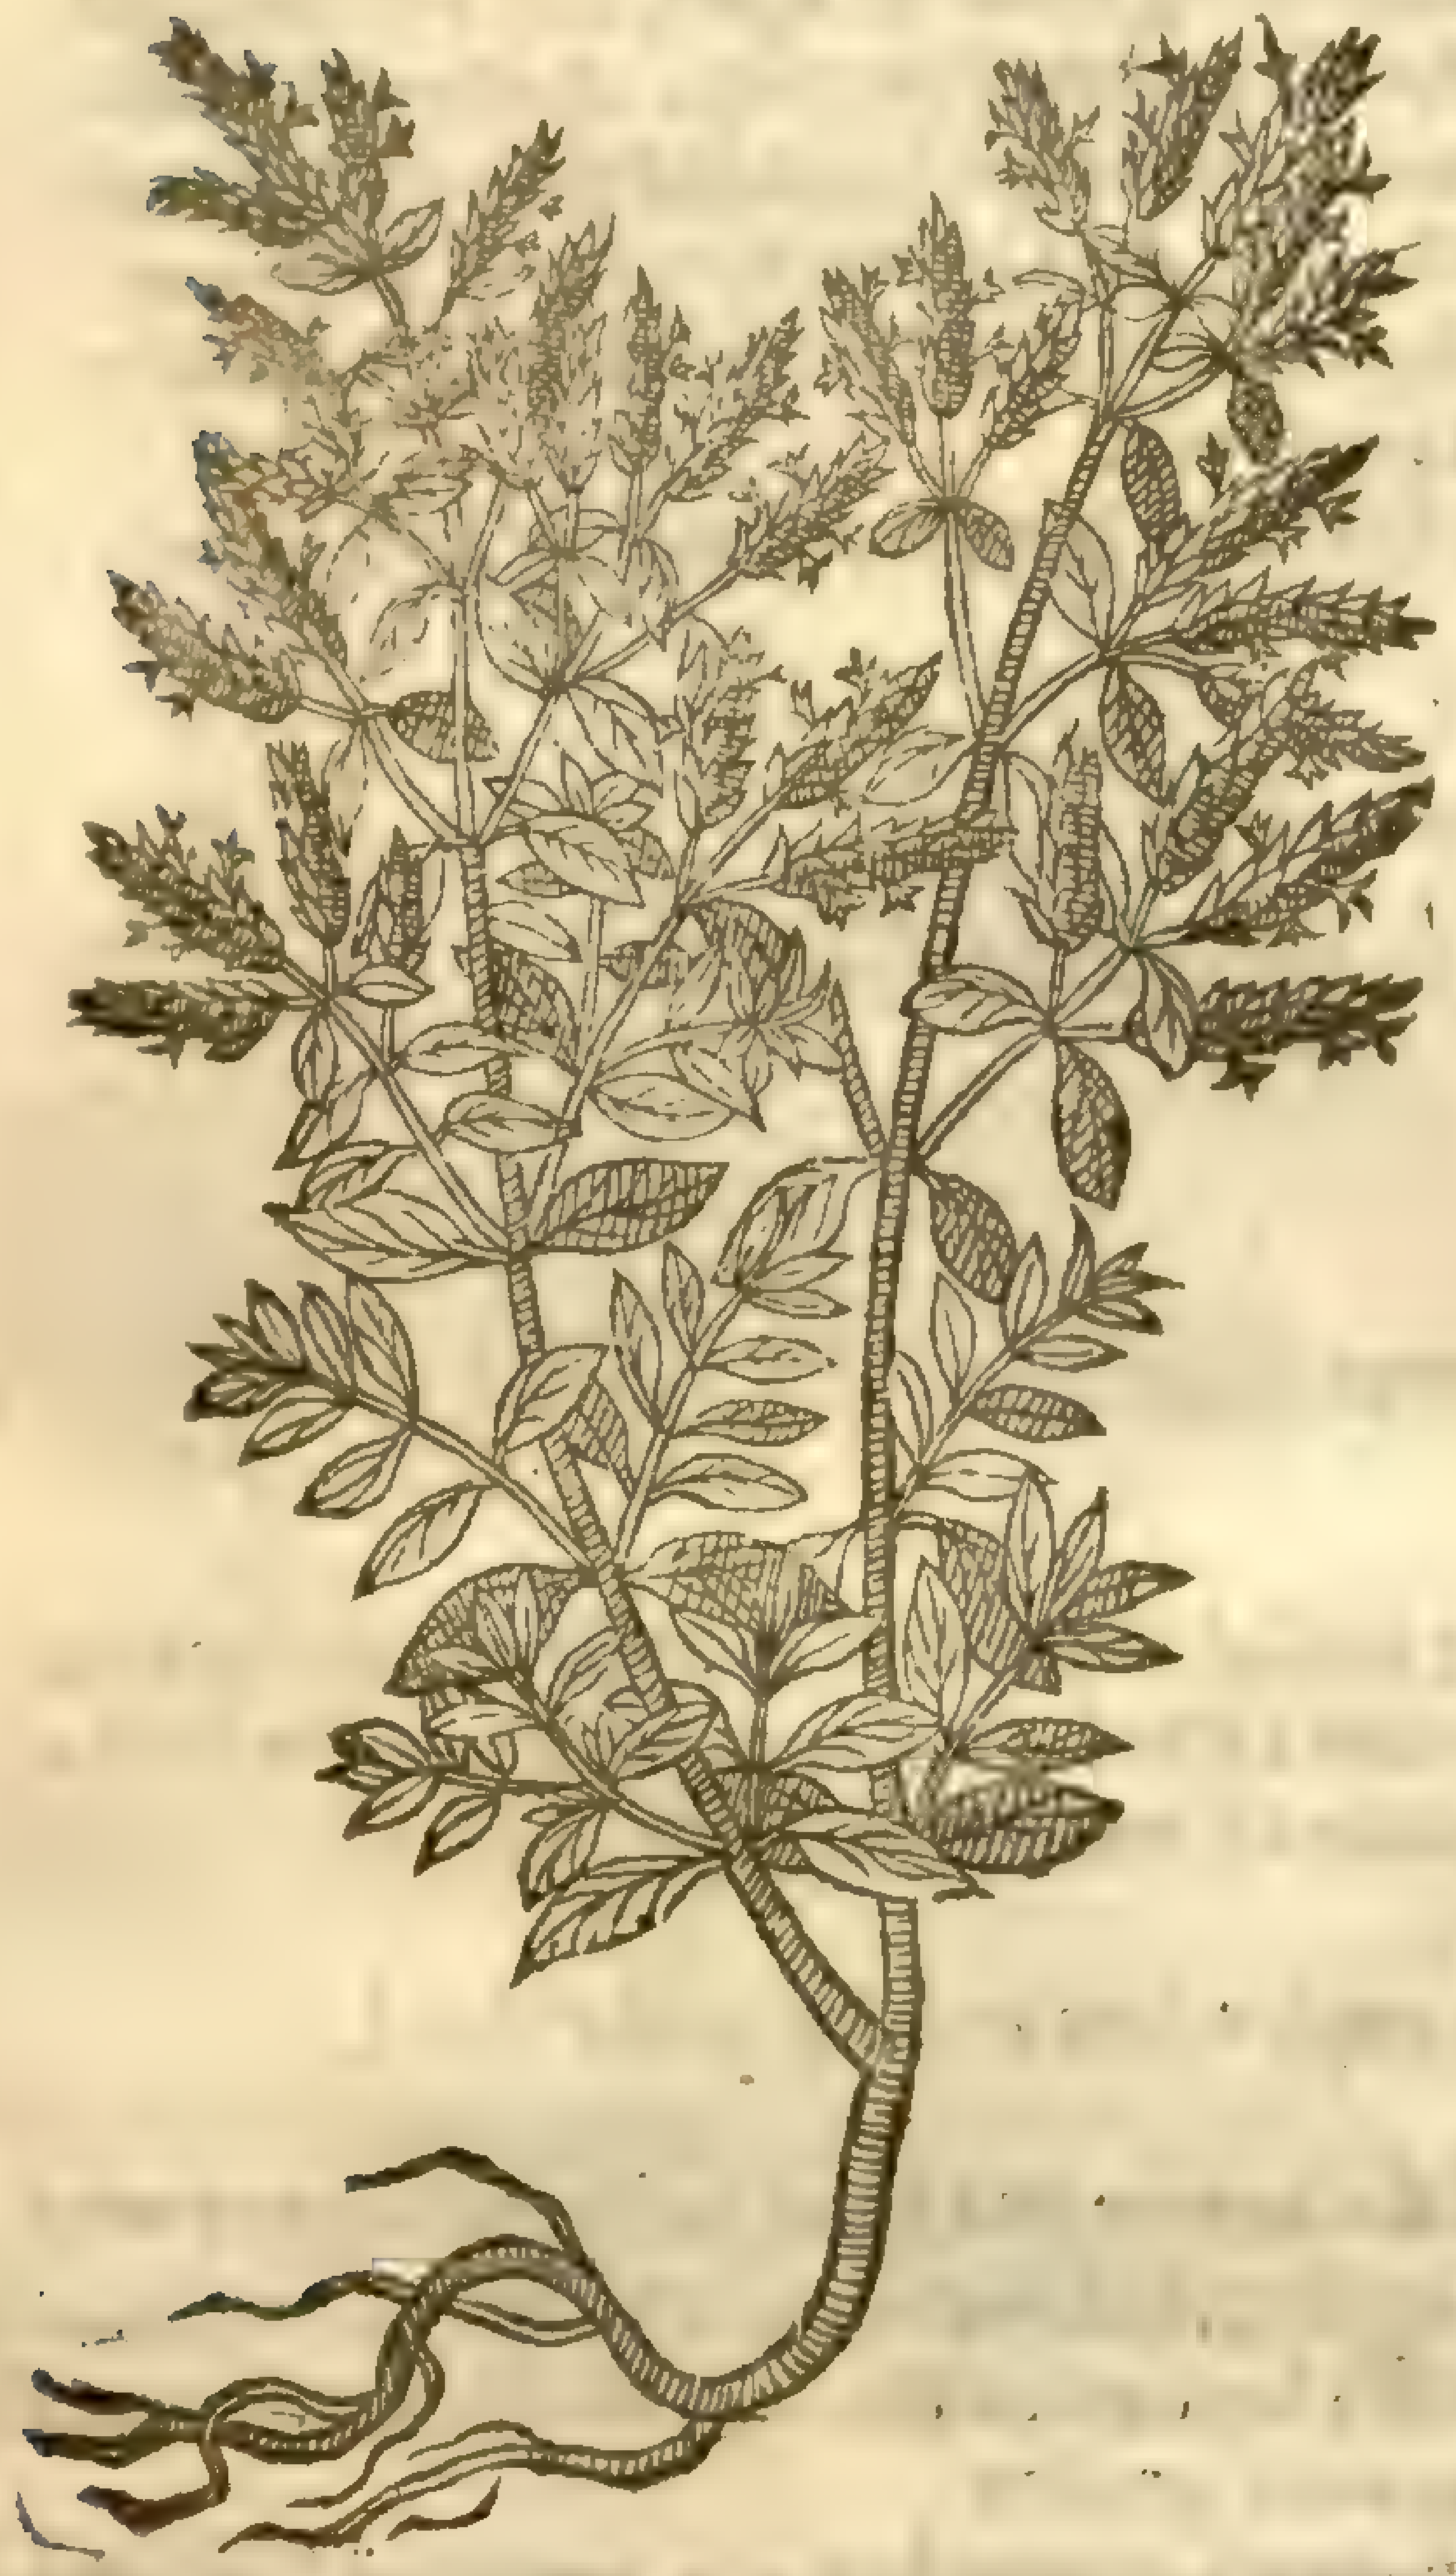
¶ *The Deſcription.*

1 Baſtard Marjerome groweth ſtraight vp with little round ſtalkes of a reddiſh colour, full of branches, a foot high and ſometimes higher. The leaues be broad, more long than round, of a whitiſh greene colour: on the top of the branches ſtand long ſpikie ſcaled eares, out of which ſhoot forth little white floures like the flouring of wheat. The whole plant is of a ſweet ſmell, and ſharpe biting taſte.

2 The white Organy, or baſtard Marjerome with white floures, differing little from the precedent, but in colour and ſtature. This plant hath whiter and broader leaues, and alſo much higher, wherein conſiſteth the difference.

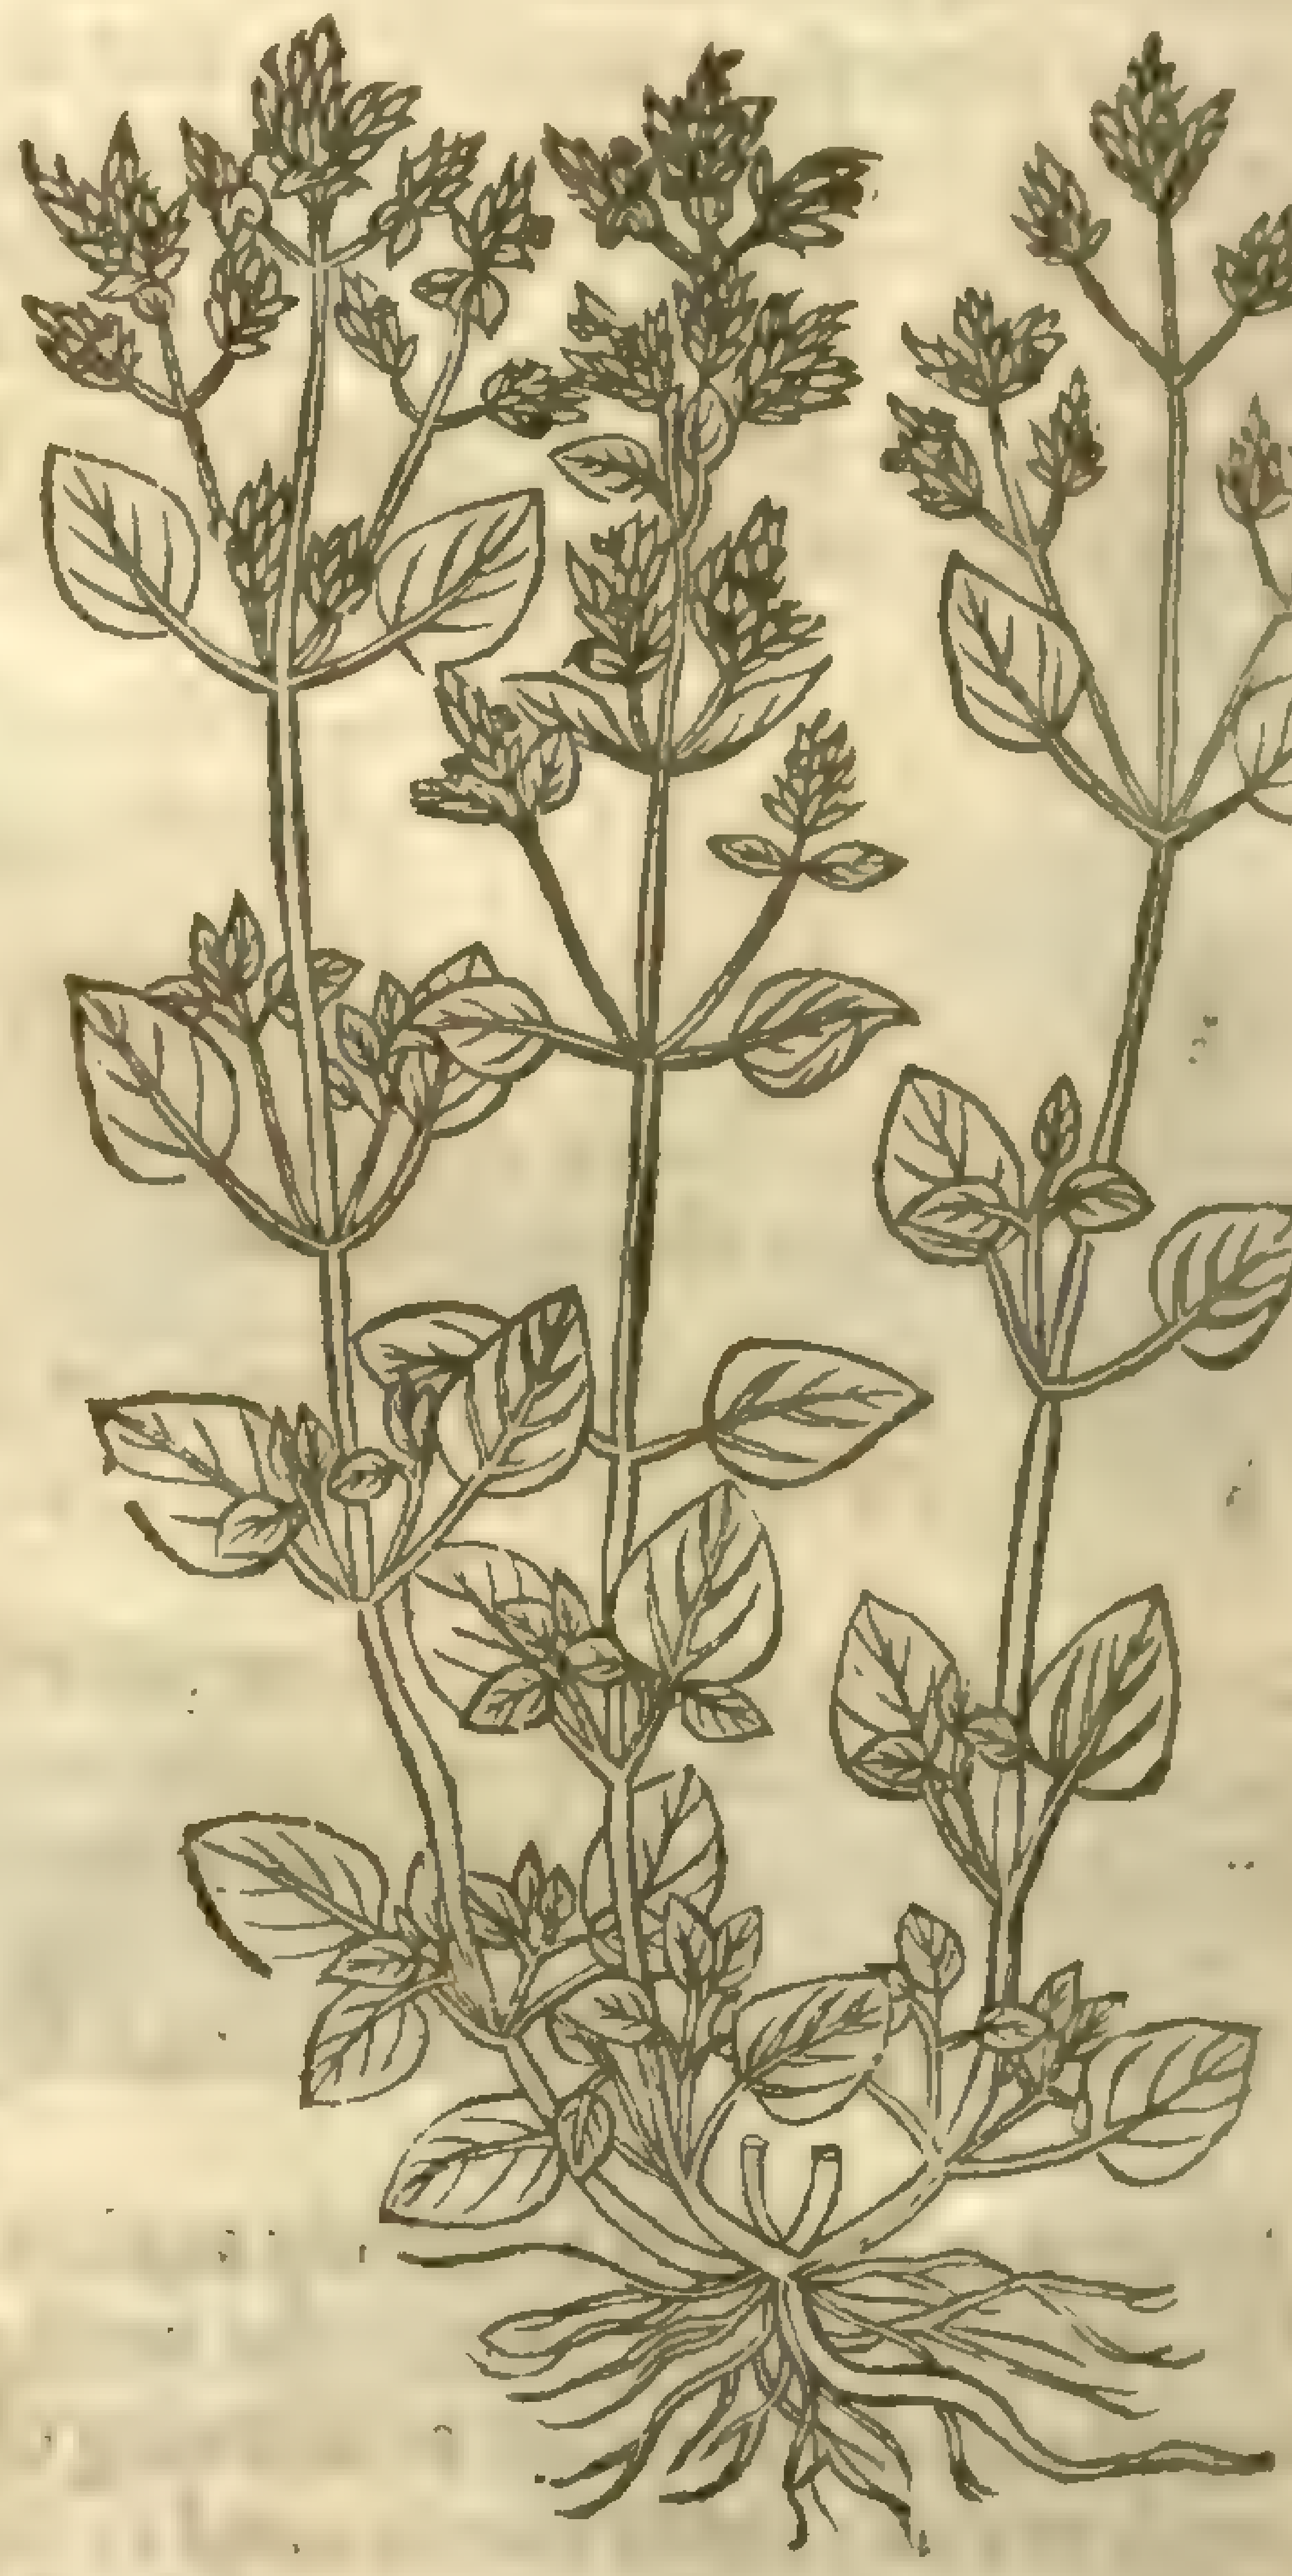
3 Baſtard Marjerome of Candy hath many threddy roots; from which riſe vp diuers weake and feeble branches trailing vpon the ground, ſet with faire greene leaues, not vnlike thoſe of Penny Royall, but broader and ſhorter: at the top of thoſe branches ſtand ſcalie or chaffie eares of a purple colour. The whole plant is of a moſt pleaſant ſweet ſmell. The root endured in my garden

1 *Origanum Heracleoticum.*
Baſtard Marjerome.

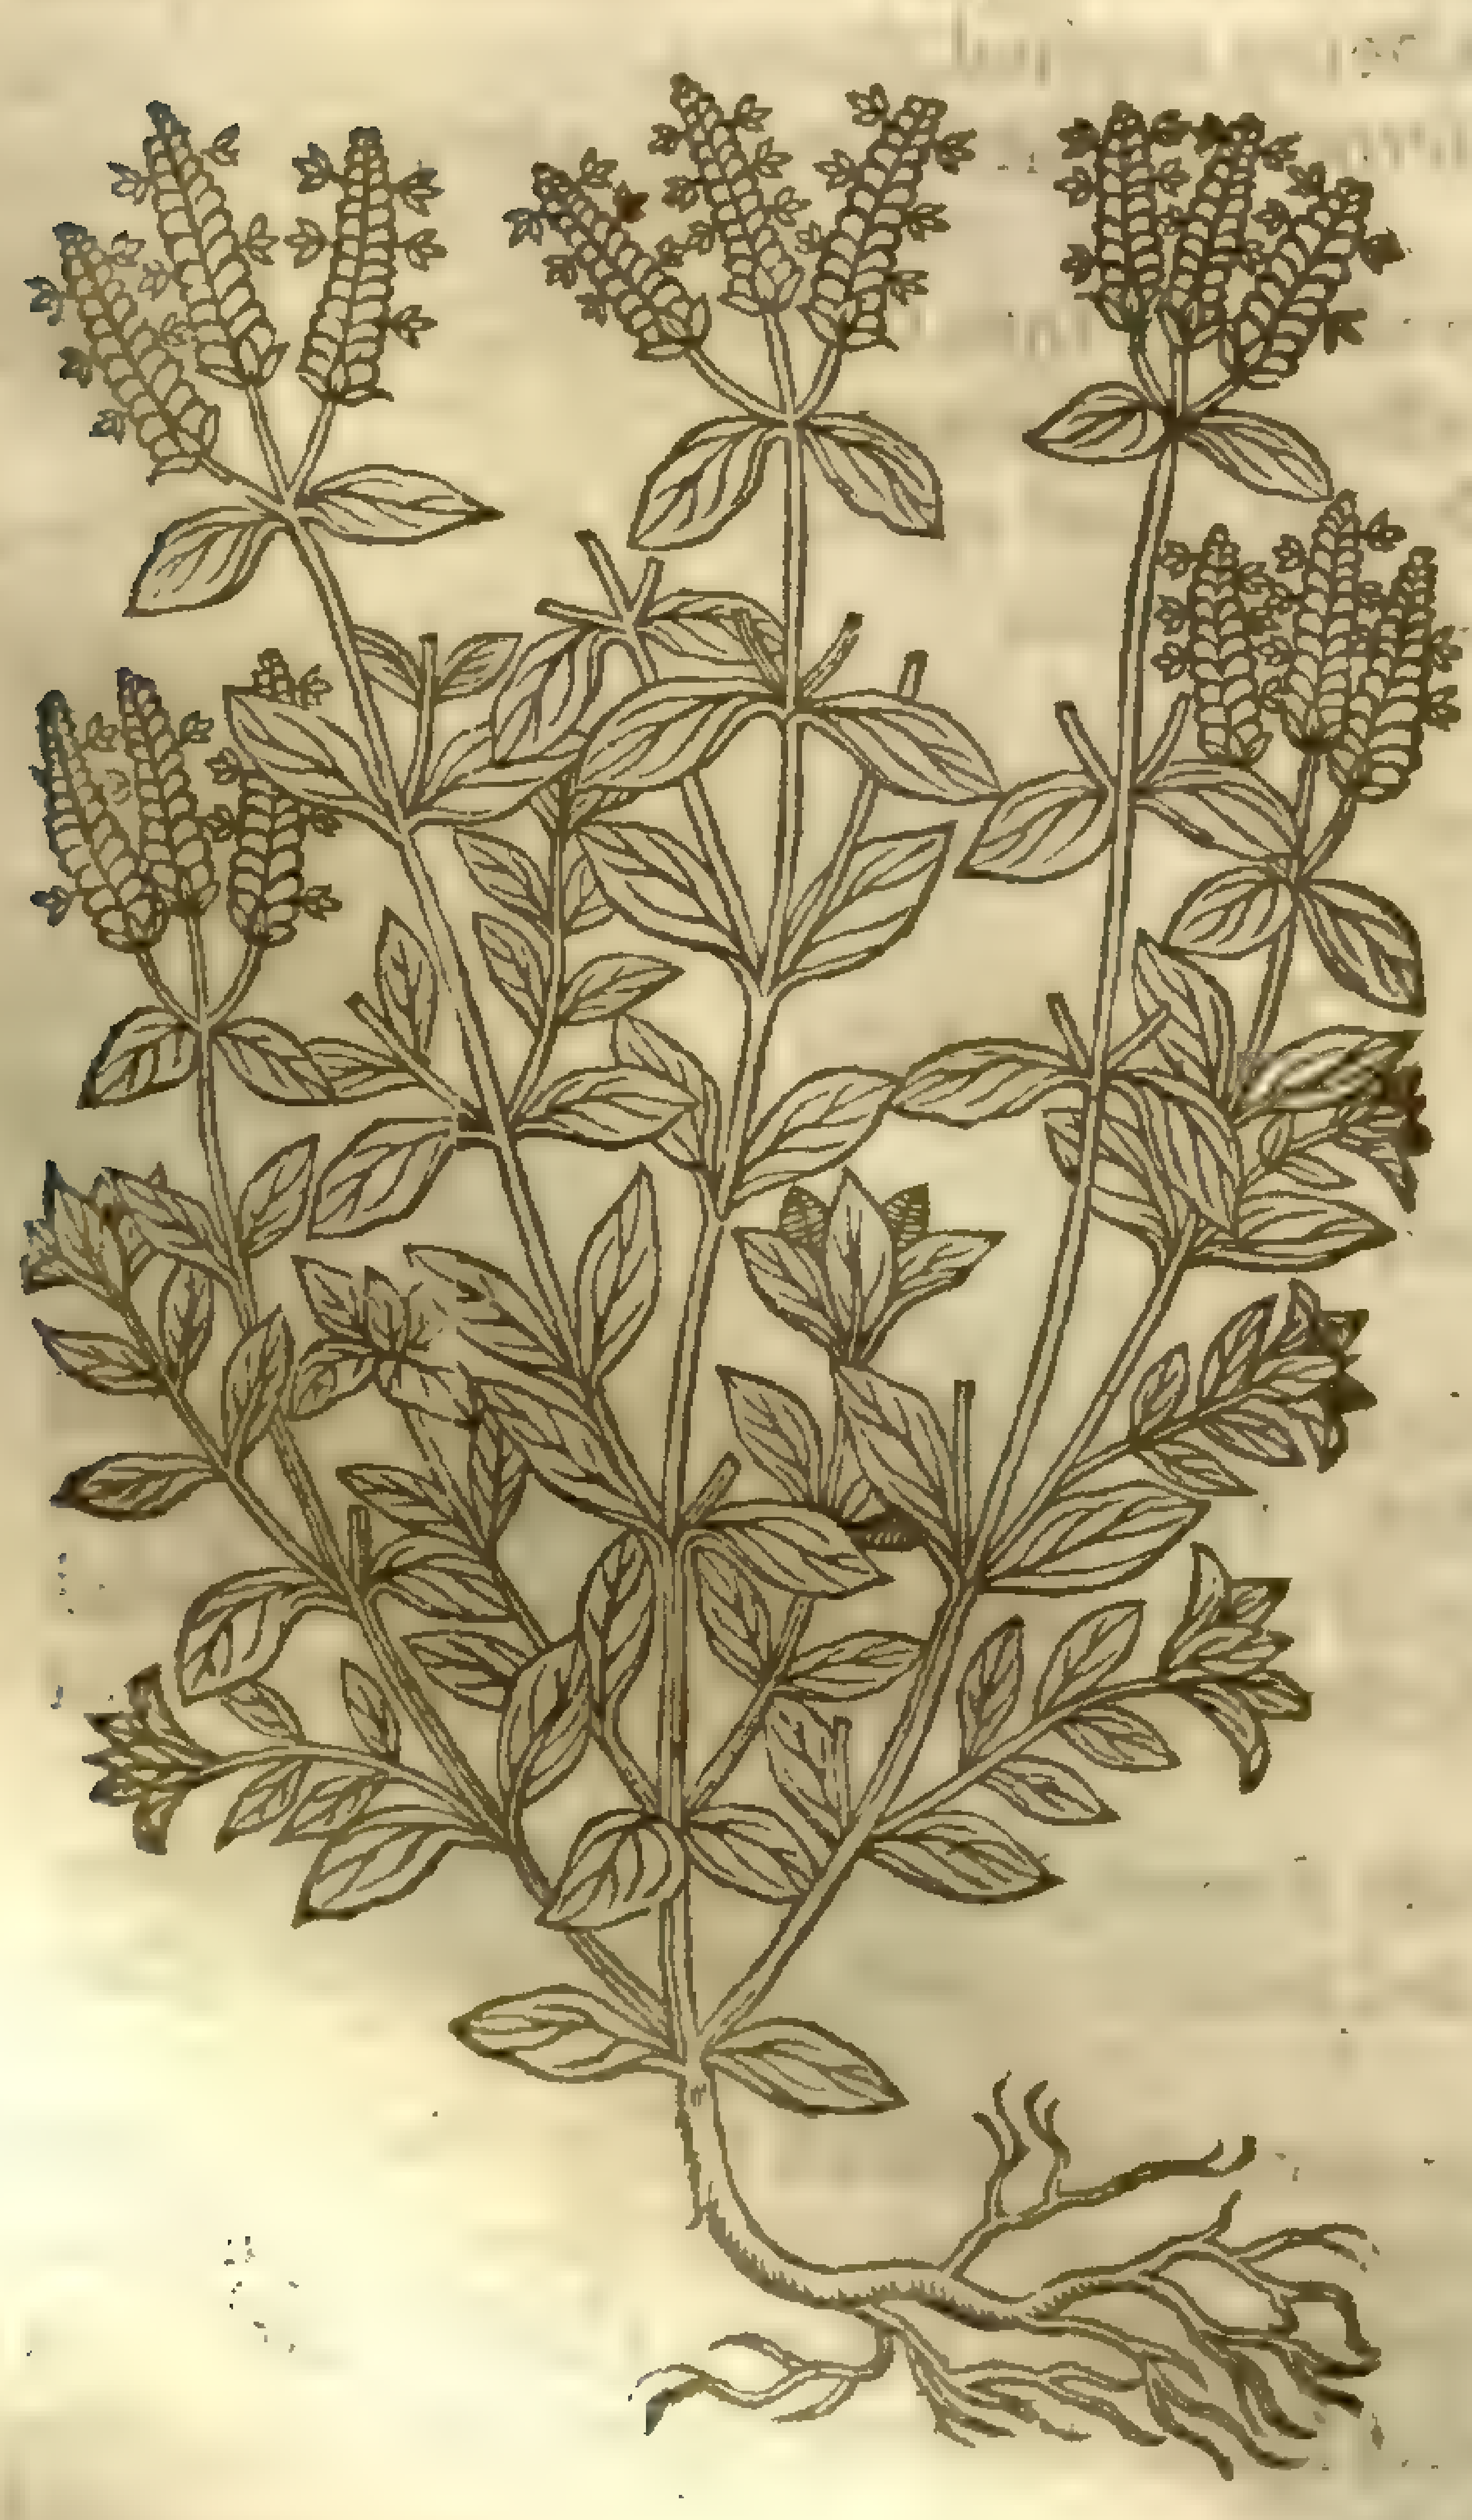


O. heracleoticum, & Linn. descr.

† 2 *Origanum album, Tabern.*
White baſtard Marjerome.

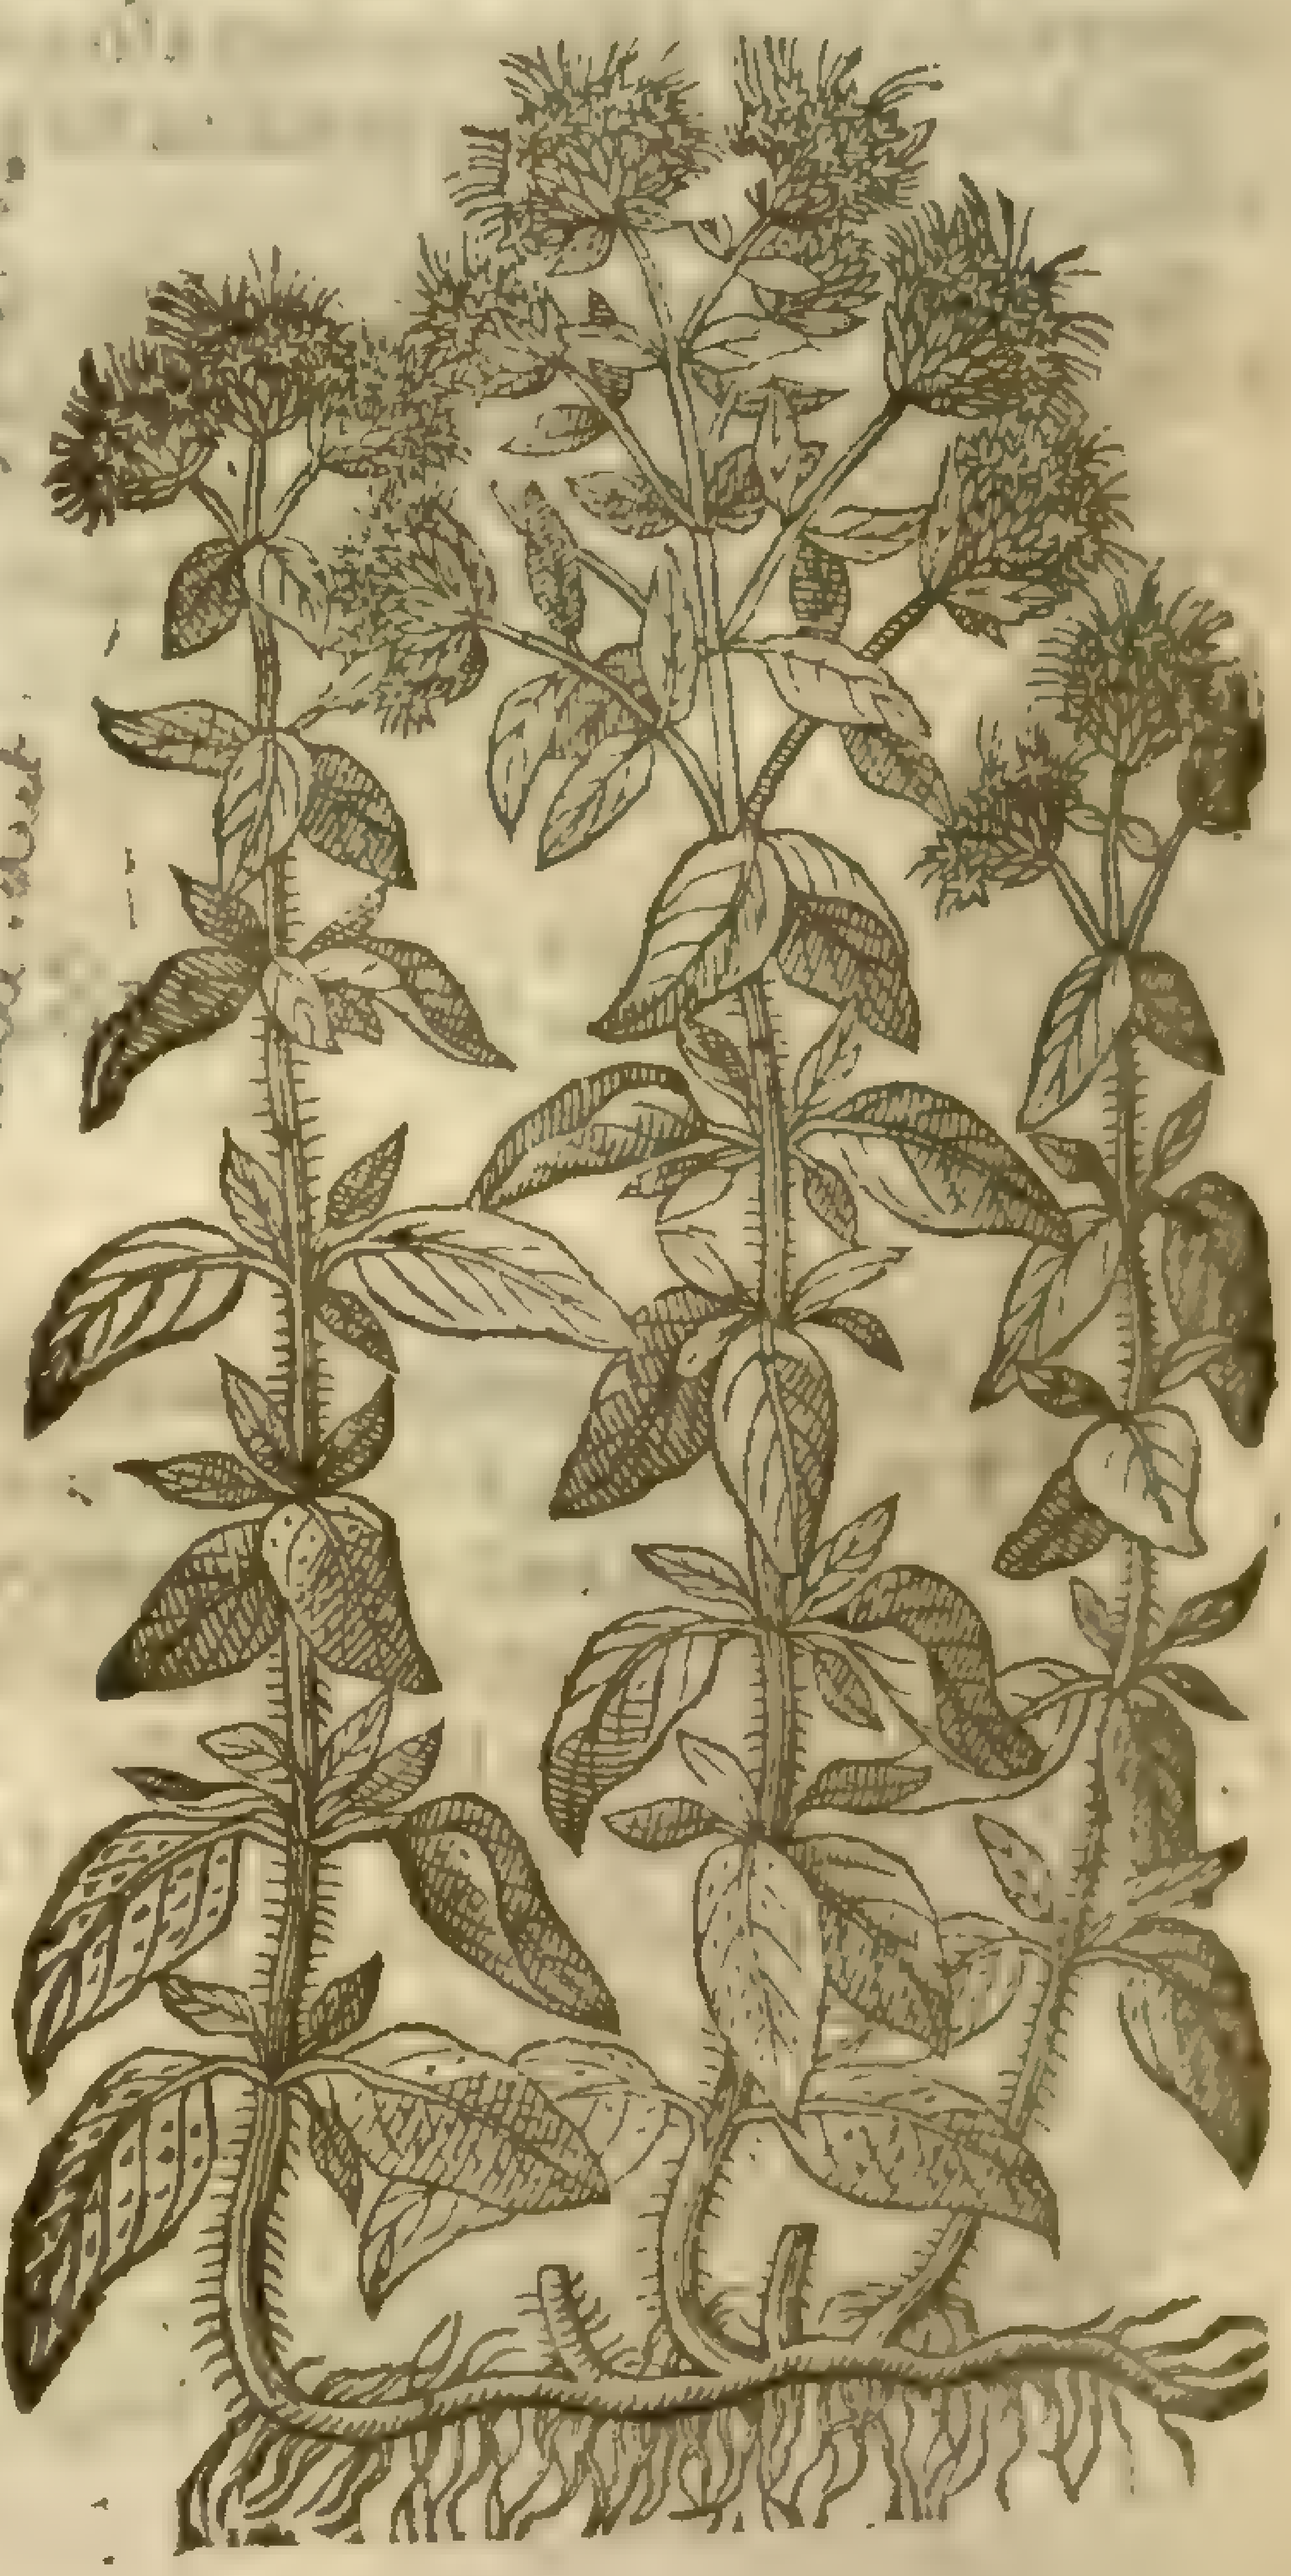


† 3 *Origanum Creticum.*
Wilde Marjerome of Candy.



4 *Origanum Anglicum.*
Engliſh wilde Marjerome.

O. vulgare, & male desc. Sm. f. 3.



and the leaues alſo greene all this Winter long, 1597. although it hath beene ſaid that it doth periſh at the firſt froſt, as ſweet Marjerome doth.

4 Engliſh wilde Marjerome is exceedingly well knowne to all, to haue long, ſtiffe, and hard ſtalkes of two cubits high, ſet with leaues like thoſe of ſweet Marjerome, but broader and greater, of a ruſſet greene colour, on the top of the branches ſtand tufts of purple floures, compoſed of many ſmall ones ſet together very cloſely vmbell faſhion. The root creepeth in the ground, and is long laſting.

¶ *The Place.*

Theſe plants do grow wilde in the Kingdome of Spaine, Italy, and other of thoſe hot regions. The laſt of the foure doth grow wilde in the borders of fields, and low copſes, in moſt places of England.

¶ *The Time.*

They floure and flouriſh in the Summer moneths, afterward the ſeed is perfected.

¶ *The Names.*

Baſtard Marjerome is called in Greeke, ὀρίγανος; and that which is ſurnamed *Heracleoticum*, ὀρίγανος ἡρακλεωτικὴ: of diuers it is called *Cunila*: in ſhops, *Origanum Hiſpanicum*, Spaniſh Organy: our Engliſh wilde Marjerome is called in Greeke of *Dioſcorides*, *Galen*, and *Pliny*, *Onitis*: of ſome *Agrioriganum*, or *Sylueſtre Origanum*: in Italian, *Origano*: in Spaniſh, *Oregano*: in French, *Mariolaine baſtarde*: in Engliſh, Organe, baſtard Marjerome: and that of ours, wilde Marjerome, and groue Marjerome.

¶ *The Temperature.*

All the Organies do cut, attenuate, or make thin, dry, and heate, and that in the third degree; and *Galen* teacheth, that wilde Marjerome is more forceable and of greater ſtrength; notwithſtanding Organy of Candy which is brought dry out of Spaine (wherof I haue a plant in my garden) is more biting than any of the reſt, and of greater heate.

¶ *The Vertues.*

Organy giuen in wine is a remedy againſt the bitings, and ſtingings of venomous beaſts, and cureth them that haue drunke *Opium*, or the juyce of blacke Poppy, or hemlockes, eſpecially if it be giuen with wine and raiſons of the ſunne. A

The decoction of Organy prouoketh vrine, bringeth downe the monethly courſe, and is giuen with good ſucceſſe to thoſe that haue the dropſie. B

It is profitably vſed in a looch, or a medicine to be licked, againſt the old cough and the ſtuffing of the lungs. C

It healeth ſcabs, itches, and ſcuruineſſe, being vſed in bathes, and it taketh away the bad colour which commeth of the yellow jaundiſe. D

The weight of a dram taken with meade or honied water, draweth forth by ſtoole blacke and filthy humors, as *Dioſcorides* and *Pliny* write. E

The juyce mixed with a little milke, being poured into the eares, mitigateth the paines thereof. F

The ſame mixed with the oile of *Ireos*, or the roots of the white Florentine floure-de-luce, and drawne vp into the noſthrils, draweth downe water and flegme: the herbe ſtrowed vpon the ground driueth away ſerpents. G

The decoction looſeth the belly, and voideth choler; and drunke with vinegre helpeth the infirmities of the ſpleene, and drunke in wine helpeth againſt all mortall poyſons, and for that cauſe it is put into mithridate and treacles prepared for that purpoſe. H

Theſe plants are eaſie to be taken in potions, and therefore to good purpoſe they may be vſed and miniſtred vnto ſuch as cannot brooke their meate, and to ſuch as haue a ſowre ſquamiſh and watery ſtomacke, as alſo againſt the ſwouning of the heart. I

† The ſecond and third figures were formerly tranſpoſed.

Chap. 219. *Of Goates Marjerome, or Organy.*

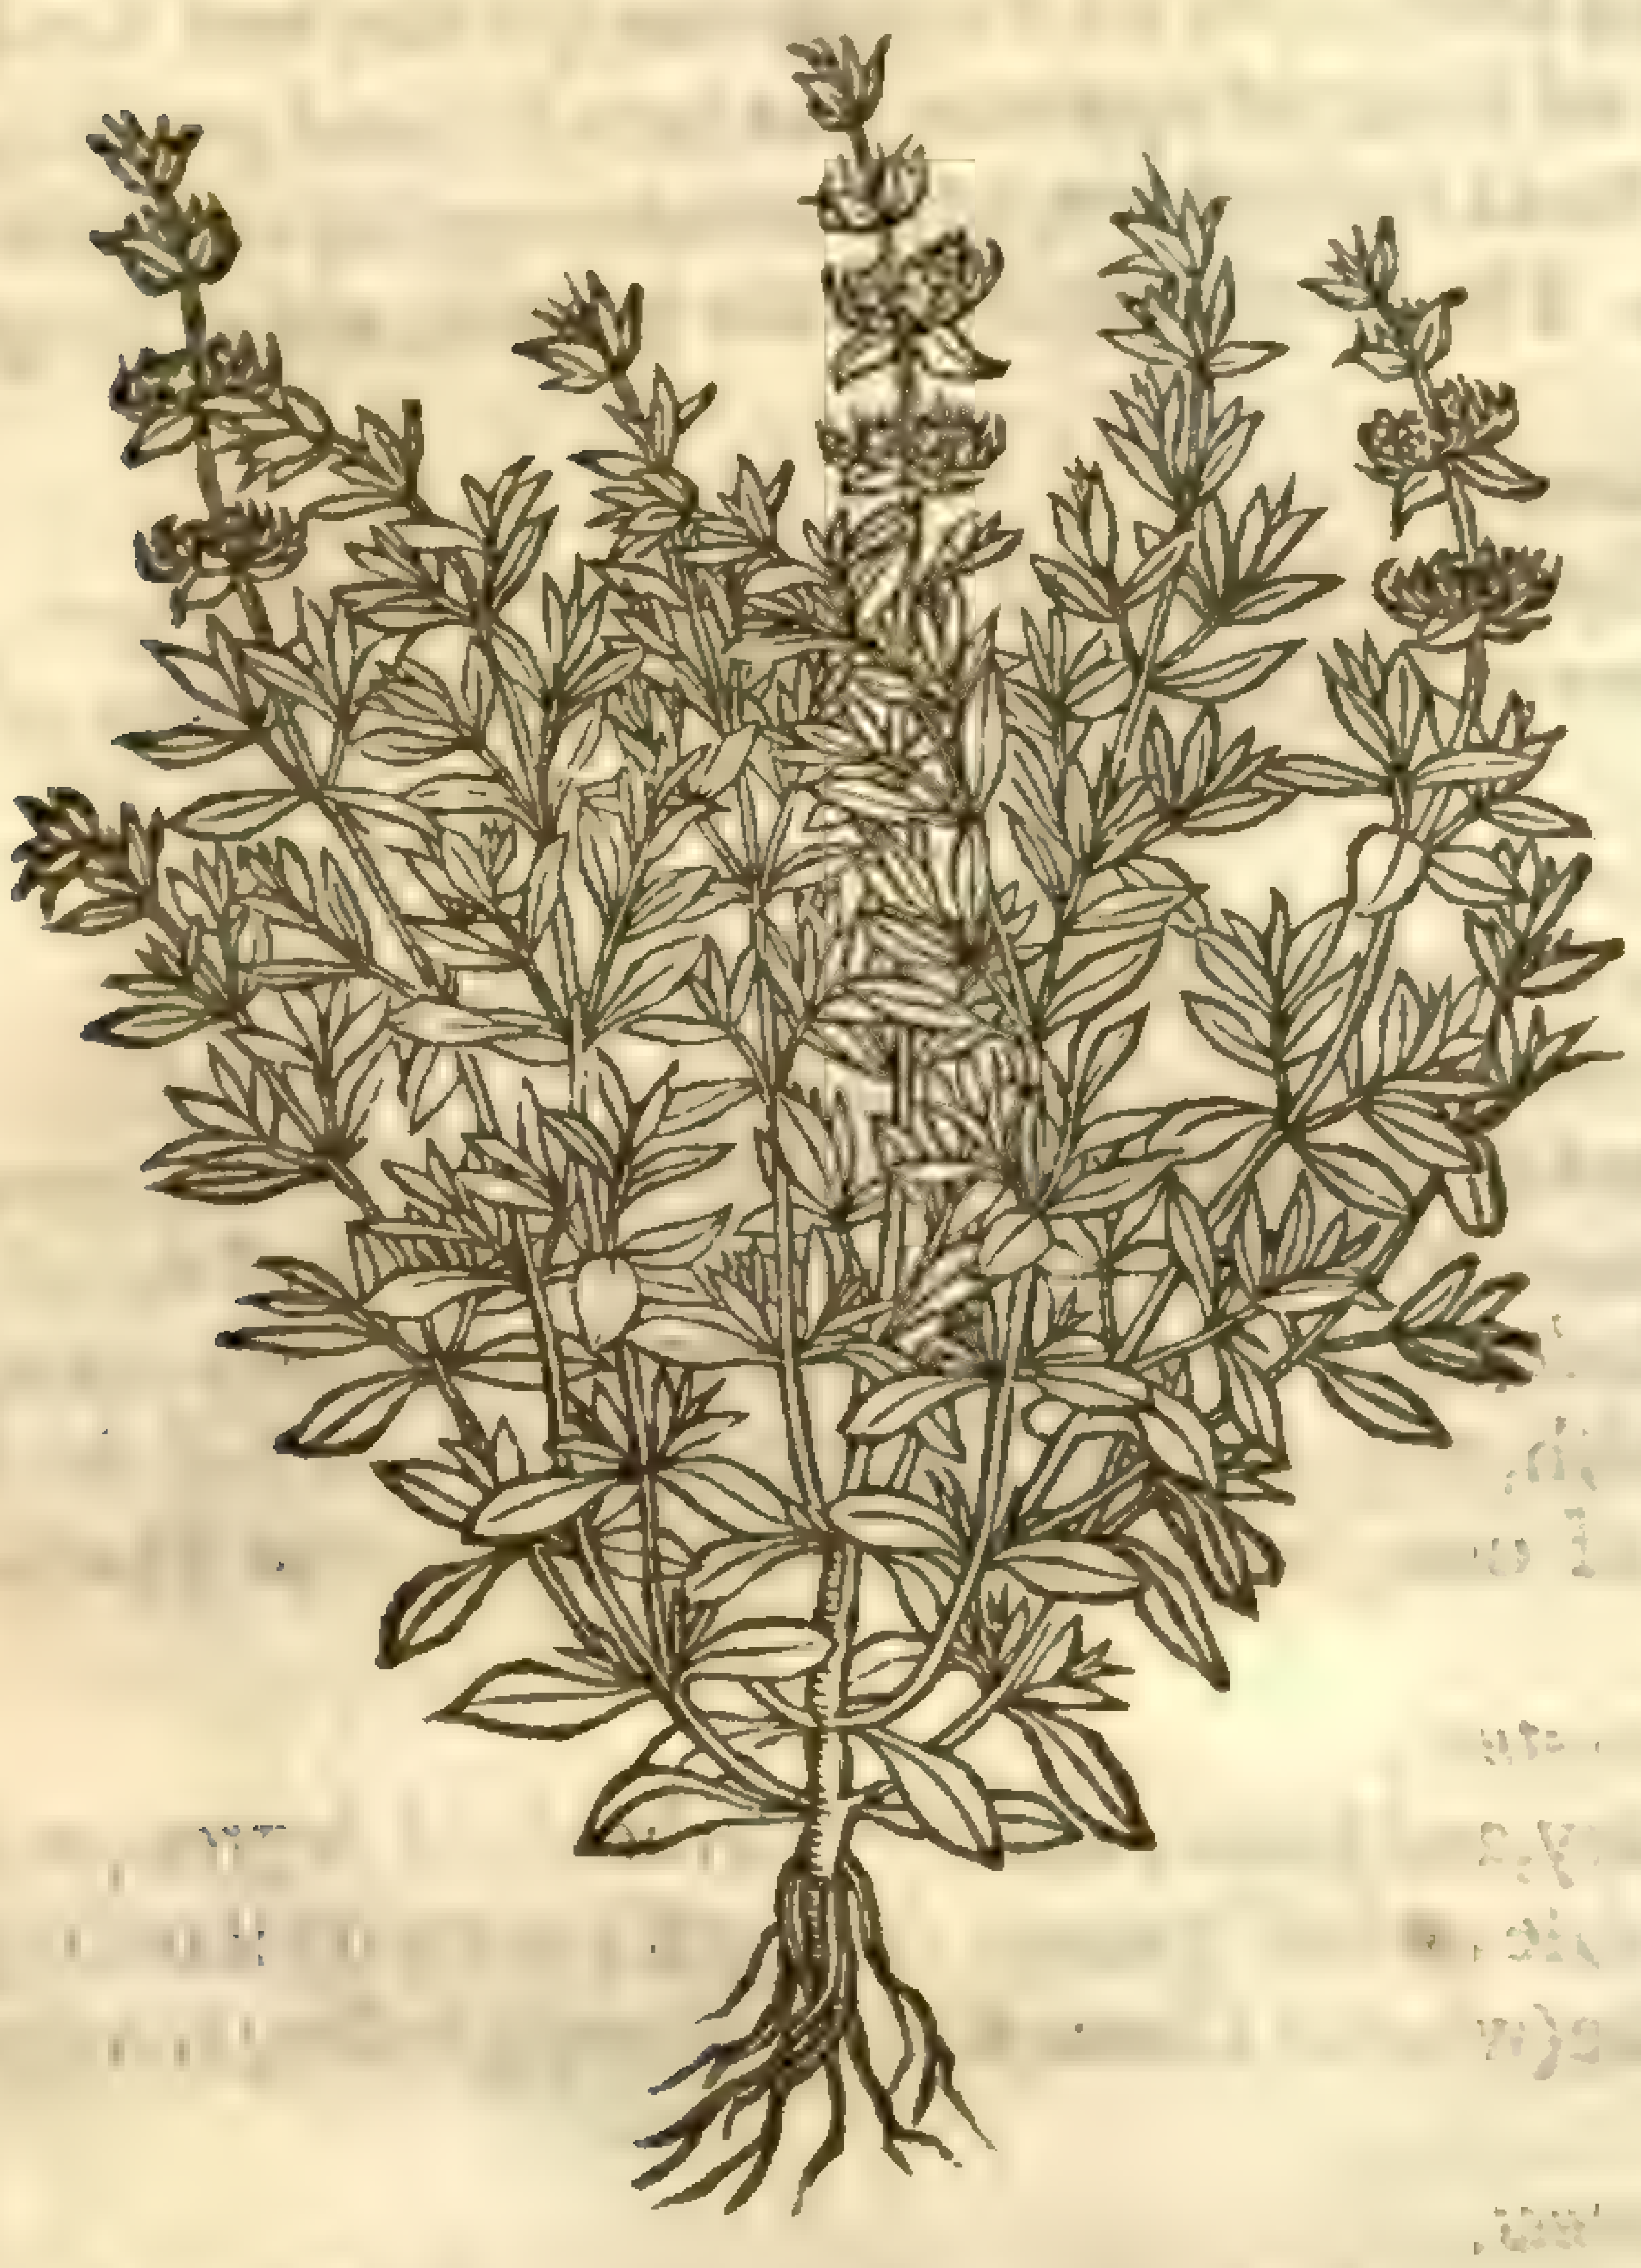
¶ *The Deſcription.*

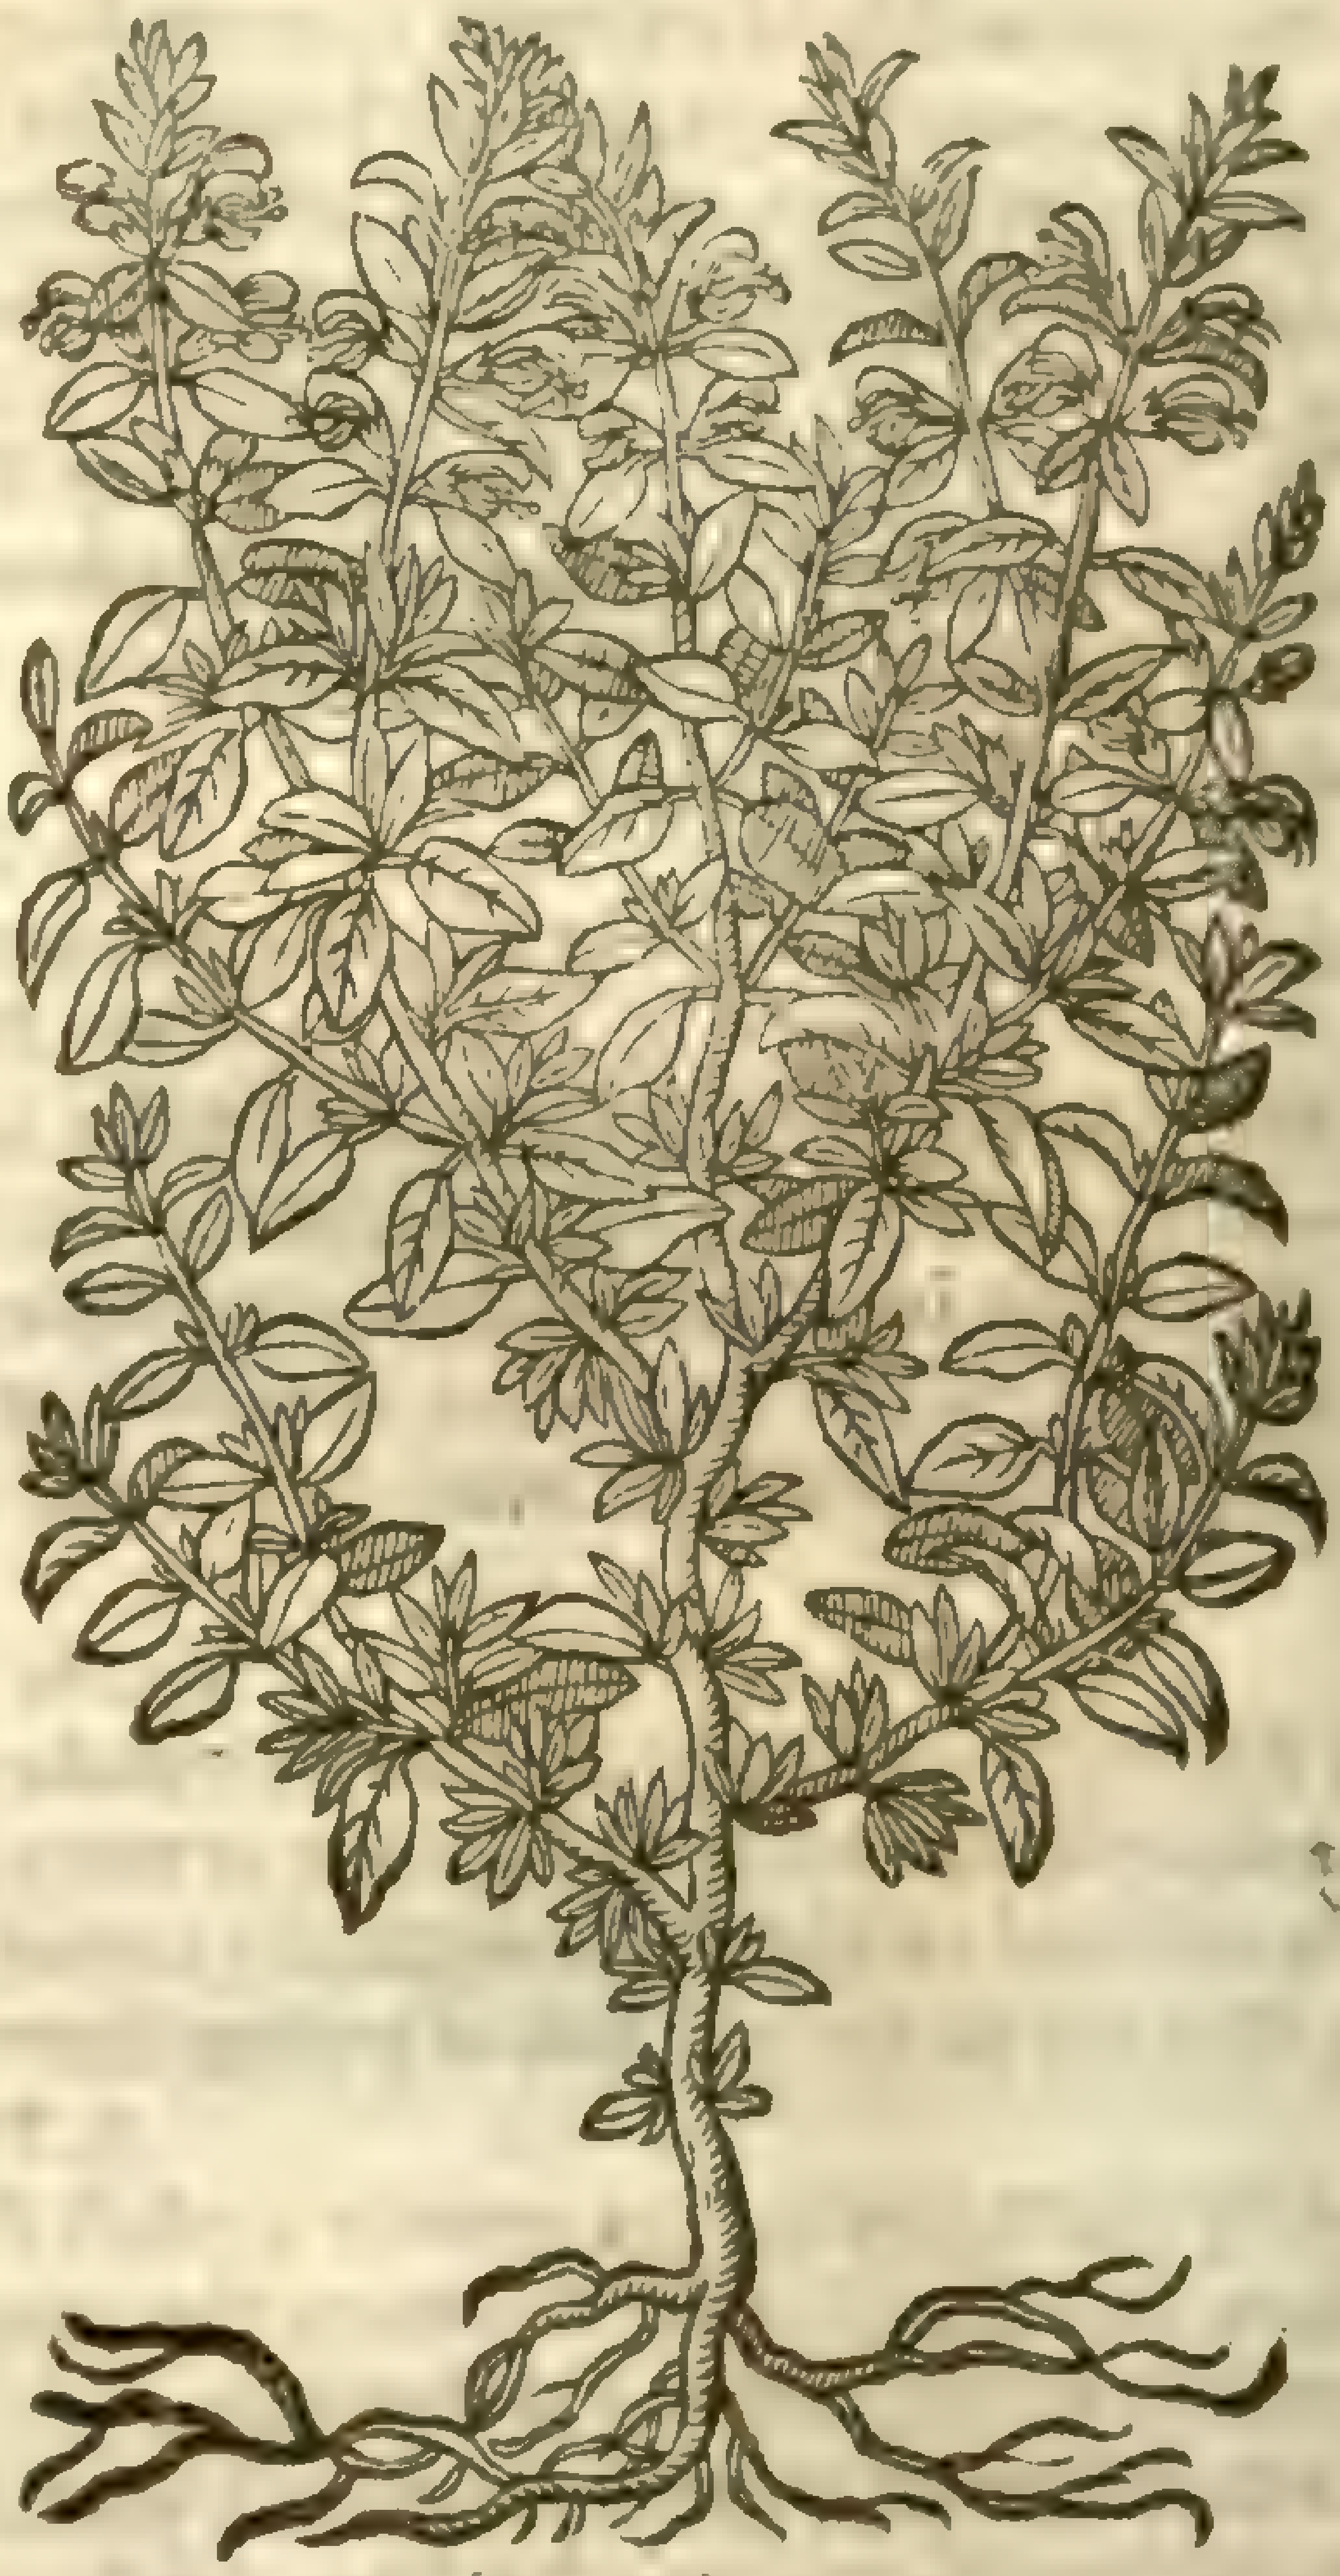
1 The ſtalkes of Goates Organy are ſlender, hard and wooddy, of a blackiſh colour; whereon are ſet long leaues, greater than thoſe of the wilde Time, ſweet of ſmell, rough, and ſomewhat hairy. The floures be ſmall, and grow out of little crownes or wharles round about the top of the ſtalkes, tending to a purple colour. The root is ſmall and threddy.

† 1 *Tragoriganum Dod.*

† *Tragoriganum. Lob.*

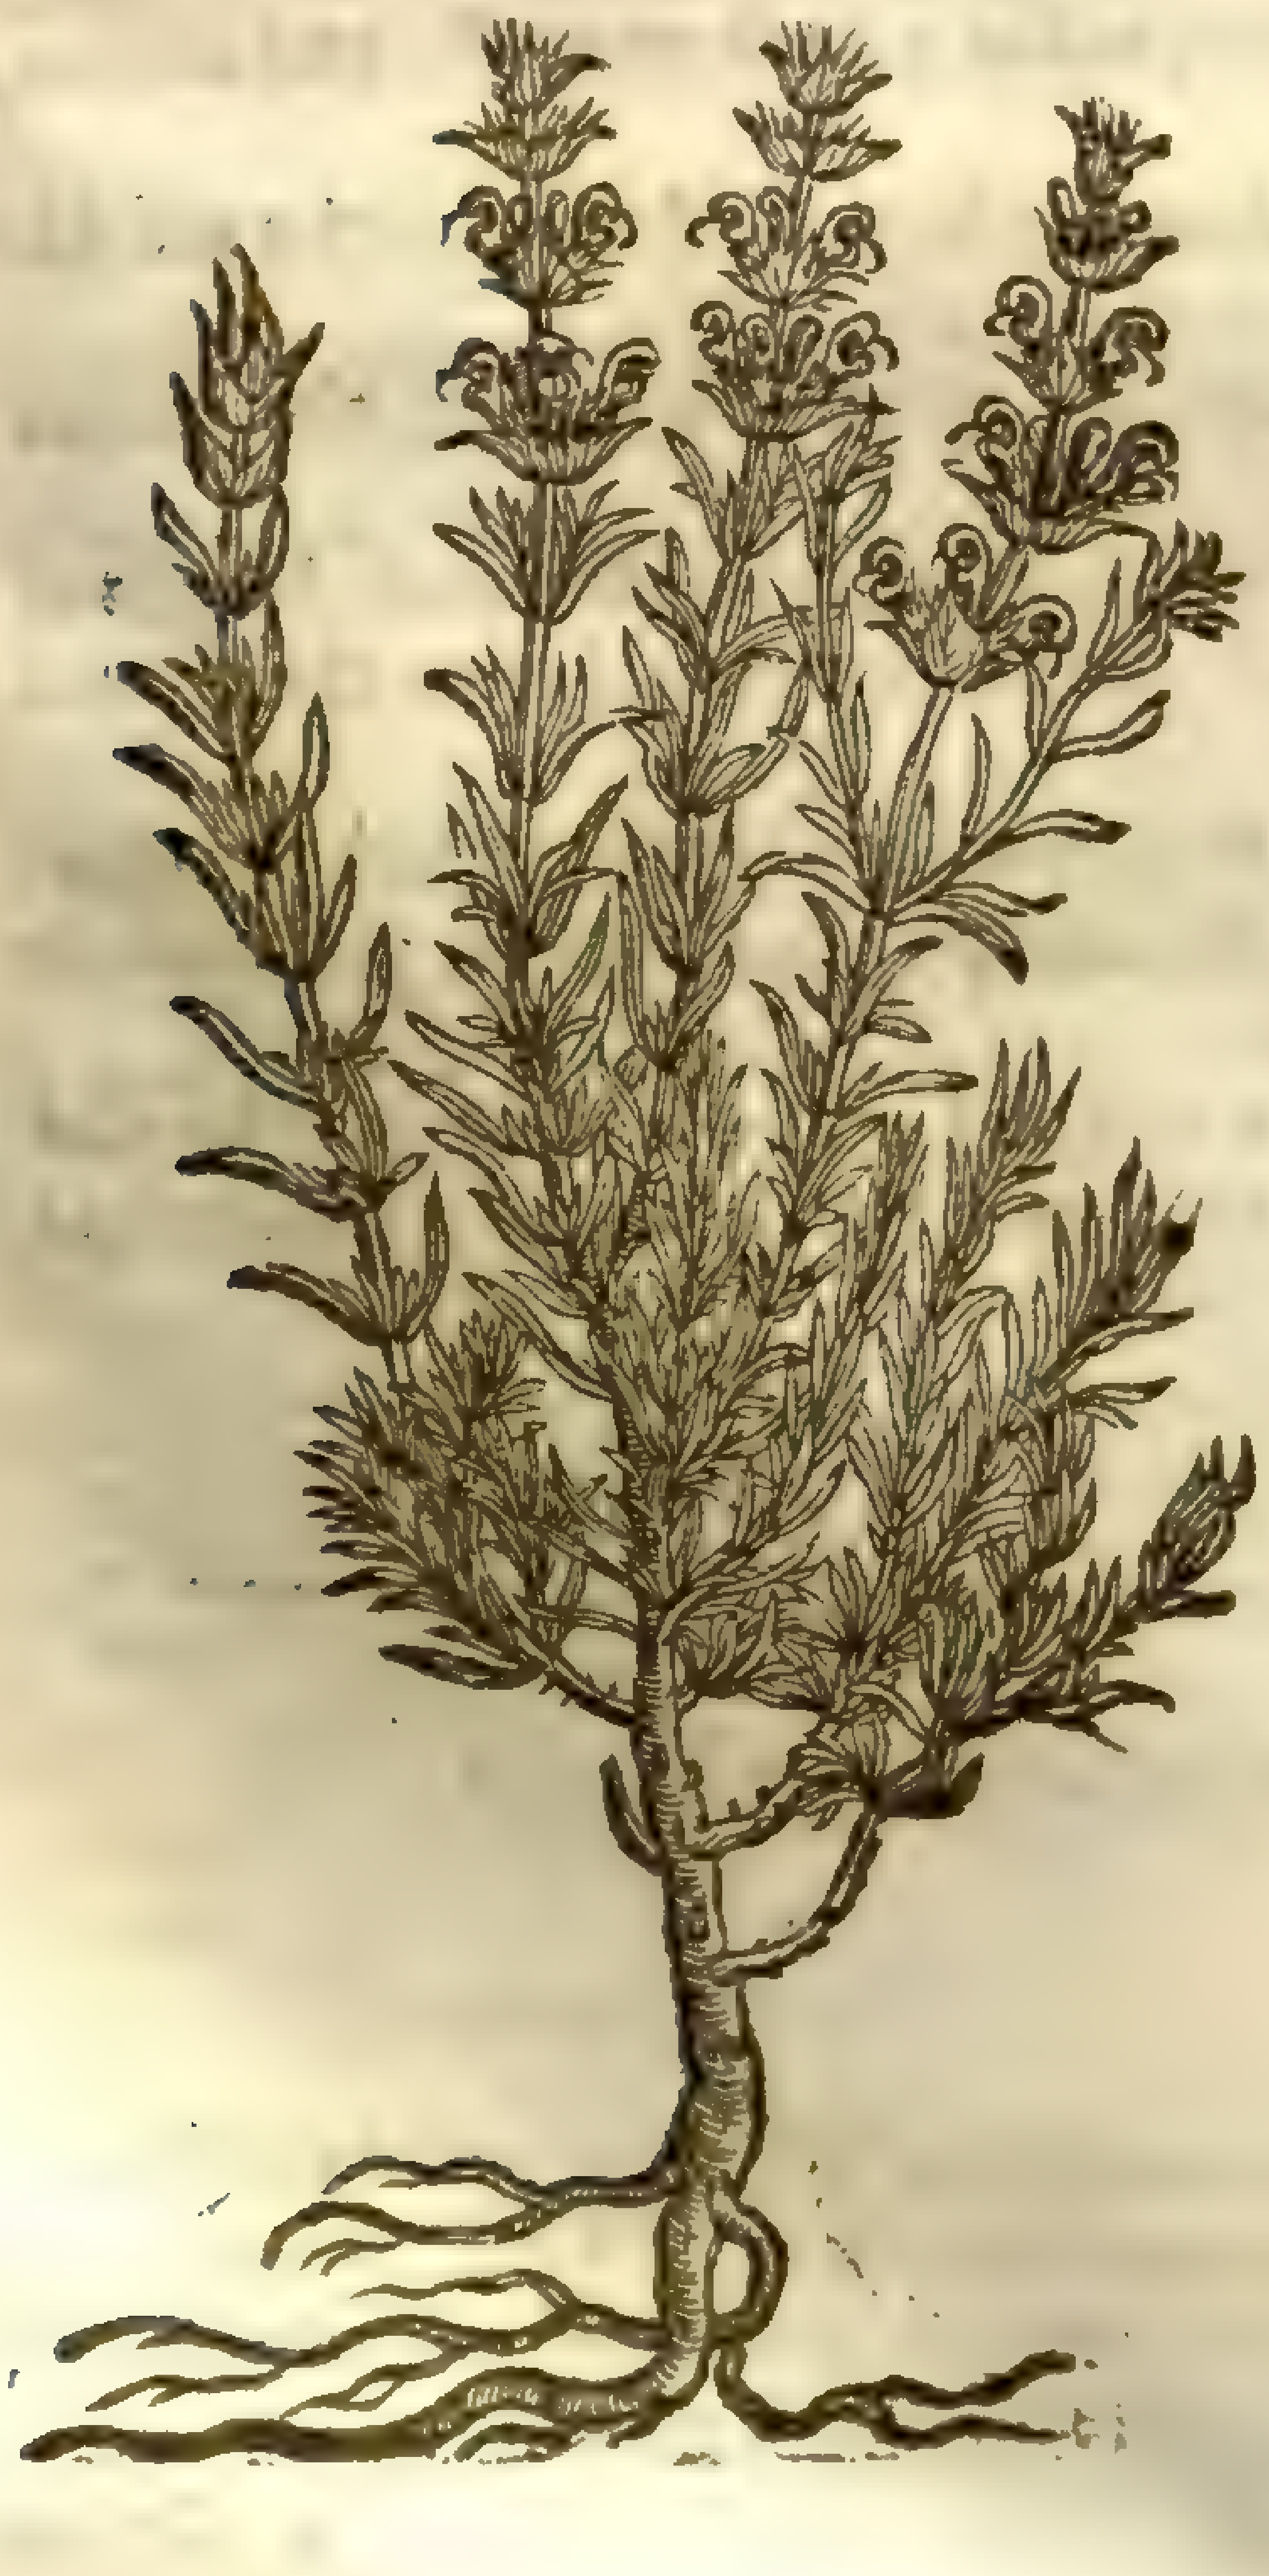
Goates Marjerome.





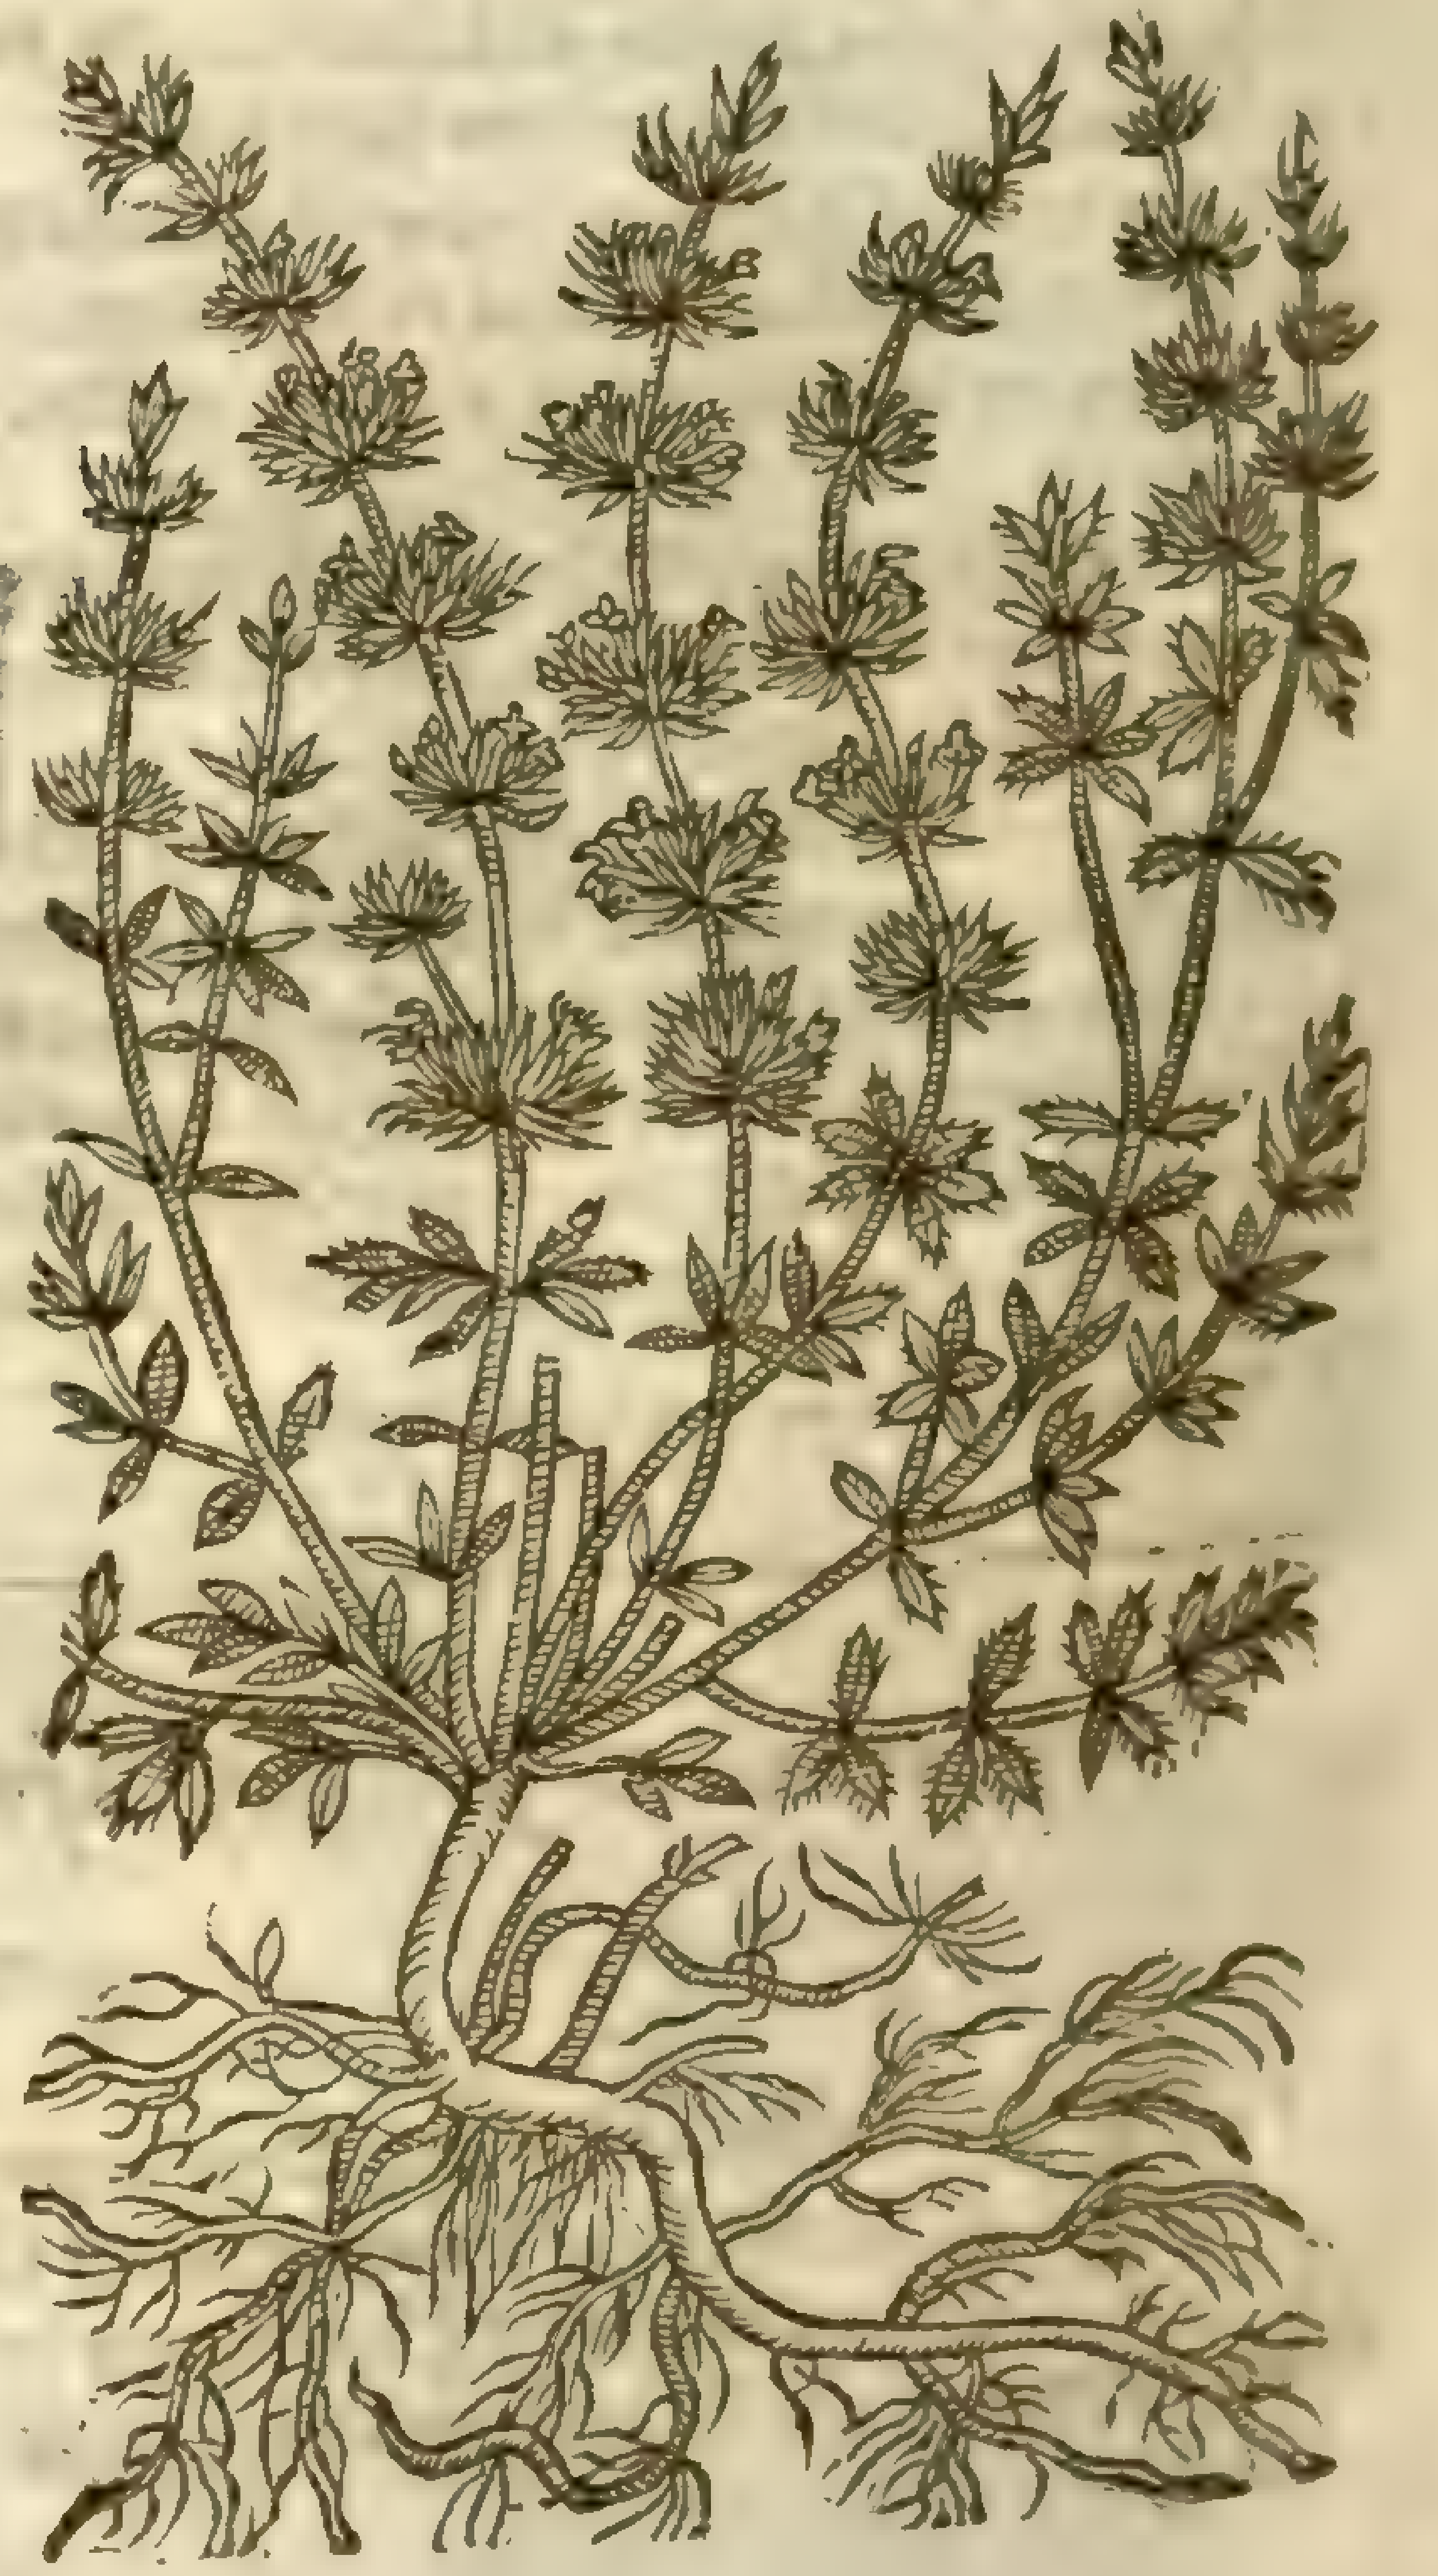
Teucrium marum, L. [illegible]

† 2 *Tragoriganum Cluſij.*
Cluſius his Goats Marjerome.



Thymus tragoriganum, L. [illegible]

‡ 3 *Tragoriganum Cretenſe.*
Candy Goats Marjerome.



2 *Carolus Cluſius* hath ſet forth in his Spaniſh Obſeruations another ſort of Goats Marjerome growing vp like a ſmall ſhrub: the leaues are longer and more hoarie than wilde Marjerome, and alſo narrower, of a hot biting taſte, but of a ſweet ſmell, though not very pleaſant. The floures doe ſtand at the top of the ſtalkes in ſpokie rundles, of a white colour. The root is thicke and wooddy.

‡ 3 This differs little in forme and magnitude from the laſt deſcribed, but the branches are of a blacke colour, with rougher and darker coloured leaues: the floures alſo are leſſer, and of a purple colour. Both this and the laſt deſcribed continue alwaies greene, but this laſt is of a much more fragrant ſmell. This floures in March, and was found growing wilde by *Cluſius* in the fields of Valentia: he cals it *Tragoriganum Hiſpanicum tertium*. *Pena* and *Lobel* call it *Tragoriganum Cretenſe apud Venetas*; that is, the Candy Goats Marjerome of the Venetians. ‡

¶ *The Place.*

Theſe plants grow wild in Spaine, Italy, and other hot countries. The firſt of theſe I found growing in diuers barren and Chalky fields and high-waies neere vnto Sittingburne and Rocheſter in Kent, and alſo neere vnto Cobham houſe and Southfleet in the ſame county.

‡ I doubt our Author was miſtaken, for I haue not heard of this growing wild with vs. ‡

¶ *The Time.*

They floure in the moneth of Auguſt. I remember (ſaith *Dodonæus*) that I haue ſeene *Tragoriganum* in the Low-countries, in the gardens of thoſe that apply their whole ſtudy to the knowledge of plants; or as we may ſay, in the gardens of cunning Herbariſts.

¶ *The Names.*

Goats Organie is called in Greeke τραγορίγανος: in Latine likewiſe *Tragoriganum*: in Engliſh, Goats Organie, and Goats Marjerome.

¶ *The Temperature.*

Goats Organies are hot and dry in the third degree: They are (ſaith *Galen*) of a binding qualitie.

¶ *The Vertues.*

Tragoriganum or Goats Marjerome is very good againſt the wambling of the ſtomacke, and the ſoure belchings of the ſame, and ſtaieth the deſire to vomit, eſpecially at ſea. A

Theſe baſtard kindes of Organie or wild Marjeromes haue rhe ſame force and faculties that the other Organies haue for the diſeaſes mentioned in the ſame chapter. B

† There were formerly two figures in this chapter; the firſt whereof was of that which is deſcribed in the ſecond place: the ſecond was of *Tragoriganum* of *Matthiolus*, whereof here is no mention made. The figure of the *Tragoriganum alterum* of *Lobel* (which as I haue formerly ſaid, *Bauhine* would haue all one with that of *Dodonæus*) was formerly vnder the name of *Thymum Creticum*, pag. 459. of the former edition.

CHAP. 220. *Of Herbe Maſticke.*

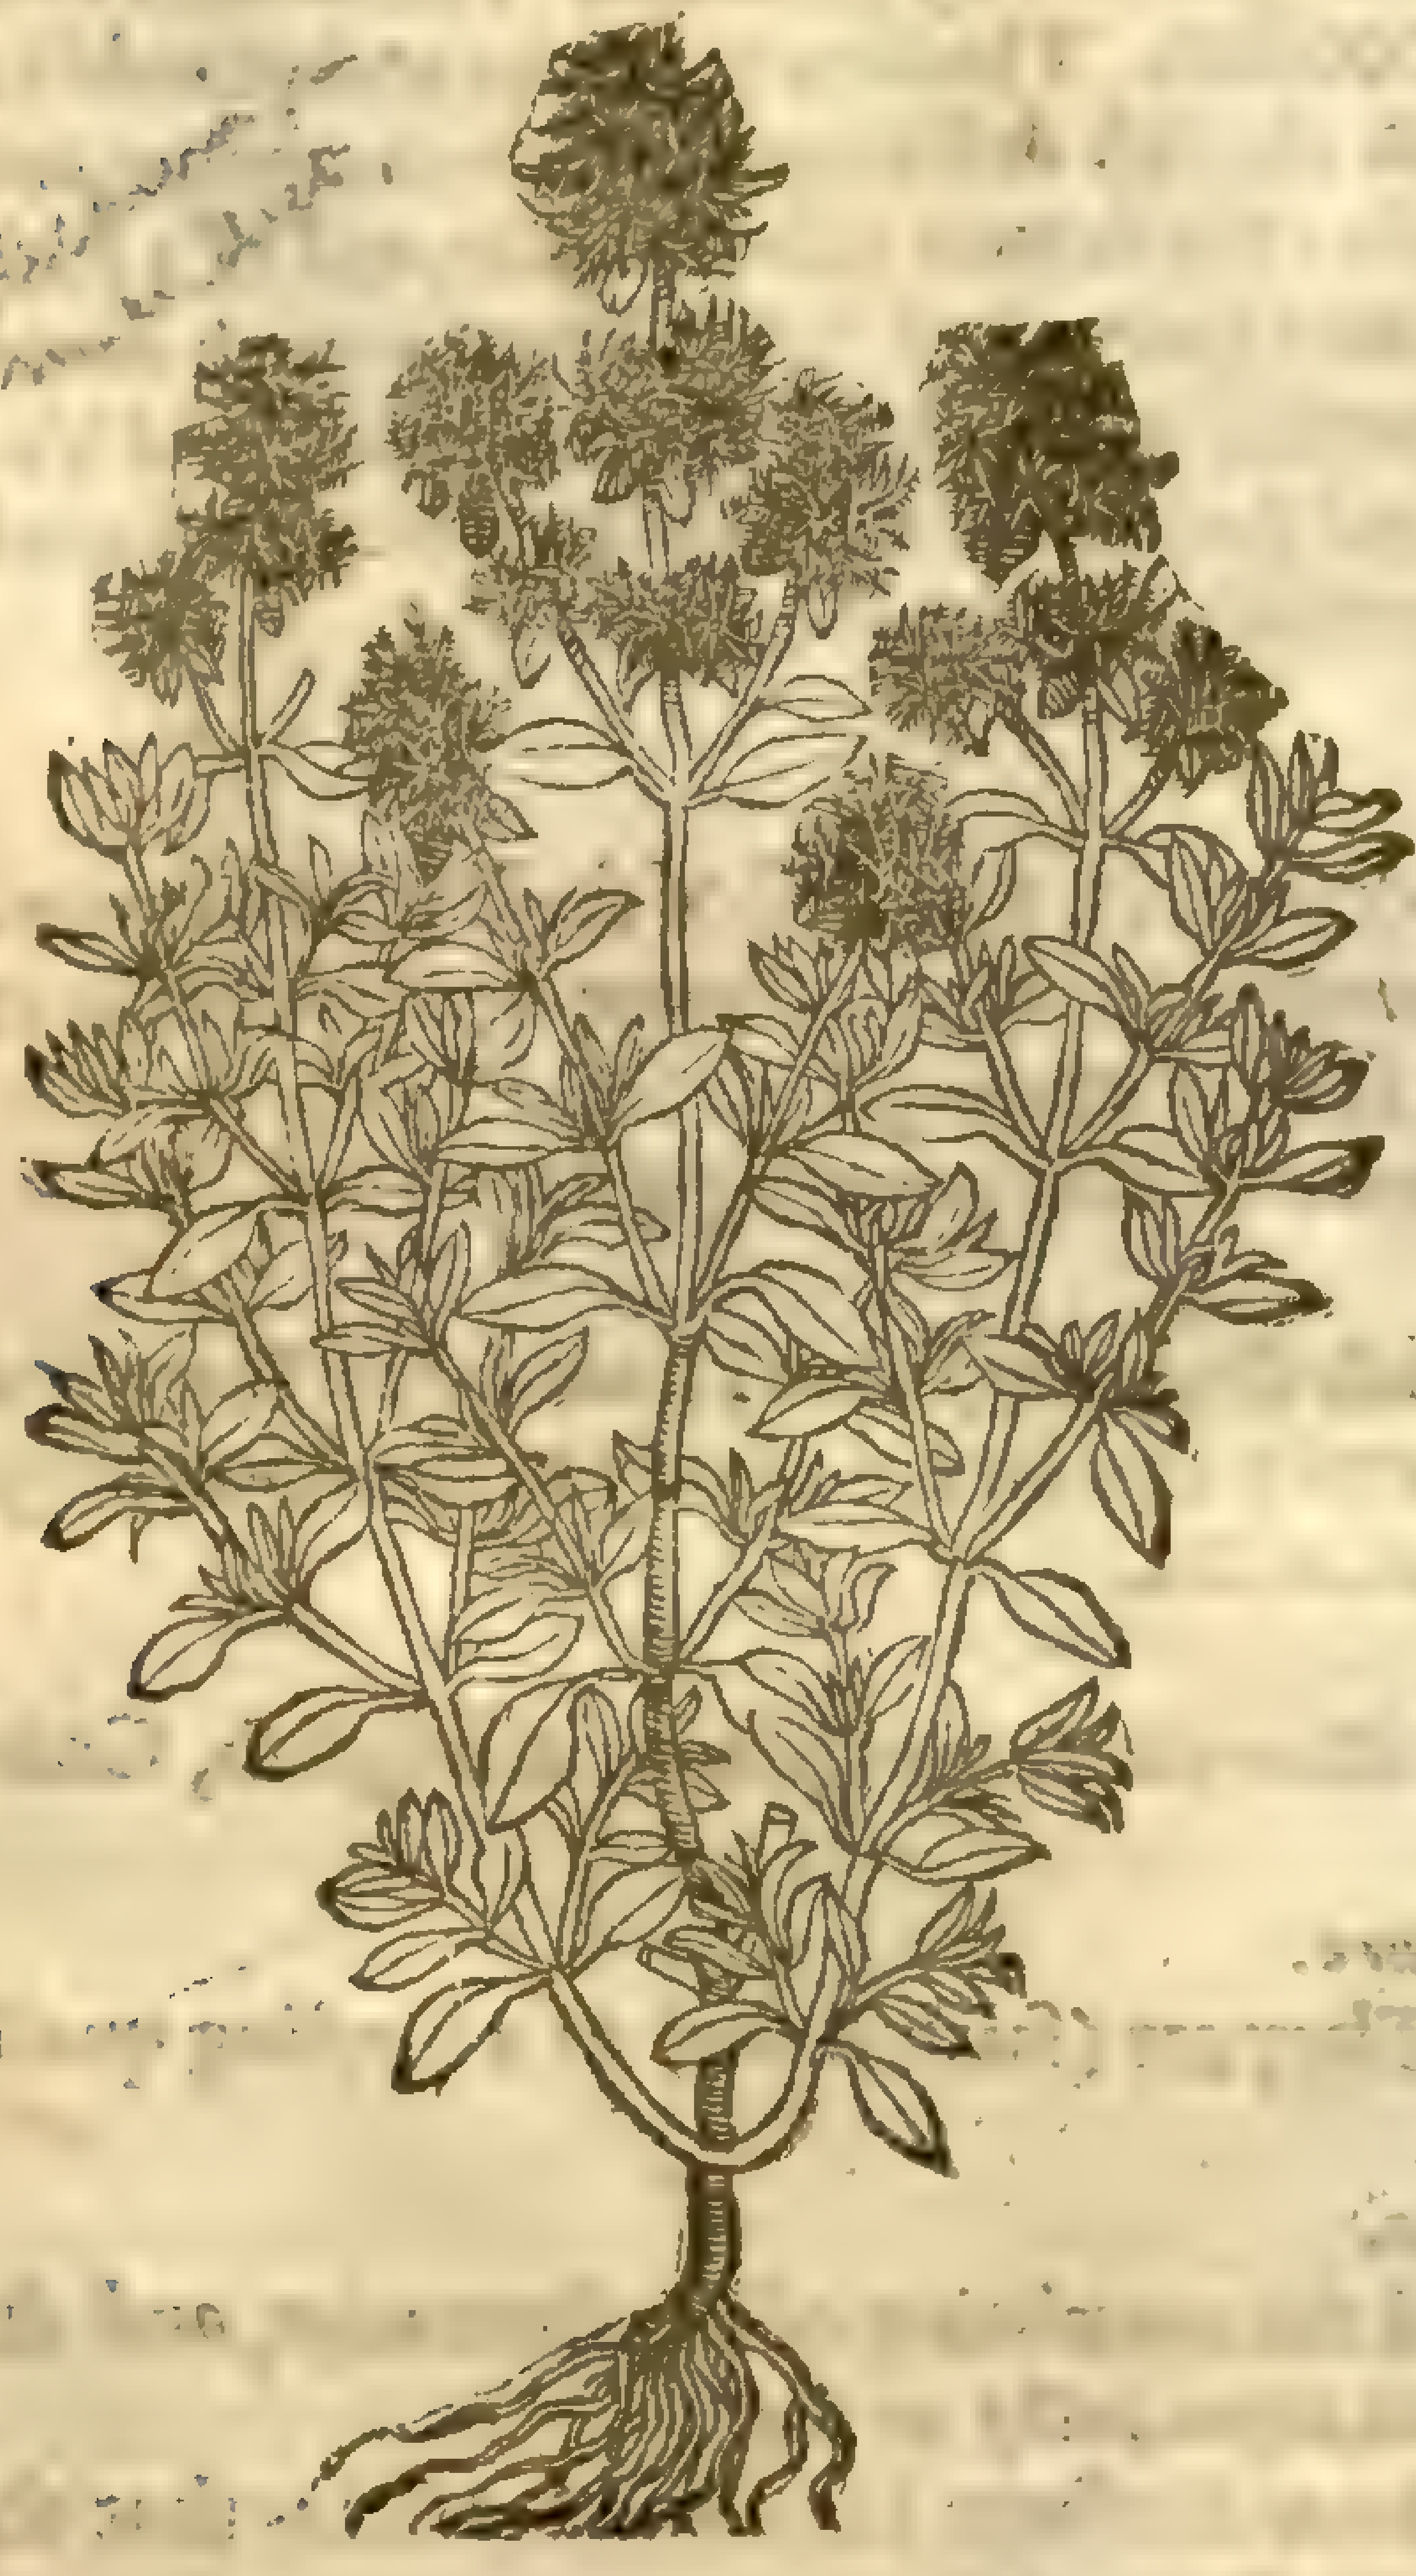
¶ *The Description.*

1 THe Engliſh and French Herbariſts at this day do in their vulgar tongues call this herb Maſticke or Maſtich, taking this name *Marum* of *Maro* King of Thrace; though ſome rather ſuppoſe the name corruptly to be deriued from this word *Amaracus*, the one plant being ſo like the other, that many learned haue taken them to be one and the ſelfe ſame plant: others haue taken *Marum* for *Sampſucus*, which doubtleſſe is a kinde of Marjerome. Some (as *Dodonæus*) haue called this our *Marum* by the name of *Clinopodium*: which name rather belongs to another plant than to Maſticke. ‡ This growes ſome foot high, with little longiſh leaues ſet by couples: at the tops of the ſtalkes amongſt white downy heads come forth little white floures: the whole plant is of a very ſweet and pleaſing ſmell. ‡

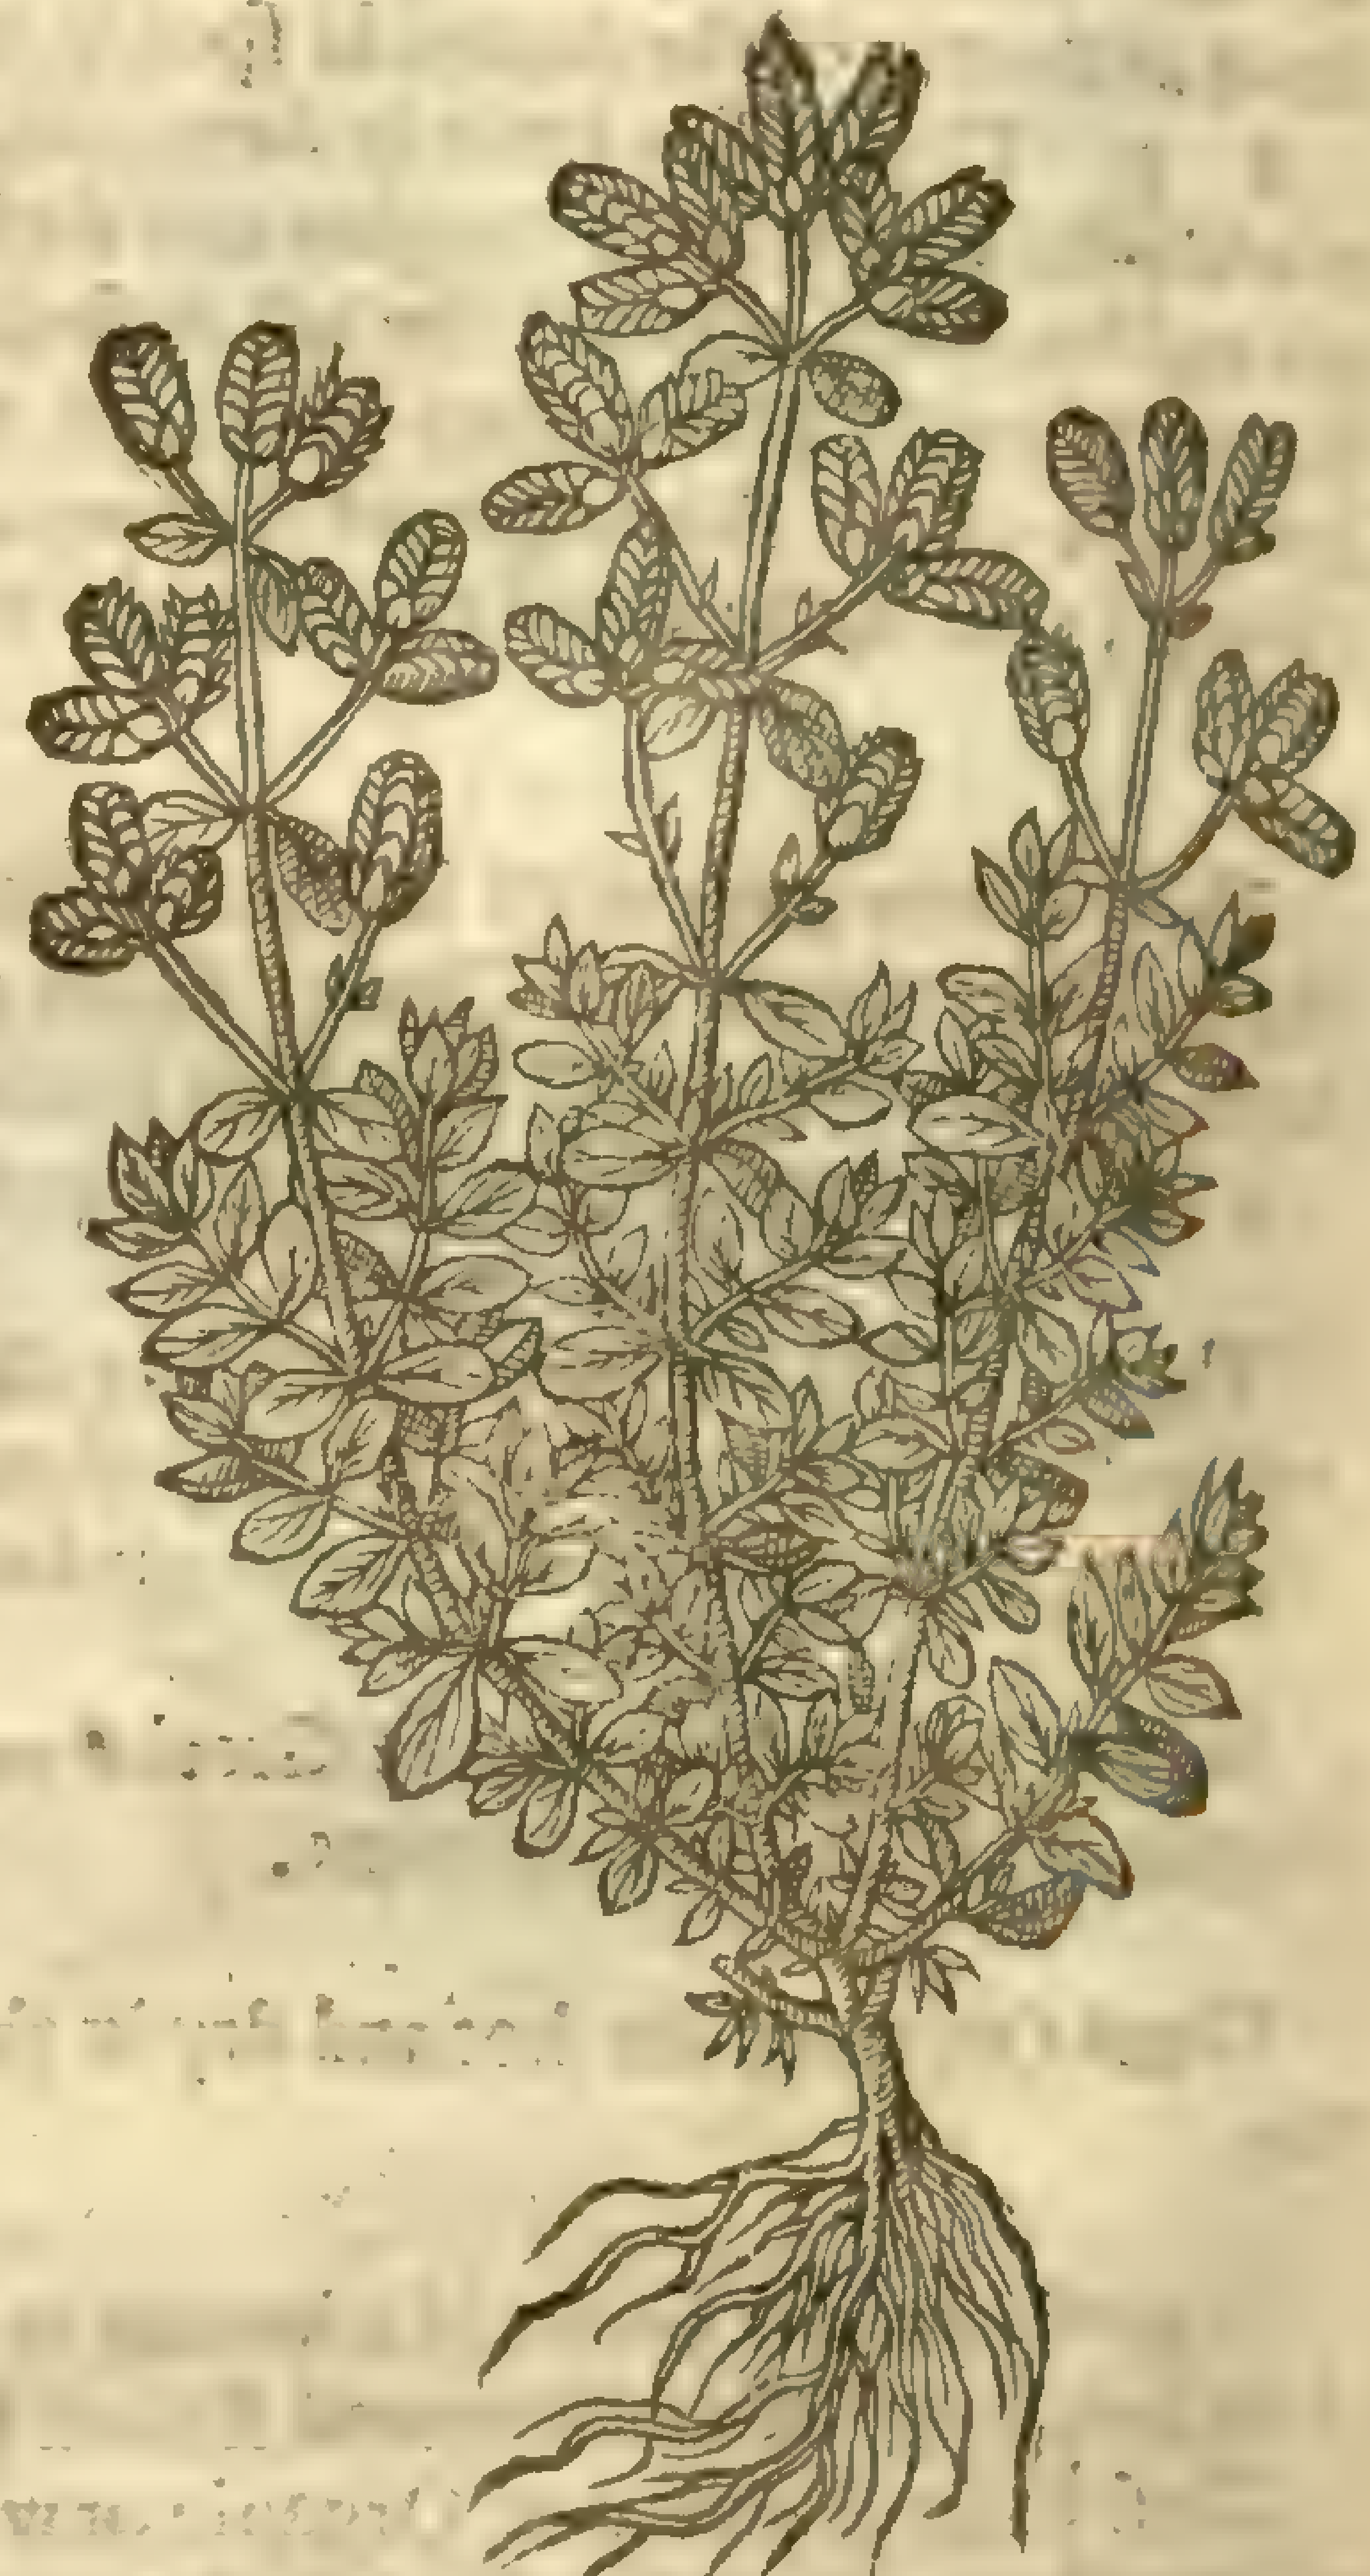
2 If any be deſirous to ſearch for the true *Marum*, let them be aſſured that the plant laſt mentioned is the ſame: but if any do doubt thereof, for nouelties ſake here is preſented vnto your view a plant of the ſame kinde (which cannot be rejected) for a ſpeciall kind thereof, which hath a moſt pleaſant ſent or ſmell, and in ſhew reſembleth Marjerome and *Origanum*, conſiſting of ſmall twigs a foot and more long; the heads tufted like the common Marjerome; but the leaues are leſſe, and like *Myrtus*: the root is of a wooddy ſubſtance, with many ſtrings hanging thereat.

3 There is another kind hereof ſet forth by *Lobel*, which I haue not as yet ſeen, nor himſelfe hath well deſcribed, which I leaue to a better conſideration. ‡ Though our Author knew not how to deſcribe this creeping *Marum* of *Lobel*, yet no queſtion, if hee had knowne ſo much, hee would haue giuen vs the figure thereof as well in this place, as in the third place of the next chapter

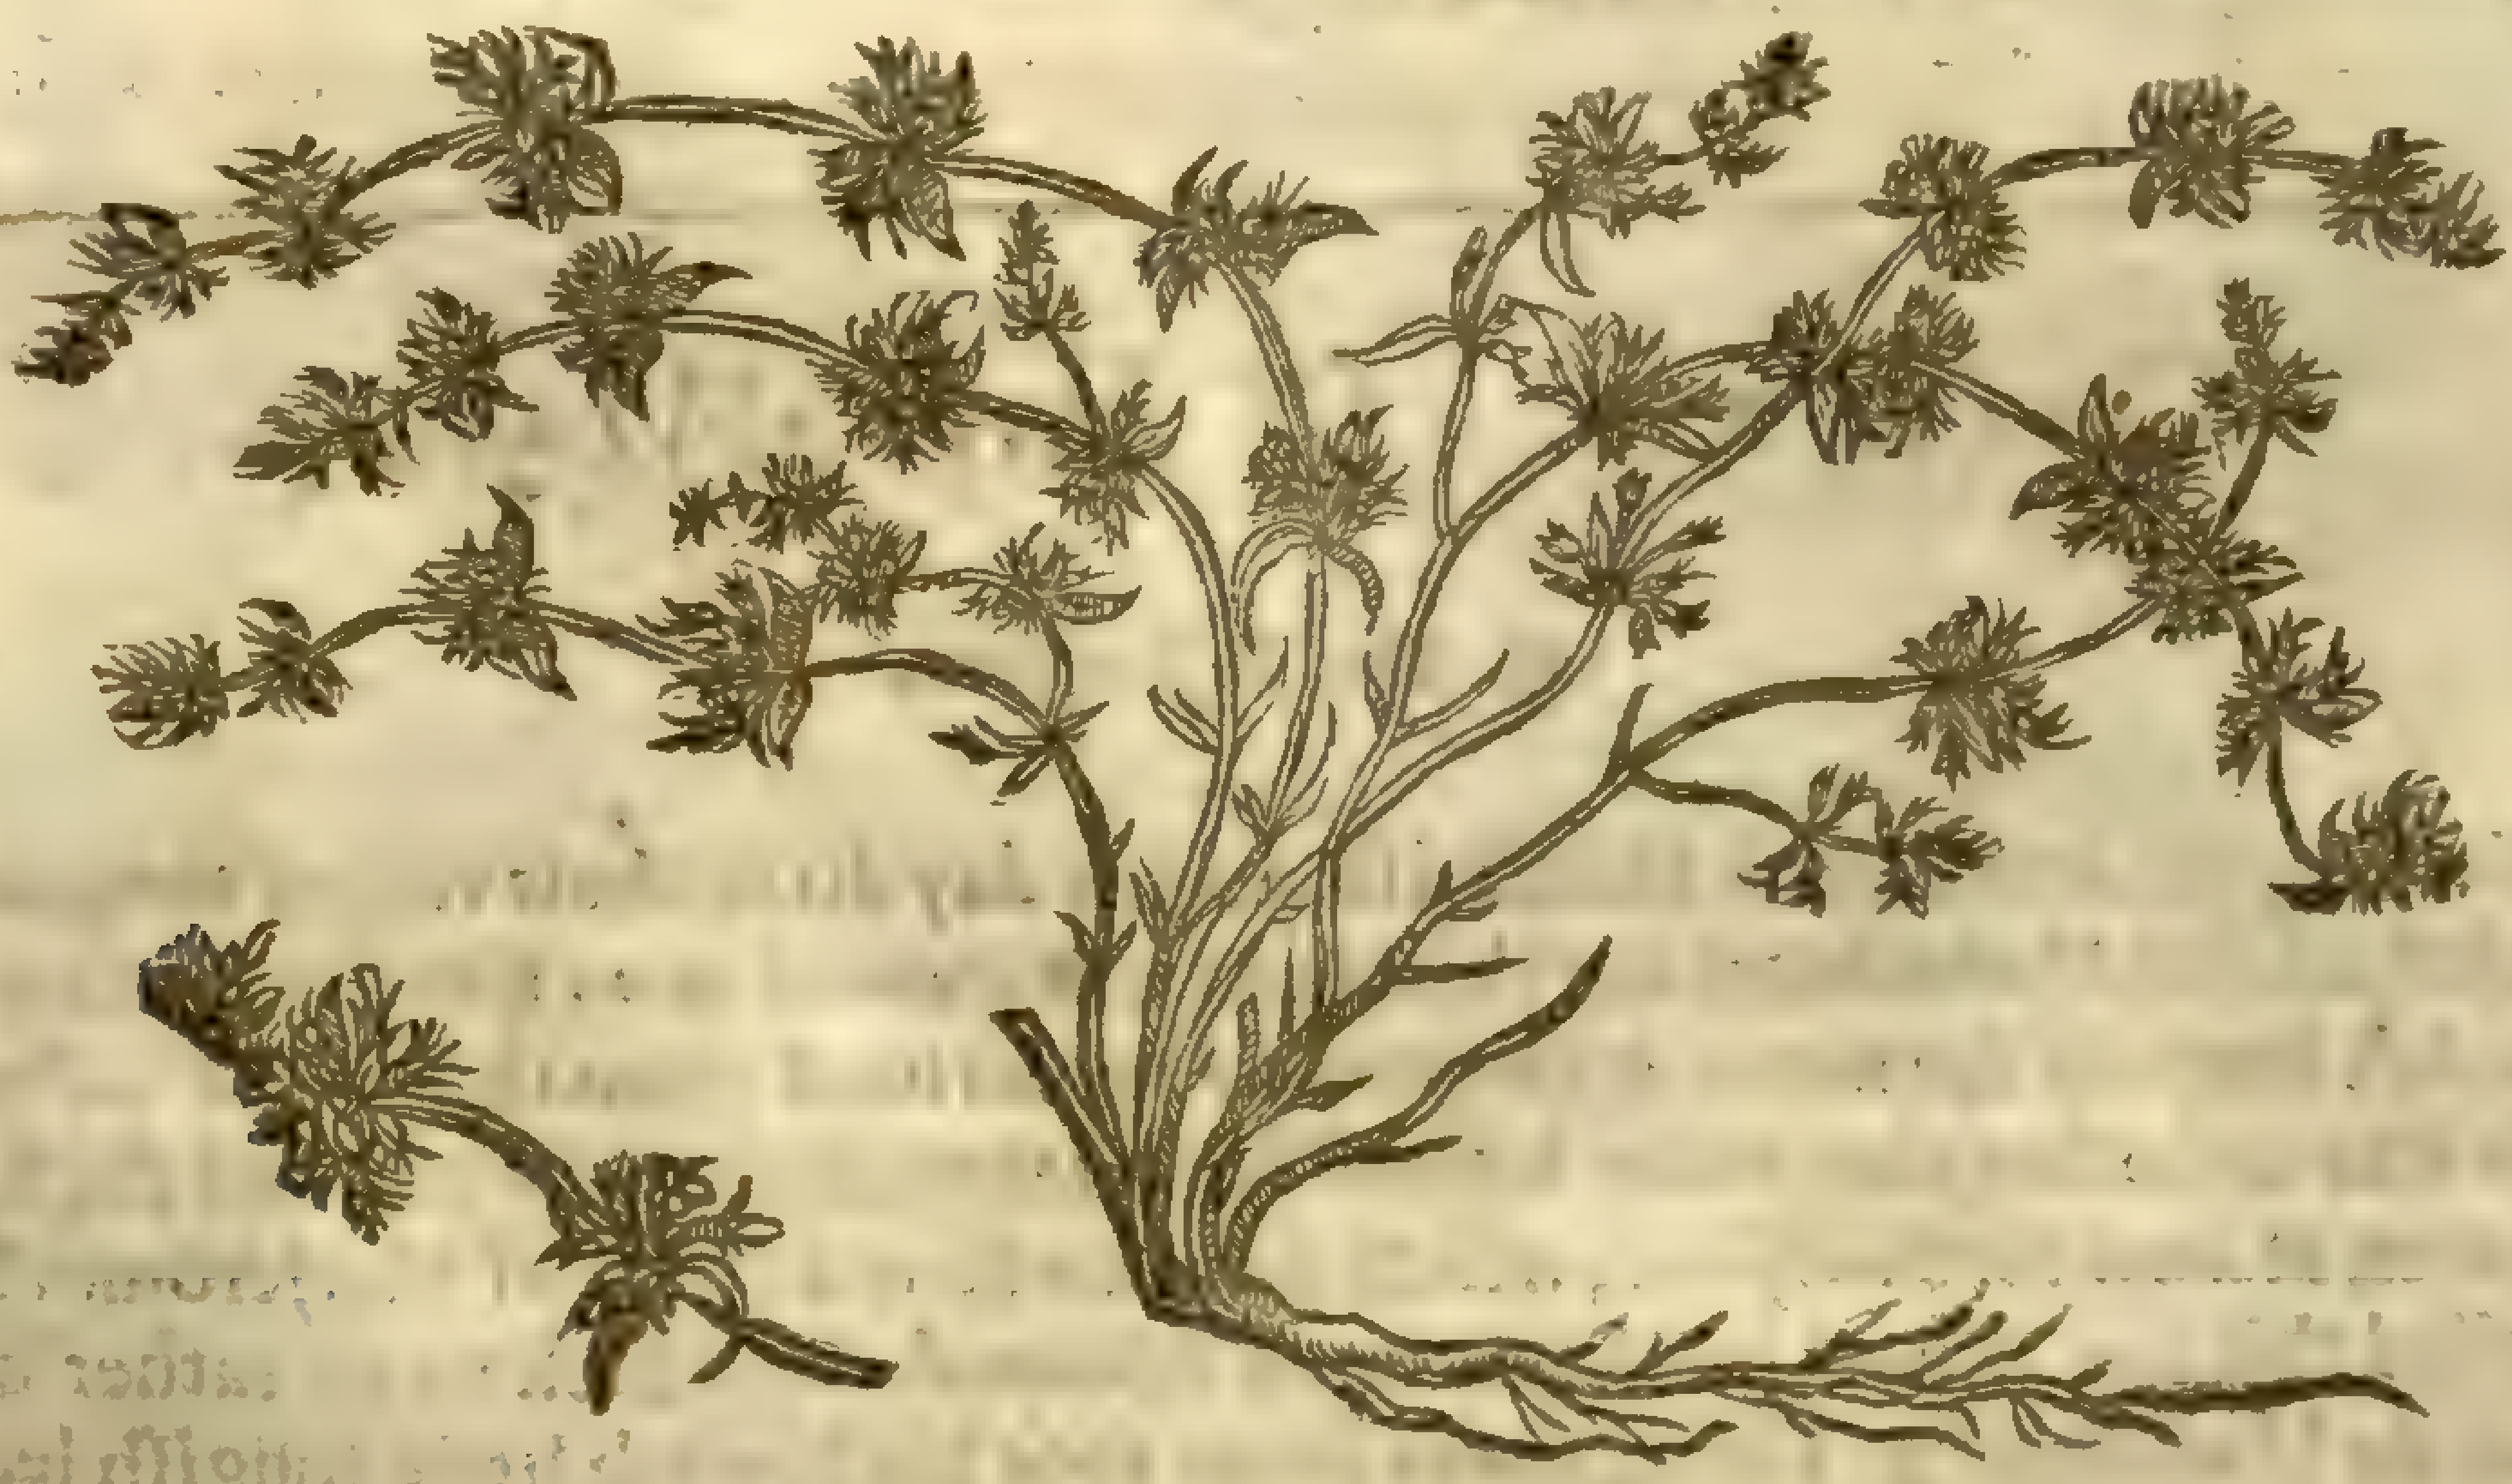
Thymus maſtichina [illegible]



1 *Marum.*
Herbe Maſticke.



2 *Marum Syriacum.*
Aſſyrian Maſticke.



† 3 *Marum ſupinum Lobelij.*
Creeping Maſticke.

for a Penny-Royall; and might as well here as there, and much more fitly haue ventured at a deſcription. But that which is defectiue in him and *Lobel*, I will endeauour to ſupply out of *Cæſalpinus*. This plant hath many creeping branches like to thoſe of wilde Time, but ſet with whiter and ſhorter leaues like to thoſe of the ſmaller Marjerome, but ſomewhat narrower: the floures grow in rundles amongſt the leaues, as in Calamint and are of a purple colour: the whole plant is of a ſtrong and ſweet ſmell, and of an hot and bitter taſte. *Cæſalpinus* thinkes this to be the *Sampſuchum* of *Dioſcorides*: and ſo alſo doe the Authors of the *Aduerſaria*. *Tabernamontanus* calls it *Marum repens*. ‡

¶ *The Place.*

Theſe plants are ſet and ſowne in the gardens of England, and there maintained with great care and diligence from the injurie of our cold clymate.

¶ *The Time.*

They floure about Auguſt, and ſomewhat later in cold Summers.

¶ *The Names.*

‡ Maſticke is called of the new writers *Marum:* and ſome, as *Lobel* and *Anguillara*, thinke it the *Helenium odorum* of *Theophraſtus*. *Dodonæus* iudges it to be the *Clinopodium* of *Dioſcorides*. *Cluſius* makes it his *Tragoriganum* 1. and ſaith he receiued the ſeeds thereof by the name of *Ambra dulcis*. ‡

¶ *The Nature.*

Theſe plants are hot and dry in the third degree.

¶ *The Vertues.*

A *Dioſcorides* writeth, that the herbe is drunke, and likewiſe the decoction thereof, againſt the bitings of venomous beaſts, crampes and conuulſions, burſtings and ſtrangury.

B The decoction boiled in wine till the third part be conſumed, and drunke, ſtoppeth the laske in them that haue an ague, and vnto others in water.

† That we here giue you in the third place was formerly vnfitly figured in the third place of the enſuing Chapter, by the name of *Pulegium Anguſtifolium*.

CHAP. 221. *Of Pennie Royall, or pudding graſſe.*

† 1 *Pulegium regium.*
Penny Royall.

mentha | pulegium maii. dict. in p. 3.8)

† 2 *Pulegium mas.*
Vpright Penny Royall.

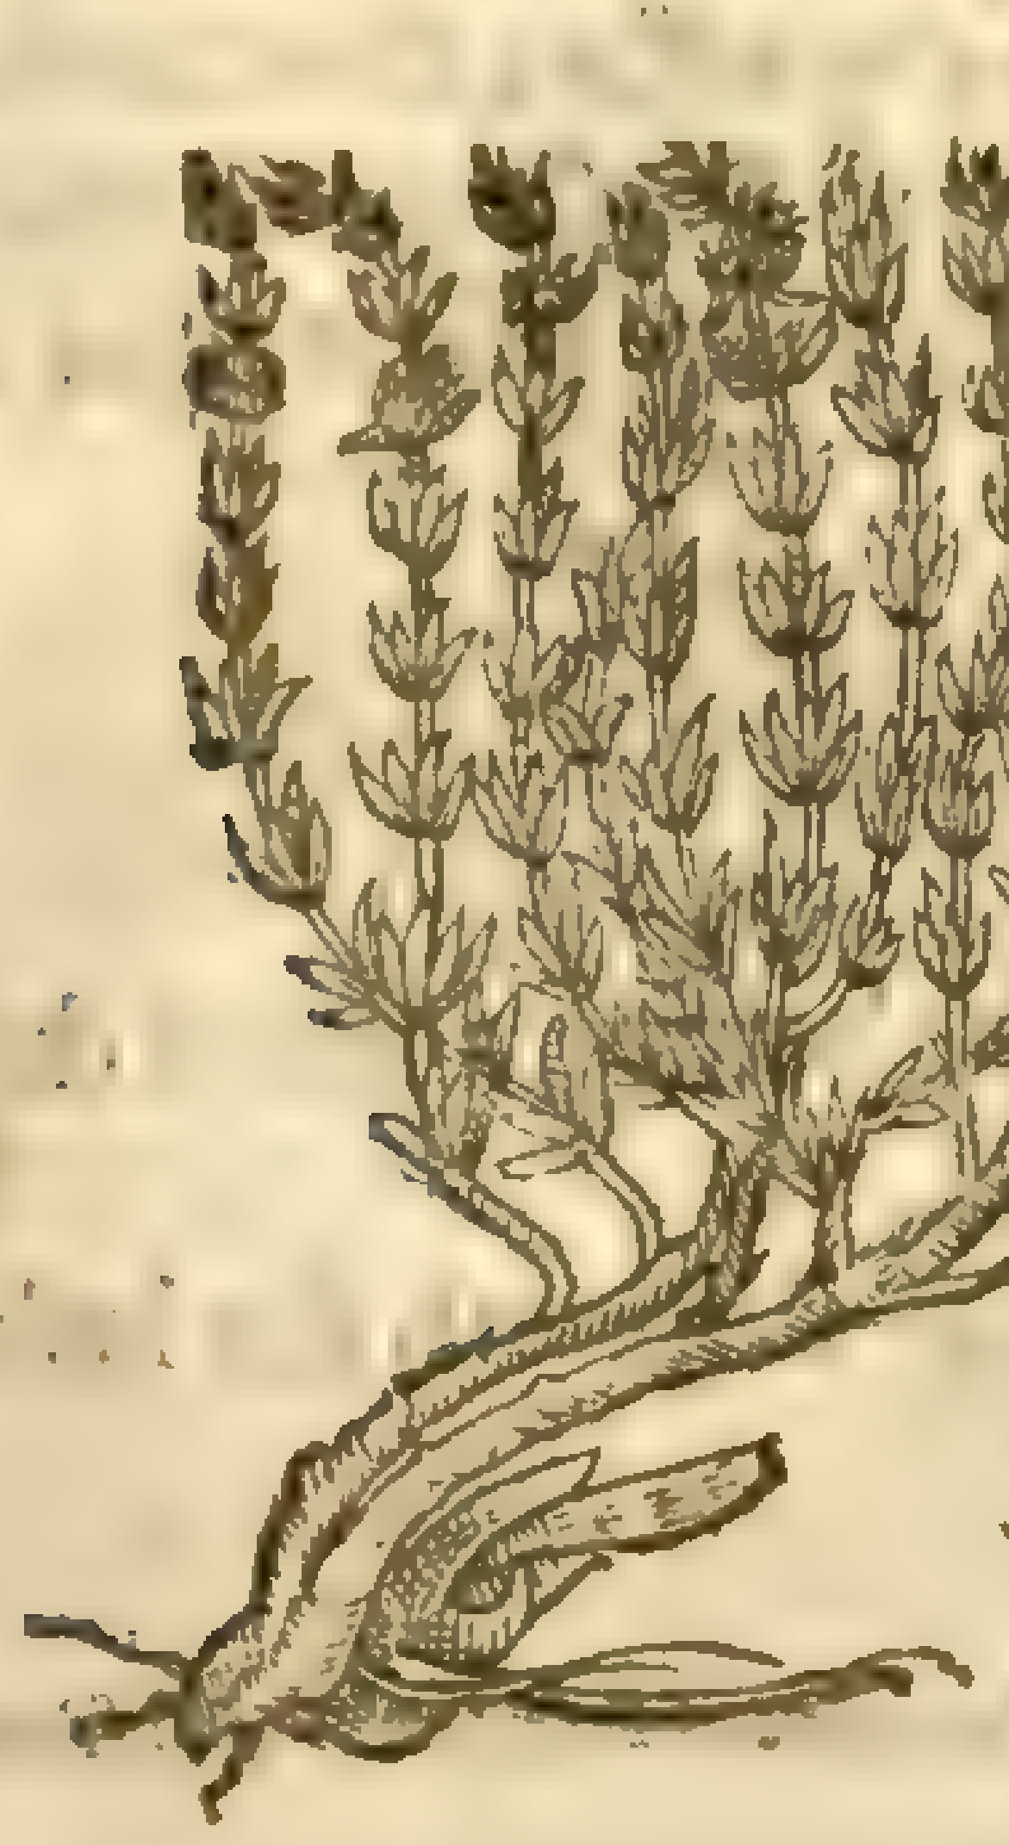
¶ *The Deſcription.*

1 *Pulegium regium vulgatum* is ſo exceedingly well knowne to all our Engliſh Nation, that it needeth no deſcription, being our common Pennie Royall.

2 The ſecond being the male Penny Royall is like vnto the former, in leaues, floures and ſmell, and differeth not in that this male kinde groweth vpright of himſelfe without creeping, much like in ſhew vnto wilde Marjerome.

3 The

† 3 *Pulegium anguſtifolium.*
Narrow leafed Penny-Royall.



3 The third kinde of Pennie Royall growes like vnto Tyme, and is of a wooddy ſubſtance, ſomewhat like vnto the thinne leafed Hyſſope, of the ſauour of common Pennie-Royall, ‡ but much ſtronger and more pleaſant: the longiſh narrow leaues ſtand vpon the ſtalkes by couples, with little leaues comming forth of their boſomes: and towards the tops of the branches grow rundles of ſmall purple floures. This grows plentifully about Montpellier, & by the Authors of the *Aduerſaria*, who firſt ſet it forth, it is ſtiled *Pulegium anguſtif. ſive cervinum Monſpelienſium.* ‡

¶ *The Place.*

The firſt and common Penny Royall groweth naturally wild in moiſt and ouerflown places, as in the Common neere London called Miles end, about the holes and ponds thereof in ſundry places, from whence poore women bring plenty to ſell in London markets; and it groweth in ſundry other Commons neere London likewiſe.

The ſecond groweth in my garden: the third I haue not as yet ſeene.

¶ *The Time.*

They floure from the beginning of Iune to the end of Auguſt.

¶ *The Names.*

Pennie Royall is called in Greeke γλήχων, and oftentimes βλήχων: in Latine, *Pulegium*, and *Pulegium regale*, for difference ſake betweene it and wilde Time, which of ſome is called *Pulegium montanum*: in Italian, *Pulegio*: in Spaniſh, *Poleo*: in Dutch, **Polep**: in French, *Poulıot*: in Engliſh, Pennie Royall, Pudding graſſe, Puliall Royall, and of ſome Organie.

¶ *The Temperature.*

Pennie Royall is hot and dry in the third degree, and of ſubtill parts, as *Galen* ſaith.

¶ *The Vertues.*

A Pennie Royall boyled in wine and drunken, prouoketh the monethly termes, bringeth forth the ſecondine, the dead childe and vnnaturall birth: it prouoketh vrine, and breaketh the ſtone, eſpecially of the kidnies.

B Pennie Royall taken with hony clenſeth the lungs, and cleareth the breaſt from all groſſe and thicke humours.

C The ſame taken with hony and Aloes, purgeth by ſtoole malancholy humours; helpeth the crampe and drawing together of ſinewes.

D The ſame taken with water and vinegre aſſwageth the inordinate deſire to vomit, and the paines of the ſtomacke.

E If you haue when you are at the ſea Penny Royall in great quantitie dry, and caſt it into corrupt water, it helpeth it much, neither will it hurt them that drinke thereof.

F A Garland of Pennie Royall made and worne about the head is of great force againſt the ſwimming in the head, and the paines and giddineſſe thereof.

G The decoction of Penny Royall is very good againſt ventoſitie, windines, or ſuch like, & againſt the hardneſſe and ſtopping of the mother being vſed in a bath or ſtew for the woman to ſit ouer.

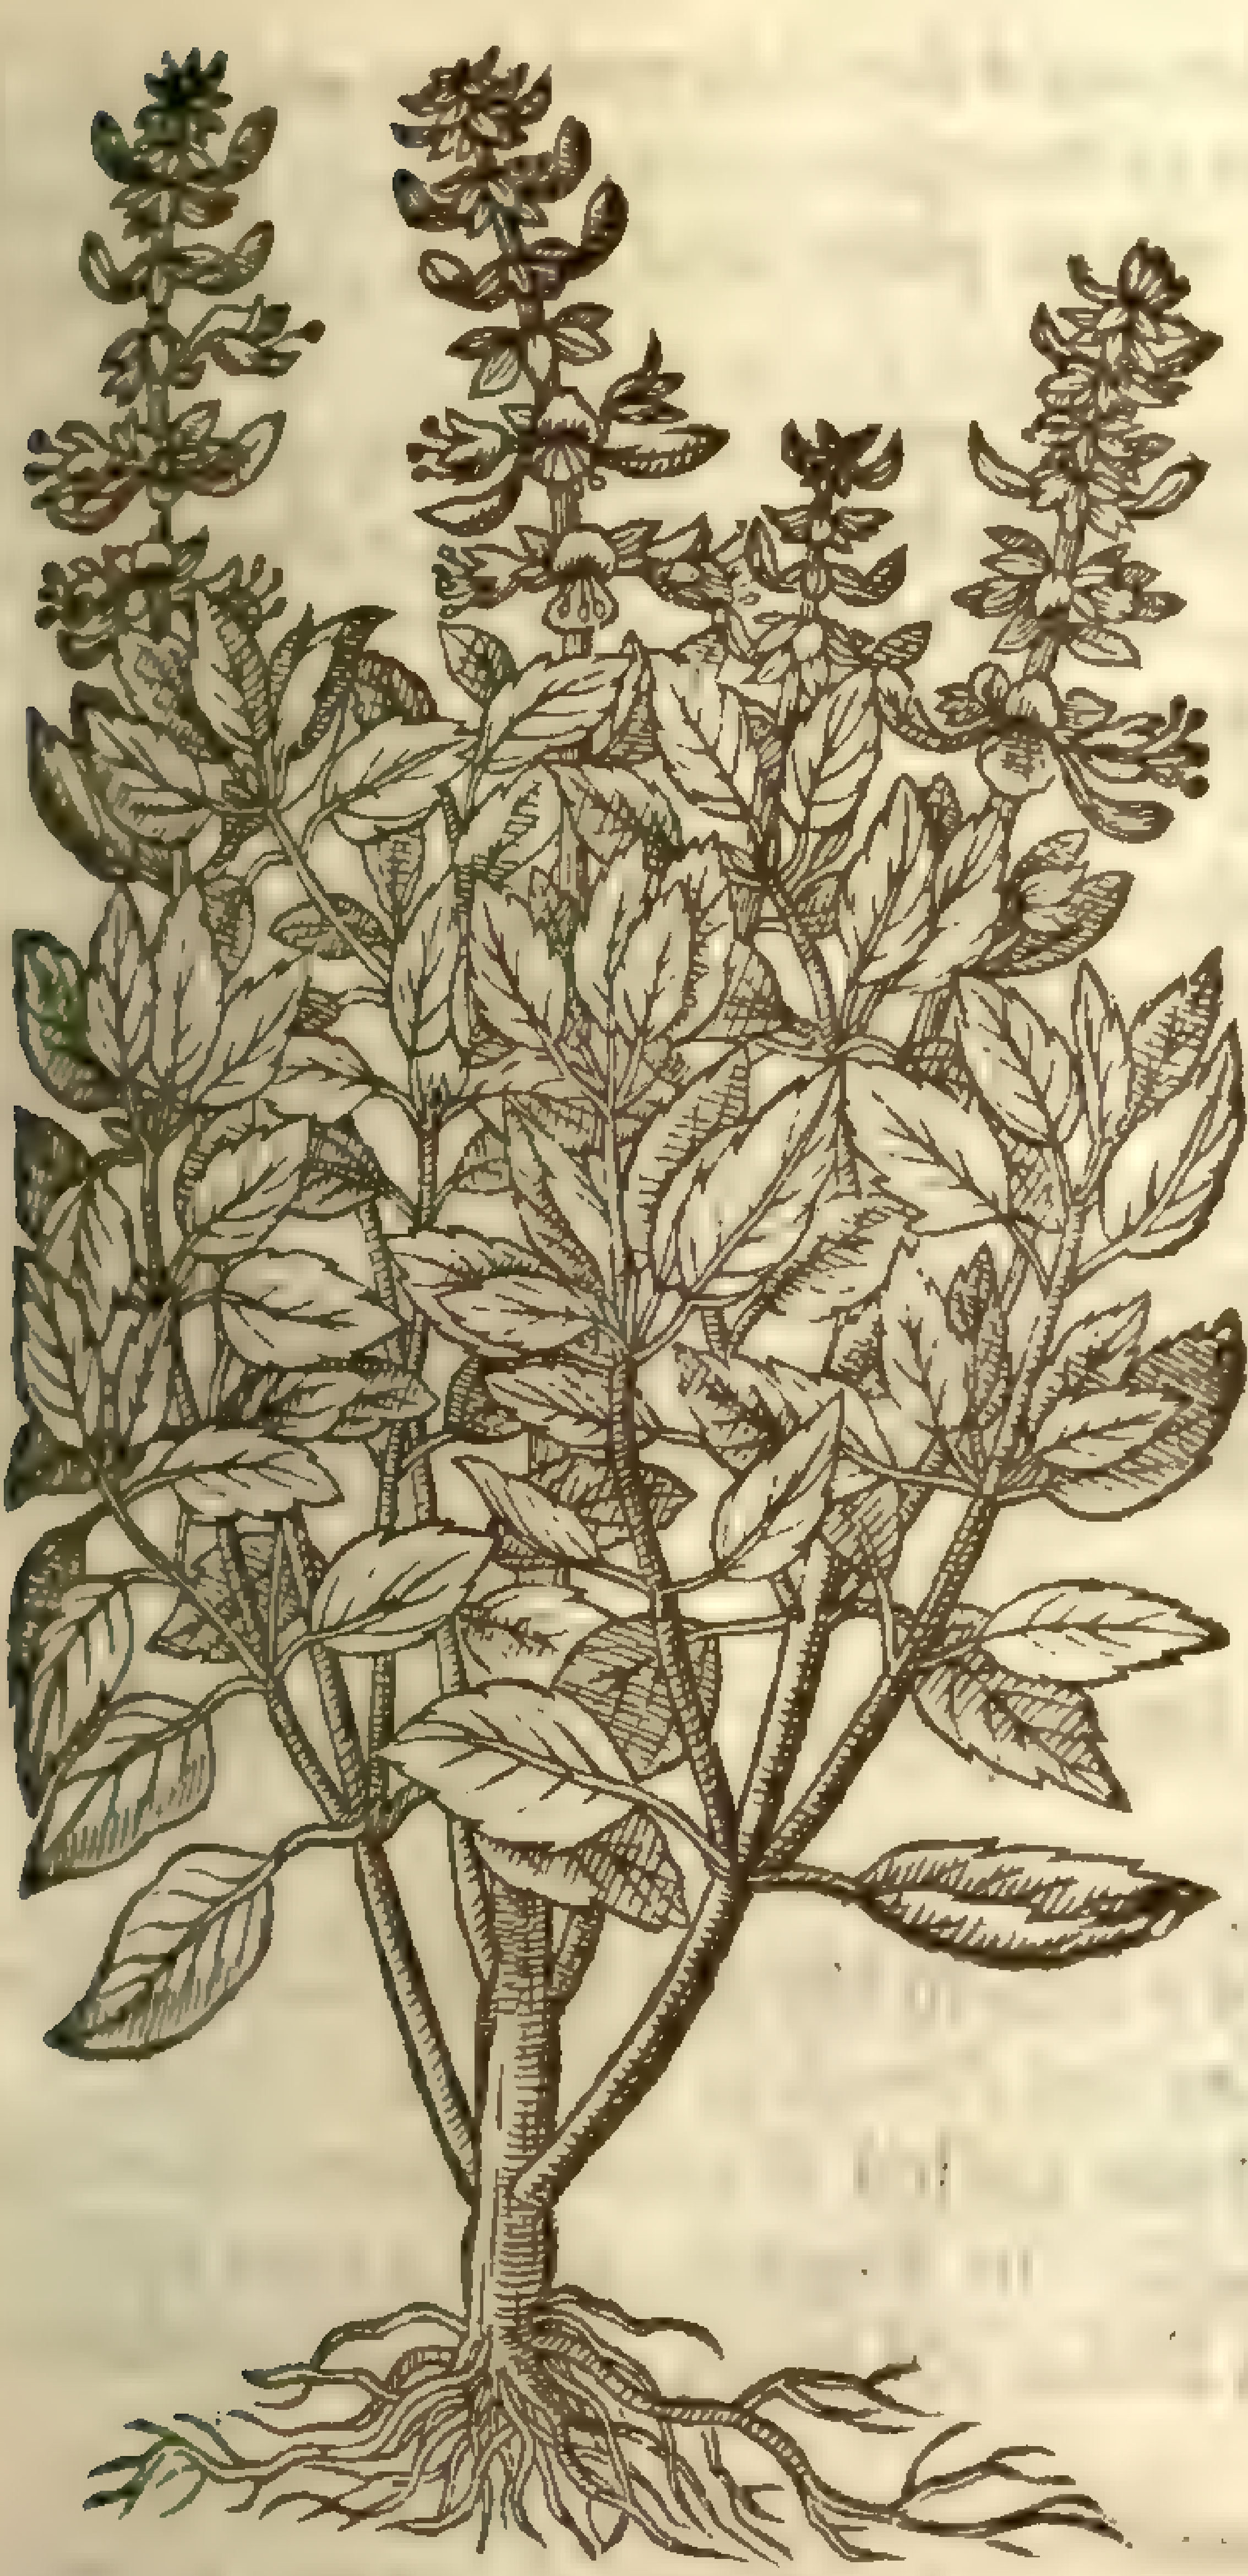
† It is apparant by the titles and deſcriptions that our Authour in this chapter followed *Lobel*, but the figures were not agreeable to the Hiſtory, for the two firſt figures were of the *Pulegium Anguſtifolium* deſcribed in the third place; and the third figure was of the *Marum ſupinum* deſcribed in the laſt place of the foregoing Chapter.

Chap. 222. *Of Baſill.*

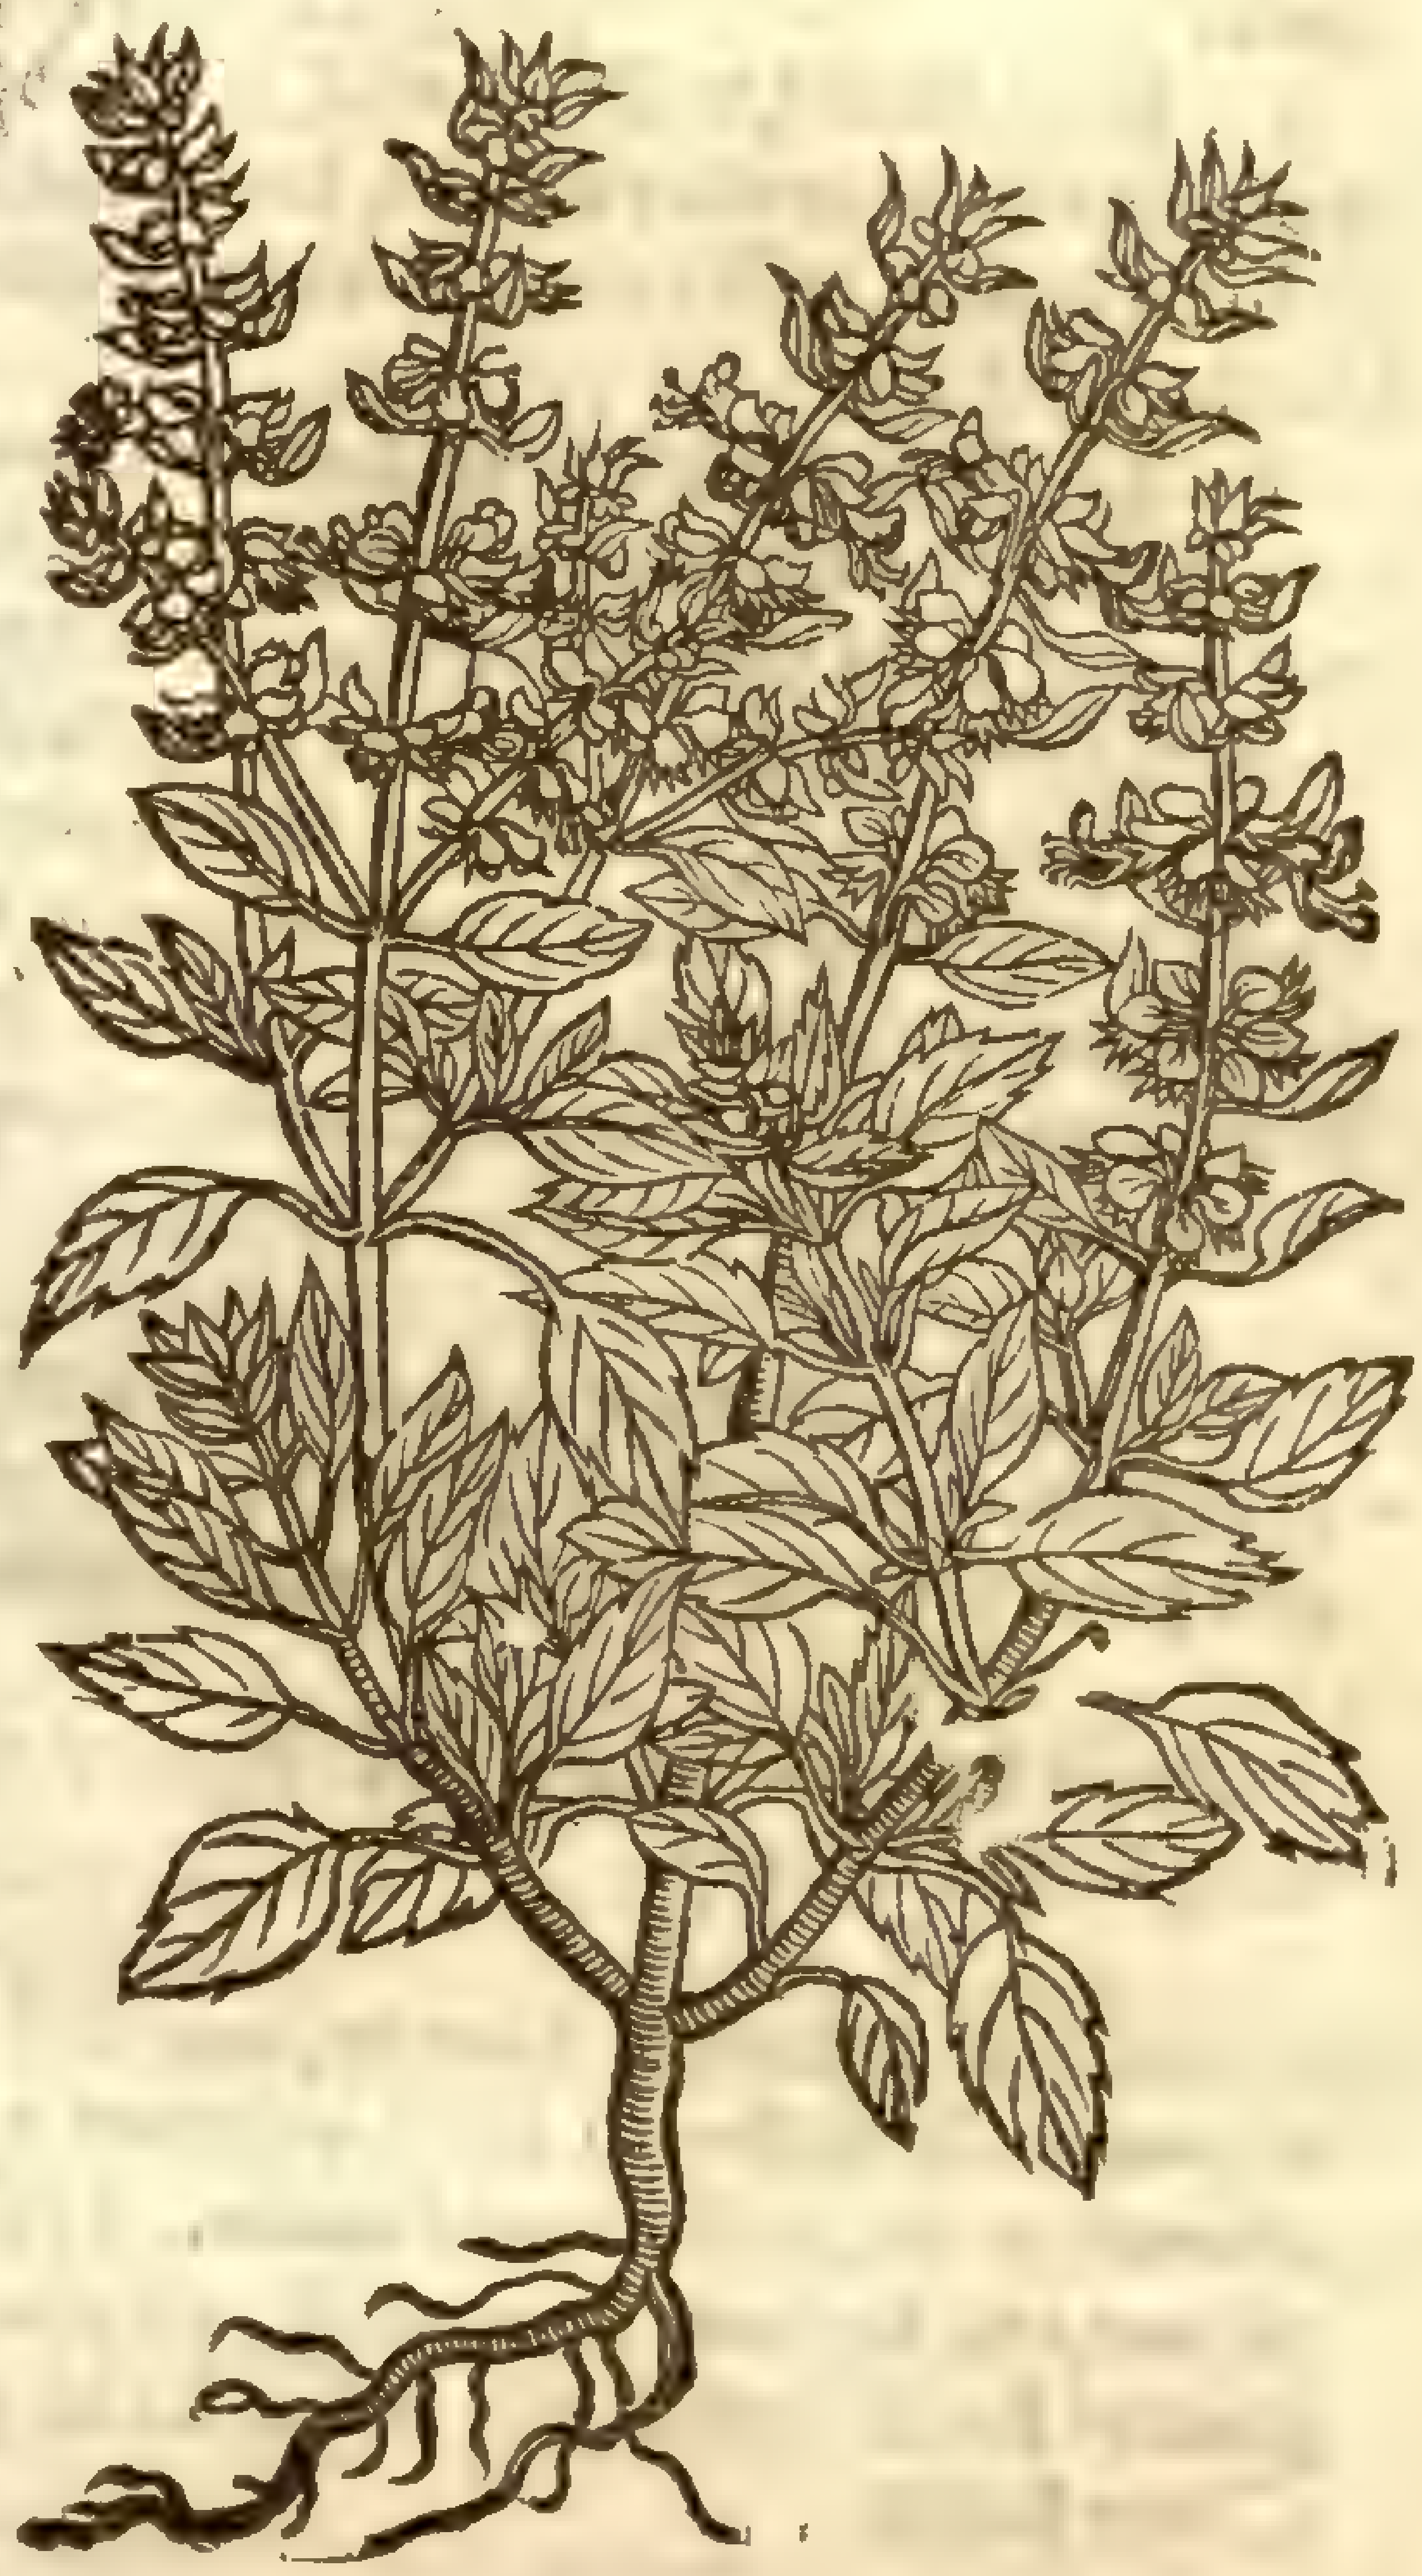
¶ *The Deſcription.*

1 Garden Baſill is of two ſorts, differing one from another in bignes. The firſt hath broad, thicke and fat leaues, of a pleaſant ſweet ſmell, and of which ſome one here and there are of a black reddiſh colour, ſomwhat ſnipped about the edges, not vnlike the leaues of French Mercury. The ſtalke groweth to the height of halfe a cubit, diuiding it ſelfe into diuers branches, whereupon do ſtand ſmall and baſe floures and ſometimes whitiſh, and often tending to a darke purple. The root is threddy, and dieth at the approach of Winter.

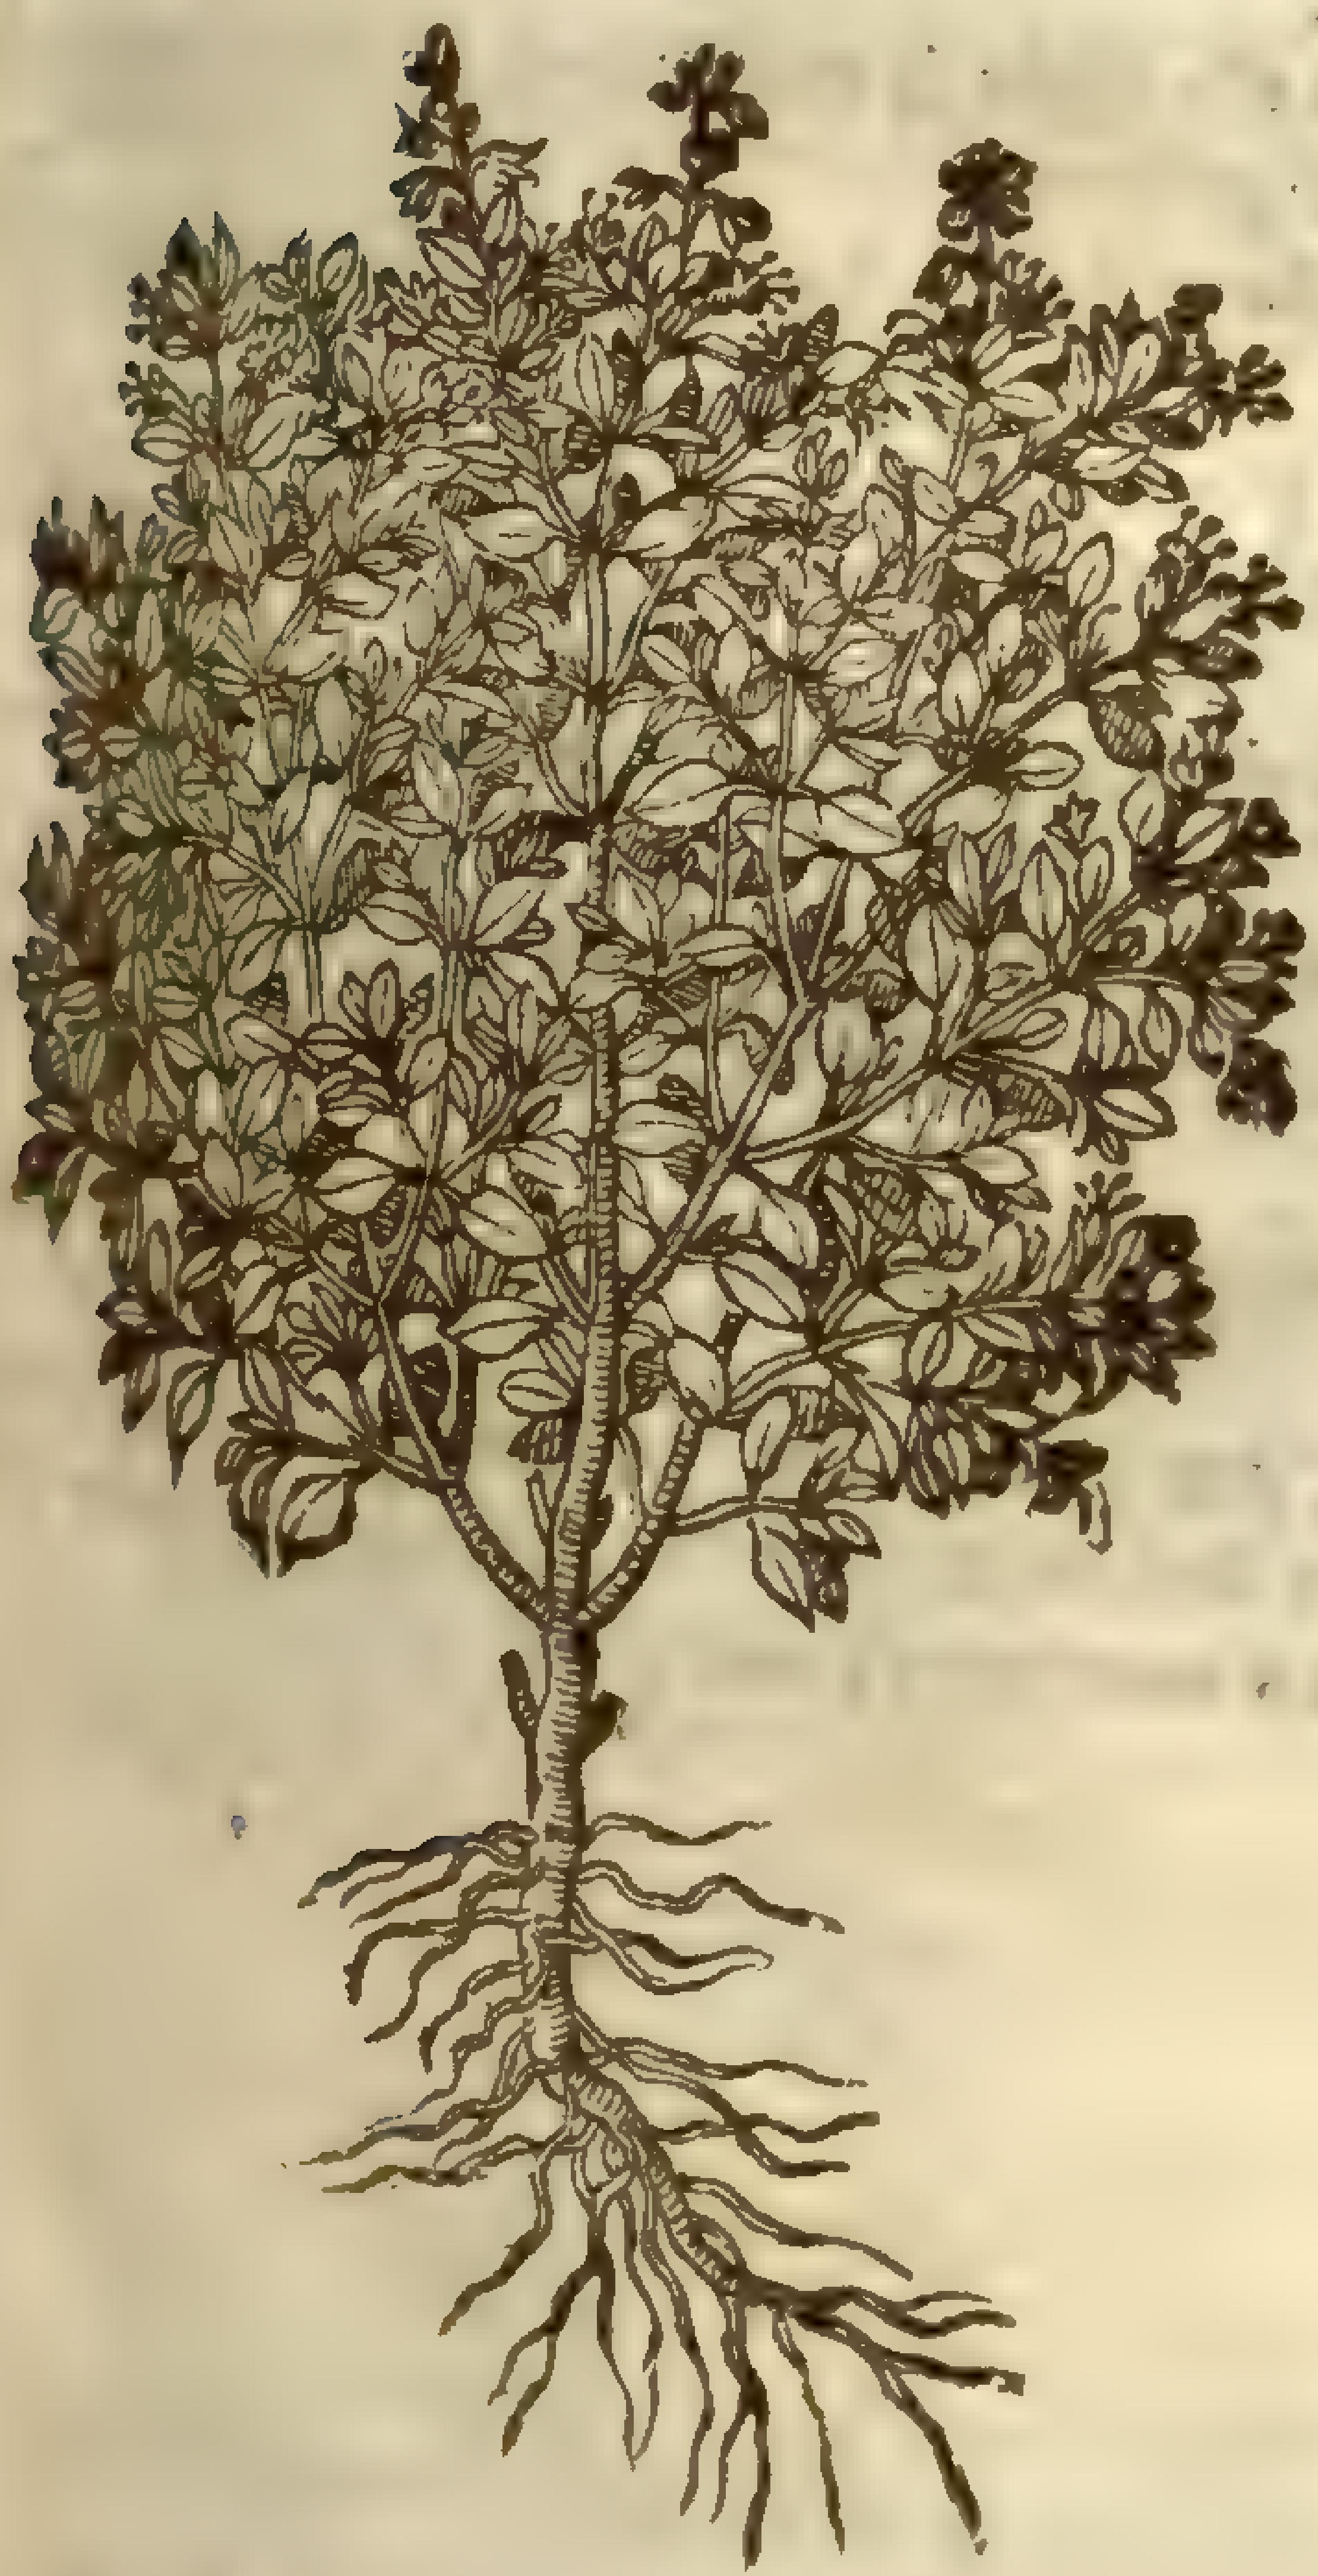
1 *Ocimum magnum.*
Great Baſill.



2 *Ocimum medium citratum.*
Citron Baſill.

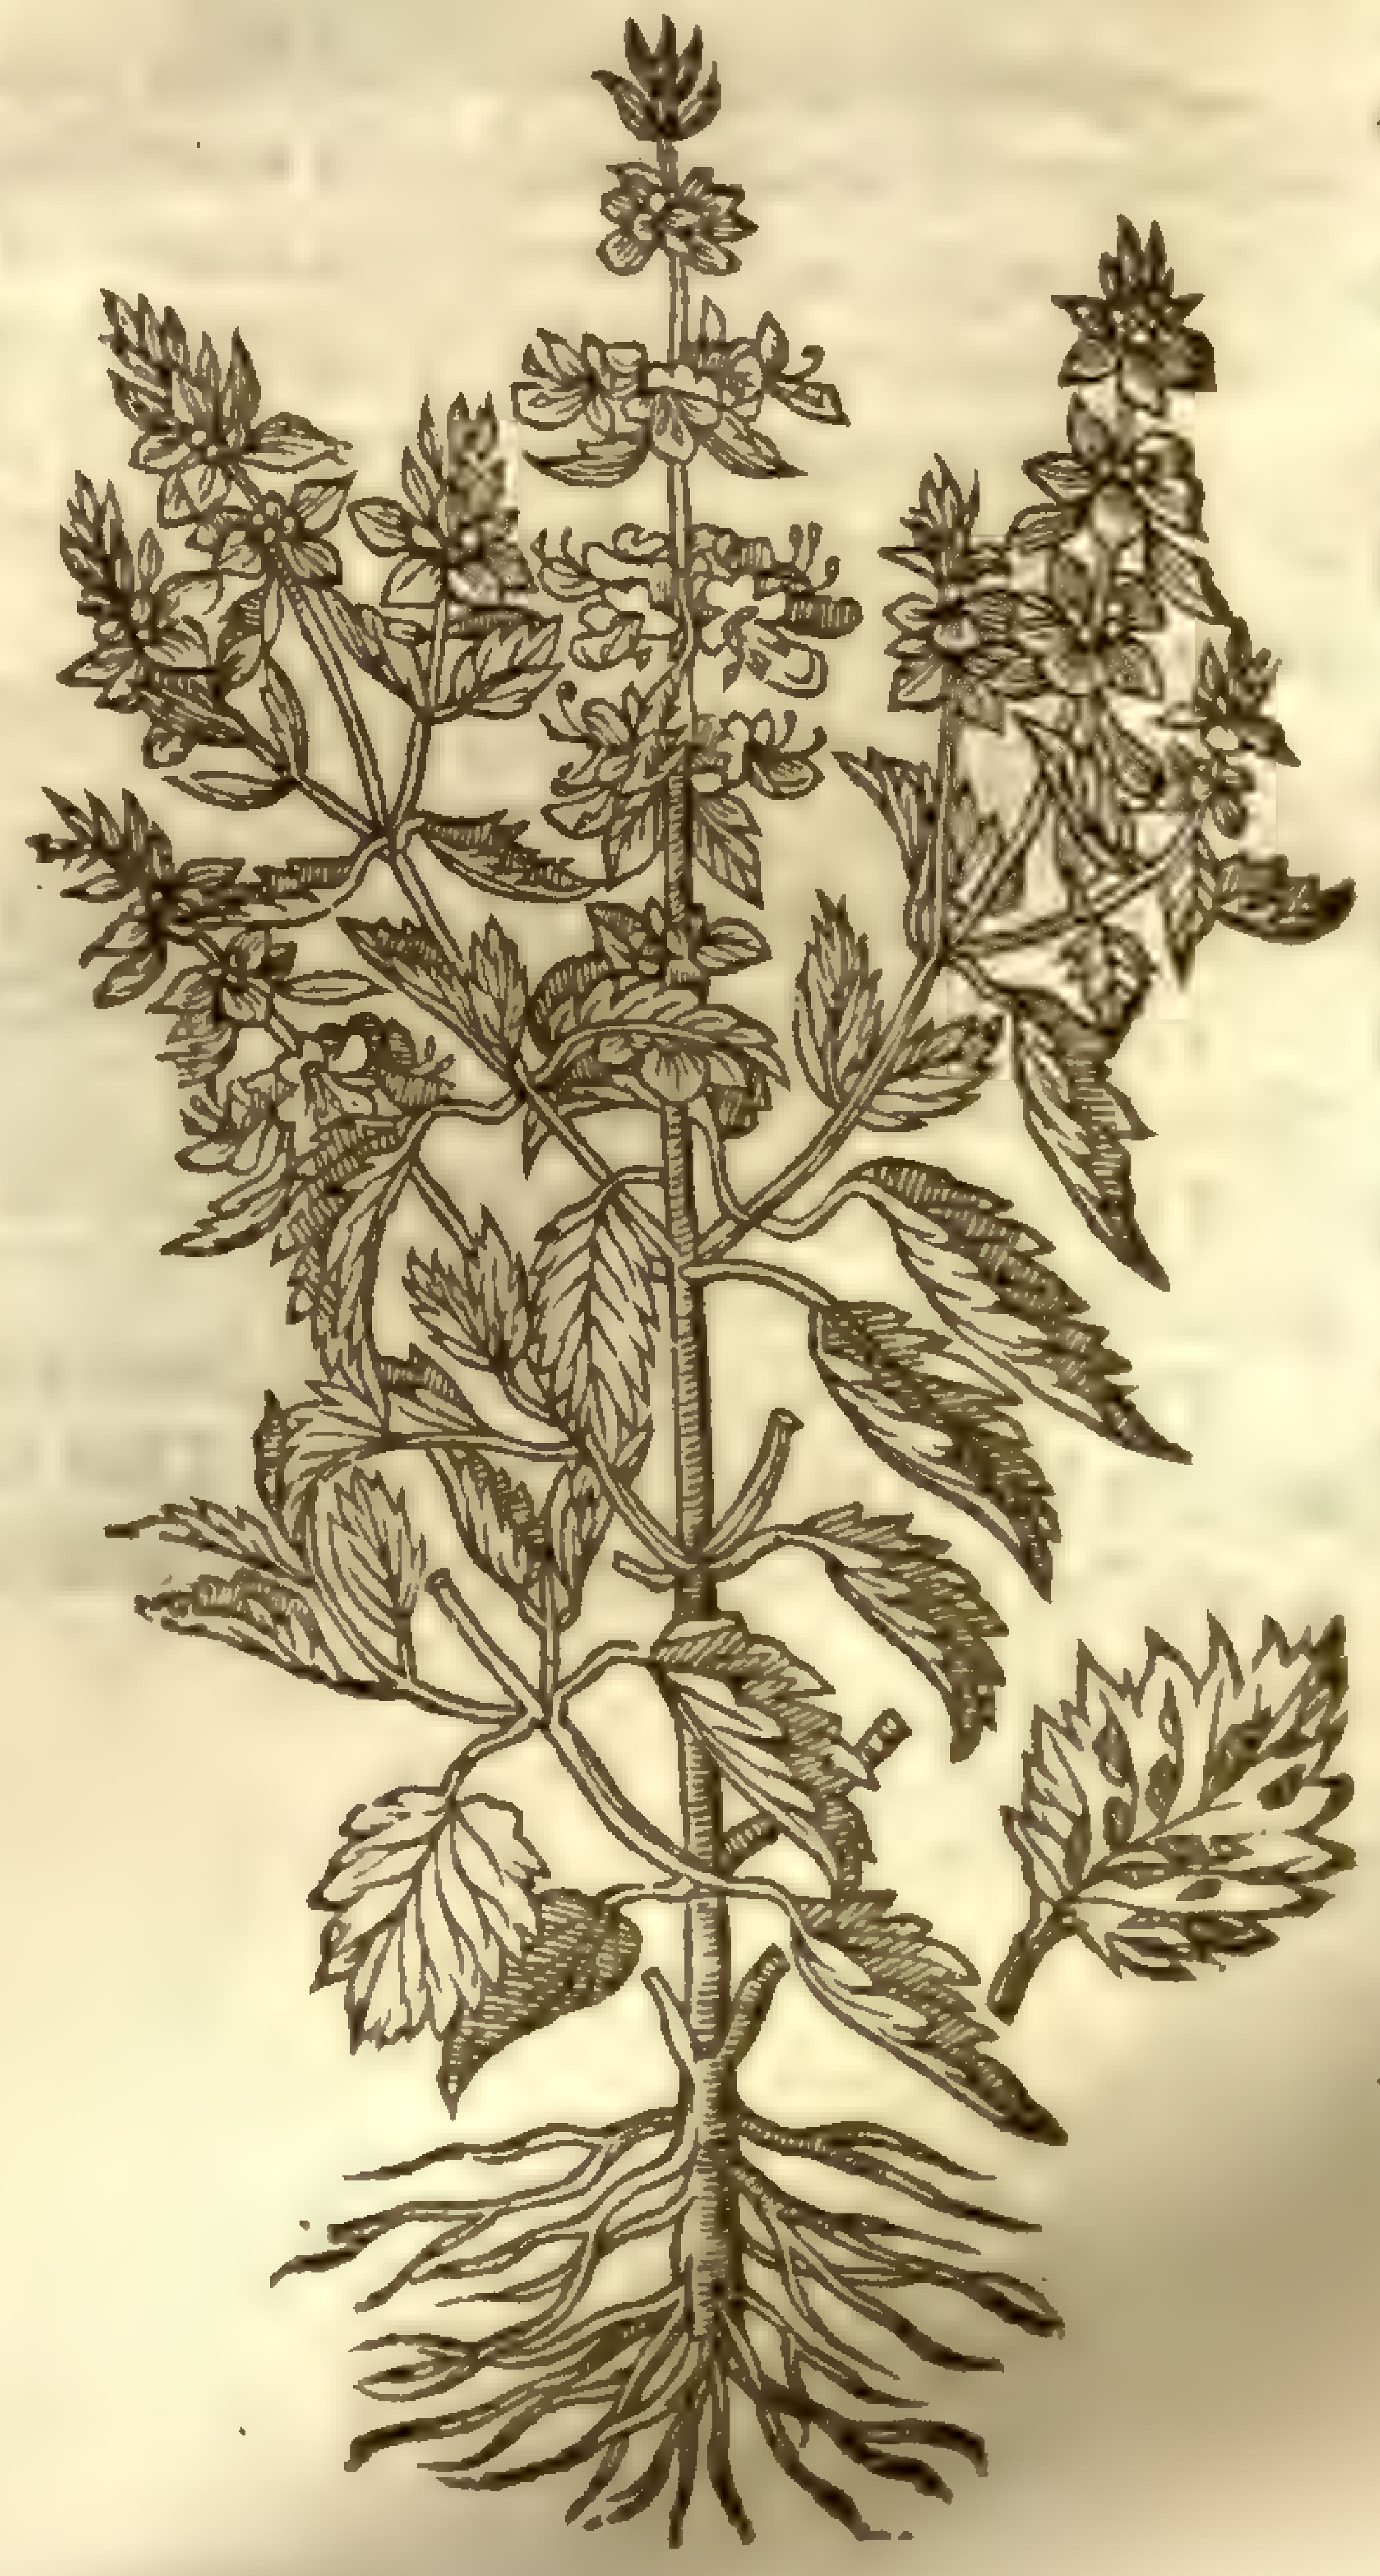


3 *Ocimum minus Garyophyllatum.*
Buſh Baſill.



[illegible]

‡ 4 *Ocimum Indicum.*
Indian Baſill.



2 The middle Baſill is very like vnto the former, but it is altogether leſſer. The whole plant is of a moſt odoriferous ſmell, not vnlike the ſmell of a Limon, or Citron, whereof it tooke his ſurname.

3 Buſh Baſill, or fine Baſill, is a low and baſe plant, hauing a threddy root, from which riſe vp many ſmall and tender ſtalkes, branched into diuers armes or boughes; whereupon are placed many little leaues, leſſer than thoſe of Penny Royall. The whole plant is of a moſt pleaſing ſweet ſmell.

‡ 4 This which ſome call *Ocimum Indicum*, or rather (as *Camerarius* ſaith) *Hiſpanicum*, ſends vp a ſtalke a foot or more high, foure ſquare, and of a purple color, ſet at each joynt with two leaues, and out of their boſomes come little branches: the largeſt leaues are ſome two inches broad, and ſome three long; growing vpon long ſtalkes, and deepely cut in about their edges, being alſo thicke, fat, and juicie, and either of a darke purple colour, or elſe ſpotted with more or leſſe ſuch coloured ſpots. The tops of the branches end in ſpokie tufts of white floures with purple veines running alongſt them. The ſeed is contained in ſuch ſeed veſſels as that of the other Baſils, and is round, blacke and large. The plant periſhes euery yeare as ſoone as it hath perfected the ſeed. *Cluſius* cals this *Ocimum Indimum*. ‡

¶ *The Place.*

Baſil is ſowne in gardens, and in earthen pots. It commeth vp quickly, and loueth little moiſture except in the middle of the day; otherwiſe if it be ſowne in rainie weather, the ſeed will putrifie, and grow into a jellie or ſlime, and come to nothing.

¶ *The Time.*

Baſill floureth in Iune and Iuly, and that by little and little, whereby it is long a flouring, beginning firſt at the top.

¶ *The Names.*

Baſill is called in Greeke, ὄκιμον, and more commonly with ω in the firſt ſyllable ὤκιμον: in Latine, *Ocimum*. It differeth from *Ocymum* which ſome haue called *Cereale* as we (ſaith *Dodonæus*) haue ſhewed in the Hiſtorie of Graine. The later Græcians haue called it βασιλικόν: in ſhops likewiſe *Baſilicum*, and *Regium*: in Spaniſh, *Albahaca*: in French, *Baſilic*: in Engliſh, Baſill, garden Baſill, the greater Baſill Royall, the leſſer Baſill gentle, and buſh Baſill: of ſome, *Baſilicus Gariophyllatum*, or Cloue Baſill.

¶ *The Temperature.*

Baſill, as *Galen* teacheth, is hot in the ſecond degree, but it hath adjoyned with it a ſuperfluous moiſture, by reaſon whereof he doth not like that it ſhould be taken inwardly; but being applied outwardly, it is good to digeſt or diſtribure, and to concoct.

¶ *The Vertues.*

A *Dioſcorides* ſaith that if Baſill be much eaten, it dulleth the ſight, it mollifieth the belly, breedeth winde, prouoketh vrine, drieth vp milke, and is of a hard digeſtion.

B The juyce mixed with fine meale of parched barly, oyle of Roſes, and Vinegre, is good againſt imflammations, and the ſtinging of venomous beaſts.

C The juyce drunke in wine of *Chios* or ſtrong Sacke, is good againſt head-ache.

D The juyce clenſeth away the dimneſſe of the eies, and drieth vp the humour that falleth into them.

E The ſeed drunke is a remedy for melancholy people; for thoſe that are ſhort winded, and them that can hardly make water.

F If the ſame be ſnift vp in the noſe, it cauſeth often neeſing: alſo the herbe it ſelfe doth the ſame.

G There be that ſhunne Baſill and will not eat thereof, becauſe that if it be chewed and laid in the Sun, it engendreth wormes.

H They of Africke do alſo affirme, that they who are ſtung of the Scorpion and haue eaten of it, ſhall feele no paine at all.

I The later Writers, among whom *Simeon Zethy* is one, doe teach, that the ſmell of Baſill is good for the heart and for the head. That the ſeed cureth the infirmities of the heart, taketh away ſorrowfulneſſe which commeth of melancholy, and maketh a man merry and glad.

CHAP. 223. *Of wilde Baſill.*

¶ *The Deſcription.*

1 The wilde Baſil or *Acynos*, called of *Pena, Clinopodium vulgare*, hath ſquare hairie ſtems, beſet with little leaues like vnto the ſmall Baſil, but much ſmaller, and more hairy, ſharpe pointed, and a little ſnipt toward the end of the leaſe, with ſmall floures of a purple colour, faſhioned like vnto the garden Baſill. The root is full of hairie threds, and creepeth along the ground, and ſpringeth vp yearely anew of it ſelfe without ſowing. ‡ This is the *Clinopodium alterum* of *Matthiolus*. ‡

2 This kinde of wilde Baſill called amongſt the Græcians ἄκινος, which by interpretation is *Sine ſemine*, or *Sterilis*, hath cauſed ſundry opinions and great doubts concerning the words of *Pliny* and *Theophraſtus*, affirming that this herbe hath no floures nor ſeeds; which opinion I am ſure of mine owne knowledge to be without reaſon: but to omit controuerſies, this plant beareth purple floures, wharled about ſquare ſtalkes, rough leaues and hairy, very like in ſhape vnto Baſil: ‡ The ſtalkes are ſome cubit and more high, parted into few branches, and ſet at certaine ſpaces with leaues growing by couples. This is the *Clinopodium vulgare* of *Matthiolus*, and that of *Cordus*, *Geſner*, and others; it is the *Acinos* of *Lobel*. ‡

3 *Serapio* and others haue ſet forth another wilde Baſill vnder the title of *Molochia*; and *Lobel* after the minde of *Iohn Brancion*, calleth it *Corcoros*, which we haue Engliſhed, Fiſh Baſill, the ſeeds whereof the ſaid *Brancion* receiued from Spaine, ſaying that *Corcoros Pliny* hath the leaues of Baſill: the ſtalkes are two handfuls high, the floures yellow, growing cloſe to the ſtalkes, bearing his ſeed in ſmall long cods. The root is compact and made of an innumerable company of ſtrings, creeping farabroad like running Time. ‡ This figure of *Lobels* which here we giue you is (as *Camerarius* hath obſerued) vnperfect, for it expreſſes not the long cods wherein the ſeed is contained, neither the two little ſtrings or beards that come forth at the ſetting on of each leafe to the ſtalke. ‡

Bartsia alpina, c
Sm pt. 3. 119

‡ 4 It may be our Authour would haue deſcribed this in the firſt place, as I conjecture by thoſe words which he vſed in mentioning the place of their growing; and [*Clinopodium vulgare* groweth in great plentie vpon Long-field downs in Kent;] but to this neither figure nor deſcription did agree, wherefore I will giue you the *Hiſtory* therof. It ſends vp many little ſquare ſtalks ſome handfull and halfe high, ſeldome diuided into branches: at each joynt ſtand two ſmal greeniſh leaues, little, hairy, and not diuided or ſnipt about the edges, and much like thoſe of the next deſcribed, as you ſee them expreſt in the figure: the little hollow and ſomewhat hooded floures grow in roundles towards the tops of the ſtalkes, as in the firſt deſcribed, and they are of a blewiſh violet colour. The ſeeds I haue not yet obſerued: the root is fibrous and wooddy, and laſts for many yeares. The whole plant hath a pretty pleaſing but weake ſmell. It floures in Iuly and Auguſt. I firſt obſerued it *Anno* 1626, a little on this ſide Pomfret in Yorkſhire, and ſince by Datford in Kent, and in the Iſle of Tenet. I haue ſometimes ſeene it brought to Cheapſide market, where the herbe women called it Poley mountaine, ſome it may bee that haue taken it for *Polium montanum* miſinforming them; *Cluſius* firſt tooke notice of this plant, and called it *Acinos Anglicum*, finding it growing in Kent, *Anno*, 1581. and he thinkes it to

be the *Acinos* of *Dioſcorides*:now the vertues attributed by *Dioſcorides* to his *Acinos* are ſet downe at the end of the chapter,vnder the letter B.

5 This which *Cluſius* hath alſo ſet forth by the name of *Clinopodium*, or *Acinos Auſtriacum*,differeth not much from the laſt deſcribed,for it hath tender ſquare hard ſtalks like thoſe of the laſt deſcribed,ſet alſo with two leaues at each joint,here and there a little ſnipt(which is omitted in the figure) the floures grow onely at the tops of the ſtalkes, and theſe pretty large and of a violet colour(yet they are ſomtimes found white:)they hang commonly forward, and as it were with their vpper parts turned downe. The ſeed veſſels are like thoſe of the firſt deſcribed,and containe each of them foure little black ſeeds:This floures in May,and the ſeed is ripe in Iune: It growes about the bathes of Badon, and in diuers places of Auſtria.

6 *Pona* alſo hath giuen vs knowledge of another, that from a fibrous root ſends vp many quadrangular rough branches, of the height of the two former,ſet alſo with two leaues at each joint, and theſe rough and lightly ſnipt about the edges;the floures grow thick together at the tops of the ſtalks of a dark red colour,and in ſhape like thoſe of the mountain Calamint. It floures in the beginning of Iuly,and growes vpon mount Baldus in Italy; *Pona* ſets it forth by the name of *Clinopodium Alpinum.*

7 To theſe I thinke fit to adde another, whoſe deſcription was ſent me by Mr.*Goodyer*, and I queſtion whether it may not be the plant which *Fabius Columna Phytobaſani,pag*.23.ſets forth by the name of *Acinos Dioſcoridis*,for he makes his to be endured *odore fragrantiſſimo*: but to the purpoſe.

Acinos odoratiſſimum.

This herbe hath foure,fiue,or more,foure ſquare hard wooddy ſtalks growing from one root, diuided into many branches, couered with a ſoft white hoarineſſe, two or three foot long, or longer, not growing vpright, but trailing vpon the ground; the leaues grow on little ſhort footſtalkes by couples of a light greene colour,ſomewhat like the leaues of Baſill, very like the leaues of *Acinos Lobelij*,but ſmaller,about three quarters of an inch broad,and not fully an inch long,ſomwhat ſharp pointed, lightly notched about the edges,alſo couered with a light ſoft hoary haírineſſe,of a very ſweet ſmell,little inferiour to garden Marjerome,of a hot biting taſt:out of their boſomes grow other ſmaller leaues,or elſe branches; the floures alſo grow forth of the boſomes of the leaues toward the tops of the ſtalkes and branches, not in whorles like the ſaid *Acinos*, but hauing one little ſhort footſtalke growing forth of the boſome of each leafe,on which is placed three,foure,or more ſmall floures,gaping open, and diuided into foure vnequall parts at the top, like the floures of Baſil,and very neer of the likenes and bignes of the flours of garden Marjerome,but of a pale blewiſh colour tending towards a purple. The ſeed I neuer obſerued by reaſon it floured late. This plant I firſt found growing in the garden of Mr.*Wil. Yalden* in Sheete neer Petersfield in Hampſhire, *Anno* 1620.among ſweet Marjerome,and which by chance they bought with the ſeeds therof. It is to be conſidered whether the ſeeds of ſweet Marjerome degenerate and ſend forth this herbe or not.

11.October,1621.*Iohn Goodyer.* ‡

¶ *The Place.*

The wild kinds do grow vpon grauelly grounds by waters ſides,and eſpecially I found the three laſt in the barren plaine by an houſe in Kent,two miles from Dartford, called Saint Iones in a village called Sutton; and *Clinopodium vulgare* groweth in great plentie vpon Longfield downes in Kent. ‡ One of the three laſt of our Authors deſcription is omitted,as you may find noted at the end of the chapter,yet I canot be perſuaded that euer he found any of the foure he deſcribed euer wilde in this kingdome,vnleſſe the ſecond, which growes plentifully in Autumne almoſt by euery hedge: alſo the fourth being of my deſcription growes neere Dartford, and in many ſuch dry barren places in ſundry parts of this kingdome. ‡

¶ *The Time.*

Theſe herbes floure in Iune and Iuly.

¶ *The Names.*

Vnprofitable Baſil,or wild Baſill is called by ſome *Clinopodium.*

¶ *The Temperature.*

The ſeed of theſe herbes are of complexion hot and dry.

¶ *The Vertues.*

A Wild Baſill pound with wine appeaſeth the pain of the eies,and the juice mundifieth the *ſame*, and putteth away all obſcurity and dimneſſe, all catarrhes and flowing humors that *fall into* the eies,being often dropped into the ſame.

B † The ſtone Baſill howſoeuer it be taken ſtoppeth the laske, and courſes, and outwardly applied it helps hot tumors and inflammations.

‡ Theſe plants are good for all ſuch effects as require moderate heate and aſtriction. ‡

---

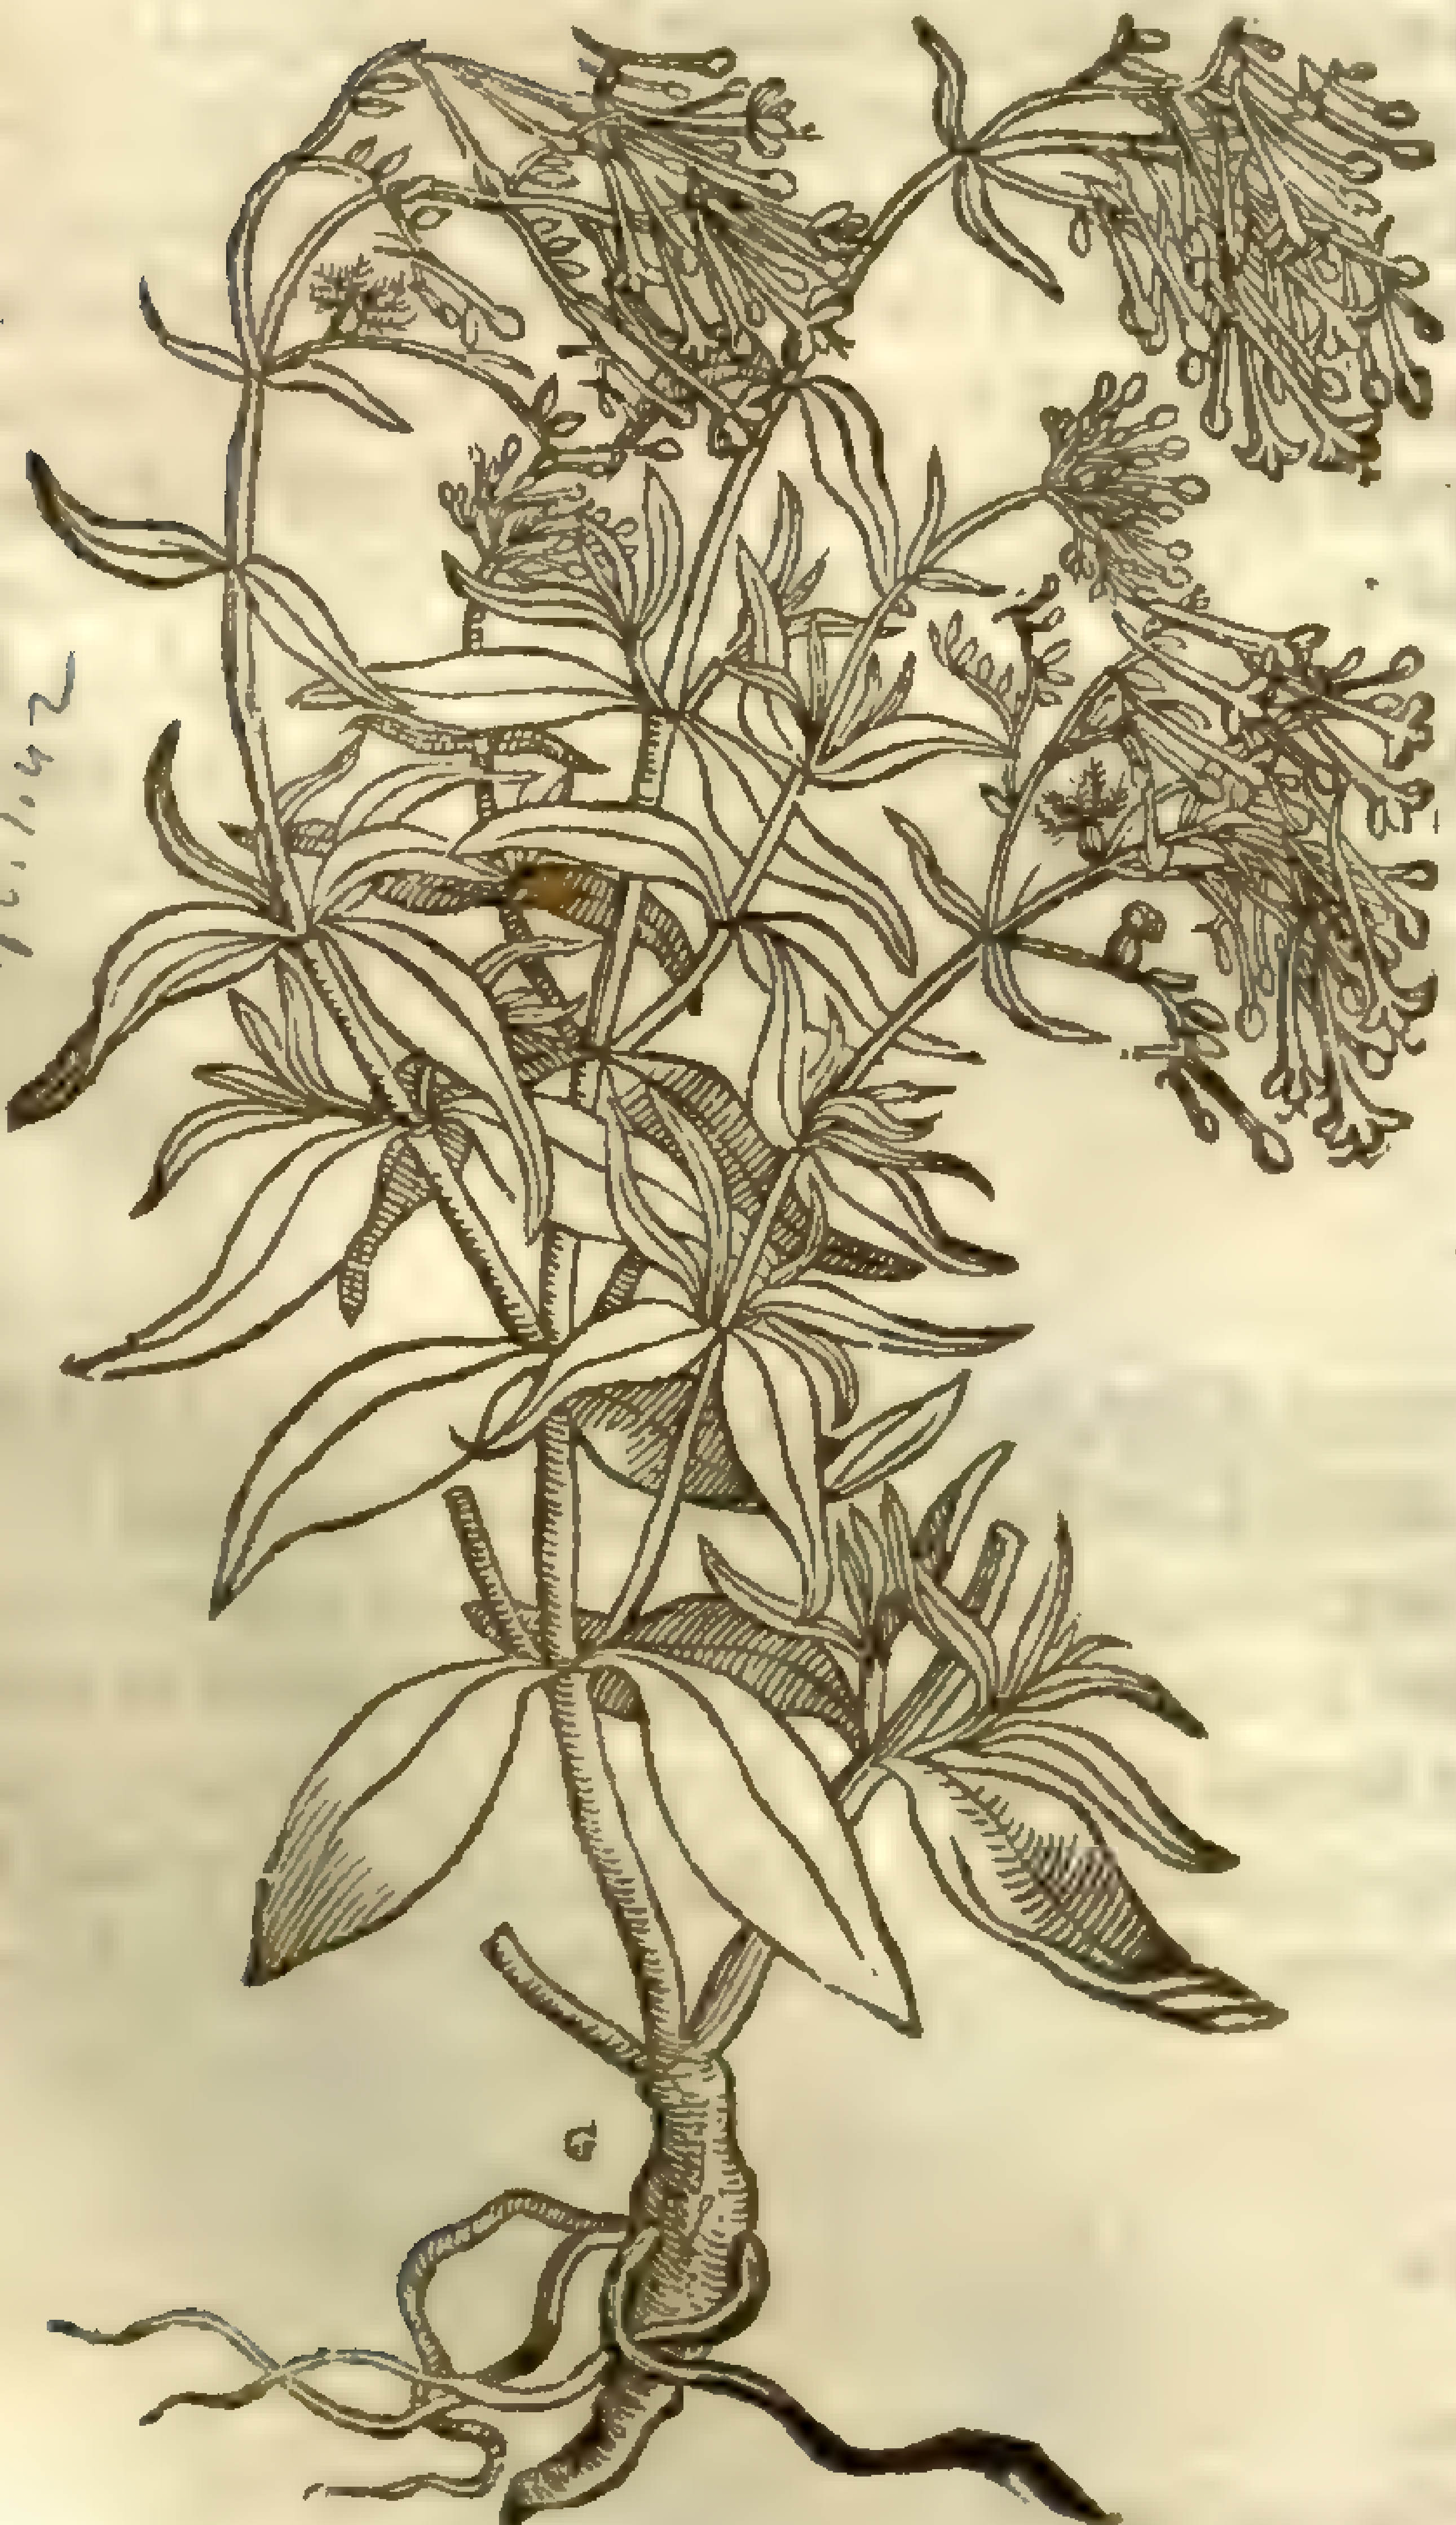
† The figure that was formerly in the third place of this chapter was of the *Calamentha Ocymoides* of *Tabernamontanus*, and it was deſcribed by our Author in the fourth place of the next chapter ſaue one, and there you ſhall finde it: the deſcription ſeemes to be of the *Ocymoides repens Polygonifolia* of the *Adverſaria*, formerly deſcribed by me in the fifth place of the 128. chapter of this booke; if that the place and floures in the omitted deſcription of our Author did not ſeeme to vary: howeuer I iudge it the ſame, and therefore haue here excluded it.

Chap. 224. *Of Baſill Valerian.*

¶ *The Deſcription.*

1 The firſt kinde of *Ocymaſtrum*, called of *Dodonæus*, *Valeriana rubra*, bringeth forth long and brittle ſtalks two cubits high, full of knots or joints, in which place is joined long leaues much like vnto great Baſill, but greater, broader, and larger, or rather like the leaues of the Woad, at the top of the ſtalks grow very pleaſant and long red floures, of the faſhion of the floures of Valerian, which hath cauſed *Dodonæus* to call this plant red Valerian; which being paſt, the ſeeds are carried away with the winde, being few in number, and little in quantity, ſo that without great diligence the ſeed is not to be gathered or preſerued: for my ſelfe haue often indeauored to ſee it, and yet haue loſt my labour. The root is very thick, and of an excellent ſweet ſauor

1 *Valeriana rubra Dodonæi.*
Red Valerian.



V. rubra, β.
rubra, dicti

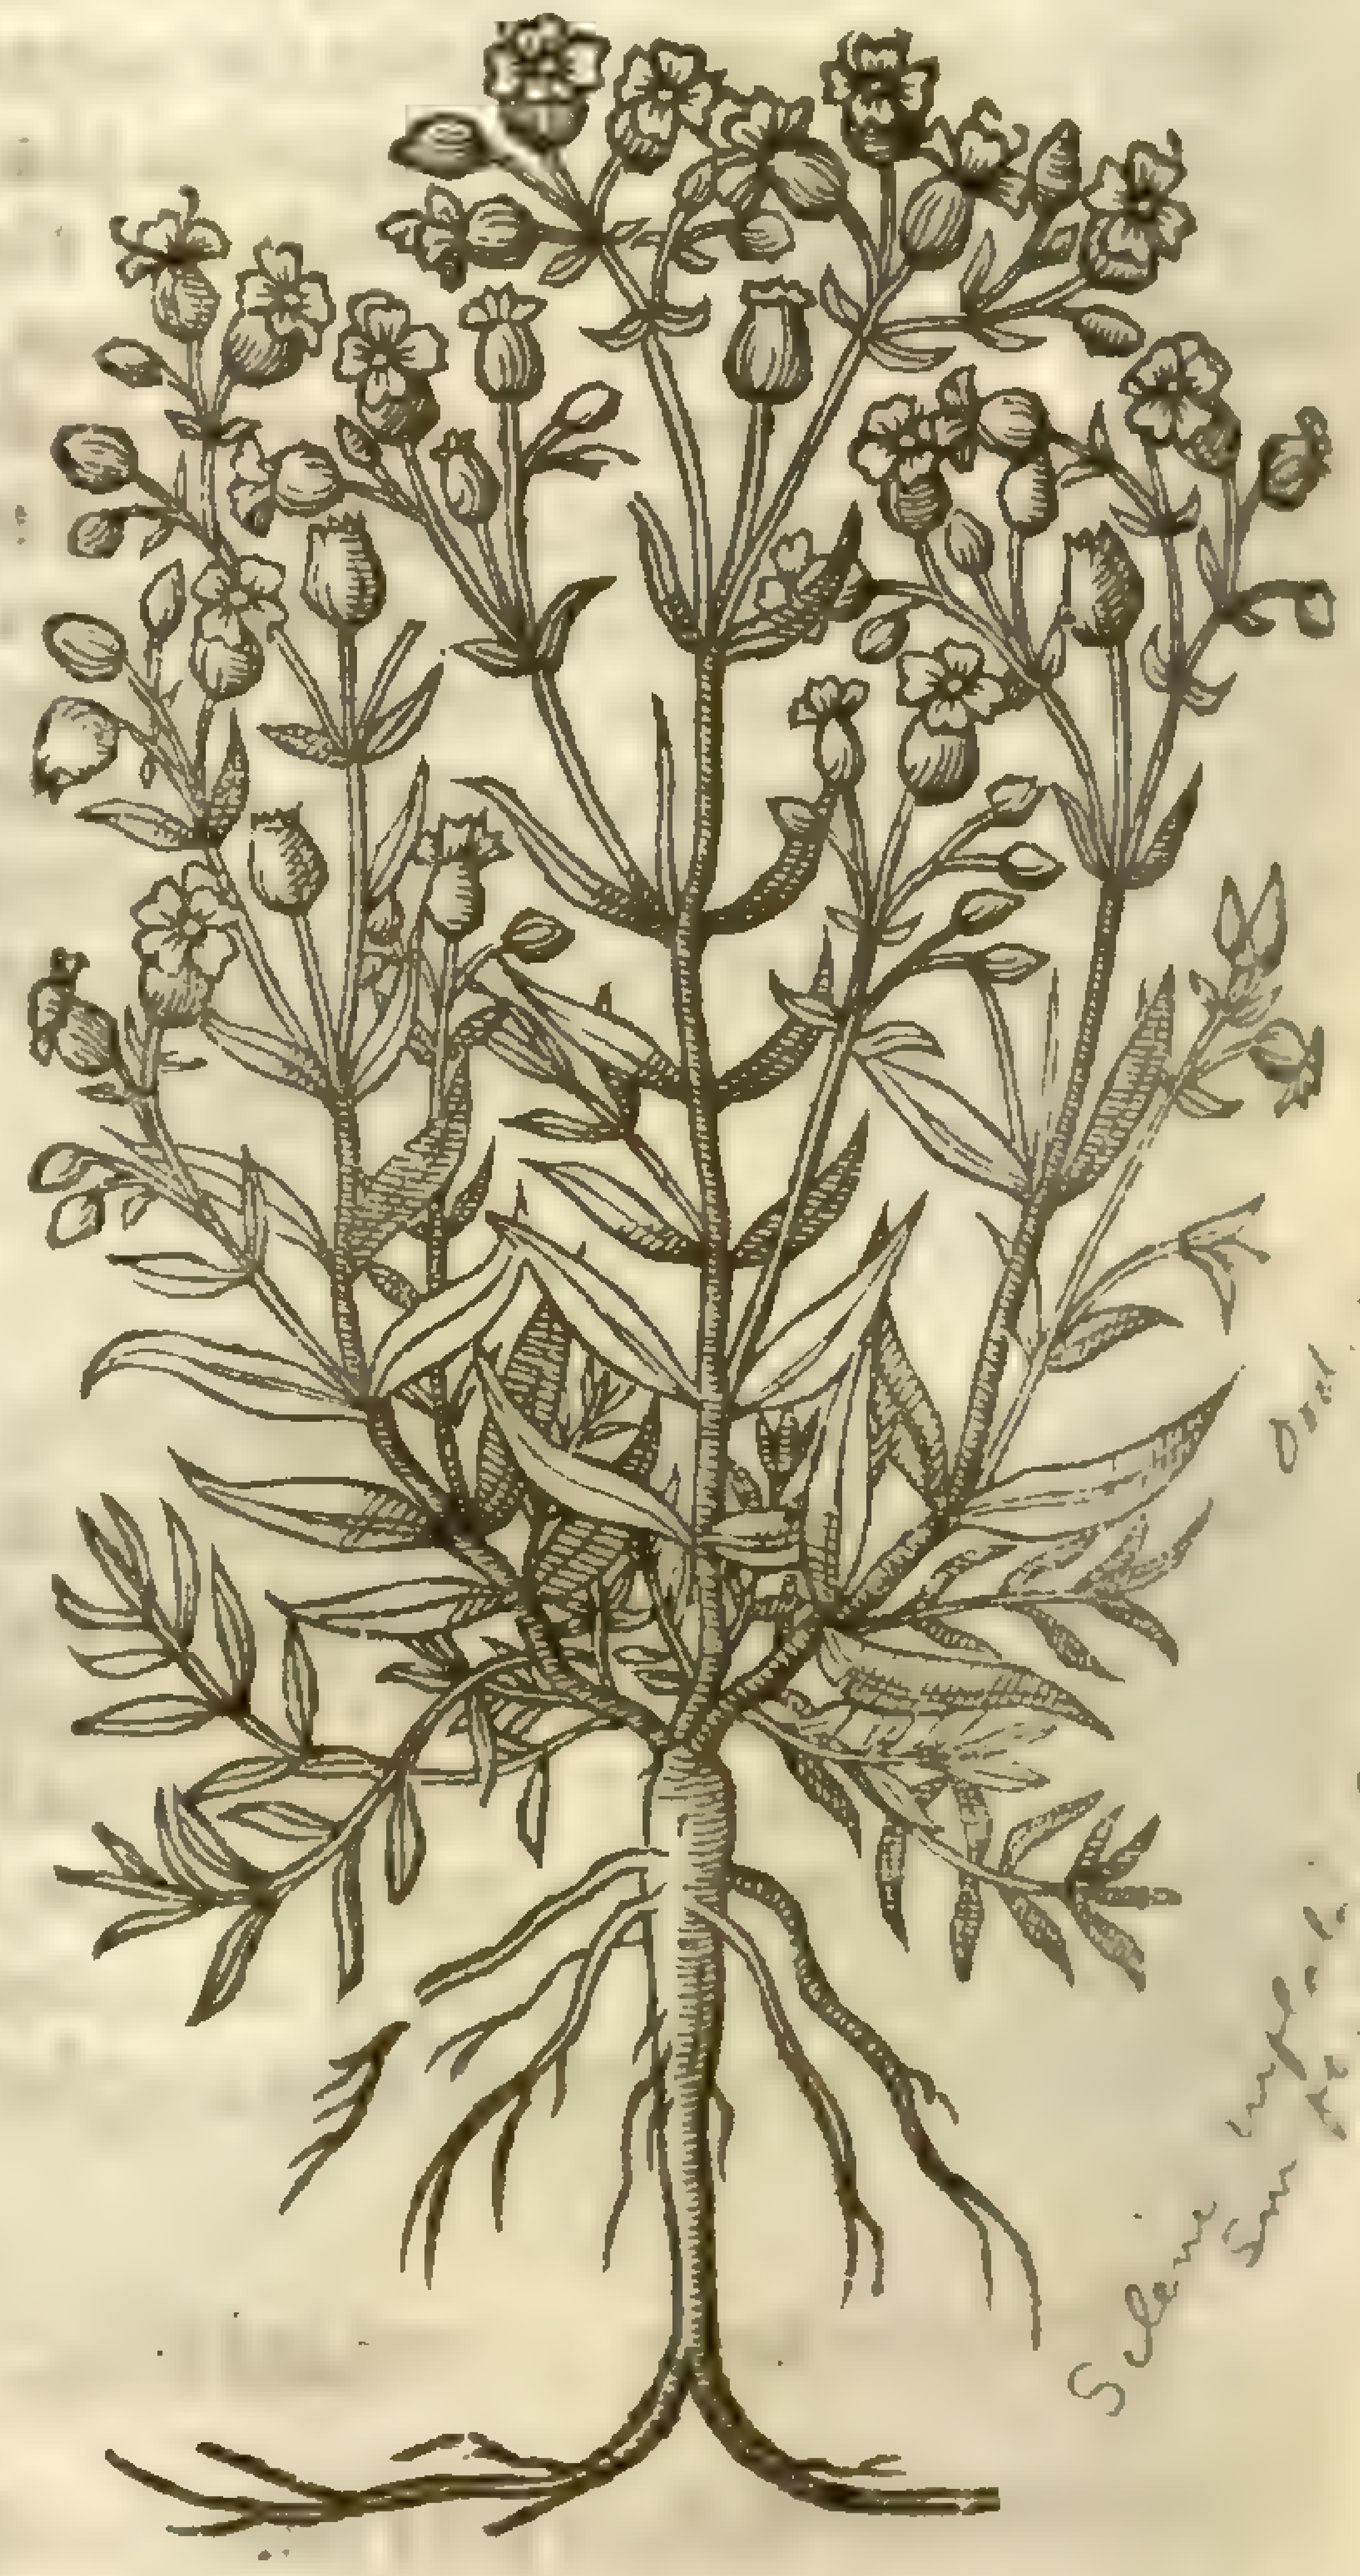
Centranthus ruber, [illegible]

2 *Behen album.*
Spatling poppy.



Ord. [illegible]

Silene inflata Sm.
Sm. fl. [illegible]

2 The ſecond is taken for *Spumeum papaver*, in reſpect of that kind of frothy ſpattle, or ſpume, which we call Cuckow ſpittle, that more aboundeth in the boſomes of the leaues of theſe plants, than in any other plant that is knowne: for which cauſe *Pena* calleth it *Papaver ſpumeum*, that is, frothy, or ſpatling Poppy: his floure doth very little reſemble any kinde of Poppey, but onely the ſeede and cod, or bowle wherein the ſeed is contained, otherwiſe it is like the other *Ocymaſtrum*;

ſtrum: the floures grow at the top of the ſtalks, hanging downwards, of a white colour, and it is taken generally for *Behen album*: the root is white, plain, and long, and very tough and hard to break.

¶ *The Place.*

The firſt groweth plentifully in my garden, being a great ornament to the ſame, and not common in England.

The ſecond groweth almoſt in euery paſture.

¶ *The Time.*

Theſe plants floure from May to the end of Auguſt.

¶ *The Names.*

Red Valerian hath bin ſo called of the likeneſſe of the floures and ſpoked rundles with Valerian; by which name we had rather haue it called, than raſhly to lay vpon it an vnproper name. There are ſome alſo who would haue it to be a kinde of *Behen* of the later Herbariſts, naming the ſame *Behen rubrum*, for difference between it and the other *Behen album*, that of ſome is called *Ocymaſtrum*, and *Papauer ſpumeum*, which I haue Engliſhed Spatling Poppy; and is in truth another plant much differing from *Behen* of the Arabians: it is alſo called *Valerianthon*, *Saponaria altera*, *Struthium Aldroandi*, and *Condurdum*: in Engliſh, red Valerian, and red Cow Baſill.

Spatling Poppy is called *Behen album*, *Ocymaſtrum alterum*; of ſome, *Polemonium*, and *Papauer ſpumeum*: in Engliſh, Spatling Poppy, frothy Poppy, and white Ben.

¶ *The Temperature.*

Theſe plants are dry in the ſecond degree.

¶ *The Vertues.*

The root of *Behen album* drunke in wine is good againſt the bloudy flix; and being pound leaues and flours, and laid to, cureth the ſtingings of Scorpions and ſuch like venomous beaſts; inſomuch that whoſo doth hold the ſame in his hand, can receiue no damage or hurt by any venomous beaſt. A

The decoction of the root made in water and drunke, prouoketh vrin, helpeth the ſtrangury and paines about the necke and huckle bone. B

---

† That which was formerly here ſet forth in the third place by the name of *Ocymaſtrum multiflorum*, is nothing elſe but the *Lychnis ſylueſtris alba multiplex*, which I haue deſcribed amongſt the reſt of the ſame kinde in the 128 Chapter of this booke.

Chap. 225. *Of Mints.*

¶ *The Kindes.*

There be diuers ſorts of Mints, ſome of the garden, others wilde or of the field; and alſo ſome of the water.

¶ *The Deſcription.*

1 The firſt tame or garden Mint commeth vp with ſtalks foure ſquare, of an obſcure red colour ſomewhat hairy, which are couered with round leaues nicked in the edges like a Saw, of a deep green colour: the floures are little and red, and grow about the ſtalkes circle-wiſe as thoſe of Penny-Royall: the root creepeth aſlope in the ground, hauing ſome ſtrings on it, and now and then in ſundry places it buddeth out afreſh: the whole herb is of a pleaſant ſmel, and it rather lieth downe than ſtandeth vp.

2 The ſecond is like to the firſt in hairy ſtalks ſomthing round, in blackiſh leaues, in creeping roots, and alſo in ſmell, but the floures do not at all compaſſe the ſtalke about, but ſtand vp in the tops of the branches, being orderly placed in little eares, or rather catkins or aglets.

3 The leaues of Speare-Mint are long like thoſe of the Willow tree, but whiter, ſofter, and more hairy: the floures are orderly placed in the tops of the ſtalks, and in eares like thoſe of the ſecond. The root hereof doth alſo creepe no otherwiſe than doth that of the firſt, vnto which it is like.

4 There is another ſort of Mint which hath long leaues like to the third in ſtalks, yet in leaues and roots leſſer; but the flours hereof ſtand not in the tops of the branches, but compaſſe the ſtalks about circle-wiſe as do thoſe of the firſt, which be of a light purple colour.

‡ 5 This hath round leaues broader than the common Mint, rounder alſo, and as criſp or curled as thoſe deſcribed in the ſecond place (of which it ſeemes but a larger *varietie*:) the ſtalkes are

foure

† 1 *Mentha ſativa rubra.*

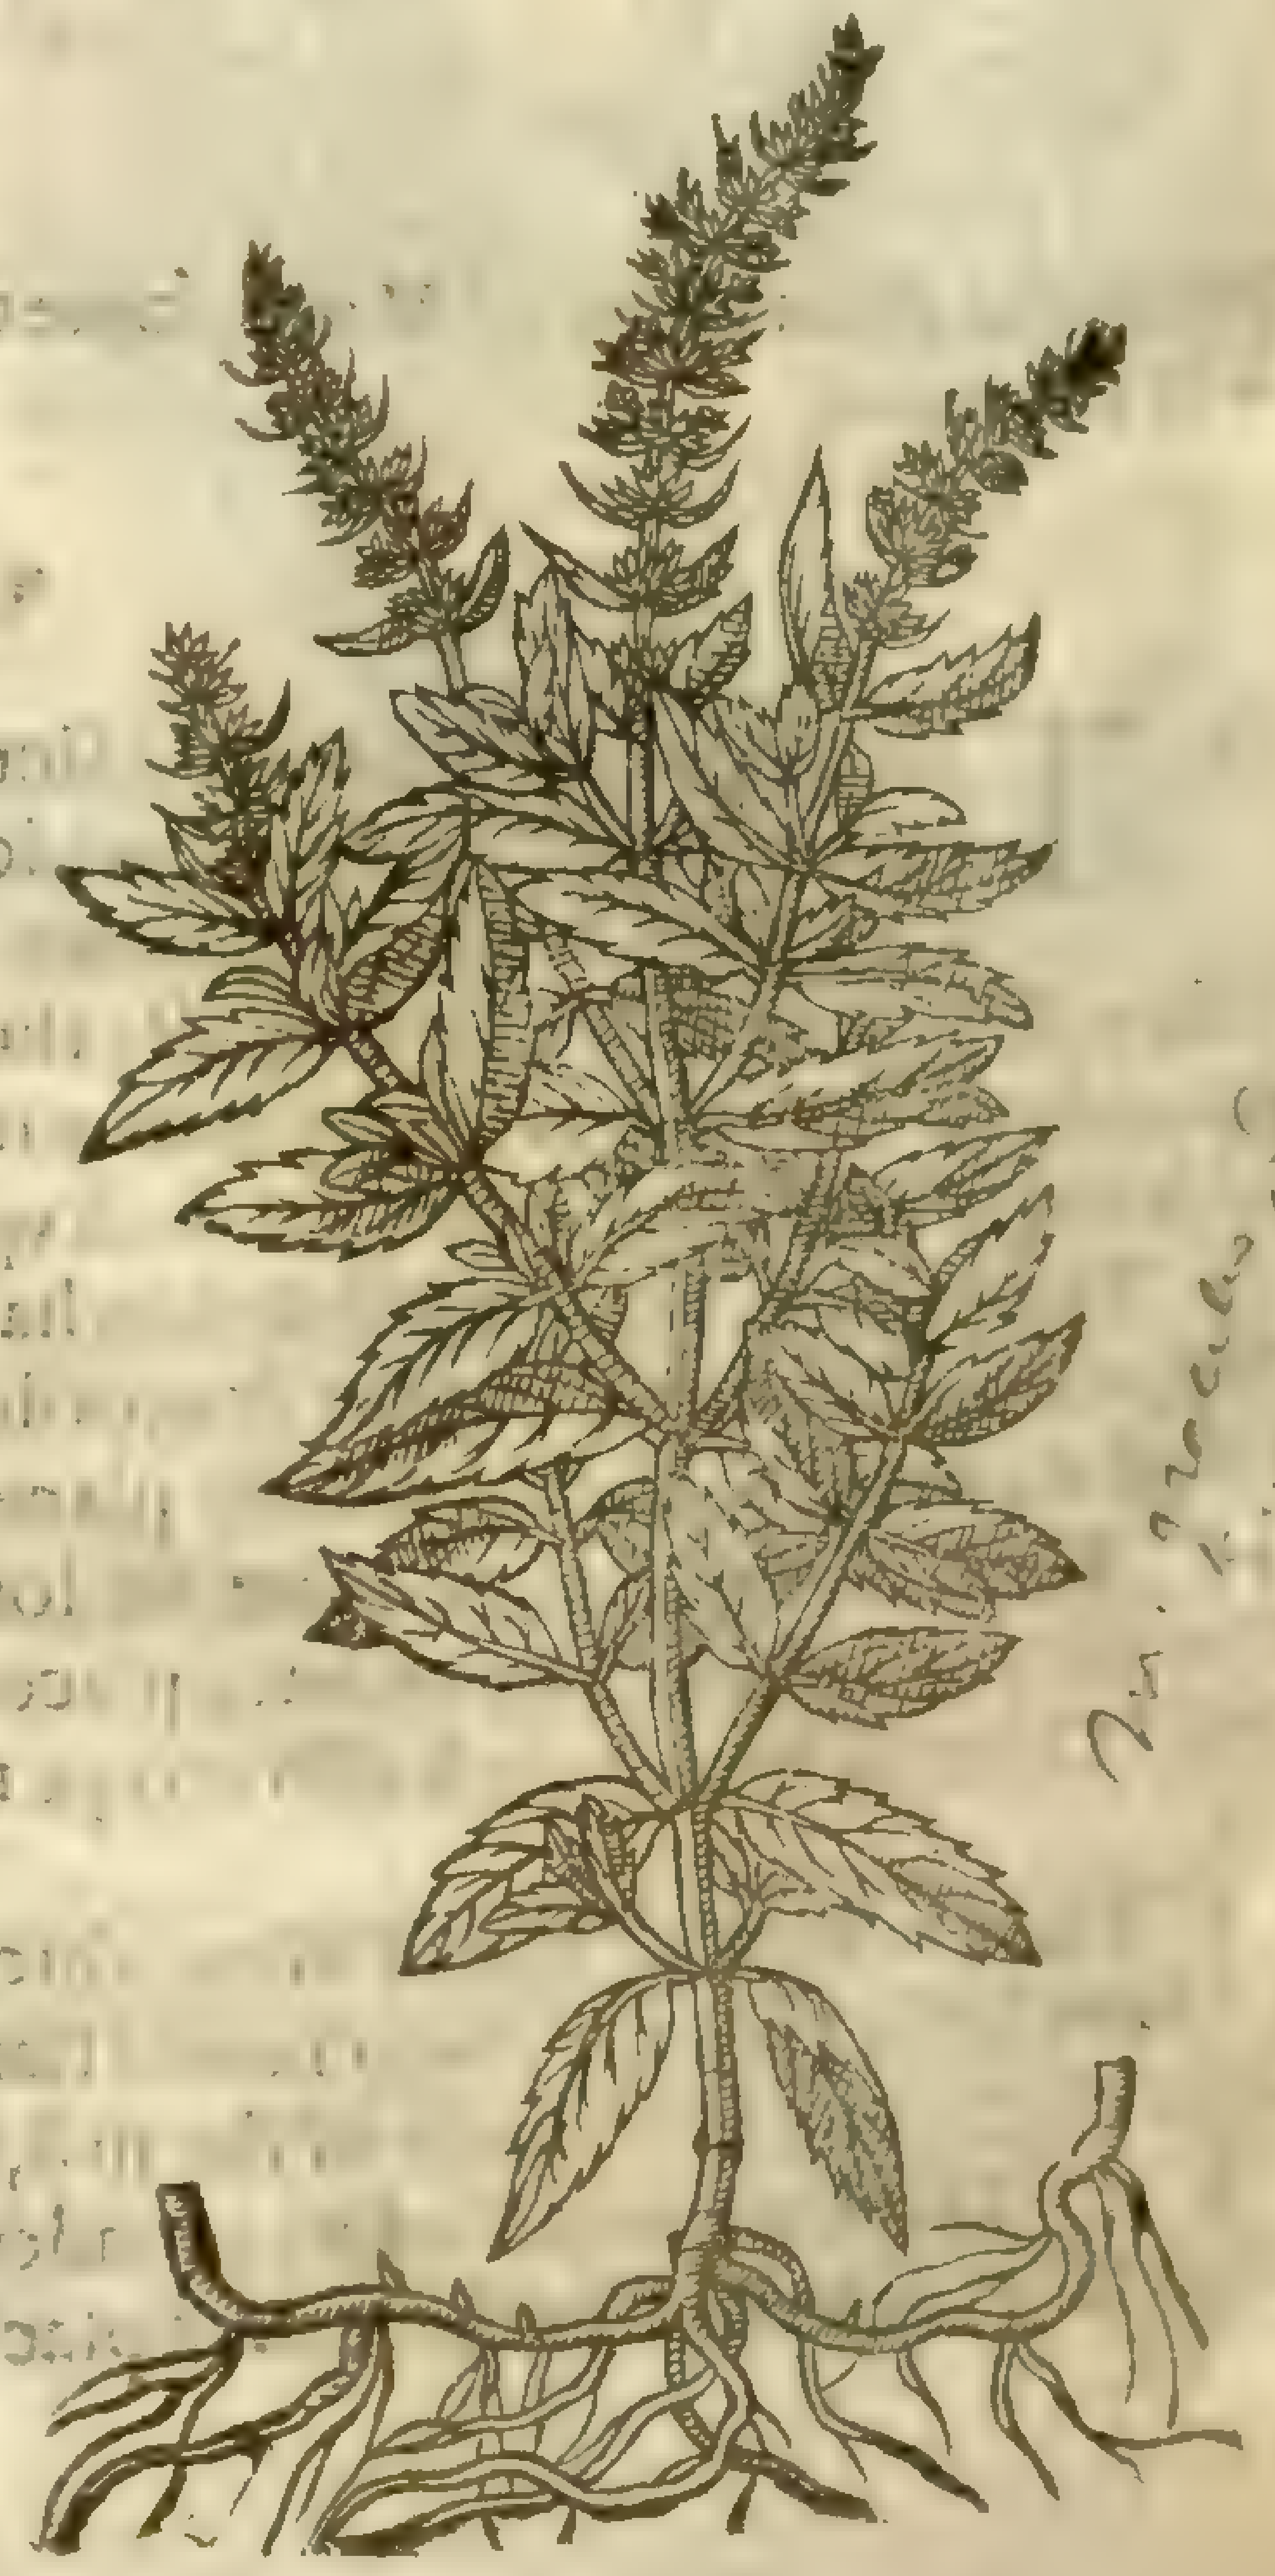
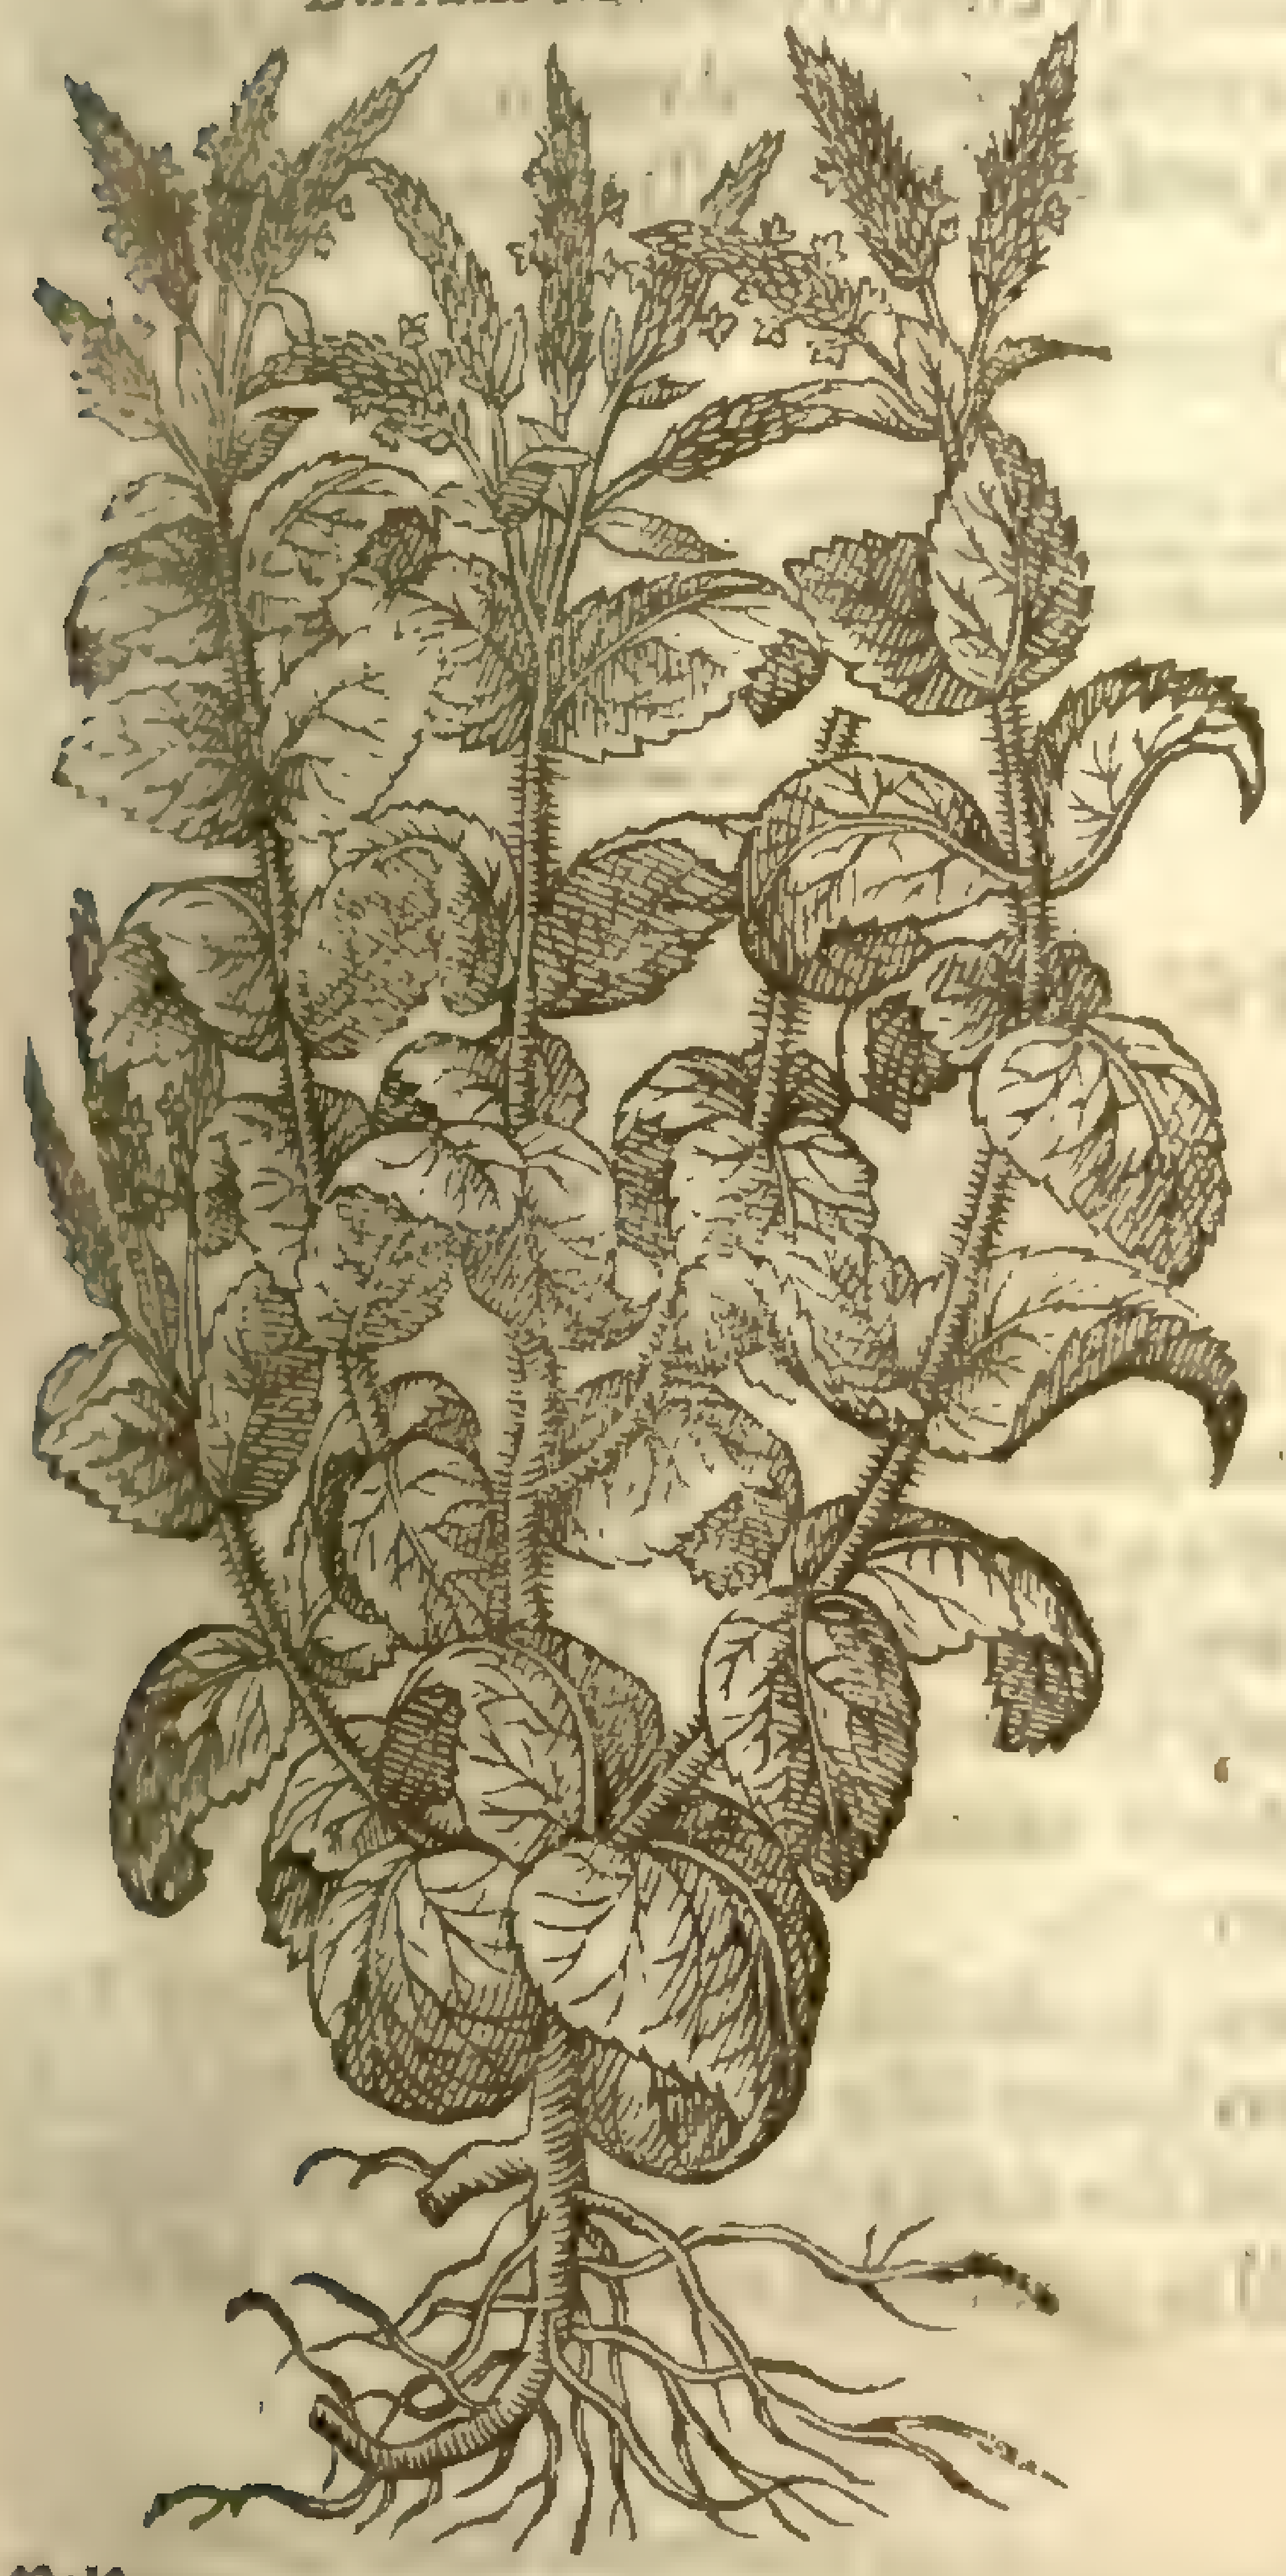
† 4 *Mentha Cardiaca.*
Heart Mint.



foure ſquare, and the floures grow in eares or ſpoky tufts like thoſe of the ſecond. ‡

‡ 5 *Mentha ſpicata altera.*
Balſam Mint.



¶ *The Place.*

Moſt vſe to ſet Mints in gardens almoſt euery where.

¶ *The Time.*

Mints doe floure and flouriſh in Summer: in winter the roots only remain: being once ſet, they continue long, and remaine ſure and faſt in the ground.

¶ *The Names.*

Mint is called in Greeke ἡδύοσμος, and μίνθη: The ſweet ſmell, ſaith *Pliny, lib.* 19. *ca.* 8. hath changed the name among the Grecians, whenas otherwiſe it ſhould be called *Mintha*, from whence our old Writers haue deriued the name: for ἡδὺ ſignifieth ſweet, and ὀσμὴ ſmell: the Apothecaries, Italians, and French men doe keepe the Latine name *Mentha*: the Spaniards do call it *Yeruá buena*, and *Ortelana*: in high-Dutch, **Muntz**: in low-Dutch, **Munte**: in Engliſh, Mint.

The firſt Mint is called in high-Dutch, **Dieſment**: in low-Dutch, **Bruyn heylighe**: he that would tranſlate it into Latine muſt call it *Sacrá nigricans*, or the holy blackiſh Mint: in Engliſh, browne Mint, or red Mint.

The ſecond is alſo called in high Dutch **Krauſz diement, Krauſz muntz**, and **Krauſz Balſam**; that is to ſay, *Mentha cruciata*: in French, *Beaume criſpu*: in Engliſh, Croſſe Mint, or curled Mint.

The third is called of diuers, *Mentha Sarracenica*, *Mentha Romana*: it is called in high-Dutch, **Balſam muntz Onſer frawen muntz, Spitzer muntz, Spitzer balſam**: it may be called *Mentha anguſtifolia*, that is to ſay, Mint with the narrow leafe; and in Engliſh, Speare-Mint, Common garden Mint, our Ladies Mint, browne Mint, and Macrel Mint.

The fourth is called in high-Dutch, **Hertzkraut**, as though it were to be named *Cardiaca*, or *Car-* *a Mentha*: in Engliſh, Heart-wort, and Heart-Mint. ‡ This is the *Siſymbrium ſatiuum* of *Mat-* *lus*, and *Mentha hortenſis alter* of *Geſner*: the Italians call it *Siſembrio domeſtico*, and *Balſamita*; the Germanes, **Katzenbalſam.** ‡

¶ *The Temperature.*

Mint is hot and dry in the third degree. It is, ſaith *Galen*, ſomwhat bitter and harſh, and is inferior to Calamint. The ſmell of Mint, ſaith *Pliny*, doth ſtir vp the minde, and the taſte to a greedy deſire of meat.

¶ *The Vertues.*

Mint is maruellous wholeſome for the ſtomacke, it ſtayeth the Hicket, parbreaking, vomiting, and ſcouring in the Cholericke paſſion, if it be taken with the juice of a ſoure pomegranat. A

It ſtoppeth the caſting vp of bloud, being giuen with water and vineger, as *Galen* teacheth. B

In broth, ſaith *Pliny*, it ſtayeth the flours, and is ſingular good againſt the Whites, namely that Mint which is deſcribed in the firſt place: for it is found by experience, that many haue had this kinde of flux ſtayed by the continuall vſe of this only Mint. The ſame beeing applied to the forehead or temples, taketh away the head-ache, as *Pliny* teacheth. C

It is good againſt watering eies, and all maner of breakings out in the head, as alſo for childrens ſore heads, and againſt the infirmities of the fundament. D

It is poured into the eares with honied water. It is taken inwardly againſt Scolopendres, Beare-wormes, ſea Scorpions, and ſerpents. E

It is applied with ſalt to the bitings of mad dogs. It will not ſuffer milke to cruddle in the ſtomacke (*Pliny* addeth, to wax ſoure) therefore it is put in milke that is drunke, leſt thoſe that drinke thereof ſhould be ſtrangled. F

It is thought, that by the ſame vertue it is an enemy to generation, by ouerthickning the ſeed. G

Dioſcorides teacheth, That being applied to the ſecret part of a woman before the act, it hindreth conception. H

I Garden Mint taken in meat or drinke warmeth and ſtrengthneth the ſtomacke, and drieth vp all ſuperfluous humors gathered in the ſame, and cauſeth good digeſtion.

K Mints mingled with the floure of parched barly conſume tumors and hard ſwellings.

L The water Mint is of like operation in diuers medicines, it cureth the trenching and griping paines of the belly and bowels; it appeaſeth head-ache, ſtayeth yexing and vomiting.

M It is ſingular againſt the grauel and ſtone in the kidnies, and againſt the ſtrangurie, being boiled in wine and drunke.

N It is laid to the ſtinging of waſps and bees with good ſucceſſe.

† The figures which were formerly in this Chapter were no way agreeable to the deſcription and names taken forth of *Dodonæus*. The firſt was of the *Calamintha montana vulgaris* of *Lobel* and *Tab.* The ſecond was of that which is deſcribed in the third place: the third was of the *Mentha Cattaria anguſtifolia* deſcribed in the third place of the next Chapter. The figure agreeing to the fourth deſcription was in the Chapter next ſaue one afore, by the title of *Ocymoides repens*.

Chap. 226. *Of Nep or Cat-Mint.*

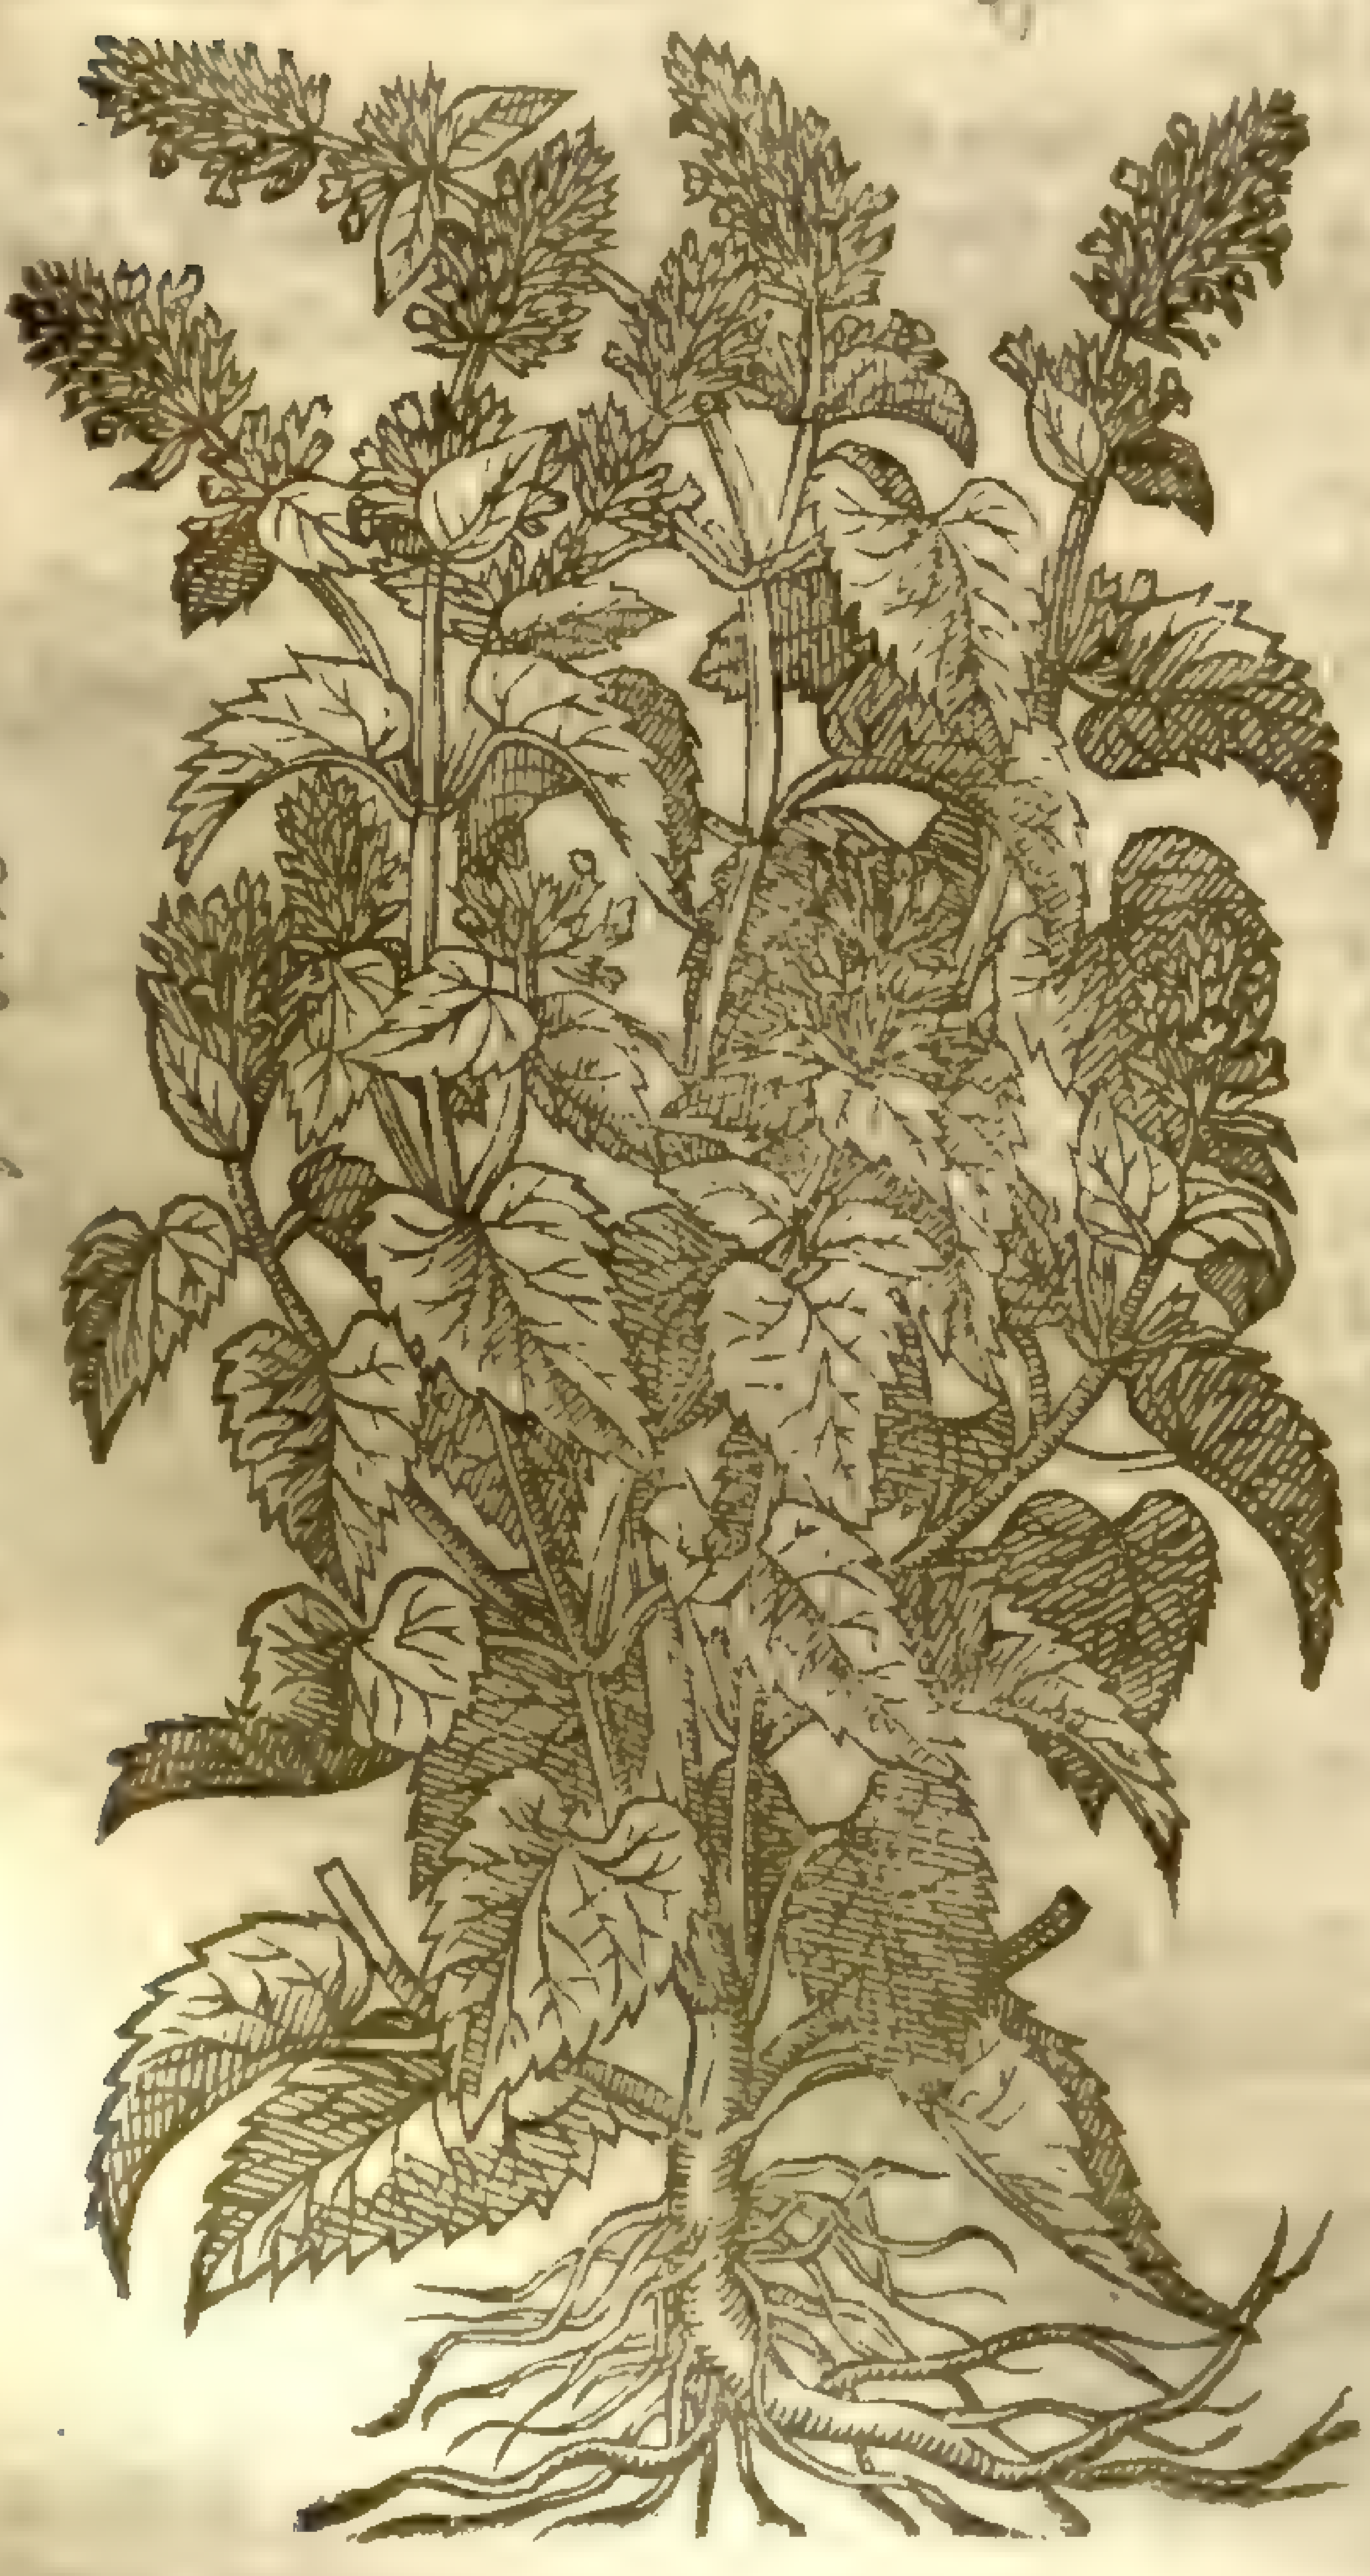
¶ *The Deſcription.*

1 Cat-Mint or Nep growes high, it brings forth ſtalks aboue a cubit long, couered, chamfered, and full of branches: the leaues are broad, nickt in the edges like thoſe of Bawm or Hore-hound, but longer. The floures are of a whitiſh colour, they partly compaſſe about the vppermoſt ſprigs, and partly grow on the very top, ſet in manner of an eare or catkin: the root is diuerſly parted, and endureth a long time: the whole herb together with the leaues & ſtalks are ſoft, and couered with a white down, but leſſer than Horſe-mint: it is of a ſharp ſmel, and pierceth into the head: it hath a hot taſte with a certain bitterneſſe.

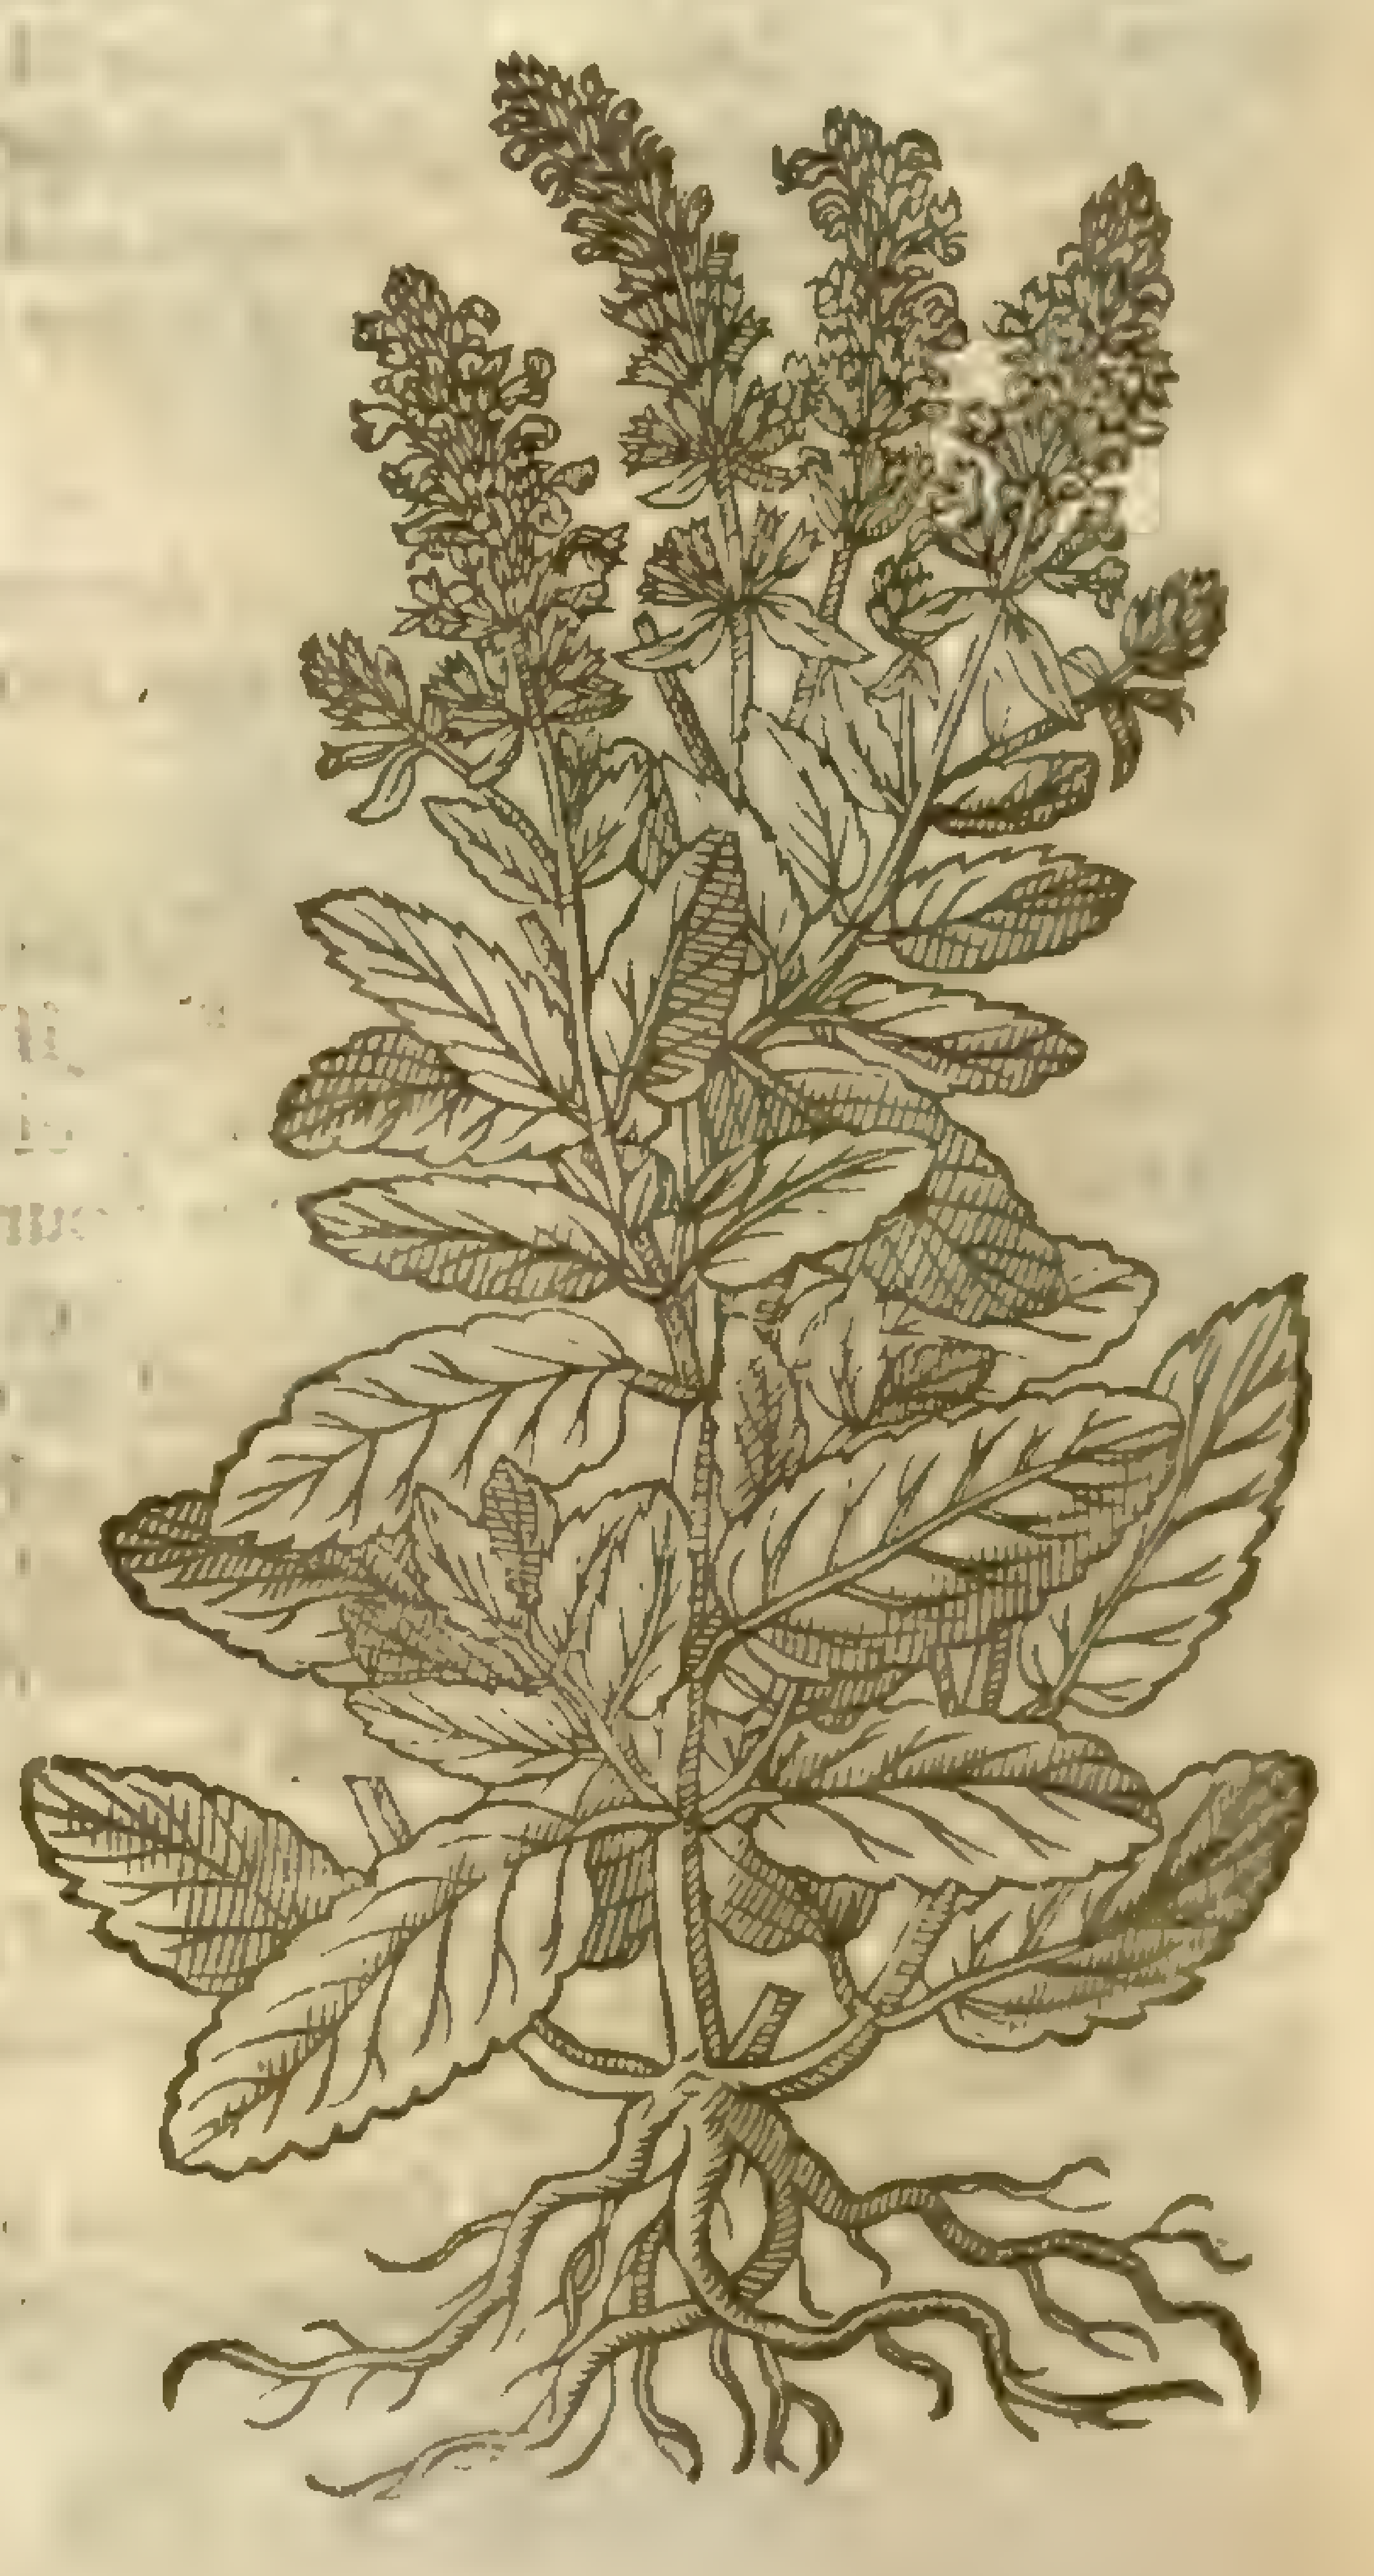
‡ 2 Our Author figured this, and deſcribed the next in the ſecond place of this Chap. This hath pretty large ſquare ſtalkes, ſet at each joint with two leaues like thoſe of Coſtmary, but of a gray or ouerworne colour: the floures grow at the tops of the ſtalks in long ſpoky tufts like thoſe of the laſt deſcribed, and of a whitiſh colour; the ſmell is pleaſanter than that of the laſt deſcribed. ‡

1 *Mentha Felina, ſeu Cattaria.*
Nep or Cat-mint.

Nepeta cataria, & [illegible]
Sm. fl. 3. 2.

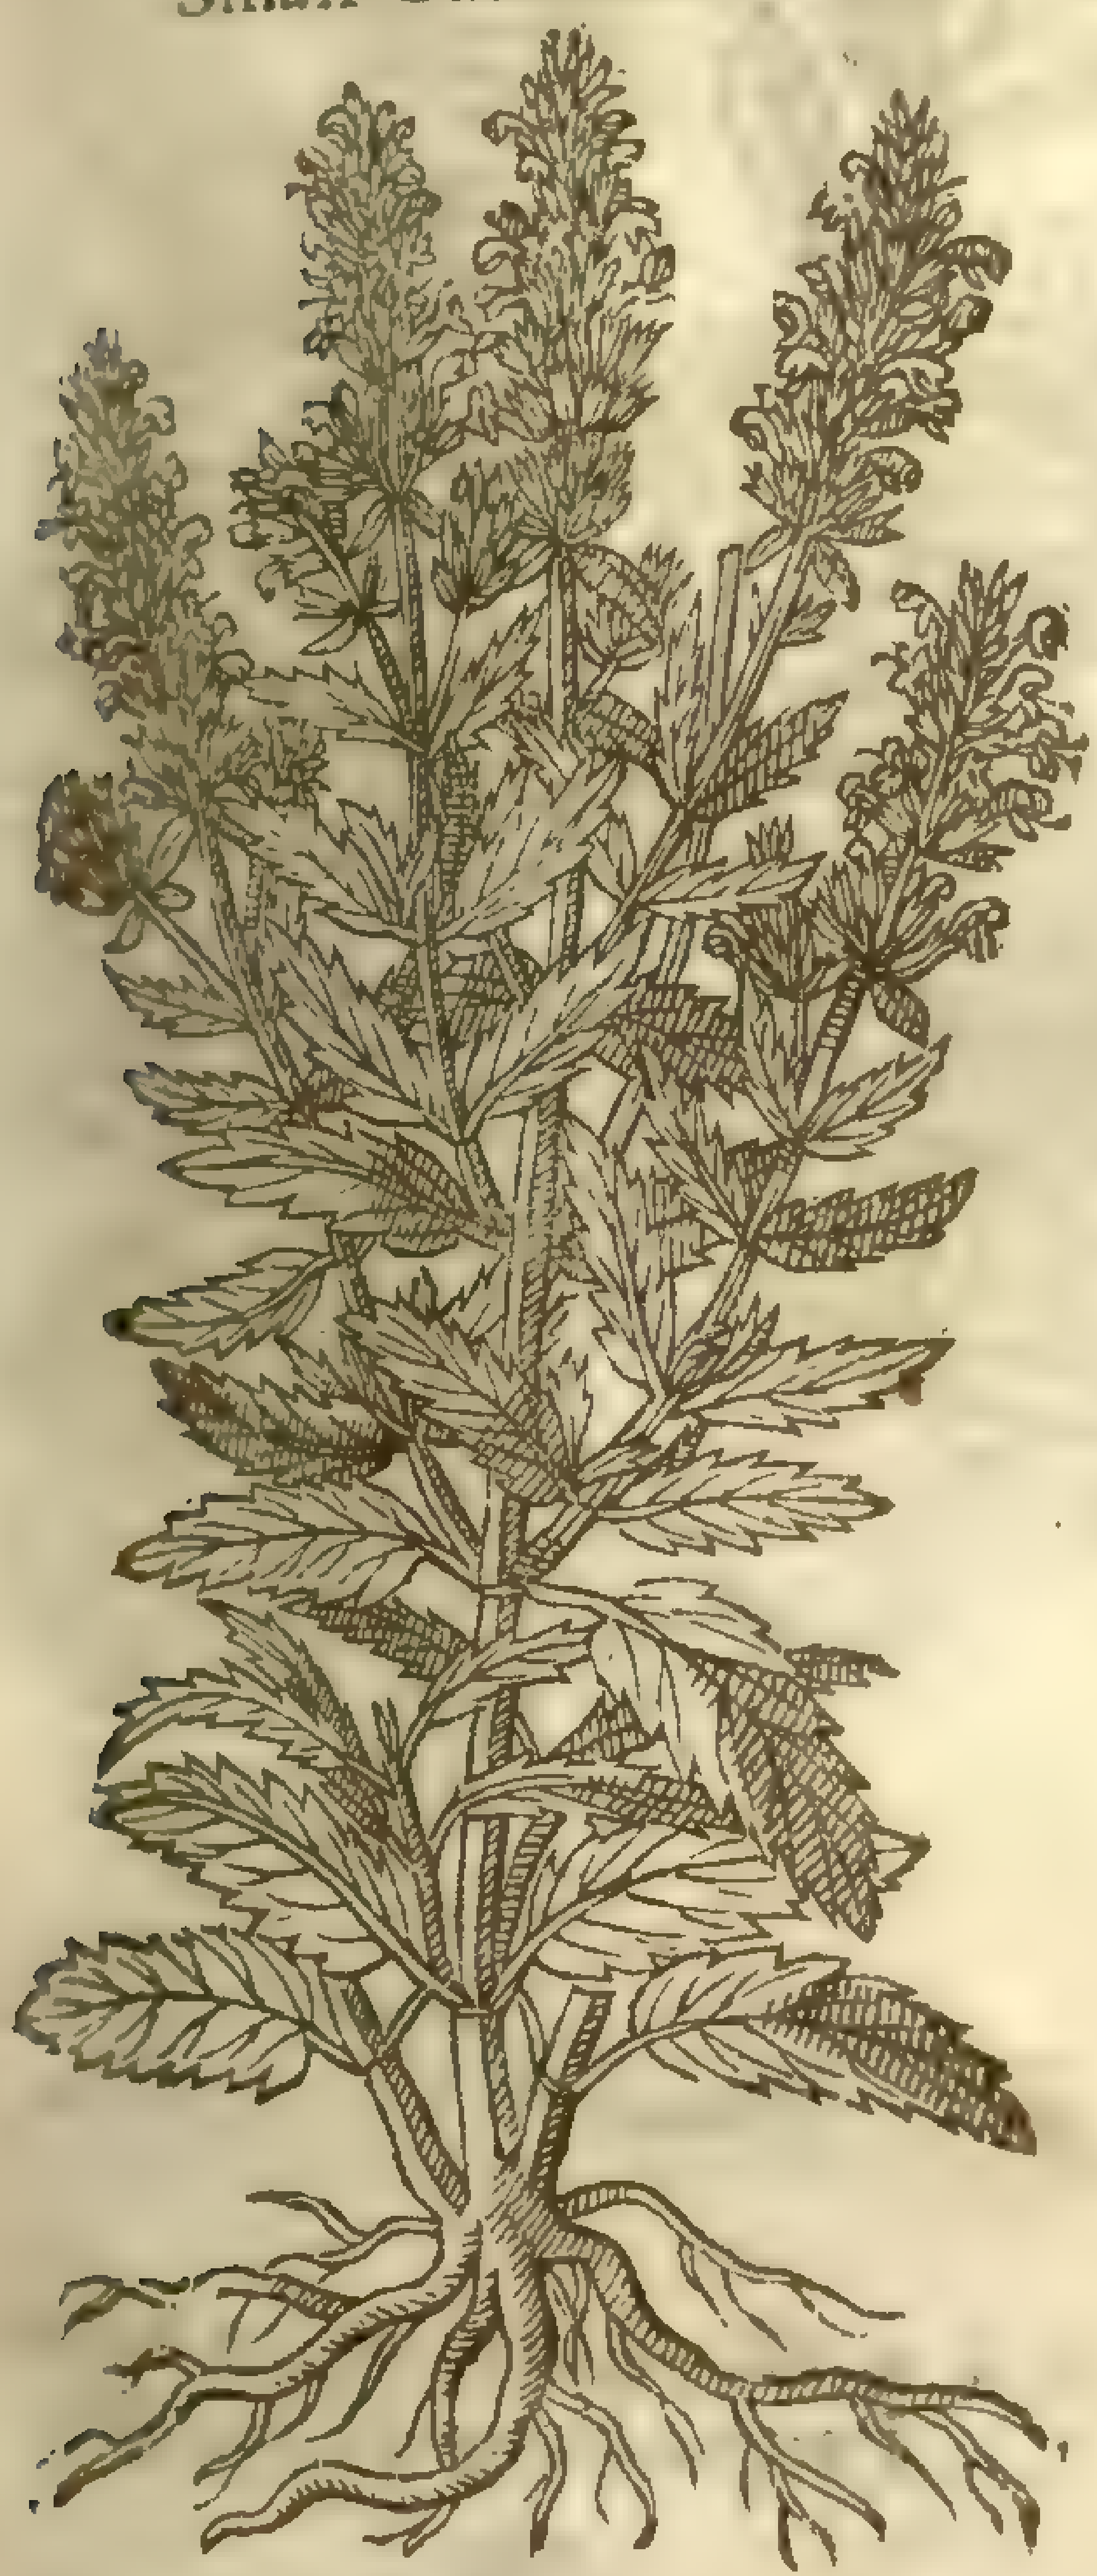


2 *Mentha Cattaria altera.*
Great Cat-mint.



3 There is alſo another kind hereof that hath a longer and narrower leafe, and not of ſo white a colour: the ſtalks hereof are foure ſquare, the floures be more plentifull, of a red light purple colour inclining to blew, ſprinkled with little fine purple ſpecks: the ſmell hereof is ſtronger, but the taſte is more biting. ‡ The figure of this was formerly in the third place of the laſt chapter. ‡

† 3 *Mentha Cattaria anguſtifolia.*
Small Cat-mint.



¶ *The Place.*

The firſt groweth about the borders of gardens and fields, neere to rough banks, ditches, and common wayes: it is delighted with moiſt and watery places, and is brought into gardens.

¶ *The Time.*

The Cat-mints flouriſh by and by after the Spring: they floure in Iuly and Auguſt.

¶ *The Names.*

The later Herbariſts doe call it *Herba Cattaria*, & *Herba Catti*, becauſe cats are very much delighted herewith; for the ſmell of it is ſo pleaſant vnto them, that they rub themſelues vpon it, & wallow or tumble in it, and alſo feed on the branches and leaues very greedily. It is named of the Apothecaries *Nepeta* (but *Nepeta* properly ſo called is a Calamint, hauing the ſmell of Penny-Royall:) in high-Dutch, **Katzen Muntz**: in Low-Dutch, **Catte cruijt**: in Italian, *Cattaria*, or *Herba Gatta*: in Spaniſh, *Yerua Gatera*: in Engliſh, Cat-Mint and Nep.

¶ *The Nature.*

Nep is of temperature hot and dry, and hath the faculties of the Calamints.

¶ *The Vertues.*

A It is commended againſt cold paines of the head, ſtomacke, and matrix, and thoſe diſeaſes that grow of flegme, raw humors, and winde. It is a preſent helpe for them that be burſten inwardly by means of ſome fall receiued from an high place, and that are very much bruiſed, if the juice be giuen with wine or meade.

B It is vſed in baths and decoctions for women to ſit ouer, to bring downe their ſickneſſe & make them fruitfull.

C ‡ It is alſo good againſt thoſe diſeaſes for which the ordinarie Mints do ſerue and are vſed. ‡

CHAP. 227.

Of Horſe-Mint or Water-Mint.

¶ *The Deſcription.*

1 WAter Mint is a kinde of wilde Mint like to the firſt garden Mint: the leaues thereof are round, the ſtalkes cornered, both the leaues and ſtalkes are of a darke red colour: the roots creep far abroad, but euery part is greater, and the herb it ſelfe is of a ſtronger ſmell: the floures in the tops of the branches are gathered together into a round eare, of a purple colour.

† 2 The ſecond kinde of water-Mint in each reſpect is like the others, ſauing that it hath a more odoriferous ſauor being lightly touched with the hand; but being touched hard, it is ouer hot to ſmell vnto: it beareth his floures in ſundry tufts or rundles ingirting the ſtalks in many places, being of a light purple colour; the leaues are alſo leſſe than thoſe of the former, and of an hoary gray colour.

‡ 3 This common Horſe-Mint hath creeping roots like as the other Mints; from which proceed ſtalkes partly leaning, and partly growing vpright: The leaues are pretty large, thicke, wrinkled,

† 1 *Mentha aquatica, ſiue Siſymbrium.*

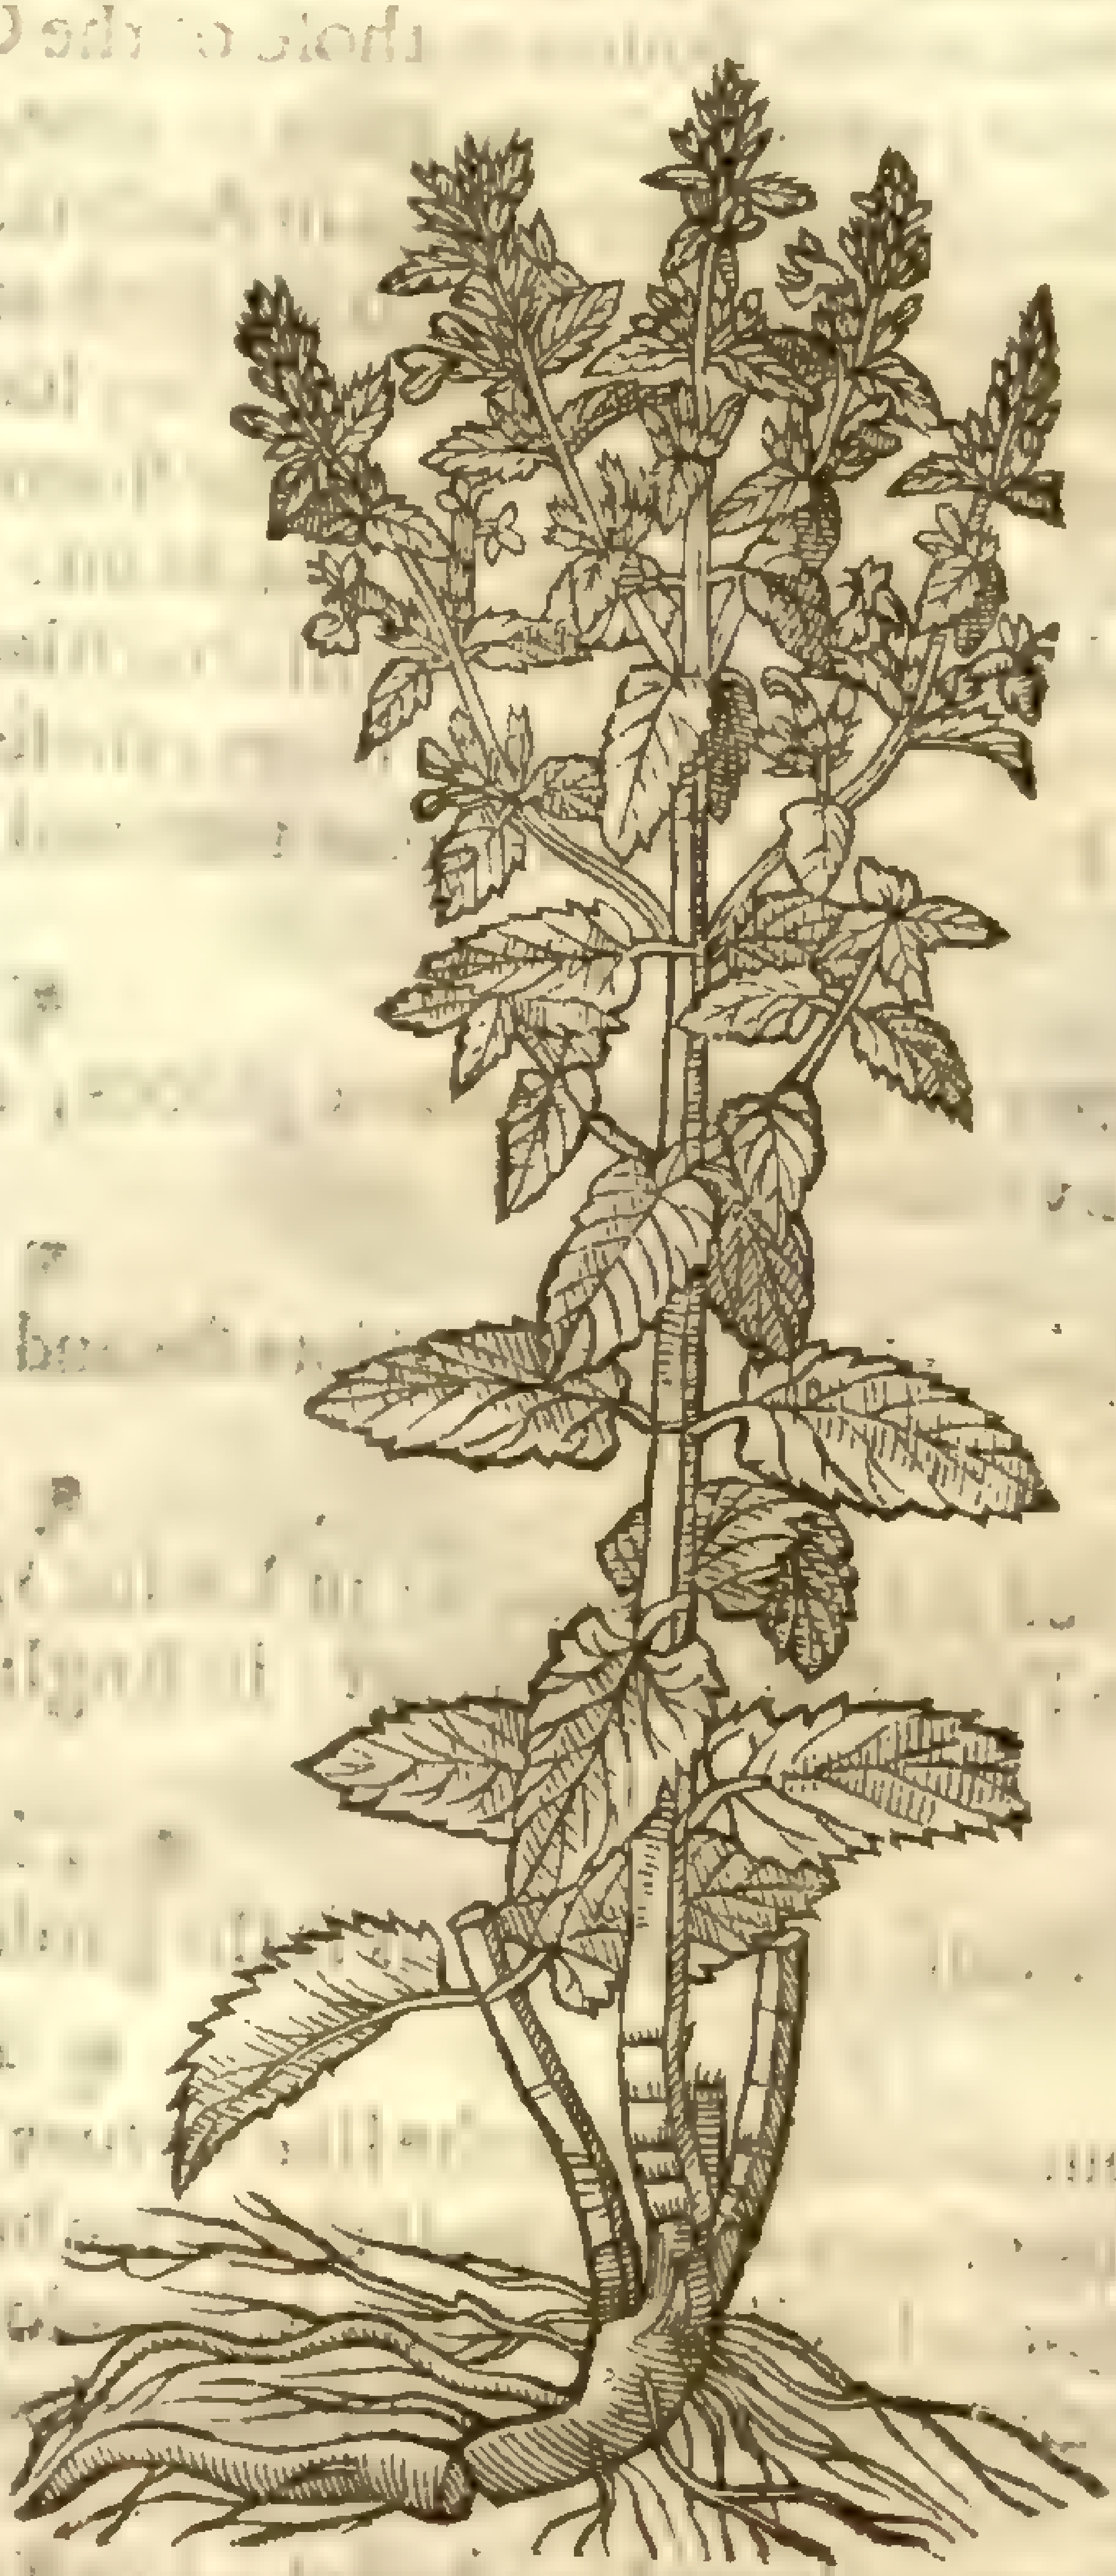
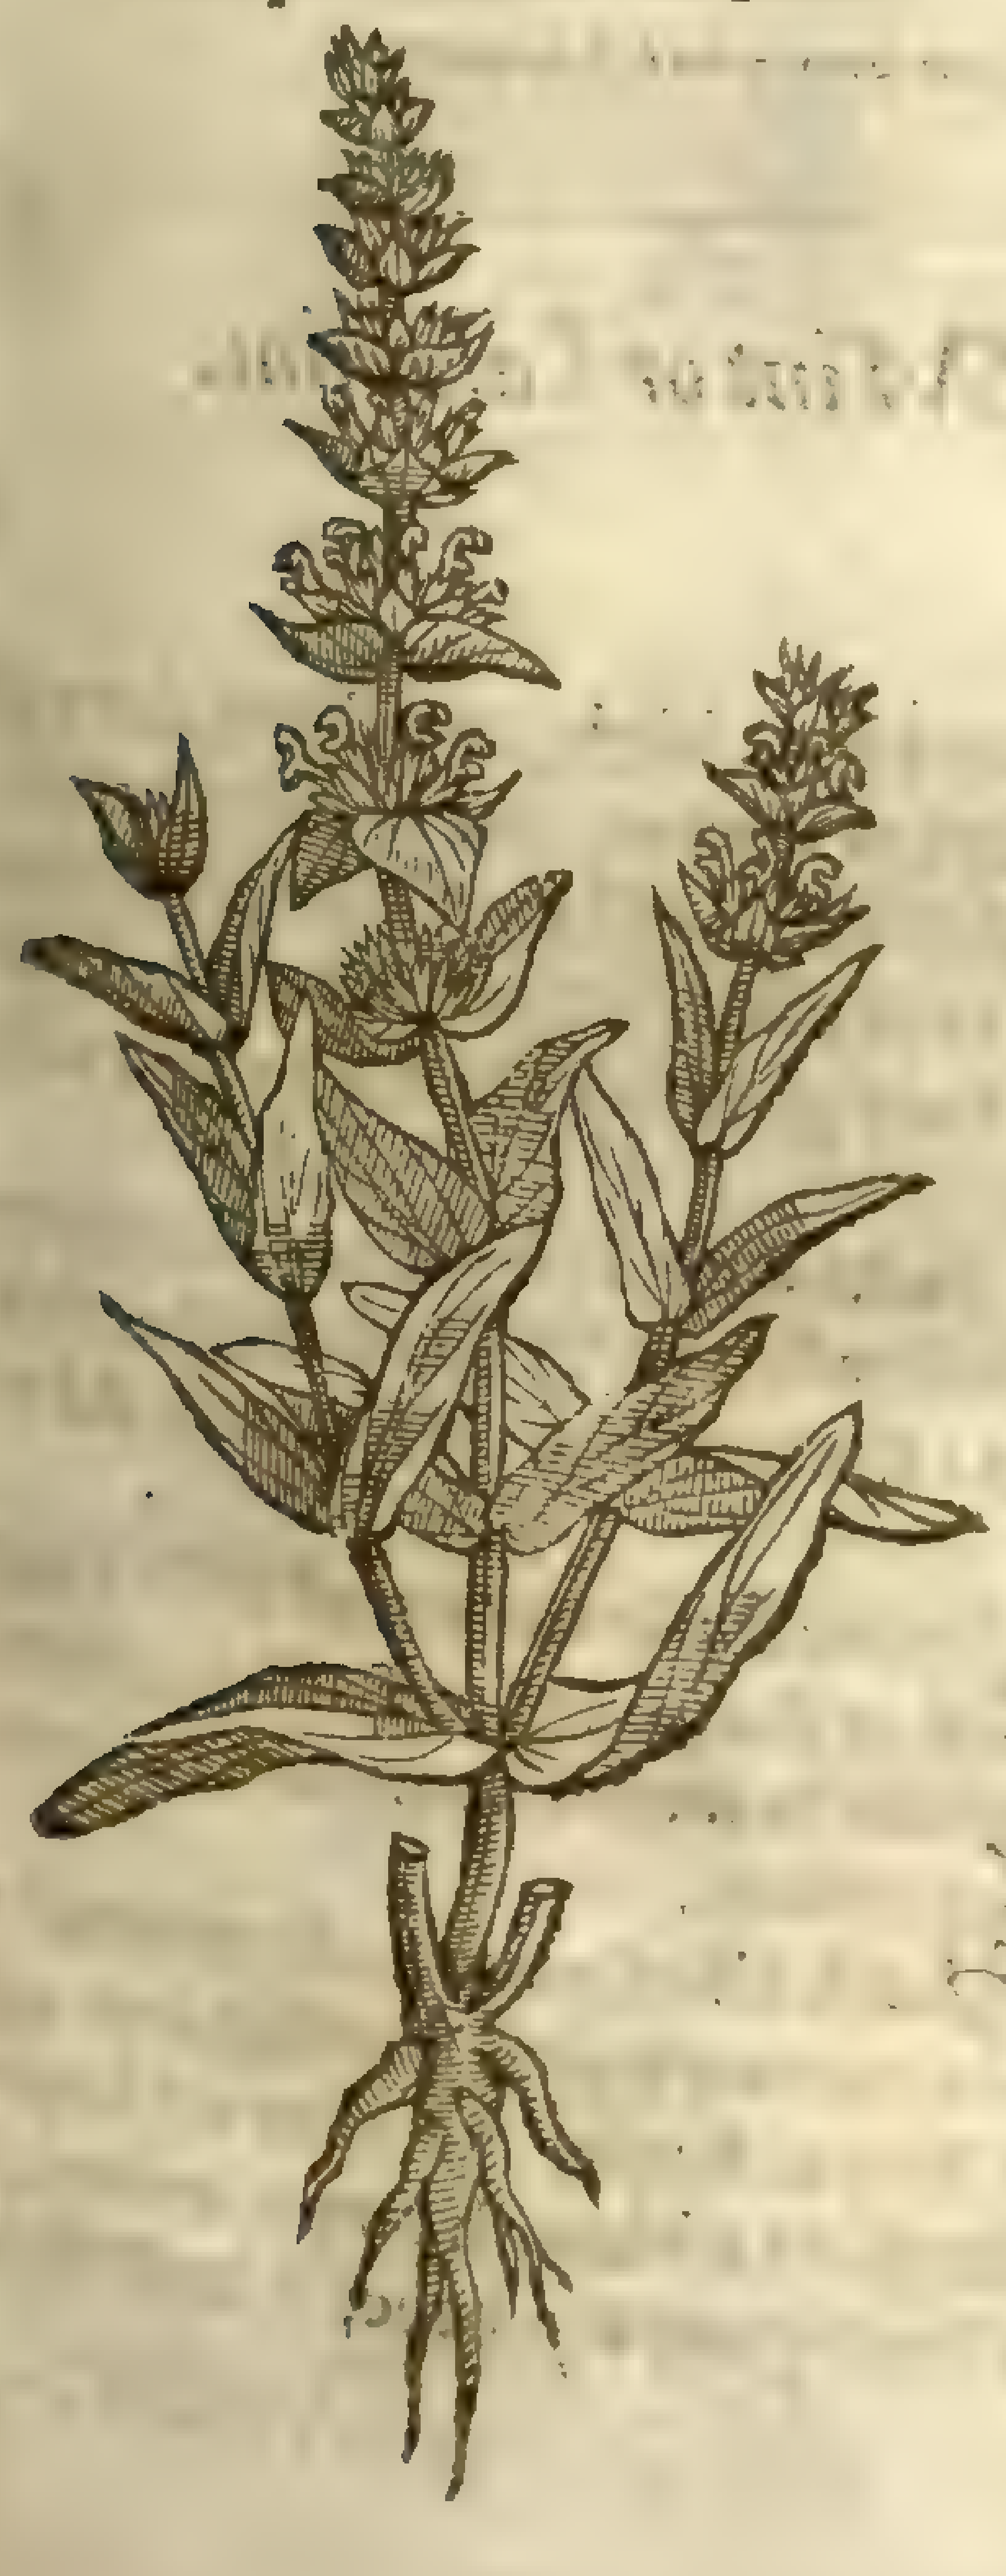
‡ 6 *Mentaſtrum montanum 1. Cluſij.*
Mountain Horſe-Mint.



‡ 7 *Mentaſtrum tuberoſa radice Cluſij.*
Turnep rooted horſe-Mint.



wrinkled, hoary, and rough both aboue and below, and lightly ſnipt about the edges; the floures grow in thick compact ears at the tops of the ſtalkes, and are like thoſe of common Mint. The whole plant is of a more vnpleaſant ſent than any of the other Mints. It groweth in diuers wet & moiſt grounds, and flours in Iune and Iuly. This by moſt writers is called onely *Mentaſtrum*, without any other attribute.

4 In ſome of our Engliſh gardens (as *Pena* and *Lobel* obſerued) grows another Horſe Mint much leſſe, and better ſmelling than the laſt mentioned, hauing the leaues partly green, and partly milke white; yet ſometimes the leaues are ſome of them wholly white, but more and more commonly all green: the ſtalkes, floures, and other parts are like thoſe of the former, but leſſe. This is the *Mentaſtrum niueum Anglicum* of *Lobel*; and *Mentaſtrum alterum* of *Dodonæus*.

5 This growes in waterie places, hauing a ſtalk of a cubit or cubit and halfe high, ſet with longiſh hoary leaues like thoſe of horſe mint: the flours grow in ſpoky tufts at the top of the ſtalks, of a dusky purple colour, & in ſhape like thoſe of the common Mint. The ſmell of this comes neere to that of the water Mint. This is the *Mentaſtri folia aquatica hirſuta, ſiue Calamintha 3. Dioſcoridis* of *Lobel*. In the *Hiſt. Lugd.* it is called *Mentaſtrum minus ſpicatum*.

6 The ſtalke of this is ſome cubit and halfe high, ſquare and full of pith: the leaues are like in ſhape to thoſe of Cat-Mint, but not hoary, but rather green: the tops of the branches are ſet with rundles of ſuch white floures as thoſe of the Cats-mint: the ſmell of this plant is like to that of the horſe-Mint; whence *Cluſius* calls it *Mentaſtrum montanum primum.* It floures in Auguſt, and growes in the mountainous places in Auſtria.

7 The ſame Author hath alſo ſet forth another, by the name of *Mentaſtrum tuberoſa radice.* It hath roughiſh ſtalkes like the former, any longiſh crumpled leaues ſomewhat ſniht about the edges like thoſe of the laſt deſcribed: the floures grow in rundles alongſt the tops of the branches, white of colour, and like thoſe of Cat-Mint. The root of this (which, as alſo the leaues, is not well expreſt in the figure) is like a Radiſh, and blackiſh on the outſide, ſending forth many ſuckers like to little turneps, and alſo diuers fibres; theſe ſuckers taken from the main root will alſo take root and grow. It floures in Iune. *Cluſius* receiued the ſeed of it from Spaine. ‡

¶ *The Place.*

They grow in moiſt and waterie places, as in medowes neere vnto ditches that haue water in them, and by riuers.

¶ *The Time.*

They floure when the other Mints do, and reuiue in the Spring.

¶ *The Names.*

It is called in Greeke Σισύμβριον: in Latine *Siſymbrium*; in high-Dutch, **Roſzmuntz**, and **Waſſermuntz**: in French, *Menthe ſauvage*: in Engliſh, Water-Mint, Fiſh-Mint, Brooke-Mint, and Horſe-Mint.

¶ *The Temperature.*

Water Mint is hot and dry as is the garden Mint, and is of a ſtronger ſmell and operation.

¶ *The Vertues.*

A It is commended to haue the like vertues that the garden Mint hath, & alſo to be good againſt the ſtinging of bees and waſps, if the place be rubbed therewith.

B The ſauor or ſmell of the water Mint reioyceth the heart of man, for which cauſe they vſe to ſtrew it in chambers and places of recreation, pleaſure, and repoſe, and where feaſts and banquets are made.

C There is no vſe hereof in phyſick whileſt we haue with vs the garden Mint, which is ſweeter and more agreeing to mans nature.

† The figure that was in the firſt place was of the horſe Mint, and that in the ſecond place ſhould haue been in the firſt, as now it is.

Chap. 228. *Of Mountaine Mint or Calamint.*

¶ *The Deſcription.*

1 Mountaine Calamint is a low herb ſeldome aboue a foot high, parted into many branches: the ſtalks are foure ſquare, and full of joints as it were, out of euery one wherof grow forth leaues ſomewhat round, leſſer than thoſe of Baſil, couered with a very thin hairy down, as are alſo the ſtalks, ſomewhat whitiſh, and of a ſweet ſmell: the tops of the branches are notably deckt with floures ſomwhat of a purple colour; then groweth the ſeed which is black: the roots are full of ſtrings and continue.

2 This moſt excellent kinde of Calamint hath vpright ſtalks a cubit high, couered ouer with a woolly moſſineſſe, beſet with rough leaues like a Nettle, ſomewhat notched about the edges: among the leaues come forth blewiſh or sky-coloured floures: the root is wooddy, and the whole plant is of a very good ſmell.

3 There is another kinde of Calamint which hath hard ſquare ſtalkes, couered in like manner as the other: with a certaine hoary or fine cotton: the leaues be in ſhape like to Baſil, but that they are rough; and the floures grow in rundles toward the tops of the branches, ſomtimes three or four vpon a ſtem, of a purpliſh colour. The root is threddy and long laſting.
